【英文摘要】ETR1 was the controlling gene in ethylene signal transduction.A pair of oligo nucleotide primers were designed from conserved domain of ETR1 gene family.PCR amplifications were performed on genomic DNA template of Citrullus lanatus(Thunb.) Matsum & Nadai var.lanatus and Cucumis sativus L.,they produced two fragments of 1 633 bp and 1 491 bp,named CLETR1 and CSETR1 respectively.The results of Blastn on NCBI Genebank database indicated that many highly matched homologous nucleic acid sequences and amino acid sequences were all ethylene receptor gene ,the ratio were 80 % - 95 % and 75 % - 90 % respectively. The single nucleotide variations were found in the conserved sequences between CL ETR1 and CSETR1 ,there were 23 SNPs(single nucleotide polymorphisms) in the encoding region ,and 5 of them resulted 4 amino acids difference.

【题目】辐射花粉授粉诱导甜瓜单倍体
【中文关键词】甜瓜 ; 辐射花粉 ; 单倍体 ; 胚离体培养
【英文关键词】Cucumis melo L.; Irradiated pollen; Haploid; Emhryo cu]ture in vitro
【中文摘要】为了掌握辐射花粉授粉诱导甜瓜单倍体技术,以5种基因型甜瓜为材料,通过应用γ射线辐射的花粉进行授粉结合胚胎培养,从2种基因型中获得了单倍体植株,单倍体的平均诱导频率为0.29%.这2种基因型分别属于厚皮和薄皮甜瓜类型.花粉的辐射剂量为300 Gy和600 Gy时,供试材料的平均坐果率分别为50%和10%.辐射剂量为300 Gy时,诱导厚皮甜瓜4810和薄皮甜瓜新富玉形成了单倍体植株,单倍体植株的诱导频率分别为0.55%和0.63%;剂量为600 Gy时未能诱导供试材料形成单倍体.研究结果表明母本的基因型和花粉的辐射剂量对坐果率和单倍体的产生有一定的影响.此外,对单倍体植株与正常二倍体植株的形态学进行了比较观察,结果表明单倍体植株生长势弱,叶片较小,雄花和雌花均败育.
【英文摘要】Haploid melon {Cucumis melo L.) plants were obtained from two among five genotypes tested through pollination with γ-irradiated pollens and subsequent embryo culture in vitro, the average induction rate was 0.29%. These two genotypes represent thick (C. melo ssp. melo) and thin [C. melo ssp. conomon (Thunb) Greb] rind melon. Average fruit settings of donor plants were 50% and 10%, when the γ-ray doses were 300 Gy and 600 Gy respectively. Haploid were induced from thick and thin rind melon, line 4810 and cultivar Xinfuyu, to which the induction rate of haploid were 0.55% and 0.63% respectively, when the dose was 300 Gy. When the dose was 600 Gy, however, no haploid plant was produced from any tested material. The results indicated that matemal genotypes and irradiation doses had certain effects on both fruit setting and haploid production. Morphological comparison between haploid and diploid donor plants showed that the haploid had smaller leaves and sterile male and female flower, grew less vigorously.

【题目】雪峰全新花皮无籽西瓜新品种的选育
【中文关键词】无籽西瓜; 新品种; 雪峰全新花皮无籽;
【英文关键词】Seedless watermelon; New variety; Xuefeng Quanxin Huapiwuzi;
【中文摘要】雪峰全新花皮无籽[2440(SBW4×SQW2)×XH]是湖南省瓜类研究所最新育成的高产、优质无籽西瓜三交花皮新品种。全生育期106d左右,果实发育期35d左右,易坐果,单果重6~7kg,667m2产量3800~4500kg,果实中心可溶性固形物含量12%左右。2006年2月通过湖南省农作物品种审定委员会审定。
【英文摘要】A new seedless watermelon variety named Xuefeng Quanxin Huapiwuzi with pedigree(SBW4×SQW2)×XH is developed by Hunan Cucurbit Research Institute. It is a seedless watermelon variety with high yield and quality. It is resistant to diseases and wetness. It sets fruit easily and produces fruit with average size of 6-7 kg. Fruit matures about 106 days from sowing and 35 days from pollination. The yield per 667 m2 is 3 800-4 500 kg. The soluble solid content in center of the fruit is 12%. It is officially registered in Hunan Province in February 2006.

【题目】白皮甜瓜品种雪峰蜜2号的选育
【中文关键词】厚皮甜瓜; 新品种; 雪峰蜜2号; 白皮; 白肉;
【英文关键词】Melon; New variety; Xuefengmi No.2; White rind; White flesh;
【中文摘要】雪峰蜜2号系湖南省瓜类研究所选育的白皮白肉厚皮甜瓜新品种。2001-2002年参加品种比较试验,2003-2004年参加国家甜瓜品种区域试验、生产试验。其主要特性为:中熟种,全生育期100~110d,果实发育期40~45d;生长势中等,易于坐果;果实圆形,果皮白色、光滑有光泽,商品率高;果肉白色,肉厚3.5~4.0cm,中心可溶性固形物含量14%~17%,肉质脆;单果重1.1~1.7kg,单产2350kg/667m2左右,高产在4000kg以上;耐贮运,抗病性强,适应性广。
【英文摘要】Xuefengmi No. 2 is a new melon F1 hybrid developed by crossing two inbred lines M8208 and N7056. The whole growing period is about 100-110 days and the to ripening of fruit is about 40-45 days. The vines is medium growth tendency and easy to set fruit. The fruit is white and shape is round. The skin is white,sleek and lucency. The central soluble solid content is 14%-17%. Hardrind and easy to store. Yield of 2 350 kg/667 m2. This variety is resistant to disease and moisture. The adaptabilities is good, especially adapt to be cultivated in safeguard.

【题目】西瓜杂交制种中细菌性果腐病的预防措施探讨
【中文关键词】西瓜;杂交制种;细菌性果腐病;预防措施
【英文关键词】无
【中文摘要】瓜类细菌性果腐病是近年来威胁全球瓜类作物的严重病害,是典型的由种子带菌引起的传染性病害,对我国的冲击首先表现在西瓜制种业,是影响种子进出口的最大障碍。细菌性果腐病主要通过伤口、气孔侵染,借风力、雨水、灌溉水、喷灌和昆虫等传播。西瓜制种整枝去雄的伤口、污染的刀具和器皿及人为的传播均有助于病害的流行;病害远距离传播靠带菌的种子、鲜果和病果。病原主要在种子和土壤的病残体上越冬,成为来年发病的初侵染源。长时间低温阴雨反常天气是其大发生的主要诱因。根据本所对该病多年的研究,探讨西瓜人工杂交制种过程中对细菌性果腐病的预防措施,对于保证种子质量,促进西瓜产业发展和提高制种效益,具有积极而重要的意义。

【题目】应用基因芯片检测酸味抗病甜瓜果实基因表达
【中文关键词】甜瓜;基因芯片;实时荧光定量PCR;果实基因表达
【英文关键词】Cucumis melo;microarray;RT-PCR;fruit gene expression
【中文摘要】利用Melon cDNA array ver1.0检测新疆厚皮甜瓜(Cucumis melo var.ameri)果实基因表达的可行性,并检测了经60Co γ射线辐射诱变后的新疆厚皮甜瓜酸味抗病变异株成熟果实基因的表达.结果显示:该芯片平均能够检测新疆厚皮甜瓜基因2 008个,检测出的基因占该芯片基因探针总数的65.4%;检测酸味抗病变异株上调表达的基因251个,占检出基因总数的12.5%;下调表达的基因224个,占检出基因总数的11.16%.利用RT-PCR验证芯片结果的可靠性,结果表明,用Melon cDNA array ver 1.0检测新疆厚皮甜瓜成熟果实基因表达水平是可行的.
【英文摘要】The feasibility of using Melon cDNA array ver1.0 to detect the gene epression in mature fruit of Cucumis melo var. ameri with sourness taste and resistance variation. The results showed that the melon cDNA array verl.0 could detect the expression of 2008 genes in Cucumis melo var. ameri variety of sourness taste and resistance. The detected genes accounted for 65.4% of the total 3068 probe group.251 upregulated and 224 down-regulated genes were detected in variety of sourness taste and resistance,accounting for 12.5% and 11.16% of total detected genes respectively. Using RT-PCR to validate the changes in mRNA abundance detected by microarray analysis ,the results showed that melon cDNA array verl.0 could be efficiently used for gene expression analysis of Cucumis melo var. ameri.

【题目】无籽西瓜枯萎病抗性的遗传分析
【中文关键词】无籽西瓜;枯萎病抗性;遗传分析
【英文关键词】无
【中文摘要】西瓜枯萎病(Fusarium oxysporum f. sp. niveum)是西瓜生产中的毁灭性病害,培育和应用抗病品种是防治此病害最经济有效的措施。我国自20世纪80年代开展西瓜抗枯萎病育种以来,已培育出一批抗病品种并在生产上推广应用,但主要集中于二倍体西瓜,在三倍体无籽西瓜育种方面几乎没有涉及,因此无籽西瓜生产中缺少抗枯萎病品种。生产上对无籽西瓜枯萎病的防治主要是采用嫁接,防病的效果也较为理想,但嫁接增加了生产成本而且还存在不亲和、果实品质降低等问题。目前无籽西瓜生产面积正在逐年扩大,适时开展无籽西瓜抗枯萎病育种是满足生产需要、有效防治病害的根本途径。本试验采用NCⅡ杂交设计配制了部分无籽西瓜组合,鉴定双亲及F1 的枯萎病抗性并进行配合力分析,以初步了解无籽西瓜抗枯萎病组合双亲选配的一般规律。

【题目】四倍体西瓜种质资源的抗枯萎病性鉴定及其遗传规律初探
【中文关键词】四倍体西瓜; 种质资源; 三倍体西瓜; 枯萎病抗性; 抗性遗传分析;

【英文关键词】tetraploid watermelon; germplasm; triploid watermelon; resistance to fusarium wilt; genetic analysis of resistance;
【中文摘要】采用苗期接种法对51份四倍体西瓜种质资源进行枯萎病抗性鉴定,并选择不同抗性的四倍体西瓜与二倍体西瓜按NCⅡ杂交设计配制三倍体西瓜组合,通过方差分析研究四倍体西瓜的枯萎病抗性遗传规律。结果表明:三倍体西瓜枯萎病抗性受其双亲的加性和非加性遗传共同控制,且以加性遗传为主,源于四倍体母本的加性遗传相对重要于二倍体父本的加性遗传;亲本的一般配合力效应与其枯萎病抗性呈显著正相关。
【英文摘要】Fusarium wilt(Fusarium oxysporum f.sp.Niveum) resistance in 51 accessions of tetraploid watermelon germplasm was identified in the seedlings through artificial inoculation,and inheritance of resistance was studied by analysis of variance of resistance in triploid watermelon combinations which were made with tetraploid and diploid watermelon using incomplete diallel mating method(NCⅡ).The results indicated that the resistance of triploid watermelon combinations was controlled by additive and non-additive heredity components, and the former was more important relatively than the later.The additive heredity component of tetraploid female parentwasmore important than that of diploid male parent. The resistance of each parentwas significantly positively related to its general combining ability.

【题目】江苏省蔬菜种质资源保护与利用现状
【中文关键词】蔬菜; 种质; 资源; 保护; 利用
【英文关键词】无
【中文摘要】21世纪是生物技术的世纪,生物技术竞争的关键是种质资源的竞争。种质资源工作是育种工作的基础。植物育种的实践证明,突破性的成就决定于关键性基因资源的开发与利用。加入WTO 和农业产业的升级,对蔬菜育种提出了优质、多抗、专用的要求。而实现这些目标,首先取决于资源。一个地方和单位所拥有种质资源的数量和质量,以及对其特性和遗传规律的研究深度和广度,是衡量其育种水平的重要标志之一。因此,广泛地搜集、科学地保存、不断地创新种质资源,是现代生物技术竞争的重要特点。蔬菜种质资源的保存与创新,是保证江苏省蔬菜产业可持续发展的基础性工作、公益性研究。因此,构造江苏省蔬菜种质资源保护平台十分必要。

【题目】甜瓜蔓枯病的防治药剂筛选试验
【中文关键词】甜瓜;蔓枯病;防治药剂;筛选试验
【英文关键词】无
【中文摘要】甜瓜蔓枯病已成为保护地厚皮甜瓜栽培中发生最普遍、危害最严重的真菌性病害,它的发生常会导致毁灭性的后果[1]。在许多甜瓜生产区,蔓枯病是仅次于根结线虫病的第二大病害[2],尤其在老瓜产区和专业种瓜田块更为突出。蔓枯病如防治不当,植株死亡率高达30%~40%,直接导致甜瓜品质和产量严重下降。由于目前尚无高抗品种,化学防治仍是主要防治途径。

【题目】网纹甜瓜果实主要性状的配合力分析
【中文关键词】网纹甜瓜; 果实性状; 配合力;
【英文关键词】Muskmelon; Character of fruit; Ability of combining;
【中文摘要】选用6份网纹甜瓜材料按Griffing方法Ⅳ配制杂交组合15个,对网纹甜瓜果实的主要性状进行配合力分析。结果表明,单果质量、折光糖含量、果肉厚度和果形指数的遗传均受加性效应和非加性效应的控制,其中单果质量、折光糖含量和果形指数的遗传以加性效应为主,果肉厚度的遗传则以非加性效应为主。M-14为综合性状较优,利用潜力高的亲本材料。
【英文摘要】Combining ability of main characters of muskmelon fruit was analyzed by 15 cross combinations which were made with 6 muskmelon parents by the method of Griffing Ⅳ.The results showed that the fruit weight,the sugar content,the flesh thickness and the shape exponent were controlled by additive and non-additive heredity components.The fruit weight,the sugar content and the shape exponent were mainly controlled by additive effect but the flesh thickness was mainly controlled by non-additive effect.M-14 could be a fine parent for breeding for its general characterswere excellent.

【题目】应用PAGE梯度电泳技术鉴定西瓜杂交种纯度
【中文关键词】西瓜; PAGE梯度电泳; 杂交种纯度;
【英文关键词】watermelon(Citrullus vulgaris); electrophoresis gradient-PAGE; hybrid seed purity;
【中文摘要】应用PAGE梯度电泳技术分析西瓜杂交种苏蜜五号、早抗京欣和抗病苏蜜及其父母本种子的酯酶、过氧化物酶、多酚氧化酶及种子蛋白。结果显示:除早抗京欣发芽5 d时过氧化物酶有一明显谱带特征可以有效区别杂种与亲本

外,其他电泳组合谱带虽清晰但无明显差异,表明西瓜遗传基础相对狭窄。蛋白质和同工酶难以发现统一的谱带特征来检测不同西瓜杂交种子的纯度。由于不同杂交种双亲的遗传背景不同,对于亲缘关系相对较远的一些品种可能会出现某些特别的特征以用来鉴别真假杂种。

【英文摘要】Electrophoresis patterns of esterase,peroxidase and polyphenoloxidase in the seed of watermelon hybrids Sumi 5,Zaokangjinxin,Kangbingsumi,and their parents were analyzed by gradient-PAGE.A band of POD in the seeds of Zaokangjinxin after five days of germination was seen obviously which could distinguish the hybrid with its parents.The bands of POD were not found in the electrophoresis patterns of other hybrids and parents.The bands of protein and esterase isoenzyme did not show any difference between hybrids and their parents. Some specific bands could be used to distinguish hybrid from its parents with different genetic backgrounds.

【题目】甜瓜蔓枯病病原鉴定及其生物学特性

【中文关键词】蔓枯病菌;生物学特性;rDNA-ITS;甜瓜

【英文关键词】gummy stem blight;biological character;rDNA-ITS;muskmelon

【中文摘要】从江苏省部分地区感染蔓枯病的甜瓜茎上分离病原菌,并对其形态学、生物学特性及致病力进行了研究.结果表明,共分离得到4株甜瓜蔓枯病菌株,这4株病菌的最适生长温度为25 ℃,培养基pH值对病菌生长的影响不大.另外,对这4个菌株的核糖体RNA基因内转录间隔区(rDNA-ITS)进行了PCR扩增和序列测定,并在GenBank中进行了Blast搜索和比对分析,根据rDNA-ITS序列分析结果结合甜瓜病株症状和病菌的形态学特征,初步认为江苏省甜瓜蔓枯病的病原菌为Didymella bryoniae (Auersw.) Rehm.,其无性型为西瓜壳二孢Ascochyta citrullina Smith.

【英文摘要】Gummy stem blight is an important disease of muskmelon in the middle and later growth season.The affected stems of muskmelon were collected from some areas of Jiangsu province,China,and four strains of the pathogenic fungi isolated from the sample stems were investigated for the morphological and biological characters.The optimal temperature for the fungal growth Was 25°C.and there were no significant effects of the pH value in the media on the growth of the pathogen.The rDNA-ITS genes of 4 isolates were amplified and sequenced.Based on the Blast search and the alignment analysis in GenBank database combined morphological characters,the pathogen of muskmelon gummy stem blight was identifled as Didymella bryoniae(Auersw.)Rehm.,anamorph being Ascochyta citrullina Smith.

【题目】西瓜品种枯萎病抗性的遗传研究
【中文关键词】西瓜; 枯萎病; 抗性; 遗传;
【英文关键词】watermelon; Fusarium wilt; resistance; inheritance;
【中文摘要】选用7份对西瓜枯萎病抗性不同的材料作亲本,采用Griffing双列杂交方法II对西瓜枯萎病抗性遗传规律进行研究。试验结果表明,西瓜对枯萎病抗性由隐性多基因控制,其遗传符合加性-显性模型,加性效应比显性效应更为重要,且感病对抗病表现为部分显性,显性方向指向增效,隐性基因为减效,在所有亲本中所携带的隐性基因比显性基因多。且不同西瓜抗性材料的杂交组合所表现的遗传规律不一致:Calhoun Gray、Sugerlee对枯萎病1号生理小种的抗性遗传是呈基因互作的单基因显性性状遗传;Charleston Gray和欣抗♀、红5-2对枯萎病1号生理小种的抗性遗传则很复杂,不能用简单的显隐关系来解释。
【英文摘要】Seven watermelon materials with different resistances to fusarium wilt were used as parents to study the inheritance rule of resistance to fusarium wilt by Griffing s diallel crossing system Ⅱ.The inheritance of resistance to fusarium wilt in watermelon was controlled by recessive polygene and conformed to the additive-dominance model.Additive effect played a more important role than dominant effect did.The susceptibility was partially dominant,with dominant gene showing the effect of increasing susceptibility, and the recessive gene, the effect of decreasing suscep tibility. All the parents carried less dormant genes than the dominant genes. The inheritance rule of resistance to fusarium wilt varied in tested materials and their cross combination. The resistance to race 1 fusarium wilt showed a single gene dominant hereditywith gene interaction in watermelon Calhoun Gray and Sugerlee. The inheritance of resistance to race 1 fusarium wiltwas comp licated,and could not be exp lained with dominant and recessive theory in watermelon Charleston Gray, Xinkang♀, and Hong 522.

【题目】利用RAPD和ISSR分子标记对西瓜作图亲本的多态性分析
【中文关键词】西瓜; RAPD; ISSR; 体系优化; 多态性分析;
【英文关键词】watermelon; RAPD; ISSR; system optimization; polymorphism analyses;
【中文摘要】以西瓜为材料,对基因组DNA的RAPD和ISSR分析体系中的Mg2+、dNTPs和引物浓度进行了优化。筛选出的RAPD优化体系(20μl)为:引物0.4μmol/L,dNTPs 200μmol/L,Mg2+2.0 mmol/L,DNA 20 ng,1×Buffer缓冲液,Taq酶1.0 U;ISSR优化体系(16μl)为:引物0.25μmol/L,dNTPs 160μmol/L,Mg2+1.0 mmol/L,DNA 20ng,1×Buffer缓冲液,Taq酶0.64 U。以远生态西瓜品种自交系64-1-3和6-2、及23-1和4-1-2为作图亲本,利用筛选好的RAPD和ISSR体系对作图亲本的多态性进行分析。结果表明,在作图亲本64-1-3和6-2中,181个RAPD引物中有11个引物不能有效扩增,其余170个引物产生了525条扩增带,平均每个引物在基因组中可检测到3.08个基因位点,其中可检测出多态性位点的引物有55个,产生了77条多态性扩增带,平均多态率为14.67%; 62个ISSR引物中有17个引物不能有效扩增,其余45个引物产生了188条扩增带,平均每个引物产生了4.18条扩增带, 15个多态性引物可以在双亲间检测到多态性位点23个,平均每个多态性引物能扩增出1.53个多态性位点,多态率为12.23%。在作图亲本23ª 21和421ª 22中,利用499个RAPD引物进行了基因组的扩增,其中43个引物为非有效引物,456个引物产生了1 431条带,平均每个引物产生3.14条带, 142个多态性引物检测到了240个多态性基因位点,平均多态率为16.77%。表明西瓜作图亲本间的遗传背景较狭窄。

【英文摘要】Genomic DNA of watermelon was analyzed by optimizing the concentration of Mg2+,dNTPs,and primer in RAPD and ISSR analysis systems.The screened optimization system of RAPD for watermelon genomic DNA was 20 μl,which contained primer 0.4 μmol/L,dNTPs 200 μmol/L,Mg2+ 2.0 mmol/L,DNA 20 ng,1×Buffer,Taq E 1.0 U.The optimization system of ISSR was 16 μl,which contained primer 0.25 μmol/L,dNTPs 160 μmol/L,Mg2+ 1.0 mmol/L,DNA 20 ng,1×Buffer,Taq E 0.64 U.RAPD and ISSR were applied in polymorphism analyses of watermelon mapping parents,64-1^{a}-3 and 6^{a}-2,and 23^{a}-1and 4-1^{a}-2, which were self lines of district variety far from zoology.The results of mapping parents 64-1^{a}-3 and 6^{a}-2 showed that 170 out of 181 RAPD primers generated 525 amplified bands with an average of 3.08 gene loci per primer, and of the 170 amplified primers, 55 could test the polymorphic loci, which produced 77 polymorphic bands, and the polymorphism rate was 14.67%; 45 out of 62 ISSR primers generated 188 amplified bandswith an average of 4.18 bands per primer. And 15 polymorphic primers produced 23 polymorphic loci in mapping parents 64-1^{a}-3 and 6^{a}-2. One polymorphic primer could amplify 1.53 polymorphic loci averagely. The polymorphism rate of ISSR analyseswas 12.23%1 In mapping parents 23^{a}-1and 42-1^{a}-2, 456 out of 499 RAPD primers amplified 1431 bands with an average of 3.14 bands per primer, and 142 polymorphic primers produced 240 polymorphic loci, and the polymorphism rate was 161.77%1 These showed that the genetic background of watermelon mapping parents was narrow.

【题目】甜瓜抗白粉病基因SRAP分子标记筛选
【中文关键词】甜瓜; 白粉病抗性基因; SRAP标记;
【英文关键词】melon(Cucumis melo L.); powdery mildew resistant gene; SRAP marker;
【中文摘要】以感白粉病甜瓜A120和抗白粉病甜瓜A119为亲本构建F2代分离群体,采用BSA和SRAP相结合的方法筛选与甜瓜抗白粉病基因相连锁的分子标记。结果显示,294条SRAP引物中有6条引物在抗病与感病池间表现出多态性;对8个高抗和8个高感单株进行扩增,引物me46em51和me3em6分别在高感单株中扩增出210 bp和205 bp的多态性条带,而高抗单株无此扩增带,与抗病、感病池结果一致。采用JoinMap3.0软件进行连锁分析,两标记与抗白粉病基因的连锁距离分别为18.2 c M和23.4 c M,初步推测本实验中甜瓜白粉病抗性为隐性多基因控制。
【英文摘要】The mapping population was constructed with the susceptible melon A120 and the resisant melon A119 as parents.The markers of resistance to powdery mildew were screened with the BSA and SRAP technique.The results showed that 6 primers of 294 SRAP primers could detect the polymorphism between the resistant pool and susceptible pool.No band were detected in 8 high-resistant individuals and signature band of 210 bp and 205 bp were amplified respectively in 8 high-susceptible individuals with me46em51 and me3em6 ,which was correspondent to the results in resistant and susceptible pool . Based on the linkage analysis by JoinMap3. 0 , the distance between the two markers with the powdery mildew resistance gene were 18. 2 cM and 23. 4cM separately. It is preliminarily deduced that powdery mildew resistance in melon is controlled by polygene recessive genes.

【题目】甜瓜白粉病抗性反应中相关防御酶活性变化
【中文关键词】甜瓜; 白粉病; 抗性; 防御酶活性;
【英文关键词】melon; powdery mildew; resistance; defense enzyme activity;
【中文摘要】在人工接种条件下,通过测定接种后过氧化物酶(POD)、过氧化氢酶(CAT)、多酚氧化酶(PPO)的活性,研究了甜瓜白粉病抗性反应中相关防御酶活性变化。结果表明,抗、感品种对照的POD、CAT、PPO酶活性无明显差异。接种后,它们的3种酶活性都比对照提高;抗性品种CAT活性高于感病品种;感病品种POD活性高于抗性品种;直到接种后5天,抗病品种PPO活性才超过感病品种,并呈上升趋势。
【英文摘要】The change of defense enzyme activity in the resistant reaction to melon powdery mildew were studied through determined the perroxidase(POD), catlase(CAT)and Polyphenoloxidase(PPO) activity after artificial inoculation. The results showed that the activity of POD、CAT and PPO had no obvious difference between resistance and susceptible control. Activity of the three kind enzymes had increased after inoculating compared with their control. CAT activity of the resistant variety was higher than the susceptible variety. The case of POD activity is opposite to CAT. PPO activity of resistant variety was exceeded than susceptible variety until five days after inoculation.

【题目】西瓜抗病毒RNAi植物表达载体的构建
【中文关键词】西瓜; 病毒病; RNA沉默; 植物表达载体;
【英文关键词】Watermelon; Virus diseases; RNA silencing; Plant expression vector;
【中文摘要】为了研究转化同一种病毒的不同基因在转基因西瓜中引发RNA沉默的效果以及利用RNA沉默培育抗多种病毒的策略,以pFGC5941为骨架质粒,分别构建了ZYMV cp、nib和Hc-Pro基因的反向重复植物表达载体pFIRZYMVCP、pFIRZYMVNIb和pFIRZYMVHc-Pro;利用重叠延伸PCR的方法,首先构建了含有CMV cp、WMV cp和ZYMV cp部分基因片

段的CWZ cp三价基因,采用该三价基因构建了CWZ cp基因的反向重复植物表达载体pFIRCWZ CP。研究首次在国际上构建了西瓜转基因抗病毒RNAi植物表达载体,为探讨RNA沉默在转基因抗病毒西瓜中的应用奠定了基础。

【英文摘要】In order to investigate the effect of different genes of a virus genome on gene silencing in tansgenic plants and the strategy of gene silencing for resistance to multiple viruses,On the basic of pFGC5941 vector,the plant expression vectors pFIRZYMV CP,pFIRZYMV NIB and pFIRZYMV Hc-Pro obtainting inverted repeat gene sequences of coat protein (CP) gene,replicases gene (nib)and helper componentproteinase gene (Hc-Pro)of Zucchini yellow mosaic virus(ZYMV) respectively,under the control of the cauliflower mosaic virus 35S promoter were constructed. The overlap-extention PCR technology was applied to obtain the trivalent CMV - WMV-ZYMV cp genes containing the partial Cucumber mosaic virus(CMV)cp gene sequence,Watermelon mosaic virus (WMV)cp gene sequence and ZYMV cp gene sequence. The plant expression vector pFIRCWZ CP containing inverted repeat trivalent CMV-WMV-ZYMV cp gene sequence under the control of the cauliflower mosaic virus 35S promoter was constructed. This research firstly constructed the RNAi plant expression vectors in transgenic watermelon field,which will be a basis of application of RNA silencing in transgenic watermelon of resistanceto viruses.

【题目】BTH诱导西瓜甜瓜抗病毒病研究

【中文关键词】西瓜; 甜瓜; BTH; 系统获得性抗性; 病毒病;

【英文关键词】Watermelon; Melon; BTH; Systemic acquired resistance; Virus;

【中文摘要】为了考察S-甲基苯基(1,2,3)噻二唑-7-硫代羧酸酯(benzothiodiazole,BTH)诱导西瓜对小西葫芦黄花叶病毒(Zuccini yellow mosaic virus,ZYMV)、西瓜花叶病毒(Watermelon mosaic virus,WMV)与甜瓜对黄瓜花叶病毒(Cucumber mosaic virus,CMV)的抗病效果,分别在接种ZYMV、WMV、CMV前喷施BTH。结果表明:在接种ZYMV、WMV、CMV前3d用25 μg/mLBTH处理西、甜瓜,4周后植株的病情指数减少,相对防效分别为55.6%、56.8%、78.2%;进一步研究发现,经BTH处理后,诱导时间的长短对病情指数有一定的影响;BTH对病毒病的防治效果优于病毒A、病毒K、宁南霉素、芸薹素内酯。

【英文摘要】Benzo-(1,2,3)-thiadiazole-7-carbothioic acid S-methyl ester(benzothiodiazole,BTH)was applied to watermelon and melon plants to test systemic acquired resistance(SAR)in watermelon plants against Zucchini yellow mosaic virus (ZYMV)and Watermelon mosaic virus(WMV),and melon plants against Cucumber mosaic virus(CMV). The application of BTH was done before the plants were inoculated with ZYMV,WMV and CMV. The resistance was evident with reduced disease severity in BTH-treated plants. The average relative effectiveness 4 weeks after treatments was 55.6% ,56.8%,78.2% for ZYMV,WMV and CMV,respectively,when watermelon and melon plants were treated with BTH at concentration of 25 μg/mL 3 days before virus inoculations. Further research showed that the time between treatment with BTH and inoculation with virus also affected disease indices. The effectiveness of BTH was better than that of moroxydine hydrochloride copper acetate,K virusicide,Ningnanmycin and brassinolide.

【题目】甜瓜种质资源遗传多样性及亲缘关系研究

【中文关键词】薄皮甜瓜; 厚皮甜瓜; 形态学; AFLP; 薄皮与厚皮甜瓜杂交; 聚类分析;
【英文关键词】Cucumis melo ssp. conomon; C. melo ssp. melo; Morphology; AFLP; Hybrid between subspecies C. melo ssp. conomon and C. melo ssp. melo; Cluster analysis;
【中文摘要】利用形态学分类方法、AFLP技术对甜瓜育种资源及品种进行分类及亲缘关系的研究。形态学聚类分析将31份材料分为薄皮甜瓜和厚皮甜瓜,厚皮甜瓜又可分为网纹甜瓜、早熟、晚熟厚皮甜瓜3组,选育的新品种大部分被划分在早熟组。利用AFLP技术的聚类分析表明,6对引物共扩增产生524条扩增带,多态性带的比率为76%,聚类分析将之分为5大组:包括根据生态区域划分的3组薄皮甜瓜、厚皮甜瓜、网纹甜瓜,但网纹甜瓜并不包括所有有网纹的瓜。试材的亲缘关系为:长江中下游的薄皮甜瓜与厚皮甜瓜的亲缘关系最近,其次是华南薄皮甜瓜、东北薄皮甜瓜、网纹甜瓜。说明AFLP用于检测差异性不大的甜瓜种质之间的亲缘关系非常有效,这些结果有助于确定育种资源的亲缘关系,为育种提供理论依据。
【英文摘要】Total of 31 melon samples collected from melon breeding resources and cultivated species, were used as materials for studying their genetic diversity and phylogenetic relationship by traditional taxonomy as well as AFLP markers. Based on morphological cluster analysis these melons could be classified into Cucumis melo ssp. conomon and C. melo ssp. melo. C. melo ssp. melo could be subdivided into 3 groups, which are: C. melo L. var. reticulates Nad, early variety and late variety. The new melon cultivars were subsumed into the early variety. With 6 informative primers in AFLP analysis, there were 524 amplified bands in total, and polymorphic frequency was 0.76. The AFLP cluster analysis revealed that these 31 cultivated melons could be classified into 5 groups, including the 3 groups of C. melo ssp. conomon classified by different ecological regions,one group of C. melo ssp. melo, and finally the group of C. melo L. var. reticulates Nad . The C. melo L. var. reticulates Nad were classified into one group alone, but not including all the melons that have nets. The relationship among the 31 cultivated melons was classified into C. melo ssp. Conomon, C. melo ssp. Melo, C. melo ssp of the Lower Yangtze Region.Conomon Northest China C. melo ssp., Conomon South China C. melo L. var. reticulates Nad .AFLP has been proven effective in classifying the melon germplasmthat genetic distance have little difference. These results are helpful to determine the relationship of these cultivated melons, offering theoretical foundations for breeding.

【题目】利用二硝基苯胺类除草剂离体诱导西瓜四倍体
【中文关键词】西瓜; 四倍体; 二硝基苯胺类除草剂; 离体诱导; 倍性;
【英文关键词】watermelon; tetraploid; dinitroaniline herbicide; in vitro induction; ploidy;
【中文摘要】以二倍体西瓜单系Z-A和Z-R为试验材料,采用不同浓度的二硝基苯胺类除草剂——胺磺灵、二甲戊乐灵和氟乐灵处理其离体子叶,以秋水仙素和不含任何诱导剂的液体培养基为对照,研究诱导西瓜四倍体的效果。结果表明,3种除草剂诱导西瓜四倍体的效果都比秋水仙素好,二甲戊乐灵、胺磺灵、氟乐灵和秋水仙素的四倍体诱导率分别为40.0%、33.3%、26.7%和13.3%。采用子叶直接处理比间接处理的四倍体诱导率高。通过FDA荧光法对西瓜试管苗叶片表皮保卫细胞叶绿体计数,进行四倍体变异早期鉴定,准确率为90%以上。
【英文摘要】Tetraploid watermelons were successfully induced in vitro by treating cotyledons of diploid watermelon lines Z-A and Z-R in liquid MS medium with three dinitroanilines herbicide oryzalin,pendimethalin and trifluralin in different concentrations,colchicine or no inductor used as control.The results indicated that the effects of tetraploid induction were better by using three dinitroanilines than those of colchicine.The induced tetraploid rate of oryzalin,pendimethalin,trifluralin and colchicine was 40.0%,33.3% , 26.7% and 13.3% respectively. The induction rate of direct treatment in which the cut cotyledonswere directly planted into inductive medium was higher than that of indirect treatment in which the cotyledonswere pre-cultured on differentiation medium (MS +BA 210 mg · L - 1) for 7 d before p lanted into inductive medium. The tetraploid of watermelon plantlets was determined in the early stage with FDA fluorescence method in which the chlorop lasts of epidermal guard cellswere counted under a microscope and UV light. The detective rate was above 90%. The confirmed tetrap loid plantlets were transp lanted into a greenhouse and self-pollinated and the seeds of tetrap loidswere obtained.

【题目】高产优质西瓜新品种郑抗无籽8号的选育
【中文关键词】无籽西瓜; 三倍体; 新品种; 郑抗无籽8号; 高产;
【英文关键词】Seedless watermelon; Triploid; New variety; Zhengkang Wuzi No. 8; High yield;
【中文摘要】郑抗无籽8号是以MMD为母本、将军为父本杂交育成的无籽西瓜新品种。中晚熟,果实发育期37~40d。生长势强,抗病耐湿性好。果个大,产量高,单果重可达8~10kg,普通栽培667m2产量4500kg左右,温室嫁接栽培在5000kg以上。果实圆球形,纯黑皮,幼果转黑快,外形美观;瓜瓤大红色,中心可溶性固形物含量可达11.8%以上,边部8.5%以上;瓤质硬脆,白秕籽小、少,风味好,品质优,极耐贮运。全国各地均可栽培。2008年通过河南省无籽西瓜品种审定。
【英文摘要】Zhengkang Wuzi No. 8 is a new triploid seedlezater maturity,grows vigorously,sets fruit normally,is resistant to disease and humidity. The average fruit is about 8-10 kg, and the 667m2 yield is 4 500 kg in open field and over 5 000 kg with grafting cultivation in greenhouse. The fruit is round with dark green skin color without stripes,the young fruit skin gets dark fast. The flesh is red with small undeveloped seed hull,fine texture,crisp and sweet. The flesh sugar content is over 11.8% at center. It has good adaptability and is suitable for long distance shipping. It can be grown in most seedless watermelon production areas in China.

【题目】特大新抗9号西瓜新品种及其配套栽培技术
【中文关键词】西瓜;新抗9号;新品种;栽培技术
【英文关键词】无
【中文摘要】特大新抗9 号(郑抗9 号改良型) 系中国农业科学院郑州果树研究所最近培育出的中熟、大果型新品种。该品种具植株生长势强, 分枝性中等, 坐果力强, 瓤色大红, 含糖量高,品质优, 产量高, 果皮韧, 耐贮运, 中抗枯萎病等特点。我国大部分地区均可栽培, 特别适宜于黄淮海和西北地区栽培。多年试验和生产栽培表明, 特大新抗9 号品种采用自根或嫁接育苗, 地膜覆盖或双膜覆盖栽培, 整枝压蔓, 667 m2 栽植密度700~900 株(双蔓整枝) 或600~700 株(三蔓整枝) , 重施底肥,适时足量浇水, 主蔓第2、第3 雌花留瓜、1 株1 瓜, 八至九成熟采收, 能充分发挥品种特性, 含糖量在12% 以上, 单果重8~10 kg, 667 m2 产量4 500 kg 左右。

【题目】Real time TaqMan RT-PCR assay for the detection of Cucumber green mottle mosaic virus.
【中文关键词】无

【英文关键词】cucumber green mottle mosaic virus; tobamovirus; real time RT-PCR; quarantine virus
【中文摘要】无
【英文摘要】A real time reverse-transcription polymerase chain reaction (RT-PCR) was developed for efficient detection of Cucumber green mottle mosaic virus (CGMMV). The method was designed to use a duo-primer system with a TaqMan probe targeting the conserved sequence in 3' noncoding region (NCR) of CGMMV to detect isolates of this virus collected in China. The sensitivity of the real time RT-PCR assay was 0.13 pg of total RNA or 50 molecules of RNA transcripts. This level of sensitivity indicated that the one step real time RT-PCR developed in the present study could be used for routine testing assays. The real time RT-PCR method could assist in the implementation of quarantine measures for prevention and control of the disease caused by CGMMV. (c) 2008 Elsevier B.V. All rights reserved.

【题目】哈密瓜风味小果型厚皮甜瓜新品种中甜2号的选育
【中文关键词】厚皮甜瓜; 新品种; 中甜2号; 小果型;
【英文关键词】Cucumis melo; New variety; Zhongtian No. 2; Small fruit;
【中文摘要】中甜2号是适合我国西部露地及东部地区保护地栽培的的厚皮甜瓜优良品种。果实发育期30~35d,椭圆形果,单果重1.5~2.5kg,果皮金黄色,果肉橘红色,中心可溶性固形物含量14%~17%,口感脆甜,具哈密瓜的美味。2003年10月通过国家级甜瓜新品种鉴定;2006年获河南省科技进步二等奖。
【英文摘要】Zhongtian No. 2 is a new variety of Cucumis melo. It is suitable for growing in open field in western China and protected production in eastern China. The fruit matures 30-35 days from pollination. The fruit is oval shaped with golden skin and light red flesh. The soluble solids content is 14%-17%. The average fruit weights 1.5-2.5 kg. It has the taste of Hami melon. Zhongtian No. 2 is officially registered in October 2003 in China.

【题目】小西葫芦黄花叶病毒外壳蛋白基因导入西瓜的遗传转化
【中文关键词】西瓜; 外壳蛋白; 遗传转化;
【英文关键词】Watermelon; Coat protein; Transformation;
【中文摘要】研究了西瓜品种ZKM的再生体系和农杆菌介导小西葫芦黄花叶病毒(Zucchini yellowmosaic virus,ZYMV)的外壳蛋白(cp)基因导入西瓜的遗传转化体系。结果表明,质量分数0.6%琼脂是适宜种子萌发的基本培养基,切取5d龄的西瓜无菌苗子叶为外植体,接种在MS+BA2.0mg/L诱导培养基上,诱导不定芽效率最高。选用75mg/L卡那霉素筛选西瓜抗性芽较为合适,外植体经预培养2~3d,菌液浓度以OD600nm值为0.4,共侵染10min有利于提高西瓜转化的效率。经PCR检测,ZYMVcp基因已经导入西瓜植株,转化频率为0.15%。
【英文摘要】The regeneration and transformation of watermelon with Zucchini yellow mosaic virus coat protein gene by Agrobacterium tumefaciens were studied.The results showed that 0.6% agar was suitable to watermelon seed germination.The explants taken from 5 day-old seedlings were better for regeneration and transformation.MS medium containing 2.0 mg/L benzyladenine(BA) was the best induction medium.To induce resistant adventitious shoots,75 mg/L kanamycin was suitable for selection.Pre-culturing explants for 2 to 3 days and infection with Agrobacterium tumefaciens LBA 4404 with OD600 nm of 0.4 for 10 minutes could improve transformation rate. The transformation frequency was 0.15%. The integration of ZYMV cp gene into the regenerated progenies was confirmed by PCR.

【题目】地高辛标记探针检测5种葫芦科作物病毒的斑点杂交方法
【中文关键词】聚合酶链反应(PCR); 地高辛标记探针; 斑点杂交; ZYMV; WMV; CMV; PRSV-W; SqMV;
【英文关键词】PCR; Digoxigenin-labelled cDNA probe; Dot-blot hybridization; ZYMV; WMV; CMV; PRSV-W; SqMV;
【中文摘要】【目的】探索5种葫芦科作物病毒即小西葫芦黄花叶病毒(Zuccini yellow mosaic virus,ZYMV)、西瓜花叶病毒(Watermelon mosaic virus,WMV)、黄瓜花叶病毒(Cucumber mosaic virus,CMV)、番木瓜环斑病毒西瓜株系(Papaya ringspot viruswatermelon strain,PRSV-W)和南瓜花叶病毒(Squash mosaic virus,SqMV)的斑点杂交检测技术,为葫芦科作物种子带毒的快速准确鉴定、流行病学研究和转基因检测等提供技术和方法。【方法】以构建的重组质粒为模板,用PCR方法合成了相应的地高辛标记的cDNA探针。通过斑点杂交检测西葫芦病叶汁液来考察探针的灵敏性和特异性。同时设计了3种不同长度的SqMV探针(0.55、1.6、2.7kb)对杂交效果进行了研究。【结果】ZYMV、WMV、CMV、PRSV-W 和SqMV 的5 种探针检测各自侵染西葫芦病汁液的稀释低限分别为1∶160、1∶160、1∶320、1∶160、1∶320,而每种探针与健康西葫芦和其它4 种病毒的反应均为阴性。不同长度的SqMV 探针杂交结果相同。【结论】用PCR 方法合成的地高辛标记的探针,能够直接在植物组织中将5 种病毒检测出来,具有较好的灵敏性、特异性和重复性。探针的长度对杂交的灵敏性和特异性没有影响。
【英文摘要】【Objective】 To provide a good alternative assay in seed health test,epidemiological and transgenic research, dot-blot hybridization was developed to detect five viruses infecting cucurbitaceous crops-Zuccini yellow mosaic virus (ZYMV), Watermelon mosaic virus (WMV), Cucumber mosaic virus (CMV), Papaya ringspot virus-watermelon strain(PRSV-W)and Squash mosaic virus (SqMV).【Method】Digoxigenin-labelled cDNA probes of the five viruses were synthesized by PCR with specific primers. The probes were applied in dot-blot hybridization to detect ZYMV, WMV, CMV, PRSV-W and SqMV in crude extraction of infected leaves. And three SqMV probes of different lengths (0.55, 1.6, 2.7 kb) were designed to research the effect of hybridization.【Result】The sensitivity for detection of the crude extraction of infected leaves by ZYMV, WMV, CMV, PRSV-W and SqMV was down to 1∶160,

1：160, 1：320, 1：160, 1：320, respectively. The three SqMV probes of different lengths showed no differences.【Conclusion】The digoxigenin-labelled probes prepared by PCR could be used for accurate and rapid identification of five viruses infecting cucurbitaceous crops with good stability, sensitivity, specificity and reproducibility.

【题目】黑皮大果无籽西瓜新品种郑抗无籽5号的选育
【中文关键词】无籽西瓜; 新品种; 郑抗无籽5号; 黑皮; 大果;
【英文关键词】Seedless watermelon; New variety; Zhengkang Wuzi No. 5; Dark rind; Big fruit;
【中文摘要】郑抗无籽5号是以MMD为母本,D106为父本杂交育成的新品种。该品种中晚熟,果实发育期36-39d。生长势较强,抗病耐湿,易坐果,单果重6-8kg,普通栽培667m2产量4500kg左右。果实圆球形,黑皮,覆蜡粉,外形美观;瓜瓤鲜红色,中心可溶性固形物含量12%以上;瓤质硬脆,白秕籽小、少,汁液多,风味正,品质优。果实整齐度好,商品果率高,极耐贮运。该品种适应性强,全国各地均可栽培。已在全国15个省示范推广逾1.2万hm2。
【英文摘要】Zhengkang Wuzi No. 5 is a new triploid seedless watermelon by crossing tetraploid line MMD as female parent with diploid line D106 as male parent. It has later maturity,grows vigorous,set fruit normally,resistance to disease and humidity. The average fruit is about 6-8 kg. The yield is 4 500 kg/667 m2 in open field. The fruit is round with dark green rind with no stripes,covered with white cere. Flesh is dark red with small seed traces,fine texture,crisp and sweet. Its sugar content is over 12.0%. It is unique in market for size, shape and rind pattern and for long distance shipping. It is suitable for cultivation in all the country.

【题目】西瓜倍性回复突变研究
【中文关键词】西瓜; 倍性; 回复突变;
【英文关键词】Watermelon; Ploidy; Revertant;
【中文摘要】2001年和2002年在四倍体西瓜品种790010、日み66、91E7和770007中各发现1份类似二倍体西瓜的种子,对这4份突变体进行了形态学和细胞学的观察和鉴定。结果表明:突变体的茎、叶、花、果实和种子的形态特征与对照四倍体有明显差异。显微特征也有差异,其花粉粒直径和保卫细胞均较小,叶绿体数也减少,体细胞具22条染色体,是对照四倍体的一半,具典型的二倍体西瓜特征,同时还具原品种特征,因此确定4份突变体均由四倍体西瓜回复突变而来。
【英文摘要】Four mutants were discovered in autotetraploid watermelon varieties 790010,日み66,91E7 and 770007 in 2001 and 2002. Their morphological and cytological characteristics were observed and identified, comparing with original autotetraploid watermelon. The morphological traits of the mutants had been obvious characteristics of diploid watermelon and original variety. The pollen size and leaf guard cell size of the mutants become smaller and chloroplasts number in guard cell diminished, and chromosomes number of the mutants somatic cell were 22, which were half of autotetrap loid watermelon. Finally four mutants were confirmed revertants of autotetrap loid watermelon.

【题目】嫁接砧木对西瓜果实糖分积累及蔗糖代谢相关酶活性的影响
【中文关键词】砧木; 西瓜; 糖分积累; 蔗糖转化酶; 蔗糖磷酸合酶; 蔗糖合酶;
【英文关键词】rootstock; watermelon; sugar accumulation; invertase; sucrose phosphate synthase; sucrose synthase;
【中文摘要】【目的】研究在果实发育过程中嫁接西瓜糖分积累及蔗糖代谢相关酶活性的变化,探讨不同砧木影响果实品质的机理。【方法】采用优质中小型西瓜早佳为接穗和对照,丝瓜、南瓜(铁木真)、葫芦(昌砧力士F1)、野生西瓜1号、野生西瓜2号为砧木,测定嫁接和对照西瓜果实在发育过程中果糖、葡萄糖、蔗糖的含量以及与蔗糖积累相关酶的活性。【结果】与对照相比,野生西瓜2号/早佳组合的果实糖积累极显著增高,而其他嫁接组合的糖积累均降低,丝瓜/早佳组合的果实糖含量最低;自根和嫁接西瓜果实发育过程中蔗糖转化酶(Inv)活性降低,蔗糖磷酸合酶(SPS)活性升高,蔗糖合酶(SS)在西瓜果实发育后期主要起合成作用,促进果实蔗糖积累, 蔗糖代谢相关酶净活性值增大。在整个果实发育过程中, Inv、SPS、S S 共同作用于嫁接西瓜和自根西瓜果实的糖分积累及构成; 嫁接和对照西瓜果实以己糖积累为主, 蔗糖积累为辅。【结论】砧木不同, 西瓜果实的糖分积累量也不同, 其中野生西瓜2 号对早佳西瓜品质影响最小, 可以作为优良的嫁接砧木在生产实践中应用。
【英文摘要】【Objective】 The sugar accumulation,changes of activities of sucrose-metabolism related enzymes and the mechanism of the effects on fruit quality by grafting were all studied in this research.【Method】 Zaojia was taken on the CK,and wild watermelon 1 and 2,pumpkin(Tiemuzhen),calabash(Changzhanlishi F1)and loofah were used as five different rootstocks.Then,fructose,glucose,sucrose and the activities of sucrose-metabolism related enzymes were all determinated.【Result】 Compared with the ck,the sugar accumulation increased extremely significant by grafting with the wild watermelon 2, but that of the other treatments all decreased and the sugar accumulation of loofah/ Zao jia was the lowest . The sucrose invertase activity decreased; the activitives of sucrose phosphate synthase and net for sucrose-metabolism enzymes all increased during the development of own-rooted and grafted watermelons. During the whole fruit development including own-rooted and grafted watermelon fruits, the invertase, sucrose phosphate synthase and sucrose synthase together acted on sugar accumulation and constitution, and accumulation of hexose sugar was more than sucrose accumulationin grafted and owned-rooted watermelons. 【Conclusion】 Different root stocks had different sugar contents in watermelons, the wild watermelon 2 made the smallest effects on fruit quality, and the sucrose synthase

played the important role in promoting sugar accumulation in the latter part of the developing fruits. So it can be used as a good root stock in the field.

【题目】西瓜不同品种苗期人工接种炭疽病菌后的生理生化变化
【中文关键词】西瓜; 炭疽病菌; 生理生化变化; 苗期抗性;
【英文关键词】watermelon; Colletotrichum orbiculare; biochemical and physiological changes; seedling anthrachos resistance;
【中文摘要】【目的】探讨西瓜苗期炭疽病抗性与叶片组织中过氧化物酶(POD)、多酚氧化酶(PPO)活性及叶绿素、可溶性蛋白含量的关系。【方法】以抗性不同的西瓜品种西农八号、M08(抗病品种)和红小玉、玲珑王(感病品种)为材料,在苗期用1×106mL-1炭疽病菌孢子悬浮液接种,于接种当天(接种前)及接种后第2,4,6,8天,对西瓜叶片中与抗性有关的POD、PPO活性及叶绿素、可溶性蛋白含量进行了测定。【结果】西瓜炭疽病抗性与叶片组织中POD、PPO活性以及叶绿素、可溶性蛋白含量密切相关。接种炭疽病菌后,各品种西瓜叶片组织中POD和PPO活性都显著提高,抗病品种POD和PPO活性始终高于感病品种;叶绿素含量与品种的抗病性呈正相关;接种后各西瓜品种叶片可溶性蛋白含量均高于对照,但感病品种峰值出现时间较抗病品种早。【结论】不同抗性西瓜品种对炭疽病的抗性与POD、PPO 活性及叶绿素含量存在一定的正相关, 与可溶性蛋白含量存在一定的负相关。
【英文摘要】【Objective】The study determined the relationship between watermelon cultivars of anthracnose resistance and POD,PPO and the content of chlorophyll and soluble protein.【Method】The activity of peroxidase(POD),polyphenol oxidase(PPO) and the content of chlorophyll and soluble protein in the leaves of four watermelon cultivars with different resistance to Colletotrichum orbiculare were measured.Xinongbahao and Hongxiaoyu were resistant cultivars,Hongxiaoyu and Linglongwang were susceptible cultivars.The seedlings ino culated by 1 106 mL- 1 spore solution were studied before ino culation and on the 2nd , 4th , 6th and 8th day.【Result】The results showed that there was a close relation between watermelon cultivars of anthracnose resistance and POD, PPO and the co ntent of chlorophy ll and soluble protein. POD and PPO activities were all enhanced obviously after ino culation, and the activities of resistant cultivars were higher than those of the susceptible cultivars. The content of chlorophyll and the resistance of cultivar had positive relativity. The contents of soluble protein of the inoculated were all higher than the comparison, but the peak value of the cultivars whose resistance appeared earlier than the susceptible cultivars.【Conclusion】The relative POD and PPO activity and chlorophy ll content were possibly correlated with disease resistance of the tested watermelon cultivars. Negative relationship was possibly in existence between the content of soluble protein and the disease resistance of the tested watermelon cultivar.

【题目】籽用西瓜种质资源抗枯萎病离体筛选技术的研究
【中文关键词】籽用西瓜; 中信1号红籽瓜; 种质资源; 枯萎病; 体细胞无性系变异; 抗性; 离体筛选; 离体鉴定;
【英文关键词】Citrullus lanatus ssp.vulgaris var.megalaspermus Lin et Chao; Zhongxin No.1 red-seed watermelon; Germplasm resources; Fusarium wilt; Somaclonal variation; Resistance; Selection in vitro; Evaluation with detached leaves;
【中文摘要】以籽用西瓜中信1号红籽瓜不定芽为筛选材料,利用镰刀菌酸(Fusariumacid,FA)为胁迫剂,进行红籽瓜抗枯萎病无性系变异体离体筛选技术和红籽瓜种质资源抗病性鉴定的研究。结果表明,红籽瓜体细胞无性系抗性变异体离体筛选的FA适宜浓度为15mg.L-1。初步建立了红籽瓜抗性变异体离体筛选体系,获得了抗FA变异体的再生植株。筛选出红籽瓜种质资源高抗材料2份,中抗材料6份,轻抗材料11份,高感材料17份。
【英文摘要】Somaclonal variation of red-seed watermelon(Citrullus lanatus ssp.vulgaris var.megalaspermus Lin et Chao)was used in selecting in vitro of the germplasm resources resistant to Fusarium wilt under the stress of Fusarium acid(FA).The results showed that the suitable concentration of FA for selection was 15 mg · L-1.The system of selection in vitro for the resistant mutants in red-seed watermelon was preliminary established and the plantlet regeneration of mutants were obtained.Two high resistant(HR)varieties,6 m odera tely resistant(MR) varieties, 11 slightly resistant(SR) varieties and 17 high susceptible(HS) varieties were selected by using the system.

【题目】淹水对红籽瓜嫁接苗生长和根系生理生化的影响
【中文关键词】红籽瓜; 嫁接苗; 淹水胁迫; 根系; 生理代谢;
【英文关键词】Red-seed edible seed watermelon; Grafted seedling; Waterlogging stress; Roots; physiological metabolism;
【中文摘要】以丝瓜为砧木,"中信1号"红籽瓜为接穗,研究淹水胁迫对红籽瓜嫁接苗和自根苗生长和根系生理生化特性的影响。研究结果表明,淹水胁迫后,嫁接苗的生物量和根系活力均显著高于自根苗。随着淹水胁迫时间的延长,可溶性糖和脯氨酸含量均呈先上升后下降的趋势,嫁接苗植株上升幅度较大而下降幅度较小,并始终显著高于同期的自根苗。嫁接苗根系MDA含量先升后降,而在自根苗中持续上升,且同期自根苗增加幅度明显大于嫁接苗。
【英文摘要】Using luffa(Luffa cylindrica Roem.) as rootstock and "Zhongxin No.1" Red-seed edible seed watermelon(Citrullus lanatus ssp.vulgaris var.megalaspermus Lin et Chao) as scion,the effects of waterlogging stress on the contents of physiological metabolism in leaves of both grafted and own-root seedlings were studied.The results indicated that the biomass of grafted seedlings and the vitality of root system was significantly obviously higher than the own-root seedlings under the waterlogging stress.With the extension of time to waterlogging stress, soluble sugar and proline content showed a phenomenon of first rising then declining. The level of increasing was bigger than the level of decreasing on both soluble sugar and proline, and the level of changes in grafted seedling is significantly higher than that in own-root seedlings at the same period. MDA content in the root of grafted seedlings increased first and then decreased, but it in own-root seedlings was significantly higher than that in grafted seedling at the same period, and in own-root seedlings was higher than that in the other treatment all the time.

【题目】‘风味3号’甜瓜光合特性和果实品质研究初报
【中文关键词】甜瓜; 光合特性; 果实; 品质;
【英文关键词】melon; photosynthetic characteristics; fruit; quality;
【中文摘要】以风味3号甜瓜为主要试材,雪丽和雪里红2个甜瓜品种为对照,研究叶片的光合特性和果实品质的变化。结果表明:在结果中期,风味3号叶片的净光合速率和叶色值都显著高于对照,表现出较强的光合能力。风味3号果实可溶性固形物含量显著高于对照。在甜瓜果实发育过程中,对风味形成起主导作用的可溶性糖和有机酸分别是蔗糖和柠檬酸,而且两者在风味3号果实中的含量都显著高于对照品种,表现出特殊风味。
【英文摘要】The leaf photosynthetic characteristics and fruit qualities of Flavor No.3,Xueli and Xuelihong melon were investigated.The results showed that Net photosynthetic rate and leaf colour value of Flavor No.3 leaf were significantly higher than those of Xueli and Xuelihong at the middle stage of fruit development.It indicated that Flavor No.3 had a higher potential in photosynthesis.The soluble solid content of Flavor No.3 fruit was significantly higher than those of Xueli and Xuelihong.During the fruit development, sucrose and citric acid were the major soluble sugar and organic acid contributing to the fruit flavor. The contents of sucrose and citric acid in Flav or No. 3 were significantly higher than those of Xueli and Xuelihong.

【题目】西瓜、甜瓜果实品质及调控研究进展
【中文关键词】西瓜; 甜瓜; 果实; 品质; 进展;
【英文关键词】Watermelon; Melon; Fruit; Quality; Progress;
【中文摘要】西瓜甜瓜深受消费者喜爱,但是近年来品质呈现下降的趋势。西瓜甜瓜的品质包括外观品质、营养品质和风味品质,而品质的形成又受品种、土壤环境、肥料供应、水分供应、栽培方式、生长调节剂以及采收与贮运等因素的影响,所以要针对以上因素,从改进育种手段和栽培技术2大方面来改良和提高品质。
【英文摘要】Watermelon and melon are popular fruits,but their qualities have decreased in recent years.The qualities of watermelon and melon includes outer appearance,nutrition and flavor qualities,and they are affected by many factors such as cultivar,soil condition,fertilizer supply,water supply,cultivate means,growth regulator,harvest,storage,and etc.Breeding methods and culture techniques should be considered to improve the qualities of watermelon and melon.

【题目】红籽瓜主要产量性状的遗传力及相关性分析
【中文关键词】红籽瓜; 产量性状; 遗传力; 相关性;
【英文关键词】Red-seed edible seed watermelon; Yield related traits; Heritability; Genetic correlation;
【中文摘要】以红籽瓜农家品种及自交系为供试材料,采用随机区组试验设计,用方差分析法估算了单株坐瓜数、单瓜重、单瓜种子数、单瓜种子重、种仁重、千粒重、出仁率、产籽率和种子体积的广义遗传力;并对43个红籽瓜品种9个产量性状的遗传力、遗传变异系数和相关性进行了研究。结果表明,上述9个产量性状的广义遗传力分别为12.86%,80.14%,75.96%,74.39%,48.01%,17.12%,24.97%,18.60%和37.07%。单瓜重、单瓜种子数和单瓜种子重的遗传力较高,对其进行早世代单株选择有较好的效果;遗传变异系数以千粒重和出仁率较高,选择潜力大。性状间相关性的研究表明:通过对单瓜重的选择,可实现对单瓜种子数、单瓜种子重、种仁重和种子体积等性状的间接选择。并对红籽瓜产量性状遗传力分析结果及其在育种中的应用进行了讨论。
【英文摘要】Local varieties and inbred lines of red-seed edible seed watermelon were used as experimental materials in this study. The randomized block design and analysis of variance were adopted to estimate broad sense heritability of fruit per plant,fruit

weight,seeds per fruit, seed weight per fruit,seed embryo weight,1 000-seed weight,percentage of embryo,percentage of seeds and seed size. Heritability,genetic variation coefficient and genetic correlation of 9 yield related traits of 43 varieties of red-seed edible seed watermelon were studied. Results showed that the broad sense heritability of 9 yield related traits were 12.86%, 80.14%, 75.96%, 74.39%, 48.01%, 17.12%, 4.97%, 18.60% and 37.07%, respectively. The results showed that heritability of fruit weight, seeds per fruit and seed weight per fruit were high and can be selected effectively by the method of selecting single plant at earlier generations. The variable coefficients of the 1 000- seed weight and percentage of embryo were high and can be selected with high potential gain. Based on the genetic correlation of traits, seeds per fruit,seeds weight per fruit, embryo weight and seed size can be indirectly selected by selecting fruit weight. The results of heritability analysis and the utilization of heritability in red- seed edible seed watermelon breeding were discussed in this paper.

【题目】厚皮甜瓜新品种秋季设施栽培适应性试验研究
【中文关键词】厚皮甜瓜; 设施栽培; 品质; 适应性;
【英文关键词】Hami melon; Greenhouse production; Quality; Adoptability;
【中文摘要】以新疆哈密瓜研究中心选育的4个高档厚皮甜瓜品种黄皮98-18、绿皮98-18、雪里红和新金雪莲为材料,研究了在武汉市秋季塑料大棚栽培条件下4个厚皮甜瓜品种的生长发育过程,以期筛选出适宜华中地区秋季栽培的厚皮甜瓜品种。结果表明,4个甜瓜品种的果实发育期依次为45、47、40和35d,单果重依次为952.08、995.26、937.84和661.28g,果形多样;黄皮98-18和新金雪莲风味浓郁,口感绵软,绿皮98-18和雪里红鲜脆淡爽;4个品种都富含维生素C、游离氨基酸和可溶性蛋白。4个厚皮甜瓜品种都适合秋季设施栽培,综合产量、品质和抗病性考虑,黄皮98-18是最佳品种。
【英文摘要】Four Hami melon cultivars Yellow 98-18,Green 98-18,Xuelihong and Xinjinxuelian, developed by Hami Melon Research Center of Xinjiang,were evaluated in greenhouse in the fall in Wuhan to select suitable variety for East China. The fruit of the 4 cultivars matured 45,47,40 and 35 days after pollination,and the fruit weights were 952.08,995.26,937.84 and 661.28 g,respectively. Yellow 98-18 and Xinjinxuelian flesh was flavorful and soft,and Green 98-18 and Xuelihong had crisp flesh and were light in flavor. The fruits of four cultivars had high content of vitamin C, free amino acid and soluble protein.All cultivars are suitable for greenhouse production in autumn, and Yellow98- 18 is the best.

【题目】西瓜主要农艺性状与裂果性状的相关及通径分析
【中文关键词】西瓜; 裂果; 农艺性状; 通径分析;
【英文关键词】Watermelon; Fruit-cracking; Agronomic trait; Path analysis;
【中文摘要】对西瓜的14个农艺性状进行相关与通径分析。相关分析结果表明,裂果率与果皮厚度、外果皮木质化程度呈显著或极显著相关。经过逐步回归,10个性状与裂果有直接和间接效应,决定系数为1.000,剩余通径系数为0.0018。外果皮木质化程度对裂果的直接作用最大,直接通径系数达到0.796,可将其作为筛选抗裂品种的重要参考性状。
【英文摘要】The correlation and path analysis on 14 agronomic traits of watermelon were studied.The results of correlation analysis showed that the thickness of skin and lignifications degree of epicarps were significantly related to fruit cracking rate.The gradual regression analysis revealed that 10 traits have direct and indirect effects on fruit cracking.The determine coefficient is 1.000 and the rest

path coefficient is 0.001 8.Because of the direct path coefficient reaches 0.796,the lignifications degree of epicarps plays an important role on fruit cracking. So it can be taken as a ma in selective trait for anti cracking variety

【题目】西瓜裂果性状的基因型研究
【中文关键词】西瓜; 裂果; 抗性; 基因型; 鉴定;
【英文关键词】Watermelon; Fruit cracking; Resistance; Identification;
【中文摘要】在普通大棚和露地两种栽培条件下鉴定西瓜裂果性,制定西瓜的裂果性状分级标准和抗性评价标准;田间鉴定发现,14个稳定自交系中有13个发生不同程度的裂果,占92.86%;两种栽培环境对裂果的影响效应有差异(F=27.048**,F0.01=3.91),但抗裂程度显著相关(r=0.937**,r0.01=0.6614,df=13)。不同基因型西瓜裂果性差异显著(F保护地=10.7218**,F露地=5.783**,F0.01=1.90,df=13),其中,材料‘x-101’在两种不同的栽培条件下均不裂果,性状稳定,且其综合品质表现优良,可作为抗裂育种的材料。
【英文摘要】Resistance to fruit cracking in the 14 gene-types watermelon was evaluated under opening and protected conditions.Grades,symptoms characters and rating of fruit-cracking in watermelon are drawn up.13(92.86%) of them crack under two conditions.According to the comprehensive evaluation,the variance of the susceptibility indices were significant in opening field (F=5.783**,F0.01=1.90,df=13) and protected field(F=10.721 8**,F0.01= 1.90,df=13).The correlation coefficients of susceptibility indices in both conditions were signif icant (r = 0. 937** , r0. 01 =0.661 4, df= 13) . x- 101 has the immunity to fruit- cracking with good quality, and can be potentially used in the breeding program as the resistant parents to the fruit- cracking.

【题目】流式细胞术在乳酸菌自溶检测中的应用
【中文关键词】流式细胞术 乳酸菌 自溶 检测
【英文关键词】Flow cytometry Lactic acid bacteria Autolysis
【中文摘要】目的】使用流式细胞术(Flow Cytometric)建立一种新的检测方法,可快速筛选自溶度不同的乳酸菌菌株。【方法】菌悬液经20mmol/L的PI-PBS染液在4°C条件下避光染色30min,上流式细胞仪进行测定,检测器激发光波长488nm,检测波长630nm,每个样品收集1×10^5个细胞,联机使用CellQuest软件分析结果。【结果】阳性染色细胞数与细胞总数之比很好地反映菌液中自溶细胞与非自溶细胞的比例关系,整个检测过程耗时仅为1h左右。【结论】与传统检测方法比较,FCM测定结果稳定可靠,检测时间短,为乳酸菌的自溶特性研究及筛选自溶度不同的菌株用作商业发酵剂提供了便利条件。
【英文摘要】[Objective]The autolysis rate of lactic acid bacteria is crucial for their applications as dairy starters and as probiotics.To establish a rapid and sensitive method to detect autolysis rate of lactic acid bacteria,Flow Cytometry Method (FCM) can be employed.[Methods]Cell suspensions were dyed by PI-PBS (20 mmol/L) in 4°C dark environment for 30 min.A 630 nm long pass filter was used to collect the red fluorescence (FL3 488 nm),and 1 × 10^5 cells were collected from each sample.Data were analyzed by CellQuest online analysis system.Test time ranged from 40 to 100 s,depending on the concentrations of cell suspensions.FCM enumerations were accurate to 104 cells/mL.[Results]Correlation test did not show difference between FCM test and other methods for the determination of autolysis rate of lactic acid bacteria.[Conclusion]FCM is a good analytical method that allows rapid and sensitive

measuring the viability of lactic acid bacteria

【题目】费氏丙酸杆菌谢氏亚种和植物乳杆菌亚油酸异构酶的分离纯化
【中文关键词】共轭亚油酸(CLA) 费氏丙酸杆菌费氏亚种(P.freudenreichii ssp.shermanii) 植物乳杆菌(L.plantarum) 亚油酸异构酶
【英文关键词】conjugated linoleic acid (CLA) P. freudenreichii ssp. shermanii L. plantarum linoleate isomerase
【中文摘要】采用盐析、Sephacryl S-200HR凝胶过滤层析、DEAE Sepharose F.F.离子交换层析相结合的方法,分别建立了来源于费氏丙酸杆菌谢氏亚种(P.feudenreichii ssp.shermanii)和植物乳杆菌(L.plantarum)的亚油酸异构酶的分离提取步骤。结果表明不同来源的亚油酸异构酶在纯化的过程中表现出不同的洗脱特性,P.freudenreichii ssp.shermanii亚油酸异构酶的分子质量约为56kDa,L.plantarum亚油酸异构酶的分子质量为50.65kDa。不同来源亚油酸异构酶的分离纯化方法存在差异。
【英文摘要】Using sahing-out method, combined with Sephacryl S-200HR gel filtration chromatography and DEAE Sepharose F.F. ion exchange chromatography, linoleate isomerase was isolated and purified from P. freudenreichii ssp. shermanii and L. plantarum, respectively, linoleate isomerase from different sources showed different elution characteristics in the purification process. The molecular weight of linoleate isomerase from P. freudenreichii ssp. shermanii was 56 kDa, and that from L. plantarum was 50.65 kDa.

The result indicated that big differences existed in the purification method of linoleate isomerase due to their different sources.

【题目】Mapping drought status of winter wheat from MODIS data in North China plain
【中文关键词】干旱监测;MODIS;TVDI;华北平原
【英文关键词】drought mapping, MODIS, TVDI, North China Plain
【中文摘要】冬小麦是华北平原最重要的作物体系之一,但其干旱十分严重。本文中,为更好的进行农业管理,提出了一种方法来监测平原冬小麦的干旱情况。这种方法是基于温度植被干旱指数(TVDI),TVDI是从Ts-NDVI空间的干湿边缘计算得到的。本方法使用MODIS数据来监测华北平原冬小麦2006年生长季3-5月的干旱状态。结果表明此地区农业干旱的空间变异十分明显。河北东部、山东西部和河南西北部的干旱相对严重。中国气象局的天气报告证实了对干旱状态的监测结果。干旱监测结果与中国气象局报道的干旱分布有高度的一致性,这表明利用TVDI方法对监测华北平原干旱情况具有适应性。
【英文摘要】Drought is very severe in North China Plain, where winter wheat is one of the most important cropping systems. In this paper,we present an approach to map drought status of winter wheat in the plain for better farming management. The approach isbased on the temperature-vegetation dryness index (TVDI) computed from the wet and dry edges of Ts-NDVI space. Usingthe MODIS data, we applied the approach to map drought status in North China Plain for the winter wheat growing periodfrom March to May in 2006. Our results show that spatial variation of agricultural drought is very obvious in the region.Severe drought was observed in eastern Hebei, western Shandong, and northwestern Henan province respectively. Theweather reports from China Meteorological Administration were used to validate our mapping results of the drought status.The highly accordance of our drought mapping results with the reported drought distribution from CMA confirms theapplicability of TVDI approach in drought mapping in North China Plain.

【题目】MODIS-based remote sensing monitoring of grass production in China
【中文关键词】遥感,监测;草原,产草量,MODIS数据
【英文关键词】remote sensing, monitoring, grass, production, MODIS data
【中文摘要】草原产草量的监测对于草地资源的管理、畜牧业的发展以及改善生态环境具有重要意义。根据 MODIS遥感数据和同期地面调查数据,对我国 2005年草原产草量进行了系统估算。用 MODIS数据计算全国草原的归一化植被指数(NDVI),针对6个不同类型草原区建立了NDVI和地面样方的产草量之间的关系模型,用这些模型推算全国草原产草量分布。结论如下: (1)2005年全国草原干草总产量达到 29421万吨,平均单产达到830kg/hm2干草;(2) 2005年我国草原有 3个牧草高产区,分别位于东北呼伦贝尔草原、锡林浩特草原和大兴安岭西麓;青海东部、四川西北部和甘肃中南部以及新疆西北部;(3) 2005年干草产量位列前 7位的省区依次是内蒙古、青海、新疆、四川、西藏、黑龙江和甘肃;例如,内蒙古因草原面积大而成为我国第一大草原牧草生产省 , 2005年有 6037万吨干草;(4)总产草量位于前5位的草地类型依次为高寒草甸类、温性草原类、低地草甸类、温性草甸草原类与山地草甸类;(5)2005年8月份全国草原产草量与 2004年同期相比总体持平;各草原大省的变化情况分别为:青海、甘肃2省区的草产量略有增加,青海增加了9%,甘肃增加了4%;内蒙古减少约3%;西藏、新疆和四川3省区基本与2004年同期持平。研究结果对我国草原资源管理、 草原畜牧业发展和草地生态系统研究具有较大

的参考价值。
【英文摘要】Monitoring grassland production is of great importance for utilizing andadministering grassland, developing pasturage and improving the ecologicalenvironment. Using Moderate Resolution Imaging Spectroradiometer (MODIS)data and ground truth data for the six grassland regions of China, regional modelswere established to estimate the grassland production in 2005. The NormalizedDifference Vegetation Index (NDVI) was first computed from the MODIS data.Ground truth data were obtained from a large-scale field investigation in 2005. Thefollowing results were obtained: (1) total hay output from the grassland in Chinawas 294 214 thousand tons in 2005, with an average yield of 830 kg/ha. (2) Therewere three regions with high grass productivity in 2005: the grassland coveringHulunbuir, Xilinhaote and the western Daxing ’anling; the region including easternQinghai, northwestern Sichuan and mid-southern Gansu; and the northwesternXinjiang region. (3) Grassland production for the whole of China in August 2005remained at the same level as that in August 2004. However, the situation in themajor grassland provinces was different: grass production in 2005 in both Qinghaiand Gansu increased by 9% and 4%, respectively, when compared with that in2004. Grass production in Inner Mongolia decreased by 3%, while the productionin Liaoning, Xinjiang and Sichuan remained unchanged in comparison to that in2004. (4) The models based on the six regions are the most suitable for monitoringgrass production in China and can meet the need of estimating of grassproductivity. The results are very important for grassland administration, pasturegrazing and grassland ecosystem studies in China.

【题目】Remote sensing monitoring of grass growing in grassland ecosystems of China
【中文关键词】草地长势;草地类型;草地退化;草地;遥感
【英文关键词】grassland growing, grassland types, grassland degradation, pasture, remote sensing
【中文摘要】近几十年,中国草地生态系统的退化受到了高度关注。草地长势是判断草地是否退化的重要因素。本文中,我们利用EOS/MODIS数据来开发一种合适的方法来监测中国草地长势。首先,计算得到2005-2006年草地生长季的4-10月归一化植被指数(NDVI)。为了评估草地长势,提出植被指数R,R值为计算得到的2006和2005年NDVI差值。根据R值将其分为5级(从1级到5级):差,较差,持平和较好、好。根据不同区域和草地类型将中国的草地区域分为许多小的亚区。研究结果表明2006年长势好于2005年。长势情况为持平、较好和好的区域占整体草原区域的71.43%,其面积为251420km2。2006年整体长势为:3级>4级>2级>5级>1级。草地长势的评价对于草地生态系统的可持续管理是急需的。
【英文摘要】Grassland degradation in grassland ecosystems of China has been highly concerned in recent decades. Grasslandgrowing is an important element for identification of grassland degradation. In this paper we intend to develop anapplicable method for grassland growing monitoring in China using the EOS/MODIS data. Firstly the normalizeddifference of vegetation index (NDVI) can be calculated from April to October within grassland growing period in 2005and 2006. In order to evaluate the grassland growing, vegetation index R was proposed, which was calculated from theNDVI value difference of the two years 2006 and 2005. According to the R value, five grades (from grade1 to grade5)were obtained: worse, slightly worse, balance, slightly better and better. Grassland region in China can be divided into anumber of small sub-regions for determination of different regions and grassland types. Our results indicate thatgrassland growing was better in 2006 than in 2005. The grassland with balance, slight better and better growingaccounted for 71.43% of the total grassland area, the area is 251.42 thousand KM2. The overall growing of 2006 is:Grade3>Grade4>Grade2>Grade5>Grade1.Valuation of the grassland growing is thus urgently required for betteradministration of the grassland ecosystem for sustainable development.

【题目】Remote sensing monitoring upon the grass production in China
【中文关键词】遥感;监测;草原;产草量;MODIS
【英文关键词】remote sensing; monitoring; grassland; grass production; MODIS data
【中文摘要】利用MODIS遥感数据和全面的地面调查数据,对我国 2005年草原产草量进行了估算。首先利用MODIS数据计算NDVI,然后针对六个分区分别建立产草量与NDVI估算模型。主要结论如下:(1) 2005年我国草原有 3个牧草高产区,分别位于东北呼伦贝尔草原、锡林浩特草原和大兴安岭西麓;青海东部、四川西北部和甘肃中南部以及新疆西北部;(2)2005年全国草原干草总产量达到 29421.39万吨,平均单产达到829.67kg/hm2干草;(3) 2005年干草产量位列前7位的省区依次是内蒙古、青海、新疆、四川、西藏、黑龙江和甘肃;例如,2005年内蒙古有 6037万吨干草而成为中国产草量第一大省。(4)总产草量位于前5位的草地类型依次为高寒草甸类、温性草原类、低地草甸类、温性草甸草原类与山地草甸类;其中温性草甸草原与山地草地占全国总产草量的62.2%。(5)2005年8月份全国草原产草量与 2004年同期相比总体持平;各草原大省的变化情况分别为:青海、甘肃2省区的草产量略有增加,青海增加了9.02%,甘肃增加了3.63%;内蒙古减少约3%;西藏、新疆和四川3省区基本与2004年同期持平。研究结果对我国草原资源管理、 草原畜牧业发展和草地生态系统研究具有较大的参考价值。
【英文摘要】Using MODIS remote sensing data and ground truth data, a thorough investigation was conducted to monitor the productivityof grasslands in China for the year 2005. The Normalized Difference Vegetation Index (NDVI) was first computed from theMODIS data. Then the data from the NDVI images were used to correlate with the grass yield data from the ground sampling campaigns.Six regional models were accordingly established from the correlation for estimation of grass production in the six maintypes of steppe in China. The main results from the estimation could be summarized as follows: (1) High grass productivity in 2005was obtained in the following 3 regions: the grassland covering Hulunbuir, Xilinhaote, and the western Daxing ’anling, the region includingthe eastern Qinghai, the northwestern Sichuan and the mid-southern Gansu, and the northwestern Xinjiang region. (2) Totalhay output from the grasslands in China amounted to 294213.86 thousand tons in 2005 with an average yield of 829.67 kg/hm2. (3)The following 7 provinces were the largest grass producers in China: Inner Mongolia, Qinghai, Xinjiang, Sichuan, Tibet, Heilongjiangand Gansu. For example, Inner Mongolia produced 60370.82 thousand tons of hay in 2005, and hence became the No. 1 grassproducer of China. (4) Among the steppe types, the following 5 had the largest grass production: Alpine meadow, Temperate steppe,Low-land meadow, Temperate meadow steppe and Montane meadow with total production accounting for 62.2% in China. (5) Grassproduction of the entire China in August 2005 remained at the same level as that in August 2004. However, the situations of majorgrassland provinces were different: grass production in both Qinghai and Gansu in 2005 increased to 9.02% and 3.63%, respectively,when compared with that in 2004. The grass production in Inner Mongolia decreased by 3%, while the production in Tibet, Xinjiangand Sichuan remains unchanged when compared with that in 2004. These results were very important for grassland administration,pasture grazing and grassland ecosystem studies in China.

【题目】Remote Sensing of Agro-droughts in Guangdong Province of China Using MODIS Satellite Data
【中文关键词】广东省;农业干旱;干旱监测;遥感;MODIS数据
【英文关键词】Guangdong province, agricultural drought, drought monitoring, remote sensing, MODIS data
【中文摘要】本研究基于植被供水指数(VSWI)和降水距离指数(PDI)开发了一种实用的方法来监测中国广东省的干旱情况。从归一化的VSWI和PDI中发展得到评估农业干旱严重性的综合指数(SADI)。使用MODIS卫星影像和地面观测站得到的降水数据,及此方法监测了广东省2006年的干旱情况。监测结果表明省内生长季5-9月的干旱平均情况是非常低的。然而,在广东省的不同县严重程度的季节变化是非常明显的。6月下旬(中国传统将每个月分为3期。每10天为1期)、7月上旬

、8月中旬及9月下旬的干旱情况较严重。空间上,西部雷州半岛在5月中旬干旱最严重。验证表明只使用了遥感数据的监测结果与干旱统计数据和中国国家气象卫星中心的数据具有普遍的一致性。这证明此干旱监测方法具有适用性。在广东西部雷州半岛的干旱严重性鉴别结果好于中国国家气象局,这可能表明了本方法能够为农业管理与农业经营提供一个较好的选择方法来提高干旱监测的精度。

【英文摘要】A practical approach was developed in the study for drought monitoring inGuangdong province of China on the basis of vegetation supply water index (VSWI) andprecipitation distance index (PDI). A comprehensive index for assessment of agro-droughtseverity (SADI) was then established from the normalized VSWI and PDI. Using MODISsatellite images and precipitation data from ground-observed meteorological stations, weapplied the approach to Guangdong for drought monitoring in 2006. The monitoring resultsshowed that the drought severity on average was very low in the province during the maingrowing season from May to September in 2006. However, seasonal variation of theseverity was also obvious in difference counties of the province. Higher severity of droughtcould be seen in the periods of late-June (In China each month is traditionally divided into3 periods. Each is with 10 days and has different names. This division system is mainlywith consideration of farming seasons hence has been widely used as the basis of droughtmonitoring periods in China. In order to keep this tradition, we define, for example, forJune, the early-June as the period from 1st to 10th of June, the mid-June as the period from11th to 20th, and the late-June as the period from 21st to 30th. So mid-August denotes theperiod from 11th to 20th of August, and early-July the period from 1st to 10th of July, and soon.), early-July, mid-August and late-September. Regionally, Leizhou Peninsula in the west had the most serious drought before mid-May. Validation indicated that our monitoringresults were generally consistent with the drought statistics data and the results fromChinese National Satellite Meteorological Center (CNSMC), which used only remotesensing data. This consistence confirmed the applicability of our approach for droughtmonitoring. Our better identification of drought severity in Leizhou Peninsula of westernGuangdong than that of CNSMC might suggest that the approach developed in the studywas able to provide a better alternative to increase the accuracy of drought monitoring foragricultural administration and farming.

【题目】Using vegetation photosynthesis model to estimate net primary production of rangeland ecosystem in Inner Mongolia of China

【中文关键词】植被光合模型;草原生态系统;NPP;内蒙古

【英文关键词】Vegetation Photosynthesis Model, rangeland ecosystem, NPP, in Inner Mongolia

【中文摘要】内蒙古的干旱草原生态系统较为脆弱,人为活动尤其是过牧被认为是导致脆弱生态系统转为退化生态系统的主要原因。NPP是干旱生态系统脆弱性监测的重要因素。在本次研究中,使用植被光合模型评估内蒙古草原生态系统的NPP。其目的是监测到内蒙古NPP的空间分布情况,并加强对脆弱地区的可持续发展。已对模型中几处做出改善,尤其是参数部分,模型中用到的地表温度是从MODIS热波段数据中的分割窗算法中得到的。使用MODIS影像数据和地表气候数据,应用改善的模型评估2003年内蒙古NPP值。结果表明内蒙古2003年平均NPP值为192.03gCm-2GR-1,NPP的空间分布十分明显。西部NPP值非常低,而东部和东北部NPP值相对高些。在多种草地类型中,温性草甸草原NPP值最高,尽管温性草原平均NPP值不高,但由于其面积最大,所以在整体NPP值中占有最高比率。将我们的研究与使用传统方法进行的研究进行比较证实了本次研究结果的准确性。

【英文摘要】Rangeland in Inner Mongolia is an arid ecosystem with vulnerability. Anthropogenic activities especially over-grazinghave been believed to be a leading factor shifting the vulnerability into actual degradation in the ecosystem. Net primaryproductivity (NPP) is an important indicator for vulnerability monitoring in arid ecosystem. In this study we use thevegetation photosynthesis model to estimate NPP of rangeland ecosystem in Inner Mongolia. The objective is to examinethe spatial variation of NPP in Inner Mongolia and to highlight vulnerable areas for sustainable development. Severalimprovements have been done to the model especially in its parameterization. Land surface temperature required by themodel was estimated from split window algorithm proposed for MODIS thermal band data. Using the MODIS imagedata and the ground climate datasets, we applied the improved model to estimate the NPP in 2003 in Inner Mongolia.Our results showed that mean NPP was 192.03gC m-2 Gr-1 in Inner Mongolia in 2003. Spatial variation of the NPP wasvery obvious. Very low NPP was observed in the western parts while relatively high NPP could be

seen in the easternand northeastern parts. For various type rangelands, temperate alpine meadow is the highest. Although the mean NPP oftemperate steppe is not high, its area is the largest in Inner Mongolia, so it has the highest ratio to total NPP. Comparisonof our NPP with similar studies from conventional methods confirms the accuracy of our estimation.

【题目】草原产草量遥感估算方法发展趋势及影响因素

【中文关键词】草原估产;遥感模型;植被指数;生物量;信息匹配

【英文关键词】estimating grass production ; model of remote sensing ; vegetation index ; biomass ; information matching

【中文摘要】草原产草量估算是实行以草定畜、草畜平衡管理的前提条件。遥感模型方法是目前从宏观上用于估算产草量的有效方法。该研究对遥感估算方法进行了详细阐述,并针对国内外的研究现状,分别讨论了基于遥感的统计模型法、综合模型法和其它相关方法,分析了不同方法的优缺点,探讨了建模过程中的影响因素,最后对产草量遥感估算方法的发展趋势及前景进行了展望。遥感模型法中的统计模型仍是今后大面积估产中应用的重点,而遥感模型法中的综合模型在今后草地生物量估算中将有很大的发展潜力,新的数学方法的不断探索和多种相关模型的不断融合将实现从微观形成机制的研究到宏观产量形成模拟的一体化方面有着重要的前景。

【英文摘要】Estimating grass production is a precondition of animal loading balance and range management . Thereare three main types of models for estimating grass production : field measurement , meteorological model s andremote sensing. The remote sensing met hod is t he one principally discussed , but ot her approaches are brieflyint roduced. Advantages and limitations are analyzed and t rends and pro spect s are discussed. Statistical methodsbased on remotely sensed data are al so important in application for large areas of grasslands , and integratedmodel s will play an increasingly important role in f ut ure grasslands studies. The continual exploration of newmat hematical methods will result in production and f usion of many related model s of micro forming mechanismswhich will be integrated wit h t he models of macro yield formation.

【题目】规模化猪场废水污灌农田的土壤 Zn 和 Cu空间变异分析
【中文关键词】猪场废水; 污水灌溉; 农田土壤; 重金属; 空间变异
【英文关键词】swine wastewater; sewage- irrigation; farmland soil; heavymetal; spatial variability
【中文摘要】为了解长期施用猪场废水对农田土壤 Zn 和 Cu 的影响, 应用 GIS 结合地统计学方法对河北省京安猪场区域农田的清洁区和灌溉 8 年猪场废水的污灌区耕层(0~20 cm) 共 52 个土壤样品的 Zn 和 Cu 的全量和有效态含量的空间结构和分布特征进行了分析。结果表明, Zn 和 Cu 的全量和有效态量受随机性和结构性影响, 其中, 有效 Zn 和全 Cu 以随机性影响为主, 全 Zn 和有效 Cu 受结构性影响为主。Zn 和 Cu 有效态含量分别与全量正相关, 与全氮、有效氮、全磷和有效磷正相关, 与 pH 负相关, 与有机质相关不明显。从空间分布来看, Zn 和 Cu 全量和有效态含量主要为果园>污灌地>机井地>林地和苜蓿地。根据背景调查、变异函数分析、Kriging 内插图分析和不同采样区 Zn 和 Cu 含量统计分析, 影响整个研究区土壤 Zn 和 Cu 分布的主要随机性因素为猪场废水的应用, 长期灌溉猪场废水会带来土壤 Zn 和 Cu 积累, 以及 Zn 和 Cu 有效态含量的增加。
【英文摘要】Spatial variability of heavy metal in the plough layer (0~20 cm) of groundwater- irrigation farmland soils and sewage-irrigationfarmland soils which had been applied swine wastewater from Jing' an swine- farm for 8 years was studied using geographic information sys-tem (GIS) technique and geostatistical analysis, to analyze the effects of long- term swine wastewater applied on Zn and Cu in soils. 52 soilsamples were collected and analyzed in terms of the total concentration and bio- available concentration of Zn and Cu, pH and the contents ofsoil nutrients. The results indicated that the spatial variability of the total concentration and bio- available concentration of Zn and Cu wereimpacted byrandomfactors and structural factors together, bio- available Zn and total Cu were dominated by random factors, and total Zn andbio- available Cu were primarily controlled by structural factors. Bio- available Zn and bio- available Cu positively correlated to total Zn andtotal Cu respectively, positively correlated to total nitrogen, bio- available nitrogen, total phosphor and bio- available phosphor, but negativelycorrelated to pH, and correlated to organic matter insignificantly. The statistics analysis of Zn and Cu in soil from different samples and mapof ordinary Kriging interpolation revealed that the total concentration and bio- available concentration of Zn and Cu were: orchard soil>sewage soil>soil irrigated with groundwater>woodland and clover- land. According to the analysis of background investigation, the variogram,the value of the total concentration and bio- available concentration of Zn and Cu in different samples and the map of ordinary Kriging inter-polation, the main randomfactor influencingthe distribution ofZn and Cu in soils in this region was swine wastewater applied. The Zn and Cuwould be accumulated and the bio- available concentration of Zn and Cu would be increased in soils if the swine wastewater was long-termapplied in this region.

【题目】规模化猪场区域农田土壤重金属积累及影响评价分析
【中文关键词】猪场废水; 污水灌溉; 农田土壤; 重金属; 因子分析; 影响评价
【英文关键词】Swine wastewater; Sewage- irrigation; Farmland soil; Heavy metals; Factor analysis; Assessment
【中文摘要】为了解长期灌溉猪场废水对农田土壤重金属的影响, 采集了河北省京安猪场区域农田清洁区和灌溉 8 年猪场废水污灌区的耕层(0~20 cm) 共 52 个土壤样品, 并测定了样品的 pH、养分和 Zn、Cu、Cr、Ni、Pb 和 As 全量和有效态含量,根据背景资料、相关分析和主成分分析确定重金属污染来源, 应用富集因子分析重金属积累程度, 并应用污染指数进

行重金属影响评价分析。结果表明,灌溉猪场废水对土壤主要带来 Zn 和 Cu 的富集,对 Ni、Cr 和 As 几乎没有富集效应,Pb 和 As的富集主要由施用化肥引起。尽管灌溉 8 年猪场废水后土壤的 Zn、Cu、Cr、Ni、Pb 和 As 含量在安全范围内,但土壤重金属有效态含量不仅与重金属全量正相关,还与土壤 pH 负相关,而灌溉猪场废水会降低土壤 pH,从而增加土壤重金属有效态含量。因此,长期灌溉猪场废水不但要注意土壤 Zn 和 Cu 积累,还需采取措施降低土壤 Zn、Cu 等重金属有效态含量以防重金属带来环境风险。

【英文摘要】The total and bio- available concentrations of Zn, Cu, Cr, Ni, Pb and As , pH and the contents of soilnutrients of the 52 soil samples (0- 20cm) of the groundwater- irrigated farmland soils and the sewage- irrigatedfarmland soils applied with swine wastewater from Jing ’ an swine- farm (total 8 years) were measured. The primarysource of heavy metals was confirmed according to background investigation, correlation analysis and principalcomponent analysis. Heavy metal accumulation were analyzed by enrichment factors, and the assessment of heavymetals was done by pollution index. The results indicated that swine wastewater irrigation lead to accumulation of Znand Cu,but not for Cr, Ni and As. Accumulation of Pb and As was from fertilization principally. Swine wastewaterirrigation would decrease soil pH and increase the bio- available concentrations of Zn, Cu, Cr, Ni, Pb and As. Thoughconcentrations of Zn, Cu, Cr, Ni, Pb and As in the soils were within the safty range after the application of swinewastewater in the last 8 years, the accumulation of Zn and Cu should be paid attention and some measures should betaken to decrease the bio-available concentrations of heavy metals after long- term application of swine wastewater.

【题目】青藏高原那曲地区冬虫夏草资源分布空间分析方法
【中文关键词】冬虫夏草;GIS;空间分析;分布;西藏那曲
【英文关键词】Cordyceps sinensis; GIS; spatial analysis; distribution; Nakchu; Tibet
【中文摘要】:冬虫夏草(Cordyceps sinensis)是分布在我国青藏高原的可再生资源,具有极其名贵的中药材价值,而目前我国冬虫夏草资源的分布区域尚不清楚。以西藏那曲地区为例,根据冬虫夏草资源分布的生境条件,结合冬虫夏草的生态特性指标,利用地理信息系统(GIS)空间分析方法对冬虫夏草的空间分布区域进行了分析。结果表明,那曲地区冬虫夏草资源主要分布于那曲的东部,分布面积约为4. 93 万km2 ,占地区总面积的12. 54%。与实地调查结果比较,提出的基于GIS 空间分析的冬虫夏草分布区分析方法精度较高,说明空间分析方法在冬虫夏草资源调查评价上具有一定的可行性,为今后的冬虫夏草资源调查等相关研究提供方法支持。
【英文摘要】Cordyceps sinensis is a unique resource as traditional Chinese medicine with precious value in Tibetan Plateau ofChina. However,spatial distribution of the resource was still unknown very clearly. This paper intended to map thedistribution of Cordyceps sinensis resource in Nakchu region in Tibet,using an approach of GIS spatial analysis. Thecharacteristics of Cordyceps sinensis were considered with habitat conditions for the mapping. Our mapping result showedthat Cordyceps sinensis in Nakchu was mainly distributed in Eastern Regions,with an area of 49300 km2,accounting for12. 54% of the total. Verification with field investigation confirmed the accuracy of the mapping approach. This indicatedthe feasibility of applying GIS technology in monitoring the spatial dynamics of Cordyceps sinensis resource in future.

【题目】我国退牧还草工程重点县草原植被长势遥感监测
【中文关键词】MODIS 数据;草原遥感;归一化植被指数;草原植被长势;退牧还草工程
【英文关键词】MODIS data ; remote sensing ; NDVI ; grassland vegetation growth; the project of grassland withdraw from grazing
【中文摘要】利用遥感和地理信息系统等先进技术手段,基于MODIS 数据,对我国4 大主要草地类型区的退牧还草工程县的草原植被长势进行了监测,主要结论如下:1) 内蒙古东部退化草原区2005 年草原植被长势虽然差于2004年的面积有上升趋势,但是总体长势良好,明显好于2004 年;2) 蒙甘宁西部荒漠草原区2005 年草原植被长势较差,虽然生长季节草原植被长势差于2004 年的面积呈上升趋势,但总体相对比较稳定;3) 新疆北部退化草原区2005与2004年相比长势持平的草地面积所占比重大,比较稳定,呈现出长势好差交替的时序变化格局;4) 青藏高原东部江河源草原区2005 年草原长势好于2004 年的草地面积占本区总草地面积的48.07 % ,长势差于2004 年的草地面积占本区草地总面积的32.56 % ,与2004 年持平的占19.37 % ,由此表明青藏高原东部区草原长势明显好于2004年同期,长势差和长势好于2004 年的草原面积波动较为明显。
【英文摘要】The integration of 3S (RS , GIS , GPS) was used to monitor t he vegetation growt h in t he project of the grassland wit hdrawn f rom grazing in t he counties wit h MODIS data. Some conclusions are : 1) The areas of degraded grassland in 2005 were bigger t han in 2006 in eastern Mongolia , but t he whole grassland vegetationgrowt h was bet ter t han in 2004 ; 2) In 2005 , vegetation growt h in desertified grassland of western Inner Mon2golia2Ningxia2Gansu was worse t han in 2006 and t he variance was smaller ; 3) The share of areas in nort hernXinjiang grassland where vegetation growt h was unchanged or larger and stable than 2004 , and t here appear s tobe a bet ter2wor se alternation of temporal changes ; 4) In t he riverhead areas of t he Yangtze and Yellow Riversof t he eastern Tibet Plateau , the areas where vegetation growt h was bet ter t han 2006 occupy 48. 1 % of allgrassland in t he area , but vegetation growth was wor se in 32. 56 % of t he grassland areas in t his region. Areawhere vegetation growt h was unchanged relative to 2004 occupy 19. 37 % of all t he area. Grassland growt h in2005 was bet ter in t he same period t han in the previous year

【题目】县域可持续发展评价中的生态足迹动态研究
【中文关键词】县域;可持续发展评价;生态足迹;阿鲁科尔沁旗
【英文关键词】County-level region; Assessment of sustainable development; Ecological footprint; Aluke ’rqin Banner
【中文摘要】:【目的】县域(县级区域)是中国同时具备地域、空间和行政独立性的最基本区域单元,对其进行可持续发展评价具有积极的理论和现实意义。【方法】运用基于生物物理量计算实现区域可持续发展评价的生态足迹模型,对内蒙古阿鲁科尔沁旗1982　2003 年的发展进行时间序列动态分析。【结果】计算结果显示,阿鲁科尔沁旗人均生态足迹以6.01%的年均增速从1982 年的1.19gha 增长到2003 年的4.05gha,从1982 年人均0.58gha 的生态盈余,转变为2003 年的人均生态赤字1.47gha;全旗生物生产性面积供需不对称,存在结构性错位;万元GDP占用生态足迹衡量的资源利用效益一直处于低水平。【结论】研究表明,阿鲁科尔沁旗的自然资源消耗、土地利用及对环境的影响已经远超过生态系统的承载力,亟需采取有效措施以扭转长期以来的不可持续状况。
【英文摘要】【Objective】As China ’s basic regional units characterized with regional, spatial and administrational independence,assessments of county ’s (county-level region ’s) sustainable development is a matter of importance. 【Method】The paper tookAluke ’rqin Banner of Inner Mongolia Autonomous Region as a studied example and assessed its developmental history based ontime-series data from 1982 to 2003 by applying Ecological Footprint (EF) Model. The model is a natural capital accounting inbiophysical units and a useful indicator for measuring the pressure imposed by humanity on natural capital. 【Result】The calculatedresults showed that the EF per person increased at a speed of 6.01% per year from 1.19gha in 1982 to 4.05gha in 2003. The

countyfaced a ecological deficit of 1.47 gha in 2003, though there appeared an ecological reserve of 0.58 gha in 1982. Structural asymmetryexisted between demand for and supply of bio-productive areas. Ecological footprints per 104yuan (GDP) had no significant changefrom 1982 to 2003, which was 20.6 gha in 2003 and also higher than that of average value (EF per 104yuan GDP in 1999) of China,Western China and Inner Mongolia Autonomous Region, etc.. 【Conclusion】 Human activities in Aluke’rqin Banner had exceededthe biosphere capacity. The county had suffered from ecological overshoot and severe depletion of natural resources. Obviously theway of development of Aluke’rqin Banner was unsustainable and corresponding countermeasures should be taken as soon aspossible.

【题目】中国草原产草量遥感监测
【中文关键词】遥感; 监测; 草原; 产草量; MODIS 数据
【英文关键词】Remote Sensing; monitoring; grassland; grass production; MODIS Data
【中文摘要】根据MODIS遥感数据和同期地面调查数据, 对我国2005年草原产草量进行了系统估算。用MOD IS数据计算全国草原的归一化植被指数NDV I, 针对6个不同类型草原区建立了NDVI和地面样方的产草量之间的关系模型, 用这些模型推算全国草原产草量分布。结论如下: (1) 2005年我国草原有3个牧草高产中心, 分别位于东北呼伦贝尔草原、锡林浩特草原和大兴安岭西麓; 青海东部、四川西北部和甘肃中南部以及新疆西北部; (2) 2005年全国草原干草总产量达到29421. 39万t, 平均单产达到829. 67kg /hm2干草; (3) 2005年干草产量位列前7位的省区依次是内蒙古、青海、新疆、四川、西藏、黑龙江和甘肃; 例如, 内蒙古因草原面积大而成为我国第一大草原牧草生产省, 2005年有6037. 08万t干草; (4)总产草量位于前5位的草地类型依次为高寒草甸类、温性草原类、低地草甸类、温性草甸草原类与山地草甸类; (5) 2005年8月份全国草原产草量与2004年同期相比总体持平; 各草原大省的变化情况分别为: 青海、甘肃2省区的草产量略有增加, 青海增加了9. 02%、甘肃增加了3. 63%; 内蒙古减少约3%; 西藏、新疆和四川3省区基本与2004年同期持平。研究结果对我国草原监理、草原畜牧业发展和草地生态系统研究具有较大的参考价值。
【英文摘要】Us ing MODIS rem ote sens ing data and ground truth data, we conducted a thorough invest igat ion to theproductiv ity of grasslands in China for the year 2005. The Norm alized D ifference Vegetation Index (NDV I) was firstcomputed from theMODIS data. Then the data from theNDV I mi agesw ere used to correlate to the grass yield data from theground sampling cam paigns. S ix reg iona lmodels w ere accordingly established from the corre lation for estmi ation o f grassproduction in the six ma in types of steppes in China. Them ain results from the estmi ation cou ld be summarized as fo llow s:(1) H igh grass product iv ity in 2005 was obta ined in the fo llow ing 3 reg ions: the grassland coveringH ulunbuir, X ilinhaote,and the w estern Daxing a'nling, the region includ ing the eastern Q ingha,i the northwestern Sichuan and the m id-southernGansu, and the northwestern Xinjiang reg ion. (2) T otal hay output of the grasslands in Ch ina amounted to 294213.9 thousand tons in 2005, w ith an average yield of 829. 67 kg /hm2. (3) The fo llow ing seven prov inces were the largest grassproducers in China: InnerM ongolia, Q ingha,i X injiang, Sichuan, T ibet, H eilong jiang and Gansu. For example, InnerM ongolia produced 60370. 82 thousand tons of hay in 2005, hence becam e the no. 1 grass producer of Ch ina. (4) Amongthe steppes types, the follow ing five had the largest grass production: A lp ine m eadow, T emperate steppe, Low-landm eadow, T emperatemeadow steppe and M ontane m eadow, w ith total production accounting for 62. 2% o f China. (5)G rass product ion of the entire Ch ina in August 2005 rem ained at the same level as that in August 2004. How ever, thes ituations of m ajor grassland prov inces w ere different: grass product ion in both Q ingha i and Gansu in 2005 increased9102% and 3. 63% respectively when com pared w ith that in 2004. The grass production in InnerM ongolia decreased 3%,wh ile the production in T ibet, X in jiang and S ichuan rem ains unchanged when com pared to that in 2004. These resultswerevery mi portant for grassland adm inistrat ion, pasture graz ing and grass land ecosystem studies in China.

【题目】与TaFRA 蛋白相互作用候选蛋白的筛选
【中文关键词】酵母双杂交; 共转化; TaFRA; 相互作用; 候选蛋白
【英文关键词】TaFRA; yeast two hybridization; co-transformation; candidate proteins
【中文摘要】F-box 蛋白是E3 泛素连接酶SCF 复合体的重要亚基, 通过底物蛋白的特异识别发挥功能。TaFRA 是在盐胁迫差异表达片段基础上通过RACE 方法获得的一个基因, 编码F-box 蛋白。文章利用TaFRA 基因构建诱饵表达载体, 直接用cDNA+pGAD+pBD 共转化酵母双杂交的方法筛选相互作用的候选蛋白。通过对阳性克隆的鉴定和测序分析, 共获得44 个与TaFRA 相互作用的候选蛋白, 32 为已知蛋白, 包括硫氧还蛋白、金属硫蛋白、ATP 合成酶及丝氨酸/苏氨酸蛋白激酶等多种逆境胁迫反应蛋白及转录因子蛋白, 说明TaFRA 与胁迫反应相关,可能通过对上述蛋白编码基因的调控参与了植物的胁迫反应过程, 为进一步阐明TaFRA 的功能及作用机制奠定了理论基础。
【英文摘要】F-box protein is an important subunit of SCF complex, an E3 ligase in ubiquitin system, and its function was determined through mediating the specific recognition and combining with substrate protein. TaFRA (F-box related to abiotic stress) was identified by RACE based on the fragments diferently expressing in wheat seedling exposed to salt stress and encodes an F-box protein. In this study, pBD-TaFRA bait expression vector was constructed, and DNA+pGAD+pBDwas directly co-transformed into yeast hybrid system to screen condidate proteins interacting with TaFRA. Fourty-four candidate proteins were obtained, in which 32 were known proteins and transcript factors related to stress tolerance such as thioredoxin, metallothinein, ATP synthase, and serine/threonine protein kinase etc. This indicates that TaFRA participates instress response through regulating above condidate genes, which will provide basis for revealing the mechanism of TaFRA reaction to abiotic stress.

【题目】基于SSR 标记的小麦骨干亲本育种重要性研究
【中文关键词】小麦;大面积推广品种;骨干亲本;基因型分析
【英文关键词】common wheat;major cultivar;founder;microsatellite genotyping
【中文摘要】目的 通过对大面积推广小麦品种和育种骨干亲本的全基因组多位点扫描分析,探讨两者之间的遗传关系及骨干亲本在小麦育种中的作用。方法 利用ABI3730 对中国66 份大面积推广的小麦品种和13 份育种骨干亲本的481个SSR位点进行基因型扫描分析。结果 以基因型数据为基础的主坐标及NJ 聚类分析,发现中国大面积推广品种可聚成6个大组,每一组中至少有一个骨干亲本。系谱分析表明,每一组中大面积推广品种和骨干亲本之间均存在密切的血缘关系,前者大多为骨干亲本的后裔;同一省份的品种多数聚在一起。来自同一组合的骨干亲本碧蚂4 号含有的优势等位变异数多于大面积推广品种碧蚂1 号,同样,郑引4 (St2422-464)多于郑引1 号(St1472-506);新一代骨干亲本往往由上一代骨干亲本衍生而来;来源于同一组合的骨干亲本与大面积品种相比,前者与其组合中的骨干亲本间存在更大的遗传差异。【结论】只有对资源的创新、引进和利用给予足够的重视,育种工作才能取得大的突破。
【英文摘要】【Objective】 The purpose of this study was to reveal genetic relationship between the large-scale cultivated wheat varieties and the founder genotypes (cornerstone breeding parents) and illuminate the role of the founder genotypes in breeding at genomic level. 【Method】 Sixty-six large-scale planted varieties and 13 founder genotypes were genotyped at 481 SSR loci by the ABI 3730. 【Result】 Analyses of principal coordinate (PCO) and neighbor-joining cluster based on the genotyping data showed that the 66 large-scale planted varieties were clustered into six major groups. In each group, there is at least one founder. Within each group, most of the large-scale planted varieties are the descendents of the founder. Varieties from the same province usually jointed into one group. Two founders, Bima 4 and St2422-464 convey more alleles favored in breeding than their sister lines, Bima 1 and St1472-506, respectively. Usually, the older cornerstone breeding parents are the founders for the new ones. Among sister lines, the new founder has more difference than large-scale cultivated varieties to their founder genotype. 【Conclusion】 Therefore, innovation and enhancement of germplasm is the base for breeding large-scale planted varieties. It should occupy proper portion in national breeding program.

【题目】Diverse approaches to achieving grain yield in wheat
【中文关键词】小麦;籽粒产量;比较基因组学;关联单元型
【英文关键词】Wheat; Grain yield;Comparative Genomics;Association Haplotype
【中文摘要】人工选择(驯化与育种)在植物基因组上留下了强烈的印迹。第二代高通量测序技术使得在3至5个月内完成一个完整基因的测序工作成为可能,并且测序成本逐渐降低。这为规模化鉴定经历了强烈选择的植物基因组区域奠定了基础。重要农作物如水稻、玉米、高粱等参考序列的完成将极大地促进在这些作物中进行重测序。标记/性状关联分析,特别是单元型(单元型块)关联分析,将有力于重要基因组区域、优异等位基因或单元型的精细定位。综述了小麦中解析产量相关性状的基因组方法。
【英文摘要】Artificial selection (domestication and breeding) leaves a strong footprint in plant genomes. Second generation high throughput DNA sequencing technologies make it possible to sequence the gene complement of a plant genome within 3 to 5 months, and the costs of doing so are declining very quickly. This makes it practical to identify genomic regions that have undergone very strong selection. Available reference sequences of important crops such as rice, maize, and sorghum will promote the wide use of re-

sequencing strategies in these crops. Marker/trait associations, especially haplotype (or haplotype block) association analyses, will help the precise mapping of important genomic regions and location of favored alleles or haplotypes for breeding. This mini-review examines a genomics approach to defining yield traits in wheat.

【题目】Nocturnal windborne migration of ground beetles, particular Pseudoophonus griseus (Coleoptera: Carabidae), in China
【中文关键词】步甲,飞行的行为,陷光,夜间迁移,Pseudoophonus
霉菌(装甲),雷达观测
【英文关键词】Carabid , flight behaviour , light trapping , nocturnal migration , Pseudoophonus griseus (Panzer) , radar observations
【中文摘要】1光陷阱,空中网进行由kytoon(气球)和两个ento的网络mological雷达使用,以调查是否迁移地面甲虫noctur中国应受通过。网络广,同时突然增加光陷阱捕获,随后下降后,表明季节性长途夜间地面甲虫迁移,Pseudoophonus霉菌(装甲)预占主导地位,在8月。 2空中网诱捕表示,步甲能够登上海拔在至少有200米,成为windborne。雷达观测表明,迁徙甲虫形成于约200层浓度高密度 - 300米。 这些浓度的逆温层顶部重合和风速最大,这表明,步甲倾向于选择温暖,他们的长途迁移的快速移动的空气。 4,地面甲虫向顺风方向的导向和流离失所偏南风。他们的空气顺风下降的速度增加,因此,迁移甲虫似乎是节约能源。 5平均值±SD位移速度(地面速度)和空气的速度分别为6.85±1.73米/ S(N= 172)和4.45±1.54米/秒(N= 172),分别。持续时间飞行,从面积密度变化来自雷达数据估计,约9 - 10小时,表明甲虫可能迁移数百公斤米,在一个单一的飞行。
【英文摘要】1 A network of light-traps, an aerial net carried by kytoon (balloon) and two ento-mological radars were used to investigate whether ground beetles migrate noctur-nally through China. The network-wide, simultaneous sudden increase in light trap catches, and after subsequent decrease, indicated a seasonal long-distance night migration of ground beetles, with Pseudoophonus griseus (Panzer) pre-dominant, in August. 2 Aerial net trapping indicated that carabids were able to ascend to altitudes of at least 200 m and become windborne. Radar observations indicated that the migratory beetles formed high-density layer concentrations at approximately 200 – 300 m. 3 These concentrations were coincident with the top of the temperature inversion and a wind speed maximum, which suggested that the carabids tended to select warm, fast moving air for their long-distance migration. 4 The ground beetles orientated and displaced towards the downwind direction in southerly winds. Their air speed decreased as the tailwind increased and, thus, migrating beetles appeared to be conserving energy. 5 The mean ± SD displacement speed (ground speed) and air speed were 6.85 ± 1.73 m/s (n = 172) and 4.45 ± 1.54 m/s (n = 172), respectively. The duration of flight, estimated from the variation in area density derived from radar data, was approximately 9 – 10 h, indicating that the beetles might migrate hundreds of kilo-metres in a single flight.

【题目】抗青霉芽孢杆菌优良菌株的分离、筛选及鉴定
【中文关键词】解淀粉芽孢杆菌 青霉 鉴定 抑菌
【英文关键词】Bacillus amyloliquefaciens Penicillium sp. identification antifungal activity

【中文摘要】为了获得一株对青霉有强烈拮抗作用的芽孢杆菌以应用于食品的防腐保鲜中,从木瓜、柑橘、葡萄、全麦面包、太子参、陈皮等食品及中草药共计30个样品中分离得到132株芽孢杆菌。通过平板对峙法,筛选出18株对青霉有较强拮抗作用的芽孢杆菌。对其中3株抑菌效果显著的芽孢杆菌利用杯碟法测定其发酵液的抑菌效果,最终筛选出一株芽孢杆菌LPL40,其发酵上清液对青霉的抑菌圈直径达到(13.94±1.90)mm。通过形态学、生理生化及16SrDNA鉴定,最终将该菌株命名为解淀粉芽孢杆菌LPL40(Bacillus amyloliquefaciens LPL40)。

【英文摘要】In order to screen antifungal Bacillus sp. strains for applications in food preservation, 132 strains were separated from 30 kinds of fruits and herbs, of which 18 were assessed by plate confrontation tests to have strong antifungal activity against Penicillium sp. The fermentation supernatants of 3 of the 18 strains with stronger antifungal activity were tested for their antifungal activity, and LPL40 revealed the strongest antifungal activity against Penicillium sp. and the inhibition zone of cell- free supernatant was (13.94 ± 1.90) mm in diameter. Based on morphological characteristics, physiological and biochemical tests and identification of 16S rDNA sequence, LPL40 was identified as Bacillus amyloliquefaciens.

【题目】基于图像的昆虫远程自动识别系统的研究

【中文关键词】关键词:昆虫;自动识别;远程识别;图像处理;计算机视觉

【英文关键词】关键词:昆虫;自动识别;远程识别;图像处理;计算机视觉

【中文摘要】摘 要:只有对害虫进行鉴定才能在农业生产中对害虫进行有目的的防治,而对昆虫进行鉴定只有少数分类专家才能完成,鉴定需求的日益增加与专家相对较少形成了一对尖锐的矛盾。该文的研究尝试为该矛盾的解决提供一条新的思路:在标准方法下获取昆虫图像,并经由 Internet 网络上传给自动种类识别系统服务器,从而实现远程识别。系统首先对昆虫图像进行基于形状和颜色特征值的提取。昆虫图像的形态特征值由矩形度、延长度、球状型、叶状型、似圆度和 7个Hu不变矩等12个特征值组成,颜色特征值由红、绿、蓝、灰度真方图及基于红、绿的二维色度直方图特征值分别组成,然后建立径向基神经网络分类器,每一特征向量由独立的径向基神经网络做为分类器,最终识别由每个分类器识别结果的线性组合而成。采用该系统对16种昆虫进行了测试,每种昆虫取40个样本,20个用做训练、20个用做测试,准确率达到96%以上。

【题目】Cloning of a 9-cis- epoxycarotenoid dioxygenase gene and the responses of Caragana korshinskii to a variety of abiotic stresses

【中文关键词】脱落酸,柠条锦鸡儿,克隆,9-顺式-环氧类胡萝卜双加氧酶,抗逆
【英文关键词】Abscisic acid,caraganakotshinskii,cloning, 9-cis-epoxycarotenoid dioxygenase,stress tolerance
【中文摘要】脱落酸(ABA)调节植物适应对各种环境响应。9-顺式-环氧类胡萝卜双加氧酶(NCED)是ABA合成途径中主要的步骤之一。利用RACE技术,NCED基因从柠条锦鸡儿中克隆出来。CkNCED全长2442bp,开放阅读框1818bp,编码605个氨基酸。其氨基酸序列与其它物种NCED有很高同源性。Southern blot分析显示,CkNCED1在柠条锦鸡儿基因组中是单拷贝。当柠条锦鸡儿在水份缺乏,ABA积累增加很大,同时CkNCED1 mRNA在叶、茎中也极大增加,但在根中也适度增加。在干旱、ABA、盐份、冷处理下,实时荧光定量PCR结果显示,CkNCED1 转录水平极大增加,同时其ABA量也迅速增加。综合这些结果,CkNCED1在柠条锦鸡儿ABA合成中可能起重要作用
【英文摘要】Abscisic acid (ABA) regulates plant adaptive responses to various environmental stresses. Oxidative cleavage of cis-epoxycarotenoids catalyzed by 9-cis-epoxycarotenoid dioxygenase (NCED) is the main regulatory step in the biosynthesis of ABA in higher plants. Using RACE technology, a full-length cDNA-encoding NCED gene was isolated and characterized from the leaves of Caragana korshinskii (Peashrub). The 2442-bp full-length CkNCED1 had a 1818-bp ORF, which encodes a peptide of 605 amino acids. The deduced amino acid sequence of CkNCED1 protein shared high identity with other NCEDs. Southern blot analysis revealed that the gene CkNCED1 was a single copy in the genome of C. korshinskii. When C. korshinskii plants were exposed to a water deficit, ABA accumulation was followed by large increases in CkNCED1 mRNA in leaves and stems, but only a moderate increase in the roots. Conversely, rehydration of stressed leaves caused a rapid decrease in CkNCED1 mRNA and ABA levels. RT-PCR and Quantitative real-time PCR analysis showed that salt stress rapidly induced the strong expression of CkNCED1 in leaves and roots of C. korshinskii, as well as ABA accumulation. The expression of CkNCED1 and ABA accumulation was also induced by cold stress and the application of exogenous ABA. Taken together, these results suggest that CkNCED1 likely plays a primary role in the biosynthesis of ABA in C. korshinskii.

【题目】Isolation and Characterization of GoRAV ,a noval gene encoding a RAV-type Protein in Galegae orientalis
【中文关键词】生物胁迫,山羊豆侧柏,半定量RT-PCR,亚细胞定位,转录因子RAV
【英文关键词】abiotic stress, Galegae orientalis, semi-quantitative RT-PCR, subcellular localization, transcription factor RAV
【中文摘要】RAV是在高等植物中具有AP2和类B3两个不同的DNA结合域的独特的转录因子,在植物生长和发育中的作用还不清楚。该试验中,我们从山羊豆和侧柏中分离了一个新的RAV家族基因,GoRAV,对冷刺激有响应。序列比对表明它和RAV其他家族成员中AP2和B3具有较高的同源性。洋葱表皮细胞的瞬时表达分析表明GoRAV蛋白定位在细胞核中的。而半量RT-PCR(S-Q RT-PCR)分析表明GoRAV会受寒冷,脱水,高盐和脱落酸的诱导,在非生物胁迫的早期响应中,侧柏能被强烈诱导。GoRAV在叶中比在茎中的含量丰富,但是在根中不表达。这个研究将一个新的成员加入RAV家族中。
【英文摘要】RAV is a unique transcription factor in higher plants with AP2 and B3-like two distinct DNA-binding domains, but its roles in plant growth and development remains unknown. We have isolated a novel RAV family gene from Galegae orientalis, called GoRAV, which responds to cold induction. Sequence alignment showed that it shares high identity with other RAV family members in AP2 and B3 domain. Transient expression analysis using onion epidermal cells indicated that GoRAV protein is localized in the nucleus. Semi-quantitative RT-PCR (S-Q RT-PCR) analysis indicated that GoRAV is induced by cold, dehydration, high-salinity and abscisic acid, with the strongest induction in G. orientalis leaves during the early response to abiotic elicitors. GoRAV is more abundant in leaf than in stem, but is not expressed in root. This work adds a new member to the RAV family.

【题目】Suppression of cotton bollworm in China in areas with Bt toxin-containing cotton
【中文关键词】转基因棉花,Bt
【英文关键词】Transgenic cotton;Bacillus thuringiensis (Bt)
【中文摘要】从苏云金芽孢杆菌(Bt)中产生杀虫毒素转基因棉花抵制棉花害虫棉铃虫(Helicoverpa armigera)已经被广泛种植在亚洲。H. armigera从1992年到2007年的种群动态的分析来研究显示, Bt棉花的种植可以防治害虫爆发。研究领域包括在中国北部六省每年总共300万公顷的棉花和2200万公顷的其他作物(玉米、花生、大豆和蔬菜)增长超过1000万资源贫乏的农民。我们的数据表明Bt棉花不但控制H. armigera来设计能够抵御在转基因棉花这种害虫,但也可能减少它出现在其他主机作物和可能减少一般需要喷洒杀虫剂。
【英文摘要】Transgenic cotton that has been engineered to produce insecticidal toxins from Bacillus thuringiensis (Bt) and so to resist the pest cotton bollworm (Helicoverpa armigera) has been widely planted in Asia. Analysis of the population dynamics of H. armigera from 1992 to 2007 in China indicated that a marked decrease in regional outbreaks of this pest in multiple crops was associated with the planting of Bt cotton. The study area included six provinces in northern China with an annual total of 3 million hectares of cotton and 22 million hectares of other crops (corn, peanuts, soybeans, and vegetables) grown by more than 10 million resource-poor farmers. Our data suggest that Bt cotton not only controls H. armigera on transgenic cotton designed to resist this pest but also may reduce its presence on other host crops and may decrease the need for insecticide sprays in general.

【题目】Baseline susceptibility of Cnaphalocrocis medinalis (Lepidoptera: Pyralidae) to Bacillus thuringiensis toxins in China
【中文关键词】转基因棉花,Bt
【英文关键词】Cnaphalocrocis medinalis, Bacillus thuringiensis, baseline susceptibility, bioassay
【中文摘要】Geographic variability in susceptibility of Teld-collected Cnaphalocrocis medinalis(Guene ´ e) (Lepidoptera: Pyralidae) to Bacillus thuringiensis (Berliner) was studied to establish ageographic baseline for comparison of future population responses to the increased use of B.thuringiensis-based insect control products. Colonies of C. medinalis were established from 10 populations collected from 10 different provinces in the major rice (Oryza savita L.)-growing regions of China. Populations were evaluated for their susceptibility to Cry1Ac and Cry1Ab endotoxin proteins with the leaf-dip bioassay. The LC50 values to Cry1Ac and Cry1Ab were estimated for the 10 populations. Bioassay results indicated that the ranges of LC50 in the second instars of C. medinalis to Cry1Ac and Cry1Ab were from 3.77 to 208.22 mg ([AI])/liter and 0.22D7.05 mg ([AI])/liter, respectively. The relative ratios in susceptibility between the most susceptible and the most tolerant populations were beyond 50-fold for Cry1Ac and 30-fold for Cry1Ab. Moreover, there was a signiTcant positive correlation between susceptibilities to the two toxins tested, suggesting that insect populations that are relatively tolerant to one protein are also relatively tolerant to the other.

【题目】Effects of different brush border membrane vesicle isolation protocols on proteomic analysis of Cry1Ac binding proteins from the midgut of Helicoverpa armigera
【中文关键词】Bacillus thuringiensis, binding protein, brush border membrane vesicles, Cry1Ac, Helicoverpa armigera, two-dimensional electrophoresis
【英文关键词】Bacillus thuringiensis, binding protein, brush border membrane vesicles, Cry1Ac, Helicoverpa armigera, two-dimensional electrophoresis
【中文摘要】Brush border membrane vesicles (BBMV) isolated from insect midguts have been widely used to study Cry1A binding proteins. Sample preparation is important in twodimensional electrophoresis (2-DE), so to determine a suitable BBMV preparation method in Helicoverpa armigera for 2-DE, we compared three published BBMV preparation methods mostly used in sodium dodecyl

sulfate-polyacrylamide gel electrophoresis (SDSPAGE). All methods yielded similar types and numbers of binding proteins, but in different quantities. The Abdul-Rauf and Ellar protocol was the best of the three, but had limitations. Sufficient protein quantity is important for research involving limited numbers of insects, such as studies of insect resistance to Bacillus thuringiensis in the field. Consequently, we integrated the three BBMV isolation methods into a single protocol that yielded high quantities of BBMV proteins from H. armigera larval midguts, which proved suitable for 2- DE analysis.

【题目】Introgression of a disrupted cadherin gene enables susceptible Helicoverpa armigera to obtain resistance to Bacillus thuringiensis toxin Cry1Ac

【中文关键词】Helicoverpa armigera (Hu ¨ bner), Bacillus thuringiensis, Cry1Ac, resistance, cadherin, fitness costs
【英文关键词】Helicoverpa armigera (Hu ¨ bner), Bacillus thuringiensis, Cry1Ac, resistance, cadherin, fitness costs

【中文摘要】A disrupted allele (r1) of a cadherin gene (Ha_BtR) is genetically associated with incompletely recessive resistance to Bacillus thuringiensis toxin Cry1Ac in Cry1Ac-selected strain (GYBT) of Helicoverpa armigera. The r1 allele of Ha_BtR was introgressed into a susceptible SCD strain by crossing the GYBT strain to the SCD strain, followed by repeated backcrossing to the SCD strain and molecular marker assisted family selection. The introgressed strain (designated as SCD-r1, carrying homozygous r1 allele) obtained 438-fold resistance to Cry1Ac, > 41-fold resistance to Cry1Aa and 31-fold resistance Cry1Ab compared with the SCD strain; however, there was no significant difference in susceptibility to Cry2Aa between the integrated and parent strains. It confirms that the loss of function mutation Ha_BtR alone can confer medium to high levels of resistance to the three Cry1A toxins in H. armigera. Reciprocal crosses between the SCD and SCD-r1 strains showed that resistance to Cry1Ac in the SCD-r1 strain was completely recessive. Life tables of the SCD and SCD-r1 strains on artificial diet in the laboratory were constructed, and results showed that the net replacement rate (R0) did not differ between the strains. The toxicity of two chemical insecticides, fenvalerate and monocrotophos, against the SCD-r1 strain was not significantly different from that to the SCD strain. However, larval development time of the SCD-r1 strain was significantly longer than that of the SCD strain, indicating a fitness cost of slower larval growth is associated with Ha_BtR disruption in H. armigera.

【题目】A single linkage group confers dominant resistance to Bacillus thuringiensis d-endotoxin Cry1Ac in Helicoverpa armigera
【中文关键词】Bacillus thuringiensis, Helicoverpa armigera, Amplified fragment length polymorphism, Cry1Ac, dominant resistance
【英文关键词】Bacillus thuringiensis, Helicoverpa armigera, Amplified fragment length polymorphism, Cry1Ac, dominant resistance
【中文摘要】The BKBT strain of Helicoverpa armigera was derived from a susceptible BK77 strain (collected from Bouake, Cote D ’ Ivoire in 1977) through 30 generations of selection with activated Bacillus thuringiensis d-endotoxin Cry1Ac. Unlike recessive inheritance of Cry1Ac resistance in H. armigera from previous reports, resistance to activated Cry1Ac in the BKBT strain is dominant. A backcross approach was used to map dominant resistanceto Cry1Ac in the BKBT strain. One hundred and forty-seven informative amplified fragment length polymorphism (AFLP) DNA markers covered all 31 linkage groups of H. armigera. Five AFLP markers linked to Cry1Ac resistance in the BKBT strain were on the same autosomal linkage group, which is the only linkage group contributing dominant Cry1Ac resistance in the BKBT strain of H. armigera.

【题目】Toxicity of chlorantraniliprole to Cry1Ac-susceptible and resistant strains of Helicoverpa armigera
【中文关键词】Chlorantraniliprole ; Cry1Ac resistance ; Glutathione-S-transferase ; Helicoverpa armigera ; Total esterase
【英文关键词】Chlorantraniliprole ; Cry1Ac resistance ; Glutathione-S-transferase ; Helicoverpa armigera ; Total esterase
【中文摘要】Transgenic Bt cotton expressing Cry1Ac is important in controlling various agricultural pests, including Helicoverpa armigera. Especially for transgenic crops that are cultivated in large expanses, avoiding resistance development is a key for ensuring sustainability of Bt technologies. Integrated pest management, in which transgenic crops are strategically combined with rational pesticide use, may help to prevent H. armigera resistance acquisition in Bt cotton. In this study, we evaluated the toxicity of a novel insecticide (chlorantraniliprole) on Cry1Ac-susceptible and resistant individuals of H. armigera. More specifically, we assessed the effect of chlorantraniliprole on the activity of two enzymes and conducted laboratory bioassays to determine its toxicity on H. armigera larvae. Chlorantraniliprole increased esterase and glutathione- S-transferase activities in Cry1Ac susceptible and resistant populations of H. armigera. Cry1Ac resistant populations XJ-F (Cry1Ac resistance ratio 21.8-fold), XJ-10.0 (95.8-fold) and BTR (3536.5-fold) did not show cross-resistance to chlorantraniliprole, with LC50 values of 0.0733 (lg/mL) in XJ-F, 0.0545 (lg/ml) in XJ-10.0 and 0.0731 (lg/mL) in BTR, which were close to that in the susceptible strain 96S (0.0954 lg/mL). Our work shows that chlorantraniliprole could be considered to be integrated in Bt cotton management schemes to delay the H. armigera resistance development.
【英文摘要】Transgenic Bt cotton expressing Cry1Ac is important in controlling various agricultural pests, including Helicoverpa armigera. Especially for transgenic crops that are cultivated in large expanses, avoiding resistance development is a key for ensuring sustainability of Bt technologies. 【题目】Cotton bollworm resistance to Bt transgenic cotton: A case analysis
【中文关键词】棉铃虫,Bt 棉花,抗性机制,抗性监测,抗性治理
【英文关键词】Helicoverpa armigera, Bt resistance, transgenic cotton, resistance mechanism, management strategies
【中文摘要】棉铃虫是危害棉花最严重的害虫之一. 作为生物技术产品, 转Bt 杀虫基因棉花产生的Cry 毒素对棉铃虫有高效毒杀作用. Bt 棉花已在世界范围内商业化种植, 通过有效控制棉铃虫种群数量, 而显著减少了化学农药的用量. 尽管没有发现棉铃虫田间种群对Bt 棉花产生高水平抗性, 但室内持续筛选已培育出多个高水平抗性品系, 表明存在棉铃虫对Bt 棉花

产生抗性的风险. 鉴于棉铃虫对Bt 棉花产生抗性可能对Bt 棉花利用价值的影响, 国内外近10 年来对此进行了系统深入地研究. 本文综述了棉铃虫对Bt 棉花抗性的生物化学和分子机制、抗性治理与监测技术的最新研究进展, 并分析了中国、澳大利亚和印度等国家棉铃虫对Bt 棉花的抗性治理策略.

【英文摘要】Cotton bollworm (Helicoverpa armigera) is one of the most serious insect pests of cotton. Transgenic cotton expressing Cry toxins derived from a soil bacterium, Bacillus thuringiensis (Bt), has been produced to target this pest. Bt cotton has been widely planted around the world, and this has resulted in efficient control of bollworm populations with reduced use of syn-thetic insecticides. However, evolution of resistance by this pest threatens the continued success of Bt cotton. To date, no field populations of bollworm have evolved significant levels of resistance; however, several laboratory-selected Cry-resistant strains of H. armigera have been obtained, which suggests that bollworm has the capacity to evolve resistance to Bt. The de-velopment of resistance to Bt is of great concern, and there is a vast body of research in this area aimed at ensuring the contin-ued success of Bt cotton. Here, we review studies on the evolution of Bt resistance in H. armigera, focusing on the biochemi-cal and molecular basis of Bt resistance. We also discuss resistance management strategies, and monitoring programs imple-mented in China, Australia, and India.

【题目】Proteomic analysis of novel Cry1Ac binding proteins in Helicoverpa armigera (H ü bner)

【中文关键词】Bacillus thuringiensis; Helicoverpa armigera; brush border membrane vesicles; proteomics; peptide mass fingerprinting

【英文关键词】Bacillus thuringiensis; Helicoverpa armigera; brush border membrane vesicles; proteomics; peptide mass fingerprinting

【中文摘要】Aminopeptidase N (APN) and cadherin-like proteins have been previously identified as Cry1Ac-binding proteins in Helicoverpa armigera (Hu ¨ bner). In this study, a proteomic approach was used to identify novel Cry1Ac-binding proteins in H. armigera. Brush border membrane vesicles (BBMV) of H. armigera were extracted and separatedby two-dimensional gel electrophoresis (2-DE). Cry1Ac-binding proteins were detected using antisera against Cry1Ac. Peptide mass fingerprinting (PMF) was used to identify Cry1Ac-binding proteins. In total, four proteins were identified as candidate Cry1Ac-binding proteins in H. armigera: vacuolar ATP synthase (V-ATPase) subunit B, actin, heat shock cognate protein (HSCP), and a novel protein.

【题目】Gene cloning and expression of aminopeptidase N and cadherin from midgut of the rice stem borer, Chilo suppressalis

【中文关键词】aminopeptidase N, cadherin, Chilo suppressalis, heterologous expression,
Tn cells

【英文关键词】aminopeptidase N, cadherin, Chilo suppressalis, heterologous expression,
Tn cells

【中文摘要】The rice stem borer, Chilo suppressalis Walker is one of the most important insect pests on rice in Asia, north Africa and southern Europe. Transgenic Bt rice has beendeveloped in the laboratory with good resistance to this pest and other Lepidopteran insects,which will provide a possible alternative tool for this pest control. The full-length cDNAsencoding an aminopeptidase N (CsAPN) and a cadherin (CsCad) were cloned from C.suppressalis. CsAPN showed common features of, and high identities to, other insect APNsin its deduced amino acid sequence. Although a full-length cDNA encoding cadherin-likeprotein has been reported in GenBank, the newly isolated cadherin here (CsCad) showedsome differences in its amino acid sequence, especially at the 7th cadherin repeat region(CR7), which indicated the newly isolated CsCad might be another allele. CsAPN andCsCad were successfully expressed in insect Tn cells, and the blot analysis showed thesetwo proteins could bind Bt toxin Cry1Ab. The results will provide valuable informationfor the studies of toxin mode of action and the possible toxin resistance mechanisms in thispest.

【题目】Cross-resistance of Cry1Ab-selected Asian corn borer to other Cry toxins
【中文关键词】Bacillus thuringiensis, Ostrinia furnacalis, Bt maize, cross-resistance, Cry proteins
【英文关键词】Bacillus thuringiensis, Ostrinia furnacalis, Bt maize, cross-resistance, Cry proteins

【中文摘要】The Asian corn borer, Ostrinia furnacalis (Guene ´ e) (Lepidoptera: Crambidae),is the most important insect pest of maize in China. Despite the proven track record of biotech Bacillus thuringiensis (Bt) maize to provide an effective means to control lepidopteran pests such as the European corn borer Ostrinia nubilalis (Hu ¨ bner), these crops have not been commercialized in China. However, Cry1Ab- and Cry1F-expressing maize derived from genetic transformation events MON810 (Monsanto), Bt11 (Syngenta) and TC1507 (Pioneer, DuPont) as well as Cry1Ah-, Cry1A- (a Cry1Ab/Cry1Ac hybrid toxin), and Cry1Ac-, Cry1Ie-expressing maize developed by the Chinese institutions have been shown to effectively suppress O. furnacalis in field trials. The development of resistance in target pests is a major threat to the use of Bt maize. A strain of O. furnacalis selected with Cry1Ab protein incorporated into artificial diet developed more than 100-fold resistance to Cry1Ab after 35 generations of selection, and readily consumed Cry1Ab-expressing maize silks. Although LC50s of the selected insect strain were not progressively increased, andeven decreased in the following generations, these insects (ACB-AbR) could survive on Cry1Ab-expressing maize tissue after 51 generations of selection. In addition, susceptibility of ACB-AbR to a number of other Bt toxins to which the selected strains had not previously been exposed, was significantly decreased. The highest level of cross-resistance was observed with Cry1Ah (131-fold), followed by Cry1Ac (36-fold). A low level of cross-resistance (6-fold) to Cry1F was also detected. In contrast, ACB-AbR was equally susceptible to Cry1Ie as the unselected control strain. These results indicate that the availability of multiple toxins couldimprove resistance management strategies, provided that the potential for cross-resistance among toxins is not an issue.

【题目】Diverse cadherin mutations conferring resistance to Bacillus thuringiensis

【中文关键词】Helicoverpa armigera , Bacillus thuringiensis ,Cadherin ,Resistance ,Bt cotton

【英文关键词】Helicoverpa armigera , Bacillus thuringiensis ,Cadherin ,Resistance ,Bt cotton

【中文摘要】Transgenic cotton expressing Bacillus thuringiensis (Bt) toxins has been widely adopted to control some key lepidopteran pests including the bollworm Helicoverpa armigera. Evolution of resistance to Bt cotton by target pests is a major threat to the continued success of Bt cotton. Previous results revealed 3 null alleles (r1-r3) of a cadherin gene (Ha_BtR) conferring Cry1Ac resistance in H. armigera. An F1 screen of 123 singlepairfamilies was conducted between a Cry1Ac-resistant strain (the SCD-r1 strain, homozygous for the r1 allele of Ha_BtR) and field-derived insects from Jiangpu population (Jiangsu province, China) in 2008. Five new null alleles of Ha_BtR (r4-r8) were identified in six candidate single-pair families. These null alleles were created through either an insertion or a point mutation. Interestingly, intact alleles of Ha_BtR were found in two field-derived insects from another two candidate single-pair families. It suggests that these two field-derived insects may carry novel resistance alleles of Ha_BtR, with missense mutations resulting in a non-functional cadherin protein, or a major dominant mutation at a locus other than cadherin. The resistance allele frequency of Ha_BtRwas detected at an appreciable level (0.024) in the Jiangpu population of H. armigera in 2008. Together with previous findings, a total of eight different resistance alleles of Ha_BtR were identified from three Chinese strains of H. armigera. Mutational diversity of Ha_BtR could impairDNA screening for Bt resistance allele frequency in the field, and an F1 screen should be used routinely for monitoring cadherin-based resistance allele frequencies in H. armigera.

【题目】Lethal and sub-Lethal effects of transgenic rice containing cry1Ac and CpTI genes on the pink stem borer, Sesamia inferens (Walker)
【中文关键词】transgenic rice ;Sesamia inferens lethal ; sub-lethal effect
【英文关键词】transgenic rice ;Sesamia inferens lethal ; sub-lethal effect
【中文摘要】【Objective】 Lethal and sub-lethal effects of transgenic rice containing cry1Ac and CpTI genes on the pink stem borer(Sesamia inferens) were studied to collect information for ecological risk assessment on insect-resistance to transgenic rice.【Method】 In vitro insect-feeding bioassay was conducted to evaluate the lethal and sub-lethal effects of transgenic rice lines (ⅡYouKF6 and KF6) on S. inferens at four different growing stages, i.e., seedling, tillering and elongation, booting, milk and maturing.【Result】 Transgenic rice at seedling stage showed significantly high lethal effect on S. inferens with the shortest lethal duration of 50% and 100% of individuals and the highest corrected mortalities after feeding on transgenic lines at this stage for 3 and 6 days. Secondly followed by tillering and elongation stage, 50% and 100% of S. inferens were dead after feeding on transgenic lines at this stage for 4 and 10 days, respectively. Moreover, corrected mortalities for 6 days feeding on transgenic lines at this stage were significantly higher than that at booting and milk and maturing stages. Lethal effect of KF6 on S. inferens decreased significantly atbooting stage. Lethal duration of 50% of S. inferens significantly extended and its corrected mortalities for 6 days feeding also declined remarkably. However, lethal effect of ⅡYouKF6 on S. inferens did not decrease significantly at this stage. Transgenic rice at booting and milk and maturing stages did not present significantly lethal to S. inferens and it showed the longest lethal duration of 50% of individuals and the lowest corrected mortalities for 3 and 6 days feeding. A few larvae of S. inferens could survive, pupate and emerged on these two transgenic lines at boot and milk and maturing stages. Sub-lethal effect of two transgenic lines on S. inferens also differed significantly between different developmental stages. Continuously feeding on transgenic rice lines at seedling and tillering and elongation stages could delay the development of larvae and pupae and decrease pupation rate, but no effect was shown on eclosion rate. Larval development was significantly inhibited after feeding on transgenic rice at booting stage, but no obvious effects were observed in pupal stages, pupation and eclosion rates. There were no significant differences for larval and pupal development, pupation and eclosion rates between feeding on transgenic and control rice lines at milk and maturing stages. Larval and pupal weights significantly declined, but no influence was shown on fecundity, when S. inferens infested on transgenic rice at any stage.【Conclusion】 There were significant differences in lethal and sub-lethal effects of transgenic rice on S. inferens at different developmental stages, and the effects gradually decreased with the increase of growing stages of rice plant.

【题目】Early Warning of Cotton Bollworm Resistance Associated with Intensive Planting of Bt Cotton in China
【中文关键词】Early Warning , Cotton Bollworm Resistance , Bt Cotton
【英文关键词】Early Warning , Cotton Bollworm Resistance , Bt Cotton
【中文摘要】Transgenic crops producing Bacillus thuringiensis (Bt) toxins kill some key insect pests, but evolution of resistance by pests can reduce their efficacy. The predominant strategy for delaying pest resistance to Bt crops requires refuges of non-Bt host plants to promote survival of susceptible pests. To delay pest resistance to transgenic cotton producing Bt toxin Cry1Ac, farmers in the United States and Australia planted refuges of non-Bt cotton, while farmers in China have relied on ‘‘natural’’ refuges of non-Bt host plants other than cotton. Here we report data from a 2010 survey showing field-evolved resistance toCry1Ac of the major target pest, cotton bollworm (Helicoverpa armigera), in northern China. Laboratory bioassay results show that susceptibility to Cry1Ac was significantly lower in 13 field populations from northern China, where Bt cotton has been planted intensively, than in two populations from sites in northwestern China where exposure to Bt cotton has been limited. Susceptibility to Bt toxin Cry2Ab did not differ between northern and northwestern China, demonstrating that resistance to Cry1Ac did not cause cross-resistance to Cry2Ab, and implying that resistance to Cry1Ac in northern China is aspecific adaptation caused by exposure to this toxin in Bt cotton. Despite the resistance detected in laboratory bioassays, control failures of Bt cotton have not been reported in China. This early warning may spur proactive countermeasures, including a switch to transgenic cotton producing two or more toxins distinct from Cry1A toxins.

【中文摘要】在比对已公布的37种杆状病毒包涵体蛋白氨基酸序列的基础上,选定棉铃虫核型多角体病毒(aN HaNaNPV)多角体蛋白的两个高度保守多肽(aa54-113aaaa和206-245aaaa)制备多克隆抗体,用 Westernesternesternesternesternestern blotblotblotblot法检测这两个高度保守多肽与多种杆状病毒包涵体蛋白之间的血清学关系. 结果表明,HaNaNPV多角体蛋白的两个多肽的抗体与14种核型多角体病毒的多角体蛋白和5种颗粒体病毒的颗粒体蛋白均有明显的杂交信号,表明杆状病毒的包涵体蛋白之间具有共同的抗原决定簇. 根据杆状病毒包涵体蛋白之间的这种血清学关系,进一步讨论了利用免疫金试纸技术检测病毒杀虫剂中包涵体含量的可行性.

【题目】用甜菜夜蛾增殖马尾松毛虫质型多角体病毒的研究
【中文关键词】甜菜夜蛾,马尾松毛虫质型多角体病毒,替代寄主
【英文关键词】Dendrolimus punctatus; cytoplasmic polyhedrosis virus; Spodoptera exigua; substitutive host
【中文摘要】以甜菜夜蛾为替代宿主增殖马尾松毛虫多角体病毒DpCPV的研究结果表明,DpCPV在甜菜夜蛾体内连续繁殖三代后的DpCPV-Se3与DpCPV具有相同电泳图谱,多角体和病毒粒子在电子显微镜下观察未发现形态上的明显变化,生测结果表明,二者毒力差异不显著,认为以甜菜夜蛾为替代宿主增殖马尾松毛虫多角体病毒DpCPV有可行性
【英文摘要】The infectivity and genetic stability of Dendrolimus punctatus cytoplasmic polyhedrosis virus (DpCPV) propagated in the substitutive host Spodoptera exigua were investigated. DpCPV-Se3, which was propagated in S. exigua for three passages, had identical electrophoresis pattern with the original isolate. They were shown with no differences in polyhedra and virion morphology under electron microscope. According the results of bioassays, DpCPV-Se3 had a similar infectivity with original isolate against the second instars of D. punctatus and the median lethal concentration (LC50) of DpCPV-Se3 (0.92×103 PIB/mL) was not significantly different from that of the original isolate (1.44×103 PIB/mL). Sequencing analysis indicatedthat the variations of S7 and S10 fragments between DpCPV-Se3 and DpCPV were minor, and S. exigua might be a good substitutive host for the mass-production of DpCPV for biological control.

【题目】Impact of Helicoverpa armigera nucleopolyhedroviruses expressing
【中文关键词】棉铃虫核型多角体病毒,靶标昆虫,非靶标昆虫
【英文关键词】Helicoverpa armigera; nucleopolyhedrovirus Genetically modified viruses; Cathepsin L-like cysteine protease; Insecticidal activity; Control efficacy
【中文摘要】表达蛋白酶棉铃虫核型多角体病毒对棉田靶标和非靶标昆虫没有显著影响,具有应用前景
【英文摘要】Baculoviruses have been genetically engineered to improve their insecticidal properties and reduce crop damage. In this study, a recombinant Helicoverpa armigera nucleopolyhedrovirus (HearNPV-cathL) expressing a cathepsin L-like cysteine protease from the flesh fly, Sarcophaga peregrina, was constructed.Its insecticidal properties in the laboratory, occlusion body yield in diseased larvae, efficacy of protecting cotton from larval feeding damage and impact on predator densities in the fields were assessed. In the laboratory, the infectivity of this recombinant was not different from the wild-type parent (HearNPV-WT) and a recombinant virus (HearNPV-AaIT) which expresses an insect-selective neurotoxin from the scorpion Androctonus australis. The median survival times of 2nd or 3rd instar H. armigera larvae after infection with HearNPV-cathL were reduced about 26% in comparison to Hear-NPV-WT. Occlusion body yield in the diseased larvae inoculated with HearNPV-cathL, which were similar to that with HearNPV-AaIT, was reduced 63% in comparison to HearNPV-WT. In the field, when virus formulations were multiply applied to control natural infestations of H. armigera on cotton, both HearNPV-cathL and HearNPV-AaIT treatments protected cotton from larval feeding damage better than the wild-type virus treatment. Predator densities in the recombinant virus treatments were similar to those in wild-type virus treatments and untreated control. These results suggest that the recombinant HearNPVs have potential for practical use.

【题目】The open reading frame Bm21 of Bombyx mori nucleopolyhedrovirus is not essential for the viral replication in vitro but its deletion extends the median survival time of the infected larvae
【中文关键词】蚕核型多角体病毒的开放阅读框21(Bm21);生物活性
【英文关键词】Bombyx mori nucleopolyhedrovirus (BmNPV),the open reading frame 21 (Bm21),biological activity
【中文摘要】本文对家蚕核型多角体病毒的开放阅读框21(Bm21)进行了特性研究。 bm21预测编码含有55.8 kDa的蛋白质和不完全保守的富含亮氨酸重复。快速扩增cDNA末端的(39RACE)显示,Bm21单首次发现感染后6小时也包含了完整的Bm20。 59RACE发现3个转录起始位点,其中映射到杆状病毒早期转录图CGTGC和CAGT。瞬时表达和二重感染分析表明,BM21定位在细胞核内。病毒的一步生长曲线分析表明, Bm21空病毒与出发病毒生产动力学类似。生物活性分析表明, Bm21空病毒致死浓度LC50值与对照病毒类似,但是,ST50显着高于控制病毒。这些结果表明,BM21在病毒体外复制是不必要的,但基因缺失延缓杀死被感染的幼虫。
【英文摘要】In this report, the open reading frame 21 (Bm21) of Bombyx mori nucleopolyhedrovirus (BmNPV),one of the unique genes of group I NPVs, was characterized. Bm21 is predicted to encode a protein of 55.8 kDa and was found to contain imperfectly conserved leucine-rich repeats. 39 Rapid amplification of cDNA ends (39RACE) showed that the transcript of Bm21 was first detected from 6 h post-infection and that it also encompassed the complete Bm20. 59RACE revealed three transcription initiation sites, one of which mapped to the baculovirus early transcription motifs CGTGC and CAGT. Transient-expression and superinfection assays indicated that BM21 localized in the nucleus of infected BmN cells. To study the function of BM21, a Bm21-null virus was constructed using bacmid technology. Viral one-step growth curve analyses showed that the Bm21-null virus had similar budded virus production kinetics to those of the parental virus. Bioassay analyses showed that the median lethal concentration (LC50) of the Bm21-null virus was similar to that of the control virus; however, the median survival time (ST50) of the knockout virus was significantly longer than the control virus. These results indicate that BM21 is not essential for virus replication in vitro, but that deletion of the gene delays the killing of the infected larvae.

【题目】In vitro assessment of plant lectins with anti-pinwood nematode activity
【中文关键词】松材线虫
【英文关键词】Lycoris radiata agglutinin (LRA); Pinellia ternata agglutinin (PTA); Pinewood nematode
【中文摘要】从球茎的Pinellia ternata和Lycoris radiata纯化两种凝集素蛋白。p . ternata凝集蛋白PTA和l . radiata凝集蛋白LRA形成聚合物并凝固兔子红血细胞和酵母细胞。两种蛋白质稀释到不同浓度后混入松木线虫、测量和线虫生存。结果表明,两种凝集素蛋白显著降低线虫种群数量。经过,当500 μg /毫升蛋白质使用96小时,线虫数量显著下降,高浓度的蛋白质对松木线虫毒性更强。此外,蛋白质对松木线虫持续时间长、我们的结果显示这两个凝集素蛋白有显然毒性作用,影响松木线虫体外生存。
【英文摘要】Two lectin proteins were purified from the corms of Pinellia ternata and Lycoris radiata. Both P. ternata agglutinin (PTA) protein and L. radiata agglutinin (LRA) protein formed polymers and coagulated both rabbit red blood cells and yeast cells. The two proteins were each diluted to different concentration and then mixed with pinewood nematodes, and nematode survival was measured. Results showed that the two lectin proteins showed significant levels of resistance against nematodes and the nematode population was significantly reduced, compared to PBS buffer without protein control group. The mean number of nematodes of two lectin proteins group was significantly lower than that of control group constantly throughout the assay period with differences being very significant at $P < 0.01$ after 24 h. After 96 h, when 500 μg/ml proteins were used, nematode number significantly declined to an average of 26 (approximately 43% of the controls) and 32.2 (approximately 53.3% of the controls) nematodes at LRA and PTA protein,

respectively, compared to the control group. Results also indicated that higher concentrations of protein were more toxic to the pinewood nematode. Even when the concentration was as low as 30 μg/ml, the toxic proteins retained their anti-nematodeactivity. Furthermore, pinewood nematode was exposed to the proteins for longer, more pinewood nematodes were killed. Our results indicated the two lectin proteins both apparently have a toxic effect on the pinewood nematode that affects its survival in vitro.

【题目】Isolation and characterization of GoDREB, a novel gene encoding an ERF-type protein in Galegae orientalis
【中文关键词】脱落酸,生物胁迫,东方山羊豆,信号途径,转录因子ERF
【英文关键词】ABA,abiotic stress,Galegae orientalis,signaling pathway,transcription factor ERF
【中文摘要】在高等植物中,ERF是具有AP2 DNA结合域的一类独特转录因子。从东方山羊豆中,克隆一个类ERF基因,命名为GoDREB。序列比对发现,与其它拥有AP2结构域的ERF家族成员有较高同源性。基因瞬时表达表明,GoDREB定位于细胞核。实时荧光定量PCR分析表明,GoDREB受非生物胁迫的诱导,如:冷、干旱、盐份。外源激素,如茉莉酸甲酯、水杨酸都可使GoDREB表达上调。然而,ABA并没有诱导GoDREB mRNA积累。这些结果表明,GoDREB可能在这两个激素调节中起作用,但可能不参与在ABA依赖的信号调节中。在烟草中超表达GoDREB,在盐分、干旱、低温胁迫下,表现出高的忍耐性。这些结果表明,GoDREB作为ERF转录因子一员,在东方山羊豆信号传导中起重要作用。
【英文摘要】ERF is a unique transcription factor in higher plants with AP2-like DNA-binding domains. An ERF-like gene was isolated from Galegae orientalis, termed GoDREB. Sequence alignment showed that it shares high identity with other ERF family members in AP2 domain. Transient expression analysis indicated that GoDREB protein is localized in the nucleus. Quantitative RT-PCR analysis results showed that GoDREB is induced by a variety of abiotic stress, such as cold, dehydration, and high-salinity. Exogenous hormones, such as methyl jasmonate acid and salicylic acid, also up-regulate the expression of GoDREB. However, ABA did not induce the mRNA accumulation of GoDREB. These results implied that the GoDREB might play a role in these two hormones-dependent but not be involved in the ABA-dependent stress signaling pathway. Overexpression of GoDREB in transgenic tobacco plants resulted in higher tolerance to high salinity, osmotic and low-temperature stresses. These results suggest that GoDREB may play an essential role as an ERF transcription factor in regulation of stress-responsive signaling in G. orientalis

【题目】The inhibitory activity of endophytic Bacillus sp. strain CHM1 against plant pathogenic fungi and its plant growth-promoting effect
【中文关键词】从稻田分离了一株Bacillussp strainCHM1,具有抗真菌活性的分离。从形态,生理生化特性,16S rDNA序列分析的基础上,CHM1鉴定为地衣芽孢杆菌。CHM1培养滤液能抑制灰霉病cinereapers镰刀菌枯萎病,纹枯病,赤霉病,Dothiorella gregaria和炭疽病菌菌丝。当CHM1悬浮液喷洒在植物叶片上,对玉米小斑病和蚕豆纹枯病菌防治效果分别为70.22%和62.79%。水稻和油菜(油菜)根围使用能促进幼苗生长,表明CHM1可能是一个潜在的保护玉米,蚕豆,油菜和水稻(Oryza sativa)的植物体内细菌(PGPE)。
【英文关键词】• PGPE; Endophytic bacteria; Identification; Antifungal activity
【中文摘要】内生细菌,鉴定,促进植物生长,抗真菌活性

【英文摘要】A Bacillussp., strainCHM1, possessing antifungal activity was isolated from a paddy field in the present study. On the basis of the comprehensive taxonomic data from morphological, physiological and biochemical characteristics, and 16S rDNA sequence analysis, CHM1 was identified to be Bacillus licheniformis. The culture filtrate of CHM1, even when sterilized, inhibited mycelial growth of Fusarium oxysporum, Rhizoctonia solani, Botrytis cinereapers, Gibberella zeae, Dothiorella gregaria and Colletotrichum gossypii in vitro. When CHM1 culture suspension was sprayed on plant leaves, it protected maize (Zea mays) against infection by Bipolaris maydis and horsebean (Vicia faba) against infection by R. solani with a mean control efficacy of 70.22 and 62.79%, respectively. The culture suspension of CHM1, drenched around the root of rice and cole (Brassica napus), promoted seedling growth. The data here showed that Bacillussp. CHM1 could be a potential agent to protect maize, horsebean, cole and rice (Oryza sativa) plants from infection by pathogenicfungiin vivo and had properties as a plantgrowth-promotingendophytic bacterium (PGPE).

【题目】A novel dehydration-responsive element- binding protein in Caragana korshinskii is involved in responding to multiple abiotic stress and enhance the stress-tolerance in over-expression transgenic tobacco
【中文关键词】柠条锦鸡儿,DREB,信号调节,耐逆
【英文关键词】Caragana korshinskii, DREB , Signaling regulation ,Stress tolerance
【中文摘要】脱水应答元件结合蛋白(DREB)特异性结合于干旱应答响应元件,并且是植物特有转录因子家族成员,在植物应对各种非生物胁迫(如冷、干旱、盐),调节基因表达起重要作用。在本研究中,从柠条中克隆该基因,命名为CkDBF(DRE结合因子)含有保守的APETLA2(AP2)/ERF乙烯响应结合元件结构域。在CkDBF N端,富含K、R氨基酸的基序,对于其定位于细胞核起重要作用。CkDBF 其DNA结合特异性、转录活性在酵母单杂实验中得到验证。CkDBF在高盐、干旱、低温、ABA处理下,表达量都被上调。在转基因烟草中,对盐、干旱有高的忍耐性;在正常生长条件下,诱导下游基因表达。这些结果表明,CkDBF作为转录因子在柠条胁迫应答信号中起重要作用。
【英文摘要】The dehydration-responsive element-binding (DREB) protein specifically binds the dehydration-responsive element and is part of a plant-specific family of transcription factors that play important roles in regulating the expression of genes in response to a variety of abiotic stresses, including drought, high salt, and low temperature. In this study, a DREB-like gene containing a conserved APETLA2 (AP2)/ethylene responsive element binding factor (ERF) domain, termed DRE binding factor (CkDBF), was isolated from Caragana korshinskii. The K, R-rich motif in the N-terminal region was shown to play an essential role in nuclear localization of CkDBF. DNA-binding specificity and transactivation activity of CkDBF were verified by yeast one-hybrid experiments. Expression of CkDBF was shown to be upregulated by high salt, dehydration, low temperature, and the phytohormone abscisic acid (ABA). Overexpression of CkDBF in transgenic tobacco plants resulted in higher tolerance to high salinity and osmotic stresses and induction of a downstream target gene under normal conditions. These results suggest that CkDBF may play an essential role as a DREB transcription factor in regulation of stress-responsive signaling in C. korshinskii.

【题目】Purification of novel protein elicitor from Botrytis cinerea that induces disease resistance and drought tolerance in plants
【中文关键词】灰葡萄孢菌,蛋白激发子,纯化,抗病性,抗旱性

【英文关键词】Botrytis cinerea, protein elicitor, purification, disease resistance, drought tolerance

【中文摘要】PebC1, 是从灰葡萄孢BC-4-2-2-1中分离的一个新蛋白质。通过HiTrapTM FF和RESOURCETM阴离子交换色谱法纯化,蛋白质显示为一个单带,分子量36KD,pI为4.85。质谱测定获得三肽段,比对同源性匹配两种蛋白XP_001593856.1和XP_001551609.1。XP_001551609.1为初生多肽。PebC1能显著提升小麦幼苗生长,最佳浓度5μg/毫升。提高小麦根系活力1.29倍,小麦幼苗抗旱综合指数增加了从36.53到57.08。在最佳的PebC1蛋白质浓度10μg/毫升下对番茄灰霉诱导抗病性达69.19%。此外,苯丙氨酸解氨酶活性(PAL),过氧化物(POD),和多酚氧化酶(PPO)植物抗病相关的新陈代谢也大大增,24小时后PAL活力增加了46.84%, ,而POD和PPO活动增加了109.5%和111.0%。

【英文摘要】PebC1, a novel protein elicitor was isolated and purified from the mycelium of gray mold fungus, Botrytis cinerea strain BC-4-2-2-1. The protein was eluted through HiTrapTM DEAE FF and RESOURCETM Q anion exchange chromatography and displayed as a single band with an apparent molecular weight of 36 kDa on silver staining SDS-PAGE. The pI of the purified protein PebC1 was determined by 2-DE and was 4.85. Three peptide segments were obtained by MALDI-TOF. Similarity, the homology matching using protein BLAST search found that two proteins viz. XP_001593856.1 and XP_001551609.1 were having high score and covered sequence of the three peptides. Protein XP_001551609.1, a deduced protein nascent polypeptide-associated complex alpha-polypeptide, was more authentic because it was from Botryotinia fuckeliana that is better known as its anamorph, Botrytis cinerea and showed 95% homology with the three polypeptides. The gene pebC1 (Genbank accession number FJ748868) was amplified from Botrytis cinerea and consists of 639bp, which is same as a registered gene of XM_001551559, a nascent polypeptide-associated complex alpha polypeptide derived from an annotated genomic sequence of Botryotinia fuckeliana B05.10. The PebC1 protein significantly promoted wheat seedling growth with an optimum protein concentration of 5 μg/mL. Root systemic activity of wheat with 4-5 leaves increased by 1.29 fold, and the wheat seedling drought resistance integrated index increased from 36.53 to 57.08 under two cycles of drought stress after treatment of PebC1. PebC1 protein at the optimum concentration of 10 μg/mL induced 69.19% disease resistance against gray mold fungus in tomato.Furthermore, Phenylalanine ammonia-lyase (PAL), peroxides (POD), and polyphenol oxidase (PPO) related to plant resistance metabolism were also increased considerably after PebC1 treatment.. PAL activity was increased by 46.84% at 24 h post treatment, while POD and PPO activity increased by 109.5% and 111.0% at 72 h, respectively over the control.

【题目】极细链格孢菌peaT1基因在毕赤酵母中的表达与功能 分析

【中文关键词】peaT1, 极细链格孢菌, 毕赤酵母

【英文关键词】peaT1, Alternaria tenuissima, Pichia pastoris

【中文摘要】建立了在毕赤酵母(Pichia pastoris)中分泌表达PeaT1蛋白的技术。将来源于极细链格孢菌(Alternaria tenuissima)的基因peaT1亚克隆至酵母分泌型表达载体pPIC9K, 构建了重组表达载体pPIC9K-peaT1, 分别用Sal I或Bgl II酶切线性化后电击转入毕赤酵母GS115菌株中, 经MD平板筛选、PCR鉴定获得整合有外源基因的重组菌株。在 -Factor及AOX1基因启动子和终止信号的调控下, PeaT1在酵母中大量表达并分泌到胞外, SDS-PAGE检测表明表达蛋白的表观分子量约为35 kD。表达蛋白上清稀释液能诱导烟草产生对TMV抗性, 其枯斑数抑制率可达到30.37%。每升表达上清液经超滤浓缩和离子交换层析可纯化目的蛋白16.13 mg, 该纯化蛋白能显著地促进小麦幼苗的生长

【英文摘要】In this study, peaT1 gene was subcloned into the Pichia pastoris expression vector pPIC9K, which contained both the methanol-inducible promoter and the transcription terminator of the AOX1 gene, resulting the plasmid pPIC9K-peaT1. The recombinant plasmid was linearized by Sal I or Bgl II and transformed into P. pastoris GS115 by electroporation method. Recombinant strain was screened by Minimal Dextrose Medium and further confirmed by PCR. The gene was in frame integrated into the Pichia genome through homologous recombination, resulting the recombinant strain. Regulated by the α-Factor, promoter of AOX1 gene and termination signal of yeast genomic, the recombinant protein was expressed and secreted into the supernatant. The SDS-PAGE analysis indicated that the apparent molecular weight of target protein was about 35 kD. Bioassay results showed that the inhibition rate of the expressed protein against TMV was 30.37%. The supernatant was collected and then purified by anion exchange chromatography. This protein can promote seedling growth of wheat obviously

【题目】植物激活蛋白PeaT1诱导烟草对TMV的系统抗性
【中文关键词】激活蛋白;烟草;TMV;病程相关蛋白基因;实时荧光定量PCR;系统获得抗性
【英文关键词】elicitor PeaT1; tobacco; TMV; pathogenesis-related gene; real-time Q-PCR; SAR
【中文摘要】枯斑三生烟草(Samsun-NN)经激活蛋白PeaT1诱导后接种烟草花叶病毒(Tobacco mosaic virus, TMV),对TMV产生了明显的系统获得抗性,枯斑抑制率达54.05%,枯斑大小也受到一定程度的限制。研究结果表明,PeaT1处理烟草植株下位三片叶不同时间后,其上部叶片中PPO、POD和PAL3种抗病防御酶活性均比对照提高,第4 d 酶活性达到最高值。实时荧光定量PCR检测结果显示,经PeaT1诱导4 d 后烟草叶片中抗病相关基因PR1a、PR1b、NPR1在转录表达水平上较未诱导对照都有不同程度的上调。由以上结果我们推测PeaT1诱导烟草产生了系统获得抗性,本研究为进一步阐明PeaT1诱导植物抗病信号传导途径奠定了基础。
【英文摘要】The systemic resistance to Tobacco mosaic virus (TMV) was induced after treatment of Samsun-NN tobacco leaves with elicitor PeaT1, the inhibition rate of necrosis was up to 54.05%. Smaller size of TMV lesions was also detected on these leaves. When the three lower leaves of tobacco plants were treated with PeaT1 by foliar spraying, the significant increase of PPO, POD and PAL activities was observed in untreated upper leaves, and the maximum of them appeared at the 4th day after treatment. The real-time Q-PCR study revealed that the level of resistance related genes PR1a、PR1b、NPR1 expression was also increased compared with control to varying degrees. The results indicated that elicitor PeaT1 could induce disease resistance in tobacco plant, which would lay a basis for studying signal transduction of disease resistance induced by PeaT1 in plant.

【题目】提高蛋白激发子产量的培养基及发酵条件的优化
【中文关键词】极细链格孢菌;培养基;发酵条件;蛋白激发子
【英文关键词】Alternaria tenuissima; Culture medium; Fermentation condition; Protein elicitor
【中文摘要】为了进一步提高极细链格孢菌产蛋白激发子的产量,本文通过单因子和多因子试验与分析,筛选优化了适于极细链格孢菌产生蛋白激发子的培养基和培养条件,并检测了发酵过程中pH、还原糖、氨基氮和菌丝量变化以及与蛋白激发子产量的关系。结果表明,土豆淀粉和黄豆粉对蛋白激发子产量影响最大,其次是蛋白胨和无机盐。优化的发酵培养基主要成分为(g/L):碳源Ⅰ15、葡萄糖5、玉米淀粉5、土豆淀粉20、谷氨酸10、氮源Ⅰ5、黄豆粉10、硫酸铵5。确定了优化的培养条件,调整培养基起始pH为7.0~7.5,将18h菌龄的种子培养液按10%接种量接种到装液量为75mL的500ml摇瓶中,在温度28±1℃、摇床转速180r/min下培养可获得理想的蛋白产量。在优化的培养基和培养条件下,发酵12~48h该菌进入对数生长期,48h进入稳定生长期, 60h菌丝和蛋白激发子产量达最高。蛋白产量与菌体生物量呈正相关,当还原糖、总糖量消耗到最低水平时, 菌丝产量和蛋白激发子产量达最高。优化的培养基菌丝干重收率达3.9g/100ml,蛋白激发子产量达到5.17g/L,比普通的土豆液体培养基提高近4倍。
【英文摘要】The optimum medium and culture conditions of Alternaria tenuissima were studied for increase the production of protein elicitor. The fermentation parameters such as pH, DO2, reducing sugar, total sugar and animo nitrogen in the process of the fermentation was mensurated. The relationship between these parameters and protein elicitor yield was analyzed. The results indicated that potato starch and soybean powder are key factors for increase of protein elicitor yield. The optimum medium is carbonaceous

component I 15g/L, glucose 5g/L, corn starch 5g/L, potato starch 20g/L, glutamic acid 10g/L, nitric component I 5g/L, soybean powder 10g/L, (NH4)2SO4 5g/L. Medium initial pH was adjusted to 7.0~7.5. The stock was cultured for 18h and inoculated to 75 mL liquid medium in 500mL shake flask at 10%(V/V). Culture temperature was 28±1 ° C and rotation speed was 180 r/min. The fermentation for 12~48h was log stage of the fungus growth and then come into steady stage in 48 h. The highest yieid of protein elicitor occurred in 60 h. The yield of protein elicitor is directly proportional to mycelium. When the content of reducing sugar and total sugar was consumed to bottom, the hightest yields of biomass and protein elicitor were obtained. The yield of dry mycelium reached 3.9 g/100 mL and protein elicitor yield reached 5.17g/L, which increased by 4 times compared with usual potato medium.

【题目】Purification and characterization of a glycoprotein elicitor from Alternaria tenuissima

【中文关键词】极细链格孢,糖蛋白激发子,纯化,特性,诱导植物抗病性

【英文关键词】Alternaria tenuissima, glycoprotein elicitor, purification, character, inducing plant resistance.

【中文摘要】糖蛋白激发子诱导植物抗性,并成为一个潜在的植物病害生物防治剂。本文从极细链格孢中分离纯化了一个新的糖蛋白激发子。蛋白质的SDS-PAGE银染显示单峰,高效液相色谱法鉴定显示一个主要蛋白质峰。纯化蛋白的表观分子量为66 kDa,等电点(PI)约4.27。这种蛋白质被确定为糖蛋白。蒽酮比色法和考马斯蓝G-250染色表明,碳水化合物和蛋白质的含量比例为1.75。糖蛋白在15°C能诱导烟草抗烟草花叶病毒(TMV),增强小麦幼苗生长。糖蛋白激发子为植物病害防治提供了一个有效途径。

【英文摘要】Glycoprotein elicitor can induce plant resistance and become a potential agent for biological control of plant diseases. Here, a new glycoprotein elicitor was purified with the method of cold alcohol precipitation and anion exchange chromatography from the mycelium of Alternaria tenuissima strain JH505, which was identified on the basis of morphological features and sequence analysis of rDNA internal transcribed spacer (ITS). The protein showed a single band on SDS-PAGE stained with silver and appeared one main protein peak in HPLC. The apparent molecular weight of the purified protein was 66 kDa and isoelectric point (pI) was about 4.27. This protein was identified as glycoprotein by glycoprotein staining Kit. Anthrone-colorimetric assay and Coomassie blue G-250 staining showed that carbohydrate and protein content was in a ratio of 1.75. After deglycosylation by trifluoromethane-sulfonic acid (TFMS), this glycoprotein showed two bands on the SDS-PAGE, and which means the glycoprotein may have at least two glycosylation sites. The glycoprotein induced tobacco resistance against tobacco mosaic virus (TMV) and enhanced wheat seedling growth at 15°C. The glycoprotein elicitor provided an effective way of alternative strategies for plant disease control.

【题目】激活蛋白PeaT1在烟草细胞膜上的结合位点及其特性

【中文关键词】PeaT1;PR蛋白;结合位点;质膜

【英文关键词】PeaT1; PR protein; binding sites; plasma membrane

【中文摘要】激活蛋白PeaT1是从极细链格孢菌(Alternaria tenuissima)中分离的、能诱导植物产生系统获得抗性的蛋白激发子。为了阐明PeaT1诱导植物提高抗性的分子机制,本文采用RT-PCR技术研究了PeaT1诱导烟草悬浮细胞后不同时间PR-1a基因的转录活性,在烟草悬浮细胞中加入20 μg/mL的PeaT1 8 h后,PR-1a基因转录活性达到最高;相同浓度的PeaT1处理烟草植株,烟草叶片中酸性PR蛋白表达量升高。激光共聚焦显微镜观察到FITC荧光素标记的PeaT1可与烟草悬浮细胞表面结

合;免疫荧光法进一步证明PeaT1可与烟草细胞质膜结合;使用共价交联剂BS3证明125I- PeaT1可与烟草细胞质膜上的两个分子结合,而与加热和蛋白酶解后的质膜不能发生交联,说明与PeaT1结合的分子具有蛋白特性,分子量分别为20kDa和30kDa。上述实验结果证明在烟草细胞质膜上存在着激发子PeaT1受体样的结合位点。

【英文摘要】The protein elicitor, PeaT1 derived from Alternaria tenuissima has been found to trigger systemic acquired resistance in plant. The present investigation is aimed to study the molecular mechanisms of PeaT1 in disease resistance. It was found that the transcription level of PR-1a gene in tobacco suspension cells was highest after 8 hours of incubation with PeaT1 at the concentration of 20 μg/mL. Similarly, the expression level of acidic PR protein was observed in tobacco leaves treated with same concentration of PeaT1. It was revealed that FITC labeled PeaT1 could bind with surface of tobacco suspension cells by using Confocal Scanning Laser microscope. Similarly, it was noticed that PeaT1 could bind with protoplasts of tobacco cells when immunofluorescence method was used. Furthermore, two proteins of about 20 kDa and 30 kDa linked with 125I-PeaT1 were identified on tobacco plasma membranes by using the homobifunctional cross-linking reagent BS3. The sensitivity of binding sites to proteinase and heat treatment further supported the proteinaceous nature of interacting molecules at plasma membrane. The work reports the existence of binding site with many characteristics of expected elicitor receptor.

【题目】A toxin protein from Xenorhabdus nematophila var. pekingensis and insecticidal activity against the larvae of Helicoverpa armigera.

【中文关键词】xenorhabdus nematophlia var. pekingensis,是从北京土壤中分离的斯氏carpocaposae的共生细菌。以前的研究已经证明,这种细菌表现出对棉铃虫,小菜蛾和甜菜夜蛾幼虫的高拒食活性。本文报道了胞内毒蛋白的纯化、分子克隆和拒食活性。纯化的蛋白显示单一条带,相对分子量为212 kDa,我们将此蛋白命名为XnAFP2。MALDI-TOF得到的多肽片段覆盖了线虫PMFI1296毒蛋白的40%氨基酸序列,扩增获得了XnAFP2编码序列,由7575 bp组成。该基因同源比对表明:与来自X. nematophila strain BP 的A2 gene from (GenBank accession number AY282763) 有99%相似性,与毒蛋白 xptA2 有92% 相似性。该蛋白能引起棉铃虫幼虫体重下降,迅速停止取食。当喂食人工饲料含6.0微克/克(W / W)毒蛋白对棉铃虫3龄幼虫生长抑制率达97.90%。4龄幼虫体重下降,幼虫期延长,减少化蛹和羽化率明显下降。在选择和非选择叶盘试验中,24小时对5龄幼虫的拒食率分别为78.43%和87.64%。

【英文关键词】Xenorhabdus nematophila var. pekingensis, Purification, Insecticidal protein, Antifeedant activity

【中文摘要】嗜线虫致病杆菌,纯化,杀虫活性,拒食活性

【英文摘要】Xenorhabdus nematophlia var. pekingensis, which is highly virulent for many insects,is a symbiotic bacterium of Steinernema carpocaposae isolated from the soil of Beijing in China. Previous study had proved that the bacterium showed high antifeedant activity against the larvae of Helicoverpa armigera, Plutella xylostella and Spodoptera exigua. Herein, we reported the purification, molecular cloning and antifeedant activity of an intracellular toxic protein. The purified protein displayed a single band and the relative molecular weight was over 212 kDa determined by SDS-PAGE. We designated the protein as XnAFP2. Peptide segments were obtained by MALDI-TOF and covered 40% amino acid sequence of a toxin protein from X. nematophilus PMFI1296. The full cDNA sequence encoding for XnAFP2 (Genbank accession number FJ222606) was amplified from X. nematophlia var. pekingensis and consists of 7575 bp. The gene showed homology with up to 99% identity to the A2 gene from X. nematophila strain BP (GenBank accession number AY282763) and 92% identity to the insecticidal toxin xptA2 gene from X. nematophila PMFI 1296(GenBank accession number AJ308438). The protein caused a rapid cessation in feeding and reduction in larvae weight of H. armigera. When fed to 3rd instar larvae of H. armigera with artificial diet containing 6.0 μg/g (w/w) toxin protein, growth reduction reached 97.90%. The insecticidal protein obviously decreased 4th instar larva weight, lengthened larval stage, reduced pupation and emergence rate. The antifeedant rate in choice and no- choice leaf disk test against 5th instar larvae was 78.43% and 87.64% in 24 h, respectively.

【题目】低磷供应对植物根系构型的影响
【中文关键词】拟南芥; 低磷; 生理机制; 根系构型
【英文关键词】Arabidopsis thaliana; low-phosphate supply; physiolog icalmechanism; root system arch itecture
【中文摘要】在人工气候箱中, 采用Johnson培养基对拟南芥在低磷供应条件下根系构型的变化进行了研究, 结果表明: 拟南芥在磷饥饿诱导下, 主根缩短, 侧根密度、根毛的数量和长度显著增加, 并且, 根尖到第一侧根和第一根毛的距离也大大缩短。这些改变增加了根系比表面积, 并且使得根系分布更加靠近土壤表层, 有利于提高植物吸收土壤中有机磷的效率。低磷胁迫还导致拟南芥根系分生组织区细胞形状变异, 柱细胞数量减少; 主根生长和细胞伸长的动力学分析显示, 磷饥饿促使拟南芥主根生长变缓, 细胞长度随磷饥饿程度的加深迅速缩小。Cy cB 1; 1: GUS染色分析结果表明, 低磷破坏拟南芥根系分生组织细胞分裂能力, 这些结果说明磷胁迫同时抑制了细胞的伸长和分裂, 从而引起拟南芥主根的缩短。
【英文摘要】Using Johnson medium, under climatic chamber cond ition, we detected the change o f roo t arch itecture under Pistarvation in Arabidop sis. Results showed that the P deficiency inhib ited primary root g row th, enhanced lateral root concentrat ion and stimulated root hair e longation and root hair pro liferat ion. Moreover, P-starvation decreases the d istance from roo t tip to first latera l root primordium and to f irst roo t hair. These changes increased the root spec ific surface area and distributed the roo t system closer to so il surface, therefore enhanced the absorption ab ility of roo .t P starvation also induced the cell distortion, arrested columella cells deve lopmen.t The kinetic assays on cell length and prim ary root grow th showed a reduction in the primary root elongat ion and in the cell length w hen compared w ith high P-grow n plants. CycB 1; 1: GUS staining suggested that P-starvation destroyed cell div ision in roo tmeristem. Therefore, the reduced primary root growth was due to the reduced cell elongation and cell division.

【题目】Purification and expression of a protein elicitor from Alternaria
【中文关键词】极细链格孢,蛋白激发子,SAR,TMV,烟草
【英文关键词】Alternaria tenuissima; protein elicitor; SAR;TMV; tobacco.
【中文摘要】从极细链格孢菌中分离纯化了一种新的蛋白激发子PeaT1。 PeaT1为热稳定酸性蛋白。能诱导烟草对烟草花叶病毒(TMV)的系统性获得抗性的,但没有引起过敏性反应。克隆获得了激发子编码序列,序列分析表明,该cDNA长度为624 bp的开放阅读框,编码与新生多肽相关的207个氨基酸多肽。 将peaT1基因克隆到表达载体PET-28A并转化大肠杆菌BL21(DE3)中。重组蛋白激发子也引发了烟草植物的防御反应。
【英文摘要】A new protein elicitor, PeaT1, was purified from the mycelium of Alternaria tenuissima by column chromatography. PeaT1 was identified as a heat-stable and acidic protein. It induced systemic acquired resistance to tobacco mosaic virus (TMV) in tobacco plants but did not cause hypersensitive response. The elicitor-encoding genewas cloned by rapid amplification of cDNA ends method. Sequence analysis revealed that the cDNA is 624 bp in length and the open reading frame encodes for a polypeptide of 207 amino acids with a nascent polypeptide-associated complex domain. The peaT1 gene was cloned into the expression vector pET-28a and transformed into Escherichia coli BL21 (DE3). The recombinant elicitor also triggered defence responses in intact tobacco plants. The availability of the pure protein offers the possibility to isolate the corresponding receptor and links it to the downstream signalling pathway。

【题目】The role of the PI3K-Akt signal transduction pathway in Autographa californica multiple nucleopolyhedrovirus infection of Spodoptera frugiperda cells
【中文关键词】杆状病毒;PI3K-Aktsignaltransductionpathway; 病毒复制,基因表达
【英文关键词】Baculovirus; PI3K-Aktsignaltransductionpathway;Viral replication; Gene expression
【中文摘要】许多病毒激活磷酸肌醇3激酶(PI3K)-Akt信号通路,从而调节与抗细胞凋亡,增殖,细胞周期,蛋白质的合成和糖代谢相关的信号途径的多样化的下游,以增强其复制。到今天为止,在杆状病毒复制的PI3K-Aktpathway的作用尚未确定。在本研究中,我们证明,感染Sf9细胞与Autographacalifornicamultiplenucleopolyhedrovirus(AcMNPV的)在感染后1小时能升高细胞Akt磷酸化。最大的Akt磷酸化发生在感染后6小时,并保持不变,直到18小时后。 PI3K的特异性抑制剂LY294002,抑制Akt的磷酸化并有剂量依赖性,表明AcMNPV诱导Akt的磷酸化存在PI3K的依赖性。 LY294002抑制PI3K-AKT活化,显著降低病毒产量。只有当被感染24小时内添加抑制剂,病毒产量减少,暗示PI3K的激活发生在感染早期。相应的,病毒的DNA复制和晚期(VP39),很晚(POLH)病毒蛋白表达被LY294002处理破坏,LY294002对早期(IE1)和中早期(GP64的)蛋白表达没有影响。这些结果表明,PI3K-Aktpathway是高效杆状病毒复制所需要的。
【英文摘要】pathway, thereby modulating diverse downstream signaling pathways associated with antiapoptosis, proliferation, cell cycling, protein synthesis and glucose metabolism, in order to augment their replication. To date, the role of the PI3K-Aktpathway in Baculovirus replication has not been defined. In the present study, we demonstrate that infection of Sf9 cells with Autographacalifornicamultiplenucleopolyhedrovirus (AcMNPV) elevated cellular Akt phosphorylation at 1 h post-infection. The maximum Akt phosphorylation occurred at 6 h post-infection and remained unchanged until 18 h post-infection. The PI3K-speci fi c inhibitor, LY294002, suppressed Akt phosphorylation in a dose-dependent manner, suggesting that AcMNPV-induced Akt phosphorylation is PI3K-dependent. The inhibition of PI3K-Akt activation by LY294002 significantly reduced the viral yield, including a reduction in budded viruses and occlusion bodies. The virus production was reduced only when the inhibitor was added within 24 h of infection, implying that activation of PI3K occurred early in infection. Correspondingly, both viral DNA replication and late (VP39) and very late (POLH) viral protein expression were impaired by LY294002 treatment; LY294002 had no effect on immediate-early

(IE1) and early-late (GP64) protein expression. These results demonstrate that the PI3K-Aktpathway is required for efficient Baculovirus replication.

【题目】柠条锦鸡儿肌动蛋白基因的克隆和表达稳定性分析
【中文关键词】肌动蛋白; 柠条锦鸡儿; 克隆; 表达稳定性
【英文关键词】actin; Caragana korshinskii; cloning; expression stability
【中文摘要】以几种豆科植物中肌动蛋白的氨基酸保守序列设计简并引物, 采用RT-PCR 结合RACE 扩增技术, 从柠条锦鸡儿叶片中克隆到一个编码肌动蛋白的基因, 命名为CkACT。该基因cDNA全长为1 655 bp, 开放阅读框1 134 bp, 编码377个氨基酸。氨基酸比对分析表明, 该基因编码的氨基酸与其他植物肌动蛋白基因具有较高的同源性。不同组织中的表达基本上一致, 不同发育时期的基因表达相似, 低温、NaCl、干旱和ABA 处理后的表达强度没有明显差异, 说明CkACT 基因表达稳定。
【英文摘要】An actin gene, CkACT, was cloned from the leaves of Caragana korshinskii by using RT-PCR andRACE with degenerate primers which were synthesized based on the high homologous region among the sequencesof several leguminous ACT genes. The full-length cDNA of CkACT was 1 655 bp and contained a1 134-bp open reading frame encoding a 377-amino acid protein. The deduced amino acid sequence of CkACT protein shared high identity with other ACTINs via multiple alignment. CkACT expressed constitutively in all tested organs, including root, shoot and leaf. There was no significant difference in mRNA expression in different development stage or under cold, NaCl, drought and ABA treatment. These results indicated that the expressionof CkACT is stable.

【题目】Autographa californica multiple nucleopolyhedrovirus ac76 is involved in intranuclear microvesicle formation
【中文关键词】夜蛾核型多角体病毒(AcMNPV的)orf76;胞核内微泡形成
【英文关键词】Autographa californica multiple nucleopolyhedrovirus ac76;intranuclear microvesicle formation
【中文摘要】在这项研究中,我们描述了多个夜蛾核型多角体病毒(AcMNPV的)orf76(ac76)特征,这是一个高度保守的鳞翅目昆虫杆状病毒功能未知的基因。 ac76转录分析显示,多重multicistronic转录的转录从一个典型的TAAG后期转录起始,但在AcMNPV感染Sf9细胞后24小时终止在不同的3'两端。为了调查ac76在杆状病毒生命周期中的作用,用AcMNPV的Bacmid的系统构建敲除ac76病毒。显微镜,滴定分析和Western blot分析表明,敲除ac76病毒无法产生出芽病毒。实时定量PCR分析表明敲除ac76病毒并不影响病毒DNA的合成。电子显微镜显示,在ac76缺失病毒转染的细胞中没有观察到病毒诱导的细胞核内的microvesicles。共聚焦显微镜分析表明,在感染后期Ac76主要定位在核周围。这表明ac76在细胞核内的微泡形成中起着作用。据我们所知,这是鉴定的第一个杆状病毒基因参与细胞核内微泡的形成。
【英文摘要】In this study, we characterized Autographa californica multiple nucleopolyhedrovirus (AcMNPV) orf76 (ac76), which is a highly conserved gene of unknown function in lepidopteran baculoviruses. Transcriptional analysis of ac76 revealed that transcription of multiple overlapping multicistronic transcripts initiates from a canonical TAAG late-transcription start motif but terminates at different 3′ ends at 24 h postinfection in AcMNPV-infected Sf9 cells. To investigate the role of ac76 in the baculovirus life cycle, an ac76-knockout virus was constructed using an AcMNPV bacmid system. Microscopy, titration assays, and Western blot

analysis demonstrated that the resulting ac76-knockout virus was unable to produce budded viruses. Quantitative real-time PCR analysis demonstrated that ac76 deletion did not affect viral DNA synthesis. Electron microscopy showed that virus-induced intranuclear microvesicles as well as occlusion-derived virions were never observed in cells transfecte d with the ac76-knockout virus. Confocal microscopy analysis revealed that Ac76 was predominantly localized to the ring zone of nuclei during the late phase of infection. This suggests that ac76 plays a role in intranuclear microvesicle formation. To the best of our knowledge, this is the first baculovirus gene identified to be involved in intranuclear microvesicle formation

【中文关键词】水稻条斑病菌; hrp 调节基因; Ó型分泌系统; RT-PCR
【英文关键词】Xanthomonas oryzae pv. oryzicola; hrp genes; T3S components; RT-PCR
【中文摘要】决定水稻条斑病菌(Xanthomonas oryzae pv. oryzicola) 在非寄主植物上激发过敏反应(hypersensitive response, HR) 和在寄主水稻上致病性(pathogenicity) 的hrp 基因簇是受hrpG 和hrpX 基因调控的, 但还不清楚hrpG 和hrpX 基因是否共同决定着所有hrp 基因的表达。=方法>本文通过基因敲除方式获得了水稻条斑病菌的hrpG 和hrpX 基因的双突变体。=结果>烟草和水稻上测定结果显示, 双突变体与单突变体一样, 均在烟草上失去HR 激发能力和丧失在水稻上的致病性; 相

应地, 功能互补后双突变体恢复至野生表型。细菌在水稻悬浮细胞、hrp 诱导培养基XOM3 和营养丰富的培养基NB 中生长后的RT-PCR 结果显示,NB 中hrp 基因低水平表达, XOM3 和水稻细胞能够高水平诱导hrp 基因表达。无论何种生长条件, hrpG 单突变体中hrcC、hrcT 、hpa3 和hrpE 基因表达, 而hpa1 、hpa2 、hpaB、hrcJ 和hrpG 基因不表达; hrpX 单突变体中hpa2、hrcC、hpa3、hrpE 和hrpG 基因表达, 而hpa1 、hrcT、hpaB 和hrcJ 基因不表达; hrpG 和hrpX 双突变体中hrcC、hpa3 和hrpE 基因表达, 而hpa1 、hpa2 、hpaB、hrcT、hrcJ 和hrpG 基因不表达。=结论>这提示, 水稻条斑病菌的hrcC、hrpE 和hpa3 基因不受hrpG 和hrpX 基因单独或同时调控, 而hrcT 基因受HrpG 调控。由此推测, 水稻条斑病菌Ó型分泌系统关键组份的表达有可能通过另外的信号途径进行调控, 这为进一步分析型分泌途经的形成提供了线索。

【英文摘要】The hrp(hypersensitive response on nonhost plants and pathogenicity in host plants) gene cluster, which conforms Xanthomonas oryzae pv. oryzicola, the causal agent of bacterial leaf streak in rice, to the ability to elicit a hypersensitive response (HR) in nonhost tobacco and pathogenicity in host rice, is thought to be regulated by the hrpG and hrpX genes.However, it is unclear whether the hrpG and hrpX genes regulate all the hrp gene expression of the cluster coordinately or not. [Methods] We constructed amutant with both hrpG and hrpX genes knocked out. [Results] which, as the same as the singlemutant at the hrpG or hrpX gene, lost the ability to trigger HR in tobacco and pathogenicity in rice, respectively.Correspondingly, the hrpG and hrpX genes together could restore such the ability to the double mutant at the hrpG and hrpX loci. After grew in rice suspension cells, hrp- inducing medium XOM3 and nutrien-t rich medium NB for 16 hours, respectively,reverse transcriptional polymerase chain react ion (RT- PCR) revealed that: the expression of hrp genes in NB medium was lower that that in rice cells and XOM3 medium; in whatever growth media, the hrcC, hrcT, hrpE and hpa3 genes expressed, while the hpa1, hpa2, hpaB, hrcJ , and hrpG genes did not in the hrpG mutant; the hpa2, hrcC, hpa3, hrpE and hrpG genes expressed, while the hpa1 , hrcT , hpaB and hrcJ genes did not in the hrpX mutant; the hrcC, hrpE and hpa3 genes expressed, but the hpa1 , hpa2 , hpaB, hrcT , hrcJ and hrpG genes did not in the hrpG and hrpX double mutant.[Conclusion] This indicated that the expression of the hrcC, hrpE and hpa3 genes was not regulated by the hrpG andPor hrpX genes, but the expression of the hrcT gene was negat ively controlled by the hrpG gene. Thus, we postulated that the expression of key type- Ó secretion (T3S) apparatus components was controlled by an unknown signaling pathway, which may facilitate our further understanding on the formation of the T3S machine.

【题目】蛋白激发子PeaT1的高密度发酵及生理功能检测

【中文关键词】蛋白激发子 PeaT1 高密度发酵 低温

【英文关键词】Protein elicitor PeaT1 High cell density fermentation Low temperature

【中文摘要】PeaT1是从极细链格孢菌(A lternaria tenuissim a)中提取出的一种植物蛋白激发子,具有促进植物生长,增强作物抗逆性的功能。由于该蛋白具有无残留、无毒副作用的优点,因此具有发展为生物农药的应用前景。在100 L发酵罐中利用分批补料技术对PeaT1工程菌进行高密度发酵,通过AKTA蛋白纯化仪对发酵产物进行了亲和纯化,并检测了纯化所得蛋白对水稻在15℃低温下生长的影响。发酵最终菌体密度达80 g/L,每升菌液纯化得到蛋白90 mg,纯化所得蛋白能够促进水稻低温下的生长,具有激发子活性。

【英文摘要】PeaT1 is a p rotein elicitor obtained from A lternaria tenuissim a. Itwas found that this p rotein had the function of p romo2ting p lant growth and increasing the tolerance of crop s. It could be developed as a biological pesticide without residual, and effect char2acters. In this paper, the engineering bacteria of PeaT1 was used for high cell density fermentation. The exp ressed p rotein was purifiedby affinity chromatography. The final cell density reached 80 g/L and about 90 mg/L purified PeaT1 could be gained. The function as2say indicated that PeaT1 could p romote rice growth at 15℃ temperature. This research could p romote the development of PeaT1 as bio2logical pesticide.

【题目】III型分泌装置蛋白HrcJ 决定条斑病菌在植物上的过敏反应和致病性的研究
【中文关键词】水稻条斑病菌;hrcJ;III型分泌系统;致病性;过敏反应
【英文关键词】Xanthomonas oryzae pv.oryzicola; hrcJ; type-III secretion system; pathogenicity; Hypersensitive response
【中文摘要】水稻条斑病菌(Xanthomonas oryzae pv. oryzicola,Xooc)的hrp(hypersensitive responseand pathogenicity)基因编码形成的III型分泌系统(type III secretion system,T3SS),将致病性效应分子注入水稻细胞中,但Xooc 的hrcJ 基因在致病性中的作用以及其如何参与形成T3SS 分泌装置,并不明确。【方法】本研究根据标记交换原理对Xooc 的hrcJ 基因进行了敲除。【结果】发现hrcJ 突变体丧失在水稻上的致病性和在烟草上的HR 激发能力。酵母双杂交显示,HrcJ 蛋白N 端脂蛋白结构域可与HrcC 互作,HrcJ 蛋白C 端跨膜结构域可与HrcV 互作,提示HrcJ 蛋白联接于T3SS 装置的内膜和外膜之间。功能互补结果显示,缺失脂蛋白结构域和跨膜结构域的hrcJ 基因均不能恢复hrcJ 突变体在烟草上的HR 激发能力和在水稻上的致病性。RT-PCR 结果显示,hrcJ 的表达受hrpX 基因调控,hrcJ 基因突变后不影响效应分子hpa1 的表达。【结论】hrcJ 基因是水稻条斑病菌致病性和非寄主上激发HR 的关键因子,其基因产物参与了T3SS 装置的形成。
【英文摘要】【Objective】 Repertoires of pathogenicity effectors in Xanthomonas oryzae pv. oryzicola are injected into plant cellsthrough type-III secretion system (T3SS) which is encoded by the hrp (hypersensitive response and pathogenicity) genes, but it isunclear what roles the hrcJ gene plays in pathogen pathogenesis in rice and in T3SS formation. 【Method】 In this report, the hrcJgene was knocked out by marker exchange method. 【Result】 It was found that the mutant had lost the ability to trigger HR intobacco and pathogenicity in rice. Protein-protein interactions, revealed by yeast two-hybrid system, demonstrated that thelipoprotein domain at N-terminal of HrcJ interacted with HrcC and the transmembrane domain at C-terminal interacted with HrcV,indicating that HrcJ was a linker protein between the inner and out membranes of the pathogen cell for T3SS formation.Complementation assays in planta showed that either the deletion in the lipoprotein domain or in the transmembrane domain did notrestore HR induction in tobacco and pathogenicity in rice to the hrcJ mutant. The reverse transcriptional polymerase chain reaction(RT-PCR) revealed that the hrcJ gene expression was regulated by the hrpX gene and the expression of the effector gene hpa1 wasnot affected in the hrcJ mutant. 【Conclusion】 These results suggest that the hrcJ gene is required not only for HR induction in tobacco and pathogenicity in rice, but also in T3SS formation through which pathogenicity determinants are secreted into plant cells.

【题目】受条斑病菌侵染的水稻cDNA文库构建
【中文关键词】水稻;水稻条斑病菌;cDNA文库;sMAR下“技术;病程相关蛋白
【英文关键词】Xanthomonas oryzae pv.Oryzicola,cDNA library, pathogenesis related protein genes
【中文摘要】:提取经条斑病菌(‰毗如彻枷删pv.明融)侵染诱导后的水稻mRNA,利用sMARTTM技术于载体pGADl7一够AB上构建了水稻cDNA文库。检测发现.文库中含有水稻病程相关蛋白基因仇PR~,n、DsJP尺一,6和JpHL。随机提取cDNA文库克隆的质粒,酶切分析发现,该cDNA文库的插入片段分布在500~2 000 bP之间,平均大小约为l kb,重组率达95%。上述结果表明.水稻受条斑病菌侵染的cDNA文库质量较好,这为研究条斑病菌致病性因子与水稻互作机制奠定了工作摹础。
【英文摘要】Condtructing a a rice cDNA library is a fundamental basis for understanding molecular interaction of rice with Xanthomonas oryzae, the pv.Oryzicola, the critical pathogen of bacterial leaf streek in rice.The total RNA were extracted from rice leaves previously infected for10 hours by the pathogen.The cDNA were reversely transcripted from the mRNA using SMARTTM technique and then ligated into a vector pGADT7-siAB at the sites of sfiA and sfiB. Collections of the ligated plasmid DNA were the cDNA library of rice which had interaction with the pathogen.The PCR amplification of OsPr-1a , OsPr-1b and PAL as pathogenesis related protein genes indicated that the cDNA library contained those genes.Digestion of randomly selected clones of library with enzyme sfi I demonstrated that the sizes of inserted fragments in the vector were between 500一2 000 bp,that the average size was about l kb,and that 95%of the library clones were recombinants. The above suggests that the constructed cDNA library of rice is of good quality and of use for isolation of interacting proteins with pathogenicity deteminants of the bacterium by a yeast two—hybrid system.

【中文关键词】水稻条斑病细菌;hrp基因;^hrp诱导培养基;水稻;RT-PCR
【英文关键词】Xanthomonas oryzae pv. Oryzicola (Xooc),hrp gene;^hrp- inducing medium;rice;RT-PCR
【中文摘要】:水稻条斑病细菌(‰n#幻,加n∞omm pv.o聊驰。如,‰Dc)决定在非寄主植物上激发过敏反应(hypersensitive response)和在寄主水稻上具致病性(patllogenicity)的^伊基因簇是诱导表达的。为研究危,p基因的功能,利用卸01和^帜基因的启动子与曲基因进行融合,构建了^伊基因诱导表达系统。绿色荧光蛋白表达揭示,‰”的唧基因在营养丰富的NB培养基上不能有效表达,在h甲诱导培养基x0M3上可有效表达。以^帜和^伊G突变体为参照,RT-PCR研究结果提示,‰oc野生型菌株伽l基因在NB上不能有效表达,在xOM3培养基上可有效表达。相应地,矗帜突变体中切口1基因不能被诱导表达,而在^甲G突变体中却01基因转录表达水平低于野生菌。研究结果还证实,水稻悬浮细胞能高效诱导‰oc的矗甲基因表达。‰oc h甲基因诱导表达系统的建立为研究^伊基因功能、发掘r13Ss效应分子以及开展‰oc致病性研究奠定了基础。
【英文摘要】The hrp genes of Xanthomonas oryzae pv. Oryzicola (Xooc),which is the causal agent of bacterial leaf streak in rice,possesses the ability to elicit hypersensitive response on nonhost plants and the pathogenicity in host rice.In order to analyze the function of the hrp genes,we developed hrp- inducing systems using transcriptional hrp::gfp fusions with the promoters of hrpX and hpa 1 of xooc.The levels of GFP protein expression indicated that the hrp gene expression in xooc was not efficiently induced in NB medium,but efficiently in XOM3 medium. Using the hrpG and hrpX mutants of xooc as the contro1s,the results by RT-PCR

demonstrated that in wild type strain the expression of hpa1 gene was suppressed in NB medium,but was increased in XOM3 medium.When incubated in XOM3, the expression of the hpa1 gene was abolished in hrpXmutant,whIe the level of the hpa1 gene expression was lower in the hrpG mutant than that in wild-type strain.More importantly,it was found that the induction of the hrp gene expression was strongly increased in response to rice suspension cells and callus in this study.This suggests that the,hrp一inducing systems,XOM3 or rice suspension cells or rice callus, for the induction of the hrp genes expression be useful for functionally analyzing the hrp genes,mining effectors secreted by the type III secretion apparatus and understanding pathogenicity determinats of.Xooc.

【题目】灰葡萄孢菌激活蛋白PebC2的生物功能.
【中文关键词】灰葡萄孢菌;激活蛋白PEBC2;纯化;生物活性
【英文关键词】Botrytis cinerea; activator protein PEBC2; purification; bioactivity
【中文摘要】通过沸水浴、离心、阴离子交换层析等方法,从灰葡萄孢菌Botrytis cinerea BC-4-2-2-1菌丝体中分离纯化出一种激活蛋白,命名为PEBC2,经SDS-PAGE银染显示呈单一条带,相对分子量约为14kD。该激活蛋白能显著提高小麦种子的发芽率,促进小麦幼苗生长,增强小麦的抗旱性和番茄对灰霉病的抗性。经激活蛋白处理后小麦发芽率从75.00%提高到98.33%,处理7、9、11天时株高分别比对照增加了17.07%、23.05% 和17.19%,幼苗抗旱综合系数从36.53提高到57.45;该激活蛋白对番茄灰霉病的诱抗效果达60.09%。
【英文摘要】An activitor protein named as PEBC2 was isolated and purified from the hypha of Botrytis cinerea by boiling water bath, centrifugation, ultra-filtration and anion exchange chromatography, etc. The activator protein appeared as a single band corresponding to molecular weight of approximately 14 kD on SDS-PAGE with silver staining. This protein can obviously promote seed germination,seedling growth and drought tolerance of wheat, it can also induce tomato to gain resistance to gray mould. By treating with this protein, the germination rate of wheat seed increased from 75.00% to 98.33%, the plant height of wheat in 7, 9, 11 days respectively increased by 17.07%, 23.05%, 17.19%, the comprehensive drought-resistance coefficient of wheat seedling improved from 36.53 to 57.45. This protein ’s effect of induced resistance to gray mould of tomato reached 60.09%.

【题目】柠条GDP-甘露糖-3',5'-异构酶基因的克隆、表达分析及植物表达载体的构建
【中文关键词】克隆; GDP- 甘露糖- 3′, 5′- 异构酶; 柠条; 序列分析
【英文关键词】Cloning; GDP-mannose-3′, 5′-epimerase; Caragana korshinskii; Sequence analysis
【中文摘要】L- 抗坏血酸是一种抗氧化剂, 能够保护植物免受活性氧的伤害, GDP- 甘露糖- 3c, 5c- 异构酶基因(GME) 是L- 抗坏血酸合成途径中的关键基因。根据其他植物GME 的氨基酸保守序列设计简并引物, 通过RT- PCR 结合RACE 扩增技术, 从柠条叶片中克隆了1 个编码GM E 的基因, 命名为CkGME , Genebank 登录号为FJ603689。基因全长1604bp, 开放阅读框1134bp, 编码377 个氨基酸, 氨基酸同源性比对分析表明, 该基因编码的氨基酸与其他植物GME 基因具有较高的同源性。进化树分析表明, 该基因编码的氨基酸序列与豆科植物大豆和截型苜蓿的亲缘关系最近, 与十字花科植物拟南芥的亲缘关系次之, 与禾本科植物水稻和玉米的亲缘关系较远。利用4e 和GA3 处理不同时间的柠条植株进行半定量RT- PCR 分析结果表明, 该基因在4e 处理不同时间后表达量没有明显变化, 在GA3处理不同时间后表达量显著下降。利用pCAMBIA- 1300 质粒构建含35S 启动子的正义表达载体, 酶切图谱和PCR检测结果证明该表达载体构建成功。
【英文摘要】L -ascorbic acid is a kind of ant iox idant , w hich could protect the plants from ROS. GDP-mannose-3′, 5′-epimerase(GME) gene is a key gene in the biosynthesis pathway of L -ascorbic acid. Using a pair of degenerate primer designed based on the sequences of the homolog ous gene from other plants and the RACE technology , a full length cDNA encoding GME gene was isolated and characterized from the leaves of Caragana korshinskii . The 1604bp full length CkGME (accessio number FJ603689) had a 1134bp ORF, which encodes a peptide o f 377 amino acids. The deduced amino acid sequence of CkGME protein shared high identity with other GMEs. Phylogenetic analysis indicated that CkGME is closely related with Gly cine max and Medicago truncatula, then with

Arabidopsis thaliana, but far away from Oryza sativa and Zea mays. Semi-quantitive RT-PCR analysis indicated that gene expression of CkGME had no difference compared with control after treated with 4°C for a during time, but was dow n -regulated after treated with GA3 . Subsequently, the over - expression vector of CkGME gene was constructed with the aid of pCAMBIA -1300.

【题目】A Solution on Pork Quality Traceability from Farm to Dinner Table in Tianjin City,China
【中文关键词】动物标识;猪肉;跟踪;溯源;PDA;GPRS
【英文关键词】animal identification, pork, tracking, traceability, PDA, GPRS
【中文摘要】【目的】满足政府监管猪肉的安全生产和食品消费者的知情权,保障猪肉食品的公共安全。【方法】采用动物的标识技术、PDA 智能识读技术、GPRS 技术、Intranet 和Internet 等技术,结合中国《畜禽标识和养殖档案管理办法》,提出基于猪肉安全生产的物质流与信息流的跟踪与溯源流程,设计集约化养猪场及散养模式下养殖、屠宰与销售环节的元数据及相应的关系型数据表,并开发上述3 个环节的数据记录系统,以及面向政府监管和消费者查询的公共网络平台。【结果】开发的集约化养殖过程信息系统在记录猪只各种事件数据的基础上,具有对饲料添加剂和兽药使用的业务预警功能,能及时向溯源中央数据库提交出栏猪只的养殖过程事件;开发的PDA数据采集系统,能移动采集散养猪只的养殖事件数据,并通过GPRS 远程提交溯源数据;开发的基于web 技术的天津猪肉质量溯源平台,具有在线集成来自养殖、屠宰和销售环节的各种标识数据及有关猪肉质量安全数据,并实现标识的转换与数据的关联,最终实现从生产源头向消费终端的跟踪和反方向的可追溯。【结论】本研究开发的或集成的各种标识技术、元数据规范及数据记录系统和web 查询平台,经过实际应用是可行的,个别技术瓶颈随通讯技术的发展将得到解决,其全面实施将为保证猪肉质量安全生产的监管及满足消费需求提供技术支撑。
【英文摘要】In order to meet government supervision of pork production safety as well as consumer’s right to know what they buy and protect the public safety of pork food, this study adopts animal identification, intelligent personal digital assistant (PDA) reading and writing, general packet radio service (GPRS), and other information technologies, proposes a pork tracking and traceability inferstructure based on pork production substrace flow and data flow, designs the metadata structure and related datatbases for farming, slaughtering, and retailing sector based on intensive pig farming and smallhold pig farming, develops three different data-recording systems, and finally establishes a public network platform for the information inquiry in light of “the administrative rules on identification and rearing files for animal and poultry” in China. The farming process information system supplies early warning for the usage of drugs and feed additives based on data of every individual pig and timely uploading all events data to remote traceability database when pigs are sold; the PDA data collecting system can collect farming events data for pigs fed by farmers and submit to the center database by GPRS; the web-based Tianjin’s pork traceability platform can integrate all identifications and related pork quality data from farming,slaughtering to marketing by online, and achieve pork tracking from product origin to consumption and tracing in the turnover direction. It is feasible to realize pork quality traceability by identification technologies developed and/or integrated, metadata specifications designed, three data-recording systems developed, and web-inquiring platform established.Some individual technical bottlenecks will be resolved with the development of communication technologies. The full implementation in Tianjin, China, will supply technical support for guaranteeing the quality and safety of pork production and meeting consumer’s demands.

【题目】生猪及其产品从农场到餐桌质量溯源解决方案-以天津为例
【中文关键词】动物标识;猪肉;跟踪;溯源;PDA;GPRS
【英文关键词】animal identification; pork; tracking; traceability; PDA; GPRS
【中文摘要】【目的】满足政府监管猪肉的安全生产和食品消费者的知情权,保障猪肉食品的公共安全。【方法】采用动物的标识技术、PDA 智能识读技术、GPRS 技术、Intranet 和Internet 等技术,结合中国《畜禽标识和养殖档案管理办法》,提出基于猪肉安全生产的物质流与信息流的跟踪与溯源流程,设计集约化养猪场及散养模式下养殖、屠宰与销售环节的元数据及相应的关系型数据表,并开发上述3 个环节的数据记录系统,以及面向政府监管和消费者查询的公共网络平台。【结果】开发的集约化养殖过程信息系统在记录猪只各种事件数据的基础上,具有对饲料添加剂和兽药使用的业务预警功能,能及时向溯源中央数据库提交出栏猪只的养殖过程事件;开发的PDA数据采集系统,能移动采集散养猪只的养殖事件数据,并通过GPRS 远程提交溯源数据;开发的基于web 技术的天津猪肉质量溯源平台,具有在线集成来自养殖、屠宰和销售环节的各种标识数据及有关猪肉质量安全数据,并实现标识的转换与数据的关联,最终实现从生产源头向消费终端的跟踪和反方向的可追溯。【结论】本研究开发的或集成的各种标识技术、元数据规范及数据记录系统和web 查询平台,经过实际应用是可行的,个别技术瓶颈随通讯技术的发展将得到解决,其全面实施将为保证猪肉质量安全生产的监管及满足消费需求提供技术支撑。
【英文摘要】The study was made to meet government supervision of safe pork production as well as consumer's right to know what they will buy and to protect the public safety of pork food.【Method】This study adopted animal identification, intelligent PDA reading and writing, GPRS, intranet and internet and other information technologies, and proposed a pork tracking and traceability infarstructure based on pork production substrance flow and data flow, and designed the metadata and related databases for farming and slaughtering as well as retailing sector based on pigs intensive farming and backyard farming,and developed three different data-recording systems for different production processes, and finally formed a public network platform for inquiring in light of China's "Animal Identification and Animal Feeding File Management Approach". 【Result】 The farming process information system supplies early warning for the usage of drugs and feed additives on the basis of data of pigs individual and timely uploading all events data to remote central tracing database when pigs are sold. The PDA data acquisition system can collect farming events data for those pigs owned by farmers by mobile and submitted them to the oriented database through GPRS. The web-based Tianjin ’s pork traceability platform can integrate the whole labeling and related pork quality data from farming, slaughtering to marketing by online, and set up these data inner relationships, and reached pork tracking from its origin to consumption and its tracing through turn-over direction. 【Conclusion】The developed and/or integrated various identification technologies, designed metadata specifications, three data-recording systems and the formed web-inquiring platform are feasible in pork quality traceability. Some individual technical bottlenecks will be resolved with the development of communication technology. The full implementation of this solution will supply technical support in guarantee of the quality and safety of pork production supervision and meet consumers ’ demand.

【题目】散养模式下猪只个体标识及溯源体系的建立
【中文关键词】散养,移动装置,农产品,猪,养殖档案,溯源
【英文关键词】separated feeding, mobile devices, agricultural products, swine,f eeding files, traceability
【中文摘要】为了猪肉安全生产的监管和满足食品消费者的知情权,保障猪肉食品的公共安全,论文采用标识技术、PDA移 动智能识读技术、GPRS技术和Internet等技术,结合中国“ 畜禽标识及养殖档案管理办法 ”,提出了猪只散养模式下养殖过程信息的采集技术方案,设计了散养模式下养殖过程信息的元数据结构及相应的mobile数据表,开发了猪只移动养殖环节数据采集记录与传输的嵌入式系统,与面向政府监管和消费者查询的公共网络平台实现了移动互联。所开发的移动系统能够实现猪只耳标的移动识别、包括饲料、兽药使用和违禁药品监测等各种事件的移动记录,及时向溯源数据库移动系统提交出栏猪只的养殖数据,同样可远程维护散养猪只的养殖档案数据,最终实现散养模式下从生产源头到消费终端的跟踪和溯源。该移动数据采集系统,解决了中国养猪业主体模式——农户散养模式下猪只养殖电子档案建立的难题,并经在

天津猪肉质量溯源体系中的实际应用证明是可行的,个别技术瓶颈随通讯技术的发展将得到解决,其全面实施将为保证中国农户养殖模式下生猪及其产品溯源体系与制度的建设提供技术支撑。

【英文摘要】In order to meet the requirements of government supervision of pork production safety as well as consumer's right to know what they buy and to protect the public safety of pork food, animal identification, intelligent PDA mobile inquiring and reading, GPRS, internet and other information technologies were adopted, and a data collection method was uploaded to set up pigs farming files under free-range pig-rearing system. Related metadata structures and its mobile database was designed, and a mobile PDA embedded system was developed to collect pig individual information. And the information was uploaded into the remote central database. Finally, a mobile link with a specific website was realized. The formed embedded PDA could identify both a special swine bar ear tags appointed by Ministry of Agriculture of China and a general data-matrix bar ear tags was designed and it could record all of input data including feed types, feed additives, animal drugs and even some forbidden medicines and submit them to the oriented database through GPRS. At the same time, the remote central database could be maintained by mobile PDA and GPRS, and finally reach the aim of pork tracking from its origin to consumption and its tracing through turn-over direction. A feasible technology solution was suggested how to set up network electronical swine feeding data files involved swine separated mode based on farmers. The solution was proved practical through its application in the Tianjin ’s pork quality traceability system construction. Although some individual techniques have some adverse effects on the system running such as GPRS transmitting speed now, these will be resolved with the development of communication technolog. The full implementation of this solution around China will supplly technical supports in guaranteeing the quality and safety of pork production supervision and meet the demand of consumers.

【题目】A Practical Web-based Tracking and Traceability Information System for the Pork Products Supply Chain

【中文关键词】溯源,食品安全,条形码,信息系统
【英文关键词】traceability;food safety; bar code;information system.

【中文摘要】猪肉是中国人主要的膳食蛋白质来源,猪肉质量安全需要建立猪产品溯源系统。基于对猪生产过程中主要投入品(疫苗、饲料、兽药等)和猪饲养、屠宰及零售关键控制点的分析,本研究开发完成了包括条码识别系统、数据记录系统、关系数据库系统、数据查询系统在内的应用平台。其能满足政府管理及消费者的需要,能够收集猪肉质量安全信息,多种渠道传输数据,同时通过查询终端和产品分割条码回溯到养殖场及生猪个体。本平台已在天津示2个猪养殖场及相关的屠宰场、零售超市示范运行,实现了从农场到餐桌猪肉产品全链条监管。

【英文摘要】Pork is the major dietary animal protein source of Chinese, the concerns on pork quality and safety have urged China Administration establish the tracking and traceability system for animal products safety through the legislation. Based on analysis of the factors that affect pork products quality including inputs (vaccines, fodder, additives and veterinary drugs, et al.) and key control points during swine feeding, slaughtering and retail process, This study has developed a practical application platform consists of a bar-code based data identification system, a data-record keeping system, correlated databases, and a data query interface. This application platform can meet the government's regulation and consumer demands by enabling the pork quality data be collected and uploaded different processes, and through inquiries interface terminals and a final splitting product tracing code, the safety information of its final farm and corresponding individual pig can be retrieved. The designed systems have already be deployed in Tianjin ’s two farms, with their associated abattoirs and retail supermarkets, indicating the methodology and its technical solution are applicable, and can be used to monitor the pork products supply chain from the farm to the dinner table.

【题目】A Collection Scheme for Tracing Information of Pig Safety Production
【中文关键词】猪,PDA,溯源,信息采集
【英文关键词】Pig, PDA, Traceability, Information Collection
【中文摘要】以天津市散养模式猪场为研究原型,深入分析包括疫苗、饲料、兽药等投入品和监督监管信息特征,提出了投入品事件元数据模型,事件整合及数据传输标准规范,开发完成了基于移动PDA的二维耳标识别和溯源信息采集系统。通过移动PDA实现溯源投入品及监督监管事件的信息采集,上传到溯源中心数据库并完成事件整合处理。该系统已在天津市示范运行,证明方便可行,可以满足猪产品质量溯源需要。
【英文摘要】This study takes one main production pattern of smallhold pig farming in Tianjin as a study prototype, deeply analyzes characters of informations about tracing inputs including vaccines,feeds,veterinary drugs and supervision test in pig farming, proposes inputs metadata, criteria for integrating inputs event and interface norms for data transmision, developes and completes identification of 2D ear tags and traceability information collection system of pig safety production based on mobile PDA. The system has implemented functions including setting and invalidate of 2D ear tags, collection of tracing inputs and supervision in the mobile PDA and finally integration of tracing events (the epidemic event,feed event,drug event and supervision event) on the traceability data center (server). The PDA information collection system has been applied for demonstration in Tianjin, the collection is simple, convenient and feasible. It could meet with requirements of traceability information system of pig safety production.

【题目】动物及动物产品标识与可追溯体系的研究进展
【中文关键词】动物; 动物产品; 标识; 可追溯
【英文关键词】animal; animal p roduct; identification; traceability
【中文摘要】如何实现动物及其产品的全程质量监控是当前的一个重大课题。而实行动物及其产品标识与可追溯管理是有效解决动物卫生与动物产品安全问题的重要措施。本文借鉴发达国家经验,回顾可追溯制度的建设与可追溯系统的实施,提出适合中国国情的可追溯管理,建议制定相关的与国际接轨的动物卫生标准体系。同时,介绍中国可追溯系统试点研究的进展,以及面对制约溯源系统的问题,指出应用的难点与未来可追溯体系的发展。
【英文摘要】How to realize fully quality control in animals and their p roducts is currently a major issue. And implementing identification and traceabilitymanagement in animals and their p roducts is an effective solution to animal health and animal p roducts safety issues. According to the advance experience in developed counties and reviewing the construction and imp lementation of the traceability system in China, the traceability management for Chinaps national conditions was raised, and the animal health standards system with international norm was recommended to constituted. At the same time, this paper introduced the development of the experimental p ig traceability system in China, and p roblems in restricting traceability system, also pointed out difficulties in app lication and development of traceability system in future.

【题目】动物及动物产品标识与可追溯体系研究的探讨
【中文关键词】动物;动物产品;标识;可追溯
【英文关键词】animal,animal products,identification,traceability
【中文摘要】现代化的动物产业发展模式,给动物产品安全带来诸多风险,导致食源性疾病患病人数增多,引发一系列动物产品安全事件。在养殖阶段,为控制疫病发生,提高生产效率,需要使用疫苗、药物及添加剂等,但是,超标准使用或违规使用,将导致动物产品药物残留、重金属等有害物质超标;在动物产品的加工、物流和销售等环节,均存在不合格卫生条件与违规使用添加剂等风险。在世界范围内,动物产品安全性成为重大公共安全问题,关系到产业可持续发展和人类身心健康,是亟待解决的社会问题。本文根据我国畜牧业生产现状、经济社会发展水平和动物源食品的消费特点,借鉴国外动物标识技术的经验,阐述作者2002 年以来从事《动物及动物产品标识与可追溯体系研究》工作,提出建立我国动物及动物产品标识技术与可追溯管理的框架,如何与生产单位相结合推广溯源系统,跨省大流通格局与多部门管理的问题和可追溯体系的未来。

【英文摘要】The characteristics of information chain for traceability of farm animals and their meat products was discussed in this paper, also the effective countermeasures were brought forward for the design of entire information chain. Some advices were given according to characteristics of different objects and the environment in series phases of animal production and processing, including animal raising, slaughtering, cutting, packaging and distributing, especially for the selection of animal identification. A preliminary solution to the traceability of meat transportation cold chain was proposed as well. Based on the idea of suggested countermeasures for traceability system, construction of a prototype traceability system was introduced, in which variety technologies, such as barcode technology, radio frequency technology, information and network technology were employed, and findings of this paper could provide a basis for establishing a national traceability system for farm animals and their products, and eventually to reach the goal of safe production and safe consumption of animal products.

【题目】A Solution on Identification and Rearing Files in Smallhold Pig Farming
【中文关键词】猪,散养猪场,移动PDA,养殖档案,溯源
【英文关键词】Pig; Smallhold Pig Farming; Mobile PDA; Rearing files; Traceability
【中文摘要】为了猪肉安全生产的监管和满足食品消费者的知情权,保障猪肉食品的公共安全,本文采用标识技术、PDA移 动智能识读技术等技术,结合中国“畜禽标识及养殖档案管理办法”,提出了猪只散养模式下养殖过程信息的采集技术方案,开发了猪只移动养殖环节数据采集记录与传输的嵌入式系统,与面向政府监管和消费者查询的公共网络平台实现了移动互联。所开发的移动系统能够实现猪只耳标的移动识别、包括饲料、兽药使用和违禁药品监测等各种事件的移动记录,及时向溯源数据库移动系统提交出栏猪只的养殖数据,同样可远程维护散养猪只的养殖档案数据,最终实现散养模式下从生产源头到消费终端的跟踪和溯源。该移动数据采集系统在天津猪肉质量溯源体系中的实际应用证明是可行的,个别技术瓶颈随通讯技术的发展将得到解决。
【英文摘要】In order to meet government supervision of pork production safety as well as consumer's right to know what they will buy and to protect the public safety of pork food, this study adopts animal identification, mobile intelligent PDA reader , GPRS, internet and other information technologies, and put forward a data collection method to set up rearing files of pig in smallholdpig farming, and designs related metadata structures and its mobile database, and develops a mobile PDA embedded system to collect

individual information of pig and uploading into the remote central database, and finally realizes mobile links to the a specific website. The embedded PDA can identify both a special pig bar ear tag appointed by the Ministry of Agricultural and a general data matrix bar ear tag designed by this study by mobile reader, and can record all kinds of inputs data including bacterins, feed additives, animal drugs and even some forbidden medicines and submitted them to the center database through GPRS. At the same time, the remote center database can be maintained by mobile PDA and GPRS, and finally reached pork tracking from its origin to consumption and its tracing through turn-over direction. This study has suggested a feasible technology solution how to set up network pig electronic rearing files involved smallholdpig farming based on farmer and the solution is proved practical through its application in the Tianjin ’s pork quality traceability system construction. Although some individual techniques have some adverse effects on the system running such as GPRS transmitting speed now, these will be resolved with the development of communication technology. The full implementation of the solution around China will supply technical supports in guaranteeing the quality and safety of pork production supervision and meet consumer demand.

【题目】Development for Breeding Performance Management System on Pig Farms

【中文关键词】猪场,繁育母猪,信息管理,泌乳性能

【英文关键词】Pig farms, Breeding sows, Information management, Farrowing performance

【中文摘要】本系统对种猪场过程管理尤其是繁殖参数进行了系统分析,提出了种猪场的完整模拟模型,包括一系列的参数如配种参数、妊娠参数、断奶参数等,使用Visual Basic 6.0,Access 数据库,水晶报表和不同品种猪的遗传参数开发完成了猪场数字管理系统。原始数据输入方便,智能提醒,能对不同时期多种繁殖参数进行统计、分析并图形化显示。母猪历史资料卡能显示母猪全生命周期的繁殖记录,包括配种率,配种间隔,平均妊娠天数、平均断奶重等重要繁殖信息。借助于系统分析和软件设计技术,本系统实现了不同猪品种和不同胎次,从配种至断奶整个繁殖过程数字化管理,种猪场的信息管理和智能分析。

【英文摘要】The study was conducted to supply systemic and dynamic analysis data to support a better operation on a breeding pig farm with process management, especially in reproduction parameters. A full simulation model on a breeding pig farm running was proposed in the study, and a series of definitions of process parameters related to service performance, farrowing performance and weaning performance was put forward. Some of them are described on the calculating models. The relationship structural database was designed and a set of digital management information system was developed, based on proposed definitions and models by using Visual Basic 6.0、Access databases and Crystal report combined with genetic characteristic of different pig breeds. The System supplies a series of convenient , intelligent input interfaces of original datum, and all different reproduction data can be counted, analyzed and graphically shown, based on different performances in a specific duration, and it can dynamically derive out all sows history card that shows a complete reproduction performances including some important indexes such as farrowing rate, farrowing interval, average gestation days and average weaned weight etc. in terms of parities, which can be used to decide whether a female needs to be fell into disuse. Therefore, with the help of system analysis and software design techniques, the system made it possible to realize information management and intelligence analysis for a breeding pig farm based on whole digital management of reproduction process from services through weaning and among different categories of breeding pigs and parities.

【题目】一种促进植物根系生长的极细链格孢菌
【中文关键词】蛋白纯化; 激发子; 极细链格孢菌; 生物活性
【英文关键词】protein purification ; plant activator protein ; Alternaria tenuissima ; bioactivities
【中文摘要】通过硫酸铵沉淀、有机溶剂沉淀、离子交换和分子筛连用的方法,从极细链格孢菌JH505菌株中分离纯化到分子量约为35kD 的植物激发子。利用固相梯度凝胶双向电泳方法测定了该蛋白的等电点为4122 。将该纯化蛋白稀释液浸泡小麦种子8h ,7d 后小麦根系琥珀酸脱氢酶活性提高65127 % ,经蛋白处理的小麦根长比对照提高1311 %。
【英文摘要】A new plant activator from Alternaria tenuissima was purified using ammonium sulphate frac2tionation , organic solvent , anion exchange chromatography and size exclusion chromatography. The protein exhibited a single band on SDS2PAGEwith molecular weight of 35 kD. Its pI was determined as 4.22 using immobiline dry strip gel . The wheat seeds were treated with the purified elicitor at various concentrations for 8 h and the succinate dehydrogenase was measured after 7 d growth. The result showed that the protein has a remarkable effect on the activity of succinate dehydrogenase which was 65127 % higherthan that of control . Also , the length of main root was improved 1311 % comparing to the control .

【题目】交链孢菌中一种酸性糖蛋白
【中文关键词】细极链格胞 糖蛋白 β - 消去反应
【英文关键词】A lternaria tenu issim a glycop rotein β -elimination reaction
【中文摘要】采用液氮研磨、离心、阴离子交换柱HitrapTM DEAE FF、分子筛柱Hitrap Superdex 75 /300等一系列分离纯化方法对细极链格胞(A ternaria tenuissim a)水溶性酸性糖蛋白激发子进行了纯化。经SDS2PAGE、Native2PAGE检测,蛋白

分子量约为66KDa;经全蛋白银染和糖蛋白染色试剂盒对其鉴定为糖蛋白。经蒽酮2硫酸法测定,糖与蛋白比例为1. 75。经β2消去反应判定糖蛋白的连接类型为O2连接。生物活性测定表明,该蛋白可促进小麦种子的萌发和幼苗的生长。

【英文摘要】A acidic glycop rotein from A lternaria tenu issim a. had been isolated and purified by anion2exchange chromatography on HitrapTM DEAE FF and molecular sieve chromatography on Hitrap Superdex 75 /300. The glycoprotein was p roved to have the molecularweight of about 66 kD byNative2PAGE and SDS2PAGE. The glycoprotein was identified that the carbohydrate and p rotein contentswere in a ratio of 1. 75 by GelCode Glycop rotein Staining Kit (Pierce accompany) , antrone2colorimetric assay. The type of glycocidic bond was judged by β2elimination reaction oxygen juncture. B ioassay detection indicated that the glycop rotein could increase the sp routing rate and promote the growth of wheat seeds

【题目】Stable isotope labelled mass spectrometry for quantification of the

【中文关键词】极细链格孢蛋白激发子,稳定同位素标记,差异蛋白

【英文关键词】Alternaria tenuissima ,protein elicitor, the stable isotope labelled mass spectrometry method

【中文摘要】从极细链格孢分离了蛋白激发子,该激发子激发烟草对烟草花叶病毒的抗性,但不会导致过敏性坏死。激发子诱导棉花对黄萎病的抗性,增加棉花产量,但其机制尚不清楚。在这项研究中,利用稳定同位素标记的质谱法定量研究差异蛋白表达的相对丰度。差异表达蛋白在拟南芥中与蛋白质代谢,修饰,胁迫和抗氧化登发有关。

【英文摘要】The protein elicitor from the mycelium of Alternaria tenuissima has been isolated. The elicitor triggered resistance to the tobacco mosaic virus in tobacco by inducing relative oxygen species, but without causing hypersensitive necrosis. The elicitor is reported to impart resistance against Verticillium dahliae and to increase yield in cotton, but its mechanism is not yet clear. In this study, the stable isotope labelled mass spectrometry method was used to quantify the relative abundances of protein expression induced by PeaT1 in Arabidopsis. A significant difference in the relative abundances for the expression of different proteins related to metabolism, modification, regulatory, defense, stress and antioxidation was found in Arabidopsis.

【题目】稻瘟菌蛋白激发子基因pemG1 植物表达载体的构建及其转化烟草的研究

【中文关键词】烟草, 蛋白激发子, 植物表达载体, 遗传转化

【英文关键词】Tobacco, Protein elicitor, Plant expression vector, Genetic transformation

【中文摘要】设计含Mlu Ⅰ酶切位点的接头,将其连接入经Kpn Ⅰ和BamH Ⅰ酶切后的质粒pCAMBIA2300-Ubi-Ocs,得到pCAMBIA2300-Ubi-adaptor-Ocs。设计含有Kpn Ⅰ和Mlu Ⅰ酶切位点的引物,以稻瘟菌基因组DNA 为模板扩增得到pemG1 序列。将其连接入pMD18-T 得到pMD18-T-pemG1。最后,用Kpn Ⅰ和Mlu Ⅰ从pMD18-T- pemG1 切下pemG1 基因片段,将其连接入pCAMBIA2300-Ubi-adaptor-Ocs 的Kpn Ⅰ-Mlu Ⅰ酶切位点,构建成稻瘟菌蛋白激发子基因pemG1 的植物表达载体体pCAMBIA2300-Ubi-pemG1-Ocs。用冻融法将pCAMBIA2300-Ubi-pemG1-Ocs 导入根癌农杆菌菌株AGL-1,再通过根癌农杆菌介导转化获得了转基因烟草株系。用PCR,Northern 和Western 杂交验证了pemG1 基因在受体烟草基因组中的整合,转录和表达。此研究为下一步通过稻瘟菌蛋白激发子基因pemG1 的表达来提高转基因烟草的抗病性打下了基础。

【英文摘要】An adaptor harboringMlu Ⅰ restriction site was designed and cloned into Kpn Ⅰ-BamH Ⅰ site of pCAMBIA2300-Ubi-Ocs plasmid to get pCAMBIA2300-Ubi-adaptor-Ocs. Primer pair harboring Kpn Ⅰ and Mlu Ⅰ sites was also designed to amplify

Magnaporthe grisea DNA template to get pemG1 sequence, which was cloned into pMD18-T vector to form pMD18-T- pemG1. Finally, the Kpn Ⅰ-Mlu Ⅰ fragment of pemG1 from pMD18-T-pemG1 was cloned at Kpn Ⅰ-Mlu Ⅰ site of pCAMBIA2300-Ubi-adaptor-Ocs to form plant expression vector pCAMBIA2300- Ubi-pemG1-Ocs. The expression vector construct was transfered to Agrobacterium tumefaciens AGL-1 strain by freeze-thaw method. Transgenic tobacco lines were produced by Agrobacterium-mediated transformation.Integration, transcription and expression of pemG1 in tobacco were respectively confirmed by PCR, Northern blot and Western blot. This work layed a good foundation for enhancement of disease resistance conferred by expression of pemG1 gene in tobacco.

【题目】灰葡萄孢菌激活蛋白对番茄灰霉病的诱导抗性
【中文关键词】灰霉病;激活蛋白;诱导抗性;防御酶
【英文关键词】gray mould disease;protein activator;induced resistance;protective enzyme
【中文摘要】为探索激活蛋白对植物诱导抗病性机理,分析诱导过程中植物的应激反应,采用室内盆栽的方法,研究了来源于灰葡萄孢菌(Botrytis cinerea)的14kD激活蛋白PEBC2诱导番茄对灰霉病的抗性,结果表明,经1.182 μg/mL激活蛋白诱导处理后番茄对灰霉病的抗性有显著提高,番茄接种灰霉菌17d后,对灰霉病的诱抗效果达到67.03%。测定了番茄体内与抗病代

谢有关的苯丙氨酸解氨酶(PAL)、过氧化物酶(POD)和多酚氧化酶(PPO)活性的动态变化,经激活蛋白处理后,番茄幼苗叶片的苯丙氨酸解氨酶(PAL)、过氧化物酶(POD)和多酚氧化酶(PPO)活性均有不同程度提高,PAL活性在诱导48h后达到最高,比对照提高53.82%;POD活性在诱导168h后达到最高,是对照的2.63倍;PPO活性在24h和120h出现两个峰值,分别比对照增加77.57%和87.21%。说明防御相关酶活性的提高,是激活蛋白诱导番茄植株抗灰霉病的主要生理机制之一。

【英文摘要】A 14kD protein elicitor from Botrytis cinerea, which can induce tomato to gain resistance of gray mould disease, was researched by the method of pot culture in the green room. The inducing efficiency reached 67.03% at 17th day post inoculation of pathogen when seeds were dipped in 1.182 μg/ml activator protein. To reveal the mechanism of resistance induction, the dynamic variation of PAL, POD, PPO which relate with resistance metabolism were measured as following. The activity of Phenylalanine ammonia lyase (PAL) Peroxides (POD) and polypheol oxidase (PPO) were increased effectively after inducement The activity of PAL increased by 53.82% comparing with contrast at 48h. The maximum activity of POD was2.63 times of untreatment and appeared at 168 h .The activity of PPO increased by 77.57% and 87.21% at 24 h and 120 h, respectively .The enhancement of activity of the enzyme correlated with defense is one of the main physiological mechanisms of protein activator inducing disease resistance.

【题目】紫花苜蓿种子水分快速测定方法研究
【中文关键词】紫花苜蓿; 种子; 水分; 快速测定
【英文关键词】A lfalfa (Med icago sativa); seed; moisture conten;trapidmeasurement
【中文摘要】试验以不同水分含量的紫花苜蓿种子为材料, 应用高恒温烘干法、微波加热法和种子水分速测仪法分别测定种子水分。结果表明, 高恒温烘干法作为种子质量检测的标准方法, 能够准确测定种子水分, 但需要较长的时和专业的设备。种子水分速测仪仅局限于其规定的测量范围内测定种子水分变化。利用微波加热法在低档下连续加热紫花苜蓿种子9 m in, 再以1 m in为单位加热3~ 5次即可基本烘干水分。测定水分值虽均低于高恒温烘干法, 但在短时间内能够较准确测定高水分样品, 对于及时快速确定苜蓿种子收获、加工以及贮藏过程中的水分变化, 指导紫花苜蓿种子的生产具有重要作用。
【英文摘要】The experiments w ere conducted to determ ine the su itable test ing method o fmo isture content of alfa lfa (M ed icago sativa) seeds, d ifferent moisture content samples were tested by apply ing h igh constant temperature oven dry ing, m icrow ave hea ting and seed mo isturemeter. The resu lts show ed: seedmo isture con tent cou ld be accurate ly tested by the oven method, but it requ ired long t ime and specif ic equipm ents. The seed mo isture meter is lim ited in instrumentm easuring range to determ ine the variety o fmo istur conten.t The results obta ined from m icrow ave oven heating, dry ing continuous under the low-g rade after 9m inutes, then heated aga in as 1 m inute for the heating un its to 3- 5 times, w ere low er than h igh constant temperature oven dry ing, but itw as usefu l for detecting h ighmo isture content seeds in a sho rt time. Itw ou ld play an important ro le in understanding the change of alfalfa seedsmo isture content during seed harvesting, processing and storage, gu iding the seed product ion to ma intain the high quality of seeds.

【题目】遮荫对紫花苜蓿生长发育和产草量
【中文关键词】紫花苜蓿; 遮荫; 生长发育; 产草量
【英文关键词】Medicago sativa; shading ; grow th; yield
【中文摘要】以3 个紫花苜蓿(Medicago sativa) 品种为材料, 通过田间遮荫网控制光照强度, 研究了紫花苜蓿在不同遮荫强度下(对照、遮荫50%、遮荫80%) 的生长情况, 分析了紫花苜蓿的生长发育和产草量指标。结果表明, 遮荫处理对紫花苜蓿叶绿素a 和b 含量影响不显著, 叶绿素a/ b 值随遮荫强度的增大而降低; 苜蓿株高、茎叶比、产草量等指标随遮荫强度的增大而降低, 全年产草量对照分别是遮荫50%和80%的3 倍和8倍; 第1 茬产草量占总产草量的百分比随遮荫强度的增大而增大。在遮荫条件下种植紫花苜蓿, 建议遮荫强度不要超过50%, 产量以第1 茬为主, 减少刈割次数。
【英文摘要】An ex periment w as carr ied out using three Medi cago sat iv a varieties by cont rolling lig ht intensity with shading net to study the growth in different shading t reatment s (the cont rol, shaded 50% and shaded 80%) , and to analy ze indices of grow th and y ield. T he r esult s show ed that the content of chloro phyll a and b w as not af fected significant ly by shading tr eatment s, but chlo rophy ll a/ b decreased with the increased shading intensity. The plant height, stem/ leav es rat io, yield of alfal fa decreased with the increased shading intensity. The y ields o f w hole y ear in the co nt rol w ere three t imesand eig ht t imes in shaded 50% and 80% respect iv ely . The percent of first cut t ing yield in total y ield increased w ith the higher shading intensity . T he shading intensity should be not mo re than 50% if planting M. sati va in shading env ir onment , at the same t ime the y ield w as priority to f irst cut t ing y ield and should reduce cutt ing times.

【题目】紫花苜蓿茎叶浸提液对波斯婆婆纳化感效应的研究
【中文关键词】化感作用;紫花苜蓿;品种;波斯婆婆纳
【英文关键词】Allelopt hy ; Alfalfa ; Variety ; Per sian speedwell
【中文摘要】以波斯婆婆纳为受体,采用培养皿砂培法对15 个紫花苜蓿品种的化感作用进行研究。结果表明,不同品种的紫花苜蓿茎叶浸提液对波斯婆婆纳种子萌发、幼苗生长产生不同程度的影响,具有浓度效应,即浓度高时产生抑制作用,浓度低时则产生促进作用;受体波斯婆婆纳幼根对紫花苜蓿化感物质的敏感性强于幼苗;同一浓度处理下,不同紫花苜蓿品种化感作用存在很大差异,0.15gFW/ mL 浓度处理下陇东苜蓿对受体种子发芽的抑制作用明显强于其他品种,抑制率达到98.62 % ,同时完全抑制了幼苗的生长;其次是皇冠和中苜1 号。
【英文摘要】The allelopathy of fif teen varieties of alfalfa was st udied by cult ure plate and sand cult ure bioassays. The acceptor was persian speedwell seed. The result s showed that the aqueous ext ract s from stems and leaves of different varieties of alfalfa affected seed germination and growth of seedlings of per sian speedwell in various degree. And the effect was related to concent ration. There was inhibition effect at higher concent ration and t here was the enhancement effect at lower concent ration. Root s of t he per sian speedwell was more sensitive to the ext ract s t han seedlings. Allelopathy of t he fif teen varieties differed at the same aqueous ext ract s concent ration. The inhibition effect of t he aqueous extracts from Longdong (0.15gFW/ mL) was t he st rongest in t he fif teen varieties. The inhibitory rate was 98. 62 %. And the aqueous ext ract s f rom Longdong (0. 15gFW/ mL) inhibited the growt h of seedlings absolutely The inhibition effect of Phabulous and Zhongmu No. 1 were st ronger t han that of other varieties except Longdong.

【题目】偃麦草属植物叶片表皮形态与结构研究
【中文关键词】偃麦草属;叶表皮形态;解剖结构;聚类分析
【英文关键词】Elytrigia Desv.;Leaf epidermal morphology;Anatomy structure;Cluster analysis
【中文摘要】于2008年6月初对偃麦草属1 2个植物种15份种质材料抽穗期的叶片表皮形态与结构进行了扫描电镜观察,旨在通过形态解剖结构特点的分析,为该属植物的分类鉴定提供科学依据。结果表明:所有材料上表皮都具有长细胞和气孔器细胞;除EE009、EE022、E1021、E1029、EPY002、EC002、EH001、ES001外,都含有乳突,呈斑泡状、圆头状或倾斜状;刺毛存在于除EC002、EE009、EE022、EJ00l、EPO004、EPY002外的其他所有种;短细胞马蹄形或椭圆形,仅存在于EB001、EC002和EI 001中;大毛仅在EJ001和ES001中发现;从横切面看,脉间普遍存在泡状细胞,且EB001、EH001、EPY002泡状细胞下陷形成“绞合细胞”,其余均不下陷;维管束鞘2层,纤维分布在维管束的上下方,与维管束连接。然后,利用15份种质材料的10个叶片表皮的形态指标进行欧氏距离聚类分析,将其分为6类,较好地反映出各种质材料亲缘关系的远近。
【英文摘要】The leaf epidermal morphology and structure of 1 5 germplasms belong to 1 2 Elytrigia Desv.species at heading stage were examined using scanning electron microscope at the beginning of J une,2008 in order to provide scientific basis for the taxonomy of the genus.The results show that the long cells and stomata cells were found in the upper epidermis of all species. The tested germplasm s except for EE009, EE022,E1021,E1029,EPY002,EC002,EH O01,and ES001 showed papillae in spot,spherical,or oblique shapes.The prickle hair existed in the tested germplasms except for EC002,EE009,EE022,EJ001,EP0004,and EPY002. The short cells showed horseshoe or ova1 shapes and only existed in EB001,EC002,and EL001.The macrohair was only found in EJOOl and ES001.According to the leaf transverse sections.the bulliform cells were found in the intercostaI zone of all tested germplasm s and showed sankand formed into the hinge cells only in EB001,EH OO1。and EPY002. Two layers of the vascular bundle sheaths were showed in al1 germplasm s,and the fibre was distributed in both upper and below sides of the vascular bundle and joined together.At the same time,the 1 5 germplasms were divided into 6 groups indicating the genetic relationships among them according to the Euclidean Distance Cluster Analysis based on 10 indices of the leaf epidermal morphology and structure.

【题目】偃麦草属植物种质材料不同耐盐群体生理指标分析
【中文关键词】偃麦草属;种质;耐盐性;生理指标
【英文关键词】Elytrigia Desv.;germplasm;salt tolerance;physiological indexes
【中文摘要】采用温室苗期模拟NaC1盐分胁迫方法,对来自于21个国家的偃麦草属8个植物种34份种质材料苗期的叶片相对含水量(RWC)、相对电导率(REc)、脯氨酸(Pro)、K /Na 、相对生长速度变化率、耐盐系数、存活率和出现盐害到死亡时间等指标进行测定,且将0.9%NaC1浓度下的各项生理指标变化率和生长指标测定值,利用欧氏最大距离聚类分析,将34份偃麦草属植物种质划分为3个耐盐群体(级别):即耐盐种质、中度耐盐种质、敏盐种质。在此基础上,对NaC1胁迫下的RWC、REC、Pro和K /Na 等生理指标进行比较分析,结果显示:随着NaC1胁迫浓度的增加,不同耐盐群体的偃麦草属植物种质材料叶片的各项生理指标表现出不同的变化趋势,其中REC、Pro、Na均呈逐渐增加趋势,而K 、K /Na 和RWC则呈逐渐下降趋势,但当NaC1浓度上升至1.2% 时,与对照(CK)相比,耐盐种质的REC、Pro和Na 分别增加了121.83% 、29.25倍和145.45% ,K 、K /Na 和RWC分别下降了26.89% 、74.26% 和l6.40% ;而敏盐种质的REC、Pro和№ ’分别增加了199.20% 、75.45倍和617.86% ,K 、K /Na 和RWC分别下降了43.16% 、93.55% 和27.69% ,中度耐盐种质的增加和下降幅度居于二者之间

。
【英文摘要】The simulating salinity stress method in green house was adopted,and the relative water content,the relative electrical conductivity rate(REC),the content of free proline(Pro),K /Na ,the change rate of relative growth(RWC),the salt.tolerant coeficient,the livability and the days of salinity injure to death of 34 germplasm and materials 0f 8 species of Etyt@ /a Desv.collected from 21 difierent countries were measured and analyzed at seedling stage,and the ab0ve 8 index values at 0.9% NaCl concentration were an alyzed using the Euclidean Farthest Distan ce Cluster MetIlod. e results showed that 34 germplasm and materials were classified into 3 salt tolerant colonies(classes),namely higher salt tolerant germplasm (HSTG),medium salt tolerant germplasm (MSTG)and sensitive salt germplasm (SSG).And diferent variation trends and rules of the physiological indexes of diferent salt tolerant Elytrigia Desv.germpalsm were showed, among them, REC, Pro and Na showed gradually increase but K 、 K /Na and RWC showed gradually decrease,but when NaCl concentration was raised up to 1.2% ,REC,Pro an d Na were increased by 121.83% ,29.25 times an d 145.45% ;K ,K /Na an d RW C were decreased by 26.89% ,74.26% an d 16.40% for the HSTG,respectively.However,REC,Pro an d Na were increased by 199.20% ,75.45 times an d 17.86% ;K .K /Na and RW C were decreased by 43.16% ,93.55% an d 27.69% for the SSG,respectively.rI1le increase and decrease seales of the MSTG were in the middle.

【题目】偃麦草属植物种质材料苗期耐盐性综合评价
【中文关键词】偃麦草属;种质;苗期;耐盐性;评价
【英文关键词】Elytrigia;germplasm ;seedling stage;salt tolerance;evaluation
【中文摘要】采用温室苗期模拟NaC1盐分胁迫方法,对来自于21个国家的偃麦草属8个植物种34份种质材料苗期的叶片相对含水量、相对电导率、脯氨酸、K /Na 、相对生长速度变化率、耐盐系数、存活率和出现盐害到死亡的时间等指标进行测定与分析,并对偃麦草属植物种质材料苗期的耐盐性进行综合评价。结果表明,上述指标均是偃麦草属植物种质材料苗期耐盐性评价的有效指标。且通过对0.9 NaCI浓度下的各项指标进行综合聚类,可将34份偃麦草属植物种质划分为3个耐盐级别,即耐盐种质有ER030、ER035、ER041、EE011、EE014、EE017、EE023、EE026、EE047、EH001、EH002和EPU02;中度耐盐种质有ER008、ER014、ER027、ER032、ER037、ER038、ER044、ER045、EE007、EE027、EJOOl、EPO02、EPO03和EPO04;敏盐种质有ER028、ER033、ER036、ER039、EE022、EJ003、EL001和E1022。
【英文摘要】Abstract:Simulating salinity stress in a green house was used to study the relative water content(RW C),relative electrical conductivity rate(EC),content of free proline(Pro),K /Na ,changes of relative growth rate,the salt-tolerant coefficient,the livability and time of salinity injury to death of Elytrigia.Materials of 34 germplasms and 8 species of Elytrigia collected from 2 1 countries were measured and analyzed at the seedlingstage,and the salt tolerances were comprehensively evaluated.Eight indexes were all effective for evaluation of salt tolerance of germ plasm and materials of Elytrigia at seedling stage.Cluster analysis of salt tolerant indexes showed the 34 germ plasms and materials could be divided into three salt tolerant levels,e.g.
strong(ER030,ER035,ER041,EE011,EE014,EE017,EE023,EE026,EE047,EH001,EH002,EPU02),medium(ER008,ER014,ER027,ER032,ERO37,ERO38,ER044,ER045,EE007,EE027,EJ001,EPO02,EP0O3,EP004),and the
weaker(ER028,ER033,ER036,ERO39,EE022,EJ003,ELO01,E1022).

【题目】中间偃麦草和长穗偃麦草解剖结构的扫描电镜观察
【中文关键词】中间偃麦草;长穗偃麦草;形态解剖;扫描电镜
【英文关键词】Elytrigiaintermedia ; Elytrigia elongata ; morphological anatomy; scanning eletron microscope (SEM)
【中文摘要】运用扫描电镜观察了中间偃麦草El y t ri gia intermedia 和长穗偃麦草E. elongata 的根、茎、叶以及根茎的形态解剖结构,结果显示:2 种植物的根形态均由表皮、皮层和中柱组成,表皮着生大量根毛,内皮层细胞壁5 面加厚,在横切面上呈马蹄形;茎与根茎的维管束分内外两圈分布,中央有髓腔;叶片形态由表皮、叶肉和叶脉3 部分构成,表皮细胞包括长细胞、附属物、气孔器细胞和泡状细胞。中间偃麦草和长穗偃麦草的叶片表皮微形态上存在显著差异,其中长穗偃麦草叶脉上分布3~4 列乳突,而中间偃麦草叶脉上则分布3~4 列刺毛,另外在根皮层细胞中发现了发达的类似通气组织的结构,产生原因亟待进一步研究。
【英文摘要】The anatomical st ruct ure of root , stem , leaf and rhizome of Elytrigia elongata and E.intermedia was examined under t he scanning elect ron microscope (SEM) . The anatomical structure of root transverse section was consisted with epidermis , cortex and stele. The number of root hairs appeared in the epidermis , and t he endodermis cell had 5 t hickened walls and was the horseshoe2shaped in the transverse section. Two circles of vascular bundles and a central pith cavity showed in the stem and rhizome morp hology. The leaf was differentiated into parts , including epidermis , mesophyll and veins. The epidermal cell consisted with long cell s , stomata cell s , bulliform cell s and subsidiary objects. Two species had significant difference in leaf epidermis micromorp hology , 3 to 4 rows of papillawere dist ributed in the costal zone of E. elogata leaves , but 3 to 4 rows of prickle hair were dist ributed in the same areas of E. i ntermedi a leaves. In addition , the well-developed similar aerenchyma was found in the root cortex and f urther research is necessary to find out the cause.

【题目】被内生真菌侵染的禾草提取液对真菌的抑制作用
【中文关键词】禾草内生真菌,抑菌作用,孢子萌发,菌丝生长
【英文关键词】Neotyphodium, inhibition, spore germination, mycelial growth
【中文摘要】以带有与不带有Neotyphodium 属内生真菌的醉马草Achnatherum inebrians、披碱草Elymus dahuricus 和野大麦Hordeum brevisubulatum 的草粉浸提液对细交链孢Alternaria alternata、根腐离蠕孢Bipolaris sorokiniana、燕麦镰孢Fusarium avenaceum 和绿色木霉Trichoderma viride 进行了抑菌活性研究。结果表明:披碱草、醉马草和野大麦草粉浸提液对细交链孢、根腐离蠕孢、燕麦镰孢和绿色木霉的菌落生长、孢子萌发率和芽管长度均有一定的抑制作用。而披碱草中的Neotyphodium可显著增强披碱草草粉浸提液对细交链孢、燕麦镰孢、绿色木霉菌落生长及对细交链孢和根腐离蠕孢孢子萌发及燕麦镰孢芽管长度的抑制作用;醉马草中的Neotyphodium 显著增强了醉马草草粉浸提液对燕麦镰孢、绿色木霉菌落生长和芽管长度,以及细交链孢、根腐离蠕孢和燕麦镰孢孢子萌发的抑制作用;野大麦中的Neotyphodium 显著增强了野大麦草粉浸提液对绿色木霉菌落生长、孢子萌发和芽管长度的抑制作用。
【英文摘要】Fungistasis of the acetone extracts of endophyte-infected (E+) and endophyte-freed (E-) Achnatherum inebrians, Elymus dahuricus and Hordeum brevisubulatum was tested with against Alternaria alternata, Bipolaris sorokiniana, Fusarium avenaceum and Trichoderma viride. The results showed that the extracts of A. inebrians, E. dahuricus and H. brevisubulatum had inhibiting effect to mycelial growth and spore germination of A. alternata, B. sorokiniana, F. avenaceum and T. viride to a certain extent. E.extracts of E. dahuricus could remarkably enhanced the inhibition on mycelial growth of A. alternata, F. avenaceum and T. viride,spore germination of A. alternata and B. sorokiniana, as well as length of germ tube of F. avenaceum; E+ extracts of A. inebrians could remarkably enhanced inhibition on mycelial growth of F. avenaceum and T. viride, spore germination of A. alternata, B.sorokiniana and F. avenaceum, as well as length of germ tube of F. avenaceum and T. viride; E+ extracts of H. brevisubulatum could remarkably enhanced the inhibition on mycelial growth, spore germination and length of germ tube of T. viride. It was indicated that Neotyphodium endophytes could enhance the antifungal activity of the extracts of A. inebrians, E. dahuricus and H. brevisubulatum against A. alternata, B. sorokiniana, F. avenaceum and T. viride.

【中文关键词】紫花苜蓿;果糖-1 ,6-二磷酸醛缩酶(ALD) ;SMART RACE;进化树;半定量RT2PCR
【英文关键词】Medicago sativa L. ;fructose-1 ,6-bisphosphate aldolase (ALD) ; SMART RACE ;phylogenetic tree ;RT-PCR
【中文摘要】根据已知的与盐胁迫相关的EST 序列,采用SMART RACE 方法克隆了紫花苜蓿果糖-1 ,6-二磷酸醛缩酶(ALD) 全长cDNA ,命名为MsALD(GenBank accession No. FJ896113) 。序列分析结果表明,该cDNA 全长1 487bp ,包含一个1194 bp 的最大开放阅读框,编码398 个氨基酸。经同源比对和进化树分析,MsALD 基因编码的氨基酸与红三叶草、马铃薯、烟草等的果糖21 ,62二磷酸醛缩酶(ALD) 氨基酸序列一致性高达90 %以上,确定其属于第Ⅰ类果糖-1 ,6-二磷酸醛缩酶。半定量RT2PCR 分析表明,MsALD 基因可能与紫花苜蓿抗盐机理相关。
【英文摘要】Based on an EST of Medicago sativa L., a full length of 1487 bp cDNA was isolated using SMART RACE. This gene was named MsA L D (GenBank accession No. FJ 896113) . The sequence analysis has revealed that MsALD contains a maximum open reading frame of 1194 bp for 398 amino acids. The putative amino acid sequence was highly similar to ALD from some other plants ,such as T rifolium pratense ,So lanum tuberosum and Nicotiana paniculata. Sequence analysis indicated that MsA L D belogs to tclass I ALD. The result of the RT-PCR showed t hat MsALD is highly expressed in Medicago sativ a L . after being treated for 2 hours. This indicated that MsALD may play an important role in salt tolerace of Medicago sativa L.

【题目】紫花苜蓿LEA 蛋白基因ihpRNA 表达载体构建及烟草转化

【中文关键词】紫花苜蓿; MsLEA3-1 基因; RNA 干扰; ihpRNA 表达载体; 烟草转化
【英文关键词】Medicago sativa L.; MsLEA3-1 gene; RNA interference; ihpRNA expression vector; Tobacco transformation
【中文摘要】根据紫花苜蓿LEA 蛋白MsLEA3-1 基因(GenBank 登录号为EU665182)序列, 设计两对含有酶切位点的特异性引物LEAf1/LEAf2 和LEAr1/LEAr2, 以构建好的PMD-LEA 质粒为模板, 分别合成用于构建干扰载体的正反义片段pMD-F 和pMD-R, 将正反义片段分别插入表达载体pART27 的相应位置, 构建成含有发夹结构的RNAi 载体pART-F-R, 经过Not I 酶切鉴定, 证明载体构建成功。通过农杆菌介导的方法, 以干扰表达载体pART-F-R 转化烟草,经过PCR 检测, 得到16 株阳性转基因植株, 为MsLEA3-1 基因的功能研究奠定基础。
【英文摘要】During long-term evolution, plant has developed various physiological functions and bio-chemical mechanisms to respond the diverse stresses in different environments. Plant cell accumulates a series of proteins to reduce cell dehydration in the period of water shortage, of all proteins, late embriogenesis abundant LEA protein has been paid attention, which is one of the hot topics in plant stress physiology. In the paper, an RNAi expression vector harboring MsLEA3-1 gene fragment from Medicago sativa L. was constructed. On the basis of the sequence of Medicago sativa LEA protein (MsLEA3-1) gene (GenBank accessionnumber: EU665182), two pairs of specific primers containing different enzyme sites were designed. With the template of PMD-LEA plasmid constructed, positive-sense strand and antisense strand were obtained, which were separately inserted into the expression vector pART27. The RNAi vector pART-F-R containing a hairpin structure was confirmed by the digestion of restriction enzymes. pART-F-R was transformed into tobacco by Agrobacterium-mediated transformation system. PCR testing showed that 16 transgenic plants were obtained.

【题目】紫花苜蓿锌指蛋白基因RNAi表达载体的构建及在苜蓿的转化
【中文关键词】紫花苜蓿; 锌指蛋白; RNAi; 转基因
【英文关键词】Alfalfa (Medicago sativa L.); Zinc finger protein; RNAi; Transgene
【中文摘要】根据紫花苜蓿锌指蛋白MsZFN 基因(GenBank 登录号为EU624138)序列, 设计两对含有酶切位点的特异性引物, 以紫花苜蓿cDNA 为模板, 分别合成用于构建干扰载体的正反义片段, 将正反义片段分别插入表达载体pART27的相应位置, 构建成含有发夹结构的RNAi 载体pART-F-R。利用农杆菌介导方法, 将pART-F-R 转化到紫花苜蓿中,经过PCR 检测, 获得了3 株转基因植株。经过RT-PCR 检测, 证明转基因植株中MsZFN 基因表达量明显低于未转基因的植株。结果表明, 已构建成功具有发夹结构的RNAi 载体pART-F-R, 它可有效的抑制紫花苜蓿MsZFN 基因。
【英文摘要】On the basis of the sequence of Medicago sativa Zinc Finger Protein (MsZFN) gene (GenBank accession No.EU624138), two pairs of specific primers containing different enzyme sites were designed. With the template of full-length cDNA,positive-sense strand and antisense strand were obtained, which were separately inserted into the expression vector pART27. TheRNAi vector pART-F-R containing a hairpin structure was constructed. Mediated by Agrobacterium tumefaciens, pART-F-R was transformed into alfalfa plants. PCR testing showed that three transgenic plants were obtained. The result of RT-PCR showed that transgenic alfalfas had lower expression level of MsZFN gene than the wild type. These results indicated that the RNAi vector pART-F-R containing a hairpin structure was constructed successfully and highly efficient for the simultaneous silence of MsZFN gene.

【题目】Effects of rotation and interplanting on soil bacterial communities and cucumber yield
【中文关键词】轮作 套作 土壤细菌多样性
【英文关键词】rotation interplanting soil bacterial communities
【中文摘要】通过PCR-DGGE方法,主要研究了小麦、菜豆等轮作或套作对黄瓜根际土壤细菌多样性的影响。
【英文摘要】By the method of PCR-DGGE, this paper studied the effects of rotation with wheat, soybean, villose vetch, clover, and alfalfa and intercropping with onion and garlic on the bacterial communities in rhizosphere soil of cucumber. The results showed that rotation and intercropping with test plants increased the diversity and evenness indices of bacterial communities in cucumber rhizosphere soil, and also, cucumber yield. The sequencing of DGGE bands indicated that most of the bands had high homology with uncultured bacterial species, and were of Sphingobacterium and Proteobacteria. High bacterium G+C was only detected when cucumber was intercropped with onion. The diversity of soil bacterial communities varied with the growth stages of cucumber, being the highest at vigorous fruiting stage. It was suggested that intercropping with onion and rotation with wheat were the best cultivation modes of cucumber.

【题目】不同作物间作对黄瓜病害及土壤微生物群落多样性的影响
【中文关键词】间作 土壤微生物群落多样性 病情指数 RAPD T-RFLP
【英文关键词】intercropping soil microbial community diversity disease index RAPD T-RFLP
【中文摘要】分别采用RAPD和T—RFLP技术,研究了小麦、毛苕子和三叶草分别与黄瓜间作对黄瓜病害、黄瓜根际土壤微生物群落多样性和黄瓜产量的影响。结果表明,小麦、毛苕子与黄瓜间作均能提高黄瓜根际土壤微生物群落多样性,其中,小麦一黄瓜间作对黄瓜根际土壤微生物群落多样性的影响最为突出;3种作物分别与黄瓜间作均显著提高了黄瓜产量(p〈0.01),其中小麦一黄瓜间作的产量优势最强;同时,3种作物分别与黄瓜间作均降低了黄瓜角斑病、白粉病、霜霉病和枯萎病的病情指数和尖孢镰刀菌的数量。间作有利于提高土壤微生物群落的多样性、减轻病害、提高黄瓜产量。
【英文摘要】
Plenty of reports about effects of intercropping improving yield and reducing disease incidence are availabl e, but little was reported about the mechanism of the effects. RAPD and T-
RFLP methods were used to study effects of intercropping of cucumber with wheat, vicia villosa and cl over, individually, on cucumber disease indexes, cucumber rhizosphere soil microbial community diversity an d yield. Results showed that intercropping of cucumber with wheat and vicia villosa increased soil micro bial community diversity in cucumber rhizosphere, and the effect of the latter was the most prominent.
All intercropping modes increased cucumber yield significantly (p 〈
0. 01), and the effect of the intercropping of cucumber with wheat was more significant over that of the others. Meanwhile, intercropping decreased disease indexes of angular leaf spot, powdery mildew, downy mildew and Fusarium wilt, and decreased population of Fusarium oxysporum no matter with wh at plant. So it is quite obvious that intercropping increasees soil microbial community diversity and yield of cucumber, but mitigates diseases.

【题目】富有机质土壤栽培方式对大白菜产量及品质的影响
【中文关键词】大白菜;富有机质土壤;限根栽培;产量;品质
【英文关键词】Chinese cabbage, organic soil, root restriction cultivation, yield, nutrient quality
【中文摘要】为明确不同栽培方式对大棚大白菜蔬菜产量、品质和土壤养分利用的影响,以园田土壤栽培为对照,研究了以农业废弃物腐熟麦秸与腐熟大粪干及园田土壤等为主要原料配制的富有机质土壤限根和非限根栽培方式的作用。结果表明,与富有机质限根栽培和普通土壤栽培相比,采用富有机质土壤非限根栽培的大白菜生长势好,根系活力强,叶绿素含量高,增产效果显著,产量较对照提高了20.68%;硝酸盐含量降低了359 mg/kg,降幅达38.26%,富有机质土壤非限根栽培还明显增加了大白菜叶球的干物质含量,增幅为17.2 %;与对照相比,富有机质土壤非限根栽培的大白菜的粗蛋白含量、总糖含量和维生素C含量分别提高了4.9%、0.9%和2.44%。表明富有机质土壤非限根栽培方式对提高白菜产量及改善营养品质效果良好。
【英文摘要】"To study the effects of organic soil cultivation ways on the yield and nutrient quality of Chinesecabbage, the ordinary soil cultivation (CK), organic soil (mixture of composed straw, composed manure and soil) cultivation with root restriction and organic soil cultivation without root restriction were used. The results showed that the vegetable with organic soil cultivation growth better than CK, which had higher plant height and stem diameter. The root activity and photosynthesis rate of organic soil was higher than CK. And the yield of Chinese cabbage was increased about 20.68% . The nutrient quality of Chinese cabbage was improved compare to CK. Although root restriction by a plastic film decreased the leakage of the soil nutrient and water,it might save water and fertilizer, the root unrestricting organic soil had higher root activity and chlorophyll content in leaves; and organic soil without root restriction significantly increased the Chinese cabbage yield and improved its nutrient quality. The results showed that organic soil cultivation without root restriction of Chinese cabbage had higher root activity, higher chlorophyll content, which yield significant increased and nitrate content reduced significantly than ordinary soil

【题目】温室有机土限根栽培对番茄生长和产量品质的影响
【中文关键词】番茄;有机土;限根栽培;产量;营养品质
【英文关键词】tomato ; organic soil;root restriction cultivation;yield;nutrient quality
【中文摘要】以普通土壤栽培为对照,研究了番茄在以由腐熟玉米秸、腐熟牛粪和园田土配制成的有机土限根栽培与非限根栽培条件下对日光温室越冬栽培番茄生长、生理特性和产量形成的影响。结果表明:有机土栽培的番茄生长势好,株高与茎粗均显著优于普通土壤;有机土栽培的根系活力、光合速率均高于土壤栽培;最终表现为有机土栽培的产量提高和营养品质改善,且成熟期提早。与非限根栽培相比,随番茄栽培的延续,限根栽培土壤中速效N、P、K含量在前期与非限根栽培相当的情况下,在中后期明显高于非限根处理,而有机质和全N、P、K的下降速度也显著低于非限根栽培,非限根栽培的土壤电导率明显下降,而限根则相对稳定,非限根栽培的耗水量明显多于限根栽培处理,表明非限根栽培的肥水渗漏较高,而限根栽培的肥水损耗率显著降低。限根栽培的根系活力在前期和中期均高于非限根栽培,限根栽培较非限根栽培明显提高了番茄的坐果数,显著提高了前期产量和总产量,增幅分别达31.3%和8.3%,而非限根栽培和土壤栽培的平均单果重均高于限根栽培。有机土栽培的番茄其营养品质如总糖、番茄红素含量明显优于普通土壤栽培,而有害健康的硝酸盐含量显著低于土壤栽培,且限根栽培的番茄又明显优于非限根番茄。因此番茄有机土栽培具有促使番茄提早成熟,增加番茄产量提高番茄品质的效果,而限根栽培方式明显优于非限根栽培,且具有更好的节水节肥和增产效果。
【英文摘要】The effects of organic soil (mixture of decomposed corn stalk,manure and soil) with root restriction culture to tomato in plant growth ,yield and nutrient in solar greenhouse over the winter were studied compare to ordinary soil cultivation(CK).The results showed that the plant under organic soil cultivation growth better than CK,which has higher plant height and stem diameter. the root activity and photosynthesis rate of organic soil is better than CK,the mature stage will be earlier than CK.comparing with root non-restriction culture,root restriction by a plastic film will decerase the leakage of the nutrient atoms and water to keep a suitable fertility level,so it will saving water and fertilizer.The root activity of root restriction organic soil will higher than organic soil without film.

Organic soil cultivation will increased tomato chlorophy II a, chlorophy II (a+b)content in leaves;and organic soil with film root restriction significantly increase the tomato yield and improve tomato nutrient quality. The root reatriction by film will saving water and increase soil fertility, so it is a environment friendly technique in protected horticulture.

【英文关键词】Arbuscular mycorrhizal fungi; cucumber; organic soil; greenhouse

【中文摘要】研究了2种丛枝菌根真菌在有机土基质和普通土壤中对温室黄瓜生长、产量及营养品质的影响。结果表明:接种GM后黄瓜的光合速率,叶片可溶性糖都显著高于对照;接菌可显著提高黄瓜产量,在有机土中接种Glomouse (GM)和Glomous versiform~(GV)可使黄瓜产量分别比对照提高28.5% 和25.4% ,而土壤中接种GM和GV亦可使其产量分别比对照提高58.1%和31.3% ,同时接种菌根菌后瓜条中的总糖、VC、干物重均明显提高,营养品质得到明显改善。因此可以认为在黄瓜生产中应用菌根苗可以明显提高黄瓜的产量品质。

【英文摘要】2 strains arbuscular mycorrhizal fungi(AMF)were used to study the efects on cucumber growth,yield and quality of fruit in organic soil and ordinary soil cultivation under greenhouse.The results showed that cucumber plants with GM inoculation may have higher photosynthetic rate。soluble sugar content in leaves than plants without inoculation.Glomous versiforme(CV)and Glomous mosseae(GM)inoculation may increase cucumber yield by 28.5% and 25.4% in organic soll respectively.Whereas GV and GM inoculation plants in soil may increase the yield by 58.1% and 31.3% higher than CK.Meanwhile AMF inoculation seedlings can also improve nutrient quality by increase fruit sugar content,VC,dry matter weight

【题目】Effects of Hot Environment and Dietary Protein Level on Growth Performance and Meat Quality of Broiler Chickens
【中文关键词】肉鸡 有效温度 蛋白质 代谢能 肉品品质
【英文关键词】Hot environment, Dietary protein level, Performance, Meat quality, Broiler
【中文摘要】本试验选用21-42日龄AA肉鸡216只,随机分为12个组,每组3个重复,每个重复6只鸡,分别饲养于四个环境控制舱中。试验采用4×3双因子安排的随机设计,第一因子为温度(以有效温度ET表示)处理,设4个水平,分别是15.0、21.2、35.3和37.6℃。第二个因子为日粮蛋白含量(以粗蛋白CP表示),设3个水平,分别是18.67、20.00和21.33%,代谢能均为12.55 MJ/Kg。试验结果表明:(1)有效温度对肉鸡的日采食量、日增重及料肉比影响显著(P<0.05),常温组的生产性能最好,当温度超过常温时,随温度上升,日采食量及日增重显著(P<0.05)下降。适宜蛋白水平(20%)组的生产性能最高。(2)与常温组相比,高温显著增加(P<0.05)肉鸡的屠宰率、半净膛率、全净膛率、腹脂率和腿肌率,显著(P<0.05)降低屠体重、胸肌重、腿肌重、胸肌率及肌间脂肪宽。低温组屠宰率显著(P<0.05)升高。随着日粮的蛋白浓度升高,肉鸡的半净膛率及全净膛率显著(P<0.05)降低。(3)与低温组相比,高温组的胸肌及腿肌PH值显著(P<0.05)升高。与常温组相比,低温组及极高温组的腿肌剪切力显著(P<0.05)上升。与常温组相比,极高温组的胸肌L*值及高温组的腿肌L*值都显著(P<0.05)升高。极高温组的胸肌及腿肌a*值显著升高(P<0.05)。高蛋白组的胸肌及腿肌a*值显著(P<0.05)上升。有效温度与日粮蛋白水平对胸肌及腿肌的L*值及a*值都有互作效应(P<0.05)。(4)与常温组相比,高温及极高温组鸡的胸肌及腿肌蛋白质含量显著(P<0.05)下降,随着日粮蛋白水平的升高,胸肌的蛋白质含量显著(P<0.05)升高。与常温组相比,有效温度的上升与下降都显著(P<0.05)增加了胸肌及腿肌脂肪含量。高蛋白组的胸肌粗脂肪含量比适宜蛋白组显著(P<0.05)降低。高温及极高温显著(P<0.05)增加了胸肌的水分含量。低温显著(P<0.05)降低腿肌的粗灰分。高蛋白组的胸肌粗灰分显著(P<0.05)高于其它组。(5)高温显著(P<0.05)升高血清中总蛋白和白蛋白、显著(P<0.05)降低血清球蛋白的含量。极高温组的血清胆固醇浓度显著(P<0.05)升高。与常温组相比,低温组及极高温组的血清甘油三酯含量显著(P<0.05)降低。极高温组血清尿酸显著(P<0.05)升高。高蛋白组的血清胆固醇含量显著(P<0.05)下降、尿酸含量显著(P<0.05)升高。有效温度与日粮蛋白浓度对血清胆固醇浓度有显著(P<0.05)的互作效应。(6)有效温度对肝脏及胸肌中的丙二醛(MDA)含量影响显著(P<0.05)。与常温组相比,极高温组的肉鸡肝脏及胸肌中的丙二醛含量显著(P<0.05)升高。总之,通过试验研究可知温度是影响肉鸡生产性能及肉品品质的重要因素之一,日粮能量及蛋白水平也对生产性能及肉品品质有一定的影响。
【英文摘要】This study was conducted to determine the effect of hot environment and dietary crude protein level (CP) on performance, carcass characteristics, meat visual quality, muscle chemical composition and malondialdehyde (MDA) concentration of tissues in broilers. Two hundred and sixteen 21-d old Arbor Acre broilers were used in a 4×3 factorial arrangement and randomly reared in 4 environmental chambers and fed on 3 diets with different CPs for 3 weeks. The results showed: (1) when air temperature (AT) rose to 33°C,average daily feed intake, average daily gain, carcass weight, right breast meat weight, left thigh and drumstick meat weight decreased (p<0.05) and feed conversion rate decreased (p<0.05), but the ratio of carcass to live weight and of left thigh and drumstick meat weight to carcass weight had opposite change (p<0.05). (2) There were significant differences in pH and shear force in breast meat, and shear force, L* and a* in thigh meat (p<0.01 or 0.05) among hot environments. Dietary CP level tended to affect breast meat pH and pH and L* of thigh meat (p<0.06 or 0.09). Compared to the normal temperature (22°C), low temperature (15°C) and hot humid (AT 33°C, relative humidity (RH) 80%) treatment significantly (p<0.05) decreased the tenderness of thigh meat. L* and a* value in thigh meat under high temperature treatments, regardless of RH, was higher (p<0.05) than those under normal temperature. (3) Protein content in breast and thigh meat of broilers fed under high temperature (33°C) was lower (p<0.05) than that under 22°C, but fat content had an adverse change. High temperature (33°C) increased the moisture of breast meat significantly (p<0.05). Protein content in breast meat increased significantly (p<0.05), in which fat content had an adverse change (p<0.05), when the dietary protein rose.(4)MDA concentration in liver and breast meat under hot humid (AT 33°C, RH 80%) treatment increased markedly (p<0.05). (5) High damp could sharpen the bad effect of high temperature on performance, carcass yield and choice cuts, crude protein and moisture content in breast meat. It was concluded that hot environment could affect the performance and meat quality of broiler chicks more significantly than CP level and that high humidity would aggravate the bad influence of high temperature on the broiler.

【题目】二氢杨梅素对肉鸡抗氧化酶及胸肌品质的影响
【中文关键词】二氢杨梅素;肉鸡;抗氧化酶;胸肌品质
【英文关键词】Dihydromyricetin; Broiler; Antioxidant enzyme; Breast meat quality
【中文摘要】本文旨在研究二氢杨梅素(DMY)对肉鸡抗氧化酶及胸肌品质的影响。采用单因子完全随机设计,将144只28日龄的AA肉用公鸡分为4个处理组,每个处理组6个重复,每个重复6只鸡。分别饲喂含0、100、200、400mg/ kg DMY的4种日粮,饲养于7月中旬高温季节,试验持续3周,试验期间日平均温度26.5℃。研究发现,二氢杨梅素对肉鸡血清、肝脏中的超氧化物歧化酶(SOD) 、过氧化氢酶(CAT)无显著影响(P>0. 05) ,但显著降低血清肌酸激酶(CK)的活性及血清和肝脏中丙二醛(MDA)的含量(P<0. 05) ,同时显著降低肉鸡胸肌的滴水损失和剪切力值(P<0.05) ,对肉色L值、a值、b值和pH的影响未达到显著水平。表明二氢杨梅素对肉鸡体内的抗氧化酶无影响,可能通过直接清除自由基,降低体内的脂质过氧化物含量,减少细胞内特征酶的流失,这种作用可能与二氢杨梅素改善胸肌滴水损失和嫩度有关。
【英文摘要】The study was conducted to study the effects of dihydromyricetin (DMY) on antioxidant enzyme and breast meat quality of broilers. One hundred and forty four 28-day-old AA made broilers were randomly allocated to four treatments with six replicates each and six broilers in each replicate, andrespectivelyfedwith0, 100, 200, 400mg/kg DMY. The trial started at Late-July and lasted for three weeks with an average temperature of 26.5°C. The results showed that the supplement of DMY had no significant effect on the activities of SOD and CAT enzyme in serum and liver of broiler (P>0.05) , but significantly decreased the serum CK enzyme activity and the MDA content in serum and liver (P<0.05) . At the same time, it significantly decreased drip loss and shear force of broiler breast muscle (P<0.05) , but had no significant effect on meat color L, a, b and pH value (P>0. 05) . These results indicated that DMY could not affect the antioxidant enzymes. It might reduce lipid peroxidation and loss of feature enzyemes by clearing free radicals directly, which might be associated with improving the drip loss and tenderness of breast muscle.

【题目】Identification of Differentially Expressed Proteins Between Bull X and Y Spermatozoa
【中文关键词】Cattle;2-DE;Differentially expressed proteins
【英文关键词】Cattle;X/Y spermatozoa;2-DE;Differentially expressed proteins
【中文摘要】Differential expression of genes leads to variation in phenotypes of X and Y sperm, even though some differential gene products are shared through an intercellular bridge. Differentially expressed proteins between X and Y sperm sorted from semen of nine bulls were compared using two-dimensional electrophoresis (2-DE) coupled with mass spectrometry (MS) analysis. Overall, 663 ± 12 and 647 ± 22 protein spots were detected in X sperm and Y sperm, respectively, and 42 significant protein spots were differentially expressed between them ($P < 0.05$). Sixteen of these protein spots were successfully identified by MS and tandem MS and were found to be closely relevant to energy metabolism, stress resistance, cytoskeletal structure and the activity of serine proteases. Expression levels of two of these proteins, CAPZB and UQCRC1, were verified by Western blot. We propose that these differentially expressed proteins may affect the phenotype of X and Y sperm, binding and fusion of sperm/oocyte and development of the zygotic embryo. Our preliminary results provide an overview of differential expression in total protein levels between X and Y spermatozoa. Identification of these altered proteins may provide a theoretical basis for understanding the biological differences between the two types of sperm.

【题目】Study of the amplification capacity of a two-temperature PCR and its application in bovine sex identification
【中文关键词】Bovine; Rapid PCR; sex identification; Two-temperature PCR
【英文关键词】Bovine; Rapid PCR; sex identification; Two-temperature PCR
【中文摘要】To study the amplification potential and establish a Two-temperature PCR sex identification method, DNA templates prepared from bovine blood, sperm and hair follicles were amplified through two-temperature PCR in this study. Fragments from 207 bp to 1413 bp could be amplified successfully, while fragments of 1500 bp in length could not be amplified. In further studies, we found that an extension step was necessary to amplify longer fragments, and as the extension time decreased, the denaturation and annealing times were increased. After optimization, we found the best two-temperature PCR to be a reaction using 1.0 mmol/l $Mg2+$, 1.0 unit polymerase and 30 cycles. The amplification results using different equipment and Taq polymerases indicated that the two-temperature PCR can be used for any fragment equal to or less than 1413 bp with any common Taq polymerase. The kinetic rate of the polymerase was determined to be the factor limiting the amplification length and rate. Additionally, the PCR timing was shortened from 1.5-2.0

hours to 30-38 min with the two-temperature PCR. The sex identification of bovine blood, fibroblasts and blastmeres were carried out by turns using this rapid PCR, and a rapid sex identification method of cattle embryo was establishment. Both amplification time and cost were saved greatly with this method and we found that the two-temperature PCR was sensitive and fast enough for widespread use in many research areas, such as genetics, sex identification, forensics and clinical medicine.

【题目】A study of a method to assess the purity of sorted bovine semen using rapid single-sperm sexing PCR

【中文关键词】Single sperm; sex typing; rapid PCR; bovine semen
【英文关键词】Single sperm; sex typing; rapid PCR; bovine semen

【中文摘要】Sort reanalysis using flow cytometry is the most common method for determining the purity of X- or Y-enriched semen. The high cost of this technique (including the required expensive, proprietary machine) limits efforts to improve the technique and to promote develop applications for the sorted semen. In this study, the “ sperm sex ”(the presence of the X or Y chromosome) was identified by both rapid PCR and flow cytometry reanalysis. The rapid PCR results showed that the percentages of X and Y sperm were 48% and 52% in unsorted semen, 92% and 8% in X-enriched semen and 17% and 83% in Y-enriched semen, respectively. Reanalysis of the DNA content of the sorted samples revealed that the X and Y sperm frequencies were 92% and 8% in X-enriched semen and 15% and 85% in Y-enriched semen, respectively. The sex ratio of unsorted semen analyzed by PCR did not significantly deviate from the expected ratio of 1:1, and there was no significant difference between the sex ratios of sorted semen samples determined by PCR and flow cytometry reanalysis. These results indicate that we have established an effective, reliable and rapid PCR method to verify the purity of sorted semen. This method should contribute greatly to the improvement of sperm sorting techniques and the development of applications for sorted semen.

【题目】Study of a simple and rapid PCR sex identification of bovine embryo
【中文关键词】Bovine embryo; rapid PCR; sex identification; Simple PCR
【英文关键词】Bovine embryo; rapid PCR; sex identification; Simple PCR
【中文摘要】A rapid and simple PCR sex identification of embryo is very important for bovine embryo transferring. Many sex identification methods using duplex PCR were established according to Sry gene. But the identification process was affected greatly by more primers interaction. In order to decrease the interference from more primers, we explored a simple and rapid PCR method. The sequences of Amelogenin alleles located at both sex chromosomes were downloaded from GenBank. A pair of sex specific primers was designed to span the 63-bp longer insertion sequence in X chromosome. Bovine samples of blood, fibroblasts and demi-embryos were sexed with these primers. Two-temperature PCR cycling program was used, in which the extension step was deleted, while the denaturizing and annealing steps were shortened to 1 s. The results shown ideal identification were obtained, and observable amplification were also obtained using even single fibroblast. 20 bovine embryos were identified by this PCR cycling program, and 15 embryos (9 females and 6 males) were transferred. The sexing results were confirmed by the anatomically proven sex after parturition, respectively. The comparison of amplification results between blood samples of bovine and human shows the excellent specificity to bovine. Thus, a simple, rapid and effective PCR sex identification method was established.

【题目】牛精子蛋白质组学技术平台的建立及冻融前后精子差异蛋白初步分析
【中文关键词】精子 TRIzol 差异蛋白
【英文关键词】Spermatozoa TRIzol Differential proteins
【中文摘要】通过探索不同的精子蛋白制备方法、水化液成分和优化 2D 电泳程序以建立牛精子蛋白质组学研究技术平台,同时以牛鲜冻精为实验材料通过差异凝胶电泳寻找冻融前后精子蛋白的改变。结果表明:使用改进的热 TRIzol法裂解精子细胞制备蛋白,结合优化的2D 电泳技术可建立稳定的牛精子蛋白质组学研究技术平台。差异凝胶电泳揭示牛精子在冻融后有质和量的改变:冻融后缺失的蛋白点有 20个,表达下调的有 2个,表达上调的有 10个。作为一项阶段性的实验成果,研究建立的 2D平台和所发现的冻融引起的差异表达蛋白质点为揭示冷冻损伤机理和性控精液的差异蛋白质组学研究奠定了较好的基础。
【英文摘要】The proteomics technique platform of bovine spermatozoa was established by exploring the different sample preparation methods, the components of rehydration solution and optimizing the 2D electrophoresis protocols. The differential proteins between the fresh and frozen-thawed spermatozoa were also explored. The results indicated that the technique system with the high qualitative and stable 2D image had been obtained by p reparing the bovine spermatozoa p roteins with the heat TRIzol method and combining with the optimized 2D electrophoresis protocols. The differential in-gel electrophoresis showed that 20 protein spots were absent in quality, 2 spots decreased and 10 spots increased significantly in quantity after frozen2thawed. As a intermediate result, the 2D platform established in the research and the differential proteins found between fresh and frozen sperm will p rovide better basis for revealing the cryodamage mechanism of sperm cryop reservation and studying the differential p roteom ics of the X, Y spermatozoa.

【题目】精子性染色体相关基因转录本及检测方法研究进展
【中文关键词】转录物 精子 性别相关基因
【英文关键词】Transcript Spermatozoa Sex related gene
【中文摘要】精子形成过程中,基因表达经历了减数分裂性染色体失活,但有很多基因在减数分裂后期转录又重新被激活。转录产物研究表明, X和 Y染色体特异基因在不同物种精子中都发生了不同程度的转录,并且对转录产物的研究方法也取得了巨大进展,产生了微阵列、SAGE及抑制消减杂交等先进的技术手段,随着这些技术的日益成熟和完善,通过深入研究,精子中性别相关基因转录表达调控机理将越来越清晰,并推动性别特异蛋白的研究取得更大进展。
【英文摘要】The expression of genes are subject to meiotic sex-chromosome inactivation (MSC I) during spermatogenesis, but lots of gene transcripts are reactivated in postmeiotic. The studies on transcripts show that the transcription of X and Y chromosome

specific genes occur in differentmammalian species spermatozoa in some extent. The study techniques of the transcripts had made great progress, such as DNA microarray, Serial Analysis of Gene Expression, Suppression Subtractive Hybridization and so on. With further development of these technologies, the transcription and regulation mechanism of sex-determining genes in spermatozoa will be more and more clear, and greater progress will be made on the research of sex specific protein.

【题目】猪精液冷冻保存影响因素的研究进展及展望
【中文关键词】精液 冷冻保存 蛋白质
【英文关键词】Semen Cryopreservation Protein
【中文摘要】由于在经济生产中的重要意义,猪精液冷冻保存技术已成为研究的焦点。早期的研究多集中在对冷冻保护剂和冷冻方法的筛选与优化上,对猪精液冷冻保存进行了深入的探索。但研究表明,无论采用何种冷冻保护剂、何种冷冻方法都损害了精子的受精能力,并伴随有蛋白质的丢失、表达量的改变、功能活性的增减等,这就迫使该领域的研究向充分揭示冷冻对精子损伤的机理方向转移,希望通过揭示冷冻保存所导致的蛋白质结构和功能改变的实质,充分阐明冷冻损伤的机理,为猪精液冷冻保存提供理论依据,并最终促进猪精液冷冻保存技术的快速发展。
【英文摘要】Abstract For the important role in economic production, the study has been focused on the technique of cryopreservation of boar semen. During earlier time the screening and optimizing the cryprotective mediums and freezing methods were focused on, which exploited the technique of cryopreservation deeply. However, it indicated that the fecundation ability was decreased no matter what cryoprotective mediums and what freezing methods were used, companied with the losing of proteins, changing of p roteins expressing quantity and increasing or decreasing of the function and activity in sperm after cryopreservation. Now, it is altering to exploit the essence of the change of protein structure and function, and elucidate the cryodamage mechanism of sperm cryopreservation, which may provide the basic theory for cryopreservation of boar semen and promote the rapid development of the technique of boar semen cryopreservation.

【题目】PCR技术在性别鉴定及性别控制应用中的研究进展
【中文关键词】PCR技术 性别鉴定 性别控制 研究进展
【英文关键词】PCR technology Sex identification Sex control Progress
【中文摘要】PCR技术是一项发展迅猛的生物技术,因具有快速、灵敏、简便及特异性强等特点而被广泛应用于性别鉴定及其它许多相关研究领域。应用于性别鉴定的PCR方法从简单PCR法、双重或多重PCR法、巢式PCR法发展到改进的两温度梯度PCR法;而不同性别间除了呈现有或无关系(类似于Sry基因)的基因序列外,也检测到了很多类似于锌指蛋白和牙釉蛋白的呈现不同性别特征的基因序列,这为性别鉴定引物的设计和PCR法进行性别鉴定提供了另一种全新的思路,即如果根据这种性别多态性DNA序列特点设计引物,采用两温度梯度PCR扩增技术进行PCR性别鉴定,则可望简化鉴定程序、降低检测时间、提高鉴定效率,使PCR性别控制技术更加成熟和实用化。随着研究的深入,PCR技术在性别鉴定及控制的应用中必将日益成熟,并推动此项技术在其它相关领域中的研究和应用取得更大的进展。
【英文摘要】As a rapid development biological technology, PCR has been widely used in many related fields such as sex identification with its rapidness sensitiveness, convenience and specificity. The PCR method used in sex identification varies from simple PCR, nested PCR tomodified two-temperature gradient PCR. Besides the gene sequences such as SRY, which only locates in the Y chromosome, gene sequences like zinc finger protein which present different gender characteristics between different genders were also detected. This has provided a brand-new primer designing thought and PCR method for sex identification. With the development of the study, the PCR technique is bound to become more mature on the application of sex identification and sex control. Much more progress will be made on promoting the application of PCR to other related fields at the same time.

【题目】cDNA消减文库差异表达基因检测分析方法的研究进展
【中文关键词】文库筛选; 差异表达基因; 检测分析
【英文关键词】library screening ; differentially expressed genes; detection and assay
【中文摘要】同已有的差异表达基因分离方法相比, 抑制消减杂交以其快速、高效及假阳性率低等优点被广泛应用, 并形成了反向Northern 斑点杂交和表达谱基因芯片技术2 种差减cDNA 文库筛选方法, 同时, 快速发展的生物信息学为文库中大量阳性差异表达片段的序列分析提供了最有力的技术手段, 而RT- PCR 和实时荧光定量PCR 为进一步在mR N A 水平验证基因的表达差异性和初步揭示基因功能奠定了技术基础。作者在简要综述上述各方法的原理、特点及应用基础上指出, 先测序后筛库的研究策略可以在成本增加较低的前提下大幅度提高差异表达基因的研究效率。
【英文摘要】Compared with the existing methods on separating differentially expressed g enes, suppression subtractive hybridization has been used extensively for the characteristics of high eff iciency and low false positive rate, and reverse Northern dot blotting and expression profile gene chip of two kinds of techniques had been developed to screen the subtractive cDNA libraries. At the same time, the highly developing bioinformatics provides the most forceful means to analyse the sequence information of positive differentially ex pressed fragments. Further more, RT- PCR and real time fluorescence quantitative PCR are the methods that further validate the differential expression of genes at mRNA level and exposit the gene functions preliminarily. After reviewing the principles, characteristics and applications of these methods, suggestion was given that the efficiency of research on differentially expressed genes will be increased largely while the cost will not if the library screening strategy was used after sequencing the clones.

【中文关键词】精子;蛋白质组学;双向电泳;基质辅助激光解吸电离飞行时间质谱
【英文关键词】spermatozoa; proteomics; two-dimenional gel electrophoresis; MALDI-TOF-MS
【中文摘要】通过建立牛精子双向电泳 - 质谱鉴定研究平台 ,为从蛋白质水平研究精子生理机能奠定技术基础;采用改进的热 TRIzol法裂解精子细胞制备蛋白 ,应用双向凝胶电泳 (22DE)分离牛精子蛋白 ,通过基质辅助激光解吸电离飞行时间质谱 (MALD I2TOF2MS)鉴定蛋白质点。得到了重复性较好的牛精子2DE图谱 ,质谱鉴定 16个蛋白质点。建立牛精子双向电泳- 质谱鉴定研究平台,为后续牛精子X、Y差异蛋白点的检测和分析奠定了理论和技术基础。
【英文摘要】In order to lay a technological foundation for studying physiological function of spermatozoa, proteomics research of bovine spermatozoa with two dimensional gel electrophesis and MALDI-TOF-MS were established. The heat TRIzol method and two dimensional gel electrophoresis(2DE) were used to separate the total proteins of bovine X and Y spermatozoa, ImageMaster 6. 0 software was applied to analyze 2DE images, and proteins were identified by both MALD I-TOF-MS and 2DE. As a result, 16 proteins in the spermatozoa were identified. So it provided a basis for detecting and analyzing the differential proteins of the X and Y bovine spermatozoa.

【题目】Study on cryodamge mechanism of sperm cryopreservation of bovine
【中文关键词】Proteomics / transcriptomics / cryodamage mechanism/sperm
【英文关键词】Proteomics / transcriptomics / cryodamage mechanism/sperm
【中文摘要】Cryopreservation of bovine sperm can result in as much as a sevenfold fertility decrease. Studying the change of gene expression in transcriptomics and the proteomics level will be useful in understanding the damage mechanism of sperm cyopreservation, and help to find the solution method to increase the efficacy of cryopreservation. Fresh and frozen bull sperm were lysed by TRIzol combining with β -mercaptoethenol respectively. The aqueous phase was used to isolate the total RNA to construct the suppression subtract hybridization library, while the organic phase was used to prepare the global protein. Now the optimized 2D technique has been set up, and the primary 2D map of bovine sperm protein was obtained, in which more than 1000 protein spots could be detected with 2D Platinum 6.0 software. The comparative analysis of global protein between fresh and frozen bull sperm was being proceeded. At the same time, the suppression subtract hybridization library had been constructed and the differential screening step was being performed to minimize the false positive. The results will be verification from the transcriptomics and the proteomics respectively, the cryodamage mechanism will be primarily revealed at last.

【题目】牛冻、鲜精子差异蛋白双向电泳和质谱鉴定的初步研究
【中文关键词】冻、鲜精子;2-DE;质谱分析;冷冻损伤
【英文关键词】frozen and fresh spermatozoa; 2-DE; MS; cryodamage
【中文摘要】采用适合于精子裂解的热 Trizol法制备牛精子全蛋白质,应用线性固相IPG 胶条(pH3~7、24cm)进行精子全蛋白2-DE电泳,在冻精和鲜精蛋白图谱中分别检测到839 ±34个蛋白点和564 ±16个蛋白点,经差异比较和显著性检验,在冻、鲜精子中共得到19个具有显著差异的蛋白点,在冻精中表达上调的蛋白点有9个,表达下调的蛋白点有1个,只在 冻精中表达的蛋白点有9个。经过酶解和质谱鉴定,获得了3个差异蛋白点的质谱信息,生物信息学分析结果发现,这3个差异点分别为中性鞘磷脂酶激活结合因子(FAN)、谷胱甘肽S转移酶(GST-Mu5)及锌离子结合细胞色素氧化酶,分别与细 胞 应 激 和 凋 亡有 关。推测认为,这3种与细胞应激反应及凋亡相关的蛋白在冻精中显著增高可能与精子冷冻损伤有关。
【英文摘要】Heat Trizol method was used to prepare the global protein of bovine spermatozoa, and the global proteins of fresh sperm and frozen sperm was separated by the technique of 2-DE with linear IPG(pH 3 to pH7, 24 cm). 839±34 protein spots were obtained from the sample of frozen spermatozoa, while 564±16 from the sample of fresh spermatozoa. 19 differential proteins between frozen and fresh sperm were detected after analysis and significance test with software of ImageMasterTM 2D platinum, 9 of which were expressed up-regulated while one of which was down-regulated in the sample of frozen spermatozoa. In addition, 9 spots were found only in frozen sperm. After enzymolysis and MS detection, mass sperctrum information of 3 differential proteins were considered to be neutral sphingomyelinase(N-SMase) activation associated fractor(FAN), glutathione-S-transperase(Mu5) and zincion binding structure of bovine heart cytochrome coxidase in the fully oxidized state, which were related to cell stress and apoptosis. It was

presumed that the increasing of these proteins significantly in frozen sperma were involved with cryodamage of sperm.

【题目】猪精子冷冻损伤研究进展
【中文关键词】猪 精子 冷冻损伤
【英文关键词】Boar, Sperm, Frozen-thawed damge
【中文摘要】综述了猪冻存精子顶体、质膜和线粒体的形态学变化及其对精子受精能力的影响,同时分析了冻融精子中所发生的蛋白质、DNA等生物大分子的变化及其可能对冻存精子质量及受精能力的影响,指出冷冻保存过程对精子蛋白质、DNA等生物大分子质和量的影响是精子冷冻损伤的实质,应用先进的蛋白组学进行猪精子冷冻损伤机理研究,有助于深刻揭示冷冻损伤的分子机理,为推动猪精液冷冻保存技术研究取得突破性进展提供理论依据。
【英文摘要】The morphological change of acrosome, plasma membrane and mitochondrion of rozen-thawed boar sperm and their effect on the fertilization ability of sperm were reviewed, and the changes of biomacromolecules of frozen-thawed boar spermatozoa were also analysed. As a result, the conclusion was drawn that the effect of quality and quantity of biomacromolecules such as protein, DNA, are the cryodamage essence of frozen- thawed spermatozoa in the process of cryopreservation. The application of the advanced proteomics on study of the cryodamage mechanism of frozen-thawed boar spermatozoa will contribute to the elucidation of the molecular mechanism of freezing injury, and will provide rationale support for the technique breakthrough of the cryopreservation of boar semen.

【题目】宰前休息方式对猪福利、血液成分及肉质的影响
【中文关键词】商品猪 休息方式 猪福利 血液指标 肉质;
【英文关键词】finishing pigs; lairage conditions; mental performance; blood index; meat quality
【中文摘要】选取体质量约为100 kg、氟烷基因型为NN的长×大二元杂交猪60头,随机分为3组:不休息组,休息3 h组,休息3 h+玩具组,公母各半。根据评分标准分别记录休息过程中猪的精神状况。放血时收集血样,用于分析血浆中皮质醇、促肾上腺皮质激素(ACTH)浓度,乳酸脱氢酶、肌酸激酶活性,乳酸、血糖浓度;添加EDTA-K2抗凝剂的血样用于血细胞分析。同时在放血时,测定血温。屠宰后,测定背最长肌24 h滴水损失;背最长肌(LM)、半膜肌(SM)45 min以及24 h的pH、色值、导电率。结果表明:①休息3 h+玩具组在3个时间段的精神评分要极显著高于休息3 h组,随着时间的延长猪都表现出趋于平静的趋势;②休息3 h+玩具组和休息组3 h组在皮质醇、促肾上腺皮质激素要显著低于不休组(P<0.05),相反乳酸脱氢酶、肌酸激酶要显著高于不休息组(P<0.05),而休息3h+玩具组与休息3 h组差别不显著(P<0.05);③3个休息处理组在肉质指标上没有出现显著差别(P<0.05);④休息3 h+玩具组、休息3 h组在红细胞数(RBC)、血红蛋白含量(HGB)均要显著低于不休息组(P<0.05);休息3h+玩具组在白细胞数(WBC)上显著高于不休组(P<0.05);休息3 h组的淋巴细胞绝对值(W-SCC)显著高于不休息组(P<0.05);而休息3 h+玩具组与休息3 h组在所有的免疫指标上都没有显著差异(P>0.05)。根据上述的结果显示,宰前一定要让猪有一个休息的过程,这种措施能有效缓解猪的应激,并能恢复其免疫能力;在休息的过程中,添加部分福利玩具,至少对猪的精神状态有明显的好处。
【英文摘要】A total of 60 crossbred(Large White × Landrace) pigs with halothane genotype NN(castrated males and females) were allotted into three treatments:3 h lairage with toys,3 h lairage and 0 h lairage in a randomized complete block design and used to evaluate the influence of lairage conditions on mental performance, blood index and meat quality for finishing pigs at slaughter.Mental performance of the pigs was recorded by score standards during lairage. Blood samples were taken at exsanguinations to measure blood temperature, plasma cortisol, ACTH, glucose, lactate, plasma enzymes and hematological index.Post-mortem meat quality measurements including muscle colour value(MCV),electrical conductivity(EC),pH at 45 min and 24 h from Longissimus thoracis and Semimembranosus and drip loss were taken respectively.The result showed:① 3 h lairage group with toys demonstrated significantly higher mental performance than 3 h lairage group at 3 sampling times.All the pigs showed increasedly calm with the lairage time running off;② 0 h lairage increased cortisol, ACTH and lactate(P<0.05),while decreased lactate dehydrogenase(LDH), creatine kinase(CK)(P<0.05).All biochemical index in serum were not influenced by toys during lairage(P<0.05);③ Muscle colour value, electrical conductivity, pH at 45 min and 24 h from Longissimus thoracis(LM)and Semimembranosus(SM) and drip loss were not affected by any treatment(P<0.05);④ 3 h lairage with toys and 3 h lairage groups exhibited high red blood cell(RBC),hemoglobin(HGB) when compared to 0 h lairage.Whereas,3 h lairage with toys displayed higher white blood cell(WBC) levels than 0 h lairage. In addition, Lymphocyte(W-SCC) was significantly higher in 3 h lairage compared with 0 h lairage. There were significant difference for hemocyte index between 3 h lairage with joys and 3 h lairage groups.We could conclude from the results that in local commercial conditions, the most adequate pre-slaughter lairage time was 3 hours for short travel. Pigs resting showed an increase in relieving stress and a recovery in immune competence. Hence, holding pigs in lairage with toys for a few hours after arrival at the abattoir may at least improve mental state.

【题目】宰前应激对猪肉质的影响以及初步机理研究

【中文关键词】宰前应激;肉质;应激激素;肌细胞
【英文关键词】pre-slaughter stress; meat quality; stress hormones; primary muscle cells
【中文摘要】宰前应激在我国猪肉生产中普遍存在。本文旨在研究宰前应激对肉质的影响以及肉质的变化与应激激素之间的关系。并通过体外细胞模型来模拟应激状态下应激激素对肌细胞的影响。结果表明:宰前导致应激激素显著上升(P<0.05),同时大部分肉质指标也发生显著的变化(尸<0.05)。进一步的相关分析表明:宰前应激状态下,应激激素的变化与大部分肉质指标存在着显著相关(P<0.05)。细胞应激模型表明:地塞米松(DEX)对肌细胞有明显的细胞毒性,同时下调GRa基因的表达。BAx基因表达量随DEX刺激浓度的增加而上调,Bcl-2与之相反。且均具有浓度依赖效应。等浓度的Ru486能够完全抑制DEx的生物学效应。推测宰前应激可能通过应激激素与GRa结合发挥其对肌肉组织的毒性作用,这种作用可能通过BAX/Bcl-2来实现对肉质的改变。
【英文摘要】The Pre-slaughter stress commonly existed in the meat practice of pigs. To study the effects ofPre-slaughter on the meat quality and stress hormones of finishing Pigs. A stress model of skeletal muscle was employed in vitro to further find some mechanism of stress hormones how to influence meat quality. The result showed: most of the meat quality was marked change accompanies with an exaggerated release of stress hormones(P<0.05). Statistically there was significant correlation between most of the meat quality and stress hormones(P<0.05). Here we show that in stress model of muscle cells, DEX has significant cytotoxic effects on muscle cells and also markedly down- regulated the expression of GRa. In addition, the mRNA level of Bel-2 was down-regulated while that of BAX was up-regulated, leading to increased ratio of Pro- aPoPtotie BAX/Bcl-2 in a dose-dependent manner. These effects could be prevented by isoconeentration of RU486. We could speculate on the basis of the results obtained from this pilot study that stress hormones might exert its cytotoxic effects on muscle tissue via the binding of GRa and GRa might up- regulate the ratio of BAX/Bel-2 which in turn finally affect meat quality.

【题目】宰杀方式对猪血液成分以及肉质的影响
【中文关键词】宰杀方式; 生化指标; 免疫指标; 肉质
【英文关键词】slaughter measure; biochemical indicator; immunity indicator; meat quality
【中文摘要】选择体重约为100 kg、氟烷基因型为NN的长×大二元杂交猪16头,按照年龄、体重相近,公母各半原则分为2组,试验1组采取直接刺杀心脏放血致死。试验2组采取电麻(75 V1、.5 A、3~4 s)击晕后,割破颈部血管放血致死。屠宰后测定血液生化指标、相关肉质指标以及免疫指标。结果表明:屠宰方式对肉质与免疫能力的影响较小,但反映应激程度的激素指标(皮质醇、促肾上腺皮质激素)差异显著,在屠宰过程中,经历电麻击晕方式的猪比直接刺杀心脏放血屠宰的猪应激程度要小得多,从动物福利角度考虑,电麻击晕优于直接刺杀心脏放血。因此,在这2种屠宰方式选择上,应该优先考虑电麻击晕这一屠宰方式。
【英文摘要】Sixteen crossed pigs(Landrace×LargeWhite) with same HAL genotype(NN) were allotted to two groups according to the age,weight,and sex through a randomized complete block design.The average body weight of these pigs were 100 kg.Pigs were slaughtered by directly killing heart in group 1,and the others were stunned by electricity(75 V,1.5 A,3~4 s).Some blood indicators,meat quality and immunity indicators were analyzed immediately after exsanguinations.The result showed:slaughter measures had little effect on immunity and meat quality.However,some stress indicatiors,such as cortisol and ACTH,showed significant differences between two slaughter methods.It was concluded that pigs subjected to directly killing showed a more intense stress response than pigs subjected to electrical stun-kill.Accordingly,compared to those slaughter methods,we should preferentially choose electrical stun-kill methods,taking into account pig welfare.

【题目】环境富集和饲养密度对绵羊福利的影响
【中文关键词】小尾寒羊;福利;环境富集;饲养密度
【英文关键词】small tail han sheep; welfare; environmental enrichment; stocking density
【中文摘要】试验主要研究环境富集和饲养密度对绵羊生产性能、血清指标、屠宰性能的影响。选用健康的小尾寒羊24只,分为A、B、C3组,每组8只,A组为高集约化模式,B组为高集约化模式+运动场模式,C组为环境富集模式。结果表明,各组绵羊的末重、平均日增重、平均日采食量、饲料转化率差异不显著,环境富集和适宜的饲养密度有提高绵羊生产性能的趋势。环境富集和适宜的饲养密度可以极显著改善前膝清洁度指数(P<0.01),显著改善后膝、后臀的清洁度指数(P<0.05);环境富集和适宜的饲养密度能显著降低第37天血清皮质醇浓度(P<0.05);各组肉品质差异不显著(P>0.05);宰杀后各组pH45min和pHult的差异不显著(P>0.05)。因此,环境富集和饲养密度能在一定程度上提高绵羊福利。
【英文摘要】A study was conducted to investigate effects of environmental enrichment and stocking density on performance,serum cortisol concentrations,meat quality and sarcous pH of sheep,twenty four small tail han sheep were assigned to three treatments:①confinement in a pen(A);②confinement in a pen with a yard(B);③confinement in a pen with a yard and environmental enrichment as well(C).The results showed that environmental enrichment and stocking density had no significant effects on growth performances(P>0.05),although they tended to improve it.A highly significant difference in surface cleanness existed among groups(P<0.01)and at Day 37,environmental enrichment and stocking density significantly significantly decreased serum cortisol concentration(P<0.05).Environmental enrichment and high stocking density did not affect meat yield and pH45 min,pHult of sarcous(P>0.05).The results indicated that environmental enrichment and stocking density can improve sheep welfare.

【题目】畜禽应激、福利与肉品质
【中文关键词】动物应激;动物福利;肉品质
【英文关键词】animal stress; animal welfare; meat quality
【中文摘要】规模化、集约化的工厂式畜禽养殖及加工方式在我国不断推广,与之相关的畜禽应激问题也随之而来,严重影响了动物的福利,进而影响了畜禽的健康及产品品质。本文主要从饲养、运输和屠宰三个环节阐述了畜禽应激、福利与肉品质的联系。
【英文摘要】With the development of intensive livestock, more and more studies focus on animal stress and welfare, which further affected the animal health and meat quality. This article expatiates the relationship between animal stress, animal wealfare and meat quality induced during livestock production, transport and slaughter period.

【题目】地面类型和玩具对生长猪生长和健康的影响
【中文关键词】生长猪;地面类型;玩具;加热地面;健康
【英文关键词】growing pig; floor type; toys; warm floor; health
【中文摘要】试验选用平均体重为26.22kg的生长母猪(大白♂×长白♀)432 头,随机等分成冷地面、冷地面+玩具、加热地面、加热地面+玩具 4 个处理,每个处理 6 个重复,每个重复18 头猪,1 圈为1 个重复,试验期为 35 天。试验期间记录每个处理猪的采食量皮肤损伤得分和圈栏污染情况;采集血样测定肌酸激酶、血糖浓度以及嗜中性粒细胞/淋巴细胞比值(N/L);采集唾液测定皮质醇浓度。结果表明:①与冷地面组相比,加热地面组平均日增重显著升高(P =0.01) ,料肉比极显著降低 (P <0.01) ;玩具能够显著降低猪的平均日采食量(P =0.03) ,但是地面和玩具的互作对猪的生产性能没有显著影响 (P =0.27-0.78) 。②加热地面组相比冷地面组能够显著降低圈栏污染面积(P =0.02) 和躯体皮肤损伤程度(P =0.01) ,加热地面上猪的蹄部损伤也有降低的趋势 (P =0.10) ;玩具对圈栏污染面积和猪体表损伤的影响均不显著(P>0.05) 。③加热地面与冷地面相比显著降低了血糖(Glu)水平(P =0.02) ,玩具显著降低了嗜中性粒细胞的数量(P =0.03) 和N/L 值(P=0.04) 。④试验第一周加热地面上饲养的猪皮质醇浓度极显著降低(P <0.01) ,但是第三周皮质醇浓度无显著减少(P =0.44) ,到第五周仍显著降低 (P =0.04) 。由本试验得出,加热地面可以提高猪的生产性能,减少圈栏污染面积和皮肤损伤;加热地面和玩具都可以减少猪的应激,改善动物福利。
【英文摘要】Four hundreds and thirty-two White×Landrace female growers with initial weight of 26.22±1.17kg were randomly allotted to investigate the effect of floor type (no warm floor and warm floor) and toys (no provided and provided) on the performance and welfare of growing pigs for 35 days. The results showed that, warm floor significantly increased ADG (P =0.01) and decreased F/G (P<0.01) compared to cold floor and toys significantly decreased ADFI (P =0.03), but no interaction between floor type and toys was showed on performance (P =0.27-0.78). The pollution area in pens (P =0.02) and body skin lesion scores (P =0.01) were significantly decreased in the warm floor group compared with the cold floor group. In addition, hoof lesions showed degressive trend in warm floor group (P =0.10), and the pollution of pens and body skin lesion scores had no significant differences between no toys and toys provided. Blood sugar level was significantly decreased in the warm floor compared with the cold floor (P =0.02). Blood neutrophil / lymphocyte (N/L) in the pigs provided with toys significantly decreased (P =0.04). The saliva cortisol level of warm floor group was significantly decreased in the former phase and the latter phase of the trial (P <0.01, P=0.04). In conclusion, warm floor could enhance the performance, reduce the pollution of pens and skin lesions, and in addition, warm floor and toys could reduce the stress and improve the welfare in the pigs.

【题目】不同胚龄皮质酮处理对鸡胚胎生长发育的影响
【中文关键词】鸡; 胚胎发育; 皮质酮; 孵化率
【英文关键词】chicken; embryo development; corticosterone; hatching ability
【中文摘要】本试验通过不同胚龄鸡胚外源皮质酮处理,研究外源皮质酮对鸡胚生长发育及出雏效果的影响,初步探索肉鸡代谢程序化效应。700枚质量相近的AA肉鸡种蛋,分3个不同时间进行卵黄囊重复注射:孵化前注射(E0);7胚龄注射(E7);14胚龄注射(E14);每一时间点分200 ng皮质酮处理组和玉米油正对照组,并设定负对照组1个。21胚龄记录出雏时间、出雏率、出雏重、屠宰器官质量,并测定雏鸡血浆中血糖、尿酸和甘油三酯含量。结果表明:0胚龄皮质酮处理显著降低了孵化率(P<0.05),增加了胚胎的死亡率;7胚龄200 ng皮质酮处理组缩短了孵化时间(P<0.05),并有降低孵化率的趋势,鸡胚胎的心脏、肝脏的发育受到了抑制(P<0.05)。研究表明皮质酮的处理效应与注射胚龄有关,此外注射本身也会对胚胎的发育和物质代谢造成一定的影响。
【英文摘要】The experiment was conducted to investigate the possible effect of corticosterone treatment at different hatching time on the development of chicken embryos.Seven hundreds of AA broiler eggs were divided into 7 groups and randomly subjected to one of the seven treatments:corticosterone treatment(200 ng) at E0,E7 and E14,three positive control groups that injected with corn oil at E0,E7 and E14,and one negative control group.The incubation time,hatching ability and posthatching body weight were recorded.The blood samples were collected and the organs weight were measured after hatching.The results indicated that corticosterone treatment at E0 significantly reduced hatching ability(P<0.05) and increased mortality of embryo.Corticosterone treatment at E7 shortened the incubation time(P<0.05) and tended to reduce the hatching ability.The development of heart and liver were restrained by corticosterone treatment(P<0.05).The result showed that the effect of corticosterone on the development of chicken embryo was age dependent.Moreover,the effect of injection had an adverse effect on embryos as well.

【题目】蛋鸡笼养的福利问题
【中文关键词】蛋鸡;笼养;福利
【英文关键词】hen;cage culture;welfare
【中文摘要】随着蛋鸡生产集约化程度的不断提高,蛋鸡笼养所产生的动物福利问题越来越受到人们关注,世界各国的动物福利组织及法规都要求改善蛋鸡的福利状况。作者综述了蛋鸡笼养所产生的福利和健康问题,以及对传统鸡笼的替代方式。
【英文摘要】With the continuous improvement of the degree of intensification of laying hens, more and more attention is arisen to animal welfare issues for the caged hens. Animal welfare organizations and regulations of the countries in the world are for improving the welfare of laying hens. Caged laying hens welfare and health issues, as well as an alternative to the traditional cages are reviewed here.

【题目】不同笼养条件下蛋鸡健康与福利的比较研究
【中文关键词】笼养条件;蛋鸡;健康;福利;环境
【英文关键词】cage conditions;layers;health;welfare;environment
【中文摘要】研究不同笼养条件下蛋鸡的健康和福利状况。选取位于北京地区的3家商品蛋鸡场,场A、B、C,其饲养密度分别为411、420和450 cm2/只。对夏季不同蛋鸡场内环境参数及空气中NH3、CO2和H2S的质量浓度进行测定,记录蛋鸡的产蛋性能和死亡率,分析异常行为的发生频率。结果表明:场C的即时风速、最大风速和平均风速均显著高于场A和B(P<0.05),场C和A的空气温度、风寒温度、应激温度、露点温度均显著低于场B(P<0.05)。NH3和CO2质量浓度各场均有显著差异(P=0.003和P=0.011),其中均以场C最低,分别为1.00和83.73 mg/m3;H2S质量浓度低于测定下限1.00 mg/m3。观察发现,场C鸡群比场A和B鸡群对外界敏感性强。蛋鸡外观评分各场差异不显著,但蛋鸡步态评分及鸡蛋污损评分各场差异显著(P=0.042和P=0.023),其中步态评分场C显著高于场A和B(P<0.05),鸡蛋污损评分场C显著低于场A和B(P<0.05)。各场中蛋鸡异常行为的发生频率无显著差异。场C入舍母鸡产蛋量显著高于场A和B(P<0.05),平均蛋重、料蛋比、平均产蛋率、高峰期产蛋率、腿病发生率、产蛋疲劳症发生率、死亡率各场均无显著差异,但场C蛋鸡生产周期显著短于场A和B(P<0.05)。3家商品蛋鸡场饲养环境、管理措施等综合因素造成的差异远大于单纯饲养密度造成的差异,为了提高现阶段我国笼养蛋鸡的健康和福利状况,应该更加重视蛋鸡整体养殖环境和管理措施的改善。
【英文摘要】Layer’s health and welfare were compared under different cage conditions.Three commercial layer farms in Beijing were chosen(named A,B and C,respectively) and their stocking densities were 411,420 and 450 cm2,respectively.The environmental parameters,atmospheric NH3,CO2 and H2S concentrations were measured;and laying performance,mortality and incidence frequency of abnormal behavior of layers were recorded and analyzed.The results show that the wind speed,maximum wind gust and average wind speed of C were significantly higher than those of A and B(P<0.05);atmospheric temperature,wind chill,hot stress and dew point in A and C were significantly lower than those B(P<0.05).There were significant differences for average NH3 and CO2 concentration among the farms(P=0.003 and P=0.011) and NH3 and CO2 concentrations in C were lowest(1 mg/m3 and 83.73 mg/m3,respectively)(P<0.05); average H2S concentration was below the limit of 1 mg/m3.The birds from C were observed to have a greater sensitivity to outside visitors compared with those from A and B.Appearance score had no significant difference,but gait score and egg contamination score had significant difference among the farms(P=0.042 and P=0.023),in which gait score of C was significantly higher than that of A and B,and egg contamination score of C was significantly lower than that of A and B.The incidence frequency of abnormal behaviours had no significant differences among the farms.The hen-week egg production was significantly different among the farms(P=0.004),in which C was significantly higher than A and B(P<0.05);there had no significant differences for average egg mass,feed egg ratio,average egg production rate,egg production rate at peak period,leg diseases incidence,layer fatigue incidence,and mortality,except that the production period of C was significantly shorter than that of A and B(P<0.05).The study showed that great differences among the three cage conditions had greater effects on the health and welfare of layers than the stocking density and cage way themselves.To increase the current layer’s health and welfare,more emphasis should be put on the improvement of the total environmental condition and management measures.

【题目】环境丰富度对肉猪生产性能及胴体性状的影响
【中文关键词】舍饲; 环境丰富度; 育成育肥猪; 生产性能; 胴体品质
【英文关键词】housing system; environmental enrichment; growing-finishing pig; performance; carcass trait
【中文摘要】舍饲圈栏环境对猪的生长发育和健康影响很大,为了解不同环境丰富度配置与肉猪生产性能和胴体性状之间的关系,利用铁链、玩具球以及拱槽3种福利性设施,设置8种不同的环境丰富度,对达兰配套系的320头70至150日龄的育成育肥猪进行了试验研究。结果表明:环境丰富度对育成育肥猪的生产性能和胴体品质有明显影响,其中同时设置铁链、玩具球、拱槽试验组的猪只生产性能和胴体品质最好,平均出栏重、平均日增重比对照组提高了5.49kg(p<0.05),10.84%(p<0.05),料重比比对照低13.83%(p<0.05),各处理组的背膘厚、屠宰率、瘦肉率、眼肌面积、胴体长度和后腿比例也均以同时设置铁链、玩具球、拱槽试验组为最好。

【英文摘要】In order to investigate the relationships of housing system environment enrichment on performance and carcass traits of pork pigs, eight different combinations of environmental enrichment were placed in the growing-finishing pig pen with three kinds of welfare establishments: iron chain, toy ball and concrete box with cobbles. A total of 320 Darlland synthetic line pigs(from 70 d to 150 d in day-age) were used to evaluate the influences of the eight combinations environment enrichment on growth performance and carcass characteristics. The results showed that the growth performance and carcass characteristics of pork pigs could be affected by the environment enrichment. Among the seven pens, the highest growth performance and the best carcass characteristics of pigs were showed in the seventh pen which enriched with iron chain, toy ball, and concrete box together. The average finishing weight of the seventh experimental group was 5.49 kg and average daily weight gain(ADG) was 10.84% higher than that of control group($p<0.05$). And the feed conversion ratio(FCR) significantly decreased by 13.83% at the experiment stage. The results of slaughting trial showed that the average thickness of backfat, carcass yield, eye muscle area, carcass length, and the hinder leg weight ratio were better than those of the control group. The seventh group was also the best among the experimental groups.

【题目】夏季饮水温度和圈舍使用风扇对绵羊福利的影响
【中文关键词】小尾寒羊;动物福利;热应激;饮水温度;风扇
【英文关键词】Small-tail Han sheep; animal welfare; heat stress; water temperature; fan
【中文摘要】选用健康的小尾寒羊36只,分为4组,每组3个重复,每重复3只,研究了水温和风扇因素对小尾寒羊生长性能、血清指标、运动量、生理参数的影响。人工设置环境分别为:A组.暴晒+饮水水温35°C;B组,饮水水温25°C;c组,饮水水温15°C;D组,风扇(3.5 m/s)+饮水水温1O°C。结果表明,饮用冷水和风扇因素对试验羊的生产性能没有显著影响($P>0.05$);血清学指标显示,第3O天D组血清皮质醇浓度显著低于A、B组($P<0.05$);第4周c、D组的运动量显著高于A、B组($P<O.05$),A组直肠温度显著高于其他3组($P<O.05$);整个试验期D组的呼吸频率极显著低于其他3组($P<0.O1$)。因此,夏季采用凉水和风扇能部分改善小尾寒羊的福利。

【题目】环境富集材料对不同饲养密度条件下肉鸡生产性能的影响
【中文关键词】饲养密度; 环境富集材料; 肉鸡; 生产性能
【英文关键词】stocking density; environmental enrichment materials; broiler; production performance
【中文摘要】选择21日龄健康的AA肉公鸡816只,研究环境富集材料对不同饲养密度条件下肉鸡生产性能和屠宰性能的影响。试验采用3(饲养密度)×2(环境富集材料)设计,每个处理4个重复。试验结果表明:随着饲养密度的增加,肉鸡日增重和采食量极显著地降低($P<0.01$),料肉比明显增加($P<0.01$),添加环境富集材料除能使高饲养密度组的死亡数大幅度降低外,对生产性能的其他指标影响不明显($P>0.01$);添加环境富集材料能使不同饲养密度水平下饲养的肉鸡的腹脂率明显下降($P<0.05$)。研究表明:高饲养密度降低了肉鸡的日增重和采食量,增加了料肉比;在肉鸡舍中添加环境富集材料降低了肉鸡的腹脂率,且在一定范围内可提高屠体率。
【英文摘要】The effects of environmental enrichment materials on the production and slaughter performance in different stocking density were investigated in these treatments in broiler.This experiment adopted 3(stocking density) ×2(enriched material)

design,selecting 21-day-old healthy Male chickens 816 piece from Arbor Acres(AA) and respectively were equally randomly distributed to 6 treatments,each treatments with repeat 4.The results of this experiment showed that with the stocking density increasing,broiler ’ s daily gain and feed intake was significantly decreased(P<0.01),and feed conversion rate was significantly increased(P<0.01).Add environmental enrichment materials,except enable high stocking density treatments mortality decreased by half,other performance indicators was not obvious effects(P>0.01);stocking density was not affected for carcass ’ s property(P>0.05),but add environmental enrichment materials enable different stocking density levels of feeding chickens percentage of abdominal fat was significantly decreased(P<0.05).The study indicates that high stocking density reduces the broiler ’ s daily gain and feed intake and increased feed conversion rate;Add environmental enrichment materials to percentage of reduce abdominal fat in broiler housing,thereby improving the utilization of the carcass.

【题目】不同饲养方式对肉仔鸡健康状况和行为的影响
【中文关键词】饲养方式; 肉仔鸡; 健康状况; 行为
【英文关键词】rearing pattern; broiler; health; behavior
【中文摘要】本文旨在探讨不同饲养方式对肉仔鸡健康状况和行为的影响。选择健康状况良好、体重为(367.66±1.12)g的480只22日龄爱拔益加肉公鸡,随机分在地面平养、网上饲养及散养3个处理中,每个处理4个重复,每个重复40只鸡。试验期28 d。结果表明:各处理间肉仔鸡的饮水、采食、修饰和休息行为的次数、紧张不动性的持续时间、腿长、腿宽的不对称性(FA)及腿长、腿宽和翅膀长的综合FA、羽毛质量评分(FCS)无显著差异(P>0.05)。与其他2个处理相比,散养组肉仔鸡日常的觅食、沙浴及运动行为的次数显著增加,步态评分值显著降低(P<0.05)。与网上饲养相比较,散养显

著降低了肉仔鸡翅膀宽的FA(P<0.05)。由此可知,散养在一定程度上提高了肉仔鸡的健康状况,丰富了肉仔鸡的自然行为。
【英文摘要】The trial was conducted to investigate the effects of rearing pattern on health and behavior of broilers. Four hundred and eighty 22-day-old healthy AA cocks with an average body weight of (367. 66 ±1.12) g were allocated into three treatments, which included floor-reared, net-reared, extensive-reared group, and four replicates in each treatment, forty broilers in each replicate. The results showed that, there were not significant differences in the times of drinking, foraging, preening and resting, the tonic immobility duration (TI), fluctuanting asymmetry (FA) of leg length and width and the combined fluctuanting asymmetry of leg length, leg width and wing length, and feather conditions score (FCS) among treatments (P>0. 05). Compared to the other two treatments, the times of foraging, sand bathing and movement behavior in extensive-reared group increased significantly, and gait score (GS) decreased significantly (P<0. 05). Compared to the netreared group, fluctuanting asymmetry (FA) of wings width in extensive-reared group increased significantly (P<0. 05). It was concluded that the extensive-reared group improved the health status and enriched the natural behavior of broilers.

【中文关键词】生长母猪;群体规模;玩具;生产性能;福利
【英文关键词】growing pig; group size; toys; performance; welfare
【中文摘要】本试验选用日龄、体重相近(26.32 ±0.98kg)的648 头二元杂交生长母猪(大白♂×长白♀)随机分为四组,采用2*2 双因子设计,因子一为群体规模,设18 头/ 圈和54头/ 圈2 个水平,因子二为玩具,设无玩具和有玩具两个水平。每个处理组合设 4 或6圈(重复),所有试猪获得的资源(料槽宽度、饮水器数量)和饲养密度(0.96m2/ 头)相同,试验期为35 天。试验发现,群体规模和玩具对生长猪的生产性能影响不大(p >0.05) ;大圈饲养能明显降低圈栏的污染面积(p <0.01) ,而玩具因素对圈栏的污染面积影响不大 (p >0.05) ;试验初期,有玩具的猪只唾液皮质醇含量明显低于无玩具组(p <0.01) ;大圈饲养和提供玩具分别与小圈饲养和无玩具组相比均能显著降低血液中嗜中性粒细胞与淋巴细胞比(N/L)值 (p <0.01, p<0.05) 。因此表明,群体规模和玩具因素在不降低猪生产性能的同时,能提高猪的抗应激能力,一定程度上提高了猪的福利水平;大圈饲养还

能有效地减少圈栏的污染面积,提高猪舍的卫生状况。
【英文摘要】Six hundreds and forty-eight White×Landrace female growers of similar initial weight (26.32 ±0.98kg) and age were randomly allocated to investigate the effect of group size (18 and 54 pigs/pen) and toys (no provided and provided) on performance and welfare for 35 days. For all the trial pigs, space allowance was 0.96m2/pig, with one drinker per 9 pigs and 7.8cm feeder allowance per pig. The result showed that average daily feed intake (ADFI), average daily ga in (ADG) and feed conversion ration (FCR) were not different among all the treatments (p >0.05). Over the entire period of the trial, large groups had less pollution proportion of the pens than small groups (p <0.05).Toys decreased saliva cortisol concentration at day 3 of the trial (p <0.01). Neutrophil: lymphocyte ratios (N/L) also differed and the pigs with large-group or toys had low N/L value (p <0.01, p <0.05). It was concluded that large group and toys could increase the anti-stress capability and welfare of the pigs with no difference of performance, and that large group also decreased the pollution proportion of the pens.

【题目】实行畜禽福利饲养是有机畜牧业的基本要求
【中文关键词】畜禽福利; 有机畜牧业
【英文关键词】animal welfare; organic animal husbandry
【中文摘要】从畜禽福利和有机畜牧业的概念出发,阐述了二者之间的内在联系以及在我国的重视程度、发展现状和实践意义,最后探讨了畜禽福利和有机畜牧业在促进我国畜牧业持续发展中的作用。由此得出,实行畜禽福利饲养是有机畜牧业的基本要求,而且发展福利饲养和有机畜牧业将有利于从根本上解决目前我国畜牧业面临的环境污染、产品品质和安全问题。
【英文摘要】Based on the concepts of animal welfare and organic animal husbandry,this paper expounds the inherent relation between the two,their development status,significance for practice and the importance in China.Finally,it discusses the role of animal welfare and organic animal husbandry in promoting the sustainable development of animal husbandry in China.It is therefore concluded that welfare raising is a basic requirement for organic animal husbandry,and that developing welfare raising and organic animal husbandry will solve the problems of environmental pollution,quality and safety of products confronting animal husbandry in China.

【题目】有效温度与日粮能量水平对肉鸡生产性能及胴体组成的影响
【中文关键词】肉鸡; 有效温度; 代谢能; 生产性能; 胴体组成
【英文关键词】broiler; effective temperature; metabolizable energy; performance; carcass composition
【中文摘要】采用4×3双因子多水平随机试验设计,研究了有效环境温度(ET,15.0、21.2、35.3和37.6℃)和日粮能量浓度(ME,11.71、12.55和13.39 MJ/kg)对4~6周龄肉鸡生产性能、屠体性能和肌肉成分的影响。试验选用21日龄AA肉鸡216只,随机分为12个组,置于4个环控舱中,每舱3组,每组等分成3个重复(笼),每个重复(笼)6只鸡,饲喂1种试验日粮,为期3周。试验开始及结束时测量试鸡的个体体重和相应阶段各重复的耗料量;饲养试验结束时进行屠宰,测量屠宰指标,并取胸、腿肌测定其成分。结果表明:(1)有效温度对肉鸡的日采食量、日增重及料肉比影响显著(P<0.05),当温度超过常温时,日采食量及日增重显著下降(P<0.05),料肉比显著升高(P<0.05);(2)高温或极端高温显著提高肉鸡的屠宰率、半净膛率、全净膛率和腿肌

率(P<0.05),显著降低屠体重、胸肌重、腿肌重、胸肌率、皮下脂肪厚、肌间脂肪宽(P<0.05)。低温组屠宰率显著升高(P<0.05),皮下脂肪厚显著下降(P<0.05)。随着日粮能量浓度的升高,肉鸡屠体重显著升高(P<0.05),胸肌率及皮下脂肪厚显著降低(P<0.05);(3)有效温度对胸肌常规成分和胆固醇含量均有显著影响(P<0.05)。与常温组相比,极高温组鸡的胸肌和腿肌蛋白质含量显著下降(P<0.05);有效温度的上升与下降都显著增加了胸肌及腿肌的粗脂肪含量(P<0.05);高温及极高温显著增加了胸肌的水分含量(P<0.05);低温显著降低腿肌的粗灰分(P<0.05)。日粮能量水平对腿肌粗蛋白含量有显著影响(P<0.05),与适能组相比,高能组腿肌蛋白质含量显著降低(P<0.05)。有效温度与日粮能量蛋白水平对胸肌粗灰分含量有交互作用(P<0.05)。由此可得,有效温度对肉鸡生产性能、屠体组成和胸肌、腿肌成分的影响程度远远超过日粮能量浓度,高温能显著降低肉鸡生产性能、屠体性能、肌肉蛋白质含量,增加肌肉脂肪含量,而提高日粮能量浓度则可增加肉鸡屠体重,但能否通过调整日粮能量浓度以减缓高温对肉鸡生产性能、其它屠体指标和肌肉成分的影响还有待进一步研究。

【英文摘要】In a 4×3 factorial design trial,216 21-day-old Arbor Acre(AA) broilers were randomly allocated into 12 groups,each with 3 replicates of 6 birds,reared in 4 chambers which effective temperature(ET) was controlled at 15.0,21.2,35.3 and 37.6℃,respectively,and fed on one of the trial diets containing 11.71,12.55 and 13.39 MJ/kg ME,respectively,for three weeks.Body weight and feed consumption were measured at d 21 and d 42.After feeding trial,two birds from each replicate were slaughtered for carcass and meat measurement.The results showed that:(1) Under high temperature(35.3℃ and 37.6℃),average daily feed intake(ADFI) and average daily gain(ADG) significantly decreased(P<0.05),and feed conversion rate(FCR) markedly rose(P<0.05).Trial dietary ME level and the interaction between ET and ME had no remarkable effect on performance.(2) High temperature(35.3℃ or 37.6℃) increased significantly the ratio of carcass yield to live weight,percentage of half-eviscerated yield,percentage of eviscerated yield and the ratio of meat yield in left thigh and drumstick to uneviscerated carcass yield(P<0.05),but decreased significantly carcass yield,meat yield in right breast,meat yield in left thigh and drumstick,the ratio of meat yield in right breast to uneviscerated carcass yield,subcutaneous fat thickness and fat width between muscles(P<0.05).Under low temperature the ratio of carcass yield to live weight increased and subcutaneous fat thickness decreased significantly(P<0.05).Carcass yield increased,and the ratio of meat yield in right breast to uneviscerated carcass yield and subcutaneous fat thickness decreased significantly(P<0.05),as the dietary ME level rose.(3) High temperature(37.6℃) decreased the protein of breast meat and thigh meat significantly(P<0.05);Both high and low temperature significantly increased the fat deposition of breast and thigh meat(P<0.05);High temperature(35.3℃ and 37.6℃) increased the moisture of breast meat significantly(P<0.05);Low temperature decreased the meat ash significantly(P<0.05).The protein of thigh meat in the broilers reared under high dietary ME was significantly lower than that under proper dietary ME(P<0.05).It was concluded that ET had more significant effect on performance and carcass composition in broiler than dietary ME level,and that there were lower performance,carcass composition and crude protein content in meat in broiler reared under high temperature.

【题目】沙棘提取物对断奶仔猪消化机能的影响

【中文关键词】沙棘提取物; 断奶仔猪; 断奶应激; 消化机能

【英文关键词】sea buckthorn extracts; weaned piglets; weaned stress; digestive function

【中文摘要】选取28日龄长×大二元断奶仔猪24头,随机分两处理组,每个处理3个重复,每个重复4头,对照组饲喂基础日粮,试验组饲喂添加0.1%沙棘提取物的日粮,试验期28d。试验结束时测定胃、胰腺和小肠内容物的胃蛋白酶;胰腺和十二指肠的淀粉酶、脂肪酶、蛋白酶;胃黏膜厚度、小肠各段绒毛高度和隐窝深度。结果表明,在饲料中添加0.1%沙棘提取物可显著提高断奶仔猪消化酶活性以及空肠和回肠的绒毛高度(P<0.05),并可改善断奶仔猪消化机能,缓解仔猪的断奶应激。

【英文摘要】To evaluate the effects of sea buckthorn extracts on digestive function in weaned piglets, 24 Landrace×Large White weaned piglets at (28±2) d of age were randomly allotted into the treatment and control group, respectively. Each group was randomly assigned to a diet containing 0 or 0.1% of sea buckthorn extracts. Each treatment was replicated using three repititions with four piglets. Experimental period was 28 d. The results showed that both jejunum villus height and the activities of digestive enzymes of weaned piglets increased significantly by sea buckthorn extracts (P<0.05), others were not significantly (P>0.05). The results suggest that digestive function is improved by diet containing 0.1% sea buckthorn extracts, thereby weaned stress is alleviated.

【题目】生长育肥猪对环境丰富度材料的选择倾向性研究
【中文关键词】生长育肥猪; 环境丰富度; 选择倾向; 接触频次; 福利
【英文关键词】finishing pig; environmental enrichment; selection preference; contact frequency; welfare
【中文摘要】研究舍饲圈栏条件下猪对环境丰富度材料的选择倾向性。随机抽取20头70~150日龄生长育肥猪,选择不同的啃咬、鼻拱及蹭痒材料,就生长育肥猪对各种材料的接触频次及时间等行为学指标进行研究。结果表明:生长育肥猪对各种材料的选择偏爱程度随放置时间的延续而减弱;对啃咬材料的接触频次大小和接触时间长短顺序依次为,铁链>尼龙绳>剪成条状的自行车内胎>塑料水管>细铁棍,其中对铁链的接触频次显著高于其他材料;对鼻拱材料的接触频次大小、接触时间长短依次为新鲜泥土>鹅卵石>蘑菇培养土>稻草>碎木屑>玩具塑料球;猪蹭痒时更多的选择木质蹭痒架。
【英文摘要】It is an important technical measure to improve the welfare of housing pigs by increasing the environmental enrichment.To investigate the selection preference of finishing pigs for different environmental enrichment materials in a housing system,some environmental enrichment materials were tested in this study.The actions of 20 finishing pigs randomly selected were video-recorded and analyzed the contact frequency and time.The result showed that the contact frequency and times between the pigs and the gnawing materials decreased with the time of a material to be provided.The sequence of the contact frequency and time was: iron chain>nylon string>striped bicycle inner tube>plastic water pipe>thin iron stick.The average contact frequency of iron chain is significantly higher than that of others.The sequence of contact frequency and time between pigs and the rooting materials is: fresh clay>cobble>incubation earth for mushroom>straw>smashed sawdust>plastic ball.The favorite ranking material for pigs is wood shelf.

【题目】长期高温对商品肉鸡和地方品种鸡肉质及风味的影响
【中文关键词】热应激;肉质性状;风味;肉鸡
【英文关键词】heat exposure; meat quality traits; flavor; broiler
【中文摘要】选择体质量相近、健康的5周龄AA肉公鸡和北京油鸡公鸡各108只,评价持续高温对其胸肌肉质性状及风味物质含量的影响。试验设3个处理:34℃持续高温,自由采食(试验组,34AL);21℃适温,自由采食(适温对照组,21AL);21℃适温,采食量与34AL组相同(采食配对组,21PF)。每个品种的鸡随机分在3个处理中,分别在3个人工环境控制舱中饲养,试验至8周龄结束。结果表明:在34℃环境温度下饲养3周后,AA肉鸡胸肌L*值和滴水损失增加(P<0.05),肌苷酸含量降低(P<0.01),肌内脂肪含量明显升高(P<0.01);热暴露北京油鸡胸肌肉质性状(除pHu外)及肌内脂肪、肌苷酸含量与对照组相比无显著差异(P>0.05)。研究指出,持续34℃高温使AA肉鸡胸肌肉质有一定程度下降;而北京油鸡对高温的适应性较强,肌纤维对高温不敏感。
【英文摘要】108 healthy male chickens(5 wk old) with similar body weight,from Arbor Acres(AA) and Beijing-You(BJY) respectively were used to study the effects of chronic heat stress on meat quality and contents of the flavor substances in breast muscle.Chickens from each stock were randomly alloted into 3 treatments: constant high ambient temperature at 34 ℃ with ad libitum feeding(34AL),constant optimal ambient temperature at 21 ℃ with ad libitum feeding(21AL),and constant optimal ambient temperature 21 ℃ but pair-fed to the amount consumed by the 34AL group(21PF).All birds were reared in 3 environmental chambers until the end of the trial at 8 wk of age.The results showed that exposed to the heat of 34 ℃ for three weeks,AA broilers exhibited higher L* values and drip loss in breast muscle(P<0.05),moreover,they showed decreased content of insine monphosphate(IMP)(P<0.01).For BJY chickens,heat exposure had no significant influence on meat quality traits(except for pHu) and contents of IMF and IMP in breast muscle(P>0.05).The data indicated that chronic heat exposure(34 ℃) had a detrimental effect on meat quality traits of breast muscle in AA broilers,while Beijing-You chickens had higher adaptability to high temperature,their muscle fibers were insensitive to heat exposure(34 ℃).

【题目】用超声波活体检测建立肉牛宰后性状的预测模型
【中文关键词】肉牛 超声波技术 宰后性状 数学模型
【英文关键词】无
【中文摘要】为了对肉牛进行早期选择并适时屠宰,该文通过超声波活体检测技术获得6种国内常用肉牛杂交品种和本土品种(60头)8月龄、22月龄眼肌面积和背膘厚数据,集中育肥屠宰后,用50头幼龄牛和成年牛超声测定的眼肌面积、背膘厚及体重建立了成年牛宰后性状(眼肌面积、背膘厚、产肉性状(高档肉质量、后部肉质量、优质肉质量和胴体质量))的数学预测模型,并对加入体重资料前后的预测模型进行检验分析.结果表明,屠宰后眼肌面积、背膘厚预测模型的决定系数小于0.75,但产肉性状预测模型的决定系数均大于0.75,经10头牛数据验证,所有模型预测结果与实测结果无显著差异,说明利用超声波技术测得幼龄牛或成年牛的眼肌面积和背膘厚预测屠宰后眼肌面积、背膘厚和产肉性状是可行的,且加入体重的预测模型较未加入的模型更为精确

【题目】牛Fas基因的cDNA克隆及其功能预测分析
【中文关键词】as/APO-1/CD95;牛;基因克隆;序列分析
【英文关键词】无
【中文摘要】RT-PCR技术从中国西门塔尔牛睾丸组织总RNA中反转录Fas cDNA,将其克隆于PMD19-T vector后进行测序分析,并对其表达的蛋白结构功能进行预测、分析.结果表明,牛的FaS cDNA序列为1109 bp,编码323个氨基酸残基,在氨基酸序列上与羊、猪、人、小鼠的同源性分别为90.5%、65.3%、56.7%和48.6%。Fas蛋白的胞外区有2个糖基化位点和3个富含半胱氨酸残基的结构亚域,对Fas蛋白的定位及凋亡信号识别有重要作用。牛与羊、猪、人、小鼠Fas的死亡结构域(FADD)氨基酸序列的同源性分别为94.3%、68.5%、59.6%和70.8%,体现了该结构在各物种间较强的保守性及接受凋亡信号诱导靶细胞凋亡的重要性。组织表达谱发现Fas不仅表达于牛的淋巴、脾等淋巴系统,而且高表达于牛生殖系统的睾丸,卵巢等器官,对于进一步阐明Fas在公牛精子发生过程中的调控作用奠定基础.

【题目】牛生长性状、肉质性状和胴体性状间的典型相关分析
【中文关键词】:生长性状;肉质性状;胴体性状;典型相关
【英文关键词】无
【中文摘要】在牛的育种实践中,通常要同时对多个性状进行选育。为了取得更大的经济效益,就要努力选育生长速度快、肉质鲜嫩并且牛肉产量高的品种或品系。在制定育种方案时,较难同时考虑两两性状间相关关系,而通过对包含不同数量性状指标的各组变量进行相关关系研究,就可以达到对多个数量性状综合选择的目的。典型相关分析就是研究两组性状之间相关关系的一种统计方法,它既能反映各性状组内部的线性关系,又能反映组间的相关关系,是了解多个性状间遗传规律的好方法。本研究通过对牛育种中常用的二类性状进行典型相关分析,揭示各组性状间的内在联系,为我国牛的遗传育种提供参考。

【题目】牛睾丸差异表达基因Septin 10的筛选、鉴定及组织表达研究
【中文关键词】睾丸周长;DDRT—PCR;Septin 10;反Northern杂交i荧光定量PCR;组织表达谱
【英文关键词】rotal circumference;DDRT—PCR;Septin 1 0;the reverse Northern blot;realtime PCR;multi-tissue expression profile
【中文摘要】本研究旨在筛选出决定或影响公牛睾丸周长(SC)的基因片段,并研究其功能和表达特征,为今后种公牛的选育提供理论基础.用mRNA差异显示技术从睾丸周长极显著差异(P<0.01)的睾丸组织中筛选差异表达的基因片段,并用反Northern杂交及荧光定量的方法鉴定筛选的结果,研究筛选出基因的组织表达谱.结果,筛选出1条差异表达片段A71,经测序和BLAST分析发现该片段与牛Septin 10基因高度间源(99%),且该基因在肝脏等9个组织中都有表达,在2组睾丸组织中相对表达量差异显著(P<0.05).分析结果表明,Septin 10基因是牛睾丸差异表达基因,可作为一个研究牛繁殖性状的候选基因.
【英文摘要】This study was designed to detect differential gene expression fragments in bulls of two groups which had significant difference in scrotal circumference (SC) (P<0.01), and analyze their expression characteristics. The differential gene expression fragments were detected by dif-ferential display RT-PCR, then were identified by the reverse Northern blot analysis and real-time PCR analysis, finally the expression profile of the differential gene was analyzed. One spe-cific fragment named A71 was found. After sequencing and BLAST analysis, A71 showed high homology (99%) to bovine Septin 10 gene. The gene was expressed in various tissues, and showed significant difference between the two groups (P<0.05). The results indicated that the Septin 10 gene was differential

expression gene in testicle of bulls and it might be a candidate gene in regulating reproduction traits in bulls.

【题目】牛PON1基因对生长和胴体性状的影响
【中文关键词】肉牛;PONl基因;SNPs;关联分析;生长性状;胴体性状
【英文关键词】beef cattle;PONl gene;SNPs;association analysis;growth traits;carcass trait
【中文摘要】克隆了牛PONl基因,检测其外显子上的SNPs,对EcoRV和Alu I 2种限制性内切酶酶切PONl基因后的等位基因频率和所产生的基因型频率进行估计,并对EfoRV和Alu I 2种酶酶切后所产生的多态性对生长和胴体性状的影响进行分析。实验动物为30头安格斯、30头海福特和28头西门塔尔牛。关联分析应用SAS9.1的GLM过程中最小二乘均数Tukey7S检验进行分析。结果明,PONl基因克隆获得1 205 bp的cDNA序列,其编码区为1 068 bp,编码355个氨基酸;外显子SNPs检测表明,仅在其第6外显子区域存在2个突变化点,且没有引起氨基酸变异,但可分另0被EcoRV和Alu I 2种酶酶切。EcoRV位点,AG基冈型的个体有着较高的试验前体质量(329.97土6.08)kg,宰前质量(577.56士8.32)kg,净肉质量(275.894-4.05)kg和较为适僦的嫩度(3.10_-4-0.19)kg(P<O.05);Alu I位点,AA基因型的个体也有着较高的试验前体质量(333.37±8.93)kg,宰前质量(576.82±1'3.18)kg,净肉质量(275.49士6.43)kg和平均口增质量(o.68±0.02)kg·d。(P<O.05);并在此位点不同的基因型个体间肉色评分有着硅著的差异(P<O.05)。在曲种和基因之间除了全骨质量、眼肉质量、大理行花纹评分、眼肌面积和肉色评分外,其它性状均存在显著的差异(P<0.05)。连锁分析表明,作为一个新陈代谢功能基因,PONl基因的单核苷酸多态性可能直接影响肉牛的背膘厚,如A。A。G。G。基因型。
【英文摘要】In order to estimate the allelic and genotypic frequencies at the PONl/EcoR V and PONl/AluI loci and association analysis between these SNPs and growth and carcass traits.The cDNA of bovine PONl gene was cloned,and the SNPs in its exons were detected.Genotyping was performed on 30 Angus,30 Hereford and 28 Simmental cattles using the GLM procedure of SAS and the least square means of the genotypes were compared by the Tukey’S test.1 205 bp cDNA sequence were obtained.including 1 068 bp ORF region and which encodes 355 amino acids residues,and was accessed by GenBank,the accession number is EU289337.Two SNPs were detected in exon6 only.Individuals with AG genotype at the PONl/EcoR V 10CUS have higher weight at the time of entry into the fattening corrals(329.97±6.08)kg and close to the time of slaughter(577.56±8.32)kg and net meat weight(275.89±4.05)kg,fitted tenderness(3.10士0.19)kg(P<O.05);Individuals with AA genotype at PONl/Alu I locus has higher weight at the time of entry(333.37±8.93)kg and slaughter(576.82士13.18)kg and net meat weight (275.49±6.43)kg,and average daily

gain(0.68±0.02)kg · d叫(P<0.05).The meat color score is also significant higher(P<0.05).Between genotypes and breeds,there were significant difference observed except TBW,REMG,MBS,REA and MCS(P<O.05).As a metabolism gene,genotypes of the SNPs of PONl gene might be reflecting BFT directly,such as A。A。G。G。genotype ·

【题目】牛TG基因启动子区遗传变异与肉质和胴体性状的相关性研究
【中文关键词】牛 甲状腺球蛋白基因 肉质性状 胴体组成性状
【英文关键词】cattle;thyroglobulin gene;meat quality traits;carcass composition traits
【中文摘要】以8个肉牛品种为试验材料,扩增TG基因启动子区,测序后发现G82A和C422T 2个突变位点.利用SAS软件采用最小二乘法拟合线性模型将2个位点的不同基因型与牛胴体组成和肉质性状进行关联分析.结果发现,C422T位点与先前报道的大理石花纹等级无相关性,与其它胴体组成和肉质性状也未发现相关性.位于C422T位点上游的G82A位点与宰前活体质量和眼肌面积显著相关(P<0.05),GG为有利基因型,G等位基因为有利等位基因.因此,G82A可能是影响牛胴体性状的分子标记
【英文摘要】In this experiment,promoter region of TG gene from eight breeds was amplified and sequenced.Two SNPs were identified at position 82 and 422 of TG gene(X05380).The effects of these polymorphisms of TG gene on carcass and meat quality traits were analyzed.The results showed that C422T polymorphism had no association with marbling score and any other carcass and meat quality traits.G82A polymorphism significantly associated with live weight and loin muscle area(LMA)(P<0.05).Individuals with genotype GG and GA had significantly larger liveweight and LMA than those with AA genotype(P<0.05).In a word,G82A SNP might be a good DNA marker to be used in MAS for carcass traits

【题目】RESEARCH ON AN EFFECTIVE DOMAIN META-SEARCH ENGINE SYSTEM
【中文关键词】meta search engine; domain information; web search engine.
【英文关键词】meta search engine; domain information; web search engine.
【中文摘要】The rapid growth of web information brings a fact that a single search engine can not return a satisfied result for users ' queries. In this paper, we propose an effective domain search engine system, called DSES, which can obtain results by a unified interface to several searches and aggregates them using an efficient domain determination algorithm. Finally, we give an experiment whose result proves the validity of the method using for searching domain Web page's information.

【题目】Allelic variants of phytoene synthase 1 (Psy1) genes in Chinese and CIMMYT wheat cultivars and development of functional markers for flour colour
【中文关键词】小麦, Psy1, 基因, 功能标记
【英文关键词】Wheat, Psy1, Gene, Functional markers
【中文摘要】Phytoene synthase genes influence yellow pigment (YP) content in wheat grain, and are associated with the quality of end-use products. In the present study, a suite of 217 Chinese winter wheat cultivars and 342 CIMMYT spring wheat cultivars were used to search for phytoene synthase 1 gene variations and to detect and compare their genetic effects in different genetic backgrounds. An initial focus on the Chinese winter wheat cultivars revealed four allelic variants of this gene on chromosome 7B (Psy-B1), designated as Psy-B1a, Psy-B1b, Psy-B1c and Psy-B1d. The frequencies of these four alleles were 39.6, 43.8, 15.7 and 0.9%, respectively. A co-dominant marker YP7B-1 based on a 5-bp InDel of polyCin the fifth intron of Psy-B1 amplified a 151-bp PCR fragment in accessions with the medium YP content allele Psy-B1a, and a 156-bp fragment in lower YP content accessions with Psy-B1b. Two dominant markers YP7B-2 (428 bp) and YP7B-3 (884 bp) were designed for accessions with Psy-B1c and Psy-B1d, respectively. Allele Psy-B1c was associated with high YP content, but the phenotypic effect of Psy-B1d was not determined due to the limited number of accessions. In CIMMYT spring wheat cultivars, Psy-B1a, Psy-B1b, Psy-B1d and a further allelic variant, Psy-B1e, were detected with frequencies of 50.6, 29.2, 19.6 and 0.6%, respectively. Psy-B1c was not found in the CIMMYT germplasm. However, no significant differences were detected for mean YP content among CIMMYT wheat lines with different Psy-B1 genotypes. A new allelic variant of Psy-A1, designated Psy-A1c, was identified in three CIMMYT wheat lines, and this allele was associated with higher YP content.

【题目】Allelic Variation at the Vernalization Genes Vrn-A1,Vrn-B1, Vrn-D1, and Vrn-B3 in Chinese Wheat Cultivars and Their Association with Growth Habit

【中文关键词】小麦,春化基因,分布规律

【英文关键词】Wheat, Varnalization genes, Distribution

【中文摘要】Information on the distribution of vernalization genes and their association with growth habit is crucial to understanding the adaptability of wheat (Triticum aestivum L.) cultivars to different environments. In this study, 278 Chinese wheat cultivars were characterized with molecular markers for the vernalization genes Vrn-A1,-B1, -D1, and -B3. Heading time was evaluated in a greenhouse under long days without vernalizaton. The dominant Vrn-D1 allele showed the highest frequency in the Chinese wheat cultivars (37.8%), followed by the dominant Vrn-A1, -B1, and -B3 alleles. Ninety-two winter cultivars carried recessive alleles of all four vernalization loci, whereas 172 spring genotypes contained at least one dominant Vrn allele. All cultivars released in the North China Plain Winter Wheat Zone were winter type. Winter (53.0%), spring (36.1%), and early-heading (10.9%) cultivars were grown in the Yellow and Huai River Valley Winter Zone. Most of the spring genotypes from this zone carried only the dominant Vrn-D1 allele, which was also predominant (64.1%) in the Middle and Lower Yangtze Valley Winter Zone and Southwestern Winter Wheat Zone. In three spring-sown wheat zones, all cultivars were early-heading spring types that frequently possessed the strongest dominant Vrn-A1a allele and combinations with other dominant Vrn gene(s). The Vrn-D1 allele is associated with the latest heading time, Vrn-A1 the earliest, and Vrn-B1 intermediate values. The information is important for breeding programs in countries interested in using Chinese wheats.

【题目】Allelic variation of polyphenol oxidase (PPO) genes located on chromosomes 2A and 2D and development of functional markers for the PPO genes in common wheat
【中文关键词】小麦,Ppo基因,功能标记
【英文关键词】Wheat, Ppo genes, Functional marker
【中文摘要】Polyphenol oxidase (PPO) activity is highly related to the undesirable browning of wheat-based end products, especially Asian noodles. Characterization of PPO genes and the development of their functional markers are of great importance for marker-assisted selection in wheat breeding. In the present study, complete genomicDNA sequences of two PPO genes, one each located on chromosomes 2A and 2D and their allelic variants were characterized by means of in silico cloning and experimental validation. Sequences were aligned at both DNA and protein levels. Two haplotypes on chromosome 2D showed 95.2% sequence identity at the DNA level, indicating much more sequence diversity than those on chromosome 2A with 99.6% sequence identity. Both of the PPO genes on chromosomes 2A and 2D contain an open reading frame (ORF) of 1,731 bp, encoding a PPO precursor peptide of 577 amino acids with a predicted molecular mass of » 64 kD. Two complementary dominant STS markers, PPO16 and PPO29, were developed based on the PPO gene haplotypes located on chromosome 2D; they amplify a 713-bp fragment in cultivars with low PPO activity and a 490-bp fragment in those with high PPO activity, respectively. The two markers were mapped on chromosome 2DL using a doubled haploid population derived from the cross Zhongyou 9507/CA9632, and a set of nullisomic – tetrasomic lines and ditelosomic line 2DS of Chinese Spring. QTL analysis indicated that the PPO gene co-segregated with the two STS markers and was closely linked to SSR marker Xwmc41 on chromosome 2DL, explaining from 9.6 to 24.4% of the phenotypic variance for PPO activity across three environments. In order to simultaneously detect PPO loci on chromosomes 2A and 2D, a multiplexed marker combination PPO33/PPO16 was developed and yielded distinguishable DNA patterns in a number of cultivars. The STS marker PPO33 for the PPO gene on chromosome 2A was developed from the same gene sequences as PPO18 that we reported previously, and can amplify a 481-bp and a 290-bp fragment from cultivars with low and high PPO activity, respectively. A total of 217 Chinese wheat cultivars and advanced lines were used to validate the association between the polymorphic fragments and grain PPO activity. The results showed that the marker combination PPO33/PPO16 is eYcient and reliable for evaluating PPO activity and can be used in wheat breeding programs aimed for noodle and other end product quality improvement.

【题目】Characterization of phytoene synthase 1 gene (Psy1) located on common wheat chromosome 7A and development of a functional marker
【中文关键词】小麦,Psy1基因,7A染色体,功能基因标记
【英文关键词】Wheat, Psy1 gene, 7A chromosome, Functional marker
【中文摘要】Phytoene synthase (Psy), a critical enzyme in the carotenoid biosynthetic pathway, demonstrated high association with the yellow pigment (YP) content in wheat grain. Characterization of Psy genes and the development of functional markers for them are of importance for marker-assisted selection in wheat breeding. In this study, the full-length genomic DNA sequence of a Psy gene (Psy-A1) located on chromosome 7A, was characterized by in silico cloning and experimental validation. The cloned Psy-A1 comprises six exons and Wve introns, 4,175 bp in total, and an ORF of 1,284 bp. A co-dominant marker, YP7A, was developed based on polymorphisms of two haplotypes of Psy-A1, yielding 194 and 231-bp fragments in cultivars with high and low YP content, respectively. The marker YP7A was mapped on chromosome 7AL using an RIL population from cross PH82-2/Neixing 188, and a set of Chinese Spring nullisomic – tetrasomic lines and ditelosomic line 7AS. Psy-A1, co-segregating with the STS marker YP7A, was linked to SSR marker Xwmc809 on chromosome 7AL with a genetic distance of 5.8 cM, and explained 20 – 28% of the phenotypic variance for YP content across three environments. A total of 217 Chinese wheat cultivars and advanced lines were used to validate the association between the polymorphic band pattern and grain YP content. The results showed that the functional marker YP7A was closely related to grain YP content and, therefore, could be used in wheat breeding programs targeting of YP content for various wheat-based products.

【题目】Development of an STS marker tightly linked to Yr26 against wheat stripe rust using the resistance gene-analog polymorphism (RGAP) technique

【中文关键词】小麦, STS标记, Yr26, RGAP技术
【英文关键词】Wheat, STS marker, Yr26, RGAP technique
【中文摘要】The gene Yr26 confers resistance to all races of Puccinia striiformis f. sp. tritici (PST), the casual pathogen of wheat stripe rust in China. Here, we report development of a molecular marker closely linked to Yr26 using a resistance gene-analog polymorphism (RGAP) technique. A total of 787 F2 plants and 165 F3 lines derived from the cross Chuanmai 42/Taichung 29 were used for linkage analysis. Eighteen near-isogenic lines (NILs) and 18 Chinese wheat cultivars and advanced lines with different genes for stripe rust resistance were employed for the validation of STS markers. A total of 1,711 RGAP primer combinations were used to test the parents and resistant and susceptible bulks. Five polymorphic RGAP markers were used for genotyping all F2 plants. Linkage analysis showed that the five RGAP markers were closely linked to Yr26 with genetic distances ranging from 0.5 to 2.9 cM. These markers were then converted into STS markers, one, CYS-5, of which was located 0.5 cM to Yr26 and was closely associated with the resistance gene when validated over 18 NILs and 18 Chinese wheat cultivars and lines. The results indicated that CYS-5 can be used in marker-assisted selection targeted at pyramiding Yr26 and other genes for stripe rust resistance.

【题目】Development of STS markers and establishment of multiplex PCR for Glu-A3 alleles in common wheat (Triticum aestivum L.)
【中文关键词】小麦,Glu-A3亚基,STS标记,多重PCR
【英文关键词】Wheat, Glu-A3 alleles, STS markers, multiplex PCR
【中文摘要】Low-molecular-weight glutenin subunits (LMW-GS) play a key role in determining the processing quality of the end-use products of common wheat. The objectives of this study were to identify genes at Glu-A3 locus, develop the STS markers, and establish multiplex PCR with the STS markers for Glu-A3 alleles. Gene-specific PCR primers were designed to amplify six near-isogenic lines (NILs) and Glenlea with different Glu-A3 alleles (a, b, c, d, e, f and g) defined by the protein electrophoretic mobility. Three Glu-A3 genes with complete coding sequence were cloned, designated as GluA3-1, GluA3-2 and GluA3-3, respectively. Seven dominant allele-specific STS (sequence tagged sites) markers were designed based on the SNPs (single nucleotide polymorphisms) among different allelic variants for the discrimination of the Glu-A3 protein alleles a, b, c, d, e, f and g. Four multiplex PCRs were established including Glu-A3b t Glu-A3f, Glu-A3d t Glu-A3f, Glu-A3d t Glu-A3g, and Glu-A3b t Glu-A3e. These markers and multiplex-PCR systems were validated on 141 CIMMYT wheat varieties and advanced lines with different Glu-A3 alleles, confirming that they can be efficiently used in marker-assisted breeding.
【英文摘要】Low-molecular-weight glutenin subunits (LMW-GS) play a key role in determining the processing quality of the end-use products of common wheat. The objectives of this study were to identify genes at Glu-A3 locus, develop the STS markers, and establish multiplex PCR with the STS markers for Glu-A3 alleles. Gene-specific PCR primers were designed to amplify six near-isogenic lines (NILs) and Glenlea with different Glu-A3 alleles (a, b, c, d, e, f and g) defined by the protein electrophoretic mobility. Three Glu-A3 genes with complete coding sequence were cloned, designated as GluA3-1, GluA3-2 and GluA3-3, respectively. Seven dominant allele-specific STS (sequence tagged sites) markers were designed based on the SNPs (single nucleotide polymorphisms) among

different allelic variants for the discrimination of the Glu-A3 protein alleles a, b, c, d, e, f and g. Four multiplex PCRs were established including Glu-A3b t Glu-A3f, Glu-A3d t Glu-A3f, Glu-A3d t Glu-A3g, and Glu-A3b t Glu-A3e. These markers and multiplex-PCR systems were validated on 141 CIMMYT wheat varieties and advanced lines with different Glu-A3 alleles, confirming that they can be efficiently used in marker-assisted breeding.

【题目】Development of two multiplex PCR assays targeting improvement of bread-making and noodle qualities in common wheat
【中文关键词】小麦,加工品质,多重PCR
【英文关键词】Wheat, processing quality, multiplex PCR
【中文摘要】Wheat quality properties are genetically determined by the compositions of high and low molecular weight glutenin subunits, grain hardness, polyphenol oxidase (PPO) activity and starch viscosity. Two multiplex PCR assays were developed and validated using 70 cultivars and advanced lines from Chinese autumn-sown wheat regions. Multiplex PCR I includes molecular markers for genes/loci x-secalin, Glu-B1-2a (By8), Glu-D1-1d (Dx5), Glu-A3d, Glu-B3 (for non-1B/1R type) and Pinb-D1b targeting improved gluten parameters and pan bread quality. Multiplex PCR II comprises markers for genes/loci Ppo-A1, Ppo-D1 and Wx-B1b targeting improved noodle quality. The results were consistent with those achieved by SDS-PAGE and RPHPLC, indicating that the two multiplex assays were highly effective, with good repeatability and low costs enabling their use in wheat breeding programmes. In total, nine alleles (subunits) at locus Glu-B1,four at Glu-D1 and five at Glu-A3 locus were identified, and the alleles (subunits) Glu-B1b (7 + 8), Glu-B1c (7 + 9), Glu-D1a (2 + 12), Glu-D1d (5 + 10), Glu-A3a, Glu-A3c and Glu-A3d were most frequently present in the cultivars and lines tested. The 1B ¦ 1R translocation was present in 28 (40.0%) lines, whereas the Wx-B1 null allele for better noodle quality was present in only seven (10.0%) cultivars and advanced lines, and 37 (52.9%) lines had Pinb-D1b associated with hard grains. The allele Ppo-A1b on chromosome 2AL associated with lower PPO activity was present in 38 (54.3%) genotypes, whereas the less effective allele Ppo-D1a on chromosome 2DL, also associated with low PPO activity was present in 45 (64.3%) of genotypes. These two multiplex PCR assays should be effective in marker assisted selection targeting improved pan bread-making and noodle qualities.

【题目】Distribution of the photoperiod insensitive Ppd-D1a allele in Chinese wheat cultivars
【中文关键词】中国,小麦品种,光周期基因,分布
【英文关键词】China, Wheat cultivars, photo-period genes, distribution
【中文摘要】Photoperiod response is of great importance for optimal adaptation of bread wheat cultivars to specific environments, and variation is commonly associated with allelic differences at the Ppd-D1 locus on chromosome 2D. A total of 926 Chinese wheat landraces and improved cultivars collected from nine wheat growing zones were tested for their genotypes at the Ppd-D1 locus using allele-specific markers. The average frequency of the photoperiod-insensitive Ppd-D1a allele was 66.0%, with the frequencies of 38.6 and 90.6% in landraces and improved cultivars, respectively. However, the Ppd-D1a allele was present in all improved cultivars released after 1970 except for spring wheats in high latitude northwestern China, and winter wheats in Gansu and Xinjiang. The presence of the Ppd-D1a allele in landraces and improved cultivars increased gradually from north to south, illustrating the relationship between photoperiod response and environment. Ppd-D1a in Chinese wheats is derived from three sources, Japanese landrace Akagomughi and Chinese landraces Mazhamai and Youzimai. The current information is important for understanding the broad adaptation of improved Chinese wheat cultivars.

【题目】Identification of Genomic Regions Controlling Adult-Plant Stripe Rust Resistance in Chinese Landrace Pingyuan 50 Through Bulked Segregant Analysis
【中文关键词】小麦,条锈病,成株抗性基因,定位
【英文关键词】Wheat, Stripe rust, Adult-plant resistance, Genomic regions
【中文摘要】Stripe rust, caused by Puccinia striiformis f. sp. tritici, is one of the most widespread and destructive wheat diseases worldwide. Growing resistant cultivars with adult-plant resistance (APR) is an effective approach for the control of the disease. In this study, 540 simple sequence repeat markers were screened to map quantitative trait loci (QTL) for APR to stripe rust in a doubled haploid (DH) population of 137 lines derived from the cross Pingyuan 50 × Mingxian 169. The DH lines were planted in randomized complete blocks with three replicates in Gansu and Sichuan provinces during the 2005 – 06, 2006 – 07, and 2007 – 08 cropping seasons, providing data for four environments. Artificial inoculations were carried out in Gansu and Sichuan with the prevalent Chinese race CYR32. Broad-sense heritability of resistance to stripe rust for maximum disease severity was 0.91, based on the mean value averaged across four environments. Inclusive composite interval mapping detected three QTL for APR to stripe rust on chromosomes 2BS, 5AL, and 6BS, designated QYr.caas-2BS, QYr.caas-5AL, and QYr.caas-6BS, respectively, separately explaining from 4.5 to 19.9% of the phenotypic variation. QYr.caas-5AL, different from QTL previously reported, was flanked by microsatellite markers Xwmc410 and Xbarc261, and accounted for 5.0 to 19.9% of phenotypic variance. Molecular markers closely linked to the QTL could be used in

marker-assisted selection for APR to stripe rust in wheat breeding programs.

【题目】Identification of SNPs and development of functional markers for LMW-GS genes at Glu-D3 and Glu-B3 loci in bread wheat (Triticum aestivum L.)

【中文关键词】小麦,低分子量,功能基因标记

【英文关键词】Wheat, LMW-GS, Functional markers

【中文摘要】Low-molecular-weight glutenin subunits (LMW-GS) have great effect on wheat processing quality, but were numerous and difficult to dissect by SDS-PAGE. The development of functional markers may be the most effective way for a clear discrimination of different LMW-GS genes. In the present study, three different approaches were used to identify SNPs of different genes at Glu-D3 and Glu-B3 loci in bread wheat for the development of six STS markers (3 for Glu-D3 and 3 for Glu-B3 genes) that were validated with distinguished wheat cultivars. Firstly, seven LMW-GS gene sequences (AY585350, AY585354, AY585355, AY585356, AY585349, AY585351 and AY585353) from Aegilops tauschii, the diploid donor of the D-genome of bread wheat, were chosen to design seven pairs of AS-PCR primers for Glu-D3 genes. By amplifying the corresponding genes from five bread wheat cultivars with different Glu-D3 alleles (a, b, c, d and e) and Ae. tauschii, a primer set, S13F2/S13R1, specific to the gene AY585356, was found to be positive to cultivars with alleles Glu-D3c and d. Nevertheless, the other five pairs of primers designed from AY585350, AY585349, AY585353, AY585354 and AY585355, respectively, did not produce specific PCR products to the cultivars tested. Secondly, all the PCR products from the five primer sets without specific characteristics were sequenced and anSNPfrom the gene AY585350 was detected in the cultivarHartog, which resulted in the second STS marker S1F1/S1R3 specific to the allelic variant of AY585350. Thirdly, three Glu-D3 sequences (AB062851, AB062865 and AB062872) and three Glu-B3 sequences (AB062852, AB062853 and AB062860) defined by Ikeda et al. (2002) were chosen to query wheat EST and NR databases, and DNAmarkers were developedbasedon the putative SNPs among the sequences. Using this approach, four STS markers were developed and validated with 16-19 bread wheat cultivars. The primer set T1F4/T1R1 was also a Glu-D3 gene-specific marker for AB062872, while T2F2/T2R2, T5F3/T5R1 and T13F4/T13R3 were all Glu-B3 gene specific markers for AB062852, BF293671 and AY831800, respectively. The chromosomal locations of the sixmarkers wereverifiedbyamplifying thegenomicDNAof Ae. tauschii (DD), T. monococcum (AA) and T. turgidum(AABB) entries, as well as Chinese Spring and its group 1 chromosome nulli-tetrasomic lines. The results are useful to discriminate the corresponding Glu-D3 and Glu-B3 genes in wheat breeding programs.

【题目】Molecular characterization of allelic variations at Pina and Pinb loci in Shandong wheat landraces, historical and current cultivars
【中文关键词】小麦,籽粒硬度,基因
【英文关键词】Wheat, Kernel hardness, Genes
【中文摘要】Grain hardness is very important in determining the milling and end-use quality of bread wheat. The objectives of this study were to develop gene specific primers for the allele Pina-D1b, evaluate the method for the identification of Pinb-D1p with restriction enzyme PflMI and characterize allelic variations at Pina and Pinb loci in Shandong wheat germplasm. Based on the nucleotide sequences of Ha locus reported previously (CR626934 and CR626926), 121 primer sets were developed to test the Pina-D1b allele. Sequence alignment showed that the promoter region of Pina-D1b allele was highly conserved in the region from _1134 to _23 bp relative to the transcription start codon ATG. Pinb-D1p was first reported in Chinese wheat landraces, with a base A deletion at position 213 in the coding region. Restriction analysis of Pinb-D1p indicated that the base A deletion resulted in the missing of the cleavage site with enzyme PflMI and the digestion with PflMI was validated as a reliable tool for the identification of Pinb-D1p allele. A total of 523 wheat accessions from Shandong province including 431 landraces, 63 historical and 29 current cultivars were chosen for the test of SKCS hardness and identification of puroindoline alleles using DNA markers developed in this study and those reported previously. Frequencies of soft, mixed and hard genotypes were 3.9%, 20.4% and 75.6% in Shandong landraces; 68.3%, 19.0% and 12.7% in historical cultivars; and 27.6%, 58.6% and 13.8% in current cultivars, respectively. Frequencies of Pina-D1b, Pinb-D1b and Pinb-D1p were 38.0%, 0.9% and 59.6% in hard landraces; and 37.5%, 37.5% and 25% in hard historical cultivars, respectively, whereas the Pinb-D1b was the only genotype in hard current cultivars. A novel Pinb allele with double mutations at the positions 96 (C to A) and 213 (deletion of A) was found in three landraces and designated as Pinb-D1aa.

【题目】Molecular characterization of Pina and Pinb allelic variations in Xinjiang landraces and commercial wheat cultivars

【中文关键词】小麦,新疆品种,籽粒硬度,基因
【英文关键词】Wheat, Xinjiang cultivars, Kernel hardness, Genes

【中文摘要】Grain hardness plays an important role in determining both milling performance and quality of the end-use products produced from common or bread wheat. The objective of this study was to characterize allelic variations at the Pina and Pinb loci in Xinjiang wheat germplasm for further understanding the mechanisms involved in endosperm texture formation, and the status of grain texture in Chinese bread wheat. A total of 291 wheat cultivars, including 56 landraces, and 95 introduced and 140 locally improved cultivars, grown in Xinjiang, were used for SKCS measurement and molecular characterization. Among the harvested grain samples, 185 (63.6%), 40 (13.7%), and 66 (22.7%) were classiWed as hard, mixed and soft, respectively. Eight diVerent genotypes for the Pina and Pinb loci were identiWed, including seven previously reported genotypes, viz., Pina-D1a/Pinb-D1a, Pina-D1a/Pinb-D1b, Pina-D1b/Pinb-D1a, Pina-D1a/Pinb-D1p, Pina-D1a/Pinb-D1q, Pina-D1a/Pinb-D1aa, Pina-D1a/Pinb-D1ab, and a novel Pinb allele, Pinb-D1ac. This new allele, detected in Kashibaipi (local landrace) and Red Star (from Russia) has a double mutation at the 257th (G to A substitution) and 382nd (C to T substitution) nucleotide positions of the coding region. Pina-D1b, Pinb-D1b, and Pinb-D1p were the most common alleles in Xinjiang wheat germplasm, with frequencies of 14.3%, 38.1% and 28.6% in hard textured landraces, 25.5%, 56.9% and 11.8% in hard introduced cultivars, and 24.8%, 47.8% and 26.5% in hard locally improved cultivars, respectively. The restriction enzymes ApaI, SapI, BstXI and SfaNI were used to identify Pinb-D1ab or Pinb-D1ac, Pinb-D1b, Pinb-D1e and Pinb-Dg, respectively, by digesting PCR products of the Pinb gene. The unique grain hardness distribution in Xinjiang bread wheat, as well as the CAPs markers for identiWcation of the Pinb alleles provided useful information for breeding wheat cultivars with optimum grain textures.

【题目】Novel DNA variations to characterize low molecular weight glutenin Glu-D3 genes and develop STS markers in common wheat
【中文关键词】小麦,麦谷蛋白,低分子量亚基,功能基因标记
【英文关键词】Wheat, Gluten, LMW-GS, Functional markers
【中文摘要】Low-molecular-weight glutenin subunits (LMW-GS) play an important role in bread and noodle processing quality by inXuencing the viscoelasticity and extensibility of dough. The objectives of this study were to characterize Glu-D3 subunit coding genes and to develop molecular markers for identifying Glu-D3 gene haplotypes. Gene speciWc primer sets were designed to amplify eight wheat cultivars containing Glu-D3a, b, c, d and e alleles, deWned traditionally by protein electrophoretic mobility. Three novel Glu-D3 DNA sequences, designated as GluD3-4, GluD3-5 and GluD3-6, were ampliWed from the eight wheat cultivars. GluD3-4 showed three allelic variants or haplotypes at the DNA level in the eight cultivars, which were designated as GluD3-41, GluD3-42 and GluD3-43. Compared with GluD3-42, a single nucleotide polymorphism (SNP) was detected for GluD3-43 in the coding region, resulting in a pseudo-gene with a nonsense mutation at the 119th position of deduced peptide,and a 3-bp insertion was found in the coding region of GluD3-41, leading to a glutamine insertion at the 249th position of its deduced protein. The coding regions for GluD3-5 and GluD3-6 showed no allelic variation in the eight cultivars tested, indicating that they were relatively conservative in common wheat. Based on the 12 allelic variants of three Glu-D3 genes identiWed in this study and three detected previously, seven STS markers were established to amplify the corresponding gene sequences in wheat cultivars containing Wve Glu-D3 alleles (a, b, c, d and e). The seven primer sets M2F12/M2R12, M2F2/M2R2, M2F3/M2R3, M3F1/M3R1, M3F2/M3R2, M4F1/M4R1 and M4F3/M4R3 were speciWc to the allelic variants GluD3-21/22, GluD3-22, GluD3-23, GluD3-31, GluD3-32, GluD3-41 and GluD3-43, respectively, which were validated by amplifying 20 Chinese wheat cultivars containing alleles a, b, c and f based on protein electrophoretic mobility. These markers will be useful to identify the Glu-D3 gene haplotypes in wheat breeding programs.

【题目】QTL mapping for adult-plant resistance to stripe rust in Italian common wheat cultivars Libellula and Strampelli
【中文关键词】小麦,抗条锈病,基因标记
【英文关键词】Wheat, Strip rust resistance, Gene markers
【中文摘要】Italian common wheat cultivars Libellula and Strampelli, grown for over three decades in Gansu province of China, have shown effective resistance to stripe rust. To elucidate the genetic basis of the resistance, F3 populations were developed from crosses between the two cultivars and susceptible Chinese wheat cultivar Huixianhong. The F3 lines were evaluated for disease severity in Beijing, Gansu and Sichuan from 2005 to 2008. Joint- and single-environment analyses by composite interval mapping identified five quantitative trait loci (QTLs) in Libellula for reduced stripe rust severity, designated QYr.caas-2DS, QYr.caas-4BL, QYr.caas-5BL.1, QYr.caas-5BL.2 and QYr.caas-7DS, and explained 8.1 – 12.4, 3.6 – 5.1, 3.4 – 8.6, 2.6 and 14.6 – 35.0%, respectively, of the phenotypic variance across four environments. Six interactions between different pairs of QTLs explained 3.2 – 7.1% of the phenotypic variance. The QTLs QYr.caas-4BL, QYr.caas-5BL.1 and QYr.caas-7DS were also detected in Strampelli, explaining 4.5, 2.9 – 5.5 and 17.1 – 39.1% of phenotypic variance, respectively, across five environments. Three interactions between different pairs of QTLs accounted for 6.1 – 35.0% of the phenotypic variance. The QTL QYr.caas-7DS flanked by markers csLV34 and Xgwm295 showed the largest effect for resistance to stripe rust. Sequence analyses confirmed that the lines with the QYr.caas-7DS allele for resistance carried the resistance allele of the Yr18/Lr34 gene. Our results indicated that the adult-plant resistance gene Yr18 and several minor genes confer effective durable resistance to stripe rust in Libellula and Strampelli.

【题目】QTL mapping for flour and noodle colour components and yellow pigment content in common wheat
【中文关键词】小麦,黄色素含量,基因定位
【英文关键词】Wheat, Yellow pigment content, QTL
【中文摘要】Improvement of flour colour is an important breeding objective for various wheat-based endproducts. The objectives of this study were to identify quantitative trait loci (QTL) for flour colour components and yellow pigment content (YPC), using 240 recombinant inbred lines (RILs) derived from a cross between the Chinese wheat cultivars PH82-2 and Neixiang 188. Field trials were performed in a Latinized a-lattice design in Anyang and Jiaozuo, Henan Province and Taian, Shandong, in the 2005 – 2006 and 2006 – 2007 cropping seasons providing data for six environments. One hundred and eighty-eight polymorphic SSR markers, rye

secalin marker Sec1, STS markers YP7A for a phytoene synthase gene (Psy-A1), and four glutenin subunit markers, were used to genotype the population and construct the linkage map for subsequent QTL analysis. Two major QTL were detected for YPC, associated with 1RS (1B.1R translocation) and the Psy-A1 (7A) gene, explaining 31.9% and 33.9% of the phenotypic variances, respectively. 1RS also had large influences on Fa*, Fb*, KJ, NL*and Nb*, and Psy-A1 genes showed large effects on Fa*, Fb*, Kj, Fci, NL*, Na* and Nb*, explaining from 4.5 to 26.1% and 4.3 to 35.9% of the phenotypic variances, respectively. In addition, QTL for flour colour parameters and yellow pigment content were also detected on chromosomes 1A and 4A, accounting for 1.5 – 4.1% of the phenotypic variance. The genetic effect of the 1B.1R translocation on flour colour parameters was also discussed.

【题目】Quantitative Trait Loci Mapping for Adult-Plant Resistance to Powdery Mildew in Chinese Wheat Cultivar Bainong 64

【中文关键词】小麦,条锈病,成株抗性,基因定位
【英文关键词】Wheat, Strip rust, Adult-plant resistance, QTL

【中文摘要】Adult-plant resistance (APR) is an effective means of controlling powdery mildew in wheat. In the present study, 406 simple-sequence repeat markers were used to map quantitative trait loci (QTLs) for APR to powdery mildew in a doubled-haploid (DH) population of 181 lines derived from the cross Bainong 64 × Jingshuang 16. The DH lines were planted in a randomized complete block design with three replicates in Beijing and Anyang during the 2005 – 06 and 2007 – 08 cropping seasons. Artificial inoculations were carried out in Beijing using the highly virulent Blumeria graminis f. sp. tritici isolate E20. Disease severities on penultimate leaves were scored twice in Beijing whereas, at Anyang, maximum disease severities (MDS) were recorded following natural infection. Broad-sense heritabilities of MDS and areas under the disease progress curve were 0.89 and 0.77, respectively, based on the mean values averaged across environments. Composite interval mapping detected four QTLs for APR to powdery mildew on chromosomes 1A, 4DL, 6BS, and 7A; these were designated QPm.caas-1A, QPm.caas-4DL, QPm.caas-6BS, and QPm.caas-7A, respectively, and explained 6.3 to 22.7% of the phenotypic variance. QTLs QPm.caas-4DL and QPm.caas-6BS were stable across environments with high genetic effects on powdery mildew response, accounting for 15.2 to 22.7% and 9.0 to 13.2% of the phenotypic variance, respectively. These results should be useful for the future improvement of powdery mildew resistance in wheat.

【题目】多重PCR的建立及黄淮麦区主要品种品质相关基因的鉴定

【中文关键词】普通小麦;加工品质;多重PCR

【英文关键词】Common wheat (Triticum aestivum L.); Processing quality traits; Multiplex PCR

【中文摘要】【目的】小麦加工品质由多个位点控制,而每个位点又有多个等位基因控制。建立品质性状多重PCR反应体系是提高分子标记辅助选择效率及降低成本的一种重要措施。【方法】选择影响小麦品质性状重要基因的分子标记,即高分子量谷蛋白亚基基因标记Ax2*;Bx14;Bx17 和Dx5;低分子量谷蛋白亚基基因标记Glu-A3 d;糯蛋白亚基Wx-B1 基因标记BDFL-BRD 和Wx-D1 基因标记MAG269;1BL/1RS 易位标记ω-sec 及多酚氧化酶(PPO)活性基因标记PPO18。根据优质面包;优质面条亚基组成要求及引物的退火温度,建立3 个多重PCR 反应体系PCR-Ⅰ(Ax2*/Bx17/Dx5);PCR-Ⅱ(BDFL-BRD/MAG269/PPO18)和PCR-Ⅲ(Bx14/Glu-A3d/ω-sec)。【结果】用构建的3 个多重PCR 对141 份黄淮麦区小麦品种加工品质相关基因的分布情况进行了检测。结果表明Ax2*;Bx14;Bx17具有较低的分布频率,分别为4.3%;7.1%;1.4%;Dx5 和Glu-A3 d 分布频率相对较高,分别为17.7%和27.7%;而1BL/1RS 易位和低PPO 活性(扩增片段为876 bp)的材料分别占44.0%和51.8%;Wx-B1 缺失材料占4.3%。在供试的141 份材料中已有80 份进行了高;低分子量谷蛋白亚基和黑麦碱的SDS-PAGE 电泳检测,与本研究建立的多重PCR 检测结果完全一致。【结论】建立的多重PCR 体系可以准确;稳定;高效地检测9 个小麦品质性状的基因组成。

【英文摘要】Abstract:【Objective】Wheat quality is controlled by many loci and each of them has several alleles. Development of multiplex PCR is very important to enhance the efficiency and reduce the cost in molecular marker assisted breeding for wheat quality traits.【Method】 In the present study, the molecular markers for important quality trait genes, i.e., high-molecular-weight glutenin subunit (HMW-GS) genes Ax2*, Bx14, Bx17 and Dx5, and low-molecular-weight glutenin subunit (LMW-GS) gene Glu-A3d, as well as the marker BDFL-BRD for Wx-B1, MAG269 for Wx-D1, ω-sec for 1BL/1RS translocation and PPO18 for polyphenol oxidase(PPO)activity, were chosen. Three combinations of multiplex PCRs, PCR-Ⅰ(Ax2*/Bx17/Dx5), PCR-Ⅱ(Bx14/Glu-A3d/ω-sec) and PCR-Ⅲ (BDFL-BRD/MAG269/PPO18) were built up according to genes controlling for pan bread and Chinese noodle quality, and the annealing temperatures of different markers. 【Result】A total of 141 wheat cultivars from Yellow and Huai River Valley wheat region were evaluated adopting the multiplex PCRs, and 80 of them were previously assessed using SDS-PAGE for HMW-GS, LMW-GS and secalin, and the corresponding results were identical. Of the 141 wheat cultivars, the frequencies of Ax2*, Bx14 and Bx17 were 4.3%, 7.1%, and 1.4%, while Dx5 and Glu-A3d accounted for 17.7% and 27.7%, respectively. Presences of 1BL/1RS translocation and low polyphenol oxidase (PPO) activity genes were much higher, up to 44.0% and 51.8%, respectively. Wx-B1 null type accounted for 4.3%, and no Wx-D1 null type presented.【Conclusion】The results indicated that the three multiplex PCRs developed can be used to detect the nine genes stably and efficiently.

【题目】小麦新品种济麦22抗白粉病基因的分子标记定位
【中文关键词】普通小麦; 白粉病; 抗病基因; 分子标记
【英文关键词】Common wheat; Powdery mildew; Resistance gene; Molecular markers
【中文摘要】为明确济麦22 携带抗白粉病基因的染色体位置, 利用济麦22 与感病亲本中国春杂交, 用小麦白粉菌(Blumeria graminis f. sp. tritici)强毒性小种E20 对F2 抗;感分离群体和F2:3 家系进行抗病鉴定和遗传分析。结果表明,济麦22 携带1 个显性抗白粉病基因, 暂被命名为PmJM22。运用SSR 和EST 标记及分离群体分组分析法(bulked segregant analysis, BSA), 将其定位在2BL 染色体上, 与4 个SSR 和5 个EST 标记间的连锁距离为7.7 cM (Xwmc149)到31.3 cM (Xbarc101)。通过分析2BL 上其他抗白粉病基因的来源;染色体位置和抗性反应, 认为PmJM22 不同于Pm6;Pm26;Pm33 和MlZec1。
【英文摘要】Abstract: Wheat powdery mildew, caused by Blumeria graminis f. sp. tritici, is one of the most important diseases of wheat (Triticum aestivum L.) worldwide. Breeding resistant wheat cultivars is the most economical and effective approach to control the disease. Jimai 22, a newly released wheat cultivar with high yield, broad adaptability, and good quality, is related to broad-sprectrum resistance to the isolates of B. graminis f. sp. tritici at both seedling and adult plant stages. To map the resistance gene of Jimai 22 on wheat chromosome, we used a highly virulent isolate E20 to screen the F2 plants and F2:3 lines derived from the cross of Jimai 22/Chinese Spring. Genetic analysis indicated that Jimai 22 carried a single dominant gene for resistance to powdery mildew, designated PmJM22 tentatively. Using bulked segregant analysis (BSA) with SSR and STS markers, PmJM22 was located to chromosome 2BL. Linkage analysis indicated that the resistance gene was linked to four SSR and five EST markers, with genetic distances from 7.7 (Xwmc149) to 31.3 cM (Xbarc101). Based on the origins, chromosome locations, and reaction patterns, PmJM22 is different from all the known powdery mildew resistance genes Pm6, Pm26, Pm33, and Mlzec1 on chromosome 2BL.

【题目】新疆小麦品种高分子量谷蛋白亚基及相关品质基因的分子标记检测
【中文关键词】普通小麦; 高分子谷蛋白亚基; SDS-PAGE; 品质基因; 分子标记
【英文关键词】Common wheat; HMW-GS; SDS-PAGE; Processing quality; Molecular markers
【中文摘要】高分子量麦谷蛋白亚基;1B・1R 易位系;多酚氧化酶(PPO)活性及黄色素含量等基因对小麦加工品质有重要影响, 准确;快速鉴定这些基因对品质改良有重要意义。本研究对新疆当地及国内外引进的321 份小麦品种进行SDS-PAGE 分析, 利用特异性分子标记对高分子量谷蛋白亚基中的Dx5;Bx7;By8;By9 亚基;1B・1R 易位系;PPO和黄色素含量基因进行鉴定, 进一步验证分子标记检测的可靠性和准确性, 为优质小麦分子标记辅助育种提供材料和方法。SDS-PAGE 分析表明, 供试材料有21 种亚基类型, 其中Glu-A1 位点有3 种类型, 以null 为主; G1u-B1 位点有10 种类型, Bx7+By8 和Bx7+By9 亚基占主导地位; Glu-D1 位点有8 种类型, Dx2+Dy12 和Dx5+Dy10 占主导地位。分子标记检测表明, Dx5 亚基的频率为38.3%, Bx7 亚基的频率为85.7%, By8 亚基的频率为38.9%, Bx9 亚基的频率为42.7%; 特异性PCR 标记扩增与SDS-PAGE 鉴定结果的吻合率分别为97.2%;98.4%;93.4%和97.2%。在新疆当地品种;其他国内品种和国外品种中, 1B・1R 易位系材料的频率分别为22.0%;31.5%和25.0%, Psy-A1b 的频率分别为9.0%;10.8%和5.4%, Ppo-A1b 的频率分别为38.0%;43.8%和45.7%, Ppo-D1a 的频率分别为48.0%;66.9%和40.2%。同时含Ppo-A1b 和Ppo-D1a 的材料有74 份, 占23.0%。本试验中采用的基因特异性标记重复性好;准确率高, 可有效用于小麦品质分子标记辅助选择。
【英文摘要】Abstract: High molecular weight glutenin subunits (HMW-GS), 1B・1R translocation, polyphenol oxidase (PPO) activities, and yellow pigment content are mostly correlated with the processing quality of common wheat (Triticum aestivum L.). An accurate and fast characterization of these genes is of great importance in the improvement of wheat quality. In this study, a total of 321 wheat genotypes, including 100 Xinjiang local wheat cultivars, 130 introductions from other provinces of China, and 91 introductions from other countries, were analyzed by SDS-PAGE method. In addition, the functional markers of Dx5, Bx7, By8, By9, 1B・1R, PPO16, PPO18, PPO29, and YP7A were used to detect their allelic variations. Twenty-one subunit combinations were found according to the SDS-PAGE data, three types at Glu-A1 locus with null as a major subunit, 10 types at Glu-B1 locus with Bx7+By8 and Bx7+By9 as major subunits, and eight types at Glu-D1 locus with Dx2+Dy12 and Dx5+Dy10 as major subunits. The frequencies of the Dx5, Bx7,

By8, and Bx9 subunits revealed by functional markers were 38.3%, 85.7%, 38.9%, and 42.7%, respectively, with 97.2%, 98.4%, 93.4%, and 97.2% of consistency with SDS-PAGE results, respectively. Eighty-six genotypes had 1B • 1R translocations, with 22.0% in Xinjiang local cultivars, 31.5% in the introductions from other provinces of China, and 25.0% in those from other countries, respectively. The frequencies of Psy-A1b detected by YP7A marker were 9.0%, 10.8%, and 5.4% among three group genotypes, respectively. The PPO18 marker for the Ppo-A1 locus yielded Ppo-A1b allele with frequencies of 38.0%, 43.8%, and 45.7% among three group genotypes, respectively. The Ppo-D1a allele frequencies were 48.0%, 66.9%, and 40.2% among three group genotypes, respectively, according to the PPO16 and PPO29 markers at Ppo-D1 locus. However, only 74 genotypes contained Ppo-A1b and Ppo-D1a alleles at both loci, accounting for 23.0% of the genotypes. The functional markers applied in this study were repeatable, accurate and stable, and can be effectively used in wheat quality breeding.

【中文关键词】普通小麦;PPO基因;功能标记;分子标记辅助选择
【英文关键词】Common wheat(Triticum aestivum L.);Polyphenol oxidase(PPO)genes;Functional marker;Marker—assisted selection(MAS)

【中文摘要】【目的】利用分子标记研究中国冬小麦品种PPO基因的等位变异及其与PPO活性的关系,为小麦PPO活性的分子标记辅助选择(MAS)奠定基础。【方法】利用PPO基因的功能标记PP01 8;PP029和PP016对中国4个麦区的冬小麦品种(系) (试验I)和山东省常用亲本(试验II)共31l份进行2A和2D染色体上PPO等位基因Ppo-Ala;Ppo-Alb;Ppo-Ola和 D 6的检测。【结果】PP018在等位基因Ppo-Ala(高PPO)和 p 6(低PPO)中分别扩增685 bp和876 bp的片段,PP016和PP029在Ppo-91a(低PPO)和Ppo-Dlb(高PPO)两个等位基因中分别扩增71 3 bp和490 bp的片段 31l份品种(系)中Ppo-Ala;Ppo-Alb;Ppo-91a和Ppo-9lb等位基因的频率分别为41.8%;58.2%;59.8%和4O.2%,PPO活性在同一基因的两个等位基因间差异均达显著水平(p<0.05);两个PPO基因的等位基因组合类型分布频率为:Ppo-~la/Ppo-91a(2 7.3%);Ppo-Ala/Ppo-Dlb(1 4.5%);D Ppo-91a(32.5%)和 D Ppo-9lb(25.7%),彼此差异均达显著水平(尸<0.05)。各麦区间PPO活性基因分布存在明显差异,Ppo-Ala基因在长江中下游冬麦区和西南冬麦区分布较多,频率分别为6O.7%和56.O%;Ppo-Alb基因在北部冬麦区和黄淮冬麦区分布较高,频率分别为65.6%和6O.3%;而Ppo-91a基因在北部冬麦区;黄淮冬麦区;长江中下游冬麦区和西南冬麦区分布明显高于Ppo-9lb基因频率,分别为65.6%;53.6%;75.O%和76.O%。【结论】PP018;PP01 6和PP029标记的检测方法简单;稳定性好,所检测的等位变异类型能有效反映品种的PPO活性值。中国冬麦区品种低PPO活性基因分布频率相对较多。因此,根据PPO基因类型组配亲本,并利用PP0基因功能标记在育种早代筛选低PPO活性的基因型,可促进面制品色泽的改良。

【英文摘要】Abstract:【Objective]The aims of this study were to characterize the allelic distribution of PPO genes in Chinese winter wheat cultivars with molecular markers and analyze the association between PPO activity and different PPO alleles for the improvement of PPO activity in marker—assisted selection(MAS).[Method]A total of 3 1 1 Chinese wheat cultivars and advanced lines collected from four winter wheat regions(Experiment 1)and common parents in Shan dong province(Experiment 2)were tested with the functional markers PPO18,PPO16 and PPO29 for the identification of four allelic variants Ppo-Ala,Ppo-Alb,Ppo—Dla and Ppo—Dlb on chromosomes 2A and 2D.[Result]PPO18 could amplify a 685一bp and an 876一bp fragments in the cultivars with the allele PpD—AJa (high PPO)and Ppo-Alb(1ow PPO),respectively.Two complementary dominant markers.PPO 1 6 and PPO29。amplified a 7 1 3.Bp and a 490一bp fragment in the genotypes with Ppo—Dla(1ow PPO)and Ppo—Dlb(high PPO),respectively.The frequencies for Ppo-Ala,印lo-Alb,Ppo—Dla and Ppo—Dlb were 41.8%,58.2%,59.8% and 40.2%,in the 3 1 1 cultivars and advanced lines, respectively.Significant differences in PPO activities were detected between the genotypes with Ppo-Ala and those with Ppo-Alb (P<0.05),and between the genotypes for印lD—Dla and those for Ppo—Dlb.Frequencies of PPO allelic combinations for Ppo-Ala/epo—Dla,Ppo-Ala/Ppo—Dlb,Ppo-Alb/Ppo—Dla an d Ppo-Alb/Ppo—Dlb were 27-3%,14.5% ,32.5% an d 25.7%,and highly significant differences in PPO activity were found among the four genotypes <0.05).Ppo-Ala was present as a major allele in middle and low Yangtze Valley winter wheat region and southwestern winter wheat region.with frequencies of 60.7% and 56.0% .respectively,whereas Ppo-Alb was found as a major allele in northern winter wheat region and Yellow and huai facultative winter wheat region,with frequencies of 65.6% and 60-3% ,respectively.Ppo—Dla was dominant in northern winter wheat region,Yellow and Huai

facultative winter wheat region,middle and low Yangtze Valley winter wheat region and southwestern winter wheat region, with frequencies of65.6%,53.6%,75.0%and 76.0%,respectively.[Conclusion]PP018,PPOI6 and PPO29 were simple and stable functional markers that can accurately discriminate different alleles of PPO genes on chromosomes 2A and 2D,exhibiting high correlation between grain PPO activity and PP0 genotypes.The alleles of low PPO activity were dominant in Chinese winter wheat regions.Therefore,employing the PPO markers to test parents and separating generations descendants in wheat breeding programs would help breeder to select the individuals with low PPO activity,accelerating the progress for the improvement of undesirable darkening of end—use product

【题目】中国和CIMMYT小麦品种Bx7亚基超量表达基因(Bx7OE)的分子检测

【中文关键词】普通小麦(Triticum aestivum L.); RP-HPLC; STS 标记; 分子标记辅助选择; Bx7OE

【英文关键词】Common wheat (Triticum aestivum L.); RP-HPLC; STS marker; Marker-assisted selection; Bx7OE

【中文摘要】高分子量谷蛋白亚基Bx7 的超量表达对提高小麦面筋强度有重要作用。利用反相高效液相色谱(RP-HPLC)和STS 标记检测了163 份中国和CIMMYT 小麦品种(系)的高分子谷蛋白亚基Bx7 超量表达基因(Bx7OE)。结果表明,TaBAC1215C06-F517/R964 标记和TaBAC1215C06-F24671/R25515 标记可分别在含有Bx7OE 基因的材料中扩增出447bp 和844 bp 的特异带, 在不含Bx7OE 基因的材料中无相应目标带, 两个STS 标记的检测结果完全一致。在163 份小麦品种(系)中, 11 份品种(系)含有Bx7OE 基因, 占总数的6.7%。RP-HPLC 与STS 标记检测结果一致。利用这两个STS标记可以方便;快速;准确地检测Bx7OE 基因。

【英文摘要】Abstract: Over-expression of the high molecular weight glutenin subunit (HMW-GS) Bx7 is highly associated with dough strength of wheat (Triticum aestivum L.) flour. A total of 163 Chinese and CIMMYT wheat cultivars and advanced lines were tested by two STS markers and RP-HPLC to understand the presence of HMW-GS gene Bx7OE. The results indicated that the markers TaBAC1215C06-F517/R964 and TaBAC1215C06-F24671/R25515 could amplify a 447 bp and a 844 bp PCR fragments, respectively, in the lines with Bx7OE, whereas no PCR products were detected in the lines without Bx7OE. Of the 163 cultivars and lines, specific PCR fragments were amplified in 11 genotypes by the two markers, indicating the presence of Bx7OE in these lines, with a frequency of 6.7%. The results obtained by RP-HPLC were consistent with those revealed by STS markers. These two STS markers could be used to detect the presence of Bx7OE gene in wheat cultivars.

【题目】中国小麦品种黄色素含量基因等位变异分子检测及其分布规律研究

【中文关键词】普通小麦;黄色素;八氢番茄红素合成酶基因;功能标记;分子标记辅助选择

【英文关键词】Common wheat (Triticum aestivum L.); Yellow pigment (YP); Phytoene synthase (Psy) gene; Functional marker; Marker-assisted selection (MAS)

【中文摘要】【目的】八氢番茄红素合成酶(phytoene synthase,Psy)基因是影响小麦黄色素含量的关键基因,利用分子标记检测中国冬小麦品种(系)Psy-A1 基因的等位变异及其与黄色素含量的关系,进一步验证Psy-A1基因分子标记的有效性。【方法】利用7A 染色体上Psy-A1 基因的分子标记YP7A 检测该基因在中国217 份冬小麦品种(系)中的等位变异,分析不同等位变异与黄色素含量的相关性及变化趋势。【结果】Psy-A1 基因标记YP7A为共显性标记,在高;低黄色素含量的小麦材料

中分别扩增出194 bp 和231 bp 片段,相应的等位基因为Psy-A1a和Psy-A1b(GenBank 编号分别为EF600063 和EF600064)。在217 份冬小麦品种(系)中,含有等位基因Psy-A1a和Psy-A1b 的品种(系)分别占62.2%和37.8%,二者黄色素含量平均值差异达到极显著水平(P<0.01)。其中,北方冬麦区;黄淮冬麦区;长江中下游冬麦区及西南冬麦区Psy-A1a 等位基因的分布频率分别为75.0%;72.0%;25.9%和33.3%。【结论】分子标记YP7A 可以作为小麦品种黄色素含量选择的辅助工具。

【英文摘要】Abstract:【Objective】 Phytoene synthase (Psy) gene is a critical gene influencing biosynthetic pathway of yellow pigment (YP) in common wheat. The aims of this study were to detect the allelic variations of Psy-A1 gene in 217 Chinese winter wheat cultivars and lines using the functional marker YP7A developed from the sequence polymorphisms of Psy-A1 gene on chromosome 7A, and to investigate the association between YP content and allelic variations of Psy-A1 gene to evaluate the feasibility of the marker for selecting wheat cultivars with either low or high YP content. 【Method】 Allelic variations of 217 Chinese winter wheat cultivars from different wheat regions were detected using YP7A. The association between allelic variations of Psy-A1 gene and YP content were investigated. 【Result】 YP7A, a co-dominant marker of Psy-A1 gene, can amplify a 194-bp and a 231-bp fragment in the genotypes with Psy-A1a frequently for high YP content and Psy-A1b mostly for low YP content, respectively. Highly significant differences in YP content were detected between the genotypes with Psy-A1a and those with Psy-A1b (P<0.01). The occurrence frequencies for Psy-A1a and Psy-A1b were 62.2% and 37.8% in the 217 cultivars, respectively. Significant differences of allelic variations were found in wheat cultivars from different wheat regions of China. In the Northern Winter Wheat Region, Yellow & Huai Winter Wheat Region, the Middle & Lower reaches of the Yangtze River Winter Wheat Region and Southwestern Winter Wheat Region, frequencies of the allele Psy-A1a were 75.0%, 72.0%, 25.9% and 33.3%, respectively. 【Conclusion】 The molecular marker YP7A exhibites the characteristics of high efficiency and reliability in evaluating YP content, and can be used as a molecular tool for marker-assisted selection (MAS) in wheat breeding programs targeting for either low or high YP content.

【题目】BACILLUS SUBTILIS for Salt Stress Relief in Vegetable Cultivation

【中文关键词】无土栽培,基质,栽培槽,番茄

【英文关键词】beneficial microorganism, bacterium, NaCl stress, lettuce, FZB 24

【中文摘要】无

【英文摘要】Bacillus subtilis is a beneficial microorganism (Gram positive bacterium) safe to humans and the environment. Since Johnson reported in 1945 that Bacillus subtilis produced bacitracin many studies have taken place on Bacillus subtilis as a biocontrol agent to suppress biotic diseases. In this paper we have studied the effects of Bacillus subtilis for abiotic stress relief on lettuce growth under salt stress. The strain we used was Bacillus subtilis FZB 24. 0.1% and 0.2% NaCl were used as the stress levels. The cultivation system was water culture. The results showed that, compared to the control treatments without Bacillus subtilis, under 0.1% NaCl and 0.2% NaCl stress, the yield of lettuce of Bacillus subtilis treatments was raised by 6.5% and 32.0%, respectively. Bacillus subtilis significantly increased the activity of SOD and CAT of lettuce while decreasing the MDA content under salt stress. This indicated that Bacillus subtilis enhanced the stability of the cell membrane. Bacillus subtilis raised the root vigor of lettuce under salt stress. Bacillus subtilis also improved photosynthesis of lettuce under salt stress by increasing the net photosynthetic rate and the stomatic conductance. The quality of lettuce did not change greatly by adding Bacillus subtilis. So the application of Bacillus subtilis is a safe and promising way to relieve salt stress in vegetable production.

【题目】枯草芽孢杆菌对盐胁迫条件下黄瓜根际酶活性的影响
【中文关键词】枯草芽孢杆菌,盐胁迫,根际,酶活性
【英文关键词】Bacillus subtilis, Salt stress, Rhizosphere, Enzyme activities
【中文摘要】通过基质栽培方式,研究了枯草芽孢杆菌在盐胁迫条件下对黄瓜根际脱氢酶、多酚氧化酶、过氧化氢酶、过氧化物酶、脲酶和碱性磷酸酶活性的影响。结果表明,在无盐胁迫条件下,枯草芽孢杆菌提高了根际脱氢酶、脲酶和碱性磷酸酶的活性,显著提高了根际多酚氧化酶和过氧化氢酶的活性;在低浓度盐胁迫,即2倍正常浓度营养液浇灌下,枯草芽孢杆菌提高了根际脱氢酶、过氧化物酶活性,显著提高了根际过氧化氢酶、脲酶和碱性磷酸酶的活性;在高浓度盐胁迫,即4倍浓度营养液浇灌下,添加枯草芽孢杆菌对根际酶活性的影响与不加菌处理没有显著差异。
【英文摘要】Effects of Bacillus subtilis (B. S) on dehydrogenase activity,polyphenoloxidase activity,catalase activity,peroxidase activity,urease activity and alkaline phosphatase activity of cucumber under salt-stress was studied through substrate culture. The results showed that under no salt stress,Bacillus subtilis increased dehydrogenase activity,urease activity and alkaline phosphatase activity,significantly increased polyphenoloxidase activity and catalase activity in the rhizosphere. Under lower-concentration salt stress,(i. e. double of normal nutrient solution level) ,Bacillus subtilis increased dehydrogenase activity and peroxidase activity,significantly increased catalase activity,urease activity and alkaline phosphatase activity in the rhizosphere. Under higher-concentration salt stress,(i. e. four times of normal nutrient solution level) ,compared to no B. S treatment,Bacillus subtilis had no significant influence on rhizosphere enzyme.

【题目】规模化猪场六种绿化树种固碳释氧能力的研究
【中文关键词】规模化猪场; 绿化植物; 固碳释氧
【英文关键词】Large-scale Pig Farm; greening tree species; carbon fixation and oxygen release
【中文摘要】利用LI- 6400便携式光合测定系统分析测定了辽宁阜新原种猪场6种绿化树种的生理生态指标, 进而对其固碳释氧能力进行评价。结果表明: 不同月份, 6种绿化树种的净光合速率日变化曲线明显不同, 主要为双峰型, 第一个峰值多出现在上午7: 00- 9: 00左右, 第二个峰值在14: 00- 16: 00之间, 中午时均出现明显的光合午休现象。银中杨和小叶杨净光合速率分别在6、7月份达到最高值, 呈单峰曲线变化; 南果梨和苹果梨在8月份明显降低, 随后升高, 呈双峰曲线变化; 白丁香和紫丁香在6月份有明显降低, 也呈双峰曲线变化。6、7、8三个月份6种绿化树种的固碳释氧能力较强, 9月份次之, 5月份最弱。苹果梨的固碳释氧能力最高, 其次是白丁香、南果梨、小叶杨和银中杨, 而紫丁香的固碳释氧能力最差。苹果梨、白丁香及小叶杨是合适的绿化植物, 适宜于广泛推广, 大面积种植。
【英文摘要】The physiological indices of six greening tree species on a large-scale Pig Farm of Fuxin city were measured by the LI-6400 portable photosynthesis system, and their carbon- fixation and oxygen-release potentials were evaluated. The results indicated that the daily curves of the net photosynthetic rates of the six tree species were mainly a double-peak type, with the first peak appearing between7: 00 - 9: 00, the second one between 14: 00- 16: 00, and an apparent photosynthetic siesta phenomenon at noon. The net photosynthetic rates of Populus alba bero linensis and Populus simonii Car seasonally varied as single-peak curve and arrived at the peak in June and July, respectively. And that of Pyrusussur iensisM iaxin. f. and Pyrus ussuriensisM axin. varied as adouble-peak curve, with a valley August. The net photosynthetic rates of Passer montanus saturatus Stejneger and Syringa ob lata Lindl also seasonally varied as a double-peaks curve, with a significant reduction in June1 The potentials of the six tree species on fixing carbon and releasing oxygen were high in them onths of June, July and August, weaker in September, and weakest in May. The order of the irpotentials on fixing carbon and releasing oxygen was Pyrus ussur iensisM iaxin. f. > Passerm ontanus saturatus Stejneger > Pyruus suriensisM axin. > Populus simonii Carr. > Populus alba berolinensis > Syringa oblata Lindl. Pyrus ussur iensisM iaxin. f., Passerm ontanus saturatus Stejneger and Populus simonii Carr. were suitable greening tree species for widely planting on the large-scale pig farm.

【题目】对畜禽粪便发酵腐熟指标判定的探讨
【中文关键词】畜禽粪便; 好氧发酵; 堆肥; 腐熟指标
【英文关键词】livestock and poultry manure; good oxygen fermentation; compost; indexes of compost
【中文摘要】以猪粪为例, 通过加入腐熟剂发酵与自然发酵对比, 探讨了畜禽粪便好氧发酵堆肥腐熟度的判定指标。实验表明, 松散度、感官气味、温度、pH 值、含水量、铵态氮、碳氮比、蛋白酶活性、大肠杆菌数、蛔虫卵死亡率、种子发芽率等可作为判定畜禽粪便腐熟度的指标, 另外, 重金属和抗生素也应作为重要指标进行检测, 随着研究的深入还应从生物学、物理学、生物化学等方面综合判断。
【英文摘要】With the comparison of decomposition both maturing agent fermentation and natural fermentation, the indexes of compost for maturity livestock and poultry manure with good oxygen fermentation are discussed by taking the pig manure as the example. The experiment shows that loose divergence, sense organ smell, temperature, pH value, water content, ammonium nitrogen, carbon nitrogen ratio(C / N) , protein enzyme activity, backwoods coli number, roundworm egg mortality rate, the seed- germination percentage can be as theindexes of compost. Moreover, the heavy metal and the antibiotic also should be as the important indexes of compost. Along with the thorough research, the evaluation from the biology, physics, biochemistry should be done.

【题目】沃特和PAM 施用方式对土壤水分及玉米生长的影响.
【中文关键词】土壤水含量,施用方式,沃特保水剂,PAM,玉米,生长状况
【英文关键词】soil moisture, application methods, Wote super absorbent, PAM, maize, growth condition
【中文摘要】:为了鉴别沃特保水剂和 PAM 不同施用方式的施用效果,在陕北黄土丘陵沟壑区开展了撒施、沟施、穴施对土壤水含量和玉米生长影响的田间试验。结果表明不同施用方式提高了 0~10 cm土层土壤水含量,而 30~40 cm土层土壤水含量则随降水量的多少呈现出不同的规律性。随着玉米的生长,不同施用方式影响的土层深度逐渐加深,从三叶期 0~50 cm土层增加到成熟期的 0~200 cm土层,土壤水含量表现为沟施、穴施高于撒施,撒施高于对照。3 种施用方式对玉米出苗无显著影响,但均提高了玉米生物量、籽粒产量、水分利用效率,降低了玉米的耗水量,其中沟施、穴施的效果强于撒施。沃特、PAM 相同施用方式对土壤水含量和玉米生长无显著影响,且沟施和穴施之间无显著性差异,但沃特单位施用量单位面积的增产量高于 PAM。玉米生产中,沃特、PAM 应以沟施或穴施为主
【英文摘要】Abstract: In order to determine the effects of Wote super absorbent and PAM with various application methods, fieldexperiments were conducted to investigate their effects on soil moisture and maize growth in the loess hilly and gully areas ofnorthern Shaanxi Province. Wote super absorbent and PAM were applied with three treatments of broadcasting, furrowing, andholing. The results showed that the three treatments could increase soil moisture within 10 cm deep below soil surface, whilesoil moisture in 30~40 cm layer showed different regimes with various precipitations at the maize growing stage. At the maizegrowing stage, soil depth affected by the treatments extended from 50 cm at three leaves stage to 200 cm at the maturationstage. The application treatments, in terms of soil moisture, were ranked in the descendant order of furrowing and holing,broadcasting, and CK. The three application methods could hardly influence maize germination, but could increase maizebiomass, kernel yield, and water use efficiency and decrease water consumption by maize. The effects of furrowing and holingtreatments were better than that of broadcasting treatment. Wote super absorbent and PAM with the same application methoddid not significantly affect soil moisture and maize growth. There was no evident difference between furrowing and holingtreatments as well. Yield per unit amount of application for Wote super absorbent was higher than that for PAM. Optimumapplication method ofWote and PAM should be furrowing or holing application in maize production.

【中文关键词】仁用杏;沙打旺;间作;土壤水分;土壤养分;树体生长
【英文关键词】Armeniaca vulgaris×A.sibirica;Astragalus adsurgens;Interplant;Soil moisture;Soil nu。trient;Growth status
【中文摘要】:在陕北黄土丘陵沟壑区对清耕和间作沙打旺(Astragalus adsurgens)6年、4年、2年仁用杏园0 500 cm土层土壤水分、有机质、全氮、全磷、速效氮、速效磷、速效钾含量及树体生长状况进行了测定,结果表明,间作沙打旺,除了在秋季提高了0—100 cm土层土壤水分以外,在春季、夏季和秋季均显著降低了0—500 cm土层土壤水分,且间作沙打旺年限越长,降低越显著。间作沙打旺提高了0—100 cm土层土壤有机质和全氮含量,间作年限越长效果越显著,但对100 cm土层以下的土壤有机质和全氮无显著影响。间作沙打旺对土壤全磷含量无显著影响。间作沙打旺显著降低了土壤速效养分含量,其中速效氮降低深度达500 cm土层,速效磷、速效钾达300 cm土层,且间作年限越长,降低越显著。间作沙打旺显著削弱了树体的长势,降低了坐果率和杏仁产量。间作沙打旺存在着与仁用杏争水争肥的矛盾,黄土丘陵沟壑区仁用杏园不宜间作沙打旺。
【英文摘要】Abstract:The experimentation of interplant Astragalus adsurgens in Armeniaca vulgaris×A.sibirica or.chard had been done in loess hilly and gully region of northern Shaanxi.The moisture,organic matter,totalN,total P,available N,available P。available K of 0—500 em soil layers and the growth status of A.vulgar~×A.sibirica of clean tillage,interplant six years,interplant four years and interplant two years had been de-termined.The results showed that the soil moisture of interplant As.adsurgens increased in 0—100 em soillayer in autumn.but the soil moisture of the treatments of interplant As.adsurgens reduced significantly inspring time,summertime and autumn in 0—500 em soil layer,and the soil moisture reduced obviously as inter.plant years increasing.In 0—100 em soil layers,organic matter and total N of the treatments of interplant As.adsurgens were higher than clean tillage,and increased obviously as interplant years increasing,but the soilorganic matter and total N under 100 em soil layers weren ' t significant difference than clean tillage.Betweenthe treatments of interplant As.adsurgens and clean tillage,soil total P didn ' t have significant difference.Soilavailable N,available P and available K of the treatments of interplant As.adsurgens were significant lowerthan clean tillage,soil available N reduced from 0 em to 500 em soil layers,soil available P and available Kreduced from 0 em to 300 em soil layers,and thedecreased obviously as interplant years increasing.content of available N,available P and available K in soilThe A.vulgaris×A.sibirlca growth of the treatments of interplant As.adsurgens were significant weaker,and fruit set

percentage and the almond yield were significantlower than clean tillage.Between As.adsurgens and A.vulgaris×A.sibirica there were a contention for waterand nutrient.A. vulgaris×A. sibirica orchard wasn ' t suitable interplant As. adsurgens in loess hilly and gullyregion.

【题目】沃特保水剂对西瓜生长及土壤环境的影响
【中文关键词】沃特保水剂; PAM; 西瓜栽 培; 土壤环境
【英文关键词】Wote super absorbent; PAM; watermelon cultivate; soi1 environment
【中文摘要】[摘 要] 在陕北黄土丘陵沟壑区, 以不施保水 剂为对照, 开展 了沃特和 PAM 保水剂对西瓜 生长及 土壤环境影响的研 究。结果表明, 施用沃特和 PAM 降低 了西瓜缓苗期的地表最高温度, 提高 了地 表的平均温度 、 最低温度及 10em土层 和20 em土层的土壤温度, 增加 了土壤的含水量, 特别是开花坐瓜期 0~30 em土层 的土壤含水量 。西瓜幼苗的成活率随沃特 和 PAM 施用量 的增加而提高。沃特和 PAM 保水剂 的施用促进 了西瓜主蔓和根系的生 长, 增强 了叶片的光合作用能力, 增加 了西瓜 的生物量, 使西瓜 的成熟期 提前, 产量 和产值增加, 水分利 用效率 显著提高 。相 同施用量的沃特与 PAM相 比, 对西瓜 生长及 土壤环境的影响差异均不显著 。沃特和 PAM 在西瓜上 的适宜使用量均为每株1.5~2.0 g, 即16.67~22.22 kg/hm 。
【英文摘要】Abstract:Compared with the loess hilly and gully regions of northern Shaanxi without using Wote SU—per absorbent and PAM, influence of Wote and PAM on the soi1 environment and the growth of watermel—on had been researched. The result showed that Wote and PAM increased the average temperature of theearth S surface, temperatures of 10 cm soi1, 20 cm soi1 and the 1owest temperature of the earth ' S surface。butreduced the highest temperature of the earth ' S surface in reviving phase. Soil moisture was increased by u—sing Wote and PAM, and the soil moisture of 0—30 cm soil in florescence and fruiting phase was also in—creased. The surviving percent of watermelon seedling increased with the increasing of quantities of Woteand PAM. It was Wote and PAM that promoted the growth of main tendrilled vine and roots, enhanced thephotosynthesis, increased watermelon biomass, moved the harvest phase up, increased the yields and theproduction value, and obviously increased the water use efficiency of watermelon. There were not remarka—ble differences betwen the soi1 environment and the growth of watermelon when Wote and PAM were usedsame quantities. Suitable quantities of Wote and PAM for watermelon should be 1.5—2.0 g plant, or16.67—22.22 kg/hm .

【题目】玉米地膜覆盖的土壤环境效应
【中文关键词】玉米;地膜覆盖;土壤;环境 效应

【英文关键词】maize;plastic film mulching;soil ;effect on environment
【中文摘要】:通过田间试验研究了地膜覆盖和露地栽培对玉米的土壤温度、水分、养分、盐分含量和土壤生物学特性及硝酸盐含量的变化。结果表明,在玉米生长前期,地膜覆盖5,lO,l5,2O,25 cm土层的土壤日平均温度比露地提高2.4"C、3.O℃、2.9℃、2.2℃、2.7"C,6~7月份比露地降低1.1℃、O.5℃、O.5℃、O.6℃、O.6℃。地膜覆盖O~1O,1O~2O,2O-30,30~40 cm土层的土壤含水量分别比霉地增加18.84%、1O.67%、11.12%和8.9%。地膜覆盖增强了土壤蔗糖酶和碱性磷酸酶的活性,增加了土壤微生物的数量、CO2浓度、土壤呼吸和土壤NO—N的含量。减少了土壤氮素的损失。地膜覆盖降低了土壤有机质、氮素、速效磷的含量、过氧化氢酶和脲酶的活性及土壤表层的盐分含量。地膜覆盖提高了玉米的生物量和经济产量。
【英文摘要】:Change of temperature,moisture,nutrient,biological characteristic,salinity and nitrate contentin soil was studied under cultivation with plastic film mulching and no film covering.The results showed thatdaily average temperature of soil with plastic mulching was higher than that without film covering in growthprophase of maize.The degree of enhancing temperature in 5,10,15,20 cm and 25 cm soil layers was 2.4℃、3.0℃、2.9℃、2.2℃and 2.7"C respectively.In June and July,daily average temperature of soil with filmmulching was lower than that without film covering.The degree of dropping temperature in 5,10,15,20 cm and25 cm soil layers was 1.1℃、0.5℃、0.5℃、0.6℃、0.6℃.The amount of enhancing soil moisture in 0~10,10~20,20~30 cm and 30~40 cm soil layer was 18.84%、10.67%、11.12%and 8.9%.Under cultivation withplastic mulching,it increased sucrase activity,phosphatase activity,number of soil microorganism,CO2 concen—tration,soil respiratory intensity,NO]一N content and decreased loss of soil nitrogen.Simultaneity it de—creased soil organic,N,avail N,avail P,catalase activity,urease activity and salinity content in soil surface lay—er.Thus plastic film mulching increased maize yield and biomass

【题目】影响"山地苹果"发展的因素分析
【中文关键词】黄土丘陵沟壑区;苹果;农村政策;地方政府;农民行为
【英文关键词】loess hilly and gully region; apple; rural policy; local government; farmer behavior
【中文摘要】采用问卷调查、入户调查等方法,调查影响陕北黄土丘陵沟壑区“山地苹果”发展的因素变化。结果表明该区“山地苹果”发展具有明显的区域特征。随着衣食问题的解决及土地承包期限的延长,山地苹果栽植面积迅速增加;农业特产税对苹果发展没有太大的影响,但农业特产税的取消以及退耕还林还草的实施促进了苹果的发展;地方政府在苹果发展过程中起到了决策者和开拓者的作用;该区苹果销售基本不受市场的影响,但技术创新能力低,技术匮缺仍为苹果生产效益较低的主要原因。随着农村劳动力的转移和生产资料价格的上升,苹果生产将转向机械化和科技化。
【英文摘要】Abstract: The paper investigated influencing factors changes on apple development in loess hilly and gully region ofnorthern Shaanxi since reform and opening up by questionnaire surveys, house surveys and other methods. The resultsshowed that the apple development had obvious regional characteristics. With the problem of food and clothing solvedafter the land contract to individual, demand for sunny slope land and semi-sunny slope land which suitable for plantingapple surged, but demand for shady slope land which suitable for grain production reduced. Short duration of landcontract in early stage had limited the apple development, after prolonging it, the apple cultivation area had been rapidlyincreased. Although special agricultural products tax had no significant impact on apple development, the abolitionof it and the implementation of the policy of returning farmland to forest had promoted the apple development. Localgovernment had played a role of decision-maker and pioneer in apple development process. There would be no rapiddevelopment but for local government strong advocacy and support. The apple had a good quality, and its good price hadstimulated the apple development. Although the fruit grower had changed the learning technologies attitude from passiveto active, lack of regional technological innovation, and technology scarcity was still the main reason of lower productionefficiency. Apple production should shift to mechanization and technology with the rural labor transfering and capitalgoods prices increasing.

【题目】黄土丘陵区雨季栽植油松试验
【中文关键词】油松,雨季,生境,存活率,生长量
【英文关键词】Chinese pine,rainy season,habitat,survival rate,growth amount
【中文摘要】:在陕北黄土丘陵沟壑区以春季栽植的2年生油松为对照,开展了雨季栽植2年生和1年生油松试验.通过测定春季、雨季栽植油松后45 d的气候、土壤水分,调查栽后4年内啮齿类动物的危害状况和油松的存活率、生长状况后得知:雨季的降水量比春季大,空气相对湿度高,风速低,气温与地温高,土壤含水量高,蒸发量在栽植后26 d内较低,利于油松缓苗和生长;雨季栽植躲过了栽植当年啮齿类动物的春季危害高峰,苗木存活率高.从栽植当年到栽植后第4年,雨季栽植的油松存活率一直比春季栽植的高,雨季栽植的2年生苗木树体生长量比春季栽植的2年生苗木生长

量大,雨季栽植的1年生苗木树体生长量与春季栽植的2年生苗木基本相同.雨季栽植油松能够显著提高苗木的存活率,促进苗木生长.

【英文摘要】Compared with planted two-year-old seedlings of Chinese pine in spring time,the experimentation ofplanted two・-year-・old and one・-year・-old seedlings of Chinese pine in rainy time in the loess hilly and gullyregions of northern Shaanxi Province had been done. rhe climate of 45 days from planted date and the soilhumidity had been observed in spring time and rainy season。Harm status of rodent,Chinese pine ’S survivalrate.and Chinese pine ’S growth status of four years fromplanted year had been investigated。 rhe resultsshowed that the precipitation in rainy season was more than that in spring time,the air relative humidity washigher,the evaporation of 26 days fromthe planted date was lower,and wind speed was lower;the airtemperature,soil temperatures,and the soil humidity were higher in rainy season than those in spring time。The habitat in rainy season was benefiting the seedlings to revive and grow.The seedlings planted in rainyseason had avoided rodent harm peak in spring time in the planted year,SO the seedlings’survival rate washigher。From the planted year to four years later,the seedlings’survival rate planted in rainy season washigher than that planted in spring time,and the growth amount of two-year-old seedlings was more than thatplanted in spring time,that of one-year-old seedlings was almost same as that planted in spring time。PlantedChinese pine in rainy season could obviously improve seedlings ’survival rate,and promote seedlings ’growth

【题目】柿炭疽病鉴别与防治

【中文关键词】柿炭疽病;为害症状;发病规律;防治措施

【英文关键词】Persimmon anthracnose; Damage symptoms ; Occurrence law; Controlling measure

【中文摘要】[目的]研究柿炭疽病的鉴别与防治方法。[方法]研究柿炭疽病病原及特征、侵染与发生规律、为害症状,总结其防治方法。[结果]柿炭疽病病原为柿盘长孢菌,属半知菌亚门真菌。孢子萌发、入侵、菌丝体生长、产孢都需要较高的温度,最适温度为25 ℃,致死温度为50 ℃(10 min)。柿炭疽病发生的强弱与寄主、环境、栽培情况等因素有关,主要为害果实和枝条。采用清洁果园、选用抗病品种和选栽无病苗木、平衡施肥、完善排灌系统、密植稀枝、利用坐地苗嫁接建园及提高嫁接部位的农业措施可控制病害的发生,病情严重则需要喷洒杀菌剂或保护剂,喷药时重点应喷施在嫩梢、果面和枝干的病斑上。[结论]该研究可为柿炭疽病防治提供参考。

【英文摘要】[Objective] The study aimed t o research the identificati on of persimmon anthracnose and its controlling methods . [Method] Thepathogen and characteristics, infection and occurrence law, damage symp t oms of persimmon anthracnose were stated simply and the methodsfor controlling the disease were summed up. [Result] The pathogen of persimmon anthracnose was Gloeosporium kaki Hori, belonging to Deu2teromycotina. The spore germinati on and invasion, the sporulation and the mycelial growth all required a higher temperature, with the op timumtemperature of 25 ℃ and the lethal temperature of 50 ℃ (10 min) . The occurrence strength of persimmon anthracnose related with the factorssuch as host, environment, culture circumstances, mainly doing harm to the fruits and branches . The occurrence of the disease could con2trolled by such agricultural measures as cleaning the orchard, using the resistant varieties and planting the disease2 free seedlings, adopting thebalanced fertilizati on, imp roving the irrigati on and drainage systems, conducting the dense planting and thin branches, building the gardenwith grafting the ground seedlings and raising the grafted parts of the stock . In a serious condition of the disease it needed to spray the fungi2cides or p rotective agent for the control of the persimmon anthracnose . The fungicides should be mainly s p rayed on the scab of the shoot, fruitsurface and branches . [Conclusi on] The study provided the reference for the control of the persimmon anthracnose

【题目】灰藜光合日变化及其与环境因子相关性的研究
【中文关键词】灰藜;光合特性;环境 因子;相关系数
【英文关键词】Chenopodium glaucum;photosynthetic character;environmental factor;correlative coeffi.cient
【中文摘要】:在晴朗无风的天气条件下,用LI一6400便携式光合仪测定了灰藜的光合作用日变化特性及光合有效辐射(PAR)、田间co浓度(ca)、空气湿度(RH)和空气温度(.ra)的日变化规律,分析了净光合速率(Pn)、蒸腾速率(Tr)和气孔导度(Gs)与环境因子的相关性。结果表明:灰藜的Pn、Tr和Gs的日变化均为典型的“双峰”曲线.峰值和低谷出现的时间一致,峰值约出现在12:00和l4:o0,约l3:00处于“低谷”;环境因子的日变化均为“单峰”曲线。灰藜的Pn、Tr和Gs与PAR、Ta呈极显著的正相关(P<0.01),与RH呈显著的负相关(P<O.O5),与Ca的负相关关系不显著,并且三者之间有极显著的相关性(P<0.O1)。
【英文摘要】:On sunny days,diurnal dynamics of photosynthetic characters of Chenopodium glaucum andenvironmental factors(PAR,Ca,RH and Ta)were measured using the Portable LI一6400 PhotosynthesisSystem made in the US,and the correlation between photosynthetic rate or transpiration rate or stomataconductance in leaves of Chenopodium glaucumand phy—ecological factors was analyzed.The resuhshowed that the curves of diurnal variation of photosynthetic rate,transpiration rate and stomata conduc—tance of Chenopodium glaucum leaves had two peaks and the peaks and depression occu~ed at the sametime,peaks at 12:00 and 14:00,and depression at 13:00.The curves of diurnal variation ofPAR,Ca,RH and Ta had one peak.Correlation analyses showed that there was an extremely remarkable positivecorrelation between photosynthetic rate,transpiration rate,stomata conductance and PAR,Ta(P<0.01),and a remarkable negative correlation between photosynthetic rate,transpiration rate,stomataconductance and relative humidity(P<0.05),and an inapparent negative correlation between photosyn-thetie rate,transpiration rate,stomata conductance and Ca,moreover,there was an extremely remarkablepositive correlation among photosynthetic rate,transpiration rate and stomata conductance.

【题目】Immune Condition of Chlamys farreri in Response to Acute Temperature Challenge
【中文关键词】无
【英文关键词】Acutetemperaturechallenge; Chlamysfarreri; Biomarkers; Haemocyte activities; High tolerance
【中文摘要】无
【英文摘要】The effects of acutetemperaturechallenge on some immune parameters of haemocyte in Zhikong scallop, Chlamysfarreri, recognised as a temperature sensitive bivalve species, were evaluated over a short period of time. Scallops were suddenly transferred from 17 ° C to 11 ° C, 23 ° C and 28 ° C for a period of 72 h. Total haemocyte count (THC), percentage of phagocytic haemocytes, reactive oxygen species (ROS) production, acid phosphatase (ACP) and superoxide dismutase (SOD) activities (in both haemocyte lysate and cell-free haemolymph) were chosen as biomarkers of temperature stress. Results demonstrated that the percentage of phagocytic haemocytes and ACP activity in cell-free haemolymph of scallops challenged at 28 ° C for 72 h significantly decreased. By contrast, reactive oxygen species production by haemocytes increased when compared to the initial values. It is concluded that haemocyte activities of C. farreri appear to be compromised when scallops were transferred from 17 ° C to 28 ° C. Meanwhile, no obvious negative effect of acutetemperature stress was detected on haemocyte activities of C. farreri challenged at 11 ° C, which highlighted the high tolerance of scallops to acute decrease of seawater temperatures.

【题目】Immune responses of the scallop Chlamys farreri after air exposure to different temperatures
【中文关键词】无
【英文关键词】Airexposure; Chlamysfarreri; Immuneresponses; Survival time; Temperature
【中文摘要】无
【英文摘要】The present study examined the influence of airexposure at differenttemperatures: a common perturbation associated with aquaculture handling practices, on immuneresponses in zhikong scallopChlamysfarreri. Scallops were exposed to air for 2 h, 6 h, 12 h and 24 h at 5 ° C, 17 ° C and 25 ° C respectively. Thereafter, a recovery period of 24 h at 17 ° C was applied. Haemocyte mortality, phagocytosis and reactive oxygen species (ROS) production of haemocytes, acid phosphatase (ACP) and superoxide dismutase (SOD) activity in haemocyte lysates were chosen as immunomarkers of anoxic stress. The results showed that an increase of haemocyte mortality and a decrease of phagocytosis and ACP activity were observed after 2 h of airexposure for all temperatures tested. Moreover, a significant increase of ROS production occurred following 2 h of airexposure at 25 ° C and 24 h of airexposure at 17 ° C. Significant differences were also observed in haemocyte mortality, percentage of phagocytic cells and ACP and SOD activity depending on the temperature of airexposure. Finally, after 24 h of recovery at 17 ° C, percentage of phagocytic haemocytes and ACP activity did not return to initial values. ROS production was significantly higher than before the recovery period and initial values for scallops subjected to airexposure at 5 ° C. In our study, scallops showed a relative low anoxia tolerance under a high temperature. All the scallopsair exposed to 25 ° C died after the 6 h sampling. In conclusion, airexposure associated to aquaculture practices was demonstrated to strongly affect functional immune activities of scallop haemocytes, and high

temperatureairexposure caused reduced survival of scallops.

【题目】Variations of enzyme activities in the haemocytes of scallop Chlamys farreri after infection with the acute virus necrobiotic virus (AVNV)
【中文关键词】无
【英文关键词】Chlamysfarreri; Acutevirusnecrobioticvirus (AVNV); Haemocyte; Enzymeactivities
【中文摘要】无
【英文摘要】Acute virus necrobiotic virus (AVNV) is one of the main pathogens for large scale mortality of Chinese scallop Chlamys farreri. In this paper, C. farreri were infected by different dilutions of AVNV supernatant (5(0), 5(-1), 5(-2), 5(-3), 5(-4), 5(-5), 5(-6), 5(-7), respectively), and dead individuals were counted every day for 15 days. Samples from groups of 5(-3) and 5(-5) were taken every day till 15 days and the activities of acid phosphatase (ACP), alkaline phosphatase (ALP), superoxide dismutase (SOD), myeloperoxidase (MPO), phenoloxidase (PO), peroxidase (POD) and catalase (CAT) in haemocytes were measured. The results of virus challenge showed that survival rates of scallops in groups of 5(0) and 5(-1) decreased sharply after the first day and died out completely on the 5th and 4th day, respectively. In other groups (5(-2), 5(-3), 5(-4), 5(-5), 5(-6) and 5(-7)), survival rates decreased gradually till 6 or 7 days, then kept steady till 15 days, and they were dose-dependent, increasing from 12% to 80% as the dose decreased from 5(-2) to 5(-7) viral supernatant. In the control group, survival rate was 88%. Enzyme activities for groups of 5(-3) and 5(-5) illustrated that activities of ACP, SOD, MPO, PO in groups of 5(-3) and 5(-5) were significantly higher than the control group in the first 9 or 10 days, and went back to the control group levels gradually after 10 days. Moreover, their activities in group of 5(-3) varied more than that in the group of 5(-5), especially activities of MPO, PO. Differently, the activities of POD and CAT were reduced or induced by virus infection and showed no regular trends in the experiments. The activity of ALP was not detected.

【题目】Loop-mediated isothermal amplification for rapid detection of Acute viral necrobiotic virus in scallop Chlamys farreri
【中文关键词】无
【英文关键词】Acute viral necrobiotic virus; scallop Chlamys farreri; loop-mediated isothermal amplification
【中文摘要】无
【英文摘要】Loop-mediated isothermal amplification (LAMP) assay for rapid and sensitive detection of Acute viral necrobiotic virus (AVNV) in scallop Chlamys farreri was developed and evaluated. Four primers recognizing six targets on distinct AVNV DNA sequences were designed and the LAMP reaction was carried out in a water bath. Reaction temperature and time were optimized at 64 degrees C for 60 mins and LAMP products were detected using agarose gel electrophoresis and visual assessment. Confirmation of the expected LAMP products was performed with MboI restriction enzyme analysis. The detection limit of LAMP assay was as low as 1 fg AVNV DNA and accordingly, this assay was 100 times more sensitive than conventional PCR technique. A comparative evaluation of 20 samples using the LAMP and PCR assays revealed a complete accord in positivity or negativity for AVNV. These results indicate that the LAMP assay is simple, sensitive, specific, and has a great potential for detection of AVNV in the laboratory and field.

【题目】Assessment of the local environmental impact of intensive marine shellfish and seaweed farming - application of the MOM system in the Sungo Bay, China
【中文关键词】无
【英文关键词】Shellfish culture; Environmentalimpact; Redox potential; Benthic fauna; Modelling-Ongrowing fish farms-Monitoring (MOMsystem); China; Shandong; SungoBay
【中文摘要】无
【英文摘要】The impact of large scale shellfish (Crassostrea gigas, Chlamys farreri) and seaweed (Laminaria japonica) culture on the benthic environment at the SungoBay, China was assessed using the B-investigation of the MOMsystem. The MOMsystem (Modelling-Ongrowing fish farms-Monitoring) was developed to control the impact of organic waste from marine fish farms in Norway, but it is based on a general concept of environmental management and may be adapted to other fish species and longline shellfish or seaweedfarming by adjusting parameters and techniques. 10 sampling station were set and a total of 66 sediment samples were collected. Seasonal variations in three groups of parameters were compared, but no significant differences were detected between the different culture species sites. Benthic animals were found in all samples, and the redox potential stayed above + 50 mV. The sediment conditions according to the Groups 2 and 3 parameters of the MOM-system were compared. The results suggest that the Sungou Bay benthic environment belong to condition 1 or 2, which means that the effects of long term shellfish and seaweedfarming activities on the benthic environment of Sungou Bay were low. But the result also showed that the impacts in summer and autumn are likely to be greater than in winter and spring. More studies need to be performed to adjust the investigation to Chinese conditions and to shellfishfarming, so as to form an adequate system for China. The reasons that keep the SungoBay benthic environment in good condition were analysed.

【题目】Development of a loop-mediated isothermal amplification assay for rapid and sensitive detection of ostreid herpesvirus 1 DNA
【中文关键词】无
【英文关键词】Ostreidherpesvirus1 (OsHV-1); Oyster; Loop-mediatedisothermalamplification (LAMP); Detection
【中文摘要】无
【英文摘要】A loop-mediated isothermal amplification (LAMP) assay was developed for rapid, specific and sensitive detection of ostreid herpesvirus 1 (OsHV-1) DNA. A set of four primers was designed, based on the sequence of the ATPase subunit of the OsHV-1 DNA-packaging terminase gene. The reaction temperature and time were optimized to 64 ° C and 60min, respectively. LAMP products were detected by agarose gel electrophoresis or by visual inspection of a color change due to addition of fluorescent dye. The developed method was highly specific for detection of OsHV-1, and no cross-reaction was observed with other DNA viruses, such as White spot syndrome virus (WSSV), Penaeus stylirostris densovirus (PstDNV), Turbot reddish body iridovirus (TRBIV) and Lymphocystis disease virus (LCDV) found commonly in China. The lower detection limit of the LAMP assay was approximately 20 copies per reaction, and it was 100 times more sensitive than that of conventional PCR. A comparative evaluation of 10 oyster samples

using LAMP and PCR assays showed overall correlation in positive and negative results for OsHV-1. These results indicate that the LAMP assay is a simple, rapid, sensitive, specific and reliable technique for the detection of OsHV-1. The LAMP technique has capacity for use for the detection of OsHV-1 both in the laboratory and on farms.

【题目】Physiological and immune responses of Zhikong scallop Chlamys farreri to the acute viral necrobiotic virus infection

【中文关键词】无

【英文关键词】Chlamysfarreri; Acuteviralnecrobioticvirus; Physiological; Immuneresponse

【中文摘要】无

【英文摘要】The Zhikong Scallop, Chlamys farreri, is one of the most important bivalve mollusks cultured in northern China. However, mass mortality of the cultured C. farreri has posed a serious threat to the maricultural industry in recent years. Acute Viral Necrobiotic Virus (AVNV) is believed as an important etiological agent causing the scallop mass mortalities. To understand the mechanism behind the AVNV associated scallop disease and mortality, we assessed the physiological and immune responses of C. farreri to the virus infection using oxygen consumption rate, ammonium-nitrogen excretion rate, hemocyte copper, zinc superoxide dismutase gene expression, and plasma superoxide dismutase activity and alkaline phosphatase activity as indicators. Scallops challenged by AVNV at 25 degrees C developed typical disease signs 2 days after virus injection. Before the disease manifested, scallop oxygen consumption and NH4+-N excretion rates rose and then fell back. Real-time PCR revealed that the hemocyte cytosol Cu, Zn SOD gene expression was upregulated followed by recovery. The plasma SOD activity, however, augmented consistently following virus injection. Moreover, plasma AKP activity first lowered and then elevated gradually to the highest level at 24 h post virus injection. Scallops challenged by AVNV at 17 degrees C neither developed notable disease nor showed obvious responses that could be associated with the virus infection. While the results suggested a correlation between the elevated seawater temperature and the AVNV infection associated C. farreri mortalities, they also indicated that the viral infection provoked multiple physiological and immune responses in the host scallops.

【题目】Seasonal variations in growth and clearance rate of the Zhikong scallop Chlamys farreri suspended in the deep water of Haizhou Bay, China

【中文关键词】无

【英文关键词】Chlamys farreri, Growth, Clearance rate, Biodepositon method, Water temperature

【中文摘要】无

【英文摘要】The growth and survival of the Zhikong scallop Chlamys farreri suspended in deep water of Haizhou Bay were studied from July 2007 to June 2008, and the biodeposition method was used to estimate the clearance rate of C. farreri under field conditions. Results showed that the scallop grew fast during all the culture time, with the exception of summer. The condition index of the scallop increased with time and reached the highest value in spring of the second year. The survival of scallops was 60.8 ± 3.9% at the end of this study, mortality occurring mainly during the summer and autumn of the first year. The clearance rate fluctuated obviously with season,with the highest value in September 2007, and the lowest value in March 2008. Factors accounting for variations in growth and

clearance rate of scallops are also discussed.

【题目】Growth, survival and immune activity of scallops, Chlamys farreri Jones et Preston, compared between suspended and bottom culture in Haizhou Bay, China
【中文关键词】无
【英文关键词】Chlamys farreri;aquaculture;seasonal variation;water temperature;dissolved oxygen (DO);immune activities
【中文摘要】无
【英文摘要】We examined the growth, survival and immune response of the scallop, Chlamys farreri, during a 1-year period in deep water of Haizhou Bay. Scallops were cultured using two methods: (1) in lantern nets at a 5 m depth and (2) in a bottom culture system (sleeves) on the seabed at about a 25 m depth. Shell heights, meat dry weight and immune activities in the haemolymph (superoxide dismutase and myeloperoxidase) were measured bimonthly or quarterly from July 2007 to June 2008. Survival was measured at the end of the study and environmental parameters in the experimental layers were monitored during the experiment. The growth and immune activities of scallops were lower when the water temperature was high, which was consistent with the main mortality occurring in summer. The growth and immunity of scallops were higher in the suspended culture than in the bottom culture during the experiment, with the exception of shell growth during the last study period. Survival of scallops in the suspended culture (54.6±12.3%) was significantly lower than that in the bottom culture (86.8±3.5%) at the end of this study. We conclude from our results that the high mortality of C. farreri can be prevented by culturing them in a bottom culture system before November of the first year, and then transferring them to a suspended culture to improve scallop production.

【题目】Survival, growth, and immune activity of scallop Chlamys farreri cultured at different depths in Haizhou Bay during the warmest months of the year
【中文关键词】无
【英文关键词】Chlamys farreri, survival, growth, mortality, immune activity, hot season, water depth
【中文摘要】无
【英文摘要】Survival, growth and immune response of the scallop, Chlamys farreri, cultured in lantern nets at five different depths (2, 5, 10, 15, and 20 m below the sea surface) were studied in Haizhou Bay during the hot season (summer and autumn) of 2007. Survival and growth rates were quantified bimonthly. Immune activities in hemolymph (superoxide dismutase (SOD) and acid phosphatase (ACP)) were measured to evaluate the health of scallops at the end of the study. Environmental parameters at the five depths were also monitored during the experiment. Mortalities mainly occurred during summer. Survival of scallops suspended at 15 m (78.0%) and 20 m (86.7%) was significantly higher than at 2 m (62.9%), 5 m (60.8%) or 10 m (66.8%) at the end of the study. Mean shell height grew significantly faster at 10 m (205.0 μm/d) and 20 m (236.9 μm/d) than at 2, 5 or 15 m in summer (July 9 to September 1); however, shell growth rate at 20 m was significantly lower than at the other four depths in autumn (September 2 to November 6). In contrast to summer, scallops at 5 m grew faster (262.9 μm/d) during autumn. The growth of soft tissue at different depths showed a similar trend to the shell. Growth rates of shell height and soft tissue were faster in autumn than in summer, with the exception of shell height at 20 m.

SOD activity of scallops increased with depth, and ACP activity was significantly higher at 15 and 20 m than at other depths, which suggests that scallops were healthier near the bottom. Factors explaining the depth-related mortality and growth of scallops are also discussed. We conclude that the mass mortality of scallop, C. farreri, during summer can be prevented by moving the culture area to deeper water and yield can be maximized by suspending the scallops in deep water during summer and then transferring them to shallow water in autumn.

【题目】Variations of retention efficiency of bivalves to the different concentration and organic content of suspended particles
【中文关键词】无
【英文关键词】retention efficiency, Mytilus edulis, Crassostrea gigas, Chlamys farreri
【中文摘要】无
【英文摘要】Retention efficiencies (RE) of scallop (Chlamys farreri), oyster (Crassostrea gigas) and mussel (Mytilus edulis) in a flow-through system were measured to understand the short-term response to various particle and organic matter concentrations. By comparing the RE of C. farreri with that of C. gigas and M. edulis, we gained further knowledge on the feeding physiological characteristics of C. farreri and ascertained the possible cause of high summer mortalities of this species. The experimental feeding conditions included natural differences in the abundance and composition of suspended seston, as well as conditions in which seston abundance and composition were manipulated by adding natural silt or cultured microalgae. The results show that in natural sea water, the minimum particle size for maximal retention in M. edulis, C. gigas and C. farreri was approximately 4, 6, and 8 μm, respectively; the RE of 2-μm (equivalent spherical diameter) particles was 17%, 19%, and 8%, respectively; and the relative standardized RE was 58%, 49%, and 18%, respectively. In C. gigas and M. edulis, the minimal particle size for maximal retention did not change with food quality (organic content). C. farreri was more sensitive to fluctuations in particle concentration and organic content. With particle concentration increase, the minimal particle size for maximal retention in scallop shifted to large particles and the RE for 2-μm particle decreased from 8% in natural seawater to 1.6% – 6% in silt-enriched groups. With organic content increase, the minimal particle size for maximal retention shifted from 8 to 5 μm in natural seawater.Variation in RE of C. farreri with food conditions and the relationship between lower RE and smaller particle size may hamper C. farreri from food taking due to the decrease in the size distribution of phytoplankton in Sungo Bay.

【题目】栉孔扇贝急性病毒性坏死症(AVND)病理学观察与分析
【中文关键词】栉孔扇贝, 急性病毒性坏死症, 组织病理学, 细胞病理学
【英文关键词】Chlamys farreri, Acute viral necrobiotic disease, Histopathology, Cytopatholog
【中文摘要】2000~2002年,应用光镜和电子显微技术对AVND发生期间栉孔扇贝(Chlamys farreri)各主要组织器官病理变化进行了连续观察。光镜观察显示,除生殖腺、闭壳肌外,濒死栉孔扇贝的外套膜、鳃、肾、消化腺和肠组织都有不同程度的组织病理变化。病灶主要出现在上述各器官的结缔组织以及上皮组织,病理变化表现为细胞核肿大、固缩、破裂,核染色质边缘化或空泡化,受感染细胞崩解、脱落,留下大片均质无结构的空白区域,形成凝固性坏死,结缔组织细胞质中有嗜碱性包涵体样颗粒存在。电镜观察显示,在病灶出现的组织细胞内,细胞核染色质异常凝集和边缘化、核膜周隙扩张或溶解

。细胞器病理变化明显,内质网扩张,核糖体脱落,有髓鞘样小体出现;线粒体肿大、嵴融解,整个细胞出现解体现象。病变的结缔组织细胞与间质细胞细胞质中有大量直径为130~170 nm、具有囊膜的球形病毒粒子存在,负染电镜观察表明,病毒囊膜表面覆有长20 nm放射状纤突。病毒的发生基质在细胞质内,并被一膜性结构所包围。病毒在宿主细胞中的繁殖分为3个阶段,即病毒发生期、病毒装配期和病毒释放期。病理学观察证明,病毒感染与病理变化具有明显的相关性。

【英文摘要】Successive pathologic observations on main tissues and organs of cultured scallop Chlamys farreri, collected from the coast of Shandong (China) during mass mortality due to the onslaught of virulent disease,were conducted with light microscope and transmission electron microscope in 2000~2002. The observation of the moribund scallops showed that distinct histopathological changes appeared. The lesions were found in gills, mantle, kidney, intestine and digestive gland, but adductor muscle and sexual gland were excepted. The typical infection was characterized as multiple and severe infection with disordered and necrotic architecture. Indistinct basophil inclusions were observed on the infected tissues. Cellular changes included nclear hypertrophy, chromatin margination, pyknosis, karyorrhexis, and cellular disintegration that often resulted in empty space amongst the lesions. Transmission electron microscope revealed the presence of sphere2shaped, enveloped virions, 130 to 170 nm in diameter, in the cytoplasm of infected cell from above2mentioned various tissues. The spike of envelope, according to observation by using negative stain after isolation and purification, was 20nm in length. The virogenic matrix was inside the cytoplasmic vesicles with membrane. Virion development in the cytoplasmic vesicles could be divided into three stage, viz. emergence, assembly and release. Infected cell with virion could bring about obvious pathologic changes, such as chromatin marginated and perinuclear space dilated in hypertrophied nuclei, ribosome detach from turgescent rough endoplasmic reticulum, myelinbody appeared in the cytoplasm, mitochondria swell and mitochondrial cristae rupture. Lastly, cellular disintegration resulted in empty space amongst the lesions. The pathological observation verified that the pathological effects were associated with the viral infection.

【题目】栉孔扇贝急性病毒性坏死病毒荧光定量PCR检测方法的建立和应用
【中文关键词】栉孔扇贝 AVNV AVND 荧光定量聚合酶链式反应(FQ-PCR) Taq Man探针
【英文关键词】Chlamys farreri, AVNV, AVND, FQ-PCR, Taq Man prob
【中文摘要】根据栉孔扇贝(Chlamys farreri)急性病毒性坏死病毒(Acute viral necrobiotic virus,AVNV)的基因序列,选择保守区段,应用Beacon Designer 7.0软件设计了一对能特异性扩增90bp片段的引物和TaqMan探针,建立并完善了AVNV荧光定量聚合酶链式反应(Fluorescent quantitative polymerase chain reaction,FQ-PCR)诊断方法。该方法在108~102病毒拷贝范围内有较好的线性关系,AVNV拷贝数(X)和循环数(C)t的相关关系为:lgX=-0.29Ct+13.28(相关系数R2=0.998);检测AVNV的灵敏度为102拷贝;特异性实验表明只对AVNV基因组呈阳性反应。应用FQ-PCR对76份采自夏季发病期前后的栉孔扇贝样品进行检测,结果发现68份样品检测结果为阳性,阳性检出率为89.47%,高于普通PCR的阳性检出率(80.26%)。研究结果表明,该方法快速、灵敏,特异、重复性良好且能实现AVNV的定量检测,对AVNV的快速诊断和分子流行病学的调查以及AVNV疫情监测具有重要意义。
【英文摘要】Acute viral necrobiotic virus (A V N V) is an enveloped, spherical virus (130 nm to 170 nm in diameter), with spike-like surface protrusions. This pathogen has been causing acute viral necrobiotic disease (A V N D) in scallop Chlamys farreri in China during summer time. Acute mortality of infected scallop can be as high as 90% within 5 to 8 days. Successful therapeutics for scallop against this virus is not available thus far, to the best of our knowledge. Therefore, development of preventive strategies, especially rapid and early detecting assay for this viral pathogen, is of special urgency in disease management of scallop farming. Several methods such as ultrastructural examination and ELISA have been developed for ANAV detection. However, these assays are generally time-consuming, laborious and insensitive. In this paper, based on the DNA sequences of AVNV, a pair of specific primers which can specifically amplify a 90bp fragment, and a fluorescent Taq Man probe were designed. Then, a specific, fluorescence based quantitative polymerase chain reaction (F Q-PCR) assay for real-time detection of AVNV was developed and optimized initially. It could obtain excellent linearity when the AVNV concentration is between 108 and 102 copies, lgX = - 0.29 Ct + 13.28 (correlation coefficient R2 = 0.998). After the procedure of fluorescent quantitative polymerase chain reaction (F Q- PCR) assay for acute viral necrobiotic virus was optimized, the specificity, sensitivity and reproducibility of the method were estimated. The detection limit of this assay was 102 copies for AVNV. It was also found that the specificity of this assay was high without any cross-reactions with DNA from AVNV uninfected C. farreri and other viruses such as WSSV, IHHNV, TRBIV and KHV found commonly in China. The coefficients of variance (CV) of cycle threshold were 0.61 %-2.03 % and 0.92 %-2.88 % for the intra-assay and inter-assay tests respectively, which indicated good reproducibility. Seventy-six samples of C. farreri collected from Qingdao, Rongcheng, Changdao in Shandong province and Dalian in Liaoning province during July to September in 2007 were tested by using FQ-PCR and conventional PCR assays. The results showed that the detection rate of FQ-PCR was 89.47 %, higher than that of conventional PCR (8 0. 26 %). The FQ-PCR assay demonstrated exceptionally higher sensitivity compared to that of traditional PCR by picking up 7 additional positive cases. None of the positive samples by PCR assay were missed by FQ-PCR assay, thereby showing superior sensitivity of FQ-PCR method. This increased sensitivity makes FQ-PCR a better choice than the traditional PCR for the detection of AVNV in cases when lower concentrations of virus are expected in asymptomatic samples. Thus, virus-carrying C. farreri can be found during early infection stages and effectively controlled before the infection becomes epizootic. Therefore, it is confirmed that the FQ-PCR assay is a powerful tool for the detection of AVNV with rapidity, sensitivity, specificity, accuracy and quantification.

【题目】鱼虾贝病毒分离纯化技术概述
【中文关键词】水产动物, 病毒, 分离纯化
【英文关键词】Aquatic animals, Virus Purification
【中文摘要】多年来由于水产动物病毒病的流行,在世界范围内给水产养殖业,尤其是鱼类、对虾类和贝类养殖产业带来了严重的危害。病毒的分离纯化作为研究病毒病的必要手段,作用十分重要。因此,国内外学者对此进行了大量的研究,并

取得了许多成果。本文综述了这3种水产动物病毒分离纯化的研究概况。
【英文摘要】In recent years,the outbreak of the aquatic animal diseases caused serious damage to aquaculture industry.The damage was particularly serious in cultivated fish and shellfish.Virus purification is very important as a necessary step for virus disease research.A lot of work on virus purification has been done by domestic and foreign scholars,and lots of accomplishments were achieved.This paper reviews the virus purification methods in fish and shellfish.

【题目】浅海养殖滤食性贝类生态容量的研究进展
【中文关键词】滤食性贝类; 生态容量; 模型; 海水养殖
【英文关键词】filter-feeding shellfish; ecological carrying capacity; model; mariculture
【中文摘要】全球贝类养殖强度和规模日趋增长,在追求海域养殖产出最大化的同时,引发了一系列生态环境问题,其中,生态容量问题已引起世界范围的广泛关注,并成为水产养殖业可持续发展中迫切需要解决的科学问题。尽管中国是世界上贝类养殖的第一大国,但是在贝类养殖的容量研究方面起步较晚,数值模型的研究也相对滞后。本文概述了滤食性贝类生态容量的概念和国外生态容量研究现状和进展,介绍了目前国际上较为成熟的2个生态容量评估模型(DEPOMOD模型和ECOPATH模型)及其优点和局限性,列举了中国目前贝类养殖容量和生态容量的研究现状与实践,并分析了其中存在的问题,展示了近海养殖生态和生态容量的研究思路,旨在为建立基于生态系统水平管理的健康养殖模式提供科学依据。
【英文摘要】With rapidly development of shellfish mariculture in the world,the problem of environmental impact became serious. In order to make the mariculture industry sustainable development,ecological carrying capacity becomes one of worldwide problem. China as the biggest country for producing marine shellfishes in the world,the research on the production carrying capacity,especially on numerical model of ecological carrying capacity of shellfish mariculture was lag. In this paper,the conception and evaluation model of ecological carrying capacity of filter-feeder shellfish were briefly described. It exhibited two kinds of mathematic model(DEPOMOD model and ECOPATH model) that were used worldwide in the assessment of ecological carrying capacity,and introduced the progresses and shortages. The current status and problem of research on carrying capacity in China were reviewed. And some scientific proposals for the improvements of the studies on the ecological carrying capacity were made in this paper.

【题目】盐度和饵料密度对栉孔扇贝Chlamys farreri稚贝滤水率的影响
【中文关键词】栉孔扇贝; 稚贝; 滤水率; 盐度; 饵料密度
【英文关键词】Chlamys farreri Spat Filtration rate Salinity Microalgae density
【中文摘要】采用静水法研究了恒定温度(24±0.5°C)、饵料密度(3.0×104cell/ml)、不同盐度(20、25、30和35)和恒定温度(24°C±0.5°C)、盐度30、不同饵料密度梯度(3.0×104、4.5×104和6.0×104cell/ml)对栉孔扇贝稚贝(壳长1.177~2.017mm)滤水率的影响。结果表明,栉孔扇贝稚贝的滤水率(FRS)开始随着盐度的升高而升高,在25~30之间存在最大值,然后随盐度的升高而下降,与盐度(S)间的相关关系为FRS=-30.893S2+1691.5S-19610(r=0.847,以整体干重计算)或FRS=-0.022S2+1.2236S-14.522(r=0.928,以个体数量计),通过公式推算在盐度27.8时FRS达到最大值,为3.54L/g.dw.h(2.49×10-3L/h.ind);投饵密度(Q)对栉孔扇贝稚贝的滤水率(FRQ)有显著影响(P<0.05),二者之间的相关关系为FRQ=-0.0693Q2+0.6484Q-1.0835(r=0.722),其变化趋势亦呈现先升高后下降的抛物线趋势,推算金藻密度为4.7×104cell/ml时滤水率最大,为0.43×10-3L/h.ind。

【英文摘要】At temperature 24±0.5℃, the filtration rates of scallop Chlamys farreri spats (1.177~2.017 mm in shell length) were determined at different salinities (20,25,30,35) when microalgae density was 3.0×104cell/ml and different density of microalgae (Dicrateria zhanjiangensis) (3.0×104 cell/ml, 4.5×104 cell/ml, 6.0×104 cell/ml) when salinity was 30, using static water method. The relationship between the filtration rate (FRS) and the salinity (S) can be expressed by FRS =-30.893S2+1 691.5S-196 10 (r=0.847) (calculated by whole dry weight), FRS =-0.022S2+1.223 6S-14.522 (r= 0.928, calculated by individual quantity) . We estimated that at the salinity of 27.8,the filtration rate reached the maximum value, 3.54L/g · dw · h(2.49×10-3 L/ h · ind). The filtration rate of the scallop spats increased with the salinity when the salinity was lower than 27.8 and decreased when it was more than 27.8. Feeding rate had significant influence on the filtration rates of the scallop (P< 0.05). When fed with D.zhanjiang ensis at in the concentrations of 3.0×104 cell/ml, 4.5×104 cell/ml, 6.0×104 cell/ml, the filtration rate of the scallop spats increased and then decreased in a parabolic trend.It was estimated that the highest filtration rate(0.43×10-3 L/ h · ind)could be reached when the density was 4.7×104cell/ml.The relationship between the filtration rate (FRQ) and the microalgae density (Q) was FRQ=-0.069 3Q2+0.648 4Q-1.083 5(r= 0.722)。

【题目】栉孔扇贝急性病毒性坏死病毒(AVNV)卵内的垂直传播途径
【中文关键词】AVNV; 垂直传播; 间接ELSIA; 间接免疫荧光; 电子显微镜技术
【英文关键词】acute viral necrotic virus(AVNV); vertical transmission; indirect ELISA; IFA; technology of electron microscope
【中文摘要】急性病毒性坏死病毒已被证实为是一种对养殖栉孔扇贝危害极大的病原体,探讨其传播途径是防控扇贝"大规模死亡症"的前提之一。将亲贝各放在一独立育苗水体内产卵、孵化,并进行幼虫培育。通过春季和秋季室内人工育苗,从40个独立育苗水体中,采获亲贝、卵各23个家系样品,受精卵、D形幼虫、壳顶幼虫各12个家系样品,眼点幼虫2个家系样品。采用间接ELISA法、间接免疫荧光技术和电子显微镜技术对亲贝、卵和发育各期的幼虫进行定性和定位的检测。结果发现,栉孔扇贝的性腺组织中存在病毒粒子,而卵、受精卵及各期发育幼虫体内均未检测到病毒。由此可以判断:AVNV可以感染栉孔扇贝的性腺,但并不存在卵内垂直传播的可能性。
【英文摘要】The virus named AVNV (acute viral necrotic virus) can cause the mass mortality in cultured scallops Chlamys farreri. So the research of AVNV vertical transmission is necessary. In the experiment,the study put the parental scallops into the separate breeding waters,then spawning,hatching,and cultivating larvae. According to the artificial spring and autumn seed of scallop indoors,from the forty separate breeding water bodies,23 parental scallops,23 eggs,12 spermoviums,D larvae and shell young,2 eyebot larvae were obtained. For the qualitative and localized detection,the methods of Indirect ELISA,IFA and Electron microscope were used to detect parental scallops,eggs and the larvae with different development phases. The result shows that the virus can be detected in the gonad of the parental scallops,but it can not be detected in the eggs,spermoviums,D larvae,shell young,and eyebot larvae. This indicates that AVNV can infect the gonad of scallop (Chlamys farreri),but there does not exist the route of vertical transmission sensu stricto. For further study,the research of horizonatal transmission is essential.

【题目】栉孔扇贝春季升温育苗与保苗技术研究
【中文关键词】栉孔扇贝春苗; 虾池; 保苗

【英文关键词】spring seed of Chlamys farreri; shrimp pond; temporary cultivation
【中文摘要】栉孔扇贝Chlamys farreri在中国海水养殖业中占有十分重要的地位,但目前苗种来源仍多采用半人工采苗的方法,苗种数量和质量均无法保证,已经严重制约了产业的发展。2007年2~6月,笔者在红岛蛤原良种有限公司进行了春季升温育苗试验,采取在自然水温很低的情况下(6.9℃),逐步升温促熟,经过23d室内亲贝暂养,在52m3水体中共培养出库稚贝(壳长719.58±65.74μm)12.8×106粒,保苗后壳长4.923mm×5.661mm稚贝8.3×106粒。此次出库稚贝的中间培育采用改造后的虾池(5.33hm2),在虾池中打桩拉浮绠,每隔1.5m悬挂浮球一个,吊养保苗袋,虾池中水温适宜,饵料生物丰富,提高了稚贝成活率,平均保苗率高达65%.
【英文摘要】Zhikong scallop Chlamys farreri plays an important role in China’s mariculture.The seeds of this species were collected artificially from natural waters at present.Thus,it is difficult to meet the needs in quantity and quality and the development of the industry is seriously limitted.The artificial reproduction experiment in spring was carried out from February to June of 2007 in Hongdao Clam Original and Eugenic Breed Development Co.Ltd.Under relative low water temperature(about 6.9℃),by promoting water temperature gradually,the induced mature was obtained.After 23 days’ indoor culture,the parents spawned.In the water body of 52 m3,12.8×106 seeds with mean shell height 719.58±65.74 μm were got.After the temporary cultivation,there were 8.3×106 individuals.Temporary cultivation was carried out in the mended shrimp pond.Because of the suitable temperature and abundant bait-organisms in the shrimp pond,the survival rate of the juvenile was increased,reaching 65%.

【题目】桑沟湾营养盐时空分布及营养盐限制分析
【中文关键词】营养盐分布; 季节变化; 营养盐限制因子; 海水养殖; 桑沟湾
【英文关键词】Nutrient distribution Seasonal variation Nutrient limitation Mariculture Sanggou Bay
【中文摘要】根据2006年4、7、11月和2007年1月共4个航次的调查数据,分析了桑沟湾水域的溶解无机氮(DIN)、活性磷酸盐(PO43-)和活性硅酸盐(Si)含量的时空分布特征,采用营养盐浓度阈值法和化学计量法对桑沟湾营养盐潜在的限制性进行了分析。结果显示,桑沟湾DIN、PO43-、Si含量及分布呈现出明显的季节变化:DIN在秋季最高,春季最低;PO43-在秋季最高,夏季最低;Si在夏季最高,秋季最低。春季DIN和PO43-的含量低于理论上浮游植物生长的营养盐阈值的站位分别占44%和39%;夏季PO43-的潜在限制性较强,浓度低于营养盐阈值的站位占68%,受PO43-潜在限制的几率达79%,DIN和Si分别为5%和0;秋、冬季Si可能是浮游植物生长的主要限制因子。讨论了海水养殖、陆源输入及外海交换对营养盐时空分布的影响。目前,桑沟湾营养盐浓度基本属于国家一类、二类水质。但是,长期变化趋势显示DIN有上升的趋势。

【英文摘要】The distribution of dissolved nutrients in Sanggou Bay was investigated in April,July and November 2006 and January 2007.The concentration and distribution of dissolved inorganic nitrogen (DIN),phosphate (PO43-) and silicate in Sanggou Bay showed obvious seasonal variation.DIN reached the lowest level in spring and the highest level in autumn; PO43- concentration was at the lowest level in summer and the highest level in autumn; while Si concentration reached the lowest point in autumn and the highest point in summer.Limiting nutrients for the growth of phytoplankton were assessed by the method of theoretical half-saturation constant (Ks) and stoichiometric ratios among DIN,PO43-and SiO2-3.The results showed that in spring,the percentage of stations with concentration of DIN and PO43-below Ks was 44% and 39%,respectively,suggesting for potential N and P limitation.In summer,the percentage of stations with PO43-concentrations below Ks was 68%,and potential P-limitation was at 79% probability,N and Si limitation were at 5% and 0% probability,respectively.In autumn and winter,Si was the major limiting nutrient,and the potential Si-limitation was at 94% and 78% probability,respectively.The effect of mariculture activities,land-based input,and water exchange with Yellow Sea on the space-time distribution of nutrients were discussed.Based on the long-term data,more attention should be paid to DIN enrichment in Sanggou Bay.

【题目】桑沟湾夏季栉孔扇贝养殖笼内水质变化
【中文关键词】海水养殖; 污损生物; 栉孔扇贝; 桑沟湾
【英文关键词】Mariculture Biofouling Scallop Chlamys farreri Sanggou Bay
【中文摘要】以2006年桑沟湾筏式养殖的栉孔扇贝为研究对象,测定了网笼内的水质状况及栉孔扇贝的死亡率,探讨了污损生物的可能影响。结果表明,(1)经过7个月的养殖,初始密度低于30个/层的实验组,栉孔扇贝的死亡率低于6%;高密度实验组(40个/层)的死亡率高达27%;(2)网笼内、外的磷酸盐、硅酸盐浓度没有显著性差异,但是,7、8月份的氨氮浓度差异较为明显;(3)同营养盐浓度的变化相比,网笼内、外叶绿素a浓度的变化较大,在9月份,高密度组的网笼内叶绿素a浓度低于0.67mg/m3,食物可能为高密度组扇贝生长、存活的限制因子;(4)8月份,高密度组网笼内的细菌总数显著高于笼外及其他密度组。分析认为,高温期网笼内的水质状况及食物限制可能与养殖栉孔扇贝的死亡有关。
【英文摘要】Water quality inside the lantern nets and the mortality of scallop Chlamys farreri in Sanggou Bay in 2006 were evaluated.The results showed that after 7 months of culture,the mortality rate was below 6% for scallops with the initial density of less than 30 individuals per disk,while up to 27% for scallops with high initial density of 40 individuals per disk.There was no significant difference between the concentrations of dissolved phosphorous and silicate inside and outside the lantern nets.However,the concentration of ammonia was significantly different in July and August.The concentration of chlorophyll a inside and outside the lantern nets was significantly different.In September,for the experimental scallop groups with high density,the concentration of chlorophyll a was lower than 0.67 mg/m3,and food may be the limiting factor for the growth and survival of scallops.In August,the concentration of bacteria inside the lantern nets with the high density group was significantly higher than that of the outside and the low density group.Therefore,in summer,water quality and food supply may be closely related to the mortality of scallops.

【题目】主要浮游微藻携带急性病毒性坏死症病毒(AVNV)的研究

【中文关键词】浮游微藻; 急性病毒性坏死症病毒(AVNV); 栉孔扇贝; 水平传播途径
【英文关键词】microalgae; acute viral necrobiotic disease virus (AVNV); Chlamys farreri; horizontal transmission
【中文摘要】研究常见浮游微藻对栉孔扇贝"急性病毒性坏死症病毒"(AVNV)的黏附和携带,探讨微藻作为病毒水平传播媒介的可能性,进而了解AVNV的水平传播途径。我们选取培养17种海区常见浮游微藻,在微藻生长的指数增长期混入AVNV病毒粗提液,用PCR等分子检测法定期对试验微藻携带AVNV的情况进行检测。实验结果表明,亚心形扁藻、小球藻、绿色杜氏藻、四爿藻、中肋骨条藻和小新月菱形藻可以在一定时间内携带AVNV,占到实验微藻总数的35.3%。用携带AVNV的6种微藻投喂试验栉孔扇贝以分析其致病力,结果表明,试验扇贝表现出典型的急性病毒性死亡症状,在试验的9d时间内,6组感染组试验扇贝的累积死亡率均显著(P<0.05)或极显著(P<0.01)高于对照组,表明携带AVNV的微藻具有显著的致病性。本研究的结果表明,栉孔扇贝通过摄食携带AVNV的微藻而感染发病是可能的,浮游微藻可能是AVNV水平传播的重要传递体。
【英文摘要】We studied the possible role that marine microalgae may play during the outbreaks of acute viral necrobiotic disease(AVND) of cultured zhikong scallops(Chlamys farreri) .In order to elucidate the possibility of marine microalgae carrying AVNV(acute viral necrobiotic disease virus) ,seventeen species of microalgae were co-cultured with pure AVNV solution and were assayed daily by PCR to study whether they could carry AVNV.Further experiments were conducted to investigate whether the virus carried by microalgae could re-infect zhikong scallops.The results showed that 6 (including Platymonas subcordiformis,Chlorella sp., Dunaliella viridis,and Tetraselmis tetrathele in Chlorophyta and Nitzschia closterium minutissima,and Skeletonema costatum in bacillariophyta) of 17 microalgae,which account for 35.3% of the tested algae,could carry AVNV,the AVNV detections in microalgae were positive during 96 to 144 h.The 6 AVNV-microalgae complex were fed to zhikong scallops,the tested scallops show a typical acute viral necrobiosis symptom,and the accumulated mortalities of scallops fed with the AVNV-microalgae complex were significant(P<0.05) or highly significant(P<0.01) compared with that of the control fed with mixture with 6 species microalgae during the nine-day experiment,which indicated that the AVNV-microalgae complex have an impressing ability to infect the scallops.Based on these laboratory challenges studies,the microalgae can serve as a vector in the horizontal pathway of transmission of AVNV via feeding or filtering process of scallops.

【题目】扇贝养殖海区浮游生物携带AVNV的荧光定量分析
【中文关键词】栉孔扇贝; 浮游生物; 急性病毒性坏死症; 荧光定量PCR
【英文关键词】Chlamys farreri; acute viral necrosis virus(AVNV); FQ-PCR; plankton
【中文摘要】为了探明养殖海区浮游生物与AVNV流行传播的关系,实验自2009年5月至11月,分别从青岛沙子口和荣成桑沟湾两个扇贝养殖海区定期采取50和300cm两个水层水样,经25、3和0.22μm3个孔径的滤膜分级过滤收集3个粒径的浮游生物组分,利用荧光定量PCR技术对浮游生物携带AVNV的情况进行了定量检测。结果表明两个海区浮游生物样品均检测到AVNV,检测的AVNV数量也均在8月份达到峰值,沙子口海区每升海水中浮游生物携带4.11×106拷贝的AVNV,桑沟湾海区浮游生物携带1.49×105拷贝的AVNV。两个海区3个粒径浮游生物组分携带AVNV的数量从高到低依次为0.22~3μm组分、3~25μm组分和大于25μm组分,但两个水层(50和300cm)浮游生物携带AVNV的数量则没有显著差异。结合养殖期间扇贝摄食浮游生物的特点,研究认为,扇贝在养殖期间可能会通过滤食携带病毒的浮游饵料而感染AVNV,海区浮游生物可能是导致AVNV流行的重要传播媒介。
【英文摘要】AVNV(acute viral necrosis virus)is the pathogen leading to mass mortality of cultured Chlamys farreri,but the transmission of the virus is unknown.In order to clarify the relationship between the plankton and transmission of AVNV,and to afford proof for tracing transmission track,the sea water samples were fetched from 50 cm and 300 cm depths in the sea area for culturing Chlamys farreri at Shazikou of Qingdao and Sanggouwan of Rongcheng regularly from May to November in 2009,and the plankton was collected by 25 μm,3 μm,0.22 μm pore size filter,respectively.The AVNV carried by the plankton was identified by FQ-PCR.The results showed that the virus could be carried by the plankton,and the virus number in the plankton from both sea areas arrived at the peak in August.The highest number of AVNV identified for the samples from Shazikou sea area was 8.21×106 copies per litre sea water,and that was 2.98×105 copies for the samples from Sanggouwan sea area.Based on the number of AVNV carried,the plankton

group with different particle sizes was 3-0.22 μm,25-3 μm and >25 μm from high to low in turn.The number of AVNV carried by the plankton from 50 cm and 300 cm depths was not different significantly.This is the first report about AVNV carried by the plankton from the sea area for cultured scallop.These results implied that the scallop could be infected by taking the plankton that carried AVNV as food,and the plankton was crucial carrier of AVNV.

【题目】海州湾前三岛海域栉孔扇贝(Chlamys farreri)生长特征与养殖容量的评估
【中文关键词】栉孔扇贝; 离岸养殖; 生长; 生物沉积法; 滤水率; 养殖容量
【英文关键词】Chlamys farreri; Offshore aquaculture; Growth; Biodepositon method; Clearance rate; Carrying capacity
【中文摘要】2007年7月—2008年6月,在海州湾前三岛附近海域进行了栉孔扇贝深水筏式养殖实验。周年监测了海区的环境因子和栉孔扇贝的生长情况,并利用生物沉积法,现场研究了各生长时期扇贝的滤食作用。结果表明,该海区养殖栉孔扇贝在当年秋、冬季和次年春季生长迅速,夏季生长相对缓慢,周年平均软组织生长速度为11.29mg/d,平均干贝壳生长速度为48.84mg/d,扇贝能够于次年年初达到商品规格(6cm)。不同时期栉孔扇贝滤水率之间差异显著,在扇贝规格相似的情况下,滤水率随水温升高而升高;而水温相近的情况下,滤水率随扇贝规格增大而增加。利用改进的Incze等(1981)的养殖容量模型,评估了该海区养殖容量,结果表明在现有养殖模式下,2007年7、9、11、12月以及2008年3、6月,沿着海流方向适养区域长度分别为4.0、4.6、4.7、5.1、4.5和3.2km,平均为4.35km;垂直于海流方向单位宽度(100m)的海区可以支持的扇贝湿重随着扇贝的生长逐渐增加,到2008年3月份达到最高(16.73t),随后开始下降。
【英文摘要】The growth of scallop Chlamys farreri suspended-cultured in deep water of Haizhou Bay was studied from July 2007 to June 2008;and a biodeposition method was used to estimate the clearance rate of C.farreri in field conditions.Results show that the scallop grew fast in the culture time,except for summer;the average growth rate of dry tissue weight was 11.29mg/d;the average growth rate of dry shell weight was 48.84mg/d;and the scallop could reach the commercial size(6cm in shell height) at the beginning of the second year.The clearance rate was influenced significantly by water temperature and scallop size,and increased with water temperature rising and scallop growing.A modified model after Incze et al.was used to evaluate the carrying capacity of scallop cultured in this area.Results of test in different seasons show that the suitable length of culture area along current direction was 4.35km in width of 100m,in which the wet weight of scallop increased steadily with growth,reaching the maximum in March 2008 for 16.73t.

【中文关键词】栉孔扇贝; D形幼虫; 血细胞; 单克隆抗体
【英文关键词】Chlamys farreri; D larvae; haemocyte; monoclonal antibody
【中文摘要】研究组前期实验表明,栉孔扇贝(Chlamys farreri)从囊胚期开始的各发育时期中,以D形幼虫期开始出现形态可辨的血细胞。本文采用石蜡切片、组织化学、栉孔扇贝血细胞单克隆抗体的免疫组化方法,定位、观察栉孔扇贝D形幼虫血细胞的分布和形态特点。结果表明:可辨形态的血细胞集中分布于幼虫的外套膜、面盘、口、食道、胃、消化腺、肠等组织,游离的血细胞大多为球形或椭球形,直径约为1~3 μm,中央有一深色细胞核,而在消化腺中血细胞密集层叠,形态各异。在该时期未观察到不同类型的血细胞和造血组织。结论认为,D形幼虫期开始出现形态可辨的血细胞,主要分布于与摄食消化相关的组织器官内。

【英文摘要】Preliminary data showed that,during the development of Chinese scallop Chlamys farreri,distinguishable haemocytes occurred since the stage of D larvae.In this paper,the study on the distribution and morpha of haemocytes in D larvae were carried out by the methods of light microscopy,histochemical staining and immunohistochemistry(IHC) with monoclonal antibodies against haemocytes of C.farreri.The results showed that the haemocytes with distinguishable morpha were mainly distributed in the tissues of mantle,velum,mouth,esophagus,stomach,digestive gland and intestine.Moreover,the dissociative haemocytes with a fuscous nuclear in center were spherical or spheroidical,with a diameter of 1~3 μm,and assembled in digestive gland.However,the different types of haemocytes and the hematopoietic tissues were not found in D larvae stage.So,as a conclussion,we deduced that the haemocytes became morphologically distinguishable from D larvae stage and mainly distributed in tissues and organs which are related to feeding and digestion.

【题目】扇贝养殖海区浮游生物及大型海藻携带AVNV病毒的检测分析

【中文关键词】栉孔扇贝; FQ-PCR; AVNV; 浮游生物; 大型海藻

【英文关键词】Chlamys farreri; AVNV; FQ-PCR; plankton; macroalgae

【中文摘要】为了解扇贝养殖海区浮游生物及大型海藻与急性病毒性坏死症病毒(AVNV)流行传播的关系,本研究于2008年和2009年从青岛沙子口和荣成桑沟湾2个养殖海区采集水样,离心收集浮游生物并随机采集大型海藻,采用荧光定量PCR(FQ-PCR)技术对这些样品携带AVNV情况进行检测。结果显示,沙子口海区8月份的浮游生物样品中检测到AVNV,每升海水中浮游生物携带的病毒数量为6.92×105拷贝;桑沟湾海区4月份的浮游生物样品也检测到AVNV,每升海水中浮游生物携带的病毒数量为1.26×103拷贝。从青岛沙子口海区随机采集的10种大型海藻中有7种[包括孔石莼(Uiva pertusa)、浒苔(Enteromorpha prolifera)、细毛石花菜(Gelidium crinale)、缘管浒苔(E.Linza)、海膜(Halymenia floresia)、扁江蓠(Gracilaria textorii)、刚毛藻(Cladophora)]检测到病毒,带毒样品占到检测样品总数的55.56%,其中在12份孔石莼样品中,11份样品检测到病毒,携带病毒数量最高为7.68×104/0.1(g2009年8月25日)。从荣成桑沟湾海区采集的14种大型海藻样品中有3种(包括孔石莼、海膜和马尾藻)检测到病毒,带毒样品占到检测样品总数的20.83%,其中2009年7月采集的孔石莼样品携带病毒数量最高,为3.06×103/0.1g。这一结果说明海区浮游生物及部分大型海藻均可携带AVNV,而摄食携带病毒的浮游生物可能是扇贝感染发病的原因,有关大型海藻携带AVNV在该病原流行传播中的作用还有待进一步研究。

【英文摘要】In order to illuminate the function of plankton and macroalgae on transmission of Acute Viral Necrobiotic Viru(sAVNV),samples of macroalgae and plankton were collected randomly from sea areas along Shazikou of Qingdao and Sanggouwan of Rongcheng in 2008 and 2009.The AVNV carried by plankton and different species of macroalgae was identified by PCR and FQ-PCR technique.The results showed that the AVNV was detected from plankton collected along the sea areas for Chlamysfarreri culturing at Shazikou in August and at Sanggouwan in April by FQ-PCR,and the copy numbers of AVNV were 6.92×105 and 1.26×103 per liter of sea water,respectively.Twenty of 36 macroalgae samples collected along the sea areas of Shazikou in 14 months were AVNV positive,accounting for 55.56%of the total number.The positive samples included seven species which were Uivapertusa,Enteromorpha prolifera,Gelidium crinale,E.linza,Halymenia floresia,Gracilaria textorii and Cladophora.Five of 24 macroalgae samples collected along the sea area of Sanggouwan in nine months were AVNV positive,accounting for 20.83%of the total number.The positive samples belonged to three species including U.pertusa,H.floresia and Sargassum.U.pertusa was the main macroalgae carrying AVNV.Eleven of 12 U.pertusa samples collected along sea areas of Shazikou were AVNV positive,with the highest AVNV number being 7.68×104/0.1g in fresh sample collected on August 25,2009,while at that of Sanggouwan,three of fiveU.pertusa samples collected were AVNV positive,with the highest AVNV number being 3.06×103/0.1g in fresh sample collected in July,2009.The present results implied that plankton and some of macroalgaes could carry AVNV,and the scallops could be infected when they take plankton carrying virus as food.The role of macroalgae carrying AVNV in transmission of AVNV remains to be further studied.

【题目】Study on water-releasing, heat-absorbing and temperature-declining potential of six green plants in large-scale pig farm
【中文关键词】猪场、绿色植物、降温增湿
【英文关键词】Pig farm; Green plants; Water release and temperature degradation
【中文摘要】采用LI-6400光合仪测定了辽宁阜新市祖代原种猪场6种绿化植物的降温增湿等生理生态指标。结果表明,蒸腾速率日变化在5月和7月呈双峰型,峰值出现在9:00和13:00;明显的单峰出现在9月份11:00。6种绿化植物的降温增湿潜力6-8月份较强,5月次之,9月最低。银中杨降温增湿潜力最高;随后是苹果梨、南果梨、小叶杨、白丁香,紫丁香最低。4种乔木增湿能力超过1500 g/m2/d,说明4种乔木降温增湿能力好于2中灌木,适合猪场栽种。
【英文摘要】Physiological indices of six green plants in large-scale Pig Farm of Fuxin city were tested by LI-6400 photosynthesis testing system. Furthermore, the water-releasing, heat-absorbing and temperature-declining potential of these plants were studied. The results indicated that diurnal change of transpiration rate mostly presents the double-peak curve in May and in July, and the peak value appears in 9:00 and 13:00. It appears single-peak curve in September, and the peak value appears about 11:00. The water-releasing, heat-absorbing and temperature-declining potential of six green trees was stronger in June, July and August, and took second place in May, and was lowest in September. The water-releasing, heat-absorbing and temperature-declining potential of Populus alba berolinensis was the highest, and followed by Pyrus ussuriensis Miaxim.f., Pyrus ussuriensis Maxim., Populus simonii Carr and Passer montanus saturatus Stejneger, and those of Syringa oblata Lindl were the lowest. The amount of water-releasing of four arbor trees exceeded 1500 g/m2/d, which indicated that the water-releasing, heat-absorbing and temperature-declining potential of arbor trees were better than those of shrub trees, and were suitable green trees in large-scale pig farm.

【题目】Effects of untreated pig manure and slurry on the accumulation of soil
【中文关键词】猪粪、土壤NH4+-N and NO3--N累积;
【英文关键词】Pig manure; Pig slurry; Accumulation of soil NH4
+-N and NO3
--N; Large-scale pig farm
【中文摘要】土壤无机氮随采样深度和时间下降;和对照比,施猪粪和猪粪液的土壤无机氮分别增加76.0% and 156.1%(P <0.001),施猪圈肥土壤 NH4+-N 增加 33.7%,而猪粪液仅增加7.4% ;NO3--N 分别是 86.9% 和 198.0%,(P < 0.001)。
【英文摘要】The amount of soil inorganic N declined significantly with increasing of sampling depthand sampling time (P < 0.001). Compared with CK, application of untreated pig manure and slurry increased significantly the amount of soil inorganic N by 76.0% and 156.1%, respectively (P <0.001). Compared with CK, application of untreated pig manure increased significantly the amount of soil NH4+-N by 33.7%, however, application of untreated pig slurry decreased remarkably that of soil NH4+-N by 7.4% (P < 0.001). Application of untreated pig manure and pig slurry increased significantly the amount of soil NO3--N by 86.9% and 198.0%, respectively compared with CK, (P< 0.001). Soil NO3--N accounted for the majority of soil inorganic N irrespective of fertilization treatment or sampling time, its percent were 80.13%, 84.27% and 92.63% in the CK, pig manure and pig slurry treatments, respectively. This result indicated that application of untreated pig manure and slurry increased significantly the amount of soil inorganic N, especially soil NO3--N, which occurred the potential risk of nitrate pollution.

【题目】论黄土沟壑区小尺度水资源优化配置的重要性
【中文关键词】黄土高原；沟壑区；小尺度；水资源；优化配置
【英文关键词】:loess plateau;hilly and gully regions;small scale;water resources;optimal deployment
【中文摘要】:通过深入黄土高原丘陵沟壑区的腹地调查，对水资源特点、地形地貌特征、生产经营方式等进行了分析，指出由于该区域水资源量少、分布不均、缺乏常规水源；地形破碎、山高、坡陡、沟深、沟谷密度大；区域内农业生产只能在小流域分割的自然单元内进行、生产特别分散、规模小、以户经营、城镇间经济联系不紧密、彼此呈孤立的发展状态等特点，决定此类区域水资源配置与开发利用以小流域单元内自身资源为主，小尺度水资源配置更符合此类区域的特点。通过对黄土丘陵沟壑区水资源开发利用中存在的问题和国内外水资源配置研究的进展分析认为，目前在水资源配置方面的研究成果，主要集中在大区域及宏观水资源优化配置，对小尺度的水资源优化配置研究较少,可支撑和指导黄土丘陵沟壑区的小尺度水资源优化配置、高效利用的研究成果和科学规划的不足，开展小尺度水资源配置研究，对于指导该类区域的水资源合理利用具有重要意义，十分必要。
【英文摘要】:The present study mainly analyrzes water features,gemorphology features,production andoperation modes in the loess hilly and gully regions through an in—depth investigation.It is found out thatthe major characteristics in the regions are deficient water resources,uneven distribution and brokenterrain(such as high and steep hills,deep gully and dense valleys)..The agricultural production can onlybe carried on within natural cells in the fragmented basins with features of decentralization,small—scale,household—level,isolation and weak economic ties between towns.All the above points would lead to afact that water resources in these regions should be deployed and utilized depending on their ownresources in the cells. An optimaldeployment of water resources at small scale Canbetter meet therequirement of the characteristics of the regions.Analyses on optimal deployment of water resources athome and at abroad are mainly performed for large—scale or macro—scale regions.Little study results Canbe referred for optimal deployment of water resources related to small—scale regions

.Therefore,it issignificant and necessary to study the optimal of water resources for small—in scale regions,which ismeaningful to guide reasonable utilization of water resources in these regions

【题目】温度处理对温室黄瓜根结线虫的控制效果研究
【中文关键词】温度;黄瓜;根结线虫;控制效果
【英文关键词】Temperat ure ; Cucumber ; Root knot nematodes ; Cont rol effect
【中文摘要】通过盆栽与大田试验相接合的方法研究了温度处理对黄瓜根结线虫病的效应。结果表明,黄瓜根结线虫病对温度反映比较敏感,45 ℃温度处理8 h,在盆栽条件下发病程度减轻98. 8 %,处理16 h防治效果达到100 %,50 ℃温度处理 8 h,防治效果也达到100 %。在田间试验条件下,高温闷棚4 d发病程度减轻99. 6 %,高温闷棚 8 d田间未见病株。高温处理后棚室第 3 年对根结线虫病的控制效果仍高达 95 %以上。该技术具有可操作性、 可持续性和环境友好型的特点,是控制北方地区温室黄瓜根结线虫病的有效技术措施,具有广阔的应用前景。
【英文摘要】Effect s of different temperat ure on the cucumber root knot nematodes disease was studied byt he test in pot s and field , The result s showed t hat t he knot nematodes was sensitive to temperat ure.In pot cultivation , t he cucumber was t reated for 8 hour s at 45 ℃, and t he disease incidence and indicewas decreased 89. 8 % and 98. 8 % , respectively. The cont rol effect s of t reating of 16 hour s are 100 % ,and 8 hour s at 50 ℃are al so 100 %. In field , t he cucumber was t reated for 4 day by solarization , andt he disease incidence and indice was decreased 89. 2 % and 99. 6 %. The cucumber was t reated for 8 dayby solarization , and the disease did not occur . The cont rol effect s of Solarization on t he cucumber rootknot nematodes disease was over 95 % af ter t hree year . The character of technical measure is practical2ly , sustainable and environment2 f riendly , so it is effective measure of cont rolling the cucumber rootknot nematodes disease in t he nort hern area of China.

【题目】陕西温室黄瓜根腐病及流行因素研究
【中文关键词】陕西省 温室黄瓜 根腐病 病原菌 流行因素 栽培环境
【英文关键词】Shaanxi Province, Greenhouse cucumber, Root rot, Pathogen, Epidemic factor, Cultivation environment
【中文摘要】摘 要 为明确陕西省温室黄瓜根腐病的病原及流行影响因素，采用病原物组织分离的常规方法及田间系统调查，对陕西温室黄瓜棚室出现的两种类型根腐病进行了系统研究。结果表明，陕西省不同生态区温室黄瓜根腐病病原菌不同，陕北地区黄瓜根腐病病原菌为甜瓜疫霉(Phytophthora melonis)，关中地区为尖孢镰刀菌(Fusarium oxysporum)。菌落均在10~30 ℃条件下正常生长发育，以20~25 ℃条件下发育最快，当温度超过30 ℃菌落生长速度减慢。设施栽培面积的增加、土壤连作年限的延长、不合理的轮作种植及大水漫灌等与温室黄瓜根腐病的发生密切相关。黄瓜栽培环境的变化是影响黄瓜根腐病流行的主要因素。
【英文摘要】Abstract To elucidate pathogen and epidemic factors of cucumber root rot, two pathotypes of cucumber root rot weresystematically investigated under solar greenhouse conditions by tissue isolation, single spore purification and re-inoculation inShaanxi Province. The results show that the pathogens are different in different ecological regions, and the pathogen responsible forcucumber root rot in northern Shaanxi is identified as Phytophthora melonis, while that for Guanzhong region is Fusariumoxysporum. The pathogen colony grows normally within 10~30 ℃, and rapidly within 20~25 ℃. When temperature is over 30 ℃,the colony growth rate lowers. The prevalence of cucumber root rot are closely related to increased plantation areas, the number ofyears of continuous cropping, unreasonable crop rotation and flood irrigation. Environmental changes in cucumber fields constitutethe main epidemic factor of cucumber root rot.

【题目】陕西枣缩果病流行因素研究
【中文关键词】枣树缩果病；发病过程；流行 因素
【英文关键词】jujube-fruit shrink disease,development of disease,disease fact
【中文摘要】：为有效控制陕西关中地区枣树生产中危害不断加重的枣缩果病，通过田间定点、 定株调查，对陕西大荔县6处枣园枣缩果病的病原菌越冬场所、 侵染循环规律进行了调查，并对发病情况、 病情指数和流行因素进行了分析。结果表明：病原菌于5月下旬开始侵染，7月中旬开始发病，8月下旬至9月中旬为田间发病高峰期。病原菌主要靠风雨传播，从水孔、 气孔及果洼侵入枣果而发病。枣树皮、 枣头、 枣吊、枣枝条、 枣落叶都是病原菌的越冬场所。其发生与枣果发育期 、 枣吊位置、 挂果量 、 气候 因子、 立地条件、虫害、 栽培品种及管理水平有密切关系。根据缩果病发病规律，提出了合理选择园址、 选择抗病品种、 加强田间管理等防治建议。
【英文摘要】:In order to control the jujube—fruit shrink disease,the development and factors of jujube-fruitshrink disease were studied according to the experiments conducted in 6 jujube gardens of Dali county from2005--2007.The results showed that pathogens started to infect the fruit in the last ten days of May.Thedisease first occurred in the mid ten days of June,and reached the peak from the last ten days of Augusttothe mid ten days of September.The pathogen mainly spreaded by wind or rain,and infected the dot of fruitor fruit depression.The pathogens could overwinter in many organs,such as bark,once branches,fruitingbranch,fruits,and deciduous,but the fruits were the most important infection source.The shrink of fruitisclosely related with fruit development,fruiting branch location,fruit number,tree vigor,weather factor,standsite,insect attack,management,and variety.Some control suggestions for farmers are given according to reg-ularity of the jujube—fruit shrink disease epidemic.

【题目】几种杀菌剂防治温室黄瓜根腐病的效果
【中文关键词】杀菌剂; 温室黄瓜; 根腐病; 防治效果
【英文关键词】fungicides, greenhouse cucumber, root- rot, control effect

【中文摘要】摘 要: 采用菌丝生长速率测定法, 测定了 25%奥宁、 70%代森锰锌、 55%敌克松 3 种药剂对陕西温室黄瓜根腐病陕北菌株和关中菌株的毒力, 并进行了土壤药剂处理及灌根田间药效试验。 结果表明, 参试的 3种药剂对关中和陕北两种菌株的菌丝生长均具有明显的抑制作用, 25%奥宁可湿性粉剂抑菌效果最好,55%敌克松可湿性粉剂效果次之, 70%代森锰锌可湿性粉剂抑菌效果最差。对关中菌株 EC50 分别为0.3754、 219.5887、 105.5966, 对陕北菌株依次 0.2771、160.5462、 89.5241。 药剂处理土壤田间经济有效的用量均分别为 200g、 2000g、 2000g。药剂灌根防治效果均不明显, 生产上不宜推广应用。

【英文摘要】Abstr act: Three fungicides (25% AONING, 70% Mancozeb, 55% sodiump (dimethylamino) benzenediazo sul-fonate) toxicity on cucumber root rot were tested by hypha growth speed of Northern Shaanxi and Guanzhongregion solar greenhouse, carry out fungicides treatment soil and irrigate root experiment .The result showedthat three fungicides have obviously repress function on hypha growth in two pathogens. The best effect was25% AONING WP, the followed was 55% sodiump (dimethylamino) benzenediazosulfonate WP, the worst is70% Mancozeb WP. Guanzhong Region Pathogens EC50 separately was 0.3754, 219.5887, 105.5966. North-ern Shaanxi Pathogens EC50 separately were 0.2771, 160.5462, 89.5241. Economics effective amount used inthe field is 200g, 2000g, 2000g. The result of irrigate root are not remarkable, and not suitable promoted inthe production.

【题目】不同灌溉方式对温室嫁接黄瓜根系分布影响的研究

【中文关键词】黄土高原 温室 黄瓜 根系分布 灌溉方式

【英文关键词】Loess Plateau,Greenhouse,Cucumber,Root distribution,Irrigation pattern

【中文摘要】采用土柱模拟试验和大田调查相结合的方法, 研究 了不 同灌溉方式下温室嫁接黄瓜根 系分布特征 ,结果表明: 膜下暗灌和滴水灌溉温室黄瓜根系干重最大值分别出现在黄瓜定植后 180 d和 210 d, 黄瓜拔蔓时根系干重后者较前者高 29.0%。黄瓜不同发育时期根系垂直分布特征有明显差异 , 在初瓜期前, 0—20 cm根系干重前者明显高于后者, 20 cm以下根系干重二者无明显差异; 结瓜盛期 以后, 0~20 cm根系干重二者差异不明显, 20 cm以下根 系干重后者显著高于前者。膜下暗灌和滴水灌溉黄瓜根系水平分布在 0—15 cm, 分别 占总根干重的96.6%、 94.2%。随着黄瓜生长发育的推进 , 膜下暗灌内侧根系分布数量逐渐下降, 结瓜期以前内侧根 系占植株根系总数量的61.1%, 中后期 占15.6%; 而滴灌黄瓜全发育期, 内外侧根系分布数量比较均衡。说明灌水方式对温室嫁接黄瓜根系分布特征有显著影响。

【英文摘要】Abstract Root distribution characteristics of greenhouse cucumber were analyzed using simulated soil column culture method and~rmland research.The results show that irrigation under plastic film mulch and drip irrigation yield the highest cucumber root dryweight at 180 d and 210 d after planting,but root dry weight is 29%higher under drip irrigation at harvest.There is significantdifference in vertical distribution of cucumber root at different growth periods between drip irrigation and irrigation under plasticfilm mulch.Before initial fruit appearance stage,the difference in root dry weight is insignificant below 20 cm depth of soil,whileroot dry weight under irrigation with plastic film mulch treatment is higher than that under drip irrigation at 0—20cm depth.Afterabundant fruit stage,root dry weight difference between two irrigation patterns is insignificant at 0—20 cm depth,but root dryweight of drip irrigation is significantly higher than irrigation under plastic film mulch below 20 cm.Cucumber root horizontal dis—tribution is mainly in the 0—15 cm.accounting for 96.6%and 94.2%of total root weight for two irrigation patterns.With thegrowth of the cucumber plant.inner root distribution gradually decreases from 61.1%to 15.6%of total root amount from beforefruit appearance stage to mid or late fruit stage for irrigation under plastic film mulch.The inner and outer rootdistribution bal—ances out during cucumber growth period under drip irrigation.

【题目】不同药剂防治温室黄瓜根结线虫病效果及安全性评价
【中文关键词】药剂 温室黄瓜 根结线虫 田间药效 安全性评价
【英文关键词】solarhouse
【中文摘要】采用盆栽试验与田间试验相结合的方法,研究了不同药剂对黄瓜根接线虫病的防治效果及对温室黄瓜生长发育的效应。结果表明,5亿活孢子/g淡紫拟青霉颗粒剂、1.8%阿维菌素乳油、98%垄鑫微粒剂、10%福气多颗粒剂、0.15%杀线丹颗粒剂、50%辛硫磷乳油对温室黄瓜根接线虫病均有一定的防治效果。以98%隆鑫微粒剂防治效果最好,每666.7m~2 10 000g使用剂量,药后50d、200d防效分别为100%、92.3%。10%福气多防效次之。淡紫拟青霉、1.8%阿维菌素等生物制剂防治效果较低。同一种药剂在同一使用剂量条件下,土壤施用防治效果优于灌根的防治效果。参试的上述6种药剂在试验浓度范围内对温室黄瓜均未产生药害或抑制黄瓜生长,其安全系数分别为4.8倍、2.7倍、2.3倍、2.9倍、3.7倍

【题目】纸房沟流域植被恢复区乔木林昆虫群落结构及动态分析
【中文关键词】昆虫群落; 林分类型; 多样性; 恢复区
【英文关键词】i nsect commun i ty ; p lant types ; d i versi ty ; resto ration area
【中文摘要】摘要: 2008年 4~ 11月通过对纸房沟流域乔木林恢复区昆虫进行调查, 结果表明: 昆虫种类数以自然乔木林最高, 混交林次之, 单纯林分较低, 个体数量以柳树林昆虫数量最高, 其次为混交林和刺槐林, 自然乔木林变化幅度最小。昆虫群落多样性指数高低次序均为自然乔木林 > 混交林 > 单纯林分, 均匀度以单纯林和混交林的昆虫群落变化幅度较大, 自然乔木林变化幅度最小。群落的优势度与均匀度值的变化呈相反趋势。主分量分析表明, 林分类型不同的昆虫群落, 其主导因素和时间格局不同, 且结构越复杂, 主导因素和时间格局越明显; 相反, 则主导因素和时间格局分化不明显; 植食性昆虫类群在各林分中均为优势类群, 自然乔木林的天敌种类数和个体数量明显高于其它林分, 通过排序不同功能类群在各林分昆虫群落变化的不同时期占主导因素。并探讨了植物群落与昆虫多样性间的生态关系, 为植被恢复和森林害虫的自然生态调控提供依据。

【题目】施肥对日光温室土壤微生物与酶活性变化的影响.
【中文关键词】日光温室 施肥 土壤酶活性 土壤微生物
【英文关键词】Greenhouse ,Fertilization ,Soil enzyme activity ,Soil microorganisms
【中文摘要】在日光温室内 ,采用田间试验的方法 ,研究不同施肥处理对西红柿土壤酶活性和土壤微生物数量的影响。结果表明:施有机肥、 化肥、 有机肥 +叶面肥处理土壤磷酸酶活性增加 ,施化肥 +叶面肥处理比施化肥处理土壤磷酸酶活性增加;施有机肥处理土壤脲酶活性增强;施化肥 +叶面肥处理土壤磷酸酶活性比施有机肥 +叶面肥处理降低;施肥对蔗糖酶和过氧化氢酶活性的影响较小。施有机肥处理土壤细菌、 真菌和放线菌数量增加 ,施化肥处理土壤细菌数量降低 ,土壤真菌和放线菌数量增加。
【英文摘要】The effect of different fertilizations of tomato on soil microorganisms and enzyme activity was studied undergreenhouse condition. Results show that phosphatase activity increases by using organic manure , NP fertilizer and organicmanure plus foliar feed. There is a greater increase in phosphatase activity with the use of NP fertilizer plus foliar feed thanthe use of NP fertilizer alone. Using organic manure enhances urease activity. Fertilization with NP plus foliar feed leads tolower phosphatase activity than fertilization with organic manure plus foliar feed. Fertilization shows no significant effectson the activities of catalase and sucrase. The number of bacteria and fungi and actnomycete increases by using organize ma2nure. Using NP fertilizer decreases the number of bacteria ,increases the number of fungi and actinomycete.

【题目】不同地区与栽培方式下蔬菜品质的变异性分析
【中文关键词】地区;栽培方式;品质;变异性
【英文关键词】Region ; Cultivating model ; Quality ; Variability
【中文摘要】摘 要: 通过对陕西省延安和杨凌两地春季蔬菜进行对比试验 ,分析了不同地区及栽培方式下的蔬菜 p H值、维生素 C含量、 可溶性糖含量和硝酸盐含量等的差异。结果表明 ,陕西延安春季蔬菜的可溶性糖含量和维生素 C含量较杨凌的高;杨凌露地蔬菜的硝酸盐污染指数为轻度 ,延安露地蔬菜除绿叶菜类为硝酸盐中度污染外 ,其余菜类为轻度污染。从营养品质和安全品质分析 ,延安蔬菜的品质优于杨凌蔬菜的品质。延安露地蔬菜的可溶性糖含量和维生素 C含量都较拱棚和日光温室的高。除拱棚葱蒜类受到硝酸盐中度污染外 ,其他菜类为轻度污染;露地和拱棚中的蔬菜受到硝酸盐的轻度污染。从营养品质和安全品质上比较 ,露地蔬菜的品质比拱棚和日光温室的蔬菜品质要好。
【英文摘要】Abstract : According to the experiment on spring vegetable in Yan ′ an and Yangling , Shaanxi province ,t his paper analyzed t he variability of vegetable quality including p H , vitamin c (vC) content , solublesugar and nit rate content under different region and cultivating model . The result s showed t hat t hecontent of vC and soluble sugar in Yan ′ an , Shaanxi was higher t han t

hose in Yangling. The vegetableplant under open field condition in Yangling was light2polluted by nit rate , but in Yan ′ an only greenleaf vegetable in open field was middling 2polluted by nit rate , the other vegetable species were light2polluted by nit rate. Compared f rom nut rition and safety quality , vegetable quality in Yan ′ an were bet2ter t han t hose in Yangling. In Yan ′ an , the vegetable content of soluble sugar and vC under open fieldcondition were higher than t hose under shield t rellises and sunlight greenhouse condition. Undershield t rellises condition , only shallot garlic vegetable was middling 2polluted by nit rate , t he othervegetable species were light2polluted. The vegetable under open field and shield t rellises conditionwere light2polluted. Compared f rom nut rition and safety quality , quality of open field vegetable werebet ter than t hose under shield t rellises and sunlight greenhouse condition.

【题目】黄土丘陵区纸坊沟流域农业生态经济安全评价
【中文关键词】黄土丘陵区;纸坊沟流域;农业生态经济安全;指标体系;评价
【英文关键词】Key words the Hilly—gully region of Loess Plateau;Zhifanggou watershed;agricultural eco—economic safetindex system;evaluation
【中文摘要】摘要 以近70年纸坊沟流域农业生态经济系统演变过程为基础,利用国家“九五”科技攻关项目中所提出的评价指标体系,对纸坊沟流域不同发展阶段标志年份的农业生态经济安全状况进行了评价,得出:农业生态经济系统在1938、2000、2005年处于亚安全状态,1958、1975年处于极端不安全状态,1985、1990、1995年处于不安全状态。通过对农业生态经济安全变化驱动力的分析,预测了纸坊沟流域农业生态经济安全的发展趋势,提出了黄土丘陵区实现农业生态经济安全的策略:以培育主导产业为中心,完善农业系统循环链网,调整产业结构,实现农业资源的有效、永续利用。
【英文摘要】Abstract Based on the developing process of agricultural eco—economic system of Zhifanggou watershed nearly70 years,and the evaluation index system which was suggested in national ninth five years subject,thesituation of the agricultural eco—economics snfety in mark years of different development stage of Zhifanggouwatershed Was evaluatied.It Was concluded that,the agricultural eco—economic system had been the situationof sub—safety in 1938,2000,2005,extreme unsafe in 1958,1975,and unsafe in 1985,1990,1995.Through the analysis of driving force for the change of agricultural eco—economics safety,it may be forecastedthat the developing trend of the agricultural eco—economics safety,and some proposals to achieve agriculturalCS safety,focusing on the cultivation of leading industry,improving circular chain of the system,and adjusting industry structure,achieving the effective and sustainable use of agricultural resource weresuggested.

【题目】黄土丘陵区纸坊沟流域近70年农业生态安全评价
【中文关键词】黄土丘陵区;纸坊沟流域;农业生态安全;层次分析法;评价
【英文关键词】he Loess Hilly Region;Zhifanggou Valley;agricultural ecO—security;analytic hierarchy process(AHP);assessme
【中文摘要】摘要:在国内外已有研究的基础上,结合黄土丘陵区纸坊沟流域近70a来农业生态经济系统演变过程,参考PSR模型,从生态环境、社会经济和综合功能3方面构建黄土丘陵区流域农业生态安全评价指标体系,基于层次分析法赋权的综合指数评价方法,对纸坊沟流域1938—2005年农业生态安全状况进行评价。结果表明:该流域农业生态安全状况发生了先降后升的变化,1938年处于较安全状况,1958年为极不安全状况,1975年和1985年都处于较不安全状况,1995年处于临界安全状况,2005年属于较安全状况。评价结果表明纸坊沟流域还需要进一步优化农业系统结构,实现农业生态安全。
【英文摘要】Abstract:Ecological security is one of the foundations of national security,and is the basis of regional sustainabledevelopment.Regional ecological security includes ecological—environmental security,economic security and socialsecurity.On the basis of the development of the eco · economic system of Zhifanggou Valley in the Loess Hilly Region over 70years,based on historical research and related literature,and with the Pressure—State—Response(PSR)model framework鸽afoundation,a 3-layer conceptual assessment index system for the agricultural eco—security,which included ecological · environment,socio-economic,and integrated functions,Was established for the Loess Hilly Region.Using the AnalyticHierarchy Process(AHP)and an integrating index evaluation method,the Zhifanggou Valley Was used as a ease study andits agricultural eco-security status,from 1938 to 2005,Was assessed quantitatively.The results showed that its EcologicalSecurity Integrated Value(ESIV)had a trend of unsafe to safe.The valley was in arelatively safe and avery unsafe statin 1938 and 1958,respectively;in an

unsafe condition in 1975 and 1985;and in acritically safe and arelatively safe statein 1995 and 2005,respectively.The research results indicated that the agricultural system structure of the ZhifanggouValley is still in need of further optimization for realizing agricultural eco · security.

【题目】An immune deficiency homolog from the white shrimp, Litopenaeus vannamei, activates antimicrobial peptide genes
【中文关键词】无
【英文关键词】LvIMD
Death domain
AMPs
Innate immunity
Toll/Imd pathway
【中文摘要】无
【英文摘要】Invertebrates rely on innate immunity as the fi rst line defense against microbes. In Drosophila, theinducible antimicrobial peptides (AMPs) regulated by the Toll and immune de fi ciency (Imd) pathways are important effectors in innate immunity. Here we report an immune de fi ciency homolog (LvIMD) from the white shrimp, Litopenaeus vannamei. The full-length cDNA of LvIMD is 758 bp with an open reading frame of 483 bp that encodes a putative protein of 160 amino acids including a death domain at the C-terminus. LvIMDdeath domain shows similarity to that ofDrosophila IMDand human receptor interacting protein 1 (RIP1) of the tumor necrosis factor receptor (TNFR) pathway, with 27.9% and 26.4% identity, respectively. Phylogenetic analysis

shows that LvIMD clusters with a predicted protein from the starlet sea anemone (Nematostella vectensis) independent to insect IMDs and vertebrates RIP1s. LvIMD mRNA is expressed in most tissues and is induced in hepatopancreas and hemocytes after immune challenge. Luciferase reporter assays con fi rm that LvIMD is able to induce the expression of AMP genes, including Drosophila Attacin A and shrimp Penaeidin 4 in S2 cells. To our knowledge, this is the fi rst report that LvIMD participates in innate signaling to activate the expression of AMP genes in shrimp.

【题目】Identification of miRNA from Porphyra yezoensis by High-Throughput Sequencing and Bioinformatics Analysis
【中文关键词】高通量测序;生物信息学分析;条斑紫菜miRNA
【英文关键词】High-Throughput Sequencing; Bioinformatics Analysis Identification;miRNA;Porphyra yezoensis
【中文摘要】利用高通量测序和生物信息学分析手段鉴定条斑紫菜miRNA
【英文摘要】Background: miRNAs are a class of non-coding, small RNAs that are approximately 22 nucleotides long and play important roles in the translational level regulation of gene expression by either directly binding or cleaving target mRNAs. The red alga, Porphyra yezoensis is one of the most important marine economic crops worldwide. To date, only a few miRNAs have been identified in green unicellar alga and there is no report about Porphyra miRNAs.Methodology/Principal Findings: To identify miRNAs in Porphyra yezoensis, a small RNA library was constructed. Solexa technology was used to perform high throughput sequencing of the library and subsequent bioinformatics analysis to identify novel miRNAs. Specifically, 180,557,942 reads produced 13,324 unique miRNAs representing 224 conserved miRNA families that have been identified in other plants species. In addition, seven novel putative miRNAs were predicted from a limited number of ESTs. The potential targets of these putative miRNAs were also predicted based on sequence homology search.Conclusions/Significance: This study provides a first large scale cloning and characterization of Porphyra miRNAs and their potential targets. These miRNAs belong to 224 conserved miRNA families and 7 miRNAs are novel in Porphyra. These miRNAs add to the growing database of new miRNA and lay the foundation for further understanding of miRNA function inthe regulation of Porphyra yezoensis development.

【题目】Somatic cells serve as a potential propagule bank of Enteromorpha prolifera forming a green tide in the Yellow Sea, China
【中文关键词】浒苔;绿潮;微观世代;繁殖体;再生;体细胞
【英文关键词】Enteromorpha prolifera . Green tide .Microscopic forms . Propagule bank . Regeneration . Somatic cells
【中文摘要】体细胞无性繁殖是导致绿潮藻浒苔爆发的潜在机制
【英文摘要】For the last 2 years, vast accumulations of the unattached filamentous green alga, Enteromorpha prolifera, have occurred during summer along the coastal region ofthe Yellow Sea, China. However, algae do not seem to occur after the end of the fertile season. It has been suggested that banks of microscopic forms of the algae,primarily spores, function as a survival mechanism for this opportunistic alga. Therefore, in this study, field surveys and laboratory cultures were conducted to determine if somatic cells were serving as a propagule bank to enable the algae to survive through periods of unfavorable conditions. Laboratory experiments demonstrated that somatic regeneration was one of the most important approaches by which E. prolifera colonized and flourishedin the

study area. Indeed, at least 19.32% of somatic cells from the filamentous segments could survive for 2 months under various temperatures (0, 5, 10, 15, 20, and 30 ° C at anirradiance of 60 μ mol photons m − 2 s − 1) and irradiances (darkness, 5 10, 15, 20 and 30 μ mol photons m − 2 s − 1 at a temperature of 20 ° C). Additionally, greater than 35.85% of the somatic cells could survive at 0 ° C or in darkness for 2 months, and no less than 15.99% of these cells resumed growth when the temperature and irradiance were adjusted to the normal levels (20 ° C and 60 μ mol photons m − 2 s − 1). Furthermore, the results of field surveys revealed that viable E. prolifera was widespread in high quantities in the sediment of the Yellow Sea when the macroalga was absent. Taken together, the results of this study suggest that somatic cells may act as an overwintering stage for the annual spring bloom of E. prolifera. These findings should be useful in future studies conducted to behavior of somaticcells in green tide as well as in the management of future spring blooms of E. prolifera.

【题目】Evaluation of the pyrolytic and kinetic characteristics of Enteromorpha prolifera as a source of renewable bio-fuel from the Yellow Sea of China

【中文关键词】浒苔; 热解; 动力学

【英文关键词】Enteromorpha prolifera; Pyrolysis; Kinetics

【中文摘要】评估中国黄海浒苔作为生物能源的热裂解动力学特征

【英文摘要】The pyrolytic and kinetic characteristics of Enteromorpha prolifera fromthe Yellow Sea were evaluated at heating rates of 10, 20 and 50 ◦ C min − 1, respectively. The results indicated that three stages appeared during pyrolysis; dehydration, primary devolatilization and residual decomposition. Differences in the heating rates resulted in considerable differences in the pyrolysis of E. prolifera. Speci fi cally, the increase of heating rates resulted in shifting of the initial temperature, peak temperature and the maximum weight loss to a higher value. The average activation energy of E. prolifera was 228.1 kJmol − 1, the pre-exponential factors ranged from 49.93 to 63.29 and the reaction orders ranged from 2.2 to 3.7. In addition, there were kinetic compensation effects between the pre-exponential factors and theactivation energy. Finally, theminimumactivation energy was obtained when a heating rate of 20 ◦ Cmin − 1 was used.

【题目】Laboratory studies on vegetative regeneration of the gametophyte of Bryopsis hypnoides Lamouroux (Chlorophyta, Bryopsidales)

【中文关键词】羽藻;原生质体;叶片;繁殖方法;生活史

【英文关键词】Bryopsis hypnoides, protoplast, thallus segment, propagation method, life history.

【中文摘要】羽藻原生质体融合再生研究

【英文摘要】Vegetative propagation from thallus segments and protoplasts of the gametophyte of Bryopsis hypnoides Lamouroux (Chlorophyta, Bryopsidales) was studied in laboratory cultures. Thallus segments were cultured at 20 ° C, 20 mol photons m-2 s-1, 12:12 h LD); protoplasts were cultured under various conditions, viz. 15 ° C, 15 mol photons m-2 s-1, 10:14 h LD; 20 ° C, 20 mol photons m-2 s-1, 12:12 h LD; and 25 ° C, 25 mol photons m-2 s-1, 14:10 h LD. Microscope observation revealed that the protoplast used for regeneration was only part of the protoplasm and the regeneration process was complete in 12 h. The

survival rate of the segments was 100% and the survival rate of protoplasts was around 15%, regardless of culture conditions. Protoplasts were very stable in culture and were tolerant of unfavorable conditions. Cysts developed at the distal end or middle portion of gametophytic filaments under low illumination (2 - 5 mol photons m-2 s-1), the key induction factor. Cysts formed several protoplast aggregations inside or the cyst as a whole detached directly from the matrix and all the units were able to develop directly into new gametophytes. Regeneration directly from protoplasts and thallus segments were also discovered in the field. A relatively completed life history of B. hypnoides is established with newly discovered propagation methods, namely protoplast regeneration.

【题目】Identification of the S-genotypes of several sweet cherry (Prunus avium L.) cultivars by AS-PCR andpollination
【中文关键词】自交不亲和性;李属;S-RNase;AS-PCR; 授粉.
【英文关键词】Self-incompatibility, Prunus avium, S-RNase, AS-PCR, pollination test.
【中文摘要】通过AS-PCR和授粉技术鉴定几个不同栽培品系樱桃树的S基因型
【英文摘要】Sweet cherry cultivars display a self-incompatibility system that restricts self-fertilization and fertilization between cultivars bearing identical S-alleles. PCR-based S-allele typing system for sweet cherry cultivars has been recently developed. It has been reported that all known self-incompatibility (S) alleles of sweet cherry were more than 16 based on the AS-PCR analysis. In this work, two sets of AS-PCR primers that were designed based on conserved domains of cDNA sequences of S-RNases has been used to characterize the S-genotype of 38 sweet cherry cultivars, including 15 cultivars whose S-genotype had not been previously described.Pollination test was also performed to validate the PCR results, and the consistent results were got. A wide variation in the frequency of S-alleles in the Sweet cherry germplasm was observed. S3 was the most common in the cultivars evaluated, and S7, S10-S16, S23-S25 as rare allele was not found in China geographical areas in our study.

【题目】Photosynthetic properties of the protoplasts from Bryopsis hypnoides Lamouroux. during the earlyregeneration process
【中文关键词】光合放氧速率;吸收光谱;激发光谱
【英文关键词】Photosynthetic oxygen evolution rate, absorbance spectra, excitation spectra.
【中文摘要】羽藻再生过程中光合特性的变化
【英文摘要】The scanning electronic microphotograph (SEM), photosynthetic oxygen evolution rate and excitation spectra at liquid nitrogen temperature (77 K) of the protoplasts from Bryopsis hypnoides were determined at the early regeneration period (12 h). SEM revealed an existence of the tight aggregation; cell membrane and wall were about 10 min, 6 and 12 h respectively, after the culture. Oxygen evolution rate decreased slowly during the whole process and a minus value appeared at 6 h. Peaks originated from photosystem II (PS II) and photosystem I (PS I) apparently shifted to shorter wavelength during the regeneration process in the excitation spectra. No peak from PS I was determined until in the spectrum of 12 h, which was excited by the wavelength of 436 nm; while the peak from PS I appeared in the spectrum of extruded protoplast excited by the wavelength of 660 nm and strengthened during the rest of the regeneration process.

【题目】Pyrolytic characteristics and kinetics of two brown algae and sodium alginate
【中文关键词】海带;马尾藻;海藻酸钠;热裂解;动力学分析
【英文关键词】Laminaria japonica;Sargassum pallidum;Sodium alginate;Pyrolysis;Kinetic analysis
【中文摘要】两种褐藻热裂解动力学特性
【英文摘要】The pyrolytic and kinetic characteristics of two macro-algae (Laminaria japonica and Sargassum pallidum)and sodium alginate were evaluated and compared at heating rates of 10, 30 and 50 C min 1under aninert atmosphere after which the kinetic factors were calculated. The results indicated that three stagesappeared during pyrolysis, moisture evaporation, primary devolatilization and residual decomposition.Signi fi cant differences in the average activation energy, thermal stability, fi nal residuals and reactionrates existed between the samples studied. The primary devolatilization stage of L. japonica and S. pallidum could be described by the Avramic – Erofeev equation (n = 3), whereas that of alginate sodium could be described by the Jander equation (n = 2). Calculation of the most probable mechanism function of zoneI of the two macro-algae indicated that alginate was mainly decomposed during zone I. The average activation energies of L. japonica, S. pallidum and sodium alginate were 207.7, 202.9 and 188.1 kJ mol 1,respectively.

【题目】黄海绿潮浒苔的形态学观察及分子鉴定
【中文关键词】浒苔:形态学观察;分子鉴定
【英文关键词】Enteromorpha prolifera;morphological characters;molecular phylogenetic analysis
【中文摘要】2008年6月初,黄海中南部海域出现罕见的大面积的绿潮现象,经初步鉴定,认为造成本次绿潮的种类为浒苔属(Enteromorpha)藻类,但是其种一级分类地位的确定成为自绿潮爆发以来最有争议的问题之一。本研究采用形态学观 察与分子鉴定相结合的方法, 对在黄海海域采集的 2 2个浒苔样品及青岛栈桥海域的漂浮浒苔样品进行了鉴定。结果表 明, 不同站位的浒苔样品均具有主枝, 且高度分枝, 但丝状体的长度及宽度有较大差异; 藻体色泽也有较大差异, 有深绿色、 鲜绿色和黄绿色之分: 藻体细胞大小差异较大: 切片观察表明所有样品都具有浒苔典型的管状结构, 且细胞位于单层藻体的中央;ITS及 5.8 SrDNA序列分析表明2 3个浒苔样品序列完全一致, 由此确定这些浒苔样品均属于同一种浒苔属浒苔(Enteromorphapr olifera)。

【题目】黄土高原坡地苹果土壤肥力及矿质氮积累分析
【中文关键词】坡地; 苹果园; 黄土高原; 矿质氮
【英文关键词】slope; apple orchard; Loess Plateau; mineral N
【中文摘要】摘 要: 采用田间取样与室内分析相结合的方法, 研究了黄土高原坡地苹果园肥力状况与矿质氮累积。结果表明,坡地苹果园土壤肥力低, 氮、 磷严重缺乏,钾相对丰富, 土壤属于砂壤土, 通气性强, 保肥、 保水性差。0) 60 cm 土层土壤有机质含量为 9. 24~ 28. 12 g/ kg ,全氮为 0. 22~ 0. 60 g / kg ,速效磷为 0. 17~ 16. 08mg / kg ,速效钾为 80. 06~ 168. 39 mg / kg ;黄土高原坡地苹果园中 NO-3) N 有深层累积分布, 累积深度大于 2 m, 在 180) 200 cm 层最高累积量达 249. 61 kg/ hm2, 而 NH+4) N 无深层累积。不同施肥处理对土壤剖面中的 NH+4) N 和 NO-3) N 含量分布影响不同, 对 NH +4) N 含量和分布影响不明显, 但不同施肥方式对 NO-3) N 含量分布影响显著。施加氮肥促进 NO-3) N 深层累积, 施加磷肥有助于降低土层中的NO-) N 含量, 缩小富集量的分布范围。
【英文摘要】Abstract: Soil fert ility and mineral N accumulat ion of slope apple o rchard on the Loess Plateau are studied.Result s show that soil appears low -fert i lity due to the serious lack o f N and P. Soil is sandy loam, w ith bet tersoil aerat ion and poor w ater and nut rient retent ion. Fert i lity status of slope apple or chard o n the Loess Plat -eau is low o n the w ho le. The content of soil nut rient s of the 0) 60 cm soil lay er is as follow s: or ganic mat teris 9. 24~ 28. 12 g / kg; to tal N is 0. 22~ 0. 60 g/ kg; av ailable P is 0. 17~ 16. 08 mg/ kg ; and available K is80. 06~ 168. 39 mg/ kg . T her e are NO-3) N enrichment lay er s below 2 m of slope apple o rchard o n the Lo essPlateau. Dif ferent fert ilizat ions have significant effect s on the NO-3) N dist ribut ion and its co ntent in the soilpro files, w hile the NH+4) N dist ribut ion and it s content w ere relat ively constant . For mo re N t reatment , theNO-3) N enrichment depth

increases, w hile fo r mo re P treatment , the NO-3) N enrichment depth decreasesin the soil prof iles.

【题目】黄土高原丘陵沟壑区不同土地利用模式对土壤氮素淋溶的影响
【中文关键词】黄土高原丘陵沟壑区; 氮素淋溶; NO-3 - N 淋溶
【英文关键词】loess hilly and gully region; nit rog en leaching; ni t rate ni t ro gen leaching
【中文摘要】摘 要:通过对黄土高原丘陵沟壑区不同土地利用模式土壤剖面 NO3 - N、 NH4 - N、 有机质和全氮分布的测定, 论述黄土高原丘陵沟壑区不同土地利用模式对土壤氮素淋溶的影响,对当地农业发展提出建议。结果表明:在 200 cm内土壤 NO-3 - N 最大值都出现在 200 cm 处,其中日光温室最大为20. 36 mg/ kg。土壤 NH+4 - N 在200 cm内是较均匀的分布在 10~ 25 mg/ kg。不同土地利用模式对土壤剖面土壤NH+4 - N、 有机质和全氮分布没有影响。随着深度的变化对土壤 NH +4 - N 分布也没有影响。土壤有机质和全氮在土壤剖面的分布是, 随着深度的增加而减少, 60 cm 以下有机质保持在 1. 07~ 5. 95 g/ kg,全氮保持在 0. 12~ 0. 35 g / kg。根据试验结果得出, 土壤氮素淋溶的主要成分是NO-3 - N,土壤 NO-3 - N 淋溶程度与降雨、 灌溉、 施肥量呈正比,在坡地的淋溶较少。
【英文摘要】Abstract: According to soil pro file of nitr ate nitro gen, ammo nium nit rogen, o rganic mat ter and total ni t ro -g en under dif ferent land uses pat terns, ef fects of soil nitr ogen leaching under dif ferent land uses in the loesshilly and gully region w ere discussed in detail, and pr opo sals w er e gaven fo r lo cal ag ricultural develop -ment . T he result s show ed that soil nitr ate nit rogen max imum appeared on 200 cm. The max imum is thatsolar greenhouse. s content is 20. 36 mg/ kg . Soil ammonium ni t ro gen content is 10~ 25 mg / kg. Ef fect ofsoil ammonium nit rogen, o rganic matter and total ni t ro gen under dif ferent land uses in the loess hilly andgully region w ere not o bv io us. With the depth of the changes soil ammonium nitr ogen haven. t changes.Soil org anic mat ter and total nit rog en. s dist ribut io n decreases w ith the incr ease in depth, but kept organicmatter content at 1. 07~ 5. 95 g/ kg and kept total nitrogen at 0. 12~ 0. 35 g/ kg under 60 cm. The results showedthat soi l ni t rogen leaching. s main components is soi l nitrate nitrogen, soil ni t rate ni t rogen leaching and rainfall , ir -rigation, fertil izat ion amount w as posi tive correlation, soil nitrate nitrogen leaching is less in slope land.

【题目】免耕施肥对灌浆期玉米、鼓粒期大豆叶片过氧化
【中文关键词】免耕施肥;叶片; 膜脂过氧化;脯氨酸;玉米; 大豆
【英文关键词】no- tillage ; leaves ; membrane lipid perox idation; Pro ; maize ; soybean
【中文摘要】摘要: 研究免耕施肥对玉米灌浆期、 大豆鼓粒期叶片过氧化作用和脯氨酸含量的影响,为黄土丘陵旱作农区确定合理的耕作施肥方式提供叶片生理方面的科学依据。试验在陕西安塞黄土丘陵旱作农区的田间小区进行, 分析了传统翻耕化肥 (CF)、 翻耕有机肥 (CM)、 翻耕无肥 (CN); 免耕化肥 (NF)、 免耕有机肥 (NM)、 免耕无肥 (NN) 6种处理对玉米灌浆期、 大豆鼓粒期叶片 POD活性、 MDA、 Pro和叶绿素含量的影响。免耕玉米 POD 活性小于翻耕, 免耕大豆与传统翻耕无显著差异,免耕方式 NN、 NM 和 NF对其 MDA、 Pro和叶绿素含量的影响均表现为差异显著。具体为免耕措施下玉米灌浆期、 大豆鼓粒期叶片中 MDA 含量均低于翻耕, 叶绿素含量高于翻耕, 免耕玉米 Pro含量高于翻耕; 但免耕大豆 Pro含量小于翻耕, 其中免耕措施下玉米 NM、 大豆 NF表现最优。在黄土丘陵旱作农区实施免耕能减缓玉米灌浆期、 大豆鼓粒期叶片膜脂过氧化程度, 提高叶绿素含量,延缓叶片衰老,增强抗旱能力。

【中文摘要】摘 究 表覆 方式对辣椒 (a n u u)水分利 效率 品质 叶片硝酸 原酶 性 植株 壤中氮素分布的影响。结果表明,覆盖可增加辣椒整个生育期土壤水分含量。覆盖地膜和覆盖秸秆 +地膜比其他地表处理方式能显著增加辣椒的产量和经济收人 ,提高产量水分利用效率和经济水分利用效率。覆盖可显 著降低耕作层(0一2 0。m)土壤硝态氮含量,且随着土层深度的增加,硝态氮含量显著降低,但对各土壤铁态氮含量无 显著影响。对品质而言,覆盖地膜处理辣椒果实pH 、维生素C 含量显著高于其他处理 ,且其电导率、阳离子交换量和硝酸盐含量显著低于其他处理 。覆盖可增强叶片硝酸还原酶活性,降低叶片中的全氮含量,显 著降低每百千克产量氮肥吸收量。从提高辣椒的品质、环境安全、肥料利用和经 济效益各因素考虑 ,生产中辅以科学的水分管理 ,覆盖地膜和覆盖秸秆十 地膜是可行的地表覆盖方式。

【题目】超声波辅助浸提浒苔水溶性物质的工艺条件优化
【中文关键词】浒苔;水溶性活性物质;超声波;浸提
【英文关键词】Enteromorpha prolifera;Water—soluble activity material;Ultrasonic;Extraction
【中文摘要】[目的] 优化超声波辅助浸提浒苔水溶性物质的工艺条件。[方法] 采 自青岛海区的新鲜浒苔作为试材, 采用超声波辅助法浸提了浒苔水溶性活性物质,通过单因素试验研究了浸提时间、浸提温度、超声波功率对浸提得率的影响, 并通过正交试验优化 了提取工艺。 [结果] 3种因素均对浒苔水溶性物质浸提得率具有显著影响, 其中超声波功率对浸提影响最大, 其次是浸提温度和浸提 时间。通过单因素试验研究以及正交试验优化的最佳工艺条件: 超声波辅助浸提时间为4.5h,浸提温度为75℃,超声波功率为200W。该活性物质的浓缩采用旋转蒸发法, 干燥采用冷冻真空干燥。[结论]浒苔水溶性活性物质为晶体状,颗粒均匀, 可作为功能活性成分添加于各种食品之中。

【题目】水土保持耕作及施肥对盛花期大豆光合生理的影响
【中文关键词】水土保持耕作 施肥 光合速率 水分利用效率 旱作农田 大豆
【英文关键词】Conservation tillage, Fertilization, Photosynthetic rate, Water-use efficiency, Dryland farming, Soybean
【中文摘要】摘 要 依据陕西安塞田间试验, 采用LI-6400便携式光合仪, 在自然条件下对黄土丘陵区旱作农田传统翻耕化肥(CF)、翻耕有机肥(CM)、翻耕无肥(CN)、免耕化肥(NF)、免耕有机肥(NM)、免耕无肥(NN)等处理下盛花期大豆叶片的净光合速率、气孔导度、水分利用效率及影响因子日变化进行了研究。结果表明: 6 种不同处理的大豆叶片净光合速率日变化均为双峰曲线, 峰值分别在 11:30、16:00 出现。NM、NF 处理对提高大豆净光合速率有明显的促进作用, 其中以有机肥(NM)最为显著。气孔导度与蒸腾速率之间达极显著正相关(P<0.01,r=0.999 4)。气孔导度日变化也为双峰, 峰值分别出现在 11:30、16:00。不同处理下, 大豆的水分利用效率呈单峰曲线, 峰值出现在 10:00, 低谷出现在 13:00 以后。其中, NF、NM 处理能显著提高大豆盛花期的水分利用效率。相关分析表明: 气孔导度、蒸腾速率、叶温、光合有效辐射及基于叶温的蒸汽压亏缺是大豆光合作用的促进因子, 而胞间 CO2 浓度、 空气 CO2 浓度、 空气相对湿度则为主要的限制因子。 CF、 NF 处理在 8:30~10:20和 13:00, CM、NN 处理在 8:30、11:30~13:00、17:30, CN、NM 处理则在 8:30、13:30 各影响因子与净光合速率相关程度较高, 相关系数一般在±0.9 以上。在黄土丘陵区旱作农田大豆最适宜的管理方式为 NM、NF。
【英文摘要】Abstract Based on field plot experiments in the Ansai region, Shaanxi Province, the paper analyzed net photosynthetic rate, stomatal conductance and water-use efficiency in soybean leaves at full-bloom stage under different tillage and fertilization. The LI-6400 portable photosynthesis system was used in the analysis. The treatments included plow tillage with chemical fertilizer (CF), plow tillage with organic fertilizer (CM), non-fertilized plow tillage (CN), fertilized no-tillage (NF), no-tillage with organic manure (NM) and non-fertilized no-tillage (NN). The results show that diurnal variation of net photosynthetic rate of soybean follows the typical bimodal curve in the different treatments; peaking at 11:30 and 16:00. NM and NF treatments, especially NM, significantly enhance net photosynthetic rate of soybean. A significant correlation exists between stomatal conductance and net photosynthetic rate (P<0.01), with a correlation coefficient of 0.999 4. Diurnal variation of stomatal conductance is also a bimodal, peaking at 11:30 and 16:00. In different treatments, water-use efficiency of soybean follows a uni-peak curve, highest at 10:00 and lowest after 13:00. NM and NF treatments have a significantly enhancing effect on soybean water-use efficiency. Correlation analysis shows that stomatal conductance (Cond), evaporation ratio (Tr), leaf temperature (Tl), photosynthetically active radiation (PA R) and supplemental vapor pressure deficit (Vpdl, based leave temperature) are positive factors of photosynthesis in soybean. On the other hand, inter-cell CO2 concentration (Ci), air CO2 concentration (CO2R) and air relative humidity (RH-R) mainly limit photosynthesis in soybean. CF & NF at 8:30~10:20 and 13:00; CM & NN at 8:30, 11:30~13:00 & 17:30; and CN & NM at 8:30 & 13:30 have significant correlation between impacting factors and net photosynthetic rate, with a correlation coefficient of ±0.9. The optimum management modes forgrowing soybean in dry farmlands on the Hilly Loess region are NM and NF.

【题目】不同前茬对设施黄瓜产量和品质及土壤酶活性的影响
【中文关键词】轮作 前茬作物 黄瓜产量 黄瓜品质 土壤呼吸 土壤酶活性
【英文关键词】Rotation, Proceding crop, Cucumber yield, Cucumber quality, Soil respiration, Soil enzyme activity
【中文摘要】摘 要 试验研究了在延安日光温室不同前茬作物条件下, 黄瓜随着生长季节的变化其产量和品质及土壤呼吸和酶活性的动态变化。 结果表明, 前茬为豇豆的黄瓜产量和土壤碱性磷酸酶活性较高, 前茬为番茄的黄瓜可溶性糖含量和土壤呼吸强度较高, 前茬为四季豆的黄瓜维生素C含 量较高, 前茬为翻青玉米的黄瓜硝酸盐含量和土壤脲酶活性较高, 前茬为翻青黑豆的土壤蔗糖酶活性较高。从提高黄瓜产量的角度出发, 豇豆-黄瓜是最佳模式, 而从改善黄瓜品质的角度出发, 番茄-黄瓜和四季豆-黄瓜是最优模式。
【英文摘要】Abstract Dynamic changes in cucumber yield, quality, soil respiration and enzyme activity were studied under different proced-ing crops in different growing seasons in Yan ’an solar greenhouse. The results show that cucumber yield and soil alkaline phos-phatase activity are high under cowpea-cucumber rotation. Soil respiration and cucumber soluble sugar content significantly increase under tomato-cucumber rotation. Vc content of cucumber improves significantly under kidney bean-cucumber rotation. Soil urease activity and nitrate content of cucumber also increase under maize-green manure-cucumber rotation. And sucrase activity in the soil is highest under black bean-green manure-cucumber rotation system. For high cucumber yield, cowpea-cucumber rotation system is the most suitable model. However, tomato-cucumber and kidney bean-cucumber rotation systems are the most suitable models for improving cucumber quality.

【题目】施用PAM防治松散土风蚀的机理及其抵御风沙能力研究

【中文关键词】松散土; PAM; 风蚀控制; 风沙流

【英文关键词】loo sen so il ; Polyacrylamide (PAM) ; w ind erosion co nt ro l ; w ind f low w i th sand

【中文摘要】摘要: 采用室内风洞试验方法, 研究了内蒙古西部干旱半干旱地区荒漠沙地松散土风蚀规律、风沙流对风蚀量的影响和施用 PAM 防治松散土壤风蚀的机理及其抗风沙流的能力。风沙流对风蚀量的影响试验, 采用试样接续放置的方法, 前一试样为后一试样提供风沙流; 施用 PAM 试样抗风沙流的能力试验, 采用 PAM 使用量为 1g / m2, 2 g/ m2和 4 g/ m2等 3 个处理水平和 0, 17. 6%, 36. 4%, 7. 7%等 4 个吹角水平。试验结果表明, 相同的风速条件下风沙流对土壤的侵蚀程度比净风侵蚀程度高得多, 侵蚀量显著不同; PAM 用量为 1 g / m2时, 在 7~ 8m/ s 风速的风沙流作用下只能经历 5~ 10 min 的吹蚀试样即破坏; PAM 用量为 2 g / m2时可以抵御 8~ 10 m/ s 风速的风沙流历时 30 min 的吹蚀; PAM 用量达 4 g/ m2时, 可以抵御 10 m/ s 风速的风沙流历时 30 min 的吹蚀试样仍未破坏, 几乎可以防止自然界 99% 的各级风速所引起的土壤风蚀。从经济方面考虑, 推荐 PAM 用量为 2g / m2可以防止自然界中大部分风力(约 97%~ 99%) 造成的风蚀,经济上是可行的。经 PAM 处理的试样破坏过程和切片分析得出, 在松散土表面喷施 PAM 之所以能够有效地防止风蚀,最根本的原因是施用 PAM 溶液后松散土表面可形成较厚的结皮。

【英文摘要】Abstract: It have been studied with w ind tunnel exper iment s that the w ind erosion rule of loosing soil on thehungriness sand land of w estern Inner Mengo lia, the impact of w ind flow w ith sand o n the w ind erosion a mount , the mechanism by use of PAM to keep f rom w ind er osion of loosing soil and it s capability to w ith stand w ind f low w ith sand. The samples w ere taken in sequences abo ut the impact of w ind f low w i th sand o nthe w ind ero sion amo unt and anterior sample applied w ind f low w ith sand for po ster io r one. T he 3 lev els ofPAM dosag e (1 g / m2, 2 g / m2and 4 g/ m2) and 4 w ind degrees (0, 17. 6%, 36. 4% and 57. 7%) w as co ntainedin the test s for PAM sample capability to w ithstand w ind f low w ith sand. T he result s show ed that the ero sion ability of w ind f low with sand w as much more than the ability of pur e wind w hen the w ind v elo city w asequal and the w ind er osion amount s of them w ere evident ly dif ferent . The samples just only w ithsto od windflow w i th sand for 5 to 10 minutes w ith a w ind veloci ty of 7~ 8 m/ s w hen PAM do sage w as 1 g/ m2. How ev er the samples w ould w ithstand w ind f low w ith sand for 30 minutes w ith a w ind velocity o f 8~ 10 m/ s w henPAM dosage was 2 g/ m2. It w ould withstand wind f low with sand for more than 30 minutes with exceeding 10 m/ swind velocity w hen PAM dosage w as 4 g/ m2and the sample almost could prevent 99% of all soil erosion caused bynatural w inds. The dosage of 2 g/ m2PAM was recommended normal ly and economically in the paper for most ofwind erosion (about 97% ~ 99%) could be prevented. T he surface could form a crack w hen PAM solution w assprayed on loosing soils surface so that it could effectually prevent from wind erosions.

【题目】温室土壤连作对黄瓜主要病害的影响
【中文关键词】日光温室 连作 黄瓜 病害
【英文关键词】Sunlit greenhouse, Succession p roduction system, Cucumber,Disease
【中文摘要】摘 要 在温室条件下,通过田间系统观察和室内测定相结合的方法,研究了不同连作年限温室土壤对黄瓜主要病害发生的影响。结果表明:随种植年限的延长,土壤中病原微生物数量增加,是导致黄瓜土传病害加重的主要原因;黄瓜植株生长发育不良,黄瓜的光合速率及抗性酶活性降低,植株自身抗病性下降,是引起黄瓜病害发生加重的内因;温室内温度降低、 湿度提高、 光照下降,是导致黄瓜病害发生加重的外部条件。随着连作年限延长,黄瓜病害发生依次加重,土传病害对连作的反应比气传病害敏感,病害是土壤连作障碍的重要原因之一。
【英文摘要】Abstract Under sunlit greenhouse conditi on, systematic field and laboratory surveyswere carried out to study the effects of differ2ent cr op successi ons on main disease devel opment in cucumber . The results show increasing numbers of s oil pathogenic micr obeswith p r ol onged p lanting, the main reas on for disease occurrence and sp read of soil2 borne diseases . Hypogenetic p lant, l ower photo2synthetic rates and enzyme activities decrease self2resistance of the cucumber p lant t o disease . These form the internal2

causes ofcucumber disease outbreak . I ncreases in humidity, decreases in temperature and sunlight are the external2 causes of cucumber dis2ease outbreak . The longer the successi on, the severer is the s p read of s oil2 borne diseases . The effect of continuous cropp ing ismorea sensitive factor in the s p read of s oil2 borne diseases than in the s p read of air2 borne diseases . Diseases are one of themain i mpedi2ments t o succession p roducti on systems .

【题目】海带不同部位褐藻胶含量及其凝胶性能研究
【中文关键词】海带;褐藻胶;M / G值;凝胶强度;持水力
【英文关键词】laminaria,alginate,M/G ratio,gel hardness,water holding capacity
【中文摘要】将海带藻体划分为基部边缘部分、基部中间部分、中部边缘部分、中部中间部分和尖部 5个部分,分别测定了其褐藻胶含量、M / G值、褐藻胶凝胶的强度和持水力,并对不同部位褐藻胶的含量和 M / G 值进行比较 ,并研究 M/ G值对褐藻胶凝胶特性的影响。研究发现 ,海带中部的褐藻胶含量高于基部和尖部, 边缘部分褐藻胶含量高于中间部分。而海带的M/ G值的大小顺序为基部 >中部 >尖部,海带中部的 M / G值大于边缘的。褐藻胶的M / G值的不同对其凝胶特性有较大的影响,M / G值越大,褐藻胶凝胶的凝胶强度越小,而其持水力越强。在食品中应用褐藻胶时,可以根据实际的要求来改变褐藻胶的M / G值获得所需要的凝胶强度和持水力等凝胶特性。

【题目】黄土丘陵区不同土地利用方式对土壤含水率的影响
【中文关键词】土壤水分,分布格局,土地利用,梯田建设,黄土丘陵区
【英文关键词】soil moisture,distribution pattern,land use,temce building,loess hilly and gully region
【中文摘要】干旱半干旱地区,土壤含水率是影响作物生长和植被恢复的重要因子。采用土钻法对黄土丘陵区典型流域不同土地利用方式下土壤含水率进行了比较。结果表明,农田土壤含水牢显著较高,这与农田坡度较小及梯田建设有关,还与农作物蒸腾耗水相对较小有关。林地、灌木地和草地土壤含水率相对较低,且相互间无显著差别。黄土丘陵区土壤含水率主要受坡度和土壤稳定入渗速率的影响。但草地十壤含水率还与坡向及年生物量有关。土壤水分分布格局与该区土层深厚,地下水埋藏较深,土壤水分收入主要受降雨的补给有关。因此,该区农田建设应在坡度较小(<100)的地形上进行,并优先考虑梯田。坡度较大的地方应以天然灌木和草奉群落的保育为手。人工乔灌林只适宜在沟道等水分条件较好的地方种植。
【英文摘要】In arid and semiarid region,soil moisture is one of the key factors influencing plant growth.In this paper,the soil moisture in different land use types were investigated by auger in a small watershed in hilly and gully region of the Loess Plateau,China.The results showed that soil moisture in croplands was the highest,which was due to gentle slopes,terrace building and lower crop water requirements.The soil moisture in forestlands,shrub lands and grasslandswere lower and had no significant difference between any two of them.The stepwise regression analysis showed that soil moistures was mainly influenced by slope gradient and soil stable infiltration rate.Furthermore,the soil moisture in grassland was also influenced by slope aspect and aboveground biomass.In conclusion,croplands can be built on gentle slopes(<100).In steep gradient,the vegetation building should emphasize the natural community conservation.The artificial vegetation including forest and bush can be built in small topographies with higher soil moisture

such as the bottom of gully.

【题目】黄土丘陵区退耕前后典型流域农业生态经济系统能值分析
【中文关键词】农业生态经济系统,环境工程,退耕生态,黄土丘陵区,退耕还林草政策,能值分析
【英文关键词】agricultural eco-economic system, environmental engineering,ecological restoration,loess hilly region,grain for green policy,emergy analysis
【中文摘要】应用能值分析理论和方法,从资源的投入和产出结构角度对黄土丘陵区退耕还林草政策实施前后纸坊沟流域农业牛态经济系统的资源利用、环境压力、能值指标变化及生态经济效益进行比较研究。结果表明:退耕前,该流域农业生态经济系统农产品总产出能值为7.53E+18 sej,退耕后减小了1.50E+17 sej,单位面积农产品生产力由退耕前的5.38E+15 sej,hm2上升到退耕后的1.68E+16 sej/hm2,畜产品的产出能值有所下降。退耕后系统生产优势度指数由退耕前的O.60上升到O.72,系统稳定性指数由退耕前的0.51增加到退耕后的0.53,退耕后流域人口承载力较退耕前大。退耕前后该流域能值投入率及环境负荷几乎无变化,净能值产出率由0.11增加到O.29,退耕前流域人均能值用量为5.16×10 ” sej,退耕后增加到5.41×10 ¨ sej,系统可持续发展指数由退耕前的2.55上升到退耕之后的6.69。退耕后,能值一货币比为2.21×1012 sej/$,与退耕前相比变化不大。为了使该流域的农业生态系统更加持续稳定的发展,需进一步调整农业结构,优化资源投入配置,提高资源生产效率,减小环境负荷,逐步走向系统可持续性不断增强的健康发展轨道。
【英文摘要】Based on emergy theory and method,resource utilization,environmental pressure,variation of emergy indexes and efficiency of agricultural eco-economic system were analyzed before and after ‘ ‘ grain for green policy ’ ’ from resource input and output in zhifanggou watershed in loess hilly region of China.The results showed that the total emergy output of agricultural products of agricultural eco—economic system was 7.53E+1 8 sej before grain for green in watershed,and decmased 1.50E+17 sej after this policy.The production of agricultural products per unit area increased from 5.38E+15 sej/hm2 to 1.68E+16 sej/hm2 and emergy output ofanimal products decreased.The dominance index of system production increased from O.60 to 0.72,the stability index of system increased from 0.5 1 to 0.53,and the population carrying capacity Was also increased after grain for green.However,emergy investment ratio and environmental loading were nearly stable.Net emergy yield ratio increased from 0.1 1 to 0.29.and emergy per capita also change from 5.16x1015 sejto 5.41×10 ” sej.Index ofsystem sustainable development also increased from 2.55 to 6.69. After grain for green,the ratio of emergy-monetary was 2.21x 10 “ sej/$,which changed little鹤compared with before returning farmland.For sustainable and stable development of agricultural ecosystem in zhifanggou watershed,adjusting agricultural structure,optimizing the allocation of resource input,improving resource productivity and reducing the environmental loading were all needed in the next step.In this way,the agriculture of zhifanggou watershed could develop more sustainable and healthy.

【题目】不同灌溉方式对温室黄瓜根系分布影响的研究
【中文关键词】黄土高原　温室　黄瓜　根系分布　灌溉方式
【英文关键词】Loess P l ateau , G ree nhouse , Cucu mber , Root d i stri bution , Irr i gati on pattern
【中文摘要】摘　要　采用土柱模拟试验和大田调查相结合的方法, 研究了不同灌溉方式下温室嫁接黄瓜根系分布特征,结果表明: 膜下暗灌和滴水灌溉温室黄瓜根系干重最大值分别出现在黄瓜定植后 180 d和 210 d , 黄瓜拔蔓时根系干重后者

较前者高 29 . 0%。黄瓜不同发育时期根系垂直分布特征有明显差异,在初瓜期前, 0~ 20 c m根系干重前者明显高于后者, 20 c m以下根系干重二者无明显差异; 结瓜盛期以后, 0~ 20 c m根系干重二者差异不明显, 20 c m以下根系干重后者显著高于前者。膜下暗灌和滴水灌溉黄瓜根系水平分布在 0~ 15 c m, 分别占总根干重的 96 . 6%、 94 . 2 %。随着黄瓜生长发育的推进,膜下暗灌内侧根系分布数量逐渐下降, 结瓜期以前内侧根系占植株根系总数量的 61 . 1%, 中后期占 15 . 6% ;而滴灌黄瓜全发育期, 内外侧根系分布数量比较均衡。说明灌水方式对温室嫁接黄瓜根系分布特征有显著影响。

【题目】侵蚀环境小流域生态经济系统健康定量评价
【中文关键词】生态系统健康;定量评价;小流域;侵蚀环境
【英文关键词】ecosystem health;quantitative assessment;small watershed;erosion environment
【中文摘要】生态经济系统健康是黄土丘陵区侵蚀环境下水土保持与生态建设的目标。在分析侵蚀环境下生态系统健康特征和诊断指标筛选原则的基础上,从资源环境支持、社会经济人文影响和生态综合功能3个方面,选择17个因素作为参评因子,建立了一套适合于侵蚀环境小流域生态经济系统健康诊断的指标体系。以均方差决策法确定各指标的权重,运用递阶多层次综合法、线性加权函数法分别建立二级层次和综合指标健康诊断模型——健康指数。分析研究侵蚀环境小流域生态经济系统健康动态,结果表明,该环境系统健康状况相对稳定,健康指数呈逐年波动式上升趋势(由1985年的o.370增大到2003年的O.573),具有较强的可持续发展能力。同时,以现实生态经济最佳水平为目标,引入障碍度、优势度等概念,运用通经分析对该环境小流域系统健康进行障碍和优势诊断,并据此提出了建设对策和建议,为该环境小流域生态环境建设提供科学依据。
【英文摘要】To reach the ecosystem health from both ecological and economic points is the objective of water conservation and ecological building in the loess hilly area under erosion environment.On the principle of ecosystem healthy quantitative assessment and diagnosis index selecting, 17 factors were selected and evaluation index system was established to make ecosystem health assessment form the following three aspects: resource and environmental capacity, social and economic impact, and ecological services in a small watershed under erosion environment.The mean-square deviation decision method was employed to determine the weight of each factor and then the step-up multilayer synthesis with liner weighting function method was used to build two-level hierarchy and collecting index health consultation model-health index.The health dynamics of eco-economy system in the small watershed under erosion environment was analyzed.It was shown that the watershed ecosystem is relatively stable and the health index has an increasing trend from annual fluctuation(0.370 in 1985 to 0.573 in 2003).This is indicates that it has a quite strong ability on sustainable development.At the same time,the obstacle and advantage to the watershed ecosystem health were studied by introducing the concepts of obstacle degree and advantage,and path analysis method,with considering the real eco-economicoptimal level as the uppermost goal.Finally,suggestions on ecological building were provided which give a scientific basis to the ecosystem rehabilitation in the small watershed.

【题目】白于山山区大扁杏生产中的问题分析.
【中文关键词】大扁杏; 品种;霜冻; 园址;结果部位; 结果枝
【英文关键词】P. armeniaca ∀ P. sibirica; fros t; variety; orchard site; frui t - set ting position; fruiting branch
【中文摘要】摘 要: 陕北白于山山区以大扁杏为主开展了仁用杏基地建设, 但大扁杏开花不结果, 经济效益差。通过多年的调查和监测认为该区大扁杏生产中存在的主要问题是花期、 幼果期霜冻频繁且强度较重,易冻花冻果; 选择的主栽品种为龙王帽,树体生长量小, 开花早且花期短,不抗霜冻;大多数杏园建立在南坡坡地上, 培育的树形以开心形为主,树体的结果部位较低, 选留的结果枝为花束状果枝和短果枝, 开花早、 花期短且集中, 不易躲避霜冻等。建议该区积极选育开花晚、 抗霜冻的大扁杏品种, 加强栽培管理, 同时建立以山杏为主的仁用杏生产基地。
【英文摘要】Abstract: Baiyushan hilly area of northern Shaanxi w as a large base of almond apricot that is dominated byPrunus armeniaca ∀ P . sibi rica, but P . armeniaca. ∀ P . sibir ica t rees in this reg ion only blossom w ithoutfruit, having no output value. Invest igat ion and observ at ion have been taken for many years and the causes ofthe problem have been unvei led. It has been found out that P. armeniaca ∀ P. sibir ica f lorescence and sett ingfruit phase encountered strong and frequent frost, w hich could easily hurt the f low er and young frui t . At thesame t ime, Longw angmao, the dominat ing variety , grew slowly and i t s f lorescence w as shorter and earlier thanother variet ies, and resisted frost w eakly. Most P . armeniaca ∀ P . sibir ica orchards w ere built in southernslope land, where the frui t t rees∋ florescence w as shorter and earl ier than in other slope land, very easy to en counter f rost . Most t rees w ere trained as open center shape, f rui t sett ing posit ions w ere relat ively low, and mostfruit ing branches were spur frui t ing and short fruiting ones, so the f lorescence was shorter, earlier and more cen t ralized, making it different to avoid the frost. Some suggest ions are put forw ard in order to resolve these prob lems, including select ing and breeding new varieties w i th late f lorescence and anti f rost , strengthening cul t iva t ion management. At the same time, a larger base of almond apricot dominated by P. armeniaca var. ansushould be established.

【题目】土壤水分对日光温室西葫芦耗水量及产量的影响
【中文关键词】西葫芦; 日光温室; 产量; 耗水量; 水分利用效率
【英文关键词】Summer squash; So lar g reenho use; Yield; Water consumpt ion; Water use eff iciency
【中文摘要】摘 要: 在日光温室中研究了不同土壤水分条件对西葫芦耗水量、 产量及水分利用效率的影响。结果表明,在整个生育期,西葫芦总耗水量随土壤含水量的增大而增大。土壤相对含水量保持在 90%~ 100% 时,耗水量最大,为 8 668. 25 m3/ hm2。然而水分利用效率却最低,仅为 39. 7 kg/ m3。相反, 土壤含水量下限为 70%(T3)时, 耗水量虽不高,产量却最高, 达到 352. 4 t/ hm2,叶片净光合速率和结瓜数也最大,水分利用效率也相应最大,达到了 66. 1 kg/ m3。综合考虑产量构成诸因子和水分利用效率, 认为过量灌溉对提高西葫芦产量并不利,合理利用水资源, 土壤水分控制在田间持水量的 70%~ 80%较适宜。
【英文摘要】Abstract: Water consumpt ion, yields and WUE (w ater use ef ficiency) o f summer squash (Cueurbi ta.p ep o) under di f ferent w ater condit ions w ere studied in so lar gr eenhouse. The result s show ed that,during the w ho le gr ow th, the to tal amount of w ater co nsumpt ion g ot higher with the increase of soilmoisture. U nder 90% ~ 100% relat ive so i l moisture, the the to tal w ater consumpt ion w as hig hest, upto 8 668. 25 m3/ hm2. However, WU E to ok on o pposite tr end, o nly w as 39. 7 kg / m3. On the co nt rary,under 70% ~ 80% (T 3) r elat ive soil moisture, yield, net photosynthesis rate and the amount of fr uitw ere hig hest , WUE w as also highest , up to 66. 1 kg/ m3. Considered sy stematically f rom all part s ofyield form and WUE, under 70% ~ 80% relat ive soil moisture, both w ere suitable. It co ncluded thatto o much irrig at ion w as no t goo d to impro ve yield, in order to ut i lize w ater resources reasonably , soilw ater content sho uld be co nt ro lled under 70%~ 80% of field water content.

【题目】水肥交互作用对黄土高原南瓜光合特性及其产量的影响
【中文关键词】水肥交互; 南瓜; 光合特性; 产量
【英文关键词】water and fertilizer coupling, pumpkin, photosynthetic character, yield
【中文摘要】摘 要: 通过不同的灌水和施肥处理, 研究水肥交互作用对南瓜光合特性日变化及产量的影响, 结果表明: 水分与施肥因子对南瓜叶片的光合特性和产量有重要影响, 在水分胁迫的情况下, 肥水交互作用不显著, 在水分较低的情况下, 二者表现互为限制条件的协同作用; 在水分较高的情况下, 肥水交互作用转变成顺序加和作用。 其中单因素效应大小表现为: 氮 > 水 > 磷, 耦合效应大小表现为: 氮与水耦合 > 氮与磷耦合 > 磷与水耦合。在水分适宜时, 适宜的施肥量(施氮量 50kg / hm2、 施磷量 35 kg / hm2)可以提高南瓜光合速率和产量, 不施肥或施肥量过高都会影响南瓜光合速率和产量。
【英文摘要】Abstr act: Effects of water and fertilizer coupling on photosynthetic characteristics and yield of pumpkin wereinvestigated at conditions with different water and fertilizer treatments. The results showed that: the influenceof water and fertilizer factors on the pumpkin photosynthetic characters and yield are great, water and fertil-izer coupling was not significant under the water stress situation, water and fertilizer coupling was restrictedeath other under the low water situation, water and fertilizer coupling was increased eath other under the highwater situation. The ingle factor effect is: N>water>P, the coupling effect is: nitrogen and water coupling>ni-trogen and phosphorus coupling>phophorus and water coupling. The appropriate fertilization level (nitrogen50kg.hm- 2,

phosphorus 35 kg.hm- 2) can increase the photosynthetic rate and yield of pumpkin when the waterlevel was appropriated.

【题目】侵蚀环境生态恢复过程中人工刺槐林(Robinia pseudoacaia)土壤微生物量演变特征
【中文关键词】侵蚀环境;人工刺槐林;生态恢复;微生物量;土壤质量
【英文关键词】erosion environment; Robinia pseudoacaia;ecological restoration; soil microbial biomass ;soil quality
【中文摘要】采用时空互代法,以典型侵蚀环境纸坊沟流域生态恢复过程中不同年限的人工刺槐林为研究对象,选取坡耕地和天然侧柏林为参照,分析了植被恢复过程中土壤微生物量、呼吸强度、代谢商及理化性质的演变特征。结果表明,生态恢复过程中刺槐林土壤理化性质得到明显改善,微生物量随恢复年限的增加变化显著,10-15a后达到显著水平;并随年限逐渐增加,在近熟林和成熟林期基本达到稳定,成熟林后期又开始上升,恢复50a的刺槐林微生物量碳、氮、磷较坡耕地增加幅度分别为213%,201%和83%,但仅为天然侧柏林的50.98%,55.17%和61.48%。呼吸强度随恢复年限增加先升高后降低,与有机碳变化规律不同步;qCO2在恢复初期较坡耕地显著升高,随后迅速降低,25a后开始回落到坡耕地以下,50a后达到最低值,与天然侧柏林没有显著差异。相关性分析显示微生物量碳、氮、磷、qCO2与土壤养分和恢复年限相关性最为密切,达到显著(P<0.05)或极显著水平(P<0.01)。人工刺槐林促进生态恢复可以依靠生物的自肥作用恢复土壤肥力和增加微生物量,但要恢复到破坏前该地区顶级群落时的土壤微生物量和理化性状,还需要一个漫长的阶段,这个阶段可能需要上百年的时间。

【题目】温室黄瓜根结线虫非化学防治技术研究初报

【中文关键词】温室黄瓜; 根结线虫病; 非化学防治
【英文关键词】cucumber in greenhouse, root knot nematodes, Not chemistry control
【中文摘要】摘 要:采用大田与室内相结合的方法, 研究了高温闷棚、 低温冷冻、 轮作倒茬、 淹水等不同绿色防治技术措施对温室黄瓜根结线虫病的防治效果。结果表明低温冷冻法对温室黄瓜根结线虫病具有显著的防治效果, 适宜在冬季温度低于- 15℃, 且持续 20d 以上的地区推广应用。黄瓜与棉花、 大葱和大蒜轮作切断根结线虫的食物链, 减轻根结线虫的危害。淹水法虽然对根结线虫病有较好的防治效果, 但在缺水和保水性能比较差的垆土和黄绵土的北方地区推广应用受到很大限制。高温闷棚法对根结线虫病的防治效果最好, 高温闷棚 8d 对根结线虫病的防治效果达到 100%, 闷棚后第 3 年防治效果仍高达 96.2%。完全能替代化学药剂防治, 可操作性强, 成本低, 协调了根结线虫病的防治与温室绿色食品黄瓜生产的矛盾。
【英文摘要】Abstr act: Effects of different control measures such as high temperature disinfection, rational rotation ,freez-ing and flooded condition on the cucumber root knot nematodes disease was studied by the test in laboratoryand field .The results showed that the effects of freezing on the root knot nematodes disease was significant,and the control measure could be applied extensively in the areas which temperature is less than - 10°Candcontinues more than 20 days in winter. Cucumber- cotton, Scallion and Garlic rotation system cut off the foodchain of the root knot nematodes, and decreased its damage. The control effect of flooded condition was bet-ter, but it was not suitable in the northern area of China which soil is Lou soil and loessial soil. The controleffect of high temperature disinfection was the best, when the soil were treated for 8 day by high temperaturedisinfection, the control effects on the cucumber root knot nematodes was 100%,and still was 96.2% afterthree year. So the high temperature disinfection might alternate chemical control, and coordinate conflict be-tween the root knot nematodes disease control and cucumber green production in greenhouse

【题目】中国沙棘、俄罗斯沙棘和俄罗斯沙棘×中国沙棘光合特性及影响因子
【中文关键词】中国沙棘; 俄罗斯沙棘; 俄罗斯沙棘 × 中国沙棘; 光合特性; 植物因子; 环境因子
【英文关键词】Chinese seabuckthorn ; Russian seabuckthorn ; Russian seabuckthorn ×Chinese seabuckthorn ; photo synthetic characteristic ; plant factor ; environment factor
【中文摘要】摘 要: 在陕北黄土丘陵沟壑区用L I 26400 光合仪对中国沙棘、 俄罗斯沙棘和俄罗斯沙棘 ×中国沙棘光合特性及影响因子进行了测定。测定结果表明三者的光合速率、 气孔导度、 胞间 CO2 浓度、 蒸腾速率日变化均为“ 双峰 ”曲线。中国沙棘光合“ 午休 ”现象较轻 ,日光合速率和午后光合速率、 气孔导度、 胞间 CO2 浓度、蒸腾速率极显著(p < 0. 01)高于俄罗斯沙棘和俄罗斯沙棘 × 中国沙棘。中国沙棘光合作用最适气孔导度、大气 CO2 浓度、 空气相对湿度比俄罗斯沙棘小 ,最适胞间 CO2 浓度、 蒸腾速率、 气温、 光合有效辐射比俄罗斯沙棘高。中国沙棘在最适气孔导度、 胞间 CO2 浓度、 蒸腾速率和大气 CO2 浓度下的光合速率比俄罗斯沙棘高;在最适气温、 空气相对湿度、 光合有效辐射下的光合速率比俄罗斯沙棘低。俄罗斯沙棘 ×中国沙棘光合“ 午休 ”现象比中国沙棘强 ,比俄罗斯沙棘弱 ,午后光合速率与俄罗斯沙棘相近;俄罗斯沙棘 ×中国沙棘最适气孔导度、 大气 CO2 浓度高于中国沙棘和俄罗斯沙棘 ,最适胞间 CO2 浓度低于中国沙棘和俄罗斯沙棘 ,最适蒸腾速率、 气温、 空气相对湿度、 光合有效辐射居于中国沙棘和俄罗斯沙棘之间。俄罗斯沙棘× 中国沙棘在最适气孔导度下的光合速率高于中国沙棘和俄罗斯沙棘;在最适胞间 CO2 浓度、 蒸腾速率、气温、 大气 CO2 浓度、 空气相对湿度、 光合有效辐射下的光合速率低于中国沙棘和俄罗斯沙棘。中国沙棘、俄罗斯沙棘和俄罗斯沙棘 × 中国沙棘的光合速率均与上午的气孔导度、 胞间 CO2 浓度、 蒸腾速率、 气温、 大气 CO2 浓度、 空气相对湿度、 光合有效辐射显著相关 ,均为“ 抛物线 ”关系。
【英文摘要】Abstract : In order to under stand the p hotosynt hetic characteristics of Chinese seabuckt horn , Russian sea2buckt horn , and Russian seabuckthorn ×Chinese seabuckt horn , research on the 3 species and t heir influenceactor s were conducted with Portable L I26400 Photosynt hesis System in t he loess hilly and gully region ofNort hern Shaanxi Province. Result s showed t hat diurnal cour ses of p hotosynt hetic rates , stomatal conduct2nce , intercellular CO2 concent ration , and t ranspiration rate of the 3 species were t he double2peak typeurves. Midday depression of Chinese seabuckthorn was light , and diurnal p hotosynt hetic rates and af ter2noon p hotosynthetic rates were significantly higher than Russian seabuckthorn and Russian seabuckt horn ×Chinese seabuckt horn (p < 0. 01) . Stomatal conductance , intercellular CO2 concent ration , and t ranspirationate in af ternoon for Chinese seabuckt horn were

significant ly higher than Russian seabuckthorn and Russianeabuckt horn × Chinese seabuckthorn (p < 0. 01) . Optimum stomatal conductance , air CO2 concent ration ,nd air relative humidity for p hotosynthesis of Chinese seabuckthorn were lower t han Russian seabuckt horn ,nd optimum intercellular CO2 concent ration , t ranspiration rate , air temperat ure , and p hotosynt hetic activeradiation were higher t han Russian seabuckt horn. Under the conditions of optimum stomatal conductance ,intercellular CO2 concent ration , t ranspiration rate , and air CO2 concent ration , p hotosynt hetic rates of Chi2nese seabuckt horn were higher than Russian seabuckt horn. Under t he conditions of optimum air tempera2t ure , air relative humidity , and p hotosynt hetic active radiation , p hotosynt hetic rates of Chinese seabuckt hornwere lower than Russian seabuckt horn. Midday dep ression of Russian seabuckt horn × Chinese seabuckt hornwas lower t han Chinese seabuckt horn and higher t han Russian seabuckt horn , and p hotosynt hetic rates weresimilar to Russian seabuckt horn in af ternoon. Optimums stomatal conductance and air CO2 concent ration forp hotosynt hesis of Russian seabuckt horn × Chinese seabuckt horn were higher than Chinese seabuckt horn andRussian seabuckt horn ; it s optimum intercellular CO2 concent ration was lower t han Chinese seabuckthorn andRussian seabuckt horn ; and it s optimum t ranspiration rate , air temperat ure , air relative humidity , and p hoto2synt hetic active radiation were between Chinese seabuckt horn and Russian seabuckthorn. Under t he condi2tion of optimum stomatal conductance , p hotosynt hetic rates of Russian seabuckt horn × Chinese seabuckt hornwere higher t han Chinese seabuckt horn and Russian seabuckt horn. Under t he condition of optimum intercel2lular CO2 concent ration , t ranspiration rate , air temperat ure , air CO2 concent ration , air relative humidity ,and p hotosynt hetic active radiation , p hotosynt hetic rates of Russian seabuckt horn × Chinese seabuckt hornwere lower than Chinese seabuckt horn and Russian seabuckthorn. Photosynthetic rates of t he 3 species hadsignificant ly cor relations with stomatal conductance , intercellular CO2 concent ration , t ranspiration rate , airtemperat ure , air CO2 concent ration , air relative humidity , and p hotosynt hetic active radiation in forenoon ,and t heir relationship s might be described by a parabola.

【题目】延河流域本氏针茅(Stipa bungeana)分布预测——广义相加模型及其应用
【中文关键词】自然植被;植被·环境关系;广义线性模型;广义相加模型
【英文关键词】natural vegetation;species—environment relation;Generalized Linear Model;Generalized Additive Model
【中文摘要】物种分布预测,对于物种的保护、利用和恢复具有重要意义。利用广义相加模型(GAM,Generalized Additive Model),对延河流域典型地带性物种本氏针茅(Stipa bungeana)的空间分布预测进行研究,以期为该流域本氏针茅草地的保护、恢复等提供依据。结果表明,本氏针茅分布的环境梯度较广,在坡度、坡向、温度与降雨的各个梯度上都有分布,除高平地和侵蚀剧烈的沟道外,各种地形部位上亦可以存在。建立的广义相加模型表明,本氏针茅的分布主要取决于年均蒸发量和温度季节变化两个因子,而非单纯的降雨、温度因素。从其分布概率看,本氏针茅在延河流域大部分地区都有可能分布,但其分布集中区主要在中北部,与实际观测相符。模型检验表明,建立的模型满足统计要求。

【题目】防雹网对果园立地环境及苹果生长的影响
【中文关键词】防雹网,水果,设施,生长状况
【英文关键词】anti-hail net, fruits, facilities, growth
【中文摘要】摘 要:在陕北黄土丘陵沟壑区以普通苹果园为对照,研究了覆盖防雹网对果园立地环境、冰雹伤害和苹果生长状况等的影响。结果表明:防雹网具有一定的升温及遮荫作用,对果园的气温、地表温度、20 cm土壤温度、40 cm土壤温度影响表现为早晚提高,中午降低,日均温略有提高,影响程度为气温>地表温度>20 cm 土壤温度>40 cm 土壤温度,晴 天>阴天。防雹网对果园空气湿度、土壤水分无显著影响,但极显著地降低晴天的光照强度和风速,且风速越大,降低的效果越明显。防雹网略微降低苹果叶片的光合速率,极显著地削弱枝条长势,显著降低果实产量,但对果实品质无显著影响。防雹网极显著降低果实、叶片的伤害率和伤害指数,显著提高果实的经济产值。在冰雹频繁发生区域,应加强防雹网的使用与推广。

【题目】不同水肥条件下番茄土壤微生物群落多样性及其与产量品质的关系
【中文关键词】内含子切接点引物 多样性指数 产量 品质
【英文关键词】intron-splice junction primer, Shannon-Wiener index, yield, quality
【中文摘要】摘 要 采用内含子切接点引物(Intron-splice junction primer)和长随机引物的PCR(Polymerase chain reaction, 聚合酶链)标记技术, 就黄土高原不同水肥处理对日光温室番茄土壤微生物群落多样性进行了研究, 并对产量、品质的影响进行了分析。结果表明, 所用的6个引物共能扩增出182条稳定清晰的条带, 其中142条为多态性条带, 多态性条带为78.02%。聚类分析与主坐标分析表明, 水肥对土壤微生物群落多样性的变化有不同的影响。土壤微生物群落多样性指数与番茄产量、果实的Vc、可溶性蛋白质含量成正相关, 尤其与Vc的相关系数达0.921 1, 而与可溶性固形物含量成负相关关系。6个水肥组合中WmFh(中水高肥)土壤微生物群落多样性指数最高, 且番茄果实的Vc、可溶性蛋白质含量及产量显著高于其他处理, 可溶性固形物含量较低。该组合有利于土壤微生物群落的多样性和稳定性的提高, 利于土壤生态环境的改善和番茄优良品质的形成。
【英文摘要】Abstract Aims Our objective was to investigate diversity within soil microbial communities and tomato yields and qualities under different soil water and fertilization treatments. Methods PCR (polymerase chain reaction) with long random primers and intron-splice junction prim-ers were used to study greenhouse soil microbial diversity with tomato cultivated under different treat-ments. Important findings A total of 182 bands were detected with 6 primer combinations, and 142 (78.02%) of the bands were

polymorphic. Soil microbial community diversity was affected by the different soil water contents and fertilizations. Diversity was positively correlated with yields, VC contents and solu-ble protein contents, but negatively correlated with soluble solids contents. The highest soil microbial community diversity index was detected under the treatment of medium water level and high fertiliza-tion; the VC contents, soluble protein contents and yields of tomato fruits were significantly higher and the soluble solids of the tomato fruits was lower than those in other treatments. This showed that treat-ment can enhance the soil microbial community diversity and stability and to improve soil ecological environments and tomato quality.

【题目】土壤含水量度结果期温室辣椒生长及果实品质的影响
【中文关键词】土壤含水量;温室辣椒;生长发育;果实品质;水分利用率
【英文关键词】:soil moisture ;greenhouse pepper ;plant growt h ;f ruit quality ;water utility efficiency
【中文摘要】[摘 要] 【目的】研究土壤含水量对结果期温室辣椒(Capsicum annuumL.)生长、 果实品质、 干物质分配及水分利用效率的影响 ,以确定温室辣椒结果期的最佳土壤含水量 ,提高设施蔬菜水分利用效率。 【方法】以精选牛角椒为研究对象 ,经 4 个土壤含水量(土壤含水量分别为田间持水量的 40 %~55 %(A1) ,55 %~70 %(A2) ,70 %~85 %A3)和 85 %~100 %(A4))的水分处理后 ,测定并分析植株生长、 果实品质、 干物质分配、 产量和水分利用效率的变化规律。 【结果】在土壤含水量为田间持水量的 70 %~85 %时 ,同化物在辣椒地上和地下部分的分配更趋合理 ,产量最高 ,为 6. 05 kg/ m2;在土壤含水量为田间持水量的 55 %~70 %时 ,辣椒果实品质各项指标均达到最大值 ,其中 Vc、 游离氨基酸、 可溶性总

糖和可溶性蛋白质含量分别为 1. 16 mg/ g ,363. 6 μg/ g ,19. 4 mg/ g 和 19. 7 mg/ g ,此时水分利用率也最大 ,为 28. 66 kg/ m3,分别比 A1、 A3、 A4 处理提高了19. 5 % ,30. 3 %和51. 3 %。【结论】综合考虑水分对果实品质、 干物质分配以及水分利用效率和产量的影响后认为 ,土壤含水量为田间持水量的 55 %~70 % ,可以作为辣椒结果期理想的土壤水分控制指标。

【英文摘要】Abstract :【Objective】The influence of soil moist ure on t he growt h of greenhouse pepper (Ca psicumannuum L .) ,f ruit quality ,t he accumulation and dist ribution of dry mat ter and water utility efficiency wasst udied to select t he scope of t he optimum soil moist ure indicator of greenhouse pepper of f ruiting stage.【Met hod】Horns pepper was researched by the four soil moisture level s (field capacity 40 % - 55 %2A1 ,55 % - 70 %2A2 ,70 % - 85 %2A3 ,85 % - 100 %2A4) to measure the change rule of plant growt h ,f ruit quali2ty ,t he accumulation and dist ribution of dry mat ter and water utility efficiency.【Result】The result s indica2ted that t he highest outp ut was 6. 05 kg/ m2and assimilation of dist ribution on t he ground and t he under2ground sections was more reasonable ,in t he field capacity of soil moist ure content 70 % - 85 % conditions.When soil water accounted for 55 % - 70 %of t he field capacity ,quality indicator s reached the maximum :Vc1. 16 mg/ g ,f ree amino acids 363. 6 μg/ g , soluble sugar 19. 4 mg/ g and soluble protein 19. 7 mg/ g respec2tively. And water utility efficiency in t he conditions was al so the largest (28. 66 kg/ m3) , respectively in2creased by 19. 5 % ,30. 3 % and 51. 3 % compared with A1 ,A3 ,A4 .【Conclusion】Taking into considerationof t he effect s of soil moist ure on f ruit quality , t he dist ribution of dry mat ter ,water utility efficiency andf ruit yield ,the field capacity 55 % to 70 % could be used as an ideal soil moist ure indicator of f ruiting stageof greenhouse pepper .

【题目】黄土丘陵沟壑区纸坊沟小流域农业生态安全态势变化的驱动力分析

【中文关键词】土壤; 土壤有机碳; DNDC模型; 碳循环

【英文关键词】s oil ; s oil organic carbon; DNDC model ; carbon cycling

【中文摘要】摘要: 在利用长期定位试验的实测土壤有机碳 (S OC)数据,验证 DNDC (脱氮 -分解作用)模型在黄土丘陵沟壑区应用的可行性基础上,应用 DNDC模型来研究黄土丘陵沟壑区坡耕地农田土壤碳库储量动态变化及碳循环特征。结果表明:施肥可提高作物残体与根系分泌物的外源 C携入量,也能提高土壤异氧呼吸对内源 C的消耗,且施用有机肥后提高效果显著。总体上,单施有机肥、 有机肥配施氮肥均能显著提高 0~30 cm土层 S OC含量, 40年后各处理 S OC分别比初始值提高了90129%、 86146%。不施肥和单施氮肥, S OC含量总体都呈现下降趋势, 40年后各处理 S OC分别比初始值降低了3152%、 0138%。依据 DNDC模型模拟结果,在黄土丘陵沟壑区坡地上,为保持和提高土壤肥力,增加碳库储量,以施用有机肥为主,配合施用一定量的氮肥将是非常有效的措施。

【英文摘要】Abstract: Based on the feasibility of DNDC (denitrificati on 2 decompositi on) model in the hilly2gully areas of the Loess Plateau, which was verified by the 82 year s oil organic carbon (SOC) dataderived from l ong2term experi ment, continuous SOC changes and carbon cycle features on thesl ope land were studied by usingDNDC model . The study not only p r ovides scientific basis for in2creasing the regi on ’ s agricultural s oil fertility and far m p r oducti on, but als o makes a corres pondingcontributi on t o scientific reducing, therefore it is of great p ractical significance . The results, de2rived from the combinati on data of validati on si mulati on and 402 year l ong2term si mulati on, indica2ted that fertilizer app licati on could increase the amount of input exogenous carbon, which wasbr ought int o s oil such as cr op residues and r oot exudates, while fertilizati on could increase consu2ming endogenous carbon by s oil heterotr ophic res p irati on; the effect of the only manure or com2pound manure and chemical fertilizer app licati onswere significant . On the whole, the content ofSOC in the 0 - 30 cm s oil layer of the onlymanure or the compound manure and nitr ogen app lica2ti onswere 90 . 29% or 86 . 46% higher significantly than the starting values 40 years ago, res pec2tively . However, the content of SOC in the contr ol treat ment or in the chemical nitr ogen app lica2ti on treat mentwere 3 . 52% and 0 . 38% l ower than the starting values 40 years ago, res pectively .According t o the si mulating results of DNDC model on the sl ope land in hilly areas of the LoessPlateau, app lyingmanure mainly with a certain amount of nitrogen fertilizer will be an effectivemeasure formaintaining i mp r oved s oil fertility, increasing the amount of st orage of the organic car2bon pools in s oil .

【题目】沙枣(Elaeagnus angustifolia.)和孩儿拳头(Grewia.biloba G.Don var.parviflora)幼苗气体交换特征与保护酶对干旱胁迫的响应
【中文关键词】沙枣;孩儿拳头;气体交换;保护酶;干旱胁迫
【英文关键词】E.angustifolia;G biloba G.Don var.parviflora;gas exchange;protective enzyme;drought stress
【中文摘要】以沙枣和孩儿拳头2年生盆栽苗为材料,采用称重控水的方法设置4个土壤含水量梯度(CK、T1、T2、T3),研究不同干旱胁迫对沙枣和孩儿拳头气体交换特征与保护酶的影响。结果显示:(1)干旱胁迫不仅引起两物种净光合速率、蒸腾速率、气孔导度、胞间CO2浓度的下降,而且使其日变化曲线在一定程度上发生改变;在轻度(T1)和中度胁迫(T2)下,两物种净光合速率下降主要是由气孔因素引起的,重度胁迫(T3)下,净光合速率下降主要是非气孔因素引起的。(2)随着干旱胁迫增加,沙枣瞬时水分利用效率呈现增加一下降语增加趋势,孩儿拳头呈现下降趋势;两物种表观光能利用效率显著下降,重度胁迫下(T3),下降率达50%左右,孩儿拳头表观光能利用效率对干旱胁迫比较敏感;两物种表观CO2利用效率总体呈现下降趋势,沙枣表观CO2利用效率日进程经历了单峰(T1)、双峰(T2)、单峰(T3)的变化,孩儿拳头各处理的表观CO2利用效率日变化均呈现单峰曲线。(3)随着干旱胁迫加剧,两物种叶片的超氧化物歧化酶(SOD)、过氧化物酶(POD)、过氧化氢酶(CAT)活性先升高后降低,土壤含水量高于12.8%时,两物种SOD酶活性均高于CK,随着土壤含水量的降低,SOD酶活性低于CK;重度胁迫下(T3),沙枣POD酶活性虽然有所下降,但仍高于CK,而孩儿拳头则和CK无显著差异;两物种CAT酶活性在重度胁迫下(T3)显著低于CK;随着干旱胁迫程度的增加,两物种叶片中的丙二醛(MDA)含量均呈现升高趋势,孩儿拳头脂质过氧化程度受干旱胁迫的影响较大。

【题目】Identification and functional study of a shrimp Relish homologue
【中文关键词】无
【英文关键词】Relish; Shrimp; Innate immunity; NF-κB; Antibacterial peptide
【中文摘要】无
【英文摘要】Rel/NF-κB transcription factors play central roles in induction and regulation of innate immune responses. Here we describe the identification and functional analysis of a Relish homologue, LvRelish and its shorter isoform sLvRelish, from the Pacific white shrimp, Litopenaeus vannamei. The LvRelish gene has 22 exons in approximately 15 kb genomic sequence. The full-length cDNA of LvRelish is 4071 bp with an open reading frame that encodes 1207 amino acids. LvRelish contains a conserved Rel homology domain (RHD), a nucleus localization signal, an IκB-like domain (six ankyrin repeats), and a death domain, suggesting that it belongs to the class I NF-κB. sLvRelish cDNA is 1051 bp encoding 317 amino acids. It shares the RHD region with LvRelish. RT-PCR analysis showed that LvRelish and sLvRelish mRNAs were expressed at different levels in tissues. Western blot analysis showed that recombinant intact LvRelish could be cleaved into two fragments in S2 cells, and immunofluorescence assay showed that the plasmid-expressed LvRelish protein was seen both in the cytoplasm and the nucleus. Electrophoretic mobility shift assay showed that recombinant RHD of LvRelish in S2 cells bound specifically with Drosophila melanogaster κB motifs in vitro. Both the LvRelish and its RHD domain transactivated the reporter gene controlled by the 5′ flanking region of penaeidin 4, an antibacterial peptide of shrimp, suggesting that LvRelish can regulate the transcription of penaeidin 4 gene. Identification of LvRelish will help us better understand shrimp immunity and may help obtain more effective methods to prevent shrimp diseases.

【题目】纸坊沟流域近25年景观斑块功能类型及动态
【中文关键词】纸坊沟;流域;景观斑块;景观动态;景观指数
【英文关键词】Zhifanggou;valley;landscape patch;landscape dynamic;landscape index
【中文摘要】对黄土高原安塞地区纸坊沟流域过去25a的景观动态进行了调查,结果表明,在不同时期景观呈现一定的差异,但整体结构未出现明显的改变。生态防护性景观,经济生产型景观,生活服务型景观占总体的百分比相对稳定。在2005年,生态防护型景观所占的比例最大,同时经济生产型所占比例最小。每个植被景观的斑块数量较小,但平均面积较大且破碎程度低。植被景观的生物多样性指数和均匀度指数随时间先增加后减少,而优势度指数随时间先减少后增加。2005年的景观结构较为合理,植被得到了一定的恢复,植被生态系统达到了理想的水平,森林,灌木和草地的结构比例合理,地区的生态安全和农业生产得到了加强。因此,这个景观结构可以作为当地的生态重建和植被修复的范例。

【题目】黄土高原蔡家川林场森林质量评价
【中文关键词】森林质量评价;层次分析法;次生林;黄土高原
【英文关键词】forest quality evaluation;analytic hierarchy process;secondary forest;Loess Plateau
【中文摘要】在综合考虑林分结构、群落演替特征和林地生产力水平的基础上,应用层次分析方法,以陕西延安市黄龙山林业局蔡家川林场为例。构建天然次生林森林质量评价模型和指标体系,得到油松林、辽东栎林、白桦林、油松一辽东栎混交林、油松一白桦混交林和辽东栎一白桦混交林的综合质量评分值。结果表明:采用森林结构、演替趋势和林地生产力3大类8个评价指标(郁闭度、物种丰富度、均匀度、枯枝落叶厚度、乔木蓄积量、灌草生物量、幼苗数量及优势种幼树幼苗与乔木数量之比)可以较为全面地反映该地区次生林质量状况,森林结构对森林质量影响较大,群落演替状况次之,林地生产力影响较小,评价指标对森林质量的贡献值由大到小依次为林分郁闭度0.356 2。枯枝落叶厚度0.21l 6,优势种幼树幼苗与乔木数量之比0.130 5,均匀度0.105 8,乔木蓄积量0.082 6,物种丰富度0.064 4,幼苗数量0.037 2,灌草生物量0.Oll 8;天然林保护工

程实施10多年来,蔡家川林场林分综合得分值28.0—92.2,接近一半的森林处于较好水平,质量差和较差的林分极少,油松、辽东栎及油松一辽东栎天然次生林质量相对较好,林分综合得分值65—73,而白桦林、辽东栎一白桦混交林和油松一自桦混交林的林分质量较差,综合评分值均低于60.00;该评价方法操作简单,可以解决森林质量评价中的量化问题,评价模型和指标体系可以在黄土高原其他地区的次生林质量评价中借鉴和应用。

【题目】整地时期对土壤物理性质及苹果幼树生长的影响
【中文关键词】穴状整地时期; 土壤物理性质; 苹果幼树; 成活率
【英文关键词】period of soil preparation by digging hole; soil physical property; young apple tree; livability
【中文摘要】摘 要: 为了提高陕北黄土丘陵沟壑区苹果幼树的栽植成活率和保存率,对 3 个穴状整地时期的土壤物理性状及苹果幼树生长状况进行了监测研究。结果表明,穴状整地后土壤容重降低,土壤总孔隙度和非毛管孔隙度提高。雨季前穴状整地提高了春季和幼树生长前期的土壤水分, 减小了土壤日温差, 提高了苗木成活率, 促进了树体生长。但雨季后和春季穴状整地降低了春季和幼树生长前期的土壤水分, 加大了土壤日温差, 降低了苗木成活率, 削弱了树体生长,并且加深了定植当年的地面塌陷深度,降低了苹果幼树冬春季的枝条含水量,提高了枝条抽条指数, 降低了苗木保存率。陕北丘陵沟壑区栽植苹果时应该在雨季前穴状整地。

【英文摘要】Abstract: In or der to increase the liv ability and survival rate of young apple tr ees in the loess hilly and gullyar eas of No rthern Shaanxi Prov ince, soil physical propert ies and y oung apple t ree g row th w ere monito red bythe three tr eatment s of soil preparat ion by dig ging hole before rainy season, after rainy seaso n, and inspring . Results show ed that so i l bulk densi ty w as decreased and soil total porosity and soil non -capillary po -r osity w ere increased af ter soil prepar at ion by digg ing hole. For the t reatment of soil preparat io n by dig gingho le before rainy season, soil mo istur e w as incr eased in spring and t ree grow th pr ophase perio d; soil temper -ature dif ference betw een daily max -temper ature and daily min -temper ature w as decreased; tr ee liv ability w asincreased; and t ree g row th w as promoted. How ev er, for the t reatment s of soil preparat io n by digg ing ho leaf ter rainy seaso n and in spring, soil moisture w as decreased; soil temperature differ ence w as incr eased; t reelivability w as reduced; t ree g row th w as w eakened; gr ound subsidence depth w as deepened in plant year;branch w ater content w as r educed in the w inter and spring ; branch shrivel ing index w as incr eased; and t reesurvival r ate w as decreased. Soil preparat io n by dig ging hole befo re rainy season is sug gested w hen appletr ees w er e planted in the loess hilly and gully area of No rthern Shaanx i Pro vince.

【题目】定植穴对局部土壤物理性质及苹果生长的影响
【中文关键词】定值穴,土壤物理性质,苹果树,黄土丘陵沟壑区
【英文关键词】planting hole, soil physics character, apple tree, loess hilly and gully region
【中文摘要】摘 要:为了探索陕北黄土丘陵沟壑区苹果栽植成活率低、树体生长状况差的原因,对 3 种定植穴土壤物理性状及苹果生长状况进行了监测研究。结果表明定植沟、大定植穴降低了 0~100 cm土层土壤容重和开挖到雨季的土壤水分,其中开挖到定植是土壤水分散失的主要阶段。定植沟、大定植穴提高了 0~100 cm土层土壤总孔隙度、非毛管孔隙度和地面塌陷深度,相对提高了雨季期间的土壤水分,提高了枝条失水量和抽条指数,造成苗木成活率降低,树体生长量和产量降低。陕北丘陵沟壑区栽植苹果不宜采用雨季后开挖定植沟、大定植穴,翌年春季定植;春季定植时应以普通定植穴为主,并边挖边栽。

【题目】Molecular cloning, characterization, expression and antibacterial analysis of a lysozyme homologue from Fenneropenaeus merguiensis
【中文关键词】溶菌酶-C;墨吉对虾;PCR-克隆;表达;抗菌活性
【英文关键词】Lysozyme C; Fenneropenaeus merguiensis; PCR-cloning; Expression; Antibacterial activity
【中文摘要】The gene coding for lysozyme in banana prawn (Fenneropenaeus merguiensis) was cloned, sequenced and expressed in pET-32a vector. The deduced amino acid sequence of F. merguiensis lysozyme showed 37-93% similarity with the mouse, human, chicken, and tiger prawn counterparts. The lysozyme was purified to homogeneity and observed as a band of approximately 15 kDa in 12% SDS-PAGE. Semiquantitative RT-PCR analysis demon-strated that mRNA transcripts of lysozyme could be mainly detected in the tissues of hemocytes, gill, gonad and lym-phoid organ of unchallenged shrimps, whereas the expression of lysozyme transcripts was increased in all the tested tissues after heat-killed Vibrio alginolyticus chal-lenge. The temporal expression of lysozyme mRNA in hemolymph challenged by Micrococcus luteus and V. alg-inolyticus was both up-regulated and reached the maximum level at 8 and 16 h post stimulation, respectively, and then dropped back to the original level. Bacteriolytic activity of lysozyme against different bacterial cultures was deter-mined by solid phase as well as turbidimetric assay. Lysis was obtained against Gram positive and Gram negativebacteria with strong inhibition against shrimp pathogens V. alginolyticus and V. parahemolyticus . In addition, the study of inhibition mechanism revealed that the antibacte-rial activity of lysozyme was a result of bactericidal effect.
【英文摘要】The gene coding for lysozyme in banana prawn (Fenneropenaeus merguiensis) was cloned, sequenced and expressed in pET-32a vector. 【题目】黄土丘陵区土壤水分垂直分布规律研究
【中文关键词】黄土丘陵沟壑区; 土壤水分; 垂直分布
【英文关键词】loess hilly and gully area; soil moisture content; vertical distribution
【中文摘要】摘 要: 以黄土丘陵沟壑区燕沟流域为研究对象, 对流域内 2006 年不同类型土壤水分垂直变化进行了分析。结果表明,在实验设计条件下, 不同层次的土壤水分变幅较大,坝地、 梯田和坡地各层土壤含水量变化与降雨量的季节性变化呈现出较一致的趋势, 而苹果地除 0) 100 cm 外, 100) 200 cm 随着降雨量的季节性变化出现较大波动;不同类型土地的土壤含水量变化程度不同,同一类型土地的土壤含水量变化幅度也有差异, 10 cm 处土壤含水量变异系数最大, 随着土层深度

的增加变异系数逐渐递减。根据土壤含水量变异系数分析,将不同类型土壤含水量垂直变化划分为速变层、 活跃层、 次活跃层和相对稳定层 4 个层次;并建立了不同类型土地各层土壤含水量变异系数回归方程。

【英文摘要】Abstract: The vert ical variations of different types of soil moisture in Yan. gou w atershed in the hi lly and gul ly areaof the Loess Plateau are analyzed. Resul t s show that the variat ion of soil moisture content in di fferent layers is greatunder the condi t ion of designed experiment . Soil moisture content s on dam, terrace, and slope are consistent wi th theseasonal change of rainfall. Soil moisture content of 100) 200 cm layer in orchard fluctuates significant ly w i th theseasonal change of rainfall. The variat ion of soil moisture content is different in extent not only under the differentland types, but also under the same land type. The variation coef ficient of soi l moisture content is the biggest at 10cm depth and is gradually reduced with increased soil depth. According to the analysis of the variation coefficient, thevertical distribution of soil moisture content under di f ferent land types may be divided into vertiginous layer, act ivelayer, subact ive layer, and relatively stable layer. Regression equations of the variat ion coefficient are also found forthe soil layers of different land types.

【题目】设施条件下氮肥对大青菜硝酸盐及土壤矿质氮累积的影响

【中文关键词】硝酸盐;大青菜; 氮肥;设施农业

【英文关键词】N i trate ; Garden sass ; N i trogen fertilizer ; Facili ties cond i t i on

【中文摘要】摘　要: 采用田间实验研究了施用氮肥对设施条件下大青菜生长发育和产量,以及对土壤硝酸盐含量累积分布的影响。结果表明,在施氮肥 0~ 500 kg hm- 2范围内, 氮肥施用量越大, 产量越高,但到达一定量时, 便不能再促进产量的提高,反而会引起减产。土壤铵态氮含量随着土壤剖面向下不断下降,表层的铵态氮含量较高, 土壤硝态氮含量在整个土壤剖面的分布变化较小, 但也是从表层向下处于一种缓慢减少的趋势, 铵态氮的累积主要集中在上部土壤剖面, 硝态氮的累积分布在整个土壤剖面, 土壤硝态氮含量随施肥量增加而增加; 氮肥施用量对硝酸盐含量有很大影响。在施氮肥 0 ~ 700kg hm- 2范围内, 氮肥施用量越多,大青菜硝酸盐含量越高。

【题目】黄土丘陵区沙棘人工林发育过程中物种多样性及种间关联变化

【中文关键词】物种重要值;相似性系数; α -多样性; 种间联结性;人工林

【英文关键词】species importance value; simialarity index; α -diversity;interspecific association; plan-tation

【中文摘要】根据野外调查资料,分析了不同发育阶段沙棘人工群落物种多样性及种间关联的变化特征。结果表明,群落各层及总体物种多样性基本呈“S”形波动变化。在不同发育阶段的沙棘群落中,物种丰富度和多样性指数均呈现草本层>灌木层的趋势。灌木层物种多样性指数在撂荒地中较低,随群落发育逐渐增加,灌木层物种均匀度指数在13年生的沙棘林中较高;草本层多样性指数在3年生的人工林中较高,在8年生的人工林中较低,在25年生的人工林中较高。人工沙棘林中种间关联正负绝对值基本呈抛物线形变化,13年生左右显著程度和联结强度较弱,群落内物种间物种替代速度缓慢,竞争较少,群落组成和结构相对稳定。在沙棘人工林的经营和管理上,应是13年生以前以保护为主,到25年生时进行适度择伐,抚育萌生幼苗,促进种群更新发育。

【题目】黄土丘陵沟壑区坡地土壤有机碳变化及碳循环初步研究
【中文关键词】土壤; 土壤有机碳; DNDC模型; 碳循环
【英文关键词】soi; l so i l organic car bon ; DNDC mode; l carbon cycling
【中文摘要】摘要: 在利用长期定位试验的实测土壤有机碳 (SOC)数据,验证 DNDC(脱氮 - 分解作用)模型在黄土丘陵沟壑区应用的可行性基础上,应用 DNDC模型来研究黄土丘陵沟壑区坡耕地农田土壤碳库储量动态变化及碳循环特征。结果表明:施肥可提高作物残体与根系分泌物的外源 C携入量,也能提高土壤异氧呼吸对内源 C的消耗, 且施用有机肥后提高效果显著。总体上,单施有机肥、 有机肥配施氮肥均能显著提高 0~ 30 c m土层 SOC含量, 40年后各处理 SOC分别比初始值提高了90 29 %、 86 46 %。不施肥和单施氮肥, SOC含量总体都呈现下降趋势, 40年后各处理 SOC分别比初始值降低了3 52%、 0 38%。依据 DNDC模型模拟结果,在黄土丘陵沟壑区坡地上, 为保持和提高土壤肥力,增加碳库储量, 以施用有机肥为主, 配合施用一定量的氮肥将是非常有效的措施。

【题目】黄土丘陵区延河流域潜在植被分布预测与制图
【中文关键词】潜在植被;植被-环境;广义相加模型;分布预测
【英文关键词】potential vegetation;vegetation—environment;generalized additive model;distribution prediction.
【中文摘要】在植被的分布预测与制图对植被恢复规划具有重要的指导价值.利用广义相加模型(generalized additive model,GAM),结合GIS空间分析技术和环境梯度分层采样技术,为延河流域24个地带性物种建立了分布模型,并在考虑群落内部物种种间关系及其分布概率的基础上,对物种分布进行运算,模拟预测了延河流域37种植物群落的分布状况和延河流域的潜在植被分布.结果表明:研究区植被分布预测值与实际调查值间的差异不显著,预测的植被空间分布较好地反映了延河流域潜在的植被分布状况,表明该模型具有较好的预测能力,对于区域植被恢复的目标设定和恢复规划具有重要意义.

【题目】不同密度油松人工林生长更新状况及群落结构
【中文关键词】造林密度;生长状况;更新;物种多样性;油松人工林
【英文关键词】density ;growt h ;regeneration ; species diver sity ; Pi nus t abul aef ormis artificial forest
【中文摘要】【目的】阐明黄土高原森林区油松人工林初植密度对群落更新和持续发育的影响,为当地油松人工林经营管理提供参考。【方法】通过野外调查和室内分析相结合的方法,研究了陕西宜川地区不同初植密度1 m ×1 m(密度Ⅰ) ,1 m ×2 m(密度Ⅱ) ,2 m ×2. 5 m(密度Ⅲ)) 35 年生油松人工林的林木个体生长、林地更新、群落物种多样性及土壤养分特征。【结果】油松人工林的死亡率随初植密度的增大呈增加趋势,油松死亡年龄、胸径、树高、冠高和冠幅随初植密度的增加而减小;油松死亡率、胸径、冠高和冠幅与初植密度之间有显著的相关关系,但油松树高与初植密度之间的相关性不显著。油松人工林林下幼苗(树) 的更新状况在低密度林地内最好。在各初植密度油松人工林中,各层物种丰富度指数、均匀度指数和多样性指数均表现为灌木层> 草本层。群落总体多样性表现为丰富度指数和多样性指数在3 种初植密度间的变化趋势一致,均为Ⅲ> Ⅱ> Ⅰ;均匀度指数J sw 和Ea 则表现为Ⅰ> Ⅲ> Ⅱ,而J si表现为Ⅲ> Ⅰ> Ⅱ。不同初植密度林地间土壤养分和水分存在显著差异。【结论】根据样地数据和野外实地观察结果认为,宜川地区油松初始造林密度应在2 800~3 000 株/ hm2 ,在进入生长高峰期后,适时间伐至1 200~1 500株/ hm2比较合适。

【题目】延安公路山辽东栎林优势植物光合适应性分析
【中文关键词】辽东栎林;光合参数;耐荫性;光合适应类群

【英文关键词】Quercus Liaotungensis forest; photosynthetic parameter; shade tolerance; photosynthetic adaptation pattern
【中文摘要】【目的】研究辽东栎群落中优势植物林内外光合参数的变化特点,以阐明植物的光能利用多样性在群落持续发育中的作用。【方法】在8月份生长旺盛期,采用LI-6400光合仪对延安公路山辽东栎林内16种成年优势植物进行光响应曲线测定,通过非线性拟合得到最大净光合速率(Pmax)、光饱和点(LSP)、光补偿点(LCP)和表观量效率(AQY)4个参数。对比分析16种植物在林内和林外孤立木状态不同光环境下的适应特征及平衡策略,对林内外16种植物的Pmax、AQY 与植物耐荫性的相关关系进行多元回归分析,并采用聚类分析的方法,对林内16种优势植物进行光合适应类群划分。【结果】(1)不论在林内还是林外,16种植物的光能利用特性不同。同一种植物的上述4个参数值在林内外有不同程度的升高或降低,同一类群的不同植物在林内外的光能利用调节模式具有趋同性,有15种植物林外的4个参数较林内差异显著或极显著(P<0.05)。(2)在林内,16种优势植物的LCP 与Pmax呈正相关,与AQY 呈负相关;在林外,16种优势植物的LCP 与Pmax、AQY 均呈微弱的负相关。(3)根据不同植物4个光合参数在林内外生境条件下的适应模式,对林内16种植物进行聚类分析,得到3个光合适应类群,每一类群均有其特殊的光合参数调节模式。【结论】辽东栎群落各优势植物的光合参数随生境的变化而变化,乔灌草植物变化差异不同,这是维持群落稳定的基础。

【题目】4种柳树苗木叶的PV水分参数对水分胁迫的响应
【中文关键词】柳树苗木;叶PV水分参数;水分胁迫
【英文关键词】Salix seedings; PV parameter; water stress
【中文摘要】在温室内研究了瑞典能源柳C号、2号柳、4号柳和陕北红皮柳苗木的抗旱能力。对其盆栽苗木施行水分轻度胁迫、中度胁迫、重度胁迫及正常(供水)生长4种处理,应用压力室和PV技术测定4种柳树苗木在不同处理状态下的叶组织多项水分参数,以此对其苗木的耐旱能力作综合评定。结果表明,在水分胁迫条件下,2号柳苗木叶吸收水分的能力最强;4种柳树的苗木均有一定的渗透调节和保持膨压能力,4号柳、2号柳、红柳的苗木能通过增加叶束缚水的含量来实现渗透调节,但其依靠改变苗木叶束缚水的含量来实现渗透调节的作用有限,红柳、4号柳苗木在土壤相对含水量降至61%时,2号柳苗木在土壤相对含水量降至46%时,其叶由束缚水含量所引起的渗透调节作用消失;在水分胁迫条件下,红柳、4号柳苗木通过改变叶组织细胞壁的弹性来保持其的膨压,2号柳、能源柳C号的苗木主要靠叶渗透调节来维持其的膨压。水分胁迫能增强红柳、能源柳C号、4号柳苗木保持最大膨压的能力,而降低% 号柳苗木维持最大膨压的能力;4 号柳能通过提高苗木叶细胞原生质忍耐脱水的能力来适应干旱,能源柳, 号、红柳苗木叶细胞原生质耐脱水能力对水分胁迫的适应性差,在水分胁迫条件下其耐脱水能力减弱。通过对4种柳树苗木叶组织渗透调节和维持膨压能力的综合比较,其抗旱能力由强至弱依次为能源柳C号、2号柳、红柳和4号柳。

【题目】不同能源柳无性系对NaCl胁迫的生理响应
【中文关键词】能源柳;土壤盐浓度;气体交换参数;保护酶;有机渗透调节物质
【英文关键词】energy willow; soil NaCl concentration; gas exchange parameters; p rotective enzymes; organic osmotic substance
【中文摘要】为了探索不同能源柳无性系的耐盐潜力,在盆栽条件下,对1年生能源柳无性系2、4、C、E扦插苗设置NaCl盐分梯度,使其土壤含盐量保持在0、0. 2%、0. 4%、0. 6%、0. 8% ,并以乡土旱柳为对照,胁迫45d后,对5个无性系的气体交换参数、保护酶活性和有机渗透调节物质进行测定。研究发现: (1)在低浓度盐胁迫下(土壤含盐量0 0. 4%) ,导致各能源柳光合速率降低的是气孔因素;在高浓度盐胁迫下(土壤含盐量大于0. 4%) ,导致各能源柳无性系光合速率下降的主要是非气孔因素。(2)随着土壤盐浓度的增加,各能源柳无性系的过氧化氢酶(CAT)活性逐渐减小,过氧化物酶(POD)活性先增加后减小,而超氧化物歧化酶(SOD)活性呈现增加的趋势,并且4个能源柳无性系在盐胁迫条件下保护酶活性强于旱柳。(3)在土壤含盐量小于0.16%时, 4个能源柳无性系的可溶性蛋白含量始终大于旱柳;在整个胁迫过程中,能源柳C的脯氨酸含量始终大于旱柳。(4)与旱柳相比, 4个能源柳无性系在土壤含盐量0 0. 4%的土壤中都能良好生长,其中能源柳C的耐盐潜力更大,可在土壤含盐量为0. 6%的土壤中正常生长。这说明, 4个能源柳无性系均可在天津轻、中度盐渍化地区栽培。

【题目】黄土高原子午岭柴松种群生殖特性研究
【中文关键词】柴松种群; 生殖特性; 生殖年龄; 种子与球果; 生殖力表
【英文关键词】Pinus tabulaef ormis f. shek annesi s populat ion; repro duct ive characteristic; repro duct ive age; cone sand seed; fecundity table
【中文摘要】目的:探索柴松(Pinus tabulaef ormis f. shek annesis) 种群的基本生殖特性, 为柴松种群的持续发展和合理经营管理提供依据。　　方法 在对黄土高原子午岭地区柴松分布范围进行全面踏查的基础上, 选择不同生境(阴坡、半阴坡和半阳坡) 柴松生长发育较好的地段设置12 块样地, 分析不同生境下柴松种群的生殖年龄(Ar) 、球果在树冠上的分布格局、结实和产种数量、生殖力表以及环境因子。　　结果 (1) 柴松种群的最小生殖年龄(Ar min) 、最大生殖年龄(A rma

x) 、平均生殖年龄(A r) 和周限生殖年龄(Ap c) 值分别为18, 130, 48 和112 年, 不同生境条件下柴松种群的生殖年龄差异较大,其中A r min和A r 值为阴坡> 半阴坡> 半阳坡, A rma x和A p c 值为半阳坡> 半阴坡> 阴坡。(2)不同生境中的柴松种群均具有结实能力, 阴坡种群的单株球果数和种子数均较高, 各种群球果主要分布在树冠上部及东、北方向。(3) 生殖力表显示, 随着年龄的变化, 生殖力存在低! 高! 低的趋势, 阴坡和半阴坡柴松种群的生殖旺盛期为50~ 90 年, 半阳坡为30~ 50 年; 并且阴坡柴松种群具有较强的生殖能力, 是柴松种群的最适生存环境。(4) 主成分分析表明, 人为干扰(0. 984) 和土壤水分含量(- 0. 974) 是影响柴松种群生殖的最主要因子。 结论 柴松林经营管理要以就地保护为主, 并应根据种群所在区域的生境条件进行分类管理。

【题目】黄土丘陵区不同植被恢复模式对土壤酶活性的影响

【中文关键词】黄土丘陵区; 植被恢复; 土壤酶活性

【英文关键词】eroded Hilly Loess Plateau, vegetations recovery, soil enzyme activities

【中文摘要】为了解侵蚀环境下植被恢复对土壤酶活性的影响, 以典型侵蚀环境黄土丘陵区纸坊沟流域生态恢复30a 植被长期定位试验点为研究对象, 选取坡耕地为参照, 分析了植被恢复过程中土壤脲酶、磷酸酶、蔗糖酶、淀粉酶、纤维素酶、过氧化氢酶、多酚氧化酶及理化性质的演变特征。结果表明, 黄土丘陵区的坡耕地由于不合理的人为干扰, 土壤理化性质和酶活性较弱, 通过植被恢复可以有效的改善土壤肥力, 不同恢复模式对土壤酶活性和肥力的改善作用不同, 恢复30a, 脲酶活性增加33%~213%, 磷酸酶活性增加275%~394%, 蔗糖酶活性增加70%~210%, 纤维素酶活性增加24%~48%, 过氧化氢酶增加32%~96%, 多酚氧化酶降低23%~29%, 淀粉酶变化规律不同。不同植被恢复模式其生物特性不同, 对土壤酶活性影响也不同。相关性分析说明磷酸酶、蔗糖酶、纤维素酶和多酚氧化酶与其它因子相关性相对较强,可以作为评价土壤质量的生物学指标。

【题目】黄土丘陵区两种典型灌木群落坡面侵蚀泥沙颗粒组成及养分流失的比较
【中文关键词】灌木群落; 颗粒组成; 比表面积; 养分流失
【英文关键词】shrub land; particle composition ; specif ic surface area ; nutrient loss
【中文摘要】在野外模拟降雨条件下,比较研究了黄土丘陵区柠条(Caragana korshinki i) 和狼牙刺(S ophora vici i f ol ia) 径流小区产流产沙、侵蚀泥沙颗粒组成、比表面积(SSA) 及养分流失特征。结果表明,两种灌木群落均能显著减小坡面径流泥沙的流失。产流后流失泥沙黏粒、SSA 与养分含量随降雨时间总体呈现降低趋势,其中有机质变化显著,全磷变化不显著。受植被盖度影响,泥沙中黏粒与养分含量均表现为柠条群落> 狼牙刺群落> 对照裸地。侵蚀泥沙具有富集黏粒和富集养分的特征,富集率随群落盖度增大而增大(柠条> 狼牙刺> 裸地) 。不同形态养分富集率不同,其中有机质均在2. 5 以上,全氮平均富集率为2. 13 ,全磷为1. 23 。富集率随产流时间呈线性递减。流失泥沙养分含量与黏粒(粒径< 0. 002 mm) 含量及SSA 达到极显著的正相关。坡面土壤养分主要以黏粒为载体流失。SSA 的变化不仅能体现土壤颗粒组成的变化,而且能够反映土壤养分的变化。

【题目】延河流域典型物种分布预测模型比较研究
【中文关键词】物种分布预测; R--BIOMOD; 最优模型
【英文关键词】predictive distribution of species; R--BIOMOD; best model
【中文摘要】物种分布预测一直以来都是生态学研究的重要内容之一。应用生态学的发展为物种分布预测提供了众多强有力的模型, 在推进物种分布预测进展的同时, 也增加了合适模型选择的难度。评价和比较不同模型的预测效果, 对于模型的选择和应用具有非常重要的意义。以黄土丘陵区延河流域为研究区, 采用R 语言和BIOMOD 程序包为平台, 选择人工神经网络(artif icial neural netw or ks, ANN) 等9 个较常用的物种分布模型, 比较它们在物种分布预测精度上的差异, 为物种分布预测模型的选择提供依据, 也为进一步预测未来气候变化情景下物种空间分布的变化奠定基础。研究结果表明, 不同模型对不同物种的模拟精度差异明显。根据Kappa, T SS 和Roc 评价方法, 9 个模型对百里香(T hymus mongolicus) 分布的预测精度最高; 对铁杆蒿(A r temisia g melinii) 分布的模拟精度最差; 而对其余物种分布的模拟精度均比较理想, 其中以随机树RF 模型最好。

【中文关键词】天山云杉;种群数量;结构动态

【英文关键词】Picea schrenkiana;population quantity;structure dynamics
【中文摘要】选择了15个设在天山地区25 m×25 m的样地,通过样地调查和数据统计,研究了天山云杉(Piceachrenkiana)种群的年龄结构、静态生命表,运用时间序列预测模型分析了种群数量动态。种群年龄结构分析表明,种群的年龄结构呈倒J型分布,个体数量主要集中在Ⅰ、Ⅱ龄级(个体数量比例占82.70%),幼龄个体数量较多,中、老龄个体数量较少。种群生命表、亏损率曲线、存活曲线、死亡率曲线、生存函数曲线的分析表明:天山云杉有1个死亡高峰,出现在Ⅱ龄级的年龄阶段;存活曲线基本介于DeeveyⅡ和DeeveyⅢ型之间;引入生命表的几个函数能较好地说明种群的动态和结构变化。时间序列分析表明:在未来20、40、60、80、100、120和140年中。天山云杉种群幼龄级个体数量相对丰富,种群稳定。

【题目】基于自然植被的延河流域生物量空间分布格局评估
【中文关键词】生物量; 广义相加模型; 植被指数; 分布预测
【英文关键词】biomass; gener alized additive model; vegetation index ; distribut ion prediction
【中文摘要】研究植被的生物量分布及环境对生物量的承载状况, 对于区域植被恢复规划、布局等具有重要意义。以黄土丘陵区延河流域为研究区, 以自然植被为参照, 利用广义相加模型(GAM, g eneralized additiv e mo del) 及GI S 空间分析技术预测了流域潜在生物量的分布格局; 同时, 利用遥感资料, 预测出流域现有的植被生物量及其空间格局。以潜在生物量为参照, 现实生物量为基础, 通过空间分析, 对流域环境的生物量承载状况进行评估。结果表明: 在流域东南部地区, 潜在生物量高于现实生物量; 而在中北部, 有较多的立地环境的现实生物量大于潜在生物量, 超过了环境生物量的最大现实承载能力, 导致人工植被在这些立地环境条件下的退化。识别这些植被, 对于流域植被的改造和利用、流域植被恢复规划与布局等具有重要的应用价值。

【题目】瑞典能源柳不同无性系扦插苗年生长规律研究
【中文关键词】瑞典能源柳;年生长过程;Logistic方程;灰色关联度
【英文关键词】Sweden energy willow;Annual growth;Logistic equation;Grey correlation analysis
【中文摘要】对8个瑞典能源柳(简称瑞能)不同无性系1年生扦插苗生长动态、苗木生长与气象因子的灰色关联度的研究结果表明,瑞能扦插苗的年生长规律符合Logistic曲线特征,据此方程可以建立苗高、地径与生长的拟合模型。可将苗木生长划分为3个阶段:生长初期、速生期和生长后期,其中处于速生期苗木的高和地径生长量均超过全年总量的55.2%,地径处于速生期阶段长于苗高,但两者生长量占全年总量之比较为接近,分别是56.7%和s7.4%;在制约苗木生长的气象因子中,温度是苗木生长的主导因子。

【题目】黄土高原植被恢复与建设策略
【中文关键词】植被恢复;策略;人工林草群落;天然化培育;黄土高原
【英文关键词】vegetation recovery;policy;artificial grass;loess plateau
【中文摘要】中国水土流失与生态安全综合科学考察——西北黄土区考察组获得的资料为依据,对黄土高原地区植被恢复的基础和潜力进行了系统分析,提出了植被恢复的目标和策略。黄土高原天然群落恢复的基本措施是封育,有条件的区域应实施人工促进,使植被自然恢复力与人为促进力相结合;人工植被建设应充分利用乡土树草种,合理利用外来种,采用防护性整地和管理措施,造林种草后引导乡土物种进入群落,进行天然化培育;以流域为治理单元,优化景观斑块空间布局和面积构成,逐步改造具有退化特征的人工群落,使建群种能够自我更新,群落可永续利用;政府部门在政策上要保护现有成果,扩大自然修复比例;保护大户承包治理的积极性,鼓励多元化投资,进行植被建设;扩大黄土区植被建设和科研投资力度,培育黄土区植被恢复方面的科技创新能力。

【题目】陕北黄土高原油松人工种群结实与更新
【中文关键词】油松;人工林;球果;种子;更新
【英文关键词】Pinus tabulaeformis Carr.;artificial forest;cone;seed;regeneration
【中文摘要】过野外调查和室内试验,调查了陕北黄土高原半干旱、半湿润地区油松人工种群的结实特性、种子生活力、幼苗更新和生长状况等基本特征,分析影响油松人工种群生殖及更新的因素,确定了油松人工种群的天然更新边界.结果表明八个地区的油松都具有结实能力.对不同地区种子生活力和发芽率测定表明地区间差异不显著.由北向南,随年降水量的增加,油松球果长、宽、单果种子数、种子长、宽、千粒重逐渐增加.有活力种子的数量可以满足天然更新的需要.北部地区,种子落地后不能萌芽成苗,中南部地区种子落地后能萌芽成苗,但只有南部地区幼苗幼树生长良好,林下更新有效.影响油松人工种群更新的环境闪素分析表明降水最是最主要限制岗素.油松人T种群天然更新分界线应该在年降水量550 mm的等降水线左右.未来油松人工林培育应立足于降雨量大于550 mm的南部湿润半湿润地区,半干旱地区不宜再扩大油松人工林面积.

【题目】黄土高原丘陵沟壑区不同生境条件下柠条人工种群无性繁殖与更新研究
【中文关键词】黄土高原;不同生境;柠条人工种群;无性繁殖
【英文关键词】Loess Plateau;different habitats;artificial Caragana korshinskill population;asexual propagation
【中文摘要】通过对黄土高原丘陵沟壑区纸坊沟流域12个阳坡和阴坡柠条人工种群样地群落特征和无性繁殖特征进行调查,系统地研究了柠条人工种群在黄土高原丘陵沟壑区不同生境条件下无性繁殖与更新状况,为该地区柠条人工种群的经营管理提供依据。主要结论是:生长在阳坡的柠条无性繁殖较阴坡旺盛,无性系母株通过萌生苗和根蘖苗产生的分株数量

和扩展范围均优于阴坡,山坡上部优于山坡下部,但从分株生长情况来看,阳坡无性分株的个体生长不如阴坡,山坡下部的柠条长势弱于山坡上部;不同生境柠条人工种群均存在分株枯死现象,坡上部的分株枯死量较坡下部大,最大枯死率出现在阳坡上部(25.9%);不同龄级比较,1~2 a生幼苗枯死率最高;对土壤中柠条根系萌芽点的空间分布范围分析表明,山坡上部柠条根系在6~30 cm土层最为密集,山坡下部以6~20 cm土层最为密集,山坡上部柠条根系水平扩展距离比山坡下部大;无性分株萌芽点空间分布格局受坡位影响大,而与坡向关系不密切。柠条种群适应力、繁殖力强,在丘陵沟壑区能够自我更新,是严酷条件下植被恢复的优良树种。

【题目】黄龙山林区不同培育措施对油松种群数量动态及物种多样性的影响
【中文关键词】年龄结构;生命表;存活曲线;时间序列;物种多样性
【英文关键词】age structure;life table;survival curve;time series;species diversity
【中文摘要】根据对黄龙山林区经过抚育、渐伐和封育措施的3类油松林种群开展样地调查,研究了3种培育措施对油松林种群的年龄结构、静态生命表、存活曲线和物种多样性的影响,并运用时间序列模型对不同培育措施的油松林种群数量动态进行了预测。结果表明:3种油松林种群结构特征基本一致,其幼、老龄级个体数较少,中龄级个体数量较大,总体判断黄龙山油松林种群属于稳定状态。在经历3种不同培育措施的油松林群落中,抚育和渐伐措施物种丰富度指数最大;封育措施物种多样性和均匀度指数最大。经过抚育和渐伐措施的油松种群属进展型,而经过封育措施的油松种群属稳定型。说明在黄龙山林区,油松林种群未来应该以封育为主,适当的抚育和渐伐措施为辅,以促进群落持续发育。

【中文关键词】秦岭冷杉;巴山冷杉;年龄结构;生命表;存活曲线;时间序列
【英文关键词】Abies chensiensis:Age fargesii:Age structure:Life table;Survival curves;Time series
【中文摘要】在秦岭林区对不同生境条件下濒危种秦岭冷杉(Abies chensiensis)和广布种巴山冷衫(Abiesfargesii)种群的年龄结构、生命表、存活曲线以及时间序列预测进行了比较分析。结果表明:秦岭冷杉在各个坡向上幼龄林林木株数均明显小于巴山冷杉。在各个坡向上,秦岭冷杉均呈衰退型,而巴山冷杉均呈稳定型。坡向对秦岭冷杉种群存活曲线的影响比巴山冷杉的影响大。在未来的20,40及60 a,秦岭冷杉种群Ⅱ、Ⅲ龄级的种群表现为先增后减的不稳定趋势,而Ⅳ龄级以后的种群表现为小幅度的增加趋势。巴山冷杉种群各龄级株数在未来的20、40及60 a均呈明显的增加态势。最后,给出了对不同生境的秦岭冷杉应采取的具体管理措施。

【题目】黄龙山不同白桦林群落结构特征研究
【中文关键词】白桦林群落;林分状况;物种组成;物种多样性;生物量
【英文关键词】Betula platyphylla community;stand;species composition;species diversity;biomass
【中文摘要】在黄龙山林区以4种不同白桦林群落类型为研究对象,共设置20 mx 20 m的样地15块,从林分特征、物种组成、物种多样性、灌木和草本生物量及乔木蓄积量等方面,对不同白桦林群落类型结构特征进行调查分析。结果显示:(1)群落B林(自桦+茶条械混交)中自桦林分状况为最好,其次为群落A(油松+白桦混交林),群落D(自桦纯林)最差;(2)不同群落中植物种类分别为群落A(51种)>群落B(49种)>群落D(48种)>群落c(38种);(3)物种多样性指数为群落A>群落B>群落C>群落D;(4)不同群落内草本和灌木总生物量排序为群落D(73.19t · hm_2)>群落B(65.07 t · hml)>群落C(59.93 t · hml)>群落A(44.82 t · hm_2),乔木蓄积量为群落A(123.50 m3 · hrnl)>群落D(69.50 m3 · hml)>群落B(53.25 m3 · hml)>群落C(50.25 rn3 · hml)。研究结果表明,黄龙山不同白桦林群落中混交林在生长状况、物种组成、物种多样性和生物量方面均优于纯白桦林。表明白桦混交林对保持黄龙山森林群落稳定性,提高林分质量,实现白桦林向松栎林的逐渐过渡有重要意义。

【题目】黄土高原丘陵区不同生境小叶杨人工林物种多样性及其群落稳定性分析
【中文关键词】小叶杨;不同生境;物种多样性;群落结构动态;土壤水分养分效应

【英文关键词】Populus simonii;different habitat;species diversity;community structure-dynamics;soil—water and-n11trient effects
【中文摘要】通过样地调查,对黄土高原丘陵沟壑区处于阴坡、半阴坡、半阳坡、阳坡4种生境条件下,经过30年发育的小叶杨人工林物种多样性,群落结构动态和土壤水分养分效应进行了系统研究,结果表明:(1)不同生境小叶杨人工林总体上物种丰富度、多样性指数和均匀度指数均呈现出阴坡>半阴坡>半阳坡>阳坡的趋势,且林内物种多样性指数表现为:草本层>灌木层;(2)不同生境条件下的小叶杨人工林年龄结构分析表明,尽管阴坡小叶杨长势相对较好,但更新幼苗数量相当有限,很难实现种群的自我更新,不适合作为人工林培育;(3)土壤含水量和养分因坡向不同而呈现出明显的差异,尽管阴坡和半阴坡的水分、养分条件相对较好,但也出现了枯梢、病虫害等衰老特征,因此阴坡、半阴坡的生境对小叶杨来说也不合适。未来应该对现有林地在保护的前提下,间伐衰老个体,补植和引入乡土物种,进行天然化培育。

【题目】NaCl胁迫对3种不同处理四翅滨藜种子萌发的影响
【中文关键词】四翅滨藜;冷藏;自然存放;盐胁迫;种子萌发相关指标
【英文关键词】Refrigerate;Natural store;Salt stress;Seed germination parameters
【中文摘要】为了探讨储藏条件和盐胁迫对四翅滨藜种子萌芽力的影响,以冷藏10个月(冷藏种子)、自然存放10个月(新种子)、自然存放22个月(旧种子)的四翅滨藜种子为材料,在不同NaCl浓度的溶液中培养,测定3种不同处理的四翅滨藜种子在盐胁迫下发芽率、发芽指数、活力指数、胚根和胚轴的生长指标的变化。结果表明:①新种子的最高萌发浓度为o.2 mol/L,旧种子和冷藏种子最高萌发浓度为o.25 moI/L。②与对照相比,旧种子和冷藏种子的各指标均小于新种子,且旧种子最低。长时间自然存放和冷藏均会推迟四翅滨藜种子胚根和胚轴的延伸日期,且长时间自然存放推迟的更晚。得出长时间自然存放使种子的活力降低最快。③尽管低浓度的Nacl(o.05 m01/L)处理下冷藏种子发芽率、发芽指数和活力指数均高于对照,但盐胁迫会抑制四翅滨藜种子的发芽。而对3种处理种子的胚根、胚轴的长度和生长速率的影响均表现为低浓度促进高浓度抑制。相同浓度盐胁迫对新种子和旧种子的抑制作用大于冷藏种子。说明冷藏提高了四翅滨藜种子的耐盐潜力。

【题目】黄龙山油松林和油松+辽东栎混交林物种组成及优势种群动态
【中文关键词】油松;辽东栎;物种组成;优势种群动态
【英文关键词】Pinus tabulaeforrnis;Quercus liaotungensis;species compositions;preponderant population dynflmic
【中文摘要】根据黄龙山油松(Pinustabulaeformis)林和油松+辽东栎(Quercusliaotungensis)混交林共6个群丛中27个典型样地调查资料,分析了松栎林群落物种组成、多样性指数和优势种群动态。结果表明:(1)松栎混交林中灌木层和草本层植物种数均大于油松林,且灌木和草本种类因群落生境不同而有差异。(2)物种多样性分析显示。油松林和松栎混交林中由于生境不同导致灌木层物种多样性差异最大。(3)优势种群分析表明,油松林中阴坡幼苗数量较多。种群最大的为IV和V龄级个体;松栎混交林中油松和辽东栎幼苗充足。到Ⅱ、m龄级二者均大量减少,此后油松个体增加而辽东栎减少,说明松栎林发育过程中各层次植物物种相砭制约,优势种群之间也存在竞争,凡受生境条件影响较大。(4)主成分分析表明,气温、土壤、光照和总郁闭度是主要影响因子。因此,在未来森林抚育中应适当减少优势种群密度。促进异龄化;采取有效措施合理搭

配灌木和草本,强化对森林发育有利的因素,提高林分质量。

【题目】沙棘人工种群在不同生境条件下的繁殖特征
【中文关键词】沙棘;人工种群;根蘖萌苗;生境
【英文关键词】Hippophae rhamnoides;artificial population;root suckers;habitat
【中文摘要】以沙棘人工种群根蘖萌苗为研究对象,通过对丘陵沟壑区纸坊沟流域不同生境沙棘人工种群根蘖萌苗,产生的无性系个数、空间分布和生长状况的调查,系统研究不同生境条件下沙棘人工种群的根系产生幼苗的基本特征及其与环境因素的关系。主要结论是:沙棘人工种群的更新几乎完全依赖于无性繁殖更新,种子萌发产生的幼苗在调查地内很少发现;生长在阴坡的沙棘人工种群无性繁殖较阳坡的旺盛;母株通过根蘖萌芽形成无性系小株的数量、水平扩展范围、无性系小株个体生长均优于阳坡;山坡下部优于山坡上部。不同生境种群均存在枯枝现象,阴坡沙棘种群枯枝率最小(5%);阳坡萌蘖苗的枯枝最大(20%)。不同龄级中,以5---6 a生无性小株枯枝率最高。土壤中沙棘根蘖幼苗萌发点的空间分布分析表明,在土壤2"--6 cm为密集区,水平扩展距离在山坡上部距离较远,可达到3 m,山坡下部扩展距离较近,最远不超过1.5 m,无性系小株萌发点空间分布格局受坡位影响大,而与坡向关系不密切。尽管沙棘人工种群在丘陵沟壑区基本都能自我更新,但在生境选择中,应该尽量利用水分条件较好,土质疏松的生境,以获得最佳生长效果和水土保持功能。

【题目】侵蚀环境退耕撂荒地植物种群演变动态研究
【中文关键词】侵蚀环境}退耕撂荒地;植物种群演变;生态位;种群替代
【英文关键词】Erosion environment;Abandoned arable land;Population evolution;Niche;Population substitutio
【中文摘要】以侵蚀环境不同年限的撂荒地为研究对象,研究撂荒后植物种群生态结构演变过程,结果表明,退耕撂荒后植被演替恢复过程可划分为:先锋植物物种期(1~5 a),物种渐繁荣期(6~8 a),物种鼎盛期(9~13a),物种准稳定期(13~20 a)、物种相对稳定期(20~30 a)和灌木先锋物种入侵期(30~50 a)。其中先锋植物物种期以茵陈蒿、苦买菜、猪毛菜为关键种;物种渐繁荣期以委陵菜、阿尔泰狗哇花和隐子草为关键种;物种鼎盛期多物种共存,关键种不明显;物种准稳定期以长芒草、铁杆蒿和达乌里胡枝子为关键种;物种相对稳定期以铁杆蒿、达乌里胡枝子为关键种;灌木先锋物种主要有杠柳、木本铁线莲、绣线菊等。在植被恢复过程中,先锋植物物种在演替初期先增多,而后逐渐减少,到演替中后期时演变为偶见种或从群落中基本消失;而一些过渡指示物种,其地上生物量大多星升r_一降的变化趋势;群落稳定优势种的地上生物量呈持续增大的演变趋势,它们在群落中的重要性也是越来越大。而演替中的过渡优势种的地上生物量的演变趋势为单峰曲线,它们在群落中的重要性同样经历了一个由升到降的演变过程。同时,退耕撂荒地植被演替中,大多数先锋植物的生态位宽度较窄,分布范围较小,是生态特化种;但优势先锋植物,生态位宽度却较大,分布范围极广,是生态泛化种。与之相对应的演替中后期过渡优势种或稳定优势种,生态位宽度则较窄,分布范围不及优势先锋植物,是生态相对泛化种。退耕撂荒地植被演替中植物种群的替代是通过物种的生态适应性和种间竞争来实现的。

【题目】延安公路山辽东栎林优势植物水分适应性及适应类型分析
【中文关键词】延安公路山;辽东栎林;水分关系;水分适应类型
【英文关键词】Yan’an Gonglu mountain;Quercus liaotungensis forest;plant water relation;water adaptation types
【中文摘要】以陕西省延安公路山辽东栎林群落为对象.测定林内外不同状态下12种优势植物的水势日进程、自然饱和亏、临界饱和亏等水分利用参数,分析它们在林内和林外孤立木状态下的水分利用多样性和水分平衡策略,以揭示辽东栎群落水分利用多样性在群落持续发育中的作用。结果表明:(1)在林内或林外12种优势植物的水势日变化趋势基本一致,一天内每一时段物种间水势值跨度不同,林内种间水势跨度为0.85~1.93 Mpa,林外种间水势跨度为0.6~1.83Mpa;林内物种间日最低水势(一1.43---一3.05 Mpa)及临界饱和亏(63.12%~92.59%)变幅较大;各优势植物水势日进程与气象因子显著相关。(2)林内外各时段物种间水势跨度不同,14:oo和17:oo林外物种间水势跨度大于林内;12种植物的水势日变化与林内有显著差异(P<O.05),且在林内和林外环境下水分参数具有相似变化趋势。(3)根据黎明前水势、日最低水势、自然饱和亏、临界饱和亏将辽东栎林内12种优势植物水分利用策略聚类分为4个水分适应类型,每个适应类型具有特殊的水分适应方式。可见,辽东栎群落内12种优势植物的水分利用参数及其对环境适应表现出多样性特点,为该群落持续发育奠定了基础。

【题目】侵蚀环境撂荒地植被恢复与土壤质量的协同效应
【中文关键词】侵蚀环境;撂荒地;植被恢复;土壤质量;协同效应
【英文关键词】Erosion environment; Abandoned arable land; Vegetation recovery; Soil quality; Synergistic effect
【中文摘要】【目的】探索黄土丘陵区退耕撂荒地植被恢复与土壤相关要素的关系,为生态恢复重建决策提供理论依据。【方法】以中国科学院安塞水土保持实验站墩山退耕不同年限的撂荒地为研究对象,通过植被群落特征调查和土壤质量测试分析等,运用相关和回归分析方法对植被恢复过程中植被与土壤质量的协同效应研究。【结果】在其恢复过程中,植被地上生物量与植被覆盖度呈正相关,它们与土壤容重呈负相关,而与土壤大团聚体、水稳性大团聚体、有机质含量、全氮含量、水解氮含量、速效钾含量、微生物量(C、N、P)以及土壤呼吸强度之间呈正相关,与土壤全磷、速效磷含量无显著相关性。同时,植被地上生物量和植被覆盖度与土壤抗蚀性关系密切,它们与表示土壤抗蚀性能的土壤团聚度、结构系数之间呈正相关,与土壤分散系数、结构体破坏率之间呈负相关。土壤容重与土壤大团聚体、水稳性团聚体含量之间呈负相关,土壤大团聚体含量与水稳性团聚体含量之间亦呈正相关。【结论】黄土丘陵区退耕撂荒地植被恢复过程中,土壤质量得到不断恢复提高,并能促进植被的生长繁衍,推动植被恢复演替进展,植被恢复健康和演替的同时,亦进一步推动土壤质量的改善提高,二者之间表现为正向互作效应。

【中文关键词】黄土高原; 森林自然性; 森林类型; 灰色关联分析; 构成指数
【英文关键词】the Losses P lateau; forest naturalness; forest type; gray relat ional analysis; compose index
【中文摘要】为了解陕西黄土高原子午岭林区主要森林类型的自然性, 以油松林、辽东栎林、白桦林、山杨林和侧柏林等5 种森林类型为研究对象, 通过0　　1 型变量聚类, 较为客观地提出了森林群落各个演替阶段的植物组成, 并计算出了各自的群落顶极适应值; 采用层次分析的方法, 得到群落特征指标权重, 然后利用灰色关联分析方法, 得到了各个森林群落的灰色关联度。研究结果表明, 黄土高原不同森林类型的群落顶极适应值由大到小依次为辽东栎林(Quercus wutaishan ica) 8. 37, 油松林(P inu stabulaefom is) 8. 16, 山杨林(Pop ulus david iana) 7. 89, 侧柏林(P laty cladus or ientalis) 6. 88, 白桦林(B etula p la typhy lla) 6. 87; 关联度由大到小依次为油松林1. 143、辽东栎林1. 085、侧柏林0. 893、白桦林0. 849、山杨林0. 789。油松林和辽东栎林的灰色关联度较高, 是这一地区较为稳定的理想森林类型, 侧柏林和白桦林的关联度居中, 山杨林最小。辽东栎林和油松林属于该地区的顶极和亚顶极群落类型, 白桦林和侧柏林属于演替过渡类型, 山杨林为演替阶段较低的森林类型。用灰色关联度的方法能够定量地分析森林群落的自然性, 研究结果对森林近自然经营、林分改造有一定的应用价值和科学意义。

【题目】Diploid Oocyte Formation and Tetraploid Embryo Development Induced by Cytochalasin B in Bovine
【中文关键词】四倍体;牛胚胎;细胞松弛素B;胚胎发育
【英文关键词】tetraploid; bovine embryo; cytochalasin B; development
【中文摘要】四倍体胚胎是研究植入后胚胎发育中多倍体细胞的有利模型,同时也是胚胎干细胞和IPS细胞生产嵌合体的有利工具。本研究使用细胞松弛素B(CB)处理减数分裂中的牛卵母细胞,诱导形成多倍体的卵子和胚胎。结论:(1)、2.0mg/ml的CB处理成熟中的牛卵母细胞24小时,可以显著降低卵母细胞的成熟率和成熟卵子的单倍体率。超过50%的卵母细胞不能够排出第一极体,大多数没排极体的卵子都是2倍体(60条染色体);(2)、7.5和15 mg/ml CB预处理成熟中的卵母细胞10小时,可以显著降低卵子的成熟;而后处理组的卵母细胞大多数含有2n染色体;(3)后处理组中没有排出第一极体的卵母细胞孤雌胚胎发育率(25-28%)显著高于预处理组,24小时处理组和对照组(12-16%)。(4)、核型分析发现,CB处理后没有排出第一极体的卵子所发育得到的胚胎中有74%的一细胞期胚胎是4n,120条染色体;82%的二细胞期胚胎是4n,75%的囊胚是四倍体囊胚。总之,CB可以抑制第一极体的排放,打乱纺锤体结构,降低卵子成熟效率和形成四倍体胚胎。

【英文摘要】Tetraploid embryos are a useful model for postimplantation development of polyploidy cells, and tetraploid cells are an advantage in studies for chimeras yielding offspring completely derived from embryo stem cells or induced pluripotent cells. This study was designed to investigate the effects of cytochalasin B (CB) on bovine oocyte meiosis, and to induce the formation of diploid oocytes and tetraploid embryos. The results showed that: (1) incubation of oocytes in CB at _2.0 mg/mL concentrations for 24 h significantly decreased oocyte maturation and the matured oocytes ’ haploid composition. Over 50% of the CB-treated oocytes did not expel PB1 (non-PB1), and most of the non-PB1 oocytes contained 2n (60) chromosomes. (2) Pretreatment of oocytes with CB at concentrations of 7.5 and 15 mg/mL for 10 h significantly decreased oocyte maturation. Posttreatment of oocytes with CB resulted in most of the oocytes containing 2n chromosomes.(3) The parthenogenetic blastocysts (25 – 28%) derived from the non-PB1 oocytes of posttreatment group was significantly higher than that from pretreatment, whole period treatment, and the control oocytes (12 – 16%). (4) Cytogenetic analysis of the embryos derived from CB-treated non-PB1 oocytes resulted in 74% of the one-cell stage embryos being 4n¼120 chromosomes, 82% of two-cell stage embryos contained 4n chromosomes in each blastomere, and 75% of the blastocysts were tetraploidy (4n¼120). (6) The stopped uncleaved one-cell embryos showed an amazing phenomenon of over 15% of them containing extra chromosomes, which suggested multiple DNA duplication occurred within 40 h after activation. In conclusion, CB inhibits PB1 extrusion, disfigures spindle structure, decreases oocyte maturation, and results in formation of diploid (2n or 4c) oocytes. The diploid oocytes resulted in a higher development of tetraploid embryos, which would be a unique approach for the production of tetraploid embryos in bovine.

【题目】Multiple histone site epigenetic modifications in nuclear transfer and in vitro fertilized bovine embryos
【中文关键词】表观遗传,组蛋白修饰,体外受精,体细胞核移植
【英文关键词】Epigenetic reprogramming, Histone modifications, In vitro fertilization, Somatic cell nuclear transfe
【中文摘要】无
【英文摘要】During mammalian embryonic development, DNA methylation and histone modifications are important in gene expression regulation and epigenetic reprogramming. In cloned embryos, high levels of DNA methylation and abnormal demethylation were widely observed during the preimplantation period. Little is known whether there is a difference in histone modifications between in vitro fertilization (IVF) and cloned embryos during preimplantation development. In the present study, the distributions and intensity patterns of acetylations in H3 lysine 9, 18 and H4 lysine 8, 5 and tri-methyl lysine 4 and dimethyl-lysine 9 in histone H3 were compared in cloned and IVF bovine preimplantation embryos by using indirect immunofluorescence and scanning confocal microscopy. The results showed that the acetylation and methylation levels of H3K9ac, H3K18ac, H4K5ac, H4K8ac, H3K4me3 and H3K9me2 were abnormally high in the cloned embryos from the pronuclear to the 8-cell stage. H4K8ac and H4K5ac in the cloned embryos were particularly abnormal when compared with the IVF controls. At the blastocyst stage differences dissipated between cloned and IVF embryos and the distribution and intensity patterns of all histone modifications showed no obvious difference. These results suggest that somatic cells in recipient oocytes produced aberrant histone modifications at multiple sites before the donor cell genome is activated. After zygotic genome activation, distributions and intensity patterns of histone modifications were comparable with both cloned and IVF embryos

【中文关键词】N-3多不饱和脂肪酸基因,转基因牛,体细胞核移植
【英文关键词】N-3 fatty acid desaturase gene, mfat-1, Transgenic cattle, Nuclear transfer
【中文摘要】无
【英文摘要】n-3 Polyunsaturated fatty acids (n-3 PUFA) are important for human health. Alternative resources of n-3 PUAFs created by transgenic domestic animals would be an economic approach. In this study, we generated a mfat-1 transgenic cattle expressed a Caenorhabditis elegans gene, mfat-1, encoding an n-3 fatty acid desaturase. Fatty acids analysis of tissue and milk showed that all of the examined n-3 PUAFs were greatly increased and simultaneously the n-6 PUAFs decreased in the transgenic cow.Asignificantly reduction of n-6/n- 3 ratios (P\0.05) in both tissue and milk were observed.

【题目】Nuclear transfer procedures in the ovine can induce early embryo fragmentation and compromise cloned embryo development
【中文关键词】胞质碎裂,离子霉素,体外发育,体内发育
【英文关键词】Cytoplasmic fragmentation, DC pulse, Ionomycin, In vitro development, In vivo development
【中文摘要】无
【英文摘要】Cytoplasmic fragmentations are frequently observed in early mammalian embryos, and especially in the human. In our research we have observed subtle clues that the occurrence of fragmentation was most likely a result of somatic cell nuclear transfer (NT) protocols, and in particular, the in vitro culture system. In this study we examined various putative factors that might induce early embryo fragmentation in the ovine. The results indicate that nuclear transfer protocols such as the fusion parameter, activation treatment, and especially the choice of culture medium affected embryo cleavage rates and resulted in a higher incidence of fragmented embryos. Upon using the same fusion parameter, activation parameters that were based upon amino acids containing synthetic oviduct fluids (SOFaa) culture system resulted in significantly lower fragmentation rates than when utilizing a Charles Rosenkrans 1 (CR1aa) culture system. Fragmented embryos typically exhibited irregular numbers of blastomeres with the majority of blastomeres devoid of chromatin. Factors such as fusion DC pulse, activation treatment and culture system led to higher fragmentation and also affected in vitro and in vivo embryo development. The SOFaa based culture system produced a higher number of quality NT embryos resulting in higher pregnancy rates and the birth of live lambs as compared to the CR1aa based system ($P < 0.05$). We conclude that early embryo fragmentation in the ovine is caused by suboptimal cloning protocols, and NT embryo development is especially affected by the culture system used.

【题目】大鼠肌肉卫星细胞的分离、鉴定与诱导分化
【中文关键词】大鼠,肌肉卫星细胞,成肌诱导,成脂诱导
【英文关键词】Rat, Satellite cells, Myoblast, Adipogenesis
【中文摘要】肌肉卫星细胞是组织特异性干细胞,负责着骨骼肌的生长和再生。尽管发现卫星细胞的存在已经有50 多年的历史了,但分离鉴定肌肉卫星细胞的方法仍然不稳定。本研究使用两步酶消化和差速贴壁相结合的方法分离大鼠(Rattus norvegicus)肌肉卫星细胞。免疫细胞化学染色显示,分离的大鼠肌肉卫星细胞高表达Desmin;通过RT-PCR 鉴定所分离的细胞表达肌源性干细胞因子Myf5 及Myod1;成肌诱导48 h 后,卫星细胞开始形成多核的肌管;成脂诱导1 周后,细胞内开始出现脂滴,2 周后充脂细胞明显增多。研究结果提示,分离的卫星细胞具有肌源性,有发育形成肌管和向成脂细胞分化的能力。
【英文摘要】Satellite cells are regarded as a population of muscle-specific committed progenitors which are responsible for the postnatal maintenance, growth, repair and regeneration of skeletal muscles. Although satellite cells have been first isolated for 50 years, the isolation protocols are still to be modified. In this study, the combination of two-step enzyme digestion and purification with different speed adherence protocols were used to isolate rat (Rattus norvegicus)satellite cells. Analyses of the cells with desmin immunocytochemical staining indicated that the cells were derived from skeletal muscle; RT-PCR of Myf5 and Myod1 showed that they expressed muscle-specific transcription factor; Myotubes began to form at 48 h in induced-culture medium; Lipid droplets began to appear in cells after 1 week,and the number of adipose cells increased significantly after 2 weeks. The results suggested that isolated satellite cells could be induced into adipogenesis, and had the abilities to develop into myobubes and differentiated into adipose cells.

【题目】牛体外成熟卵母细胞染色体形态学研究

【中文关键词】减数分裂; 卵母细胞; 染色体; 牛

【英文关键词】Meiosis; Qocytes; Chromosome; Bov ine

【中文摘要】[目的] 为了给牛体细胞克隆和转基因克隆工作提供基础性材料。[方法] 在显微镜下,从卵液中捡出卵丘 卵母细胞复合体, 置入成熟培养液中进行成熟培养, 处理培养不同时期的卵母细胞, 所得的去掉卵丘的卵母细胞固定在载玻片上, 染色、冲洗、晾干, 在显微镜下观察。[结果] 表明: 成熟培养0 h 到4 h 大多数卵母细胞处于GV 期(97. 5%~ 87. 8%) , 培养6 h 以后GVBD 发生了卵母细胞数量明显增多(51. 6%) , 成熟培养8 h~ 12 h 处于PreMI 的卵母细胞逐渐减少(76. 7%~ 43. 2%) , MI 期卵母细胞逐渐增多(13. 3% ~ 50. 0%) 。成熟培养16 h有17. 8% 的卵母细胞处于MII 期, 大部分细胞仍处于MI 期(40. 0%) 和AI/ T I 期(42. 2%) 。从16 h~ 24 h, MII 期卵逐渐增多, 培养24 h 后大多数卵母细胞排出第一极体到达MII 期(86. 5%) 。[结论] 在减数分裂过程中, 染色体也发生了显著的形态变化。第一次减数分裂中期时的染色体清晰可数, 进入后期时, 分开的两团染色体各自凝集成染色质团, 并且一直持续到末期, 到达第二次减数分裂中期时又成为清晰可数的染色体状态。

【英文摘要】T o invest igate the meiot ic pro gression and the chr omosomal morpholog ical changes o f the bo vine o ocy tes matured in v it ro , o ocy tes w er e collected fo rm from oo ctye liquid under micr oscope. The majority of the oocy tes maintained at GV stage (97. 5% ~ 87. 8%) during the f irst 4 h after cultur e. Six ho urs later, ar ound 51. 6% of the o ocy tes occurred GVBD. When the o ocy tes w ere matured for 8h to 12h, the number of the oocytes in pre metaphase stage gr adually decreased (from 76. 7% to 43. 2%) and the oocytes in metaphase I (MI) rapidly increased (from 13. 3% to 50. 0%) . Appr oximately 17. 8% of the oocytes reached metaphase II (MII) at 16 h, and reached the highest (86. 5%) af ter the oo cytes matured fo r 24 h. Simultaneously, the morpholog y and config urat ion o f the chromosomes occurred obviously chang ed during in v it ro maturat ion. The chromo somes w ere accountable at MI, and gradually became condensed into mass of chromatin w hen the oo cytes dev elo ped to anaphase and telophase. T he chr omosomes then became countable w hen the oocy tes dev elo ped to nex t metaphase stage.

【题目】光质对海带幼孢子体生长和假根发育的影响
【中文关键词】海带,孢子体,假根,光质,蓝光
【英文关键词】Laminaria japonica Aresch, Sporophyte, Rhizoid, Light quality,Blue light
【中文摘要】以海带Laminaria japonica幼孢子体为材料,比较了不同光质(白光、红光和蓝光)对其生长的影响,并对假根的发育进行了研究。在为期56 d的培养期内,蓝光始终促进幼孢子体的生长,平均叶片大小为9 530±125 m 长/1 350± 49肛m 宽,是对照白光组的4倍之多(2 200±56 p.m 长/356±20 p.m 宽);而红光下,藻体生长极为缓慢,叶片大小仅为580±63,um 长/135± 11 p.rn宽。但是三光质下,藻体假根生长差异较小;假根长/叶片长为红光下最大,蓝光下最小,三光质下该比值均随着培养时间的延长而下降。由于海带的主要捕光色素之一岩藻黄素的吸收峰位于蓝光区,因此加大环境中蓝光的辐射可有效提高光能利用率,从而提高实际光合效率,加快藻体的生长;而假根部由于结构和功能特性,光合能力有所退化,对光质差异不敏感,因而在三光质下的生长相似。
【英文摘要】Effects of light qualities(white light,red light and blue light)on the growthand rhizoid development of Laminaria japonica Aresch young sporophyte were investigated.During the culture period of 5 6 days,the young sporophyte cultured in blue light had a frondsize of 9 530±125 m length/1 350±49 m width,about four~folds greater than that in whitelight;and the young

sporophytes ’ growth was much delayed in red light,at a size of 580 4-63m length/135± 11 m width.However,the development of rhizoid showed little differencebetween different light qualities.The ratios of rhizoid 1ength to frond length were the highest in red 1ight and lowest in blue light,which all decreased as the cultures prolonged.Fucoxanthin,one of the major light harvesting pigments in Laminaria with absorption spectrum peaking in blue light region is highly effective in capturing blue light. Consequently,the more the blue light irradiance was provided,the more the light energy was captured,resulting in the higherphotosynthetic rate. Because the rhizoid is differentiated from the Laminaria frond and possesses degraded photosynthetic capacity,it was less reactive to light qualities than the frond and showed similar development under the three lights.

【题目】Effect of blue light on indoor seedling culture of Saccharina japonica (Phaeophyta)
【中文关键词】叶绿素荧光,配子体,光合作用,孢子体,游孢子
【英文关键词】Chlorophyll fluorescence, Gametophyte, Photosynthesis, Sporophyte, Zoospore
【中文摘要】Saccharina japonica is a brown alga that has been commercially cultured on a large scale in China. Integrating the light condition under seawater and the adaptation of Saccharina to this condition, it is expected that blue light would be beneficial to Saccharina culture system. Consequently, the detailed effect of blue light on the key stages during indoor seedling culture of S. japonica was investigated in this study. Irradiances and light qualities had little effect on zoospore attachment and germination. Egg formation occurred sooner under blue light than white light. Under optimum irradiances, 95 ± 4% female gametophytes gave rise to eggs in 6 d under blue light, while it took 12 d for over 90% formation of eggs under white light. Over a culture period of 3 weeks, mean sporeling length and width under blue light was 1.39 and 1.56 times of that under white light, respectively, while the mean sporeling size obtained under red light was only 25% of that under white light. The higher growth rate under blue light was largely due to higher photosynthetic efficiency, as indicated by chlorophyll fluorescence of photosystem II. In addition, the mean ratio of sporeling width to length under blue light was significantly higher than that under white light. These results suggest that blue light would be superior to white light for indoor seedling culture of S. japonica. Based on these findings, an improved S. japonica seedling culture system is discussed.

【题目】Rapid and Sensitive Detection of Singapore grouper iridovirus by Loop-Mediated Isothermal Amplification
【中文关键词】grouper, loop-mediated isothermalampli fi cation, nested PCR, Singapore grouperiridovirus
【英文关键词】None
【中文摘要】AIMS: The aim of this paper was to develop a loop-mediated isothermal amplification (LAMP) method for rapid, sensitive and inexpensive detection of Singapore grouper iridovirus (SGIV) in grouper (GP), Epinephelus sp. METHODS AND RESULTS: A set of six specific primers was designed by targeting the SGIV ORF-014L. With Bst DNA polymerase large fragment, the target DNA can be amplified as early as 20 min at 65 degrees C in a simple water bath. The detection limit is about 0.02 fg (equivalent to 6.3 copies) of plasmid ORF-014L. LAMP products could be judged with three different methods. There were no cross-reactions with seven other aquatic animal viruses indicating high specificity of the LAMP. The LAMP method was applied to detect SGIV in virus-infected GP cells and GP tissues effectively. CONCLUSIONS: The LAMP described in this study is a cheap, sensitive, specific and rapid

protocol for the detection of SGIV in cells and in GP tissues. SIGNIFICANCE AND IMPACT OF THE STUDY: The developed LAMP method can be simply applied both in field condition and in laboratory operation for specific detection of SGIV infection.

【题目】Variation in the immunoglobulin levels in turbot (Scophthalmus maximus) after vaccination with Streptococcus iniae
【中文关键词】turbot - Streptococcus iniae - flow cytometry - immunoglobulin
【英文关键词】None
【中文摘要】A pathogenic bacterium (S636), identified as Streptococcus iniae, was isolated from turbot (Scophthalmus maximus) in 2005. We immunized turbot with formalin-killed S. iniae four times (on days 1, 14, 21, and 28) by intraperitoneal inoculation. After each vaccination, we obtained serum samples and isolated the lymphocytes from the peripheral blood, spleen, pronephros, and mesonephros. We measured surface Ig-positive (sIg+) lymphocytes and serum antibody levels from these organs using flow cytometry and enzyme-linked immunosorbent assay (ELISA), respectively, using monoclonal antibodies against turbot immunoglobulin. We confirmed that the antibody reacted with both the surface and plasma Ig by confocal laser scanning microscopy and electron microscopy. The percentage of sIg+ in the lymphocytes increased following each successive vaccination. The mean percentage increased from 31.96% (control) to 37.49%, 38.36%, 42.9%, and 51.63% in the peripheral blood; from 27.09% to 36.63%, 36.81%, 39.28%, and 46.0% in the spleen; from 22.2% to 28.99%, 29.21%, 32.83%, and 41.58% in pronephros; and from 18.12% to 22.17%, 22.45%, 25.69%, and 31.68% in the mesonephros. The ELISA results were consistent with these results. Both the total and specific antibody levels increased with each vaccination. The mean OD value of the specific antibody assay increased from 0.094, to 0.269, 0.283, 0.333, and 0.421; for total antibody the mean OD value increased from 0.133, to 0.292, 0.323, 0.413, and 0.527.

【题目】Detection of lymphocystis disease virus in Japanese flounder Paralichthys olivaceus and other marine teleosts from northern China
【中文关键词】lymphocystis disease virus - PCR - in-situ hybridization - Paralichthys olivaceus - Sebastes schlegeli - Lepidotrigla microptera - Scophthalmus maximus
【英文关键词】None
【中文摘要】We isolated a strain of lymphocystis disease virus (LCDV) from Japanese flounder (Paralichthys olivaceus) cultured in northern China. Based on published sequences of major capsid protein (MCP) gene of LCDV-cn (GenBank: AF126405), we designed two primer sets P1/P2 and P3/P4. We then used one-step or nested PCR and in-situ hybridization (ISH) to detect LCDV and identify the target tissues or cells in infected Japanese flounder. The PCR products were positive in purified viral supernatant, skin nodules, gut, gill, kidney, spleen, stomach, heart, and liver of Japanese flounder. We compared the DNA sequence with 14 MCP nucleotide sequences from GenBank, including Megalocytivirus (OFIV and RSIV), Iridovirus (CzIV and WIV), Ranavirus (TFV and FV3), and Lymphocystivirus (8 LCDV). Based on the alignment, we confirmed the PCR product was from Lymphocystivirus (GenBank accession number DQ279090 (LCDV-HD)). Using ISH, we noted the presence of LCDV in the skin nodules, gut, gill, spleen, stomach, and heart of spontaneously infected Japanese flounders. We successfully amplified LCDV fragments from Schlegel s black rockfish (Sebastes schlegeli Higendorf), redwing sea robin (Lepidotrigla microptera G ü nther) and turbot (Scophthalmus maximus) using the one-step and nested PCR, suggesting the target genes can be widely detected in fish using this method.

【题目】Study on the Divergent Characteristics of Soil Fungi and Actinomycetes at Dry Lake Wetland on Typical Steppe
【中文关键词】典型草原,干涸湖泊湿地,真菌,放线菌,多样性
【英文关键词】Typical steppe, Dry lake wetland, Fungi, Actinomycetes, Diversity
【中文摘要】本文主要通过平板培养技术研究了优势土壤丝状菌,尤其是典型草原区干涸湖泊湿地土壤真菌和放线菌的组成和分布;对比分析了湖泊湿地和典型草原两大微生物区系的分异特征;计算了土壤丝状菌的多样性,丰富度,均匀度和优势度。对于真菌而言,湖床中心(LC),典型草原(TS)和湖床边缘(LB),湖滨(LS)的多样性和丰富度指标之间有显著差异,LC和TS与LB和LS的优势度指标之间有显着性差异。对于放线菌而言,LC与LS,LB与TS之间的多样性指标有显着差异,LC与TS之间的丰富度有显著差异,LC与LS之间的均一度有显著差异。在LC样点,占主导地位的真菌区系为毛霉,占100%。 在LB样点,毛霉占据26.25%,青霉占据45%。在LS样点,主导的区系是毛霉和青霉,分布占48%和34.48%。在TS样点,青霉已成为优势菌群,占92.23%。对于放线菌, LC最优势的菌群 是Griseofuscus,占55.71%。在LS样点,占主导地位的菌群为Griseofuscus和秃顶菌群,约占18.75%和20%。在TS样点,优势菌群Griseofuscus和Flavus菌,占16.08%和14.69%。上述研究结果为更好地认识湿地的演替和向发展机制提供了依据,为干涸湖泊湿地的保护和合理利用奠定了基础。
【英文摘要】In this study, the composition and distribution of dominant soil filamentous microbes , such as fungi and actinomycetes, at dry lake wetland soil on typical steppe were measured through Spread-Plate-Technique; the divergent characteristics of two microbial floras at lake wetland and typical steppe were analyzed; and several indicators of soil filamentous microbes, for example, diversity, richness, evenness, and dominance, were calculated. For fungi, there is significant difference between lake center (LC), typical steppe (TS) & lake bed (LB), lake side (LS) for diversity and richness; and there is significant difference between LC and TS& LB and LS for dominance. For actinomycetes, there is significant difference between LC & LS, and LB& TS for diversity; and there is significant difference between LC&TS for richness; and there is significant difference between LC&LS for evenness. At LC, the most dominant floras is Mucor, accounting for 100%. At LB, Mucor accounts for 26.25% and Penicillium accounts for 45%. At LS, the dominant floras are Mucor, accounting for 48%, and Penicillium, accounting for 34.48%. At TS, Penicillium has become the dominant flora to account for 92.23%. For actinomycetes, the most dominant floras at LC is Griseofuscus, accounting for 55.71%. At LS, the dominant floras are Griseofuscus accounting for18.75%, and balding group, accounting for 20%. At TS, the dominant flora are Griseofuscus, accounting for16.08%, and Flav us, accounting for 14.69%.The results have demonstrated a better understanding toward the development and succession mechanisms of wetland to provide the basis for protection and rational utilizations of dry lake wetland.

【中文关键词】内蒙古高原,湿地,河漫滩,土壤微生物
【英文关键词】Mongolian Plateau, wetland, floodplain, soil microorganisms
【中文摘要】本文研究了内蒙古高原河湿地土壤微生物的分布特征。结果表明,锡林河湿地不同样块土壤微生物各区系(如围封和放牧区塔头和塔间,低河漫滩与高河漫滩)的数量分布规律是相同的,表现为细菌>放线菌>真菌。封闭区湿地土壤细菌的数量高于其他区域的。由于是围封区处于自然恢复过程,塔头和塔间之间的细菌数量没有显着差异。由于塔尖为季节性洪水淹没样点,而塔间为长期积水样点、水分含量高。由于水分含量高不利于放线菌的生存,因此塔尖放线菌数高于塔间。虽然真菌对水分的要求低,塔尖真菌数目高于塔间。放牧区湿地塔尖土壤有更多的微生物,这是因为淹水时间较短和空气流通较好。塔尖有机质更为丰富,这是由于动物粪以及枯草落叶丰富了土壤有机质含量,这有利于放线菌和真菌的繁殖。由于塔间大多是亲水性的植物和较低的生物多样性,土壤微生物的数目也很少。 河漫滩区低河漫滩细菌的数量高于高河漫滩的,这是因为较高的含水量有利于细菌的繁殖。放线菌是嗜碱性的细菌,低河漫滩处的放线菌数量高于高河漫滩的,这是因为高含水量使低河漫滩土壤发生盐碱化。高河漫滩真菌的数量高说明高河漫滩环境更适于真菌的生存和繁

衍。

【英文摘要】This research is to study the distributive characteristics of soil microorganisms at river wetland on Mongolian Plateau in Inner Mongolia. The results showed that the quantities distribution of various floras of soil microorganisms in different plots (such as bump-top and in-between-bumps in enclosed and grazing regions, low floodplain and high floodplain) at wetland of the Xilin River are the same, which is bacteria > actinomycetes > fungi. In enclosed region, the amounts of bacteria are higher than that of other regions. Since is under natural restoration process in enclosed region, there is no significant difference between bump-top and in-between-bumps. At bump-top, it is seasonally flooded, and at in-between-bumps, there is always ponded water to cause high water content. Since high water content is not in favor to the survival of actinomycetes, the number of actinomycetes at bump-top is higher than that at in-between-bumps. Though there is low requirement of water for fungi, the number of fungi at bump-top is higher than that at in-between-bumps. In grazing region, there are more soil microorganisms at bump-top due to shorter flooded time and better air ventilation. At bump-top, organic matter is much richer, due to resupplied from animal manure, withered grass and falling leaves, which is in favor to the reproduction of actinomycetes and fungi. Since there are mostly hydrophilic plants and less biodiversity at in-between-bumps, the number of soil microorganisms is smaller. In floodplain region, the amount of bacteria at low floodplain is higher than that at high floodplain, due to higher water content, which is in favor to the reproduction of bacteria. Actinomycetes are basophilic bacteria. The amount of actinomycetes at low floodplain is higher than that at high floodplain, since high water content has led low floodplain to alkali soil. The amount of fungi at high floodplain is higher due to more suitable environment for survival and reproduction.

【题目】温度盐度对条斑星鲽胚胎发育的影响

【中文关键词】条斑星鲽; 胚胎发育; 温度; 盐度;

【英文关键词】Verasper moseri Embryonic development Temperature Salinity;

【中文摘要】就温度、盐度对条斑星鲽胚胎发育的影响作了初步探讨。实验表明,胚胎发育的适宜温度为6~12°C,最适水温为8~10°C,在适温范围内胚胎孵化速度与温度呈正相关关系(N=65.925T-0.9672)。盐度低于27,受精卵下沉,27~30之间悬浮于水体中,盐度高于35,受精卵浮于水面。胚胎孵化的适宜盐度范围、最适盐度范围分别为25~40和28~36;盐度低于25或高于40,孵化率都降低。研究表明,条斑星鲽胚胎发育的生物学零度(阈温度)为-0.1°C,有效积温值为1726.48°C.h。另外,根据其Q10值推算的胚胎发育的适宜水温与实验结果相似。

【英文摘要】A preliminary study was done on the ffects of temperature and salinity on embryonic development of barfin flounder Verasper moseri. The results showed that the suitable temperatures for hatching were 6~12°C, and the optimum temperatures were 8~10°C. There was a positive relationship between the embryonic development speed and temperature at the suitable range of temperatures(N= 65.925T-0.967 2). Embryos sank to the water bottom when salinity was lower than 27, suspended in the water column when salinity was between 27~30, and floated on the water surface when salinity was above 35. The suitable and optimum salinity range for hatching was 25~40 and 28~36, respectively. Salinity below 25 or above 40 both led to low hatching rate. The calculation results showed that the threshold temperature for embryo development was -0.1°C, effective accumulated temperature was 1 726.48°C · h. In addition, the suitable temperature for hatching embryos of barfin flounder according to its Q10 value was similar to the experimental result.

【题目】条斑星鲽(Verasper moseri)的早期生长发育特征
【中文关键词】条斑星鲽,胚胎发育,胚后生长发育,形态特征
【英文关键词】Verasper moseri, Embryonic development, Post-embryonic development and growth, Morphological characters
【中文摘要】采用显微观察和测绘法对条斑星鲽早期生长发育的数量和形态特征进行了系统的观察和测量。结果表明,条斑星鲽成熟卵子为悬浮性、端黄卵,圆球形,卵径1.7—1.9ram,无油球。在水温f9.0±0.5yc条件下,受精卵经196.3h孵化出膜。在水温l2—14°C条件下,7日龄(DAH,days afterhatching)仔鱼卵黄囊消耗殆尽,开口,肛门与外界相通,开始进入外源性营养阶段。仔鱼开口饵料为轮虫,8日龄仔鱼开始摄食轮虫,12日龄开始摄食卤虫无节幼体,30日龄开始进行配合饲料转化,40日龄后苗种摄食配合饲料良好。生活史无鳔。脊椎骨末端上曲发生在21日龄,至28目龄完成。70日龄幼鱼鳞片和侧线已形成,鳍条数量与成体完全一致。变态过程:32日龄苗种进入变态期,左侧眼睛开始上移,42曰龄眼睛转移至头顶,50目龄眼睛转到右倒,完成变态。研究了鳍的发生及生长过程:背鳍、胸鳍、腹鳍、尾鳍、臀鳍分别发生于l9、0、20、19、10天,至50日龄幼鱼,除胸鳍外其它鳍的鳍条数与成鱼一致。
【英文摘要】M orphology of barfin flounder Verasper moseri in early life stage were studied; including features of yolksac larva,preflexion larva,postflexion larva and juveniles.Eggs and semen were stripped from the ovary cavity and spermducts by gently compressing the genital area of sexually matured female and male fish.The eggs were fertilized artificially,cultured at(9.0±O.5)°Cand salinity 33— 35,sampled every 30- 60min,and observed with a microscope.The fenilizedeggs were 1.7— 1.9 mm in diameter.from which embry os were hatched out about 1 96 h post fertilization.Newly hatchedlarvae,(4.92~0.29)mm long,were nursed at 1 2— 1 4°C,which were dependent entirely on the egg—contained energy till 7DAH(Days After Hatching),with mouth and anus opened;this is termed as mixed feeding stage.After yolk was exhaustedat 9 DAH,the development entered exogenous feeding stage.Larvae began to feed in rotifers B.plicatili at 8 DAH,andnauplii of brine shrimp Artemia salina from 1 3 to 45 DAH.No swim bladder was shown all over the life history.The flex—ion of notochord started at 21 DAH with total length 8.3 1+0.23 mm (=30),and finished at 28 DAH with total lengthreached(9.32~0.54)mm (n=30).When total length reached 10.22~0.41 i1"1111(/7=30),post flexion larvae attained juvenilestage.Metamorphosis began at 32 DAH and completed at 50 DAH,the left eye moved to the right side,the juveniles entered the bottom life stage.At 70 DAH,lateral line form ed and total length achieved 30.5~6。62 mm =30),the juvenilesentered youth stage.Dorsal fin,pectoral fin,pelvic fin,caudal fin,anal fin anlage formed at 1 9,0,20,1 9,and 1 0 DAH,respectively,and were completed after 50 DAH except pectoral fin.70 DAH instead.

【题目】不同积温情况下栉孔扇贝雌性生殖腺中磷脂、核酸及水分的含量变化
【中文关键词】栉孔扇贝;积温;雌性生殖腺;磷脂;RNA/DNA值;水分含量
【英文关键词】Chlamys farreri;Accumulated temperature;Ovary;Phospholipid; RNA/DNA ratio;Water content
【中文摘要】为研究某些生化组分与栉孔扇贝雌性生殖腺成熟情况的关系,在亲贝促熟的后期,对不同积温情况下栉孔扇贝雌性生殖腺中的磷脂、核酸及水分的含量进行测定。结果表明,磷脂含量、RNA/DNA值及水分含量均随着积温升高(从210℃到300℃)而增加,但成熟的卵子一经产出后,雌性生殖腺中的磷脂含量、RNA/DNA值及水分含量均降到最低。组织切片的结果表明雌性生殖腺中的卵子在成熟过程中体积明显增大,以至于滤泡中充分成熟的卵子被挤压成不规则形状,细胞核的核膜和核仁在卵子排出去之前一般都消失。成熟卵子产出后的滤泡中出现空泡,未能排出的卵子部分被滤泡吸收,形态模糊。
【英文摘要】This study was conducted to find the relationship between some biochemical substance content and ripeness of the gonad of female Chlamys farreri. Changes of the contents of phospholipid, nucleic acid and water in the gonad at different stages of accumulative temperature were analyzed in late period of artificial ripening parent scallops. The results showed that RNA/DNA ratio, content of phospholipid and water increased gradually with the accumulated temperature increasing(from 210℃-300℃), but reduced dramatically after the eggs were spawned.The result of tissue slices showed that the eggs in the follicles became larger and larger so that they were extruded to be abnormal shapes, the nucleus membrane and nucleolus of mature eggs disappeared; vacuoles apeared in the follicles after mature eggs were laid out, and the residual eggs were assimilated by the follicles, at the same time, their shapes became blurry.

【题目】条石鲷的早期生长发育特征
【中文关键词】条石鲷,胚胎发育,胚后生长,发育
【英文关键词】Rock bream,Oplegnathus fasciatus,Embryonic development,Post—embryonic development,Growt
【中文摘要】对条石鲷(Oplegnathusfascmt~)早期生活史阶段生长发育特征进行了观察和测量,描述了胚胎和胚后各发育阶段的生长发育特征。条石鲷成熟卵子为浮性、端黄卵,卵径0.86 mm±0.012 mm (n:30),单油球, 油球径0.18 mm一0.22 mm。在水温23.5℃ ±0.5℃ 、盐度30.5、pH 8.0—8.3条件下,受精卵经27.5 h孵化出膜。初孵仔鱼消化道细而直,随着仔鱼发育,消化道变得粗大、弯曲,肠道内褶回增多,消化能力增强。3日龄(仔鱼孵化出膜后第一天称为0日龄,以此类推)仔鱼卵黄囊消耗殆尽,开口,肛门与外界相通,油球在6日龄消耗完毕,进入外源性营养阶段。仔稚鱼培育在室内水泥池进行。在水温2l℃一24%、盐度27—33、pH 8.0—8.3条件下,仔鱼开口饵料为s型褶皱臂尾轮虫,4日龄仔鱼开始摄食轮虫或轮虫卵,13日龄开始摄食卤虫无节幼体,25日龄开始进行配合饲料转化,30日龄后苗种摄食配合饲料良好。4 E1龄仔鱼鳔原基形成,7日龄时鳔开始充气变为亮泡状,生活史终生有鳔。色素细胞首先出现在12 h 50 rain的胚体上,至18 h已在胚体全身分布,随着胚体发育,色素细胞增多。脊椎骨末端弯曲在15日龄开始,至24日龄弯曲过程完成,除腹鳍外其它鳍的鳍条数与成鱼一致,牙齿(硬齿和绒毛齿)生成,可咬食饵料。体表七条横向黑色素带是条石鲷的一个显著体态特征。21日龄鱼体表形成第一条横向黑色素带,23日龄时体表形成第二条色素带,25日龄时形成第三条色素带,29日龄时仔鱼体表第五条色素带形成,至40日龄时第七条色素带形成,此时稚鱼体态除背鳍、尾鳍、腹鳍上色素外与成体相似。60 13龄幼鱼鳞片形成,在体态上与成体无明显区别[动物学报54(2):332—341,2008]。

【英文摘要】The rock bream Oplegnathus fasciatus,a marine fish species,has a wide distribution along the coastline of China,Japan and Korea.Morphological characters were studied in the early life stages of the rock bream,including the embryonic stage,the yolk sac lalva,preflexion lalva,postflexion lal va and juvenile stages.Experiments were carried out in Qingdgo ZhonghmFishery Co.,Ltd.from lst June to 3lAugust,2o05.Parent fish were caught from wild populations in the southern yeHow Sea.BefoIe the experiment,fish were transferred to indoor broodstock tanks(5.0 m in diameter × 1.0 m in depth),achieving arenewal of 4OO% 一500% of water exchange pe r day with constant aeration.The water quMities were:tempe rature 21.0°C 一23.0°C ,salinity 30.5。pH 8.0— 9.0.Bro dfish were fed fresh or frozen flesh of Concha ostreae and Crangon crangon L.Artificial Dhotothermal conditioning controls were applied to induce natural spawning during May, 2004 and May, 2005,respectively,and natural spawning occurred successfully.Eggs were immedlately collected when observed in the breed stock tank,transferred into incubation tanks(30 L)and maintained at temperatures of 23.5°C ±0.5°C ,salinity 30.5 and DH 8.0—8.3 inflowing water.Fertilized eggs were sampled every 10—30 min,and observed in a N1KON MSZ800 microscope . The morphologicalcharacters of the specific developmental stages were photographed using a digital camera(N1KON coolpix 4500).e fertilized egs were spherical in shape,measuring 0. 86 mm ±0.012 mm in diameter and the embryos hatched 0ut about27.5 h post fertilization.Larvae were transferred into nursery tanks(5.0 m diameter× 1.0 m deep)under the foil0w c0nditi0ns:temperature was 21°C 一24oC ,salinity 27—33,pH 8—8.3,DO≥5 mg/L. Total body length of newly hatched larvae was 1.95mm 4-0.043 mm,the intestine was thin,short and straight,and then became longer,curled and complicated during development.Larval development and growth mai~y depend on energy from the yolk sac and oil globe till 3 DAH. During 0.5 DAH to 1.5DAH,42.6% of yolk was absorbed.Yolk reserves were exhausted by 3DAH (Day after hatching).Meantime,the mou【h andanus ope ned, larvae entered a mixed feeding stage, depe nding on the endogenous energy and exogenous feeding. 0il wasexhausted by 6 DAH, and larvae entered the exogenous feeding stage. The first food consumed was S or SS type retifersB.plicatilis nourished with unicellular algae(Ch/ore//a sp.).Larvae began to feed upon retifers or retifer eggs at 4 DAH.Thefirst amount consumed was 1—2 retifer(or retifer eggs)/individual and the feeding ratio was about 26.7% (n:30),graduallvincreasing to over 94% at 7 DAH.Artemia salina was fed at l 3 DAH till 30 DAH.La rvae were eompletely weaned t0 eommereialfeeds at 30 DAH when their total length was l7.02 mm±2.292 mm (n:30).I1le swim bladder anlagen appeared at 4 DAH,then inflated as a bright vesicle at 8 DAH. I1le inflation rate increased from7 1.4% (n=30)to about 95% at 25 DAH.Swim bladder abnormalities were observed in s0me individuals and these led t0death.Melanophores occured in the embryo at l2 h post fertilization,and were distributed throughout the body by l8 h postfertilization.Flexlon of notochord started at 15 DAH with totaJ length was 4. 88 mm ±0.53l mm (n:30),and the caudal finformed.Flexion was complete at 24 DAH when total lengths ranged from 10.98 mm 4-0.792 mm (n:30).At the same time,adevelopment of the dorsal fin,pe ctoral fin and caudal fin was completed. Tooth was 10— 15 in Bumbe r.W hen total lengthreached l7.02 mm 4-2.292 mm (n=30),post flexion larvae attained iuvenile stage,all the fin completed in nu/nber,first dorsalfin well developed. e first black pigment strip of the body surface form ed at 22 DAH.the second form ed at 23 DAH.the thirdat 24 DAH,and the fifth at 30 DAH.Bv 4J0 DAH,all the seven strips were complete.At 60 DAH.the lateralline form ed and atotal length of 6.43 mm±1.037 mm (n:30)was reached,at which time the iuveniles resembled adults in appearance l ActaZoologica Sinica 54 (2):332—34l,2008 1.

【题目】条斑星鲽CYP19a基因克隆及其在雄鱼生殖周期中的表达

【中文关键词】条斑星鲽; P450芳香化酶; 克隆; mRNA表达;

【英文关键词】Verasper moseri; cytochrome P450 aromatase; clone; mRNA expression;

【中文摘要】细胞色素P450芳香化酶(P450arom)作为P450细胞色素酶超家族中的一员,是性类固醇生成途径中的末端酶,能够将雄激素转化为雌激素。在大多数脊椎动物中,P450arom由CYP19单基因编码。但是在鱼类中存在两种P450芳香化酶,分为性腺型芳香化酶(P450aromA)和脑型芳香化酶(P450aromB),它们由不同的基因(CYP19a和CYP19b)编码,分布在不同的组织。通过简并引物扩增及RACE cDNA扩增克隆,在国内外首次获得全长为2167bp的条斑星鲽CYP19a cDNA序列,并将推测的氨基酸序列与其它物种P450arom氨基酸序列进行多重比较,发现存在跨膜螺旋区、I-螺旋区、Ozol肽区、芳香化酶特异保守区以及血红素结合区。通过RT-PCR分析了P450aromA mRNA在条斑星鲽不同组织中的表达情况,结果表明,CYP19a基因主要在脑、卵巢和精巢中表达,其次在肠、肝脏、肾脏也有少量表达。同时也分析了P450aromA mRNA在处于不同发育

期的精巢中的表达情况,发现在Ⅱ期精巢中表达量最高,在Ⅴ期精巢中表达量最低。

【英文摘要】Estrogens are key players in sexual differentiation and development and their production is essential for normal sexual development in both females and males. Cytochrome P450 aromatase is the terminal enzyme in steroidogenic pathway that converts androgens into estrogens. In most of vertebrates,P450arom is the product of the CYP19 gene,which exists as a single copy per haploid genome. In contrast,there are two isoforms of aromatase in teleosts,which are encoded by two different genes,CYP19a and CYP19b,as well as have different distribution. This work describes the molecular cloning of the cDNA encoding the barfin flounder(Verasper moseri) gonad cytochrome P450 aromatase(CYP19a) by means of reverse transcriptase polymerase chain reaction(RT-PCR),degenerate primers PCR amplification and 5 ’-and 3 ’-rapid amplification of cDNA ends(RACE) analyses. We cloned the complete cDNA sequence of CYP19a gene and the length is 2 167 bp,encoding a protein of 523 amino acids. Via Blastn,the CYP19a cDNA displayed high identity with Atlantic halibut(Hippoglossus hippoglossus),Japanese flounder(Paralichthys olivaceus) and southern flounder(Paralichthys lethostigma). Alignment analysis using barfin flounder CYP19a gene deduced animo acid sequence and animo acid sequences of other species showed that there were transmembrane helix region,I-helix region,Ozol ’s peptide region,aromatase-specific conserved region and heme-binding region in the deduced animo acid sequence. Phylogenetic analysis suggested the occurrence of a gene duplication for cytochrome P450 aromatase in the teleost lineage after its divergence from the tetrapods. Furthermore,the higher identity between barfin flounder P450aromA and P450aromAs of other teleosts suggested that they have the same origin. A semiquantitative PCR was developed to measure mRNA expression levels of CYP19a gene of barfin flounder. Expression analysis in different tissues demonstrated that P450aromA transcripts were highly abundant in brain,ovary and testis,less abundant in intestine,liver and kidney,showing that not only gonads can produce steroids but also other tissues have steroidogenic capability. And we analyzed the relative mRNA expression level of CYP19a in testes at different stages of reproductive cycle,there were the highest level at stage Ⅱ and the lowest level at stage Ⅴ. These changes in expression profiles may imply differences in the functionality of the enzyme between different stages,suggesting an important role for P450aromA in barfin flounder testes development.

【题目】栉孔扇贝(♀)×虾夷扇贝(♂)杂交子代胚后发育过程中遗传构成变化研究
【中文关键词】栉孔扇贝 虾夷扇贝 杂交 GISH RAPD
【英文关键词】Chlamys farreri, Patinopecten yessoensis, Hybrid RAPD, GISH

【中文摘要】采用GISH和RAPD技术对栉孔扇贝(♀)和虾夷扇贝(♂)杂交子代胚后发育4个重要时期(担轮幼虫期、D形幼虫期、壳顶幼虫期、附着变态期)的遗传构成进行了检测。GISH结果表明,杂交扇贝在担轮幼虫期和D形幼虫期均继承了来自父母本遗传物质,而在发育至壳顶幼虫期时却已经未检测不到来自父本的遗传物质。在RAPD检测中,50条随机引物共扩增出35条栉孔扇贝的特异条带和28条虾夷扇贝特异条带,其中栉孔扇贝特异条带在杂交子代4个时期出现的条数分别为:担轮幼虫期21条、D形幼虫期19条、壳顶幼虫期23条、附着变态期23条;而虾夷扇贝特异条带在杂交子代4个时期出现的条数分别为:17、16、1、1。这些结果表说明,杂交子代遗传结构贝基因组在进入壳顶幼虫期时发生重大改变,大部分父本遗传物质从杂交贝基因组中丧失,并确定杂交子代中父本遗传物质消失的时间始于担轮幼虫期。

【英文摘要】RAPD analysis and genome in situ hybridization(GISH) were applied to reserach into the genetic variation of the Chlamys farreri and Patinopecten yessoensis hybrid scallop larvae during the four life history stages(trochophore,D shaped larvae,umbo stage larvae and eye-spot larvae).For RAPD analyses, 50 random primers were used and 35 C. farreri specific bands and 28 P. yessoensis specific bands were detected in the broodstock. Different numbers of C.farreri specific bands were found in the hybrid during the four life history stages,and the numbers were:21 in trochophore,19 in D shaped larvae, 23 in umbo stage larvae, and 23 in eye-spot larvae. The numbers of the P. yessoensis specific bands found during these stages were 17,16,1 and 1,respectevely. Meanwhile, the result of GISH analysis indicated that the hybrid scallop separately inherited one set of chromosomes(n=19) from both C. farreri and P. yessoensis brood stock during both the trochophore stage and the D-shaped larvae stage, while no P. yessoensis germ plasm was founded in the umbo stage larvae and the eye-spot larvae.It was found that, a big transformation of the genetic composition of the hybrid happened in umbo stage larvae when most of the paternal germ plasm was lost in the genome of the hybrid scallops.

【题目】Study on the relationship between CO2absorption and aboveground biomass of riparian wetland plant communities in inland river,Inner Mongolia plateau
【中文关键词】湿地群落,CO2固定,地上生物量,河岸植被
【英文关键词】wetland community; CO2 fixed; aboveground biomass; riparian vegetation
【中文摘要】在这项研究中,我们用LI-7000 CO2/H2O分析仪测量了中国内蒙古锡林河流域CO2的吸收和典型湿地植物群落的生物量。结果如下:1) The Poa annua+Equisetum一年生植物群落, Lathyrus palustris群落, Polygonum alopecuroides群落, Cirsium esculentum 群落, and Glyceria maxima+Equisetum hyemale群落进行的光合作用有类似的变化趋势,在七月初的光合作用能力最强,然而洪水期Glyceria maxima和Equisetum hyemaleachieves光合作用在七月下旬进入高峰期。 2)在整个生长季节,由Polygonum alopecuroidesreached占主导的群落的生物量在九月初达到峰值,而其他湿地植物群落生物量在8月中旬达到极值。 3)对于湿地植物群落, 被植物固定的CO2量和地上生物量之间的没有显着相关性,不能使用CO2固定量来反映植物群落的生物量。
【英文摘要】In this study, we measured CO2 absorption and biomass of the typical wetland plant communities using the LI-7000 CO2/H2O analyzer in the Xilin River Basin, Inner Mongolia, China. The results are as follows: 1) 1) The Poa annua+Equisetum arevene Community, Lathyrus palustris Community, Polygonum alopecuroides Community, Cirsium esculentum Community, and Glyceria maxima+Equisetum hyemale Communitiy have a similar changing trend of photosynthesis, taking photosynthesis ability in early July as strongest, while flooded community which is composed of Glyceria maximaand Equisetum hyemaleachieves the peak of photosynthesis ability in late July. 2) During the growing season, the biomass of community dominated by Polygonum alopecuroidesreached the extreme value at the beginning of September, whereas the biomass of other communities presented the extreme value in mid-August. 3) For a wetland plant community, there is not a remarkable relevance between CO2 fixed and aboveground biomass, and it can not use the CO2 fixed by community to reflect the standing crop of community.

【题目】桑沟湾营养盐时空分布及营养盐限制性分析
【中文关键词】营养盐分布 季节变化 营养盐限制因子 海水养殖 桑沟湾
【英文关键词】Nutrient distribution Seasonal variation Nutrient limitation Mariculture SanggouBay
【中文摘要】根据2006年4、7、11月和2007年1月共4个航次的调查数据,分析了桑沟湾水域的溶解无机氮(DIN)、活性磷酸盐(PO43-)和活性硅酸盐(Si)含量的时空分布特征,采用营养盐浓度阈值法和化学计量法对桑沟湾营养盐潜在的限制性进行了分析。结果显示,桑沟湾DIN、PO43-、Si含量及分布呈现出明显的季节变化:DIN在秋季最高,春季最低;PO43-在秋季最高,夏季最低;Si在夏季最高,秋季最低。春季DIN和PO43-的含量低于理论上浮游植物生长的营养盐阈值的站位分别占44%和39%;夏季PO43-的潜在限制性较强,浓度低于营养盐阈值的站位占68%,受PO43-潜在限制的几率达79%,DIN和Si分别为5%和0;秋、冬季Si可能是浮游植物生长的主要限制因子。讨论了海水养殖、陆源输入及外海交换对营养盐时空分布的影响。目前,桑沟湾营养盐浓度基本属于国家一类、二类水质。但是,长期变化趋势显示DIN有上升的趋势。

【英文摘要】Thedistributionof dissolvednutrients inSanggou Bay was investigatedinA-pril, JulyandNovember 2006andJanuary2007. Theconcentrationanddistributionof dissolvedinorganicnitrogen(DIN), phosphate(PO43-) andsilicateinSanggouBayshowedobvious sea-sonal variation. DINreachedthelowest level inspring andthehighest level inautumn; PO43-concentrationwas at thelowest level insummer andthehighest level inautumn; whileSi con-centrationreachedthelowest point inautumnandthehighest point insummer. Limitingnutrents for thegrowthof phytoplanktonwereassessedbythemethodof theoretical half-saturationconstant (Ks) andstoichiometricratios among DIN, PO43-andSiO2-3 . Theresults showedthatinspring, the percentageof stations withconcentrationof DINandPO43-belowKs was 44%and39%, respectively, suggestingfor potential NandPlimitation. Insummer, thepercentageofstations withPO43-concentrations belowKs was 68%, andpotential P-limitationwas at 79%probability, NandSi limitationwereat 5%and0%probability, respectively. Inautumnandwin-ter, Siwasthemajor limitingnutrient, andthepotential S-i limitationwasat 94%and78%prob-ability, respectively. The effect of mariculture activities, land-based input, andwater exchangewithYellowSeaonthespace-timedistributionof nutrients werediscussed. Basedonthelong-termdata, moreattentionshouldbepaidtoDINenrichment inSanggouBay.

【题目】半滑舌鳎卵巢发育的组织学和形态数量特征研究

【中文关键词】半滑舌鳎,卵巢发育,组织学

【英文关键词】Cynoglossus semilaevis Ganther,Gonadal development,Histological observation

【中文摘要】采用组织学方法系统研究了人工养殖条件下半滑舌鳎亲鱼卵巢的组织发育周年变化特征。结果表明,卵母细胞发育可分为6个时相,卵巢发育分为6期。卵巢不同发育时期都由不同类型的卵母细胞组成,半滑舌鳎为非同步分批多次产卵类型。周年发育过程中,6月龄前的鱼卵巢发育处于第工期;9~12月龄卵巢可发育至第Ⅱ期;12月龄半滑舌鳎性腺可发育达到Ⅲ期,并一直保持至24月龄。3龄雌鱼达到性成熟,卵巢可发育至第Ⅳ期;随着水温和光周期的调控,卵巢发育进入成熟期(Ⅴ期),发生水合现象是卵母细胞成熟并准备排卵的信号;产卵结束后卵巢退化至第Ⅵ期,排出的卵母细胞退化吸收,以Ⅲ期卵巢越冬后,卵巢退化至Ⅱ期并持续至下一个繁殖周期。人工养殖条件下,卵巢内存在卵母细胞闭锁现象。性腺周年发育过程中,性腺指数(GSI)在性腺达到成熟期时达到峰值,产卵结束后性腺快速退化,GSI值各月份差异显著(P<0.05),亲鱼性腺重量在卵巢发育成熟过程中一直处于生长状态。亲鱼肝脏指数(HSI)在产卵前7~8月份(性腺达到成熟期前30 d左右)达到最大,表明7~8月份是性腺进行卵子发育、卵黄能量储备的重要时期,亲鱼在产卵前通过积极摄食储备体内能量,肝脏在卵母细胞卵黄积累方面具有重要的生理作用。肥满度(CF)值在繁殖盛期10~ l1月份达到最大,表现出与GSI类似的变化趋势。

【英文摘要】The temporal dynamics of oocyte growth and ovary development were examinedduring a 1 2一month ovarian maturation cycle in captive Cynoglossus semilaevis Gtinther usinglight microscopy method.Results showed that the oocyte growth could be divided into 6 phases and ovary development consisted of 6 periods accordingly.Two or three distinct batches of vitel—logenic oocytes were found in Cynoglossus semilaevis Gtinther ovaries at one development stage,indicating that this species are a non—synchronized multiple batch spawners.The ovaries are in stage 1 when the fish are less than 6-month old,which only appears once in their whole life.As fish grew,the ovaries enter into stage II when they are 9 to 1 2 months old.The stage III which were characterized by cortical alveoli accumulation was attained when the fish were 1 2一month old and maintained until 24一month old.Deposition of lipids and vitellogenesis began to happen in ovaries of stageIV when the fish were over 3 years old.The ovaries could be matured (stage V)under artificial photothermal control from May to August and fish spawned between September and November.H ydration observed in oocytes indicates that the fish were complete—ly matured for ovulation.After spawning period,the ovaries retrogressed to stage Ill via stageVI ,then continued regressing to stage 1I and was maintained until the next reproductive sea—son.Gonadosomatic index(GSI),hepatosomatic index(HSI)and condition factor(CF)were all found to increase prior to,or during the peak phase of vitellogenic growth corresponding to the gonad development,which are important indices for evaluating the reproductive condition of the parental fish.Cynoglossus semilaevis Ganther appear to strategically utilize episodes of high feeding activity to accrue energy reserves early in the reproductive cycle prior to its deployment during periods of rapid ovarian growth.In the developing ovaries(mainly after stageIV),some post—vitellogenic follicles failed to undergo final maturation,resulting in widespread preovulatory atresia,which may depress the fecundity or be an indicator of capacity of multiple spawns.

【题目】温度、盐度对条石鲷胚胎发育影响及初孵仔鱼饥饿耐受力
【中文关键词】条石鲷,胚胎发育,温度,盐度,饥饿
【英文关键词】Rock bream Oplegnathus fasciatus,Embryonic development,Temperature,Salinity,Starvation
【中文摘要】研究了盐度、温度对条石鲷胚胎发育的影响和初孵仔鱼对饥饿的耐受力。结果表明,胚胎发育的适宜盐度范围为2O~35,最适盐度范围为25~30,孵化率都在89 以上,盐度低于20或高于35,孵化率都降低。盐度对孵化时间有一定影响,盐度高于35或者低于15条件下孵化时间都延长。胚胎发育的适宜温度范围为21~27℃,孵化率都在77 以上,最适温度范围为23~25℃,孵化率达89 以上,低于19℃ 或者高于27℃ 时孵化率降低且初孵仔鱼畸形率升高。胚胎孵化时间与温度成负相关关系,胚胎发育速率与温度成正相关关系。条石鲷胚胎发育的生物学零度(阈温度)为10.O6℃,有效积温值为405.3。C ·h。对胚胎发育的Q 。值进行了计算。饥饿条件下,条石鲷初孵仔鱼8日龄全部死亡,半数死亡时间出现在第6天,饥饿对初孵仔鱼生长具有明显的抑制作用。
【英文摘要】A series of experiments have been conducted to study the effects of salinity andtemperature on embryonic development and starvation endurance of newly hatched larvae ofrock bream Oplegnathus fasciatus(T.& S.).Experiments were carried out in Qingdao Zhong—hai Fishery Co.,Ltd.from 2004~ 2007.Eggs were collected immediately after spawning andtransferred into tanks for incubation.Salinity study was carried out in 2005,with treatmentsatsalinities of 40,35,30,25,2O,15,10 and 5.The results showed that the suitable salinities for em—bryonic hatching ranged from 20 to 35 with the most suitable range between 25~ 30,whenhatching rates were all above 88 .Salinities above 40 or below 20 led to low hatching rate andprolonged hatching time. Temperature study was done in 2004,2005 and 2007,respectively.Taking into consideration the hatching rate,hatching time and deformity rate of the newlyhatched larvae,it is deduced that the suitable temperatures for hatching ranged from 21---27°Cwith hatching rates above 77 ;most suitable temperatures were 23~ 25°C with high hatchingrates over 89 and low deformity rate of newly hatched larvae. Hatching time was negativelycorrelated with temperature while embryonic development speed was positively correlated withtemperature.The threshold temperature for embryo development was calculated as 10.06°C ,the effective accumulated temperature was 405.3°C · h.In addition,Q10 value was calculated,and was found tO accord with the experimental result. Newly hatched larvae were starved to death at 8 DAH with half death time appeared at 6 DAH ;starvation had regative effects on lar—val growth.

【题目】饥饿对条石鲷仔稚鱼生长发育的影响
【中文关键词】条石鲷,仔稚幼鱼,饥饿,生长
【英文关键词】Rock bream Oplegnathus fasciatus L.,Juvenile fish,Starvation,Growth
【中文摘要】采用实验生态学方法研究了饥饿对条石鲷仔稚幼鱼的影响。结果表明,水温18、22和26℃时,初孵仔鱼的PNR点分别出现在6~7 d、6~7 d和4~4.5 d。仔鱼开口摄食时间随温度降低而滞后,22℃ 时初次摄食率最高,26℃ 时初次摄食率降至50 以下。温度对仔稚幼鱼耐饥饿的能力影响明显,18和22℃ 时,前期仔鱼半数死亡时间为4~5 d,而13日龄仔鱼半数死亡时间为2.5 d,24日龄稚鱼的为1.5~2 d,实验鱼饥饿3 d后,大部分已经不能恢复摄食。在26℃ 时,前期仔鱼和13日龄仔鱼的半数死亡时间为1.5 d,24日龄稚鱼为2~2.5 d,而45日龄幼鱼在22和26℃ 时半数死亡时间都为6 d,表明随着生长发育,苗种对饥饿耐受能力明显增强。饥饿对条石鲷幼鱼的生长影响显著(P<0.05),饥饿条件下的仔鱼全长和体重增加远远低于对照组,甚至

出现体重的负增长,30日龄幼鱼在饥饿条件下的体重损失率达到50 9/6以上,而45日龄幼鱼饥饿后的体重损失率约为10 ,13日龄仔鱼阶段是条石鲷早期生长发育阶段中较为敏感的阶段。

【英文摘要】Effects of starvation on growth and surviva1 in early life stage of rock breamOplegnathus fasciatus were studied.The results showed that PNR of newly hatched larvae ap—peared at 6~ 7 d,6~ 7 d and 4~4.5 d respectively at temperatures of 18°C ,22°C and 26°C .The first feeding time was delayed at low temperatures,for example,the larvae opened mouthon 4 d at 18°C whereas mouth opened on 3 d at both 22°C and 26°C .The first feeding ratereached the highest value(73.3)at 22°C but was 1ower at 18°C and 26°C .Temperature hadsignificant effects on the survival of the larvae and j uveniles.When temperature was 1 8°C and22°C ,half mortality time of early larvae appeared at 4~ 5 d while it was 2.5 d for 13 d—old lar—vae and 1.5~2 d for 24 d-old juveniles.The half mortality time of 45 d larvae was 6 d at 22°Cand 2 6°C .These results indicated that the capability of fish to tolerate starvation and tempera—ture was enhanced with growth.Growth was delayed significantly(P< 0.05)by starvation;thefish in the experiment showed slow growth in total length and even negative growth in bodyweight.For example,the 3 0 d—old j uvenile fish lost 5 0 of body weight after starvation corn—pared tO the beginning,and the ratio was 10 for 45 d—old j uvenile.In conclusion,the results suggested that the 1 3 d—old larvae were most sensitive to starvation and environmental changes.

【题目】条石鲷的耗氧率与窒息点研究

【中文关键词】条石鲷,耗氧率,窒息点,昼夜变化

【英文关键词】Rock bream Oplegnathus fasciatus,Oxygen consumption rate,Asphyxiation point,Diurnal variation

【中文摘要】2008年4~8月,采用Winkler法研究了70日龄(平均全长37.68mm,平均体重1.07g)和105日龄(平均全长65.71mm,平均体重5.58g)的条石鲷在不同温度(15、20和25°C)、不同盐度(2O、25和30)下的耗氧率、窒息点及耗氧率昼夜变化。结果表明,105日龄组的相对耗氧率明显低于70日龄组,但个体耗氧量明显高于70日龄组;耗氧率随幼鱼体重的增加而相对减少。盐度一定时,温度升高,相对耗氧率和个体耗氧量都随之增大。盐度对70日龄幼鱼组的耗氧率影响显著(P<0.05),对105日龄幼鱼组影响不显著(P>0.05)。盐度25左右、温度2O~25°C 时是条石鲷苗种培育和生长的最适盐度和最适温度。条石鲷在温度15~25°C 、盐度20~30下的窒息点为1.602 1~2.953 8 mgO /L,窒息点随着个体的增大而降低;温度、盐度对条石鲷窒息点的影响均不显著(P>0.05)。条石鲷耗氧率的昼夜变化明显,白天的耗氧率平均为0.945 9mg 02/g · h,夜间平均为0.272 7mg 02/g · h,白天的耗氧率是夜间的3~5倍,条石鲷白天代谢旺盛并持续到夜间22:O0左右。

【英文摘要】Studies on the oxygen consumption rate,its diurnal variation and asphyxiationpoint of rock bream Oplegnathus fasciatus at different salinities(20,25,30)and temperatures(1 5°C ,2o°C ,2 5°C)were carried out in Qingdao Zhonghai Fishery Corporation,Ltd.from A—pril to August,2008.The experimental fish were divided into two groups:70d—old group at anaverage body weight of 1.07g and an average body length of 37.68 mm ;105d—old group at anaverage body weight of 5.59g and an average body length of 65.71 mm. The results showedthat relative oxygen consumption rate of J05d——old fish was significantly higher than that of 70d——old fish.while the asphyxiation point of the former was lower.The oxygen consumption rate Ofrock bream decreased as their body weight increase.Both relative oxygen consumption rate andindividual oxygen consumption increased with the rise of water temperature when salinity wasunchanged.The effect of salinity on oxygen consumption rate of 70d—old fish was significant(P< O.05)whereas it was not significant for 105d—old fish (P> 0.05).The optimum salinity forgrowth of rock bream was 2 5.and the optimum temperatures were 20~ 2 5 °C .The asphyxia—tion point of rock bream were between 1.602 1 mg 02/L and 2.953 8 mg 02/L at different tem—peratures and salinities and it decreased with the increase in body weight.Neither salinity nortemperature had significant effects on which (P> 0.05). The oxygen consumption rate of theyoung fish was 0.945 9 mg O2/g.h in daytime,which was about 3~5 times higher than thenighttime.Rock bream showed high metabolism rate till 22 :00pm.

【题目】β-integrin mediates WSSV infection
【中文关键词】无
【英文关键词】β-integrin; WSSV; Receptor; Phage display library; Coimmunoprecipitation; Gene silencing
【中文摘要】无
【英文摘要】White Spot Syndrome Virus (WSSV) is a virulent and widespread dsDNA virus with a wide range of hosts. Although remarkable progress has been made on virus characterization, however, its mechanism of infection is poorly understood. In this study, by analyzing the phage display library of the WSSV genome, a WSSVenvelope protein VP187 (wsv209) was found to interact with shrimp integrin. VP187 possesses the RGD motif. The interaction between integrin and VP187 was confirmed with coimmunoprecipitation. These results demonstrate for the first time an interaction between the WSSVenvelope protein and a cell surface molecule. Soluble integrin, integrin-specific antibody and an RGD-containing peptide were found to block the WSSVinfection in vivo and in vitro. Gene silencing using a sequence-specific dsRNA targeting β-integrin effectively inhibited the virus infection. These findings suggest that β-integrin may function as a cellular receptor for WSSV infection.

【题目】Evidence of existence of infectious hypodermal and hematopoietic necrosis virus in penaeid shrimp cultured in China
【中文关键词】无
【英文关键词】IHHNV; Litopenaeus vannamei; PCR; In situ hybridization; Dot blot hybridization; Histopathology
【中文摘要】无
【英文摘要】Infectious hypodermal and hematopoietic necrosis virus is the causative agent of a shrimp disease which causes economic losses on a global scale. A pair of primers, I2814F/I3516R, was designed from the IHHNV genomic sequence AF218266 (GenBank) that encodes for structural protein corresponding to nucleotides 2814 – 3516, which amplifies a 703 base pair (bp)region from the virus genome. PCR amplification with the primers generated a product of the expected size from the purified IHHNV DNA of Litopenaeus vannamei and IHHNV-infected penaeid populations but not from the IHHNV-free shrimp, white spot syndrome virus (WSSV) and hepatopancreatic parvovirus (HPV). The PCR amplicon described above was labeled withdigoxigenin (DIG)-11-dUTP as a probe used for dot blot hybridization and in situ hybridization test. Under the optimized PCR conditions, the primers were detected by as little as 20 fg of purified IHHNV DNA, which contained only 8.83 x103 copies ofIHHNV, a 1000-fold greater than using dot blot hybridization. Sections of histopathology showed eosinophilic intranuclear inclusions (Cowdry type A inclusions or CAIs) in infected tissues while in situ hybridization, cells displayed an intense reactionwith the DIG-labeled probe. PCR assay was developed to detect IHHNV in penaeid shrimp and other crustaceans from the rearing ponds of China (March 2001 – June 2004). The positive rate was 51.5% (154 out of 299) and 8.3% (2 out of 24) for penaeid shrimp and crab samples, respectively. The survey demonstrated the presence of IHHNV in China.

【题目】Effect of VP28 DNA Vaccine on White Spot Syndrome Virus in Litopenaeus vannamei
【中文关键词】无
【英文关键词】White spot syndrome virus (WSSV) - VP28 - DNA vaccine - Litopenaeus vannamei
【中文摘要】无
【英文摘要】White spot syndrome virus (WSSV) occurs worldwide and causes high mortality and considerable economic damage to the shrimp farming industry. Considering the global environmental, the economic and sociological importance of shrimp farming, and the constraints of high intensity cultivation, development of novel control measures against the outbreak of WSSV become inevitable. In this study, we have explored the protective efficacy of DNA vaccination and tissue distribution of the recombinant plasmid in immunized Litopenaeus vannamei. The VP28 gene was cloned in the eukaryotic expression vector pVAX1, and the construct vector was named as lpv28. The protective effect of lpv28 against WSSV was evaluated in L. vannamei by injecting lpv28 construct and later challenging with WSSV. Expression of these proteins from the recombinant plasmids was confirmed in vitro by RT-PCR and Western blot analysis. The result of vaccination trials showed that a survival rate in shrimp vaccinated with lpv28 was 52.5% at most compared to control groups (100% mortality). The immunological parameters analyzed in the vaccinated and control groups showed that the vaccinated groups owned a high level of lysozyme, alkaline phosphatase, and total superoxide dismutase when compared to the control group. Furthermore, protein expression analysis indicated that VP28 can be detected in gill, muscle and head soft tissue of the shrimps in the immunized group after 14th day injection. Thus, the result indicated that DNA vaccination strategy has a potential utility against WSSV.

【题目】Membrane Binding Activity with Virus in White Spot Syndrome Virus-Infected Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】White spot syndrome virus, Fenneropenaeus chinensis, binding activity, Infection
【中文摘要】无
【英文摘要】Problem Statement: White Spot Syndrome Virus (WSSV) is one of the most disastrous pathogens in shrimp culture, having caused high mortality in many cultured shrimp species. It is wellknown that the most important step of viral infection is cell attachment. Approach:Thereforedetermining the binding activity of shrimp cells to WSSV is an important to evaluate anti-infection ability and understanding the procedure of a viral infection. So this study aims to analyze binding activity of cell membrane with WSSV in shrimp of Fenneropenaeus chinensis (F. chienesis). WSSV was used to stimulate F. chinensis and binding activity in gills, muscle and hepatopancreas with virus within the procession of WSSV was measured. Results:The results showed that binding activity in gills with WSSV within infection stage (0-96 h) had no significant change. The highest binding activity was attained after infection 24-48 h in muscle. The binding activity in hepatopancreas with WSSV was lower during infection stage (0-96 h). Conclusion/Recommendation: The higher binding activity of WSSV to gills and muscle indicated that gills and muscle are the importance target tissue for WSSV infection. This suggested that receptor of WSSV existed in gills and muscle.

【题目】Molecular Epidemiological Investigation of Infectious Hypodermal and Hematopoietic Necrosis Virus and Taura Syndrome Virus in Penaeus Vannamei Cultured in China
【中文关键词】无
【英文关键词】Infectious hypodermal and hematopoietic necrosis virus(IHHNV); Taura syndrome virus(TSV); Prevalence; Genetic variation
【中文摘要】无
【英文摘要】The Infectious hypodermal and hematopoietic necrosis virus (IHHNV) and Taura syndrome virus (TSV) are two important shrimp viruses in cultured shrimp in America. These two viruses weretransmitted to China at the beginning of the 21st century. In this study, 214 shrimp samples of Penaeus vannamei were collected from seven different areas of China and tested by PCR for IHHNV and TSV infection. The results showed that there were a high prevalence of IHHNV (65.42%) and low prevalence of TSV (3.27%) in the tested samples. Several samples were found to be co-infected with these two viruses. A 3 kb fragment of 7 positive IHHNV samples and a structure protein region (ORF2) of three TSV positive samples were amplified and sequenced. The sequence comparison indicated that both IHHNV and TSV sequenced in China have a low genetic variations compared with the prototype IHHNV and TSV from Hawaii. Phylogenetic analysis showed that TSV isolates were clustered into two groups, Asia and America group, which was genetically correlated to geographic distribution.

【题目】Proteomic Analyses of the Shrimp White Spot Syndrome Virus
【中文关键词】无
【英文关键词】White spot syndrome virus (WSSV); Proteomic analysis; Structural proteins
【中文摘要】无
【英文摘要】White spot syndrome virus (WSSV), a unique member within the virus family Nimaviridae, is the most notorious aquatic virus infecting shrimp and other crustaceans and has caused enormous economic losses in the shrimp farming industry worldwide. Therefore, a comprehensive understanding of WSSV morphogenesis, structural proteins, and replication is essential for developing prevention measures of this serious parasite. The viral genome is approximately 300kb and contains more than 180 open reading frames (ORF). However, most of proteins encoded by these ORF have not been characterized. Due to the importance of WSSV structural proteinsin the composition of the virion structure, infection process and interaction with host cells, knowledge of structural proteins is essential to understanding WSSV entry and infection as well as for exploring effective prevention measures. This review article summarizes mainly current investigations on WSSV structural proteins including the relative quantities, localization, function and protein-protein interactions. Traditional proteomicstudies of 1D or 2D gel electrophoresis separations and mass spectrometry (MS) followed by database searches have identified a total of 39 structural proteins. Shotgun proteomics and iTRAQ were initiated to identify more structural proteins. To date, it is estimated that WSSV is assembled by at least 59 structural proteins, among them 35 are defined as the envelope fraction (including tegument proteins) and 9 as nucleocapsid proteins. Furthermore, the interaction within several major structural proteins has also been investigated. This identitification and characterization of WSSV protein components should help in the understanding of the viral assembly process and elucidate the roles of several major structural proteins.

【题目】WSSV-VP39 基因克隆与结构分析
【中文关键词】WSSV-VP39; 基因; 克隆; 序列分析;
【英文关键词】WSSV-VP39 Gene Clone Sequence analysis
【中文摘要】根据已公布的WSSV-VP39全基因序列(GenBank No.AAL89161)设计1对引物,经PCR扩增及琼脂糖凝胶电泳分析,扩增出约898bp的特异条带,将其回收后克隆入pGAPZα-A载体中,并进行序列测定与分析。结果表明,扩增序列与Gene Bank登录序列(GenBank No.AAl89161)核苷酸同源性100%。序列分析表明,WSSV-VP39基因编码蛋白无跨膜区域,有多个蛋白激酶C、酪蛋白激酶Ⅱ磷酸化位点和酪氨酸硫酸化位点,1个糖基化位点。蛋白序列比对结果表明,WSSV-VP39与WSSV-VP37具有较高的同源性,其在WSSV侵染中的作用值得关注。
【英文摘要】PCR primer was designed according to WSSV-VP39 nucleotide sequence from GenBank. After PCR reaction and electrophoresis analysis, a specific 898bp DNA band was amplified and cloned into vector of pGAPZα-A. Nucleotide sequence analysis showed that the sequence amplified was 100 % identity with the sequence of GeneBank(GenBank No.AA l89161)of WSSV-VP39. Predicted protein from nucleotide sequence of WSSV-VP39 had no notable transmembrane region, but contained much PKC-PHOSPHO-SITE, CK2-PHOSPHO-SITE, SULFATION -SITE. BLAST protein results showed that WSSV-VP39 had high homology with WSSV-VP37. The function of WSSV-VP39 in the course of WSSV infection claims attention.

【题目】一种大规模制备双链RNA的简单方法及其在斑节对虾中的应用

【中文关键词】斑节对虾; RNA干扰; 双链RNA; 体内转录; 大肠杆菌HT115; kazal型蛋白激酶抑制剂;

【英文关键词】Penaeus monodon; RNAi; dsRNA; in vivo transcription; Escherichia coli HT115; kazal proteinase inhibitor

【中文摘要】RNA干扰(RNAi)是由双链RNA(dsRNA)诱发的特异性沉默目的基因表达的过程,一种大规模制备双链RNA的方法可以便利RNAi技术的应用。以斑节对虾kazal型蛋白激酶抑制剂(KPI)基因为例,详细介绍了一种以体内载体表达大量制备dsRNA(>300nt)的方法。使用商业载体pGEMT和pDRIVE,以2步克隆法构建含有发夹环(hairpin loop)dsRNA表达载体,转化RNA酶III缺陷的大肠杆菌HT115(DE3)进行体内转录制备dsRNA。构建的发夹RNA表达载体含有494bp的正向靶序列和403bp的反向互补靶序列,其中正向靶序列多出的91bp即可成为loop环,而无需再次克隆加入。培养30mL的细菌,即可得到1mg纯化的dsRNA,而其成本仅为使用商业化体外转录试剂盒的四分之一。为评估RNAi效果,按照每1克虾体肌肉注射2μg dsRNA的剂量,在dsRNA注射后0,6,12和24h采集血淋巴,RT-PCR检测KPI mRNA的基因转录水平。与对照组GFP-dsRNA和NaCl注射组相比,KPI-dsRNA注射组可以在24h内沉默血淋巴中的KPI基因。结果表明该方法是可大规模制备长的dsRNA的方法。

【英文摘要】RNA interference(RNAi)is initiated by double-stranded RNA(dsRNA)and has been used to improve our knowledge of the shrimp immune system.RNAi has also been used on a therapeutic approach for shrimp virus control.Method for dsRNA synthesis on a large scale will facilitate the application of RNAi in farmed shrimp.Kazal proteinase inhibitor(KPI) gene of shrimp Penaeus monodon was used as an example to show a large-scale preparation of long double-stranded RNA(>300 nt) in detail by a 2-step cloning method.Two commercial vectors pGEMT and pDRIVE were used to construct a dsRNA-expression system,which transformed into RNase-deficient Escherichia coli HT115(DE3).The hairpin-RNA consisted of the target forward sequence(494 bp)and a 91-base shortened version of its inverted repeat(403 bp)to introduce a loop,no more need for direct cloning of the loop segment.The hairpin-expression vector resulted in large-scale dsRNA synthesis,the yield of dsRNA was about 1 mg dsRNA/30 mL bacterial culture,and its cost was approximately one fourth of the cost of same production by using a commercial in vitro transcription kit.A test group of shrimp Penaeus monodon(8 g,12 shrimp each group)was injected intramuscularly in the fourth or fifth abdominal segment with 16 μg dsRNA to investigate the sequence specific RNAi effect on endogenous KPI mRNA expression.The NaCl injected group and GFP-dsRNA injected group were used as control.Hemolymph(200 μL)was collected from 3 shrimp at 0 h,6 h,12 h,and 24 h.RT-PCR test showed that KPI expression was completely knocked-down at 24 h.It should be possible to produce industrial-scale dsRNA production for shrimp farms by this in vivo transcription method. 更多

【题目】鲽形目分类信息分析系统的建立与实现

【中文关键词】鲽形目; 数据库; 分类学信息; 分类检索系统

【英文关键词】pleuronectiformes; database; taxonomic information; taxonomic identification system;

【中文摘要】鲽形目鱼类经济价值较高,进化史悠久复杂,形态构造呈特殊的不对称性,分类系统备受关注但至今尚未统一。本文通过创建专项数据库、标准化数据索引和流程化分类学功能模块,将鲽形目分类阶元系统、分类检索表、序列比对搜索、DNA条码检索、分子系统树和分类参考资料等分类学信息研究的各要素有机地融为一体,实现了对传统分类特征与分子序列特征的信息集成、关联、分析和应用,阐明了将数据搜索、挖掘、分析和通用查询等综合应用于分类检索系统的方法,建立了一种特定阶元的分类系统软件开发模式,开发了鲽形目分类信息分析系统。

【英文摘要】The taxonomy system of the order Pleuronectiformes has attracted great attention because of the economic importance and the extremely specialized asymmetric morphology of flatfishes,but remains unresolved for its long and complex evolution history as well as the complicated physical structure.Here we constructed an integrated information management system for taxonomic and molecular information of the order.By establishing a new process to deal with a comprehensive database,a standard compound-index and dynamic taxonomic function modular programming,several most important taxonomic study methods are bound together to Windows platform,including the taxonomy system,identification key, DNA barcoding system and molecular software tools for gene sequence analysis of molecular phylogeny. The aim of developing the program is to establish an easy-using and functional tool for excavation,association, analysis and application of exploration and research of taxonomic data,both for traditional morphological information and for gene sequence data.The program will be able to provide a new model for designation of taxonomic information of an assigned taxonomic category. 更多

【题目】条斑星鲽精子超微结构研究
【中文关键词】条斑星鲽,精子,超微结构,核前凹陷
【英文关键词】Verasper moseri,Ultrastructure,Spermatozoon,Anterior pit of the nucleus
【中文摘要】分别以扫描电镜和透射电镜方法研究了条斑星鲽精子的超微结构。条斑星鲽精子全长45.57±3.23/~m,主要包括三部分:头部、中段和鞭毛。头部呈圆形,主要结构为近圆形的细胞核;中段不发达,主要包括线粒体和中心粒复合体两部分,具有多个未分化的圆形小线粒体;鞭毛细长,结构为典型的“9+2”型双联微管结构,无侧鳍。这些特征表明,条斑星鲽的精子属于简单的原始类型。条斑星鲽精子不具顶体,但具有开口于核前端稍偏处呈不规则状的核前部凹陷及核内核泡结构,核前凹陷与染色质区无界膜分隔,部分精子在凹陷前端存在由核膜构成的凸起。凹陷区的前部及其开口处常有多个小的具单层界膜的囊泡,这些结构可能是顶体的遗迹,但也不排除其是向外释放核内物质的一种途径的可能性。
【英文摘要】The ultrastructure of barfin flounder Verasper moseri spermatozoon was stud—ied with scanning microscopy and trans—mission electron microscopy.Total length of the spermis 45.57± 3.23tzm (n一11),and the sperm includes three parts:head,mid—piece and flagellum.The spherical head mainly consists of the nearly circular cel1 nucleus.The mid—piece iS corn—posed of mitochondria and center grain complex,with some round undifferentiated small mitochondria.The typical‘9+2’pattern of the flagellum has quite simple structure,which meansthat the spermatozoon of barfin flounder can be classified as a primitive type,which iS found inmost of the advanced fish taxa.But the anterior vesicles and pit of the nucleus of this spermato—zoon have seldom reported from other species.There is no acrosome in the sperm.At anterolat—era1 to the nucleus,there is a chromatin—free,electron—lucent area,which was named the anteri—or pit of the nucleus.W ithin and in front of the pit,an irregular—shaped structure and some dif—ferent sized vesicles that are encapsulated in a layer of membrane were found.W ith regard to ac—rosome and acrosome vestige present in some other euteleosts,we presume that the vesiclesmay represent acrosome vestiges though they may also function to release nuclear material,while the irregular—shaped structure in front of the nucleus may be caused by improper samplepreparation.

【题目】性类固醇激素及其受体在半滑舌鳎性腺分化发育过程中的表达与生理功能
【中文关键词】半滑舌蹋;E2;ERα;AR;免疫组织化学
【英文关键词】Cynoglossus semilaevis G ü nther, 17 β -Estradiol, Estrogen receptor, Androgen receptor, Immunohistochemistry
【中文摘要】首次用17丹雌二醇(E Z)及其受体(ER a) 肇酮受体(A R)的多克隆抗体在半滑舌蹋(心nog lossus sem ilae二15G 如th er)性腺分化发育过程中进行免疫细胞化学定位研究 结果表明:在半滑舌蝎原始性腺中已有民 E R 和A R 的分布和表达;卵原细胞 初级卵母细胞 精原细胞 初级精母细胞 次级精母细胞对E :及ER a A R 抗体均呈现不同程度的阳性反应,在精细胞和精子中对玖和E R 呈免疫阴性反应,而A R 则一直保持较强表达,揭示了半滑舌蹋性腺中类固醇激素可能通过旁分泌调控机制刺激卵子和精子发育和成熟 性类固醇激素及其受体免疫阳性物定位在生殖细胞的胞质 胞膜和核膜等广泛部位并有表达, 在性腺分化和不同发育时期的表达强度有所不同, 表明其在性腺分化发育过程各阶段所起生理功能不同 这些结果为证明性类固醇激素及受体参与调节半滑舌蹋性腺分化发育提供了重要形态学新证据。

【英文摘要】Immuno-histo-chemical localization of 17β-estradiol (E2), receptors of testosterone (AR) and esrogen α (ERα) were investigated for the first time in the gonads during differentiation and development of Cynoglossus semilaevis Günther using polyclonal antibodies. The results indicated that E2, AR and ERα coexisted in the primary gonad before differentiation. Oogonia, oocytes, spermatogonia, primary spermatocytes and secondary spermatocytes all showed positive reaction to E2, AR and ERα antibodies, whereas in spermatid and spermatozoa, E2 and its classical receptor ERα were not expressed expecr for AR. AR existed and strongly expressed in the gonad at all different differentiation and developmental stages, which indicated that sex steroid hormone may regulate the maturation of gametes through paracrine way. The sex steroid hormone and their receptors were expressed in cytomembrane, cytoplasm, nuclear membrane or nuclear plasm at different developmental stages with different intensity respectively, which showed their special functional characters, these results make it clear that E2, AR and ERα may physiologically functioned differently at different developmental stages of gonad. These results provided new morphological proofs that E2, AR and ERα participate in the regulation of physiological function in gonad differentiation and development in tongue fish.

【题目】Divergent Characteristics of Soil Fungi and Actinomycetes at River Wetland on Typical Steppe

【中文关键词】典型草原,河流湿地,真菌,放线菌,多样性
【英文关键词】Typical Steppe, River Wetland, Fungi, Actinomycetes, Diversity

【中文摘要】在这项研究中,通过平板培养技术研究了优势土壤优势菌的组成,如河流湿地和典型草原土壤真菌和放线菌的组成和趋异特征,分析了土壤丝状菌的几个指标,例如多样性、丰富度、均匀度和优势度。结果表明,土壤丝状菌优势菌群沿着陆向分布呈现有明显的趋异特征。对于真菌,河中心(HX),河边(HB),低河漫滩(DQ)及高河漫滩(EQ)与典型草原(DT)之间的多样性和丰富度有显著的差异;HX和DQ和EQ之间的均一度有显著的差异。对于放线菌,HX和HB之间与EQ和DT之间的多样性和均匀度有显著的差异;HX、HB、DQ、EQ与DT之间的丰富度有显着的区别。河流湿地和典型草原之间的优势菌群有一定差异。在HX点,最优势菌群是毛霉,占100%。在DQ点,优势菌群是毛霉和头孢,各占50%。在EQ点,毛霉和头孢分别占62.2%和21.1%。在DT点,青霉成为优势菌群,占69.2%。对于放线菌,秃顶菌群在HB点占100%和66.7%。在DQ点,两个主要的菌群是秃头菌和Griseofuscus菌,分别占据38.5%和41.3%。在DT点,占主导地位的菌群是Griseofuscus,为61.7%。对于河流湿地,丝状菌的数量和多样性从水生环境→湿生环境→陆生环境都表现出趋异特征,其中DQ、EQ和DT点更适合丝状微生物的生长,丝状微生物的分解过程促进了河流湿地的形成和演化。这些结果为更好地认识河流湿地的形成和演化机制提供了依据,为保护和合理利用河流湿地奠定了基础。

【英文摘要】In this study, the composition of dominant microorganisms, such as fungi and actinomycetes, in river wetland soil on typical steppe were measured through Spread-Plate-Technique; the divergent characteristics of these two floras at river wetland and typical steppe were analyzed; and several indicators of soil filamentous microorganisms, for example, diversity, richness, evenness, and dominance, were calculated. The results demonstrated that there is obvious divergence characteristics of terrestrial distribution for predominant flora, i.e. soil filamentous microorganisms, at river wetland on typical steppe. For fungi, there is significant difference between river center (HX), riverside (HB), low floodplain (DQ) & high floodplain (EQ), and typical steppe (DT) for diversity and richness; and there is significant difference between HX and DQ & EQ for evenness. For actinomycetes, there is significant difference between HX & HB, and EQ & DT for diversity and evenness; and there is significant difference between HX, HB, DQ & EQ, and DT for richness. There are certain differences between predominant floras at river wetland and typical steppe. At HX, the most dominant flora is Mucor to account for 100%. At DQ, the dominant floras are Mucor, accounting for 50%, andCephalosporium, accounting for 50%. At EQ, Mucor accounts for 62.2% and Cephalosporium accounts for 21.1%. At DT, Penicillium has become the dominant flora to account for 69.2%. For actinomycetes, balding group accounts for 100% at HB and 66.7%. At DQ, two dominant floras are balding group and Griseofuscus to account for 38.5% and 41.3%, correspondingly.At DT, the dominant flora is Griseofuscus to account for 61.7%. For filamentous microorganisms at river wetland, two indicators, numbers and diversity, have shown the divergent characteristics that it evolves from humidogene to humidogene terrestrial, then to terrestrial, where soil environment at DQ, EQ and DT are more suitable for the growth of filamentous microorganisms, and the decomposing processes from filamentous microorganisms have facilitated the development and succession process of river wetland. The results

have demonstrated a better understanding toward the development and succession mechanisms of river wetland to provide the basis for protection and rational utilizations of river wetland.

【题目】The Distributive Characteristics of Soil Microorganisms at Dry Lake Wetland on Semiarid Grassland
【中文关键词】半干旱草原,干涸湖泊湿地,土壤微生物
【英文关键词】Semiarid grassland, Dry lake wetland, Soil microorganisms
【中文摘要】这项研究调查了半干旱干旱湖泊湿地土壤微生物的分布特征。选择了辉腾锡勒4个样块,典型草原(DT),湖边(HB),湖床(HD)和湖中心(HX)进行调查。结果表明,DT样块的需氧细菌数目是HB的1.07倍、HX的1.14倍,HD的1.45倍。在DT样块真菌的数量是HD 的3.81倍、 HB的10.65倍、HX的25.75倍。 HX、HB和其他两个样块之间有显着性差异(P <0.05)。此外,HD和DT之间有显着的差异。在DT产孢细菌的数量是HD的1.65倍,HB的2.15倍,HX的6.35倍。 HD,HB和其他两个地块之间也有显着的差异。在HB的放线菌数量最高,为HD的2.12倍,DT 的2.27倍,HX的3.43倍。此外,半干旱草原区干涸湖泊湿地土壤微生物群落有一个明显的横向分布特征土。除了放线菌外,干涸湖泊湿地土壤微生物数量均低于典型草原。是一个显着的土壤微生物总数和微生物生物量碳之间存在显著的相关性。这些结果可以为退化干涸湖泊湿地的恢复提供理论基础,为湿地微生物资源的开发和利用奠定了理论基础。
【英文摘要】This research investigated the distributive characteristics of soil microorganisms at dry lake wetland on semiarid grassland. Four plots, typical steppe (DT), lake side (HB), lake bed (HD), and lake center (HX), were selected from Huitengxile located in semiarid grassland to conducted this investigation. The results showed that the number of aerobic bacteria at DT is 1.07 times that at HB, 1.14 times that at HX, and 1.45 times that at HD. The number of fungi at DT is 3.81 times that at HD, 10.65 times that at HB, and 25.75 times that at HX. There is significant difference between HX, HB and the other two plots ($p<0.05$). Also, there is significant difference between HD and DT. The number of Spore-forming bacteria at DT is 1.65 times that at HD, 2.15 times that at HB, and 6.35 times that at HX. There is significant difference between HD, HB and the other two plots, as well. The number of actinomycetes at HB is highest which is 2.12 times that at HD, 2.27 times that at DT, and 3.43 times that at HX. Moreover, there is a distinct feature of transverse distribution for soil microorganisms communities at dry lake wetland on semiarid grassland. Excluding actinomycetes, the number of soil microorganisms at dry lake wetland were both lower than that at typical steppe. There is a significant correlation between the total amount of soil microorganisms and microbial biomass C at dry lake wetland. These results can be used as the theoretical foundation for the restoration of degraded lake wetland, and the exploitation and utilization of wetland microbial resources.

【题目】Terrestrial distribution of soil microbial quantity in natural wetland of the Xilin River at Mongolian Plateau
【中文关键词】蒙古高原,天然湿地,土壤微生物,陆向分布
【英文关键词】Mongolian plateau; natural wetland; soil microorganism; terrestrial distribution
【中文摘要】本研究调查了锡林河自然湿地土壤细菌,真菌和放线菌数量的陆分布。结果发现典型草原和天然湿地土壤微生物群落组成从污泥床(HX)到典型草原(DT)发生了明显的变化,即随着海拔高度的变化土壤水分含量逐渐减少发生了显著的改变。总的微生物和好氧性细菌的数量沿着HX、HB和DQ的顺序逐渐增加。 DQ点好氧菌的数量为HB的2.74倍,为

HX的5.53倍。沿着DQ, EQ和DT的顺序微生物总数和好氧性细菌的数量逐渐减少。 DQ好氧菌数是EQ的1.36倍、为DT的9.89倍。从HX到DT微生物分布呈现单峰趋势且峰值出现在DQ,表明DQ环境更适合好氧菌的生长和繁殖。芽孢细菌和真菌数量随着土壤水分的减少逐渐增加,此外,芽孢细菌和真菌数量,与有机质,总氮,总磷和微生物生物量碳含量呈现正相关关系。HX,HB和其他三个样本间芽孢细菌的数量有显着差异,且在DQ,EQ,DT间存在显著差异。真菌数量在HX,HB,DQ,DT和EQ,EQ及DT之间有显著差异。 DT含有数量最多的放线菌,其数量与DT和湿地之间有显著差异。

【英文摘要】Terrestrial distribution with soil bacteria, fungi and actinomycetes amount of the Xilin River natural wetland was investigated. The result that soil microbial community compositions of typical grasslands and natural wetlands, with the elevation changes gradually reduce the soil moisture content from bed sludge (HX) to typical steppe (DT), changed significantly. The total microbial and aerobic bacteria numbers were gradually increased in order of HX, riparian mire (HB) and low flood plain (DQ). DQ is 2.74 times as aerobic bacteria number as HB and 5.53 times as aerobic bacteria number as HX. The total microbial and aerobic bacteria numbers were gradually decreased in order of DQ, high flood plain (EQ) and DT. DQ is 1.36 times as aerobic bacteria number as EQ and 9.89 times as aerobic bacteria number as DT. The tendency of microbial terrestrial distribution from HX to DT is single peak which appear DQ, indicating that DQ environment is more suitable for growth and reproduction of aerobic bacteria. Spore-forming bacteria and fungi numbers were gradually increased with soil moisture decreasing from HX to DT, in addition, the positive correlations are foundbetween Spore-forming bacteria and fungi numbers and organic matter, total nitrogen, total phosphorus and microbial biomass C contents. Spore-forming bacteria numbers have significant differences between HX, HB and other three samples, and significant differences were found among DQ, EQ, DT. Fungi numbers have significant differences between HX, HB, DQ and EQ, DT, and significant differences were found between EQ and DT. DT included the largest number of actinomycetes and its numbers have significant differences between DT and wetlands.

【题目】辉腾锡勒草原干涸湖泊中氨氧化微生物群落结构分析
【中文关键词】湖泊干涸,MPN-PCR,氨氧化古菌,氨氧化细菌,生物多样性
【英文关键词】dry-up,MPN-PCR,Ammonia-oxidizing archaea,Ammonia-oxidizing bacteria,biodiversity

【中文摘要】【目的】以内蒙古辉腾锡勒草原九十九泉湿地为对象,研究湖泊干涸过程中氨氧化微生物的群落结构及其变化。【方法】通过 MPN-PCR 定量测定氨氧化古菌(AOA) 和氨氧化细菌(AOB) 的数量; 构建 amoA 基因克隆文库,进行系统发育分析; 结合土壤环境因子,探讨湿地退化过程中影响氨氧化微生物的潜在因素。【结果】依湖泊湿地退水梯度的不同样点中,有 75% 的样点 AOB 的数量高于 AOA,AOB 与 AOA 的数量比率为0.3-18.1。从湖心到湖岸草原带,AOA 和 AOB 的数量有明显增加,但生物多样性呈降低趋势,二者没有呈现正相关。研究发现,AOB 的数量与土壤中 NH+4 -N 的变化存在良好响应。系统发育分析显示,退化湖泊湿地 AOA 克隆序列均来自于泉古菌门(Crenarchaeota) ; AOB 的 amoA 基因的克隆序列大部分与亚硝化单胞菌属(Nitrosomonas) 有一定同源性,较少部分与亚硝化螺菌属(Nitrosospira) 有一定同源性。【结论】湖泊退水过程增加了湿地土壤氨氧化微生物的数量,而氨氧化微生物的种群丰度有所降低。AOA 和 AOB 群落对湖泊湿地的退化过程做出了响应,其中 AOB 的响应较为明显,氧化条件和土壤铵浓度的改变可能是促成这种响应的重要原因。

【英文摘要】[Objective]To investigate the structure of ammonia-oxidation microbial communities in the wetlands to dry-up process at 99 degraded lakes of the Huitengxile grassland in the Inner Mongolia Plateau.[Methods]The microbial quantity of ammonia-oxidizing archaea (AOA) and ammonia oxidizing bacteria (AOB) were examined by most probable number-polymerase chain reaction (MPN-PCR) . The clone libraries of amoA were constructed and phylogenetics were analyzed.With analysis of the soil properties,we evaluated the effects of wetlands degradation on ammonia-oxidation microbes communities.[Results]In 75% of the samples,the quantity of AOB communities was higher than that of AOA; moreover, quantity of bacterial were up to 18. 1-fold more abundant than Archaea's.The AOB microbial quantity was strongly correlated with NH+4 -N content in the soil.Phylogenetic analyses of the amoA gene fragments showed that most AOB sequences from degraded wetlands were affiliated with Nitrosomonas-like species and a few close to Nitrosospira. All AOA sequences belonged to the kingdom Crenarchaeote.[Conclusion] Experimental results showed that quantity of ammonia-oxidation microbes increased but community diversity declined during wetlands degradation ,and

oxidation conditions and ammonium concentration in the soil might play important roles in the community structure of both the AOA and AOB.

【题目】内蒙古高原干涸湖泊反硝化及甲烷氧化细菌的群落分析
【中文关键词】反硝化细菌;甲烷氧化细菌;末端限制性片段长度多态性(T-RFLP)技术;干涸湖泊;草原湿地
【英文关键词】denitrifying bacteria;methanotrophs;T-RFLP;dry-up lake;steppe wetland
【中文摘要】以内蒙古高原半干旱草原区干涸湖泊为研究对象,应用末端限制性片段长度多态性(T-RFLP)技术对湿地土壤中的反硝化和甲烷氧化关联菌群的关键功能基因 nosZ 和 pmoA 进行了研究,根据末端限制性片段(T-RFs)分析了两种菌群的群落结构及多样性变化,以及环境因素所产生的影响,并探讨了土壤微生物群落对湖泊干涸的响应机制.结果表明:干涸湖泊的湖心、湖底土壤反硝化和甲烷氧化细菌多样性指数较高,群落结构较复杂;而较早干涸的湖坡以及相邻草原对照区,两个菌群多样性指数较低,群落结构相对单一.从湖心到相邻草原,反硝化和甲烷氧化细菌的群落相似度逐渐降低,显示两个菌群处于动态演替中.湖泊干涸过程中,水分含量和有机质含量对反硝化和甲烷氧化细菌的群落结构影响显著;高 pH 值和高铵态氮分别对反硝化和甲烷氧化细菌有抑制作用.随着湖泊干涸,土壤微生物群落因环境扰动而受到胁迫,这一过程会加剧 CO 2 等温室气体的排放.
【英文摘要】The method of terminal restriction fragment length polymorphism (T-RFLP) was used to study the community structures and diversities of denitrifying bacteria and aerobic methanotrophs by two key functional genes nosZ and pmoA in the wetland soils of dry-up lake in the Inner Mongolia Plateau. And the effects of soil factors on them were also evaluated, then the mechanism of microbiological communities in wetland soils response to the dry-up lake were discussed. The results showed that the diversity indices of denitrifying bacteria and aerobic methanotrophs were higher, and community structures appeared more complicated at the later dry-up plots. The opposite results were shown at the earlier dry-up plot and the adjacent steppe. Their similarity coefficients gradually declined from the middle of the lake to the adjacent steppe, indicating communities dynamic succession. During drying process, soil moisture and organic matter content had significant influence on both of them. In addition, high pH value and high NH+4 -N had inhibitory effects on denitrifying bacteria and the aerobic methanotrophs, respectively. The microbial communities were under the stress of dry-up process, which led to more emission of carbon dioxide and other greenhouse-gas from wetland soils.

【题目】基于活力和恢复力的典型草原健康评价和群落退化分级研究
【中文关键词】典型草原,活力,恢复力,生态系统健康
【英文关键词】typical steppe; vigor; resilience; ecosystem health
【中文摘要】根据群落的不同退化演替状况和物种组成情况, 随机选取19个位于锡林郭勒高原和呼伦贝尔高原的调查样地, 进行典型草原健康评价和群落退化分级研究。结果表明, 处在不同退化演替阶段的草原中的群落的优势种类型、活力和恢复力指数均存在很大差异, 活力和恢复力指数不存在明显的相关性, 这可能是由于活力指数表现 的是植物的地上生物量, 而恢复力指数表现的是植物的株/ 丛数, 在株/ 丛数很多的情况下生物量可能很小; 草原群落地上总生物量受 放牧强度、刈割 程度、围封时间、围封前群落状态和区域降水等因素的综合作用, 使得各调查样地群落的活力指数差异显著; 以中

国科学院草原生态系统定位研究站1981年设置的围封的羊草+大针茅草原当时的状态作为参照系统,评价了呼伦贝尔高原和锡林郭勒高原典型草原的健康状况,并对其退化程度进行了量化分级,可为草原管理、植被恢复重建和生态系统健康评价提供参考。

【英文摘要】The characterist ic of plant communities in t he t ypical st eppe of the Inner M ongolia plateau were investigated, and the vigor and resilience of plant communit ies w ere also calculated. The plant communities in different degradation and succession series presented great difference in dominant species, vigor and resilience. As the climax of typical steppe, S trip a g randis+ L eymus chinensis community kept the healthy species and higher biomass productivity because it could make full use of environmental resources. According to the characteristic of plant communities,the mode of degradat ion and succession, vigor and resilience, the ecosystem health of typical steppe was assessed using the sample of Stripa grandis+ L eymus chinensis community in 1981 as a reference system. The condit ions of degradation of communit ies were also quantitat ively classified. The results of this paper could be used as a simple, accurate and suitable method for ecosystem health assessment and management of typical steppe.

【题目】放牧对典型草原区湿地植物群落土壤呼吸的影响

【中文关键词】土壤呼吸速率;温度敏感性;土壤水分;生物量;Q10值

【英文关键词】soil respiration;temperature sensitivity;soil moisture;biomass;Q 10

【中文摘要】湿地的研究已成为生态学的重点,而湿地CO2通量研究则是该领域研究热点问题之一.采用 LI-8100土壤碳通量测量系统,测定了锡林河流域不同利用方式(围封保育与自由放牧)下的湿地土壤呼吸速率并分析了土壤温度、土壤湿地和地下根生物量等对其影响.结果表明,(1)湿地植物群落土壤呼吸日变化均呈现不对称单峰型曲线,其主要受土壤温度的影响.围封保育湿地植物群落土壤呼吸速率和日变化幅度均低于自由放牧样地,但其 Q 10值高于自由放牧样地,均值分别为2.848和2.250.(2)在0-50cm 各层土壤温度中,围封样地湿地植物群落土壤呼吸速率与地下10cm 的土壤温度拟合最好,而自由放牧样地则与地下15cm 的温度拟合最好.在围封湿地植物群落中土壤温度可以解释呼吸变化速率的57.2%-86.3%,而 在 自由放牧湿地植物群落中土壤温度则可以解释呼吸变化速率的57.7%-88.9%.(3)在湿地植物群落中,土壤温度是水分含量最高的湿地植物群落土壤呼吸的敏感因子,最高温时其呼吸速率达到峰值;而土壤水分是水分含量最低的湿地植物群落土壤呼吸的敏感因子,其土壤呼吸速率峰值出现在生长季水分含量最高月份.

【英文摘要】Research on wetlands has become the focus of ecology,and the research on CO 2 flux has been one hot topic.With the L1-8100soil carbon flux measurement system,the different soilrespiration were determined ,and the corresponding effect of relevant soil moisture,ground and underground biomass and soil temperature on it was analyzed.a)The results shown that the daily variation of soil respiration presents an asymmetric and single peak curve,and this variation was mainly determined by soil temperature.In the whole growing season,the amplitude in enclosed wetlandswas lower than that in degraded wetlands,the Q 10 of enclosed wetlands,however,was high than thatof degraded wetlands,and the means were 2.848and 2.250respectively.b)The soil respiration fitted best with temperature of underground 10cm in enclosed wetlands,but fitted best with temperature of underground 15cm in degraded wetlands.Soil temperature could explain the variation of soilrespiration in enclosed and degraded wetlands by 57.2%-86.3%and 57.7%-88.9%respectively.c)Soil temperature was the main sensitive factor of soil respiration in wetland plant communitieswith the highest moisture,when the temperature went to the highest,the respiration got to a peak;soil moisture is a sensitive factor in wetland communities with the lowest moisture,and the soil respiration rate got to a peak in the growing season when the soil moisture was highest.

【题目】15. Phylogenetic Analysis of Ammonia Oxidation Archaea from Natural Wetlands in Inner Mongolia Plateau
【中文关键词】湿地土壤,氨氧化古菌
【英文关键词】wetland soil; ammonia-oxidizing archaea
【中文摘要】为了更好地理解氨氧化古菌(AOA)的系统发育,我们使用玻璃珠/氯化钙/ SDS法提取湿地土壤样品中DNA以便于后续的聚合酶链反应。通过该方法获得amoA基因的扩增子,再通过克隆和测序来进行系统发育分析。 amoA基因序列表明,四种不同土壤中的氨氧化古菌均属于不可培养的泉古菌。
【英文摘要】To better understand the phylogeny of ammonia-oxidizing archaea(AOA), we used the glass bead/calcium chloride/SDS method to extract DNA from wetland soil samples for use in the polymerase chain reaction. Amplicons of the amoA gene obtained by this method were cloned and sequenced for phylogenetic analysis. The AmoA gene sequences obtained indicate that the ammonia-oxidizing archaea belong to uncultured Crenarchaeota in these four different soils.

【题目】内蒙古高原典型草原区河漫滩湿地植物群落退化表征
【中文关键词】退化表征,退化机制,湿地退化,锡林河
【英文关键词】degradation characterization, degradation mechanisms, wetland degradation, Xilin River
【中文摘要】草原区河流河漫滩草甸是生物多样性表现最充分和生物生产力最高的地段,但由于过度放牧利用,绝大部分草甸处于退化状态。该文以锡林河流域中游的河漫滩草甸为研究对象,比较分析了围封保育湿地与放牧退化湿地群落组成、地上生物量,以及共有植物种的植株高度、节间长、叶长、叶宽,土壤含水量、容重,群落地下根量及根的分布,土壤微生物生物量碳、氮的变化。结果表明:1)放牧使得湿地植物群落优势种发生变化,原有湿生植物逐渐向旱生化转变,同时地上及地下生物量明显降低。2)退化湿地的植物呈现显著小型化现象。3)放牧退化湿地的土壤含水量较围封保育湿地低,其垂直分布及地下根的垂直分布也发生变化。在低河漫滩,土壤水分随土层的增加而增加,根量也趋于深层化。但在高河漫滩湿地,土壤含水量接近典型草原,根未出现深层化分布趋势。4)放牧践踏引起土壤容重和土壤紧实度增加。5)放牧使得低河漫滩湿地土壤微生物生物量增加,而在过渡区及高河漫滩湿地,放牧使得土壤微生物生物量碳、氮含量显著降低。
【英文摘要】Aims River floodplain meadow is the most productive sites of biological, but due to excessive grazing, the vast majority becomes degraded meadow. In this paper, we compared Aims River floodplain meadow is the most productive sites of biological, but due to excessive grazing, the vast majority becomes degraded meadow. In this paper, we compared fenced (non-grazed) and grazed sites within the wetland. We present results of analyses of changes of vegetation in a Xilin River basin (Inner Mongolia) wetland meadow. Our findings is good information for the restoration of degraded wetlands and important for the restoration and management of degradation of wetland. Methods We carried out vegetation and soil characteristics studied include plant community composition, aboveground biomass, plant height, internode length, main species leaf length and width, plant community root biomass and root distribution, soil moisture content, soil bulk density, soil microbial biomass, carbon and nitrogen content. Important findings Grazing affects plant dominant species significantly by gradually replacing original wetland plants with more drought-resistant ones. It also significantly reduces the aboveground and belowground biomass; Plants in a degraded wetland meadow are smaller thus resulting in the decline in community productivity; Grazing also causes the drop in soil moisture in a wetland below the fenced sites. In the low flood plain, soil moisture and root biomass both increase with increasing soil depth. However, in the high flood plain, soil moisture does not change with soil depth and is similar to that of the typical steppe; Soil bulk density increases as a result of grazing and trampling by animals. Overall, soil becomes compacted due to these activities; In the high and low floodplain wetlands, the changes of soil microbial biomass carbon and nitrogen between fenced and grazed site are varied. In the low floodplain wetlands, grazing makes microbial biomass increased, while in the high floodplain wetlands, grazing makes significant reduction in microbial biomass carbon and

nitrogen.

【题目】暖温型草原土壤微生物生物量碳相关指标的评价作用
【中文关键词】暖温型草原;土地利用;土壤健康;生物学质量;呼吸商
【英文关键词】warm-temperate steppe; land use type; soil health; biological quality, qCO2
【中文摘要】选择内蒙古皇甫川流域暖温型典型草原区耕地、林地、草地等11种不同土地利用类型,测定分析了微生物生物量水平相关的土壤生物学指标,包括土壤的微生物生物量-C(Cbio)、基础呼吸量-C(CBR)、潜在呼吸量-C(CPR)、可浸提有机碳(Cext)等量化指标,计算出与土壤微生物生理生态功能有关的呼吸商(qCO2)、潜在呼吸商(CPR/Cbio)、矿化商(Cext/Cbio)、呼吸活化商(CBR/CPR)等衍生系数。结果表明:不同土地利用现状下,土壤生物学质量状况存在明显不同,土壤微生物生物量按农业耕地、乔木林地、天然草地、灌木林地、空闲湿地呈递减趋势,土壤微生物呼吸商等生理生态状况也呈基本一致的变化规律。该区域土壤肥力水平总体偏低,农业耕地、乔木林地(人工)和天然草地以生物量为指标的生态肥力仅为Ⅴ级水平。该区域土壤微生物的生理生态状况较为正常,土壤处于较为健康的状态,只有灌木林地(人工)和空闲湿地的土壤处于不稳定状态。坡上耕地、杨树林地和沙棘林地有较强的恢复潜力,沙柳林地和沟坝湿地恢复力最弱。通过因子辐射图和判别分析证实以上量化指标或参数均具有良好的土壤质量评价效果。
【英文摘要】In the warm-temperate steppe of Huangfuchuan watershed of Inner Mongolia, soil bioindicators related to soil microbial biomass were analyzed in different land use type, including quantitative indicators such as microbial biomass-C (Cbio), available organic-C (Cext), basal respiration-C (CBR), potential respiration-C (CPR), and derived parameters such as metabolic quotient (qCO2), respiratory activation quotient (CBR/CPR), potential respiration quotient (CPR/Cbio), mineralization quotient (Cext/Cbio). Analysis by synthesis showed that the soil health status was different under different land-use type. The eco-physiological responses of soil microorganism were found to be the diminishing law according to the order of agricultural land, arbor forest land, original herbage land, bush forest land and alluvial wetland. As a whole, the soil fertility of all plots is on the low side in warm-temperate steppe, in which the soil fertility of agricultural land, man-made arbor forest land, original herbage land can reach level V, that is to say, the soil is healthy correspondingly, while the soil of man-made bush forest land and alluvial wetland is ill. There is greater restoration potentiality in sloping fields, Populus simonii forest land and Hippophae rhamnoides areas, while there is the poorest restoration potentiality in Salix psammophyla land and dike fields. Based on the factors radiation charts and discriminant analysis, the bioindicators or parameters were proved to have good evaluation results. The index system for assessing soil health can be divided into three aspects,i.e. quantity,activity and functionality of soil microbe, which can synthetically reflect the soil biological quality information so that they can be used as sensitive and quantitive bioindicators in monitoring and evaluating soil health.

【中文关键词】七带石斑鱼,肌肉,营养成分,评价

【英文关键词】Epinephelus septemfasciatus,Muscle,Nutritional components,Nutrjtional evaluation

【中文摘要】对饲养的七带石斑鱼Epinephelus septemfasciatus Thunberg的含肉率、营养成分及鱼肉品质进行了研究,采用常规肌肉营养测定方法分析了4尾成鱼的肌肉营养成分。结果表明,七带石斑鱼的含肉率为76.73 ,肌肉(鲜样)中粗蛋白含量为19.6O ,粗脂肪为2.70 ,氨基酸总含量为18.33 ,其中7种必需氨基酸的总含量为7.59 ,占氨基酸总含量的41.4 ,其必需氨基酸的构成比例符合联合国粮农组织/世界卫生组织(FAO/W HO)的标准模式。必需氨基酸指数(EAAI)为82.38,5种鲜味氨基酸的总含量为8.22 。多不饱和脂肪酸含量为32.45 ,其中EPA 与DHA 的平均含量分别为6.11 和12.78 。七带石斑鱼肌肉矿物元素种类丰富,矿物质中钾含量(4561.02mg/kg)最高,在微量元素中锌含量(4.20 mg/kg)最高。

【英文摘要】Nutritional components in muscle of Epinephelus septemfasciatus were ana—lyzed with routine methods.The results showed that contents of crude protein,crude fat anddressed fish of fresh muscles were 1 9.60 ,2.70 and 76.73% ,respectively.The total con—tent of amino acids was 18.33% ;the content of essential amino acids was 7.59 ;the percent—age of essential amino acids in total amino acids was 41.40 .The five delicious amino acidaccOUnted for 8.22 and the amount of po1yunsa1turated fatty (PUFA)was 32.45 .The es—sential amino acids index (EAAI)was 82.38.The content of EPA and DHA was 6.1 l and12.78 ,respectively.It was apparent that the content of the different amino acids was stable and the corrtrition rate of the essential amino acids accorded with FAO/WHO standard.The compositon of mineral and trace elements of the fish was reasonable. It was indicated that E.septemfasciatus is a fish species with better nutritive value and therefore E.septemfasciatus will be an important cultured species in the future.

【题目】MS-222麻醉圆斑星鲽成鱼效果研究
【中文关键词】MS 222;麻醉;圆斑星鲽;有效质量浓度
【英文关键词】M S-222;anaesthetization;Verasper varieg,ates;effective mass-concentration
【中文摘要】不同水温(1 5°C 、20°C 和25°C)下、不同质量浓度的MS 222对圆斑星鲽成鱼的麻醉效果不同。根据鱼体在最终麻醉状态和复苏过程中的行为持征,分别把麻醉和复苏过程分为6个和4个时期。15°C 、20 oC和25 oC时MS 222麻醉圆斑星鲽成鱼的有效质量浓度分别为】8o~300 mg/I 、160~280 mg/I 和15O~230 mg/I 。实验结果表明:高水温条件下成鱼进入麻醉状态所需麻醉剂浓度较低;l5°C 、2o°C 和25°C 温度下在各自的有效质量浓度(180~300 mg/I 、l6o~280 rag/1 和l 5o~230 mg/I)范围内,浓度越高鱼体达到A4期的麻醉时间越短,但复苏时间无明显差异。随着水温的升高,同等麻醉浓度的麻醉剂对圆斑星鲽的麻醉效果逐渐增强。M~222麻醉圆斑星鲽的效果好,鱼体入麻时间短、复苏快,安全边界宽,是一种理想的鱼用麻醉剂。
【英文摘要】The anaesthetic effects of MS一222 on adult Verasper variegates depend upon water temperature(for exam ple,l5°C ,2O°C and 25°C) and M S一222 concentration. Based on the behavior characteristics ofthe fish at its fina】anaesthetic status and in the revival process,the final anaesthetic status can be dividedinto six stages,and the revivaI process into four stages.The effective anaesthetic concentrations of M S一222on adult Verasper variegates at 15°C ,20°C and 25°C are 180~300 mg/I ,160 280 mg/I and 150~230rag/I respectively.It is shown in the results that the effective concentration of MS一222 becomes 1owerwith higher water temperature. W ithin the effective concentration ranges described above.the higher theconcentration of M S一222 is,the shorter the tim e for the fish tO be anaesthetized up to Stage 4,while thetime for the fish tO revive are rather independent upon M S一222 concentration. If M S一222 concentration remains unchanged,the M S一222 anaesthatic effects on the fish become stronger as the water tem perature isincreased.M S一222 as a fish anaesthetics is effective,it enables the fish tO be rapidlv anaesthetized.andthen to revive soon after the fish has been anaesthetized. Also it is safe within a wider dosage range for theanaesthetization.Therefore M S一222 iS an idea1 fish anestheti

【题目】七带石斑鱼繁殖群体“突眼”症病原菌的分离与鉴定
【中文关键词】七带石斑鱼;“突眼”症;病原菌;哈维氏弧菌;
【英文关键词】Epinephelus septemfasciatus Exophthalmic disease Pathogenic bacteria Vibrio harveyi;
【中文摘要】2007~2008年间,对暴发"突眼"症的七带石斑鱼繁育群体,从细菌学、寄生虫学和病毒学等方面进行了全面的筛查和实验研究。从具有明显"突眼"症的七带石斑鱼病灶组织中分离出1株致病力极强的优势菌CB1008,经人工感染试验证实为此次七带石斑鱼"突眼"症的致病菌。该菌革兰氏染色呈阴性,电镜下观察菌体呈短杆状,极生单鞭毛。通过API-32E鉴定系统和菌体常规形态特征、培养特性和生理生化反应指标测定,以及16S rDNA测序分析等综合鉴定,菌株CB1008为弧菌属哈维氏弧菌Vibrio harveyi。药敏试验结果表明,该菌株对氯霉素、萘啶酸、四环素、氟哌酸和氟罗沙星等5种药物较为敏感。
【英文摘要】A pathogenic bacterial strain CB1008 was isolated from the eyes and internal organs of seven-band grouper Epinephelus septemfasciatus.It was proved to be the pathogen of the diseased seven-band grouper by artificial infection test.Morphological observations showed that it was a short-rod and Gram-negative bacterium with single polar flagella.According to API-32E system,through traditional physiological and biochemical experiments and 16S rDNA gene homology comparison of the bacterium,the results showed that the reisolated strain CB1008 was Vibrio harveyi.The test of sensitivity of strain CB1008 to 36 kinds of antibiotics revealed that the pathogen was sensitive to Chloramphenicol,Nalidixan,Tetracycline,Norfloxacin and Fleroxacin.V.harveyi is a kind of pathogenic bacterium commonly found in cultured marine finfish,but this is the first time that V.harveyi is reported as the pathogenic bacterium of seven-band grouper in China.

【题目】半滑舌鳎(Cynoglossus semilaevis)血浆性类固醇激素表达与卵巢发育及温光调控的关系研究
【中文关键词】半滑舌鳎; 性类固醇激素; 卵巢发育; 温光调控;
【英文关键词】Cynoglossus semilaevis G ü nther; Sex steroids; Gonadal development; Photothermal regulation;
【中文摘要】采用放射免疫法(RIA)、组织切片技术和形态测量法首次系统研究了人工养殖条件下半滑舌鳎亲鱼卵巢的年周期发育过程中血浆中性类固醇激素[雌二醇(E2)和睾酮(T)]的表达规律与性腺发育[组织结构、性腺指数(GSI)、肥满度(CF)和肝脏指数(HSI)]及温度和光周期调控的关系。结果表明,半滑舌鳎属于非同步分批产卵类型,卵巢发育依据卵母细胞形态和组成划分为五期。GSI、CF和HSI随性腺的年周期发育而呈现规律性变化。水温调节与GSI和HSI值变化呈显著正相关关系。性腺的年周期发育过程中,血浆中E2在8月(Ⅳ期)达到峰值,进入产卵期后(9月)开始下降。T含量在9月达到最大值,在10月开始下降。在年周期各月份,雌鱼体内E2表达水平都远高于T表达水平,E2与T呈显著正相关关系。水温调节对E2和T表达水平影响显著且与其呈正相关关系,光周期调节对T和E2表达水平影响不显著。E2表达水平与HSI变化呈显著正相关关系,与CF变化呈负相关关系,T表达水平与HSI变化呈正相关关系,表明性类固醇激素表达水平可用于准确判断鱼类的生殖状态。本研究结果可为温光调控人工亲鱼性腺发育成熟、激素诱导亲鱼产卵提供重要技术依据。
【英文摘要】The annual serum sex steroids (17?-estrodial, testosterone) expression and gonadal development parameters [gonadosomatic index (GSI), hepatosomatic index (HSI) and condition factor (CF)] of Cynoglossus semilaevis G ü nther were studied during annual maturation cycle. In addition, the relationships between GSI, CF, HSI, sex steroids and temperature and photoperiod were investigated using statistical analysis. C. semilaevis features asynchronous gonadal development and batch spawnings. The gonad development is divided into 5 stages according to oocytes development, during which GSI value, HSI value and CF value changed synergistically. The serum estradiol level increased in June (stage Ⅲ) and peaked in August (stage Ⅳ, $P<0.05$), just before spawning. After the spawning, it dropped to a relative low level, and back to the lowest level after November until May. The T level ascended in July and peaked in September ($P<0.05$), a month later than that of estrodiol. During the year round development, the serum estrodiol level was always higher than testosterone; and a positive relationship was found between them ($r = 0.733$, $P<0.05$). The E2/T ratio increased in November, and peaked in next January, then decreased to low level until October. Temperature imposed significant effect on E2 and T levels and the positive relationship between them; while photoperiod showed no significant effect ($r<0.3$, $P>0.05$). These results highlight the temperature may be the primary environmental cue to activate BPG axis. In addition, E2 levels were positively correlated with the HSI values, but negatively with the CF values. Moreover, the T level was significantly correlated with the HSI values. In conclusion, based on the relationship between sex steroids and gonadal development, the sex steroids level could serve as a useful tool to determine the timing for hormone induced-spawning in farmed female C. semilaevis.

【题目】条斑星鲽染色体带型的研究
【中文关键词】条斑星鲽,C带,Ag-NORs带,G 带
【英文关键词】Verasper moseri,C— binding,Ag——NORs,G—banding
【中文摘要】开展了条斑星鲽染色体C带、Ag—NORs带及G一带的研究。结果发现,条斑星鲽染色体显示较为复杂的C一带,有4对染色体整体呈阳性深染,分别为3、l3、20、22号染色体;3对具居间(一带,分别为l、4、8号染色体;9号染色体整体

显示阴性,其余有大小不一的着丝粒C一带。计算其异染色质含量为54.91 。银染分裂相中Ag—NORs出现的数目以两个的频率最高,达87.5 ,与此相一致,在间期核中通过银染表现出两个核仁的间期核数目的频率也最高,故确定条斑星鲽染色体具有1对Ag—NORs,位于亚中部着丝点染色体的短臂上,为端部Ag—NOR。Ag—NORs的数目为1~3个,以出现两个Ag—N()R的频率最高,达87.5 ,与此相同的是,在间期核中,通过银染表现出两个核仁的间期核数目的频率也最高。G一带研究显示,条斑星鲽有37条深染带,22条浅染带。

【英文摘要】The C—binding,Ag—NORs,and G—banding patterns of the metaphase chromosomes of barfin flounder Verasper moseri were investigated in this study.The results showedthat the interstitial regions of most chromosomes exhibited positive C—bands。 in which the whole3rd,13th,20th,and 22nd pair of chromosomes showed totally positive C~band,whilst the l st,4th and 8th pair of chromosomes only showed positive C—bands in the middle region,the restwith centromeric positive C—bands.However,the 9th pair of chromosomes showed negative re—sult.The C—banding heretochromatin occupied 54.91 of the total chromosome in the presentstudy.Silver staining study showed that most chromosomes featured two silver—stained nuclearorganizing regions(Ag—NORs)with the percentage of 87.5 .Accordingly,the interphase rillcleus with 2 nucleolus appeared most frequently,thus it is supposed that the barfin flounderbears a pair of Ag—NORs which 1ocated at the end of short arm of the submetacentric chromosomes.A total of 5 9 positive G—bands(3 7 strong,2 2 light)were recorded in 2 3 pairs of chromosomes.These results would provide basic data for the genomic research and biodiversity conservation of barfin flounder

【题目】条斑星鲽卵巢发育规律和性类固醇激素周年变化研究

【中文关键词】条斑星鲽,卵巢发育,组织学,性类固醇激素
【英文关键词】Verasper moseri,Ovary development,Histology,Sen1m steroi d hormone

【中文摘要】采用组织学方法、形态测量法、放射免疫法(RIA)等技术方法,研究了人工养殖条件下条斑星鲽雌性亲鱼卵巢发育成熟和性类固醇激素的年周期变化规律。结果表明,条斑星鲽属于非同步分批产卵类型。卵母细胞按其组织学特点可分为6个时相,卵巢发育依据其形态特征可划分为相应的6个时期。卵巢年周期发育过程中,性腺指数(GSI)、肝脏指数(HSI)和肥满度(CF)发生变化,表现出与性腺发育协同一致的变化规律。统计分析表明,卵巢年周期发育过程中,GSI和HSI值与CF值都存在显著的正相关关系,GS 值的变化与水温调控呈显著的负相关关系。亲鱼血浆中雌二醇(E。)在6月份开始升高,9月份达到年周期申的第1个小高峰,翌年2月份,E 表达水平达到最高峰值,4月产卵结束后,E。表达水平降低并维持较低水平至下一个生殖季节。血浆中睾酮(T)含量在7月达到第1个峰值,并在翌年1月份达到第2个峰值,在4月份产卵后降至最低水平并维持至下一个生殖季节。统计分析表明,E。与T存在正相关关系,E。与光周期调控存在正相关关系,同时与Gs 和CF呈弱的正相关关系。

【英文摘要】The annual ovarian maturation steroids levels were studied radioimmunoassay.cycle and the variation of correlated plasma sex by employing light microscopy and morphometric methods combined addition,the relationships between GSI,CF,HSI,sex steroidsand temperature,photoperiod were investigated through statistical analysis. Results showedthat barfin flounder features asynchronous oocyte development and batch spawnings. The OO—cyte growth included six phases,and six stages in ovary maturation cycle accordingly. Gonado—somatic index(GSI),hepatosomatic index(HSI)and condition factor(CF)were all found toincrease prior to,or during the peak phase of vitellogenic growth corresponding to the gonad de—velopment.Statistica1 analysis revealed that GS1 was positively correlated with CF while H SIshowed negative relationship with CF. Temperature played more important role in regulatingthe gonad development compared with photoperiod based on the correlation analysis betweenGSI,temperature and photoperiod.During spawning the serum estradiol level began to increasein June(stageⅢ)and reached the first relatively lower peak in September and peaked in Febru—ary.After the spawning,it dropped down to a relative low level and maintained until the nextreproductive cycle. The testosterone level achieved the first relatively high peak in July andpeaked in January,which was a month earlier than that of estradio1.A positive relationship wasfound between estradiol and testosterone leve1.Statistical analysis revealed that a positive rela—tionship existed between photoperiod and estradiol leve1.In addition,the estradiol level showedpositive correlations with GS I and CF. These results could highlight the reproductive cycle ofcaptive barfin flounder females,and also serve 38 useful tools for broodstock breeding and de—termination of timing for hormone induced spawning.

【题目】七带石斑鱼胚胎及仔稚鱼形态观察
【中文关键词】七带石斑鱼; 胚胎发育; 胚后发育; 饥饿
【英文关键词】Epinephelus septemfasciatus Development of embryo Post-embryonic develonment Starvation
【中文摘要】对七带石斑鱼胚胎和仔稚鱼发育过程进行了观察,描述了从受精卵到仔稚鱼各发育时期的形态特征;在水温22±0.5℃、盐度30条件下进行七带石斑鱼仔鱼的饥饿耐受力实验,记录了饥饿条件下初孵仔鱼的存活与生长、卵黄囊与油球的利用情况。结果表明,胚胎发育可划分为卵裂期、囊胚期、原肠胚期、神经胚期和器官形成期。在水温20.5±0.5℃、盐度30.0条件下,受精卵历时38h45min孵化出膜。初孵仔鱼全长1.059±0.071mm,至4日龄全长2.27~2.36mm时,卵黄囊完全消失;16日龄,全长4.99mm时,鳔形成;至25~30日龄,尾鳍鳍条发育完整。在饥饿条件下,初孵仔鱼的死亡高峰出现在孵化后4~6d,半数死亡时间出现在5d,至7d饥饿仔鱼全部死亡。卵黄囊期仔鱼的生长可分为3个阶段:仔鱼初孵时的快速生长期,卵黄囊消失前后的慢速生长期,以及在不能建立外源性摄食后的负生长期。随着生长发育时间的延长,饥饿仔鱼与正常条件下仔鱼的生长差异显著(P<0.05)。饥饿仔鱼体长较短,头大且体瘦,长期饥饿后脑后部下陷。
【英文摘要】Embryonic and early larval development and growth of Epinephelus septemfasciatus,including morphological features and developmental period, were observed and studied. Starvation tolerance test was also conducted and other index such as larvae survival and growth, yolk sac, and oil globule utilization rate were recorded under the condition of water temperature 22±0.5℃ and salinity 30. Based on the obtained data, the embryonic development of E.septemfasciatus was divided into five stages, namely cleavage stage, blastula stage, gastrula stage, neurula stage, as well as organogenesis stage. The embryos hatched at 38h45min after fertilization in seawater at 20.5±0.5 ℃ and salinity of 30.0. The whole length of newly-hatched larva was 1.059±0.07 mm. The yolk sac of larvae disappeared 4d post hatching at a whole length of 2.27~2.36 mm, and air bladder of larvae formed during 8~15d post hatching. Then

the soft rays of caudal fin developed finally at 30d post hatching.Newly-hatched larvae showed 100% mortality after 7 days of starvation, and the half mortality time was 5d and themortality peaked at 4~6d post hatching. The growth of yolk sac larvae can be divided into three periods: rapid growth period of newly hatched larvae, slow growth period before and after the disappearance of yolk sac,and negative growth period afterwards due to the lack of exogenous feeding. Starvation magnified the difference of growth between starved and normal larvae (P<0.05). Larvae had shorter soma length, bigger head and thinner body after a period of food deprivation. The rear part of head sunk after long-time starvation.

【题目】七带石斑鱼人工繁育技术研究进展
【中文关键词】七带石斑鱼; 亲鱼繁殖; 仔稚鱼培育; 苗种中间培育;
【英文关键词】Epinephelus septemfasciatus; broodstock reproduction; larval rearing; juvenile nursery;
【中文摘要】七带石斑鱼(Epinephelus septemfasciatus)具有经济价值高、生长速度快和低温耐受性强等特点,是东北亚温带海域理想的网箱养殖品种之一,已成为中、日、韩三国海水鱼类繁育研究的热点。由于存在雄鱼性成熟年龄高、人工驯养条件下难以实现自然产卵和初孵仔鱼弱小等难题,其稳定和高效的种苗规模化繁育技术尚未完全建立起来。本文综述了七带石斑鱼人工繁育技术研究现状,重点总结日本近20年在亲鱼繁殖、仔稚鱼培育和苗种中间培育等方面取得的研究进展,并就其发展前景进行分析,旨为中国七带石斑鱼苗种规模化繁育技术研发提供参考。
【英文摘要】Seven-band grouper Epinephelus septemfasciatus,a fast growing and commercially valuable marine fish species with better tolerance to cold water temperature than most other grouper species,is considered as one of the most potential species for marine fish cage culture in the temperate seas along the coast of Northeast Asia.It has been investigated intensively for aquaculture during the past several decades in the countries of China,Japan and Korea where it distributes.However,the stable and efficient artificial breeding technique of seven-band grouper has not been established fully,owing to some reproduction problems such as extended maturation age for male,failure to spawn spontaneously under captivity and the fragility of newly hatched larvae.The progress on broodstock reproduction,larval rearing,and the nursery of juveniles of seven-band grouper,which has been achieved mainly by Japanese scientists during the past twenty years,is reviewed.Further research priorities in this domain are also suggested.This paper also provides necessary referential information for the research on the mass seed production technique of seven-band grouper in China.

【题目】Evaluation of the potential role of the macroalga Laminaria japonica for alleviating coastal eutrophication
【中文关键词】无
【英文关键词】Macroalgae; Laminariajaponica; Nutrient uptake rate; Nutrient remove efficiency; Environmental factors
【中文摘要】无
【英文摘要】The rapid development of human activities has caused serious eutrophication of coastal waters in China in the recent decades. The study of the biofiltration capacity of Laminariajaponica under laboratory conditions showed a significant nutrient uptake. After 36 h of incubation, around 42%, 46%, 44% of N and 45%, 42%, 35% of P were removed from three gradients of medium concentrations, respectively. In the conditions of different ratios of N/P and NO3 – N/NH4 – N, the optimum N/P ratio for nutrient uptake was 7.4 and L. japonica prefered NO3 – N rather than NH4 – N as nitrogen source. Temperature and irradiance affected uptake

rates significantly. The maximal N uptake rate appeared at 10 ° C and 18 μ mol photons m − 2 s − 1 and the maximal P uptake rate was found at 15 ° C and 144 μ mol photons m − 2 s − 1. Moreover, further studies were needed to investigate the bioremediation potential of L. japonica in the open sea.

【题目】Preparation and characteristics of bio-oil from the marine brown alga Sargassum patens C. Agardh
【中文关键词】无
【英文关键词】Sargassum patens C. Agardh; Liquefaction; Bio-oil
【中文摘要】无
【英文摘要】The marine brown alga, Sargassum patens C. Agardh, floating on the Yellow Sea, was collected and converted to bio-oil through hydrothermal liquefaction with a modified reactor. A maximum yield of 32.1 ± 0.2 wt.% bio-oil was obtained after 15 min at 340 ° C, at a feedstock concentration of 15 g biomass/150 ml water, without using a catalyst. The bio-oil had a heating value of 27.1 MJ/kg and contained water, lipid, alcohol, phenol, esters, ethers and aromatic compounds. The solid residue obtained had a high ash and oxygen content. The results suggest that S. patens C. Agardh has potential as biomass feedstock for fuel and chemical products

【题目】Characterization of the LhcSR gene under light and temperature stress in the green alga Ulva linza
【中文关键词】无
【英文关键词】Ulva linza LhcSR .Full-length.Expression analysis.Green tide
【中文摘要】无
【英文摘要】As a green-tide-forming macroalga, Ulva linza is distributed worldwide and therefore subject to various environmental stresses. The LHCSR (also known as LI818 in green alga and LHCX in diatoms) protein is a stress-related member of the LHC family that plays an important role in photo-protective mechanism, which has been only found in algae. In this study, we cloned full-length cDNA sequence encoding the LhcSR gene from U. linza and analyzed its expression in response to different temperature and illumination gradients. The results showed that high light (HL) could enhance expression of LhcSR and that the expression level peaked at 3 h under HL. Similarly, the expression of LhcSR could also be induced by low temperature (LT). However, the expression patterns of LhcSR were quite different in response to LT and HL treatment. Specifically, the maximum gene expression under LT was much higher (11.8-fold) than under HL (5.4-fold) when compared to the expression under normal conditions. The upregulated expression of LhcSR lasted for 12 h under LT, but 3 h under HL. These data suggest that the LhcSR gene is involved in photoprotection in U. linza, and the results suggest a stronger link to LT. In addition, the discrepancy in expression under HL and LT was consistent with the ecological features of this alga, which only thrives during the cold season (featured as LT and low light).

【题目】Growth and loss of mariculture kelp Saccharina japonica in Sungo Bay, China
【中文关键词】无
【英文关键词】Kelp Saccharina japonica – Growth – Distal erosion – Falloff – Breakoff – Sungo Bay – Laminariales
【中文摘要】无
【英文摘要】The aim of this study was to understand the growth dynamics of Saccharina japonica (previously known as Laminaria japonica), particularly the portion lost during its growth cycle and the key factors that control loss rate in Sungo Bay, China. Growth and loss of S. japonica were investigated between January and July 2010 in Sungo Bay. Losses of the seaweed are typically the result of three factors: removal of the entire individual from mariculture ropes (falloff), breakage in sections of the thalli (breakoff), and erosion of distal tissue. Results showed that individual growth rates in wet weight ranged between 2.4 and 32.7 g day − 1. The total falloff rate was approximately 16% and took place during January and February. Breakoff rate showed a significant positive correlation with kelp length and took place during June and July. The erosion rate increased significantly from January to the end of April, reaching a maximum value of 20.4 g day − 1 on 25 April, and maintained a relatively higher value following the peak value (approximately 10 – 15 g day − 1). Erosion rates were positively correlated with temperature ($r = 0.787$, $n = 23$, $p < 0.01$) before May; however, they were not significantly correlated with temperature from May to July ($p = >0.05$). There was no significant relationship between erosion and transparency. At the end of this experiment, the ratio of total loss of carbon and nitrogen to gross production was 61% and 54%, respectively. Loss from distal erosion, falloff, and breakoff in carbon was 91.5, 4.2, and 4.3%, respectively. In Sungo Bay, the annual gross production and total loss in carbon and nitrogen were estimated to be 58,652 t C and 3,506 t N, and 36,150 t C and 1,920 t N. This is expected to have a significant impact on the detritus available in the food chain.

【题目】Isolation and characterization of Toll-likereceptor9 in half-smoothtonguesoleCynoglossussemilaevis
【中文关键词】无
【英文关键词】TLR9; Cynoglossussemilaevis; Vibrio anguillarum; Gene expression; Immune recognition; Quantitative real-time PCR
【中文摘要】无
【英文摘要】Toll-likereceptors (TLRs) are considered as key sensors to trigger the host's innate immune system and adaptive immune responses by recognizing various PAMPs and initiating signal transduction. TLR9, as a member of TLR family, mediates the recognition of unmethylated CpG dinucleotide motifs commonly found in both bacterial and viral genomes. In the current study, the TLR9 gene was isolated from one of flatfish species, half-smoothtonguesole (Cynoglossussemilaevis). In the 4588 bp genomic sequence, three exons, two introns, and 5′ UTR of 23 bp and 3′ UTR of 342 bp were identified. Putative amino acid sequence was 1062 residues long, including a typical conserved cytosolic Toll/interleukin-1 receptor (TIR) domain, 14 leucine-rich repeat (LRR) motifs, with greater than 60% identity to gilthead sea bream Sparus aurata and Japanese flounder Paralichthys olivaceus orthologs. Quantitative RT-PCR analysis indicated a broad expression of csTLR9, especially in spleen and gonads. No statistically significant changes were observed for csTLR9 mRNA levels in spleen and head kidney after inactive Vibrio anguillarum immunisation. In C. semilaevis ontogeny, the expression of csTLR9 appeared to be developmentally regulated. The presence of maternal TLR9 mRNA and the dramatic decrease of TLR9 expression at metamorphic stage indicated TLR9 might be involved in C. semilaevis development.

Comparing sequence and expression profile of csTLR9 with mammalian and other piscine TLR9s suggested that the main function of TLR9 might be conserved across vertebrates, although species-specific features were present

【题目】Full-length sequence and expression analysis of a myeloid differentiation factor 88 (MyD88) in half-smooth tongue sole Cynoglossus semilaevis
【中文关键词】无
【英文关键词】Cynoglossus semilaevis,Full-length sequence,MyD88
【中文摘要】无
【英文摘要】Myeloid differentiation factor 88 (MyD88) is a universal and crucial adaptor protein, which plays an essential role in the intracellular signalling elicited by IL-1R/TLR superfamily. In the present study, we report the full-length sequence of MyD88 gene in half-smooth tongue sole (Cynoglossus semilaevis). In the 2855 bp genomic sequence, five exons and four introns were identified. The cloned cDNA exhibited 110 bp of 5′ UTR, 576 bp of 3′ UTR and 858 bp of the entire open-reading frame encoding a polypeptide of 285 amino acids. The protein sequence included a typical conserved cytosolic Toll/interleukin-1 receptor (TIR) domain, an intermediate domain (ID) and a death domain (DD), and shared greater than 70% identity with Japanese flounder Paralichthys olivaceu ortholog. Real-time polymerase chain reaction (RT-PCR) analysis indicated a broad expression of csMyD88, especially in ovary and spleen. Quantitative RT-PCR analysis indicated that the csMyD88 mRNA levels were significantly increased in the spleen and head kidney after inactive Vibrio anguillarum challenge and the expression of csMyD88 appeared to be developmentally regulated during C. semilaevis ontogeny. Although, species-specific differences were present, the similarity between mammalian and piscine MyD88s suggested that the main function of MyD88 might be conserved across vertebrates.

【题目】不同溶氧条件下亚硝酸和氨氮对中国对虾的急性毒性效应
【中文关键词】亚硝酸盐,非离子氨,中国对虾,急性毒性
【英文关键词】nitrite,non-ion ammonia,Fenneropenaeus chinensis, acute toxicity
【中文摘要】研究了正常溶氧(5.5-6.0 m g /l) 和过饱和溶氧(10-12 m g /I) 条件下亚硝酸盐和氨氮对中国对虾的急性毒性效应。试验结果表明正常溶氧条件下, 亚硝酸盐对中国对虾的48 h LC50值和96 h LC50值(95 % 可信限) 分别为69.43mg/L (58.53-82.36 mg/L) ,43.80 mg/L(37.57-51.06 mg/L), 非离子氨对中国对虾的48 h LC50 值和96 h LC50值(95 % 可信限) 分别为1.36 mg/L (1.15-1.61 mg/L) 和0.98 mg/L(0.83-1.16 mg/L); 而过饱和溶氧条件下亚峭酸盐对中国对虾的48 h LC50 值和96 h LC50值(9 5 % 可信限) 分别为94.80 mg/L(79.77-112.66 mg/L) 和58.64 mg/L(51.40-66.90 mg/L);非离子氨对中国对虾的48 h LC50 值和96 h LC50值(9 5 % 可信限) 分别为1.36 mg/L (1.15-1.61 mg/L) 和0.98 mg/L(0.83-1.16 mg/L)。亚硝酸盐和非离子氨时

中国对虾均具有一定的毒性, 无论在正常溶氧还是过饱和溶氧条件下, 非离子氨对中国对虾的毒性都大于亚峭酸盐, 同时高溶氧的存在使中国对虾对这两种物质毒性耐受能力得以提高, 且过饱和溶氧对非离子氨毒性的影响程度高于亚稍酸盐。

【英文摘要】The acute toxic effects of nitrite and non-ion ammonia on Fenneropenaeus chinensis were studied at normal (5.5-6.0mg/L) and hyperoxic (10-12mg/L) dissolved oxygen.The results showed that the 48h and 96h median lethal concentrations (LC50) (98% confidence limits) of nitrite for F.chinensis at normal oxygen level were 69.43mg/L (58.53-82.36 mg/L) and 43.80 mg/L(37.57-51.06 mg/L),respectively ; and those of nonion ammonia were 1.36 mg/L (1.15-1.61 mg/L) and 0.98 mg/L(0.83-1.16 mg/L) ,respectively .However ,under hyperoxic conditions ,the 48h and 96h LC50 (98% confidence limits) of nitrite for F.chinensis were 94.80 mg/L(79.77-112.66 mg/L) and 58.64 mg/L(51.40-66.90 mg/L),respectively ;and those of non-ion ammonia were 2.37 mg/L(2.05-2.75 mg/L) and 1.52 mg/L(1.30-1.77 mg/L),respectively .Both nitrite and ammonia nitrogen were found to be toxic to F.chinensis;yet the toxic effects of non-ion ammonia were more significant than that of nitrite ,irrespective of oxygen levels .At the same time , F.chinensis could toletate much higher concentrations of nitrite or non-ion ammonia under hyperoxic conditions ,and compared to nitrite ,the toxicity of non-ion ammonia was more easily alleviated by the hyperoxic conditions.

【题目】温度对三角褐指藻叶绿素荧光特性及生长的影响
【中文关键词】三角褐指藻; 叶绿素荧光参数; 叶绿素相对含量; 细胞密度
【英文关键词】Phaeodactylum tricornutum ,chlorophyll fluorescence parameters ,relative fluorescence content ,cell density
【中文摘要】研究三角褐指藻(Phaeodactylum tricornutum) 一次性培养过程中,不同温度(5-30℃) 对其叶绿素荧光参数、细胞密度以及叶绿素相对含量的影响。单因子方差分析结果表明: 在整个培养周期中, 温度对三角褐指藻各叶绿素荧光参数(Fv / Fm 、Fv / Fo, PS , ETR, qP 和NPQ) 及生长均有显著影响(P<0.05) 。多重比较结果表明: 在本实验条件下, 三角褐指藻的

最适生长温度是20°C。5 °C处理组从接种后第1 天开始各荧光参数(Fv/ Fm, Fv / Fo, PS , ETR, qP 和NPQ)都明显下降, 但第5 天开始恢复;10°C处理组各荧光参数仅在接种后第1 天出现下降, 第2 天就基本恢复正常;30°C处理组从处理后第1 天开始一直到实验结束, 叶绿素荧光参数(Fv/Fm,Fv/Fo,PS, ETR 和qP)、叶绿素相对含量和细胞密度均显著低于其他各处理组。相关性分析结果表明: 在整个培养周期内, 叶绿素相对含量与细胞密度均成极显著的正相关关系。荧光参数(Fv/Fm , Fv/Fo ,PS , ETR) 、叶绿素相对含量以及细胞密度与温度的相关性则随着温度范围及培养天数的不同而变化。本文还初步探讨了叶绿素荧光技术在筛选耐高温或耐低温微藻品系中的应用。

【英文摘要】The effects of different temperatures(5-30°C) on the chlorophyll fluorescence parameters, cell density and relative chlorophyll content of Phaeodactylum tricornutum were examined in batch cultures. One-way analysis of variance shows that temperature had significant effects on the fluorescence parameters(Fv/Fm, Fv/Fo,PS,ETR,qP and NPQ)and growth of P. t ricornutum during the entire experimental period(P<0.05) . Multiple comparison tests show that the optimal growth temperature of P .t ricornutum under the experimental conditions is 20°C. The above fluorescence parameters of P.t ricornutum under 5°Cand 10°C significantly decreased from the very first day after inoculation, which began to recover several days after inoculation. How ever, compared with other temperatures(5-25°C),the high temperature of 30°C resulted in a significant decrease in the fluorescence parameters(Fv/Fm, Fv/Fo , PS ,ETR and qP), cell density and relative chlorophyll content during the entire experimental period. The analysis of correlations shows that there are significant positive correlations between relative chlorophyll content and cell density during the entire experimental period. Moreover, some fluorescence parameters(Fv/Fm,Fv /Fo , PS and ETR) , relative chlorophyll content and cell density all showed significant correlations with temperature, the pat tern and strength of the correlations varied with temperature range and culture age during the entire experimental period. In addition, the possibility of using chlorophyll fluorescence induct ion kinetics in selecting high or low temperature-resistant .Microalgal strains is also discussed in this paper.

【题目】投喂蚯蚓对中国明对虾生长及生化组成的影响
【中文关键词】赤子爱胜蚓;中国明对虾;生长;氨基酸;脂肪酸
【英文关键词】Fenneropenaeus chinensis;Eisenia foetida;growth;biochemical components
【中文摘要】以不同比例的鲜活赤子爱胜蚓(Eisenia foetida)和人工饲料配合投喂中国明对虾(Fenneropenaeus chinensis) 幼虾,测定各种饵料配比对其生长和生化组成的影响。结果表明,在人工饲料中配合投喂1/4 以上的赤子爱胜蚓(干重比)可显著提高中国明对虾幼虾的生长速率(P<0.05),但对对虾的成活率没有显著影响。随着蚯蚓投喂量的增加,对虾肌肉水解氨基酸的总量以及其中的必需氨基酸、鲜味氨基酸(谷氨酸Glu、天冬门氨酸Asp、甘氨酸Gly、丙氨酸Ala) 和促摄食氨基酸(蛋氨酸Met、赖氨酸Lys、甘氨酸Gly) 的含量都呈增加的趋势,分析结果表明,投喂蚯蚓对对虾肌肉中促摄食氨基酸含量的影响最大,鲜味氨基酸次之,对必需氨基酸含量的影响最小。氨基酸营养价值的评价结果表明,投喂蚯蚓可提高对虾肌肉蛋白质的营养价值,改善对虾肌肉品质。随着蚯蚓投喂量的逐渐增加,对虾肌肉脂肪中的必需脂肪酸、Σ n-3 相对含量及其表示脂肪酸营养价值高低的Σ n-3/ Σ n-6 的比值都呈降低的趋势,且在蚯蚓投喂量占日投喂量的1/4 以上时达差异显著;对蚯蚓肌肉脂肪酸的分析结果表明:蚯蚓脂肪中的二十二碳六烯酸(DHA) 相对含量较低,因此,以蚯蚓作为对虾饲料,特别是亲虾的DHA 饲料来源时,应配合投喂DHA 含量较高的其他饲料。
【英文摘要】The purposes of the present study were to evaluate the impacts of different diet compositions on growth and biochemical components of shrimp Fenneropenaeus chinensis juveniles feeding fresh diet Eisenia foetida mixed with formulated diet in different proportions. The results showed that shrimps were more fond of earthworm diet than formulated diet and the diet in the proportion 1:3 of fresh diet to formulated diet significantly increased the growth rate(P<0.05). With the increase of earthworm diet proportion,body length and its corporeity significantly meliorated but no obvious influence on survival rate happened. With the increment of fresh diet proportion,the contents of total amino acids,essential amino acids,delicious amino acids (Glu,Asp,Gly and Ala) and feeding-boosted amino acid (Met,Lys and Gly) were significantly increased in muscle. With earthworm diet,feeding-boosted amino acid was observably affected,followed with delicious amino acids and essential amino acids in shrimp muscle. According to the nutritive value evaluation,the nutritive value of protein and quality of shrimp muscle can be improved by feeding fresh diet. With the increment of fresh diet proportion,the contents of total fatty acids,essential fatty acids,relative content of Σ n-3 and the ratio of Σn-3/Σn-6 decreased significantly in muscles,especially when the fresh diet feeding accounted for more than 1/4 of the feeding scale per day. With the growth results of shrimps,the lack of DHA had no influence to its growth. With the feeding increase of earthworm,growth of shrimp juveniles were obviously accelerated. The analysis of fatty acid content in fresh diet showed that DHA level was the lowest,thus,the diet with high DHA levels should be included when Eisenia foetida was considered as the major diet resource of unsaturated fatty acids.

【题目】甲鱼养殖废水在土壤植物生态系统的处理与应用
【中文关键词】甲鱼养殖废水; 土壤- 植物系统; 生态工程; 散叶莴苣
【英文关键词】Chinese turtle aquaculture effluent; soil-plant system; ecologicial engineering; Lactuca Sativa L. Var. Longifolia L
【中文摘要】以甲鱼养殖温室排放的富含营养物的养殖废水和利用废水栽培蔬菜的生态工程生产系统为研究对象, 和商品营养液对比, 在4 种不同土壤上开展了浇灌甲鱼养殖废水栽培散叶莴苣(生菜) 的研究。120 d 的实验结果表明, 用甲鱼废水和营养液分别处理4 种土壤的生菜产量差异不显著, 但生产上要用甲鱼废水完全替代营养液作为肥料用于土壤栽培, 还需对甲鱼废水进行预处理;潮土对甲鱼养殖废水有较大的适应性; 甲鱼养殖废水的主要营养元素组成与植物需要相比, P 元素和K 元素还比较缺乏。用甲鱼类废水处理的4 种土壤生菜的含Ca 量均大于用营养液处理的4 种土壤。
【英文摘要】Reducing negative environmental impacts from aquaculture activities is a key issue for ensuring long- term sustainability of the industry .Alternately the pollution that the wastewater drained from aquaculture farms has intensified the contradiction between traditional aquaculture and environment control. To develop sustainable aquaculture on the basis of the lowest invest and friendly environment is beingextremely urgent. An ecological engineering system, which was composed of Chinese turtle farm wastewater and

plastic greenhouse where vegetables were irrigated with wastewater drained from turtle pond, was discussed. The lettuce (Lactuca Sativa L. Var. Longifolia L), contrasted with commercial nutrient solution, was irrigated with Chinese turtle aquaculture effluent in four soils, red soil, alluvial soil I, alluvial soil II and paddy soil. 120 days experiment showed that the lettuce production irrigated with commercial nutrient showed no significant differencecompared with that irrigated with Chinese turtle aquaculture effluent, however, the Chinese turtle farm wastewater could completely replace the commercial nutrient in production for irrigation only when it was pretreated. Alluvial soil revealed a favorable adaptability to Chinese turtle farm waste water .The absence of phosphorus and potassium in Chinese turtle farm wastewater did not meet with the lettuce' s normal requirement .Calcium content in the lettuce treated with Chinese turtle aquaculture effluent was more than that of commercial nutrient .This technique based on ecological engineering seems promising for reusing nutrient from intensive aquaculture, but continued research on this type of solution is required.

【题目】磷限制及恢复对小球藻叶绿素荧光特性的影响

【中文关键词】小球藻; 磷浓度; 叶绿素荧光参数; 瞬时变化; 恢复

【英文关键词】Chlorella sp; P concentration; chlorophyll fluorescence parameters; nutrient induced fluorescnce transients(NIFT); recovery

【中文摘要】研究了小球藻(Chlorella sp.) 一次性培养过程中, 培养基中不同磷浓度(0、10、36.3和290.4 uM) 对其叶绿素荧光参数、细胞密度和叶绿素含量的影响以及磷添加后各荧光参数的瞬时变化(nutrient induced fluorescence transients, NIFT反应) 及恢复情况。培养温度为20±1℃, 盐度为31, 光照强度为100 umolm-2 s-1。单因子方差分析的结果表明, 随着培养时间的延长, 磷浓度对小球藻的光合作用及生长均有显著影响(P<0.05)。多重分析的结果表明, 小球藻的最适磷浓度为36.3uM。小球藻的最大光能转化效率(Fv /Fm)、实际光能转化效率(PSII)、电子传递效率(ETR)、光化学淬灭(qP)、细胞密度以及叶绿素含量随着起始磷浓度的增大而增大, 在磷浓度为36.3 uM 达到最大值。磷重新添加后, 瞬时荧光不断下降, PSII出现瞬间的上升后恢复至原初状态, qP、非光化学淬灭(NPQ) 则不断上升。限制7 d后重新添加磷, 各处理组的Fv /Fm、5 PSII、ETR、NPQ 24 h内基本恢复, 而对照组的变化不显著。

【英文摘要】The effects of different P concentrations (0,10,3613,290.4uM) on the chlorophyll fluorescence parameters ,cell density and relative chlorophyll content o f Chlorella sp.were reported .The algae were obtained from the Microalgae Culture Center(MACC), Ocean University of China .The cultures were grown at 20±1℃ , the salinity was adjusted to 31 by using distilled water,and the light intensity was 100 umolm-2 s-1.One-way analysis of variance showed that P concentrations have significant effects on the photosynthes is and growth of Chlorella sp .with the culture age increasing (P<0.05). For Chlorella sp1, Fv/Fm , PSII, ETR, qP,cell densities and chlorophyll contents all increased with the increase of P concentrations and reached their highest values at 36.3um .Multiple comparison tests show ed that the optimal P concentrations for the photosynthesis and grow th of Chlorella sp1 is 36.3um.The chlorophyll fluorescence parameters showed characteristic NIFT responses following PO3-4 addition to P-starved Chlorella sp,fluorescence decreased but qP , NPQ increased steadily, PS II increased sharply, and then a decrease to the same steady state as that prior to add ition1Seven days later, the lacked nutrient P was added and chlorophy ll fluorescence parameters were measured every 2 hours .The results showed that Fv /Fm , PSII, ETR of Chlorella sp1w ere all recovered in 24 hours1The changes of qN, NPQ were not significant.

【题目】过饱和溶氧对大菱鲆生长及消化酶的影响
【中文关键词】大菱鲆;溶氧;过饱和溶氧;生长;消化酶
【英文关键词】Turbot(Scophthalmus maximus) ;dissolved oxygen;hyperoxic oxygen;growth;digestive enzyme
【中文摘要】为了解、确定工程化养殖中过饱和溶氧对大菱鲆生长的影响而进行本项研究。通过充液态氧与空气使实验水体的溶氧分别达到:过饱和溶氧水平为(12±1)mg/L、(14±1)mg/L,正常溶氧水平为(7.0±0.5)mg/L。实验研究结果显示,过饱和溶氧组的大菱鲆生长速度及饵料利用率明显高于正常溶氧组($p<0.05$);而在过饱和溶氧条件下与正常溶氧条件下大菱鲆的丰满度无显著差异($p<0.05$)。对大菱鲆胃和肠道蛋白酶、脂肪酶与淀粉酶的分析发现,过饱和溶氧条件下,大菱鲆的胃蛋白酶活性较正常溶氧条件下明显提高($p<0.05$),而脂肪酶与淀粉酶的酶活力未得到显著性提高($p<0.05$)。
【英文摘要】To determine that effects of hyperoxic oxygen on turbot with engineering culture systems , We discussed mainly that the effects of different dissolved oxygen environment (hyperoxic oxygen conditions 12±1 mg/L, 14±1 mg/L, normal oxygen level 7±0.5 mg/L)on growth ,digesitive activity of turbot .The mainly results was following .The growth speed of the turbot and utilization rate of feedstuff with the hyperoxic conditions were higher than that of the normal oxygen level($p<0.05$) . There was not obviously difference ($p>0.05$) between fat factor under hyperoxic oxygen conditions and that at the normal dissolved oxygen level . The digestive enzyme in the turbot stomach and gut were respectively studied . The results showed ,there was no obviously higher between amylase and lipase of stomach, gut under hyperoxic oxygen conditions than normal oxygen level($p>0.05$) .but the protease activity of stomach under hyperoxic oxygen was effectively strenghtened($p<0.05$) , although the the protease activity of gut had been raised , but the difference was not obvious ($p>0.05$).

【题目】水体中添加两种菌剂对凡纳滨对虾存活、生长及消化酶活力的影响
【中文关键词】凡纳滨对虾;消化酶;短小芽孢杆菌;胶红酵母菌; 需钠弧菌;
【英文关键词】Litopenaeus vannamei;digestive enzyme; Bacillus pumilus;Rhodotorula mucilaginosa; Vibrio natriegens
【中文摘要】向水体中添加不同浓度的短小芽孢杆菌CGM CC 1004(Bacillus p umilus) 和胶红酵母菌CGM CC 1013(Rhodotor ula mucilaginosa) 以研究凡纳滨对虾(Litoenaeus vannamei) 体长、体质量、存活率、胃蛋白酶、肝胰腺淀粉酶和肝胰腺脂肪酶的影响, 以及需钠弧菌(Vibr io natr iegens) 的感染效果。结果表明: 向水体中添加104 CFU/ mL 短小芽孢杆菌能提高对虾体长、存活率, 但结果不显著, 但对体质量增长率具有显著提高作用;水体中添加104 CFU/ mL 短小芽孢杆菌对提高需钠弧菌感染后对虾成活率有一定的提高作用; 水体中添加104 CFU/ mL 短小芽孢杆菌能显著提高胃蛋白酶活性, 但是对肝胰腺淀粉酶活性有一定抑制作用; 添加复合菌剂比添加单一菌种的作用要好; 亦证明了向水体中添加细菌的方式对凡纳滨对虾的体长、体质量、存活率以及水质指标影响比较小, 但是对消化酶具有一定的提高作用。

【英文摘要】Bacillus pumilus and Rhodotorula mucilaginosa with different concentrations were added to aquaculture tanks for shrimp(Litop enaeus vannamei) , and such parameters as body length, body weight ,survival rate, stomach proteinase , hepatobiliary & pancreatic amylase, hepatobiliary & pancreatic lipase of shrimp,etal.were determinated . An experimental infection of shrimp by Vibrio natriegens was also tested .The results showed that a treatment group with 100 mg/ kg Bacillus pumilus could promote body length and livability, but there is no significant difference. And this group can significantly promote body weight .This group could improve shrimp livability after the infection of Vibrio natriegens , significantly enhanced astomach proteinase activity, but inhibited the activity of the hepatobiliary & pancreatic amylase; the treatment group with two species is better than the group with one in inhibiting the activity of hepatobiliary.And the result s showed that methodology of adding bacteria to waters has few effect on shrimp body length,body weight , livability and water quality, but can improve digestive enzyme activities.

【题目】海水养殖废水中氨氮测定方法的影响因素及改进研究
【中文关键词】海水养殖; 氨氮测定; 次溴酸盐氧化法; 纳氏试剂比色法
【英文关键词】mariculture water;NH3-N determination;Hypobrom ite Oxidation process;nesslers' reagent colorimetry
【中文摘要】采用酒石酸钾钠溶液--氢氧化钠溶液作为屏蔽剂排除海水中钙、镁离子对测定的干扰, 将纳氏试剂比色法用于对海水养殖废水中氨氮的测定, 最佳测定条件为200 g /L 的氢氧化钠溶液用量2.5 mL, 纳氏试剂1.5 mL, 显色时间25 m in。该方法对盐度为10-32的海水可以直接测定, 氨氮质量浓度在0.01-0.04 mg/L符合比尔定律, 检出限为0.01 mg/L, 加标回收率在91%-108%。
【英文摘要】Hypobrom ite Oxidation process can not apply to NH3-N determination in mariculture water, this is mainly because the high NH3-N concentration is out of the range of standard curve. Further more, the concentration of organic matters and reducing substances are too high, NH3-N can not achieve complete oxidation due to the lack of oxidant The tests indicated that with potassium sodium tartrate and sodium hydroxide solution as shielding agent for eliminating the interference of calcium and magnesium ions, Hypobrom ite Oxidation proscess can be used to determine NH3-N. The best conditions in the lab were as follows: the dosage of sodium hydroxide solution was 2.5 mL at its concentration of 200 g /L, the dosage of Nessler s' Reagentw as 1.5mL, and the best color developing time was 25 minutes. This method is suitable for sea water with salinity at 10-32.Bear's law is obeyed for NH3-N in the range of 0.01-0.04 mg/L, the detection limit is 0.01mg/L and the recovery of standard addition is in the range of 91%-108%. This method is convenient ,good sensitivity, color fast and stable, and it fully meets the requirements of NH3-N determination in mariculture water

【题目】竹子填料海水曝气生物滤器除氮性能和硝化细菌群落变化研究
【中文关键词】海水生物滤器;竹子填料;氨氮去除;硝化细菌;养殖废水
【英文关键词】Marine biofilters ;Bamboo medium ;NH+4-N removal;Nitrifying bacteria; Aquaculture waste water
【中文摘要】生物滤器是循环水养殖系统的关键水处理单元, 主要用于去除水体中水溶性的氮化物。采用人工模拟海水养殖废水, 在系统运行的水力停留时间HRT 为1h, 水温为18-25℃, 气水比为3:1, 初始C/N= 3:1, pH 为8.05-8.53 条件下, 对竹子填料浸没式生物滤器的挂膜过程和稳定运行阶段系统去除氨氮的运行特性, 以及挂膜过程中的硝化细菌群落变化进行了实验研究。结果表明, 在较低的NH+4-N 浓度条件下, 采用竹子填料的生物滤器有较快的挂膜速度, 挂膜成功后滤料表面

上生长的氨氧化细菌和亚硝酸氧化细菌的数量分别为4.5×105、1.5×105 (光面) 和1.1×106 CFU/ml(粗面) 。具有较高且稳定的氨氮去除效果, 氨氮去除效率达到80% , 出水浓度小于0.06 mg/L, 满足海水循环养殖系统中的应用要求。

【英文摘要】Biofilter is the key water treatment unit of marine RAS(Recirculating Aquaculture System) , and it plays an important role in water soluble nitrogen removal. A pilot scale experiment study was systematically carried out with synthetic aquaculture waste water. The performances of ammonia removal in start up and steady state period were examined in the ma rine biofilters packed wit h bamboo medium. The hydraulic retention time, temperature ,gas/ water ratio, C/ N and pH were 1 hour, 18-25°C, 3 :1, 3:1 and 8.05-8.53, respectively. Results showed that marine biofilter packed with bamboo substrate enabled the nitrifying bacteria to grow rapidly, and the number of ammonia oxidizing bacteria and nitrite oxidizing bacteria was 4.5×105 CFU/ml、1.5×105 CFU/ml(smooth) and 1.1×106 CFU/ml(crude) in steady state period, respectively. The ammonia removal rate of biofilter was highly efficient.The ammonia nitrogen concentration in the effluent of bamboo biofilters was below 0.06 mg/L ,which was much lower than the toxic level for almost all the aquaculture species.

【题目】重金属胁迫对三角褐指藻生长及叶绿素荧光特性的影响
【中文关键词】三角褐指藻;重金属胁迫;叶绿素荧光
【英文关键词】Phaeodactylum tricornutum; heavy metal stress; chlorophyll fluorescence

【中文摘要】利用调制式叶绿素荧光仪研究了不同浓度的重金属Cu2+ , Zn2+ , Cd2+胁迫不同时间(24、48、72和96 h)后, 三角褐指藻叶绿素荧光特性的变化情况。测定的主要参数有: 光系统II(PS II)的最大光能转化效率(Fv/Fm)、PS II的潜在活性(Fv/Fo)、PSII的实际光能转化效率(Yield = 5P SII)、相对光合电子传递效率(rETR)、光化学淬灭(qP) 和非光化学淬灭(NPQ)。研究结果表明, 重金属(Cu2+ , Zn2+ , Cd2+)胁迫下三角褐指藻的叶绿素荧光参数F v /Fm 、F v /F o、Yield、rETR 和qP均明显降低, 并且随着重金属离子浓度的增加, 胁迫时间的延长, 下降幅度逐步增大; NPQ 先上升后下降或者逐渐上升; 细胞密度和叶绿素含量也显著降低。对3 种重金属离子的半抑制浓度(EC50)的计算结果表明, 3 种重金属毒性大小顺序为Cu2+ > Cd2+> Zn2+ 。

【英文摘要】The modulate chlorophyll fluorescence kinetics of Phaeodactylum tricornutum under different heavy metal concentrations(Cu2+ , Zn2+ , Cd2+) and different time (24h, 48h, 72h and 96h) were investigated with Water-PAM chlorophyll fluorometer.The main parameters were determined in the present study in cluding the maximalphotochemical efficiency of PS II (Fv/Fm), the potential activity of PSII (Fv/Fo) , the actual photochemical efficiency of PSII in the light (Yield = 5 PSII), the relative electron transportrate (rETR) , the photochemical quenching (qP) and the non-photochemical quenching (NPQ). The results showed that the fluorescence parameters Fv/Fm, Fv/Fo, Yield, rETR and qP of P. tricornutum all were decreased under the of stress heavy metals (Cu2+ , Zn2+ , Cd2+). The changed degree above the parameters was increased with the in crease of heavy metal concentration andtime. NPQ first was increased then decreased or increased with the exposure time under heavy metal stress. The celldensity and chlorophyll content were also decreased under heavy metal stress. The EC50 (the effective concentration causing 50% inhibition) values showed that the toxicity results can be expressed as Cu2+ > Cd2+> Zn2+ .

【题目】高温胁迫对球等鞭金藻3011和8701叶绿素荧光特性的影响
【中文关键词】球等鞭金藻;高温胁迫;叶绿素荧光
【英文关键词】Isochrysis galbana; high temperature stress; chlorophyll fluorescence kinetics
【中文摘要】以球等鞭金藻(Isochry sis galbana) 3011和8701为实验材料,研究了高温胁迫(35- 50)对其叶绿素荧光特性的影响。结果表明,与对照组相比,高温胁迫下2株金藻的叶绿素荧光参数Fv/Fm(PS的最大光能转化效率)、Fv/Fo(PS的潜在活性)、PS(PS的实际光能转化效率)、rETR (相对光合电子传递效率)和qP(光化学淬灭)均明显降低,并且随着胁迫温度的升高,胁迫时间的延长,下降幅度也逐步增大。NPQ (非光化学淬灭)的变化趋势则与其他荧光参数不同,3011的NPQ 随着胁迫温度的升高和胁迫时间的延长先上升后下降;8701的N PQ 变化则与胁迫温度有关,35和40°C理下NPQ 随着胁迫时间的延长而逐渐上升,45处理下NPQ 则先上升后下降。3011与8701的耐热性存在一定差异。3011在40°C下处理10 m in后,经过一定的时间后各荧光参数基本恢复,而在45和50°C下处理10m in后,各参数均不能恢复。8701在35和40°C处理10 min后,经过一定时间后,荧光参数Fv/Fm 和Fv/Fo基本恢复到对照水平,而在45°C下处理10m in后,各参数均不能恢复。本文还对高温胁迫下2株金藻的响应机制以及叶绿素荧光技术在筛选耐高温微藻品系中的应用进行了初步探讨。
【英文摘要】In this paper, two microalgal strains (Isochrysis galbana 3011 and 8701) were used to study the difference of chlorophyll a fluorescence parameters under high temperature stress (35-50°C). The results showed that the maximal photo chemical efficiency of PS(Fv/Fm), the potential activity of PSII(Fv/Fo), the relative electron transport rate (rETR), the actual photo chemical efficiency of the PSII reaction centers of light adapted cells (PSII) and the photo chemical quenching (qP) all decreased under high temperature stress in the two microalgal strains. The changed degree of the above parameters increased with the increase o f temperature and the increasing exposure time. NPQ in the two microalgal strains exhibiteddifferent patterns of variation with high temperature stress, the values in 3011 first increased then decreased ,while that in 8701 increased with stress time at 35°C and 40°C, but first increased then decreased at 45°C.There are some heat tolerance varieties between the two microalgal strains 3011 and 8701. Fo r 3011, the parameters Fv/Fm, Fv/Fo, PSII, rETR and qP could almost recover to the control values in the normal temperature after 10 min high temperature treatments at 40°C , but could not recover when the stress temperature are at 45°Cnd 50°C . As to 8701, the parameters Fv/Fm and Fv/Fo could almost recover to the control values at 25°C ,after 10m in high temperature stress a t 35°Cand 40 °C, but all parameters could not recover to the control value s when the temperature is above 45°C. The responsive mechanism of Isochrysis galbana to high temperature stress as well as the possibility of determining the high temperature resistance in microalgae using chlorophyl fluorescence induction kinetics was also discussed in this paper.

【题目】光照强度对雨生红球藻叶绿素荧光特性及虾青素含量的影响
【中文关键词】雨生红球藻;光照强度;叶绿素荧光参数;虾青素
【英文关键词】Haematococcus pluvialis ;illumination;chlorophyll fluorescence parameters; astaxanthin content
【中文摘要】研究了不同光照强度对雨生红球藻(Haematococcus pluvialis) 叶绿素荧光特性及虾青素含量的影响。测定的主要参数有PSII 的最大光能转化效率(Fv/Fm)、PSII 的潜在活性(Fv/Fo)、PSII 的实际光能转化效率(ΦPSII) 、光合电子传递效率(ETR)、光化学淬灭(qP)、非光化学淬灭(NPQ)、细胞密度、叶绿素相对含量以及虾青素含量。单因子方差分析结果表明,在整个培养周期中,光照强度对雨生红球藻各叶绿素荧光参数、叶绿素相对含量、细胞密度以及虾青素含量均有显著影响(P < 0.05)。多重比较结果表明,雨生红球藻的最适生长光照强度是50 umol.m-2.s-1,当光照强度为300 umol.m-2.s-1时单个细胞中的虾青素含量均显著高于其它处理组(P<0.01),但是单位体积虾青素含量以50 umol.m-2.s-1处理组为最高。相关性分析结果表明,在整个培养周期内,叶绿素相对含量与细胞密度均成显著正相关关系。荧光参数(Fv /Fm、Fv /Fo、5 PSÒ 、ETR、qP、NPQ)、叶绿素相对含量以及细胞密度与光照强度的相关性则随着培养天数的不同而变化。
【英文摘要】In this paper, the effects of different illumination on the chlorophyll fluorescence parameters and astaxanth in content of haematococcus pluvialis were examined.Themain parameters determined in the present study including the maximal photochemical efficiency of PSII (Fv/Fm), the potential activity of PSII (Fv/Fo), the actual photochemical efficiency of PSII in the light (ΦPSII),the electron transport rate (ETR) , the photochemical quenching (qP) , the non-photo chemical quenching (NPQ) , cell density, relative chlorophyll content and astaxanth in content. One-way analysis of variance showed that illumination had significant effects on

thefluorescence parameters, relative chlorophyll content, cell density and astaxan thin content of H.pluvialis during the entire experimental period (P<0. 05). Multiple comparisons show that the optimal growth illumination of H. pluvialis under the experimental conditions was 50 umol.m-2.s-1 . The astaxanth in content (ug.cell-1)at 300 umol.m-2.s-2were significantly higher than that in other treatments .But the astaxanthin content (ug/ml) at 50 umol.m-2.s-1 was highest in all treatments. The analysis of correlations showed that there were significant positive correlations between relative chlorophyll content and cell density during the entire experimental period. Moreover, some fluorescence parameters (Fv/Fm , Fv/Fo, ΦPSII, ETR, qP, NPQ), relative chlorophyll content and cell density all showed significant correlations with illumination, the pattern and strength of the correlations varied with culture age days.

【题目】温度对雨生红球藻叶绿素荧光特性及虾青素含量的影响
【中文关键词】雨生红球藻、温度、叶绿素荧光、虾青素
【英文关键词】haematococcus pluvialis ; temperature; chlorophyll fluorescence parameters;
astaxanthin content
【中文摘要】研究了不同温度(5-35℃) 对雨生红球藻(Haematococcus pluvialis) 叶绿素荧光特性及虾青素含量的影响。测定的主要参数有: PSII 的最大光能转化效率(Fv/Fm)、PSII 的潜在活性(Fv / Fo) 、PSII 的实际光能转化效率(ΦPSII) 、光合电子传递效率(ETR) 、细胞密度、叶绿素相对含量以及虾青素含量。单因子方差分析结果表明: 在整个培养周期中, 温度对雨生红球藻各叶绿素荧光参数、叶绿素相对含量、细胞密度以及虾青素含量均有显著影响(P< 0.05) 。多重比较结果表明, 在本实验条件下, 雨生红球藻的最适生长温度是20 ℃, 其单位体积虾青素含量以20℃处理组为最高, 而单个细胞中的虾青素含量则以5 ℃和30℃为最高。相关性分析结果表明: 培养天数为3-10 天时, 叶绿素相对含量与细胞密度均成显著正相关关系。本文还初步探讨了叶绿素荧光技术在筛选耐高温或耐低温微藻品系中的应用。
【英文摘要】In this paper, the effects of different temperatures (5-35°C) on the chlorophyll fluorescence parameters and astaxanthin content of Haematococcus pluvial is were examined.The main parameters determined in the present study included the max imal photochemical efficiency of PSII (Fv/Fm) , the potential activity of PSII (Fv /Fo) , the actual photo chemical efficiency of PSII in the light (ΦPSII) , the relative electron transport rate (ETR) , cell density , relative chlorophyll content , and astaxanthin content. One-way analysis of variance showed that temperature had significant effects on the fluorescence parameters, relative chlorophyll content , cell density and astaxanthin content of H.pluvialis during the entir eexperimentalperiod (P< 0. 05) . Multiple comparisons show that the optimal growth temperatureof H.p luvialis under the experimental conditions was 20 °C. T he astax anthin content of H.pluvialis expressed by ug/mL showed the highest valve at 20°C while that expressed by ug/cell reached the highest value at 5°C and 30°C. T he analysis of correlations showed that there were significant positive correlations between relative chlorophyll content and cell density from day 3 to day 10. In addition, the possibility of using chlorophyll fluorescence induction kinetics in selecting high or low temperature resistance micro algal strains was also discussed in this paper.

【题目】Cd2+胁迫对6株微藻生长及叶绿素荧光特性的影响
【中文关键词】微藻; Cd2+ ; 叶绿素荧光

【英文关键词】microalgae; Cd2+ ; chlorophyll fluorescence

【中文摘要】研究了不同浓度的Cd2+ 胁迫不同时间(24h、48h、7 2h 和96h) 后, 6 株微藻(绿色巴夫藻Pavlovaviridis 、等鞭金藻塔溪堤品系Tahitian Isochrysis galbana、小球藻Chlor ellasp. 、微绿球藻Nannochloris oculata、雨生红球藻Haematococus pluvialis 和塔胞藻Pyramidomonassp.) 生长及叶绿素荧光特性的变化情况。测定的主要参数有: PSII 的最大光能转化效率(Fv/ Fm) 、PSII 的潜在活性(Fv/ Fo) 、PSII 的实际光能转化效率(Yield) 、相对光合电子传递效率(rETR) 、细胞密度和叶绿素相对含量。研究结果表明, Cd2+ 胁迫下6 株微藻的荧光参数Fv/Fm 、Fv/ Fo 、Yield、rETR、细胞密度和叶绿素相对含量均与Cd2+ 浓度呈显著的负相关, 均随着Cd2+ 浓度的增加而降低。胁迫时间对各荧光参数也有显著影响。随着胁迫时间的延长, 绿色巴夫藻的Fv/ Fm 、Yield 和rET R 逐渐下降, Fv / Fo 先下降后上升, 至72h 时又有所下降; 等鞭金藻塔溪堤品系和微绿球藻的Fv / Fm 、Fv/ Fo、Yield 和rET R 随着胁迫时间的延长均逐渐下降;小球藻和雨生红球藻的上述荧光参数先下降, 之后分别在48h 和72h 时逐渐上升;塔胞藻的上述荧光参数则先上升后下降。在Cd2+ 胁迫下, 6 株微藻细胞密度和叶绿素相对含量也显著降低, 随着胁迫时间的延长, 细胞密度和叶绿素相对含量下降的幅度也逐步增大。相关分析结果表明, 6 株微藻的叶绿素相对含量与细胞密度均呈极显著的正相关关系。通过细胞密度计算出来的Cd2+ 对6 株微藻96h 的半抑制浓度(96h-EC50) 分别为绿色巴夫藻(151. 538umol/ L) , 等鞭金藻塔溪堤品系(14. 161umol/ L) , 小球藻(17. 150umol/ L) , 微绿球藻(3. 498umol/ L) , 雨生红球藻(15. 205umol/ L) , 塔胞藻(19. 722umol/ L) , 因此6 株微藻对Cd2+ 的耐受性大小顺序为: 绿色巴夫藻> 塔胞藻> 小球藻> 雨生红球藻> 等鞭金藻塔溪堤品系> 微绿球藻。

【英文摘要】It w as investigated that the growth and chlorophyll fluorescence characteristics of 6 microalgal strains (Pavlova viridis , Tahitian Isochrysis galbana, Chlorella sp. , Nannochloris oculata , Haematococus pluvialis and Pyramidomonas sp.) under different Cd2+ concentration and different durat io ns (24h, 48h, 72h and 96h) . The main parameters determined in the present study including the maximal photochemical efficiency of PSII (Fv/Fm) ,the potential activity of PSII (Fv/ Fo) , the actual photochemical efficiency of PSII in the light (Yield) , the relative electron transport rate (rETR) , cell density , and relative chlorophyllcontent. The results showed that the fluorescence parameters (Fv/Fm, Fv/ Fo , Yield, and rETR) , cell density , and relative chlorophyll content of 6 microalgal strains all exhibit significant negative correlations to Cd2+ concentration, being lowest at higher Cd2+ concentration. Exposure durations also have significant effects on the fluorescence parameters o f 6 microalgal strains. For P .viridis, Fv / Fm, Yield, and rETR decreased with the increasing exposure duration, Fv/ Fo first decreased then increased, and declined again at 72h; The parameters Fv/ Fm, Fv/Fo, Yield, and rETR in Tahitian I .galbana and N .oculata all decreased w ith the increasing exposure duration, while those in Chlorellasp. and H .pluvialis first decreased, and then increased at 48h and 72h, respectively; The above parameters in Pyramidomonas sp. first increased then decreased with the increasing exposure duration.Cd2+ exposure also caused the decrease of the cell density, and relative chlorophyll content of6 microalgal strains, the changed degree of the above parameters increased with the increasing Cd2+ concentration and exposure duration. The correlation analysis results showed that there are significant positive correlations between the relative chlorophyll content and cell density o f 6 microalgal strains. T he 96h-EC50 (the effective concentration causing a 50% inhibit ion) values calculated by cell density were as follows: P.viridis (151.538umol/L) , Tahitian I sochrysis galbana (14. 16umol/L),Chlorella sp.(17.150umol/ L),N .oculata(3.498umol/ L) , H.pluvialis(15. 205umol/ L) , Pyramidomonas sp. (19.722umol/L) , respectively. Therefore, comparison of the 96h-EC50 values based on the cell density variation amongthe six micro algal species indicated the order of their tolerance to Cd2+ was P.viridis> Pyramidomonas sp. > Chlorella sp. > H .pluvialis > Tahitian I sochrysis galbana >N .oculata.

【题目】不同处理方法对浒苔饲喂稚幼刺参效果的影响
【中文关键词】浒苔;刺参;蛋白酶;饲料
【英文关键词】Enteromorpha prolifera ; Sea cucumber ; Apostichopus japonicus ;Protease ;Feed
【中文摘要】浒苔Enteromorpha prolifera 是一种能形成绿潮的大型海藻, 含有丰富的蛋白质、脂肪和微量元素。用蛋白酶、纤维素酶、甲酸及自然发酵等方法处理浒苔, 并作为饲料喂养刺参Apostichopus japonicus。结果表明, 用蛋白酶处理的浒苔能显著提高刺参的生长率。说明用适当的方法加工后, 浒苔可以作为刺参的良好饲料, 实现浒苔的资源化利用。
【英文摘要】Enteromorpha prolifera is a seaweed species that is responsible for widespreadgreen tides. It is also a seafood species and contains relatively high levels of protein, fatty acids and trace elements. In t his study, fresh E.prolifera was treated by protease, cellulase, formic acid and natural fermentation, before being used as feed for young sea cucumber Apostichopus japonicus . The protease treated E. prolifera obtained good growth in sea cucumbers. It is suggested that , after proper treatment and processing, E.prolifera may be a good feed source for sea cucumbers, and this is a feasible way to utilize this green tide species as a resource.

【题目】循环水养殖系统中自然微生物生物膜形成过程实验
【中文关键词】循环水养殖系统;自然微生物;生物膜;生物载体
【英文关键词】recirculating aquaculture systems; natural microbes; bio-film;
microbial carrier
【中文摘要】进行了不同初始NH 4-N 浓度, 在实验水温20-24℃条件下, 利用微生态制剂辅助, 循环水养殖系统中自然微生物生物膜形成过程的实验研究。结果表明: 不同NH4-N 浓度对自然微生物生物膜形成产生显著影响, 5、10 和20 mg/L高浓度NH4-N 更易于微生物的扩繁生长和生物膜形成, 其生物膜达到预期水质净化效果的形成周期, 即生物挂膜成熟周期, 约需要35-40 d。生物挂膜成功后, 形成很好的硝化作用, 实验生物滤池中的NH4-N、NO2-N浓度均保持低于0.05m g/L, COD浓度低于3mg/L, 显示出对NH4-N、NO2-N和COD很高的去处效果, 但对PO4-P处理效果不明显。而1和2mg/L低浓度NH4-N不易于微生物的扩繁生长, 难以形成具有较好水质净化效果的生物膜, 即生物挂膜难以成功。
【英文摘要】The studied on the experiment of process of formed bio-film of the natural microbeswas conducted by the microbial ecological agent assisted in different ammonia nitrogen concentrations in recirculating aquaculture systems, under the condition of water temperature 20 to 24°C. The results of experiments showed that different ammonia nitrogen concentrations had a significant impact on bio-film form ation of natural microbes in bio-filter. The bio-film was prone to expand, grow and form in high ammonia nitrogen concentrations 5m g/L, 10 mg/L, 20mg/L, and could complete the formation period of anticipating purifying effect of water quality, mature periods of bio-film formation were needed about 35-40 days. A fter the bio-film formation, the complete nitrification

was established, ammonia nitrogen and nitrite nitrogen concentrations kept below 0.05mg/L, and COD concentration was under 3mg/L, but the treatment effect of phosphate was not obvious in experimental biofilter. Contrarily, in the low ammonia concentrations of 1mg/L, 2 mg/L, themicrobes were not prone to expand and grow, and were difficult to form the bio-film of preferable purifying effect of water quality, that was to say, it was difficult to form the bio-film successfully.

【题目】聚六亚甲基双胍对凡纳滨对虾不同生长阶段及饵料藻类的安全性研究
【中文关键词】凡纳滨对虾;聚六亚甲基双胍;饵料藻类;安全性
【英文关键词】Litopenaeus vannamei; polyhexamethylene biguanide(PHMB); feeding algae; security
【中文摘要】采用药浴方式,研究了一种新型消毒剂———聚六亚甲基双胍对凡纳滨对虾受精卵、无节幼体、幼虾、成虾的毒性及饵料藻类的影响。结果表明,聚六亚甲基双胍对凡纳滨对虾幼虾24、48 h 的LC50 为64.1 mg·L-1 和31.13 mg·L-1,安全浓度Sc 为2.20 mg·L-1;聚六亚甲基双胍对凡纳滨对虾成虾24、48 h 的LC50 为66.17 mg·L-1 和32.16 mg·L-1,安全浓度Sc 为2.28 mg·L-1,为了保证凡纳滨对虾的安全性,聚六亚甲基双胍的用量应控制在0.5 mg·L-1 之内;聚六亚甲基双胍在125 mg·L-1 浓度内对受精卵的孵化率无明显影响,0.5 mg·L-1 浓度以内对无节幼体的变态率无明显影响。聚六亚甲基双胍对球等鞭金藻和亚心形扁藻表现出了明显的剂量-效应关系,其对球等鞭金藻和亚心形扁藻的生长不产生抑制的最高浓度为5 mg·L-1;聚六亚甲基双胍对球等鞭金藻48、96、144 h 的EC50 为27.01、34.95 mg·L-1 和33.14 mg·L-1;亚心形扁藻为34.65、28.73 mg·L-1 和20.57 mg·L-1,聚六亚甲基双胍对两种藻类的安全浓度分别3.5 mg·L-1 和2.9 mg·L-1,表明聚六亚甲基双胍对亚心形扁藻的影响更明显。
【英文摘要】The security of polyhexamethylene biguanide(PHMB)on different growth stages of Litopenaeus vannamei and feeding algae were investigated.The results showed:cumulative mortality of juvenile and adult Litopenaeus vannamei increased with increasing concentration of PHMB. 24 h and 48 h median lethal concentrations(LC50)of PHMB on juvenile shrimp of Litopenaeus vannamei were 64.1 mg·L-1 and31.13 mg·L-1, and security concentration(Sc)was 2.20 mg·L-1. 24 h and 48 h median lethal concentrations(LC50)of PHMB on adult shrimp of Litopenaeus vannamei were 66.17 mg·L-1 and 32.16 mg·L-1, and security concentration(Sc)was 2.28 mg·L-1. In order to guarantee security on culturing Litopenaeus vannamei, the using amount of PHMB should below 0.5 mg·L-1. Hatching and metamorphosis test showed:hatchingrate of control group was 87%, and hatching rate of test group was the range of 79%~92%. There was no significant influence on hatching rate of zygote when the concentration of PHMB below 125 mg·L-1, and there was no significant influence on metamorphosis rate of nauplius when the concentration of PHMB below 0.5 mg·L-1. With the increase of PHMB concentration, the growth inhibition rate of Isochrysis galbana andPlatymonas subcordiformis was increasingly apparent. There was an excellent relationship between dose and effect of PHMB on Isochrysis galbana and Platymonas subcordiformis, and the sensitivity of Platymonas subcordiformis to PHMB is higher than Isochrysis galbana. The highest concentration of no significant influence of PHMB on Isochrysis galbana and Platymonas subcordiformis was 5 mg·L-1. 48 h, 96 h and 144 h EC50 of PHMB on Isochrysis galbana were 27.01, 34.95 mg·L-1 and 33.14 mg·L-1, and the corresponding concentrations of Platymonas subcordiformis were 34.65,28.73 mg·L-1 and 20.57 mg·L-1. According to the classification of aquatic organisms toxicity, the toxicity of PHMB to Isochrysis galbana and Platymonas subcordiformis belonged to moderate toxicity.

【题目】基于计算机视觉的罗非鱼适应环境的体色变化研究
【中文关键词】罗非鱼; 鱼体色;背景颜色;社会应激;计算机视觉
【英文关键词】Tilapia; Fish skin color; Background color; Social stress; Computer vision
【中文摘要】多数鱼类的体色会受应激条件、环境背景、健康状况、生长发育和社会地位等因素的影响而发生改变。本文利用基于计算机视觉的体色量化技术研究正常情况和社会应激条件下罗非鱼对背景颜色的适应性, 以及在背景颜色变化过程中体色变化的响应速度。实验结果表明: 已适应白色背景的鱼放入黑色背景水体后, 体色变化主要发生在前10s内, 放入时和放入10s后的体色明度值差异极显著(** p< 0.01); 在白色背景下适应的鱼放入黑色背景下适应2h后其体色变得很黑, 将其放入白色背景水体后体色在10s内可发生由深到浅的变化, 放入时和放入10s后的体色明度值差异极显著(** p < 0.01)。在蓝色背景下适应的鱼放入黑色背景水体后, 体色变化主要发生在前10s内, 放入时和放入10s后的体色明度值差异显著(* p< 0. 05)。在蓝色背景下适应的鱼放入黑色背景下适应2h后的体色变得很黑, 再将其放入白色背景水体后体色由深变浅, 放入时和10s后的体色明度值发生极显著变化(** p <0.01)。处于社会应激条件下劣势地位的鱼体色会变黑, 刚放入白色背景水体时的平均灰级达到12.7阶,放入60s、1800s后的体色和刚放入时没有显著差异。受社会应激影响轻微的鱼体色在1800 s后适应了环境的颜色, 明度值和没有受应激影响鱼的体色接近, 而受伤或受社会应激影响较严重的鱼体色改变较小。鱼在高浓度非离子氨(UIA浓度为0.178mg /L)的水中处理3h后, 鱼的体色变得很黑, 刚放入白色背景水体时平均灰级达到15 1阶, 放入10s、120s后鱼的体色变化不大, 放入180s后鱼的体色变浅, 平均灰级达到9 3阶, 与刚放入时的体色明度相比差异显著(* p< 0.05)。
【英文摘要】Some fish color modification can occur under stress conditions, environment background color, health status, fish reproductive period, along with social class .The skin color of tilapia adapted to background color under normal conditionsand social stress conditions, as well as skin color modifications response rate during color modification period, were investigated by fish color quantifying techno logy based on computer vision .The results showed that skin color modification of tilapia had adapted white background happened in the first 10s while putting tilapia into the aquarium with black background,and the lightness level of the skin color had much significant modification (** p<0.01) in 10s .The skin color of tilapiahad adapted white background appeared deeply black while putting tilapia into the aquarium with black background for 2h,and then the color changed from deep color to tint in 10swhile putting tilapia into the aquarium with white background, thelightness level of the skin color had much significant modificat ion (** p < 0.01) in 10s . The skin color modification of tilapia had adapted blue background happened in the first 10s while putting tilapia into the aquarium with black background,and the lightness level of the skin color had significant modification (* p < 0.05) in 10s .The skin color of tilapia had adapted blue background appeared deeply black while putting tilapia into the aquarium with black background for 2h, andthen the color changed from deep color to tint in 10s while putting tilapia into the aquarium with white background, the lightness level of the skin color had much significant modification (** p < 0.01) in 10s .The tilapia color modification can changed black under social stress .The mean density steps of color researched 12 7 ranks while putting tilapia into the aquarium with white background and the lightness level o f the skin color had no significant modification after 60s and 1800s in white back-ground .The skin color of tilapia suffered lower social stress conditions can adapted the environment color after 1800s and the lightness level of the skin color was similar with those in normal conditions .T he lightness level of the skin color of tilapia was hurt and suffered severe social stress changed little .The skin color of tilapia treated with high UIA (0.178mg /L) became darker and the mean density steps of color researched 15.1 ranks while putting tilapia into the aquarium with white background and the lightness level of the skin color had no significantmodification after 10s and 120s in white background .The mean density steps of color researched 15.1 ranks at 180s and the lightness level of the skin color had significant modification (* p<0.05)

【题目】循环水养殖系统生物挂膜的消氨效果及影响因素分析
【中文关键词】循环水养殖系统;生物滤池;挂膜;影响因素;水力停留时间
【英文关键词】Recirculating aquaculture systems ; Bio-filter ; Bio-film formation Impact factors; Hydraulic retention time (HRT)
【中文摘要】针对工厂化循环水养殖系统,利用海水中的自然净化微生物挂膜,挂膜成功后,形成了很好的硝化作用,进行不同水温、进水氨氮浓度和水力停留时间(HRT) 影响因素实验。结果表明,相同的进水氨氮浓度,随着水温的升高,不同水温之间氨氮浓度变化差异显著(P < 0.05) 。在28 ℃水温时,经过生物膜120 h 的净化处理,进水氨氮浓度降低到最低;随着进水氨氮浓度和HRT 的增大,氨氮去除率及特殊去除率也不断的增大,但在同一进水氨氮浓度下,氨氮特殊去除率随着水力停留时间的延长反而降低。
【英文摘要】Bio-film was successfully formed by making use of the natural purifying microbein the sea for the industrial recirculation aquaculture systems. T he nitrification impact factors , including water temperatures, influent ammonia nitrogen concentrations and hydraulic retention time (HRT) were also explored . The results showed that at the same influent ammonia nitrogen concentration and HRT, the ammonia nitrogen concentrations changed significantly at different water temperatures (P< 0.05) . When the water temperature was 28°C , after purified by bio-film for 120 hours, the influent ammonia nitrogen concentration dropped to the lowest concentration. The ammonia nitrogen removal rate and the specific ammonia removal rate were gradually increased as the influent ammonia nitrogen concentration and HRT increased. However , at the same ammonia nitrogen concentration, the specific ammonia nitrogen removal rate decreased as HRT was prolonged.

【题目】节能型半滑舌鳎循环水养殖车间优化设计
【中文关键词】循环水养殖系统;生物滤池;挂膜;影响因素;水力停留时间
【英文关键词】seawater recirculation aquaculture; fish culture engineering; optimized design; Cynoglossus semilaevlis
【中文摘要】优化设计建设了半滑舌鳎循环水养殖车间,车间建筑面积2 880 m2,养殖水面1 340 m2。优化设计主要包括节能型养鱼车间、循环水处理工艺、补充水及外排废水处理工艺、养鱼池、生物滤池及渠道式紫外线消毒池设计。该养鱼车间比一般低拱车间节能30%以上。生物滤池为4段流水式结构。养鱼池能自动清污,倒U 形管控制水位。渠道式紫外线消毒池消毒效率高,细菌去除率99%以上。通过养鱼工程优化设计及基地建设,提出了我国未来海水循环水养殖的三级推广模式。

【英文摘要】The optimized design of high efficiency engineering of marine fish culture in recirculation systems was set up at Tianjin Lida Marine Resource Development Co. Ltd. The fish farm occupies an area o f 2 880m3,including a fish culture area o f 1 340m2. The aim of this establishment is for protection of marine environmentand energy saving, so as to promote marine recirculation fish culture systems. The design covers an energy saving fish culture workshop, a series of recirculation water treatment water supplement and waste water discharge facilities, fish tanks, a sectioned flow through filtration tank and a runway style UV sterilization. The fish culture workshop can save more than 30% energy compared with ordinary low arch workshop. Bio-filtration tank is a four section flow through system. The fish tanks are designed to clean automatically, with water level controlled by an up-side-dow n U shaped tube. The runway style UV sterilization has high efficiency and can remove 99% of all bacteria. This optimized engineering design of seawater recirculation fish culture system and the building of experiment base has set up a model for the extension of marine recirculation aquaculture.

【题目】竹环填料生物滤器在两种海水鱼养殖废水处理中的运行效果及微生物群落分析
【中文关键词】竹环填料生物滤器;海水养殖废水;氨氮去除率;微生物群落
【英文关键词】bamboo medium biofilter; marine aquaculture wastewater; ammonia removal rate; microbial community
【中文摘要】以点带石斑鱼(Epinephelus malabaricas)、半滑舌鳎(Cynoglossus semilaevis)养殖排放水为处理对象, 在生产现场研究了竹环填料生物滤器处理高盐度、低氨氮负荷海水养殖废水的运行效果以及挂膜阶段和稳定运行阶段微生物群落变化规律。结果表明, 点带石斑鱼养殖废水进水氨氮质量浓度为0.93-1.33 mg/L, 氨氮去除率达到27%-39%, 挂膜时间需45 d;半滑舌鳎养殖废水进水氨氮质量浓度为0.38-0.52 mg/L, 氨氮去除率达到20%-30%, 挂膜时间需65 d。另外, 对生物滤器挂膜阶段和稳定运行阶段的氨氧化细菌数量和亚硝酸氧化细菌数量进行了统计, 氨氧化细菌的数量在点带石斑鱼和半滑舌鳎养殖排放水处理系统中分别达到104-105 CFU/mL 和103 CFU/mL, 亚硝酸氧化细菌数量则分别达到104 CFU/mL 和103 CFU/mL, 并分析了温度、进水氨氮负荷、反硝化作用对半滑舌鳎养殖废水生物滤器亚硝酸盐积累现象的影响。
【英文摘要】The performance characteristics and microbial community of biofilter packed with bamboo ring were investigated in Epinephelus malabaricas wastewater and Cynoglossus semilaevis wastewater with high salinity and low ammonia. It was found that the ammonia removal rate of E. malabaricas wastewater was 27%-39%, when theinlet ammonia concentrations were 0.93~1.33 mg/L, and the biofilm development needed about 45 days; while the ammonia removal rate of C.semilaevis wastewater was 20%-30%, when the inlet ammonia concentrations were 0.38-0.52 mg/L, and the biofilm development needed about 65 days. In addition, the number of AOB and NOBduring the start-up and steady state of the biofilter were counted, the number of AOB in E.malabaricas wastewater bioreactor and C.semilaevis wastewater bioreactor reached to 104~105 CFU/mL and 103 MPN/mL, respectively; and the NOB number reached to 104 CFU/mL and 103 CFU/mL, respectively. The influences of temperature, inlet ammonia concentration, and denitrification on the nitrite accumulation in C.semilaevis wastewater were analyzed.

【题目】对虾工程化循环水养殖系统构建技术
【中文关键词】对虾,循环水养殖,系统,构建

【英文关键词】shrimp, recirculating aquaculture, system, construction
【中文摘要】讨论了一种高效经济保持藻类生长的对虾工程化循环水养殖系统构建技术。并利用此系统开展室内凡纳滨对虾生产试验。养殖用水采用经室外池塘充分氧化后的咸井水(盐度14‰~26‰),放苗密度:500 尾/m2,排放水经系统处理后循环使用。并且在试验期间,探索了一种低耗高效运行模式。90 d 养殖期,系统溶解氧均值5.1 mg/L,氨氮0.002~0.15 mg/L,pH 值7.62~8.29,获良好水生态环境调控效果。系统产量4.6 kg/m2,饲料系数1.14,每生产1 kg 虾耗水1 000 L、耗电2.16 kWh,取得高产量、高效率养殖生产结果。
【英文摘要】The paper is focused on the construction technology of an economical recirculating aquaculture systems used for raising shrimp (Lieopenaeus vanamei) with microalgae. Original water used for the system was sea water, which would be oxygenated in the pond outside. Culture density was 500 spieces/m2. By the culture test, an economical mode was developed. In the early period, blower was used for aeration to supply the oxygen demand and the water was not reused. In the middle period, after about 15 days, all the water treatment devices were started and the water was fully reused. In the last period, oxygenation was added into the system. During the culture period, about 90 days, average dissolved oxygen concentration in the water was about 5.1 mg/L, TAN concentration changed between 0.002-0.15 mg/L,pH 7.62-8.29. The cultural test has obtained a good result, final shrimp output in the cultural tank were about 4.6 kg/m2,and the cost was very low. For raising 1 kg shrimp, 1 000 L water and 2.16 kW • h electricity was cost.

【题目】循环水养殖系统(RAS)生物载体上微生物群落结构变化分析
【中文关键词】生物载体; 生物挂膜; 微生物群落结构; 循环水养殖系统(RAS) ; PCR-DGGE
【英文关键词】bio-carrier; bio-film formation; microbial community structure; recirculating aquaculture systems(RAS) ; PCR-DGGE
【中文摘要】为研究循环水养殖系统(recirculating aquaculture systems,RAS) 生物滤池挂膜及运行过程中生物载体上微生物群落结构的变化及其脱氮机制,采用传统微生物培养方法,对不同时期生物载体上的异养细菌、氨氧化细菌及硝化菌进行培养计数. 并通过变性梯度凝胶电泳技术,对细菌的16S rDNA V3 可变区的PCR 扩增片段进行分离,分析了所得到的细菌群落特征DNA指纹图谱,对其中的优势菌属使用序列数据进行同源性分析并建立系统发育树. 结果表明,随着时间的推移,3 类细菌的数量都呈现出先增加后逐渐降低直至达到稳定的趋势. 各个时期生物载体上微生物群落的组成非常丰富,Shannon 指数分别为1. 53、1. 44、1. 57、1. 08、1. 27 和1. 30. 不同时期生物载体上微生物的种类有一定的变化,但2 个相邻时期的Cs值(相似性指数) 都比较高,说明微生物群落的变化与演替是缓慢而有规律的. 生物载体上存在多类细菌共同作用于养殖水体污染物的去除,出水水质能达到高密度养殖的要求,其主要优势种群以Proteobacteria 和Flavobacteria 为主,分离鉴定出了亚硝化单胞菌属(Nitrosomonas) 及黄杆菌(Flavobacteriaceae bacterium) 等兼性厌氧细菌,表明生物滤池中可能同时存在硝化和脱氮途径.
【英文摘要】In order to study the variation of microbial community structure and the mechanism of denitrification on bio-carrier in recirculating aquaculture systems(RAS) during the periods of bio-film formation and operation the systems,traditional microbiological methods were applied to count the quantity of heterotrophic bacteria,ammonia oxidize bacteria and nitrite oxidize bacteria. The amplified products of variable V3 region of bacterial 16S rDNA were separated by using denaturing gradient gel electrophoresis(DGGE) . And bacterial community DNA fingerprint was obtained. The sequences retrieved from the DGGE bands were used forhomology analysis and construction of phylogenetic tree. It presented a trend that the quantity of the three types of bacteria increased gradually to a top and then fallen slowly to a stable level. The composition of microbial community of bio-carrier was very abundant in all periods,and the Shannon index was 1. 53,1. 44,1. 57,1. 08,1. 27 and 1. 30,respectively. During different periods,there was a certain shift in the microbial community structure,while the Cs value(similar index) in two adjacent periods was high,indicating the variation and succession of the microbial community was slow and regular. Several bacteria had an effect on removal of pollutants for farming water and the effluent water quality could meet the requirements of high-density culture. Among them,Proteobacteria andFlavobacteria were main communities. The Nitrosomonas and some other facultative anaerobic bacteria(Flavobacteriaceae bacterium)were identified,which indicated that there may be coexisted pathways of nitrification and denitrification in bio-filter.

【题目】盐度对盐生杜氏藻叶绿素荧光参数的影响
【中文关键词】盐生杜氏藻盐度 叶绿素荧光参数 生长
【英文关键词】no
【中文摘要】本文研究了一次性培养过程中,不同盐度(15、30、60、90、120、150)对盐生杜氏藻PSII最大光能转化效率Fv/Fm、PSⅡ的潜在活性Fv/Fo、PSⅡ的实际光能转化效率ΦPSⅡ、相对光合电子传递效率rETR、叶绿素相对含量及细胞密度的影响。实验结果表明:盐度对盐生杜氏藻的光合作用及生长均有显著影响(P<0.05);盐生杜氏藻进行光合作用和生长的最适盐度都为90。相关性分析结果表明:在整个培养周期中,Fv/Fm、叶绿素相对含量均与细胞密度呈显著的正相关关系。

【题目】重金属胁迫对杜氏盐藻生长及叶绿素荧光特性的影响
【中文关键词】杜氏盐藻Dunaliella salina;重金属胁迫; 叶绿素荧光
【英文关键词】Dunaliella salina ;heavy metal stress; chlorophyll fluorescence
【中文摘要】研究了杜氏盐藻Dunaliella salina 在不同浓度的Cu2+、Zn2+、Cd2+等重金属离子胁迫一段时间(24、48、72和96 h)后, 叶绿素荧光特性的变化情况。测定的主要参数有: PSII 的最大光能转化效率(Fv/Fm)、PSII 的潜在活性(Fv/Fo)、PSII 的实际光能转化效率(Yield)、相对光合电子传递效率(rETR)、光化学淬灭(qP)和非光化学淬灭(NPQ)。研究结果表明, 当Cu2+浓度范围在600~800 μmol/L 时, 杜氏盐藻的Fv/Fm、Fv/Fo、Yield、rETR 和qP 均明显降低, NPQ 变化不规律, 随着胁迫时间的延长, 除qP 在96 h时有所上升外, 各荧光参数均逐渐降低; Zn2+胁迫下Fv/Fm、Fv/Fo、Yield 和rETR 随着浓度的增加而降低, NPQ 先下降后上升, qP 仅在Zn2+浓度范围(800~3200 μmol/L)下明显下降, 随着胁迫时间的延长, 各荧光参数均逐渐降低; Cd2+胁迫下各荧光参数均明显下降, 随着胁迫时间的延长, Fv/Fm、Fv/Fo 和NPQ先下降后上升, 在48 h 时达到最低值, Yield、rETR 和qP 均逐渐降低。在3 种重金属离子胁迫下, 细胞密度和叶绿素相对含量也显著降低。根据3 种重金属离子的半抑制浓度(EC50), 其毒性大小顺序为Cu2+ >Cd2+ > Zn2+。
【英文摘要】The modulate chlorophyll fluorescence kinetics of Dunaliella salina under different concentrations of heavy metals (Cu2+, Zn2+, Cd2+) and different durations (24, 48, 72 and 96 h) were investigated. The main parameters determined in the present study included the maximal photochemical efficiency of PSII (Fv/Fm), the potential activity of PSII(Fv/Fo), the actual photochemical efficiency of PSII in the light (Yield), the relative electron transport rate (rETR), the photochemical quenching (qP), and the non-photochemical quenching (NPQ). The results showed that the parameters of D. salina Fv/Fm, Fv/Fo, Yield, rETR and qP reduced markedly at 600~800 μmol/L by Cu2+, NPQ first decreased then increased, and declined at 400 μmol/L again. The changed degree of the parameters all reduced with the increasing exposuretime except qP rose at 96 h; Fv/Fm, Fv/Fo, Yield and rETR reduced under toxic effect by Zn2+, NPQ first decreased then increased, qP declined clearly just at 800~3200 μmol/L by Zn2+, the parameters all decreased with the increasing exposure time; all of the parameters reduced under toxic effect by Cd2+, Fv/Fm, Fv/Fo and NPQ first decreased then increased with the increasing exposure time, the data reach to the lowest at 48 h, Yield, rETR and qP decreased all the time.The cell density and chlorophyll content were also decreased under heavy metal stress. The EC50 values indicated that thetoxicities

followed the order of Cu2+ >Cd2+ >Zn2+.

【题目】三角褐指藻遗传转化体系建立及绿色荧光蛋白基因表达
【中文关键词】三角褐指藻;基因枪;遗传转化;绿色荧光蛋白;基因表达
【英文关键词】Chlamys farreri ; D larvae; haemocyte; monoclonal antibody
【中文摘要】三角褐指藻能够大量合成并积累PUFAs, 特别是EPA, 有望成为工业化生产EPA 的原料。以pPha- T1 为基础质粒构建了含有绿色荧光蛋白基因的重组质粒pPha-GFP, 采用基因枪方法转化三角褐指藻, 通过抗生素(博莱霉素) 筛选得到转化藻株, 在蓝光的激发下, 转化藻发出绿色荧光, 说明绿色荧光蛋白(GFP) 基因成功表达。三角褐指藻遗传转化体系的建立为该藻分子遗传学研究奠定了基础。
【英文摘要】Preliminary data showed that, during the development of Chinese scallop Chlamys farreri ,distinguishable haemocytes occurred since the stage of D larvae. In this paper, the study on the distribution and morpha of haemocytes in D larvae were carried out by the methods of light microscopy, histochemical staining and immunohistochemistry (IHC) with monoclonal antibodies against haemocytes of C.farreri. The results showed that the haemocytes with distinguishable morpha were mainly distributed in the tissues of mantle, velum, mouth, esophagus, stomach, digestive gland and intestine. Moreover , the dissociative haemocytes with a fuscous nuclear in center were spherical or spheroidical, with a diameter of1-3 um, and assembled in digestive gland. However, the different types o f haemocytes and the hematopoietic tissues were not found in D larvae stage. So, as a conclusion , we deduced that the haemocytes became morphologically distinguishable from D larvae stage and mainly distributed in tissues and organs which are related to feeding and digestion.

【题目】四种填料滤器处理养鱼废水的硝化性能
【中文关键词】硝化,细菌,废水处理,封闭循环水养殖,载体填料
【英文关键词】nitrification, bacteria, wastewater treatement, marine recirculation aquaculture system, substrate
【中文摘要】为了研究不同填料对海水养殖废水处理的硝化效能,并为生物滤器硝化动力学模型的构建、生物滤器的设计与管理提供基础数据支持,本文在5 个化学耗氧量/总氨氮比0、0.8、2、6、12 条件下,研究了竹制空心生化球、麦饭石、陶粒和生物滤球等4 种填料的生物滤器去除模拟海水养殖废水中化学需氧量和总氨氮,以及生物膜微生物种群结构和数量的变化。结果表明:在低化学需氧量/总氨氮(<6)条件下麦饭石填料的生物滤器具有最高的化学需氧量和总氨氮去除效能,最高分别可达850 和21 g/(m3·d)(化学需氧量/总氨氮=0.8);竹制空心生化球次之,其化学需氧量和总氨氮去除效能最高分别可达750 和23 g/(m3·d)(化学需氧量/总氨氮=6);陶粒略次于竹制空心生化球,其化学需氧量和总氨氮去除效能最高分别可达650 和15 g/(m3·d);而生物滤球效果最差,其化学需氧量和总氨氮去除效能最高分别可达650和11 g/(m3·d);化学需氧量/总氨氮的升高将抑制总氨氮去除效能,但可提高化学需氧量的去除效能。在温度为15~22°C,水力停留时间为0.5 h 的运行条件下,生物滤器的生物膜成熟需40~50 d 左右:竹制空心生化球滤器最慢,约需50 d;其他填料约需40 d。竹制空心生化球滤器在高化学需氧量/总氨氮,较其他试验填料滤器具有更好的总氨氮去除效能,在海水养殖生产中有良好的应用前景。
【英文摘要】To explore mariculture wastewater removal capacity by biofliter and to acquire the parameters of nitrification kinetics in biofilter for promoting RAS applied study and extensive application, Bamboo Ring, Maifan Stone, Ceramic Pellet and Plastic Ball (PE) substrates were packed into different biofilters. The physical chemistry characters of substrates, COD and ammonia nitrogen removal capacity were investigated and evaluated by simulated mariculture wastewater under five C/T ratio (COD/TA N=0, 0.8, 2, 6, 12). The results showed that 1) COD and TAN removalcapacities of biofilter packed with Maifan Stone substrate were the highest under low C/T (<6), with the highest rate of 850 and 21 g/(m3·d) (C/T = 0.8) respectively. The second was the Bamboo Ring substrate, with the highest rate of 750 and 23 g/(m3·d) (C/T = 6) respectively. As carbon concentration improving, the TAN removal rate decreased and COD removal rate increased. 2) Under the condition of 15 – 22°C and HRT 0.5 h, nitrobacteria number for different substrates reached a plateau and matured in 40 – 50 d, Bamboo Ring in 50 d, others in 40 d. Choosing different substrate can impact the running stability of biofilter. Substrate is closely related with biofilm maturation duration and nitrification process, and affects nitrifying capacity obviously. Bamboo Ring substrate can remove TAN with the highest rate under higher C/T(>6) ratio condition and has a potential in RAS production.

【题目】A bioaugmentation failure caused by phage infection and weak biofilm formation ability
【中文关键词】无
【英文关键词】marine culture; water circulation; ammonia removal; Lutimonas sp. H10; nitrification breakdown; fluorescent in situ ;hybridization (FISH)
【中文摘要】无
【英文摘要】Two biological aerated filters (BAF) were setup for ammonia removal treatment of the circulation water in a marine aquaculture. One of the BAFs was bioaugmented with a heterotrophic nitrifying bacterium, Lutimonas sp. H10, where the ammonia

removal was not improved and the massive inoculation was even followed by a nitrification breakdown from day 9 to 18. The nitrification was remained stable in control BAF operated under the same conditions. Fluorescent in situ hybridization (FISH) with rRNA-targeted probes and cultivable method revealed that Lutimonas sp. H10 almost disappeared from the bioaugomented BAF within 3 d, and this was mainly due to the infection of a specific phage as revealed by flask experiment, plaque assay and transmission electron observation. Analyses of 16S rRNA gene libraries showed that bacterial groups from two reactors evolved differently and an overgrowth of protozoa was observed in the bioaugmented BAF. Therefore, phage infection and poor biofilm forming ability of the inoculated strain are the main reasons for bioaugmentation failure. In addition, grazing by protozoa of the bacteria might be the reason for the nitrification breakdown in bioaugmented BAF during day 9 – 18.

【题目】Effects of cryoprotectants and salinities on viability and fatty acid profile of two haptophytes during preservation at low temperature

【中文关键词】无

【英文关键词】Pavlova viridis ; Isochrysis galbana Parke ; Cryoprotectants ; Salinity ; Viability ; Fatty acids

【中文摘要】无

【英文摘要】Effets de cryoconservateurs et de la salinite sur la viabilite et le profil des acides gras de deux haptophytes pendant la conservation a basse tempeature (-22±1°C). La production aquacole peut etre amelioree en utilisant des microalgues de bonne qualite pour les larves et les juveiles. Ce papier presente les effets de diffeents cryosonservateurs et de differents niveaux de salinit sur la viabilite et la teneur en acides gras de deux haptophytes, Pavlova viridis et Isochrysis galbana Parke lors dune conservation a -22±1°C . Les meilleurs cryoconservateurs des deux haptophytes ont ete selectionns en evaluant leur viabilite apres decongelation. Les resultats montrent que 10% de DMSO (dimehyl-sulfoxyde)+ 5% Glycerol, dune part et 10% de DMSO + 5% Proline, dautre part, sont les meilleurs cryoconservateurs pour P. viridis et I. galbana, respectivement. Ces deux haptophytes presentent une meilleure viabilit aux plus fortes salinite testeess, 21,3 et 32. Enfin, la teneur en acides gras reste stable pendant toute la duree de stockage, independemmant de la viabilite . Cest un point important dans la mesure ou les acides gras, particulierement les acides gras polyinsatures,jouent un role important dans la qualite nutritive des microalgues en aquaculture.

【题目】Construction and characterization of a normalized cDNA library of Nannochloropsis oculata (Eustigmatophyceae)

【中文关键词】无

【英文关键词】Eustigmatophyceae; Nannochloropsis oculata; normalized cDNA library; expressed sequence tag

【中文摘要】无

【英文摘要】We constructed and characterized a normalized cDNA library of Nannochloropsis oculata CS-179, and obtained 905 nonredundant sequences (NRSs) ranging from 431 – 1 756 bp in length. Among them, 496 were very similar to nonredundant ones in the GenBank (E ≤1.0e-05), and 349 ESTs had significant hits with the clusters of eukaryotic orthologous groups (KOG). Bases G and/or C at the third position of codons of 14 amino acid residues suggested a strong bias in the conserved domain of 362NRSs (>60%). We also identified the unigenes encoding phosphorus and nitrogen transporters, suggesting that N. oculata could efficiently

transport and metabolize phosphorus and nitrogen, and recognized the unigenes that involved in biosynthesis and storage of both fatty acids and polyunsaturated fatty acids (PUFAs), which will facilitate the demonstration of eicosapentaenoic acid (EPA) biosynthesis pathway of N. oculata. In comparison with the original cDNA library, the normalized library significantly increased the efficiencies of random sequencing and rarely expressed genes discovering, and decreased the frequency of abundant gene sequences.

【题目】Molecular identification of Pampus fishes (Perciformes, Stromateidae)
【中文关键词】无
【英文关键词】Pampus; Cytochrome c oxidase I;16S rRNA ; Pampus minor
【中文摘要】无
【英文摘要】Concerning the nomenclature, most problems arise from the great confusion due to the morphological similarities in Pampus. Twenty-five individuals in Pampuswere sampled from different localities about 2,000 km apart along the coast of China covering the Yellow Sea, the East China Sea and the South China Sea. The sequences of cytochrome c oxidase I (COI) and 16S rRNA (16S) genes of the mitogenomes were determined. Combined with the morphological characteristics, five Pampus species,P. minor, P. punctatissimus, P. chinensis, P. cinereus and Pampus sp., were identified. The genetic distance of intraspecies ranged from 0.000 to 0.004, while it varied from 0.012 to 0.133 for interspecies based on the 16S sequences. For COI sequence data analysis, the genetic distance of intraspecies ranged from 0.000 to 0.005, while it varied from 0.057 to 0.162 for interspecies. Phylogenetic trees showed that all Pampus fishes reciprocally constituted a monophyletic group with strong support. The sister-group relationships between P. minor and Pampus sp. andbetween P. chinensis and P. punctatissimus were revealed respectively. In the current GenBank data, P. minor isconsidered P. cinereus or P. argenteus by mistake. For the lack of a P. echinogaster specimen, we cannot decide on the name of Pampus sp. as P. argenteus or P. echinogaster.

【题目】Broader pattern of tandem repeats in the mitochondrial control region of Perciformes
【中文关键词】无
【英文关键词】mtDNA; control region; tandem repeats; Perciformes; evolution
【中文摘要】无
【英文摘要】Perciformes, the largest order of vertebrates with 20 suborders, is the most diverse fish order that dominates vertebrate ocean life. The complete mitochondrial control region (CR) of Trichiurus japonicus (Trichiuridae, Scombroidei) and Pampus sp. (Stromateidae, Stromateoidei) were amplified and sequenced. Together with data from GenBank, the tandem repeats in the mitochondrial CR from 48 species, which covered nine suborders of Perciformes, are reported in this study. The tandem repeats tendto be long in the suborder Percoidei and Stromateoidei. The identical repeats in 21 species of Cichlidae suggest a common origin and have existed before species divergence. Larimichthys crocea shows tandem repeats instead of the typical structure of the central conserved sequence blocks, which was first reportedin Perciformes and vertebrates. This might have resulted from interruption of the polymerase activity during the H-strand synthesis. The four broader patterns presented here for the tandem repeats, including those in both the 5′ and 3′ ends, only in the either 5′ or 3′ end, and in the central conserved domain of thecontrol region, will be useful for

understanding the evolution of species.

【题目】Artificial gynogenesis in Cynoglossus semilaevis with homologous sperm and its verification using microsatellite markers
【中文关键词】半滑舌鳎 雌核发育 倍性分析 微卫星
【英文关键词】Cynoglossus semilaevis gynogenesis ploidy analyser microsatellite
【中文摘要】半滑舌鳎人工雌核发育技术和
【英文摘要】Effective methods for induction of gynogenetic diploids in Cynoglossus semilaevis are needed to initiate monosex culture. An effective protocol to induce half-smooth tongue sole gynogenesis using homologous sperm was developed in this study. A UV dose of 50 mJ cm-2 was found to be the most effective for genetic inactivation of tongue sole sperm. Treatment optima for cold shocks were 5 degrees C for 20-23 min at 5 min after fertilization and the hatching rate of gynogenetic diploids was 10.0%. Microsatellite analysis at locus Csou 6 revealed that there was no genetic contribution from the paternal genome in 24 progenies of a meiotic gynogenetic family. Polymerase chain reaction demonstrated that only four individuals of 24 meiotic gynogenetic diploids produced the female-specific band of about 205 bp. The female/male ratio of gynogenetic diploids was significantly different from the theoretical ratio of 1:1. It is possible that there are some recessive lethal genes in W chromosome

【题目】Construction of Two BAC Libraries from Half-Smooth Tongue Sole Cynoglossus semilaevis and Identification of Clones Containing Candidate Sex-Determination Genes
【中文关键词】半滑舌鳎,BAC文库,性别决定
【英文关键词】Half-smooth tongue sole; BAC library; Sex determination; Female-specific marker; Sex-related gene; Cynoglossus semilaevis
【中文摘要】构建半滑舌鳎两个BAC文库及筛选性别决定基因
【英文摘要】Half-smooth tongue sole (Cynoglossus semilaevis) is an increasingly important aquaculture species in China. It is also a tractable model to study sex chromosome evolution and to further elucidate the mechanism of sex determination in teleosts. Two bacterial artificial chromosome (BAC) libraries for C. semilaevis, with large, high-quality inserts and deep coverage, were constructed in the BamHI and HindIII sites of the vector pECBAC1. The two libraries contain a total of 55,296 BAC clones arrayed in 144 384-well microtiter plates and correspond to 13.36 haploid genome equivalents. The combined libraries have a greater than 99% probability of containing any single-copy sequence. Screening high-density arrays of the libraries with probes for female-specific markers and sex-related genes generated between 4-46 primary positive clones per probe. Thus, the two BAC libraries of C. semilaevis provided a readily useable platform for genomics research, illustrated by the isolation of sex determination gene(s).

【题目】All-triploid Japanese flounder (Paralichthys olivaceus) induction by cold shock
【中文关键词】牙鲆 三倍体诱导 冷激
【英文关键词】Japanese flounder (Paralichthys olivaceus) triploidy induction cold shock
【中文摘要】冷激的方法诱导三倍体牙鲆
【英文摘要】Cold shock is a useful method of inducing triploidy in some fish species. In this paper, triploidy in Japanese flounder (Paralichthys olivaceus) was induced by applying cold shocks of 3 degrees C, three or four minutes after fertilization, for 15, 25, 35, 45, 55, or 65 min. Ploidy of fry was analyzed using a ploidy analyzer. Survival was lower in treatments shocked at four minutes than in treatments shocked at three minutes after fertilization, and decreased as the duration of the cold shock increased. The abnormality rate increased with the shock duration. The best results were achieved in the treatment shocked three minutes after fertilization for 25 min, resulting in 100% triploidy with the highest survival rate (93.27%) and one of the lowest abnormality rates (15.87%). This study shows that cold shock is a highly effective method for inducing triploidy in the Japanese flounder.

【题目】Artificial gynogenesis and assessment of homozygosity in meiotic gynogens of spotted halibut (Verasper variegatus)
【中文关键词】圆斑星鲽,人工雌核发育,微卫星
【英文关键词】Verasper variegatus; Gynogenesis; Microsatellite; Homozygosity
【中文摘要】圆斑星鲽人工雌核发育技术和纯合性评价
【英文摘要】In the present study, methodology of gynogenetic induction in spotted halibut were developed and optimized; the sex ratio of putative meiotic gynogenetic diploids was determined using AFLP-based molecular sexing technique; the homozygosity of gynogenetic population was assessed as opposed to cultivated population. The results showed that high percentage of meiotic gynogenetic diploids were generated when the eggs fertilized with irradiated heterologous sea perch frozen sperm (30-50 mJ cm(-2)) were cold shocked in sea water of -1A degrees C for 40-75 min at 5 min after fertilization. About 15,200 diploid gynogenetic larvae were achieved and they exhibited normal morphology similar to diploid control. The gynogenetic diploids were 100% female, which first confirmed the female homogamete (XX/XY) sex determination in spotted halibut. The genetic analysis showed that the average H (O) was, respectively, 0.404 and 0.724 in gynogenetic population and cultivated population, indicating an increase of homozygosity in gynogenetic population.

【题目】Comparison of Chromosome Preparation methods for the Different Developmental Stages of the Half-smooth Tongue Sole, Cynoglossus Semilaevis

【中文关键词】染色体修复 半滑舌鳎 发育阶段 性染色体
【英文关键词】Chromosome preparation Cynoglossus semilaevis Developmental stages Sex chromosome
【中文摘要】比较半滑舌鳎不同时期不同的染色体制备方法
【英文摘要】Here we present a comparison of the different chromosome preparation methods, including the method of the single embryo or larva, the method of juvenile-swimming and the method of phytohemagglutinin injection, used for the different developmental stages of the half-smooth tongue sole, Cynoglossus semilaevis. The mean index of mitosis for the three methods was 0.79%, 0.09% and 0.15%, respectively. From the well-spread metaphase chromosomes obtained, it was determined that C. semilaevis has a diploid chromosome number of 42 and heterotypic sex chromosomes. Also, the metaphase chromosomes produced could be used for karyotype preparation and banding studies. The three methods are also successfully used for chromosome preparation in Japanese flounder (Paralichthys olivaceus) and summer flounder (Paralichthys dentatus).

【题目】Three Tetraspanins from Chinese shrimp (Fenneropenaeus chinensis), may play important roles in WSSV infection
【中文关键词】WSSV; 跨膜四超家族; TM4SF; 中国明对虾
【英文关键词】WSSV tetraspanins TM4SF Fenneropenaeus chinensis
【中文摘要】中国对虾四跨膜蛋白超家族在WSSV病毒感染过程中可能起到重要作用
【英文摘要】Three members of the tetraspanin/TM(4)SF superfamily were cloned from Chinese shrimp, Fenneropenaeus chinensis. The deduced amino acid sequences of the three proteins have typical motifs of the tetraspanin/TM(4)SF superfamily. Phylogenetic analysis of the proteins, together with the known tetraspanins of invertebrates and vertebrates, revealed that they belong to different tetraspanin subfamilies: CD9, CD63 and tetraspanin-3. The three cloned genes of CD9, CD63 and tetraspanin-3 showed apparently different tissue distributions. The CD9 gene (FcCD9) was specifically expressed in the hepatopancreas. While for the CD63 gene (FcCD63), the highest expression was detected in nerves, epidermis and heart, with low expression in haemocytes, ovary, gill, hepatopancreas and stomach and no expression in intestine, muscle and lymphoid organ. Compared with FcCD9 and FcCD63, the tetraspanin-3 gene (FcTetraspanin-3) was more broadly expressed and its highest expression was detected in the intestine. Its expression in nerves was lower than in the intestine, but was higher than in other tissues. Expression in haemocytes, ovary and muscle was much lower than in other tissues. The expression profiles of FcCD9, FcCD63 and FcTetraspanin-3 in different tissues, including haemocytes, lymphoid organ and hepatopancreas, were compared by real-time PCR when shrimp were challenged by live white spot syndrome virus (WSSV) and heat-inactivated WSSV. All three tetraspanins were markedly up-regulated in the live WSSV-challenged shrimp tissues. The data suggested that the three cloned members of TM(4)SF superfamily in Chinese shrimp may play a key role in the route of WSSV infection.

【题目】Screening of genes related to ovary development in Chinese shrimp Fenneropenaeus chinensis by suppression subtractive hybridization
【中文关键词】中国对虾 卵巢 抑制性消减杂交 三倍体

【英文关键词】Fenneropenaeus chinensis Ovary Suppression subtractive hybridization Triploid
【中文摘要】通过抑制性消减杂交的方法筛选中国对虾卵巢发育相关基因
【英文摘要】In the present study, a suppression subtractive hybridization (SSH) technique was applied to identify differentially expressed genes in the ovary between diploid and triploid shrimp. For the forward library (RNA from the ovary of triploid shrimp as the tester), 54 genes were identified. For the reverse library (RNA from the ovary of diploid shrimp as the tester), 16 genes were identified. The identified genes encoded proteins with multiple functions, including extracellular matrix components, cytoskeleton, cell growth and death, metabolism, genetic information processing, signal transduction/transport or immunity related proteins. Eleven differentially expressed genes were selected to be confirmed in the ovaries of triploid and diploid shrimp by semi-quantitative RT-PCR. Genes encoding spermatogonial stem-cell renewal factor, cytochrome c oxidase subunits I and II, clottable protein, antimicrobial peptide and transposase showed up-regulated expressions in the ovary of triploid shrimp. Genes encoding tubulin, cellular apoptosis susceptibility protein, farnesoic acid O-methyltransferase, thrombospondin and heat shock protein 90 genes showed higher expressions in the ovary of diploid shrimp. The differential expressions of the above genes are suggested to be related to the ovary development of shrimp. It will provide a new clue to uncover the molecular mechanisms underlying the ovarian development in penaeid shrimp. (C) 2010 Elsevier Inc. All rights reserved.

【题目】Cloning and expression patterns of two isoforms of spermatophore-specific CHH-like gene in Chinese shrimp, Fenneropenaeus chinensis
【中文关键词】甲壳动物高血糖激素 克隆 表达 原位杂交 精荚囊 中国对虾
【英文关键词】Crustaceanhyperglycemic hormone (CHH) Cloning Expression In situ hybridization Spermatophore sac Fenneropenaeuschinensis
【中文摘要】中国对虾精巢特异性两个CHH-like基因单体的克隆和表达分析
【英文摘要】Two full-length cDNA sequences (Fc-CHH1, Fc-CHH2) encoding a crustacean hyperglycemic hormone (CHH) precursor homolog and their DNA sequences were cloned from Chinese shrimp Fenneropenaeus chinensis. The deduced amino acid sequences of them are predicted to contain a signal peptide and a mature peptide. The mature peptides of Fc-CHH1 and Fc-CHH2 shared 78% identity, but they showed low identities (less than 40%) to CHH peptides from other species. Both Fc-CHH1 and Fc-CHH2 proteins contain six highly conserved cysteine residues which are characteristic of the CHH family peptides. The transcripts of Fc-CHH1 and Fc-CHH2 were shown to be specifically present in the spermatophore sac of mature male Chinese shrimp through reverse transcription-polymerase chain reaction (RT-PCR) detection. The transcripts of Fc-CHH1 and Fc-CHH2 begin to appear at the immature stage (115 days after the first post-larvae stage) when the spermatophore sac was first observed to be appeared. In situ hybridization analyses showed that Fc-CHH1 and Fc-CHH2 transcripts located at the epithelial cells in the internal wall of the spermatophore sac. In the cloned DNA sequences of Fc-CHH1 and Fc-CHH2, the predicted transcription factor binding sites in the 5' flanking sequences are different from those previously reported for CHH family genes of crustacean. To our knowledge, these are novel CHH-like genes expressed specifically in male shrimp. Their function needs to be further investigated. (C) 2010 Elsevier Inc. All rights reserved.

【题目】Construction of a genetic linkage map and mapping of a female-specific DNA marker in half-smooth tongue sole (Cynoglossus semilaevis)
【中文关键词】半滑舌鳎, AFLP标记,微卫星标记,遗传连锁图谱,性别特异性标记,定位
【英文关键词】Half-smooth tongue sole AFLP markers Microsatellite markers Genetic linkage map Female-specific marker Mapping
【中文摘要】半滑舌鳎基因连锁图谱的构建及一种雌性特异性DNA标记的定位
【英文摘要】The half-smooth tongue sole (Cynoglossus semilaevis, hereafter, "tongue sole") is a marine flatfish with great commercial importance for fisheries and aquaculture in China. It has also been a promising model for the study of sex determination mechanisms in fish. Here, we report the construction of a genetic linkage map for the tongue sole, based on 137 markers including 103 AFLP markers, 33 microsatellite markers, and one female-specific DNA marker. Twenty-six linkage groups (LGs) were found. The total map length was 934.6 cM (Kosambi), with an average spacing of 8.4 cM, covering 64.4% of the estimated genome size. Furthermore, a female-specific SCAR marker, CseF-382, was mapped on LG5. This study represents the first genetic linkage map in the tongue sole. This map has great potential in the identification of quantitative traits loci and sex-related genes and marker-assisted selection in the tongue sole. Meanwhile, the new set of polymorphic microsatellite markers developed in this study is not only useful for genetic mapping but also of critical importance for studies on genetic diversity and broodstock management in tongue sole.

【英文摘要】In the present study, we report 31 polymorphic microsatellite markers, of which 28 were isolated from two repeat-enriched libraries constructed from genomic DNA, and three were detected in two genes (MCH-R1 and MCH-R2) of barfin flounder

(Verasper moseri). A total of 94 alleles were detected with an average of 3.0 alleles per locus. The number of alleles, observed and expected heterozygosity per locus ranged from two to six, from 0.30 to 1.00 and from 0.33 to 0.78, respectively. Three loci significantly deviated from Hardy-Weinberg equilibrium after Bonferroni correction ($P < 0.0016$) and no significant linkage disequilibrum between pairs of loci was found. Cross-species amplification of these markers was evaluated using the closely related species spotted halibut (Verasper variegatus). This study will potentially be useful for stock management, constructing of a genetic linkage map, mapping economically important quantitative trait loci (QTL), and studying the population genetic diversity of barfin flounder (Verasper moseri).

【中文摘要】大西洋牙鲆新多态性微卫星标记
【英文摘要】To address this shortcoming, a microsatellite-enriched genomic DNA library of P. dentatus was generated and screened by sequencing. Twelve dinucleotide microsatellite loci were characterized by genotyping 24 samples. The observed number of alleles ranged from three to thirteen with an average of 8.25, while the effective number of alleles ranged from 2.21 to 8.28 with an average of 5.06. The observed and expected heterozygosities ranged from 0.0833 to 0.9583 and from 0.5594 to 0.8980, respectively. Significant deviations from Hardy-Weinberg expectations were detected at three loci and linkage disequilibrium between two loci was significant after applying Bonferroni correction. In cross-species amplification, three species showed at least two polymorphic loci. The 12 highly polymorphic microsatellite markers represent a powerful molecular tool, which will allow for detailed population genetic analyses on this important marine fish.

【英文摘要】A modified surface spreading technique for synaptonemal complex (SC) analysis was tested to assess the process of chromosome synapsis in spermatocytes of diploid and induced triploid Fenneropenaeus chinensis. Spermatocytes of diploid shrimp showed typical morphological characteristics of eukaryote SC, with complete synapsis of bivalents. No recognizable bivalent associated with sex chromosomes was observed in spermatocytes of diploid shrimp. However, differences in morphology of SC, including unsynapsed univalents, bivalents, totally paired trivalents with non-homologous synapsis, partnerswitches and triple synapsis were identified at early pachytene stage of triploid spermatocytes. Triple synapsis was especially common at late pachytene stage in spermatocytes of triploid shrimp. The observed abnormal synapsis behavior of chromosomes in spermatocytes indicated that triploid male shrimp may find it difficult to develop normal haploid sperm

【题目】Cryopreservation of spotted halibut (Verasper variegatus) sperm
【中文关键词】圆斑星鲽 精子 冻存 存活率 繁殖率

【英文关键词】Spotted halibut; Verasper variegates; Semen, Cryopreservation; Motility; Fertility
【中文摘要】圆斑星鲽精子冷冻技术
【英文摘要】In this project, cryopreservation technique for sperm of spotted halibut was developed. The effects of various extenders and cryoprotectants on motility of frozen-thawed sperm were examined. The motility of frozen-thawed sperm in TS-2 was higher than that in ASW and MPRS ($p < 0.05$) and was not significantly different from that of fresh sperm ($p > 0.05$). While the motility of frozen-thawed sperm cryopreserved with 13.3% EG (ethylene glycol), 13.3% glycerol, 13.3% MeOH (methanol) and 13.3% DMF (dimethylformamide) was less than 5%, no significant differences were observed in the motility between fresh sperm and frozen-thawed sperm cryopreserved with 13.3% DMSO (dimethyl sulfoxide), 13.3% PG (propylene glycol) ($p > 0.05$). Using the above method, we cryopreserved spotted halibut semen with extender TS-2 and 13.3% DMSO or 13.3% PG. As a result, the fertilization rate (34.52 +/- 10.92%) and hatching rate (23.53 +/- 11.80%) of frozen-thawed sperm were not significantly different from that of fresh sperm ($p > 0.05$). Motility and time delay in the activation of frozen-thawed sperm activated by artificial seawater at different salinity were different. Low salinity (low osmolality) could delay the activation of frozen-thawed sperm. The highest motility was observed with artificial seawater of 30%. ($p < 0.05$). The most suitable temperature of seawater to activate spotted halibut frozen sperm was determined to be 18 degrees C ($p < 0.05$). However, temperature of seawater has no significant effect on time delay in the activation of frozen-thawed sperm ($p > 0.05$).

【题目】Molecular marker-assisted sex control in half-smooth tongue sole Cynoglossus semilaevis
【中文关键词】半滑舌鳎 雌性特异性标记 性别逆转 假雄性 遗传性别 分子标记辅助性别控制
【英文关键词】Half-smooth tongue sole; Cynoglossus semilaevis; Female specific marker; Sex reversal; Neo-male; Genetic sex; Molecular marker-assisted sex control
【中文摘要】半滑舌鳎性别控制相关分子标记
【英文摘要】In the present study, a female-specific AFLP marker (CseF305) was isolated from female genomic DNA of the tongue sole and sequenced. One pair of SCAR primers was designed based on the sequences of the female-specific marker. A PCR method for identifying genetic sex of the sole was developed. PCR amplification of genomic DNA from tongue sole adults using the SCAR primers resulted in a specific fragment in 30 female individuals, but not in 30 males. Secondly, effects of methyltestosterone treatment on the female:male sex ratio of tongue sole fry were examined. methyltestosterone at a concentration of 20-100 mu g/L center dot H2O can induce genetic females to reverse to phenotypic males in juvenile tongue sole and produce a high proportion of males (97-100% males). Phenotypic males with female genotype, that is, neo-males, were detected by using female-specific SCAR primers. The neo-males were

cultured and matured, and used to mate with normal females to produce progeny. 130,000 fry were produced by using sperm from neo-males. Genetic sex identification demonstrated that 73% of the neo-male progeny fry contained female-specific DNA markers. Three combinations of sex chromosomes (ZZ, ZW and WW) were observed in the neo-male progeny. WW super-female individuals containing 2 huge heteromorphic chromosomes were found in some fry

【题目】Artificial gynogenesis and sex determination in half-smooth tongue sole (Cynoglossus semilaevis)
【中文关键词】半滑舌鳎 人工雌核发育 性别决定机制 WW超雌
【英文关键词】Half-smooth tongue sole; Cynoglossus semilaevis; Artificial gynogenesis; Sex determination mechanism; WW super female
【中文摘要】半滑舌鳎人工雌核发育技术和性别决定
【英文摘要】Half-smooth tongue sole (Cynoglossus semilaevis) is an important cultured marine fish as well as a promising model fish for the study of sex determination mechanisms. In the present study, a protocol for artificial gynogenesis of half-smooth tongue sole was developed in order to identify the sex determination mechanism and to generate all-female stock. The optimal UV-irradiation dose for genetically inactivating sea perch spermatozoa was determined to be >= 30 mJ/cm(2). The optimal initiation time for cold shock of gynogenetic embryos was determined to be 5 min after fertilization, while the optimal temperature and treatment duration were determined to be 20-25 min at 5 degrees C. Chromosomes from common diploids, gynogenetic haploids, and diploids were analyzed. WW chromosomes were discovered in some of the gynogenetic diploids. The microsatellite marker was applied to analyze gynogenetic diploid fry. Among the 30 gynogenetic diploid fry, 11 fry contained only one allele, while 19 contained two alleles, which had the same genotype as their mother. The female-specific DNA marker was observed in four individuals out of ten gynogenetic diploid fry. Ploidy analysis of 20 putative gynogenetic fry showed them all to be diploid. Thus, a protocol for the induction of artificial gynogenesis has been developed for the first time in half smooth tongue sole, and the sex determination mechanism in the tongue sole was determined to be female heterogametic with the ZW chromosome.

【题目】Molecular cloning, characterization and expression analysis of gonadal P450 aromatase in the half-smooth tongue-sole, Cynoglossus semilaevis
【中文关键词】半滑舌鳎 细胞色素P450芳香酶 cDNA 表达
【英文关键词】Cynoglossus semilaevis; Gonadal P450 aromatase; cDNA; Expression
【中文摘要】半滑舌鳎P450芳香酶基因克隆和表达分析
【英文摘要】To Study the role of gonadal cytochrome P450 aromatase (P450aromA) in sex differentiation, the cDNA was isolated from the ovary of the half-smooth tongue-sole, Cynoglossus semilaevis. The deduced amino acid sequence exhibited high homology with P450arom of other teleosts. Alignment and phylogenetic analysis of the P450arom showed that the tongue sole P450aromA belonged to the gonadal P450arom Subfamily. The 5'-flanking region of the P450aromA gene contains two Ad4 binding motifs and a half site of the palindrome sequence of the estrogen-responsive element (the ERE half). P450aromA transcripts were highly abundant in the Ovary, less abundant in the testis, but not present in the brain, liver, spleen, kidney, muscle, skin, heart, head kidney, gill, intestine,

or eyes by RT-PCR. The P450aromA mRNA increased with gonad development, but was less abundant ill the testis compare to the ovary in all phases. Highly abundant P450aromA was detected in the female ovary, but was less abundant in the testis in neo-males obtained by methyltestosterone or temperature treatment. These results imply that P450arom may be involved in gonadal development and sex differentiation in the tongue sole.

【题目】Polymorphic dinucleotide microsatellites in tongue sole (Cynoglossus semilaevis Gu¨ nther)

【中文关键词】半滑舌鳎 富集基因组文库 微卫星序列

【英文关键词】Cynoglossus semilaevis; enriched genomic library; microsatellites

【中文摘要】半滑舌鳎二核苷酸微卫星序列多态性

【英文摘要】From a (GT)(n)-enriched genomic library, 57 microsatellites were isolated and characterized. Seventeen of these loci were polymorphic in a test population with alleles ranging from three to 13, and observed and expected heterozygosities from 0.1613 to 1.0000 and from 0.2126 to 0.8983, respectively. Five loci deviated from the Hardy-Weinberg equilibrium in the sampled population, and linkage disequilibrium between two loci was significant after applying Bonferroni correction. Three additional fish species assessed for cross-species amplification revealed that only one locus was also polymorphic in one species. These polymorphic microsatellite loci should provide sufficient level of genetic diversity to evaluate the breeding strategy and investigate the fine-scale population structure in C. semilaevis.

【英文摘要】Artificially produced male and female half-smooth tongue sole (Cynoglossus semilaevis) were used to screen sex-specific amplified fragment length polymorphism (AFLPs) molecular markers. The phenotypic sex of 28 tongue soles was determined by histological sectioning of gonads. The AFLP analysis of 15 females and 13 males via 64 primer combinations produced a total of 4681 scorable bands, of which 42.11% and 43.39% of bands were polymorphic in females and males, respectively. Seven female-specific AFLP markers were identified and designated as CseF382 ' CseF575, CscF783, CseF464, CseF136, CseF618, and CseF305, respectively. One female-specific AFLP marker (CseF382) was amplified, recovered from the gels, cloned, and sequenced (accession no. DQ487760). This female-specific AFLP marker was converted into a single-locus polymerase- chain reaction (PCR) marker of a sequence-characterized amplified region OSCAR). A simple PCR method of using the specific primers was developed for identifying genetic sex of half-smooth tongue sole. PCR products demonstrated that the initial 15 females produced the female-specific band of about 350 bp, but the initial 13 male individuals failed to produce the band. We also investigated the applicability of the PCR primers in other tongue sole individuals. The same female-specific fragment of about 350 bp was found in the additional 59 female individuals, but not in the additional 58 male individuals. This AFLP-based molecular sexing technique may have great application potential in

elucidation of sex determination mechanisms and sex control in half-smooth tongue sole.

【中文摘要】无
【英文摘要】Twenty novel microsatellite markers for halfsmoothtongue sole (Cynoglossus semilaevis) were isolatedand characterized from a simple sequence repeat-enrichedlibrary constructed with (GA)15 and (CA)15. The polymorphismwas assessed using 32 individuals collected fromone locality along the Chinese coast. The result showed thenumber of alleles ranged from 2 to 14, with an average of8.7 alleles/locus. The values of observed and expectedheterozygosities ranged from 0.2609 to 1.0000 and from0.2367 to 0.9716, respectively. Six microsatellite locideparted significantly from Hardy – Weinberg equilibrium.No linkage disequilibrium was found. These markers willbe useful for the conservation studies and populationstructure assessment for this species.

【英文摘要】A continuous cell line, TEC (turbot embryonic cell line), was established from embryos at the gastrula stage of a cultured marine fish, turbot (Scophthalmus maximus), and has been cultured for more than 200 days with more than 60 passages. The TEC cells were cultured in DMEM medium supplemented with antibiotics, fetal bovine serum (FBS), sea perch serum (SPS), and basic fibroblast growth factor (bFGF). The cells were small and round, and grew actively and stably in culture. Effect of temperature, fetal bovine serum (FBS) concentration, and bFGF on the growth of TEC cells was examined. The cells grew well in the temperature range of 24-30 degrees C, but have a reduced growth rate at temperatures below 18 degrees C. The growth rate of TEC cells in medium containing 15% FBS was higher than that in medium containing 7.5% FBS. Addition of bFGF to the medium significantly increased the growth rate of TEC cells. Chromosome analysis revealed that TEC cells have a normal diploid karyotype with 2n=4m+12st+28t. High survival rate has been obtained after cryopreservation of cell cultures.

【题目】Electron microscopic Analysis of the Viromatrix of Rana grylio Virus in a Fish Cell line
【中文关键词】蛙虹彩病毒,超微结构,定量分析
【英文关键词】iridovirus; RGV; viromatrix; ultrastructure; quantitative analysis
【中文摘要】蛙虹彩病毒在鱼类细胞系中病毒装配区的研究
【英文摘要】Rana grylio virus (RGV), a Ranavirus belonging to the family Iridoviridae, assembles in the viromatrix which is a factory for viral genome replication and particle assembly. Ultrastructural studies of the viromatrix will clarify the pathway of assembly. The viromatrix and quantitative changes in RGV infected epithelipma papulosum cyprini (EPC) cells, one of fish cell lines, were studied by electron microscopy. It was shown that viromatrices were adjacent to the nucleus, and the electron density was lower than that of the

surrounding cytoplasm. The viromatrix contained virus particles with different forms, electron-dense materials and amorphous structures which included tubules and membranous materials. Tubules were often observed in direct continuity with empty capsids. Several bundles of intermediate filaments were seen alongside the viromatrix and crystalline aggregates. Large clusters of mitochondria occurred in proximity to viromatrix. A total of 990 cells profiles were examined. The results showed that 394 cells contained viromatrix: 89.3% contained one, and 10.7% contained two to four viromatrices. The number of viromatrices increased gradually and reached a peak at 16 h p.i. The viromatrix area at 24 h p.i. increased up to 7.4 +/- 0.69 mu m(2) which was three-times lower than that at 6 h p.i. The number of empty capsids within viromatrix was generally more than that of "full" particles at different time points, and there was a strong positive correlation between them

【题目】Seasonal variation of virioplankton in a eutrophic shallow lake
【中文关键词】浮游病毒,季节变化,浅水湖
【英文关键词】virioplankton; bacterioplankton; seasonal variation; shallow lake; eutrophication
【中文摘要】富营养化浅水湖泊中浮游病毒的季节变化
【英文摘要】Lake Donghu is a typical eutrophic freshwater lake in which high abundance of planktonic viruses was recently revealed. In this study, seasonal variation of planktonic viruses were observed at three different trophic sites, hypertrophic, eutrophic, and mesotrophic regions, and the correlation between their abundances and other aquatic environmental components, such as bacterioplankton, chlorophyll a, burst size, pH, dissolved oxygen, and temperature, was analyzed for the period of an year. Virioplankton abundance detected by transmission electron microscope (TEM) ranged from 5.48 x 10(8) to 2.04 x 10(9) ml(-1) in all the sites throughout the study, and the high abundances and seasonal variations of planktonic viruses were related to the trophic status at the sampled sites in Lake Donghu. Their annual mean abundances were, the highest at the hypertrophic site (1.23x10(9) ml(-1)), medium at the eutrophic site (1.19x10(9) ml(-1)), and the lowest at the mesotrophic site (1.02x10(9) ml(-1)). The VBR (virus-to-bacteria ratio) values were high, ranging from 49 to 56 on average at the three sampled sites. The data suggested that the high viral abundance and high VBR values might be associated with high density of phytoplankton including algae and cyanobacteria in this eutrophic shallow lake, and that planktonic viruses are important members of freshwater ecosystems.

【题目】Spatial distribution and morphologic diversity of virioplankton in Lake Donghu, China
【中文关键词】浮游病毒,空间分布,形态多样性
【英文关键词】virioplankton; spatial distribution; morphological diversity; Lake Donghu; bacterioplankton
【中文摘要】中国东湖浮游病毒的空间分布和形态多样性
【英文摘要】The spatial distribution and morphological diversity of virioplankton were determined in Lake Donghu which contains three trophic regions: hypertrophic, eutrophic and mesotrophic region. Virioplankton abundance measured by transmission electron microscope (TEM) ranged from 7.7 x 10(8) to 3.0 x 109 ml(-1), being among the highest observed in any natural aquatic system examined so far. The spatial distribution of virioplankton was correlated significantly with chlorophyll a concentration ($r = 0.847$; $P < 0.01$) at the sampling sites in Lake Donghu. 76 morphotypes were observed. Most morphotypes have tails, belonging to Siphoviridae,

Myoviridae and Podoviridae. The majority of tailed phages in the lake were Myoviridae. Morphotypes which were rarely reported, such as prolate-headed virus-like particles, lemon-shaped virus-like particle, and viruses resembling Tectiviridae and Corticoviridae were all observed in the lake. It is concluded that the high viral abundance might be associated with high density of phytoplankton including algae and cyanobacteria. There was high viral diversity in this eutrophic shallow lake. In addition, cyanophage represented an important fraction of the virioplankton community in Lake Donghu

【中文摘要】牙鲆半调控抑制因子2激酶的克隆鉴定及压力胁迫下的表达
【英文摘要】The heme-regulated initiation factor 2a kinase (HRI) is acknowledged to play an important role in translational shutoffin reticulocytes in response to various cellular stresses. In this study, we report its homologous cDNA cloning andcharacterization from cultured flounder embryonic cells (FEC) after treatment with UV-inactivated grass carphaemorrhagic virus (GCHV). The full-length cDNA of Paralichthys olivaceus HRI homologue (PoHRI) has 2391 bpand encodes a protein of 651 amino acids. The putative PoHRI protein exhibits high identity with all members of eIF2akinase family. It contains 12 catalytic subdomains located within the C-terminus of all Ser/Thr protein kinases, a uniquekinase insertion of 136 amino acids between subdomains IV and V, and a relatively conserved N-terminal domain (NTD).Upon heat shock, virus infection or Poly I:C treatment, PoHRI mRNA and protein are significantly upregulated in FECcells but show different expression patterns in response to different stresses. In healthy flounders, PoHRI displays a widetissue distribution at both the mRNA and protein levels. These results indicate that PoHRI is a ubiquitous eIF2a kinaseand might play an important role in translational control over nonheme producing FEC cells under different stresses.r 2006 Elsevier Ltd. 【题目】Differential expression of three Paralichthys olivaceus Hsp40 genes in responses to virus infection and heat shock
【中文关键词】热激蛋白40,牙鲆,鲆弹状病毒
【英文关键词】heat shock protein (Hsp) 40; paralichthys olivaceus; Scophthalmus maximus rhabdovirus; differential expression; heat shock
【中文摘要】三种牙鲆Hsp40 基因在热激和病毒感染时的不同表达
【英文摘要】By subtractive suppression hybridization, three Hsp40 homologues have been identified in the flounder (Paralichthys olivaceus) embryonic cells (FEC) after treatment with UV-inactivated turbot (Scophthalmus maximus L.) rhabdovirus (SMRV), termed PoHsp40A4, PoHsp40B6 and PoHsp40B11, whose encoded proteins all possess the conserved DnaJ domain, a signature motif of the Hsp40 family. Based on different protein structure and phylogenetic analysis, they can be categorized into two subfamilies, PoHsp40A4 for Type I Hsp40, PoHsp40B6 and PoHsp40B11 for Type 11 Hsp40. Further expression analysis revealed two very different types of kinetics in response either to heat shock or to virus infection, with a marked induction for PoHsp4OA4 and a weak one for both PoHsp40B6 and PoHsp40B11. A very distinct tissue distribution of mRNA was also revealed among the three genes, even between PoHsp40B6 and PoHsp40B11. This is the first report on the transcriptional induction of Hsp40 in virally stimulated fish cells, and the differential expressions might reflect their different roles in unstressed and stressed cells

【中文摘要】鉴定蛙虹彩病毒3β羟基类固醇脱氢酶基因及抑制病毒诱导病变效应中的作用
【英文摘要】The 3β-hydroxysteroid dehydrogenase (3β-HSD) isoenzymes play a key role in cellular steroid hormone synthesis. Here, a 3β-HSD gene homolog was cloned from Ranagryliovirus (RGV), a member of family Iridoviridae. RGV 3β-HSD gene has 1068 bp, encoding a 355 aa predicted protein. Transcription analyses showed that RGV 3β-HSD gene was transcribed immediate-early during infection from an initiation site 19 nucleotides upstream of the translation start site. Confocal microscopy revealed that the 3β-HSD-EGFP fusion protein was exclusively colocalized with the mitochondria marker (pDsRed2-Mito) in EPC cells. Upon morphological observation and MTT assay, it was revealed that overexpression of RGV 3β-HSD in EPC cells could apparently suppress RGV-inducedcytopathiceffect (CPE). The present studies indicate that the RGV immediate-early 3β-HSD gene encodes a mitochondria-localized protein, which has a novelrole in suppressingvirus-induced CPE. All these suggest that RGV 3β-HSD might be a protein involved in host-virus interaction.

【题目】Molecular characterization of three Rana grylio virus (RGV) isolates and Paralichthys olivaceus lymphocystis disease virus (LCDV-C) in iridoviruses
【中文关键词】蛙虹彩病毒,虹彩病毒,淋巴囊肿病毒
【英文关键词】RGV; LCDV-C; Iridovirus; Lymphocystisvirus; Ranavirus; MCP
【中文摘要】分离鉴定三种蛙虹彩病毒和牙鲆淋巴囊肿病毒
【英文摘要】Three Rana grylio virus (RGV) isolates and lymphocystis disease virus (LCDV-C) were molecularly characterized by antigenicity comparison, Western blot detection of viral polypeptides, restriction fragment length polymorphism analysis of viral genomes, and MCP sequence analysis. Significant antigenicity differences existed among the three RGV isolates and LCDV-C. Western blot detection indicated that the viral polypeptides of three RGV isolates could be recognized by the anti-RGV9807 serum, whereas no bands were observed in the LCDV-C, and significant differences exist among the band patterns of three RGV isolates. Restriction fragment length polymorphism (RFLP) analysis was performed by digesting genomic DNA of the four iridovirus isolates with restriction endonucleases HindIII, KpnI, XbaI and BamHI. On the whole, obvious discrepancies existed between LCDV-C and RGV isolates, and some significant band pattern differences were also revealed between RGV9808 and RGV9506 (or RGV9807) in the profiles of restriction endonucleases Xbal, Kpn I and BamHI. PCR amplification and sequence analysis of MCP gene sequence further revealed their phylogenetic relationship among the three RGV isolates, LCDV-C and other iridoviruses. RGV9506, RGV9807 and RGV9808 are clustered together with other ranaviruses, such as FV3, BIV, TFV and ENHV, although the RGV9808 is more close to EHNV than to other ranaviruses. Additionally, LCDV-C is clustered with LCDV-1, the type species of genus Lymphocystisvirus. The current study provides clear evidence that significant genetic difference exists among the three RGV isolates. Therefore, further work on comparative genomic studies will contribute significantly to understanding of their taxonomic position and pathological mechanism.

【题目】Major histocompatibility complex class II B allele polymorphism and its association with resistance/susceptibility to Vibrio Anguillarum in Japanese flounder(Paralichthys olivaceus)
【中文关键词】抗病性,耐病性,牙鲆,多态性
【英文关键词】cDNA; disease resistance; disease susceptibility; Japanese flounder; major histocompatibility complex class IIB (MHC IIB) Paralichthys olivaceus; polymorphism
【中文摘要】牙鲆主要组织相容性复合体 II B等位基因多态性及对鳗弧菌耐受性
【英文摘要】The full length of major histocompatibility complex (MHC) class IIB cDNA was cloned from a Chinese population of Paralichthys olivaceus by homology cloning and rapid amplification of cDNA ends-polymerase chain reaction (RACE-PCR). The MHC IIB genomic sequence is 1,864 bp long and consists of 34-bp 5'UTR, 741-bp open reading frame, 407-bp 3'UTR, 96-bp intron1, 392-bp intron2, 85-bp intron3, and 109-bp intron4. Phylogenetic analysis showed that the putative MHC class IIB amino acid of the Chinese P. olivaceus shared 28.3% to 85.4% identity with that of the reported MHC class IIB in other species. A significant association between MHC IIB polymorphism and disease resistance/ susceptibility was found in Chinese P. olivaceus. Thirteen different MHC IIB alleles were identified among 411 clones from 84 individuals. Among the 280 (268) nucleotides, 32 (11.4%) nucleotide positions were variable. Most alleles such as alleles a, b, c, d, e, f, j, k, i, m were commonly found in both resistant and susceptible stock. Via chi(2) test, allele d was significantly more prevalent in individuals from susceptible stock than from resistant stock, and their percentages were 23.80% and 7.14%, respectively. In addition, allele g occurred in 9 and allele h in 4 of 42 resistant individuals that were not present in the

susceptible stock; their percentages were 21.4% and 9.52%, respectively. Although allele l was found only in 8 individuals from the susceptible stock, its percentage is 19.05%.

【英文关键词】turbot; Scophthalmus maximus; NKEF; natural killer cell enhancing factor; cDNA; expression
【中文摘要】分子克隆和分析大菱鲆自然杀伤细胞因子基因
【英文摘要】We have recently isolated a cDNA encoding NKEF from turbot (Scophthalmus maximus). The cDNAs of NKEF were cloned from turbot spleen cDNA library. The 904 bp full-length cDNA of the NKEF was obtained by RACE and consisted of 122 bp 5' terminal UTR, 591 bp encoding region and 191 bp 3' terminal UTR. The 591 bp open reading frame was found to code for a protein with 197 amino acid residues. The deduced amino acid sequence of turbot had 85.3%, 81.7%, 81.2%, 80.7%, 80.7%, 79.2%, 78.2%, 77.7%, 77.7%, 77.2% and 58.2% identity with that of zebrafish, channel catfish, flounder, Tetraodon nigroviridis, rainbow trout and mouse Prx2-1, human NKEF-A, carp and rat TSA, human NKEF-B and yeast TSA, respectively. RT-PCR indicated that NKEF transcripts were abundant in the head kidney, spleen and liver, less abundant in the kidney and intestine, and least in gill, muscle and heart. The level of NKEF mRNA in embryos gradually increases during embryogenesis from two cell stage to fry stage. Challenge of turbot with pathogenic bacteria Vibrio anguillarum, significantly elevated NKEF mRNA levels in the liver and spleen in a time-dependent fashion. The NKEF transcripts were detected in turbot embryonic cell line (TEC). Challenge of the TEC cell cultures with pathogenic bacteria, V. anguillarum, significantly elevated NKEF mRNA levels in TEC cell cultures 48 h after infection

【题目】Molecular polymorphism and expression analysis of MHC class II β gene from red sea bream (Chrysophrys major)
【中文关键词】主要组织相容性复合体 II B,多态性,红鲷
【英文关键词】Major histocompatibility complex class II B; MHCclass II B; Gene; Polymorphism; Redseabream; Chrysophrysmajor; cDNA; Expression
【中文摘要】红鲷MHC class Ii β 基因分子多态性分析
【英文摘要】we have isolated cDNAs encoding class II B from spleen cDNA library of redseabream (Chrysophrysmajor) by using EST sequencing, and examined genomic organization, molecularpolymorphism and expression of redseabreamclass II Bgene. As in other vertebrates, five exons and four introns were identified in redseabreamclass II Bgene. Seven class II B alleles were identified from seven individuals of redseabream. The deduced amino acid sequence of redseabreamMHCclass II B 1(Chma-DAB*0101) had 87.1, 85.1, 87.1, 90.4, 87.1, 90.8% identity with those of redseabreamclass II B 2, 3, 4, 5, 6, 7(Chma-DAB*0201-Chma-DAB*0701), respectively, and had 75.2, 74.5, 55.9, 55.1, 34.3 and 30.4% identity with those of striped sea bass, cichlid, rainbow trout, Atlantic salmon, mouse and human, respectively. Four different class II B alleles were observed in a single individual and two different 3′ untranslated region (3′ UTR) sequences from this individual may infer the existence of two loci at least. Semi-quantitative RT-PCR demonstrated that high expression was detected in liver, head kidney, kidney, intestine, gill, stomach, hear and spleen, low expression in

muscle and blood. Challenge of redseabream with the pathogenic bacteria, Vibrio anguillarum, resulted in a significant decrease in the expression of MHCclass II B mRNA from 5 to 72 h after infection in liver, spleen, head kidney and intestine, followed by a recovery to normal level after 96 h

【题目】Molecular identification and expression analysis of natural resistance associated macrophage protein (Nramp) cDNA from Japanese flounder (Paralichthys olivaceus)
【中文关键词】牙鲆,cDNA,表达
【英文关键词】Japanese flounder; Paralichthys olivaceus; Nramp; cDNA; expression
【中文摘要】自然抗性相关巨噬细胞蛋白基因克隆和表达分析
【英文摘要】We have recently isolated a cDNA encoding Nramp from Japanese flounder (Paratichthys olivaceus). The full-length cDNA of the Nramp is 3066 bp in length, including 224 bp 5' terminal UTR, 1662 bp encoding region and 1180 bp 3' terminal UTR. The 1662-nt open reading frame was found to code for a protein with 554 amino acid residues. Comparison of amino acid sequence indicated that Japanese flounder Nramp consists of 12 transmembrane (TM) domains. A consensus transport motif (CTM) containing 20 residues was observed between transmembrane domains 8 and 9. The deduced amino acid sequence of Japanese flounder had 77.30%, 82.71%, 82.67%, 79.64%, 80.72%, 90.97%, 91.16%, 60.14%, 71.48%, 61.69%, 72.37% identity with that of rainbow trout Nramp alpha and beta, channel catfish Nramp, fathead minnow Nramp, common carp Nramp, striped sea bass Nramp, red sea bream Nramp, mouse Nramp 1 and 2, human Nramp 1 and 2, respectively. RT-PCR indicated that Nramp transcripts were highly abundant in spleen, head kidney, abundant in intestine, liver and gill, and less abundant in heart. The level of Nramp mRNA in embryos gradually increases during embryogenesis from 4 h (8 cell stage) to 80 h (hatched stage) after fertilization

【题目】Molecular identification and expression analysis of a CXCL10-like chemokine from turbot (Scophthalmus maximus)
【中文关键词】趋化因子,大菱鲆,感染,cDNA
【英文关键词】chemokine; CXC; CXCL10; turbot; Scophthalmus maximus; infection; cDNA
【中文摘要】大菱鲆CXCL10-like因子基因克隆及表达分析
【英文摘要】We have constructed a turbot spleen cDNA library that has over 2.2 x 10(6) primary clones. Its average insert size was estimated to about 700-2000 bp by PCR of 40 randomly picked clones. A novel turbot CXC chemokine was screened from this library. Both 5 '-RACE and 3 '-RACE were carried out in order to obtain the complete cDNA, which contains a 79 bp 5 ' UTR, a 372 bp open reading frame encoding 123 amino acids and a 227 bp 3 ' UTR. Four exons and three introns were identified in the turbot CXC chemokine gene. The three introns were 591 bp, 86 bp and 125 bp, respectively. Both BLASTP similarity comparisons and Phylogenetic analysis showed that the turbot CXC chemokine was closer to CXCL10. Interestingly, the highest expression levels of the turbot CXC chemokine were detected at 12 h in liver and spleen after challenge with V anguillarum and at 5 h in head kidney. The expression in liver decreased gradually after 12 h and returned the level of background after 72 h. In spleen, the expression kept high levels till 24 h and then became faint consistent with background. The expression of the CXC chemokine was not detected in normal tissues of turbot, which suggested it only was induced when challenged with V anguillarum. These results indicated that the turbot CXC chemokine

played an important role in turbot immune response.

【英文摘要】Nramp (natural resistance associated macrophage protein) has been identified as one of the major candidate genes for controlling natural resistance and/or susceptibility to intracellular pathogens in vertebrates. However, few reports are available about the structure and function of Nramp in teleost. We have recently isolated the cDNA encoding Nramp from turbot (Scophthalmus maximus). The full-length cDNA of the Nramp is 2584 bp in length, including 69 bp 5'terminal UTR, 850 bp 3'terminal UTR and 1665 bp open reading frame for a protein with 554 amino acid residues (Genbank accession number: DQ263240). Comparison of amino acid sequence indicated that turbot Nramp consists of 12 transmembrane regions (TM) domains. A consensus transport motif (CTM) containing 20 residues was observed between transmembrane domains 8 and 9. The deduced amino acid sequence of turbot Nramp exhibited between 60 and 92% homology with 13 other vertebrate Nramp sequences. Nramp transcripts were found to be highly abundant in head kidney, kidney and spleen, abundant in intestine and gill, less abundant in liver, brain, heart and gonad, least in muscle and skin. The level of Nramp mRNA in embryos gradually increases during embryogenesis from blastula stage to fry stage. Challenge of turbot with pathogenic bacteria, Vibrio anguillarum, elevated Nramp mRNA levels in liver and spleen. The Nramp transcripts were detected in turbot embryonic cell line (TEC). Challenge of the TEC cell cultures with pathogenic bacteria, V anguillarum, significantly elevated Nramp mRNA levels in TEC cell cultures. (c) 2006 Elsevier Inc. All rights reserved.

【英文摘要】Chemokines represent a superfamily of chemotactic cytokines playing an important role in leucocyte chemotaxis. Here we report a novel turbot CXC chemokine screened from a turbot spleen cDNA library. The complete cDNA of the turbot CXC chemokine contains an 81 bp 5' UTR, a 414 bp open reading frame (ORF) encoding 137 amino acids and a 449 bp 3'UTR. Four exons and three introns are identified in the turbot CXC chemokine gene. Phylogenetic analysis showed that the turbot CXC chemokine clustered apart from all other CXC chemokines. RT-PCR demonstrated that turbot CXC chemokine was expressed highly in spleen and head kidney. During the early stages of embryo development after fertilization, it appears that low expression level of turbot CXC chemokine was firstly observed at somites stage. Interestingly, the turbot chemokine was highly and rapidly (5 h) induced in liver, spleen and head kidney of turbot after challenge with Vibrio anguillarum. Furthermore, the expression of CXC chemokine was also dramatically increased after challenge in turbot embryonic cells (TECs). These results indicated that the turbot CXC chemokine played

an important role in turbot immune response.

【题目】Molecular cloning and expression analysis of a hepcidin antimicrobial peptide gene from turbot (Scophthalmus maximus)
【中文关键词】大菱鲆,抗菌肽,cDNA,表达
【英文关键词】turbot; Scophthalmus maximus; hepcidin; cDNA; gene; expression
【中文摘要】大菱鲆抗菌体基因克隆鉴定及表达分析
【英文摘要】Antimicrobial peptides (AMPS) are regarded as important components of the host innate immune system and play crucial role in host defence against microbial invasion. A small number of hepcidin AMPS have been isolated from teleosts. Here, we report the isolation of a hepcidin gene from the liver of turbot (Scophthalmus maximus) (GenBank accession numbers: AY994074 and AY994075). In the 1037 bp-long genomic sequence, three exons and two introns were identified. The full-length cDNA is 778 by long and contains an ORF of 273 by encoding a prepropeptide of 90 amino acid residues. The predicted prepropeptide consists of three domains: a signal peptide (24 amino acids), a prodomain (40 amino acids) and a mature peptide (26 amino acids). RT-PCR demonstrated that hepcidin transcripts were highly abundant in liver, abundant in heart, head kidney, spleen, skin and gill, less abundant in blood cell, gonad and intestine, and undetectable level in muscle. The level of the hepcidin mRNA in embryos gradually increases during embryogenesis from 2 h (2 cell stage) to 95 h (larva stage) after fertilisation. Challenge of turbot with pathogenic bacteria, Listonella anguillarum, significantly elevated hepcidin mRNA levels in liver and spleen in a time-dependent fashion. The hepcidin transcripts were detected in turbot embryonic cell line (TEC). Challenge of TEC cells with the pathogenic bacteria significantly elevated hepcidin mRNA levels. (c) 2006 Elsevier Ltd. 【中文摘要】大菱鲆主要组织相容性复合体IIA和B基因克隆鉴定和表达分析
【英文摘要】Major histocompatibility complex (MHC) class II has a central role in the adaptive immune system by presenting foreign peptides to the T-cell receptor. The full lengths of MHC class IIA and B cDNA were cloned from turbot by homology cloning and rapid amplification of cDNA ends polymerase chain reaction (RACE PCR), and genomic organization, molecular polymorphism, and expression of turbot class IIB gene were examined to study the function of class IIB gene in fish. The deduced amino acid sequence of turbot class IIA (GenBank accession no.DQ001730) and turbot class IIB (GenBank accession no. DQ094170) had 69.8%, 67.6%, 65.5%, 59.2%, 54.5%, 52.8%, 46.2%, 46.6%, 28.3%, 28.5%, 22.2% identity and 71.5%, 70.7%, 67.1%, 68.4%, 46.7%, 53.5%, 46.7%, 50.0%, 25.2%, 29.2%, 27.6% identity with those of Japanese flounder, striped sea bass, red sea bream, cichlid, rainbow trout, Atlantic salmon, carp, zebrafish, nurse shark, mouse and human, respectively. Eleven class IIB alleles were identified from three turbot individuals. The amino acid sequence of turbot class IIB designated as Scma-DAB* 0101 had 86.9%, 88.6%, 88.6%, 89.4%, 87.8%,

86.9%, 84.1%, 86.5%, 87.3%, 77.1%, and 86.9% identity with those of turbot class IIB 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12 (Scma-DAB*0201-Scma-DAB*1201), respectively. Six different class IIB alleles observed in a single individual may infer the existence of three loci at least. Semiquantitative reverse transcriptase PCR (RT-PCR) demonstrated that turbot class IIA and B were ubiquitously expressed in normal tissues. Challenge of turbot with pathogenic bacteria, Vibrio anguillarum, resulted in a significant decrease in the expression of MHC class IIB mRNA from 24 h to 48 h after infection in liver and head kidney, and a significant decrease from 24 h to 72 h after infection in spleen, followed by an increase after 96 h, respectively.

【题目】Mitochondrion-mediated apoptosis induced by Rana grylio virus infection in fish cells
【中文关键词】鱼类细胞,凋亡,蛙虹彩病毒
【英文关键词】fish cell; apoptosis; mitochondrion; mitochondrial fragmentation; rana glylio virus (RGV); caspase
【中文摘要】鱼类细胞中蛙虹彩病毒介导的细胞凋亡
【英文摘要】A fish cell line, fathead minnow (FHM) cell, was used to investigate the alteration of mitochondrial dynamics and the mechanism of apoptosis under Rana grylio virus (RGV) infection. Microscopy observations, flow-cytometry analysis and molecular marker detection revealed the apoptotic fate of the RGV-infected cells. Some typical apoptotic characteristics, such as chromatin condensation, DNA fragmentation and mitochondrial fragmentation, were observed, and significantly morphological changes of mitochondria, including size, shape, internal structure and distribution, were revealed. The mitochondria in RGV-infected cells were aggregated around the viromatrix, and the aggregation could be blocked by colchicine. Moreover, the Delta psi m collapse was induced, and caspase-9 and caspase-3 were activated in the RGV-infected cells. In addition, NF-kappa B activation and intracellular Ca2+ increase were also detected at different times after infection. The data revealed the detailed dynamics of mitochondrion-mediated apoptosis induced by an iridovirus, and provided the first report on mitochondrial fragmentation during virus-induced apoptosis in fish cells.

【中文摘要】金鱼肠细胞系对草鱼出血病病毒的天然免疫反应
【英文摘要】Virus infection of mammalian cells activates an innate antiviral immune response characterized by production ofinterferon (IFN) and the subsequent transcriptional upregulation of IFN-stimulated genes (ISGs) by the JAK-STATsignaling pathway. Here, we report that a fish cell line, crucian carp (Carassius auratus L.) blastulae embryonic (CAB) cells,can produce IFN activity and then form an antiviral state after infection with UV-inactivated grass carp hemorrhagic virus(GCHV), a double-stranded (ds) RNA virus. From UV-inactivated GCHV-infected CAB cells, 15 pivotal genes werecloned and sequenced, and all of them were shown to be involved in IFN antiviral innate immune response. These IFNsystem genes include the dsRNA signal sensing factor TLR3, IFN, IFN signal transduction factor STAT1, IFN regulatoryfactor IRF7, putative IFN antiviral effectors Mx1, Mx2, PKR-like, Viperin, IFI56, and other IFN stimulated genes (ISGs)IFI58, ISG15-1, ISG15-2, USP18, Gig1 and Gig2. The identified fish IFN system genes were highly induced by activeGCHV, UV-inactivated GCHV, CAB IFN or poly(I).poly(C), and showed similar expression patterns to mammals. Thedata indicate that an IFN antiviral innate immune response similar to that in mammals exists in the UV-inactivatedGCHV-infected CAB cells, and the IFN response contributes to the formation of an antiviral state probably through JAKSTATsignaling pathway. This study provides strong evidence for existence of IFN antiviral innate immune response infish, and will assist in elucidating the origin and evolution of vertebrate IFN system

【中文关键词】牙鲆,双链RNA依赖的蛋白激酶PKR
【英文关键词】Thymidylate synthase; Lymphocystis disease virus from China (LCDV-C); Cell transformation; Foci formation; Anchorage-independent growth
【中文摘要】牙鲆双链RNA依赖的蛋白激酶PKR功能区和抗病性研究
【英文摘要】we identify the first fish PKR gene from the Japanese flounder Paralichthys olivaceus (PoPKR). PoPKR encodes a protein that shows a conserved structure that is characteristic of mammalian PKRs, having both the N-terminal region for dsRNA binding and the C-terminal region for the inhibition of protein translation. The catalytic activity of PoPKR is further evidence that it is required for protein translation inhibition in vitro. PoPKR is constitutively transcribed at low levels and is highly induced after virus infection. Strikingly, PoPKR overexpression increases eIF2 alpha phosphorylation and inhibits the replication of Scophthalmus maximus rhabdovirus (SMRV) in flounder embryonic cells, whereas phosphorylation and antiviral effects are impaired in transfected cells expressing the catalytically inactive PKR-K421R variant, indicating that PoPKR inhibits virus replication by phosphorylating substrate eIF2 alpha. The interaction between PoPKR and eIF2 alpha is demonstrated by coimmunoprecipitation assays, and the

transfection of PoPKR-specific short interfering RNA further reveals that the enhanced eIF2 alpha phosphorylation is catalyzed by PoPKR during SMRV infection. The current data provide significant evidence for the existence of a PKR-mediated antiviral pathway in fish and reveal considerable conservation in the functional domains and the antiviral effect of PKR proteins between fish and mammals.

【英文摘要】Thymidylate synthase (TS), an essential enzyme in DNA synthesis and repair, plays a key role in the events of cell cycle regulation and tumorformation. Here, an investigation was presented about subcellular location and biological function of viral TS from lymphocystis disease virus from China (LCDV-C) in fish cells. Fluorescence microscopy revealed that LCDV-C TS was predominantly localized in the cytoplasm in fish cells. Cell cycle analysis demonstrated that LCDV-C TS promoted cell cycle progression into S and G2/M phase in the constitutive expressed cells. As a result, the cells have a faster growth rate compared with the control cells as revealed by cell growth curves. For foci assay, the TSexpressed cells gave rise to foci 4 – 5 weeks after incubation. Microscopic examination of the TS-induced foci revealed multilayered growth and crisscross morphology characteristic of transformed cells. Moreover, LCDV-C TS predisposed the transfected cells to acquire an anchorageindependent phenotype and could grow in 0.3% soft agar. So the data reveal LCDV-C TS is sufficient to induce a transformed phenotype in fish cells in vitro and exhibits its potential ability in cell transformation. To our knowledge, it is the first report on viral TS sequences associated with transforming activity.

【英文摘要】Chinese sturgeon Acipenser sinensis, a cartilaginous ganoid, is a 'living fossil' on a deeply isolated evolutionary branch. A cell line was established from Chinese sturgeon tail-fin tissue (CSTF) . These epithelial CSTF cells grew well in Dulbecco's modified Eagle's medium at 25 degrees C. Karyotypic analysis revealed a normal diploid karyotype with 2n = 264 and large numbers of punctate chromosomes. A strain of frog iridoviruses [Rana grylio virus (RGV)] was used to test the susceptibility of this cell line to infection. Infection was confirmed by cytopathic effect, immunofluorescence and electron-microscope observations, which detected the viral antigens or particles in the cytoplasm of RGV-infected cells. Molecular analysis further suggested that c. 550 bp DNA fragment could be cloned from the RGV-infected CSTF cells' DNA with major capsid protein gene polymerase chain reaction primers. Furthermore, after transfection with pEGFP vector DNA, the CSTF cell line produced significant fluorescent signals indicating its utility in exogenous studies.

【题目】DRIP IRRIGATION LATERAL DESIGN PROCEDURE BASED ON EMISSION UNIFORMITY AND FIELD MICROTOPOGRAPHY
【中文关键词】emitter manufacturing variation; field microtopography variation; emitter hydraulic variation; irrigation uniformity
【英文关键词】emitter manufacturing variation; field microtopography variation; emitter hydraulic variation; irrigation uniformity
【中文摘要】Field microtopography, hydraulic variation of the emitter, and manufacturing variation of emitters were analyzed to study their influence on the uniformity of drip irrigation system water application. The manufacturing coefficient in the emitter flow equation is taken as a random variable that represents the emitter manufacturing variation. Uneven field microtopography resulting in emitter pressure and flow variations is also considered as a random variable. Microtopography and the manufacturing coefficient that are assumed to follow a normal distribution were generated with a computer code. The rate of emitter discharge variation, the coefficient of discharge variation,and Christiansen s coefficient of uniformity were calculated for drip irrigation systems. Finally, the emitter uniformity equation was determined through the statistical analysis of 100 data sets, and a new design method for drip irrigation laterals is proposed. The results indicate that neglecting the microtopography leads to inappropriate design of lateral pipe diameter and length, especially when emitter operating pressures are low.
【英文摘要】Field microtopography, hydraulic variation of the emitter, and manufacturing variation of emitters were analyzed to study their influence on the uniformity of drip irrigation system water application. The manufacturing coefficient in the emitter flow equation is taken as a random variable that represents the emitter manufacturing variation. Uneven field microtopography resulting in emitter pressure and flow variations is also considered as a random variable. Microtopography and the manufacturing coefficient that are assumed to follow a normal distribution were generated with a computer code. The rate of emitter discharge variation, the coefficient of discharge variation, and Christiansen ’s coefficient of uniformity were calculated for drip irrigation systems. Finally, the emitter uniformity equation was determined through the statistical analysis of 100 data sets, and a new design method for drip irrigation laterals is proposed. The results indicate that neglecting the microtopography leads to inappropriate design of lateral pipe diameter and length, especially when emitter operating pressures are low.

【题目】文家沟水库筑坝土料分散性和抗渗性能试验
【中文关键词】水工材料;分散性土;物理化学性质;分散机理;抗渗性能
【英文关键词】hydraulic material; dispersive soil; physical and chemical property; dispersive mechanism; impermeability
【中文摘要】遇水分散并流失破坏是分散性土的重要特征,对工程的安全性造成严重威胁,但是由于分散性土发现较晚,工程实例较少,因而对分散性土的判别方法、分散机理及其应用等研究不够深入。在分析土样物理化学性质和矿物成分的基础上,应用碎块、针孔、双比重计、孔隙水可溶盐和交换性钠百分比等试验方法,对文家沟水库筑坝土料的分散性和分散机理进行了研究,并探讨了土样自身抗渗和在反滤料保护条件下的抗渗性能。研究认为,文家沟水库筑坝土料属于过渡性土和分散性土;土样中含有较多的蒙脱石和钠离子以及酸碱度较高是土样产生分散性的主要原因;土样的自身抗渗较差,但是在有反滤料保护条件下具有良好的抗渗性能。结果表明:黏土产生分散性的条件是土样中含有较多的蒙脱石和钠离子以及酸碱度呈强碱性,分散性土在合适的反滤料条件下具有较强的抗渗性。
【英文摘要】The key character of dispersive clay is to be dispersed and wrecked by water flows, causing serious threats to engineering safety. But those studies on dispersive clay, such as the methods of identification, dispersive mechanism and their applications, are still not deep enough and satisfactory due to their trivial discovery and few engineering practices. Based on the analysis of physical and chemical characters and mineralogical composition, the dispersivity and dispersive mechanism of the dam soil samples in Wenjiagou Reservoir are studied by double-hydrometer tests, pore water salts tests, pinhole tests, crumb tests and exchangeable sodium percentage tests, and further investigations on the impermeability of soil samples are also carried out by itself and under the protection of inverted filter materials. The results show that soil samples are transitional and dispersive soil because of rich montmorillonoid, plenty of sodium-ion and strong alkalescence. The soil samples have weakself-impermeability, but favorable impermeability under the protection of the inverted filter materials. The studies indicate that soil becomes dispersive clay only under the conditions of rich montmorillonoid contents, more sodium-ion and strong alkalescence, and the dispersive clay presents a better seepage prevention under the protection of appropriate inverted filtermaterials.

【题目】基于CorelDRAW软件的小流域模型雨滴测量试验研究
【中文关键词】CorelDRAW;雨谱特性;人工降雨;色斑法
【英文关键词】CorelDRAW; raindrop distribution; artificially simulated rainfall; color-spot method
【中文摘要】降雨雨谱的观测,是了解降雨特性的一项重要工作。修建小流域模型,是对小流域进行各种试验研究的有效手段。该文基于相似率要求,在模型降雨雨滴较小,雨谱参数难以测定问题的基础上,运用CorelDRAW软件与传统色斑法相结合,探索出一种新的测量与数据处理方法,并得出不同情况下模型的雨谱特性。该法提高了测量精度,并减少了工作量。
【英文摘要】Raindrop spectrum observation is a key to acquiring the raindrop characteristics. To build small watershed model is an effective way to do experiment in all kinds of small drainage areas. Based on the similitude ratio and the small raindrop of model rainfall and the difficulty of measuring raindrop spectrum characteristics, the authors tried to use raditional Color-spot method with CorelDRAW to form a new method for data processing and obtained the raindrop spectrum characteristics. It proves that the new method can improve measuring precision and reduce the workload greatly.

【题目】锡林郭勒典型草原不同放牧强度下土壤微生物数量的分布特征
【中文关键词】典型草原;放牧强度;土壤微生物
【英文关键词】Typical steppe; Grazing intensity; Soil microorganisms
【中文摘要】比较研究了锡林郭勒典型草原不同放牧强度下土壤微生物数量的分布特征。平板计数的结果表明:在0~10cm和10~20cm土层中,土壤好气性细菌(Aerophilebacteria)和放线菌(Actinomycetes)数量均表现为放牧3d(G3)>不放牧(G5)>放牧12d(G1)样地的趋势;好气性细菌数量在0~10cm土层中,放牧3d与放牧12d和不放牧样地之间有显著性差异;在10~20cm土层,放牧3d和不放牧与放牧12d之间有显著性差异。放线菌数量在0~10cm和10~20cm土层中均为放牧3d与放牧12d之间有显著性差异。土壤真菌数量在0~10cm土层中,放牧12d>放牧3d>不放牧,其中放牧3d比不放牧增加5·88%。可见,适当放牧有助于土壤微生物数量的增加,而过度放牧会导致土壤微生物数量明显减少。
【英文摘要】Distribution characteristics of the number of soil microorganisms under different grazing in-tensity in Xilingol typical steppe was investigated. The results showed that the total aerophile bacteria andactinomycetes numbers in the 0~10 cm and 10~20 cm soil depth were in the order of grazing for 3 days >no grazing > grazing for 12 days. In 0~10 cm soil depth, aerophile bacteria numbers had significantdifferences among grazing for 3 days, grazing for 12 days and no grazing; In 10~20 cm soil depth, therewere significant differences in number of aerophile bacteria among grazing for 3 days, grazing for 12 daysand no grazing. In 0~10 cm and 10~20 cm soil depth, there were significant differences in actinonycetesnumber between grazing for 3 days and grazing for 12 days. The number of fungi in 0~10 cm soil depthwas in the order of grazing for 12 days > grazing for 3 days > no grazing. Fungi number in grasslandgrazing for 3 days were increased by 5.88% than that in no grazing. Conservative grazing was beneficial toincrease of soil microorganisms, but heavy grazing resulted in the reduction of soil microorganisms.

【题目】不同治理措施对退化草原土壤可培养微生物区系的影?
【中文关键词】治理措施;退化草原;土壤微生物
【英文关键词】Control measures;Degraded grassland;Soil microorganisms
【中文摘要】利用纯培养技术,对退化草原四项不同治理措施(浅耕翻、耙地、播种羊草、围栏封育)处理后的土壤微生物进行研究。结果表明,四项治理措施中,各类群土壤微生物均显著高于对照区。0~10 cm土层,微生物各类群的数量均依次为浅耕翻>耙地>播种羊草>围栏封育>对照;四项治理措施细菌数量依次比对照区增高了91.95%、89.66%、87.36%和73.56%;真菌数量增高了53.06%、50.34%、50.34%和23.81%;放线菌数量增高了41.27%、38.89%、24.47%和22.63%。10~30 cm土层,细菌和放线菌的数量均依次为浅耕翻>耙地>播种羊草>围栏封育>对照;四项治理措施细菌数量依次比对照区增高了43.59%、43.59%、41.03%和33.33%;放线菌数量分别比对照区增高了34.19%、31.15%、29.74%和5.39%;而该土层真菌数量则依次为围栏封育>播种羊草>浅耕翻>耙地>对照,四项治理措施分别比对照增高了221.74%、191.30%、162.86%和161.43%。采取不同治理措施后,微生物各类群的数量增高幅度各不相同,其中0~10cm土层细菌数量增高幅度最高,真菌次之,放线菌最低。而10~30cm土层真菌数量增高幅度最高,细菌次之,放线菌最低。四项治理措施土壤微生物与对照均有显著性差异。

【英文摘要】Soil microbial numbers in four grasslands recovered by different control measures such asshallow ploughing, harrowing, sowingLeymus chinensisand enclosed & grazing, were measured throughspread-plate-technique. The result showed that soil microbial numbers of the grassland recovered were sig-nificantly more than those of controlled grassland unrecovered. In the 0~10 cm soil layer, soil microbialnumbers of four grasslands recovered were gradually decreased in order of shallow ploughing, harrowing,sowingLeymus chinensisand enclosed & grazing. Compared to controlled grassland unrecovered, the bac-teria of four grasslands recovered increased by 91.95%, 89.66%, 97.36% and 73.56%, the fungi in-creased by 53.06%, 50.34%, 50.34% and 23.81%, the actinomycetes increased by 41.27%, 38.89%,24.47% and 22.36%, respectively. In the 10~30 cm soil layer, the bacteria and actinomycetes of fourgrasslands recovered were gradually decreased in order of shallow ploughing, harrowing, sowingLeymuschinensisand enclosed & grazing respectively. Compared to controlled grassland unrecovered, the bacteriaincreased by 43.59%, 43.59%, 41.03% and 33.33%, the actinomycetes increased by 34.19%, 31.15%,29.14% and 5.39%, respectively. The fungi of four grasslands recovered in the 10~30 cm soil layer weregradually decreased in order of enclosed & grazing, sowingLeymus chinensis, shallow ploughing and har-rowing. Compared to controlled grassland unrecovered, the bacteria of four grassland recovered in the 10~30 cm layer increased by 221.74%, 191.30%, 162.86% and 161.43%. After taking different controlmeasures, the change of bacteria, actinomycetes, and fungi in the grassland soil were not identical. In the0~10 cm layer, the change of bacteria was the fastest, and the change of fungi was faster than that of acti-nomycetes, but in the 10~30 cm layer ,the change of fungi was the fastest, and the change of bacteria wasfaster than that of actinomycetes. For soil microbial, there was significant difference between four grass-lands recovered and controlled grassland unrecovered.

【题目】Suitability of two seaweeds Gracilaria lemaneiformis and Sargassum pallidum as potential feed for the abalone Haliotis discus hannal Ino cultured in Sanggou Bay

【中文关键词】无

【英文关键词】Abalone; Haliotis discus hannai Ino; Seaweeds; Aquaculture; Feed and nutrition

【中文摘要】无

【英文摘要】The suitability of two algae species, Gracilaria lemaneiformis and Sargassum pallidum, for use as food sources for the abalone Haliotis discus hannai Ino was evaluated. Abalones were fed one of five experimental diets: 1) kelp Laminarijaponica; 2) G. lemaneiformis; 3) S. pallidum; 4) a mixed diet of L.japonica and G. lemaneiformis (1:1); and 5) a mixed diet of L. japonica and S. pallidum (1:1) for a period of 4 months. The survival, growth (shell length and body weight), condition index (body weight/shell length), and feed utilization were measured. Survival was excellent (100%) in all groups. Growth rate (body weight) was highest in the abalone fed kelp exclusively, followed by the mixed diet of kelp and G. lemaneiformis. The abalone fed S. pallidum had the lowest increase in body weight and the lowest feed intake. The mixed diet of kelp and G. lemaneiformis yielded the biggest increase in shell length. There were no significant differences in the condition index among all the treatment groups. The mean daily feed intake of L. japonica was highest, followed by the mixed diets of kelp and G. lemaneiformis, and was lowest for S. pallidum. Abalone exhibited a preference for L. japonica. The feed conversion efficiency was highest for G.lemaneiformis. Results suggest that G.lemaneiformis can be used as a partial substitute for kelp in the diet of cultured abalone.

【题目】The potential for utilizing fouling macroalgae as feed for abalone Haliotis discus hannai.,
【中文关键词】无
【英文关键词】fouling macroalgae; abalone Haliotis discus hannai; diet; nutritional value
【中文摘要】无
【英文摘要】In order to assess the potential of utilizing fouling macroalgae as feed for abalone Haliotis discus hannai, the species, biomass and total stock of fouling macroalgae attached on the aquaculture facility-lines were investigated and assessed at Sungo Bay, China, in August 2007. The nutritional value of four fouling macroalgae (Codium fragile, Sargassum muticum, Ulva pertusa and Laminaria japonica) and one cultured macroalgae (Gracilaria lemaneiformis) as the diet of abalone was assessed by analysis of the chemical composition of the macroalgae and by measuring bioavailability and digestibility to abalone H. discus hannai under laboratory conditions in August 2007. The results showed that the biomass of fouling macroalgae at the two sites was 243.61 ± 26.23 and 1078.15 ± 50.28 g m − 1 respectively. The contents of protein of G. lemaneiformis and C. fragile were 18.30% and 17.60%, respectively, which were significantly higher than the others. The five macroalgae were accepted by the abalone, and growth energies (P) and growth efficiency (%) were positive. However, significant differences were found among the different macroalgae. The growth efficiencies of abalone show a negative relationship with the levels of dietary lipid and a positive relationship with the protein contents. These results suggest that fouling macroalgae have a great potential to be used as diets of abalone.

【题目】虾夷扇贝的摄食生理及其在獐子岛海域的群体滤水能力
【中文关键词】虾夷扇贝 摄食生理 獐子岛 养殖容量
【英文关键词】Patinopecten yessoensis feeding physiology Zhang Zidao Island carrying capacity
【中文摘要】为了獐子岛海域虾夷扇贝养殖容量评估模型的建立,采用模拟现场流水系统和生物沉积方法测定了不同规格虾夷扇贝在不同季节的滤水率(CR)、摄食率和吸收效率,并探讨了温度与滤水率的关系.通过断面生物量调查,获得该海域虾夷扇贝的壳高频率分布情况.结果显示,5月份虾夷扇贝的滤水率最大.其它3个月份虾夷扇贝的滤水率差异不显著,10月份的吸收效率最低.温度(T)与滤水率(CR)呈抛物线的关系,在本实验的条件下,虾夷扇贝摄食的最适温度为10 ℃.滤水率与壳高呈典型的幂函数关系.根据滤水率与壳高的关系、獐子岛海域养殖虾夷扇贝的壳高频率分布情况以及总生物量,推算出不同月份的群体滤水能力,结合獐子岛的潮差、水面面积等数据,计算出其在该海域的食物限制性指标--清滤效率.结果显示:目前獐子岛养殖虾夷扇贝的清滤效率平均为0.054《1,虾夷扇贝的养殖量低于养殖容量,在养殖密度和规模上,尚有很大的发展空间.
【英文摘要】For the purpose of establishing the evaluation model of patiaopecten yessoensis carrying capacity in Zhang Zidao Island waters,the semi-in-situ flowing-through system and the biogenic sediment method were used to measure the clearance rate (CR),feeding and intaking rate of difference size scallops in different seasons.The relationship of clearance rate and water temperature was studied.Through 4 transect ’s field surveys,the biomass and shell heights distribution in the areas were got.The results showed that among these experimental conditions,the clearance rate (CR) was highest in May,average CR was 1.05±0.25 L.ind-1.h-1.The relationship of water temperature and CR is same as the parabola line,the CR arrived the peak value at 10 ℃.According to the relationship of CR and shell height,the biomass and shell height distribution in the areas,the population clearance rates in different months were calculated.And combining with the data of average tide range and total surface areas,the food limited indictor-clearance efficiency (CE) was assessed;the average value of CE was 0.054,which was much lower than 1.The results showed that the cultivated density in Zhang Zidao Island is lower than the carrying capacity,which means that the aquacultural industry of the scallop in the area still has a large potential developing space.

【题目】獐子岛养殖水域叶绿素含量时空分布特征及初级生产力季节变化.
【中文关键词】獐子岛 叶绿素 初级生产力 虾夷扇贝
【英文关键词】Zhangzidao Island Chlorophyll a Primary production scallop Patinopecten yessoensis Japanese
【中文摘要】2005年3、5、7和10月对獐子岛养殖海域(共设18个站位)进行叶绿素浓度的调查。结果表明,调查海区叶绿素浓度为1.23~2.85mg/m^3,均值为1.78±0.57mg/m^3。叶绿素浓度的季节性变化显著,最高值出现在冬季,夏季的值最低;平面分布的特性为春、夏、冬季分布比较均匀。秋季叶绿素浓度的区域性差异较大,主要表现为近岸区的叶绿素浓度低于中间深水区域,可能与养殖虾夷扇贝摄食压力有关,但尚需进一步研究。垂直分布较为均匀,夏季表层叶绿素浓度高于底层,其他季节的分布趋势与夏季相反。初级生产力的季节性变化明显,与叶绿素的变化趋势不同,从3~10月,初级生产力逐渐增大,变化范围为30.4~117.0mgC/m^2·d,平均值为76.6±41.9mgC/m^2·d。结合同步调查的水温、营养盐数据得知,水温和溶解性无机氮是影响初级生产力的主要因素
【英文摘要】
Zhangzidao Island is the largest opecten yessoensis in China. Chlorophyll a (chla) mariculture base for Japanese scallop Patin-
around this area (at 18 sampling stations) was investigated in March, May, July and October, 2005. Results showed that chla concentrations in the area varied between 1.23-
2.85mg/m^3 , with an annual average of 1.78±0.57mg/m^3. There was a significant seasonal variation in chla during the investigation period. The highest and lowest values of chla appeared in March and July, respectively; while the spatial distribution of chla did not vary significantly throughout the year, except in October. In October, The concentration of chla near the island was higher than that in the off-
shore areas, which might be related to the feeding impact of cultivated scallops. The vertical distribution of chla was more uniform, with chla concentration a little higher at the surface than in the bottom. Seasonal variation of primary production was significant and differed to that of chla concentration. From March to October, the primary production increased from 30. 4 mgC/m^2· d to 117.0 mgC/m^2 · d,with an annual average of 76.6±41.9 mgC/m^2 · d. Correlation analysis revealed significant positive correlations between primary production and water temperature or the concentration of dissolved inorganic nitrogen.

【题目】Immune Responses of Zhikong Scallop Chlamys farreri after Air Exposure to Different Temperatures
【中文关键词】无
【英文关键词】Airexposure; Chlamysfarreri; Immune responses; Survival time; Temperature
【中文摘要】无
【英文摘要】The present study examined the influence of airexposure at differenttemperatures: a common perturbation associated with aquaculture handling practices, on immune responses in zhikongscallopChlamysfarreri. Scallops were exposed to air for 2 h, 6 h, 12 h and 24 h at 5 °C, 17 °C and 25 °C respectively. Thereafter, a recovery period of 24 h at 17 °C was

applied. Haemocyte mortality, phagocytosis and reactive oxygen species (ROS) production of haemocytes, acid phosphatase (ACP) and superoxide dismutase (SOD) activity in haemocyte lysates were chosen as immunomarkers of anoxic stress. The results showed that an increase of haemocyte mortality and a decrease of phagocytosis and ACP activity were observed after 2 h of airexposure for all temperatures tested. Moreover, a significant increase of ROS production occurred following 2 h of airexposure at 25 ° C and 24 h of airexposure at 17 ° C. Significant differences were also observed in haemocyte mortality, percentage of phagocytic cells and ACP and SOD activity depending on the temperature of airexposure. Finally, after 24 h of recovery at 17 ° C, percentage of phagocytic haemocytes and ACP activity did not return to initial values. ROS production was significantly higher than before the recovery period and initial values for scallops subjected to airexposure at 5 ° C. In our study, scallops showed a relative low anoxia tolerance under a high temperature. All the scallopsair exposed to 25 ° C died after the 6 h sampling. In conclusion, airexposure associated to aquaculture practices was demonstrated to strongly affect functional immune activities of scallop haemocytes, and high temperatureairexposure caused reduced survival of scallops.

【题目】Immune condition of Chlamys farreri in response to acute temperature challenge.

【中文关键词】无

【英文关键词】Acutetemperaturechallenge; Chlamysfarreri; Biomarkers; Haemocyte activities; High tolerance

【中文摘要】无

【英文摘要】The effects of acutetemperaturechallenge on some immune parameters of haemocyte in Zhikong scallop, Chlamysfarreri, recognised as a temperature sensitive bivalve species, were evaluated over a short period of time. Scallops were suddenly transferred from 17 ° C to 11 ° C, 23 ° C and 28 ° C for a period of 72 h. Total haemocyte count (THC), percentage of phagocytic haemocytes, reactive oxygen species (ROS) production, acid phosphatase (ACP) and superoxide dismutase (SOD) activities (in both haemocyte lysate and cell-free haemolymph) were chosen as biomarkers of temperature stress. Results demonstrated that the percentage of phagocytic haemocytes and ACP activity in cell-free haemolymph of scallops challenged at 28 ° C for 72 h significantly decreased. By contrast, reactive oxygen species production by haemocytes increased when compared to the initial values. It is concluded that haemocyte activities of C. farreri appear to be compromised when scallops were transferred from 17 ° C to 28 ° C. Meanwhile, no obvious negative effect of acutetemperature stress was detected on haemocyte activities of C. farreri challenged at 11 ° C, which highlighted the high tolerance of scallops to acute decrease of seawater temperatures.

【题目】Effects of aestivation on the energy budget of sea cucumber Apostichopus japonicus (Selenka) (Echinodermata: Holothuroidea)

【中文关键词】无

【英文关键词】seacucumber; Apostichopusjaponicus; aestivation; energybudget; water temperature; body weight

【中文摘要】无

【英文摘要】Apostichopusjaponicus is a kind of temperate seacucumbers, known to aestivate when water temperature rises above 20 ° C to 24.5 ° C. In this study, we measured the effects of aestivation on the energy utilization (i.e., energy allocation in growth, feces

discharge, respiration and excretion) of A. japonicus with two different body weights (134.0 g ± 3.5 g and 73.6 g ± 2.2 g) at water temperature from 10 ° C to 30 ° C with an interval of 5 ° C. Noticeable variation in the energy utilization of seacucumbers was observed in this study. During the non-aestivation period, energy deposit in growth was lower and the energy loss in feces accounted for the majority of the feeding energy. Under the threshold temperature, the feeding energy reduced and the proportion of energy deposit in growth became negative. During aestivation, seacucumbers discontinued feeding energy, resulting in weight loss. Our study suggested that the ecological implication of aestivation in this species could lead to a model of energy saving during the long-term hot period.

【题目】Food sources of three bivalves living in two habitats of Jiaozhou Bay (Qingdao, China): indicated by lipid biomarkers and stable isotope analysis.
【中文关键词】无
【英文关键词】bivalve, food sources, lipid biomarker, stable isotope
【中文摘要】无
【英文摘要】Food sources of three filter-feeding bivalves from two habitats (intertidal oyster Crassostrea gigas, mussel Mytilus galloprovincialis, and subtidal cultured scallop Chlamys farreri) of Jiaozhou Bay (Qingdao, China) were determined by fatty acid and stable isotope analysis. Cultured scallop was characterized by significant diatom markers such as 16:1/16:0 close to 1 and high ratio of 20:5(n － 3)/22:6(n － 3), hence we assume that the scallop mainly feeds on diatoms. Fatty acid biomarkers specific to bacteria and terrestrial materials were also found in considerable amounts in scallop tissue, which suggested that there were substantial bacterial and terrestrial input into the food of the species. Intertidal oyster and mussel, however, exhibited significant flagellate marker, 22:6(n － 3), and lower level of diatom markers, which indicated that flagellates are also part of intertidal bivalves ’ planktonic food sources; meanwhile, high level of Chlorophyta fatty acid marker, Σ18:2(n － 6) + 18:3(n － 3), suggested that Ulva pertusa (Chlorophyta) seaweed bed supplied important food sources to intertidal bivalves. Additionally, result of stable isotope analysis showed that phytoplankton contributed 86.2 to 89.0% to intertidal bivalves ’ carbon budget; macroalga U. pertusa origin source had a contribution of 8.7% to 11.0%, which indicated its role as an important supplemental food source to intertidal bivalves. From this study, it is concluded that the dietary difference of three bivalves probably relates to the different potential food sources in the scallop farm and intertidal zone in Jiaozhou Bay.

【题目】Bioenergetic responses of sub-adult sea cucumber Apostichopus japonicus (Selenka) (Echinodermata: Holothuroidea) to temperature with special discussion regarding its southernmost distribution limit in China.
【中文关键词】无
【英文关键词】Seacucumber; Apostichopusjaponicus; Temperature; Bioenergeticresponses; Global ocean warming; Geographical distributionlimit; Northward shift
【中文摘要】无

【英文摘要】1.This paper investigated the bioenergeticresponses of the seacucumber Apostichopus japonicus (wet weights of 36.5±1.2 g) to different water temperatures (5, 10, 15, 20, 25 and 30 °C) in the laboratory.2.Results showed that theoretically the optimal temperatures for energy intake and scope for growth (SFG) of sub-adultA. japonicus was at 15.6 and 16.0 °C, respectively. The aestivation threshold temperature for this life-stage seacucumber could be 29.0 °C by taking feeding cessation as the indication of aestivation.3.Our data suggests that A. japonicus is thermo-sensitive to higher temperature, which prevents it from colonising sub-tropical coastal zones. Therefore, water temperature plays an important role in its southernmostdistributionlimit in China.4.The potential impact of global ocean warming on A. japonicus might be a northward shift in the geographical distribution.

【题目】Survival, growth, and immune activity of scallop Chlamys farreri cultured at different depths in Haizhou Bay during the warmest months of the year.
【中文关键词】无
【英文关键词】Chlamys farreri, survival, growth, mortality, immune activity, hot season, water depth
【中文摘要】无
【英文摘要】Survival, growth and immune response of the scallop, Chlamys farreri, cultured in lantern nets at five different depths (2, 5, 10, 15, and 20 m below the sea surface) were studied in Haizhou Bay during the hot season (summer and autumn) of 2007. Survival and growth rates were quantified bimonthly. Immune activities in hemolymph (superoxide dismutase (SOD) and acid phosphatase (ACP)) were measured to evaluate the health of scallops at the end of the study. Environmental parameters at the five depths were also monitored during the experiment. Mortalities mainly occurred during summer. Survival of scallops suspended at 15 m (78.0%) and 20 m (86.7%) was significantly higher than at 2 m (62.9%), 5 m (60.8%) or 10 m (66.8%) at the end of the study. Mean shell height grew significantly faster at 10 m (205.0 μm/d) and 20 m (236.9 μm/d) than at 2, 5 or 15 m in summer (July 9 to September 1); however, shell growth rate at 20 m was significantly lower than at the other four depths in autumn (September 2 to November 6). In contrast to summer, scallops at 5 m grew faster (262.9 μm/d) during autumn. The growth of soft tissue at different depths showed a similar trend to the shell. Growth rates of shell height and soft tissue were faster in autumn than in summer, with the exception of shell height at 20 m. SOD activity of scallops increased with depth, and ACP activity was significantly higher at 15 and 20 m than at other depths, which suggests that scallops were healthier near the bottom. Factors explaining the depth-related mortality and growth of scallops are also discussed. We conclude that the mass mortality of scallop, C. farreri, during summer can be prevented by moving the culture area to deeper water and yield can be maximized by suspending the scallops in deep water during summer and then transferring them to shallow water in autumn.

【题目】Starvation-induced Changes of Hemocyte Parameters in the Zhikong Scallop Chlamys farreri.
【中文关键词】无
【英文关键词】immunology, scallop, aquaculture, Chlamys farreri
【中文摘要】无

【英文摘要】Substantial nutritional and energetic demands are associated with immune activation and the maintenance of an efficient immune system. One-year-old Chlamys farreri (Jones and Preston) scallops were maintained in lantern nets in different nutritional conditions (satiation and starvation) for 40 days. After the 40-day treatments, the condition index and the total hemocyte count (THC) decreased significantly in the starved group compared with the satiated and initial control groups. The percentage of phagocytic hemocytes also was significantly reduced with starvation. In contrast, no significant effect of starvation was observed on reactive oxygen species (ROS) production. The acid phosphatase (ACP) activities in cell-free hemolymph increased significantly in scallops in starved and satiated treatments compared with the initial control, whereas ACP activity in hemocyte lysate was significantly lower in the starved group. These results indicate that starvation stress compromises immunological activities of scallops.

【题目】Involvement of Ca2+ Signaling Pathway During Oocyte Maturation of the Northern Quahog Mercenaria mercenaria
【中文关键词】无
【英文关键词】GVBD, northern quahog, Mercenaria mercenaria, hard clam, oocyte maturation, Ca2+, signaling pathway
【中文摘要】无
【英文摘要】In many molluscs, it has been found that Ca2+ signaling pathway is involved in the resumption of meiotic maturation in oocytes. To better understand the possible role of Ca2+ signaling pathway in regulating meiotic maturation in oocytes of the northern quahog Mercenaria mercenaria, free extracellular Ca2+, A23187 (calcium ionophore), verapamil (calcium channel blocker), and trifluoperazin (calmodulin antagonist) were used to incubate oocytes or serotonin-induced oocytes by pharmacological methods. Results show that extracellular Ca2+ (50 10 μM) and A23187 (1 10 μM) can stimulate the meiotic maturation. In addition, verapamil (1 100 μM) and trifluoperazin (10 1,000 μM) could inhibit serotonin-induced oocyte maturation. Therefore, Ca2+ is essential for the reinitiation of meiotic maturation in oocytes of the northern quahog. Moreover, an increase in [Ca2+]i can promote meiotic maturation.

【题目】桑沟湾养殖栉孔扇贝食物来源研究——脂肪酸标志法
【中文关键词】脂肪酸标志法 栉孔扇贝(Chlamys farreri) 食物来源
【英文关键词】fatty acid biomarker Chlamysfarreri food source
【中文摘要】运用脂肪酸标志法分析了桑沟湾养殖栉孔扇贝(Chlamys farreri)春、夏季食物来源组成。结果表明,桑沟湾养殖栉孔扇贝饵料组成中含有硅藻类、细菌、大型绿藻类、鞭毛藻类等饵料来源,且各种饵料来源比例具有较显著的季节变化。采样期间硅藻脂肪酸标志16:1/16:0(相对质量分数比,下同)从0.91降至0.45,表明扇贝硅藻类饵料来源比例呈逐渐下降趋势;细菌脂肪酸标志18:1n-7/18:1n-9比值从0.31升至0.90,奇数碳、支链脂肪酸相对质量分数从2.15%升至3.28%,表明扇贝细菌类饵料来源比例呈逐渐上升趋势;绿藻脂肪酸标志∑(18:2n-6+18:3n-3)质量分数从2.78%升至5.77%,表明大型绿藻来源有机质饵料比例逐渐上升。栉孔扇贝脂肪酸组成中较高比例的DHA表明扇贝摄取了富含DHA的有机质,如鞭毛藻类、微型浮游动物等。栉孔扇贝食物来源的季节变化很可能是由水体中潜在食物来源的季节变化所导致。
【英文摘要】
Food sources of scallop Chlamys farreri cultured in Sanggou Bay from February to August (2006) were

determined using fatty acid biomarkers. Scallop's diet consisted of diatoms, bacteria, flagellate and seawee d (Chlorophyta) originated organic matters. Diatom biomarker 16:1/16:0 declined from 0.91 to 0.45, which indicated that diatom food source declined during the sampling period; bacterial biomarkers 18:1n-7/18:1n-9 and odd & branched fatty acids increased from 0.31 and 2.15% to 0.90 and 3.28% respectively, whi ch indicated the increase of bacterial food source in scallop's diet. Chlorophyta biomarker ∑(18:2n-6+18:3n-
3) increased from 2.78% to 5.77%, and it was suggested that the scallop may ingested some amount o f organic matters derived of Chlorophyta in warm season. High level of22:6n-
3 (DHA) biomarker indicated that the scallop probably ingested food sources rich in DHA, such as fla gellates, micro-
zooplankton, larvae and eggs. Seasonal changes of scallop's diet probably was caused by the variation of potential food sources in the water.

【题目】Responses of microbial biomass and respiration of soil to topography, burning, and nitrogen fertilization in a temperate steppe
【中文关键词】无
【英文关键词】Burning; Microbial biomass; N fertilization; Metabolic quotient; Temperate steppe; Topography
【中文摘要】无
【英文摘要】Abstract: Temporal dynamics of microbial biomass and respiration of soil and their responses to topography, burning, N fertilization, and their interactions were deter-mined in a temperate steppe in northern China. Soil microbial indices showed strong temporal variability over the growing season. Soil microbial biomass C (MBC) and N (MBN) were 14.8 and 11.5% greater in the lower than upper slope, respectively. However, the percentage of organic C present as MB C and the percentage of total N present as MBN were 16.9 and 26.2% higher in the upper than lower slope, respectively. Neither microbial respiration (MR) nor metabolic quotient (qCO2) was affected by topography. Both MBC and MBN were increased by burning, on average, by 29.8 and 14.2% over the growing season, and MR and qCO2 tended to reduce depending on the sampling date, especially in August. Burning stimulated the percent-age of organic C present as MBC and the percent age of total N present as MBN in the upper slope, but did not change these two parameters in the lower slope. No effects of N fertilization on soil microbial indices were observed in the first growing season after the treatment. Further research is needed to study the long-term relationships between changes in soil microbial diversity and activity and plant community in response to burning an d N fertilization.

【题目】Copper fertilizer effects on copper distribution and vertical transport in soils
【中文关键词】无
【英文关键词】oxides; Ground surface; accumulation; Long term; Manganese oxides; manganese oxides; carbonates; organic materials; Sequential extraction; Procedure; Extraction process; Pentetic acid; instability; depth; Application time; samples; Soil profile;

soil profiles; Field study; field studies; Status; Environment; Bioavailability; transport; fertilizers; copper
【中文摘要】无
【英文摘要】The fate of Cu fertilizer in soils is important for its plant availability and environmental significance. Little research has been done to investigate the status of Cu in soil under repeated application of Cu fertilizer. A field study was conducted to determine the distribution and transport of Cu in soil profiles after 17 years' applications of Cu fertilizer. Soil samples obtained at different application times and soil depths were analyzed for labile Cu by a diethylenetriaminepentaacetic acid (DTPA) extraction procedure. A modified sequential extraction technique was used to separate soil Cu into exchangeable (Exe), organic matter weakly bound (Who), carbonate bound (Carb), manganese oxides bound (MnOx), organic matter specifically bound (Sbo), and mineral bound (Min) fractions. The results showed that long-term application of Cu fertilizer caused the accumulation of Cu in the surface soil. The accumulation of soil Cu in the 0-15 cm and 0-60 cm soil layers accounted for 41.3% and 57.3% of the Cu applied over 17 years. Calculations indicated that little Cu was removed from the plots by crop harvest, which meant that about 40% of fertilizer Cu leached below the 60 cm soil depth. Additional evidence suggested that some Cu leached below 400 cm. Total labile Cu and the increase in labile Cu in the surface layer soil followed a linear relationship with the amount of Cu added and with the application time of the Cu fertilizer. Copper bound to minerals and weakly bound to organic matter accounted for 76% to 92% of the total Cu in soil. In addition, the two fractions had the same distribution trend in the soil profile. The Cu content of different fractions declined in a similar order, i.e. Min-Cu>Wbo-Cu>Exe-Cu>Sbo-Cu>Carb-Cu>MnOx-Cu, regardless of Cu treatment. Most Cu added to soil entered into Min, Exe, Wbo, and Carb fractions. The Exe-Cu, Wbo-Cu, and Carb-Cu fractions are readily mobile and can be used to predict Cu transport. The transport ability of Cu fractions followed the order of M/bo-Cu>Exe-Cu>Carb-Cu and increased with increasing soil depth. These results indicate that the accumulation of Cu in the soil resulting from the long-term application of Cu fertilizer could pose an environmental risk due to the downward mobility of Cu.

【题目】Plant Nitrogen Dynamics and Nitrogen-use Strategies under Altered Nitrogen Seasonality and Competition
【中文关键词】无
【英文关键词】Competition;C3 and C4 grasses;nitrogen seasonality;nitrogen productivity;mean residence time;temperate steppe
【中文摘要】无
【英文摘要】Background and Aims Numerous studies have examined the effects of climatic factors on the distribution of C3 and C4 grasses in various regions throughout the world, but the role of seasonal fluctuations in temperature, precipitation and soil N availability in regulating growth and competition of these two functional types is still not well understood. This report is about the effects of seasonality of soil N availability and competition on plant N dynamics and N-use strategies of one C3 (Leymus chinensis) and one C4 (Chloris virgata) grass species. Methods Leymus chinensis and C. virgata , two grass species native to the temperate steppe in northern China, were planted in a monoculture and a mixture under three different N seasonal availabilities: an average model (AM) with N evenly distributed over the growing season; a one-peak model (OM) with more N in summer than in spring and autumn; and a two-peak model (TM) with more N in spring and autumn than in summer. Key Results The results showed that the altered N seasonality changed plant N concentration, with the highest value of L. chinensis under the OM treatment and C. virgata under the TM treatment, respectively. N seasonality also affected plant N content, N productivity and N-resorption efficiency and proficiency in both the C3 and C4 species. Interspecific competition influenced N-use and resorption efficiency in both the C3 and C4 species, with higher N-use and resorption efficiency in the mixture than in monoculture. The C4 grass had higher N-use efficiency than the C3 grass due to its higher N productivity, irrespective of the N treatment or competition. Conclusions The observations suggest that N-use strategies in the C3 and C4 species used in the study were closely related to seasonal dynamics of N supply and competition. N seasonality might be involved in the growth and temporal niche separation between C3 and C4 species observed in the natural ecosystems.

【题目】Changes in ecosystem carbon stocks following grassland afforestation of semiarid sandy soil in the southeastern Keerqin Sandy Lands, China
【中文关键词】无
【英文关键词】Carbon sequestration;Land-cover change;Pinus sylvestris var. mongolica;Populus simonii
【中文摘要】无
【英文摘要】The ecological consequences of grassland afforestation in arid/semiarid sandy regions are not well known with respect to tree species and stand age. The present Study quantifies the changes in above- and belowground carbon (C) stocks following afforestation in the southeastern Keerqin Sandy Lands with species of Mongolian pine and poplar. We Studied 15-, 24-, and 30-year-old Mongolian pine plantations, 7-, 11-, and 15-year-old poplar plantations, and adjacent grasslands. The results show that total ecosystem C stocks increased following grassland afforestation. Aboveground C stocks increased at a rate of 2.75 Mg C ha(-1) yr(-1) in the poplar plantations, and 1.06 Mg C ha(-1) yr(-1) in the Mongolian pine plantations. Mineral soil C stocks decreased during the early stage of forest establishment, but recovered with increasing stand age. Root C stock increased significantly in the Mongolian pine plantations, but the poplar plantations showed no such increase relative to the grassland. Our results indicate that afforestation of the grassland in the Southeastern Keerqin Sandy Lands would sequester more C than would continuous grassland. Tree species selection and stand developmental age should be considered in planning future afforestation projects. (C) 2008 Elsevier Ltd. All rights reserved

【题目】Simulating infiltration into stony soils with a dual-porosity model
【中文关键词】无
【英文关键词】water-holding characteristics; hydraulic conductivity; rock fragments; porous-media; forest ecosystems; nitrogen balances; coarse fragments; generic model; flow; transport
【中文摘要】无
【英文摘要】Soils containing rock fragments are widely distributed in the world. However, literature on the dynamic simulation of water movement in stony soils is scarce. In this paper, a dual-porosity model was used to simulate water infiltration into soils containing rock fragments. Sensitivity analysis of the dual-porosity model parameters demonstrates that the increase of rock fragment content clearly decreased infiltration into stony soils. Big stones hampered infiltration more than small stones. Spherical stones accelerated infiltration compared with solid, cylindrical stones and rectangular, slab-like stones. Numerical analysis was also performed to test and compare a non-equilibrium dual-porosity model (NDPM) with an equilibrium dual-porosity model (EDPM) and an equilibrium single-pore model (ESPM). Infiltration experiments on disturbed soils were carried out to verify the ability of the NDPM to simulate infiltration into stony soils. Based on hydraulic parameters of soils without rock fragments and mass transfer coefficients obtained independently, the extrapolated cumulative infiltrations calculated by the NDPM were in good agreement with the observed data. Fitted model parameters of the NDPM indicate that rock fragments not only act as a source or sink to affect infiltration but also change the pore structure of the fine earth, apart from reducing the cross-sectional area for water flow. Though further studies are required to improve the dual-porosity model, it already describes more characteristics of infiltration into stony soils and explains more phenomena than does the single-porosity model.

【题目】Lemmas and Endosperms Significantly Inhibited Germination of Leymus chinensis (Trin.) Tzvel. (Poaceae)
【中文关键词】无
【英文关键词】Dormancy; Endosperm; Lemma; Leymuschinensis; Mechanical resistance; Palea
【中文摘要】无
【英文摘要】The mechanism of seed dormancy in Leymuschinensis (Trin.) Tzvel. has not been fully understood. In particular, the role of mechanical resistance offered by glumes remains unclear, and this study sought to investigate that role. Glumes (including lemmas and paleas) and endosperms were removed partly or fully and the effect of so treating the seeds on germination was assessed. Germination was significantly higher (95%) in seeds in which the lemmas had been removed than that observed in intact seeds (72%) but was not significantly different from that in seeds from which the glumes had been removed. These results show that lemmas and not paleas play a critical role in germination of L. chinensis. There was no significant difference in germination percentage between the treatments in which the glumes were removed and that in which the glumes were removed and put back again in their original position. The endosperm also significantly influenced germination: seeds in which a quarter or a half of the endosperm had been removed recorded almost 100% germination. Dormancy in L. chinensis thus appears to be controlled by the lemma and the endosperm.

【题目】Climatic warming changes plant photosynthesis and its temperature dependence in a temperate steppe of northern China
【中文关键词】无
【英文关键词】Warming; C3plants; C4plants; Photosynthesis; Temperaturedependence
【中文摘要】无
【英文摘要】Warming responses of photosynthesis and its temperaturedependence in two C3 grass (Agropyron cristatum, Stipa krylovii), one C4 grass (Pennisetum centrasiaticum), and two C3 forb (Artemisia capillaris, Potentilla acaulis) species in atemperatesteppe of northernChina were investigated in a field experiment. Experimental warming with infrared heater significantly increased daily mean assimilation rate (A) in P. centrasiaticum and A. capillaris by 30 and 43%, respectively, but had no effects on other three species. Seasonal mean A was 13, 15, and 19% higher in the warmed than control plants for P. centrasiaticum, A. capillaries, and S. krylovii, respectively. The mean assimilation rate in A. cristatum and P. acaulis was not impacted by experimental warming. All the five species showed photosynthetic acclimation to temperature. The optimum temperature for photosynthesis (Topt) and the assimilation rate at Topt in the five species increased by 0.33 – 0.78 ° C and 4 – 27%, respectively, under experimental warming. Elevated temperature tended to increase the maximum rate of ribulose-1,5-bisphosphate (RuBP) carboxylation (Vcmax) and the RuBP regeneration capacity (Jmax) in the C3plants and carboxylation efficiency and the CO2-saturated photosynthetic rate in the C4plant at higher leaf temperature, as well as the optimum temperatures for the four parameters. Our results indicated that photosynthetic responses to warming were species-specific and that most of the species in the temperatesteppe of northernChina could acclimate to a warmer environment. The changes in the temperaturedependence of Vcmax and Jmax, as well as the balance of these two processes altered the temperaturedependence of photosynthesis under climaticwarming.

【题目】Different growth responses of C3 and C4 grasses to seasonal water and nitrogen regimes and competition in a pot experimen
【中文关键词】无
【英文关键词】Chloris virgata;competition, growth;Leymus chinensis;nitrogen seasonality;water seasonality
【中文摘要】无
【英文摘要】Understanding temporal niche separation between C(3) and C(4) species (e.g. C(3) species flourishing in a cool spring and autumn while C(4) species being more active in a hot summer) is essential for exploring the mechanism for their co-existence. Two parallel pot experiments were conducted, with one focusing on water and the other on nitrogen (N), to examine growth responses to water or nitrogen (N) seasonality and competition of two co-existing species Leymus chinensis (C(3) grass) and Chloris virgata (C(4) grass) in a grassland. The two species were planted in either monoculture (two individuals of one species per pot) or a mixture (two individuals including one L. chinensis and one C. virgata per pot) under three different water or N seasonality regimes, i.e. the average model (AM) with water or N evenly distributed over the growing season, the one-peak model (OPM) with more water or N in the summer than in the spring and autumn, and the two-peak model (TPM) with more water or N in the spring and autumn than in the summer. Seasonal water regimes significantly affected biomass in L. chinensis but not in C. virgata, while N seasonality impacted biomass and relative growth rate of both species over the growing season. L. chinensis accumulated more biomass under the AM and TPM than OPM water or N treatments. Final biomass of C. virgata was less impacted by water and N seasonality than that of L. chinensis. Interspecific competition significantly decreased final biomass in L. chinensis but not in C. virgata, suggesting an asymmetric competition between the two species. The magnitude of interspecific competition varied with water and N seasonality. Changes in productivity and competition balance of L. chinensis and C. virgata under shifting seasonal water and N availabilities suggest a contribution of seasonal variability in precipitation and N to the temporal niche separation between C(3) and C(4) species.

【题目】Water-deficit stress-induced anatomical changes in higher plants
【中文关键词】无
【英文关键词】Higher plants; Drought; Water use efficiency (WUE); Morphology; Responsive genes
【中文摘要】无
【英文摘要】Water is vital for plant growth and development. Water-deficit stress, permanent or temporary, limits the growth and the distribution of natural vegetation and the performance of cultivated plants more than any other environmental factors do. Although research and practices aimed at improving water-stress resistance and water-use efficiency have been carried out for many years, the mechanism involved is still not clear. Further understanding and manipulating plant-water relations and water-stress tolerance at the scale of physiology and molecular biology can significantly improve plant productivity and environmental quality. Currently, post-genomics and metabolomics are very important to explore anti-drought gene resource in different life forms, but modern agricultural sustainable development must be combined with plant physiological measures in the field, on the basis of which post-genomics and metabolomics will have further a practical prospect. In this review, we discussed the anatomical changes and drought-tolerance strategies under drought condition in higher plants.

【题目】Advances in functional regulation mechanisms of plant aquaporins: Their diversity, gene expression, localization, structure and roles in plant soil-water relations (review)
【中文关键词】无
【英文关键词】Plant aquaporins; water channel; stress; biomembrane interface; soil-water relations
【中文摘要】无
【英文摘要】Aquaporins are important molecules that control the moisture level of cells and water flow in plants. Plant aquaporins are present in various tissues, and play roles in water transport, cell differentiation and cell enlargement involved in plant growth and water relations. The insights into aquaporins' diversity, structure, expression, post-translational modification, permeability properties, subcellular location, etc., from considerable studies, can lead to an understanding of basic features of the water transport mechanism and increased illumination into plant water relations. Recent important advances in determining the structure and activity of different aquaporins give further details on the mechanism of functional regulation. Therefore, the current paper mainly focuses on aquaporin structure-function relationships, in order to understand the function and regulation of aquaporins at the cellular level and in the whole plant subjected to various environmental conditions. As a result, the straightforward view is that most aquaporins in plants are to regulate water flow mainly at cellular scale, which is the most widespread general interpretation of the physiological and functional assays in plants.

【题目】Soil water carrying capacity for vegetation: A hydrologic and biogeochemical process model solution
【中文关键词】无
【英文关键词】Hydrologic cycle; Biogeochemicalprocesses; Soilwatercarryingcapacity; Arid and semi-arid area; Vegetation density; Model
【中文摘要】无
【英文摘要】The research for a maximum stand density that maintains sustainable development is necessary in arid and semi-arid areas where the conflict between limited soilwater storage and the need for more plants in improving environmental quality almost always exists. However, the quantification of the research is not easy since it requires insight interpretations of the effects of plant density on soilwater storage and soilwater stress on plant growth. Such quantification is incomplete with current empirical methods or physical models because the dynamics effects of soilwater stress and its feedbacks are not included. This paper presents a physically based model of soilwatercarryingcapacity for vegetation (SWCCV). The model build on the concept of an equilibrium adjustment of vegetation growth to soilwater dynamics, by iterative calculation between hydrologic and biogeochemicalprocesses that account for the interactions between the limiting effects of soil moisture on photosynthesis and evaporative demand on soilwater. It is capable to calculate the maximum plant density at any given initial conditions (site-specific data, vegetation, weather, and etc.) through hourly, daily and yearly cycles. Exploratory simulation to evaluate the model against results from previous studies for two sites indicated that the predictions by the model had good agreement with measured soilwater contents in each layer, LAI and NPP for plants. Under the same initial conditions the predicted soilwatercarryingcapacity captured well the soilwater difference between two sites in terms of controlling

vegetation density. Overall, the SWCCV model is capable in terms of predicting soilwatercarryingcapacity, providing a new approach for understanding soil – vegetation interactions and making recommendations for better management of vegetation construction in arid and semi-arid areas.

【题目】Water- and plant-mediated responses of soil respiration to topography, fire, and nitrogen fertilization in a semiarid grassland in northern China
【中文关键词】无
【英文关键词】Fire; Grassland; Nitrogenfertilization; Soil moisture; Soilrespiration; Temperature; Topography
【中文摘要】无
【英文摘要】Soilrespiration is one of the major carbon (C) fluxes between terrestrial ecosystems and the atmosphere and plays an important role in regulating the responses of ecosystem and global C cycling to natural and anthropogenic perturbations. A field experiment was conducted between April 2005 and October 2006 in asemiaridgrassland in northernChina to examine effects of topography, fire, nitrogen (N) fertilization, and their potential interactions on soilrespiration. Mean soilrespiration was 6.0% higher in the lower than upper slope over the 2 growing seasons. Annual burning in early spring caused constant increases in soilrespiration (23.8%) over the two growing seasons. In addition, fire effects on soilrespiration varied with both season and topographic position. Soilrespiration in the fertilized plots was 11.4% greater than that in the unfertilized plots. Water- and plant-mediation could be primarily responsible for the changes in soilrespiration with topography and after fire whereas the positive responses of soilrespiration to N fertilization were attributable to stimulated plant growth, root activity and respiration. The different mechanisms by which topography, fire, and N fertilization influence soilrespiration identified in this study will facilitate the simulation and projection of ecosystem C cycling in the semiaridgrassland in northernChina.

【题目】Seasonal variations in nitrogen mineralization under three land use types in a grassland landscape
【中文关键词】无
【英文关键词】Abandoned field;Crop field;Steppe;Nitrification;Inner Mongolia
【中文摘要】无
【英文摘要】Soil nitrogen (N) mineralization is an important component of the N cycling process in ecosystems. In this study, we assessed the seasonal patterns of net soil N mineralization and nitrification using an intact soil core incubation method in the upper 0 – 10cm soil layer in three representative land use types. These included a fenced steppe, an abandoned field and a crop field in a grassland landscape of Inner Mongolia, China. The study was conducted from September 2004 to August 2005. Our results demonstrate marked seasonal variations in inorganic N pools, net nitrogen mineralization and net nitrification. Net N mineralization was higher in the crop field than in the fenced steppe and the abandoned field. Daily rates of N mineralization and nitrification during the growing season were approximately twice their corresponding mean annual rates. Accumulative mineralization and nitrification of N during the growing season accounted for about 90 and 85% of that measured for the entire year. Rates of mineralization and nitrification were positively correlated with soil bulk density, but negatively correlated with soil pH. Net N mineralization and

nitrification were strongly regulated by land use, precipitation, soil water and temperature.

【题目】The responding relationship between plants and environment is the essential principle for agricultural sustainable development on the globe
【中文关键词】无
【英文关键词】Plants; Gene regulatory network system; Abiotic stress; Signal transduction; Soil environment; Physiological mechanisms
【中文摘要】无
【英文摘要】The mutual-responding relationship between plants and environment is involved in all life processes, which are the essential bases for different types of sustainable development on the globe, particularly the critical basis for agricultural sustainable development. How to regulate the above relationship between plants and the corresponding environment (in particular soil environment) is the key problem to modern sustainable agriculture development under global climate change, which is one of the hot topics in the field of plant biology. Detailed dissection of this responding relationship is also important for conducting global eco-environmental restoration and construction. Although powerful methodology and dataset related to genomics, post-genomics, and metabolomics have provided some insights into this relationship, crop physiological measures are also critical for crop full performance in field. With the increase of tested plants (including model plants) and development of integrated molecular biology, a complete understanding of the relationship at different scales under biotic and abiotic stresses will be accelerated. In the current paper, we will cover some important aspects in combination with the recent work from our laboratory and related advances reflected by international academic journals, as follows: plant physiological function performance under natural condition, plant gene regulatory network system under abiotic stresses, gene regulatory network system and drought resistance improvement, summary of the related work from our laboratory, conclusions, and acknowledgement.

【题目】Primary production and rain use efficiency across a precipitation gradient on the Mongolia plateau
【中文关键词】无
【英文关键词】ANPP; arid and semiarid land; ecosystem management; Eurasian Steppe; Inner Mongolia grassland; mean annual precipitation; nitrogen addition; plant functional group composition; rain-use efficiency
【中文摘要】无
【英文摘要】Understanding how the aboveground net primary production (ANPP) of arid and semiarid ecosystems of the world responds to variations in precipitation is crucial for assessing the impacts of climate change on terrestrial ecosystems. Rain-use efficiency (RUE) is an important measure for acquiring this understanding. However, little is known about the response pattern of RUE for the largest contiguous natural grassland region of the world, the Eurasian Steppe. Here we investigated the spatial and temporal patterns of ANPP and RUE and their key driving factors based on a long-term data set from 21 natural arid and semiarid ecosystem sites across the Inner Mongolia steppe region in northern China. Our results showed that, with increasing mean annual precipitation (MAP), (1) ANPP increased while the interannual variability of ANPP declined, (2) plant species richness increased and the relative abundance of

key functional groups shifted predictably, and (3) RUE increased in space across different ecosystems but decreased with increasing annual precipitation within a given ecosystem. These results clearly indicate that the patterns of both ANPP and RUE are scale dependent, and the seemingly conflicting patterns of RUE in space vs. time suggest distinctive underlying mechanisms, involving interactions among precipitation, soil N, and biotic factors. Also, while our results supported the existence of a common maximum RUE, they also indicated that its value could be substantially increased by altering resource availability, such as adding nitrogen. Our findings have important implications for understanding and predicting ecological impacts of global climate change and for management practices in arid and semiarid ecosystems in the Inner Mongolia steppe region and beyond.

【题目】Changes in carbon and nitrogen of Chernozem soil along a cultivation chronosequence in a semi-arid grassland
【中文关键词】无
【英文关键词】LAND-USE CHANGE; ORGANIC-CARBON; MANAGEMENT; MATTER; CONSERVATION; ECOSYSTEMS; PASTURE; TILLAGE; STORAGE; STOCKS
【中文摘要】无
【英文摘要】Changes in the carbon (C) stock of grassland soil in response to land use change will increase atmospheric CO2, and consequently affect the climate. In this study we investigated the effects of land use change on soil organic C (SOC) and nitrogen (N) along a cultivation chronosequence in the Xilin River Basin, China. The chronosequence consisted of an undisturbed meadow steppe, a 28-year-old cropland and a 42-year-old cropland (abbreviated as Steppe, Crop-28 Y and Crop-42Y, respectively). Crop-28Y and Crop-42Y were originally created on the meadow steppe in 1972 and 1958, respectively. The soil samples, in ten replications from three depth increments (0 – 10, 10 – 20 and 20 – 30 cm), were collected, respectively, in the two cropland fields and the adjacent undisturbed steppe. Bulk density, SOC, total N and 2 m KCl-extractable mineral N including ammonium and nitrate were measured. Our results showed that the greatest changes in the measurements occurred in the 0 – 10 cm soil depth. The SOC stock in the upper 30-cm soil decreased by 9.83 Mg C ha − 1 in Crop-28Y and 21.87 Mg C ha − 1 in Crop-42Y, which indicated that approximately 10 and 25% of the original SOC of the steppe had been emitted over 28 and 42 years, respectively. Similarly, the total N lost was 0.66 Mg N ha − 1 and 1.18 Mg N ha − 1, corresponding to approximately 9% and 16%, respectively, of the original N at the same depth and cropping duration as those noted for SOC. The mineral N concentration in the soil of both the two croplands was greater than that in the steppe soil, and the ammonium-N was less affected by cultivation than the nitrate-N. The extent of these changes depended on soil depth and cropland age. These effects of cultivation were much greater in the top 10 cm of soil than in deeper soil, and also greater in Crop-42Y than in Crop-28Y. The findings are significant for assessing the C and N sequestration potential of the land use changes associated with grassland conversion, and suggest that improved management practices are needed to sequester SOC and total N in the cropped soil in a semi-arid grassland.

【题目】Photosynthetic overcompensation under nocturnal warming enhances grassland carbon sequestration
【中文关键词】无

【英文关键词】carbohydrate; carbon; China; climate warming; ecosystem; photosynthesis; respiration; temperate steppe; temperature.
【中文摘要】无
【英文摘要】A mechanistic understanding of the carbon (C) cycle-climate change feedback is essential for projecting future states of climate and ecosystems. Here we report a novel field mechanism and evidence supporting the hypothesis that nocturnal warming in a temperate steppe ecosystem in northern China can result in a minor C sink instead of a C source as models have predicted. Nocturnal warming increased leaf respiration of two dominant grass species by 36.3%, enhanced consumption of carbohydrates in the leaves (72.2% and 60.5% for sugar and starch, respectively), and consequently stimulated plant photosynthesis by 19.8% in the subsequent days. Our experimental findings confirm previous observations of nocturnal warming stimulating plant photosynthesis through increased draw-down of leaf carbohydrates at night. The enhancement of plant photosynthesis overcompensated the increased C loss via plant respiration under nocturnal warming and shifted the steppe ecosystem from a minor C source (1.87 g C x m(-2) x yr(-1)) to a C sink (21.72 g C x m(-2) x yr(-1)) across the three growing seasons from 2006 to 2008. Given greater increases in daily minimum than maximum temperature in many regions, plant photosynthetic overcompensation may partially serve as a negative feedback mechanism for terrestrial biosphere to climate warming.

【题目】Response of ecosystem carbon exchange to warming and nitrogen addition during two hydrologically contrasting growing seasons in a temperate steppe
【中文关键词】无
【英文关键词】carbon; climatic warming; grassland; nitrogen; plant functional type; precipitation; respiration; soil moisture; temperature
【中文摘要】无
【英文摘要】A large remaining source of uncertainty in global model predictions of future climate is how ecosystem carbon (C) cycle feedbacks to climate change. We conducted a field manipulative experiment of warming and nitrogen (N) addition in a temperate steppe in northern China during two contrasting hydrological growing seasons in 2006 [wet with total precipitation 11.2% above the long-term mean (348 mm)] and 2007 (dry with total precipitation 46.7% below the long-term mean). Irrespective of strong intra- and interannual variations in ecosystem C fluxes, responses of ecosystem C fluxes to warming and N addition did not change between the two growing seasons, suggesting independence of warming and N responses of net ecosystem C exchange (NEE) upon hydrological variations in the temperate steppe. Warming had no effect on NEE or its two components, gross ecosystem productivity (GEP) and ecosystem respiration (ER), whereas N addition stimulated GEP but did not affect ER, leading to positive responses of NEE. Similar responses of NEE between the two growing seasons were due to changes in both biotic and abiotic factors and their impacts on ER and GEP. In the wet growing season, NEE was positively correlated with soil moisture and forb biomass. Negative effects of warming-induced water depletion could be ameliorated by higher forb biomass in the warmed plots. N addition increased forb biomass but did not affect soil moisture, leading to positive effect on NEE. In the dry growing season, NEE showed positive dependence on grass biomass but negative dependence on forb biomass. No changes in NEE in response to warming could result from water limitation on both GEP and ER as well as little responses of either grass or forb biomass. N addition stimulated grass biomass but reduced forb biomass, leading to the increase in NEE. Our findings highlight the importance of changes in abiotic (soil moisture, N availability) and biotic (growth of different plant functional types) in mediating the responses of NEE to climatic warming and N enrichment in the semiarid temperate steppe in northern China.

【题目】Spatial variability of soil total nitrogen and soil total phosphorus under different land uses in a small watershed on the Loess Plateau, China
【中文关键词】无
【英文关键词】Asia; Far East; Shaanxi China; China; geostatistics; Statistical character; Geographical division; plateaus; Sampling design; Ground surface; Spatial distribution; autocorrelation; eutrophication; surface water; Soil quality; Soil fertility; nitrogen; agriculture; loess; drainage basins; phosphorus; land cover; land use; Total nitrogen; soils; Spatial variability;
【中文摘要】无
【英文摘要】The spatial variability of soil total nitrogen (STN) and soil total phosphorus (STP) levels, which may be greatly affected by land use, plays an important role in both agriculture and the environment, especially with regard to soil fertility, soil quality, and water-body eutrophication. Little research has been done that addresses the spatial patterns of STN and STP under different land use types at a watershed scale. We collected 689 soil surface (0-20 cm) samples, using a grid sampling design, from the Liudaogou watershed (6.89 km2) on the Loess Plateau of North China. Using classical statistical and geostatistical methods, we characterized and compared the spatial heterogeneities of STN and STP under different land use types (farmland, grassland, and shrubland).Concentrations of STN and STP were normally distributed with the exception of STP in grassland, and decreased in the order: farmland > grassland > shrubland. Stepwise multiple regression analysis indicated a strong relationship between STN and soil organic carbon (which was mainly controlled by plant growth and microbial activity), while STP was associated with the content of finer soil particles (which absorb P more readily and whose distribution is related to slope aspect and altitude). Both STN and STP showed moderate variability under different land use types. Nugget ratios for STN showed a moderate spatial dependence and decreased in the order: farmland > grassland > shrubland, whereas STP increased in that order and showed strong, moderate, and weak spatial dependence, respectively. The type of optimal theoretical isotropy models differed for STN and STP as well as for the land use type. We concluded that spatial patterns of STN and STP would change significantly with land use changes currently being implemented to achieve sustainable agriculture development and environmental restoration. Taking land use type into account when considering the spatial variation of STN and STP would increase the accuracy in modeling and prediction of soil nutrient status and nutrient movement at the watershed scale.

【题目】Effects of two perennials, fallow and millet on distribution of phosphorous in soil and biomass on sloping loess land, China
【中文关键词】无
【英文关键词】Aboveground biomass; Phosphorus distribution; Sloping land; Soil moisture; Vegetation restoration
【中文摘要】无
【英文摘要】Soil erosion causes sequential eco-environmental problems in the Loess Plateau of China. Therefore, vegetation restoration measures were adopted in this area by converting steep cropland into alternative land uses in order to remedy the erosion problem and alleviate land degradation. As part of the effort to understand the potential of this management practice in sequestering nutrients, the present study assessed the impact of vegetation restoration on the distribution of phosphorus (P) and aboveground biomass on a sloping land in this area. The study compared four land uses, Korshinsk Peashrub (KOP), alfalfa (ALF), natural fallow (NAF), and millet (MIL). KOP, ALF and NAF were adopted as vegetation restoration patterns, while MIL was an example of crop land. For the sampling time the average aboveground P pools of KOP, ALF, and MIL were 1.118. 0.406. and 0.091 g m(-2), respectively. The magnitudes of the aboveground biomass and tissue P concentration of the three land uses followed the same order.

Both vertical and horizontal distributions of soil Olsen P of KOP were relatively uniform. Soil Olsen P of ALF accumulated significantly at the down-slope position within the surface 60 cm soil profile. The down-slope accumulation of soil Olsen P was significant at the depth of 80 to 100 cm and 0 to 20 cm for NAF and MIL, respectively. The soil Olsen P concentrations in deeper soil layers of KOP and ALF were clearly lower than that of NAF, while MIL had apparent higher concentrations of soil Olsen P in the 0 to 20 cm layer of soil. Generally, the vegetation restoration did not present a significant effect on total soil P level,with the average values of 0.722,0.751,0.747, and 0.729 kg m(-2) for KOP,ALF, NAF and MR, respectively. However, an apparent accumulation of total soil P at the down-slope position was observed for NAF and MIL treatments. For ALF and KOP, the soil Olsen P and the soil moisture content were correlated positively to the aboveground P pool. For MIL, however, the higher aboveground P corresponded to a higher soil Olsen P but to a lower soil moisture content. Results from the four years of data suggest that ALF is the fastest absorber of soil P, while KOP is the best vegetation to sequester soil P of the soil-plant systems in this study. 【题目】Distribution of soil organic C, N and P in three adjacent land use patterns in the northern Loess Plateau, China
【中文关键词】无
【英文关键词】Chinese Pine; Korshinsk Peashrub; Native grass; Nitrogen; Phosphorous; Organic carbon; The northern Loess Plateau
【中文摘要】无
【英文摘要】The northern Loess Plateau is an important cropping-pastoral ecotone and wind-water erosion crisscross region in China, but the distribution of soil organic carbon (C), nitrogen (N) and phosphorus (P) in different land uses across this vulnerable ecoregion is not well understood. This study was carried out to determine the distribution patterns of soil organic C, N and P in native grassland and in two woody lands (Chinese Pine land and Korshinsk Peashrub land) that were established on the native grassland 28 years ago. In the north part of the Loess Plateau, the concentrations of soil organic C, N and P were lower than in the southern Loess Plateau either across or within the land use patterns. The concentrations and stocks of organic C and total N were significantly decreased in Chinese Pine and Korshinsk Peashrub lands compared with those in native grassland in the surface 0-40 cm soil layer, where more than 70% of the roots were distributed. The decreases in organic C in 0-40 cm soil layers were 2.6 and 3.0 Mg C ha{ ^{1} (26.3 and 27.7%) by Chinese Pine and Korshrinsk Peashrub, while those of total N were 0.6 and 0.4 Mg N ha{ ^{1} (31.5 and 17.2%), respectively, compared with native grassland. Both concentration and stock of total P varied only slightly with land use. The findings suggested that the conversion of natural grass into Chinese Pine and Korshinsk Peashrub resulted in decreased soil organic C and total N in the surface 0 to 40 cm soil layer of the northern Loess Plateau. Our results further indicated that a combination of low temperatures, little precipitation and large soil degradation impede increasing C and N stocks by afforestation, and the afforestation on grassland should be viewed very critically in such areas.

【题目】Hydraulic conductance and vulnerability to cavitation in corn (Zea mays L.) hybrids of differing drought resistance
【中文关键词】无

【英文关键词】Hydraulic conductivity; Vulnerability; Cavitation; Corn
【中文摘要】无
【英文摘要】Water transport through the xylem is essential for replacing water loss during transpiration, thus preventing desiccation and permitting photosynthesis. The occurrence of cavitation and embolism due to drought impairs transport to the transpiring leaves. Most research in this discipline has been conducted on woody plants. Less attention has been given to cavitation of crops and its physiological significance for understanding crop water relations. In this paper, hydraulic conductance and vulnerability of xylem to cavitation were studied in corn hybrids with different drought resistances. The results indicated that stems of drought-resistant ‘Pioneer 3902’ not only had a higher conductivity on both a stem area and leaf area basis but also had a greater resistance to cavitation. The estimated xylem pressure at 63.2% loss of conductivity (Weibull fitting parameter b) and at 50% loss of conductivity (P50) in ‘Pioneer 3902’ were about 0.2 MPa lower than in ‘Pride 5’. Higher conductivity in ‘Pioneer 3902’ was mainly attributed to more vascular bundles per stem area rather than greater vessel diameter. The central bundles and peripheral vascular bundles showed the same degree of cavitation although the vessels of central bundles were generally larger than in peripheral bundles.

【中文摘要】无
【英文摘要】In the Songnen Plain, Northeast China, chemical parameters of salt-affected soils were previously obtained from 1:5 soil-to-water (1:5) extracts so that there is no information available for soil salinity and sodicity from the saturated paste (SP) extracts. The work reported here characterized soil salinity and sodicity of SP extracts and compared salinity and sodicity measurements using SP and 1:5 extraction methods from 121 soil samples from various sites of salt-affected soil areas in the Songnen Plain. Electrical conductivity (EC), major cations (Na+, K+, Mg2+, Ca2+), sodium adsorption ratio (SAR), and pH were determined and analyzed using SP extracts and 1:5 extracts.The sodium ion was the predominant cation so that Na+ concentration was close to total cation concentration (TCC). The SAR in the 121 samples was remarkably high; 22 soils had a SAR > 1000 (mmolc L − 1)1/2 with a maximum SAR value of 4042.57 (mmolc L − 1)1/2 for SP extract. The SAR was highly correlated with EC (r 2 > 0.86, P < 0.0001). The salt-affected soils are predominantly saline-sodic based on the classification of the USDA (195416. U.S. Department of Agriculture (USDA) . 1954 . Diagnosis and improvement of saline and alkali soils . USDA , Washington , DC . View all references). Through a regression analysis, total cation concentration was strongly related to EC with slopes of 10.3 and 9.8 without y intercept in SP and 1:5 extracts, respectively.Significant relationships (r 2 > 0.81, P < 0.0001) existed between EC, Na+, and SAR in SP and 1:5 extracts. However, K+, Ca2+, and Mg2+ of SP extracts was not related to those of 1:5 extracts.

【题目】The effects of land use on soil N mineralization during the growing season on the northern Loess Plateau of China
【中文关键词】无
【英文关键词】Ammonification; Chinese Pine woods; Grassland; Korshinsk Peashrub land; Nitrification; The northern Loess Plateau; mojave desert ecosystem; nitrogen mineralization; terrestrial; ecosystems; temperate grassland; dynamics; forest; carbon; transformations; plantations; pine
【中文摘要】无
【英文摘要】The mineralization and availability of soil nitrogen (N) are vital processes in the sustainable management of soil resources and ecosystems. We studied the mineralization and availability of soilN on the northernLoessPlateau of China during the growingseason under three different land use conditions: Chinese Pine woods, grassland, and Korshinsk Peashrub land. Mineral N varied significantly during the growingseason and was always significantly higher at soil depths of 0 – 10 cm soils than at depths of 10 – 20 cm. NO3 − -N predominated shrublands, while NH4+-N was dominant in grassland in both the 0 – 10 cm and 10 – 20 cm soil layers. In Pine woods, NO3 − -N dominated the 0 – 10 cm soil layer, while NH4+-N dominated in the 10 – 20 cm soil layers. In shrublands, the 0 – 10 cm and 10 – 20 cm soil layers showed nitrification rates of 1.6 – 3.6 and 1.0 – 3.5 times higher than those in the corresponding soil layers of grassland, respectively. However, the ammonification rate in shrublands did not differ from that in grasslands. Ammonification and nitrification dominated the Nmineralization process at the beginning and middle of the growingseason, respectively, while both processes were balanced at the end of the growing period. The cumulative nitrified, ammonified and total mineralized N in shrublands were 178%, 27%, and 116% and 161%, 29%, and 93% higher in the 0 – 10 cm and 10 – 20 cm soil layers than those in grasslands and 203%, 97%, and 165% and 235%, 69%, and 151% higher than those in pine woods, respectively. The conversion of grasslands to pine woods reduced N availability at soil depths of 0 – 20 cm, but the conversion of grasslands to shrublands increased N availability. The uptake of soilN by vegetation was close to (in pine woods) or less than (in grasslands and shrublands) the mineralized N in the 0 – 20 cm soil layer during the period of vegetation growth. Overall, the results indicated that there was abundant N availability; therefore we conclude that N availability is not likely to limit ecosystem productivity in either of these three land use patterns on the northernLoessPlateau.

【题目】Soil iron fractionation and availability at selected landscape positions in a loessial gully region of northwestern China
【中文关键词】无
【英文关键词】availability; fraction; iron; landscape position; loessial gully watershed; soils
【中文摘要】无
【英文摘要】Soil Fe fractions and availability vary with landscape positions, because landscape position affects soil chemical properties and water conditions. In the present study, we investigated Fe fractions and availability at selected landscape positions in the loessial gully region of northwestern China. Four landscape positions, plateau, slope, terrace, and gully bottom were investigated. For each landscape position, soil samples were collected at 2-cm increments to a depth of 8cm. Iron in the soil samples was fractionated by a modified sequential extraction method. Available Fe was assessed by diethylene thiamine pentacetic acid (DTPA) extraction procedure. The results showed that soil profile distributions of DTPA-Fe varied greatly with landscape position in the study area. The largest content of DTPA-Fe content was observed in the plateau soils, while the smallest content was observed in the gully bottom soils. Iron in soils existed mainly in the mineral bound fraction, which accounted for about 73 to 96% of the total Fe. The content of Fe in soil fractions varied greatly with landscape position. Exchangeable Fe and organic matter bound Fe were direct sources of available Fe, but exchangeable Fe contributed little to the total available Fe due to its low content in the soils. Oxides bound Fe was an indirect source of available Fe. The results of the present study indicate that landscape position strongly influences soil profile distribution and capacity of available Fe by influencing soil Fe fractions and organic matter distributions.

【题目】Changes in soil organic carbon and total nitrogen after 28 years grassland afforestation: effects of tree species, slope position, and soil order
【中文关键词】无
【英文关键词】Chinese pine;Korshrinsk peashrub;Soil profile;Tree canopy
【中文摘要】无
【英文摘要】The effect of conversion of grassland to woodland on organic carbon (OC) and total nitrogen (TN) has significance for global change, land resource use and ecosystem management. However, these effects are always variable. Here, we show results of a study in an arid area in China on profile distribution of OC and TN in soils covered by two different woody tree canopies and outer canopy space (grassland between woody plant canopies). The soils were at various slope positions (upper, middle and lower slopes) for Chinese pine (Pinus tabulaeformis) and Korshrinsk peashrub (Caragana korshinskii) lands, and of different soil orders (Castanozems, Skeletal, Loessial and Aeolian soils). The objectives were to relate the effects of land use change on OC and TN to slope position and soil order. Soil OC and TN were significantly larger at Korshrinsk peashrub slope locations than at Chinese pine slope locations. Soil OC and TN were small at the lower slope position for Korshrinsk peashrub, however, they were largest at the middle slope for Chinese pine. Korshrinsk peashrub always increased soil OC and TN under brush canopy at the three slope positions, while Chinese pine increased them at lower slopes and decreased them at upper slopes. For the soil types, OC and TN in Korshrinsk peashrub land were in the order of Castanozems > Skeletal > Loessial > Aeolian soils. Korshrinsk peashrub also increased OC and TN under brush canopy in the four soils. Our results indicated that soil OC and TN in canopy soils differed greatly from associated values in the outer canopy soils,

and the effects of grassland afforestation varied significantly with tree species, slope position, and soil type. Therefore, we suggest that differentiating such factors can be an effective approach for explaining variances in OC and N changes caused by land use conversion.

【题目】Soil organic carbon and total nitrogen as affected by vegetation types in Northern Loess Plateau of China
【中文关键词】无
【英文关键词】Soilorganiccarbon; Totalnitrogen; Vegetationtype; NorthernLoessPlateau
【中文摘要】无
【英文摘要】One of the most fragile areas in the ChinaLoessPlateau, is the transitional belt that is subjected to wind and water erosion. The transitional belt accounts for about 30% of the LoessPlateau area. To reduce soil degradation in the LoessPlateau, the Chinese government initiated a state-funded vegetation restoration project in 1999. The effectiveness of this project on transitional belt soils is unknown. The objective of this study is to determine the effects of four dominant vegetationtypes on soilorganiccarbon (SOC) and nitrogen (N) in a selected catchment within the transitional belt. Korshinsk Peashrub (KOP), purple alfalfa (ALF), and natural fallow (NAF) were selected as vegetation restoration types because they have been used widely to remedy soil degradation. The fourth vegetationtype selected was millet (MIL) because it has been an important crop in the region. In 2004, four 61 × 5 m plots were established on 12 ° slope land. The plots were parallel and separated by 80 cm. Based upon soil samples collected in August of 2007, there were large variations in the distributions and stocks of SOC and N across the four vegetationtypes. Compared with MIL, KOP significantly increased the concentration and stock of SOC and totalnitrogen (TN) in 0 – 100 cm soil profiles, while ALF and NAF were not significantly different. The distributions of SOC and TN concentrations and stocks of KOP, ALF and NAF were relatively uniform along a hillslope, while there was an increasing trend along the hillslope in MIL. This result suggests that ALF and NAF would be beneficial in SOC and TN sequestration over a long-term because of their ability to reduce the loss of SOC and TN by soil erosion. We also found that both vegetationtypes and hillslope position had no significant effects on C:N ratio. Our study demonstrated that improvements of SOC and TN stocks in the transitional belt could be made through well managed vegetation restoration measures.

【题目】A preliminary investigation of the dynamic characteristics of dried soil layers on the Loess Plateau of China
【中文关键词】无
【英文关键词】Asia; Far East; China; arid environment; organic carbon; chemical properties; correlation; depth; glycine; density; rainfall; thickness; vegetation; growth; drainage basins; water content; land use; soil profiles; lead; management; desiccation; plateaus; loess; soils;
【中文摘要】无
【英文摘要】Serious soil desiccation, resulting from climatic conditions and poor land management, may lead to the formation of a dried soil layer (DSL), which can negatively affect ecological and hydrological processes. To mitigate these effects through management, it is necessary to understand property interactions within DSLs, compared with those in the whole soil profile, and DSL formation processes under different land uses. We investigated the relationships between soil water content (SWC) and plant root indices, and other soil properties, under various land uses in the Liudaogou watershed on the Loess Plateau, China. We also studied the

development of DSLs as a function of the growth age of two vegetation types. Rate of formation and thickness of DSLs were dependent on vegetation type: DSLs formed after 2 years of alfalfa (Medicago sativa) growth and 3 years of Caragana korshinskii growth; after 4 years of growth, DSLs under alfalfa were thicker than those under C. korshinskii, but after 31 years the DSL thickness under C. korshinskii (4.4 m) exceeded that formed under alfalfa (3 m). The more persistent DSLs occurred below a 100 cm thick upper soil layer that was seasonally dried and replenished by rainfall under both vegetation types. The degree of soil desiccation under natural vegetation was generally less than that under non-indigenous plant species, and was similarly less over a period of about 30 years for a natural plant succession sequence than for an artificial one. Thus, the use of natural vegetation succession management principles would possibly reduce soil desiccation during vegetative restoration. Densities of root length, weight, and surface area, and the average root diameter of soybean (Glycine max), alfalfa, Stipa bubgeana, and C. korshinskii all decreased with increases in soil depths below 20 cm. Correlations between SWC and root indices, and various soil physical and chemical properties, were generally weaker within the DSL layers than within the whole soil profile. The only significant correlation was between soil organic carbon and SWC under alfalfa ($r = 0.627$, $P < 0.05$). Soil desiccation may thus interfere with these typical interrelationships occurring within the whole soil profile. Our findings may provide a helpful base reference for the control and restoration of DSLs occurring on the Loess Plateau and in similar arid and semi-arid regions.

【题目】Using a new criterion to identify sites for mean soil water sorage evaluation
【中文关键词】无
【英文关键词】Property of soil; physical properties; Soil water properties; Water storage; soils; Soil science; Earth science; evaluation; soil moisture; Site; Criterion; utilization;
【中文摘要】无
【英文摘要】Establishing a few sites in which measurements of soil water storage (SWS) are time stable significantly reduces the efforts involved in determining average values of SWS. This study aimed to apply a new criterion—the mean absolute bias error (MABE)-to identify temporally stable sites for mean SWS evaluation. The performance of MABE was compared with that of the commonly used criterion, the standard deviation of relative difference (SDRD). From October 2004 to October 2008, SWS of four soil layers (0-1.0, 1.0-2.0, 2.0-3.0, and 3.0-4.0 m) was measured, using a neutron probe, at 28 sites on a hillslope of the Loess Plateau, China. A total of 37 SWS data sets taken over time were divided into two subsets, the first consisting of 22 dates collected during the calibration period from October 2004 to September 2006, and the second with 15 dates collected during the validation period from October 2006 to October 2008. The results showed that if a critical value of 5% for MABE was defined, more than half the sites were temporally stable for both periods, and the number of temporally stable sites generally increased with soil depth. Compared with SDRD, MABE was more suitable for the identification of time-stable sites for mean SWS prediction. Since the absolute prediction error of drier sites is more sensitive to changes in relative difference in terms of mean SWS prediction, the sites of wet sectors should be preferable for mean SWS prediction for the same changes in relative difference.

【题目】Organic carbon in soil physical fractions under different-aged plantations of Mongolian pine in semi-arid region of Northeast China
【中文关键词】无
【英文关键词】Ecological restoration; Extracellular enzyme; Keerqin Sand Lands; Pinus sylvestris var.mongolica Litv.; Soilcarbon storage; Soilphysical fractionation
【中文摘要】无
【英文摘要】In order to understand the changes of surface soilcarbon (C) storage following the afforestation of sandy grasslands, we used physical fractionation procedures to quantify C concentrations and sucrase enzyme activity in bulk soil and different particle fractions along two replicate chronosequences of Mongolianpine (Pinus sylvestris var. mongolica Litv.) plantations in the southeastern Keerqin Sand Lands, NortheastChina. Carbon concentration in bulk topsoil (0 – 15 cm) initially decreased following afforestation of grassland and subsequently increased as the forest matured. In general, this pattern of C concentration changes was associated with all particle-size fractions (except clays) and both macro- and microaggregates. The patterns of topsoil C were also influenced by wind erosion and deposition, with marked increases in the relative mass of silt and fine sand fractions occurring during forest development. The loss of aggregates immediately following afforestation was counteracted by formation of aggregates as the forests developed, contributing to the stabilization of carbon. To enhance soil C storage during afforestation of sandy soils in such semi-aridregions it is recommended to minimize disruption of grassland vegetation during the planting stage.

【题目】Effects of nitrogen addition on vegetation and ecosystem carbon in a semi-arid grassland
【中文关键词】无
【英文关键词】Carbon partitioning;Carbon pool Keerqin Sandy Lands;Nitrogen limitation;Sandy grassland; Species composition
【中文摘要】无
【英文摘要】To clarify responses of plant and soil carbon (C) and nitrogen (N) pools in grassland ecosystem to N addition, a field experiment was performed in a grassland in Keerqin Sandy Lands, Northeast China. We investigated vegetation composition and C and N pools of plant and soil (0-30 cm) after five consecutive years of N addition at a rate of 20 g N m^{-2} y^{-1}. Vegetation composition and species diversity responded dramatically to N addition, as dominance by C_4 perennials was replaced with C_3 annuals. Carbon in aboveground pool increased significantly (over two-fold), mainly due to the increase of the C in aboveground living plants and surface litter, which increased by 98 and 134%, respectively. Although soil C did not change significantly, the root C pool decreased in response to 5 years of N addition. The total ecosystem C pool was not significantly impacted by N addition because the large soil pool did not respond to N addition, and the increase in aboveground C was offset by the decrease in root C pool. Moreover, N addition significantly increased the aboveground N pool, but had no significant effects on belowground and total ecosystem N pools. Our results suggest that in the mid-term N addition alters the C and N partitioning in above- and belowground pools, but has no significant effects on total ecosystem C and N pools in these N-limited grasslands.

【题目】Soil microbial properties under N and P additions in a semi-arid, sandy grassland
【中文关键词】无
【英文关键词】Basal respiration;Microbial metabolic quotient;Microbial quotient;Net nitrogen mineralization;Nitrification;Soil microbial biomass
【中文摘要】无
【英文摘要】Surface (0　15 cm) soil samples were collected from a semi-arid, sandy grassland in Keerqin Sandy Lands, Northeast China to study changes in soil microbial and chemical properties after five consecutive years of nitrogen (N) and phosphorus (P) additions. Nitrogen and P additions and their interactions negligibly affected soil organic carbon and total N contents, while P addition significantly increased soil total P content. Soil pH was significantly decreased by N addition, which significantly increased net nitrification rate, whereas it did not affect net N mineralization rate. No significant effects of N and P additions and their interactions on basal respiration were detected. In addition, N addition significantly decreased microbial biomass C (MBC) and N, and thus microbial quotient, but increased dissolved organic C and microbial metabolic quotient due to the significant decrease of MBC. Our results suggest that in the mid-term the addition of N, but not P, can change soil microbial properties, with a possible decline in soil quality of semi-arid, sandy grasslands.

【题目】Role of endogenous hormones, glumes, endosperm and temperature on germination of Leymus chinensis (Poaceae) seeds during development
【中文关键词】无
【英文关键词】endogenous hormones;temperature;Leymus chinensis;anthesis;seed;germination
【中文摘要】无
【英文摘要】Leymus chinensis is an original dominant plant in the Songnen grassland, and it has great value for restoration of severely degraded land. However, seeds are dormant, and low germination percentage is a problem for restoring L.chinensis grassland. The mechanism of seed dormancy is not been well understood. The primary aims of the present study were to investigate the dormancy mechanism of L.chinensis seeds (caryopses) with reference to the role of embryo-covering layers, endogenous hormones and temperature. Changes in concentration of the endogenous hormones GA3, indoleacetic acid (IAA), zeatin riboside (ZR) and abscisic acid (ABA) in L.chinensis seeds from anthesis to maturity were measured by the enzyme-linked immunosorbent assay method. Germination at different stages of maturity were tested at 16/28 ° C, 5/28 ° C and 5/35 ° C for intact seeds with glumes (control), intact seeds with glumes removed (naked-whole seeds) and intact seeds with glumes and one-half of the endosperm removed (naked-half seeds).Important FindingsOf the four endogenous hormones monitored, only the concentration of ZR differed significantly between the beginning and the end of seed development (increased); the GA3/ABA ratio also did not differ. Rank of germination percentage of control at the three temperature regimens was 5/28 ° C > 16/28 ° C > 5/35 ° C. Germination percentage of the naked-half seeds reached 1% under the three temperature regimens. We concluded that dormancy of L.chinensis seeds is not mainly controlled by endogenous hormones. Germination temperature, mechanical resistance of glumes and inhibition of endosperm are the main factors controlling dormancy and germination of L.chinensis seeds.

【题目】Distribution of biomass and diversity of Stipa Bungeana community to climate factors in the Loess Plateau of Northwestern China
【中文关键词】无
【英文关键词】Stipa bungeana community;biomass model;species diversity;climatic factor;Loess Plateau
【中文摘要】无
【英文摘要】Based on 28 year field data of Stipa bungeana community in arid, semi-arid, semi-humid areas of the Loess Plateau of Northwestern China, we studied species diversity and above ground biomass of S. bungeana community, analyzed the responses of above ground biomass to climate in different areas, and built a model of relationship between biomass and climatic factors. Results showed that there were significant differences for species diversity and above ground biomass among different sampling area. The species diversity range of S. bungeana was from 8.5 - 30.8 (ind/m(2)), and above ground biomass range was from 407.3 - 817.3 (g/m(2)) among studied area. The optimal distribution altitude range for S. bungeana is 1400 - 2000 m in arid area, 1200 - 1900 m in semi-arid area, and 600 - 1600 m in semi-humid area. Results also showed that the growth of S. bungeana was affected by different climatic factors, with rainfall as the major factor. Meanwhile, there was a close relationship between monthly biomass and rainfall during the growth stage. The models of monthly biomass and climate were built to compare the results and reveal the relationship between climatic factors and the growth of S. bungeana community.

【题目】Climate warming and biomass accumulation of terrestrial plants: a meta-analysis
【中文关键词】无
【英文关键词】latitude;plant functional types;plant growth;precipitation;temperature
【中文摘要】无
【英文摘要】Growth of terrestrial plant species and functional types (PFTs) in response to climate warming determines future dynamics of terrestrial vegetation. • Here, a meta-analysis was conducted with data collected from 127 publications to reveal general patterns of biomass responses of terrestrial plants to warming. • Warming significantly increased biomass by 12.3% (with a 95% confidence interval of 8.4-16.3%) across all the terrestrial plants included. However, biomass responses were dependent upon PFTs, with significantly greater stimulation of woody (+26.7%) than herbaceous species (+5.2%). Warming effects on biomass showed quadratic relationships with both latitude and mean annual temperature, but did not change with mean annual precipitation or experimental duration. In addition, the other treatments, including CO(2) enrichment, nitrogen addition, drought and water addition, did not alter warming responses of plant biomass. • Dependence of the terrestrial plant biomass responses to warming upon PFTs, geographic and climatic factors as well as warming magnitudes will have consequent influences on community composition and structure, vegetation dynamics, biodiversity and ecosystem functioning in a warmer world. Our findings of functional type-specific responses of terrestrial plants are critical for improving predictions of climate-terrestrial carbon feedbacks.

【题目】Interannual variability of soil microbial biomass and respiration in responses to topography, annual burning and N addition in a semiarid temperate steppe
【中文关键词】无
【英文关键词】Carbon; Fire; Hillslope; Microorganisms; Nitrogen; Precipitation
【中文摘要】无
【英文摘要】Soil microorganisms are sensitive to changes in environmental factors and play critical roles in the responses of terrestrial ecosystems to natural or anthropogenic perturbations. This study was conducted to examine interannualvariability of soilmicrobialbiomass and respiration in response to topography, annualburning and Naddition in asemiaridtemperatesteppe in northern China. Averaged across the 3 years from 2005 to 2007, soilmicrobialbiomass carbon (MBC), nitrogen (MBN) and respiration (MR) were 31.6, 36.7, and 16.2% greater in the lower than upper slope, respectively. The topographic difference was larger in the drier year, leading to stronger temporal variability of MBC, MBN, and MR in the upper than lower slope. Annualburning stimulated MBC and MBN, on average, by 23.3 and 14.4%, but it suppressed MR. Both the positive responses of soilmicrobialbiomass and the negative responses of MR to burning declined over time. Nitrogen addition reduced MBC and MBN by 17.1 and 8.3% respectively, and the negative effects increased with year. Naddition also amplified temporal variability of MBC, MBN and MR. Across the 48 plots, soilmicrobialbiomass and respiration showed positive dependence upon soil moisture and dissolved organic carbon (C). In addition, coefficient variations (CVs) of microbialbiomass and respiration were also positively correlated with CVs of soil moisture and aboveground biomass (AGB), suggesting water and plant regulation on the interannualvariability of soil microorganisms in response to environmental disturbances in the semiaridtemperatesteppe. Amplified temporal variability of soil microorganisms under drought, fire and Naddition indicates reduced stability of soilmicrobial community with consequent influences on ecosystem function under environmental change.

【题目】Nitrogen effects on net ecosystem carbon exchange in a temperate steppe
【中文关键词】无
【英文关键词】biofuel feedstock production; carbon sequestration; clipping; grassland; interannual variability; land use; net ecosystem carbon exchange; nitrogen; phosphorus; photosynthesis; plant cover
【中文摘要】无
【英文摘要】It has widely been documented that nitrogen (N) enrichment stimulates plant growth and net primary production. However, there is still dispute on how N addition affects net ecosystem CO2 exchange (NEE), which represents the balance between ecosystem carbon (C) uptake and release. We conducted an experimental study to examine effects of N addition on NEE in a temperate steppe in northern China from 2005 to 2008. N was added at a rate of 10 g N m − 2 yr − 1 with NH4NO3 alone or in combination with phosphorous (P, 5 g P2O5 m − 2 yr − 1) in both clipped and unclipped plots. Over the 4 years, N addition significantly stimulated growing-season NEE, on average, by 27%. Neither the main effects of P addition or clipping nor their interactions with N addition were statistically significant on NEE in any of the 4 years. However, the magnitude of N stimulation on NEE declined over time. N addition significantly increased NEE by 60% in 2005 and 21% in 2006, but its effect was not significant in 2007 and 2008. N-induced shift in species composition was primarily responsible for the declined N stimulation over time. The gradually increasing coverage of the upper canopy species (Stipa krylovii) and standing litter accumulation induced light limitation on the lower canopy species (Artemisia frigida). Thus, N-induced shifts in plant species composition strongly regulated the direct effects of N addition on C sequestration in the temperate steppe.

【题目】Water-use efficiency in response to climate change: from leaf to ecosystem in a temperate steppe
【中文关键词】无
【英文关键词】climate warming; evapotranspiration; grassland; gross ecosystem productivity; net ecosystem carbon exchange; photosynthesis; precipitation regimes; species composition; water-use efficiency
【中文摘要】无
【英文摘要】Water-use efficiency (WUE) has been recognized as an important characteristic of ecosystem productivity, which links carbon (C) and water cycling. However, little is known about how WUE responds to climate change at different scales. Here, we investigated WUE at leaf, canopy, and ecosystem levels under increased precipitation and warming from 2005 to 2008 in a temperate steppe in Northern China. We measured gross ecosystem productivity (GEP), net ecosystem CO2 exchange (NEE), evapotranspiration (ET), evaporation (E), canopy transpiration (Tc), as well as leaf photosynthesis (Pmax) and transpiration (Tl) of a dominant species to calculate canopy WUE (WUEc=GEP/T), ecosystem WUE (WUEgep=GEP/ET or WUEnee=NEE/ET) and leaf WUE (WUEl=Pmax/Tl). The results showed that increased precipitation stimulated WUEc, WUEgep and WUEnee by 17.1%, 10.2% and 12.6%, respectively, but decreased WUEl by 27.4%. Climate warming reduced canopy and ecosystem WUE over the 4 years but did not affect leaf level WUE. Across the 4 years and the measured plots, canopy and ecosystem WUE linearly increased, but leaf level WUE of the dominant species linearly decreased with increasing precipitation. The differential responses of canopy/ecosystem WUE and leaf WUE to climate change suggest that caution should be taken when upscaling WUE from leaf to larger scales. Our findings will also facilitate mechanistic understanding of the C – water relationships across different organism levels and in projecting the effects of climate warming and shifting precipitation regimes on productivity in arid and semiarid ecosystems.

【题目】Contrasting effects of clipping and nutrient addition on reproductive traits of Heteropappus altaicus at the individual and population levels
【中文关键词】无
【英文关键词】Clipping;Heteropappus altaicus;Inflorescence;Nitrogen ;Phosphorus;Pollen;Population;Temperate steppe
【中文摘要】无
【英文摘要】This study was conducted to examine the effects of clipping and nutrient addition on plant traits of a dominant perennial forb species, Heteropappus altaicus (Willd.) Novopokr. (Compositae), at both the individual and population levels in a temperate steppe in northern China. A nested experimental design was used with clipping as the main factor and nutrient, including nitrogen (N), phosphorus (P) and both, addition as the second factor. The main effect of clipping reduced plant height, aboveground biomass (AGB) per plant, and pollen production per floret by 15.8, 34.3, 28.0% (all $p < 0.05$), respectively, but enhanced reproductive allocation and population density by 8 and 28.2% (both $p < 0.05$), respectively, suggesting contrary effects of clipping on H. altaicus traits at the individual and population levels. N addition significantly stimulated plant height, AGB per plant, reproductive allocation, pollen diameter, and pistil length, but decreased population density. The main effects of P addition also stimulated the plant traits at individual level, but did not change population traits. The significant interactions of clipping and nitrogen addition were observed on AGB per plant, pollen production, and population density. The differential responses of H. altaicus at the individual and population

levels to clipping and nutrient addition indicate that the future dynamics of H. altaicus in the temperate steppe are uncertain and need long-term research to demonstrate.

【题目】The Influence of Historical Land Use and Water Availability on Grassland Restoration
【中文关键词】无
【英文关键词】community structure; diversity stability; historical land use; old field; steppe; water addition
【中文摘要】无
【英文摘要】The ecological role of historical land use has rarely been explored in the context of grassland restoration. We conducted a 4-year field experiment in a steppe and an old field in Inner Mongolia in northern China to examine the influence of historical land use and water availability on ecosystem restoration. Species richness, evenness, and plant cover were higher in the steppe than in the old field. The steppe was more temporally stable compared with the old field in terms of species richness, evenness, plant density, and cover. Water addition increased peak aboveground biomass, belowground net primary productivity, species richness, plant density, and cover in both the steppe and the old field. Water addition also enhanced the stability of ecosystems and the restoration of grassland. Our findings suggested that historical land use determines community structure and influences the process of grassland restoration. Converting grasslands to farmland in semiarid areas can cause the long-term loss of biodiversity and instability of ecosystem with consequent impacts on ecosystem services. The amendment of limited resources is an effective practice to increase the success of ecosystem restoration.

【题目】Plant responses following grazing removal at different stocking rates in an Inner Mongolia grassland ecosystem
【中文关键词】无
【英文关键词】Grazing removal;Ecosystem stability;Compensatory effect;Precipitation variation;Grassland management;Grassland restoration
【中文摘要】无
【英文摘要】Grazing removal is widely used in grassland management. Plant responses following grazing removal at different organizational levels, however, are not well understood. We examined plant responses at different stocking rates in an Inner Mongolia grassland ecosystem dominated by Leymus chinensis and Stipa grandis. Our results indicated that plant response patterns differed significantly among stocking rates, at different levels of organization, and between wet and dry years. Community aboveground net primary production (ANPP) recovered more quickly at low and moderate stocking rates than those at high stocking rates. Response of aboveground net primary production (RANPP) was significantly positively correlated with both individual biomass and density responses of L. chinensis. Overcompensation of L. chinensis after grazing removal contributed greatly to positive RANPP at the community level. Significant compensatory effects were found between the two dominant species and between dominant species and the remaining non-dominant species. Variation in precipitation significantly affected community ANPP, relationships between community and species responses, and compensatory effects between species. Our study suggests that periodic grazing removal is likely to be a useful method for grassland management and that a combination of species with compensatory effects can be advantageous for

reseeding practices in grassland restoration.

【题目】Spatial variability and distribution of soil nutrients in a catchment of the Loess Plateau in China
【中文关键词】无
【英文关键词】ArcGIS, ammonium nitrogen, nitrate nitrogen, organic matter, total nitrogen, total phosphorus
【中文摘要】无
【英文摘要】Inappropriate land use is one of the main reasons for soil erosion and nutrient loss in the hilly loess area of the Liudaogou catchment of the Loess Plateau, a typical topography area of hills and gullies. Good management practices, such as the nutrient variability for the different land uses (woodland, grassland, shrub land, farmland, and gully), would help the farmers. One study of the use of Geographic Information System (GIS) spatial analysis and geostatistic analysis was carried out in the catchment. The results showed that the trend of the content of clay and silt in the different soil ranks was: farmland < grassland < shrub land < gully soil. The sandy soil contained fewer nutrients than did the other soils. The farmland contains fewer total phosphorus (TP) and . The spatial dependence of the total nitrogen (TN) and the organic matter (OM) in the sandy soil is strong, but is only moderate in the other types of land use except for OM in farmland. The spatial dependence of TP in the different types of land use patterns is strong too, except in woodland, and the dependence of TP is moderate in grassland. The spatial dependence of and is not strong, especially in woodland, shrub land, and farmland. The dependence of is weak in grassland, gully, and farmland. In the catchment scale, the degree of spatial dependence (GD) is moderate for soil nutrients especially for TN and , but the different nutrients were modelled in different stationary models. The spatial variability of OM, TP, and was modelled by a Gaussian model, and the spatial variability of TN and was modelled by an exponential equation. The nutrients distribution in the catchment has been mapped by GIS. From the results, it was seen that annual grass played an important role in the conservation and improvement of soil quality in the Loess Plateau. In addition, the farmland should be given more fertilizer.

【题目】Estimating soil organic carbon storage and distribution in a catchment of Loess Plateau, China
【中文关键词】无
【英文关键词】Soil organic carbon density;Soil organic carbon storage;Soil organic carbon distribution;The Loess Plateau
【中文摘要】无
【英文摘要】Using soil as a carbon sink to sequester carbon dioxide has attracted much attention. But there is little research on soil organic carbon (SOC) in the Loess Plateau because of the extremely complex topography. In this study, SOC storage was estimated based on a soil survey of a small catchment in the Loess Plateau, northwest China. The SOC content of 169 profiles and the bulk density of 12 profiles were measured. The study area was classified into six different classes: farmland, grassland, shrub land, woodland, gully, Aeolian sandy soil. Results showed that the soil bulk density and SOC content are affected by land use and soil types, and the relationship between them could be expressed by a power function. Grassland had the highest SOC density, and next came farmland. Gully and Aeolian sandy soil had the lowest SOC density. The SOC content per area in the grassland and farmland was higher than the other classes and the shrub land was similar to the woodland while the Aeolian sandy soil and gully were the lowest. All of the changes in

the cumulative SOC storage with the increasing depth follows a logarithmic model. The SOC storage in the catchment of farmland, grassland, shrub land, woodland, gully, and Aeolian sandy soil was estimated as 3.32 × 106 kg, 9.45 × 106 kg, 1.023 × 107 kg, 2.73 × 106 kg, 5.76 × 106 kg, and 2.94 × 106 kg, respectively. The total SOC storage of 100 cm depth in the catchment is 3.443 × 107 kg.

【题目】Community structure and composition in response to climate change in a temperate steppe
【中文关键词】无
【英文关键词】diversity; grassland; plant functional group; temperature; water availability
【中文摘要】无
【英文摘要】Climate change would have profound influences on community structure and composition, and subsequently has impacts on ecosystem functioning and feedback to climate change. A field experiment with increased temperature and precipitation was conducted to examine effects of experimental warming, increased precipitation and their interactions on community structure and composition in a temperate steppe in northern China since April 2005. Increased precipitation significantly stimulated species richness and coverage of plant community. In contrast, experimental warming markedly reduced species richness of grasses and community coverage. Species richness was positively dependent upon soil moisture (SM) across all treatments and years. Redundancy analysis (RDA) illustrated that SM dominated the response of community composition to climate change at the individual level, suggesting indirect effects of climate change on plant community composition via altering water availability. In addition, species interaction also mediated the responses of functional group coverage to increased precipitation and temperature. Our observations revealed that both abiotic (soil water availability) and biotic (interspecific interactions) factors play important roles in regulating plant community structure and composition in response to climate change in the semiarid steppe. Therefore these factors should be incorporated in model predicting terrestrial vegetation dynamics under climate change.

【题目】Estimating total net primary productivity of managed grasslands by a state-space modeling approach in a small catchment on the Loess Plateau, China
【中文关键词】无
【英文关键词】Totalnetprimaryproductivity; Spatial heterogeneity; State-space models; Classical statistics; Vegetation restoration
【中文摘要】无
【英文摘要】Managedgrasslands are important for stabilizing soil and reducing soil erosion on sloping lands. In order to obtain information for better grassland management and soil protection at small scales, managedgrasslandtotalnetprimaryproductivity (TNPP) data were collected and analyzed with a first order state-spaceapproach and a classical linear regression approach. The objective was to determine the effects of soil properties and site elevation on managedgrassland TNPP. Soil water content (SWC), soil bulk density (BD), saturated soil hydraulic conductivity (Ks), soil temperature (T), soil clay content (CC), soil organic carbon (SOC), soil NO_3^-–N, soil NH_4^+–N, soil Olsen phosphorus concentration (OP) and site elevation (SE) data were collected along a 300-m transect in the ChinaLoessPlateau. Soil properties and site elevation were evaluated in bi- and multivariate autoregressive state-space analysis to clarify the key factors affecting the spatial distribution of TNPP. Results show that most of the measured variables contributed to the

variation of TNPP. CC and OP were especially helpful in describing the spatial pattern of TNPP. The state-spacemodeling results were compared with classical statistics methodologies, indicating that the state-spaceapproach described the spatial pattern of TNPP much better than the equivalent classical regression methods. All of the TNPP variation was represented by state-space models that included soil NO3 − N and OP or soil CC and OP. Only 76% of the variance of the TNPP was represented by classical statistics analysis because the classical statistics did not include sampling position and assumed sample independence. State-space models are recommended for studying spatial relations between vegetation and soil variables in natural soil-plant systems on the ChinaLoessPlateau.

【题目】Impact of litter quality and soil nutrient availability on leaf decomposition rate in a semi-arid grassland of Northeast China

【中文关键词】无

【英文关键词】Keerqin Sandy Lands; Litterdecomposition; Nutrient enrichment; Species identity

【中文摘要】无

【英文摘要】It was hypothesized that litter with higher N concentration would decompose faster than that with lower N concentration and that increased soilnutrientavailability would stimulate litterdecomposition. To examine the interspecific differences in decompositionrate of leaflitter in relation with differences in litter chemistry and soilnutrientavailability, senescent leaves of four species Pennisetum flaccidum, Artemisia scoparia, Chenopodium acuminatum and Cannabis sativa, and soil samples with different fertilization treatments (no fertilization, N, P, and N + P fertilizations, respectively) were collected from a sandy grassland in NortheastChina and incubated under laboratory conditions. The decompositionrate of leaflitter was determined by measuring the CO2 emission during decomposition of litter. We found remarkable interspecific differences in leafdecompositionrates. Moreover, rates of litterdecomposition at different incubation stages were correlated with different litterquality indices. The rate of litterdecomposition was positively correlated with initial litter N concentration in the initial stage of the incubation, whereas it was negatively correlated with litter N and P concentrations in the late stage. Responses of litterdecomposition to soilnutrientavailability differed among species. Our results suggest that both indirect changes in litterquality through shifts of species composition/dominance and direct changes in soilnutrientavailability under nutrient addition conditions could affect litterdecomposition and consequently C and nutrient cycling of grassland ecosystems.

【题目】Foliar N/P ratio and nutrient limitation to vegetation growth on Keerqin sandy grassland of North-east China

【中文关键词】无

【英文关键词】biomass partitioning; Keerqin sandy lands; luxury consumption; N/P stoichiometry; nitrogen limitation

【中文摘要】无

【英文摘要】To examine whether the critical leaf N/P ratios (of 14, 16) are valid to test nutrient limitation in the context of semi-arid sandy grasslands, an experiment was conducted on a Keerqin sandy grassland in North-east China to investigate the responses of plant biomass and nutrient concentrations to fertilization. Plant biomass production and leaf nutrient concentrations were measured after five consecutive years of fertilization with N (20 g N m − 2 year − 1) and/or P (10 g P2O5 m − 2 year − 1). Nitrogen fertilization increased the shoot biomass by twofold and consequently the shoot/root ratio, whereas P fertilization had little effect on either shoot biomass or

shoot/root ratio. Leaf N/P ratio varied among species with an average of 5 · 6 in the control, while the mean leaf N/P ratio (7 · 5) under the N fertilization treatment remained below the threshold of 14. Our results suggest that the critical N/P ratio (14, 16) is not applicable as a test for nutrient limitations in the context of semi-arid, sandy grassland.

【题目】Important foliar traits depend on species-grouping: analysis of a remnant temperate forest at the Keerqin Sandy Lands, China
【中文关键词】无
【英文关键词】Diminishing return; Leaf N/P ratio; Sandy forest ecosystem; Semi-arid region; Species functional group; Specific leaf area
【中文摘要】无
【英文摘要】Foliar traits are often interpreted to reflect strategies for coping with water and nutrient supply limitations. In this study, we measured several important leaf traits for 147 species sampled from a remnant, temperate deciduous broad-leaved forest in Keerqin Sandy Lands, Northeast China to test whether these traits are invariant or dependent on water supply limitations. Our data show that average specific leaf area (SLA), nitrogen (N) and phosphorus (P) concentrations, leaf C/N, C/P and N/P were 273 cm2/ g, 18.1 mg /g, 1.60 mg/ g, 28.2, 343 and 12.4, respectively. However, most of these traits were significantly different (P < 0.05) for different species groupings based on growth forms, phylogenetic history, photosynthetic pathways, or habitats. SLA was positively correlated with leaf P concentration across the broad spectrum of 118 species and most species functional groupings. However, SLA was not correlated with N concentration across all species or within each species functional group. SLA and N and P concentrations in dry habitats were lower than those in wet habitats, whereas leaf C/N, C/P, and N/P had the opposite trend both across all species and within major species functional groupings (herb, monocots and C3 species). Our data indicate that SLA vs. leaf N and SLA vs. P relationships may be regulated differentially for different species functional groupings and that water limitation may have a greater influence than nutrient limitation for plant growth.

【题目】Plant community responses to nitrogen addition and increased precipitation: the importance of water availability and species traits
【中文关键词】无
【英文关键词】community composition; community structure;nitrogen enrichment; plant functional group; plant traits; precipitation; species richness; temperate steppe; water availability
【中文摘要】无
【英文摘要】Global nitrogen (N) enrichment and changing precipitation regimes are likely to alter plant community structure and composition, with consequent influences on biodiversity and ecosystem functioning. Responses of plant community structure and composition to N addition and increased precipitation were examined in a temperate steppe in northern China. Increased precipitation and N addition stimulated and suppressed community species richness, respectively, across 6 years (2005 – 2010) of the manipulative experiment. N addition and increased precipitation significantly altered plant community structure and composition at functional groups levels. The significant relationship between species richness and soil moisture (SM) suggests that plant community structure is

mediated by water under changing environmental conditions. In addition, plant height played an important role in affecting the responses of plant communities to N addition, and the effects of increased precipitation on plant community were dependent on species rooting depth. Our results highlight the importance and complexity of both abiotic (SM) and biotic factors (species traits) in structuring plant community under changing environmental scenarios. These findings indicate that knowledge of species traits can contribute to mechanistic understanding and projection of vegetation dynamics in response to future environmental change.

【题目】Fractions and bioavailability of soil inorganic phosphorus in the Loess Plateau of China under different vegetations
【中文关键词】无
【英文关键词】bioavailability;fraction;inorganic phosphorus;vegetation;soil development;Loess Plateau
【中文摘要】无
【英文摘要】Plants play an important role in soil phosphorus nutrition. However, the effect of plants on phosphorus nutrition in soils of the Loess Plateau of China is not well understood. This study was conducted to reveal the relationships between plants and phosphorus' fractions and availability in the Loess Plateau of China. Twenty-two plant communities were surveyed and soil samples under different plant canopies were collected for the determination of soil properties and inorganic phosphorus fractionation. The results showed that Leguminosae and Lilaceae reduced pH and increased organic matter, cation exchange capacity, total and Olsen phosphorus in soils under their canopies, while Labiatae and Rosaceae increased pH and decreased organic matter, cation exchange capacity, total and Olsen phosphorus in soils under their canopies. The contents of Ca2P, Ca8P, Al-P and Fe-P were highly related with soil Olsen phosphorus. They were all higher in soils under Leguminosae and Lilaceae and lower in soils under Labiatae and Rosaceae. The results of this study indicate that Leguminosae and Lilaceae improved phosphorus nutrition in soils, yet Labiatae and Rosaceae impeded the improvement of phosphorus nutrition in soils under their canopies, which will be of more help to instruct vegetation restoration in the region and provide information for soil development.

【题目】Biological role of MicroRNA-103 based on expression profile and target genes analysis in pigs
【中文关键词】无
【英文关键词】miR-103; Tissue expression profile; GO term enrichment; Preadipocyte differentiation; Pig
【中文摘要】无
【英文摘要】MicroRNAs (miRNAs) are endogenously expressed RNAs consisting of 20-24 nucleotides. These molecules are thought to repress protein translation by binding to target mRNAs. However, biological functions have not been assigned to most of the 175 porcine miRNAs registered in miRBase (release 15.0). In an effort to uncover miR-103 important in pigs, we examined the integrative tissue expression profile and gene ontology (GO) term enrichment of predicted target genes to determine the global biological functions of miR-103. Our results demonstrated that miR-103 is involved in various biological processes including brain development, lipid metabolism, adipocyte differentiation, hematopoiesis, and immunity. Moreover, we also experimentally verified effects of miR-103 in porcine preadipocytes. miR-103 levels increased in differentiating adipocytes, and inhibition of miR-103 effectively inhibited preadipocyte differentiation. In addition, mRNA levels of the putative miR-103 target RAI14 were higher in miR-

103 inhibitor-treated adipocytes. These results demonstrate that miR-103 is involved in porcine preadipocyte differentiation and may act through the putative target gene RAI14. In a word, our data provide new insights into the global biological role of miR-103.

【题目】MicroRNA identity and abundance in developing swine adipose tissue as determined by Solexa sequencing
【中文关键词】无
【英文关键词】microRNA; ADIPOSE TISSUE; EXPRESSION PROFILES; SOLEXA SEQUENCING; SUS SCROFA
【中文摘要】无
【英文摘要】MicroRNAs (miRNAs) are small similar to 22-nt regulatory RNAs that regulate the stability and translation of cognate mRNAs. MiRNAs participate in the regulation of adipogenesis, and identification of the full repertoire of miRNAs expressed in adipose tissue is likely to significantly increase our understanding of adipose tissue growth and development. Here, we adopted a deep sequencing approach to determine the identity and abundance of miRNAs in developing swine adipose tissue. Via this approach, we identified the sequences and relative expression levels of 227 conserved miRNAs (of which 59 were novel) and 66 potential porcine miRNAs. The expression levels displayed a large range, as reflected by the number of sequence reads, which varied from several counts for rare miRNAs to several million reads for the most abundant miRNAs. The abundant miRNAs principally belonged to 32 miRNA gene families, including miR-143, miR-103, let-7, and miR-148. Of the conserved miRNAs, 93 miRNAs were up-regulated and 33 miRNAs were down-regulated in the adult pig adipose tissue. Moreover, we observed sequence variants and seed edits of the miRNAs. KEGG pathway analysis and GO term enrichment suggested that highly expressed miRNAs are involved in adipose tissue development, signal transduction, cell-cell and cell-extracellular matrix communication, neural development and function, and lipid metabolism including carboxylic acid, oxoacid, fatty acid, steroid, glycerolipid, alcohol and phospholipid metabolism. Our results expand the number of known porcine miRNAs and provide a thorough account of the miRNA transcriptome in porcine adipose tissue.

【英文关键词】Porcine myoblasts; Wnt/beta-catenin pathway; Differentiation; Lithium chloride
【中文摘要】无
【英文摘要】The Wnt/beta-catenin signaling pathway regulates cell proliferation and differentiation to determine cell fate during embryogenesis. Lithium chloride (LiCl) is known to activate canonical Wnt signaling by inhibiting glycogen synthetase kinase-3 beta and consequently stabilizing free cytosolic beta-catenin. To understand the role of the Wnt/beta-catenin pathway in the regulation of porcine myoblast differentiation, we studied the effects of LiCl on cultured porcine myoblasts and beta-catenin expression. A supplementation of 25 mM LiCl induced myoblast differentiation into myotubes over 3 days of culture. By semi-quantitative RT-PCR analyses, levels of mRNA encoding MyoD, Myogenin, Myf5 and several Wnt-responsive genes in the cultured myoblast cells were significantly increased after LiCl treatment. Using Western blotting and immunofluorescence analysis, we found that the protein levels of beta-catenin were consistently increased by LiCl. Meanwhile, phosphorylated GSK-3 beta at Ser9 levels were also increased as an indicator of GSK-3 beta inactivation. Additionally, the nuclear staining of endogenous beta-catenin was also significantly increased in

porcine myoblasts 48 h after LiCl treatment. These results provided additional evidence that Wnt/beta-catenin is a significant pathway that regulates myogenic differentiation. An enhanced level of beta-catenin plays a positive role in porcine myoblast differentiation.

【题目】Molecular Cloning, Expression and Subcellular Distribution of an Alternative Splice Variant of the Porcine Sirt2 Gene
【中文关键词】无
【英文关键词】Sirt2(T); Splice variant; Porcine; Expression; Subcellular distribution
【中文摘要】无
【英文摘要】Sirt2, a NAD(+)-dependent histone deacetylase, plays a critical role in regulating lifespan, metabolism, mitosis and adipocyte differentiation. Here two bands of the porcine Sirt2 protein were found by western blotting, so we speculated existence of Sirt2 isoforms. Next, we cloned the porcine Sirt2 gene, and also found its alternative splice variant and named the novel splicing variant Sirt2(T). The complete cDNA sequence of Sirt2(T) is 1059 bp, encoding a deduced protein of 352 amino acids which is 39 amino acids shorter at the N-terminus than Sirt2. RT-PCR revealed that the Sirt2(T) mRNA is extensively expressed in porcine tissues, and can be expressed during adipocyte differentiation. In addition, immunofluorescence and transfection demonstrated that Sirt2(T) is located in the cytoplasm and nucleus.

【题目】Regulation of ATGL Expression Mediated by Leptin in vitro in Porcine Adipocyte Lipolysis
【中文关键词】无
【英文关键词】ATGL expression; Regulation; Leptin
【中文摘要】无
【英文摘要】Adipose triglyceride lipase (ATGL), as an adipose-enriched protein, is able to hydrolyze triglycerides and plays an important part in triglyceride lipolysis of fat tissue. Leptin, an adipocyte cytokine, can increase the fat decomposition process. Many phenomena indicate that ATGL has a close relationship with leptin's promoting the hydrolysis of triglycerides. However, the regulatory mechanism of ATGL in leptin's promoting fat hydrolysis has not been directly and systematically studied yet. This study demonstrated that ATGL was expressed in vitro by leptin regulation. The amount of ATGL mRNA increased and the amount of ATGL protein decreased based on a dose-dependent manner when leptin concentrations ranged from 5 to 50 ng/ml were used to treat fully differentiated porcine adipocytes for 3 h. In addition, this study revealed that JAK-STAT and MAPK signaling pathways, as well as PPAR gamma all played important roles in the ATGL expression mediated by leptin.

【题目】Mitochondrial development and the influence of its dysfunction during rat adipocyte differentiation.
【中文关键词】无
【英文关键词】Mitochondrial development; Primary adipocyte; Differentiation; Mitochondrial dysfunction; PGC-1 beta
【中文摘要】无
【英文摘要】Mitochondrial biogenesis is inherent to adipocyte differentiation. Mitochondrial dysfunction leads to abnormal lipid accumulation or the deterioration of the differentiation process. The aim of this study is to investigate the mitochondrial development during the differentiation of rat primary adipocytes and the effect of mitochondrial dysfunction on this process. We found, for the first time, that the number of mitochondria markedly increased during adipocyte differentiation by transmission electron microscopy. By immunofluorescence staining that the protein content of Cyt c increased in differentiated adipocyte in comparison with preadipocyte. The mRNA expression levels of mitochondrial gene including cytochromes c (Cyt c), malate dehydrogenases (MDH), and peroxisome proliferator activated receptor (PPAR) gamma coactivator-1 beta (PGC-1 beta) significantly increased along with the proceeding of adipocyte differentiation. The damage to mitochondrial respiratory chain function by rotenone caused significant decrease in gene expressions including mitochondrial MDH and PGC-1 beta, and PPAR gamma, CAAT/enhancer binding protein alpha (C/EBP alpha) and sterol regulatory element binding protein-1c (SREBP-1c), which are known as transcription factors of differentiation, and differentiation marker gene named fatty acid synthetase. Moreover, an apparent decrease was found in the synthesis of triglyceride and ATP due to the damage to mitochondria by rotenone. Based on the above results, our present study revealed that the density and oxidative capacity of mitochondrial markedly increased during primary adipocyte differentiation, and on the other hand, we suggested that mitochondria dysfunction might inhibit the differentiation process.

【题目】Tissue Expression of Porcine FoxO1 and Its Negative Regulation during Primary Preadipocyte Differentiation
【中文关键词】无
【英文关键词】FoxO1; Tissue expression; Regulation; Porcine preadipocyte; Differentiation; IGF-I
【中文摘要】无
【英文摘要】The Forkhead transcription factor O 1 (FoxO1) gene plays an important role in the integration of hormone-activated signaling pathways with the complex transcriptional cascade that promotes clonal cell line differentiation. However, tissue expression of porcine FoxO1 and its function during porcine preadipocyte differentiation remained poorly understood. In the present study, we investigated tissue expressions of FoxO1 in pig by real time quantitative RT-PCR (qRT-PCR) and western blotting, and explored its role in porcine preadipocytes differentiation by RNA interference technique and qRT-PCR. FoxO1 gene expressions were highly in subcutaneous adipose and visceral adipose tissues, and higher in piglets than those in adults ($P < 0.05$). We showed that expression of endogenous FoxO1 in preadipocytes transfected with pBS/U6-siFoxO1-1748 expression vector was inhibited efficiently. After reducing expression of FoxO1, glycerol-3phosphate dehydrogenase (GPDH) activity and triglyceride (TG) content increased from day 1 to 9, and the time-course expressions of several key adipogenic genes mRNA, including peroxisome proliferator-activated receptor c on day 3, 5, and 7, adipocyte fatty acid binding protein on day 1, 3, and 5, and sirtuin1 on day 1, 3, and 5, were increased significantly ($P < 0.05$). Lipoprotein lipase was unrelevant to FoxO1. By using insulin-like growth factor-I treating, expression of FoxO1 reduced at day 3 and 5 ($P < 0.05$), and significant differentiation of porcine preadipocyte with increasing number of filled-lipid cell and size of lipid droplets, GPDH activity and TG content were promoted. These results suggested that porcine FoxO1 gene took part in the regulation of adipose and was a negative transcription regulation factor in preadipocyte differentiation.

【题目】Interleukin-6 Stimulates Lipolysis in Porcine Adipocytes
【中文关键词】无
【英文关键词】Interleukin-6; Lipolysis; Porcine adipocytes; ERK; Perilipin A; PGC-1 alpha
【中文摘要】无
【英文摘要】Interleukin (IL)-6 stimulates lipolysis in human and rodents adipocytes. However, the mechanism regulating this process is little known. In this study, we demonstrated that IL-6 increased lipolysis in differentiated porcine adipocytes by activation of extracellular signal-related kinase (ERK), which was inhibited by specific ERK inhibitor PD98059. IL-6 treatment did not elevate intracellular cAMP and specific PKA inhibitor H89 did not affect IL-6-induced lipolysis, which suggested that protein kinase A (PKA) pathway was not involved in IL-6-induced lipolysis. Also, the expressions of perilipin A and PPAR gamma 2 were significantly reduced in response to IL-6 treatment, but the expressions of peroxisome proliferators-activated receptor gamma coactivator-1 alpha (PGC-1 alpha), carnitinepalmitoyl-transferase-1 (CPT-1), and uncoupling protein 2 (UCP2) were significantly elevated. In conclusion, these results suggested that chronic high dose or IL-6 directly stimulated lipolysis in porcine adipocytes through activation of ERK, subsequently repressing perilipin A and promoting PGC-1 alpha expression.

【题目】Roles of Wnt/β-catenin signaling in adipogenic differentiation potential of adipose-derived mesenchymal stem cells
【中文关键词】无
【英文关键词】porcine AMSCs; Wnt/beta-catenin pathway; adipogenesis; differentiation
【中文摘要】无
【英文摘要】Wnt/beta-catenin signaling pathway controls differentiation of various cells by regulating the expression of target genes. beta-Catenin plays a central role in Wnt/beta-catenin signaling pathway. To investigate the molecular mechanisms of fate determination in adipose-derived mesenchymal stem cells (AMSCs), we investigated effects of Wnt3a and beta-catenin, two key members of the Wnt/beta-catenin signaling, in adipogenic differentiation of porcine AMSCs. We demonstrated that Wnt3a protein can inhibit the adipogenic differentiation of porcine AMSCs in vitro culture. By stabilization of cytoplasmic beta-catenin with continuous treatment by LiCl, the adipogenic differentiation of AMSCs was also suppressed and the osteogenesis was stimulated. In contrast, a loss of beta-catenin in AMSCs enhanced the adipogenic differentiation and rescued LiCl-induced anti-adipogenesis. In addition, the mutual activation of CCAAT/enhancer-binding protein-alpha (C/EBP alpha) and peroxisome proliferator-activated receptor-gamma (PPAR gamma) were repressed in the presence of Wnt3a or LiCl, but increased in the gene silencing of beta-catenin. Taken together, our study indicated that Wnt/beta-catenin signaling pathway inhibited the adipogenic differentiation potential and alter the cell fate from adipocytes to osteoblasts. 【题目】Expression of TGH and its role in porcine primary adipocyte lipolysis
【中文关键词】无
【英文关键词】Triacylglycerol hydrolase (TGH); hormone-sensitive lipase (HSL); Isoproterenol; lipolysis; pig
【中文摘要】无
【英文摘要】Aims Triacylglycerol hydrolase (TGH) plays an important role in intracellular lipid metabolism. However, most previous studies on TGH were focused on rodent animals. Pig is considered as one of the best models for studying obesity, diabetes, and other lipid metabolism related diseases. So far, we do not know whether TGH is to play a role in lipolysis in porcine primary adipocyte through stimulation by hormones as Hormone-sensitive lipase (HSL). The objective of this study is to explore the mechanisms that regulate TGH expression in porcine adipocyte and its role in fasting-induced and Isoproterenol-stimulated lipolysis in porcine primary adipocytes. Materials and methods Stromal-vascular cells containing preadipocytes were isolated from cervical and dorsal subcutaneous adipose tissues of approximately 3-day-old Chinese male piglets. After confluence, the differentiation was induced by Insulin, hydrocortisone, and transferrin. The primary adipocytes were cultured in various concentration (0.1 to 200 mu mol/l) Isoproterenol for 0-12 h or serum-free medium after differentiation. The glycerol release and triacylglycerol (TG) contents were detected when the cells were collected. Then, expression of TGH and HSL mRNA and their protein were determined by RT-PCR, Western Blot, and lipolytic analysis. Results Both TGH mRNA and protein were not detected on day 0, but as differentiation was induced, their expression displayed a great increase. The expression of TGH mRNA showed the highest level on day 4, but its protein reached the highest level on day 6 and began to fall down from day 8. The expression of TGH mRNA and proteins was increased in serum-free media, and mRNA expression was decreased while changed into complete media again. The glycerol release increased significantly when the cells were cultured with serum-free media. The lower concentration of Isoproterenol (0.1 and 1 mu mol/l) did not affect the expression of TGH and HSL, but higher concentration (10, 100, and 200 mu mol/l) could greatly up-regulate HSL expression but did not affect TGH level. Also, the higher concentration of Isoproterenol could increase the glycerol release and decrease TG content in dose-dependent manner. Conclusions These results suggested that TGH expression is differentiation-dependent in porcine primary adipocytes and TGH plays a role in fasting-induced lipolysis not hormone-stimulated lipolysis.

【英文摘要】Indigenous chickens from various part ofChina, due to different feather characters,always performed differently when counteredwith cold stress. In this study, the effects oflong term hypothermia on serum hormones(triiodothyronine, thyroxine and insulin) andactivity of plasma enzymes (Alanine aminotransferase,aspartate aminotransferase,gamma-glutamyltransferase, creatine kinaseand lactic dehydrogenase) were studied intwo indigenous broiler breeds, Huainan partridge(H) and Wenchang (W) chickens.Chickens in 20 ° C±2 ° C were compared withthose subjected to moderate (15 ° C±2 ° C) andsevere low temperature (10 ° C±2 ° C) for oneweek. Long-term hypothermia elevated plasmainsulin and reduced T4 in W, deceleratedinsulin and increased

T4 in H, while T3 didnot change in the two breeds. Plasmaenzymes AST, LDH and CK decreased in thetwo breeds and ALT only decreased in Wexposed to cold stress. A significantlydecreased body weight gain of H and no variationsin W at low temperature were observed.However, a trend of decreased weight gain inW was observed when bred under low temperaturecondition. Follicle density and diameterwere compared in the two breeds with backdensity in H significantly higher than W anddiameter from back of H significantly smallerthan W, while much larger than the latter atlatero-abdominal part. We investigated thepattern of serum biological change, folliclediameter and density under cold stress conditionin two indigenous broiler breeds from differentareas of China to provide informativeguidance for broiler production and indicationsin breeding of cold resistant breed.

【题目】Bingchamides A and B, two novel cyclic pentapeptides from the Streptomyces bingchenggensis: fermentation,isolation, structure elucidation and biological properties

【中文关键词】无

【英文关键词】antitumor activity; bingchamides A and B; cyclic pentapeptides; Streptomyces bingchenggensis

【中文摘要】无

【英文摘要】Two novel cyclic pentapeptides, bingchamides A (1) and B (2), have been isolated from the organic extracts of the mycelium of Streptomyces bingchenggensis. The structures of 1 and 2 were elucidated on the basis of extensive 1D and 2D NMR, as well as HRESI-MS, electrospray ionization-MS, UV and IR spectroscopic data analysis. Bingchamides A (1) and B (2) exhibited in vitro cytotoxicity toward human colon carcinoma cell line HCT-116 with the IC50 values of 14.1 and 18.0 lgml 1, respectively. The bingchamides A (1) and B (2) scaffolds are probably promising structures for the development of new antitumor agents.

【题目】Role of nsdA in negative regulation of antibiotic production and morphological differentiation in Streptomyces bingchengensis
【中文关键词】无
【英文关键词】antibiotic production; nsdA; sporulation; Streptomyces bingchengensis
【中文摘要】无
【英文摘要】To investigate the function of nsdA in Streptomyces bingchengensis, it was cloned and sequenced, which presented an 89.89% identity with that of S. coelicolor. The kRED-mediated PCR-targeting technique was used to create nsdA replacement in the S. bingchengensis_226541 chromosome. The nsdA disruption mutant, BC29, was obtained, which produced more pigment and spores than did the ancestral strain. HPLC analysis revealed that the disruption of nsdA efficiently increased milbemycin A4 production and nanchangmycin production by 1.5-fold and 9-fold, respectively. Complementation of the nsdA mutation restored the phenotype and antibiotic production. These results showed that nsdA negatively affected sporulation and antibiotic production in S. bingchengensis.

【题目】Improvement of milbemycin-producing Streptomyces bingchenggensis by rational screening of ultravioletand chemically induced mutants
【中文关键词】无
【英文关键词】Milbemycin; Streptomyces bingchenggensis; Strain improvement; Rational screening
【中文摘要】无

【英文摘要】Milbemycin antibiotics are produced by Streptomyces hygroscopicus subsp. aureolacrimosus and a newly isolated Streptomyces bingchenggensis, respectively. According to the biosynthetic pathway of milbemycins generated by S. hygroscopicus subsp. aureolacrimosus, arational screening procedure with UV irradiation and N-methyl-N0-nitroso-N-nitrosoguanidine (NTG) mutation was performed to obtain high milbemycin-producing S. bingchenggensis. Aminoacetic acid (Glycine)-resistant mutants (AAr), propionate-resistant mutants (PRPr), streptomycin- resistant mutants (STRr) and 2-deoxy-D-glucoseresistant mutants (DOGr) were selected successively. A strain S. bingchenggensis BC-109-6 with AAr, PRPr, STRr and DOGr was obtained and its production of milbemycin A3 and A4 reached 1,450 lg/ml, which was 80% higher than that of the ancestral strain S. bingchenggensis BC-101-4. The subculture experiments indicated that the hereditary characteristic of high productivity of S. bingchenggensis BC-109-6 was stable. The production of milbemycin A3 and A4 by S. bingchenggensis BC-109-6 in a 50-l fermentor could reach 1,380 lg/ml after 360 h batch fermentation.

【题目】Isolation and Identification of Novel Macrocyclic Lactones from Streptomyces avermitilis NEAU1069 with Acaricidal and Nematocidal Activity
【中文关键词】无
【英文关键词】Streptomyces avermitilis NEAU1069; novel macrolide compounds; acaricidal activity; nematocidal activity
【中文摘要】无
【英文摘要】Bioactivity-guided fractionation of Streptomyces avermitilis NEAU1069 fermentation broth was used to isolate and determine the chemical identity of bioactive constituents with acaricidal and nemotocidal activity. The structures of novel compounds 1 and 2 were determined on the basis of spectroscopic analysis, including 1D and 2D NMR as well as HRESI-MS, ESI-MS of spectrometry analysis, UV and IR spectroscopic analyses, and comparison with data from the literature. The acaricidal activities of the isolated compounds against adult mites and mite eggs were evaluated by mortality and unhatched eggs. The nematocidal activity of the isolated compounds against Caenorhabditis elegans was calculated according to the immobilized rates against the total number of tested nematodes. The results indicated that compounds 1 and 2 exhibited potent acaricidal activity against adult mites, with a mortality of >90% at a concentration of 30 μg/mL. However, compounds 1 and 2 showed only weak acaricidal activity against mite eggs, with unhatched mite egg rates of <60% at a concentration of 100 μg/mL. Compound 2, a hydroxylated derivative at C-23 of 1, possessed a high nematocidal activity against C. elegans, with an immobility of >90% at a concentration of 10 μg/mL. These results demonstrate

that compounds **1** and 2, especially compound 2, have potential as pesticides with acaricidal and nematocidal activity.

【中文摘要】无
【英文摘要】Objectives: Multidrug resistance (MDR) is a serious obstacle encountered in cancer treatment. This study was performed to explore the reversal of MDR by doramectin from the avermectin family and nemadectin belonging to the milbemycin family.Methods: The MTT assay was used to evaluate the abilities of the two compounds to reverse drug resistance in adriamycin-resistant human breast carcinoma cells (MCF-7/adr). Intracellular accumulation of adriamycin was determined by HPLC. The effects of the two compounds on inhibiting P-glycoprotein (P-gp) efflux was demonstrated by accumulation of rhodamine 123 in MCF-7/adr cells. To investigate the mechanism of reversal by the two compounds, the expressions of P-gp and the MDR1 gene encoding P-gp were tested by flow cytometry and reverse-transcriptase PCR.Key findings: Doramectin and nemadectin at the high dose of 8 mmol/l significantly increased the sensitivity of MCF-7/adr cells to adriamycin by 49.35- and 23.97-fold, respectively. They also increased the intracellular accumulation of adriamycin and rhodamine 123 in MCF-7/adr cells in a dose-dependent manner. Expression of both P-gp and MDR1 were down-regulated.Conclusions: Doramectin and nemadectin are promising agents for overcoming MDR in cancer therapy. Doramectin was more potent in reversing MDR.

【题目】5-ketoreductase from Streptomyces bingchengensis: overexpression and preliminary characterization
【中文关键词】无
【英文关键词】Biotransformation; C5-ketoreductase (MilF); Milbemycins A3 and A4; 5-Oxomilbemycins A3 and A4; Streptomyces bingchengensis
【中文摘要】无
【英文摘要】To elucidate the biotransformation from 5-oxomilbemycins A3 and A4 to milbemycins A3 andA4 in Streptomyces bingchengensis, the C5-ketoreductase gene (milF) was cloned using PCR with the specific primer designed from homologous nucleotide sequences. The C5-ketoreductase (MilF) was heterologously expressed in E. coli BL21 (DE3) as a His-tagged fusion protein. The characterization and biotransformation function of purified MilF wasverified by in vitro enzyme assay. MilF is an NADPH-dependent reductase. The biotransformation products, analyzed by LC-APCI/MS, were identified as milbemycin A3 and milbemycin A4. MilF is thus present in Streptomyces bingchengensis and can transform 5-oxomilbemycins A3 and A4 to milbemycins A3 and A4. These findings are significant for understanding the biosynthetic pathway of milbemycins in Streptomyces bingchengensis and pave the way to obtain a producer strain of 5-oxomilbemycins directly by targeted milF disruption.

【题目】A novel and practical synthesis of substituted 2-ethoxy benzimidazole: candesartan cilexetil
【中文关键词】无
【英文关键词】Candesartan cilexetil; Receptor antagonist; Antihypertensive; Synthesis
【中文摘要】无
【英文摘要】A novel and practical synthetic route for the preparation of candesartan cilexetil from methyl 2-amino-3-nitrobenzoate is described. The key steps are the reaction of methyl 2-bromo-3-(diethoxymethyleneamino) benzoate with (20-(1-trityl-1H-tetrazol-5-yl) biphenyl-4-yl) methanamine and the final formation of 2-ethoxy benzimidazole ring via intramolecular N-arylation. The final ring closure process could be utilized to prepare other 2-substituted benzimidazoles. The method is simple for operation and suitable for industrial production.

【题目】Reversal of P-glycoprotein-mediated multidrug resistance in vitro by milbemycin compounds in adriamycin-resistant human breast carcinoma (MCF-7/adr) cells
【中文关键词】无

【英文关键词】Milbemycin; MCF-7/adr; Multidrug resistance; P-glycoprotein
【中文摘要】无
【英文摘要】The effects of milbemycin A4 (MB A4), milbemycin oxime A4 (MBO A4) and milbemycin b1 (MB b1) on reversing multidrug resistance (MDR) of tumor cells were firstly conducted according to the following research, including MTT [3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide] assay, the accumulation of adriamycin, the accumulation and efflux of rhodamine 123 (Rh123), the regulations of MDR1 gene, and expression of P-gp. The three milbemycins (5 lM) showed strong potency to increase adriamycin cytotoxicity toward adriamycin-resistant human breast carcinoma cells MCF-7/adr with reversal fold (RF) of 21.42, 19.06 and 14.89, respectively. In addition, the mechanisms of milbemycins on P-glycoprotein (P-gp)-mediated MDR demonstrated that the milbemycins significantly increased the intracellular accumulations of adriamycin and Rh123 via inhibiting P-gp transport function. Based on the analysis of the P-gp and MDR1 gene expression using flow cytometry and RT-PCR, the results revealed that milbemycin compounds, particularly MB A4, could regulate down the expression of the P-gp and MDR1 gene. These findings suggest that the milbemycins probably represent promising agents for overcoming MDR in cancer therapy, and especially MB A4 is better modulator with the lowest toxicity.

【题目】Genome Sequence of the Milbemycin-Producing Bacterium Streptomyces bingchenggensis
【中文关键词】无
【英文关键词】genome sequence; S. bingchenggensis
【中文摘要】无
【英文摘要】Streptomyces bingchenggensis is a soil-dwelling bacterium producing the commercially important anthelmintic macrolide milbemycins. Besides milbemycins, the insecticidal polyether antibiotic nanchangmycin and some other antibiotics have also been isolated from this strain. Here we report the complete genome sequence of S. bingchenggensis. The availability of the genome sequence of S. bingchenggensis should enable us to understand the biosynthesis of these structurally intricate antibiotics better and facilitate rational improvement of this strain to increase their titers.

【题目】Expression pattern of dmrt4 from olive flounder (Paralichthys olivaceus) in adult gonads and during embryogenesis
【中文关键词】无
【英文关键词】Paralichthys olivaceus dmrt4 Real-time reverse transcriptase-PCR Whole mount in situ hybridization Sexually dimorphic expression
【中文摘要】无
【英文摘要】The dmrt (doublesexand mab-3 related transcription factor) gene family comprises severaltranscription factors that share a conserved DM domain. Dmrt1 is considered to be involved in sexualdevelopment, but the precise function of other family members is unclear. In this study, we isolated genomic DNA and cDNA sequences of dmrt4,a member of the dmrt gene family, from olive flounder, Paralichthys olivaceus, through genome walking and real-time reverse transcriptase (RT)-PCR. Sequence analysis indicated that its genomic DNA contains two exons and one intron. A transcriptional factor binding sites prediction program identified

a sexual develop-ment-related protein, Sox9 (Sry-like HMG box containing 9) in its 50 promoter. Protein alignment and phylogenetic analysis suggested that flounder Dmrt4 is closely related to tilapia Dmo (DM domain gene in ovary). The expression of dmrt4 in adult flounder was sexually dimorphic, as shown by real-time RT-PCR analysis, with strong expression in the testis but very weak expression in the ovary. Its expression was also strong in the brain and gill, but there was only weak or no expression at all in some of the other tissues tested of both sexes. During embryogenesis, its expression was detected in most developmental stages, although the level of expression was distinctive of the various stages. Whole mount in situ hybridization revealed that the dmrt4 was expressed in the otic placodes, forebrain, telencephalon and olfactory placodes of embryos at different developmental stages. These results will improve our understanding of the possible role of flounder dmrt4 in the development of the gonads, nervous system and sense organs.

【题目】Genetic characterization of asymmetric reciprocal hybridization between the flatfishes Paralichthys olivaceus and Paralichthys dentatus
【中文关键词】无
【英文关键词】Paralichthys olivaceus Paralichthys dentatus Asymmetric viability Hybridization Chromosomal elimination AFLP
【中文摘要】无
【英文摘要】Interspecific reciprocal crosses between the two flatfishes Paralichthys olivaceus and P. dentatus yielded hybrids with different viabilities. Specifically, the hybrids of P. olivaceus female and P. dentatus male (HI) were found to be viable, while the reciprocal hybrids from P. dentatus female and P. olivaceus male (HII) were completely inviable. All the HII individuals showed morphological deformities and died before first feeding. The chromosome analysis showed that HI individuals had the same chromosome number as parents. However, two chromosomes were missing in HII offspring indicating that the latter were aneuploids. Genomic inheritance from the parents to F(1) progeny was also examined by amplified fragment length polymorphism (AFLP) analyses, and the results showed differences between reciprocal hybrids. Almost all AFLP bands (97.71%) observed in parents were passed on to HI individuals. In contrast, only 86.64% of the AFLP bands from parents were scored in HII individuals. Frequency of lost parental bands was thus significantly higher in HII than that in HI and intraspecific crosses, which was probably associated with chromosomal elimination. In addition, higher segregation distortions were found in hybrids than in controls, although these differences were not significant. The present study indicates that chromosomal elimination and loss of AFLP loci occurred in inviable HII individuals, while such genomic changes were not found in viable HI individuals. Possible implications of such difference on genomic changes for asymmetric viability in reciprocal hybrids are discussed.

【题目】Cloning and stage-specific expression of CK-M1 gene during metamorphosis of Japanese flounder, Paralichthys olivaceus
【中文关键词】无
【英文关键词】CK-M1 metamorphosis gene expression Paralichthys olivaceus
【中文摘要】无
【英文摘要】The symmetrical body of flatfish larvae changes dramatically into an asymmetrical form after metamorphosis. The molecular mechanisms responsible for this change are poorly understood. As an initial step to clarify these mechanisms, we used

representational difference analysis of cDNA for the identification of genes active during metamorphosis in the Japanese flounder, Paralichthys olicaceus. One of the up-regulated genes was identified as creatine kinase muscle type 1 (CK-M1). Sequence analysis of CK-M1 revealed that it spanned 1 708 bp and encoded a protein of 382 amino acids. The overall amino acid sequence of the CK-M1 was highly conserved with those of other organisms. CK-M1 was expressed in adult fish tissues, including skeletal muscle, intestine and gill. Whole mount in-situ hybridization showed that the enhanced expression of CK-M1 expanded from the head to the whole body of larvae as metamorphosis progressed. Quantitative analysis revealed stage-specific high expression of CK-M1 during metamorphosis. The expression level of CK-M1 increased initially and peaked at metamorphosis, decreased afterward, and finally returned to the pre-metamorphosis level. This stage-specific expression pattern suggested strongly that CK-M1 was related to metamorphosis in the Japanese flounder. Its specific role in metamorphosis requires further study.

【题目】Expression Profiling and Validation of Potential Reference Genes During Paralichthys olivaceus Embryogenesis

【中文关键词】无

【英文关键词】Expression profiles Paralichthys olivaceus Quantitative real-time PCR Reference genes

【中文摘要】无

【英文摘要】Differential expression of genes is crucial to embryogenesis.The analysis of gene expression requires appropriate references that should be minimally regulated during the embryonic development.To select the most stable genes for gene normalization,the expression profiles of eight commonly used reference genes(ACTB,GAPDH,rpL17, α -Tub,EF1- α ,UbcE,B2M,and 18S rRNA)were examined during Japanese flounder(Paralichthys olivaceus)embryonic development using quantitative real-time polymerase chain reaction.It was found that all seven mRNA genes appeared to be developmentally regulated and exhibited significant variation of expression.However,further analyses revealed the stage-specific expression stability.Hence when normalization using these mRNA genes,the differential and stage-related expression should be considered.18S rRNA gene,on the other hand,showed the most stable expression and could be recommended as asuitable reference gene during all embryonic developmental stages in P.olivaceus.In summary,our results provided notonly the appropriate reference gene for embryonic development research in P.olivaceus,but also possible guidance toreference gene selection for embryonic gene expression analyses in other fish species.

【题目】The isolation and characterization of myostatin gene in Japanese flounder (Paralichthys olivaceus): Ubiquitous tissue expression and developmental specific regulation

【中文关键词】无

【英文关键词】Paralichthys olivaceus Myostatin GDF 11 Expression profiles SNP Microsatellite

【中文摘要】无

【英文摘要】Myostatin(MSTN) is a negative regulator of skeletal muscle growth and development. In the current study,the MSTN gene was cloned from one of fl at fi sh species, Japanese flounder (Paralichthys olivaceus). In the 5520-bp genomic sequence, three exons, two introns, and 5' and 3' flanking sequences were identified. The putative amino acid sequence was 377 residues long, including a signal peptide, nine conserved cysteine residues, and a RXXR proteolytic processing site. The overall amino acid sequence of the P.

Olivaceus MSTN(pMSTN) was highly conserved with that of other organisms. Phylogenetic analysis suggested the evolutionary relationships of pMSTN with other known MSTN and GDF-11 genes. There were four microsatellite sequences identified in noncoding regions and 19 SNPs identified in coding sequences.Expression analysis revealed that pMSTN gene was expressed not only in the skeletal muscle, but also in other tissues, including cartilage, which has not been reported in fish previously. Although pMSTN was expressed in gill, no transcript could be detected in FG-9307, a continuous gill cell line from P. olivaceus.Quantitative RT-PCR analysis indicated that the expression of pMSTN appeared to be developmentally regulated. The pMSTN mRNA detected in unfertilized eggs indicated the maternal deposit. Considering of the ubiquitous tissue distribution and the continuous expression of pMSTN during the whole embryonic development in Japanese flounder, MSTN gene in fish may play different roles in comparison with that in mammals.

【题目】Genetic linkage mapping of turbot (Scophthalmus maximus L.) using microsatellite markers and its application in QTL analysis
【中文关键词】无
【英文关键词】genetic linkage map microsatellites (SSR) quantitative trait locus (QTL) turbot Scophthalmus maximus L.
【中文摘要】无
【英文摘要】Genetic linkage maps of turbot, Scophthalmus maximus L., were constructed using a double pseudo-testcross strategy with 158microsatellitemarkers. The parents and F1 progeny (100 individuals)were used as segregatingpopulations. Weidentified 21 and 30 genetic linkage groups in the male and femalemaps, respectively. The malelinkage map was composed of 110 loci and spanned 721.7 cM, with an average intermarker spacing of 9.9 cM,while the female map was composed of 110 loci and spanned 919.1 cM, with an average intermarker spacing of12.9 cM. The estimated coverage of the linkage maps was 63.5% for the male and 54.2% for the female, based ontwo estimates of genomelength. The ratio ofmale:female recombination rates for sharedmarkers was 1:1.3. Thisstudy represents the second microsatellite genetic linkage map for turbot. In addition,we conducted quantitativetrait loci mapping of important economical traits. One possible QTL associated with turbot body length wasdetected on male linkage group 7. This QTL will be validated in a successive study and is expected to be useful inmolecular marker-assisted selection in turbot.

【题目】Cloning and characterization of type II Interleukin-1 receptor cDNA from Japanese flounder (Paralichthys olivaceus)
【中文关键词】无
【英文关键词】Japanese flounder (Paralichthys olivaceus)
Type II interleukin-1 receptor
Vibrio anguillarum
RT-PCR
Tissue expression
【中文摘要】无

【英文摘要】The type II interleukin-1 receptor (IL-1RII) cDNA was cloned from Japanese flounder (Paralichthys olivaceus) by mRNA differential display (DD-PCR) and rapid amplification of cDNA ends (RACE). The full-length cDNA is 1793 bp in length, including a 100 bp 5′-terminal untranslated region (UTR), a 430 bp 3′-terminal UTR, and a 1263 bp open reading frame (ORF). The ORF encodes 420 amino acid residues with an estimated molecular mass of 46.65 kDa. The protein possesses signature features of the IL-R family, consisting of one N-terminal signal peptide, one transmembrane (TM) domain, two Ig-like domains in its extracellular region, one short cytoplasmic tail of 17 amino acids and four conserved proline residue sites. The predicted amino acid sequence has 65.3%, 52.5% and 51.6% identity with gilthead seabream, rainbow trout and Atlantic salmon IL-1RII, respectively. Phylogenetic analysis supported a close relation to mammalian IL-1RII. Reverse Transcription Polymerase Chain Reaction (RT-PCR) analysis indicated that the IL-1RII gene expression of Japanese flounder was weakly up-regulated and reached the peak expression in the kidney, spleen, and gill at 6 h after infection with Vibrio anguillarum, at 1.9, 2.0 and 1.5 times relative to the uninfected fish, respectively. These results suggest that IL-1RII has a signal transduction function and possibly plays a minor role in immune regulation against bacterial(s) infection in Japanese flounder.

【题目】Estimates of genetic and phenotypic parameters for weight and length in P aralichthys olivaceus
【中文关键词】无
【英文关键词】Paralichthys olivaceus heritability genetic correlation genetic mating design diallel cross maternal effect
【中文摘要】无
【英文摘要】The complete diallel cross design was employed to estimate the genetic parameters of the growth of Japanese flounder(Paralichthys olivaceus).A total of 60 full-sib families were cultivated and two growth-related traits,body weight(BW)and body length(BL),were examined at average 2,3 and 8 months of age respectively,with 1 800 individuals measured in each age group(30 per family). Based on the additive-dominance-maternal-effect genetic analysis model,the restricted maximum likelihood approach was used to estimate various(co)variance components.The results showed that narrow-sense heritability estimates of BW and BL were respectively:0.29±0.01 and 0.22±0.02 at 2 months of age,0.32±0.02 and 0.30±0.04 at 3 months of age,0.48±0.04 and 0.40±0.05 at 8 months of age;broad-sense heritability estimates were respectively:0.44±0.02 and 0.54±0.04 at 2 months of age,0.35±0.01 and 0.36±0.03 at 3 months of age,0.49±0.03 and 0.45±0.04.All heritabilities were statistically significant(P<0.05).Additive genetic correlations between BW and BL at 2,3 and 8 months of age were consistently positive and highly significant(P<0.01):0.93±0.02,0.95±0.03 and 0.92±0.03 respectively.Maternal effect was significant(P<0.05)only at 2 months of age, and was not detected at 3 and 8 months of age.According to the heritability estimates,the mass selection strategy should be e?cient for the breeding of Japanese flounder.

【题目】Steroid sex hormone dynamics during estradiol-17 β induced gonadal differentiation in Paralichthys olivaceus(Teleostei)
【中文关键词】无
【英文关键词】olive flounder gonadal differentiation estradiol- β (E) testosterone(T) exogenous E treatment

【中文摘要】无
【英文摘要】Steroid sex hormones,such as estradiol-17 ² (E2)and testosterone(T),are important regulators of sex change in fish.In this study,we examined the effects of E2 treatment on the dynamics of E2 and T during gonadal differentiation in the olive flounder Paralichthys olivaceus using histology and radioimmunoassay(RIA).Flounder larvae were divided into five groups(G0 G4),and fed with 0 (control),0.2,2,20 and 100 mg E2/kg feed from 35 to 110 day post hatching(dph).Fish growth in the G1 and G2 groups was not significantly different from that of the control group(P0.05),while fish in the G3 and G4 groups were less active and showed growth depression and high mortality.The gonads of fish in the G3 and G4 groups were smaller and surrounded by hyperplastic connective tissue.The frequency of females in the G0 G4 groups was 54.5%,75.0%,100%,100%and 93.3%,respectively.The RIA analyses of E2 and T showed that T levels decreased during gonadal differentiation,and increased slightly at the onset of ovarian differentiation,while E2 levels increased gradually and peaked at the onset of ovarian differentiation in the control group.In the E2-treated groups,T levels decreased before the onset of ovarian differentiation.E2 levels were high on the 48 dph,but declined to a lower level on the 54 dph, and then increased gradually during gonadal differentiation.And a sharp increase of E2 levels were observed in all E2-treated groups at the onset of ovarian differentiation.The data suggest that T and E2 play important roles during gonadal differentiation,and an E2 dose of 2 mg/kg feed could induce sex reversal in P.olivaceus.

【题目】Induction of diploid gynogenesis in turbot Scophthalmus maximus with left-eyed flounder Paralichthys olivaceus sperm
【中文关键词】无
【英文关键词】Turbot Paralichthys olivaceus Heterologous sperm Gynogenesis
Cold shock
【中文摘要】无
【英文摘要】Turbot Scophthalmus maximus exhibits sexually dimorphic growth, with females growing faster and reaching larger adult sizes than males. Thus, development of techniques for preferentially producing females is necessary to optimize production of these species. In this paper, gynogenetic diploids of turbot were induced by activating egg development with ultraviolet (UV)-irradiated left-eyed flounder Paralichthys olivaceus sperm combined with cold shock to prevent extrusion of the second polar body. The results of UV irradiation experiments showed that survival, motility, and duration of activity of P. olivaceus sperm generally decreased with increase in UV dose. The typical Hertwig ’s effect was observed after fertilized turbot eggs with UV-irradiated P. olivaceus sperm and the optimal UV dose for gynogenetic haploid production was 36,000 erg mm-2. At 15 C, appropriate timing of cold shock for retention of the second polar body in turbot eggs was at 6 min after fertilization. Results of different combinations of two shock temperatures (1 or 3 C) and four shock durations (15, 25, 35 or 45 min) at 6 min after fertilization demonstrated that shock of 25 min at 1 C gave the highest production of diploid gynogens (39.58% relative to its diploid control). The results of this study reveal that the use of UVirradiated P. olivaceus sperm for activation of turbot eggs and cold shock for polar body retention is an effective method to produce gynogenetic offspring.

【题目】Hybrids between olive flounder Paralichthys olivaceus and stone flounder Kareius bicoloratus karyotype, allozyme and RAPD analyses
【中文关键词】无
【英文关键词】artificial hybridization - Paralichthys olivaceus (Temminck et Schlegel) - Kareius bicoloratus (Basilewsky) - karyotype - allozyme - RAPD
【中文摘要】无
【英文摘要】The hybrid between olive flounder Paralichthys olivaceus and stone flounder Kareius bicoloratus was produced by artificial insemination of olive flounder eggs with stone flounder sperm. Sinistral and dextral are two types of hybrid progeny after metamorphosis. Karyotypes of both hybrid flounders are the same as those of the two parental species. Of the 22 loci examined from 12 allozymes, 12 confirmed hybridization of the paternal and maternal loci in hybrids and no difference was found in allozyme patterns of sinistral and dextral hybrid fishes. RAPD patterns of these specimens were also studied with 38 primers selected from 104 tested. Among them, the PCR products of 30 primers showed hybridization of the paternal and maternal bands. Genetic variation between hybrids and their parental stocks was analyzed by RAPD using 10 of the above 38 primers. The average heterozygosity and genetic distance were calculated. The results suggested that the filial generation could inherit a little more genetic materials from paternal fish than that from maternal fish.

【题目】Molecular cloning and expression of PoIR2, a novel gene involved in immune response in Japanese flounder (Paralichthys olivaceus)
【中文关键词】无
【英文关键词】Paralichthys olivaceus Vibrio anguillarum immune-related gene (PoIR2) tissue expression prokaryotic expression
【中文摘要】无
【英文摘要】A novel immune-related gene was expressed in Japanese flounder (Paralichthys olivaceus) injected withVibrio anguillarum. The complete cDNA contained a 169 bp 5 UTR, a 336 bp open reading frame (ORF) encoding 111 amino acids and a 556bp 3 UTR. Six exons and five introns were identified in the PoIR2 gene. Blastp similarity comparison showed its encoding protein had 50% similarity to Danio rerio neuromedin S (NMS), but further alignment indicated they did not have NMS C-terminal conservational signature domain. So it was not defined as an NMS homologue. Protein structure analysis indicated it had a 26aa signal peptide and was a secretory pathway protein. RT-PCR demonstrated that the expression of PoIR2 was quickly induced and drastically increased in liver, kidney, spleen, gills, intestine, heart, and skeletal muscle after infected with V. anguillarum. These results indicated that the PoIR2 might play some important role in Japanese flounder immune response system. This gene was named PoIR2 (P.olivaceus immune-related gene 2, GenBank accession number: EU224372). The mature PoIR2 peptide was expressed in BL21(DE3) pLysS using pET-32a(+) vector and a great part of the recombinant mature peptide existed as soluble type.

【题目】三种鲆鲽鱼养殖群体的遗传多样性及特异性AFLP标记研究

【中文关键词】条斑星鲽 星斑川鲽 漠斑牙鲆 养殖群体 AFLP 遗传多样性
【英文关键词】Verasper moseri Platichthys stellatus Paralichthys lethostigma cultured stock AFLP genetic diversity
【中文摘要】应用AFLP技术对条斑星鲽、星斑川鲽及漠斑牙鲆的养殖群体进行遗传分析。8对EcoRI/MseI 引物在条斑星鲽、星斑川鲽、漠斑牙鲆养殖群体中分别得到196、207、187条扩增带。其群体的多态位点比例分别为26.02%、25.12%、39.57%,Nei遗传多样性指数和Shannon遗传多样性指数分别为0.1101和0.1587,0.1008和0.1465,0.1566和0.2238。结果表明,条斑星鲽和星斑川鲽养殖群体的遗传变异水平相对较低,而漠斑牙鲆的遗传变异水平相对较高。同时还筛选获得了这3种鲆鲽鱼的共享标记19个,种的特有标记依次为44、45、34个。并根据两两间的遗传距离构建了UMPGA聚类关系图,从分子生物学角度衡量了其亲缘关系。
【英文摘要】The AFLP technology was used to analyze the genetic diversity of the cultured stocks of badin flounder, starry flounderand southern flounder. Eight pairs of EcoR I/Mse I primer eombinatious were used, and 196, 207, 187 AFLP bands were amplified, respectively. Within these three stocks, the percentages of polymorphic locus Were 26.02%, 25.12% and 39.57%, and the Nei's genetic diversity values and Shannon indexes were 0.1101 and 0.1587, 0.1008 and 0.1456, 0.1566 and 0.2238, respectively. The result suggested that the cultured stocks of barfin flounders and starry flounders showed lower genetic variability, and the southern flounder stock showed higher genetic variability. Moreover, 19 species specific bands which were uniform among the three flounders were found,and the numbers of exclusive band, found in barfin flounder, starry flounder and southern flounder were 44, 34 and 45, respectively. The UMPGA based on genetic distance values among these three flounders was constructed to reveal the relationship of the species.

【题目】牙鲆GHR基因Promoter区微卫星序列多态性与生长性状关系的初步研究.
【中文关键词】牙鲆 GHR基因5’端Promoter区 微卫星 遗传多样性 性状连锁分析
【英文关键词】Paralichthys olivaceus growth hormone receptor(GHR)gene 5’ promoter region microsatellite genetic diversity association analysis of traits
【中文摘要】采用牙鲆GHR基因5’端Promoter区的1个微卫星标记,对胶南和日照2个牙鲆养殖群体进行了群体遗传多样性的研究,并探索该基因多态性位点与牙鲆生长性状之间的相关性。结果表明,2个群体在该座位的等位基因数为12和9个,有效等位基因数为6.26和5.04个,多态信息含量为0.84和0.80。2个群体该座位的Hardy-Weinberg遗传偏离指数均为正值,并没有显示出杂合子缺失,但各基因型分布频率都在一定程度上偏离Hardy-Weinberg平衡(P<0.01)。连锁分析中发现,在胶南群体中,IM基因型对应的个体在全重、全长、体长、头长、体高和眼径形态学数据中均是最大的;在日照群体中,BC基因型对应的个体在全重、全长、体高、尾柄高、尾柄长和眼径数据中均是最大的;而CJ基因型对应的个体在体长和头长这两组数据中是最大的。该结果为研究GHR基因的变异对鱼类生长发育的影响及探索将该基因作为生长遗传标记的可行性奠定了实验基础。 更多还原
【英文摘要】Genetic diversity of two cultured stocks of the left eyed flounder(Paralichthys olivaceus) from Jiaonan Country and Rizhao Country were analysed by using one microsatellite loci in the 5 promoter region of growth hormone receptor(GHR)gene,and the polymorphisms and their associations with growth traits were also investigated.The results showed that the allele numbers were 12 and 9,respectively,the effective alleles numbers were 6.26 and 5.04,the Fixation Indexes were-0.02 and-0.20,the Shannon indexes were 2.08 and 1.82,the heterozygosity observed values were 0.96 and 0.85,the unbiased expected heterozygosity values were 0.84 and 0.81,the values of polymorphism information content were 0.84 and 0.80 in the two stocks.The deviations from Hardy-Weinberg index of the two stocks were both positive,which did not show lack of heterozygosity.While the chi-square test presented that this microsatellite locus in both stocks were deviated from the Hardy-Weinberg equilibrium(P<0.01).SPSS was used to study the possible association of the detected variations with growth traits.The evaluation of association effects between these microsatellite patterns with weight,total length,body length,head length,body height and distance between eye suggests the individuals with genotype IM was the highest in the Jiaonan stock(P<0.05).While in the Rizhao stock,values of weight,total length,body height,tail height,tail length and distance between eyes of the individuals with genotype BC were higher than those of the other genotypes,and values of body length and head length of the individuals with genotype CJ were higher than those of the other genotypes.These data would provide a potential use for GHR gene as

the genetic marker of fish growth in the future MAS.

【题目】牙鲆性腺分化的组织学研究
【中文关键词】牙鲆(Paralichthys olivaceus) 性腺分化 组织学
【英文关键词】Paralichthys olivaceus gonadal differentiation histology
【中文摘要】运用组织学方法对牙鲆(Paralichthys olivaceus)的性腺分化和发育过程进行了观察。结果表明,牙鲆的性腺发育可分为3个阶段,即原始性腺阶段、性腺分化阶段和性腺分化后阶段。培育水温为18℃~20℃下,孵化后第45天、平均全长为22.0 mm±2.8 mm的牙鲆,其性腺分化尚未开始,属于原始性腺。70日龄、平均全长为38.0 mm±1.7 mm的牙鲆,部分个体中观察到卵巢的雏形,其余个体中性腺变化并不大;到了第110天、平均全长达到86.5 mm±5.9 mm时,雌性个体卵巢的卵巢腔进一步增大,并出现卵原细胞向卵母细胞的转变。精巢的分化开始于90日龄、平均全长为63.5 mm±3.4 mm的幼鱼,此期精原细胞快速增殖,体细胞进行有丝分裂并逐渐形成输精管原基;进一步的细胞学分化则出现在100日龄、平均全长为76.0 mm±8.6 mm的个体中,此时可以看到精小叶的形成;在平均全长为140.0 mm±15.2 mm时,精巢中出现初级精母细胞,标志着性腺分化的基本完成。
【英文摘要】Gonadal differentiation and development in olive flounder(Paralichthys olivaceus) were studied by histological observation.A gonad development process could be divided into three phrases,i.e.,primary gonad stage,gonadal differentiation stage and post-differentiation stage.When fish were raised at temperature of 18~20°C,gonad formed and remained undifferentiated till the 45th day post hatching(D45).When juveniles reached about 38.0±1.7 mm of mean total length(TL) on the D70,ovarian cavity was observed in pressumptive ovary.On the D1 10,when mean total 1ength reached about 86.54-5.9 mm.ovarian cavity grew bigger,and oocytes were firstly detected.Differentiation of testis was firstly observed in j uvenile flounder with mean total length of 63.5±3.4 mm on the D90。when spermatogenous cell proliferated rapidly and spermaduct formed.Seminal lobule appeared on the D100 when juveniles reached about 76.0 mm of total length.And when flounders reached total length about 140.0 mm,appearance of spermatocyte indicated the completion of gonadal sex differentiation.

【题目】牙鲆受精的细胞学研究
【中文关键词】牙鲆(Paralichthys olivaceus) 受精细胞学 单精受精
【英文关键词】Paralichthys olivaceus fertilization biology monospermy
【中文摘要】通过组织切片,对牙鲆(Paralichthys olivaceus)的受精过程进行细胞学观察发现,这一过程包括精子入卵、卵母细胞第二次成熟分裂排出第二极体、雌雄原核形成与融合,直到合子进行第一次有丝分裂,在受精的整个过程中所有观察过的受精卵都只发现一个精子形成原核,并最终与卵原核结合形成合子,由此判断牙鲆的受精方式是单精受精。本实验的研究结果,不仅能够从理论上丰富海水鱼类的受精生物学基础研究资料,又可为生产中牙鲆染色体操作遗传育种提供依据。
【英文摘要】The observations of fertilization process of flouder were showed by histology.The whole processes,such as sperm entering into egg,the second polar-body discharging,male and the female pronucleus forming,two pronuclei fusing into zygote and dividing into two cells eventually were almost the same as the processes of fetilization in the other teleost.One male pronucleus was

observed in one egg.The male and the female pronuclei contacted with each other and formed the nucleus of zygote.It could be sure that the pattern of the fertilization of flouder is monospermy.These results not only showed more theoretical data on the fertilization biology of the marine fish,but also provided the basis for the commercial chromosomal manipulation and genetic breeding of olive flounder.

【题目】8种鲆鲽鱼种间遗传距离与杂交亲和性的相关性分析
【中文关键词】鲆鲽鱼 遗传距离 杂交亲和性 16S rDNA 细胞色素C氧化酶Ⅰ基因
【英文关键词】flatfish genetic distance hybrid fitness 16S rDNA CO Ⅰ
【中文摘要】2005-2008年,先后进行了褐牙鲆♀×夏牙鲆♂、褐牙鲆♀×石鲽♂、褐牙鲆♀×条斑星鲽♂、褐牙鲆♀×大菱鲆♂、大菱鲆♀×条斑星鲽♂的正反交试验,并收集了文献报道的研究资料,包括条斑星鲽×圆斑星鲽、石鲽×星斑川鲽、夏牙鲆×漠斑牙鲆及褐牙鲆×圆斑星鲽的正反交试验结果,对所涉及的8种鲆鲽鱼远缘杂交亲和性进行分析。根据Russell对杂交亲和性的定义,正反交均可行,杂交适合度为1;正反交单向可行,杂交适合度为0.5,正反交均不可行,杂交适合度为0。同时,根据这8种鲆鲽鱼的16S rDNA和CO Ⅰ基因部分序列的差异,估算其种间遗传距离。对8种鲆鲽鱼的种间遗传距离和杂交适合度作相关性分析,二者呈线性负相关(R2=0.81,P<0.01),即杂交的亲和性随种间遗传距离增大而降低。研究表明,鲆鲽鱼的杂交亲和性与其遗传分化程度具有相关性,可以通过种间遗传距离对鲆鲽鱼远缘杂交的亲和性进行预测。
【英文摘要】Reciprocal hybrids of olive flounder ♀(Paralichthys olivaceus)×summer flounder ♂(P. dentatus),olive flounder ♀(P. olivaceus) × barfin flounder ♂(Verasper moseri),olive flounder ♀(P. olivaceus) × turbot ♂(Scophthalmus maximus) were performed by artificial fertilization from 2005 to 2008. And data of hybridization on eight flatfish species in previous reports were also collected including barfin flounder (V. moseri) × spotted halibut (V. variegatus),stone flounder (Kareius bicoloratus)× starry flounder (Platichthys stellatus),summer flounder (P. dentatus) × southern flounder (P. lethostigma) and olive flounder (P. olivaceus) × spotted halibut (V. variegatus). The hybrid compatibilities of interspecific crosses on these eight flatfish species were analyzed. According to Russell ’s definition,hybrid fitness was scored 1 when the offspring of reciprocal crosses were both viable. The hybrid fitness was scored 0.5 when one direction of reciprocal crosses was viable,and hybrid fitness was scored 0 when the offspring of reciprocal crosses were both inviable. Meanwhile,the ribosomal RNA 16S (16S rRNA) partial sequences and the mitochondrial cytochrome c oxidase subunit Ⅰ (CO Ⅰ) partial sequences of the eight flatfishes were obtained and analyzed. Based on combined sequence data of mtDNA 16S rDNA and CO Ⅰ,intrespecific pairwise distances were calculated and a phyogenetic tree was constructed. The relationship between hybrid fitness of the flatfishes and pairwise genetic distances was evaluated and linear correlation existed between the two(R2=0.81,P<0.01). The hybrid compatibilities declined with the interspecific genetic distances. Our results suggested that negetive correlation exists between hybrid compatibility and genetic divergence in flatfishes. The hybrid compatibility between different species of flatfishes could be predicted by analysis of interspecific genetic distance. And these results would be good references for further hybrid breeding study in flatfish

【题目】大菱鲆(SCOPHTHALMUS MAXIMUS)四个不同地理群体数量形态特征比较
【中文关键词】大菱鲆 群体 形态特性
【英文关键词】Turbot Scophthalmus maximus L. Population Morphological characteristics
【中文摘要】采用聚类分析、单因子方差分析和主成分分析方法,对4个不同地理群体大菱鲆进行了12 项形态性状的测定,比较了4个群体的外部形态特征。聚类分析结果表明,4种大菱鲆群体中,丹麦和挪威之间及英国和法国之间的差异较小,丹麦、挪威和英国、法国之间的差异较大。方差分析多重比较结果表明,4个群体在部分形态特征上表现出明显差异,其中,英国和法国群体、挪威和丹麦群体之间形态特征差异显著指标较少,丹麦群体和英国群体、丹麦群体和法国群体、挪威群体和英国群体、挪威群体和法国群体之间差异显著指标较多。主成分分析构建了3个反映形态特征信息的综合性指标——主成分1、主成分2和主成分3,三者的贡献率分别为38.663%、14.117%和8.976%.三个主成分的累积贡献率为61.756%。分析结果显示,英国和法国群体、挪威和丹麦群体之间形态差异不显著,丹麦群体和英国群体、丹麦群体和法国群体、挪威群体和英国群体、挪威群体和法国群体之间形态差异显著,且差异主要来源于主成分1,而主成分1主要由经方差分析多重比较差异显著的指标组成,显然,主成分分析与聚类分析、方差分析的结论基本上是类似的,它们从不同的角度反映了群体间的形态学差异。
【英文摘要】Statistic morphologic characters of four different populations of Scophthalmus maximus in Denmark,Norway,Britain,and France were revealed and compared on the basis of 1 2 morphological indices using hierarchical cluster, one—way ANOVA,and principal component analyses.The results show that among the four populations,the Danish and Norwegian are similar in morphology,SO be the British and France ones.The Danish/Norway ones are quite different from Britain/France ones.One—way ANOVA analysis and multiple comparison have revealed also the same results.In principal component analysis,three principal components were constructed,the contributions from the first,second and third principal component were 38.663%,14.117%and 8.976%,respectively.The cumulative contribution rate was 61.756%.The results show that the morphological variations of Denmark—-Norway population and Britain—-France population are small but large in other pairs.Moreover,the discriminative variation comes mainly from the first component.Therefore,the 3 different statistic methods on the morphology of the species demonstrated a consistent result that indicates the biological affinity of the anima1

【题目】大菱鲆4个引进地理群体遗多样性的微卫星分析
【中文关键词】大菱鲆 地理群体 微卫星 遗传多样性
【英文关键词】Turbot Scophthalmus maximus L. Geographical stock Microsatellite DNA Polymorphic analysis
【中文摘要】利用12对微卫星分子标记对大菱鲆Scophthalmus maximus 4个引进地理群体进行遗传多样性分析。结果表明,等位基因数(A)为2~10个,平均等位基因数为4.3,有效等位基因数(Ne)为1.6~6.1,平均有效等位基因数为2.7,各位点的杂合度观测值(Ho)为0.0000~0.5625,杂合度期望值(He)为0.3823~0.8416。各群体之间无偏倚杂合度期望值由小到大依次为丹麦群体、英国群体、法国群体、挪威群体,运用SPSS软件对无偏倚杂合度期望值进行Kruskal-Wallis检验,其结果(H=4.438,df=3,P=0.218)表明,4个群体的遗传多样性差异不显著。群体间平均遗传分化指数(Fst)为0.1117,各群体之间存在中度遗传分化。用UPGMA法进行聚类分析,4个群体聚为两类,挪威群体和丹麦群体聚为一类,法国群体和英国群体聚为一类。结合Hardy-Weinberg平衡和遗传偏离指数(d),4个群体都不同程度的偏离平衡。4个群体具有一定的遗传分化、较好的遗传多样性,适合作为大规模家系选育的基础群体。
【英文摘要】Genetic diversities within and between four geographical stocks of turbot Scophthalmus maximus(imported from Norway,Denmark,France,and UK) were assessed through 12 microsatellite loci.The results showed that the number of alleles(A) and effective alleles(Ne) were in the range of 2~10 and 1.6~6.1,with an average of 4.3 and 2.7,respectively.The observed heterozygosities(Ho) and unbiased expected heterozygosities(He) ranged in 0.000 0~0.562 5 and 0.382 3~0.841 6 respectively.The rank of the He values for the four stocks in an increasing order was: DenmarkUKFranceNorway.A comparison by Kruskal-Wallis test(SPSS software)(H=4.438,df=3,P=0.218) revealed that there was no significant difference in genetic diversities of the four geographical stocks.Genetic diversity coefficient(Fst) was 0.111 7,which indicated that there was moderate genetic differentiation among these four geographical stocks.The genetic distance of the four geographical stocks was calculated and the cluster analysis by UPGMA method was carried out.The stocks were pooled into two groups: one goup of Norway and Denmark stocks,the other group of France and UK stocks.Hardy-Weinberg equilibrium and genetic deviation index(d) showed a reasonable difference within each stock.

【题目】大菱鲆不同进口群体杂交后代的早期生长差异
【中文关键词】大菱鲆 杂交组合 家系 选育 生长
【英文关键词】Scophthalmus maxinms L. crossing combination families selective breeding growth
【中文摘要】2003-2005年间,分5批收集不同批次进口的大菱鲆群体,从各群体中挑选性腺发育良好的个体,利用人工授精技术,通过不平衡巢式交配设计,构建了5种杂交组合,测试其杂交子一代生长性能,为培育优良的大菱鲆养殖新品种提供基础资料。5个杂交组合共生产31个家系,在初孵仔鱼第25天和第80天,从每个家系随机取样50尾,测定其体长、体重等性状值,计算各杂交组合和家系25~80 d的绝对增重率,通过方差分析、聚类分析比较各组合、家系间的生长性能的差异,并对不同家系25 d和80 d的体长体重相关性进行了分析。结果表明:杂交组合25 d、80 d体重性状间存在较大变异,80 d体重LSD多重比较显示丹麦与法国进口群体的杂交组合(D×F)子一代生长优于其它杂交组合。系统聚类分析表明,丹麦×智利(D×C)组合与丹麦×法国(D×F)组合生长性能较为接近聚为一类,丹麦×西班牙(D×S)组合、丹麦×英国(D×E)组合和英国×西班牙(E×S)3个组合聚为一类,且前者的生长速度高于后者。家系间生长性能聚类分析表明,生长速度最快的家系分布在不同的杂交组合,80 d体重的组合内家系间方差分析也表明组合内家系间存在较大变异。组合间和家系间生长分析发现大部分

组合和家系在25 d和80 d的体长、体重性状值排序上不一致。家系相关分析表明,25 d体长、体重与80 d体长、体重间相关系数(0.132、0.096)和决定系数(0.017、0.009)均较小,25 d体长体重对80 d体长体重的影响甚微。

【英文摘要】Five batches of turbot,Scophthalmus maxinms L.,imported from 2003 to 2005 was collected to initiate the genetic breeding program.The five batches of turbot were Spain(S),Chile(C),Denmark(D),England (E)and France(F)respectively.The unbalanced nest design was adopted and five cross combinations(thirty one full-sib families)were obtained by in vitro fertilization.Sample of fifty individuals was randomly collected from each family,and body length (cm) and the body weight (g) of fry on 25 days and 80 days were analysed by variance analysis,correlation analysis and cluster analysis.Th e results showed that there was significant diference in body weight of fry on 25 days and 80 days.Least significant difference for comparisons of multiaverage in body weight showed the fastest growth rate occured in the Cross between the Danish batch and the French batch.Th e results of the cluster analysis indicated that five cross combinations could be divided into two groups.The first group including two cross combinations(D×C and D×F)was better than the other groups including three cross combinations(D×S,D×E and E×S)on growth rate.The families with better growth rate were found in each CroSS and the ANOVA analysis for body weight showed it was significantly diferent among the cross combinations.The data sorting of body length and the body weight on 25 days and 80 days ranked diferent in most cross and families.Th e results of the correlation an alysis showed that the correlation index(0.132,0.096)and determination coeficients (0.017,0.009)were small betwen the body length and the body weight of fry on 25 days and 80 days.It was clear that the growth time gave slightly indirect efect on body weight from 25 days to 80 days.The early growth traits varied in diferent hybrids CroSS combinations of the imported turbot. Th e results of this study im ply the need and eficiency for turbot genetic breeding,by hvbridization and selection based on Best Linear Unbiased Prediction,for the im po rted Scophthalmus maxinms L.

【题目】大菱鲆25日龄3个经济性状的遗传参数评估
【中文关键词】大菱鲆 遗传力 遗传相关 育种值
【英文关键词】Scophthalmus maximus L. Heritability Genetic correlation Breeding value

【中文摘要】为估计我国引进大菱鲆群体的遗传学参数,2006年从多个大菱鲆养殖场采集源于不同国家和地区、不同进口批次的大菱鲆亲鱼,利用人工授精技术构建了66个全同胞家系,包括26个父系半同胞家系组。选用混合模型方程,通过约束最大似然法进行了方差、协方差、遗传力和遗传相关等估计。结果表明,大菱鲆25d仔鱼体长、存活率和白化率的遗传力分别为0.20、0.07和0.22;3个性状间呈负遗传相关关系,检验不显著。研究结果表明,大菱鲆体长和白化率是中度遗传力,选择育种潜力较大;3个性状任何性状的选择对其他两个性状的影响很小,利用一个性状对另一个性状的间接选择是不可行的。

【英文摘要】Different batches of imported turbot Scophthalmus maximus L.,were collected from different fish farms as broodstock for a genetic breeding program in 2006.Twenty-six paternal half-sib families and sixty-six full-sib families were obtained by artificial fertilization.Variance,covariance matrix,heritability and genetic correlation were estimated by restricted maximum likelihood.The results showed that the heritability of body length,survivorship and albinism rate for 25 d fry were 0.20,0.07 and 0.22,respectively.There was no significant correlation between the three traits.The study revealed moderate heritability in body length and albinism rate and a relatively high potential for selective breeding.Selection of any one of the three traits had little effect on the others,indicating that indirect selection of these traits was unfeasible.

【题目】大菱鲆生长性状在不同生长发育阶段的相关分析
【中文关键词】大菱鲆 生长性状 遗传相关 表型相关
【英文关键词】Scophthalmus maximus Growth trai t Genetic correlation
Phenotypic correlation
【中文摘要】为培育优良大菱鲆养殖品种,收集来源于不同国家、不同地区和不同批次的大菱鲆亲鱼8批,从各群体中挑选性腺发育良好的个体,利用不平衡巢式设计方法和人工授精技术,每条雄鱼个体配两条雌鱼个体,共构建38个父系半同胞和76个母系全同胞,分别测定了每个家系生长到25和80日龄的体重、全长和体长,利用父系半同胞组内相关法估计各性状之间的相关性。对大菱鲆遗传相关分析表明,体重和全长的遗传相关系数为0.95,体重和体长的遗传相关系数为0.88和1.00,全长和体长的遗传相关系数为0.99。对大菱鲆表型相关分析表明,体重和全长的表型相关系数为0.881,体重和体长的表型相关系数为0.622和0.871,全长和体长的表型相关系数为0.947。并且经相关系数显著性检验,各性状间的表型相关都呈极显著水平(P0.01)。另外,多元回归分析建立了全长(X1)和体长(X2)对体重(Y)的回归方程,生长性状与体重的复相关指数为R2=0.789,说明它们都是直接影响体重的重要指标。
【英文摘要】Eight batches of imported turbot Scophthalmus maximus were collected as broodstock to initiate the genetic breeding program. By an unbalanced nested breeding design,artificial fertilization of the broodstock at a female:male ratio of 2: 1 resulted in 38 paternal half-sibs and 7 6 maternal full-sibs. Genetic and phenotypic correlations were estimated for body weight, body length, and total length of the turbot seedlings on 25d and 80d. Significant genetic correlations were found between body weight and total length(0.95),body weight and body length(0.88, 1.00), or total length and body length (0.99). Highly significant phenotypic correlations(P< 0.01) were found between body weight and total length(0.881),body weight and body length(0.622, 0.871),or total length and body length(0.947). Multiple regression equation of total length(X1)and body length(X2)to body weight was obtained,and the high compound correlation index (R2=0.789) indicated that these growth traits had direct influence on body weight.

【题目】水产动物育种分析与管理系统的开发和应用
【中文关键词】水产动物育种 BLUP 软件 育种
【英文关键词】Aquatic animal breeding BLU P Software Breeding
【中文摘要】针对国内水产动物多性状选择育种研究处于起步阶段的现状,以BLUP遗传评定为核心的水产动物多性状复合育种技术体系为依托,结合国内水产动物育种项目研究,开发了一套适合大多数水产动物育种分析与项目管理的软件系统。该系统是在WindowsXP环境下利用MicrosoftSQLServer2000数据库和基于ObjectPascal语言的DelphiIDE工具开发完成的。主要包括6个功能模块:系统管理、基本信息、种质管理、性能管理、育种分析和销售管理等,覆盖整个育种项目周期,并对流程实行标准化,能够自动化完成种质和性能测定数据的管理、遗传参数估计、育种值计算和配种方案制定等主要工作。软件已经在中国对虾、大菱鲆和罗氏沼虾等育种项目中得到应用,其推广和应用能够有效提升行业的整体育种技术水平,推动我国水产动物育种工作的发展。
【英文摘要】Research on aquatic animal multi-trait breeding has been launched in China only recently.We developed an aquatic animal breeding analysis and management system applicable for most aquatic animals,by focusing on BLUP breeding value evaluation and integrating several aquatic animal breeding programs in China.This software was developed using Microsoft SQL Server 2000 database and Delphi IDE tool which was based on Object Pascal language in Windows XP.It was consisted of six functional modules,including system management,basic information,germplasm management,performance management,breeding analysis and sales management.It covered the whole lifecycle of a breeding program,and standardized the program flow.The software can automatically complete primary tasks such as germplasm data management,germplasm and performance tests,estimation of genetic parameters,calculation of breeding values,design for mating schemes,etc.This software was applied in breeding programs for Chinese shrimp Fenneropenaeus chinensis,turbot Scophthalmus maximus L.and giant freshwater shrimp Macrobrachium rosenbergii.The application and extension of this software will improve the technology and support the development of aquatic animal breeding in

China.

【题目】大菱鲆4个进口群体的形态差异分析
【中文关键词】大菱鲆 形态差异 多元分析
【英文关键词】Scophthalmus maximus Morphological variationMultivariation analysis
【中文摘要】选择2003~2004年进口的4个大菱鲆不同进口群体(英国、法国1、法国2、法国3),测定了其全长、体长、头长、吻长、体高、尾柄高和尾柄长等7项形态性状。采用聚类、主成分分析和判别分析3种多元分析方法,对大菱鲆的6项比例形态性状参数进行比较研究。聚类分析与主成分分析结果均表明,法国1和法国2群体间形态最接近,而与英国群体、法国3群体的趋异程度较大。主成分分析构建了两个主成分,其贡献率:主成分1为61.069%,主成分2为34.343%,累计贡献率为95.412%。以判别分析建立了4个群体的判别函数,判别准确率分别为46.7%~80.0%(P1)和51.7%~77.4%(P2),综合判别率为62.5%。3种多元分析结果表明,4个大菱鲆群体在形态上已经产生一定程度的差异,且集中表现在全长、体长、头长、吻长和尾柄长这5个形态性状指标上。
【英文摘要】Four stocks of turbot Scophthalmus maximus, imported during 2003 and 2004, were collected from Laizhou, Ganyu, Changyi and Jiaonan city. The total length, body length, head length, snout length, body height, caudal peduncle length, caudal peduncle height were measured. Based on six morphological proportional traits of S. maximus, three multivariation analysis methods, including cluster analysis, prinpical component analysis and discriminant analysis were adopted to comparatively investigate the morphological variation. The results of cluster analysis and principal component analysis indicated that morphological traits were similar between the two French stocks, but quite different from that of the British and another French stocks. In the principal component analysis, two principal components were constructed, and contributory ratio was 61. 069% for the first principal component and 34. 343% for the second principal component, and the cumulative contributory ratio was 95. 412%. The discriminant functions of four stocks were established, and the discriminant accuracy was 46.7%-80.0% (P1) and 51.7%-77.4%(P2). The total discriminant accuracy was 62.5%. All results indicated that there were some morphological differences among the four stocks and the indicator of morphological traits were total length, body length, head length, snout length and caudal peduncle length.

【题目】大菱鲆测量性状对体重的影响效果分析
【中文关键词】大菱鲆 测量性状 体重 通经分析 回归模型
【英文关键词】Scophthalmus maximus Morphometric Body weight Path analysis Regression equation
【中文摘要】选取了初孵仔鱼90日龄的大菱鲆114尾,测定了全长、体长、头长、吻长、体高、尾柄高、尾柄长和体重等8项性状.采用相关分析和通径分析方法,剔除了与体长有共线性的自变量全长,计算了以测量性状为自变量对体重依变量的相关系数、通径系数、决定系数及相关指数,建立测量性状对体重的回归方程.结果表明,大菱鲆7个测量性状均与体重的相关系数达到极显著水平(P<0.01);体长、体高和尾柄高对体重的通径系数达到显著水平,是直接影响体重的重要指标,决定系数分析结果与通径分析结果有一致的变化趋势;所选测量性状与体重的复相关指数为R.2=0.895,是影响体重的主要自变量;多元回归分析建立了体长(X2)、体高(X5)和尾柄高(X6)对体重(Y)的回归方程.

【英文摘要】The effects of metric traits on body weight of turbot were analyzed, using correlation analysis and path analysis. Data for this study were collected from 114 fry 90 days after hatch in Haiyang city, Shandong Province. The total length (X1), body length (X2), head length (X3), snout length (X4), body depth (X5), caudal peduncle depth (X6), caudal peduncle length (XT)and body weight (Y) were measured. Total length was eliminated from the variable data set because it was co-linear with body length. Seven metric traits were used as independent variables, and body weight was used as a dependent variable for path analysis. Path coefficients (Pi), determination coefficients (di) and correlation index (R2) were calculated in path analysis. The results showed that all seven correlation coefficients between each metric traits and the weight achieved were all very significantly different (P〈0.01). The path coefficients (Pi) of the body length (X2), body depth (X5) and caudal peduncle depth (X6) to the body weight all reached a level of significance. These attributes were very indicative of determining the body weight. Judging from the result of high correlation index (R^2 =0. 895), the main variables (X2, X5, X6) were selected. The multiple regression equation of body length (X2), body depth (X5) and caudal peduncle depth (X5) to the body weight was obtained. This paper provides a theoretical support for genetic breeding of turbot.

【题目】微卫星标记在大菱鲆(SCOPHTHALMUS MAXIMUS L.)家系系谱印证中的应用研究
【中文关键词】微卫星 大菱鲆 系谱识别
【英文关键词】microsatellites Scophthalmus maximus L. genealogical identification
【中文摘要】用8个微卫星标记对大菱鲆7个人工选育家系进行了系谱鉴别和遗传多样性研究。8个微卫星位点的平均多态信息含量为0.6721,平均杂合度为0.7206。8个微卫星位点在7个家系分析中,共检测到40个等位基因,每个位点的等位基因数在38个之间,每个位点平均有5个等位基因。根据已知亲本及子代基因型,成功的推断出了7个家系中缺失亲本的基因型。在双亲未知的情况下8个微卫星位点累积排除概率是97.07%,已知单亲时累积排除概率达99.63%。用UPG-MA法对7个家系的137个子代个体进行了聚类分析,90.5%同一家系的子代个体能完全聚类到一起,分类结果与系谱来源基本一致。微卫星标记可以为大菱鲆混养家系进行亲权鉴定和系谱构建提供技术支持。
【英文摘要】Eight microsatellite markers were used to estimate the kinship and the genetic diversity of seven turbot(Scophthalmus maximus L.) families.The average polymorphic information content(PIC) and the average heterozygosity were 0.6721 and 0.7606,respectively.Totally forty alleles were detected at eight microsatellite loci in seven full-and half-sib families of turbot.The number of the alleles at each locus ranged from three to eight.Based on the genotypes of either known parent or none of them and offspring,all the absent parental genotypes of the seven families were deduced.According to the unique alleles among the families,each family could be distinguished from the others.Cervus3.0 analysis showed that the combined exclusion probability was 97.07% if parents were both unknown and the combined exclusion probability was 99.63 % when only one of the parental genotype was known.A dendrogram was constructed using UPGMA based on genetic similarity matrix.The UPGAM dendrogram of the 137 individuals indicated that 90.5% of the individuals from each family could be fully clustered and the classification results accorded with the source of genealogy.The results showed that microsatellite marker is useful tool for genealogical identification of turbot.

【题目】牙鲆鳃细胞系染色体组型的变异分析

【中文关键词】牙鲆 细胞系 染色体 组型
【英文关键词】Paralichthys olivaceus cell line chromosome karyotype
【中文摘要】对传代296次的牙鲆(Paralichthys olivaceus)鳃细胞系(FG)进行染色体制备和组型分析,并与牙鲆活体鳃细胞组型进行比较。牙鲆活体鳃细胞染色体数目为48,且均为端部着丝粒染色体,染色体组型公式为2n=48,48t,NF=48。而鳃细胞系的染色体数目出现较大变化,有两个分布区间,一个区间是53~79;另一个是119~139。其模式染色体数为68,在模式细胞分裂相中,有30对端部着丝粒染色体和4对中部着丝粒染色体;染色体条数在119以上的分裂相中,除了有很多中部着丝粒染色体以外,小染色体也以很高的频率出现。通过上述研究分析表明,牙鲆鳃细胞系经多次传代后,其染色体与活体鳃细胞染色体相比存在着明显的差别,已经发生了变异,不适合用于牙鲆染色体核型、组型等方面的研究。[
【英文摘要】The karyotypes of flounder Paralichthys olivaceus gill and flounder gill cell line (FG) which had been subcultured for 296 generations were analyzed and compared with that of live gill cell of P. olivaceus. The chromosomes of flounder gill were all acrocentric chromosomes and the chromosome number was 481 the karyotype formula was 2n=48,48t, NF=48. The chromosome number of FG cell line fluctuated largely. Two interval distribution were identified: one was from 53 to 79, and the other was from 119 to 139. Its modal chromosome number was 68, and the metaphase chromosomes of modal cells included 4 pairs of metacentric chromosomes and 30 pairs of acrocentric chromosomes. Among the metaphases whose chromosome numbers were more than 119 many metacentric chromosomes were detected, and microchromosomes were also found at a high frequency. The results showed that after subcultured for many generations the flounder gill cell line chromosomes had changed apparently compared to flounder gill; the cell line had undergone cell transformation and karyotype evolution, and the chromosomes of FG cell line could not be used for chromosome research of flounder P. olivaceus

【题目】ISSR标记在牙鲆(PARALICHTHYS OLIVACEUS)与石鲽(KAREIUS BICOLORATUS)种间杂交一代的分离方式分析
【中文关键词】单对杂交 牙鲆 石鲽 ISSR标记 分离方式 连锁图谱 分离比例 孟德尔偏分离 多态性
【英文关键词】Tairmating Paralichthys olivaceus Kareius bicoloratus ISSR markers Segregation pattern Linkage map
【中文摘要】利用ISSR标记对牙鲆♀与石鲽♂单对杂交亲本及其子一代(全同胞家系)的分离方式进行了研究。结果表明,8个ISSR引物共扩增出181个标记,其中116个为多态性,占总数的64.09%;标记在F1代呈三种分离方式:符合孟德尔分离比例、偏离孟德尔分离比例和异常分离。符合孟德尔分离比例的情况包括:不分离(代表了亲本基因型的5种组合:AA×AA、AA×Aa、Aa×AA、AA×aa、aa×AA);1∶1分离(代表了亲本基因型的2种组合:Aa×aa、aa×Aa);3∶1分离(代表了亲本基因型的1种组合:Aa×Aa)。偏分离的标记包括:亲本中呈多态而在子代中偏离1∶1分离的标记和亲本均有而在子代中偏离3∶1分离的标记。异常分离的标记包括:F1代出现双亲均不具备的标记和双亲或单亲有而子代却无的标记。3种分离位点出现的频率和数量分别为:82.87%、150,11.05%、20,6.08%、11;双亲共有标记中85.33%的不发生分离,单亲特有标记中28.57%—35.85%发生正常分离,该研究结果可为进一步利用该群体构建牙鲆和石鲽遗传连锁图谱奠定良好的工作基础并提供一定的理论依据。
【英文摘要】The segregation pattern of ISSR markers in the F1 of interspecies cross between Paralichthys olivaceus and Kareius bicoloratus was studied.Eight primers yielded 181 markers,of which 116(64.09%) were polymorphic.The segregation showed three patterns:Mendelian,deviated Mendelian,and abnormal.The Mendelian segregation included three types:(1) non-segregation that reflects five genotypic combinations of the parents:AA×AA,AA×Aa,Aa×AA,AA×aa,and aa×AA;(2) 1∶1 segregation,reflecting two genotypic combination of the parents,Aa×aa and aa×Aa;(3) 3∶1 segregation,reflecting one genotypic combination of the parents,Aa×Aa.The deviated pattern includes two types:polymorphic in the parents and deviated from 1∶1 ratio in the progenies and the appeared in the parents and deviated from 3∶1 ratio in progenies.The abnormal pattern includes two types:absent in the parents but present in the progenies,and present in the parents but absent in the progenies.The percentages and amounts of the three patterns were 82.87%,150;11.05%,20;and 6.08%,11;respectively.In addition,85.33% of the markers presenting in both the parents did not segregate and 28.57%— 35.85% of the markers presenting in only one parent showed normal segregation.The above results could provide certain theoretical basis for further work to the construction of linkage map of P.olivaceus and K.bicoloratus.

【中文关键词】牙鲆Paralichthys olivaceus fibrinogen β 克隆 组织表达
【英文关键词】Paralichthys olivaceus fibrinogen β cloning expression
【中文摘要】通过mRNA差异显示发现一个鳗弧菌刺激后在牙鲆肝脏中表达量显著增加的片段,结合RACE技术得到了该差异片段1856bp的全长eDNA,包含一个1479bp的开放阅读框,编码的蛋白质含有fibrinogen β的C末端签名序列。同源性分析表明其氨基酸序列与鱼类以及哺乳类的fibrinogen β都具有高度的相似性,因此可断定此基因为牙鲆的fibrinogen β基因(GenBank登录号为EF581895)。RT—PCR分析表明,在注射鳗弧菌后,该基因在肝脏、肾脏、脾脏、腮、肠、心脏中的表达量呈现逐渐增加的趋势。推测其可能在鳗弧菌侵染中,起到了促进伤口愈合的作用,或通过和其他细胞因子结合在防御细菌的侵染中发挥免疫调节作用。
【英文摘要】A number of novel genes are identified,which are expressed in Japanese flounder(Paralichthys olivaceus) injected with Vibrio anguillarum by differential display.This paper reports the characterization of one of these novel genes,fibrinogen β.The full length cDNA is 1 856 bases long and contains an ORF of 1479 bases.Sequence analysis revealed that there was a C-terminal domain signature in the deduced amino acids.Alignment analysis showed that the amino acid sequence had a high identity with that from fishes and mammals.When challenged with Vibrio anguillarum,the expression level of flounder fibrinogen β in liver,kidney,spleen,gill,intestine and heart tissues increased obviously.These results might indicate that the flounder fibrinogen β may help stop bleeding by helping blood clots formation,or associate with other cytokines and play a critical role in the host immune response.

【题目】牙鲆同质雌核发育二倍体的诱导及其早期生长研究
【中文关键词】牙鲆 同质雌核发育 静水压力 生长 性控育种
【英文关键词】Paralichthys olivaceusmitogynogenetic diploidshydrostatic pressuregrowthsex control
【中文摘要】人工诱导雌核发育是水产动物性别控制的重要技术手段之一,同时也是快速建立近交系或纯系、建立遗传作图群体的方法之一。采用静水压力抑制受精卵第一次卵裂的方法诱导了牙鲆同质雌核发育二倍体。不同的处理起始时刻、不同压力及压力持续的时间对受精卵的发育及染色体加倍率有较大影响。处理组受精卵发育相对缓慢,畸形率较高,正常仔鱼孵化率较低。如果处理前受精卵保持在(15.5±0.5)℃,压力处理受精卵的最佳条件是:从受精后75 min开始、用55 MPa的压力处理6 min,该条件下处理组正常仔鱼孵化率较高,为13.7%,染色体观察和最大核仁数计数结果表明,此时的二倍体诱导率也最高。染色体观察结果还显示在不同处理组中存在不同比例的非整倍体。利用获得的最佳诱导条件处理获得了数千尾雌核发育幼鱼,观察表明,雌核发二倍体鱼的生长速度明显低于普通二倍体,且个体间差异较大。该研究为进一步开展牙鲆全雌育种和连锁图谱的构建提供技术支撑。
【英文摘要】Artificial production of gynogenetic diploids is one of the methods for sex control in aquatic animals,for the establishment of inbreeding or pure lines and for the construction of mapping material.In this study we produced viable mitogynogenetic diploids by hydrostatic pressure shocks in olive flounder Paralichthys olivaceus.The timing,different pressures and different treatment durations greatly affected the development as well as the diploidy rates of treated embryos.Treated eggs showed

slower development speed,higher malformation rate and lower hatching rate than normal diploid did.When the fertilized eggs were maintained at(15.5±0.5) ℃ before any treatment,the optimal hatching rate of normal fry was achieved by pressure shocks of 55 MPa applied at 75min after fertilization with 6min duration.Under these conditions,the normal fry hatching rate of the treated eggs was 13.7%.Chromosome observation and counting of the maximum number of nucleolus showed that the diploidy rate was the highest.Chromosome observation also defined some aneuploids in the treated groups.Several thousand of gynogens were obtained by treatment with the optimal conditions.These diploid gyngens showed slower growth rate and bigger among-individual variation than the normal diploid control did.The successful production of mitogynogenetic diploids provided materials for sex control breeding and for the construction of fine genetic map in this species.

【题目】3月龄牙鲆形态性状对体质量的通径分析
【中文关键词】牙鲆 形态形状 相关分析 通径分析 多元回归方程
【英文关键词】Paralichthys olivaceus Morphometric traits Correlation analysis Path analysis Multiple regression equation
【中文摘要】随机选取3月龄牙鲆 Paralichthys olivaceus 100尾,分别测量全长(X1)、体长(X2)、头长(X3)、体厚(X4)和体高(X5)共5个形态学指标和体质量(y)。通过SAS软件进行相关性分析和回归分析,分别计算以形态性状为自变量对体质量的通径系数和决定系数,进而对各性状对体质量的影响进行剖分。明确影响3月龄牙鲆体质量的主要形态性状,为牙鲆选育提供数据支持和理想的测度指标。结果表明,各形态性状间及与体质量的相关系数均达到极显著(P<0.01)。体长、体厚和体高对体质量的通径系数均达到极显著的水平(P<0.01);所选形态性状对体质量的决定系数R2=0.945,表明所选形态性状是影响3月龄牙鲆体质量的主要性状。通过对各形态性状偏回归系数的显著性检验,剔除不显著的性状自变量后,建立最优的多元回归方程:Y= -4.988+ 0.763X2+2.997X +1.089X,各偏回归系数均达到极显著水平(P<0.01)。
【英文摘要】One hundred 3-month aged Paralichthys olivaceus were randomly sampled for measuring five morphometric traits including full length (X1),body length (X2),head length(X3),body thickness (X4),body height(X5)and body weight(y). Through path analysis and multiple linear regression with SAS8.2 software,this study estimated the path coefficients and determination coefficients of each morphometric trait to body weight and dissected effect of each morphometric trait on body weight as direct effect and indirect effect.This study also confirmed the main morphometric traits influencing the body weight of 3-month aged P.olivaceus and provided data support and optimal measuring indexes for selective breeding of P.olivaceus.The results showed that the correlation coefficients between all morphometric traits and body weight were extremely significant(P< 0.01).The path coefficients of body length,body thickness and body width of 3-month aged P.olivaceus to body weight were all extremely significant (P<0.01). The total determination coefficient(R2)of all selected morphometric traits to body weight was 0.945, Indicating that the morphometric traits included in this study were major factors influencing body weight.The insignificant morphometric traits were excluded through coefficient test of partial regression,and then the optimal multiple linear regression equation was established as Y= -4.988+ 0.763X2+ 2.997X4+ 1.089X5,for which all included partial regression coefficients were extremely significant(P< 0.01).

【题目】牙鲆抗病群体和家系的建立及其生长和抗病性能初步测定

【中文关键词】牙鲆 抗病群体 日本群体 黄海群体 家系 选育 生长率 抗病力
【英文关键词】Paralichthys olivaceus Japanese population disease-resistant population Huanghai population family selection breeding growth rate disease resistance
【中文摘要】通过自然选择和人工感染途径筛选出抗鳗弧菌病牙鲆鱼种,将其培育成亲鱼94尾,建立了牙鲆抗病群体;从日本引进了牙鲆日本群体;以上述2个群体以及黄海中捕捞的黄海群体为基础群体,通过不同组合的交配,建立了63个牙鲆家系,其中半同胞家系54个,全同胞家系9个.生长比较实验表明这63个家系的生长速度存在着明显差异,从中筛选出生长快速的家系4个(家系36,42,43和57),生长较快的家系9个(家系27、28、35、39、41、51、60、65和76),生长慢的家系1个(75号家系).通过对59个家系的抗病能力测定表明,不同家系在抗鳗弧菌感染的能力上存在着明显差别,从中鉴定出抗病力强的家系3个(家系50,61和68号),其在鳗弧菌感染后的成活率高达60%以上;抗病力比较强的家系17个,其成活率为39%~60%;抗病力一般的家系33个,其成活率为17%~39%之间;抗病力差的家系6个,其成活率在17%以下.这些牙鲆家系的建立为牙鲆抗病、高产新品种的培育奠定了重要基础.
【英文摘要】Japanese flounder (Paralichthys olivaceus)is a widely cultured marine fish species in China and is high valued because of its fast growth and good taste.However,diseases of the cultured fish have occurred frequently and losses due to infectious diseases limit profitability and development of aquaculture.To breed new flounder strain with enhanced disease-resistance and growth rate is an important task in marine fish aquaculture.In the present study,94 disease-resistant individuals selected from natural selection and artificial challenge by pathogenic bacteria,Vibrio anguillarum, were used as one of basic populations for developing family.Japanese population of the flounder were imported from Japan in 2003 and used as one of basic populations.In addition,the flounder captured from Yellow sea were used as one of the basic population for developing family .Different mating of the above three populations resulted in 63 families in which 54 families are half-sibling family,9 families are full-sibling families. Growth comparison demonstrated that there are big differences in growth rate among the 63 families.Some families exhibited fast growth while some families grow very slowly.Among the 63 families,4 fast-growth families(Family36,42,43and57),9 secondly fast-growth families(Family27,28,35,39,41,51,60,65and76), and one slow-growth family(75)were identified.Bacterial challenge experiments demonstrated that there are big differences in disease resistance among the 59 tested families.Some families exhibited strong disease resistance to bacterial infection,while some families are not resistant to bacterial challenge.Among the 59 families,3 families(Family50,61and 68)with strong disease resistance with a survival rate of over 60%were identified,17 families with secondly strong disease resistance with a survival rate of 39-60%,33 families with normal disease resistance with a survival rate of 17-39% ,and 6 families with low disease resistance with a survival rate of less than17% were identified.Development of the 63 families lay foundation for selective breeding of flounder stains with fast growth and disease resistance.

【题目】异源冷冻精子诱导大菱鲆的雌核发育
【中文关键词】大菱鲆 鲈 精子 雌核发育 冷休克
【英文关键词】Scophthalmus maximus Lateolabrax Japonicus sperms gynogenesis cold shock
【中文摘要】采用冷冻保存的鲈(Lateolabrax japonicus)精液不经紫外线照射直接与大菱鲆(Scophthalmus maximus)卵进行杂交,可以刺激大菱鲆卵进行胚胎发育,胚胎发育率(发育至原肠期后胚胎成形的卵占总卵数的百分比)可达79.1%。通过与精子照射组单倍体发育过程等对比观察发现,杂交后代为大菱鲆的单倍体。如果在"受精"后2~10min内将大菱鲆卵在0~6℃冷休克处理10~50min,均能诱导卵子染色体加倍。对冷休克处理条件的筛选结果表明,在0℃条件下,卵子在受到鲈鱼精子刺激后6min开始进行冷休克处理25min,二倍体孵化率(雌核二倍体苗占受精卵的百分比)最高,可达34.8%。通过对各实验组卵发育情况的跟踪观察,发现单倍体与雌核发育二倍体在发育过程中有明显的差异,这种差异最早出现在8细胞期。单倍体胚胎头部发育不正常,眼泡较小,身体短且扭曲较严重,从肌节期开始沉积大量的黑色素颗粒。仔鱼孵化1周内单倍体即全部死亡。与正常二倍体对照组相比较,证明所得正常形态仔鱼即为雌核发育二倍体。
【英文摘要】The study aims to establish the method of gynogenesis induction in turbot(Scophthalmus maximus)by heterologous sperms of sea perch(Lateolabrax japonicus). Sperms of L. japonicus whether irradiated by UV light or not,both can stimulate S. maximus eggs to start development process. Besides,embryonic development of the two groups is entirely the same. Turbot eggs were

fertilized with untreated and UV light treated sperms of sea perch,respectively. Embryonic development rate of untreated group is almost 79.1% and that of treated group was 47.6%. Put into 13 °C seawater,the eggs hatched out after about 95 h. Because the genome is not doubled,both of them exhibit aberrant development. The embryos are deformed,with shorter tails,and hard to hatch. Only a few can hatch out. They present "haploid syndrome" such as small brain,shorter body axes, weak activition and diffi cult hatching. So,it can be concluded that the hybridization fries of turbot eggs and sea perch sperms are haploids. When the fertilized eggs are maintained at 13 °C before any treatment,chromosome diploid is achieved by early cold shocks starting at 2-10 min after fertilization,at -1-6 °C and for 10-50 min durations. For obtaining the maximal hatching rate of diploid (proportion of diploids to fertilized eggs) in this species(34.8%), the optimal cold shock starts at 6 min after fertilization,at -1.5-0 °C and continues for 25 min. The haploids die out after 5-7 days and the left ones are turbot gynogenesis diploids. There is no difference between gynogenesis diploid and common diploid and no crossbreed individuals of S. maximus and L. japoniaus are found. By comparing the development rate and morphological characteristics of common diploid,haploid and manually induced gynogenesis diploid embryos,it can be concluded that there are signifi cant differences in embryonic development rate among them. The development rate of common diploid and haploid is higher than that of manually induced gynogenesis diploid. In morphological characteristics,the haploid embryos exhibit typical haploid syndrome with the characteristics of small head,short tail,weak activation and being diff icult to break membrane. However,manually induced gynogenesis diploid embryos are identical to common diploid in the above parameters.

【题目】牙鲆抗鳗弧菌病家系筛选及其分析
【中文关键词】牙鲆 杂交组合 家系 弧菌病 抗病力
【英文关键词】Paralichthys olivaceus combination family Vibrio anguillarum disease resistance
【中文摘要】2007年以从养殖牙鲆(Paralichthys olivaceus)中筛选出的抗病选育群体、从日本引进的日本群体以及从黄海捕捞的野生群体为摹础,进行各种组合方式的交配,建立了63个牙鲆家系;2008年又建立了30个家系.对2007年培育的59个家系和2008年培育的30个家系进行了鳗弧菌(Vibrio anguillarum)感染实验,结果表明,不同家系间的抗病力存在极显著的差异(P<0.01).从2007年培育的59个家系中筛选出4个抗病家系,鳗弧菌感染后存活率达到50%以上;2008年的30个家系中5个家系抗病力较强,鳗弧菌感染后的存活率达到60%以上.2008年培育的30个家系其4月龄和6月龄的感染后存活率的相关系数为0.403(P<0.05),表明不同生长时期的感染结果具有一致性.230 d的体长和体质量与对鳗弧菌的抗病力存在显著的相关关系(P<0.05),皮尔森相关系数分别为0.282和0.237.研究发现,日本群体与抗病选育群体的杂交后代抗病性能表现优异,可以通过日本群体与中国群体间的杂交进行遗传改良,达到培育出高产、抗病牙鲆新品种的目的.

【题目】牙鲆不同家系生长性能比较及优良亲本选择
【中文关键词】牙鲆 家系 生长性能 后裔测定 亲本选择
【英文关键词】Paralichthys olivaceus family growth performance progeny testing parent selection
【中文摘要】针对牙鲆生长慢的问题,实验室建立了63个牙鲆家系生长性能进行了测定和比较分析.对日龄80~230 d的不同家系鱼苗的体长和体重进行了测量,发现家系之间存在明显的生长差异,生长最快家系平均体重是最慢家系的3.08倍,最大体长是最小体长的1.47倍.家系的绝对增重率分布在0.138~0.478.利用多元方差分析(MANOVA)对家系因子进行分析表明,牙鲆家系生长日龄对家系体长和体重未达显著影响(P>0.05);利用单因素方差(one-wayANOVA)分析和多重比较法(SNK)对63个家系的生长指标进行分析比较后表明,所有家系可分为生长快速、生长较快、生长一般、生长较慢和生长最慢5个组,5组之间具有显著性差异(P<0.01),筛选出19、36、51、21、69、61、64和81号8个生长快速家系.利用多重比较法对RS♂×JS♀、RS♂×RS♀、RS♂×YS♀、JS♂×RS♀、JS♂×JS♀、YS♂×:RS♀、YS♂×Js♀7个杂交组合产生的后代生长性状进行综合分析,发现JS♂×RS♀杂交产生的家系生长最快(P<0.05),不同群体间与群体内杂交产生家系在生长上存在着明显的差异(P<0.05).利用半同胞家系进行后裔性状测定和分析,对牙鲆3个群体中14个父本和12个母本的生长遗传性状进行鉴定,发现JS29、JS12和RS41 3个父本及RS75、RS28、RS86、JS21和JS22 5个母本产生的家系生长较快(P<0.05).利用生长最快家系和生长最慢家系的体长和体重数据,建立了体长和体重关系式,决定系数R~2>0.5、α值相近、b<3,表明家系个体的体长和体重密切相关,家系生长环境较稳定,两家系都处于异速生长阶段.

【题目】牙鲆3个养殖群体遗传结构的微卫星分析
【中文关键词】牙鲆 养殖群体 微卫星标记 遗传多样性
【英文关键词】Paralichthys olivaceus Cultured population Microsatellite marker Genetic diversity
【中文摘要】采用微卫星标记分析技术,用5个多态性的微卫星标记对来自3个不同国家(中国、日本和韩国)的牙鲆养殖群体进行了遗传多样性研究。研究结果表明,3个牙鲆群体平均等位基因在4.8~5.6之间,平均观测杂合度(H0)在0.3917~0.5643之间,平均期望杂合度(HE)在0.5981~0.6264之间。有多个位点在不同的群体中偏离哈代-温伯格平衡。遗传距离分析表明,中国群体与日本群体遗传距离最近,韩国群体与日本群体遗传距离最远。分子方差分析(AMOVA)表明,群体内遗传变异与群体间遗传变异分别占总遗传变异的92.44%和7.56%,固定系数(Fst)为0.0752(P<0.001),表明牙鲆3个养殖群体遗传分化显著。
【英文摘要】The genetic diversity of cultured Japanese flounder Paralichthys olivaceus from three countries (China, Japan and Korea) was studied by using five microsatellite markers. The results showed that the average number of alleles per population ranged between 4.8~5.6, and the mean observed heterozygosity (Ho) was 0.391 7~0.564 3, while the mean expected heterozygosity (HE) was 0.598 1~0.626 4.Hardy-Weinberg Equilibrium (HWE) test revealed several loci in some populations deviated significantly from HWE balance. Genetic distance analysis showed that the smallest distance was between Chinese and Japanese populations and the largest distance was between Korean and Japanese populations. The Fst values between populations indicated that there was significant genetic differentiation among the three cultured populations.

【题目】双列杂交分析比较两个养殖群体杂交牙鲆抗病力
【中文关键词】牙鲆 群体 杂交优势 抗病力
【英文关键词】Japanese flounder Paralichthys olivaceus Broodstock Heterosis Disease resistance
【中文摘要】采用双列杂交设计对牙鲆Paralichthys olivaceus两个养殖群体:日本群体(J)和中国抗病选育群体(C)进行群体间杂交和群体内自繁,获得C(♀)×C(♂)、J(♀)×J(♂)、J(♀)×C(♂)和C(♀)×J(♂)4个交配组合的子一代。针对受精率、孵化率、白化率和存活率4个性状进行了组合间的比较,计算了各项性状的杂种优势率,对组间各性状进行了方差分析,并进行了相关分析。结果表明,杂交组在受精率、孵化率及存活率上存在着不同程度的杂种优势,其中C(♀)×J(♂)后代在孵化率和存活率两个性状上的杂种优势率分别为33.99%和31.37%。对4个性状的表型相关分析表明,受精率和孵化率的相关系数为0.657,受精率和存活率相关系数为0.432,分别达到了极显著水平(P<0.01)。分析结果认为,两个不同群体间的种内杂交是牙鲆优良品种培育的有效途径。 更多还原
【英文摘要】The first generation of four broodstock combinations, C (♀) ×C (♂), J (♀) ×J (♂), J (♀) ×C (♂) and C (♀) ×J (♂) were obtained from mating and crossing within and between Japanese broodstock (J) and China disease resistante broodstock (C) of Japanese flounder Paralichthys olivaceus using complete diallel crosses. Comparisons of fertilization rate, hatch rate, albinism rate and survivorship were made among four treatments in this study. Heterosis and correlations were found in different characteristics. The results showed that there were significant differences between the hybridization groups and self-fertilized groups on albinism rate and survival rate. Heterosis on hatch rate reached 33.99% and heterosis on survivor rate reached 31.37% in C (♀) ×J (♂) group. Correction analysis demonstrated highly significant correlations (P<0.01) between fertilization rate and hatch rate (0.657), and fertilization rate and survival rate (0.432). These results indicated that the crosses between different stocks might be potentially effective for genetic improvement in Japanese flounder. 更多

【中文关键词】牙鲆 主要组织相容性复合体 等位基因 多态性
【英文关键词】Japanese flounder Paralichthys olivaceus Major histocompatibility complex Allele Polymophism
【中文摘要】根据牙鲆(Paralichthys olivaceus)主要组织相容性复合体(MHC)DAB基因序列设计特异性引物,在日本牙鲆基因组中扩增了包括DAB基因完整外显子2和内含子1在内的长度为408bp的DNA片段。对该片段克隆测序后,发现了37个MHC-DAB等位基因,各等位基因的频次以及各主型中亚型数目分布都不平衡。在第二外显子273bp核苷酸序列中有50个位点发生变异,核苷酸多样性PI值为0.0618,在编码的氨基酸序列中存在多态变异位点30个,其中简约信息位点29个,单变异位点1个。非同义替代与同义替代的比率在抗原结合区(PBR)和非PBR编码区分别为10.0和1.62,分析表明正向选择机制可能是产生牙鲆MHC-DAB多态性的主要因素。估计的核苷酸的转换和颠换数随着遗传距离的增加而增加。各等位基因间的系统发生关系表明,19个主型分为两个群。对氨基酸组分和密码子的偏倚性以及分布频率的分析表明各同义密码子的使用频率不均衡。本研究为牙鲆MHC-DAB基因的遗传进化和分子标记辅助育种的研究提供了理论基础。
【英文摘要】Polymorphismof themajor histocompatibilitycomplex (MHC) DAB gene inJapaneseflounder Paralichthys olivaceus was investigated using sequences analysis. Inthis study, 24individuals were selected to amplify partial exon1 and intron2,complete intron1 and exon2of DAB gene. 131sequences were subsequently used to analyze genetic variation and revealed 31different sequences, which presented 31 novel alleles belonging to19 allele major types according to accepted nomenclaturerules.Frequencyof alleles and numbers of subtype were not distributed equally. There were 50 variable sites inexon2, the average number of nucleotide diversity PI value of the whole sequences was 0106181 The nucleotide sequence was corresponded with putative91amino acids peptide, 32.97%(30out of 91) of the amino acid were variable, of which29parsimonyinformativesites wereobserved. The rates of non2synonymous substitution (dN) were 10100 times and 1162 times higher than the rate of synonymoussubstitution(dS) inthe peptide2bindingregions (PBR) andnon2PBR, respectively. The rate of dN occurredat a significantlyhigher frequencythanthat of dS in PBR, dN in PBRwas higher thanthat in non2PBR, but dS in PBR was significantlylower thaninnon2PBR. Inthis study, the highratioof dNPdS value andhighallelic diversityobservedinflounder suggesteda balancingselectionintheMHC2DAB gene, whichexplainedthe high polymorphism of MHC2DAB gene in Japanese flounder. The number of transitions and tranversions gradually increased with genetic distances, indicating that the MHC2DAB gene might discuss the genetic evolution. Phylogenetictree was based using NJ method revealed apreliminary phylogeny among19 MHC2DAB major typeof alleles. Frequencyof synonymcodonswere not distributed equally. These results provide molecular date for the study on genetic variation and marker 2 assisted selective breeding inJapaneseflounder [Acta ZoologicaSinica54 (5) :909- 917, 2008].

【题目】三个牙鲆育种群体亲本效应及遗传参数估计
【中文关键词】牙鲆 随机效应 遗传相关 遗传力
【英文关键词】Japanese flounder Paralichthys olivaceus random effect genetic correlation heritability
【中文摘要】针对牙鲆(Paralichthys olivaceus)养殖品种生长速度变慢、抗病力降低这一问题.近年来构建了牙鲆抗病群体(RS)、日本群体(JS)和黄海群体(YS)3个育种群体,开展牙鲆选择育种,建立了63个家系,收集了所有家系5 328尾鱼苗的体长和体重数据.借助线形混合模型(Linear mixed model)、"加性-显性"模型、约束极大似然法(REML)及最佳线性无偏预测(BLUP)分别估计亲本效应值、体重和体长遗传力和遗传相关、父母本效应和杂交效应.预测结果显示,其中父本130,141,146,170,218,229,303和308随机效应达到了极显著效应水平(P<0.01),父本112,122,141,190,212达到显著水平(P<0.05),所有母本体重随机效应达到了极显著水平(P<0.01);体长和体重两性状的加性、显性、表型和基因型相关分量都达到极显著

水平(P<0.01),体长和体重的加性方差比率均大于显性方差比率,可见两性状的遗传效应主要取决于基因的加性效应.体长的总遗传效应率为31.20%,体重的总遗传效应率为33.58%,体长和体重的随机方差比率分别达到68.80%和66.41%,说明养殖环境等因素对牙鲆体长和体重的影响较大,同时说明在牙鲆选择育种中消除环境影响极为重要.体长和体重的狭义遗传率分别为0.199和0.256(P<0.01),广义遗传率分别为0.312和0.336(P<0.01),牙鲆在以上两性状上属于中等遗传力,通过选择育种可取得较大的遗传进展.对3个牙鲆育种群体杂交随机效应估计结果显示,抗病群体和黄海群体在体长和体重两性状上加性随机效应显著(P<0.05);抗病群体分别与日本群体、黄海群体杂交,其后代表现出显性随机效应达到0.10的水平(P<0.10),黄海群体自交、日本群体和黄海群体杂交随机效应不显著(P>0.05),因此在杂交组配中选择抗病群体与其他两个群体交配可取得较好的效果.

【英文摘要】The Japanese flounder (Paralichthys olivaceus) is one of the most important species for the coastal fisheries and mariculture in China. However, in recent years, the Japanese flounder aquaculture has many problems such as disease, growth rate depression etc. due to neglect systemic breeding research.In recent years, through three methods such as artificial selection, introduction of fine stocks from Japanese and collection of local wild stocks, we have established gradually disease-resistant stock (RS), Japanese stock (JS) and Huang hai(Yellow) Sea stock (YS) as broodstocks. Subsequently, we constructed 63half-and full-sib families. After 230 days of growth, in total 5 328 individuals from these families were randomly captured to measure their body length and body weight. Based on these data, we estimated parents'random effect for each family using Linear mixed model. At the same time, we estimated the heritability and correlation coefficient between body weight and body length using Restricted Maximum Likelihood method (REML) based on additive - dominance model. Simultaneously, the parents' effect and hybrid effect were estimated using BLUP (Best Linear Unbiased Prediction) method. According to the estimated results of parents' random effect, the effect value for male 130, 141, 146, 170, 218, 229, 303 and 308 has reached a significant level of random effect (P<0. 01), and male parent 112, 122, 141, 190. and 212 has reached a significant level of random effect (P<0. 05). While the effect value for all female parents has reached a significant level of random effect (P<0. 01). The results of genetic correlations for body length and body weight showed that four components such as additive, dominant, phenotype and genotype have been to achieve significant level (P<0. 01). The results of estimated heritability showed that the additive variance ratio of body length and body weight was bigger than that of dominant variance, which suggested that the genetic effect of body length and body weight depends largely on the additive effect of genes. The total genetic effect of body length and body weight was 31. 20% and 33. 58%, respectively, and the random variance of body weight and body length was 68. 80% and 66. 41%, respectively. These findings suggested that environmental factors have great impacts on body length and body weight of Japanese flounder,so the elimination of the environmental factors was important in the process of breeding. The narrow sense heritability of body length and body weight was 0. 199 and 0. 256(P<0. 01), respectively, and the broad sense heritability of body length and body weight was 0. 312 and 0. 336(P<0. 01) , respectively. The heritability of body length and body weight was moderate, which indicated that selection for the two growth traits would result in greater genetic improvement. RS showed positive additive effect (P<0. 05) on body length and body weight, however, YS showed negative additive effect (P<0. 05) on body length and body weight. The hybrids between RS and JS showed positive additive random effect (P<0. 10), and the hybrids between RS and YS showed negative additive random effect (P<0. 10) , however, the random effects of the offspring of RS and the hybrids between JS and YS were not significant (P>0. 05). Therefore, RS hybridized with the other two stocks (JS and YS) could obtain good result in selective breeding of Japanese flounder.

【题目】牙鲆4个选择性繁育后代群体遗传结构的微卫星分析

【中文关键词】牙鲆 养殖群体 遗传多样性微卫星分析

【英文关键词】Paralichthys olivaceus Cultured stocks Genetic diversity Microsatellite analysis

【中文摘要】为了检测由3个牙鲆基础群体组合交配建立的4个选择性繁育后代群体的遗传多样性水平,本研究利用10对微卫星引物分析了其遗传结构信息。计算结果表明,等位基因数3~10个,平均等位基因数5.7个,有效等位基因数1.3571~4.5979,平均有效等位基因数2.9832,各个位点的平均观测杂合度0.2083~1.0000,平均期望杂合度0.2081~0.7956,多态信息含量0.1671~0.7501,其中中度多态位点两个,高度多态位点7个,各群体的多态信息含量从大到小依次为日本亲鱼与抗病亲鱼杂交后代群体、抗病亲鱼自繁后代群体、抗病亲鱼与黄海野生亲鱼繁殖后代群体、日本亲鱼自繁后代群体。分析结果

表明,4个群体的遗传多态水平均较高,对4个选择性繁育后代群体的平均观测杂合度值进行X。检验表明,群体间遗传多样性差异不显著。日本亲鱼自繁后代群体与中国海域亲鱼繁育后代群体(抗病亲鱼自繁后代群体和抗病亲鱼与黄海野生亲鱼繁殖后代群体)的遗传距离较远,分别为0.2724和0.3310。根据群体间的遗传距离利用NJ法构建系统树,抗病亲鱼自繁后代群体和抗病亲鱼与黄海野生亲鱼繁殖后代群体聚为一支,日本亲鱼自繁后代群体和日本亲鱼与抗病亲鱼杂交后代群体聚为一支,对遗传偏离指数的分析表明群体间的遗传平衡差异很大。

【英文摘要】Genetic diversity among four selective offspring stocks obtained by mating among three basic populations of Japanese flounder Paralichthys olivaceus was assessed using ten microsatellite loci.Results showed that the allele number(A)was 3~1 0,average allele number was 5.7,effective allele number(A,)was 1.357 1~4.597 9,average effective allele number was 2.983 2,average observed heterozygosity(H。)of each locus was 0.208 3~1.000 0,average expected heterozygosity(H)of each lOCUS was 0.208 1~0.795 6,average polymorphism information content(PIC)of each lOCUS was 0.167 1~0.7501,and polymorphism information content of JRS,RRS,RYS and JJS followed a decreasing order.Moderate and high genetic diversity was found in JJS and the other three stocks,and X。test revealed that there was no significant difference in average observed heterozygosity of the four selective offspring stocks.Genetic distance between JJS and RRS or RYS was comparatively higher than that between RRS and RYS.The genetic distance among the four stocks was used to construct NJ dedrogram via MEGA software.RRS and RYS were within one branch。and JJS and JRS within another branch.Genetic deviation index indicated a difference among stocks.These results indicated that these microsatellite 1OCi selected were very sensitive and could be used in further selective and genetic breeding studies of Japanese flounder.

【题目】Actinoalloteichus nanshanensis sp. nov., isolated from the rhizosphere of a fig tree (Ficus religiosa)

【中文关键词】无

【英文关键词】Actinoalloteichus nanshanensis sp. nov.

【中文摘要】无

【英文摘要】A Gram-positive, aerobic actinomycete, designated strain NEAU 119T, was isolated from the rhizosphere of a fig tree and was characterized using a polyphasic approach. The isolate formed branching, non-fragmenting vegetative hyphae and produced black pigment on yeast extract/malt extract (ISP medium 2). The G+C content of the DNA was 76.6 mol%. The organism had chemotaxonomic characteristics typical of the genus Actinoalloteichus and was closely related to the type strains of Actinoalloteichus cyanogriseus, Actinoalloteichus spitiensis and Actinoalloteichus hymeniacidonis, currently the only three recognized species of the genus Actinoalloteichus, sharing 16S rRNA gene similarities of 96.4, 96.6 and 98.1 %, respectively. However, the results of DNA – DNA hybridization studies demonstrated that the novel strain showed only 46.8% relatedness with the type strain of A. hymeniacidonis. In addition, a set of phenotypic characteristics also readily distinguished strain NEAU 119T from the type strains of recognized species of the genus Actinoalloteichus. According to the above data, it is proposed that strain NEAU 119T represents a novel species, Actinoalloteichus nanshanensis sp. nov. The type strain of Actinoalloteichus nanshanensis is NEAU 119T (5CGMCC 4.5714T5NBRC 106685T).

【题目】Identification of the major flavonoids from the extract of Pleioblastus argenteastriatus leaves in
【中文关键词】无
【英文关键词】Antioxidant activity; Pleioblastus argenteastriatus; Flavonoid; Structure elucidation
【中文摘要】无
【英文摘要】Pleioblastus argenteastriatus leaves were extracted with 95% ethanol, then the extract waspartitioned with water and petroleum ether. The water fraction after removal of the solvent was subjected to macroporous absorption resin (AB-8), and was eluted with H2O, 20% ethanol, 40% ethanol, 60% ethanol, 80% ethanol and acetone respectively. Most of the flavonoids were eluted into 20%, 40% and 60% ethanol fractions, and total flavonoid content of these three fractions were determined to be 38.01, 48.57 and 23.24 g of RE/100 g DW by colorimetric method. These three fractions exhibited strong scavenging activities for DPPH, hydroxyl radical and superoxide anion. Nine major flavonoids were isolated from these three fractions by sephadex LH-20 column chromatography method, and their structures were elucidated through analysis of MS, IR, UV and NMR data, and they were identified as follows: 5,7,3′-trihydroxy-6-C-β-D-digitoxopyranosyl-4′-O-β-D-glucopyranosyl flavonoside (1), 5,7,4′-trihydroxy-3′,5′-dimethoxy flavone (2), 5,3′,4′-trihydroxy-7-O-β-Dglucopyranosyl flavonoside (3), 5,4′-dihydroxy-3′,5′-dimethoxy-7-O-β-D-glucopyranosyl flavonoside(4), 5,7,3′,4′-trihydroxy-6-C-[α-L-rhamnopyranosyl-(1→6)]-β-D-glucopyranosyl flavonoside. (5),5,7,3′,4′-tetrahydroxy-6-C-β-D-glucopyranosyl flavonoside (6), 5,7,3′,4′-tetrahydroxy-8-C-β-Dglucopyranosyl flavonoside (7), 5,7,4′-trihydroxy-6-C-β-D-glucopyranosyl flavonoside (8) and 5,7,4′-trihydroxy-8-C-β-D-glucopyranosyl flavonoside (9).

【题目】5个群体微卫星DNA多态性研究
【中文关键词】5 个群体; 微卫星DNA; 多态性
【英文关键词】Five groups; Micro- satellite DNA; Polymorphism
【中文摘要】选用草原红牛30 头、蒙古牛10 头、夏洛来牛10 头、利木赞牛6 头和西门塔尔牛10 头组成的试验牛群体共计66 头, 经过牛血液或肝脏基因组DNA 的提取、8 对微卫星引物的PCR 扩增、扩增产物的聚丙烯酰胺电泳分型、分析各位点等位基因及全部个体的标记基因型、PPAP3.0 和SPSS10.0 软件计算基因频率、多态信息含量(PIC)和杂合度、遗传距离等步骤从分子水平上分析了在8 个位点的遗传多态性。结果表明, 微卫星位点IDVGA2、IDVGA46、TGLA44、BM1824、ETH225、BM2113、IDVGA44、IDVGA55 扩增出的条带数分别为6、6、6、5、4、2、6、4 条, 平均条带数分别为4.4、4、4.2、3.6、3.4、2、4.8、3.2 条, 平均PIC/H 分别为0.683 1/0.733 7、0.596 3 /0.660 2、0.646 2/0.700 1、0.558 1/0.630 2、0.552 9/0.615 8、0.371 1/0.417 4、0.683 1/0.728 4、0.5431/0.615 3, 均属于高度多态性位点。用于群体遗传标记的研究是较理想的。

【英文摘要】In this study, a group of Charolais, Limousin, Simmental, Steppe Red Cattle, Mongolian Cattle waschosen and its population genetic polymorphism was analyzed in the level of molecule by the process of genomeDNA extraction from blood, PCR amplification of 8 primers, fragment typing with polyacrylamide gelelectrophoresis (PAGE), allele and genotype analysis of every locus by UVIBAND system, calculation of allelefrequencies, Polymorphism information content (PIC) and Heterozygosity by PPAP3.0 and SPSS10.0. The resultsshowed that the number of alleles in IDVGA2, IDVGA46, TGLA44, BM1824, ETH225, BM2113, IDVGA44,IDVGA55 was 6, 6, 6, 5, 4, 2, 6, 4, and the polymorphism information content (PIC) and H was 0.6831/0.7337,0.5963/0.6602, 0.6462/0.7001, 0.5581/0.6302, 0.5529/0.6158, 0.3711/0.4174, 0.6831/0.7284, 0.5431/0.6153.All of them were high polymorphic loci. So they were ideal loci in the study of looking for genetic markers relatedto the production performance.

【题目】草原红牛H-FABP基因单核苷酸多态性及其对肉质的影响
【中文关键词】H-FABP; PCR-SSCP; 肉质; 草原红牛
【英文关键词】H- FABP, PCR- SSCP, meat quality, Red Steppe
【中文摘要】通过选择对肉质性状有影响的优势基因型作为遗传标记, 为草原红牛的继续选育提供理论依据。运用PCR- SSCP 方法对草原红牛H-FABP 基因5′- 调控区进行研究, 分析其与肉质性状的相关性。草原红牛H-FABP 基因5′- 调控区136 位点一个T 碱基的插入突变, 142 位点发生了G- A 转换。相关分析结果表明剪切力在AA 和AB、BB 基因型间差异极显著(P<0.01) , AB 与BB 基因型间差异不显著(P>0.05) , 其余肉质性状不同基因型间差异均不显著(P>0.05) 。H-FABP 基因对草原红牛嫩度有显著影响。
【英文摘要】Selected superiority genotype that influenced meat quality trait as molecular genetic marker, whichcould provide some theoretical basis for Red Steppe further breeding. H- FABP 5 ’ UTR polymorphisms in 16Red Steppes was studied used PCR- SSCP. The correlationship was carried out between different genotypeand meat quality. The results showed that base T was inserted in 136bp and the transformation of G→A in142bp. The difference between AA with AB and BB was extremely significant (P<0.01) in tenderness, but ABand BB was no significant difference (P>0.05). The difference between genotype with the others meat quality was not significant (P>0.05). The effect was very significant of H- FABP gene to tenderness traits in RedSteppe.

【题目】Histological study of germ cells development and apoptosis in mongolian sheep fetal ovaries
【中文关键词】无
【英文关键词】Sheep; Fetal ovary; Oogonia; Ovigerous cords; Primordial follicles; Apoptosis
【中文摘要】无

【英文摘要】Mammalian germ cells proliferate by mitosis and begin meiotic development in fetal ovaries. The aim of this study is to demonstrate the germ cell proliferation and apoptosis, and elucidated some of the key developmental events and stages in Mongolian sheep fetal ovaries. Fourty three pairs of sheep fetal ovaries at days 37 – 99 of gestation were collected from local slaughterhouse. Studies in histological structure of ovaries and germ cell apoptosis were achieved by employing light microscopy and terminal deoxynucleotidyl transferase-mediated nick end labeling (TUNEL). Following fetal gestation age increasing, three key development events were detected: oogonia fleetly proliferated by mitosis and clustered at days 37 – 55 of gestation in ovarian cortex forming oogonia nest; the formation of ovigerous cords (OC) and disorganization took place at day 51 – 81, especially at days 63 – 66 more OC developed, and more germ cells in OC entered meiosis prophase; subsequently, with the OC disappeared, primordial follicles gradually prevailed from day 73 of gestation. Another observation was germ cells apoptosis and the number of apoptotic germ cells showed a peak from day 58 to day 73 ($P < 0.05$) and germ cells in OC were prone to apoptosis. The study provides evidence about histological feature and germ cells apoptosis in sheep fetal ovaries.

【题目】Phytohemagglutinin improves efficiency of electrofusing mammary gland epithelial cells into oocytes in goats
【中文关键词】无
【英文关键词】Electrofusion; Mammary gland epithelial cells; Nuclear transfer; Phytohemagglutinin; Goat
【中文摘要】无
【英文摘要】The objective was to investigate the effect of phytohemagglutinin (PHA) on the fusion of mammary gland epithelial (MGE) cells into enucleated oocytes in goats. The toxicity of PHA was evaluated by testing its effect on the development of parthenogenetic caprine oocytes. The effective dose and duration of PHA treatment (100 mg/mL, 20 min incubation) was selected and used to compare fusion efficiency and embryo development following nuclear transfer. Two electrofusion protocols, chamber fusion (CF) and pressurized microelectrode fusion (pMEF), were also compared, when couplets were treated with and without PHA (100 mg/mL, 20 min). Fusion rate of couplets increased from 52.8 to 74.0% for the CF protocol ($P < 0.05$), but was not significantly different for the pMEF protocol (72.7% vs. 78.1%) after PHA treatment. There were no significant differences between treated group and control in rates of subsequent cleavage or blastocyst development. Following transfer of the cloned blastocysts derived from the PHA-treated group and the control group into synchronized recipients, pregnancy rates (Day 30) were not significantly different between treated group and control (28.6% vs. 25.0%). However, all recipients aborted within 120 d, microsatellite DNA analyses confirmed that the aborted fetuses were genetically identical to the donor goat. In conclusion, the fusion rate of caprine MGE cell couplets was improved by pre-incubating couplets in medium containing 100 mg/mL PHA prior to electrical pulsing, and embryos derived from PHA treatment established early pregnancies.

【题目】植被作用下土壤干化的反馈效应及相关问题讨论
【中文关键词】植被建设; 土壤干化; 反馈效应; 黄土高原
【英文关键词】vegetation construction; soil desiccation; feedback effect; Loess Plateau
【中文摘要】黄土高原普遍发生的植被作用下的土壤干化现象,从一个独特角度恰当反映了环境对植被的限制作用。由于人工林草植被不同于天然植被,其负反馈调节机制脆弱,这种植物生长用水与环境供水之间的矛盾表现,使人工林草植被生长滞缓,稳定性下降,甚至导致其衰亡,并对后续深根性植物的生长发育一般起到显著的抑制作用。但是,后续天然植被或者浅根性植物却仍然能够继续良好发育。显然,植被作用下的土壤干化,对追求一定的经济目标来说有其不利性,但对于防止土壤侵蚀并不一定就产生负面影响。需要根据经营目标区别对待人工林草植被的稳定性。人工林草植被的自然化过程研究是有关生态恢复的一个有意义的命题。
【英文摘要】Owing to vegetation construction in the Loess Plateau, much attention has been paidto soil desiccation by vegetation for many years. Right thinking about soil desiccation by vegetation would conduce to controlling it, and furthering reasonable management and evolution of vegetation. The feedback response of vegetation to soil desiccation by itself is mainly discussed in this paper. We believe that the phenomenon of soil desiccation by vegetation occurring universally in the Loess Plateau just reflects

environmental limitation on vegetation from a peculiar angle. Because artificial forest and grass vegetation is weak in the mechanism of negative feedback regulation compared with natural vegetation, the contradictory show between water use by plant growth and water supply by environment constitutes a so serious threat to stability of artificialforest and grass vegetation that it grows slowly and even declines, and commonly takesmarked restraining effect on development of follow- up plant rooting deep after vegetation declination. But on the other hand it is noticeable that follow- up natural vegetation or plant rooting superficially still may succeed to grow well. It is obvious that soil desiccation by vegetation isn ’t favorable for seeking economical goal, but it would uncertainly cause a negative effect on protection of soil from erosion. The stability of artificial forest and grass vegetation should be treated respectively according to their managing goals. The research on naturalizing process of artificial forest and grass vegetation would be a significant proposition related to ecological restoration.

【题目】ABT和CaCN_2对葡萄插条萌芽生根及一些生理生化指标的影响
【中文关键词】葡萄; 生根粉; 石灰氮; 生化代谢; 生根
【英文关键词】grape, ABT, CaCN2, biochemical metabolize, rooting
【中文摘要】以无核白葡萄一年生枝条为试材,研究ABT和CaCN2对葡萄插条萌芽生根及生理生化代谢的影响。结果表明,ABT处理的葡萄硬枝插条生根早,生根率高,生根数多,不定根生长健壮;CaCN2处理的葡萄插穗萌芽早,萌芽率高,萌芽后枝条平均生长量大;ABT+CaCN2处理的萌芽率和生根率介于二者之间,但均与对照差异显著(P≤0.05),与ABT、CaCN2单独处理差异不显著。ABT和ABT+CaCN2处理能促使插穗中淀粉向可溶性糖的转化,从而促进插穗生根。IAAO、PPO与葡萄扦插生根过程有密切关系,其变化因生根时期不同而不同。总的趋势是前期高活性的IAAO有利于降解体内高浓度的IAA,促进根的诱导;后期低活性的IAAO有利于保护IAA免受分解,促进根的生长。PPO在不定根形成时,活性迅速上升,从而促进生根。
【英文摘要】The rooting and physiological biochemistry metabolize changes were studied during rooting of the hardwood of Thompson seedless grape (Vitis vinifera L.) by treating of ABT and CaCN2 with water control. The results indicated that the cuttings by treating of ABT rooted earlier, rooting date and the number of roots more than other treatments, and the roots grew healthily. The cuttings by treating of CaCN2 buded earlier,and buding date and the length of branchs were more than others.Root rates and bud rates by treating of CaCN2 firstly , then by treating of ABT were between ABT and CaCN2, respectively, but there were significantdifference with water control, and no significance ABT and CaCN2, respectively. Starch could change to soluble sugar easily by treating of ABT singly or both ABT and CaCN2, so promoting rooting. The activity of indoleacetic acid oxidase (IAAO) , polyphenol oxidase (PPO) , as w ell as, the relationship between enzyme activities and rooting capacities of Thompson seedless grape cuttings was studied in this paper. There were the more relationship between rooting capacities and enzyme activities, which changed with different rooting time. During callus formatting, higher IAAO activities could release IAA in grape, benefiting inducingroots, but during root elongating, lower IAAO activities benefited to protect IAA been released, promoting roots growing. During the course of adventitious root formation, PPO activities increase quickly, promoting rooting.

【题目】黄土丘陵沟壑区林地水文生态效应
【中文关键词】丘陵沟壑区; 林地; 水土保持; 土壤水分
【英文关键词】loess hilly gullied region; woodland; soil and water conservation; soil water content
【中文摘要】根据安塞水土保持试验站1993~2002年林地径流小区的降雨产流产沙的定位观测资料及2002年土壤含水量资料,分析了不同树种对坡面尺度降雨产流产沙及土壤水分的影响。结果表明:场降雨径流小区的产流量、产沙量与降雨量具有较好的相关性;多元回归分析表明,场降雨产流量和产沙量与降雨量和最大30min雨强的乘积呈正相关,与植被覆盖度呈负相关,场降雨产沙量回归方程复相关系数为0.253,各处理场降雨产流量回归方程复相关系数的变化范围为0.465~0.723,均达到了极显著的水平(P<0.01)。同时,各树种均具有良好的减流减沙功能,与农地相比,年均产流量和产沙量分别减少4.8%~52.9%和26.8%~86.0%;沙棘纯林及其混交林的减流减沙效益优于油松纯林。同时,沙棘纯林及其各混交林在造林初期就表现出良好的减流减沙效益,随着树龄的增长,其作用更加明显;而油松纯林在造林初期作用不明显,甚至出现产流量和产沙量大于农地的现象,但随着树龄的增长,减流减沙作用逐渐呈现并增大。沙棘纯林及其混交林30cm以下土壤含水量在整个生长季中均呈递减趋势,生长季初(4月份)土壤含水量最高,而生长季末(10月份)降到最低值。2002年沙棘纯林的耗水深度为220cm,而其混交林的耗水深度达到300cm。同时,在整个生长季节中,沙棘纯林及其混交林整个剖面平均土壤含水量存在着显著的差异,表现为:沙棘×杨树<沙棘<沙棘×油松。
【英文摘要】Soil and water conservation benefits of different afforested trees in the loess hilly gullied region were evaluated based on runoff and soil erosion measured in vegetated runoff plots between 1993 and 2002. Soil water conditions and their dynamics under forestation trees were also analyzed according to soil water content measured in 2002. Results showed that runoff and sedmient were correlated w ith rainfal.l Multiple regression analysis indicated that there was a positive correlation between runoff and the product of rainfall depth and maxmium 0.5 hour rainfall intensity at the significant level of 0.01, as well as between sedmient and the product of rainfall depth and maxmium 0.5 hour rainfall intensity. However, both runoffand sedmient were negatively correlated with vegetation cover. The multiple correlation coefficient ranged from 0.465 to 0.723 for runoff and was 0.253 for sedmient. In addition, soil and water conservation benefits were reasonably evident for all afforested trees. Compared with farm land, runoff and sedmient decreased to 4.8% ,52.9% and 26.8% 86.0%,respectively. The soil and water conservation benefits of Hippophae rhamnoides and its mixtures were greater than those of Pinus tabulae form is whose cover was poor in the early growth years, during which runoff and sedmient were even greater than those of farm land. But the benefits increased as the trees grew. However, the soil and water conservation benefits ofHippophae rhamnoides and its mixtures were good even in the early grow ing years and became even better as trees grew over tmie in eleven years. So ilw ater content below 30 cm soil layer under the H rhamnoides and itsm ixtures decreased during the entire growing season, being highest in April and lowest in October. Water consumption depths of the Hippophaerhamnoides under monoculture and biculture were 220 and 300 cm, respectively, in 2002. There were significant differences in soil water content form ono species of Hippophae rhamnoides and its binarym ixtures during the entire growing season. The tree species, in terms of soil water content, ranked in the ascendant order of Hippophae rhamnoides Populussim onii Carr mixture, Hippophae rhamnoides, and Hippophae rhamnoides Pinus tabulae form is mixture

【题目】黄土高原沟壑区不同树种的水土保持效益及其适应性评价
【中文关键词】黄土高原沟壑区; 造林树种; 造林方式; 水保效益; 土壤水分
【英文关键词】tableland gully area of the Loess Plateau; afforested tree species; afforestation method; soil and water conservation benefit ; soil water content
【中文摘要】【目的】研究黄土高原沟壑区不同树种幼林的水土保持效益及其适应性。【方法】以草地为对照,对黄土高原沟壑区刺槐、油松、沙棘、侧柏纯林及其混交林径流小区的产流产沙情况、土壤水分状况及各树种的生理特性进行了分析。【结果】造林初期,各树种及其不同造林方式的水土保持效益均比较差,处于水土保持功能低下阶段,土壤侵蚀的差异主要是由植被的不同覆盖度引起的,二者呈二次多项式关系;回归分析表明,当覆盖度达53%时土壤侵蚀较为轻微。草地和各树种林下0~250 cm土层土壤水分变化较大,其中以刺槐消耗土壤水分最多,其次是侧柏,油松、沙棘和草地之间差异不明显;刺槐纯林与其混交林下土壤水分的差异比较明显,而其他树种不同造林方式下的土壤水分无明显差异。各树种叶片的水分利用效率表现为侧柏>油松≈沙棘>刺槐,油松与沙棘混交造林后两者的水分利用效率都有显著提高;各树种叶片的蒸腾速率表现为刺槐≈沙棘>油松>侧柏,沙棘与油松或刺槐混交后,油松与刺槐的蒸腾速率均有所降低,而沙棘变化不显著。【结论】综合考虑树种的水保效益及其适应性可以发现,沙棘与油松混交可能是黄土高原沟壑区较为适宜的一种造林方式。
【英文摘要】Objective Soil and water conservation benefits and suitability of different young afforestedtrees were evaluated in tablel and gully area of the Loess Plateau. Method The runoff, soil erosion, soil water content and physiological characteristics of , mono species of R . p seudoacacia, P. tabulae formis, P. or iental is, H . r hamnoides and their mixtures in vegetated runoff plots were analyzed taking grassland asa control. Result The results demonstrated that in the early stage of afforestation, the benefits of water and soil conservation were relatively poor for all afforested tree species and afforestation methods. The differences of soil ero sion amo unt s betw een each tree species under monoculture or biculture resulted f rom differences in vegetation cover . The relationship between soil erosion and vegetation cover could be ex pressed by a quadratic function. Regression analysis showed that soil erosion was not severe w hen vegeta tion cover was more than fifty percent . Soil water content varied with the soil depth within the top 250 cm in grassland and each wood lot, but it became more or less constant below the 250 cm depth. R. p seudoaca cia consumed most soil water, follow ed by P . or ientali s, P . tabulaef ormi s, and H . r hamnoides with the lasttwo being similar to the grassland. There were no significant differences in soil water contents between mono species and its binary mixtures, except for R. p seudoacacia and its mixtures. Water use ef ficiency followed the orderof: P. or ientalis > P. tabulaef ormis !H . rhamnoides > R. p seudoacacia. The leaf water use efficiencies of bothP. tabulaeformis and H . rhamnoides in the mixture were significantly increased compared to the mo nocul tures. The leaf transpiration rates follow ed the order of : R. p seudoacacia ! H . rhamnoides > P. tabulae formi s > P . or ientali s. Compared to their monocultures, the leaf transpirationrates of P. tabulaeformisand R. p seudoacacia decreased in their biculture mixed with H . r hamnoides, while the transpiration rates ofH . rhamnoides remained relatively constant . Conclusion Considering soil and water conservation benefitsand adaptability of each tree species, we could conclude that the biculture of H . r hamnoides and P . tabulae formis is very likely suitable for af forestation in tableland gully areas o f the Loess Plateau.

【题目】渭北旱塬不同龄苹果细根空间分布特征
【中文关键词】根长密度;细根分布;苹果;渭北旱塬
【英文关键词】root length density; fine root distribution; apple; Weibei rainfed tableland
【中文摘要】以渭北旱塬3龄、10龄、15龄和20龄苹果树为对象,采用根钻法,沿3等分园半径方向(径向)、距树干1.0、1.5m和2.0m处设置采样点,研究了不同树龄的细根空间分布特征。结果表明,3龄苹果细根主要分布于径向1.5m以内和垂向0.5m以上,15龄和20龄苹果细根分布超出径向2.0m和垂向1.4m,10龄细根分布范围大于3龄,与15龄和20龄接近。在根系主要分布区内3龄和10龄细根分布稀疏,15龄和20龄细根分布密集;细根空间分布演化过程可分为3个阶段,即3~10龄为细根范围扩张阶段,10~15龄为细根密度扩张阶段,15~20龄为细根密度退化阶段;苹果细根空间分布无明显方向性差异;10龄、15龄和20龄苹果表层(0~20cm)平均根长密度低于下层(20~40cm),高峰值一般出现在40~80cm,此深度以下根长密度随深度递减,3龄苹果表层平均根长密度高于下层;在径向2.0m内随径向距离增大,3龄、15龄和20龄平均根长密度逐渐降低,而10龄根长密度逐渐增加。根长密度在径向变化上存在局部变异现象。
【英文摘要】Root distribution and its resource demands of different aged app le trees are not same. Numerous studies focused on the spatial distribution of roots of specific aged trees and however, few studieswere done for different aged app le trees.The spatial distribution of the fine roots of different aged apple trees in the Weibei rainfed tableland was investigated. Thefine roots of the 32 aged apple tree were distributed mainly within a range of 1. 5 m, horizontally, and within a thickness of 0.5 m, vertically, while those of the 20 and 152aged app le trees exceeded 2 m in the radial direction and 1. 4 m in the vertical direction. The dominated distribution range of the 10-aged tree was greater than that of the 3-aged tree, and it was close to those of the 15 and 20-aged trees. The fine roots of the 3 and 10 aged treeswere sparsely distributed, while those of the 20 and 15-aged trees were densely distributed. Evolution of root length density (RLD) of the fine roots can bedivided into three stages: range expanding stage (3 and 10-aged) , density expanding stage (10 and 15-aged) , and density degradation stage (15 and 20-aged) . Directional difference in the RLD of fine roots was not distinct. The RLDs in 0220 cm surface soil for 10, 15, and 20-aged trees were less than those in 20-40 cm soil layer. Peak values for the trees wereobserved in 40-80 cm soil layer below which the RLDs decreased gradually. The RLD of the 3- aged tree in 0-20 cm surface soil was higher than those in deeper layers. Within 2 m range in radial direction, the RLDs of the 3, 15, and 20-aged trees increased with distance, while that of the 10-aged tree decreased. Some variations of RLD in radial direction were found forall aged trees.

【题目】黄土塬区不同地形部位和土地利用方式对土壤物理性质的影响
【中文关键词】土壤物理性质;地形部位;土地利用方式;黄土塬区;小流域
【英文关键词】soil physical property; slope position; land use type; loess tableland area; small watershed.
【中文摘要】在黄土塬区王东沟流域采集不同地形部位和不同土地利用方式下土壤样品,测定其颗粒组成、容重和饱和导水率,借助变异系数、非参数检验等方法研究了不同地形部位和不同利用方式对土壤物理性质的影响.结果表明:土壤物理性质在水平方向和沿垂直剖面都存在变异,但在同一地形部位或同一土地利用类型内,容重和颗粒组成基本相似.水平方向,饱和导水率属强变异,粘粒和砂粒含量属中等变异,粉粒含量和容重属弱变异;沿垂直剖面,土壤的粒级分布具有连续性,但0~25cm的土壤容重和饱和导水率与下层土壤差异显著.沿坡面从上向下,土壤趋向粘重,但饱和导水率增大;其中上坡位和中坡位的土壤性质相似,在相关研究中可以进行合并.草地与其他利用方式下的土壤性质差异显著,主要受地形部位的影响;耕地和果园的土壤性质相似且不同于其他利用类型,表明人为干扰对土壤物理性质有重要影响.
【英文摘要】Soil samp les under different land use types and at different slope positions in theWang2donggou watershed of loess tableland area were collected to determine their particle composition,bulk density (ρ b) , and saturated hydraulic conductivity (Ks) , and the effects of land use type andslope position on the soil physical p roperties were studied in virtue of the variation coefficient andnon2parameter tests. The results showed that the physical p roperties of soil varied in horizontal di2rection and vertical p rofile, however at the same slope position or under the same land use type, the ρ b and particle composition were similar. In horizontal direction, Ks varied strongly, slit content and ρ b varied weakly, and clay and sand contents varied medially. In vertical p rofile, soil particles hada continuous distribution, but ρ b and Ks varied greatly in 0- 25 cm layer. W ith the slope degree de2scended, soil contained more clay and had a higher ρ b, and Ks increased. At upper and middleslopes, soil physical p ropertieswere similar, and thus, could be merged into one in related resear2ches. There was a significant difference in soil physical p roperties between grassland and other landuse types, which wasmainly due to the effects of slope position, but the soil physical p roperties infarmland and orchard were similar, indicating the important effects of human activities.

【题目】黄土塬区旱作农田长期定位施肥对冬小麦水分利用的影响
【中文关键词】黄土高原; 长期定位施肥; 土壤水分; 水分利用; 冬小麦
【英文关键词】Loess Plateau; long term fertilization; soil water; water use; winter wheat
【中文摘要】对长期定位施肥试验第22年度的测定数据进行了分析,探讨了旱地施肥对冬小麦水分利用的影响。试验结果表明,测定年份冬小麦的耗水深度受播种前雨季降雨入渗深度的影响位于地下200 cm左右。长期单施磷肥处理,播种期土壤有效贮水量与不施肥的对照接近,而单施氮肥,氮磷配施和氮磷钾配施均显著低于对照;在施P2O590 kg/hm2配施氮肥或施N 90 kg/hm2配施磷肥,随着施氮量或施磷量从0增加到180 kg/hm2,播种期土壤有效贮水量均逐渐降低,但前者作物的土壤水分消耗表现出降低趋势,而后者表现出增加趋势。与对照相比,各施肥处理均提高了土壤有效底墒的利用率。氮磷配施比单施磷肥降低了土壤供水占作物耗水的比例,使得作物生长和产量的形成对当季降水的依赖性增加。与对照相比,氮磷配施及氮磷钾配施显著提高了冬小麦收获指数、产量和水分利用效率,而单施磷肥和氮肥使收获指数、产量和水分利用效率显著降低。施P2O590 kg/hm2的条件下,不同施氮量之间收获指数差异较小,而产量和水分利用效率均高于单施磷肥;施N 90 kg/hm2的条件下,不同施磷量作物的收获指数、产量和水分利用效率均得到提高。
【英文摘要】The water utilization of winter wheat in dryland farming was studied according to the data measured at the long term fert ilization experiment, which has been established for 22 years on the Loess Plateau. The results indicated that soil water consumption depth was affected by the infiltration depth during raining season before seeding, and it was as deep as200 cm in the soil profile in the study year. As for ASWS(available soil water storage) at seeding stage after long term fertilization, single phosphorus application treatment was similar to the controlled treatment , while single nitrogen appli cation or mixed nitrogen phosphorous application or mixed nitrogen phosphorous potassium application was less than the control treatment. For the mixed nitrogen with 90 kg/ ha phosphorus or mixed phosphorus with 90 kg/ ha nitrogen treat ment, ASWS at seeding stage took a descendant trend as the nitrogen rates or the phosphorus rates increased from 0 to 180 kg/ ha, while for this experiment year, soil water consumption by crop was decreased by the former treatments con trary to the latter. For phosphorus applicat ion of 90 kg/ ha,

both available soil water content and soil water consumption of winter wheat in the study year were significantly decreased by increasing nitrogen applicat ion. For nitrogen applicationof 90 kg/ ha, available soil water content was decreased with increased phosphorus application, while soil water consump tion of winter wheat was increased. Compared with the control treatment, single phosphorus applicat ion, mixed nitrogen phosphorous application, and mixed nitrogen phosphorous potassium application increased utilizat ion rate of available soil water content. Mixed nitrogen phosphorus applicat ion increased utilization rate of available soil water content in compari son with the single applications of the two fertilizers, but compared with single phosphorus applicat ion, mixed nitrogen phosphorus applicat ion decreased the proportion of soil water consumption to crop water consumption and increased the dependency of crop yield on precipitat ion during the growing season. Harvest index, grain yield, and water use efficiencyfor mixed nitrogen phosphorus applicat ion and mixed nitrogen phosphorus potassium application were all increased in comparison with single nitrogen application or single phosphorus application treatments. When phosphorus was applied at90 kg/ ha, the difference in harvest index for various nitrogen applicationrates was not significant, while grain yield and water use efficiency were higher than those in the case of single phosphorus application. When nitrogen was applied at 90kg/ ha, harvest index, grain yield, and water use efficiency at different phosphorus application rates were all increased in comparison with single nitrogen application.

【题目】提高人工植被培育中土壤抗旱性的综合措施
【中文关键词】作物栽培,造林种草,抗旱,技术
【英文关键词】crop cultivation, forestation and grass planting, drought resistance, techniques
【中文摘要】干旱条件下培育人工植被,采取适当的抗旱措施是必不可少的,其中作为植物生长发育所需水分、营养的载体,土壤是显著的可调控对象,对其合理处置与抗旱有着密切的关系。以土蓄水、抑制蒸发、改良土壤、培肥地力等有利于对有限水分的利用。提高土壤抗旱性的综合措施包括土壤耕作、土壤培肥、土壤覆盖、防止水分深层渗漏等方面。在气候暖化的背景下,为增强土壤抗旱措施的效果,提高其技术水平,分析了与蓄水、保水、集水以及用水有关的土壤抗旱方式及其特点。在综合述评的基础上,还讨论了土壤抗旱措施的技术应用问题和需要研究的主要方面。
【英文摘要】Cultivating artificial vegetation under drought circumstances needs to take adequate measures for drought resistance indispensably. Soil is a notable controlled object as carrier of water and nutrients required by plant growth and development, and reasonable treatments of it are closely related with drought resistance. Soil water storage, restraint evaporation, soil improvement and betterment of land fertility are beneficial to the using of limited water. Thecomprehensive measures for improving drought resistance of soil include several aspects such as soil tillage, soil fertilization, soil mulching and preventing water seepage to deep layer. In the background of the climate warming, in order to enhance the effects of measures for improving drought resistance of soil and raise their technical level, ways andcharacteristics of soil drought resistance measures concerning water storing, water retaining, water harvesting and water using were analyzed. Based on the synthetical review, issues on application of techniques for soil drought resistance measures and main aspects which needed to research for the future were also presented.

【题目】黄土高原农村社会-生态系统适应性循环机制分析
【中文关键词】社会—生态系统; 适应性循环; 黄土高原; 王东村
【英文关键词】social-ecological system; adaptive cycle ; Loess Plateau; Wangdong Village
【中文摘要】基于社会—生态系统适应性循环模型,以陕西省长武县王东村为例,通过对系统几个关键变量的观察,分析了黄土高原地区农村社会—生态系统适应性循环的演变机制;并从适应性循环周期中研究了系统的恢复力和适应性能力变化过程。结果表明,建国以来王东村社会—生态系统依次经历了一个完整的适应性循环(1949—1961年)、贫穷困境(1961—1980年)和新的一个适应性循环的前环阶段(1980至今);制度变革特别是土地制度的调整是系统循环过程的驱动力,而技术革新可以使系统维持在开发阶段;干旱等气候变化事件对系统具有强烈的扰动作用,并可能导致整个系统崩溃释放。
【英文摘要】Based on the adaptive cycle model , the evolvement mechanism of social2ecological system was explored in a case st udy of Wangdong Village , Changwu County , Shaanxi Province. The dynamic adaptive cycles of Wangdong Village were identified by integrating key variables from social , economic ,and ecological aspect s. The social2ecological system of Wangdong Village has experienced a total adaptive cycle (1949 —1961) , then fell into a poverty t rap (1961 —1980) , and now is in t he exploitation p hase of a new adaptive cycle (1980 -) . The institutional changes , especially the adjustment of land use policies , are the main drivingforce for t he adaptive cycles. The technical innovation maintains t he current system in the exploitation p hase. Climate change such as drought is a st rong dist urbance to the social ecological system and may lead the system into a releasing phase.

【题目】长武塬区大气降水中氢氧同位素特征分析
【中文关键词】氢氧同位素;降水;大气降水线;环境效应;氘盈余;长武塬区
【英文关键词】ydrogen and oxygen isotopes;precipitation;local meteoric water line(LMWL);environmental effects;deuterium excess;Changwu tableland
【中文摘要】通过测定长武塬区2005年降水水样的氢氧同位素组成,分析了该区降水氢氧同位素组成的基本特征。结果表明,长武塬区大气降水线方程为δD=7.44δ~(18)O+1.69,其斜率和截距与全球以及我国大气降水线相比均偏小,这与研究区地理位置和气候条件有关;降水氘盈余d值4—6月份较大,大于或接近10,7—10月份则小于10;以天为时间单位采集的次降水,其氢氧同位素组成的温度效应和降水量效应均不显著,而连续2 d长历时降水的雨量效应极显著;降水氢氧同位素组成季节变化明显,春季降水的氢氧同位素值较高,夏季同位素值降低,秋季同位素值最小,这在以次降水量为权重的加权平均值中表现得更加明显。
【英文摘要】Precipjtation is the most important component of water cycle procesS. Hydrogen and oxygen isotopic compositions of precipitation are closely related to the source of vapor and the meteorologic process of rainfan formation. The isotopic compositions of precipitation over the Changwu tableland in 2005 are studied.Local meteoric water line is fitted as)=7.44 818 O+1.69.Its slope and intercept are Iower than those of global meteoric water line and Chinese meteoric water line,which are related to the geographical and meteorological characteristics in the area. Deuterium excess shows seasonal variatioll. The values of deuterium excess are higher than or about lO from April to June and Iess than 10 from July to October.EIoth temperature and rainfaU amount have ‘ no significant effect on the isotopic compositions of individual rainfall events with one—day—period. For the 2一day—period rainfall events,rainfall amount have significant effect on them. Moreover,the isotopic compositions of precipitation have seasonal variation. The 8D and 18 0 values arehigher in springj lower in summer,and much lower in autumn,which is more remarkable in the average of 8D and 818 O when the individual rainfall amount is assigned as a weight.

【题目】汶川大地震陇东黄土高原崩塌滑坡的调查分析
【中文关键词】5. 12汶川大地震; 陇东黄土高原; 土壤侵蚀; 环境效应
【英文关键词】5. 12 Wenchuan Earthquake; the Loess Plateau of East Gansu Province; soil erosion; environmental effect
【中文摘要】通过对甘肃省庆阳市、平凉市5. 12汶川大地震地质灾害实地调查,发现此次地震造成的崩塌和滑坡,以小型为主,数量众多,主要分布在现代侵蚀沟边缘部位的断崖和陡坡上。地震在塬面、缓坡丘陵和川台地上所造成的崩塌,与窑洞住宅和采矿业的分布基本一致。此次地震虽未造成大中型崩塌和滑坡,但对该地环境的影响不能忽视———可改变微地貌、使未来几年内的土壤流失量有所增加等。认为在黄土高原地区,地震烈度到达Ⅳ度以上,就会引起较为严重的重力侵蚀。对于我国地震高发区之一的黄土高原而言,探讨水土流失的成因时,须要关注地震的影响。
【英文摘要】This paper is based on the field investigation of the geological disaster that caused by the 5. 12 Wenchuan Earthquake in Qingyang City and Pingliang City, Gansu Province. It is found that the earthquake2induced collap ses and landslides are charcterized by small type and large number and are mainly distributed at the of the edges ofmodern erosion ditch; The earthquake induced landslides distributed in the tableland surface, gentle slope hills and tableland of the valley, is consistent with the cave dwelling and the engineering construction. Although this earthquake has not caused large or medium sized landslip, we cnnont neglect the influence of its natural environment, which may change the microphysiognomy and increase the soil erosion etc. in the next few years. It indicates that it will cause more serious gravity erosion once the earthquake intensity over degree Ⅳ in the Loess Plateau area, which slightly has the difference from the former general recognition. For the Loess Plateau that is one of the frequent earthquake areas in China, effects of theearthquakes need to be considered when the genesis of soil erosion discussed

【题目】长武黄土高塬沟壑区降水及侵蚀性降雨特征
【中文关键词】降水量; 侵蚀性降雨; 黄土高塬沟壑区
【英文关键词】precipitation ; erosive rainfall ; Loess Plateau-gully Region
【中文摘要】利用长武县气象局1957—2006年的日降水量资料,分析该地区降水的年内、年际变化、概率分布特征等。结果表明:该区降水量季节分布不均,主要集中在7—9月;降水量的年际变化幅度较大,多年变化呈明显的丰水、平水、枯水年交替发生现象;降水量的年际变化大于年降水时间的年际变化。对侵蚀性降雨研究发现,其主要发生在7、8月,以降雨量小于30 mm的降雨次数较多;降雨强度随降雨量增加而减小;同时,以短历时降雨为主,历时在30min以内的降雨次数较多,其他时段相对较少。

【英文摘要】The monthly and annual distribution characteristics of precipitation as well as the probability distribution of annual precipitation were studied , utilizing the daily precipitation from 1957 to 2006 , data of which supplied by the Changwu Meteorological Station. The results demonstrate that the distribution of monthly precipitation is variable , and mainly concentrated in July , August , and September. The total annual precipitation varied greatly from year to year. The annual variation of precipitation is larger than the annual variation of rainy days. Analysis of the soil erosive rainfall showed that the highest occurrence of rainfall happened in July and August . The times of rainfall that amounts of rainfall less than 30 mm were more than others. As to single soil erosive rainfall , the rainfall intensity reduced along with the rainfall amount increasing. Meanwhile the times of rainfall duration within 30 min are more than that over 30 min.

【题目】高塬沟壑区董志塬沟头溯源侵蚀典型调查研究

【中文关键词】董志塬;溯源侵蚀;发生类型

【英文关键词】Dongzhiyuan;head-cut;genetic types

【中文摘要】详细调查了董志塬地区的西峰区、宁县以及庆城县的沟头溯源侵蚀情况,并对近年来发生前进的沟头进行了详细的实地测量和地形地貌特点分析,对董志塬沟头溯源侵蚀整体情况做出概括。在此基础上将溯源侵蚀的发生类型划分:水力冲刷型、陷穴诱发型、裂缝诱发型和人为诱发型。针对每种类型进行了典型的实例分析。

【英文摘要】This paper investigated the situation of head-cuts in Xifeng area, Ning county and Qingchengcounty on Dongzhiyuan. We carried out a detailed measurement and analysis of terrain characteristics on the gully heads, and summarized the overall situation of head-cuts on Dongzhiyuan. On this basis we summed up the genetic types of head-cuts that included flow induced types, sink hole-induced types, fissure-induced types and human-induced types, and analyzed each type.

【题目】黄土高塬沟壑区董志塬沟头溯源侵蚀特征及其防治途径

【中文关键词】董志塬; 溯源侵蚀; 影响因素; 发生类型; 防治措施

【英文关键词】Dongzhiyuan ; head-cut ; influence factor ; genetic type ; protective measure

【中文摘要】黄土高塬沟壑区沟头溯源侵蚀非常普遍,已经对塬面地区的土地、农田、村庄民居、道路和工厂造成了严重的威胁。通过对董志塬的调查发现,影响溯源侵蚀的因素为自然和人为因素两类。自然因素主要包括降雨径流、地形地貌和土质。总结出溯源侵蚀的发生类型为水力冲刷型、陷穴诱发型、裂缝诱发型和人为诱发型。溯源侵蚀的过程从时间顺序上可分为3 个阶段,主要分为水力冲刷阶段、水力和重力共同作用阶段、重力侵蚀阶段。最后,根据不同类型的沟头侵蚀与活动特点,提出了沟头的主要防护措施。

【英文摘要】Head-cut is a widespread and serious ero sion type on t he Loess Plateau and it has already t hreat ened farmlands , local residents , roads , and factories. According to t he field investigation on Dongzhiyuan ,the influence factor s of head-cuts are natural and human factor s. The nat ural factor s mainly include runoff ,topography , and soil . The genetic types of head2cut are summed up , including flow2induced type , sink hole induced type , fissure induced type , and human induced type. According to the order of time , the development of head cut can be divided into three stages : water erosion stage , water and gravity erosion stage , and gravity erosion stage. The cont rol measures of gully head are presented based on the characteristics of different erosion types.

【题目】水土保持构建黄河水沙调控体系的地位及模式
【中文关键词】水土保持;水沙;调控;治理
【英文关键词】soil and water conservation ; water and sediment ; regulation ; governing model
【中文摘要】论述了黄土高塬沟壑区水沙在时空分布、功能和效益上的差异性,提出通过对径流的调控实现对泥沙的调控,径流的调控利用就成为构建协调的水沙关系的主要技术手段. 首次提出了基于径流调控利用的多元综合治理模式,以汇水单元为径流调控利用单元,在治理顺序上,根据治理效益依次按照塬面、沟谷、阴坡、阳坡的顺序进行治理. 采取“ 调蓄汛期径流,减少入黄泥沙 ”是构建黄土高塬沟壑区水沙调控体系的技术关键,也就是就地拦蓄汛期的雨洪资源,达到就地截留、入渗、集蓄、转化或利用,大幅度减少泥沙的流失,减轻黄河下游泥沙淤积危害. 同时分析了该区水土流失具有径流的主导性、多因子、多单元、多手段、多效益和多目标的特点,总结出了20 种径流泥沙调控利用范式,该模式已在黄河水土保持生态工程建设中得到推广应用并取得了显著成效.
【英文摘要】This paper discusses on the differences in spatial and temporal dist ribution , functions and benefits of water and sediment in t he gully regions of loess plateau , proposes a method to achieve the control of sediment by the means of runoff regulation and control. So the runoff control utilization has become themain technical means to build the coordinate relationship between water and sediment . The pluralistic general governing model based on t he runoff2cont rol utilization is firstly proposed. Taking catchment unit as the runoff regulation unit according to the management benefit s , we should fir st control the plateau area ,and then valleys , shady slope and sunny slope accordingly in cont rol sequence. “ to regulate and store runoff , reduce the Yellow River sediment ” is t he key technology to construct the water and sediment regulation system in the gully regions of loess plateau ; that is , to store the flood runoff resources in site , to get the aim of intercepting , infilt rating , storing and using runoff , reducing soil loss greatly , reducing downst ream sedimentation hazards of the Yellow River . At the same time , the soil erosion characteristics which are runoff dominated , multi-factor , multiunit , multi-means , multiple benefit and multi-objective are analyzed. In t he end , 20 kinds of runoff and sediment control paradigms are summed up , which has been popularized and achieved remarkable results at the Yellow River soil and water conservation ecological engineering construction.

【题目】黄土高原环境异质性与植被的恢复与重建
【中文关键词】生物气候条件;自然植被;造林实践;区域分异;黄土高原
【英文关键词】bioclimatic conditions; natural vegetation; forestation p ractices; regional diffenrentiation; the Loess Plateau
【中文摘要】黄土高原是一个独特的地理区域,由于对其原生植被的不同认识,自然区划历来富有争议。为因地制宜地进行植被建设,在辨析植被属性有关论点(黄土无林、草原次生等)的基础上,主要由现代植被证据进一步讨论黄土高原的自然地带。分析了生物气候条件在不同地域之间的分异性,阐述了植被地带特征。为充分说明植被地带性,还从历史的角度探讨了植被建设的效果。表明黄土高原环境的非均质性可表征为森林、草原等地带,不能认为黄土高原不具有森林发育的地带性环境。相对于森林地带北界森林线,森林草原地带北界应为树木线。植被建设不应局限于一种土地利用模式,不能无视疏林及稀疏灌丛在森林草原地带的客观存在。

【英文摘要】The Loess Plateau is a distinct geographical region, where natural regionalization has always been of much controversy because of variation in understanding its primary vegetation. In order to construct vegetation in line with local conditions, based on the discrimination on the viewpoints (no forests in the loess Plateau, secondary grasslands, etc.relevant to the vegetation p roperty of the Loess Plateau, the paper further dealt with the natural zonation of the Loess Plateau by adop ting modern vegetation evidences. After analyzing the regional differentiation of bioclimatic conditions and the vegetation zonal characteristics in the region, the author investigated the actual effects of the vegetation construction inhistory so as to fully illustrate the vegetation zonality. It is shown that the Loess Plateau might be regionalized into several different vegetation zones of forest and steppe for no homogeneity of its environment. The op inion that the zonal environment for forest growth is not possessed in the Loess Plateau is accordingly inadequate. So far as the north demarcation line for the forest zone is called forest line, the north demarcation line for the forest2steppe zone should be called tree line. The vegetation construction shouldn ′ t be confined to such a land use pattern as “ the 28-word general plan ” put forward by ZhuXianmo. The objective reality of thin woods and sparse shrubberies in the forest-steppe zone should not be ignored. At last, some other issues deserving attention and research were also presented.

【题目】长武塬区不同土地利用条件下土壤水分深剖面分布特征比较
【中文关键词】土壤水分;土壤水分垂直分布;长武塬区
【英文关键词】soil moisture ; vertical distribution of soil moisture ; Changwu tableland
【中文摘要】通过调查取样的方法对长武塬面不同土地利用条件下(作物地,果园,苜蓿地) 土壤水分状况在0~600 cm范围深度内进行对比,结果显示:长武塬区小麦收获期,不同土地利用条件下土壤水分含量总体存在较大差异,其中春玉米地由于上年小麦收获后直到春玉米播种前土地休闲,土壤含水量显著高于其它土地利用方式。其它土地利用条件下土壤平均含水量相对较低,在0~300 cm 的范围内含水量分布表现为果园> 苜蓿地> 小麦地。300 cm以下含水量表现为小麦地> 果园> 苜蓿地;同时,不同利用条件下土壤水分剖面低湿层的位置深度也不相同,小麦地土壤水分低湿层深度较果园地和多年苜蓿地浅,土壤水分剖面形态与分布特征受利用模式影响显著。
【英文摘要】The study was conducted to compare soil moisture under different models of land use by field investigation and sampling in Changwu tableland. Results showed that there were great differences in the total content of soil moisture under different models of land use after wheat-cutting date and before rainy season. The content of soil moisture inmaize land was greater than that under other models of land use because of recharging of rainwater and fallow of cropland in past year. The averaged content of soil moisture under other models of land use showed significant differences in different soil layers. According to soil moisture in 0~300 cm soil layer , the land uses could be ranked in the order of orchard land > Alfalfa land > farmland. The 200~300 cm soil layer was a transition layer and below the 300 cm soil depth , the land uses could be ranked in the order of farmland > orchard land > alfalfa land. At the same time , different land uses caused different soil moisture profiles. The main differences of soil moisture in farmland could be found in orchardland and alfalfa land , which showed that the types of land use and land coverage were the main factors affecting the depth of water use.

【题目】配施钾肥、有机肥对旱地春玉米光合生理特性和产量的影响
【中文关键词】钾肥; 有机肥; 产量; 光合生理特性; 旱地; 春玉米
【英文关键词】Potassium; Organic fertilizer; Yield; Photosynthetic physiological characteristics; Dry land; Spring maize
【中文摘要】以长期定位施肥试验为平台, 研究在施用氮磷肥条件下, 配施钾肥、有机肥对黄土塬区春玉米光合生理特性和产量的影响。结果表明: 配施钾肥在灌浆前期降低了L AI 、W UE 、叶片水势、干物质积累量、叶片光合和蒸腾速率, 但在灌浆后期提高了LA I 、WUE 、干物质积累量和叶片光合速率, 且与对照间达显著差异, 这说明配施钾肥对春玉米生长的影响主要表现在生育后期; 配施钾肥可显著提高整个生育期的S PA D(叶绿素相对含量) 、株高; 可促进同化向籽粒的转移, 使籽粒产量增加; 但收获指数下降了3. 2%。而配施有机肥可显著提高春玉米整个生育期的L AI 、株高、SPA D、光合速率和蒸腾速率等生理指标(WUE 和水势除外) 和产量,使籽粒产量和生物产量增加, 与对照、钾肥间差异均达到显著水平(P< 0. 05) 。在富含钾素的黄土塬区, 配施有机肥对春玉米光合生理特性和产量的作用优于配施钾肥。
【英文摘要】Field experiments were conducted to investig ate the effect s of potassium and organic fertilizer on photosynthetic physiolog ical characteristics and yield of spring maize in phosphorus and nitrogen fertilizer application to an experimental field on the Changwu tableland of the Loess Plateau. Results showed that application of potassium fertilizer decreased the LAI , leaf water potential, dry matter accumulation, and leaf photosynthetic and transpiration rate before the filling stage, but increased the LAI , dry matter accumulation, and photosynthetic rate af ter the f illing stage. The dif ference was significant in contrast to CK. This indicated that the effects of potassium fertilizer on spring maize mostly o ccurr ed at the later gr ow ing stage. In cont rast to CK, the effect s could significantly increase SPAD and plant height through the whole growing stage, increase grain y ield by 844. 8 kg/ ha, or 10% , and reduce har vest index by 3. 2% . However, application of organic fertilizer could significantly increase the LAI , plant height , SPA D, photosynthetic and transpiration rate (except leaf WUE and water potential) , and yield, and increase grain yield by 687. 8 kg / ha, o r 20. 0 % . Application of or ganic fertilizer could raise biomass yield by 11025 kg / ha, or by 18. 7%, with the harvest index reaching to 48. 8%. T he applicatio n of org anic fert ilizer fo r biomass yield had significant difference (P <0. 05) in contr ast to CK and potassium fert ilizer application, increasing 6. 5% and 9. 7%, respectively. The effects of o rganic fertilizer on photosynthetic physiological characteristics and the yield were greater than those of potassium fertilizer in the tableland of enriched potassium, but application of potassium and organic fertilizer had no significant effects on the leaf WUE .

【题目】不同施肥处理对农田生态系统微量元素收支及循环率的影响1
【中文关键词】饲喂-堆腐过程; 养分循环; 下辽河平原; 有机肥; 化肥;
【英文关键词】feeding-composting process; nutrient cycling; lower reaches of Liaohe Plain; manure; chemical fertilizer;
【中文摘要】以下辽河平原一组长期定位试验为平台,研究了不同施肥制度下农田生态系统微量元素的循环率及当季微量养分收支。结果表明:不同元素在饲喂-堆腐过程中的循环率差异较大,Zn的循环率最低,但也接近80%,Fe、Mn、Cu、Pb的循环率均超过80%,其中Fe、Mn、Pb的循环率均接近90%,微量元素在饲喂-堆腐过程中的循环率随投料量的增加有增加的趋势。以有机肥形式输入农田的微量元素远大于以化肥形式输入农田的量,且输入量随有机肥用量的增加而增加。不同处理间微量元素的移出量以NPK+M处理最高,CK处理最低。各处理土壤微量元素收入小于支出,不同处理间收支差额NPK+M<M<CK<NPK,表明单施化肥加剧土壤微量元素赤字化,养分循环利用可弥补土壤微量元素的损失,减小收支差额。
【英文摘要】A group of long-term field trials was conducted at the lower reaches of Liaohe Plain to study the effects of different fertilization modes on the recycling rates and current season budgets of trace elements in cropland ecosystems.In the process of feeding-composting,the recycling rates of trace elements varied with the elements.Zn had the lowest recycling rate which still approached to 80%,while Fe,Mn,Zn,and Pb had a recycling rate of>80%,and especially that of Fe,Mn and Pb was>90%.The recycling rate increased with the increasing amount of feed stuffs and bedding materials.The trace elements input of farmland from manures was far higher than that from chemical fertilizers,and increased with increasing amount of the manures applied;while the trace elements output by crops was the highest in treatment NPK+M,and the lowest in treatment CK.The input was lower than the output,and the budget in different fertilization treatments followed the order of NPK+M<M<CK<NPK.Therefore,applying chemical fertilizers alone induced the deficit of soil trace elements,while nutrients recycling would offset the soil trace elements loss by crops,and minimize the deficit.

【题目】水土保持效益评价指标研究
【中文关键词】效益评价; 指标体系; 水土保持; 问卷调查
【英文关键词】benefit evaluation; index system; soil and water conservation; questionnaire
【中文摘要】基于对陇东黄土高原部分地区的问卷调查和相关文献资料分析,发现大多数群众对水土流失综合治理事业及其各项措施具有很高的认同感,但参与治理的积极性不高,进而影响了综合治理的效果;小区域的水土保持工作虽有成效,但因非示范区、非项目区效果不明显,大尺度地域范围内综合治理的成效就有限。造成这些问题的一个重要原因是没有充分重视综合治理实施者的经济利益;因此,水土流失综合治理的评价,应将经济效益放在首位。利用综合治理的经济利益调动实施者的参与热情和积极性,把引导群众致富与其客观上所具有的生态效益和社会效益紧密结合,以达到综合治理目的。基于此,提出了综合治理效益评价指标体系。
【英文摘要】Through questionnaire survey and the analysis of relative literature data on soil and waterconservation of the Loess Plateau in east Gansu Province, it is found that most of local people are aware of the importance of soil and water conservation measures, but they are not so active in the participation in the work, which thus reduces the effects of comprehensive control. Soil and water conservation obviously succeeds at small scale. However, at large scale the implementation is not as desirable as expected because of the undesirable applications in the non2demonstration zones and non2project areas. The major reason for this is that an insufficient attention is paid to the economic benefits during the implement of soil and water conservation measures. Therefore, an evaluation of comprehensive control of soil and water loss should give first priority to economic efficiency. In order to achieve the better comprehensive control, implementers. enthusiasm and initiative should be mobilized by economic benefits and the efforts for them to get rich should combine closelycomprehensive control with ecological and social benefits. Based on the consideration, a system of evaluation indexes is presented for comprehensive control of soil and water loss

【题目】不同水分条件下化肥对玉米产量的贡献
【中文关键词】长期定位试验; 降雨; 施肥; 肥料贡献率;
【英文关键词】Long-term field experiment; Precipitation; Fertilization; Contribution rate of fertilizer;
【中文摘要】以16年长期定位试验为平台,研究了8种施肥制度与4种降雨年景条件下肥料的增产、稳产性能及其对产量的贡献。结果表明:施肥与水分条件对玉米产量均有显著影响,平水年份玉米产量最高,肥料增产效果也达到最佳,其次为丰水年,旱、涝年份最低;N、P和K配施玉米产量最高,无N肥处理作物产量偏低,但在旱、涝条件下P、K肥有利于提高玉米的抗逆性;对玉米产量贡献N>P>K,单施K肥其在平、丰水年对产量贡献率为负值,说明这一地区K尚未成为玉米生产中的限制因子,其只有与N肥配施才可发挥增产作用。综上,合理的养分配施可以提高肥料对玉米产量的贡献,促进肥料交互作用对产量的提升,同时,适宜的水分条件可使肥料增产作用更好发挥。
【英文摘要】Based on a 16-year located experiment,this paper studied the yield-increasing effect,yield-stabilizing feature and contribution rate of fertilizers to maize yield under different fertilization and precipitation conditions.The results showed that fertilization and precipitation had obvious influences on crop output.In normal precipitation years the yields were the highest and the yield-increasing effect of chemical fertilizers was the best.In the higher precipitation years the yield was the highest under NPK treatment and was lower under non-nitrogen treatments,but P and K could increase the stress resistance of maize.The contribution rate of chemical fertilizers to maize yield was N>P>K and maize yield under K treatment was lower than CK treatment in normal or higher precipitation years.It suggests that K was not a limiting factor for crop yield and K could increase maize yield when applied with N.Proper nutrients and water supply would improve the contribution rate of fertilizers to maize yield and promote the interaction between fertilizers on yield-increasing effect.

【题目】补充灌溉及氮磷配施对黄土塬区冬小麦水分利用及产量的影响
【中文关键词】冬小麦; 补充灌溉; 氮磷配施; 产量; 水分利用效率
【英文关键词】Triticum aestivum L. ; supplemental irrigation ; nitrogen and phosphorus rates ; crop yield ; water use efficiency
【中文摘要】采用裂区试验设计,对黄土塬区补充灌溉及氮磷配施条件下麦田土壤水分动态、作物产量及水分利用效率等进行研究。结果表明:1)冬小麦对土壤水分的利用深度随小麦生长发育逐渐加深,在越冬前期和孕穗期分别达1.2和2.2 m土层以下,不同处理土壤含水量在小麦生育前期差异不明显,孕穗后氮磷配施处理的土壤含水量显著低于不施肥处理;2)试验条件下,补充灌溉后同样施肥处理的作物产量与雨养相比,虽有增加但不显著;不论是雨养水平,还是补充灌溉水平,氮磷配施均表现出显著的增产效果,从低氮低磷到高氮高磷,增产幅度在134%到240%之间;3)氮磷配施能显著提高冬小麦水分利用效率,而补充灌溉后水分利用效率降低3%~30%,但未达显著水平;4)不同氮磷配施的增产效应高于补充灌溉,补充灌溉与高氮高磷处理有显著的水肥协同效应,能显著提高作物产量并保持较高的水分利用效率。
【英文摘要】Effects of supplemental irrigation and different nitrogen and phosphorus rates on crop yield , soil water content , and water use efficiency of Triticum aestivum L. were studied by using a randomized complete block split plot design. Results indicated that soil water consumption depth increased along with wheat growing stages , which went down to 112 and 212 m during pre-wintering stage and booting stage respectively. Soil water content for different treatments had no significant difference in initial stages , however , after bootingstage , soil water content for the treatments of different nitrogen and phosphorus rates were significantly lower than that for non2fertilization application. Soil water content for rain-fed and supplemental irrigation treatments had no significant difference. Both

supplemental irrigation and different nitrogen and phosphorus ratestreatments increased crop yields and significantly increased soil water consumption. Supplemental irrigation increased crop yields , but had no significant difference than rain2fed treatment , however , the nitrogen and phosphorus application treatment increased crop yields from 134 % to 240 % more than non2fertilization application treatment . Application of different nitrogen and phosphorus ratessignificantly increased water useefficiency of Triticum aestivum L. . Howerver , supplemental irrigation decreased water use efficiency from 3 % to 30 % , which had no significant difference statistically. The different nitrogen and phosphorus rates treatments significantly improved crop yield compared with supplemental irrigation. Supplemental irrigation and the treatment of high nitrogen and high phosphorus rate significantly increased crop yield and gave higher water use efficiency.

【题目】下辽河平原不同生态系统土壤呼吸动态变化
【中文关键词】土壤呼吸; 生态系统; 季节变化;
【英文关键词】soil respiration; ecosystem; seasonal fluctuation;
【中文摘要】利用长期定位试验对下辽河平原农田生态系统、人工林生态系统和草地生态系统等土壤呼吸状况进行了分析,探讨了不同生态系统土壤呼吸强度的季节变化规律及其主要影响因素。结果表明:下辽河平原不同生态系统土壤呼吸强度季节动态变化趋势基本一致,土壤呼吸强度高峰首先出现在水、热条件适宜的夏季,而后在秋季由于有机物归还量增加,且水热条件亦较适宜的情况下再一次出现高峰;在农田生态系统中,施肥可明显增强土壤呼吸作用,两年平均土壤呼吸强度NPK+M与NPK分别比CK处理提高70%和40%;在草地生态系统中,有机物料归还和人类活动是影响土壤呼吸的主要因素,其强度变化顺序为:每年收获移出>荒地>裸地;人工林生态系统虽有一定有机物料输入,但其数量有限,呼吸强度低于农田生态系统和草地生态系统。
【英文摘要】Soil respiration is one of important sources of CO2 emitted from biosphere to atmosphere.Based on a long-term monitor results, seasonal fluctuation and main influence factors of soil respiration with different ecosystems in the lower reaches of the Liaohe River plain were analyzed.The results showed that there was a similar seasonal pattern for soil respiration with different ecosystems.The first peak value was in summer with suitable hydrothermal condition,and the second was in autumn.Fertilization could increase soil respiration in agro-ecosystem and the highest soil respiration was in NPK+M treatment,followed by NPK,and the lowest in CK.Compared with CK treatment,soil respiration was increased by 70% and 40% for NPK+M and NPK treatments,respectively.Soil respiration in grass ecosystem was determined by the rate of organic materials returning and human activities.The changes of soil respiration intensity was mowing land>waste land>bare land.Although it had some residues backed to plantation ecosystem,soil respiration in plantation system was still lower than in agro-ecosystem and grass ecosystem.

【题目】Vertical Distribution and Seasonal Dynamics of Fine Root Parameters for Apple Trees of Different Ages on the Loess Plateau of China

【中文关键词】无

【英文关键词】fine root, vertical distribution, seasonal dynamics, apple tree, Loess Plateau
【中文摘要】无
【英文摘要】The vertical distribution pattern and seasonal dynamics of fine root parameters for the apple trees of different ages(3,10,15,and 20 years old) on the Loess Plateau of China were studied.Soil coring method was used to determine the vertical distribution and seasonal dynamics of fine roots at different root radial distances(1.0,1.5,and 2.0 m from the main tree trunk).The fine root biomass density(FRD),fine root length density(RLD),and specific root length(SRL),as well as soil water content and soil temperature were also measured.The FRD and RLD for the 10,15,and 20 years old trees reached peak values in the 20-30 cm soil layer.For the 3 years old tree,the highest FRD and RLD were observed in the 10-20 cm soil layer.The FRD and RLD decreased with increased soil depth from the 10-20 or 20-30 cm soil layer for all age apple trees.The SRL declined with the increase of tree age.The FRD at the 1.0 m radial distance from the main tree trunk was higher than that at other radial distances in the 3 and 10 years old orchard.However,in the 15 and 20 years old orchards,especially the 20 years old orchard,the FRD at the 2.0 m radial distance was nearly equal to or higher than that at the 1.0 and 1.5 m radial distances.For all the root radiuses or the tree ages,the FRD,RLD,and SRL were the highest in spring and the lowest in autumn.The age of an apple tree does not affect the vertical distribution pattern but the biomass of fine roots and the SRL.Radial distance affects the root horizontal distribution of 3 and 10 years old trees but the 15 and 20 years old trees.Additionally,effects of soil temperature and soil moisture on fine root distribution or seasonal dynamics are not significant.

【题目】不同施肥制度对作物产量及土壤磷钾肥力的影响
【中文关键词】施肥; 土壤肥力; 产量;
【英文关键词】application of fertilizer; soil fertility; yield;
【中文摘要】在潮棕壤上进行了19 a的定位试验,研究了不同施肥制度对作物产量和土壤磷钾肥力变化的影响。结果表明,单施氮肥能显著提高玉米产量,施钾肥能显著提高大豆籽实产量,其效果优于磷肥。循环猪圈肥的施用能在一定程度上增加作物的产量,但不能达到显著水平。氮磷钾配合循环猪圈肥不仅能增加作物产量而且有很好的稳产作用。未施磷肥处理,土壤速效磷含量呈迅速下降趋势,随种植时间推移,土壤速效磷含量下降速率趋缓。施用磷肥,土壤速效磷含量均有显著增加。不施钾肥处理加剧了土壤钾素的消耗,土壤速效钾和缓效钾浓度下降明显;氮磷钾肥并施处理基本能维持土壤钾初始水平;同时施用氮磷钾肥和循环堆肥土壤速效钾和缓效钾浓度均有所增加。
【英文摘要】A study on crop yield and soil P and K fertility was conducted based on a consecutive 19-year field trial in different fertilization systems.The result indicated that N treatment had a significant yield-increasing effect on maize.Soybean yield increased with the application of K fertilizer,while the application of P fertilizer could not increase soybean yield significantly.The application of recycled manure increased soybean seeds and maize grain yields to a certain degree.Combined application of NPK and recycled manure could not only increase significantly but also stabilize crop yield.In the treatments without phosphorous fertilizer,the available P content decreased rapidly in the first several years,then the rate of decrease slowed over time.In the treatments with phosphorous,the soil available P content increased significantly.The concentration of soil available K and slow-release K decreased significantly without K fertilizer application,and the concentration of soil available K and slow-release K maintained the initial value in NPK treatment.The application of recycled manure and NPK fertilizer increased significantly the concentration of soil available K,while the increment of slow-release K was not significant.

【题目】影响“山地苹果”发展的因素分析
【中文关键词】黄土丘陵沟壑区;苹果;农村政策;地方政府;农民行为
【英文关键词】loess hilly and gully region; apple; rural policy; local government; farmer behavior
【中文摘要】采用问卷调查、入户调查等方法,调查影响陕北黄土丘陵沟壑区“山地苹果”发展的因素变化。结果表明该区“山地苹果”发展具有明显的区域特征。随着衣食问题的解决及土地承包期限的延长,山地苹果栽植面积迅速增加;农业特产税对苹果发展没有太大的影响,但农业特产税的取消以及退耕还林还草的实施促进了苹果的发展;地方政府在苹果发展过程中起到了决策者和开拓者的作用;该区苹果销售基本不受市场的影响,但技术创新能力低,技术匮缺仍为苹果生产效益较低的主要原因。随着农村劳动力的转移和生产资料价格的上升,苹果生产将转向机械化和科技化。
【英文摘要】The paper investigated influencing factors changes on apple development in loess hilly and gully region of northern Shaanxi since reform and opening up by questionnaire surveys, house surveys and other methods. The results showed that the apple development had obvious regional characteristics. With the problem of food and clothing solved after the land contract to individual, demand for sunny slope land and semi-sunny slope land which suitable for plantingapple surged, but demand for shady slope land which suitable for grain production reduced. Short duration of land contract in early stage had limited the apple development, after prolonging it, the apple cultivation area had been rapidly increased. Although special agricultural products tax had no significant impact on apple development, the abolitionof it and the implementation of the policy of returning farmland to forest had promoted the apple development. Local government had played a role of decision-maker and pioneer in apple development process. There would be no rapid development but for local government strong advocacy and support. The apple had a good quality, and its good price hadstimulated the apple development. Although the fruit grower had changed the learning technologies attitude from passive to active, lack of regional technological innovation, and technology scarcity was still the main reason of lower productionefficiency. Apple production should shift to mechanization and technology with the rural labor transfering and capital goods prices increasing.

【题目】不同施肥制度对作物产量及土壤磷素肥力的影响
【中文关键词】施肥制度; 作物产量; 磷素; 土壤肥力;
【英文关键词】Fertilization system; Crop yield; Phosphorous; Soil fertility;
【中文摘要】在潮棕壤上连续进行18年的定位试验,研究了不同施肥制度对作物产量和土壤磷素肥力的影响。结果表明:与对照处理相比,施用磷肥有明显的增产和稳产作用。不施磷肥处理,土壤磷素收支赤字,土壤全磷和速效磷含量均明显下降,且土壤磷收支的盈亏值与土壤速效磷的增减量呈显著直线相关;施磷肥处理,土壤磷素收支盈余,18年间耕层土壤全磷含量均明显提高,提高幅度为0.02~0.04g·kg-1,土壤速效磷含量亦明显增加,特别是在试验的后几年,土壤速效磷含量似有加速上升的趋势。施氮肥对玉米有明显增产作用,施磷钾肥对玉米增产作用不明显;大豆则相反,施氮肥增产作用不明显,施磷钾肥有显著增产作用。
【英文摘要】The effect of different fertilization systems on crop yield and soil phosphorous fertility was investigated in an 18-year field experiment in aquic-brown soils.The results indicate that crop yield significantly increases while the yield fluctuation decreased in treatments with phosphorous fertilizer compared to the control.In treatments without phosphorous fertilizer,there is a deficit in P budget and total and available P content decreases significantly.A strong linear correlation exists between P budget and available P fluctuation in treatments without phosphorous.In treatments with phosphorous,total P content increases significantly (from 0.02 to 0.04 g·kg-1),while available P content also increases significantly (especially in the latter stages of the trial).N fertilizer application significantly increases maize grain yield,while P and K fertilizers have insignificant effect on maize yield increase.Conversely,while mean soybean yield is unaffected by N fertilizer application,P and K fertilizers affect mean soybean yield significantly.

【题目】不同有机肥处理对设施菜地土壤硝态氮分布影响
【中文关键词】设施菜地; 有机肥; 硝态氮;
【英文关键词】greenhouse soil; organic manure; NO3--N;
【中文摘要】以辽宁省新民市某设施蔬菜生产基地土壤为研究对象,通过设置5个不同有机肥处理的实验小区,系统研究了不同的有机肥施入量(0~60 t.hm-2)在黄瓜和豆角生长期间对0~40 cm土层土壤NO3--N含量的影响,以及在黄瓜和豆角分别收获后土壤剖面NO3--N垂直分布特征。结果表明,土壤NO3--N含量的动态变化与植株的生长发育和有机肥施用水平关系密切。5月份,0~40 cm土壤各个土层的硝酸盐含量均高于其他时期;对于不同的施肥水平,当施肥量为60 t.hm-2时0~40 cm各个土层的土壤硝态氮含量均高于其他处理。土壤剖面NO3--N含量分布特征表明,低量有机肥的施入不会引起NO3--N在深层土壤的累积和淋溶,但会导致填闲作物生长过程中氮素供给的不足;当有机肥的施入量为60 t.hm-2时,0~120 cm土层出现了不同程度的淋溶现象。
【英文摘要】A field plot experiment was conducted in Xinmin suburb to study the effects of different applying organic manure(0~60 t · hm-2) on NO3——N distribution and the vertical distribution of NO3——N in soil depth profile in greenhouse soil.Five treatments(0,10,20,40 and 60 t · hm-2 of organic manure)were installed.The results showed that the distribution characteristics of NO3——N in soil were affected by the growth stage of plants and the application rate of organic manure.The NO3——N content in 0~40 cm soil layer was higher than the other growth stages in May.For different applying organic manure,when the application rate of organic manure was 60 t · hm-2,the NO3——N content in 0~40 cm soil layer was the highest.In the latest growth stages,the low application rate of organic manure could not lead to the accumulation and eluviation in deep-seat soil,but could cause insufficient supply of nitrogen on crops during their growth.When the applying organic manure was 60 t · hm-2,there were some different degrees about eluviations in the soil of 0~120 cm.

【题目】整地时期对土壤物理性质及苹果幼树的影响
【中文关键词】穴状整地时期; 土壤物理性质; 苹果幼树; 成活率
【英文关键词】period of soil preparation by digging hole ; soil physical property; young apple tree ; livability
【中文摘要】为了提高陕北黄土丘陵沟壑区苹果幼树的栽植成活率和保存率,对3个穴状整地时期的土壤物理性状及苹果幼树生长状况进行了监测研究。结果表明,穴状整地后土壤容重降低,土壤总孔隙度和非毛管孔隙度提高。雨季前穴状整地提高了春季和幼树生长前期的土壤水分,减小了土壤日温差,提高了苗木成活率,促进了树体生长。但雨季后和春季穴状整地降低了春季和幼树生长前期的土壤水分,加大了土壤日温差,降低了苗木成活率,削弱了树体生长,并且加深了定植当年的地面塌陷深度,降低了苹果幼树冬春季的枝条含水量,提高了枝条抽条指数,降低了苗木保存率。陕北丘陵沟壑区栽植苹果时应该在雨季前穴状整地。
【英文摘要】In order to increase t he livability and survival rate of young apple t rees in t he loess hilly and gully areas of Northern Shaanxi Province , soil p hysical properties and young apple t ree growt h were monitored by the t hree t reatment s of soil preparation by digging hole before rainy season , af ter rainy season , and in spring. Results showed that soil bulk density was decreased and soil total porosity and soil non2capillary porosity were increased after soil preparation by digging hole. For the treatment of soil preparation by digginghole before rainy season , soil moisture was increased in spring and tree growth prophase period ; soil temperature difference

between daily max-temperature and daily min-temperature was decreased ; tree livability was increased ; and t ree growt h was promoted. However , for the t reatment s of soil preparation by digging hole after rainy season and in spring , soil moist ure was decreased ; soil temperat ure difference was increased ; treelivability was reduced ; tree growth was weakened ; ground subsidence depth was deepened in plant year ;branch water content was reduced in t he winter and spring ; branch shriveling index was increased ; and tree survival rate was decreased. Soil preparation by digging hole before rainy season is suggested when apple trees were planted in t he loess hilly and gully area of Northern Shaanxi Province.

【题目】沈阳西郊污灌区农田铜锌铅污染特征分析
【中文关键词】农田; 土壤污染; 重金属污染; 铜; 锌; 铅; 污水灌溉;
【英文关键词】farmland; soil pollution; heavy metal pollution; copper; zinc; lead; waste water irrigation;
【中文摘要】为评价污水灌溉区农田土壤重金属污染状况,采用单因子指数和综合多因子指数法,对沈阳西郊污灌区农田土壤重金属铜锌铅的污染特征进行了研究。结果表明,于洪区宁官、高明、胡孤家和四台子四个样点土壤均受到三种重金属污染,其中宁官点0~10 cm土层铜、锌、铅含量分别达到69.74 mg.kg-1、275.09 mg.kg-1和81.83mg.kg-1,分别是当地土壤背景值的2.82、4.59和3.60倍。各样点土壤有效态铜、锌、铅含量也远高于未受污染地区的平均含量,土壤铜、锌、铅有效态含量占全量的比例分别为4.65%~15.46%、1.36%~3.84%和5.46%~18.86%。说明沈阳西郊污灌区农田土壤重金属污染较严重,必须通过工程、生物及化学措施进行长期的污染治理。

【英文摘要】The farmland soils in western Shenyang suburb,Liaoning Province of China were irrigated with waste waster in late of the last century.To assess heavy metal contamination status in soils irrigated with waste water,the characteristics of Cu,Zn and Pb pollution in farmland soils of western Shenyang suburb were evaluated using single-factor indices and multiply-factor indices.The results show that all the test soils in Ningguan,Gaoming,Hugujia and Sitaizi were contaminated by Cu,Zn and Pb.Total content of Cu,Zn and Pb in 0-10 cm layer of the Ningguan site were up to 69.74mg.kg-1,275.09mg.kg-1 and 81.83mg.kg-1,respectively,and the pollution indices based on background values were 2.82,4.59 and 3.60,respectively.The available Cu,Zn and Pb were also higher in the test soils than in the unpolluted soils.The ratios of available to total content of Cu,Zn and Pb were 4.65%-15.46%,1.36%-3.84% and 5.46%-18.86%,respectively.It is concluded that the test soils in waste water irrigation area of western Shenyang suburb were heavily contaminated,suggesting that engineering,biological and chemical measures must be taken to remedy contaminated soils in a long period.

【题目】施磷对不同质地土壤Olsen-P和CaCl-2-P动态变化的影响
【中文关键词】施磷; Olsen-P; CaCl2-P;
【英文关键词】Phosphorous fertilization; Olsen-P; CaCl2-P;
【中文摘要】通过对河北栾城农业生态站潮土和吉林白城淡黑钙土2种质地不同的土壤施用不同剂量磷肥,在25℃恒温条件下好气培养,培养期的第1、3、10、30和60天采集土样,测定土壤Olsen-P和CaCl2-P含量的动态变化,研究了磷肥施入土壤引起农业磷面源污染的可能性。利用Heckrath分段回归模型,分别对培养60d后2种土壤Olsen-P、CaCl2-P含量进行拟合,得到土壤环境敏感磷临界点对应的土壤Olsen-P含量,以此证明土壤固磷能力。结果表明:当施磷量超过400kg · m-2时,2种土壤Olsen-P和CaCl2-P含量均显著增加,并且2种土壤在相同条件下培养后,同一处理的各组分有效磷的变化规律并不相同,说明当施磷量超过400kg · hm-2,2种土壤磷流失的可能性均增加,并且不同类型土壤,磷流失能力也不同;培养60d后拟合得到的栾城和白城土壤环境敏感磷临界点对应的土壤Olsen-P含量分别为88.9和142.5mg · kg-1,表明白城土壤固磷能力明显高于栾城土壤。
【英文摘要】Aquic brown soil samples from the Agro-Ecological Experimental Station of Chinese Academy of Sciences in Luancheng of Hebei Province and light chernozem samples from Baicheng of Jilin Province were applied with different doses of phosphorous fertilizer, and aerobically incubated at 25 ℃ for 1, 3, 10, 30, and 60 days. The dynamic changes of Olsen-P and CaCl2-P in the soil samples during incubation were studied, aimed to approach the possibility of agricultural phosphorus non-point source pollution from these soils caused by phosphorous fertilization. In the meantime, Heckrath segmented regression model was used for fitting the Olsen-P and CaCl2-P contents in the two soils after incubated for 60 days to obtain the Olsen-P content corresponding to the environmental sensitive point of soil phosphorus, which would be regarded as the proof of soil phosphorus-fixation capacity. The results indicated that when the phosphorous fertilization rate exceeded 400 kg · hm-2, the Olsen-P and CaCl2-P contents in the two soils increased significantly, and under the same incubation conditions, the quantitative changes of Olsen-P and CaCl2-P in the same phosphorous fertilization treatments were different, illustrating that a phosphorous fertilization rate of > 400 kg · hm-2 increased the possibility of phosphorus loss from the soils, and the phosphorus loss capacity was different between the two soils. After incubated for 60 days, the Olsen-P content corresponding to the environmental sensitive point of soil phosphorus in Luancheng and Baicheng was 88.9 and 142.5 mg · kg-1, respectively, suggesting that the soil from Baicheng had an obviously higher phosphorus fixation capability than that from Luancheng.

【题目】灌溉方式对黄瓜生长产量及水分利用效率的影响
【中文关键词】黄瓜; 灌溉方式; 生长; 产量; 根系活力; 水分利用效率
【英文关键词】cucumber ; irrigation method ; growth ; yield ; root activity ; water use efficiency
【中文摘要】以黄瓜为试验材料,研究常规沟灌、滴灌、交替沟灌和固定沟灌4种灌溉方式对日光温室内黄瓜生长、产量及水分利用效率的影响.结果表明:4种灌溉方式对黄瓜株高、茎粗、叶片数和叶面积的影响不同;黄瓜前期产量是交替沟灌>滴灌>常规沟灌>固定沟灌,中期和后期产量是滴灌>交替沟灌>固定沟灌>常规沟灌,总产量的变化与中期和后期产量的变

化相同;滴灌和交替沟灌的黄瓜根系活力无显著差异,但二者的根系活力极显著地高于常规沟灌和固定沟灌;水分利用效率和水分产出率的变化趋势一致,滴灌最高,交替沟灌次之,常规沟灌最低,而耗水量的变化与水分利用效率和水分产出率的变化相反.说明日光温室内黄瓜适宜的灌溉方式为滴灌和交替沟灌.

【英文摘要】The effects of tradition irrigation , dropping irrigation , alternation irrigation and fixed irrigation on the growth , yield and water use efficiency of cucumber in sunlight greenhouse were analyzed. Results showed that the effects of four irrigation methods on plant height , stem diameter , leaf number and leaf area of cucumber were different . The prophase yield under different irrigation t reatments were ranked in the descendant order of alternation irrigation , dropping irrigation , tradition irrigation , and fixed irrigation ,and the metaphase , anaphase yield and total yield were ranked in the descendant order ofdropping irrigation , alternation irrigation , fixed irrigation and t radition irrigation , respectively. Root activities of cucumber for dropping irrigation and alternation irrigation were remarkablely higher than those of tradition irrigation and fixed irrigation , but there was no significant difference between dropping irrigation and alternation irrigation. The order of water use efficiency and water output rate was as follows : dropping irrigation > alternation irrigation > fixed irrigation > t radition irrigation , however , theorder of water consumption amount of cucumber was opposite. It is indicated that the suitable irrigation methods of cucumber are dropping irrigation and alternation irrigation in the sunlight greenhouse.

【题目】双氰胺对设施菜地土壤硝酸盐淋溶和苦苣硝酸盐累积的影响

【中文关键词】设施菜地; 双氰胺; 硝酸盐;

【英文关键词】protected vegetable field; dicyandiamide; nitrate;

【中文摘要】在设施菜地条件下,研究了添加不同浓度双氰胺(DCD)对土壤和苦苣硝酸盐含量及苦苣产量的影响。结果表明,添加2%和5%双氰胺可有效降低苦苣生长初期表层土壤硝酸盐含量,推迟硝酸盐含量高峰出现15d左右,减少硝酸盐的深层淋溶,显著降低苦苣体内硝酸盐和亚硝酸盐含量,提高苦苣产量。添加10%双氰胺使土壤硝酸盐含量始终保持较低水平,对防止硝酸盐深层淋溶和降低苦苣硝酸盐和亚硝酸盐含量效果显著,对苦苣产量影响较小。

【英文摘要】A field experiment was conducted on a protected vegetable field in Shenyang suburb of Liaoning to study the effects of applying dicyandiamide(DCD) on the nitrate leaching in the profile of aquic brown soil and the nitrate accumulation in chicory under protected cultivation. Applying DCD with a rate of 2% and 5% of fertilizer N could effectively decrease the nitrate accumulation in topsoil at the early growth stage of chicory,postpone the peak period of this nitrate accumulation by about 15 days,reduce the nitrate leaching into deeper soil layers,and also,decrease the nitrate and nitrite contents in chicory plants and increase chicory yield. When the application rate of DCD was 10% of fertilizer N,soil nitrate content maintained at a lower level,which was of significance in preventing nitrate leaching into deeper soil layers and decreasing the nitrate and nitrite contents in chicory plants,and chicory yield was less affected.

【题目】陕西渭北高原苹果绵蚜的发生与防治

【中文关键词】苹果绵蚜;传播途径;危害特征;防治措施

【英文关键词】woolly apple aphid; transmission route; harm characteristics; control measures
【中文摘要】简述了苹果绵蚜的形态特征、生活习性、危害特性、迁移和传播途径以及在陕西渭北高原的防治关键时期,提出防治苹果绵蚜应首先抓好植物检疫,做好农业防治,保护和引进、释放天敌,及时开展化学防治,并提出防治时的注意事项。
【英文摘要】This paper introduced the morphological characteristics, living habits, harm characteristics, migration and transmission route of woolly apple aphid, and key control periods in Weibei Plateau in Shaanxi. In order to control woolly apple aphid, plant quarantine should be the first job to be done; agricultural control should be actively done; native predator should be protected, introduced and released; chemical control should be done in a timelymanner, and matters need attention when prevention and treatment had been put out.

【题目】沈阳市郊不同年限蔬菜温室土壤有效态微量元素分布特征
【中文关键词】蔬菜温室; 土壤; 微量元素; 土壤pH; 土壤有机碳;
【英文关键词】Vegetable greenhouse; Soil; Micronutrient; Soil pH; Soil organic carbon;
【中文摘要】对沈阳市郊大民屯镇不同使用年限蔬菜温室77个样点土壤有效态微量元素的分布特征进行调查研究的结果表明,土壤有效态Fe、Mn、Cu、Zn含量分别为8.57~60.30mgkg-1、2.69~22.43mgkg-1、0.64~7.52mgkg-1和0.56~9.29mgkg-1,变异系数为50%左右;随着温室使用年限的增加,土壤有效态Fe、Mn、Cu、Zn含量总体上呈增加的趋势;使用年限较短的蔬菜温室,土壤微量元素缺乏的可能性较大,而使用年限较长的蔬菜温室,土壤Cu和Zn超量的风险则相对较高。由于温室管理个体的差异,一些使用年限相对较长的温室通过置换土壤、施加腐熟牛粪、厩肥、作物秸秆以及其他有机物料等措施,也可使土壤中微量元素保持在较适宜的状态。温室土壤微量元素有效态含量与土壤pH呈极显著负相关关系(P<0.01),与土壤有机C含量呈极显著正相关关系(P<0.01)。
【英文摘要】The distribution of soil available micronutrients in vegetable greenhouses of different utilization ages with 77 sampling sites was examined in Damingtun Township of Shenyang . Results showed that the contents of soil available Fe, Mn, Cu and Zn were 8.57-60.30 mg kg-1, 2.69-22.43 mg kg-1, 0.64-7.52 mg kg-1 and 0.56-9.29 mg kg-1, respectively. The coefficient of variation was about 50% for test variables. Generally, soil available Fe, Mn, Cu, and Zn contents increased with the greenhouse utilization ages. The possibilities of micronutrient deficiency were more in greenhouses with shorter utilization ages, while the risks of Cu and Zn contamination were more in those with longer utilization ages. Some vegetable greenhouses with longer utilization ages could sustain a suitable micronutrient status with soil replace, cattle manure, stable manure, crop residue and other organic amendments, depending on the management level of individual farmers. Soil available micronutrient contents were negatively correlated with soil pH (P<0.01), but positively correlated with soil organic carbon (P<0.01).

【题目】葡萄糖对东北黑土有机氮矿化的调控作用
【中文关键词】氮; 矿化; 葡萄糖; 黑土;
【英文关键词】nitrogen; mineralization; glucose; black soil;

【中文摘要】采用Stanford和Smith的间歇淋洗好气矿化培养法研究了添加外源底物对东北黑土有机氮矿化进程和矿化速率的影响。结果表明,葡萄糖能够降低土壤有机氮的矿化进程和矿化速率,促进土壤有机氮的固定。葡萄糖与氮肥配施处理也表现出对土壤有机氮的截获作用。葡萄糖对土壤有机氮的矿化具有调控作用,这对于提高农田土壤氮素利用率、减少氮素损失具有重要意义。

【英文摘要】Effects of extraneous substrates on the process and rate of organic nitrogen mineralization in black soil,Northeast China was studied,using the Stanford and Smith mineralization and incubation method.Results show that addition of glucose inhibited mineralization process and reduced mineralization rate of soil organic nitrogen and promoted fixation of soil nitrogen,and that combined application of glucose and nitrogen demonstrated positive effect on sequestration of organic nitrogen.In conclusion,glucose could regulate mineralization of soil organic nitrogen,which is of important significance in improving nitrogen utilization efficiency and reducing nitrogen loss in farmland.

【题目】Identification and Control of Persimmon anthracnose

【中文关键词】无

【英文关键词】Persimmon anthracnose; Damage symptoms; Occurrence law; Controlling measure

【中文摘要】无

【英文摘要】[Objective]The study aimed to research the identification of Persimmon anthracnose and its controlling methods. [Method]The pathogenand characteristics,infection and occurrence law,damage symptoms of persimmon anthracnose were stated simply and the methods for controllingthe disease were summed up. [Result]The pathogen of Persimmon anthracnose was Gloeosporium kaki Hori,belonging to Deuteromycotina.Germination and invasion of the conidia,sporulation and growth of mycelium all required high temperature,with the optimum temperature of 25℃ and the lethal temperature of 50 ℃ (10 min) . The occurrence strength of Persimmon anthracnose related with the factors including host,environment,culture circumstances,mainly doing harm to the fruits and branches. The occurrence of the disease could be controlled by such agriculturalmeasures as cleaning the orchard,using the resistant varieties and planting the disease-free seedlings,adopting the balanced fertilization, improvingthe irrigation and drainage systems,conducting the dense planting and thin branches,building garden using the seedling that grafting on plantedstock and raising the grafted parts of the stock. When the incidence was heavy, it needed to spray the fungicides or protective agent for the controlof the Persimmon anthracnose. The fungicides should be mainly sprayed on the lesion of shoot,fruit surface and branches. [Conclusion]Thestudy provided the reference for the control of the Persimmon anthracnose.

【题目】基于GIS的黄土高塬沟壑区砚瓦川流域地形特征提取与分析

【中文关键词】数字高程模型(DEM) ; 地形因子; GIS 空间分析; 地形特征

【英文关键词】DEM; terrain factors ; spatial analysis ; terrain feature

【中文摘要】以GIS技术为依托,研究了典型高塬沟壑区砚瓦川流域的地形分布特征。以1∶5万地形图作为信息源,矢量化等高线,并用Hutchinson方法建立DEM(ANUDEM)。从DEM中提取了坡度、剖面曲率和坡长三个地形因子,并对其特征进行了分析,同时与丘陵沟壑区相应地形因子特征进行了对比。结果显示:流域50%的面积坡度在9°以下、剖面曲率小于

7,这反映出高塬沟壑区地面比较平坦的地形特点。坡长分布主要集中在10~150m,其中10m坡长分布最广。这些地形特征信息为砚瓦川流域及同类地区的生态建设与农业生产提供了有力的技术和基础数据支撑。

【英文摘要】With t he using of GIS , many topograp hical dist ribution characteristics information of Yanwachuan basin which located in typical tableland2gully region can be obtained. This studyextracted the contour lines f rom 1 ： 50 000 topograp hic map firstly , and utilized Hutchinson ’ s algorithm to create DEM (ANUDEM) , from which much surface morphology information such as slope , profile curvature and slope length are extracted , and their characteristic are discussed then. The results showed that 50 % of the areaconcent rated below 9 degrees and t he slope curvat ure less t han 7 , which indicated t hat the relatively flat area is the most distributed area. Slope length dist ribution mainly concent rated in 10~150 m , and 10 m is the moste distributed area. The information provided a st rong technology and basic data support for ecological const ruction and agricult ural production in Yanwachuan basin and similar areas.

【题目】黄土塬区苹果园土壤有机碳分布特征

【中文关键词】土壤有机碳;苹果园;黄土塬区

【英文关键词】soil organic carbon; apple orchard; Loess Tableland

【中文摘要】以黄土塬区塬面和梁坡梯田5、10、15a和20a苹果园为对象,在行间距果树1.0、1.5m和2.0m处用土钻法分层采集0-100cm土样,LiquiTOCⅡ测定样品土壤有机碳(Soil Organic Carbon,SOC)含量,分析两种地形条件下各龄果园SOC的分布特征。结果表明:塬面5、10、15a和20a果园SOC分别为6.39、6.46、6.66g/kg和6.47g/kg,梁坡分别为5.83、6.05、6.54g/kg和6.09g/kg,两种地形条件下同龄果园SOC差异显著(P<0.05),但龄间SOC消长趋势相似,均有15a的>20a的>10a的>5a的;水平方向上,5a果园SOC沿树干向外增大,10a果园减小,15a和20a果园变化较小,塬面和梁坡同龄果园间SOC水平分布格局较一致;垂直方向上,同梁坡相比,塬面果园4个层次(0-10cm、10-20cm、20-50cm和50-100cm)的平均SOC较高;梁坡果园50-100cm土层的SOC龄间差异较大,20-50cm土层龄间差异较小,塬面果园50-100cm土层的SOC龄间变化较小;在"纯果园"利用阶段,果园利用方式并未引起SOC下降,深层SOC有明显的积累效应。

【英文摘要】Soil organic carbon(SOC) is a large component of the global carbon cycle,and related to atmospheric CO2 levels because soils have the potential for C release or sequestration,depending on land use,land management and climate. In addition,SOC is vital for ecosystem function,having the greater influences on soil structure,soil fertility,water holding capacity,cation exchange capacity and the soil ’ s ability to form complexes with metal ions and store nutrients. The influence of landuse changes on SOC is not only relevant to vegetation type,but also to its growth phase. As an important landuse pattern on Loess Tableland,apple orchard is inconsistent with cereal field in the input and output forms of SOC. In order to understand the influence of the transition of landuse pattern from cereal field to apple orchard on the SOC pool,as well as the characteristics of spatial distribution and variations of SOC in different growth periods of apple orchards,SOCwas measured at the distances of 1. 0m,1. 5m and 2. 0m from each apple tree core in 5a,10a,15a and 20a apple orchards on tableland and slope terrace of the Loess Tableland. Soil samples were collected by Soil Drill and the SOC was measuredby LiquiTOCII analyzer. Results showed that the SOC contents in 5a,10a,15a and 20a apple orchards on tableland were 0. 39 g /kg,6. 46 g /kg,6. 66 g /kg and 6. 47 g /kg,respectively,and on slope terrace,were 5. 83 g /kg,6. 05 g /kg,6. 54g /kg and 6. 09 g /kg,respectively. The SOC content on tableland was significantly higher than that on slope land for the same age apple orchards(P < 0. 05),and however,the SOC content rank of apple orchard on tableland and slope land hadthe same order. Along apple tree core in the horizontal direction,the SOC content ascended at 5a,declined at 10a,and steadied at 15a and 20a. The horizontal distribution patterns of the SOC on slope land were similar to the same age appleorchard on tableland. In vertical direction,the SOC contents of 0 - 10cm,10 - 20cm,20 - 50cm and 50 - 100cm layers in 5a,10a,15a,and 20a apple orchards on tableland were higher than those on slope land,respectively. The SOC content indifferent age apple orchards varied widely at the 50 - 100 cm layer on slope land and slightly in the 20 - 50cm layer onslope land and 50 - 100 cm layer on tableland. Based on our experiment,the SOC content did not decrease in the 5a to 20aapple orchards,and on the contrary,increased in the deeper soil layers.

【题目】渭北黄土高原苹果生产中的问题及解决方案
【中文关键词】渭北黄土高原;苹果;问题;解决方案
【英文关键词】Weibei Loess Plateau;apple;problem;solution
【中文摘要】渭北黄土高原是世界上唯一符合优质苹果生产7项气象条件的地区,是世界上苹果连片种植面积最大的区域,但在生产过程中仍然存在盲目性生产,品种单一,修剪技术差,大量施用氮肥,缺乏品牌效应及营销机构等,且随树龄的增加,果园土壤中出现了干层和硝态氮积累等问题。针对苹果生产中存在的问题,提出建园前应做好规划,生产中要开辟肥源,量化施肥,节水灌溉,合理修剪等,并且要加强自然灾害防治,建立良好的营销体系。
【英文摘要】Weibei Loess Plateau was the only high-quality apple production region in China which was in line with theseven weather conditions,and it was the largest area where had contiguous apple growing regions in the world. However,there still exsited many problems on the production process such as aimless production,a single species, poor pruning techniques,and use of a large number of nitrogen fertilizer,lack of branding effects and marketing organizations.And with the tree-age increasing,the dry layer appeared,in orchard soil accumulation of NO3-N and so on.For these problems in apple production,some proposes had been put out to make a good program before building,set up the production of manure,quantify fertilization,water-saving irrigation,reasonable pruning etc,and ability to the prevention for strong natural disaster and establishment of a good marketing system.

【题目】解集GCMs输出评估黄土塬区农田侵蚀的潜在变化

【中文关键词】气候变化; 黄土高原; 土壤侵蚀; GCMs; WEPP
【英文关键词】clmi ate change; the Loess P lateau; so il loss; GCMs; WEPP
【中文摘要】已经确认的极端降水事件增多等气候变化趋势, 可能对黄土高原的土壤侵蚀造成重要影响。使用一种简单有效的转换函数法和天气发生器CLIGEN (climate GENerator), 解集4种GCM s (Genera l Circulation models)在3种排放情景下的时空尺度建立气候变化情景, 结合WEPP (Water Erosion Prediction Project)模型评估2010- 2039年气候变化对黄土高塬沟壑区长武农田土壤侵蚀的潜在影响。结果表明, 较1957- 2005年, 长武2010- 2039年的年均降水量可能变化- 2. 6% - 17. 4%, 年均降水方差是当前的0. 984- 1. 389倍, 降水量增多且暴雨次数增加的概率较大; 最高和最低温度分别升高0. 6- 2. 6℃ 和0. 6 - 1. 7 ℃ , 方差分别是当前值的0. 748- 1. 155和0. 736 - 1. 387倍, 方差增大的概率较大。受气候变化影响, 2010- 2039年径流普遍增长0% - 130%, 土壤侵蚀变化- 5% - 195%, 侵蚀加剧的可能性极大; 但保护性耕作可有效减少径流和侵蚀, 是农田生态系统适应未来气候变化的有效措施。
【英文摘要】The confirmed clmiate change trends, such as the increase of extrem e ra infall events, may have great m ipacts on soil erosion through a ltering driving forces of soil erosion and influencing the growth condition of plants. The Loess Plateau of China is one of the most erodible areas in the world, the potent ia l response of so il erosion to future clmiate change need to be assessed specifically for th is information is very useful for decis ion m aking. The objective of this study was to assess the site specific mi pacts o f clmiate change during 2010- 2039 on so il eros ion in Changwu County in the tableland gullyregion of the Loess P lateau. A new smiple transfer function method and weather generator CL IGEN (CL Imate GENerator) were used to downscale the spatial tempora l scales o f fourGeneralC irculat ionM odels (CCSR /NIES, CGCM2, CSIRO M k2andH adCM 3) under three em ission scenarios (A2, B2 and GGa) . TheWEPP (Water and Erosion Prediction Project) model was employed to smiulate the responses of agro ecosystem s. Two t illage system s, .i e. conventional tillage andconservation tillage, w ere used to discuss the adaptive m easures to clmiate change. Results show ed that clmi ate would change signif icantly during 2010- 2039 comparedw ith 1957- 2005. The annualm ean precipitation would change - 2. 6% to 17. 4%, the variance of annual precipitation would be 0. 984 to 1. 389 tmi es of the present, and it is very likely that theprecipitation am ount and storm frequency would increase. Annual mean maxmium and minmium tem perature would increase0. 6 to 2. 6 ℃ and 0. 6 to 1. 7 ℃ , and the variance rat ios of 2001- 2039 to 1957- 2005 for maxmium and minmiumtemperature were 0. 748- 1. 155 and 0. 736- 1. 387, respectively. The probability of variance increase was great. The predicted clmi ate changes would cause great changes in runoff and soil loss in slope field of the Loess P lateau. Underconventional tillage, WEPP predicted a change of 10% to 130% for runof,f - 5% to 195% for soil loss during 2010-2039. However, WEPP predicted a change of - 34. 2% to 71% for runoff - 76. 5% to - 25. 8% for soil loss during2010- 2039 under conservation t illage. The changed magn itudes of runoff and soil loss under conservation tillage were farless than those under convent ional t illage. The results indicated that adopt ion of conservation t illage had great potential toreduce the adverse effects of clmiate changes on runoff and soil loss and thus protect agro ecosystems. The new spatial downscaling m ethod, emphasizing on matching the probability distributions, can be widely used in clmiate scenariosdevelopment based on GCM s as it relaxed the demands upon the ex istence of strong correlationsh ips between station measured and GCM projected monthly precipitation and temperature.

【题目】黄土塬区坡面土壤侵蚀对全球气候变化的响应
【中文关键词】气候变化; 黄土高原; 全球环流模式; 天气发生器; WEPP
【英文关键词】climate change ; Loess Plateau; general circulation model ; CLIGEN; WEPP
【中文摘要】气候变化将对黄土高原土壤侵蚀产生重要影响,评估其可能影响可为农业生产提供重要的决策依据。基于全球环流模式HadCM3,建立黄土塬区长武县2010—2039年A2a,B2a和GGa1共3种气候情景;进而使用土壤侵蚀预报模型WEPP模拟该区农田(5 ° 和10 ° 坡地)的土壤侵蚀变化。结果表明,2010—2039年长武县年均降水量可能增长1.8%~17.5%,年均最高和最低温度分别升高0.5℃~0.9℃和2.0℃~2.3℃。相对于目前气候下的耕作条件,2010—2039年5月和8—10月的径流量和侵蚀量显著增大;年均径流量可增长52%~119%,年均土壤侵蚀量可能增长37%~170%。气候变化将加剧黄土高原农田水土流失,需要采取相应的措施来减缓其不利影响。

【英文摘要】Climate change will have considerable impact s on soil erosion on t he Loess Plateau and assessing the possible impact s may provide usef ul information for agriculture production. The objective of this study was to simulate t he response of slope erosion (5 ° and 10 °) on the loess tableland during 2010 - 2039 based onHadCM3 (Hadley Cent re Coupled Model , ver sion 3) and WEPP (Water Erosion Prediction Project) model .GCMs predicted a 1. 8 % to 17. 5 % increase in annual precipitation , 0. 5 °Cto 0. 9 °Crises in maximum temperature , and 2. 0 °Cto 2. 3 °Crise in minimum temperat ure for the region. Compared with the present climate , the runoff and soil loss of May and August to October will increase greatly. Percent increases , as averaged for each emissions scenario and slope , ranged from 51 % to 117 % for annual runoff and 31 % to 170 %for annual soil loss. Climate change will exacerbate soil and water loss in hill slopes on the Loess Plateau and some counter measures are necessary to mitigate the adver se effects of climate change.

【题目】1965年至2005年泾河流域极端降水事件的变化趋势分析
【中文关键词】黄土高原;泾河流域;极端降水事件;Mann-Kendall;小波分析
【英文关键词】Loess Plateau; Jing River watershed; Extreme precipitation events; Mann-Kendall test;Wavelet analysis
【中文摘要】极端降水事件是导致黄土高原水土流失的主要原因之一,分析其变化趋势可为该区的生态建设提供重要的参考信息。选取泾河流域为研究区域,基于Mann-Kendall和小波分析等方法,分析了1965年-2005年极端降水事件的降水量、降水天数、降水强度和严重干旱次数等的变化趋势、突变、年代际变化和振荡周期等。结果表明,泾河流域极端降水事件的整体变化趋势不显著,但其发生频率和强度等都可能呈上升趋势,且存在空间差异,流域中下游呈上升趋势而流域西南部和北部呈下降趋势。各指标均呈波动变化,但基本都在1985年以后呈上升趋势,且在2000年左右发生多次上升突变;波动周期为2~3a,7~8a,13a和17a。尽管变化趋势不显著,但极端降水事件的各指标都趋于升高,表明未来极端降水事件可能对泾河流域的水土保持工作造成更加严重的威胁。
【英文摘要】Extreme climate events often cause more damages to society and ecosystems than dosimple shifts in the mean values, and the impacts of extreme precipitation events are one of the most critical reasons causing severe soil and water loss over the Loess Plateau. Therefore,variations trends in extreme precipitation events need to be reasonably assessed, which can provide meaningful information on regional ecological conservation. The authors performed a study on the Jing River watershed using daily precipitation data from 18 meteorological stations during 1965-2005. Extreme precipitation events were defined in terms of percentile values. Indices, such as amount, frequency, intensity and severe drought frequency, were used to quantify the extreme precipitation events. The Mann-Kendall test and wavelet analysis method were employed to analyze the monotonic trend, abrupt change, interdecadal change and the period of each index. Results showed that the mean annual amount of extreme precipitation events was 143.9 mm/a, accounting for 27% of the total amount of annual precipitation. The mean annual frequency, intensity and maximum daily amount of extreme precipitation events were 3.6 d/a, 39.8 mm/d and 52.3 mm/d, respectively; while the mean annual frequency of severe drought was 7.4 times/a. Most stations in the Jing River watershed had no significant monotonic trend in each selected index of extreme precipitation events; however, the frequency and intensity of extreme precipitation eventstended to increase. Furthermore, the variation trends in extreme precipitation events exhibited spatial variability, which might be caused by the integrated effects of terrain, meteorological conditions and global warming. Specifically, there was a positive trend in extreme precipitation events in the middle and lower reaches of the river that was generally in line with the dominant change trends; while a negative trend in extreme precipitation events in the southwestern and northern watershed was detected, which was opposite to the dominant change trend. Each index was fluctuating during 1965-2005; however, they all increased since 1985 and showed several abrupt changes around the year 2000. The oscillating periods of all indices were found to be 2-3 a, 7-8 a, 13 a and 17 a. Though the annual precipitation amount had a slightly downward trend, each index of extreme precipitation events showed an insignificant upward trend. Therefore, the changesin extreme precipitation events should be paid more attention compared with annual precipitation amount due to potential catastrophic damages resulting from extreme precipitation events to water and soil loss. The findings of this study implied that extreme precipitation events in future mightcause more severe adverse influences on soil and water conservation in the Jing River watershed.Therefore, some adaption actions should be taken to mitigate the adverse effects of climate change on human and natural systems.

【题目】1965~2005年泾河流域极端温度事件变化特征
【中文关键词】气候变化;极端温度事件;黄土高原;Mann - Kendall小波分析
【英文关键词】climate change; extreme temperature events; the Loess Plateau; Mann-Kendall Test; Wavelet Analysis
【中文摘要】利用18个气象站点1965~2005年的日气温数据,基于Mann-Kendall检验、小波分析等方法,分析黄土高原泾河流域极端温度事件的频次、平均强度、年极值和气温日较差的变化趋势、年代际变化和振荡周期等。结果表明,41a以来泾河流域极端高温事件增多而极端低温事件减少,极端低温平均强度显著降低,年极值呈增长趋势。各变量均发生突变,一般在1990年有明显趋势转变。较1965~1990年,90年代以来各变量的变幅较大,极端高(低)温的发生频次变化+9.5d(-8.6d),极端高(低)温的平均强度变化+0.8℃(-1.3℃),气温年极大(小)值增加1.8℃(0.2℃),日较差增大了0.4℃。极端温度事件有3、8~9和17a的振荡周期。
【英文摘要】Based on temperature data during 1965 - 2005 in J inghe watershed and through Mann-Kendall test and morlet wavelet method, this study analyzed the monotonic trend, interdecadal change and period of frequency, intensity, annual extreme value and diurnal range for extreme temperature events. Results showed that in recent 41 years the frequency of extreme high temperature events (EHT) increased while that of extreme low temperature events (ELT) decreased, the intensity of ELT decreased significantly and the annual extreme temperature increased. For each variable abrupt change occurred and generally changed in 1990. Compared with 1965 - 1990, each variable changed greatly since 1990s, the frequency of EHT and ELT changed +9. 5 d and - 8. 6 d, the intensity of EHT and ELT changed +0. 8 ℃ and - 1. 3 ℃, the annual extreme highest and lowest temperature increased 1. 8 ℃ and 0. 2 ℃, respectively; the diurnal range increased 0. 4 ℃. The extreme temperature events haveseveral oscillating period such as three years, eight to nine years, seventeen years and twenty eight years

【题目】泾河流域气候变化及其与ENSO的关系
【中文关键词】泾河流域;气候变化;ENSO;Mann-Kendall;小波分析
【英文关键词】Jinghe watershed; climate change; ENSO; Mann-Kendall; wavelet analysis
【中文摘要】ENSO(厄尔尼诺-南方涛动)常引起大气环流的改变并导致气候异常,探讨区域气候变化与ENSO的关系有助于理解区域水文等各方面的变化。通过Mann-Kendall、相关性检验和小波分析等方法,研究了1960-2005年泾河流域气候变化及其与ENSO的关系。结果表明,1960-2005年,泾河流域气候趋向暖干,且这种趋势在90年代以来愈加显著。气候变化与ENSO有显著的关系。降水对ENSO的响应程度强于温度;降水可能受南方涛动的影响比较大,而温度可能受海表温度的影响较多;ENSO暖事件对泾河流域气候变化的影响可能大于冷事件。
【英文摘要】As ENSO (El Nino-Southern Oscillation) often leads to alteration in atmospheric circulation and further causes climatic variation, exploring the relationship between regional climate changes and ENSO is helpful for understanding the variation in regional hydrology. This study analyzed the relationship between the climate changes in the Jinghe watershed and ENSO through Mann-Kendall, correlation test and wavelet analysis. Results showed that climate tended to be warmer and drier during 1960-2005, and this trend has been more significantsince the 1990s. Climate changes in the Jinghe watershed were closely correlated with ENSO. Precipitation was more sensitive to ENSO than temperature. Precipitation was more sensitive to SOI and temperature was more

sensitive to SST. The impacts of ENSO warm events on climate changes in the Jinghe watershed were more significant than cold events.

【题目】1961—2007年黄土高原极端降水事件的时空变化分析
【中文关键词】极端降水事件; 黄土高原; Mann-Kendall
【英文关键词】extreme precipitation events; the Loess Plateau; Mann-Kendall
【中文摘要】极端降水事件会引起严重的灾害事件,其变化趋势需要进行详尽的评估。基于50个站点1961—2007年日降水数据,定义极端降水事件及衡量指标后,使用M ann-Kendall法评估了黄土高原极端降水事件的空间分布和时间变化特征。结果表明,极端降水事件的空间分布具有东南—西北方向的梯度变化特征,降水量、强度和年最大日降水量均从东南向西北递减,而严重干旱事件从东南向西北递增。多数站点极端降水事件的各指标都具有单一趋势,但各指标具显著性趋势的站点数差异很大。约40%的站点极端降水频率具有显著降低趋势;约30%的站点极端降水量的减少趋势和严重干旱频率的增加趋势具有显著性;约10%的站点极端降水强度的上升趋势和年最大日降水量的下降趋势显著。
【英文摘要】Extreme p recip itation events (EPE) can result in severe hazards, and their changingtrend needs to be assessed in details. Based on the daily p recip itation data of 50 weather stations and the definition of EPE as well as the indices, the spatial distribution and temporal trends of EPE in the Loess Plateau of China during 1961 - 2007 were assessed usingMann2Kendall method. Results showed that annual total amount, intensity and annual dailymaximum p recip itation amount decreased from the southeast to the northwest, severe drought events increased from the southeast to the northwest. Most stations have monotonic trends in indices of EPE during 1961 -2007; however, the numbers of stationswith significant trends are of great difference. About 40% of the stations have significant downward trend in frequency of EPE, 30% of the stations have significant downward trend in annual total amount of EPE and upward trend in frequency of severe drought events, and about 10% of the stations have significant upward trend in intensity of EPE and downward trend in annual daily maximum precipitation amount.

【题目】黄土高塬沟壑区植物路面与土质路面水动力参数特征对比
【中文关键词】道路侵蚀; 剥蚀率; 水流剪切力; 水流功率; 单宽能耗
【英文关键词】road erosion; soil detachment rate; flow shear stress; flow power; energy consumption of unit width
【中文摘要】黄土高塬沟壑区道路侵蚀异常严重,给农业生产与农产品运输造成了极大不便,目前情况下植物路是防治道路侵蚀最经济有效的方式。通过野外放水冲刷试验,系统对比分析了植物路与土质路土壤剥蚀率与各水动力参数间的关系。结果表明:3°~9°的植物路较土质路平均减沙64.68%;道路侵蚀剥蚀率与各水力学参数之间具有很好的相关性,其中水流功率与土壤剥蚀率相关性最高;土壤剥蚀率与水流剪切力呈幂函数关系,与水流功率和单宽能耗呈线性关系。研究结果对深入揭示植物路防蚀机制有重要意义。
【英文摘要】The condition of road erosion was extremely serious on the Loess Plateau, which caused great inconven ience to the ag ricultura l product ion and transportation. At present the plant covered road was the most effective and economical way to prevent the road erosion. The scouring experiments were conducted to contrastive analyze the relationships between soil detachment rate and hydrodynamic parameters of plant covered road and earth covered road. The results showed that with the range of slope gradient from 3 to 9 , compared to the earth covered road, the soil detachment rate of the plant covered road reduced by 64- 68% ; Significant correlation exits between soil detachment rate and the hydrodynamic parameters, and the flow power has the highest significant correlation with soil detachment rate; There was a power function relationship between the soil detachment rate and the flow shear stress,and there was a linear relationship betw een the soil detachment rate and the flow power, energy consumption of unit width; It had important significance to get a further analysis on the mechanism of erosion reduction of plant covered road.

【题目】长武塬区地下水位动态特征分析
【中文关键词】地下水位;动态特征;补给;长武塬区
【英文关键词】groundwater level;dynamic characteristic;recharge;Changwu tableland
【中文摘要】依据长武塬区1975~2005年间地下水位4个不同长度时间序列监测资料,对塬区不同地段地下水位多年动态变化进行系统研究。距离塬心较近位置监测井551#和552#的地下水季节变幅分别达0.26 m和0.29 m,受降水补给明显;多年动态监测均呈先稳定后下降的趋势,受年降水量先增后减和地下水开采量逐渐增加的影响;距离塬心较远的监测井554#和555#水位季节变化较小,年际变化也各异,受降水垂直补给影响较小,与地下水埋藏较深、塬面破碎有关。针对塬区地下水变化特点,为保护有限地下水,应该加强地下水资源统一管理,限制地下水的开采量,"以补定采";同时,合理规划,增加地下水补给量,从而实现塬区地下水有效持续利用。
【英文摘要】According to the monitored data of groundwater level in four diferent time series during 1975—2006,well 551 ,552 ,554 and 555 on Changwu tableland,the annual an d monthly changes of groundwater level were systematically analyzed.As to well 551 and 552 ,which are near to the middle of the tableland,the monthly changes of groundwater level reach 0.26m and 0.29m respectively and are significantly afected by rainfall recharge.And the annualchanges of groundwater level show “ stable · downward ” trend,which is afected by the same trend of annual precipitation and gradual increasing groundwater exploitation.The monthly change of groundwater levels of well 554 and 555 ,which are far from the middle of the tableland,is small and the annual change is different,both of which are lessaffected by the direct recharge of precipitation and are more afected by the deeper groundwater levd and smaller physiognomy.Therefore,dome suggestions on wisely using and protection of groundwater were put forward SO as to supply

referentialmaterials for the efficiency and sustainable use of groundwater on Changwu tableland,such as strengthening uniform management and restraining the exploitation,by constricting the number of motor-pumped wells and adopting the rule that the exploitation amount should comply with that of recharge,an d scientific planning of infiltration depressions to increasethe recharge of precipitation.

【题目】唐以来方家沟流域地貌的演变与复原
【中文关键词】方家沟; 地貌复原; 唐代初期
【英文关键词】Fang jiagou drainage area; restoration of landforms; early Tang Dynasty
【中文摘要】以方家沟沟掌台地上的十六国末期赫连伦墓地和沟口汉墓群为依据,确定出方家沟流域现代侵蚀沟的地貌年龄上限为北魏太武帝始光二年(425 A D)。结合现代侵蚀沟地貌年龄计算公式,最终确定其现代侵蚀沟初始侵蚀年代为唐贞元五年(789 A D)前后。根据洪河流域20多年来的侵蚀模数值,计算方家沟流域1 129 a来的侵蚀总量。在1∶10 000地形图上测得方家沟流域现代侵蚀沟的空腔体积。在此基础上,以今天地貌为基准,复原其地貌至唐初,并虚拟绘制出地貌复原图。结果显示,至少到唐初,方家沟流域还是低丘宽谷地貌,不存在深陷的V型谷,V型谷形成的时间要稍晚一些。这种现象普遍存在于陇东盆地泾河的三、四级支流和部分一、二级支流流域。复原结果很好地支持了历史时期黄土高原水土流失日趋严重这一结论。
【英文摘要】This paper focuses on the research of landform restoration of the entire watershed- Fang jiagou drainage area, with some breakthrough in research methods and contents. The upper limit of the initial development period of the contemporary erosion ditch is obtained by using the tomb relics sites, and then its initial developmental period is gotten by using geomorphic age formula of the contemporary erosion ditch of the loess plateau. The final result of the contemporary erosion ditchs geomorphic ages is got by making the comparative analysis of the two results. The historical land form recovery of the entire watershed is achieved by integrating the land form age, erosion modulus of the Honghe River basin for nearly 20 years, and the data of cavity of the contemporary erosion ditch on110 000 landform map. It is ascertained that the geomorphologic age of the contemporary erosion ditch of Fang jia gou drainage area was 425 A. D. , the 2nd year of Shiguang, Taiwu Emperor, Northern Wei Dynasty. This is the result based on the information obtained from the Cemetery of Lun He lian in the Six teen Countries Period (317-420 A. D.) and the Tombs of the Han Dynasty in Fang jiagou Mizoguch.i With the formula of geomorpho logic agesof the contemporary erosion ditch, the age in this area was finally defined as around 789 A. D. , the 5th year of Zhenyuan, TangDynasty. The tota l amount of erosion in this area since 1 129 has been

calculated based on the data in the recent 20 years. The volume of the contemporary erosion ditch in th is areaw asm easured on a topographicmap (1 10 000). The land forms were restored to early Tang dynasty, and a geomorpho logicmap was virtually designed in accordance with the data obtained and with the present landforms in th is area. The results show that at least in early Tang Dynasty, the landform w as a low lying hill and roomy valley, and there was no chasmalV modelerosion ditch. It was estimated that the V model erosion ditch was shaped later. It was also found that this phenomenon is universa l in the 3rd and 4th, and some of 1st and 2nd grades drainage areas of the branches o f the Jinghe R iver, Longdong B asin. It is supported by the results of restoration of landforms that soil and water loss was in creasingly severe in historical period in Loess Plateau. A lthough it is only one sample, evolutional law of the loess plateau landform in history period can be discovered through the research of a number of samples of the watershed.Therefore the research can provide us with relative exact and valuable indicators for the comprehensive soil erosion control in the Loess Plateau.

【题目】西晋以来彭原古城附近沟谷的演变与复原
【中文关键词】彭原古城;沟谷演变;地貌年龄;现代侵蚀沟
【英文关键词】Pengyuan Ancient - Town Sites ; landform evolution ; geomorphic age ; contemporary erosion ditch
【中文摘要】根据历史文献和考古调查,确定出甘肃省庆阳市西峰区彭原乡的两座古城遗址分别是后汉富平县城(GC1)和唐宋彭原县城(GC2),唐宋彭原县是北魏永和元年(434年)以后从今庙头嘴村搬迁到南庄村。据此推断泾河四级支流、马莲河三级支流彭原沟(当地称湫沟)流域的现代侵蚀沟,是在此年以后开始发育的。利用黄土高原现代侵蚀沟地貌年龄计算公式,计算出彭原沟主干沟道现代侵蚀沟的地貌年龄为1669±819年,沟口附近的现代侵蚀沟发育于西晋成帝咸康五年(339年)前后,其主要分支沟谷现代侵蚀沟的地貌年龄介于900±442~1300±638年之间。沟头平均延伸速度为3.367m/a,沟谷平均下切速度为0.063m/a,平均加宽速度0.19m/a。公式计算结果与考古结果基本相符,研究结果具有较高的信度。依此结果,将彭原沟及其支流地貌复原至西晋时期。
【英文摘要】This paper focuses on historical document s and archaeological investigation , theAncient - Town Sites Determined that were Fuping county of Donghan Dynasty and Pengyuan countyof Tang Dynasty and Song Dynasty in Pengyuan Town , Xifeng county , Gansu province. The countytown of Donghan Dynasty and Pengyuan county of Tang Dynasty relocated f rom Miaotouzui Village to Nanzhuang Village af ter 434 ’ s A. D. , the 1th year of Yonghe , Beiwei Dynasty. It was speculate that contemporary erosion ditches of the 3th branches of Manlian River , the 4t h branches of Jinghe River developed after this year . Based on the formula of geomorp hologicages of the contemporary erosion ditch , calculated t he geomorp hic ages of main St ream of contemporary erosion ditch of Pengyuangou was 1669 ±819 years old , developed after 339 ’ s A. D. , the 5th year of Xiankang , Xijin Dynasty. The geomorphic ages of its branches were 900 ±442~1300 ±638 years old. The average forward speedy ofgullies head was 3. 367m/ a. The average speedy of vertical erosion of gullies was 0. 063m/ a. The average widened speedy of gullies was 0. 19m/ a. The two results is basically same that based on formula and archaeological study. The results had high reliability. Based on this results restored the landforms of the Pengyuangou drainage area and its branches to Xijin Dynasty.

【题目】黄土塬区苹果树蒸腾速率变化特征及其影响因子
【中文关键词】苹果树;蒸腾速率;茎流计;黄土塬;总辐射
【英文关键词】apple tree ; transpiration rate ; sap flow probe ; the loess tableland ; global solar radiation
【中文摘要】报道了应用茎流计(TDP)测定黄土塬区苹果树主要生长季节蒸腾速率的试验结果,并对其影响因子做了分析。研究表明:晴天苹果树蒸腾速率的日变化为单峰曲线;逐日变化为昼高夜低、骤升骤降的特征,夜间接近于0,白天单株苹果树蒸腾速率峰值变化幅度为300~1 000 g/h;6~8月是苹果树蒸腾耗水的主要月份,其中7月份的单株平均日蒸腾量为3 038 g/d;与苹果树的生育期相联系,平均日蒸腾量最大出现在果实膨大期,随后是秋梢生长期和幼果膨大期。在测定时段,随总辐射的增强及气温的升高,苹果树蒸腾速率随之增加。
【英文摘要】This paper reported the experimental results of apple tree transpiration rate measured by TDP mainly in the growing seasons on the Loess Plateau , and the influencing factors to transpiration rate was also analyzed. The results showed that : the change of transpiration rate in clear day was in a form of single peak curve ; the diurnal change of transpiration rate was characterized by an upsurge and followed by a plummet . The transpiration rate , at night , was near 0g/ h , while it changed from 300 g/ h to 1 000 g/ h in the day time. June , July and August were the main periods for transpiration water consumption. In July , the amounts of daily transpiration reached to 3038 g/ d. Associated with the growthphase of apple trees , the maximum daily transpiration amounts appeared in the fruit expanding process stage , then the growing stages of shoots and young fruit in the autumn. In the experimental period , the transpiration rate of apple trees increased with the increasing of global solar radiation and atmospheric temperature

【题目】应用时间序列模型分析长武塬区地下水水位的变化特征
【中文关键词】地下水位; 动态变化; 时间序列分析; 长武塬区
【英文关键词】groundwater level ; dynamic variation of groundwater ; time-series analysis ; Changwu tableland
【中文摘要】针对长武塬区地下水资源贫乏的问题,运用时间序列分析理论对长武塬区地下水位动态变化进行了分析和模拟。采用多项式拟合计算水位动态的趋势分量,运用谐波分析提取周期项,利用自回归(AR)模型模拟随机分量,将得到的三个分量进行叠加建立预报模型。依据长武塬区三口监测井的月平均水位埋深资料,运用SAS提供的指数平滑模型建立地下水位动态模拟和预测模型,并对模型的模拟和预测精度进行分析。(1)时间序列分析法可以简易快捷地模拟预测研究区的地下水位变化,且计算简单,所需资料较少且易于获得,可作为一种简易快速的地下水位模拟预测模型;(2)所建立的时间序列模型需要及时更新资料以提高预测精度;(3)通过对周期项的分析可知研究区地下水位变化存在的主要周期为7.4~10a,且周期逐年增长,揭示了地下水位的多年变化规律;(4)研究区地下水水位呈下降趋势,尤其近几年水位下降幅度增大,应加以控制。
【英文摘要】According to problem existed in water resource indigent on Changwu tableland , the time-series analysis theory is applied to analyze and simulate the dynamic variation of groundwater on Changwu tableland. First , the trend component of groundwater level dynamic variation is picked up by polynomial calibration , the periodic component is extracted by spectrum analysis and the stochastic component is simulated by using autoregression (AR)model. Then , a forecasting model is established through superposition of the three components. According to the month average ground water level data of the three wells in Changwu tableland ,the dynamic simulating and forecasting model of groundwater level is established respectively by using index smooth model provided by SAS , and t he accuracy of models is analyzed. The analysis of t he application example shows that : (1) Thetime-series model is a simple simulation and forecast model of groundwater level because of simple computation and less demand of data. But the data should be continually updated in order to improve the accuracy of model ; (2) But the data should be continually up dated in order to improve the accuracy of model ;(3) There is a major period in the variation of groundwater level in this area , including 7. 4 years and 10 years cycle which becomes longer year by year , by which seasonal and secular variation of groundwater level is revealed ; (4) The prediction for years after 2008 indicates that a continuing decline of groundwater level exists in this area , which must be controlled in time.

【题目】轮作及不同施肥措施对春玉米生长、产量及水分利用的影响
【中文关键词】春玉米; 连作; 轮作; 有机肥; 产量; 耗水量
【英文关键词】spring maize; continuous cropping; rotation; manure; crop yield; water consumption
【中文摘要】依托24a轮作与施肥长期定位试验,重点对2007年不同轮作方式和施肥条件下春玉米生长、产量及水分利用状况进行了研究。结果表明,不同处理春玉米叶面积,生物量及籽粒产量有相同的变化规律,即在相同施肥条件下,玉米连作(CT)处理的叶面积、生物量以及籽粒产量均高于玉米轮作处理;在轮作(RT)条件下,叶面积、生物量以及籽粒产量均为:RT—NPM>RT—NPK>RT—NP;不同处理间总生物量及籽粒产量均有显著性差异;不同处理0—300cm土壤平均含水量在整个生育期先降低后升高,灌浆期降至最低,春玉米耗水量顺序为:CT—NPM>RT—NPM>RT—NPK>RT—NP;在相同施肥条件下,轮作处理的水分利用效率大于连作处理的水分利用效率;轮作不同施肥处理,RT—NPM处理的水分利用效率最高,RT—NP和RT—NPK处理的水分利用效率均较低。
【英文摘要】Based on 24 year rotation and fertilizer experiments, the effects of rotation and fertilization on the growth, yield and water consumption of spring maize were studied. Results showed that at the same fertilization level, leaf area, yield, and biomass of continuous cropping maize were higher than rotation treatment .Under the same rotation conditions, RT-NPM had the highest leaf area, yield, and biomass, RT-NPM was the second, and RT-NP was the lowest . Yield and biomass of the three treatments were significantly different . The averaged soil water content in 0-300 cm layer decreased firstly and then increased in different development stages and eventually fell to the lowest level in the silking stage. The order of treatments, by water consumption of spring maize, was CT-N PM> RT-N PM> RT-NPK> RT-P. The rotation maize had the highest water use efficiency, continuous cropping maize was in the second level, and RT-NP and RT-NPK were in the lowest level.

【题目】不同添加剂对淮南麻黄鸡抗冷应激能力的影响
【中文关键词】添加剂; 冷应激; 淮南麻黄鸡; 生长发育
【英文关键词】additive; cold stress; Huainan spotted-y ellow chicken; growth and development
【中文摘要】研究不同添加剂对淮南麻黄鸡冷应激处理时血液中激素水平的动态变化和冷应激处理后淮南麻黄鸡生长发育的影响。将480 只40 日龄的淮南麻黄鸡随机分为6 组, 第1~ 4组为冷应激试验组, 分别在日粮和饮水中加入中草药、复合添加剂、营养成分和生理调节剂, 第5 组为冷应激对照组, 第6 组为非冷应激对照组。结果表明, 第1 组采食量显著高于第3、4、5和6 组(P < 0. 01) , 第3 组饮水量显著高于第4、5 和6 组(P < 0. 05) 。淮南麻黄鸡血清三碘甲腺原氨酸(T3) 、游离三碘甲腺原氨酸(FT 3) 、游离甲状腺素(FT4) 的含量与冷应激时间呈极显著的正相关关系(P < 0. 01) 。冷应激处理后, 不同处理组间淮南麻黄鸡血液中T 3、T4、FT 3 和FT 4 的含量发生了变化, 不同处理组的FT 4、T4、T3 和FT3 分别于第1、2、4 d 和4 d出现了显著性差异(P < 0. 05) 。冷应激处理后淮南麻黄鸡的生长发育以第1 组最佳, 第2 组 较差。当鸡处于冷应激状态时, 在日粮中加入中草药, 有助于提高机体的抗应激能力。

【英文摘要】T he aim of this study w as to invest igate the effect of four kinds o f addit ives o n the dy namicchang e of blood hormo ne during cold st ress and grow th and development af ter cold st ress in Huainan spotted-yellow chicken. 480 chickens were selected and randomly allocated to six t reatment gro ups. The diet scontaining Chinese herbs and compound addit ives w ere given to feed group one and group tw o , respect ively. T he drinking w ater containing nut rit ion compo nent and physiolog ical regulator w ere employed fo rgroup three and gro up four , respect ively. The basic diet w ere used fo r g roup five considered as cont ro lgroup during co ld st ress and g roup six fed in the normal temperature. The result s show ed that , the feedintake of gro up o ne w as sig nif icant ly higher than that of g roup three, four, five and six (P < 0. 01) anddrinking amo unt of g roup three w as higher than that o f group four five and six (P < 0. 05) . T he concentrat ions of t riiodo thyr onine (T3) , f ree tr iiodothyronine (FT3) , f ree thyro xine (FT 4) in the ser um and thetr eatment time of cold st ress w er e posit ively correlated (P < 0. 01) . T here w ere differ ence among thesegroup on the chang ing concent rat ions of T3, T4, FT 3 and FT 4 in the ser um at the f ir st , second, fouth andfouth day (P < 0. 05) , r espect ively. The growth and development o f group one was the best and that wasthe worst of group tw o among these groups. When the chickens w ere ex posed to cold st ress, Chinese herbs added in the diet could improve the ability of r esistance of co ld st ress.

【题目】高塬沟壑区中尺度流域水土保持示范基地建设

【中文关键词】水土保持; 综合治理; 中尺度流域; 砚瓦川流域

【英文关键词】soil and water conservation; integrated treatment; mesorscale watershed; Yanwachuan Watershed

【中文摘要】砚瓦川流域水土流失面积为208.7 km2,占流域总面积的63.52%,水土流失较为严重,主要采用工程措施、植物措施、小型拦蓄工程措施、节水灌溉措施对该流域进行了综合治理,共完成水土保持综合治理面积138.81 km2,建成谷坊928道、沟头防护62处、水窖1496眼、涝池90座、骨干坝6座、小型淤地坝2座、径流高效利用示范点5个,使该流域土地利用结构发生了很大变化,取得了可观的经济效益、生态效益和保水保土效益。

【英文摘要】The area of soil and water loss of Yanwachuan Watershed where the soil and water loss is severe is 208. 7 km2, making up 63. 52% of the total drainage area. It mainly implements the following measures of engineering, vegetation, small sized im pounding workand water saving irrigation for integrated treatment. It has completed integrated treatment area of 138. 81 km2 through soil and water conservationand built 928 check dams, 62 protection of gully heads, 1 496 cisterns, 90 ponds, 6 key dams, 2 small sized warping dams and 5 pilot areas of efficient use of runoff in total having a great change on the structure of land use of the watershed and achieving considerable benefitsin economy, ecology and soil and water conservation.

【题目】黄土塬区土壤水分分布特征及其对不同土地利用方式的响应

【中文关键词】土壤,水分,土地利用,黄土塬区,土壤干燥化,响应

【英文关键词】soils, moisture, land use, the Loess Tableland, soil desiccation, response

【中文摘要】该文就陕西省长武黄土塬区主要土地利用方式下0~20 m土壤剖面水分分布特征及其与土壤质地的关系进行了调查与分析,以期服务于土地利用方式的优化配置及区域水文水资源研究。结果表明,黄土剖面古土壤层物理黏粒含量较黄土层高约2%~6%,质地较重;0~20 m剖面田间持水率和萎蔫湿度分别为(21.39±0.13)%和(8.06±0.45)%。黄土深层土壤

水分分布特征与黄土-古土壤序列有关,一般情况下,一层黄土和一层古土壤构成一次湿度高低起伏,并有随深度增加湿度变大的趋势。荒草地、18年苹果园地、8年生及23年生苜蓿草地0~20 m土层平均湿度分别为18.89%、15.45%、14.77%和10.59%,连作高产小麦地0~13 m土层平均湿度为18.74%。高产麦田和荒草地3 m以下土层没有发生干燥化现象;18年苹果园地在10 m以上土层发生了中度和轻度为主的土壤干燥化现象;8年苜蓿草地在10 m以上土层发生了重度、中度和轻度的土壤干燥化现象,其中重度干燥化现象出现在4 m以上土层;而23年苜蓿在整个20 m土层都发生了重度和中度的土壤干燥化现象,其中重度干燥化现象出现在17 m以上土层。可以看出,高耗水型人工林草因水分负平衡所导致土壤干燥化,随年限增加渐进地向深层土层发展,这在苜蓿草地上表现的更为突出。

【英文摘要】The characteristics of soil moisture distribution in 0~20 m loess profiles under different land use patterns and its relations with soil texture on the Changwu Loess Tableland were investigated for the optimal allocation of land use patterns and the study of regional hydrology and water resources. Results showed that physical clay in soil layers of red-brown paleosol was 2%-6% higher than in loess layers. Field capacity and wilting point were (21.39±0.13)% and(8.06±0.45)%, respectively. The characteristics of soil moisture distribution in deep layers were related to the loesspaleosol sequences. Generally, one paleosol layer and one loess layer constituteda up-down humidity level and there was an increasing trend in soil moisture with increased depth. The average soil moisture contents in the loess profiles in grasslandwas measured, 18-yr apple orchard, and 8-yr and 23-yr planted alfalfa grasslands were 18.89%, 15.45%, 14.77%, and 10.59%, respectively. The average soil moisture content at 0-13 m layer in high-yield wheat field was 18.74%. There was no soil desiccation below the depth of 3 m in high-yield wheat field and grassland. In 18-yr apple orchard, soil desiccationoccured in the upper 10 m of the profile, being mainly moderate desiccation and light desiccation. In 8-yr planted alfalfa grassland, soil desiccation occured above 10 m of the profile, being severe desiccation, moderate desiccation, and light desiccation, and the severe desiccation occured above 4 m of the profile. In 23-yr planted alfalfa grassland,soil desiccation occured in the whole loess profile and the severe desiccation occured in the upper 17 m of the profile. The soil desiccation caused by negative water balance can gradually develop to deep soil layers with age in planted woodland and grassland and it is more prominent in alfalfa grassland.

【题目】高塬沟壑区水畜沼果生态经济技术试验研究
【中文关键词】高塬沟壑区; 生态; 经济; 径流
【英文关键词】Hilly-gullied area of loess plateau,Ecology,Economy,Runoff
【中文摘要】通过试验监测方法,在甘肃省庆阳市西峰区崔沟"水畜沼果"示范村的生态经济户中,确定家庭经济收入很好、好、一般、差、很差各1户,共5户,以户为单元,系统监测各户的需水量、用水来源、耗水量、水去向和经济效益等方面的指标。自来水用量、集蓄水量占总用水量72.3%和27.7%;自来水主要用于果园灌溉、畜用、人用和菜园灌溉,依次为86.3%、6.7%、4.7%和2.3%;集蓄水主要用于畜用、果园和菜园灌溉,依次为75.2%、16.9%和7.9%。沼气年平均使用率为49.1%。研究提出"水畜沼果"生态经济示范标准户,对实现模块化、集成化和快速、大规模推广具有重要的作用。

【英文摘要】Through experimental and monitoring methods,we chose five ecological economy families in the village of Cuigou “ water livestock methane-fruits ” model units. These five families are divided into five types of very good,good,normal,poor, and very poor by their incomes. Each family is a unit,systematic monitoring indicators such as the family water demand,water sources,water consumption water use,and economic benefit etc. Running,water storage capacity takes 72. 3% and 27. 7% of total water consumption; it is mainly used for orchard irrigation,livestock use,and human use,garden irrigation,followed by86. 3%,6. 7%,4. 7% and 2. 3%. Stored water is mainly used for livestock,irrigation of orchards and vegetable gardens, followed by 75. 2%,16. 9% and 7. 9%. Biogas utilization rate is 49. 1% on average. The research gives standard ecological economic model families for “ water livestock methane-fruits ”,it plays an important role in realizing modular,integrated,rapid and large-scale promotion.

【题目】山地苹果树更新修剪对树体营养及生长的影响
【中文关键词】苹果;更新修剪;树体营养;生长
【英文关键词】apple;renewal pruning;nutrition;growth
【中文摘要】在陕北黄土丘陵沟壑区以常规修剪为对照,探讨更新修剪对盛果期山地苹果树体营养和生长方面的影响。结果表明:更新修剪提高了叶片、枝条中的氮、磷、钾、钙含量,提高了果实中的氮、钾、钙含量,对果实中的磷和根系中的磷、钾无显著影响;降低了根系中的氮、钙含量;显著增加了长枝、中枝的比例,显著降低了短枝、叶丛枝比例,促进了枝条健壮发育。更新修剪增加了叶面积,提高了叶绿素、单果质量、果实维生素C和有机酸含量,对果实可溶性固形物、总糖、着色面积等无显著影响,提高了果实产量,极显著提高了果园的经济产值。
【英文摘要】Compared with common pruning in Loess hilly and gully region of Northern Shaanxi,theeffects of renewal pruning on mountain apple tree ’s nutrition and growth at full productive age had been determined. The results showed that renewal pruning increased nitrogen,phosphorus,potassium,calcium contents in leaves and branches,and increased nitrogen,potassium and calcium contents in fruit,reduced nitrogen and calcium contents in roots,but had no significant effects on phosphorus content in fruit,phosphorus and potassium contents in roots. Renewal pruning significantly increased the proportion of long branch and medium branch,significantly reduced the proportion of short branch and leafage branch, and promoted branch robust development. Renewal pruning increased leaf area,chlorophyll content,fruit weight,fruit vitamin C and organic acid contents,but had no significant effects on fruit firmness,soluble solids,total sugar,and coloring area. Renewal pruning increased fruit yields and significantly improved orchard economic value.

【题目】更新修剪对盛果末期苹果光合能力及果实品质的影响
【中文关键词】盛果末期苹果树; 更新修剪; 光合能力; 果实品质; 枝条生长
【英文关键词】apple tree in final full productive stage; renewal pruning ; photosynthetic ability ; fruit quality ; shoot growth
【中文摘要】【目的】探讨更新修剪对盛果末期苹果树光合能力及枝条生长、果实品质的影响。【方法】在渭北旱原,对盛果末期苹果树进行更新修剪和长放修剪(对照),利用LI-6400光合仪测定2种修剪方式下不同枝条叶片的光合能力,并测定枝条生长状况和果实品质的相关指标。【结果】盛果末期苹果树果台副梢、叶丛枝、发育枝叶片的光合速率和气孔导度日变化曲线均呈双峰曲线,蒸腾速率则呈单峰曲线,胞间CO2浓度呈"反抛物线";更新修剪极显著提高了不同枝条叶片的光合速率、气孔导度和蒸腾速率,极显著降低了叶片胞间CO2浓度;更新修剪显著或极显著提高了中枝、长枝的数量,显著或极显著提高了果实单株产量、单果质量、果形指数及有机酸、可溶性固形物和可溶性糖含量,对果实硬度及维生素C含量无显著影响。【结论】更新修剪提高了盛果末期苹果树叶片的光合能力,促进了枝条生长,提高了果实产量和单果质量。
【英文摘要】Objective The study was to investigate the effect of renewal pruning on photosynthetic ability and shoots g rowth, fruit quality of apple tree in final full productive stage. Method In Weibei Plateau, renewal pruning and long branch pruning (control) on final full productive stage, photosynthetic ability of different shoots with two types o f pruning were measured by LI6400 photosynthetic and shoo growth and related indicators of fruit quality w ere measure. Result The diurnal variation of photosynthetic rate and stomatal conductance of bourse shoot , leafage shoot and vegetative shoot all showed bimodalcurve, the diurnal variation of transpiration showed single curve, and the diurnal variation of intercellula CO2 concent ratio n showed antiparabolacurve . Renewal pruning significantly increased photosynthetic rate, stomatal conductance and transpiration of different shoots; and significantly decreased intercellularCO2 concentration. Renewal pruning extremely signficant or significantly increased amount of long branch and medium branch, ext remely significant or significantly increased fruit yields, fruit weight, fruit

shape index and acid content , solule solids and the content of soluble sugar; and it had no significant effect on fruit firmness and vitamin C. Conclusion Renewal pruning increased the photosynthetic ability of leaves, promoted shoots growth, and improved yields and fruit weight of apple tree in final full productive stage.

【题目】旱区经营人工植被对土壤干化过程的调控
【中文关键词】人工植被; 土壤干化; 水分平衡; 旱区
【英文关键词】artificial vegetation; soil desiccation; water balance; dry land areas
【中文摘要】人工植被在北方旱区具有重要的意义,但在干旱少雨的条件下开展建设,必须讲求水分平衡。基于此,作者通过考察长期的经营实践,从土壤水分角度讨论人工植被与环境之间的耦合匹配问题。阐述了普遍发生的人工植被作用下的土壤干化对植被自身的不利影响以及其可调控性,并进一步对调控途径和措施进行了分析。表明人为采取措施可以将土壤干化现象加以调节和控制,如局部带状或团块状种植、疏伐、轮作、休闲、灌溉等。在贯彻适地适种原则的基础上,还需选择耗水量少的抗旱节水植物和可维持土壤水库水平的密度或盖度,这是保证人工植被稳定持久值得重视的又一重要方面。预防土壤干化是首要的,需多途径相互结合进行调控。对土壤干化过程的调控实际上就是有效经营人工植被。需要结合经营目标评定人工植被的稳定性。
【英文摘要】Artificial vegetation is of great significance in the dryland areas of northern China, butwater balance must be thought over in its construction under droughty conditions of less precipitation. Based on this, the paper dealt with the matching of artificial vegetation to its environment from the angle of soil moisture by investigating long-term management practices. After presenting the unfavorable feedback effects of so il desiccation occurring un iversally by artificial vegetation and its contro llab ility, the author further analyzed the controlling ways andmeasures. It is shown that the phenomenon of soil desiccation might be controlled by artificia lmeasures, such as partial afforestat ion or cultivation of forage grasses in strips or patches, thinning, rotation cropping, fallowness, irrigation, etc. On the basis of carrying out the principle of planting in a ccordance with site conditions, drought resistant and water-saving plants that consume less water and communitydensity or coverage to mainta in soil reservoir level would need to be chosen, which is another important aspect to deserve to be taken seriously for guaranteeing vegetation stability. Preventing soil desiccation is themost importan,t and some controllingw ays should be integrated. Controlling soil desiccation is actually equivalent to effective ly m anaging artificial vegetation. The managing goal is one of them a in factors to assess the stability of artificial vegetation

【题目】糙米替代玉米在麻黄鸡育肥期应用效果研究
【中文关键词】麻黄鸡; 育肥期; 糙米; 玉米
【英文关键词】Partridge chicken; Fattening period; Brown rice; Corn
【中文摘要】研究了不同比例糙米替代玉米, 对育肥期麻黄鸡生产和屠宰性能的影响。将180只120日龄麻黄鸡随机分为3个处理组, 即对照组(0%替代)、试验Ñ组(10% 糙米替代) 和试验Ò组(20%糙米替代) , 每个处理组4个重复。每周统计各组耗料量, 每2周称重1次, 并于第4周末于每个重复内随机取2只测定其屠宰性能。结果表明: 各糙米替代组对麻黄鸡增重无显著影响, 育肥前期饲料转化率高于育肥后期, 但各组间差异不明显; 各糙米替代组对育肥期麻黄鸡主要屠宰性能无显著影响, 10%替代组腹脂率显著低于对照组和试验Ò组。表明糙米部分替代玉米作为麻黄鸡育肥期饲料是可行的, 但糙米用量以不超过10%为宜。
【英文摘要】T he effects o f brown rice instead of corn on the production and slaughter perform ance during the fatten ingperiod of partridge chicken were studied1The resu lts show ed that the effects of corn, 10% brown rice and 20% brown riceon the weight gain of ch icken w ere not s ign ificant1The feed conversion rate at early fatting stage was higher than that atlate, while the differences am ong three groupsw ere not obv ious1The brown rice had no s ign ificant effect on the slaughterperformance1The percentage of abdom inal fat o f10% brown rice was s ign ificantly low er than those of corn and 20% brownrice1That was to say, the brown rice could be used as feed instead of corn, and the am ount was less than 10%.

【题目】低温环境下不同采食量对黄羽肉种鸡生产性能的影响
【中文关键词】黄羽肉鸡;采食量;生产性能
【英文关键词】Huangyu broiler; food intake; production performance
【中文摘要】试验研究了低温环境下采食量对肉种鸡生产性能的影响。选取20 周龄体重相近的黄羽肉种鸡432 只,随机分成4 个饲料水平组,每组9 个重复(12 只/重复):基础日粮组(C);试验组分别在基础日粮上增加2 g(C+2 组)、4 g(C+4 组)和6 g(C+6 组)日粮,统计产蛋初期不同饲料水平下黄羽肉种鸡产蛋率和蛋重。结果表明:在整个试验周期内,各试验组与基础日粮组间产蛋率差异不显著(P >0.05);各试验组内产蛋率差异亦不显著(P<0.05);而C+6 组的蛋重显著高于对照组(C)(P<0.05);各试验组与对照组体重差异不显著(P >0.05)。结论:在低温环境下,适当增加饲喂量有助于黄羽肉种鸡生产性能的提高。
【英文摘要】Effects of different feed intake on Huangyu broilers were tested under low temperature in the trial. 432 broilers with similarbody weigh at 20 week-old were randomly divided into 4 groups, and respectively fed with different diet level, namely basal diet group(C), basal diet with 2 g feed addition (C+2), basal diet with 4 g feed addition (C+4) and basal diet with 6 g feed addition (C+6).Statistics in egg production rate and egg weight indicated that, in the experimental period, there was no difference between experimentalgroup and basal diet group in egg production rat(P>0.05), but C+6 in egg weight was higher than that of C(P<0.05). However, there wasno marked difference between C and the other groups in body weight again (P>0.05). In conclusion, application of addition into feed intake would improve the productivity of Huangyu broilers under low temperature to a degree.

【题目】干旱影响下人工林的天然更新进程
【中文关键词】人工林; 天然更新; 幼苗建立; 土壤水分; 黄土高原
【英文关键词】plantation forest; natural regeneration; seedling; soil moisture; Loess Plateau
【中文摘要】通过植被状况调查、气象条件分析以及地面处理试验,在分析人工林天然更新因子的同时,对更新幼苗的发生进行了探讨。结果表明:落种的萌发成苗过程是干旱影响下人工林天然更新的关键环节,其间水分因子起着显著的作用。更新幼苗与降水特点密切相关,冬季积雪、春季或旱季出现连续数日的降水过程或连阴雨天气,都是更新幼苗发生的有利条件。冬、春季缺少持续降水,干燥的地表使得更新幼苗难以发生。地面处理产生的覆土效果可改善落种的水分环境,克服降水条件的制约,从而促进更新幼苗的发生。为使成苗状况稳定和完成天然更新,进一步讨论了人工促进更新的一些措施。
【英文摘要】Based on the investigation of some typical plantation forests and peripheral natural grasslands in adrought-prone semihumid area on the Loess Plateau,the analyses on meteorological conditions and the trial of shallowscarification of plantation land with fallen seeds and seedlings for regeneration were mainly regarded the factorsaffecting the natural regeneration of plantation forests. The results indicated that the germination of fallen seeds onland surface and seedling formation would be the key links for the natural regeneration of plantation forests underdrought,in which water factor might be a dominant factor. Closely related to rainfall,the favorable aspects to ensureseedling occurrence for regeneration is snow cover accumulated in winter without thawing until early spring,and also precipitation lasting for a number of days or continuous rainy overcast appearing in spring or droughty season.Owing to successive scarcity of precipitation in winter and spring,it is difficult to emerge seedlings for regenerationin dry land. Nevertheless,to earth up may improve soil moisture conditions in dry land for fallen seeds andovercome the restriction of precipitation scarcity,thus the emergence of seedlings for regeneration may be improved.In order to stabilize the survival and growth of seedlings and achieve the natural regeneration of plantationforests,it is suggested to take some artificial measures.

【题目】低温应激对淮南麻黄鸡血清生化指标的影响
【中文关键词】淮南麻黄鸡;血清酶;低温应激
【英文关键词】Huainan partridge chicken; serum enzyme; cold stress
【中文摘要】为探讨不同强度和时间冷应激对皖北地方鸡种淮南麻黄鸡公鸡血清酶的影响,将4 周龄健康公雏分别暴露于2℃和10℃环境温度下,分别于0、0.5、1、2、3、6、12、24、72 和144 h 取6 只公雏,检测血清中丙氨酸氨基转移酶(ALT)、天门冬氨酸氨基转移酶(AST)、γ-谷氨酸氨基转移酶(γ-GT)、乳酸基质速率法测乳酸脱氢酶(LDH)和酶偶联法测肌酸激酶(CK)的水平。结果表明:极端低温应激(2℃)下,各时段血清中ALT、AST、γ-GT、LDH 及CK 均表现出不同的变化规律,即在应激早期血清酶水平快速升高,至中期下降至与对照组接近的水平,慢性应激达3~6 d 时,各血清酶水平再次升高。在中度冷应激(10℃)条件下,血清中各酶水平变化较不明显,只在慢性应激达3~6 d 时检测到血清酶水平的上升或下降。
【英文摘要】In order to investigate the effects of different intensities and time of cold stress on the serum enzyme ofHuainan partridge chicken, 4-week-old healthy male chicken were randomly selected and exposed at 2°C and 10°C,respectively. 6 blood samples were collected at 0, 0.5, 1, 2, 3, 6, 12, 24, 72 and 144 h, respectively, and ALT, AST, γ-GT, LDH and CK in the serum were measured. The results showed that under the extreme low temperature (2°C), theALT, AST, γ-GT, LDH and CK in each time all showed different change rules, i.e., serum enzymes elevated significantlyduring early time of cold stress and then decreased to the level of control group's at middle time, and when cold stresssustained for 3 to 6 days, serum enzymes rose again. Under the mid-cold stress (10°C), no obvious changes were observedfrom each serum enzyme, but the significant rise or decrease of serum enzymes was observed from long-term cold stress (3 to 6 days).

【题目】Soil water dynamics and deep soil recharge in a record wet year in the southern Loess Plateau of China
【中文关键词】无
【英文关键词】Soil water recharge;
Eco-hydrology;
Loess Plateau;
Dryland farming
【中文摘要】无
【英文摘要】Terrestrial water cycles are influenced by hydrologic and textural properties of the deep loess layer in the Loess Plateau. Analyses of soil water profile distributions are needed to understand the regional water cycle processes and to guide agricultural production and sustainability. The objective of this study was to quantify the extent of deep soil water recharge and soil water profile dynamics during 1987 – 2003, especially in a record wet year of 2003, in common cropping systems in a semiarid-subhumid region of the southern Loess Plateau. The Chinese Ecological Research Network (CERN) site and a long-term rotation experiment site in a flat tableland were selected for this study. Soil moisture profiles were measured by a neutron probe to a depth of 6 m in 2003. The precipitation of 954 mm at the Changwu County Meteorological Station in 2003 was 63.4% higher than the long-term average (584 mm), and was a record high since 1957. Although cropping systems affected deep soil water recharge, the persistent dry soil layer

formed between 2- and 3-m depths in croplands, resulting from many years of intensive cropping, was fully replenished in all cropping systems in 2003. Further frequency analysis indicated that the desiccated layer between 2- and 3-m depths would be fully recharged at least once in about 10 years for all existing cropping systems excluding continuous alfalfa. This finding should alleviate concerns about the formation of a permanent deep-soil desiccation layer as well as its potential impact on the long-term sustainability of the existing intensive cropping systems in the region.

【题目】Spatial distribution and temporal trends of extreme temperature and precipitation events on the Loess Plateau of China during 1961——2007
【中文关键词】无
【英文关键词】extreme temperature;precipitation events;Loess Plateau of China
【中文摘要】无
【英文摘要】Extreme climate events often cause catastrophic damage to nature and human society. Therefore, regional assessments in various climates and geographic regions are needed for understanding the uncertainties of the change trends for extreme climate events. The objective of this study was to assess the spatial distribution and temporal trends of extreme precipitation and temperature events on the Loess Plateau of China during 1961 – 2007. Nine indicators (pq90, px5d, pint, pxcdd, pnl9, txq90, tnq10, tnfd, txhw90) were chosen to quantify extreme climate events, the Mann-Kendall method and linear trend analysis were used to test the change in trend and the magnitude, and inverse distance weighted interpolation was used to interpolate the spatial patterns. Results showed that most extreme climate indicators were spatially distributed with obvious gradients from the southeast to the northwest. Heavy rainfall threshold (pq90), greatest 5-day total rainfall (px5d), heavy rainfall days (pnl9) and cold-night threshold (tnq10) decreased from the southeast to the northwest, while simple daily rainfall intensity (pint), longest dry period (pxcdd) and number of frost days (tnfd) increased from the southeast to the northwest. Most stations had monotonic trends in extreme indicators during 1961 – 2007. However, the number of stations with significant trends varied greatly. Precipitation-based indicators showed more mixed patterns of change and few stations had significant trends. However, temperature-based indicators had more uniform changes and most stations had significant trends. Hot-day threshold (txq90) and cold-night threshold (tnq10), and the longest heatwave (txhw90) tended to increase while the number of frost days decreased since the 1960s on the Loess Plateau. Overall, extreme precipitation events did not change significantly; however, extreme temperature events became more severe and frequent. The results implied that extreme climate events on the Loess Plateau will continue to have adverse impacts, and adaptive measures should be considered for future ecological construction and agriculturally sustainable development.

【题目】Generation of induced pluripotent stem cell from buffalo (Bubalus bubalis) fetal fibroblasts with buffalo-derived defined factors
【中文关键词】无
【英文关键词】无

【中文摘要】无

【英文摘要】Ectopically, expression of defined factors could reprogram mammalian somatic cells into induced pluripotent stem cells (iPSCs), which initiates a new strategy to obtain pluripotent stem cell lines. Attempts have been made to generate buffalo pluripotent stem cells by culturing primary germ cells or inner cell mass, but the efficiency is extremely low. Here, we report a successful method to reprogram buffalo fetal fibroblasts (BFFs) into pluripotent stem cells [buffalo induced pluripotent stem cell (biPSCs)] by transduction of buffalo defined factors (Oct4, Sox2, Klf4, and c-Myc) using retroviral vectors. The established biPSCs displayed typical morphological characteristics of pluripotent stem cells, normal karyotype, positive staining of alkaline phosphatase, and expressed pluripotent markers including Oct4, Sox2, Nanog, Lin28, E-Cadherin, SSEA-1, SSEA-4, TRA-1-81, STAT3, and FOXD3. They could form embryoid bodies (EBs) in vitro and teratomas after injecting into the nude BALB/C mice, and 3 germ layers were identified in the EBs and teratomas. Methylation assay revealed that the promoters of Oct4 and Nanog were hypomethylated in biPSCs compared with BFFs and pre-biPSCs, while the promoters of Sox2 and ECadherin were hypomethylated in both BFFs and biPSCs. Further, inhibiting p53 expression by coexpression of SV40 large T antigen and buffalo defined factors in BFFs or treating BFFs with p53 inhibitor pifithrin-a (PFT) could increase the efficiency of biPSCs generation up to 3-fold, and nuclear transfer embryos reconstructed with biPSCs could develop to blastocysts. These results indicate that BFFs can be reprogrammed into biPSCs by buffalo defined factors, and the generation efficiency of biPSCs can be increased by inhibition of p53 expression. These efforts will provide a feasible approach for investigating buffalo stem cell signal pathways, establishing buffalo stem cell lines, and producing genetic modification buffaloes in the future.

【题目】基于光谱分析技术的苹果花钾素含量估测研究

【中文关键词】光谱分析,苹果花,钾素含量,估测

【英文关键词】spectral analysis,apple flower,kalium content,estimation

【中文摘要】用光谱分析技术手段探索了苹果花钾素含量的估测方法。先对苹果花的原始光谱反射率(Ri)及其8种光谱变换形式(Ri'、Ri''、1/Ri、(1/Ri)'、lg(1/Ri)、(lg(1/Ri))'、lgRi、(lgRi)')与钾素含量进行相关分析,找出与钾素含量相关性较显著的光谱形式;然后,采用逐步回归分析方法,筛选敏感波长与光谱参数,建立钾素含量估测模型;进而对模型进行优选和检验,确定最佳估测模型。结果表明,苹果花光谱反射率的一阶微分Ri'与钾素含量的相关性最显著;以筛选出的敏感波长669nm和1442nm的一阶微分建立的估测模型具有较好的线性趋势;经检验,其拟合方程的R2为0.6955,RMSE为2.7,RE%为4.6。这表明该模型对苹果花钾素含量的估测具有较好的准确度,可作为最佳估测模型。该研究为快速估测苹果花营养元素含量提供了理论依据与参考。

【英文摘要】The kalium content in apple flowers are estimated by using a spectroscopic technology.Firstly,the correlation of the original spectral reflectance(Ri)and 8 spectral transformation forms(Ri'、Ri''、1/Ri、(1/Ri)'、lg(1/Ri)、(lg(1/Ri))'、lgRi、(lgRi)') of apple flowers with the kalium content are analyzed,so as to find the most significant spectral forms.Then,the stepwise regression analysis methodis is used to select the sensitive wavelengths and spectral parameters and establish kalium content estimation models.Finally,the best estimation models are determined through model verification.The result shows that the first derivative of spectral reflectance Ri ’ is most correlated with the kalium content in apple flowers.The estimation model established with the 669nm and 1442nm sensitive wavelengths of the first derivative has the best linear trend.In its fitting equation,R2 is 0.6955,the root mean square error is 2.7and the relative error RE% is 4.6.This indicates that the model has a better estimation accuracy for the kalium content in apple flowers and can be used as the best estimation mode1.This study provides the theoretical basis for the fast estimation of nutrient content in apple flowers.

【题目】基于高光谱的苹果果期冠层光谱特征及其果量估测
【中文关键词】高光谱;数码照片;苹果果期;光谱特征;估测模型
【英文关键词】hyperspectral; digital photos; applefruit stage; spectral features; estimationmodel
【中文摘要】苹果冠层光谱特征是苹果树遥感生理监测和生产管理的重要依据。对栖霞市苹果果期的冠层反射光谱进行实测,结合数码照相技术探明了苹果果期的反射光谱特性和敏感波段,并通过敏感波段与果树比指标建立回归模型,实现了对苹果冠层果量(果树比)的无损估测。结果表明:苹果树果期冠层光谱曲线总体表现为对蓝光和红光的吸收及对绿光的反射,在近红外750—1300nm之间表现为强烈的反射,且在1650nm和2200nm附近呈现两个反射峰。选择435、670、730、940、1140nm和1480nm等6个波段为苹果果期的敏感波段。利用这些波段分别构建了差值、比值及归一化植被指数,筛选了最佳光谱参数,进而构建了果量(果树比)估测模型,经筛选验证确定苹果果量的最佳估测模型为: y = 0.0086[NDVI(940, 730)]2-1.0934NDVI(940, 730)+0.3209。模型为苹果果期果量的精确估测提供了比较快捷的方法途径。
【英文摘要】Canopy spectral characteristics of apple tree are the basis for apple physiological monitoring with remote sensing and production management. This study carriedout the measurement of apple tree canopy spectral reflectance at apple fruit stage in Qixia City. The reflective spectral features and sensitive wavebands of apple tree canopy at fruit stage were initially explored and regression models between sensitive bandsand the ratio of fruit/tree were established with digital photography techniques. The non-destructive estimation of fruit amount (fruit/tree ratio) was realized. The results showed that thespectral featuresof apple treecanopyat fruit stage mainly presented as absorption of blue light and red light, reflectionof green light, and the strong reflection of near-infrared between 750nm to 1300nm, with two reflection peaks near 1650nm and 2200nm. The sensitive bands tofruit amount were 435nm, 670nm, 730nm, 940nm, 1140nm and 1480nm. Vegetation indices of difference, ratio and normalized difference were built respectively with the sensitive bands, and the best spectral parameterswere selected. Estimation models of fruit amount (fruit/tree ratio) were established accordingly and the best model was evaluated and validated as y = 0.0086[NDVI (940, 730)]2- 1. 0934NDVI (940, 730) + 0. 3209. This model is expected to provide a relatively fast and accurate estimation method for canopy fruit amount at apple tree fruit stage.

【题目】基于高光谱的苹果花氮素含量预测模型研究
【中文关键词】苹果花; 高光谱; 氮素含量; 预测模型
【英文关键词】Appleflower; Hyperspectrum; Nitrogencontent ; Predictionmodel
【中文摘要】苹果花氮素含量是反映其质量高低的重要因素, 利用高光谱技术对苹果花氮素含量进行定量化反演, 可为苹果信息化管理提供理论依据。在室内条件下, 利用ASDFieldSpec 3地物光谱仪, 测定了120个盛花期苹果花样品的高光谱反射率, 并化验了其氮素含量。在分析苹果花原始光谱和一阶导数光谱特征的基础上, 与其氮素含量进行相关分析, 确定敏感波段, 构建特征光谱参数, 建立氮素含量预测模型, 对模型进行了优选和检验。结果表明, 苹果花氮素含量与原始光谱反射率在374~696, 1340~1890, 2052~2433nm波段呈极显著负相关, 在736~913nm呈极显著正相关; 与一阶导数光谱反射率在637~675nm呈极显著负相关, 在676~746nm呈极显著正相关。构建的6个特征光谱参数与苹果花氮素含量均呈极显著相关。通过进一步比较和筛选, 确定了基于640nm和676nm原始光谱反射率的2个苹果花氮素含量最佳预测模型。经检验, 模型决定系数R2分别为0.18258和0.18936, 平均预测精度达92.9%和94%。研究成果为快速预测苹果花氮素含量及苹果的实时营养诊断提供了理论依据和技术支撑。
【英文摘要】The present paper aims to quantitatively retrieve nitrogen content in apple flowers, so as to provide an important basis for apple information nization management. By using ASD FieldSpec 3 field spectrometer , hyperspectral reflectivity of 120 apple flower samples in full-bloom stage was measured and their nitrogen contents were analyzed. Based on the apple flower original spectrum and

first derivative spectral characteristics, correlation analysis was carried out between apple flowers original spectrum and first derivative spectrum reflectivity and nitrogen contents, so as to determine the sensitive bands. Based on characteristic spectral parameters, prediction models were built , optimized and tested. The results indicated that the nitrogen content of apple was very significantly negatively correlated with the original spectral reflectance in the 374-696, 1340-1890 and 2052-2433nm,while in 736-913nm they were very significantly positively correlated; the first derivative spectrum in 637-675nm was very significantly negatively correlated, and in 676-746nm was very significantly positively correlated. All the six spectral parameters establishedwere significantly correlated with the nitrogen content of apple flowers. Through further comparison and selection,the prediction models built with original spectral reflectanceof 640 and 676nm were determined as the best for nitrogen content predictionof apple flowers. The test results showed that the coefficients of determination(R ’) of the two models were 0.8258 and0.8936, the total root mean square errors (RMSE) were0.732and0.6386, and the slopes were 0.8361and1.0192respectively. Therefore the models produced desired results for nitrogen content prediction of apple flowers with average prediction accuracy of 92.9%and94.0%. This study will provide theoretical basis and technical support for rapid apple flower nitrogen content prediction and nutrition diagnosis.

【题目】基于案例推理与虚拟仪器的砀山酥梨黑星病预测系统研究
【中文关键词】梨黑星病, 虚拟仪器, 基于案例推理, 数据采集, 预测, 远程传输, 集成
【英文关键词】Pear Scab, Virtual Instrument, Case-Based Reasoning, Forecast, Data acquisition, Remote transfer, Integration
【中文摘要】预测预报是梨黑星病得到有效控制和防治的前提和首要环节。当前在实际生产应用中,梨黑星病主要预测方法是专家依据其经验来预测未来发病趋势。该方法过于依赖专家经验,实时性差,效率较低,很难满足生产需求。因此,建立一套科学有效的梨黑星病预测预报方法及综合防治体系在生产上具有十分重要的意义。本研究在安徽省高校自然科学研究项目“基于案例推理与虚拟仪器技术的集成应用:梨黑星病预测新途径”支持下,研究将虚拟仪器和基于案例推理技术相结合,利用虚拟仪器技术开发梨园生态环境数据自动采集系统,采用基于案例推理技术建立梨黑星病自动预测系统,并将二者集成为梨黑星病实时预测系统,实现梨黑星病发病状况和趋势的及时、准确与远程预测,为杨山酥梨黑星病乃至果树病害的预测预报提供了一条新的途径和方法。
【英文摘要】Pear scab forecast is a premise of its effective control. Currently, the main technique of the forecast applied in the practice of pear production is that the future occurrence trend is forecasted by experts'experience. Excessively relying on experts'experience results in poor real-time, low efficiency and hard situation to meet the production demand.Therefore,a scientific and effective forecast method and an integrated management system for pear scab is greatly significant in pear production.The study was in the support of Anhui Higer School natural science research program"A new forecasting method for Pear scab based on the integration of case-based reasoning and vitural instrument".Vitural instrument was combined with case-based reasoning technique in the research.The vitural instrument was used to develop an automatic acquisition system for pear orchard and the case-based reasoning was used to establish an automatically forecasting system for pear scab. Both systems were integrated into a whole, which realized real-time, remote and accurate forecast for future situation and occurance trend of pear scab. The research provided a new method and technique for the forecast for pear scab even fruit disease.

【题目】基于高光谱的苹果花磷素含量监测模型研究
【中文关键词】苹果花;高光谱;磷素含量;监测模型
【英文关键词】apple flower;hyperspectrum;phosphorus content;monitoring model
【中文摘要】在室内条件下,利用 ASD FieldSpec 3地物光谱仪,测定了盛花期苹果花的高光谱反射率,在分析苹果花原始光谱反射率及其一阶导数特征的基础上,分析了高光谱反射率与磷素含量间的相关关系,确定其敏感波段,构建了特征光谱参数,并建立了苹果花磷素含量的监测模型. 结果表明:苹果花磷素含量与 350 ~370nm 、670 ~1385nm 、1620 ~1760 nm 波段的原始光谱反射率以及波段 500 ~520 nm 光谱反射率的一阶导数呈极显著正相关,与波段 670~730nm一阶导数呈极显著负相关;光谱参数 DVI (936, 676)、DVI (977, 676)、NDVI (936, 676)、NDVI (977 , 676)与苹果花磷素含量的相关性较好,其相关系数均达到 0.77以上,由此建立了以4种光谱参数为自变量的磷素含量监测模型,其中, 以NDVI (936, 676)为自变量构建的监测模型具有最大的决定系数(R2=09385)、最小的均方根误差(RMSE=0.6883)和最小的相对误差(RE=76%),预测精度达到92.4 %,为最佳监测模型.
【英文摘要】By using ASD FieldSpec 3 field spectrometer, the hyperspectral reflectance of apple flowers at fullb-looming stage was measured under laboratory conditions, and the correlations of the hyperspectral reflectance with the phosphorus content of apple flowers were analyzed based on the original spectrum and the first derivative spectral characteristics of the flowers. The sensitive wavebands were determined, the characteristic spectral parameters were constructed, and the monitoring models for the phosphorus content of apple flowers were established accordingly. Correlation analysis showed that the phosphorus content of apple flowers was significantly positively correlated with the original spectral reflectance at 350- 370nm , 670- 1385nm , and 1620- 1760nm , and the first derivative reflectance at 500- 520 nm , and significantly negatively correlated with the first derivative reflectance at 670 - 730nm. The spectral parameters DVI (936, 676) , DVI (977, 676) , NDVI (936, 676) and ND VI (977 , 676) had close correlations with the phosphorus content of apple flowers, the correlation coefficients being all > 077. By using these spectral parameters as independent

variables, four monitoring models for the phosphorus content of apple flowers were established, among which , the model with NDVI (936, 676) as the variable was validated a s the best monitoring model, its determination coefficient was the highest (R2 = 09385) , root mean square error and relative error were the smallest (RM S E= 0. 6883, and R E = 76%) , and prediction accuracy reached 92 4 %.

【题目】基于高光谱和数码照相技术的苹果花期光谱特征研究
【中文关键词】高光谱;数码照片;苹果花期;光谱特征;相关性
【英文关键词】hyperspectral; digital photoes; apple florescence; spectral features; correlation
【中文摘要】【目的】旨在探索苹果花期的光谱特征和敏感波段。【方法】以栖霞市为研究区,利用苹果花期数码照片监督分类,提取苹果花树比和花叶比指标信息,通过与同步高光谱探测数据的相关分析,研究苹果树花期光谱特性,确定其敏感的光谱波段。【结果】苹果树花期光谱特征主要表现为对蓝光和红光的吸收、对绿光的反射,和对 750~1 300 nm 近红外的强烈反射。其光谱特征变化与花叶比和花树比指标呈现较好的相关性,敏感波段范围为400~530 nm的蓝青光和570~700 nm的橙红光,以及中等花树比果树760~1 350 nm的近红外。【结论】该研究提出了高光谱遥感与数码照相技术相结合的有效方法,初步探明了苹果树花期的光谱特征,为苹果园地信息提取、营养诊断和苹果生产管理的实时性与信息化提供了理论依据和技术支撑。
【英文摘要】【Objective】 This study aims on the spectral features and sensitive spectrum wave band in the apple florescence. 【Method】Taking Qixia City as the research region, using supervised classification of the flowering apple digital photos to extract the target information of the ratio of apple flower/leaf and apple flower/tree, this paper carries out the correlation analysis of the ratio data with synchronization hyperspectral detection data, to determine the spectral features and sensitive spectrum wave band of the apple florescence. 【Result】 The spectral features of apple florescence mainly presented as absorption of blue light and red light, reflection of green light, and the strong reflection of near-infrared between 750 nm to 1 300 nm. The change of apple florescence spectral features and the target information of apple flower/leaf and apple flower/tree present a good correlation, and it indicates that the sensitive wave band range is 400-530 nm cyan light, 570-700 nm orange-red light, and the 760-1 350 nm nearly infrared of medium flower/tree of apple trees. 【Conclusion】 This study puts forward an effective way of the hyperspectral remote sensing with the combination of digital photos, preliminaryly proved the spectral characteristics of flowering apple trees, and it has provided a theoretical basis and technical support for the extracting apple's field information, nutrition diagnosis and apple production and management of real-time and informationization.

【题目】基于中高分辨率卫星遥感数据的县域冬小麦估产
【中文关键词】相对辐射校正,决策树分类,植被指数,冬小麦估产
【英文关键词】relativeradiometriccalibration, decision tree classification, vegetation index, winter wheat yield estimation
【中文摘要】随着人口的增加和耕地面积的不断减少,粮食安全问题一直备受关注。该文以山东省广饶县为研究区,探讨基于中高分辨率卫星遥感数据的县域冬小麦估产技术。采用陆地卫星和中巴资源卫星(CBERS)中高分辨率遥感图像,选择冬小麦信息较为突出的4个相似时相,经几何精校正、掩膜、相对辐射校正等预处理,在分析研究区典型地物光谱特征的基

础上,采用决策树分类方法提取冬小麦种植面积。同时,利用植被指数变化规律对各时相植被指数进行修正,根据植被指数分布情况及其与产量的关系,分别构建了基于像元比值植被指数之和(∑RVI)及不同长势区归一化植被指数(NDVI)的冬小麦估产模型。结果显示:各时相冬小麦种植面积的提取精度均在96%以上,且具有较好的空间精度;二种估产模型的估产精度分别达到了96%以上和94.74%,效果较好。研究为县域冬小麦产量的预测提供了有效方法,能更好地指导冬小麦生产和粮食政策的制定,对区域农业可持续发展和粮食安全有积极价值。

【英文摘要】Grain safety has been attracting much more attention as the population increasing and cultivated land decreasing continually. Taking Guangrao County, Shandong Provinceas the study area,winter wheat yield estimation techniques were explored based on high and moderate resolution remote sensing data at county level.Selecting four medium and high resolution images of Landsat and China-Brazil Earth Resources Satellite(CBERS), which hare the similar temporal characteristics with obvious winter wheat information, the area of winter wheat was acquired by a decision tree classification approach through image pre-processing,including geometric accurate correction, masking and relative radiometric calibration, based on the analysis of spectrum characteristics of typical objects in the study area.Vegetation indexes were calibrated according to their changing trends, and winter wheat yield estimation models were established based on the sum of vegetation index with pixel ratio (∑RVI) and normalized difference vegetation index(NDVI) in different growing areas, respectively, according to their relations to wheat yields. The results showed high precision for winter wheat area extraction of more than 96%, and precision for yield estimation of two models were better than 96% and 94.74%, respectively. The study provides an effective method for winter wheat yield prediction, which is favorable for winter wheat production and grain policy-making and has significance for regional agriculture sustainable development and grain safety.

【题目】苹果花期冠层光谱探测的规范化技术方法探讨

【中文关键词】苹果花期; 冠层; 光谱探测; 规范化技术方法

【英文关键词】Apple florescence; Canopy; Spectral detection; Standardizationof technical methods

【中文摘要】2008年和2009年, 针对苹果花期冠层光谱进行了不同天气条件、不同探测时间、不同探头高度、不同探测角度条件下的冠层反射光谱探测试验, 分析其对苹果花期冠层光谱特性的影响, 探索规范化的光谱探测技术方法。结果表明, 苹果花期冠层在不同条件下的反射光谱响应呈现出一定的规律性, 特别是在760~1350nm近红外波段表现尤为明显。研究发现, 随着光照强度的减弱, 冠层光谱反射率降低, 在晴天和少云时探测冠层光谱较理想; 风速在2级以下时, 冠层光谱较稳定; 在10:00~15:00测定冠层光谱差异较小; 探测高度以整个苹果树冠层充满光谱仪探头视场时光谱曲线较稳定; 探头以垂直或近似垂直观测为最佳。在此基础上, 提出了苹果花期冠层光谱探测的规范化技术方法, 为苹果冠层光谱探测及信息提取提供了科学依据。

【英文摘要】Aiming at spectral detection of apple florescence canopy, the present paper carried out spectral detection tests under different weather conditions, different detection times, and different detection heights and angles to apple canopy in the two years of 2008and2009, so as to analyze impacts of these factors on apple canopy spectral characteristics and explore standardized spectral detection methods for apple florescence canopy. The results indicated the regularity in spectral reflectance of apple florescence canopy to a certain degree under different conditions, especially in the 760-1350nmnear-infrared bands. The authors found that canopy spectral reflectance declined along with the decrease in sunshine and it is appropriate to detect canopy spectrum in sunny days with few clouds. In addition, spectral reflectance tended to be stable when the windscalewasbelowgrade2. The discrepancy of canopy spectra is small during the time periodfrom10:00to 15:00of a day compared to that of other times. For maintaining stable spectral curves, the height of detector to apple canopy needed to be adjusted to cover the whole canopy within the field of view according to detection angle of the detector. The vertical or approximately vertical detection was the best for canopy spectral reflectance acquisition. The standardization of technical methods of spectral detection for apple florescence canopy was proposed accordingly, which provided theoretical references for spectral detection and information extraction of apple tree canopy.

【题目】苹果叶片的高光谱特征及其色素含量监测研究
【中文关键词】苹果叶片;高光谱特征;叶片色素含量;红边面积
【英文关键词】apple leaf; hyperspectral characteristic; leaf pigment content; red edge area
【中文摘要】【目的】分析苹果叶片的高光谱特征,探索建立苹果叶片色素含量的高光谱监测模型,以促进高光谱技术在苹果长势监测中的应用。【方法】通过方差分析方法,分析苹果春梢和秋梢停止生长两个时期功能叶片的不同部位、不同含水率、不同品种的高光谱特征。利用相关分析方法,研究高光谱参数与叶片色素含量间的关系,并建立基于光谱参数的叶片色素含量监测模型。【结果】在760—1 300 nm 的近红外波段,叶片光谱反射率后部低、前部高、中部居于二者之间;随着叶片含水率降低,光谱反射率逐渐增大;不同品种的叶片,光谱反射率差异显著。光谱参数 R 800/R550、红边面积 S r 和绿峰反射率R g 与叶片色素含量之间有较好的相关性,并分别建立了色素含量监测模型。其中以S r 建立的 Chl a、Chl(a+b)、Car 含量监测模型和以R 800/R 550 建立的 Chl b 含量监测模型为最佳。经均方根误差(RMSE)和相对误差(RE%)指标测试表明,模型能较好地监测苹果叶片色素含量。【结论】用红边面积S r 和波段组合R 800/R550 来监测苹果叶片色素含量效果较好,为苹果长势遥感监测提供了理论依据。
【英文摘要】【Objective】The aims of this study are to analyze hyperspectral characteristics of apple leaves, to build hyperspectral monitoring models for pigment content in apple leaves and to promote the application of hyperspectral techniques in apple growth monitoring.【Method】Hyperspectral characteristics of apple functional leaves of different leaf parts with different water contents and apple species were analyzed by using variance analysis method at apple spring and autumn branch stop-growing stages. Relationship between leaf hyperspectral parameters and pigment content was investigated by using relevance analysis method. Hyperspectral parameter based monitoring models for apple leaf pigment content estimation were established.【Result】 The results showed that in 760-1 300 nm near-infrared band, spectral reflectance of the rear part of the leaf was the lowest, that of the front part was the highest and reflectance of the middle area was in the between. The reflectance gradually increased with the decrease of leaf water content, and it appeared different obviously for different apple varieties. Spectral parameters R800/R550, red edge area Sr and green peak reflectivity Rg showed a close correlation with leaf pigment cont ent, and their monitoring models were established accordingly. Models established with Sr for Chl a, Chl (a+b) and Car content monitoring and models established with R800/R550for Chl b monitoring showed the best results. These models were proved to be reliable fo r apple leaf pigment monitoring by the in dex validation of root mean square deviation (RMSE) and relative error (RE%). 【Conclusion】 The results indicated the effectiveness of red edge area Srand band combination of R800/R550for apple leaf pigment content monitoring and provided a theoretical basis for apple growth remote sensing monitoring.

【题目】苹果花期冠层反射光谱特征
【中文关键词】光谱分析,模型,反射光谱,苹果花期,冠层
【英文关键词】spectrum analysis, models,reflective spectral, apple florescence, canopy
【中文摘要】苹果花期是果树生产与管理的关键阶段,对冠层反射光谱特征研究具有重要的理论和现实意义。该文以山东省栖霞市为研究区,通过实测的120棵苹果花期冠层反射光谱数据,在分析不同累计样本容量冠层反射光谱特征的基础上,用方差分析和相关分析的方法,系统地研究了苹果树有花与无花、不同花量、花期不同阶段、不同树龄及不同品种的冠层反射光谱特征。研究结果表明,随着累计样本容量的增加,冠层反射光谱曲线趋于稳定、平滑。有花与无花冠层光谱反射率

在431~500、591~680、761~1300nm波段方差分析结果极显著(α=0.01);不同花量的冠层与391~513、598~687、711~1193nm波段的反射率显著相关(p<0.05);在670nm“红谷”附近,反射率随花量的增加而增大,在近红外761~1300nm波段,反射率随花量的增加而减小;不同品种之间,除嘎啦外,红富士、金帅和新红星之间不易区分。

【英文摘要】The apple florescence is a key stage for apple production and management, and the study of apple canopy reflective spectralis of important theoretical and practical significance. Qixia City, Shandong Province was selected as the study area, and reflective spectral data of120apple florescence canopies were obtained. Based on the effects of different sample numbers on reflective spectral, the reflective spectral characteristics of apple florescence canopies with and without flowers, with different amount off lowers ,at different florescence stages,and with different ages and species of apple trees were system atically studied by using variance and correlation analysis methods. The results indicated that with the increase of cumulative sample numbers, the reflective spectral curves of apple florescence canopyes became stable and smooth. In the wave bands of 431-500, 591-680and761-1300nm,the variance analysis results of canopies with and without flowers were very significant(α=0.01). Results showed that the correlations of canopies with different amount off lowers with reflectances in 391-513, 598-687and711-1193nmwave bands were significant(p<0.05).Reflectance increased at the 670 nm Red Valley and decreased in the near-infrared band of761-1300 nm with the increase off lower amount. Reflective spectral characteristics among different apple species of Red Fuji, Jinshuai and New Red Star were hard to be distinguished except that for Gala. These results revealed the tremendous potential of capturing information of apple florescence with hyperspectral measurement, and it provided the references for constructing retrieval models of remote sensing.

【题目】苹果花期的冠层高光谱特征研究

【中文关键词】苹果花期; 高光谱; 冠层; 红边

【英文关键词】Appleflorescence; Hyperspectrum; Canopy; Red-edge

【中文摘要】系统分析苹果花期冠层高光谱特征, 探明其敏感光谱波段, 为大面积苹果树信息提取与营养状况的遥感反演等提供理论依据。利用ASDFieldSpec3便携式地物光谱仪实测的120个苹果花期的冠层高光谱数据, 在分析了不同累计样本容量对花期冠层高光谱特征影响的基础上, 采用方差分析的方法, 明确了苹果花期的冠层高光谱特征及反映花期冠层高光谱的敏感波段。结果表明, 随着累计样本容量的增加, 苹果花期的高光谱曲线趋于稳定、平滑。在550nm绿峰处和760~1300nm的反射高原区, 反射率随着花量的增多而减小, 在670nm的红谷处, 反射率随着花量的增多而增大; 在350~400 nm, 400~500 nm, 600~680nm, 760~1300nm波段的方差分析结果极显著, 是反映花期冠层光谱的敏感波段; 随着花量的增多, 红边位置、红边斜率和红边面积有逐渐减小的趋势。

【英文摘要】The present study aims to system atically analyze the hyperspectral characteristics of appleflorescencecanopyandex2plore the sensitive spectra to provide the theoretical basis for large area apple information extracting and remote sensing retrieval for nutrition diagnosis. Basedonthe120hyperspectral data of appleflorescencecanopyacquiredwithASDFieldSpec3portable object spectrometer , the effects of different sample numbers on hyperspectral characteristics were analyzed. Using variance analysis method, the hyperspectral characteristics of apple flore scence canopy and the sensitive wave bands were obtained. The re2sults showed that with the increase in cumulative sample numbers, the hyperspectrumcurves of apple florescence became stable and smooth. At the 550nmgreenpeakandthe 76021300nmreflectionplateau, the reflection rate reduced with the increase in flowering amount , while in the redvalley of 670nm, the reflection rate increased with the increase in flowering amount ; At the wave bands of 3502500, 6002680and76021300nm, the variance analysis results showed very significant differences, indicating that they were sensitive wave bands of florescence canopy. With the increase in flowering amount , the red2edge position, thered2edge slopeandred2edge area tended to decrease gradually.

【题目】苹果盛果期冠层高光谱与其组分特征的定量模型研究
【中文关键词】苹果盛果期; 高光谱; 冠层组分; 相关分析; 定量模型
【英文关键词】Appletree canopy at prosperous fruit stage; Hyperspectrum; Canopy components;Correlationanalysis; Quantitative models
【中文摘要】从分析苹果树盛果期冠层高光谱入手, 结合同一时间的数码照片, 在Erdas, ViewSpec Pro, DPS和LIBSVM等软件的支持下, 采用相关分析、线性回归、逐步回归、基于BP人工神经网络分析、支持向量机回归方法, 探析高光谱反射率及其转换数据与冠层组分指数间的关系。结果表明, 冠层反射率受地表反光膜的影响显著; 原始反射率与果叶比的相关性最好, 611~ 680nm为反映两者关系的特征波段; 在特征波段内, 依据原始反射率和果叶比所建立的4种模型都可满足预测需要, 但基于BP人工神经网络模型和支持向量机回归模型整体上优于一元线性回归模型和多元线性回归模型, 尤以支持向量机回归模型精度最高。研究结果可为后续的苹果遥感估产工作提供理论支持。
【英文摘要】Hyperspectral technique has become the basis of quantitative remote sensing. Hyperspectrum of apple tree canopy at prosperous fruit stage consists of the complex information of fruits, leaves, stocks, soil and reflecting films, which was mostly affected by component features of canopy at this stage. First, the hyperspectrum of 18sample apple trees with reflecting films was compared with that of 44treeswithout reflecting films. It could be seen that the impact of reflecting films on reflectance was obvious, so the sample trees with ground reflecting films should be separated to analyze from those without ground films. Secondly, nine indexes of canopy components were built based on classified digital photos of 44apple trees without ground films. Thirdly, the correlate on between the nine indexes and canopy reflectance including some kinds of conversion data was analyzed. The results showed that the correlation between reflectance and the ratio of fruit to leaf was the best, among which the max coefficient reached0.815, and the correlation between reflectance and the ratio of leaf was a little better than that between reflectance and the density of fruit. Then models of correlation analysis, linear regression, BPneural network and support vector regression were taken to explain the quantitative relationship between the hyperspectral reflectance and the ratio of fruit to leaf with the softwares of DPSandLIBSVM. It was feasible that all of the four models in611 680nmcharacteristic band are feasible to be used to predict, while the model accuracy of BPneural network and support vector regression was better than onevariable linear regression and multi variable regression, and the accuracy of support vector regression model was the best. This study will be servedasa reliable theoretical reference for the yield estimation of apples based on remote sensing data.

【题目】乡镇级耕地质量综合评价及其时空演变分析
【中文关键词】乡镇级 ; 综合评价 ; 农户行为
【英文关键词】townscale; cultivatedland; householdbehavior
【中文摘要】以山东广饶县丁庄镇为例 ,探索乡镇尺度耕地质量评价的体系与方法 , 以便更好地指导农业生产 。在系统分析耕地自然环境条件 、土壤理化性质 、农业基础设施的基础上 ,充分考虑农户对耕地质量的影响并构建指标体系 , 以模糊评判法综合评价了 1979 年 、2005年和2007年的耕地质量 ,并在此基础上分析了其时空变化特征 。结果表明:丁庄镇耕地质量不断提高 ,呈现出明显的时空演变规律 。一 、二级地所 占耕地面积从 1979 年 的0.060% , 增加到 2005年的 91.42%和2007年的 98.62 % ,耕地质量稳步提高 ;耕地离行政中心 、河流越远 ,离渤海越近 ,其质量降低 ,东北部近海地区和镇政府驻地附近地区耕地质量增幅明显高于其它地区。研究发现 ,作物平均产量与耕地质量之间存在极显著的线性关系 。该研究丰富了乡镇尺度耕地质量评价的方法体系 ,对乡镇耕地质量评价及其耕地资源高效 、可持续利用有积极指导意义 。

【英文摘要】Taking Dingzhuang Town, Guangrang County of Shandong Province as a case, the system and method of cultivated land evaluation at town scale were explored in order to serve agricultural production better than before. Basing on the analysis of environmental conditions of cultivated and, soil physical and chemical properties and agricultural infrastructure, indexes system was established with sufficientconsiderationoffarmers ’ influenceoncultivatedlandqualitywhichwas estimated by fuzzy discrimination method in1979, 2005 and2007, and then their spatial and temporal variation characteristics were analyzed. The results show that cultivated land quality of Dingzhuang Town improves continuously and presents obvious spatio2temporal variation rules. The area of the first and second grades is0. 060%of the total cultivated land area in1979, which increases to 91.42%and98.62% in 2005 and 2007, separately, and the quality of cultivated land improves steadily. The quality of cultivated land decreases which is located farfrom administration center and rivers or nears the Bohai Sea, and the increase amplitude of cultivated land that nears the Bohai Sea in the northeast and around the administration center is higher than other area. Average yield of crops has extremely significant linear relationship with cultivated and quality. This study enriches the system and methods of cultivated land quality evaluation and has significance to cultivated land quality evaluation and effective and sustainable use of land resource at town scale.

【题目】小尺度地形因子对农地土壤质量的影响研究
【中文关键词】小尺度;地形;农地;土壤质量;影响
【英文关键词】small-scale;terrain;agricultural land;soil quality;influence
【中文摘要】地形差异是土地利用结构和空间分布格局分异的重要影响因子,也是土地质量的重要参评因素。选择泰山东麓多种地貌类型过渡区,利用数字高程模型(DEM)提取研究区坡度、高程等地形因子信息,通过GIS空间分析划分研究区农地土壤质量等级,利用SPSS统计分析高程、坡度等地形因子对土壤质量的影响。结果表明:土壤质量等级随地形变化呈规律性演替,坡度和高程与土壤质量呈极显著相关关系,且坡度对土壤质量的影响大于高程;随着坡度的上升,土壤质量分值呈抛物线趋势,而随着高程的上升,土壤质量呈降低趋势,且各高程段内不同坡度等级土壤质量分值也呈抛物线走势;土壤质量的最高分值位于坡度2°~5°、高程0~150 m的地形部位。
【英文摘要】The difference of terrain is an important influence factor to land-use structure and spatial patterns. And it is also an important evaluation factor to the evaluation of land quality. Taking various terrain transitional zones in the east of MountainTai as the study area, Digital Elevation Model (DEM) was used to acquire the information of slope and elevation, and the levels of soil quality in the study area were classified through the GIS spatial analysis.On this basis,SPSS statistical analysis was used to analyze the influences of slope and elevation to soil quality and the distribution of scores in the different slope and elevation grades. The results demonstrate that with the terrain changing, the level of soil quality presents a regular succession, that it presents a significant correlation between the slope and the soil quality ,and also between the elevation and the soil quality, and the influence of slope to the soil quality is greater than that of elevation. With the rise in slope, the soil quality presents aparabolic trend ,and as the elevation rises,the soil quality presents a depressed trend. The soil quality of different slope grades also presents aparabolic trend in the different elevation grades,and that the highest scoreof the soil quality is at the site of 2 ° ~5 ° and0~150m. The results well prove the influences of the slope and the elevation to the soil quality ,and also providea scientific basis for soil improvement and sustainable use of land resources in the study area.

【中文关键词】甲基橙; ε-聚赖氨酸;比色法
【英文关键词】methyl orange; ε-polylysine;colorimetric method
【中文摘要】研究了甲基橙法测定 ε-聚赖氨酸的试验条件,得出结论:甲基橙从水中重结晶后,溶于pH6.6、0.1 mol/L 磷酸钠缓冲液中,终浓度为1 mmol/L;将2 mL ε-聚赖氨酸溶液与2 mL 1 mmol/L甲基橙溶液混合;混合物在30°C条件下剧烈振荡30 min,4 000 r/min 离心15 min;取1 mL上清液稀释50 倍,在465 nm 波长下测吸光度,计算 ε-聚赖氨酸含量.
【英文摘要】The conditions of detecting ε-polylysine (ε-PL) concentration by the methyl orange were studied in the paper. The results were as follow. After recrystallization from water,methyl orange was dissolved in 0.1mol/L sodium phosphate buffer (pH6.6) at a final concentration of 1 mmol/L. Then 2ml ε-PL solution was mixed with 2ml methyl orange solution. The mixtureswere vigorously reacted on a reciprocal shaker at 30°C for 30min and then centrifuged for 15min at 4000 r/min. The absorbance of the supernate diluted 50-fold was read at 465nm and the ε-PL content was calculated.

【题目】采用超滤法纯化 ε-聚赖氨酸
【中文关键词】 ε-PL;超滤;膜通量;蛋白截留率; ε-PL 透过率
【英文关键词】 ε-PL; ultrafiltration; membrane flux; retention rate of proteins; transmittance rate of ε-PL
【中文摘要】采用超滤技术从 ε-聚赖氨酸(ε-PL)粗品溶液中纯化 ε-PL,研究了超滤过程中的操作压力、操作温度、超滤液的体积和料液初始浓度等因素对膜通量和粗品溶液中蛋白截留率及 ε-PL 透过率的影响;并确立了采用聚砜膜去除 ε-PL 粗品溶液中蛋白工艺的最佳参数,在此条件下,蛋白去除率达到86.2%, ε-PL 透过率达到86.7%。
【英文摘要】The purification of ε-polylysine (ε-PL) by Ultrafiltration was studed. The processing conditions, including effects of operation pressure, temperature, volume and initial concentration of crude product solution, were optimized. Under the optimal conditions, the protein removal rate and the transmittance rate reached 86.2% and 86.7%, respectively.

【题目】淀粉酶产色链霉菌TUST2中 ε-聚赖氨酸降解酶的纯化和性质
【中文关键词】淀粉酶产色链霉菌; ε2聚赖氨酸降解酶; 分离纯化
【英文关键词】Streptom yces diastatochromogenes; ε-Poly-L-lysine-degrading enzyme; Purification and characte rization
【中文摘要】分离得到产抗菌聚氨基酸 ε2聚赖氨酸菌株淀粉酶产色链霉菌TUST2, 从中纯化了 ε2聚赖氨酸降解酶, 并对其性质进行了研究. 结果表明, 该酶为膜结合蛋白. 为提取该降解酶, 先收集菌体细胞并用超声波破碎, 细胞膜部分用110 mol/L NaSCN溶液溶解. 将粗酶液进行Sephadex G100凝胶柱层析分离. 用100mmol/L磷酸缓冲液洗脱, 收集活性部分. 纯化后的样品用SDS2PAGE检测, 酶亚基分子量约为54700. 酶活力在pH = 610~910间稳定, 最适宜pH = 710. 酶的最适温度为30 °C, 在10~50 °C水浴30 min酶活力未见明显下降. 研究了不同金属离子对酶活力的影响, 结果表明, Zn2 + , Cu2 + 和Fe3 + 可分别提高酶活力29172% , 15185%和15108%; 但Ag+ , Hg2 + , Co2 +和Mn2 +对酶活力有强烈的抑制作用. Ca2 + , K+和Ba2 +对酶活力没有影响. 添加4% Tween280能提高酶活力10% , 但EDTA能强烈抑制酶活力. 研究结果表明, 此降解酶的性质与白色链霉

菌产生的ε2聚赖氨酸降解酶的性质相似.
【英文摘要】S treptom yces diastatochrom ogenes TUST2, which was isolated from Hainan province, p roduced the antimicrobial poly(amino acid) , ε -poly-L -lysine. In this study, the ε -poly-L -lysine-degrading enzyme was purified from this strain and its p roperties of this enzyme were determined. Preliminary data suggested that the ε -poly-L-lysine-degrading enzyme was a cell membrane associated protein. To extract this enzyme, bacterial cells were collected and disrup ted with an ultrasonic oscillator, the membrane fraction were solubilized with110 mol/L NaSCN solution. The coarse enzyme extraction was subjected to Sephadex G100 column for purification. With 100 mmol/L phosphate buffer as elution solution, the fractionswith the enzyme activitywere collected. The purified sample was analyzed with SDS2PAGE and the subunitmolecularmass of the enzyme was estimated to be about 54700. The enzyme was stable between pH 610 and 910, with a maximum at pH = 710.The optimum temperature was 30 °C, and no significant activity losswas observed when the enzyme was incubated at 10—50 °C for 30 min. The effect of differentmetal ions on the activity of the enzyme were also investigated, some metal ions, including Zn2 + , Fe3 + , and Cu2 + , could increase the enzyme activities by29. 72% , 15. 85%, and 15. 08% , respectively; while some other metal ions, including Ag+ , Hg2 + , Co2 + and Mn2 + , strongly inhibited the enzyme activity. The enzyme activity was not affected by Ca2 + , K+ and Ba2 + . Experiment results also showed that the enzyme activity increased 10% by addition of 4% Tween280,while EDTA strongly inhibited the enzyme activity. These results suggested that the specificities of this enzyme are similar to that of the ε -poly-L-lysine-degrading enzyme from streptomyces albulus.

【题目】二氧化碳对鸡胚发育和孵化的影响
【中文关键词】鸡;孵化;胚胎发育;CO2
【英文关键词】无。
【中文摘要】长期以来人们认为高CO2水平对家禽孵化是有害的,但近年来的研究显示在孵化的某些阶段高碳酸血对发育的胚胎是有利的。本文综述CO2对家鸡胚胎发育和孵化的影响,认为胚胎在发育的某些关键期需要CO2来增加胚胎的生长,刺激早期出雏,改善孵化率,提高出雏后生长。然而,不同孵化阶段对CO2耐受程度不同,需要进一步研究有利水平的适宜阶段和限度,以确定实际孵化生产中最佳的气体条件。

【题目】利用实时荧光定量RT- PCR 检测鸡A-FABP和H-FABP基因的差异表达
【中文关键词】荧光定量逆转录PCR;A-FABP 基因;H-FABP 基因;相对定量;鸡
【英文关键词】A-FABP gene;H-FABP gene;relative quantification;chicken
【中文摘要】依据鸡A-FABP 和H-FABP 基因及参照基因GAPDH 序列设计引物,以鸡心肌、胸肌和腿肌、肝脏和腹脂总RNA 逆转录合成的cDNA 为模板,GAPDH 基因为参照基因,应用SYBR Green I 实时荧光定量PCR 检测如皋黄鸡和安卡红鸡A-FABP 和H-FABP 基因的差异表达。结果表明:A-FABP、H-FABP 基因和参照基因GAPDH 基因融解曲线为单峰,无杂峰及二聚体,其扩增效率分别为99.7%、99.8% 和100.0%。如皋黄鸡H-FABP基因在心肌、胸肌和腿肌的差异表达量分别是安卡红鸡的0.0860、0.0680 倍和0.0580 倍(P<0.05)。H-FABP 基因mRNA 表达量与肌内脂肪含量呈显著负相关。如皋黄鸡A-FABP 基因在腹脂和肝脏的表达量分别是安卡红鸡的15.9640 倍和10.9640 倍(P<0.05),而在心肌、胸肌和腿肌的表达量差异不显著。
【英文摘要】The relative expression in heart and adipocyte fatty acid-binding protein (H-FABP and A-FABP) genes wasdetected using real time quantitative RT-PCR in Rugao and Anka chicken. The primers were designed according to thesequences of H-FABP, A-FABP and GAPDH gene. GAPDH gene was the internal reference gene. The cDNA fragmentwas amplified from leg muscle, breast muscle, cardiac muscle, liver and abdominal fat mRNA;H-FABP, A-FABP andGAPDH gene expression was detected using SYBR Green I real-time fluorescent quantity PCR. Melting curve analysisshowed a single peak of H-FABP, A-FABP gene and GAPDH gene. PCR efficiency of H-FABP, A-FABP and GAPDHwas 99.7%,99.8% and 100.0% respectively. The relative H-FABP mRNA level (ratio of Anka to Rugao) in cardiacmuscle was 0.0860, 0.0680 and 0.0580, significantly higher than that of the other tissues (P < 0.01). H-FABP mRNAexpression level was significantly negative correlation with IMF contents. The relative A-FABP mRNA level (ratio ofAnka toRugao) in abdomen fat and liver was 15.9640 and 10.9640, significantly higher than that of the other tissues (P <0.01). The relative A - FABP mRNA level in abdomen fat was higher than that of Liver. There were no significantdifferences between leg muscle, breast muscle and cardiac muscle of relative A-FABP mRNA levels .

【题目】Bacterially expressed dsRNA protects maize against SCMV infection
【中文关键词】玉米,SCWV,RNAi,dsRNA,
【英文关键词】Maize, Sugarcane Mosaic Virus (SCMV), RNAi, dsRNA, RNA-mediated virus resistance
【中文摘要】待定
【英文摘要】RNA interference (RNAi) is a sequence-spe-cific, posttranscriptional gene silencing (PTGS) process in plants that is mediated by dsRNA homologous to the silenced gene(s). In this study, we report an efficient method to produce dsRNA using a bacterial expression system. Two fragments of the Sugarcane Mosaic Virus (SCMV) CP (coat protein) gene were amplified by RT-PCR, and cloned into the inverted-repeat cloning vector pUCCRNAi. The two recombinant plasmids were trans-formed individually into E. coli HT115, an RNase-III deficient strain, and dsRNA was induced by isopropyl-b- D-thiogalactopyranoside (IPTG). The crude extracts ofE. Coli HT115 containing large amounts of dsRNA were applied to plants as a spray and the experiment confirmed a preven-tative efficacy. Our findings demonstrated that spraying crude dsRNA-containing extracts inhibited SCMV infec-tion, and the dsRNA derived from an upstream region (CP1) was more effective than was dsRNA derived from a downstream region (CP2) of the

SCMV CP gene. The results provide a valuable tool for plant viral control using dsRNA and the PTGS approach.

【题目】玉米自交系B73全基因组NBS类型抗病基因分析
【中文关键词】玉米;生物信息学;抗病基因;核苷酸结合位点(NBs);系统进化树
【英文关键词】Zea mays L.:Bioinformatics;Disease resistance gene;Nucleotidebinding site:Phylogenetic tree
【中文摘要】核苷酸结合位点(NBS)类型抗病基因是植物抗病基因中最大的一个类别,也是近年来植物抗病分子育种研究的一大热点。本研究对玉米自交系B73全基因组中含有NBS结构的候选抗病基因进行了基因总数、类型、系统进化关系等分析。在B73全基因组中含有165个NBS结构的基因,远远少于水稻中的同类基因,按照N.端结构和亮氨酸富集区(LRR)结构,将其分为153个标准结构和12个非标准结构NBS基因。其中,标准结构基因又分为CC.NBS.LRR、CC.NBS、NBS、NBS—NBS、NBS—LRR、NBS.NBS—LRR、NBS.X、X.NBS等8个类型。系统进化树分析表明,NBS类型抗病基因存在明显的两大分支,与水稻的星状发散型分布有很大差异。通过基因家族分析,还发现了玉米NBS类型基因的复制现象,但发生复制的因比例低于水稻,可能足造成玉米NBS抗病基因数目较少的原因之一。
【英文摘要】Nucleotide—bindingsite(NBS)disease resistance gene is a largest category in plant disease resistance genes,which is a focusin recent studies onmolecular breeding of plant disease resistance.Usingmaize(ZeamaysL.)inbred line B73,thecomplete set of diseaseresistancecandidate genes at encodeNBSwasidentifiedin the genome.Theputative NBS genes werecharacter-izedwith respect tostructural diversity,phylogenetic relationships andSO on.0nehundredand sixty—five NBS—codingsequences wereidentified intotwo types:nonregular(12)andregular NBS genes(153).The amountofNBS genesis muchsmallerin maize thanin japonicarice(Oryza sativa L.).The 153 regular NBS genes were categorized into eightclasses,includingCC—NBS—LRR, CC.NBS,NBS,NBS—NBS,NBS.LRR,NBS—NBS—LRR,NBS—X,and X.NBS,according toN—terrainal motifand leucine.Rich repeat(LRR)domains motif.The 165NBS genes showedtwo remarkablebranchesin the phylogenetictree,differing from the radiation structure in japonica rice.Gene duplication event Was observed based on gene family analysis of the NBSdis— ease.Resistance genes in maize;howeveL theratio of gene duplication Wassmallerthan that in rice.This might beoneoftherea-sonsfor less NBSdisease—resistance genes in maizethanin rice.

【题目】Cold stress in broiler: global gene expression analyses suggest a major role of CYP genes in cold responses
【中文关键词】无。
【英文关键词】Broiler Cold stress Pituitary Gene expression profile CYP gene
【中文摘要】无。
【英文摘要】To understand the exact mechanism of coldstressin broilers depends heavily on identification of differentiallyexpressed genes, rarely conducted so far, in thepituitary of 1 day pre- and post-cold-stress. Therefore, toidentify such genes in the present study, gene expressionprofiling was performed using the pituitary as a model. Theresults showed that the expression of 15 genes were upregulatedand 15 down-regulated in the pituitary of coldstressed broilers compared with normal ones; and thesedifferentially expressed genes belong to groups involvedwith catalytic activity, enzyme regulatory activity, signaltransducer activity and transporter activity. Functionalanalysis revealed that cytochrome P450 (CYP) gene group,such as CYP7A1, CYP1A1, which are highly related to fatmetabolism, involved in those biological activities. Furthermore,blood lipid levels of triglyceride, total cholesterol,low-density-lipoprotein and high-density-lipoproteinwere measured, and the decreased level of blood lipid aftercold stress suggested that lipid could positively affectCYP7A1 gene expression in broilers. However, future studyis required to quantify the CYP gene expression during coldstress. In conclusion, our findings will not only offer basicgenetic information to identify candidate genes for chickenbreeding of anti-cold stress broilers, but also provide newclues for deciphering mechanisms underlining cold stress in vertebrates.

【题目】Effect of bamboo (Phyllostachys pubescens) extract on broiler chickens under cold stress
【中文关键词】无。
【英文关键词】Huainan partridge chicken, powdered bamboo extract, weight gain, serum enzymatic activity
【中文摘要】无。
【英文摘要】The objective of the study was to establish whether powdered bamboo extract (BFRE) as a feedadditive for chickens was effective in maintaining body weight gain and serum enzymatic activity whenbirds are exposed to cold stress. Broiler Huainan partridge chickens (4 weeks old), fed a diet containingpowdered BFRE (0.3 g/kg) for one week, showed significant weight gains compared to the control.Subsequently, the chickens were exposed to low temperatures (15 or 10 ° C) for one week with or withoutBFRE addition. After one week of exposure to 15 or 10 ° C, serum enzymatic activities were recorded.Chickens not receiving BFRE and exposed to 10 ° C showed a significant decrease in the body weight gainand in serum creatine kinase, lactic dehydrogenase L and alanine aminotransferase activities, whereas theactivity of these enzymes changed to a lesser extent in chickens receiving BFRE. However, body weightgains were maintained within the normal range when the ambient temperature was 10 ° C. In conclusion,BFRE was an effective additive in preventing chicken losing body weight during cold stress and in variationin serum enzymatic activities when exposed to cold stress. The results suggest that powdered BFRE is aneffective additive in minimizing the negative effects of cold stress in broiler chickens.

【题目】冬虫夏草液态发酵菌丝体中化学成分分析

【中文关键词】冬虫夏草(Cordyceps sinensis);发酵菌丝体;化学成分
【英文关键词】Cordyceps sinensis;submerged cultivation mycelium;chemical ingredients
【中文摘要】对冬虫夏草(Cordyceps sinensis)液态发酵菌丝体的主要化学成分进行了分析。冬虫夏草液体发酵菌丝体中粗蛋白和粗脂肪的含量分别为24.53% 和6.69%;腺苷含量为0.3755mg/g,D- 甘露醇含量为88.80mg/g,胞内多糖含量为133.9mg/g,麦角甾醇含量为1.80mg/g。冬虫夏草液态发酵菌丝体主要成分含量与天然虫草相似。
【英文摘要】This investigation characterized the main chemical ingredients of submerged cultivation mycelium of Cordycepssinensis. The contents of crude protein and crude fat were 24.53% and 6.69% respectively; The contents of adenosine, mannitol,intracellular polysaccharide and ergosterol were 0.3755, 88.80, 133.9 and 1.80 mg/g respectively. The level of main ingredients in the submerged cultivation mycelium was similar to that in the natural Cordyceps sinensis.

【题目】生物防腐剂 ε -聚赖氨酸的稳定性
【中文关键词】 ε -聚赖氨酸;稳定性;抑菌剂
【英文关键词】 ε -polylysine;stability;antimicrobial agent
【中文摘要】研究了 ε -聚赖氨酸(ε -PL)在不同温度、pH、盐离子浓度条件下的稳定性及 ε -PL 适宜的贮存条件.结果表明: ε -PL 在121 ℃处理60 min 仍具有优良的热稳定性;在pH 4.0~7.5 时 ε -PL 相对抑菌活性高于95%,但在pH 8.0~9.0 时其相对抑菌活性下降约15%;Na+、NH4+、Mg2+对 ε -PL 的相对抑菌活性无影响;而Ag+、Fe2+、Cu2+浓度大于0.8 mol/L 时,这些盐离子对供试菌的毒害作用显著于 ε -PL 的抑菌作用. ε -PL 适宜的贮存条件是避光、低温,其稳定率大于97%.
【英文摘要】The stability of ε -polylysine(ε -PL)at different temperature,pH,concentrations of salt irons and the appropriate storage conditions of ε -PL were studied. The results indicate that ε -PL remains excellent thermal stability even with the treatment of 121 ℃ for 60 min. The relative antimicrobial activity of ε -PL is more than 95% during pH 4.0-7.5,however therelative antimicrobial activity decreases by 15% or so at pH 8.0-9.0. Na+,NH4+ and Mg2+ have no effect on the relative antimicrobial activity of ε -PL,whereas the poisonous impact of Ag+,Fe2+ and Cu2+ on the tested strains is more prominent than the antimicrobial activity of ε -PL when the concentrations of these metallic irons are more than 0.8 mol/L. The favorablestorage condition for ε -PL is dark environment and low temperature,and the stability rate is more than 97%.

【题目】氮离子入法筛选 ε -聚赖氨酸高产菌株
【中文关键词】氮离子注入;诱变选育;抗性平板法; ε -聚赖氨酸
【英文关键词】nitrogen ion implantation; mutation breeding; resistant mutant; ε - polylysine
【中文摘要】研究氮离子注入法诱变选育 ε -聚赖氨酸高产菌株。本文从土壤筛选的菌株TS02 出发,通过注入不同剂量30 keV 氮离子,辅以抗性平板法结合抑菌圈法,筛选出了一株 ε -聚赖氨酸高产白色链霉菌(Streptomyces albulus)GC11。经多次传代实验结果表明GC11稳定性良好。摇瓶发酵培养24 h,GC11 抑菌圈直径为23.20 mm,比TS02 提高了1.32 倍;5 L 自控发酵罐发酵培养72 h,GC11 ε -PL产量为4.21 g/L,比TS02 提高了 1.30 倍,达到了提高 ε -聚赖氨酸产量的目的。
【英文摘要】The screening of high ε - polylysine(ε -PL)-producing strains was studied by mutation with nitrogen ion implantation. After implantation of different dose of 30keV nitrogen ions and using inhibitive circle screening method and resistant

mutant assay, a Streptomycesalbulus GC11 strain with high ε-PL yield was obtained with stable genetic characteristics. After 24 h rotation-flask cultivation, the diameter of inhibition zone of GC11 strain was 23.20 mm which was 1.32-fold than that of TS02 strain; and after 72 h 5 L automatic fermentation jar cultivation, the productivity of ε-polylysine of GC 11 strain was 4.21 g/L which was 1.30-fold than that of TS02 strain.

【题目】pH 调控和蔗糖流加控制对乳酸链球菌素发酵的影响
【中文关键词】乳酸乳球菌;乳酸链球菌素;pH 调控;补料发酵
【英文关键词】Streptococcus lactis;nisin;pH control;fed-batch fermentation
【中文摘要】研究了乳酸乳球菌发酵过程中pH 调控和补料对产物生成的影响.研究采用三种不同的pH 调控方式(初始pH7.0):(1)恒定pH6.8;(2)当pH 降到6.2 时恒定pH6.2;(3)发酵6,h 后每2,h 调节pH 至6.8.结果表明,在发酵过程中按方式2 调节pH 与不调控pH 相比,乳酸链球菌素效价提高了2.48 倍.分别选用了4、5、6 和8,g·(L－1·h－1)蔗糖流加速度,当按5,g·(L－1·h－1)恒速流加蔗糖溶液,乳酸链球菌素效价提高约2.9 倍.
【英文摘要】The combined effects of various pH control strategies and sucrose feeding rates on nisin production were studied.Three different pH control strategies were studied in this study(the intial pH was 7.0):(1)a constant pH at 6.8;(2)after pH dropped 6.2,a constant pH at 6.2;(3)after 6 h, adjusting pH at 6.8 every 2 h. The results demonstrate that nisintiter by strategy(2)yielded almost 2.6 times higher than that by strategy without pH adjustment. Sucrose feeding rates are designed at 4,5,6 and 8,g·(L－1·h－1),respectively. Nisin titer increase about 2.9-fold by constant addition of sucrose at afeeding rate of 5,g·(L－1·h－1).

【题目】米酒乳杆菌素分离纯化条件研究
【中文关键词】米酒乳杆菌素;分离纯化;葡聚糖凝胶层析
【英文关键词】sakacin;isolation and purification;Sephadex column chromatography
【中文摘要】目的:对米酒乳杆菌产生的广谱细菌素进行分离纯化技术研究。方法和结果:采用活性炭脱色、冷乙醇沉淀、Sephadex G50 葡聚糖凝胶层析和高效液相色谱技术对米酒乳杆菌产生的细菌素进行分离纯化。结果表明,发酵浓缩液脱色的最佳工艺条件为活性炭加量3.5%、温度40°C、脱色时间20h,脱色率达64.5%。冷乙醇沉淀的最佳乙醇终浓度为80%,葡聚糖凝胶层析的洗脱液流速为0.5ml/min,上样量3ml,高效液相色谱纯化的流动相为90% 的甲醇水溶液,在此条件下可得到电泳纯的细菌素。结论:确定了米酒乳杆菌素的分离纯化条件,为细菌素的理化性质和抑菌机理的研究提供依据。
【英文摘要】Objective: To study the isolation and purification technology of a broad-spectrum bacteriocin, sakacin produced by Lactobacillus sake G2. Methods: The cell-free fermentation broth of Lactobacillus sake G2 containing sakacin was decolored with active carbon and precipitated with cold ethanol to remove macromolecular impurities, and purified by Sephadex G50 column chromatography and HPLC. Results: The optimum conditions for isolation and purification were as follows: decoloring the cell-free supernatant of Lactobacillus sake G2 with 3.5% of active carbon addition at 40 °C for 20 h (the decolorization rate reached 64.5%), finial ethanol concentration 80%, elution flow rate of Sephadex G50 column 0.5 ml/min, sampling volume 3 ml, and taking 90% methanol aqueous solution as mobile phase for HPLC. Under these conditions, the electrophoretic purity of sakacin was obtained.

Conclusions: This study can lay the foundation for the future study of physicochemical properties and bacteriostatic mechanism of sakacin.

【题目】A novel bacteriocin with a broad inhibitory spectrum produced by Lactobacillus sake C2, isolated from traditional Chinese fermented cabbage
【中文关键词】米酒乳杆菌;细菌素;16S rDNA鉴定;分子量;中国传统发酵食品泡菜
【英文关键词】Lactobacillus sakei;Bacteriocin;16S rDNA sequence;Molecular weight;Traditional Chinese fermented cabbage
【中文摘要】本文从中国传统发酵食品泡菜中分离出300株乳酸菌,从中筛选得到一株产细菌素的菌株C2,排除有机酸和过氧化氢的作用后,发现该菌株所产细菌素能够强烈抑制金黄色葡萄球菌ATCC63589和大肠杆菌ATCC25922的生长。通过表型观察、生理实验和16S rDNA鉴定菌株C2为米酒乳杆菌。该菌株所产细菌素为米酒乳杆菌素,后经低温乙醇和葡聚糖凝胶色谱柱纯化。通过Tricine凝胶电泳确定米酒乳杆菌素C2的分子量约为5.5kDa,在目前已知米酒乳杆菌素中分子量为最大。米酒乳杆菌素C2表现出广谱的抑菌活性、热稳定性(121℃15min)和pH稳定性(pH3.0-8.0)。米酒乳杆菌素C2对蛋白酶敏感,但对脂肪酶、α-淀粉酶和β-淀粉酶不敏感。以上特性均表明米酒乳杆菌素C2是一种新型的,具有广谱抑菌活性的Ⅱ类细菌素,而且该细菌素的发现很可能扩展乳酸菌所产细菌素在食品工业中的应用范围。
【英文摘要】By excluding the effects of organic acids and hydrogen peroxide, strain C2 producing a bacteriocin strongly inhibited Staphylococcus aureus ATCC 63589 and Escherichia coli ATCC 25922 was selected from 300 lactic acid bacteria isolated from traditional Chinese fermented cabbage. Strain C2 was identified as Lactobacillus sakei by phenotypical and physiological tests and 16S rDNA identification. This bacteriocin,which was designated sakacin C2, was purified by cold ethanol and Sephadex G50 column chromatography for further studies. The molecular weight of sakacin C2 was 5.5 kDa by Tris-Tricine SDS – PAGE, which was the largest among all known sakacins. Sakacin C2 exhibited a wide range of antimicrobial activity,strong heat stability (15 min at 121 C) and pH stability (pH 3.0 – 8.0). Sakacin C2 was sensitive to protease but insensitive to lipase, a-amylase and b-amylase. These characters suggested that sakacin C2 was a novel Class II bacteriocin with a broad inhibitory spectrum and might broaden the

application range of bacteriocins from LAB in the food industry.

【题目】不同地理群体三疣梭子蟹非特异性免疫功能的比较
【中文关键词】三疣梭子蟹,免疫酶活,非特异性免疫
【英文关键词】Portunus trituberculatus, Enzyme activities, Nonspecific immunity
【中文摘要】研究了不同地理群体的三疣梭子蟹免疫酶活之间的差异。
【英文摘要】The non-specific immune functions were studied in four populations of Portunus trituberculatus from Haizhou Bay, Dandong, Zhoushan and Laizhou Bay for the immunity enzyme activities in haemolymph, muscle and hepatopancreas tissue of the crabs. Results showed that SOD activities of haemolymph and muscle were not significant different by four populations. However, the hepatopancreas SOD activity of Haizhou Bay population was higher than that of Laizhou Bay population significantly ($P<0.05$), and there was no significant difference among other populations ($P>0.05$). On the GSH-px activities of the haemolymph and hepatopancreas, Haizhou Bay population was significantly higher than Laizhou Bay population ($P<0.05$). The MDA content, LSZ and ALP activities in different tissues were similar and there were no significant differences among the four populations. The results of the immunity enzyme activities are quite correlated with those of nonspecific immunity abilities of preventing disease and disease resistance evaluation.

【题目】Effects of inbreeding on growth and WSSV resistance of the juvenile Chinese shrimp,Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】 Fenneropenaeus chinensis; inbreeding; inbreeding depression; body weight; survival time; WSSV resistance;
【中文摘要】无
【英文摘要】To date,few studies had investigated the effects of inbreeding on growth and disease resistance,although inbreeding depression of such traits could play an important role in the evolution and ecology in Chinese shrimp,Fenneropenaeus chinensis.Effects of inbreeding on body weight and survival time post infection WSSV of juvenile shrimp were quantified in this study.All families were reared under the similar environment conditions,and the differences of growth time between two groups were not significant.The mean body weight and mean survival time of the wild shrimp group were(1.58±0.01) g and(100.43±0.68) h,and those of the shrimp group with inbreeding coefficient 25% were(1.43±0.04) g and(85.84±1.70) h,respectively.The differences of body weight and survival time post infection WSSV between two groups were all extremely significant($P<0.01$).The difference of phenotypic correlation was not significant($P>0.05$) between body weight and WSSV resistance of the wild shrimp group,which is 0.16±0.00,and the inbred shrimp group,which is 0.20±0.00.In this study the estimated inbreeding depression coefficient was-3.80%±0.17% for body weight and-5.81%±0.11% for survival time post infection WSSV per 10% increase in inbreeding coefficient.Results were consistent with the viewpoint that inbreeding could reduce growth and disease resistance.Those highlight the need to maximize the genetic diversity in base population,and to control the rate of inbreeding in selective breeding programs and wild resource protection.

【题目】5- 溴尿嘧啶对中国明对虾受精卵的处理条件
【中文关键词】化学诱变;5- 溴尿嘧啶;中国明对虾
【英文关键词】 chemical mutagen; 5-bromouracil; Fenneropeaeus chinensis;
【中文摘要】利用化学诱变剂5- 溴尿嘧啶(5-Bromouracil,5-BrUra) 处理不同发育时期中国明对虾(Fenneropenaeus chinensis)胎,统计孵化率,根据统计学分析结果获得最佳处理条件,并探讨温度、盐度和pH 对5- 溴尿嘧啶处理效果的影响以及- 溴尿嘧啶对中国明对虾幼体发育的影响。结果表明:(1)5- 溴尿嘧啶诱变中国明对虾的最佳起始处理阶段为原肠期,达到接近半致死效果的浓度和处理时间组合分别为0.5 mg/mL 6 h、0.3 mg/mL 15 h 和0.1 mg/mL 24 h;(2) 温度和盐度5- 溴尿嘧啶诱变中国明对虾胚胎的效果可产生显著影响,而pH 影响不显著;(3)5- 溴尿嘧啶能影响中国明对虾幼体前期(无节幼体N→ 溞状III) 发育,而对溞状III至仔虾期间的幼体发育没有显著影响。在此阶段,经5- 溴尿嘧啶处理后孵化出的幼体能够正常变态
【英文摘要】Artifi cially induced mutation by chemical mutagens plays an important role in new variety breeding of crops and micro-organisms. And a lot of new strains with new commercial traits have been produced. However, few studies are reported on mutagen ’ s application in aquatic organism breeding,especially in marine shrimps. In the present study,embryos of marine shrimp Fenneropenaeus chinensis at different developmental stages were treated by 5-bromouracil (5-BrUra) at different concentration and duration time. To investigate the influence of environmental factors on the effects of 5-BrUra,three temperature (17,20 and 23 °C),three salinity (24,30 and 36) and three pH value(7.6,8.1 and 8.6)were set and orthogonal test was adopted in this test. Metamorphic rates and survival rates were obtained under different treatment conditions. Results are as follows:1)The optimum initial embryonic stage for mutagen treatment was gastrula stage,and three combinations of treating concentration and duration which could induce 50% lethal death were screened as 0.5 mg/mL and 6 hours duration,0.3 mg/mL and 15 hours duration,and 0.1 mg/mL and 24 h duration,respectively. 2)Temperature and salinity signifi cantly affected the effects of 5-BrUra on hatching rate($P < 0.05$) while no signifi cant effects of pH was observed within the experimental pH ranges($P > 0.05$). 3)From the stage of zoea III,no meaningful differences were observed on the metamorphosis rates between 5-BrUra treatment and control groups,and 5-BrUra treated larva could normally metamorphosize,suggesting that 5-BrUra mainly affect larva on the early developmental stages from nauplius to zoea III .ion.

【题目】中国对虾生长性状遗传参数的估计
【中文关键词】中国对虾 遗传力 遗传相关 生长性状
【英文关键词】 Fenneropenaeus chinensis Heritability Genetic correlation Growth traits;
【中文摘要】通过人工授精的方法建立了中国对虾21个半同胞家系(47个全同胞家系)。测量了中国对虾21个半同胞(47个全同胞)家系的体长、头胸甲长、头胸甲宽、第2和第3腹节处宽、第2和第3腹节处高、第1腹节长、第6腹节长和体重,共测量中国对虾1387尾。采用混合家系材料,利用Mtd-freml软件中的动物模型进行分析,平均体重作为协变量,得到的生长性状遗传力在0.04~0.20。体重遗传力为0.14±0.16。体长的遗传力为0.10±0.06,头胸甲长为0.07±0.06,头胸甲宽为0.05±0.04,第2、3腹节宽为0.20±0.16,第2、3腹节高的最低为0.04±0.13,第1腹节长为0.09±0.09,第6腹节长为0.19±0.15。各个性状间表现出高的正相关,其中头胸甲宽和体长以及2.3腹节高的遗传相关最大,达到了1.0±0.01,第1腹节长和2.3腹节宽的

遗传相关最小为0.82±0.08。遗传力估计结果表明,中国对虾体长、体重性状的遗传力属于中度遗传力,在加性效应控制下,对中国对虾生长性状进行选择育种具有很大的遗传改良潜力,可以获得较好的选择效果。性状间高遗传相关说明在对体重进行选择的同时,其余的生长性状可以获得相关的间接选择反应。通过性状间的相关关系研究,可以对两性状间的关系进行明确的定量,有利于制定合理的多性状选择方案。在实际育种工作过程中,可以排除一些不利的或者相关性小的性状,以达到目的性状的最佳选择进展。实验结果为中国对虾的间接选择和早期选择育种提供依据。

【英文摘要】Twenty-one half-sib families(47 full-sib families)of the Chinese shrimp Fenneropenaeus chinensis were obtained by artificial insemination.Eight growth traits of 1 387 shrimps of these families were measured,including body length,cephalothorax length,cephalothorax width,width of the second and third abdominal segment,height of the second and third abdominal segment,length of the first abdominal segment,length of the last abdominal segment and body weight.The values of heritability were estimated using mixed-animal model in multiple-trait derivative-free restricted maximum likelihood(MTDFREML)software,with average body weight as covariate,and family as a random factor in the statistical model.The heritability estimates for all growth traits were at medium level,ranging from 0.04±0.13~0.20±0.16.The heritability was 0.10±0.06 for total body length,0.07±0.06 for cephalothorax length,0.05±0.04 for cephalothorax width,0.20±0.16 for the width of the second and third abdominal segment,0.04±0.13 for the height of the second and third abdominal segment,0.09±0.09 for the length of the first abdominal segment,0.19±0.15 for the length of the last abdominal segment and 0.14±0.16 for body weight,respectively.Genetic correlations were high between the growth traits.The genetic correlation between cephalothorax width and total body length was the highest(1.0±0.01),and that between the length of the first abdominal segment and the width of the second and third abdominal segment was the lowest(0.82±0.08).The findings in this work suggested that these growth traits were under additive genetic control and are expected to respond to selection.The high and positive genetic correlation between growth traits indicated that selection for high body length levels would result in positive response in other traits.Correlation analysis of genetic parameters could quantify the relationship between growth traits,and facilitate the planning for multi-traits breeding programme.Growth traits of little correlations should be excluded in practice,in order to achieve the best result of selection for the target traits.The results of this study provided theory basis for indirect and early breeding of F.chinensis.

【中文摘要】通过人工授精的方法建立了中国对虾21个半同胞家系(47个全同胞家系)。测量了中国对虾21个半同胞(47个全同胞)家系的体长、头胸甲长、头胸甲宽、第2和第3腹节处宽、第2和第3腹节处高、第1腹节长、第6腹节长和体重,共测量中国对虾1387尾。采用混合家系材料,利用Mtd-freml软件中的动物模型进行分析,平均体重作为协变量,得到的生长性状遗传力在0.04~0.20。体重遗传力为0.14±0.16。体长的遗传力为0.10±0.06,头胸甲长为0.07±0.06,头胸甲宽为0.05±0.04,第2、3腹节宽为0.20±0.16,第2、3腹节高的最低为0.04±0.13,第1腹节长为0.09±0.09,第6腹节长为0.19±0.15。各个性状间表现出高的正相关,其中头胸甲宽和体长以及2.3腹节高的遗传相关最大,达到了1.0±0.01,第1腹节长和2.3腹节宽的遗传相关最小为0.82±0.08。遗传力估计结果表明,中国对虾体长、体重性状的遗传力属于中度遗传力,在加性效应控制下,对中国对虾生长性状进行选择育种具有很大的遗传改良潜力,可以获得较好的选择效果。性状间高遗传相关说明在对体重进行选择的同时,其余的生长性状可以获得相关的间接选择反应。通过性状间的相关关系研究,可以对两性状间的关系进行明确的定量,有利于制定合理的多性状选择方案。在实际育种工作过程中,可以排除一些不利的或者相关性小的性状,以达到目的性状的最佳选择进展。实验结果为中国对虾的间接选择和早期选择育种提供依据。

【英文摘要】 Breeding values of three traits for 170 d Fennerpenaeus chinensis,including body weight,survival time and survivorship in resistance to White Spot Syndrome Virus(WSSV)were estimated using single trait animal model,and correlation analysis was performed at family level between the phenotype and the breeding value of these traits.Heritability of the three traits were estimated as 0.22±0.16,0.14±0.12 and 0.03±0.021,respectively,and the breeding value of each trait was calculated against these values.At family level,correlation analysis of phenotypic value revealed a certain positive and significant

correlation(r=0.35,P<0.05)between average 170d body weight and resistance to WSSV,while coefficients between all the other traits were very small and not significant.All correlation coefficients of family breeding values between the three traits were small;among which the correlation coefficient between 170d body weight and resistance to WSSV was the highest(0.038),while those between 170d body weight and survival rate,or between survival time and survival rate were negative(r=-0.24,r=-0.027),and statistically insignificant.Therefore,the multi-traits composite selection method was required for shrimp F.chinensis genetic breeding program.

【题目】中国对虾家系水平遗传多样性的AFLP分析
【中文关键词】中国对虾 家系 遗传多样性 AFLP 标记
【英文关键词】 Fenneropenaeus chinensis Family Genetic diversity AFLP Marker;
【中文摘要】采用扩增片段长度多态性分子标记技术对中国对虾的40个家系共200个样品进行了家系水平的遗传多样性分析。利用10对引物共产生307个表达清晰可用于分析的标记,其中189个标记表现为多态性,占总标记数的61.56%;中国对虾各个家系多态位点百分率在12.7%~34.2%之间;各个家系基因多样性指数在0.0494~0.122之间,Shannon指数的范围在0.0725~0.182之间(家系水平为0.1975)。对40个家系的AMOVA分析结果显示,家系间的基因分化系数Gst=0.4713,即总的遗传变异中有47.13%的变异存在于家系间,家系内的遗传变异占总遗传变异的52.87%。采用UPGMA法对中国对虾的40个家系进行了聚类分析,确定了各个家系之间的遗传亲缘关系;并且对200个个体进行了聚类分析。结果表明,90%同一家系的子代个体能完全聚类在一起。通过家系间的遗传分化系数Gst对中国对虾的40个家系间的基因流进行了估测,结果显示,Nm=0.5609,表明基因流处于较低水平。
【英文摘要】 Amplified fragment length polymorphism(AFLP)technique was used to detect the genetic variation among a total of 200 individuals representing 40 families.Popgene version 1.32,MEGA3.1 and AMOVA in Alequin 2.0 software were used for data analysis.Ten pairs of selective EcoR Ⅰ and Mse Ⅰ primers produced 189 polymorphic markers out of total 307 bands amplified;the percentage of polymorphic loci was 61.56%.The percentages of polymorphic loci of the forty families were between 12.7% and 34.2%.Genetic diversity index of the families were between 0.049 4~0.122,and Shannon genetic diversity index were between 0.072 5 and 0.182(intra-family index was 0.197 5).AMOVA(Analysis of molecular variance)showed that a large proportion(52.87%)of genetic variation resided within families,while only a small proportion(47.13%)of genetic variation resided between families,representing an inter-family genetic differentiation index of Gst=0.471 3.Cluster analysis by UPGMA revealed the genetic distance and relationship between the 40 families,and the UPGMA dendrogram of the 200 individuals indicated that 90% of the individuals from each family could be fully clustered.Genetic diversity index G-based estimation revealed a low gene flow(Nm=0.560 9)among the 40 families.

【题目】中国对虾3种育种模式的BLUP遗传评定分析
【中文关键词】中国对虾 精细育种模式 全同胞育种模式 群组育种模式 BLU P
【英文关键词】Fenneropenaeus chinensis Half-sib breeding mode Full-sib breeding mode Group breeding mode BLUP;
【中文摘要】设计了3 种育种模式, 精细育种模式(A) 、全同胞育种模式(B) 和群组育种模式(C) , 分别利用不同的系谱信息(所有系谱、全同胞、群组) , 考虑不同的遗传力水平, 在家系和个体水平上进行选择效果的对比分析。采用单性状动物模型, 考虑各家系标记时的平均体重为协变量, 通过BLUP 法估计个体体重育种值。家系选择水平上的结果表明, 利用全同

胞育种模式选取的家系(50% 的淘汰率)与精细育种模式相比, 一致率在90% 以上, 估计的家系育种值与精细育种模式间的相关系数在0.9以上, 相关程度高。在个体选择水平上, 全同胞育种模式与精细育种模式间存在着较大差距。以10%的留种率为标准, 前者留取的个体与后者的一致率在68.61%~ 83.21% 。全同胞育种模式估计的个体育种值与精细育种模式间的相关系数在0.770~ 0.935 之间, 低于家系选择水平的相关程度。群组水平上的比较分析表明, 利用群组育种模式选取的群组(50%的淘汰率) 与精细育种模式相比, 除C5 为90.91% 外, 其余模式一致率均为100% 。群组育种模式估计的育种值与精细育种模式间的相关系数在0.98 以上, 相关程度高。这说明通过群组育种模式选取的群组, 准确可信度高。与精细育种模式相比较, 在个体水平上群组育种模式估计的个体育种值和其排队顺序是存在较大差别的。以10% 的留种率为标准, 群组育种模式与精细育种模式相同留种个体的百分比在57.66%~ 85.40% 。群组育种模式估计的个体育种值与精细育种模式间的相关系数在0.772~ 0.941 之间。相对于精细育种模式, 采用群组育种模式进行个体选择的可信度要低一些。

【英文摘要】 Three breeding modes,including half-sib breeding(A),full-sib breeding(B)and group breeding(C)were designed,and the effects of individual and family selection based on simulation of three breeding strategies were compared and analyzed at different levels of heritability.Breeding value for weight was calculated by single trait animal model and BLUP,and average family body weight was used as a covariate.Over 90% of selected families(50% families selected)by either A or B strategy were the same for family level selection,and the correlation coefficients for their family breeding values of body weight were all more than 0.9 at different levels of heritability,indicating for a high degree of correlation between the two modes of family selection.However,there were great difference for individual selection between A and B strategies,for which 68.61%~83.21% of the selected individuals(at a standard individual selection ratio of 10%)were the same.The correlation coefficient of the breeding values for individual body weight between the two modes varied between 0.770 ~ 0.935,and was lower than family selection between A and B.The ratio of uniformity for groups selected(50% group selection ratio)between C and A modes were 100% except C5,and correlation coefficients for their group breeding values of body weight were all more than 0.98 at different levels of heritability,indicating that the groups selected by group breeding mode(C)was accurate and authentic.However,there were big differences between C and A modes for individual selection,in terms of the breeding values and their sequence.The uniformity ratio of individuals selected(at a standard of 10% selection ratio)by C and A modes was between 57.66%~85.40% at different levels of heritability.The correlation coefficient of breeding values of individual body weight between the two modes varied between 0.772~0.941.Compared with A mode,C mode was less reliable for individual selection.

【题目】中国对虾体重育种值估计的动物模型分析。

【中文关键词】中国对虾 动物模型 BLU P 育种值 家系选择 个体选择
【英文关键词】 Fenneropenaeus chinensis Animal model BLUP breeding value Family selection Individual selection;

【中文摘要】育种值是选种和配种计划制定的基础, 其准确性与选择效果密切相关。利用中国对虾2005年21 个父系半同胞组共1 387 个个体体重数据, 将家系标记时的平均体重、全同胞组效应等因子组合, 建立了4 种不同的动物模型, 应用BLU P 法估计体重育种值。4 种模型的估计结果分析表明, 家系标记时的平均体重和全同胞家系效应是两个重要影响因子, 建立的AFB 动物模型比其他模型所估计的结果更准确。AFB 动物模型估计中国对虾145 d 的体重遗传力为0 14 0 076, 据此计算育种值并进行模拟留种分析。结果显示, 在根据表型值或育种值选种的情况下, 育种值选种的留种家系或个体的育种值比表型值选种分别提高50% 和80 59% , 育种值选择的效率更高。

【英文摘要】Breeding value estimation is the basis for selective breeding and planning of a mating programme,and its accuracy has a direct effect on the result of selection.Four animal models(A,AB,AF,AFB)were built based on the combination of average body weight at tagging(covariate)and full-sib group effect(uncorrelated random effect)of 1 387 animals from 21 paternal half-sib groups of Fenneropenaeus chinensis,and the breeding value of body weight of all individuals were estimated using BLUP(Best linear unbiased prediction)method.Analysis of these breeding values revealed that,average body weight at tagging and full-sib group effect were important factors for estimating breeding value of body weight,and AFB model achieved greater accuracy in breeding value estimation than the other models.The estimated heritability of 145d body weight by AFB model was 0.14±0.076;and based on this,the breeding value was estimated and simulated selection was made.It was found that,the efficiency of breeding value selection for family or individual body weight was 50% or 80.59% higher than phenotypic value selection. dual selection.

【题目】应用BLUP法对中国对虾一代选择的遗传进展
【中文关键词】中国对虾　BLU P　生长性状　遗传进展
【英文关键词】 Fenneropenaeus chinensis BLUP Growth traits Genetic gain;
【中文摘要】为了评估中国对虾最佳线性无偏预测(Best liner unbiased predict ion, BLUP) 的育种效果,利用2005 年评估的个体育种值, 组建3 个高育种值家系为实验组, 3 个平均值育种值家系为对照组,进行了生长对比测试。2006 年, 6 个家系的苗种经过独立培育、中间暂养, 体重达到1 g 左右时用荧光标记进行了标记, 标记后的幼虾同时放养于对虾养殖池中。在生产养殖池中养殖63 d 后进行生长性状的测定。BLUP 法预测结果显示, 中国对虾一代选育后的预期遗传进展为0.78 g, 相对于选育前全群的平均值6.68 g 提高了约11.68%。实际对比测试结果表明, 高育种值家系后代平均体重为21.55g, 平均育种值家系的平均体重为19.03 g , 选育一代的体重提高13.28%。结果表明, BLU P 育种技术对中国对虾生长性状的选育效果显著。
【英文摘要】 A growth comparison experiment was carried out on F1 of Fennropenaeus chinensis to evaluate the genetic gain of BLUP(best linear unbiased prediction)breeding method.Based on individual breeding value estimation of 2005,three families with high breeding values were constructed as treatments,and three families with medium breeding values were used as control.Offspring of the six families were cultured separately through the larval and juvenile stages in 2006,and were fluorescence-tagged when they reached a body weight of 1 g.The shrimps were tagged with a unique family code by injecting different colours of"Visible Implant Fluorescent Elastomers"(VIE)before being stocked in one grow-out pond.Growth of these shrimps was measured after 63 d.The expected genetic gain of the growth trait by BLUP method was 0.78 g,representing an 11.68% increase compared to the average value of the population before selective breeding(6.68 g).Result of measurement showed an average weight gain of 21.56 g for offspring of the high breeding value families,and 19.03 g for offspring of the medium breeding value families,representing a 13.28% increase of body weight in F1.It is suggested that,BLUP breeding technology was effective for selecting growth traits of F.chinensis. on. dual selection.

【题目】微卫星技术对黄、渤海海域7个不同地理群体中国对虾的遗传结构和遗传分化研究
【中文关键词】中国对虾　地理群体　遗传分化　微卫星DNA
【英文关键词】 Fenneropenaeus chinensis Geographic populationGenetic differentiation Microsatellite DNA;
【中文摘要】采用微卫星DNA 技术对黄、渤海海域7 个不同地理群体的中国对虾进行了遗传结构和遗传分化研究。7 个地理群体分别来自辽东湾(LD) 、渤海湾(BH) 、海州湾(HZ) 、乳山湾(RS) 、海洋岛(HYD) 、朝鲜半岛西海岸(KW) 以及朝鲜半岛南海岸(KS) 。7 对多态性良好的微卫星引物共检测到109 个等位基因, 群体平均期望杂合度(H e) 范围为0 810~ 0 864。49 个群体位点中, 只有15 个符合Hardy-Weinberg 平衡。U PGMA 聚类分析显示, 各地理群体亲缘关系与地理位置关系密切。根据各地理群体间遗传距离及AMOVA 遗传分化检验结果, 可将中国对虾分为3 个独立种群, 分别为中国沿岸黄、渤海群体、朝鲜半岛西海岸群体及朝鲜半岛南海群体; 其中中国沿岸黄、渤海群体内部也发生了一定程度的遗传分化, 但是否达到种群水平还有待于进一步验证。
【英文摘要】 In the present study, microsatellite DNA technique was applied to investigate the genetic structure and differentiation of prawn Fenneropenaeus chinensis from seven geographic locations: Liaodong Bay (LD), Bohai Bay (BH), Haizhou Bay (HZ), Rushan Bay (RS), Haiyangdao fishing ground (HYD),the west coast of the Korean Peninsula (KW) and the south coast of the Korean

Peninsula (KS) in the Bohai and Yellow Seas. A total of 109 alleles were obtained from seven loci in 210 prawns. The average expected heterozygosity (He) of populations varied from 0.810 to 0.864. Out of 49 population-locus cases, only 15 accorded with the Hardy-Weinberg equilibrium. Cluster analysis by UPGMA indicated that the relationship among different geographic populations was related to their locations. Based on the values of genetic distance (D) and AMOVA analysis, three independent populations were identified as population of the Bohai and Yellow seas along the Chinese coast, population of the west coast of the Korean Peninsula and population of the south coast of the Korean Peninsula. Moreover, some differentiation in the population of Bohai and Yellow seas along the Chinese coast has also been observed, but further analysis is needed to verify the degree of differentiation.

【中文关键词】无

【英文关键词】 Fenneropenaeus chinensis; earthworm; housefly larva; white-spot syndrome virus(WSSV); artificial infection;

【中文摘要】无

【英文摘要】Chinese shrimp(Fenneropenaeus chinensis) is one of the leading cultured species in China.But shrimp farming is currently threatened by pathogen,such as virus,bacteria,etc,among which the white spot syndrome virus(WSSV) is the most serious.The efficient method to avoid or diminish the influence of the virus may lie in the diet,as evidences had revealed the main way that the WSSV was spread in Chinese shrimp was caused by food.This study was initiated to assess the effect of earthworm and housefly larva on growth and survival rate of F.chinensis after WSSV infection.Commercial feed and clam were control groups,and earthworm and housefly larva were assigned into four treatment groups.Three repetitions were made for each diet treatment with 130 individuals in each repetition.The body length and the body weight were measured before and after the experiment,respectively.The survival rate was also calculated when the shrimp were challenged with different gradient WSSV by oral infection,and the dead shrimp were removed every two hours.The descending order of the gain of body weight and body length in the four diet treatment was clam,earthworm,housefly larva and commercial feed.There was significant difference between the body length($P<0.05$) and very significant difference between the body weight of each group($P<0.01$).Fixed linear model was applied to test the survival rate of F.chinensis by diet variation and different WSSV dosage.The results showed that the survival rate of F.chinensis fed on earthworm and housefly larva was significantly higher than that of the clam and commercial diet fed groups,and the survival rate of group fed on housefly larvae was significantly higher than that of group fed on artificial feed.The results indicated that earthworm and housefly larvae can obviously enhance the growth and disease resistance of Chinese shrimp,and are good food for Chinese shrimp.Results detected by Nest-PCR showed none of shrimp was infected by WSSV prior to the experiment,and the positive rate of 96.94% of shrimp mortality was possibly caused by infection.

【题目】近交对中国明对虾生长、存活及抗逆性的影响

【中文关键词】中国明对虾;近交;生长;存活;抗逆

【英文关键词】 Fenneropenaeus chinensis; inbreeding; growth; survival; stress resistance;
【中文摘要】以“中国对虾遗传育种中心”2个近交家系为基础培育近交群体,近交系数为0.375;以“中国对虾遗传育种中心”选育的核心群体做对照群体。将实验对虾养殖60 d,每隔20 d测量体长与体质量。通过体长、体质量、存活率、耐盐力、耐温力和抗白斑综合症病毒(WSSV)感染能力6个指标来评价近交对中国明对虾生长、存活和抗逆性的影响。方差分析表明,近交群体和对照群体在体长、体质量和存活率这3个性状上差异显著(P<0.05),近交衰退系数分别为-4.027 O%、-7.300 0%、一5.803 3%;而近交群体和对照群体在耐盐力、耐温力和抗WSSV感染能力3个抗逆性状上差异不显著(e>o.os),近交衰退系数分别为0.084 1%、--0.739 4%、1.911 0%。研究结果表明,近交使中国明对虾生长、存活等性状产生显著的衰退,而对抗逆性这一性状没有显著影响
【英文摘要】 Inbreeding,which refers to situations in which relatives mate,is unavoidable in aquaculture populations because of the restricted population size. To date,few studies investigated the effects of inbreeding on growth and stress resistance traits,although inbreeding depression of such traits had made great impact on the evolution and ecology of Chinese shrimp,Fenneropenaeus chinensis. This study quantified the effects of inbreeding on body length,body weight, survival rate,salinity-tolerance,temperature-tolerance and anti-WSSV(White spot syndrome virus) of domesticated F. chinensis in Chinese Shrimp Genetics Breeding Centre. Two inbreeding F. chinensis families from the Centre were used as broodstocks to produce inbreeding populations whose inbreeding coefficient was 0.375. Meanwhile,core populations of F. chinensis from the same center were settled as control. Inbreeding and control groups were both tagged with visible implant elastomer(VIE),and then cultivated together under the same conditions. Body length as well as body weight was measured per 20 days during the experiment. The results showed that the first three traits including body length, body weight and survival rate of inbreeding population were significantly higher than those of control populatio(nP<0.05), whose inbreeding depression coefficients were -4.027 0%,-7.300 0% and -5.803 3%,respectively. Compared with the first three traits,the last three traits including salinity-tolerance,temperature-tolerance and anti-WSSV were slightly affected by inbreeding effect(P>0.05),with their inbreeding depression coefficients being 0.084 1%, -0.739 4% and 1.911 0%,respectively. These results demonstrated that inbreeding could cause significant depression on growth and survival,but not on stress resistance traits in F. chinensis. Nest-PCR(Polymerase Chain Reaction) was used to detect WSSV infection in F. chinensis. Result showed that few individuals were infected by WSSV before the experiment,but the virus positive rate was 83.33% according to the fist-step PCR and 90.00% according to the secondstep PCR after the experiment.

【题目】水产动物选择育种的近交分析
【中文关键词】群体选择 近交 有效群体 选择反应 水产动物
【英文关键词】
【中文摘要】采用随机模拟技术模拟了水产动物的群体选择流程, 比较分析了15 个世代后群体的近交系数、近交率、选择反应、表型值等参数. 模拟分析中, 亲本的雌雄比例定为1 1, 选种数量设定500, 1000 和2000 个个体, 个体产卵量分别设为104 , 5 104 , 1 105 , 2 105 , 5 105 和1 106 共6 个梯度, 选种池塘个数设为1, 2, 3. 采用个体选择和家系内选择两种方式选择留种. 结果表明, 产卵量、个体选择方式和选择池塘数目是影响水产动物群体选择中近交系数和选择反应的3 个最主要的因素. 进一步的分析认为, 目前水产动物群体选择技术能够导致育种群体严重近交, 应采取相应的近交控制策略, 主要包括增加有效群体的数目、增加池塘数目以及选择合适的选育方法.

【题目】通过精液移植构建中国明对虾家系及微卫星分型鉴定父本
【中文关键词】中国明对虾;精液移植;微卫星;基因分型
【英文关键词】 Fenneropenaeus chinensis; semen transplantation; microsatellite; genotype;
【中文摘要】:本研究首次采用精液移植法进行中国明对虾(Fenneropenaeus chinensis)的家系构建,利用10尾已交尾雌虾纳精囊精液对17尾未交尾雌虾进行了移植,共建立11个中国明对虾家系,其中含有父系半同胞家系2个;精液移植的平均受精率为46.8%,最高受精率为78%,授精成功率为64.7%。为了揭示每个家系母本内精液的来源情况,选用6个中国明对虾微卫星标记对11个家系的母本、母本内精液及每个家系的6个个体进行分析,推算出每个家系各自的父本基因型,并与各自母本精液基因型进行比较,成功地对11个家系进行了父本鉴定。实验结果表明,11个家系的父本基因型与各自母本内精液基因型相同,每个家系内个体属全同胞关系,即对于1尾自然交尾雌虾,其纳精囊内精液只来自于1尾雄虾。通过本实验,验证了精液移植在构建中国明对虾全同胞家系和半同胞家系中的可行性,阐明了精液移植家系内个体的亲缘关系,为中国明对虾选育工作提供了技术保证。
【英文摘要】 the construction of base population with broad genetic variation.The base population can be established by forming a synthetic breeding population where brood stock from different populations are systematically crossed with each other to secure that their offsprings do not inbreed but carry new combinations of alleles.Howerer,lack of male brood stocks restricts the establishment of enough families.In order to resolve this problem,we used semen transplantation to construct families of F.chinensis among different populations,and for the sake of obtaining pedigree information, microsatellites were used for identifying parentage relationships among individuals. Semen from spermathecas of ten mated shrimps was transferred into the spermathecas of 17 shrimps which were not mated,and 11 full-sib families were obtained,including two half-sib families.The average fertilization rate was 46.8%with the highest being 78%.The success rate of artificial insemination by semen transplantation was 64.7%. Six microsatellite markers were used to identify parentage relationships among the individuals.We identified paternity of the 11 families through genotype data of female parents,semen and six individuals of each family,and constructed clear pedigrees by using microsatellite loci.All of the six microsatellite loci were polymorphic.Forty alleles were detected in 11 female parents at six microsatellite loci.The numbers of alleles at each locus were between four and nine.Forty-two kinds of genotypes were acquired in 11 female parents.All the paternal genotypes of the 11 families were inferred based on the genotypes of the female parents and their offsprings.Through the analysis of expected sire genotypes and semen genotypes,we successfully identified the paternity of 11 families.Results indicated that the male parent genotypes were identical with the semen genotypes,which demonstrated that semen in each spermatheca was from one male shrimp,and the offsprings of each

family were full-sibs.These results demonstrate that it is feasible to use semen transplantation technique as a way to establish F.chinensis families.It also shows that microsatellite markers can be used as a powerful tool for obtaining pedigree information in selective breeding programs of F. chinensis.The results of the experiment will establish foundation for producing full-and half-sibs families,and the technology of semen transplantation can provide basis for shrimp breeding programs.

【题目】中国对虾抗WSSV相关基因表达特征的DDRT-PCR分析

【中文关键词】中国对虾;抗白斑综合征病毒;mRNA 差异显示技术;

【英文关键词】 Fenneropenaeus chinensis; WSSV-resistant; mRNA differential display PCR;

【中文摘要】为了分析中国对虾(Fenneropenaeus chinensis)抗白斑综合征病毒(WSSV)相关的分子机理,本研究以中国对虾“黄海2号”作为实验材料,进行白斑综合征病毒感染实验,感染20 d后获得了59尾存活的对虾。采用mRNA差异显示技术(DDRT-PCR)分析感染实验中早期濒死中国对虾和感染20 d后仍存活对虾基因表达的差异,共回收到46个阳性差异片段。差异片段序列同源性功能分析的结果表明,差异片段所编码的蛋白主要参与氧化磷酸化、蛋白质合成、糖酵解、信号转导等生物过程。以上结果初步反映了中国对虾抗白斑综合征病毒相关基因的表达特征,为研究对虾抗白斑综合征病毒的作用机制及培育抗白斑综合征病毒对虾新品种提供了基础数据

【英文摘要】White spot syndrome is a viral disease that seriously threatens shrimp aquaculture.In order to study the molecular basis related to WSSV-resistance in Fenneropenaeus chinensis,"Huanghai No.2"was challenged by WSSV.There were 59 shrimps survived from the challenge experiment after twenty days post-infection in the end.The gene expression in survival shrimps twenty days post-infection was compared with the earliest moribund shrimps in post-infection by mRNA Differential Display PCR.Forty-six positive differential fragments were recovered.Then sequences of the positive differential fragments were determined and blasted in GenBank.Most of them were foundto code proteins related to oxidative phosphorylation,protein synthesis,glycolysis and signal transduction.The study showed partly the molecular basis related to WSSV-resistant genes in shrimp,and provided basic data for understanding mechanisms related to WSSV-resistant in shrimp and WSSV-resistant shrimp breeding.

【题目】三疣梭子蟹四个野生群体形态差异分析

【中文关键词】三疣梭子蟹;野生群体;形态学差异;聚类分析;判别分析

【英文关键词】Portunus trituberculatus ,wild population ,morphological difference cluster analysis, discriminant analysis

【中文摘要】:通过对鸭绿江121、莱州湾、海州湾、舟山4个野生群体的三疣梭子蟹(Portunus trituberculatus)14项生物学外部形态性状的测量,采用多元分析方法对其进行比较分析。聚类分析结果表明,海州湾、舟山2个群体形态最为接近,鸭绿江口和莱州湾2个群体形态较为接近。对样本所属群体进行判别分析,4个群体雌蟹的综合判别率为87.0%,其中海州湾最低,为80.0%;莱州湾最高为92%。4个群体雄蟹的综合判别率为80.8%,其中海州湾最低,为72.0%;鸭绿江口最高,为96%。并建立4个群体各自的判别函数公式。通过对16项形态比例参数进行单因素方差分析,找到了4个群体间存在显著差异的形态比例参数。3种分析结果均认为,4个群体三疣梭子蟹在形态上已产生一定程度的差异,但所有的差异均未达到亚种水平,需要多项参数综合判别才能将4个群体的三疣梭子蟹区分开。

【英文摘要】
Portunus triuberbuculatus is an important economical species in China. In recent years, the wild stocks of P. triuberbuculatus along the coast of China have suffered fatal decrease in their resources due to overfishing and cultivation. So it is very important to analyze the morphological diversity of P. triuberbuculatus. In October 2005,50 individuals were collected individually from four wild geographic populations distributed in the Yalu River estuary, Laizhou Bay, Zhoushan, and Haizhou Bay. In this research, cluster analysis,discriminant analysis and One-Way ANOVA analysis were applied in the analytical process. Based on 14 morphological characters of each population of P. trituberculatus from four locations, cluster analysis and discriminant analysis were conducted. Crabs from Haizhou Bay and Zhoushan were pooled into one group while crabs from Yalu River estuary and Laizhou Bay were pooled into another group by cluster analysis. In discriminant analysis, total accuracy rate of discriminant on female crabs from four locations was 87.0 %. The accuracy rate of Haizhou Bay population was the lowest(80.0 %), while that of Laizhou Bay population was the highest (92%). Total accuracy rate of discriminant on male crabs from four locations was 80.8%. Haizhou Bay population was the lowest at 72.0 %, while Yalu River estuary population was the highest at 96 %. The discfiminant functions of the populations from four locations were established, respectively. OneWay ANOVA was conducted on 16 proportional parameters. The results showed that some proportional parameters were significantly different among the four populations. In this study all results supported that there were some morphological differences among the four populations, but variations of all the morphological traits were not characterized subspecies. Some integrative analysis was needed to distinguish accurately all geographic populations.

【题目】三疣梭子蟹不同地理种群内自繁和种群间杂交子一代生长性状的比较
【中文关键词】三疣梭子蟹, 种群, 杂交, 杂种优势, 育种
【英文关键词】Portunus trituberculatus, Population, Cross, Heterosis, Breeding
【中文摘要】采用不同地理种群体内自繁和种群间杂交的方法, 进行了自繁和杂交子一代生长性状的比较研究。结果表明, 80 日龄时的杂交子一代在各项指标都表现出一定的杂种优势(0.24%—13.50%),LS 在这5 个性状中都高于ZL。100 日龄时杂交子一代表现出的杂种优势有所下降, 杂种优势率在-0.88%—4.13%之间, 甲长表现出杂种劣势。120 日龄时杂交子一代的杂种优势范围为-1.91%—4.37%, 甲长、甲宽表现出杂种劣势。可见不同杂交组合、不同性状、不同时间表现出的杂种优势有显著差异。ANOVA 分析表明:80 日龄、100 日龄、120 日龄时, 5 个生长性状在群体之间存在极显著差异。实验结果表明:三疣梭子蟹4 个杂交子一代在生长性状上存在一定程度的杂种优势, 可见种内群体间杂交是培育三疣梭子蟹优良新品系的重要方法之一。
【英文摘要】Portunus trituberculatus(Family Portunidae)is an economically valued crab species.However,rapid expansion in agro-industry of it in recent years in China yielded also some problems such as frequent diseases outbreak,breed/strain degeneration,and natural resource depletion.They have limited the sustainable development.In this research,matings and crosses within and among three different geographical populations(Zhoushan:ZS;Laizhou Bay:LZ;and Haizhou Bay:HZ)of the species were screened for new breed and strains.Seven populations of first filial generations have been obtained,of which three were of matings and 4 crossings.The characteristic indices of the first filial generations were measured on Days 80,1 00,and 1 20.Results show that the heterosis was significant in the whole carapace width,carapaceidth,carapace length,body height,and body weight;for instance,the difference in heterosis of Day 80 one was 0.24% 一13.5% .The heterosis in LS was greater than in ZL in all dimensions.On Day 100.the heterosis varied 一0.88% 一4.13% with hybrid weak ness in carapace length.On Day 120.the heterosis varied 一1.91%一4.37% with hybrid weakness in carapace length and carapace width.Analysis with ANOVA program shows that some traits were significantly different among seven populations of the first filial generations.Hybridization was proved important in this study for increasing the growth performance of trituberculatus

【题目】三疣梭子蟹形态性状对体重的影响结果效果分析
【中文关键词】三疣梭子蟹 形态性状 相关分析 回归分析
【英文关键词】Portunus trituberculatus ,Morphological characters,Correlation analysis, Regression analysis
【中文摘要】通过对鸭绿江口、莱州湾、海州湾和舟山4个采样地点的三疣梭子蟹Portunus tritubercul。一tus12项形态性状的测量,采用相关分析和通径分析方法,计算了以形态性状为自变量对体重作依变量的相关系数、通径系数、决定系数及相关指数,定量分析了形态性状对体重的影响效果。结果表明,三疣梭子蟹12个形态性状均与体重的相关系数达到极显著水平(P<0.01);通径分析揭示了多元分析中多个自变量与依变量的真实关系。全甲宽、甲长、体高、第1侧齿间距、第2侧齿间距、大螯不动指长对体重的通径系数达到显著水平。所选形态性状与体重的复相关指数为R。:0.882 6,说明影响体重的主要自变量指标已经找到;多元回归分析建立了全甲宽(X)、甲长(X)、体高(X)、第一侧齿间距(X)、大螯不动指长(X)对体重(y)的回归方程,为三疣梭子蟹育种提供理论依据。
【英文摘要】Based on the measurement of 1 2 morphological characters of blue crab(PortunUS trituberculatus)from four areas including Yalu River estuary,Laizhou Bay,Haizhou Bay,and Zhoushan Island,the relationships between these data and body weight of these crabs wereinvestigated,using correlation analysis and path analysis.The 1 2 morphological characters were used as independent variables,and body weight was used as a dependent variable for path analysis.Path coefficients(Pi),determination coefficients( )and correlation index(R)were calculated in path analysis.All twelve correlation coefficients between the 1 2 morphological characters and the body weight were found tO be significant(P~ 0.01).Path analysis revealed a rel able relationship between the independent variables and the dependent variable. Significant path coefficients(Pi)were found between the full carapace width(X1),carapace length(X2),body height(X4),first obital margin width (X5),second orbital margin width (X6),fixed finger length of the claw (X7)and the body weight.According to their high compound correlation index(R 一0.882 6),the main variables(X1,X2,X4,X5,X6,X7)were selected.Multiple regression equations for the full carapace width(X1),carapace length(X2),body height(X4),first obital margin width(X5),fixed finger length of the claw (X7)and the body weight wereobtained,which provided a theoretical basis for blue crab breeding.

【题目】三疣梭子蟹3个地理种群杂交子一代生长和存活率的比较
【中文关键词】三疣梭子蟹 自繁 杂交 生长性状 存活率
【英文关键词】Portunus trituberculatus;cross population;mating population;trait;breeding
【中文摘要】为了培育三疣梭子蟹P ortunus trituberculatus 新品系, 开展了不同地理种群内自繁和种群间杂交的工作, 获得了3个自繁群体和4个杂交群体, ZZ1、LL1和HH1分别来自舟山野生种群(ZS)、莱州湾野生种群(LZ) 和海州湾野生种群(H Z) 自繁一代; ZL1和LS1是ZS 与LZ杂交一代, HL1和LH1是LZ与H Z杂交一代。运用方差分析对7个子一代群体的5个主要生长性状(全甲宽、甲宽、甲长、体高、体重) 进行了比较, 发现一些性状在7个子一代群体之间表现出显著差异, 计算各项生长性状及存活率的杂种优势,4个杂交子一代群体在一些性状方面表现出杂种优势(01 33% ~ 46112%) , 但不同杂交组合间和不同性状间的杂种优势存在差异, 有的性状甚至表现出杂交劣势。获得的7个群体将成为进一步选育的基础群体,子一代变异性的增加为进一步选育奠定了基础。

【英文摘要】Hybridization was carried out within and among different geographical populations of crab Portumts trituberculatusto breed new strains.Seven populations of first filial generations were obtained,in which three popula · tions,designated ZZ1,LL1 and HH1,were from wild populations ofZhoushan(ZS),Laizhou Bay(LZ),and Haizhou Bay(HZ).Two populations ZL1,and LS1 were from cross between ZS and LZ,two populations HLl and LHl were from cross between LZ and HZ. Analysis of five growth traits,total carapace width, carapace width ,carapace length,body height and body weight by ANOVA revealed that some traits were significantly diferent among the seven populations of first filial generations.There existed different extent heterosis(0.33% 一46.12%)for growth in total carapace width,carapace width,carapace length,body height,body weight and livability in first filial generation of four hybrids.Heterosis was diferent in diferent combinations and traits,indicating that the seven populations were considered as the basic po pulations to breed new strains.Increased variation parameters in first filial generation of cross could be a very good potential for new strain selecting.

【题目】三疣梭子蟹基因组小卫星特征分析

【中文关键词】三疣梭子蟹;基因组;重复序列;小卫星

【英文关键词】Por tunus t ri tuber culatus; genome; repeat sequences; minisatel lites

【中文摘要】通过构建三疣梭子蟹部分基因组文库,对获得的4 164个克隆测序,共获得总长度为622 409 bp的DNA序列。在序列拼接后长度500~1 500 bp的709个克隆中,筛选到130个小卫星序列,其序列总长度占测序序列总长度的2.55 。小卫星序列中,以12 bp重复单位的序列数量最多(10.77),总体趋势表现为重复单位越长,相应的重复序列数目越少(R=一0.663,P<O.01)。小卫星重复单位拷贝数分布范围以8 bp重复单位最广为3.9~66.5;其次是13 bp重复范围在2.0~40.6;再次是26 bp重复,范围在2.3~21.0。平均拷贝数最高的三种重复类型分别为8 bp重复(19.96),25 bp重复(16.00)和22 bp重复(15.85)。小卫星序列中各重复单位的拷贝数分布范围2~66.5,集中分布在2~25,且表现为拷贝数目越大,其相应的重复序列数目越低的趋势。130个重复序列分别由123种重复单位所组成,因而小卫星重复序列的类型很多。初步分成三类:2种碱基组成类别、3种碱基组成类别和4种碱基组成类别,并进一步根据各个重复序列中所含有的碱基种类的数量从大到小排列这些碱基而分成若干小类。从这些分类中可以看出,三疣梭子蟹基因组中的小卫星整体上是富含A/T的重复序列,并揭示了其与微卫星重复序列之间的关系,即一部分小卫星重复序列可能起源于微卫星序列。

【英文摘要】In this paper, genome library of crab Por tunus t ri tuberculatus w as const ructed. By sequencing randomly, 4 164 clones o f sequences in the genomic libr ar y o f crab Por tunus tr ituber culatus w ere obtained. Then, using softw are DNAST AR (V ersion 5?? 0) to assemble all of the clones, 709 clones independent o f each other, w er e made in w hich the length of DN A sequences is about 622 409 bp in total. With the help o f the bio-soft T andem Repeat s Finder (Version 2?? 02) , 130 minisatellites w ere screened in the crab??s g enome DNA sequences. Their cumulative length occupied 2?? 55% of the to tal length of DNA sequences. In the minisatellite sequences, tw elve-nucleot ide repeats w ere the mo st f requent type, accounting fo r 10?? 77% o f the total number of minisatellites. It show ed that the number o f sequences decreased w ith the length of it s repeat unit (R = - 0?? 663, P < 0?? 01) . Eig ht-nucleot ide r epeat had the largest range of copy number of repeat unit (3?? 9- 66?? 5) , the fo llow ing w ere thirteen-nucleot ide repeat type(2?? 0- 40?? 6) and twenty-six-nucleot ide(2?? 3- 21?? 0) , respectively. Descending three r epeat types in mean copy number of r epeat unit w ere eig ht-nucleo tide repeat (19?? 96) , tw enty-five-nucleot ide (16?? 00) and tw enty-tw o-nucleot ide (15?? 85) , respect ively. The range of copy number of repeat unit varied fr om 2 to 66?? 5, and the copy number mostly rang ed from 2 to 25. Mor eo ver , it w as show ed that the number o f corresponding minisatellites decreased as copy number of repeat unit increased. In this research, the 130 minisatellite sequences are composed of 123 kinds of repeat units, so it is very diff icult to classify the minisatellite sequences. The minisatellite sequences can be classified into three types: dinucleotide minisatellite sequences composed of two kinds of nucleotide, t rinucleotide minisatellite sequences composed of three kinds of nucleotide and tet ranucleot ide minisatellite sequences composed of four kinds of nucleotide. Further, all of above sequences can be divided into many sub-types according to the composition of nucleotide and their number from large to small. Totally , the minisatellite sequences in Portunus trituberculatus are A/ T rich. This paper also discussed the genesis and evolut ion of minisatellite repeat sequences, and it is belived that the minisatellite repeats may come f rom the microsatellite repeat s. It could be very pract ical to use minisatellite to study the genome of Portunus tr ituber culatus and

would be applied to a variety of fields.

【题目】三疣梭子蟹基因组微卫星特征分析
【中文关键词】三疣梭子蟹;基因组;微卫星
【英文关键词】Portunus trituberculatus:microsatellite:genome
【中文摘要】:对三疣梭子蟹(Portunus trituberculatus)部分基因组DNA文库测序,获得了总长度为622 409个碱基的基因组DNA序列,从中找到微卫星重复序列(1~6 bp重复)697个。统计微卫星重复类型,以两碱基重复数目最多,为445个,占微卫星序列总数目的63.84%;其次是三碱基重复152个,占21.81%;再次分别是单碱基重复45个,占6.46%;四碱基重复31个,占4.45%;五碱基重复14个,占2.01%;六碱基重复10个,占1.43%。在单碱基重复类型中,重复拷贝类别全部为A;两碱基重复类型中,AG重复数目最多,其次是AC和AT;三碱基重复类型中以ACT最多,其次是AGG和AAT.四碱基重复类型中,AGAC重复数目最多:五碱基重复类型中,以AACCT重复拷贝类别最多;六碱基重复中以AGGGGA重复数目最多。GC重复拷贝类别的重复数目很少,只发现1个(GenBank注册号为EU113241)
【英文摘要】By sequencing randomly,4 1 64 clones of sequences in the genomic library of crab Portunus trituberculatus were obtained.Software DNASTAR (Version 5.0)was used to assemble all of the clones in this study.The length of DNA sequences is about 622 409 bp totally.W ith the help of the bio-software Tandem Repeats Finder (Version 2.02),697 microsatellite repeat sequences are found in the sequences.In the 697 repeat sequences,the number of dinucleotide repeat is 445,being the richest(63.84%)of all the repeat sequences.The second one is trinucleotide repeat with 1 52(2 1.8 1%);the third one is mononucleotide repeat with 45(6.46%);the forth one is tetranucleotide repeat with 3 1(4.45%):the fiflh one is petranucleotide repeat with l 4(2.0 1%);the sixth one is hexanucleotide repeat wilh 1 0(1.43%).Forty-five mononucleotide repeat sequences are all composed of the motif ofA,while the motif of C was not found among the mononucleotide repeats.In dinucleotides repeats,the number ofAGrepeat is 214,accounting for 48.09%;and the numbers ofAC and AT repeats are 187(42.02%)and 43(9.66%),respectively.Eight classes of repeat sequences that include motifs OfACT,AGG,AAT,ACC,AAG,ATC,AAC and AGC are found in trinucleotides repeat,in which the number of ACT repeats is the largest with 42:the second one is AGG (35);the others are AAT(28),ACC(21),AAG(9),ATC(7),AAC(7)and AGC(3)in turn.AGAC,AACCT and AGGGGA repeats are the richest ones in tetranucleotide一,pentranucleotide-an d hexanucleo.tide.repeat,respectively.Only one GC dinucleotide repeat is found in the study and its GenBank accession numberis EU 11 324 1.The reason of fewer GC repeat is possibly that methylation of C in CpG islands results in mutation ofC.T or that it is difi cult to sequence the GC repeat sequences.Distributions of copy numbers in diferent types of repeat sequences are as follows:copy numbers of mononucleotide repeats are mainly between 28 and 40 or between 68 and 76,accounting for 80.00% totally;copy numbers of dinucleotides are mainly betw een l 2 and 36,accounting for 64.04% :copy numbers of trinucleotides repeats are mainly between 8 and 24,accounting for 57.90% ;copy numbers oftetre一,pen~a-and hexanucleotides repeats together are mainly betw een 4 and 12.In general,the length ofmicrosatellite repeat sequences are mainly 24-72 bp.Based on the above,it can be concluded that the nucleotide mutation of microsatellite locations has been accumulated largely in a long term of evolution;and there would be abundant polymorphism in these loca.tions.Therefore,it would be practical to use microsatellite to study the genome of trituberculatus and the method would be applied to a variety of fields including population diferentiation,kinship analysis,linkage analysis,and evolutional and ecological studies.Th is study provides base for P trituberculatus microsatellite researches.

【题目】建立半定量检测养殖环境和水产动物中的致病性副溶血弧菌
【中文关键词】副溶血弧菌; 快速检测; 半定量; 菌落PCR; tl基因
【英文关键词】Vibrio paraha emolyticus ; rapid detection; semi-quantitative; colony PCR; tl gene
【中文摘要】以tl为靶基因, 将菌落PCR 技术和平板菌落计数法相结合, 建立致病性副溶血弧菌快速、半定量检测方法。PCR 扩增的目的片段为673 bp, 人工污染样品检测最低限固体样品为3. 1 @ 102 cfu /g, 液体样品为1. 3@ 102 cfu /mL, 菌落PCR 每反应体系的检测低限为90 cfu。对人工污染样品的检测结果显示, PC-PCR方法检测结果与常规检测结果一致, 可用于养殖环境及水产品中细菌的动态监测。
【英文摘要】A rapid and semi2quantita tive method was deve loped for detec tion of p athogenic Vibrio pa raha rm olyticus, using t l gene a s a targe ted gene, combined the me thod of pla te count for bacteria l colonie s and colony PCR. The expec ted PCR product was 673 bp. Detec tion limit for a rtificia l contaminants wa s 3. 1 ×102 cfu/g of solid samp le and 1. 3 102 cfu/ml of liquid samp le; Detection limit of co lony PCR reaction system was 90 cfu. The contamina ted samp les we re detected by both PC2PCR and routinemethods with a comp le tely coinc ident re sult. This integra ted analytical PC2 PCR method should be further app lied for dynamic detection in aquaculture

【题目】三疣梭子蟹不同日龄生长性状相关性及其对体重的影响
【中文关键词】三疣梭子蟹 生长性状 表型相关 遗传相关 通径分析
【英文关键词】Portunus trituberculatus,growth traits,phenotypic correlation,genetic correlation,path analysis;
【中文摘要】利用定向交尾技术构建三疣梭子蟹15个半同胞家系和38个全同胞家系。测量每个家系80d、100d和120d的全甲宽(X1)、甲宽(X2)、甲长(X3)、体高(X4)和体重(Y)。采用相关分析和通径分析方法计算不同日龄各性状的遗传相关、表型相关、以形态性状为自变量对体重作依变量的相关系数、通径系数、决定系数。结果表明,5个生长性状的表型相关系数在0.759~0.972之间,遗传相关系数在0.170~0.975之间。经显著性检验,各性状间的表型相关和遗传相关都呈极显著水平(P0.01),各性状不同日龄对体重的直接影响不同,80d:X1X2X3X4,100d:X1X3X2X4,120d:X3X2X1X4,80d和100d时主要通过全甲宽间接影响体重,120d主要通过甲长和甲宽间接影响体重。建立全甲宽(X1)、甲宽(X2)、甲长(X3)和体高(X4)对体重(Y)的多元回归方程,不同日龄各生长性状与体重的复相关指数R2分别为0.960,0.971,0.892,说明它们都是直接影响体重的重要指标。
【英文摘要】In order to find out the main growth traits of Portunus trituberculatus which have influence on body weight,and define degree of correlation among characters,thirty eight full-sib groups and fifteen half-sib groups of Portunus trituberculatus were obtained by directional mating techniques. Full carapace width(X1),carapace width(X2),carapace length(X3),body height(X4),and body weight (Y) of each family on 80 d,100 d and 120 d were measured. The phenotype correlation coefficients and the genetic correlation coefficients were calculated by correlation analysis at the different ages. The first 4 morphometric attributes (X1-X4) were used as independent variables,and body weight (Y) was used as a dependent variable for path analysis. Path coefficients,and determination coefficients were calculated in path analysis. The results showed that the phenotypic correlation of the five traits was between 0.759 and 0.972,and the genetic correlation was between 0.170 and 0.975. All five correlation coefficients achieved very significant difference(P<0.01)levels. The direct effects by the characters have an order at the three stages,80 d: X1>X2>X3>X4,100 d: X1> X3> X2> X4,120 d: X3> X2> X1> X4,among them X1 weighted the most to the body weight on 80 d and 100 d,X1 and X3 weighted the most to the body weight on 120 d. Full carapace width which have the largest direct impact on body weight (0.471 9) is the most important indicators for indirect selection of body weight. Multiple regression equation of (X1,X2,X3,X4) to body weight at different developmental stages was obtained as: 80 d Y=-54.113+0.491X1+0.632 X2+0.325 X3+0.451 X4;100 d Y=-123.484+0.627 X1+0.928 X2+1.433 X3+0.152 X4;120 d Y=-158.239+0.137 X1+1.410 X2+2.370 X3+0.800 X4.The high compound correlation index(R2=0.960,0.971,0.892) indicated that these growth traits had direct influence on body weight. Efficient scheme of multiple trait

selection will be made if we obtain definite quantitative relationship between each two characters.This study provides theoretical evidence and perfect measure target for breeding of Portunus trituberculatus

【题目】溶藻弧菌对三疣梭子蟹抗氧化酶系统的影响
【中文关键词】三疣梭子蟹(Portunustrituberculatus);溶藻弧菌(Vibmo alginolyticus);抗氧化酶活;脂质过氧化物
【英文关键词】Portunus trituberculatus;Vibrio alginolyticus;Antioxidant enzyme system ;Lipid peroxidation
【中文摘要】从患乳化病的养殖三疣梭子蟹(Portunus trituberculatus)体组织内分离出病原菌——溶藻弧菌(Vibrioalginolyticus),通过肌肉注射的方式对三疣梭子蟹进行感染实验,对照组注射等量的生理盐水,在感染后0、24、48和72 h分别采集不同处理组三疣梭子蟹的血淋巴、肌肉和肝胰腺组织,测定溶藻弧菌对其各组织抗氧化相关酶活的影响。结果表明:注射生理盐水的对照组三疣梭子蟹体组织中抗氧化酶和MDA含量在不同的采样时间变化不显著(P>0.05)。与对照组比较,三疣梭子蟹感染溶藻弧菌后血淋巴、肌肉和肝胰腺组织中s0D活性随着感染时间的延长显著降低(P<0.05)。在感染溶藻孤菌24 h时血淋巴和肝胰腺组织中GSH—px活性有增强的趋势(P>0.05),随后在感染48 h后GSH—px活性显著降低(P<0.05);感染组各体组织中的MDA含量均随着感染时间的延长而显著上升(P<O.05)。结果显示梭子蟹感染溶藻弧菌后机体消除氧化过程自由基的抗氧化酶活降低,脂质过氧化物水平升高,使得抗氧化防御能力下降。
【英文摘要】The present study examined the changes occurring in the antioxidant defence status in haemolym ph,muscle hepatopancreas and tissue of Portunus trituberculatus infected by Vibrio alginolyticus. It is a kind of bacteria-V.alginolyticu that was isolated from tissue of diseased P.trituberculatus farmed under natural conditions.The healthy crabs were infected with V.alginolyticu by intramuscular injection of the isolated bacteria and 0.9 Nacl solution as a contro1 respectively. Activities of superoxide dimutase (SOD),glutathione peroxidase(GSH-px)and levels of lipid peroxides(MDA)were measured at 0 h,24 h, 48 h and 72 h following the infection.The results showed:The control crabs did not exhibit any significant variation in SOD,GSH-px and MDA activities in the tissues.However,V.alginolyticu infection induced a significant decrease of SOD activities in haemolymph,and muscle hepatopancreas of infected crabs compared with the control(P< 0.05).The GSH-px activities of the haemolymph and hepatopancreas were higher at 24 h after infection。whereas decreased significantly in the 1 ast course of infection compared with the eontrol (P< 0.05).The M DA levels of different tissues were increased significantly in infected crabs with the infection time(P<0.05).The results of this study indicated that the tissue antoxidant enzyme activities in P.trituberculatus infected by V.alginolyticu were decreased and were consistent with M DA leve1.The antoxidant defence system of crab was destroyed,and the abilities of preventing disease and disease resistance decjned.

【题目】Computational Study on the Conformation and Vibration Frequencies of β-Sheet of ε-Polylysine in Vacuum
【中文关键词】环庚烷岔型氢键; ε-聚赖氨酸;多肽;ONIOM
【英文关键词】cyclohepta bifurcated hydrogen bond; ε-polylysine; peptide; ONIOM
【中文摘要】设计两种含有三个L-赖氨酸的低聚物作为模型分子,用于模拟ε-聚赖氨酸(ε-PL)链中β折叠的构造,它们的C端和N端分别由乙胺和α-L-氨基丁酸封端。采用ONOIM(B3L YP/6-31G:PM3)方法对它们进行了化学计算。获得最优构象并将IR频率与实验数据相对比。结果显示,两条链通过自由折叠形成环庚烷岔型氢键,其中酰胺基和α-氨基基团来源于一条链,而羰基则源于另一条链。岔型氢键的键角为66.6°。利用ONIOM [B3LYP/6-31G(d):PM3]进行的频率分析,结果表

明主要基团如氨基化合物和胺基基团的IR吸收频率和实验结果一致。

【英文摘要】Two oligomers, each containing 3 L-lysine residues, were used as model molecules for the simulation of the β-sheet conformation of ε-polylysine (ε-PLL) chains. Their C terminals were capped with ethylamine and N terminals were capped with α-L-aminobutanoic acid, respectively. The calculations were carried out with the hybrid two-level ONOIM (B3LYP/6-31G:PM3) computational chemistry method. The optimized conformation was obtained and IR frequencies were compared with experimental data. The result indicated that the two chains were winded around each other to form a distinct cyclohepta structure through bifurcated hydrogen bonds. The groups of amide and α-amidocyanogen coming from one chain and the carbonyl group from the other chain were involved in the cyclohepta structure. The bond angle of the bifurcated hydrogen bonds was 66.6°. The frequency analysis at ONIOM [B3LYP/6-31G (d):PM3] levelshowed the IR absorbances of the main groups, such as the amide and amidocyanogen groups, were in accordance with the experimental data.

【题目】溶藻弧菌对三疣梭子蟹溶菌酶和磷酸酶活性的影响

【中文关键词】三疣梭子蟹 溶藻孤菌 溶菌酶 酸性磷酸酶 碱性磷酸酶

【英文关键词】 Portunus trituberculatus Vibrio alginolyticus Lysozyme(LSZ) Acid phosphatase(ACP)Alkaline phosphatase(ALP)

【中文摘要】将健康的三疣梭子蟹(平均体重176 4-21.3g)分别注射生理盐水和溶藻弧菌,在感染后0、24、48和72h分别采集不同处理组梭子蟹的血淋巴、肌肉和肝胰腺组织,测定其中的溶茵酶(LSZ)、酸性磷酸酶(ACP)及碱性磷酸酶(ALP)活性,研究溶藻弧茵对三疣梭子蟹体内免疫相关酶活的影响。结果表明,感染组梭子蟹血淋巴LSZ活性在感染后24h显著高于对照组(P<0.05),随后活性显著降低(P<0.05);肌肉和肝胰腺组织中LSZ活性在感染24h有稍微上升的趋势,但是随着感染时间的延长其活性又逐渐下降,且在感染48h后分别显著低于对照组(P<0.05)。感染组梭子蟹不同组织中ACP和ALP酶活随着感染时间的延长均呈下降的趋势,且感染48h后显著低于对照组(P<0.05)。试验表明,三疣梭子蟹感染溶藻弧菌后对机体免疫相关酶活指标的影响较大,导致机体免疫防御能力的减弱。

【英文摘要】Healthy Portunus trituberculatus(averaging body weight 176±21.3g)were used to determine the changes of the immunity enzyme activities in haemolymph,muscle and hepatopancreas tissue after the crabs were injected with 0.9% Nacl solution(Control)and Vibrio alginolyticus.The relative immunity indicators were measured at 0h,24h,48h and 72h after the infection.The results showed that:The lysozyme(LSZ)activity of heamolymph increased significantly(P<0.05)in V.alginolyticus infected crabs in the initial 24h,but at 48h and 72h the activity reduced significantly(P<0.05)below the control level.The LSZ activities of muscle and hepatopancreas decreased significantly after infection(P<0.05).Both the ACP and ALP activities reduced significantly in the heamolymph,muscle and hepatopancreas tissue of infection group respectively(P<0.05).However,the control crabs did not experience any significant variation in LSZ,ACP and ALP activities in all the tissues.The results of this study indicated that immunity enzyme in P.trituberculatus infected by V.alginolyticu was induced more significantly,which accompanied by weakened immunity ability of the crab

【题目】三疣梭子蟹4个野生群体遗传差异的同工酶分析

【中文关键词】三疣梭子蟹 野生群体 同工酶 遗传差异
【英文关键词】Portunus trituberculatus Wild populations Isozyme Genetic diversity
【中文摘要】采用聚丙烯酰胺不连续凝胶垂直电泳技术对三疣梭子蟹Portunus trituberbuculatus4个野生群体(鸭绿江口、莱州湾、海州湾和舟山)的同工酶进行检测,分析群体间的生化遗传差异。结果发现(1)4个群体的多态座位百分数(P。.。。)分别为:鸭绿江口13.6 、莱州湾13.6 、海州湾13.6%和舟山13.6 。(2)4个群体间的生化遗传差异不显著,4个群体间的遗传距离D一0.000 54~0.001 70,属种内群体间差异。(3)聚类分析表明:4个群体分为两组,海州湾和舟山两群体之间的亲缘关系最近,聚为一组。莱州湾和鸭绿江口群体亲缘关系比较近,聚为另一组。
【英文摘要】Vertical polyacrylamide gel electrophoresis was used to investigate the genetic variation of isozyme of Portunus trituberbuculatus. Four wild geographic populations distributed in the Yalujiangkou(YL),Laizhou Bay(LZ),Zhoushan(ZS) and Haizhou Bay(HZ) (48 individuals each)were surveyed. Of 22 loci encoding 11 enzymes,three were polymorphic. The results showed that: (1)the mean proportion of polymorphic loci(P0.99) of YL,LZ,ZS and HZ were 13.6%,13.6%,13.6% and 13.6%,respectively ;(2) there were no significant differences in biochemical genetic characteristics of the P. trituberbuculatus among four wild geographic populations. The genetic divergences (Dnei) among the four wild geographic populations ranged from 0.00054 to 0.00170,which were lower than that between subspecies;(3) dendrogram constructed based on the genetic distances among the four populations showed that there were two different groups: one being composed of YL and LZ and the other of ZS and HZ.　还原

【题目】三疣梭子蟹(Portunus trituberculatus)莱州湾、舟山野生个体定向交配产生F2代家系的AFLP分析
【中文关键词】三疣梭子蟹 定向交配F家系 AFLP分析 遗传距离 多态位点 遗传连锁图谱 分子标记技术 莱州湾 遗传多样性分析 分离比例
【英文关键词】　Portunus trituberculatus Directional mating F2 family AFLP analysis;
【中文摘要】以三疣梭子蟹莱州湾、舟山野生群体杂交(莱州湾♀×舟山♂)产生F2代家系63个个体及F1代亲本为实验群体,采用AFLP分子标记对其进行遗传分析。35对选择性引物共扩增出1742个位点,其中分离位点为417个,不分离位点为1325个,多态位点比例为23.9%。在分离位点中,符合1∶1孟德尔分离比例的位点为226个,占总分离位点数的54.2%;偏离1∶1孟德尔分离比例的位点为31个,占总分离位点数7.4%。符合3∶1孟德尔分离比例的位点为128个,占总分离位点数的30.7%;偏离3∶1孟德尔分离比例的位点为32个,占总分离位点数的7.7%。家系内基因多样性指数为0.130,Shannon指数为0.193。遗传距离分析显示,子代个体与母本Nei’s遗传距离介于0.064~0.111之间,与父本Nei’s遗传距离介于0.065~0.107之间。其中,63号个体与48号个体分别与父、母本亲缘关系最远。本实验中,偏分离位点比例属正常范围,杂交F2代家系遗传多样性偏低。本研究结果为三疣梭子蟹野生群体及家系遗传多样性分析,遗传连锁图谱构建等方面提供一定的技术支持。
【英文摘要】Portunus trituberculatus is one of the most important fishery resources in China because of its high commercial value. In recent years,it has suffered from overfishing and various diseases,and the total resource of wild populations has decreased year by year. Considering for this situation,it is necessary to study the genetic diversity and genetic linkage map of P. trituberculatus. In this study,maternal broodstock and paternal broodstock were sampled from Laizhou Bay and Zhoushan Island wild population,respectively. Through directional mating (1♂×3♀),they generated F1 family. 63 individuals of F2 family came from sisterhood intercross between F1 family and these broodstock were used as experiment materials. The AFLP analyses showed that a total of 1 742 loci were produced,of which 417 loci were polymorphic,accounting for 23.9%. In these polymorphic loci,there were 226 (accounting for 54.2% of total segregating loci) loci segregating as 1∶1 Mendelian model while 31 (7.4%) loci segregating as distorted model.128 loci (30.7%) segregated as 3∶1 model and the numbers of 32 (7.7%) loci were distortion bands. Additionally,several AFLP bands which segregated neither as 1∶1 nor as 3∶1 were named with odd segregating loci. They were treated as non-segregating loci in order to reduce the influence of statistical error. Genetic diversity index of the F2 was 0.130,and Shannon genetic diversity index was 0.193. Analysis of distances showed that Nei’s genetic distance of family with male parent and female parent were between 0.064~0.111,0.065~0.107 respectively. In the mean time,No63 individual was most distant from its male parent and No48 individual was most distant from its female parent. The main purpose of the study was to provide the technical support for genetic diversity analysis of wild populations or families and construction of high density genetic linkage map of P. trituberculatus.

【题目】三疣梭子蟹家系的建立及生长性状比较
【中文关键词】三疣梭子蟹 家系 生长性状 交配模式 平均值 日龄 体重比 成活率 生长优势 选育
【英文关键词】Portunus trituberculatus; family; growth traits
【中文摘要】以莱州湾和舟山野生群体为材料,以完全双列杂交法设计搭配组合,采用1×3♀交配模式,首次利用人工控制定向交尾技术成功构建三疣梭子蟹家系,经过两代选育,对生长到80,100,120日龄10个F2代家系的生长和家系内的变异进行了比较分析。120日龄时,10个家系体重大小顺序为:J9J10J1J8J4J3J2J5J7J6,全甲宽大小顺序为:J9J10J1J4J8J3J2J5J7J6,甲宽大小顺序为:J9J10J1J8J4J3J2J5J7J6,甲长大小顺序为:J9J10J1J8J4J3J2J5J7J6,体高大小顺序为:J9J10J1J8J4J3J2J5J7J6。J9J、10的体重极显著大于其他8个家系(P≤0.01),J9体重比J6大96.10%,比J7大76.87%;J10体重比J6大72.77%,比J7大55.76%,表现出明显的生长优势,是两个生长性状良好的家系,为育种工作提供了良好的材料。
【英文摘要】With the rapid expansion and intensification of the culture of Portunus trituberculatus,various issues such as diseases,bad quality of larvas and less natural resources,have occurred and become increasingly serious,causing economic losses.They have become the limiting factors in the sustaining development of this program.Finally,these issues can be resolved by providing excellent breeds provided by using the selective breeding program,which is an important way of selecting breeding by establishing families.Ten families of second generation of P.trituberculatus were established by using an unbalanced nested design.For the ten families,at the age of 120 days,the body weight is in the order of J9>J10>J1>J8>J4>J3>J2>J5>J7>J6,the full carapace width is in the order of J9>J10>J1>J4>J8>J3>J2>J5>J7>J6,the carapace width is in the order of J9>J10>J1>J8>J4>J3>J2>J5>J7>J6,J9>J10>J1>J8>J4>J3>J2>J5>J7>J6,and the body height is in the order of J9>J10>J1>J8>J4>J3>J2>J5>J7>J6.The families named J9 and J10 are significantly larger than the other eight families in body weight(P≤0.01).For example J9 is larger than J6 and J7 by 96.10%,and 76.87% in body weight,respectively.J10 is larger than J6 and J7 by 72.77% and 55.76% in body weight,respectively.It is suggested that J9 and J10 are the families with the best growth traits

【题目】三疣梭子蟹遗传连锁图谱的初步构建
【中文关键词】三疣梭子蟹 AFLP SSR 遗传连锁 图谱
【英文关键词】Portunus trituberculatus AFLP SSR Genetic linkage map
【中文摘要】利用 AFLP和 S S R标记技术结合“ 拟测交 ”策略, 以三疣梭子蟹莱州湾、 舟山野生群体杂 交(1 x 3 早) 产生的 F 代 家系为作 图群体 , 初步构建 了三疣梭子蟹雌、 雄性遗传连锁 图谱。用经过筛选的 6 0对 AF I P引物和 3对 S S R引物对亲本及 1 0 8个 F 。 代个体进行遗传分析, 共得到母本分 离 标记 214个, 其 中155个标记 (AFL P标记 1 5 3个 , S S R标记 2个) 符合 1:1孟德 尔分 离规律 ; 父本分 离标记 1 9 5个, 1 3 9个标记(AFLP标记 1 3 8个, S S R标记 1个) 符合 1:1孟德 尔分离规律 。雌性图谱包括 1 0 0个遗传标记 , 分布在 9个连锁群 , 6个三联体 , 1 5个连锁对 , 图谱总长度为 1544c M,标记平均间隔 22.0c M, 总覆盖率为 52.9 。雄性图谱 包括 7 1个遗传标记 , 分布在 6个连锁群 , 6个三联体 , 1 1 个连锁对, 图谱总长度 1 1 7 4 . 2 c M, 标记平均间隔 2 4 . 0 c M, 总覆盖率为 4 9 . 5 , 图谱 中遗传标记 分布 比较均 匀 。
【英文摘要】Genetic linkage map of Portunus trituberculatus was constructed using "double pseudo-testcross" strategy with AFLP and SSR molecular labeling techniques.In this study,maternal and paternal broodstock were sampled from Laizhou Bay and Zhoushan

Island wild populations of P.trituberculatus,respectively.Through the directional mating(1♂×3♀),the wild parents were used to generate F1 family.The 108 progenies of directional mating F2 family coming from sisterhood intercross between F1 family and its parents were used as experiment materials.Sixty AFLP primer combinations and 3 pairs of SSR primers were screened to produce 214 maternal markers and 195 paternal markers.There were 155 markers which included 153 AFLP markers and 2 SSR markers segregating as 1∶1 model from 214 maternal markers.139 markers which contained 138 AFLP markers and 1 SSR marker segregated in 1∶1 model in 195 parental markers.The female linkage map consisted of 100 markers distributed in 9 linkage groups(more than three markers),6 triplets and 15 doublets,which covered a total length of 1 544 cM.Average marker spacing of female linkage map was 22.0 cM and the observed genome length accounted for 52.9% of the estimated genome length.The paternal linkage map consisted of 71 markers distributed in 6 linkage groups,6 triplets and 11 doublets,spanning the distance about 1 174.2 cM with average marker spacing of 24.0 cM and its genome coverage was 49.5%.The Pearson analysis results showed that all the genetic markers distributed in linkage map uniformly.This study provided a starting point for further construction of high density linkage maps,as well as for the mapping of functional genes and the location of quantitative trait loci(QTL)in P.trituberculatus.

【中文关键词】三疣梭子蟹; 线粒体; 16S rRNA; CO Ñ ; 梭子蟹科; 系统进化
【英文关键词】Portunus trituberculatus; mtDNA; 16S rRNA gene; CO Ⅰ; Portunidea; molecular phylogeny
【中文摘要】对分别采自辽东湾、 莱州湾、 海州湾和舟山的三疣梭子蟹(P ortunus tr ituber culatus) 4 个野生群体的线粒体 16SRNA 和 CO Ñ基因片段进行了扩增和测序,分别得到长度为 524 bp 和 658 bp 的片段。2 段序列的碱基组成均显示较高的 A+ T 比例(16S rRNA 基因 70. 8%, CO Ñ基因 63%) , 这与果蝇、 虾类、 蟹类等无脊椎动物的 16S rRNA 和 CO Ñ基因片段研究结果相似。通过对三疣梭子蟹 16S rRNA 和 CO Ñ基因片段遗传特征的研究, 发现种内变异较低, 在 16 个样本中,16S rRNA 基因序列中共检测到 1 个变异位点, 2 种单倍型; CO Ñ基因序列中共检测到 4 个变异位点, 5 种单倍型。另外,以中华绒螯蟹为外群探讨了梭子蟹科(Por tunidea)几个属种的系统进化关系。用 MEGA4. 0 软件中的 NJ 法构建了系统进化树,基于 16S rRNA 和 CO Ñ 2 种片段的聚类结果均显示梭子蟹属(Por tunus)与美青蟹属(Callinectes)亲缘关系最近,先聚在一起,然后再与蟳属(Char y bd is)聚在一起, 最后才与外群中华绒螯蟹聚在一起, 这一结果与传统分类基本一致。
【英文摘要】Mitochondrial 16S rRNA gene and CO Ⅰ gene fragments were amplified and sequenced from 4 wild populations of Portunus trituberculatus.Respectively,524 bp and 658 bp long partial gene fragments of the 16S rRNA gene and the CO Ⅰ gene were obtained.A high percentage of A+T base composition in the two sequences was observed,which was similar to the results of studies on drosophila,shrimp,crab and other invertebrates.Little sequence variation was observed in 16S rRNA gene and CO Ⅰ gene fragments within species.Two haplotypes were identified from 16 samples with 1 variation site of 16S rRNA gene and 5 haplotypes were identified from 16 samples with 4 variation sites of CO Ⅰ gene.In addition,the phylogenetic relationship among several genera of Portunidea was discussed using Eriochier sinensis as the out-group.The molecular phylogenetic trees were constructed by the NJ method using software MEGA4.0,and Portunus was clustered with Callinectes first,then they were clustered with Charybdis,and finally with Eriochier sinensis.The results are consistent with classical taxonomy.

【题目】氨氮胁迫对三疣梭子蟹酚氧化酶原系统和免疫指标的影响
【中文关键词】氨氮胁迫; 三疣梭子蟹; 酚氧化酶原系统; 免疫指标
【英文关键词】ammonia exposure; Portunus trituberculatus; prophenoloxidase system; immune parameters;
【中文摘要】摘要: 以三疣梭子蟹 (Portunus trituberculatus) 为研究对象, 研究氨氮胁迫对其酚氧化酶原系统和免疫指标的影响。 实验分0 mg/L、 1 mg/L、 5 mg/L、 20 mg/L氨氮处理组, 分别于0 h、 6 h、 12 h、 24 h、 48 h取样并进行相关指标测定。结果表明: 氨氮胁迫对三疣梭子蟹血淋巴多巴胺含量、 血细胞数量、 血细胞酚氧化酶原 (p r o PO) 活力和mRNA表达以及抗菌、 溶菌活力的影响显著 (P < 0.05) 。各处理组血淋巴多巴胺含量于6 h达到最大值, 12 h后恢复至对照组水平; 各处理组血细胞数量均呈明显下降趋势, 除20 mg/L氨氮处理组半颗粒细胞、 总细胞数量表现为逐渐下降趋势外, 其他处理组3类血细胞和总细胞数量分别于12 h或24 h时降至最低值, 然后保持稳定。各处理组上述指标分别呈明显下降、 升高、 下降和峰值变化趋势, 其中1 mg/L处理组血细胞proPO活力在12 h后恢复至对照组水平, 而mRNA表达与对照组差异不显著, 其他处理组血胞proPO活力和mRNA表达分别于12 h、 6 h后保持稳定; 各处理组抗菌活力于6 h或12 h达到最小值, 然后恢复至对照组水平, 而溶菌活力在24 h后趋于稳定, 且1 mg/L处理组与对照组无明显差异。各处理组血细胞数量、 proPO活力、 溶菌活力在稳定后均与氨氮浓度呈明显的负相关性, 而血细胞proPO mRNA表达呈显著正相关性。由此可见, 三疣梭子蟹在氨氮胁迫下血细胞数量、 proPO活力和mRNA表达以及免疫指标表现出明显的时间剂量效应性, 具有显著的免疫毒性效应。本研究旨在为三疣梭子蟹养殖水环境调控和病害防治提供基础依据。[
【英文摘要】The object of this study was to evaluate the effects of ammonia on prophenoloxidase system and immune parameters of swimming crab Portunus trituberculatus. The crabs were exposed to different ammonia levels:0 mg/L (nature seawater or control),1 mg/L,5 mg/L and 20 mg/L NH4Cl for 48 h and sampled randomly at 0 h,6 h,12 h, 24 h and 48 h. The results indicated that ammonia exposure had a significant effect on dopamine(DA) concentration, haemocyte count,proPO activity,proPO mRNA expression,antibacterial and bacteriolytic activities of the crabs (P < 0.05). DA concentration in haemolymph of the experimental groups increased until 6 h,then recovered to the same level as control after 12 h. Total haemocyte count(THC) and differential haemocyte count(DHC) decreased significantly. THC and semi-granular cell count of the crab exposed to 20 mg/L ammonia decreased during 48 h exposure time. The haemocyte count of the other groups decreased until 12 h or 24 h,and then became stable. The proPO activity,proPO mRNA level and bacteriolytic activity showed significant decrease,increase and decrease trends respectively during the 48 h exposure. The proPO activity of 1 mg/L group recovered to control level after 12 h,and no significant difference of mRNA expression was observed between 1 mg/L group and control. The activity of proPO and mRNA expression of 5 mg/L and 20 mg/L groups became stable at 12 h and 6 h. Bacteriolytic activities became stable after exposed to ammonia for 24 h,meanwhile,1 mg/L group recovered to control level. Antibacterial activity reached the minimum at 6 h or 12 h,having no significant difference with control. Haemocyte count,proPO activity and bacteriolytic activity in experimental groups were negatively related with ammonia concentration after stabilized,while proPO mRNA level showed a positive relation. It is concluded that ammonia exposure has the effects to decline the haemocyte count,proPO activity,proPO mRNA expression,antibacterial and bacteriolytic activities on crab P. trituberculatus which can cause deleterious effects on the immune system

【题目】莱州湾三疣梭子蟹的生化遗传分析
【中文关键词】三疣梭子蟹　　莱州湾　　同工酶　　生化遗传分析
【英文关键词】Portunus trituber culatus,Laizhou Bay , Isozyme, Biochemical genetic analysis
【中文摘要】摘要　　采用聚丙烯酰胺不连续凝胶垂直板电泳技术对三疣梭子蟹的同工酶进行检测。分析了13种同工酶在莱州湾三疣梭子蟹肌肉中的表达情况,并对同工酶的表型进行了生化遗传分析。结果表明, 13 种同工酶有22 个基因位点编码,其中L d h -1, Me -3, G dh -1, Sdh -1, G6p d -1 和S od -3 共 6 个位点是多态的,多态位点百分数是27. 3 %。三疣梭子蟹的平均每个位点的等位基因的有效数目 Ae为1. 227 0,平均每个位点的预期杂合度H e为0. 117 0,实际杂合度H o为0. 215 9。同时还分析了三疣梭子蟹的各个多态位点的H ardy -Weinberg 偏离指数: L d h -1、 Me -3 和S od -3 的 d 值都为 1. 000 0,Gdh

-1、 Sdh -1 和G6p d -1 的d 值分别为0. 504 7、 0. 872 6 和0. 059 7。这些数据表明,莱州湾三疣梭子蟹的种质资源还处于较好的状态。

【英文摘要】"Expressions of isozymes in muscle of Portunus trituberculatus collected fromLaizhou Bay were detected with the technique of vertical polyacrylamide gels electrophoresis.Thirteen isozymes(MDH,LDH,ME,ADH,SDH,EST,SOD,POD,IDH,GDH,G6PD,PGM,SCD)were examined,with their genetypes being recorded.Then biochemical genetics a—nalysis was conducted according to the lOCUS number,alleles etc.The results indieated that the 13 isozymes had 22 loci,among them 6 loci,including Ldh-1,』‰3,Gdh-1,Sdh-1,G6pd-1and Sod一3。were polymorphisc,the mean percentage of polymorphic loci(P)being 2 7.3%.The mean effective number of alleles per locus(A。)is 1.227 0;the mean expected heterozygosi—ty per locus(H。)is 0.117 0;and the mean observed heterozygosity per locus(Ho)is 0.215 9.In addition,the deviation indexes of each polymorphic locus from Hardy-Weinberg(d value)were also calculated.All of the data indicated that the Portunus trituberculatus had higher geneticv ariability."

【题目】复方三氯异氰尿酸对斑节对虾(Penaeus monodon)幼体的毒性试验

【中文关键词】斑节对虾 幼体 半致死浓度 安全浓度

【英文关键词】Penaeus monodon Larvae Medium lethal concentration Safe concentration

【中文摘要】摘要 用静水试验法研究了复方三氯异氰尿酸对斑节对虾幼体的急性毒性。试验设8个浓度组和1个对照组:0、0.5、1.0、1.5、2.0、2.5、3.o、3.5和4.0(×10_6)每组3个平行。结果表明,24 hLC50、48 hLC50和安全浓度(×10-6)分别是无节幼体:1.58、1.35和0.29;蚤状幼体:1.71、1.24和0.2;糠虾幼体:2.2、1.46和O.24;仔虾:3.23、2.62和0.53。幼体对试验药物的忍受力由大到小分别是仔虾、无节幼体、糠虾幼体和蚤状幼体。试验结果可为斑节对虾育苗安全用药提供参考。

【英文摘要】Trichloroisocyanuic acid(TCCA)is a type of antibiotic medicine with high efficiency,low toxicity,and non-residue which meets the requirement of harmless medicine use in food.Acute toxicity of TCCA to the larvae of Penaeus monodon was determined in static bioassay tests.The concentrations of the chemical used in the experiment were 0,0.5,1.0,1.5,2.0,2.5,3.0,3.5 and 4.0(×10-6),with three replicates for each concentration.The results showed that the 24h LC50,48h LC50 and safe concentration(SC)values(10-6)were 1.58,1.37 and 0.29 for nauplius,respectively;1.7 1,1.24 and 0.2 for zoea larvae,respectively;2.2,1.46 and 0.24 for mysis larave,respectively;3.23,2.62 and 0.53 for post-larvae,respectively.From high to low,the endurance of larvae to the chemical was post-larvae,nauplius, mysis and zoea.The result can be used as a reference for safe application of medicines in larvae rearing of P.monodon.

【题目】中国南海斑节对虾群体与西印度洋、西太平洋群体种群遗传结构的比较分析

【中文关键词】斑节对虾　延伸因子1-alpha 内含子序列　种群结构　遗传多样性

【英文关键词】斑节对虾; 延伸因子1-alp ha 内含子序列; 种群结构; 遗传多样性

【中文摘要】采用聚合酶链式反应(PCR) 技术对海南三亚、深圳、湛江、北海4 个斑节对虾群体共95个个体的延伸因子1-alp ha 内含子序列进行了扩增, 对扩增产物进行克隆转化, 并将阳性克隆产物进行序列测定, 最终获得了大小约216 bp 的可供分析的核苷酸序列。将获得的序列与从Genbank 上下载的西太平洋、西印度洋种群的序列进行比较分析, 结果表明, 中国海域种群的基因多样性最低, 西太平洋海域的基因多样性水平最高; 通过对遗传分化指数F ST 的分析,发现西太平洋群

体和西印度洋群体之间以及两者与中国海域群体间遗传分化具有极显著性差异(P < 0　　001) 。U PGMA 系统树显示, 10 个斑节对虾群体形成两大分支, 一支由西太平洋群体和中国海域群体组成, 另一支由西印度洋群体单独组成; 中国海域群体中北海群体单独聚成一支。序列差异的分析结果表明, 中国海域群体与西印度洋群体之间的亲缘关系最远, 与西太平洋群体之间的亲缘关系较近; 中国海域内部各群体之间, 北海群体与海南、深圳、湛江群体之间的亲缘关系较远, 形成一个独特的地理种群。

【英文摘要】Polymerase chain react ion (PCR) technique w as used to amplify the elo ng at ion factor 1-alpha intronsequences region for 95 wild individuals of Penaeus monodon caught from sea waters of Sanya of Hainan, Shenzhen, Zhanjiang and Beihai in the south China Sea. The PCR products were cloned. The electropositive cloned products were sequenced. As a result, about 216 bp nucleotide sequences that could be analysed were obtained (the primer and some of the marg inal sequences were excluded) . The nucleotide sequences of the black tiger prawn from China combined with the sequences of the western Indian Ocean and western Pacific populations (from Genbank) were analysed. By using Clustal X to align and compare the sequences of the 207 individuals with each other, 188 v ariation sites were observed, of which there were 67 insert ion sites or deletions, and 121 polymorphic sites. 89 haplotypes w were detected from the elongat ion factor 1-alp ha intro n sequences, the Haploid div ersity(H d) was 0.975. The results showed that gene diversity of the China populat ion w as minimum, gene diversity of the western Indian Ocean populat io n w as the greatest. By analyzing popult ion pair wise FST-valules, it indicated very strong differentiat ion between populations from the western Pacific Ocean and western Indian Ocean(P < 0.001) , this differentiation was also detected among the south China Sea, western Indian Ocean and western Pacific populations. In the molecular phylogenetc tree constructed by the method of UPGMA, the w estern Pacific Ocean and China populations aggregated into a branch, the western Indian Ocean population aggregated another branch. Judged by sequence difference analysis, the distance related between the China and western Indian population was farther than the distance related between China and w ester n Pacific population; among four populations of the south China Sea, Beihai population was more distantly related with Shenzhen, Hainan and Zhanjiang populations, while Shenzhen, Zhanjiang and Hainan populations were more closely related.

【题目】盐度对斑节对虾蜕壳、存活、生长和饲料转化率的影响
【中文关键词】盐度, 斑节对虾; 存活率; 生长; 饲料转化率
【英文关键词】salinity ; Penaeusm onodon; survivalrate ; growth ; feed conversion rate
【中文摘要】对平均体重 1　　20　　0　　05 g的斑节对虾 (P enaeusm onodon) 稚虾进行为期 30 d的养殖试验, 分别测定其在不同养殖盐度条件下的蜕壳间期、成活率、特定增长率和饲料转化率。斑节对虾的成活率在盐度 5时最低, 低于 60%, 与其它盐度试验组差异显著, 而其它试验组之间差异不显著。在 5 ~ 25盐度范围内, 蜕壳间期随着盐度升高而延长, 盐度达 30以上后又缩短, 25时为最大值; 盐度 5 、 10和 15之间差异显著, 15、20 、 30和 35之间差异不显著。特定增长率和饲料转换率随盐度升高呈现双峰的波浪式变化趋势; 特定增长率在盐度 20 (3　18　0　14)%　d- 1和 25 (2　98　0　26)%　d- 1时达到最高。蜕壳间期与生长率存在极显著的正相关关系 (P < 0　001)。在盐度 20、 25、30时饲料转化率高, 分别为 (52　76　3　06)%、(54　90　5　14)% 和 (51　56　7　58)%, 与其它盐度试验组之间差异显著。因此, 斑节对虾养殖的适宜盐度应为 20~ 30 , 在此条件下可实现较高的成活率、特定增长率和饲料转换率
【英文摘要】Juveniles Penaeus mondon with average weight (1.20±0.05 g) were cultured at salinities of 5,10,15, 20,25,30 and35. The intermolt period, survival rate, specific growth rate (SGR) and feed conversion rate (FCR) were analyzed. The resultsshowed that survival rate of P. monodon at salinity 5 was the lowest (< 60 %) and significantly different (P < 0.05) from that of the other salinity groups, and there were no significant (P > 0 .05) differences in survival rate among the other salinity groups. With the salinity increasing from 5 to 25, the intermolt period increased , and when the salinity was over 30 , the inter molt period decreased,the peak w as appeared at salinity 25 ; there were significant differences among salinity 5 , 10 , 15 groups,but no significant differences among salinity 20,25,30,35 groups. As the salinity increasing, the SGR and FCR showed a wavy line with double peaks.SGR was higher at salinity 20 (3.18± 0.14)% • d- 1and 25 (2.98±0.26)% • d- 1.There was a significant positive relationship between the intermolt period and SGR (P < 0.001). FCR was higher at salinity 20~ 30 and significantly different from that of the other treatments. The results suggusted that the

optimal salinity for P. monodon culture was 20~ 30 at which higher survival rate, SGR and FCR can be attained.

【题目】中国南海野生斑节对虾5个地理群体线粒体16S rRNA基因序列比较分析
【中文关键词】斑节对虾; 延伸因子1 -alp ha 内含子序列; 种群结构; 遗传多样性
【英文关键词】Penaeus monodon; elo ng at ion facto r 1 -alp ha int ron sequence; populat ion st ructure
【中文摘要】摘要: 采用聚合酶链式反应(PCR)技术对海南三亚、 深圳、 湛江、 北海4 个斑节对虾群体共95个个体的延伸因子 1 -alp ha 内含子序列进行了扩增, 对扩增产物进行克隆转化, 并将阳性克隆产物进行序列测定,最终获得了大小约 216 bp 的可供分析的核苷酸序列。将获得的序列与从Genbank 上下载的西太平洋、 西印度洋种群的序列进行比较分析, 结果表明, 中国海域种群的基因多样性最低, 西太平洋海域的基因多样性水平最高; 通过对遗传分化指数F ST的分析,发现西太平洋群体和西印度洋群体之间以及两者与中国海域群体间遗传分化具有极显著性差异(P < 0　001) 。U PGMA 系统树显示, 10 个斑节对虾群体形成两大分支, 一支由西太平洋群体和中国海域群体组成, 另一支由西印度洋群体单独组成; 中国海域群体中北海群体单独聚成一支。序列差异的分析结果表明,中国海域群体与西印度洋群体之间的亲缘关系最远,与西太平洋群体之间的亲缘关系较近;中国海域内部各群体之间, 北海群体与海南、 深圳、 湛江群体之间的亲缘关系较远, 形成一个独特的地理种群。
【英文摘要】"The aim of the present study was to survey mtDNA 16S rRNA sequence variation to assess genetic diversity and genetic structure of the wild tiger prawn in the coastal waters of Sout h China. The samples of P. monodon had been obtained from the coastal waters of South China which included the coastal waters of Sanya (SY) , Shenzhen (SZ) , Zhanjiang (Z J) , Yang jiang (Y J) , and Beihai (BH) . 100 individuals of P. monodon were caught from the five putative populations (SY putative population , SZ putative population , Y J putative population, Z J putative population and BH putative population) . The PCR technique was used to amplify the mtDNA 16S rRNA among 100 individuals. The PCR products were purified and sequenced. As a result, 440 bp nucleotide sequences o f partial16S rRNA were obtained (some of the marginal sequences were excluded) . 19 haplotypes and 28 variable sites were detected among all partial mitochondrial 16S rRNA sequences of 100 tiger prawns. Nucleotide diversities (∏) in SY putative population , SZ putative population, Y J putative population, Z J putative population and BH putative population were 0.004 35,0. 005 86, 0.01050, 0 .01081 and 0.01168 respectively. Haplotype diversities (H) in SY putative population, SZ putative population, Y J putative population, Z J putative population and BH putative population were 0. 6895, 0.5211, 0.5737, 0.6000 and 0.7211 respectively. FST values between Z J and SY, SZ putative populations , between BH and SY, SZ putative populations showed significant genetic differences, and FST values among all the other populations showed no strong genetic differences . Significant genetic differentiation among all five putative populations was found by analysis of molecular variance (AMOVA) . The N J tree of the five putative populations showed the SY and SZ putative populations had the closest relation among the five putative populations ; the BH and Z J putative populations had the greatest genetic distance from the SY and SZ putative populations among t he five putative populations . Therefore, we conclude that the five putative populations can provide two basic populations for selective breeding of P. monodon; one is the SY and SZ geographic stock , and the other is the Z J and BHgeographic stock. 【题目】工厂化养殖循环水固液分离特性及处理工艺选择分析
【中文关键词】固体废物;固液分离;表面负荷;水产养殖;水力粒径
【英文关键词】solids waste; solid- liquid separation; overflow rate; aquaculture; hydraulic particle size
【中文摘要】采用固体颗粒去除率累积计算法,以牙鲆(Paralichthys olivaceus) 养殖循环水为例,研究了其固液分离特性。结果表明,120min 时固体颗粒去除率可达49.3%±0.02%,对应表面负荷为0.39m ▪ 3m-2 ▪ h-1,与城市污水处理中二次沉淀池设计表面负荷接近。大于100 μm的固体颗粒水力粒径占50%左右,此部分颗粒适于用重力沉降或水力旋流工艺去除。小于60 μm的颗粒占37% 左右,此部分难于水力分离。应基于养殖循环水的固液分离特性选择适合的固液分离工艺处理养殖循环水。
【英文摘要】The solid-liquid separating characteristics in the recirculating aquaculture system (RAS) ofJapanese flounder (Paralichthys olivaceus) cultivation was investigated by using the cumulati-ve particle removal rate calculus to process data. From test data the key parameters can be obtained including overflow rate, removal rate and hydraulic particle size.The results showed that the removal rate of solids waste was 49.3%±0.02% at 120 min and 0.39m ▪ 3m-2 ▪ h-1of overflow rate, close to that of the second sedimentation basin used in municipal sewageplant. The distribution of particle size above 100 μm varied obviously while that below 60 μm varied narrowly. Hydraulic particle size of solid above 100 μm made up about 50% of all solids. The processes of gravity settling and swirl separation were suitable for separating this part of solids. Particle size of solid less than 60 μm made up about 37% and was difficult to separate by hydraulics. Suitable process of solid- liquid separation should be chosen based on the solid- liquid separating characteristics of recycled aqualculture wastewater. Finally foam separating and hollow fibre membrane process were discussed. Fine filters used in industry maybe suit for recycled aquaculture wastewater treatment.

【题目】斑节对虾亲环素A(cyclophilinA)基因的克隆及启动子序列分析
【中文关键词】斑节对虾; cyclophilinA基因;克隆;启动子;序列分析
【英文关键词】Penaeus monodon; cyclophilinA gene; genomic walking; promoter; gene library
【中文摘要】摘要: 通过同源克隆和RACE技术获得斑节对虾(Penaeus monodon) 亲环素A (cyclophilin A, CYPA) 的cDNA序列。 根据已克隆的cDNA序列设计引物, 利用染色体步移技术(Genomic DNA walking)从斑节对虾卵巢组织中克隆了CYPA基因的启动子和基因组DNA序列。测序结果表明, 斑节对虾亲环素A (PmCYPA) cDNA全长834 bp, 其中开放阅读框(open reading frame, ORF)为495 bp, 可编码164个氨基酸; 5 ’ 非编码区为31 bp, 3 ’ 非编码区为308 bp。从斑节对虾基因组文库中扩增的CYPA基因组DNA全长3 181 bp, 其中包括启动子区域1 173 bp, 1个内含子426 bp, 2个外显子序列:分别为101 bp和399 bp。在5 ’ UTR上游区域有明显的启动子序列, 包含一个GC盒和2个CAAT盒, 同时还包含AP1、 CRE等调控元件, 符合真核生物典型的启动子特征。分析基因的结构表明所克隆的PmCYPA符合PPIase家族成员特征, 属于此基因家族成员
【英文摘要】CyclophilinsA is a family of proteins that bind the immunosuppressive agent cyclosporin A(CsA) with high affinity and belong to the superfamilies of peptidyl-prolyl cis-trans isomerases(PPIase). CypA has highly conserved structures and exhibits various biological activities which have an important role in cell cycle events. The PPIase activity of CypA can bind to intra-cellular proteins and accelerate folding, assembly and transport of these proteins. It also has molecular chaperones action. The techniques of homology cloning and anchored PCR were used to clong the cyclophilin A (CYPA) gene from Penaeus monodon. We obtained the CYPA ’ S promoter and genomic DNA sequence from the muscular tissue of Penaeus monodon on basis of designed primers according to the cloned full-length cDNA using genomic walking technology. The results showed after the sequence was analysed,the cDNA sequence contained 495bp ORF which could translate a putative peptide of 164 amino acids,31bp 5 UTR and 308bp 3 UTR. The CYPA genomic DNA amplified from Penaeus monodon genomic library was 3 181bp which consists of 1 173 bp promoter region,one 426 bp intron and two exons sequences(101bp,399bp).The CYPA genomic DNA has apparente promoter region in the 5 UTR upstream including a GC box and two CAAT box,it also contains AP1 and CRE regulatory element,all these typical characteristics are accord with eukaryon promoter region,these characteristic conform that our cloned gene belongs to the family of PPIase.

【题目】养殖密度对斑节对虾存活、生长和能量收支的影响
【中文关键词】斑节对虾;养殖密度;存活;生长;能量收支
【英文关键词】P e anae usmonodon ; Stocki ng density ; Surv i va; l Grow t h ; Energy budget
【中文摘要】摘要　[目的]研究斑节对虾(Penaeusm onodon)不同养殖密度对其存活、 生长和能量收支的影响。[方法]设置养殖密度分别为 20 、 40 、80、 120 、 160尾 /m2(相当于 2 0、 40 、 80 、 120 、 160万尾 /hm2)的不同试验组, 测定斑节对虾在试验条件下存活、 生长及能量收支情况。[结果] 20尾 /m2情况下对虾存活率最高, 160尾 /m2最低,其他 3个密度水平存活率差异不显著。湿重特定生长率除 20尾 /m2外,随密度增加而下降, 1 60尾 /m2最低。增重量 (湿重)与密度的回归关系为: y = - 0 . 19 5 4 l n(x) + 1 . 41 3 2(R2= 0 . 726 8)。生长能占食物能的比例和密度的回归关系为 y = - 3 . 283 6 ln(x) + 30 . 548 0(R2= 0 . 786 5)。[结论]该研究从体重生长、 能量收支及环境负荷角度探讨了不同养殖密度下斑节对虾生长情况,为斑节对虾的科学养殖提供了依据。
【英文摘要】This study was to investigatet he effects of different stocking densities on the survival growth and energy budget of juvenile Peanaeusmonodon. [Method] Different stocking densities of 20,40,80,120,and 160 individuals persquaremeter (. ie .200 000 ,400 000 , 800 000 , 1 200 000 , and 1 600 000 individuals perhectare) were designed to investigate the survival growth and energy budget of juvenile P. monodon under expermiental conditions . [Result] The survival rate in the treatment of 20 individuals persquaremeter was highest, while in the treatment of 160 individuals persquaremeter was the lowest; the differences in survival rates among the other three levels of stocking density failed to pass the significant test. Except the treatment of 20 individuals persquaremeter, the specific growth rate of wet weight assumed a falling trend with the increase of stocking densities to them inmiumin the treatment of the treatment of 160 individuals persquaremeter. The relationship between wet body weight gain and stocking density could be described by the regression equationy = - 0.195 4ln(x) + 1 . 413 2 (R2= 0.726 8) ; and the relations hip between the ratio of growth energy to diet energy and stocking density could be described by the regression equation y = - 3.2836ln(x) + 30 . 548 0 (R2= 0.786 5).[Conclusion] From the angle of growth of bodyweight, energy budget and environmental burden , we investigated the growth conditions of P. monodon at different stocking densities , which provided basis for the scientific breeding of P. monodon .

【题目】血清素在斑节对虾催熟过程中的作用.
【中文关键词】血清素 切除眼柄 班节对虾 催熟
【英文关键词】serotonin ; eyesta l k -ab l a ti on ; Penaeus monodon ; ma t uration
【中文摘要】摘要: 在斑节对虾 Penaeusm onodon催熟催产过程中, 常用的方法是切除眼柄。此实验选用体重为 149　5　25　8 g自然海区斑节对虾, 比较了注射血清素 (serotoni n) 和切除眼柄 2种处理方法对斑节对虾的催熟效果。血清素注射剂量为 50　g　g- 1体重, 在实验的第 1、5和 10天注射, 共计 3次。结果显示, 2种方法处理后, 受试亲虾性腺指数 (gonad soma ti c i ndex , GSI) 显著高于对照组, 同时注射血清素的实验组亲虾的存活率及其卵子孵化率显著高于切除眼柄的实验组。实验结果表明, 血清素对斑节对虾催熟有促进作用, 但发挥效应所需要的时间较长; 从切除眼柄手术到第一次产卵所需时间较短, 但是手术后的亲虾死亡率较高
【英文摘要】Eyestalk-ablation is used usually to induce ovarian maturation in Penaeus monodon. Wild P.monodon females were obtained from the sea around Sanya, weighted 149.5±25.8 g. Serotonin solution was injected into broodstock at 50 μg・g-1

bodyweight on the 1st, 5th, 10th day. Survival and hatching rate were significantly higher in serotonin - injected females than unilaterl eyestalk-ablated shrimp. But the time to the first spawning event from the beginning o f treatment was shorter for eyestalk-ablated females. Gonadso-matic index (GSI) inseroton in - injected and eyestalk -ablated groups were both significantly higher than the control. The results suggested that stimulation of serotonin can enhance the ovarian maturation of P.monodon.

【题目】斑节对虾6个家系生长、饲料利用和全虾营养成分的比较 .
【中文关键词】斑节对虾; 家系; 生长; 饲料利用; 营养成分
【英文关键词】P enaeusm onodon ; fa m ily ; g row th
【中文摘要】以海南三亚野生斑节对虾 (P enaeus m onodon) 为亲本, 建立 6个家系 (hsy5 -5 , hsy7 -7 , hsy8 -5 , hsy10 -10 , hsy12 -13和 hsy15 -15) 进行生长、饲料利用和混养生长试验, 同时分析各个家系全虾的营养成分。在生长和饲料利用试验中, 家系 hsy10 -10的增重率和饲料系数优于其它家系; hsy8 -5、 hsy10 -10和 hsy12 -13的成活率高于hsy5 -5、 hsy7 -7和 hsy15 -15 , 但差异不显著 (P > 0 1 05)。在混养生长试验中, 水泥池混养时, 家系 hsy10 -10的成活率 高达 90%, 分 别比 hsy8 -5、 hsy12 -13、 hsy7 -7 、 hsy15 -15 和 hsy5 -5 家 系 高出 13 13%、 13 1 3 %、 2010%、23 1 3%和 30 1 0 %; hsy10 -10和 hsy8 -5的月总增重率高于其它 4个家系; 池塘混养时, hsy10 -10家系的平均体重高于 6个家系平均值的 1311%。结果表明, 家系 hsy10 -10的成活率、增重率和饲料系数均优于其它家系, 且含有最高的粗蛋粗脂肪和最低的水分。
【英文摘要】The growth, feed utilization and whole-body composition of six Penaeusmonodon families (hsy5-5, hsy7-7, hsy8-5, hsy10-10, hsy12-13and hsy15-15) were studied .These families were established using wild brood stock from Sanya Bay by the method of artificial in semination. In the feed utilization and growth experiment, the weight gain and feed conversion ratio (FCR) of hsy10-10 were superior to the others. The survival rates of hsy8-5 , hsy10-10 and hsy12 -13 were higher than the others but not significant (P >0.105).When cultured in concrete tank in mix , the survival rate of hsy10-10 was as high as 90 percent, higher than other five families (hsy8-5 , hsy12-13 , hsy7-7 , hsy15-15 and hsy5-5) by 13.3%, 13.3 %, 20.0%, 23.3 % and 30.0%, respectively. The total month weight gain of hsy10-10 and hsy8-5 was higher than other four families. When cultured in earthen pond, the final body weight of hsy10-10 was higher than the average of the six families by 13.1%. It was concluded that the survival rate, weight gain and FCR of family hsy10-10 were superior to the other families, and the whole shrimp of hsy10-10 had the highest contents of crude protein and lipid and the lowest of moisture among six families.

【题目】斑节对虾真核生物翻译起始因子3亚基4 (btselF3g)序列分析及组织表达特性.
【中文关键词】斑节对虾; e I F3g ; 克隆; 组织表达
【英文关键词】P enaeusm onodon ; e I F3g ; m olecular clon i ng ; tissue expressi on
【中文摘要】摘要: 通过 mRNA 差异显示 (differenti a l d isplay , DD) 技术筛选的差异片段, 与斑节对虾 (Penaeus m onodon)混合组织 cDNA文库中的 EST进行拼接, 获得斑节对虾真核生物翻译起始因子 3亚基 4 (btse I F3g) 的全序列(GenBank登录号: FJ829364)。 btseIF3g全长 1 041 bp , 由 72 bp 5 c 非编码区、 90 bp 3 c 非编码区以及 879 bp的开放阅读框组成, 推测编码一个长度为 292个氨基酸的蛋白。经 BLAST分析, btse I F3g C端含有一个 RNA 识别基 (RNA recogn ition m oti, f RRM) 的保守结构域 (E值为 2 1 72e -25)。利用氨基酸序列进行系统发育分析表明,btseIF3g与 e I F3g属于同一分支。采用荧光定量

PCR (Rea- l ti m e PCR) 方法对 250日龄的雌、雄斑节对虾不同组织表达特性研究发现, btseIF3g在眼柄神经节、脑神经、肝胰腺、性腺和肌肉组织中均有表达, 在卵巢中的相对表达量极显著 (P < 0101) 高于其他组织, 这一结果提示 eIF3g可能与斑节对虾卵巢发育相关。

【英文摘要】In order to analyze the function of a differential expression cDNA fragment of gonads of domesticated broodstock blacktiger shrimp (Penaeusmonodon), the blacktiger shrimp eukaryotic translation initiation factor 3 subunitG (btseI F3g) had been found by spliced with the EST, after screening in the P.monodon mix cDNA library.The full length cDNA of btseIF3g (GenBank accession no.FJ 829364) contained a 5 ’ cuntranslated region (UTR) o f 72bp, a 3 ’ UTR of 90bp and an ORF of 879bp encoding a polypeptide of 292 aminoacids with an estimated molecular mass of 32.97 kDa. RNA recognition motif (RRM) was found in the btseIF3g deduced amino acid sequence. Phylogenetic analysis of the eIF3 gene family indicated that the btse I F3g was homologous to the eIF3g1 mRNA expression of btseIF3g could be detected in 250 -day – oldP.monodon ’ s eyestalk , brain , hepatopancreas , gonad and muscle by fluorescent quantitative realtime PCR analysis. The highest expression level of btseIF3g in the ovary indicated that btseIF3g played an important role in oogenesis.

【题目】丁香酚对中国对虾幼虾麻醉效果的研究
【中文关键词】中国对虾;丁香酚;麻醉
【英文关键词】Fen nero penae us c hinens is ; Eugenol; Anesthet ic effec
【中文摘要】为麻醉中国对虾幼虾寻求一种好的方法。[方法]研究不同浓度丁香酚对中国对虾的麻醉效果、 麻醉后对虾离水操作的可行性及温度对麻醉效果的影响。[结果]水温为2 4 、 丁香酚浓度为50~ 40 0 mg/ L 时,幼虾可被有效麻醉;且在50~ 40 0 mg/ L的浓度范围内,随着丁香酚浓度的增加,对虾麻醉所需的时间缩短,而复苏所需的时间不断增加;丁香酚浓度低于200 mg/ L 时,麻醉对虾的复苏率可达 1 00% ;而用40 0 mg/L 的药液麻醉对虾时,对虾的复苏率仅有66 . 67%。对苏醒后的对虾继续观察3 d,各试验组的对虾存活率均为10 0%。同种剂量的药液,其麻醉效果随着水温(18~ 2
【英文摘要】The aim of the study is to seek a good anesthetic to Fenneropenaeus chinensis.[Method] The anesthetic effect of eugenol on juvenile Fenneropenaeus chinensis was investigated.[Result] The juvenile can be effectively anaesthetized by 50-400 mg/L eugenol aqueous solution with temperature of 24 °C. Within the concentration range of 50-400 mg/L,the increasing of the eugenol concentration could shorten the required time of anesthesia,meanwhile prolong the time of recovery.The recovered rate of prawn reached 100% when the eugenol concentration was lower than 200 mg/L,while the recovered rate of prawn was just 66.67% when the eugenol concentration was higher than 400 mg/L.The survival rate of prawns in test group is 100% from the observation of three consecutive days. For the specific dose,the anesthetic effect enhanced with the increase of water temperature during 18-27 °C.[Conclusion] Eugenol is safe and efficient anesthetics that can be applied in genetic breeding of prawn.

【题目】两个凡纳滨对虾家系体重与体长的关系
【中文关键词】凡纳滨对虾L itop eneaus vannam ei; 家系; 体长; 体重; 相互关系
【英文关键词】 Litopeneaus vannamei; family; body weight; body length; relationship;

【中文摘要】凡纳滨对虾Litop eneaus vannam ei家系的培育是遗传选育种的基础, 其生长特性包括生长速度、体重与体长的关系等, 是家系的表型特征。报道了凡纳滨对虾2个家系的体长与体重的关系。通过回归分析, 凡纳滨对虾家系1体重(W)与体长(L) 的关系为: W = 0. 005 9L 3. 2809 (R 2 = 0. 993 1); 家系2 体重与体长的关系为: W = 0. 005 9L3. 297 4 (R2 =0. 994 0), 2个家系体重与体长的关系没有明显的变化, 得出凡纳滨对虾体重与体长的关系为: W = 0. 005 9L3. 2895 (R2 =0. 993 4)。
【英文摘要】 The cultivation of Litopeneaus vannamei families is the base of selected genetic breeding. Family phenotype features consist of growth speed, body weight (W)-length(L) relationship and so on. The relationship between body weight and length of the two families of Litopeneaus vannamei was reported. By regress analysis, the regress equations of the body weight (W)-length (L) relationship of the two families were obtained as W=0.005 9L 3.280 9(R 2=0.993 1) for family one and W=0.005 9L 3.297 4(R 2=0.994 0)for family two. As there was no difference in the relationship between body weight and length of the two families,the regressive equation of W-L relationship of Litopeneaus vannamei cultivated in pond was obtained as W=0.005 9L 3.289 5 (R 2=0.993 4).

【题目】抗生素对于对虾苗池水体细菌区系的影响
【中文关键词】抗生素 细菌群落 对虾育苗池 PCR-DGGE
【英文关键词】antibiotics; bacterial community; shrimp hatchery system; PCR-DGGE
【中文摘要】以细菌16S rDNA片段作为分子标记,采用PCR结合DGGE(Denaturing gradient gel electrophoresis)的方法构建了细菌区系指纹图谱,研究了对虾苗池使用硫酸链霉素、土霉素和氨苄青霉素3种抗生素后水体细菌区系的变化.结果表明:在120h试验期内,与对照组相比,苗池水体分别经0.5mg·mL-1的硫酸链霉素、土霉素和氨苄青霉素处理后,细菌区系均产生了显著变化;对照组水体0~30h时段的细菌DGGE条带聚为一组,56~120h取样时的条带聚为一组;而3个处理组水体0~56h时段的细菌DGGE条带聚为一组,72~120h聚为一组.对DGGE图谱典型条带进行测序,经BLAST-N比对,表明对虾苗池水体细菌多

样性丰富,包括可培养的细菌(主要包括亚硫酸盐杆菌、红假单胞菌、美人鱼发光杆菌、聚球菌、海洋放线菌、黄杆菌、丝状光合细菌、粘细菌、哈氏弧菌)和某些不可培养的其他海洋细菌等.其中,单胞菌、发光杆菌、放线菌、黄杆菌、粘细菌和2种不可培养的其他海洋细菌不受抗生素的影响;而硫细菌、丝状光合细菌和另外8种不可培养的其他海洋细菌则因抗生素种类不同产生了不同的时空变化.

【英文摘要】W ith bacterial16S rRNA gene (rDNA) asmolecularmarker and by using PCR-DGGE technique, the fingerprints ofbacterial communitywere constructed to study the effects of applying streptomycin sulfate, terramycin, and penicillin on the bacterial community in shrimp hatchery system. W ithin the 120 h experimental period, significant difference in the diversity of the bacterial communitywas observed between the treatments applied with 0・5 mg・L-1of test antibiotics and the contro.l In the contro,l the band patterns in 0-30 hwere clustered into one clade, and those in 56-120 h were clustered into another; while in the treatments applied with test antibiotics, the band patterns in 0-56 hwere clustered into one clade, and those in 72-120 hwere clustered into another. After the sequencing of DGGE bands, the BLAST-N searches for sequence similarity showed greatdiversity ofbacterial species, including culturable bacteria (mainlySulfitobactersp., Rhodobacteraceaesp.,Photobacterium damselae, Synechoccoccussp.,Actinomycetales, Flavobacteriaceae, Filamentousphotosynthetic, Mucus, andVibrio harveyi) and some unculturedmarine bacteria, amongwhich,Rhodobacteraceaesp.,Photobacterium damselae, Actinomycetales, Flavobacteri-aceae, Mucus, and two unculturable bacteriawere less affected by the three antibiotics, while Sulfitobactersp.,Filamentousphotosynthetic, and other eightunculturablemarine bacteria changed in different spatiotemporal patternswith the kinds of test antibiotics.

【题目】凡纳滨对虾全同胞家系的建立及生长比较

【中文关键词】凡纳滨对虾　全同胞家系　生长　变异系数

【英文关键词】Litopenaeus vannamei; full-sib family; growth; coefficient of variation;

【中文摘要】全同胞家系是遗传分析的重要材料.采用自然交配法建立了62个凡纳滨对虾第一代全同胞家系,对其中17个家系进行了比较研究.结果表明,各家系的孵化率、出苗率与雌性亲本的大小相关性不显著.17个家系中有7个家系显示生长优势,其大小顺序依次是A02>A11>A01>A17>A06>A08>A16;7个家系在40周内的生长速度较17个家系的平均值高23.2%.在所有家系中,A01、A02、A11等3个家系的体重显著大于其它家系(P<0.05),其平均生长速度较所有家系平均生长速度分别快25.5%、31.6%和31.0%.这3个家系的整齐度良好,在养殖中期的个体变异系数分别为11.58%、9.95%和8.48%,后期均小于5%,显示出优良的经济性状,为进一步选择培育凡纳滨对虾的快速生长新品系奠定了基础.

【英文摘要】Full-sib family is an important material for genetic analysis. Sixty-two full-sib families of the first generation of Pacific white leg shrimp,Litopenaeus vannamei,are constructed by natural mating and seventeen of them are studied in growth traits. Results indicate no significant correlation of hatchability and survival rate of postlarvae to the weight of female parent. Seven families are significantly faster in growth than others in the 40 weeks of growth traits,and the order of their weight is A02>A11>A01>A17>A06>A08>A16. These seven faster families are 23.2% higher than the mean value of all 17 families in growth rate (g/week) during the 40 weeks traits (P<0.05). By comparison of each family,families A01,A02 and A11 are 25.5%,31.6% and 31.0% larger than the mean value of the seventeen families respectively. Moreover,these three families display the smaller coefficient of variation (CV),and the CV values in the middle of growth period are 11.58%,9.95% and 8.48% respectively. The CV values of the three families are <5% in the later growth period. Therefore the results indicate that they are three families with excellent economic properties. These results are helpful for further selective breeding of fast-growth line of Litopenaeus vannamei.

【题目】凡纳滨对虾海水养殖系统内细菌群落的PCR- DGGE分析
【中文关键词】凡纳滨对虾 细菌群落 PCR-DGGE 海水养殖系统
【英文关键词】Litopenaeus vannamei; bacterial communities; PCR-DGGE; marine culture system;
【中文摘要】采用PCR-DGGE(PCR-denaturing gradient gel electrophoresis)技术对一个典型的凡纳滨对虾(Litopeneaus vannamei)海水养殖系统细菌群落进行分子分析。结果表明,沿岸水、蓄水池、养殖池水具有较高的细菌种类多样性,而蓄水池进水、对虾粪样、肠壁定植细菌样以及排水渠污水的细菌多样性程度低。每种环境群落的优势种明显。3个养殖池水样(Y1、Y2、Y3)、2个沿岸水样(W1、W2)、2个粪样(F1、F2)、蓄水池水样(B1、B2)及2个肠壁定植细菌样(G1、G2)各自具有高度群落相似性。BLAST结果表明,12个条带克隆序列所代表优势种很可能来源于以下几个属:柔发菌属(Flexithrix)、黏纤维菌属(Cytophaga)、Dyella属、聚球菌属(Synechococcus)、Chlorarachnion属、支原菌属(Mycoplasma)、草螺菌属(Herbaspirillum)、河氏菌属(Hahella)、Ruegeria属。本研究表明,PCR-DGGE技术可以用于海水对虾养殖系统的细菌群落结构分析。对于海水对虾养殖系统来说,一些序列所代表的主要细菌种类极有可能是很少被注意到或研究过的,具有潜在的研究价值。
【英文摘要】The bacterial communities in a typical culture system of marine shrimp (Litopenaeus vannamei) was analyzed at molecular level. DNA was extracted from three samples from farming water,three samples from longshore water,three sample from impounding reservoir,one sewage water sample,three feces samples,and three bacterial samples on the gut wall,and PCR was carried out with primer pairs GC968f/1401r followed by agarose electrophoresis and DGGE. The band fingerprinting in DGGE gel was performed with cluster analysis by MVSP software. The main bands in DGGE gel were recovered for reamplification and following clone sequencing. The acquired sequences were performed BLAST searches against NCBI database,and the sequences including the closely related sequences were aligned with Clustal W program in BioEdit software for phylogenetic analysis. The results indicated that all the samples could be well amplified in PCR and gave rise to predicted 470 bp fragments. DGGE result showed that environmental water samples from longshore,impounding reservoir,and farming pond have much higher bacterial diversity than the samples from impounding reservoir,the feces,intestinal walls,and sewage water. The dominant bacterial species were obvious in any environment samples. The bacterial communities profile from three samples farming water had high similarity. So did two samples from longshore water,two feces samples,two samples from impounding reservoir and two samples from intestinal walls. The" genetic distance" of the samples evaluated by the cluster with MVSP revealed the difference of the bacterial communities,but the order of the samples in the cluster did not correspond with the spatial order of the samples and the similarity due to adjacent spatial order. Obviously,it could be explained by the fact that the shrimp culture system investigated was managed under high-density and intensive mode,and more easily influenced by human effort. The main microbes represented by 12 main bands in DGGE gel were closely related to Flexithrix,Cytophaga,Dyella,Synechococcus,Chlorarachnion,Mycoplasma,Herbaspirillum,Hahella,and Ruegeria,most of which belong to the members of Proteobacteria and Cytophaga-Flexibacter-Bacteroides. Thus it is suggested that conventional culture methods can cause huge bias on analysis of environmental bacterial communities. The present study demonstrates that PCR-DGGE can be used for molecular analysis of bacterial communities from marine shrimps culture system . As for marine shrimp culture system,it is most likely that some bacteria have not been noticed or investigated,and has potential research value.

【题目】凡纳滨对虾精子发生的超微结构研究
【中文关键词】凡纳滨对虾Litopenaeus vannamei 精子发生 顶体 超微结构
【英文关键词】Litopenaeus vannamei; spermatogenesis; acrosome; ultrastructure;
【中文摘要】对凡纳滨对虾Litopenaeus vannamei精子发生的过程进行了透射电镜的观察。结果表明,成熟凡纳滨对虾精巢为指状,分16叶。凡纳滨对虾精子发生分为精原细胞、初级精母细胞、次级精母细胞、精子细胞和精子5个时期。染色质

经历了从以异染色质为主变为高度凝聚状态,再经解聚为弥散絮状的变化过程。核膜由完整转变为不完整。凡纳滨对虾精子发生过程中仅见线粒体、内质网、核糖体细胞器的参与,未见有典型的高尔基体结构的出现。顶体由内质网囊泡团和线粒体囊泡共同转变而来。精子的棘突以及亚顶体区需在输精管的中后端形成,而非在精巢中形成。纳精囊内精子比储精囊内精子的棘突细长。

【英文摘要】Spermatogenesis in shrimp Litopenaeus vannamei was investigated using light and transmission electron microscopy.Results showed that the matured testis of L.vannamei was fingers-like,which was comprised of 16 leaves.Spermatogenesis in L.vannamei could be divided into five stages: spermatogonium,primary spermatocyte,secondary spermatocyte,spermatid and sperm.During spermatogenesis,chromatins underwent dramatic changes.At the stage of spermatogonium,the heterochromatins were spread in the nucleus and some of them were distributed under the nuclear membrane.At the stage of spermatocyte,chromatins became highly coacervative.At the stage of spermatid and sperm,the chromatins lost condensation and looked like flocculus.Mitochondria,endoplasmic reticulum and ribosome were observed during spermatogenesis.No typical golgi apparatus were observed.The acrosome was derived from endoplasmic reticulum vesicles and mitochondria vesicles.The sperm spike and sub-acrosome were formed in the vas deferens,not in the testis.The sperm spike from the seminal receptacle was longer than that from the terminal ampullae.

【题目】两个凡纳滨对虾全同胞家系在不同盐度下的生长比较

【中文关键词】凡纳滨对虾 盐度梯度 生长 体长 体重

【英文关键词】Litopenaeus vannamei; salinity gradient; growth; body length; body weight;

【中文摘要】在1‰—40‰盐度范围内,设置9个盐度梯度(1‰、5‰、10‰、15‰、20‰、25‰、30‰、35‰、40‰),比较不同盐度对2个具有不同遗传背景凡纳滨对虾Litopenaeus vannamei全同胞家系的影响。结果表明,盐度对2个凡纳滨对虾家系的影响存在较大差异。对虾家系B03在10‰—40‰盐度范围内,体长、体重差异不明显,成活率较高;对虾家系B08在1‰—40‰盐度范围内,体长、体重、增长率具有明显的变化规律,从盐度1‰到15‰逐渐升高,15‰以后逐渐减小。对虾家系B03的成活率整体高于B08的成活率,2个家系均难以适应盐度为1‰和5‰的水体。研究为凡纳滨对虾的家系选育提供一定的数据支持。

【英文摘要】An experiment was conducted to determine effects of different salinities(1‰,5‰,10‰,15‰,20‰,25‰,30‰,35‰,40‰) on growth rates of two full-sib families of Litopenaeus vannamei.The results suggested that salinity has different effects on the two families.For family B03,no obvious differences in body length and body weight existed in salinity range from 10‰ to 40‰.The growth of family B08 changed obviously with salinity,which increased with salinity in the range of 1 ‰ to 15‰ but decreased when salinity varied from 15‰ to 40‰.The mean survival rate of family B03 was higher than that of family B08.Both families did not show good tolerance to salinity between 1‰ and 5‰.Our findings provide evidence for the selective breeding of new line of L.vannamei.

【题目】新凡纳滨对虾生长性状的双列杂交分析

【中文关键词】凡纳滨对虾; 双列杂交; 杂种优势; 生长; 成活率
【英文关键词】Litopenaeus vannamei; diallel cross; heterosis; growth; survival rate
【中文摘要】以来源于两个不同遗传背景群体的凡纳滨对虾Litopenaeus vannamei 为亲本, 设置PP(P♀×P♂)、PH(P♀×H♂)、HP(H♀×P♂)、HH(H♀×H♂) 4 个实验组(P 代表进口群体, H 代表选育群体), 进行进口个体(P♂和P♀)与选育个体(H♂和H♀)间的双列杂交实验, 分析比较其子一代的生长与存活情况。结果发现, 对虾存活由高到低顺序为HH>HP>PH>PP, PH 实验组表现出明显的存活杂种优势, 其育苗期间的杂种优势平均值为(27.72±11.88)%, 下塘90d 后成活率的杂种优势为30.50%。在生长前期(30 日龄以前)对虾平均体长和体重的顺序是HP>PH>HH>PP, 而在生长后期则为PP>HP>PH>HH。HP 实验组在整个养成期(10、30、60 和90d)均表现出体长和体重上的杂种优势, 杂种优势值分别为24.00%、13.71%、2.55%、2.79%和112.46%、54.06%、8.16%、12.48%。结果表明, 选育群体为母本、进口群体为父本的对虾杂交后代的生长和存活性状明显提高。
【英文摘要】The authors analyzed the growth and survival of the first generation of Litopenaeus vannamei after crossing within and between imported shrimp individuals(P♂,P♀) and selected individuals(H♂,H♀) using complete diallel crosses to set up four combinations,PP(P♀×P♂),PH(P♀×H♂),HP(H♀×P♂) and HH(H♀×H♂).The results showed that survival rate was in the order of HH>HP>PH>PP,and the survival heterosis appeared in PH,with average survival heterosis of(27.72-11.88)% in the young stage and 30.50 at the 90th day.In the early growth stage(the first 30 days),the average body length and weight were both sequenced as HP> PH> HH> PP,while in the late growth,as PP> HP> PH> HH.The growth heterosis was found in body length and weight.The values of body length heterosis were 24.00%,13.71%,2.55%,and 2.79%;while the values of body weight heterosis were 112.46%,54.06%,8.16%,and 12.48% at the 10th,30th,60th and 90th days.In conclusion,the growth and survival traits of hybrids offspring crossing selection individuals as male parents and imported individuals as female parents will be improved significantly.

【题目】中国明对虾与5种虾类线粒体16SrRNA和COI基因片段的序列比较及其系统学初步研究
【中文关键词】中国明对虾 S rRNA基因 COI基因 PCR 多态性
【英文关键词】Fennerpenaeus chinensis; 16S rRN A gene; COI gene; PCR; polymorphism
【中文摘要】采用PCR扩增和序列测定等技术,对中国明对虾(Fennerpenaeus chinensis)线粒体DNA16S rRNA和细胞色素氧化酶I(COI)基因片段进行了初步研究,分别得到16S rRNA和COI 2个基因片段的碱基序列,其中16S rRNA基因片段的大小为515 bp,碱基A+T,G+C的组成分别为66.47%和33.53%;COI基因片段的大小为472 bp,碱基A+T,G+C的组成分别为62.50%和37.29%.在2种基因片段中,AT的组成明显高于GC的组成,这与果蝇、虾类、蟹类等无脊椎动物的16S rRNA和COI基因片段的研究结果相似.通过对中国明对虾16S rRNA和COI 2个基因片段遗传特征的研究,16S rRNA只有8处核苷酸的碱基在4个群体间表现出差异,COI基因片段中共检测出24个多态性核苷酸位点,其种内变异较低.另外,将本研究所得序列与GenBank中对虾科5个种的16S rRNA基因片段序列进行比较后,发现其聚类关系与传统分类相一致.
【英文摘要】Mitochondrial 16S rRNA and COl gene fragments of F.chinensis were amplified via PCR,and then the PCR products were purified and sequenced.For 16S rRNA gene fragments,515 bp nucleotide sequences were obtained,and the A+T and G+C contents in this fragment were respectively 66.47%,33.53 %.As for the COI gene fragments,the size was 472 bp and the A+T and G+C contents were 62.50%,37.29% respectively.Analysis of 16S rRNA and COI gene fragments indicated that: 1) the AT content was higher than CG content,which was similar to the results of studies on drosophila,shrimp,crab and other invertebrates;2) four families from the test had 6 variable nucleotide positions of 16S rRNA gene fragments,but there were twenty-four variable nucleotide positions about the sequence of COI gene fragments.In addition,it is found that the graphical phylogenetic tree of 16S gene fragment of five shrimps in shrimp family is consistent with current systematic of these species

【题目】用煤渣和沸石处理海水养殖废水的挂膜动力学研究
【中文关键词】动力学;挂膜;海水养殖废水;煤渣;沸石
【英文关键词】kinetics; biofilm formation; mariculture waste water; cinder; zeolite
【中文摘要】研究了用煤渣和沸石作为填料的硝化滤器挂膜过程中动力学参数的变化规律,并对生物膜进行了电镜观察。结果表明:在挂膜过程中,总氨氮的降低遵循一级反应规律:一级反应的相关性随着时间的延长显著性增加,直至挂膜成熟稳定;煤渣和沸石填料挂膜的一级反应速率常数分别为0.744d-1和0.679 d-1。
【英文摘要】The regularity of kinetics parameterswas determined and biofilm surface was observed through microscopes during biofilm formation in nitrification filters by cinder and zeolite media. It was found that during biofilm formation the ammonia degradation followed the first-order dynamics which became more obvious as the time went on. This tendency was kept until the biofilm functional stabilization. The first-order dynamics degradatio nrate was 0.744d-1for cinder and 0.679 d-1 for zeolite.

【题目】凡纳滨对虾各月龄性状的主成分与判别分析
【中文关键词】凡纳滨对虾 相关分析 主成分分析 判别分析
【英文关键词】Litopenaeus vannamei; correlation analysis; principal component analysis; discriminant analysis
【中文摘要】为了研究凡纳滨对虾各性状增长规律和判定最佳生长季节凡纳滨对虾的体格与月龄的关系,选择1~6月龄凡纳滨对虾各1000只,选择全长、体长、第一腹节背高、第三腹节背高、第一腹节背宽、头胸甲长和体重共7个性状,进行主成分与判别分析。结果表明:各月龄凡纳滨对虾性状之间均呈现显著的正相关(P0.01),其中以全长与体长的相关性最为明显,1月龄凡纳滨对虾体重与形态性状的相关系数较小。各月龄凡纳滨对虾的主成分有所不同,1~2月龄凡纳滨对虾的第一主成分为长度因子,第二主成分为宽度因子,第三主成分为高度因子;3月龄凡纳滨对虾的第一主成分与1~2月龄凡纳滨对虾一致,但第二主成分为高度因子,第三主成分为体重因子;4~6月龄凡纳滨对虾的第一主成分为体重因子,第二主成分为高度因子,第三主成分为宽度因子。1~3月龄凡纳滨对虾形态性状的增长优先于体重,4~6月龄凡纳滨对虾体重优先于形态性状的增长。错过最佳生长季节的凡纳滨对虾的与体格大小相符的月龄可通过建立的判别式来判断,总的判别准确率为98.98%,其中2~4月龄凡纳滨对虾的判别准确率为100%。
【英文摘要】In order to research on the rule of the relative growth of traits of Litopenaeus vannamei and judging the age matching with the size of L.vannamei missing the best growing season,the data acquired by measuring the total length(X1),body length(X2),first abdominal segment depth(X3),third abdominal segment depth(X4),first abdominal segment width(X5),carapace length(X6)and body weight(Y)of Penaeus vannamei at different ages in Banqiao Village of Dongfang City,Hanan Province were analyzed by principal component and discriminant analysis.Result shows that the correlation between any two traits of L.vannamei is significant(P<0.01)at all tested ages.,among which those between the total length(X1)and body length(X2)are relatively larger and those between body weight(Y)and morphometric attributes are relatively smaller.The principal components of L.vannamei at different ages are different.For example,the first principal component of L.vannamei at from one month of age to two months is length factor,the second principal component is width factor and the third principal component is depth factor.Also,for L.vannamei at three months of age,its first principal component is the same as that at from one month of age to two months,but its second principal component is depth factor and its third principal component is body weight factor.Finally,the first principal component of L.vannamei at from four months of age to six months is body weight factor,the second principal component is depth factor and the third principal component is width factor.The results of principal component analysis reflect that the growth of morphometric attributes of L.vannamei at from one month of age to three months takes priority compared with that of body weight,but the growth of body weight of L.vannamei at from three

months of age to six months is given priority to compared with that of morphometric attributes.The month age closely related to the size of L.vannamei which has missed the best growing period can be deduced by employing the discriminant equations mentioned in this paper and the results of the discriminant analysis demonstrate that the overall accuracy is 98.98% and those of L.vannamei at two months of age to four months all reach 100%

【题目】凡纳滨对虾净肉质量的影响因素分析
【中文关键词】凡纳滨对虾(Litopenaeus vannamei)　形态性状　生产性能　相关分析
【英文关键词】Litopenaeus vannamei; morphometric attribute; correlation analysis;
【中文摘要】选择5月龄凡纳滨对虾(Litopenaeus vannamei)1 200尾,测定净肉质量、去头质量、全长、体长、第一腹节背高、第三腹节背高、第一腹节背宽和头胸甲长共8个性状,采用相关分析和通径分析的方法,计算了以形态性状和去头质量为自变量对净肉质量作依变量的通径系数、决定系数及相关指数,定量地分析了形态性状和去头质量对净肉质量的影响效果.研究表明,凡纳滨对虾6个形态性状和去头质量与净肉质量的相关系数除头胸甲长外均达到极显著水平(P<0.01);所选性状与净肉质量的复相关指数R2=0.958;多元回归分析建立了去头质量、全长、头胸甲长对净肉质量的回归方程,为对虾的良种选育提供了理论依据.
【英文摘要】The effects of morphometric attributes on net weight for Litopenaeus vannamei were analyzed.Data for this study were collected from five-month-old 1 200 L.vannamei in Banqiao Village of Dongfang City,Hainan Province.The body weight except for head(X1),whole body length(X2),body length(X3),fist first abdominal segment depth(X4),third abdominal segment depth(X5),first abdominal segment width(X6),carapace length(X7) and net weight(Y) were measured.The correlation coefficients among the attributes were calculated. Path coefficient(pi),determination coefficients(di) and correlation index(R2) were calculated in path analysis.The results showed that six correlation coefficients between each morphometric attribute and the weight achieved very significant difference(P<0.01) levels.The path coefficient analysis revealed a truthful relationship between the independent variables and the dependent variable.Judging from the result of high correlation index(R2=0.958),the main variables(X1,X2,X7) have been selected.The multiple regression equation of body weight except for head,whole body length,carapace length to the net weight is obtained to estimate the net weight.This paper provides a theoretical tool to measure breeding shrimps in aquaculture.　更多

【题目】The cytosolic manganese superoxide dismutase cDNA in swimming crab Portunus trituberculatus: Molecular cloning, characterization and expression
【中文关键词】无
【英文关键词】Portunus trituberculatus; Cytosolic manganese superoxide dismutase (cMnSOD); Cloning; Expression

【中文摘要】无
【英文摘要】A cytosolicmanganesesuperoxidedismutase (cMnSOD) cDNA was cloned from the haemocytes ofswimmingcrabPortunus trituberculatus using reverse transcription polymerase chain reaction (RT-PCR) and rapid amplification of cDNA ends (RACE) method. Analysis of the nucleotide sequence revealed that the cMnSOD full-length cDNA consisted of 1106 bp with an open reading frame of 861 bp encoding a protein of 286 amino acids. Four conserved amino acids responsible for binding manganese (H110, H158, D243 and H247) and MnSOD signatures from 243 to 250 (DVWHHAYY) were observed. Sequence comparison showed that the cMnSOD deduced amino acid sequence of P. trituberculatus had similarity of 92%, 78%, 77% and 75% to that of blue crabCallinectes sapidus, white shrimp Litopenaeus vannamei, giant tiger prawn Penaeus monodon and freshwater prawn Macrobrachium rosenbergii, respectively. Quantitative real-time RT-PCR analysis revealed that P. trituberculatus cMnSOD transcript was strongly detected in haemocytes, hepatopancreas, heart, stomach, intestine, gill, ovary and muscle. RT-PCR analysis indicated that cMnSOD transcripts both in haemocytes and hepatopancreas increased at 3 h and 6 h after infection. These facts indicate that cMnSOD is potentially involved in the acute response against invading bacteria in P. trituberculatus.

【题目】Identification and functional study of a shrimp Dorsal homologue
【中文关键词】无
【英文关键词】Dorsal, Shrimp, Innate immunity, NF-kappa B, Antibacterial peptide
【中文摘要】无
【英文摘要】Rel/NF-kappa B transcription factors play central roles in induction and regulation of innate immune responses. Here, identification and functional analysis of LvDorsal, a Dorsal homologue from the Pacific white shrimp Litopenaeus vannamei, were described. The full-length cDNA of LvDorsal is 2204 bp with an open reading frame that encodes 400 amino acids. The deduced LvDorsal contains a conserved Rel homology domain (RHD), an IPT (Ig-like, plexins and transcription factors) domain and a nucleus localization signal, suggesting that it belongs to the class II NF-kappa B. RT-PCR analysis showed that LvDorsal mRNAs were expressed in all the tissues tested, including gill, epidermis, hemocytes, intestine, stomach, eyestalk, brain, hepatopancreas, muscle, heart and pyloric caecum. Immunofluorescence assay showed that recombinant LvDorsal was translocated into the nucleus of Drosophila S2 cells. Electrophoretic mobility shift assay illustrated that recombinant LvDorsal RHD from S2 cells bound specifically with D. melanogaster kappa B motifs. Additionally, the dual-luciferase reporter assays indicated that LvDorsal could transactivate the reporter gene controlled by the 51 flanking region of shrimp penaeidin-4 and Drosophila attacin genes, suggesting that LvDorsal can regulate the transcription of shrimp penaeidin-4 gene. Study of LvDorsal will help us to better understand shrimp immunity and may help to obtain more effective methods to prevent shrimp diseases

【题目】cDNA cloning, expression and antibacterial activity of lysozyme C in the blue shrimp (Litopenaeus stylirostris)
【中文关键词】无

【英文关键词】Lysozyme C; Litopenaeus stylirostris; PCR-cloning; Expression; Antibacterial activity
【中文摘要】无
【英文摘要】The gene coding for lysozyme in blue shrimp (Litopenaeus stylirostris) was cloned, sequenced and expressed in pET-32a vector. The deduced amino acid sequence of F. merguiensi lysozyme showed 37-93% similarity with the mouse, human, chicken, and tiger prawn counterparts. The lysozyme was purified to homogeneity and observed as a band of approximately 15 kDa in 15% SDS-PAGE. Semi-quantitative RT-PCR analysis demonstrated that mRNA transcripts of lysozyme could be mainly detected in the tissues of haemocytes, gill, gonad and the lymphoid organ of unchallenged shrimps, whereas the expression of lysozyme transcripts was increased in all the tested tissues after the heat-killed Vibrio alginolyticus challenge. The temporal expression of lysozyme mRNA in haemolymph challenged by Micrococcus luteus and V. alginolyticus was both up-regulated and reached the maximum level at 8 and 16 h post-stimulation, respectively, and then dropped back to the original level. Bacteriolytic activity of the lysozyme against different bacterial cultures was determined by the solid phase and turbidimetric assays. The results demonstrated that the lysozyme we obtained was not only against Gram-positive and Gram-negative bacteria but also against shrimp pathogens V. alginolyticus and V. parahemolyticus. In addition, the study of the inhibition mechanism revealed that the antibacterial activity of the lysozyme was a result of the bactericidal effect. 【题目】Molecular cloning and mRNA expression of cathepsin C gene in black tiger shrimp (Penaeus monodon)
【中文关键词】无
【英文关键词】molecular cloning; Cathepsin C; mRNA expression; Penaeus monodon
【中文摘要】无
【英文摘要】Cathepsin C (dipeptidyl-peptidase 1, DPPI) is a lysosomal cysteine proteinase belonging to the papain superfamily, which is capable of removing dipeptides sequentially from the amino terminus of peptide and protein substrates. In the present study, the cDNA of a cathepsin C was cloned from black tiger shrimp Penaeus monodon (designated PmcathepsinC) by homology cloning and rapid amplification of cDNA ends (RACE) approaches. The full-length cDNA of PmcathepsinC consisted of 2051 nucleotides with a canonical polyadenylation signal sequence AATAAA and a poly(A) tail, and an open reading frame (ORF) of 1350 bp encoding a polypeptide of 449 amino acid residues with a predicted molecular weight of 50.0 kDa and theoretical isoelectric point of 5.65. The high identity of PmcathepsinC with Cathepsin C in other organisms indicated that PmcathepsinC should be a new member of the Cathepsin C family. By fluorescent quantitative real-time PCR, mRNA transcript of PmcathepsinC was detectable in all the examined tissues with higher level in ovary and heart. The temporal expression of PmcathepsinC mRNA in the hepatopancreas was up-regulated by lipopolysaccharicle (LPS) stimulation and reached the maximum level at 4 h post-stimulation, and then dropped back to the original level gradually. These results indicated that PmcathepsinC was a constitutive and inducible acute-phase protein that perhaps involved in the immune defense of P. monodon

【题目】Molecular cloning and mRNA expression of peroxiredoxin gene in black tiger shrimp (Penaeus monodon)
【中文关键词】无
【英文关键词】Cloning; Peroxiredoxin; RT expression; Black tiger shrimp (Penaeus monodon)
【中文摘要】无
【英文摘要】The techniques of homology cloning and anchored PCR were used to clone the peroxiredoxin (Prx) gene from black tiger shrimp (Penaeus monodon). The full length cDNA of black tiger shrimp Prx (PmPrx) contained a 5' untranslated region (UTR) of 51 bp, an ORF (open reading frame) of 582 bp encoding a polypeptide of 193 amino acids with an estimated molecular mass of 22.15 kDa and a 3' UTR of 948 bp. Sequence comparison showed that PmPrx shared higher identities with Prx IVs than that with other isoforms of Prx, indicating PmPrx was a member of the Prx IV family. A quantitative reverse transcriptase Real-Time PCR (qRT-PCR) assay was developed to assess the mRNA expression of PmPrx in different tissues and the temporal expression of PmPrx in the hepatopancreas challenged by lipopolyssacharide (LPS). Higher-level mRNA expression of PmPrx was detected in the tissues of hepatopancreas, gonad and heart. The expression of PmPrx in the hepatopancreas was up regulated after stimulated by LPS. The results indicated that PmPrx was a constitutive and inducible expressed protein and could be induced by LPS.

【题目】Variation of Specific proteins,Mitochondria and fatty acid composition in gill of Scylla serrata (Crustacea, Decapoda) under low temperature adaptation
【中文关键词】无
【英文关键词】fatty acid; gill; low temperature adaptation; mitochondria; proteomic; Scylla serrata
【中文摘要】无
【英文摘要】The mud crab Scylla serrata is an important commercial crustacean inhabiting estuarine water along the coast of southeast China. Metabolism in the gill is affected continuously by fluctuating water temperature and, therefore, the ability to cope with temperature change is essential to maintain physiological function. This experiment was conducted to help understand the mechanism of low temperature adaptation in S., serrata gill. In this study, 40 healthy juvenile male S. serrata from the same broodstock were grouped randomly into four groups, which were kept at 5 degrees C, 10 degrees C, 15 degrees C and 27 degrees C, with the same feeding regime during a 3-week adaptation period. Two-dimensional electrophoresis of the proteome was conducted to separate the specific proteins responsible for low temperature adaptation. Variations in the mitochondria were observed using transmission electron microscopy, and fatty acid composition was determined using gas chromatography. The results showed that different numbers of specific proteins were expressed under different low temperature adaptation, with more expressed at 5 degrees C and 10 degrees C than at 15 degrees C. Mitochondrial morphology also varied under different low temperature adaptation, but there was no linear relationship between microbial density and adaptation temperature. The composition of different fatty acids in the gill varied considerably with adaptation temperature, but elongation of the carbon chain and transition from fatty acids occurred at lower temperatures. Thus, changes in the specific proteins, mitochondria and fatty acid composition of the gill were the positive effects of low temperature on metabolism, leading to improved adaptation ability in S. serrata.

【题目】Seasonal variations of ATPase activity and antioxidant defenses in gills of the mud crab Scylla serrata (Crustacea, Decapoda).
【中文关键词】无
【英文关键词】MUSSEL MYTILUS-GALLOPROVINCIALIS; SHRIMP MACROBRACHIUM-OLFERSII; NA+-K+-ATPASE; DIGESTIVE GLAND; LIPID-PEROXIDATION; OXIDATIVE STRESS; BIVALVE MOLLUSKS; COMMON MUSSEL; VITAMIN-E; ENZYMES
【中文摘要】无
【英文摘要】The mud crab Scylla serrata is an important commercial crustacean being widely distributed along the southeastern coast of China. This crab and particularly its gills are subjected to seasonal fluctuations of environmental factors due to direct exposure to seawater. The investigation of seasonal variations of ATPase and antioxidant defenses in gills could be helpful for the understanding of physiological regulation mechanism of seasonal adaptations. In this study, mud crabs were collected from the subtropical waters near Xiamen island, Southeast China (24 degrees 26' 46 " N, 118 degrees 04' 04 " E), in August and November, 2002, and February and May, 2003, respectively, being considered as specimens from summer, autumn, winter and spring, respectively. Only healthy intermoult male crabs without carapace or appendage damage were used, having a carapace width of 7.05 +/- 0.52 cm and a wet weight of 130 +/- 20 g. The activities of four ATPases and three antioxidation enzymes (superoxide dismutase, catalase, glutathione peroxidase) and the content of malondialdehyde in gills were measured. The results showed that the activities of Na+, K+- ATPase, Mg2+- ATPase, Ca2+- ATPase and Ca2+, Mg2+- ATPase reached maximum levels similarly in summer and decreased in winter. The activities of superoxide dismutase and catalase were higher in summer and lower in winter, with a significant decrease in winter compared to the other seasons ($p < 0.01$). Glutathione peroxidase activity was higher in summer, and lower in autumn, being significantly higher in summer or winter than in spring or autumn ($p < 0.01$). Malondialdehyde content was higher in summer and lower in spring with significant differences among the different seasons ($p < 0.01$). In summary, the obvious seasonal activity variations of four ATPases and antioxidant enzymes and the content of malondialdehyde reflect a seasonal regulation of the physiological metabolising enzyme and the antioxidant capacity to cope with seasonal alterations of environment factors such as fluctuating salinities and temperatures.

【题目】Hepatopancreas cell culture from Scylla paramamosain .
【中文关键词】无
【英文关键词】Hepatopancreas; Cell culture; Subculture; Scylla paramamosain
【中文摘要】无
【英文摘要】Hepatopancreas is an important digestive and endocrine organ in crustacean. However, there are few reports on cell cultures from crabs. Here, the cell cultures of hepatopancreas from Scylla paramamosain was studied in vitro. Both the primary cell culture and subculture were grown in Leibovitz' L-15 medium, M199 medium, or a specially designed medium for S. paramamosain (MSP). The results showed that hepatopancreas cells in vitro grew in compact clusters in 2-3 d. Four types of cells could be identified. They were embryo cells, fibrillar cells, resorptive cells, and blister-like cells, respectively. Some of these cells could be subcultured for three generations. The MSP supported the best survival of these hepatopancreas cells, while M199 medium was the least effective of these three media. Fetal bovine serum and crab muscle extracts as supplements stimulated growth, but the crab hemolymph inhibited cell growth. Taken together, MSP is an appropriate medium for hepatopancreas cell cultures from S. paramamosain and can support cultures through several passages.

【题目】Changes in progesterone levels and distribution of progesterone receptor during vitellogenesis in the female mud crab (Scylla paramamosain)
【中文关键词】无
【英文关键词】crab; hormones; progesterone; progesterone receptor; vitellogenesis; Scylla paramamosain
【中文摘要】无
【英文摘要】Vertebrate-type steroids, such as progesterone, have been identified in crustaceans. The physiological activity of progesterone during vitellogenesis is still not well understood. In this study, progesterone levels in the female mud crab, Scylla paramamosain, were determined by enzyme-linked immunosorbent assay. Peak levels of progesterone were detected during the previtellogenic stage in the hemolymph, ovary, and hepatopancreas, whereas the progesterone level decreased significantly in vitellogenic stage I. During vitellogenic stage II, progesterone levels rose again in the hemolymph and ovary, but continued to decrease in the hepatopancreas. By using western blotting, progesterone receptor (PR), with an apparent molecular weight of 70 kDa, was identified in the ovary during both vitellogenic stages I and II. By means of immunohistochemistry, PR was detected mainly in the follicle cells during vitellogenic stage I and in the nuclei of oocytes in vitellogenic stage II. Our results strongly suggest that progesterone promotes vitellogenesis in the mud crab, S. paramamosain via a classical genomic mechanism.

【题目】Molecular cloning and characterization of a heat shock protein 70 gene in swimming crab (Portunus trituberculatus)
【中文关键词】无
【英文关键词】Portunus trituberculatus; Heat shock protein 70; SNP; mRNA expression; Vibrio alginolyticus
【中文摘要】无
【英文摘要】Hsp70 can stimulate cells of the innate immune system directly by acting as "danger"-signaling molecules. To understand the immune defense mechanisms of swimming crab Portunus trituberculatus (Decapoda: Brachyura: Portunidae), the cDNA of Hsp70 (designated PtHsp70) was cloned by the combination of homology cloning and rapid amplification of cDNA ends (RACE). The full-length PtHsp70 cDNA was 2195 bp, including an open reading frame (ORF) of 1950 bp encoding a polypeptide of 650 amino acids with estimated molecular mass of 71.1514 kDa and theoretical isoelectric point of 5.38. FASTA and BLAST analysis indicated that PtHsp70 should be an inducible cytosolic member of the Hsp70 family. The coding region of PtHsp70 was uninterrupted and four SNIPS with 1133C/T, 1311C/T, 1551C/T and 1809 A/G were detected by direct sequencing of 20 genomic samples. Using fluorescent real-time quantitative PCR, the transcriptional expression of PtHsp70 showed a clear time-dependent response after challenge by Vibrio alginolyticus, the main causative agent of emulsification disease causing large mortality in P. trituberculatus. This is the first report on the expression of Hsp70 induced by pathogen stimulation in Brachyura. Phylogenetic analysis revealed that the inducible Hsp70s were divided into two groups in crab and PtHsp70 was clustered into the Hsp/Hsc group (Clade I) by maximum-likelihood (ML) and Bayesian inference (BI) methods. GAP repeat and GGMP motif of inducible Hsp70 gene in the crab species were only found in Clade I.

【题目】Complete mitochondrial genome of the Asian paddle crab Charybdis japonica (Crustacea: Decapoda: Portunidae): gene rearrangement of the marine brachyurans and phylogenetic considerations of the decapods.
【中文关键词】无
【英文关键词】Charybdis; Mitochondrial genome; tRNA(His) gene; Gene rearrangement; Phylogenetics
【中文摘要】无
【英文摘要】Given the commercial and ecological importance of the Asian paddle crab, Charybdis japonica, there is a clearly need for genetic and molecular research on this species. Here, we present the complete mitochondrial genome sequence of C. japonica, determined by the long-polymerase chain reaction and primer walking sequencing method. The entire genome is 15,738 bp in length, encoding a standard set of 13 protein-coding genes, two ribosomal RNA genes, and 22 transfer RNA genes, plus the putative control region, which is typical for metazoans. The total A+T content of the genome is 69.2%, lower than the other brachyuran crabs except for Callinectes sapidus. The gene order is identical to the published marine brachyurans and differs from the ancestral pancrustacean order by only the position of the tRNA (His) gene. Phylogenetic analyses using the concatenated nucleotide and amino acid sequences of 13 protein-coding genes strongly support the monophyly of Dendrobranchiata and Pleocyemata, which is consistent with the previous taxonomic classification. However, the systematic status of Charybdis within subfamily Thalamitinae of family Portunidae is not supported. C. japonica, as the first species of Charybdis with complete mitochondrial genome available, will provide important information on both genomics and molecular ecology of the group.

【题目】Complete mitochondrial genome of the Chinese spiny lobster Panulirus stimpsoni (Crustacea: Decapoda): genome characterization and phylogenetic considerations
【中文关键词】无
【英文关键词】Panulirus stimpsoni; Decapoda; Mitochondrial genome; Phylogenetics
【中文摘要】无
【英文摘要】The genetics and molecular biology of the commercially important Chinese spiny lobster, Panulirus stimpsoni are little known. Here, we present the complete mitochondrial genome sequence of P. stimpsoni, determined by the long polymerase chain reaction and primer walking sequencing method. The entire genome is 15,677 bp in length, encoding the standard set of 13 protein-coding genes, two ribosomal RNA genes, and 22 transfer RNA genes. The overall A + T content of the genome is 65.6%, lower than most malacostracan species. The gene order is consistent with the pancrustacean ground pattern. Several conserved elements were identified from P. stimpsoni control region, viz. one [TA(A)]n-block, two GA-blocks and three hairpin structures. However, the position of [TA(A)]n-block and number of hairpin structure are different from those in the congeneric P. japonicus and other decapods. Phylogenetic analyses using the concatenated nucleotide and amino acid sequences of 13 protein-coding genes do not support the monophyly of suborder Pleocyemata, which is in contrast to most morphological and molecular results. However, the position of Palinura and Astacidea is unstable, as represented by the basal or sister branches to other Reptantia species. P. stimpsoni, as the second species of Palinura with complete mitochondrial genome available, will provide important information on both genomics and conservation biology of the group.

【题目】Molecular cloning and characterization of a serine proteinase homolog prophenoloxidase-activating factor in the swimming crab Portunus trituberculatus
【中文关键词】无
【英文关键词】Portunus trituberculatus; Serine protein homologous; Eyestalk; Haemocyte
【中文摘要】无
【英文摘要】Serine proteinase homologues (SPHs), as one of prophenoloxiase-activating factors (PPAFs), play critical roles in innate immunity of crabs. Based on an EST from the eyestalk full length cDNA library, the complete cDNA (designated as PtSPH) and genomic DNA of SPH from the swimming crab Portunus trituberculatus were cloned in this study. The estimated molecular weight of mature PtSPH (354 amino acids) was 38.7 kDa and its isoelectric point was 5.08. Multiple sequence alignment revealed that PtSPH lacked a catalytic residue with a substitution of Ser in the active site triad to Gly. Phylogenetic analysis indicated PtSPH together with PPAFs of Callinectes sapidus (AAS60227), Eriocheir sinensis (ACU65942), Penaeus monodon (ABE03741, ACP19563) and Pacifastacus leniusculus (ACB41380), formed a distinct cluster which only included clip-SPHs. As the first analyzed genomic structure of PPAFs in crustaceans, two introns were found in the open reading frame region of this gene. The mRNA transcripts of PtSPH could be detected in all the examined tissues, and were higher expressed in the eyestalk than that in gill, hepatopancreas, haemocytes and muscle. Accompanied with the change in phenoloxidase (PO) activity and total haemocyte counts, the temporal expression of PtSPH gene in haemocytes after Vibrio alginolyticus challenge demonstrated a clear time-dependent expression pattern with two peaks within the experimental period of 32 h. These findings suggest that PtSPH is involved in the antibacterial defense mechanism of Portunus tritubercualtus crab.

【题目】The complete mitochondrial genome of the mantid shrimp Oratosquilla oratoria (Crustacea: Malacostraca: Stomatopoda): Novel non-coding regions features and phylogenetic implications of the Stomatopoda
【中文关键词】无
【英文关键词】Oratosquilla oratoria; Stomatopoda; Mitochondrial genome; Non-coding regions; Phylogenetics
【中文摘要】无
【英文摘要】The complete mitochondrial (mt) genome sequence of Oratosquilla oratoria (Crustacea: Malacostraca: Stomatopoda) was determined; a circular molecule of 15,783 bp in length. The gene content and arrangement are consistent with the pancrustacean ground pattern. The mt control region of O. oratoria is characterized by no GA-block near the 3' end and different position of [TA(A)]n-blocks compared with other reported Stomatopoda species. The sequence of the second hairpin structure is relative conserved which suggests this region may be a synapomorphic character for the Stomatopoda. In addition, a relative large intergenic spacer (101 bp) with higher A + T content than that in control region was identified between the tRNA(Glu) and tRNA(Phe) genes. Phylogenetic analyses based on the current dataset of complete mt genomes strongly support the Stomatopoda is closely related to Euphausiacea. They in turn cluster with Penaeoidea and Caridea clades while other decapods form a separate group, which rejects the monophyly of Decapoda. This challenges the suitability of Stomatopoda as an outgroup of Decapoda in phylogenetic analyses. The basal position of Stomatopoda within Eumalacostraca according to the morphological characters is also questioned. (C) 2010 Elsevier Inc. All rights reserved.

【题目】Genetic differentiation in seven geographic populations of the fleshy shrimp Penaeus (Fenneropenaeus) chinensis based on microsatellite DNA
【中文关键词】无
【英文关键词】Penaeus (Fenneropenaeus) chinensis; Genetic differentiation; Geographic Population; Microsatellite DNA
【中文摘要】无
【英文摘要】Microsatellite DNA markers were used to investigate the genetic diversity of Penaeus (Fenneropenaeus) chinensis, a topic of controversy in previous Studies. A total of 210 individual shrimps were collected in seven geographic locations in the Yellow and Bohai Seas: Liaodong Bay (LD), Bohai Bay (BH), Haizhou Bay (HZ), Rushan Bay (RS), Haiyangdao fishing ground (HYD), the west coast (KW), and the south coast of the Korean peninsula (KS). A new population of P. chinensis was identified in KS. A total of 109 alleles were identified from seven loci. Among the 49 population loci, 34 showed significant deviation from the Hardy-Weinberg equilibrium. Cluster analysis using UPGMA revealed a close genetic relationship of P. chinensis between BH and LD and between RS and HZ, while the shrimp from KW and KS diverged. Genetic distance and AMOVA analysis identified three areas with distinct populations: the Bohai and Yellow Seas along the Chinese coast; the west coast of Korea, and the south coast of Korea. These results are consistent with tagging-recapture data and some molecular DNA marker studies, but different from results by mitochondrial gene methods. (c) 2008 Elsevier B.V. All rights reserved.

【题目】Construction of AFLP-based genetic linkage maps for the Chinese shrimp Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】Fenneropaeneus chinensis, genetic linkage maps,Construction of AFLP-based
【中文摘要】无
【英文摘要】Fenneropaeneus chinensis is an important species in marine fishery resources and aquaculture in China. A genetic linkage map is essential for improving the efficiency of its breeding by marker-assisted selection and identifying commercially important genes. Linkage maps of F chinensis were constructed with an F2 mapping population (110 progenies) using amplified fragment length polymorphic (AFLP) marker in this study. Fifty-five AFLP primer combinations produced 532 AFLP markers fitting for map strategy in mapping family. The markers with 3:1 segregating ratios were analyzed using F2 intercross model for the common linkage map, while the markers with 1:1 ratio were analyzed using the pseudo-testcross strategy. The maps of male, female and common were constructed. The female map included 103 markers that formed 28 linkage groups, covering a total length of 1090 M All markers were linked with the linkage groups. Segregation distortion was observed for 6 of 103 markers in the female map. The average distance between markers was 14.53 cM and ranged from 4.4 to 24.8 M The male map included 144 markers that formed 35 linkage groups. Ten markers remained unlinked in male map. Segregation distortion was observed for 7 of 144 markers in the male map. The total distance of male map covered 1617 M The average distance between markers was 16.36 cM. The male map was 32.6% longer than the female map, which may reflect sex-specific recombination rates in Chinese shrimp. The common map was composed of 216 markers, including in

44 linkage groups covering a total distance of 1772.1 cM. Two markers remained unlinked. No distorted markers of 216 markers were shown in the common map. The distance between markers was 10.42 M An average estimated genome size for the Chinese shrimp was 2420 cM, which was consistent with the relative size of the Penaeid genome. The distribution of AFLP markers was relatively even in chromosomes of Chinese shrimp maps. The linkage analysis presented in this work provided some insight into the level of polymorphism and genetic variation of Chinese shrimp.

【题目】Molecular cloning and characterization of prophenoloxidase gene in swimming crab Portunus trituberculatus
【中文关键词】无
【英文关键词】Portunus trituberculatus; Prophenoloxidase; Immunity; Cloning; Expression
【中文摘要】无
【英文摘要】Phenoloxidase (PO), a melanin-synthesizing enzyme, found as a zymogen (proPO) in hemolymp, plays an important role in arthropod defence. In this study, a prophenoloxidase (proPO) cDNA was cloned from the haemocytes of swimming crab Portunus trituberculatus by a reverse-transcription polymerase chain reaction (RT-PCR) and rapid amplification of cDNA end (RACE) method. Analysis of the nucleotide sequence revealed that the cDNA clone had a full-length of 3040 bp, with an open reading frame of 2019 bp, a 5'-untranslated region of 138 bp, and a long 3'-untranslated region of 1707 bp. It encoded a protein of 672 amino acids which has a predicted molecular weight of 77.4 kDa and with an estimated pI of 6.19. It is predicted to possess all the expected features of proPO members, including two putative tyrosinase copper-binding motifs with six histidine residues and a proteolytic activation site. Comparison of amino acid sequences showed that the proPO-deduced amino acid of P. trituberculatus has an overall similarity of 56%-87% to that of other crustaceans. Northern blot analysis revealed that the presence of proPO was expressed in haemocytes, hepatopancreas and ovary, but not in eyestalk, gill and muscle. RT-PCR analysis indicated that proPO showed different expression profiles in crab haemocytes and hepatopancreas after Vibrio alginolyticus challenging. These facts indicated that proPO was potentially involved in the acute response against invading bacteria in P. trituberculatus. (C) 2009 Elsevier Ltd. All rights reserved.

【题目】Molecular cloning, characterization and mRNA expression of two antibacterial peptides: Crustin and anti-lipopolysaccharide factor in swimming crab Portunus trituberculatus.
【中文关键词】无
【英文关键词】Crustin; Anti-lipopolysaccharide factor; cDNA cloning; mRNA expression; Bacterial challenge; Portunus trituberculatus
【中文摘要】无
【英文摘要】In this study, the cDNAs of a crustin and an anti-lipopolysaccharide factor (ALF) were cloned from the hemocytes of swimming crab Portunus trituberculatus using rapid amplification of cDNA ends (RACE) approaches. The full-length cDNA of P. trituberculatus crustin (denoted as PtCrustin) was of 584 bp, including an open reading frame (ORF) of 333 bp encoding a 21 amino acids signal peptide and a mature polypeptide of 89 amino acids with the predicted molecular mass of 10.08 kDa. The typical conserved cysteine residues containing WAP domain at the C-terminal displayed high similarity to other crustins. Moreover, the full-length

cDNA of P. trituberculatus ALF (denoted as PtALF) was of 1050 bp, including an ORF of 372 bp encoding a 26 amino acids signal peptide and a mature polypeptide of 97 amino acids with the predicted molecular mass of 11.35 kDa. PtALF contained two conserved cysteine residues and showed high similarity to other crab ALFs. Using fluorescent real-time quantitative PCR. PtCrustin mRNA was expressed at the highest level in hemocytes and higher level in stomach while extremely low in hepatopancreas, muscle, gill and heart. In contrast, the PtALF mRNA expression was observed in all tissues. The relative expression levels of PtCrustin and PtALF in hemocytes of P. trituberculatus showed a clear time-dependent response after challenge with Vibrio alginolyticus. These results indicate that PtCrustin and PtALF are two acute-phase proteins involved in the immune responses of P. trituberculatus. (C) 2010 Elsevier Inc. All rights reserved.

【题目】Molecular cloning and characterization of a novel c-type lysozyme gene in swimming crab Portunus trituberculatus

【中文关键词】无

【英文关键词】C-type lysozyme; Portunus trituberculatus; cDNA cloning; mRNA expression; Bacterial challenge

【中文摘要】无

【英文摘要】Lysozymes are key proteins to invertebrates in the innate immune responses against bacterial infections. In this study, the full-length cDNA of a novel c-type lysozyme was cloned from the haemocytes of swimming crab Portunus trituberculatus using rapid amplification of cDNA ends (RACE) approaches. The full-length cDNA of lysozyme was of 984 bp, containing a 5' untranslated region (UTR) of 90 bp, a 3' UTR of 222 bp with a poly (A) tail, and an open reading frame (ORF) of 672 bp encoding an 18 amino acids signal peptide and a mature polypeptide of 205 amino acids with the predicted molecular weight of 23.76 kDa. The conserved catalytic sites Glu51 and Asp69, and the eight conserved cysteine residues identified in lysozyme suggesting it belonged to c-type lysozyme. Also, the swimming crab c-type lysozyme may belong to calcium-binding c-type lysozymes because of containing the three Asp residues (Asp98, Asp103 and Asp104), which are conserved in calcium-binding c-type lysozymes. Quantitative real-time RT-PCR analysis revealed that the mRNA transcripts of lysozyme were expressed at the highest level in haemocytes, with higher level in gill, moderately in hepatopancreas and muscle while low in stomach and heart. The mRNA expression of lysozyme in haemocytes was down-regulated significantly after challenge with Vibrio alginolyticus at 3 h, and then kept at the low expression level until 24 h. As time progressed, the mRNA expression of c-type lysozyme was recovered to the control level after 24 h injection. The results indicate swimming crab c-type lysozyme may be an inducible acute-phase protein and bacterial challenge could decline its mRNA expression. (C) 2010 Elsevier Ltd. All rights reserved.

【题目】Immune responses and expression of immune-related genes in swimming crab Portunus trituberculatus exposed to elevated ambient ammonia-N stress

【中文关键词】无

【英文关键词】Ammonia-N; Portunus trituberculatus; Immune response; Gene expression; Crustin; Anti-lipopolysaccharide factor; Lysozyme; alpha(2)-Macroglobulin

【中文摘要】无
【英文摘要】The effects of ammonia-N (0, 1, 5 and 20 mg L(-1)) on immune responses and immune-related gene expression were determined in swimming crab Portunus trituberculatus. The results showed that the THC and phagocytic activity of P. trituberculatus exposed to 1, 5 and 20 mg L(-1) ammonia-N decreased significantly during the experimental time. The antibacterial and bacteriolytic activities decreased significantly to the minimum at 6 or 12 h respectively, then recovered to the control level except bacteriolytic activity exposed to 5 and 20 mg L(-1) ammonia-N. alpha(2)-macroglobulin (alpha(2)-M) activity of all ammonia-N exposure groups decreased significantly, then recovered to the control level rapidly and tended to be stable after 12 h. With crabs exposed to 20 mg L(-1) ammonia-N, the gene expression levels of crustin and lysozyme decreased significantly, then recovered to the control level after 12 h. ALF expression also decreased significantly when exposed to 5 and 20 mg L(-1) ammonia-N, then remained stable and significantly lower than the control group after 6 h. In contrast, alpha(2)-M gene expression was induced by ammonia-N exposure significantly. The results suggest that high concentration ammonia-N exposure could reduce the crab immunity severely, and induce the short-term response in terms of immune gene regulation. (C) 2010 Elsevier Inc. 【题目】Molecular characterization and expression analysis of extracellular copper – zinc superoxide dismutase gene from swimming crab Portunus trituberculatus
【中文关键词】无
【英文关键词】Portunus trituberculatus; Extracellular copper-zinc superoxide dismutase (ecCuZnSOD); Immunity; Cloning; Expression
【中文摘要】无
【英文摘要】An extracellular CuZnSOD cDNA was cloned from the haemocytes of swimming crab Portunus trituberculatus by a reverse-transcription polymerase chain reaction (RT-PCR) and rapid amplification of cDNA end (RACE) method. Analysis of the nucleotide sequence revealed that the ecCuZnSOD full-length cDNA consisted of 965 bp with an open reading frame of 579 bp. It encoded a polypeptide of 192 amino acids which had a predicted molecular weight of 20.0 kDa and with an estimated pI of 6.23. The deduced amino acid sequence contained a putative signal peptide of 31 amino acids. It is predicted to possess all the expected features of CuZnSOD members, including amino acids responsible for binding Cu and Zn, two putative CuZnSOD signatures, two cysteines and one N-linked glycosylation site. Sequence comparison showed that the CuZnSOD deduced amino acid sequence of P. trituberculatus has similarity of 80%, 76%, 55% and 50% to that of blue crab Callinectes sapidus, mud crab Scylla serrata, crayfish Pacifastacus leniusculus and freshwater prawn Macrobrachium rosenbergii, respectively. The ecCuZnSOD transcripts expressed in all examined tissues, including haemocytes, hepatopancreas, heart, stomach, intestine, gill, ovary and muscle. RT-PCR analysis indicated that ecCuZnSOD transcripts both in haemocytes and hepatopancreas increased in the first 3 h after Vibrio alginolyticus challenging, as the bacterial infection progressed, the challenged crabs decreased to levels significantly lower than control by 96 h post-infection. These facts indicated that ecCuZnSOD was potentially involved in the acute response against invading bacteria in P. trituberculatus.

【题目】The construction of a cDNA library enriched for immune genes and the analysis of 7535 ESTs from Chinese mitten crab Eriocheir sinensis
【中文关键词】无
【英文关键词】cDNA library; ESTs analysis; Eriocheir sinensis; Bacteria challenge; Innate immunity
【中文摘要】无
【英文摘要】Chinese mitten crab Eriocheir sinensis is one of the most important aquaculture crustacean species in China. A cDNA library was constructed from hemocytes of E. sinensis challenged with the mixture of Listonella anguillarum and Staphylococcus aureus, and randomly sequenced to collect genomic information and identify genes involved in immune defense response. Single-pass 5' sequencing of 10368 clones yielded 7535 high quality ESTs (Expressed Sequence Tags) and these ESTs were assembled into 2943 unigenes. BLAST analysis revealed that 1706 unigenes (58.0% of the total) or 4593 ESTs (61.0% of the total) were novel genes that had no significant matches to any protein sequences in the public databases. The rest 1237 unigenes; (42.0% of the total) were closely matched to the known genes or sequences deposited in public databases, which could be classed into 20 or 23 classifications according to "molecular function" or "biological process" respectively based on the Gene Ontology (GO). And 221 unigenes (7.5% of all 2943 unigenes, 17.9% of matched unigenes) or 969 ESTs (12.9% of all 7535 ESTs, 32.9% of matched ESTs) were identified to be immune genes. The relative higher proportion of immune-related genes in the present cDNA library than that in the normal library of E. sinensis and other crustaceans libraries, and the differences and changes in percentage and quantity of some key immune-related genes especially the immune inducible genes between two E. sinensis cDNA libraries may derive from the bacteria challenge to the Chinese mitten crab. The results provided a well-characterized EST resource for the genomics community, gene discovery especially for the identification of host-defense genes and pathways in crabs as well as other crustaceans. 【题目】A thioredoxin with antioxidant activity identified from Eriocheir sinensis
【中文关键词】无
【英文关键词】Thioredoxin; Eriocheir sinensis; Gene cloning; Innate immunity; mRNA expression; Antioxidant capacity
【中文摘要】无
【英文摘要】Thioredoxin, with a redox-active disulfide/dithiol in the active site, is the major ubiquitous disulfide reductase responsible for maintaining proteins in their reduced state. In the present study, the cDNA encoding thioredoxin-1 (designated EsTrx1) was cloned from Chinese mitten crab Eriocheir sinensis by using rapid amplification of cDNA ends (RACE) approaches. The full-length cDNA of EsTrx1 was of 641 bp, containing a 51 untranslated region (UTR) of 17 bp, a 3' UTR of 306 bp with a poly (A) tail, and an open reading frame (ORF) of 318 bp encoding a polypeptide of 105 amino acids. The high similarity of EsTrx1 with Trx1s from other animals indicated that EsTrx1 should be a new member of the Trx1 sub-family. Quantitative real-time PCR analysis revealed the presence of EsTrx1 transcripts in gill, gonad, hepato-pancreas, muscle, heart and haemocytes. The expression of EsTrx1 mRNA in haemocytes was up-regulated after Listonella anguillarum challenge, reached the maximum level at 6 h post-stimulation, and then dropped back to the original level gradually. In order to elucidate its biological functions, EsTrx1 was recombined and expressed in E. coli BL21 (DE3). The rEsTrx1 was demonstrated to possess the expected redox activity in enzymatic analysis, and to be more potent than GSH in antioxidant capacity. These results together indicated that EsTrx1 could function as an important antioxidant in a physiological context, and perhaps is involved in the responses to bacterial challenge. 【题目】蒺藜苜蓿全基因组抗病基因和基因扩张分析
【中文关键词】苜蓿;核苷酸结合位点(NBs);抗病基因;基冈复制;生物信息学;
【英文关键词】medicago thunctula;nucleotide—binding-site(NBS);disease resistance gene;gene duplication;bioinformatics
【中文摘要】摘要:利用BLAST(basiclocal alignment search t001)和HMM(hidden markov model)工具,对蒺藜苜蓿(Medicagotruncatula) 全基因组Mr2.0数据中含有核苷酸结合位点(NBS)结构的抗病基因进行了分析,包括NBS基因数量、类型、基因复制、物理位置分析和系统进化树关系分析。结果表明,在苜蓿全基因组中找到469个含有NBS结构的抗病基因,其中包括446个标准结构NBS基因、23个非标准结构NBS基因。通过对全基冈组内标准NBS类型抗病基因进行物理位置和基闪家族分析,发现苜蓿基因组中抗病基阂存在明显的基因复制现象,基因的复制对苜蓿基因组中NBS类型抗病基因数量扩张起到了重要的作用。
【英文摘要】By BLAST (basic local alignment search tool) and HMM (hidden markov model) analyses, a complete set of disease resistance candidate genes encoding nucleotide-binding-sites NBS) was identified in a complete genome(Mt2.0) of medicago truncatula and these putative R genes were characterized with respect to structural diversity, gene duplication, physical positions and phylogenetic relationships. The results showed that 469 NBS-coding sequences, which contained 446regular NBS genes and 23 non-regular NBS genes, were found in the complete genome. By NBS standard physical locations and gene families analyses, significant excesses of gene duplications which played a major role for the expansion of disease resistance genes were found in the whole genome of medicago thunctula.

【题目】Leptin promoted meiotic maturation of bovine oocytes and development of parthenogenetic activation and yak (Bos grunniens)-bovine interspecies cloned embryos
【中文关键词】无
【英文关键词】yak, leptin, oocyte maturation, interspecies cloning
【中文摘要】无
【英文摘要】Leptin has a central role in the regulation of oocyte and embryo development. The objective of the current study was to investigate the effect of leptin addition during oocyte maturation in vitro on meiotic maturation of bovine oocytes and development of parthenogenetic activation (PA) and yak-bovine interspecies cloned embryos. In addition, the effect of leptin supplementation in embryo culture medium on preimplantation development of yak-bovine interspecies cloned embryos was investigated. Leptin addition at 10 and 100ng/mL during oocyte maturation significantly increased the proportion of bovine oocytes that developed to metaphase II (MII) stage compared to the control (81.0+/-3.8 and 77.0+/-4.0 versus 62.2+/-1.8, P<0.05). Leptin at 10ng/mL significantly increased the blastocyst rate after PA compared to the control (31.6+/-4.3 versus 20.4+/-3.2, P<0.05). Leptin supplementation at 10ng/mL during oocyte maturation strikingly increased the blastocyst development of yak-bovine interspecies cloned ernbryos (33.2+/- 4.0 versus 22.8+/- 2.7, P<0.05) and the inner cell mass (ICM) and total cell number per blastocyst, and reduced the incidence of apoptotic cells per blastocyst compared to the control. When present in the embryo culture medium, leptin at 100 ng/mL significantly increased the blastocyst development of yak-bovine interspecies cloned embryos compared to the control (34.2 +/- 4.9 versus 22.0 +/- 3.2, P<0.05). Meanwhile, leptin at 100 and 1000ng/mL significantly increased ICM and total cell number per blastocyst and reduced the proportion of apoptotic cells per blastocyst. In conclusion, leptin supplementation promoted the meiotic maturation of bovine oocytes and the developmental capacity of PA and yak-bovine interspecies cloned embryos.

【题目】Development of bovine – ovine interspecies cloned embryos and mitochondria segregation in blastomeres during preimplantation
【中文关键词】无
【英文关键词】bovine; ovine; nuclear transfer; mitochondrion; real-time PCR
【中文摘要】无
【英文摘要】The objective of the study was to investigate interspecies somatic cell nuclear transfer (iSCNT) embryonic potential and mitochondrial DNA (mtDNA) segregation during preimplantation development. We generated bovine-ovine reconstructed embryos via iSCNT using bovine oocytes as recipient cytoplasm and ovine fetal fibroblast as donor cells. Chromosome composition, the total cell number of blastocyst and embryonic morphology were analyzed. In addition, mtDNA copy numbers both from donor cell and recipient cytoplasm were assessed by real-time PCR in individual blastocysts and blastomeres from 1- to 16-cell stage embryos. The results indicated the following: (1) cell nuclei of ovine fetal fibroblasts can dedifferentiate in enucleated bovine ooplasm, and the reconstructed embryos can develop to blastocysts. (2) 66% of iSCNT embryos had the same number of chromosome as that of donor cell, and the total cell number of iSCNT blastocysts was comparable to that of sheep parthenogenetic blastocysts. (3) RT-PCR analysis in individual blastomeres revealed that the ratio of donor cell mtDNA: recipient cytoplasm mtDNA remained constant (1%) from the one- to eight-cell stage. However, the ratio decreased from 0.6% at the 16-cell stage to 0.1% at the blastocyst stage. (4) Both donor cell- and recipient cytoplasm-derived mitochondria distributed unequally in blastomeres with progression of cell mitotic division. Considerable unequal mitochondrial segregation occurred between blastomeres from the same iSCNT embryos. (c) 2007 Elsevier B.V All rights reserved

【题目】Development In Vitro and Mitochondrial Fate of Interspecies Cloned Embryos
【中文关键词】无
【英文关键词】NUCLEAR TRANSFER EMBRYOS; CYTOPLASM SUPPORTS DEVELOPMENT; BOVINE EMBRYOS; SOMATIC-CELLS; SPERM MITOCHONDRIA; RABBIT OOCYTES; CUMULUS CELLS; DNA; CATTLE; SHEEP
【中文摘要】无
【英文摘要】Although the technique of interspecies somatic cell nuclear transfer can be used to increase the population size of endangered mammals, the mitochondrial heteroplasmy in cloned embryos and animals makes this idea doubtful. In present study, goat-sheep cloned embryos were constructed by fusing goat foetal fibroblasts (GFFs) into sheep oocytes and then cultured in vitro to investigate the capability of sheep oocyte dedifferentiating GFF nucleus. Moreover, at each stage of 1- (immediately after fused), 2-, 4-, 8-, 16- cell, morula and blastocyst, the copy number of mtDNA from GFF and sheep oocyte was examined using real-time PCR. The results showed that: 7.4% of the fused cloned embryos can develop to the blastocyst stage; in the process of one cell to the morula stage, the copy number of two kinds of mtDNA was stable relatively; however, in the process of morula to the blastocyst stage, the decreasing in the copy number of GFF-derived mtDNA, while the increasing in sheep oocyte-derived, resulted in their ratio of decreasing sharply from 2.0 +/- 1.0% to 0.012 +/- 0.004%. This study demonstrates that: (i) the goat-sheep cloned embryos have the ability to develop to

blastocyst in vitro; (ii) from the morula stage to the blastocyst stage of goat-sheep cloned embryos, goat derived mitochondria can be gradually replaced with those from sheep oocyte.

【题目】Quantitative analysis of mitochondrial RNA in goat-sheep cloned embryos
【中文关键词】无
【英文关键词】IN-VITRO DEVELOPMENT; EARLY MOUSE EMBRYOS; NUCLEAR TRANSFER; BOVINE EMBRYOS; CUMULUS CELLS; SPERM MITOCHONDRIA; DNA; FATE; TRANSCRIPTION; OOCYTES
【中文摘要】无
【英文摘要】Mitochondria are the key generators of cellular ATP, and contain extranuclear genome-mitochondrial DNA (mtDNA). In the process of nuclear transfer (NT), heteroplasmic sources of mtDNA from a donor cell and a recipient oocyte are mixed in the cytoplasm of the reconstituted embryo. Previous studies showed inconsistent patterns of mtDNA inheritance in offspring and early fetuses generated through interspecies NT. The quantitative analysis of mitochondrial RNA (mtRNA) in interspecies cloned embryos is useful for better understanding the fate of two types of mitochondria. The components of nicotinamide adenine dinucleotide (NADH) dehydrogenase were coded by both nuclear DNA (nDNA) and mtDNA. The Subunit 1 (ND-1) is one of seven NADH dehydrogenase subunits coded by mtDNA. In present study, using real-time and reverse-transcription PCR, the copy number of species-specific ND-1 mRNA was examined in goat-sheep cloned embryos of various developmental stages, and was applied to evaluate the expression pattern of species-specific mtDNA. The results of showed that (1) the expression of mtDNA derived from goat fetal fibroblast (GFF) decreased from 1-cell stage (immediately after fused) to 2-cell stage, and could not be detected from 4-cell stage onward to blastocyst stage; (2) the expression of mtDNA derived from sheep oocyte was roughly constant from 1-cell stage to the 8-cell stage, increased gradually from 16-cell stage, and sharply at morula and blastocyst stage. Moreover, we strongly argued a mechanism, that is GFF-derived mitochondria were degraded for the depression of bioenergetic functions, and then selectively eliminated during the embryogenesis of goat-sheep cloned embryos.

【题目】Reconstruction of corneal epithelium with cryopreserved corneal limbal stem cells in a goat model
【中文关键词】无
【英文关键词】limbal stem cells; cryopreservation; amniotic membrane; allograft
【中文摘要】无
【英文摘要】We describe a procedure to construct an artificial corneal epithelium from cryopreserved limbal stem cells (LSCs) for corneal transplantation. The LSCs were separated from limbal tissue of male goats. The primary LSCs were identified by flow cytometry and were expanded. They were examined for stem cell-relevant properties and cryopreserved in liquid nitrogen. Cryopreserved LSCs were thawed and then transplanted onto human amniotic membrane, framed on a nitrocellulose sheet, to construct corneal epithelium sheets. The artificial corneal epithelium was transplanted into the right eye of pathological models of total limbal stem cell deficiency (LSCD). Then, the effects of reconstruction were evaluated by clinical observation and histological examination. Polymerase chain reaction analysis was used to detect the SRY gene. The data showed that transplantation of cryopreserved LSCs, like fresh LSCs,

successfully reconstructed damaged goat corneal surface gradually, but the SRY gene expression from male goat cells could only be detected in the first 2 months after transplantation. The therapeutic effect of the transplantation may be associated with the inhibition of inflammation-related angiogenesis after transplantation of cryopreserved LSCs. This study provides the first line of evidence that cryopreserved LSCs can be used for reconstruction of damaged corneas, presenting a remarkable potential source for transplantation in the treatment of corneal disorders.

【英文关键词】bioremediation Rhodococcus enviromental protection applied research
【中文摘要】生物修复技术是在生物降解的基础上发展起来的一种新兴的环境保护技术。红球菌属的许多菌株可降解多种有机污染物,有些菌株可产生多种生物活性物质,是环境生物修复中非常重要的一个菌属。目前,红球菌已被研究应用于生物脱硫、石油污染修复、危险性有机化合物降解、污水处理等环保行业。文章综述了红球菌属在环境保护领域的应用研究进展,对红球菌的深入研究作了展望。
【英文摘要】Bioremedation, based on biodegradation, is a new environmental protectin technology. As many strains can degrade a variety of organic pollutants and can produce diverse bioactive substance, Rhodococcus spp plays a very important role in enviromental bioremediation. At present, many strains of Rhodococcus have been applied to biodesulfurezation, remendiation of oil pollution, degradation of hazardous chemicals, sewage treatment and other environmental protection industries. Applied research progress of Rhodococcus in environmental protection is summarized and in-depth research of Rhodococcus is also prospected in this paper.

【题目】Isolation and characterization of chlorpyrifos degrading strains from soil with high chlorpyrifos accumulation
【中文关键词】毒死蜱降解微 嗜酸寡养单胞菌 副球菌 不动杆菌 硝基还原假单胞菌
【英文关键词】chlorpyrifos degradation Stenotrophomonas acidaminiphila Paracoccus pantotrophus Acinetobacter lwoffii Pseudomonas nitroreducens
【中文摘要】许多高效毒死蜱降解菌被从生产毒死蜱公司的污水处理系统污泥出口附近分离。四株典型的菌株, β ,Z5 T15 E30被选作进一步的研究。当毒死蜱在10 mg/l,四个菌株在24小时内的降解率分别为89.42%、59.66%、81.42%和43.1%,并以毒死蜱作为唯一碳源。研究它们的细胞形态学、生理学和生物化学特性,并分析研究了16S rDNA 。这四种菌株被鉴定为嗜麦芽寡养单胞菌(Stenotrophomonas maltophilia),副球菌(Paracoccus pantotrophus)鲁氏不动杆菌鲁氏不动杆菌(Acinetobacter lwoffii)和硝基还原假单胞菌(Pseudomonas nitroreducens)。
【英文摘要】Many strains with high chlorpyrifos degradation efficiency were isolated from thesludge near the export of wastewater treat system of the company that produces chlorpyrifos. Fourtypical strains, β , E30, T15 and Z5, were chosen for further studies. The degradation rates of fourstrains were 89.42%, 59.66%, 81.42% and 43.1%, respectively in 24 hours when chlorpyrifos at10 mg/L was used as the only carbon source. The cell morphology, physiology and biochemistrycharacters, and analysis of 16S rDNA were studied. The four strains were identified asStenotrophomonas maltophilia, Paracoccus pantotrophus, Acinetobacter lwoffii and Pseudomonasnitroreducens, respectively.

【题目】有机磷农药降解菌及其基因工程研究新进展
【中文关键词】有机磷农药 微生物降解 基因工程菌
【英文关键词】Organophosphorus pesticides microorganism degradation genetic engineering strain
【中文摘要】有机磷农药是目前我国使用量最大的农药, 对农业的发展有重要的作用, 但同时造成了严重的环境污染. 利用微生物及其产生的降解酶来降解农药是行之有效的方法. 随着分子生物学技术的深入利用,农药的微生物降解已在基因工程领域取得了很大进展. 本文综述了有机磷农药降解微生物的筛选、降解酶和基因的克隆、基因工程菌的构建以及应用等几个方面的研究进展。
【英文摘要】Organophosphorus pesticides (Ops) are most extensively used pesticides around the world. Although Ops have playing imporant roles in protecting agricultural crops from insect pests and weeds, and in controlling disease-transmitting vectors, they cause serious environmental pollution problems. The biotechnology involving the use of microorganisms or their cell-freeenzyme preparations in degrading pesticides appears to have promising applications in degrading the residual pesticides. With the depth of molecular biology techniques to use, microbial degradation of pesticides in the field of genetic engineering has made considerable progress. The screening of microorganisms degrading these pesticides, the study on degrading enzymes ang genes, the construction and application of genetic engineering strains are summarized.

【题目】电转化法将luxAB基因导入毒死蜱降解菌β菌株的研究
【中文关键词】电转化 luxAB 菌株β 毒死蜱 微生物降解
【英文关键词】electroporation luxAB strain β chlorpyrifos microbial degradation
【中文摘要】采用电转化法将带发光酶基因luxAB的质粒pTR102导入毒死蜱降解菌β菌株,研究了细胞生长状态、电压强度、电击时间和质粒浓度对转化效率的影响,并对转化子的生理特性进行研究.实验结果表明,以处于对数生长早期的菌液制备感受态细胞,在质粒浓度16.5μg·mL-1、电压2.5kV,电击时间3ms条件下的转化率最高,可达2.73×102个.μg-1(以每μg质粒DNA中所含转化子个数计).转化子lux-β分别在抗生素平板和LB平板中传代10次,仍具有发光活性和对卡那霉素(Km)的抗性,说明质粒pTR102在转化子中可以稳定遗传.转化子的生理特性变化不显著,对毒死蜱的降解能力较出发菌株提高了近1倍.
【英文摘要】A new luxAB gene-labelling method was established in this study in order to provide a method of investigating and tracing the colonization dynamics and degradation activity of chlorpyrifos-degrading bacteria in the natural environment. The luxAB genes were introduced into chlorpyrifos-degrading strain β by electroporation. Cells in initial logarithmic phase were more sensitive to foreign DNA,and the maximum transformation rate was up to 2.73×10^{2} transformants per microgram plasmid DNA when the plasmid concentration was 16.5 μg·mL-1 under the conditions of voltage 2.5kV and time 3ms. After plate transfers with or without antibiotics for 10 generations the transformant lux-β still had lum inescence activity and Km resistance,indicating that the transformant was genetically stable. In addition,the physiological and biochemical characteristics of lux-β changed little,and the chlorpyrifos-degradation rate of lux-β doubled compared with that of the wild strain β.

【题目】一株毒死蜱降解新菌株Sphingopyxis terrae R17的分离鉴定及降解特性
【中文关键词】毒死蜱 Sphingopyxis terrae 分离鉴定 降解特性
【英文关键词】Chlorpyrifos Sphingopyxis terrae Isolation and idetification Degradation characteristics
【中文摘要】从农药厂排污沟排污口分离到一株能降解毒死蜱的新菌株,命名为R17,经生理生化和16S rNDA序列同源性分析,鉴定为Sphingopyxis terrae。R17可以利用毒死蜱作为唯一碳源生长,该菌株的最适生长温度为35℃、最是pH为7-8,在此条件下培养28h后,菌落浓度达9.18×108cfu·mL-1。研究了该菌株在不同时间,对不同浓度毒死蜱大的降解特性,结果表明,当接菌量为9×107cfu·mL-1,在1d,2d,3d和4d内对10mg·L-1的毒死蜱降解率分别达到18.95%,31.23%,36.55% and 47.69%,在2d内对10mg·L-1的毒死蜱降解率分别达到50.21%, 43.46% and 31.23%.
【英文摘要】One bacterial strain, named R17, was isolated from the sludge polluted with chlorpyrifos which had the capability to utilize chlorpyrifos as the sole carbon and energy sources. Strain R17 was identified preliminarily as Sphingopyxis terrae based on its physiological and biochemical characters and its 16S rDNA homologue sequence analysis. Under the optimal growth condition, 35℃ and pH 7-8,Strain R17 could reach 9.18×108cfu·mL-1 after 28h. The chlorpyrifos degradation characteristics of strain R17 were studied with different times and different initial chlorpyrifos concentrations. The results showed that with the inoculation of 9×107cfu·mL-1, the degradation rate of chlorpyrifos by strain R17 were 18.95%,31.23%,36.55% and 47.69% in 1d, 2d,3d and 4d respectively. The degradation rate of R17 with initial concentration of 1mg·L-1, 5mg·L-1, 10mg·L-1 chlorpyrifos reached 50.21%, 43.46% and 31.23% after 2d ,respectively.

【题目】Colonization and Chlorpyrifos degradation of Strain Stenotrophomonas acidaminiphila lux-β in Soil
【中文关键词】微嗜酸寡养单胞菌 lux-β 毒死蜱 降解 定殖
【英文关键词】Stenotrophomonas acidaminiphila lux-β chlorpyrifos degradation colonization
【中文摘要】一个毒死蜱降解菌微嗜酸寡养单胞菌(Stenotrophomonas acidaminiphila) lux-β被选为研究对象,菌株lux-β在土壤中的生存和毒死蜱降解能力被研究,为毒死蜱降解细菌在自然环境中的检测和定殖提供技术支持。结果表明,在灭菌土壤中菌株lux-β数量先上升,再缓慢下降。而在非灭菌土壤中数量下降很快。这表明土著微生物对外来的微生物产生重大影响。相比没有毒死蜱的土壤,在添加毒死蜱的土壤中有更大数量的lux-β,这表明,毒死蜱可以作为lux-β的营养。微生

物在毒死蜱降解中扮演重要角色,菌株lux-β比本地微生物具有更高的降解能力,这两类微生物在降解毒死蜱过程中可能产生协同效应。

【英文摘要】A chlorpyrifos-degrading strain of Stenotrophomonas acidaminiphila, lux-β was chosen for research object, and the survival and chlorpyrifos-degrading activity of strain lux-β in the soil with different treatments have been investigated in this study, so as to provide technique support for monitoring the colonization and degrading activity of chlorpyrifos-degrading bacteria in natural environment. The result indicated that the quantity of lux-β in the soil rose first and decreased slowly in sterilized soil while quickly in non-sterile soil, which suggested that native microbes had a significant influence on alien microbes. The quantity of lux-β was larger in soils with chlorpyrifos than those in soils without chlorpyrifos, and this indicated that chlorpyrifos could be used as nutrient by strain lux-β. Microbes played an important role in degrading chlorpyifos, and lux-β had higher degradation ability than native microbes, the two of which could generate synergistic effect on degrading chlorpyrifos.

【题目】Viability and Chlorpyrifos Degradation Characteristics of Strain lux-R17 in Soil

【中文关键词】毒死蜱降解菌株 luxAB标记 土壤 可行性 降解特性

【英文关键词】chlorpyrifos-degradation strain, luxAB labeling, soil, viability, degradation characteristics

【中文摘要】利用三亲本杂交的方法,luxAB基因被引入Sphingopyxis terrae R17, 标记基因在宿主菌中具有良好的遗传稳定性。标记菌株luxR17在1、2、3、4 d对10 mg/l毒死蜱降解率分别为17.72%、24.14%、35.06%和48.48%。在2 d,菌株luxR17对1、5、10 mg/l毒死蜱的降解速率分别为41.64%、35.20%、24.14%。接种3-6d后,luxR17的数量在自然土壤减少,后趋于稳定,菌落数为1.89×105 cfu/g。 而luxR17在接种至灭菌土后,在9 d内菌落的数量持续增加,在15 d保持在一个较高的水平,然后逐渐下降,趋于稳定。在3、6、9、12 d,在无菌土中,菌株luxR17对20 mg/l毒死蜱降解速率分别为42.37%,70.92%,80.04%和94.70%,而在自然土中,相同的降解时间降解率达到55.92%、72.27%、89.13%和98.31%。

【英文摘要】luxAB gene was introduced into strain Sphingopyxis terrae R17 by triparental mating methodsuccessfully, and the labeled strain luxR17 with good genetic stability was obtained. Thedegradation rate of luxR17 on 10 mg · L-1 chlorpyrifos were 17.72%, 24.14%, 35.06% and 48.48%respectively after 1, 2, 3, 4d. Within 2d, the degradation rate of luxR17 on 1, 5, 10 mg · L-1chlorpyrifos were 41.64%, 35.20% and 24.14% respectively. The quantity of luxR17 in naturalsoil decreased generally after inoculated for 3-6d, and became stable with the viable counts of1.89×105cfu · g-1. The quantity of luxR17 in sterilized soil kept increasing within 9d, andmaintained at a high level within 15d, then decreased gradually and became stable. Thedegradation rate of luxR17 on 20 mg · L-1 chlorpyrifos in sterilized soil were 42.37%, 70.92%,80.04% and 94.70% after 3, 6, 9, 12d, while which achieved 55.92%、72.27%、89.13% and98.31% in natural soil after the same degradation time.

【题目】Isolation and identification of malathion – degrading strain of Brevundimonas diminuta

【中文关键词】马拉硫磷 生物降解 缺陷假单抱菌

【英文关键词】Malathion Biodegradation Brevundimonas diminuta

【中文摘要】在本研究中,由电穿孔的方法,含有luxAB基因的质粒pTR10被成功地转入B.diminuta L19。影响L19电转化效率的影响因素如电场强度,电击时间和细胞生长时期被优化,电穿孔的最佳条件,如下所示:电场强度是14 kv/cm,电击时间是

3.5ms,细胞生长阶段为OD600 0.724。研究了转化子的遗传稳定性,以及luxAB对有机磷农药降解的影响。为了监测B.diminuta,标记菌为有机磷农药降解菌的示踪提供可靠的路径。B.diminuta对马拉松,甲基对硫磷、毒死蜱降解的加能力被研究。实验结果表明,luxAB基因可以在菌株L19中表达,在连续传代15次,发光仍然是稳定的。菌株在标记和未标记是对有机磷农药降解的能力差异不显著。发光标记可以用作选择标记的细菌检测。由于有一个广泛的农药降解谱,并且对马拉松有最强的降解能力。48小时对马拉松,甲基对硫磷、毒死蜱是24.06 mg/L、3.51mg/L和1.86 mg/L。对土壤修复和污水处理具有很大的潜在应用能力。

【英文摘要】A malathion (MLT) degrading strain L19 was isolatedfrom the soil that had been sprayed with MLT for a long time,and strain L19 could grow up with MLT as the sole carbonsource. Strain L19 could degrade 87.32% of MLT in mediumwith 20 mg · L-1 MLT after 48h with conditions of 30°C and pH6.5, and the MLT decomposed was positively correlated withdegradation time. Morphological characteristics and 16SrDNAsequence analysis indicated the homology between strain L19 andstrain AB021415 (Brevundimonas diminuta) was 98%. Thereforestrain L19 was preliminarily identified as Brevundimonasdiminuta.

【题目】Fast degradation of chlorpyrifos in soil by strain Cupriavidus taiwanensis X1 labeled with luxAB

【中文关键词】毒死蜱 台湾贪铜菌 降解 电穿孔 LuxAB 土壤

【英文关键词】Chlorpyrifos Cupriavidus Taiwanensis Degradation Electroporation LuxAB Soil

【中文摘要】为研究拥有强的毒死蜱水解能力的台湾贪铜菌毒的生态行为,利用电转将报告基因luxAB成功引入细胞。具有遗传稳定性和荧光的标记菌株被获得。标记和未标记的两个菌株在12h内,无机盐培养基中都能完全降解200 mg/l的毒死蜱。实验结果表明,引入luxAB并不影响菌株X1生长和对毒死蜱的降解。当标记菌株luxX1和菌株X1被接种到含500mg/l毒死蜱的土壤中,细胞浓度和毒死蜱残留检测和数据显示,标记菌株luxX1可以完全去除毒死蜱在12 d并存活在土壤中。标记菌lux X1在有机磷的环境修复中是一个潜在的优秀选择。

【英文摘要】For researching ecological behaviors of Cupriavidus taiwanensis X1 which has strong hydrolysis activity on chlorpyrifos(CP), reporter gene luxAB was successfully introduced into cells by electroporation. The labeled strain X1-lux with genetic stability and fluorescence was obtained. Both of strain X1 and X1-lux could completely degrade 200 mg/l CP within 12h in minimal salt

medium, and experimental results showed that introduction of luxAB did not affect strain X1 growth and degradation on CP. The cells of X1-lux and X1 were inoculated into soil with 500 mg/l CP, the cell concentration and CP residual was detected, and data revealed that strain X1 could absolutely removed CP in 12d and survive in soil. Strain X1 is a potential excellent choice for bioremediation of organophosphorus polluted environments.

【题目】Impact of long-term organic fertilizer application on lignin in Mollisol
【中文关键词】无
【英文关键词】Soil organic carbon; Lignin; CuO oxidation; Long-term fertilization
【中文摘要】无
【英文摘要】Fertilization is one of the essential managements to maintain and increase soil organiccarbon (SOC) level in agroecosystems. It has been realized that fertilizer applications influenced theturnover of labile and refractory organic carbon pools in arable soil markedly. However, the dynamicof relatively refractory lignin in response to fertilization is still kept unclear. Therefore, the impact oflong-term organic fertilization on the content and degradation degree of lignin in Mollisol wasinvestigated. Lignin monomers were released by alkaline CuO oxidation method and quantified bygas chromatography (GC). At the time scale of decades, lignin was clearly accumulated in soil and therelative accumulation of lignin in SOC was evident after long-term organic fertilizer application.Compared with the unfertilized soil, lower acid to aldehyde ratios of vanillyl and syringyl unitsinduced by organic fertilization suggested a lower degradation degree of lignin incorporated into soilto some extent. It could be concluded that long-term organic fertilization was an effective fertilizerpractice for lignin accumulation in soil and SOC sequestration in Mollisol in northeast of China.

【题目】风障对茶园的减风增温效果及对茶树冠层叶片含水率影响
【中文关键词】风,含水率,保温,茶园,风障
【英文关键词】wind , moisture content , thermal insulation , tea garden ,windbreaks
【中文摘要】为解决冬季茶园风寒冻害问题,于2008年1月在安徽农业大学茶场建立塑料薄膜风障,测定风障对茶园的减风增温作用及其对茶树冠层叶片含水率的影响。风障的高度为2.0 m,以5×7网格点测定2.8、2.0 m风障高和1.2 m茶树冠层高度3个层次的风速,以4×4网格点测定地表温度、茶树冠层叶片含水率。结果表明2.8 m高度,风障上方的风速比环境风速增加30%左右,下风方向的减风作用随风速增大而减小,距离风障7 m区域是风速减弱最强的区域,环境风速2.6 m/s时中轴线风速减小13.5%,环境风速1.0 m/s时的减小幅度达40.0%,在15 m位置基本恢复环境风速。风障高度(2.0 m)最大减风距离出现的位置介于距离风障7~10 m之间。由于薄膜风障不透风,在冠层高度(1.2 m)形成约2倍风障高度宽的准静风区。风障的有效减风作用区域大约相当于风障高度的7.5倍。风障的保温作用与日照条件关系密切,日照较强则可提高保护区的温度,夜间与阴天保温作用较不明显。大风作用下,茶树叶片含水率呈一定程度下降,下降幅度与风速正相关,风速大区域含水率下降幅度也大。在风障有效保护区域,大风结束后叶片含水率可较迅速地恢复,风障有效保护区域外的叶片含水率降幅较小,但恢复较慢。综合减风、增温及叶片含水率恢复情况,薄膜风障对于减轻冬季大风降温的危害具有较好的作用。

【题目】稻草和地膜覆盖对冬季茶园保温增温作用的研究
【中文关键词】茶园 稻草覆盖 地膜覆盖 地表温度 冬季保温增温作用
【英文关键词】Tea plantation, Straw mulching, Plastic film mulching, Surface temperature, Winter warming and insulation
【中文摘要】通过对稻草秸秆覆盖、地膜覆盖等不同覆盖物表层及其对应的地表最低、最高温度 23 d 连续测定与对比分析, 研究了覆盖物对地表的保温、增温作用。各测点最低温度相关系数最小为 0.889, 最高温度相关系数最小为 0.813, 均在 0.01 水平显著相关, 表明温度场高度相关。与对照相比, 稻草覆盖使地表最低温度平均提高 1.2 ℃以上, 地膜覆盖则提高 0.2 ℃以上。天气晴好状态下, 稻草覆盖的保温作用强于地膜覆盖, 且与覆草厚度无关; 阴雨雪天气, 稻草与地膜的保温作用均显著下降, 稻草覆盖的降幅小于地膜覆盖, 且覆盖厚度大降幅较小。 天气晴好条件下地膜覆盖可以提高地表温度, 无光环境中地膜无显著增温作用; 将茶园覆盖的稻草分为晴天干草、晴天湿草、阴天干草、阴天湿草 4 种类型, 其增温效果与稻草类型有关, 且强于地膜覆盖。总之, 与地膜相比, 稻草覆盖保温效果好, 并具有一定的增温效果, 无污染, 材料来源丰富, 更适宜于作为冬季防寒材料。

【题目】茶园地面覆盖的保温防冻作用
【中文关键词】茶园;稻草覆盖;地膜覆盖;地表温度;防冻作用
【英文关键词】Tea plantation; Straw mulching; Plastic film mulching; Surface temperature; Freeze protection
【中文摘要】以茶园为研究对象 ,设置两种厚度的稻草覆盖、 地膜覆盖和不覆盖 (对照) 4种处理 ,在最冷月份(2009年1月)连续观测覆盖层表面及其对应的地面最高温度、 最低温度 ,研究地表覆盖的保温作用和对茶树的防冻效果。结果表明 ,逐日最低温度与太阳辐射日总量呈显著的反相关关系 ,其中覆盖物表面最低温度与太阳辐射的相关系数大于覆盖下地表面。观测期间深草、 浅草与地膜覆盖的地面最低温度平均值分别为1.2℃、 1.1℃和- 1.4℃,分别比对照高 4.4℃、 4.3℃ 和 1.8℃,稻草覆盖的保温作用明显强于地膜覆盖 ,但稻草厚度差异所产生的保温作用差异不显著。同时观测到 ,地膜覆盖处理的地表最高温度明显高于对照 ,而稻草覆盖处理的地表最高温度明显低于对照 ,不同厚度稻草覆盖处理间的差异不显著 ,说明地膜覆盖有明显的增温作用而稻草覆盖没有。进一步观测发现 ,稻草覆盖处理的茶树冠层叶片冻伤脱落率 <地膜覆盖 <对照 ,但相互间差异不大;而地膜覆盖处理的春茶早芽萌发期最早 ,稻草覆盖的最晚。

【题目】茶树冷诱导基因RAV的克隆与表达特性分析
【中文关键词】茶树; RAV转录基因; 基因克隆; qRT-PCR; 表达分析
【英文关键词】Camellia sinensis; RAV transcription factor; gene clone; qRT-PCR; expression analysis
【中文摘要】对利用cDNA-AFLP技术所获得的茶树低温诱导差异表达片段TDF, 通过RACE方法获得含完整编码区序列的茶树RAV基因cDNA克隆, 其开放阅读框编码361个氨基酸, 包含两个保守的结构域AP2和B3, 与多种植物RAV蛋白具有高度同源性。qRT-PCR分析表明, 茶树RAV基因受低温、乙烯、NaCl等上调表达, 最大表达量分别是诱导前的5.8、10.0和1.9倍。在成熟叶片、芽、嫩茎中RAV基因表达量相近, 花蕾和嫩根中表达较低, 而在种子中不表达。推测该基因在组织中的表达受到严格控制以及在响应非生物胁迫中发挥重要作用。

【题目】Pb(Ⅱ)、Zn(Ⅱ)对孔石莼吸收总氨氮的影响
【中文关键词】重金属;胁迫;孔石莼;总氨氮;吸收
【英文关键词】Heavy metals; stress; Ulva pertusa; ammonia nitrogen; uptake
【中文摘要】在实验室条件下研究了大型海藻孔石莼Ulva pertusa在Pb(Ⅱ)、Zn(Ⅱ)胁迫下对不同浓度总氨氮的吸收过程。总氨氮的设计水平为0、0.25、0.5、110、1.5、2.0mg/L, Pb(Ⅱ)、Zn(Ⅱ)的质量浓度为0.5、1.0mg/L,持续时间为12h。结果表明:对照组在0~1h内,孔石莼对总氨氮的吸收速率显著高于之后的时间段,有明显的快吸收过程;在Pb(Ⅱ)、Zn(Ⅱ)的胁迫下,这种初期快速吸收的现象减弱;两种重金属都能对孔石莼吸收总氨氮产生抑制作用,其中Pb(Ⅱ)、Zn(Ⅱ)对孔石莼吸收总氨氮初期阶段(0~1h)的胁迫作用显著,抑制率达40%~70%;高浓度(1mg/L)的Pb(Ⅱ)、Zn(Ⅱ)对孔石莼吸收总氨氮的胁迫作用大于低浓度(015mg/L);Zn(Ⅱ)对孔石莼吸收总氨氮的抑制作用强于Pb(Ⅱ)。
【英文摘要】The TNH3- N uptake by sea lettuce Ulv apertusa under stress of different concentrations (0.5, and1. 0mg/L) of Pb(Ⅱ) and Zn(Ⅱ) were determined at ammonia nitrogen concentrations of 0, 0.25, 0.5, 1.0, 1.5, and 2.0mg/L for 12 hours in a laboratory. The uptake rate was found to be significant higher in 0-1h than in interval time, and significant surge up take occurred at beginning of the experiments in the control group, but the surge uptake decreased significantly by stress of Pb(Ⅱ) and Zn(Ⅱ). Significant inhibition was observed when the concentration of Pb(Ⅱ) and Zn(Ⅱ) was 0.5 and 1.0mg/L in the 0- 1 hour. Zn(Ⅱ) showed stronger inhibition of the uptake rates than Pb(Ⅱ).

【题目】牙鲆海水循环养殖系统生物膜上3种细菌的数量与代谢活性
【中文关键词】移动床生物滤器;异养细菌;氨化细菌;氨氧化细菌;亚硝酸氧化细菌
【英文关键词】Moving bed biofilter; heterotrophic bacteria; ammonifiers; ammonia oxidizing bacteria; nitrite oxidizing bacteria
【中文摘要】从牙鲆(Paralichthys olivaceus)海水循环养殖系统中移动床生物滤器载体生物膜上获取异养细菌、氨化细菌和硝化细菌样本。异养细菌用平板涂布法计数,其代谢活性以培养8 h的氧吸收速率表示。氨化细菌、氨氧化细菌(AOB)

和亚硝酸氧化细菌(NOB) 用MPN法计数,其代谢活性分别以培养24 h NH4+-N 浓度的增加、NH4+-N浓度的减少和NO2--N浓度的减少表示。结果表明,生物膜成熟之后,4 种生理类群细菌的数量和代谢活性基本保持稳定。异养细菌数量为107~108CFU ▪ m-2(载体),氨化细菌、AOB和NOB 数量分别为107~108MPN ▪ m-2(载体)、105~106 MPN ▪ m-2(载体) 和105~106 MPN ▪ m-2 (载体)。分批培养测得异养细菌的氧吸收速率、氨化细菌的氨化速率、AOB 的氨氧化速率和NOB 的亚硝酸氧化速率分别是0.591~0.738 g (O2) ▪ m-2 ▪ d-1、0.081~0.135 g (NH4+-N) ▪ m-2 ▪ d-1、0.017~0.031 g (NH4+-N) ▪ m-2 ▪ d-1和 0.020~0.038 g (NO2—N) ▪ m-2 ▪ d-1。异养细菌的氧吸收速率、氨化细菌的氨化速率和AOB 的氨氧化速率与异养细菌、氨化细菌和AOB 的数量呈正相关。移动床生物滤器生物膜的平均氨和亚硝酸盐去除速率为(0.121±0.076) g (NH4+-N) ▪ m-2 ▪ d-1和(0.139±0.181) g (NO2—N) ▪ m-2 ▪ d-1。同时测定了底物浓度和pH 对氨化细菌、AOB 和NOB 代谢活性的影响。结果显示,氨化细菌的氨化速率、AOB 的氨氧化速率和NOB 的亚硝酸氧化速率与底物浓度(蛋白胨、NH4+-N和NO2—N) 呈线性相关,pH 为8.0 时3 种生理类群细菌的代谢活性较pH 6.5 或pH 9.5 时高。

【英文摘要】In the present study, viable numbers and metabolic activities of aerobic heterotrophic bacteria, ammonifiers ,ammonia oxidizing bacteria (AOB), nitrite oxidizing bacteria (NOB) in marine biofilms were investigated. The studied biofilms were associated with media of a moving bed biofilter in marine aquaculture recirculating system. The system was stocked with Japanese flounder (Paralichthys olivaceus). Numbers of heterotrophic bacteria were determined by plate counts and metabolic activities were measured oxygen uptake rate (OUR) determination during eight hours incubation. Numbers of ammonifiers, AOB and NOB involved in N metabolism were evaluated by the most probable numbers-test (MPN) method, Their metabolic activities were estimated by calculating the increase in NH4+-N concentration, the decrease in NH4+-N and NO2—N concentrations during 24 h incubation, Results showed that the numbers and activities of the four physiological groups of bacteria kept relatively stable after biofilm maturation. The numbers of heterotrophic bacteria expressed as colony-forming units per square meter of media and the MPN of ammonifiers, AOB and NOB per square meter of media were 107~108, 107~108, 105~106 and 105~106, respectively. In batch culture, the OURs of heterotrophic bacteria, the ammonification rates of ammonifiers, the ammonia oxidizing rates of AOB and the nitrite oxidizing rates of NOB ranged from 0.591~0.738 g (O2) ▪ m-2 ▪ d-1、0.081~0.135 g (NH4+-N) ▪ m-2 ▪ d-1、0.017~0.031 g (NH4+-N) ▪ m-2 ▪ d-1and 0.020~0.038 g (NO2—N) ▪ m-2 ▪ d-1, respectively. The oxygen uptake rates of heterotrophic bacteria, the ammonification rates of ammonifiers and the ammonia oxidizing rates of AOB were correlated with the numbers of heterotrophic bacteria, ammonifiers and AOB. The mean ammonia and nitrite removal rates of the moving bed biofilter were (0.121±0.076) g (NH4+-N) ▪ m-2 ▪ d-1 and (0.139±0.181) g (NO2—N) ▪ m-2 ▪ d-1 calculated according to the difference between NH4+-N, NO2—N inlet biofilter concentrations, Furthermore, influences of substrate concentration and PH on metabolic activities of ammonifiers and nitrifiers (AOB and NOB) were detected,. Results showed that ammonification rate, ammonia- and nitrite oxidizing rates were linearly correlated with substrate concentrations (peptone, NH4+-N or NO2—N), and at pH 8.0 higher ammonification and nitrogen conversion rates were got than those of pH 6.5 and pH 9.5.

【题目】茶树冷诱导基因的 AFLP 筛选及其表达分析
【中文关键词】茶树; 冷诱导; cDNA-AFLP; qRT-PCR
【英文关键词】Camellia sinensis ; cold stress; cDNA-AFLP; qRT-PCR
【中文摘要】以中小叶茶树良种舒茶早和云南大叶种73-11为材料,于4°C低温处理4 d后,采用AFLP技术筛选出冷诱导下茶树差异表达基因并进行分析.结果显示,实验共获得41个差异片段(TDFs),其中舒茶早产生19条差异条带,73-11产生38条差异条带,两品种共有条带16条.所获得的差异片段按功能可划分为4类,即信号传导蛋白、转录因子、基础代谢相关蛋白、抗逆蛋白质,此外还有一些假设蛋白质以及未知蛋白.利用qRT-PCR对Kh1、Kh3和Kh11差异片段进行验证,结果显示这3个片段均被低温诱导,表达量上升.研究表明,茶树在低温胁迫下的逆境反应非常复杂,涉及多种代谢过程中的众多基因,而且大叶种比中小叶种对低温反应更为敏感.

【题目】牙鲆养殖循环系统中固体废物的粒径分布与沉降特征
【中文关键词】牙鲆;循环养殖系统;颗粒物;固体废物去除
【英文关键词】Japanese flounder;recirculating aquaculture system(RAS);particles;solids removal
【中文摘要】沉淀槽是收集系统中固体废物的最简单装置,其设计参数与其沉淀的颗粒物特性有关。通过研究牙鲆(Paralichthys olivaceus)养殖循环系统产生固体废物的粒径分布和沉降特征,得到了牙鲆养殖固体废物去除的沉淀槽设计参数——溢流率与颗粒物去除效率间的关系,可作为设计沉淀槽时参考。结果表明:系统产生固体废物量为0.13—0.27 kg TSS/kg饲料,平均为(O.22±0.06)kg TSS/kg饲料。沉淀槽中固体废物主要为粒径<200 m的颗粒,占51.5%,其粒径分布符合双曲线型分布。在给定溢流率的情况下,沉淀槽的固体废物理论去除效率可采用颗粒物的沉降曲线估算。溢流率为1/16 m3/(m2·s)时计算的颗粒物理论去除效率为8l%。
【英文摘要】The settling basin is simplest equipment for capturing solids waste from recirculating aquaculture system.Knowledge of particle properties is essential to the design of effective solids removal systems.The particle size distribution and settling characteristics of solids from recirculating aquaculture system for Japanese flounder(Paralichthys olivaceus)culture were investigated.The relationship between design parameter overflow rates and removal efficiencies of sedimentation basin for removal of solids waste was obtained.The results show that the contents of solids waste generated from per kg of food per day at three different feed levels was 0.22±0.06 kg of dry weight ranging from 0.13 to 0.27 kg of dry weight.In the particles settled in sedimentation basin,the majority of the particles were found to be in the size less than 200 μ m.percentage is 51.5%.The particle size distribution settled in the sedimentation basin could be described using hyperbolic function.. The theoretical removal efficiencies were estimated according to settling curve of particles at given overflow rates(OFR)for the reference of sedimentation design.

【题目】牙鲆养殖循环系统中3种硝化作用滤器性能的比较
【中文关键词】牙鲆;养殖循环系统;硝化滤器;载体;氮去除
【英文关键词】Paralichthys olivaceus;recirculating system;nitrification filter;medium;nitrogen removal
【中文摘要】摘通过测定牙鲆Paralichthys olivaceus养殖循环水中总氨氮、亚硝酸态氮和硝酸态氮的含量,了解以塑料环、火山石和牡蛎壳为载体的3种硝化滤器生物膜的熟化情况;调节循环水流量,使硝化滤器水力停留时间分别为5、15、20、30、60 min,比较氨氮去除率,得到实验条件下3种载体硝化滤器的最佳水力停留时间,并在此条件下,投加NH4C1,使循环养殖水中总氨氮浓度分别为1、3、5 mg/L,测定水中总氨氮随时间的变化,研究氨氮去除动力学规律,计算硝化滤器的去除效率。结果表明:附着于3种载体上生物膜的熟化时间约为25 d;塑料环上异养菌和硝化菌数量均为最高,氧化还原反应最活跃,火山石次之,牡蛎壳最低;3种载体硝化滤器的最佳水力停留时间为2O~30 min。氨氮负载为1 mg/L时,12 h内氨氮去除为 0级反应;氨氮负载分别为3 mg/L和5 mg/L条件下,24 h内氨氮去除为0级反应。氨氮负载越大,氨氮去除速率就越大。在氨氮负载为1、3、5 mg/L时,3种载体的氨氮去除效率分别为17.5l~16.39、36.39 ~33.04、58.96—53.25 g/(m3·d)。
【英文摘要】The growth and nitrification performances of plastic ring,volcano stone and oyster shell biofiher media were studied in a water recirculation system for Japanese flounder Paralichthys olivaceus culture by determination of the nitrogen concentrations of ammonia, nitrite and nitrate. Ammonia removal was compared in the same filter media 5,15,20,30,and 60 min after hydraulic retention. The nitrification kinetics and ammonia removal rate were studied by ammonia concentrations decreasing with time at different initial

ammonia—N concentrations of 1,3,and 5 mg/L. The maturation time of the three types of filter media was found to be about 25 d. The maximal heterotrophic bacteria and the nitrite bacteria and the maximal active oxidation-reduction reaction were observed on the plastic ring among three types filter media, followed by on the volcano stone, then on the oyster shel1.The optimum hydraulic retention period of the three types of filter media was found to be 20—30 min. The biodegradation of ammonia—N followed the zero—order kinetics in 12 h at the nitrogen load of 1 mg/L,and in 24 h at the nitrogen load of3 mg/L or5 mg/L. The ammonia removal rate by the three types of nitrification filter was 17.51—16.39,36.39—33.04,and 58.96—53.25 g/(m3 · d)at nitrogen load of 1,3,5 mg/L.

【题目】Neuroendocrine responses to cold stress in Chinese indigenous breeds from different latitude
【中文关键词】无。
【英文关键词】adrenal axis,thyroid axis,chinese indigenous breed,cold stress,china
【中文摘要】无。
【英文摘要】It is well established that stress is related to neurochemical and hormonal changes including alterations in adrenal and thyroid hormone levels. In the present study, thyroid axis and hypothalamic-pituitary-adrenal axis related hormomal, Triiodothyronine (T3), Thyroxine (T4), Thyroid-Stimulating Hormone (TSH), Adreno-Cortico-Tropic-Hormone (ACTH) and Thyroid Releasing Hormone (TRH) mRNA, ACTH mRNA changes during cold stress with different intensities were recorded in two Chinese indigenous breeds from different latitude. The results showed that Huainan partridge chicken from central China, showed obvious conversion in

T3 and T4 under severe cold stress. Plasma TSH and pituitary TRH mRNA highly expressed over 12-24 h long time severe cold exposure. However, mild cold did not obviously affect those hormones mentioned above. In the Wenchang chicken which from south of China, severe and mild cold stress showed the same affection on the thyroid axis but not obvious on the adrenal axis. The results would further help the revealing of the mechanism of injury caused by cold stress and provide better controls for chicken from loss of cold stress in different areas.

【题目】pH吸附法纯化乳酸乳球菌素Lacticin LLC518的研究
【中文关键词】乳酸乳球菌素LLC518;细菌素;pH吸附;纯化
【英文关键词】The adsorption rate of Lacticin LLC518 to Lactococcus lactis subsp.lactis 518 at different pH conditions was studied. At pH 6.0 the adsorption rate was 100%, while at pH 2.0, Lacticin LLC518 was not adsorbed at all. By changing pH several times, Lacticin
【中文摘要】论文研究了不同pH条件下乳酸乳球菌素LLC518吸附于乳酸乳球菌LLC518的规律,并利用这一规律进行了细菌素的分离,其效果良好。
【英文摘要】The adsorption rate of Lacticin LLC518 to Lactococcus lactis subsp.lactis 518 at different pH conditions was studied. At pH 6.0 the adsorption rate was 100%, while at pH 2.0, Lacticin LLC518 was not adsorbed at all. By changing pH several times, Lacticin

LLC518 was adsorbed at pH 6.0 and released at pH 2.0 to achieve better effect of purification. As ammonium sulfate precipitation samples as controls, the specific activity of Lacticin LLC518 was increased 83.02 fold with a yield of 20 % using chromatogram contrast analysis methods of preparation of separation bacteriocins. It is simple and effective, could be used as commercial preparations for food industry.

【题目】戊糖乳杆菌素pentocin LPEM818的初步纯化及特性研究
【中文关键词】戊糖乳杆菌;细菌素;纯化;特性
【英文关键词】Lactobacillus pentosus; bacteriocin; purification; characterization
【中文摘要】对戊糖乳杆菌(Lactobacillus pentosus) LPEM818所产戊糖乳杆菌素(pentocin) LPEM818进行了初步纯化,并对其生物学特性进行了研究。结果表明该细菌素具有良好的应用性能,具有作为食品生物防腐剂的潜在应用价值。
【英文摘要】The partial purification and characterization of pentocin LPEM818 produced by Lactobacillus pentosus LPEM818 were studied. Pentocin LPEM818 was purified by 80 % ammonium sulfate precipitation and Sephadex G-25 column chromatography. The results showed that an 11.09 fold purification and 4.6 % yield were obtained. Pentocin LPEM818 exhibited strong heat stability (remained 84.52 % of the antibacterial activity after 15 min at 121 ° C) and pH stability (pH 2.0-8.0). The activity of pentocin LPEM818 was destroyed after treatment with proteinase K and trypsin. The mode of action of pentocin LPEM818 was bactericidal. Pentocin LPEM818 exhibited inhibitory activity against part of the Gram-positive bacteria and Gram-negative bacteria. The identified properties of pentocin LPEM818 indicate that it is a novel bacteriocin with potential application as a bio-preservative to improve the safety of food products.

【题目】抑黄曲霉乳酸菌的筛选及菌种鉴定
【中文关键词】黄曲霉;乳酸菌;16S rRNA
【英文关键词】Aspergillus flavus;Lactic acid bacteria;16S Rrna
【中文摘要】筛选具有抑制黄曲霉(Aspergillus flavus)生长的乳酸菌。对筛选出的菌株进行生理生化及16S rRNA分子生物学鉴定。结果 分离得到756株乳酸菌,其中有6株菌株对黄曲霉的生长有明显的抑制作用。结论 实验获得的6株产酸菌,3株为植物乳杆菌(Lactobacillus plantarum),2株为消化乳杆菌(L.alimentarius),1株为亚利桑那乳杆菌(L.arizonenensis)。
【英文摘要】Objective To obtain strains of lactic acid bacteria with inhibitory activity against Aspergillus flavus. Method Strains of lactic acid bacteria isolated from many sorts of pickles, bean dregs, chicken and pig intestines were screened for antifungal activity in the agar-well diffusion assay. The isolates were identified with physiological and biochemical characteristics and 16SrRNA sequencing. Result Among of the 756 strains isolated, 6 strains showed strong inhibitory activity against A.flavus. Conclusion The results show that 3 strains are Lactobacillus plantarum, 2 strains are L. alimentarius and 1 strain is L. arizonenensis.

【题目】Characterization of a novel bacteriocin produced by Lactobacillus sakei LSJ618 isolated from traditional Chinese fermented radish
【中文关键词】细菌素;清酒乳杆菌;请酒乳杆菌素;生物防腐剂
【英文关键词】Bacteriocin; Lactobacillus sakei; Sakacin; Biopreservative
【中文摘要】论文研究了一株产细菌素的清酒乳杆菌所产清酒乳杆菌素的性质,为进一步的应用奠定了基础。
【英文摘要】A novel bacteriocin, sakacin LSJ618, produced by the strain Lactobacillus sakei LSJ618 isolated fromtraditional Chinese fermented radish, was studied. L. sakei LSJ618 was identi fi ed by both phenotypicaland physiological tests combined with 16S rDNA sequence analysis. Sakacin LSJ618 is sensitive tohydrolytic enzymes including lipase, is stable between pH 2e8, and is heat resistant (30 min at 121 C).Sakacin LSJ618 exhibits inhibitory activity against food-spoiling bacteria and food-borne pathogens,including the

Gram-positive Listeria monocytogenes, Staphylococcus aureus, Sarcina sp., Micrococcusluteus, and the Gram-negative Proteus sp. and Escherichia coli, but not against most of the lactic acidbacteria tested. Maximal production of bacteriocin was reached in the late stationary phase, andinhibitory activity declined within 26 h. The mode of action of sakacin LSJ618 was determined to bebactericidal, as evidenced by its action upon Micrococcus tetragenus. After partial puri fi cation byammonium sulfate precipitation and Sephadex G-25 chromatography, the molecular weight of sakacinLSJ618 was determined to be 5.2 kDa by Tricine-SDS-PAGE. The identi fi ed properties of sakacin LSJ618indicate that it is a novel bacteriocin with potential application as a biopreservative in the food industry.

【题目】Optimization of medium composition for production of lacticin LLC518 by Lactococcus lactis subsp. lactis LLC518 using response surface methodology

【中文关键词】优化,细菌素,乳酸球菌,乳酸菌素,相应面

【英文关键词】Optimization, bacteriocin, Lactococcus lactis, lacticin, response surface methodology.

【中文摘要】论文采用响应面的方法研究了乳酸乳球菌惨细菌素的发酵条件,优化后细菌素产量较原始条件提高了86.3%,研究结果为该细菌素的进一步研究奠定了基础。

【英文摘要】Response surface methodology (RSM) was applied for the optimization of lacticin LLC518 production, which was produced by Lactococcus lactis subsp. lactis LLC518. Tryptone, KH2PO4 and MgSO4 had signicant effects on lacticin LLC518 biosynthesis by a Plackett-Burman design (PBD). After steepest ascent design (SAD) and central composite design (CCD), the optimum medium compositions were obtained as follows (g/l): sucrose 20, yeast extract 5, tryptone 8.18, beef extract 10, MgSO4 · 7H2 O 0.82, K2HPO4 2.8, (NH4)2HC6H5O7 5.0, CH3COONa 5.0, MnSO4 0.25 and Tween 80 5 ml. An 86.3% increase in bacteriocin production (180.13 IU/ml) was achieved under this condition compared within unoptimized medium (96.72 IU/ml). Under these optimized conditions, the production of Lacticin LLC518 began at 4 h, peaked at 14 h.

【题目】Cytopathic Effect of Classical Swine Fever Virus NS3 Protein on PK-15 Cells.

【中文关键词】无

【英文关键词】classical swine fever virus; cytopathic effect; apoptosis

【中文摘要】无

【英文摘要】In order to further research the relationship between classical swine fever virus' (CSFV) NS3 protein and the cytopathic effect (CPE) in cells infected with the CSFV, and to reveal the effect of protein NS3 on the host cells, the NS3 of CSFV Shimen strain amplified by RT-PCR was subcloned into the pEGFP-C1, named pEGFP-C1-NS3. The insert position, the size and the reading frame were correct for restriction enzyme digestion and sequence analysis. The pEGFP-C1-NS3 and pEGFP-C1 were transfected into PK-15 cells by liposome, and positive cell clones were gained by G418. The NS3-EGFP fusion protein expressed in pEGFP-C1-NS3 cells was observed by inverted fluorescence microscopy and identified by Western blot. The CPE appeared in positive pEGFP-C1NS3 cells 72 h after passaging, apoptosis detection was also performed on positive pEGFP-C1-NS3 cells and pEGFP-C1 cells 72 h after passaging by TUNEL assay. The apoptosis rates in the positive pEGFP-C1-NS3 and pEGFP-C1 cells were 43.4 and 13.1%, respectively ($p < 0.05$). The results suggest that the CPE in positive pEGFP-C1-NS3 cells was induced by apoptosis and there is a relationship between the

expression of NS3 and apoptosis. Copyright (c) 2008 S. Karger AG, Basel.

【题目】Recent Advances in the Derivation of Germ Cells from the Embryonic Stem Cells
【中文关键词】无
【英文关键词】IN-VITRO; BONE-MARROW; SEXUAL-DIFFERENTIATION; OVARIAN STRUCTURES; C-KIT; MOUSE; EXPRESSION; MICE; GENE; PROTEIN
【中文摘要】无
【英文摘要】: In recent years, considerable progress has been made in the establishment and differentiation of human embryonic stem (ES) cell lines. The primordial germ cells (PGCs) and embryonic germ (EG) cells derived from them share many of their properties with ES cells. ES cell lines have now been derived from different stages of germ cell development and they have differentiated into gametes and shown embryonic development in mice, including the production of live pups. Conversely, germ cells can also be derived from ES cells. It has been demonstrated that murine (m) ES cells can differentiate into PGCs and subsequently into early gametes (oocytes and sperms) and blastocysts. Recently, immature sperm cells derived from mES cells in culture have produced live offspring. Preliminary research has indicated that human (h) ES cells probably have the potential to differentiate into germ cells. Adult stem cells have been reported to differentiate into mature germ cells in vitro. Therefore, stem cells may offer a valuable in vitro model for the investigation of germ cell development and the early stages of human gametogenesis, including epigenetic modifications of the germ line. This review discusses recent developments in the derivation and specification of mammalian germ cells from ES cells and describes some of the mechanisms of germ cell development.

【题目】Increased pre-implantation development of cloned bovine embryos treated with 5-aza-2 ′ -deoxycytidine and trichostatin A.
【中文关键词】无
【英文关键词】cloned embryo; pre-implantation development; blastocyst quality; 5-aza-2 '-deoxycytidine; trichostatin A
【中文摘要】无
【英文摘要】Limited success of somatic cell nuclear transfer is attributed to incomplete reprogramming of transferred nuclei. The objective was to determine if 5-aza-2'-deoxycytidine (5-aza-dC) and trichostatin A (TSA) promoted reprogramming and improved development. Relative to untreated controls, treatment of donor cells, cloned embryos, and continuous treatment of both donor cells and cloned embryos with a combination of 0.01 mu M 5-aza-dC and 0.05 mu M TSA significantly increased the blastocyst rate (11.9% vs 31.7%, 12.4% vs 25.6%, and 13.3% vs 38.4%, respectively) and total cell number (73.2 vs 91.1, 75.2 vs 93.7, and 74.6 vs 96.7). Moreover, blastocyst rate and inner cell mass (ICM) cell number of embryos continuously exposed to both reagents were significantly higher than that of a TSA-treated group (38.4% vs 23.9% and 27.4 vs 18.2). The DNA methylation level of 2-cell embryos was decreased significantly, whereas the histone acetylation level increased dramatically after donor cell treatment and continuous treatment with both reagents. However, these epigenetic features of cloned blastocysts were not significantly different than the untreated control group. Following embryo treatment. DNA methylation and histone acetylation levels of cloned blastocysts were unchanged, except for

the group given 0.5 mu M TSA (acetylation level was significantly increased, but development potential was reduced). In conclusion, development of cloned bovine embryos was enhanced by 5-aza-dC and TSA; furthermore, the combination was more effective than either one alone. (c) 2008 Elsevier Inc. 【中文关键词】拟穴青蟹;幼蟹; 中间培育;设施养殖; 存活率
【英文关键词】无
【中文摘要】在水温 25. 2 1 、连续充气和 pH 7. 8~ 8. 3 条件下, 以蚊帐布和筛绢网制成网笼作为养殖设施,以 7 个盐度梯度、 6 种养殖密度和 2 种网衣材质的 3 因素多水平实验设计进行幼蟹养殖试验. 结果表明: 幼蟹存活率均在盐度 25 时最高,分别为 C1 95. 0%, C2 90. 5%, 盐度高于或低于 25 均有下降趋势, C1 和 C2 在各盐度梯度组累计存活率均差异显著(p< 0. 01) ,而在同一盐度梯度下差异不显著(p > 0. 05) ; C1 至 C2 和 C2 至 C3 在盐度 5、 30、 35 时发育时间为 120 2 h, 而在盐度 10、 15、 20、 25 时为 96 2 h,同时在盐度 10、 15、 20、 25 组中幼蟹蜕皮的同步性优于盐度 5、 30、 35 组.在不同密度条件下,幼蟹均在密度为 637 ind/ m2时存活率最高, 且 C1 的平均存活率(89. 6%)比 C2 (84. 5%) 高, C1 和 C2 在同一密度梯度下的存活率差异极显著(p < 0. 01) . 在蚊帐布和筛绢网 2 种材质养殖容器中, C1 的平均存活率分别为 90. 4% 和88. 7%, 差异不显著(p> 0. 05) , 而 C2 的平均存活率分别为 86. 6%和 82. 6%, 差异极显著(p< 0. 01) , 表明 C1 对养殖容器材质的选择性不强.综上所述,在盐度为 25,养殖密度为 637 ind/ m2,蚊帐布为网衣材质的实验条件下,幼蟹生长最好,存活率可达到最高值.
【英文摘要】Under the condition of water temperature(25. 2± 1℃) , continuous aeration and pH 7.8~ 8. 3, a 3 factor multilevel juvenile crab culture experient were implemented with 7 salinity levels, 6 cultural density and 2 rearing container textiles. The result showed that the juvenile crab had the highest survival rate (C1 95. 0%, C2 90. 5%) at 25 salinity. There was a decreased trend at the

salinity either lower or higher 25. The survival rate of C1 and C2 had significant differences among all salinity levels groups (p< 0. 01), but no significant differences (p > 0. 05) in the same salinity level. The intermolt period of C1 to C2 and C2 to C3 at 5, 30, 35 salinity was 120±2 h, while at 10, 15, 20, 25 salinity, it was 96±2 h, the extent of metamorphism synchronization was more higher at 10, 15,20, 25 g ro ups than those of which at 5, 30, 35. Among all cultural densities , 637 ind/ m2 had the highest survival rate (90. 00%) . The average survival rate of C1 (89. 6%) was higher than C2(89. 6%) , and significant differences (p < 0. 01) of survival rate between C1 and C2 were found at the same cultural density. The survival rate of juvenile crab C1 in mosquito net and bolting silk container were 88. 50% and 85. 65% respectively , the survival rate of mosquito net (90. 4%) and bolting silk(88. 7%) had no significant differences(p> 0. 05) , while the survival rate of C2 in mosquito net (86. 6%) and bolting - silk(82. 6%) had significant differences(p < 0. 01) ,which suggested that C1 was not much selective to the textile of container. In conclusion, the optimum condition was 25 salinity, 637ind/ m2and mosquito net container.

【题目】锯缘青蟹可溶性蛋白与可溶性糖的季节变化
【中文关键词】锯缘青蟹; 可溶性蛋白;可溶性糖;季节变化
【英文关键词】Scylla serrata; soluble proteins; soluble saccharide; seasonal changes
【中文摘要】锯缘青蟹(Scy lla ser rata) 是生活在河口海区的一种经济甲壳动物, 环境温度对其生化组成具有重要影响,而其环境温度是随季节变化而不断变化.本研究采用生物化学方法对锯缘青蟹鳃、 肝胰腺和肌肉等 3 种器官组中可溶性蛋白和可溶性糖含量的季节变化进行研究. 结果显示锯缘青蟹 3种不同器官、 组织中可溶性蛋白含量, 均是夏季最低,冬季最高, 春秋季介于 2 者之间. 3 者的变化趋势一致, 春季后降低, 夏季降至最低,然后秋季和冬季依次升高. 3 种不同器官、 组织中可溶性糖含量均是春季最高,夏季最低, 秋冬季介于 2 者之间. 其变化趋势是春季后降低,夏季降至最低, 然后秋季和冬季升高(肝胰腺) 或依次升高(鳃和肌肉) . 本实验结论为锯缘青蟹鳃、 肝胰腺和肌肉中可溶性蛋白的季节变化基本一致;不同器官组织中可溶性糖的季节变化也较为一致. 但可溶性蛋白和可溶性糖之间的季节变化有差异,说明不同器官组织中同一生化成分的季节变化较为相似
【英文摘要】 Mud crab(Scylla serrata) is an important economic crustacea,living in estuary waters.Great impact on biochemistry composition in tissues always is exerted by environment temperature,which usually fluctuates with seasonal changes.In this work,biochemistry methods were used to measure seasonal soluble proteins and soluble saccharide in gill,hepatopancreas and muscle of S.serrata.The results show that soluble proteins in organs and tissues are the lowest in summer and the highest in winter.The change trends are conformable in different organs or tissues,namely,soluble proteins decrease after spring,get to the lowest in summer and increase in autumn and winter in order of precedence.Soluble saccharide in different organs and tissues are the highest in spring,and the lowest in summer.The change appear to be that soluble saccharide decrease after spring,get to the lowest in summer,then increase in autumn and winter(Hepatopancreas) or gradually increase in order(Gill and Muscle).The above results suggest that seasonal changes of soluble proteins are almost conformable in gill,hepatopancreas and muscle;seasonal changes of soluble saccharide are almost resemble in different organs and tissues,but there are some seasonal differences between the two components.

【题目】拟穴青蟹大眼幼体和第I期仔蟹底质选择的研究
【中文关键词】海洋生物学; 拟穴青蟹; 大眼幼体; 第　　期仔蟹; 底质; 生境选择
【英文关键词】　marine biology;　S.paramamosain;　megalopae;　juvenile;　substrata;　habitat preference
【中文摘要】拟穴青蟹大眼幼体和仔蟹对海泥和泥沙底质的选择性显著高于各种粒径的沙底(粒度 0 . 06~2 . 00mm) .其原因可能与海泥和泥沙底质在流动海水中物理稳定性高于沙砾有关.通过以埋栖选择性和相对埋栖率为指标考察了大眼幼体和仔蟹的栖息方式,发现白昼大眼幼体埋栖在底质中的比例显著高于夜间,也高于仔蟹;夜间大眼幼体栖息方式与仔蟹差别不明显; 并发现大眼幼体栖息方式存在着昼夜差异和昼夜节律性.这揭示了拟穴青蟹大眼幼体对底质的选择性和在底质上栖息的方式表现出对 FTT机制的适应.
【英文摘要】　The settlement mode of the mud crab(Scylla paramamosain) megalopa and juveniles were studied by observing the frequency of burrowing-in or settling-on the surface of substrata.It shows that the mud crab preferred to habitat the mud or mud/sand substratum much than the sand substrata of 3 granular sizes(0.06~2.00mm).The difference is possibly due to the physical stability of mud or mud/sand substratum rather than the unstable sand by the current.The burrowing-in preference and relative burrowing rate of the crab megalopae show that the burrowing-in frequency is significantly higher during daytime than nighttime.It is also higher than that of juvenile.No significant difference exists between the megalopae and the juvenile in their preferences for burrowing-in substrata during nighttime.The settlement mode of megalopae displays day-night difference and day-night rhythm.It reveals that the substratum selection and utilization of the megalopae are an adaptation to the FTT(flood-tide transport) mechanism.

【题目】拟穴青蟹大眼幼体和第I期仔蟹对隐蔽物的选择。
【中文关键词】青蟹; 大眼幼体;第　期仔蟹; 隐蔽物选择
【英文关键词】　Scylla paramamosain;　megalopae;　first juvenile;　shelter preference;
【中文摘要】采用实验生态方法,以攀附率为指标, 研究了青蟹大眼幼体和第　期仔蟹对不同材质(棉布、 尼龙筛绢、 PVC 和竹木) 、 放置方式(水平或垂直) 和构型(3 种结构　3 种规格) 隐蔽物的选择性.结果表明: 大眼幼体和仔蟹对各种隐蔽物材质选择差异不显著(p > 0. 05) ,对垂直放置隐蔽物的选择性显著高于水平放置者(p< 0. 01) , 对不同结构(草丛型、 洞穴型和折角型)和不同规格(5, 7和 10 mm) 隐蔽物选择差异均极显著(p< 0. 01) . 其中, 对草丛型、 洞穴型和折角型隐蔽物的选择性依次降低,对 5, 7 和 10 mm 隐蔽物的选择性也依次降低.随着规格增大, 大眼幼体和仔蟹对草丛型隐蔽物的选择性下降幅度最大,对 5 mm 草丛型隐蔽物的攀附率为 30. 92%和 25. 9%,对 10 mm 草丛型的仅为 0. 46% 和 1. 4%. 综上所述,在研制或使用青蟹大眼幼体和仔蟹的隐蔽物时, 材质选择主要应考虑耐腐蚀、 对水质无不良影响、 不易钩挂幼体和仔蟹附肢等因素. 隐蔽物的结构以草丛型为佳, 当其亚结构的最小空隙接近大眼幼体或仔蟹全长时, 应可达到最好的使用效果.
【英文摘要】There are two important stages in the development process of mud crab Scylla paramamosain:megalopae and first juveniles.In the present study,the two stages of S.paramamosain were collected to investigate their preferences of different materials(cloth,net,PVC and bamboo sheet),layouts and conformations(3 structures × 3 sizes) shelters by employing experimental ecological methods based on the index of sheltering rates.The results showed that there was no obvious preference of different materials for megalopae and first juveniles(p > 0.05),however,horizontal shelters attracted both megalopae and first juveniles more than vertical ones(p< 0.01),shelter structures(grassy type,cavity type and knuckling type) and sizes(5,7,10 mm) had significant effects on the preferences of them(p< 0.01).Structure preferences of megalopae and first juveniles decreased consequently among grassy type,cavity type,knuckling type shelters and also decreased with increasing sizes(5,7,10 mm).Meanwhile,the decreasing extent of the preference of grassy type shelters was the greatest:30.92% & 25.9% respectively for 5 mm sized ones and 0.46% & 1.4% for the 10 mm sized ones.Therefore,materials with corrosion resistance,without harmful effects to water quality or appendage of the megalopae and first juveniles should be mainly considered when developing or using shelters.A better effect may be gained when grassy type shelters were used,especially when the smallest inter-space of the sub-structure of the shelters approximates to the total length of megalopae and first juveniles.

【题目】三疣梭子蟹胚胎发育过程中肝胰腺的发生与卵黄物质利用的关系
【中文关键词】三疣梭子蟹;胚胎发育;卵黄囊;肝胰腺;卵黄利用;组织学
【英文关键词】Portunus trituberculatus; Embryonic development; Yolk sac; Hepatopancreas; Yolk utilization; Histology
【中文摘要】通过对三疣梭子蟹胚胎进行连续采样和组织切片,系统研究了三疣梭子蟹胚胎发育过程中卵黄囊和肝胰腺的发生与卵黄物质利用的关系。结果表明:(1)三疣梭子蟹胚胎的卵黄岛和卵黄囊结构分别出现在原肠期和无节幼体期,胚胎从原肠期至卵内第一期溞状幼体期,始终存在卵黄岛结构,且卵黄岛中的卵黄物质不断被分解和利用. (2)卵内第二期溞状幼体后,卵黄囊分为两个区域,卵黄囊壁中出现肝胰腺细胞(柱状上皮细胞),此时肝胰腺前体已开始形成,卵黄岛开始融合. (3)卵内第三期溞状幼体阶段,卵黄囊发育成一双肝胰腺,由于肝胰腺中的卵黄物质互相融合,卵黄岛结构消失。此阶段胚胎对卵黄物质的利用加快, 卵黄物质中存在许多空泡状结构;(4)胚胎发育进入孵化前期后,肝胰腺腔内的卵黄物质极少,而初孵溞状幼体肝胰腺腔内卵黄物质已完全消失,肝胰腺为一对囊状结构。这些结果表明在三疣梭子蟹胚胎发育从原肠期到孵化前的过程中,卵黄岛和肝胰腺细胞对于卵黄物质分解和利用起着十分重要的作用。
【英文摘要】By serial histological sections, embryos at different development stages were sampled and fixed to investigate the relationship between the organogenesis of yolk sac, hepatopancreas and the yolk utilization during the embryonic development of swimming crab, Portunus trituberculatus. The results showed that: (1) the formation of yolk island and yolk sac were in gastrula stage and egg nauplius stage, respectively, while the yolk islands could be found in the yolk sac from egg gastrula to egg Zoea Ⅰ stage. (2) From egg Zoea Ⅱ stage, the yolk sac was divided into two parts because of further development of the midgut while the hepatopancreatic cells (columnar epithelium) were appearing in the inner of yolk sac membrane. This indicated the starting formation of hepatopancreas. (3) At egg Zoea Ⅲ stage, the yolk sac had been developed into a pair of hepatopancreas while the yolk from different yolk islands were combined, then all yolk islands disappeared from this stage. Due to yolk utilization, many vacuoles could be found in the hepatopancreatic lumen. (4) When the embryo developed into pre-hatching stage, the yolk in the lumen of hepatopancreas had been nearly depleted while for newly-hatched Zoea Ⅰ, the yolk had been completely utilized and

hepatopancreasseemed to be a pair of saccate structure. These results indicated that both the yolk islands and hepatopancreatic cells play important roles for the disintegration and utilization of egg yolk from gastrula stage to pre-hatching stage in P. trituberculatus.

【题目】东海三疣梭子蟹第一次卵巢发育规律的研究
【中文关键词】三疣梭子蟹; 卵巢发育; 卵巢指数; 卵母细胞
【英文关键词】Portunus trituberculatus; ovarian development; gonadosomatic index(GSI); oocyte
【中文摘要】2004 年7 月至2005 年4 月在舟山海区定点连续采样, 系统研究了东海三疣梭子蟹卵巢发育期间的卵巢指数(GSI) 、肝胰腺指数(H SI) 、卵巢外部特征、卵巢发育分期及其组织学的变化. 结果表明:东海三疣梭子蟹生殖蜕壳和交配主要发生在9~ 10 月, 产卵主要在3~ 4 月, 卵巢发育早期不同个体间的GSI 差异较大, 后期则趋于同步; 三疣梭子蟹卵巢发育期间, GSI 显著增加, H SI 呈现先上升后下降的趋势, GSI 和H SI 呈负相关性; 根据GSI 、卵巢形态特征和组织学变化等, 三疣梭子蟹卵巢发育可以分为6 期,Ñ期卵巢呈透明细带状, 雌体尚未生殖蜕壳, 卵巢中主要为卵原细胞(OG) 和卵黄合成前的卵母细胞(PR) ; Ò期卵巢呈乳白色, 主要为卵黄合成前的卵母细胞(PR) 和内源性卵黄合成期的卵母细胞(EN) ; Ó期卵巢为淡黄色或橘黄色, 主要为外源性卵黄合成期的卵母细胞(EX) ; Ô期卵巢呈橘红色, 主要为近成熟的卵母细胞(NO) , 卵径为200~ 300 Lm; Õ期卵巢发育成熟, 主要为成熟期的卵母细胞(MO) ; Ö 期卵巢呈淡橘红色, 已排卵, 卵巢中主要为排卵后剩余的基膜和滤泡核.
【英文摘要】By the continuous sampling in Zhoushan sea area from July 2004 to April 2005,the study was conducted to investigate the change of gonadosomatic index(GSI),hepatosomatic index(HSI),external features of ovary(size,morphology,color,etc),ovarian histology and its stages during the first reproductive cycle of Portunus trituberculatus.The results indicated that,the reproductive molt of Portunus trituberculatus occurs from September to October,while it spawns from March to April.During the ovarian development,the GSI increases significantly,while the HSI rises slightly,then declines gradually.The negative correlation could be found between GSI and HSI during the period.Based on GSI,HSI,external features of ovary,and histological configuration,the process of ovarian development could be divided into six stages, Ⅰ the ovary is ribbonlike and transparent,the main cells in the ovary are oogonia(oo) and previtellogenic oocyte(PR) before reproductive molt; Ⅱ the ovary is milk white,the main cells in the ovary are endogenous vitellogeic oocyte(EN) and PR;Ⅲ the ovary is buff and orange,the main cell type in the ovary is exogenous vitellogenic oocyte(EX);Ⅳ the ovary is deep orange,the main cell types are EX and nearly-mature oocyte(NO) in the ovary; Ⅴ the ovary is ripe,the main cell type is mature oocyte(MO);Ⅵ the crab has spawned,the ovary is light orange, the basal laminas(BL) and follicular cells(FC) could be found in the ovary.

【题目】三疣梭子蟹的第二次卵巢发育规律
【中文关键词】三疣梭子蟹; 第二次卵巢发育; 组织学; 卵巢指数; 卵母细胞
【英文关键词】Portunus trituberculatus; Second ovarian development; Histological; Gonadosomatic index; Oocyte
【中文摘要】2005 年3) 5 月, 在室内养殖条件下对第二次卵巢发育的三疣梭子蟹进行连续采样, 系统研究了其第二次卵巢发育期间的卵巢指数(GSI) 、肝胰腺指数(HSI) 、卵巢外部特征、卵巢发育分期及其组织学变化。结果表明: [1] 三疣梭子蟹第二次卵巢发育过程可以分为4 期, Ñ 期卵巢为乳白色或者淡黄色细带状, 卵巢中主要为卵黄合成期的卵母细胞和内源

性卵黄合成前卵母细胞; Ò 期为淡黄色或橘黄色, 主要为外源性卵黄合成期的卵母细胞; Ó 期卵巢为橘红色, 主要为外源性卵黄合成期的卵母细胞和近成熟期的卵母细胞; Ô 期卵巢发育基本成熟, 肉眼可见卵粒, 主要为成熟期的卵母细胞; º 三疣梭子蟹第二次卵巢发育期间, GSI 显著增加,HSI 变化不显著, GSI 和发育天数呈显著正相关性, HSI 和GSI 的变化没有显著的相关性。

【英文摘要】During March to May of 2005, mature female swimming crabs were held in captive conditions and fed with fresh clam, Sinonovacula constricta. The spawned crabs were sampled and dissected to investigate the changes to the gonadosomatic index (GSI), hepatosomatic index (HSI), external features of ovary, ovarian histology and its stages during the second ovarian development of Portunus trituberculatus. The results demonstrated that: (1) the process of the second ovarian development could be divided into four stages: stage Ⅰ ovary was ribbonlike and milk white or buff, the main cells in the ovary were endogenous vitellogenic oocytes (EN) and previtellogenic oocytes (PR); stage Ⅱ ovary was buff and orange, the main cells were exogenous vitellogenic oocytes(EX); stage Ⅲ ovary was deep orange, the main cell types were ex and nearly-mature oocytes (NO); stage Ⅳ ovary was ripe, the main cell type was mature oocytes(MO); (2) During the period, the GSI increased significantly, while the HSI did not show a significant difference. A positive correlation could be found between GSI and ovarian development, days after spawning, however there was no significant correlation between GSI and HSI

【题目】三疣梭子蟹雌性化育苗技术的研究
【中文关键词】三疣梭子蟹 雌性化 育苗
【英文关键词】Portunus trituberculatus Feminization Breed
【中文摘要】采用热休克法和冷休克法分别对胚胎处于第1 极体、第2 极体外排期、膜内无节幼体期及膜内蚤状幼体期的三疣梭子蟹亲蟹处理后进行室外水泥池育苗, 幼体发育至Ó期仔蟹(CÓ) 时每池随机取样3 次, 每次取样200 只, 在解剖镜下辨别雌、雄生殖孔的位置来确定雌性比例。结果显示, 膜内无节幼体期热、冷休克处理和膜内蚤状幼体期热、冷休克处理的亲蟹成活率分别为80%、60%、8 0% 和100% , 幼体雌性比例分别为(57 ? 01 5)%、(64 ? 01 5)%、(561 5 ? 01 5) %和(65 ? 01 5)%

【英文摘要】Studies on feminization breeding of Portunus trituberculatus were carried out using heat chock and cold shock. Heat shock(39.0~40.5°C,15min, 10.02mg/L, 31.0) and cold shock (3.5~4.5°C, 1min, 9.73 mg/L, 30.0) were applied to the crab ova twice(30~50min and 1~1.5h) after fertilization.Nauplius in membrane and zoea in membrane were also treated with heat and cold shock. After that,the crabs were bred in the outdoor concrete ponds.200 larvae were sampled randomly from each ponds for three times, then the larvae were observed through stereoscope at the stage of CIII,and the female rate was calculated. The results were: the survival rate of the heat and cold shocked crabs (nauplius in membrane and Zoea in membrane) was 87%、80%、80% and 100%,respectively,while the female larval rate was (57±0.5%)、(64±0.5%)、(65±0.5%) and (65±0.5%),respectively.

【中文摘要】测定三疣梭子蟹(P or tunus tr ituber cul atus) 9 个个体COI 基因部分序列467 bp, 7 个个体16S rR NA 基因部分序列519 bp, 同时测定样品蟹1 个个体COI 基因部分序列468 bp。结合GenBank 中收集的梭子蟹科COI , 16S rR NA 两个基因所有同源序列信息, 使用Kimur a 双参数模型采用邻接法(NJ) 、最大简约法(M P)构建梭子蟹科分子系统发育树; 将样品蟹测得的COI 基因序列和已知属的其他蟹同源序列(429 bp) 进行比对分析。结果分析表明: 两个基因片段序列平均碱基AT 数量分数都明显高于GC 数量分数; 梭子蟹属与美青蟹属关系最近, 属应为区别于梭子蟹属、美青蟹属、青蟹属的另一支, 支持属应划分在短浆蟹亚科的观点; 根据遗传距离以及转换/ 颠换(R) 值分析, 判定出样品为锐齿。本试验运用线粒体基因片段探讨了梭子蟹类的系统发育关系以及样品蟹的种类鉴定, 为线粒体基因片段在梭子蟹的物种鉴定和系统发育重建中的开发和利用提供重要参考。

【英文摘要】The partial sequences of COI and 16S genes were determined from Portunus trituberculatus,and partial sequences of COI was determined from sampled specimen.All homologous partial sequences of COI and 16S in Portunidae were collected from GenBank and aligned with the homologous sequences of P.trituberculatus.The NJ tree and MP tree were constructed using Kimura 2-parameter model.Homologous sequences(429 bp) of sampled specimen and genus Charybdis were aligned.The results show that the average content of AT is obviously higher than that of GC in both genes.Charybdis is a different group which separated from Portunus,Callinectes and Scylla.Charybdis should be included in subfamily Thalamitinae but not in subfamily Portuninae.Sampled specimen is identified as Charybdis acuta for its genetic distance and R value.This experiment researched on the phylogenetic relationships of portunid crab and identification of sampled specimen,and it provides important information for the phylogeny reconstruction and species identification of portunid crab.

【题目】应用微卫星标记分析野生中国明对虾的亲权关系
【中文关键词】微卫星; 中国明对虾(Fenneropenaeus chinensis) ; 亲权分析
【英文关键词】Microsatellite; Fenneropenaeus chinensis; Kinship analysis;
【中文摘要】利用5 个高度多态性的微卫星座位(Fc04、Fc06 、Fc18 、Fc24 、Fc27) , 分析了不同年份中建立的10 个野生中国明对虾家系中的雌性亲虾及其后代基因型分离的情况, 表明每个家系中只有一个雄性野生中国明对虾对子代的遗传有贡献。从其中3 个家系的雌性亲虾纳精囊中提取了雄虾精子DNA, 微卫星标记显示各家系的子代个体均有一个等位基因与雄性亲虾的基因型相符, 且符合孟德尔遗传规律, 这为野生中国明对虾雌虾在繁殖季节一对一的繁殖行为提供了遗传学的证据。用UPMGA 的方法随机对3 个家系的40 尾子代个体进行聚类分析, 每个家系都能被单独聚成一类。上述工作表明微卫星标记在对虾育种中作为一种有效的亲子关系分析工具, 在种群的遗传结构、亲缘关系、繁殖行为等方面具有广阔的应用前景。
【英文摘要】The mating mode of Chinese shrimp (F. chinensis) is supposed to be pair mat ing from observation of their mating habits.However, this suggestion has not been confirmed genetically yet. In this study, fivemicrosatellite loci (Fc04, Fc06, Fc18, Fc24 and Fc27) were used to survey the mating mode of the wild Chinese shrimp in ten families which were built in different years. The male?? s genotypes could be determined from those of a female and her offspring at every locus.Only one combination of male genotypes was observed in each family. Farther, the sperm DNA ofwild male was extracted from copulatedwild female thelycum in three families of the ten. The result of microsatellite markers showed that the sperm DNA of wild males were not contam-I nated by female genome DNA. At each locus, every progeny had one allele found in the male genotype. The distributions of genotypes in offspring of the ten families were consistent with the Mendelian segregation.All of these suggested that one female copulated to one male and supported that the mating mode of this prawn is pair-mating. The cluster analysis based on UPMGA (unweighted pair-group method using arithmetic averages) between individual within/ among families was also examined and showed that each family formed single cluster, respect ively.Microsatellitemarkers as an effective tool for kinship analysis could be widely used to reveal the population structure, mating mode, etc. in breeding programs.

【题目】微卫星用于凡纳滨对虾育种过程中亲权分析及遗传多样性的变化监测
【中文关键词】凡纳滨对虾; 微卫星; 亲权分析; 遗传监测
【英文关键词】:Litopenaeus vannamei microsatellite kinship analysis genetic monitoring
【中文摘要】利用7个微卫星标记分析了6个凡纳滨对虾家系的亲本(G0)及其后代(G1)的基因型分离情况, 同时对G0 和G1 的所有座位期望杂合度进行配对比较分析, 并且通过对G 1 群体每个位点的F statist ics分析检验群体的遗传分化, 以期对凡纳滨对虾育种进行遗传监测。结果表明: 共检测到44个等位基因。G0 和G1 的平均每个座位的等位基因数目分别为6. 14和6. 27,平均期望杂合度为0. 786和0. 733, 平均多态性信息含量为0. 709和0. 695。7个微卫星座位的累计排除概率为0. 99, 并且在有亲本存在的情况下, 能够将6个家系分开。G0 与G1 的所有座位期望杂合度的配对比较分析结果表明G0 平均期望杂合度要显著高于G1 (P < 0. 01)。G1 各座位的遗传分化指数F ST在0. 270 3~ 0. 465 4, 平均分化系数为0. 358 4。说明亚群间属于高度遗传分化。最后, 根据6个家系的遗传距离, 利用U PGMA 法对G1 个体聚类分析, 结果表明亲缘关系较近的家系A 和B 以及C 和D 的相似系数很高分别各聚为一类, E 和F分别聚为一类。
【英文摘要】Genotype segregation of parents livestocks (G0 generation)and their offspring (G1 generation)of 6 Litopenaeus vannamei families was analyzed on basis of 7 microsatellite DNA markers.In addition, heterogeneity analysis for pairwise comparisons of expected heterozygosities (He) of all loci between G0 and G1 was carried out and genetic differentiation through F-statistics at each locus in G1 population was expected to monitor genetic variation in Litopenaeus vannamei breeding. The results showed that 44 alleles

were detected in total across 7 loci assayed,mean number per locus,mean expected heterozygosity and mean polymorphism information content of G0 generation were 6.14, 0.786 and 0.709 respectively, and those of G1 generation were 6.27, 0.733 and 0.695 respectively. The combined exclusion probability of 7 microsatellite markers arrived at 0.99 and could seperate all 6 families with known parent. Heterogeneity analysis for pairwise comparisons of expected He of all loci between G0 and G1 indicated that He of G0 was significantly higher than G1(P<0.01). FST of G1 per locus ranged from 0.270 3 to 0.465 4 and average was 0.358 4 which meant that genetic differentiation in its sub population was high. The UPGMA analysis based on six families genetic distances showed all individuals of G1 generation could be classified into 4 categories.Similarly to families C and D, families A and B sharing father had high similarity coefficient and clustered together, family E and F were assigned into another group respectively.

【题目】大豆异黄酮与脂肪、蛋白质含量基因定位分析
【中文关键词】大豆;SSR;QTL;品质;异黄酮
【英文关键词】soybean; SSR; QTL; quality; isoflavone
【中文摘要】摘要:【目的】研究大豆异黄酮与脂肪、蛋白质含量基因定位及相关性,为大豆品质改良、分子育种及基因克隆等应用提供理论依据。【方法】利用SSR 技术,对晋豆23 号和灰布支杂交构建的F13 代大豆重组自交系群体的474 个家系进行了连锁图谱的构建。在此基础上,利用 WinQTLCart2.0 软件分析了影响大豆异黄酮含量、脂肪含量和蛋白质含量3 个重要品质性状的QTL,通过复合区间作图分析,检测QTL;同时,对异黄酮与脂肪、蛋白质的含量相关性分析。【结果】检测到23 个QTL,其中控制异黄酮含量QTL 有6 个,分别定位在J、N、D2 和G 染色体的连锁群上;控制脂肪含量的QTL 有11 个,分别定位在第A1、A2、B2、C2 和D2 染色体的连锁群上;控制蛋白质含量的QTL 有6 个,分别定位在B2、C2、G 和H1 染色体的连锁群上。相关性分析结果表明:异黄酮与蛋白质含量呈极显著负相关;蛋白质和脂肪含量呈极显著负相关;蛋白质和蛋白质脂肪总量呈极显著正相关。【结论】3 个重要品质性状的部分基因定位结果与其相关性分析是一致的,其结果对大豆品质育种应用有重要利用价值。

【题目】应用SSR分析5个三疣梭子蟹野生群体的遗传多样性
【中文关键词】三疣梭子蟹; 野生群体; 遗传多样性; 微卫星
【英文关键词】Portunus trituberculatus; wild populations; genetic diversity; microsatellite marker
【中文摘要】利用本实验室筛选的8 个微卫星分子标记, 对中国舟山(ZS)、海州湾(HZ)、青岛会场(HC)、莱州湾(LZ)和鸭绿江口(YL)5 个三疣梭子蟹(Portunus trituberculatus)野生群体共计120 个个体进行了遗传多样性分析。结果显示, 8个位点共扩增到72 个等位基因, 平均等位基因数为9.0, 平均有效等位基因数为5.467 7; 平均多态信息含量为0.696 7; 平均期望杂合度(He)为0.750 8。5 个群体的期望杂合度由高到低依次为LZ(0.770 4)、HC(0.758 8)、YL(0.755 2)、HZ(0.741 5)、ZS(0.728 3)。卡方检验可知, 34 个群体位点组合符合Hardy-Weinberg 平衡, 占总数的85%。5 个群体间的遗传距离在0.245 1~0.517 9 之间, HC 和HZ 的遗传距离最小, LZ 和ZS 的遗传距离最大; 通过构建UPGMA聚类树, 发现5 个群体聚为南北两大支, HC 和HZ 两个群体遗传距离最近先聚到一起, 再与ZS 群体相聚, 形成南方群体; YL 与LZ 群体相聚形成北方群体, 最后南北两大群体聚为一支。分析群体间的Fst 值可知, 两两群体间的Fst 值在0.054 8~0.108 3 (0.05<Fst<0.15)之间, 群体间产生了极显著的遗传分化。
【英文摘要】We evaluated genetic diversity and differentiation among five wild populations of the swimming crab (Portunus trituberculatus) using eight polymorphic microsatellite loci. We collected crabs from Zhoushan (ZS), Haizhou Bay (HZ), Huichang (HC), Laizhou Bay (LZ), and the mouth of the Yalu River (YL). We isolated 72 alleles from eight loci among the five populations. The number of alleles ranged from 6 to 12 and the average number of alleles (A) and effective numbers of alleles (Ne) were 9.0 and 5.467 7, respectively. The mean PIC value for the eight microsatellite loci was 0.696 7. The expected heterozygosity (He) of each population was as follows: LZ (0.770 4), HC (0.758 8), YL (0.755 2), HZ (0.741 5), and ZS (0.728 3). The observed heterozygosity (Ho) was between 0.648 1 and 0.760 4. Six loci deviated significantly or very significantly from Hardy-Weinberg equilibrium. The genetic distances among populations ranged from 0.245 1 to 0.517 9. The UPGMA tree suggested that there were two different groups: one being composed of YL and LZ, and the other of HC, HZ and ZS. The Fst values ranged from 0.054 8 to 0.108 3, suggesting that the degree of differentiation was moderate among the five wild populations (0.05<Fst<0.15).

【题目】黄芩苷增强中国对虾组织免疫和解毒代谢能力
【中文关键词】中国对虾　黄芩苷　酸性磷酸酶　过氧化氢酶　一氧化氮合酶　溶菌酶　超氧化物歧化酶　鳗弧菌
【英文关键词】Fenneropenaeus chinensis; baicalin; ACP; CAT; INOS; LZA; SOD
【中文摘要】用含不同浓度梯度(0、50、100、150 mg/ kg) 黄芩苷的饲料连续投喂健康的中国对虾F ennerop enaeus chinensis , 于给药第1、3、5/7/9、11 天采集实验对虾的血淋巴、肝胰腺、肌肉组织, 测定不同组织的酸性磷酸酶(ACP) 、过氧化氢酶(CAT) 、一氧化氮合酶(INOS) 、溶菌酶(LSZ) 、超氧化物歧化酶(SOD) 活性的变化, 研究黄芩苷对中国对虾非特异性免疫酶活指标和解毒代谢能力的影响。实验结果表明, 中、高浓度处理组血淋巴、肝胰腺、肌肉组织的A CP、INOS、SOD 在第3 天后呈上升趋势, 分别达到峰值后趋于稳定状态, 与同期对照组相比差异显著(P < 01 05) ; 低浓度黄芩苷处理组各种酶活性与同期对照组相比差异不显著(P > 01 05) , 而低、中、高浓度处理组血淋巴LSZ 酶活性与同期对照组相比差异极显著(P< 01 01) 。各种酶活亦存在组织差异性, 其中ACP、CAT 在肝胰腺中活性最高, 肌肉和血淋巴次之; 而INOS、LSZ、S OD 活性, 血淋巴中最高, 肌肉和肝胰腺次之。同时攻毒试验表明, 黄芩苷能有效地降低试验组中国对虾的死亡率, 提高免疫保护率。其中, 中浓度处理组的保护效果最佳。
【英文摘要】The aim of the study was to research the baicalin on immune enzymes of shrimp Fenneropenaeus chinensis. Four treatments were designed with different concentrations of baicalin (0g · kg-1, 50mg · kg-1, 100mg · kg-1, 150mg · kg-1) mixed with the raw diet, and the diets were orally fed to healthy Fenneropenaeus chinensis. The activities of acid phosphatase (ACP), catalase (CAT), nitric oxide synthase (INOS), lysozyme (LZA), superoxide dismutase (SOD) in haemolymph, hepatopancreas and muscle were assayed on days 1, 3, 5, 7, 9 and 11. The results showed that the enzyme activities in lower group had no significant difference compared to the control. However, the enzyme activities including ACP, CAT, INOS, LSZ and SOD were higher significantly both in middle level group and high level group (P<0.05) than in the control, respectively. The activities of ACP and CAT changed most greatly in hepatopancreas, followed by muscle and hemolymph; and the activities of INOS, LZA, SOD changed most greatly in hemolymph followed by muscle and hepatopancreas, and all of them reduced significantly (P<0.05) below the control level. The result showed that baicalin could regulate the immune system of F. chinensis significantly, and enhance non-specific immune function and antibacterial effects. All these results would provide a theoretical basis for preparation of compound Chinese herbal medicine.

【题目】Capsular and slime-polysaccharide production by Lactobacillus rhamnosus JAAS8
【中文关键词】乳酸菌,鼠李糖乳杆菌,胞外多糖,黏液多糖,酸菜
【英文关键词】Lactic acid bacteria; Lactobacillus rhamnosus ; Exopolysaccharides; Capsular polysaccharide; Chinese sauerkraut
【中文摘要】乳酸菌产生的胞外多糖可以显著提高发酵乳制品的物理特性。从中国传统酸菜中分离到鼠李糖乳杆菌JAAS8,在MRS培养基或以葡萄糖作为碳源的半组合培养基中可以产生2种形式的胞外多糖。通过光学显微镜和透射电镜观察到胞外多糖围绕在JAAS8的表面。该菌在对数生长期分泌黏液多糖,发酵过程中产生荚膜多糖。对多糖样品的单糖分析结果显示,荚膜多糖由半乳糖和N-乙酰氨基葡萄糖组成,摩尔比5:1。黏液多糖由半乳糖,葡萄糖和N-乙酰氨基葡萄糖组成

,摩尔比4:1:1。鼠李糖乳杆菌JAAS8可以用于乳制品工业,通过增加持水力和粘度来提高发酵乳制品的流变学特性。

【英文摘要】Exopolysaccharides (EPSs) produced by lactic acid bacteria (LAB) play an important role in the improvement of the physical properties of fermented dairy products. To find EPS-p roducing LAB strains with poten tial industrial applications , a Lactobacillus rhamnosus strain, L. rhamnosus JAAS8, that is capable of producing two forms of EPS when grown in MRS broth or semi-define d medium with glucose as a carbon source was isolated and identified from Chinese sauerk raut. The capsu lar-polysaccharide (CPS) present surrounding the bacterial surface of L. rhamnosus JAAS8 was observed by both optical microscopy and tran smission electron microscopy. The slime-polysacch aride (SPS) present in the growth medium was produced mainly during the exponen tial growth phase, while the CPS was produced only in fermentatio n. Monosaccharide analysis of the purified polysaccharide sampl es showed that the CPS was composed of galactose and N-acet ylglucosamine in a molar ratio of 5:1, and the SPS was composed of galactose, glucose and N -acetylglucosamine in a molar ratio of 4:1:1. The use of L. rhamnosus JAAS8 could be considered for potential applications in the dairy industry to improve the rheological properties of fermented milk products by increasin g their water-hold ing capacity and viscosity.

【题目】Growth and Exopolysaccharide Production by Lactobacillus fermentum F6 in Skim Milk

【中文关键词】乳酸菌,发酵乳杆菌,胞外多糖

【英文关键词】Lactic acid bacteria, Lactobacillus fermentum, exopolysaccharides.

【中文摘要】从中国内蒙古传统乳制品中分离出1株发酵乳杆菌F6,研究不同培养条件下发酵乳杆菌F6在10%脱脂乳中的生长特性及产胞外多糖能力。结果显示最适培养温度为37 ° C,pH值为6.5,此时胞外多糖产量也较高。在10%脱脂乳中添加不同碳源(葡萄糖、乳糖、半乳糖和果糖)可以增加胞外多糖的产量,其中葡萄糖效果最好。添加0.5%的乳清蛋白浓缩物可以使胞外多糖产量提高2倍。脱脂乳中添加2%葡萄糖和0.5%乳清蛋白浓缩物,培养温度为37 ° C,pH值为6.5时,发酵乳杆菌F6胞外多糖产量达到最大,为44.49 mg/l。单糖分析显示发酵乳杆菌F6产胞外多糖由葡萄糖和半乳糖组成,摩尔比为4:3。胞外多糖的分子量为3.54 × 106 Da,1%的胞外多糖水溶液具有很高的粘度,显示出这种胞外多糖可以在食品生产中作为增稠剂使用。

【英文摘要】Growth and exopolysaccharide (EPS) production by Lactobacillus fermentum F6 isolated from traditional dairy products in Inner Mongolia of China were studied when the strain was grown in 10% (w/v) reconstituted skim milk under different culture conditions. The results showed that culturing of L. fermentum F6 at a temperature (37 ° C) and pH (6.5) optimal for growth was also favorable for EPS production. Supplementation in 10% (w/v) skim milk with different carbon sources (glucose, lactose, galactose and fructose) increased EPS production; glucose being more effective than other sugars. Supplementation with whey protein concentrate (WPC) at 0.5% (w/v) resulted in about two-fold increase in EPS production. A maximum of 44.49 mg/l of EPS was produced by L. fermentum F6 in the skim milk medium supplemented with 2% (w/v) glucose and 0.5% (w/v) WPC at 37 ° C and at initial pH 6.5. Monosaccharide analysis showed that the EPS of L. fermentum F6 was composed of glucose and galactose in a molar ratio of 4:3. The molecular mass of the EPS was determined to be 3.54 × 106 Da. A 1% (w/v) aqueous solution of the EPS showed relatively high viscosity, indicating the potential of this EPS to be used as a viscosifying agent in food products.

【题目】Stucture of the Complex between Mucor pusillus pepsin and the Key Domain of κ-casein for Site-directed Mutagenesis: A combined Molecular Modeling and Docking Approach
【中文关键词】κ-酪蛋白,分子建模,微小毛霉,突变,蛋白次级水解
【英文关键词】κ-casein, Molecular docking, Mucorpusillus, Mutagenesis, Secondary proteolysis
【中文摘要】本研究首先构建并优化了κ-酪蛋白肽段CSD(His102 Leu103 Ser104 Phe105 Met106 Ala107 Ile108)三维结构;通过比对MPP(微小毛霉凝乳酶)与Chymosin(牛凝乳酶)和凝乳酶抑制剂CP-113972复合物的三维结构,初步确定了MPP的活性中心及其与CSD对接的初始条件;进而采用计算机模拟了MPP与CSD的反应,提出了其催化反应的机理;最后通过比对Chymosin与MPP和CSD复合物的三维结构,结合能量分析和空间结构分析,给出了在不改变凝乳活力的前提下,可改变水解活力的建议突变位点-Glu13和Leu11。实验结果表明,相对于改造前,突变体Glu13Pro的水解活力降低了17%,在干酪生产领域具有较大的产业化应用前景。
【英文摘要】In the structural-based mutagenesis of Mucorpusillus pepsin (MPP), understanding how κ-casein interacts with MPP is a great challenge for us to explore. Chymosin-sensitive peptide is the key domain of κ-casein that regulates milk clotting through the specific proteolytic cleavage of its peptide bond (Phe105-Met106) by MPP to produce insolublepara-κ-casein. Here, we built the model of this large peptide using molecular modeling technique. Docking study showed that MPP can accommodate the designed model with afavorable binding energy and the docked complex has proven to locally resemble the inhibitor-chymosin complex. The catalytic mechanism for the peptide model binding withMPP was explored in terms of substrate-enzyme interaction and property of contacting surface. Some critical amino acid residues in the substrate binding cleft have been identified as an important guide for further site-directed mutagenesis. Glu13 and Leu11 in the S3 region of MPP, predicted as the special mutation sites, were confirmed to retain clotting activity and decrease the proteolytic activity. These novel mutants may provide a promising application for improving cheese flavor.

【中文摘要】为了寻求黄土台原旱地冬小麦的适宜耕作栽培技术,以传统耕作方式为对照,比较了留茬覆盖深松膜侧沟播技术与留茬免耕秸秆全程覆盖技术和留茬深松秸秆全程覆盖技术的蓄水增产效果。结果表明,在参试的各技术模式中,其农田效应增产效果和水分利用效率均以留茬覆盖深松膜侧沟播技术最好其次是留茬深松秸秆全程覆盖技术和留茬免耕秸秆全程覆盖技术留茬覆盖深松膜侧沟播技术能融深松深层贮水效应 秸秆覆盖保水增肥效应和起垄覆膜沟播聚水保水增温透光效应于一身可显著改善旱地麦田水肥气热环境条件与传统耕作比较该模式在夏闲期可多贮水 蓄水率提高 小麦生育期水分利用效率达到增产是陕西渭北及同类地区旱地小麦高效利用自然降水实现高产稳产的最佳模式选择
【英文摘要】In order to find a suitable integrated dry land farming technology for winter wheat in losess plateau,the crop yield and water utilization efficiency of three farming technology systems,no-tillage high stubble mulching,stubble-mulching and deep loosing,and plastic mulching and film side planting,were compared.The results showed that the integrated farming technology,combining leaving higher stubble in the field ,deep loosing and cultivation. plastic mulching and film side planting together, has greatest potential in improving farmland condition, crop yield and water utilization efficiency,followed by the integrated farming technology combining leaving higher stubble in the field,deep loosing and straw mulching and the technology combining leaving higher stubble in the field,no tillage and straw mulching. The integrated farming technology combining leaving higher stubble in the field,deep loosing and straw mulching has comprehensive functions to improve the ability of water storage,moisture conservation and fertility and temperature of soil。 It can improve water,fertilizer,air,and heat condition of farmland greatly。Compared with the traditional technology,this one can increase the water storing ability,by 84.4mm and the water storage by 18.2%,The water utilization efficiency of wheat can reach 15.56kg/(mm.hm2),and the yield may increase by 40.6%. this integrated farming technology is the best choice to

improve rainfall mechanical utilization efficiency and wheat yield for Shaanxi Weibei dryland area and other regions of this kind。

【题目】Sprinkler Irrigation Uniformity Evaluation Based on Continuous Variable-rate Theory
【中文关键词】sprinkler irrigation, uniformity, evaluation, cubic splines, double interpolation
【英文关键词】sprinkler irrigation, uniformity, evaluation, cubic splines, double interpolation
【中文摘要】An evaluation method, with accompanying software, was developed to precisely calculate uniformityfrom catch-can test data, assuming sprinkler distribution data to be a continuous variable. This has value in assessingapplication uniformity of sprinkler irrigation designs. Two interpolation steps are required to compute unknownwater application depths at grid distribution points from radial distribution of catch-cans ’ data: using both radial andperipheral interpolations. Interpolation by cubic splines was used to give accurately interpolated values. In theory,this method has higher accuracy compared with conventional methods to analyze catch-can data. Water applicationdepths were calculated at each grid point and uniformity coefficients were computed from the grid distribution mapsof water application depths.

【题目】Variable-Rate Contour-Controlled Sprinklers for Precision Irrigation
【中文关键词】variable-rate sprinkler; precision irrigation; contour-controlled wetted area; irrigation uniformity; square
【英文关键词】variable-rate sprinkler; precision irrigation; contour-controlled wetted area; irrigation uniformity; square wetted area sprinkler
【中文摘要】The theoretical relationship between several hydraulic performance parameters of variable-rate contour-controlled sprinklers for high uniformity precision irrigation was researched. The operational equation that describes the internal connection of flow rate, rotating speed and throw distance of the variable-rate contour-controlled sprinkler was derived using mathematical theory of limitation and double integral. The derived operational equation indicates that the flow rate of the variable-rate contour-controlled sprinkler is proportional to the product of rotating speed and square throw distance. The square wetted area sprinklers were used to illustrate the application of the operational equation of the variable-rate contour-controlled sprinkler. The theoretical throw distance equation for the square wetted area sprinkler was built. With the operational equation and theoretical throw distance equation, the theoretical flow rate and rotating speed equations of the square wetted area sprinkler were derived. The results of this research provide fundamental principles for the design of variable-rate contour-controlled sprinklers and square wetted area sprinklers.

【题目】冬季桃树生理生态指标变化规律研究
【中文关键词】冬季桃树;土壤水势;土壤温度;茎干变化
【英文关键词】winter peach;soil water potential;soil temperature;trunk diameter variation
【中文摘要】分析空气温度、土壤水势以及土壤温度生态因子变化的基础上,研究了桃树茎干日变化规律以及冬季桃树的茎干变化。得出冬季土壤水势随时间逐渐减小,并受土壤温度变化影响.分析了冬季桃树地5、15和30 cm深度的土壤温度变化规律。并对曲线进行拟合,发现冬季土壤温度以二次函数规律变化,并且相关系数都在O.9以上。桃树茎干有明显的日变化规律。日最大收缩量受土壤水分状况影响较大,土壤水势高的处理,桃树茎干日最大收缩量大,相反水势较低的最大日收缩量变化较小。在2006年11月~2007年1月桃树茎干随时间不断收缩,但是收缩幅度与土壤水势有关,土壤水势高的收缩幅度较小,水势低的,收缩幅度较大.
【英文摘要】The peach winter irrigation has a direct influence on the peach growth and production next year. So we will seek a goal that is an index for making decision irrigation the peach in winter.Based on the analysis of change of soil water potential(SWP)and soil temperature(ST),we researched the daily trunk diameter variation(DTDV)and trunk diameter variation(TDV)of peach in winter.Drawing a conclusionis the SWP graduaUy decreasing with the time and affected by changing of soil temperature. We analyzed change law of ST below 5 cm,15 cm and 30 cm in winter and got a conclusion that the change of soil temperature is quite the Quadratic Function and the correlation coefficient is all aboVe O.9.The law of change of the trunk of peach is very obvious.SWP wiU affect maximum daily shrinkage(MDS)of the trunk diameter of peach. SWP is high then MDS is high and vice versa. The trunk diameter of peach has diminished gradually from November 2006 to January 2007.The shrinkage of trunk diameter(STD)of peach is reIated to SWP,SWP is high then STD is less and vice versa.

【题目】固定管道式喷灌系统支管的布设方法
【中文关键词】喷灌;支管;布设方法;投资成本
【英文关键词】sprinkle irrigation;lateral pipe;layout method;investment cost
【中文摘要】传统固定管道式喷灌系统中的支管一般为最末一级管道,一般为单管顺长布置,支管上不再分支,喷头全部均匀分布在各条支管上,其缺陷是喷灌支管布设密度高,增加固定管道式喷灌系统的投资成本。为降低管道布设密度和投资

成本,提出了一种新型支管布设方法,即在传统支管布设的基础上间隔去掉一半原有支管,保留原支管上的喷头位置不变。在保留支管上每间隔一个喷头增设一个垂直于支管的短管,向被去掉支管上的喷头供水。从支管布设密度和管材用量两个方面对新型和传统两种布设方法进行了对比分析。结果表明,新型布设方法降低了支管的布设密度,当喷头为正三角形布置时,支管布设密度降低率为7%。当喷头为等腰三角形布置,且喷头间距为支管间距的两倍时,支管布设密度降低率为25%。新型布设方法增加了支管管材用量,管材用量增加率始终大于141.4%,需要通过变管径的设计方法降低管材用量增加率。研究结果为固定管道式喷灌系统的支管布设提供了一种新的方法,为降低喷灌系统管道投资成本提供了一种新的思路。

【英文摘要】Conventionallayout method of lateral pipe may result in high pipe line density and investment cOSt for set sprinkler systerns.in which sprinklers are distributed on lateral pipes equidistantly and directly.In order tO reduce the lateral pipe line density and investment cost,a layout method for lateral pipe of set sprinkler system,in which half lateral pipes were alternatively removed and additional short pipes were installed on reserved half lateral pipes perpendicularly tO deliver water tO original sprinklers on removed lateral pipe lines,was put forward in this paper.The new and conventional layout methods were analyzed and compared from the aspects of lateral pipe line density and quantity of lateral pipe materials.The results showed that the new method could reduce the distribution density of lateral pipe lines by 7%with equiangular triangle spacing of sprinklers or 25%when sprinklers were spaced in isosceles triangle and the sprinitler space was twice as the lateral space.The results also showed that the new method improved the quantity of lateral pipe by more than 141.4%.This problem could be resolved by using design method with variational lateral pipe diameter.The results of this paper provided a new design method for lateral pipe line layout and a new way to reduce lateral pipe line density and investment cost of set sprinkler systems

【题目】喷灌分布均匀系数研究.
【中文关键词】喷灌;均匀性;分布均匀系数;几何平均数;算术平均数
【英文关键词】sprinkle irrigation;uniformity;distribution uniformity parameter;geometHc average;arithmetical average
【中文摘要】突出局部灌溉不足或灌溉过量对均匀性的影响程度,提出了基于几何平均数分布均匀系数的概念,将其定义为部分测点水深几何平均值与所有测点算术平均值的比值。并根据部分测点水深数据的提取方法不同,分为1/4低值、1/4高值、1/2低值和1/2高值分布均匀系数。用MATLAB和VC川语言编制了可以实现上述分布均匀系数计算的软件“SIUEWl.0”。结果初步证明:基于几何平均数的乘法模型要比基于算术平均数的加法模型更加突出了部分低(或高)于平均值的测点水深数据对均匀系数的影响程度,因此更适用于对局部灌溉不足或过量灌溉有严格控制要求地块的灌溉均匀性评价;无论高值和低值,取点数越少,均匀性的评价结果越差。

【英文摘要】In order to emphasize the influence of over—irrigation or insufficient irrigation on irrigation unifofruity,this paper put forward the concept of distribution uniformity coefficient based on geometric average,which is defined as the ratio between geometric average of the depth of partial measuring points and arithmetic average of all points.According tO the different method for gaining the depth of partial measuring points,the distribution uniformity coefficient is defined as four categories。i.e.Low Quarter Distribution Uniformity,High Quarter Distribution Uniformity,Low Half Distribution Uniformity,and High Half Distribution Uniformity. The SIUEWl.0 software for the calculation of above coefficients is programmed through using VC++ and MATALAB software. Taking the water quantity distribution data of single RAINBIRD 30PSH sprinkler under the windy condition and 300kPa work pressure as example,which is measured through six rain gauges with spokewise layout,the distribution uniformity coefficients based on geometric average and arithmetical average under the condition that the sprinklers are foursquare or equilateral triangular layout and the layout coefficient is 1.oo~1.40,are calculated.The results show that the multiplication model based on geometric average amphasizes the influence of partial data,which are lower than the average value.on the unifortuity coefficients more than the addition model based on arithmetical average.So it is more suitable for the uniformity evaluation of irrigation systems,in which over irrigation and insufficient irrigation are prevented strictly.No matter the value is high or low,less the quantity of measuring point is, worse the result of uniformity evaluation is.

【题目】喷灌均匀系数的三次样条两次插值计算方法研究
【中文关键词】喷灌均匀系数三次样条插值
【英文关键词】Sprinkler irrigation, Uniformity, Cubic splines, Double interpolation
【中文摘要】为提高喷灌水量分布均匀性评价的准确性,当雨量筒径向布置时,为考虑所有测点数据对插值点降水深的影响,采用径向和周向两次的三次样条插值计算出未知点的降水深。从而计算喷灌均匀系数。以美国雨鸟30PSH型喷头雨量筒间隔为lm和2m的喷洒试验数据,计算网格点取lm和0.25 m,分别采用三次样条两次插值法和邻近四点距离线性插值法计算了克里斯琴森均匀系数。结果表明,均匀系数由高至低的顺序依次为采样间隔为2m的线性插值、采样间隔为2m的三次样条两次插值、采样间隔为lm的线性插值和采样间隔为lm的三次样条两次插值。采样间隔2m比lm计算出的均匀系数总体高3-4个百分点,三次样条两次插值法比邻近点距离线性插值法略低1个百分点,2种计算网格点间距下的均匀系数差值小于1个百分点。结果证明,采样间距、插值方法、计算网格间距对均匀系数的影响依次降低,三次样条两次插值法可以用来评价喷灌组合均匀系数。
【英文摘要】A new evaluation method, with accompanying software SIUEWl.0, was developed to precisely calculate uniformity from catch-can test data. Water application depths of a rain-bird sprinkler 30PSH were calculated at each grid point. The Christiansen uniformity (CU) for four sprinklers in square and triangular spaced were computed with 1 m and 2 m spaces, and with 1 m and 0.25 m grid spaces. The results showed that the sequence of CUs from high to low is 2 m sampling spaces by linear interpolation, 2 m sampling spaces by cubic spline interpolation, 1 m sampling spaces by linear interpolation and lm sampling spaces by cubic spline interpolation. CUs computed from 2 m space catch-can data are greater than that from 1 m space catch-can data by 3%一4%.CUs computed with cubic spline twice interpolation are less than that with linear interpolation by using nearest four points by 1.0%.The deviation between CUs computed from grid points with 1 m space and 0.25 m separately are less than 1. 0 %.It could be concluded from these results that the influence of sampling space, interpolation method, and grid space on CU is less and less in turn.

【题目】水分胁迫下小麦S-腺苷甲硫氨酸合成酶基因的半定量表达模式分析
【中文关键词】小麦;S-腺苷甲硫氨酸合成酶(SAMS);水分胁迫;基因表达
【英文关键词】Wheat;S-adenosylmethionine synthetase(SAMS);Water stress;Gene expression
【中文摘要】为了解小麦S腺苷甲硫氨酸合成酶(S-adenosylmethionine synthetase,SAMS)基因(SAMS)在抗旱节水中的功能,以小麦品种陕229为材料,以本实验室克隆的普通小麦SAMS基因的序列设计引物,利用半定量RTPCR方法,对小麦叶片中SAMS基因在正常供水及PEG 6000模拟水分胁迫12、24、48、60、78 h以及复水3、6、12 h时的表达模式进行分析。结果表明,小麦SAMS基因在正常生长情况下有一定量的表达,在水分胁迫早期(PEG6000胁迫12、24、48 h)诱导上调表达,水分胁迫程度严重时(PEG 6000胁迫60、78 h)表达受到抑制,表达量低于对照,复水后(3、6 h)上调表达,复水18 h后表达量下调至对照水平。说明小麦SAMS基因的表达受水分胁迫及水分胁迫后复水诱导,是小麦抗旱节水的关键基因。
【英文摘要】To study the functions of wheat S-adenosylmethionine synthetase(SAMS)gene in drought tolerance and water use efficiency,the semi—quantitative RT—PCR was used to investigate the expression patterns of SAMS gene in the leaves of wheat

seedling of Shaan 229 during PEG-simulated water stress and re-watering after serious water stress.The results showed that the expressions of SAMS were up—regulated at 1 2,24 and 48 h of 0.5 Mpa PEG 6000 simulated water stress,then were down—regulated at 60 and 78 h of 0.5 Mpa PEG 6000 simulated water stress to less than normal level,and were up—regulated again at 3 and 6 h of rewatering,decreased again after 1 8 h of re-watering to the normal level.The expression patterns of wheat SAMS during water stress and re-watering after serious water stress suggested that this gene might be involved in the regulations of wheat to water stress and recovery,and was one of the key genes for the improvement for water use efficiency in wheat.

【题目】赤霉素敏感性不同矮秆基因对小麦胚芽鞘长度和株高的效应

【中文关键词】普通小麦;矮秆基因;Rht-B1b;Rht-D1b;Rht8;胚芽鞘长度;株高

【英文关键词】bread wheat; dwarfing genes; Rht-B1b; Rht-D1b; Rht8; coleoptile length; plant height

【中文摘要】明确赤霉素敏感性不同的矮秆基因对小麦株高和胚芽鞘长度的效应,促进小麦不同矮秆基因的合理利用.[方法]利用分子标记和系谱分析相结合,对中国小麦主产区部分小麦品种及品系中所含的矮秆基因Rht-B1b、Rht-D1b和Rht8进行分类,结合田间株高和室内胚芽鞘长度调查,比较赤霉素(GA_3)敏感性不同的矮秆基因对胚芽鞘长度和株高的效应. [结果]分子标记检测结合系谱分析对129份供试品种进行分类,含有矮秆基因Rht-B1b的小麦品种58份,含有Rht-D1b的24份,含有Rht8的73份.其中35份品种含有2个矮秆基因Rht-B1b和Rht8,16份品种含有Rht-D1b和Rht8.赤霉素敏感性检测发现含有矮秆基因Rht-B1b或Rht-D1b的小麦品种多对赤霉素反应不敏感,含有矮秆基因Rht8的小麦品种多对赤霉素反应敏感,而同时含有2个矮秆基因Rht-B1b+Rht8或Rht-D1b+Rht8的小麦品种绝大多数对赤霉素反应不敏感.赤霉素不敏感的矮秆基因Rht-B1b和Rht-D1b以及同时含有赤霉素不敏感和赤霉素敏感2个矮秆基因的小麦品种(Rht-B1b+Rht8和Rht-D1b+Rht8)降低株高的效应较大,分别为24.6%、30.4%、28.2%和32.2%,而赤霉素敏感的矮秆基因Rht8降低株高的效应为14.3%.赤霉素不敏感的矮秆基因Rht-B1b、Rht-D1b以及Rht-B1b+Rht8和Rht-D1b+Rht8在降低株高的同时,也缩短了胚芽鞘长度,其效应分别为25.4%,31.3%、28.4%和31.3%,而赤霉素敏感的矮秆基因Rht8缩短胚芽鞘长度的效应较小,仅为6.0%.[结论]以上分析结果表明,赤霉素不敏感的矮秆基因Rht-B1b和Rht-D1b在降低株高的同时也限制了胚芽鞘的伸长,不适于旱地小麦改良利用,而赤霉素敏感的矮秆基因Rht8既降低了株高又不影响胚芽鞘长度,是旱地小麦改良中比较理想的矮秆基因.

【英文摘要】Understanding the effects of wheat dwarfing genes on coleoptile length and plant height is crucial for the proper utilization of dwarfing genes in yield improvement of wheat. [Method] Molecular markers analysis combined with pedigree information were used to classify wheat cultivars widely used in the major wheat growing regions of China into different categories based on the dwarfing genes carried, then the effects of dwarfing genes with different response to Gibberellins (GA_3) on coleoptile length and plant height were analyzed based on plant height data from the field and coleoptile length data from the lab. [Result] The screening of 129 cultivars with molecular markers revealed that 58 genotypes contained the dwarfing gene Rht-B1b, 24 genotypos had Rht-D1b, and 73 genotypes possessed Rht8, and among them there were 35 genotypes with two dwarfing genes Rht-B1b+RhtS, and 16 genotypes with two dwarfing genes Rht-D1b+RhtS. Test on response to GA_3 of these cultivars revealed that wheat cultivars with the dwarfing genes Rht-B1b or Rht-D1b were insensitive to GA_3, and those with the dwarfing gene Rht8 were responsive to GA_3. Genotypes with Rht-B1b+Rht8 and Rht-D1b+Rht8 were also insensitive to GA_3. The height reducing effects of GA_3 insensitive dwarfing genes Rht-B1b, Rht-D1b, Rht-B1b+Rht8, and Rht-D1b+Rht8 were as 24.6%, 30.4%, 28.2% and 32.2%, respectively, while that of GA_3-responsive dwarfing gene Rht8 was 14.3%. The GA_3 insensitive dwarfing genes Rht-B1b, Rht-D1b, Rht-B1b+Rht8, and Rht-D1b+Rht8 also shortened the coleoptile length by 25.4%, 31.3%, 28.4%, and 31.3%, respectively, whereas the GA_3-responsive dwarfing gene Rht8 only shortened the coleoptile length by 6.2%. [Conclusion] To summarize, the GA_3 insensitive dwarfing genes Rht-B1b and Rht-D1b shorten the eoleoptile length largely as well as reducing plant height and are not suitable to wheat improvement for dryland, while the GA_3-respoasive dwarfing gene Rht8 has much less effects on shortening eoleoptile length and also could reduce plant height to some extent, it is the right dwarfing gene for wheat improvement of dry land.

【中文关键词】小麦;干旱胁迫;抑制消减杂交(SSH);表达序列标签(EST);RT.PCR
【英文关键词】wheat;drought stress;suppression subtraction hybridization(SSH);expression sequence tag(EsT);RT-PCR
【中文摘要】利用抑制消减杂交(SSH)技术构建了小麦(Triticum aestivum)品种小偃22干旱胁迫诱导基因表达的SSH-cDNA文库,从文库中随机挑选插入片段大于400 bp的阳性克隆60个进行测序,去除冗余序列和嵌合序列后,获得了31条高质量表达序列标签(EST)序列(GenBank登录号:ES466737~Es466766,ES466799)。进一步采用RT.PCR对其中的胚胎形成晚期富集蛋白基因(LEA)和△1.吡咯啉.5一羧基合成酶基因(P5CS)的表达模式进行了分析。结果表明,获得的EST序列中的26条EST序列具有功能已知的同源基因,这些基因多数不仅与植物的非生物胁迫相关,也与植物的生物胁迫反应相关,表明植物在胁迫反应中有明显的交叉适应性,其中与小麦表达序列高度同源的EST占58%。24条EST序列与功能已知蛋白的同源性较高,主要涉及植物的信号传导、能量代谢、转录调控及防卫反应等。表达模式分析表明,LEA家族蛋白D9在土壤绝对含水量达到4.8%时上调表达,在萎蔫后复水2 h时表达量最高,随着复水时间延长表达量降低并趋于稳定;PSCS基因D16在渍水条件下、严重干旱胁迫下均上调表达,而在可维持生长的水分条件下和严重干旱后复水4 h后表达量急剧下降。序列分析表明,LEA蛋白基因D9与PSCS基闪D16均是部分同源基因,暂命名为TaLEA-D9和TaP5CS-D16。
【英文摘要】A forward subtractive cDNA library of wheat(Triticum aestivuml)Xiaoyan22 under drought stress was constructed by mRNA from drought stressed leaves used as tester and normal watered leaves used as driver using SSH(suppression subtraction hybridization) technique.A total of 60 positive clones with insertion over 400 bp were randomly picked from the library and sequenced.The redundancy and false sequences were removed after sequence alignment,3 1 high quality EST(expression sequence tag)sequences (GenBank accession No.ES466737-ES466766,ES466799)were obtained.The expressions of 2 homological genes to LEA(1ate-em—bryogenesis—abundant like protein)and PSCS(pyrroline-5-carboxylate synthetase)under drought and recovery after serious drought were further determined by RT-PCR analysis.Sequence homologous comparison and function querying showed that 26 EST ofthe 31EST sequences were highly homologous with known ESTs.Most of those genes were not only related to abiotic stresses,but also related to biotic stresses in plants,suggesting the interactions in response to different stresses in plants,and 58%of the ESTs were homologous with wheat ESTs.BlastX analysis revealed that 24 EST sequences were similar to known proteins,the functions of those proteins mainly involved in signal transmission。energy metabolism,transeription regulation,protein processing and defense response.Expressions of the LEA protein homological gene D9 showed that this LEA protein gene was up—regulated at wither stage of serious drought stress,reached to its peaK at 2 h after recovered water, then decreased and maintained stabilization.Expressions of the P5CS homological gene D16 showed that this PSCS gene was up-rvgulated at water logging(33.4%of soil absolute water content)and serious drought stresses(4.8%of soil absolute water content),and decreased steeply under no-water stress conditions and at 4 h after re-watering.Sequence analysis showed that those 2 genes were partial homologous genes with genes cloned in wheat.and were desigmated as TaLEA-D9 and TaP5CS-D16,respectively.

【题目】The Effects of Dwarfing Genes with Different Sensitivity to GA_3 on the Coleoptile Length and Plant Height of Wheat
【中文关键词】bread wheat, dwarfing genes, Rht-B1b, Rht-D1b, Rht8, coleoptile length, plant height
【英文关键词】bread wheat, dwarfing genes, Rht-B1b, Rht-D1b, Rht8, coleoptile length, plant height

【中文摘要】Understanding the effects of wheat dwarfing genes on the coleoptile length and plant height is crucial for the properutilization of dwarfing genes in the improvement of wheat yield. Molecular marker analysis combined with pedigreeinformation were used to classify wheat cultivars widely planted in major wheat growing regions in China into differentcategories based on the dwarfing genes they carried. The effects of the dwarfing genes with different sensitivity togibberellins (GA3) on the coleoptile length and plant height were analyzed. Screening of 129 cultivars by molecular markeranalysis revealed that 58 genotypes of wheat contained the dwarfing gene Rht-B1b, 24 genotypes of wheat containedRht-D1b gene and 73 genotypes of wheat possessed Rht8 gene. In addition, among these 129 cultivars, 35 genotypes ofwheat cultivars contained both Rht-B1b and Rht8 genes and 16 genotypes of wheat cultivars contained both Rht-D1band Rht8 genes. Wheat cultivars with the dwarfing genes Rht-B1b or Rht-D1b were insensitive to GA3, while the cultivarswith the dwarfing gene Rht8 were sensitive to GA3. Most of the wheat genotypes containing combination of Rht8 genewith either Rht-B1b or Rht-D1b gene were insensitive to GA3. The plant height was reduced by 24.6, 30.4, 28.2, and 32.2%,respectively, for the wheat cultivars containing Rht-B1b, Rht-D1b, Rht-B1b + Rht8, and Rht-D1b + Rht8 genes. The plantheight was reduced by 14.3% for the wheat cultivar containing GA3-sensitive gene Rht8. The coleoptile length wasshortened by 25.4, 31.3, 28.4 and 31.3%, respectively, in the wheat cultivars containing Rht-B1b, Rht-D1b, Rht-B1b+ Rht8and Rht-D1b +Rht8 genes, while the coleoptile length was shortened only by 6.2% for the wheat cultivar containing Rht8gene. We conclude that GA3-insensitive dwarfing genes (Rht-B1b and Rht-D1b) are not suitable for the wheat improvementin dryland because these two genes have effect on reducing both plant height and coleoptile length. In contrast, GA3-sensitive dwarfing gene (Rht8) is a relatively ideal candidate for the wheat improvement since it significantly reduces theplant height of wheat, but has less effect on the coleoptile length

【英文摘要】Understanding the effects of wheat dwarfing genes on the coleoptile length and plant height is crucial for the properutilization of dwarfing genes in the improvement of wheat yield. Molecular marker analysis combined with pedigreeinformation were used to classify wheat cultivars widely planted in major wheat growing regions in China into differentcategories based on the dwarfing genes they carried. 【题目】谷子抗旱相关性状的主成分与模糊聚类分析
【中文关键词】谷子;抗旱性;主成分分析;模糊聚类;综合评价
【英文关键词】foxtail millet; drought tolerance; principal component analysis; fuzzy clustering; comprehensive evaluation

【中文摘要】【目的】探讨作物抗旱性分析评判的方法,对谷子主要农艺性状和部分生理指标与抗旱性之间的关系进行综合评价。【方法】采用主成分分析(Principal Components Analysis,PCA)和模糊聚类(Fuzzy Clustering,FC)分析,根据16 个谷子品种在干旱胁迫和自然降水条件下的抗旱相关性状对其抗旱性进行综合评价。【结果】主成分分析结果表明,6 个综合主成分可代表谷子抗旱性90.71%的原始数据信息量。利用抗旱性度量值进行模糊聚类,可将16 个谷子品种的抗旱性划分为3类,聚类结果可以较好地反映这些谷子品种的选育和种植区域的干旱特点,其中冀谷18 和豫谷1 号抗旱性强且稳定性好。【

结论】利用主成分分析,结合模糊聚类的方法进行谷子的抗旱性综合评价,不仅可以避免单一指标的片面性和不稳定性,而且可以较好地揭示谷子抗旱相关性状与其抗旱性的关系。
【英文摘要】【Objective】 The main purpose of this paper was to explore the methods of drought tolerance evaluation, and to evaluate the relationships between some agronomic traits and physiological indicators with drought-tolerance in foxtail millet (Setaria italica). 【Method】 Principal Component Analysis (PCA) and Fuzzy Clustering (FC) were used to evaluate the drought tolerance of 16 foxtail millet cultivars based on their performance under the conditions of rainfed and water limited cultivation under rainout shelter. 【Result】 The result of Principal Component Analysis indicated that 6 principal components could present 90.71% information of the raw data of the traits related to drought tolerance of foxtail millet. The 16 cultivars used in this study could be divided into 3 clusters by Fuzzy Clustering based on their Drought-tolerance Value (DV), which could reflect the drought characteristics of the origins and planting areas of those cultivars. Among those cultivars,the drought tolerance of Jigu18 and Yugu1 were better and more stable. 【Concussion】 It is an effective way to comprehensively evaluate the drought tolerance of foxtail millet by Principal Component Analysis and Fuzzy Clustering,which not only could avoid the bias and the instability of single factor analysis, but also reflect the relationship between different drought tolerance related traits and drought tolerance in foxtail millet better.

【题目】模拟干旱胁迫下冬小麦胚芽鞘长度变化及与抗旱性的关系研究
【中文关键词】小麦;干旱胁迫;胚芽鞘长度;抗旱指数;抗旱性
【英文关键词】wheat;drought stress;coleoptile length;drought index;drought resistance capacity
【中文摘要】以6个抗旱性不同的冬小麦品种(系)为材料,通过不同浓度的PEG一6000渗透溶液模拟干旱胁迫处理,研究了小麦苗期的胚芽鞘长度、苗高、主胚根长等性状,并与其在大田及防雨棚控水条件下的产量构成和抗旱性的关系进行分析。结果表明,在不同浓度的PEG一6000渗透溶液干旱胁迫处理下,小麦苗期胚芽鞘长度在品种间差异显著;产量的抗旱指数与苗期不同干旱胁迫处理下的胚芽鞘长度的相关性分析表明,小麦的胚芽鞘长度与其抗旱指数呈极显著正相关(相关系数为0.9600),抗旱性强的品种胚芽鞘较长,抗旱性弱的品种胚芽鞘较短。在不同程度的干旱胁迫处理下,各品种的胚芽鞘长度变化趋势大致相同,因此利用胚芽鞘长度可以在早期对小麦的抗旱性进行鉴选。
【英文摘要】6 winter wheat varieties (or lines)were used as materials,their coleoptile length,seedling length and main radicle length of wheat seedlings were investigated under different concentrations of PEG—-6000 osmotic solution simulated drought stress,and their relations with the yield components and drought tolerance under different and rainout shelters were further analyzed.Under different concentrations PEG一6000 osmotic solution simulated drought stress.significant differences were observed among different wheat varieties.The correlation analysis on their coleoptile length in seedlings under different treatments with their yield drought tolerance index revealed significant and positive association with correlation coefficient of 0.9600.The longer the coleoptile length of the variety is,the higher the drought tolerance index is.Coleoptile length were observed in different varieties.and the differences among varieties were consistent under different simulated drought stresses,therefore,coleoptile length could be used in the evaluation of drought in wheat at the early stage.

【题目】基于蓝牙的温室温度检控系统研究
【中文关键词】蓝牙 AT89S51 电流型温度传感器 温室
【英文关键词】Bluetooth AT89S51 currentmode temperature sensor greenhouse
【中文摘要】介绍了基于蓝牙的温室温度检控系统的设计。该系统以AT89S51系列单片机为控制单元,选用电流型温度传感器AD590采集测温点的温度信号,监控的温度范围为- 55~150°C。蓝牙技术的使用省去了通信线路的铺设,使检控系统的初期建设周期短、投资小。该系统通过键盘设定温度的上、下限,将温室温度控制在适合作物生长的最适宜温度区,使作物快速、高效生长,确保温室经济效益。
【英文摘要】This paperpresent the design of check and control system for greenhouse temperature based on Bluetooth. In this system, a AT89S51 single-chip is applied as a control unit and current mode temperature sens or AD590 is applied to collect the temperature on measuring temperature point. The system temperature can be controlled in a range of - 55~150°C. The application of Bluetooth technology leave out communication circuit and shorten the initial building period and reduce the investment of the check and control system. The upper and lower limit value of temperature can be set by keyboard. The temperature of greenhouse is controlled in the most suitable temperature area for crop growth, which urge crop fast and efficiently growth, insure greenhouse economy benefit.

【题目】作物需水信息无线传输方式现状及研究进展
【中文关键词】作物需水信息 无线传输 GPRS 蓝牙 ZigBee
【英文关键词】crop water demand information;wireless transmission; GPRS; Bluetooth; ZigBee
【中文摘要】综述了国内外作物需水信息无线传输方式的现状和发展趋势。无线通信方式可分为长距离通信(GSM和GPRS等)与短距离通信(蓝牙和ZigBee等) 。GSM和GPRS借助于移动通讯网络,实现了作物需水信息远程采集与设备远程监控;蓝牙和ZigBee在温室作物需水信息采集与监控等方面显示出巨大潜力。未来作物需水信息系统的发展趋势将是各种无线传输方式的结合与融合,从而构建超级的传输网络。
【英文摘要】The progress of wireless data transmission and communication technology on crop water demand information was reviewed. Wireless communication techniques are divided into two types. Long distance communication mode (GSM, GPRS and so on) and short distance communication mode (Bluetooth, Zigbee and so on). GSM and GPRS can perform remote crop water demand information collection and remote control by mobile communication network. Bluetooth, Zigbee show enormous potentiality for monitoring environment of greenhouse. In the future, the trend of the wireless data transmission and communication technology is suggested to be combination and convergence of all kinds of wireless transmission, thus to construct the super- transmission network..

【题目】小麦碳同位素分辨率与叶片气孔相关指标的关系

【中文关键词】小麦; 碳同位素分辨率;替代指标; 气孔导度;叶面温度

【英文关键词】Carbon isotope discrimination; Substitution indexes; Stomatal conductance; Flag leaf temperature

【中文摘要】为了探讨气孔相关指标替代碳同位素分辨率(Δ)作为评价指标的可行性, 测定了56个小麦品种(系)的碳同位素分辨率(Δ), 并分析了灌浆期不同阶段气孔相关指标与Δ值的相关性。结果表明,小麦旗叶和籽粒的Δ值均具有较好的遗传稳定性;灌浆中后期小麦旗叶的气孔导度和叶面温度都与Δ值有较强的相关性。因此,在育种中,可以通过测定灌浆中后期小麦旗叶的气孔导度和叶温代替Δ值对材料的蒸腾速率进行初步选择。

【英文摘要】This paper aims at probing whether the stomatal indexes could be used as an substitution for carbon is otope discrimination(Δ) in breeding program. The stomatal conductance and surface temperature of flag leaf at 5 different grain-filling stages were measured in 56 wheat cultivars grown at no-irrigation conditions, and their relationship with carbon isotope discrimination were analyzed. The results showed that the measured from either flag leaf or grains had good stability and correlation analysis between the measured stomatal indexes and Δ indicated that there were significant correlations between stomatal conductance and surface temperature of flag leaf measured at middle-later period of grain-filling with Δ Therefore measuring the stomatal conductanceandtemperatureof flagleaf at middle later periodof grain filling couldbe used instead of carbon is otope discrimination for primary screening of transcription efficiency in breeding materials.

【题目】中国小麦地方品种春化基因的分布及其与冬春性的关系

【中文关键词】小麦 地方品种 春化基因 分布频率 冬春性

【英文关键词】wheat; landraces; vernalization genes; distribution frequency; winter hardness
【中文摘要】了解春化作用相关基因在中国小麦地方品种中的分布特点及其与小麦冬春性的关系,促进小麦地方品种的合理利用.[方法]采用小麦春化作用相关基因Vrn-A1、Vrn-B1、Vrn-D1和Vrn-B3的STS分子标记,对其在中国小麦十大生态栽培区的153份地方品种中的分布进行检测,并分析其与冬春性的关系.[结果](1)中国小麦地方品种中4个显性春化基因的分布频率依次为60.78%(Vrn-D1)、5.88%(Vrn-A1a)、5.2 3%(Vrn-B1)和0(Vrn-B3).(2)Vrn-A1a和Vrn-B1,在东北春麦区等春麦区地方品种中的分布频率较高,以东北春麦区最高,达5O%和33.33%,在大部分冬麦区未检测到这2个显性突变.10个麦区地方品种均检测到Vrn-D1,在青藏春冬麦区地方品种分布频率最高(83.33%),也是在中国冬麦区小麦地方品种中检测到的主要春化基因类型.(3)中国十大麦区地方品种的春化基因型与其对春化作用的要求基本吻合,除中部和南方冬麦区地方品种基因型与文献记载的冬春性的一致性指数较低外,其它麦区的冬春性一致性指数较高.[结论]通过分子标记检测,明确了中国小麦地方品种的春化基因类型及其分布特征,分子检测与田间观察相结合能够更准确地反映品种的冬春性.
【英文摘要】[Objective] The objective of this experiment is to understand the distribution of vernalization genes in Chinese wheat landraces and their relations with winter hardness so as to promote the reasona ble utilization of thos e landraces in wheat improvement. [Method] Using STS markers of wheat vernalization genes Vrn-A1 , Vrn-B1 , Vrn-D1 , and Vrn-B3 , the loci distribution of those genes among 153 Chinese wheat landraces from 10 major wheat ecological regions of China were detected, and their relationship with winter hardness was analyzed. [Result] The frequencies of the dominant loci of the four vernalization genes in Chinese wheat landraces were 60.78% (Vrn-D1), 5.88% (Vrn-A1a), 5.23% (Vrn-B1), and 0 (Vrn-B3), respectively. The higher frequencies of Vrn-A1a and Vrn-B1 were detected in spring wheat regions, with the highest in Northeastern China Spring Wheat Region with 50% and 33.33%, respectively, while in most winter wheat regions, thos e loci weren ’ t detected. Vrn-D1 was detected in all the 10 wheat ecological regions, which also was the main locus of vernalization genes in the landraces of winter wheat regions in China and the highest frequency was detected in Qinghai-Tibet Spring-Winter Wheat Region (83.33%). The genotypes of vernalization genes in wheat landraces from 10 major wheat ecological regions of China detected by molecular marker analysis we re largely consistent with their vernalization requirement, and the consistency index of genotypes detected with the winter hardness recorded from the field was higher in general, while the consistency index for the landraces from the winter wheat regions of central and southern China were lower. [Conclusion]The types and distribution characters of vernalization genes in Chinese wheat landraces were clarified, combining molecular detection of geno type and field investigation of phenotype could reflect the wint erhardness of wheat better.

【题目】转酿酒酵母HOG1基因拟南芥植株的获得与检测
【中文关键词】HOGJ基因;构建植物表达载体;拟南芥转化
【英文关键词】HOGl gene;Construction of plant expressionvector;Arabidopsis thalianatransformation
【中文摘要】HOGl(highosmolarityglycerol,HOGl)是酵母中参与耐高渗透压调控的重要基因。根据已发表的酿酒酵母序列,设计特异引物,扩增到完整的H()GJ基因;构建植物表达载体pBll21一HOGl,通过农杆菌介导转化拟南芥,获得转化植株种子。对收获的T。代种子进行卡那霉素抗性筛选,并通过PCR和RT-PCR对抗性苗进行检测。结果表明,构建的载体成功转化拟南芥,并获得了13份转HDGj基因苗。
【英文摘要】HOGl is an important regulatory factor which regulates response to high osmolarity in Yeast.In this paper,the full-length HOGl gene from the genomie DNA of Saccharomyces cerevisiae was isolated with PCR technique using primers designed according to the published sequence.To identify potential function of this gene in plant,expression vector pBll21一HOGl was constructed,and then transformed into Arabidopsis thaliana by Agrobacterium tumefaciens-mediated method.Totransgenic seeds were screened on MS plate containing Kanamycin.After PCR and RT-PCR,13 positive trans genie seedlings were identified,providingMaterial for further studies on the function ofHOGl gene and its interaction with other genes in plants.

【题目】桃树茎干日变化与生态因子之间的关系研究
【中文关键词】桃树 茎干日变化 生态因子
【英文关键词】peachtree; trunkdaily variation; ecological factors
【中文摘要】采用SPSS软件分析了2007年5-10月桃树茎干日变化与生态因子之间的关系,建立了多元回归数学模型,各月份回归系数均在0.9以上.结果表明,不同生长阶段影响茎干日变化的主要因子不同,而且在一日内影响茎干变化的主要因子也在随时间的推移而变化.从整个生长过程来看,桃树茎干日变化与空气温度和空气相对湿度这2个因子之间的关系相对比较密切.研究不同土壤水势条件下桃树茎干日变化与生态因子之间的关系,可为桃树生长环境的调控提供科学依据.
【英文摘要】The relationship between daily variation of peach stem and ecology parameters during May and October in 2007 was analyzed by SPSS. Meanwhile, multiple regression mathematical model was built and the regression coefficient of each month was greater than 0. 9. The results showed that the key factor which influence stem daily variation was different indistinct growth period. Moreover, thekeyfactor was changed as time goes on in the same day. Close relation ships between stem daily variation and air temperature, air relative humidity were found during whole growth period. Investigating the relationship between stem daily variation

and ecology parameters can provide the scientific foundation for regulation and control of pear tree growing environment.

【题目】硬粒小麦和野生二粒小麦高分子量谷蛋白亚基的遗传多样性
【中文关键词】野生二粒小麦;硬粒小麦;高分子量谷蛋白亚基;遗传多样性
【英文关键词】Durumwheat;Wildemmer
wheat;High
molecular
weightglutenin;Genetic diversity
【中文摘要】为了解硬粒小麦和野生二粒小麦的高分子量谷蛋白亚基(HMW—GS)组成及优质亚基的分布特点,并对其多样性进行分析,利用SDS聚丙烯酰胺凝胶电泳(SDS-PAGE)对32份硬粒小麦和75份野生二粒小麦共107份材料的HMw—GS组成进行了分析。结果表明,Glu-1位点共有27种等位基因,其中Glu-A1位点4种。Glu-B1位点23种;亚基null和6+8在各自的位点上出现频率最高,分别达到38.84%和16.82%;其亚基组成类型共有47种,主要为l/6+8,频率达7.48%;同时筛选出33份含有l、2*,13+16、14+15,17+18等优质亚基的材料,可作为优质基因源。多样性分析结果表明,在Glu-A1和Glu-B1位点以及HM-

GS组成上,野生二粒小麦的多样性都大于硬粒小麦。另外,在材料GW-2、GW-4中发现未命名的新亚基。
【英文摘要】In order to know the genetic diversity of high molecular weight gluten,32durum wheat and 75 wild emmer wheat were analyzed by means of SDS-PAGE.There sult indicated that there were 27 alleles on Glu-1 loci,including4 alleles onGlu-A1 loci,23 alleles on Glu-B1 loci;Andnull,6+8 subunits oceurred with highest frequency on each loci,reaching 38.84% and 16.82%respectively.There were 47 types of subunit compositions and the predominant was 1/6+8 with a frequency of 7.48%.Materials conferred with elite subunits of l,2＊,13+16,14+15,17+18 were selected and could be a source of desirable genes.Results from the diversity analysis showed that the diversity of wild emmer wheat were greater than of durum wheat in the GIu-A1 and GIu-B1 loci,as well as HMW—GS composition.One newsubunit combinations type was found in wild emmerwheat materials GW-2andGW-4.

【题目】矮秆基因对小麦部分农艺性状的效应
【中文关键词】普通小麦;矮秆基因;Rht-B1b;Rht-D1b;Rht8;农艺性状
【英文关键词】Bread wheat ;dwarfing genes;Rht-B1b;Rht-D1b;Rht8; agronomic traits
【中文摘要】以中国主要麦区的124份小麦品种为材料,利用分子标记和系谱分析相结合,对其按照所含的矮秆基因Rht-B1b、Rht-D1b和Rht8进行分类,结合田间株高、旗叶长、小穗数和穗粒数以及室内苗期根系长度等农艺形状的调查,分析不同矮秆基因对小麦农艺性状的效应。结果显示: (1) 参试的124份小麦品种(系) 中23份含有Rht-B1b,7份含有Rht-D1b,22份含有Rht8基因,34份同时含有Rht-B1b和Rht8,16份同时含有Rht-D1b和Rht8,可分为6组。(2) Rht-B1b和Rht-D1b在降低株高的同时也缩短了旗叶的长度和苗期叶长,Rht8对株高的影响较弱,对旗叶和苗期叶长的影响也较小;3个矮秆基因对苗期根系长度、小穗数没有显著影响;Rht-D1b和Rht8显著增加穗粒数。研究表明,矮秆基因Rht8对小麦株高以及其他农艺性状的影响均较小,但能够显著增加穗粒数,是小麦矮化育种中比较理想的矮秆基因。
【英文摘要】To investigate the effects of dwarfing genes Rht-B1b, Rht-D1band Rht8 on agronomic traits of wheat ,we use molecular markers analysis combined with pedigree information,124 wheat cultivars widely used in Chinese major wheat production regions were classified into different categories based on the dwarf genes carried,then the effects of dwarf genes on plant height ,length of flag leaf ,spikes per individual and kernels per spike were analyzed based on these data from the field and root length data from the lab. Results indicated that (1) The screening of 124 varieties with molecular markers revealed that there were 23 geno types with dwarfing gene Rht-B1b,7genotypes with dwarfing gene Rht-D1b and 22 genotypes with dwarfing gene Rht8,and 34 genotypes with two dwarfing genes of Rht-B1b and Rht8,and 16 genotypes with two dwarfing genes of Rht-D1b and Rht8. (2) The effects of dwarfing genes Rht-B1b, Rht-D1b and Rht8 on agronomic traits of wheat showed that the strongest effect on reducing plant height was observed for dwarf genes Rht-D1b and Rht-B1b,and then Rht8,and no significant differences was observed in seedling root length;The length of flag leaf of wheat cultivars with Rht8 was significantly longer than that of other dwarfing genes;there were no significant differences observed in spikes per individual ;the kernels number per spike of wheat cultivars with dwarfing genes Rht-D1b and Rht8 were significantly higher than that with dwarf gene Rht-B1b. To summarize,the dwarfinggenes Rht-B1b and Rht-D1b shorten the flag leaf length largely while reducing plant height ,the dwarfing gene Rht8 had muchless negative effects on other agronomic traits and also could reduce plant height to some extent ,mean while increasing grain number per spike. Rht8 is an ideal dwarfing gene for wheat improvement.

【题目】喷头水量分布仿真及组合优化软件系统研究
【中文关键词】喷灌; 水量分布仿真;组合优化;MATLAB; VC
【英文关键词】sprinkler irrigation; water distributionsimulation; spacing optimization; MATLAB; VC+ +
【中文摘要】喷灌以其适应性广、易于机械化作业等优点成为目前世界上广泛采用的节水灌溉技术之一。喷灌均匀度是衡量灌溉质量和喷头水力性能的重要指标, 是喷灌系统规划设计中的重要参数。通过接口软件MATCOME4. 5,结合MATLAB与Visual C+ +工具混合开发出喷头水量分布仿真及组合优化软件系统。该系统操作简单, 功能强大,能够脱离混合开发环境独立运行。用户只需输入雨量筒实测数据, 选择喷头组合方式, 插值方法及插值间距等指令,系统即可快速得出基于给定组合方式下的多种喷灌均匀度系数, 喷洒水量分布图, 或以某种均匀度数为评价指标的喷头组合间距优化结果。系统给喷灌质量或喷头性能的评价分析工作以及喷灌系统的规划设计工作带来了极大便利。
【英文摘要】As one of the water-saving irrigation technologies, sprinkler irrigationis widely used in the world due to its wide adapt ability, easy mechanized operation and other advantages. Sprinkler uniformity is an important index to evaluate irrigation quality and the performance of sprinkler, also a significant parameter to design a sprinkler irrigation system. Through the interface MATCOM4. 5,computer software for Sprinkler Water Distribution Dynamic Simulation and Spacing Optimization is developed based on MATLAB andVisual C+ + in this paper. This softw are with powerful function can be operated easily and run without installation of MATLAB.It can quickly computed most kinds of application uniformity coefficients, draw water distribution maps and determine the best sprinkler spacing and lateral spacing with a certain coefficient as evaluation index according to catch-cansdata, sprinkler combination, interpolation method and interpolation spacing. In conclusion, it brings great convenience to the evaluation of irrigation quality and sprinkler performance as well asthe designof a sprinkler irrigation system.

【题目】作物需水信息实时监测与无线远程传输系统
【中文关键词】作物需水信息;传感器;GPRS ;无线数据传输
【英文关键词】crop water demand information;sensors;GPRS;wireless data transmission
【中文摘要】为了解决作物需水信息的快速获取和无线远程传输问题,提出并实现了一种作物需水信息无线远程传输与监测系统该系统由3部分组成,即PTW-48M 植物生理生态监测仪及所适配的传感器构成的数据采集与监测系统、GPRS DTU与 GPRS网络构成的无线数据传输系统以及数据存储和处理中心为此,阐述了系统的整体结构,并从软硬件两方面描述了系统的设计及实现结果实现GPRS DTU和PTM-48M 植物生理生态监测仪的成功连接,且PTM-48M 连接多个传感器可实时采集多个信息,进而实现了多通道作物需水信息的异地实时监测与无线远程传输实践证明,该系统使用灵活,数据传输可靠。
【英文摘要】For obtaining the water demand information of the crop quickly and achieving wireless remote data transmitting, put forward and carry out the system of the real time monitoring and wireless remote transmitting of the crop water demand information. The system is made up of three parts that PTM-48M Photosynthesis and Transpiration Monitor and the sensors to constitute the data collecting and monitoring, GPRS DTU and the GPRS network to constitute wireless remote transmitting, the data center of storing data and processing data. Elaborated the whole structure of the system, and describe how to design and carry out the system on the software and hardware. The results achieved connectivity of GPRS DTU and PTM-48M Photosynthesis and Transpiration Monitor, and PTM-48M linked to a number of sensors, can collect a number of real-time information. Proceed to achieve a multi-channel on crop water demand information real-time remote monitoring and remote wireless transmission. It is proved that the system is vivid and the data transmission is credible.

【题目】基于Web的农业环境信息实时发布系统研究
【中文关键词】Web; 实时; 农业环境
【英文关键词】Web; real- time; agricultural environment
【中文摘要】农业环境信息的远程动态管理对制定科学合理的生产措施具有重要意义。为此, 应用VB6. 0实现了实时读取农业环境传感器系统的DAT数据文件, 并将数据存储在网络数据库表中。同时, 应用ASP动态网页技术实现了信息发布。经验证, 系统可以实现农业环境信息的实时发布、历史数据查询以及分析等功能。系统充分利用数据库技术和Web技术的优势, 为农业生产的远程实时管理提供了可能。
【英文摘要】The remote and dynamic management of agricultural environment information is of critical significance for making scientific and reason able production measures. Based on VB6. 0, DATdata file of agricultural environment sensor system was read in real time, and then the data were stored in the table of network data base and released on web through ASP dynamic web technology in this paper. It is proved that the system can release agricultural environment information in real time, query and analyze historical data. Through this system which made full use of advantages of data base and web technology, it is possible to manage agriculture production in real time remotely.

【题目】牛凝乳酶基因的克隆与表达
【中文关键词】牛凝乳酶; 克隆; 表达;
【英文关键词】bovine chymosin; cloning; expression;
【中文摘要】为了获得大量高纯度高活性的凝乳酶制剂,采用基因工程方法,从犊牛皱胃黏膜细胞中克隆得到凝乳酶基因,然后将此基因插入原核表达载体pTWlN1中,使之与几丁质结合域(CBD)一内含肽(intein)融合,从而获得原核表达质粒pTWIN1/EchybF2。经转化大肠杆菌BL21(DE3)后,在IPTG诱导下进行凝乳酶的表达。SDS-PAGE电泳分析和酶活性实验结果显示,CBD-intein-EchybF2融合蛋白在BL21(DE3)中获得高效表达,在低温诱导时主要以可溶性蛋白的形式存在,并具有凝乳活性。
【英文摘要】Traditionally cheese is made mainly by the use of bovine chymosin,but the source of supply of this enzyme is limited due to decreasing number of calves.In order to obtain large quantities of pure and active enzyme,the gene of bovine chymosin was cloned from the mucosal cells of the abomasum of calf.The DNA fragment was then inserted into the prokaryotic expression vector pTWIN1,resulting in the expression plasmid pTWIN1/EchybF2,which was further transformed into E.coli BL21(DE3).Expression of the enzyme was performed at different temperatures with IPTG induction.SDS-PAGE and activity tests showed that chymosin was expressed in soluble form at a low temperature,and the recombinant protein had milk-clotting activities.

【题目】Cloning, Expression and Structural Modification of Milk-Clotting Enzymes.
【中文关键词】牛凝乳酶 天冬氨酸蛋白酶 干酪
【英文关键词】Milk-clotting enzymes Chymosin Aspartic proteinase Cheese
【中文摘要】凝乳酶是干酪生产过程中主要的凝乳剂。该酶主要来源于动植物及微生物,属于天冬氨酸蛋白酶。传统干酪的生产主要使用牛凝乳酶。而来源于梅褐毛霉(Mucor miehei)和微小毛霉(Mucor pusillus)的真菌天冬氨酸蛋白酶也广泛地用作凝乳剂。部分凝乳酶可以通过将其基因转入微生物中过量表达来获得,而且成本相对较低。但是有关凝乳酶生物工程技术还有很多方面需要进一步研究,如在不同的食品级微生物宿主中高效表达凝乳酶、改善凝乳酶的生产特性如凝乳活力、酶特异性及降低真菌凝乳酶的热稳定性等。本文就牛凝乳酶和真菌天冬氨酸蛋白酶的克隆与表达,以及酶的分子结构改造等方面进行了论述。
【英文摘要】Milk-clotting origins, are the primary milk enzymes, mainly belonging to aspartic pmteinases of animal, plant and microbial eoagulants in the manufacture of eheese. Bovine ehymosin is traditionally used for cheese processing. Fungal aspartic proteinases from Mucor miehei and Mucor pusillus have also been extensively used as milk-clotting agents. Although some of these enzymes have been produced by overexpression of their genes in microorganisms with relatively low costs, further work needs to be done to express the enzymes efficiently in different food-grade microbial hosts, to improve the technological properties such as milk-clotting activity, specific activity, and to decrease the thermostability of the enzymes. The present paper discussed the cloning and expression, and structural modifications of chymosin and fungal aspartic proteinases.

【中文关键词】干酪 加速成熟 乳酸菌 酶 蛋白水解
【英文关键词】Cheese Accelerated ripening Lactic acid bacteria Enzyme Proteolysis
【中文摘要】干酪的成熟是一个缓慢而且昂贵的过程,不能完全进行预测与控制。在保持干酪的风味与质构不受影响的情况下加速干酪成熟是很有意义的。加速干酪成熟的方法主要有:提高成熟温度、高压处理、添加外源酶、使用弱化的发酵剂、使用基因工程菌株、添加附属发酵剂与使用干酪浆。本文讨论了干酪快速成熟的最新研究进展,以及不同成熟方法的优点与不足。
【英文摘要】The ripening of cheese is a slow and consequently an expensive process that is not fully predictable or controllable. Accelerated ripening processes are primarily aimed at accelerated flavor formation, while maintaining a satisfactory texture. The accelerated ripening methods include elevation of ripening temperature, high-pressure processing, addition of enzymes, attenuated starter cultures, genetically modified strains, culture adjuncts and addition of slurry systems. The most recent developments on the acceleration of cheese ripening, as well as the advantages and limitations of these methods are discussed.

【题目】Cloning and expression of a chymosin gene from calf
【中文关键词】牛凝乳酶 克隆 表达
【英文关键词】Bovine chymosin Cloning Expression
【中文摘要】为了获得重组的凝乳酶,本研究首先提取了小牛皱胃总RNA,通过RT—PCR的方法得到了凝乳酶的cDNA。然后,构建了原核表达载体pTWIN1/chy,并将该质粒转化大肠杆菌BL21(DE3),在IPTG诱导下表达重组凝乳酶蛋白。SDS—PAGE电泳分析和酶活性实验结果显示,目的蛋白在BL21(DE3)中获得高效表达,并具有凝乳活性
【英文摘要】Total cellular RNA was extracted from the abomasum of calf ,and the cDNA containing the open-reading frame of chymosin gene was obtained by reverse transcription polymerase chain reaction (RT-PCR).The fragment was cloned into pMD18-T vector, identified by both restriction endonucleases and sequence analysis.The sequencing results showed that it shared 99.6% homology with the sequence published in GeneBank (NM-180994). Then, the fragment was inserted into a pTWINI expression vector to yield the expression plasmid pTWIN1/chy.The resulting recombinant plasmid was thansformed into E. coli BL21 (DE3) competent cells. SDS-PAGE results indicated that the fusion protein was expressed after IPTG induction. Milk clotting assay showed that the recombinant protein was biologically active.These experimental results implied that the bovine chymosin was cloned successfully and expressed efficiently.

【题目】Real-Time Micrography of Mouse Preimplantation Embryos in an Orbit Module on SJ-8 Satellite
【中文关键词】无
【英文关键词】Space-flight; Microgravity; Satellite; Real-time micrography; Image transmission; Embryonic development; Mouse
【中文摘要】无

【英文摘要】The developmental capacity of mouse embryos in the Chinese SJ-8 Satellite was observed by real time micrography and telecontrol image transmission. Frozen/thawed 4-cell embryos and blastocysts injected with mouse epidemical stem cells were placed in a specially sealed embryonic incubator, and then the incubator was loaded in a space embryonic culture box devised for space-flight. After the satellite launched and arrived at the anticipated orbit, the real time micrography device was opened based on the telecontrol operational technology. Real time micrographs of the mouse embryos were obtained and stored every 3 hours, then the data of images were transmitted at the suitable time. The experiment persisted for 72 hours. The results showed that during space-flight, most mouse embryos cultured in the sealed culture unit kept integrity and natural structure, their location had minor change, but the embryos did not develop. However, the experiment performed on the ground in the same device showed that 4-cell mouse embryos could develop to blastocysts and hatched blastocysts. It may be concluded that the space environment, especially the change of gravity was likely to harm development of the mouse embryo.

【题目】Modifications of chemically induced-enucleated nuclear transfer technique by reverse-order nuclear transfer in mouse
【中文关键词】无
【英文关键词】Demecolcine; Mouse; Oocytes; Preimplantation development
【中文摘要】无
【英文摘要】To improve the developmental potential of somatic cell cloned embryos derived from demecolcine (DC) induced-enucleated nuclear transfer (INT), we modified the INT procedures by transferring donor nuclei into recipient cytoplasts prior to the induced enucleation of the recipient cytoplasts, and we called this modified INT technique as reverse-order and induced-enucleated nuclear transfer (RINT). Standard nuclear transfer (SNT) and INT were performed as controls. The dynamic changes of maternal and transferred donor nuclei in the RINT oocytes were monitored to evaluate the feasibility of this new nuclear transfer (NT) technique by timed immunofluorescence. Timed immunofluorescence showed that RINT is feasible because none of the transferred donor nuclei were expelled with the second polar body (Pb) in the RINT oocytes, while 42.2% of the oocytes showed extrusion of all maternal chromosome and spindles with the second Pb at 60 min after activation and DC treatment. Although there was no difference in cleavage rate (86.6% vs. 82.1%), the rates of successful enucleation and blastocyst formation were significantly increased in RINT compared with INT (44.1% vs. 27.5%, and 43.3% vs. 12.8'%, respectively; $p < 0.01$). Compared with SNT, there was no difference in cleavage rate (86.6% vs. 78.4%), but the blastocyst developmental rate was significantly increased in the RlNT group (43.3% vs. 253%; $p < 0.01$). Blastocysts derived from RINT had a higher total cell number than those from SNT (45.1 +/- 3 vs. 37.6 +/- 4; $p < 0.05$). Our results provide evidence that RINT is feasible and may provide a more efficient and simple method for NT than INT.

【题目】Isolation and Culture of Bovine Mammary Epithelial Stem Cells.
【中文关键词】无
【英文关键词】bovine; cellular differentiation; mammary epithelial stem cells; suspension culture
【中文摘要】无

【英文摘要】Bovine mammary epithelial stem cells (MESCs) are very important in agricultural production and bioengineering. In the present study, we compared different isolation and Culture methods for MESCs and observed their growth and differentiation characteristics. MESCs have an extremely weak proliferation capacity, and it is very difficult to obtain and prolong subculture or a bovine mammary epithelial stem cell line. We obtained sonic multipotent MESC aggregates that looked like spherical colonies. These colonies were only derived from suspension Culture and were induced to differentiate into epithelial-like cells, myoepithelial-like cells and secretory cells and to establish a ductal-like structure. In contrast, MESCs cultured in adherent culture displayed low morphogenetic competence and only differentiated into epithelial-like cells, MESCs are often identified by testing their differentiation in vivo; however, herein, we have demonstrated the in vitro differentiation potential of bovine MESCs. in our Study, beta I-integrin and alpha 6-integrin which are expressed by human epidermal stem cells, were found in bovine, which shows that bovine MESCs share the same molecular signature as human MESCs.

【题目】Efficiency of human lactoferrin transgenic donor cell preparation for SCNT.
【中文关键词】无
【英文关键词】beta-Casein gene; Donor cells; EGFP; Human lactoferrin; Multiple PCR amplification
【中文摘要】无
【英文摘要】The combination of somatic cell nuclear transfer (SCNT) and transgenic technology leads to the production of transgenic cloned animals, wherein the preparation of competent transgenic donor cells is the pivotal upstream step. The purpose of this study was to establish an efficient procedure to prepare human lactoferrin (hLTF) transgenic donor cells for SCNT. Thus, two cell culture systems were employed: caprine mammary epithelial cells (for evaluation of the hTLF transgenic expression in vitro), and fetal-derived fibroblast cells (for identification of competent transgenic donor cells). Induced by hormonal signals, recombinant hLTF was detected in the supernatant of transfected mammary epithelial cells by Western blot. Reliable hLTF transgenic fibroblast cell clones were identified by screening with multiple PCR amplification, EGFP fluorescence, and chromosomal counting (32.5 +/- 2.3%). This study may provide an effective upstream system to prepare SCNT donor cells for the production of human recombinant pharmaceuticals from the milk of transgenic animals. (c) 2009 Elsevier Inc. 【题目】Connexin37 mRNA expression in in vivo and in vitro mouse oocyte
【中文关键词】无
【英文关键词】Connexin; Follicle culture; Mouse; Oocyte development
【中文摘要】无
【英文摘要】To evaluate gene expression of Connexin37 (Cx37) in oocytes from in vitro follicles at different stages, mouse preantral follicles were isolated and cultured for 12 days in vitro. Compared with in vitro follicles, follicles grown in vivo were collected at day 14 (d14), d16, d18, d20, d22 and d24 with the same stages for gene expression of Cx37 in oocytes. Our results showed that Cx37 mRNA increased along with follicular development, reached the highest level at the onset of antrum cavity formation and decreased after antrum formation in both in vivo and in vitro mouse oocytes. However, Cx37 mRNA was significant higher ($p < 0.01$) in in vitro

cultured oocytes than in vivo oocytes. Moreover, significantly higher levels of Cx37 mRNA were found in oocytes from in vitro disrupted follicles ($p < 0.01$) and non-grown follicles ($p < 0.05$) than those from normal follicles with a similar size. These data determine temporal gene expression of Cx37 in oocytes from follicules at different stages and indicate that the gene expression level of Cx37 in oocytes could be evaluated as a criterion to the regulatory mechanism of Cx37 in an in vitro model.

【题目】An immortalized goat mammary epithelial cell line induced with human telomerase reverse transcriptase (hTERT) gene transfer
【中文关键词】无
【英文关键词】Immortalization; Goat mammary epithelial cells; hTERT; Somatic cell nuclear transfer; Donor cells
【中文摘要】无
【英文摘要】Although mammary epithelial cell lines can provide a rapid and reliable indicator of gene expression efficiency of transgenic animals, their short lifespan greatly limits this application. To provide stable and long lifespan cells, goat mammary epithelial cells (GMECs) were transduced with pLNCX2-hTERT by retrovirus-mediated gene transfer. Transduced GMECs were evaluated by reverse transcriptase polymerase chain reaction (RT-PCR), proliferation assays, karyotype analysis, telomerase activity assay, western blotting, soft agar assay, and injection into nude mice. Non-transduced GMECs were used as a control. The hTERT-GMECs had higher telomerase activity and extended proliferative lifespan compared to non-transfected GMECs; even after Passage 50, hTERT-GMECs had a near diploid complement of chromosomes. Furthermore, they did not gain the anchroage-independent growth property and were not associated with a malignant phenotype in vitro or in vitro. (C) 2009 Elsevier Inc. All rights reserved.

【题目】大豆子粒棉子糖含量与生态因子的关系
【中文关键词】大豆; 棉子糖; 生态因子; 分期播种
【英文关键词】Soybean; Raffinose; Ecological factors; Seeding dates
【中文摘要】棉子糖是人与动物重要的营养成分。为了研究生态因子对大豆子粒中棉子糖含量的影响,2001—2002年在河南省夏大豆主产区的3个试点,以豫豆25为材料分13期播种,将78个样本子粒的棉子糖含量与气象、土壤养分和海拔等37个生态因子进行统计分析。诸样本棉子糖含量的变异范围为0.220%~0.869%。用逐步回归法筛选出8个生态因子与大豆棉子糖含量极显著正相关,各因子对于棉子糖含量影响的最大、最小值分别为0.392%和0.156%,按各因子的贡献大小依次为鼓粒成熟期昼夜温差、分枝期日照、土壤pH值、花荚期日照、土壤锰含量、花荚期降水、分枝期降水、出苗期降水。该结果对高棉子糖含量品种选育和配套栽培技术研究有参考价值。

【题目】Reprogramming donor cells with oocyte extracts improves in vitro development of nuclear transfer embryos.
【中文关键词】无
【英文关键词】Oocyte extracts; Donor; Reprogramming; Bovine; Nuclear transfer
【中文摘要】无
【英文摘要】This study investigated the effects of donor cells pretreated with oocyte extracts on in vitro development of cloned embryos. Bovine fibroblasts were exposed to immature, mature and parthenogenetic oocyte extracts respectively before nuclear transfer. The detectable expression of Oct4 and global cleacetylation in the treated cells showed that extracts could reprogram fibroblasts. Although all three groups of extracts exhibited reprogramming capacity, embryo development was not compliant with reprogramming effect. Improved quality and development of blastocysts were observed only in the mature extract treated group. We demonstrated that pretreatment of donor cells with mature oocyte extract improved in vitro development of cloned embryos. Our results suggested that reprogramming donor nuclei to a state synchronized with recipient cytoplasm before nuclear transfer would be beneficial for the development of cloned embryos. 【题目】Methylation patterns in 5 ' terminal regions of pluripotency-related genes in bovine in vitro fertilized and cloned embryos
【中文关键词】无
【英文关键词】bovine; DNA methylation; Fgf4; Nanog; Oct4; Rex1; Sox2
【中文摘要】无
【英文摘要】: In order to investigate DNA methylation profiles of five pluripotency-related genes (Oct4, Sox2, Nanog, Rex1 and Fgf4) during bovine maternal to zygotic transition (MZT) in both in vitro fertilized (IVF) and nuclear transfer (NT) embryos, sodium bisulfite sequencing method was used to detect DNA methylation levels, accompanied by the statistical analysis of embryo developmental rates. The results showed that Oct4, Nanog, Rex1 and Fgf4 were respectively demethylated by 25.22% ($P < 0.01$), 3.84% ($P > 0.05$), 31.82% ($P < 0.01$) and 10% ($P > 0.05$) while Sox2 retained unmethylation during MZT in IVF embryos. By contrast, Oct4 and Rex1 respectively underwent demethylation by 23.04% ($P < 0.01$) and 6.02% ($P > 0.05$), and, reversely, Sox2, Nanog and Fgf4 respectively experienced remethylation by 0.84% ($P > 0.05$), 5.39% ($P > 0.05$) and 5.46% ($P > 0.05$) during MZT in NT embryos. Interestingly, the CpG 14 site of Sox2 was specifically methylated in both 8-cell and morula NT embryos. In addition, the development of blastocysts between IVF and NT embryos showed no significant difference. DNA methylation analysis showed that only Oct4 and Sox2 underwent the correct methylation reprogramming process, which may be responsible for the development of blastocysts of NT embryos to a certain extent. In conclusion, the five genes respectively experienced demethylation to different extents and incomplete DNA methylation reprogramming during bovine MZT in both IVF and NT embryos, suggesting that they may be used as indicators for bovine embryo developmental competence.

【题目】A hepatopancreas specific C-type lectin from the Chinese shrimp Fenneropenaeus chinensis exhibits antimicrobial activity.
【中文关键词】中国明对虾 c-型凝集素 模式识别蛋白 抗菌活性
【英文关键词】Chinese shrimp; Fleshy prawn; Fenneropenaeus chinensis; C-type lectin; Pattern recognition receptor; Antimicrobial activity
【中文摘要】凝集素在动物先天免疫中发挥重要作用,本文介绍了一种中国明对虾的c型凝集素,命名为Fc-hsl。Fc-hsl的cDNA编码蛋白全长为159氨基酸,Fc-hsl在肝胰腺组织中组成型表达,其表达量会因为受到细菌和病毒的刺激而上调。重组表达的Fc-hsl没有凝血活性,但是在Ca离子存在下,对革兰氏阳性菌和革兰氏阴性菌有凝集活性。
【英文摘要】Lectins play important roles in animal innate immune responses by serving as pattern recognition receptors, opsonins, or effector molecules. Here, we report a novel hepatopancreas-specific C-type lectin, designated Fc-hsL, from the hepatopancreas of the Chinese shrimp, Fenneropenaeus chinensis. The cDNA of Fc-hsL is 571 bp long with a 480 bp open reading frame that encodes a 159-residue protein. Fc-hsL contains a signal peptide and a single C-type lectin-like domain (CTLD) or carbohydrate recognition domain (CRD). It has an EPN(Glu-Pro-Asn) motif with a predicted ligand-binding site specific for mannose. Fc-hsL was constitutively expressed in the hepatopancreas of normal shrimp, and its expression was up-regulated following challenge of shrimp with bacteria or virus. Fc-hsL was not detected in other tissues but was induced in the stomach of immune-challenged shrimp. Fc-hsL protein was detected in both hemolymph and the hepatopancreas of bacteria- and virus-challenged shrimp. Recombinant mature Fc-hsL has no hemagglutinating activity, but calcium-dependent agglutinating activity against some Gram-positive and Gram-negative bacteria was detected. The rFc-hsL also has binding activity to some Gram-positive and Gram-negative bacteria and high antimicrobial activity against some bacteria and fungi. These in vitro functions of recombinant Fc-hsL were calcium-independent. Fc-hsL may act as a pattern recognition receptor in antibacterial defense and as an effector in innate immunity of Chinese shrimp.

【题目】Effect of transporting donor or recipient does and their embryos on the outcome of fresh embryo transfer in Boer goats
【中文关键词】无
【英文关键词】Donor; Recipient; Embryo transfer; Boer goats; Transportation
【中文摘要】无
【英文摘要】Between-farm embryo transfer of livestock animals can potentially increase the spread of quality genetic material. However, the transporting of donor or recipient animals or their embryos has become a practical problem. The objective of this study was to compare the effect of transporting donor and recipient does and their embryos between various farms on inter-farm fresh embryo transfer in Boer goats. Results indicate the transportation of donor does within 4 h before embryo collection not to have a significant effect on embryo recovery number, embryo Survival rate and the subsequent pregnancy in recipient does. Also, the transportation of embryos at 36.5-38 degrees C within 2 h before embryo transfer did not significantly affect the embryo Survival rate and subsequent pregnancy rate, but the transportation of embryos at 20 degrees C resulted in a significant ($P<0.05$) lower survival rate (41.7%) and pregnancy rate (42.0%). The transportation of recipient does resulted in a significantly lower pregnancy rate (42.0%) and embryo survival rate (32.1%) than the transportation of donor does and embryos. Results suggest the transportation of donor does to be the best method for embryo transfer programs on the farm. Alternatively, the supply of fresh embryos kept at body temperature (36.5 degrees C) was also preferred for short or long distances between farms. (C) 2009 Elsevier B.V. All rights reserved.

【题目】Molecular marker-assisted selection of the ae alleles in maize
【中文关键词】无
【英文关键词】Maize; Starch branching enzyme; High amylase;Marker-assisted selection
【中文摘要】无
【英文摘要】The ae (amylose extender) recessive mutant alleles in maize are an important genetic resource for the development of high-amylose cultivars. On the basis of ae allele sequences (from the National Center for Biotechnology Information), the ae mutant alleles were cloned from high-amylose maize and the allelic Ae gene from common maize luyuan92 inbred lines. Five pairs of primers were designed to screen for a molecular marker of ae alleles, yielding a dominant molecular marker, ae 474. We used 53 types of high-amylose maize and common maize inbred lines and their hybrid and backcross offspring for verification and analysis. The ae dominant molecular marker was effective in selecting for the ae alleles and for biological materials with a high-amylose genotype. Presence and absence of the marker in the offspring conformed to the expected Mendelian ratios. Using this marker, we were able to detect the ae alleles in a backcross and its second generation more efficiently (53.3 and 73.3%, respectively) than was possible without marker selection. These data indicate that the marker can be used as a tool to improve selection efficiency and accelerate the cultivation of new varieties of high-amylose maize.

【题目】对生玉米互生玉米内源激素含量的差异分析
【中文关键词】对生玉米;互生玉米;ELISA;内源细胞分裂素;内源生长素

【英文关键词】opposite maize;alternative maize;ELISA;endogenous cytokine;endogenous auxin
【中文摘要】利用ELISA方法测定近等基因系玉米(Zeamays)对生、互生玉米的不同组织和不同生育期内源细胞分裂素ZRs (zeatin riboside group)、DHZRs(dehydro zeatin riboside group)、iPAs(isopentenyladenosine group)以及内源生长素IAA(indole acetic acid)含量差异。结果表明,不同叶序玉米在不同生育期幼胚、成熟花粉和成熟叶片的内源ZRs、DHZRs、iPAs和 A均无显著差异;不同生育期对生叶序玉米幼苗顶端分生组织和成熟苗顶端雄幼穗ZRs、DHZRs和iPAs含量显著高于同期近等基因系的互生玉米,IAA含量在两者之间无显著差异;对生叶序玉米幼苗顶端分生组织、成熟苗顶端雄幼穗CTK/IAA(CTK表示ZRs、DHZRs和iPAs含量相加)比值显著高于同期近等基因系互生叶序玉米,但在不同生育期幼胚、叶片及花粉内均无显著差异。对生叶序的形成与生长点组织细胞分裂素含量增加密切相关。
【英文摘要】The contents of endogenous cytokine including ZRs(zeatin riboside group),DHZRs(dehydro zeatin riboside group), iPAs(isopentenyladenosine group),and endogenous auxin(IAA)in opposite and alternative maizes were determined by the ELISA method using two sets of Zea mays near isogenic lines(8701d,8701D and H4d,H4D).The results showed that the maize with different phyllotary leaf had same level of endogenous cytokine and auxin in mature pollen,different development leaf and young embryo. However,the contents of above cytokine in immature male spikes and shoot apical meristem(SAM)from opposite maize were great higher than that in isogenic alternative maize.At the same time,there was no significant difference between them.Further analysis indicated that the value of CTK(total contents of ZRs,DHZRs and iPAs)/IAA in opposite maize was dominant hi曲er than that in alternative maize.Results suggested that there are close relativity between the opposite phenotype and the level of cytokines in SAM.

【题目】QTL Mapping of Isoflavone, Oil and Protein Content in Soybean
【中文关键词】大豆,SSR,QTL,质量,异黄酮
【英文关键词】soybean; SSR; QTL; quality; isoflavone
【中文摘要】:【目的】研究大豆异黄酮与脂肪、蛋白质含量基因定位及相关性,为大豆品质改良、分子育种及基因克隆等应用提供理论依据。【方法】利用SSR 技术,对晋豆23 号和灰布支杂交构建的F13 代大豆重组自交系群体的474 个家系进行了连锁图谱的构建。在此基础上,利用 WinQTLCart2.0 软件分析了影响大豆异黄酮含量、脂肪含量和蛋白质含量3 个重要品质性状的QTL,通过复合区间作图分析,检测QTL;同时,对异黄酮与脂肪、蛋白质的含量相关性分析。【结果】检测到23 个QTL,其中控制异黄酮含量QTL 有6 个,分别定位在J、N、D2 和G 染色体的连锁群上;控制脂肪含量的QTL 有11 个,分别定位在第A1、A2、B2、C2 和D2 染色体的连锁群上;控制蛋白质含量的QTL 有6 个,分别定位在B2、C2、G 和H1 染色体的连锁群上。相关性分析结果表明:异黄酮与蛋白质含量呈极显著负相关;蛋白质和脂肪含量呈极显著负相关;蛋白质和蛋白质脂肪总量呈极显著正相关。【结论】3 个重要品质性状的部分基因定位结果与其相关性分析是一致的,其结果对大豆品质育种应用有重要利用价值。
【英文摘要】Soybean (Glycine max L. Merr.) is the world's foremost source of edible plant oil and proteins, meantime, the biologically active secondary metabolites such as saponins and isoflavones are benefit to human health. The objective of this study was to identify quantitative trait loci (QTL) and epistatic interactions associated with isoflavone, protein, and oil contents in soybean seeds. An F13 recombinant inbred line (RIL) comprising 474 lines was derived from a cross between Jindou 23 and Huibuzhi cultivars. SSR technique was employed for mapping of the QTLs. The QTLs for isoflavone, protein, and oil contents were analyzed and 23 QTLs were detected based on the constructed linkage map. Six QTLs for isoflavone content were localized in linkage groups J, N, D2, and G, eleven QTLs for oil content were localized in the linkage groups A1, A2, B2, C2, and D2, and six QTLs for protein content were localized in linkage groups B2, C2, G, and H1. The correlative analysis demonstrated that the isoflavone content had significant correlation with protein content, while significantly negative correlations was existed between oil and protein content, and significantly positive correlations was existed between protein and oil content. All these findings have laid an important basis for the marker assisted breeding in soybean. The phenotypic correlations of quantitative traits may be resulted from the correlation of the QTL controlling those traits.

【题目】DNA methyltransferases and methyl-binding proteins of mammals
【中文关键词】无
【英文关键词】DNA methylation; DNA methyltransferase; methyl-binding protein
【中文摘要】无
【英文摘要】In mammals, DNA methylation, characterized by the transfer of the methyl group from S-adenosylmethionines to a base (mainly referred to cytosine), acts as a major epigenetic modification. In parallel to DNA sequences arrangement, modification of methylation to DNA sequences has far-reaching influence on biological functions and activities, for it involves controlling gene transcription, regulating chromatin structure, sustaining genome stability and integrity, maintaining parental imprinting and X-chromosome inactivation, suppressing homologous recombination as well as limiting transposable elements, during which DNA methyltransferases (DNMTs) and methyl-binding proteins play important roles. Their aberrance can give rise to dysregulation of gene expression, cell maltransformation and so on. Hence, it is necessary to gain a good understanding of these two important kinds of proteins, which will help to better investigate the epigenetic mechanisms and manipulate the modifications according to our will based on its reversibility. Here we briefly review our current understanding of DNMTs and methyl-binding proteins in mammals.

【题目】Cloning and Sequence Analysis of the NAD-dependent Cytosolic Malate Dehyogenase Gene from Zea Mays.
【中文关键词】玉米;细胞质型苹果酸脱氢酶基因;克隆;序列分析
【英文关键词】mize;cytosolic malate dehydrogenase gene;cloning;sequence analysis
【中文摘要】苹果酸脱氢酶普遍存在于各种生物中,它负责催化草酰乙酸和苹果酸之间的相互转换。根据其辅酶的特异性和在细胞内的分布及其生理功能的不同,苹果酸脱氢酶在高等植物中可以区分出不同的类型,依赖于NAD的细胞质型苹果酸脱氢酶是其中研究较少的一类。根据已发表的其他高等植物的依赖于NAD的胞质型苹果酸脱氢酶基因的保守序列。运用SMARTRACERT.PCR技术,从玉米叶片中分离了cyMDH的l264bp全长cDNA序列,通过生物信息学分析发现,该序列含有一个999bp的完整的开放阅读框,其共编码332个氨基酸(GenBank登陆号EU625276)。序列联配与树状分析结果表明,该玉米cyMDH序列与多个物种的cyMDH基因具有高度的同源性。组织特异性表达分析显示MDH基因在玉米叶片中表达量最高,在茎、根中亦有低水平表达。本研究将为更深入的研究玉米cyMDH基因的分子调控机理奠定基础。
【英文摘要】Malate dehydrogenase(MDH) which catalyzes the reversible reaction from oxaloacetate to malate ubiquitously exists in nature.Higher plants contain multiple forms of MDHs that differ in co—enzyme specificity,subcellular localization and physiological function.The NAD • dependent cytosolic MDH(cyMDH) is one class of MDH that is still seldom investigated.On the basis of the conserved amino acid residues in the published cytosolic malate dehydrogenase protein sequences from other higher plant species,a full-length cDNA was amplified by SMART RACE RT-PCR from the total RNA of maize leaves.Bioinformatics analysis of the cDNA sequence indicates that the 264bp full length of the ta-get clone includes a 70bp 5 ’ UTR,an ORF of 999bp,and a 195bp 3 ’一 UTR(GenBank accession EU625276).This cDNA sequence codes 332amino acids residues with a predicted molecular mass of 35.6l68kD and an isoelectric point(p1)of 5.4.The deduced maize amino acids share high sequence homology with cyMDH from other species,such as 0.sative,M.crystaUinum,and G.max.Analysis of semiquantitive RT-PCR shows that the expression of cyMDH is higher in maize leaves than that in roots and stems.All of these results will provide a theoretical basis for further investigation of the cyMDH

gene in molecular regulation mechanism.

【题目】Detrimental effects of antibiotics on mouse embryos in chromatinintegrity, apoptosis and expression of zygotically activated genes
【中文关键词】无
【英文关键词】Antibiotics, Apoptosis, DNA damage, Embryo culture, Gene expression
【中文摘要】无
【英文摘要】The effects of specific components in culture medium on embryo physiology have been extensively investigated to optimize in vitro culture systems; however, little attention has been paid to antibiotics, the reagents used most commonly in culture systems to prevent contamination. To investigate the potential effects of routine use of antibiotics on cultured embryos, mouse zygotes were cultured with or without antibiotics. In both groups, the developmental rate and cell number of blastocysts appear to be normal. The proportion of embryos with blastomere fragmentation increased slightly when embryos were cultured with antibiotics. In contrast, the presence of antibiotics in the embryo culture system significantly disturbs expression of zygotically activated genes, damages chromatin integrity and increases apoptosis of cultured embryos. These results provide evidence that, when cultured with antibiotics, embryos with normal appearance may possess intrinsic physiological and genetic abnormalities. We demonstrate that the adverse effects of antibiotics on mammalian embryos are more severe than we previously presumed and that antibiotics are not essential for sterility of embryo culture system therefore abolishing antibiotic supplementation during embryo culture.

【题目】Recombinant human activin A promotes development of bovine somatic cell nuclear transfer embryos matured in vitro
【中文关键词】无
【英文关键词】activin A; SCNT; embryo development; bovine
【中文摘要】无
【英文摘要】To improve the culture system of bovine somatic cell nuclear transfer (SCNT) embryos, we studied the effects of activin A on developmental competence of bovine SCNT embryos during the early development stage based on the traditional culture method, and analyzed the expression level of the genes related to blastocyst hatching (Na/K-ATPase, Glut-1) and related to activin A signalling pathway (ActRII and Smad2). We generated the bovine SCNT embryo using a Holstein cow oocyte as recipient cytoplasm and a foetal ear fibroblast (Holstein cow, 120 days) as donor cell. The embryos were cultured as follows: experiment 1, the addition of activin A at the concentrations of 0 (control), 20 (M1-20), 40 (M1-40) or 80 ng/ml (M1-80) to the media during the first three days and no addition during the subsequent 5 days; experiment 2, no addition of activin A to the media during the first 3 days and the addition of activin A at the concentrations of 0 (control), 20 (M2-20), 40 (M2-40) or 80 ng/ml (M2-80) during the subsequent 5 days. The results indicated that the blastocyst formation rate and hatching rate, and total blastomere numbers as well as ICM/TE obtained in experiment 1 were not significantly different from the control group ($P > 0.05$). In contrast, these values obtained in experiment 2 were significantly higher than in the control group ($P < 0.05$). In addition, the relative abundance (ratio to GAPDH mRNA) of each gene (Glut-1, ActR II and Smad2) was not significantly different among the treatments in the experiment. The expression levels of 4 genes (Na/K-ATPase,

Glut-1, ActR II and Smad2) in blastocysts obtained in experiment 2 were higher than those obtained in experiment 1. In conclusion, the present study suggests that the addition of activin A to the culture media from day 4 to day 8 can enhance the developmental competence of bovine SCNT embryos.

【题目】Codeposition of dNTPs Detection for Rapid LAMP-based Sexing of Bovine Embryos
【中文关键词】无
【英文关键词】无
【中文摘要】无
【英文摘要】Loop-mediated isothermal amplification (LAMP) is a novel nucleic acid amplification method with high specificity and rapidity under isothermal conditions. According to the LAMP method, a rapid and simple detection system was established for bovine embryo sexing. Two sets of primers were designed by targeting the bovine male-specific sequence and bovine common sequence respectively. The reaction condition of the detection system was optimized within 60 min under isothermal conditions of 65 degrees C by detection of the reaction mixture on agarose gel. Especially, the primers F2 and B2 could replace the F3 and B3 as outer primers, making the primer design simpler and the amplification efficiency higher. Additionally, codeposition of dNTPs was firstly performed to detect the reaction products by addition of 1 mu l 0.1 mm CuSO(4), the visible ring-shaped deposit was found in the middle of the reaction tube with negative mixture. It could be employed as an alternative method in the detection of the reaction products in place of the time-consuming electrophoresis or the turbidity meter. Furthermore, the embryo sexing system was carried out in the embryo transfer and achieved 98% of efficiency and 99.5% of accuracy.

【题目】A caprine chimera produced by injection of embryonic germ cells into a blastocyst.
【中文关键词】无
【英文关键词】EG cells; chimera; microsatellite DNA; SRY; goat
【中文摘要】无
【英文摘要】This report details a chimeric goat derived by injecting caprine embryonic germ (EG) cells into a host blastocyst. The EG cells, isolated from the primordial genital ridge of white Guanzhong goat fetuses (28-42 days of pregnancy), had alkaline phosphatase activity and several stem cell markers, including SSEA-1, c-kit, and Nanog. Ten to 20 EG cells were microinjected into the blastocoelic cavity of a host blastocyst collected from a black goat following natural service. Twenty-nine injected blastocysts were transferred into nine white surrogate goats. One of the recipients maintained pregnancy to term and gave birth to three kids: one male, one female, and a dead, malformed fetus of undetermined gender; all three fetuses were black, but the female and the malformed fetus each had a large white spot on their head. Based on PCR and microsatellite DNA assay, the female and the malformed fetus were monozygotic twins and chimeras. Microsatellite assay on various tissues from the dead fetus (including skin, blood, liver, placenta, lung, heart, spleen, muscle, and brain), revealed that these tissues and organs were chimeric and contained cells derived from EG cells. In conclusion, caprine EG cells differentiated into all three germ layers in vivo

【题目】Genome-wide analysis of cyclins in maize (Zea mays)
【中文关键词】无
【英文关键词】Cyclin; Gene duplication; Phylogenetic analysis; Zea mays
【中文摘要】无
【英文摘要】Cyclins are primary regulators of the activity of cyclin-dependent kinases and play crucial roles in cell cycle progression in eukaryotes. Although extensive studies have revealed the roles of some cyclins and underlying mechanisms in plants, relatively few cyclins have been functionally analyzed in maize. We identified 59 cyclins in the maize genome, distributed on 10 chromosomes; these were grouped into six types by phylogenetic analysis. The cyclin genes in the maize genome went through numerous tandem gene duplications on five chromosomes. However, no segmental duplications, which occur in rice, were found on maize chromosomes. This information allows us to assess the position of plant cyclin genes in terms of evolution and classification, which will be useful for functional studies of maize cyclins.

【题目】外源细胞分裂素对组培玉米叶原基分化的调控

【中文关键词】玉米; 6-BA; 叶原基分化; 组织培养

【英文关键词】Maize; 6-BA; Differentiation of leaf primordium; Tissue culture

【中文摘要】以互生玉米自交系H4d 、8701d 为材料, 取自交授粉12 d 的幼胚, 分别在含不同浓度6-BA 的脱分化培养基上诱导愈伤组织, 筛选II 型愈伤组织, 分别转入0~3 mg L - 1 6-BA 浓度梯度的分化培养基上诱导出芽。芽点出现时, 在解剖镜下剥离顶端分生组织, 电镜扫描观察叶原基形态, 并用ELISA 反应测定顶端分生组织细胞分裂素6-BA、ZRs 、DHZRs、iPAS 和生长素IAA 、NAA含量。结果表明, 外源细胞分裂素6-BA 可调控互生基因型玉米材料幼苗叶原基转换为对生甚至畸形叶原基类型, 6-BA 浓度越高、处理越早, 出现对生叶原基、畸形叶原基的频率越高。ELISA 反应显示, 生长点激素含量的改变是外源激素的吸收累积造成的, 内源细胞分裂素的含量并未明显改变, 在互生基因型下通过增加外源细胞分裂素6-BA 提高细胞分裂素/ 生长素值可导致叶原基分化类型向对生、畸形类型转换, 解除外源激素作用后, 生长点细胞分裂素/ 生长素值的恢复导致叶原基分化类型返回原始基因型类型。这进一步证实生长点细胞分裂素/ 生长素是决定玉米叶原基分化类型的关键因素。

【英文摘要】The 12-day immature embryos of 2 maize (Zea mays L.) inbred lines with alternativ e phyllotaxy, 8701d and H4d, were cultured on media with different contents of 6-BA for 14 d to produce calluses, which were furthe r subcultured twice on the sam e media. Type II calli were established on the differentiation mediums with 0 – 3 mg L - 1 of 6-BA content ladder to induce sprout formation. Sprouts in shoot tips were peeled off under a dissecting microscope and the im ages of the phyllotactic patterns of l eaf primordium were taken by scanning electr on microscope. The contents of 6-benzylaminopurine (6-BA), zeatin riboside group (ZRs), dehydro zeatin riboside group (DHZRs), isopentenyl adenosine group (iPAs), napthalene acetic acid (NAA), and in-dole-3-acetic acid (IAA) in shoot apical meristem were measured by ELISA meth od. Three phyllotactic patterns, namely opposite, misshapen, and alternate were observed in the leaf primordium. In H4d plants, exogenous application of the cytokinin 6-BA in-duced a change in the phyllotaxy of shoot apical meristem (S AM) from alternate to opposite and misshapen. Higher 6-BA content and earlier treatment led to higher proportions of SAM with missh apen leaf primordia and opposite leaf primordia. The cyto-kinin/auxin (CTK/AUX) ratio in SA M with misshapen leaf primordia was higher than that with decussate leaf primordia, which in turn, was higher than that with alternate leaf primordia. The ac cumulation of cytokinin 6-BA increased the levels of cytokinin in SAM, but did not change the levels of endogenous cytokinins (ZRs, DHZRs, and iPAs). The comeback of CTK/AUX ratio in tissue cultured immature seedlings could induce th e leaf primordium of them to come back to the original ph yllotactic patterns. The CTK/AUX ratio is the determinative factor that re gulates the differentiation of maize leaf primordium.

【中文关键词】大豆,籽粒形状,遗传效应,数量性状位点
【英文关键词】soybean, seed shapes, genetic effects, quantitative trait loci(QTL)
【中文摘要】By using the full genetic model including seed, cytoplasmic and maternal effects on diploid plant, the resutlsindicated that the seed shapes were controlled by seed direct genetic effects. The seed genetic effects of seed length and length/ width, length/ thickness, width/ thickness were mainly controlled by cytoplasmic effects, while the seed genetic effects of seed width, seed thickness were mainly controlled by maternal effects. The heritabilities of direct effects were intermediate for seed length and length/ width, width/ thickness, when the heritability of seed effects were high for seed width, seed thickness. Therefore, more attention should be paid to single seed selection and the single plant selection in late generations in hybrid offspring on the seed length and length/ width, width/ thickness, while in the case of the seed width and seed thickness, attention should be paid to the maternal single plant selection in early generations. So, soybean inbreds could be developed by those selection for these shapes. In the same time, total 7 QTLs of seed length, 3 QTLs of seed width, 3 QTLs of seed thickness, 6 QTLs of length/width, 9 QTLs of length/ thickness and 5 QTLs of width/ thickness were mapped on A1, B1, B2, D1a, D2, F_2, G, I, J_2 and O 10 chromosomes and trended to cluster together. According to analysis of this investigation, the phenotype correlations of quantitative traits may result from the correlations of QTLs controlling those traits. Those will be helpful to further understand genetic basis of seed shape in soybean.

【题目】Molecular cloning, genomic organization and functional analysis of an anti-lipopolysaccharide factor from Chinese mitten crab Eriocheir sinensis
【中文关键词】中华绒螯蟹 抗脂多糖因子
【英文关键词】Eriocheir sinensis; Anti-lipopolysaccharide factor; Northern blot; Quantitative real-time PCR; Recombinant protein; Bactericidal activity
【中文摘要】中华绒螯蟹抗脂多糖因子的基因克隆和功能研究
【英文摘要】Anti-lipopolysaccharidefactor (ALF) represents one kind of basic proteins, which binds and neutralizes LPS and exhibits strong antibacterial activity against Gram-negative R-type bacteria. The ALF gene of ChinesemittencrabEriocheirsinensis (Milne Edwards, 1853) (denoted as EsALF) was identified from haemocytes by expressed sequence tag (EST) and PCR approaches. The full-length cDNA of EsALF consisted of 700 nucleotides with a canonical polyadenylation signal-sequence AATAAA, a polyA tail, and an open-reading frame of 363 bp encoding 120 amino acids. The high similarity of EsALF-deduced amino acid sequence shared with the ALFs from other species indicated that EsALF should be a member of ALF family. The mRNA expression of EsALF in the tissues of heart, gonad, gill, haemocytes, eyestalk and muscle was examined by Northern blot analysis and mRNA transcripts of EsALF were mainly detected in haemocytes, heart and gonad. The temporal expression of EsALF in haemocytes after Vibrio anguillarum challenge was recorded by quantitative real-time RT-PCR. The relative expression level of EsALF was up-regulated rapidly at 2 h post-injection and reached 3-fold to that in blank group. After a drastic decrease to the original level from 4 to 8 h, the expression level increased again and reached 4-fold to that in the blank group at 12 h post-injection. The genomic DNA sequence of EsALF gene consists of 1174 bp containing three exons and two introns. The coding sequence of the EsALF mature peptide was cloned and expressed in Escherichia coli BL21(DE3)-pLysS to further elucidate its biological functions. The purified recombinant product showed bactericidal activity against both Gram-positive (G+) and Gram-negative (G −) bacteria, which demonstrated that the rEsALF was a broad-spectrum antibacterial peptide. All these results indicated that EsALF was an acute-phase protein involved in the immune responses of Chinesemittencrab, and provided a potential therapeutic agent for disease control in aquaculture.

【题目】不同苜蓿品种种子萌发期耐盐性的研究
【中文关键词】苜蓿; 耐盐性; 发芽率; 苗高; 根长;
【英文关键词】alfalfa; salt tolerance; germination capacity; seeding height; root length;
【中文摘要】用0(CK),0.2%,0.4%,0.6%,0.8%和1.0%溶液分别对15个苜蓿品种种子进行处理,通过发芽势、发芽率、幼根长和幼苗高对各品种种子萌发期耐盐性进行了研究,其品种间存在显著性差异(P<0.05,P<0.01)。结果表明:用0.6%,0.8%或1.0%NaCl溶液进行苜蓿种子萌发期耐盐性鉴定较为合理。1.0%NaCl溶液处理苜蓿种子,其幼根长及其幼苗高可作为苜蓿品种种子耐盐性鉴定的指标。对15个苜蓿品种种子的发芽率、幼根长、幼苗高、半致死浓度和耐盐极限浓度5个鉴定指标进行综合分析,结果表明:宁苜1号、龙牧801号、WL-525耐盐性最强,其次是龙牧803号,耐盐性最弱的为MagnumV-wet。
【英文摘要】Salt to tolerance of 15 alfalfa varieties in geminating period was studied by measuring the germinating energy,germination rate,seedling height and root length under the treatments with 0(CK),0.2%,0.4%,0.6%,0.8% and 1.0% NaCl solution.There were significant differences in characteristics of growth and development(P<0.05,P<0.01).The results showed that

0.6%,0.8% and 1.0% NaCl solutions were appropriate to identify the salt tolerance of alfalfa in geminating period.The root length and seedling height were regarded as two adaptive salt-tolerant indexes under the treatment with 1.0% NaCl solution.By comprehensive analysis of germinating energy,seedling height,root length,medial lethal dose and medial lethal dose,the result showed that salt tolerance degrees of 15 alfalfa varieties were: ' Ningxia No.1 ', ' Longmu No.801 ' and ' WL-525 ' were strong, ' Longmu No.803 ' was medium,and MagnumV-wet was weak.

【题目】A lectin (Cflec-2) aggregating Staphylococcus haemolyticus from scallop Chlamys farreri
【中文关键词】栉孔扇贝 C型凝集素
【英文关键词】Chlamysfarreri; Lectin; Ca2+ independent; Staphylococcus haemolyticus
【中文摘要】栉孔扇贝C型凝集素-2(CfLec-2)基因的克隆和分析
【英文摘要】Lectins are a family of carbohydrate-recognition proteins which play crucial roles in innate immunity. In this study, a new lectin (CfLec-2) gene was cloned from Chlamysfarreri by EST and RACE approaches. The full-length cDNA of CfLec-2 was composed of 708 bp, encoding a typical long form carbohydrate-recognition domain of 130 residues. The deduced amino acid sequence showed high similarity to Brevican in Homo sapiens, C-type lectin-1 and lectin-2 in Anguilla japonica. The cDNA fragment encoding the mature peptide of CfLec-2 was recombined into plasmid pET-32a (+) and expressed in Escherichia coli Rosseta-Gami (DE3). The recombinant CfLec-2 (rCfLec-2) protein exhibited aggregative activity toward Staphylococcushaemolyticus, and the agglutination could be inhibited by d-mannose but not EDTA or d-galactose, indicating that CfLec-2 was a Ca2+ independent lectin. Moreover, rCfLec-2 could suppress the growth of E. coli TOP10F ' . These results suggested that CfLec-2 was perhaps involved in the recognition and clearance of bacterial pathogens in scallop.

【题目】Molecular Cloning and Analysis of Function of Nucleoside Diphosphate Kinase (NDPK) from the Scallop Chlamys farreri
【中文关键词】栉孔扇贝 Nucleoside Diphosphate Kinase (NDPK)
【英文关键词】scallop - Chlamys farreri nucleoside diphosphate kinase (NDPK) expression profile recombinant expression
【中文摘要】栉孔扇贝Nucleoside Diphosphate Kinase (NDPK)
【英文摘要】Nucleoside diphosphate kinase (NDPK) is a key metabolic enzyme that catalyzes the synthesis of non-adenine nucleoside triphosphate (NTP) by transferring the terminal phosphate between nucleoside diphosphate (NDP) and NTP. NDPK regulates a variety of eukaryotic cellular activities including cell proliferation, development, and differentiation. The ndpk cDNA was cloned from the hemocytes of the scallop Chlamys farreri and designated Cf-ndpk. The full-length sequence of Cf-ndpk consists of 715 bp encoding a polypeptide of 153 amino acids with a calculated molecular mass of 16927.52 daltons and pI of 7.64. The mRNA expression and distribution of Cf-ndpk in both bacterially challenged and unchallenged scallops were studied by Northern blotting and in situ hybridization. The results showed that Cf-ndpk transcripts were present in hemocytes, gill, adductor muscle, mantle, digestive gland, foot, and gonad, and the expression level increased in hemocytes after bacterial challenge. Recombinant Cf-NDPK expressed in Escherichia coli could transfer the terminal phosphate between UDP and ATP. The Cf-NDPK protein was present in all tested tissues including foot, adductor muscle, digestive gland, gonad, mantle, gill, and hemolymph. It was up-regulated in hemolymph after bacterial challenge. Taken together, these results suggest that NDPK may play roles in the innate immune response of scallop.

【题目】A single whey acidic protein domain (SWD)-containing peptide from fleshy prawn with antimicrobial and proteinase inhibitory activities
【中文关键词】中国明对虾 抗菌肽 Fc-SWD
【英文关键词】Fleshy prawn; Chinese shrimp; Fenneropenueus chinensis; Antimicrobial peptide; Fc-SWD; Innate immunity
【中文摘要】中国明对虾SWD抗菌肽基因的表达与功能研究
【英文摘要】With their inherent immune system, shrimps survive in marine environments despite the presence of different stressors, such as bacteria, fungi, and virus. In order to fight against and subsist even in the presence of such pathogens, the shrimps' ability to produce and release antimicrobial peptides are indeed important. in view of this, a new type of genetic material, an antimicrobial peptide containing a single whey acidic protein domain (SWD), was cloned from the haemocytes of fleshy prawns (Fenneropenaeus chinensis). Hence, this peptide is named Fc-SWD. The full-length cDNA of Fc-SWD was 399 bp, and it contained a single open reading frame (ORF) of 273 bp encoding an Fc-SWD of 90 amino acids, including a putative 24-amino acid signal peptide and a mature 66 residue peptide. Sequence comparison and phylogenetic analysis of SWDs and other whey acidic protein (WAP) domains containing proteins in crustaceans suggested that the crustacean WAP containing proteins can be divided into four classes: crustin I, crustin II, SWD, and carcinin and carcinin-like proteins. Apparently, the Fc-SWD is a new type in the SWD subgroup. Northern blot analysis demonstrated that Fc-SWD transcripts were constitutively expressed in the haemocytes of non-infected shrimps and increased in the haemocytes of infected shrimps. Meanwhile, Fc-SWD mRNA was not detected in the hearts, hepatopancreas, stomachs, gills, intestines, or ovaries of the non-infected shrimps nor the infected ones. Reverse transcription polymerase chain reaction (RT-PCR) experiments showed that the Fc-SWD signal was detected in the haemocytes, hearts, and gills of both the unchallenged and the challenged shrimps, and in the stomach of the challenged shrimps. Western blot analysis indicated that the Fc-SWD protein appeared to be synthesized in the haemocytes with a signal peptide and then secreted to the haemolymph as a mature peptide when the F chinensis was infected by pathogens. Thus, the Fc-SWD (for the full-length peptide including the signal peptide), the mFc-SWD (for the mature peptide), and the Fc-WAPD (for the single WAP domain) were manifested in the Escherichia coli, respectively. Further findings indicated that the purified recombinant Fc-SWD and the mFc-SWD have antimicrobial activities against Gram-positive (G(+)) and Gram-negative (G(-)) bacteria and fungi, as well as a strong inhibitory activity against subtilisin A and protein K. The Fc-WAPD has anti-protease activities and low antimicrobial activity. In view of the foregoing findings, it can be concluded that Fc-SWD is one of the factors that affect shrimps' immunity against various pathogens.

【题目】Molecular cloning and expression analysis of chymotrypsin-like serine protease from the Chinese shrimp, Fenneropenaeus chinensis
【中文关键词】中国明对虾 先天免疫 胰凝乳蛋白酶
【英文关键词】Chinese shrimp; Fenneropenaeus chinensis; Chymotrypsin; Innate immunity; Quantitative real-time PCR
【中文摘要】中国明对虾胰凝乳蛋白酶基因的克隆与功能研究
【英文摘要】A new member of the serine protease (SP) chymotrypsin (designated Fc-chy) was isolated from the hepatopancreas of Chinese shrimp Fenneropenaeus chinensis. The full-length cDNA of Fc-chy contained 951 nucleotides with a polyadenylation sequence and a polyA tail. It encoded a peptide of 271 amino acids with a signal peptide of 17 amino acids and an activation peptide of 28 amino acids. The mature peptide concludes 226 amino acids. It contained the conserved catalytic triad (H, D, and S). Similarity analysis showed that Fc-chy shared high identity with chymotrypsins from the Pacific white shrimp, Litopenaeus vannamei. Northern blot, quantitative real-time PCR, in situ hybridization, and western blot analysis were carried out to analyze the expression pattern and distribution profiles of Fc-chy after bacteria and virus challenges. The results showed that Fc-chy transcription and Fc-chy protein levels were upregulated in the hepatopancreas after bacterial and viral infection. Fc-chy from the hepatopancreas was purified by affinity chromatography. It showed high hydrolytic activity toward the substrate N-succinyl-ala-ala-pro-phe p-nitroanilide (AAPF), and its activity was inhibited by Kazal-type SP inhibitor from Chinese shrimp. All of these may indicate that Fc-chy is involved in the innate immune reactions in Chinese shrimp.

【题目】Molecular cloning, recombinant expression, and characterization of lysozyme from Chinese shrimp Fenneropenaeus chinensis
【中文关键词】中国明对虾; 溶菌酶; 先天免疫; 重组表达
【英文关键词】Chineseshrimp (Fenneropenaeuschinensis); lysozyme; innate immunity; recombinantexpression
【中文摘要】溶菌酶是机体先天免疫系统中一个重要的效应分子,参与机体多种免疫反应,在溶菌过程中形成一个水解体系,破坏和消除侵入体内的病原,从而实现机体的免疫防御。从中国明对虾中克隆得到了溶菌酶基因(称为FcLyz基因),该基因全长709bp,其完整的阅读框为477bp,编码158个氨基酸,前18个氨基酸(-1~-18)为信号肽,成熟肽由140个氨基酸组成(1-140aa),其分子量为16.2kD。经SMART分析,该基因具有1个溶菌酶1(LYZ1)结构域(19-130aa)。半定量RT-PCR分析结果表明溶菌酶虽在多种组织中有较低水平的组成性表达,但在细菌诱导的血细胞、心脏、肝胰腺和鳃等多种组织中表达上调。将中国明对虾溶菌酶基因的成熟肽亚克隆进原核表达载体pET-30a(+)中,转化大肠杆菌BL21(DE3),再进行诱导表达和亲和纯化,得到了纯化的重组溶菌酶,并进行了抑菌活性检测。结果表明,重组对虾溶菌酶对革兰氏阳性菌的抑菌能力较强,最小抑菌浓度达到3.43 μ mol/L,但对革兰氏阴性菌抑制作用较小。上述结果表明,该溶菌酶作为一种重要的免疫效应分子,参与了对虾的免疫防御反应。
【英文摘要】Lysozyme hydrolyses bacterial cell walls and acts as a nonspecific innate immunity molecule against the invasion of bacterial pathogens. We cloned the cDNA of lysozyme from Fenneropenaeus chinensis and named Fc-lysozyme (FcLyz in short). The full length of the gene was of 709 bp, and the open reading frame (477 bp) encoded 158 amino acids. The predicted protein had a signal peptide (-1--18 residue) and molecular weight of the mature protein (residue 1-140) was of 16.2 kD. A Lyz 1 domain (residue 1-130) in the lysozyme was found by SMART analysis. The results of semiquantity RT-PCR showed that FcLyz was constitutively expressed in tested tissues in a low level in normal shrimp, and up-regulated in hemocytes, heart, hepatopancreas and gill of bacterial challenged shrimp. The DNA fragment of mature Fc-Lys was subcloned to pET-30a (+) expression vector, the recombinant plasmid was transformed into Escherichia coli BL21 (DE3) and then induced by isopropylthio-beta-D-galactoside (IPTG). The antibacterial activity of the purified recombinant FcLys was analyzed and minimal inhibitory concentration (MIC) was assayed. The recombinant protein showed high antibacterial activity against some Gram-positive bacteria, and MIC reached 3.43 micromol/L, and relatively low activity against Gram-negative bacteria. All together, the Fc-Lys was regulated by pathogen infection and had antibacterial activity. This suggested that the FcLyz may be one of the important molecules against pathogens in innate immunity of the shrimp.

【题目】A C-type lectin is involved in the innate immune response of Chinese white shrimp
【中文关键词】c型凝集素 先天免疫 中国明对虾
【英文关键词】C-type lectin; Innate immunity; Agglutination; Sugar specificity; Pull-down
【中文摘要】c型凝集素参与了中国明对虾的先天免疫反应

【英文摘要】C-type lectins may function as pattern-recognition receptors (PRRs) and play important roles in immuneresponses. In this work, a cDNA for a new C-typelectin, FcLec3, was obtained from ChinesewhiteshrimpFenneropenaeus chinensis using expressed sequence tag analysis and rapid amplification of the cDNA ends. FcLec3 contains an N-terminal signal peptide and a carbohydrate recognition domain (CRD). RT-PCR analysis showed that FcLec3 was mainly expressed in hepatopancreas and that the expression of FcLec3 was obviously up-regulated by Vibrio anguillarum or white spot syndrome virus (WSSV) challenge. Recombinant FcLec3 could agglutinate Gram-negative and -positive bacteria with the presence of calcium. A following agglutination inhibitory test indicated that FcLec3 could recognize muramic acid and peptidoglycan. Besides, pull-down assay showed that the recombinant protein could interact with VP28, one major envelope protein of WSSV. These results suggested that FcLec3 might function in the recognition of bacterial and viral pathogens in shrimp.

【题目】A novel C-type lectin (FcLec4) facilitates the clearance of Vibrio anguillarum in vivo in Chinese white shrimp
【中文关键词】c型凝集素 先天免疫 中国明对虾
【英文关键词】C-type lectin; Fenneropenaeus chinensis; Vibrio anguillarum; Bacteria clearance
【中文摘要】c型凝集素参与了中国明对虾的先天免疫反应
【英文摘要】C-type lectins play important roles in innate immunity of invertebrates. In the present study, we report a novel C-type lectin, named FcLec4, from the Chinese white shrimp Fenneropenaeus chinensis. FcLec4 contains a single carbohydrate recognition domain (CRD) with a putative signal peptide. Phylogenetic analysis indicated that FcLec4 was distant from most reported C-type lectins from shrimps. The expression of FcLec4 increased at both mRNA and protein level after stimulation of Vibrio anguillarum, Recombinant FcLec4 could agglutinate both Gram-positive and -negative bacteria in the presence of calcium. The recombinant protein could bind to peptidoglycan and selectively bind to microorganisms. Interestingly, the tight binding of recombinant FcLec4 to V. anguillarum might facilitate the subsequent clearance of the bacteria in vivo. To the best of our knowledge, this might be the first report that a C-type lectin was found to be directly involved in the anti-V. anguillarum response in shrimps.

【题目】Study on the purification of polysaccharides from Noscoc flagelliforme with radial flow chromatography
【中文关键词】无
【英文关键词】radial flow chromatography,purificaiton,Noscoc flagelliforme,polysaccharide
【中文摘要】无
【英文摘要】The isolation and purification of polysaccharide from k ç ë Å ç Å=Ñ ä ~Ö É ä ä á Ñ ç ê ã É by radial flow chromatography were studied. Thecolumn (7.7 cm of bed length and 229.6 cm3of bed volume) was packed with DEAE-01 anion ion-exchange resin and gradienteluted with NaCl solutions. The content of the polysaccharide was determined with the phenol-sulfuric acid method.The effects of sampling weight, elution velocity, and elution concentration gradient on the separation efficiency were examinedand three isolated peaks were obtained. The optimal separation conditions are 10 mg of the sampling weight (samplingvolume is 20 mL), 1.0 mL/min of the elution velocity, and 1.00 mol/L2of NaCl gradient elution. The adjacent peak resolutionsamong the three main components (1, 2, and 3 according to their elution order) are 0.660 (o12) and 0.786 (o23),

respectively.It is deduced that 39.8 cm of the bed length is required for the fully separation of the three polysaccharides.

【题目】Molecular characterization and expression analysis of a chicken-type lysozyme gene from housefly Musca domestica
【中文关键词】家蝇 溶菌酶
【英文关键词】innate inununity; lysozyme; antibacterial activity; Musca domestica
【中文摘要】家蝇溶菌酶基因的克隆和功能
【英文摘要】Lysozymes can hydrolyze bacteria and play an important role in animal digestion and innate immunity. The cDNA of a chicken-type lysozyme gene (Mdlys) was cloned from housefly (Musca domestica). The 484 bp full-length cDNA contains a 426 bp open reading frame (ORF) that encodes MdLys of 141 amino acids. Phylogenetic analysis indicated that the MdLys was similar to chicken-type lysozymes. Spatio-temporal expression of Mdlys was analyzed by RT-PCR. The Mdlys transcript can be detected in both midgut and fat body and was expressed at a relatively lower level at the embryo stage. Mdlys mRNA was upregulated 2 h post bacterial challenge, maintained for 2 to 6 h, and slightly declined from 12 to 24 h post-injection. Western blot analysis showed that MdLys was highly expressed in midgut and was also detected in the hemolymph and fat body. MdLys expression was slightly increased in midgut after challenging with Escherichia coli or Staphylococcus aureus. Its expression was also slightly increased in the fat body after challenging with S. aureus, but no obvious change occurred after E. coli challenge. MdLys expression in the hemolymph was not affected by bacterial challenge. In the developmental stages, MdLys expression levels had no obvious change from the first instar to the pupae stage. There was also no variation under 24 h starvation stress. Recombinant MdLys displayed inhibitory activity against Gram-negative and Gram-positive bacteria. Together, these results suggest that MdLys may play an important role in the innate immunity of houseflies.

【题目】Study on the morphology,crystalline structure and thermal properties of yellow ginger starch acetates with different degrees of substitution
【中文关键词】无
【英文关键词】Yellowginger; Starchacetate; Degrees of substitution; Physicochemical properties
【中文摘要】无
【英文摘要】Yellowgingerstarchacetates with differentdegrees of substitution (DS) were prepared by reacting native starch with glacial acetic acid/acetic anhydride using sulfuric acid as catalyst. X-ray diffraction (XRD) of acetylated starch revealed that the crystal structure of native starch was disappeared and new crystalline regions were formed. Their formation was confirmed by the presence of the carbonyl signal around 1750 cm − 1, as well as the reduced hydroxyl groups, in the Fourier transform infrared spectroscopy (FT-IR). The scanning electron microscopy (SEM) suggested most of the starch granules disintegrated with many visible fragments along with the increasing DS. The thermal behavior of the native starch and starchacetate were investigated using thermogravimetric analysis (TGA) and differential thermal analysis (DTA), it was observed that the thermal stability of acetylated starch depends on the degree of substitution. Thermal stability of high DS acetylated starch is much better than that of the original starch when DS reached to 2.67.

【题目】中国明对虾抗脂多糖因子基因克隆与表达研究
【中文关键词】中国明对虾; 抗脂多糖因子; cDNA克隆; 表达研究
【英文关键词】Fenneropeneas chinesis; anti-lipopolysaccharide factor; cDNA cloning; expression study
【中文摘要】从中国明对虾中成功克隆到抗脂多糖因子(ALF)的cDNA。该cDNA全长594bp,编码由123个氨基酸组成的蛋白质,该蛋白分子量为13694.02Da,等电点pI为10.24,有25个氨基酸的信号肽。RT-PCR研究表明,ALF基因在中国明对虾血细胞和鳃中有高水平的组成型表达,在细菌刺激后,ALF基因在各组织中的表达均增加,尤其在心脏和胃中表达上调明显。从表达模式可以推测,中国明对虾的抗脂多糖因子,作为一种抗菌肽类效应分子,在清除病原的防御反应中可能起着重要的作用。
【英文摘要】Anti-lipopolysaccharide factor(ALF) cDNA from Chinese shrimp Fenneropeneus chinensis was cloned and its expression profile was analyzed.The total length of the cDNA is 594 bp,the ORF(372 bp) encode 123 residues with the molecular weight of 13694.02 Da,and pI of 10.24.The first 25 residues is a signal peptide.The expression profile of ALF was analyzed by RT-PCR,and the result showed that the ALF gene was high-level constitutive expression in hemolymph and gills,and was up-regulated by bacterial challenge,especially in heart and stomach.This means that the ALF may have the important role in the innate immunity of the shrimp.

【题目】A Toll receptor from Chinese shrimp Fenneropenaeus chinensis is responsive to Vibrio anguillarum infection
【中文关键词】Toll-like receptors (TLRs) 对虾 弧菌 先天免疫
【英文关键词】toll-tike receptor; shrimp; Vibrio anguillarum; WSSV; innate immunity; real-time PCR
【中文摘要】中国明对虾Toll-like receptors (TLRs)参与抵抗弧菌感染
【英文摘要】Toll-like receptors (TLRs) are an evolutionarily ancient family of pattern recognition receptors (PRRs), playing a crucial role in innate immune responses. Here we present a Toll homolog from Chinese shrimp Fenneropenaeus chinensis, designated FcToll. The full-length cDNA of FcToll is 4115 bp including a poly A-tail of 16 bp, encoding a putative protein of 931 amino acids. The predicted protein consists of an extracellular domain with a potential signal peptide, 16 leucine-rich repeats (LRR), two LRR-C-terminal (LRR-CT) motifs, and two LRR-N-terminal (LRR-NT) motifs, followed by a transmembrane segment of 23 amino acids, and a cytoplasmic Toll/Interteukin-IR (TIR) domain of 139 residues. Genomic structure of FcToll gene contains five exons and four introns. Phylogenetic analysis revealed that it belongs to insect-type invertebrate Toll family. Transcripts of FcToll gene were constitutively expressed in various tissues, with predominant level in lymphoid organ. Real-time PCR assays demonstrated that expression patterns of FcToll were distinctly modulated after bacterial or viral stimulation, with significant enhancement after 5 h post-Vibrio anguillorum challenge but markedly reduced levels immediately after white spot syndrome virus (WSSV) exposure. These results suggest that FcToll might be involved in innate host defense, especially against the pathogen V. anguillarum.

【题目】Fractionation and characterization of ε-poly-l-lysine from Streptomyces albulus CGMCC 1986
【中文关键词】无
【英文关键词】ε-poly-l-lysine fractionation characterization antibacterial
【中文摘要】无
【英文摘要】ε-Poly-l-lysine (ε-PLL) produced by Streptomyces albulus CGMCC 1986 was fractionated using ultra-filtration technique with 2 and 5 kDa cut-offs of membrane. The number-average molecular weight of each fraction was determined by 1H nuclear magnetic resonance (NMR) method. The number-average molecular weights of the cutoffs of 5 and 2 kDa and the filtrate are 4,230.95, 3,687.80, and 1,900.82 Da, respectively. 1H NMR indicates the chemical shifts of α-H, β-H, γ-H, δ-H, and ε-H are very similar to all the fractions. Fourier transform-infrared (FTIR) spectra showed that the ε-PLL solid samples obtained by freeze-drying at pH 5 with molecular weights higher than 2 kDa take on a β-turn conformation, however, the fraction with molecular weight smaller than 2 kDa adopts random coil structure. The antibacterial test proved that the fraction between 2 and 5 kDa of membranes behaves the highest antibacterial activity than other fractions for the test strains of Staphylococcus aureus, Micrococcus luteus, Bacillus subtilis, Escherichia coli, and Shigella.

【题目】中国明对虾过氧化物还原酶基因在大肠杆菌中的重组表达、产物纯化及活性测定
【中文关键词】中国明对虾;过氧化物还原酶;重组表达;纯化;活性
【英文关键词】Fenneropenaeus chinensis Peroxiredoxin Expression Purification Activity analysis
【中文摘要】采用RT-PCR扩增编码中国明对虾Prx成熟肽的基因,并克隆到大肠杆菌表达载体pCR T7/NT TOPO TA中进行体外重组表达。重组质粒转化大肠杆菌BL21(DE3)pLysS后,经IPTG诱导表达产生包涵体形式的目的蛋白。对重组蛋白进行LC-ESI-MS分析,结果表明融合蛋白的4个肽段与中国明对虾Prx相应肽段完全一致。将重组蛋白通过金属螯合柱进行

纯化,进而透析、复性,最后获得了具有较高过氧化物酶活性的重组Prx
【英文摘要】The cDNA encoding peroxiredoxin(Prx) of Fenneropenaeus chinensis protein was amplified by RT-PCR and cloned into prokaryotic expression vector pCR T7/NT TOPO TA. The recombinant peroxiredoxin gene was expressed in E.coli and the recombinant protein was expressed as inclusion body after IPTG induced. LC-ESI-MS analysis showed that four peptide fragments of the recombinant protein were identical to the corresponding sequence of F.chinensis Prx. The fusion protein was purified using the immobilized-metal affinity chromatography. After refolded, the purified recombinant protein was shown high reducibility of H2O2 in the presence of dithiothreitol.

【题目】三角褐指藻基因枪转化体系的建立
【中文关键词】三角褐指藻; 基因枪转化; GUS; 抗生素敏感性
【英文关键词】Phaeodactylum tricornutum Micro-particle bombardment GUS Antibiotic sensitivity
【中文摘要】三角褐指藻具有较高的脂肪酸含量,是一种很有潜力的生物柴油生产原料。此外,它是多不饱和脂肪酸尤其是二十碳五烯酸(EPA)重要的来源。合适转化体系的缺乏限制了通过基因工程手段对其进行改造。首次采用基因枪方法成功地将外源基因转入三角褐指藻,转化细胞经染色后呈现蓝色,表明外源报告基因β-糖苷酸酶(GUS)基因得到了成功的表达。同时还进行了转化参数等因素对转化效率影响的分析,优化了转化条件。结果显示最佳的转化条件为:每60μg钨粉包被1μg质粒DNA,样品室真空度为27英寸汞柱,可裂膜为1500psi,受体与阻挡网距离6cm。此外,转化载体采用了三角褐指藻内源基因fcp的启动子,实现了外源基因在细胞内的表达。通过5种基因工程中常用抗生素对三角褐指藻生长抑制的研究发现,三角褐指藻对卡那霉素、氨苄青霉素、链霉素和新霉素不敏感,500mg/L的卡那霉素、氨苄青霉素和新霉素,以及1000mg/L链霉素仍不能抑制其生长;三角褐指藻对氯霉素非常敏感,130mg/L的氯霉素可以完全抑制其生长,其半抑制浓度为60mg/L。这为基因工程手段改造三角褐指藻脂肪酸代谢相关途径奠定了基础。
