【英文摘要】The existence of specific immunological priming in protection upon secondary exposure in invertebrates remains controversial. By exploring the changes in the expression patterns of Bf, C3 and C6, key genes involved in the alternative complement pathway (AP), after challenge with different combinations of three bacteria Vibrio anguillarum, Escherichia coli and Staphylococcus aureus, we show that re-exposure to the same species of bacteria or the different species of the same (Gram-negative or Gram-positive) class of bacteria results in a significant increase in the expression of Bf, C3 and C6, and an earlier occurrence of gene expression peak compared with the first exposure in amphioxus Branchiostoma belcheri; in contrast, re-exposure to the different class of bacteria did not induce such responses. These characteristics appear to bear some analogy to the immunological memory in vertebrates, suggesting that amphioxus B. belcheri possesses the ability to discriminate between classes of microorganisms. Moreover, our results for the first time establish a link between the alternative complement components and the specific immune priming.

【题目】Structural analysis of SNARE motifs from sea perch, Lateolabrax japonicus by computerized approaches
【中文关键词】鲈鱼;SNARE蛋白;7S核复合体;蛋白结构分析
【英文关键词】sea perch; SNARE proteins; motif; 7S core complex; protein structure analysis
【中文摘要】三个cDNA序列编码4个SNARE motif在鲈鱼中被克隆,并且翻译的氨基酸序列用来进行结构预测用14个不同的网站和软件。SNARE 7S核复合体的离子层结构,三维延伸和构象特点用生物数学的方法来比较。结果显示鱼类SNARE核复合体的形式和稳定性可能被氢键所驱动,这揭示了SNARE蛋白在鱼内的反应可能有和哺乳动物相同的分子机制,显示了SNARE核复合体理论的普遍性和可靠性。这项工作也显示了一个可能性,用计算机的方法得到蛋白的3D结构信息
【英文摘要】Three cDNA sequences encoding four SNARE (N-ethylmaleimide-sensitive fusion protein attachment protein receptors) motifs were cloned from sea perch, and the deduced peptide sequences were analyzed for structural prediction by using 14 different web servers and softwares. The "ionic layer" structure, the three dimensional extension and conformational characters of the SNARE 7S core complex by using bioinformatics approaches were compared respectively with those from mammalian X-ray crystallographic investigations. The result suggested that the formation and stabilization of fish SNARE core complex might be driven by hydrophobic association, hydrogen bond among R group of core amino acids and electrostatic attraction at molecular level. This revealed that the SNARE proteins interaction of the fish may share the same molecular mechanism with that of mammal, indicating the universality and solidity of SNARE core complex theory. This work is also an attempt to get the protein 3D structural information which appears to be similar to that obtained through X-ray crystallography, only by using computerized approaches.

【题目】Molecular cloning and tissue expression patterns of a small conductance calcium-activated potassium channel gene in turbot (Scophthalmus maximus L.)
【中文关键词】大菱鲆 钾离子通道 与免疫
【英文关键词】Calcium-activated potassium channel; Gene expression; Immune response; Turbot
【中文摘要】细胞膜上钙激活的钾通道使得钾离子流入细胞,同时造成膜电势的变化以及随之而来的细胞代谢功能的变化。最近有报道钾离子通道可调控哺乳动物免疫细胞的反应。本研究中报道了鱼类免疫细胞中的钾离子通道及其与免疫功

能的关系。从大菱鲆血清中克隆了新的钙激活的钾通道TSKCa。此基因长1698bp,编码544个氨基酸,其表达于几乎所有组织中。用鳗弧菌处理大菱鲆后发现头肾、脾脏和血液表达较高,而肠道和肝脏中没有明显变化,说明前者与免疫相关

【英文摘要】Calcium-activated potassium channels on plasma membrane enable potassium influx into the cell with ensuing changes in plasma membrane potential and consequent effects on cellular metabolic functions. Recently, this potassium channel was reported to regulate the cellular responses of mammalian immune cells. We have postulated the presence of such a channel in fish immune cells and its potential role in immunoregulation in fish. Employing specific primers and RNA template, we cloned a segment of novel gene from turbot blood sample and subsequently obtained a full cDNA sequence using RACE approaches. Bioinformatic analysis revealed structural and phylogenetic characteristics of a novel small conductance calcium-activated potassium channel gene, we called TSKCa, which exhibits homologous domains to other species particularly in the transmembrane regions. Full-length TSKCa cDNA is 1698 bp with a 1632 bp open reading frame encoding a protein of 544 amino acids. TSKCa gene is expressed in majority of the tested organs and tissues of turbot. To assess the postulated immune function of TSKCa, we infected turbot with the pathogen Vibrio anguillarum. Here, semi-quantitative RT-PCR analysis demonstrated increased mRNA expression of TSKCa in head kidney, spleen and blood, indicating an important role of TSKCa in these organ tissues that mediate the immune defense response of turbot. In contrast, there was less change in expression in the turbot intestines and liver which were less implicated in the immune response in present study.

【题目】Interleukin-1beta gene in orange-spotted grouper, Epinephelus coioides: molecular cloning, expression, biological activities and signal transduction

【中文关键词】IL-1 beta; 橙色斑点石斑鱼; 基因结构; 组织分布; 重组蛋白; 信号转导

【英文关键词】IL-1 beta; orange-spotted grouper; gene organization; tissue distribution; mitogen; recombinant protein; signal transduction

【中文摘要】IL-1β,一个关键的炎症中介,通过启动基因表达协调各种免疫反应。在此,我们克隆得到在橙色斑点石斑鱼(Epinephelus coioides) IL-1β的序列,在大肠杆菌中表达可溶性成熟重组IL-1β蛋白,并鉴定了其生物学特性和下游转导信号。石斑鱼IL-1β cDNA全长1364个碱基,包含一个765个碱基的开放阅读框。这个预测蛋白含有254个氨基酸,存在IL-1家族特征序列位点,并且确实常规的ICE剪切位点。系统发生分析表明石斑鱼IL-1beta聚集成一组,与硬骨鱼的鲈形目相近,与哺乳动物相距较远。IL-1beta组分布在几乎所有的检测组织中,当在PBL中添加LPS或Poly I:C刺激后表达量倍增。原核表达的rIL-1beta明显的刺激头肾细胞增殖,促进IL-1beta和COX-2基因表达。另外,p38 MAPK抑制剂(SB203580)和JNK抑制剂(SP600125)都能减少rIL-1beta蛋白诱导的IL-1beta和cox – 2的表达。综上所述,目前的研究表明,石斑鱼IL-1beta和哺乳动物一样可能会起到重要作用在石斑鱼的免疫系统和激活类似下游级联反应

【英文摘要】IL-1beta, a key mediator of inflammation, orchestrates a variety of immune responses by initiating gene expression. Herein, we have cloned and sequenced the IL-1beta in orange-spotted grouper (Epinephelus coioides), produced soluble mature recombinant IL-1beta in Escherichia coli, and characterized its biological properties and downstream signal transduction. The grouper IL-1beta cDNA was 1364bp in length, containing an open reading frame of 765bp. The predicted protein of 254 amino acids revealed the presence of the IL-1 family signature motif and the absence of a conventional ICE cut site. Phylogenetically, the grouper IL-1beta clustered closely with those of teleost belonging to Perciformes and apart from those of mammals. The grouper IL-1beta was constitutively expressed in almost all tissues examined, and was augmented in PBL after the addition of LPS or Poly I:C in vitro. The prokaryotically produced rIL-1beta significantly stimulated the proliferation of grouper head kidney cells, and activated gene expression of IL-1beta and COX-2. Moreover, the rIL-1beta-induced IL-1beta and COX-2 expression were reduced by p38 MAPK inhibitor (SB203580) and JNK inhibitor (SP600125), respectively. Taken together, the present study indicated that grouper IL-1beta may have an important role in grouper immune system and activate similar downstream cascades as its mammalian counterparts.

【题目】Analyzing S-Adenosylhomocysteine Hydrolase Gene Sequences in Deuterostome Genomes
【中文关键词】SAHH;文昌鱼;外显子;系统进化分析
【英文关键词】Sahh, amphioxus exon phylogenetic analysis
【中文摘要】本文就海胆,两个文昌鱼,海鞘和八个脊椎动物的S—腺苷高半胱氨酸水解酶(SAHH)基因序列进行比较分析。尽管SHAA蛋白序列在这些物种中非常保守,他们的核苷酸序列差别很大,从文昌鱼的5446个碱基到斑马鱼的40174个碱基。一部分物种长度的差异主要是由于不同的外显子基因引起的。SAHH基因在文昌鱼(或者海胆)、海鞘和脊椎动物中分别由八、九、十个外显子组成。序列比对表明,外显子3在文昌鱼和海胆类似于外显子3 + 4在脊椎动物中,外显子5在文昌鱼和海胆类似于外显子5 + 6在海鞘中,这两个外显子结合成脊椎动物的外显子6。此外,外显子7在海鞘类似于外显子7 + 8在脊椎动物,表明SAHH基因外显子分裂和外显子融合事件在后口的演化过程已经发生。在文昌鱼中,活性的位点和NAD +结合位点位于外显子2 7,在脊椎动物的进化过程分散到更多外显子。推测SAHH基因十个外显子的结构发生在无脊椎动物和脊椎动物分离后。同义突变和非同义替代分析表明, 在SAHH基因演变中负选择起着主导作用。进化分析表明,基因SAHH在文昌鱼,海胆和海鞘形成一枝,位于进化树底部,这表明它们是脊椎动物SAHH基因的原型。
【英文摘要】S-adenosylhomocysteine hydrolase (SAHH) gene sequences of sea-urchin, two amphioxus, sea-squirt and eight vertebrates are comparatively analyzed in the current analysis. Although SAHH protein sequences are highly conserved in these species, their nucleotide sequences are much different, ranging from 5,446 bp in amphioxus to 40,174 bp in zebra fish. The length divergence is mainly caused by distinct introns in some species. SAHH genes in amphioxus (or sea-urchin), sea-squirt and vertebrates are composed of eight, nine and ten exons, respectively. Sequence alignment shows that exon 3 in amphioxus and sea-urchin is similar to exons 3 + 4 in vertebrates, exon 5 in amphioxus and sea-urchin is similar to exons 5 + 6 in sea-squirt, and the two exons are fused into exon 6 in vertebrates. Furthermore, exon 7 in sea-squirt is similar to exons 7 + 8 in vertebrates, indicating that exon-fission and exon-fusion events have been taken place during the evolution of deuterostome SAHH genes. Active sites and NAD+-binding sites are located in exons 2 7 in amphioxus, which are dispersed into much more exons along with the evolution of vertebrates. It is speculated that ten-exon organization of SAHH gene occurred after the separation of invertebrates and vertebrates. Synonymous and non-synonymous substitution analysis shows that negative selection plays a dominant role in the evolution of SAHH genes. Phylogenetic analysis shows that SAHH genes in amphioxus, sea-urchin and sea-squirt form a cluster and locate at the base of neighbor-joining tree, suggesting that they are the archetype of vertebrate SAHH genes.

【题目】Cloning and identification of promoter Prd29A and its application in
【中文关键词】甘蔗;RD29A启动子
【英文关键词】rd29A, promoter, Saccharum officinarum,
【中文摘要】RD29A 抗旱诱导启动子的使用
【英文摘要】The 420 bp upstream regulatory region of rd29A gene from Arabidopsis thaliana genome was amplified by PCR. Sequence analysis showed that it shared 100% identity with the reported rd29A promoter and contained several cisacting elements including dehydration responsive elements (DRE), ABA responsive elements (ABRE) and so on. The plant expression vector prd29A-S65T was constructed with this fragment linked up with green fluorescent protein (GFP) gene controlled by rd29A promoter, which was transferred to sugarcane callus by bombardment. The expressions of gfp in the transformed sugarcane callus and leaves treated with 6g/L PEG and 40%PEG, respectively, were detected by fluorescent microscope. The results showed that the expression vector had been transferred into sugarcane callus and GFP gene could be induced by PEG treatment. Through PCR analysis, 5 plants were identified to be the transgenic. At the same time, plant expression vector rd29a-dreb-hyg was constructed with this fragment linked up with DREB2B gene controlled by inducible promoter rd29A, which will lay the foundation for drought resistant transgenic breeding in sugarcane. Molecular analysis showed that the rd29a-dreb-hyg has been successfully integrated into corresponding sugarcane variety.

【中文关键词】转基因甘蔗; 生理; 变化
【英文关键词】transgenic sugarcane; Bt gene
【中文摘要】选取3个含有Bt基因甘蔗株系进行光合系统和抗氧化系统的研究。转基因株系的净光合速率、胞间二氧化碳浓度、气孔导度、蒸腾速率和对照相比没有明显的差异;转基因株系中的SOD、POD、CAT和MDA的变化较小。结果表明:Bt基因的插入导致部分甘蔗的生理指标发生变化,不同的株系生理变化不一致。
【英文摘要】The photosynthetic system and antioxidant systems in three Bt transgenic sugarcane strains were studied. The changes of net photosynthetic rate, stomatal conductance, transpiration rate and intercellular CO2 concentration in the leaves of Bt transgenic sugarcane strains were not obviously different with non – transgenic sugarcane strains(ROC20). The SOD, POD, CAT activity and MDA content in transgenic sugarcane strains had a little change. The results showed that Bt gene in sugarcane partially led to the change of photosynthetic and antioxidant systems, and the physiological changes of different strains were inconsistent.

【题目】甘蔗△^1-吡咯啉-5-羧酸合成酶基因(P5CS)的克隆及其表达分析
【中文关键词】甘蔗;脯氨酸;△^1-吡咯啉-5-羧酸合成酶;荧光实时PCR
【英文关键词】sugarcane;P5CS
【中文摘要】△L吡咯琳一5一羧酸合成酶是植物脯氨酸合成过程的关键酶。应用同源性克隆结合RACE技术获得甘蔗P5CS基因cDNA全长序列2 714 bp,其中5 端非编码区为226 bp,3 端非编码区340 bp,poly(A)上游有1个聚腺苷酸五碱基AATAAA;开放读码框为2 148 bp编码715个氨基酸,含双功能域;其编码的蛋白分子量为77.7 ku,等电点为6.47。序列比对分析结果表明, cs基因的4个主要功能区(doraain)中亮氨酸功能区(Leucine domain)相对不保守.其它功能区均较为保守。对17个物种的P5CS基因进行聚类分析。结果与公认的生物学分类及进化关系吻合。对甘蔗P5CS在根、茎、叶的表达进行实时PCR分析,结果表明,该基因在茎、叶表达量相近,但在根的表达量极低
【英文摘要】Most plants synthesize and accumulate proline under osmotic stress. A pyrroline-5-carboxylate synthetase (PSCS) plays a key role for proline biosynthesis.The P5CS was obtained from sugarcane Saccharum officinarum L. through homology-based cloning and rapid amplification of cDNA ends (RACE). The full-length cDNA of P5Cs term ed as Sc-P5CS from sugarcane was 2714 bp,containing a 2148 bp open reading frame(ORF)that encoded a 715 amino acids protein,with a 226 bp UTR at the 5 end and a 340 bp UTR at the 3 end,and included 2 poly(A)signals at the 2 571st position.The molecular weight of Sc-PSCS was 77.7 ku.with a theoretical isoelectriec point of 6.47.The alignment of the sequences showed that the P5CS genes from different species were not conserved in the leucine domain,but were highly conserved in the other functional domains such as the ATP binding site,Glu-5-kinase domain,NAD(P)H binding site and GSA-DH domain.The phylogenetic tree of the P5Cs from 17 species was consistent with putative evolutionary relationships within these 17 species.The expression of the Sc-P5CS in roots,stalks and leaves of sugarcane seedling was analyzed by Real-time PCR.The result indicated that the expression of the Sc-PSCS was very low in roots but normal in leaves and stems.This study provides theoretical basis of the molecular mechanism for Sc-PSCS regulation in sugarcane.

【题目】甘蔗水分胁迫响应的δ-鸟氨酸转氨酶基因克隆及分子特征分析
【中文关键词】甘蔗;水分胁迫;δ-鸟氨酸转氨酶;荧光实时PCR
【英文关键词】Saccharum officinarum L. water stress ornithine-δ-aminotransferase real-time PCR
【中文摘要】通过消减文库技术,结合cDNA芯片技术筛选到1个明显受水分胁迫诱导的EST序列(Ratio值为8.1),比对分析推测其为δ-OAT基因的片段,进而通过RACE结合PCR技术获得该基因全长cDNA序列为1782bp,其中5′端非编码区150bp,开放阅读框为1362bp,3′端非编码区为270bp且存在2个终止加A信号AATAA。预测其编码的蛋白质分子量为49.5ku,等电点为6.5,为一个跨膜蛋白。序列比对分析结果表明,δ-OAT基因家族N末端和C末端相对不保守,而主要功能区均表现保守。基因进化分析显示,单子叶禾本科植物和双子叶植物鸟氨酸转氨酶编码基因分别由各自祖先进化而来,而微生物的鸟氨酸转氨酶编码基因表现出复杂的进化关系。荧光实时PCR分析δ-OAT在根、茎、叶的表达,该基因在茎的表达较高,其次是叶而后为根,但没有明显的组织表达特异性。本文首次报道甘蔗δ-OAT基因克隆研究结果,为该基因的深入研究和应用奠定一定基础
【英文摘要】An obvious up-regulated EST of ornithine-δ-aminotransferase (δ-OAT) was obtained from Saccharum officinarum L. under drought treatment through cDNA microarray hybridization. The full-length cDNA of δ-OAT termed as Sc-δ-OAT from sugarcane was 1 782 bp, containing a 1 362 bp open readingframe(ORF) that encoded a 454 amino acid protein with 150 bp UTR in the 5′ and 270 bp UTR in the 3′, and included 2 poly(A) signals at 1 676 and 1 737 positions. The molecular weight of δ-OAT was 49.5 ku with a theoretical isoelectric point of 6.5, and was presumed to be a transmembrane protein. The alignmentof the sequences showed that the δ-OAT genes of different species were not conserved in N-terminal and C-terminal, but highly conserved in the functional domain. The expression of Sc-δ-OAT in roots, stalks and leaves of sugarcane seedling was investigated with Real-time PCR and found that it was higher in stalks, followed by leaves and roots, but not tissue specific. This study provides references for further studyof molecular mechanism for δ-OAT regulation in sugarcane.

【题目】斑茅SAMDC基因的克隆及其原核表达分析
【中文关键词】斑茅 samdc 表达载体构建 基因表达
【英文关键词】Erianthus arundinaceus SAMDC cDNA cloning vectors gene expression
【中文摘要】以斑茅(Erianthus arundinaceus)samdc基因的cDNA为基础,采用基因重组技术,将该基因按正确的阅读框架定向克隆于原核表达载体pET-29a(+)中,转化大肠杆菌BL21(DE3),用IPTG诱导表达,并对表达产物进行SDS—PAGE分析。结果表明:重组斑茅samdc基因在大肠杆菌中获得高效表达,其分子量约为43.281kDa。斑茅samdc基因原核表达载体的成功构建和重组斑茅SAMDC蛋白在大肠杆菌中的高效表达,为进一步研究其生物学功能奠定了基础
【英文摘要】Prokaryotic expression vector pET-SAMDC of Erianthus arundinaceus samdc gene cDNA was constructed by means of recombinant gene technology and expressed in Escherichia coil BL21 under induction of IPTG, the expressed products were detected by SDS-PAGE analysis. Result show: Recombinant samdc was efficiently expressed in E.coli BL21,it molecular weight

was about 43.281Kda. The successful construction of prokaryotic expression vector containing Erianthus arundinaceus samdc gene and effective expression of recombinant SAMDC in E.coli BL21 laid the foundation for further study on its biological function.

【题目】甘蔗斑茅属间远缘杂种真实性的ITS鉴定及其抗旱性分析
【中文关键词】甘蔗 抗旱 斑茅
【英文关键词】Saccharum L. drought resistance E. arundinaceum(Retz.) Jeswiet
【中文摘要】对甘蔗斑茅属间远缘杂种真实性进行ITS鉴定。同时在水分胁迫下对斑茅及其杂种后代的生理进行研究,参照已建立的甘蔗抗旱鉴定技术体系进行筛选和评价。结果表明:崖城96—40、崖21号、崖城01—3和崖城01—6等都是斑茅的真实杂种;海南92—105(斑茅)、崖城92—77(斑茅)都表现为高抗或特抗。可见斑茅具有很强的抗旱性
【英文摘要】
The genuine hybrids from the cross of Saccharum and E. arundinaceum were identified by ITS analysis, the physiological characteristics orE. arundinaceum and their hybrid progenies under water stress were studied and then screened and evaluated based on the techniques of identification for drought resistance in sugarcane. The results showed that Yacheng 96 - 40, Yacheng 21, Yacheng 01 - 3 and Yacheng 01 - 6 were all the real genuine hybrids from the cross of Saccharum and E. arundinaceum. Both Hainan 92 - 105 and Yacheng92- 77 showed high resistance, which indicated that E. arundinaceum has strong drought -resist-ance.

【题目】外源ABA和乙烯利胁迫下斑茅ACO基因表达的实时PCR分析
【中文关键词】斑茅 1-氨基环丙烷-1-羧酸氧化酶基因(ACO基因) 脱落酸 乙烯利 实时荧光PCR
【英文关键词】Erianthus arundinaceus, 1-aminocyclopropane-l-carboxylate oxidase gene (ACO gene), abscisic acid (ABA), ethephon, Real-time fluorescence PCR
【中文摘要】研究了外源ABA和乙烯利胁迫处理对斑茅1-氨基环丙烷-1-羧酸氧化酶基因(ACO基因)表达情况的影响。在项目组克隆斑茅ACO基因的基础上,应用实时荧光PCR技术分析斑茅ACO基因在ABA、乙烯利胁迫下的表达。结果表明,斑茅ACO基因在ABA的胁迫下,在3h有微弱上调表达,而6h日寸明显抑制,其后表达趋向平缓;在乙烯利的胁迫下,ACO基因在前期受抑制,其后呈明显上调表达,在24h后ACO基因的表达趋向平缓。斑茅ACO基因的表达受乙烯利诱导,而不受外源ABA诱导
【英文摘要】
In order to study the molecular mechanism of A CO gene from Erianthus arundinaceum under exogenous ABA and ethephon stress. In this paper, based on the cloning of A CO gene in Erianthus arundi - naceus, the expression of A CO gene in Erianthus arundinaceus under ABA and ethephon treatments

was investigated by Real-time fluorescence PCR. The results showed that the expression of A CO gene was slightly up-regulated at the beginning and continuous inhibited, then became normal by ABA stress . Under the tr eatment of ethephon, the expression of A CO gene was prohibited at the earlier stage along with the subsequent continuous more obvious up-regulation. The results showed that the expression of A CO gene in Erianthus arundinaceus could be i nduced by ethephon, but not by ABA.

【题目】充入N2和CO2对贮藏橙汁品质的影响研究
【中文关键词】充入;氮气;二氧化碳;贮藏橙汁;品质
【英文关键词】filling;N2;CO2;"Olinda"valencia orange juice;quality
【中文摘要】主要探讨充入N2 和CO2,并控制温度和压力条件下,贮藏橙汁的品质变化。研究结果表明:分别充入N2 或CO2 气体0.2、0.4MPa,15℃贮藏6个月,L值增加,a值、b值减少;与对照组比充气0.4MPa的两个处理组对色差值变化有一定抑制作用,橙汁可溶性固形物保存率在97%以上,菌落总数前期升高后期下降(总数<40CFU/ml),VC损失均小于6mg/100g,以0.4MPa、N2 组的损失最小,0.4MPa、N2 处理组主要香气成分保有量为1001μg/ml。由此可见,充气加压贮藏能够有效保持橙汁原有的风味和品质,综合各项指标测定结果以0.4MPa、N2处理组效果最好。
【英文摘要】“ Olinda ” Valencia orange juice was stored for 6 months in a container filled with N2 or CO2 to 0.2 or 0.4 MPa at 15 ℃. Quality changes of four “ Olinda ” valencia orange juice samples (sample P-1: N2, 0.4 MPa; sample P-2: CO2, 0.4 MPa; sample P-3: N2, 0.2 MPa; and sample P-4: CO2, 0.2 MPa) during the storage were investigated. A slight increase of L* value wasobserved in all the samples while the a* and b* values decreased dramatically. An obvious inhibition was found in color difference of the two orange juice samples stored under 0.4 MPa when compared to the control sample stored hermetically in a PET bottle at -5 ℃. Over 97% of soluble solids were preserved in the orange juice samples and the total bacterial count showed a changing trend of first increase and then decrease and the loss of vitamin C was less than 6 mg/100 g during the storage, which was the least in the sample P-1. The content of major aroma components in the sample P-1 was 1001 μg/ml. In general, the original quality and flavor of the orange juice can be preserved when stored under N2 or CO2 pressure environment.

【题目】超高压处理对橙汁品质影响研究
【中文关键词】超高压;橙汁;品质
【英文关键词】ultra high pressure;orange juice;quality
【中文摘要】研究比较超高压杀菌和热力杀菌处理对橙汁品质的影响。结果表明:超高压杀菌对橙汁色泽参数的影响程度较小(P>0.05);杀菌处理后,橙汁主要成分都出现程度不同的损失,但超高压杀菌处理橙汁主要成分的下降普遍低于热力杀菌处理;杀菌处理后,橙汁中挥发性风味组成成分发生变化,醇类、酯类、烃类总含量变化相对较少,醛类热杀菌与鲜榨橙汁比较无明显变化,而超高压杀菌与鲜榨橙汁相比醛类增加3倍以上。
【英文摘要】Two samples of orange juice were sterilized by ultra high pressure (UHP) and thermal treatments, respectively and their qualities were analyzed and compared by sensory and chemical evaluation. Less influence of UHP was observed on the color quality of orange juice (P < 0.05). Both the two sterilization ways led to the loss of main constituents in orange juice to different degrees. However, the decrease degree of main components in orange juice sterilized by UHP was lower than that by thermal treatment. After sterilization,

the relative contents of alcohols, ester and hydrocarbons in orange juice slightly decreased. There was no significant change in the relative content of aldehydes. However, the relative content of aldehydes in UHP-sterilized orange juice was more than three times higher than that in fresh orange juice.

【题目】中国甜橙果汁色泽的定量评价
【中文关键词】甜橙;果汁色泽;定量评价
【英文关键词】orange;juice color;quantitative evaluation
【中文摘要】色泽是甜橙及其橙汁的一项重要的感官指标,直接影响到消费者的选择。本研究采用国际公认的色差法定量测定我国主要甜橙产区目前栽培的具有代表性的94个甜橙样品果汁的色泽参数,建立了我国橙汁色泽特征数据库。统计结果表明:我国的甜橙果汁的色泽普遍高于36,优于美国和巴西的同类品种;不同品种、不同产区甜橙果汁色泽差异显著,但不同年度采收的甜橙果汁色泽差异不显著(P>0.05)。
【英文摘要】Color is very important sensory feature of oranges and orange juice, which directly affects the choice of consumers. Color parameters of orange juice made from 94 kinds of orange samples collected from major orange production area in China were quantitatively determined using chromatic aberration method to establish the color database for color properties of orange juice in China. Statistical analysis indicated that color values of orange juice in China were over 36 points, which was higher and better than that of orange juice from USA and Brazil. An obvious difference in color values of orange juice from different varieties and production areas was observed, however, the color values of orange juice produced in different years didn’t exhibit a significant difference (P > 0.05).

【中文关键词】气力式;免耕;中央排种槽轮装置;适应性
【英文关键词】null
【中文摘要】为了广泛应用于大田作物种子和牧草种子等多种作物的免耕播种作业。农机院工程师通过反复试验研制出了带有浮动槽轮的中央排种槽轮装置,这种分配器在气流作用下能够均匀分配种子进入输送管,流动性好,不易产生管内的堵塞。因此带有浮动槽轮的中央种子分配器更加适应免耕播种机的排种机构要求。在9BQM-3.0型气力输送式免耕播种机上首次应用了这种装置。本文对新型气力输送式免耕播种机的播量调整机构做了详尽的介绍。

【题目】鲜橙汁冷藏期间色泽变化研究
【中文关键词】冷藏;橙汁色泽参数;类胡萝卜素;VC
【英文关键词】orange juice;color change;refrigerated storage;carotenoids;VC
【中文摘要】在4℃条件下贮藏鲜橙汁12周期间,橙汁的红绿值a*、色泽指数OJ值减小,亮度值L*、黄蓝值b*,饱和度C*以及色调Hue增大,ΔE*值显著增大(P<0.05),橙汁色泽显著变差。同时,橙汁中类胡萝卜素和VC含量不断降低,褐变指数上升。橙汁色泽参数变化与类胡萝卜素和VC含量的变化呈显著正相关,与褐变指数呈显著负相关。在4℃冷藏条件下贮藏鲜橙汁,其色泽的保质期为7~9周。
【英文摘要】Orange juices derived from 3 orange cultivars were stored at 4 °C for 12 weeks, and their color, carotenoids and vitamin C contents were determined at intervals of 2 weeks. Color changes of the orange juices and their possible relationships with the changes of carotenoids and ascorbic acid contents were investigated. Results showed that during storage, CIE1976 a* value (red-green) and OJ value decreased and CIE1976 L* value (brightness), b* value (yellow-blue), C* and Hue values increased, and overall color change (ΔE*) increased significantly (P < 0.05). Simultaneously, the content of carotenoids and vitamin C decreased and browning index increased. The color of orange juice was significantly positively correlated with the content of carotenoids and vitamin C, and significantly negatively correlated with the browning index. From the viewpoint of color, the expiration time of the orange juices is 7-9 weeks.

【题目】几种柑橘品种制汁适应性评价研究
【中文关键词】制汁;适应性;理化指标
【英文关键词】juicing;suitability;physico-chemical parameters
【中文摘要】利用感官及理化指标的综合评价研究北碚447#锦橙、中育七号#甜橙、雪柑#锦橙、江津长叶橙、溆浦哈姆林甜橙、洪江大红甜橙、无核大红甜橙和溆浦长型无核甜橙的制汁适应性,其中,感官评价使用百分法进行评定,理化指标的评定包括出汁率、可溶性固形物、可滴定酸、总黄酮、精油、柠檬苦素等12项。通过实验得出北碚447#锦橙、中育七号#甜橙、江津长叶橙、雪柑#锦橙、溆浦哈姆林甜橙、无核大红甜橙综合评分均高于80分,为适宜制汁品种;而洪江大红甜橙和溆浦长型无核甜橙固酸比均低于10,综合评分均高于75分,为可以制汁品种。
【英文摘要】Comprehensive assessment of sensory and physico-chemical parameters was used for suitability study of several citrus varieties (namely, Beibei Jincheng orange No. 447, Zhongyu sweet orange No. 7, Xuegan Jincheng orange, Jiangjin long-leaf orange, Xupu Hamlin sweet orange, Hongjiang Dahong sweet orange, Dahong seedless sweet orange and Xupu oval-shaped seedless sweet orange) for juicing. Sensory evaluation score was on 100 scale. The physico-chemical parameters assessed were juice percentage, the contents of soluble solids, total flavonoids, volatile oil and limonin, titratable acidity and so on. Beibei Jincheng orange No. 447, Zhongyu sweet orange No. 7, Jiangjin long-leaf orange, Xuegan Jincheng orange, Xupu Hamlin sweet orange and Dahong seedless

sweet orange scored a comprehensive score over 80, indicating excellent suitability for juicing. The soluble solids-to-acid ratios of Hongjiang Dahong sweet orange and Xupu oval-shaped seedless sweet orange were both less than 10, but the comprehensive scores exceeded 75; therefore, the two varieties have good suitability for juicing.

【题目】酶法处理柑橘果渣回收果汁技术与中试试验
【中文关键词】农业废弃物,果汁,酶,柑橘果渣,理论浓缩耗能
【英文关键词】agriculture wastes, fruit juices, enzymes, citrus pulp, theoretical condense energy
【中文摘要】以柑橘果渣为原料,研究酶法回收果汁工艺,并对工艺进行优化。通过单因素分析和响应面设计,考察酶用量、酶解时间、酶解温度、渣水比对酶法回收柑橘果汁的影响,确定了酶法回收柑橘果汁回归方程,当酶用量213.38 μg/L,酶解时间164.02min,酶解温度53.76℃,渣水比1∶1.05时,预测的综合指标最佳,达到0.0138,验证试验的综合指标为0.0137,与预测的综合指标接近。利用优化后的工艺进行中试试验,动态跟踪了果汁的可溶性固形物、酸度、pH值和氨基酸的变化,将中试的回收果汁与柑橘还原汁进行感官评价,评价结果相似,可部分替代柑橘还原汁应用于橙汁饮料。
【英文摘要】Citrus juice was recovered from pulp by enzyme. Taking composite indicator as the main index, the technology was optimized with enzyme dosage, reaction time, reaction temperature, and ratio of pulp to water dilution through single-factor test and responsible surface design. Best predicted composite indicator 0.0138 was got under the conditions: enzyme dosage of 213.38 μg/L, reaction time of 164.02 min, reaction temperature of 53.76℃, and ration of pulp to water 1:1.05 (by weight). And it was proved correct that the composite indicator 0.0137 was got by the confirmative test. Meanwhile pilot plant tests were carried out based on the optimized technology. Changes of solid soluble, acid, pH and amino acids were studied during the tests. Recovered juice in the tests can alternatively replace restored juice in citrus beverage, since the similar results of the sensory evaluation.

【题目】Bioaccumulation of silver, cadmium and mercury in the abalone Haliotis diversicolor from water and food sources
【中文关键词】鲍,金属,生物放大,生物累积,大型海藻
【英文关键词】Abalone; Metal; Biomagnification; Bioaccumulation; Macroalgae
【中文摘要】在中国,大部分鲍鱼场面临着与日俱增的污染,其中包括重金属污染。大型藻类,如现在广泛作为鲍鱼饵料的江蓠,能够吸附相当可观的重金属,因此,关于鲍鱼中重金属营养转移的担忧也日益增加。通过测定杂色鲍对各溶解态金属的吸附收率,以及杂色鲍对不同藻类的同化效率和输出速率常数,可以量化得出杂色鲍对Ag、Cd、Hg等金属的吸收途径和速率。鲍鱼对溶解态的Ag、Cd、Hg的吸收速率常数分别为1.78Lg-1d-1,0.056Lg-1d-1,0.32Lg-1d-1,相关的吸收效率分别是58-83%,33-59%,65-78%。随着摄食藻类中重金属溶度的增加,Ag,Hg的吸收效率却出现显著性的降低,这可能是肠道对于重金属吸收的减弱的缘故。而当摄食中Cd浓度发生变化时,Cd的吸收效率却没有显著变化。Ag、Cd、Hg的输出速率常数分别是0.003d,0.010-0.011d,0.010-0.011d,这与下文从水体和食物的吸收具有一定可比性。Ag低的输出速率主要是因为其与大颗粒金属和细胞碎片的结合作用。模拟计算表明,在典型的条件下,摄食同化是鲍鱼对Ag、Cd、Hg富集的主导途径。三种重金属的营养转移因子都大于一,这是由于其高摄食同化而表现出的生物放缩潜力。这些结果表明,由于来自大型藻类中潜在的营养传递而使得鲍鱼中的重金属成为一个食品安全问题。
【英文摘要】Most abalone farms in China are confronted with increasing pollution, including metal pollution. Macroalgae such as Gracilaria, widely used as abalone forage, can very appreciably concentrate metals, thus there is an increasing concern for metal trophic transfer in abalones. The route and rate of Ag, Cd and Hg uptake in the abaloneHaliotisdiversicolor were quantified by determining each metal's uptake rate from the dissolved phase, its assimilation efficiency (AE) from different macroalgae and its efflux rate constant.

The uptake rate constants in abalones from the dissolved phase were 1.78 L g − 1 d − 1 for Ag, 0.056 L g − 1 d − 1 for Cd and 0.32 L g − 1 d − 1 for Hg. The corresponding AEs were 58 – 83%, 33 – 59%, and 65 – 78%. The AEs of Ag and Hg decreased significantly with increasing metal concentration in the ingested macroalgae, which may be caused by the decreasing desorption of metals in the gut. The AEs for Cd varied little when the Cd concentration in the diet varied. The efflux rate constants were 0.003 d − 1 for Ag, and 0.010 – 0.011 d − 1 for Cd and Hg, respectively, and were comparable following uptake from water and food. The low efflux rate of Ag was mainly due to its binding with metal-rich granules and cellular debris. Modeling calculations suggest that, under typical conditions, dietary uptake is the dominant route for Ag, Cd and Hg accumulation in abalones. The trophic transfer factors for all three metals were greater than one, implying a potential for biomagnification due to their high dietary assimilation. These results suggest that metals in abalones can be afood safety issue due to the potential for trophic transfer from macroalgae.

【题目】A monoclonal antibody-based sensitive enzyme-linked immunosorbent assay (ELISA) for the analysis of the organophosphorous pesticides chlorpyrifos-methyl in real samples
【中文关键词】甲基毒死蜱;单克隆抗体;酶联免疫检测
【英文关键词】Chlopyrifos-methyl; Monoclonal antibody; ELISA
【中文摘要】本文合成了甲基毒死蜱的半抗原(H1),并通过活泼酯法与BSA和OVA偶联。其中以H1-OVA作为包被原,H1-BSA作为免疫原来制备单克隆抗体。通过一系列条件优化,建立了一套高效竞争性间接ELISA体系。其中IC50值为75.22 ppb, 检测限为0.32ppb。该体系除了与毒死蜱有1.4%的交叉反应外,与其余受测农药的交叉反应均小于1%。同时,将该体系应用于实际样品的添加回收实验,回收率在82.4%-110.2%之间。
【英文摘要】Chlorpyrifos-methyl hapten, O-methyl-O-(3,5,6-trichloro-2-pyridinyl)-N-(2-carboxyethyl)-phosphoramidothionte (H1), was synthesized and conjugated with bovine serum albumin (BSA) and ovalbumin (OVA) by the active ester method. Then H1 – OVA conjugate was used as coating antigen, while H1 – BSA conjugate was used as immunogen for producing monoclonal antibody. After optimisation, a monoclonal antibody-based effective competitive indirect enzyme-linked immunsorbent assay (ELISA)

was developed and applied for determination of chlorpyrifos-methyl with a novel combination of antibody/antigen, I50 of which was 75.22 ng/ml, limit detection (LD) was 0.32 ng/ml, and there was relative high cross-reactivity (CR) only with chlorpyrifos (1.4%), and CRs with other tested pesticides were all below 1% and regarded as negligible. The recoveries obtained by standard chlorpyrifos-methyl addition to real samples, including grape, Chinese cabbages, water and soil were all from 82.4% to 110.2%. Therefore, theoptimised ELISA might become a convenient and satisfied analytical tool for monitoring chlorpyrifosmethyl residues in agriculture ecosystem.

【题目】Development of 11 polymorphic microsatellite loci in the small abalone (Haliotisdiversicolor Reeve)
【中文关键词】遗传标记,杂色鲍,微卫星,九孔
【英文关键词】genetic marker; Haliotis diversicolor; microsatellites; small abalone
【中文摘要】我们从杂色鲍中分离出11个多态微卫星基因位点,并在(CT)n和(AC)n库中表征。本研究将这些基因位点检测了自然群体中24个个体。结果显示,所有个体都是多态性的,且等位基因数量在3到10间变化。观测的杂合度和期望的杂合度分别在0.083-0.0913和0.159-0.856间变化。这11个分离的微卫星位点,除SA-JMU6和SA-JMU12外,均遵循Hardy – Weinberg期望。在近缘物种H. ovina和H. asinine中,七套引物得到扩增。结果表明,这11个多态微卫星将对于分析杂色鲍群落结构和遗传多样性有很大的作用。
【英文摘要】Eleven polymorphic microsatellite loci for Haliotis diversicolor were isolated and characterized from (CT)(n)- and (AC)(n)-enriched library. They were tested in 24 individuals from a natural population. All of them were polymorphic, with the number of alleles varying between three and 10. The observed heterozygosities and expected heterozygosities ranged from 0.083 to 0.913 and from 0.159 to 0.856, respectively. The 11 isolated microsatellite loci, except SA-JMU6 and SA-JMU12, followed Hardy-Weinberg expectations. Seven sets of primers also amplify in closely related species, H. ovina and H. asinine. These 11 polymorphic microsatellites will be useful for analysing the population structure and genetic diversity in H. diversicolor.

【题目】Fusion expression of bovine lactoferricin in Escherichia coli
【中文关键词】冯兴军
【英文关键词】Bovine lactoferricin Antibacterial activity Factor Xa Thrombin Fusion expression; AY nity chromatography
【中文摘要】无
【英文摘要】The drug resistance problem has been growing with the utilization of current antibiotics in feed and medical industries. LfcinB, a 25-amino acid antibacterial peptide derived from bovine lactoferrin, is one of potential alternatives of antibiotics. According to the bias of codon utilization of Escherichia coli, a fragment encoding LfcinB has been chemically synthesized, inserted into vector pGEX-4T-2 and expressed in E. coli . The antibacterial peptide was fused with GST with a protease cleavage site located between them. Two constructs with di Verent cleavage sites were made. One construct, pGEX-Th-LfcinB, contains a thrombin cleavage site carried by the vector, and the other, pGEX-Th-Xa-LfcinB, contains a Factor Xa cleavage site which was introduced after the thrombin cleavage site. Fusion prot ein GST-Th-LfcinB protein was eY ciently cleaved by thrombin, yielding recombinant LfcinB showing antibacterial activity. However, fusion protein GEX-Th-Xa-Lfcin B containing Factor Xa recognition site could not be cleaved by Factor Xa at the conditions tried in this study. Successful expression of LfcinB in E. coli provides a possible method to produce LfcinB in large

amounts.

【题目】女贞子对蛋鸡育成期生长发育和免疫功能的影响
【中文关键词】石莉莎
【英文关键词】Ligu strum lucidum layer chickens growth immunity
【中文摘要】本研究旨在观察女贞子对蛋雏鸡生产性能和免疫功能的影响。试验选用1 日龄海兰褐蛋雏鸡384 只,随机分为4 组,每组设6 个重复。结果表明,女贞子对蛋鸡日增重、饲料转化率无显著影响;饲料中添加0.5%女贞子能显著提高雏鸡生长前期的法氏囊指数,添加1%的女贞子能提高雏鸡生长中、后期的胸腺与脾脏指数;女贞子能显著提高蛋雏鸡的新城疫抗体效价;女贞子对雏鸡生长前、中期的C3 含量和生长中期的TNF 含量有提高作用;女贞子能显著提高鸡外周淋巴细胞转化率。说明女贞子对蛋鸡育成期的生长发育和免疫功能有积极作用。

【题目】牛乳铁蛋白素(1-15)-蜂毒素(5-12)杂合肽基因的合成及在大肠杆菌中的表达
【中文关键词】毕重朋
【英文关键词】LfcinB melittin hybrid peptide
【中文摘要】为了构建新型的杂合肽,设计了一种新型杂合抗菌肽牛乳铁蛋白素(1-15)-蜂毒素(5-12),由牛乳铁蛋白素(LfcinB)N端第1~15个氨基酸残基和蜂毒素(Melittin)N端第5~12个氨基酸残基组成。根据大肠杆菌密码子的偏爱性,设计合成了杂合肽LfcinB(1-15)-Melittin(5-12)的基因片段,插入到表达载体pET-32a的Nco Ⅰ和Sal I的酶切位点之间,构建重组表达质粒。重组表达质粒转化到Escherichia coli BL21(DE3)中,经异丙基-β-D-硫代半乳糖苷(IPTG)诱导表达,融合蛋白

以可溶形式在Escherichia coli BL21(DE3)中获得成功表达，表达量占菌体总蛋白的35%以上，每升培养物可获得35 mg融合蛋白。带His标签的融合蛋白经His Bind纯化试剂盒纯化、肠激酶切割和抑菌实验表明，杂合肽具有明显的抑菌效果。这为利用基因工程方法生产抗菌肽奠定了理论基础。

【英文摘要】In order to get new antibacterial peptide, we designed a hybrid peptide LfcinB(1-15)-Melittin(5-12), composed of 1－15 amino acid residues of bovine Lactoferricin and 5－12 amino acid residues of Melittin. According to the bias of codon utilization of Escherichia coli, We synthesized the gene encoding the hybrid peptide. We inserted the gene between the sites of Nco Ⅰ and Sal Ⅰ of pET-32a and obtained the recombinant expression vector for heterologous expression of LfcinB(1-15)-Melittin(5-12) in Escherichia coli. We used Escherichia coli BL21(DE3) as expression host for the recombinant plasmid. After induced by isopropyl-β-D-thiogalactoside (IPTG) under the optimized conditions, we realized the fusion protein was successfully expressed. The fusion protein was expressed in soluble form and the level was more than 35% of the total proteins. With (His)6 Tag, the fusion protein was easily purified by His Bind Purification Kit. After purification, we obtained 35 mg of fusion protein from 1 L of culture medium. At last, we accomplished that the peptide LfcinB(1-15)-Melittin(5-12) was released from the fusion protein cleaved by enterokinase. The recombinant LfcinB(1-15)-Melittin(5-12) showed antimicrobial activity assayed by agar diffusion test. This is the first report on the heterologous expression of the hybrid antibacterial peptide LfcinB(1-15)-Melittin(5-12) in Escherichia coli and also provides basis for next cost-effective expression of other antimicrobial peptides in genetic engineering.

【题目】鸡IL-18基因的克隆表达及对新城疫疫苗诱导的HI抗体变化的研究

【中文关键词】姜文博

【英文关键词】chicken interleukin-18 clone expression New casltle disease virues

【中文摘要】通过RT-PCR方法从新城疫Ⅰ系疫苗诱导的11日龄鸡胚脾脏细胞中扩增出鸡白细胞介素18 (Chicken interleukin-18 ,ChIL-18)成熟蛋白基因的cDNA,并将其克隆到pMD18-T载体上。DNA序列测定表明,克隆得到ChIL-18全基因,其编码区大小为597 bp,编码198个氨基酸多肽。将该基因片段克隆到原核表达载体pProEXTMHTb构建重组质粒pProEXTMHT-ChIL-18转化大肠杆菌DH5α中,并用IPTG诱导。重组菌菌体裂解物b SDS-PAGE可检测到相对分子量为28.6 ku的重组蛋白。观察ChIL-18蛋白对新城疫疫苗诱导的HI抗体动态变化。结果表明,同时接种ChIL-18蛋白和活疫苗的免疫鸡在接种后,所产生的HI抗体效价高于PBS和活疫苗免疫组,并且,HI抗体效价在15 d及热应激24 h时表现差异显著(P<0.05)。表明ChIL-18蛋白对新城疫疫苗诱导的HI抗体有增强作用。

【英文摘要】Chicken interleukin-18(ChIL-18) mature protein gene was amplified from spleen cells of chicken embryo which were induced by New casltle disease virues by RT-PCR. PCR product was cloned into pMD18-T vector. Sequencing analysis showed that the nucleotide sequence of this ChIL-18 mature protein gene was 597 bp, pProEXTMHT-ChIL-18 was obtained by subcloning the encodeing region of the ChIL-18 mature protein gene b into pProEXTMHT. The recombinant ChIL-18 (rChIL-18) was expressed efficiently in pProEXTMHT-ChIL-18 b b transformed DH5α induced by IPTG. SDS-PAGE analysis showed that the recombinant mature protein had a relative molecular mass of approx in ately 28.6 ku. The effects of the ChIL-18 protein on Newcastle disease vaccine were observed by the kinetic changes of HI antibody. The results showed that ChIL-18 protein could enhance the valence of HI antibody.

【题目】鸡β-防御素基因的克隆、序列分析及其在组织中的分布
【中文关键词】马得莹
【英文关键词】antimicrobial peptides β-defensins chicken gene expression
【中文摘要】本研究采用RT-PCR法,分别从鸡肝脏和舌组织中扩增到鸡β-防御素(Gallinacin, Gal)Gal-6、Gal-8与Gal-9基因,经序列测定表明,Gal-6、Gal-8和Gal-9大小分别为201、204和201 bp,其成熟肽分别由67、68和67个氨基酸残基组成。组织表达分析表明,Gal-6基因在鸡体内各组织器官中广泛地表达,在鸡皮肤、舌、心脏、小肠、胸肌、肝脏、肾脏、法氏囊、脾脏和胰腺中表达量较高;在肺脏、睾丸和骨髓中也有一定量表达。相比之下,Gal-8在鸡体内的表达较为局限,Gal-8基因仅在舌、小肠、肺脏和肝脏中大量表达。Gal-9基因在鸡体内组织中分布也较广泛,在舌和小肠中大量表达,在气管、肺脏、肝脏、肾脏、骨髓和胸腺有少量表达。
【英文摘要】Three Gallinacin (Gal) genes:Gal-6, Gal-8 andGal-9 were cloned from liver andtongue of chicks by RT-PCR, respectively. In addition, we have sequenced these genes. The full cDNA length ofGal-6 andGal-9 consist of 201 bp encoding 67 amino acids, whileGal-8 consist of 204 bp encoding 68 amino acids. Differential gene expression ofGal-6,Gal-9 andGal-8 has beendemonstrated across a panel of tissues in the chick. It has been shown thatGal-6 mRNA was highly expressed in the skin, tongue, liver, heart, small intestine, breast muscle, kidney, bursa of Fabricius, spleen, and pancreas, and moderately expressed in the lung, testis, and borrowmarrow.Gal-8 mRNA was highly expressed in the liver, tongue, small intestine and lung of chick. While,Gal-9 mRNA was highly expressed in the tongue and small intestine, and moderately expressed in the trachea, lung, liver, kidney, borrow marrow and thymus of chick.

【题目】Growth and survival of three small abalone Haliotis diversicolor populations and their reciprocal crosses
【中文关键词】九孔,杂色鲍,杂种优势,种群,杂交,生长,存活
【英文关键词】small abalone; Haliotis diversicolor; heterosis; population; cross; growth; survival
【中文摘要】在中国南方,小型杂色鲍的水产养殖业因为其养成阶段的高死亡率面临崩溃。为了检验种间杂交育种是否能够提高杂色鲍的存活率和生长状况(即壳长的增长),本研究在来自日本A,台湾B,越南C的三个种群中进行3*3的同列杂交实

验。最后将生长性状比和早期幼体、晚期幼体和养成期的存活率在六个互相交错系和三个亲本系间进行对比。结果显示在三种生长期的杂交系中存活率和生长的杂合优势度都不同。就中亲优势而言,在三个生长期的存活率和生长率中HAB明显(P<0.01)高于HAC和HBC,且所有中亲优势都在两个相应的单亲优势间有所降低。在第420天,壳长和存活率的HAB分别为6.84%和69.09%。本研究结果中,AB系和BA系的高存活率杂交优势表明了不同种群间的杂交有利于小型鲍鱼育种项目和产业的收益增加。

【英文摘要】The aquaculture industry of small abalone Haliotis diversicolor in southern China is now close to collapse because of high mortality at the grow-out stage. To examine if survival and growth (shell length increase) could be improved by cross breeding among populations, a 3 x 3 complete diallel cross was conducted among three populations from Japan (A), Taiwan (B) and Vietnam (C). Performances in growth rate and survival at early juvenile, later juvenile and grow-out stages were compared among the six reciprocal cross lines and three parental lines. Magnitude of heterosis for survival and growth varied among cross lines in the three growing stages. As to mid-parent heterosis, H(AB) was significantly (P < 0.01) higher than H(AC) and H(BC) at all three growing stages for both growth and survival, and all mid-parent heterosis fell between the two corresponding single-parent heterosis. H(AB) was 6.84% for shell length and 69.09% for survival at Day 420. Our results of high survival heterosis in line AB and line BA show that crossbreeding between different populations can benefit the small abalone breeding programs and the industry.

【题目】Effects of small abalone, Haliotis diversicolor, pedal mucus on bacterial growth, attachment, biofilm formation and community structure

【中文关键词】斧足粘液;杂色鲍;细菌;附着;生物粘膜

【英文关键词】Pedal mucus; Haliotis diversicolor; Bacteria; Attachment; Biofilm

【中文摘要】在富足刚中,足部粘液在运动、保护和信号传导过程中具有重要作用。同时,它还为微生物提供营养和栖息环境。在本研究中,,我们检测了小型鲍鱼杂色鲍的足部粘液和粘液小道对于细菌生长,附着,生物膜形成和群落结构的影响。结果表明,足部粘液促进了细菌的生长,且因为基质覆盖着粘液,为病原体提供更多附着的机会。(如溶藻弧菌,其细胞浓度比附着在干净基底上高出5倍)。在微型板试验中,当足部粘液作为唯一的营养添加剂,溶藻弧菌可以形成了细胞膜,但如果没有添加粘液,只有少数细胞在井底生长。在流式细胞细胞培养条件下,干净的玻片上和覆盖足部粘液的玻片上形成了不同结构的细胞膜。粘液小道诱导产生一个异构细胞膜的细胞集群。此外,足部粘液能偶比干净基底提供更多的CFUs。使用变性梯度凝胶电泳比较干净基质和粘液小道上的细胞群落,我们发现,后者上存在着几个特殊的物种。至少有一个物种,肺炎克雷伯氏菌,对于小鲍鱼具有潜在危害。总之,杂色鲍的足部粘液能够富集细菌,包括一些本该在高密度培养条件下的致病菌。

【英文摘要】Pedal mucus is important for locomotion. protection and signal transmission in the Gastropoda. It also provides nutrients and a habitat for microbes. In this study, we examined the effects of pedal mucus and the mucus trail of the small abalone, Haliotis diversicolor, on bacterial growth, attachment, biofilm formation and community structure. The results showed that pedal mucus enhanced the growth of bacteria, and that more opportunistic pathogens attached to a substrate covered with pedal mucus (for Vibrio alginolyticus, the cell density was up to 5 times higher than on a clean substrate). During microplate assay, when pedal mucus was added as the sole nutrient source, V. alginolyticus formed a biofilm, but few cells grew on the bottom of the wells if no mucus was added. Under flow-cell culture conditions, differently structured biofilms were formed in the clean and pedal mucus conditioned glass slides. The mucus trail induced a heterogeneous biofilm with cell clusters. Moreover, pedal mucus could support much more CFUs than the clean substrates. Using denatured gradient gel electrophoresis comparison of the bacterial community on a clean substrate and in the mucus trail, we found several specific species in the latter. At least one species, Klebsiella pneumoniae, is potentially harmful to the small abalone. In summary, the pedal mucus of Haliotis diversicolor enriched bacterial occurrence, including some pathogens, which deserves to be considered in high density culture conditions.

【题目】模糊评判优化水酶法提取膨化大豆油脂和蛋白
【中文关键词】农产品　蛋白　油脂　提取　大豆
【英文关键词】The agricultural products protein soybean extract
【中文摘要】针对水酶法同时提取大豆油与蛋白时,两种目标对工艺参数的优化有差别,因此应用模糊综合评判法对工艺参数进行双目标综合优化,得到同时兼顾高油脂提取率与高蛋白提取率的酶解工艺参数。其结果为:加酶量1.85%,酶解温度50°C,酶解时间3.6h,料液比1:6,pH值为9。此时,油脂提取率为92.76%左右,蛋白提取率为93.81%左右。利用扫描电子显微镜、能谱分析以及显微切片分别就蛋白水解状态对油脂释放影响机理进行了研究。通过研究可知,挤压膨化再粉碎后的大豆粉水解过程中油脂的释放取决于蛋白水解状态,经过挤压膨化后大豆细胞结构已经被较充分破坏,而大豆油脂与蛋白的作用没有被完全破坏,所以需要把蛋白充分水解才能使油脂释放聚集.因此挤压膨化后水酶法可以兼顾得到高油脂提取率和高蛋白提取率.
【英文摘要】The application of fuzzy comprehensive evaluation method for the Aqueous Enzymatic simultaneously extracted soybean oil and protein, the goal of the optimization of the process parameters difference dual goal of comprehensive optimization of the process parameters, get both high oil extraction rate and high-protein extractthe rate of hydrolysis process parameters. The results: 1.85% of the amount of enzyme hydrolysis temperature 50 ° C, the enzymatic time 3.6h, solid-liquid ratio 1:6, pH value of 9. At this point, the oil extraction rate of 92.76%, protein extraction rate is about 93.81%. Using scanning electron microscopy, energy spectrum analysis and microscopic sections on protein hydrolysis state grease release mechanism. Study shows extrusion puffed and then crushed soy flour hydrolysis process depends on the proteolytic release of grease after extrusion the soybean cell structure has been more fully destroy, soybean oil and protein is not completely destroyed need to be fully hydrolyzed protein to the fat to release aggregation. extrusion water enzymatic can take into account the high rate of oil extraction and protein extraction rate.

【题目】挤压膨化后纤维降解对大豆水酶法提油率的影响
【中文关键词】挤压 膨化 提油率 水酶法 纤维降解 响应面分析
【英文关键词】Extrusion Expansion Oil extraction yield Enzyme-assistaed aqueous extraction Cellulose degradation Response surfacemethodology
【中文摘要】在单因素试验和挤压膨化机稳定工作基础上,采用响应曲面设计研究了挤压膨化工艺参数对水酶法提取大豆油脂得率与纤维降解率的影响。利用SAS软件建立了数学模型,并对各因素及交互作用进行了分析。结果表明:当模孔孔径为20mm、物料含水率为14・5%、螺杆转速为105 r/min、套筒温度为90°C时,总油提取率最优值为93・02%±0・29%。当模孔孔径为18mm、物料含水率为15%、螺杆转速为100 r/min、套筒温度为95°C时,纤维降解率最优值为40・28%±0・43%。挤压膨化过程中纤维降解程度对总油提取率影响很大。总油提取率并不完全取决于挤压膨化过程中纤维降解程度
【英文摘要】Based on single factor experimen,t response surface methodology was used and orthogonal experimentwas designed to investigate the effect of extruding parameters on soybean oil yield extracted with enzyme-assisted aqueous extraction processing and cellulose degradability after extrusion and expansion. Statistical analysis system (SAS) was employed to establish regressionmodel and

interaction of factorswas analyzed. Results showed that the optimal total soybean oil yield is 93・02%±0・29% onresponse surfacewith the die length of20mm, moisture ofmaterial of14・5%, rotate speed for screw of 105 r/min, and sleeve temperature of 90°C. Furthermore, There existences a optimal cellulose degradability value of40・28%±0・43% on response surfacewhen die length is18mm, moisture ofmeal is 15%, rotate speed of screw is 100 r/min, and sleeve temperature is 95°C. The degree of cellulose degradability has a significant effect on total oil extraction yield during extrusion and expansion period,total oil extraction yield during extrusion and expansion was not only dependent on cellulose degradability.

【题目】挤压豆渣中可溶性膳食纤维制备工艺的优化
【中文关键词】可溶性膳食纤维,工艺,优化,挤压,豆渣
【英文关键词】soluble dietary fibers technology optimization extrusion soybean residue
【中文摘要】为了获得碱法制备挤压豆渣中可溶性膳食纤维的最适工艺参数,以液固比、温度、时间和碱浓度为试验因子,以可溶性膳食纤维产率为响应值,采用中心旋转组合试验设计进行试验。结果表明:4 个因素对可溶性膳食纤维产率的影响大小依次为碱浓度>液固比>温度>时间。通过典型性分析得出可溶性膳食纤维最适制备条件为:液固比 26∶1、温度 89°C、时间 68 min、碱浓度 1.12%。在此条件下,可溶性膳食纤维产率的预测值为 33.96%,验证试验所得可溶性膳食纤维产率为 34.12%。回归方程的预测值和试验值差异不显著,所得回归模型拟合情况良好,达到设计要求。在本试验优化的条件下,以经挤压豆渣为原料制备的可溶性膳食纤维产率(34.12%)显著高于以未经挤压豆渣为原料的产率(13.51%)。
【英文摘要】Optimized technology for preparing soluble dietary fiber from extruded soybean residue was studied by the centralcomposite rotatable design with four variables of the ratio of liquid to solid, temperature, time and alkali concentration. Theyield of soluble dietary fiber was the evaluation index. The results indicated that the effect order of four factors on the yield ofsoluble dietary fiber was as follows: alkali concentration, ratio of liquid to solid, temperature and time. The canonical analysisrevealed that the optimal

conditions for preparation of soluble dietary fiber were: ratio of liquid to solid 26∶1, temperature89℃, time 68 min and alkali concentration 1.12%. Under optimal conditions, the predicted yield of soluble dietary fiber fromextruded soybean residue was 33.96%, whereas, the experimental yield of soluble dietary fiber was 34.12%. TheRSM-predicted yield and the experimental yield of soluble dietary fiber were not significantly different from each other. Theresults showed that the empirical model developed by response surface methodology was adequate to describe the relationshipsbetween the factors and response values. Under optimal conditions,the yield of soluble dietary fiber from extruded soybeanresidue (34.12%) was significantly more than that from soybean residue (13.51%).

【题目】挤压蒸煮对豆渣中可溶性膳食纤维含量的影响

【中文关键词】挤压蒸煮 豆渣 可溶性膳食纤维

【英文关键词】extrusion- cooking soybean residue soluble dietary fiber

【中文摘要】采用挤压蒸煮技术提高豆渣中可溶性膳食纤维的含量。通过单因素和正交试验, 研究不同挤压条件对豆渣中可溶性膳食纤维含量的影响。结果表明: 在物料水分20% 、螺杆转数 175r/min、挤压温度160e条件下处理的豆渣, 其可溶性膳食纤维含量从2.79%提高到14.53%, 不溶性膳食纤维的含量从 60.15%下降到 48.53% , 且不溶性膳食纤维的减少量和可溶性膳食纤维的增加量基本一致, 总膳食纤维的含量基本没有发生变化, 同时豆渣膳食纤维的持水力从 5.56g/g 上升到 9.71g/g, 膨胀力从 6.33mL/g 上升到9.58mL/g。豆渣经上述挤压条件处理,其可溶性膳食纤维含量得到显著提高,物化特性得到明显改善, 生理功能特性得到增强。

【英文摘要】The aim of this work is to increase the content of soluble dietary fiber in soybean residue adopting extrusion -cooking technique. Basing on single- factor tests and orthogonal experiments, the relationship between the content of soluble dietary fiber and the extrusion conditions was studied. Results show: When the soybean residue with moisture 20 % was extruded at extrusion temperature 160 e and screw- speed 175 r/min, the content of soluble dietary fiber increases to 14.53 % from 2.79 %, meanwhile the content of insoluble dietary fiber is reduced to 48.53% from 60. 15 % . The decrement of insoluble dietary fiber is almost consistent with the increment of soluble dietary fiber, and the content of total dietary fiber has hardly any change. At the same time, thewater holding capacity of the dietary fiber increases to9.71g/g from 5.56g/g and swelling ability increases to 9.58 mL/g from 6.33 mL/g. Under the optimum conditions, the physio2 logical and functional characteristics of soybean residue are enhanced.

【题目】微波辅助磷酸化改性提高大豆分离蛋白乳化性的研究

【中文关键词】大豆分离蛋白 磷酸化 微波 乳化性

【英文关键词】soy protein isolate phosphorylation microwave emulsifying activity

【中文摘要】以提高大豆分离蛋白乳化性为目的 ,微波辅助磷酸化改性大豆分离蛋白 ,测定改性前后大豆分离蛋白乳化性 ,并与磷酸化改性方法进行比较。结果显示 ,相较空白对照、微波对照和磷酸化对照组 ,微波辅助磷酸化蛋白粉乳化性显著增加 ,其乳化活性分别提高了 3、1. 9 和 1. 3 倍 ,乳化稳定性提高了 1. 3、1. 2、1. 1倍 ,乳化性在考察范围内随磷酸化程度的增加而增大 (P < 0. 05) 。微波辅助磷酸化改性技术参数为预处理2 min ,微波功率 600 W ,微波时间 3 min。相较磷酸化改性方法 ,将改性时间由 180 min 缩减至 3 min ,大幅提高效率、节约成本 ,具有广阔的应用前景。

【英文摘要】Aiming to improve the emulsification properties of soy protein isolate (SPI) , the effect of microwave - assisted phosphorylation was compared with that of phosphorylation and that of microwave treatment , and the emulsifying activity of SPI before and after the treatments were examined. Results show that the emulsifying activity of SPI increases sigificantly (P < 0. 05) after the microwave - assisted phosphorylation. Compared with control sample , microwave sample and phosphorylation sample , the emulsifying activity of the microwave - assisted phosphorylation sample is about 3 , 1. 9 ,and 1. 3 times higher , respectively , and the emulsification stability is about 1. 3 , 1. 2 , and 1. 1 times higher , respectively.The optimum condition of the microwave - assisted phosphorylation are pretreating time 2 min , microwave power 600 W and radiation time 3 min. Compared with the phosphorylation technology , the microwave - assisted phosphorylation technology shortens modification time from 180 min to 3 min , greatly enhances efficiency and decreases cost , and it is promising forapplication.

【题目】可降解大豆分离蛋白复合薄膜制备技术的研究
【中文关键词】大豆卵磷脂 罗红霉素 脂质体 薄膜相结合的方法 冷冻-解冻
【英文关键词】soybean lecithin roxithromycin liposome thin film method combined with the freeze - thawing leakage
【中文摘要】研究并确定了大豆分离蛋白成膜的关键技术,包括复合膜配方、成膜温度和时间、干燥条件、涂膜和揭膜方式等。制备出可以降解,并具有一定机械强度、弹性、阻气性、阻水性的复合蛋白包装薄膜,部分替代塑料用于食品包装领域(方便面或茶叶料包;果腊、糖衣、糯米纸;禽蛋、水果、蔬菜的涂膜保鲜包装等),以减少环境污染,具有十分广阔的市场应用前景。研究结果表明:大豆分离蛋白浓度 4. 0 %,增塑剂 2.0%,还原剂1.0%,成膜性能较好,抗拉强度可达 6 315. 551 g,厚度为 0.11mm,透H2O 性 16.204 mg/(cm2 · d),透O2性0.313 mg/(cm2 · d),透 CO 2 性 3. 016 mg/(cm2 · d)。
【英文摘要】To prepare the roxithromycin liposome with granule soya lecithin , the thin film method combined with freeze - thawing was adopted , and the entrapment efficiency of roxithromycin liposome was determined by UV spectrophotometry. The influence of component proportions in oxithromycin liposome formulation and hydration medium on the entrapment efficiency were studied. Results : The optimum conditions of making roxithromycin liposome are temperature 40 ℃,mass ratios of roxithromycin ν lecithin = 1∶25 , roxithromycin ν vitamin E = 100∶1 ,roxithromycin ν cholesterol = 1∶2 ;hydration medium is 6 % mannitol solution ,and dose of the 6 % mannitol solution is 20 mL. In this case , the entrapment efficiency of roxithromycin liposome is 63. 98 %. This method is accurate and applicable , and the product property is very stable.

【中文关键词】大豆及豆制品 加速溶剂萃取 凝胶渗透色谱 气相色谱 六六六 滴滴涕
【英文关键词】soybean and soybean products accelerated solvent extraction (ASE) gel permeation chromatography (GPC) gas chromatography (GC) hexachlorocyclohexane (HCH) dichlorodiphenyl trichloroethane (DDT)
【中文摘要】建立一种同时测定大豆及豆制品中α-HCH、β-HCH、γ-HCH、δ-HCH、ρ,ρ′-DDE、ρ,ρ′-DDD、o,ρ′-DDT、ρ,ρ′-DDT8种有机氯农药残留的气相色谱分析方法。样品经加速溶剂系统萃取(ASE)和凝胶渗透色谱净化(GPC)后,采用气相色谱配备电子捕获检测器进行分离测定。0.005~0.100mg/kg范围内各残留药物线性良好,相关系数r均在0.9990以上;在0.005、0.020、0.050mg/kg3个加标水平下进行了方法验证,平均回收率为78.3%~107.6%,相对标准偏差为2.1%~5.5%;方法检测限(LOD)为0.2~1.8μg/kg。该方法重现性好、灵敏度高、分析迅速,各项指标均满足国内外法规要求,适用于大豆及豆制品中六六六和滴滴涕残留的分析检测。
【英文摘要】A method for the determination of 8 HCH and DDT in soybean and soybean products was established with accelerated solvent extraction (ASE), auto gel permeation chromatography purification (GPC) and gas chromatography quantification. The

calibration curves presented good linear relationship in the range of 0.005-0.100 mg/kg, and the correlation coefficients were above 0.9990 for all compounds. Recoveries of all added were 78.3%-107.6% respectively, and relative standard deviations (RSD) were 2.1%-5.5% with spiked at 0.005, 0.020, 0.050 mg/kg of HCH and DDT in blank samples. The limit of detection of the method were 0.2-1.8 μg/kg. The method was of good reproducibility, high sensitivity, shorter analysis time, and its performance could meet the requirements of the domestic and international legislation.

【题目】超声波法提取大豆糖蜜中大豆皂苷的研究
【中文关键词】超声波 大豆糖蜜 大豆皂苷
【英文关键词】ultrasonic wave soy molasses soybean saponin
【中文摘要】以醇洗大豆浓缩蛋白副产物大豆糖蜜为原料,研究了超声波法提取大豆糖蜜中大豆皂苷的试验条件,并与索氏提取法进行比较。在对超声温度、超声功率、超声时间、丙酮浓度和料液比单因素试验基础上,采用了正交试验法优化提取工艺条件。正交试验结果显示,超声波法提取大豆皂苷的最佳条件为:超声温度40℃,超声功率400 W,超声时间30 min,丙酮浓度40%,料液比1∶14,大豆皂苷的得率可达2.56%,提取率达51.20%。与索氏提取法相比,均提高了25.5%。
【英文摘要】For the extraction of soybean saponin from soy molasses(a by-product of alcohol treated soy protein concentrate),the conditions of ultrasonic wave extraction were studied and compared with Soxhlet extraction.The influence factors such as ultrasonic temperature,power,time,acetone concentration,and solid-liquid ratio were studied with single factor tests,and the extraction conditions were optimized through an orthogonalized experiment.Results: The obtained optimum ultrasonic wave extraction conditions are ultrasonic wave power 400 W,ultrasonic wave treating time 30 min,acetone solution concentration 40% and solid-liquid ratio 1∶14.Under the conditions the yield rate and extraction efficiency of soybean saponin are 2.56% and 51.20% respectively,which are both higher than those of Soxhlet extraction by 25.5%.

【题目】超声波辅助水酶法提取大豆油的研究
【中文关键词】全脂大豆粉 水酶法 超声波 大豆油
【英文关键词】full-fat soybean powder aqueous enzymatic extraction ultrasound soybean oil
【中文摘要】以全脂大豆粉为原料,采用超声波辅助水酶法提取大豆油,并对其中的超声波处理条件和酶解条件进行研究,经单因素实验与正交实验,确定水酶法提取大豆油的适宜酶解条件为:料液比1∶6,酶用量2.0%,pH 9.0,酶解温度55℃,酶解时间4 h。在此条件下大豆油提取率为73.56%。水酶法提油前对全脂大豆粉进行超声波预处理,可有效提高大豆油提取率。在超声波温度50℃,超声波功率400 W下处理15 min可将大豆油提取率提高至86.13%,比未经超声波预处理的高出12.57%。
【英文摘要】Aqueous enzymatic extraction of soybean oil from full-fat soybean powder assisted by ultrasound was studied,and the enzymatic hydrolysis conditions were optimized emphatically.The hydrolysis conditions were determined as follows: ratio of stuff to water 1∶6,dosage of Alcalase 2.0%,temperature 55℃,time 4 h,pH 9.0.Under the optimal conditions,the oil extraction efficiency reached 73.56%.The ultrasound irradiation at 400 W and 50℃ for 15 min followed by aqueous enzymatic extraction could increase the oil extraction efficiency to 86.13%,which was 12.57% higher than that of non-irradiation with ultrasound.

【题目】大豆肽对白羽肉鸡生产性能及胴体品质的影响
【中文关键词】大豆肽 肉鸡 生产性能 胴体品质
【英文关键词】The soybean peptide broiler performance carcass quality
【中文摘要】探讨大豆肽对肉鸡生产性能和胴体品质的影响,试验将1日龄的180只AA+白羽肉鸡,采用单因素随机试验设计分为5个处理,每处理设4个重复,在相同基础日粮中分别添加0、0.2%、0.4%、0.6%和0.8%(大豆肽≥40%)的大豆肽,试验期为6周。肉鸡21和42日龄时称质量并统计耗料量和死亡数,计算平均日增质量、平均日采食量、料肉比和成活率。试验结束时,从每重复中随机选取2只试鸡做屠宰试验,计算屠宰率、全净膛率、胸肌率、腿肌率和腹脂率。结果表明,日粮中添加大豆肽可提高白羽肉鸡的生产性能,改善白羽肉鸡的胴体品质,而且随大豆肽添加量的增加效果越明显。
【英文摘要】Soybean peptide on broiler performance and carcass quality, testing 1-day-old 180 AA + white feather chicken, divided into five treatment single factor randomized trial design, each processing four replicates, in the same basal dietadd 0, 0.2%, 0.4%, 0.6% and 0.8%, respectively (soybean peptide ≥ 40%) and soybean peptide, a trial period of six weeks. Broiler 21 and 42 days, said quality and Statistics feed consumption and the number of deaths, calculate the average daily gain, average daily feed intake, feed conversion and survival rate. The end of the trial, were randomly selected from each repeated two to try the chicken do slaughter test calculation of slaughter rate, eviscerated yield, breast muscle rate, leg muscle rate and abdominal fat percentage. The results show that the diets supplemented with soybean peptide white feather broiler production performance, improved white feather broiler carcass quality, and with the effect of an increase in the amount of soybean peptides Add more obvious.

【题目】蛋白酶对水酶法提取大豆油脂及蛋白质的影响研究
【中文关键词】大豆 蛋白酶 油脂提取率 蛋白质提取率
【英文关键词】soybean protease the extraction yield of oil the extraction yield of protein
【中文摘要】选择了中性蛋白酶、风味蛋白酶、碱性蛋白酶、复合蛋白酶及木瓜蛋白酶,分别按不同添加量及不同酶解时间对全脂豆粉进行了水酶法实验,考察不同蛋白酶对油脂及蛋白质提取率的影响。结果显示,不同蛋白酶的选择对油脂及蛋白质提取率具有较大影响。当碱性蛋白酶的添加量为2%(酶与底物质量比),酶解时间为4h时,油脂及蛋白质提取率最高,分别为73.08%和73.97%。
【英文摘要】Neutural protease,flavourzyme,alcalase,compound protease and papain were chose to carry out aqueous enzymatic extraction of full soybean flour. These different proteases were used with different accession and different zymohydrolysis time in the process of aqueous enzymatic extraction in order to enhance protein. The results indicated that it was important to choose a proper protease in order to enhance the extraction yield of oil and protein. Furthermore,the extraction yield of oil and protein could reach to 73.08% and 73.97% respectively when 2% alcalase was added in the processes of aqueous enzymatic extraction for 4 hours,and it was higher than all other proteases.

【题目】豆酱生产中HACCP体系的应用效果评价
【中文关键词】豆酱 HACCP 效果评价
【英文关键词】Soybean sauce HACCP Effect evaluation
【中文摘要】本文以HACCP体系实施前、后两个不同时期的酱醅和成品豆酱为研究对象,对其各项理化指标及微生物指标进行检测,阐述HACCP体系在豆酱生产中的重要作用。结果表明:HACCP体系的实施对产品的各项理化指标影响不大,铅、砷等重金属含量均达到国家标准;体系的实施对于大肠菌群和菌落总数控制效果明显,HACCP体系实施前的产品中大肠菌群和菌落总数明显高于实施后的产品;体系实施前的酱醅产品中检出少量的沙门氏菌和蜡样芽孢杆菌,体系实施后的酱醅中未检出沙门氏菌和蜡样芽孢杆菌;体系实施前后各时期产品中均无黄曲霉毒素、肉毒梭菌、和金黄色葡萄球菌检出。通过HACCP体系的实施,产品的报废率明显下降,产品质量得到了有效控制。
【英文摘要】In this paper,soy sauce mash and soybean paste in different periods which were produced by using or without using HACCP system were taken as the objects; meanwhile,their physical and chemical indicators and microbiological indicators were examined,and then the importance effects of HACCP application was described. The results showed that HACCP application had little effects on different physical and chemical factors,the contents of the heavy metal all achieved the standards of the government; Coliform group and the total numbers of bacterial flora were controlled better by the application of HACCP; the products which produced by using HACCP system had less Coliform and Bacterial flora than the products which produced without using HACCP system; less Salmonella and Cerea baucillus were detected in soy sauce mash before using HACCP system; there were no Aflatoxin,Clostridium botulinum,and Sstaphylococcus aureusnever detected before and after applying this kind of system. Thus,by using HACCP system,the scrappage was decreased obviously,the quality of the products was controlled effectively.

【中文关键词】水酶法 挤压膨化 大豆蛋白
【英文关键词】enzymatic hydrolysis method extrusion soybean protein
【中文摘要】采用水酶法结合挤压膨化预处理提取大豆蛋白,筛选5种蛋白酶,确定选用碱性蛋白酶作为水解酶;得出碱性蛋白酶提取大豆蛋白的最佳条件:加酶量1.9%、酶解温度50°C、酶解时间200min、料水比1:4.6、酶解pH8.5,经过验证与对比实验可知在最优酶解工艺条件下总蛋白提取率可达到93.76%左右,比传统的湿热预处理后酶解的总蛋白提取率78.83%提高了近15个百分点。
【英文摘要】Enzymatic hydrolysis combined with pretreatment of extrusion was used to extract soybean protein.An alkaline proteinase has been screened from 5 proteinases.The optimal condition for soybean protein extraction by alkaline proteinase was 1.9% proteinase,reaction at 50 °C,3.3 h of hydrolysis,1:4.6 of material and water ratio,and pH 8.5.The total protein extraction rate reached to 93.76% under this optimal condition,which was nearly 15% higher than total protein extraction using enzymatic hydrolysis combined with traditional treatment of heating.

【题目】挤压膨化预处理水酶法提取大豆油工艺的研究
【中文关键词】水酶法 挤压膨化 大豆油
【英文关键词】aqueous enzymatic method extrusion soy oil
【中文摘要】采用挤压膨化预处理水酶法提取大豆油,对酶解工艺条件进行优化,得到适宜的酶解条件为:加酶量2%,酶解温度57℃,酶解时间3h,料水比1∶6.5,酶解pH9.5。经验证与对比实验可知,在最优酶解工艺条件下大豆油提取率达到91.67%左右,比传统湿热预处理后酶解的提取率72.54%提高了19%左右。
【英文摘要】After extrusion pretreatment,aqueous enzymatic method was used to extract soy oil,and the enzymatic hydrolysis conditions were optimized.The best conditions were determined as follows:amount of proteinase 2%,temperature 57℃,hydrolysis time 3 h,ratio of material to water 1∶6.5,and pH value 9.5.The verification and comparative tests showed that the extaction ratio of soy oil reached about 91.67% at the best conditions,which was nearly 19% higher than that with the method of aqueous enzymatic method combined with heat-moisture pretreatment(72.54%).

【题目】酶水解高温豆粕制备高水解度大豆肽的研究
【中文关键词】酶解 高温豆粕 大豆肽 响应面分析
【英文关键词】enzymatic hydrolysis high-temperature soybean meal soy peptides response surface analysis
【中文摘要】采用碱性蛋白酶水解高温豆粕制备高水解度大豆肽,通过单因素和响应面实验确定酶解高温豆粕的优化条件。以水解度为指标,考察温度、时间、pH、加酶量、底物浓度等因素对水解度的影响。优化的酶解条件为:温度50°C、时间5h、pH8.60、加酶量17700U/g底物、底物浓度10.25%,该条件下得到大豆肽的水解度为37.20%。
【英文摘要】The high-temperature soybean meal was hydrolyzed into high-DH soy peptides by Alkaline Protease method. The optimum condition of enzymatic hydrolysis high-temperature soybean meal was determined by the single factor and response surface experiment method. During experiment period, the degree of hydrolysis (DH) was used as an index and the influence of five factors on the degree of hydrolysis were studied. The five factors were Optimized and the optimum conditions were: temperature 50°C, time 5h, pH 8.60, proteases concentration 17 700 U per gram substrate, and substrate concentration 10.25%. Under these conditions, the resulted DH is 37.20%.

【题目】日粮中添加大豆肽对白羽肉鸡肉品质的影响
【中文关键词】大豆肽 肉鸡 胸肌 肉品质
【英文关键词】The soybean peptide broiler Chest muscle
carcass quality
【中文摘要】为了探讨大豆肽对肉鸡肉品质的影响,试验选用1日龄的健康AA+白羽肉鸡180只,采用单因素随机试验设计分为5个处理,每个处理设4个重复,在相同基础日粮中添加0、0.2%、0.4%、0.6%、0.8%(大豆肽≥40%)的大豆肽,试验期为6周。试验结束时,从每个重复中随机选取2只试鸡屠宰,进行胸肌采样,测定其pH值、肉色、嫩度、保水性及肌内粗脂肪的含量。结果表明:日粮中添加大豆肽能提高肉鸡胸肌pH值及嫩度;增强其保水性并改善肉色;粗脂肪含量略微下降,但差异性不显著,不影响其风味。
【英文摘要】In order to investigate the impact of soybean peptide on the quality of the meat, chicken, were selected to the 1-day-old healthy AA + white feather chicken 180, divided into five treatment single factor randomized trial design with four replications for each treatment, in the same basal dietadd 0, 0.2%, 0.4%, 0.6%, 0.8% (soy peptide ≥ 40%), soybean peptide, a trial period of six weeks. The end of the trial, were randomly selected from each repeat two trials chicken slaughter pectoral muscle sampling, determination of the pH value, color, tenderness, Paul aqueous and intramuscular crude fat content. The results show that: the diets supplemented with soybean peptide can improve broiler breast muscle pH and tenderness; enhance its water retention and improve the flesh-colored; crude fat content decreased slightly, but the difference was not significant, does not affect its flavor.

【题目】大豆水酶法提取副产物_水溶性糖工艺优化及机理研究
【中文关键词】大豆水溶性糖 响应曲面 水酶法
【英文关键词】soybean soluble polysaccharides response surface enzyme-assistant aqueous extraction method
【中文摘要】水酶法提油条件温和,油料蛋白的性能几乎不发生变化,无论是水相中直接加工利用,还是回收分离蛋白再利用,效果都十分理想,但有关水酶法提取植物油脂和蛋白质的副产物-水溶性糖的相关研究较少,故针对挤压膨化后水酶法提取大豆油脂和蛋白质的副产物-大豆水溶性糖进行研究。利用响应面分析方法对酶法提取副产物-大豆水溶性糖得率进行了优化。建立了相应的数学模型,为以后的中试以及工业化生产提供理论基础,并且得到了最优酶解工艺条件为加酶量为2.1%,温度为58°C,酶解时间为3.5 h,料水比为1:6.4,pH为10,响应面有最优值在(20.98±1.03)%。经过验证与对比试验可知在最优酶解工艺条件下水溶性糖得率可达到19.97%左右,比相同酶解条件下未经挤压膨化预处理水溶性糖得率以及碱提工艺水溶性糖得率均有显著提高。利用超微结构能谱分析为手段,针对水溶性糖得率提高机理进行了研究,经研究表明:①挤压膨化再粉碎后大豆细胞组织破坏,水溶性糖与蛋白复合物中蛋白质与蛋白酶作用位点较充分暴露,有利于其酶解使得水溶性糖与蛋白复合物破坏。②大豆中水溶性糖部分以糖与蛋白复合物形式存在,而想提取此类大豆水溶性糖需要将蛋白水解。
【英文摘要】The conditions of enzyme-assistant aqueous extraction for oil are mild,and the protein in raw material is hardly denatured during the extraction and the protein in the liquid phase after extraction can be reused or withdrawn after separation.However,there is little research on the soluble polysaccharides in the liquid phase.This experiment was aimed to study the soluble polysaccharides in the liquid phase after the enzyme-assistant aqueous extraction of soybean oil and protein.Response surface methodology was used to optimize the soluble polysaccharides extraction with enzyme hydrolysis,and a corresponding mathematical model was established to provide practical recommendation and theoretical basis.Results: The optimal technological parameters for the soybean soluble polysaccharides extraction are enzyme concentration 2.1%,temperature 58 °C,enzyme hydrolysis time 3.5 h,material to

water ratio 1∶6.4,and pH 10.Optimal value of 20.98±1.03% was obtained on response surface.The soluble polysaccharides extraction yield reaches 19.97% under the optimal conditions.The soluble polysaccharides extraction yield with extrusion and expansion pretreatment is significantly higher than that without extrusion and expansion pretreatment.A mechanism study by microstructure and energy spectrum analysis on the reasons about the increase of soluble polysaccharides yield was carried out.Results show the reasons are: 1) Soybean cells are destroyed under extrusion and expansion followed by grounding during which action sites of soluble polysaccharides and protein compounds for protease are exposed and favorable to disruption of soluble polysaccharides and compounds.2) Part of soybean soluble polysaccharides exists as form of compounds of soluble polysaccharides and protein.In order to obtain more soluble polysaccharides,the compound protein needs to be hydrolyzed. 更多

【题目】硫代磷酸二乙酯类农药半抗原设计及抗体识别特性
【中文关键词】有机磷农药; 类特异性抗体; 异源包被; 酶联免疫分析
【英文关键词】Organophosphorus pestic ide; G eneric hapten; H eterology coating; Enzyme-linked immunosorbent assay(ELISA)
【中文摘要】通过分析硫代磷酸二乙酯类农药的结构特点, 设计并合成了系列半抗原; 采用活泼酯法将半抗原分别与牛血清蛋白(BSA)和卵清蛋白(OVA)偶联制备了系列免疫原和包被原; 通过免疫新西兰大白兔获得了相应抗硫代磷酸二乙酯类农药的类特异性抗体. 建立检测硫代磷酸二乙酯类农药的间接竞争酶联免疫分析(ELISA) 方法, 分析探讨了免疫半抗原结构对抗体特性的影响, 并阐述了包被半抗原结构对ELISA灵敏度的影响规律. 结果表明, 手臂取代位置在苯环对位且手臂较短的免疫原具有较好的免疫效果, 同时异源包被可以显著提高ELISA方法的灵敏度. 由抗体PAb-H 1和包被原H 6-OVA 建立的间接竞争ELISA 方法可以同时检测7个广泛使用的有机磷农药, 其半抑制浓度(IC50)分别为蝇毒磷(01 013 m g /L) 、对硫磷(01 348 m g /L)、喹硫磷(01022 m g /L)、三唑磷(01035 m g /L) 、甲拌磷(01 751 m g /L) 、除线磷(01 850 m g /L)及辛硫磷(11301m g /L), 最低检测限符合国内外相关有机磷药物最大允许残留限量标准(MRLS)的检测要求.
【英文摘要】Class-spec ific polyclonal an tibod ies fo rO, O-diethy l phosphorothioate pesticides had been generated. A series of generic haptensw ere synthesized and coup led to bov ine serum album in(BSA) and ovalbum in (OVA) for immunogens and coating an tigens, respectively. New Zealand rabb itsw ere immun ized with immunogens to obtain corresponding polyclonal antibodies. The effects of hapten structure on antibodies properties and hapten heterology on ELISA sensitivity were also investigated. The results show that haptens with simplespacer-arm can generate antibodies with desired properties, and hapten heterology can improve ELISA sensiti ity significantly. The polyclonal antibody PAb-H1 shows high sensitivity to seven commonly used O, O-diethylphosphorothioate pesticides in an indirect competitive ELISA using a heterologous coating antigen(H 6-OVA). The 50% inhibition value(IC50) is 0.013mg /L for coumaphos, 0. 348 mg /L for parath ion, 0. 022 mg /L for quinalphos, 0. 035 mg /L for triazophos, 0. 751 mg /L for phorate, 0. 850 mg /L for dichlofenthion and 1. 301mg /L for phoxim, respectively. And the limit of detection(LOD) is lower than MRLS of all the sevenO, O-diethy l phosphorothioate pesticides in food and agricultural products . Thus, this indirect ELISA with high sensitivity can potentially be used to develop commercial ELISA kits for a sensit ive and rapid detection of O, O-diethy l phosphoro th ioate pesticides residues.

【题目】氯氟氰菊酯及其代谢物的人工抗原合成与多克隆抗体的制备
【中文关键词】人工抗原; 多克隆抗体; 氯氟氰菊酯; 酶联免疫吸附测定法
【英文关键词】artif ic ial antigen; po lyc lonal ant ibody; cyhalo thrin; EL ISA
【中文摘要】于氟氰菊酯分子的酸部分连接4-氨基丁酸间隔臂(HCA 1)、醇部分连接丁二酸酐间隔臂(HCB 2) , 分别合成了两种不同的半抗原, 通过碳二亚胺法将HCA 1和HCB 2分别与牛血清蛋白(B SA)偶联制备了人工抗原HCA1-BSA 和HCB 2-B SA, 通过混合酸酐法将HCA 1、HCAS[3-(2-氯-3, 3, 3-三氟丙烯基)-2, 2-二甲基环丙烷羧酸]和HCB2分别与卵清蛋白(OVA)偶联制备包被抗原,两种人工抗原通过免疫新西兰大白兔制备相应的多克隆抗体。结果表明, 用HCA1-BSA 获得的多克隆抗体对氯氟氰菊酯和氯氟氰菊酸有免疫反应性(IC50值分别为33. 12 和0. 95 m g /L) , 用HCB 2-BSA 获得的多克隆抗体对氯氟氰菊酯几乎没有免疫反应性
【英文摘要】Two types o f haptens, the carboxylated propylamino derivative of the acid moiety (HCA 1) that is the hydrolyzed product of cyhalothrin, and the carboxylated ethyl carbonyl derivative of theAlcohol moiety (HCB 2) were synthesized. HCA1 and HCB2 were conjugated with the carrier proteins bovine serum album in (BSA) by the active ester method to obtain the artificial imm unogens. HCA1、HCA S [(3-2 -ch lo ro-3 ’, 3 ’ , 3 ’ -trif luo ropropeny l)-2, 2-d ime thylcy clopro panecar-boxylic acid] and HCB 2 were conjugated with ovalbumin (OVA) by the mixed anhydride method to obtain the coating antigens respectively. The polyclonal antibodies (PAbs) were obtained after the immunogens immunized to the New Zealand rabbits. One PAbs, which raised against the former haptenHCA 1, was reactive with cyhalothrin and cyhalothric acid (IC50: 33. 12 mg /L, 0. 95 mg /L) . However, the other PAbs, which raised against the later hapten HCB2, was not particularly reactive with cyhalothrin.

【中文关键词】拟除虫菊酯; 酶免疫分析; 半抗原设计; 农药残留
【英文关键词】py rethro id; enzyme immunoassay; hap ten design; pestic ide residue
【中文摘要】对拟除虫菊酯类单一农药残留和多残留酶免疫分析方法的研究进展进行了综述。在介绍单一农药残留酶免疫分析方法中半抗原分子设计和EL ISA 方法建立的基础上, 指出刚性连接臂是菊酯类农药免疫半抗原分子设计的一般原则, 包被原和免疫原采用不同的载体蛋白和不同结构的半抗原有利于菊酯类农药EL ISA 方法的建立。在介绍菊酯类农药多残留酶免疫分析方法时, 剖析了通用免疫半抗原的结构特点, 阐述了宽谱特异性抗体的筛选方法, 揭示了在菊酯类农药多残留酶免疫分析法中存在竞争半抗原的选择具有盲目性、宽谱特异性抗体对不同农药的特异性差异较大的问题。并对拟除虫菊酯类农药通用免疫半抗原设计及多残留酶免疫分析技术的发展趋势进行了探讨。
【英文摘要】Enzyme immunoassay is a desirable method for detecting residues of pyrethroids insecticides.Recently many immunoassays methods for pyrethroids have been reported, but few focused on them ultiresidue analysis of pyrethroids. The development of enzyme immunoassays for the determination of pyrethroidresidues were reviewed, including hapten design, antibody preparation, and immunoassay establishment and applications. Most of the studies showed that a rigid or shorter side chain in an immunizing hapten is important for the generation of sensitive and se lective antibodies for pyrethroids. In addition, the advantages of the heterologous immunoassay were also pointed out The structure characters of the general immunizing hapten were introduced, and the selective method of broad specific antibody was referred to. The key points in the mulltiresidue immunoassays, including the selection of the competitive hapten, and the specificity of the broad specific antibody to different pesticides were discussed. Finally, the development trends of general hapten design and mu ltiresidue immunoassay of pyethroids were summarized.

【题目】Effects of marbling on meat quality characteristics and intramuscular connective tissue of beef longissimus muscle
【中文关键词】大理石花纹;肉品质;肌间组织
【英文关键词】Effects;marbling ;meat quality ;intramuscular connective tissue
【中文摘要】本文研究了牛背最长肌大理石花纹对肉的品质特性和肌内结缔组织的影响。
【英文摘要】This study was designed to explore the effects of marbling on meat quality characteristics and intramuscular connective tissue of beef longissimus muscle. Chemical determinations, histological and mechanical measurements were performed on the raw and cooked meat at d 4 postmortem. The results showed that crude fat, collagen, fiber diameter and maximum transition temperature of intramuscular connective tissue increased ($p<0.05$) with the increase of marbling score. The cooking losses, collagen solubility, WBSF and perimysial thickness decreased ($p<0.05$) with the increasing marbling. WBSF correlated ($p<0.05$) with moisture,crude fat, collagen, cooking losses, sarcomere length and perimysial thickness. The development of marbling results in the decline in cooking losses, the avoidance of sarcomere shortening, and the disorganization of the perimysia, which accounts for the improvement of beef tenderness.

【题目】Rheological Properties of Myosin-Gelatin Mixtures
【中文关键词】凝胶;肌红蛋白;品质
【英文关键词】DSC;gelatin;myosi;rheological property
【中文摘要】本文从分子水平阐明了肌红蛋白-凝胶混合物的特性,为进一步的机理研究提供参考
【英文摘要】This study was designed to investigate changes of dynamic rheological properties of myosin and gelatin mixtures during heating and cooling. The rheological and calorimetric attributes (G′, G″, tan δ, and heat flow) of myosin and gelatin mixtures were measured during heating and cooling. The results indicated that gelatin could increase the G′ and G″ values and decrease the denaturation temperature of myosin. The G′ and G″ values of myosin and gelatin mixtures decreased with pH over 5.5 to 7.5 and ionic strength over 0.3 to 0.6. Therefore, it is advisable to add gelatin into chicken meat comminuted products in that it could improve the rheological attributes of myosin.

【英文关键词】Comparisons; meat quality characteristics;intramuscular connective tissue;beef longissimus dorsi;semitendinosus muscles
【中文摘要】本文阐述了中国黄牛的品质特征及内部结构的情况,为中国特色品种的研究作出了贡献
【英文摘要】This study was designed to compare meat quality characteristics and the traits of intramuscular connective tissue (IMCT) of beef longissimus dorsi (LD) and semitendinosus (ST) muscles at 4 and 21 days postmortem. LD had higher ($P < 0.05$) moisture content and Warner-Bratzler shear force (WBSF) but lower ($P < 0.05$) collagen content and filtering residue than ST at 4 days. Aging could more efficiently improve LD tenderness by decreasing the perimysial maximum transition temperature, increasing the collagen solubility and destroying the muscle structure. Both the natures of IMCT (insoluble collagen, perimysial thickness) and the status of muscle fiber were contributors to the tenderness of different muscles from the same carcass.

【题目】Prediction of yield of retail cuts for native and crossbred Chinese Yellow cattle
【中文关键词】预测;产量;中国黄牛
【英文关键词】Prediction ; yield ; Chinese Yellow cattle
【中文摘要】本文预测了中国本土黄牛和杂交黄牛的产量,具有一定的前沿性
【英文摘要】Seven hundred and three native and crossbred Chinese Yellow cattle (mean live weight: 523 ± 38 kg) were slaughtered, chilled and segmented. The hot carcass weight (HCW, kg), fat thickness (FT, cm) and rib eye area (REA, cm2) were measured to predict weights and percentages of beef cattle retail cuts. A correlation analysis showed that the HCW and REA were positively correlated with the weights of the total retail cuts (TRC, kg), top grade retail cuts, prime retail cuts and percentage of total carcass weight. A regression analysis indicated that HCW and REA were the best predictors for the weight of total retail cuts ($Y = -16.71 + 0.382\ HCW + 0.593\ REA$), and the HCW explained more of the variation than REA. Meanwhile, HCW and REA accounted for 62% of the variation of percentage of total retail cuts ($Y = 43.24 - 0.025\ HCW + 0.170\ REA$), whereas the REA was more valuable than the HCW. The FT contributed little in estimating weight or percentage of retail cuts.

【题目】Effects of low voltage electrical stimulation and chilling methods on quality traits of pork M. longissimus lumborum
【中文关键词】影响;点刺激;冷却;质量
【英文关键词】effects; electrical stimulation ;chilling; quality
【中文摘要】本文研究了电刺激和冷却对肉品质的影响,可以为加工提供一定的参考
【英文摘要】The effects of low voltage electrical stimulation and chilling methods on the quality aspects of pork carcasses were evaluated in this study. A total of 16 pigs (Long white × Huainan) were randomly allocated immediately prior to slaughter to two groups: low voltage electrically stimulated (LVES or ES) or nonstimulated (NS). Carcasses were split before cooling. Each side of the

carcass was then randomly allocated to either conventional chilling or blast chilling. Results showed that LVES increased the rate of muscle pH decline in the early time postmortem and accelerated the onset of rigor. But LVES with conventional chilling had disadvantageous effects on water-holding capacity (WHC), Warner-Bratalor shear forces and lightness of meat color. However, LVES combined with blast chilling can avoid this disadvantage. And blast chilling achieved low internal muscle temperature faster than with conventional chilling and delayed the rate of muscle pH decline. Furthermore, blast chilling increased WHC of pork without risk of cold toughing. The disadvantageous effect of LVES on pork quality can be equalized by the advantageous effect of blast chilling. Therefore, it is desirable for commercial pig abattoirs to apply blast chilling, or low voltage electrical stimulation combined with blast chilling for rapid processing without compromising meat quality.

【题目】Effects of high pressure/thermal treatment on lipid oxidation in beef and chicken muscle

【中文关键词】超高压;热处理;牛肉组织;鸡肉组织;脂肪氧化;抗氧化

【英文关键词】Highpressure; Thermaltreatment; Beefmuscle; Chickenmuscle; Lipidoxidation; Antioxidants

【中文摘要】本文研究了超高压对牛肉和鸡肉中脂肪氧化的影响,对新型保鲜技术提出了要求

【英文摘要】Lipidoxidation was studied in beef and chickenmuscle after highpressuretreatment (0.1 – 800 MPa) at different temperatures (20 – 70 ° C) for 20 min, prior to storage at 4 ° C for 7 days. Pressuretreatment of beef samples at room temperature led to increases in TBARS values after 7 days storage at 4 ° C; however, the increases were more marked after treatment at pressures 400 MPa (at least fivefold) than after treatment at lower pressures (less than threefold). Similar results were found in those samples treated at 40 ° C, but at 60 ° C and 70 ° C pressure had little additional effect on the oxidative stability of the muscle. Pressuretreatments of 600 MPa and 800 MPa, at all temperatures, induced increased rates of lipidoxidation in chickenmuscle, but, in general, chickenmuscle was more stable than beef to pressure, and the catalytic effect of pressure was still seen at the higher temperatures of 50 ° C, 60 ° C and 70 ° C. The addition of 1% Na2EDTA decreased TBARS values of the beefmuscle during storage and inhibited the increased rates of lipidoxidation induced by pressure. The inhibition by vitamin E (0.05% w/w) and BHT (0.02% w/w), either alone or in combination, were less marked than seen with Na2EDTA, suggesting that transition metal ions released from insoluble complexes are of major importance in catalysing lipidoxidation in pressure-treated muscle foods.

【题目】Effects of carcass maturity on meat quality characteristics of beef semitendinosus muscle for Chinese Native Yellow steers

【中文关键词】牛肉;肌间组织;成熟;嫩度

【英文关键词】beef; connective tissue; maturity; sarcomere length; tenderness

【中文摘要】本文研究了成熟度对肉质品质的影响,为生产实践提供了参照

【英文摘要】This work was designed to study the effects of carcass maturity on meat quality characteristics and intramuscular connective tissue of beef semitendinosus muscle from Chinese native Yellow steers. Chemical determinations, histological and mechanical measurements were performed on the raw and cooked meat at 4 days post mortem. In raw meat, intramuscular fat, collagen solubility, mechanical strength and transition temperature of intramuscular connective tissue increased ($P < 0.05$) with carcass maturity before body maturation, whilst moisture, total collagen, fibre diameter decreased after body maturation. Warner-Bratzlar shear force

(WBSF) of cooked meat increased with maturity before body maturation due to the muscle atrophy, and thus the decline of moisture content and the increase of cooking losses. After body maturation, the increase of WBSF was neutralised by the increase of intramuscular fat, the decrease of total collagen and the elongation of sarcomere length.

【题目】Changes of intramuscular phospholipids and free fatty acids during the processing of Nanjing dry-cured duck
【中文关键词】南京盐水鸭;自由脂肪酸;氧化
【英文关键词】Nanjing dry-cured duck; Phospholipids; Free fatty acids; Lipolysis
【中文摘要】本文研究传统肉制品的营养成分变化,对实际应用有重大意义
【英文摘要】In this study, changes of intramuscular phospholipids and free fatty acids were tracked during the processing of Nanjing dry-cured duck. Phospholipids were identified and quantified by high performance liquid chromatography combined with UV and evaporative light scattering detectors. The types and quantities of free fatty acids and fatty acids derived from phospholipids were analyzed by capillary gas chromatography. The results showed that raw duck meat had high quantities of phosphatidylethanolamine, and phosphatidylcholine (37.95% and 54.07% of total phospholipids, respectively), which contained high percentages of polysaturated fatty acids. The percentages of total phospholipids, phosphatidylethanolamine, and phosphatidylcholine decreased during processing, with a concomitant increase in quantities of free fatty acids. The lipolysis of phospholipids, especially phosphatidylethanolamine is the main contributor to the increase of free fatty acids.

【中文摘要】本文阐述了屠宰后尸僵期间品质及组织结构间的变化,对实际生产提供了依据
【英文摘要】This study was designed to explore the changes of meat quality characteristics and intramuscular connective tissue of beef semitendinosus muscle during postmortem aging for Chinese Yellow bulls. Semitendinosus muscles were obtained at day 4 postmortem and then further aged for different periods. Chemical determinations, histological and mechanical measurements were performed for the raw and cooked steaks on days 4, 11, 14, 21, and 28 postmortem, respectively. The results showed that postmortem aging resulted in an increase in moisture content and collagen solubility, a decrease in filtering residues, primary perimysial thickness, fibre diameter, Warner-Bratzler shear force, and transition temperature of the endomysium. The synergic effects of the myofibril and the intramuscular connective tissue determined the tenderness of aged beef.

【题目】A newly Isolated Strain Pediococcus parvulus from Xuanwei Ham, a traditional Chinese fermented meat production
【中文关键词】发酵香肠;肽;稳定性
【英文关键词】Dry fermented sausages;Pediococcus parvulus;technological suitability
【中文摘要】本文研究了从中国传统宣威火腿肉制品中提出的菌株,具有很大进步意义
【英文摘要】A comparative study on technological suitability for fermented dry sausages of Pediococcus parvulus, a newly isolated strain from Xuanwei ham, a traditional Chinese fermented meat product, was carried out. One type of fermented dry sausage was produced with P. parvulus and the other without starter culture, using the same formulation and technological conditions. Thus, the evolutions of microbiological and physicochemical parameters during ripening, as well as colour, texture and sensory quality of end products, were measured and assessed. The results indicated that P. parvulus had an inhibitory effect on non-lactic acid bacteria, especially Enterobacteriaceae. It was thought that the use of P. parvulus could enhance the hygienic quality of fermented sausages, which could mainly be attributed to its acidification of fermented sausages. Differences in colour parameters, with higher value in lightness (L*) and lower in redness (a*), were also found ($P < 0.05$). The most significant differences were observed in texture, informing the influence of P. parvulus on texture profile analysis characteristics of fermented sausages ($P < 0.05$). However, the evolutions of total nitrogen, fat and ash were the same. That meant the starter had no effects on these parameters during ripening of sausages. Free amino acid analysis showed that P. parvulus might have some proteolytic activity and more intense odour detected by our sensory judges. Our panelists also gave a higher score to the sausage with starter in terms of overall acceptability, indicating their preference of this product to the control. For all these results, we concluded that the newly isolated strain P. parvulus was a good starter for the production of fermented sausages.

【题目】Effects of dietary Chinese cured meat on lipid metabolism in rats
【中文关键词】成品率;脂肪氧化;质构剖面
【英文关键词】Chinese cured meat; Organ/body weight ratio; Plasma lipid profile; Lipid oxidation
【中文摘要】本文通过小鼠实验,从营养学角度解释了肉制品的价值,有重大意义
【英文摘要】The effects of different fats on animal lipid metabolism were investigated in order to clarify the safety of cured meat. The physical effect of nitrite in the cured meat was also explored due to a increased concern of this compound as a food additive. Body weight, food intake, organ/body weight ratio and plasma lipid profiles were analyzed. Rats fed with cured meat fat did not show any differences in body weight and food intake, compared with the control, and no significant difference was observed among groups. However, lard-fed rats showed marked morphological alternations in aortic intima and liver tissue. The cured meat group did not show apparent morpho-logical changes on aorta intima compared to the control. Rats that received lard diet had significantly elevated TC (2.27 ± 0.46 mmol/ml), higher LDL-C (0.78 ± 0.31 mmol/ml) but lower HDL-C (1.55 ± 0.14 mmol/ml). Lard-fed rats had elevated oxidized LDL in serum and MDA level in blood and liver. However, diets containing fresh fat (with/without added nitrite) or cured meat fat failed to show thesedetrimental effects.

【题目】Proteolysis in biceps femoris during Jinhua ham processing.
【中文关键词】金华火腿;蛋白质分解;蛋白指标
【英文关键词】Jinhua ham; Dry-cured ham; Proteolysis; Protein degradation; Proteolytic index; Non-protein nitrogen
【中文摘要】本文从分子学角度阐释了金华火腿中的蛋白质水解情况,为基础的理论研究提供了参考
【英文摘要】Sixty experimental Jinhua hams were processed by a traditional method. The nitrogen fractions and free amino acids in biceps femoris were analyzed. Intense proteolysis was found in ham muscle and totally more than 10% of muscle proteins were degraded during the course of Jinhua ham processing. The proteolytic index of Jinhua ham was between 14 and 20. Both insoluble and soluble proteins were degraded to some degree and the later showed more intense degradation. In the soluble fraction, the percentage of non-protein nitrogen(NPN) increased gradually whereas that of protein nitrogen decreased during processing ($P < 0.05$). However, very small amount of pep-tides larger than 1 kDa was accumulated during the whole course of processing, which proved that intense degradation reactions were also happened to them, especially at the post ripening stage when dramatic decrease of nitrogen fraction from all the peptides larger than1 kDa was found. As a result, more than 90% of the NPN products from muscle proteolysis were free amino acids and peptides of MW less than 1 kDa that might make important contribution to Jinhua ham taste and provide precursors for the generation of volatile flavor compounds in ham muscle. The pattern of muscle proteolysis coincided with the reported changes of muscle proteolytic enzymes during processing, seemingly indicating that the enzymes could have played important roles in ham muscle proteolysis.

【题目】Characterization of the predominant spoilage bacteria in sliced vacuum-packed cooked ham based on 16S rDNA-DGGE
【中文关键词】腐败菌;熟火腿;PCR技术
【英文关键词】Predominant spoilage bacteria;Sliced cooked ham;PCR-DGGE
【中文摘要】本文研究了传统金华火腿中的微生物情况,为解决实际问题提供了参考价值
【英文摘要】16S rDNA DGGE fingerprinting and phylogenetic analysis were used to reveal the dynamics and identi-fication of the predominant spoilage bacterial in sliced vacuum-packed cooked ham during storage at 4 C. Total bacteria DNA was directly extracted from the ham. Simultaneously, culture methods were per-formed. The Nest PCR and touchdown protocol were applied to amplify the V3 region of the 16S rDNA. By analysis of the community dynamic directly obtained from the DGGE profiles, the predominant spoilage bacteria were found to be Lactobacillus sakei, Lactobacillus curvatus and minor components were members of the genus Leuconostoc (Leuconostoc mesenteroides and unculturedLeuconostoc).

【题目】Dynamical Changes of Beef Intramuscular Connective Tissue and Muscle Fiber during Heating and their Effects on Beef Shear Force
【中文关键词】热处理
【英文关键词】Water-bath heating
Intramuscular connective tissue
Muscle fiber
Shear force
Beef semitendinosus
【中文摘要】本文深入研究牛肉肌间组织及肌纤维在加热过程中剪切力的变化,有着重大意义
【英文摘要】Changes of meat shear force and its characteristics during cooking have been extensively studied, but great variability existed due to the cooking method among different studies. This study was designed to focus on the dynamic changes of beef intramuscular connective tissue (IMCT) and muscle fiber during water-bath heating and their effects on beef shear force. At 4 d postmortem, beef semitendinosus muscles were divided into 11 steaks and then cooked respectively to an internal temperature of 40, 50, 55, 60, 65, 70, 75, 80, 85, and 90 ° C (the remainder was not cooked as control). Collagen content and its solubility, transition temperature of perimysia and endomysia, fiber diameter, and Warner – Bratzler shear force values (WBSF) were determined. The results showed that fiber diameter decreased gradually during cooking, concomitant with the increases in filtering residue and WBSF. The maximum transition temperature (T max) of endomysial components was lower than that of perimysial components (50.2 vs. 65.2 ° C). Muscle fiber and IMCT (especially perimysia) shrank during cooking, resulting in the increase of WBSF when the internal temperature was lower than 75 ° C, but further cooking led to the disintegration of perimysial structure, lowing up the increase of WBSF between 75 and 90 ° C. For beef semitendinosus muscle, the internal temperature of 65 ° C is a critical cooking point where meat gets tougher.

【题目】Irradiated Chinese Rugao ham: changes in volatile N-nitrosamine, biogenic amine and residual nitrite during ripening and post-ripening
【中文关键词】中国如皋火腿;辐照;亚硝胺;残留量
【英文关键词】Chinese Rugao ham;c-Irradiation;Residual nitrite;Biogenic amine;N -nitrosamines
【中文摘要】本文从食品安全性角度对中国传统肉制品如皋火腿中的有毒有害物质进行了深入研究,为食品安全问题的检测性提供了良好的依据
【英文摘要】N-nitrosamines, biogenic amines and residual nitrite are harmful substances and often present in curedmeat. The effects of gamma-irradiation (c-irradiation) on these chemicals in dry-cured Chinese Rugaoham during ripening and post-ripening were investigated. Rugao hams were irradiated at a dose of 5 kGy before ripening and were then ripened in an aging loft. Although c -irradiation degraded tyramine,putrescine and spermine, on the other hand, it promoted the formation of spermidine, phenylethylamine,cadaverine and tryptamine. Residual nitrite was significantly reduced by c -irradiation. N -nitrosodimeth-ylamine (NDMA),N -nitrosodiethylamine (NDEA) and N -nitrosopyrrolidine (NPYR) were found in Chinese Rugao ham during ripening and post-ripening but could be degraded withc -irradiation. The results sug-gest that c -irradiation may be a potential decontamination measure for certain chemical compounds found in dry-cured meat.

【中文摘要】本文从剔骨和尸僵时间来阐明其对品质的影响,对实际生产应用有很大的作用
【英文摘要】This work investigated the effects of boning method and postmortem aging on pork loin color, shearing value and sensory attributes. Two experiments were assigned. In Experiment I, 30 Chinese native black pigs were slaughtered and their carcasses were divided into three groups: (i) hot-boning: carcasses were fabricated within 45 min postmortem just after dressing; (ii) cold boning at 24 h: carcasses were fabricated after chilling at 0 ° C for 24 h; (iii) cold boning at 36 h: carcasses were fabricated after chilling at 0 ° C for 36 h. In Experiment II, right sides of the second group in Experiment I were used and primal cuts were vacuum packed and aged for 1 day, 8 days and 16 days. Pork loins (Longissimus lumborum) were used for color measurement, shearing test, and sensory evaluation. Among three boning methods, cold-boning at 36 h postmortem had the advantages of giving muscles a better color, the lowest cooking loss and cooked shearing value, and the highest sensory tenderness, juiciness, flavor and overall liking. Postmortem aging could improve pork quality characteristics, but it is not the fact that the longer aging time is, the better pork quality would be. Eight days may be enough to obtain an acceptable sensory attribute. These results are meaningful for pork processing and pork consumption.

【题目】Determination of intramuscular phospholipid classes and molecular species in Gaoyou duck
【中文关键词】高邮鸭;分类
【英文关键词】Gaoyou duck;Phospholipids;Classes;Molecular species

【中文摘要】本文对传统肉制品高邮鸭成分的分析,为进一步传统肉制品理论基础研究起了良好的基础奠定
【英文摘要】In this study, intramuscular phospholipid classes and molecular species in Gaoyou duck meat were deter-mined. Classes of phospholipids were identified and quantified by normal phase HPLC combined with UV and evaporative light scattering detectors (ELSD). The main phospholipid classes (phosphatidylcholine and phosphatidylethanolamine) were prepared on a semi-preparative silica gel column by HPLC. Reverse phase HPLC was coupled in parallel with both an ELSD and a mass spectrometry in order to characterise molecular species of phosphatidylcholine (PC) and phosphatidylethanolamine (PE). The results showed that Gaoyou duck meat had high quantities of PC and PE (64.66% and 28.10% of total phospholipids,respectively). Arachidonic acid was mainly present in PE and formed molecular species containing a sat-urated fatty acid, such as stearic or myristic acid; however, oleic acid together with palmitic or stearic acid formed the main molecular species in PC. The content of the molecular species with polyunsaturated fatty acids in PE accounted for 98.33%, while that in PC only 46.20%.

【中文关键词】自然保存;气调包装;货架期
【英文关键词】natural preservative; modified atmosphere package; sliced beef ham; shelf life
【中文摘要】本文由研究了不同贮藏方式对畜禽产品或假期的影响,有着重大意义
【英文摘要】The influencesof natural preservative and modified atmosphere package on the shelf-life of sliced beef ham stored at 9°Cunder fluorescence lighting conditions were studied with vacuum-packaged products as controls. The results show that the number of Lactobacilliin the vacuum-packaged products grow rapidly and exceeded 6. 70log(cfu · g)-1 at 28d with continuous decline of pH values. The growth of lacticacid bacteriais not retarded in the modified atmosphere package(MAP) (60%CO2+ 40%N2) . The a*values(redness) of MAPproducts decrease significantly(p < 0. 05) . The natural preservative(150mg/ kg Nisin 0.3%teapolyphenols)has significant bacteriostatic activities against Lactobacilli,and the effects of bacteriostatic are better by dipping after slicing(DAS) than that by incorporation before curing(IBC) . Duringstorage,the a* values of products are not affected by natural preservative(p < 0. 05) . The MAP or natural preservative has little effects on TBARS changes.

【中文关键词】肌纤维蛋白;鸡;酶
【英文关键词】chicken; myofibrillar protein; degradationmechanism; aging; caspase-3; calcium
【中文摘要】本文从分子角度解释肌肉在成熟过程中的变化,这有着重大意义
【英文摘要】In order to investigate the mechanism underlying postmortem proteolysis of muscle proteins during meat aging, five broilers were slaughtered and treated individually. After breast muscles were removed, the samples at death were obtained quickly. The other muscles were dissected into small blocks and divided into six groups randomly. One group marinated in solution containing 100mmol/ L NaCl and 2mmol/ LNaN3 was desig-nated as control, the others were soaked in solutions as controls but containing 30mmol/ L EGTA, 20mmol/ LCaCl2, protease inhibitor cocktail (10 mL/ tablet) , 100 Lmol/ L caspase3 selective inhibitor(DEVD-CHO) ,20mmol/ L CaCl2 plus protease inhibitor cocktail, respectively inthe ratio 1∶1(W/ V) (meat : solution) , then stored at 4℃ for 1, 3, 7d. At each conditioning time point, meat samples were obtained, and the changes of myofibril proteins(titin, nebulin, desmin, andtroponin-T) were examined by SDS-PAGE and western blotting.Results reveal that proteases inhibitor cocktail and DEVD-CHO inhibit myofibril proteins digestion markedly,wherea scalcium accelerated the process implying that the endogenous proteases contribute to meat protein degra-dation, calciummay play a role by activating calpains and that the apoptosis related caspase-3 is possibly another new biological can didate involvedin meat tenderization.

【中文关键词】冷冻;解冻;损失率
【英文关键词】freezing; thawing; thawing loss rate; ultrastructure
【中文摘要】本文从冻结和解冻两个方面解释保水性及超微结构的变化情况,对实际生产有着重大意义
【英文摘要】Uniform design experiment was adopted to study the effects of freezing rate, thawing rateand individuals on water holding capacity and ultra structure of pork. Results show that the effect of thawing rate on thawing loss rate is nonlinear,and there is an optimum thawing rate to decrease the thawing loss rate; The mainfactor that affect cookloss rate is not thawing rate but freezing rate, and different individuals have significant effect oncookloss rate; Water holding capacity is correlatedto different individuals,and is independent of freezing rate and thawing rate; Thawing rate has som eeffect on total protein solubility with monlinear relation-ship,and other factors considered have no effects onit Freezing and thawing have bad effects on the ultrastructure of thawed meat,the quicker the thawing rate,the worse the effect.

【题目】溴氰菊酯酶联免疫吸附分析方法研究
【中文关键词】溴氰菊酯; 酶联免疫吸附分析; 多克隆抗体
【英文关键词】deltamethrin; enzyme-linked immunosorbent assay; po lyc lonal antibody
【中文摘要】建立了定量测定溴氰菊酯间接竞争酶联免疫吸附分析方法(ic-ELISA)。合成了半抗原1-羧基-(3c-苯氧基苯基)甲基-3-(2c,2c-二溴乙烯基)-2, 2-二甲基环丙基羧酸酯(Med)和N-2-(羧基丙基)氨基甲酰基-(3c-苯氧基苯基) 甲基-3-(2c,2c-二溴乙烯基)-2, 2-二甲基环丙基羧酸酯(Di)。分别采用碳二亚胺法和混合酸酐法将半抗原与牛血清蛋白(BSA)和卵清蛋白(OVA)偶联制备了免疫原D -i B SA 和包被原D -iOVA、M ed-OVA。将制得的溴氰菊酯免疫原免疫动物获得多克隆抗体, 经间接非竞争EL ISA 法测得其效价为2. 5 @ 105。通过对甲醇含量、离子强度、pH 值等影响因素进行异源分析条件的优化, 确立了溴氰菊酯间接竞争酶联免疫分析方法的最佳检测条件(30%甲醇、氯化钠0.4mol/L、pH7.5) , 并建立了标准竞争曲线。该方法的IC50值为0.55±0.05mg/L,检测限(IC10)为3.76±0.35 Lg/L, 对大多数拟除虫菊酯无交叉反应。分别在自来水、河水和土壤样品中添加0. 05~ 5. 0 m g /L (或mg /kg)的溴氰菊酯, 回收率分别为89. 7%~ 106. 8%、82. 4% ~101. 7% 、75. 6%~ 97. 8%。
【英文摘要】An indirect competitive enzyme-linked immunosorbent assay (ic-ELISA) was developed forthe quantitative detection of deltamethrin. The haptens of deltamethrin1-carboxy-(3c-phenoxyphenyl) m ethy-l 3-(2c,2c-dibromoethenyl)-2,2-dimethylcyc lopropanecarboxylate (Med) and N-2-(carboxypropyl) carbamoy-l (3c-phenoxyphenyl) methy-l 3-(2c,2c-d ibromo ethenyl)-2, 2-dimethylcyclopropanecarboxylate (Di) were synthesized. Di was conjugated with bovine serum album in (BSA) as immunogen (D -iBSA) by carbodiimide method and coating antigens (D -iOVA, Med-OVA) of deltamethrin were prepared by conjugating these two haptens with ovalbumin (OVA) by mixed anhydride method. Polyclonal antibodies were obtained from rabbits immunized with immunogen and the titer of the freezedried powder (2. 5* 105) was determined by indirect non-competitive ELISA procedure. Standard competitive curve of the optimized ic-ELISA for deltamethrin was developed. Thus, the optimized assay conditions such as concentration of methanol (30%) , inonicstrength (NaCl 0.4mol /L) , pH value (7. 5) were investigated and obtained by analysis of heterologous. The value of 50% inhibition of antibody

【题目】高亲和力的农药克百威单克隆抗体的制备及鉴定
【中文关键词】克百威;单克隆抗体;免疫化学分析
【英文关键词】Carbofuran; Monoclonal antibodies; Immunochemical assays
【中文摘要】摘要:【目的】制备高亲和力农药克百威单克隆抗体,建立克百威残留免疫检测方法,控制克百威残留,保障人民身体健康与保护环境。【方法】合成克百威半抗原BFNB,用人工抗原BFNB-BSA 免疫Balb/c 小鼠,取脾细胞与骨髓瘤细胞在PEG4000 作用下融合,经间接ELISA 筛选及显微克隆法亚克隆,分离出阳性细胞株,腹水诱导法及辛酸-硫酸铵沉淀法大量制备及纯化单克隆抗体,间接ELISA 法测定抗体滴度及亲和力,间接竞争ELISA 法测定抗体特异性。【结果】获得1 株稳定分泌抗克百威单克隆抗体的杂交瘤细胞株5D3,其培养上清和腹水抗体滴度分别为1∶2.048×103和1∶1.024×106,其抗体亚类为IgG1,亲和力常数为2.54×109 L·mol-1,IC50为1.18 ng·ml-1,最低检测限为0.01 ng·ml-1。与克百威降解产物呋喃酚的交叉反应率为4.59×10-4%,另外几种结构类似的氨基甲酸酯类农药的交叉反应率均小于3.0×10-4%。【结论】此抗克百威的单克隆抗体亲合力高、特异性强,为建立克百威简便、快速、特异的免疫检测方法奠定了基础。

【英文摘要】【Objective】The objective of the experiment was to study production of high affinity monoclonal antibodies against pesticide carbofuran, and the developmet of immunochemical assays for health and environmental protection.【Method】The hapten 4-[[(2,3-dihydro-2,2-dimethyl-7-benzofuranyloxy) carbonyl]-amino]-butanoic acid (BFNB) of carbofuran was synthesized and Balb/c mice were immunized by the hapten-carrier(BFNB-bovine serum albumin, BFNB-BSA) conjugates. The splenocytes of immunized mice were fused with Sp2/0 cells and the cultural supernatants of hybridoma cell were screened by indirect enzyme-linked immunoabsorbent assay (ELISA) based on BFNB- ovoalbumin conjugates (BFNB-OVA). Purified monoclonal antibody (McAbs) were obtained from ascites fluids deposited by octanoic acid and ammonia sulfate. The affinity and the specificity of McAbs were characterized by ELISA or indirect competitive ELISA.【Result】A hybridoma cell line (5D3) secreting anti-carbofuran McAb had been established. The titre of culture medium and ascites were up to 1：2.048×103 and 1：1.024×106 respectively and the subtype of the McAb was IgG1. The affinity constant of the McAb was about 2.54×109 L・mol-1, with a IC50 value of 1.18 ng・ml-1 and the detection limit of 0.01 ng・ml-1. Cross-reactivity studies showed that the McAb was quiet specific for carbofuran since, of the four analogous compounds, all they were hardly recognized (4.59×10-4% for 2,3-Dihydro -2,2-dimethyl-7-benzofuranol and less than 3.0×10-4% for others).【Conclusion】The prepared McAb had very high affinity and specificity . It could be used to develop ELISA for rapid determination of carbofuran.

【题目】Biochemical changes during processing of traditional Jinhua ham
【中文关键词】金华火腿;脂肪氧化;风味影响
【英文关键词】Jinhua ham Processing Proteolysis Lipolysis Flavor development
【中文摘要】本文由深入研究传统金华火腿的质量控制与加工发展,有着重大意义
【英文摘要】Jinhua ham is the most famous traditional meat product of China and one of the most famed dry-cured hams in the world. Its pro-cessing consists of six stages: green ham preparation, salting, washing and sun-drying and shaping, ripening, and post-ripening. Intenseproteolysis and lipolysis occur during processing period. As a result, the content of free amino acids in final ham products is 14 – 16 timesthat of green ham, and 191 volatile compounds have been identified during processing, which make a major contribution to the flavor ofJinhua ham.

【题目】Changes in taste compounds of duck during processing
【中文关键词】熟鸭;风味成分;自由氨基酸;肽
【英文关键词】Cooked duck; Taste compounds; Free amino acids; Peptides; Nucleotides
【中文摘要】本文对传统肉制品的发展起着重大意义
【英文摘要】Nanjing cooked duck is one of the few low temperature cooked meat products in traditional Chinese featured meat products. It is famous for its delicate processing, savoury, and tender flavour. Taste compounds of Nanjing cooked duck during processing, namely free amino acids, peptides and nucleotides, were analyzed. During boiling, both free amino acids and flavour nucleotides decreased sig-nificantly. Most peptides decreased during processing and the changes of total peptides were consistent with the nucleotides. Results showed that the special processes before boiling, especially brining, produced an increased of effect on the taste

compounds, which could be the reason for the savoury taste of Nanjing cooked duck.

【题目】Effect of low dose gamma irradiation on beef quality and fatty acid composition of beef intramuscular lipid
【中文关键词】辐照;牛肉;脂肪酸;质构;微生物计数
【英文关键词】Radiation; Beef; Fatty acid; TBARS; Total bacterial counts
【中文摘要】本文采用辐照的手段解释了牛肉成分的变化情况,为基础的机理研究奠定了基础
【英文摘要】Eight Chinese Yellow Cattle semitendinous muscles were irradiated using a60Co irradiation source (with the dose of 1.13, 2.09, or3.17 kGy) and stored (0 day or 10 days at 7 C) to estimate fatty acids change of neutral lipid (NL), polar lipid (PL) and total lipid(TL) fractions, and the beef quality change. Total saturated fatty acid (SFA) and monounsaturated fatty acid (MUFA) increased with irradiation, ratios of MUFA to SFA did not change in TL. Whilst, total polyunsaturated fatty acid (PUFA) reduced with irradiation,which resulted in PUFA to SFA ratio decreased in TL (0 dayor 10 days). Purge loss and 2-thiobarbituric acid reactive substances values increased with irradiation (from 0 to 3.17 kGy) at 0 day, but these values were lower with irradiation at 10 days. Total bacterial counts decreased proportionally with irradiation dose increasing from 0 to 3.17 kGy. It can be concluded that fatty acid profiles in beef changed with irradiation; however, fatty acid profiles did not change much at 3.17 kGy compared with 1.13 or 2.09 kGy, and the beef quality were most acceptable at the dose of 3.17 kGy, thus, low dose of about 3 kGy gamma irradiation was recommended to apply in fresh beef preparation.

【题目】Study of the Lactobacillus sakei protective effect towards spoilage bacteria in vacuum packed cooked ham analyzed by PCR – DGGE
【中文关键词】乳酸菌;保护技术;熟火腿;PCR技术
【英文关键词】Lactobacillus sakei ; Protective effect; Cooked ham; PCR – DGGE
【中文摘要】本文阐述了了真空包装中火腿的腐败菌变化,对实际生产提供了技术指标,有着重大意义
【英文摘要】The effectiveness ofLactobacillus sakei B-2 inoculated as a protective culture on the inhibition of spoilage bacteria on sliced vacuum packed cooked ham was investigated by using culture-dependent and -independent approaches. Total microbial DNA was directly extracted from both control and treatment samples, and subjected to a nested PCR protocol, PCR – DGGE analysis was used to identify and monitor the dynamic changes in the microbial population, followed by partial 16S rDNA sequencing. The DGGE profile demon-strated that the protective culture effectively suppressed growth of predominant spoilage bacteria L. sakei, Lactobacillus curvatus and Leuconostoc mesenteroides in cooked ham during storage at 4 C, however, growth of uncultured Leuconostocwas not inhibited. The shelf-life of this product inoculated with L. sakeiB-2, at levels of 5.91 ± 0.04 log10CFUg-1 was 35 days, compared to 15 days of control samples, when the ham was stored at 4 C.

【题目】Electron microscopy of contractile bands in low voltage electrical stimulation beef
【中文关键词】点刺激;冷却;牛肉、组织结构
【英文关键词】Electrical stimulation;Delay chilling;Beef;Ultrastructure
【中文摘要】本文从分子水平解释了微观结构,便于机理的基础研究,有着重大意义
【英文摘要】This study was designed to explore the effects of low voltage electrical stimulation and delay chilling onthe ultrastructure of beef longissimus muscle. The results showed that 44.9% of sarcomeres in the ES sam-ples had contractile zones, and 16.9% of sarcomeres adjacent to contractile zones were stretched in 100 views of electron microscopy. The ultrastructures of 60.9% of sarcomeres changed when the samples were electrically stimulated and then delay-chilled. Contractile bands play an important role in meat tenderization during postmortem aging.

【题目】Isolation and characterization of eleven microsatellite loci in small abalone, Haliotis diversicolor Reeve

【中文关键词】磁珠富集,微卫星标记,杂色鲍,基因连锁图谱
【英文关键词】Magnetic beads enrichment; Microsatellite markers; Haliotis diversicolor Reeve; Genetic linkage map
【中文摘要】本研究从小鲍鱼,杂色鲍中分离出11种微卫星标记,并在不同地理种群中的24个个体进行检测。我们从11种微卫星位点中确认了162个等位基因,且所有的位点具有高度多态性。多态信息含量(PIC)从0.7276到0.9163不等。观察杂合度和期望杂合度分别从0.2727到1.000和0.7738到0.9429不等。从Hardy – Weinberg平衡看,三个基因位点显著倾斜,没有成对基因位点显示连锁不平衡。这些多态标记将对于分析种群结构,基因多样性和遗传连锁图的构造有重要作用。
【英文摘要】Eleven novel microsatellite markers were isolated from small abalone, Haliotis diversicolor Reeve. These loci were tested on 22 individuals from two different geographic populations. We identified a total of 162 alleles from the 11 microsatellite loci. All of the loci were highly polymorphic. Polymorphism information content (PIC) is ranging from 0.7276 to 0.9163. Observed and expected heterozygosities ranged from 0.2727 to 1.0000 and from 0.7738 to 0.9429, respectively. Three loci deviated significantly from Hardy – Weinberg equilibrium. No pairs of loci displayed linkage disequilibrium. These polymorphic markers will be used to analyze population structure, genetic diversity and construct a genetic linkage map.

【题目】Characterization of Ornithine Decarboxylase, a Potential Selective Breeding Marker, from Small Abalone, Haliotis Diversicolor
【中文关键词】鸟苷酸脱羧酶,选择育种,杂色鲍,九孔
【英文关键词】Ornithine Decarboxylase; SelectiveBreeding; Haliotis Diversicolor; Small Abalone;

【中文摘要】鸟氨酸脱羧酶(ODC)是第一个在生物合成聚胺过程中限制酶,且在生物过程中扮演重要的角色。虽然在脊椎动物中被认定为潜在的标志物,但在水生生物中还未被很好的研究过。识别ODC是其在小鲍鱼,杂色鲍中作为选择性育种标记应用的先决条件。在本文,我们将集中研究小鲍鱼ODC基因的体外表征。表达结果显示L-鸟氨酸的脱羧酶活动且受制于DL-α-二氟甲基鸟氨酸盐酸盐水化合物。在广泛组织中ODC具有不同程度的表达,在肝胰腺最低而在触角最高。ODC作为分子标记对于小鲍鱼育种有着重要作用,同时还可以促进软体动物生物功能研究的进一步深入。

【英文摘要】The enzyme ornithine decarboxylase (ODC) is the first limiting enzyme in polyamine biosynthesis and plays an important role in biological processes. Although recognized as a potential biomarker in vertebrates, it has not been well studied in aquatic animals. Identification of ODC is a prerequisite for its application as a selective breeding marker in small abalone, Haliotis diversicolor. In this article, we focused on the in vitro characterization of the ODC gene from small abalone. The expressed product showed decarboxylase activity for l-ornithine and was inhibited by DL-α-difluoromethylornithine hydrochloride hydrate. ODC was expressed in a wide range of tissues at varying levels, with the lowest in the hepatopancreas and the highest in the antennae. ODC is potentially useful as a molecular marker for small abalone breeding and can also facilitate further investigations on its biological functions in mollusks.

【题目】An Enzyme-linked Immunosorbent Assay for the Detection of Bifenthrin

【中文关键词】联苯菊酯,多克隆抗体,酶联免疫检测

【英文关键词】Bifenthrin; Polyclonal antibody; Enzyme-linked immunosorbent assay (ELISA)

【中文摘要】建立了一种针对联苯菊酯的间接竞争性酶联免疫检测体系。两种半抗原(LBc和LBy)被合成出来,其中LBc与BSA偶联做为免疫原,同时两种半抗原与OVA偶联作为包被原。通过免疫,多克隆抗体被制备出来,并建立了基于多克隆抗体的酶联免疫检测体系。

【英文摘要】An indirect competitive enzyme-linked immunosorbent assay (ic-ELISA) was developed for the quantitative detection of bifenthrin. Two haptens, LBc ((2-methyl[1,1′-biphenyl]-3-methoxy) carbonyl propionic acid) carbonyl propionic acid) and LBy ((2-methyl[1,1′-biphenyl]-3-yl)carboxylic acid), were synthesized from 2-methyl-3-phenylbenzyl alcohol, a metabolite of bifenthrin.The LBc was conjugated to bovine serum albumin (BSA) for the immunogen by the carbodiimide method, and the LBc and LBy were conjugated to ovalbumin (OVA), respectively, for the coating antigens by the mixed anhydride method. Polyclonal antibodies was raised against LBc-BSA conjugate in rabbits and hapten-OVA conjugates as coating antigens were screened and selected for the assay in the homologous and heterologous ELISA systems, and the titers of antiserum (5.12 × 104) were determined by non-competitive ELISA procedure. Under the optimum assay conditions of pH 7.5, PBS of 0.3 M Na+ and 30% methanol, the heterologous assay system was more sensitive. The IC50 value for bifenthrin was (2.16 ± 0.32) mg l − 1, and the detection limit was (0.016 ± 0.002) mg l − 1. Pyrethroids, such as cyhalothrin, deltamethrin, cypermethrin, fenvalerate, fenpropathrin, and pyrethroid metabolite, 3-phenoxybenzoic acid, did not cross-react significantly in this assay.

【题目】Divergent selection for shell length in two stocks of small abalone Haliotis diversicolor

【中文关键词】杂色鲍,遗传率,选择反应,趋异选择,壳长
【英文关键词】Haliotis diversicolor, realized heritability,response to selection, divergent selection, shell length
【中文摘要】为了检验是否可以通过选择性育种达到遗传改良的效果,我们对两种杂色鲍种群进行壳长随机选择。种群A源于以日本野生群体为母本和台湾野生种群为父本的杂交,而种群B源于台湾养殖种群,这个种群在中国大陆已经成功养殖近10代。分别从两个种群中各选出壳长最长10%和最短10%,作为大选育家系和小选育家系。在选育前,先从两个种群中随即选取同等数量的鲍鱼作为杂交家系的亲本。选育家系和杂交家系在其幼体早期、幼体晚期和成体期时都被饲养在相同的条件下。结果显示种群A在选育响应和实际遗传率方面明显高于种群B.(P<0.01)在壳长方面,种群A和种群B中的选育大家系分别比杂交家系增长快12.79%和4.58%。种群A和种群B的壳长平均实际遗传率分别为0.441±0.064和0.113±0.013。不同年龄的不同种群对于选育响应也不同,在两个种群的选育家系中,成体体重也明显不同于杂交家系。同时我们发现两个种群的对于两个方向选育的响应呈现不对称趋势。我们推测这两个种群对于选育响应和实际遗传率的不同可能是因为遗传多样性。
【英文摘要】To determine whether genetic improvement can be attained through a selective breeding programme, divergent selection for shell length was applied to two stocks of Haliotis diversicolor. Stock A was descended from the cross between males from a Japanese wild population and females from a Taiwan aquacultured population and Stock B was from the Taiwan cultured population, which had been successively cultured in mainland China for about 10 generations. The 10% largest and 10% smallest abalones for each of these two stocks were selected as parents for the large-selected and small-selected lines respectively. Equal numbers of abalone were randomly chosen from the two stocks to serve as parents for the control lines before the selection. The selected and control lines were reared under the same conditions at early juvenile, later juvenile and grow-out stages. Stock A showed a significantly higher response to selection and realized heritability than Stock B (P < 0.01). The large-selected line of Stock A and Stock B grew 12.79% and 4.58% faster than their control lines on shell length respectively. The average realized heritability for shell length was 0.441 +/- 0.064 for Stock A and 0.113 +/- 0.013 for Stock B. Responses to selection were different at different ages in each stock and the body weights of the selected lines were significantly different from the control lines in both stocks at the grow-out stage. Asymmetric responses to selection in the two directions were also observed in both stocks. Differences in response to selection and realized heritability between the two stocks are presumably due to genetic variability.

【题目】Application of computer-assisted molecular modeling for immunoassay of
【中文关键词】食品残留;半抗原设计;免疫分析;分子模拟
【英文关键词】Food contaminants
Hapten design
Immunoassay
Molecular modeling
【中文摘要】为了适合农药、兽药以及毒枝菌素等小分子食品残留物的快速、灵敏的检测需要,免疫检测方法被广泛应用起来。然而,由于对抗体识别位点以及抗原表位的认识的局限,传统的免疫检测方法无法避免反复操作和尝试的弊端。于是,引进计算机辅助分子模拟技术对提高免疫检测方法建立效果显得格外重要。本文便展现了计算机辅助分子模拟技术的一些优势以及成功案例,并对它的理论、功能、程序等方面进行讨论。
【英文摘要】Immunoassay for low molecular weight food contaminants, such as pesticides, veterinary drugs, and mycotoxins is now a well-established technique which meets the demand for a rapid, reliable, and cost effective analyticalmethod.However, due to limited understanding of the molecular structure of antibody binding sites and antigenic epitopes, as well as the intermolecular binding forces that come into play, the traditional ‘ trial and error ’ method used to develop antibodies still remains the method of choice. Therefore,development of enhanced immunochemical techniques for specific- and generic-assays, requires new approaches for antibody design that will improve affinity and specificity of the antibody in a morerapid and economic manner. Computer-assisted molecular modeling (CAMM) has been demonstrated to be a useful tool to help the immunochemist develop immunoassays. CAMM

methods can be used to help direct improvements to important antibody features, and can provide insights into the effects of molecular structure on biological activity that are difficult or impossible to obtain in any otherway. In this review, we briefly summarize applications of CAMMin immunoassay development, including assisting in hapten design, explaining cross-reactivity, modeling antibody – antigen interactions, and providing insights into the effects of the mouse body temperature on the three-dimensional conformation of a hapten during antibody production. The fundamentals and theory, programs and software, limitations, and prospectsof CAMM in immunoassay development were also discussed.

【题目】Molecular identification of interspecific hybrids between Haliotis discus hannai Ino and Haliotis gigantea Gmelin using amplified fragment-length polymorphism and microsatellite markers

【中文关键词】皱纹盘鲍,西氏鲍,杂交,分子鉴定,AFLP, 微卫星

【英文关键词】Haliotis discus hannai, Haliotis gigantea, hybridization, molecular identi ¢ cation, AFLP, microsatellite

【中文摘要】基于扩增片段长度多样性和微卫星标记法对A和B杂交种进行分子标记。本研究的对象为皱纹盘鲍和大鲍两种鲍的杂交种,并用通过扩增片段长度多样性(AFLP)和微卫星标记(SSR)方法对其杂交性进行确认。为了确定皱纹盘鲍、大鲍和两者的杂交种的扩增片段长度多样性的属性,本研究采用了5种扩增片段长度多样性(AFLP)引物组合,其结果显示皱纹盘鲍和大鲍的基因具有多样性且都具有种类特异的条带。种间杂交种的AFLP结果显示所有的杂交种都从皱纹盘鲍和大鲍两个母体继承了种类特异条带。从皱纹盘鲍微卫星标记上选取的20个微卫星基因座经评估后发现有8个基因座在大鲍中同样存在着多态性,且每个基因座有3.375个等位基因。初步的筛选结果表明这8个微卫星基因座中有2个(Awb002和Awb022)可以用作区别杂交种和亲代个体的种间特异性标记。简单序列重复分析显示杂交种的两个微卫星基因座分别从两个亲代个体中遗传了一个等位基因。以上的这些数据表明了这种经诱导产生的种间杂交种的确是皱纹盘鲍和大鲍的杂交种。

【英文摘要】Interspecific hybrids between Haliotis discus hannai Ino and Haliotis gigantea Gmelin were produced in this study. The hybridity of the interspecific hybrids was confirmed by using the methods of amplified fragment-length polymorphism (AFLP) and microsatellite [simple sequence repeats (SSR)] markers. Five AFLP primer combinations were used to develop the AFLP profiles of H. discus hannai, H. gigantea and their reciprocal hybrids. AFLP analysis revealed that genetic variations of H. discus hannai and H. gigantea were relatively diverse and each species holds species-specific bands. The AFLP profiles of reciprocal hybrids showed that all of the hybrids inherited bands specific to H. discus hannai and H. gigantea. Of a total of 20 microsatellite loci, which were selected from H. discus hannai microsatellite markers evaluated, eight loci were polymorphic in H. gigantea samples, with an average of 3.375 alleles per locus. Preliminary screening showed that, two of these eight microsatellite loci (Awb002 and Awb022) could be used as species-specific markers to distinguish the hybrids and their parental species. Simple sequence repeats analysis showed that the reciprocal hybrids inherited one allele from each parent for both of the two SSR loci investigated. These data strongly suggest that the induced interspecific hybrid is a true hybrid between H. discus hannai and H. gigantea.

【题目】Construction, production, and characterization of recombinant scFv antibodies against methamidophos expressed in Pichia pastoris

【中文关键词】巴斯德毕赤酵母; 单链抗体;表达;甲胺磷;
【英文关键词】Pichia pastoris; ScFv; Expression;
Methamidophos
【中文摘要】在巴斯德毕赤酵母P. pastoris(X-33)中分泌表达Met-28D4-ScFv。设计引物从Met-28D4-pCANTAB5E-ScFv 上扩增Met-28D4-ScFv,亚克隆至 P. pastoris 表达载体 pPICZα C,获得酵母表达质粒pPICZα C-ScFv。表达质粒 pPICZα C-ScFv 线形化后,电转化P. pastoris(X-33)。随机挑选转化子菌落进行PCR鉴定,结果显示,转化子的酵母染色体中均整合有外源ScFv基因。在抗性梯度筛选多拷贝整合菌株试验中,共获得5个在2000 μg/mL ZeocinTM的YPDS选择平板上正常生长的菌落,表型鉴定结果均为甲醇利用快速型(Mut+)。对5个多拷贝Mut+型转化菌进行甲醇诱导表达,SDS-PAGE结果显示,各菌株诱导48 h后在约30KD处均可见明显条带,72 h处表达量最大,各菌株表达量之间无明显差异;间接 ELISA结果显示,各菌株诱导72 h的表达产物具有较好的抗原结合活性。
【英文摘要】Pichia pastoris was used to express a recombinantscFv antibody against methamidophos derived froma recombinant phage-display library. The specific scFvgene was amplified from a positive clone and then subclonedinto the expression vector pPICZa C. The resultingplasmid, pPICZa C – scFv, was linearized and transformedinto P. pastoris (X-33). A transformant named X-33-Pp-Met-28D4, which showed strong expression of antibodies,was isolated, and the culture conditions were optimized.Under optimal conditions, P. pastoris cultures yieldedmuch higher levels of scFv product than the Escherichiacoli expression system. Immunochemical characterizationof the scFv antibodies produced in P. pastoris indicatedthat the affinity and specificity of scFv against methamidophosare comparable to those of scFv antibodiesproduced in E. coli. Recoveries of methamidophosfortifiedsamples demonstrated that the P. pastoris-derivedscFv antibodies can be used to determine the content ofmethamidophos residue in environmental and agriculturalsamples. For our purposes, expression in Pichia proved tobe an efficient and economical method for the large-scaleproduction of functional scFv antibodies against methamidophosfor downstream applications.

【题目】Allogyogenetic Progeny are Produced from a Hybrid Abalone Cross of Female Haliotis diversicolor and Male Haliotis Discus Discus
【中文关键词】鲍,种间杂交,雌核发育,AFLP,杂色鲍,盘鲍
【英文关键词】abalone; interspecific hybridization; allogynogenesis; AFLP; Haliotis diversicolor; Haliotis discus discus
【中文摘要】雌性杂色鲍(Hds)与雄性皱纹盘鲍(Hdd)杂交得到种间杂合体,通过扩增片段多态性技术对杂合体基因型进行分析,并揭示了子一代(F1)基因结构。子一代存活率很低,为0-0.13%。通过三个AFLP引物组合,我们对来自三个不同母本与一个共同父本杂交得到的20个子一代基因型进行了分析,共检测到266个标记。通过产生一个相似的和遗传差异的基质评估了子代与亲本之间的基因关系。Hds 和Hdd之间的遗传差异很大,差异范围为1.471-1.492。子一代的AFLP条带模式与母本很相似而与父本差异很大。在子一代与母本之间的平均遗传差异值为0.024 - 0.039,比这些母本之间的遗传差异值略小,说明子一代与它们的母本Hds之间具有很高的基因相似性。但是,在所有的个体的AFLP条带中,有0 - 0.8%是来自亲本,0 - 3.3%的条带是非亲本的。最后,我们对这种父本特异性与非亲本条带存在的原因进行了讨论。
【英文摘要】Interspecific hybrid families of female Haliotis diversicolor X male H. discus discus were produced and analyzed using amplified fragment length polymorphism (AFLP) technology to reveal the genetic makeup of F1 progenies. The survival rates of the hybrid F1 were very low, ranging from 0-0.13%. Twenty hybrid F1 from 3 families along with 3 different female parents and their common male parent were analyzed with 3 AFLP primer combinations. In total, 266 markers were detected. Genetic relationships among the progenies and the parents were evaluated by generating a similarity and genetic distance matrix. The genetic divergence between Haliotis diversicolor and Haliotis discus was at a high level, with genetic distance ranging from 1.471-1.492. The AFLP band patterns of hybrid F1 progeny were similar to those of the female parents, but were quite different from that of the male parent. The mean genetic distance between hybrid F1 and their female parents were 0.024-0.039, slightly less than that among the female parents, which indicates that the hybrid F1 shared high genetic similarity with their female parents, Haliotis diversicolor. However, 0-0.8% of total AFLP bands of each individual were found to be parental bands, and 0-3.3% were found to be nonparental bands. The possible reason for the presence of paternal-specific and nonparental bands is discussed.

【题目】Cupric ion enhanced molecular imprinting of bovine serum albumin in hydrogel
【中文关键词】分子印迹水凝胶;BSA-Cu 结合物
【英文关键词】BSA-Cu(II) complex / Coordinate interaction / Molecularly imprinted hydrogel
【中文摘要】一种新型的Cu-BSA分子印迹材料被合成出来,其中NIPA作为辅助单体被使用。体系的pH,温度,和盐离子浓度作为关键实验因素被优化,同时验证了该方法与Zn(II), Ni(II), Co(II), Cd(II), and Al(III)的交叉结合能力,验证了该方法具有对蛋白和铜离子较高选择性。
【英文摘要】A novel molecularly imprinted hydrogel for bovine serum albumin (BSA) was preparedusing cupric ion as the bridge between the template BSA and the functionalmonomer 4-vinylpyridine. N-Isopropylacrylamide (NIPA) was used as an assistantmonomer to provide the stimuli-responsibility of the polymer. The adsorption conditionsof BSA on the BSA-Cu(II)-imprinted hydrogel were optimized considering theinfluences of pH, temperature, and salt concentration. The proteins bound on theimprinted hydrogel can be easily recovered under mild conditions by using10 mmol/L ethylene diamine tetraacetic acid (EDTA) (pH 7.0) containing 150 mmol/LNaCl as the eluting solution. The imprinting effect and adsorption capacity of thepolymer were found to be significantly improved compared to the hydrogel preparedin the absence of cupric ion. The results demonstrated the advantages ofusing a template-metal ion-monomer coordination system to strengthen the interactionbetween the protein and monomer. The effects of different metals ions includingZn(II), Ni(II), Co(II), Cd(II), and Al(III) on the recognition ability of the BSA-Cu(II)-imprinted hydrogel were also investigated. The polymer showed high selectivitytoward both the template protein and the cupric ion.

【题目】Karyological Studies of the Hybrid Larvae of Haliotis Disversicolor Supertexta Female and Haliotis Discus Discus Male
【中文关键词】鲍,种间杂交,核型分析,雌核发育,杂色鲍,九孔鲍,盘鲍
【英文关键词】abalone; interspecific hybridization; karyotype analysis; gynogenesis; Haliotis diversicolor supertexta; Haliotis discus discus
【中文摘要】为了鉴定杂色鲍(Hds) ♀与皱纹盘鲍(Hdd) ♂的杂合子在早期发育阶段的基因组结构,抽取的试样为由杂合体(SJ-5 and SJ-50)以及纯合体(SS and JJ) 产生的面盘幼体,并用标准细胞核学法基因组原位杂交实验进行分析。在细胞中期,除了来自父本的单倍体组型,其他的来自亲本的染色体都能检测到。通过GISH初步结果,杂合子的基因组结构也能得以确定。与对照组相比,在杂合体(SJ-5 and SJ-50)中存在更多的非整倍体和染色体片段,说明在杂合体中基因组不稳定,染色体组容易丢失。在亚二倍的细胞中期,通过配对,完整的Hds染色体组和Hdd染色体组都可以检测到。母本染色体组在杂合体幼虫阶段会产生自发的二倍化现象,形成2.2%的异质三倍体,和具有两个完整的Hds 染色体组的17.9%亚二倍体。这些结果表明:单亲染色体的消除伴随着母本染色体组的自发二倍化,这或许是在Hds×Hdd杂交过程中产生异育效应的原因。
【英文摘要】To determine the genomic composition of the interspecific hybrid between Haliotis diversicolor supertexta female and H. discus discus male at an early developmental stage, veliger larvae produced from hybrid (SJ-5 and SJ-50) and pure species crosses (SS and JJ) were sampled and analyzed using standard karyological methods and genomic in situ hybridization. In hybrid metaphase spreads, chromosomes from both parents were detected, except one metaphase, which showed the H. diversicolor supertexta haploid karyotype. The genomic composition of the hybrid was also confirmed through preliminary genomic in situ hybridization results.

Many more aneuploids and chromosome fragments were found in the hybrids than those in the control pure species crosses, indicating genome instability and chromosome loss in the hybrids. In the hybrid hypodiploid metaphase spreads, two intact sets of H. diversicolor supertexta chromosomes and several H. discus discus chromosomes were detected by pairing. Spontaneous diploidization of the maternal chromosome set was shown to occur in hybrid larvae, as 2.2% heterogeneous triploid and 17.9% hypodiploids with two intact H. diversicolor supertexta chromosome sets for SJ-5. The current findings suggest that uniparental chromosome elimination along with spontaneous diploidization of maternal chromosome sets may be the reason for allogynogenesis production in H. diversicolor supertexta X H. discus discus hybridization.

【题目】Development of a sensitive ELISA for the analysis of the organophosphorous insecticide fenthion in fruit samples
【中文关键词】有机磷农药;倍硫磷;半抗原;抗体;酶联免疫分析
【英文关键词】Organophosphorus pesticide; Fenthion; Hapten; Antibody; ELISA
【中文摘要】两种倍硫磷的半抗原被合成出来,其中H1与BSA偶联作为免疫原用来制备多克隆抗体,H2与OVA偶联作为包被原。经过系统优化,一套高效竞争式间接免疫检测方法被建立起来。其中IC50达到0.01 ppb,其中只于杀螟硫磷的交叉反应达到了4.5%,与其他的受测农药交叉反应均小于0。1%。在实际样品的添加回收中,添加回收率处于79.8-106.0%之间。因此该ELISA方法是一套高效可行的免疫检测方法。
【英文摘要】Two fenthion haptens, 4-(4-(dimethoxyphosphorothioyloxy)-2-methylphenylamino)-4-oxobutanoic acid (H1) and 6-(methoxy(4-(methylthio)phenoxy)phosphorothioylamino)hexanoic acid (H2), were synthesized. H1 was conjugated with bovine serum albumin(BSA) and H2 with ovalbumin (OVA) by the active ester method. Then H2-OVA conjugate was used as coating antigen, while H2-BSA conjugate was used to produce polyclonal antibodies. After optimization, an effective competitive indirect enzyme-linked immunosorbentassay (ELISA) for determination of fenthion was established with the new combination of antibody/antigen, I50 of which was0.01 ng/ml, and there was only cross reactivity (CR) with fenitrothion (4.5%), and CRs with other tested pesticides were all below 0.1%.The recoveries obtained by standard fenthion addition to the different fruit samples such as grape, peach, pear and tomato were all from79.8% to 106.0%. Therefore, the optimized ELISA may become a new convenient and satisfied analytical tool for monitoring fenthionresidues in agricultural samples.

【题目】Effect of hapten structures on specific and sensitive enzyme-linked immunosorbent assays for N-methylcarbamate insecticide metolcarb
【中文关键词】半抗原;多克隆抗体;酶联免疫分析;氨基甲酸酯类农药;速灭威
【英文关键词】Polyclonal antibody
Enzyme-linked immunosorbent
assay
N-Methylcarbamate insecticide
Metolcarb
【中文摘要】氨基甲酸酯类农药速灭威的五种半抗原被合成出来。所有的半抗原与OVA偶联作为候选包被原,而其中包含速灭威整体结构的半抗原与BSA偶联作为免疫原。由此,两种多克隆抗体被制备出来,而10中抗体/包被原的组合也由此而生。以灵敏度和选择性为筛选条件,一种光谱检测方法被确定起来。该方法中,针对7种氨基甲酸酯类农药的IC50处于0.64-20.98ppm之间。
【英文摘要】Five different haptens of the N-methylcarbamate insecticide metolcarb were designed andsynthesized. All of the haptens were conjugated with ovalbumin (OVA) for the coating antigen,and one hapten containing all of the structure of metolcarb was conjugated withbovine serum albumin (BSA) for the immunogen. Two polyclonal antisera were raisedagainst the BSA conjugate, and ten antibody/coating conjugate combinations were selectedfor studies of assay sensitivity and specificity for metolcarb. A class-specific combinationwas found, with the I50 of the assay ranged from 0.64 to 20.98 gmL − 1 for seventested N-methylcarbamate insecticides except for pirimicarb. Considering titer, I50 andcross-reactivity of all combinations of antibody/coating conjugate, a competitive indirectenzyme-linkedimmunosorbent assay (ELISA) in a homologous system, whose limit of detection(LoD) reached 1.4 ngmL − 1, was presented. The results of competitive ELISAs indicatedthat coating hapten structure can significantly affect not only assay sensitivity but also itsspecificity.

【题目】腐生葡萄球菌M36耐有机溶剂脂肪酶基因的克隆与原核表达
【中文关键词】腐生葡萄球菌, lip3 基因, 耐有机溶剂脂肪酶, 基因克隆, 序列分析, 原核表达
【英文关键词】Staphylococcus saprophyticus, lip3 gene, organic solvent tolerant lipase, gene cloning, sequence analysis, prokaryotic
【中文摘要】脂肪酶是重要的工业用酶, 在食品加工、生物柴油的合成等领域具有广泛的应用。但是在应用中有机溶剂对脂肪酶具有一定的毒性, 因此获得耐有机溶剂的脂肪酶基因并实现高效表达是脂肪酶规模化应用的前提。本研究应用PCR技术首次从耐有机溶剂脂肪酶产生菌腐生葡萄球菌M36 基因组DNA 中扩增得到脂肪酶Ⅲ基因lip3(GenBank AccessionNo. FJ979867), 其编码区长度为741 bp, 编码247 个氨基酸, 推测蛋白分子量大小为31.6 kD。它与腐生葡萄球菌lip3推测的基因(GenBank Accession No. AP008934)只有83%的同源性。将该基因与大肠杆菌表达载体pET-DsbA 连接, 转化大肠杆菌Escherichia coli BL21(DE3)获得重组菌株BL21(DE3)/pET-DsbA-lip3, 在pH 8、25 oC 条件下, OD600 为1.0 时用0.4 mmol/L IPTG 诱导12 h 酶活达到25.8 U/mL。重组酶在甲醇、正己烷、异辛烷、正庚烷等有机溶剂中具有较好的耐性。lip3 基因的克隆及在大肠杆菌中有效表达的研究为进一步进行基因工程改造和脂肪酶应用奠定了基础。

【题目】Aflp Analysis of Populations of Haliotis Discus Hannai, Haliotis gigantea, and Their Hybrids
【中文关键词】鲍,皱纹盘鲍,西氏鲍,杂交,AFLP
【英文关键词】abalone; Haliotis discus hannai; Haliotis gigantea; hybridization; AFLP analysis
【中文摘要】本研究对皱纹盘鲍(D),西氏鲍(G)及它们的互交杂种(DG)(GD)种群遗传结构和遗传多样性进行了扩增片段长度多态性分析。在所有的479个高度重复的AFLP标记中,311个是多态的,这些是通过7种引物组合获得的。杂合子遗传了来自亲本双方的条带,说明杂合子的基因确实是异型的。D,G及它们的杂合子DG和GD的物种多样性指标分别是:0.169±0.188, 0.211±0.227, 0.236±0.267 and 0.231±0.242。通过对分子变异分析,实验表明29.58%的变异是来自种间,71.42%来自种内。D与G之间的遗传差异最大(0.681),GD与G之间的遗传差异最小(0.482)。通过类平均聚类法,这四种群体聚集形成两种主要的进化枝。所有遗传参数表明,在反交杂种D × G中,遗传多样性相当丰富。研究结果表明: AFLP标记拥有大量多态变形标记的特性,因此该方法可促进鲍鱼育种的发展。
【英文摘要】Amplified fragment length polymorphism (AFLP) analysis of the population genetic structure and genetic diversity of Haliotis discus hannai (D), Haliotis gigantea (G), and their reciprocal hybrids D female x G male (DG) and G female x D male (GD) was carried out in this study. A total of 479 unambiguous and highly repeatable AFLP markers, 311 of which (64.93%) were polymorphic, were obtained using 7 primer combinations. The reciprocal hybrids inherited bands from both parents, indicating that the hybrids were truly heterogeneous. The Shannon diversity index for D, G, and their reciprocal hybrid populations DG and GD was 0.169 +/- 0.188, 0.211 +/- 0.227, 0.236 +/- 0.267, and 0.231 +/- 0.242, respectively. Analysis of molecular variance revealed that 29.58% of the variance was among populations, whereas 71.42% of variance was within populations. Genetic distance was maximum (0.681) between D and G, and was minimum (0.482) between GD and G. The 4 populations were clustered into 2 major clades using the unweighted pair group method with arithmetic mean. All genetic parameters indicated that there was plentiful genetic diversity in the reciprocal hybrids of D X G. Results of this study suggest that these AFLP markers can be used in the future to enhance current breeding

practices in abalone culture because of the large numbers of polymorphic markers.

【题目】高效产脂肪酶菌株Burkholderia cepacia C1产酶条件优化
【中文关键词】脂肪酶;Plackett-Burman 设计;响应曲面;发酵优化
【英文关键词】words:lipase;Plackett-Burman design;response surface methodology;fermentation optimization
【中文摘要】从油菜地土壤中分离到一株高效产脂肪酶菌株C1,经鉴定为Burkholderia cepacia。为了进一步提高C1 脂肪酶的产量,对其产酶的发酵条件进行优化。首先采用单因子试验筛选出最佳碳源为麸皮,最佳氮源为蛋白胨。通过Plackett-Burman 设计对发酵产酶的11 个相关因子进行试验,筛选出3 个主效因子,即蛋白胨质量浓度、橄榄油质量浓度及装液量。利用Box-Behnken 试验设计和响应曲面法分析确定主效因子的最优水平,得出产脂肪酶菌株C1 的最优产酶条件:1.50g/100mL 麸皮、1.05g/100mL 蛋白胨、1.63g/100mL 橄榄油、0.2g/100mL K2HPO4、0.05g/100mL MgSO4、初始pH 值为7.0、装液量为30mL。在优化条件下30℃,180r/min 培养72h,脂肪酶活力达到89.65U/mL,比未优化前的28.50U/mL 提高了2.15倍。

【题目】Identification of tenuazonic acid as a novel type of natural photosystem II inhibitor binding in QB-site of Chlamydomonas reinhardtii
【中文关键词】无
【英文关键词】Tenuazonic acid; Photosystem II inhibitor; JIP-test; Binding niche; psbA mutant; Resistance
【中文摘要】无
【英文摘要】Tenuazonic acid (TeA) is a natural phytotoxin produced by Alternaria alternata, the causal agent of brown leaf spot disease of Eupatoriumadenophorum. Results from chlorophyll fluorescence revealed TeA can block electron flow from QA to QB at photosystem II acceptor side. Basedon studies with D1-mutants of Chlamydomonas reinhardtii, the No. 256 amino acid plays a key role in TeA binding to the QB-niche. The resultsof competitive replacement with [14C]atrazine combined with JIP-test and D1-mutant showed that TeA should be considered as a new type ofphotosystem II inhibitor because it has a different binding behavior within QB-niche from other known photosystem II inhibitors. Bioassay of TeAand its analogues indicated 3-acyl-5-alkyltetramic and even tetramic acid compounds may represent a new structural framework for photosyntheticinhibitors.

【题目】普通变形杆菌位置非特异性脂肪酶基因的克隆及在Escherichia coli中的表达
【中文关键词】Proteus vulgaris 脂肪酶; 基因克隆; 原核表达;位置非特异性
【英文关键词】Proteus vulgaris lipase; gene cloning; prokaryotic expression; non-positional specificity
【中文摘要】【目的】本文拟克隆普通变形杆菌(Proteus vulgaris) 脂肪酶基因,并实现其在大肠杆菌中的高效表达,并检验外源表达脂肪酶的催化性质。【方法】通过PCR 方法,从P. vulgaris 基因组中扩增其脂肪酶基因(PVL) ,并将其开放读码框区域连接到表达载体pET-DsbA 及pMBP-P 上,在大肠杆菌中用IPTG 诱导表达。我们对培养基组分及培养条件进行优化,以获得最高的酶产量。用Ni 柱亲和层析法对所得重组脂肪酶进行纯化,并考察其酶学性质。【结果】PVL 基因编码区含864 个碱基,编码含287 个氨基酸的酶蛋白。该序列在GenBank 的登录号为FJ643627。PVL 基因在大肠杆菌BL21 内诱导表达的最佳条件为:在pH8. 5 的LB 培养基中添加15 g /L 葡萄糖及200 mg /L 氨苄青霉素,在培养至OD600为1. 2 时加入100 mg /L IPTG,15℃ 诱导15 h,最高酶活达到192. 2 U /mL。通过亲和层析纯化了重组脂肪酶,得到一个约31 kDa 的蛋白条带。外源表达的脂肪酶的催化特性与野生菌脂肪酶相似,具有催化的位置非特异性,对长链脂肪酸酯亲和性最高。【结论】PVL 基因在大肠杆菌中的高效表达为P. vulgaris 脂肪酶的进一步研究与应用奠定基础。

【题目】Factors Affecting the Fertilization Success in Laboratory Hybridization between Haliotis discus hannai and Haliotis gigantea
【中文关键词】鲍,皱纹盘鲍,西氏鲍,杂交,人工授精,精子浓度,卵龄
【英文关键词】abalone, Haliotis discus hannai, Haliotis gigantea, hybridization, artificial fertilization, sperm concentration, gamete age
【中文摘要】在这项研究中,我们对精子浓度和配子年龄对皱纹盘鲍×西氏鲍受精成功率的影响进行了研究。结果表明,正反杂交的受精卵比原种自繁的受精率低。在精子浓度的实验中,对于DG交配,有最大受精率并在随后的发育中有最少变异的精子浓度为4.66×107 sperm mL-1,对于分别进行GD正反交,该浓度为 2.6×107 sperm mL-1。在配子年龄实验中,每0.5 h释放的精子与最新排出的卵子进行受精时,最优受精率出现在异种交配中。此外,在异种交配中,当排出的卵子在10分钟后受精,受精率显著下降,而卵细胞的年龄递增。我们建议在皱纹盘鲍和西氏鲍种间.杂交中使用新鲜的配子和更高的精子浓度。
【英文摘要】In this study, effects of sperm concentration and gamete age on fertilization success of Haliotis discus hannai (D) × H. gigantea (G) were investigated. Results showed that the fertilization rates of heterologous crosses H. discus hannai♀ × H. gigantea♂ (DG) and H. gigantea♀ × H. discus hannai♂ (GD) were consistently lower than those of homospecific groups H. discus hannai♀ × H. discus hannai♂ (DD) and H. gigantea♀ × H. gigantea♂ (GG). In sperm concentration experiments, the sperm concentrations that yielded maximum fertilization rates with the least abnormality in subsequent development were 4.66 × 107 sperm/mL for the DG cross and 2.6 × 107 sperm/mL for the reciprocal cross GD. In gamete age experiments, the optimal fertilization rates were achieved in heterologous crosses when freshly spawned ova were fertilized with sperm that were released within 0.5 h. Furthermore, in heterospecific crosses, when ova were fertilized 10 min after being spawned, fertilization rates declined significantly with increasing ova age. It is suggested to use fresh gametes and higher sperm concentrations for hybridization between H. discus hannai and H. gigantea.

【题目】Genetic Correlations to Morphological Traits of Small Abalone Haliotis diversicolor
【中文关键词】鲍,杂色鲍,遗传相关性,形态性状,通径分析
【英文关键词】abalone, Haliotis diversicolor, genetic correlation, morphological traits, path analysis
【中文摘要】本实验使用从商品规格的8个全同胞家系获得的241个杂色鲍的样本。我们测量了壳长(X1),壳宽(X2),壳高(X3),壳顶高(X4),体重(Y1),肌肉重(Y2)和壳重(Y3),并计算了相关系数矩阵。壳的形状特征作为独立变量,体重和肌肉重量作为因变量,做曲线分析。并对曲线系数,决定系数和相关指标进行计算。结果表明,每个贝壳形状特征和体重,肌肉重量和壳重量的相关系数都有显著性差异(P < 0.01)。在壳的四个因数中,体重(Y1)与壳长(X1)拥有最高的相关系数,而肌肉重量(Y2)与壳宽(X2)拥有最高的相关系数。高相关指标的结果有利于选择杂色鲍遗传育种计划中重要的增长相关特性。
【英文摘要】A total of 241 samples of small abalone (Haliotis diversicolor) from 8 full-sib families of market size were used in this experiment. Shell length (X1), shell width (X2), shell height (X3), apex height (X4), body weight (Y1), muscle weight (Y2), and shell weight (Y3) were measured, and the correlation coefficient matrix was calculated. The shell shape traits were used as independent variables, then body weight and muscle weight were used as dependent variable for path analysis. Path coefficients, determination coefficients, and correlation index were calculated. The results showed that correlation coefficients between each shell shape trait and body weight, muscle weight, and shell weight were all significant (P < 0.01). For the 4 shell morphological traits, body weight (Y1) had the highest correlation coefficient with shell length (X1), and muscle weight (Y2) had the highest correlation coefficient with shell width (X2). The results of high correlation index would be useful for selecting important growth-related traits in genetic breeding program of small abalone.

【题目】Hapten heterology for a specific and sensitive indirect enzyme-linked immunosorbent assay for organophosphorous insecticide fenthion
【中文关键词】半抗原;手臂连接点;抗体;灵敏度;选择性;酶联免疫分析;有机磷农药
【英文关键词】Hapten; Spacer-arm attachment site; Antibody; Sensitivity; Specificity; Enzyme-linked immunosorbent assay (ELISA); Organophosphorus insecticide;
【中文摘要】在有机磷农药倍硫磷结构上引如不同的分子手臂,合成出5种不同的半抗原。其中,所有的半抗原与OVA偶联作为包被原,而其中包含倍硫磷分子的全部或大部分结构的半抗原与BSA偶联作为免疫原。制备了6中多克隆抗体,30种抗体 / 包被原组合以供选择。本文根据筛选,选择了最高灵敏度(IC50达到了0.08ppb)和选择性的一组以建立相应的检测方法。
【英文摘要】Five haptens with different spacer-arm attachment sites on the structure of the organophosphorus insecticide fenthion were designed andsynthesized. All of the haptens were conjugated with ovalbumin (OVA) for the coating antigen, and three haptens containing all or most of thestructure of fenthion were conjugated with bovine serum albumin (BSA) for the immunogen. Six polyclonal antisera were raised against the threeBSA conjugates, and 30 antibody/coating conjugate combinations were selected for

studies of assay sensitivity and specificity for fenthion. Thestudy revealed the best combination with high sensitivity (I50 of 0.08 ngmL − 1) and high assay specificity, which indicated that when structuraldifference between the analyte and an immunizing hapten is less than that between a coating hapten and the immunizing hapten, a high sensitiveenzyme-linked immunosorbent assay (ELISA) in the heterologous system may stand a good chance to be developed. The immunity results showedthat heterology in the hapten spacer-arm attachment site of the immunogen could achieve a remarkable improvement in the quantity, sensitivity,and/or specificity of antibody, and that the moiety of an analyte, which is the same as the moiety near/on the immunizing spacer-arm haptenattachment site, contributes greatly to the interaction of antibody and hapten.

【中文摘要】制备了针对二乙氧基类有机磷农药的多克隆抗体。在异源包被下,竞争性免疫检测体系中,所制备的抗体针对7种拥有二乙氧基通用结构的农药表现出较高的灵敏度。其针对7种农药均有较理想的检测限。同时,为了了解抗原抗体结合关系,模拟出了一种基于分子结构的构效关系。

【英文摘要】Polyclonal antibody (PAb) with broad-specificity for O,O-diethyl organophosphorus pesticides(OPs) against a generic hapten, 4-(diethoxyphosphorothioyloxy)benzoic acid, was produced. Theobtained PAb showed high sensitivity to seven commonly used O,O-diethyl OPs in a competitiveindirect enzyme-linked immunosorbent assay (ciELISA) using a heterologous coating antigen, 4-(3-(diethoxyphosphorothioyloxy)phenylamino)-4-oxobutanoic acid. The 50% inhibition value (IC50) was348ngmL − 1 for

parathion, 13 ngmL − 1 for coumaphos, 22 ngmL − 1 for quinalphos, 35 ngmL − 1 for triazophos,751 ngmL − 1 for phorate, 850 ngmL − 1 for dichlofenthion, and 1301 ngmL − 1 for phoxim.The limit of detection (LOD) met the ideal detection criteria of all the seven OP residues. Aquantitative structure – activity relationship (QSAR) model was constructed to study the mechanismof antibody recognition using multiple linear regression analysis. The results indicated that thefrontier-orbital energies (energy of the highest occupied molecular orbital, EHOMO, and energy ofthe lowest unoccupied molecular orbital, ELUMO) and hydrophobicity (log of the octanol/water partitioncoefficient, log P) were mainly responsible for the antibody recognition. The linear equation waslog(IC50) = − 63.274EHOMO + 15.985ELUMO + 0.556 log P − 25.015, with a determination coefficient (r2) of0.908.

【题目】加拿大一枝黄花的开花动态及柱头与花粉活力

【中文关键词】菊科;加拿大一枝黄花;花粉活力;柱头活力;头状花序

【英文关键词】Asteraceare;Solidago canadensis L.;pollen viability;stigma receptivity;capitulum

【中文摘要】对加拿大一枝黄花(Solidago canadensis L.)的花序结构、开花动态进行了观察,并运用联苯胺-过氧化氢法和联苯胺法,对其柱头活力和花粉活力进行了研究。结果表明:加拿大一枝黄花的花序为具有雌花和两性花的异型头状花序,属于雌全性系统。开花结果过程可大致分为舌状花开放期、管状花开放期、果实发育期和果实成熟期。柱头活力在开花第2天开始出现,开花后的第6天达到最高,第3天至第7天均维持在较高水平;花粉活力则在开花后第5天开始出现,开花后第8天达最高,第7天至第9天均维持在较高水平。加拿大一枝黄花头状花序的结构特征以及柱头活力和花粉活力的比较研究结果均显示出其有利于异交的特征和机制,有利于提高种子产生的数量和质量,增强其入侵性。

【英文摘要】The structure and flowering phenology of capitulum,pollen viability and stigma receptivity in Solidago canadensisL.were studied in this paper.The results showed that capitulum of S.canadensis was heterotypic one being composed of female and bisexual florets.It is gynomonoecious species.Flowering phenology of capitilum is classified into the following four stages,i.e,the stage of peripheral florets flowering,the stage of disk florets flowering,the stage of achene development and the stage of achene the stage of peripheral florets flowering,the stage of disk florets flowering,the stage of achene development and the stage of achenematurity.Stigma receptivity and pollen viability changed during the different development stage of capitula.The stigma receptivity appeared on the 2nd day after flowering,were highest on the 6th day after flowering,and were high from the 3th day to the 7th day after flowering.The pollen viability appeared on the 5th day after flowering,were highest on the 8th day after flowering,and were high from the 7th day to the 9th day after flowering.The structure and flowering phenology of capitulumin in S.canadensis displayed the characteristics of being beneficial to cross-pollination and seed production.

【题目】Production and Characterization of Monoclonal Antibody for Class-Specific Determination of O,O – dimethyl Organophosphorus Pesticides and Effect of Heterologous Coating Antigens on Immunoassay Sensitivity
【中文关键词】有机磷农药,单克隆抗体,广谱选择性,异源酶联免疫分析,灵敏度
【英文关键词】Organophosphorus pesticides; Monoclonal antibody; Class-specific manner, Heterology; ELISA; Sensitivity
【中文摘要】一种针对二甲氧基有机磷农药的通用半抗原被合成出来,并制备出了相应的单克隆抗体。同时设计了6中异源半抗原来研究半抗原结构对免疫检测方法灵敏度的影响。利用杂交瘤细胞技术,通过细胞筛选,系统优化等步骤,建立了针对6中有机磷农药的广谱性免疫检测方法。该方法的IC50值处于0.58-10.47ppm 之间。
【英文摘要】A generic hapten (H1), 3-(4-Dimethoxyphosphorothioyloxy phenyl)propanoic acid, was synthesized to produce monoclonal antibodies (mAbs) for the determination of organophosphorus pesticides (OPs) in a class-specific manner. Six heterologous haptens were designed to study the effect of hapten heterology on immunoassay sensitivity. Several mice were immunized with this H1-BSA immunogen. Spleen cells of two immunized mice were fused with myeloma cells, and the resulting hybridomas were screened using H1-OVA. In a competitive indirect enzyme-linked immunosorbent assay (ELISA) format, three hybridoma cell lines (B4-C6, D12-B5, E5-H2) that produced mAbs with high selectivity and broad specificity were selected and expanded. The monoclonal antibody D12-B5 with higher titer was chosen for further study. In heterologous assay, the combination of D12-B5 and coating antigen H7-OVA constituted a particularly sensitive assay for competitive indirect ELISA and showed broad specificity for the determination of OPs, including parathion-methyl, chlorpyrifos-methyl, tolclofos-methyl, fenthion, malathion, fenitrothion. This combination resulted in the IC50 of 0.58 – 10.47 μg/ml.

【题目】Molecular analysis of the intestinal bacterial flora in cage-cultured adult small abalone, Haliotis diversicolor
【中文关键词】16S rRNA基因克隆文库,DGGE,肠道菌群,九孔
【英文关键词】16S rRNA gene clone library; DGGE; intestinal bacterial flora; small abalone
【中文摘要】为了研究网箱养殖的成熟杂色鲍肠道菌群的组成,我们采用了纯培养和非培养的方法。此外,为了验证潜在病原菌的存在,我们使用变性梯度凝胶电泳(DGGE)指纹图谱技术来比较健康和患病的成熟鲍鱼的肠道细菌群落结构。从健康鲍鱼的肠道分离出来的细菌属于弧菌属,海洋细菌Flammeovirga,希瓦氏菌属,桃色杆菌属和Paraferrimonas。从16S rRNA基因克隆文库分析得出,肠道细菌群包含两个群体:变形细菌门和软壁菌门。变形菌Betaproteobacteria (18.48%),变形菌Deltaproteobacteria (30.43%)和柔膜细菌(35.87%)是克隆中占支配地位的组分,同时,柔膜细菌是主要的支原体附属的克隆。DGGE聚合模式显示,与患病的鲍鱼(D group)相比,健康鲍鱼(H group)中出现更多的细菌的聚合。尽管从D group几乎没有检测到潜在病原菌,但是一个集群系统树表明,H 和 D groups (D6除外)形成了两个单独的群,一个未被鉴定变形菌Deltaproteobacteria物种和支原体物种是H 和 D groups肠道中占支配地位的组分。
【英文摘要】To characterize the composition of the intestinal bacterial flora in cage-cultured adult small abalone, Haliotis diversicolor, we used both culture-dependent and culture-independent approaches. In addition, in order to investigate the presence of probable pathogens, the intestinal bacterial community structures of healthy and diseased adult abalones were compared using the denaturing gradient gel electrophoresis (DGGE) fingerprinting technique. Bacteria isolated from the healthy abalone intestine belonged to the genera Vibrio, Flammeovirga, Shewanella, Persicobacter and Paraferrimonas. From the 16S rRNA gene clone library analysis, the intestinal bacterial community comprised two groups: the Proteobacteria and Tenericutes. Betaproteobacteria (18.48%), Deltaproteobacteria (30.43%) and Mollicutes (35.87%) were the most dominant components in the clones and the Mollicutes were mainly Mycoplasma-affiliated clones. The DGGE band pattern demonstrated that more bands appeared in the healthy abalones (H group) than in the diseased abalones (D group). Although few potential pathogens were detected from the D group, a clustering dendrogram indicated that individuals of the H and D groups (except for D6) formed two separate clusters. An unidentified Deltaproteobacteria species and Mycoplasma sp. were the dominant components in the intestine of both the H and the D group.

【题目】十种菊科外来入侵种连萼瘦果风力传播的特性
【中文关键词】菊科,连萼瘦果,传播能力,水平扩散距离,入侵种,冠毛,沉降速度
【英文关键词】Asteraceae,cypsela,dispersal potential,horizontal dispersal distance,invasive species,pappus,settlementvelocity
【中文摘要】借助风力传播连萼瘦果,是菊科入侵种最普遍的自然扩散方式,而其适应风力传播的特性与入侵性关系的研究还未得到足够的重视。阐明种子本身的风力传播特性与入侵潜力间的关系,可以为深入理解外来入侵种的入侵机制以及入侵种的控制提供理论依据。该研究以10种菊科入侵种为研究对象,测量其连萼瘦果的形态特征,测定它们在静止空气中的垂直沉降速度和模拟风力条件下的水平扩散距离,分析比较连萼瘦果的形态性状与沉降速度、水平扩散距离以及这些菊科入侵种在国内入侵范围的相关性。结果表明,根据连萼瘦果的形态特征,将这10个入侵种分为强、中和弱风传播3类;连萼瘦果的重量和冠毛特征对垂直沉降速度和水平扩散距离均有显著影响,对垂直沉降速度影响最大的因素是冠毛长度和冠毛上的小刺对数,对水平扩散距离影响最大的因素是连萼瘦果的重量和冠毛长度。在垂直沉降速度和水平扩散距离间存在极显著负相关性(r= – 0.806,p=0.005),表明沉降速度越慢,借风力水平移动的距离越远。这些入侵种的发生程度与沉降速度间存在显著负相关性(r= – 0.721,p=0.019),而与水平扩散距离之间存在着极显著正相关性(r=0.927,p=0.000),说明水平扩散距离比垂直沉降速度更适合作为评估菊科入侵种入侵能力的指标。根据上述研究结果,提出了南京市需重点防范胜红蓟

(Agratum conyzoides)和牛膝菊(Galinsoga parviflora)等菊科入侵种的建议。
【英文摘要】Wind dispersal of cypsela is the prevailing natural dispersal pattern in Asteraceae alien invasive species,but few studies have addressed the relationship between the characteristics of cypsela adapted to wind-dispersaland invasiveness.Our objective is to study the relationship between wind-dispersal traits and invasiveness to pro-vide insight into invasion mechanisms and control of alien invasive species.Methods We selected ten wind-dispersed Asteraceae invasive species with cypselas,observed morphologicaltraits of cypsela such as pappus number,pappus length,barb number on pappus and 1000-grain weight of cypselaand measured vertical settlement velocity in still air and horizontal dispersal distance in moving air.Correlationsbetween morphological traits of cypsela and settlement velocity and horizontal dispersal distance were analyzed inrelation to invasive range.Important findings We categorized the ten Asteraceae invasive species into three classes with strong,mediumand weak dispersal-wind potential according to morphological traits of cypsela.Correlation analysis showed thatpappus traits and weight of cypsela significantly affected both the settlement velocity and the horizontal dispersaldistance.The settlement velocity was significantly affected by both pappus length(r= – 0.483,p<0.001)andbarb numbers on pappus(r= – 0.282,p=0.002).Factors most affecting horizontal dispersal distance were cypselaweight and pappus length.Settlement velocity and horizontal dispersal distance were negatively correlated(r= – 0.806,p=0.005).The occurrence of these Asteraceae invasive species was significantly negatively correlatedwith settlement velocity(r= – 0.721,p=0.019)and significantly positively correlated with horizontal dispersaldistance(r=0.927,p=0.000),suggesting that the horizontal dispersal distance better reflected invasiveness.Agratum conyzoides and Galinsoga parviflora with high invasiveness should be primary targets for invasive spe-cies management in Nanjing,China based on our results.

【题目】The acyl-homoserine lactone (AHL)-type quorum sensing system affects growth rate, swimming motility and virulence in Acidovorax avenae subsp. citrulli
【中文关键词】Acyl-homoserine lactone Acidovorax avenae subsp. citrulli Autoinducer Quorum sensing Bacterial fruit blotch
【英文关键词】Acyl-homoserine lactone Acidovorax avenae subsp. citrulli Autoinducer Quorum sensing Bacterial fruit blotch
【中文摘要】Acidovorax avenae subsp. citrulli is a Gram-negative bacterium and is the causal agent of bacterial fruit blotch (BFB) in cucurbits. In this study, the role played by the acyl-homoserine lactone (AHL)-type quorum sensing (QS) system in growth, swimming

motility and virulence was characterized in A. avenae subsp. citrulli strain XJL12. The AHL synthase gene of the QS system from strain XJL12, defined as aacI, was cloned and characterized, and an aacI disruption mutant was generated. The aacI mutant XJL13 abolished the ability to produce AHL molecules, whereas the corresponding complemented strain CPXJL13 produced wild-type levels of AHL. The aacI mutant exhibited a significant decrease in growth rate relative to the wild type in minimal medium, and was partially impaired in swimming motility. In plants, the aacI mutant showed a significant reduction of virulence in watermelon fruits and melon seedlings when compared to the wild-type strain. However, the aacI mutation in strain XJL12 had no effects on biofilm formation, exopolysaccharide production, or induction of hypersentitive response in Nicotiana tabacum. Our data suggest that the AHL-type QS may play a key role in pathogen virulence and this may provide an opportunity to explore novel approaches for managing BFB in cucurbits by QS interference.

【英文摘要】Acidovorax avenae subsp. citrulli is a Gram-negative bacterium and is the causal agent of bacterial fruit blotch (BFB) in cucurbits. 【题目】Production and Characterization of Polyclonal Antibody for the NMethylcarbamate Insecticide Metolcarb

【中文关键词】速灭威,免疫原,多克隆抗体,抗血清识别,酶联免疫分析

【英文关键词】metolcarb, antigen, polyclonal antibody, antiserum characterization, ELISA

【中文摘要】针对速灭威的半抗原被合成并利用核磁共振进行鉴定。同时,将半抗原利用活泼酯法与载体蛋白BSA和OVA相偶联,形成包被原和免疫原。免疫兔子后,制备出多克隆抗体。血清效价通过非竞争式免疫方法进行测定,达到1.28*106.与被测农药的交叉反应也可以忽略影响。该结果显示,该抗体适合于对速灭威快速检测方法的建立。

【英文摘要】The hapten, 3-{[1-(3-(methyl)phenyloxy)-carbonyl]amino}propanoic acid (HOM), mimicking the analyte metolcarb, was synthesized and verified by mass spectrometry (MS) and 1H-nuclear magnetic resonance spectrometry (1H-NMR). Then, HOM was conjugated with the carrier proteins bovine serum albumin (BSA) and ovalbumin (OVA) with stoichiometric amounts of N-hydroxysuccinimide/dicyclohexylcarbodimide (NHS/DCC) using the activated ester method. Polyclonal antibodies were raised against the conjugate of HOM-BSA in rabbits. Antiserum titres were determined by noncompetitive indirect ELISA procedures and the titer of pAb01 reached 1.28 × 106. The cross-reactivities of the structurally related Nmethylcarbamate insecticides were 0.0% except for dimethacarb. These results indicate that the antibody pAb01 with strong affinity and high specificity can be used to develop a sensitive and rapid detection protocol for metolcarb residue.

【题目】松材线虫及其近缘种热激蛋白90基因(hsp90)克隆与序列分析
【中文关键词】松材线虫,拟松材线虫,豆伞滑刃线虫,热激蛋白90,基因克隆
【英文关键词】Heat shock protein90, Gene clone
【中文摘要】热激蛋白90家族(heat shock protein 90(HSP)family)是一种进化保守的蛋白质,在分子伴侣功能、细胞循环调控、抗原传递方面发挥着重要作用。本研究用RT-PCR和RACE技术,克隆得到了松材线虫(Bursaphelenchus xylophilus)、拟松材线虫(Bursaphelenchus mucronatus)和豆伞滑刃线虫(Bursaphelenchus doui)热激蛋白90基因的cDNA全长序列,分别命名为Bx-hsp90、Bm-hsp90和Bd-hsp90,(GenBank登录号分别为:GU013561、HMO34943和HM347331),其cDNA全长分别为2255、2193和2232bp,开放阅读框均为2127bp,编码708个氨基酸,5'端非编码区的长度分别为33、13和13bp,3'端非编码区的长度分别为95、53和92bp。其DNA全长分别为2440、2388和2407bp,包含3个内含子。三者氨基酸序列的一致性为98.78%。进化分析表明,松材线虫、拟松材线虫、豆伞滑刃线虫与秀丽小杆线虫(Caenorhabditis elegans)的亲缘关系较近,推测三者的进化较为低等。松材线虫热激蛋白90基因与松材线虫对环境温度的适应性密切相关。本研究结果对于深入了解和研究松材线虫的入侵机制具有重要的实际意义,为松材线虫及其近似种对环境适应性等方面的研究提供了良好的技术基础。
【英文摘要】Heat shock protein 90 (HSP90) family is an evolutionarily conserved protein, to be involved in chaperone tion, cell cycle control and antigen presentation. The cDNA sequences of heat shock protein 90 from , and were cloned by RT-PCR and RACE methods, and named - 90, - 90, - 90 (GenBank Accession No. GU013561, HMO34943 and HM347331)respectively. Theire full cDNA length were 2 255, 2 193 and 2 232 bp, the ORF were all 2 127 bp encoding 708 amino acid residues, 5'-untranslated region (UTR) was 33, 13 and 13 bp, and 3'-UTR was 95, 53 and 92 bp,respectively. And their full genomic length were 2 440, 2 388 and 2 407 bp, and all genomic sequences contained 3 introns. The amino acid sequence identities among - 90, - 90 and - 90 was 98.78%, Evolutionary anal yses showed that , and had a close relationship with , which might be indicative of their low evolution. Heat shock protein 90 from , and shared highly homologous, which made to be a candidate gene for studying the biological evolution. The present study has a practical significance for understanding the invasive mechanism of B. and lays a good foundation for understanding the environmental adaptabilities of these three plant parasitic nematodes.

【题目】The research on enzyme-linked immunosorbent assay for fenvalerate
【中文关键词】氰戊菊酯,半抗原,多克隆抗体,酶联免疫分析
【英文关键词】fenvalerate; hapten; polyclonal antibody; enzyme-linked immunosorbent assay
【中文摘要】本文建立了一套针对氰戊菊酯的定量间接竞争性酶联免疫分析方法。化学合成了两种针对氰戊菊酯的半抗原(FVa和FVb),其中FVa与OVA偶联形成包被原,而FVb与BSA偶联形成免疫原。将免疫原常规免疫兔子,获得了效价为1.28*104的多克隆抗体。并对ELISA体系进行条件优化。使得IC50值达到了1.19ppb,检测限达到了0.017ppb.
【英文摘要】An indirectly competitive enzyme-linked immunosorbent assay (ic-ELISA) wasdeveloped for the quantitative detection of fenvalerate. The hapten FVa(a-carboxy-3-phenoxyphenyl-2-(4-chloro-phenyl)-3-methyl-butyrate) and FVb(N-2-(carboxybutyl)carbamoyl-3-phenoxyphenyl-2-(4-chlorophenyl)-3-methylbutyrate)for the fenvalerate were prepared starting from 2-(4-chlorophenyl)-3-methyl-butyric acid and a-cyano-3-phenoxyhenzyl-benzyl alcohol. The haptenFVa was conjugated to ovalbumin (OVA) to form the coating antigen (FVa OVA); the hapten FVb was conjugated to bovine serum albumin (BSA) to formthe immunogen (FVb BSA). The rabbits were immunised by conjugate of FVb BSA, and titres of anti-fenvalerate serum (1.28 104) was determined by noncompetitiveindirect ELISA. After optimisation of the ic-ELISA, such as pHvalues, ionic strengths, concentrations of methanol, pH 7.5, phosphate-bufferedsaline of 0.3 M Na and 30% methanol were determined to optimum assaycondition. The medium inhibitory concentration (IC50) for fenvalerate was(1.1990.09) mg/L, and limit of detection (LOD) was (0.01790.002) mg/L.Pyrethroids, such as fenpropathrin, cyhalothrin, permethrin, cypermethrin,deltamethrin and bifenthrin did not

cross-react significantly in this assay.

【中文关键词】无
【英文关键词】Apparent modulus of elasticity;Compression;Maximum contact stress;Node;Timothy;Uniaxial compression
【中文摘要】In this work, the crushing strength (through maximum contact stress) of timothy stem nodes was determined at differentnode sizes, positions on the stalk, and moisture contents.
【英文摘要】To disinfest Hessian fly in timothy hay bales by mechanical compression, the crushing strength of timothy stem nodes was investigated using an Instron testing machine. Unbaled first‐cut timothy hay of the 2007 crop year was used in the test.The apparent modulus of elasticity and maximum contact stress values increased with increasing moisture content and decreased with increasing node size, and these values decreased from top position to bottom position on the stem.

【题目】瓜类细菌性果斑病菌组氨酸营养缺陷型与致病性相关
【中文关键词】瓜类细菌性果斑病,致病性,his基因,组氨酸
【英文关键词】Bacterial fruit blotch,pathogencity,his genes,histidine
【中文摘要】瓜类细菌性果斑病菌(Acidovorax citrulli,Ac)是近年来发生在西瓜、甜瓜等葫芦科植物上的一种重要病原细菌。它主要危害西瓜、甜瓜,引起叶斑或叶枯,造成果实腐烂,严重时导致绝产。【目的】验证组氨酸的合成缺陷与Ac的致病性之间的关系。【方法】采用Mini-Tn5转座子随机插入方法,从瓜类细菌性果斑病菌xjl12突变体文库中筛选突变体,并通过亚克隆技术对基因进行鉴定。【结果】筛选到一株在烟草上失去过敏反应且致病性降低的突变体。鉴定其为hisC(histidinol-phosphate aminotransferase)基因的突变体。同时也对Ac中组氨酸合成过程中的另外3个酶(hisA、hisB和hisD基因)进行了研究。这些基因突变后均丧失了激发烟草过敏性反应的能力,致病性明显下降,发病时间比野生型延迟了约48 h,通过外源添加组氨酸可恢复其突变特征。【结论】这些基因的突变所致性状改变与组氨酸的合成缺陷直接相关。
【英文摘要】disease symptoms caused by mutants were delayed for 48 hours when compared to the wild type strain.By adding exogenous histidine,pathogenicity of the mutants was restored.[Conclusion]The change of the characteristics of the mutants was directly related to the synthesis of histidin

【题目】杂色鲍肠道菌群多样性研究
【中文关键词】杂色鲍;肠道菌群;菌群多样性;16S rRNA gene 克隆文库;DGGE
【英文关键词】small abalone; intestinal bacterial flora; bacterial diversity; 16S rRNA clone library; DGGE
【中文摘要】杂色鲍是我国南方沿海海水养殖的重要经济贝类。肠道菌群在宿主生长发育、新陈代谢等方面起到重要作用。通过开展杂色鲍肠道菌群多样性的研究,旨在理解肠道菌群与杂色鲍之间相互关系,包括消化食物、病理发生等,对探讨微生物与海洋无脊椎动物相互关系具有重要意义。本文通过微生物分离培养鉴定与不依赖培养的微生物分子生态学方法对不同养殖环境的杂色鲍肠道菌群的多样性进行研究。从两个养鲍场(江口、大嶝)杂色鲍肠道内共分离到35 株细菌,经16S rRNA gene 分子鉴定分属于9 个属,分别为Vibrio,Shewanella,Paraferrimonas,Flammeovirga,Persicobacter,Agarivorans,Tenacibaculum,Polaribacter,Agarobacterium,其中Vibrio占共总菌数的50%,是分离培养菌群中的优势菌。不同养殖环境下杂色鲍肠道菌群可培养类群组成也存在差异。通过分子生态学方法构建了三个不同养殖环境下的杂色鲍肠道16S rRNA gene 克隆文库,两个陆地养殖场(江口、后蔡)和一个海区渔排吊养区(岱仔)。陆地养殖杂色鲍(江口)肠道菌主要由变形杆菌门(Proteobacteria)和软壁菌门(Tenericutes)组成,其中柔膜菌纲(Mollicutes)占整个文库的35%,优势菌群不同于可培养类群组成。通过岱仔海区养殖杂色鲍和后蔡陆地水泥池养殖杂色鲍肠道菌群克隆文库多样性的比较发现,渔排吊养杂色鲍肠道菌主要类群包括变形杆菌,柔膜菌和梭杆菌(Fusobacteria),菌群多样性不同于养殖环境杂色鲍肠道菌组成。研究还发现,陆地和海区杂色鲍肠道菌群中,柔膜菌纲类群

丰富,占较大比例,是杂色鲍肠道菌群未培养的优势菌群。其中,90%的柔膜菌类群存在于养殖条件下杂色鲍肠道内。经序列相似性分析,发现这些类群属于支原体属(Mycoplamsa),但最高同源性仅为90%。用DGGE技术分析陆地养殖杂色鲍肠道菌群的季节性变化,表明柔膜菌类群具有一定的稳定性,在同一养殖环境情况下不会受到季节变化的影响。支原体属在健康杂色鲍肠道菌占优势,且具有稳定性,与杂色鲍之间可能是一种共生关系而非病原关系。

【英文摘要】Small abalone, one of the most important commercial culture shellfish in SouthChina, mainly feed with the red macroalgae, Gracilaria. Intesitinal bacterial floraplays an important role in host physiology and involves in many new unexploitedmicrobial species. Research on the diversity of intestinal bacterial flora can providemore comprehensively understanding for interactions between microbes and theinvertebrate in the aspect of the host digestion, pathogenesis and so on.We have used culture-dependent and culture-independent approaches to investigatethe bacterial composition of the intestine of small abalone from the land-cultured andraft-cultivated areas. Thirty-four intestinal bacterial strains were isolated from twodifferent abalone farms and identified using the 16S rRNA gene biomarker, our resultshowed that they were fell into 9 genera, which were Vibrio, Shewanella,Paraferrimona, Flammeovirga, Persicobacter, Agarivorans, Tenacibaculum,Polaribacter and Agarobacterium. Vibrio was the predomiant genus, which accountedfor 50 percent. Using culture-independent technique three 16S rRNA gene clonelibraries were constructed from the intestinal microflora of three different cultureenvironments, including two land-culture farms, Jiangkou and Houcai, and araft-cultivated area, Daizai. Microbial diversity analysis showed that the intestinalmicroflora of Jiangkou small abalone fell into three groups, Proteobacteria (α -, δ -, ε -),Mollicutes and Verrucomicrobia, accounting for 62.37%, 35.48%, 2.15%, respectively,which was different from the culturable bacterial composition. Comparison on theintestinal bacterial composition of small abalone from Daizai and Houcai uncoveredthat the intestinal bacterial flora of raft-cultivated abalone belonged to Proteobacteria,Mollicutes and Fusobacteria, which was different from the land-cultured abaloneintestinal bacteria, which consisted of Proteobacteria, Mollicutes, Bacteroidetes,Planctomycetes and Verrucomicrobia. Mollicutes group were clustered into 8 and 12OTUs (cut-off=3%) for Houcai and Daizai 16S rRNA gene clone library respectively.Phylogenetic tree indicated that these Mollicutes phylotypes have a nearer relativewith Mycoplasma species. A clustering dendrogram which indicated that individualsof Daizai (YP group) and Houcai (CTL group) formed two separate clusters, showedthe surroundings greatly affected the intestinal bacterial community structure.Seasonal variation analysis revealed that some bacterial group Mollicutes wereconsistent with the host abalone, and these band sequences shared high similarity withreported Mycoplasma.Our present study showed that uncultured Mycoplasma, a genus of Mollicutesdominated in the intestine of small abalone, different from the bacterial identificationof cultured bacterial species. These phylotypes affiliated to Mycoplasma might have asaprophytic or symbiotic, rather than pathogenic relationship with small ablone.

【题目】Determination of N-methylcarbamate Insecticide Metolcarb by Enzyme-linked Immunosorbent Assay

【中文关键词】氨基甲酸酯类农药,速灭威,半抗原,抗原,抗体,酶联免疫分析

【英文关键词】N-Methylcarbamate insecticide; Metolcarb; Hapten; Antigen; Antibody; Enzyme-linked immunosorbent assay

【中文摘要】针对速灭威的半抗原HOM被合成出来,并通过活泼酯法与BSA和OVA相偶联形成包被原和免疫原。通过对ELISA系统的优化,一套高效免疫检测方法被建立起来。其中,检测范围为1-104ppb,IC50为40.74ppb,检测限为0.08-0.1ppb.同时针对实际样品大米,水和土壤的添加回收分别为80,,9.4,107%。

【英文摘要】The hapten of the N-methylcarbamate insecticide metolcarb, 3-{[1-(3-(methyl)phenyloxy)carbonyl]amino}propanoic acid (HOM), was synthesized and conjugated with the carrier proteins bovine serum albumin (BSA) and ovalbumin (OVA), respectively, by the active ester method. The conjugate of HOM-BSA was used as immunogen, and we prepared rabbits' anti-metolcarb serum, the titres of which were determined by noncompetitive indirect ELISA procedures and reached 1.28×106. The results of the cross reaction indicate that the antiserum produced could specially recognize the insecticide metolcarb. After optimization of the ELISA conditions, such as ionic strengths, organic solvents, pH values, blocking agents, and so on, the proper parameters of ELISA procedure were determined, and an assay protolcol for the N-methylcarbamate insecticide metolcarb was established. On the basis of statistical analysis, the linear range of determination was from 1 to 104 ng/mL, IC50 was 40.74 ng/mL, limit detection was 0.08 – 0.10 ng/mL, intra-assay coefficient of variation (CV) reached 2.9%, and inter-assay CV reached 4.6%. The recoveries obtained by standard

metolcarb addition to different samples such as rice, water, and soil were 80, 93.4, and 107%, respectively. This is the first time that polyclonal antibodies to the N-methylcarbamate insecticide metolcarb are produced, and the ELISA, used here for efficient and available detection of metolcarb, may become a convenient and satisfied analytical tool for monitoring metolcarb residues in environmental and agricultural samples.

【题目】杂色鲍杂交后代壳色遗传与抗性特征研究

【中文关键词】杂色鲍;杂交;壳色;免疫;抗性
【英文关键词】Small abalone; cross breeding; shell colour; immunity; resistance

【中文摘要】本文以杂色鲍为研究对象,从贝壳颜色的遗传学、生化组成、免疫防御特性及生态因子胁迫下的抗性四个方面阐述了杂色鲍质量性状遗传、营养与免疫方面的内容。主要的结果如下:1. 杂色鲍贝壳颜色的遗传学和标记研究:采用家系育种的方法,将贝壳颜色为黄色的突变型杂色鲍与贝壳颜色为褐色的正常表型杂色鲍进行了连续2代的交配实验。结果表明,杂色鲍的黄壳色明显受到遗传因素的影响,当至少一方亲本中有黄壳色时,后代中同样出现黄壳色表型的个体。杂色鲍贝壳上的黄壳色不会随生长而消失,可作为一种稳定的形态标记,用于标识黄壳色突变型的个体,该标记技术也可用于杂色鲍的养殖技术和遗传学研究。此外,选用了贝壳颜色遗传学实验中建立的贝壳颜色发生分离的家系,以壳长为指标,分析、比较了来自相同家系的两种壳色个体之间的生长速度。在幼鲍发育至420天止的5-7个统计时段内,没有在同一家系来源的2种贝壳颜色表型个体之间检测到生长速度的显著差异。2. 杂色鲍不同群体的化学成分比较:对杂色鲍台湾群体、日本群体和杂交群体的基础营养成分、氨基酸、脂肪酸和矿物质元素的含量进行了测定,并对不同群体足肌的营养价值进行了评价。结果表明,通过杂交育种的方法培育的杂色鲍杂交种,继承了父本日本群体肉质优良的特点,足肌的营养价值明显高于母本台湾群体,证明了通过杂交育种手段对杂色鲍的足肌营养起到了很好的种质改良效果。两种不同壳色鲍壳的矿物质元素和氨基酸的含量具有明显的差别,在不同的生长阶段,黄壳色鲍壳氨基酸和矿物质元素的含量变化具有一定的规律性。3. 杂色鲍不同群体的免疫防御特性比较:采用流式细胞法对杂色鲍台湾群体、日本群体和杂交群体血细胞的吞噬能力、基础的呼吸爆发水平及密度值进行了比较,同时采用南京建成的试剂盒测定了血淋巴中与体液免疫密切相关的酸性磷酸酶(ACP)、碱性磷酸酶(AKP)、超氧化物歧化酶(SOD)和髓过氧化物酶(MPO)这四种酶的活力。结果表明,杂色鲍的杂交种继承了父本日本群体较高的机体免疫力,血细胞吞噬能力、基础的呼吸爆发水平、三种酶(ACP、AKP、SOD)的活力都显著高于母本台湾群体,证明了通过杂交育种手段对杂色鲍的免疫能力起到了很好的改良效果,培育出的杂交鲍机体免疫力高,抗逆性强,更加适应外界环境的变化。采用FCM法对杂色鲍两种壳色群体的血细胞吞噬能力、基础的呼吸爆发水平及密度值进行了比较,结果表明:两种壳色的杂色鲍个体没有表现出免疫应答方面的显著差异。4. 杂色鲍三个群体在不同生态因子胁迫下的耐受力比较:采用生态因子骤变胁迫的方法,比较了杂色鲍台湾群体、日本群体和杂交群体三个群体在高温、低温、低盐和干露胁迫下的生理表现和存活率情况。结果表明,同样的胁迫条件下,杂色鲍的杂交种比母本台湾群体更加适应环境的急剧变化,具有更高的存活率。同时研究结果显示,在水温突变实验中,8℃、32℃是杂色鲍存活的临界低温和高温。在温度为25℃,湿度为30%条件下,5小时是杂色鲍在干露胁迫下存活的临界时间。5. 杂色鲍三个群体腹足吸力的比较:利用改良的拉力工具,对杂色鲍台湾群体、日本群体和杂交群体三个群体个体正常吸附状态下将腹足拉离吸附底物所用的拉脱力进行了测量,并计算了正常吸附状态下的腹足单位面积吸力。实验结果表明,对于同样的吸附底物,台湾群体个体的腹足吸力和单位面积吸力均显著低于日本群体和杂交群体。日本群体和杂交群体在正常吸附状态下,机体活力强,生理状态好,能够更牢靠地吸附在底物上,不易受环境变化的扰动。

【英文摘要】In this research, quality traits genetics, nutrition and immunology of small abalone Haliotis diversicolor were studied in four parts: genetics of shell color, biochemical compositions, immune defense properties, resistance under the stress of ecological factors. The main results are as follows:1. Shell color genetics and markers of small abaloneA recently discovered mutation that displays a novel yellow shell coloration that is distinguishable from the normal brown coloration was reported in this study. Cross-mating experiments between the two types abalones were carried out to detect the F1 phenotypes and F2 phenotypic segregations. The results showed that, the yellow shell color significantly influenced by genetic factors, When at least one parent were in the yellow shell color, the offspring also appeared yellow shell color phenotype. The yellow shell coloration did not disappear with the growth, which can be used as a stable morphological markers to identify the yellow shell color mutant individuals.All family lines occurring shell color segregation

were selected and the shell lengths were measured for 5-7 times for the juvenile abalones aged at 2 – 14 months. Among them, there were no significant differences in all groups of abalones between the two colour type juvenile abalones.2. Chemical compositions of different small abalone groupsThe contents of basic nutrients, amino acids, fatty acid and mineral elements in Taiwan group, Japan group, hybrid group and two shell color groups were measured, and muscle nutritional value of different groups were also evaluated. The results showed that: the hybrid group, which was cultivated in cross breeding method inherited the meat quality of Japan group, the muscle nutritional value of it was significantly higher than Taiwan group. This results indicated that cross breeding method is an effective method to improve meat quality of small abalone. Mineral element and amino acids ciontents in two color abalone shell have significant differences, and the amino acid and mineral element contents in yellow color abalone shell had a certain regularity at different growth stages.3. Immune defense characteristics of different small abalone groupsPhagocytosis, basic respiratory burst level and density of blood cell in Taiwan group, Japan group and hybrid group were measured by flow cytometry (FCM) method, and the activity of acid phosphatase (ACP), alkaline phosphatase (AKP), superoxide dismutase (SOD) and myeloperoxidase (MPO) was measured using the kits built by Nanjing Jiancheng company. The results showed that the hybrid group, which was cultivated in cross breeding method inherited the excellent immunity of Japan group, phagocytosis, basic respiratory burst level and activity of three enzymes (ACP, AKP, SOD) were significantly higher than Taiwan group. This conclusion proved that cross breeding method is an effective method to improve immunity of small abalone, small abalone hybrids had high immunity and strong resistance to respond to external environmental changes. Phagocytosis, basic respiratory burst level and density of blood cell in two shell colour abalone groups were also measured by flow cytometry (FCM) method. The results showed that two colour small abalone did not show significant differences in immune response.4. Tolerance of small abalone under the stress of different ecological factorsPhysiological performance and survival rate of Taiwan group, Japan group and hybrid group under the stress of high temperature, low temperature, low salinity and dry exposure were measured in the method of sudden environmental change stress. The results showed that hybrid group showed a higher survival rate than Taiwan group. They had better ability in adapting to sudden drastic changes in the sea environment. The critical thermal maximum and minimum of small abalone were 32°C and 8°C when the temperature changed suddenly. the critical dry expoure time maximum of small abalone was five hours under the condition of temperature 25°C and humidity 30%.5. Pedal foot suction of different small abalone groupsPedal foot pull-off force and suction per unit aera of Taiwan group, Japan group and hybrid group was measured in the normal adsorption state. The results showed that pedal foot pull-off force and suction per unit aera of Taiwan group were significantly lower than Japan group and hybrid group. Japan group and hybrid group were in better physiological state and had higher body activity when they were adsorbing on the same substrate, and they were not easily disturbed by environmental changes.

【题目】海洋细菌生物膜的形成机制与影响因素
【中文关键词】生物膜;海洋;细菌;粘附;环境
【英文关键词】biofilm; marine; bacteria; attachment; environment
【中文摘要】细菌生物膜广泛的存在于海洋环境中的固-液界面上,本文主要在实验室内从生态学角度研究了海洋细菌生物膜的形成过程与生态机制,旨在通过实验室内的研究获得一些关于海洋环境细菌生物膜形成的一般规律和机制,从而为更多基础和应用科学研究提供参考。在研究中共涉及三个方面:1)海洋细菌的粘附过程及影响因素;2)海洋细菌的生物膜形成过程、影响因素及某些特殊海洋界面上的生物膜形成;3)以悬浮菌为对照比较海洋中粘附细菌和生物膜对不利环境抵抗与耐受问题。首先,在考察海洋细菌粘附问题时,主要进行了细菌特征与它们粘附能力的相关性和水环境因素对细菌粘附的影响两个方面的研究。针对45 株细菌的7 个特征(分类、形态、运动性、疏水性、胞外蛋白含量、胞外多糖含量和zeta电位)与其在海水中两种界面上(玻璃和聚苯乙烯)粘附的情况的调查研究表明:1)没有任何单一因素能够很好的预测细菌的粘附;2)对于能够运动的细菌,运动速度与其粘附能力有较强的相关性;3)某些菌属具有先天趋向粘附的特征;4)细胞亲水性极强的种类往往粘附较差,而疏水性较强的种类粘附能力一般较好,总体上更多的细菌在疏水性的聚苯乙烯表面粘附能力更好。5)胞外蛋白含量与细菌在聚苯乙烯表面的粘附有一定的正相关性,而胞外多糖含量与细菌在亲水性表面的粘附呈现略微的负相关。6)zeta 电位值与粘附的关系在不同细菌间的比较意义不大,对于同种细菌可能具有预测粘附能力的作用。

另一方面,比较多种有机物形成的条件膜对两株细菌粘附影响时发现,以甘露糖和牛血清白蛋白作为条件膜组成时细胞粘附比对照组均有显著提高;海水盐度的上升会导致这两株细菌粘附细菌密度的增加,pH 和二价离子的影响在两个菌株间有所不同。其次,在作为研究重点的第二章里,考察了1)不同海水条件对32 株海洋细菌在下96 孔板内生物膜形成的影响及机制;2)在流动培养体系中考察了不同环境条件对一株能形成典型生物膜结构的溶藻弧菌Vibrio alginolyticus 成膜结构的影响,特别针对二价离子的影响进行了深入研究。3)三种海水中人工或天然界面上的生物膜形成问题,包括不同粗糙度的不锈钢、贝类足粘液和防污涂料表面。研究结果表明。结果表明:1)对于多数海洋细菌,极低盐的环境往往不利于生物膜形成,生物膜一般需要一定盐度的海水维系其稳定。在实验涉及的较小pH 值范围内(pH6-8.5),多数海洋细菌的生物膜形成受到的影响较小。二价离子对于许多海洋细菌的生物膜形成的各个过程(粘附、粘附生长与脱落)均有显著影响。2)流动培养体系中溶藻弧菌菌株在实验检测的环境条件中,盐度和pH对生物膜形成的影响较小,只有二价离子的影响极其显著,当二价离子Ca 和Mg 均缺失时,该菌生物膜形成能力完全丧失,而缺失Ca 则导致生物膜去结构化,仅仅形成单层细胞生物膜。进一步研究表明,二价离子能够影响该菌株的粘附、表面swarming 运动、胞外多聚物生产,成熟生物膜暴露于二价离子缺失的海水中对其结构影响较小;对该菌株粘附能力的影响可能是引起生物膜形成能力完全丧失的原因,而这种影响被证明是物理化学水平的。Ca 离子缺失对于swarming 运动的促进和胞外多聚物生产的抑制可能导致了生物膜的去结构化。3)在不同粗糙度的不锈钢表面对于海洋污损细菌的粘附影响根据种类的不同而有差异;一株Alteromonas sp.污损细菌在粗糙度越大的表面形成生物膜的生物量和细胞团直径越大;而采用一株Pseudoalteromonas flavipulchra 研究其在不同粗糙度不锈钢表面的运动及生长时发现,在粗糙度较大的界面上该细菌的表面扩散能力被抑制,而表面扩散能力与细菌的繁殖速度具有正相关性。以上结果表明对于不同的情况,不同粗糙度的表面可能面临不同的污损程度。界面粗糙度或微地形学、细菌表面扩散能力和繁殖速度的相关性可能为防污技术提供一个新的思路。4)杂色鲍Haliotis diversicolor 的足粘液能够为海洋细菌提供营养物并促进其繁殖、粘附和生物膜形成,足粘液表面的生物膜中还具有对照组生物膜未检出的细菌种类,包括一些潜在的致病菌。该结果提示腹足类水产养殖中需要考虑在高密度情况下,足粘液可能带来的病原菌富集问题。5)在厦门九龙江口区的冬夏两季挂板上,红杆菌科Rhodobacteraceae 和黄杆菌Flavobacteriaceae 都常常作为一类优势类群出现,交替单胞菌Alteromonadales 目的种类特异性并以高丰度出现在以氧化亚铜为防污剂的涂料表面,该类群可能能够可以作为高耐毒的细菌在涂料表面形成生物膜,成为微型污损生物。最后,在第三章里,考察了海洋中粘附细菌和生物膜对不利环境的抵抗与耐受问题。1)采用了独创的简单且相对精确的方法研究了一株假单胞杆菌Pseudomonas sp.的_____粘附细胞在各种海水条件下的生长速度。结果表明,在几乎不受空间限制的条件下,实验菌株Pseudomonas sp. 的粘附态细胞在环境因素不利的条件下展现出比悬浮细胞更快的生长速度。这些条件包括低营养(高盐海水中),极端的盐度,pH,亚致死水平的毒性物质(Cu 离子和氨苄青霉素)的存在。这暗示着某些细菌在某些非最佳条件下,可能是以粘附态的形式作为其默认存在方式。而粘附态细菌与悬浮细菌在不同环境中生长速度上的差异变化,则表明了这两种状态对于细菌个体或种群在不同环境中具有不同的地位。2)生物膜中的细菌对极端不利环境,包括低渗、干燥、贫营养、高毒性重金属和抗生素的抵抗不同程度地高于悬浮细菌。

【英文摘要】Bacterial biofilms are universally distributed on marine solid-liquid interfaces.This thesis is concentrated on the processes and mechanisms of biofilm formation inmarine environments with an ecological insight. The intention is to attain somegeneral rules and mechanisms of marine biofilm formation that help us to do morebasic and applied researches on marine biofilms. There are three chapters in this thesis:1) Effcets of bacterial characteristics and environmental factors on marine bacterialattachment; 2) Effects of environmental factors on biofilm formation and biofilmformation on several specific marine interfaces; 3) Resistance and tolerance of sessilebacteria and biofilm to stressful and lethal environment comparing with theirplanktonic counterparts.

【题目】杂色鲍鸟氨酸脱羧酶和抗酶基因的鉴定及靶向转基因表达载体的构建

【中文关键词】杂色鲍;鸟氨酸脱羧酶;抗酶;靶向转基因;表达载体

【英文关键词】Haliotis diversicolor; ornithine decarboxylase; antizyme; targeting transgenic; expression vector

【中文摘要】鸟氨酸脱羧酶(Ornithine decarboxylase,ODC)和抗酶(Antizyme,Az)是多胺生物合成中的两个关键酶,而多胺在生物体内扮演着重要的生物学角色。对多胺的深入研究将有助于人类揭示更多的与多胺相关的疾病。在软体动物有关多胺的研究未见报道。因此,开展杂色鲍ODC和Az基因的研究将为软体动物和高等动物多胺的生物学研究提供更多的基础信息。另外,由于ODC基因位点在生物体内大都为非重复性位点,已有研究证明在提高转基因稳定性方面,该位点为一个合适的靶向位点。杂色鲍(Haliotis diversicolor)在我国主要分布在南部沿海地带,由于其成品规格较小(5-7 cm),达到商品规格所需的养殖时间较短,再加上其风味独特,因此深受养殖者和消费者的欢迎。但近年来由于病害频发,成活率急剧下降,给养殖者带来巨大的经济损失。针对杂色鲍养殖中存在的问题,利用日趋完善的转基因技术和合适的转基因靶向位点培育出具有高遗传稳定性的、抗逆的杂色鲍优良品种是当前育种工作的目标。而实现这一目标的一个前提是获得含有“ 全鱼 ”元件的靶向转基因表达载体。针对以上问题,本论文进行了如下的研究:1. 分离和鉴定杂色鲍ODC基因用同源克隆的方法对杂色鲍的ODC基因进行了分离和鉴定。分析发现,该序列全长为2600 bp。ORF分析编码区为1419 bp,编码472个氨基酸;氨基酸序列分析发现了一些是属于ODC家族的序列特征;对杂色鲍ODC氨基酸序列进行比对分析,表明了杂色鲍ODC氨基酸序列和其他物种的ODC氨基酸序列有较高的序列一致性,特别是在一些关键的活性位点十分保守;体外功能鉴定结果表明,杂色鲍ODC编码区的原核表达产物能够与鸟氨酸发生脱羧反应生成腐胺,而该反应又能够被ODC特异抑制剂DFMO所抑制;体内研究发现ODC在杂色鲍体内为组成型表达,其mRNA水平能对温度改变产生快速的反应。2. 分离和鉴定杂色鲍Az基因分析发现杂色鲍Az基因序列核酸长度为1434 bp。在mRNA序列上有两个重叠的ORF,第一个ORF编码51个氨基酸,终止密码子TGA。第二个ORF无起始密码子,与第一个ORF共享起始密码子。在第一个终止密码子附近发现Az基因特有的保守序列TCCTGATGT。在这个保守的序列上的A为Az的移码位点即在翻译第二个ORF时会跳过这个A与后面的T形成有意密码子TGT,进而形成有功能的Az。体外功能鉴定发现,只有第二个ORF的表达产物能够在26s蛋白酶体存在的条件下抑制ODC与鸟氨酸作用生成腐胺的反应。其体内研究的结果与ODC类似。3. 获得杂色鲍ODC基因组信息及其下游部分序列根据ODC的mRNA的信息,采用基因组步移法获取了杂色鲍ODC基因序列。结果显示获得的序列全长为16434 bp,扩增出了杂色鲍ODC基因的11个外显子和11个内含子。获得的ODC基因序列和mRNA序列比较发现,编号的第1和第2号外显子不含有编码序列,起始密码子ATG在第3号外显子上,终止密码子TAA和PolyA在第12号外显子上。在polyA信号后有一段约600 bp的核酸片段,经比对搜索没有发现无任何编码氨基酸的信息,确定该位点为外源载体进入的靶向位点。4. 构建三个杂色鲍靶向转基因表达载体靶向位点的获取:根据ODC基因序列下游的信息,成功扩增出了ODC基因下游的两个1800 bp的核酸片段,作为载体构建的左右两个臂。启动子的获取:为了构建组成型的表达载体,成功分离了杂色鲍肌动蛋白基因启动子序列。为了构建诱导型的表达载体,成功分离了由杂色鲍致病菌引起的表达上调基因的启动子序列即Qm启动子。目的基因抗冻肽(Antifreeze peptide,AFP)的获取:利用引物重叠方法合成了美洲大绵鳚(Macrozoarces americanus)AFP核酸序列,原核表达和死活菌染色鉴定结果表明表达产物有较高抗冻活性。元件的组装:根据表达载体的特征,把获得的元件左右臂、增强子、启动子、抗冻肽、kozak、IRES、EGFP和3 ’末端片段根据需要连接在p19T-Simple上。最后获得三个杂色鲍靶向转

基因表达载体,分别为Va:p19T-S-L-En-ActinP-IRES-EGFP-R,Vb:p19T-S-L-En-ActinP-AFP-IRES-EGFP-R,Vc:p19-S-L-En-QmP-IRES-EGFP-R。

【英文摘要】Ornithine decarboxylase (ODC) and antizyme (Az) are the key enzymes in the synthesis of polyamine. Polyamines are small molecular with positive charge, and play important roles in biology. It is meaningful to reveal the animal diseases with the research of polyamine. The researches on polyamine in abalone will provide more basic knowledge for mollusk and high animals. In addition, it is reported that the locus of ODC was a suitable targeting sit to transgenic task for the stability. Small abalone, Haliotis diversicolor is naturally distributed in South China. Because of its short culture cycle and special flavor, it was a popular abalone species for the mariculture farmers and consumers in South China. Unfortunately, with the development of small abalone industry, many problems occur such as disease outbreak and the low rate of growth and survival. The massive economic losses have been brought to the farmers which affected the development of abalone industry. Hence, breeding the transgenic small abalone with higher genetic stabilization and stronger tolerance to environment is vital. While, the first and key step to achieve the aim is to constructe the targeting expression vectors by the elements that completely derive from fishes.In this thesis, the following studies were performed and the main results were as follows:1. Isolation and characterization of ODC gene from small abalone.2. The isolation and characterization of small abalone Az.3. The isolation of small abalone ODC genome and the down-stream segment. 4. Construction of three targeting transgenic expression vectors.

【题目】A quantitative knowledge-based model for designing suitable growth dynamics in rice

【中文关键词】无

【英文关键词】dry matter; expert system; knowledge-based model; LAI; rice; stem number

【中文摘要】无

【英文摘要】Quantifying growth dynamics in rice (Oryza saliva L.) is important for precision design and diagnosis in Cultural management. The primary Objective Of this Study was to develop a general knowledge-based model to design the time-course growth dynamics including stem number, leaf area index (LAI) and aboveground dry, matter accumulation with desired tat-get yield tinder different conditions in rice. Driven by physiological development time (PDT)-based growing degree-days (GDD), the fundamental algorithms Of rice growth indices, which vary with the variety, environmental factors and production levels, were formulated from the existing literature and research data. The stem number curve was established according to the dynamic pattern Of the stem development and the principle of determining stein number from final particle number. Under the principle of realizing the maximal photosynthetic production during forty days before and after heading, we obtained the Optimum LAI at heading was calculated, and the LAI dynamic from the ratios of LAIs at different growth stages to optimum LAI at heading with linear interpolation method. The aboveground dry matter accumulation curve was described by a logistic curve. Case Studies with the typical data sets and variety types at different eco-sites indicated a good performance of the model system, with the root mean square error (RMSE) of 2.5 x 10(4) ha(-1), 0.37 and 700 kg ha(-1), for the stein number, LAI and aboveground dry matter accumulation, respectively. This model overcomes the weakness of poor spatial and temporal adaptation of traditional rice management patterns and expert systems.

【题目】A knowledge model system for wheat production management
【中文关键词】无
【英文关键词】expert system; knowledge model; quantitative decision-making; regulation index; wheat
【中文摘要】无
【英文摘要】A knowledge model with temporal and spatial characteristics for the quantitative design of a cultural pattern in wheat production, using systems analysis and dynamic modeling techniques, was developed for wheat management, as a decision-making tool in digital farming. The fundamental relationships and algorithms of wheat growth indices and management criteria to cultivars, ecological environments, and production levels were derived from the existing literature and research data to establish a knowledge model system for quantitative wheat management using Visual C++. The system designed a cultural management plan for general management guidelines and crop regulation indices for time-course control criteria during the wheat-growing period. The cultural management plan module included submodels to determine target grain yield and quality, cultivar choice, sowing date, population density, sowing rate, fertilization strategy, and water management, whereas the crop regulation indices module included submodels for suitable development stages, dynamic growth indices, source-sink indices, and nutrient indices. Evaluation of the knowledge model by design studies on the basis of data sets of different eco-sites, cultivars, and soil types indicated a favorable performance of the model system in recommending growth indices and management criteria under diverse conditions. Practical application of the knowledge model system in comparative field experiments produced yield gains of 2.4% to 16.5%. Thus, the presented knowledge model system overcame some of the difficulties of the traditional wheat management patterns and expert systems, and laid a foundation for facilitating the digitization of wheat management.

【题目】Regional evaluation of critical nitrogen concentrations in winter wheat production in the North China Plain
【中文关键词】无
【英文关键词】GRAIN PROTEIN-CONCENTRATION; NUTRIENT MANAGEMENT; CHLOROPHYLL METER; CORN YIELD; FERTILIZER; SOIL; BALANCE; AVAILABILITY; INDICATOR; SYSTEMS
【中文摘要】无
【英文摘要】Investigating critical nitrogen concentration (CNC) in grain and straw provides insights into N nutrition, and can serve as a guide to improved agricultural practice. This regional study evaluated the relationship between N fertilization rate and grain yield, N concentration, potential N loss, and determined critical grain and straw nitrogen concentrations (CGNC and CSNC) for winter wheat (Triticum aestivum L.) production in China. At the economically optimum nitrogen rate (EONR), grain N concentration was similar to the maximum value calculated using a linear plus plateau model, while straw N concentration was significantly less than the relevant maximum value. Soil nitrate N content after harvest and apparent N loss for maximum straw N concentration increased by 19 and 9 kg N ha(-1) compared to values at the EONR. Based on nine field experiments, CGNC and CSNC corresponding to optimal N rate were established to be 21.9 g kg(-1) (20.8-23.0 g kg(-1)) and 6.8 g kg(-1) (6.5-7.1 g kg l), respectively. An evaluation of CGNC and CSNC across 111 on-farm sites indicated that while many sites had grain and straw N concentrations falling within the CGNC and CSNC, a substantial portion of the sites had grain and straw N concentrations falling outside of the CGNC and CSNC or falling within the critical ranges when N supply was deficient (0 N control) or excess (at farmer's N practice). This region-wide study provided evidence for the usefulness of CSNC, and particularly CGNC, as indicators of N deficiencies in wheat production; however, neither indicator provided information about excess N fertilization.

【题目】Development of a growth model-based decision support system for crop management
【中文关键词】无
【英文关键词】growth model, decision support system,stand-alone edition, web-based edition
【中文摘要】无
【英文摘要】Growth model-based decision support system for crop management (GMDSSCM was developed including process based models of 4 different crops, i.e. wheat, rice, rapeseed and cotton. This system aims in facilitating simulation and application of crop models for different purposes. Individual models each include six submodels for simulating phasic development, organ formation, biomass production, yield and quality formation, soil-crop water relations, and nutrient (N, P, K) balance. The implemented system can be used for evaluating individual and comprehensive management strategies based on the results of crop growth simulation under various environments and different genotypes. 4 Stand-alone version (GMDSSCM,4) was established under the platforms VC++ and VB by adopting the characteristics of object-oriented and component-based software and with the effective integration and coupling of the growth-prediction and decision-making functions. 4 web-based system (GMDSSCW was further developed on a net platform using C# language. These GMDSSCM systems have been used to predict dynamically crop growth and to make decisions regarding to management systems. This tool should be helpful for construction and application of informational and digital farming systems

【题目】人工模拟降雨条件下紫色土陡坡地土壤颗粒分布空间变异特征
【中文关键词】:人工模拟降雨;紫色土;径流小区;土壤颗粒
【英文关键词】ain simulation;purple soil;plot runoff;soil particle
【中文摘要】"土壤颗粒分布特征作为土壤物理性质的基本组成部分,对土壤中水分运移、溶质迁移等土壤物理过程有着重要的作用,同时也是影响土壤侵蚀过程的主要因素之一。紫色土作为一种侵蚀型高生产力的岩性土壤,当其分布于三峡库区大于25°陡坡地时,成为了该地区水土流失的重要物质来源。为了分析降雨强度对紫色土陡坡地土壤颗粒分布空间变异的影响,该文研究了25°径流小区在不同人工模拟降雨条件下(0.285,0.978,1.737mm/min)紫色土土壤机械组成和团聚体稳定性的空间变异特征,结果表明:(1)25°陡坡地土壤机械组成在各个降雨强度下,空间分布特征都表现为小区上坡位置粘粒和粉粒含量减少,砂粒含量增加;中坡粘粒及粉粒含量增加,砂粒含量减少;下坡粘粒及砂粒含量增加,粉粒含量减少的特征。但是土壤机械组成各组分随雨强的变化,各自的含量表现出不同程度的增加或减少幅度。(2)陡坡地中>0.25mm水稳性土壤

团聚体含量(WAS0.25)、>2mm和>0.25mm团聚体分散度(P2、P0.25)的变化特征与降雨强度有密切关系,但是其空间差异性变化不明显。在不同降雨强度影响下WAS0.25的减小幅度在6.7%~16.87%中变化,而P2和P0.25各自的增幅则分别达到了1.94%~5.45%和4.46%~15.45%。通过对陡坡地径流小区紫色土土壤颗粒分布在降雨作用下的空间变异特征研究,为坡面土壤颗粒侵蚀-迁移-沉积这一微观过程的宏观反映提供了一定的理论依据,同时也为三峡库区紫色土25°陡坡地水土流失的防治提供相应的理论基础。"

【英文摘要】"As one character of soil physical properties,particle size distributions(PSDs)of soil played some very important roles on estimating soil properties,such as soil hydraulic properties,solute diffusion and other properties about soil erosion process.Purple soil as a easily eroded soil,largely distributed in the abrupt slope(>25°)of theThree Gorges area.In order to analyzed the effects of rainfall on the PSDs and its spatial variability in the steep purple soil area,this article tested the spatial variability characters of soil textures and aggregates in the purple soil runoffplots(grade=25°)under three different simulative rainfall intensity which were 0.285,0.978,1.737mm/min,the results show as follow:(1)With the increasing of rainfall intensity,the spatial characters of soil texture were that:theamount of clay and silt decreased in the up-slope,and the amount of sand increased in the up-slope;in the mid-slope,clay and silt increased and the sand decreased;but in the down-slope the amount of clay and sand increased and thesilt decreased.(2)the characters of>0.25mm water stable aggregate(WAS0.25)and the>2mm,>0.25mm degree of aggregate dispersion(P2,P0.25)were influenced by the rainfall intensity,but there were no spatial variabilitycharacters in the WAS0.25,P2,and P0.25。In different rainfall intensity conditions,the range of WAS0.25decreasingwas from 6.7%to 16.87%,and the ranges of P2,P0.25increasing were from 1.94%to 5.45%and from 4.46%to15.45%respectively.According to research on spatial variability characters of steep purple soil particles under rainfall simulation condition,this could supplied some theories of purple soil erosion in the steep slope,and also could"

【题目】Production of recombinant ScFv antibodies against methamidophos from a phage-display library of a hyperimmunized mouse

【中文关键词】甲胺磷;单链抗体;片段表达;竞争式酶联免疫分析

【英文关键词】methamidophos; scFv; phage display; panning; CI-ELISA

【中文摘要】获得了三条针对甲胺磷的高特异性重组单链抗体28D4,29D0和36B2。利用竞争性免疫方法,三条抗体针对甲胺磷的IC50值分别为46.25,35.39和17.99 ppb。与受测农药的交叉反应均小于0.1%。同时,分析出了三条单链抗体的核苷酸序列,分析表明,这三个单链抗体的分子量均在141D左右。

【英文摘要】A recombinant phage display library was generated using splenocyte mRNA isolated from a Balb/c mouse hyperimmunized with a hapten conjugate that mimicked the structure of methamidophos, one of the most acutely toxic organophosphate pesticides. Three recombinant single-chain variable fragment (scFv) antibodies with the highest specificity for methamidophos, termed 28D4, 29D0, and 36B2, were produced via a stringent selection protocol. In a competitive enzyme-linked immunosorbent assay, the IC50 values for 28D4, 29D0, and 36B2 were 46.25, 35.39, and 17.99 ng/mL, respectively. The cross-reactivity of the three scFv antibodies with other organophosphate pesticides was below 0.1% except for acephate (O,S-dimethyl acetylphosphoramidothioate). Nucleotide and deduced amino acid sequences indicated that the respective heavy chains and light chains of the three scFvs were involved in the distinctive VDJ segment rearrangements associated with somatic hypermutations during the process of several immunizations with higher dosages of immunogen. Taken together, these data constitute the first detailed description of an immunoassay that utilizes scFvs against the methamidophos, an analyte with a simple structure and low molecular mass (141 Da).

【题目】Effects of Slopes and Rainfalls on Soil Organic Carbon under Water Erosion in Regions of Hilly Purple Soil
【中文关键词】-
【英文关键词】soil erosion; organic carbon; impact factors;slopes;rainfalls;
【中文摘要】-
【英文摘要】The soil productive forces are mainly affected by soil erosion as soil nutrients and organic carbon are taken away. To determine the relationships between the reduction of soil organic carbon and impact factors of soil erosion,the last 17 years ’ data of slopes and rainfalls in Xiejiawan,Chongqing,China was investigated and analyzed.Results showed that amount of soil erosion and loss of soil organic carbon caused by water erosion goes up with the increase of gradient, and there was linear correlation between them on the slopes at the range between 8.75% ~ 46.63%.And the main effects of rainfall on the loss of organic carbon in purple soil were not embodied in rain intensity ,but rainfall parameter had little influence.Therefore, there was a significant seasonal effect of rain on the loss of organic carbon in purple soil. Useful information is provided on the effects of water erosion on soil organic carbon in regions of hilly purple soil.

【题目】奶牛精细饲养系统给的研究现状
【中文关键词】精细饲养;信息采集;信息处理;自动饲喂
【英文关键词】null
【中文摘要】随着奶牛养殖规模的不断扩大,传统的粗放型饲养模式已严重制约了奶牛生产效益的提高。基于奶牛个体体况信息的精细饲养能够充分发挥每头奶牛的产奶潜能,提高产奶量,同时减少饲料浪费,降低生产成本。为此,介绍了奶牛精细饲喂系统的组成、工作过程、饲喂方式以及实现精细饲料所需的关键技术和设备。

【题目】Effects of Cultivation and Vegetation Coverage on Soil Organic Carbon under Water Erosion in Regions of Hilly Purple Soil
【中文关键词】-
【英文关键词】"soil erosion, organic carbon,
cultivation, vegetation coverage, impact factors"
【中文摘要】-
【英文摘要】"The soil productive forces are mainly affected by soilerosion as soil nutrients and organic carbon are taken away. On thepremise of analysis the last 17 years ’ data of cultivation andvegetation coverage in Xiejiawan small watershed, therelationships between the reduction of soil organic carbon andimpact factors of soil erosion was investigated and analyzed.Results showed that

transverse slope with ridge in a fieldcontributed less to the losses of organic carbon of purple soil thanslope farming, and even less than traditional farming under thecondition of the same slope and rainfall. However, deeply diggingof the bared land was easier to bring about loss of organic carbonof soil. And with the increase of vegetation cover, the loss of soilorganic carbon reduced gradually. The vegetation coverage shouldbe maintained at more than 66% if the loss of organic carbon ofsoil was to be controlled from the aspect of vegetation coverage.Thus, it is effective to control loss of soil organic carbon byincreasing vegetation coverage unless there was more than 66%vegetation coverage, under the condition of water erosion."

【题目】Development of polyclonal antibody based enzyme-linked immunosorbent assay for the analysis of the agricultural insecticide imidacloprid: food quality and safety
【中文关键词】杀虫剂,吡虫啉,酶联免疫分析,多克隆抗体,残留检测
【英文关键词】insecticide; imidacloprid; ELISA; polyclonal antibody; residue detection
【中文摘要】为建立一套针对吡虫啉农药的免疫检测方法,制备出了抗吡虫啉多克隆抗体并与三种包被原进行亲和性比较实验。通过实验,建立了针对吡虫啉农药的检测工作曲线。同时ELISA系统中关键实验因素进行优化。实验结果表明,表位结合比为14:1的IMMP-OVA的包被原与抗体具有较高的亲和度。在工作中,IC50值为995.4 ppb, 检测限为30ppb。
【英文摘要】In order to develop an indirect competitive enzyme-linked immunosorbent assay (ELISA) for the insecticide imidacloprid, the anti-imidacloprid polyclonal antibody was produced and the affinity of three different coating antigens with the polyclonal antibody was compared. The antigenic determinant in antigen aimming at the polyclonal antibody was raised and analyzed. The standard curve for imidacloprid had been developed. The effects of organic solvents and buffer ionic strength on the ELISA for insecticide were studied and conditions of analysis were also optimized in this research. Experiment result showed that the coating antigen IMMP-OVA whose binding ratio was 14: 1, had stronger affinity with the anti-imidacloprid polyclonal antibody than IMMB-OVA and IMEB-OVA; the IC50 value in the standard curve was 995.4ng.mL(-1) and the limit of detection (LOD) was 30ng.mL(-1); the cross reaction ratios with nitenpyram and acetamiprid were 5.73% and 11.31% respectively

【题目】基于土地利用的喀斯特地区生态系统服务功能价值评估——以贵州省为例
【中文关键词】贵州省;喀斯特地区;生态系统服务功能价值;生态系统类型;土地利用
【英文关键词】Guizhou; Karst region; value of ecosystem service function; ecosystem; land use
【中文摘要】"为探讨喀斯特地区生态系统服务功能价值特征,对贵州省生态系统服务功能价值进行评估,结果表明生态系统服务功能价值在2005、2010、2020年分别为1 610.43亿、2 357.86亿、4 328.89亿元. 贵州省各类生态系统服务功能单价顺序为湿地>水体>森林>草地>农田>荒漠,其中湿地生态系统是荒漠生态系统服务功能价值的149.31倍.2005~2020年贵州省生态服务功能价值结构和土地利用结构以森林生态系统占绝对优势,各类型生态系统服务功能价值顺序为森林>农田>草地>水体>荒漠>湿地,各类型生态系统面积大小顺序为森林>农田>荒漠>草地>水体>湿地. 2005、2010、2020年贵州省单位面积生态系统服务功能价值分别为9 142、13 385、24 573元/hm2. 根据至2020年的土地利用规划,贵州省生态系统服务功能将持续增加. 表4 参51"
【英文摘要】"In order to assess the value of the ecosystem service functions in Karst mountainous region in Guizhou, China,the economic value of the Karst ecosystem service functions was estimated in the region. The economic values of ecosystemservice functions in 2005, 2010, and 2020 were 161.04×109, 235.79×109, and 432.89×109 Yuan (RMB), respectively. The unitprice of the service functions of each ecosystem in the region was in the order: wetland>water body>forest>grassland>farmland>desert. The value of wetland ecosystem service functions was 149.31 times higher than that of desert. The forestecosystem was absolutely predominant both in the ecosystem service value and land use structure. The service function valueof each ecosystem was in the order: forest>farmland>grassland>water body>desert>wetland. The area of each ecosystemwas: forest>farmland>desert>grassland>water body>wetland. In 2005, 2010 and 2020, the ecosystem service functionvalues per unit area in Guizhou was and will be 9 142, 13 385 and 24 573 Yuan/hm2. According to the 2005~2020 Land UsePlanning of Guizhou, the value of ecosystem service functions will continue to increase. Tab 4, Ref 51"

【题目】奶牛精料自动补饲装置的研究进展
【中文关键词】奶牛; 计量; 自动补饲; 发展方向
【英文关键词】null
【中文摘要】目前,随着中国已成为世界第三大产奶国,奶牛业在中国农业体系中的地位越来越重要,但是,中国奶牛单产水平低这一因素严重制约着奶业的发展,同时,中国精饲料利用率比奶业发达国家要低,这与缺乏适合中国使用的奶牛精饲料饲喂机械及普及率低等有着很大的关联。作者在简要分析讨论了国内奶牛生产力水平低的原因和奶牛养殖的发展趋势后,论述了国内外奶牛精饲料自动补饲装置的研究现状及成果,介绍了装置中计量的方法,比较和分析了现有精饲料自动补饲装置所存在的问题,并提出了一种新的奶牛精饲料自动补饲装置的设计方法,这为中国提高奶牛产奶量和精饲料利用率打下了坚实基础。

【题目】不同土地利用方式及开垦时间对岩溶山区土壤养分空间分布的影响分
【中文关键词】岩溶山区;土地利用;开垦时间;土壤养分
【英文关键词】karst mountainous region; land use; cultivation time; soil nutrient
【中文摘要】"采集贵州普定典型岩溶山区7种土地利用方式和3个不同开垦时间(27 a、39 a、48 a)的0~10 cm、10~20 cm、20~40 cm土壤样品,进行室内理化分析. 结果显示,林地土壤有机质、全氮、碱解氮累积量较多,玉米黄豆地含量最少. 林地土壤0~10 cm层有机质、全氮、碱解氮分别比玉米黄豆地高271.0%、317.7%、246.1%. 林地和撂荒地对土壤养分循环较为有利. 林地开垦为农业用地后,土壤有机质、全氮、碱解氮含量明显下降,全磷、有效磷、全钾含量没有明显变化,有效钾含量增多. 开垦39 a的0~10 cm层土壤有机质、全氮、全磷、有效磷、有效钾含量高于开垦27 a和48 a土壤的含量,碱解氮低于开垦27 a和48 a土壤的含量;开垦27 a的土壤全钾含量高于开垦39 a和48 a土壤的含量. 开垦时间长或短对土壤养分含量的影响未表现特殊规律性,可能受到其他因素的影响.
【英文摘要】"Puding County in Guizhou, China is a typical karst mountainous region, where the 0~10 cm, 10~20 cm, 20~40 cmsoil samples were collected from an area with 7 types of land uses and 3 cultivation periods (27 a, 39 a, 48 a). The contentsof soil nutrients including organic matter (OM), total nitrogen (TN), total phosphorus (TP), total potassium (TK), availablenitrogen (AN), available phosphorus (AP) and available potassium (AK) were determined and analyzed. The result showedthat the contents of OM, TN and AN in forest land were higher than those of other land uses. OM, TN and AN in maizesoybeanfields were lowest. OM, TN and AN in 0~10 cm soil of forest land were 271.0%, 317.7% and 246.1% higher than thosein maize-soybean fields, respectively. Forest land and uncultivated land had advantage in soil nutrient cycling. OM, TN andAN decreased with the process of forest land becoming cultivated land, TP, AP and TK were not found with this trend, but AKincreased in this process. However, in this study different cultivation periods (27 a, 39 a, 48 a) had no significant effect on soilnutrients, which indicate that other influencing factors might exist. Fig 2, Ref 20"

【题目】贵州喀斯特石漠化过程中的土壤有机碳与容重关系
【中文关键词】"喀斯特; 石漠化; 土壤有机碳; 土壤容重
"
【英文关键词】"Karst; Rocky desertification; Soil organic carbon; Soil bulk density
"
【中文摘要】"测定了不同石漠化等级的西南喀斯特生态系统的土壤容重和土壤有机碳。结果表明: 西南喀斯特生态系统的土壤容重为 0. 91 ~1. 37 kg cm-3,土壤有机碳含量变化较大,为8. 1 ~58. 9 g kg-1。在0 ~40 cm 的土层中,没有发生石漠化的生态系统的有机碳储量达 16. 91 kg m-2,伴随着石漠化程度的加剧,土壤有机碳储量急剧下降,极度退化土壤的有机碳储量只有 0. 52 kg m-2。在 1999-2005 年间,中国西南石漠化(约 55 ×104km2) 导致的有机碳流失通量年增加量超过 28 Tg。同时,探讨了喀斯特石漠化过程中土壤有机碳流失的去向,喀斯特石漠化过程土壤有机碳对生态恢复的限制作用,利用土壤容重推算土壤有机碳的可靠性。"
【英文摘要】"The relationship between soil bulk density and soil organic carbon in a rocky desertification process ofkarst ecosystem in Guizhou were studied by using time-space mutual substitution method. The results showed thatthe soil bulk density ranged from 0. 91 kg cm-3to 1. 37 kg cm-3,and soil organic carbon content from 8. 1 g kg-1to58. 9 g kg-1. Soil organic carbon storage decreased with the progress of rocky desertification, there were16. 91 kg m-2in the original karst ecosystem and 0. 52 kg m-2in the extreme rocky desertification area at 0-40 cmsoil depth layer. Annual soil organic carbon loss caused by rocky desertification was more than 28 Tg during 1999-2005 in Southwest China. Furthermore,where soil organic carbon went in the rocky desertification process wasdiscussed,as well as the inhibition effects of soil organic carbon on ecosystem restoration,and the reliability of soilorganic carbon calculated by soil bulk density."

【题目】Biological Control Agent for Rice Weeds from Protoplast Fusion between Curvularia lunata and Helminthosporium gramineum
【中文关键词】无
【英文关键词】Biological weed control, efficacy, weeds in rice.
【中文摘要】无
【英文摘要】The advancement of biological weed control is limited by the slow development of effective, broader-spectrum biologicalcontrol agents. Protoplast fusion was carried out between the Helminthosporium gramineum subsp. echinochloae (HGE)strain, HM1, and Curvularia lunata (CL) to breed new strains with improved biocontrol efficiency. The HM1 strain wasderived from HGE by ultraviolet (UV) treatment. Conditions for protoplast fusion were optimized, including lytic enzymemixtures and incubation time. The efficacy of lytic enzyme mixtures on cell wall digestion was also compared. The mosteffective lytic enzyme mixture for CL was 2% lywallzyme plus 2% snailase and for HM1, 2% cellulase plus 2% snailase.The optimum incubation time was 16 h for CL and 24 h for HM1. All fusant strains exhibited similar morphological andconidial properties to the HM1 parent. A total of 1,360 fusant strains were produced, 136 of which were randomly selectedfor characterization. Seven fusant strains showed improved spore productivity and four fusant strains had increasedproduction of the phytotoxin ophiobolin A, compared with HM1. Random amplified polymorphic DNA (RAPD)analysis of the fusant strains showed that the seven phytoactive fusant strains had a high similarity index (95 to 99%) to theparent HM1, but low similarity (22 to 26%) to the parent CL. Ethyl acetate extract of the culture broth and myceliaeffectively controlled major weeds in rice production.

【题目】川中紫色丘陵坡耕地细沟发生临界坡长及其控制探讨
【中文关键词】细沟; 临界坡长; 紫色土; 坡耕地
【英文关键词】rill; crit ical slope leng th; purple soil; cultivated land
【中文摘要】"细沟侵蚀是坡面土壤侵蚀的主要形式之一, 是介于片状侵蚀与沟道侵蚀之间的一种侵蚀类型, 细沟一旦发生, 坡面侵蚀量将成倍增加。由于细沟侵蚀的发生需要一定的坡长来汇集径流, 对于某一坡度的地块, 一次暴雨中细沟总是表现在一定的坡长处发生, 这一坡长称为细沟发生的临界坡长。在细沟发生的临界坡长处采取措施控制细沟的发生将大大降低坡耕地水土流失量。通过人工降雨试验发现: 细沟发生过程分为片蚀为主阶段、跌坎发育阶段、细沟侵蚀为主阶段和雨后径流侵蚀阶段, 紫色土坡耕地细沟的发生以坡面跌坎的贯穿为标志; 10b、1 5b、20b、2 5b 坡耕地细沟发生的平均临界坡长分别为6. 25, 4. 19, 2. 77, 1. 60 m; 细沟发生临界坡长与坡度呈二次抛物线关系。在人工降雨试验基础上, 总结了以控制细沟发生为核心的/ 大横坡+ 小顺坡0 耕作模式, 通过构建横坡截流沟分割地块, 实施有效的拦截径流, 减少坡面侵蚀泥沙。"
【英文摘要】"Ril l ero sion is one of the main formats in slope erosio n, o f w hich is one special erosio n sty le betw eensheet ero sion and gully ero sion. 【题目】Molecular analysis of introgression lines from Cucumis hystrix to Cucumis sativus.
【中文关键词】无
【英文关键词】Cucumber; Introgression; SSR; AFLP
【中文摘要】无
【英文摘要】Two stable introgression lines (ILs), IL56 and IL73 with fourteen chromosomes, derived from a cross between the wild relative Cucumis hystrix Chakr. (2n = 24) and the cultivated cucumber "beijingjietou" (Cucumis sativus L, 2n = 14) were characterized using SSR and AFLP markers. Twenty-three SSR primers were used to detect the introgression from C hystrix to C sativus, and one locus at 210 bp was revealed and assigned to introgressive fragment of C hystrix genome in IL56. Substantial genomic changes in these two lines were detected by AFLP analysis with thirty different primer combinations. C. hystrix-specific bands, novel bands for the two parents and deleted bands in C sativus were observed. One hundred and forty-seven polymorphic bands were observed, but only four and five introgressed bands were found in IL56 and IL73, respectively. Although representing only a small proportion of the C hystrix genome, these two introgression lines with downy mildew and fusarium wilt resistance will be valuable to resistant genetics and

breeding. (c) 2008 Elsevier B.V. All rights reserved.

【题目】An AFLP marker linked to turnip mosaic virus resistance gene in pak-choi
【中文关键词】无
【英文关键词】Pak-choi; TuMV resistance; AFLP; BSA
【中文摘要】无
【英文摘要】Pak-choi is one of the most important vegetable crops in China. Turnip mosaic virus (TuMV) is one of its main pathogen. Screening the molecular marker linked to the TuMV resistance gene is an efficient method to improve pak-choi breeding. In this paper, a dominant gene, TuRBCH01, has been mapped. 180 F(2) individuals were inoculated with TuMV-C5 and tested by direct ELISA. The 3: 1 ratio of F(2) hybrids segregation proved a single dominant allele for TuMV resistance. Amplified fragment length polymorphism (AFLP) technique and bulked segregant analysis (BSA) method were used to study the F(2) population. An AFLP marker (EccMctt3) linked to TuMV resistance gene with 7.8cM map distance was identified.

【题目】Cytological studies on microsporogenesis and male gametophyte development in autotriploid cucumber (Cucumis sativus L.); implication for fertility and trisomic.

【中文关键词】无
【英文关键词】Cucumis sativus L.; Meiosis; Chromosome configuration; Trisomy
【中文摘要】无
【英文摘要】To understand the correlation between chromosomes behavior and fertility in autotriploid cucumber (Cucumis sativus L.), microsporogenesis in pollen mother cells (PMCs) and male gametophyte development were studied using improved staining and chromosome preparation techniques. Meanwhile, for more efficient selection of trisomics from the progeny of autotriploid-diploid crosses, fertilization rates of ovules from reciprocal crosses were counted to observe the transfer rate of gametes in the autotriploid cucumber. Variable chromosome configurations, e.g. multivalents, quadrivalents, trivalents, bivalents and univalents were observed in the most PMCs of the autotriploids at metaphase I. Chromosome lagging and bridges at anaphase in both meiotic divisions resulted from irregular chromosome separation and asynchronization was frequently observed as well, which led to formation of micronuclei and inviable gametes. The frequency of normal PMCs in autotriploids at the stage of tetrad was only 40.6%. Among those normal microspores, most of them (91.2%) could develop into normal gametophytes with 2 cells and 3 germ pores. Stainability and germination rate of pollen grains were only 18.8 and 13.5%, respectively. However, chromosomes separated to form gametes with 8 chromosomes at anaphase I, suggesting a possible method for the production of primary trisomics from the progeny of autotriploid-diploid crosses. Fruit set of 3n x 2n and 2n x 3n were 80 and 70%, respectively. It obtained an average of 6.2 plump seeds per fruit in 3n x 2n, while 4.9 in 2n x 3n crosses. Transfer rates of gametes through the gastrula or the pollen in autotriploids were 13.4 and 10.4%, respectively. Some aneuploid gametes (n + 1 = 8, n + 2 = 9) also have capability of setting seed and sexual reproduction besides normal gametes containing whole chromosome sets (n = 7, 2n = 14). Further, some primary trisomic plants were selected from the progeny of autotriploid-diploid crosses. Based on the results obtained we suggest that abnormal meiosis in PMCs was the cytogenetic reason for low fertility of autotriploid cucumber pollen. 3n x 2n cross was more efficient for selecting primary trisomic plants in cucumber.

【题目】Expression and sequence variation of the cucumber Por gene in the synthesized allotetraploid Cucumis 3 hytivus
【中文关键词】无
【英文关键词】Allopolyploidy; Cucumis; Protochlorophyllide oxidoreductase; Silencing; Base substitution; Intron retention
【中文摘要】无
【英文摘要】The molecular evolution of the cucumber Por gene in early generations of the synthesized allotetraploid Cucumis x hytivus was investigated. The results from gene expression analysis showed that the cucumber Por gene was silenced in the S(1) generation, and re-activated in the S(2) generation. In the S(3) and S(4) generations, the transcripts remained activated but sequence changes were observed. Further analysis indicated that base substitutions, including two transitions and one transversion, occurred in the S(1) and S(3) generation, respectively, and in the S(3) generation, an intron was found to be retained in the transcript. This indicates allopolyploidy induced rapid silencing and mutation of the cucumber Por gene. Further, gene mutations such as base substitution and intron retention are modes of evolution for duplicated genes in newly formed polyploids.

【题目】Changes of gene expression in early generations of the synthetic allotetraploid Cucumis hytivus Chen & kirkbride
【中文关键词】无
【英文关键词】Allotetraploid; Cucumis; Evolution; Gene expression
【中文摘要】无
【英文摘要】Changes of gene expression played an important role in the evolution of plant allopolyploids. Frequency, time and type of the changes of gene expression between the first two self-pollinated generations (S(1) and S(2)) of a synthesized allotetraploid Cucumis x hytivus Chen et Kirkbride and in its diploid parents was analyzed with cDNA-AFLP and reverse-Northern blot technique. Sequences similarity of genes involved in changed expression were also analyzed with BLAST package. The results from cDNA-AFLP analysis showed that 36 (3.37%) genes showed silencing (27) or activation (9) in allotetraploids. These changes initiated in S(1) or S(2) generation. The silenced/activated genes included rRNA and protein-coding genes. Further reverse-Northern blot analysis validated the results obtained. Thus four types of changes of gene expression were observed, including silencing of genes from both parents, maternal parent, paternal parent, and genes novel expression. The results indicate rapid changes in gene expression in early generations of C. x hytivus, which contributed to the evolution of this synthetic allotetraploid.

【题目】A linkage map of pak-choi (Brassica rapa ssp. chinensis) based on AFLP and SSR markers and identification of AFLP markers for resistance to TuMV.
【中文关键词】无
【英文关键词】pak-choi; linkage map; AFLP; SSR; resistance; TuMV
【中文摘要】无
【英文摘要】P>A genetic linkage map for pak-choi, a very important economical and nutritional vegetable crop in Asia, has been constructed using amplified fragment length polymorphism (AFLP) and simple sequence repeat (SSR) markers based on 180 F-2 individuals. It includes 133 AFLP and 74 SSR markers from 57 AFLP and 65 SSR primer combinations, respectively. Fifty SSR markers were previously used to construct a framework map and all AFLP markers and another 24 SSR markers were inserted. The linkage map consists of 10 linkage groups with a total distance of 1123 cM and an average interval of 5.43 cM. Turnip mosaic virus (TuMV) is one of the most important pathogens of pak-choi. TuRBCH01, a TuMV-C-5 resistance gene, was successfully mapped into R6 linkage group in the present genetic linkage map and was positioned between AFLP markers E36M62-3 and E44M48-1.

【题目】Analysis and evaluation of nutritional quality in Chinese radish(Raphanus sativus L.)
【中文关键词】无
【英文关键词】radish; nutritional facts; comprehensive evaluation; correlation analysis; principal component analysis (PCA)
【中文摘要】无
【英文摘要】Radish (Raphanus sativus L.) is an important vegetable crop worldwide. High nutritional quality was critical in itsgenetic improvement and production. The nutritional quality of 42 Chinese radish cultivars was analyzed in this study.The contents of six nutritional facts, dry matter (DM), crude fiber (CF), total soluble sugar (TSS), vitamin C (VC), protein,and nitrate, ranged from 29.7 to

88.2, 4.507 to 18.546, 2.233 to 15.457, 0.1416 to 0.3341, 0.34 to 1.15, and 1.81 to 5.89 g kg-1 freshweight (FW), respectively. Significant differences among the 42 radish cultivars were detected in the contents of nutritionalfacts. The data were subjected to cross-correlation analysis and principal component analysis (PCA). It was found that DMcontent was positively correlated with the content of TSS (r = 0.7104), VC (r = 0.4011) and protein (r = 0.4120). Vitamin C (VC)content of radish showed a positive correlation (r = 0.3300) with the protein content. According to the principal componentanalysis, out of the 42 radish cultivars, Nau-17, Nau-28, Nau-6, Nau-11, Nau-10, Nau-27, and Nau-31 were detected with veryhigh scores in comprehensive evaluation. It could be concluded that abundant diversity of nutritional fact content occurredin different radish genotypes, and PCA analysis was effective for selecting radish germplasm with high quality. The resultscould contribute useful knowledge of nutritional quality, and provide important germplasms for the elite cultivar developmentand the inheritance study of nutritional facts in radish.

【题目】黄瓜游离小孢子培养诱导成胚与植株再生
【中文关键词】黄瓜、小孢子培养、胚状体、植株再生
【英文关键词】cucumber ; mierospore culture ; embryoid ; plant regeneration
【中文摘要】以10个不同基因型黄瓜为试材进行游离小孢子培养,通过对成胚条件的系统研究,从'7447'和'Poinsett97'中获得了子叶形胚和再生植株.研 究结果表明:基因型和小孢子发育时期是限制黄瓜游离小孢子成胚的关键因子.不同品种间胚状体产量差异显著,每皿产胚1.05~33.4个.单核靠边期是进 行黄瓜游离小孢子培养的最佳时期.低温预处理有利于胚状体的诱导,4℃预处理2~4 d为宜,以处理2 d的胚状体产量最高.外源激素在诱导胚状体时并非必需,但低浓度外源激素(0.5 mg · L-1 2,4-D、0.2 mg · L-1 6-BA)能促进小孢子成胚.NLN和B5两种基础培养基在诱导胚状体上无显著差异.子叶形胚易分化成苗,而其它类型的胚状体未能获得再生植株.
【英文摘要】
Isolated microspore culture in cucumber was studied by using 10 different varieties of cucumber. Cotyledo nary embryoids and plantlets were obtained from ' 7447' and ' Poinsett97' genotypes for the first time. The results showed that genotype and the developmental stage of mierospore were the key factors in embryoid induction. The embryoid yield was different significantly among different genotypes. Embryoid yi eld per culture dish varied from 1.5 - 33.4. The late-
uninueleate stage of mierospore was found optimum for isolated mierospore culture in cucumber. Cold-pretreatment (4℃) for 2 -
4 days also promoted embryoid induction, while the highest embryoid yield was obtained form mierospor e pre-
treated at 4 ℃ for 2 days. The results also indicated that low concentration of exogenous hormones (0. 5 mg · L^-1 2, 4-D and 0. 2 mg · L^-1 6-
BA) were conductive to embryogenesis, whereas NLN and B5 medium had no significant difference on e mbryoid induction. The regenerated plantlets were obtained only from cotyledonary embryoids and no plan tlet was produced from the embryoids at other developmental stages.

【题目】黄瓜无侧枝品系S61的形态解剖学观察及其无侧枝成因分析
【中文关键词】黄瓜; 侧生分生组织; 侧枝; 成花逆转; 形态; 解剖;
【英文关键词】Cucumis sativus L.; axillary meristem; lateral branching; inflorescence reversion; morpha; anatomy;
【中文摘要】在田间发现一个无侧枝表型的黄瓜品系。通过对该品系进行多年的田间观察、形态解剖学观察以及不同温度和光周期的影响试验,发现该品系的无侧枝表型是由于侧生分生组织全部向花芽方向分化所造成的。当温度或光周期提高至一定程度时,该品系能出现花序逆转的现象。将此无侧枝黄瓜品系和有侧枝黄瓜品系的形态解剖学观察结果对比后发现,在黄瓜叶腋部位原基形成的早期阶段,原基是同质的,由遗传和环境共同决定将来的分化方向。
【英文摘要】Lateral branching and inflorescence are important components of plant architecture.Plant usually changes from vegetative growth to reproductive growth.A cucumber line S61 with non-lateral branch phenotype was observed in greenhouse for several years.Both anatomy observation and different growth condition tests had been taken in this study.The results showed that the axillary meristem of line S61 had differentiated to flower buds.Inflorescence reversion could happen in S61 when growth condition changed.Anatomy comparison results between had/non lateral branch cucumber lines proved that at the early steps of development,axillary primordium were all the same,differentiation aspect were determined mainly by inheritance.

【题目】萝卜RsSRK-a 基因cDNA克隆与表达特性分析
【中文关键词】萝卜; 自交不亲和性; SRK基因; 克隆; 表达分析
【英文关键词】Raphanus sativus L.; self-incompatibility; SRK gene; cloning; expression analysis;
【中文摘要】以萝卜Nau-DY06为试材,采用亲和指数和荧光显微镜进行自交不亲和性测定,结果表明其为稳定自交不亲和系。根据不同作物SRK基因保守序列设计特异引物,以Nau-DY06柱头为材料,采用RT-PCR扩增获得SRK基因cDNA序列,包含2562bp开放阅读框(ORF),命名为RsSRK-a(GenBank登录号:GQ121139)。该基因cDNA序列编码853个氨基酸,其核苷酸序列与甘蓝型油菜SRK3、羽衣甘蓝SRK13-b基因同源性均为89%。RsSRK-a基因序列编码的蛋白质相对分子质量为96.6×103,等电点为6.69。半定量RT-PCR分析表明,RsSRK-a基因在自交不亲和系花期柱头中表达量远远高于蕾期柱头,而在植株的其他部位均不表达,表明SRK基因与自交不亲和特性表达密切相关。
【英文摘要】The radish self-incompatibility line Nau-DY06 was identified with the compatibility index and the fluorescence microscopy method.An ORF encoding 853 amino acids was amplified by RT-PCR from cDNA of the stigma of Nau-DY06 with the primer derived from the conserved sequences of the SRK genes in different crops.The gene was designated as RsSRK-a (GenBank accession number:GQ121139).Its identity with the SRK3 in Brassica rapa,the SRK13-b in B.oleracea var.acephala,was 89% respectively.The molecular weight of the predicated protein encoded was 96.6 × 103 and its theoretical pI was 6.69.Semi-quantitative RT-PCR analysis showed that expression of the RsSRK-a was detectable in the stigma of two days before anthesis and especially high at anthesis stage.Expression profiling of the RsSRK-a in radish stigma indicated that it might play an important role in the selfincompatibility.The results provide important information for the exploration of the mechanism and utilization of self-incompatibility in radish

【题目】低温胁迫对3个小白菜OguCMS与保持系生化指标的影响
【中文关键词】小白菜 OguCMS 低温胁迫 生化指标
【英文关键词】Non-heading Chinese cabbage ; OguCMS ; Cold stress ; Biochemical index ;
【中文摘要】以3个小白菜OguCMS与保持系为试材,苗期进行低温处理,对其叶绿素、可溶性糖、可溶性蛋白质和脯氨酸含量及超氧化物歧化酶(SOD)、过氧化物酶(POD)和过氧化氢酶(CAT)活性的变化进行研究。结果表明:不育系的叶绿素、可溶性糖、可溶性蛋白质和脯氨酸含量在处理的各阶段均低于其保持系,SOD、POD和CAT活性则是不育系高于其保持系。随着低温处理时间的延长,不育系和保持系叶绿素和可溶性蛋白质含量一直下降,可溶性糖和脯氨酸含量呈现先上升后下降的趋势;SOD、POD和CAT活性呈现先上升后下降的趋势。不育系和保持系在处理的各个阶段变化的一致性和处理后各生化指标数值差异缩小,表明小白菜OguCMS在苗期遇低温的抗逆能力与保持系很接近
【英文摘要】Three cytoplasmic male sterile lines(CMS)and their maintainer lines of the non-heading Chinese cabbage〔Brassica campestris L.ssp.chinensis(L.)Makino var.communis Tsen et Lee〕.were taken as experimental materials,and the contents of chlorophyll,soluble sugar,soluble protein,proline and changes of the activities of SOD,POD,CAT in leaf were tested during seedling.The results showed that the contents of chlorophyll,soluble sugar,soluble protein,proline in CMS were significant lower than their maintainer,while the activities of three protective enzymes(SOD,POD and CAT)were higher in CMS with the treatment of low temperature stress.The contents of chlorophyll and soluble protein decreased continuously in both CMS and their maintainer;while the contents of soluble sugar,praline and the activities of three protective enzymes(SOD,POD and CAT)at first increased,then decreased under cold-stress.There was consistency in all stages of change between CMS and its maintainer line.And after processing,the differences in physiological and biochemical characteristics reduced.All these facts suggested the resistance of cold stress of non-heading Chinese cabbage OguCMS was greatly improved.

【题目】甜(辣)椒花药培养胚状体诱导与植株再生.
【中文关键词】甜(辣)椒 花药培养 胚状体 植株再生
【英文关键词】pepper (Capsicum annuum L.) ; anther culture ; embryoid ; plant regeneration ;
【中文摘要】以10份不同基因型甜(辣)椒为试材进行花药培养,通过对基因型、取蕾时期、低温预处理、热激处理、碳源及外源激素浓度配比等因素的研究,建立有效的甜(辣)椒花药培养胚状体发生体系。结果表明:基因型是限制甜(辣)椒花药培养胚状体诱导的关键因素,不同品种间出胚率差异显著,其中品种003出胚率最高,为10.8%;处于盛花期的花蕾最适于甜(辣)椒花药培养;4℃低温预处理1~3d有利于胚状体的诱导,以处理2d的胚状体产率最高;以2%的麦芽糖代替3%的蔗糖能显著提高出胚率和子叶形胚的比率,筛选出适于甜(辣)椒花药培养胚状体诱导的最佳培养基为MS+0.5mg/LNAA+1.0mg/LKT+2%麦芽糖,能有效地提高出胚率并促进植株再生;获得了6个基因型的子叶形胚和再生植株。
【英文摘要】Ten varieties of pepper were used to study the effects of genotype, flower buds harvest time,eold-pretreatment, hot-shock treatment, carbon source and combination of hormones on the anther culture in Capsicum annuum L. Through these tests, an effective system of embryoid production was established. Cotyledonary embryoids and plantlets were obtained from six genotypes. The results showed that genotype was the key factor in embryoid induction. The embryoid formation frequency was different significantly among different genotypes. The variety 003 had the highest embryoid formation frequency which was 10.8%. The flower buds at full-bloom stage were found to optimum for anther culture in pepper. Coldpretreatment (4 ℃) for 1-3 d also promoted embryoid induction,while the highest embryoid formation frequency was obtained from anther pretreated at 4 ℃ for 2 d . Embryoid and eotyledonary embryoid formation frequency could be more re-markably improved by 2% maltose than 3% sucrose. The optimal culture medium whieh could effectively improve embryoid and regenerated plantlets formation was MS + 0. 5 mg/L NAA + 1.0 mg/L KT + 2% maltose.

【题目】辣椒抗黄瓜花叶病毒(CMV)基因的ISSR标记
【中文关键词】辣椒 黄瓜花叶病毒 ISSR标记 遗传距离
【英文关键词】Hot pepper (Capicum onnuum L.), CMV, ISSR marker, Genetic distance ;
【中文摘要】辣椒(Capicum annuum L.)抗黄瓜花叶病毒(CMV)一直是辣椒育种的主攻目标之一。本研究以辣椒抗CMV品种VC16a和感CMV品种SS69杂交的F2群体60个单株材料,通过人工接种鉴定,采用高抗单株和高感单株分别构建抗、感基因池,利用BSA法筛选了40条ISSR引物,其中引物I-34在抗感病池中扩增出450bp多态性片段,通过F2单株验证后证明I-34450与抗CMV基因紧密连锁,其遗传距离为27.3cM,为辣椒抗CMV分子标记辅助育种奠定了基础。
【英文摘要】Resistance to cucumber mosaic virus (CMV) is an important objective in pepper breeding program. ISSR analysis was conducted using BSA (bulked segregant analysis) of a segregating F2 population which has 60 individuals from a cross between VC 16a (resistant) and SS69 (susceptible). After performing in ISSR-PCR analysis with 40 primers and PAGE, only one ISSR marker I-34450 was identified to be linked to the resistant gene and was determined to be 27.3 cM from the resistant gene. In present research it would provide the basis for the resistant to CMV gene tagging in modem pepper breeding.

【题目】低温贮藏对丝瓜花粉省活力和结实的影响
【中文关键词】有棱丝瓜 普通丝瓜 冷藏花粉 花粉活力 结实率 单瓜结籽数 生殖隔离 母体效应 冷藏处理 杂交组合
【英文关键词】无
【中文摘要】冷藏处理没有降低有棱丝瓜和普通丝瓜的花粉活力,对种间杂交授粉的结实率和单瓜结籽数也没有趋势性的影响。有棱丝瓜和普通丝瓜种间正反交F1间没有生殖隔离现象,一般来说,以有棱丝瓜为母本的单瓜结籽数略多。种内和种间杂交组合结实率的差异可能与母本植株长势弱、不易坐果有关。特定杂交组合的结实率偏低,可能与柱头和花粉的亲和性有关。种内杂交有棱丝瓜做母本的单瓜结籽数明显比普通丝瓜做母本的少。普通丝瓜的单瓜结籽数在F0代有正向优势;普通丝瓜种内杂种的单瓜结籽数、种子产量有母体效应。

【中文关键词】普通丝瓜 性别分化 无性节 纯雄节 纯雌节 双性节
【英文关键词】无
【中文摘要】通过对78份普通丝瓜品种30节内的雄、雌花蕾着生状况进行调查,分析了无性节、纯雄节、纯雌节和双性节(同时存在雌雄花蕾)的分布规律。结果表明:普通丝瓜的性别分化比较复杂。无性节一般分布在起始几节,呈现连续或不连续分布,少量品种在高节位还有零星分布;双性节中雌花和雄花有11种组合方式,以多雄+单雌节最常见,在所有丝瓜材料中均有出现;雄花从个体(枚数)存在状态看,有单枚和多枚(又叫总状花序)之分,雄花分布在纯雄节和双性节之中,雄花在纯雄节中存在6种表现形式;早熟材料的有雄节(包括纯雄节和雌、雄节)有24.1节,中熟材料的有雄节有23.6节,晚熟材料的有雄节有21.3节,且熟性越早有雄节数越多;雌花在纯雌节中有4种表现形式,以单雌形式存在最普遍;早熟材料的有雌节(包括纯雌节和双性节)有23节,中熟材料的有雌节有18.7节,晚熟材料的有雌节有13.55节;无性节、纯雄节、纯雌节和双性节的数量与品种来源地、果形、植株长势和叶色均未表现出趋势性差异。

【题目】普通丝瓜与有棱丝瓜亚种间杂交的正反交效应分析
【中文关键词】普通丝瓜 有棱丝瓜 亚种间杂交 正反交效应 杂种优势
【英文关键词】无
【中文摘要】对2个有棱丝瓜品系(有棱丝瓜1号、有棱丝瓜2号)与3个普通丝瓜品系(极早丝瓜、短棒丝瓜、长沙肉丝瓜)配制的12个正反交亚种间杂交组合杂种F1代农艺性状进行分析,结果表明:有棱丝瓜作父本或母本在F1代第一雌花节位和前期产量上表现出显著差异,且不同有棱丝瓜材料对正反交效应影响较大;F1代瓜长、瓜径、单瓜质量表现出较小差异,不同有棱丝瓜材料对正反交效应影响不大。普通丝瓜无论作母本还是父本,与有棱丝瓜1号的杂交F1代第一雌花节位负向杂种优势均大于与有棱丝瓜2号的杂交组合;而杂交F1代的瓜长、瓜径、单瓜质量杂种优势基本上也大于与有棱丝瓜2号杂交

的组合。

【题目】不同品种花粉对江蔬一号丝瓜结实率的影响
【中文关键词】江蔬一号丝瓜 品种 结实率 花粉 周年供应 设施栽培 露地栽培 草本植物
【英文关键词】无
【中文摘要】普通丝瓜为葫芦科丝瓜属一年生攀缘性草本植物,原产亚洲南部热带地区,大部分品种以主蔓结瓜为主,以嫩果供食用,瓜肉细腻柔软,味道鲜美,是深受广大消费者喜爱的夏季蔬菜作物之一。随着我国设施园艺产业的迅猛发展,丝瓜从单一露地栽培到露地和规模设施栽培并重发展,从传统夏秋供应到全年上市,形成了周年生产周年供应的局面,在全年蔬菜生产和供应中发挥了越来越重要的作用。

【题目】丝瓜种质资源亲缘关系的ISSR分析
【中文关键词】丝瓜 种质资源 亲缘关系 ISSR
【英文关键词】luffa(Luffa cylindrical(L.)Roem.) ; germplasm resources ; genetic relationship ; ISSR ;
【中文摘要】利用ISSR标记,对来源于不同地区的丝瓜种质资源的亲缘关系进行了分析。从80个ISSR引物中筛选出多态性强、重复性好的9个引物,对43份丝瓜种质基因组DNA进行扩增,共扩增出60条谱带,平均每个引物扩增出6.67条带,其中多态性带47个,多态性位点百分率为78.3%。丝瓜种质间遗传相似系数变化范围在0.37~0.98之间,暗示了丝瓜栽培种内的遗传基础相对狭窄。利用UPGMA聚类分析,43份丝瓜种质被划分为6个类群,类群的划分与形态学性状较吻合,而且与地理来源也有较高的相关性。
【英文摘要】Phylogenesis of 43 common luffa germplasm from different regions was analyzed with ISSR.9 primers were selected from 80 ISSR primers.60 DNA fragments were amplified from 43 samples and each primer resulted in 6.67 DNA fragments.47 fragments were polymorphic(percentage of polymorphic bands was 78.3%).The value of Nei ′ s genetic similarity(GS)indexes of 43 common luffa germplasm varied from 0.37 to 0.98,suggesting that the genetic diversity among them is short.Cluster analysis with UPGMA method showed that the 43 germplasm could be divided into six groups.The results according to the pedigree relations had connections with morphological traits and regions of germplasm origin.

【题目】普通丝瓜果实性状的遗传分析
【中文关键词】普通丝瓜 遗传 果实性状 主基因+多基因遗传模型 多世代联合分离分析
【英文关键词】luffa ; inheritance ; fruit characters ; mixed major gene plus polygene mixed inheritance model ; joint segregation analysis of multiple generations ;
【中文摘要】应用植物数量性状主基因+多基因混合遗传模型对普通丝瓜品种50—5(黑籽短圆筒)X204(桂林水瓜)杂交组合6个世代群体的5个果实性状(果柄长、果长、果径、果形指数和单果质量)进行了联合分析,结果表明:50-5×20-4组合果柄长的遗传符合2对加性-显性-上位性主基因+加性-显性多基因遗传模型,其B1、B2和F2群体遗传率(主基因+多基因)分别为68.49%、53%和82.07%,环境方差占总表型方差的比例分别是31.50%、29.47%和17.92%;果长遗传符合2对加性-显性-上位性主基因+加性-显性-上位胜多基因遗传模型,其B1、B2和F2群体遗传率(主基因+多基因)分别为68.85%、84.55%和81.68%,环境方差占总表型方差的比例分别是31.15%、15.44%和18.32%;果径遗传符合2对加性-显性-上位性主基因+加性-显性-上位性多基因遗传模型,其B1、B2和F2群体遗传率(主基因+多基因)分别为65.23%,73.06%和73.82%,环境方差占总表型方差的比例分别是34.62%,26.94%和26.13%;果形指数遗传符合2对加性-显性-上位性主基因-加性-显性-上位性多基因遗传模型,其B1、B2和F2群体遗传率(主基因+多基因)分别为65.23%、62.80%和78.89%,环境方差占总表型方差的比例分别是34.76%、3Z19%和21.11%;单果质量遗传符合2对加性-显性-上位性主基因+加性-显性-上位性多基因遗传模型,其B1、B2和F2群体遗传率(主基因+多基因)分别为70.71%、85.35%和89.64%,环境方差占总表型方差的比例分别是29.29%、14.64%和10.36%。果柄长性状的主基因遗传率较小,宜采用个体选择法(基因型选择法),宜在分离晚世代进行选择;果长、果径、果形指数和单果质量性状的主基因遗传率较大,宜采取混合选择法(表型选择法),可在分离早世代进行选择;且宜对5个果实性状进行综合选择。5个果实性状的环境方差占总表型方差的比例均较高,故在育种过程中要尽量采取措施以减少环境影响

。
【英文摘要】Inheritance of the five fruit characters (fruit stalk length, fruit length, fruit diameter, fruit shape index and weight of single fruit) for luffa in P1, P2, F1, B1, B2 and F2 from the cross 50-5 (Heiziduanyuantong) × 20-4 (Guilinshuigua) were investigated by the mixed major gene plus polygene mixed inheritance model of quantitative traits. The joint analysis results showed that the fruit stalk length of the cross was controlled by two adding-dominanceepistatic major gene plus adding-dominance polygene model, while the fruit length, fruit diameter, fruit shape index and weight of single fruit of the cross were controlled by two adding-dominance-epistatic major gene plus adding-dominance-epistatic polygene model. In inheritability ratios (major gene + polygene), fruit stalk length in the cross of B1 , B2 and F2 populations were estimated as 68.49%, 70. 53% and 82. 07% respectively, fruit length were 68.85% , 84. 55% and 81.68% respectively, fruit diameter were 65.23%, 73.06% and 73.82% respectively, fruit shape index were 65.23% , 62. 80% and 78. 89% respectively, and weight of single fruit were 70. 71%, 85.35% and 89. 64% respectively. In the ratios of environmental variance to phenotype variance, fruit stalk length in the cross of B1, B2 and F2populations were estimated as 31.50% , 29.47% and 17. 92% respectively, fruit length were 31.15%, 15.44% and 18. 32% respectively, fruit diameter were 34. 62%, 26. 94% and 26. 13% respectively, fruit shape index were 34. 76%, 37.19% and 21.11% respectively, and weight of single fruit were 29. 29%, 14. 64% and 10. 36% respectively. To fruit stalk length, the method of individual selection (genotype selection method) on high separated generations was effective because of its small heritability values, while to fruit length, fruit diameter, fruit shape index and weight of single fruit, the method of mixed selection (phenotype selection method) on young (low) separated generations was effective because of their high heritability values. Systematic consideration on the five fruit characters was better. Because the ratioes of environmental variance to phenotype variance in the five indexes were all high, environmental influence must be reduced in the luffa breeding.

【题目】茂名地区甜椒栽培试验初报
【中文关键词】甜椒 栽培 产量
【英文关键词】sweet pepper ; planting ; yield ;
【中文摘要】2007年在茂名市茂南区鳌头镇林道村进行了不同甜椒品种、不同种植密度、不同栽培方式的多因子正交试验,结果表明:对甜椒产量影响力大小顺序为:品种〉栽培方式〉密度,其中产量较高的品种是中椒5号和福康圆椒;露地栽培、地膜覆盖栽培、地膜+稻草覆盖栽培3种栽培方式的甜椒产量差异不大;在行距为75cm条件下,采用株距21、24、27cm种植的甜椒产量差异也不大。
【英文摘要】Orthogonal design was utilized to determine the effects of combinations of cuhivars, plant density and cultivated form on yield in sweet pepper at Maomin city, Guangdong province in 2007. Results showed the turn of effects was as follow: cuhivars 〉 cultivated form〉 plant density, and the yield of Zhongjiao No.5 and Fukang Yuanjiao were higher than other cuhivars'. In addition, there are not significant difference among the three cultivated forms, including of outerdoor planting, plastic mulch planting and plastic mulch with straw cover planting. Moreover, under the same planting form with 75 cm between-row distance, there are also not remarkable difference among the three cultivated form with 21 cm, 24 cm and 27cm between-tree distance.

【题目】辣椒耐高温高湿灰色关联度分析
【中文关键词】辣椒 耐高温高湿性 生理生化性状 灰色关联度分析
【英文关键词】Hot pepper ; High temperature and air humidity resistance ; Physic-biochemical traits ; Gray correlation analysis ;
【中文摘要】采用灰色关联分析(Graycorrelationanalysis),探讨辣椒生理生化性状与耐高温高湿的关系。对分别处于高温高湿和正常条件下的10个辣椒品种(系)21个生理生化性状耐高温高湿系数进行了分析和评价。依据各品种(系)的加权关联度对参试品种(系)进行了聚类分析,参试品种(系)中极耐高温高湿的品种(系)有I、G二个品种(系)。与耐高温高湿关联度最大的是花青素含量、过氧化氢含量、超氧化物歧化酶活性和脱氢抗坏血酸还原酶活性4个生理生化性状,它们在高温高湿双重逆境胁迫下所受的影响最大,与辣椒耐高温高湿性关系最密切。因而可以选用花青素含量、过氧化氢含量、超氧化物歧化酶活性、脱氢抗坏血酸还原酶活性等生理生化性状进行辣椒耐高温高湿的以性状为基础的选择,以提高选择效率。
【英文摘要】This paper aims at probing the relationship between physic-biochemical traits and the high temperature and air humidity resistance of hot pepper varieties. A total 21 physic-biochemical traits that measured in 10 hot pepper varieties at high temperature and air humidity and control conditions, were analyzed using gray relational grade analysis method. Gray correlation degrees facilitated in identifying the high temperature and air humidity resistance of hot pepper. And the cluster based on the relation degree of 10 hot pepper varieties. Varieties that had the strongest high temperature and air humidity resistance among the 10 hot pepper varieties were I and G. It was concluded that the physicbiochemical traits had the closest relationship with the high temperature and air humidity resistance of hot pepper, and these traits were significantly influenced by high temperature and air humidity stress, thus had the greatest relation degree with the high temperature and air humidity index. So the physicbiochemical traits including leaf flower pigment content, H2O2 content, SOD, DHAR could be used .

【题目】辣椒苗期耐热耐湿鉴定方法研究
【中文关键词】辣椒 苗期 耐热耐湿 鉴定
【英文关键词】hot pepper (Capsicum annuum L.) ; seedling stage ; high temperature and air humidity resistance ; identification ;

【中文摘要】以辣椒各生理指标的耐逆系数为衡量辣椒单项耐逆能力大小的指标,用聚类分析法、主成分分析法、隶属函数法对辣椒不同品种(系)耐热耐湿性予以综合评价。综合评价的结果,将10个供试品种(系)按耐热耐湿由强到弱划分为4级:高度耐热耐湿(I)、中度耐热耐湿(G、J、W、H)、不耐热耐湿(C、E、F、K)和极不耐热耐湿(D)。几种关于辣椒品种(系)耐热耐湿综合评价的方法具有较好的一致性,同时利用耐热耐湿性的综合评价值与单项指标间建立的最优回归方程可以预测其他辣椒品种(系)耐热耐湿性大小。

【英文摘要】The high temperature and air humidity resistance coefficient of single character were used to value the single capability of high temperature and air humidity resistance of hot peper(Capsicum annuum L.), and the methods of cluster analysis, principal component analysis and subordinate function were used in comprehensive evaluation for high temperature and air humidity resistance of hot pepper varieties at the seedling stage. On the basis of correlation analysis between the high temperature and air humidity resistance obtained from the above components in varieties, the 10 tested varieties could be divided into four classes of tolerance:most tolerant variety was I, followed by G, J, W, H. Less tolerant were C, E, F, K. The rest variety was not tolerant at all. The results showed that the above comprehensive evaluation methods for high temperature and air humidity resistance of hot pepper varieties at the seedling stage were well coincident. At the same time, the evaluation of high temperature and air humidity resistance could be forecasted by using the best regressive function that was founded by the comprehensive value of high temperature and air humidity resistance and the value of single index.

【题目】Temporal Variation of Beryllium-7 Fallout and Its Inventory in Purple Soil in the Three Gorges Reservoir region, China
【中文关键词】-
【英文关键词】"7Be Deposition flux Purple soil Erosion
Three Gorges Reservoir region China"
【中文摘要】-
【英文摘要】"The deposition flux of 7Be was measured in therange from 0.4 to 5.2 Bq m-2 d-1, with a mean value of2.6 Bq m-2 d-1, during the period of May 31, 2009 – May31, 2010 in the Three Gorges Reservoir region, China.The low annual deposition flux of 7Be was probably due tothe adsorption of 7Be within high altitude clouds and theQinling-Daba Mountain ’s barrier and blocking effects onthe cold air during winter months. There was a seasonaltrend for 7Be deposition, showing a spring maximum andwinter minimum, which may be attributed to the seasonalfolding of tropopause in spring and little rainfall amount inwinter. A strong positive correlation (R2 = 0.67) between7Be deposition flux and rainfall was observed. The depthdistribution of 7Be in undisturbed purple soil profiles suggestedthat the nuclide was mainly distributed within thetop 20.0 kg m-2 (*1.5 cm) of soil in depth and themaximum concentration occurred at a depth of 3.0 kg m-2(*0.2 cm), then the concentration declined quickly andexponentially with depth. The seasonal inventories of 7Bein soils were consistent with the values calculated from theatmospheric fluxes, which shows a great potential for using7Be as a tracer to assess soil redistribution in purple soilareas of China."

【题目】Heritability of Growth Traits for Small Abalone Haliotis diversicolor Estimated from sib Matings
【中文关键词】鲍,杂色鲍,遗传力,生长,半同胞
【英文关键词】abalone; Haliotis diversicolor; heritability; growth; half-sib
【中文摘要】我们通过使用一个雄性个体的精子对3个雌性个体进行人工授精的方法而设计了不平衡巢,由此获得了杂色鲍12个半同胞群体和36个全同胞群体。分别在10天,40天,120天,220天,320天和420天,估算了鲍鱼从稚鲍到到商品规格大小的遗传力增长相关的特性。遗传力的估算以雄性个体0.15-0.37的壳长和0.18-0.42的壳宽为基础。最近研究的结果显示,对杂色鲍使用选择育种来进行基因改良或许是可行的,同时有可能是获得好的选择结果的有效方法。
【英文摘要】Twelve half-sib groups and 36 full-sib groups of small abalone Haliotis diversicolor were obtained by the unbalanced nest design using artificial fertilization of 3 females by each male. Heritabilities of growth-related traits were estimated from postlarva to market size at days 10, 40, 120, 220, 320, and 420. The estimated heritabilities based on sire components for shell length and shell width were 0.15-0.37 and 0.18-0.42, respectively. Heritability estimate for shell length and shell width based on dam component were larger than those based on sire component. The results in the current study indicate that genetic improvement through selective breeding conducted on small abalone might be available and would be an efficient method to obtain a positive response to selection.

【题目】底墒对压砂地西瓜生长和产量的影响
【中文关键词】播前底墒; 西瓜; 压砂地; 生长; 产量;
【英文关键词】soil water storage before sowing; watermelon; field with gravel mulching; growth; yield;
【中文摘要】通过田间试验研究了底墒差异对西瓜生长和产量以及水分利用效率的影响。结果表明:播前适宜的底墒(0~100 cm土层储水量在223~238 mm)可以促进西瓜主蔓长的生长、叶片的发生以及提高西瓜叶面积;播前底墒较丰时(0~100 cm土层储水量在283 mm),不利于西瓜前期的生长。与播前不灌水相比,播前灌水造墒处理不同程度地提高了地上部生物量和西瓜产量;其中播前灌水量达到70m3/667m2时,西瓜产量和瓜蔓重最大,分别为1 645 kg/667m2和25.4 kg/667m2,相比播前不灌水处理分别提高了30%和49%。西瓜水分利用效率随播前土壤储水量增加而降低。 更多还原
【英文摘要】Irrigation before sowing for increasing soil moisture is a common method of water supplement for watermelon in the field with mulching gravel around Xiangshan region,Zhongwei in Ningxia.A field experiment was carried out to study the effect of soil water storage before sowing on growth,yield and water use efficiency of watermelon.The results showed that appropriate amount of soil moisture in 0~100 cm soil layer(223~238 mm) could promote main stem growth,leaf occurrence and leaf area increase of watermelon.However,abundant amount of soil water storage was not beneficial for watermelon in the early growing period.Compared with no irrigation treatment,treatment of irrigation before sowing improved watermelon yield and vine to some extent.Watermelon got the highest yield and vine biomass with 70 m3/667m2 irrigation amount,reaching 1 645 kg/667m2 and 25.4 kg/667m2 and the increasing rate was 30% and 49% respectively compared with no irrigation treatment.Nevertheless,water use efficiency of watermelon decreased with the increase of soil water storage amount before sowing.

【题目】Construction of an Integrated Map of Haliotis diversicolor Using Microsatellite Markers
【中文关键词】九孔,杂色鲍,连锁图谱,微卫星,整合图谱
【英文关键词】Small abalone; Haliotis diversicolor; Linkage map; Microsatellite; Integrated map
【中文摘要】杂色鲍自然分布在从日本到菲律宾群岛的东亚沿岸水域。它在中国南部和台湾是一种重要的经济水产养殖物种。我们通过使用含有297个特异标记的308个简单重复序列标记构建了杂色鲍的遗传连锁图谱。利用拟侧交策略得出96个后代基因型的种群隔离。在雄性和雌性图谱中鉴定出16个连锁群,与单倍染色体的数量相一致。758.3 cM的母系连锁图谱中有平均5.2 cM长的间隔。雄性连锁图谱跨越了共676.2 cM的遗传距离,平均间隔为4.5 cM。通过合并同源亲本连锁群创建了一个综合图谱,形成共762.1 cM长的16个连锁群。基因组覆盖了大约80.7%的综合连锁图谱。杂色鲍的基因连锁图可能会促进标记辅助选择和数量性状轨迹图谱。
【英文摘要】Small abalone, Haliotis diversicolor, is naturally distributed along the coastal waters of East Asia from Japan to the Philippines. It is an economically important maricultured species in southern China and Taiwan. Genetic linkage maps for small abalone were constructed using a total of 308 simple sequence repeat markers including 297 novel markers. Segregation data on 96 progeny were genotyped using a pseudo-testcross strategy. Sixteen linkage groups were identified in both female and male maps, consistent with the haploid chromosome number. The female linkage map covered 758.3 cM, with an average interval of 5.2 cM. The male linkage map spanned a total genetic distance of 676.2 cM, with an average interval of 4.5 cM. An integrated map was constructed by incorporating the homologous parental linkage groups, resulting in 16 linkage groups with a total of 762.1 cM. Genome coverage of the integrated linkage map was approximately 80.7%. The genetic linkage maps of small abalone may facilitate marker-assisted selection and quantitative trait loci mapping.

【题目】中棉所12配制的2个杂交棉DNA甲基化遗传与传递
【中文关键词】中棉所12;杂交棉;甲基化;MsAP
【英文关键词】CRI-12;Hybrids cotton;DNA methylation;MSAP
【中文摘要】DNA甲基化在真核生物的生长发育过程中起着重要的调控作用。本研究用MsAP方法分析了中棉所12配制的2个杂交棉和亲本不同发育时期的基因组DNA5’一ccGG位点胞嘧啶的甲基化水平及其遗传传递模式。研究表明:(1)杂交棉及其亲本不同发育时期的胞嘧啶甲基化水平不同,随着生育期的逐步推进,出现两头低而中间高现象;(2)两个杂交棉组合的DNA甲基化总体水平为12.41%一20.05%,其中以内侧胞嘧啶全甲基化为主(约占6.90‰11.47%);(3)棉花中绝大多数CCGG胞嘧啶甲基化位点是由亲本稳定遗传给杂交种的,但杂交棉仍有1.14%~3.39%的位点显示了变异,其变异频率在不同亲本组合之间和不同发育时期都存在差异:(4)对甲基化差异条带测序分析发现,其功能涉及到富含亮氨酸重复、类PDR的ABc转运蛋白、GTP结合蛋白、病程相关蛋白、磷酸激酶、功能未知的蛋白质和反转录酶等,部分差异序列没有产生有意义的匹配。

【题目】衣分不同陆地棉品种的产量及产量构成因素的遗传分析

【中文关键词】衣分;产量;产量构成因素;主基因.多基因;双列杂交
【英文关键词】Lint percentage;Yield;Yieldcomponents;Majorgene-polygene;Diallel cross
【中文摘要】选用衣分不同的陆地棉品种配置组合,率先将主基因.多基因联合世代分析与双列杂交试验分析相结合,分别从单个和整体基因水平上对棉花产量及产量构成因素进行了遗传研究。对2个高×低衣分组合的主基因.多基因6世代联合分析结果表明,各产量性状至少在1个组合中检测到主基因的存在,说明产量性状主基因存在的普遍性。由2个组合各产量性状的主基因、多基因遗传率比较得出,产量性状的主基因遗传率比多基因遗传率在不同组合间趋势变化相对较稳定;各性状在2个组合中的主基因、多基因遗传率分量不完全相同。衣分、铃重和籽指在2个组合中分别以主基因遗传为主和以多基因遗传为主;子棉产量和皮棉产量在2个组合中均以主基因遗传为主;衣指在组合I中以多基因遗传为主,在组合II中属于典型的多基因遗传;单株铃数在组合I中属于典型的主基因遗传,在组合II中以多基因遗传为主。双列杂交结果表明,陆地棉产量及产量构成因素都有较高的遗传主效应方差,产量性状受加性效应和显性效应共同控制,其中。衣分、衣指以加性效应为主;子棉产量、铃重和籽指以显性效应为主;皮棉产量和单株铃数以加性和显性效应为主。衣分和衣指的普通广义遗传率和普通狭义遗传率均最高,与联合世代分析两性状的总遗传率平均值结果趋势一致。相关和通径分析一致表明,产量构成因素中单株铃数对皮棉产量的贡献最大,衣分次之,铃重最小

【题目】中棉所12及其选系配制的4个杂交棉幼苗期基因差异表达
【中文关键词】中棉所12;杂交棉:基因差异表达
【英文关键词】CRI-12:Hybrid cotton:Differential expression gene
【中文摘要】以与中棉所12及其2个选系为亲本组配的4个杂交棉中棉所28、中棉所29、湘杂棉2号和冀棉18苗期的根和顶端叶为研究材料,采用eDNA.AFLP技术分析苗期杂交棉与亲本的根和叶基因差异表达,并用QuantitativeReal.Time技术加以验证。结果表明:(1)在4个杂交组合中,中棉所12选系是营养生长杂种优势高值亲本;(2)杂交种和亲本间存在显著的基因表达差异,可分为杂交种上调、单亲显性、单亲沉默、杂交种下调4种表达型。4个杂交组合在三叶期根和叶中差异表达基因的4种类型比例趋势基本一致,单亲差异表达型(包括显性和沉默表达)在根和叶中所占比例较高。杂种下调表达型所占比例较低,反映出苗期单亲差异表达型在杂种优势形成中起主要作用;叶部差异表达基因数目和比例(29.20%一46.09%)比根(15.65%-22.49%)高的多,说明叶中基因差异表达可能比根中基因差异表达对杂种优势形成作用更大;(3)高值亲本中棉所12选系与杂交棉共同表达的基因多于低值亲本与杂交棉共同表达的基因,从分子水平上证明中棉所12选系在杂交棉冀棉18、中棉所29和中棉所28的苗期营养生长杂种优势产生中起优势亲本的作用;(4)4种杂交组合差异表达基因(包含叶和根)占总表达基因的27.00%-34.56%,分析差异表达基因类型和4个杂交组合的关系发现,超显性效应占3.30%-7.17%,超低亲效应占2.62%~4.14%,低亲效应占5.65%-13.03%,显性效应和加性效应是主要的杂种优势效应,占79.52%~83.79%。多种杂种优势效应的并存说明杂种优势可能是多基因共同作用产生多种效应的结果;(5)超亲优势组合中棉所28的超显性效应占7.17%,明显高于其他3个表现中亲优势组合,说明杂交种上调表达型可能对苗期杂种优势产生起重要作用。

【题目】陆地棉抗黄萎病基因的分子标记定位
【中文关键词】陆地棉 黄萎病 遗传模型 QTL 作图
【英文关键词】无
【中文摘要】棉花黄萎病是棉花生长过程中最具破坏力的病害之一, 在世界范围内流行. 棉花黄萎病已成为棉花生产中的主要障碍. 减轻棉花黄萎病损失最为经济、安全、有效的办法就是培育和推广抗病品种. 本研究利用抗黄萎病品系60182 和感黄萎病品种军棉 1 号为亲本配制杂交组合, 对陆地棉抗黄萎病性状进行遗传分析和抗病基因分子标记定位. 用主基因+多基因混合遗传模型和P1, P2, F1 , B1 , B2 和F2 六世代联合分析的方法对病叶比例性状进行遗传分析. 结果表明, 接种BP2, VD8, T9和三者等浓度混合病菌时, 抗病性都受两对加性-显性-上位性主基因控制, 陆地棉60182 的抗病性在各个分离世代都以主基因遗传为主. 运用 F2 为作图群体构建了一个含 139 个标记位点 , 31 个连锁群 , 总长 1165 cM 的分子标记连锁遗传图谱, 标记平均距离为 8.38 cM, 覆盖棉花全基因组的 25.89%. 调查 229 个F2: 3 家系各时期平均病级代表 F2 单株抗病性, 结合连锁遗传图谱 , 复合区间作图检测 QTL. 结果显示, 在60182 上, 接种 BP2 时检测到 4 个QTL 位于D7染色体上 , 4 个QTL 位于 D9染色体上; 接种 VD8 时, 有5 个QTL 位于 D7染色体上 , 9 个QTL 位于D9染色体上; 接种T9时, 有4 个QTL 位于 D7染色体上, 5 个QTL 位于D9染色体上; 接种混合病菌时, 有3 个QTL 位于 D7染色体上, 7 个QTL 位于D9染色体上 . 60182 在不同调查时期对4 种黄萎病菌的抗性 QTL 都集中在 D7、D9两条染色体上 , 形成两个明显的抗病 QTL 集中区 . 这一结果与两对主基因的遗传模式相吻合, 充分表明陆地棉抗黄萎病品系 60182 兼具对落叶型, 非落叶型黄萎病菌的广谱抗性. 同时与陆地棉抗黄萎病 QTL 连锁的分子标记可加速抗黄萎病基因的应用, 为培育稳定高抗黄萎病新材料提供有价值的理论依据.

【题目】利用四交群体构建陆地棉栽培品种间的SSR标记遗传图谱
【中文关键词】陆地棉; 四交群体; 遗传作图
【英文关键词】up land cotton (Gossypium hirsutum L.) ; four way cross population; genetic mapping
【中文摘要】作物遗传作图与QTL定位常应用在源于两自交系的单交群体上, 是利用2个亲本之间的遗传多态信息; 而育种实践中经常用到的四交群体却很少用于遗传作图。本研究将异交物种中F1 分离群体的作图方法应用于常异花授粉作物棉花上, 以4个陆地棉栽培品种泗棉3号、苏棉12、中4133和8891为亲本, 构建陆地棉品种间四交作图群体泗棉3号/苏棉12//中4133/8891, 利用JoinMap310构建了1张陆地棉栽培品种间的SSR标记遗传图谱。该图谱由56个连锁群组成,总长为211313cM, 含有286个SSR多态位点, 覆盖率达4213%; 单个连锁群的标记数2~24个, 平均512个; 长度为0137~125cM, 平均3814cM; 标记间的平均距离为714cM。这是目前报道的第1张覆盖率达40%的陆地棉栽培品种间的分子标记遗传图谱
【英文摘要】L inkage and QTL mapp ing in crop s have been app lied mainly to single cross population derived from two inbred lines, and only polymorphism information between two parents was emp loyed to develop linkage map. Four2way cross population was rarely used to construct linkage map in crop s. In this paper, the method of linkage mapp ing used in heterozygous F1 was app lied to cot2 ton, an often2crossed pollination crop , and four up land cotton cultivars (Gossypium hirsutum L.) , Sim ian 3 , Sum ian 12 , Zhong 4133 and 8891 were used to develop a four2way cross population, Sim ian 3 /Sum ian 12 / /Zhong 4133 /8891. A linkage map was constructed based on SSR markers with JoinMap310. The linkage map was comp rised of 56 linkage group s spanning a distance of 0137 cM to 125 cM with 286 mapped loci. These loci covered 2 11313 cM , which was estimated as 4213% of the total recombina2 tion length of the cotton genome. The average genetic distance between two lociwas 714 cM. This is the first linkage map with dis2 tance beyond 40% of the total recombination length of the cotton genome.

【题目】QTL Analysis of Epistatic Effects on Yield and Yield Component Traits for Elite Hybrid Derived2RILs in Upland Cotton
【中文关键词】陆地棉; 上位性; 数量性状基因位点; 优良家系
【英文关键词】Gossypium hirsutum L1 ; Epistasis ; QTL ; Superior lines
【中文摘要】棉花的产量及产量构成因子性状是以复杂的方式遗传,遗传力较低并易受环境条件影响。经典数量遗传学指出,上位性是复杂性状的遗传基础。本研究以湘杂棉2号F8 和F9 世代重组自交系为材料,调查了3个环境下的产量及产量构成因子性状,并构建了遗传连锁图。旨在定位产量及产量构成因子性状的上位性QTL并分析QTL与环境的互作效应。所有产量及产量构成因子性状均检测到上位性QTL,共检测到16对加性互作QTL(AA) ,涉及的位点中仅4个有单位点效应,这反映了上位性的复杂性及其对产量和产量构成因子性状的重要贡献。共检测到17对QTL加性和环境互作(AE) ,以及14对上位性QTL与环境的互作,表明环境因素对产量和产量构成因子性状起重要影响作用。研究结果还表明上位性效应作为湘杂棉2号的遗传基础起着重要作用。对各性状在不同环境的优良基因型进行了预测。综合优良家系(GSL)和特定环境下的优良家系(SL)的性状表现高于两亲本,表明湘杂棉2号重组自交系各性状都有提高的潜力。由于QTL加性和环境互作以及上位性QTL与环境互作的影响,预测的优良家系基因型会随着环境的改变而不同,表明应针对特定环境开展棉花育种。
【英文摘要】Yield and yield component traits of cotton are inherited quantitatively with low heretibility and tend to vary with environmental variation1 Classical quantitative genetics has indicated that epistasis is the foundation of such complex traits1 In this study , a genetic linkage map was constructed using the recombinant inbred line (RIL) populations developed froman elite upland cotton hybrid Xiangzamian 2 (XZM2) 1 Yield and yield component traits were investigated in F8 and F9generations of RILs in three environments in China1 The purpose of the study was to map epistatic QTL and analyze QTL by environment interactions in yield and yield components of cotton1 Epistatic QTL were detected for all yield and yield component traits1 Altogether 16 pairs of QTL interactions (AA) were identified1 However , only 4 of the loci involved had single2locus effects , indicating the complexity of epistasis and their important contributions to yield and yield component traits1 Altogether 17 pairs of QTL by environments interactions (AE) and 14 pairs of epistasis by environment (AAE) interactions were detected , indicating that environment influenced yield and yield componment traits greatly1 The results suggest that epistatic effects might be importantly involved in the genetic basis of heterosis in the cotton hybrid of XZM21 Superior genotypes under different environments were predicted for all traits , indicating that there existed potential of increasing yield and yield components from XZM22derived RILs1 Due to influence of AE and AAE , the predicted SLs in different environments might be different1 In cotton breeding , it is a practical strategy to perform breeding program according to special environment1

【题目】用单片段代换系对不同时期水稻分蘖数QTL的非条件和条件定位
【中文关键词】单片段代换系;非条件QTL定位;条件QTL定位;分蘖数;水稻
【英文关键词】Single segment substitution lines; Unconditional QTL mapping; Conditional QTL mapping; Tiller number; Rice
【中文摘要】【目的】了解各个发育时期控制水稻分蘖数 QTL 的“ 静态 ”和“ 动态 ”信息。【方法】利用单片段代换系对不同时期的水稻分蘖数QTL同时进行非条件和条件定位分析。【结果】(1)水稻分蘖数至少受14个QTL影响,它们分布在第 1、2、3、4、6、7 和 8 号共 7 条染色体的相应代换片段上;(2)各个时期影响水稻分蘖数的QTL数量(变动在6~9之间)和效应(变动在1.49~3.49之间)均不相同;(3)水稻分蘖数QTL的表达具有很强的时序性,主要集中在移栽后0~7 d(有6个正表达),14~21 d(有9个随机表达)和35~42 d(有6个负表达)3个时间段内,正、负表达分别决定了最高分蘖和有效分蘖的数量;(4)每个QTL在整个生育期至少表达1次,有些可多次表达;(5)某个时期的分蘖数量取决于所有QTL的累积效应,而某个时间段内分蘖数的增减量则取决于所有QTL的净效应。【结论】用单片段代换系和条件QTL定位方法对发育性状进行QTL定位分析非常有效和准确。

【英文摘要】【Objective】 Research was carried out to understand the static and dynamic information of the QTLs for tillers in rice. 【Method】Unconditional and conditional QTL were simultaneously mapped by using single segment substitution lines for tiller number at various stages in rice.【Results】(1) At least 14 QTLs influenced tiller number in rice, distributing on the corresponding substitution segments of seven chromosomes with the number of 1, 2, 3, 4, 6, 7 and 8, respectively. (2) Both the number and the effect of tiller number QTLs were different at various stages , varying from 6 to 9 in the number and from 1.49 to 3.49 in the e ffect, respectively. (3) Tiller number QTLs expre ssed timely, mainly arising at three stag es of 0-7 d, 14-21 d and 35-42 d after transplanting with six positive, nine random and six negative expressing QTLs, respectively, which determined the number of the up most and the effective tillers in sequence. (4) Each of the QTLs detected expressed at least one time or more during the whole duration of rice growth. (5) The tiller number was determined by sum of QTL effects estimated by unconditional method, while the number of increasing or decreasing was controlled by total of QTL effects estimated by conditional method at a given stage.【Conclusion】 It is highly effective and accurate to map QTLs by using both materials of single segment substitution lines and conditional analysis methodology.

【题目】The determination of biogenic amines in chinese fermented sausages
【中文关键词】生物胺,高效液相色谱法,中国发酵香肠
【英文关键词】Biogenic amines, HPLC, Chinese fermented sausages
【中文摘要】发酵香肠样品中生物胺的测定表明该方法有效。所提出的方法,我们决定在江苏,浙江生产的8种不同的生物胺的内容。结果表明,中国的商业发酵香肠中生物胺的含有至少有7种。样品中的生物胺的平均水平是13.40毫克/升,范围从7.83至19.13 mg/100g 。这些级别以下的水平,对于大多数消费者来说,可能会引起直接的不良反应。
【英文摘要】The proposed method for biogenic amines determination in fermented sausage samples showed valid. Using the proposed method, we determined the contents of biogenic amines of 8 different produced in Jiangsu and Zhejiang province. The results showed that Chinese commercial fermented sausages contain at least seven kinds of biogenic amines. The mean total level of biogenic amines in samples was 13.40 mg/l with a range from 7.83 to 19.13 mg/100g. These levels are below the level that may elicit direct adverse reactions for most consumers.

【题目】Polyphosphates hydrolysis in chicken breast and effects of their hydrolysis on homogenate gel WHC
【中文关键词】聚磷酸盐,水解,31P NMR ,鸡,WHC
【英文关键词】polyphosphates, hydrolysis, 31P NMR, chicken, WHC
【中文摘要】本结果表明,焦磷酸钠和三聚磷酸钠在鸡胸脯肉水解。来自31 P NMR谱中,典型的峰形成的焦磷酸钠和三聚磷酸钠。焦磷酸得到了充分水解,在10小时之内。三聚磷酸钠也水解完全在10小时和焦磷酸水解率是高于,焦磷酸盐。
【英文摘要】The present results showed that both pyrophosphate and tripolyphosphate were hydrolyzed in the chicken breast meat. From the 31P NMR spectra, the typical peaks were formed by pyrophosphate and tripolyphosphate. Pyrophosphate had been fully hydrolyzed within 10h. Tripolyphosphate was also hydrolyzed completely within 10h and the rate of pyrophosphate hydrolysis was higher than that of pyrophosphates. The different hydrolysis between pyrophosphate and tripolyphosphate resulted in different effects on the WHC of chicken breast meat homogenate gel. Pyrophosphate can increase the gel WHC more effectively than tripolyphosphate, but pyrophosphate effect on the WHC of chicken breast homogenate gel diminished with its hydrolysis.

【题目】Influence of temperature, ph value and storage conditions on nisin activity
【中文关键词】乳链菌肽,活性,温度,pH值,储存条件
【英文关键词】nisin, activity, temperature, pH value, storage conditions
【中文摘要】乳酸链球菌素的活动可以使用滤纸以股代息的方法,根据抑菌圈直径估计。中国乳链菌肽的活性温度,pH值和储存条件显着影响。乳链菌肽在酸性条件下是稳定的温度,然而,随着pH值增加,温度越高是,乳链菌肽的活性的更多的损失。
【英文摘要】Using the method of filter paper scrip, nisin activity could be estimated according to the inhibition zone diameters. Chinese nisin activity was affected significantly by temperature, pH value and storage conditions. Nisin was stable to temperature under acidic condition; however, as pH was increased, the higher the temperature was, the more losses of nisin activity were. Meanwhile, the activity of nisin solution was different from that of nisin powder, which indicated that the effectiveness of nisin used in liquid food may be different from that in solid food. It is reconmanded that all these factors should be considered when use nisin in food processing and preserving.

【题目】Unconditional and Conditional QTL Mapping for Tiller Numbers at Various Stages with Single Segment Substitution Lines in Rice (Oryza sativa L.)

【中文关键词】single segment substitution line, unconditional QTL mapping, conditional QTL mapping, tiller number, rice
【英文关键词】single segment substitution line, unconditional QTL mapping, conditional QTL mapping, tiller number, rice

【中文摘要】Tiller is one of the most important agronomic traits which influences quantity and quality of effective panicles and finally influences yield in rice. It is important to understand “static” and “dynamic” information of the QTLs for tillers in rice. This work was the first time to simultaneously map unconditional and conditional QTLs for tiller numbers at various stages by using single segment substitution lines in rice. Fourteen QTLs for tiller number, distributing on the corresponding substitution segments of chromosomes 1, 2, 3,4, 6, 7 and 8 were detected. Both the number and the effect of the QTLs for tiller number were various at different stages, from 6 to 9 in the number and from 1.49 to 3.49 in the effect, respectively. Tiller number QTLs expressed in a time order, mainly detected at three stages of 0-7 d, 14-21 d and 35-42 d after transplanting with 6 positive, 9 random and 6 negative expressing QTLs, respectively. Each of the QTLs expressed one time at least during the whole duration of rice. The tiller number at a specific stage was determined by sum of QTL effects estimated by the unconditional method, while the increasing or decreasing number in a given time interval was controlled by the total of QTL effects estimated by the conditional method. These results demonstrated that it is highly effective and accurate for mapping of the QTLs by using single segment substitution lines and the conditional analysis methodology.

【英文摘要】Tiller is one of the most important agronomic traits which influences quantity and quality of effective panicles and finally influences yield in rice. It is important to understand “static” and “dynamic” information of the QTLs for tillers in rice. This work was the first time to simultaneously map unconditional and conditional QTLs for tiller numbers at various stages by using single segment substitution lines in rice. Fourteen QTLs for tiller number, distributing on the corresponding substitution segments of chromosomes 1, 2, 3,4, 6, 7 and 8 were detected. Both the number and the effect of the QTLs for tiller number were various at different stages, from 6 to 9 in the number and from 1.49 to 3.49 in the effect, respectively. Tiller number QTLs expressed in a time order, mainly detected at three stages of 0-7 d, 14-21 d and 35-42 d after transplanting with 6 positive, 9 random and 6 negative expressing QTLs, respectively. 【题目】磷酸盐混合物对鸡胸肉盐溶蛋白凝胶特性的影响
【中文关键词】磷酸盐;鸡胸肉;凝胶;特性
【英文关键词】polyphosphates;chicken breast;gel;functionalyties
【中文摘要】本试验以艾维茵肉鸡鸡胸肉为试材,采用混料回归试验设计,在特定的条件下加入不同配比的磷酸盐TSPP、STPP、HMP,提取盐溶蛋白,制备热诱导凝胶。通过蛋白含量及其组分、凝胶保水性、流变性的测定,筛选最适磷酸盐混合物。结果表明,不同磷酸盐混合物改善凝胶特性的程度不同。在0.01mol/LMgCl2、0.6mol/LNaCl和pH7.0条件下,改善鸡胸肉盐溶蛋白凝胶特性的最佳磷酸盐配比为TSPP:STPP:HMP=1/3:5/12:1/4。当这种磷酸盐混合物的添加量为3g/kg时,可使鸡胸肉盐溶蛋白凝胶保水性和流变特性保持较高水平。
【英文摘要】The gel functional properties of salt soluble proteins of chicken breast was studied here by Mixed regression design in this experiment. Different polyphosphates mixture(STPP, DSPP, HMP) were applied to improve the meat quality in a certain cases. The protein content, protein composition, water-holding-capacity(WHC), rheological properties of heat-induced gel of chick breast were measured and analysed, so that the better polyphosphates mixture was choosed. The main research contentswere as followed: the effect of different polyphosphates mixture was different. In certain cases(0.01mol/L MgCl2, 0.6mol/L NaCl, pH7.0), the WHC and rheological properties of the chicken breast gel was better when the polyphosphates mixture was DSPP: STPP:HMP = 1/3:5/12:1/4 and total amount was 3g/kg.

【题目】瓜类细菌性果斑病菌过敏性反应和致病性(hrp)基因簇部分基因的克隆及功能分析
【中文关键词】瓜类细菌性果斑病菌,过敏性反应和致病性(hrp)基因,突变,致病性
【英文关键词】Bacterial fruit blotch of melon,Hypersensitive response and pathogenicity(hrp)gene,Mutant,Pathogenicity
【中文摘要】过敏性反应和致病性(hrp)基因存在于革兰氏阴性植物病原细菌中,决定病原细菌对寄主植物致病性和诱导非寄主及抗病植物过敏性反应(hypersensitive response,HR)。本研究从果斑菌(Acidovorax avenaesubsp.citrulli)的hrp基因簇中克隆了hpaA、hrcT、hrcC和hrpG基因,通过同源重组的方法,分别构建了其突变体。电镜观察发现,hpaA和hrpG基因突变体的鞭毛缺失且细胞定结果显示,hpaA、hrcT和hrcC的突变体均失去在烟草上的HR激发能力和在哈密瓜叶片上的致病性;hrpG形态发生显著变化,而hrcT和hrcC基因突变体的鞭毛和细胞形态未发生明显变化。在烟草(Nicotiana tabacam)和哈密瓜(Hami cantaloupe)叶片上的测在烟草上的HR激发能力和在哈密瓜上的致病性则显著减弱;进一步的生长曲线测定结果表明,hpaA、hrcT、hrcC和hrpG的突变体的定殖能力均显著下降。相应地,功能互补后突变体基本恢复至野生表型。证明瓜类细菌性果斑病菌hrp基因作为III型分泌系统关键组份影响病原细菌对寄主植物的致病性和对非寄主及抗病植物的过敏性反应。
【英文摘要】The hypersen sitive response and pathogenicity(hrp)genes exist in Gram-negative plant pathogenic bacteria and are responsible for the pathogenicity of bacteria.They can induce hypersensitive response(HR)on non-host and resistant plants.hpaA,hrcT,hrcC and hrpG genes were cloned from the hrp gene cluster of Acidovorax avenae subsp.citrulli.Disruption mutants of strain xjl12 were successfully generated by a single cross-over event.Electron microscopy observation showed that the cells of hpaA and hrpG mutants lacked detectable flagella and obviously changed in cell morphology,while hrcT and hrcC mutants'flagella and cell morphology did not change.Surprisingly,hpaA,hrcT and hrcC mutants lost HR-in duced capacity in tobacco (Nicotiana tabacam)and the pathogenicity in melon(Hami cantaloupe)leaves;while the hrpG mutant was significantly reduced.Furthermore,growth analysis results showed that colonization of hpaA,hrcT,hrcC and hrpG mutants were significantly decreased,respectively.Accordingly,the mutant phenotypes nearly recovered after complement.Overall,these results indicate that the hrp genes of bacterial fruit blotch of melon

as a key component

【题目】瓜类细菌性果斑病菌luxR基因的功能分析
【中文关键词】信号分子,群体感应,luxR基因,瓜类细菌性果斑病菌
【英文关键词】Signal molecule,Quorum sensing,luxR gene,Acidovorax avenae subsp.citrulli
【中文摘要】luxR基因作为信号分子受体蛋白的编码基因,在革兰氏阴性菌群体感应(quorum sensing,QS)LuxI/LuxR环路中起重要作用。本研究采用PCR技术从瓜类细菌性果斑病菌(Acidovorax avenae subsp.citrulli)xjL12中扩增出luxR同源基因,应用同源重组的方法构建了突变株(△luxR),并对其功能进行初步研究。实验结果表明,△luxR与野生型菌株相比产生的群体感应信号分子浓度降低,抗生素耐受水平有所提高,对哈密瓜(Cucuumis melo var.cantalupensis)幼苗的致病能力下降;RT-PCR实验表明,luxR基因的缺失对luxI基因的表达有抑制作用。本研究为今后对以luxR基因为靶标,利用信号干扰技术综合防治瓜类细菌性果斑病提供基础资料。
【英文摘要】LuxR homologues are the main component of LuxI/LuxR circus in quorum sensing(QS)of Gram-negative bacteria.In this study,an internal fragment of luxR homologue from Acidovorax avenae subsp.citrulli was amplified by PCR,the luxR insertion mutant was constructed by homologue recombination.In comparison withthe wild-type strain,the luxR deletion mutant(△luxR)had a significantly reduced ability to form acyl homoserine lactones(AHLs),which are quorum-sensing molecules.Tolerance to antibiotics were enhanced in the△luxR than that of the wild-type strain.△luxR had reduced virulence on melon(Cucuumis melo var.cantalupensis)leaves.RT-PCR indicated that LuxR protein regulated expression of the luxI gene.The study of luxR gene is to provide basic data for the prevention and control of Acidovorax avenae subsp.citrulli using the technology of signalinterference.

【题目】干腌火腿现代滚揉腌制工艺研究
【中文关键词】干腌火腿;滚揉腌制;用盐量;
【英文关键词】dry-cured ham;knead-salting;salt dosage;
【中文摘要】 通过干腌火腿现代滚揉腌制成套技术装备进行滚揉腌制工艺正交试验,研究用盐量、腌制时间、上盐次数等试验因素对腌制效果的影响。结果表明:采用滚揉腌制能有效提高腌腿表层盐分和内部水分传质渗透速度,腌制25d股二头肌NaCl含量达到传统工艺35d水平,且用盐量比传统工艺降低30%,均匀性提高10%;回归试验因数的相关分析结果表明:NaCl含量与腌制时间呈极显著正相关(p<0.01),与用盐量也呈显著正相关(p<0.05)。滚揉腌制工艺优化结果为:6%用盐量—25d腌制时间—4次上盐滚揉处理组合。
【英文摘要】 The modern knead-salting technique of dry-cured ham was studied by orthogonal test, in test factors salt dosage, salting time and salting method. The results showed that the modern knead-salting technique effectively enhances the permeation rate of salt on surface layer and internal moisture transfer speed. Salted for 25 days, the NaCl content in biceps femoris muscles has achieved the traditional process level of 35 days salting, and the salt dosage has been reduced 30% in comparison to the traditional process with the uniformity improved 10%. NaCl content in biceps femoris muscles is significantly and positively correlated with salting time (p<0.01)and salt dosage (p<0.05). The optimizing orthogonal test results are: 6% salt dosage for 25 days and knead- salting 4 times.

【题目】中国农业生态系统外来种入侵及其管理现状
【中文关键词】入侵种发生数量,原产地,抗药性,化学防治,生物防治
【英文关键词】tobacc o; Ral stonia solanac earum; phylotype; biovar; Fujian province
【中文摘要】农业生态系统极易遭受外来生物入侵。作者根据文献资料和多年工作观察统计出入侵我国农业生态系统的外来生物共计92科175属239种,其中植物155种,动物55种,微生物29种,植物多为有意引入后逸生,而动物和微生物则主要是无意引入。外来入侵种发生数量呈现从南到北、从东到西逐渐减少的趋势。这些入侵种中,来源于美洲的最多(占45.04%),其次是欧洲(22.90%);菜地(包括温室大棚)和果生物,应作为防除的重点目标。目前农业生态系统外来入侵物种的控制以化学防治为主,但由于长期施用化学农园入侵种最多,分别达64.85%和66.53%,而半年期的秋熟旱地和夏熟旱地分别占34.31%和23.85%。其中17种外来杂草、10种害虫、7种病原菌为恶性有害药,在侵入我国农田的入侵种中,已有51种在世界不同地区演化出抗药性生物型,因而需重视生物防治、农业和生态防治以及检疫等的综合应用。今后外来种对农业生态系统的入侵格局、机制和趋势,入侵途径以及生物入侵和抗药性生物型对农业生态系统中有害生物群落演替的影响、转基因作物导致的生物入侵等问题值得关注。
【英文摘要】Agricultural ecosystems are vulnerable to biological invasions.There are a total of 239 invasive alien species in a variety of agricultural ecosystems in China.Among them,155 species are plants,55 are animals and 29 are microbes.The number of invasive alien species decreases from south to north,and from east to west in China.Invasive alien plant species are generally introduced intentionally,while animals and microbes are mainly unintentionally introduced.Among these invaders,45.04%have a geographical origin in the Americas,22.90%in Europe,and 16.41%in Asia.Of these species,64.85%and 66.53%occur in vegeta-ble gardens(including greenhouses)and orchards,respectively,while 34.31%,23.85%and 6.28%occur in summer-harvested crop dry land,autumn-harvested crop dry land and paddy field,respectively.Among these 239 invaders,17 plant species,10 animals and 7 microbes are noxious pests which,we feel,deserve closer management attention.Currently,chemical control is the principal approach to managing these species in agricltural ecosystems.However,long-term application of pesticides has led to pesticide resistance in some invasive species,with 51 of the 239 invasive alien species reported as exhibiting pesticide-resistant popula- tions worldwide.Therefore,more attention should be paid to management which integrates biological con-trol,ecological measures,agronomic means and quarantine.We suggest that research into the followin is-sues would be fruitful:patterns and mechanisms of and trends in biological invasions in agricultural ecosys-tems,origin sources and invasion pathways,influences of biological invasions and pesticide resistance on successions of pest communities,and biological invasions caused by transgenic crops.

【题目】热死环丝菌生长预测模型的建立
【中文关键词】冷却肉; 热死环丝菌; 温度; 预测模型;
【英文关键词】chilling pork;Brochothrix thermosphacta;temperature;predictive models;
【中文摘要】针对引起冷却肉腐败的优势微生物热死环丝菌,以分离得到的S-8菌株作为受试菌株,研究了0~10℃低温条件下热死环丝菌S-8的生长情况。利用SAS程序拟和不同温度条件下的生长情况,经过比较发现,Gompertz模型比线性模型能更好地拟合热死环丝菌的生长,从而得到了其生长的Gompertz模型参数;利用平方根模型对其的最大比生长速率平方根-温

度(U(1/2)-T)进行拟合,得到热死环丝菌S-8生长的二级模型:U(1/2)=0.1192(T+6.00),T∈[0,10];利用培养基数据,冷却肉产品数据和温度波动条件下的数据对所得到的二级模型进行验证,计算得到总的偏差因子和准确因子分别为0.982和1.223,结果表明二级模型能真实快速有效地预测冷链条件下冷却肉中热死环丝菌的生长。

【英文摘要】 Brochothrix thermosphacta is the major spoilage microorganism in chilling pork.Based on one of the isolated strain S-8 from chilling pork,its status of growth from 0~10 ℃ was studied.By the SAS program and the status of growth at different temperatures,compared to linear model,Gompertz model predicted well the growth of Brochothrix thermosphacta,and gained its parameter in Gompertz model;The secondary model of Brochothrix thermosphacta gained by square-root model was described by the following equation:U(1/2)=0.1192(T+6.00),T∈[0,10];Based on the data from experiments,the average bias factor and accuracy factor were 0.982 and 1.223 respectively,and this result showed that the secondary model could be a useful tool for predicting growth of Brochothrix thermosphacta from the temperature history of chilling pork.

【题目】福建烟草青枯菌演化型及生化变种鉴定研究

【中文关键词】烟草; 青枯菌; 演化型; 生化变种; 福建

【英文关键词】tobacc o; Ral stonia solanac earum; phylotype; biovar; Fujian province

【中文摘要】本研究尝试采用国际上新兴的青枯菌演化型分类框架并结合传统的生化变种鉴定方法,旨在探究福建省烟草青枯病菌系的构成,从而揭示青枯病的流行规律,为指导烟草青枯病的抗病育种提供理论依据。2008~2009年,分别于福建省南平、三明以及龙岩地区田间烟草病株上分离获得了45个烟草青枯病菌株。经青枯菌演化型复合PCR检测,45个菌株均能够扩增得到片段大小分别为144 bp和280 bp的两条特异性扩增条带,从而表明全部分离菌株均系青枯菌演化型I型即亚洲分支菌株。继而基于45个分离菌株对3种双糖和3种己醇氧化利用能力的检测结果,鉴定出其中43个菌株属于青枯菌生化变种III,1个菌株属于生化变种IV,1个菌株属于非标准型生化变种(能利用山梨醇和甜醇,不能利用3种双糖和甘露醇)。该研究结果部分揭示了造成国外引进的烟草品种青枯病抗性水平下降或丧失的可能原因。

【英文摘要】Abstract: Rising phylotype identification system and tradi tional biovar determination method was combined to determine the structure of tobacco Ralstonia solanacearum strains from Fujian province and the epidemic pattern so as to provide theoret icguidance to disease resis tant breeding. 45 Ralstonia solanacearum strains, isolated from wilted tobacco plants in Sanming,Nanping, and Longyan region of southeast Chinas Fujian province, were collected from 2008 to 2009. Phylotype specific multiplex PCR (Pmx PCR) revealed that all 45 isolates, producing both 144 bp and 280 bp amplicons, belonged to R.solanacearum phylotype I (the Asiaticum division) . Furthermore, on the basis of the ability of isolated strains to oxidize three hexose (lactose, maltose and cellobiose) and three disaccharides (mannitol, sorbitol and dulcite) , 43strains were identified as biovar III, 1 as biovar IV, and 1 asatypical biovar on account of the ability to utilize sorbitol and dulcite. The results explained the possible reason why tobaccocul tivars introduced from abroad lost their resistance or showed lower resistant level to bacterial wilt.

【题目】原料腿对金华火腿腌制及产品品质的影响

【中文关键词】金华火腿;原料腿;品质;生产工艺;

【英文关键词】Jinhua ham;raw ham;quality;processing technology;
【中文摘要】采用传统工艺和新工艺加工金华火腿,研究了原料腿重量、鲜冻状态、皮下脂肪厚度对金华火腿腌制过程和加工品质的影响。结果表明:原料腿重影响腌制用盐量、加工各阶段后的失重率、后熟后的产品质量;皮下脂肪厚度影响腌制进程和腌制失重率;冻腿可以作为金华火腿加工的原料腿,但产品加工质量略差。
【英文摘要】Jinhua hams were processed by traditional processing technology or new technology for industrial production, and the effects of the weight, fresh or frozen state, and under-skin fat thickness of the raw hams on curing and product quality of Jinhua hams were studied. The results showed that the salt consumption curing, the weight loss rate after each processing stage, the post- aging quality and under-skin fat thickness can affect the curing procedure and the weight loss during curing. Frozen raw ham can be used for Jinhua ham processing but result in relatively inferior products.

【题目】植物青枯菌VI型分泌系统核心基因vasK突变株的构建及其致病型的测定
【中文关键词】青枯菌; Ö 型分泌系统; vasK 基因
【英文关键词】Ralstonia solanacearum ; type VI secretion system; vasK gene
【中文摘要】[目的]通过测试vasK基因突变株对番茄的致病力变化,评价该基因在青枯菌致病过程中的作用。[方法]根据青枯菌(Ralstonia solanacearum)中存在的VI型分泌系统基因簇中的核心基因vasK序列设计PCR引物,扩增并克隆vasK基因,将庆大霉素抗性基因(Gm)插入vasK基因内部,克隆至自杀质粒pK18mobsacB中,获得重组自杀质粒pK18-vasK-Gm。将自杀质粒电转化至青枯菌GMI1000感受态细胞中,采用同源重组双交换法,将野生型vasK基因置换。对vasK基因突变菌株进行三步筛选和PCR扩增鉴定。[结果]筛选获得了具有庆大霉素抗性的目标基因被抗性基因替换的青枯菌突变株(GMI1000-m)。土壤接种番茄青枯菌结果显示,突变株GMI1000-m的致病性较野生型GMI1000明显下降。[结论]vasK基因在青枯菌致病过程中具有重要作用。
【英文摘要】Abstract [Object ive] The change in pathogenicity of the vasK mutant to the tomato was investiga ted to estimate the function of the vasK gene in the pathogenicity process o f Ralstonia solanacearum . [Method] According to the sequence of vasK gene, a key component of type Ö ecr etion system in Ralsto niasolana cearum , PCR primerswere designed to amplify vasK gene . vasK gene w as m utate d by inser ting a gentamicin # 3 - aetyltr ansfe rase gene (Gm gene) , and the mutated vasK wa sinserted into suicide vctor pK18mobsacB , resulting in pK18 - vasK-Gm .The vector pK18 - vasK-Gm w as then ntroduced into R. solanacearum GMI1000. The vasK mutant, named GMI 1000-m, was g ener ated by homologousrecom bination and selected by a three - step method. MI1000-m was identif ied by PCR amplification. [Result] The pathogenicity test of the mutant GMI1000-m was decreased com -pared with the wild type GM 1000. [Conclusio n] The vasK gene was animportant factorin the pathog enesis of R . solanacearum .

【题目】大豆质核互作雄性不育系NJCMS2A及其保持系的花药蛋白质组比较研究
【中文关键词】大豆;质核互作雄性不育;花药;蛋白质组;双向凝胶电泳;基质辅助激光解吸飞行时间质谱
【英文关键词】an;Cytoplasmic—nuclear male.sterility;Anther;Proteomics;2*DE;MALDI一’110F—MS
【中文摘要】大豆质核互作雄性不育系NJCMS2A是以栽培大豆组合(N8855×N1628)F2不育株为母本,以N1628为父本,通过连续回交选育而成的,N1628(或NJCMS2B)为其同型保持系。对NJCMS2A和NJCMS2B的二胞花粉期花药进行蛋白质组比较分析,获得重复性好的双向电泳图谱,在分子量18.4~116.0 kD、等电点4~7线性范围内,检测到约217个蛋白点,其中差异表达蛋白点25个,包括在NJCMS2A中出现而在NJCMS2B中缺失的蛋白点13个,在NJCMS2A中缺失而在NJCMS2B中出现的蛋白点10个,另有2个蛋白点的表达量在NJCMS2B中比在NJCMS2A中明显增强。利用基质辅助激光解吸飞行时间质谱(MALDI—TOF—MS)技术对差异表达蛋白进行分析,获得肽质量指纹图谱,用Mascot软件搜索NCBInr数据库,鉴定出14个差异表达蛋白,其中10个在NJCMS2A中出现而在NJCMS2B中缺失和4个在NJCMS2A中缺失而在NJCMS2B中出现。对热激蛋白22 kD、半胱氨酸蛋白酶、v型H+一ATP酶A亚基、MADS盒蛋白和淀粉分支酶等主要差异蛋白进行功能分析,推测不育系NJCMS2A雄性不育性可能与能量代谢紊乱、细胞程序化死亡(PCD)、淀粉合成受抑制和花器官发育调节基因作用失控等有关。
【英文摘要】Cytoplasmic.nuclear male sterility iS a moior tool in the hybrid seed production for utilization of heterosis in crops.The soybean cytoplasmic.nuclear male.sterile line NJCMS2A was developed through a consecutive backcross procedure with male—sterile plants of(N8855 x N1628)F,as donor parent and N1628(designated as NJCMS2B afterwards)as recurrent parent.,111e present paper was aimed at the differential expressed proteins of anther at binucleate pollen stage between NJCMS2A and its maintainer NJCMS2B.The developmental stage of the anther was determined by both the external morphological performance of the flower bud and the microscopic observation of the microsporogenesis.Two—dimensional gel eleetrophoresis(2一DE)technique was used to separate the protein spots and the gels were stained with Coomassie Blue G.250.The obtained 2一DE maps were pretty consistent among replications.The difference between the protein maps of anthem from NJCMS2A and NJCMS2B was analyzed with the PDQuest image software.About 217 protein spots were detected within Mr 18.4—116.0 kD and pH 4 7.’rotal 25 spots out of 217 were found differentially expressedbetween NJCMS2A and NJCMS2B.Among these.1 3 protein spots were present in the anther protein map of NJCMS2A but absent in that of NJCMS2B,and 10 protein spots present in that of NJCMS2B but absent in that of NJCMS2A,another two protein spots were up—regulated significantly in the map of NJCMS2B in comparison with that of NJCMS2A.The matrix—assisted laser-adsorotion/ionization time.of-flight mass spectrometry(MALDI.TOF—MS)technique was used to obtain the peptide mass fingerprinting of the differentially expressed proteins and the MASCOT software was used to search the protein database NCBInr.%e results were as follows:10 proteins were present in NJCMs2A anther at binucleate pollen stage but absent in NJCMS2B.These were heat shock 22 kD protein,AIGl-like protein,oligouridylate binding protein,cysteine proteinase,hypothetical protein MtrDRAFY—ACl4657098vl,vacuolar H+一ATpase A subunit,adenosine/AMP deaminase,translational initiation factor EIF,4A,cullin,and beta.am-ywin synthase.Four proteins were absent in NJCMs2A anther but present in NJCMS2B.These were MADS box protein,starch branching enzyme,glutathione—S—transt’erase,and auxin— induced protein AUX28.According to the literature.the functions.especially those related to the male sterility of the major differentially expressed proteins,including heat shock 22姻protein,cysteine proteinase,vacuolar H+一ATPase A subunit, MADS box protein。and starch branching enzyme were reviewed and discussed.It was inferred that the male sterility of NJCMS2A might be related to energy metabolism turbulence。the programmed cell death(PCD),starch synthesis suffocation and the disturbed function of the flower developmental gene.But the exact mechanism of the difierentially expressed proteins above leading to the male sterility of NJCMS2A are to be further studied。

【题目】Effect of um calpain mrna expression on tenderness in duck meat
【中文关键词】鸭,压痛,蛋白酶基因
【英文关键词】Duck, tenderness, calpain gene
【中文摘要】根据鸡calpain和β-肌动蛋白的序列,两个引物设计为充分地鸭肌肉的mRNA ,和蛋白酶基因和β-肌动蛋白基因的部分克隆。两个引物被用来进行实时PCR分析蛋白酶和β-肌动蛋白与SYBR Green法。
【英文摘要】According to the sequence of chicken calpain and β-actin, two primers were designed to amply duck muscle mRNA, and calpain gene and β-actin gene were partially cloned. Then two primers were used to conduct real-time PCR analysis of calpain and β-actin with SYBR Green method. The result showed: (1) The similarity of calpain gene between duck and chicken was only 90%; (2) The expression level between breast and thigh meat differ dramatically, which indicated that calpain may play an important role in duck meat tenderization.

【题目】黄鹌花与一枝黄花及其同属近缘种的形态比较
【中文关键词】黄鹌花;加拿大一枝黄花;一枝黄花; 形态特征;加拿大一枝黄花复合种
【英文关键词】Key words Huang-ying -hua ; Solidago canadensis L . ; Solidago decurrens Lour . ; morphological characteristic ; Solidago canadensis complex
【中文摘要】形态上与入侵杂草加拿大一枝黄花十分相似的 黄鹌花 , 近来作为鲜切花的配花走俏花卉市场,也引起了社会对其管理的高度关注。本文通过比较市售 8个批次的 黄鹌花 与 5个入侵中国的加拿大一枝黄花种群、原产地的一枝黄花属 2个种群以及一枝黄花的叶和花的 11个形态学特征, 并进行聚类分析。结果表明除第 5批 黄鹌花 外的 7个批次单独聚为一类,第 5批次与 35个入侵中国的加拿大一枝黄花种群聚为一大类, 再结合加拿大的 2个种群, 而一枝黄花单独为一类。这充分说明 黄鹌花 并非一枝黄花, 而与入侵我国的加拿大一枝黄花各种群接近。进一步再与巨大一枝黄花和粗糙一枝黄花特征相比较分析, 发现 黄鹌花 与粗糙一枝黄花聚在一组,并进一步与入侵的加拿大一枝黄花相聚,加拿大 1和 2的种群更接近巨大一枝黄花, 而一枝黄花单独成为一支。无论是加拿大一枝黄花、 粗糙一枝黄花还是巨大一枝黄花都属于 加拿大一枝黄花复合种 。由此可以认为市售 黄鹌花 属于外来入侵杂草加拿大一枝黄花的复合种。叶片长宽比、 离基三出脉距叶基距离、 表皮毛数的多少、 缘花 /盘花比等是 黄鹌花 与该属其它类群分类鉴定的重要形态学特征性指标。
【英文摘要】Abstract Huang-ying -hua is awidely-used cut flower in florist currently , but it is similar to the invasiveweed Solidago canadensisinmorpholoical characteristics , so it has caused public concerns . Comparat i vestud ieson mor phological characteristics of eight batches of Huang-ying-hua with 35 invasive populations ofS. cana-densis in our country , two populations ofSolidago L. sampled from Canada and Soli dagodecurrens were conduc-ted . The cluster analysis sho w ed that seven batches of Huang -ying -hua samplesw ere clustered together except the fifth batch , which was clustered with S.canadensis in one group, Huang-yng-hua , S. canadensis , and the popu lations sampled in Canada ere clustered intoone group while S. decurrens was grouped in tosoleone . This sh wed Huang-ying -hua is similar to S. canadensis, not S. decurrens . The further comparative stud ies onmor -pholog ical ofS. gigan tea and S. alt issi ma showed that Huang-ying -hua and S.altissima were together and clustered with invasive populations , and the populations sampl d from Canada were more similar to S. gigantea.S. canadensis , S. altissima and S. gigantea a llbelonged to S. canadensi s complex . The length /width ratio of leaves , the leng thbetween triplinerved and leaf base , the number o f epider m al hai r on vein and the ratio of disc floetstoray floretswere the importantmorpho logical characteristics of Huang -ying -hua and ot

herspeciesinge -nus of Solidago L .

【题目】马铃薯腐烂茎线虫类FMRF酰胺多肽Dd-flp-1基因的克隆与表达定位分析
【中文关键词】马铃薯腐烂茎线虫,类FMRF酰胺多肽(FLPs),基因克隆,原位杂交
【英文关键词】Ditylenchus destructor, FMRFamide-like neuro peptides(FLPs), Gene cloning, hybridization
【中文摘要】植物寄生性线虫类FMRF酰胺多肽(FMRFamide-like neuropeptides,FLPs)在线虫的取食、分泌、迁移入侵和繁殖过程中发挥着重要的作用。本研究根据EST序列结合RACE方法,获得了一个马铃薯腐烂茎线虫(Ditylenchus destructor)类FMRF酰胺多肽基因的cDNA全长。该基因cDNA全长序列为891bp,包括一个681bp的完整开放阅读框,编码一个包含227个氨基酸的蛋白,预测的分子量为25.36kD。序列分析表明,该蛋白N端有一个由43个氨基酸残基组成的信号肽,C端含117个氨基酸的FMRF酰胺肽的特征区,其中包含有5个NFLRFG的FLPs肽,属于典型的FLP-1型蛋白,该基因命名为Dd-flp-1(GenBank登录号为GU198750)。系统发育分析表明,Dd-FLP-1与自由生活线虫、动物寄生线虫和其他迁移性植物寄生线虫的FLPs属于同一支,推测线虫FLP的进化与其生活习性密切相关。原位杂交结果表明,Dd-flp-1在马铃薯腐烂茎线虫的咽神经环、后膀胱神经节多个细胞特异表达。推测DD-FLP-1主要与马铃薯腐烂茎线虫的取食、运动和排泄功能相关。本研究结果将为植物线虫flp基因功能的研究和寻求新的植物寄生线虫防治策略提供理论依据。
【英文摘要】FMRF amide-like peptides (FLPs) play an important role in infection, feeding and reproduction of plant arasitic nematode. A novel FMRFamide-like europeptide gene was isolated from by EST analysis and RACE methods. The full length cDNA of - - consisted of 891 bp, with a 681 bp ORF encoding a 227 amino acid rotein and the predicted molecular weight was 25.36 kD. The protein included a signal peptide of 43 amino acids on the N-terminal and a predicted FMRF domain with five FLPs as NFLRFG on the C-terminal. It was a typical FLP-1-type protein, named

【题目】宣威火腿加工过程中挥发性风味化合物分析
【中文关键词】宣威火腿;挥发性化合物;分析;风味;
【英文关键词】Xuanwei ham;volatile compounds;analysis;flavor;
【中文摘要】根据传统宣威火腿的生产工艺条件,实施标准化生产关键工艺控制。用同时蒸馏萃取法(SDE)结合气相色谱/质谱(GC/MS)对宣威火腿生产过程中形成的挥发性风味化合物进行分析。结果表明:挥发性化合物的种类随着加工时间的延续逐渐增多,挥发性化合物的相对总含量则在6月龄时最高,两者均存在肌肉部位的差异;从0、4、6、12月龄火腿样品的半膜肌和股二头肌中鉴定出的挥发性化合物分别为48、29和19、79和50、98和67种;相对总含量分别为1685.50、3433.40和6677.56、9240.16和13227.85、5550.80和9675.81μg壬烷·100g-1(DM)。醛类是重要的挥发性风味化合物,由于它们的风味阈值较低,对宣威火腿的风味有重要贡献;杂环化合物和含硫化合物,因其含量低、变异大,对宣威火腿风味的贡献还不能定论。
【英文摘要】According to the producing technology condition of traditional Xuanwei ham, the key producing technology of standardization was conducted and the volatile flavor compounds formed were extracted and analyzed with simultaneous distillation extraction (SDE) and GC/MS methods. The results showed that the kinds of the volatile flavor compounds varied with the prolonged processing, and the relative total content reached the most at 6 months. The volatile flavor compounds identified were 48, 29 and 19, 79 and 50, 98 and 67 respectively from samples of M. semimembranosus and M. Biceps semoris at 0, 4, 6 and 12 months; the relative contents at the same samples were 1 685.50, 3 433.40 and 6 677.56, 9 240.16 and 13 227.85, 5 550.80 and 9 675.81 μg nonane · 100 g-1(DM).Aldehydes with low flavor threshold have made great contribution to the flavor of Xuanwei ham. Heterocycle and sulphur compounds as to how to influence Xuanwei ham flavor have not been settled because of their low content and great variation.

【题目】1923-2005 年中国大豆育成品种的核心祖先亲本分析
【中文关键词】大豆;育成品种;直接亲本;祖先亲本;遗传基础
【英文关键词】Soybean; Released cultivar; Direct parent; Ancestor; Genetic base
【中文摘要】【目的】研究中国1923~2005年育成大豆品种的系谱,分析其祖先亲本和直接亲本的来源和类型,归纳出近20年来最重要的祖先亲本和直接亲本,为今后大豆育种亲本选配提供参考。【方法】利用1923~2005年全国6 个生态区育成的 1 300 个大豆育成品种的系谱资料研究其祖先亲本和直接亲本组成,计算其核遗传贡献值。【结果】1923~2005年1 300个大豆育成品种来源于670 个终端祖先亲本,其中51.64%为地方品种、38.36%育种品系、7.01%改良品种、2.54%野生豆和0.45%类型不详,相应核遗传贡献率分别为76.29%、14.93%、7.79%、0.54%和0.45%。1 391个直接亲本由育成品种、外国品种、地方品种和育种品系4类型组成,分别占27.76%、6.10%、11.62%和54.52%。在全国1 019个杂交育成品种中,以育成品种和育种品系作为直接亲本的组配方式比例最高,达71.78%。归纳出了1986~2005年间中国941个大豆育成品种最重要的54个祖先亲本和37个直接亲本。【结论】与1923~1995 的相比,近十年来中国大豆育成品种遗传基础有所拓宽,祖先亲本和直接亲本群体扩大了近一倍,地理来源更广泛。但遗传贡献有向少数祖先亲本集中的趋势,各生态区间的种质交流仍少。中国大豆品种遗传基础有待进一步拓宽。
【英文摘要】【Objective】 The present study was aimed to analyze the pedigrees of the 1 300 cultivars released during 1923-2005, to reveal the geographical sources and types of their end ancestors and direct parents, especially those during the recent 20 years, and to summarize the implications in utilization of breeding approaches and parental materials. 【Method】 Based on the collected pedigree data of the 1 300 soybean cultivars released during 1923-2005 in China, the end ancestors and direct parents were traced and then the nuclear contribution from the ancestors estimated and analyzed. 【Result】 Total 1 300 released soybean cultivars were traced to their 670 final ancestors, composed of 51.64% landraces, 38.36% breeding lines, 7.01% improved cultivars, 2.54% wild accessions and 0.45% uncertain type, which provided 76.29%, 14.93%, 7.79%, 0.54% and 0.45% nuclear contribution to the 1 300 released cultivars, respectively. The 1 300 released cultivars were derived from 1391 direct parents, composed of 27.76% cultivars, 6.10% exotic introductions, 11.62% landraces, and 54.52% breeding lines. Among the 1 019 released cultivars developed from artificial hybridization, about 71.78% were from the crosses among cultivars and breeding lines. Total 54 major ancestors out of the 670 ones and 37 major direct parents out of the 1 391 ones of the cultivars released during 1986-2005 were nominated. 【Conclusion】 After a comparison between the data of the cultivars released during 1923-2005 and those during 1923-1995 reported before, the number of end ancestors and direct parents was about the double, the exotic germplasm increased, the geographic source extended, and therefore, the genetic bases of cultivars released during recent ten years in China were broadened. However, the mostpart of the end ancestors was used in only 1-5 released cultivars, while only a few end ancestors provided large genetic contribution but still limited basically in their local ancestors. The authors emphasized the utilization of germplasm rather than the local sources for broadening the genetic base of future cultivars, and suggested further exploration of the genetic structure and potential of core ancestors for achieving breeding by design strategy.

【中文关键词】梨火疫菌, 基因,致病性,胞外多糖
【英文关键词】gene, Virulence, Extracellular polysaccharide (EPS)
【中文摘要】梨火疫菌可引起梨 苹果等蔷薇科(Rosaceae)植物的火疫病 在菊欧文氏菌 中,由 基因编码的环腺苷酸受体蛋白(cyclic adenosine monphosphate (cAMP)receptorprotein, CRP)对果胶酶基因的表达调控和菌株致病性起着重要的作用 本研究首次鉴定并克隆出梨火疫菌中的 同源基因,命名为 ,并通过同源重组的方,构建了梨火疫菌的 基因突变体 Ea以及互补子,进行了致病性 过敏性反应 胞外多糖 鞭毛运动等一系列相关表型的鉴定 结果表明, 基因影响着梨火疫菌的致病性 胞外

多糖 游动性 生长情况等多种分子生物学特性,然而, Ea 仍能引起烟草过敏性反应,并且在过氧化氢敏感度以及沉降性 生物膜和 AI-2 信号分子的生成方面与野生型菌株相比差异明显 本研究结果说明,梨火疫菌 基因对病菌的胞外多糖分泌 生长游动性以及致病性方面具有关键作用关键词 梨火疫菌, 基因,致病性,胞外多糖

【英文摘要】causes fire blight of pear, apple, and many of the Rosaceae family. The cyclic adenosine monphosphate (cAMP) receptor protein (CRP), which is encoded by gene, plays a crucial role in expression of the pectinolysis genes and regulation of the pathogenicity in . In this study, the homolog of gene, designated , was identified and cloned in . A disruption mutant Ea was successfully generated by homologous recombination. Complement strain Ea (pME-) was also constructed. Then gene was characterized to virulence, hypersensitive response (HR), extracellular polysaccharide (EPS), motility and other phenotypes of the phytopathogens . The results showed that the mutant Ea displayed the reduced virulence, EPS production and growth and motility.However, compared to wild type strain NCPPB1665 (Ea1665), the induction of HR in nonhost tobacco, peroxide resistance, sedimentation, biofilm synthesis and AI-2 production of the mutant Ea was not affected. These findings demonstrated that gene in is involved in EPS production, growth, and motility and play an important role in virulence.

【题目】豚草和苍耳上广聚萤叶甲的寄主选择和取食量比较

【中文关键词】豚草; 苍耳; 外来昆虫; 寄主专一性; 寄主转移

【英文关键词】Key words : Ambro siaarte misiifolia ; Xanthium sibiricum; exoticinsec; t host specificity ; host shift

【中文摘要】为探究豚草与苍耳上的广聚萤叶甲种群是否存在分化,对来自这两种植物上的叶甲(分别称为/豚草叶甲0和/苍耳叶甲0)进行了选择性试验,并测定了其对 5种近缘植物的取食量。选择性试验结果表明,两群来源不同的叶甲对豚草和苍耳的选择偏好存在显著差异,表现为豚草叶甲更偏好豚草,而苍耳叶甲相对更偏好苍耳。对广聚萤叶甲成虫取食量的

测定结果表明,对不同测试植物的取食量随来源寄主植物不同而存在显著差异, 两群叶甲对向日葵的取食量存在显著差异,但对其他植物的取食量均无显著差异。豚草叶甲对豚草的取食量显著大于对其他测试植物的取食, 24 h平均取食量达51127 mm2,而对其他 4种植物的取食量无显著差异,均低于 40mm2;苍耳叶甲取食豚草的量为 52124mm2 24 h),与取食向日葵和三裂叶豚草量无显著差异, 但显著大于取食苍耳和菊芋的量,取食后两种植物的量没有显著差异。研究结果说明, 苍耳属植物可能是广聚萤叶甲除豚草外的另一潜在寄主植物。

【英文摘要】Abstract : To study whet herOphraella communa has host specialization on Ambrosiaarte misiifola and Xanthium sibiricum, adualchoice trialwas conducted to s udy the host selection of the O.communa originated from A. arte misii folia (ragw eed cohort) and X. sibiricum (cock lebur cohort) , wih the leaf consumption of the cohorts on five relative plantsX. sibiricum, A.trifida, Helian t hus annuus , H. tuberosus , and A. arte m i sii folia measured . The ragweed cohort O.communa showed asignificant pre ference for A. arte misii folia overX. sibiricum, while the cock -lebur cohortO. communa showed a significant preference to X. sibiricum over A. arte misii folia,asm anifested by t he relative over -preferences . The leaf consumption by the two cohorts differed si gnificantly on sunflower , but had no significant differences on the o ther test plants . Ragweed cohort showed asignificant preference toA. arte misii olia over the other test plants , with a consumption of leaf discs by 51127 mm2 in 24 hours , but sho w ed less difference in the preference to other test plants , with the consumption of leaf discs by < 40mm2. The lea f discs consu mption f A. arte misiifoli by cocklebur cohortw as 52124mm2 , not different from the consumption of sunflower and A. trifida but greaterthan that of X. sibiricum and H. tuberosus , and no si gnificant difference betweent helatter two plants . It was suggested that X. sibiricum could be a suboptimalhost plant as an alternative tooptimal A.artemisiifolia for the leaf beetle O. communa.

【题目】玉米抗氧化肽对于中式香肠的氧化稳定性的影响

【中文关键词】玉米蛋白;酶解;中式香肠;抗氧化;

【英文关键词】zein hydrolysates;Chinese sausage;antioxidant activity;

【中文摘要】 主要研究玉米抗氧化肽对于中式香肠氧化稳定性的提高作用。实验以玉米蛋白为原料,采用酶法水解制备玉米抗氧化肽,将其作为抗氧化剂添加到中式香肠中,将香肠在37℃条件下贮藏,分别采用过氧化值(POV)、酸价和硫代巴比妥酸反应物(TBARS)含量变化3种指标考察玉米抗氧化肽对于香肠的氧化稳定性的影响。结果表明,玉米肽的添加显著提高了香肠的氧化稳定性(p<0.05),氧化稳定性随玉米肽添加量的增大而增强,并且2%的玉米肽的抗氧化性要显著高于0.01%的叔丁基羟基茴香醚(BHA)。实验结果还显示,玉米肽的添加不会影响中式香肠应有的质构。

【英文摘要】 In this study,the antioxidant activity of zein hydrolysate was investigate against lipid oxidation in Chinese sausages during storage at 37 °C.Peroxide value(POV),acid value and TBARS value were deter-mined to measure the degree of lipid oxidation.Results showed that the addition of zein hydrolysate significantly increased the oxidative stability of the sausages(p<0.05).The higher the zein hydrolysate con-centration,the stonger the antioxidant activity.Furthermore,the antioxidant activity of 2% zein hydrolysateI was higher than that of 0.01% BHA)(p<0.05).The texture of the sausages were not affected by the addition of zein hydrolysates.

【题目】基于Maxent的麦瘟病在全球及中国的潜在分布区预测
【中文关键词】马铃薯腐烂茎线虫,类FMRF酰胺多肽(FLPs),基因克隆,原位杂交
【英文关键词】Ditylenchus destructor, FMRFamide-like neuro peptides(FLPs), Gene cloning, hybridization
【中文摘要】[目的]麦瘟病是小麦上的一种新病害,明确该病害在全球及我国的潜在分布区域,对于有效控制此病害在全球的扩展蔓延具有重要的意义。[方法]利用MaxEnt生态位模型预测麦瘟病在全球及我国的潜在分布。[结果]南美中东部、非洲东南部和中西部、南亚东南部和东南亚以及澳大利亚东部沿海地区是该病害在全球的主要适生区;而该病害在我国的适生区仅包括云南、广东和海南等省的少数地区。[结论]该病害在我国的适生区较小,但随着全球气候变化,该病原菌的潜在分布范围可能将进一步扩大。
【英文摘要】Abstract [Objective] Wheat blast is a new wheat disease caused by Magnapor the grisea , and now it has become one of the major diseases of wheat in South America. It is urgent to determine the potential geographical distribution of M . grisea in China and the world. [Metho d] The otential distribution regions of M . grisea in the world and China were predicte d by using MaxEnt model. [Result] Mid-east of South America, Southeast and Midwest of Africa, southe ast of South Asia, Southeast Asia and east coast of Australia are the main suitable are as for M.grisea in the world. The suitable areas for M. grisea cover only some ar eas in Yunnan, Guangdong and Hainan in China . [Conclusion] The predicted results showed that the suitable areas for M. grisea in China are relatively small. Climate change may make the potentia ldistribution regions of M. grisea larger.

【题目】醋酸和乳酸结合处理对冷却猪肉贮藏性的影响
【中文关键词】醋酸和乳酸混合液;冷却猪肉;贮藏性;
【英文关键词】acetic acid and lactic acid combination solution;cooled pork;preservation;
【中文摘要】实验对浓度为1%~4%醋酸和乳酸结合(1:1)处理对冷却猪肉保藏性的影响进行了研究。结果表明,2%以上的醋酸和乳酸混合液可有效降低肉样的初始菌落总数和大肠菌群数,并延缓细菌在贮藏过程中的生长和pH值以及TVBN值的增加,可延长猪肉贮藏期7d。同时,4%浓度的混合液可导致肉样轻微的变色和残留的混合酸味,因此,浓度为2%~3%的醋酸和乳酸混合液是较为合理的处理浓度。
【英文摘要】Treated with 1%~4% acetic acid and lactic acid(1∶1) combinations,the storage effect of cooled pork was determined.The results showed that by using over 2% acetic acid and lactic acid(1:1) combinations,the initial total viable count and coliform group were reduced,the growth of bacteria was inhibited and the pH and TVBN were also controlled to rise.The shelf life of pork could be lengthened for about 7 days.On the other hand,the 4% acetic acid and lactic acid combination could induce slightly discoloration and acidic odor,therefore,2%~3% concentration of acetic acid and lactic acid combination is recommended for cooled pork preservation.

【题目】工艺条件对猪皮提取物质构和微观结构影响的初步研究
【中文关键词】提取物 质构特性 微观结构 猪皮
【英文关键词】extraction texture microstructure pork skin

【中文摘要】为了给猪皮提取物在肉制品加工中的应用创造条件,采用单因素试验,分别测定不同提取条件(煮沸时间、料液比、pH值、盐浓度)下凝胶质构和微观结构的变化,在此基础上,采用正交试验优化提取条件。单因素试验表明煮沸时间、料液比、提取液pH值对猪皮提取物的质构特性都有显著影响,煮沸时间为60min、料液比为1:5、提取液pH值为5时形成的凝胶最好,盐浓度对质构特性无显著影响。正交试验表明,料液比1:5,盐浓度为3%,煮沸时间60min,pH=6的提取条件下获得的提取物凝胶的质构特性及微观结构最好。

【英文摘要】In order to create conditions for application of pork skin extracts in meat processing,the effects of different extraction conditions such as cooking time,ratio of skin to water,pH value,and salt concentration on texture properties and microstructure of pork skin extracts were conducted by single factor experiments.Then the orthogonal design was used to optimize the extraction conditions.The results of single factor experiments show that cooking time,ratio of skin to water and pH value have significant effects on textural properties and microstructures of pork skin extracts,but salt concentration has no significant effects on those.The property of the gel extracted under the conditions of cooking time 60 minutes,ratio of skin to water 1∶5,and pH5 is the best.The results of orthogonal experiments show the optimal extraction conditions are as follows:ratio of skin to water 1:5,salt concentration 3%,cooking time 60 minutes and pH6.

【题目】人类活动是导致生物均质化的主要因素

【中文关键词】生物均质化; 农业; 城市化; 生物入侵和灭绝

【英文关键词】biotic homogenization; agriculture; urbanization; biological invasion and extinction

【中文摘要】随着全球化和现代化的持续发展, 生物均质化(不同地区的生物群落在物种组成 基因库和功能上趋向于相似或简单化)在全球范围内广泛发生, 给保护生物多样性和种质资源库带来严峻挑战 人类活动是当前全球生物均质化最为重要和直接的推动因素 农业耕作活动直接导致了农田生态系统的普遍生物均质化: 垦荒可直接导致生物多样性大幅减少, 大面积单一化的作物类型 品种和耕作管理模式, 农药化肥的大量使用, 机械化 集约化和转基因作物的推广所带来生物均质化问题都直接威胁粮食生产和安全 城市所带来的普遍相似的高强度人工干扰 交通运输和建设 规划 破坏自然生境等各种人类活动必然驱动全球生物大规模的均质化 人类活动直接导致的少数成功种恶性扩散并迅速取代大量失败种从而导致生物均质化的现象普遍 生物入侵和灭绝 本地种以及新的杂交种的恶性扩散都直接导致生物均质化 生物均质化的隐患严重威胁着我国生态环境和经济社会安定发展, 相关研究在我国尚未起步, 当前我国生物均质化研究的迫切任务主要有: (1) 建立有效的均质化评估方法体系; (2) 研究我国各种主要生态系统类型以及主要生物类群的均质化现状 规律和趋势; (3) 掌握我国农业生态系统生物均质化的现状 规律和趋势; (4) 建立和完善均质化长期监测研究的相关数据库资源

【英文摘要】Abstract: With the development of globalization and modernization,biotic homogenization (BH,referring to the process by which the taxonomic,genetic or functional similarities of regional biotas increase over time) pervasively occurs worldwide.BH seriously challenges the conservations of biodiversity and germplasm resources. Human activities are the principle cause of current global BH. Agriculture directly cause pervasive BH in agro- ecosystems worldwide. Land reclamation usually results in great decease of biodiversity. And BH caused by large areas of homogenized crop species,varieties and tillage management,heavy use of pesticides and fertilizers,mechanization,intensification and the popularizing of genetically modified crops seriously challenges the crop production and security. Unfortunately,information about BH situation,occurrence and trend in agro- ecosystems is rare. And thus the relative study is very urgent,in particular that the agricultural model in China is undergoing dramatic changes. Urbanization generally leads to large areas of uniform artificial habitats and habitat degradation which directly cause pervasive BH. Human- induced species distributions and tinctions can also directly cause BH,such as biological invasions and extinctions and the serious spread of local generalists and new hybrids. Generally eaking,in large scale,indigenous species lean to cause BH,while in small scale they may cause biotic differentiation. China is undoubtedly suffering from ervasive BH,however,relative research has not initiated.Currently,it is urgent to conduct BH researches in China to: (1) establish effective BH ssessing model; (2) understand the BH situations of major ecosystems and species groups; (3) understand situation,regulation and trend of BH in arable

【题目】广聚萤叶甲地理种群间交配选择及子代的发育表现
【中文关键词】选型交配; 种群分化; 生殖隔离; 物种形成; 生物入侵
【英文关键词】assortative mating ; population differentiation ; reproductive isolation ; speciation ;biological invasion .
【中文摘要】为探究分布于我国不同地域的广聚萤叶甲(Ophraella co mmuna)种群之间的分化现状,本文对来自南京、 长沙和福州等 3个地理种群的交配选择行为及杂交后代发育表现进了研究。结果表明,在试验观察的 6 h内南京种群与福州种群间个体发生交配的概率显著低于对照(种群内雌雄个体间的交配) ,但南京种群与长沙种群个体间发生交配的概率与对照无显著差异;南京和福州种群的雄性与同种群雌性交配选择次数显著多于与异种群雌性交配的次数,但南京与长沙种群间个体交配的次数与对照无显著差异。3个地理种群间个体杂交后代在卵孵化率、 幼虫化蛹率和成虫羽化率等发育特性上与对照 (种群内个体自交)无显著差异。根据研究结果推测,广聚萤叶甲南京种群与福州种群间在个体交配行上存在着一定程度的交配前隔离
【英文摘要】Abst ract : To assess the differen tiation among the geographical populations of exotic leaf beetle Ophrael la communain China , a laboratory experiment w as conducted to observe the assortative mating among the O. communa populations f rom Nan ji ng (32bN, 11817b E), Changsha (28bN,11219b E), and Fuzhou (26bN, 11913bE) and the ofspring developmen tal parameters . The mating choice trial showed that in the six hours of observation, the probability of mating for the individuals ofO. communa population from Nanjingwith those from Fuzhou was significantly low-er than that for the individuals with in the populationrom Nanjing , but no significant differences were observed for the individuals between the populations from Nanjing and Changsha and withinthe population from Nan jing . When given choice between the females from different populations,them ales of the populations from Nanjing and Fuzhou made more mating choice for the females from their own populations , but the males of the populations from Nanjngand Changsha exercised the samemating choice for the femalesrom their own and other populations . The offspring from the mating among populations did not showany significant differences inegg hatching ,pupation, and adultemergence rates . This study suggested that definite degreepre-mating isolation occurred between theO. communa populations from Nanjing and Fuzhou .

【题目】托盘和真空包装对冷却猪肉中MetMb还原活性的影响
【中文关键词】冷却肉;托盘包装;真空包装;MetMb还原酶;
【英文关键词】chilled meat;tray packaging;vacuum packaging;MetMb reductase;
【中文摘要】在冷却肉的贮藏过程中,其肌红蛋白(Mb)被氧化为高铁肌红蛋白(MetMb),导致了冷却肉的褐变。研究了托盘包装和真空包装条件下,冷却肉自身的还原系统活性变化规律及其对肉色稳定性的影响。在2周的贮藏期内,真空与托盘包装冷却肉糜肌浆蛋白粗提液的还原活性持续下降;但真空包装组MetMb还原酶粗提液还原活力第1天到第14天活性差异不显著,托盘包装组前后差异显著。真空包装组在贮藏期间MetMb含量持续下降,但托盘包装组MetMb含量则持续上升,说明无氧条件有利于MetMb的还原。托盘包装组TBA在贮藏期间持续上生,但真空包装组TBA变化不明显。结果表明,托盘包装不利于冷却肉自身MetMb还原能力的维持,而真空包装的无氧环境,有利于MetMb的还原和肉色的保持。
【英文摘要】 The myoglobin will be oxidized into metmyoglobin during the storage, causing the discoloration of the chilled meat. This paper focus on the changes of the meat reduction system and its effect on the color of the tray packaged and vacuum packaged chilled meat during storage. During the two weeks of storage, the reduction activity of the sarcoplasmic protein extract was decreased for both tray packaged and vacuum packaged chilled meat, while the reduction ability of the extract of MetMb reductase did not decrease for vacuum packaged meat and decreased for tray packaged meat. The results indicated that vacuum packaging is good for the reduction of MetMb and the color of the meat because of the oxygen free environment compare with the tray packaging.

【题目】瓜类细菌性果斑病菌 tvrR 基因的克隆及其对致病性的影响
【中文关键词】瓜类细菌性果斑病菌; tvrR 基因; 突变; 致病性
【英文关键词】Acidovorax avenae subsp. citrulli; tvrR gene; mutant; pathogenicity
【中文摘要】据丁香假单胞菌番茄致病变种 (Pseudomonas syringae pv. tomato) DC3000 中新的毒性基因 tvrR (TetR- like virulence regulator) 的氨基酸序列,从瓜类细菌性果病菌 (Acidovorax avenae subsp. citrulli,Aac) 的全基因组中发现并克隆了 tvrR 基因的同源物 通过同源重组的方法,构建了 tvrR 基因的插入突变体,并且经过 PCR 及 outhern 杂交验证确认突变体和野生型一样可以激发烟草过敏反应 致病性试验结果显示: 突变体比野生型的病程延长,但最终致病情况与野生型无差异 接种的寄主组织中菌生长能力检测发现,突变体的繁殖速度慢于野生型,但最终其菌体数量也能达到野生型菌株的最大值 在营养丰富的LB 培养基和营养贫乏的MMX 基本培养基中生长测定均发,突变体生长速度慢于野生型,但最终也能达到野生型的最大生长量 瓜类细菌性果斑病菌 tvrR 基因突变体致病性的改变与其生长能力变化的一致性表明,其致病性的变化是由其生长能力的改变引起的
【英文摘要】Abstract: According to the sequence of the novel virulence gene tvrR (TetR- like virulence regulator) of Pseudomonas syringae pv. tomato DC3000,a tvrR omolog was found and cloned from the genomic DNA of Acidovorax avenae subsp. citrulli. The tvrR inserted mutant was constructed by homologous ecombination and confirmed by PCR and Southern blot. Both the mutants and the wild- type strains could elicit the hypersensitive response (HR) in onhost tobacco. Pathogenicity tests showed that the disease symptom caused by mutants was delayed when compared to the wild- type strains,but there ere finally no significant differences in pathogenicity between the mutants and the wild- type strains. The inserted mutants grew more slowly than the wild- ype strains,but

their population could finally reach the maximum of the wild- type strains in inoculated leaf tissues of Hami- melon. The inserted utants grew more slowly than the wild- type strains,but they could finally reach the maximum biomass of the wild- type strains in both utrient-rich LB edium and nutrient- poor MMX medium. The consistency of the changes in pathogenicity and growth ability of tvrR mutants indicated that the changes in athogenicity might be caused by the changed growth ability in A. avenae subsp. citrulli.

【题目】马铃薯腐烂茎线虫28S rDNA-D2/D3区序列分析
【中文关键词】马铃薯腐烂茎线虫; D2 /D3区片段; 序列分析
【英文关键词】Ditylenchus destructor; D2 /D3 expansion segments ; sequences analysis
【中文摘要】我国危害甘薯的马铃薯腐烂茎线虫 rDNA-ITS基因片段长度存在 A 型 (900 bp)和 B 型 (1 100 bp) 2个类型, A 型腐烂茎线虫群体的 ITS片段比 B型群体少 200 bp。为了进一步研究这 2种类型群体的发育关系, 本文用线虫通用引物 D 2A和 D 3B对来自国内的 21个马铃薯腐烂茎线虫群体和 1个韩国的马铃薯腐烂茎线虫 28S rDNA-D2 /D3区进行了 PCR 扩增, 均产生大小一致的片段,长度约为 780 bp ,克隆、 测序后用 DNAM AN 5 . 2软件和 M EGA4软件进行分析比对,结果表明我国 21个马铃薯腐烂茎线虫群体 28S rDNA-D2 /D3区只有 20余个碱基的差异, 相似率达 97 . 2%。基于 UPGMA 构建的系统发育树很好地区分了马铃薯腐烂茎线虫 A 型和 B型群体, 展现出了群体的来源及发育关系。
【英文摘要】Two types of rDNA-I TS (Type A, 900 bp and Type B, 1100 bp) were demonstrated to exist in Ditylenchus destructor populations on sweet ptatoin China . TheD 2 /D 3 regons of 28S rDNA from 22 populations ofD. destructor were amplifed with universal primer pairsD2A and D 3B. All 22 populations yielded one single fragment about 780 bp . Sequence anaysis and alignment were conducted by using the soft wareM EGA 4 and DNAMAN5 . 2 and all 22 sequencesw ere sub mitted at theGenBank . The results showed hat sequence differences of D 2 /D3 region were only in a fewsites , and that the similarity was 97.2 %. Two types could be disinguished in the phylogenetic tree by using UPGMA method . The evolutionary relationship beween two types and the origin of Ditylenchus specieswere discussed .

【中文关键词】冷却猪肉肉色;仪器测定;客观评定;逐步回归;BP人工神经网络;
【英文关键词】chilled pork color;instrumental measurement;objective evaluation;stepwise regression;BP artificial neural net work;
【中文摘要】研究了仪器测定对冷却猪肉肉色客观评定分级的效果。对宰后冷却24h的猪胴体,切开第3~4肋骨间背最长肌,发色60min,用色度计仪器测定断面肉色参数(L*,a*,b*,Chroma和Hueangle),并进行感官评分。获取的80头猪胴体背最长肌肉色参数经逐步回归和BP人工神经网络建立了肉色预测模型,对其预测效果进行了比较评价。结果表明,仪器测定能够对冷却猪肉肉色进行客观评定。
【英文摘要】 Objective:To objectively evaluate chilled pork color by instrumental measurement . Methods: Pork carcass longissimus dorsi muscles were cut at 3-4th rib and blooming for 60min. The surface color features (L*,a*,b* ,Chroma, Hue angle)were measured by instrument chromameter and the surface sensory color scores were evaluated by 6 panelists thereafter. Color features from 80 carcass longissimus dorsi muscles were used to establish color score prediction models by stepwise regression and BP artificial neural net work(ANN) and the prediction models were evaluated comparatively. Conclusion: these results demonstrated that instrumental measurement could be an effective tool for objective evaluation of chilled pork color.

【题目】肉鸡屠宰加工及冷藏中的微生物污染来源及菌相分析
【中文关键词】屠宰加工;微生物污染;肉鸡;菌相变化;
【英文关键词】poultry processing;microbial contamination;broilers;changes of microflora;
【中文摘要】研究了商业屠宰及冷藏过程对肉鸡胴体天然菌落的影响,结果表明,空气、预冷水与环境中各种接触面均是禽类生鲜产品的潜在污染源。尽管加工过程能减少胴体表面各种腐败菌、致病菌污染,但某些工序也增加了特定细菌的污染程度,细菌交叉污染发生在加工过程中的所有阶段。总的说来净膛操作会导致胴体污染程度上升,冲洗、预冷过程对减菌都有很好效果。但预冷过程也可能导致嗜冷菌污染的发生,并且加工过程中存活的细菌能在冷藏阶段继续增殖进而导致产品腐败。
【英文摘要】The effect of commercial processing and refrigerated storage in natural microflora of broiler carcasses was studied in this paper , the result indicated that the immersion chiller water, the air at workshops as well as environmental contact surface were the potential sources of contamination. Although poultry processing could eliminate bacterial contamination to a certain extent, some processing steps increased the level of carcass contamination by definite bacteria. Cross-contamination of carcasses occurred in all stages of processing .In a word, evisceration increased the level of carcass contamination , spray rinse and pre-chilling were an effective way of decontamination. However, contamination also happened on the pre-chilling process by spreading some psychotropic spoilage bacteria. Bacteria that survive processing may proliferate during refrigerated storage and cause meat spoilage.

【题目】电刺激和延迟冷却对宰后牛肉肌原纤维Troponin-T降解的影响
【中文关键词】电刺激 延迟冷却 肌原纤维 骨架蛋白 Troponin-T
【英文关键词】electrical stimulation delay chilling myofibrillar skeleton protein Troponin-T
【中文摘要】为了探讨牛肉嫩化的机理,选择 24头 24 月龄,体重约 500 kg杂交牛(鲁西黄牛×西门塔尔)随机分成 4 组,在宰前或宰后分别进行以下 4种处理: 常规预冷组, 延迟冷却组, 电刺激处理组, 电刺激和延迟冷却处理组。 用 SDS-PAGE和蛋白免疫印迹的方法比较分析了 4 种处理牛肉成熟1,3,7,10 d 其肌原纤维骨架蛋白 Troponin-T的降解情况。结果表明:与常规冷却组相比,电刺激处理在 1、3、7 d 时显著加快了 Troponin-T的降解,而 10d 时差异不显著;延迟冷却处理在 1、3 d 时显著加快了 Troponin-T的降解,而 7、10 d时差异不显著;1、3d 时延迟冷却对 Troponin-T的降解影响比电刺激显著,而 7、10 d 时则是电刺激比较显著;电刺激和延迟冷却处理的结合对 Troponin-T 降解的影响比电刺激处理组、 延迟冷却处理组显著。综上可见, 延迟冷却、 电刺激无论在速度和数量上显著加快了 Troponin-T的降解,加快了牛肉成熟,缩短了成熟时间,且二者有协同作用。
【英文摘要】In order to investigate the mechanism of the beef tenderness, 24 hybrid cattle (Chinese Yellow cattle crossedwith Simental) of 24 months and 500kg were chosen to be divided into four groups and treated with four method such asconventional chilling, electrical stimulation, delay chilling, combination of electrical stimulation and delay chilling.Effects of electrical stimulation and delay chilling on the degradation of skeleton protein Troponin-T from myofibrillarwere studied with SDS-PAGE and Western blotting at the aging time of 1, 3, 7,10 days. The results show that comparedwith conventional chilling treatment, the effects of electrical stimulation on the degradation of Troponin-T have obvious difference in 1, 3, 7 aging days, but no obvious difference in 10 aging days, while the one of delay chilling had obvious difference in 1, 3 aging days, but no obvious difference in 7, 10 aging days. The effect of the

combination of electricalstimulation and delay chilling on the degradation of Troponin-T is more obvious than that of electrical stimulation ordelay chilling. It can be concluded that electrical stimulation and delay chilling increase the degradation of Troponin-T not only in velocity but also in quantity, shorten the aging time and had cooperative effect.

【题目】热鲜猪肉、普通冷却猪肉和真空包装冷却猪肉加工过程中品质变化研究
【中文关键词】猪肉;成熟;真空包装;保质期;食用品质;
【英文关键词】pork;aging;vacuum packing;shelf life;eating quality;
【中文摘要】比较研究了热鲜猪肉、普通冷却猪肉和真空包装冷却猪肉在加工过程中胴体温度、pH值、肉色、食用品质(嫩度、风味、多汁性、喜好程度和总体评价)、微生物等的变化。结果表明,真空包装冷却猪肉的嫩度、风味、多汁性、喜好程度和总体评价都比普通冷却猪肉、热鲜猪肉好,真空包装延长了猪肉保质期,宰后成熟提高了猪肉的食用品质,真空包装冷却猪肉更受消费者青睐。
【英文摘要】 In this article, differences between the changes of carcass temperature, pH, meat color, eating quality (including tenderness, flavor, juiciness, overall likeness, and total score) and microbe in hot boned pork, traditionally chilled pork, and vacuum-packed chilled pork were compared. The results showed that vacuum packed chilled pork obtained higher scores in the aspects of sensory tenderness, flavor, juiciness, overall establishment than the others. Vacuum packed, aged pork is preferred by consumers much more since the vacuum packing extended the pork ’s shelf life and postmortem aging processing improved the pork ’s eating quality.

【题目】瓜类细菌性果斑病菌hpaP基因的功能分析
【中文关键词】细菌性果斑病菌; 转座子(Tn5); hpaP
【英文关键词】Acidovorax citrulli; Transposon(Tn5); hpaP
【中文摘要】瓜类细菌性果斑病(bacterial fruit blotch of watermelon,BFB)是近年来发生在西瓜、甜瓜等葫芦科(Cucurbitaceae)植物上的重要细菌病害,由西瓜噬酸菌(Acidovorax citrulli,Ac)引起。本研究以xjL12菌株为背景构建了转座子(Tn5)插入文库。通过注射接种哈密瓜(Cucumismelovar.saccharinus)子叶和烟草叶片进行突变体的筛选,得到1株致病性完全丧失并失去激发烟草(Nicotiana tabacum)过敏反应的突变体△xj48。对△xj48中转座子插入基因的克隆和测序表明,其突变基因为西瓜噬酸菌III型分泌系统(T3SS)中的保守基因hpaP。利用基因重组技术构建了hpaP基因的突变体,发现hpaP突变后影响了xjL12菌株的游动性、生物膜的形成能力及hrcV基因的表达。hpaP基因的互补菌株部分恢复其致病力。本研究证实了果斑病菌中的hpaP基因与该细菌的致病力相关,在侵染瓜类作物的过程中起着不可缺失的作用。
【英文摘要】Acidovorax citrulli(Ac) is the causal agent of bacterial fruit blotch(BFB),a disease affecting watermelon,melon and other cucurbits.A transposon(Tn5) mutant library was constructed with strain xjL12.The mutant △xj48 was selected for its loss of pathogenicity on hami melon(Cucumis melo var.saccharinus) seedlings and its ability to elicit hypersensitive reaction(HR) on tobacco(Nicotiana tabacum).The gene disrupted by Tn5 was identified as a homolog of the hpaP gene,a conserved gene of type III secretion system(T3SS).Further characterization of the mutant using genetic recombination revealed that swimming motility,biofilm formation and the expression of the hrcV gene required a functional hpaP gene.Pathogenicity was partially recovered in a hpaP

complemented strain.The genetic evidence in this report demonstrates that the hpaP gene is critical for the pathogenicity of Acidovorax citrulli,and plays an important role in infection

【题目】数字图像和逐步回归客观评定冷却猪肉肉色
【中文关键词】色泽 数字图像存储 冷却猪肉 客观评定 逐步回归
【英文关键词】color ;digital image storage;chilled pork;objective evaluation;stepwise regression
【中文摘要】为开发准确、快速的猪肉肉色质量客观评定方法,研究了数字图像处理和和逐步回归模型对冷却猪肉肉色客观评定分级的效果。对宰后冷却 24 h 的猪胴体,切开第3~4 肋骨间背最长肌,发色 60 min,数码相机获取数字图像处理后提取断面肉色参数(L*、a*、b* 、Chroma、 Hue angle)。提取的 80 头猪胴体背最长肌肉色参数经逐步回归建立了肉色评定模型。结果表明,数字图像处理后提取肉色参数建立的逐步回归模型评定冷却猪肉肉色分值的效果优于 BP 人工神经网络模型;若以 | 评定肉色分值-感官肉色分值 | ≤0.3为评定正确判断标准,前者评定正确率为 78.8%,后者为60.4%; 前者与本试验评定正确率最高的单个感官评定人员相比(78.2%),差异不显著(P>0.05)。因此,数字图像处理可有效地对冷却猪肉肉色进行客观评定。
【英文摘要】To develop accurate and rapid method for objective evaluation, the effect of digital image processing and stepwise regression on chilled pork color evaluation were studied. Pork carcass longissimus dorsi muscles were cut at 3~4th rib and bloomed for 60min. Digital images of the muscle surface were captured by digital camera and processed to extract image color features(L*, a*, b*, Chroma, Hue angle). Extracted color features from 80 carcass longissimus dorsi muscles were used to establish color score evaluation model by stepwise regression . The results showed the color score evaluation model by stepwise regression based on color features from digital image processing was better than that by BP artificial neural network and the evaluation accuracy was 78.8% and 60.4%, respectively if judged by the formula | evaluation color score-sensory color score | ≤0.3. The former had no significant variation with evaluation accuracy(78.2%) compared with the best single panelist (P>0.05). Therefore, digital image processing is an effective tool for objective evaluation of chilled pork color.

【题目】广式腊肠加工及贮藏过程中蛋白质降解动态研究
【中文关键词】广式腊肠;蛋白质动态降解;人工加热烘烤脱水;日照自然干燥脱水;
【英文关键词】Cantonese sausage;dynamic proteolysis;roasting dehydration;solarizing dehydration;
【中文摘要】 本文以总氮、非蛋白氮、游离氨基酸、氨基态氮及挥发性盐基氮为指标,通过对比方法,系统研究了广式腊肠日照自然干燥脱水和人工加热烘烤脱水加工工艺和不同的贮藏条件下蛋白质降解的动态变化。研究结果表明,人工加热烘烤脱水腊肠非蛋白氮、游离氨基酸的含量均高于日照自然干燥脱水腊肠,而氨基态氮含量则低于日照自然干燥脱水腊

肠。在贮藏过程中,干燥脱水方法、包装形式及贮藏温度对于腊肠的非蛋白氮含量及氨基态氮含量有显著性影响(p<0.05)。长期高温贮存(30°C、100d)腊肠挥发性盐基氮含量尽管有所上升但对腊肠风味的影响不大。

【英文摘要】Dynamic proteolysis in Cantonese sausage was determined during process (solarizing dehy-dration and roasting dehydration) and different storage conditions by comparing and charactering total nitrogen, non-protein nitrogen (NPN), free amino acids (FAA), the α-aminoacidic nitrogen (NH2-N) and the total volatile basic nitrogen (TVBN). The result showed that the NPN and FAA content of the roasted was higher than that of the solarized, but the NH2-N content of the roasted was lower. Drying method, package and temperature influenced the NPN and NH2-N content of Cantonese sausage significantly in storage. Long time and high temperature (30°C, 100d) storage increased the TVBN content of sausage, however which hardly debased the flavor of sausage.

【题目】干切牛肉冷冻干燥中高速率升华条件的动态研究

【中文关键词】干切牛肉 冷冻干燥 升华 温度 含水率

【英文关键词】beef slice freezing drying sublimation temperature moisture ratio

【中文摘要】该文研究了干切牛肉冷冻干燥中使升华干燥速率最大化所需要的操作条件。通过建立升华过程中冻结物料温度在瓦时冰晶以最大速率升华所允许的升华层厚度δis、升华时间tis及升华所需物料表面温度瓦的计算模型,计算了预冻终温-30、-29、-28、-26、-24、-22°C的冻结物料以最大速率升华所允许的物料厚度分别为18、15、12、8、6mm时,升华过程中物料含水率、升华所需物料表面温度Tis;进而预测了干切牛肉冷冻干燥升华过程中制品含水率、物料中心温度随时间发生的动态变化及升华所需物料表面温度的动态值。设定干燥室压强为10Pa,以物料表面温度预测值控制加热搁板温度开展验证实验,结果表明:物料厚度分别为15、12、8、6mm的干切牛肉在升华干燥过程中预测含水率与实测含水率相对误差±10%,物料中心温度计算值与实测值的绝对误差±5°C,说明所建立的物料表面温度预测模型可用于6、8、12、15mm干切牛肉冷冻升华干燥中搁板加热温度的优化控制,比较不同厚度干切牛肉冷冻升华干燥实验的平均升华速率、脱除水分耗能,6mm厚物料在升华干燥中升华速率最大、能耗最低。

【英文摘要】The operation conditions for the higher sublimation rate during freeze drying of cooked beef slice were studied. Mathematical models were established for sublimation layer thickness(δis), sublimation time (tis) and sample surface temperature (Tis) suited for the higher sublimation rate when the temperature of frozen sample is Ti during the sublimation. When the terminal freeing temperatures were -30, -29, -28, -26 and -24°C, respectively, The suitable sample thickness were 18, 15, 12, 8 and 6mm, respectively under the higher sublimation rate and the moisture rate and surface temperature of the sample were calculated. Moreover, the moisture ratio, center and surface temperature changing with time were forecast. The validation experiments were conducted, in which chamber pressure was 10 Pa, and shelf temperatures were controlled according to predictive temperature of sample surface. The results show that the comparative errors between forecast and measured moisture ratio are lower than 10%, and absolute errors between forecast and measured centre temperature of drying sample are lower than 5°C. It can be concluded that the predictive model of surface temperature can be applied in shelf temperature control during sublimation drying of frozen cooked beef slice with the thickness of 6~15 mm. Comparing average sublimation rate and energy consumption for dehydrating water from different samples with the thickness are 6, 8,12 and 15 mm, the highest sublimation rate and the lowest energy consumption are obtained when sample thickness is 6 mm.

【题目】Identification and characterization of a new coleviroid (CbVd-5)
【中文关键词】multiplex PCR, detection, Wolbachia , Cardinium , spider mite
【英文关键词】multiplex PCR, detection, Wolbachia , Cardinium , spider mite
【中文摘要】A viroid-like RNA was detected from coleus (Coleus blumei) in China. It consisted of 274 nucleotides and had 66% sequence identity with a member of the closest known viroid species. The predicted secondary structure is rod-shaped with extensive base pairing, and it has the conserved region characteristic of the genus Coleviroid. Two terminal sequences that are highly conserved among some members of the genus were also identified. The viroid-like RNA was successfully transmitted to coleus by slash-inoculation. This viroid was identified as a new member of the genus Coleviroid, and we tentatively propose the name Coleus blumei viroid 5 (CbVd-5).

【题目】冷却肉中假单孢菌温度预测模型的建立与验证
【中文关键词】冷却肉 假单胞菌 温度 预测模型
【英文关键词】chilling pork Pseudomonas temperature prediction model
【中文摘要】为了快速预测和监控引起冷却肉腐败变质的主要微生物——假单胞菌的生长,以从冷却猪肉中分离得到的假单胞菌P-1菌株作为受试菌,建立和验证0~10°C低温条件下假单胞菌的生长动力学模型。利用SAS 程序拟合不同温度条件下的生长情况,经过比较发现,Gompertz 模型比线性模型能更好地拟合假单胞菌的生长,从而得到假单胞菌生长的Gompertz 模型参数;利用平方根模型对假单胞菌的最大比生长速率平方根-温度进行拟合,得到假单胞菌生长的二级模型;利用培养基数据、冷却肉产品数据和温度波动条件下的数据对所得到的二级模型进行验证,计算得到总的偏差因子和准确因子分别为0.944和1.256, 结果表明建立的二级模型能真实快速有效地预测0~10°C下冷却肉中假单胞菌的生长。
【英文摘要】To quickly predict and monitor the growth of Pseudomonas P-1 causing decay of pork at 0~10°C isolated from chilling pork, the growth model was developed. The growth condition of Pseudomonas P-1 was simulated at different temperatures using the SAS program. Compared results show that the estimated parameters from Gompertz equation for the assayed results show better predictive ability than that of linear model. Square-root model was applied to simulate and integrate the secondary model of Pseudomonas. The validation of the secondary model was based on culture data, chilling pork data and fluctuate temperature data. The average bias factor and accuracy factor are 0.944 and 1.256 respectively. The research results indicate that the secondary model is valuable for rapid and precise prediction of the growth of Pseudomonas at 0~10°C.

【题目】三种TBA方法用于测定腌腊肉制品脂肪氧化程度适用性的研究
【中文关键词】腌腊肉制品;TBA试验;亚硝酸钠;蔗糖丙二醛;
【英文关键词】cured meat products;TBA test;nitrite;sucrose;malonaldehyde;
【中文摘要】本文研究了亚硝酸钠和蔗糖对TBA试验的影响,比较了这两种物质对三种不同的TBA方法(蒸馏法、酸萃取法和样品直接反应法)用于腌腊肉制品脂肪氧化程度测定的适用性。研究发现,亚硝酸钠在酸性或加热条件下与丙二醛反应,导致吸光值降低;此外,TBA在常温下就可以和亚硝酸钠反应生成不可逆产物,利用此反应能够消除亚硝酸钠对吸光值的影响。蔗糖对TBA反应的影响与溶液pH值有关,当反应液的pH值小于2时,蔗糖与TBA反应生成的黄色物质(吸收峰450nm)就会叠加到532nm的吸收峰上,导致吸光值偏高;当反应液的pH值大于2时,蔗糖不会对吸光值产生影响。在三种不同的TBA试验方法中,样品直接反应法受亚硝酸钠和蔗糖的影响不显著(P>0.05)。蒸馏法和酸萃取法试验中TBA值都会随亚硝酸钠含量的增加而降低,随蔗糖含量的增加而升高。
【英文摘要】The effects of cured meats residual nitrite and sucrose on TBA reaction have been researched. We also have tested their influences on TBA value by three TBA methods used for evaluation of cured meats lipid oxidation.We found that nitrite could react with MDA quickly after acidification and heat treatment,which made lower results. However,it also could react with TBA to producea steady compound,which could eliminate the ef- fect of nitrite on absorbance.The reaction of sucrose with TBA depends on pH.Sucrose couldn ’t produce yellow substances to disturb the absor- bance at 532nm if pH value was beyond 2. Compared with distillation method and acid extraction, directly testing with the whole sample had no insignificant differenc(eP>0.05)when the samples were added with nitrite and sucrose.

【题目】Development of a polyprobe for the simultaneous detection of four grapevine viroids in grapevine plants
【中文关键词】Detection . Dot blot hybridization .Grapevine viroid . olyprobe
【英文关键词】Detection . Dot blot hybridization .Grapevine viroid . olyprobe
【中文摘要】This study aimed to develop a polyprobe for the simultaneous detection of four viroids that infect grapevine: Hop stunt viroid (HSVd), Australian grapevine viroid (AGVd), Grapevine yellow speckle viroid-1 and 2 (GYSVd-1, 2), using a non-isotopic dot blot hybridization technique. A polyprobe was constructed by cloning tandem full-length sequences of HSVd, AGVd and GYSVd-1 into a single vector. The cRNA polyprobe detected all four viroids with similar sensitivity to that obtained using individual probes. In addition, samples of 78 varieties from Beijing and Xinjiang were analyzed using the polyprobe to survey the incidence of grapevine viroids in China. The result demonstrated that grapevine viroids were detected in 56 (71.8%) varieties. In this study, a rapid, reliable and cost-effective approach to the simultaneous detection of four grapevine viroids has been developed which has the potential for routine use in quarantine and certification programs.

In addition, samples of 78 varieties from Beijing and Xinjiang were analyzed using the polyprobe to survey the incidence of grapevine viroids in China. The result demonstrated that grapevine viroids were detected in 56 (71.8%) varieties. In this study, a rapid, reliable and cost-effective approach to the simultaneous detection of four grapevine viroids has been developed which has the potential for routine use in quarantine and certification programs.

【题目】基于判别分析法的金华火腿挥发性风味物质的形成过程分析
【中文关键词】金华火腿;挥发性风味化合物;判别分析;特征风味物质
【英文关键词】Jinhua ham volatile flavor compounds discriminant analysis character flavor compound
【中文摘要】为了弄清金华火腿风味物质的形成过程,以60只杂交猪后腿为原料,按照传统工艺加工金华火腿,用气质联用仪(GC-MS)分析了6个工艺点的肌肉中挥发性风味物质的出峰面积,并用判别分析法分别研究了用挥发性风味物质的出峰面积和出峰面积占总出峰面积的百分率建立的判别函数判断金华火腿加工程度的可能性。研究结果表明,用金华火腿挥发性风味化合物的峰面积进行逐步判别分析,有20种挥发性化合物进入判别函数,而用峰面积占总出峰面积的百分率进行逐步判别分析,有17种挥发性化合物进入判别函数,建立的两套判别函数都能准确判别火腿的加工程度。结果提示:金华火腿风味化合物是在加工过程中逐步形成的,在不同加工阶段,火腿特征风味化合物的含量及其比例各具特征,可以用以辨别火腿的加工时间。
【英文摘要】In order to realize the forming process of the flavor substances in Jinhua ham, 60 Jinhua hams were processed using legs of cross-line pigs by traditional processing technology and the peak areas of flavor volatiles in ham muscle after each processing stage were analyzed by using Gas Chromatography and Mass Spectrometer (GC-MS). The possibility of discriminating Jinhua hams of different processing stages by using discriminant functions established on the volatile peak areas or ratios of the volatile peak areas accounting for the total peak area was individually studied. The results show that when stepwise discriminant analysis was performed on volatile peak areas of Jinhua ham, 20 kinds of volatile compounds enter the gained discriminant functions; while 17 kinds of volatile compounds enter the gained discriminant functions when ratios of the volatile peak areas accounting for the total peak area are analyzed. All of the two series of discriminant functions established can be used to discriminate Jinhua hams of different stages accurately. The results indicate that the flavor compounds are formed gradually during Jinhua ham processing and characterized by the concentrations and ratios of the character flavor compounds at different stages, which can be used to discriminate Jinhua hams of different processing stages.

【题目】Development of a SCAR marker by inter-simple sequence repeat for diagnosis of dwarf bunt of wheat and detection of Tilletia controversa K ü hn.
【中文关键词】SCAR;Tilletia controversaK ü hn
【英文关键词】SCAR;Tilletia controversaK ü hn
【中文摘要】Dwarf bunt of wheat, caused by Tilletia controversa K ü hn, is a destructive disease on wheat as well as an important internationally quarantined disease in many countries. The primer ISSR818 generated a polymorphic pattern displaying a 867-bp DNA fragment specific for T. controversa. The marker was converted into a sequence characterized amplified region (SCAR), and specific primers (TCKSF3/TCKSR3) designed for use in PCR detection assays; they amplified a unique DNA fragment in all isolates of T. controversa but not in the related pathogens. The detection limit with the primer set (TCKSF3/TCKSR3) was 5 ng of DNA which could be obtained from 5.5 μ g of teliospores in a 25- μ L PCR reaction mixture.

【题目】宰前因素对牛肉DFD发生率及品质的影响
【中文关键词】DFD肉 牛肉品质控制 宰前管理 宰前因素 极限pH值
【英文关键词】DFD meat beef quality control pre-slaughter managements pre-slaughter condition ultimate pH values
【中文摘要】为规范宰前管理,减少屠宰后DFD(黑切)牛肉的发生率,通过测量牛胴体背最长肌的pH值和温度,探讨了经过不同宰前处理的杂交牛DFD肉的发生率,建立了宰前因素与牛肉品质的量化关系。结果表明,待宰24h时DFD肉发生率最低,宰前不混群的待宰方式和安静、温湿度适宜的待宰环境能有效降低DFD肉的发生率;夏季DFD肉的发生率要高于冬季;也可以由牛肉的品质推测此肉牛宰前的状况以及可能影响此牛肉品质的宰前因素。
【英文摘要】To decrease the incidence of Dark Firm Dry(DFD)beef through the normative pre-slaughter managements,the incidences of DFD beef with different pre-slaughter managements were assessed by measuring pH and temperature values in the Longissimus dorsi muscle.The quantitative interactions between pre-slaughter conditions and beef qualities were built.The results showed that the incidence of DFD beef was the lowest when lairage time was 24 h.Unmixed group of cattle before slaughter,quiet environment,appropriate temperature and humidity lairage conditions could decrease the incidence of DFD beef availably.The incidence of DFD beef was higher in summer than in winter.Pre-slaughter managements and the conditions which affect beef quality can be speculated by the beef quality.

【题目】Development of a sequence-characterized amplified region marker for diagnosis of dwarf bunt of wheat and detectionof Tilletia controversa Kuhn
【中文关键词】ampli fi ed fragment length polymorphism,dwarf bunt of wheat, PCR, sequence-characterized ampli fi ed region, Tilletiacontroversa Ku ¨ hn.
【英文关键词】ampli fi ed fragment length polymorphism,dwarf bunt of wheat, PCR, sequence-characterized ampli fi ed region, Tilletiacontroversa Ku ¨ hn.
【中文摘要】AIMS: Dwarf bunt of wheat, caused by Tilletia controversa K ü hn, is a destructive disease on wheat as well as an important international quarantined isease in many countries. The objective of this investigation was to develop a diagnostic molecular marker generated from amplified fragment length olymorphism (AFLP) for rapid identification of T. controversa.METHODS AND RESULTS: A total of 30 primer combinations were tested by AFLP to detect DNApolymorphisms between T. controversa and related species. The primer combination E08/M02 generated a polymorphic pattern displaying a 451-bp DNA fragment specific for T. controversa. The marker was converted into a sequence-characterized amplified region (SCAR), and specific primers (SC-01(49)/SC-02(415)), designed for use in PCR detection assays, amplified a unique DNA fragment in all isolates of T. controversa, but not in the related pathogens. The etection limit with the primer set SC-01(49)/SC-02(415) was 10 ng of DNA which could be obtained from 11 microg of teliospores in a 25-microl PCR eaction.CONCLUSIONS: An approach to distinguish T. controversa from similar pathogenic fungi has been developed based on the use of a SCAR marker.SIGNIFICANCE AND IMPACT OF THE STUDY:

Development of the simple, high throughput assay kit for the rapid diagnosis of dwarf bunt of wheat and etection of T. controversa is anticipated in further studies.

【题目】广式腊肠干燥及贮藏过程中主要理化特性的变化

【中文关键词】广式腊肠 脂肪水解 脂肪氧化 酸价 过氧化值

【英文关键词】Chinese Guangdong sausage lipolysis lipid oxidation acid value peroxide value

【中文摘要】为了准确把握和控制广式腊肠加工贮藏过程中脂肪氧化和水解反应引起的理化指标和风味等变化,本文系统研究了烘烤和传统日晒两种加工方式生产出的广式腊肠的酸价、过氧化值、含水率等理化指标的变化。结果表明:加工过程中烘烤肠含水量、酸价及过氧化值的变化速度较日晒肠大,而贮藏过程中,日晒腊肠的酸价及过氧化值的变化速度高于烘烤腊肠。真空包装对酸价无明显抑制,但对过氧化值有明显的抑制作用。贮藏温度与酸价和过氧化值呈正相关,但在100 d的贮藏期内广式腊肠的过氧化值均未超过国家标准,而无论是日晒肠还是烘干肠的酸价,即使在10°C抽真空包装的理想贮藏条件下,在60 d和80 d时分别超过了国家标准。烘烤腊肠在30°C散装贮藏条件下保质期为20 d,添加0.15%瓜尔豆胶及0.15%硬脂酰乳酸钠可使腊肠保质期延长到60d左右。

【英文摘要】In order to grasp and control physicochemical properties and flavor changes of Chinese Guangdong sausage induced by lipolysis and lipids oxidation in process and storage,the physicochemical properties changes,including acid value,peroxide value and water content,of Chinese Guangdong sausages which were produced through roasting and solarizing processes were studied systematically.The results showed that the changes of acid value,peroxide value and water content in roasting process were faster than that of in solarizing process.However,during storage,the changes of acid value,peroxide value in roasted sausage were slower than that of in solarized sausage.Though vacuum storage did not inhibited acid value of sausage during storage,it inhibited effectively peroxide value increase.Higher storage temperature induced higher peroxide value,but peroxide value accorded with the national standard even after storing for 100 d.Acid values of the solarized and roasted sausage,which were even stored in vacuum at 10°C,overrun the government standard at 80 d and at 60 d,respectively.The roasted sausage could keep good quality for 20 days at 30°C in bulk;the shelf time of the roasted sausage was prolonged to about 60 days under the same storage condition by adding guar gum(0.15%)or sodium stearyl lactate(0.15%).

【题目】Effects of Wolbachia on mtDNA variation and evolution in natural populations of Tetranychus urticae Koch
【中文关键词】Wolbachia, mtDNA variation, Tetranychus
【英文关键词】Wolbachia, mtDNA variation, Tetranychus
【中文摘要】We investigated the effects of Wolbachia infection on mtDNA variation in spider mites by sequencing a portion of the mitochondrial cytochrome oxidase I (COI) gene from 198 individuals of known infection status. Four Wolbachia strains were described in the current study, namely wUrtOri1, wUrtOri2, wUrtOri3 and wUrtCon1. As predicted, the haplotype and nucleotide diversity were lower in infected individuals than in uninfected individuals. However, these mtDNA haplotype data are not entirely concordant with the surface protein of wolbachia (wsp) sequence data and both infected and uninfected individuals were found of the same haplotype. Although values of Tajima's D and Fu & Li's F were consistently less than zero for most infected groups, McDonald-Kreitman tests suggested that the patterns of variation were different from those expected under neutrality in only the uninfected group. Thus, the neutrality tests do not show a clear effect of Wolbachia infection on patterns of mtDNA variation and substitution in spider mites.

【题目】Genetic Diversity and Phylogenetic Analysis of Australian Grapevine Viroid (AGVd) Isolated from Different Grapevines in China.
【中文关键词】Australian grapevine viroid Phylogenetic analysis equencing analysis Secondary structure
【英文关键词】Australian grapevine viroid Phylogenetic analysis equencing analysis Secondary structure
【中文摘要】Australian grapevine viroid (AGVd) is found in only three countries in the world. Here, the genetic diversity and phylogenetic relationships of AGVd isolates from three different grape varieties (Thomson Seedless, Jingchuan and Zaoyu) in China were studied. A hundred of independent cDNA clones from each of the three isolates, in total of 300, were sequenced. We identified 29 sequence variants including two predominant ones in Thomson Seedless, and 48 each including a unique predominant one in Jingchuan and Zaoyu. In silico structure analysis revealed that base changes were clustered in the left terminal domain of the predicted secondary structure in all three isolates. Further, these changes were shown to affect their secondary structures to varying degrees. Genetic diversity and phylogenetic analysis of four predominant sequence variants from this study, plus four others from Australia and Tunisia, revealed obvious regional disparity and variety-specificity in AGVd.

【题目】电刺激和延迟冷却对牛肉食用品质的影响
【中文关键词】电刺激 延迟冷却 嫩度 食用品质 剪切力值 牛肉
【英文关键词】Electrical stimulation; Delay chilling; Tenderness; Eating quality; Shear force; Beef
【中文摘要】【目的】探讨电刺激和延迟冷却对宰后牛胴体温度、pH降低速率和肉的食用品质的影响。【方法】24头鲁西黄牛杂交牛按试验设计进行电刺激(刺激时间60 s、电压42 V、电流0.7 A、频率50 Hz)和延迟冷却(温度 15±2℃、时间 3 h,随后转入常规冷却间至 24 h)处理,研究不同处理对牛肉食用品质的影响。【结果】电刺激处理没有改变胴体温度的降低速率、但显著加快了胴体pH的降低速率;电刺激和延迟冷却没有改变胴体的冷却失重,但降低了背最长肌的保水性。两种处理均可以有效预防冷收缩、降低肉的剪切力值,改善肉的嫩度。【结论】在肉牛屠宰加工流程中,采用电刺激技术或延迟冷却处理可以有效改善肉的食用品质。
【英文摘要】【Objective】The objective of this paper was to study the effects of electrical stimulation and delay chilling on drop rate of temperature and pH of carcass and eating quality of beef. 【Method】 This article studied the effect of electrical stimulation (ES 60 s, 42 V, 0.7 A, 50 Hz) and delay chilling (DC (15±2)°C for 3 h, then changed into conventional chilling till 24 h) on eating quality of beef L-muscle. 【Result】Electrical stimulation of carcass had no effect on the carcass temperature drop, increased the rate of pH drop. Both ES and DC decreased water holding capacity of beef, though did not change the shrinkage of carcass. 【Conclusion】The results suggested that electrical stimulation and delay chilling could prevent cold shortening and lowered the shear force of beef.

【题目】Molecular Characterization of a member of a new Species of Grapevine Viroid
【中文关键词】grapevine viroid;GYSVd-3
【英文关键词】grapevine viroid;GYSVd-3
【中文摘要】Currently, viroids of five species are known to infect grapevine trees: Hop stunt viroid (HSVd-g) [1], Citrus exocortis viroid (CEVd-g) [2], Australian grapevine viroid (AGVd) [3], Grapevine yellow speckle viroid 1 (GYSVd-1) and Grapevine yellow speckle viroid 2 (GYSVd-2) [4 – 6]. These five grapevine viroid species have been divided into three genera based on sequence homologies of their central conserved regions (CCRs) [7]. GYSVd-1, GYSVd-2, and AGVd are classified in the genus Apscaviroid, whereas HSVd-g [8] and CEVd-g are classified in the genera Hostuviroid and Pospiviroid, respectively [9]. Mixed infections involving these viroids in cultivated grapevines are common, and in general, grapevine viroids produce very few, if any, disease symptoms. In the absence of manifested disease symptoms, these viroids are able to replicate in a host unnoticed. Of the five grapevine viroids identified, GYSVd-1 and GYSVd-2 are associated with disease symptoms such as yellow speckle, which was originally identified under hot greenhouse conditions in Australia [4, 5, 10]. Taylor and Woodham first described yellow speckle (YS) disease in Australia, and it is still the only grapevine disease known to be caused by viroids [10]. GYSVd-1, which is approximately 367 nucleotides (nts) in length, was first isolated from the grapevine cultivar ‘ Cabernet Franc ’, showing typical symptoms of YS disease. From this cultivar, a single

circular RNA was isolated by two-dimensional electrophoresis [4]. GYSVd-2, which is approximately 363 nts in length, was first purified from the grapevine cultivar ‘ Kyoto ’, which was grafted onto the ‘ Dogridge ’ rootstock and also exhibited symptoms of YS disease [5]. So far, GYSVd-2 has only been reported in Australia and China [5, 6], and the molecular characterization of GYSVd-2 has been described [11].

【题目】现代化工艺金华火腿肌肉水分活度变化规律研究

【中文关键词】金华火腿 水分活度 现代化工艺 贮藏安全性

【英文关键词】Jinhua ham;Water activity; Modem technology ;Storage safety

【中文摘要】【目的】研究金华火腿肌肉水分活度变化与原料腿型、肌肉部位和腌制用盐量的关系,为确定不同规格原料腿的加工安全性和制订现代化工艺金华火腿原料标准提供依据。【方法】采用现代化工艺加工金华火腿,测定了不同原料腿型、肌肉部位和腌制用盐量的肌肉水分活度。【结果】金华火腿肌肉水分活度随加工进程呈现规律性降低,盐渍期间浅层肌肉水分活度下降迅速,加工后期变缓,而股二头肌的水分活度在整个加工期间相对匀速下降,最终内外层趋于均衡。加大腌制用盐量能够促进浅层肌肉水分活度快速下降,但不利于加工后期水分活度的均衡分布;皮下脂肪厚度增加会延缓内外层肌肉水分活度的下降速度和均衡速度,经过腌制过程后其影响变小。原料腿重量越大,肌肉水分活度越高,加工后期尤其明显。加工结束时所有火腿各部位肌肉水分活度都在0.88以下,表现出良好的贮藏安全性。【结论】火腿各加工阶段水分活度受原料腿重量、皮下脂肪厚度和腌制用盐量等因素影响。

【英文摘要】[Objective] In order to understand the processing safety of different green hams and set up material standards for modem technology, the relationship between muscle water activity of Jinhua ham and green ham types, muscle position and salt dosage were discussed. [Method] Jinhua ham was processed by modern technology and muscle water activity (Aw) of different green ham types, muscle position and salt dosage were determined. [Result] Jinhua ham muscle Aw displayed regular drop along with processing. Surface layer muscle Aw dropped very quickly during salting stage and the drop tendency slowed down during later processing period, while biceps femoris AW dropped in a relatively uniform speed during the whole processing of Jinhua ham and eventually the surface and deep layer muscle Aw tended to become uniform. Many factors affected the change of muscle Aw during processing. Heavy green hams resulted in higher muscle Aw than normal green ham under same processing conditions, which became more significant during later stage of processing than early stage. Large salt dosage during salting stage accelerated drop speed of muscle Aw, but it also affected its uniform tendency during later stage of processing. Increase of the subcutaneous fat layer of green ham would slow down the drop speed of muscle Aw and the uniform tendency and the effect weakened after curing process. All ham muscle Aw was below 0.88 at the end of processing, which indicated that all hams could be stored with good security. [Conclusion] The muscle water activity of Jinhua

ham during processing were affected by green ham weight, thickness of subcutaneous fatty tissue and salt dosage

【题目】Molecular characterization of grapevine yellow speckle viroid-2 (GYSVd-2)
【中文关键词】Grapevine yellow speckle viroid-2 Genetic variation Sequencing analysis Secondary structure
【英文关键词】Grapevine yellow speckle viroid-2 Genetic variation Sequencing analysis Secondary structure
【中文摘要】Grapevine yellow speckle viroid-2 (GYSVd-2) is a viroid found only in grapevines in China and Australia. Here, we report the molecular characterization of GYSVd-2 isolated from three grapevine varieties in China. A total of 90 cDNA clones were sequenced including 30 cDNA clones obtained from each of the Black Olympia, Zaoyu, and Thomson Seedless isolates. Sequencing analysis identified 20, 18, and 12 different sequence variants from the 3 isolates, respectively. Furthermore, each of the isolates included one predominant sequence variant. Compared to the Australian variant of GYSVd-2 (Accession number: NC_003612), the Black Olympia variant was identical and the Zaoyu variant contained one substitution. In contrast, the Thomson Seedless isolate significantly varied from the Australian variant with three substitutions, two insertions, and four deletions. In silico structure analysis predicted that the variations were clustered in the terminal left, the pathogenicity, and the variable region of the predicted secondary structure of GYSVd-2.

【题目】肉牛胴体背最长肌脂肪酸组成与大理石花纹等级相关性研究
【中文关键词】牛肉 脂肪酸 大理石花纹 肌内脂肪 皮下脂肪 Beefc Fatty acid Marbling Intramuscular fat Subcutaneous fat
【英文关键词】Beefc Fatty acid Marbling Intramuscular fat Subcutaneous fat
【中文摘要】[目的]研究中国黄牛背最长肌肌内脂肪及皮下脂肪含量与其脂肪酸组成相关性.[方法]选取大理石花纹等级2级以上(含1级和2级)、3级和4级的黄牛胴体各10头,分别测定脂肪含量和脂肪酸组成.[结果]背最长肌水分和肌内脂肪含量与大理石花纹等级显著相关.肌内脂肪和皮下脂肪中单不饱和脂肪酸(MUFA)的顺式油酸含量最高,其次是饱和脂肪酸(SFA)中的棕榈酸和硬脂酸,多不饱和脂肪酸(PUFA)含量很少,主要是亚油酸.背最长肌棕榈酸、硬脂酸及SFA与肌内脂肪含量没有相关性,膜脂和储存脂肪中SFA百分含量趋于一致.[结论]油酸、MUFA百分含量以及M/S与肌内脂肪含量存在正相关,大理石花纹越丰富,肌内脂肪中油酸和MUFA百分含量越高,M/S比值也越高;而亚油酸、PUFA、n-6PUFA百分含量及P/S、n-6/n-3都与肌内脂肪含量呈负相关,大理石花纹越丰富,肌内脂肪中亚油酸、PUFA、n-6PUFA百分含量及P/S、n-6/n-

3比值都越低.皮下脂肪中n-3PUFA含量显著低于肌内脂肪n-3PUFA含量.

【英文摘要】【Objective】The objective of this experiment was to determine fatty acids changes with different intramuscular or subcutaneous fat content of Chinese Yellow cattle.Method】Thirty beef longissimus dorsi and the back fat from bulls of Chinese Yellow Cattle with marbling grade of 1&2, 3, and 4 were used, fat content and fatty acid profiles were detected. 【Result】 The results obtained show a great variability in the content of water and intramuscular fat and the percentages of fatty acids. Water content and intramuscular fat content (IMF) correlated with beef marbling. In intramuscular fat and subcutaneous fat as well, 18:1cis-9, which is one of the monounsaturated fatty acids (MUFA), was the main fatty acid, followed by two saturated fatty acids (SFA), 16:0 and 18:0. The percentage of polyunsaturated fatty acids (PUFA) was relatively lower. 【Conclusion】The percentages of 16:0, 18:0 and SFA were not correlated with IMF, which showed that the percentage of 16:0, 18:0 and SFA in beef longissimus dorsi were absolutely the same with subcutaneous fat. The percentages of 18:1cis-9, MUFA and ratio of M/S were positively correlated with IMF, with beef marbling increased from Grade 4 to Grade 2, the percentages of 18:1cis-9 and MUFA and the ratio of M/S increased. However, the percentages of 18:2cis-9,12, PUFA and n-6PUFA and the ratio of P/S, n-6/n-3 were negatively correlated with IMF, and with beef marbling increased, the percentages of 18:2cis-9,11, PUFA, n-6PUFA and the ratio of P/S, n-6/n-3 decreased significantly. The composition of n-3PUFA in subcutaneous fat was significantly lower than that of beef intramuscular fat.

【题目】Risk to nontarget plants from Ophraella communa (Coleoptera: Chrysomelidae), a potential biological control agent of alien invasive weed Ambrosia artemisiifolia (Asteraceae)in China

【中文关键词】Host speci fi city Biological weed control Oviposition selection Choice test Open- fi eld test

【英文关键词】Host speci fi city Biological weed control Oviposition selection Choice test Open- fi eld test

【中文摘要】Ophraella communa LeSage is an oligopha-gous insect that shows promise for controlling the alien invasive weed Ambrosia artemisiifolia L. in China. Thisstudy was performed to evaluate the risk of O. communa on the basis of host-speci fi city testing of larval development under no-choice conditions and of oviposition preferences under choice conditions in greenhouses and in the open fi eld. Under no-choice conditions, O. communa larvae experienced much igher mortality rates on the nontarget plants than on the target weed, but a small proportion of larvae completed development on the nontarget plants examined, including Xanthium sibiricum Patrin ex Widder,Helianthus tuberosus L., and H. annuus L. Multiple-choice tests indicated that O. communa showed a strong oviposi-tion preference for the target weed over the nontarget plants and laid few eggs on the economically important Helianthus crops tested. In paired-choice trials, O. comm-una adults showed an obvious preference for the target weed over X. sibiricum but preferred X. sibiricum to H. annuus. The results suggest that X. sibiricum might be used as a lower-ranked host plant next to the target weed by O. communa, and that Helianthus crops would not be at risk of being used for oviposition in the fi eld

【题目】宰前热应激对肉鸡胸肉氧化损伤和蛋白质功能特性的影响
【中文关键词】氧化 蛋白质 功能特性 热应激 鸡胸肉
【英文关键词】Oxidation;Protein;Functionality;Heat stress;Broiler breast muscle
【中文摘要】【目的】研究宰前热应激对肉鸡胸肉pH、脂肪氧化和蛋白质氧化的影响,探讨热应激影响宰后肌肉蛋白质功能特性的机制。【方法】将30日龄AA肉鸡由(25±1)°C突然暴露在(40±1)°C高温中,并分别持续0、1、2、3和5h后,各处理组中随机抽取10只,宰杀后剥取的胸肌在4°C条件下成熟24h,测定鸡胸肉的pH、脂肪氧化产物MDA、蛋白羰基值和蛋白质功能特性的变化。【结果】与对照组相比,热应激处理组的鸡胸肉pH30min、pH24h呈现下降趋势(P〈0.05),3h和5h处理组提高了胸肉脂肪氧化程度(P〈0.01),2、3和5h处理组胸肉肌浆蛋白和肌原纤维蛋白氧化程度高于对照组(P〈0.01),热应激时间由1h到5h,胸肉蛋白质溶解度呈下降趋势,肉汁损失、压榨损失和煮制损失呈增加趋势,热应激处理组胸肉肌原纤维蛋白凝胶具有较低的硬度和弹性(P〈0.01),热应激2、3和5h处理组胸肉肌原纤维蛋白凝胶保水性较对照组差(P〈0.01)。【结论】宰前热应激引起宰后肉鸡胸肉的pH下降,促使肌肉脂肪和蛋白质氧化程度加剧,导致胸肉蛋白质溶解度和持水能力降低,对肌原纤维蛋白凝胶特性造成不利影响。
【英文摘要】【Objective】This study was conducted to determine the effects of heat stress on pH,lipid peroxidation,protein oxidation and protein functionality in broiler breast meat. 【Method】Two hundred AA broilers were randomly divided into 5 groups,40 broilers for each group. After 30 days adaptive feeding under the normal temperature,broilers were suddenly stressed for 0,1,2,3 and 5 h by increasing environmental temperature from (25±1)°C to (40±1)°C. The pH,lipid or protein oxidative status and protein functionality of 10 broiler breast muscles in every group were investigated. 【Result】As compared with the control group,the pH30min and pH24h of muscle decreased significantly (P〈0.05),oxidative extent of intramuscular fat increased significantly at 3 h and 5 h (P〈0.01),oxidative extent of sarcoplasmic and myofibrillar protein also increased significantly at 2,3 and 5 h (P〈0.01). A decreasing tendency was found in muscle protein solubility and water holding capacity from 1 h to 5 h. Lower hardness and springness was observed in myofibrillar protein gels of breast muscles in heat stress groups (P〈0.01),also lower water holding capacity was scrutinized in 2 h,3 h and 5 h treatments (P〈0.01). 【Conclusion】The results indicated that preslaughter exposure of broiler chickens to heat stress could induce breast muscle lower pH and oxidative damage,increase intramuscular fat and protein oxidation,also decrease solubility of muscle protein and water holding capacity,thus result in a greatly negative influence on myofibrillar protein gels.

【题目】大豆分离蛋白热变性程度对肌纤维蛋白凝胶性质的影响
【中文关键词】大豆分离蛋白;肌纤维蛋白;热处理;凝胶特性;
【英文关键词】Soy protein isolate;Myofibrillar protein isolate;Heat treatment;Gelation;
【中文摘要】 研究大豆分离蛋白(SPI)热变性程度对肌肉纤维蛋白(MPI)凝胶性质的影响。将SPI在80,90,100°C分别热处理0,15,30,60,100,180min,得到一系列不同热变性程度的SPI,将其与MPI按1∶3(V∶W,总蛋白浓度为4%)的比例混合,热诱导得到混合蛋白凝胶。分别研究这些混合蛋白的流变学性质、凝胶性质以及凝胶持水性。结果表明:热变性的SPI有利于混合凝胶的性质提高,经过100°C热处理180min的SPI与MPI形成的混合蛋白的弹性模量G′值最大,凝胶强度和弹性也最接近纯MP凝胶性质,持水性甚至好于纯MP凝胶性质。
【英文摘要】The effects of preheated soybean protein isolate (SPI) on the gel properties of myofibrillar protein isolate (MPI) were studied. SPI was preheated at 80,90,100 °C for 0,15,30,60,100,180 min,then mixed with MPI at 1 ∶ 3 ratio (SPI ∶ MPI,V ∶ W,total protein concentration 4%) to obtain heat-induced gels separately. The rheology properties, gel strength and water holding capacity of

the gels were determined. The results showed that preheated SPI was benefit for the gel properties of mixture of SPI and MPI. The gel with MPI and SPI which was preheated at 100 ℃ for 180 min,and exhibited the highest storage modulus G′,gel hardness and water holding capacity.

【题目】Transcriptional Programming and Functional Interactions within the Phytophthora sojae RXLR Effector Repertoire
【中文关键词】Phytophthora sojae; RXLR Effector; Repertoire
【英文关键词】Phytophthora sojae; RXLR Effector; Repertoire
【中文摘要】The genome of the soybean pathogen Phytophthora sojae contains nearly 400 genes encoding candidate effector proteins carrying the host cell entry motif RXLR-dEER. Here, we report a broad survey of the transcription, variation, and functions of a large sample of the P. sojae candidate effectors. Forty-five (12%) effector genes showed high levels of polymorphism among P. sojae isolates and significant evidence for positive selection. Of 169 effectors tested, most could suppress programmed cell death triggered by BAX, effectors, and/or the PAMP INF1, while several triggered cell death themselves. Among the most strongly expressed effectors, one immediate-early class was highly expressed even prior to infection and was further induced 2- to 10-fold following infection. A second early class, including several that triggered cell death, was weakly expressed prior to infection but induced 20- to 120-fold during the first 12 h of infection. The most strongly expressed immediate-early effectors could suppress the cell death triggered by several early effectors, and most early effectors could suppress INF1-triggered cell death, suggesting the two classes of effectors may target different functional branches of the defense response. In support of this hypothesis, misexpression of key immediate-early and early effectors severely reduced the virulence of P. sojae transformants.

【题目】Variable fitness and reproductive effects of Wolbachia infection in populations of the two-spotted spider mite Tetranychus urticae Koch in China
【中文关键词】Wolbachia Tetranychus urticae Koch Cytoplasmic incompatibility Fitness

【英文关键词】Wolbachia Tetranychus urticae Koch Cytoplasmic incompatibility Fitness

【中文摘要】Maternally inherited Wolbachia bacteria are widely distributed among insects, and their presence usu-ally causes modi fi cations of the host. To understand the evolutionary history of diverse host-Wolbachia associa-tions, we investigated the symbiosis between Wolbachia and the two-spotted spider mite Tetranychus urticae Koch in China. The cytoplasmic incompatibility (CI) level,fecundity, female ratio, host longevity and host develop-ment time were examined. Our results indicate that Wol-bachia bacteria had variable effects on the reproduction and fi tness of Chinese populations of T. urticae. Variability of CI expression within T. urticae ranged from no CI to a strong level of CI in spite of the low variability of the wsp gene. Relative to uninfected mites, infected females in one of the three populations showed enhanced fecundity asso-ciated with the infection of Wolbachia. This is the fi rst report of a Wolbachia infection promoting the fecundity of infected females in T. urticae. Furthermore, we found both positive and negative effects of Wolbachia infection on longevity and the development time. The differences in ecological characters may be attributed to both Wolbachia and host genotype.

【题目】风鹅加工过程中挥发性风味成分的变化
【中文关键词】风鹅 固相微萃取与气质联用 挥发性风味成分
【英文关键词】Dry-cured goose;HS-SPME-GC-MS;Volatile flavour compounds
【中文摘要】【目的】探讨风鹅加工过程中挥发性风味成分的变化规律,为传统风鹅的工业化改造提供理论依据。【方法】运用固相微萃取与气质联用(HS-SPME-GC-MS),对加工过程中各工艺点风鹅肌肉中挥发性风味物质进行测定,分析研究了风鹅加工各阶段挥发性风味物质的成分、种类、相对含量和绝对含量的变化。【结果】在原料和腌制的鹅肉中分别检测到43和63种风味化合物;在风干1d、2d和3d的鹅肉中分别检测到50、61和62种风味化合物。这些成分可归类为:酯类、醛类、酮类、醚类、醇类、羧酸类、烯烃、烷烃、芳香族、杂环类化合物。在风鹅成品的风味成分中,烯烃类、酮类、醛类和芳香族化合物分别占化合物总数的39.67%、14.20%、12.12%和8.27%。【结论】风鹅加工过程中风味物质的总峰面积大幅增长,风干3d达到原料肉3倍以上,尤其是烯烃、醛、酮、芳香族等化合物最为显著,这类物质对形成风鹅特有的风味起了重大作用。
【英文摘要】[Objective] The objective of this study is to discuss the changing rules of volatile flavor compounds in dry-cured goose during processing and provide scientific basis for industrialized alteration of traditional dry-cured goose. [Method]Headspace solid phase microextraction combined with gas chromatgraphy-mass spectrometry (HS-SPME-GC-MS) were used to identify the kinds and amounts of volatile flavor compounds at different stages of dry cured goose during processing. [Result] Analysis of flavor compounds showed that, there were 43 compounds in material goose, 63 in dry-cured goose, 50 in l-day drying, 61 in 2-day drying and 62 in 3-day drying. The flavor compounds were clustered in the following chemical families: esters, aldehydes, ketones, aethers, alcohols, carboxylic acids, category, alkyl, aromatic hydrocarbons and heterocyclic compounds. In the flavor substances of the final product of dry-cured goose, the contents of category, ketones, aldehydes and aromatic hydrocarbons compounds were 39.67%, 14.20%, 12.12% and 8.27% of all, respectively. [Conclusion] The total area of the flavor compounds in dry-cured goose, especially in category, aldehydes, ketones

and aromatic hydrocarbons compounds increased dramatically during the processing and was 3 times more than that in raw material after 3 days of drying. All these compounds could play important roles for the specific flavor of dry-cured goose.

【题目】瓜类细菌性果斑病菌tvrR 基因的克隆及其对致病性的影响
【中文关键词】瓜类细菌性果斑病菌; tvrR 基因; 突变; 致病性
【英文关键词】Acidovorax avenae subsp. citrulli; tvrR gene; mutant; pathogenicity
【中文摘要】据丁香假单胞菌番茄致病变种 (Pseudomonas syringae pv. tomato) DC3000 中新的毒性基因 tvrR (TetR- like virulence regulator) 的氨基酸序列,从瓜类细菌性果病菌 (Acidovorax avenae subsp. citrulli,Aac) 的全基因组中发现并克隆了 tvrR 基因的同源物 通过同源重组的方法,构建了 tvrR 基因的插入突变体,并且经过 PCR 及 outhern 杂交验证确认突变体和野生型一样可以激发烟草过敏反应 致病性试验结果显示: 突变体比野生型的病程延长,但最终致病情况与野生型无差异 接种的寄主组织中菌生长能力检测发现,突变体的繁殖速度慢于野生型,但最终其菌体数量也能达到野生型菌株的最大值 在营养丰富的LB 培养基和营养贫乏的MMX 基本培养基中生长测定均发,突变体生长速度慢于野生型,但最终也能达到野生型的最大生长量 瓜类细菌性果斑病菌 tvrR 基因突变体致病性的改变与其生长能力变化的一致性表明,其致病性的变化是由其生长能力的改变引起的
【英文摘要】Abstract: According to the sequence of the novel virulence gene tvrR (TetR- like virulence regulator) of Pseudomonas syringae pv. tomato DC3000,a tvrR omolog was found and cloned from the genomic DNA of Acidovorax avenae subsp. citrulli. The tvrR inserted mutant was constructed by homologous ecombination and confirmed by PCR and Southern blot. Both the mutants and the wild- type strains could elicit the hypersensitive response (HR) in onhost tobacco. Pathogenicity tests showed that the disease symptom caused by mutants was delayed when compared to the wild- type strains,but there ere finally no significant differences in pathogenicity between the mutants and the wild- type strains. The inserted mutants grew more slowly than the wild- ype strains,but their population could finally reach the maximum of the wild- type strains in inoculated leaf tissues of Hami- melon. The inserted utants grew more slowly than the wild- type strains,but they could finally reach the maximum biomass of the wild- type strains in both utrient-rich LB edium and nutrient- poor MMX medium. The consistency of the changes in pathogenicity and growth ability of tvrR mutants indicated that the changes in athogenicity might be caused by the changed growth ability in A. avenae subsp. citrulli.

【中文摘要】利用RT22PCR 和RACE22PCR 技术, 从热激处理的紫茎泽兰叶片总RNA 中扩增出了细胞质小分子量热激蛋白(sHSP) 全长683 bp 的cDNA 基因序列. 在GeneBank 上的登录号是EF105483. 通过半定量分析, HS P1717 基因编码的热激蛋白在常温下有表达
【英文摘要】Abstract: According to the sequence of the novel virulence gene tvrR (TetR- like virulence regulator) of Pseudomonas syringae pv. tomato DC3000,a tvrR omolog was found and cloned from the genomic DNA of Acidovorax avenae subsp. citrulli. The tvrR inserted mutant was constructed by homologous ecombination and confirmed by PCR and Southern blot. Both the mutants and

the wild- type strains could elicit the hypersensitive response (HR) in onhost tobacco. Pathogenicity tests showed that the disease symptom caused by mutants was delayed when compared to the wild- type strains,but there ere finally no significant differences in pathogenicity between the mutants and the wild- type strains. The inserted mutants grew more slowly than the wild- ype strains,but their population could finally reach the maximum of the wild- type strains in inoculated leaf tissues of Hami- melon. The inserted utants grew more slowly than the wild- type strains,but they could finally reach the maximum biomass of the wild- type strains in both utrient-rich LB edium and nutrient- poor MMX medium. The consistency of the changes in pathogenicity and growth ability of tvrR mutants indicated that the changes in athogenicity might be caused by the changed growth ability in A. avenae subsp. citrulli.

【题目】水稻水分精确管理的知识模型研究

【中文关键词】水稻 水分精确管理 知识模型 节水灌溉 土壤水势

【英文关键词】rice precision water management knowledge model water-saving irrigation soil water potential

【中文摘要】【目的】水稻是中国主要的粮食作物,其生长需消耗大量的水资源,因此水分精确管理对于水稻高效生产具有重要的意义。【方法】在分析和提炼水稻栽培理论与技术研究资料的基础上,通过定量描述水稻需水规律与栽培技术、品种类型、生态环境之间的动态关系,根据土壤水分平衡原理,采用土壤水势作为灌溉指标,建立水稻水分精确管理知识模型;基于系统工程思想,进一步在Microsoft Visual Studio.NET 2005平台上构建水分精确管理知识模型系统。【结果】模型具有灌溉管理方案设计以及动态调控的功能,在杭州和南京两个生态点进行的大田对比试验表明,两生态点按照模型设计方案进行水分管理的田块,其产量平均分别提高了6.9%和9.1%,灌溉水分生产率平均分别提高了53.61%和42.73%。【结论】该模型对于不同条件下的水稻水分精确管理具有较好的适用性和指导性。

【英文摘要】Objective Rice is the most important staple crop and needs much water resource in China,so precision water management is necessary for high efficiency rice production.MethodBased on analysis and extraction of the research results in rice cultural theories and technologies,further on the theory of soil water balance,with soil water potential as the irrigation index,a knowledge model for precision water management in rice(KMPWM) was developed by quantifying the relationships of water demand and cultivation technologies,variety traits,and eco-environments.Furthermore,based on the system engineering theory,a decision support system for rice precision water management was established on the platform of Microsoft Visual Studio.NET 2005.ResultKMPWM realized the functions of irrigation management scheme design and real-time regulation.The field comparison experiments at Hangzhou and Nanjing showed that the average grain yields were improved by 6.9% and 9.1%,respectively,and irrigation water use efficiencies were remarkably increased by 53.61% and 42.73%,respectively,in two eco-sites under the model-designed irrigation strategies,as compared to conventional irrigation regimes.Conclusion It appears that the present model has good applicability and proper guidance for rice precision water management. 更多

【题目】稻麦适宜氮素营养指标动态的模型设计

【中文关键词】水稻 小麦 氮素指标动态 相对生长度日 精确管理

【英文关键词】rice wheat nitrogen index dynamics relative growing degree days (RGDD) precision management

【中文摘要】以水稻和小麦为研究对象,通过解析和提炼稻麦适宜氮素营养指标与品种类型、栽培技术、生态环境之间的定量关系,以基于生理发育时间(PDT)的相对生长度日和相对氮素营养指标为参数,建立了稻麦适宜氮素营养指标动态模型,并利用南京3年的大田试验资料对所建模型的可靠性和适应性进行了验证.结果表明:模型生成的水稻植株氮积累量和氮含量与实际观测值之间的平均根均方差(RMSE)分别为0.1245和0.1316;模拟的小麦植株氮积累量和氮含量与实际观测值之间的平均RMSE分别为0.1166和0.1301,表明模型对稻麦氮素营养指标动态具有较好的指导性,可为不同生态环境、品种类型和生产条件下的稻麦氮素营养诊断与管理调控提供定量化和精确化的指导.

【英文摘要】By analyzing and extracting the quantitative relationships of suitable nitrogen index dynamics of rice and wheat to their cultivar types,cultural techniques,and eco-environments,a design model for the suitable nitrogen index dynamics of rice and wheat was developed.The model was driven by the physiological development time-based relative growing degree days,with the relative nitrogen indices as modeling parameters,and could be used to generate the time-course indices such as the nitrogen accumulation and concentration of rice and wheat under different growth conditions.Case studies with the datasets from 3-year field experiments in Nanjing showed that the average RMSEs of the simulated to measured plant nitrogen accumulation and concentration were 0.1245 and 0.1316 for rice,and 0.1166 and 0.1301 for wheat,respectively.It was suggested that this model could reliably guide the dynamics of major nitrogen indices of rice and wheat,which would help with the quantitative nitrogen diagnosis and precision nitrogen management of rice and wheat under different eco-environments,cultivar types,and production conditions.

【题目】基于图像分析方法的水稻根系形态特征指标的定量分析

【中文关键词】水稻　根系形态　定量分析　WinRhizo　图像分析
【英文关键词】Rice　Root morphology　Quantitative analysis　WinRhizo　Image analysis
【中文摘要】利用图像分析方法定量研究水稻根系形态特征指标的变化规律。通过实施不同水氮处理和不同品种的水稻桶栽试验,选用WinRhizo(WR)软件的不同模式(LM和T200)分析根系图像,分别提取根直径范围0~0.30mm和0.25~1.80mm的根系形态数据,并与基于Image-Pro Plus6.0软件(IP)的根直径和不定根长的测量结果进行比较分析;确定了3种水稻品种不同类型根直径的范围;对不同生育时期水稻根长、根体积、根表面积、根系干重和不定根数量等水稻根系形态特征指标变化差异,以及分枝特征进行了分析。结果表明:(1)基于WR软件LM和T200模式下的根直径测量结果与基于IP软件的测量结果之间NRMSE分别为5.44%和10.95%。(2)界定细分枝根直径范围为0.03~0.10mm,扬稻6号(V3)粗分枝根和不定根分别为0.10~0.30mm和0.30~1.65mm,而日本晴(V1)和武香粳14(V2)分别为0.10~0.25mm和0.25~1.40mm,不定根长与IP测量结果进行比较,其NRMSE为10.78%~12.01%。(3)各指标抽穗前增长迅速,之后增长减缓或衰老下降;不同氮肥处理间各指标分蘖至成熟均差异显著,增施氮肥可促进根系生长,明显提高不定根比例;适当控水可促进根系生长,明显提高分枝根比例;品种V3自分蘖期到成熟期各指标均显著高于V1和V2,V1与V2间差异不显著。本研究表明,本方法具有较好的精度和可行性,为推进水稻或其他作物根系的定量研究提供了参考。　更多
【英文摘要】The objective of this study was to quantitatively analyze the change patterns of rice root morphological characteristics based on image analysis method in pot experiments with different nitrogen rates,water regimes,and rice cultivars in different years.WinRhizo software (WR) was used as the root image analysis tool,and two modes of LM and T200 were used to measure the root diameter and adventitious root length under two ranges of root diameter as 0 – 0.30 mm and 0.25 – 1.80 mm,respectively.The measurement results from WR were compared with those from Image-Pro Plus 6.0 software (IP).Then,the diameter ranges of different types of root were determined.On the basis of the dataset from WR,the statistical analysis were performed on rice root morphological characteristic indices,including dry weight,total volume,total surface area,total adventitious root length and number per plant at different growth stages.The results were as follows: (1) The average NRMSEs between WR (LM and T200) and IP for root diameters were 5.44% and 10.95%.(2) The diameter range of fine lateral root was circumscribed within 0.03 – 0.10 mm for all the experiments,coarse lateral and adventitious root were circumscribed within 0.10-0.30 and 0.30 – 1.40 mm for V1 (Nipponbare) and V2 (Wuxiangjing 14),but 0.10 – 0.25 and 0.25 – 1.65 mm for V3 (Yangdao 6).Following this method,the NRMSEs for adventitious root length measured by WR and IP were 10.78 – 12.01%.(3) All indices increased rapidly in the growth process and reached or approached the maximum at heading,then increased slowly or decreased after heading.There were significant differences between treatments with different nitrogen rates from tillering to maturing on all indices.Increasing nitrogen rate accelerated the growth of roots,and especially enhanced the proportion of adventitious roots.Properly control of irrigation could promote the growth of roots and increase the proportion of lateral roots.All indices of V3 were significantly higher than these of other cultivars,and there were no significant differences between V1 and V2.The results indicated that it was feasible to measure morphological indices of different types of rice root by WR with different modes,and the methods used in this paper have a good accuracy and reliability.These results could provide a support for the quantitative analysis on root morphology of rice or other crops.

【题目】Complete Resequencing of 40 Genomes Reveals Domestication Events and Genes in Silkworm (Bombyx)
【中文关键词】FORK HEAD; MORI; EXPRESSION; DROSOPHILA; SEQUENCE
【英文关键词】FORK HEAD; MORI; EXPRESSION; DROSOPHILA; SEQUENCE
【中文摘要】A single-base pair resolution silkworm genetic variation map was constructed from 40 domesticated and wild silkworms, each sequenced to approximately threefold coverage, representing 99.88% of the genome. We identified similar to 16 million single-nucleotide polymorphisms, many indels, and structural variations. We find that the domesticated silkworms are clearly genetically differentiated from the wild ones, but they have maintained large levels of genetic variability, suggesting a short domestication event involving a large number of individuals. We also identified signals of selection at 354 candidate genes that may have been important during domestication, some of which have enriched expression in the silk gland, midgut, and testis. These data add to our understanding of thedomestication processes and may have

applications in devising pest control strategies and advancing the use of silkworms as efficient bioreactors.

【题目】The genome of a lepidopteran model insect, the silkworm Bombyx mori
【中文关键词】Bombyx mori; Silkworm; Genome; Transposable elements; Silk production; Gene duplication
【英文关键词】Bombyx mori; Silkworm; Genome; Transposable elements; Silk production; Gene duplication
【中文摘要】Bombyx mori, the domesticated silkworm, is a major insect model for research, and the first lepidopteran for which draft genome sequences became available in 2004. Two independent data sets from whole-genome shotgun sequencing were merged and assembled together with newly obtained fosmid- and BAC-end sequences. The remarkably improved new assembly is presented here. The 8.5-fold sequence coverage of an estimated 432 Mb genome was assembled into scaffolds with an N50 size of approximately 3.7 Mb; the largest scaffold was 14.5 million base pairs. With help of a high-density SNP linkage map, we anchored 87%of the scaffold sequences to all 28 chromosomes. A particular feature was the high repetitive sequence content estimated to be 43.6% and that consisted mainly oftransposable elements. We predicted 14,623 gene models based on a GLEAN-based algorithm, a more accurate prediction than the previous gene models for this species. Over three thousand silkworm genes have no homologs in other insect or vertebrate genomes. Some insights into gene evolution and into characteristic biological processes are presented here and in other papers in this issue. The massive silk production correlates with the existence of specific tRNA clusters, and ofseveral sericin genes assembled in a cluster. The silkworm's adaptation to feeding on mulberry leaves, which contain toxic alkaloids, is likely linked to the presenceof new-type sucrase genes, apparently acquired from bacteria. The silkworm genome also revealed the cascade of genes involved in the juvenile hormone biosynthesis pathway, and a large number of cuticular protein genes.

【题目】Mutations of an arylalkylamine-N-acetyltransferase, Bm-iAANAT, are responsible for silkworm melanism mutant
【中文关键词】BOMBYX-MORI; SYNTHESIS ENZYMES; PAPILIO-XUTHUS; INSECT; PIGMENTATION; DROSOPHILA; GENETICS; SCLEROTIZATION; MELANIZATION; PURIFICATION
【英文关键词】BOMBYX-MORI; SYNTHESIS ENZYMES; PAPILIO-XUTHUS; INSECT; PIGMENTATION; DROSOPHILA; GENETICS; SCLEROTIZATION; MELANIZATION; PURIFICATION
【中文摘要】Coloration is one of the most variable characters in animals and provides rich material for studying the developmental genetic basis of pigment patterns. In thesilkworm, more than 100 gene mutation systems are related to aberrant color patterns. The melanism (mln) is a rare body color mutant that exhibits an easily distinguishable phenotype in both larval and adult silkworms. By positional cloning, we identified the candidate gene of the mln locus, Bm-iAANAT, whose homologous gene (Dat) converts dopamine into N-acetyldopamine, a precursor for N-acetyldopamine sclerotin in Drosophila. In the mln mutant, two types ofabnormal Bm-iAANAT transcripts were identified, whose expression levels are markedly lower than the wild type (WT). Moreover, dopamine content was approximately twice as high in the sclerified tissues (head, thoracic legs, and anal plate) of the mutant as in WT, resulting in phenotypic differences between the two. Quantitative reverse transcription PCR analyses showed that other genes involved in the melanin metabolism pathway were regulated by the aberrant Bm-iAANATactivity in mln mutant in different ways and degrees. We therefore propose that greater accumulation of dopamine results from the functional deficiency of BmiAANAT in the mutant, causing a darker pattern in the sclerified regions than in the WT. In summary, our results indicate that Bm-iAANAT is responsible for the color pattern ofthe silkworm mutant, mln. To our knowledge, this is the first report showing a role for arylalkylamine-N-acetyltransferases in color pattern mutation in Lepidoptera.

【题目】Evidence of selection at melanin synthesis pathway loci during silkworm domestication
【中文关键词】silkworm; domestication; body color; melanin synthesis pathway; selection; tyrosine hydroxylase
【英文关键词】silkworm; domestication; body color; melanin synthesis pathway; selection; tyrosine hydroxylase
【中文摘要】The domesticated silkworm (Bombyx mori) was domesticated from wild silkworm (Bombyx mandarina) more than 5,000 years ago. During domestication, body color between B. mandarina and B. mori changed dramatically. However, the molecular mechanism of the silkworm body color transition is not known. In the present study, we examined within- and between-species nucleotide diversity for eight silkworm melanin synthesis pathway genes, which play a key role in cuticular pigmentation of insects. Our results showed that the genetic diversity of B. mori was significantly lower than that of B. mandarina and 40.7% of the genetic diversity ofwild silkworm was lost in domesticated silkworm. We also examined whether position effect exists among melanin synthesis pathway genes in B. mandarina and B. mori. We found that the upstream genes have significantly lower levels of genetic diversity than the downstream genes, supporting a functional constraint hypothesis (FCH) of metabolic pathway, that is, upstream enzymes are under greater selective constraint than downstream enzymes because upstream enzymes participate in biosynthesis of a number of metabolites. We also investigated whether some of the melanin synthesis pathway genes experienced selection during domestication. Neutrality test, coalescent simulation, as well as network and phylogenetic analyses showed that tyrosine hydroxylase (TH) gene was a domestication locus. Sequence analysis further suggested that a putative expression enhancer (Abd-B-binding site) in the intron of TH gene might be disrupted during domestication. TH is the rate-limiting enzyme of melanin synthesis pathway in insects. Real-time polymerase chain reaction assay did show that the relative expression levels of TH gene in B. mori were significantly lower than that in B. mandarina at three different developmental stages, which is consistent with light body color of domesticatedsilkworm relative to wild silkworm. Therefore, we speculated that expression change of TH gene may contribute to the body color transition from B. mandarina to B. mori. Our results emphasize the exceptional role of gene expression regulation in morphological transition of domesticated animals.

【英文关键词】ALPHA-CRYSTALLIN; CAENORHABDITIS-ELEGANS; EXPRESSION; EVOLUTION; GENOME; SUPERFAMILY; NEMATODES; MUSCLE; BODY

【中文摘要】Background: Small heat shock proteins (sHSPs) are products of heat shock response and of other stress responses, and ubiquitous in all three domains of life, archaea, bacteria, and eukarya. They mainly function as molecular chaperones to protect proteins from being denatured in extreme conditions. Study on insect sHSPs could provide some insights into evolution of insects that have adapted to diverse niches in the world. Results: Taking advantage of the newly assembled genome sequence, we performed a genome-wide analysis of the candidate sHSP genes in the silkworm, Bombyx mori. Based on known silkworm sHSP sequences, we identified 16 silkworm sHSP genes. Most of them are distributed on two silkworm chromosomes 5 and 27, respectively. 15 of 16 silkworm sHSPs have expression evidence. The comparative analysis of insect sHSPs from B. mori, Drosophila melanogaster, Apis mellifera, Tribolium castaneum, and Anopheles gambiae revealed that there is only one orthologous cluster whereas remaining clusters are species-specific on the phylogenetic tree. This suggested that most of sHSPs might have diverged in function across insects investigated. In addition, the data presented in this study also revealed that sHSPs in the insect orthologous cluster are highly conserved in both sequence and expression pattern. In sum, insect sHSPs show a completely different evolutionary pattern from that found in vertebrate sHSPs. Conclusion: B. mori has the largest number of insect sHSP genes characterized to date, including 16 genes. The inference that most species-specific sHSPs might have diverged in function across insects investigated will help us understand the adaptability of these insects to diverse environments.

【题目】The UDP-glucosyltransferase multigene family in Bombyx mori

【中文关键词】DROSOPHILA-MELANOGASTER; TRANSMEMBRANE PROTEINS; ENDOPLASMIC-RETICULUM; INSECTICIDE RESISTANCE; DRUG-METABOLISM; ENZYMES; GLUCURONOSYLTRANSFERASES; EXPRESSION; RETENTION; DETOXIFICATION

【英文关键词】DROSOPHILA-MELANOGASTER; TRANSMEMBRANE PROTEINS; ENDOPLASMIC-RETICULUM; INSECTICIDE RESISTANCE; DRUG-METABOLISM; ENZYMES; GLUCURONOSYLTRANSFERASES; EXPRESSION;

RETENTION; DETOXIFICATION

【中文摘要】Background: Glucosidation plays a major role in the inactivation and excretion of a great variety of both endogenous and exogenous compounds. A class of UDP-glycosyltransferases (UGTs) is involved in this process. Insect UGTs play important roles in several processes, including detoxication of substrates such as plant allelochemicals, cuticle formation, pigmentation, and olfaction. Identification and characterization of Bombyx mori UGT genes could provide valuable basic information for this important family and explain the detoxication mechanism and other processes in insects. Results: Taking advantage of the newly assembled genome sequence, we performed a genome-wide analysis of the candidate UGT family in the silkworm, B. mori. Based on UGT signature and their similarity to UGT homologs from other organisms, we identified 42 putative silkworm UGT genes. Most of them are clustered on the silkworm chromosomes, with two major clusters on chromosomes 7 and 28, respectively. The phylogenetic analysis of these identified 42 UGT protein sequences revealed five major groups. A comparison of the silkworm UGTs with homologs from other sequenced insect genomes indicated that some UGTs are silkworm-specific genes. The expression patterns of these candidate genes were investigated with known expressed sequence tags (ESTs), microarray data, and RT-PCR method. In total, 36 genes were expressed in tissues examined and showed different patterns of expression profile, indicating that these UGT genes might have different functions. Conclusion: B. mori possesses a largest insect UGT gene family characterized to date, including 42 genes. Phylogenetic analysis, genomic organization and expression profiles provide an overview for the silkworm UGTs and facilitate their functional studies in future.

【题目】Identification, genomic organization and expression pattern of glutathione S-transferase in the silkworm, Bombyx mori

【中文关键词】Glutathione S-transferases; Bombyx mori; Genomic organization; Expression pattern
【英文关键词】Glutathione S-transferases; Bombyx mori; Genomic organization; Expression pattern

【中文摘要】Glutathione S-transferases (GSTs) are a multifunctional supergene family and some play an important role in insecticide resistance. We have identified 23 putative cytosolic GSTs by searching the new assembly of the Bombyx mori genome sequence. Phylogenetic analyses on the amino acid sequences reveal that 21 ofthe B. mori GSTs fall into six classes represented in other insects, the other two being unclassified. The majority of the silkworm GSTs belong to the Delta, Epsilon, and Omega classes. Most members of each class are tandemly arranged in the genome, except for the Epsilon GSTs. Expressed sequence tags (ESTs) corresponding to 19 of the 23 GSTs were found in available databases. Furthermore RT-PCR experiments detected expression of all the GSTs in multiple tissues on day 3 of fifth instar larvae. Surprisingly, we found little or

no expression of most Delta and Epsilon GSTs in the fat body, which is thought to be the main detoxification organ. This may explain the sensitivity of the silkworm to certain insecticides. Our data provide some insights into the evolution of the B. mori GST family and thefunctions of individual GST enzymes. (C) 2008 Elsevier Ltd. All rights reserved.

【题目】Annotation and expression of carboxylesterases in the silkworm, Bombyx mori

【中文关键词】JUVENILE-HORMONE ESTERASE; INSECTICIDE RESISTANCE; ACETYLCHOLINESTERASE GENE; DROSOPHILA-MELANOGASTER; PHENOLIC GLYCOSIDES; CARBOXYL-ESTERASES; MOLECULAR-BASIS; MULBERRY LATEX; MOTH; PHEROMONE
【英文关键词】JUVENILE-HORMONE ESTERASE; INSECTICIDE RESISTANCE; ACETYLCHOLINESTERASE GENE; DROSOPHILA-MELANOGASTER; PHENOLIC GLYCOSIDES; CARBOXYL-ESTERASES; MOLECULAR-BASIS; MULBERRY LATEX; MOTH; PHEROMONE

【中文摘要】Background: Carboxylesterase is a multifunctional superfamily and ubiquitous in all living organisms, including animals, plants, insects, and microbes. It plays important roles in xenobiotic detoxification, and pheromone degradation, neurogenesis and regulating development. Previous studies mainly used Dipteran Drosophila and mosquitoes as model organisms to investigate the roles of the insect COEs in insecticide resistance. However, genome-wide characterization of COEs in phytophagous insects and comparative analysis remain to be performed. Results: Based on the newly assembled genome sequence, 76 putative COEs were identified in Bombyx mori. Relative to other Dipteran and Hymenopteran insects, alpha-esterases were significantly expanded in the silkworm. Genomics analysis suggested that BmCOEs showed chromosome preferable distribution and 55% of which were tandem arranged. Sixty-one BmCOEs were transcribed based on cDNA/ESTs and microarray data. Generally, most of the COEs showed tissue specific expressions and expression level between male and female did not display obvious differences. Three main patterns could be classified, i.e. midgut-, head and integument-, and silk gland-specific expressions. Midgut is the first barrier of xenobiotics peroral toxicity, in which COEs may be involved in eliminating secondary metabolites of mulberry leaves and contaminants of insecticides in diet. For head and integument- class, most of the members were homologous to odorant-degrading enzyme (ODE) and antennal esterase. RT-PCR verified that the ODE-like esterases were also highly expressed in larvae antenna and maxilla, and thus they may play important roles in degradation of plant volatiles or other xenobiotics. Conclusion: B. mori has the largest number of insect COE genes characterized to date. Comparative genomic analysis suggested that the gene expansion mainly occurred in silkworm alpha-esterases. Expression evidence indicated that the expanded genes were specifically expressed in midgut, integument and head, implying that these genes may have important roles in detoxifying secondary metabolites of mulberry leaves, contaminants in diet, and odorants. Our results provide some new insights into functions and evolutionary characteristics of COEs in phytophagous insects.

【题目】New and highly efficient expression systems for expressing selectively foreign protein in the silk glands of transgenic silkworm
【中文关键词】Transgenic silkworms; Fibroin heavy chain; Bombyx mori; Silk gland expression system; piggyBac
【英文关键词】Transgenic silkworms; Fibroin heavy chain; Bombyx mori; Silk gland expression system; piggyBac
【中文摘要】 We constructed three different fibroin H-chain expression systems to estimate the efficacy of producing recombinant proteins in the cocoon of transgenicsilkworms. The results showed that the three different EGFP/H-chain fusion genes were all expressed selectively in the posterior silk gland of the transgenicsilkworm. The recombinant protein content of transgenic silkworm cocoons is up to 15% (w/w) when using the most highly efficient H-chain expression system. To our knowledge, in comparison with silkworm silk gland expression systems in the literature, the highly efficient expression system developed in this study is the mostefficient silkworm silk gland expression system to date. This expression system is the best candidate for foreign gene production and for creation of novel functionalsilk material. The results suggested the N-terminal domain and the intron of the H-chain gene are important in the secretion of fibroin and its transcription, respectively.

【题目】Burst expansion, distribution and diversification of MITEs in the silkworm genome
【中文关键词】 REPEAT TRANSPOSABLE ELEMENTS; BOMBYX-MORI; ANOPHELES-GAMBIAE; FAMILY; RICE; SEQUENCE; GENES; SOFTWARE; STOWAWAY; IDENTIFICATION
【英文关键词】 REPEAT TRANSPOSABLE ELEMENTS; BOMBYX-MORI; ANOPHELES-GAMBIAE; FAMILY; RICE; SEQUENCE; GENES; SOFTWARE; STOWAWAY; IDENTIFICATION
【中文摘要】Background: Miniature inverted-repeat transposable elements (MITEs) are widespread in plants and animals. Although silkworm (Bombyx mori) has a large amount of and a variety of transposable elements, the genome-wide information of the silkworm MITEs is unknown. Results: We used structure-based and homology approaches to search for MITEs in the silkworm genome. We identified 17 MITE families with a total of 5785 members, accounting for similar to 0.4% of the genome. 7 of 17 MITE families are completely novel based on the nucleotide composition of target site duplication (TSD) and/or terminal inverted repeats (TIR). Silkworm MITEs were widely and nonrandom distributed in the genome. One family named BmMITE-2 might experience a recent burst expansion. Network and diversity analyses for each family revealed different diversification patterns of the silkworm MITEs, reflecting the signatures of genome-shocks that silkworm experienced. Most silkworm MITEs preferentially inserted into or near genes and BmMITE-11 that encodes a germline-restricted small RNA might silence its the closest genes in silkworm ovary through a small RNA pathway. Conclusions: Silkworm harbors 17 MITE families. The silkworm MITEs preferred to reside in or near genes and one MITE might be involved in gene silence. Our results emphasize the exceptional role of MITEs in transcriptional regulation of genes and have general implications to understand interaction between MITEs and their host genome.

【题目】Comparative analysis of proteome maps of silkworm hemolymph duringdifferent developmental stages

【中文关键词】BETA-N-ACETYLGLUCOSAMINIDASE; MAJOR PLASMA-PROTEINS; BOMBYX-MORI; MANDUCA-SEXTA; INSECT; EXPRESSION; METAMORPHOSIS; INHIBITOR; HYDROXYPYRUVATE; PURIFICATION
【英文关键词】BETA-N-ACETYLGLUCOSAMINIDASE; MAJOR PLASMA-PROTEINS; BOMBYX-MORI; MANDUCA-SEXTA; INSECT; EXPRESSION; METAMORPHOSIS; INHIBITOR; HYDROXYPYRUVATE; PURIFICATION
【中文摘要】Background: The silkworm Bombyx mori is a lepidopteran insect with four developmental stages: egg, larva (caterpillar), pupa, and adult. The hemolymph of the silkworm is in an open system that circulates among all organs, and functions in nutrient and hormone transport, injury, and immunity. To understand the intricate developmental mechanisms of metamorphosis, silkworm hemolymph from different developmental stages, including the 3(rd) day of fifth instar, the 6(th) day of fifth instar, the 3rd day of pupation, the 8(th) day of pupal stage and the first day of the moth stage, was investigated by two-dimensional electrophoresis and mass spectrometry. Results: Two-dimensional polyacrylamide gel electrophoresis showed that from the larval to moth stages, silkworm hemolymph proteins changed markedly. Not only did major proteins such as SP1, SP2, and the 30 K lipoprotein change, but other proteins varied greatly at different stages. To understand the functions of these proteins in silkworm development, 56 spots were excised from gels for analysis by matrix-assisted laser desorption ionization time-of-flight mass spectrometry (MALDI-TOF MS). We identified 34 proteins involved in metamorphosis, programmed cell death, food digestion, metabolism, and nutrient storage and transport. Most proteins showed different expression at different stages, suggesting functions in development and metamorphosis. An abundance of proteins related to immunity were found, including hemolin, prophenoloxidase, serine proteinase-like protein, paralytic peptide-binding protein, and protease inhibitor.Conclusions: Proteomics research not only provides the opportunity for direct investigation of protein expression patterns, but also identifies many attractive candidates for further study. Two-dimensional maps of hemolymph proteins expressed during the growth and metamorphosis of the silkworm offer important insights into hemolymph function and insect metamorphosis.

【题目】Characterization and expression patterns of let-7 microRNA in the silkworm (Bombyx mori)
【中文关键词】CAENORHABDITIS-ELEGANS; C-ELEGANS; REGULATORY RNA; BROAD-COMPLEX; DROSOPHILA-MELANOGASTER; CELL-DEATH; FAT-BODY; TRANSCRIPTION FACTORS; INSECT METAMORPHOSIS; PROGRAMMED AUTOPHAGY
【英文关键词】CAENORHABDITIS-ELEGANS; C-ELEGANS; REGULATORY RNA; BROAD-COMPLEX; DROSOPHILA-MELANOGASTER; CELL-DEATH; FAT-BODY; TRANSCRIPTION FACTORS; INSECT METAMORPHOSIS;

PROGRAMMED AUTOPHAGY

【中文摘要】Background: lin-4 and let-7, the two founding members of heterochronic microRNA genes, are firstly confirmed in Caenorhabditis elegans to control the proper timing of developmental programs in a heterochronic pathway. let-7 has been thought to trigger the onset of adulthood across animal phyla. Ecdysone and Broad-Complex are required for the temporal expression of let-7 in Drosophila melanogaster. For a better understanding of the conservation and functions of let-7, we seek to explore how it is expressed in the silkworm (Bombyx mori). Results: One member of let-7 family has been identified in silkworm computationally and experimentally. All known members of this family share the same nucleotides at ten positions within the mature sequences. Sequence logo and phylogenetic tree show that they are not only conserved but diversify to some extent among some species. The bmo-let-7 was very lowly expressed in ova harvested from newborn unmated female adult and in individuals from the first molt to the early third instar, highly expressed after the third molt, and the most abundant expression was observed after mounting, particularly after pupation. The expression levels were higher at the end of each instar and at the beginning of each molt than at other periods, coinciding with the pulse of ecdysone and BR-C as a whole. Using cultured ovary cell line, BmN-SWUI, we examined the effect of altered ecdysone levels on bmo-let-7 expression. The expression was also detected in various tissues of day 3 of the fifth instar and of from day 7 of the fifth to pupa, suggesting a wide distributing pattern with various signal intensities. Conclusion: bmo-let-7 is stage- and tissue-specifically expressed in the silkworm. Although no signals were detected during embryonic development and first larval instar stages, the expression of bmo-let-7 was observed from the first molt, suggesting that it might also function at early larval stage of the silkworm. The detailed expression profiles in the whole life cycle and cultured cell line of silkworm showed a clear association with ecdysone pulse and a variety of biological processes.

【题目】Identification and expression of the achaete-scute complex in the silkworm, Bombyx mori

【中文关键词】achaete-scute (AS-C) homologue; Bombyx mori; genomic organization; expression pattern; RNA interference
【英文关键词】achaete-scute (AS-C) homologue; Bombyx mori; genomic organization; expression pattern; RNA interference

【中文摘要】Recently, the study of achaete-scute (AS-C) homologues has contributed enormously to understanding of gene duplication and function evolution, particularly inDiptera. We identified four AS-C homologue

genes in the silkworm, Bombyx mori, referred to as BmASH, BmASH2, BmASH3, and Bmase. The complex displayed tandem array structure in the genome. Analysis of spatial expression profiles showed that they all were expressed in obviously higher levels in wing disc than in other tissues, suggesting that they might play important roles in the development of the wing. Furthermore, we found that their expression profiles in the wing discs were mostly correlated with the development of the scales, especially the BmASH gene. RNA interference results further indicated that BmASH was necessary for scale formation in silkworm wing.

【英文摘要】Recently, the study of achaete-scute (AS-C) homologues has contributed enormously to understanding of gene duplication and function evolution, particularly inDiptera. We identified four AS-C homologue genes in the silkworm, Bombyx mori, referred to as BmASH, BmASH2, BmASH3, and Bmase. The complex displayed tandem array structure in the genome. Analysis of spatial expression profiles showed that they all were expressed in obviously higher levels in wing disc than in other tissues, suggesting that they might play important roles in the development of the wing. Furthermore, we found that their expression profiles in the wing discs were mostly correlated with the development of the scales, especially the BmASH gene. RNA interference results further indicated that BmASH was necessary for scale formation in silkworm wing.

【题目】A genomewide survey of homeobox genes and identification of novel structure of the Hox cluster in the silkworm, Bombyx mori

【中文关键词】Bombyx mori; Homeobox; Hox cluster; Bmshx family

【英文关键词】Bombyx mori; Homeobox; Hox cluster; Bmshx family

【中文摘要】 Homeobox genes encode transcriptional factors that play crucial roles in a variety of developmental pathways from unicellular to multicellular eukaryotes. We have identified 102 homeobox genes in the typical insect of Lepidoptera, Bombyx mori, based on the newly assembled genome sequence with SIX coverage. These identified homeobox genes were categorized into nine classes including at least 74 families. The available ESTs and microarray data at present confirmed that more than half of them were expressed during silkworm developmental processes. Orthologs of pb, zen and ftz were newly identified in the Bombyx Hox cluster on chromosome 6. Interestingly, a special group of 12 tandemly duplicated homeobox genes was found located between Bmpb and Bmzen in the Bombyx Hox cluster, suggesting that Hox cluster might have experienced a lineage-specific expansion in the silkworm. A detailed analysis on genome data reveals that a split exists between Bmlab and Bmpb. Our data provide valuable information for future research on the development and evolution of silkworm. 【题目】Establishment and characterization of an ovarian cell line of the silkworm, Bombyx mori
【中文关键词】Bombyx mori; Ovarian cell line; Growth curve; BmNPV infection; Transgenic cell line
【英文关键词】Bombyx mori; Ovarian cell line; Growth curve; BmNPV infection; Transgenic cell line
【中文摘要】A cell line BmN-SWU1 was established from the ovarian tissues of 3-day-old fourth instar Bombyx mori larvae of the 21-872nlw variety by performing primary cultures in Grace's medium supplemented with 20% fetal bovine serum (FBS). The cell line primarily consisted of short spindle cells and round cells. The frequencyof cells with chromosome number 2n = 56 was 80.5%; therefore, the cell line was considered to be a diploid cell line. The population-doubling time (PDT) at 45th passage line was 57.7 h. This cell line was susceptible to the B. mori nuclear polyhedrovirus (BmNPV), and the median tissue culture infective dose (TCID(50)) at acell density of 105 cells/ml was 16.3 OBs/ml. The transient expression efficiency of the green fluorescent protein (GFP) gene in this cell line was 54.8%. We used theBmN-SWU1 cell line to select and establish a GFP transgenic cell line. (C) 2009 Elsevier Ltd. All rights reserved.

【题目】Species-specific expansion of C2H2 zinc-finger genes and their expression profiles in silkworm, Bombyx mori.
【中文关键词】C2H2 zinc-finger; Transcription factor; Metamorphism; Development; Expression pattern; Bombyx mori
【英文关键词】C2H2 zinc-finger; Transcription factor; Metamorphism; Development; Expression pattern; Bombyx mori
【中文摘要】Most C2H2 zinc-finger proteins (ZFPs) function as sequence-specific DNA-binding transcription factors, and play important roles in a variety of biology processes, such as development, differentiation, and tumor suppression. By searching the silkworm genome with a HMM model of C2H2 zinc-fingers, we have identified a total of 338 C2H2 ZFPs. Most of the ZFP genes were clustered on chromosomes and showed uneven distribution in the genome. Over one third of geneswere concentrated on chromosome 11, 15 and 24. Phylogenetic analysis classified all silkworm C2H2 Ups into 75 families; 63 of which belong to evolutionarily conserved families. In addition, 188 C2H2 ZFP genes (55.6%) are species-specific to the silkworm. A species-specific expansion of a family with 39 members in a tandem array on chromosome 24 may explain the higher number of species-specific ZFPs in silkworm compared to other organisms. The expression patterns ofC2H2 ZFP genes were also

examined by microarray analysis. Most of these genes were actively expressed among different tissues on day 3 of the fifth instar. The results provide insight into the biological functions of the silkworm C2H2 ZFP genes in metamorphism and development. (C) 2008 Elsevier Ltd. All rights reserved.

【题目】利用转基因RNA干涉提高家蚕对BmNPV的抗性初探

【中文关键词】家蚕; p iggyB ac转座子; RNA干涉; 转基因; 家蚕核型多角体病毒

【英文关键词】Bom byx m o ri; p ig g yBa c tra nspo so n;RNA;i Tra nsg e ne; Bom byx m o ri nuc leo po lyhed ro v irus

【中文摘要】基于探讨利用转基因RNA 干涉技术使家蚕获得对核型多角体病毒抗性的目的, 将家蚕核型多角体病毒(BmNPV)的DNA聚合酶基因、蛋白激酶(PK1)基因以及bro-d 和orf1629基因的部分编码片段, 分别以其反向重复的形式与家蚕Actin3启动子连接, 构建了基于p iggyBac转座子载体的转基因表达载体, 通过显微注射于家蚕卵, 获得了36~ 107个G1 蛾区, 得到了20~ 23头转基因阳性家蚕。经Southern杂交及RT-PCR分析表明, BmNPV的4个反向重复片段都已经导入家蚕基因组中, 并且可以进行转录。攻毒实验结果表明, BmNPV的DNA聚合酶基因和PK 1基因反向重复片段对病毒的增殖有抑制作用, 从而使家蚕对BmNPV 具有一定抗性; 而BmNPV 的bro-d 和orf1629基因反向重复片段对病毒的增殖没有抑制作用。针对特定病毒的转基因RNA i技术有望使家蚕获得对该病毒的抗性。

【题目】转植酸酶基因家蚕的制作及表达检测
【中文关键词】家蚕;转基因蚕;piggyBac;转基因;绿色荧光蛋白;植酸酶
【英文关键词】Bombyx mori; transgenic silkworm ; piggyBac; transgene; green fluorescent protein(GFP);phytases
【中文摘要】家蚕Bombyx mori丝腺具有高效合成蛋白质的特性,开发在丝腺特异表达外源蛋白质的生物反应器具有重要的意义。本研究利用piggyBac来源的两种载体pPIGA3GFP和pBac{3 X P3 · EGFPaf},建立了稳定的家蚕转基因技术体系;然后,利用一株黑曲霉来源的植酸酶基因,构建了在家蚕后部丝腺特异表达的融合表达载体pBac[3×P3-EGFP+FibLphyADsRed],注射蚕卵后,在53个G1蛾区中检测到3个有荧光蚕的蛾区。经Southern blot和反向PCR验证,转基因表达盒整合到家蚕染色体上。RT—PCR结果显示,植酸酶基因特异性地在后部丝腺表达,其表达模式与家蚕轻链丝素基因一致。结果表明我们成功获得了在后部丝腺特异表达植酸酶融合蛋白的转基因蚕,这为进一步开发家蚕生物反应器,利用转基因蚕生产各种重组蛋白具有积极的促进作用。
【英文摘要】In this study, we produced germline transgenic silkworm that spin cocoons containing recombinant phyase in the fibroin layer.Using the piggyBac-derived vector pPIGA3 GFp and pBac{3×P3一 EGFPaf}.we successfully developed stable germline transformation in the silkworm Bombyx mori L.We further constructed a piggyBac.based transform ation vector that carried a fusion cDNA of phyase with partial fibroin 1ight chain(FibL)and red fluorescent protein(DsRed).The fusion cDNA was driven by FibL gene promoter.Silkworm eggs were injected with the vectors,producing woi'Ins displaying red fluorescence in their silkglands and cocoons. Southern blot and inverse.PCR results indicated that the insertion fragment was recombined with the chromosome of silkworm. RT.PCR analysis showed that the phytase gene was expressed especially in the posterior silkgland,and this expression pattern was the same as that of fibroinlight chain gene. These results showed that we successfully got phy-transgene silkworm. This studydemonstrates the viability of transgenic silkworm s as a tool for producing useful proteins in the silkglands

【中文摘要】从西南大学家蚕基因库中发现体形自然突变/ 新缢蚕0。幼虫表型特征为: 环节中央部位呈缢缩状, 色素聚集, 腹部节间膜呈隆起状, 5龄中后期最明显, 与缢蚕(constricted, co) 相似。至成虫期观察, 腹背通常少有鳞毛。经遗传分析, 新缢蚕为隐性基因支配, 将其命名为new constricted, 基因符号: co-n。连锁分析结果表明, co-n 与黄血(Y)基因连锁, 故判定该基因属于第2连锁群。这是家蚕第2连锁群30多个突变中发现的第一个体形突变。经过新缢蚕(co-n)与灰色卵(Gr)、黄血(Y)基因间的三点测验定位实验, 结合伴野丰2005年最新公布的家蚕连锁遗传图的第2连锁群基因座数据, 将co-n基因座确定为: 2-51 7。

【中文摘要】作为重要经济昆虫和鳞翅目昆虫模式的家蚕Bombyx mor i, 其突变体是生理学、遗传学、功能基因组学等研究的宝贵资源。作者在家蚕资源保存和遗传分析中发现一种新的体形突变体))) 短体蚕(Squab, Sq), 其特征是: 杂合体(Sq / +)成活, 蚕体长只有正常型的约4 /5, 腹中部略肥大, 胸部稍狭小; 纯合体(Sq / Sq) 胚胎期致死。遗传分析结果表明该突变为显性遗传。通过与各染色体标记基因进行连锁分析, 发现突变基因Sq 在家蚕第14染色体上; 通过与同一染色体上的标记基因青熟油蚕基因(oa)、不洁蚕基因(D i)进行三点测验, 将Sq 定位在家蚕连锁图谱第14连锁群的34. 6 cM 位点, 表示为Sq (14-34. 6)。本研究结果为深入研究和利用该突变体奠定了重要基础。
【英文摘要】The silkw orm, Bombyx mori, is an important econom ic insect and a model for Lep idoptera insects; the mutants o f silkworm are the va luab le resources for physio logy, genetics and functional genom ics. W e d iscovered a new body shapemutant named Squab (Sq) during the conservat ion and genetic analysis of the silkw orm resources. The heterozygo te (Sq /+) could surv ive, and the length of mutant is just about four-fifths o f the normal and is character ized by slight fat abdom en in the m iddle reg ion and a little narrow thorax; the homozygo te (Sq /Sq) is embryon ic letha.l The genetic analysis show ed that itw as contro lled by dom inantmutant gene. It is confirm ed that the mu tant gene Sq be longs to the 14th linkage group by crossing it w ith the marker genes fo r

each linkage g roup. Three-po int test among ao juku translucent (oa), d irty (D i) and Sq show ed that the gene locus of Sq is at 34. 6 cM on the 14 th linkage group in silkw orm linkage map. This study has important significance for further research and utilization o f th is mutan.t

【题目】家蚕Hox基因研究进展
【中文关键词】家蚕; 躯体模式; H ox基因; E群突变; 基因表达
【英文关键词】Bombyx mori; body plan; Hox genes; E mutants; gene expression
【中文摘要】H ox基因(homeobox genes)在昆虫躯体模式(body p lan)的发育调控机制中扮演着重要角色, 其表达具有严格的组织特异性和胚胎发育的程序性。家蚕Bom byx m ori作为鳞翅目昆虫的代表, 其H ox基因也陆续得到鉴定。在家蚕中存在一个拟复等位基因群))) E群基因, 其突变表型均与过剩斑纹和过剩附肢有关, 这可能与H ox基因有着密切联系。家蚕全基因组测序完成后, 发现其H ox基因簇中存在12个特有的hom eobox基因(Bm shx1 ~ Bm shx12) , 说明家蚕H ox基因可能具有独特的生物学意义。我们还利用家蚕基因芯片数据分析了Bm lab 与Bmpb 基因的组织表达特征。通过对家蚕H ox基因的研究, 探索家蚕躯体模式建立机制, 可望为解析其他鳞翅目昆虫的躯体模式的建立机制提供理论依据。本文就家蚕H ox基因的表达、功能及其与E群突变的关系等方面进行了综述。
【英文摘要】Hox genes play an impo rtant ro le in the mechanism o f developmental regu lation o f insect body plan and the expression of H ox genes show s strict t issue specificity and the programm ing of embryonic deve lopm ent1 The silkw orm, Bombyx mori, is a good representat ive insect of the order Lep idoptera1 The Hox genes have been iden tified one after ano ther in the silkw orm1 There is a complex loci of pseudoalle lic genes in the silkw orm called E complex and itsmutant phenotypes are re lated w ith the extramarkings or the supernum erary legs in the abdom ina l segm ents, w hich may have a close re la tionship w ith Hox genes1 A fter the comp letion of sequenc ing for the silkwo rm genome it w as found that there are 12 homeobox genes (Bmshx1 - Bmshx12) specific for the silkw orm in the Hox genes, wh ich show s a un ique b io log ical significance of H ox genes1 We have analyzed the spat ial expression pro file o f Bm lab and Bmpb in the silkw orm based on theB1m ori m icroarray data1 Through the research onHox genes and the mechan ism o f the establishment o f silkworm body plan, it is expected that it may found a theoretical basis for the body plan of o ther Lep idoptera insects1 W e rev iew ed the expression and function of H ox genes and the irre lationsh ip w ith E mutants in this art icle1

【题目】冷却猪肉不同贮藏温度货架期的预测模型
【中文关键词】冷却猪肉 特定腐败菌 货架期 预测模型
【英文关键词】chilled pork;specific spoilage;organisms;shelf-life;prediction model
【中文摘要】为了建立冷却猪肉货架期的预测模型,把特定腐败菌接种到无污染的冷却猪肉表面,托盘包装分别置于0℃,4℃,7℃,10℃,14℃和20℃的温度下贮藏,分别测定不同贮藏时间的细菌总数,同时对4℃贮藏的不同企业冷却猪肉进行品质分析,确定腐败限控量。结果表明,冷却猪肉腐败限控量为7.23lg(cfu/g)。应用修正的Gompertz函数能很好的描述特定腐败菌在不同温度下的生长动态,建立了6种温度下其在猪肉中的生长模型。温度对最大比生长速率和延滞时间等动力学参数的影响,采用平方根模型呈现良好的线性关系,模型残差值的绝对值均小于0.1,上下浮动于零左右,表明该模型描述的温度与比生长速率和延滞时间是可信的,由此建立了0-20℃范围内冷却猪肉贮藏过程中货架期的预测模型。

【英文摘要】In order to validate model for the shelf-life of chilled pork, mixed specific microorganisms were inoculated to the non-contamination longissimus muscle. The samples were tray-packaged at 0°C, 4°C, 70C, 10°C, 14°C and 20°C, and their total aerobic psychrotrophic counts were determined. Simultaneously, the characteristics of chilled pork purchased from different corporations stored at 4°C were analyzed in order to determine the average number of specific spoilage microorganisms when the shelf-life was ended. Gompertz type model and Belehradek (square root) model were used to establish the prediction model for shelf-life of chilled pork. Results show that the average number of specific spoilage microorganisms is 7.23 lg(cfu/g) at the end of shelf-life. The kinetics models of specific spoilage microorganisms were developed and the growth dynamics of this organism could be well described by a Gompertz type model. And six growth models were established for chilled pork. The temperature dependence of specific spoilage microorganisms kinetic parameters- μ max (maximum specific growth rate) and X (lag phase) were modeled using Belehradek (square root) model. The correlation coefficient can finely describe the influences of temperature on μ max, and λ. The absolute values of model residuals are all less than 0.1 and they all fluctuate around zero. The model for describing temperature with μ max, and λ is credible. Therefore, the prediction model for the shelf-life of chilled pork stored aerobically from 0°C to 20°C were validated.

【题目】A Knowledge-Based Model for Nitrogen Management in Rice and Wheat
【中文关键词】无
【英文关键词】Grain yield; Nitrogen fertilization model; Nitrogen strategy; Rice; Wheat
【中文摘要】无
【英文摘要】Excessive nitrogen fertilization results in low nitrogen-use efficiency. TO improve nitrogen management for high yield and high nitrogen efficiency in rice and wheat, we developed a knowledge-based nitrogen fertilization model by integrating the quantitative relationship between N fertilization and yield target with respect to N supply mid demand balance. The total amount of nitrogen and ratio of haul to top dressing nitrogen could be determined by this nitrogen fertilization model, and the desirable nitrogen fertilizer strategies could be made under the Conditions of, different climates, Soil types and managements. Furthermore, the function of dynamic regulation of pre-designed N dressing rate could he determined by using the nitrogen fertilization model on the basis of actual growth status under a specific production system. The nitrogen fertilization model is evaluated using We dam from field experiments of rice and wheat m Nanjing, and the results Oil Crop growth pattern mid N use showed Mat Me grain yield and N recovery, were markedly improved by the N fertilization plan given by the model. The nitrogen fertilization model call be used as guidance for quantifying N fertilization strategy in cereal crop production.

【题目】大豆重组自交系群体NJRISX 豆腐和豆乳得率的QTL分析
【中文关键词】大豆; 重组自交系(RIL); 豆腐; 豆乳; 得率; 分离分析; QTL 定位
【英文关键词】Soybean; Recombinant inbred line (RIL); Tofu; Soymilk; Output; Segregation analysis; QTL mapping
【中文摘要】以176 个家系组成的苏88-M21× 新沂小黑豆重组自交系群体NJRISX 为材料, 通过MAPMAKER3.0构建了包含131 个SSR 标记、24个连锁群的遗传图谱, 覆盖大豆基因组2 044.6 cM, 标记平均间距15.6 cM; 经2005和2006两年试验, 所获数据按主基因加多基因混合遗传模型分析干豆腐、湿豆腐和干豆乳得率的遗传机制; 应用软件Win QTL Cartographer

Version 2.5 复合区间作图法(CIM) 和多区间作图法(MIM) 检测QTL 。结果显示, 在A2 连锁群的Satt424~Sat_162区间检测到控制干豆腐和干豆乳得率的主效 QTL 各1 个, qODT -A2-1 可以解释15.7% ~ 28.2% 的表型变异, qODS -A2-1 可以解释30.0% ~ 34.8% 的表型变异。检测到湿豆腐得率2 个主效QTL, qOWT -A2-1 位于A2连锁群的Satt424~Sat_162区间, 可以解释20.7% ~ 30.7% 的表型变异, qOWT -L 位于L 连锁群的Satt481~Sat_397区间, 可以解释19.0% ~ 27.4% 的表型变异。分离分析结果表明, 干豆腐和干豆乳得率均属于1 对主基因加多基因遗传, 湿豆腐得率属于2 对非连锁主基因加多基因遗传模型。上述QTL 定位结果与分离分析所获的主基因数、贡献率及其和多基因的相对贡献可以相互验证, 建议育种中要兼顾主基因和多基因的利用。

【英文摘要】Genetic improvement of tofu and soymilk output is interested by both farmers and processors. The objective of the present study was to reveal the genetic system and map QTLs of tofu and soymilk output for improvement of the traits. The RIL population NJRISX consisting of 176 famili es was derived from a cross Su88-M21×Xinyixiaoheidou and was tested in two crop-ping years (2005 and 2006). A genetic linkage map, containing 131 SSR markers, spa nning 24 linkage groups (LG) at a total length of 2 044.6 cM, with an average distance of 15.6 cM be tween the flanking markers was constructed by using MAPMAKER 3.0. Genetic analysis was performed under main gene plus polygene mixed inheritance model for the P 1, P2, and RIL population and QTLs were mapped with both composite interval mapping (C IM) and multiple interval mapping (MIM) of the software Win QTL Cartographer Version 2.5 on output of dried tofu, wet tofu and dried soymilk. The main QTL qODT-A2-1 associated with dried tofu output, explaining 15.7% − 28.2% of the total phenotypic variation was identified between Satt424 and Sat_162 on LG A2; the main QTL qODS-A2-1 related to dried soymilk output, explaining 30.0% − 34.8% of the phenotypi c variation was also between Satt424 and Sat_162 on LG A2; and two main QTLs qOWT -A2-1 and qOWT -L associated with wet tofu output, explain-ing 20.7% − 30.7% and 19.0% − 27.4% of the total phenotypic variation were iden tified between Satt424 and Sat_162 on LG A2 and between Satt481 and Sat_397 on LG L, respectively. The results from segregation analysis showed that dried tofu and soymilk output were dominated by one main gene plus polygenes and wet tofu output was by two unlinked main genes plus polygenes. In comparison, the number of main genes, the phenotypic variation proportion explained by the main genes, and the relative contri-bution of main gene vs. ploygene from both segregation analysis and QTL mapping were similar, and two gene tic analyses could be used for verification each other. From described above, it was inferred that breeders for tofu and soymilk output should pay attention to both main genes and polygenes.

【题目】Modeling grain protein formation in relation to nitrogen uptake and remobilization in rice plant.
【中文关键词】无
【英文关键词】rice grain protain formation nitrogen uptake simulation model
【中文摘要】无

【英文摘要】Protein concentration of grain is an important quality index of rice, and formation of grain protein largely depends on pre-anthesis nitrogen assimilation and post-anthesis nitrogen remobilization in the rice plant. The primary objective of this study was to develop a simplified process model for simulating nitrogen accumulation and remobilization in plant and protein formation in rice grains on the basis of an established rice growth model. Six field experiments, involving different years, eco-sites, varieties, nitrogen rates, and irrigation regimes, were conducted to obtain the necessary data for model building, genotypic parameter determination, and model validation. Using physiological development time (PDT) as general time scale of development progress and cultivar-specific grain protein concentration as genotypic parameter, the dynamic relationships of plant nitrogen accumulation and translocation to environmental and genetic factors were quantified and synthesized in the present model. The pre-anthesis nitrogen uptake rate by plant changed with the PDT in a negative exponential pattern, and post-anthesis nitrogen uptake rate changed with leaf area index (LAI) in an exponential equation. Post-anthesis nitrogen translocation rate depended on the plant nitrogen concentration and dry weight at anthesis as well as residue nitrogen concentration of plant at maturity. The nitrogen for protein synthesis in grains came from two sources: the nitrogen pre-stored in leaves, stem and sheath before anthesis and then remobilized after anthesis, and the nitrogen absorbed directly by plant after anthesis. Finally, the model was tested by using the data sets of different years, eco-sites, varieties, and N fertilization and irrigation conditions with the root mean square errors (RMSE) 0.22% C0.26%, indicating the general and reliable

features of the model. It is hoped that by properly integrating with the existing rice growth models, the present model can be used for predicting grain protein concentration and grain protein yield of rice under various environments and genotypes.

【题目】中国野生大豆的遗传多样性和生态特异性分析
【中文关键词】Glycine soja, SSR 标记, 植物学性状, 遗传多样性, 遗传分化
【英文关键词】Glycine soja, SSR marker, botanical traits, genetic diversity, genetic differentiation
【中文摘要】野生大豆(Glycine soja)是栽培大豆的祖先, 为东亚特有种, 大部分分布在中国。我们采用52对SSR 引物和10个植物学性状, 以遗传丰富度和Simpson多样性指数为指标, 对来自中国3 个地理生态区域涉及24个省区的196 份野生大豆所构成的代表性样本的遗传变异进行了研究, 以期从分子水平和表型水平两个层面上揭示中国野生大豆遗传多样性和地理生态特异性。结果表明: 中国野生大豆群体SSR 位点的等位基因平均丰富度 (NA) 和平均Simpson多样性指数(H)分别为16.1 和0.852, 高于栽培大豆 (NA = 11.4, H = 0.773), 野生群体的遗传多样性明显高于栽培群体。3个地理生态群体中南方群体多样性最高(NA = 12.9, H = 0.842), 黄淮海群体最低(NA = 11.4, H = 0.805), 东北群体居中(NA = 12.5, H = 0.834) 。群体间存在遗传分化, 不同群体具有不同的特异等位基因, 位点AW132402 (A2连锁群)、Satt522 (F) 、satt150 (M) 、Sat_332 (D1a) 、Satt046 (K) 、sct_190 (K) 等的一些等位基因只在特定群体出现, 表现出群体分化后的生态特异性。中国野生大豆植物学性状的群体变异丰富, 平均Simpson多样性指数为0.710。地理群体间存在分化, 最明显的是生育期性状的分化, 反映了地理、光照和温度等生态因子的选择作用, 其中南方地理群体多样性最高(H = 0.671)。SSR 分子标记和植物学性状所获结果相对一致, 表明中国野生大豆地理群体间性状分化有其遗传分化的基础。
【英文摘要】The annual wild soybean (Glycine soja), known as the ancestor of the cultivated soybean (G. m a x), is endemic to East Asia with most of its range in China. It is believed that the wild soybean holds a reservoir of genetic variation potentially useful for improvement of cultivated soybeans. Our study combined molecu-lar techniques with evaluation of botanical traits to investigate genetic diversity and genetic specificity caused by geographic differentiation in wild so ybean populations in China. A total of 196 wild accessions from three distinct geographic regions (Northeast China, Huang-Huai-Hai Valleys and South China, abbrevi-ated as NEC, HHH and SOC, respectively) were genotyped using 52 SSR markers and phenotyped using 10 botanical traits. The average allelic richness (NA) of the entire wild population and Simpson diversity index (H) were 16.1 and 0.852, respectively; higher than those of cultivated populations (NA = 11.4, H = 0.773). Among the three geographic populations, the SOC population had the highest genetic diversity (NA = 12.9, H = 0.842), the NEC population the next highest (NA = 12.4 and H = 0.834), and the HHH population the low-est (NA = 11.4, H = 0.805). Population-specific alleles existed on a number of loci (including AW132402 (Linkage group A2), Satt522 (F), satt150 (M), Sat_332 (D1a), Satt046 (K), sct_190 (K), thus indicating the existence of genetic differentiation among, and ecological specificity of geographic populations. Analysis of botanical traits revealed high variation, diversity (H = 0.710) and geographic differentiation, especially in growth period traits. These differences in botanical tr aits indicate the significance of natural selection due to geographic variation in day-length and temperature. Analysis of molecular data and botanical traits indicated that the geographic differentiation observed in botanical traits was based on genetic differentiation, and that genetic diversity of the SOC population was higher than the other two populations.

【题目】大豆抗筛豆龟蝽Megacota cribraria (Fabricius) 的QTL分析
【中文关键词】大豆[Glycine max (L.) Merr.]; 筛豆龟蝽[Megacota cribraria (Fabricius)]; 抗虫性; QTL 定位
【英文关键词】Soybean [Glycine max (L.) Merr.]; Globular stink bug [Megacota cribraria (Fabricius)]; Resistance to insects; QTL Mapping
【中文摘要】筛豆龟蝽是我国南方大豆的主要害虫之一, 本研究旨在定位筛豆龟蝽抗性 QTL, 分析其稳定性, 为大豆抗筛豆龟蝽育种提供参考。以科丰1 号× 南农1138-2 组合衍生的含184 个重组自交系的群体NJRIKY(简称KY) 和皖82-178× 通山薄皮黄豆甲组合衍生的含142 个重组自交系的群体NJRIWT(简称WT)为材料, 2004 —2006在田间自然虫源下鉴定了筛豆龟蝽抗性。不同年份内以黑霉程度为指标的方差分析结果表明家系间差异在每年都达极显著水平, 遗传变异系数都相当大, 遗传率中等偏高。利用Windows QTL Cartographer Version 2.5的复合区间作图法(CIM), KY群体的抗性QTL 主要位于D1a 和C2连锁群, WT 群体的抗性QTL 主要位于H 和D1b 连锁群。KY 群体3 年均检测出的qRMC-d1a-1 位于D1a 连锁群, 贡献率为7.6%~31.4%; 2005和2006两年均检测出的qRMC-c2-1 位于C2连锁群, 与环境有互作, 效应相对较小; 抗性等位基因来自南农1138-2; qRMC-d1a-1 和qRMC-h-1 在2005年和2006年存在显著的互作。WT群体连锁群H 上的qRMC-h-1 在3 年中都被检测到, 贡献率为16.3%~36.2%; D1b连锁群上的qRMC-d1b-2在2004年和2005年被检测到, 效应相对较小; 抗性等位基因来自通山薄皮黄豆甲。虽然WT群体D1b 和H 连锁群上的这2 个QTL 在KY群体中也有一年被检测到, 但2 个群体抗性位点基本上是不同的。QTL 在不同环境被重复检出, 说明大豆对筛豆龟蝽的抗性由稳定的主效QTL 所控制, 其2 侧邻近标记有希望用于标记辅助选择育种。
【英文摘要】Globular stink bug [Megacota cribraria (Fabricius)] is one of the important pests for soybean [Glycine max (L.) Merr.] in the central and southern China. However, very few reports on soybean resistant to M. cribraria were found in the literature. The objectives of the present study were to find QTLs associated with resistance to M. cribraria in soybean and to analyze the stability of mapped QTLs among years by using two RIL populations, NJRIKY (or KY) and NJRIWT (or WT) derived from the crosses of Kefeng 1 × Nannong 1138-2 and Wan 82-178 × Tongshanbopihuangdoujia, respectively. The 184 lines of KY and 142 lines of WT were tested and the percentage of black mildew on stem and purple spots on leaves was used as indicator to evaluate their resis-tance to M. cribraria under natural infestation during 2004 – 2006. There existed significant differences among lines in the two RIL populations during the three years, with heritability of 66.5% – 88.8% in KY and 61. 3% – 84.8% in WT. The composite interval mapping (CIM) of the software Windows QTL Cartographer Versi on 2.5 was used to map QTLs. The linkage group D1a and C2 in KY and the linkage group H and D1b in WT were found to be related with resistance to M.crubrarua. The QTL qRMC-d1a-1 on Linkage group D1a was detected consis tently associated with reaction to M. cribraria in KY during the three years, which accounted for 7.6% – 31.4% of phenotypic variation; the QTL qRMC-c2-1 on linkage group C2 was detected in 2005 – 2006, which accounted for less phenotypic variation than the former one; the resistance alleles were from Nannong 1138-2. There appeared significant interactions between qRMC-d1a-1 and qRMC-h-1 in KY in 2005 and 2006. The QTL qRMC-h-1 on linkage group H was detected also consistently associated with reaction to M. cribraria in WT during the three years, which accounted for 16.3% – 36.2% of phenotypic variation; the QTL qRMC-d1b-2 on linkage group D1b was detect ed in 2004-2005, which accounted for less phenotypic variation than the former one; the resistant alleles were from Tongshanbopi huangdoujia. Therefore, different QTLs conferred resistance to M. cribraria in KY and WT basically although the two QTLs in the latter population were also iden-tified in one year in the former population. The fact that the QT Ls were repeatedly detected in different environments indicated the resistance was controlled stab ly by the main QTLs. Based on the results, it is inferred that the markers linked to the dete cted QTLs should be useful for marker-assisted selection for resistance to M. cribraria in soybean.

【题目】关于Mapmaker/Exp 遗传作图中标记分群和排序操作技术的讨论
【中文关键词】Mapmaker/Exp (3.0); 遗传连锁图谱; 作图技术; 标记分群; 标记排序

【英文关键词】Mapmaker/Exp (3.0); Genetic linkage map; Mapping technique; Marker grouping; Marker ordering

【中文摘要】Mapmaker/Exp (3.0) 是国内外广泛使用的遗传连锁数据分析软件，在分子标记数量大时(多于500 个) 往往出现所绘制连锁图谱图距偏大的现象。本文从标记分群和标记排序两个遗传作图环节分析原因并概括出以下两个实施要点:(1)标记分群不应强求同一LOD值，对特殊的连锁群可试用不同LOD值; (2) 在标记排序时，一次order命令后用ripple 命令反复梳理有时并不能获得最佳排列顺序，而应多次使用order，每次order后用ripple 反复梳理，经反复比较才能得出最佳排列顺序，必要时还须结合人工调整。通过大豆遗传作图实例比较了软件推荐思路2 的通常用法和作者建议的新用法所构建的遗传图谱及相应 QTL 定位的差异，认为新用法具有更好的效果。

【英文摘要】Mapmaker/Exp (3.0) is one of the most often used computer software packages for constructing genetic linkage map worldwide. It was found that the distances of the map constructed with the software were often exaggerate d when large number of markers was involved. The present paper is to introduce our technical experiences in using Meth od 2 (marker number more than 500) of the software for a more reasonable linkage map. In Method 2 of Mapmaker/Exp (3.0), markers were usually grouped into linkage groups under an identical LOD value for all linkage grou ps; and then an “ order ” command followed by multiple “ ripple ” command was used to test the order with a window size of 5. The causes for the exaggerated map distances were found probably in two aspects in Method 2, i.e. the way of assignment of LOD value and utilization of “ order ” and “ ripple ” commands in marker grouping and marker ordering. Therefore, two innovations were taken in the application of Method 2 as: (1) different LOD values used for some specific linkage groups in addition to a common LOD value for the others; and (2) multiple “ order ” commands each followed with multiple “ ripple ” commands used for ordering markers in linkage groups, combined with some artificial ad-justments when needed, for relatively higher likelihoods of th e linkage groups. The innovations were used to construct a soybean genetic linkage map which showed more reason able than that constructed with the old procedure with a better consistency to the soybean consensus map.

【题目】大豆对豆卷叶螟Lamprosema indicata (Fabricius) 抗性的遗传分析

【中文关键词】大豆; 豆卷叶螟; 抗虫性; 主基因+ 多基因混合遗传模型; 分离分析

【英文关键词】Soybean; Lamprosema indicata (Fabricius); Resistance to insects; Ma jor-gene plus polygenes mixed inheri-tance model; Segregation analysis

【中文摘要】大豆对豆卷叶螟抗性的最佳指标。对NJRIKY、NJRIWT和NJRISX 3个群体抗性遗传分离分析的结果一致表明，大豆对豆卷叶螟抗性符合2 对主基因+ 多基因的混合遗传模型，主基因遗传率分别为51.0% 、80.5% 和56.3%，多基因遗传率分别为39.1% 、11.4% 和29.1% 。2 对主基因的作用方式表现组合间有差异。在此基础上对群体各家系的主基因基因型作了归类，可供家系抗性选择参考。

【英文摘要】Bean pyralid (Lamprosema indicata Fabricius) is one of the major leaf-feeding insects for soybeans and causes serious damage in soybean production in central and southern China. The objective of the presen t study was mainly to reveal the inheri-tance of resistance to L. indicate in soybeans using three recombinant inbred lin e (RIL) populations derived from susceptible by resistant crosses, i. e. NJRIKY, NJRIWT and NJRISX (derived from Kefeng 1 × Nannong 1138-2, Wan 82-178 × Tongshanbopi-huangdoujia and Su 88-M21 × Xinyixiaoheidou, respectively) in the field under natural infestation. Based on the observation of symptoms damaged by the insect on soybeans, rolled leaf percentage, rolled leaf number, and seed yield were examined as resis-tance (damage) indices. Am ong them, the rolled leaf percentage tested in early September was the best index of resistance to L. indicata due to its higher genetic variation, heritability value and environment-stability, as well as higher negative correlation with seed yield in the three populations. Segrega tion analyses showed that resistance to L. indicata was dominated by two major genes plus polygenes in the three populations, with their major gene heritability of 51.0%, 80.5%, and 56 .3%, and polygene heritabili ty of 39.1%, 11.4%, and 29.1%, respectively. The major gene genotypes of the RILs of the three populations were determined and grouped according to their posterior probability, which could be utilized as reference in selection for resistance lines.

【题目】大豆豆腐和豆乳得率的遗传分析与QTL定位
【中文关键词】豆腐;豆乳;得率;重组自交系;分离分析;QTL 定位
【英文关键词】Tofu; Soymilk; Output; Recombinant inbred lin e (RIL); Segregation analysis; QTL mapping
【中文摘要】【目的】优质高产豆腐与豆乳专用品种的选育是现代大豆品质育种的重要方向,本研究欲通过对大豆同一重组自交系群体 2004 和 2005 两年的豆腐与豆乳得率进行相关的遗传分析与 QTL 定位,为豆腐与豆乳专用品种选育提供遗传学依据。【方法】以干豆腐与干豆乳得率均差异极显著的大豆品种科丰 1 号与南农 1138-2 及其构建的 184 个重组自交系的群体为试验材料,应用主基因+多基因混合遗传模型进行遗传分析;以该群体所构建,由 488 个分子标记组成,覆盖 4226.40 cM,平均图距 8.66 cM 的遗传连锁图谱为基础,应用软件 Cartographer V 2.5 的复合区间作图(CIM)程序检测 QTL。【结果】两个年份两个性状均存在双向超亲变异,年份间、群体各家系间、以及年份与家系互作间的差异均极显著;干豆腐得率的遗传,两个年份及两年平均值均属两对具有累加作用的连锁主基因加多基因混合遗传模型,重组率均为 0.00,主基因遗传率为 13.23%~26.84%,多基因遗传率为 73.15%~86.77%;各年份及两年平均干豆乳得率的遗传均为两对连锁主基因加多基因混合遗传模型,重组率均为 0.00,主基因遗传率为17.27%~22.29 %,多基因遗传率为 77.71%~82.73%。CIM 检测的 QTL 结 果显示,在 C2 连锁群STAS815T~A676I 标记区间检测到与干豆腐得率相关的 2 个紧密连锁的 QTL,能在不同年份稳定表达,对表型变异的贡献率累计为 16.23%~23.18%;在 M 连锁群 satt728~K24I 标记区间定位到 1 个控制干豆乳得率的 QTL,在不同年份稳定表达,距离其左侧标记 0.01 cM,对表型变异的贡献率为 4.73%~7.14%。【结论】豆腐与豆乳得率均属主基因加多基因遗传,主基因遗传贡献不大,多基因占主要部分(≥73.15%),遗传分析和 QTL 定位的结果可以相互验证,遗传改良需要更多地依靠多基因积聚。

【英文摘要】【Objective 】Breeding for output and quality of tofu and soymilk in soybeans is highly concerned recently by related food industry. The objective of the present study was aimed at revealing the genetic syst em of tofu and soymilk output for the traits improvement. 【Method】Segregation analysis for tofu and soymilk output in two cropping years (2004 and 2005) were conducted on a RIL population with 184 lines derived from Kefeng 1 ×Nannong 1138-2 under the Major Gene Plus Polygene Mixed Inheritance Model. Based on a genetic linka ge map, spanned 4226.40 cM with 488 markers in 25 linkage groups, constructed from the same RIL population, the QTLs of tofu and soymilk output were mapped under the composite interval mapping (CIM) procedure of the software Cartographer V 2.5. 【Result】The results from segregation analysis showed that tofu output was controlled by two linked major genes (recombination value 0.00) plus polygenes, with the major gene heritability of 13.23%-26.84%, and polygene heritability of 73.15%-86.77%; soymilk output was also controlled by two linked majo r genes (recombination value 0.00) plus polygenes, with the major gene heritability of 17.27%-22.29%, and polygene heritabili ty of 77.71%-82.73%. The results of QTL mapping showed that two linked QTLs associated with tofu output between STAS815T and A676I on Linkage Group C2 were identified with CIM, explaining 16.23%-23.18% of the total phenotypic variation, and a QTL related with soymilk output in the interval of satt728-K24I on Linkage Group M was identified, explaining 4.73%-7.14% of the total phe notypic variation.【Conclusion】Both tofu and soymilk output in soybean were controlled by major genes with smaller heritability and polygenes with heritability more than 73.15%, wh ich indicated that accumulation of polygenes should be emphasized in the improvement of tofu a nd soymilk output. The results between segregati on analysis and QTL mapping appeared somewh at consistent, therefore could be used for verification each other.

【题目】不同密度处理下玉米根系干重空间分布动态的研究
【中文关键词】玉米 根系分布 种植密度 干物重
【英文关键词】Maize Root distribution Dry matter Planting density
【中文摘要】采用根钻挖掘法对不同密度处理下玉米根系干重在土壤中的空间分布特征进行了研究。结果表明:不同密度处理下,各取样点0~100 cm土层内根系干重在整个生育期内均呈单峰曲线变化,峰值出现在灌浆期前后。在1/2行距处随着密度的增加,根系干重呈增加趋势变化;在1/2株距处,中密和高密处理差异较小,但显著大于低密。在1/4行距处,根系干重则随着密度的增加而逐渐减少。根系达到干重最大值后的下降过程均以高密处理的下降速度最快。不同取样点根系干重在土壤中的垂直分布情况为在大喇叭口期以前,根系干重最大值出现在10~20 cm的土层内,而后随着土层深度的增加根系干重迅速下降;大喇叭口期以后根系干重在土壤中的垂直分布呈负指数曲线趋势变化。密度对不同取样点根系干重影响主要表现在0~40 cm土层内1/2行距处拔节期各密度处理间无明显差异;小喇叭口期到灌浆期表现为高密>中密>低密;成熟期表现为中密>高密>低密。1/4行距处大喇叭口期以前各密度处理之间的差异不明显;从吐丝期到成熟期,中密和低密处理各土层的根重差异不明显,但均较高密处理的大。1/2株距处在大口期以前中密处理和高密处理各土层的根重无明显差异,但均较低密处理高,吐丝期以后各土层的根重则以中密处理最大,高密次之,低密最小。
【英文摘要】With the roots drill excavate experiments, studies on distribution and dry material accumulation on different densities of maize with the root drill. The result showed that at maize growth and development period, changes current was a single apex of roots dry weight from different densities. The Maximal value appeared in the grain filling period. Comparison the maximal of different densities at 1/2 individual plant space, with the density increasing by root dry weight increased, at 1/2 row space, difference is less on height density and middle density, but above low density, at 1/4 row space, with the density increasing by root dry weight reduced. In the horizontally distribution, root dry weight decreased gradually from the root center to outer space. Root dry weight perpendicularity distributing in soil, in pre-tassel before, dry measure maximum value appeared within 10 - 20 cm ’ s soil layers. At pre-tassel ling after. Root dry weight distributes memorial negative exponent curve law changed in perpendicularity in soil.

【题目】基于WebGIS和知识模型的精确农作决策支持系统
【中文关键词】WebGIS;精确农作;知识模型;决策支持系统;
【英文关键词】WebGIS; precision farming; knowledge model; decision support system;
【中文摘要】在提炼和优化作物管理知识模型的基础上,以WebGIS为空间信息平台,运用软构件技术及B/S分布式网络结构,构建了网络化精确农作决策支持系统。系统实现了基本地图操作、信息查询、差异分析、决策支持、结果展示以及系统维护功能,其中决策支持功能可基于田区土壤肥力和苗情长势差异进行数字化管理方案生成和因苗动态调控。在水稻试验示范区的系统应用结果表明,根据系统推荐的方案进行水稻田间管理,可使该区整体产量水平提高12.16%,肥料施用量减少23.55%,产量变异度下降79.49%。研究结果为实现网络化、数字化、广适性的精确农作决策支持提供了基本平台。
【英文摘要】On the basis of extracting and optimizing the knowledge model for crop management,with WebGIS as spatial information platform,a Web-based decision support system for precision farming was developed,by using the technology of software component and Browser/Server network mode.The system realized the functions as normal map handling,information query,difference analysis,result display,system maintenance and decision support.The digital management prescription was generated on the basis of the differences in soil fertility among the fields and further adjusted according to the growth status monitored at specific growth stages.Case studied on the system with the rice field experiments in Nanjing indicated that under the management plan recommended by the system,the average rice yield in the experiment area was increased by 12.16%,the amount of nitrogen fertilization decreased by 23.55%,and grain yield variation decreased by 79.49%,as comparing to the regular management plan.The present work has provided a basic platform for realizing Web-based,digital and dynamic decision support in precision farming.

【题目】不同施肥处理对青贮玉米产量和品质的影响
【中文关键词】青贮玉米;“ 3414 ”部分实施肥效试验; 产量;品质;
【英文关键词】silage maize; "3414" partly fertilizer experiment; yield;quality
【中文摘要】2006年在北京市顺义区布置了青贮玉米肥料效应试验,研究氮磷钾的不同配比对青贮玉米产量和品质的影响,确定当地青贮玉米的氮磷钾适宜施用量。采用"3414"部分实施设计,3次重复,完全随机区组设计。施用氮肥对青贮玉米产量的影响要显著大于磷、钾肥的效应。处理6(N2P0K2)的纯收入和产投比是所有处理中最高的,分别达到10446.4元/hm2和14.4。蛋白质含量最高的处理是处理5(N3P2K2),蛋白质含量为9.93%。合理施肥能提高青贮玉米产量,增加氮肥用量显著提高蛋白质含量,改善青贮玉米的品质。综合试验结果,结合当地农业生产实际,北京市顺义区青贮玉米生产体系的氮、钾肥推荐用量分别为180kg/hm2和180kg/hm2,在该地区不建议施用磷肥。
【英文摘要】A field experiment was conducted to study the effects of different fertilizer application on the yield and quality of silage maize in Shunyi district of Beijing city in 2006. Experiment with part implementing plan of "3414" ,three repeats, a randomized complete block design. Results indicated that application of N fertilizer have more significant effects on increasing the silage maize yield than P and K fertilizer. Treatment N2P0K2 has the greatest economic return and the ratio of input to output, which is 10446.4yuan/hm2 and 14.4, respectively. Treatment N3P2K2 has the highest protein content, which is 9.93%. Reasonable fertilization could enhanced silage corn yield, and the protein content of silage maize could be significantly improved by more nitrogen input. Based on the experimental results and the local agricultural production status, we recommend the optimum nitrogen and potassium rates should be 180kg/hm2 and 180kg/hm2, respectively, and no phosphorus is recommended.

【题目】不同肥料类型对豫麦34冠层结构特征及产量的影响
【中文关键词】冬小麦 肥料类型 冠层结构 产量
【英文关键词】Winter wheat ; Fertilizer Types ; Canopy architecture ; Grain yield ;
【中文摘要】为给小麦合理施肥提供依据,在等氮条件下,研究了尿素、鸡粪和尿素与鸡粪配施三种肥料处理对豫麦34冠层结构特性和产量的影响。结果表明,在小麦拔节期,尿素与鸡粪配施处理小麦平均叶倾角最小,为53.89°;叶面积指数、群体透光率、消光系数依次为4.63、0.055和0.63,均处在鸡粪处理和尿素处理之间。在孕穗期到灌浆期,尿素与鸡粪配施使小麦平均叶倾角介于鸡粪和尿素处理之间,为51.96°;叶面积指数、群体消光系数均最大,分别为5.80和0.66;群体透光率最小,为0.028。尿素与鸡粪配施的小麦穗粒数、穗粒重、生物产量、经济产量均高于鸡粪处理和尿素处理。综合来看,配施处理的小麦冠层结构适宜,株型最佳,群体光分布合理。
【英文摘要】At the same amount of nitrogen application, the effects of treatments of urea, chicken manure and mixed fertilizer on canopy architecture and grain yield of Yumai 34 was studied, and the results showed as follows, during Jointing stage, average leaf angle of mixed fertilizer treatment was 53.89° , this number was less than that of urea and chicken manure treatment, and its leaf area index , light transmission rate and extinction coefficient was 4.63, 0. 055 and 0.63, respectively, and in the middle of the three treatments. From booting stage to grain filling stage, the average leaf angle of mixed fertilizer treatment was 51.96° , and in the middle of the three treatments; Leaf area index and extinction coefficient numbers was 5.80 and 0.66,respectively, and were the biggest among the three treatments. Light transmission rate was 0. 028, which was the least among the three treatments. Grains of per spike, spike weight, biomass yield,grain yield of the mixed fertilizer treatment were all higher than that of the other two treatments. In general, canopy architecture of Yumai34 was the best, and sunlight distribution was reasonable in mixed fertilizer treatment.

【中文关键词】西氏鲍;皱纹盘鲍;杂交;免疫;抗性;营养成分
【英文关键词】Haliotis sieboldii; Haliotis discus hannai; hybrization; immune; tolerance; nutritive compositions
【中文摘要】本文主要从免疫防御能力、胁迫条件下的生理抗性和及营养成分这三方面对皱纹盘鲍、西氏鲍以及两者正反杂交F1代的生理生化指标进行比较评估。首先,通过比较免疫酶系统的效率、血细胞的吞噬率和呼吸爆发能力以及弧菌注射后四者的存活率,以此来对正反杂交F1代与其亲本的免疫防御特性进行评估;其次,通过观察高温胁迫、低盐胁迫、干露胁迫以及外力胁迫条件下,4组鲍的活力状况和存活率来比较它们的生理抗性;最后,测定了四者的含肉率、基本营养成分、矿物质含量及氨基酸和脂肪酸的组成含量,并对其肌肉营养成分进行氨基酸评分、化学评分,比较肌肉的必须氨基酸指数,以此来对它们的营养价值进行综合评价。经过综合比较分析,具体研究结果如下:1.亲本及正反杂交F1代免疫防御特性的比较通过对4组鲍水解酶类活力、氧化酶类活力以及抗氧化酶类活力的综合比较比较,可以得知西氏鲍和两种杂交子代的免疫酶系统无论是在排异杀灭能力还是修复能力都比皱纹盘鲍强。西氏鲍的血细胞吞噬率最高,和皱纹盘鲍、皱纹盘鲍♀×西氏鲍♂之间都存在极显著差异(P<0.01),与西氏鲍♀×皱纹盘鲍♂之间仅存在显著性差异(P<0.05);西氏鲍♀×皱纹盘鲍♂的呼吸爆发值最高,其显著高于亲本皱纹盘鲍(P<0.05),但和其他两者差异不显著(P>0.05)。比较血细胞的吞噬率和呼吸爆发值,结果显示,通过种间杂交,杂交子代的免疫能力与亲本皱纹盘鲍相比,已有明显改进,表现出杂交中亲优势及超亲优势。2.亲本及正反杂交F1代生理抗性的比较西氏鲍对高温的耐受性最强,皱纹盘鲍对高温的耐受性最差,两组杂交鲍对高温的耐受能力已超过皱纹盘鲍,表现出了明显的中亲优势;四者对低盐环境的耐受能力差别不大,皱纹盘鲍♀×西氏鲍♂的耐受能力略优于其他三者;西氏鲍对干露环境的耐受能力明显不如其他三者,除西氏鲍外,其余三者的耐受能力差别不大,西氏鲍♀×皱纹盘鲍♂的耐受能力略强。由此可见,通过杂交,杂交鲍对脱水环境的耐受能力相对于西氏鲍来说,已有所改进,西氏鲍♀×皱纹盘鲍♂的耐受能力甚至超过了双亲表现出了超亲优势。4组鲍之间的个体吸附力差异明显:西氏鲍的个体吸附力最弱(27.1±2.8 N),与其他3组鲍相比存在极显著差异(P<0.01),杂交组合西氏鲍♀×皱纹盘鲍♂的个体吸附力最强,并且显著高于亲本皱纹盘鲍(P<0.05)。对造成鲍吸附力差异的原因进行探索,结果表明,西氏鲍个体吸附力与其他3组鲍存在极显著差异主要是由于其吸盘面积较小,而西氏鲍♀×皱纹盘鲍♂单位面积吸附力和单位体重吸附力较高表示其机体活力比其他三者强。3.亲本及正反杂交F1代营养成分的分析比较　正反交F1和皱纹盘鲍的含肉率均显著高于西氏鲍(P<0.05);西氏鲍的粗蛋白含量最高(63.65%),粗脂肪含量最低(3.37%),两组杂交F1代的肌肉蛋白含量都高于皱纹盘鲍;亲本和杂交F1代内脏中的Fe、Mn、K、Ca、Zn、P、Cd、Pb、Cr含量均高于足部肌肉,但四者足部肌肉的各种元素含量差别不大。实验测定皱纹盘鲍♀×西氏鲍♂杂交F1代的不饱和脂肪酸相对总量和牛磺酸含量高于其他三种鲍;西氏鲍♀×皱纹盘鲍♂杂交F1代的氨基酸总量(56.50%)、必需氨基酸总量(17.26%)、必需氨基酸指数(93.47)以及鲜味氨基酸总量(24.5%)均高于其他三者。以上实验数据说明,通过种间杂交,亲本某些遗传性状缺陷在子代中得以改良,并且杂交获得的正反交F1代都有部分性状优于双亲。
【英文摘要】The evaluation about physiological and biochemical characteristics which is related to resistance from H. discus hannai, H. sieboldii, H. discus hannai ♀ × H. sieboldii ♂ and H. sieboldii ♀ × H. discus hannai ♂ including three phase: comparison about their ability of immunologic defence, comparison about their tolerance to evironmental factor ; evaluate their nutritive compositions. At first, in order to evaluate the ability about immunologic defence from the 4 groups of abalones, we did comparative studies about their efficiency of immunoenzyme system, the phagocytosis rate and ability of respiratory burst of their hemocytes, as well as their survival rate under the condition that infection by Vibrio sp. Then we observed the abilities and survival rates of abalones under high temperature conditions, low salnity conditions and aerial exposure conditions to compare the evironmental tolerance of these 4 groups of abalones; At last, The nutritional values of H. discus hannai, H. sieboldii and H. sieboldii ♀ × H. discus hannai ♂, H. discus hannai ♀ × H. sieboldii ♂ were evaluated. Their ratio of flesh were determined, nutritional compositions, mineral material content, amino acid compositions and contents, fatty acid compositions and relative contents of muscle were analyzed.The major results are limitied as follows:1. Comparison about ability of immunologic defence of parents and their hybridsThe activities of hydrolytic ferment, oxidase and antioxidase in haemolymph of these 4 groups of abalones were tesed. It shows that H. sieboldii and the hybrids can kill the pathogen and clear peroxide more efficiently than H. discus hannai. The phagocytosis rate of hemocytes of H. sieboldii is highest, it has extremely significant difference than H. discus hannai and H. discus hannai ♀ × H.sieboldii ♂ (P<0.01) but only has significant difference than H. sieboldii ♀ × H. discus hannai ♂ (P<0.05); The ability of respiratory burst of H. sieboldii ♀ × H. discus hannai ♂ is strongest and it does not have significant difference to others except H. discus hannai . It concluded that the ability of immunologic defence of hybrids is superior than H. discus hannai by means of hybrization.2. Comparison about tolerance to

evironmental factor of parents and their hybridsH. sieboldii is best suited high temperature evironment, H. discus hannai reversed. The tolerance to high temperature of two hibriys were superior than H. discus hannai and showed a heterosis. The tolerances to low salnity evironment of these 4 groups of abalones were similar but H. discus hannai ♀ × H. sieboldii ♂ had a little advantage; H. sieboldii had worst performance under the condition of aerial exposure stress, the performance of other 3 groups of abalones were similar and H. sieboldii ♀ × H. discus hannai ♂ is superior to other 2 groups of ablones. The tolerance to aerial exposure stress of hybrids is superior than H. sieboldii, showed a heterosis, even overdominance. The attachment abilities of these four groups of abalones have distinct differences. The attachment ability of H. sieboldii is weakest (27.1±2.8 N), and it has extremely significant difference with other three groups (P<0.01), H. sieboldii ♀ × H. discus hannai ♂ has the strongest attachment ability(42.6 ±6.9 N), even it is significant stronger than H. discus hannai (P<0.05). It presented that the minimal area of pedal cupule of H. sieboldii caused the extremely significant difference about its attachment ability with others; H. sieboldii ♀ × H. discus hannai ♂ has the highest AAPA (Attachment Ability Per unit Area) and APPB (Attachment Ability Per unit Body weight) due to its highest activity .3. Evaluation of nutritive compositions of parents and their hybridsThe nutritional values of H. discus hannai, H. sieboldii and H. sieboldii ♀ × H. discus hannai ♂, H. discus hanna ♀ × H. sieboldii ♂ were evaluated. The ratio of flesh was determined, nutritional compositions, mineral material content, amino acid compositions and contents, fatty acid compositions and relative contents of muscle were analyzed. The results showed that the ratio of flesh from H. discus hannai, H. sieboldii ♀ × H. discus hannai ♂, H. discus hannai ♀ × H. sieboldii ♂ are obviously higher than H. sieboldii(P<0.05). H. sieboldii contains the richest protein (63.65%) and the least fat (3.37%). The unsaturated fatty acid content and taurine content from H. discus hannai ♀ × H . sieboldii ♂ are higher than other groups. The total amino acid content, the ratio of essential amino acid and the delicious acid content in H. sieboldii ♀ × H. discus hannai ♂ are all the highest. Therefore, we can conclude that some nutritional qualities of parents can be improved by hybridization. Meanwhile, the hybrids have some qualities superior than their parents.

【题目】2 大豆苗期耐淹性的遗传与QTL分析
【中文关键词】大豆[Glycine max (L.) Merr.]; 耐淹性; RIL; 分离分析; QTL 定位
【英文关键词】Soybean [Glycine max (L.) Merr.]; Submergence tolerance; Recombinant inbred line (RIL); Segregation analysis; QTL mapping
【中文摘要】涝害是世界上许多国家的重大自然灾害。耐涝性可分为耐湿(渍) 性和耐淹性。以科丰1 号(高度耐淹)× 南农1138-2(不耐淹) 衍生的RIL 群体(NJRIKY) 为材料, 以盆栽全淹条件下的存活率为耐淹性指标, 采用主基因+ 多基因混合遗传模型分离分析法进行遗传分析, 并利用WinQTL Cartographer Version 2.5 程序的复合区间作图法(CIM) 及多区间作图法(MIM) 进行QTL 定位。结果表明, 两次试验的耐淹性均存在超亲变异, 试验间、家系间以及试验与家系互作间的差异均极显著; NJRIKY 大豆群体的耐淹性为3 对等加性主基因遗传模型, 主基因遗传率为42.40%; 在QTL分析中, 用CIM 和MIM共同检测到3 个耐淹QTL, 分别位于A1、D1a 和G 连锁群上的Satt648~K418_2V 、Satt531~A941V 、Satt038~Satt275 (B53B~Satt038)区间, 表型贡献率为4.4%~7.6% 。分离分析与QTL 定位的结果相对一致, 可相互印证。
【英文摘要】Flooding is often a serious natural disaster in the world. Flooding tolerance has been recognized in two categories: tolerance to soil waterlogging and tolerance to submergence. The objective of the present study was to reveal the inheritance a nd then to map the QTLs of tolerance to submergence in soybean. The survival percentage of seedlings of the RIL population NJRIKY derived from Kefeng No.1 (highly tolerant) × Nannong 1138-2 (sensitive) was evaluated under completely submerged condition in a pot experiment. The results from segregation analysis under major gene plus polygene mixed inheritance model showed that submergence tolerance of soybean was dominated by three major genes with the heritability of 42.40% and no poly-gene detected. With composite interval mapping (CIM) and mu ltiple interval mapping (MIM) under Win QTL Cartographer Ver-sion 2.5, three QTLs associated with submergence tolerance were identified, which located in Satt648-K418_2V, Satt531-A941V and Satt038-Satt275 (B53B-Satt038) on linkage groups A1, D1a and G, respectively, explaining 4.4 − 7.6% of the total phenotypic variation. The results from segregation analysis and QTL mapping a ppeared relatively consistent and could be verified each othe r.

【题目】西氏鲍与皱纹盘鲍杂交的遗传基础研究
【中文关键词】西氏鲍;皱纹盘鲍;种间杂交;遗传分析;杂种优势;遗传相关
【英文关键词】Haliotis sieboldii; Haliotis discus hannai; hybridization; genetic analysis; heterosis; genetic correlation
【中文摘要】杂交是目前水产生物育种中应用广泛、行之有效的育种途径之一。以培育一个或数个生长迅速、抗逆性强的鲍养殖新品种为主要目的,本研究利用西氏鲍(Haliotis sieboldii Reeve)和皱纹盘鲍(Haliotis discus hannai Ino)为材料,开展二者间的杂交工作,查清影响西氏鲍与皱纹盘鲍杂交受精率的主要因素,并借助常规染色体分析技术、AFLP、SSR 和线粒体DNA 分子标记技术,分别从形态学、细胞学以及分子生物学水平上对杂交F1 的遗传本质进行分析,确认了西氏鲍与皱纹盘鲍的杂交系实质性杂交;同时探讨了杂交F1 在不同生长时期、不同养殖条件及养殖模式下杂种优势的表现。主要结果如下:1.西氏鲍与皱纹盘鲍杂交受精率的影响因素影响西氏鲍与皱纹盘鲍杂交受精率的主要因素依次为水温、授精精子浓度及配子排放时间。将水温控制在18-20 ℃,授精精子浓度达2.6×107 个・mL-1 以上,在配子排放时迅速授精,可以显著提高杂交受精率。2.西氏鲍与皱纹盘鲍杂交F1 的形态学比较1)西氏鲍与皱纹盘鲍杂交F1 形态特征西氏鲍、皱纹盘鲍及正反交F1 的8 个形态特征比例参数的方差分析、聚类分析、主成分分析和判别分析表明,正反交F1 的形态特征介于两亲本之间,略偏向西氏鲍。正反交F1 在SW/SH 和PO/SH 上差异显著(P<0.05),这两个参数可作为区分正反交F1 的形态学指标。2)西氏鲍与皱纹盘鲍杂交F1 齿舌结构比较西氏鲍、皱纹盘鲍及正反杂交F1 齿舌的齿式均为∞+5+R+5+∞,在结构上极为相似。对西氏鲍、皱纹盘鲍及正反杂交F1 的8 个齿舌形态比例参数分别进行了方差分析、聚类分析和主成分分析,结果表明,西氏鲍与皱纹盘鲍正反杂交F1 齿舌形态结构除了正交F1 在中央齿基部宽度/壳长(WR/SL)的比值上表现出与其母本不同外,在其余齿舌形态比例参数上均表现出与母本相似的特点。3)西氏鲍与皱纹盘鲍杂交F1 精子形态分析正反交F1 的精子超微结构与西氏鲍及皱纹盘鲍相似,均分为头部、中段和尾鞭,头部同样是由圆柱状顶体和长柱状细胞核组成。正交F1 的精子全长53.95±2.48 μm,反交F1 的精子全长52.48±2.63 μm。正反交F1 精子的超微结构与皱纹盘鲍相比无明显差异,但与西氏鲍存在一定的差异。正反交F1 精子的线粒体数量具多态性,线粒体数量为5 或6 个。聚类分析和主成分分析结果表明,正反交F1 精子的形态结构与皱纹盘鲍较为接近而与西氏鲍有较大差异。3.西氏鲍与皱纹盘鲍杂交F1 的遗传本质1)杂交F1 的染色体核型分析染色体核型分析和比较,结果表明,正反交F1 与西氏鲍和皱纹盘鲍的染色体核型相同,均为2n=20m+16sm,NF=72。正反交F1 染色体的1 号染色体对的相对长度介于西氏鲍与皱纹盘鲍之间(6.87-8.21),与其余染色体间的差异较大,可作为区分亲本和杂交F1 的特征染色体对。在部分正交和反交F1 的幼体染色体分裂相中,出现了异常的染色体分裂相,其核型为2n=24m+10sm+2st。2)杂交F1 的SSR 分子鉴定从20 对已公布皱纹盘鲍的微卫星引物中筛选出2 对引物对西氏鲍与皱纹盘鲍正反交F1 进行分子鉴定,结果表明在杂交F1 中能同时扩增出分别来自西氏鲍与皱纹盘鲍的片段,可以有效地区分杂交F1 与双亲。3)杂交F1 的AFLP 分析利用5 对引物对AFLP 标记在西氏鲍与皱纹盘鲍正反交家系F1 中的多态性和分离规律进行研究,结果表明AFLP 标记在正反交F1 中多态性高,在正交和反交家系中,经卡方检验(α=0. 05),符合孟德尔分离规律的位点分别占总位点数的52.46%和50.16%,说明西氏鲍与皱纹盘鲍杂交家系适合于遗传图谱的构建。利用7 对AFLP 引物对西氏鲍与皱纹盘鲍杂交F1 群体遗传结构进行分析,结果表明杂交F1 群体与亲本自繁群体相比具有较高的多态性,西氏鲍与皱纹盘鲍的遗传差异较大,正反交F1 同时拥有皱纹盘鲍和西氏鲍的特异位点,表明双亲遗传物质均传递给杂交F1,证实了种间杂交的成功。正反交F1 与其母本组合的基因分化系数(Gst)均较小,分别为0.2747(DS/DD)和0.2684(SD/SS);与父本组合的Gst 值则分别为0.4785(DS/SS)和0.5126(SD/DD),表明正反交子代群体与母本分化程度低于与父本分化程度,正反交F1 在分子水平上偏向母本。4)杂交F1 与亲本的线粒体16S rRNA 和COI 基因片段差异以线粒体16S rRNA 和COI 基因作为分子标记对正反交F1 的遗传特性进行分析,结果表明,除个别个体的个别碱基发生变化外,正反交杂交子代的16SrRNA 和COI 基因均与各自的母本一致,未检测到父本的线粒体DNA 类型,说明西氏鲍与皱纹盘鲍杂交过程中线粒体16S rRNA 和COI 基因是遵循严格的母性遗传的。4.西氏鲍与皱纹盘鲍杂交F1 的数量性状遗传初步研究1)西氏鲍与皱纹盘鲍的杂交优势西氏鲍与皱纹盘鲍正反交F1 在苗种阶段即表现出一定的生长优势,但在苗种阶段杂交F1 成活率的杂种优势不明显,在养成阶段(180-720 d),正反交F1的生长明显优于其双亲自繁F1(P<0.05),正反交F1 生长的中亲杂种优势率和超亲优势率均得到大幅度的提高,表现出正向的杂种优势。正反杂交F1 在养成阶段的存活率与皱纹盘鲍相比显著提高(P<0.05);但与西氏鲍相比无显著差异(P>0.05),正反交F1 之间的存活率无显著差异(P>0.05)。2)不同养殖条件下西氏鲍与皱

纹盘鲍杂交F1的杂种优势养殖密度和养殖种类对鲍生长和存活的影响极显著(P<0.01),尤其是在高密度养殖条件下杂交F1在存活率上具有更高的杂种优势;正反交F1在工厂化养殖模式和海区吊养模式下的生长与存活均表现出杂种优势,但杂种优势的表现程度并不同,在工厂化养殖模式下杂交F1的杂种优势得到更好的表现。3)西氏鲍与皱纹盘鲍杂交F1的遗传相关采用通径分析方法分析了以杂交F1贝壳形态性状为自变量对活体重作依变量的通径系数、决定系数及相关指数。结果表明,正交F1的壳高与活体重相关联程度最大,反交F1的壳长与活体重相关联程度最大。通径系数可准确反映自变量对依变量的直接影响;通径分析表明,正交F1的活体重受壳高的直接影响最大,反交F1的活体重受壳长的直接影响最大。采用多元回归分析分别建立了正反交F1贝壳性状与活体重的回归方程,分别为:正交F1:Y=-181.723+2.4327X1+1.2548X2+1.2128X3+2.2128X4,反交F1:Y=-241.131+3.1122 X1+2.0166 X2+1.7543 X3+2.7312 X4。

【英文摘要】Nowadays, hybridization has been used widely in aquacuture breeding. In order to produce some faster growth and well disease-resistant aquacuture varieties, hybridization between Haliotis sieboldii and Haliotis discus hannai was studied. The present study is to deal with the feasibility and early development of hybridization between these two abalone species. Factors affecting fertilization success has also been reported. By taking advantage of karyotype analysis, amplified fragment length polymorphisms (AFLP), microsatellite (SSR) and mitochondrial 16S rRNA and COI gene sequences, the morphologieal cytological and molecular characterizations of hybrids and pure progenies were conducted. The status of hybrids were confirmed.Meanwhile, the heterosis of hybrids in different stages and cuture enviroments was investigated.The major results and conclusions were as follows:1. Factors affecting fertilization success of hybridizaiton between H. sieboldii and H.discus hannai2. Comparative morphological study on reciprocal hybrids between H. sieboldii and H.discus hannai3. Genetic analysis of H. sieboldii, H. discus hannai and their reciprocal hybrids4. Preliminary study of quatitative genetics of hybrids between H. sieboldii and H.discus hannai

【题目】不同基因型水稻钾素吸收利用对施钾量的生理响应

【中文关键词】水稻 施钾量 钾素吸收 利用效率

【英文关键词】rice ;potassium application rates ; potassium absorption ; use efficiency ;

【中文摘要】以常规粳稻武运粳7号、武香粳14号和杂交粳稻86优8号、泗优422为材料,研究了施钾量对不同基因型水稻钾素累积、分配和利用的影响。结果表明,施钾提高了水稻产量和经济系数,以12 kg/667 m2K2O处理最高;施钾提高了水稻群体吸钾量及拔节期到成熟期吸钾比例;施钾使植株钾素快速累积的平均速率和最大速率增大,但起止时间和持续时间缩短;施钾提高了水稻抽穗期和成熟期叶片、茎鞘和穗的钾素分配量及茎鞘分配比例,但降低了叶片分配比例,并以茎鞘分配量差异最大;随施钾量增加,水稻钾素回收效率、利用指数和植株钾生产效率降低,钾素农学效率、生理效率和生理指数则先升后降,以钾素生理指数、生理效率与产量的相关性较高。常规粳稻的产量、拔节期到成熟期吸钾比例、钾素快速累积的起止时间和持续时间及钾素生理效率、生理指数、植株钾生产效率高于杂交粳稻,但群体吸钾量、移栽到拔节期吸钾比例、钾素快速累积的最大速率和平均速率、茎鞘钾素分配量及比例、钾素回收效率低于杂交粳稻。

【英文摘要】Effects of potassium application rates (0, 6, 12, 18 kg/667 m^2 K2O) on plant potassium accumulation, distribution and utilization characteristics of different genotypes rice were studied by using conventional japonica cultivars (Wuyunjing7, Wuxiangjingl4) and hybrid japonica cultivars (86you8, Siyou422). The resulted showed as follows. Both rice yield and harvest index were increased with the increment of potassium application, which they obtained the highest at the K2O application rate of 12 kg/667m^2. Plant potassium accumulation and absorption percentage from elongation stage to maturing stage were raised, as well as average and maximal rate of potassium speediness accumulation period under potassium application, but starting to terminating date and duration date of potassium speediness accumulation period were opposite. Through potassium fertilizing, plant potassium absorption and the percentage of potassium accumulation from elongating stage to maturing stage were increased. Potassium application promoted potassium distribution amount in leaf, culm and sheath, panicle, and distribution percentage of cuhn and sheath, whereas reduced distribution percentage of leaf. The variation of potassium distribution amount in culm and sheath were larger than oth- ers. With the increment of potassium application rates, rice potassium recovery efficiency, plant potassium productivity and potassium utilization index decreased, potassium agronomy efficiency, physiology efficiency and physiology index increased at first and then decreased. Among these estimation index, the correlation of potassium physiology index and physiology efficiency to yield were

higher. Rice yield, potassium absorption percentage from elongation stage to maturing stage, starting to terminating date and duration date of potassium speediness accumulation period, potassium physiology efficiency, potassium physiology index, and plant potassium productivity of conventional japonica cultivars were higher than those of hybrid japonica cultivars,however, potassium accumulation, potassium absorption percentage from transplanting stage to elongation stage, average and maximal rate of potassium speediness accumulation period, potassium distribution amount and percentage in culm and sheath, and potassium recovery efficiency were lower.

【题目】基于模型和GIS的水稻生产管理决策支持系统构建与应用
【中文关键词】水稻 精确管理 知识模型 地理信息系统 决策支持系统
【英文关键词】rice ; precise management ; knowledge model ; geographic information system ; decision support system ;
【中文摘要】为实现水稻生产过程的精确化管理,以水稻精确管理知识模型为管理决策的智能依托,以GIS为空间数据管理平台,应用系统工程思想和软构件技术,设计实现了基于模型和GIS的水稻生产管理决策支持系统。该系统具有基本地图操作、信息管理、栽培方案设计、肥水运筹、病虫草害管理、适宜生长指标设计、因苗实时调控、专家咨询以及系统帮助等功能。系统在江苏和浙江部分水稻生产区的应用结果表明,精确管理田块平均产量达10464.8kg/hm^2,较常规管理田块增产12.53%,减少氮肥投入31.5kg/hm^2。系统的建立为水稻生产全过程变量管理处方的生成提供了模型化和系统化的决策工具,也为其他作物管理决策支持系统的构建提供了基础框架。
【英文摘要】In order to realize the precise management for rice production, a model and GIS-based decision support system for rice production and management (MGDSSRM) was developed, which was guided by the system engineering theory and software technology, using rice precision management knowledge model as intelligentized and digital decision support, with GIS as spatial data management platform. The system realized the functions as basic map handling, information management, cultural plan design, fertilizer and water management, pest-disease-weed management, suitable dynamic indices design, real-time regulation based on growth status, expert consultation, and system help, etc. Case studies on the system in the rice field experiments in Jiangsu and Zhejiang Provinces, China indicated that the average yield under the precision management plan was 10 464.8 kg/hm^2, 12.53% over that in the general plan (9 299.5 kg/hm^2). Moreover, the amount of nitrogen fertilizer decreased by 31.5 kg/hm^2, as comparing to the general plan. The present work has provided a modeling and systematized decision tool for the design of rice production management prescription, and a basal framework for developing other crop management decision support system.

【题目】基于图像处理技术的夏玉米群体长势监测研究
【中文关键词】夏玉米 图像处理技术 叶面积指数 干物质积累 回归模型
【英文关键词】Summer maize ; Digital image processing technology ; LAI ; DMA ; Regression model ;
【中文摘要】试验采用均匀设计,在大田条件下固定数码相机高度垂直拍摄夏玉米拔节期和大喇叭口期的群体图像,利用图像处理技术获取玉米地面覆盖度,建立覆盖度与人工测得的叶面积指数(LAI)和干物质积累(DMA)的回归关系模型,并对该模型的适用性进行统计检验.结果表明:地面覆盖度与LAI和DMA间存在极显著正相关关系,相关系数分别达到了0.946和0.935,在叶面积估算模型中引入密度因素后模型的精确性得到了进一步改善,表明利用图像处理技术估测夏玉米群体长势具有很好的可行性.

【英文摘要】The test adopted uniform design method, under field conditions, the group images of summer maize were obtained vertically by a digital camera from fixed height at jointing stage and bell stage.Then the test established the relation models between GCR extracted via image processing technique and leaf area index(LAI), dry matter accu-mulation(DMA), which were measured by traditional methods, and the practicality of those models were tested.The results showed that LAI and DMA were significantly correlated with GCR, and the determination coefficient(R~2) were 0.946 and 0.935, respectively.And further analysis found that multiple regression model by adding density factor can effectively improve precision of LAI prediction model.Generally, the test results indicated that it has better feasibility to monitoring the growth of summer maize via using image processing technique.

【英文关键词】wheat growth model COM+ component Web application decision support system
【中文摘要】基于生长模型的作物管理决策支持系统(DSS),是在作物生长模型的基础上,增加数据库管理系统和策略评估系统,通过有目的的模拟试验与分析评价来辅助用户进行管理决策。将Web技术应用于DSS是当前农业决策支持系统发展的主要方向。该研究在已有单机版基于生长模型的小麦管理决策支持系统的基础上,采用“Web浏览器/Web服务器/应用程序服务器/数据库服务器”四层结构设计,应用面向对象的程序设计、COM+构件化技术与WEB应用程序扩展技术,构建了一个具有较强兼容性、层次性和安全性的网络化小麦生长模拟与管理决策支持系统(GMDSSWMW),具有系统管理、数据管理、动态模拟、方案评估、因苗预测、时空分析与系统帮助7项功能。系统的测试应用结果表明,GMDSSWMW系统具备较强的远程预测功能、决策支持功能与动态调控功能,从而为构建网络化数字麦作系统及其它作物基于Web应用的管理决策支持系统奠定了基础。
【英文摘要】Growth model-based decision support system(DSS) for crop management is the tool to help users make decision by simulation experiments and strategy analysis on the basis of crop growth model, DBMS and strategy evaluation system. Application of web technology to DSS is becoming a major direction for development of DSS in agriculture. Based on the stand-alone growth model-based decision support system for wheat management and the four-layer web structure of "Web browser/Web server/Application server/Database server", a growth model and web-application-based decision support system for wheat management(GMDSSWMw) with good compatibility, arrangement and security was developed by using the techniques of object-orientation, COM+ component and web application. The implemented system can be used for evaluating individual and comprehensive management strategies based on the results of wheat growth simulation under the web service environment. The test and application of the system showed that the GMDSSWMw was realized with proper functions of long-distance prediction, decision-making and dynamic regulation, thus providing basis for establishing web-based digital wheat farming system as well as other crops' management systems.

【题目】基于CERES-Maize模型的华北平原玉米生产潜力的估算与分析
【中文关键词】CERES-Maize 春玉米 华北平原 产量潜力 播期
【英文关键词】CERES-Maize spring maize North China Plain potential productivity sowing date

【中文摘要】在对DSSAT4.0中CERES-Maize模型进行参数校正和验证的基础上,进一步利用华北地区具有代表性的10个气象站30年(1976~2005年)的气象资料以及华北地区典型的土壤数据展开模拟。结果表明,在一年一季的生产条件下,华北平原各地区玉米多年平均光温生产潜力为13.53~22.56 t/hm2;各地区玉米产量在4月下旬至6月中旬的播期范围内均呈随播期的延迟而增加的趋势,对这一趋势和各气象指标进行相关分析表明,在华北北部主要驱动因子是灌浆期平均日辐射量,而华北中南部主要驱动因子是灌浆期的温度。华北平原自北向南,优化播期呈逐渐推迟的趋势:北部怀来地区5月上旬播种较为适宜,北京、乐亭和天津地区以5月下旬至6月初播种产量最高;中南部以6月中上旬播种(夏播)较适宜。

【英文摘要】A field experiment with three nitrogen managements was conducted from 2005 to 2006 in Beijing Dongbeiwang experimental station to calibrate CERES-Maize model in DSSAT 4.0. Another two field experiments regarding irrigation amounts and sowing dates were conducted in 2006 to validate CERES-Maize model. After model validation, normal maize production and photothermal potential productivity were simulated by using 30 years weather data from 10 weather stations in the North China Plain (NCP). The results show that average photothermal potential productivity is in the range of 13.53 to 22.56 t/hm2 in the NCP under the condition of one crop one year. Maize photothermal potential yield increased by delaying sowing date in range of the end of April to middle of June, and the main driving factor of this trend was average daily radiation during grain filling stage in the north NCP, while that in the south and middle NCP was on daily temperature condition. There was a delaying trend about optimized sowing dates from north to south in the NCP. In the north NCP, optimized sowing date was around early May in Huailai region (40.23 oN Latitude), while it was late May in region of Beijing, Tianjin and Laoting (39.05oN~39.48oN Latitude). And in the south and middle NCP (35.34 oN~38.20 oN Latitude), maize sowed in early June could reach the maximum yield.

【题目】作物模型资源构造平台(CMRCP)的构建研究

【中文关键词】作物模型 集成建模 模型表示 重构 元模型 模型引擎

【英文关键词】crop model integrated modeling model representation reconfiguration metamodel model engine

【中文摘要】为有效促进作物系统数字化研究的深入发展,将集成制造的工业化思想引入作物模型领域,提出了作物模型资源(CMR)及作物模型资源构造平台(CMRCP)的概念。在提炼作物生长通用概念模型的基础上,将作物模型资源分解为通用模型结构、模型算法表示和模型资源映射三部分;并通过模型概念与/或树、模型算法与/或图与模型实现形态相结合,提出了综合性模型资源表示方法。另外,借鉴自适应软件开发方法,基于组件框架、组件组装、模型解析等技术,提出了平台构造原理,表明模型构建任务应该由作物元模型、建模学习机制、模型构造引擎和建模支撑工具共同协作完成。结果表明,构建具有学习能力、自适应和组件化特征的作物模型资源构造平台,可促进作物建模知识资源和软件开发资源的相互转化,并可积累易于共享与复用的作物模型资源库,降低作物模型构建与开发难度,提高农业模型软件开发效率和质量,为作物智能建模提供构建平台。

【英文摘要】To advance research on digital crop system simulation, the industrialized idea of the integrated manufacturing was introduced into the case of crop modeling, the concept of Crop Model Resource (CMR) and Crop Model Resource Construction Platform (CMRCP) were proposed in this paper. The crop model resource includes general model structure, modeling algorithm expression and model resource mapping. The all-around model representation method of crop model resource was proposed that combines model and/or concept tree, model and /or algorithm graphics with pattern of implementation. Based on component framework, component assembly and model compiling techniques, the principle of CMRCP was established according to adaptive software development. The platform works with crop metamodel, learning mechanism, model construction engine and support tools for modeling. The results show that constructing the CMRCP with ability of learning, adaptability and component characteristics, can advance the crop modeling knowledge resources and the crop model development resources changes, can enhance the crop model resource library for sharing and reuse. It helps to make it easy to conduct crop model construction and development, which improves the quality and efficiency of software development, and provides construction platform for crop intelligence modeling.

【题目】基于多库融合的作物模型资源仓库构建
【中文关键词】作物模型,信息整合,模型库,知识库,构件库,关系数据库
【英文关键词】crop model information integration model library knowledge library component library relation database
【中文摘要】构建作物模型资源仓库(CMRW)有助于模型资源的组织、集成、积累和管理。该文提出CMRW可由作物模型实验数据库、框架库、算法库和方案库组成,具有模型结构与建模流程并重以及多库融合的特点,可通过模型资源生命周期的变化提升其价值。研究以关系型数据库技术为基础,采用虚节点方法扩展作物模型结构,利用“知识页+算法知识组+算法单元”方式组织建模知识,结合刻面分类方法描述模型组件属性,并综合基础数据库和方案数据库信息,将作物模型框架库、算法库、实验数据库和方案库共同转化为CMRW的关系数据模型。并在Microsoft SQL Server数据库平台上,建立了小麦生长模型资源仓库,实现了作物模型构件库、建模知识库和实验数据库的多库融合,为作物模型集成与重用积累资源。
【英文摘要】Construction of crop model resources warehouse(CMRW) can help resesrchers to organize, integrate, accumulate, and manage crop model resources. CMRW consists of experiment database, framework library, algorithm library and solution database. It has model framework and modeling flow with the characteristics of multi-libraries fusion, and model resources can raise values through life-cycle changes. Based on the technology of relation database in the paper, the crop models were mapped to E-R model, in which, crop model structure was constructed by using virtual node method, and modeling knowledge was organized by the integration of knowledge page, knowledge group and algorithm unit, and properties of model components were described by using faceted classification scheme, and by integrating basal database and solution database for crop models, the relation database models of CMRW including crop model framework library, algorithm library, experiment database and solution database, were constructed. By using the database platform of Microsoft SQL Server, the CMRW for wheat was constructed, which realized the multi-libraries fusion of crop model component library, modeling knowledge library and experiment database. The results show that the CMRW can accumulate assets for integration and reuse of crop models.

【题目】基于叶面积指数(LAI)的小麦变量施氮模型研究.
【中文关键词】小麦 模型 变量施氮 精确农业
【英文关键词】wheat ; model ; variable fertilization ; precise agriculture ;
【中文摘要】为探讨基于叶面积指数变化的小麦变量施氮技术,依据养分平衡原理和“作物-土壤-环境-技术”整体原则,采用土壤空间信息数据与小麦需氮量和各生育阶段叶面积指数相结合的方法,设计了小麦播前施氮总量和播后精确追氮的数量模型。根据拔节期和抽穗期小麦的长势,对施氮量的初值进行订正,确定小麦的最适追氮量。在河南郑州市和鹤壁市两地的试验验证结果表明:小麦产量模拟值与实测值间的相关系数分别为0.7799和0.7169,达显著水平。与传统施肥技术相比,在相同产量下,使用模型后每公顷施氮量减少43.5kg。该研究提出的基于模型的变量施氮技术,可以兼顾天气、地力和作物长势三方面因素,最终实现小麦的精确施氮,对促进精确农业的发展具有重要意义
【英文摘要】In order to study the variable nitrogen fertilization techniques based on LAI, the model on total amount of N fertilization before sowing and precise N amount after sowing was designed following the theory of nutrient balance and the principle of"crop-soil-environment-technology", taking spatial variability of soil nutrition, wheat N requirement and LAI in different development phrase into account. According to the growth status of elongation period and heading period of wheat, initial rate of N

application was corrected, and optimum additional amount of N fertilizer was ensured. Field experiments of wheat with variable nitrogen fertilization model were respectively carried out at Henan Agricultural University Research Station and Agricultural Research Institute of Hebi from 2004 to 2005. The results showed that the simulated value of yield was significant correlated with that of field survey, and the correlation coefficient was 0.7799 and 0.7169 respectively. Compared with traditional N fertilization system, the variable nitrogen fertilization model can save 43.5 kg N per hm^2 with the same yield. Variable nitrogen fertilization model based on this model can take weather, soil fertility and the growth status into account, and realize precise nitrogen fertilization in small size field at last, which means a lot to develop precise agriculture.

【题目】基于GIS和模型的种植系统设计
【中文关键词】GIS,模型,种植设计,动态知识模型,软构件技术,数字化农业
【英文关键词】GIS model cropping design dynamic knowledge models software component technology digital agriculture
【中文摘要】本研究在总结、提炼相关农业种植设计理论与技术研究成果的基础上,运用系统分析原理和数学建模技术,构建了生态区划、种植制度设计、精确管理和生产力分析的定量化农业管理知识模型。并运用软构件技术,基于GIS空间信息管理平台,建立了数字化的基于GIS和模型的种植设计系统。系统实现了区域性种植信息的规范化管理及不同层次下的农业种植制度设计与管理,具有文件管理、地图操作、信息查询、生态区划、种植制度设计、精确管理、生产力分析、专家咨询、系统维护以及系统帮助等主要功能。以江苏省为案例区,对系统进行了初步的实例分析,结果表明,系统有效地实现了种植设计功能,从而为农作物种植设计的定量化和数字化奠定了基础。
【英文摘要】Based on the summarization and extraction of regional agriculture cropping evaluation theory and technology achievements, a set of dynamic knowledge models which can be used for cropping ecological zoning, cropping system design, precision management, and estimation of cropping productivity were developed through system analysis theory and modeling method. By using the technology of software component, with GIS as spatial information management platform, a GIS and model-based system for cropping design was developed. The system realized the standard management about regional cropping information and cropping system design and management at different levels, provided the functions such as file management, map handling, information query, ecological zoning, cropping system design, precision management, estimation of cropping productivity, expert knowledge consultation, system maintenance and system help. Case studies on the system with the datasets in Jiangsu Province indicate that the system can effectively carry out cropping design function, which lays a foundation for facilitating the quantification and digitization of cropping design system.

【题目】稻麦适宜氮素营养指标动态的设计模型
【中文关键词】水稻 小麦 氮素指标动态 相对生长度日 精确管理
【英文关键词】rice ; wheat ; nitrogen index dynamics ; relative growing degree days(RGDD) ; precision management ;
【中文摘要】以水稻和小麦为研究对象,通过解析和提炼稻麦适宜氮素营养指标与品种类型、栽培技术、生态环境之间的定量关系,以基于生理发育时间(PDT)的相对生长度日和相对氮素营养指标为参数,建立了稻麦适宜氮素营养指标动态模型,并利用南京3年的大田试验资料对所建模型的可靠性和适应性进行了验证.结果表明:模型生成的水稻植株氮积累量和氮含

量与实际观测值之间的平均根均方差(RMSE)分别为0.1245和0.1316;模拟的小麦植株氮积累量和氮含量与实际观测值之间的平均RMSE分别为0.1166和0.1301,表明模型对稻麦氮素营养指标动态具有较好的指导性,可为不同生态环境、品种类型和生产条件下的稻麦氮素营养诊断与管理调控提供定量化和精确化的指导.

【英文摘要】By analyzing and extracting the quantitative relationships of suitable nitrogen index dynamics of rice and wheat to their cultivar types,cultural techniques,and eco-environments,a design model for the suitable nitrogen index dynamics of rice and wheat was developed.The model was driven by the physiological development time-based relative growing degree days,with the relative nitrogen indices as modeling parameters,and could be used to generate the time-course indices such as the nitrogen accumulation and concentration of rice and wheat under different growth conditions.Case studies with the datasets from 3-year field experiments in Nanjing showed that the average RMSEs of the simulated to measured plant nitrogen accumulation and concentration were 0.1245 and 0.1316 for rice,and 0.1166 and 0.1301 for wheat,respectively.It was suggested that this model could reliably guide the dynamics of major nitrogen indices of rice and wheat,which would help with the quantitative nitrogen diagnosis and precision nitrogen management of rice and wheat under different eco-environments,cultivar types,and production conditions.

【题目】抗冻蛋白基因Type Ⅲ AFP HPLC-12的原核表达、抗冻活性的鉴定及杂色鲍表达载体的初步构建
【中文关键词】杂色鲍;抗冻蛋白;转基因;载体构建
【英文关键词】Haliotis diversicolor; Antifreeze Proteins; Transgenic; Vector Construction
【中文摘要】杂色鲍(Haliotis diversicolor)是我国南方重要的水产养殖种类,近年来由于诸多原因,其海产养殖业中的比例逐年下降。本文的研究目的即是以Ⅲ型AFP HPLC-12抗冻蛋白序列构建杂色鲍AFP转基因载体。希望利用此载体通过转基因的方法使杂色鲍获得耐低温、抗冻性状,快速培育杂色鲍新品种,向中国北部沿海方向扩大杂色鲍的养殖范围。 按照去除其前部的信号肽序列保留AFP功能区(261 bp)的Ⅲ型AFP HPLC-12序列设计引物,合成Ⅲ型AFP HPLC-12基因序列,同时在片段两端分别增加BamH Ⅰ和Sal Ⅰ酶切位点。测序结果表明克隆所得序列全长为275 bp,去掉两端酶切位点后长度为261 bp,共编码87个氨基酸残基,多肽分子重量为9.284 kDa,克隆所得片段序列与目的片段完全吻合。IPTG原核诱导后SDS-PAGE检验结果表明,AFP/GST融合蛋白条带位于约35 kDa处,符合其正常的蛋白分子质量大小(26 +约9 kDa),证明合成的Ⅲ型AFP HPLC-12基因片段具有原核转录活性。 以转化空载体pGEX-4T-2的BL 21细胞悬浮液为对照,对Ⅲ型AFP HPLC-12的原核诱导表达蛋白进行冷冻保护实验。结果表明,在0 ℃下,冷冻时间分别为72 h、96 h和120 h时,两种细菌的存活率差异显著(P<0.05);在-20 ℃下,冷冻时间为24 h,存活率差异即表现出了显著性(P<0.05),冷冻时间分别为72 h、96 h和120 h时的存活率差异为极显著(P<0.01)。细菌冷冻保护实验证明原核诱导表达的Ⅲ型AFP HPLC-12在0 ℃和-20 ℃下均具有抗冻生物学活性。 首次获得了长度为632 bp的杂色鲍肌动蛋白启动子ActinP序列区域,(GenBank登陆号为EU622901),具有两个CAAT BOX,分别位于472 bp和559 bp处,具有一个TATA BOX,位于591 bp处;启动子长度为50 bp,位于583 bp-632 bp,位于623 bp处的T经软件分析推测为转录的起始位点,同时推测从TATA BOX开始到转录起始位点T结束的这段序列可能组成了杂色鲍肌动蛋白启动子的核心序列,对于杂色鲍肌动蛋白的转录具有关键性的调控作用。 以EGFP为报告分子,采用定向插入片段方式构建Ⅲ型AFP HPLC-12杂色鲍表达载体pIRES-EGFP-ActinP-AFP。经Ⅲ型AFP HPLC-12引物与ActinP引物PCR鉴定证明,载体初步构建成功,为Ⅲ型AFP HPLC-12基因转化杂色鲍做出了基础性的工作。
【英文摘要】Small abalone, Haliotis diversicolor is an important aquaculture species in South China. In recent years, because of a series of reasons, the proportion of the small abalone in the aquaculture is decreasing year by year. The objective of this study is to

construct the transgenic vector with the sequence fragment of the antifreeze protein type III AFP HPLC-12. By the method of transgene, we hope the transgenic small abalone obtain the low temperature tolerance and the antifreezing character so that enlarge the culture area to the seashore of North China. Primers were designed according to the encoding gene of the type III AFP HPLC-12 of which the sequence of the signal peptide had been removed. The type III AFP HPLC-12 was cloned by the method of gene synthesis and restriction sites of Bam H Ⅰ and Sal Ⅰ was added to the two ends respectively. Sequencing showed that the full-length of the cloned DNA is 275 bp (261 bp not including the restriction sites), encodes 87 amino acid residues and the deduced peptide has a molecular weight of 9.284 kDa. The cloned DNA sequence is completely consistent with the target fragment. After inducted by IPTG, cells were sampled by SDS-PAGE identification. Results showed that the band of the AFP/GST fusion protein was about 35 kDa and consisted with the expected molecular weight (26 + about 9 kDa). The result of the SDS-PAGE proved that the synthesized sequence of the type III AFP HPLC-12 gene has the prokaryotic transcription activity. Cryoprotective experiments were employed to test the antifreeze activity of the cells embodied AFP HPLC-12 gene while the cells without AFP HPLC-12 were chosen as the controls. Results showed that, at 0 °C, the survival probability differences of the two kinds of the bacteria were significant ($P<0.05$) when the freezing time were 72 h, 96 h and 120 h; at -20 °C, the difference was significant ($P<0.05$) when the freezing time was 24 h, and the difference was extremely significant ($P<0.01$) when the freezing time were 72 h, 96 h and 120 h. The result of the cryoprotective experiments showed that the type III AFP HPLC-12 within prokaryotic expression has the antifreezing biological activity at the temperature 0 °C and -20 °C. The promoter region (ActinP) of the Actin of the small abalone was first obtained of which the length is 632 bp. There are two CAAT BOXes located at 472 bp and 559 bp meanwhile there is one TATA BOX located at 591 bp. The length of the promoter which located at 583 bp-632 bp is 50 bp. The Thymine located at 623 bp was analyzed and conjectured to be the transcription initiation site by the analysis software, and the sequence which from TATA BOX to the Thymine also was conjectured to be the core sequence of the Actin protein promoter of H. diversicolor, it could play a critical role in transcription of the Actin protein. The sequence of the Actin protein promoter of H. diversicolor, has been submitted into GenBank, the accession number is EU622901. The type III AFP HPLC-12 transgenic vector pIRES-EGFP-ActinP-AFP for H. diversicolor was constructed, which the EGFP was as the reporter molecule by the method of directional fragment insertion. The vector was identified successfully by PCR with the primers of the type III AFP HPLC-12 and the ActinP. This study was prophase work of the transgenic type III AFP HPLC-12 H. diversicolor.

【题目】Amount and composition of the moulds population on drycured jinhua ham
【中文关键词】金华火腿,黑曲霉
【英文关键词】Jinhua ham, moulds, Panicillium, Aspergillus
【中文摘要】在预熟化和成熟的阶段,不同的模具上形成干燥的火腿表面。主要来自加工环境的污染,而不是原始的肉。模具菌群是可变的,主要体现在曲霉,青霉属,青霉属。占主导地位的火腿生产的早期阶段。曲霉。中后期的成熟阶段占主导地位。
【英文摘要】Jinhua ham is one of the best products of China. During the pre-ripening and the ripening phase, different moulds are formed on the dried ham surface. The contamination come mainly from the processing environment, rather than the raw meat. The moulds flora is variable and is mainly represented by Aspergillus spp., Penicillium spp. Penicillium spp. predominate in the early stage of ham production. Aspergillus spp. predominate in the late stage of ripening. Moulds may work mainly in the early stage of ripening and do little with favor formation.

【题目】The effect of raw materials and processing conditions on the quality of home-style chicken soup.
【中文关键词】鸡,汤,营养,加工条件,质量
【英文关键词】Chicken, soup, nutrition, processing condition, quality
【中文摘要】这项研究的结果表明,乌鸡是整体上最好的肉源制备低脂肪,美味的汤。营养素和汤　　的主要风味化合物的总量,可通过使用相对高的水肉类比,以及由控制时间增加。
【英文摘要】The results from this study demonstrated that black-boned chicken is overall the best meat source for preparing low-fat, savoury soup. The total amount of nutrients and main flavour compounds in soup can be increased by using a relatively high water to meat ratio, as well as by controlling the simmering time. To obtain maximum nutrition value, palatability and efficiency, the broth should be simmered for no more than 2 hours.

【中文关键词】土耳其火鸡胸肉、洋葱汁、肉品质、挥发性化合物
【英文关键词】Turkey breast, onion juice, flavour, volatile compounds, meat quality
【中文摘要】在这项研究中,顶空分析与硫具体的检测中明确表现出显着,但选择性吸收的硫挥发物的洋葱汁火鸡
【英文摘要】In this study, headspace analysis with sulphur specific detection clearly demonstrated significant but selective uptake of sulphur volatiles from the onion juice by turkey meat. There was also evidence that some compounds may have derived from interactions of onion juice and meat components. Thus, the results help explain the improved flavour characteristics of turkey rolls by the treatment with onion juice.

【题目】Traceability of rigor mortis of muscle using a texture analyzer: A feasibility study
【中文关键词】尸僵,数学模型,纹理分析仪
【英文关键词】rigor mortis; mathematical models; texture analyzer
【中文摘要】结果表明,鸡,鸭胸脯严格死后不同时间达到最大。环境温度的过程中,尸僵,其分辨率有显着效果。本研究中的方法将让我们更精确的细节死后骨骼肌中的物理化学变化。
【英文摘要】Rigor mortis is one of the most important changes of muscle at earlier time postmortem, which ultimately affects meat palatability. However, there seems no efficient way to track the whole process of rigor mortis continuously and automatically. This study is designed to explore a new method to realize the traceability of the onset and development of rigor mortis of muscles using a texture analyzer. A compression analysis was proven feasible to determine the changes of muscle within 48 h to 84 h postmortem at a 10 s interval. Chicken and duck breasts, obtained within 30 min postmortem, were immediately compressed under a 50 mm probe holding until 172800 s (48 h) at an acquisition rate of 0.10 point per second. The results showed that chicken and duck breasts reached the maximum rigor at different postmortem time. Environment temperature had a significant effect on the process of rigor mortis and its resolution. The approach in the present study would give us more accurate details on postmortem physicochemical changes in skeletal muscle.

【题目】鸭肉在加热和盐腌过程中嫩度和超微结构变化
【中文关键词】鸭肉腌制,蒸煮,嫩度,超级结构
【英文关键词】duck meat curing cooking tenderness ultra-structure
【中文摘要】"通过对鸭肉加热及盐腌加热过程中嫩度及相关指标变化的研究,阐明了在此过程中嫩度变化的机制。取新鲜的番鸭胸肉,分为两组,一组在 50、 55、 60、65、 70、 75、80、 85、 90 e 水中加热,测定剪切力;另一组先分别在 20、40、60、 80 g/L- 1N aC l溶液中腌制,再加热到 72~ 75 e,测定剪切力和结缔组织热变性温度,并在透射电镜及扫描电镜下观察肌原纤维的结构变化。结果表明,剪切力随温度升高呈现先升后降的趋势,60 e 是鸭胸肉的关键加热温度。差示量热扫描 (DSC) 分析显示,随着 NaCl质量浓度的增加,热变性点的数量减少,并且变性的温度发生了变化。超微结构观察表明,用NaCl腌制新鲜鸭肉,将对肌原纤维的崩解起到促进作用,并可避免肌原纤维发生强烈收缩,其中 20~ 40g/L- 1N aC l溶液的作用尤为明显,有助于改善加热后鸭肉的嫩度."

【英文摘要】"Th is study w as designed to explore the effect of cook ing tem pera ture and curing on duck m eat tenderness and an explanation w as g iven for how it changes during cook ing and cur ing. B reast mea t samp les from duck were taken and divided into wt o g roups. T he sam ples of one group w ere heated in wa ter to 50, 55, 60, 65, 70, 75, 80, 85 and 90e, respectiv ely. 【题目】金华火腿现代化发酵工艺中微生物区系变化研究
【中文关键词】金华火腿,现代发酵技术,微生物菌群鉴定
【英文关键词】Jinhua ham; modern fermentation technology; microbial flora; identification
【中文摘要】金华火腿是我国最著名火腿品种, 与宣威火腿、如皋火腿称为我国(三大火腿), 是世界著名传统肉制品. 传统产品走向工业化是发展趋势, 因此, 开展金华火腿现代加工工艺研究十分重要. 本试验通过对现代化控温控湿发酵库中火腿发酵过程中微生物区系变化的研究, 检测了不同发酵过程中微生物数量及种类, 并进行了菌种鉴定. 结果表明, 金华火腿腌制工艺过程中内部及表面微生物很少; 洗腿、晾腿工艺进入控温控湿库后, 前期脱水阶段, 火腿内部微生物数量急剧增加, 达到 1.39*106cfu/ g , 在火腿成熟生香的时期, 火腿内部微生物数量降至 2.0*103cfu/ g, 内部的优势细菌是乳酸菌, 其次是葡萄球菌. 经鉴定乳酸菌主要是戊糖片球菌, 马脲片球菌和戊糖乳杆菌等, 葡萄球菌主要是马胃葡萄球菌, 鸡葡萄球菌和木糖葡萄球菌等组成, 内部优势酵母菌是欧诺比假丝酵母、红酵母、赛道威汉逊酵母、白色布勒掷孢酵母、多形汉逊酵母和汉逊德巴利酵母等. 金华火腿现代化发酵工艺过程中仅在原料腿上检测到霉菌, 整个加工过程中没有检测到霉菌, 现代化发酵工艺成品腿香气略次于传统工艺成品腿, 其它风味尚可, 该研究为金华火腿现代化加工奠定了理论基础.

【中文关键词】冻结工艺,解冻,组织结构
【英文关键词】Freezing process, thawing, organizational structure
【中文摘要】采用配对试验研究了直接冻结工艺和两阶段冻结工艺所冻结肉样在冻结损失、解冻汁液流失、蒸煮损失、加压失水率、蛋白溶解度、pH 值、剪切力和组织结构变化等方面的差异, 结果显示: (1)直接冻结工艺冻结的肉在总损失、冻结损失、解冻汁液流失、蒸煮损失和加压失水率方面均显著 (P < 0. 05)小于两阶段冻结工艺冻结的肉。 (2)直接冻结工艺冻结的肉肌浆蛋白溶解度极显著高于两阶段冻结工艺冻结的肉 (P < 0. 01), 而总蛋白溶解度和肌原纤维蛋白溶解度都是直接冻结工艺冻结的肉低于两阶段冻结工艺冻结的肉。 (3)直接冻结工艺冻结肉的 pH值极显著高于两阶段冻结工艺冻结的肉 (P < 0. 01)。 (4)随着宰后时间的延长, 未冻结肉的肌细胞外的空隙明显增大, 组织结构弱化。 (5)直接冻结工艺冻结的肉比两阶段冻结工艺冻结的肉冰晶分布更均匀, 相对来说其冰晶也较小一些, 可能与组织结构的弱化有关。随着宰后时间的延长肌肉的组织结构明显弱化, 是直接冻结工艺冻结的肌肉保水性弱于两阶段冻结工艺的一个重要原因。
【英文摘要】"Paired test study directly freeze freezing process and the two-stage process frozen meat samples in the freeze loss, thaw drip loss, cooking loss, pressurized water loss rate, protein solubility, pH, shear force, and organizational structure changedifferences, the results show: (1) direct freezing process frozen meat in a total loss, freezing loss thaw drip loss, cooking loss and pressurized water loss rate were significantly (P <0. 05) is less than a two-stage freezing process freezemeat. (2) direct freeze process frozen meat sarcoplasmic protein solubility was significantly higher than the two-stage freezing process freeze the meat (P <0. 01), and total protein solubility and myofibrillar protein solubility are freezing process frozen meat directly less than a two-stage meat freezing process frozen. (3) direct freeze process freeze meat pH value was significantly higher than the two-stage freezing process freeze the meat (P <0.01). (4) As the extension of the time of the post-mortem, the voids in the the unfrozen meat muscle extracellular significantly increased tissue structural weakening. (5) directly freeze process frozen meat to freeze than the two-stage process frozen meat ice is more evenly distributed, relatively speaking, ice also smaller, may be related to the weakening of the organizational structure. With the extension of the time of the post-mortem muscle tissue structure significantly weaken the direct freeze process frozen muscle water retention is an important reason for weaker than the two-stage freezing process."

【题目】宰前热应激对肉鸡胸肉pH、氧化和嫩度、肉色及其关系的影响
【中文关键词】氧化,嫩度,肉色,热应激,鸡胸肉
【英文关键词】Oxidation Tenderness Meat color Heat stress Breast muscle Brioler
【中文摘要】研究了宰前热应激对肉鸡胸肉 pH、氧化和嫩度、肉色的影响, 探讨了肌肉 pH、氧化与嫩度、肉色的联系。结果表明, 与对照组相比, 2h以上热应激组的 pH24h呈现显著性下降 (P< 0. 05); 随着热应激时间的延长, 各处理组鸡胸肉 GSH- Px活力较对照组的普遍升高, 胸肉肌浆中 GSH 总体呈现下降趋势; 3h和 5h处理组极显著提高胸肉 MDA 含量 (P< 0. 01), 2h、3h和 5h处理组胸肉肌浆和肌原纤维蛋白羰基含量极显著高于对照组 (P< 0. 01); 热应激导致肉鸡胸肉剪切力值增大, 肌原纤维小片化指数变低,使肉鸡胸肉 L*值升高, 并显著降低肉鸡胸肉 a*值 (P< 0. 01)。结合相关性分析, 结果表明热应激导致的肉鸡胸肉 pH值下降和肌肉氧化程度的增加对肌原纤维蛋白的降解和胸肉肉色有较大影响。
【英文摘要】"The present study was conducted to determ ine the effects of heat stress on pH, ox idation, tenderness and color in breast meat of broilers. The relationsh ips am ong pH, ox ida tion and tenderness, co lo r were assessed. The resu lts showed tha,t in comparison w ith the control group, the pH of meat decreased sign ificantly in above 2h treamt ent g roups(P< 0.05), the activ ities o f GSH- Px increased, the content of GSH showed a decreasing tendency. H eat stress sign ifican tly enhanced the content ofM DA in 3h and 5h treamtents (P < 0. 01), significantly increased the levels of sarcoplasm ic and m yofibr illar pro tein carbony l g roups in 2h, 3h and 5h treamt ents, high shear force and low myofibrillar pro tein fragm ent indexesw ere found in heat stress treatments. L*value of breastm eatw as higher than tha t in the contro l group, but a*value was low er(P < 0. 01). These results ind icated that low pH and mo reoxidation of breast meat resulted from heat stress effected the degradation of the myofibrillar prote in and the color of the breast meat."

【题目】如皋火腿酯类物质氧化和水解分析
【中文关键词】如皋火腿,酯类物质
【英文关键词】Rugao ham;Free fatty acid; Trans fatty acid
【中文摘要】"为了研究如皋火腿中的酯类物质。选取7条 4. 5~ 5. 0 kg如皋火腿为试材, 用常规方法测定其理化指标(水分、盐分和pH 值), 通过气相色谱测定从提取脂质中分离的游离脂肪酸含量, 并测定其共轭二烯值与羰基值。在如皋火腿股二头肌和皮下脂肪中含盐量为11. 60% 和 1.07% , 水分为 40. 21% 和 3. 65% , pH 值为 5. 71 和 6. 02, 游离脂肪酸含量为49. 65% 和 26. 11% , 除 pH 外均存在极显著差异。如皋火腿中含有丰富的游离脂肪酸,在皮下脂肪中油酸的含量最多, 股二头肌中亚油酸的含量最多。火腿中存在少量的反式脂肪酸, 皮下脂肪有反式的油酸, 股二头肌中有反式油酸、亚油酸和亚麻酸。股二头肌的氧化明显高于皮下脂肪, 可能与酶活力、氧化方式有关。"

【英文摘要】"The aim of the research was to investigate esters in Rugao ham. 7 Rugao ham of 4. 5~ 5. 0 kg selected as tested materials, some physical and chemical indexes (water content,salinity and pH value) were determined by conventional methods and the free fatty acid contents isolated from extracted lipids were determined by gas chromatography and their conjugated diene value and carbonyl value were also determined. The salt content in biceps femorisand subcutaneous fat of Rugao ham were 11. 60% and 1. 07% , water contents were 40. 21% and 3. 65% , pH values were 5. 71 and 6. 02 and the contentsof free fatty acid were 49. 65% and 26. 11% respectively. Except pH value, the differences of all indexes were extremely significant. Free fatty acids in Rugao ham were abundant, oleic acid content was highest in subcutaneous fat and linoleic acid content was highest in biceps femoris. A small quantity of trans fatty acid existed in ham, trans oleic acid existed in subcutaneous fat and trans oleic acid, linoleic acid and linolenic acid existed in biceps femoris. Oxidation in biceps femoris was higher than that in subcutaneous fat, which might be related with enzyme activity and oxidation manner."

【题目】传统风鸭加工过程中脂肪水解和氧化的研究

【中文关键词】传统风鸭,脂肪氧化,脂肪水解

【英文关键词】traditional dry-cured duck lipolysis oxidation

【中文摘要】以樱桃谷瘦肉鸭为原料,按传统工艺加工风鸭,分析了鸭胸肉及皮下脂肪的硫 代 巴 比 妥 酸 值(T B A R)S、拨基双 烯值、游离脂肪 酸(FFA)含量在加工 过程中的变化规律。结果 表明,胸 肉脂肪 的 T BA R S 值在干腌工 艺阶段显 著上 升(P <0.50),在风干工 艺阶段先降后升;而皮下脂肪的T BA R S 值持续增加,在风干最后阶段略有下 降。胸 肉脂肪和皮下脂肪 的拨 基双 烯值在 加工 过 程中均逐 渐增加,最 后 有下 降趋势。饱 和脂肪 酸(S SF A)和 单 不 饱和 脂肪 酸 (S M U FA)在加工过 程中变化不 大,而多不 饱和脂肪 酸(S P U FA)在腌制 后有下 降,后逐 渐 回升,在风 干20 d达到最高。亚 油 酸、花 生四 烯酸、油 酸和棕 桐酸是游离脂肪 酸的主 体成分,不 饱和脂肪 酸占 FFA 总量的76% 以上。

【英文摘要】Cherry Valley lean ducks as the raw materials, by traditional processing duck analyzed duck breast and subcutaneous fat of the thiobarbituric acid value (TBar) S value reversal yl diene, the content of free fatty acids (FFA) in themachining process variation. The results show that the brisket fat T BA RS values in dry-cured process stages significant rise (P <0.50) liter air-dry stage of the process after the first drop; subcutaneous fat T BA RS value continues to increase, dried final stage slightly decline. Brisket and subcutaneous fat reversal group value of the diene in the process are gradually increased, and finally a downward trend. Saturated fatty acids (S SF A) and single-unsaturated fatty acids (SMU FA) changed little in the process, and polyunsaturated fatty acids (SPU FA) pickled decline, after a gradual recovery in air-dried 20 d highest . Linoleic acid, arachidonic acid, oleic acid and palmitic acid is the main component of free fatty acids, unsaturated fatty acids account for more than 76% of the total amount of FFA.

【中文摘要】无
【英文摘要】A new acetolactate synthase (ALS)-inhibiting herbicide, propyl 4-(2-(4,6-dimethoxy-pyrimidin-2-yloxy)benzylamino)benzoate (ZJ0273), was applied to oilseed rape (Brassicanapus L.) leaves in different leaf positions. Visible/near-infrared (Vis/NIR) spectroscopy wasinvestigated for fast and non-destructive determination of ALS activity and protein con-tent in rapeseed leaves. Partial least squares (PLS) analysis was the calibrationmethod withcomparison of different spectral preprocessing by Savitzky – Golay (SG) smoothing, standardnormal variate (SNV), first and second derivative. The best PLSmodelswere obtained by first-derivative spectra for ALS,whereas original spectra for soluble, non-soluble and total proteincontents. Simultaneously, certain latent variables (LVs) were used as the inputs of back-propagation neural network (BPNN) and least squares-support vector machine (LS-SVM)models. All LS-SVM models outperformed PLS models and BPNN models. The correlationcoefficient (r), root mean square error of prediction (RMSEP) and bias in validation set byLS-SVM were 0.998, 0.715 and 0.079 for ALS, 0.999, 33.084 and 1.178 for soluble protein,0.997, 42.773 and 6.244 for non-soluble protein, 0.999, 59.562 and 7.437 for total protein,respectively. The results indicated that Vis/NIR spectroscopy combined with LS-SVM couldbe successfully applied for the determination of ALS activity and protein content of rapeseedleaves. The resultswould be helpful for further on field analysis of using Vis/NIR spectroscopyto monitor the growing status and physiological properties of oilseed rape

【英文关键词】Brassica napus New herbicide propyl 4-(2-(4,6-dimethoxypyrimidin-2-yloxy)benzylamino) benzoate 5-Aminolevulinic acid Synergism Antioxidants
【中文摘要】无
【英文摘要】Weeds are one of themajor constraints in oilseedBrassica production. Use of effective herbicides to controlweeds in the fields is one of the major objectives of agron-omists. To improve weed control efficacy and minimize theapplication costs, complex combinations of 5-aminolevuli-nic acid (ALA) and a new postemergence herbicide, propyl4-(2-(4,6-dimethoxypyrimidin-2-yloxy)benzylamino)ben-zoate (ZJ0273), were used to investigate their combinedeffects in relation to seedling growth and development ofoilseed rape (Brassica napus cv. ZS 758). Brassica seedswere treated with different concentrations of ZJ0273 [100(normal dose for rape), 200, 500, and 1000 mg/L] and ALA(0.1, 1, 10, and 50 mg/L). ALA was applied as pre- and post-treatment alone and in combination with ZJ0273. We foundthat ZJ0273 stress imposed negative effects on rape seedlinggrowth. Shoot fresh weight, shoot length, and root freshweight were inhibited significantly under ZJ0273 stress, andthe rate of decline increased consistently with increasedZJ0273 concentration. Root oxidizability was also inhibitedsignificantly under ZJ0273 stress conditions, and the higherthe concentration of the herbicide ZJ0273, the lower theoxidizability. Herbicide ZJ0273 treatment produced agradual decrease in antioxidant enzymes (peroxidase,superoxide dismutase, and ascorbate peroxidase) and anincrease in peroxidation substance (malondialdehyde accu-mulation). The increase and decrease were consistent withthe ZJ0273 dosage. Our results indicated that pre- and post-treatments with a lower dosage of ALA (1 mg/L) improvedrape seedling growth and root oxidizability parameters,whereas a higher concentration ofALA(50 mg/L) depressedgrowth.We also found that plants treated with 1 mg/L ALAproduced the highest shoot fresh weights, shoot lengths, rootfresh weights, and root oxidizability when the seeds weretreated with different concentrations of ZJ0273. Lowerdosages of ALA improved the activities of antioxidantenzymes, whereas the highest dosage of ALA increased theaccumulation of peroxidation substance. These resultsindicate that ALA has promotive effects in the recovery ofgrowth and development of rape seedlings under herbicideZJ0273 toxicity stress.

【题目】Action of tenuazonic acid, a natural phytotoxin,on photosystem II of spinach
【中文关键词】无
【英文关键词】Chlorophyll a fluorescence; JIP-test; PSII inhibitor; QB-site; Tenuazonic acid
【中文摘要】无
【英文摘要】Tenuazonic acid (TeA) is a putative phytotoxin obtained fromAlternaria alternata, the organismthat can cause brown leaf spot disease of Croftonweed (Eupatorium adenophorum). It is demonstrated here that the tenuazonic acid inhibits the activity of photosystem II (PSII); the I50-value is48 gmL − 1. Evidences from chlorophyll fluorescence show that tenuazonic acid interrupts electron transport between QA and QB on the acceptorside of PSII. It does not have an effect on the antenna pigments, the oxygen-evolving complex (OEC) at the donor side of PSII.On the basis of the fluo-rescence induction kinetics and competition experimentswith [14C]atrazine, it is shown that tenuazonic acid does not share the same binding environ-mentwith atrazine despite their common action target: theQB-site. It is concluded that tenuazonic acid is amember of a novel class of PSII inhibitors.© 2007 Elsevier B.V. All rights reserved.

【题目】Isolation and Phytotoxicity of α, β-dehydrocurvularin, a metabolite from Curvularia eragrostidis and characterization of its modes of action
【中文关键词】无
【英文关键词】a,b-dehydrocurvularin; chlorophyll
fluorescence; Curvularia eragrostidis; Digitaria
sanguinalis; phytotoxin; weed biocontrol.
【中文摘要】无
【英文摘要】Digitaria sanguinalis is a widespread troublesome weed distributed all over theworld. Curvularia eragrostidis QZ-2000 is a potential candidate for biocontrol ofD. sanguinalis. A phytotoxic metabolite from the culture filtrate of this funguswas extracted by ethyl acetate, isolated by bioassay-guided column chroma-tography and thin layer chromatography on silica gel, characterised by ultraviolet, infrared ray (IR), mass spectrometry (MS),1H-nuclear magnetic reso-nance (NMR) and 13C-NMR spectral data analyses and identified as a,b-dehydrocurvularin. The phytotoxin significantly inhibited seed germinationof D. sanguinalis from 43 to 688 lM. The EC50 value of seed germination was152 lM. The EC50 values of elongation of radicle and coleoptile were 102 and172 lM, respectively. a,b-dehydrocurvularin caused extensive necrosis onleaves of many notorious weeds at 688 lM, while maize and soybean wereinsensitive to it. Therefore, a,b-dehydrocurvularin was regarded as a non-host-selective phytotoxin. At concentrations of 172 – 688 lM, a,b-dehydrocurvularincaused a decrease in chlorophyll content. a,b-dehydrocurvularin had strongerimpacts on chlorophyll A fluorescence, photophosphorylation and Mg2+-ATPase activity at higher concentrations. These results suggest that a,b-dehydrocurvularin affected the photosynthetic capacity. In the present study,a,b-dehydrocurvularin significantly inhibited mitosis of root tip cells. Itsupports that the a,b-dehydrocurvularin has potential for development asa natural bioherbicide.

【题目】基于Pocket PC的小麦栽培管理知识模型系统的设计与实现
【中文关键词】Pocket PC UML 小麦栽培管理 知识模型
【英文关键词】Pocket PC UML wheat cultivation management knowledge model
【中文摘要】介绍一种基于Windows Mobile的Pocket PC型小麦栽培管理知识模型系统的设计与实现。首先在总结与提炼小麦栽培理论与技术的研究成果基础上,使用UML语言进行系统建模,然后在Microsoft Visual Studio .NET 2003环境下,运用Microsoft Visual C#编写小麦栽培管理知识模型类和设计用户界面,采用SQL Server CE 2.0管理基础数据,系统实现了小麦播前栽培方案的设计和产中适宜调控指标动态的预测及基础数据管理等功能。系统的建立将为数字化作物栽培管理决策提供新的实现形式。
【英文摘要】This paper introduced the design and implementation of a pocket PC-based knowledge model system for wheat cultivation management on Windows Mobile. On the basis of summarizing and extracting wheat cultivation theory and technology achievements, the system model was built by using UML language. By using Microsoft Visual C#, wheat cultivation management knowledge model classification and user interface were designed on the platform of Microsoft Visual Studio .NET 2003. SQL Server CE 2.0 was used in the system to manage basic data. The system can make the design of pre-sowing cultivation plans, prediction of regulation index dynamics and support of basic data management functions. The construction of this system can provide new representative formats for digital crop cultivation management decision.

【题目】Effects of epicuticular wax from Digitaria sanguinalis and Festuca arundinacea on infection by Curvularia eragrostidis
【中文关键词】无
【英文关键词】conidial differentiation, non-host resistance, selective invasion.
【中文摘要】无
【英文摘要】Abstract. Epicuticular wax is a plant ’s initial defence system to various foreign invasions, including invasion by fungi.In this study, we investigated the effect of epicuticular wax of Digitaria sanguinalis and Festuca arundinacea on invasionby the fungus Curvularia eragrostidis and the difference in components of epicuticular waxes between the two plants.The epicuticular wax of D. sanguinalis (host) signi fi cantly enhanced the growth of germ tubes of C. eragrostidis conidia,but had no effect on appressorium formation. However, the epicuticular wax of F. arundinacea (non-host) inhibited theextension of germ tubes and the differentiation of appressoria. Analysis using gas chromatography – mass spectrometryindicated that the constituents of these two epicuticular waxes were remarkably different. Among the 24 and 21 compoundsfound in the wax of D. sanguinalis and F. arundinacea, respectively, only four were the same. (Z, Z)-9,12-Octadecadien-1-ol constituted 54.3% of the total wax of D. sanguinalis, while 9-tricosene accounted for 49.8% of the total waxes ofF. arundinacea. Furthermore, an extracellular esterase preparation from C. eragrostidis conidia could completely degradethe epicuticular wax of D. sanguinalis after 4 h incubation at 25 ◦ C, but only partially degrade the wax from F. arundinacea.These results suggest that the components of the wax and their chemical characteristics are important in determining howeffectively these plants are able to combat invasion of C. eragrostidis.

【题目】Environmental, genetic and cellular toxicity of tenuazonic acid isolated from Alternaira alternata
【中文关键词】无
【英文关键词】Tenuazonic acid, Chlamydomonas reinhardtii, micronucleus, mammalian cell line, protein content, toxicity.
【中文摘要】无
【英文摘要】Alternaria alternata, an important pathogen of many plants, produces tenuazonic acid (TeA) with bioactivity to microbes, plants and animals. TeA is one of the main mycotoxin to humans and other organisms. Using Chlamydomonas reinhardtii, Vicia faba root tip and three mammalian normal cell lines as target materials, environmental toxicity, genetic toxicity and cytotoxicity of TeA were examined. The growth and chlorophyll concentration of C. reinhardtii were inhibited at above 100 g/ml concentration, with EC50(G) of 310.36 g/ml and EC50(Chl) of 294.27 g/ml. The micronuleus test results indicated that MCN‰ was >15‰ only at higher concentrations. TeA inhibited the proliferation and total protein contents of 3T3 mouse fibroblasts (3T3 cells), Chinese hamster lung cells (CHL cells) and human hepatocytes (L-O2 cells) at concentrations ranging from 12.5 - 400 g/ml. Of the three cell lines, 3T3 cells were the most sensitive to the toxin (EC50(24h) = 41.64 g/ml), followed by CHL cells (EC50(24h) = 59.33 g/ml), and L-O2 cells (EC50(24h) = 85.98 g/ml) had the lowest sensitivity.

【题目】Citric acid enhances the phytoextraction of manganese and plant growth by alleviating the ultrastructural damages in Juncus effusus L.
【中文关键词】无
【英文关键词】Plant biometry
Metal accumulation
Antioxidative enzymes
Chloroplast ultrastructure
Lipid peroxidation
Thylakoid disruption
【中文摘要】无
【英文摘要】Chelate-assisted phytoextraction by high biomass producing plant species enhances the removal of heavymetals from polluted environments. In this regard, Juncus effusus a wetland plant has great potential.This study evaluated the effects of elevated levels of manganese (Mn) on the vegetative growth, Mnuptake and antioxidant enzymes in J. effusus.We also studied the role of citric acid and EDTA on improv-ing metal accumulation, plant growth and Mn toxicity stress alleviation. Three-week-old plantlets of J.effusus were subjected to various treatments in the hydroponics as: Mn (50, 100 and 500 M) alone, Mn(500 M) + citric acid (5mM), and Mn (500 M) + EDTA (5mM). After 2 weeks of treatment, higher Mnconcentrations signi fi cantly reduced the plant biomass and height. Both citric acid and EDTA restored theplant height as it was reduced at the highest Mn level. Only the citric acid (but not EDTA) was able torecover the plant biomass weight, which was also obvious from the microscopic visualization of meso-phyll cells. There was a concentration dependent increase inMn uptake in J. effusus plants, and relativelymore deposition in roots compared to aerial parts. Although both EDTA and citric acid caused signi fi cantincrease inMn accumulation; however, theMn translocation was

enhanced markedly by EDTA. Elevatedlevels of Mn augmented the oxidative stress, which was evident from changes in the activities of antiox-idative enzymes in plant shoots. Raised levels of lipid peroxidation and variable changes in the activitiesof antioxidant enzymes were recorded under Mn stress. Electron microscopic images revealed severalmodi fi cations in the plants at cellular and sub-cellular level due to the oxidative damage induced byMn.Changes in cell shape and size, chloroplast swelling, increased number of plastoglobuli and disruptionof thylakoid were noticed. However, these plants showed a high degree of tolerance against Mn toxicitystress, and it removed substantial amounts ofMn fromthemedia. The EDTA best enhanced theMn uptakeand translocation, while citric acid best recovered the plant growth.

【题目】II1465 栽培方式对寒地玉米群体结构特性的影响

【中文关键词】栽培方式;寒地玉米;群体结构

【英文关键词】cultivation methods;maize of cold region;community structure

【中文摘要】研究了 II1465 栽培方式与传统垄作栽培方式在不同种植密度条件下,玉米群体结构的变化 结果表明:在相同种植密度条件下 II1465 栽培与传统垄作栽培相比,其穗位及穗位以上叶片茎叶夹角要低于传统垄作栽培;穗位以下要高于传统垄作栽培;整株水平叶向值则始终高于传统垄栽培 栽培方式与种植密度对玉米株高影响不大,茎粗随着密度的增加而减小,II1465 栽培方式下茎粗始终要高于传统垄栽培,在8 万株 hm-2和 10 万株 hm-2时,茎粗间差异显著(P<0.05) 在低密度种植条件下, LAI差异不大,在高密度种植条件下 II1465 栽培方式生育后期LAI 下降速度慢,体现出了 前快 中稳 后衰慢 的良好群体结构特性 II1465 栽培方式下玉米群体内各层次PAR要高于传统垄栽培,并有随着种植密度的增加差异增大的趋势。

【英文摘要】Study on the maize of cold region in II1465 cultivation methods and the traditional ridge planting cultivation methodsin different planting density,the changes of community structure character of maize. The results showed as follows:comparedII1465 Cultivation methods with the traditional cultivation methods in the same planting density,the ear and the ear above theangle of leaf and stem was lower than the traditional ridge planting cultivation;ear below was higher than the traditional ridgeplanting cultivation;the whole plant level of leaf orientation values were always higher. Cultivation methods and planting density hadlittle effects on the plant height of maize,the stem diameter decreased gradually with the increase of planting density. the stemdiameter in II1465 cultivation methods should always be higher than the traditional ridge planting cultivation. The stem diameterled to significant increase(P<0.05) in 80 and 100 thousand plants hm-2. LAI had little differences in low planting density. In highdensity planting,LAI of II1465 cultivation methods reduced slow in late birth, showed prompted rapidly stabilize descendedslowly a good community structure character. The all levels of PAR of II1465 cultivation methods were higher than thetraditionalridge planting cultivation,it was significant in high density planting.

【题目】Simultaneous detection of endosymbionts Wolbachia and Cardinium in spider mites (Acari: Tetranychidae) by multiplex-PCR

【中文关键词】multiplex PCR, detection, Wolbachia , Cardinium , spider mite

【英文关键词】multiplex PCR, detection, Wolbachia , Cardinium , spider mite

【中文摘要】Several species of spider mites were infected with both Wolbachia and Cardinium causing reproductive abnormalities in their hosts. A PCR-based method was developed for simultaneous detection of Wolbachia and Cardinium in spider mites. Two pairs of primers were designed to amplify two DNA fragments of different length specific to wsp gene of Wolbachia and 16S rDNA gene of Cardinium respectively in a single reaction. The specificity of multiplex PCR was tested by amplifying specific DNA fragments from positive controls and confirmed by DNA sequencing of PCR product. Multiplex PCR also showed high sensitivity, which could be applied to detect the presence of very low grade of Cardinium and Wolbachia. The result of detecting spider mites collected from fields in China by multiplex PCR was identical to results by traditional PCR, which proved the feasibility and reliability of multiplex PCR.

【题目】Characterisation of Hop stunt viroid (HSVd) isolates from jujube trees (Ziziphus jujuba)

【中文关键词】HSVd . Jujube .Molecular characterisation . Sequence analysis

【英文关键词】HSVd . Jujube .Molecular characterisation . Sequence analysis

【中文摘要】Hop stunt viroid (HSVd) has been detected in many woody species including grapevine, citrus, peach, plum, apricot, and almond.Here, we report the first detection of HSVd in jujube trees (Ziziphus jujuba). Ninety-five samples were collected from jujube trees in Cangzhou, Baoding, and Handan of the Hebei province of China inJune 2006. An additional 70 samples were collected from Taigu, the Shanxi province of China in August 2008. From these samples,low molecular weight RNAs were extracted for two-dimensional polyacrylamide gel electrophoresis (2D-PAGE), hybridisation,and reverse transcription polymerase chain reaction (RT-PCR) assays. HSVd was detected in three of the 165 samples, givingan infection rate of 1.8%. The sequences of the HSVd isolates from jujube trees shared 92.6 – 92.8% homology with the firstreported HSVd sequence (GenBank: X00009). Using alignment and phylogenetic analyses, the HSVd sequence variants from jujubewere classified in the plum subgroup and were found to be more conserved than other HSVd subgroups.

【题目】Identification and characterization of Hop stunt viroid infecting almond in China.
【中文关键词】Hop stunt viroid . HSVd . Phylogenetic analysis . Prunus . Grapevine . Stone fruits . Humulus lupulus
【英文关键词】Hop stunt viroid . HSVd . Phylogenetic analysis . Prunus . Grapevine . Stone fruits . Humulus lupulus
【中文摘要】A survey for the incidence of Hop stunt viroid (HSVd) infection in China was conducted using dot-blot hybridization. Out of 553 tested samples, 127samples of stone fruits (apricot, peach, plum and al-mond), grapevine and hop were positive for HSVd,giving a mean infection rate of 23 %. Phylogeneticanalysis revealed that most of the HSVd variants iso-lated from stone fruits, grapevine and hop were clus-tered into known hop and plum groups. However, two grapevine variants, HSVd.g50 and HSVd.g57, could not be clustered into any known groups, indicating a previously unknown phylogenetic group of HSVdisolates. HSVd.g38 was the single grapevine variant that clustered with the plum group isolates, supporting cross transmission between grapevine and stone fruits and the heterogeneity of grapevine isolates.

Out of 553 tested samples, 127samples of stone fruits (apricot, peach, plum and al-mond), grapevine and hop were positive for HSVd,giving a mean infection rate of 23 %. Phylogeneticanalysis revealed that most of the HSVd variants iso-lated from stone fruits, grapevine and hop were clus-tered into known hop and plum groups. However, two grapevine variants, HSVd.g50 and HSVd.g57, could not be clustered into any known groups, indicating a previously unknown phylogenetic group of HSVdisolates. HSVd.g38 was the single grapevine variant that clustered with the plum group isolates, supporting cross transmission between grapevine and stone fruits and the heterogeneity of grapevine isolates.

【题目】Cultivated Grapevines Represent a Symptomless Reservoir for the Transmission of Hop Stunt Viroids to Hop Crops: 15 Years
【中文关键词】Hop stunt
【英文关键词】Hop stunt
【中文摘要】Hop stunt was a mysterious disorder that first emerged in the 1940s in commercial hops in Japan. To investigate the origin of this disorder, we infected hops with natural Hop stunt viroid (HpSVd) isolates derived from four host species (hop, grapevine,

plum and citrus), which except for hop represent possible sources of the ancestral viroid. These plants were maintained for 15 years, then analyzed the HpSVd variants present. Here we show that the variant originally found in cultivated grapevines gave rise to various combinations of mutations at positions 25, 26, 54, 193, and 281. However, upon prolonged infection, these variants underwent convergent evolution resulting in a limited number of adapted mutants. Some of them showed nucleotide sequences identical to those currently responsible for hop stunt epidemics in commercial hops in Japan, China, and the United States. Therefore, these results indicate that we have successfully reproduced the original process by which a natural HpSVd variant naturally introduced into cultivated hops was able to mutate into the HpSVd variants that are currently present in commercial hops. Furthermore, and importantly, we have identified cultivated grapevines as a symptomless reservoir in which HSVd can evolve and be transmitted to hop crops to cause epidemics.

【题目】Genetic diversity in Veronica hederifolia (Plantaginaceae), an invasive weed in China, assessed using AFLP markers

【中文关键词】Veronica hederifolia; an invasive weed; AFLP markers
【英文关键词】Veronica hederifolia; an invasive weed; AFLP markers

【中文摘要】Veronica hederifolia (Plantaginaceae) an invasive, alien weed in eastern China is of great concern due to its potential to spread. This study was conducted to determine the genetic diversity of V hederifolia in comparison with several congeneric species, including V persica, V. arvensis, V. didyma and V. peregrina as outgroups, using the Amplified Fragment Length Polymorphism (AFLP) technique. The samples of V. hederifolia were collected from 24 locations in Nanjing and Zhoushan, and genomic DNA was digested with the enzymes EcoRI/MseI and amplified with six E+3/M+3 primer combinations. Both mono- and polymorphic AFLP markers were analyzed to estimate genetic diversity of V hederifolia based on a range of standard indicators. A high percentage of polymorphic bands (89.23%) existed in the populations examined, implying high genetic diversity. Based on all genetic indices, the Nanjing population, which was the first reported in China, exhibited greater genetic diversity than the Zhoushan population. Substantial variation was also found among individual plants collected from a single site near Nanjing, with 79.56% polymorphism. This high genetic diversity indicates this weed species potentially has broad adaptability. Cluster analysis of AFLP data placed V. hederifolia samples into three groups depending largely on geographical locations.

【题目】Helminthosporium graminum Rabehn f. sp. echinochloae conidia for biological control of barnyardgrass
【中文关键词】无
【英文关键词】Biological control, conidia, mycoherbicide.
【中文摘要】无
【英文摘要】A fungal pathogen, Helminthosporium gramineum Rabehn f.sp. echinochloae (HGE), has been developed as amycoherbicidal agent for the control of barnyardgrass in China. Under greenhouse conditions, the effect of the pathogenon disease incidence, mortality, and dry weight reduction of barnyardgrass was tested to determine the potential of thismycoherbicide. Field experiments during 2007 and 2008 showed that the conidia of HGE displayed excellent activity onbarnyardgrass and good activity on a few other weed species. The HGE treatment increased the rice yield when comparedwith the untreated control and had no negative impact on the rice plant. In addition, the progression of HGE infectionand the alteration of cellular ultrastructure in infected barnyardgrass were observed by using scanning and transmissionelectron microscopes. After infection, cell membranes of barnyardgrass leaves were found dramatically changed, and theultrastructure of cells was severely deformed. This study clearly shows the scope of HGE as a potential mycoherbicide forcontrol of barnyardgrass in agricultural cropping systems and has laid the groundwork for further studies on the mode ofinfection and the nosogenesis of HGE

【题目】Male age influences the strength of Cardinium-induced cytoplasmic incompatibility expression in the carmine spider mite Tetranychus cinnabarinus
【中文关键词】Cardinium Tetranychus cinnabarinus (Boisduval) cytoplasmic incompatibility bacteria density
【英文关键词】Cardinium Tetranychus cinnabarinus (Boisduval) cytoplasmic incompatibility bacteria density
【中文摘要】Candidatus Cardinium ’, a recently described bacterium from the Bacteroidetes group, causes diverse reproductive alterations of its arthropod hosts, including cytoplasmic incompatibility (CI), parthenogenesis and feminization. We detected severe CI expression induced by Cardinium in the carmine spider mite Tetranychus cinnabarinus (Boisduval). CI was expressed as a reduction in egg hatchability and a male-biased sex ratio in crosses between uninfected females and infected males. To determine whether male age affects Cardinium-induced CI expression, uninfected females were crossed with infected virgin males at different ages. Cardinium density in males, as measured by quantitative PCR using the 16S rDNA gene, declined rapidly with increasing age. The CI level also declined rapidly with increasing age. Cardinium lost the ability to induce CI by day 12, and the Cardinium density declined to 3.0×106 copies per ml. Cardinium density was positively correlated with the CI level, which is consistent with the bacterial density model of CI. Our results suggest that both male age and Cardinium density are key factors in Cardinium-induced CI expression in T. cinnabarinus, and a threshold level of Cardinium density may be required for induction of CI.

【题目】供锌水平对寒地春玉米幼苗抗氧化酶活性等生理特性的影响
【中文关键词】玉米幼苗; 锌水平; 保护酶活性; 硝酸还原酶
【英文关键词】maize seedlings; Zn supply level; protective enzymes activities; NR
【中文摘要】本试验选用不同耐锌玉米品种, 采用营养液水培, 研究不同锌浓度对玉米株高、地上部干重、根干重及SOD、POD、TTC、硝酸还原酶活性、细胞膜透性的影响。结果表明: 耐锌品种‘牡单九’的适宜锌浓度为0.1 μmol·L-1, 锌敏感品种‘四单十九’的适宜锌浓度为1 μmol·L-1。不同锌浓度对玉米生长的影响主要表现在地上部, 而对地下部生长影响较小。随着锌浓度的升高, SOD和POD的活性增大。当锌浓度为0.1 μmol·L-1时根系活力最高, 在锌浓度大于1 μmol·L-1时, 根系活力下降较明显。硝酸还原酶活性在锌浓度大于0.01 μmol·L-1时, 随着锌浓度升高而降低。在锌浓度为1 μmol·L-1时, 细胞膜透性最小, 低锌和高锌胁迫下细胞膜透性都有不同程度的增加。
【英文摘要】In order to investigate the effects of different zinc concentrations on physiological characteristics inmaize, different Zn-tolerant maize cultivars were used as materials. Plant height, dry weights of root and shoot,root activity, cell membrane permeability, and activities of SOD, POD, TTC and NR were measured. Theresults showed that the optimal concentration of Zn in maize cultivar ‘Mudan 9’ and ‘Sidan 19’ were 0.1 μmol·L-1 and 1 μmol·L-1, respectively. Different Zn concentrations had more effects on aerial part than under-ground part. The activities of SOD and POD increased with the increasing of Zn concentration. The Zn concen-tration of the highest root activity was 0.1 μmol·L-1, and root activity decreased obviously when Zn concentra-tion was more than 1 μmol·L-1. When Zn concentration was more than 0.01 μmol·L-1, NR activity decreasedwith the increasing of Zn concentration. When Zn concentration was 1 μmol·L-1, cell membrane permeabilitywas lowest. Cell membrane permeability increased under low or high Zn stress.

【题目】Herbicidal Activity of the Metabolite SPRI-70014 from Streptomyces griseolus
【中文关键词】无
【英文关键词】Mycotoxins, natural products.

【中文摘要】无

【英文摘要】Microbial metabolites have been identified as a promising class of natural herbicides due to their effective control againstweeds and a relatively low environmental impact. Here we report on the potency and crop safety of a natural compoundwith herbicidal properties, the metabolite SPRI-70014 from Streptomyces griseolus CGMCC 1370. The compound showedexcellent herbicidal activities on various broadleaf and gramineous weeds in both greenhouse and field trials. Ingermination inhibition experiments, SPRI-70014 inhibited the emergence of both root and shoot at 1 mg L21. At a doseof 31.3 g ai ha21, SPRI-70014 provided effective control over most broadleaf weeds in greenhouse trials. Observations onabsorption and translocation using a cucumber plant model system indicated that SPRI-70014 could be absorbed by theroot but only partly by the stem. Field trials showed that SPRI-70014 provided effective control over most weed speciestested at a dose of 1,000 g ai ha21. Crop safety experiments showed that the compound had no harmful effect on peanutor wheat plants at doses up to 2,000 g ai ha21. These results indicated that this compound could be developed as apotential POST herbicide for control of broadleaf weeds in peanut and wheat fields.Nomenclature: Cucumber, Cucumis sativus L.; peanut, Arachis hypogaea L.; wheat, Triticum aestivum L.

【题目】First report of Coleus blumei viroid 2 from commercial coleus in China.

【中文关键词】First Report ; Coleus blumei viroid 2 ; Commercial Coleus in China

【英文关键词】First Report ; Coleus blumei viroid 2 ; Commercial Coleus in China

【中文摘要】Coleus (Coleus blumei) is an ornamental plant that is susceptible to infection by several viroids of the genus Coleviroid, which is a member of the family Pospiviroidae. Coleus blumei viroid (CbVd) -1 was first reported in commercial yellow coleus fields in Brazil in 1989 (1). In addition, CbVd-2, CbVd-3, and CbVd-4 have only been detected from coleus in Germany in 1996 (4). CbVd-5 and CbVd-6 were recently identified in China (2). In March 2010, leaves were collected from 50 symptomless coleus plants from a commercial nursery in Hainan Province, China. Total RNA was extracted from the leaves (3). Reverse transcription (RT)-PCR using CbVd-2 specific primers (forward: 5 ′ -AGCTTACCTGGGTTCCCT-3 ′ and reverse: 5 ′ -CTCTCCTCTATTTACTCTCTTCTC-3 ′) corresponding to positions 76 to 93 and 52 to 75 on the CbVd-2 reference sequence, respectively (GenBank Accession No. NC003682). Amplification of a 301-bp product was obtained from one sample. This PCR product was then cloned into pMD18-T (Takara, Dalian, China). Twelve positive clones were sequenced and the results were subjected to BLAST analysis. Sequence analysis showed that two sequences (GenBank Accessions Nos. HQ727542 and HQ727544) shared 99% identity with the reference sequence of CbVd-2 (NC003682), and four sequences (HQ727541, HQ727543, HQ727545 and HQ727547) had 99.34% identity with the reference sequence of CbVd-2 (NC003682). The proposed secondary structures of these variants have approximately 75% paired nucleotides. Results suggested the presence of CbVd-2, which is a member of the Coleviroid genus, Pospoviroidae family. To our knowledge, this is the first report of CbVd-2 from commercial coleus in China.

【题目】杂色鲍的数量性状遗传与育种研究
【中文关键词】杂色鲍;数量性状;选择育种;杂交育种;基因型与环境互作
【英文关键词】Small abalone;quantitative traits;selective breeding;crossbreeding;genotype and environment interaction
【中文摘要】本文以杂色鲍为研究对象,从选择育种及遗传参数的估计、杂交育种及杂种优势的利用和基因型与环境的互作三个方面阐述杂色鲍数量性状遗传与育种方面的研究。主要研究结果如下: 1.两个杂色鲍群体的歧化选择及选择效应:采用歧化选择法对两个杂色鲍群体的壳长进行了双向选择。群体A (台湾群体♀×日本群体♂) 经过一代选择,上选组和下选组的生长速度较对照组分别提高和降低了12.79%和15.20%,选择效果十分显著。群体B (台湾群体♀×台湾群体♂)上选组和下选组的生长速度较对照组分别提高和降低了4.58%和5.95%,选择效果较不显著。A群体上选组和下选组壳长的现实遗传力平均值分别为0.396±0.074和0.487±0.056;B群体上选组和下选组壳长的现实遗传力平均值为0.104±0.069和0.122±0.076。 2.杂色鲍生长性状遗传力的估算:采用平衡巢氏设计,通过建立12个父系半同胞家系和36个母系全同胞家系的方法,估算了杂色鲍养殖群体壳长、壳宽以及养成期体重的狭义遗传力。在三个培育阶段中,基于雄亲组分估算的壳长遗传力为0.15-0.37,壳宽遗传力为0.18-0.42,养成期体重遗传力为0.27-0.34。 3.杂色鲍形态性状的遗传相关:采用相关分析的方法研究了杂色鲍主要形态性状-壳长(X1)、壳宽(X2)、壳高(X3)、壳顶高(X4)、全湿重(Y1)、足肌肉重(Y2)与壳重(Y3)间的遗传相关。结果显示,各性状间的相关系数都很高。同时,采用通径分析的方法计算了表型性状为自变量对全湿重和足肌肉重为依变量的通径系数,结果表明全湿重受壳长的直接影响最大,足肌肉重受壳宽的直接影响最大,并建立了全湿重和足肌肉重与形态性状的多元回归方程。 4.微卫星技术分析杂色鲍不同地理群体的遗传多样性和遗传结构:利用课题组开发的杂色鲍微卫星标记分析了3个杂色鲍野生群体(日本、广东和海南)和2个养殖群体(台湾和越南)的遗传多样性及遗传结构。研究表明各个群体的平均等位基因数、观测杂合度和期望杂合度等指标的值都很高,但各群体间的遗传距离并不大。 5.杂色鲍的不同地理群体间杂交及杂种优势利用:对杂色鲍日本(A)、台湾(B)和越南(C)三个群体进行了完全双列杂交,研究杂色鲍不同地理群体间杂交的杂种优势及配合力分。结果表明,不同杂交组合后代在生长速度和存活率上表现出不同的杂种优势。台湾和日本群体正反交后代的生长速度和存活率的中亲杂种优势值显著的($P<0.05$)高于其他组合,配合力分析结果进一步证实BA组合(台湾群体♀×日本群体♂)为最优交配组合。 6.杂色鲍群体的回交和级进杂交研究:采用BA群体(D)与台湾群体进行回交实验,结果表明回交组合BD的生长速度在420日龄显著($P<0.05$)高于其他组合,但正、反回交组合的养成存活率值都不高,DB和BD组合分别为46.3%和32.5%。选择日本群体作为轮回亲本,与台湾群体进行了三代的级进杂交。结果表明级进杂交的代数越多,杂色鲍的存活率越高,八个月的养殖比较试验显示,级进杂交F3的存活率达到83.4%。 7.杂色鲍的基因型与环境互作研究:在设定的16、20、24和28°C水温下,对四个不同基因型(日本、台湾、越南以及台湾群体♀×日本群体♂杂交组)杂色鲍群体的生长与存活进行了比较,本实验观测到显著的基因型与环境互作效应,同时,台湾群体♀×日本群体♂杂交组的壳长、体重日增长率以及饵料转化率都要高于其他三个组合。将此四个不同基因型的杂色鲍组合,采用海区吊养和陆地工厂化两种养成模式,分别在福建、广东和海南进行一年的养殖比较。结果表明,台湾群体♀×日本群体♂杂交组在三个实验点的生长和存活率方面都表现出比较显著的优势。
【英文摘要】In this research, quantitative tratis genetics and breeding of small abalone Haliotis diversicolor were studied in three parts: selective breeding and estimation of genetic parameters, crossbreeding among different geographically populations and genotype ×environment interaction. The main results are as follows: 1. Divergent selection for shell length in two stocks of small abalone 2. Heritability of growth traits estimated from sib matings 3. Genetic correlations on morphological traits of small abalone 4. Genetic variation of cultured and wild populations estimated by microsatellite DNA markers 5. Growth and survival of three populations and their reciprocal crosses 6. Backcross and grading cross of different populations7. Genotype × environment interaction

【题目】Spatial and temporal changes in acetolactate synthase activity as affected by new herbicide ZJ0273 in rapeseed, barley and water chickweed
【中文关键词】无
【英文关键词】Acetolactate synthase
Alopecurus aequalis
Brassica napus
Herbicide activity
Hordeum vulgare
Malachium aquaticum
Propyl 4-(2-(4,6-dimethoxypyrimidin-2-yloxy)benzylamino)benzoate
【中文摘要】无
【英文摘要】Propyl 4-(2-(4,6-dimethoxypyrimidin-2-yloxy)benzylamino)benzoate (ZJ0273), derived from a precursorcompound pesticide (a derivative of 2-pyrimidinyloxy-N-aryl benzoate), is a novel herbicide used in therapeseed fi eld. This paper studied the differential tolerance or susceptibility of four plant species viz.Brassica napus L. (rapeseed), Hordeum vulgare L. (barley), Malachium aquaticum (L.) Fries (water chick-weed), and Alopecurus aequalis Sobol. (equal alopecurus), to various concentrations of ZJ0273, based onthe rate of inhibition of acetolactate synthase (ALS) activity. Brassica napus was observed as the most tol-erant among four species in which ALS activity in vivo was hardly affected by ZJ0273 at 100 mg/L (rec-ommended dose in the rapeseed fi eld). In contrast, H. vulgare was found to be more susceptible whichwas re fl ected in the relative decline of ALS activity and lower biomass production even under at a lowerrate of 10 mg/L of ZJ0273. The two weed species exhibited moderate susceptibility as compared toH. vulgare. The present study con fi rmed that ZJ0273 at 100 mg/L is the optimal dose of herbicide for rape-seed fi eld. Seedling stage was critical in determining the tolerance of crops and susceptibility of weedswhich indicated that over seven leaf stage was much safer for rapeseed whereas the two leaf stage juve-nile water chickweed was more susceptible to the same rate of ZJ0273. Spatial and temporal variations inALS activity as affected by 100 mg/L ZJ0273 in water chickweed, rapeseed and barley also suggested thatthe synchronized

sampling based on the tissue position and seedling stage was necessary to examine pre-cisely, the special difference in tolerance or susceptibility to ALS-inhibiting herbicide. The uppermostyounger leaf seemed to be themost appropriate sample for evaluation. Furthermore, the variant tendencyof ALS activity from different parts of plants between monocotyledons and dicotyledons to ZJ0273 treat-ments showed differential response which revealed some possible mechanism related to the alteredabsorption and translocation of the herbicide.

【题目】First report of Coleus blumei viroid 2 from commercial coleus in China
【中文关键词】Coleus blumei;CbVd;CbVd-2
【英文关键词】Coleus blumei;CbVd;CbVd-2
【中文摘要】Coleus (Coleus blumei) is an ornamental plant that is susceptible to infection by several viroids of the genus Coleviroid, which is a member of the family Pospiviroidae. Coleus blumei viroid (CbVd) -1 was first reported in commercial yellow coleus fields in Brazil in 1989 (1). In addition, CbVd-2, CbVd-3, and CbVd-4 have only been detected from coleus in Germany in 1996 (4). CbVd-5 and CbVd-6 were recently identified in China (2). In March 2010, leaves were collected from 50 symptomless coleus plants from a commercial nursery in Hainan Province, China. Total RNA was extracted from the leaves (3). Reverse transcription (RT)-PCR using CbVd-2 specific primers (forward: 5′-AGCTTACCTGGGTTCCCT-3′ and reverse: 5′-CTCTCCTCTATTTACTCTCTTCTC-3′) corresponding to positions 76 to 93 and 52 to 75 on the CbVd-2 reference sequence, respectively (GenBank Accession No. NC003682). Amplification of a 301-bp product was obtained from one sample. This PCR product was then cloned into pMD18-T (Takara, Dalian, China). Twelve positive clones were sequenced and the results were subjected to BLAST analysis. Sequence analysis showed that two sequences (GenBank Accessions Nos. HQ727542 and HQ727544) shared 99% identity with the reference sequence of CbVd-2 (NC003682), and four sequences (HQ727541, HQ727543, HQ727545 and HQ727547) had 99.34% identity with the reference sequence of CbVd-2 (NC003682). The proposed secondary structures of these variants have approximately 75% paired nucleotides. Results suggested the presence of CbVd-2, which is a member of the Coleviroid genus, Pospoviroidae family. To our knowledge, this is the first report of CbVd-2 from commercial coleus in China.

【题目】大豆生物量积累、收获指数及产量间的相关与QTL分析
【中文关键词】大豆; 生物量积累; 表观收获指数; 产量; QTL 分析
【英文关键词】Soybean; Biomass accumulation; Apparent harvest index; Yield; QTL analysis
【中文摘要】利用亲本间生物量、收获指数和产量有较大差异的南农1138-2 和科丰1 号杂交衍生的大豆重组自交家系(NJRIKY), 研究始花期(R1) 、始荚期(R3) 、始粒期(R5) 、收获期生物量以及表观收获指数和产量间的相关, 并进行QTL 定位, 分析相关的遗传基础。结果表明, (1) 生物量与产量显著相关, 相关程度随生长进程逐渐增加, 收获期生物量与产量相关最高, R2=0.76。R1、R3、R5期生物量与产量的相关呈负指数曲线相关, 生物量分别达到1 000、2 300和5 500 kg hm－2时, 产量不再随生物量的增加而增加。收获期生物量与产量呈直线正相关, 在试验范围内未发现高产的收获期生物量上限。表观收获指数与产量呈指数曲线相关, 小于0.42 时与产量具正变关系, 大于0.42 时与产量具负变关系。收获期生物量与表观收获指数呈指数曲线相关, 表观收获指数增加生物量降低。(2) 检测到产量、表观收获指数、收获期生物量有关的QTL 分别为9 、10和10个, 其中两年稳定的QTL 分别有2 、3 、3 个。检测到R1、R3和R5期生物量有关的QTL 分别有6 、9 和6 个, 其中3 个时期在两年均能稳定表达的有2 个。(3)在9 个产量QTL中的6 个区间, 还同时检测到生物量和表观收获指数有关的 QTL, 该3 性状有部分QTL 共享同一连锁区间, 表明有其共同的遗传基础, 同时也解释了性状间相关的遗传原因。

【英文摘要】Since soybean seed yield is the product of both biomass accumulation and harvest index, the objective of the present study was to measure the correlations of seed yield with the other two traits as well as with biomass accumulation at different seed development stages, to map their QTLs, and to reveal the QTL basis of the correlations. A RIL population, NJRIKY, derived from the cross between Nannong 1138-2 and Kefeng 1, quite diverse in biom ass, harvest index and yield, was used to study the correla-tion among biomass accumulation, apparent harvest index and yield, to map the QTLs of the traits for revealing the genetic basis of the correlation among the traits. The results obtained were as follows: (1) Yield was closely and positively correlated with bio-mass accumulation and their correlation increased in the process of growth with the highest R2=0.76 at harvest stage. There ap-peared some negative exponential correlation between yield and biomass at R1, R3, and R5, with the biomass of 1 000, 2 300, and 5 500 kg ha − 1 as the highest turning point, respectively. A linear correlation of yield with biomass at harvest stage [BM (H)] was detected, but without upper limit of the biomass found in the present experiment. There was an exponential correlation between yield and apparent harvest index, with 0.42 as the turning point, positive relationship as less than 0.42 and negative relation ship as larger than 0.42. (2) 9, 10, and 10 QTLs for yield, apparent ha rvest index and BM (H) were detected in NJRIKY and 2, 3, and 3 QTLs of them respectively detected in both years. In addition, 6, 9, and 6 QTLs for biomass at R1, R3, and R5 were identified i n the population, respectively, with 2 of them being detected across R1 through R5 in both years. (3) Among the 9 yield QTLs, 6 marker intervals were found to have QTLs conferring biomass and apparent harvest index, which implied a partially common genetic basis among the three traits.

【题目】Allelopathic effects of Conyza canadesis on germination and growth of wheat, sorghum, cucumber, rape and radish
【中文关键词】无
【英文关键词】Allelopathic effects, aqueous extracts, Conyza canadesis L., cucumber,
radish, rape, root exudates, seed germination, seedling growth , shoot
leachates, sorghum, wheat
【中文摘要】无
【英文摘要】The allelopathic effects of aqueous extract from Conyza canadesis were tested in Petri dishes in Laboratory and Greenhouse assays. The aqueous extract strongly inhibited the germination, germination speed and seedling growth of sorghum

(Sorghum vulgare Pers.), cucumber (Cucumis sativus L.), wheat (Triticum aestivum L.), rape (Brassica campestris L.) and radish (Raphanus sativus L.). Rape and radish were more sensitive than other spp. C. canadesis released the allelochemicals mainly as root exudates. The extract inhibited the hypocotyl and root growth of endosperm-removed wheat and sorghum cultivated in darkness, but the inhibitory effect was drastic in sorghum than in endosperm-removed wheat. The aqueous extract decreased the photosynthesis activity but increased the MDA contents of cucumber and radish. Thus allelopathic effects of C. canadesis affects non-photosynthesis activity and MDA, but may also affect the photosynthesis activity.

【题目】大豆抗倒伏性的评价指标及其QTL分析
【中文关键词】大豆; 倒伏指标; 相关; QTL 分析
【英文关键词】Soybean; Lodging indix; Correlation; QTL analysis
【中文摘要】倒伏性的鉴定通常采用倒伏程度分级法, 但其表现依赖于田间实时环境, 分级较粗放。育种实践需要一种不依赖于实时环境的倒伏潜势评价方法。本研究利用表型差异大的32个大豆品种和1 个重组自交系(RIL) 群体NJRIKY, 研究了鲜重力矩(株高× 鲜重, PF)、干重力矩 (株高× 干重, PD)、单位抗折力鲜重力矩(株高× 鲜重/ 抗折力, PFS) 和单位抗折力干重力矩(株高× 干重/ 抗折力, PDS) 等4 种倒伏性评价指标与倒伏程度的关系, 从中遴选出PF与倒伏程度的相关系数高、物理意义明确、测度简便、环境稳定性高, 与倒伏程度共同QTL 多, 综合表最优, 反映了倒伏势。在A2、C2、D2和G 连锁群上, 共检测到7 个倒伏程度相关的QTL, 分别解释表型变异的6%~12%, 2 年未检测到相同的QTL; 在B1、C2和O 连锁群共检测到7 个倒伏势有关的QTL, 分别解释表型变异的5%~12%, 其中qPFC2-2 , 2 年均能稳定表达, 贡献值较大; 倒伏程度和倒伏势共有的QTL 区间有GMKF059a ~ satt319和satt286~ A63_1T 两个; 抗倒伏性等位基因来自亲本科丰1 号。
【英文摘要】The used lodging resistance index is lodging score, with 0 as most resistant and 4 as most sensitive. In breeding for lodging resistance, an index more precise than lodging score and independent from the cultivation conditions is expected. In the present study, four kinds of lodging resistance indices, i.e. fresh matter moment (plant height × above ground fresh weight, PF), dry matter moment (plant hei ght × above ground dry weight, PD), fresh weight moment per unit of stem broken strength (PFS), and dry weight moment per unit of stem br oken strength (PDS), were designed in two experiments, one with 32 diverse cultivars and one with the RIL population NJRIKY including 184 recombinant inbred lines of the cross (Kefeng 1 × Nannong 1138-2) in 2005 and 2006. Among the four indices, fresh we ight moment (PF) designated as lodging potential performed with higher correla-tion with lodging score, more relevant physical meaning, easier operation of measurement, better stability in various environments and more common QTLs with lodging score than those of the other indices, therefore PF was the best candidate of lodging resis-tance index to replace lodging score. On the basis of the re sults, QTL analysis was performed for lodging score and lodging pot en-tial. Seven QTLs for lodging score on linkage groups A2, C2, D2, and G explaining 6% – 12% of phenotypic variation, but no common one between the two years, were detected. There were seven QTLs for lodging potential on linkage groups B1, C2, and O, explaining 5% – 12% phenotypic variation, with the same QTL qPFC2 - 2 in two years. Between l odging score and lodging po-tential, two QTLs were with same flanking markers, i.e. GMKF059a – satt319 and satt286 – A63_1T, and the lodging resistance alleles were mainly contributed from Kefeng 1. Between the two loci, qPFC2-2 was of larger contribution, so its flanking markers can be used in marker-assisted selection for lodging resistance in soybean.

【题目】Molecular Characterization of a new tentative strain of Sugarcane streak mosaic virus (SCSMV) from sugarcane in china.
【中文关键词】SCSMV;characterization
【英文关键词】SCSMV;characterization
【中文摘要】The complete nucleotide sequences of three sugarcane streak mosaic virus (SCSMV) isolates found in sugarcane plants imported from Japan (JP1, JP2) and Indonesia (ID) into China were determined. Sequence analysis showed that, based on the whole genome sequence and the nucleotide sequences encoding the ten mature proteins, the three SCSMV isolates shared identities of 81.62%-81.67% and 76.39%-85.93%, respectively, with a Pakistan (PAK) isolate of SCSMV. Phylogenetic analysis indicated that SCSMV-JP1, -JP2 and -ID were clustered in a subgroup separate from the previously described SCSMV-PAK and -India isolates, and may thus represent a new strain of SCSMV.

【题目】玉米生理成熟后籽粒脱水速率与品质性状的相关分析
【中文关键词】玉米; 脱水速率; 品质; 相关
【英文关键词】corn; dry- down rate; quality; correlation
【中文摘要】以黑龙江省 10 个熟期相近而脱水速率差异较大的优良玉米自交系为试验材料, 采用完全双列杂交设计配制杂交组合, 对玉米的淀粉等 10 个品质性状与生理成熟后籽粒脱水速率进行遗传相关和通径分析。结果表明, 淀粉等 3 个性状与生理成熟后籽粒脱水速率之间均表现为极显著正向相关, 脂肪等 4 个性状与生理成熟后籽粒脱水速率之间均表现为显著或极显著负向相关。通径分析表明, 淀粉、支链淀粉与生理成熟后籽粒脱水速率直接通径系数为正值, 脂肪等 5 个性状与生理成熟后籽粒脱水速率直接通径系数均为负值。为获得脱水速率快的玉米, 应着重选育淀粉、支链淀粉含量高, 脂肪、谷蛋白含量少, 胚占体积小的基因型杂交种。
【英文摘要】A set of complete diallel cross used 10 inbred lines with different dry- down rate in HeilongjiangProvince was adopted to study genetic correlation and path analysis between 10 quality characters of corn anddry- down rate after physiological maturity. The results showed that the performance of starch content was sign-ificantly positively correlated with kernel dry- down rate, and the performance of fat conten was significantly neg-atively correlated with kernel dry- down rate. Path analysis showed that the direct path coefficients of starch,amylopectin content and kernel dry- down rate after physiological maturity were positive, and those of the other fivetraits including fat content were negative. The corn hybrid with rapid dry- down rate should be high starch andamy- lopectin content, low fat and glutenin content, and the percentage of embryo was small.

【题目】Sap-direct RT-PCR for the rapid detection of coleus blumei viroids of the genus Coleviroid from natural host plants.
【中文关键词】Sap; RT-PCR; Coleus; CbVd; Pipettor
【英文关键词】Sap; RT-PCR; Coleus; CbVd; Pipettor
【中文摘要】A simple and fast sap-direct RT-PCR (reverse transcription-polymerase chain reaction) for the rapid detection of 3 viroids of the genus Coleviroid is presented. The templates for cDNA synthesis were obtained directly from the sap of coleus using a pipettor, a common tool in molecular biology laboratories, and 3 coleus blumei viroids (CbVds) were detected simultaneously using a pair of universal primers designed according to sequences in the central conserved region (CCR) of CbVds. RT-PCR results demonstrated that CbVd-1, CbVd-5, and CbVd-6 can be detected accurately in viroid-infected plants but not in viroid-free plants. The results of RT-PCR, dot-blot, sequencing, and batch-detection revealed that this method can be used to identify CbVds rapidly. The method also reduces cross-contamination among different samples to a minimum. It is considered that this rapid and simple technique is an effective method for the identification and cloning of CbVds.

【题目】中国栽培和野生大豆农艺品质性状与SSR 标记的关联分析 I. 群体结构及关联标记
【中文关键词】栽培大豆[Glycine max (L.) Merr.]; 野生大豆(Glycine soja Sieb. et Zucc.); SSR; 群体结构; 关联分析
【英文关键词】Cultivated soybean [Glycine max (L.) Merr.]; Wild soybean (Glycine soja Sieb. et Zucc.); Simple-sequence repeat (SSR); Population structure; Association mapping
【中文摘要】关联作图是一种利用连锁不平衡(linkage disequilibrium, LD)检测自然群体中基因位点及其等位变异的方法。利用60个SSR 标记, 对全国大豆地方品种群体(393 份代表性材料) 和野生大豆群体(196 份代表性材料) 的基因组变异进行扫描, 分析两类群体的连锁不平衡位点、群体结构, 并采用TASSEL 软件的GLM (general linear model)方法对16个农艺、品质性状观测值进行标记与性状的关联分析。结果表明: (1) 在公共图谱上不论共线性的或是非共线性的SSR 位点组合都有一定程度的LD, 说明历史上发生过连锁群间的重组; 栽培群体的连锁不平衡成对位点数较野生群体多, 但野生群体位点间连锁不平衡程度高, 随距离的衰减慢。(2) 群体SSR 数据遗传结构分析发现, 栽培群体和野生群体分别由9 和4 个亚群体组成, 亚群的划分与群体地理生态类型相关联, 证实地理生态类型划分有其遗传基础。(3) 栽培群体中累计有27个位点与性状相关; 野生大豆种质中累计有34个位点与性状相关。部分标记在两类群体中都表现与同一性状关联, 检出的位点有一致性, 也有互补性; 一些标记同时与2 个或多个性状相关联, 可能是性状相关乃至一因多效的遗传基础; 关联位点中累计有24位点(次) 与遗传群体连锁分析定位的QTL 一致。
【英文摘要】Association mapping is a procedure for detecting QTLs as well as their alleles based on linkage disequilibrium (LD). The genotyping data of 60 simple-sequence repeat (SSR) markers on representative samples of 393 landraces of Glycine max (L.) Merr. and 196 wild accessions of Glycine soja Sieb. et Zucc. were used in the present study. Linkage disequilibrium of pairwise loci and population structure were firstly analyzed for the two populations, then the association analysis between SSR loci and 16 agronomic and quality traits was performed by using TASSEL GLM (general linear model) program. The different degrees of LD were detected not only among syntenic markers but also among nonsyntenic ones, suggesting that there had been historical re-combination among linkage groups. The cultivated soybean population had more LD loci pairs than wild soybean population, while the later had higher degree and slower attenuation of LD than the former. Genetic structure analysis showed that both of the cultivated and wild populations were composed of nine and four subpopulations, respectively, which associated with their geo-graphic eco-types, indicating the classification of geographic eco-types was of sound genetic bases. Twenty seven and thirty fo ur SSR loci associated with the traits were screened out from cultivated and wild populations, respectively. Some loci were found to associate with a same trait in both populations, and there existed both consistent and inconsistent association between the cul ti-vated and wild populations. There were a few loci associated with two or more traits simultaneously, which might be the genetic reason of correlation among traits or pleiotropic phenomena. In addition, twenty-four associated markers were in agreement with mapped QTLs from family-based linkage mapping procedure.

【题目】密度对不同株型玉米光合特性及产量的影响
【中文关键词】玉米;密度;株型;光合特性;产量
【英文关键词】Corn; Density; Plant type; Photosynthetic characteristics; Yield
【中文摘要】对不同密度条件下3个不同株型春玉米的光合特性及产量进行了研究 结果表明,随密度增加叶面积指数(LAI)初始荧光(0)上升,单株功能叶片光合速率(n) PSⅡ的潜在活性(v / 0) PSⅡ最大光化学量子产量(v / m)下降;产量构成因素表现为单位面积有效穗数先上升后下降,穗粒数下降,百粒重变化因品种而异 先玉335 金玉 4号和吉农大 302 最高产量分别为 9 638.45 8 523.94 8 330.92 kg/hm2;先玉 335 最适播种密度为 75 000 株 /hm2,吉农大302为60 000 67 500株 /hm2,金玉 4 号为 45 000 株 /hm2先玉 335 群体产量与 LAI 单株 0 呈正相关,与单株 nv / m v / 0 呈负相关;吉农大302与金玉 4 号群体产量与LAI 单株 0 呈负相关,与单株 n v / m v / 0 呈正相关,且金玉 4号的相关程度要高于吉农大 302。

【英文摘要】Under different density conditions, it was studied that the photosynthesis characteristics and yield ofthree plant types spring corn. The results showed that with the density increased, LAI and Fo were to rise, n, v / 0and m / v were to decline. With the density increasing, effective ear of unit area fall after raise, Kernel number per earwas to decline, 100- grain weight changed for varieties. The max yield ofXY335, JY4, JND302 were 9 638.45, 8 523.94,8 330.92 kg/ha. The optimal density of XY335 was 75 000 plants/ha, JND302 was 60 000 - 67 500 plants/ha, JY4 was45 000 plants/ha. There was a positive correlation between the yield of XY335 and LAI, 0 . At the same time, therewas a negative correlation between the yield of XY335 and n , v / m, v / 0 . The correlation of photosynthesis charac-ters with yield of JND302 and JY4 were opposite with XY335, and the level of JY4 was higher than JND302

【题目】中国栽培和野生大豆农艺及品质性状与SSR 标记的关联分析II. 优异等位变异的发掘
【中文关键词】栽培大豆[Glycine max (L.) Merr.]; 野生大豆(Glycine soja Sieb. et Zucc.); SSR; 关联分析; 优异等位变异; 等位变异效应
【英文关键词】Cultivated soybean [Glycine max (L.) Merr.]; Wild soybean (Glycine soja Sieb. et Zucc.); Simple-sequence repeat (SSR); Association mapping; Elite allele; Allele effect
【中文摘要】在前文研究已检出与农艺品质性状显著关联的 SSR 位点的基础上, 本文进一步对与性状关联位点的等位变异作解析, 通过将携带某等位变异的所有材料表型均值与携带无效等位基因(null allele)材料表型均值做比较, 估计等位变异的潜在表型效应增量(减量), 进一步利用该信息估计位点增效(减效) 等位变异的平均效应, 鉴别出一批农艺品质性状优异位点、等位变异及携带优异等位变异的载体材料。发现在栽培及野生种质中检出的优异等位变异有同、有异、有互补性。发现关联位点正、负效应等位变异均值间有差异, 可根据育种目标性状选择要求, 选取适合的位点及相应等位变异。同一标记位点可与多性状关联, 其等位变异在不同性状间各有其表型效应的方向和大小; 等位变异在相关性状效应上方向、大小的异同解释了性状间正、负相关的遗传原因。关联作图得到的信息可以弥补家系连锁法 QTL定位信息的不足, 并直接利用等位变异信息进行亲本选拔、组合选配及后代等位条带辅助选择以提高育种成效。
【英文摘要】On the basis of our previous results of SSR loci associated with the 16 traits, alleles of loci significantly associated with the traits were analyzed further in the present paper. The phenotypic allele effect was estimated through comparison between the average phenotypic value over accessions with the specific alle le and that of accessions with “ null allele ”, and then the a verage positive (negative) allele effect (AAE) of a locus was calculated over the estimated phenotypic effects of all positive (negative) alleles. The results showed that a set of elite alleles, loci and their carrier materials were screened out. Among the elite al leles existed in Glycine max and Glycine soja , some were consistent, some inconsistent and some complementary. The phenotypic ef-fects of positive (negative) alleles were different from each other, and therefore, the average positive (negative) effects of a locus were also different from each other, indicating the potential of genetic recombination for breeding purposes. A same marker locus could associate with multiple traits with its alleles performed in their own way in direction and size, and the covariation of a same allele performed in two related traits might be the genetic ba sis of their phenotypic correlation. In summary, the results implied that association mapping could offer further genetic information complementary to the family-based linkage mapping for the im-provement of breeding procedures. In addition, further detailed in formation on elite alleles and phenotypic effects of the 16 traits were shown in the text.

【题目】Development of a SCAR marker for diagnosis of dwarf bunt of wheat and detection of Tilletia controversa K ü hn
【中文关键词】SCAR;Tilletia controversaK ü hn
【英文关键词】SCAR;Tilletia controversaK ü hn
【中文摘要】Dwarf bunt of wheat, caused by Tilletia controversa K ü hn, is a destructive disease on wheat as well as an important internationally quarantined disease in many countries. The primer ISSR818 generated a polymorphic pattern displaying a 867-bp DNA fragment specific for T. controversa. The marker was onverted into a sequence characterized amplified region (SCAR), and specific primers (TCKSF3/TCKSR3) designed for use in PCR detection assays; they amplified a unique DNA fragment in all isolates of T. controversa but not in the related pathogens. The detection limit with the primer set TCKSF3/TCKSR3) was 5 ng of DNA which could be obtained from 5.5 μ g of teliospores in a 25- μ L PCR reaction mixture.

【题目】中国东北大豆育成品种遗传多样性和群体遗传结构分析
【中文关键词】中国东北;大豆育成品种;遗传多样性;互补等位变异;群体遗传结构
【英文关键词】Northeast China;Released soybean cultivar;Genetic diversity;Complementary alleles;Population genetic StrUcture
【中文摘要】l923-2005年中国育成1 300个大豆品种,其中东北育成682个品种。选用大豆基因组64个SSR标记分析 东北169份大豆育成品种的遗传变异,探讨东北大豆育成品种群体遗传多样性及分时期亚群间、分省亚群间的遗传 多样性和互补性,及该地区育成品种群体的遗传结构。结果表明,东北大豆育成品种遗传多样性丰富,分时期亚群随 着时间推移旧的等位变异在消失而新的等位变异不断增加,新增加的多于消失的旧等位变异。分省亚群(黑龙江、吉林、辽宁)间都存在较多互补等位变异数,最多的在黑龙江与辽宁亚群间。分时期亚群间、分省亚群间分别拥有各自特有或特缺的等位变异。东北大豆育成品种分省亚群、分时期亚群分类与SSR标记遗传距离聚类间有显著相关,省份分群、时期分群都有其相应的遗传基础。东北大豆育成品种可能源自两个血缘群体,分别占I、II类群的绝大部分,和III、Iv类群中较大比例;黑龙江品种兼有两方面血缘,吉林、辽宁品种则侧重在同一种血缘,前者遗传基础较后两者广;东北各分时期亚群均有2种血缘。研究结果启示在新品种选育中应加强东北3省间大豆育成品种种质的交流、增加优异基因相互渗透,从而拓宽大豆品种的遗传基础。
【英文摘要】There were 1 300 soybean cultivars released during 1923—2005 in China,of which 682 were from northeast China.In the present study,169 cultivars out of the 682 were analyzed with 64 SSR markers to reveal the genetic diversity of the north— east China soybean cultivar population(NECSCP),the genetic diversity and marker allele complementarity among provincial subpopulations(PSP)and released period subpopulations(RPSP),and the genetic structure of the population and subpopulations. The results showed that there existed a plenty of genetic diversity in NECSCP;with the period advance,some of the old alleles in earlierRPSPdisappearedand somenew alleles cameoutinlaterRPSPandthenew onesweremorethantheold ones.Somemu— tual complementary alleles appeared among PSE with the largest number of mutual complementary alleles between Heilongjiang subpopulation and Liaoning subpopulation.There also existed some specifically existent and specifically deficient alleles in PSP and RPSP Significant relationship was found between SSR clusters and PSP as well as RPS indicating the sound genetic bases of the classification of PSP and RPSE The NECSCP was traced to two mode1.based populations according to the Structure Analysis(Structure version 2.2).The two sources of germplasm accounted for the most part of Cluster I and II.and the most part of Cluster III and IV,respectively.The Heilongjiang subpopulation mainly contained both sources of germplasm,while Jilin and Liaoning subpopulations contained one of them,indicating the former possesed genetic base broader than the latter.In addition, all of the RPSP almost equally

contained the two sources of germplasm.The results implied that germplasm exchange among PSP should be encouraged for broadening the genetic base in NECSCR

【题目】An ISSR-based approach for the molecular detection and diagnosis of dwarf bunt of wheat, caused by Tilletia controversa K ü hn
【中文关键词】ISSR;PCR;SCAR;Tilletia controversa K ü hn
【英文关键词】ISSR;PCR;SCAR;Tilletia controversa K ü hn
【中文摘要】Dwarf bunt of wheat, caused by Tilletia controversa K ü hn, is an important international quarantine disease in many countries. The objective of this investigation was to develop a diagnostic molecular marker generated from intersimple sequence repeat (ISSR) for rapid identification of T. controversa. A total of 60 primers were tested by ISSR to detect DNA polymorphisms between T. controversa and related species. The primer ISSR818 generated a polymorphic pattern displaying a 952- bp DNA fragment specific for T. controversa. The marker was converted into a sequence characterized amplified region (SCAR), and specific primers (TCKSF2/TCKSR2) were designed for use in a PCR detection assay. Its detection limit was 1 ng of DNA, which could be yielded by 1.1 μ g of teliospores in a 25- μ l PCR. Conclusively, a method to distinguish T. controversa from similar pathogenic fungi has been successfully developed based on the use of a SCAR marker

【题目】Genome-wide identification of Phytophthora sojae SNARE genes and functional characterization of the conserved SNARE PsYKT6
【中文关键词】Vesicular trafficking; Phytophthora sojae; PsYKT6
【英文关键词】Vesicular trafficking; Phytophthora sojae; PsYKT6
【中文摘要】Soluble N-ethylmaleimide-sensitive factor attachment protein receptors (SNAREs) are central components of the machinery mediating membrane fusion and key factors for vesicular trafficking in all eukaryotic cells. Taking advantage of the available whole genome sequence of the oomycete plant pathogen Phytophthora sojae, 35 genes encoding putative SNARE proteins were identified in the genome of this organism. PsYKT6, one of the most conserved SNARE proteins, was functionally characterized by homology-dependent gene silencing. The phenotype analysis showed that PsYKT6 is important for proper asexual development, sexual reproduction, and pathogenesis on host soybean cultivars.

【题目】1923-2005年中国大豆育成品种种质的地理来源及其遗传贡献
【中文关键词】大豆; 种质构成; 地理来源; 祖先亲本; 遗传贡献
【英文关键词】Soybean; Germplasm constitution; Geographic source; End ancestor; Genetic contribution
【中文摘要】中国大豆育成品种的种质构成可通过追溯其祖先亲本的遗传贡献来估计。本研究搜集1923—2005年全国育成的1 300 个大豆育成品种系谱资料, 追溯其祖先亲本, 计算每一育成品种祖先亲本的细胞核和细胞质遗传贡献值, 并分析其种质的地理来源及其年代演变特点。结果表明, 全国1 300 个大豆育成品种来源于670 个细胞核、344 个细胞质终端祖先亲本, 其地理来源按国内I 、II 、III、IV、V 、VI生态区和国外归类, 地理来源不详的另归一类, 相应的核(质) 遗传贡献率分别为45.44 (49.77) % 、23.23 (26.31) % 、7.33 (9.62) % 、4.40 (4.62) % 、0.87 (1.08) % 、0.55 (0.77) % 、17.75 (7.00) %和0.45 (0.85) %; 各生态区育成品种的核(质) 种质主要来自本区祖先亲本。近十年(1996 —2005)全国育成的592 个品种中, 国外、VI区和地理来源不详者祖先亲本核(质) 贡献率分别增加了11.96 (8.85) % 、0.89 (1.07) %和0.22 (0.62) %, I 、II 、III、IV和V 区祖先亲本核(质) 贡献率分别下降了7.83 (4.22) % 、3.66 (6.13) % 、0.66 (0.34) % 、0.64 (0.41) % 和0.27 (0.12) %; 归纳出了这期间育成品种的46个重要祖先亲本; 各生态区间种质交流虽有增加, 但所在区种质仍占绝大部分。整体上说, 十年来我国大豆育成品种种质的地理来源有所增宽, 但仍主要局限在本生态区,为了拓宽未来品种的遗传基础需进一步加强各生态区间的种质交流与利用。
【英文摘要】It provides important and necessary in formation for future soybean breeding to estimate the genetic contribution from the end ancestors of the released cultivars. Based on the pedigree data of 1 300 soybean cultivars released during 1923 － 2005 in China, the nuclear and cytoplasmic contribution rates of the end ancestors to each of the cultivars were calculated and analyzed. The 1 300 cultivars were traced back to 670 nuclear and 344 cytoplasmic ancestors and had 45.44% (49.77%), 23.23% (26.31%), 7.33% (9.62%), 4.40% (4.62%), 0.87% (1.08%), and 0.55% (0.77%) of nuclear (cytoplasmic) germplasm from Eco-region I, II, III, IV, V, VI, 17.75% (7.00%) from foreign countries, and 0.45% (0.85%) from geographic-unknown sources, respectively, while the nuclear (cytoplasmic) germplasm of the cultivars mainly came from their own eco-regions released them. During the last dec-ade (1996－ 2005), among 592 cultivars released, their nuclear (cytoplasmic) germpasm from foreign countries, eco-region VI and some geographic-unknown sources increased by 11.96% (8.85%), 0.89% (1.07%), and 0.22% (0.62%), but those from eco-region I－ V decreased by 7.83% (4.22%), 3.66% (6.13%), 0.66% (0.34%), 0.64% (0.41%), and 0.27% (0.12%), respectively; 46 core end ancestors of the cultivars released during 1996 － 2005 were nominated on the basis of thei r nuclear and cytoplasmic contribution; the exchange and utilization of germplasm among eco-regions were improved but mo stly still limited in their own eco-regions. Therefore, it is necessary to strengthen germplasm exchange among eco-regions for broadening genetic bases of the future cultivars.

【题目】Two host cytoplasmic effectors are required for pathogenesis of Phytophthora sojae by suppression of host defenses

【中文关键词】Phytophthora sojae;host defenses
【英文关键词】Phytophthora sojae;host defenses
【中文摘要】Phytophthora sojae encodes hundreds of putative host cytoplasmic effectors with conserved FLAK motifs following signal peptides, termed crinkling- and necrosis-inducing proteins (CRN) or Crinkler. Their functions and mechanisms in pathogenesis are mostly unknown. Here, we identify a group of five P. sojae-specific CRN-like genes with high levels of sequence similarity, of which three are putative pseudogenes. Functional analysis shows that the two functional genes encode proteins with predicted nuclear localization signals that induce contrasting responses when expressed in Nicotiana benthamiana and soybean (Glycine max). PsCRN63 induces cell death, while PsCRN115 suppresses cell death elicited by the P. sojae necrosis-inducing protein (PsojNIP) or PsCRN63. Expression of CRN fragments with deleted signal peptides and FLAK motifs demonstrates that the carboxyl-terminal portions of PsCRN63 or PsCRN115 are sufficient for their activities. However, the predicted nuclear localization signal is required for PsCRN63 to induce cell death but not for PsCRN115 to suppress cell death. Furthermore, silencing of the PsCRN63 and PsCRN115 genes in P. sojae stable transformants leads to a reduction of virulence on soybean. Intriguingly, the silenced transformants lose the ability to suppress host cell death and callose deposition on inoculated plants. These results suggest a role for CRN effectors in the suppression of host defense responses
【英文摘要】Phytophthora sojae encodes hundreds of putative host cytoplasmic effectors with conserved FLAK motifs following signal peptides, termed crinkling- and necrosis-inducing proteins (CRN) or Crinkler. Their functions and mechanisms in pathogenesis are mostly unknown. 【中文关键词】玉米幼苗; 锌; 碳氮代谢
【英文关键词】maize seedlings; zinc; C, N metabolism
【中文摘要】选用不同耐锌玉米品种‘四单19’(低锌敏感型)和‘牡丹9’(低锌不敏感型), 采用营养液水培, 研究不同锌浓度对碳酸酐酶(CA)活性、光合特性、可溶性糖含量等的影响。结果表明: 玉米对锌具有选择运输的能力, 当锌浓度过大对幼苗造成伤害时, 根系吸收的锌向地上部运输的比例减少, 以减少过量的锌对地上部造成的伤害。锌与CA活性密切相关, 而CA活性与净光合速率的变化并非密切相关。低锌和高锌均显著增加了‘四单19’的可溶性糖含量, 而‘牡丹9’的可溶性糖含量在缺锌与低锌处理下增加幅度并不明显, 但在高锌处理下可溶性糖含量迅速增加。低锌和高锌处理都显著降低了‘四单19’叶片的蛋白质含量, 而‘牡丹9’低锌处理下叶片可溶性蛋白含量下降并不明显, 但在高锌处理下叶片可溶性蛋白含量大幅度下降。低锌处理下, ‘四单19’的蛋白质合成受到抑制, 而游离氨基酸大量积累, 明显抑制了植株的生长; ‘牡丹9’的蛋白质和氨基酸含量变化较小。
【英文摘要】Two Zn-tolerant maize cultivars‘ Sidan 19 ’(low zinc sensitive) and‘ Mudan 9 ’(low zinc insensitive)were used as materials to investigate the effects of different Zn contents on CA activity, photosyntheticcharacteristics, soluble sugar content. The results showed that maize could transport zinc selectively. Whenzinc concentration was enough to damage seedlings, zinc absorbed by the roots reaching the above-grounddecreased to reduce harm them. CA activity and zinc supply were closely related to each other, but CA activityand net photosynthesis, were not closely related to each other. Low zinc and high zinc promoted‘ Sidan 19 ’soluble sugar

content notablely; for ‘ Mudan 9 ’, the soluble sugar content under zinc deficiency and low zinctreatment did not increase significantly, while displayed a rapid increase in high-zinc processing. Under low zincand high zinc treatment the blades protein content of ‘ Sidan 19 ’ reduced significantly. The soluble proteincontent in blades of ‘ Mudan 9 ’ reduced non-significantly under low zinc processing, and decreased sharplyundert high zinc processing. Under low zinc treatment, protein synthesis of ‘ Sidan 19 ’ was suppressed with alarge accumulation of free amino acids, which significantly inhibited the growth of the plants; while the proteinand amino acid content of ‘ Mudan 9 ’ altered a little

【题目】大豆育成品种农艺性状QTL与SSR 标记的关联分析
【中文关键词】大豆育成品种; 农艺性状; SSR 标记; 关联分析; 优良等位变异; 设计育种
【英文关键词】Released soybean cultivar; Agronomic trait; SSR marker; Association analysis; Elite allele; Breeding by design
【中文摘要】利用85个SSR 标记, 对大豆育成品种群体(190 份代表性材料) 的基因组进行扫描, 在检测群体结构基础上搜索连锁不平衡位点, 并采用TASSEL 软件的GLM方法对11 个大豆农艺性状QTL 进行关联分析。结果表明: (1) 在公共图谱上共线性或非共线性的SSR 位点组合均广泛存在连锁不平衡(LD), 但不平衡程度D ′ >0.5 的组合数只占总位点组合的1.71%, 共线位点D ′ 值随遗传距离衰减较快; (2) SSR 数据遗传结构分析表明, 育成品种群体由7 个亚群体组成, 矫正后全群体共有45个位点累计136 个位点(次) 与11 个大豆农艺性状QTL 关联, 其中22个位点(次) 与家系连锁定位的QTL 区间相重, 有43个位点(次) 2 年重复出现; (3) 一些标记同时与2 个或多个性状关联, 可能是性状相关或一因多效的遗传基础; (4) 育成品种群体关联位点与地方品种群体和野生群体只有少数相同, 群体间育种性状的遗传结构有相当大差异; (5) 发掘出农艺性状优异等位变异及其载体品种, 包括增效最大的产量等位变异 Satt347-300 (+932 kg hm － 2, 中豆26), 生物量等位变异Satt365-294(+3 123 kg hm － 2, 黄毛豆), 蛋白质含量等位变异Be475343-198 (+0.41%, 淮豆4 号), 脂肪含量等位变异Satt150-273 (+2.32%, 科丰15)等。在此基础上作了设计育种的探讨。
【英文摘要】The genotyping data of 85 simple-sequence repeat (SSR) ma rkers on released cultivar popul ation (RCP) (a representative sample with 190 accessions) were obtained and analyzed for LD of pairwise loci and population structure, and then for asso-ciation between SSR loci and 11 soybea n agronomic traits under TA SSEL GLM (general linear model) program. The results showed that: (1) LD was detected extens ively not only among syntenic markers but al so among nonsyntenic ones, while the loci D ′ >0.5 accounted for only 1.71% of the total ones. The syntenic D ′ value attenuated fastly along with the increase of genetic distance. (2) Genetic structure analysis showed that RCP was composed of seven subpopulations. The 45 SSR loci with a total of 136 loci (time) were found to be associated with 11 ag ronomic traits in the RCP. Among those, 22 loci (times) were con -sistent with mapped QTLs from family-based linkage mapping procedure and 43 loci (times) were consistently detected in two experiment years. (3) There also found a certain number of loci associated simultaneously with tw o or more traits, which might be the genetic reason of correlation among trai ts as well as the pleiotropic effects of gene(s). (4) There found only a few association loci in released cultivar population coincided with those in landrace and wild populations, indicating the large difference of ge-netic structure between the populations. (5) The elite alleles of the agronomic traits along with their carriers were detected, such as the allele Satt347-300 for largest positive yield effect (+932 kg ha － 1 for Zhongdou 26), Satt365-294 for biomass(+3 123 kg ha － 1 for Huangmaodou), Be475343-198 for protein content (+0.41% for Huaidou 4), Satt150-273 for oil content (+2.32% for Kefeng 15), and were used to illustrate their potential in breeding programs.

【题目】Characterization of intronic structures and alternative splicing in Phytophthora sojae by comparative analysis of expressed sequence tags and genomic sequences
【中文关键词】oomycete, Phytophthora sojae, intron, alternative splicing
【英文关键词】oomycete, Phytophthora sojae, intron, alternative splicing
【中文摘要】The oomycetes, a distinct phylogenetic lineage of fungus-like microorganisms, are heterokonts (stramenopiles) belonging to the supergroup Chromalveolata. Although the complete genomic sequences of a number of oomycetes have been reported, little information regarding the introns therein is available. Here, we investigated the introns of Phytophthora sojae, a pathogen that causes soybean root and stem rot, by a comparative analysis of genomic sequences and expressed sequence tags. A total of 4013 introns were identified, of which 96.6% contained canonical splice sites. The P. sojae genome possessed features distinct from other organisms at 5' splice sites, polypyrimidine tracts, branch sites, and 3' splice sites. Diverse repeating sequences, ranging from 2 to 10 nucleotides in length, were found at more than half of the intron-exon boundaries. Furthermore, 122 genes underwent alternative splicing. These data indicate that P. sojae has unique splicing mechanisms, and recognition of those mechanisms may lead to more accurate predictions of the location of introns in P. sojae and even other oomycete species.

【题目】亚洲大豆栽培品种遗传多样性、特异性和群体分化研究
【中文关键词】亚洲;大豆栽培品种;遗传多样性;遗传特异性;互补等位变异;群体分化
【英文关键词】Asia; Soybean cultivar; Genetic diversity; Genetic specifi city; Complementary alleles; Population differentiation
【中文摘要】【目的】研究亚洲大豆栽培品种地理群体的遗传多样性、特异性和群体分化。【方法】应用大豆基因组64对 SSR 分子标记技术,对亚洲 216 份栽培大豆品种遗传变异进行分析。【结果】亚洲大豆栽培品种遗传多样性丰富,地理群体(中国东北、中国黄淮、中国南方、朝鲜半岛、东南亚、南亚)间存在较多互补等位变异数,最多的在中国黄淮与南亚群体间;各地理群体拥有各自特有或特缺的等位变异。亚洲大豆全群 SSR 标记遗传距离聚类(聚成 6 类)与地理群体分类间有极显著相关性,地理分群有其相应的遗传基础。亚洲全群由 2 类血缘组成,分别占中国国内和国外 2 大类群的绝大部分;地理群体间 2 类血缘组成的差异明显。国内与国外各群体间以中国南方与东南亚群体间分化最小;国外群以东南亚与朝鲜半岛群体间分化最小;国内群以中国黄淮与中国南方群体分化最小。【结论】亚洲大豆栽培品种地理群体间具有位点和等位变异的特异性,各群体间可以相互补充的位点及其等位变异甚丰富,利用国外栽培品种可以拓宽中国品种的遗传基础。
【英文摘要】【Objective】 The present study was aimed to reveal the genetic diversity, specificity and population differentiation of soybean cultivars in Asia. 【Method】 A total of 64 simple sequence repeat (SSR) markers scattered on the genome were used to analyze the genetic variation of 216 soybean cultivars sampled from Asia. 【Result】 There was a plenty of genetic diversity in populations of soybean cultivars in Asia as well as a plenty of complementary alleles am ong geographic populations (Northeast China, China’s Huanghuai Region, Southern China, Korean Peninsula, Southeast Asia and South Asia), especially between China’s Huanghuai and South Asia population. Unique and deficient alleles in each geographi c population were detected. A significant association showed between the classification of geographic cultivar populations and clustered cultivar populations, indicating the sound genetic bases of geographic classification of the soybean cultivars. According to the model-based clustering method for u sing multi-locus data to infer population structure and assign cultivars to populations (structure analysis), two ancestry sources i n Asia were detected, with one composing the most part of Chinese cul tivar group, another composing the most part of exotic cultivar g roup. The composition of the two ancestry sources in the geographic populations differed markedly. Significant differentiation among eographic populations was found, while the least differentiation between Chinese and exotic group was in the pair of Southern China vs. Southeast Asia population, that within exotic group was in the pair of Southeast Asia vs. Korean Peninsula population , and that within Chinese group was in the pair of China’s Huanghuai and Southern China population. 【Conclusion】 Plenty of unique and deficient loci and alleles existed in each geographic population. Therefore, plenty of complementary alleles were detected betw een pairs of populations for broadening the genetic base s of the respective geographic cultivar populations.

【题目】Population genetic structure of Tetranychus urticae and tits sibling species Tetranychus cinnabarinus (Acari: Tetranychidae) in China as inferred from microsatellite data
【中文关键词】Acari: Tetranychidae; in China ; microsatellite data
【英文关键词】Acari: Tetranychidae; in China ; microsatellite data
【中文摘要】Several species of spider mites were infected with both Wolbachia and Cardinium causing reproductive abnormalities in their hosts. A PCR-based method was developed for simultaneous detection of Wolbachia and Cardinium in spider mites. Two pairs of primers were designed to amplify two DNA fragments of different length specific to wsp gene of Wolbachia and 16S rDNA gene of Cardinium respectively in a single reaction. The specificity of multiplex PCR was tested by amplifying specific DNA fragments from positive controls and confirmed by DNA sequencing of PCR product. Multiplex PCR also showed high sensitivity, which could be applied to detect the presence of very low grade of Cardinium and Wolbachia. The result of detecting spider mites collected from fields in China by multiplex PCR was identical to results by traditional PCR, which proved the feasibility and reliability of multiplex PCR.

【题目】The PsCZF1 gene encoding a C2H2 zinc finger protein is required for growth, development and pathogenesis in Phytophthora sojae
【中文关键词】PsCZF1 gene ;C2H2 zinc finger protein
【英文关键词】PsCZF1 gene ;C2H2 zinc finger protein
【中文摘要】The C(2)H(2) zinc finger proteins form one of the largest families of transcriptional regulators in eukaryotes. We identified a Phytophthora sojae C(2)H(2) zinc finger (PsCZF1), that is highly conserved in sequenced oomycete pathogens. In transformants of P. sojae containing the PsCZF1 promoter fused to the beta-glucuronidase (GUS) reporter gene, GUS activity was highly induced in the P. sojae oospore stage and upregulated after infection. To elucidate the function of PsCZF1, its expression was silenced by introducing anti-sense constructs into P sojae. PsCZF1-silenced transformants did not exhibit altered cell size or morphology of sporangia and hyphae; however, hyphal growth rate was reduced by around 50% in the mutants. PsCZF1-deficient mutants were also impaired in production of oospores, swimming zoospores and germinating cysts, indicating that the gene is involved in various stages of the life cycle. Furthermore, we found that PsCZF1-deficient mutants lost virulence on host soybean cultivars. Our results suggest that this oomycete-specific C(2)H(2)-type zinc finger protein plays an important role in growth, development, and pathogenesis; therefore, PsCZF1 might be an attractive oomycete-specific target for chemical fungicide screening.

【题目】Coleus Blumei Viroid 6 : A new member of the genus Coleviroid derived from extensive natural genome shuffling
【中文关键词】Coleus blumei;CbVd-5
【英文关键词】Coleus blumei;CbVd-5
【中文摘要】Coleus blumei can be infected by several viroids of the genus Coleviroid. One year after detecting a mixed infection of coleus blumei viroid 1 (CbVd-1) and 5 (CbVd-5) in coleus seedlings inoculated with these two viroids, we found an additional viroid-like RNA. Sequence analysis revealed a viroid of 342 nucleotides that contains the central conserved region of coleviroids and is a chimera of the left half of CbVd-3 and the right half of CbVd-5. This new viroid, tentatively referred to as coleus blumei viroid 6 (CbVd-6), appears to have arisen from a natural recombination event or genome shuffling.

【题目】GPR11, a Putative Seven-Transmembrane G Protein-Coupled Receptor, Controls Zoospore Development and Virulence of Phytophthora sojae
【中文关键词】G protein;PsGPR11
【英文关键词】G protein;PsGPR11
【中文摘要】G protein-coupled receptors (GPCRs) represent a large receptor family involved in a broad spectrum of cell signaling. To understand signaling mechanisms mediated by GPCRs in Phytophthora sojae, we identified and characterized the PsGPR11 gene, which encodes a putative seven-transmembrane GPCR. An expression analysis revealed that PsGPR11 was differentially expressed during asexual development. The highest expression level occurred in zoospores and was upregulated during early infection. PsGPR11-deficienct transformants were obtained by gene silencing strategies. Silenced transformants exhibited no differences in hyphal growth or morphology, sporangium production or size, or mating behavior. However, the release of zoospores from sporangia was severely impaired in the silenced transformants, and about 50% of the sporangia did not completely release their zoospores. Zoospore encystment and germination were also impaired, and zoospores of the transformants lost their pathogenicity to soybean. In addition, no interaction was observed between PsGPR11 and PsGPA1 with a conventional yeast two-hybrid assay, and the transcriptional levels of some genes which were identified as being negatively regulated by PsGPA1 were not clearly altered in PsGPR11-silenced mutants. These results suggest that PsGPR11-mediated signaling controls P. sojae zoospore development and virulence through the pathways independent of G protein.

【中文关键词】鲍;杂交育种;蛋白质组学;胚胎发育; 双向电泳;质谱;鲍属

【英文关键词】abalone; crossbreeding; proteomic; embryonic development; 2-DE; MALDI-TOF-TOF; hybridization; Haliotis

【中文摘要】鲍是我国重要养殖贝类,但近年来由于种质退化及环境污染的加剧,鲍的养殖面临着严重的病害威胁。杂交是目前水产生物育种中应用广泛、行之有效的育种途径之一,以培育生长迅速、抗逆性强的鲍养殖新品种为主要目的。本研究运用蛋白质组学技术方法(双向电泳、串联质谱、数据库搜索),对西氏鲍(Haliotis gigantean)与皱纹盘鲍(Halioti discus hannai)种间杂交、杂色鲍(Haliotis diversicolor)群体间杂交以及杂色鲍胚胎发育过程等的蛋白质表达进行了比较分析,目的是为杂交优势分子机理解析和杂交育种方法提供参考依据。主要结果如下:1. 鲍种间杂交子代及其亲本系谱的蛋白质组分析;2. “东优1号”杂色鲍及其亲本足部肌肉的蛋白质组学分析;3. 杂色鲍三个地理群体足部肌肉蛋白质的双向电泳研究;4.杂色鲍胚胎发育蛋白质表达。

【英文摘要】Abalone is the most important breeding species in South of China, but in recent years because of germplasm of aggravated environmental pollution and degradation, abalone farms face serious disease threat. In order to produce some faster growth and well disease-resistant aquacuture varieties, nowadays, hybridization has been used widely in aquacuture breeding. In this study, analysis of abalone hybrids and its parental lines and embryonic development using a proteomic approach. The main results are as follows:1. Pedigree analysis of abalone hybrids and its parental lines using a proteomic; 2. Genetic changes of different geographical groups H. diversicolor hybrids and its parental lines using a proteomic approachapproach; 3. Two-dimensional gel electrophoresis analysis of H. diversicolor of differentgeographical population; 4. Protein expression during the embryonic development of abalone

【题目】PsSAK1, a Stress- Activated MAP Kinaseof Phytophthora sojae, Is Required for Zoospore Viability and Infection of Soybean

【中文关键词】PsSAK1

【英文关键词】PsSAK1

【中文摘要】Mitogen-activated protein kinase (MAPK) pathways are universal and evolutionarily conserved signal transduction modules in all eukaryotic cells. In this study, PsSAK1, which encodes a stress-activated MAPK of Phytophthora sojae, was identified. PsSAK1 is highly conserved in oomycetes, and it represents a novel group of MAPK due to its pleckstrin homology domain. Reverse-

transcription polymerase chain reaction analysis showed that PsSAK1 expression was upregulated in zoospores and cysts and during early infection. In addition, its expression was induced by osmotic and oxidative stress mediated by NaCl and H(2)O(2), respectively. To elucidate the function, the expression of PsSAK1 was silenced using stable transformation of P. sojae. The silencing of PsSAK1 did not impair hyphal growth, sporulation, or oospore production but severely hindered zoospore development, in that the silenced strains showed quicker encystment and a lower germination ratio than the wild type. PsSAK1-silenced mutants produced much longer germ tubes and could not colonize either wounded or unwounded soybean leaves. Our results indicate that PsSAK1 is an important regulator of zoospore development and pathogenicity in P. sojae

To elucidate the function, the expression of PsSAK1 was silenced using stable transformation of P. sojae. The silencing of PsSAK1 did not impair hyphal growth, sporulation, or oospore production but severely hindered zoospore development, in that the silenced strains showed quicker encystment and a lower germination ratio than the wild type. PsSAK1-silenced mutants produced much longer germ tubes and could not colonize either wounded or unwounded soybean leaves. Our results indicate that PsSAK1 is an important regulator of zoospore development and pathogenicity in P. sojae

【题目】杂色鲍微卫星标记筛选、遗传连锁图谱构建

【中文关键词】杂色鲍;微卫星;遗传连锁图谱;QTL 定位;壳色;DNA 池

【英文关键词】small abalone; microsatellite; genetic linkage map; QTL mapping;
shell color; DNA pool

【中文摘要】本研究采用磁珠富集法,用14 个探针构建了杂色鲍微卫星富集文库。从文库中随机选取768 个阳性克隆进行测序,拼接得到729 个重叠群,其中656 个重叠群包含微卫星序列。利用微卫星两侧保守区域设计了583 对微卫星引物,从中筛选出退火温度在50-64°C,PCR 产物稳定扩增、条带清晰的微卫星标记308 个。随机选取其中的11 个微卫星标记用于标记质量评估,这11 个微卫星标记的PIC值在0.7276 到0.9163 之间,具有高度多态性。利用开发的308 个微卫星标记,以养殖个体♀和野生个体♂杂交F1 家系为作图群体,构建了杂色鲍的遗传连锁图谱。308 个微卫星标记中有182 个标记在亲本中具有多态性,可以用于图谱构建;采用LOD=3.5 构建杂色鲍雌雄连锁图谱,并用JoinMap 软件构建了杂色鲍的整合图谱。雌性和雄性图谱分别包括164和162 个标记,两张图谱均由16 个连锁群构成,与杂色鲍的核型2n=32 相一致。雌性连锁图谱总长度为758.3cM,平均间隔5.2cM,16 个连锁群长度从16.6cM到 81.0cM,雌性图谱的预期长度为971.3cM,图谱覆盖率为78.1%;雄性连锁图谱总长度为676.2cM,平均间隔4.5cM。雄性图谱的预期长度为867.7cM,图谱覆盖率为77.9%。利用共有标记将雌雄连锁图谱整合,整合图谱全长762.1cM,定位了175 个标记,平均间距4.6cM,图谱覆盖率80.7%。对杂色鲍作图家系的子代96 个个体进行壳长、壳宽、壳高、全湿重、壳重和肌肉重等6 个生长相关性状进行测量,并利用构建的整合图谱,对生长相关性状进行QTL 定位。检测到壳长、壳高、全湿重、肌肉重和壳重性状的推测QTL各1 个,壳宽性状没有检测到QTL。检测到的5 个推测QTL 均位于连锁群COM16上,壳长、全湿重、肌肉重和壳重的余因子均为Hdi294,可解释的表型变异分别为55.4%、56.9%、55.1%和52.0%。壳宽的余因子为Hdi133,可解释的表型变异为74.9%,全湿重、肌肉重和壳重定位在相同区域。在308 个微卫星标记中,有12 个标记在两个壳色DNA 池PCR 扩增产物中片段范围有差异,经过在32 个普通壳色和32 个黄色壳色杂色鲍个体的PCR 扩增反应后发现,标记Hdi3-119 标记在所有的黄色壳色个体中含有381bp 特殊片段,而在普通壳色个体中不含此片段,另外选取5 个家系共计384 个个体的验证结果也证实了Hdi3-119 标记为壳色紧密连锁的微卫星标记。微卫星标记Hdi3-119定位在杂色鲍整合图谱的第一连锁群14.9cM 位置上,其相邻标记为aba100 和Hdi299,标记aba100 在整合图谱上与Hdi3-119 的距离是1.4cM,与Hdi299 的距离是2.9cM。_____采用退火温度在55-60°C之间的微卫星标记264 个,用于杂色鲍“ 东优1 号 ”新品种及其配套系亲本—台湾群体(母本)和日本群体(父本)的鉴别,采用DNA 池法和个体PCR 法结合,筛选出1 个可以准确、客观的鉴别杂色鲍“ 东优1 号 ”杂交配套系的微卫星标记,标记名称为Hdi3-52。标记Hdi3-52 在“ 东

优1号”实验组特异性等位基因为223bp片段,在台湾群体特异性等位基因为大于258bp片段,在日本群体特异性等位基因为195bp片段。

【英文摘要】Small abalone, Haliotis diversicolor is naturally distributed along the coastalwaters of East Asia: from Japan to the Philippines. It is an economically importantmaricultured species in southern China and Taiwan. The molecular genetic likage mapof small abalone is essential for the identification and location of quantitative trait loci(QTL) as well as for the marker-assisted selection program, which has greatusefulness in enhancing breeding efficiency in the aquaculture important species. Thepurpose of this study includes five aspects. First aspect is to isolate lots ofmicrosatellite markers by constructing a microsatellite-enrichment library. Sencondaspect is to construct the genetic linkage maps for small abalone based onmicrosatellite markers. Third aspect is to localize some growth-related QTLs bycomposite interval mapping. Four aspect is to isolate the shell color-linked marker toimprove the economic value of small abalone. The last aspect is to distinguish threegroups to protect“ Dongyou 1 # ” new species.Small abalone genomic DNA library was constructed and included all the possiblecombinations of dimers and trimers probes. The dimers contain (AC)12, (AT)12,(AG)12 and (GC)12 probes, and the trimers include (AAT)8, (AAC)8, (AAG)8, (ATC)8,(ACG)8, (ACT)8, (AGC)8, (GCC)8, (AGG)8 and (ACC)8 probes. A total of 768 cloneswere selected from this library and 729 contigs were generated after analyzed byPhred/Phrap/Consed software. Five hundred and eighty-three pairs of primers weredesigned using the software PRIMER PREMIER 3.0. A total of 308 SSR markerswere selected from this set of primers based on amplification efficiency and stability.Eleven of these loci were tested on 22 individuals from two different geographicpopulations, and all loci were highly polymorphic. These polymorphic markers willbe used to analyse population structure, genetic diversity and construct a geneticlinkage map.Genetic linkage maps for small abalone were constructed using a total of 308 SSR(simple sequence repeat) markers. Segregation data on 96 progeny was genotypedusing a pseudo-testcross strategy. Sixteen linkage groups were identified in bothfemale and male maps, consistent with the haploid chromosome number. The femalelinkage map covered 758.3 cM, with an average interval of 5.2 cM. The male linkagemap spanned a total genetic distance of 676.2 cM, with an average interval of 4.5 cM.An integrated map was constructed by incorporating the homologous parental linkagegroups, resulting in 16 linkage groups with a total of 762.1 cM. Genome coverage ofthe integrated linkage map was approximately 80.7%.Shell length, shell width, shell height, total weight, muscle weight and shellweight are important growth-related traits in small abalone. On the basis of theintegrated map, we located five QTLs of growth-related traits. QTLs affecting shelllength, shell width, shell height, total weight, muscle weight and shell weight wereidentified on a genome-wide scale. The genome-wide LOD significance thresholdswere 5.8, 5.4, 5.2, 5.3, 5.0, and 4.9 for shell length, shell width, shell height, totalweight, muscle weight and shell weight, respectively. We didn’t identify anysignificant QTL, but identify five suggestive QTLs, each of the shell length, shellheight, total weight, muscle weight and shell weight has one suggestive QTL. Thesefive QTLs were located on the same linkage group COM16. QTLs for total weight,muscle weight and shell weight were scattered as the same region.Small abalone has two shell colors, one is brown which is the nomal color, anotheris yellow which is an unusual color. We find one microsatellite marker (Hdi3-119) has381 bp unique allele in the yellow shell color small abalone. Hdi3-119 was located onthe linkage group COM1 in the integrated map.Three DNA pools of small abalone were mixed by Taiwan population, Japanesepopulation and“ Dongyou 1 # ”, respectively. 264 microsatellite markers were used inthis study, one microsatellite loci named Hdi3-52 can distinguish the three smallabalone groups (Taiwan population, Japanese population and“ Dongyou 1 # ”). Eachof the three groups has its own private allele.

【题目】A test of Baker‘s Law: breeding systems of invasive species of Asteraceae in China"

【中文关键词】invasive species ;Asteraceae

【英文关键词】invasive species ;Asteraceae

【中文摘要】Invasive alien plant species are frequently characterized by a high fecundity. However, because suitable pollinators and/or mates may be absent in the new range, it is not clear how they achieve high seed production. According to Baker’s Law, species capable of uniparental reproduction are more likely to establish after long-distance dispersal than species that rely on suitable mates and pollinators. To test whether self-compatible species, and particularly species capable of autonomous seed set, are more likely to establish

and spread, we experimentally assessed the breeding systems of 12 species of Asteraceae that are invasive in China. Among these 12 species of Asteraceae, the percentages of self-compatible species (66.7%) and species capable of autonomous seed set (83.3%), which included self-fertilizing and apomictic species, were significantly larger than expected from the percentages of such species in global data sets of Asteraceae (36.8% and 46.0%, respectively). Furthermore, the number of Chinese provinces in which the invasive alien species occur was significantly positively correlated with the proportion seed set on bagged capitula (i.e. with the degree of autonomous seed set). Among 36 species of Asteraceae that are invasive in China and for which we found breeding-system data in the literature, we also found a higher than expected percentage of self-compatible species (65.7%), and that these self-compatible species are more widespread in China than self-incompatible species. These results support the predictions of Baker ' s Law that self-compatible species, and particularly those capable of autonomous seed production, are more likely to establish and spread in a new range. Therefore, breeding systems of plants should be included as one of the key elements in risk assessment protocols for plant invasiveness.

【题目】First report of coleus blumei viroid 2 from China.

【中文关键词】First Report ; Coleus blumei viroid 2 ; Commercial Coleus in China
【英文关键词】First Report ; Coleus blumei viroid 2 ; Commercial Coleus in China

【中文摘要】Coleus (Coleus blumei) is an ornamental plant that is susceptible to infection by several viroids of the genus Coleviroid, which is a member of the family Pospiviroidae. Coleus blumei viroid (CbVd) -1 was first reported in commercial yellow coleus fields in Brazil in 1989 (1). In addition, CbVd-2, CbVd-3, and CbVd-4 have only been detected from coleus in Germany in 1996 (4). CbVd-5 and CbVd-6 were recently identified in China (2). In March 2010, leaves were collected from 50 symptomless coleus plants from a commercial nursery in Hainan Province, China. Total RNA was extracted from the leaves (3). Reverse transcription (RT)-PCR using CbVd-2 specific primers (forward: 5 ′ -AGCTTACCTGGGTTCCCT-3 ′ and reverse: 5 ′ -CTCTCCTCTATTTACTCTCTTCTC-3 ′) corresponding to positions 76 to 93 and 52 to 75 on the CbVd-2 reference sequence, respectively (GenBank Accession No. NC003682). Amplification of a 301-bp product was obtained from one sample. This PCR product was then cloned into pMD18-T (Takara, Dalian, China). Twelve positive clones were sequenced and the results were subjected to BLAST analysis. Sequence analysis showed that two sequences (GenBank Accessions Nos. HQ727542 and HQ727544) shared 99% identity with the reference sequence of CbVd-2 (NC003682), and four sequences (HQ727541, HQ727543, HQ727545 and HQ727547) had 99.34% identity with the reference sequence of CbVd-2 (NC003682). The proposed secondary structures of these variants have approximately 75% paired nucleotides. Results suggested the presence of CbVd-2, which is a member of the Coleviroid genus, Pospoviroidae family. To our knowledge, this is the first report of CbVd-2 from commercial coleus in China.

【题目】杂色鲍三个免疫相关基因的克隆及表达分析

【中文关键词】杂色鲍;SaGABARAP;SaEGFR;SaUPR;免疫防御

【英文关键词】Haliotis diversicolor; SaGABARAP; SaEGFR; SaUPR; Immune Defense

【中文摘要】杂色鲍(Haliotis diversicolor)是我国南方海域水产养殖业中重要的经济贝类之一,但自从上世纪90 年代以来,养殖杂色鲍陆续暴发大规模病害,成活率急剧下降,给养殖业造成了巨大的经济损失,严重影响了杂色鲍养殖业的健康可持续发展。引起杂色鲍大规模死亡的原因是多方面的,最主要的是养殖环境恶化、杂色鲍种质衰退以及抗病力下降。遗传改良和培育抗病优良品种、开发免疫增强剂等是解决目前杂色鲍养殖业面临病害问题的必然选择,而所有这些措施的基础都有赖于对杂色鲍免疫防御机制有深刻的了解。本研究对杂色鲍天然免疫系统中3 个重要的功能基因进行克隆及表达分析,旨在为深入了解鲍免疫防御分子机制提供新资料。本研究的主要结果如下:1. 克隆获得了 GABAA 受体相关蛋白(GABAA receptor-associated protein,GABARAP)、表皮生长因子受体(Epidermal growth factor receptor, EGFR)和功能未预测受体(Unpredicted receptor, UPR)3 个基因的全长cDNA,分别命名为SaGABARAP、SaEGFR 和SaUPR。SaGABARAP 基因cDNA 全长为963bp,354bp 的ORF 编码117 个氨基酸,有一个自吞噬蛋白Atg8 结构域。SaEGFR 基因cDNA 全长为2620bp,2373bp 的ORF 编码790 个氨基酸,有两个EGF 受体L 结构域。SaUPR 基因cDNA 全长为1779bp,1641bp 的ORF 编码546 个氨基酸,有一个清道夫受体半胱氨酸丰富结构域、两个表皮生长因子结构域和一个透明带结构域,推测可能是个膜受体。2. 克隆获得了SaGABARAP 和SaUPR 两个基因的基因组DNA。SaGABARAP基因组DNA全长为4352bp,包含3 个外显子和2 个内含子。SaUPR基因组DNA 全长为7517bp,包含7 个外显子和6 内含子。3. 揭示了 SaGABARAP、SaEGFR 和SaUPR 在杂色鲍各组织和胚胎幼体发育时期的表达情况。这三个基因在检测的各组织和胚胎幼体发育时期均有表达,而且都在肝胰脏中表达水平最高,SaGABARAP 在原肠胚中的表达水平最高,SaEGFR 和SaUPR 在囊胚中的表达水平最高。所有这些暗示着这三个基因可能在杂色鲍生命过程中发挥着广泛而重要的作用。4. 揭示了杂色鲍在溶藻弧菌感染后血细胞和肝胰脏中三个基因的表达情况。弧菌感染后,SaGABARAP 基因在血细胞和肝胰脏中的表达量均发生显著提高,SaEGFR 基因在血细胞和肝胰脏中的表达水平均发生极显著提高,而SaUPR 基因在血细胞中的表达水平发生显著提高,但在肝胰脏中并没有显著提高。所有这些暗示着这三个基因可能在杂色鲍免疫防御体系中发挥着重要作用,它们表达量上升对于鲍机体清除病原菌感染可能是有益的。

【英文摘要】Small abalone Haliotis diversicolor is one of the most commercially importantmolluscs for aquaculture in China southern sea area. But since 1990s, abaloneaquaculture has been undergoing large-scale disease and low rate of growth andsurvival. So it has brought massive economic losses to aquaculture, and severelyaffected the healthy and continuable development of small abalone aquaculture.There are several aspects that trigger small abalone mass mortality, but the mostimportant are the worse suivival environment, small abalone strain degeneration anddeclining disease resistance. There are necessary ways to solve current

diseaseproblems of small abalone aquaculture, such as genetic improvement strain, breedingdisease-resistant abalone and development immunity boosting agents, but thefoundation of all is dependent on the deep understanding of small abalone immunedefense mechanism. This study focused on cloning and expression analysis of threeimportant functional genes involving in small abalone innate immune system,aiming to provide new information for further understanding of the immune defensemolecular mechanism of small abalone. The main results are as follows:1. This study cloned full-length cDNA of GABAA receptor-associated protein(GABARAP), epidermal growth factor receptor (EGFR) and unpredicted receptor(UPR), we named SaGABARAP, SaEGFR and SaUPR. The full-length cDNA ofSaGABARAP is 963bp, with a 354bp ORF coding 117 aa, and the deduced proteinhas an Autophagy protein Atg8 ubiquitin-like domain. The full-length cDNA ofSaEGFR is 2620bp, with a 2373bp ORF coding 790 aa, and the deduced protein hastwo EGF receptor L domains. The full-length cDNA of SaUPR is 1779bp, with a1641bp ORF coding 546 aa, and the deduced protein has a Scavenger receptorCys-rich (SRCR) domain, and we predicted it is a menbrane receptor.2. This study cloned genomic DNA of SaGABARAP and SaUPR.SaGABARAP genomic DNA is 4352bp, and comprises 3 exons and 2 introns, whileSaUPR is 7517bp, and 7 exons and 6 introns.3. This study analysed the expression of these three genes in several smallabalone tissues and embryonic and larval development stages. They were allconstitutively expressed in all tested tissues and embryonic and larval developmentstages, and the highest expression level was in hepatopancreas, while SaGABARAPhad the highest expression level in gastrula, SaEGFR and SaUPR in morula. Allimplied that these three genes would play a wide and vital role in small abalone lifeprocess.4. This study analysed the expression of these three genes in hemocytes andhepatopancreas after abalone were infected with Vibrio alginolyticus. After infection,SaGABARAP expression level in hemocytes and hepatopancreas was significantlyup-regulated, SaEGFR expression level in hemocytes and hepatopancreas was verysignificantly up-regulated, while SaUPR expression level in hemocytes wassignificantly up-regulated, but not significantly up-regulated in hepatopancreas. Allimplied that these three genes might play an important role in the immune defensesystem of small abalone, and their enhanced expression might be benificial forclearing pathogens in abalone.

【题目】The essential role of GhPEL gene, encoding a pectate lyase, in cell wall loosening by depolymerization of the de-esterified pectin during fiber elongation in cotton.

【中文关键词】GhPEL gene; Cotton (Gossypium hirsutum); Pectate lyase; Fiber elongation; Cell wall; Pectin
【英文关键词】GhPEL gene; Cotton (Gossypium hirsutum); Pectate lyase; Fiber elongation; Cell wall; Pectin

【中文摘要】Cotton fiber elongation, largely achieved by cell wall loosening, is an important stage during cotton fiber development. In this present research, a fiber preferential cDNA encoding a pectate lyase (PEL) which could exclusively degrade the de-esterified pectin was isolated from a cotton (Gossypium hirsutum) fiber cDNA library. Subsequently, the corresponding PEL genes were isolated from four different cotton species and characterized. In vitro enzyme assays indicated that GhPEL really exhibited cleavage-activity against de-esterified pectin. The temporal-spatial expression analyses revealed that the GhPEL gene was preferentially expressed in fibers at 10 days-post anthesis (DPA). Antisense GhPEL transgenic cotton plants were generated by Agrobacterium-mediated transformation. Six homozygous lines, each with one or two copies of the transgene inserted as determined by southern blot analysis of the NPTII gene, were selected for further functional analysis. The GhPEL expression during fiber elongation in these transgenic lines was significantly suppressed in various degrees. Furthermore, the reduction of GhPEL enzymatic activity by decreasing GhPEL transcripts severely affected the degradation of de-esterified pectin in primary cell walls of transgenic cotton fibers, which consequently blocked cell wall loosening in early fiber development. Ultimately, the fiber elongation of all these transgenic lines was repressed. These results suggested that GhPEL may play an important role in the process of normal fiber elongation in cotton.

【题目】EST-SSR Sequences Revealed the Relationship of D Genome in Diploid and Tetraploid Species in Gossypium.

【中文关键词】Gossypium; Cotton; EST-SSR; D-genome; Diploid; Tetraploid; Genetic relationship

【英文关键词】Gossypium; Cotton; EST-SSR; D-genome; Diploid; Tetraploid; Genetic relationship

【中文摘要】Tetraploid cotton species included two subgenomes, named as A-subgenome and D-subgenome, respectively. Prior to this study, the D-subgenome donor in tetraploid cotton species remained elusive. In a previous study, simple sequence repeats developed from expressed sequence tags (EST-SSRs) of G. raimondii was found to possess a high polymorphic frequency between G. hirsutum and G. barbadense [W.Z. Guo, C.P. Cai, C.B. Wang, Z.G. Han, X.L. Song, K. Wang, X.W. Niu, C. Wang, K.Y. Lu, B. Shi,T.Z. Zhang, A microsatellite-based, gene-rich linkage map reveals genome structure, function, and evolution in Gossypium, Genetics 176 (2007) 527-541]. We questioned the role of the D-genome cotton species in the evolution of tetraploid cotton. In this paper, 14 EST-SSR primer pairs from G. raimondii were used to amplify 23 species in Gossypium. In total, 438 amplicons were cloned, sequenced and analyzed. A phylogenetic tree of 13 D-genome diploid species and 8 AD-genome tetraploid species was constructed based on the combined simple sequence repeat (SSR) flanking sequence data. The results showed that 13 D-genome species were congruent with Fryxell's subsection taxonomy. The relationship between D-subgenome tetraploid species and D-genome diploid species indicated that G. raimondii is the sole D-genome donor of all tetraploid species. (c) 2008 Elsevier Ireland Ltd. A phylogenetic tree of 13 D-genome diploid species and 8 AD-genome tetraploid species was constructed based on the combined simple sequence repeat (SSR) flanking sequence data. The results showed that 13 D-genome species were congruent with Fryxell's subsection taxonomy. The relationship between D-subgenome tetraploid species and D-genome diploid species indicated that G. raimondii is the sole D-genome donor of all tetraploid species. (c) 2008 Elsevier Ireland Ltd. 【题目】Effect of H2O2 on Fiber Initiation Using Fiber Retardation Initiation Mutants in Cotton (Gossypium hirsutum).
【中文关键词】Cotton fiber initiation; H2O2; Retardation development; RT-PCR; SEM
【英文关键词】Cotton fiber initiation; H2O2; Retardation development; RT-PCR; SEM
【中文摘要】Single-celled fibers initiate at anthesis from cotton seed epidermal cells of normal developmental cotton cultivars; however, fiber initiation is retarded in some cotton fiber mutants. In this study, the relationship between genes associated with fiber initiation retardation and fiber initiation development was investigated using three cotton fiber developmental mutants: recessive naked seed n2; dominant naked seed N1; and Xinxiangxiaoji Linted-Fuzzless Mutant (XinFLM); with genetic standard line TM-1 (TM-1) as control. Retardation during fiber initiation development was observed in N1 and XinFLM by scanning electron microscope (SEM) analysis. Reverse transcription-polymerase chain reaction (RTPCR) analysis of genes related to the fiber initiation development showed that the expression of GhEXP1 and GhMYB25 was lower in N1 and XinFLM than in TM-1 and n2, however, the expression of Gh7TG1 and GhTTG3 in XinFLM and n2 was higher than in TM-1 and N1. In vivo and in vitro treatments on ovules demonstrated that 30% hydrogen peroxide (H2O2) could prevent fiber initiation retardation in XinFLM, but no evident effect on N1. To further confirm the relationship between gene expression and the effects of H2O2 in XinFLM, qRT-PCR analysis of four differentially expressed genes was performed using -1 d post-anthesis (DPA) ovules of XinFLM treated for 24 and 48 h with 30% H2O2 and H2O, respectively, with 0 and 1 DPA untreated ovules from XinFLM and TM-1 as control. The results showed that the expression of GhMYB25 and GhEXP1 showed significant difference in XinFLM after 1 DPA ovule treated for 24 h relative to the untreated or H2O-treated ovules, with the expression of GhMYB25 increased significantly and that of GhEXP1 decreased. This implied that H2O2 might be one of the upstream signal molecules affecting the expression of GhMYB25 and GhEXP1 genes. The fiber initiation retardation in XinFLM might be related to the production of reactive oxygen species (ROS). (C) 2009 Elsevier GmbH. All rights reserved.

【题目】Molecular cloning and localization of a novel cotton annexin gene expressed preferentially during fiber development.
【中文关键词】GhFAnnx; Fiber; Cloning; Expression; Localization; Cotton
【英文关键词】GhFAnnx; Fiber; Cloning; Expression; Localization; Cotton
【中文摘要】Annexins constitute a family of multifunction and structurally related proteins. These proteins are ubiquitous in the plant kingdom, and are important calcium-dependent membrane-binding proteins that participate in the polar development of

different plant regions such as rhizoids, root caps, and pollen tube tips. In this study, a novel cotton annexin gene (designated as GhFAnnx) was isolated from a fiber cDNA library of cotton (Gossypium hirsutum). The full-length cDNA of GhFAnnx comprises an open reading frame of 945 bp that encodes a 314-amino acid protein with a calculated molecular mass of 35.7 kDa and an isoelectric point of 6.49. Genomic GhFAnnx sequences from different cotton species, TM-1, Hai7124 and two diploid progenitor cottons, G. herbaceum (A-genome) and G. raimondii (D-genome) showed that at least two copies of the GhFAnnx gene, each with six exons and five introns in the coding region, were identified in the allotetraploid cotton genome. The GhFAnnx gene cloned from the cDNA library in this study was mapped to the chromosome 10 of the A-subgenome of the tetraploid cotton. Sequence alignment revealed that GhFAnnx contained four repeats of 70 amino acids. Semi-quantitative reverse transcriptase-polymerase chain reaction revealed that GhFAnnx is preferentially expressed in different developmental fibers but its expression is low in roots, stems, and leaves. Subcellular localization of GhFAnnx in onion epidermal cells and cotton fibers suggests that this protein is ubiquitous in the epidermal cells of onion, but assembles at the edge and the inner side of the apex of the cotton fiber tips with brilliant spots. In summary, GhFAnnx influences fiber development and is associated with the polar expansion of the cotton fiber during elongation stages.

【题目】Mining, characterization, and exploitation of EST-derived microsatellites in Gossypium barbadense.
【中文关键词】Gossypium barbadense; EST-SSRs; characterization; polymorphism; genetic map
【英文关键词】Gossypium barbadense; EST-SSRs; characterization; polymorphism; genetic map
【中文摘要】Simple sequence repeats (SSRs) have been widely applied as molecular markers in genetic studies. However, the number of expressed sequence tags (ESTs) and SSR markers from Gossypium barbadense is fewer than those from other cotton species. In this study, EST-SSR distribution from G. barbadense was characterized and new G. barbadense-derived EST-SSR markers were determined on the basis of the ESTs obtained by randomly sequencing 2 cDNA libraries associated with fiber development in G. barbadense. By mining 9697 non-redundant ESTs, a total of 638 SSR loci derived from 595 ESTs were observed. In G. barbadense, the frequency of ESTs containing SSRs was 6.13%, with an average of 1 SSR in every 10.4 kb of EST sequence. Furthermore, trinucleotide was found to be the most abundant repeat type among 2-6-nucleotide repeat types. It accounted for 26.6% of the total, followed by the hexanucleotide (26.0%) and pentanucleotide repeats (25.9%). Among all the repeat motifs, (AAG)(n) accounted for the highest proportion. EST-SSR primer pairs were developed using the Primer3 program, and the redundant primers were removed using the virtual PCR approach. As a result, 380 non-redundant EST-SSR primer pairs were developed and used to detect polymorphisms between the mapping parents G. hirsutum 'TM-1' and G. barbadense 'Hai7124' for constructing linkage groups in cultivated allotetraploid cotton. Out of these, 98 (25.8%) primer pairs detected polymorphisms. Finally, 95 polymorphic loci from 82 primer pairs were integrated into the backbone genetic map; of these, 42 were mapped into the A subgenome and 53 into the D subgenome. The

present work provided the foundation for constructing saturated genetic maps and conducting comparative genomic studies on different cotton species.

【题目】渝棉1号优质纤维QTL的标记与定位

【中文关键词】陆地棉; 纤维品质; QTLs; 分子标记

【英文关键词】Upland cotton; Fiber quality; QTLs; Molecular marker

【中文摘要】利用陆地棉遗传标准系TM-1和优质品种渝棉1号组建了(TM-1×渝棉1号)F2和F2:3分离群体。通过5 544对SSR引物对亲本进行筛选,获得178个多态性标记,用其中138个构建了总长为959.7 cM的遗传图谱,覆盖棉花基因组的19%。应用复合区间作图法分析了该组合的F2单株和F2:3家系纤维品质性状,共检测到12个纤维品质数量性状基因座(QTL),包括1个纤维长度的、4个纤维强度的、3个马克隆值的、3个整齐度的和1个伸长率的,分别解释各性状表型变异的6.1%、5.31%~14.62%、7.88%~19.17%、7.4%~11.71%和8.26%。研究还发现Chr.23和Chr.24是优质纤维QTLs的富集区。

【英文摘要】Cotton fiber is one of known natural resources comprising the highest purity cellulose.It plays an important role in the textile industry worldwide.With acceleration of spinning speeds and improvement of people ’s living level,the demand of improving cotton fiber qualities is getting stronger and stronger. Using molecular marker linked tightly with main QTL of super quality to make marker-assisted selection is the most direct and effective method to improve fiber quality of commercial cultivars quickly.In this paper,a genetic linkage map was constructed by the F2 segregation population derived from a cross between Yumian 1,a high quality cotton cultivar,and TM-1,a genetic standard line.We identified 178 polymorphic loci with 5 544 pairs of SSR primers.The genetic map with 138 loci was constructed,which had a whole length of 959.7 cM and covered 19% of the whole cotton genome.Moreover,the fiber characteristics of the F2 plants and the F2:3 family lines were analyzed by composite interval mapping(CIM) and 12 putative quantitative trait loci(QTLs) were detected for 5 traits,1 for fiber length,4 for fiber strength,3 for fiber fineness,3 for fiber uniformity and 1 for fiber elongation.These QTLs explained their corresponding phenotypic variations with 6.10%,5.31%14.62%,7.88%19.17%,7.40%11.71%,and 8.26%,respectively.Many QTLs associate with fiber quality located in Chromosome 23 and Chromosome 24 through chromosome tagging analysis combining with different elite fiber lines in the lab.The result provides references for utilizing reasonably Yumian1 in cotton breeding improvement.

【题目】Detection of Phytophthora melonis in samples of soil, water, and plant tissue with polymerase chain reaction
【中文关键词】molecular detection, Phytophthora melonis , real-time quantitative polymerase chain reaction
【英文关键词】molecular detection, Phytophthora melonis , real-time quantitative polymerase chain reaction
【中文摘要】A polymerase chain reaction (PCR) assay for the detection of Phytophthora melonis, the causal agent of phytophthora blight of cucumber, was developed. PCR primers specific to P. melonis (Pm1 and Pm2) were designed using sequences of the internal transcribed spacer (ITS) of nuclear ribosomal DNA. More than 115 isolates representing 26 species of Phytophthora and 29 other species of pathogens were used to test the specificity of the primers. PCR amplification with these primers resulted in a product of ca 545 base pairs exclusively for isolates of P. melonis. The detection sensitivity with P. melonis primers was 100 fg of genomic DNA. A nested PCR procedure with DC6 and ITS4 as first-round primers, followed by Pm1 and Pm2 primers, increased detection sensitivity 1000-fold to 100 ag. With nested PCR, the detection sensitivity for the soil pathogens was 10 zoospores in 0.5 g of artificially inoculated soil. PCR with Pm1 and Pm2 was also used to detect P. melonis in naturally infected cucumber tissue, soil, and irrigation water. Real-time fluorescent quantitative PCR assays were developed to detect and monitor the pathogen in plant samples. The PCR-based methods developed could simplify both plant disease diagnosis and pathogen monitoring as well as help guide plant disease management.

【题目】Rapid Detection of Phytophthora nicotianae in Infected Tobacco Tissues and Soil Samples Based on Its Ypt1 gene
【中文关键词】Phytophthora nicotianae, molecular detection, Ypt1 gene, PCR assay
【英文关键词】Phytophthora nicotianae, molecular detection, Ypt1 gene, PCR assay
【中文摘要】This paper describes the development of a polymerase chain reaction (PCR) assay for the detection of Phytophthora nicotianae, the causal agent of Phytophthora blight of tobacco and other plants. The PCR primers were designed based on a Ras-related protein (Ypt1)gene, and 115 isolates representing 26 species of Phytophthora and 29 fungal species of plant pathogens were used to test the specicity of the primers. PCR amplication with species-specic (Pn) primers resulted in a product of 389 bp only from isolates of P. nicotianae.The detection sensitivity with Pn primers was 1 ng of genomic DNA. Using Ypt1F Ypt1R as rst-round amplication primers, followed by a second round using the primer pair Pn1 Pn2, a nested PCR procedure was developed, which increased the detection sensitivity 100-fold to 10 pg. PCR with the Pn primers could also be used to detect P. nicotianae from naturally infected tobacco tissues and soil. The PCR-based methods developed here could simplify both plant disease diagnosis and pathogen monitoring as well as guide plant disease management.

【题目】陆地棉优质纤维QTL的分子标记筛选及优质来源分析。
【中文关键词】陆地棉; 纤维品质; QTL; 来源
【英文关键词】Gossypium hirsutum; Fiber quality; QTL; Source
【中文摘要】利用陆地棉优质品系7235、渝棉1号做亲本,以7235×渝棉1号的F2与F2:3分离群体为材料,开展不同来源棉花高强纤维QTL微卫星标记筛选,为进一步进行优质纤维QTL聚合育种提供基础。通过5514对SSR引物对亲本进行多态性筛选,获得117个多态性标记,用其中80个标记构建了总长为1147.8cM的遗传图谱;应用复合区间作图法分析了该组合的F2单株和F2:3家系纤维品质性状,共检测到36个纤维品质数量性状基因座(QTL),其中与纤维长度、比强度、细度、伸长率及整齐度相关的QTL各6、8、7、8和7个,分别解释各性状表型变异的3.4%~14.4%、5.0%~42.4%、6.5%~11.7%、5.1%~19.4%和6.9%~14.0%。通过分析来源于7235和渝棉1号高强QTL的染色体分布,表明两亲本在D7、D8、D9染色体上都存在控制纤维比强度的QTL,其中存在于D7和D8染色体上来自双亲的QTL紧密连锁,成簇分布在染色体上的一定区间内。而在D7和D9染色体上也发现双亲完全相同的优质QTL,其优质供体可能来自陆地棉优质品系PD4381。进一步分析了获得的QTL在聚合育种中的应用潜力。

【英文摘要】With the development and application of molecular biology technology in recent years,several genetic maps developed from different combinations have been constructed and lots of QTL controlling fiber quality or yield components detected,which makes the breeding procedure more effective,immediate and time-saving.In this paper,both F2 and F2:3 populations were constructed using two elite upland cotton (Gossypium hirsutum L.) strains (variety),7235 and Yumian 1 as parents.Linkage analysis with SSR molecular markers revealed that 80 loci were mapped into 19 linkage groups that covered 1 147.8 cM genetic distance.A total of 36 QTLs were detected by composite interval mapping method,including 6 for fiber length,8 for fiber strength,7 for micronaire value,8 for fiber elongation and 7 for fiber uniformity;and explained 3.4% – 14.4%,5.0% – 42.4%,6.5% – 11.7%,5.1% – 19.4%,and 6.9% – 14.0% of the corresponding phenotypic variations,respectively.Analysis of QTL distribution indicated that D7,D8,and D9 chromosomes were enriched with QTLs controlling fiber strength in both parents,among them those existed in D7 and D8 chromosomes were closely linked and two QTLs controlling fiber strength located respectively in D7 and D9 chromosomes were in the complete same position,which could be related with that both 7235 and Yumian 1 bear the pedigree of elite fiber accession PD4381.The utilization potential of the QTL of super quality in the pyramiding breeding was also discussed.

【题目】AutoSSR: Automatic Software for SSR Analysis from Large-Scale EST Sequences.
【中文关键词】简单序列重复; 表达序列标签; 发掘; 软件
【英文关键词】simple sequence repeats; expressed sequence tags; distribution; software
【中文摘要】为从大量的序列中快速发掘和利用简单序列重复(微卫星,SSRs),开发了一个软件工具——AutoSSR。该软件能够从一个包括大量FASTA格式的序列文件中发掘SSR,并分析不同SSRs类型的分布状况。与已开发的类似软件相比,该软件可以不受序列数量和不同系统平台的限制,高效、快速完成SSR信息的搜索和分析。利用该软件对GenBank上释放的来源于棉花、苹果和水稻的DNA序列进行了SSR发掘,得到了36000个SSRs。其中,对来源于棉花的SSRs信息,进一步利用Primer 3软件开发了位点特异性引物,为棉花基因组分析奠定了基础。
【英文摘要】Microsatellites,also known as simple sequence repeats(SSRs),are repeated small sequence motifs that are highly polymorphic and abundant in the genomes of eukaryotes.We have created a software tool,AutoSSR,for quickly detecting simple sequence repeats from a large number of sequences.The software can detect SSRs from one file,including large number of FASTA-formatted sequences,and analyze the distributions of different SSR types.Importantly,this tool is not restricted to sequence numbers and different system platforms with high efficiency and vast amounts of information.We have applied this tool for the discovery of SSRs within DNA sequences publicly released in GenBank in Gossypium,Malus Pumila and Oryza sativa L.,in which we detected over 36000 SSRs.Of the identified SSRs,we parsed information Gossypium to Primer 3 software for designing locus-specific primers and applications in genomics analysis.

【中文摘要】以14个纤维品质差异的棉花品种(或品系)为材料,研究10个纤维发育相关基因时空表达变化与纤维品质的关系,为阐明棉纤维发育相关基因与纤维品质形成关系提供理论基础。利用实时荧光定量PCR技术检测10个基因在14个供试品种(或品系)不同纤维发育时期的相对表达量,结果表明,虽然遗传背景完全不同,但它们具有某些共同表达特征。GhExp1、GhCIPK1、GhSus1、GhSusA1和GhPL这5个基因都是在纤维伸长期优势表达;GhACT1、GhRacA和GhRacB是在纤维伸长前期和次生壁加厚期高表达;而GhCelA1和GhcelA3是在纤维伸长后期和次生壁加厚期优势表达。这些基因表达谱与纤维品质关联分析显示,GhRacA在23DPA高表达且表达量与纤维品质显著正相关,其余基因在低表达时其表达量与纤维品质呈显著性相关,而在高表达时其表达量与纤维品质无相关性。GhExp1在20DPA的表达量与纤维比强度和整齐度呈显著负相关,与伸长率呈极显著正相关;GhPL在23DPA的表达量与纤维长度呈显著负相关;GhRacA在5DPA和23DPA的表达量均与伸长率呈极显著正相关;GhRacB在10DPA的表达量与长度和整齐度呈显著负相关;GhCelA1基因在5DPA的表达量与纤维长度呈显著正相关,与马克隆值呈显著负相关,在10DPA的表达量与马克隆值呈显著正相关,与伸长率达到极显著正相关,与比强度呈显著负相关,与长度和整齐度呈极显著负相关;GhCIPK1、GhACT1、GhSus1、GhSusA1和GhCelA3这5个基因在纤维发育各时期的表达量与纤维品质各指标未检测到相关性。

【英文摘要】Ten genes expressed preferentially in fiber development period reported previously and 14 cotton cultivars (strains) with distinctly different fiber quality were selected in this paper. To test the relative expression values of the genes in six different fiber developmental stages, 0 day post anthesis (DPA), 5DPA, 10DPA, 15DPA, 20DPA, 23DPA, by real-time quantitative RT-PCR (qRT-PCR), and the data of fiber qualities from 14 cotton varieties (strains). The expression profile showed that GhExp1, GhCIPK1, GhSus1, GhSusA1, and GhPL genes were expressed preferentially during fiber elongation; GhACT1, GhRacA, and GhRacB genes all had high expression level in earlier stage of fiber elongation and the thickening period of secondary cell wall. Two cellulose synthase genes (GhCelA1 and GhCelA3) were expressed predominantly during late stage of fiber elongation and the thickening period of secondary cell wall. For most genes, the expression value in low expression level period had significant correlation with fiber quality, while no significant correlation was detected in preferential expression stage of these genes with an exception of GhRacA gene. The expression level of GhExp1 in 20DPA fiber of 14 cotton varieties (strains) had a significant negative correlation with fiber strength and uniformity and a significant positive correlation with fiber elongation percentage; the expression level of GhPL gene in 23DPA had a significant negative correlation with fiber length; the expression level of GhRacA gene in 5DPA and 23DPA both had a high significant positive correlation with fiber elongation percentage; the expression level of GhRacB gene in 10DPA had a significant negative correlation with fiber length and uniformity; the expression level of GhCelA1 gene in 5DPA had a significant positive correlation with fiber length and a significant negative correlation with micronaire value; the expression level of GhCelA1 gene in 10DPA had a significant negative correlation with fiber length, a significant positive cor-relation with micronaire value, and a high significant correlation with fiber elongation percentage; the correlation between the expression levels of GhCIPK1, GhACT1, GhSus1, GhSusA1and GhCelA3 gene and fiber quality indexes had not been detected.

【题目】Molecular Cloning and Characterization of Two Fiber Elongation Genes Using a Cotton Fiber Developmental Mutant (Gossypium hirsutum L.)

【中文关键词】棉花; 纤维突变体; DDRT-PCR; 谷氨酸脱羧酶; 质子焦磷酸酶

【英文关键词】Cotton; Fiber developmental mutant; DDRT-PCR; Glutamate decarboxylase (GhGAD); Vacuole-pyrophosphatase (GhVP1)

【中文摘要】棉纤维发育突变体是克隆棉纤维发育关键基因和阐明其发育分子机理的优异资源。陆地棉李氏超短纤维突变体(Li1li1)是显性单基因突变体,表现为显性纯合体(Li1Li1)致死,显性杂合时(Li1li1)表型为茎秆扭曲、叶片卷曲和纤维短至6mm,而隐性纯合体(li1li1)则表现为株型和纤维发育都正常。本文对开花后10d的李氏纤维发育正常材料(li1li1)和超短纤维突变体(Li1li1)胚珠纤维混合体进行mRNA差异显示反转录PCR(DDRT-PCR)分析,获得2条在李氏纤维发育正常材料中上调表达的差异片段。测序及DNA序列的生物信息学分析表明该差异片段分别与编码谷氨酸脱羧酶和质子焦磷酸酶的基因有较高同源性。通过电子拼接,5′RACE和全长cDNA序列验证,克隆了棉花的谷氨酸脱羧酶(GhGAD)和质子焦磷酸酶

(GhVP1)基因全长cDNA,进一步对其功能和染色体定位进行了初步分析。转录水平分析表明,这两个基因在棉花根、茎、叶和纤维中组成性表达,在棉纤维中优势表达。利用本实验室陆地棉遗传标准系TM-1和海岛棉海7124培育的含140个单株的BC1作图群体,将GhGAD和GhVP1分别定位在第12条染色体和第8条染色体。

【英文摘要】Cotton fibers are single-celled seed trichomes of major economic importance.Many important genes are expressed during cotton fiber development and fiber developmental mutants can be used to preferentially detect the genes controlling fiber development.The Ligon lintless mutant (Li1li1) is a fiber elongation developmental mutant with a dominant monogenetic mutation characterized by short fibers and distorted leaf,stem and flower growth,and the recessive pure line (li1li1) exhibits normal fiber developmental characteristics.The objectives of this study were to isolate genes preferentially or specifically expressed in fiber elongation stage by comparing gene expression differences between Li1li1 and li1li1.RNAs isolated from 10 days post anthesis (DPA) fibers and mixtures in Li1li1 and li1li1 were used to screen differential gene expression in fiber development using differential display reverse transcriptase polymerase chain reaction (DDRT-PCR).Two differential expression cDNA segments were isolated,the corresponding full-length cDNAs were cloned and their primary function was analyzed.The two genes encoded 542 and 667 amino acid residues and functioned as glutamate decarboxylase (GhGAD) and vacuole-pyrophosphatase (GhVP1),respectively.Transcriptional level assays showed the two genes were constitutively expressed in tested tissues with higher expression levels during the fiber elongation stage.Furthermore,a BC1 mapping population derived from hybridization between G.hirsutum acc.TM-1 and G.barbadense cv.Hai 7124,and TM-1 as the recurrent parent,was used for the location of GhGAD and GhVP1 on chromosomes 12 and 8,respectively,using cleaved amplified polymorphic sequences (CAPs).

【题目】我国黄淮和南方主要大豆育成品种家族产量和品质优异等位变异在系谱中遗传的研究

【中文关键词】大豆育成品种; 家族系谱; 优异等位变异; 遗传

【英文关键词】Soybean released cultivar; Family pedigree; Elite allele; Inheritance

【中文摘要】以往研究育成品种间的遗传关系只能通过系谱追踪进行一般性分析, 分子标记的发掘则提供了在位点及其等位变异基础上分析育成品种间遗传关系的手段。本研究在黄淮和南方 190 份大豆育成品种的85个SSR 标记与农艺性状关联分析基础上, 将其中163 份品种按系谱祖先归为58-161 、徐豆 1 号、齐黄1 号、南农 493-1、南农 1138-2五个家族, 对产量和品质性状进行优异等位变异在系谱中传承情况的分析。所涉及的最佳位点, 产量9 个、百粒重3个、蛋白质含量2个、脂肪含量4 个, 总解释率分别为91% 、36% 、13% 和31% 。每位点考查2 个最优等位变异, 家族系谱祖先具有各自的优异等位变异, 随着育种轮次的增加在后育成品种中有丢失; 在系谱祖先基础上新品种衍生过程中吸纳其他亲本, 5 个家族趋向共有大部分优异等位变异, 但频率分布不同。5 个家族的品种所含有产量最多优异等位变异数未达饱和, 9 个位点中最高含7 个优异等位变异, 平均每个品种2.23 个, 产量有进一步改良潜力。供试条件下高产品种平均产量是低产的2.36 倍, 平均优异等位变异数是低产的4.17 倍, 高、低产品种优异等位变异构成差异明显, 但高产品种间优异等位变异构成并不相同。也有的品种高产而优异等位变异数并不多, 有的品种优异等位变异较多但产量并不高。大豆育种不断从不同亲本中累积目标性状优异等位变异, 同时有些也在丢失, 应重视保存过时品种的优异等位变异, 以备后用。

【英文摘要】It is commonly understand that molecular markers have provided an opportunity for plant breeders to trace genetic relationship precisely among released cultivars, while it can be done only roughly through pedigree analysis. In the present st udy, 163 released soybean cultivars of the five major family pedigrees in Huanghuai Valleys and Southern China, with 58-161, Xudou 1, Qihuang 1, Nannong 493-1, and Nannong 1138-2 as their respective pedigree ancestor, were analyzed for transition of elite alleles of yield and quality traits in each family pedigree based on the association analysis between 85 SSR loci and agronomic traits in 190 released cultivars in the same region. Two best alleles of each of the nine, three, two and four major loci, explaining 91%, 36%, 13%, and 31% of total phenotypic variation of the four traits, respectively, were traced for their transition in the five cultivar pedigrees. It was found that each pedigree ancestor had its own elite alleles which transited to its progenies, but some of them might be lost during the process. The five family pedigrees tended to share all the elite alleles but with different frequ ency distributions due to diverse parental materials used in the pedigrees. The cultivars in the pedigrees had different number of elite alleles for yield, where the highest elite allele number contained in a cultivar was seven but not the full of 9 and the average was only 2.33, indicating great yield potential in recombination

and accumulation of elite alleles for future breeding. Under the e x-periment conditions, the average yield of high-yielding cultivars was 2.36 times of that of low-yielding cultivars while the av erage elite allele number of the former was 4.17 times of that of the latter, but the composition of elite alleles among the high-yielding cultivars was quite different. On the other hand, unusual cases of some cultivars with high yield but less elite alleles and so me with low yield but more elite alleles were also observed. It is suggested for breeders to conserve carefully the old cultivars for future breeding since they might have some specific elite alleles in their genome.

【题目】棉花阿拉伯半乳糖蛋白基因的克隆、表达与染色体定位分析

【中文关键词】棉花; 纤维突变体; 阿拉伯半乳糖基因; 克隆; 表达; 基因定位

【英文关键词】cotton; fiber development mutant; arabinogalatan gene; cloning; expression; chromosome tagging

【中文摘要】陆地棉李氏超短纤维突变体(Li1li1)是显性单基因突变体,表现为茎秆、叶片卷曲,纤维短至6mm,其隐性纯合体(li1li1)则表现为株型和纤维发育都正常。对开花后10d的李氏纤维发育正常材料(li1li1)和超短纤维突变体(Li1li1)胚珠纤维混合体进行mRNA差异显示反转录PCR(DDRT-PCR)分析,获得1条在李氏纤维发育正常材料中上调表达的差异片段。进一步通过5’RACE技术获得全长为621bp的cDNA,测序及DNA序列的生物信息学分析表明该cDNA片段与拟南芥编码阿拉伯半乳糖蛋白基因AGP14有52%相似性,故命名为GhAGP。表达特征分析表明,该基因在陆地棉根、茎、叶和纤维中组成性表达,在棉纤维中优势表达。基因组序列分析显示,该基因在二倍体棉种非洲棉和雷蒙德氏棉中各有1个拷贝,在四倍体棉种陆地棉TM-1和海岛棉海7124中分别存在2个拷贝,表明A、D亚组中各有1个拷贝。利用本实验室陆地棉遗传标准系TM-1和海岛棉海7124培育的含140个单株的BC1作图群体,将GhAGP基因的2个拷贝分别定位在四倍体棉花部分同源转化群染色体6和染色体25上。

【英文摘要】The Ligon lintless mutant (Li1li1) is a fiber elongation developmental mutant with a dominant monogenetic mutation characterized by short fibers and distorted leaf,stem and flower growth,and the recessive pure line (li1li1) exhibits normal fiber developmental characteristics. The objectives of this study were to isolate genes preferentially or specifically expressed in fiber elongation stage by comparing gene expression differences between Li1li1 and li1li1. RNA isolated from 10 days post anthesis (DPA) fibers and ovules mixture in Li1li1 and li1li1 were used to screen differential gene expression in fiber development using differential display reverse transcriptase polymerase chain reaction (DDRT-PCR). One differential expression cDNA segment was isolated and the corresponding full-length cDNA was cloned by 5’ RACE method. Sequencing and bioinformatics analysis showed the protein had 52% homology with arabinogalactan protein from Arobidopsis,therefore,this gene was temporarily des-ignated GhAGP. RT-PCR and quantitative real time RT-PCR assays all indicated that the transcript of GhAGP is constitutively expressed in root,stem,leaf and fiber,with higher expression levels in fiber cells as fiber developments. Genomic sequence analysis showed there was one copy of GhAGP in diploid cotton species,G. herbaceum and G. raimondii,and two copies in te-traploid cotton species,G. hirsutum and G. barbadense respectively,indicating that the sub-genome A and subgenome D contain each of them. Using the BC1 mapping population derived from the hybridization between the upland cotton standard line TM-1 and G. barbadense cultivar Hai7124,and TM-1 as recurrent parent,two copies of GhAGP were located on the homoelo-gous chromosomes 6 and 25,respectively.

【题目】中国大豆育成品种群体遗传结构分化和亚群特异性分析
【中文关键词】大豆育成品种群体;群体分化;遗传结构;遗传多样性;遗传特异性
【英文关键词】released soybean cultivar population; population differentia tion; genetic structure; genetic diversity; genetic
【中文摘要】【目的】研究中国大豆育成品种总群体的遗传结构分化及其地理生态亚群和育成时期亚群的遗传多样性、特异性及其相互关系,为中国大豆育种主干亲本遴选提供遗传背景依据。【方法】从1923-2005年育成的1 300个品种中抽选378份中国大豆育成品种组成代表性样本,选用大豆核基因组64个SSR标记,采用Structure Version 2.2软件,进行群体遗传结构分析、亚群体分化分析和遗传多样性与遗传特异性分析。【结果】中国大豆育成品种群体由7类血缘组成,遗传上明显分化为不同的地理生态亚群和育成时期亚群,各有其不同的血缘构成特点;各地理生态亚群具有其特有、特缺和互补等位变异,体现了其遗传来源的相对生态特异性;随着品种育成时期的推进,不同时期有不同血缘的种质加入,各育成时期亚群具有其特有、特缺和互补等位变异,体现了育种发展的特点。中国大豆育成品种群体与中国地方品种群体、中国野生大豆群体相比,其遗传基础因源于有限祖先亲本数的瓶颈效应而相对狭窄;分省亚群中黑龙江、江苏亚群的等位变异数可以向其他亚群提供的补充等位变异数均依次最多,其亲本来源较宽、遗传基础较广。分时期亚群平均等位变异数随着时期的推移各亚群等位变异数增加,遗传多样性程度增高,近期育成品种的遗传基础宽于历史上前期育成的品种。【结论】研究结果证明中国大豆育成品种群体存在遗传结构上的地理生态分化和育成时期分化,因而各亚群具有相对遗传特异性,体现在血缘构成和特有、特缺及互补等位变异上,这构成了未来大豆育种中亚群间种质或基因交流的遗传基础。
【英文摘要】【Objective】 The objective of the present study was to explore the differentiation of genetic structure of the general population of released soybean cultivars in China and the genetic diversity, genetic specificity and genetic relationship of th e geo-ecological subpopulations and released period subpopulations for serving the genetic improvement of soybeans in China with relevant genetic background inform ation in selecting key parental materials from the population. 【Method】 A total of 64 simple sequence repeat (SSR) markers scattered on the whole genome were used to analyze the differentiation of genetic structure of the population with a sample of 378 out of total 1 300 soybean cu ltivars released during 1923-2005 in China under the software Stru cture Version 2.2, to analyze the genetic differentiation of the population into geo-ecological subpopulations and released period subpopulations and to analyze the genetic diversity, specificity and relationship of the subpopulations. 【Result】 The Chinese soybean released cultivar population was composed of seven groups of germplasm and obviously differentiated into geo-ecological subpopulations and released period subpopulations with differ ent composition of germplasm groups. Each geo-ecological subpopulation held its own specifically existent, deficient and compleme ntary alleles, which reflec ted ecological specificity of its genetic source. Along with the a dvance of released period, new germplasm was introduced into the subpopulations, which made specifically existent, deficient and complementary alleles added to the subpopulations and, therefore, made the new subpopulations with their new specificity. In comparison with the Chinese wild soybean population and landrace population, the Chinese release dcultivar population has relatively narrow genetic background due to the bottle-neck effect of a limited number of ancestors. Among the province subpopulations, the number of total alleles and that of complementary alleles in Heilongjiang and Jiangsu subpopulations were the first and second larg est due to a relatively wide source of ancestors and broad genetic background. The number of total alleles in the 1923-1970 subpopulation was the least; it increased along with the advance of released period and that in the 2001-2004 subpopulation was the largest even only a short period involved, indicating its relatively high genetic divers ity and broad genetic background. 【Conclusion】 The present results demonstrated that geo-ecological differentiation and released period differentiation existed in Chinese released soybean cultivar population, which caused the subpopulations having their own genetic specificities characterized by their germplasm composition and specifically existent, deficient and complementary alleles. All the subpopulation specificities have laid the gene tic bases of germplasm or gene exchange among the subpopulations in future soybean breeding.

【题目】重组自交家系群体4对主基因加多基因混合遗传模型分离分析方法的建立
【中文关键词】重组自交家系群体(RIL); 主基因加多基因混合遗传; 分离分析
【英文关键词】RIL population; Major gene plus polygenes mixed inheritance; Segregation analysis

【中文摘要】主基因加多基因混合遗传模型分离分析方法是基于数量性状表型数据的统计遗传分析方法，该方法适于育种工作者利用杂种分离世代的数据对育种性状的遗传组成做出初步判断，制订相应的育种策略，也可用以校验QTL定位所揭示的性状遗传组成。重组自交家系群体(RIL)是一种永久性群体，可以进行有重复的比较试验，适合于环境影响较大的复杂性状的遗传研究。本研究以RIL群体为对象，将遗传模型拓展到4对主基因，建立相应的分离分析方法。新构建的模型共包括4对主基因和4对主基因加多基因两类共15个遗传模型，通过极大似然法和IECM算法估算各种模型的分布参数，由AIC值和一组适合性测验选取最佳遗传模型，再由最小二乘法估计模型的遗传参数。通过模拟实验对所建立的模型进行验证，模拟群体中一阶遗传参数的估计值与设定值之间有很好一致性。以大豆科丰1号×南农1138-2构成的RIL群体及其亲本棕榈酸含量的遗传(I-1模型，即4对加性-上位性主基因和加性-上位性多基因遗传模型)为例，说明该方法的应用效果。

【英文摘要】The segregation analysis of major genes plus polygenes is a statistical method for genetic an alysis of quan titative traits. This method is particularly valuable for breeders to use their data accumulated fr om segregation populati ons to estimate the ge -netic system of target traits which is necessary for designing breeding strategies and also useful for validating the results o f QTL mapping. The recombinant inbred line (RIL) population is a permanent population, which is suitable for genetic analyses of com-plex traits and can be used in replicated experiments. For RIL, the analytical procedures of three major genes plus polygenes mixed inheritance models have been established and widely used in crops. There is an increasing demand on the genetic model expanding from three major genes plus polygenes to four or more major genes plus polygenes. Therefore, the objective of the present study was to establish the analytical procedures of segregation analyses for four major genes plus polygenes mixed inhe ri-tance model in RIL population. Fifteen genetic models with four additive and/or epistatic major genes including those without and with polygenes were established. The genetic models and their distribution parameters were solved and estimated with maximum likelihood method and IECM algorithm. The best model was chosen based on Akaike ’s In formation Criterion (AIC) and a set of goodness of fit tests. The genetic parameters of the best mode l were estimated with the least square method. The established pr o-cedure was validated with a set of Monte Carlo simulation experime nts. The results showed a rela tively high accuracy and consis -tency for first order parameters between the simulated population and sc heduled population. For demonstration of the usefulness of the established procedure, the data of palmitic acid content obtained from a RIL population NJRIKY (derived from Kefeng 1 × Nannong 1138-2) along with their P1and P2were analyzed. The results showed that the data fitted to Model I-1, i.e. four additive and epistasis major genes plus additive and ep istatic polygenes mixed inheritance model.

【题目】日光温室墙体与地面吸放热量测定分析
【中文关键词】温室,墙体,热交换,地面,放热
【英文关键词】greenhouses,walls,heat exchangers,ground,heat release
【中文摘要】为研究日光温室土质后墙与地面对室内的放热情况,测定了晴、阴天气条件下土质后墙和地面的表面温度及热通量。结果表明,单位面积墙体与地面各自的放热量与室内太阳辐射密切相关,晴天夜间单位面积墙体放热量为1.90 MJ/m2,地面放热量为1.36 MJ/m2,而阴天夜间单位面积墙体放热量为0.76 MJ/m2,地面放热量为1.34 MJ/m2。对于单位面积墙体和地面而言晴天墙体放热量大于地面,阴天地面放热量大于墙体,无论晴天与阴天地面全天放热总量总是大于墙体释放总量,且地面对周期热量变化的缓冲大于墙体。
【英文摘要】The increased use of rotation, grafting, and soil sterilization has been documented to increase crop yieldin intensive vegetable production systems in China. It is believed that these practices can promotechanges in the rhizosphere that enhance early growth of plants. A 2-year greenhouse experiment ontomato double-cropping systems was conducted to investigate the effects of different agriculturaltreatments on microbial properties of rhizosphere soils and tomato fruit yield. The treatments includedplanting of welsh onion as a cover crop in the summer fallow (SF) period (CW), rotating vegetablechrysanthemumand tomato (CT), planting graft-tomato instead of auto-root tomato (GT), sterilizing soilwith calcium cyanamide in the SF period (TC), and fallowing in the SF period (Control). Microbialpopulation was analyzed by dilution plating. In general,microbial populationswere higher in CT, GT andTC than in control. Fungal population was higher in TC whereas a high number of bacteria were found inCT. Soil microbial biomass C and N, total microbial population, organic C and total N showed significantpositive correlations (P 0.01) with each others, and tomato yield showed significant positivecorrelations (P 0.05) with organic C, total N and totalmicrobial population. Inmost treatments, CW, GTand TC significantly (P 0.05) increased tomato yield by 8%, 21% and 19% in four growing seasons,respectively. CT significantly (P 0.05) increased tomato yield by 26% in the spring season of 2007. Theseresults suggested that rotation, grafting and soil sterilization could lead to changes in the microbialproperties of plant rhizosphere and consequently increase plant yield. Additionally, the responses ofplant yield were complex dependent on rhizosphere soil microbes in rotation-, grafting-, and soilsterilization-induced systems.

【题目】不同农艺措施下温室土壤酶活性的动态变化及其相关性分析
【中文关键词】"农艺措施;土壤酶活性;相关分析
"
【英文关键词】"agricultural measures; soil enzyme activity; correlation analysis
"
【中文摘要】"针对日光温室随种植年限增加,土壤质量退化的问题,研究了5种不同的农艺处理措施对土壤酶活性的影响。结果表明,食用菊花和番茄轮作、番茄嫁接2个处理对提高不同土壤酶活性的效果显著;夏季石灰氮消毒处理对提高脲酶、磷酸酶和过氧化物酶活性的效果显著;夏季填闲大葱对前季作物土壤酶活性的影响大于后季作物。番茄产量与土壤酶活性的变化趋势基本一致。蔗糖酶、脲酶、磷酸酶、多酚氧化酶和过氧化物酶可以作为设施蔬菜敏感的土壤酶学指标。在难以进行轮作的以番茄生产为主的地区,采取嫁接栽培能有效提高土壤酶活性;在有条件轮作地区,采取食用菊花与番茄轮作,对提高土壤酶活性和栽培效益方面有积极作用"
【英文摘要】"To solve the problemof soil degradationwiththe increase of continuous croppingyears in the solargreenhouse,changes of soil enzyme activities under five different agricultural treatmentswere studied. The results suggest that the soilenzyme activities are increased significantly underthe rotation between vegetable chrysanthemumand tomato, and graftingtomato treatments. Soil urease, phosphatase and peroxidase activities are increased significantly aswell underthe calciumcyanamide treatment in summer. Cultivatingwelsh onion in summer, the soil enzyme activities in autumn are significantlyhigher than that in spring. The tomato yield coincideswith activity variation of soil enzymes, this indicates that sucrase,urease, phosphatase, polyhenoloxidase and peroxidase can be used as sensitive biological indices for vegetable cultivationin greenhouse. In the region in which crop rotation is difficult, grafting cultivation can be used to increase soil enzymeactivities, while, the rotation between vegetable chrysanthemum and tomato can play a positive role in maintaining soilenzyme activities and cultivation efficiencywhen the crop rotation is available."

【题目】大豆苗期耐淹性的遗传与QTL分析
【中文关键词】大豆; 耐淹性; RIL 群体; 分离分析; QTL 定位
【英文关键词】Waterlogging tolerance; Recombinant inbr ed line (RIL); Segregation analysis; QTL mapping
【中文摘要】洪涝灾害是大豆生产的主要逆境之一, 培育耐涝品种是抗灾保收的重要措施。大豆耐涝性育种方案的设计必须以耐涝性遗传为前提。以苏88-M21(淹水不敏感) × 新沂小黑豆(淹水敏感) 衍生的175 个重组自交系(NJRISX)为材料, 在盆栽V2期土壤表层保持5~7 cm水层20 d 的淹水条件下, 研究大豆苗期耐淹性的遗传和 QTL 定位。通过对 8 个耐淹性有关性状的相关分析和主成份分析, 确定以处理前后株高变化量、处理终叶龄和成熟期株高3 个性状的平均耐淹指数为评价指标。NJRISX 家系间耐淹性差异极显著, 存在超亲分离。主基因+ 多基因分离分析表明该群体的耐淹性为2 对连锁主

基因+多基因遗传，主基因遗传率为62.83%，多基因的遗传率为8.90%。WinQTLCart2.5复合区间及多区间QTL定位分析均检测到2个QTL，位于连锁群L2上的Satt229~Satt527和Satt527~Sat_286区间，对表型的解释率分别为11.76%~25.20%和10.10%~12.34%。大豆NJRISX群体苗期耐淹性遗传分离分析与QTL定位结果相对一致。

【英文摘要】Flooding is a serious problem for soybean production in easte rn and southern China. Development of cultivars with tolerance to waterlogging is one of the effective ways to cope with the stress problem. For which, the genetic knowledge of wa-terlogging tolerance is of essent ial importance. The present study was aimed at revealing the in heritance and mapping the QTLs for waterlogging tolerance of soybean at seedling stage. The materials used were 175 recombinant inbred lines (RILs) derived from the cross Su88-M21 (tolerant) × Xinyixiaoheidou (highly sens itive), designated as NJRISX. A pot experiment was held un-der 5 – 7 cm waterlogging stress for 20 days at V2 stage. Based on the correlation and pr incipal component analysis of eight trai ts, we calculated the joint waterlogging tolerance index from the average of individual tolerance index of plant height increment, number of leaves at the end of waterlogging and plant height at maturity to evaluate the tolerances of the materials. There existed obvious transgressive segregation and significant differences am ong the RIL lines. The segregation analysis under major gene plus polygene mixed inheritance model showed that waterlogging tolerance of soybean was c ontrolled by two linked major genes plus polygenes with major gene heritability of 62.83% and polygene heritability of 8.90%. By using composite interval mapping (CIM) and multiple interval mapping (MIM) of WinQTL Cartographer Version 2.5, two QTLs conferri ng waterlogging tolerance were mapped in the marker regions of Satt229 – Satt527 and Satt527 – Sat_286 on linkage groups L2, explaining 11.76% – 25.20% and 10.10% – 12.34% of the total phenotypic variation, respectively. Accordingly, the results from segregation analysis and QTL map-ping are relatively consistent in NJRISX population.

【题目】陆地棉产量相关性状的QTL定位

【中文关键词】棉花; 产量性状; QTL 定位
【英文关键词】Upland cotton; Yield traits; QTL mapping

【中文摘要】中棉所28和湘杂棉2号分别是以中棉所12×4133和中棉所12×8891配制而成的两个陆地棉强优势杂交种。以其F2为作图群体，筛选6 000多对SSR引物，利用两群体间27个共有多态位点，通过JoinMap 3.0软件整合了一张包含245个多态位点、全长1 847.81 cM的遗传图谱。利用Win QTLCart 2.5复合区间作图法分别对两群体8个产量相关性状在F2和F2:3中进行QTL定位，在中棉所28群体多环境平均值的联合分析中检测到16个QTL，三环境分离分析中检测到43个QTL；在湘杂棉2号群体分别检测到20个和66个QTL。在A3、D8、D9等染色体上有QTL成簇分布现象，同时在两个群体中发现一些不受环境影响且稳定遗传的QTL。对考察的8个性状在两个群体中发现12对共有QTL，控制果枝数、衣分和籽指的QTL增效基因位点均来源于共同亲本中棉所12。综合分析推测中棉所12的育种价值主要是通过提高后代的结铃性来实现的。研究结果为棉花产量性状的分子设计育种提供了有用的信息。

【英文摘要】As a major source of fiber and the world ’s second-most important oil-seed crop after soybean, cotton plays an important role in the global economy. With the development of textile technology a nd social demand, it is urgent to breed and plant cotton varieties with high yield and super fiber quality. If the marker tightly linked with major gene controlling desired traits was identi-fied, the efficiency of selection for agronomic traits might im prove greatly. To date, high-id entity genetic linkage map derived from upland cotton cultivars was lack because of their narrow genetic basis. Increasing the map density and tagging QTLs related with agronomic traits in Upland cotton wi ll accelerate the process of marker assisted selection (MAS) breeding. CRI28 and XZM 2 are two cotton hybrids with high heterosis, which were bred by crossing CRI12, 4133, and 8891, respectively, with CRI12 as mutual parent. In this paper, two F2 mapping populations were re spectively assembled by using the parents of CRI28 hybrid (CRI12 and 4133, their corresponding population named as Pop1) and the parents of XZM 2 hybrid (CRI12 and 8891, their cor-responding population named as Pop2), further, a joinmap linkage map which contained 245 loci and covered 1 847.81 cM was integrated with 27 mutual polym orphic loci in the two mapping populations by JO INMAP 3.0 software, after screening about 6 000 SSR primers. By the composite interval mapping method (CIM), the QTLs for eight yield-related traits in F2 and F3 popula-tions were mapped. Of them, 43 QTLs were identified in the three environments by separating analysis and 16 QTLs by the joint analysis in Pop1; similarly, 66 and 20 QTLs in Pop2 respectively. Some QTLs on chromosome A3, D8, and D9, and some stable QTLs not influenced by environment were

also detected. Twelve QTLs for eight tra its could be found simultaneously in the two populations, and additive QTLs for fruit branches per plant, lint pe rcentage and seed index all were offered by CRI12, suggesting that the value of CRI12 in breeding is mostly contributed by in creasing the offspring ’ s bolls. These results will provide very im-portant information in Upland cotton breeding for yield by MAS.

【题目】Molecular phylogeny of miR390-guidedtrans-acting siRNA genes(TAS3) in the grass family
【中文关键词】无
【英文关键词】Trans-acting siRNA (tasiRNA) ,TAS3,Poaceae ,Evolution,miR390
【中文摘要】无
【英文摘要】Trans-acting siRNAs (tasiRNAs) are a plant-specific class of 21-nt endogenous siRNAs that function as miRNA-like posttranscriptional negative regulators.Several tasiRNA loci (known as TAS genes) have been characterized to date in rice and Arabidopsis . The TAS3 family is distinguished from other TAS loci by the dual miR390 complementary sites flanking the tasiRNA

region and its dependence on ARGONAUTE7. In this study, 55 putative TAS3 genes were identified by database mining and PCR amplification from the grass family. Phylogenetic analysis indicated that several genome/gene duplication events have been involved in the expansion of TAS3genes while some TAS3genes might have been lost during evo-lution of the grass family. The role of miR390 target genes in the origin of TAS3genes are discussed.

【题目】Index selection on seed traits under direct,cytoplasmic and maternal effects in multiple environments
【中文关键词】无
【英文关键词】index selection; seed trait; mixed linear model approach; genotype by environment interaction
【中文摘要】无
【英文摘要】Crop seeds are important sources of protein, oil, and carbohydrates for food, animal feeds, and industrial products. Recently, much attention has been paid to quality and functional properties of crop seeds. However, seed traits possess some distinct genetic characteristics in comparison with plant traits, which increase the difficulty of genetically improving these traits. In this study, diallel analysis for seed models with genotype by environment interaction (GE) effect was applied to estimate the variance-covariance components of seed traits. Mixed linear model approaches were used to estimate the genetic covariances between pair-wise seed and plant traits. The breeding values (BV) were divided into two categories for the seed models. The first category of BV was defined as the combination of direct additive, cytoplasmic, and maternal additive effects, which should be utilized for selecting stable cultivars over multi-environments. The three genetic effects, together with their GE interaction, were included in the second category of BV for selecting special lines to be grown in specific ecosystems. Accordingly, two types of selection indices for seed traits, i.e., general selection index and interaction selection index, were developed and constructed on the first and the second category BV, respectively. These proposed selection indices can be applied to solve the difficult task of simultaneously improving multiple seed traits in various environments. Data of crop seeds with regard to four seed traits and four yield traits based on the modified diallel crosses in Upland cotton (Gossypium hirsutum L.) were used as an example for demonstrating the proposed methodology.

【题目】人工鱼礁建设对浙江嵊泗海域营养盐与水质的影响及评价
【中文关键词】关键词: 人工鱼礁; 营养盐; 水质; 富营养化
【英文关键词】Key words: Artificial reef; Nutrient; Water quality; Eutrophication
【中文摘要】摘要: 根据2003—2007 年对嵊泗人工鱼礁海域11 个航次调查所获得的实验数据, 运用鱼礁区和对照区相比较的方法, 分析了该海域不同季节氮、磷营养盐和水质在投放人工鱼礁后的变化, 并对海域水质状况进行评价。结果表明, 无机氮大多数处于阈值范围或低于最小阈值, 活性磷酸盐含量则严重超标, N/P 值范围为0.6280—14.8273, 嵊泗海域处于氮限制, 溶解氧不成为该海域浮游生物的生长限制因子。投放人工鱼礁后,生态效应不能在短期里得以体现, 鱼礁区的水质情况要好于对照区, 海域对P 的富集强度大于N, 人工鱼礁建设对再生生产力影响较大, 对新生产力的贡献很小。
【英文摘要】Abstract: Zhejiang Fishing Ground is one of the most productive sea area in China. Zhejiang province, which provides high quality habitats for many marine organisms and has numerous islands waters, colonizes hundreds of species (such as fish, shrimp, shellfish, algae ect.) in the waters. Zhejiang sea waters are nutrient prosperous area, being rich in marine primary productivity, and have a wide range of flow lines and water masses between the turn of the intersection of growth and decline. But after a large-scale over-intense blind fishing, fisheries resources in the waters are recession seriously, the marine environment also have been damage. In order to improve the ecological environment quality, and to conserve fishery resources of Zhejiang coastal fishing grounds, the local governments of Shengsi county had begun to implement artificial reef construction projects, and then the project was going to be planning in 2003. The first phase of the project was successfully implemented at the end of 2004, including different types of concrete artificial reefs and vessel-reefs with a total volume of 14 985 cubic meters deployed in the middle of Dongku and L ü hua sea area (30 ° 47'—30 ° 49'N, 122 ° 39'—122 ° 41'E) from 2005 to the early year of 2006, with a total reef monomer of 554. Marine environment quality might be significant changed after deploying so many artificial reefs. So far, domestic research focused mainly on the three major benefits, site selection, layout, leisure fisheries, proliferation of resources and so on, however, very few relevant impacts on nutrients and water quality after artificial reef construction is reported. Moreover, understanding and grasping the nutrient content, distribution and its impact factors were of great significance to scientific evaluation and forecasting capacity of the area and nutrition status, marine environmental protection, utilization and management. Based on the experimental data from 11 voyages carried out in Shengsi artificial reef areas and near waters in 2003—2007, the seasonal variations of nitrogen, phosphorus and water quality after the deployment of artificial reefs were studied in comparative ways between artificial reef areas and control areas, and the assessment for water quality were discussed. The results show that the majority of inorganic nitrogen is in the threshold or below the minimum threshold, and the content of active phosphate is over standard seriously. The value of N/P is in the range of 0.6280—6.7635. The water quality in Shengsi artificial reef area is nitrogen restriction, dissolve oxygen is not the limiting factor in the areas. The ecological effects could not be reflected in the short term after the deployment of artificial reefs. The water quality of the artificial reef area is better than the control area. The enrichment strength for P is greater than N in the waters, and the impact of artificial reef construction on regenerated production is significant and have lower contribution to new production.

【题目】Using matrix of thresholding partial correlation coefficients to infer regulatory network
【中文关键词】无
【英文关键词】network inference; partial correlation coefficient; permutation test; UDG; microarray
【中文摘要】无

【英文摘要】DNA arrays measure the expression levels for thousands of genes simultaneously under different conditions. These measurements reflect many aspects of the underlying biological processes. A method based on the matrix of thresholding partial correlation coefficients (MTPCC) is proposed for network inference from expression profiles. It includes three main parts: (1) hierarchical cluster analysis, (2) cluster boundaries establishment, and (3) regulatory network inference. The method was applied to the expression data of 2467 genes in Saccharomyces cerevisiae measured under 79 different conditions [Eisen, M.B., Spellman, P.T., Brown, P.O., Botstein, D., 1998. Cluster analysis and display of genome-wide expression patterns. Proc. Nad. Acad. Sci. 95, 14863-14868]. Using hierarchical clustering and cluster boundaries establishment, the 2467 genes were grouped into 12 clusters. The expression profiles of each cluster were expressed as a set of expression levels average over the cluster that constituted genes of each condition. Then the expression data of these clusters were subjected to the analysis of partial correlation, and the significance of each element in the obtained partial correlation coefficient matrix (PCCM) was examined by a permutation test. The corresponding undirected dependency graph (UDG) was obtained as a model of the regulatory network of S. cerevisiae. The veracity of the network was evidenced by the consistency of our results with the collected results from experimental studies. (C) 2007 Elsevier Ireland Ltd. All rights reserved.

【题目】Characterization of donor genome contents of backcross progenies detected by SSR markers in rice
【中文关键词】无
【英文关键词】backcross; donor chromosome segment; genome; SSR; rice
【中文摘要】无
【英文摘要】Backcrossing is a trait introgression method of renewed importance in crops. The evolution of introgressed or substituted segments through backcross generations has been analyzed theoretically using simulations. In this study, the content of donor genomes, including donor segment number (DSN), donor segment length (DSL), and donor genome size (DGS), were directly analyzed in six crosses over three successive backcrosses using a set of single sequence repeat (SSR) markers covering the entire rice genome. The results of this analysis demonstrated that the average DSN in each genome was 8.39 in BC2F1, 4.13 in BC3F1, and 2.41 in BC4F1, decreasing nearly by half with each backcrossing. The average DSL was 33.43 cM (centiMorgans) in BC2F1, 29.04 cM in BC3F1, and 25.07 cM in BC4F1, display a progressive decrease slightly greater than 10% in each additional backcross generation. Meanwhile the average DGS was 280.51 cM in BC2F1, 119.97 cM in BC3F1, and 60.53 cM in BC4F1, decreasing 57.2% from BC2F1 to BC3F1 and 50.4% from BC3F1 to BC4F1. This revealed that the reduction in DGS was approximately 50% with each backcrossing. These results provide a guide for introgression or substitution of target chromosome segments from donors into recipients in backcross programs.

【题目】宁夏半冷式温棚内红地球葡萄延后栽培的小气候特征.
【中文关键词】"小气候;半冷式温棚;延后栽培
"
【英文关键词】"microclimate; plastic greenhouse; prolong-autumn cultivation
"
【中文摘要】"为了解宁夏第一栋半冷式温棚红地球葡萄延后栽培的小气候特征,对其进行为期2年的小气候观测,结果表明:①棚外最低气温为-21.7℃,棚内为-4.8℃;在20 cm土层,棚外最低地温为-5.0℃,棚内为-0.3℃,说明棚内葡萄枝蔓及根系直接越冬安全.②扣棚后,日平均温度高于10℃的日数持续到11月下旬,这对露地不能完熟的晚熟品种进一步成熟提供了良好的环境条件,如葡萄继续挂果活体保鲜,可延迟至12月上旬采收.③棚内气温在南北方向较均匀,东西方向靠近薄膜处受外界影响较大;在垂直方向上,气温一日内除14:00时变化较大外,其余时间较均匀.④红地球葡萄从萌芽到成熟所需的大于10℃活动积温在3 400℃以上,由全年的温度测定,棚内≥10℃的积温为4 415.2℃,表明此设施结构能够完全满足红地球葡萄生长发育的条件."
【英文摘要】"In order to understand the microclimate features of the plastic greenhouse that growing the RedGlobe and its growing characteristic of autumn-prolong cultivation, we observed the microclimate featuresof the plastic greenhouse that growing the Red Globe in Ningxia for two years. The result shows: 1. Thelowest temperature that outside the greenhouse is -21.7°Cand the lowest temperature within thegreenhouse is -4.8°C, while at the height of 20cm below the ground, the lowest temperature outside thegreenhouse is -5°Cand the lowest temperature within the greenhouse is -0.3°C, which illustrates thatthe branches and root system of the grapes in the greenhouse can pass winter safely. 2. When the plasticfilm is covered, the days that the average temperature higher than 10°Cwill last by late November, whichwill continue to provide a good environment for the ripping of the late-ripen grape species. And if the fruitsare still on the trees, the picking time can be delayed by early December. 3. The temperature iscomparatively even from the south to the north, while it is affected by the outside from the east to the westthat closes to the membrane, and in vertical direction, the temperature is even during the day except 14 o ' clock. 4. The accumulated temperature that the Red Globe need above 10°Cis 3 400°C, while thetemperature that within the greenhouse above 10°Caltogether is 4 415.20°Cduring the whole year, whichshows that the facility can fulfill the factors that the Red Globe need in growing."

【题目】浙江舟山人工生境水域日本黄姑鱼和黑鲷的增殖放流效果及评估
【中文关键词】关键词:黑鲷;日本黄姑鱼;人工生境;增殖放流;效果;评估
【英文关键词】Key words:Sparus macrocephalus;Nibea japonica;artificial habitat;enhancement release;effect;assessment
【中文摘要】摘要:基于2004-2008年浙江舟山趋礁性鱼类的增殖放流数据,以日本黄姑鱼(Nibea japonica)和黑鲷(Sparus macrocephalus)作为研究对象,采用现场调查与理论推算相结合的方法,分析放流后放流点附近海域放流种类的回捕率、移动分布情况、生长情况及死亡情况。结果表明,黑鲷和日本黄姑鱼的回捕率逐年增长,黑鲷在2008年仅游钓回捕率就达到3.68%,手钓率逐年上升,规格逐年变小,补充群体数量有增加的趋势;放流3个月后回捕的黑鲷平均叉长和平均体质量分别增加70.29%和390.25%,而日本黄姑鱼平均体长可增加200%,日均体质量增长速度为1 g/d;预计至放流后第4黑鲷总的投入产出比将达1∶6.55,日本黄姑鱼投入产出比当年就可达1∶12以上。生长比对实验表明,黑鲷和日本黄姑鱼在自然海域生长比网箱养殖和池塘养殖更具优势,岩礁性种类在连续放流3年以上时增殖的累积正效应才逐渐得以体现。结论认为,人工生境水域的增殖放流增加了渔业产量,种群得以恢复,也丰富了自然水域的生物多样性,改善了水域生态群落结构,有利于水域生态环境的修复。
【英文摘要】Abstract:Effect and assessment of enhancement release has important practical significance in guiding the development of effective strategy for fishery resource conservation and has attracted international attention. In this study,based on the data of enhancement release of coastal reef fish in Zhoushan Archipelago during 2004-2008,relevant data of black sea bream(Sparus macrocephalus) and Japanese croaker(Nibea japonica) were obtained through sentinel surveillance surveys,social investigations and fish tags recycling. The recapture rate,migration and distribution,growth and mortality conditions of the two released species near releasing sites were analyzed by using a combination approach of site investigation and theoretical calculations. In this study,the

recapture rate of black sea bream and Japanese croaker has been increasing year by year. The recapture rate of black sea bream by sport fishing reached 3.68% in 2008,and the rate by hand-lining increased year by year,with the size becoming smaller,which indicated there was a growing recruit population. Average fork length and average body weight of recaptured black sea bream increased by 70.29% and 390.25% in 3 months. Average body length of Japanese croaker could increase by 200%,and the growth rate of average daily body weight was up to 1 g/d. The instantaneous rates of total mortality,natural mortality and fishing mortality were 0.641 8,0.293 8 and 0.348 0,respectively. The total input/output ratio of black sea bream would reach 1∶6.55 from releasing time to the fourth year,while that of the Japanese croaker was up to 1∶12 or more in the current years. Growth of black sea bream and Japanese croaker in natural waters had more advantages than that in cage culture and pond culture. Due to the impact of fishing,the residual groups in the sea were reduced greatly,while the cumulative effects of enhancement release can be seen on the basis of continuous,large-scale manual releasing for many years. The results indicated that enhancement release in artificial reef habitat waters increased fisheries production,restored populations to a certain extent,maintained diversity of natural waters,thus improved the ecological community and benefited the ecological environment restoration.

【题目】桃树砧木品种筑波4号筑波5号对爪哇根结线虫的抗性

【中文关键词】桃;砧木;筑波4号;筑波5号;爪哇根结线虫;抗性

【英文关键词】Prunus persica; rootstock; Tsukuba-4; Tsukuba-5;Meloidogyne javanica; resistance

【中文摘要】为探明桃树砧木品种筑波4号(Prunus persica‘tsukuba-4’)和筑波5号(P. persica‘tsukuba-5’)的抗根结线虫性能和抗原价值,对实生钵苗采用人工接种、根系次氯酸钠-酸性品红染色等方法研究了其对爪哇根结线虫(Meloidogyne javanica)的抗性。结果表明:接种后30~40 d,90株筑波4号中9株有线虫侵入,1株产生根结,侵入根中的13条线虫有11条未发育,2条发育至3龄阶段,无雌成虫形成;90株筑波5号中11株有线虫侵入,5株产生根结,侵入根中的24条线虫20条未发育,4条发育至3龄阶段,无雌成虫形成。表明2品种高抗爪哇根结线虫;实生苗个体间存在显著的抗性分离现象,但分离范围较小,只存在免疫和高抗2种基因型;免疫株率分别为98·9%和94.4%;对爪哇根结线虫均具有极强的抗侵入与抗发育能力,接种侵入率分别为0.014%和0.027%,根中线虫分别有15.4%和16.7%发育至3龄幼虫阶段,未形成成虫。筑波4号、筑波5号是极优异的抗爪哇根结线虫桃砧木品种和抗原植物种质资源。

【英文摘要】Using pot-seedlings as materials,the reaction of Tsukuba-4 and Tsukuba-5 toMeloidogyne javanicawasstudied through artificial inoculation and staining method of acidic fuchsin. We found that only 0.014% second stagejuvenile nematodes (J2) penetrated tsukuba-4 and 0.027% J2 penetrated tsukuba-5 in all 1 000 inoculation J2 perplantlet. About 15.4% J2 which penetrated tsukuba-4 developed to third-stage juveniles (J3) and 16.7% J2 whichpenetrated tsukuba-5 developed to J3. A little segregation of resistance was observed in seedlings of tsukuba-4 andtsukuba-5; the immunity proportions of tsukuba-4 and tsukuba-5 were 98.9% and 94.4%, respectively. Both tsukuba-4 and tsukuba-5 were good resistant species and germplasm resource forM. javanicabecause they could resistpenetration and resist the development of juvenile nematodes.

【题目】几种李属植物对花生根结线虫的抗性

【中文关键词】毛桃;蒙古扁桃;长柄扁桃;筑波4号;筑波5号;花生根结线虫;抗性评价

【英文关键词】Prunus. persica; P. mongolica; P. pedunculata; P. persica‘tsukuba-4’;P. persica‘'tsukuba-5’; Meloidogyne arenaria;resistance

【中文摘要】为筛选抗根结线虫桃树砧木,以实生钵苗为试材,采用人工接种(每株1 000条二龄幼虫)的方法研究了5个树种、品种对花生根结线虫(Meloidogyne arenaria)的抗性。结果表明:5个树种毛桃、筑波4号、筑波5号、蒙古扁桃、长柄扁桃均为高抗基因型树种或品种,其实生个体间有明显的抗性分离现象,均存在免疫和高抗2种基因型;长炳扁桃、筑波4号、筑波5号具有极强的抗侵入和抗发育能力,绝对免疫株率分别高达77%、56%和40%,线虫接种侵入率分别只有0·057%、0·11%和0·14%,且根内幼虫分别只有22%、22%和15%发育至三、四龄阶段,未发现成虫;蒙古扁桃和毛桃具有极强的抗侵染能力和很强的抗发育能力,绝对免疫株率为2%和4%,接种侵入率为0·77%和0·85%,根内幼虫分别有63%和51%停留在二龄幼虫或二龄贮虫阶段,只有10·6%和7·7%发育为雌成虫,未发现卵块。筑波4号、筑波5号是优异的抗花生根结线虫桃砧木品种和种质资源;毛桃、蒙古扁桃和长柄扁桃为优异的抗花生根结线虫种质资源。

【英文摘要】In order to discover the materials resistant to root-knot nematode, pot experiment was carried out with fivePrunusplants. Their effects on reducingMeloidogyne arenariawere evaluated through the methods of artificial inocula-tion,acidic fuchsine staining and microscopic examination. The results showed that the fivePrunusplants ofPrunuspersicaL.)Batsch,P. persica ‘ tsukuba-4 ’ ,P. persica ‘ 'tsukuba-5 ’ ,P. mongolicaMaxim and P.pedunculata(Pall.) Maxim were all high resistant genotype cultivates or varieties. Their resistance was obviously separated amongseeding plants. All the tested varieties had both immunity and high resistant two genotypes. They had great influenceon infection and development ofMeloidogyne arenaria.The quantities of absolute immunity plants ofP. pedunculata(Pall.) Maxim, ‘ tsukuba-4 ’ and ‘ tsukuba-5 ’ were 77%、56% and 40% respectively. Accordingly, the infecting ratesof second-stage juveniles(J2) were only 0·057%、0·11% and 0·14%. The J2 ’ development were intensively limited.AlthoughP. persicaandP. mongolicahad 2% and 4% immunity plant respectively, but infecting rates were only0·77% and 0·85%. About 63% and 51% nematodes inP. persicaandP. mongolicarespectively were at J2 and J2ecesis, only 10·6% and 7·7% being females adults without egg mass. It was thus obvious that ‘ tsukuba-4 ’ and ‘ tsukuba-5 ’ were suitable peach rootstock varieties and germ plasm resources resisting toM.arenaria.Other showedsome resistance to the nematode as well.

【题目】蒙古扁桃对根癌病的抗性评价

【中文关键词】蒙古扁桃;抗病性;发根土壤杆菌

【英文关键词】Prunus mongolica; Disease resistance;Agrobacterium rhizogenes

【中文摘要】以实生苗新梢为试材,采用人工接种的方法研究了蒙古扁桃(Prunus mongolica)对发根土壤杆菌(Agrobacterium rhizogenes)的抗性。结果表明:接种后70 d,株平均瘤径范围在0~16.6 mm,群体平均瘤径6.6 mm,蒙古扁桃对发根土壤杆菌中度感病,实生群体抗性分离宽泛,其中存在免疫、高抗、中抗、中度感病和高度感病5种类型,分别占8.60%、19.23%、14.42%、33.65%和24.04%。蒙古扁桃是发根土壤杆菌的优异抗原植物,是核果类果树抗根癌病砧木品种选育的珍贵种质资源,具有极为重要的开发价值。

【英文摘要】The resistance ofPrunusmongolicato crown gall was studied using new shoots and evalua-ted for their reaction toAgrobacterium rhizogenesthrough the artificial inoculation. The resultsshowed thatPrunus mongolicawas excellent germplasm resources resist to crown gall.The range ofdiameter was 0~16.6 mm and mean diameter of tumor in all plants is 6.60 mm at 70 days after inocu-lation. Immunity, high resistance, moderate resistance, moderate susceptibility and high susceptibili-ty were found inPrunus mongolicaand its percentage were 8.6%, 19.23%, 14.42%, 33.65%,24.04%, respectively.

【题目】不同架式对设施葡萄光合特性及果实品质的影响
【中文关键词】葡萄;设施栽培;架势;光合特性;品质
【英文关键词】Grape; Protected cultivation; Training structure; Photo synthetic character; Fruit quality
【中文摘要】以设施红提葡萄为试材,研究不同的整形方式对葡萄叶片光合特性和光合关键酶活性的影响。结果表明:与扇形整形方式相比,L形和FI形整形方式可明显提高叶面积;在果实迅速发育时期,L形整形方式显著提高了叶绿素含量,Rub isco及Rub isco活化酶活性显著升高;同时,叶片质膜A TPa se和叶绿体膜A TPa se活性也显著升高,从而提高了叶片的光合速率。L形、F I形和V形整形方式均不同程度提高了平均单果质量、可溶性固形物含量,降低了可滴定酸含量,而L形则显著地提高了果实的品质。因此,适当的整形方式可通过调节提高设施葡萄的叶绿含量、光合关键酶和A TPa se活性来提高光合速率,最终提高果实的品质。
【英文摘要】The effect of different grap e train ing structures on the photo synthetic character and fru it quality u sing V itis vin if era (var. R ed Globe) in greenhou se were inve stigated in the current ca se. The re su lts showed that comp ared w ith the conventional train ing structu re of fan typ e, the typ e s of L and F I sign ificantly in crea sed the leaf area. In the rap id berry grow th p eriod, typ e L obviou sly elevated ch lorophyll content and Rub isco, Rub isco activase activitie s. A lso, the activity of P - A TPa se or F - A TPase was rem arkab ly in crea sed, resu lting in an obviou s increa se in photo synthetic rate. The typ e L , F I or V m ight diversely increase the average berry weight and the content of solub le solid. Conversely, the se typ e s decrea sed the content of ti tratab le acidity. Typ e L sign ificantly enhanced the berry quality. Therefore, app rop riate train ing structure m ay increa se fru it quality via adju sting ch lorophyll content, the photo synthetic key enzym e s and A TPase ac tivity in greenhou se.

【题目】外援抗氧化剂对高温胁迫下红地球葡萄果实日灼的影响
【中文关键词】葡萄;日灼;高温胁迫;酶活性;抗氧化剂
【英文关键词】root restriction; apple; nutrient distribution; constituteof shoot types
【中文摘要】以红地球葡萄为试材,通过施用抗坏血酸(AsA)、苯甲酸钠(SBN)和氯化钙(CaCl2),研究不同种类外源抗氧化剂对高温胁迫下果皮组织对丙二醛(MAD)含量、相对电导度(REC)、过氧化氢酶(CAT)和抗坏血酸-过氧化物酶(APX)活性的影响,比较几种抗氧化剂对提高果实抗氧化能力的效果。结果表明:在高温胁迫下,以施用0.03mol/L抗坏血酸、0.02mol/L苯甲酸钠和0.10%氯化钙后,能显著和极显著地降低膜脂过氧化产物MDA的含量,保持膜结构及功能相对稳定性,提高果实CAT和APX酶活性,从而提高了果实抗日灼的能力。
【英文摘要】Abstract:Theeffect of different roo-t zonespaceonnutrient distributionandconstituteof shoot typeswasconductedonHanfuapple. Theresultsindicatedthat total dry matter content reducedwiththe decreasing of roo-t zonespace. Thesolublesugar andother nutrient matter mainly locatedinleaf inearlygrowing phaseandthentransferredtocoarserootindefoliationphase. Withthedecreasingof roo-t zonespacetheratioof drymatter andother nutrient mattersdistributiontoxylemincreasedanddecreasedtophloem. At thesametimethegrowvigor becomeslowly, thespurratioincreasedandtheappletreetransferredfromvegetativetoreproductivegrowth.

【题目】延后栽培红地球葡萄生长特性及与小气候因子关系
【中文关键词】设施;红地球葡萄;延后栽培; 气象因子
【英文关键词】Plasticgreenhouse; RedGlobeGrape; Autumn-prolongingcultivation; Meteorological factors
【中文摘要】在通风、遮荫避雨、揭膜、扣棚一系列管理措施下, 将红地球葡萄设施延后栽培与露地栽培进行比较,通过气象因子与葡萄生长指标的平行观测, 探求葡萄延后栽培生长发育规律的特殊性。结果表明:新梢、叶面积以及糖分的积累均呈现明显的/ S0型变化, 利用逻辑斯蒂方程拟合较好, 且设施延后栽培的最大生长速率出现的时间比露地推迟; 果粒的生长变化曲线也呈现明显的双/ S0型,延后栽培果粒生长发育缓慢, 完全成熟时间在11月上、中旬。对葡萄生长指标与期间的气象因子作逐步回归分析, 方程经检验均为显著。新梢和叶面积的增长与空气相对湿度密切相关; 果粒的增长与积温以及20cm处的土温密切相关。
【英文摘要】Inorder tounderstandthe growing regulationsof theRedGlobeGrape characteristicsof autumn-prolongingcultivationinplasticgreenhouse, themeteorological factorsandgrapegrowingindexeshadbeenobservedat twogrowthseasons. Theresultsshowedthat thegrowthcurvesof grapeshoot, leaf areaandtheaccumulationof sugar content were"S" typeandfittedtheLogisticequationvery well. Theoccurredtimeof themaximumgrowthvelocitywaslater thanthat of outsidegreenhouse; thefruit growingcurvewasalsolikedouble"S", thegrowthvelocityof fruitswasslower ingreenhouse, andmatureperiodof thefruit wasprolongedtoNovember. Thepositivecorrelationwasfoundbetweenthegrowthof shoot, leaf areaandrelativehumidity; thesoil temperatureat 20cmandair temperaturewerealsopositivetothesugar content accumulating.

【题目】红地球葡萄设施栽培后期叶片生理变化研究
【中文关键词】葡萄叶片; 衰老; 生理变化
【英文关键词】Grapeleaves; Senescence; Physiological changes
【中文摘要】对设施葡萄衰老时叶片中叶绿素含量、可溶性蛋白质、膜的透性、丙二醛(MDA)、超氧化物歧化酶(SOD)和过氧化物酶(POD)进行了测定和理论分析, 以研究不同上市时期的设施红地球栽培后期叶片衰老时的生理变化特征。结果表明: 促早和延后栽培条件下葡萄衰老时叶片的叶绿素含量都在缓慢减少, 延后栽培叶绿素含量显著高于其它处理;可溶性蛋白质含量呈现先升后降的趋势, 其中露地环境下叶片内蛋白质含量的最大值比其他处理的最大值高但后期下降较快, 延后栽培的叶片可溶性蛋白含量较低但后期下降较缓慢; 葡萄叶片细胞膜的相对透性在生育后期都呈上升趋势,露地(CK) >促早2>延后U促早1;促早和延迟栽培条件下葡萄衰老时叶片MDA呈普遍上升趋势,在葡萄生育后期(9月16日以后) MDA含量表现为露地>促早1>促早2>延后; 促早和延后栽培条件下葡萄后期叶片SOD酶的活性呈双峰曲线, 都表现为延迟>露地>促早, 而POD活性的变化都呈现先升高再下降的趋势, 延后栽培的POD活性显著高于促早和露地葡萄; 葡萄叶片衰老过程中叶绿素、蛋白质、SOD和POD活性在9月25日以后都表现出相同的缓慢下降趋势,而膜透性和MDA含量明显上升, 说明从这个时候起植物正式进入衰老期。
【英文摘要】Inorder tostudythephysiological changesof RedGlobal grapeleavesintheir early or postponedcultivation,chlorophyll,protein,POD, SOD, MDAandmembranepermeabilityweretested. Theresult showed: All chlorophyll con-tent went downgently, but chl. of thepostponedcultivationwasaboveothersobviously; Theproteinof all went upfirst, thenwent down, theCK. scurvewasaboveothers, but went downquicklyintheend; thepostponedcultivationcurvewasthelowest,but goesdowngentlyintheend; All membranepermeabilitywent uptotally, CK>earlycultiva-tion2>postponedcultivationUearlycultivation1; All MDAwent uptotally, after Sept. 16, CK>earlycultivation1>fearlycultivation2>postponedcultivation; TheSODof all showedtwopeakscurve, postponedcultivation>CK> earlycultivation; thecurveof PODfirst went upthengoesdown, andthePODof postponedcultivationwasaboveothersre-markably; After Sept. 25, chl, protein, SODactivity andPODactivityall went downgently, whilemembranepermea-bilityandMDAwent upremarkably, sowecouldsaytheplant begintosenescefromthistime

【题目】阴阳棚共用墙体不同季节的吸放热状况分析
【中文关键词】阴、阳结合型日光温室;墙体; 吸热; 放热
【英文关键词】combininglight withshadesolar greenhouse; wall; accumulationof heat; dissipationof heat
【中文摘要】对新近出现的阴阳结合型温室共用墙体的吸放热状况进行了测定。结果表明: 休眠和通风时期, 阴面的蓄热明显的低于阳面; 露天生长时, 阴面的吸热量在日出到8点时显著高于阳面, 之后差异逐渐减小, 但其吸热量始终小于阳面; 不同季节, 阴阳面的吸、放热量晴天均大于阴天; 阳面在冬季蓄冷(2008年12月)到春季通风降温(2009年2月) 期间, 在测试的2点中, 高度越高, 蓄热量越多, 散热量越少, 其热量损失越小, 3月份之后高度越高, 蓄热量越少, 散热量越多, 其热量损失越大; 而阴面全年中, 均为高度越高,蓄热量越多, 而散热量在冬季蓄冷的12月和1月时高度越高, 散热量越少, 其热量损失越小; 而从春季通风到采收期间, 则为高度越高, 散热量越多, 热量损失越大。
【英文摘要】Throughwall of thecombininglight withshadesolar greenhouseheat fluxweredetermined, theresultsshowedthat dormancy andventilationperiod, andshadeof theaccumulatorwill havetoclearlylessthanthelight. Inair, shadeof thewall absorbingheat fromsunriseto8point, significantly higher thanthelight of wall, thendifferencesbetweenlight andshadesidealsogradually decreased, but theshadeof theabsorptionheat wasalwayslessthanthelight side;Typical weather conditionsindifferent seasons, theshadeandlight of theabsorptionof heat sunnydayswasgreaterthancloudyday. thetest pointsduring light surfacestorageduring thewinter months(December2008) tothespringair coo-ling(February2009) , theheight of thehigher build, themoreheat, lessheat dissipation, thesmaller theheat loss, afterMarch, theheight of the higher has less heat, themore heat dissipation, the greater the heat loss; while the shadethroughout theyear, boththe higher height, the morecalories, while the amount of heat storage during thewintermonthsof December andJanuarywhentheheight of thehigher volumeof lessheat, thesmaller theheat loss; andfromspringto harvest, moreheat

【题目】日光温室葡萄促早栽培休眠期和生长期的温度变化
【中文关键词】日光温室; 葡萄; 休眠期; 生长期;温度变化
【英文关键词】sunlit greenhouse;grape; dormancytimes;growthstage; changesof temperature
【中文摘要】对宁夏银川地区日光温室促早栽培葡萄休眠期至果实成熟期温度变化进行测定分析。结果表明: 葡萄休眠期采取低温集中处理, 可以延长打破葡萄休眠的有效低温(0~7. 2#) 时数, 但夜间应将棚室风口开小或者关闭。采取低温集中处理, 可以使温室内地温不会下降很快,升温后地温仅比气温延迟1d达到10#以上, 满足葡萄根系生长和冬芽萌发需求; 葡萄初花期至盛花期和浆果生长期至成熟期温室内平均气温分别为16.1~ 20. 0#、19. 9~22. 3#, 对于葡萄开花期和浆果成熟期的最适温度来说, 气温略低; 葡萄萌芽生长期到浆果生长期, 日光温室内的最高气温达到29. 8~40. 4#,最低气温为3. 7~8. 5#, 昼夜温差较大, 白天应注意通风降温, 夜间注意保温。
【英文摘要】Abstract:Temperaturechangingfromthedormancytoripenessof grapecultivatedinsolar greenhousewasmonitoredandanalysized. Theresultsshowedthat covering greenhousewithplasticandthermal insulationquilt during thedormancytimesof grape, theeffectivetemperatureof breakingdormancyof grapecanbeextended, but thegreenhousevent shouldbeopenasmall or closedat night. Thesoil temperaturedecreasedslowly, andafterwarminggreenhouse, thesoil temper aturewasonlyadaylater thantheair temperaturerisentoover 10#, whichcanmeet theneedsfor buds& shootingandroots& growing.During earlyflorescenceandfull florescence, theaverageair temperatureinsola greenhouse wasfrom16. 1~ 20. 0#, andfromgrowthperiodof fruit to periodof ripeness, thetemperature, whichrangesbetween19. 9~22. 3#, wereabit of lower thanthemost proper temperaturefor theperiodof bloomingandripeness. 【题目】水杨酸对休眠期茶树光合作用和抗冻性的影响
【中文关键词】水杨酸;茶树;光合作用;抗寒性;保护酶
【英文关键词】salicylic acid (SA), tea tree, photosynthesis, cold resistant, protective enzyme
【中文摘要】为了探讨水杨酸对冬季茶树抗寒性的调控机制,以“ 龙井43号 ”茶树为试材,研究休眠期叶面喷施水杨酸对茶树叶片光合作用、叶片中碳水化合物含量和活性氧代谢的影响,结果表明,叶面喷施水杨酸30天后即能明显提高茶树叶片净光合速率,处理60天后,2 mmol/L的水杨酸处理显著提高了叶片中可溶性总糖和淀粉含量、使丙二醛、活性氧含量显著下降,同时,叶片中脯氨酸含量、超氧化物歧化酶、过氧化氢酶和过氧化物酶活性显著升高,其它水杨酸处理虽然也能提高这些酶活性,但是效果不如2 mmol/L的水杨酸处理显著。因此,在休眠期,叶面喷施适当浓度的水杨酸可显著提高茶树叶片的Pn和保护酶活性,从而提高茶树的抗寒性,这也有利于提高次年茶叶的产量与品质。
【英文摘要】This paper aims to find out the regulator metabolism of salicylic acid on cold resistance in dormancyof tea tree. Effects of difference concentration of salicylic acid on photosynthesis, carbohydrate content and me tabolism of reactive oxygen species in Longjing43were studies. Results showed that net photosynthesis rateswere obviously increased in30th day after sprayed salicylic acid to

tea foliar in dormancy. 2 mmol/L salicylicacid significantly increased total soluble sugar, starch contents, and significantly decreased foliar reactive oxy gen species and MDA contents in 60th day after treatment. At the same time, the proline content, SOD, CATand POD activities were significantly increased. Others concentration of salicylic acid also improved photosyn thesis and protective enzymes activities, but the results were not as better as 2 mmol/L salicylic acid. It is con cluded that foliar sprayed of suitable concentration of salicylic acid in tea tree's dormancy can improve photo synthesis and protective enzymes activities, and increase the cold resistant, in the end, the tea yield and qualityin the next year could improve

【题目】宁夏半冷式温棚内红地球葡萄延后栽培的小气候特征
【中文关键词】小气候; 半冷式温棚;延后栽培
【英文关键词】microclimate; plasticgreenhouse; prolong-autumncultivation
【中文摘要】为了解宁夏第一栋半冷式温棚红地球葡萄延后栽培的小气候特征, 对其进行为期2年的小气候观测, 结果表明: 棚外最低气温为- 21.7 , 棚内为- 4.8 ; 在20cm土层,棚外最低地温为-5.0 ,棚内为- 0.3 ,说明棚内葡萄枝蔓及根系直接越冬安全. 扣棚后,日平均温度高于10 的日数持续到11月下旬, 这对露地不能完熟的晚熟品种进一步成熟提供了良好的环境条件,如葡萄继续挂果活体保鲜,可延迟至12月上旬采收. 棚内气温在南北方向较均匀, 东西方向靠近薄膜处受外界影响较大; 在垂直方向上,气温一日内除14:00时变化较大外, 其余时间较均匀. 红地球葡萄从萌芽到成熟所需的大于10 活动积温在3400 以上,由全年的温度测定,棚内 10 的积温为4415.2 , 表明此设施结构能够完全满足红地球葡萄生长发育的条件
【英文摘要】Abstract:Inorder to understandthe microclimate featuresof the plastic greenhouse that growing theRedGlobeanditsgrowing characteristicof autumn-prolongcultivation, weobservedthemicroclimatefeaturesof theplasticgreenhousethat growing theRedGlobeinNingxiafor twoyears. Theresult shows: 1. Thelowest temperature that outside the greenhouse is - 21. 7 and the lowest temperature within thegreenhouseis- 4. 8 , whileat theheight of 20cmbelowtheground, thelowest temperatureoutsidethegreenhouseis- 5 andthe lowest temperaturewithinthegreenhouseis-0. 3 , whichillustratesthatthebranchesandroot systemof thegrapesinthegreenhousecanpasswinter safely. 2. Whenthe plasticfilmiscovered, thedaysthat theaveragetemperaturehigher than10 will last by lateNovember, whichwill continue toprovideagoodenvironment for therippingof thelate-ripengrapespecies. Andif thefruitsare still on the trees, the picking time can be delayed by early December. 3. The temperature iscomparatively evenfromthesouthtothenorth, whileit isaffectedbytheoutsidefromtheeast tothewestthat closesto themembrane, andinvertical direction, thetemperatureisevenduring theday except 14o clock. 4. The accumulated temperature that the Red Globe need above 10 is 3400 , while thetemperature that withinthegreenhouseabove10 altogether is4415. 20 during thewholeyear, whichshowsthat thefacility canfulfill thefactorsthat theRedGlobe needingrowing

【题目】曼氏无针乌贼(Sepiella maindroni)繁殖习性及其产卵场修复的研究
【中文关键词】关键词:曼氏无针乌贼, 繁殖行为, 附卵基, 产卵场修复
【英文关键词】Key words:Sepiella maindroni, Reproductive behavior, Adhesion substrates, Spawning grounds rehabilitation
【中文摘要】提要:采用对比分析方法, 观察了曼氏无针乌贼的繁殖习性, 比较了不同产卵附着物的附卵效果,选择典型产卵场(中街山列岛海区)进行附着物的调查。结果表明, 曼氏无针乌贼有较高等复杂的性行为, 有显著的求偶、争偶及雌雄博斗现象, 乌贼交配对其它乌贼交配有诱导作用; 乌贼对附卵基有严格选择, 没有充足适宜的附卵基, 不仅使乌贼产卵时间延迟、数量减少, 而且易被水流冲散、沉入底部致受精卵大量死亡, 是影响乌贼繁衍的重要因素; 附卵基附卵效果依次为聚乙烯(PE)绳、聚丙烯(PP)绳、钢筋、竹子、木头, 颜色依次为黑色、蓝色、红色、黄色, 形状依次为圆柱体、正三棱柱体、正长方体、扁长方体, 粗度以直径0.25—0.50cm 为宜, 此外附卵基间应有适当空隙; 目前, 中街山列岛海区柳珊瑚(Plexaauraa sp.)生物量为0.15—0.64 棵/m2, 平均生物量为0.32 棵/m2, 资源数量趋于恢复, 但远不能适应乌贼资源修复需要。增殖放流试验表明, 修复乌贼资源的可能性很大, 但在加大增殖放流工作的同时, 必须尽快开展产卵场生态环境修复尤其是产卵附着物修复工作。
【英文摘要】Abstract:Reproductive and spawning habits of Sepiella maindroni de Rochebrune were studied for understanding the animal's reproduction in Zhongjieshan Waters off Zhejiang, China, one of the spawning grounds. Factors affecting the oosperms adhesion on different substrates were examined, including material type, color, size, and shape. The sexual behavior of the animal from displaying, fighting, mating, spawning, were observed complicated. Study shows that S.maindroni are very picky for the substrates. Unfavarable substrates would not only affect the egg laying amount, but also the survival rate of oosperms. The preferable conditions are as follows: polyethylene (PE) > polypropylene (PP) > steel >bamboo > wood in material; black > blue > red > yellow in color; cylinder > triangular prism > rectangular prism > waferyrectangular prism in shape; and diameter of 0.25—0.50cm. At present, the biomasses of coral Plexaauraa sp. are between 0.15—0.64 ind/m2 in average of 0.32 ind/m2, showing a trend of enhancement; however, it is still far more satisfactory for the cuttlefish resource recovery. Practice of releasing and enhancement has been proven very feasible to restore the cuttlefish natural habitat. Meanwhile, repairing the spawning grounds by providing favorable adhesion substrates is suggested in the future.

【题目】基于循环迭代算法的水稻发育期模型参数调试方法研究
【中文关键词】水稻;发育期;模型;参数调试
【英文关键词】rice;phenology;model;parameter adjustment
【中文摘要】参数调试是作物生长模型应用的首要问题。以CERES—Rice模型的发育期模块为基础,建 立基于循环迭代算法的模型参数自动调试方法,结合栽培试验资料,对参数适宜取值范围和步长进行讨论,分析分阶段调试和全程调试的结果差异。结果表明:累积生长度日的适宜步长为 1个GDD,感光因子和临界日长的适宜步长分别为 0.01和 0.20 。分阶段调试和全程调试对参数取值结果有一定影响,造成误差的原因在于全程调试过程中用模拟发育期代替 了实 际发育期。尽管分阶段调试得到的参数下的模拟发育期误差较全程调试得到的参数下 的模拟误 差大,但分阶段调试得到的参数更能体现作物品种的发育特性。
【英文摘要】Parameteradjustment was the first step in the application of crop growth model.Based on the phenology model of CERES-rice and iterative method,the automatic parameter adj ustment method was developed and then combined with the field experiment,the suitable steps for phenology parameters and the adj ustment difference between stage by stage and whole were discussed.The results showed that the suitable steps for accumulated GDD,photosensitive factor and critical daylength were 1,0.01 and 0.2 respectively.The suitable parameter adjusted in stages was different with those adjusted in whole,because the observed heading data was replaced by the simulated values.Although the RMSE for the suitable parameter adj usted in stages was greater than that in whole,the parameter adj usted in stages embodied the phase development characteristics of crop varieties.

【题目】A Study on Subunit Groups of Soybean Protein Extracts under SDS-PAGE
【中文关键词】无
【英文关键词】7S; 11S; molecular weight (MW); soybean; protein extract; SDS-PAGE; subunit group; cultivar
【中文摘要】无
【英文摘要】Protein extracts of 640 soybean cultivars and landraces, mainly from China and a few from the US, were analyzed for their components and subunits based on distribution patterns of bands with varying molecular weights (MW) under SDS-PAGE (sodium dodecyl sulfate-polyacrylamide gel electrophoresis). The number and molecular weight of the bands in SDS-PAGE varied among materials and showed a tendency of continuous distribution. Accordingly, the SDS-PAGE patterns of the soybean protein extracts were divided into two regions: the region of bands with MW < 44 KDa and that with MW >= 44 KDa. The first region containing mainly 11S proteins was divided into four parts, called subunit groups, i.e. 11S-1 (14.4-22 KDa), 11S-2 (22-26 KDa), 11S-3 (26-34 KDa) and 11S-4 (34-44 KDa). The second region containing mainly 7S protein was divided into six subunit groups, i.e. 7S-1 (44-49 KDa), 7S-2 (49-55 KDa), 7S-3 (55-67 KDa), 7S-4 (67-73 KDa), 7S-5 (73-82 KDa) and 7S-6 (82-91 KDa). The sum of relative contents of 11S-1-11S-4 was obtained as the relative content of 11S protein, those of 7S-1-7S-6 as that of 7S protein, and therefore, the 11S/7S ratio obtained. The proposed criteria were demonstrated to be simple, stable and feasible. Among the 640 tested materials, 39 lacked 11S-1 but none lacked the other 11S subunit groups, while deficiencies existed in all the six subunit groups of 7S, indicating a great potential for the genetic variation of protein components and subunits for breeding for the improvement of protein qualities.

【题目】极端低温条件下日光温室保温性能分析
【中文关键词】极端低温;日光温室;热量
【英文关键词】"Greenhouse; Low-temperature; Heat
"
【中文摘要】为研究2008年极端低温条件下日光温室的保温性,通过对2008、2006及2007年室外气温及太阳辐射的测定与对比,并选择2008年降温前、中、后期较典型的3个晴天进行环境及传热指标的测定和计算,结果表明,①外界环境各年1月12日-2月17日这段时间里,2008年平均气温为-13.2℃,比2007年低9.1℃,比2006年低8.0℃。较同期往年气温2008-01-10气温开始下降,最低温达-27℃,2月17日气温回升到往年同等气温,在这段时间里2008年太阳平均总辐射为76.8 W/m2,2006年为83.6 W/m2,2007年为81.6W/m2,2008年日均太阳辐射量最小。②降温过程中单位面积墙体导热总量为3 448 kJ/m2,比降温前的导热量多427.5 kJ/m2,比降温后多1 155 kJ/m2,降温中墙体的导热量明显高于其他两天。③2008-01-10,10 cm处土壤日均温度开始下降,日均最低温7~8℃,2月4日后土温开始回升,降温中各层次土壤平均温度比降温前低3.3℃,比降温后低4.4℃。室外气温与室内气温呈正相关,与墙体导热量呈负相关,且相关性极显著。外界气温降低时墙体导热量增大,室内热量损失增大,室内土温和气温随之降低。
【英文摘要】In order to study the warmth retaining property of greenhouse under extreme low tempera-ture in 2008, the outdoor temperature and solar radiation in 2008 and the recent two years were meas-ured and compared. And three typical sunny days that before, during and post temperature-reducingin 2008 were chosen to measure and calculate the environment and heat transfer target. The resultshowed:①from January 12th to February 17th during these three years, the average outdoor temper-ature is -13.2°Cin 2008 which is 9.1°Clower than that in 2007, and 8.0°Clower than that in2006. The temperature began to reduce from January 1st in 2008, and the lowest temperature is -27°C. And the temperature returned to the same level of the previous years. During this period, the to-tal average solar radiation is 76.8 W/m2in 2008, 83.6 W/m2in 2006, and 81.6 W/m2in 2007. The av-erage amount of solar radiation in each day is the lowest in 2008;②the total amount of heat conduc-tion in per unit area is 3 448 kJ/m2, and 427.5 kJ/m2more than that before temperature-reducing,and 1 155 kJ/m2more than that post temperature-reducing, heat conduction is obviously higher thanthat during temperature-reducing;③The daily average soil temperature 10 cm under ground began toreduce on January 1st in 2008, and the lowest daily average soil temperature is between 7°Cand 8°C,and the daily average soil temperature began to rise. During temperature-reducing, the average soiltemperature is 3.3°Clower than that of before temperature-reducing at all levels, and 4.4°Clowerthan that of post temperature-reducing. Outdoor temperature was positively correlated with indoortemperature and negatively correlated with wall thermal, and the correlations were significant. Whenthe air temperature reduced, the wall thermal increased, the indoor heat loss rose, and the soil temperature and air temperature decreased, too.

【题目】不同栽培方式对水稻生长发育的影响
【中文关键词】水稻; 种植方式;生长发育; 产量
【英文关键词】Rice
【中文摘要】以宁粳 1 号和南粳4 4为供试水稻品种, 选用旱育秧稀植 、 塑盘育苗抛栽、 直播种植和湿润秧常规移栽4种方式进行了对比试验, 研究了水稻不同种植方式对水稻产量及其产量构成、 生育进程 、 茎蘖动态、 叶面积指数变化以及干物质积累等方面的影响。结果显示 , 旱育秧稀植方式群体生长协调、 分蘖成穗率较高, 生育进程合理 , 干物质积累量高 , 并表现出较高的产量水平和协调的穗粒结构 ; 塑盘旱育抛栽方式生育进程相对较慢, 分蘖发生量较大, 分蘖成穗率有所下降, 物质积累及产量水平次于旱育稀植方式 ; 直播种植方式全生育期大幅缩短, 生育进程虽然有所加快 , 但拔节期、 抽穗期和成熟均明显后延 , 对于生育期相对较短的品种南粳4 4仍表现出较高的产量水平, 而品种宁粳 1号的产量有大幅降低, 其高峰苗后延, 有效成穗率低; 湿润秧常规移栽方式分蘖成穗率相对较高, 生育进程合理 , 但产量水平略低于旱育秧稀植方式。

【题目】Transcriptome analysis reveals critical genes and key pathways for early cotton fiber elongation in Ligon lintless-1 mutant
【中文关键词】棉花;纤维伸长;微阵列;李氏无纤维
【英文关键词】Cotton;Fiber elongation;Microarray;Ligon lintless-1
【中文摘要】摘要
【英文摘要】Fiber length is a key determinant of cotton yield and quality. Using a monogenic dominant cotton mutant Ligon lintless-1 with extremely short fibers, we employed microarray technology and quantitative real time PCR to compare transcriptomes of Li1 and the normal wild-type TM-1, the results showed that only a few genes differentially expressed in 0 days postanthesis (DPA) ovules and 3 DPA fibers, whereas 577 transcripts differentially expressed in 6 DPA fibers. 6 DPA is probably a key phase determining fiber elongation. Gene ontology analyses showed such processes as response to stimulus, signal transduction, and lipid metabolism were readjusted by themutant gene. Pathway studio analysis indicated that auxin signaling and sugar signaling pathways play major roles in modulation of early fiber elongation. This work provides new insight into the mechanisms of fiber development, and offers novel genes as potential objects for genetic manipulation to achieve improvement of fiber properties.

【题目】韭山列岛附近海域渔业资源分析
【中文关键词】关键词: 韭山列岛附近海域; 渔获水生动物; 资源量指数; 优势种
【英文关键词】Key words: Sea area around the Jiushan Archipelago; catches; abundance index; dominant species
【中文摘要】摘 要: 根据浙江省海洋水产研究所于2005年11月至2006年10月在韭山列岛附近海域四个航次的底拖网调查资料,结合2006年定置刺网调查资料和张网与灯光围网监测资料,对该海域的渔业资源状况进行了分析。结果表明:四种作业方式共捕获水生动物119种,其中,鱼类72种,虾蟹类29种,头足类6种,其他类(包括腹足纲、双壳纲及甲壳纲中的虾蛄科) 12种 ,隶属于3门, 6纲, 22目, 66科。其中,拖网调查共捕获水生动物77种,其中鱼类41种,虾蟹类21种,头足类3种,其他类12种,隶属于3门, 6纲, 18目, 45科。拖网调查渔获的水生动物中鲈形目的数量达22种,明显高于其他目的鱼类数量。拖网各航次各类群的资源尾数密度指数与资源重量密度指数的最大值分别出现在5月份和10月份。拖网渔获水生动物的优势种: 4月份为日本鼓虾、日本蟳与鲅鱼; 5月份为六丝钝尾鳅虎鱼,日本鼓虾与日本蟳; 10月份为龙头鱼、口虾蛄、日本蟳、棘头梅童鱼与中华管鞭虾; 11月份为棘头梅童鱼、日本鼓虾、口虾蛄与海鳗。
【英文摘要】Abstract:Based on the investigated data taken from trawl, gillnet, swing net and purse seine duringNovember 2005 to October 2006, conducted by the Marine Fisheries Research Institute of Zhejiang Province, the condition of the fishery resources in the sea area around the J iushan Archipelago was analyzed. It came to the conclusions that 119 species of aquatic animalswere caught, which belonged to 66 families, in 22 orders, 6 classes and 3 phylums. Among them there were 77 species of aquatic animals belonging to 45 families in 18 orders caught by trawl, of which 41 species were fishes, 21 species were crustaceans, 3 species were cephalopodas, and 12 specieswere other invertebrates. The number of fish species of perciformes in the four trawl investigating trip s was 23, obviously more than that in the other orders. In all trawl trip s, the weight abundance density index in October 2006 was the highest, the number abundance density index was the highest inMay 2006 and the dominant species composition were A lpheus japonicus, Charybd is japonica and M iichthys m iiuy in Ap ril; Am blychaeturichthys hexanem a, A lpheus japonicus and Charybdis japonica in May;Harpodon nehereus, O ratosquilla ora toria, Charybdis japonica, Collichthys lucida and Solenocera crassicornis in October; Collichthys lucida, A lpheus japonicus, O ratosquilla oratoria andM uraenesox cinereus in November.

【题目】东海区适宜增殖放流种类的筛选与应用
【中文关键词】关键字:东海区;增殖放流;种类筛选
【英文关键词】Key words: The East China Sea ; enhencement and releasing ; species selection
【中文摘要】摘要:围绕选种的 “ 技术可行 ”、“ 生物安全 ”、“ 生物多样性 ”、“ 兼顾效益 ” 四个筛选原则,结合东海区各海域生物资源特点和海况实际,初步筛选出大黄鱼、海蜇、日本对虾、曼氏无针乌贼、三疣梭子蟹、黑鲷等多个品种为东海区最理想放流品种。对放流海区生态容纳量和生物种间相容性,苗种、环境适应和栖息地问题,制定标准技术规范等的探讨可供其他海区和其它种类增殖放流时借鉴。实行多种类综合开发,发展多种生产方式的综合性海洋增殖渔业,以充分发挥水域的生态效益。
【英文摘要】Abstract:Based on the 4 species selection principles of “ technical feasibility ”、“ biosafety ”、“ biodiversity ” and “ benefit consideration ”. Combined with characteristic of biological resources and actual sea state of different areas in the East China Sea. The results showed that most ideal released species was preliminarily selected, which was Pseudosciaena crocea、Rhopilema esculentum、Penaeus japonicus、Sepiella japonica、Portunus trituberculatus、Sparus macrocephalus, etc.. Discuss on a series of problems about ecosystem carrying capacity and interspecific compatibility in released areas, seed rearing 、environmental adaptation and habitat availability , constituting standard technical criterion can be used for reference on other sea areas and other species. Carrying out multicategory comprehensive exploitation, developing multiple way of mode of production on enhancement of fishery resources can play an important role in ecological benefit sufficiently.

【题目】Comparative proteomic analysis reveals the mechanisms governing cotton fiber differentiation and initiation
【中文关键词】棉花;胚珠;纤维;发育;无纤维突变体;蛋白质组
【英文关键词】Cotton;Ovule;Fiber;Development;Fuzzless – lintless mutant;Proteome
【中文摘要】摘要
【英文摘要】Cotton fibers are single-celled seed trichomes and provide an ideal model for studying plant cell patterning. At present, the molecular mechanisms of fiber differentiation and initiation are unclear. To determine the proteins involved in these processes, a comparative proteomic analysis based on 2-DE and MS/MS technology was conducted between the fuzzless – lintless mutant (fl) and its parental wild type (WT). Forty-six differentially expressed proteins were identified in ovules at − 3 and 0 days post-anthesis (DPA), at the times of cotton fiber differentiation and initiation, respectively. Most of the proteins (72%) were expressed at lower levels in the fl mutant than in the WT, suggesting deleterious effects of the mutant genes on ovule development. The consistency between protein levels and transcript levels was examined using quantitative PCR. The differentially expressed proteins had diverse putative functions related to redox homeostasis, stress responses, post-transcriptional and post-translational regulation, and carbohydrate, energy, protein, amino acid, and sterol metabolism. A strong burst of ROS was detected on the surface of − 3 and − 2 DPA fl ovules, and the concentrations of several carbohydrates at 0 DPA were lower in the fl mutant than in the WT ovules. These findings suggest that ROS homeostasis may be a central regulatory mechanism for cotton fiber morphogenesis and that post-transcriptional and posttranslational regulation may be pivotal in this process.

【题目】浙南潮间带大型底栖藻类时空分布及多样性研究
【中文关键词】关键词: 浙南; 大型底栖藻类; 物种; 生物量; 优势度; 多样性指数

【英文关键词】Key words: southern Zhejiang; benthic macro-algae; species; biomass; dominance; diversity index
【中文摘要】摘要: 在浙南地区布设10 条断面开展春秋航次潮间带大型底栖藻类调查, 重点对大型底栖藻类的时空分布及多样性进行研究。共鉴定出大型底栖藻类61 种, 其中包括绿藻门8 种, 褐藻门16 种, 红藻门36 种, 蓝藻门1 种, 区系特征明显, 大型底栖藻类的季节演替也非常明显, 春季的物种数(53 种)明显高于秋季(25 种), 而两个季节都出现的物种只有17 种。浙南大型底栖藻类平均生物量为540.16g · m − 2, 春季(722.18g · m − 2)明显高于秋季(358.14g · m − 2);从垂直分布来看, 秋季与春季各断面生物量也并不相同, 秋季低潮区739.45g · m − 2>中潮区334.95g · m − 2>高潮区0g · m − 2; 春季中潮区1 943.30g · m − 2>低潮区965.03 g · m − 2>高潮区290.41g · m − 2。从物种优势度可以看出, 两个季节的主要优势种有相同之处, 但它们在群落的功能地位上随着季节有着较大的变化, 如春季鼠尾藻Sargassum thunbergii(Mert.) O. Kuntze 是第1 优势种, 而秋季却成第2 优势种。Shannon-Winner 指数(H ′)、Margalef 物种丰富度指数(d)和Pielou 均匀度指数(J ′) 的平均值秋季分别为1.38±0.66、0.70±0.38、0.93±0.41,春季分别为1.65±1.09、1.07±0.63、0.80±0.38。各断面多样性相差较大, 这与浙南各断面的大型底栖藻类的稳定和复杂性有很大关系, 这一点从群落结构聚类分析也得到验证。
【英文摘要】Abstract: The authors investigated the spatiotemporal distribution of intertidal benthic macro-algae and their diversity in 10 sections of southern Zhejiang province in autumn 2006 and spring 2007. The results showed that 61 species of benthic macro-algae were collected, including eight Chlorophyta, 16 Phaeophyta, 36 Rhodophyta and one Cyanophyta. Flora characteristic of the benthic alga distribution was very obvious in the inter-tide of southern Zhejiang, and it also changed obviously with seasons in species composition and biomass of benthic algae. More species were found in spring (53 species) than in autumn (25 species), among which only 17 species existed in both of these two seasons. The average biomass of intertidal benthic marco-algae was 540.16g · m − 2 in southern Zhejiang, and there was more biomass in spring (722.18g · m − 2) than in autumn (358.14g · m − 2). As for the vertical distribution of biomass, it was also different in the 10 sections during the two seasons.In autumn, the biomass of intertidal benthic marco-algae was in the order of low intertidal zone (739.45g · m − 2)> middle intertidal zone (334.95g · m − 2)> high intertidal zone (0g · m − 2); in spring it was sequenced as middle intertidal zone (1 943.30g · m − 2)>low intertidal (965.03g · m − 2) > high intertidal zone (290.41g · m − 2). There was something in common for the dominant species in the two seasons in terms of dominance, but their functions in the community changed greatly with seasons. For example, Sargassum thunbergii (Mert.) O. Kuntze was the first dominant species in spring, but it was the second in autumn. The averages of Shannon-winner index, Margalef ’s species richness index and Pielou ’s evenness index were 1.38±0.66, 0.70±0.38 and 0.93±0.41 in autumn, and 1.65±1.09, 1.07±0.63, 0.80±0.38 in spring, respectively. There was great difference in diversity of benthic marco-algae among sections, which was related to the stability and complexity of benthic marco-algae in southernZhejiang, as certified by the cluster analysis.

【题目】朱家尖人工鱼礁区鱼类和大型无脊椎动物群落结构变动初探
【中文关键词】关键词:朱家尖;人工鱼礁;鱼类和大型无脊椎动物;群落结构
【英文关键词】Key words:Zhujiajian;artificial reef;fish and macroinvertebrate;community structure
【中文摘要】摘要: 基于2002年朱家尖建礁水域的本底调查和2005~2006年4个航次跟踪调查数据,初步探讨了朱家尖人工鱼礁海域投礁前后鱼类和大型无脊椎动物的组成、优势种和群落结构变化。结果表明,投礁后出现的种类数为投礁前的2.8倍,鱼礁海域采集到鱼类和大型无脊椎动物53种,由鱼类、甲壳类和软体类3大类组成,鱼类和甲壳类分别占调查种类的49%和45%;投礁前后,甲壳类优势种发生了很大变化,从低值虾类转变成以日本鼓和日本鼓虾等经济虾蟹类为主;甲壳类为拖网渔获的主要构成部分;投礁前后鱼类和大型无脊椎动物种类组成具有相近的群落多样性测度值,但皆未达到中等相似水平,优势种在不同月份差异大。人工鱼礁的建设使石首鱼科种类和岩礁性鱼类增加明显,鱼礁生境既具有维持固有种类的优势,还可为更多生物提供栖息地。
【英文摘要】Abstract:Based on the data from background investigation in 2002 and from the four follow-up voyages carried out in the artificial reef(AR) waters of Zhujiajian during 2005 and 2006. The diversity index and relevant multivariate statistics methods were used to deal with data analysis, which discussing preliminary on fish and large invertebrates composition, dominant species and change of community structure before and after the deployment of AR waters. Species number after the deployment of ARs are 2.8 times than before, A total of 53 species of fish and large invertebrates sampled in artificial reef sea areas were identified, which composed of fish,

crustaceans and molluscs 3 major categories, Most of them were fish and arthropods, which accounted for 49% and 45 % in the total survey species; Great changes had taken place on dominant species of crustaceans after the deployment of ARs, low-value shrimp turned into economic shrimps and crabs (eg, Charybdis japonica, Alpheus japonicus); Crustaceans are the main components of trawl catches; There was a similar measure of community diversity values of species composition before and after the deployment of ARs, but none of them reached the medium similarity level, the number of dominant species was varied in different months. The deployment of ARs had been made a large number of sciaenidae fish and rocky fish increased significantly, Additionally AR habitat could not only has the advantages of maintaining the inherent species, but also of offering more bio-available habitat.

【题目】基于多光谱遥感影像的表层土壤有机质
【中文关键词】多光谱 TM 影像 土壤有机质 空间格局
【英文关键词】multispectral TM image; soil organic matter; spatial pattern.
【中文摘要】利用多光谱 LandSat TM 遥感影像反演辽宁省阜新镇表层土壤有机质的空间格局,筛选出与土壤有机质分布相关的 TM 波段,分析并确定表层土壤有机质含量与 TM1、TM2 、TM3、TM4、TM5、TM6、TM7 波段亮度值(digital number,DN) 的相关关系,建立了土壤有机质含量的光谱预测模型. 结果表明: 研究区表层土壤有机质含量与 TM 4、TM 5 波段 DN 值呈极显著的负相关关系(r 分别为 -0. 617 和 -0. 623,P <0. 001) ,与 TM 3、TM 5 波段 DN 值之间满足负二次多项式回归关系(R2= 0. 9134,P < 0. 001) ; 基于 TM 3、TM 5 波段 DN 值的回归模型对研究区表层土壤有机质含量的预测结果可靠(R2= 0. 9151,P < 0. 001) . 研究区表层土壤有机质含量 <10 g · kg- 1的农田主要分布在山地边缘地带,而平坦地区农田表层土壤有机质含量一般 >10 g · kg- 1,部分达到 15 ~20 g · kg- 1
【英文摘要】Remotely sensed multispectral LandSat TM image was used to analyze the spatial patternof surface soil organic matter across the cropland in Fuxin Town of Liaoning Province. The properbands of the TM image that correlated with the distribution of surface soil organic matter were select-ed,and the quantitative relationships between surface soil organic matter and the digital number(DN) values of bands TM 1,TM 2,TM 3,TM 4,TM 5,TM 6,and TM 7 were analyzed and de-termined,which could be applied to establish a prediction model of surface soil organic matter. Itwas shown that the surface soil organic matter in study area had a strong negative correlation withthe DN values of TM 4 and TM 5 (r = - 0. 617 and - 0. 623,P < 0. 001),and an inverse secondorder polynomial regression with the DN values of TM 3 and TM 5 (R2= 0. 9134,P < 0. 001). Theregression model using the DN values of TM 3 and TM 5 could make a reliable prediction of the spa-tial pattern of surface soil organic matter (R2= 0. 9151,P < 0. 001). Across the study area,thecropland with soil organic matter content less than 10 g · kg- 1was mainly distributed in the zones athill foot,while that with surface soil organic matter content usually more than 10 g · kg- 1and partlyreached 15 - 20 g · kg- 1was in flat zone.

【题目】曼氏无针乌贼荧光标记技术初步研究
【中文关键词】关键词:曼氏无针乌贼;茜素络合指示剂;荧光标记
【英文关键词】Key words: Sepiella maindroni; ALC; fluorescent marking
【中文摘要】摘要:通过在曼氏无针乌贼幼体(胴长2.0-3.0 cm)背部注射浓度为350 mg/L 的茜素络合指示剂(Alizarin Complexone,ALC)溶液,以实现对其内壳的染色标记。将标记组与对照组幼体各125 头饲养于同一养殖试验池(370 cm×370

cm×140cm)内,并分别于标记后的第0 d、10 d、20 d、30 d、40 d、50 d 对2 组个体进行随机取样,测量其胴长、胴宽、体重、壳长、壳宽、壳重6 个生物学指标,观察内壳标记色保持情况并记录死亡率。将结果进行方差分析后显示,荧光注射标记方法对曼氏无针乌贼的成活率和生长发育均没有显著影响(P>0.05);至乌贼发育成熟并产卵时,紫红色的椭圆形标记依然清晰可见,从外部透过皮肤也具有可视的直观效果,保持率为100%。荧光注射标记法适用于曼氏无针乌贼的标记,具有成本低、操作简单、标记色易识别等优点,可进行批量标记试验。

【英文摘要】Abstract: 350 mg/L alizarin complexone (ALC) was injected into the back of the larval cuttlefish(torso length 2.0-3.0 cm) to dye the cuttlebone directly in order to observe the change of the marker and the growth index of the cuttlefish. The tagged group and control group (125 ind/group) were reared in a 370 cm×370 cm×140 cm indoor pond after being tagged, then sampled when being tagged after 0 d, 10 d, 20 d, 30 d, 40 d and 50 d to record the growth, death, and the dye-retention. The results showed that there were no significant differences between the tagged group and the control group (P>0.05) in growth and death rate respectively; the amaranth oval tag was very clear in the cuttlebone even when they were in spawning time after being tagged 50 d. In conclusion, due to the lower cost, maneuverability and cognoscibility of this method, lots of samples could be tagged easily at a time, and make a 100% retention rate when recapture. Injectable fluorescent tags could be a suitable marking method for Sepiella maindroni.

【题目】舟山海域黑鲷标志放流试验
【中文关键词】关键词:黑鲷;金属线码标记;荧光标记;挂牌标记;放流; 回捕率;舟山海域
【英文关键词】Key words:Sparus macrocephalus;coded wire tag;visible implant elastomer tag;scutcheon tag;Releasing;recapture rate;Zhoushan sea area
【中文摘要】摘 要:2004年~2006年分别采用金属线码标记、荧光色素可见式标记(荧光标记)和挂牌标记三种方法,在舟山海域进行黑鲷Sparus macrocephalus标志放流试验,三年内共放流标志黑鲷17616尾,平均体长131.9 mm,平均体重46.46 g。结果表明:挂牌标记的死亡率和脱标率最高,荧光和挂牌标志鱼只获得当年回收,回捕率分别为0.16 %和0.64 %,没有捕获金属线码标志鱼,说明在开放性的水域,总体回捕结果不佳,金属线码标记法不适合黑鲷放流;标志黑鲷移动范围不大,最远不超过15海里,栖息地具有明显的区域性;标志鱼放流后2个月左右生长缓慢,此后生长加快。本试验基本达到标志放流的预期目的。
【英文摘要】Abstract:The experiment of tagging and releasing Sparus macrocephalus (Basilewsky) was carried out in 2004, 2005 and 2006 using three tagging methods of coded wire tag, visible implant elastomer tag and scutcheon tag respectively in the Zhoushan sea area. In 3 years, 17616 Sparus macrocephalus with average body length of 131.9 mm and average body weight of 46.46 g were tagged

and released. The mortality and lost tag rate of scutcheon tag is the highest of all, The fish with visible implant elastomer tag and scutcheon tag were recaptured in the same year and the recapture rate were 0.16 % and 0.64 % respectively, and there has no reception of fish with coded wire tag. All the results showed that in the open sea area the recapture rate was low, and the wire tag was not fit for the tagging and releasing of Sparus macrocephalus. Otherwise, the migration area of the tagged Sparus macrocephalus was small and the longest instance was 15 nautical miles and the territorial habitat was distinct. In addition the tagged Sparus macrocephalus grow slowly in 2 months after released and then grow faster. All desired results were obtained in this experiment.

【题目】尿素氮形态转化对腐殖酸的响应
【中文关键词】腐殖酸; 尿素水解; 硝化作用; 氮转化
【英文关键词】Humic acid; Urea hydrolysis; Nitrification; N transformation
【中文摘要】通过模拟试验研究了不同用量腐殖酸对土壤中尿素氮形态转化的影响。结果表明,腐殖酸对尿素态氮形态转化的影响受其施用量的制约。与对照相比,低浓度腐殖酸(< 15 g kg-1)对尿素水解及以后的氮转化过程抑制作用较小,有时甚至促进了尿素水解;高浓度腐殖酸(15 g kg-1和 20 g kg-1)则能明显的抑制尿素水解,延长尿素态氮在土壤中的停留时间,增加铵态氮含量,减少硝态氮的生成及氮素损失量,大大提高尿素利用效率。由此可见,腐殖酸不仅是一种脲酶抑制剂,还是一种硝化抑制剂。
【英文摘要】By simulation, an experiment was conducted to study the effects of different application amounts of humicacid on urea-N transformation. The results showed that the effectiveness of humic acid on urea-N transformationmainly depended on its application amount. Compared with control, lower application amount (<15 g kg-1) of humicacid had little inhibition on urea hydrolysis and thereafter N transformation processes, and even a positive effect wasobserved on urea hydrolysis. On the contrary, higher application amount (15 g kg-1and 20 g kg-1) of humic acidsignificantly retarded urea hydrolysis, prolonged the lasting time of urea-N in soil, increased the amount of NH4+-N,and decreased the amount of NO3--N and the loss of fertilizer N, which increased the use efficiency of fertilizer N. Itseemed from the results that humic acid was not only a urease inhibitor but also a nitrification inhibitor with apromising prospect.

【题目】用营养动态模式估算东海区大陆架渔场渔业资源蕴藏量
【中文关键词】关键词: 营养动态模式; 资源量; 可捕量; 营养级; 大陆架渔场; 东海区
【英文关键词】Key words: trophic level method; biomass; allowable catch; trophic level; continental fishing grounds;East China Sea
【中文摘要】摘要: 引用在东海区渔场进行的“海洋生物资源补充调查和资源评价”获得的初级生产力调查结果, 综合已有的研究数据, 采用PARSONS 和CUSHING 营养动态模式, 对东海区渔场的渔业资源蕴藏量进行了估算。结果表明: 1996~2005 年东海区大陆架渔场渔业资源平均营养级为3.531 级, 近10 年渔业资源年平均蕴藏量为836×104 t, 可捕量为418×104 t 左右; 其中东海陆架渔场平均资源量为591×104 t, 可捕量296×104 t; 黄海南部平均资源量为245×104 t, 可捕量123×104 t。2002~2005年东海区大陆架渔场平均资源蕴藏量为855×104 t, 可捕量为428×104 t 左右; 东海区大陆架单位面积渔业资源蕴藏量为14.59 t/km2, 可捕量7.5 t/km2; 有机碳与鱼的比例为10.32: 1, 在世界各渔场中均属于较高水平; 东海的单位面积渔业资源蕴藏量为8.89 t/km2, 东海区海域单位面积渔业资源蕴藏量为10.20 t/km2, 可捕量分别为4.5 t/km2 和5.1 t/km2, 高于黄渤海区和南海, 略低于福建海区。目前东海区大陆架渔场的年渔获量已达750×104 t 左右, 远远超过估算的420×104 t 左右年可捕量水平, 使渔业资源始终处于过度捕捞状态。要使渔业资源恢复到良好状态, 至少要减少目前40%的渔获量。
【英文摘要】Abstr act: Based on the survey results of primary production and other research data in the fishing grounds of the East China Sea, biomass of continental fishery resources were estimated using Parsons and Cushing trophic level method. Results showed that average trophic level of continental fishery resources were 3.531 during 1996- 2005, and that annual biomass amounted to 8.36 million tons and allowable catch 4.18 million tons for the recent decade in the East China Sea. Average annual biomass of continental fishery resources in the East China Sea reached at 5.91 million tons and allowable catch 2.96 million tons. In the southern areas of Yellow Sea, average annual biomass of fishery resources were estimated at 2.45 million tons and allowable catch 1.23 million tons. But during 2002- 2005, annual biomass of continental fishery resources went up to 8.55 million tons and allowable catch 4.28 million tons in the East China Sea. Abundance index of continental fishery resources were 14.59 tons per square kilometer and catchable rate were 7.3 tons per square kilometer. The ratio of organic carbon to fish was 10.32:1, which belonged to considerable high level in the global fishing grounds. Abundance index of fishery resources were 8.89 tons per square kilometer in the whole East China Sea and in the fishing areas were 10.20 tons per square kilometer. Catchable rate were 4.5 and 5.1 tons per square kilometer respectively in the above two areas, which was higher than that of Yellow Sea and Bohai and South China Sea, but slightly lower than that of Fujian areas. So far, annual catch of continental fishery resourceshad hit 7.5 million tons and far exceeded the allowable catch of estimated 4.2 million tons, which make the fishery resources overfishing status. In order to make the fishery resources in heathy status, current catch should be at least reduced 40%.

【题目】Mapping Quantitative Trait Loci Associated with Aluminum Toxin Tolerance in NJRIKY Recombinant Inbred Line Population of Soybean (Glycine max)

【中文关键词】无
【英文关键词】aluminum toxin tolerance; membership index; quantitative trait loci; recombinant inbred line population; soybean
【中文摘要】无
【英文摘要】To investigate the genetic mechanism of Al-tolerance in soybean, a recombinant inbred line population (RIL) with 184 F(2:7:11) lines derived from the cross of Kefeng No.1 x Nannong 1138-2 (Al-tolerant x Al-sensitive) were tested in pot experiment with sand culture medium in net room in Nanjing. Four traits, i.e. plant height, number of leaves, shoot dry weight and root dry weight at seedling stage, were evaluated and used to calculate the average membership index (FAi) as the indicator of Al-tolerance. The composite interval mapping (CIM) under WinQTL Cartographer v. 2.5 detected five QTLs (i.e. qFAi-1, qFAi-2, qFAi-3, qFAi-4 and qFAi-5), explaining 5.20%-9.07% of the total phenotypic variation individually. While with the multiple interval mapping (MIM) of the same software, five QTLs (qFAi-1, qFAi-5, qFAi-6, qFAi-7, and qFAi-8) explaining 5.7%-24.60% of the total phenotypic variation individually were mapped. Here qFAi-1 and qFAi-5 were detected by both CIM and MIM with the locations in a same flanking marker region, GMKF046-GMKF080 on B1 and satt278-sat_95 on L, respectively. While qFAi-2 under CIM and qFAi-6 under MIM both on D1b2 were located in neighboring regions with their confidence intervals overlapped and might be. the same locus. Segregation analysis under major gene plus polygene inheritance model showed that Al-tolerance was controlled by two major genes (h(mg)(2) = 33.05%) plus polygenes (h(pg)(2) = 52.73%). Both QTL mapping and segregation analysis confirmed two QTLs responsible for Al-tolerance with relatively low heritability, and there might be a third QTL, confounded with the polygenes in segregation analysis.

【题目】Genetic diversity, geographic differentiation and evolutionary relationship among ecotypes of Glycine max and G. soja in China
【中文关键词】无
【英文关键词】cultivated soybean [Glycine max (L.) Merr.]; wild soybean [G. soja Sieb. et Zucc.]; geographic ecotype; genetic diversity; genetic peculiarity; genetic differentiation; evolutionary relationship
【中文摘要】无
【英文摘要】The knowledge of origin and evolution of cultivated soybeans is one of the basic issues in both biology and agronomy of the crop. In order to investigate the nuclear and cytoplasmic genetic diversity, geographic differentiation and genetic relationship among geographic ecotypes of cultivated (Glycine max) and wild (G. soja) soybeans, the allelic profiles at 60 nuclear simple-sequence repeat (nuSSR) loci and 11 chloroplastic SSR (cpSSR) loci evenly distributed on whole genome of 393 landraces and 196 wild accessions from nation-wide growing areas in China were analyzed. (1) The genetic diversity of the wild soybean was obviously larger than that of the cultivated soybean, with their nuSSR and cpSSR alleles as 1067 vs. 980 and 57 vs 44, respectively. Of the 980 nuclear alleles detected in the cultivated soybean, 377 new ones (38.5%) emerged, while of the 44 chloroplastic alleles in the cultivated soybean, seven new ones (15.9%) emerged after domestication. (ii) Among the cultivated geographic ecotypes, those from southern China, including South-Central China, Southwest China and South China possessed relatively great genetic diversity than those from northern China, while among the wild geographic ecotypes, the Middle and Lower Changjiang Valleys wild ecotype showed the highest genetic diversity. (iii) The analysis of molecular variance, association analysis between geographic grouping and molecular marker clustering and analysis of specific-present alleles of ecotypes demonstrated that the geographic differentiation of both cultivated and wild soybeans associated with their genetic differentiation, or in other words, had their relevant genetic bases. (iv) The cluster analysis of all accessions clearly showed that the wild accessions from Middle and Lower Changjiang Valleys and South-Central & Southwest China had relatively small genetic distances with all cultivated accessions. The UPGMA dendrogram among geographic ecotypes further showed that the genetic distances between all cultivated ecotypes and the Middle and Lower Changjiang Valleys wild ecotype were smaller than those with other wild ones, including their local wild counterparts. Therefore, it is inferred that the wild ancestors in southern China, especially those from Middle and Lower Changjiang Valleys might be the common ancestor of all the cultivated soybeans.

【题目】Somatic embryo genesis and plant regeneration in Chinese soybean (Glycine max(L.) Merr.) —impacts of mannitol,abscisic acid, and explant age
【中文关键词】无
【英文关键词】Somatic embryogenesis,Manni tol.Abscisic acid,Enzyme-linked immunosorbent assay
【中文摘要】无
【英文摘要】From a preliminary experiment on 98 Chinese soybean varieties, 12 varieties with somatic embryogenesis frequency ranging from 0.0% to 85.7% were selected for further study in order to enhance the efficiency of somatic embryogenesis and plant regeneration. The effects of different mannitol concentrations, abscisic acid (ABA) concentrations,and embryo explant ages (sizes) were investigated. Significant differences in somatic embryogenesis were found among the 12 soybean varieties, with initiation frequencies varying from 22.1% to 89.0% under suitable mannitol concentration, and with N25281, N25263, and N06499 having the highest somatic embryogenic capacity. The results showed that all three factors were relevant for raising rates of callus initiation and somatic embryogenesis, but with differential responses among the genotypes. The treatment of 3.0% (w/v)mannitol,5mgl − 1ABA, and a 4- to 5-mm-sized explant was found to be optimal for somatic embryogenesis, generating the highestexplant-bas ed regeneration rate at 83.0%. The greatest average number of plantlets regenerated per explant (1.35) was observed in N25281. The above results provide a basis for efficient regeneration of soybean and are informative for the development of geneti c tr ansformati on systems in Chinese soybean germplasm.

【题目】Mapping quantitative trait loci for b inary trait in the F2: 3 design
【中文关键词】无
【英文关键词】binary trait; F-2:3 design; liability model; maximum likelihood; Monte-Carlo simulation; penetrance model
【中文摘要】无
【英文摘要】In the analysis of inheritance of quantitative traits with low heritability, an F-2:3 design that genotypes plants in F-2 and phenotypes plants in F-2:3 progeny is often used in plant genetics. Although statistical approaches for mapping quantitative trait loci (QTL) in the F-2:3 design have been well developed, those for binary traits of biological interest and economic importance are seldom addressed. In this study, an attempt was made to map binary trait loci (BTL) in the F-2:3 design. The fundamental idea was: the F-2 plants were genotyped, all phenotypic values of each F-2:3 progeny were measured for binary trait, and these binary trait values and the marker genotype informations were used to detect BTL under the penetrance and liability models. The proposed method was verified by a series of Monte-Carlo simulation experiments. These results showed that maximum likelihood approaches under the penetrance and liability models provide accurate estimates for the effects and the locations of BTL with high statistical power, even under of low heritability. Moreover, the penetrance model is as efficient as the liability model, and the F-2:3 design is more efficient than classical F-2 design, even though only a single progeny is collected from each F-2:3 family. With the maximum likelihood approaches under the penetrance and the liability models developed in this study, we can map binary traits as we can do for quantitative trait in the F-2:3 design.

【题目】Reconstruction of linkage maps in the distorted segregation populations of backcross, doubled haploid and recombinant inbred lines
【中文关键词】无
【英文关键词】segregation population; distorted segregation; genetic maps; viability selection; EM algorithm
【中文摘要】无
【英文摘要】Non-Mendelian segregation of markers, known as distorted segregation, is a common biological phenomenon. Although segregation distortion affects the estimation of map distances and the results of quantitative trait loci (QTL) mapping, the effects of distorted markers are often ignored in the construction of linkage maps and in QTL mapping. Recently, we have developed a multipoint method via a Hidden Markov chain method to reconstruct linkage maps in an F2 population that corrects for bias of map distances between distorted markers. In this article, the method is extended to cover backcross, doubled haploid and recombinant inbred line (RIL) populations. The results from simulated experiments show that: (1) the degree that two linked segregation distortion loci (SDL) affect the estimation of map distances increases as SDL heritability and interval length between adjacent markers increase, whereas sample size has little effect on the bias; (2) two linked SDL result in the underestimation of linkage distances for most cases, overestimation for an additive model with opposite additive effects, and unbiased estimation for an epistatic model with negative additive-by-additive effects; (3) the proposed method can obtain the unbiased estimation of linkage distance. This new method was applied to a rice RIL population with severely distorted segregation to reconstruct the linkage maps, and a bootstrap method was used to obtain 95% confidence intervals of map distances. The results from real data analysis further demonstrate the utility of our method, which provides a foundation for the inheritance analysis of quantitative and viability traits.

【题目】Advances on methods for mapping QTL in plant
【中文关键词】无
【英文关键词】QUANTITATIVE-TRAIT LOCI; RICE ORYZA-SATIVA; CHAIN MONTE-CARLO; MARKER-FACILITATED INVESTIGATIONS; COMPLEX BINARY TRAITS; GENETIC ARCHITECTURE; MAXIMUM-LIKELIHOOD; ENDOSPERM TRAITS; HEADING DATE; DEVELOPMENTAL BEHAVIOR
【中文摘要】无
【英文摘要】Advances on methods for mapping quantitative trait loci (QTL) are firstly summarized. Then, some new methods, including mapping multiple QTL., fine mapping of QTL, and mapping QTL for dynamic; traits, are mainly described. Finally, some future prospects are proposed, including how to dig novel genes in the germplasm resource, map expression QTL (eQTL) by the use of all markers, phenotypes and micro-array data, identify QTL using genetic mating designs and detect viability loci. The purpose is to direct plant geneticists to choose a suitable method in the inheritance analysis of quantitative trait and in search of novel genes in germplasm resource so that more potential genetic information can be uncovered.

【题目】Influence of outliers on QTL mapping for complex traits
【中文关键词】无
【英文关键词】QTL mapping, Outliers and influential observations, Complex trait
【中文摘要】无.
【英文摘要】A method was proposed for the detection of outliers and influential observations in the framework of a mixed linear model, prior to the quantitative trait locus (QTL) mapping analysis. We investigated the impact of outliers on QTL mapping for complex traits in a mouse BXD population, and observed that the dropping of outliers could provide the evidence of additional QTL and epistatic loci affecting the 1stBrain-OB and the 2ndBrain-OB in a cross of the abovementioned population. The results could also reveal a remarkable increase in estimating heritabilities of QTL in the absence of outliers. In addition, simulation s were conducted to investigate the detection powers and false discovery rates (FDRs) of QTLs in the presence and absence of outliers.The results suggested that the presence of a small proportion of outliers could increase the FDR and hence decrease the detection power of QTLs. A drastic increase could be obtained in the esti mates of standard errors for position, additive and additive environment interaction effects of QTLs in the presence of outliers.

【题目】Relationships between differential gene expression and heterosis in cotton hybrids developed from the foundation parent CRI-12 and its pedigree-derived lines
【中文关键词】无
【英文关键词】GENOME-WIDE EXPRESSION; MOLECULAR-BASIS; DIALLEL CROSS; AFLP ANALYSIS; MAIZE; LEAVES; WHEAT; PATTERNS; INBREDS; L.
【中文摘要】无
【英文摘要】CRI-12, an Upland cotton variety with high yield, elite fiber quality and disease resistance, is further characterized by its high heritability, combining ability and genetic stability. CRI-12 and its pedigree-derived lines were used to develop increased heterosis cotton hybrids, including CRI-28, CRI-29, XZM 2 and Jimian18.CRI-12 was chosen as the cotton foundation parent and analyzed by gene differential expressions between hybrids and their corresponding parents at seedling, squaring and flowering stages. The following approaches were considered the most viable candidates to elucidate the molecular basis of CRI-12: cDNA-amplified fragment length polymorphisms (cDNA-AFLPs), gene differential expression ratios, and vegetative growth heterosis and yield heterosis for correlation analysis. Theresults indicated that CRI-12 plays a predominant role in vegetative heterosis in CRI-28, CRI-29 and Jimian18 hybrids at the seedling and squaring stages; thepercentage of dominant expression in single parents was greater than other patterns; downregulated expression in single parents was higher than upregulatedexpression in hybrids, and downregulated expression in hybrids was the lowest of the four patterns in the three growth stage cumulative totals. The gene differentialexpression ratio of hybrids and parents varied for the three growth stages, suggesting gene differential expression changes over time. Further analysis of differentialgene expression ratios, vegetative growth and yield heterosis correlation revealed upregulated expression in hybrids were correlated with vegetative heterosis at theseedling and squaring stages, which play an important role in yield heterosis at the flowering stage. Downregulated expression in the maternal parent (CRI-12 andits pedigree-derived lines) suggested benefits in vegetative heterosis at the squaring stage, but a possible

hybrid yield decrease at the flowering stage. These results provided evidence that CRI-12 and its pedigree-derived lines express genes integral for heterosis in CRI-28, CRI-29 and Jimian18. (C) 2010 Elsevier Ireland Ltd. All rights reserved.

【题目】QTLs mapping for Verticillium wilt resistance at seedling and maturity stages inGossypium barbadense L.
【中文关键词】无
【英文关键词】COTTON GOSSYPIUM; ALLOTETRAPLOID COTTON; UPLAND COTTON; HIRSUTUM L.; FIBER QUALITY; LINKAGE MAP; TOLERANCE; EVOLUTION; DAHLIAE; GENES
【中文摘要】无
【英文摘要】Verticillium wilt (Verticillium dahliae) is a major concern for cotton producers and consumers. The major strategy to control disease has been the development of resistant varieties of Gossypium. To identify Verticilium resistant genes in cotton, we generated FZ and BC1 populations by crossing a tolerant cultivar of Gossypium barbadense var. Hai 7124 with a susceptible cultivar, Gossypium hirsutum var. Junmian 1. Individual plant reaction to disease was quantified using a leaf trait in the seedling stage and a vascular tissue trait in mature stage. Two genetic linkage maps were constructed with SSR, RGA and DDRT markers. Four QTLsfor the leaf trait, located on chr. A5, A7 and A8 and three QTLs for the vascular tissue trait on chr. A5, A7 and A9 were detected by composite interval mapping (CIM) in F-2 inoculated with a non-defoliating isolate BP2. BC1S2 families were planted separately and inoculated with the isolates, BP2, VD8 and 592. In the BP2 nursery, one QTL located on chr. D4 for the leaf trait and two QTLs on chr. D4 and A8 for the vascular tissue trait were detected. We detected two QTLs on chr. A5 and A8 forthe leaf trait and three QTLs on chr. A5, D5 and D11 for the vascular tissue trait in plants grown in the VD8 nursery. In the 592 nursery, three QTLs on chr. A5 and D5for the leaf trait and two QTLs on chr. D5 and D11 for the vascular tissue trait were detected. The present QTL mapping results revealed that two stable QTLs existed in different populations, four QTLs expressed at both the seedling and mature stages, and some QTLs controlling resistance to Verticillium wilt were located on different chromosomes and in different developmental stages for different isolates. The markers associated with these QTLs may facilitate the use of Verticillium wiltresistant genes in resistant breeding programs for cotton. (c) 2007 Elsevier Ireland Ltd. All rights reserved.

【题目】Identification and Distribution of Soybean mosaic virus Strains in Southern China
【中文关键词】无
【英文关键词】RESISTANCE; INHERITANCE; VIRULENCE; GENE
【中文摘要】无
【英文摘要】From 1,417 leaf samples with Soybean mosaic virus (SMV)-like symptoms collected from about 1,500 fields of 117 counties of 13 provinces in Southern Chinaduring 2004 to 2006, 201 SMV isolates were obtained after biological purification with single-lesion isolation and serological determination. Based on disease reactions on 10 differentials used in China as a representative from various reported differential cultivar systems, the isolates were grouped into 12 strains. Among them, eight were the same as those previously reported from Northeast China and the Huang-Huai Valleys while the other four were new and were designated as SC18, SC19, SC20, and SC21. Strains SC15 and SC18, which were predominant and widespread in Southern China, accounted for 32.3 and

26.4% of the total isolates and were distributed in 9 and 10 provinces, respectively. Thus far, 21 strains have been identified in the three soybean-producing regions in China under the uniform differentials system. According to their responses on the 10 differentials, the strains were clustered into five groups at similarity coefficient 0.6. Among them, SC15 in cluster V is the most virulent strain because it infects all differentials. Therefore, specific attention should be placed on control of its prevalence in soybeanproduction.

【题目】Unconditional and conditional QTL mapping for the developmental behavior of tiller number in rice (Oryza sativaL.)
【中文关键词】无
【英文关键词】Unconditional QTL mapping,Conditional QTL mapping,Developmental behavior,Tiller number,Rice (Oryza sativaL.)
【中文摘要】无
【英文摘要】A single segment substitution population of 26 lines and their recipient parent Hua-jing-xian 74 (HJX74) were selected as experimental materials for analyzing the developmental behavior of tiller number in rice. By the unconditional QTL (quantitative trait locus) mapping method, a total number of 14 SSSLs were detected with QTLs controlling rice tiller number. The number of QTLs significantly affecting tiller number and their effect values estimated differed across measuring stages. More QTLs could be detected based on time-dependent measures of different stages. By the conditional QTL mapping method, it is possible to reveal net expression of gene in a time interval. 14 QTLs on tiller number expressed their effects in dynamic patterns of themselves during whole ontogeny.They exhibited mainly negative effects within 7 days after transplanting. During 7 – 21 days, QTLs were in active status and expressed larger positive effects. In the mid-period of 21 – 35 days, they had opposite genetic effects to wither tillers. Since then these QTLs expressed positive effects again to cause the appearance of noneffective til-lers. The dynamics of QTL effects was in agreement with the actual change of tillers. Mapping QTL combining unconditional with conditional analysis for time-dependent measures is helpful to understand roundly the genetic bases for the development of quantitative traits.

【题目】Mapping Binary Trait Loci in the F2:3 Design
【中文关键词】无
【英文关键词】MAXIMUM-LIKELIHOOD; EM ALGORITHM; QUANTITATIVE TRAITS; INBRED LINES; DAIRY-CATTLE; GRAIN-YIELD; MARKER LOCI; POPULATIONS; LINKAGE; METHODOLOGY
【中文摘要】无
【英文摘要】In the inheritance analysis of quantitative trait with low heritability, the precision is relatively low. In this situation, an F-2:3 design, which is genotyped in F2 plants and phenotyped in the F2:3 progeny, is applied to increase the precision in the detection of quantitative trait loci (QTL). This is because that residual variance on thebasis of family-mean-based observations has been significantly decreased by increasing the number of F2:3 progeny. Our previous results showed that the mixture distribution for the F2,3 family of heterozygous F2 plant can significantly increase the power of QTL detection relative to the classical F2 design. In this article, we extended our previous method from continuous traits to binary traits in the F2:3 design. The method here also takes full advantage of the mixture distribution. However, the method presented here differs from our previous method in 2 aspects. One is that the penetrance

model is integrated with the liability model formapping binary trait loci (BTL), and another is that the phenotypic data used in the analysis are the sum of phenotypic values of F2:3 progeny derived from each F2plant rather than the average Of F2:3 progeny due to the fact that the distribution of the sum follows binomial distribution. in addition, the threshold in the liability model could also be estimated. Therefore, a new framework of mapping BTL on the basis of a single BTL model was set up and implemented via the Expectation-Maximization algorithm. Results of simulated studies showed that the proposed method provides accurate estimates for both the effects and the locations of BTL, with high statistical power even under the low heritability. With the new method, we are ready to map BTL, as we can do for quantitative traits under the F2:3 design.The computer program performing the analysis of the simulated data is available to users for real data analysis.

【题目】An EM algorithm for mapping segregation distortion loci
【中文关键词】无
【英文关键词】QUANTITATIVE TRAIT LOCI; MAXIMUM-LIKELIHOOD MODELS; INBREEDING DEPRESSION; VIABILITY SELECTION; MOLECULAR MARKERS; GENETIC-BASIS; LINKAGE MAPS; POPULATIONS; RICE; BACKCROSS
【中文摘要】无
【英文摘要】Background: Chromosomal region that causes distorted segregation ratios is referred to as segregation distortion locus (SDL). The distortion is caused either by differential representation of SDL genotypes in gametes before fertilization or by viability differences of SDL genotypes after fertilization but before genotype scoring. In both cases, observable phenotypes are distorted for marker loci in the chromosomal region close to the SDL. Under the quantitative genetics model for viability selection by proposing a continuous liability controlling the viability of individual, a simplex algorithm has been used to search for the solution in SDL mapping. However, they did not consider the effects of SDL on the construction of linkage maps. Results: We proposed a multipoint maximum-likelihood method to estimate the position and the effects of SDL under the liability model together with both selection coefficients of marker genotypes and recombination fractions. The method was implemented via an expectation and maximization (EM) algorithm. The superiority of the method proposed under the liability model over the previous methods was verified by a series of Monte Carlo simulation experiments, together with a working example derived from the MAPMAKER/QTL software. Conclusion: Our results suggested that the new method can serve as a powerful alternative to existing methods for SDL mapping. Under the liability model, the new method can simultaneously estimate the position and the effects of SDL as well as the recombinant fractions between adjacent markers, and also be used to probe into the genetic mechanism for the bias of uncorrected map distance and to elucidate the relationship between the viability selection and genetic linkage.

【题目】Molecular evidence for post-domestication selection in the Waxygene of Chinese waxy maize

【中文关键词】无

【英文关键词】Chinese waxy maize,Waxylocus ,Domestication selection,Selective sweep.Origin

【中文摘要】无

【英文摘要】Waxy maize was first reported in China in 1909 and is mainly used in food production in Asia.The evidence for strong domestication selection in the Waxylocus of rice and a selective sweep around its genomic region make us to wonder whether there has been similar selection in Waxyin glutinous maize. To address this issue, DNA sequences of Waxy, three flanking genes and an unlinked gene (Adh1)of 30 accessions sampled from Chinese waxy maize acces-sions, including representative landraces and inbred lines, were determined in this study. Sharp reduction of nucleotide diversity and significant neutrality tests (Tajima ’s D and Fu and Li ’s F *) were observed in the Waxy locus in Chinese waxy maize but not in nonglutinous maize; comparison with the unlinked gene confirmed that this pattern was different to Waxy. Sequence analysis across a 143 kb genomic segment centered on the Waxylocus revealed patterns consis-tent with a selective sweep in the upstream region of Waxy. The selective sweep detected based on current limited genomic sequences exceeded over 50 kb,indicating strong selection in this or a bigger region.However, No sweep effect was detected in the repetitive downstream region of Waxy. Phylogenetic analysis indicated that Chinese waxy maize was domesticated from the cultivated flint maize (Zea mays ssp. mays) that was introduced from the new world. At least two independent deletions in exon 7(30 bp) and 10 (15 bp) were identified in the Chinese accessions respectively. These findings demonstrate a similar pattern of domestication selection in the Waxy genomic region in both glutinous maize and rice,suggesting that this pattern in the rise of glutinous phenotype is likely in other cereal crops.

【题目】Functional mapping of quantitative trait loci associated with rice tillering

【中文关键词】无

【英文关键词】ORYZA-SATIVA L; PROGRAMMED CELL-DEATH; DEVELOPMENTAL BEHAVIOR; GENETIC DISSECTION; MOLECULAR MARKERS; DIALLEL ANALYSIS; QTLS; GROWTH; YIELD; NUMBER

【中文摘要】无
【英文摘要】Several biologically significant parameters that are related to rice tillering are closely associated with rice grain yield. Although identification of the genes that control rice tillering and therefore influence crop yield would be valuable for rice production management and genetic improvement, these genes remain largely unidentified. In this study, we carried out functional mapping of quantitative trait loci (QTLs) for rice tillering in 129 doubled haploid lines, which were derived from a cross between IR64 and Azucena. We measured the average number of tillers in each plot at seven developmental stages and fit the growth trajectory of rice tillering with the Wang-Lan-Ding mathematical model. Four biologically meaningful parameters in this model--the potential maximum for tiller number (K), the optimum tiller time (t (0)), and the increased rate (r), or the reduced rate (c) at the time of deviation from t (0)--were our defined variables for multi-marker joint analysis under the framework of penalized maximum likelihood, as well as composite interval mapping. We detected a total of 27 QTLs that accounted for 2.49-8.54% of the total phenotypic variance. Nine common QTLs across multi-marker joint analysis and composite interval mapping showed high stability, while one QTL was environment-specific and three were epistatic. We also identified several genomic segments that are associated with multiple traits. Our results describe the genetic basis of rice tiller development, enable further marker-assisted selection in rice cultivar development, and provide useful information for rice production management.

【题目】Functional mapping of genotype-environment interactions for soybean growth by a semiparametric approach
【中文关键词】无
【英文关键词】QUANTITATIVE TRAIT LOCI; PHENOTYPIC PLASTICITY; GENETIC ARCHITECTURE; COMPLEX TRAITS; STATISTICAL-MODEL; ONTOGENIC GROWTH; MULTIPLE LOCI; GENERAL-MODEL; FRAMEWORK; ALGORITHM
【中文摘要】无
【英文摘要】Background: Functional mapping is a powerful approach for mapping quantitative trait loci (QTLs) that control biological processes. Functional mapping incorporates mathematical aspects of growth and development into a general QTL mapping framework and has been recently integrated with composite interval mapping to build up a so-called composite functional mapping model, aimed to separate multiple linked QTLs on the same chromosomal region. Results: This article reports the principle of using composite functional mapping to estimate the effects of QTL-environment interactions on growth trajectories by parametrically modeling the tested QTL in a marker interval and nonparametrically modeling the markers outside the interval as co-factors. With this new model, we can characterize the dynamic patterns of the genetic effects of QTLs governing growth trajectories, estimate the global effects of the underlying QTLs during the course of growth and development, and test the differentiation in the shapes of QTL genotype-specific growth curves between different environments. By analyzing a real example from a soybean genome project, our model detects several QTLs that cause significant genotype-environment interactions for plant height growth processes. Conclusions: The model provides a basis for deciphering the genetic architecture of trait expression adjusted to different biotic and abiotic environments for any organism.

【题目】QTL mapping of yield and fiber traits based on a four-way cross population in Gossypium hirsutum L.
【中文关键词】无
【英文关键词】UPLAND COTTON; ALLOTETRAPLOID COTTON; LINKAGE MAP; GENOME; LOCI; EVOLUTION; ORGANIZATION; BARBADENSE; MARKERS
【中文摘要】无
【英文摘要】Four-way cross (4WC) involving four different inbred lines frequently appears in the cotton breeding programs. However, linkage analysis and quantitative trait loci (QTL) mapping with molecular markers in cotton has largely been applied to populations derived from a cross between two inbred lines, and few results of QTL dissection were conducted in a 4WC population. In this study, an attempt was made to construct a linkage map and identify QTL for yield and fiber quality traits in 4WC derived from four different inbred lines in Gossypium hirsutum L. A linkage map was constructed with 285 SSR loci and one morphological locus, covering 2113.3 cM, approximately 42% of the total recombination length of the cotton genome. A total of 31 QTL with 5.1-25.8% of the total phenotypic variance explained were detected. Twenty-four common QTL across environments showed high stability, and six QTL were environment-specific. Several genomic segments affecting multiple traits were identified. The advantage of QTL mapping using a 4WC were discussed. This study presents the first example of QTL mapping using a 4WC population in upland cotton. The results presented here will enhance the understanding of the genetic basis of yield and fiber quality traits and enable further marker-assisted selection in cultivar populations in upland cotton.

【中文摘要】摘要:目的:简历核桃外果皮中国总多酚含量的比色测定方法。方法:以没食子酸为对照品,ui测定核桃外果皮中总多酚含量的比色条件,包括检测波长、碳酸钠溶液用量、Folin-Ciocalteu试剂用量、反应温度及时间对吸光值的影响进行了研究。结果:对照品标准曲线在1-7um/ml范围内为y=0.1031x+0.0793, R2=0.9996,线性关系良好,测定方法为采用核桃外果皮中总多酚提取液1.0ml,Folin-Ciocalteu试剂1.0mL、15%的碳酸钠溶液4.0mL、30°C显色1.5h, 平均回收率为100.2%(RSD=0.91%)。此条件下测得核桃外果皮中总多酚含量为3.306mg/g。结论:该方法简便快速、结果准确、重现性和稳定性好,可用于核桃外果皮中总多酚含量的测定。
【英文摘要】Abstract Objective To set up an assay method for the determination of total polyphenol in walnut husk.Method The determination conditions of total polyphenol content in walnut husk including the detection wavelength, the amount of sodium carbonate solution, Folin-Ciocalteu reagent, reaction temperature and time were studied and gallic acid was used as a standard. Results The standard curve was linear in the range of 1~7 μg/mL (R2=0.9996)and the optimum conditions for determining total polyphenol in walnut husk were as followed: 1.0mL of the walnut husk extract polyphenol,1.0mL of Folin-Ciocalteu reagent dosage and 4.0mL of 15% sodium carbonate solution, treatment at 30°C for 1.5h,the average recovery was 100.2% RSD=0.91% .Under these conditions, the total polyphenol content of walnut husk was3.306mg/g. Conclusion This method is simple and quick the result is accurate repeatable and stable .It can be used for the the determination of total polyphenol content in walnut husk.

【题目】Analysis of genetic effects of nuclear-cytoplasmic interaction on quantitative traits: Genetic models for seed traits of plants
【中文关键词】无
【英文关键词】FERTILITY RESTORATION; MALE-STERILITY; WHEAT; CARBOXYLASE; CHARACTERS; EXPRESSION; STAMENS
【中文摘要】无
【英文摘要】Two Genetic models (an embryo model and an endosperm model) were proposed for analyzing genetic effects of nuclear genes, cytoplasmic genes, maternal genes, and nuclear-cytoplasmic interaction (NCI) as well as their genotype by environment interaction for quantitative traits of plant seed. In these models, the NCI effects were partitioned into direct additive and dominance NCI components. Mixed linear model approaches were employed for statistical analysis. For both balanced and unbalanced diallel cross designs, Monte Carlo simulations were conducted to evaluate unbiasedness and precision of estimated variance components of these models. The results showed that the proposed methods work well. Random genetic effects were predicted with an adjusted unbiased prediction method. Seed traits (protein content and oil content) of Upland cotton (Gossypium hirsutum L.) were analyzed as worked examples to demonstrate the use of the models.

【题目】Genetic diversity and peculiarity of annual wild soybean (G. soja Sieb. et Zucc.) from various eco-regions in China
【中文关键词】无
【英文关键词】GLYCINE-SOJA; SSR MARKERS; GERMPLASM POOLS; LINKAGE MAP; MICROSATELLITE; JAPAN; DNA
【中文摘要】无
【英文摘要】Annual wild soybean (Glycine soja Sieb. et Zucc.) is believed to be a potential gene source for future soybean improvement in coping with the world climate change for food security. To evaluate the wild soybean genetic diversity and differentiation, we analyzed allelic profiles at 60 simple-sequence repeat (SSR) loci and variation of eight morph-biological traits of a representative sample with 196 accessions from the natural growing area in China. For comparison, a representative sample with 200 landraces of Chinese cultivated soybean was included in this study. The SSR loci produced 1,067 alleles (17.8 per locus) with a mean gene diversity of 0.857 in the wild sample, which indicated the genetic diversity of G. soja was much higher than that of its cultivated counterpart (total 826 alleles, 13.7 per locus, mean gene diversity 0.727). After domestication, the genetic diversity of the cultigens decreased, with its 65.5% alleles inherited from the wild soybean, while 34.5% alleles newly emerged. AMOVA analysis showed that significant variance did exist among Northeast China, Huang-Huai-Hai Valleys and Southern China subpopulations. UPGMA cluster analysis indicated very significant association between the geographic grouping and genetic clustering, which demonstrated the geographic differentiation of the wild population had its relevant genetic bases. In comparison with the other two subpopulations, the Southern China subpopulation showed the highest allelic richness, diversity index and largest number of specific-present alleles, which suggests Southern China should be the major center of diversity for annual wild soybean.

【题目】Dynamic expression of nine QTLs for tiller number detected with single segment substitution lines in rice
【中文关键词】无
【英文关键词】ORYZA-SATIVA L.; QUANTITATIVE TRAIT LOCI; YIELD-RELATED TRAITS; DEVELOPMENTAL BEHAVIOR; DIALLEL ANALYSIS; PLANT HEIGHT; ENVIRONMENT INTERACTION; GENETIC DISSECTION; MOLECULAR MARKERS; FLOWERING TIME
【中文摘要】无
【英文摘要】Nine single segment substitution lines (SSSLs) in rice, which contain quantitative trait loci (QTLs) for tiller number on substituted segments detected in previous studies, were selected as materials to analyse dynamic expression of the QTLs in this study. These SSSLs and their recipient parent, Hua-jing-xian 74 (HJX74), were grown in four different environments and were measured for tiller number at nine different growth stages. An indirect methodology was applied in QTL mapping through analyzing multi-environment phenotypic data. Dynamics of three types of effects (including total effect, main effect, and QE interaction effect) of QTLs was released. It was shown that nine QTLs exhibited statistically significant effects only at certain stages. Effects of a QTL, although insignificant at certain stages, displayed dynamic change with the growth of rice plants. Two common features of nine QTLs were detected, one is no expression within 7 days after transplanting, and the other is opposite expression existed during the whole growth period. Nine QTLs largely focused on expression in certain stages, and accordingly were suggested to partition into three types, expression in prophase, both in prophase and in anaphase, and evenly during the whole stage. It may be reasonable explanation that dynamics of main effects of QTLs are likely due to gene expression selectly at certain times, while dynamics of QE interaction effects of QTLs might attribute to the subrogation of environmental factors. Examination of the association between QE interaction effect and specified environmental factors across stages may provide useful information on how an environmental factor regulates QTL expression.

【题目】Effect of energy density and citric acid concentration on anthocyanins yield and solution temperature of grape peel in microwave-assisted extraction process
【中文关键词】葡萄皮渣,花青素得率,高斯函数,微波辅助提取,能量密度,溶液温度上升
【英文关键词】Grapepeel; Anthocyaninsyield; Gaussian function; Microwave-assistedextraction; Energydensity; Solutiontemperature rise
【中文摘要】为了验证微波过程中能量密度(给定单位体积的微波功率)和柠檬酸浓度对葡萄皮渣中花青素得率的影响,本实验研究了能量密度和柠檬酸浓度在微波过程中的影响。结果表明,能量密度比微波功率对花青素得率的影响更大。花青素得率和能量密度的关系遵从高斯函数,R2>0.9399。指数衰减模型能很好的描述花青素得率和柠檬酸浓度之间的关系,或溶液温度上升和能量密度之间的关系。溶液温度是柠檬酸浓度和提取时间的线性函数。能量密度是影响花青素得率的最显著的因素,其次依次为柠檬酸浓度、料液比和提取时间(p>0.5)
【英文摘要】In order to verify the sensitivity of anthocyanins (Acys) yield of grapepeel to the energydensity (microwave power for a given unit of volume) and citricacidconcentration in microwave-assistedextraction (MAE) process, the effect of energydensity and citric acid concentration in MAE process were investigated. The results indicated that, Acys yield was more sensitive to energydensity than to microwave power. The correlation between Acys yield and energydensity follows well Gaussian function, suggested by higher R squares (R2 > 0.9399). Exponential decay model can well describe the correlation between Acys yield and citricacidconcentration, or between solutiontemperature rise and energydensity. The solutiontemperature was a linear function of citricacidconcentration and extraction time. Energydensity was the most significant factor affecting the Acys yield, followed by citricacidconcentration, ratio of liquid to solid and extraction time (p < 0.05).

【题目】Kinetics and thermodynamics characteristics of microwave assisted extraction of anthocyanins from grape pee
【中文关键词】葡萄皮渣,花青素,微波辅助提取,动力学,热力学
【英文关键词】grape peel, anthocyanins, microwave assisted extraction (MAE), kinetics, thermodynamics
【中文摘要】为拓展微波辅助提取技术在食品工业领域的应用,研究了微波辅助技术对提取葡萄皮中花色苷的作用,并对其动力学和热力学进行了评价。结果表明:柠檬酸浓度、液料比、提取时间和微波功率可以显著影响总花色苷提取率。采用高浓度柠檬酸水溶液(1.00 mol/L)提取的总花色苷含量(172.99 mg/100 g)是低浓度柠檬酸水溶液(0.02 mol/L)提取的总花色苷含量(43.48 mg/100 g)的4 倍。此外,在实验选取的动力学模型中,指数衰减模型可以更好的拟合提取动力学数据(R2>0.9875)。微波辅助提取葡萄皮中花色苷的有效扩散系数(2.12~4.87×10-11 m2/s)随着微波功率的增加而增大。微波辅助提取过程的热力学参数表明微波提取方式有利于传质过程。所得研究结果将为微波辅助提取技术的工业化应用提供理论依据。
【英文摘要】In order to expand the application of microwave assisted extraction (MAE) in food industry, the effects of MAE of anthocyanins from grape peel was investigated, and the related kinetics and thermodynamics were evaluated. The results showed that the citric acid concentration, liquid-to-solid ratio (RL/S), extraction time and microwave power level have a significant influence on the anthocyanins yield. The anthocyanins yield (172.99 mg/100 g) with the higher concentration of citric acid solution (1.00 mol/L) is 4 times larger than that (43.48 mg/100 g) in the lower concentration solution (0.02 mol/L). Furthermore, the extraction kinetic analysis indicated that the exponential decay model is the best model to fit the experimental data of anthocyanins obtained from MAE in this study (R2>0.9875). The effective diffusivity value of anthocyanins (2.12~4.87×10-11 m2/s) was enhanced concomitantly with increasing values of microwave power level in MAE process. The thermodynamic parameters of MAE indicated that microwave irradiation benefit the mass transfer. The result can provide a reference for industrial production of MAE.

【题目】Detection of QTLs with additive effects and additive-by-environment interaction effects on panicle number in rice (Oryza sativa L.) with single-segment substitution lines
【中文关键词】无
【英文关键词】QUANTITATIVE TRAIT LOCUS; CONTROLLING HEADING DATE; YIELD-RELATED TRAITS; PHOTOPERIOD SENSITIVITY; MENDELIAN FACTORS; FLOWERING TIME; PLANT HEIGHT; IDENTIFICATION; POPULATION; COMPONENTS
【中文摘要】无
【英文摘要】A novel population consisting of 35 single-segment substitution lines (SSSLs) originating from crosses between the recipient parent, Hua-jing-xian 74 (HJX74), and 17 donor parents was evaluated in six cropping season environments to reveal the genetic basis of genetic main effect (G) and genotype-by-environment interaction effect (GE) for panicle number (PN) in rice. Subsets of lines were grown in up to six environments. An indirect analysis method was applied, in which the total genetic effect was first partitioned into G and GE by using the mixed linear-model approach, and then QTL (quantitative trait locus) analyses on these effects were conducted separately. At least 18 QTLs for PN in rice were detected and identified on 9 of 12 rice chromosomes. A single QTL effect (a + ae) ranging from -1.5 to 1.2 was divided into two components, additive effect (a) and additive x environment interaction effect (ae). A total number of 9 and 16 QTLs were identified with a ranging from -0.4 to 0.6 and ae ranging from -1.0 to 0.6, respectively, the former being stable but the latter unstable across environments. Three types of QTLs were suggested according to their effects expressed. Two QTLs (Pn-1b and Pn-6d) expressed stably across environments due to the association with only a, nine QTLs (Pn-1a, Pn-3c, Pn-3d, Pn-4, Pn-6a, Pn-6b, Pn-8, Pn-9 and Pn-12) with only ae were unstable, and the remaining seven of QTLs were identified with both a and ae, which also were unstable across environments. This is the first report on the detection of QE (QTL-by-environment interaction effect) of QTLs with SSSLs. Our results illustrate the efficiency of characterizing QTLs and analyzing action of QTLs through SSSLs, and further demonstrate that QE is an important property of many QTLs. Information provided in this paper could be used in

the application of marker-assisted selection to manipulate PN in rice.

【题目】Modeling segregation distortion for viability selection I. Reconstruction of linkage maps with distorted markers
【中文关键词】无
【英文关键词】EM algorithm,Genetic linkage map,Hidden Markov chain,Segregation distortion,Viability selection
【中文摘要】无
【英文摘要】Molecular markers have been widely used to map quantitative trait loci (QTL). The QTL mapping partly relies on accurate linkage maps. The non-Mendelian segregation of markers, which affects not only the estimation of genetic distance between two markers but also the order of markers on a same linkage group, is usually observed in QTL analysis. However, these distorted markers are often ignored in the real data analysis of QTL mapping so that some important information may be lost. In this paper, we developed a multipoint approach via Hidden Markov chain model to reconstruct the linkage maps given a specified gene order while simultaneously making use of distorted, dominant and missing markers in an F-2 population. The new method was compared with the methods in the MapManager and Mapmaker programs, respectively, and verified by a series of Monte Carlo simulation experiments along with a working example. Results showed that the adjusted linkage maps can be used for further QTL or segregation distortion locus (SDL) analysis unless there are strong evidences to prove that all markers show normal Mendelian segregation.

【题目】Multiple quantitative trait loci Haseman – Elston regression using all markers on the entire genome
【中文关键词】无
【英文关键词】LINKAGE; QTL; POPULATION; MAIZE; PLANT; MICE; L.
【中文摘要】无
【英文摘要】The Haseman-Elston (HE) regression, developed in the 1970s, remains in common use to detect genetic linkage between a quantitative trait and a genetic marker. Although the technique has been improved in a number of ways, it predicts a high rate of false positive quantitative trait locus (QTL) because it is based on a single-QTL model. We have extended the origin HE regression to multi-QTL HE (MQHE) regression, so that all markers across the entire genome can be exploited simultaneously. The parameters have been estimated by the penalized maximum likelihood method, and several response variables for phenotypic difference have been compared in order to optimize the procedure. The method has been tested by simulation in a pedigree population of maize inbred lines of known ancestry. These simulations show that the trait product is the optimal response variable for phenotypic difference. The false positive rate produced by the MQHE regression is substantially lower than that generated by either variance component analysis or the origin HE regression. The MQHE regression, with the trait product as the response variable, represents a significant improvement on existing methods for QTL mapping in a set of inbred lines (or cultivars) of known ancestry.

【题目】Mapping of epistatic quantitative trait loci in four-way crosses
【中文关键词】无
【英文关键词】SIMPLE REGRESSION METHOD; INBRED LINES; BAYESIAN-ANALYSIS; OUTBRED PEDIGREE; FLANKING MARKERS; GENETIC-MARKERS; PRIOR KNOWLEDGE; LOBLOLLY-PINE; LEAST-SQUARES; MULTIPLE LOCI
【中文摘要】无
【英文摘要】Four-way crosses (4WC) involving four different inbred lines often appear in plant and animal commercial breeding programs. Direct mapping of quantitative trait loci (QTL) in these commercial populations is both economical and practical. However, the existing statistical methods for mapping QTL in a 4WC population are built on the single-QTL genetic model. This simple genetic model fails to take into account QTL interactions, which play an important role in the genetic architecture of complex traits. In this paper, therefore, we attempted to develop a statistical method to detect epistatic QTL in 4WC population. Conditional probabilities of QTL genotypes, computed by the multi-point single locus method, were used to sample the genotypes of all putative QTL in the entire genome. The sampled genotypes were used to construct the design matrix for QTL effects. All QTL effects, including main and epistatic effects, were simultaneously estimated by the penalized maximum likelihood method. The proposed method was confirmed by a series of Monte Carlo simulation studies and real data analysis of cotton. The new method will provide novel tools for the genetic dissection of complex traits, construction of QTL networks, and analysis of heterosis.

【题目】Molecular evolution and selection of a gene encoding two tandem microRNAs in rice
【中文关键词】无
【英文关键词】MicroRNA; MIR156b/c; Selection; Genome duplication;Oryza sativa
【中文摘要】无
【英文摘要】It has been shown that overexpression of M1R156blc resulted in a bushy phenotype in maize and rice. Our results indicated that the M1R156blc locus was highly conserved among cereals, but not in dicots and that genome duplication events played an important role in the evolution of the miR156 family. Genetic diversity investigation at the locus indicated that only similar to 9% of nucleotide diversity observed in wild rice (O. rufigogon) was maintained in the cultivated rice and the neutral model was rejected ($P < 0.05$) based on Tajima's D and Fu and Li's D* and F* tests. To our knowledge, this is the first example of miRNA gene to be targeted by both natural and domestication selection in plants. (c) 2007 Federation of European Biochemical Societies. 【题目】Selection and mutation on microRNA target sequences during rice evolution
【中文关键词】无
【英文关键词】ARABIDOPSIS-THALIANA; BINDING-SITES; NONCODING DNA; CONSTRAINTS; DUPLICATION; PREDICTION; ALIGNMENT; GENOME; IDENTIFICATION; POLYMORPHISM
【中文摘要】无
【英文摘要】Background: MicroRNAs (miRNAs) posttranscriptionally down-regulate gene expression by binding target mRNAs. Analysis of the evolution of miRNA binding sites is helpful in understanding the co-evolution between miRNAs and their targets. To understand this process in plants a comparative analysis of miRNA-targeted duplicated gene pairs derived from a well-documented whole genome duplication (WGD) event in combination with a population genetics study of six experimentally validated miRNA binding sites in rice (O. sativa) was carried out. Results: Of the 1,331 pairs of duplicate genes from the WGD, 41 genes (29 pairs) were computationally predicted to be miRNA targets. Sequence substitution analysis indicated that the synonymous substitution rate was significantly lower in the miRNA binding sites than their 5' and 3' flanking regions. Of the 29 duplicated gene pairs, 17 have only one paralog been targeted by a miRNA. This could be due to either gain of a miRNA binding site after the WGD or because one of the duplicated genes has escaped from being a miRNA target after the WGD (loss of miRNA binding site). These possibilities were distinguished by separating miRNAs conserved in both dicots and monocot plants from rice-specific miRNAs and by phylogenetic analysis of miRNA target gene families. The gain/loss rate of miRNA binding sites was estimated to be 3.0 x 10(-9) gain/loss per year. Most (70.6%) of the gains/losses were due to nucleotide mutation. By analysis of cultivated (O. sativa; n = 30) and wild (O. rufipogon; n = 15) rice populations, no segregating site was observed in six miRNA binding sites whereas 0.12-0.20 SNPs per 21-nt or 1.53-1.80 x 10(-3) of the average pairwise nucleotide diversity (p) were found in their flanking regions. Conclusion: Both molecular evolution and population genetics support the hypothesis that conservation of miRNA binding sites is maintained by purifying selection through elimination of deleterious alleles. Nucleotide mutations play a major role in the gain/loss of miRNA binding sites during evolution.

【题目】A Conceptual Framework for Mapping Quantitative Trait Loci Regulating Ontogenetic Allometry
【中文关键词】无
【英文关键词】Quantitative Trait Loci
【中文摘要】无
【英文摘要】Although ontogenetic changes in body shape and its associated allometry has been studied for over a century, essentially nothing is known about their underlying genetic and developmental mechanisms. One of the reasons for this ignorance is the unavailability of a conceptual framework to formulate the experimental design for data collection and statistical models for data analyses. We developed a framework model for unraveling the genetic machinery for ontogenetic changes of allometry. The model incorporates the mathematical aspects of ontogenetic growth and allometry into a maximum likelihood framework for quantitative trait locus (QTL) mapping. As a quantitative platform, the model allows for the testing of a number of biologically meaningful hypotheses to explore the pleiotropic basis of the QTL that regulate ontogeny and allometry. Simulation studies and real data analysis of a live example in soybean have been performed to investigate the statistical behavior of the model and validate its practical utilization. The statistical model proposed will help to study the genetic architecture of complex phenotypes and, therefore, gain better insights into the mechanistic regulation for developmental patterns and processes in organisms.

【题目】Post-Domestication Selection in the Maize Starch Pathway
【中文关键词】无
【英文关键词】Post-Domestication Selection
【中文摘要】无
【英文摘要】Modern crops have usually experienced domestication selection and subsequent genetic improvement (post-domestication selection). Chinese waxy maize, which originated from non-glutinous domesticated maize (Zea mays ssp. mays), provides a unique model for investigating the post-domestication selection of maize. In this study, the genetic diversity of six key genes in the starch pathway was investigated in a glutinous population that included 55 Chinese waxy accessions, and a selective bottleneck that resulted in apparent reductions in diversity in Chinese waxy maize was observed. Significant positive selection in waxy (wx) but not amylose extender1 (ae1) was detected in the glutinous population, in complete contrast to the findings in non-glutinous maize, which indicated a shift in the selection target from ae1 to wx during the improvement of Chinese waxy maize. Our results suggest that an agronomic trait can be quickly improved into a target trait with changes in the selection target among genes in a crop pathway.

【题目】QTLNetwork: mapping and visualizing genetic architecture of complex traits in experimental populations
【中文关键词】无
【英文关键词】LOCI,CROSSES
【中文摘要】无
【英文摘要】QTLNetwork is a software package for mapping and visualizing the genetic architecture underlying complex traits for experimental populations derived from a cross between two inbred lines. It can simultaneously map quantitative trait loci (QTL) with individual effects, epistasis and QTLenvironment interaction. Currently, it is able to handle data from F-2, backcross, recombinant inbred lines and double-haploid populations, as well as populations from specific mating designs (immortalized F-2 and BCnFn populations). The Windows version of QTLNetwork was developed with a graphical user interface. Alternatively, the command-line versions have the facility to be run in other prevalent operating systems, such as Linux, Unix and MacOS.

【英文摘要】Understanding how interactions among set of genes affect diverse phenotypes is having a greater impact on biomedical research, agriculture and evolutionary biology. Mapping and characterizing the isolated effects of single quantitative trait locus (QTL) is a first step, but we also need to assemble networks of QTLs and define non-additive interactions (epistasis) together with a host of potential environmental modulators. In this article, we present a full-QTL model with which to explore the genetic architecture of complex trait in multiple environments. Our model includes the effects of multiple QTLs, epistasis, QTL-by-environment interactions and epistasis-by-environment interactions. A new mapping strategy, including marker interval selection, detection of marker interval interactions and genome scans, is used to evaluate putative locations of multiple QTLs and their interactions. All the mapping procedures are performed in the framework of mixed linear model that are flexible to model environmental factors regardless of fix or random effects being assumed. An F-statistic based on Henderson method III is used for hypothesis tests. This method is less computationally greedy than corresponding likelihood ratio test. In each of the mapping procedures, permutation testing is exploited to control for genome-wide false positive rate, and model selection is used to reduce ghost peaks in F-statistic profile. Parameters of the full-QTL model are estimated using a Bayesian method via Gibbs sampling. Monte Carlo simulations help define the reliability and efficiency of the method. Two real-world phenotypes (BXD mouse olfactory bulb weight data and rice yield data) are used as exemplars to demonstrate our methods.

【题目】A Study on Subunit Groups of Soybean Protein
【中文关键词】无
【英文关键词】soybean; backcross line; RHL (residual heterozygous line); SSR (simple sequence repeat) marker; flowering date; QTL; fine-mapping
【中文摘要】无
【英文摘要】The results of QTL mapping based on a primary mapping population should be further verified and refined for its real utilization in marker-assisted selection or map-based cloning. The primary mapping population contains 114 BC(1)F(1) plants of the backcross between Essex (maturity group V, MG V) as the donor parent and ZDD2315 (MG II) as the recurrent parent. In this study, a genetic linkage map with 250 SSR markers spanning a total length of 2963.5 cM on 25 linkage groups (LG) was constructed using software MAPMAKER3.0. Six kinds of genetic statistical models of 4 softwares, i.e. WinQTL Cartographer Version 2.5, IciMapping Version 2.0, MapQTL Version 5.0 and QTLnetwork Version 2.0, were used to map QTLs conferring days to flowering of the BC(1)F(3) lines. Nine QTLs were mapped on 6 different linkage groups (LG). Of those, 6 QTLs were detected by at least two different genetic statistical models, while the other three were detected by only one procedure. Among the three QTLs, Flwdt7 was mapped between Sat_213 and Satt643 on LG C2 with only 11.0% contribution rate. For confirmation of Flwdt7, 5 RHL populations were developed through selfing eight BC(1)F(5) plants heterozygous at seven markers around the locus. The RHL populations with the same segregating loci were bulked and used to construct a secondary linkage map of the specific segment using software JoinMapA (R) 3.0. The genetic distances among the markers on the specific segment became shorter than those of the whole genome map. On the secondary map, Flwdt7 was mapped between Satt277 and Satt489, next to its primary interval Sat_213-Satt643, with distance 1.40 cM to Satt277 and 0.45 cM to Satt489, confidence interval narrowed to 2.7 cM, and contribution rate increased to 36.8%. The results were confirmed with significance analysis among marker genotypes on individual loci and comparison analysis of target marker intervals among near isogenic lines (plants). Thus the strategy by using residual heterozygous lines for QTL fine-mapping on target segments based on primary whole genome scanning with multiple mapping models was demonstrated to be effective.

【题目】Chloroplastic oxidative burst induced by tenuazonic acid, a natural photosynthesis inhibitor, triggers cell necrosis in Eupatorium adenophorum Spreng

【中文关键词】无
【英文关键词】TeA
Chloroplast
ROS
Mode of action
Phytotoxin
Photosynthesis inhibitor
【中文摘要】无
【英文摘要】Tenuazonic acid (TeA), a nonhost-speci fi c phytotoxin produced by Alternaria alternata, was determined to bea novel natural photosynthesis inhibitor owning several action sites in chloroplasts. To further elucidate themode of its action, studies were conducted to assess the production and involvement of reactive oxygenspecies (ROS) in the toxic activity of TeA. A series of experiments indicated that TeA treatment can inducechloroplast-derived ROS generation including not only 1O2 but also O2U − ,H2O2 and UOH in Eupatoriumadenophorum mesophyll cells, resulting from electron leakage and charge recombination in PSII as well asthylakoid overenergization due to inhibition of the PSII electron transport beyond QA and the reduction ofend acceptors on the PSI acceptor side and chloroplast ATPase activity. The initial production of TeA-inducedROS was restricted to chloroplasts and accompanied with a certain degree of chloroplast damage.Subsequently, abundant ROS were quickly dispersed throughout whole cell and cellular compartments,causing a series of irreversible cellular harm such as chlorophyll breakdown, lipid peroxidation, plasmamembrane rupture, chromatin condensation, DNA cleavage, and organelle disintegration, and fi nallyresulting in rapid cell destruction and leaf necrosis. These results show that TeA causing cell necrosis of host-plants is a result of direct oxidative damage from chloroplast-mediated ROS eruption.

Resurrection plants
【中文摘要】无
【英文摘要】A new instrument (M-PEA), which measures simultaneously kinetics of prompt fl uorescence (PF), delayed fl uorescence (DF) and modulated light re fl ection at 820 nm (MR), was used to screen dark-adapted leaves ofthe resurrection plant Haberlea rhodopensis during their progressive drying, down to 1% relative watercontent (RWC), and after their re-watering. This is the fi rst investigation using M-PEA, which employsalternations of actinic light (627-nm peak, 5000 μ mol photons m − 2s − 1) and dark intervals, where PF-MRand DF kinetics are respectively recorded, with the added advantages: (a) all kinetics are recorded with hightime resolution (starting from 0.01 ms), (b) the dark intervals' duration can be as short as 0.1 ms, (c) actinicillumination can be interrupted at different times during the PF transient (recorded up to 300 s), with theearliest interruption at 0.3 ms. Analysis of the simultaneous measurements at different water-content-statesof H. rhodopensis leaves allowed the comparison and correlation of complementary information on thestructure/function of the photosynthetic machinery, which is not destroyed but only inactivated (reversibly)at different degrees; the comparison and correlation helped also to test current interpretations of each signaland advance their understanding. Our results suggest that the desiccation tolerance of the photosyntheticmachinery in H. rhodopensis is mainly based on mechanism(s) that lead to inactivation of photosystem IIreaction centres (transformation to heat sinks), triggered already by a

small RWC decrease.

【题目】CERES-Rice模型区域应用中遗传参数升尺度的一种方法
【中文关键词】模拟模型;区域应用;遗传参数;升尺度;水稻
【英文关键词】simulation model;regional application;genetic parameter;upscaling;rice
【中文摘要】为了提升CERES-Rice模型中遗传参数的空间尺度,以适应区域性研究需要,以江苏省为例,在具有不同水稻品种生态类型的4个稻区各选5~6个样点,以稻区为空间尺度,利用每个样点4年(2001一2004年)县级统计水稻单产资料及同期同地的气象和土壤资料,结合江苏省各地的水稻品种区域试验资料,采用试错法对CERES-Rice中8个遗传参数,特别是4个与产量相关的遗传参数分别进行了调试与确定(方法1,简称稻区尺度调试法),并与传统的其他3种升尺度方法,即代表性品种单点调试法(方法2)、县级尺度调试法(方法3)和超大尺度调试法(方法4)的模拟效果进行了比较。结果显示,方法1的模拟效果较为理想,各稻区模拟产量与统计产量的相关系数均达到显著或极显著水平,均方根差值均小于9%。而其他3种方法的模拟效果均明显不如方法1。研究提出的遗传参数升尺度方法不仅适用于气候变化影响评价研究,也可为作物生长模型在其他区域研究中的应用提供方法上的借鉴。
【英文摘要】In order to upscale the genetic parameters of CERES-Rice to satisfy the requirements in its regional applieations,Jiangsu Province,the second largest rice producing province in China,was taken as an example.The province was divided into four rice regions for different varietal types and five to six sites in each region were selected.Then the eight genetic parameters of CERES-Rice,particularly the four parameters related to yield were modified and then validated using Trial and Error Method and based on the local statistical rice yield data at a county level from 2001 to 2004.combined with the regional experiments of rice varieties in the province as well as the local meteorological and soil data(Method 1).The simulated results of Method 1 were compared with that of the other three traditional methods upscaling the genetic parameters,i.e.,using one-site experimental data of a local representative rice variety(Method 2),using local long—term rice yield data at a county level after deducting the trend yield due to progress of science and technology(Method 3)and using rice yield data at a super scale,such as provincial,ecological zone,country or continent levels(Method 4).The results showed that a good fitness efficiency was obtained by using the Method 1,its correlation coefficients between the simulated yields and the statistical yields were significant at 0.05 or 0.01 statistical levels and the RMSE(root mean squared error)values were less than 9 for all the fourrice regions,which were obviously better than those of the other three traditional methods.The method upscaling the genetic parameters of CERE Rice presented is not only valuable for the impact studies of climate change.but also favorable to provide a methodology for reference in crop model applications to the other regional studies.

【题目】Bioassay of the Herbicidal activity of AAC-toxin produced by Alternaria alternata isolated from Ageratina adenophora
【中文关键词】无
【英文关键词】Biobased herbicide, biological control, natural product, weed.
【中文摘要】无
【英文摘要】Tenuazonic acid (TeA), a naturally occurring product of Alternaria alternata, a pathogen to croftonweed, was discovered tobe a novel natural photosystem II (PSII) inhibitor. However, herbicidal activity of AAC-toxin, a metabolite of this funguscontaining TeA as the main active ingredient, has not been evaluated systematically. In this study, we conducted activity-evaluation experiments in the laboratory, greenhouse, and field trials to assess the herbicidal potential of this fungalmetabolite. AAC-toxin had high herbicidal activity on all species tested: croftonweed, large crabgrass, barnyardgrass,redroot pigweed, and eclipta. The AAC-toxin caused brown, leaf spot symptoms and leaf necrosis, subsequently killing theseedlings. When AAC-toxin was applied POST at 83 ml ai/ha, more than 95% of large crabgrass, barnyardgrass, andredroot pigweed plants were controlled 2 d after treatment in field trials. It can be concluded that AAC-toxin has broad-spectrum, rapid, and high herbicidal activity similar to that of paraquat and may have the potential to be developed as amicrobe-based herbicide.

【题目】First Report of Southern Blight on Canadian Goldenrod (Solidago canadensis) Caused by Sclerotium rolfsii in China
【中文关键词】无
【英文关键词】Canadian goldenrod
【中文摘要】无
【英文摘要】Canadian goldenrod (Solidago canadensis L., Asteraceae) is a rhizomatous perennial plant native to North America that has invaded eastern China and continues to spread northward and westward. It is quite common on field borders, roadsides, and in undeveloped areas, posing a serious threat to native ecosystems and their biodiversity. During the late summers of 2007 and 2008, wilted Canadian goldenrod plants were occasionally found in invasive populations in the suburb of Nanjing city. Wilted plants were transplanted and maintained in a greenhouse at Nanjing Agricultural University. A white mass of fungal hyphae, which grew on the soil surface around the stem of the symptomatic S. canadesis plants and eventually covered the stem, was observed. Initially, the base of the stem became yellow, turned brown, and the light brown discoloration extended up the stem to a height of 3 to 7 cm. The leaves then collapsed, starting from the top until the entire plant wilted. The fungus produced numerous, small, roundish sclerotia of uniform size (0.7 to 2.0 mm in diameter), which were white at first and then became brown to dark brown. The fungus grew into the stems and downward into the rhizome area, but no sclerotia were detected inside the stem or root. Diseased tissue with sclerotia was disinfested for 1 min in 1% NaOCl and plated on potato dextrose agar amended with 100 mg/liter of streptomycin sulfate. On the basis of sclerotia morphology and the presence of clamp connections at hyphal septa, the fungus was identified as Sclerotium rolfsii. Pathogenicity of the isolate was confirmed by inoculating 1-year-old S. canadensis plants (average 1.5 m high) grown in pots. The inoculum consisted of cottonseed hulls infested with mycelium and sclerotia of the pathogen and was placed on the soil surface around the base of each unwounded plant. Noninoculated plants served as controls. The pathogenicity test was conducted twice. After inoculation, the plants were maintained at high humidity and 30 ° C for 3 days and then transferred to a greenhouse. All inoculated plants developed symptoms of southern blight. Inoculated plants developed symptoms of wilting 5 to 7 days after inoculation and were completely wilted within 15 to 20 days. Symptoms of wilting were soon followed by the appearance of white-to-light brown sclerotia on the collar region. Control plants remained symptomless and Sclerotium rolfsii was reisolated from inoculated plants. To our knowledge, this is the first report of southern blight of Canadian goldenrod caused by Sclerotium rolfsii in China.

【题目】5-Aminolevulinic acid improves photosynthetic gas exchange capacity and ion uptake under salinity stress in oilseed rape (Brassica napus L.)
【中文关键词】无
【英文关键词】5-Aminolevulinic acid . Brasscia napus .
Mineral nutrition .Na
+
uptake .
Photosynthetic gas exchange . Salinity
【中文摘要】无
【英文摘要】Salinity is one of the major constraints inoilseed rape (Brassica napus L.) production. One ofthe means to overcome this constraint is the use ofplant growth regulators to induce plant tolerance. Tostudy the plant response to salinity in combinationwith a growth regulator, 5-aminolevulinic acid(ALA), oilseed rape plants were grown hydroponical-ly in greenhouse conditions under three levels ofsalinity (0, 100, and 200 mM NaCl) and foliarapplication of ALA (30 mg/l). Salinity depressed thegrowth of shoots and roots, and decreased leaf waterpotential and chlorophyll concentration. Addition ofALA partially improved the growth of shoots androots, and increased the leaf chlorophyll concentra-tions of stressed plants. Foliar application of ALAalso maintained leaf water potential of plants growingin 100 mM salinity at the same level as that of thecontrol plants, and there was also an improvement inthe water relations of ALA-treated plants growing in200 mM. Net photosynthetic rate and gas exchangeparameters were also reduced significantly with increasing salinity; these effects were partially re-versed upon foliar application with ALA. Sodiumaccumulation increased with increasing NaCl concen-tration which induced a complex response in themacro-and micronutrients uptake and accumulation inboth roots and leaves. Generally, analyses of macro-(N, P, K, S, Ca, and Mg) and micronutrients (Mn, Zn,Fe, and Cu) showed no increased accumulation ofthese ions in the leaves and roots (on dry weight basis)under increasing salinity except for zinc (Zn). Foliarapplication of ALA enhanced the concentrations of allnutrients other than Mn and Cu. These results suggestthat under short-term salinity-induced stress (10 days),exogenous application of ALA helped the plantsimprove growth, photosynthetic gas exchange capac-ity, water potential, chlorophyll content, and mineralnutrition by manipulating the uptake of Na+.

【题目】长江中下游地区水稻孕穗开花期高温发生规律及其对产量的影响
【中文关键词】高温;长江中下游稻区;孕穗开花期;气候产量
【英文关键词】high temperature; rice areas in the middle and lower reaches of Yangtze River; booting and flowering stages; climate yield.
【中文摘要】以长江中下游平原7个省(市)的19个地区作为样点,统计分析了各样点近36年 (1970—2005年)水稻始穗前15d至始穗后20d内日最高气温≥35℃的时空分布特点;并根据全球气候渐变模型GISSGCMTransientBRuns生成的研究区域2030、2050年的气候渐变情景,分析了该地区未来水稻孕穗开花期≥35℃高温逆境的时空演变趋势。结果表明:近36年来长江中下游的早稻孕穗开花期出现高温日数的上升趋势显著,未来气候情景下水稻逆境指标出现日数最多的是单季稻,其次依次为早稻、后季稻;双季稻种植区,在未来气候变化中,长江中游地区温度逆境出现日数将大于下游地区。研究区域水稻气候产量的增减与该地区水稻逆境指标的关系说明,高温导致的颖花败育是水稻减产的重要原因;未来气候变化的两种

(2030、2050)情景下,长江中游地区的减产幅度大于长江下游地区,减产幅度最大的是长江中游地区的后季稻。

【英文摘要】Taking 19 regions of 7 provinces and municipalities in the middle and lower reaches of Yangtze River as the objects ,this paper analyzed the temporal and spatial distribution patterns of their daily maximal temperature over 35°C from the 15th day before rice booting to the 20th day after rice flowering in last 36 years(1970-2005). According to the climate transient scenarios of these regions in 2030 and 2050 generated by GISS GCM Transient B Runs, the temporal and spatial evolving tendency of the daily maximal temperature over 35°C was further discussed. In last 36 years, the day number of high temperature at the booting and flowering stages of early rice in the middle and lower reaches of Yangtze River increased significantly, and under the future climate scenarios, the day number of high temperature would be the largest for single-cropping rice, followed by for early rice and later ice. For double-cropping rice production areas, the day number of high temperature in the middle reaches would be larger than that in the lower reaches of Yangtze River. The relationships between the regional quantity of rice climate yield and the stress-index occurrence pattern in the same regions suggested that the rice-spikelet abortion due to high temperature was the main cause for the decrease of rice yield. In the two climate transient scenarios in 2030 and 2050, the yield decrement in the middle reaches of Yangtze River would be larger than that in the lower reaches, and the largest yield decrement would be the late rice in the middle reaches of Yangtze River.

【题目】Silicon improves the tolerance to water-deficit stress induced by polyethylene glycol in wheat (Triticum aestivum L.) seedlings

【中文关键词】无

【英文关键词】Antioxidant defense Drought stress Osmotic adjustment Silicon Wheat (Triticum aestivum L.)

【中文摘要】无

【英文摘要】Drought stress usually causes a serious yieldreduction in wheat production. Silicon (Si) has beenreported to be able to alleviate drought stress damage;however, the mechanism is still poorly understood. In thisarticle, the effects of Si (as sodium silicate) on someparameters related to oxidative damage, proline, solublesugar, and inorganic ions in the leaves of wheat under 20%(w/v) polyethylene glycol (PEG-6000) simulative droughtstress are investigated. PEG stress depressed the growth ofshoot and root and decreased leaf water potential andchlorophyll concentration. Addition of 1.0 mM Si couldpartially improve the growth of shoot (but not root) andincrease the leaf chlorophyll concentrations of stressedplants. Inclusion of Si in culture solution also maintainedleaf water potential of stressed plants at the same level asthat of the control plants. PEG stress induced signi fi cantaccumulation of leaf hydrogen peroxide (H_2O_2) and mal-ondialdehyde (MDA) as well as an increase in electrolyteleakage, which were all decreased by added silicon. Theseresults suggest that stress-induced membrane lipid peroxi-dation could be partly alleviated by added silicon. More-over, the results were also supported by the observationthat PEG stress-induced decrease in glutathione concen-tration in the leaves was reversed by added silicon. The proline concentration in the leaves was markedly increasedunder PEG stress, whereas added silicon partially reversedthis. PEG stress decreased the leaf soluble sugar concen-tration. There were signi fi cant negative regressionsbetween proline concentration and both shoot dry weightand leaf chlorophyll concentrations, whereas there werepositive regressions between the proline concentration andboth H_2O_2 and MDA concentrations in the leaves, sup-porting the view that proline accumulation is a symptom ofstress damage rather than stress tolerance. Addition of Siobviously increased Si accumulation in the shoot. Analysesof Na, Mg, K, and Ca showed no accumulation of theseions in the shoot (on the basis of per tissue dry weight)under water stress, and added Si even decreased theirconcentrations. These results suggest that under short-termPEG-induced water stress conditions (1 week), antioxidantdefense, rather than osmotic adjustment, contributed to theimproved wheat growth by Si.

【题目】A Study on the regional application of rice growth model in county level
【中文关键词】no
【英文关键词】Crop; growth model; regional application; county level
【中文摘要】No
【英文摘要】On the basis of spatial aggregation, the upscaling technique was one of methods for the regional application of crop growth model. In this paper, the aggregation technique of regional soils, varieties and cultivar measures was discussed for regional application of rice growth model in county level, and the difference of rice development and yield among the county stations of Suzhou and Lianyungang, Jiangsu, was explored with experiment data from national agrometeological stations at Kunshan and Ganyu, Jiangsu and RCSODS. The results showed although the development stages were similar among counties, the yield difference was significant; After aggregation of model inputs, the RMSEs between statistical and simulated yields were 742kg/ha and 975kg/ha for Suzhou and Lianyungang respectively, and the NRMSEs were 8.7% and 12.4%, which indicated the spatial aggregation approach for model inputs was suited to regional application of rice growth model..

【题目】Differential morphological and physiological responses of two oilseed Brassica species to a new herbicide ZJ0273 used in rapeseed fields.
【中文关键词】无
【英文关键词】Acetolactate synthase
Antioxidant enzymes
Oilseed rape
Propyl 4-(2-(4,6-dimethoxypyrimidin-2-
yloxy) benzylamino)benzoate (ZJ0273)
Photosynthetic system
Seed quality
【中文摘要】无
【英文摘要】Weeds are considered as a major threat to the production of oilseed Brassica crops. The use of herbicidesthat are safe for crops and effective in controlling weeds is crucial for the agronomists and farmers. Propyl4-(2-(4,6-dimethoxypyrimidin-2-yloxy)benzylamino)benzoate (ZJ0273), a derivative of 2-pyrimidinyl-oxy-N-aryl benzoate, is a new herbicide used in the rapeseed fi eld. To evaluate the tolerance of Brassicaspecies against this new herbicide, two cultivars of rapeseed Brassica napus cv. ZS 758 and Brassica rapacv. Xiaoyoucai were tested by a foliar spray of ZJ0273 at the rate of 100, 500 and 1000 mg/L and a cur-rently used ALS (acetolactate synthase)-inhibiting herbicide bispyribac-sodium (BS) at the rate of100 mg/L. The results showed that both the cultivars of Brassica were less affected by ZJ0273 as comparedto BS. Increasing level of ZJ0273 herbicide from 100 to 1000 mg/L increased the stress for the plants ofboth the cultivars as indicated by enhanced accumulation of malondialdehyde content. The activitiesof ALS and antioxidant enzymes (superoxide dismutase and peroxidase), soluble protein and sugar con-tents, photosynthetic system (SPAD value, photosynthetic rate and chlorophyll fl uorescence) as well asthe agronomic characters also declined consistently with each successive increase in ZJ0273 concentra-tion. In general, the plants treated with 100 mg/L ZJ0273 recovered from the herbicide stress after28 days. B. napus showed more tolerance than B. rapa to the new herbicide. Nevertheless, BS applicationat 100 mg/L did not allow the plants of

both the cultivars to recover from the herbicidal stress.

【题目】A Study on Dynamic Forecast Technique of Regional Rice Productivity
【中文关键词】no
【英文关键词】crop productivity; dynamic forecast; region; model; GIS
【中文摘要】no
【英文摘要】Dynamic forecast of crop productivity is critical for food security and decision-making of agriculture manager. Based on the Rice Cultivational Simulation- Optimization and Decision-making System (RCSODS) and aggregation methods on the model inputs, and combined normal year meteorological data and spatial interpolation technique of weather data, the dynamic forecast technique of regional rice productivity was discussed in this study. The model and the aggregation methods were validated with the experimental data from eight National agrometeorological stations located in Jiangsu province and statistical yields. Rice productivity of Jiangsu was forecasted dynamically with observed meteorological data and normal year weather data generated from the monthly meteorological data. The results showed the RMSEs of development stages and yields between simulated and observed values were 5.0 d and 1344kg/ha and the NRMSEs were 1.6% and 16.7% respectively, which indicated RCSODS could simulate the rice development process better and yield well. The RMSE and NRMSE between simulated and statistical county yields were 1081kg/ha and 13.2%, which showed the aggregation method on the meteorological data, soil attributes, variety and cultural method in county level was suitable to the regional application of rice model. The forecast yield would generally be equal to simulated yield with the delay of forecast time.

【题目】Nine Pathogenic Fungi of aterhyacinth(Eichhornia crassipes) Isolated in China
【中文关键词】无
【英文关键词】Waterhyacinth; Pathogenic fungi; DI; Virulence
【中文摘要】无
【英文摘要】The native pathogens of waterhyacinth in china, were studied and compared on pathogenicity by Koch ’s postulate. Nine pathogenic fungi, which are the isolates YBH, YBB, YB, YYX,YY, YBA1,YBA2, YBA3 and YYB12, were isolated from diseased Waterhyacinth plants, collected from Zhejiang province and Shanghai. According to cultural characteristics, the nine isolates were preliminarily identified. Isolates YBH and YBB were Collectotrichum sp., YB, YYX and YY were placed in Fungi Imperfecti, and the isolates YBA1, YBA2, YBA3 and YYB12 were Alternaria sp. The isolate YBH was the highly virulent with a disease index (DI) of 65.28% one month after inoculation. The isolate YBA3 was equily virulent, with the disease index of 67% 7 days after introduction. These two pathogens appear to have the potential as biocontrol agents and they deserve further study.

【题目】The allelopathy of Flaveria bidentis (L.) Kuntze, an invasive weed species.
【中文关键词】无
【英文关键词】Flaveria bidentis (L.) Kuntze, allelopathy,
herbicide activity
【中文摘要】无

【英文摘要】To identify the allelopathic effect of Flaveriabidentis (L.) Kuntze (F. bidenti) on other plants, the effectsof different extracts from F. bidentis on the growth of sev-eral plants were studied by bioassay. Results showed thatthe water extracts inhibited the growth of corn (Zea maysL.), wheat (Triticum aestivum L.), cotton (GassypiumHirsutum L.), soybean (Glycine hispida L.), peanut (Arachishypogaea L.), rice (Oryza sativa L.), crabgrass (Digitariasanguinalis L.) and rigweed (Amaranthus retroflexus L.),with the most reactive indexes found in root and stem ofcotton at 20.85 and 20.88, respectively, at a concentrationof 0.2 g?mL21. However, the water extracts accelerated thegrowth of rice. In addition, the reactive indexes of theextracts of petroleum ether chloroform, ethyl acetate, acetand alcohol were higher than that of the water extracts, andthat of the acet extracts was the highest. The melting pointof the refined acetone extract ranged from 192.5uCto193.5uC, and its maximum absorbing wavelength was220 nm. This extract was found to be herbicide-active andplayed an inhibitory role in the growth of crabgrass andrigweed at concentrations of 1000, 500, 100 and 50 mg?L21.the surrounding plants. Flaveria bidentis (L.) Kuntze,belonging to Flaveriinae-Asteraceae, was found in Heng-shui in Hebei Province and in Nankai University for thefirst time in 2003 (Gao et al., 2004). As of today, researcheshave been focused on its biological characteristics (Gaoet al., 2004; Li et al., 2006), but so far no research on theallelopathy of F. bidentis extracts has been published.Powell (1978) and Agnese et al. (1999) reported that sec-ondary metabolites of F. bidentis contained sulfated flavo-noids. According to Broussalis et al. (1999), its alcoholextract and chloroform extract were effective in killing wee-vil, and had an evident repellent effect on cotton bollworm.Li et al. (2006) reported that in the regions where F. bidentisfirst invaded, nearly pure communities of F. bidentisdeveloped, with the accompanying species only beingChinese Tamarisk (Tamarix chinensis Lour.) and Russianthistle (Salsola collina Pall.). Therefore, the allelopathy of F.bidentis was researched to know the effects of secondarymetabolites from F. bidentis on the growth of other plants,to search for pesticide-oriented compounds, and to providea theoretical and practical basis for the integrated control of the surrounding plants. Flaveria bidentis (L.) Kuntze,belonging to Flaveriinae-Asteraceae, was found in Heng-shui in Hebei Province and in Nankai University for thefirst time in 2003 (Gao et al., 2004). As of today, researcheshave been focused on its biological characteristics (Gaoet al., 2004; Li et al., 2006), but so far no research on theallelopathy of F. bidentis extracts has been published.Powell (1978) and Agnese et al. (1999) reported that sec-ondary metabolites of F. bidentis contained sulfated flavo-noids. According to Broussalis et al. (1999), its alcoholextract and chloroform extract were effective in killing wee-vil, and had an evident repellent effect on cotton bollworm.Li et al. (2006) reported that in the regions where F. bidentisfirst invaded, nearly pure communities of F. bidentisdeveloped, with the accompanying species only beingChinese Tamarisk (Tamarix chinensis Lour.) and Russianthistle (Salsola collina Pall.). 【题目】Isolation and screening of microorganisms capable of degrading nicosulfuron in water
【中文关键词】无
【英文关键词】nicosulfuron, microbial degradation, enrich-
ment culturing

【中文摘要】无

【英文摘要】Abstract In order to screen and isolate microorganismscapable of degrading nicosulfuron, five strains of microorganisms coded as YF1, YB1, YB2, YB3, and YB4 that cantake nicosulfuron as the only source of carbon, nitrogen,and energy were obtained by enrichment culture. Of the fivestrains, YF1 was a fungus and the others were bacteria. Allof the microorganisms were inoculated into the culturemedia with different concentrations of nicosulfuron andshaking culture was performed for 5 days at 30uCand150 r?min21. High Performance Liquid Chromatography(HPLC) was used to detect the concentration of nicosul-furon and calculate the degradation efficiency. The resultsshowed that the degradation rates of the five strains ofmicroorganisms were higher in low concentrations than inhigh concentrations of nicosulfuron. YF1 had the highestdegradation rate of 80.31%, followed by YB1 and YB2 withdegradation rates of 78.18% and 73.72%, respectively.However, YB3 and YB4 had lower degradation rates of36.82% and 25.75%, respectively. Upon primary identifica-tion of the three strains of microorganisms with higherdegradation rates, it was discovered that YF1 wasAspergillus niger, while YB1 and YB2 were Bacillus sp.

【题目】气候变化对福建省水稻生产的阶段性影响

【中文关键词】气候变化; 水稻生产; 模拟模型

【英文关键词】climate change,rice production,crop simulation model

【中文摘要】将福建省划分为3个水稻种植区, 选取19个样点, 采用近5年(2000--2004年)中逢单年份的产量进行CERES.Rice模型参数的调试, 逢双年份的产量用于检验模型在研究区域的适用性; 利用GISSGCMTransientRun的输出值生成了每个样点2030年及2050年的气候变化情景; 在各情景文件下运行CERES.Rice模型, 并将模拟结果与当前气候情景(BASE情景)下的模拟值进行比较, 再结合蒸散比(B)、产量波动系数(F)等指标, 定量评价了未来气候渐变过程对福建省水稻生产的影响; 在此基础上提出了适应气候渐变的若干可能对策。结果表明: 在未来气候变化过程中, 研究区域水稻生长季的土壤水分条件将变得不如目前湿润; 研究区域早稻及单季稻生育期都将不同程度的缩短, 后季稻2050年情景下有所延长; 闽东南及闽西北双季稻区产量在未来两种气候情景下均表现为减产, 且减产幅度随温度升高而加大。闽西北山地气候的单季稻区表现为增产; 当前闽东南水稻的稳产性最差, 闽西北双季稻区的稳产性较好。未来气候变化中水稻稳产性将变差; 未来两种气候情景下福建省水稻总产将随着温度的升高而减少。

【英文摘要】Fujian Province is divided into three paddy rice planting areas with 19 sampling points been chosen.In the past 5 years from 2000 to 2004,yielding on odd years has been used to commission the CERES-Rice module parameter while yielding on even years has been used to check the module'S adaptability in the research area.。Ie climate change of each sampling point in 2030 and 2050 has been generated referring to the output of GISS GCM Transient Run.CERES-Rice nodule hasbeen run under all situations.The spice stimulations has been compared with that of tIle current climate and together with transpiration ration(B)and fluctuation of grain yielding(,quantity analyzing is made to introduce the influence of gradual change ofclimate has Oil the production of rice in Fujian province;and based on this.certain possible solutions are forwarded.11he research shows that in the p~ess of climate change in the future,the soil during the growth~P.agon of the rice in the research area would be less moist.The production period of the early rice and single cropping rice would be shortened more or less while that of the late season rice would be prolonged in the climate situation of 2050.The yielding of double cropping rice in southeast and northwest FujiarI province would be lessened in both two climate situations in 2030 and 2050 with the production reduction rate increases when the temperature increases;and the yielding of single cropping rice in the mountainous areas of northwest Fujian province may enjoy a production enhancement.As for the stability of yielding,currently those in the southeast of Fujian province is the worst and in the double cropping area in northwest Fujian is better;,and the yieldin

g will be less stable in the future climate change.The total yield of rice in Fujian province will be decreased with the increase of temperature in both two future climate situations.

【题目】棉花航天诱变敏感材料的筛选机多态性分析
【中文关键词】棉花;航天诱变;突变体;农艺性状;多态性
【英文关键词】cotton;space mutation;mutant;agronomy characters;polymorphism
【中文摘要】利用“实践八号”育种卫星搭载棉花10个品种(系),对SP1代、SP2代进行了突变体的筛选、DNA分子标记检测和田间农艺性状调查,研究棉花不同材料对航天诱变的敏感性。其中7个材料对航天有一定的敏感性,其分子标记多态性高,田间农艺性状变化明显。结果表明,太空能够诱导棉花种子发生基因变异,航天诱变可作为棉花种质资源创新和品种选育的方法之一。
【英文摘要】Dry seeds of ten cotton varieties were carried by the Shijian-8 satellite for space mutation treatment. The SP1 and SP2 offspring of cotton varieties were used to screen mutants and analyze DNA molecular polymorphism and investigate the agronomic traits. The aim was to study sensitivity of cotton varieties under space mutation. The results showed that seven susceptivevarieties were confirmed and expressed high polymorphism and changed significantly on the agronomic traits. These results indicated that the outer space mutation would be an effective method to develop new cotton varieties.

【题目】Mechanism of herbicidal action of the component I from Pythium aphanidermatum
【中文关键词】无
【英文关键词】Keywords Pythium aphanidermatum, herbicidal compo-
nent, herbicidal mechanism
【中文摘要】无
【英文摘要】The herbicidal mechanism of the componentsextracted from Pythium aphanidermatum was examined inthis study. Component I was isolated using the HPD500macroporous adsorption resin and HPLC. Its impact onseed germination and plant growth of weeds wasdetermined and the contents of MDA, superoxide anionradical, and the activities of hills and roots were examined.The root length of weed plants was inhibited underillumination while the stem height was inhibited evidentlyunder darkness. The relative electric conductivity ofDigitaria sanguinalis and Amaranthus retro fl exus underillumination was 94.55 μS$cm – 1and 58.75 μS · cm – 1,respectively, whereas that under darkness was85.25 μS · cm – 1and 36.25 μS · cm – 1, respectively. TheMDA contents of Digitaria sanguinalis and Chlorellapyrenoidosa were 0.08385 μmol$L – 1and 0.1742 μmol · L – 1under illumination, respectively, while those were0.0129 μmol · L – 1and 0.01935 μmol · L – 1under darkness,respectively. Simultaneously, superoxide anion radicalcontent was higher under illumination than under darkness.These results showed the photosynthesis was affected bycomponent I extracted from Pythium aphanidermatum.

【题目】不同树脂对瓜果腐霉代谢产物中除草活性成分的吸附分析
【中文关键词】大孔吸附树脂;瓜果腐霉;吸附;除草活性
【英文关键词】无
【中文摘要】:利用 HPD400、HPD500、HPD600、HPD700、HPD850、ADS-17、D101、DM130 大孔吸附树脂对瓜果腐霉培养滤液中除草活性成分的吸附情况进行了研究, 通过对树脂吸附后的流出液和洗脱液的浓缩物进行HPLC检测分析,确定了其除草活性成分。实验发现,在所选择的8种树脂中以HPD500、HPD850、HPD600、ADS-17对除草活性成分的吸附能力最强,其中以HPD500 和 HPD600 树脂的 10%的乙醇洗脱液中除草活性成分含量最高。综合结果表明,以HPD500 树脂作为吸附瓜果腐霉培养滤液中除草活性成分的适宜树脂。研究发现,HPD500 树脂对除草活性成分吸附和解吸附的最佳条件是:吸附最适温度为 20°C,树脂吸附饱和度为33.75mL/g,较适宜吸附流速为 2BV/h,较适宜脱附流速为 1BV/h,洗脱剂浓度为 10%乙醇,洗脱剂用量为2.5BV。

【题目】泥胡菜等8种草本植物提取物除草活性的生物测定
【中文关键词】草本植物; 提取物; 除草活性; 生物测定; 泥胡菜; 葎草
【英文关键词】herb; extracts ; herbicidal activity; bi oassay; Hem istepta lyrata Bunge; Hum u lus scandens (Lour .) Merr .
【中文摘要】采用顺序提取法制备了泥胡菜 (Hem istepta ly rata Bunge)等 8种草本植物全草的石油醚、 乙酸乙酯和乙醇提取物 ,并以高粱 (Sorghum vulgare Pers .)、 黄瓜 (Cucum is sativus L.)、 小麦 (Triticum aestivum L.)和油菜 (B rassicacam pestris L.)为供试对象 ,用种子萌发法对提取物的除草活性进行了生物测定。结果表明 ,所有提取物对 4种作物幼苗根和茎的生长均有一定的抑制作用 ,但抑制率有一定差异。泥胡菜和葎草〔Hum ulus scandens (Lour .) Merr .〕 的乙酸乙酯提取物对作物幼苗根和茎的抑制作用最强 ,抑制率随提取物浓度的提高逐渐增高 ,且对作物幼苗根生长的抑制强度高于茎。在低浓度 (12 . 5 g · L - 1)条件下 ,泥胡菜乙酸乙酯提取物对小麦幼苗根和茎生长的抑制作用最强;葎草乙酸乙酯提取物对高粱幼苗根的生长及油菜幼苗根和茎的生长抑制作用最强。研究结果显示 ,泥胡菜及葎草的乙酸乙酯提取物具有潜在的除草活性。
【英文摘要】The petroleum ether, ethyl acetate and ethanol extracts fr om eight herbs were extracted bysequential extracti on, and the herbicidal activity of these extracts were bi oassayed using the seedger minati on test of Sorghum vulgare Pers . , Cucum is sativus L. , Triticum aestivum L. and B rassicacam pestris L. The results show that these extracts can inhibit the gr owth of root and stem of seedlings ofthe four crop s, but the inhibiti on rate is different . The inhibiti on of ethyl acetate extracts from Hem isteptalyra ta Bunge and Hum ulus scandens (Lour .) Merr . is the str ongest, and the inhibiti on rate increasesgradually with concentrati on rising . The inhibit ory effect of ethyl acetate extracts fr om Hem istepta lyra taand Hum ulus scandens is str onger t o r oot gr owth than t o stem. Under a l ower concentrati on (12 . 5g · L - 1) , the inhibiti on of ethyl acetate extract from Hem istepta lyrata t o growth of r oot and stem of T .aestivum seedling is the strongest, and the inhibiti ons of ethyl acetate extract fr om Hum ulus scandens t or oot growth of S. vulgare seedling and gr owth of r oot and stem of B. cam pestris seedling als o reach thepeak . It is indicated that the ethyl acetate extracts from Hem istepta ly rata and Hum ulus scandens have apotential herbicidal activity .

【题目】外来入侵植物黄顶菊的化感作用初步研究
【中文关键词】黄顶菊; 化感作用; 除草活性
【英文关键词】Flaver ia bidentis (L.) Kuntze; allelopathy; herbicide act ivi ty
【中文摘要】为明确黄顶菊对其他植物的化感作用,利用黄顶菊茎叶的不同提取物对几种植物的生长影响进行了测定。结果表明,黄顶菊茎叶水提物对玉米、 小麦、 棉花、 大豆、 花生、 马唐和反枝苋都表现出了不同程度的抑制作用, 其中以对棉花的化感效应最强,在其浓度为 0 2 g/ mL 时,对根长和茎长的化感指数分别为- 0 85和- 0 88,而该水提物对水稻的生长则表现为促进作用。黄顶菊茎叶的石油醚、 氯仿、 乙酸乙酯、 丙酮和乙醇的提取物, 对几种植物的化感效应要高于水提物,其中以丙酮提取物的化感效应最强。利用重结晶法从黄顶菊茎叶的丙酮提取物中得到了一个具有除草活性的物质,该物质的熔点为 192 5 ~ 193 5 ,最大吸收波长为 220 nm,初步判断该化合物是一种碱性有机物,该物质在浓度为 1 000, 500, 100, 50 mg/ L 时,对马唐, 反枝苋生长均有抑制作用。
【英文摘要】To ident ify the al lelopathic ef fects of Flaveria bident is (L.) Kunt ze on other plants, theef fects of di f ferent ext ract s f rom F. bident is (L.) Kuntze on the grow th of several plant s w erestudied by bioas say. Result s show that w ater ex tracts inhibited the growth of corn, wheat, cotton,soybean, peanut, Digi tar ia sanguinal is L. and A mar anthus r etrof l ex us L. , especially cotton,w i th the reactive index to root and stem being - 0. 85 and - 0 88 at the concent rat ion 0 2 g/ mL.But the w ater ext ract s accelerated the growth of rice. In addit ion, the reactive index w as higher forthe ext racts of pet roleum ether chloroform, ethyl acetate, acetone and alcohole than that of thewater ext ract s, and that of the acetone ext ract s w as the highest . The refined acetone ex tract hasmelt ing point from 192 5 to 193 5 , and max imum absorbing wave leng th of 220 nm, herbicideactivi ty, and played inhibitory roles on the grow th of D . sanguinali s L and A . r etrof lex us L. atthe concent rat ion 1 000, 500, 100, and 50 mg/ L.

【题目】放线菌10885除草活性物质的分离鉴定
【中文关键词】除草剂; 微生物发酵; 分离提纯; 除草素
【英文关键词】herbicide; ferment; isolation identification; herbicidin
【中文摘要】: 雪白链霉菌SPRI-10885菌株的发酵代谢产物对多种阔叶杂草和禾本科杂草具有显著的除草活性, 通过溶剂萃取、 柱层析分离、 HPLC等手段, 从中分离得到5个主要活性物质。 经过质谱、 核磁共振等分析, 确定10885-Ⅰ分子质量为453、 分子式为C18H23N5O9、 10885-Ⅱ分子质量为535、 分子式为C23H29N5O10、 10885-Ⅲ分子质量为551、 分子式为C23H 29N 5O 11; 另外两个分子质量分别为254和270, 分子式分别为C 15H 10O4和C15H 10O5。综合各种谱图分析确定前3个化合物的结构分别与文献报道的除草素herbicidin B、 F、 A相同, 后两个与大豆异黄酮类物质三羟基异黄酮(genistein)、 黄豆甙原(daidzein)一致。
【英文摘要】The metabolites of Streptomyces niveus SPRI-10885 showed strong herbicidal activity against variousbroad-leaved and grass weed. With the help of solvents extraction, silica gel chromatograph and HPLC, five activecompounds were purified from the ferment broth. According to the MS and NMR spectra data, the molecular formulaof the compounds were confirmed as C18H23N5O9, C23H29N5O10, C23H29N5O11, C15H10O4, C15H10O5. Compared with theknown compounds in literatures and compounds database, the structures of 10885-Ⅰ, 10885-Ⅱ and 10885-Ⅲ wereas same as herbicidin B, herbicidin F and herbicidin A, the structures of 10885-Ⅳ and 10885-Ⅴ were confirmed asgenistein and daidzein.

【题目】高温胁迫后的棉花花粉活力测定方法
【中文关键词】陆地棉;花粉;高温胁迫;花粉活力

【英文关键词】Gossypium hirsutum L.; pollen;high temperature stress;pollen viability
【中文摘要】以杂交棉南抗3号的父本南农R101为材料, 利用人工气候室, 设置日温/夜温分别为40°C /34°C (高温胁迫处理)和30°C/24°C (对照), 连续3 d处理初花期的棉花植株, 分别利用花粉原位萌发法、离体萌发法、联苯胺-甲萘酚染色法、I2-KI染色法等4种方法检测高温胁迫处理后的棉花花粉活力。结果表明, 花粉原位萌发法、离体萌发法、联苯胺-甲萘酚染色法、I2-KI染色法等4种方法均能有效测定30°C/24°C处理的花粉活力, 测定的花粉活力均在80%以上。与离体萌发法相比, 联苯胺-甲萘酚染色法、I2-KI染色法测定经过高温胁迫处理后的花粉活力值偏高。花粉原位萌发法能最真实、自然反映花粉在柱头上的萌发情况, 但是不能统计花粉萌发率。花粉离体萌发法简便、有效, 最适用于检测经过高温胁迫处理后的花粉活力。
【英文摘要】In this experiment, the male parent of hybrid cotton Nankang3(Gossypium hirsutum L.) was chosen as material. The cotton plants were stressed under high temperature 40°C/34°C(day /night), and temperature at 30°C/24°C(day /night) was set as control for three days. The pollen viability stressed under high temperature w as tested by four methods including in situ pollen germination, in vitro pollen germination, Benzidine- a -Naphthol staining and I2-KI staining. The four methods were suitable for measuring natural pollen (CK) viability which was above 80%. However, the results of the pollen viability stressed under high temperature and tested by Benzidine- a -Naphthol staining and I2-KI staining were higher, compared with in vitro pollen germination. In situ pollen germination reflected really and naturally pollen germination in the stigma, but the rate of pollen germination could not be obtained. The in vitro pollen germination method was optimal for testing the cotton viability stressed under high temperature.

【题目】链格孢菌毒素细交链孢菌酮酸在土壤中的降解研究
【中文关键词】链格孢菌毒素; 细交链孢菌酮酸; 土壤; 降解
【英文关键词】Alternaria alternata toxin; tenuazonic acid; soil; degradation
【中文摘要】细交链孢菌酮酸是病原真菌链格孢菌(Alternaria sp.)产生的主要毒素之一, 在霉变的粮食、 感病的植物和腐烂的水果中都能检测到, 其具有较强的动物毒性, 给食品安全带来一定的隐患。 分别在实验室和大田条件下对链格孢菌毒素细交链孢菌酮酸在土壤中的降解动态进行了观察。 结果表明, 在实验室条件下, 微生物对细交链孢菌酮酸在土壤中的降解影响较大, 光照的影响较弱, 不灭菌条件下, 其半衰期小于 10 d, 加药 10 d 时, 其降解率就大于 50%; 灭菌条件下, 其半衰期大于 30 d, 加药 40 d 时, 其降解率才超过 50%。土壤含水量的增加和土壤温度在一定范围内的升高可促进其降解, 土壤含水量为 12.5%~50%, 其半衰期为 11.38~5.14 d,加药 10 d 时其降解率为 38.98%~62.14%, 温度为 20~40 °C时, 其半衰期为 14.26~5.11 d, 加药 10 d 时其降解率为 36.94%~62.45%。田间研究表明, 细交链孢菌酮酸在自然条件下降解的半衰期约为 3.22 d, 20 d 后就可完全降解。 可认为细交链孢菌酮酸属于易降解类物质。
【英文摘要】Abstr act: Tenuazonic acid was an important mycotoxin from Alternaria alternata, toxic to animals. It was found in spoiled grains, diseasedplants and rotten fruit, as a hidden trouble in food safety. Degradation of tenuazonic acid in soil was investigated under laboratory and fieldconditions. The results showed that, under laboratory condition, the soil microorganisms obviously accelerated the degradation of tenuazonicacid, suggesting that microorganisms played an important role in degradation of tenuazonic acid. Sunlight also involved in degradation of ten-uazonic acid, but was not as important as microorganisms do. When the soil was not autoclaved, the T0.5 was less than 10 d, the degradationrate was larger than 50% only after 10 d treatments, when autoclaved, the T0.5 was more than 30 d, and the degradation rate was larger than50% after 40 d treatments. In addition, the increase of water contents and temperature of soil promoted the degradation of tenuazonic acid insoil, the T0.5 was 11.38~5.14 d when the water content of soil was 12.5%~50%, and the degradation rate was 38.98%~62.14% after 10 d treat-ments, the T0.5 was 14.26~5.11 d at 20~40 °C, and the degradation rate was 36.94%~62.45% respectively after 10 d treatments. The studiesunder field condition revealed that the half life of tenuazonic acid was only about 3.22 days, and the residual period was about 20 days in soil.

【题目】麦根腐平脐蠕孢及薏苡平脐蠕孢防治稻田稗草的生物活性和安全性研究
【中文关键词】麦根腐平脐蠕孢;薏苡平脐蠕孢;稗草;生物防治
【英文关键词】Bi polaris sorokiniana;Bipolaris coicis;Echinochloa crus—galli;rice(Oryza sativa);bio logical contro
【中文摘要】:对分离 自云南昆明感病稗草[Echinochloa crus—galli(L.)Beauv.]上的病原真菌麦根腐平脐蠕孢(Bipolaris SO— rokiniana)和薏苡平脐蠕孢(Bipolaris coicis)开展 了防治稗草潜力的评价。结果显示,B.sorokiniana和B.coicis两菌株培养 5 d的发酵原液对稗草根长和芽长均有很高的抑制作用,根长最高抑制率分别为 99.59 和95.78 ,芽长最高抑制率分别 为91.14 和82.13 。两菌株对稗草离体叶片致病性的室内试验表明,菌丝体悬浮液处理 5 d后稗草叶片病情指数最高可 达i00 。两菌株对稗草植株防效的温室试验表明,菌丝体悬浮液处理稗草 7 d后植株下部叶片出现萎蔫症状、 脱落及死 亡,处理 21 d后稗草最高死亡率达到 82.67 和8O.00 。菌株对作物的安全性试验表明,麦根腐平脐蠕孢对作物的安全性 显著高于薏苡平脐蠕孢。作为生防潜力菌株,麦根腐平脐蠕孢具有更大的应用潜力。
【英文摘要】Isolates of Bipolaris sorokiniana and B.coicis from diseased barnyardgrass(Echino chloa crus—galli)plants in Kunming,Yunnan Province were evaluated for their potentials agai nst barnyardgrass as biocontrol agent.The results of bio— assay showed that the 5-day cultu re filtrates of the two strains had high inhibitory activity to the growth of barnyardgrass, with the inhibitory rates of 99.59 and 95.78 on roots,91.14 and 82.13 on buds,respectively.And the barnyard— grass treated with mycelium suspension of the two strains showed i00 disease in cidence in the laboratory experiment.In greenhouse,the barnyardgrass plants showed the def

oliating of leaves,the wilting of shoots and the death of plants after 7 days treatment by the myceliumsuspension fromthe two strains,and the mortality rate added up to 82.67 for B. sorokiniana and 80.00 for B.coicis respectively at 21 days after treatment.In addition,the crop safety test showed that B. sorokinina was safer to major crops than B.soicis and had a better application prospect as bio—agent.

【题目】三个棉花雄性不育株花药发育过程的研究

【中文关键词】辐射诱变;雄性不育;花药;陆地棉

【英文关键词】irradiation-induced mutation;male-sterile;anther;upland cotton

【中文摘要】利用20 Gy的60Co射线对陆地棉品种苏棉22 号的花粉进行辐照处理, 处理后的花粉给雌蕊授粉, 并收获种子。从M1 群体中选取3 个雄性不育株, 采用石蜡切片技术对花药发育过程进行研究。通过与对照比较, 3 个雄性不育株各个时期的败育特征有一定差异, 但它们的主要败育特征是一致的: 从小孢子母细胞时期至小孢子发育阶段都有败育, 小孢子母细胞、绒毡层和中层细胞以及花药的形态都受到不同程度的影响, 包括小孢子母细胞有微核及双核现象、减数分裂阶段小孢子母细胞的细胞质膨胀、绒毡层及中层细胞异常等。

【英文摘要】Pollens of Sumian 22 were irradiated by 60Co -rays at a dose of 20 Gy, then fertilized to pistil and harvested seed. Three male-sterile lines were selected from M1 plants, their anther observed by paraffin slice technique. Although there were some different characteristics during the abortion anther development, the abortion was consistent: the abortion stage from the development periods of pollen mother cells to microspore, pollen mother cells, tapetum, middle layer cells and the shape of anther were affected, the results contained micronucleus and double nucleus, cytoplasm expansion during the period of meiosis, tapetum and middle layer cells and so on were abnormal.

【题目】树脂吸附法分离瓜果腐霉毒素除草活性物质
【中文关键词】瓜果腐霉病菌, 除草活性, 树脂柱层析
【英文关键词】Pythium aphanidermatum, Herbicidal activity, Colophony
【中文摘要】本试验以对禾本科杂草具有除草活性的瓜果腐霉菌株 PAM1 为试验材料, 研究了 X-5、AB-8、H-103 和 S-8 等 4 种大孔吸附树脂对其除草活性物质的吸附性能, 结果表明 X-5 树脂能够较好地吸附该除草活性物质。选用 50%乙醇、95%乙醇、乙酸乙酯和丙酮 4 种溶剂为供试洗脱溶剂, 采用 2 种洗脱方案, 对其最佳洗脱溶剂进行了选择, 生长抑制作用和种子萌发试验结果表明, 以方案 1 洗脱为最佳。
【英文摘要】Four kinds of colophony were used to isolate the herbicidal substance from the toxin produced by isolate PAM1 of Pythium aphanidermatum, which had herbicidal activity to Digtaria sanguinealis L and the results showed X-5 was the best one for absorbing herbicidal substance among the four kinds of colophony used. Four solvents including 50% ethanol, 95% ethanol, ethyl acetate and acetone were used as eluting sol-vent and 2 procedures were tested, and the results of growth inhibition and seed germination indicated that the best eluting procedure was procedure 1.

【题目】ALA提高丙酯草醚胁迫下油菜幼苗耐性研究
【中文关键词】油菜; 丙酯草醚; 5 一 氨基 乙酰丙酸; 光合作用; 抗氧化酶
【英文关键词】null
【中文摘要】: 对油菜幼苗叶面喷施不同浓度的丙酯草醚(z J 0 2 7 3) 和 5 一 氨基 乙酰 丙酸(A L A) , 研究 了 A L A与丙 酯草醚协同处理对苗期 的油菜是否安全。结果表 明, 丙酯草醚随浓度从 1 0 0~1 0 0 0 m g / L变化 , 逐渐抑制 油菜幼苗生长, 鲜重减少, 净光合速率和叶绿素含量降低 ; 过氧化物酶(P O D) 、 超氧化物歧化酶 (S O D) 和 抗坏血酸过氧化物酶(A P X) 活性下降, 丙二醛(MD A) 积 累提 高。而 1 0~1 0 0 m g / L的 A L A则促进油菜幼 苗生长, 增加植株的鲜重 、 净光合速 率并提 高了叶绿素含 量, P O D 、 S O D和 A P X酶 活性均 比对照显著提 高, MD A积累减少; 5 0 0 m g / L的 A L A效果相反, 表现为抑制 作物 生长。 1 0 0 m g / L A L A和不 同浓度 的丙酯 草醚协 同处理, 油菜幼苗均比对照生长的更好 , 鲜重增加 , 净光合速率提 高, 抗氧化酶活性增加, M D A积 累减少。 因此, A L A可以提高油菜幼苗在除草剂丙酯草醚胁迫下的耐性。

【题目】水花生病原菌 — 蕉斑镰刀菌菌株的筛选及其致病性测定
【中文关键词】水花生; 蕉斑镰刀菌; 致病性; 寄主专化性
【英文关键词】Alte rnanthe ra philo xeroides; Fusarium stove ri ; pathogenici ty; hos t range
【中文摘要】蕉斑镰刀菌 Fusarium stoveri 是从自然界水花生植株上分离的、 可致水花生表现萎蔫、 地上茎腐烂、 叶片上呈现褐色斑或黄化的生防真菌。室内研究表明,蕉斑镰刀菌菌丝生长和产孢的适宜温度范围在25~ 28 , 多数菌株的最适温度为28 ; 菌株间的产孢量有较大差异。在供试菌株中, 32 6 菌株的产孢量最大; 供试的9 个蕉斑镰刀菌菌株对水花生均有较强的致病力,但菌株间的致病力有所差异。根据菌株的生长速率、 产孢量和致病力等因素,菌株32 6 被选为水花生生防菌的优选菌株。采用生产上常见农作物、 蔬菜、 经济作物及物候上与水花生一致的杂草等42 种植物对菌株32 6 进行寄主专化性测定, 结果表明,蕉斑镰刀菌菌株 32 6 具有高度的寄主专化性, 只对水花生表现出较强的致病性, 对其他植物均不致病。
【英文摘要】Several potential fungal bioherbicidal st rains of Fusarium stove ri causing the leaves wi ther,brown or etiolation and stems rot were isolated from the nat ive Alte rnanthe ra phi loxe roides . The resul ts re vealed the temperature for mycelial growth and conidia production was wi thin range of 25- 28 wi th op timum at 28 . Great di fference c onidial production and pathogenicity e xis ted among the nine isolatesStrain 32 6 displayed the bes t conidial production, and was selected as the potential bioherbicidal candi date based on the mycelial growth rate, conidial production and pathogenici ty to Alte rnanthe ra phi loxe roides. The resul ts of host range tes ts of the strain 32 6 indicated that the pathogen didn! t infect the 42tested agricul tural crop and weed species.

【题目】马唐致病菌株Mds0404生物学特性的研究
【中文关键词】马唐;生物除草剂;弯孢;生物学特性
【英文关键词】Digitaria sanguinaris ; bioherbicide ; Curvularia sp. ;biological characteristics
【中文摘要】研究了影响马唐生防菌弯孢霉 Mds0404 菌株营养生长、 孢子萌发及孢子形成的因子。结果表明 ,该菌在 PSA培养基上生长最好 ,在 PDA培养基上产孢最多;在10~40°C 均可生长 ,最适生长温度为25~32°C;在20~32°C 均可产孢 ,最适产孢温度为25~28°C;pH为5时生长最快 ,pH为8时产孢量最大;在以蔗糖为碳源、硝酸钾为氮源的 Czapek培养基上生长与产孢均较好;加膜 25 cm紫光灯 12 h间隔光照产孢最丰富。分生孢子萌发的温度为10~40°C,最适为25~40°C,失活温度为55°C。黑暗有利于孢子的萌发。16 min近距离紫外光照射萌发率仍保持在50 %以上。
【英文摘要】:Factors in fluenced vegetative growth , conidial germination and sporulation of strain Mds0404 of Curvularia sp. ,which was a biological control agent for crabgrass (Digitaria sanguinaris) , had been primarily studied. PSA was the bestmedium for growth of pathogenic strain and PDA was the best for sporulation. The ranges of temperature for myceliumgrowth was 10 - 40°C,the optimumwas 25 - 32°C. The range of temperature for fungus sporulation was 20 - 32°C, the op2timum at 25 - 28°C. The optimum pH for mycelia growth and for the amount of spores produced was pH 5 and pH 8 ,re2spectively. The fungus grew and spored better in Czapek mediumwith sugar as carbon s ource and K NO3 as nitrogen s ource.The amount of spore produced most when the medium was lighted under purple lamp covered with membrane away from 25cm at 12 hours interval . The range of temperature for conidial germination was 10 - 40°C, the optimum at 25 - 40°C, thetemperature of deactivation was 55°C. Darkness was fav or of conidial germination. The percentage of spore germination wasstill over 50 % under UV2light irradiation for 16 minutes.

【中文关键词】水稻田, 土壤细菌多样性, 16S rDNA克隆文库, RFLP分析
【英文关键词】paddy rice field, bacterial diversity, 16S rDNA, RFLP analysis
【中文摘要】水稻是宁夏地区主要粮食作物, 水稻种植也具有维持生态系统平衡, 防止土地荒漠化等重要的生态功能。而稻田土壤细菌是维持土壤生态功能的基础。但长期以来缺乏对干旱地区稻田土壤细菌多样性的认识。本研究采用非培养技术提取稻田土壤样品总DNA, 构建其16S rDNA克隆文库, 用PCR-RFLP分析进一步测序后聚类分析细菌群落的多样性。从稻田土样中分离获得了大于23 kb的DNA片段。PCR-RFLP共得到74种酶切带型, 序列分析发现77.3%的克隆序列与环境中未培养细菌的16S rDNA序列有较高的相似性, 仅有22.7%的克隆序列与数据库中可培养细菌有较高的相似性, 表明宁夏稻区土壤中的多数细菌尚未培养。系统发育研究发现74个序列分属于12个类群, 其中变形细菌所占比例最大(37.8%), 依次为酸杆菌(16.2%)、 放线菌(12.2%)、 拟杆菌(10.8%)、 绿屈挠菌(10.8%)、浮游霉菌(8.1%), 另外有少量厚壁菌门、芽单胞菌门和疣微菌门细菌克隆。在变形细菌的序列中包括α、 β、 γ和δ 4个类型, 比例分别为13.5%、5.4%、12.2%和6.8%。表明宁夏稻区土壤中优势细菌类群为变形杆菌和酸杆菌, 且土壤细菌类群具有丰富的多样性。
【英文摘要】Rice is one of the most important crops in the Ningxia region of China, and rice planting helps to maintain ecosystem balance and prevent land desertification. Soil microbial diversity provides basic func-tions for rice field soil ecosystems. To better

understand bacterial diversity and community composition in Ningxia paddy soil, the total bacterial DNA was extracted from paddy soil collected from a typical rice field of Ningxia using the culture independent method. A 16S ribosomal DNA (16S rDNA) clone library of soil bacteria was constructed. The 16S rDNA fragments were analyzed by PCR-RFLP. Further sequencing and cluster analysis were conducted to elucidate the bacterial diversity. Over 23 kb DNA fragments were obtained from the paddy soil and 74 MspI restriction endonuclease types were detected by PCR-RFLP analysis. Se-quence analysis revealed that 77.3% of clone sequences were similar to those of uncultured bacteria in the environment, while only 22.7% clone sequences were most closely related to those of cultured bacteria in GenBank, suggesting great potential for undeveloped bacterial resources was available in paddy fields. Our phylogenetic analysis found that the sequenced clones fell into 12 major lineages within the domain bacteria. Among them, members of the Proteobacteria were the dominant group, accounting for 37.8%, including α-Proteobacteria (13.5%), γ-Proteobacteria (12.2%), δ-Proteobacteria (6.8%) and β-Proteobacteria (5.4%), followed by Acidobacteria, Actinobacteria, Bacteroidetes, Chloroflexi and Planctomycetes division with 16.2%, 12.2%, 10.8%, 10.8%, 8.1%, respectively. Firmicutes, Gemmatimonadetes, and Verrucomicrobia were less well represented. Our study revealed an extensive diversity of soil bacteria in a paddy field in Ningxia.

【题目】苍耳对不同植物幼苗的化感作用研究
【中文关键词】苍耳; 化感效应; 种子萌发; 幼苗生长
【英文关键词】null
【中文摘要】在室内采用离体生物测定法, 测定了苍耳水浸提物对小麦、 高粱、 黄瓜、 油菜和萝卜的化感效应。结果表明,苍耳水浸提液对5种植物种子的萌发和生长均有较强的抑制作用, 且相同浓度处理时, 对胚根的生长抑制作用高于对胚芽的抑制作用。5种受体植物中, 以油菜最为敏感, 其次为萝卜。本研究还通过测定化感物质对植物光合作用的影响及MDA含量的变化, 初步探讨了苍耳化感物质的作用特征。在0. 0 2 5g / mL浓度下, 苍耳对去胚乳小麦幼芽、 幼根的抑制率分别为5 8. 3 3%和6 7. 3 1%; 同样浓度下, 苍耳对黑暗条件下培养的高粱幼芽、 幼根的抑制率分别为5. 5 8%和3 2. 3 4%; 可以看出, 苍耳对植物光合作用的影响明显高于对非光合作用的影响。化感物质处理后黄瓜和萝卜幼苗 MDA含量均高于未加化感物质的对照处理, 且化感物质浓度越高 MDA含量越高。由此可以看出, 苍耳对植物的化感作用与抑制植物的光合作用并使植物的 MDA含量升高有关, 对植物的非光合作用亦有不同程度的影响。

【题目】超高产型杂交红麻中杂红318的选育
【中文关键词】红麻;杂种优势;超高产
【英文关键词】kenaf;hybrid;super high yield
【中文摘要】中杂红318(原名“ H318 ”)系利用外观性状叶型相似、父本L3-21 茎色红色,母本P91茎色绿色,经济性状互补性强的红麻良种为亲本,从数十个组合中筛选出的超高产型抗病优质杂交组合,在入选的杂交红麻杂优组合比较中,杂优组合的优势是显著的。其中超高产型杂优组合H318(F1)在比较试验中,分别比KB2(中红麻10 号)和红引135 增产30.2%和64.2%,达极显著水平;平均干茎1471.03kg/666.7m2,比对照中红麻10 号增产20.54%;H318 在2004-2006 年全国红麻区域试验中,平均纤维产量每公顷4411.65kg,比对照中红麻10 号增产20.75%,达极显著水平,较其它参试新品种增产显著。在全国红麻生产试验中平均纤维产量306.16 kg/666.7m2,比对照中红麻10 号增产19.12%,差异达极显著水平;纤维品质经农业部麻类产品质量监督检验测试中心检测,纤维支数266 支,强力327 牛顿,优于对照品种;该组合经人工接种炭疽病菌鉴定,烂头率为2.4%、病情指数为17.8,其指标优于对照,表现出植株高大,皮较厚,有效株数多,干茎产量和出麻率均高,纤维品质好,抗病性强,属于高抗类型。表明中杂红H318 是高产、优质、多抗、适应性广的纺织、造纸兼用的红麻新组合。
【英文摘要】Kenaf hybrid H318,red stem,divided leaf,which was bred and selected from several decades of kenaf crosses,is the most promising hybrid used in production at present. The average fiber yield of H318 was 5460kg/hm2,30.2% and 64.2% higher than that of CK KB2 and “ Hongying135 ” respectively in comparison of kenaf hybrids in 2003,4411.65kg/hm2,20.75% higher than that of CK “ KB2 ” in national kenaf regional trial at 7 locations in 3 years(2004- 2006),the highest among newlines and hybrids. The average

dry stalk yield of H318 was 22.06t/hm2,20.5% higher than that of CK at 3 sites.Its average fiber strength was 327N (1g fiber,length 30cm),fineness 266m/g. Under the artificial inoculation ,the anthracnose disease index was 17.8,the rate of died top stems 2.4% . The main advantages of kenaf hybrid H318 were large plants,more available plants at final harvest,high ratio of bark to stalk,good fiber quality,high resistance to the anthracnose disease and wide adaptability.

【题目】苎麻组织培养和遗传转化研究进展

【中文关键词】苎麻;组织培养;遗传转化

【英文关键词】Ramie;Tissue culture,Transformation

【中文摘要】苎麻是优良的精纺纤维,也是重要植物蛋白饲料资源和新型生物质产业的基础材料,本文从组织培养和遗传转化两个方面,结合本实验室工作综述了苎麻组织培养和遗传转化研究的最新进展。在苎麻组织培养的外植体中以下胚轴和子叶最适宜,而在激素使用以6-BA 诱导器官分化的效率最高,并以此为基础建立了苎麻再生体系。在苎麻遗传转化方面,目前以农杆菌介导法应用最多。本文还指出了苎麻转基因研究中存在的问题,并对生物技术培育苎麻新品种和促进苎麻生产的可能性进行了讨论。

【英文摘要】Ramie is fine worsted, and an important resource of botanic protein feed and a new basic material for biomass material industry. This article summarizes advances of ramie tissue culture and genetic transformation. The studies on tissue culture indicated that, hypocotyl and cotyledon is the most suitable. The explant and culture medium with 6-BA has the highest regeneration efficiency. Accordingly, the in vitro regeneration system of ramie has been established. The reported studies on ramie genetic transformation showed that, Agrobacterium-mediated technique was used more. In conclusion, problems and prospects on ramie tissue culture and genetic transformation are pointed out. Furthermore, the possibility of breeding new ramie varieties and promoting the ramie product via biotechnology was also discussed.

【题目】新型除草剂丙酯草醚对油菜幼苗生长与根尖细胞活性的影响
【中文关键词】油菜;丙酯草醚;根系活力;细胞膜透性;FDA-PI;有丝分裂指数
【英文关键词】null
【中文摘要】【目的】研究新型油菜田除草剂丙酯草醚(ZJ0273)对甘蓝型油菜发芽期幼苗在生长发育及根尖细胞活性等方面的安全性影响,为进一步明确其作用机理奠定理论基础。【方法】利用生理生化方法探讨了 ZJ0273 处理对发芽期油菜茎根长、干物质积累、根系活力和根细胞膜透性等的影响,并运用FDA-PI荧光对染法及根尖压片法研究了该除草剂对油菜根尖细胞活性及有丝分裂的影响。【结果】ZJ0273 处理对油菜幼苗干物质和苗高等性状的抑制作用随着处理浓度的升高和处理时间的延长而显著增强;10 与 100 mg · L-1处理显著抑制了油菜幼苗根的生长且两处理间抑制效果无明显差异;1 mg · L-1以下浓度的 ZJ0273 对油菜幼苗根系活力、细胞膜完整性几乎无显著影响,而10 mg · L-1以上浓度处理则明显抑

制根系活力且破坏细胞膜完整性;100 mg · L-1ZJ0273处理抑制油菜根尖分生区细胞有丝分裂并使多数细胞停滞于分裂中期。【结论】发芽期是油菜对ZJ0273 处理的敏感时期;10 mg · L-1 ZJ0273处理即抑制油菜幼苗的生长发育及影响根尖细胞活性,且抑制效果随处理浓度的升高和处理时间的延长而增大;对油菜幼苗较为安全的ZJ0273临界浓度为1 mg · L-1。

【题目】Effect of water temperature on digestive enzyme activity and gut mass in sea cucumber Apostichopus japonicus (Selenka), with special reference to aestivation
【中文关键词】消化酶的活性相对肠道质量度夏水温刺参(RGM)
【英文关键词】digestive enzyme activity　relative gut mass (RGM)　aestivation　water temperature　Apostichopus japonicus
【中文摘要】水温对肠道海参刺参,包括肠道相对质量(RGM),淀粉酶,脂肪酶,胃蛋白酶和胰蛋白酶活动的质量和消化酶的活性的影响进行了研究在温度为7,14,21,和28 ° C一个为期40天。结果表明,RGM显着下降后,40天,21 ° C,显着降低了整个试验期,在28 ° C;然而,没有显着效果的持续时间观察7天或14 ° C。在14 ° C,胰蛋白酶的活性显着下降超过10天,20天,然后增加,淀粉酶和胰蛋白酶的活性显着下降后,40天,28 ° C然而,没有显着效果的持续时间被发现在其他温度处理组的淀粉酶,胃蛋白酶,胰蛋白酶活动。脂酶活性在28°C下,在20天达到高峰,然后显着降低到最低限度在实验结束后,。另一方面,胃蛋白酶活性,在28°C,在整个实验期间连续地增加。主成分分析结果表明,在21 ° C组和28 ° C组的前20天,40天的海参夏眠前期。

在28 ° C,海参aestivated在实验开始后30-40天。它的结论是刺参的消化温度的影响是比较薄弱的一个特定范围内的水温和度夏行为是伴随着显着变化在RGM与消化酶活性。

【英文摘要】The effect of water temperature on gut mass and digestive enzyme activity in sea cucumber Apostichopus japonicus, including relative gut mass (RGM), amylase, lipase, pepsin and trypsin activities were studied at temperatures of 7, 14, 21, and 28 ° C over a period of 40 days. Results show that RGM significantly decreased after 40 days at 21 ° C and markedly decreased over the whole experiment period at 28 ° C; however, no significant effect of duration was observed at 7 or 14 ° C. At 14 ° C, trypsin activity significantly decreased over 10 and 20 days, then increased; amylase and trypsin activity significantly decreased after 40 days at 28 ° C. However, no significant effect of duration was found on amylase, pepsin or trypsin activities in the other temperature treatment groups. At 28 ° C, lipase activity peaked in 20 days and then markedly decreased to a minimum at the end of the experiment. On the other hand, pepsin activity at 28 ° C continuously increased over the whole experimental period. Principle component analysis showed that sea cucumbers on day 40 in the 21 ° C group and in the previous 20 days in the 28 ° C group were in the prophase of aestivation. At 28 ° C, sea cucumbers aestivated at 30-40 days after the start of the experiment. It is concluded that the effect of temperature on the digestion of A. japonicus is comparatively weak within a specific range of water temperatures and aestivation behavior is accompanied by significant changes in RGM and digestive enzyme activities.

【题目】Effects of acute temperature or salinity stress on the immune response in sea cucumber, Apostichopus japonicus

【中文关键词】刺参,温度应力,盐胁迫,免疫字符
【英文关键词】Apostichopus japonicus;Temperature stress;Salinity stress;Immune character

【中文摘要】越来越多的无脊椎动物在海水养殖中提出的,重要的是要监测免疫功能兴业,最大限度地减少压力,可以抑制免疫。活动的吞噬能力, 超氧化物歧化酶(SOD),过氧化氢酶(CAT),髓过氧化物酶(MPO),溶菌酶(LSZ)进行测量,以评估的immunecapacities,海参,刺参,急性温度变化(从12 ° C 0 ° C,8 ° C,16 ° C,24 ° C和32 ° C为72小时)和盐度的变化(从30‰至20‰,25‰,35‰,72小时)在thelaboratory。吞噬功能的显着由3小时的温度上升的影响,和盐度(25‰and35‰)在1小时的变化。超氧化物歧化酶活性明显降低,在0.5小时至6小时的样品在24 ° C在32 ° C,SODactivities减少0.5小时和1小时暴露明显,和12小时暴露明显增加。 0.5小时暴露的CATactivities在24 ° C显着下降,并在32 ° C显着增加,在3小时12 hexposures,。 MPO活性增加显着,在0°C下在0.5小时至6小时暴露在8°C下进行1小时。 Bycontrast,MPO活性在24 ° C和32 ° C的治疗显着降低。在升高,temperaturetreatments,活动LSZ6小时至12小时暴露在32 ° C除外显着增加。 SOD的活动wassignificantly盐度变化的影响。 CATactivity后仅1小时暴露salinityof20‰显着下降。 MPO和LSZ的活动表明,刺参耐受盐胁迫有限。高温应力有更大的影响刺参免疫能力比低的温度和盐度的应力。

【英文摘要】Invertebrates are increasingly raised in mariculture, where it is important to monitor immune function andto minimize stresses that could suppress immunity. The activities of phagocytosis, superoxide dismutase(SOD), catalase (CAT), myeloperoxidase (MPO), and lysozyme (LSZ) were measured to evaluate the immunecapacities of the sea cucumber, Apostichopus japonicus, to acute temperature changes (from 12 ° C to 0 ° C, 8 ° C,16 ° C, 24 ° C, and 32 ° C for 72 h) and salinity changes (from 30‰ to 20‰, 25‰, and 35‰ for 72 h) in thelaboratory. Phagocytosis was significantly affected by temperature increases in 3 h, and by salinity (25‰ and35‰) changes in 1 h. SOD activities decreased significantly in 0.5 h to 6 h samples at 24 ° C. At 32 ° C, SODactivities decreased significantly in 0.5 h and 1 h exposures, and obviously increased for 12 h exposure. CATactivities decreased significantly at 24 ° C for 0.5 h exposure, and increased significantly at 32 ° C in 3 h to 12 hexposures. Activities of MPO increased significantly at 0 ° C in 0.5 h to 6 h exposures and at 8 ° C for 1 h. Bycontrast, activities of MPO decreased significantly in 24 ° C and 32 ° C treatments. In elevated-temperaturetreatments, activities of LSZ increased significantly except at 32 ° C for 6 h to 12 h exposures. SOD activity wassignificantly affected by salinity change. CATactivity decreased significantly after only 1 h exposure to salinityof 20‰. Activities of MPO and LSZ showed that A. japonicus tolerates limited salinity stress. High-temperature stress had a much greater effect on the immune capacities of A. japonicus than did low-temperature and salinity stresses.

【题目】Effects of aestivation on the energy budget of sea cucumber Apostichopus japonicus (Selenka) (Echinodermata Holothuroidea).
【中文关键词】刺参,夏眠,能量收支,水温,体重
【英文关键词】Japonicus, aestivation, energy budget, water temperature, body weight
【中文摘要】夏眠是刺参最重要的生理特征;水温升高是其夏眠的主要诱发因子,而夏眠的临界温度与刺参体重密切相关.为揭示刺参夏眠对其能量利用对策的影响,测定了2种体重规格(134.0±13.5)g和(73.6±2.2)g刺参在10、15、20、25 ℃和30 ℃ 5个温度梯度下的能量收支.结果表明,温度和体重及其交互作用对刺参能量的摄入均有显著影响;而温度是影响其摄食能分配的主要因素.研究发现,刺参在非夏眠期、夏眠临界期和完全夏眠期的能量利用对策有所不同:在非夏眠期,刺参摄食能支出的最大组分是粪便能,占摄食能的比例超过50%,其次为呼吸耗能,占19.8%~39.4%,而生长能和排泄能占的比例较小,分别为5.7%~10.7%和2.9%~3.7%;在夏眠临界温度下,呼吸和排泄耗能占摄食能的比例均显著增大(分别为88.3%和13.6%),而生长能所占比例降为负值(-55.3%),刺参表现为负生长;而在夏眠期,刺参的摄食能和排粪能为零,为维持其基本生理活动,不得不动用以往贮存于体内的能量,消耗于呼吸和排泄等生理过程,供维持生命之用.总之,从能量生物学的角度看,夏眠的主要生态学意义在于刺参长时间处于相对高温环境,进而导致摄食受阻条件下的一种能量节约方式.
【英文摘要】Aestivation is the most important sea cucumber physiological characteristics; rising water temperatures aestivation major predisposing factor aestivation critical temperature and sea cucumber weight are closely related. Determined to reveal the impact of the utilization of the sea cucumber aestivation its energykinds of weight specification (134.0 ± 13.5) g and (73.6 ± 2.2) g stichopus energy budget. 10,15,20,25 °C and 30 °C 5 temperature gradient results show that the temperature and weight and their interactionsthe sea cucumber energy intake have a significant impact; temperature is the main factor to affect its feeding allocated study found that sea cucumber in the non-aestivation period, the aestivation critical period and full aestivation period energy utilization differ: In thenon aestivation period, the largest component of the expenditure of the sea cucumber feeding can feces can total proportion of feeding can be more than 50%, followed by respiratory energy consumption, accounting for 19.8% to 39.4%, while growth and excretion can account for a smaller proportion of5.7% to 10.7% and from 2.9% to 3.7%, respectively; under in aestivation critical temperature, respiration and excretion of energy consumption accounted for feeding proportion were significantly increased (88.3% and 13.6%, respectively), while the growth can shareproportion dropped to negative (-55.3%), sea cucumber showed negative growth; in aestivation period, the sea cucumber feeding and defecation can be zero, in order to maintain its basic physiological activities, had to draw on stored bodyenergy consumed in physiological processes such as respiration and excretion, for the maintenance of life with short, from a biological point of view of energy, aestivation major ecological significance lies japonicus at a relatively high temperature environment for a long period of time, causing feeding hindered under conditionsan energy saving way.

【中文摘要】刺参夏眠的海参生活中的历史中是不可缺少的状态。的刺参体腔液中的免疫特性,在度夏。7月和2006年11月关闭位于黄海之滨的山东省胶南市,中国从沿海池塘收集样品。的总体腔细胞计数(TCC),总超氧化物歧化酶(T-SOD),过氧化氢酶(CAT),过氧化物酶(MPO),溶菌酶(IZM)在体腔液中进行测量。活动的儿茶酚胺,肾上腺素(AD),去甲肾上腺素(NA),多巴胺(DOP)]进行了估计。 TCC下降,从七月到九月,当时指示的细胞免疫活性的弱点。活动的SOD,CAT,过氧化物酶,和LZM变化显着,从七月到十月。体腔液中儿茶酚胺AD和NA均显着高8月21日和11月27日。在DOP采样期间没有显着的变化。因此,日本的A.体液免疫字符在度夏显着改变。水的温度明显呈负相关TCC,盐度为显著正相关,与AD和NA。在刺参夏眠的机制是复杂的,并且可能不仅归因于环境的变化,如温度和盐度的,在以前的研究中所示。

【英文摘要】Aestivation is an indispensable state in the life history of sea cucumbers, Apostichopus japonicus. The immune characteristics of the coelomic fluid of A. japonicus, were investigated during aestivation. Samples were collected between July and November 2006 from a coastal pond located off the Yellow Sea in Jiaonan, Shandong Province, China. The total coelomocytes counts (TCC), total superoxide dismutase (T-SOD), catalase (CAT), myeloperoxidase (MPO), and lysozyme (IZM) in the coelomic fluid were measured. The activities of catecholamines, [adrenaline (AD), noradrenaline (NA), and dopamine (DOP)] were estimated. TCC decreased from July to September, indicating weakness of the cellular immune activity at that time. Activities of SOD, CAT, MPO, and LZM changed significantly from July to October. Catecholamines AD and NA in coelomic fluid were significantly higher on August 21 and November 27. There was no significant variation in DOP during the sampling period. Thus, immune characters in coelomic fluid of A. japonicus changed significantly during aestivation. Water temperature was significantly and negatively correlated with TCC, and salinity was significantly and positively correlated with AD and NA. The mechanism of aestivation in A. japonicus is complex and might not be attributed only to environmental changes, such as temperature and salinity, as shown in previous studies.

【题目】Phenotypic plasticity of gut structure and function during periods of inactivity in Apostichopus japonicus

【中文关键词】海参刺参刺参; PRICKLEBACK的鱼类鱼类消化酶的活动;垒礁海参;有机质;草食性鱼类;夏眠,饥饿,沉积物

【英文关键词】CUCUMBER STICHOPUS-JAPONICUS; PRICKLEBACK FISHES TELEOSTEI; DIGESTIVE ENZYME-ACTIVITIES; GREAT-BARRIER-REEF; SEA-CUCUMBER; ORGANIC-MATTER; HERBIVOROUS FISHES; ESTIVATION; STARVATION; SEDIMENTS

【中文摘要】刺参是一种常见的海参,经过季节性闲置阶段,在暑假期间停止进食。我们用这个作为一个模型,其中的消化道检查表型可塑性,在食物匮乏的海参物种。我们测量体质量,总肠道形态和消化酶活性的刺参前,中,闲置一段时间后,这种动物的肠道结构和功能研究食物匮乏的影响。个人采样半每月超过18摄氏度的温度范围内的变化9月5日,代表活动和喂养缺乏的高峰期,从6月至11月(10个采样的间隔超过178天)刺参它的身体质量下降,肠质量和肠长度的50%,85%,和70%,分别,在比较之前的非活动周期为这些参数的值。淀粉酶,纤维素酶和脂肪酶的活动下降了77%,98%和35%相比,这些酶在6月的平均值,而胃蛋白酶活性增加2倍(诱非活动期。海藻酸和胰蛋白酶活动变量并没有改变整个178天的实验显着。除了淀粉酶,纤维素酶,机身尺寸指标和消化酶的活动恢复,甚至超过前非活动期的平均值,在后者的实验的一部分(10月月)。主成分分析(PCA)利用消化酶的活性,体型指标数据,这黄瓜的生理状态划分为四个阶段:一个活跃的阶段,前期的闲置峰闲置和逆转阶段,这些阶段都是一致的与先前建议对这一物种的生命阶段,但我们的数据提供了更明确每个阶段的特征。刺参清楚的表现出表型可塑性(或生命周期分期)在其年度非活动期的消化道。

【英文摘要】Apostichopus japonicus is a common sea cucumber that undergoes seasonal inactivity phases and ceases feeding during the summer months. We used this sea cucumber species as a model in which to examine phenotypic plasticity of the digestive tract in response to food deprivation. We measured the body mass, gross gut morphology and digestive enzyme activities of A. japonicus before, during, and after the period of inactivity to examine the effects of food deprivation on the gut structure and function of this animal. Individuals were sampled semi-monthly from June to November (10 sampling intervals over 178 days) across temperature changes of more than 18 degrees C. On 5 September, which represented the peak of inactivity and lack of feeding, A. japonicus decreased its body mass, gut mass and gut length by 50%, 85%, and 70%, respectively, in comparison to values for these parameters preceding the inactive period. The activities of amylase, cellulase and lipase decreased by 77%, 98%, and 35% respectively, in

comparison to mean values for these enzymes in June, whereas pepsin activity increased two-fold (luring the inactive phase. Alginase and trypsin activities were variable and did not change significantly across the 178-day experiment. With the exception of amylase and cellulase, all body size indices and digestive enzyme activities recovered and even surpassed the mean values preceding the inactive phase during the latter part of the experiment (October-November). Principal Component Analysis (PCA) utilizing the digestive enzyme activity and body size index data divided the physiological state of this cucumber into four phases: an active stage, prophase of inactivity peak inactivity, and a reversion phase. These phases are all consistent with previously suggested life stages for this species, but our data provide more defined characteristics of each phase. A. japonicus clearly exhibits phenotypic plasticity (or life-cycle staging) of the digestive tract during its annual inactive period.

【题目】Characterization of 28 polymorphic microsatellites for Japanese sea urchin (Strongylocentrotus intermedius) via mining EST database of a related species (S. purpuratus)

【中文关键词】日本海胆,表征

【英文关键词】Japanese sea urchin;characterization

【中文摘要】日本海胆中间球海胆()的24个多态性微卫星标记开发了从EST数据库相关的种紫海胆(S.紫石)。表征结果显示,在这些位点多态性的温和。的等位基因数为2～5,从0.0667到0.9655和0.0655至0.7350,分别和H O H C值的变化。没有显着的连锁不平衡(LD)之间的对位点被发现,21个位点符合Hardy-Weinberg平衡(HWE)。在这项研究的结果表明微卫星标记开发的可行性,通过挖掘EST数据库的基因相关的物种。

【英文摘要】Twenty-eight polymorphic microsatellite markers for Japanese sea urchin (Strongylocentrotus intermedius) were developed from the EST database of a related species purple sea urchin (S. purpuratus). The characterization results showed the moderate polymorphisms at these loci. The number of alleles ranged from 2 to 5, and the values of H o and H c varied from 0.0667 to 0.9655 and 0.0655 to 0.7350, respectively. No significant linkage disequilibrium (LD) between pairs of loci was found and 21 loci conformed to the Hardy-Weinberg equilibrium (HWE). The results in this study well demonstrated the feasibility of microsatellite marker development via mining EST database of a genetically related species.

【英文关键词】Sea cucumber (Apostichopus japonicus) cDNA library Expressed sequence tags Immune-related genes
【中文摘要】分析|海参(刺参); cDNA文库;表达序列标签;免疫相关基因的体壁,肠和呼吸树的海参(刺参)的表达序列标签|海参(刺参)是一个最重要的水产养殖　　品种,在中国,要分析基因在不同组织中的表达,并确定免疫有关的基因,我们构建了3个独立的cDNA文库均来自肠道(智力),体壁(BW)和呼吸树(RT)健康的人。从这些库,共有5728高质量的表达序列标签(EST)的长度大于100 bp的产生。聚类和组装的ESTs确定了495个重叠群和2118单身,相当于2613个单一基因。基本局部比对搜索工具(BLAST)分析结果表明,902个单一基因(34 52%)有显着的同源性(E值<= 10(-5))的基因　　与GenBank中已知或假定的功能,这些个单一基因被分为18个功能类别。其中三个库,RT图书馆显示较少的类别(9),而其他两个litraries显示更多的(17和16分别为Int和BW库)。考虑三个cDNA文库中,655,259和484的组织特异性个单一基因之间的组件,观察诠释,BW和RT库,但是,只有95个单一基因是共同的所有三个库。最丰富的三个库中contigs细胞和机体防御(551个EST)相关的基因被确定为代谢(415个EST),翻译/核糖体结构和生物合成(342个EST),基因/蛋白表达(178个EST)。结构和运动(75个EST),能源生产和转换(51个EST)和细胞骨架(39个EST)的636个EST被归类为配对与免疫相关基因的模式识别受体和信令,补体成分,转铁蛋白超家族成员,细胞因子和生长李金发:器,和效应基因本最后提出了一个公平的量有关的数据的空间的许多基因的表达模式。(BW与诠释与RT的A刺参)。(C)2009爱思唯尔BV保留所有权利分析|海参(刺参); cDNA文库;表达序列标签;免疫相关基因的体壁,肠和呼吸树的海参(刺参)的表达序列标签|海参(刺参)是一个最重要的水产养殖　　品种,在中国,要分析基因在不同组织中的表达,并确定免疫有关的基因,我们构建了3个独立的cDNA文库均来自肠道(智力),体壁(BW)和呼吸树(RT)健康的人。从这些库,共有5728高质量的表达序列标签(EST)的长度大于100 bp的产生。聚类和组装的ESTs确定了495个重叠群和2118单身,相当于2613个单一基因。基本局部比对搜索工具(BLAST)分析结果表明,902个单一基因(34 52%)有显着的同源性(E值<= 10(-5))的基因　　与GenBank中已知或假定的功能,这些个单一基因被分为18个功能类别。其中三个库,RT图书馆显示较少的类别(9),而其他两个litraries显示更多的(17和16分别为Int和BW库)。考虑三个cDNA文库中,655,259和484的组织特异性个单一

基因之间的组件,观察诠释,BW和RT库,但是,只有95个单一基因是共同的所有三个库。最丰富的三个库中contigs细胞和机体防御(551个EST)相关的基因被确定为代谢(415个EST),翻译/核糖体结构和生物合成(342个EST),基因/蛋白表达(178个EST)。结构和运动(75个EST),能源生产和转换(51个EST)和细胞骨架(39个EST)的636个EST被归类为配对与免疫相关基因的模式识别受体和信令,补体成分,转铁蛋白超家族成员,细胞因子和生长李金发:器,和效应基因本最后提出了一个公平的量有关的数据的空间的许多基因的表达模式。 (BW与诠释与RT的A刺参)。(C)2009爱思唯尔BV保留所有权利分析|海参(刺参);cDNA文库;表达序列标签;免疫相关基因的体壁,肠和呼吸树的海参(刺参)的表达序列标签|海参(刺参)是一个最重要的水产养殖　　品种,在中国,要分析基因在不同组织中的表达,并确定免疫有关的基因,我们构建了3个独立的cDNA文库均来自肠道(智力),体壁(BW)和呼吸树(RT)健康的人。从这些库,共有5728高质量的表达序列标签(EST)的长度大于100 bp的产生。聚类和组装的ESTs确定了495个重叠群和2118单身,相当于2613个单一基因。基本局部比对搜索工具(BLAST)分析结果表明,902个单一基因(34 52%)有显着的同源性(E值<= 10(-5))的基因　　与GenBank中已知或假定的功能,这些个单一基因被分为18个功能类别。其中三个库,RT图书馆显示较少的类别(9),而其他两个litraries显示更多的(17和16分别为Int和BW库)。考虑三个cDNA文库中,655,259和484的组织特异性个单一基因之间的组件,观察诠释,BW和RT库,但是,只有95个单一基因是共同的所有三个库。最丰富的三个库中contigs细胞和机体防御(551个EST)相关的基因被确定为代谢(415个EST),翻译/核糖体结构和生物合成(342个EST),基因/蛋白表达(178个EST)。结构和运动(75个EST),能源生产和转换(51个EST)和细胞骨架(39个EST)的636个EST被归类为配对与免疫相关基因的模式识别受体和信令,补体成分,转铁蛋白超家族成员,细胞因子和生长李金发:器,和效应基因本最后提出了一个公平的量有关的数据的空间的许多基因的表达模式。 (BW与诠释与RT的A刺参)。(C)2009爱思唯尔BV保留所有权利

【英文摘要】Analysis of expressed sequence tags from body wall, intestine and respiratory tree of sea cucumber (Apostichopus japonicus) | Sea cucumber (Apostichopus japonicus); cDNA library; Expressed sequence tags; Immune-related genes | Sea cucumber (Apostichopus japonicus) is one of the most important aquaculture species in China. To profile gene expression in different tissues and to identify immune-related genes, we constructed three independent cDNA libraries that were derived from intestine (Int), body wall (BW) and respiratory tree (RT) of healthy individuals. From these libraries, a total of 5728 high-quality expressed sequence tags (ESTs) of longer than 100 bp were generated. Clustering and assembly of the ESTs identified 495 contigs and 2118 singletons. representing 2613 unigenes. Basic Local Alignment Search Tool (BLAST) analysis showed that 902 unigenes (34 52%) had significant homology (E value <= 10(-5)) to genes with known or putative functions in GenBank. These unigenes were grouped into 18 functional categories. When compared among these three libraries, RT library showed fewer categories (9) while the other two litraries displayed more (17 and 16 for Int and BW libraries respectively). Considering the components among the three cDNA libraries, 655, 259 and 484 tissue-specific unigenes were observed in Int, BW and RT libraries respectively; however, only 95 unigenes were common to all three libraries. The most abundant contigs in the three libraries were identified as genes related to cell and organism defense (551 ESTs). metabolism (415 ESTs), translation/ribosomal structure and biogenesis (342 ESTs), gene/protein expression (178 ESTs). structure and motility (75 ESTs), energy production and conversion (51 ESTs). and cytoskeleton (39 ESTs). The list of 636 ESTs that matched with immune-related genes were categorized as pattern recognition receptors and signaling, complement components, transferrin superfamily members, cytokines and growth fa:tors, and effector genes. The present manuscript presents a fair amount of data regarding the spatial expression pattern of many genes (BW vs Int vs. RT of A japonicus). (C) 2009 Elsevier B.V. All rights reserved

【题目】Expression of immune-related genes in embryos and larvae of sea cucumber Apostichopus japonicas

【中文关键词】海参(刺参对虾)免疫相关基因的胚胎幼虫有限合伙人的挑战

海参(刺参对虾)免疫相关基因的胚胎幼虫有限合伙人的挑战

【英文关键词】Sea cucumber (Apostichopus japonicus)　Immune-related genes　Embryos　Larvae　LPS challenge

【中文摘要】如海胆状和海参纲在几类,棘皮类动物的免疫系统已被广泛研究的成年人。然而,在胚胎和幼虫的防御机制在很大程度上仍然未开发。要分析的免疫相关基因的表达在胚胎和幼虫和监测的先天免疫反应的刺激脂多糖(LPS)的挑战,我们调查了9个免疫相关基因的表达模式,在胚胎和幼虫海参(刺参)11发育阶段,采用实时定量PCR(荧光定量RT-PCR)。编码的蛋白质,包括热休克蛋白70(HSP70),热休克蛋白90,热休克蛋白gp96的表达,胸腺素-β,铁蛋白和丈量约份104蛋白检测在

所有11个发展阶段,根据表达数据。但是,表达的甘露聚糖结合C-型凝集素(MBCL)早期黑木耳检测到少年阶段,只在少年阶段,而溶菌酶和丝氨酸蛋白酶抑制剂(SPI)进行检测。这些个基因中,有三个(MBCL,溶菌酶和SPI)被发现上调的mRNA表达对LPS刺激,没有表现出显着的变化,而其他6。我们的研究提出了初步的看法免疫相关基因的表达模式在不同发育阶段的海参,棘皮类动物的免疫力,增加了可用的信息

【英文摘要】The echinoderm immunity system has been extensively investigated in adults in several classes such as echinoid and holothuroidea. However, the defense mechanism in embryos and larvae remains largely unexplored. To profile the immune-related genes expression in embryos and larvae and to monitor the stimulation of the innate immune response by lipopolysaccharides (LPS) challenge, we investigated the expression patterns of nine immune-related genes in embryos and larvae of sea cucumber (Apostichopus japonicus) at eleven developmental stages using quantitative real-time PCR (qRT-PCR). The expression of six encoding proteins including heat shock protein70 (Hsp70), Hsp90, Hsp gp96, thymosin-beta, ferritin and DD104 protein was detected at all eleven development stages according to mRNA expression data. However, the expression of mannan-binding C-type lectin (MBCL) was detected at early auricularia to juvenile stages, while lysozyme and serine proteinase inhibitor (SPI) were detected only at juvenile stage. Out of these nine genes, three (MBCL, lysozyme and SPI) were found to be up-regulated in mRNA expression upon LPS challenge, whereas the other six showed no significant change. Our study presents a first preliminary view into the expression patterns of immune-related genes at different developmental stages of sea cucumber, which increases the available information on echinoderm immunityThe echinoderm immunity system has been extensively investigated in adults in several classes such as echinoid and holothuroidea. 【题目】Development and characterization of 45 novel microsatellite markers for sea cucumber (Apostichopus japonicus)

【中文关键词】刺参刺参;富集文库,EST;微卫星;海参
【英文关键词】Apostichopus japonicus;enriched library;EST;microsatellites;sea cucumber

【中文摘要】简单重复序列富集文库筛选和表达序列标签数据库挖掘,采用,发展海参(刺参)的微卫星标记。选择88个微卫星位点的多态性评估,使用了48个人。结果表明,有45个新的基因位点多态。的等位基因数范围从2至16,并观察和期望杂合度的值从0变化至0.93750.1135至0.9674,分别。没有显着的连锁不平衡之间的对位点被发现,26个位点符合Hardy-Weinberg平衡。因此,这些标记是一个潜在的人口结构和连锁图谱的构建刺参的研究工具。

【英文摘要】Simple sequence repeat-enriched library screening and expressed sequence tag database mining were adopted to develop microsatellite markers for sea cucumber (Apostichopus japonicus). Eighty-three microsatellite loci were selected for polymorphism assessment using 48 individuals. The results showed that 45 novel loci were polymorphic. The number of alleles ranged from two to 16, and the values of observed and expected heterozygosities varied from 0 to 0.9375 and from 0.1135 to 0.9674, respectively. No significant linkage disequilibrium between pairs of loci was found and 26 loci conformed to the Hardy – Weinberg equilibrium. These markers are therefore a potential tool for studies in the population structure and linkage map construction for A. japonicus.

【题目】An Efficient Procedure for Isolating Microsatellite DNAs from Sea Cucumber (Apostichopus japonicus)
【中文关键词】SSRS,丰富,海参,刺参
【英文关键词】SSRs,enrichment,sea cucumber,Apostichopus japonicus
【中文摘要】富集文库的建设被证明是用于隔离在这项研究中微的有效的方法之一。海参消化的基因组DNA用HaeIII和尺寸的选定的DNA片段(250-700bp的)连接到适配器。含微卫星序列捕获通过使用GA和CA探头,它被安装到尼龙膜的组合。在这项研究中的微卫星富集文库构建,包括约700个克隆。两百年和32个克隆后筛库过程中作出了积极反应。 50个克隆测序,发现都包含至少一个微卫星和一式两份克隆。约86%,允许设计的引物序列标签微卫星位点(STMS)测序片段。
【英文摘要】The construction of enrichment library proves to be one of the efficient approaches for isolating microsatellites in this study. The genomic DNA of sea cucumber was digested with HaeIII and size-selected DNA fragments (250-700bp) were ligated to an adaptor. Microsatellite-containing sequences were captured by using a combination of GA and CA probes, which were attached to a nylon membrane. The microsatellite enrichment library constructed in this study consisted of approximately 700 clones. Two hundred and thirty-two clones reacted positively after the library screening procedure. Of the 50 clones sequenced, all contained at least one microsatellite and one duplicate clone was found. Approximately 86% of the sequenced fragments permitted to design primers for sequence tagged microsatellite site (STMS).

【题目】Methods comparison for microsatellite marker development: Different isolation methods, different yield efficiency
【中文关键词】微卫星标记开发,分离效率的方法比较扇贝“
【英文关键词】microsatellite;marker development;isolation efficiency;method comparison;scallop
【中文摘要】“微卫星标记已经成为一种最重要的分子工具,用于在不同的研究需要大量的微卫星标记的全基因组分子生态学,数量遗传学和基因组学领域的调查,因此,它是十分必要的选择多个多功能,低成本,高效率和时间和劳动节能的方法开发一个大型面板的微卫星标记。在这项研究中,我们使用了栉孔扇贝,栉孔扇贝的目标物种比较效率的五种方法结果表明,小片段基因组DNA文库构建的战略导致效率低下,而微卫星富集的战略高度提高了分离效率。,虽然挖掘公共数据库的策略是时间和成本来自微卫星标记发展的三大战略。节能,这是很难获得大量的微卫星标记,主要是由于沉积在公共数据库中,基于在本研究的结果的非模型的种类有限序列数据,我们建议的两种方法,微卫星富集文库建设“方法和FIASCO - 的菌落杂交方法,为大型微卫星标记的发展,这两种方法均来自微卫星富集战略从栉孔扇贝的实验结果,在大基因组与其他物种的微卫星标记的开发提供参考。“微卫星标记已经成为一种最重要的分子工具,用于在不同的研究需要大量的微卫星标记的全基因组分子生态学,数量遗传学和基因组学领域的调查,因此,它是十分必要的选择多个多功能,低成本,高效率和时间和劳动节能的方法开发一个大型面板的微卫星标记。在这项研究中,我们使用了栉孔扇贝,栉孔扇贝的目标物种比较效率的五种方法结果表明,小片段基因组DNA文库构建的战略导致效率低下,而微卫星富集的战略高度提高了分离效率。,虽然挖掘公共数据库的策略是时间和成本来自微卫星标记发展的三大战略。节能,这是很难获得大量的微卫星标记,主要是由于沉积在公共数据库中,基于在本研究的结果的非模型的种类有限序列数据,我们建议的两种方法,微卫星富集文库建设“方法和FIASCO - 的菌落杂交方法,为大型微卫星标记的发展,这两种方法均来自微卫星富集战略从栉孔扇贝的实验结果,在大基因组与其他物种的微卫星标记的开发提供参考。
【英文摘要】Microsatellite markers have become one kind of the most important molecular tools used in various researches. A large number of microsatellite markers are required for the whole genome survey in the fields of molecular ecology, quantitative genetics and genomics. Therefore, it is extremely necessary to select several versatile, low-cost, efficient and time- and labor-saving methods to develop a large panel of microsatellite markers. In this study, we used Zhikong scallop (Chlamys farreri) as the target species to compare the efficiency of the five methods derived from three strategies for microsatellite marker development. The results showed that the strategy of constructing small insert genomic DNA library resulted in poor efficiency, while the microsatellite-enriched strategy highly improved the isolation efficiency. Although the mining public database strategy is time- and cost-saving, it is difficult to obtain a large number of microsatellite markers, mainly due to the limited sequence data of non-model species deposited in public databases. Based on the results in this study, we recommend two methods, microsatellite-enriched library construction method and FIASCO-colony hybridization method, for large-scale microsatellite marker development. Both methods were derived from the microsatellite-enriched strategy. The experimental results obtained from Zhikong scallop also provide the reference for microsatellite marker development in other species with large genomes.

【题目】Impact of Salicylic Acid on the Antioxidant Enzyme System and Hydrogen Peroxide Production in Cucumis sativus under Chilling Stress

【中文关键词】低温胁迫;黄瓜;水杨酸
【英文关键词】Chilling Stress, Cucumis sativus, Salicylic Acid
【中文摘要】水杨酸(SA)是一种自然产生的化合物,在植物防御不同的生物和非生物胁迫中发挥重要作用。为了解SA在低温胁迫的作用,选取了两个黄瓜品种,测定细胞膜的完整性,包括丙二醛(MDA)含量和电解质泄漏,内源性SA水平在两个不同的品种的差异显著性进行量化。此外,还测定了SA-预处理黄瓜植株在低温条件下。抗氧化酶,过氧化物酶(POD)和过氧化氢酶(CAT),进行定量和过氧化氢(H2O2)生产组织化学SA-处理过的叶片在低温下温度。低温胁迫导致更大的SA水平在诱导抗冷性品种长春密刺的叶子和种子相比,冷敏感的Beijing jietou,而前者比后者在正常条件下的种子中含有较高水平的SA。 SA预处理减少在这两个品种的叶片受冷引起的增加电解质泄漏和丙二醛(MDA)含量,同时要少得多MDA和电解质外渗生产中Changhcun密刺相比,Beijing jietou。此外,外施SA显着POD及CAT活性和可溶性蛋白质含量增加。最重要的是,在低温胁迫所造成两品种的叶片和子叶外源SA处理可以消除H2O2的积累。这些数据清楚地表明,抗冷性品种,显示较高的SA比冷敏感,和外源SA可以增强耐冷性的能力,这可能是通过调节抗氧化系统的结果。
【英文摘要】Salicylic acid (SA) is a naturally produced compound, and has been implicated to play important roles in defense of plants against diverse biotic and abiotic stresses. To understand how SA functions in the tolerance of cucumber (Cucumis sativus) to chilling stress, endogenous SA levels in two different cultivars with opposite chilling responsiveness were quantified. Membrane integrity, including malondialdehyde (MDA) content and leakage of electrolyte, was also examined in SA-pretreated cucumber plants under chilling conditions. In addition, activities of the two antioxidant enzymes, peroxidase (POD) and catalase (CAT), were quantified and hydrogen peroxide (H2O2) production was investigated histochemically in SA-treated leaves under chilling temperature. Chilling stress resulted in greater induction of SA levels in the chilling-tolerant cultivar Changchun mici in both leaves and seeds compared to the chilling-sensitive one Beijing jietou, while the former contains higher levels of SA than the latter in the seeds under normal condition. Pretreatment with SA diminished the increased electrolyte leakage and MDA content caused by chilling in the leaves of both cultivars, while much less MDA and electrolyte leakage was produced in Changhcun mici compared to Beijing jietou. Moreover, exogenous application of SA increased significantly POD and CAT activities and soluble protein content. Most importantly, exogenous SA treatment could eliminate the accumulation of H2O2 in leaves and cotyledons of both cultivars caused by chilling stress. The data clearly demonstrate that the chilling-tolerant cultivar displays higher SA than the chilling-sensitive one, and that exogenous SA can enhance the chilling tolerance ability, which might be achieved through modulating antioxidant system in cucumber.

【题目】Microsatellite DNA polymorphisms and the relation with body weight in sea cucumber Apostichopus japonicas
【中文关键词】微卫星DNA多态性相关性分析体重刺参
【英文关键词】microsatellite DNA polymorphism correlation analysis body weight Apostichopus japonicus
【中文摘要】的中国圈养海参刺参微卫星多态性与体重之间的关系进行了研究,在大连当地居民。在10个位点发现,9个节目改变但AJ07位点。 7个位点被发现在这两个群体具有高度的多态性。在两个群体中的每个位点的平均等位基因数为6.4286和6.28570.2257和0.2459,平均观察杂合度,期望杂合度在0.7768和0.7488,多态信息含量(PIC)在0.7092和0.6746,分别。进一步的分析表明刺参体重和发生标记AJ02和AJ04的显着相关性。的关系的研究结果可能有助于为分子育种,分子标记辅助选择以及海参
【英文摘要】The relationship between microsatellite polymorphism and body weight of captive bred Chinese sea cucumber Apostichopus japonicus was investigated in two local populations in Dalian. Among ten loci discovered, nine show changes except for AJ07 loci. Seven loci were found highly polymorphic in both populations. For each locus in two populations, the average number of alleles is 6.428 6 and 6.285 7, the average observed heterozygosity at 0.225 7 and 0.245 9, the expected heterozygosity at 0.776 8 and 0.748 8, the polymorphism information content (PIC) at 0.709 2 and 0.674 6, respectively. Further analysis show significant correlation between A. japonicus body weight and occurrence markers AJ02 and AJ04. The findings of the relation may be helpful for molecular breeding, as well as the marker-assisted selection of sea cucumbers

【题目】Role of animal pole protuberance and microtubules during meiosis in sea cucumber Apostichopus japonicas oocytes
【中文关键词】刺参卵母细胞成熟卵母细胞突起,微管组织中心;极体的形成
【英文关键词】Apostichopus japonicus ;oocyte protuberance;oocyte maturation;microtubule organizing center;polar body formation
【中文摘要】刺参有完全成熟的卵母细胞的卵母细胞的胞质突起重视的卵泡。位于的卵母细胞的相对侧上的突起和oolamina表明的动物植物轴。两个预减数分裂中心体锚定到的突起由微管之间的中心体和突起。经过减数分裂再引发引起的DTT解决方案,生发泡(GV)对突起迁移。 GV分解后,迁移到卵母细胞膜上的突起侧。的突起,然后收缩到从网站上的前突起的卵母细胞和第一极体挤压。第二极体的下方的第1形成。因此,卵母细胞的突起表示推定的动物极的卵母细胞成熟前。
【英文摘要】Fully grown oocytes of Apostichopus japonicus have a cytoplasmic protuberance where the oocyte attaches to the follicle. The protuberance and the oolamina located on the opposite side of the oocyte indicate the animal-vegetal axis. Two pre-meiotic centrosomes are anchored to the protuberance by microtubules between centrosomes and protuberance. After meiosis reinitiation induced by DTT solution, the germinal vesicle (GV) migrates towards the protuberance. The GV breaks down after it migrates to the oocyte membrane on the protuberance side. The protuberance then contracts back into the oocyte and the first polar body extrudes from the site of the former protuberance. The second polar body forms beneath the first. Thus the oocyte protuberance indicates the presumptive animal pole well before maturation of the oocyte.

【题目】夏眠对刺参(Apostichopus japonicus (Selenka))能量收支的影响
【中文关键词】刺参,夏眠,能量收支,水温,体重
【英文关键词】Japonicus, aestivation, energy budget, water temperature, body weight
【中文摘要】夏眠是刺参最重要的生理特征;水温升高是其夏眠的主要诱发因子,而夏眠的临界温度与刺参体重密切相关.为揭示刺参夏眠对其能量利用对策的影响,测定了2种体重规格(134.0±13.5)g和(73.6±2.2)g刺参在10、15、20、25 ℃和30 ℃ 5个温度梯度下的能量收支.结果表明,温度和体重及其交互作用对刺参能量的摄入均有显著影响;而温度是影响其摄食能分配的主要因素.研究发现,刺参在非夏眠期、夏眠临界期和完全夏眠期的能量利用对策有所不同:在非夏眠期,刺参摄食能支出的最大组分是粪便能,占摄食能的比例超过50%,其次为呼吸耗能,占19.8%~39.4%,而生长能和排泄能占的比例较小,分别为5.7%~10.7%和2.9%~3.7%;在夏眠临界温度下,呼吸和排泄耗能占摄食能的比例均显著增大(分别为88.3%和13.6%),而生长能所占比例降为负值(-55.3%),刺参表现为负生长;而在夏眠期,刺参的摄食能和排粪能为零,为维持其基本生理活动,不得不动用以往贮存于体内的能量,消耗于呼吸和排泄等生理过程,供维持生命之用.总之,从能量生物学的角度看,夏眠的主要生态学意义在于刺参长时间处于相对高温环境,进而导致摄食受阻条件下的一种能量节约方式.
【英文摘要】Aestivation is the most important sea cucumber physiological characteristics; rising water temperatures aestivation major predisposing factor aestivation critical temperature and sea cucumber weight are closely related. Determined to reveal the impact of the utilization of the sea cucumber aestivation its energykinds of weight specification (134.0 ± 13.5) g and (73.6 ± 2.2) g stichopus energy budget. 10,15,20,25 ℃ and 30 ℃ 5 temperature gradient results show that the temperature and weight and their interactionsthe sea cucumber energy intake have a significant impact; temperature is the main factor to affect its feeding allocated study found that sea cucumber in the non-aestivation period, the aestivation critical period and full aestivation period energy utilization differ: In thenon aestivation period, the largest component of the expenditure of the sea cucumber feeding can feces can total proportion of feeding can be more than 50%, followed by respiratory energy consumption, accounting for 19.8% to 39.4%, while growth and excretion can account for a smaller proportion of5.7% to 10.7% and from 2.9% to 3.7%, respectively; under in aestivation critical temperature, respiration and excretion of energy consumption accounted for feeding proportion were significantly increased (88.3% and 13.6%, respectively), while the growth can shareproportion dropped to negative (-55.3%), sea cucumber showed negative growth; in aestivation period, the sea cucumber feeding and defecation can be zero, in order to maintain its basic physiological activities, had to draw on stored bodyenergy consumed in physiological processes such as respiration and excretion, for the maintenance of life with short, from a biological point of view of energy, aestivation major ecological significance lies japonicus at a relatively high temperature environment for a long period of time, causing feeding hindered under conditionsan energy saving way.

【题目】刺参对浅海筏式贝类养殖系统的修复潜力
【中文关键词】刺参 ,摄食,生长,排泄,筏式贝类养殖系统,生物修复潜力
【英文关键词】Japonicus, feeding, growth, excretion, raft shellfish farming systems, bioremediation potential
【中文摘要】浅海筏式养殖滤食性贝类产生大量的粪便和假粪(总称生物沉积物),对海水养殖环境产生一系列影响;而沉积食性海参能够有效清除颗粒有机物,在海水养殖系统中扮演"清道夫"的生态角色.为评估刺参在浅海筏式贝类养殖系统中的生物修复潜力,本文在不同季节现场研究了贝-参混养模式下刺参对贝类生物沉积物的摄食及生长和排泄特征.结果表明:刺参能够在新设计的养殖设施中与滤食性贝类混养,最大生长率达0.34% · d-1; 并可通过摄食有效清除贝类生物沉积物, 摄食率为0.1746 g · g-1 · d-1(夏季,21.2 ℃)、0.0989 g · g-1 · d-1(秋季,19.2 ℃)和0.0050 g · g-1 · d-1(冬季,7.7 ℃);刺参主要通过排泄溶解形态的NH4+-N和PO43--P来促进沉积物中营养盐的再生,其排泄率也呈现明显的季节变化.基于现场试验数据,估算了刺参在桑沟湾的生物修复潜力, 刺参与贝类混养可摄食4.5~159.6 kg · hm-2 · d-1生物沉积物、排泄1 382.5~3 678.1 mmol · hm-2 · d-1 NH4+-N及74.6~335.7 mmol · hm-2 · d-1 PO43--P.表明刺参对浅海筏式贝类养殖系统具有较大的生物修复潜力,贝-参混养模式不仅能够取得较大的生态效益,而且能显著增加养殖生产的经济效益.
【英文摘要】Shallow water raft culture filter-feeding shellfish to produce large amounts of manure and false the dung the (collectively biological sediment), produce a series of impacts on marine aquaculture environment; deposition feeders sea cucumber can effectively remove the particulate organic matter, play in the mariculture system "scavengerecological role. potential biological assessment of sea cucumber in the shallow water raft shellfish farming system repair, Tony - Participation polyculture mode of sea cucumber feeding on shellfish sediments on-site research in different seasons and growth andexcretion characteristics results show that: stichopus new aquaculture facilities designed with the filter-feeding shellfish polyculture, the maximum growth rate of 0.34% d-1; and through feeding shellfish effectively remove sediment, feeding rate was.1746 g · g-1 · d-1 (summer, 21.2 ° C), 0.0989 g · g-1 · d-1 (fall, 19.2 °C) and 0.0050 g · g-1 · d-1 (winter, 7.7 ° C); to promote the regeneration of nutrients in the sediments of sea cucumber dissolved form via the excretion of NH4 +-N and PO43 - P, and its excretion also showed a significant seasonal variation. estimated based on field trial data, sea cucumber in Sanggou Baybioremediation potential thorn involved in shellfish polyculture feeding 4.5 to 159.6 kg · hm-2 · d-1 biological sediments excretion 1 382.5 3 678.1 mmol · hm-2 · d-1 of NH4 +-N and 74.6 ~335.7 mmol · hm-2 · d-1 PO43 - P. to show that the sea cucumber on shallow water raft shellfish farming system has a large potential for bioremediation, Tony - Participation polyculture mode is not only able to achieve greater ecological benefits, andcan significantly increase the economic benefits of aquaculture production.

【题目】海胆主要卵黄蛋白研究进展
【中文关键词】海胆 主要卵黄蛋白 研究进展
【英文关键词】Research progress of the sea urchin major yolk protein
【中文摘要】海胆的主要卵黄蛋白(major yolk protein,MYP)大量存在于海胆卵中,同时存在于海胆精巢和卵巢中,为配子发生及胚胎发育提供营养。经比对发现,海胆MYP cDNA序列与其他物种卵黄蛋白原并无明显相似性,而与铁传递蛋白具有更高的相似性,有研究认为MYP为铁传递蛋白。据其存在场所和合成时期的差异,MYP可分为为CFMYP(存在于体腔内,受精后合成)和EGMYP(存在于卵中,母源性),二者均由同一基因编码。就CFMYP和EGMYP合成时期、场所和功能作用等加以比较;并对海胆MYP与其他物种卵黄蛋白(原)发生、结构与分子量和功能等方面进行了综述
【英文摘要】The sea urchin major yolk protein (major yolk protein, MYP) exists in a large number of sea urchin eggs, while present in the testes and ovaries of the sea urchin gametogenesis and embryonic development of nutrition. By comparison found urchins MYP cDNA sequence with other species vitellogenin no obvious similarity with transferrin protein has a higher similarity, studies have considered MYP transferrin. According to the presence of breaks and synthesis period difference, MYP can be divided into CFMYP (synthetic) present in the body cavity, and after fertilization, and EGMYP (present in the eggs, maternal), both produced by the same gene coding. And sea urchin the MYP with other species yolk protein (original) occurs, the structure and molecular weight and functionality of synthesis period CFMYP and EGMYP place and function of comparison;

【题目】刺参vasa-1ike基因克隆及其在组织中的表达分析
【中文关键词】刺参,vasa ,全长cDNA,序列分析,组织表达
【英文关键词】Sea cucumber, vasa, full-length cDNA sequence analysis, tissue expression
【中文摘要】vasa 基迭J编码DEAD-box家族成员中一种ATP依赖的RNA解旋酶,在生殖系分化过程中发挥着重要的作用.本研究采用同源克隆和cDNA末端快速扩增技术(RACE),从刺参(Apostichopus japonicus)精巢中克隆得到vasa的全长cDNA序列.该cDNA序列全长2167bp,开放阅读框1593 bp,编码530个氨基酸,具有DEAD-box家族蛋白的全部9个保守域.经同源比对和系统进化分析,确定其属于DEAD-box家族的VASA亚家族成员.利用半定量RT-PCR检测,vosa mRNA专一性的在刺参性腺中表达,据此,刺参vaxa基冈有望用于其生殖系起源和分化的研究.
【英文摘要】The vasa base Diego J encoding DEAD-box family members in an ATP-dependent RNA helicase, plays an important role in the the germline differentiation process in this study using homology cloning and rapid amplification of cDNA ends technology (RACE),the vasa cloned from the testis of the sea cucumber (Apostichopus japonicus) full-length cDNA sequences of the cDNA sequence of full-length 2167bp open reading frame of 1593 bp, and encodes 530 amino acids, with all nine conserved domains of the DEAD-box family proteins.evolutionary homology comparison and system analysis, determine its belonging to the VASA subfamily of the DEAD-box family members using semi-quantitative RT-PCR analysis, vosa mRNA specifically expressed in the sea cucumber gonads, accordingly, the sea cucumber vaxa baseOkazaki is expected for the study of the origin and differentiation of its reproductive system.

【题目】仿刺参体壁、肠和呼吸树全长cDNA 文库的构建及部分ESTs 初步分析
【中文关键词】仿刺参,cDNA文库,构建ESTs
【英文关键词】Japonicus cDNA library was constructed ESTs
【中文摘要】利用SMART cDNA文库构建试剂盒构建了健康仿刺参的体壁、肠和呼吸树的cDNA文库。检测结果表明.3个文库库容量分别为1.7×10^6、1.5×10^6和1.8×10^6;重组率均超过98%;插入片段平均长度均大于1kb。证明所建cDNA文库的质量符合要求。对随机选取的6240个克隆进行5’端测序。得到5913条有效序列(体壁:2031,肠:1966,呼吸树:1916),去除低质量序列和小于100bp的序列后,共得到5728条高质量的ESTs序列(体壁:1791,肠:1906,呼吸树:1851),序列平均长度为589bp。经过软件拼接。共得到2613条单基因簇.包含495个序列重叠群和2118条单一序列。通过BLASTX搜索比对.获得基因注释序列853个(体壁:274个;肠:358个;呼吸树:221个),占总数32.6%.并进行了初步的功能分类。为进一步开展相关基因的克隆和分子标记的筛选奠定了基础
【英文摘要】SMART cDNA library construction kit cDNA library constructed health japonicus body wall, intestinal and respiratory tree. The test results showed. The three library storage capacity of 1.7 × 10 ^ 6,1.5 × 10 ^ 6 and 1.8 x 10 ^ 6; reorganization rate of over 98%; average insert length greater than 1kb. Quality of the cDNA library prove built to meet the requirements. 6240 clones randomly selected for sequencing of the 5 'end. 5913 sequence (body wall: 2031, intestinal: 1966, Respiratory Tree: 1916), removal of low quality sequences and less than 100bp sequence, a total of 5728 high-quality ESTs sequences (body wall: 1791, intestinal : 1906, breathing tree: 1851), the average length of the sequence 589bp. After software splicing. A total of 2613 single-gene cluster. Contains 495 sequence contigs and 2118 single sequence. BLASTX search. The gene annotation sequence 853 (body wall: 274; intestinal: 358; respiratory tree: 221), accounting for 32.6% of the total number of. And preliminary functional classification. Laid the foundation for the further development of related genes and molecular markers screening

【题目】仿刺参的微卫星标记
【中文关键词】仿刺参 微卫星标记 多态性 通用性
【英文关键词】Japonicus microsatellite markers polymorphism versatility
【中文摘要】为了评价种质资源及基础生物学研究的需要,本文开发了仿刺参的微卫星标记。NCBI数据库中共有20个含有仿刺参微卫星的序列,从中选取8个设计引物,发现6个微卫星位点有多态性。不同的引物获得的等位基因数为3~9个不等,6个位点共获得了31个等位基因,每个位点平均获得5.2个等位基因。6个位点的平均观测杂合度(Ho)为0.3611,平均期望杂合度(He)为0.6402。位点AJMS004提供的多态性信息含量值较低,为0.4862;其他5个位点均在0.5以上。另外,还尝试了红海参(Parastichopus californicus)微卫星标记在仿刺参的通用性。实验结果表明,在较高的退火温度下,5对引物均能扩增仿刺参的基因组DNA并具多态性。5个位点共获得了22个等位基因,每个位点平均获得4.4个等位基因。5个位点的平均观测杂合度(Ho)为0.1733,平均期望杂合度(He)为0.4201。其中位点Psc2的多态性信息含量值最高,为0.8500
【英文摘要】In order to evaluate the needs of germplasm resources and basic biological research, development japonicus microsatellite markers. A total of 20 of the NCBI database containing japonicus microsatellite sequence, primers were designed to select from eight to six microsatellite loci polymorphism. Different primers to obtain the number of alleles ranged from 3 to 9, six sites total of

31 alleles per locus average of 5.2 alleles. The average observed heterozygosity (Ho) of the six sites of 0.3611, and the average expected heterozygosity (He) was 0.6402. Polymorphism information content sites AJMS004 lower value, 0.4862; 5 other sites are more than 0.5. Also, try the red sea cucumber (Parastichopus californicus) the microsatellite markers japonicus versatility. Experimental results show that a higher annealing temperature, five pairs of primers can amplify the genomic DNA of the japonicus and polymorphic. The five sites received a total of 22 alleles per locus average of 4.4 alleles. The average of the five sites observed heterozygosity (Ho) was 0.1733, and the average expected heterozygosity (He) was 0.4201. In which the bit point Psc2 the highest polymorphism information content value, to 0.8500

【题目】黑嘴病及生殖对虾夷马粪海胆五种生理生化指标的影响
【中文关键词】虾夷马粪海胆 黑嘴病 生殖 指标
【英文关键词】Shrimp the Yima fecal sea urchin black mouth disease reproductive indicators
【中文摘要】对虾夷马粪海胆(Strongylocentrotus interm edius)患“黑嘴病”及生殖后体腔液中5种生理生化指标进行了检测,结果表明病理情况下的虾夷马粪海胆过氧化氢含量和丙二醛含量明显高于对照组,而过氧化氢酶活性、超氧化物歧化酶活性和总抗氧化能力明显低于对照组,其中,过氧化氢含量、总抗氧化能力和超氧化物歧化酶活性差异显著(P〈0.05),丙二醛含量、过氧化氢酶活性差异极显著(P〈0.01)。生殖后除过氧化氢含量外其他4种生理生化指标均降低,其中总抗氧化能力和丙二醛含量差异显著(P〈0.05),过氧化氢酶和超氧化物歧化酶活性差异极显著(P〈0.01)。研究表明以海胆体腔液中丙二醛含量和过氧化氢酶活性作为海胆黑嘴病发生的监测指标是可行的
【英文摘要】Shrimp the Yima fecal sea urchins (Strongylocentrotus interm edius) suffering from "black mouth" disease and reproductive body cavity fluid physiological and biochemical indicators of the testing results show that the content of hydrogen

peroxide and malondialdehyde shrimp the Yima fecal sea urchin pathological casesignificantly higher levels of catalase activity, superoxide dismutase activity and total antioxidant capacity was significantly lower than the control group, in which the hydrogen peroxide content, total antioxidant capacity and superoxide dismutase activity differencessignificant (P <0.05), MDA content, catalase activity was a significant difference (P <0.01). The reproductive except the other four kinds of physiological and biochemical indexes were lower hydrogen peroxide content, total antioxidant capacity and malondialdehyde content was significantly different (P <0.05), catalase and superoxide dismutase activity was a significant difference (P <0.01). Studies have shown that sea urchin coelomic fluid malondialdehyde (MDA) content and peroxide catalase activity as sea urchins black mouth disease monitoring indicators

【题目】虾夷马粪海胆表型性状对性腺性状的影响效果分析

【中文关键词】虾夷马粪海胆 表型性状 性腺性状 相关分析 回归分析

【英文关键词】Shrimp the Yima fecal sea urchin the phenotypic traits gonads traits analysis regression analysis

【中文摘要】从19月龄虾夷马粪海胆Strongylocentrotus intermedius养殖群体中随机选择600枚,测量了壳高(TH)、壳径(TD)、活体重(BW)、性腺湿重(GWW)、性腺颜色(L*a*b*)、性腺指数(GI)、性腺水分(GM)7个性状。采用相关分析和通径分析方法,计算了各性状间的相关系数,并定量分析了壳性状对活体重及表型性状(壳高、壳径、活体重)对性腺性状的影响效果。结果表明,壳性状与活体重极显著相关(P〈0.01);4个性腺性状除构成性腺颜色性状的a*(绿-红)、b*(蓝-黄)分别与壳径、活体重呈显著相关(P〈0.05),而与其他表型性状无显著相关外,L*(暗-亮)、性腺湿重、性腺指数和性腺水分与表型性状均达到极显著相关(P〈0.01)。壳径对活体重的直接影响最大(0.717),活体重对性腺湿重的直接影响最大(0.598),壳径和活体重可作为间接选择性腺湿重的主要指标。利用曲线回归建立了壳性状预测活体重及活体重预测性腺湿重的最优模型:BW=0.001TD2.822(R2=0.984),GWW=0.039BW1.331(R2=0.753)。

【英文摘要】600 randomly selected from the 19-month-old shrimp Yima dung sea urchin Strongylocentrotus intermedius cultured population, measured shell height (TH), shell diameter (TD), live weight (BW), gonad wet weight (GWW), the gonads color (L* a * b *), gonad index (GI), gonadal moisture (GM) traits. The correlation analysis and path analysis method to calculate the correlation coefficient between each trait and shell traits of live weight and phenotypic traits (shell height, shell diameter, liveweight) gonads traits, the effect of quantitative analysis. The results show that, shell traits and live weight extremely significant with related (P <0.01); four gonadal traits in addition to constituting gonad color traits a * (green - red), b * (blue - yellow), respectively, with the shell diameter, live weight was significantly related (P <0.05), while the other phenotypic traits without significantly with relevant outside L * (dark - bright), gonad wet weight, gonad index and gonad moisture and phenotypic traits were reached extremely significant with related (P <0.01) . Maximum shell diameter of the direct impact of live weight (0.717), the live weight of the gonad wet weight directly affect the maximum (0.598), shell diameter and live weight can be used as the main indicators of indirect selection gonad wet weight. Using curve regression the shell traits predict live weight and live weight prediction gonad wet weight optimal model: BW = 0.001TD2.822 (R2 = 0.984), GWW = 0.039BW1.331 (R2 = 0.753).

【题目】硬壳蛤形态性状对活体重的影响效果分析
【中文关键词】硬壳蛤 形态性状 活体重 多元分析
【英文关键词】Multivariate analysis of morphological traits of hard clams live weight
【中文摘要】选取4、16、28月龄3种规格的硬壳蛤各100只,测量每个个体的壳长、壳高、壳厚和活体重。采用相关分析和通径分析,计算各规格内各测量性状间的相关系数,并分析形态性状对活体重的影响效果和综合决定系数。结果表明,各规格硬壳蛤壳长、壳高、壳厚和活体重相关系数均达到极显著水平(P〈0.001);小规格硬壳蛤的壳厚(0.398)、中规格和大规格硬壳蛤的壳长(0.639、0.403)分别是影响活体重的主要因素,综合决定系数与通径系数有一致的变化趋势,表明壳厚可作为早期选择小规格硬壳蛤活体重的主要间接指标,而选择中、大规格硬壳蛤活体重应以壳长为主要指标。多元回归分析建立各规格硬壳蛤形态性状估计活体重的回归方程,小规格:Y=-1.249+0.053X1+0.04X2+0.111X3;中规格:Y=-8.743+0.345X1;大规格:Y=-62.704+0.783X1+0.585X2+1.368X3。本研究结果为硬壳蛤不同时期选种提供理论依据和理想的测度指标
【英文摘要】Select 4,16,28 months old specifications Mercenaria 100 each, measuring each individual shell length, shell height, shell thickness and live weight. Correlation analysis and path analysis to calculate the correlation coefficient between the specifications of each metric traits, and analysis of the effect of live weight and the coefficient of determination of morphological traits. The results showed that, the specifications of hard clams in shell length, shell height, shell thickness and live weight coefficient reached a very significant level (P <0.001); small size Mercenaria shell thickness (0.398) in specifications and specifications hard shell clam shell length (0.639,0.403) are the main factors affecting the live weight, consolidated the coefficient of determination, and the path coefficients consistent trend, indicating that the shell thickness can be used as the main indirect indicators of early selection of the small size of hard clams live weight choice, large-sized hard-shell clams live weight to shell length as the main indicators. Multiple regression analysis to establish the specifications of Mercenaria morphological traits regression equation estimated live weight, small size: Y = -1.249 +0.053 X1 +0.04 X2 +0.111 X3; specifications in: Y = -8.743 +0.345 X1; the large specifications: Y = - 62.704 +0.783 X1 +0.585 X2 +1.368 X3.

The results of this study provide a theoretical basis and the ideal selection of different periods of hard clams measure indicators

【题目】虾夷马粪海胆微卫星DNA标记的搜寻、设计、筛选及养殖群体遗传多样性的分析
【中文关键词】虾夷马粪海胆 微卫星 遗传多样性
【英文关键词】Sea urchin shrimp Yima manure microsatellite genetic diversity
【中文摘要】通过磁珠富集法分离获得了虾夷马粪海胆微卫星DNA序列160个.其中完美型108个(67.50%),非完美型33个(20.63%),复合型19个(11.88%),微卫星DNA序列最多重复次数达到107次.根据这些微卫星DNA序列的两翼序列,采用Primer5软件设计出虾夷马粪海胆的微卫星引物,通过筛选,采用其中的12对微卫星DNA标记对大连凌水群体(DL)、大连獐子岛群体(DZ)、山东荣城群体(SR)3个虾夷马粪海胆养殖群体的遗传多样性进行分析,共获得73个等位基因,不同引物获得的等位基因数为1.11个,片段大小为84.362bp.除SUX001位点外,其余位点的PIC值在0.2640.0.6705之间,3个群体的平均观测杂合度分别为0.4618(DL),0.4375(SR)和0.4340(DZ),平均期望杂合度分别为0.5026(DL),0.5079(SR)和0.4494(Dz).Hardy-Weinberg平衡分析显示,73%的被检测位点显著偏离平衡,F-检验显示4个位点的F。值低于0.05,表明群体间存在一定程度的分化.群体间遗传相似性系数、遗传距离及UPGMA聚类分析表明大连獐子岛群体(Dz)与大连凌水群体(DL)群体亲缘关系较近,二者与山东荣成群体(SR)亲缘关系较远.对深入了解我国虾夷马粪海胆养殖群体遗传结构特征及其种质资源状况具有重要意义.
【英文摘要】Isolated by magnetic beads enriched of shrimp the Yima fecal sea urchin microsatellite DNA sequence 160. The perfect type of 108 (67.50%), non-perfect 33 (20.63%), compound 19 (11.88%), the maximum number of repetitions of microsatellite DNA sequences up to 107 times. Under these the two wings sequences of microsatellite DNA sequence, using Primer5 Software shrimp the Yima fecal sea urchin microsatellite primer design, using 12 microsatellite DNA markers by screening of Dalian Ling water groups (DL), Zhangzidao groups (DZ), of Shandong Rongcheng groups (SR) 3 dung sea urchin aquaculture of shrimp Yima the genetic diversity analysis, a total of 73 alleles, number of alleles of different primers 1.11, fragment size 84.362bp. PIC value of the remaining sites in except SUX001 sites 0.2640.0.6705 between the three groups, the average observed heterozygosity were 0.4618 (DL), 0.4375 (SR) and 0.4340 (DZ), average expected heterozygosity were 0.5026 (DL), 0.5079 (SR) and .4494 (Dz). Hardy-Weinberg equilibrium analysis showed 73% to be detected loci significantly deviated from the equilibrium, the F-test showed the four sites F Values less than 0.05, indicating that there is a certain degree of differentiation between groups. The genetic similarity between populations, genetic distance and UPGMA cluster analysis showed that of Dalian Zhangzidao populations (Dz) population closer relationship with the the Lingshui Dalian groups (DL), both with, Shandong Rongcheng groups (SR) distantly related. Insight into our shrimp the Yima fecal sea urchin breeding population genetic structure and its germplasm resources situation is of great significance.

【题目】虾夷马粪海胆(Strongylocentrotus intermedius)Vasa基因的克隆与表达
【中文关键词】Vasa基因,虾夷马粪海胆,克隆,实时定量表达
【英文关键词】The Vasa gene, shrimp Yima dung sea urchin, cloning, and real-time quantitative expression

【中文摘要】Vasa基因是DEAD-box家族成员中的一种ATP依赖的RNA解旋酶编码基因,在生殖系分化过程中发挥重要作用.采用同源克隆和cDNA末端快速扩增技术(RACE),从虾夷马粪海胆精巢中克隆得到Vasa基因3'端cDNA序列.该3'末端cDNA长1057 bp,与太平洋牡蛎、紫球海胆、非洲爪蟾、小鼠及虹鳟经同源进行比对,其中与紫球海胆的同源率最高达到95%,并确定其为DEAD-box家族的Vasa亚家族成员.利用实时定量RT-PCR检测Vasa mRNA在虾夷马粪海胆组织和胚胎发育期的表达情况,研究结果表明Vasa基因在生殖腺表达量最高,雌、雄个体生殖腺中转录水平上的表达差异明显,雄性高于雌性,差异显著(P<0.05),在肠、体腔液、肌肉、围口膜、管足中表达量低,其中体腔液表达量最低.胚胎发育期检测发现Vasa基因在16细胞期时表达量最高,16细胞期后表达量呈下降趋势,囊胚期表达量最低.试验结果为虾夷马粪海胆生殖系统起源、分化研究提供科学依据.对于虾夷马粪海胆生殖系分化途径来讲,Vasa可作为一种有利的研究工具,追溯其生殖系的起源和分化.

【英文摘要】Vasa gene DEAD-box family members in an ATP-dependent RNA helicase encoded gene plays an important role in the process of differentiation of the reproductive system. Using homology cloning and rapid amplification of cDNA ends the technology (RACE) from Ezothe horse manure sea urchin testis the Vasa gene was cloned from the 3 'end of the cDNA sequence of the 3' end cDNA of 1057 bp, compared with the Pacific oyster, purple sea urchin, Xenopus laevis, mice and rainbow trout by homologous, which with purpleup to 95% homology rate of sea urchins and determined using real-time quantitative RT-PCR detection Vasa mRNA expression in of shrimp the Yima fecal sea urchin organizations and the embryonic development of the DEAD-box family Vasa subfamily members., researchthe results show that the Vasa gene in the gonads express the amount of the highest, female, male individual gonads on the transcriptional level expression differences obviously male higher than female differences significant significantly (P <0.05), in the intestine, body cavity fluid, muscle, Wai mouth film, tubelow enough expression, body cavity fluid was the lowest. embryonic development detected Vasa gene expression in the 16-cell stage highest expression levels in the 16-cell stage downward trend was the lowest of the blastocyst stage test results for shrimpthe sea urchin reproductive system of Yima fecal origin, differentiation studies provide a scientific basis for the shrimp Yima dung sea urchin germline differentiation pathway is concerned, Vasa as a a favorable research tool, trace the origin and differentiation of germline.

【题目】刺参选育种技术体系的建立
【中文关键词】育种技术体系 刺参 经济损失 水产养殖 药用价值 营养价值 资源退化 生长缓慢
【英文关键词】"Breeding technology system stichopus economic losses in aquaculture medicinal value of the nutritional value of resource degradation slow growth
【中文摘要】刺参(Apstichopus japonicus)以其很高的营养价值和药用价值成为我国一种重要的水产养殖经济品种。由于需求的增加,采捕强度的增大,造成我国刺参资源量和产量的急剧下降。2004年以来的病害频发造成种质资源退化,带来巨大的经济损失,每年因各种刺参病害而造成的经济损失达十余亿元,并呈逐年蔓延趋势,不同程度地危害到各主要刺参养殖产地。另外,目前生产中使用的刺参苗种大多是未经选育的野生刺参,有生长缓慢、抗逆性差、病害时有发生等不良症状。针对刺参养殖现状及发展趋势,当务之急是利用选育种技术开展优质高产抗逆刺参品系的选育。为此,笔者于2005~2007年对山东沿海不同地域的野生刺参群体进行选种繁育技术研究,以同地产刺参自交作为对照组
【英文摘要】Sea cucumber (Apstichopus japonicus) for its high nutritional value and medicinal value of an important aquaculture economic varieties. Harvesting intensity increases due to the increase in demand, resulting in a sharp decline of sea cucumber resources and production. Disease since 2004 frequent cause the germplasm resource degradation, has brought huge economic losses each year due to a variety of sea cucumber disease caused economic losses amounting to more than 10 billion yuan, and was gradually spread, in varying degrees of harm to each The main stichopus breeding origin. In addition, most of the sea cucumber seed production without the breeding of wild sea cucumber, slow growth, poor stress tolerance, disease occurrence of other adverse symptoms. For sea cucumber aquaculture status and development trend, it is imperative breeding and selection technology to carry out the breeding of high-yield, resilience stichopus strains. To this end, the author in 2005 to 2007 wild sea cucumber populations of the different regions of the Shandong coastal the selection breeding technology research, selfing sea cucumber to the same real estate as the control group撤消修改

【题目】Progress in research and development on hybrid rice, a super-domesticate in China
【中文关键词】无
【英文关键词】hybrid rice; cytoplasmic male sterility; inter-subspecies; DNA marker; molecular marker-assisted selection; quantitative trait loci
【中文摘要】无
【英文摘要】By exploiting new types of male sterility, hybrid rice production in China has become more diversified. The use of inter-subspecies crosses has made an additional contribution to broadening the genetic diversity of hybrid rice and played an important role in the breeding of super rice hybrids in China. With the development and application of indica-inclined and japonica-inclined parental lines, new rice hybrids with super high-yielding potential have been developed and are being grown on a large scale. DNA markers for subspecies differentiation have been identified and applied, and marker-assisted selection performed for the development of restorer lines carrying disease resistance genes. The genetic basis of heterosis in highly heterotic hybrids has been studied, but data from these studies are insufficient to draw sound conclusions. In a QTL study using stepwise residual heterozygous lines, two linked intervals harbouring QTLs for yield traits were resolved, one of which was delimited to a 125-kb region.

【题目】Super hybrid rice breeding in China: Achievements and prospects
【中文关键词】无
【英文关键词】biomass; DNA marker; harmonious plant type; medium type parents; super hybrid rice
【中文摘要】无
【英文摘要】Hybrid rice has contributed greatly to the self-sulficiency of food supply in China. To meet the future demand for rice production, a national program on super rice breeding was established in China in 1996. The corresponding targets, breeding strategies and most significant advances are reviewed in this paper. New plant type models have been modified to adjust to various rice growing regions. In recognition of the importance of applying parents with intermediate subspecies differentiation in increasing F, yield, medium type parental lines were selected from populations derived from inter-subspecies crosses with the assistance of DNA markers for subspecies differentiation. Results also indicate that a substantial increase of biomass is the basis for further enhancement of the grain yield potential, and amelioration of leaf characteristics is helpful in increasing the photosynthetic rate. Thirty-four super hybrid rice varieties have been released commercially, growing in a total area of 13.5 million hm(2) and producing 6.7 thousand million kg more rice in 1998-2005. Although remarkable progress has been made in super hybrid rice breeding in China, selections on the root system and integration of more biotechnological tools remain a great challenge.

【题目】Validating a segment on the short arm of chromosome 6 responsible for genetic variation in the hull silicon content and yield traits of rice
【中文关键词】无
【英文关键词】rice (Oryza sativa L); quantitative trait locus; recombinant inbred line; residual heterozygous line; hull silicon content; yield trait
【中文摘要】无
【英文摘要】Rice is a typical silicon-accumulating plant and the beneficial effect of silicon on rice has long been recognized. In a previous study using 244 recombinant inbred lines (RILs) of an indica rice cross, Zhenshan 97B/Milyang 46 grown in 2003, four QTLs were detected for hull silicon content. QTL qHUS-6 had the largest effect among these, and the same interval also had significant effects on yield traits in the same population. The primary objective of this study was to validate the QTL effect in this region on HUS and yield traits. The same RIL population and another RIL population of lower heterogeneity were grown in 2004. QTL qHUS-6 was found to have significant additive effects on hull silicon content with a consistent direction in the two populations. From a residual heterozygous line selected from RILs of the same cross, 15 F-2:3 lines that differed only in a 2.15-Mb segment extending from RM587 to RM6119 on the short arm of chromosome 6 were derived. In these lines, qHUS-6 displayed a major effect, so did QTLs for yield traits previously detected in the same region. Two more QTLs for HUS detected in 2003, qHUS-1-1 and qHUS-1-2, also had consistent effects in the Zhenshan 97B/Milyang 46 RIL population in 2004. Thus this study verified three candidate regions for fine mapping HUS QTLs and determining the genetic relationship between silicon content and yield traits in rice.

【题目】Genetic relationship between grain yield and the contents of protein and fat in a recombinant inbred population of rice
【中文关键词】无
【英文关键词】Rice (Oryza sativa L.); Major nutrient content; Yield; QTL mapping
【中文摘要】无
【英文摘要】To study the genetic relationship between grain yield and the nutrient contents in rice, 209 recombinant inbred lines derived from a cross between indica rice Xieqingzao B and Milyang 46 were used to determine quantitative trait loci (QTLs) affecting the yields and contents of the two major nutritional components in brown rice. Seven traits were analyzed, including brown rice recovery (BRR), protein content (PC), fat content (FC), grain yield (GYD), brown rice yield (BRYD), protein yield (PYD) and fat yield (FYD). The nutrient contents were significantly negatively correlated with BRR, GYD and BRYD, and the variations on nutrient yield were mainly ascribed to GYD. A total of 22 QTLs distributed on 10 regions of eight chromosomes were detected. Two QTL clusters were found on the short arm of chromosome 6 and the long arm of chromosome 10, respectively. The former was responsible for all the seven traits, and the latter for all the traits except BRR and FC. In both regions, the maternal alleles decreased nutrient contents, but they increased the yields of grain, brown rice, protein and fat. Implication of these results for the breeding of rice varieties with enhancing nutritional capacity is discussed. (C) 2009 Elsevier Ltd. All rights reserved.

【题目】水稻色素原基因C的精细定位
【中文关键词】C基因;精细定位;候选基因;剩余杂合体;水稻
【英文关键词】C gene; fine mapping; candidate gene; residual heterozygous line; rice
【中文摘要】应用籼稻组合珍汕97B/密阳46的衍生材料,针对水稻第6染色体短臂色素原基因C的可能位置,筛选到在C基因周围区间呈不同基因型组合的7个剩余杂合体,收获种子建立F2:3群体。在各个植株上,稃尖颜色和叶鞘颜色的表现完全相同。通过各个群体颜色表现与原剩余杂合体基因型的比较,将C基因定位于微卫星标记RM314与RM253之间。在该基础上,应用两个分离群体共1279个样本,经标记检测和连锁分析,进一步将C基因定位于RM111和RM253之间, 与RM111和RM253的遗传距离分别为0.7 cM和0.4 cM。最后,应用区间内的另外6个微卫星标记和1个源于C基因候选基因OsC1的标记,检测在RM111-C基因-RM253区间内发生了重组的22个个体,将C基因定位于1个大小为59.3 kb、涵盖C基因候选基因OsC1座位的区间中。
【英文摘要】Seven residual heterozygous lines (RHLs) displaying different genotype compositions in the genomic region covering probable locations of C (chromogen for anthocyanin) gene on the short arm of rice chromosome 6 were selected from the progenies of the indica cross Zhenshan 97B/Milyang 46. Seeds were harvested from each of the seven plants. and the resultant F-2 (:) (3) populations were used for fine mapping C gene. It was shown in the populations that the apiculus coloration matched to basal leaf sheath coloration in each plant. By relating the coloration performances of the populations with the genotype compositions of the RHLs. the C locus was located between rice SSR markers RM314 and RM253. By using a total of 1279 F-2 (:) (3) individuals from two populations showing coloration segregation. the C locus was then located between RM111 and RM253. with genetic distances of 0.7 cM to RM111 and 0.4 cM to RM253. Twenty-two recombinants found in the two populations were assayed with seven more markers located between RM111 and RM253, including six SSR markers and one marker for the C gene candidate. OsCl. The C locus was delimited to a 59.3-kb region in which OsCl was located.

【中文关键词】水稻;印尼水田谷型细胞质雄性不育;育性恢复基因;基因定位
【英文关键词】rice;Yinshui cytoplasmic male sterility;fertility-restoring gene;gene mapping
【中文摘要】用印尼水田谷型不育系中9A和恢复系R68配组,选取F2 的高可育株和极端不育株构建2个基因池,用82个完全不育单株作为定位群体,利用分布于12条染色体的413对SSR 引物对双亲和两池进行多态性分析。位于第1 染色体的RM283和位于第10染色体的RM5756、RM258、RM6100、RM171在亲本、两池间存在多态性,用F2 单株验证证明它们与恢复基因连锁。经典遗传分析和分子标记定位研究表明,印尼水田谷型细胞质雄性不育恢复系R68具有2对恢复基因,分别位于第1和第10染色体上。位于第1染色体的恢复基因与分子标记RM283的距离是6.7cM,位于第10染色体的恢复基因与标记RM5756、RM258、RM6100和RM171间的距离分别是10.4、8.0、2.4和4.2cM。
【英文摘要】An F-2 population derived from the cross of Zhong 9A/R68 was used to mal) the fertility-restoring (Rf) gene for Yinshui cytoplasmic male sterility (CMS). A fertile bulk was constructed by pooling equal amount of 10 highly fertile lines and a sterile bulk was obtained by pooling equal amount of 10 highly sterile lines. Four hundred and thirteen pairs of SSR primers which distributed

on 12 chromosomes, were screened for polymorphism between the parents and between the two bulks. RM283 on chromosome I and RM5756, RM258. RM6100, RM171 on chromosome 10 were found to be polymorphic between the parents and between the two gene bulks. Ten highly fertile and ten highly sterile lines were selected from F2 population Of Zhong 9A/R68 to screen the gene bulks. The results showed that the five SSR markets were linked to fertility-restoring genes. A total of eighty two-excessive sterile lines were selected from Zhong 9A/R68 F-2 population to estimate the genetic distance between the five SSR markets and fertility-restoring genes respectively. A Rf gene was located on chromosome I with a distance of 6. 7 cM to RM283, and the other Rf gene was mapped on the long arm of chromosome 10 flanked by RM5756, RM258, RM6100 and RM171 at distances of 10. 4, 8. 0, 2. 4 and 4. 2 cM, respectively.

【题目】应用重组自交系群体检测水稻茎秆和剑叶硅含量QTL
【中文关键词】茎秆硅含量;剑叶硅含量;数量性状座位(QTL);水稻(Oryza sativa L.)
【英文关键词】Silicon content in the stem; Silicon content in the flag leaf; Quantitative trait loci (QTL); Rice (Oryza sativa L.)
【中文摘要】硅在水稻生长发育过程中具有重要作用,本研究的主要目的在于通过QTL 分析研究水稻茎秆和剑叶硅含量的遗传控制。以由244 个株系组成的珍汕97B/密阳46 重组自交系群体为材料,在2003 和2004年应用两重复试验测定亲本和各株系的茎秆和剑叶硅含量,应用由240 个标记组成的连锁图谱检测数量性状座位(QTL)。所分析的两个性状表现为典型的数量性状,并呈现出以基因型控制为主、基因型×环境互作和环境影响为辅的特点。经Windows QTL Cartographer 2.0 分析,检测到3 个茎秆硅含量QTL、6 个剑叶硅含量QTL和2 对控制茎秆硅含量的QTL 间互作,它们分布于1、3、5、6、7 和12 等6 条染色体的8 个区间,单个QTL 对群体性状表型变异的贡献率为3.4%~11.8%,联合贡献率为16.8%~29.2%。进一步分析发现,研究群体中实际上可能存在更多的控制茎秆和剑叶硅含量遗传变异的QTL,但其效应大小可因环境条件和性状测定参数的不同而发生变化,在既定条件下、对于既定性状,部分QTL 因达不到给定的显著水平而得不到检测。控制水稻茎秆和剑叶硅含量性状遗传变异的QTL 数目较大、单个QTL 的效应一般较小;同一基因组区间常常表现为同时控制不同性状,其作用方向稳定而显著性、效应值和贡献率则变异较大。
【英文摘要】Silicon (Si) plays an important role in the growth and development of rice. Field and laboratory studies were conducted in China, in 2003 and 2004, to investigate the inheritance of the Si content in the stem (STS) and flag leaf (FLS) of rice. A recombinant inbred population of 244 lines derived from the rice cross Zhenshan 97B/Milyang 46 was tested for STS and FLS and a linkage map consisting of 240 markers was employed to detect quantitative trait loci (QTLs) for STS and FLS. Results showed that the 2 traits were segregated quantitatively in the population, with phenotype mainly attributed to genotype and influenced by environmental and genotype * environmental effects. By using Windows QTL Cartographer 2.0, three QTLs for STS, 6 QTLs for FLS and 2 digenic interactions between QTLs for STS were detected. The QTLs were located in 8 intervals on 6 rice chromosomes (1, 3, 5, 6, 7 and 12), with phenotypic variance explained by a single QTL ranging from 3.4 to 11.8% and a general contribution of 16.8-29.2%. More QTLs for STS and FLS functioned in the population, but their effects varied greatly depending on the environment and traits under study. In a given environment, some of the QTLs for a given trait may not be claimed because a predetermined threshold could not be reached. These results suggested that a large number of QTLs with minor effects might be responsible for the natural variation of Si content in the stem and flag leaf of rice. QTLs for related traits may be located in clusters, having consistent direction and instable magnitude.

【题目】应用剩余杂合体衍生的近等基因系分解水稻产量性状QTL
【中文关键词】剩余杂合体; 近等基因系; 数量性状座位; 产量性状; 水稻
【英文关键词】residual heterozygous line ; near isogenic line ; quantitative t rait locus ; yield t rait s ; rice
【中文摘要】以杂合区间为RM587 - RM402 的水稻剩余杂合体(RHL) 衍生群体为材料,应用SSR 标记检测,筛选到杂合区间分别为RM587 - RM225 、RM204 - RM6119 和RM6119 - RM402 的3 个单株,进一步检测其F2 群体,分别获得母本纯合型材料10 株、父本纯合型材料10 株和杂合型材料20 株。种植这3 套近等基因系材料,考查单株产量及其构成因子每株穗数、每穗实粒数和千粒重。经应用目标区间内等位基因效应分析和交迭重组染色体片段代换系分析,分解出3 个控制每穗实粒数的QTL 和2 个控制单株产量的QTL ,这些QTL 分别位于物理距离为0. 66 ~ 2. 49 Mb 的区间中,全部表现为加性作用为主,增效等位基因除qN FGP621 来自父本密阳46 外,其余均来自母本珍汕97B。提出了构建新型遗传材料,提高水稻QTL 精细定位效率的策略。
【英文摘要】Three residual heterozygous lines (RHLs) carrying heterozygous segments in intervals RM587 - RM225' RM204 - RM6119 and RM6119 - RM402 on the short arm of rice chromosome 6, respectively, were selected from a rice population derived from an RHL for interval RM587-RM402. Ten maternal homozygotes, 10 paternal homozygotes and 20 heterozygotes were selected from each of the F-2 populations derived from the three RHLs. The three sets of near isogenic lines (NILs) were grown for phenotyping on grain yield per plants number of particles per plant, number of filled grains per panicle and 1000-grain weight. With analysis on the phenotype differences among the three genotype groups in each NIL set and that among overlapping chromosome segment substitution lines, three QTI-s for filled grain number per panicle and two QTLs for grain yield were resolved. They were located in intervals ranging from 0.66 Mb to 2.49 Mb. The additive effect was higher than the dominance effect at each locus. The allele for increasing the trait value was derived from the paternal parent at qNFGP6-1, and from the maternal parent at the other QTLs. Following the present study an approach for the construction of new genetic resource to facilitate QTL fine-mapping in rice was proposed

【题目】水稻第6染色体短臂产量性状QTL簇的分解
【中文关键词】水稻(Oryza sativa L.);产量性状;剩余杂合体(RHL);数量性状座位(QTL);第6 染色体短臂
【英文关键词】Rice (Oryza sativa L.); Yield traits; Residual heterozygous line (RHL); Quantitative trait locus (QTL); Short arm of chromosome 6
【中文摘要】将水稻第6 染色体短臂上产量性状QTL 分解到更小的区间中。从珍汕97B/密阳46 重组自交系群体筛选到针对第6 染色体短臂RM587-RM19784 区间的剩余杂合体,衍生了一个由221 个株系组成的F2:3群体,种植于海南和浙江两地,考察每株穗数、每穗实粒数、每穗总粒数、千粒重、结实率和单株产量,建立SSR标记连锁图,应用Windows QTL Cartographer 2.5 检测QTL。在所分析的6 个性状中,除穗数外在第6染色体短臂上的目标区间均检测到QTL,分别座落于目标区域中3 个以上的不同区间中,单个QTL 对群体性状表型变异的贡献率为6.3%~35.2%;控制产量构成因子的QTL 基本以加性作用为主,但3 个单株产量QTL 的显性度分别为1.65、0.84 和0.42。目标区间存在3 个以上的产量性状QTL,且同一区间控制不同性状的QTL、不同区间控制同一个性状的QTL 在遗传作用模式、效应方向和效应大小上存在一定差异。
【英文摘要】The objective of this study was to dissect quantitative trait loci (QTL) controlling yield traits on the short arm of rice chromosome 6. A residual heterozygous line for interval RM587 RM 19784 on the short arm of rice chromosome 6 was selected from Zhenshan 97B/MiIyang 46 recombinant inbred population. An F2 population of 221 lines was derived and grown in two trial sites in China. Six yield traits including number of panicles per plant, number of filled grains per panicle, total number of spikelets per panicle, spikelet fertility. The 1000-grain weight and grain yield per plant was evaluated. A SSR marker linkage map was constructed and employed to detect QTL for yield traits using Windows QTL Cartographer 2.5. QTLs were detected for each of the traits except panicle number, with phenotypic variance explained by a single QTL range of 6.3-35.2%. Most of the QTLs for yield components acted as additive QTL, while the three QTL for grain yield had dominance degrees of 1.65, 0.84 and -0.42, respectively. Three or more QTLs for yield traits were located in the target region. The genetic action mode, the direction of QTL effect and the magnitude of QTL effect

sometimes varied among different QTLs for a given trait, and among QTLs for different traits that were located in a same interval.

【题目】水稻褐飞虱抗性基因的鉴定及利用现状
【中文关键词】水稻; 褐飞虱; 抗性; 基因鉴定
【英文关键词】rice; brown planthopper; resistance; gene identification
【中文摘要】褐飞虱是为害水稻生产的重要害虫,利用寄主抗性培育抗褐飞虱品种被认为是防治其为害的有效途径.自20世纪70年代起,各国相继开展了水稻褐飞虱抗性基因 的发掘工作,截至2007年12月,经国际注册确认和报道的水稻抗褐飞虱基因共22个,其中12个为显性基因(Bph),10个为隐性基因(bph),已 被定位的达18个,此外还鉴定了一些重要的抗性QTLs.文中还讨论了综合防治褐飞虱策略等合理利用抗性基因的问题.
【英文摘要】The brown planthopper(BPH) is one of the most serious insect pests in rice production.The breeding of varieties resistant to BPH by applying host-plant resistance has been recognized as an economic and effective measure for BPH control.Systematic genetic studies on rice resistance to BPH have been conducted in world since 1971.Up to December 2007,there are a total of 22 BPH resistance genes registered internationally or reported.Among them,12 and 10 out of the genes are dominant and recessive,respectively,and 18 of them have been located.Besides,some important resistant QTLs have been detected.Application of resistance to BPH was also discussed

【题目】稻瘟病抗性基因的鉴定及利用进展
【中文关键词】水稻; 稻瘟病; 抗性; 基因鉴定
【英文关键词】rice; rice blast; resistance; gene identification
【中文摘要】20世纪60年代中期,日本率先开展了水稻品种抗稻瘟病基因分析的研究工作,鉴定了最初的8个抗性位点上的14个基因,并建立了一套抗稻瘟病基因分析用的鉴别体系(JDCs,Japanese differential cultivars),随后,国际水稻研究所和中国等产稻国也逐渐开展了水稻稻瘟病抗性遗传的系统性研究。截至2007年12月,已至少报道了58个抗稻瘟病位点共67个主效基因。这些基因成簇地分布于除第3染色体外的所有水稻染色体上,其中,66个为显性基因,1个为隐性基因,包括Pi-b、Pi-ta、Pi-z^5、Pi-z^t、Pi-9、Pi-d2、Pi-36和Pi-37等8个已被克隆的基因(Pi-z^5、Pi-z^t和Pi-9同为Piz基因位点上的复等位基因)。还讨论了合理利用抗性基因等问题。
【英文摘要】Studies on host resistance to blast in rice have work of Kiyosawa's group in Japan for the identification of 14 been extensively conducted since 1960s. Following the initial resistance genes at eight loci and the development of Japanese differential cultivars (JDCs), the inheritance of rice blast resistance was comprehensively studied at the International Rice Research Institute and in rice-growing countries such as China. Up to December 2007, at least 67 resistance alleles at 58 loci had been identified. These genes are located in cluster and distributed on all the rice chromosomes except chromosome 3, of which 66 are dominant and the remaining one is recessive. Eight of the genes, namely, Pi-b, Pi-ta, Pi-z^5 , Pi-z^t , Pi-9, Pi-d2, Pi- 36 and Pi-37, have been cloned, among which Pi-z^5 , Pi-z^t and Pi-9 are allelic. Application of resistance genes to rice blast was also discussed.

【题目】野生稻有利基因的发掘和利用
【中文关键词】野生稻; 种质资源; 基因; 有利性状; 育种改良
【英文关键词】wild rice; germplasm; gene; favorable trait; breeding improvement
【中文摘要】野生稻作为栽培稻的野生亲缘种,具有许多优良的性状和有利基因,是栽培稻品种进一步改良的天然遗传种质资源库。其中,野生稻对病虫害的抗性、对各种逆境的耐受性以及胞质雄性不育等,已广泛应用于现代栽培稻的育种改良。文章综述了野生稻种质资源的有利性状及相应控制基因的发掘,探讨了其在今后水稻育种中的应用潜力。
【英文摘要】Wild rice is the closely related wild relatives of cultivated rice. Wild rice provides natural genetic germplasm resources for improving cultivated rice varieties as it possesses many desirable traits and favorable genes, many of which, such as resistance to diseases and insect pests, tolerance to different kinds of stresses and its cytoplasmic male sterility, have been widely used in cultivated rice breeding. In this paper, favorable traits of wild rice germplasm resources and the related genes were summarized, and their utilization potential in rice breeding were also discussed

【题目】水稻千粒重QTL图谱整合研究
【中文关键词】千粒重; 图谱整合; 水稻
【英文关键词】QTL; 1000-grain weight; QTL; integration map; rice
【中文摘要】以粳稻品种日本晴的测序图谱Gramene Annotated Nipponbare Sequence 2006为基础,挑选较广泛应用于水稻QTL研究的标记绘制了公共图谱,并将国内外公开发表的251个水稻千粒重QTL整合到该图谱中。研究表明,目前定位的粒重QTL虽分散于各条染色体,但主要集中在1、3、5、6、10号染色体上并成簇状分布,其中6个区间可能存在主效QTL。
【英文摘要】DNA markers that were commonly used in the mapping of quantitative trait loci (QTLs)in rice were aligned based on the Gramene Annotated Nipponbare Sequence 2006. With linked DNA markers, 251 rice QTLs for 1000-grain weight were integrated into the map. It was indicated that QTLs for grain weight were distributed in all the 12 chromosomes of rice, but the majority were located on chromosomes 1, 3, 5, 6 and 10 in which six intervals are likely to harbor major QTLs for grain weight.

【题目】一个水稻金黄色颖壳和节间基因的遗传定位
【中文关键词】水稻;金黄色颖壳和节间基因;遗传分析;基因定位

【英文关键词】Rice; goldhullandinternodegene; geneticanalysis; genemapping
【中文摘要】R68是带有金黄色颖壳和节间标记的籼稻恢复系。对来源于组合中9A/R68的F2群体的遗传分析表明,R68的金黄色颖壳和节间性状由1对隐性基因控制。利用SSR分子标记,采用隐性群体分析法,把金黄色颖壳和节间基因定位在第3染色体上,位于RM1230、RM7000和RM227、RM514之间,遗传距离分别为8.7、3.3、2.7和4.7cM,暂将该基因命名为gh-5
【英文摘要】Genetic analyses were carried out for an F-2 population derived from the cross between a cytoplasmic male sterile line Zhong 9A and R68, an indica restorer line with a gold hull and internode marker. The results indicated that the gold hull and internode trait was controlled by one recessive gene. Relying on simple sequence repeat (SSR) markers and recessive class analysis method, the gold hull and internode gene (gh) was mapped at an interval on rice chromosome 3 flanked by RM1230 and RM7000 on one side, as well as RM227 and RM514 on the otherside, at distances of 8.7, 3.3, 2.7 and 4.7 cM, respectively. The newly mapped gene was tentatively designated to be gh-5.

【题目】通过生育期基因型选择避免稻瘟病抗性与结实率的遗传累赘
【中文关键词】水稻;遗传累赘;稻瘟病抗性;数量性状座位;抽穗期
【英文关键词】Rice(Oryza sativa);genetic drag; blast resistance; quantitative trait locus; headingdate
【中文摘要】利用重组自交系研究表明,在水稻第6染色体短臂上稻瘟病抗性基因Pi25(t)与控制结实率和每穗实粒数的QTL之间存在遗传累赘。为了验证这种关系,采用了更大的遗传群体进行分析,结果表明稻瘟病抗性与结实率存在遗传累赘,但未检测到稻瘟病抗性与每穗实粒数存在遗传累赘。通过对第7染色体长臂RM2-RM214区间抽穗期基因(Qhd7)型背景进行选择,可以打破或避免稻瘟病抗性与结实率的遗传累赘。为了进一步验证这种关系,选择Pi25(t)区间基因型不同RM2-RM214区间基因型相同、其他染色体区间基本一致的两个株系发展新群体进行分析,除第6染色体的结实率QTL可以分解成2个效应较小的QTL(qSF6-1和qSF6-2)外,当第7染色体RM2-RM214区间基因型为中156背景时,Pi25(t)与结实率QTL(qSF6-2)存在遗传累赘,且qSF6-2来自父本谷梅2号的等位基因起减效作用;当第7染色体RM2-RM214区间基因型为谷梅2号背景时,第6染色体上没有检测到结实率QTL。上述结果说明在特定育种材料中对抽穗期基因进行选择可以成功打破或避免稻瘟病抗性与结实率的遗传累赘,为水稻以及其他作物的高产抗病育种提供了一种新途径。
【英文摘要】Previous study showed that genetic drag between a blast resistance gene Pi25(t) and QTLs conditioning spikelet fertility (qSF-6) and number of filled grains per panicle (qNFGP-6) were detected on the short arm of rice chromosome 6. To further verify, a larger population was used for analysis and the results confirmed the genetic drag between the blast resistance and spikelet fertility (SF) but no genetic drag was detected between the blast resistance and number of filled grains per panicle (NTGP). Breakdown or avoidance of the genetic drag could be achieved by selection against the background genotype of a heading-date gene (qHD-7) that resided in the region between RM2 and RM214 on chromosome 7. To further validate - two lines with almost identical genotypes on all chromosomal regions except the Pi25 (t) region on chromosome 6 were chosen to develop a new population. The results showed that qSF-6 could be further subdivided into qSF-6-1 and qSF-6-2. When the genotype of RM2-RM214 region was from rice variety Zhong 156, genetic drag between Pi25 M and SF (qSF-6-2) was detected. and the allele of qSF-6-2. from rice variety Gumei 2 reduced SF. When genotype of the region between RM2-RM214 was from Gumei 2, no genetic drag was detected. The results indicated that genetic drag between the blast resistance and spikelet fertility could be broken down or avoided under a certain background genotype based on the selection against heading-date and provided a marker aided solution for high level of blast resistance and yield breeding in rice and other crops as well.

【题目】超级杂交稻协优9308重组自交系的分子遗传图谱构建
【中文关键词】穗部性状;数量性状基因座;重组自交系;一因多效;超级杂交稻
【英文关键词】Panicle trait; quantitative trait locus; recombinantin bredlines; pleiotropism; siper hybrid rice
【中文摘要】将281个株系组成的超级杂交稻协优9308重组自交系群体种植在海南陵水(2006年和2007年)和浙江富阳(2006年),采用Windows QTLCartographer 2.5的复合区间作图法进行QTL检测。共检测到控制7个穗部性状的52个QTL,其中包括7个控制穗长的QTL,8个控制一次枝梗数的QTL,9个控制二次枝梗数的QTL,6 个控制着粒密度的QTL,7个控制每穗总粒数的QTL,11个控制每穗实粒数的QTL,4个控制结实率的QTL。单个QTL 对群体性状表型变异的贡献率为2.3%~31.2%。控制穗部性状的QTL基本上以加性效应为主,上位性效应和环境互作效应不大。在3组试验中都检测到控制3个穗部性状的8个QTL:qPL-1,qPL-6;qTNSP-1,qTNSP-2,qTNSP-3;qNFGP-1,qNFGP-3-2,qNFGP-6-2。这些QTL,尤其是第3染色体RM168-RM143区间控制每穗总粒数的qTNSP-3和控制每穗实粒数的qNFGP-3-2,其加性效应值和贡献率均较大,可以考虑下一步进行QTL精细定位和克隆。研究发现多个重要QTL聚集区间,在同一QTL聚集区间,控制相关性状的QTL效应方向基本上相同,利用这些QTL紧密连锁的分子标记进行辅助选择,可望同时针对多个性状进行遗传改良。
【英文摘要】A rice RIL (recombinant inbred line) population consisting of 281 lines was constructed by the single seed descent method using the maintainer line XQZB and the restorer line ZH9308 of super hybrid rice XY9308 as the female and male parents. The polymorphism between XQZB and ZH9308A was analyzed with 695 pairs of SSR (simple sequence repeat) markers. One hundred and eighty-six pairs of polymorphism markers were obtained with a polymorphic frequency of 26.8%. Furthermore, a linkage map containing 163 SSR markers was constructed. Its total length was about 1578.9 cM, covering 87.5% of the whole rice genome. The allele frequency of the female parent was 0.52 in the 281 lines and 163 markers. Serious segregation distortion was observed in this RIL population, and 80 markers (49.5%) showed significant deviation

【题目】水稻第6染色体短臂株高及产量性状QTL的分解
【中文关键词】水稻;产量性状;株高;数量性状座位;剩余杂合体;基因定位
【英文关键词】Rice;yield trait; plant height; quantitative trait locus; residualheterozygous line; genemapping
【中文摘要】针对第6染色体短臂上一个对产量性状遗传具有重要作用的区间RM587-RM19715,从珍汕97b/密阳46重组自交系群体中筛选到1个剩余杂合体,自交衍生获得一个由195个个体组成的F2群体,检测控制株高和产量性状的QTL。经分析,在目标区间的上部和下部分别检测到1个QTL簇,分别对除单株穗数以外的产量性状因子具显著作用,单个QTL对群体性状表型变异的贡献率为5.0%-55.5%。将第6染色体上的产量性状QTL分解到更小的区间中,为产量性状QTL的精细定位和克隆打下了基础。
【英文摘要】residual heterozygous line carrying heterozygous segments covering an interval RM587 - RM19715 on the short arm of chromosome 6 in rice was selected from a recombinant inbred line population of Zhenshan 97B/Milyang 46. The resultant F-2 population was used to detect quantitative trait loci (QTLs) on the short arm of rice chromosome 6 that control yield traits and plant height. Two clusters of QTLs were detected and located on the top and bottom intervals of the target region. Each cluster showed significant effects for all the yield components except for the number of panicles per plant. One QTL cluster for yield traits in the two clusters were dissected and the QTLs were defined into narrowing regions, thus providing available conditions for QTL fine mapping and cloning.

【题目】水稻盐胁迫下农艺和生理性状的遗传分析
【中文关键词】水稻; 数量性状座位; 盐胁迫; 农艺性状
【英文关键词】Rice; Quantitative trait loci; Salt stress; Agronomic trait
【中文摘要】无
【英文摘要】By employing a recombination inbreed line (RIL) population of 247 lines derived from an inidca-inidca cross Zhenshan 97B* Milyang 46,a linkage map consisting of 250 DNA markers was used for QTL mapping of plant height,maximum root length,root dry weight and relative water content under normal and salt stress (0.7% NaCl). Six QTLs for these traits were identified under salt stress,with 6.01%-16.50% phenotypic variations. Six QTLs for these traits were identified under normal conditions,with 4.39%-18.50% phenotypic variations. Meanwhile,root length and relative water content were simultaneously affected by two QTLs located in the interval RM246-RG101 on chromosome 1 and the interval RZ399-RG393 on chromosome 3.

【中文摘要】为实现水稻生物学数据的共享、交流和利用,基于ASP.NET,结合国内外水稻分子育种研究的现状和需求,构建了水稻分子育种信息平台.系统平台设计了基因库、QTL库和Ontology等多个子库和模块,并针对生物学数据的特点,采用B/S架构,运用存储过程和分页技术等多重手段,实施了客户端和服务器端双重安全屏障.对系统的实现技术、实现方案和优化设计等进行了详细的讨论和阐述.
【英文摘要】In order to realize the sharing, communication and utilization of rice biological data, the information platform for rice molecular breeding is developed by means of ASP. NET technique. Many important application databases and components, such as rice gene database, QTL database and Ontology system, are designed for the platform with careful consideration of current research status and demands of rice molecular breeding. Furthermore, according to the characteristics of biological data, the B/S structure is adopted, stored process and paging technique are used, dual security defense system for both clients and servers are implemented. Finally, the practical consideration of the system, the corresponding implementation techniques and optimum design are also discussed in detail.

【题目】盐胁迫下水稻部分生化性状的QTL定位
【中文关键词】水稻; 数量性状座位; 盐胁迫; 生化性状
【英文关键词】rice; quantitative trait loci; salt stress; biochemical traits
【中文摘要】应用247个株系组成的珍汕97B/密阳46重组自交系群体及其相应的含250个分子标记的高密度分子遗传图谱,对0.7%NaCl盐处理后的水稻苗期相关生化性状进行QTL定位.在第1染色体的RM237-RM246区间检测到1个控制蛋白质含量的QTL,贡献率为13.14%;在第12染色体的RG81-S13126和RM309-RG543区间分别检测到1个控制脯氨酸含量和抗坏血酸含量的QTL,贡献率为9.09%和7.97%.并将所定位区间与已报道的水稻盐胁迫反应基因/QTL的位置进行了比较.
【英文摘要】By employing a recombination inbreed line (RIL) population of 247 lines derived from an inidca-inidca cross Zhenshan 97B/Mi/yang 46, a linkage map consisting of 250 DNA markers was used for QTL mapping of biochemical traits in rice seedlings under salt stress with 0.7% NaCl. A QTL controlling protein content was detected in interval RM237-RM246 on chromosome 1, accounting for 13.14% phenotypic variation. In intervals RG81-S13126 and RM309-RG543 on chromosome 12, each QTL controlling proline content and ascorbic acid content was detected and explained for 9.09% and 7.97% phenotypic variation, respectively. Meanwhile, coincidence of the loci involved salt-stress-related genes/QTLs with the QTLs controlling biochemical traits was compared

【题目】一个新的水稻卷叶突变体的遗传分析与基因定位
【中文关键词】水稻(Oryza sativa L.);卷叶基因;分子标记;物理图谱
【英文关键词】rice (Oryza sativa L.), chemical mutagenesis, molecular marker, rolled-leaf gene, physical map
【中文摘要】水稻叶片发育异常的突变体是研究水稻叶片发育分子机理的重要材料.本研究在IR64的EMS突变体库中发现了一个新的卷叶突变体材料w32,在整个生育期过程叶片都表现高度卷曲.突变体w32与IR24、培矮64杂交构建F2群体进行遗传分析,结果表明,卷叶性状受一个隐性基因控制.选用w32/PA64 F2群体中的1846个卷叶单株进行基因定位,在卷叶和正常叶的DNA池中筛选到两个多态性标记RM6697和RM20781,并确定该卷叶基因位于第7染色体短臂上,是一个尚未报道过的基因,暂命名为rl11(t).利用新发展的11个SSR标记和19个InDel标记,最终将rl11(t)基因定位在一个约52kb的区段上,为最终克隆该卷叶基因奠定了基础.
【英文摘要】To understand the development of rice leaf blades, we identified a new rolled-leaf mutant, w32, from indica cultivar IR64 through EMS mutagenesis. The mutant showed a stable rolled-leaf phenotype throughout the life cycle. Two F2 populations were developed by crossing w32 to cultivar IR24 and PA64. Genetic analysis showed that the rolled-leaf phenotype was controlled by a single recessive gene. To determine the location of the gene, bulked segregant analysis was carried out using mutant and wild-type DNA pools and 1846 mutant-type F2 individuals derived from the cross w32/PA64 were geno-typed to locate the gene on the short arm of chromosome 7. The rolled-leaf gene, tentatively named rl11(t), is likely a new gene as no other rolled-leaf genes have been identified near the region. By de-veloping new SSR and InDel markers, the gene was delimited to a 52 kb region near the end of the short chromosome arm. Further fine mapping and cloning of the gene are currently underway.

【题目】加拿大一枝黄花白绢病(Sclerotium rolfsii)菌株SC64的生物学特性研究

【中文关键词】加拿大一枝黄花; 罗氏白绢小菌核菌; 菌株 SC64; 生物学特性

【英文关键词】Solidago canadensis L. ; Sclerotium rolfsii Sacc. ; strain SC64; biological characteristics

【中文摘要】在实验室条件下初步研究了加拿大一枝黄花白绢病菌株 SC64 的形态特征 致病性和生物学特性 结果表明: 引起加拿大一枝黄花白绢病的病原物是罗氏白绢小菌核菌(Sclerotium rolfsii Sacc.) ; 病菌最适生长培养基为Richard 固体培养基和PDA, 菌丝生长温度为15 ~ 40 °C, 最适30 °C; 在偏酸性条件下生长较好, 生长适宜pH 值为4. 0 ~ 6. 0, 最适为5. 0; 在所测试的碳源中, 对蔗糖的利用最好, 对乳糖和半乳糖利用最差; 氮源测试结果显示对蛋白胨和硝酸钾利用最好, 对尿素的利用最差 菌核萌发温度为15 ~ 40 °C, 最适为 30 °C; 菌核在含水量 50% 的麸皮基质上萌发较好; 适宜萌发的 pH 值范围为3. 0 ~ 9. 0 菌丝的致死温度为45 °C 10 min, 菌核的抑制萌发温度为50 °C 10 mi

【英文摘要】Abstract: A southern blight of Canadian goldernrod(Solidago canadensis) was found to be an important disease. The pathogen was identi-fied as Sclerotium rolfsii Sacc. based on morphological characteristics. Factors influencing mycelial growth and sclerotia germination of strainSC64 of Sclerotium rolfsii were studied. The results indicated that the most optimum media for the mycelial growth were modified Richardand potato dextrose agar(PDA) , the range of temperature for the mycelium growth was 15 -40 °C, with the optimum at 30 °C, and the rangeof pH was 4. 0 -6. 0, with the optimal pH of 5. 0. Through carbon sources testing on

amended Czapek, sucrose was found to support growthsignificantly faster than other sources, while lactose was found to provide the slowest growth. Among the 13 nitrogen sources tested, peptoneand potassium nitrate gave the best growth whereas urea gave the least growth. The range of temperature for sclerotia germination was 15 -40 ℃, with the optimum at 30 ℃. Sclerotia germination reached 100% when incubated on bran substrate with 50% moisture. The rangeof pH for sclerotia germination was 2 -10, with 100% germination at 3 -9. Hyphal and sclerotia viability was completely lost when hyphalagar plugs and sclerotia were incubated at 45 ℃ 10 minutes and 50 ℃ 10 minutes, respectively

【题目】尖叶胡枝子和达乌里胡枝子种子形成特性及其生产性能研究
【中文关键词】尖叶胡枝子;达乌里胡枝子;种子;开花习性
【英文关键词】L. hedysaroides;L.davurica; seed; flowering behavior
【中文摘要】通过研究尖叶胡枝子和达乌里胡枝子种子形成特性及生产性能,结果表明,尖叶胡枝子和达乌里胡枝子从返青期到种子形成分别需要111~121 d和103~108 d;二者生殖枝率较高,可达95%,尖叶胡枝子的单株花序为805.6个,达乌里胡枝子为277.0个;二者日开花高峰时间不同,尖叶胡枝子出现在9：00~10：00,达乌里胡枝子在10：30~11：30,而二者闭花高峰均出现在15：30~16：00;尖叶胡枝子的结荚率和成熟率比达乌里胡枝子高,种子收获期不同,种子的发芽率、硬实率和千粒重也不相同,两种胡枝子适宜的收获期均在9月20日左右,种子贮藏时间对其发芽率和硬实率有明显的影响;尖叶胡枝子的种子产量为607.33 kg/hm2,达乌里胡枝子为591.77 kg/hm2
【英文摘要】Seeds formulation character and productivity of twoLespedezaspecieswere studied, and the results showed that the bearing periods of twoLespedezaspecieswere different: 111~121d forL. hedysaroidesand 103~108 d for L. davurica.Seed setting rates ofbothLespedezawere as high as 95%; inflorescence ofL. hedysaroideswas 805. 6,that of L. davuricawas 277. 0; the maximum blooming time of thes twoLespedezaper day were also different:L. hedysaroidesat9：00~10：00,whileL. davuricaat10：30~11：30, but the flower closing time of thes twoLespedeza were all at15：30~16：00. The pod rate and ripe rate ofL. hedysaroideswere higher than those ofL. davurica.These twoLespedezaspecies had different characters in seed harvesting time, germination rate, hard seed rate and thousand seed weight, but they had the same harvesting time around Sept. 20th. The seed yield ofL. hedysaroides was 607. 33 kg/hm2, that ofL. davuricawas 591. 77 kg/hm2.

【题目】四种岭南水果种植系统的能值、经济与土壤整合分析
【中文关键词】岭南水果;丘陵;能值;种植系统;可持续发展
【英文关键词】Lingnan fruit;hilly area;emergy;production systems;sustainable development
【中文摘要】综合运用能值、经济与土壤生态学分析方法,定量研究了番石榴(Psidium guajava Linn)、黄皮(Clausena lansium Skeels)、枇杷(Eriobotrya japonica Lind1)、葡萄柚(Citrus paradisi Macf)4种岭南水果种植系统的物质流、能量流和货币流,综合分析其自然资源基础、经济发展状况及可持续发展程度,并将土壤有机质的消耗纳入不可更新自然资源能值投入分析,为岭南水果业的可持续发展提供科学依据。能值分析表明,4个水果种植系统的可持续发展能力依次为:葡萄柚(O.94)>枇杷(0.15)>番石榴(0.14)>黄皮(0.10 o土壤有机质分布与变化分析表明,4种水果种植系统的土壤有机质消耗量依次为:葡萄柚>黄皮>枇杷>番石榴。经济分析表明,4个水果种植系统的经济效益依次为:葡萄柚>番石榴>枇杷>黄皮。综合分析表明,番石榴、黄皮、枇杷三个系统的水果生产效率有待进一步提高;葡萄柚种植系统的水果生产效率、可持续发展能力和经济效益较高,但其对土壤有机质的消耗强度在四个系统中是最高的,这一点在水土流失严重的丘陵地区显然是不容忽视的。同时,如何降低系统在市场交换中的交换性资产流失是四个系统共同面对的问题。
【英文摘要】Abstract:A combined evaluation was done based on emergy,economic and soil ecology methods,on four Lingnan fruit production systems,including Guava,Wampee,Loquat and Grapefruit.Material flows,energy flows and currency flows were quantitatively evaluated.Natural resources,economic characteristics and sustainable development status were analyzed.The depletion of soil organic matter was also included in the calculation of non—renewable resources.The emergy evaluation indicated that thesustainability of the Grapefruit production system (2.30)was the highest in the four fruit production systems,followed by Loquat(0.38),Guava(0.35),and Wampee(0.25).The soil analysis indicated that the consumption of soil organic matter in Grapefruitproduction was the highest among the four production systems,followed by Wampee,Loquat,and Guava.The economic analysisindicated that economic profit from Grapefruit production was the highest among the four systems,followed by Guava,Loquat,and Wampee.Th e integrated analysis indicated the production eficiency of the Guava,Wampee and Loquat needs further improvement.The Grapefruit production showed the highest emergy sustainability and economic benefits among the four systems,but its consumption of soil organic matter was also the highest.Depletion of soil organic matter is a serious problem,which

clearly should not be neglected,considering serious soil erosion in the hillside area.A common problem for the four fruit production systems is how to decrease assets lost during market exchange.

【题目】起始时间对亚热带森林凋落物分解速率的影响
【中文关键词】环境因子, 布置时间, 凋落物分解速率常数k, 凋落物分解, 亚热带森林
【英文关键词】environment factor, incubation time, litter decomposition constant k, litter decomposition, subtropicalforest
【中文摘要】运用分解袋法研究了不同布置时间的凋落物在亚热带森林分解的初期过程, 探讨了不同布置时间的凋落物经过相同时间分解的差异及环境因子对其分解速率特别是分解速率常数k的影响。结果表明: 在凋落物分解较快的鼎湖山季风常绿阔叶林, 不同时间布置的凋落物经过12个月的分解, 其残留率及k均存在较大的差异。不同布置时间的凋落物的分解率在前期(0 – 6个月)与其相应阶段的环境因子呈显著相关关系, 但与后期的环境因子相关性并不显著。不同布置时间的k值的变化范围为0.78 – 1.30, 起始于雨季的k值较大, 起始于旱季的较小($p < 0.001$), 其大小与分解前期的环境因子相关性较高, 与整个分解过程中的环境因子相关性较低。因此, 凋落物的凋落时间可能影响其分解速率; 由于布置时间不同而导致k值估算的不准确将对森林生态系统的养分循环及其碳平衡的评估产生很大影响。
【英文摘要】Aims Estimation of ecosystem carbon balance may be affected by timing of sampling. Our objective was to determinethe effect of different incubation starting times on litter decomposition rate (k) in a tropical and subtropicalforest.Methods We used litter bags and incubated them in the field at the same site beginning on eight different startingtimes over a year, beginning January 13 and at 45-day intervals. Each of the eight sets of litter bags was sampled four times over a period of 12 months, remaining litter mass was determined and k values were estimated.Temperature, precipitation, photosynthetically available radiation, soil water content and relative humidity weremeasured throughout the experiment.Important findings The remaining litter mass and k values were significantly different ($p < 0.05$) among theeight starting times. Rate of litter decomposition was significantly ($p < 0.05$) correlated to temperature and precipitation during the early phase rather than the later phase of the experiment. The k values ranged from 0.78 to1.30, and were significantly higher ($p < 0.001$) for litter whose incubation started in the wet seasons as compared to the dry seasons. Therefore, time for the start of incubation may significantly influence estimation of k values,which in turn may influence estimation of ecosystem carbon balance.

【题目】广东省荔枝产业发展现状与对策分析
【中文关键词】荔枝;产业发展;对策
【英文关键词】lychee; industrial development; countermeasures
【中文摘要】广东省荔枝栽种面积约占中国栽种面积的45%,已成为世界荔枝栽种面积最大、栽培品种较多的地区。目前,广东荔枝生产已向着产业化方向发展,成为广东种植业的支柱产业之一。广东荔枝生产与国内主产区的市场竞争力比较,已形成了一个具有竞争优势的产业,具有良好的市场竞争力。笔者概述了国内外荔枝产业的生产与贸易现状,分析了广东

省荔枝的种植区域分布、生产现状以及荔枝科技情况等,并结合广东省荔枝产业发展现状,提出了广东荔枝产业发展的对策建议。

【英文摘要】Guangdong is a region of the largest cultivated area and possesses more cultivated species of lychee in the world. And lychee planting area in Guangdong province is about 45% of the total in China. Now, lychee production has moved towards industrialization and has been one of the key branches among agriculture in Guangdong. Compared with the domestic market competitiveness, lychee production in Guangdong has been developed as an industry with advantageous competition and has strong market competitiveness. So, this paper analyzed the status of lychee production and lychee trade in the world, and the situation of lychee distribution, lychee production and technologies for lychee fruits ’ fresh-keeping, processing and pests control inGuangdong province. Finally, this paper put forward several countermeasures for lychee development based on the present situation of lychee production in Guangdong province.

【题目】Histone acetyltransferases in rice (Oryza sativa L.): phylogenetic analysis, subcellular localization and expression

【中文关键词】组蛋白乙酰转移酶,激素,系统树,亚细胞定位,水稻,压力

【英文关键词】Histone acetyltransferase, Hormone, Phylogenetic tree, Subcellular localization, Rice, Stress

【中文摘要】在真核生物的转录中,组蛋白乙酰转移酶具有重要的作用

【英文摘要】Background: Histone acetyltransferases (HATs) play an important role in eukaryotic transcription. Eight HATsidentified in rice (OsHATs) can be organized into four families, namely the CBP (OsHAC701, OsHAC703, andOsHAC704), TAFII250 (OsHAF701), GNAT (OsHAG702, OsHAG703, and OsHAG704), and MYST (OsHAM701) families.The biological functions of HATs in rice remain unknown, so a comprehensive protein sequence analysis of the HATfamilies was conducted to investigate their potential functions. In addition, the subcellular localization andexpression patterns of the eight OsHATs were analyzed.Results: On the basis of a phylogenetic and domain analysis, monocotyledonous CBP family proteins can besubdivided into

two groups, namely Group I and Group II. Similarly, dicotyledonous CBP family proteins can bedivided into two groups, namely Group A and Group B. High similarities of protein sequences, conserved domainsand three-dimensional models were identified among OsHATs and their homologs in Arabidopsis thaliana andmaize. Subcellular localization predictions indicated that all OsHATs might localize in both the nucleus and cytosol.Transient expression in Arabidopsis protoplasts confirmed the nuclear and cytosolic localization of OsHAC701,OsHAG702, and OsHAG704. Real-time quantitative polymerase chain reaction analysis demonstrated that theeight OsHATs were expressed in all tissues examined with significant differences in transcript abundance, andtheir expression was modulated by abscisic acid and salicylic acid as well as abiotic factors such as salt, cold,and heat stresses.Conclusions: Both monocotyledonous and dicotyledonous CBP family proteins can be divided into two distinctgroups, which suggest the possibility of functional diversification. The high similarities of protein sequences,conserved domains and three-dimensional models among OsHATs and their homologs in Arabidopsis and maizesuggested that OsHATs have multiple functions. OsHAC701, OsHAG702, and OsHAG704 were localized in both thenucleus and cytosol in transient expression analyses with Arabidopsis protoplasts. OsHATs were expressedconstitutively in rice, and their expression was regulated by exogenous hormones and abiotic stresses, whichsuggested that OsHATs may play important roles in plant defense responses.

Rice;
Suppression
subtractive
hybridization

【中文摘要】高静电压力是影响多倍体细胞活性的极端压力

【英文摘要】High hydrostatic pressure (HHP) is an extreme thermal – physical stress affectingmultiple cellular activities. Recently, we found that HHP treatment caused variousphysiological changes in rice. To investigate the molecular mechanisms of plantresponse to HHP, we constructed forward and reverse subtracted cDNA libraries ofrice seeds treated with 75 MPa hydrostatic pressure for 12 h by suppressionsubtractive hybridization in combination with mirror orientation selection. Of 97clones isolated through microarray dot-blot and sequenced, 45 were unique genes.Among these 45 unique cDNAs, 29 clones showed significant sequence similarity toknown genes, 12 were homologous to genes with unknown function, and theremaining 4 clones did not match any known sequences. Most of the genes withknown function were involved in metabolism, defense response, transcriptionalregulation, transportation regulation, and signal transduction. To our knowledge,this is the first gene expression analysis of rice in response to HHP. The expressionprofiles of the genes identified in this study provide useful information regardingmolecular processes, including alteration of metabolism and adaptation responsecaused by HHP.

【题目】Sequence and expression analysis of histone deacetylases in rice
【中文关键词】组蛋白脱乙酰酶, RPD3/HDA1 家族,HD2家族,表达,水稻
【英文关键词】Histone deacetylase; RPD3/HDA1 family; SIR2 family; HD2 family; Expression; Rice
【中文摘要】组蛋白乙酰化水平由组蛋白乙酰基转移酶和组蛋白去乙酰化酶的活性决定的
【英文摘要】Histone acetylation levels are determined by the action of histone acetyltransferases and histone deacetylases (HDACs). Sequencesimilarity and profile searching tools were used to analyze the genome sequence of rice (Oryzae sativa) for genes encoding HDAC proteins.The rice RPD3/HDA1-family HDAC proteins can be divided into four classes based on sequence similarity and phylogenetic analysisof sequences obtained from the rice genome. The spatial expression pattern of rice HDACs genes indicated that some HDAC geneshave different expression profiles. Furthermore, our analysis indicated that expression of HDA705, HDT701, and HDT702 could beaffected by salicylic acid, jasmonic acid or abscisic acid. Expression of HDA714, SRT702, and SRT701 could be modulated by abioticstresses, such as cold, mannitol and salt. These results indicate that different HDAC genes have distinct expression patterns and membersof rice HDAC families may be involved in plant response to environmental stresses.

【英文摘要】Peptide transporters (PTRs) have diverse substrates and underlie many biological processes in plants. To better understand their function and regulation, we have analyzed the transport capabilities of eight rice PTRs (OsPTRs) in a yeast ptr2 mutant strain and their expression patterns in plants. A yeast ptr2 complementation assay demonstrated that only OsPTR6 transports Gly-His and Gly-His-Gly, and OsPTR6 shows substrate selectivity for di-/tripeptides; however, the other seven proteins could not transport the five tested di-/tripeptides. The expression patterns for the eight OsPTRs were distinct in tissues under normal growth conditions. In germinating seeds, seven of the eight OsPTRs were expressed at various levels, but OsPTR5 was not expressed. In grain-filling seeds, expression of OsPTR4, OsPTR7 and OsPTR8 increased from early to late stages of seed development and that of OsPTR2, OsPTR3 and OsPTR6 decreased. Expression of OsPTR1, OsPTR2, OsPTR5, OsPTR7 and OsPTR8 were upregulated by drought and salt, and OsPTR4 was downregulated. However, only OsPTR1 displayed a slight upregulation by cold. This study showed that rice OsPTRs have distinctive transport functions for substrates and differing expression patterns during both development and response to stress.

【题目】High-Throughput Construction of Intron-Containing Hairpin RNA Vectors for RNAi in Plants
【中文关键词】高通量,RNA干扰,发卡RNA
【英文关键词】High-Throughput, RNAi,hpRNA
【中文摘要】随着双链RNA干扰在植物基因功能分析中的广泛应用,急需一种高通量获得发卡RNA结构的系统。
【英文摘要】With the wide use of double-stranded RNA interference (RNAi) for the analysis of gene function in plants, a high-throughputsystem for making hairpin RNA (hpRNA) constructs is in great demand. Here, we describe a novel restriction-ligationapproach that provides a simple but efficient construction of intron-containing hpRNA (ihpRNA) vectors. The system takesadvantage of the type IIs restriction enzyme BsaI and our new plant RNAi vector pRNAi-GG based on the Golden Gate (GG)cloning. This method requires only a single PCR product of the gene of interest flanked with BsaI recognition sequence,which can then be cloned into pRNAi-GG at both sense and antisense orientations simultaneously to form ihpRNAconstruct. The process, completed in one tube with one restriction-ligation step, produced a recombinant ihpRNA with highefficiency and zero background. We demonstrate the utility of the ihpRNA constructs generated with pRNAi-GG vector forthe effective silencing of various individual endogenous and exogenous marker genes as well as two genes simultaneously.This method provides a novel and high-throughput platform for large-scale analysis of plant functional genomics.

【题目】Rapid one-step construction of hairpin RNA
【中文关键词】RNA干扰,发卡RNA,不对称PCR,植物,番木瓜环斑病毒,抗病毒素
【英文关键词】RNAi,hpRNA,OE-PCR,Asymmetric PCR,Plant,PRSV,Antivirus
【中文摘要】发卡RNA在基因功能探测和基因工程上应用广泛。
【英文摘要】Hairpin RNA (hpRNA) is commonly used for gene-function exploration and gene engineering. In thisstudy, a novel method was developed to construct intron-containing hairpin RNA (ihpRNA) rapidly andefficiently based on Overlap Extension PCR (OE-PCR). This method, Mixed One-step OE-PCR (MOOEPCR),can amplify two inverted repeats of DNA fragments and a spliceable intron in parallel, and thenassemble them to generate ihpRNA constructs in the same tube without the purification of intermediateproducts. This method required a PCR process of 38 – 40 cycles and ordinary PCR reagents. A total of 10ihpRNA constructs were amplified successfully using this method, with the stems ranging from 50 bpto 484 bp in length. Our results suggest that this novel method is a useful strategy for constructingihpRNA.

【题目】Research progresses on GH3s, one family of primary auxin-responsive genes
【中文关键词】GH3,生长激素,生长激素响应元件,生长激素响应因子,植物激素
【英文关键词】GH3 , Auxin ,Auxin response element (AuxRE) ,Auxin response factor (ARF) ,Phytohormone
【中文摘要】。生长激素在植物的生长和发育中具有重要的作用。
【英文摘要】Auxin plays a very important role in plantgrowth and development. Those genes that are specificallyinduced by auxin within minutes of exposure tothe hormone are referred to as early/primary auxinresponsivegenes, mainly including the auxin/indole-3-acetic acid (Aux/IAA), the small auxin-upRNA(SAUR),and the GH3 gene families. So far, GH3 genes havebeen identified in various plant species includingsoybean, Arabidopsis, rice, tobacco, pungent pepper,sweet orange, pine, and moss. Twenty members ofGH3 family were identified in Arabidopsis and thesegenes were classified into three groups (Group I – III)based on their sequence similarities and substratespecificities. GH3s belong to acyl adenylate-formingfirefly luciferase superfamily and can catalyze adenylationof specific substrates. Group I adenylatesjasmonic acid (JA), and Group II adenylates indole-3-acetic acid (IAA) and salicylic acid (SA), respectively.Because of the presence of Auxin-ResponsiveElements (AuxRE) in the GH3s ’ promoter regions,Auxin Response Factors (ARFs) are able to bind to theAuxRE and regulate expression of some GH3s, whichin turn modulate the auxin homeostasis. Identificationof GH3 mutants in Arabidopsis reveals the function ofGH3s in hypocotyl elongation under different lightconditions, root growth, stress adaptation, sensitivityto MeJA, or susceptibility to P. syringae. Takentogether, GH3s may be linkers among auxin, JA, SAand light signal transduction pathways.

【题目】水稻种子萌发期高压诱导的SSH-cDNA文库构建与分析
【中文关键词】高压;抑制差减杂交;水稻
【英文关键词】high hydrostatic pressure; suppression subtractive hybridization(SSH); rice
【中文摘要】为了研究高压处理对高等植物基因表达的影响,以萌发过程中经高压处理后的水稻种子的mRNA作为检测子(Tester),以对照样品的mRNA作为驱动子(Driver),采用抑制差减杂交(SSH)结合镜像选择技术(MOS)构建了高压处理后水稻种子萌发过程中诱导表达的差减eDNA文库,并通过蓝白斑筛选获得了580个重组克隆。菌液PCR检测结果表明,这些克隆中的插入片段的大小主要分布在2OO~1 000 bp之间,平均大小约为575 bp,其中单一扩增条带的有效重组克隆数为542个,有效的重组克隆率为93.3 。对部分重组克隆进行测序发现,受高压诱导表达的基因主要涉及到代谢、胁迫响应、转录调控等方面。为高压处理后水稻种子基因表达模式变化的研究打下了基础。
【英文摘要】In order to study the effect of expression pattern of high hydrostatic pressure on high plant,a SSH-cDNA library was constructed with rice germinating seeds in this paper.Suppression subtractive hybridization(SSH) in combination with mirror orientation selection(MOS) was performed using the mRNA from rice germinating seeds treated by 75 MPa high hydrostatic pressure as tester and the mRNA from control(seeds untreated by high hydrostatic pressure) as the driver.580 recombinant clones were picked through blue/white screening.PCR detection of the recombinant clones showed that the size of inserts mainly ranged from 200 bp to 1000 bp,and the average size of these inserts were about 575 bp.Among the 580 recombinant clones,542 clones(93.3%) were identified to be effective single band ones.After sequencing some of the recombinant clones,it was found that the genes induced by high hydrostatic pressure were mainly involved in metabolism,stress response and transcriptional regulation.The research paved the way for studying the gene expression patterns of rice seeds responding to high hydrostatic pressure.

【题目】水稻组蛋白脱乙酰化酶SIR2的功能注释分析
【中文关键词】组蛋白脱乙酰化酶; 生物信息学
【英文关键词】SIR2; RT-PCR; histone deacetylase; bioinformatics; SIR2 family; RT-PCR
【中文摘要】依赖于NAD^+的组蛋白脱乙酰化酶SIR2对酵母和哺乳动物细胞的存活、衰老、凋亡等生理活动的调节起着重要的作用。利用生物信息学方法对SIR2在水稻中的生物学功能进行研究。结果表明。SRT701和SRT702分别位于第4条和第12条染色体上;它们编码的蛋白均含有N-糖基化、蛋白激酶C磷酸化、酪蛋白激酶Ⅱ磷酸化和豆蔻酰化4个相同的位点;SRT701主要位于细胞核,而SRT702主要位于内质网,它们均有跨膜区,且为疏水性蛋白质,都无信号肽;多序列比对发现植物SIR2家族的SIR2结构域高度保守;电子表达谱分析发现SRT-101主要表达于叶片和花序,SRT702表达于整个植物中。利用RT-PCR方法进行检测的结果表明。SRT701在水稻根、茎、叶中均有表达,而SRT-102只在叶、茎中有表达,根中没有表达,说明利用生物信息学方法所得的结果只能作为初步预测。水稻SRT701和SRT702器官特异性的表达模式表明它们可能在组织或器官形成中起着重要作用。
【英文摘要】The silent information regulator protein (SIR2) and its homologs (collectively known as Sirtuins), NAD~+ -dependent deacetylase enzymes, play an important role in physiological regulation, such as the survival, aging and apoptosis of cell. In order to investigate the function of SIR2 in rice ,bioinformatics was used to analyze the SIR2 family. SRT701 and SRT702 were localized in the 4

and 12 chromosome of rice ,respectively,and their coding proteins all have the N-glycosylation site, protein kinase C phosphorylation site, the Casein kinase II phosphorylation site,and the N-myristoylation site. SRT701 localizes in the nuclear, whereas SRT702 localizes in the endoplasmic reticulum. Both SRT701 and SRT702 all have the transmembrane regions, and they are hydroproteins without signal peptide. Plant SIR2 family members were aligned by Clustal W and their domains are highly conserved. The analyses of the electronic expression profile of SRT701 and SRT702 indicated that SRT701 was expressed in the leaf and whereas the panicle SRT702 was expressed in the whole plant. In comparison, RT-PCR analysis indicated that SRT701 was expressed in the root,stem and leaf while SRT702 was expressed in the stem and leaf, but not in the root. Our analysis indicated the results predicted by the bioinformatics can be predicted but must be confirmed by the experiment methods. The organic expression profile of SRT701 and SRT702 suggest that they may play an important role in the growth and development of rice.

【题目】城市化过程中广州市农业生态系统服务价值的变化

【中文关键词】农业生态系统 生态服务价值 城市化 广州市

【英文关键词】agroecosystem; ecosystem service value; urbanization; Guangzhou City.

【中文摘要】根据1996、2000、2004和2008年广州市统计数据, 运用市场价值法、影子价格法、造林成本法、碳税法和工业制氧法等, 分别计算了广州市各农业生态系统的相关服务价值, 据此对城市化进程中广州市农业生态系统服务价值进行评估. 结果表明: 1996 2008 年, 尽管农田、草地、水体生态系统的生态服务价值有所增加, 但因林地生态系统服务价值减小较多(各年份林地生态系统在农业生态系统总服务价值中所占比例均在90% 以上) , 导致广州市农业生态系统服务价值呈减少的总趋势. 各类型生态功能的服务价值所占比例在年际间变化不大, 服务价值大小总体表现为: 气候调节> 气体调节> 产品服务> 废物处理> 土壤形成与保护> 生物多样性保护> 娱乐文化> 涵养水源, 且气候调节和气体调节的价值之和占总价值的91% 以上. 广州市城市化率与农业生态系统服务总价值间呈极显著的负相关关系(R = -0.905, P < 0.01) , 说明城市化率的提高将导致农业生态系统服务价值的降低. 在城市化发展过程中, 需要考虑保留适度的农业生态系统, 以此保证区域的可持续发展.

【英文摘要】Based on the 1996, 2000, 2004, and 2008 sta tistical data o f Guangzhou C ity, and by the methods ofmarket ing va luation, shadow price, afforestat ion cos,t carbon tax, and industria l oxygen producing, this paper calcu lated the re lated serv ice values of various agroecosystem s in Guangzhou, and assessed the changes of agroecosystem service value during the rapid urbanization of the City. In 1996- 2008, though the serv ice va lues of farm land, grassland, and w ater ecosystems had somew hat increase, the overa ll agroecosystem serv ice value o fGuangzhou decreased, m ain ly due to the more decrease of forest ecosystem serv ice value wh ich occupiedmore than 90% o f the to ta l service value each year. O ver the studied period, the proport ion o f each indiv idual functional service value to the to ta l service value changed little, and the contribution o f each ind ividual functional servicea luew as in the order of c lim ate regu lation > gases regu lation > product serv ice > waste treatment > soil conservation > biodiversity conservation > recreat ion and culture > water sourceretent ion and storage. The sum of climate regulation and gases regulat ion service va lues took over 91% of the total agroecosystem service value. There was a significan tnegative corre lation (R =- 0.905, P < 0.01) betw een urban iza tion rate and total ag roecosystem serv ice value, suggesting that the increase of urbanization ratewould lead to a decrease of ag roecosystem service value. Therefore,it requires an appropriate reservation of various agroecosystems to ma intain the regional susta inable development during urban ization.

【题目】模拟酸雨对赤红壤磷素及Ca2+、Al3+、Fe2+淋失的特征影响

【中文关键词】酸雨; 赤红壤; 磷素; Ca2+ ; Al3+ ; Fe2+
【英文关键词】acid rain; lateritic red soils; phosphorus; Ca2+ ; Al3+ ; Fe2+
【中文摘要】本研究通过室内土柱试验,研究了不同强度和持续时间的模拟酸雨淋溶下赤红壤磷素淋失量及部分阳离子(Ca2+、Al3+、Fe2+) 的释放程度和特征。结果表明,经pH 2.0、pH 3.0、pH 4.0、pH 5.0 模拟酸雨持续淋溶34 d后,淋溶液pH 值变化并不明显(P > 0. 05) ,而对Ca2 +、Fe2 + 的溶出有显著的促进作用,Ca2+、Al3+、Fe2+ 溶出量均随pH 值的降低而升高,Al3+ 和Fe2+ 淋失量在pH 2.0 时均有骤增现象。随淋溶时间的增加,土壤可溶态磷的淋失量表现为先增加后逐渐降低;随着pH 值的降低,土壤磷淋失总量也表现为先增加后降低,pH >4.0 的酸雨有助于促进土壤磷的释放,pH < 4.0 时土壤磷的淋失减少。相关分析发现淋溶液中磷淋失总量与Al3+ 和Fe2+ 溶出量均呈显著负相关(r1 =-0.6531,r2 =- 0.5107) ,和Ca2+ 总溶出量相关关系不显著(r3 = - 0. 1287) ,表明高强度酸雨降低了土壤磷淋失量,这可能与酸雨导致活性铁、铝的大量释放,增加了磷的活性吸附点位,因而增加了对磷酸根离子配位吸附与固定有关。
【英文摘要】A soil column method was applied to study influences of simulated acid rain (SAR) on leaching characteristics of dissolved phosphorus(DP) ,Ca2+ ,Al3+ and Fe2+ in lateritic red soils in south China. The results revealed that compared to the control,the change of leaching pH was not so obvious (P > 0. 05) ,but large amounts of leaching losses of Ca2+ ,Al3+ and Fe2+ were caused by SAR,and the amounts of Ca2+ ,Al3+ and Fe2+ were all increased with the decrease of SAR pH. The amounts of Al3+ and Fe2+ were increased dramatically when the pH of SAR is 2.0. While as the time elapsed,the amount of leaching phosphorus was increased at first and then decreased slowly,and the total amount of leaching phosphorus also had the same trend when the pH of SAR was decreased. The amount of water soluble P leaching was increased when pH was larger than 4. 0 and was decreasedwhen pH was less than 4. 0. The results of correlation analysis showed that the amounts of Al3+ and Fe2+ had dramatically negative correlation with the leaching phosphorus(r1 =-0.6531,r2 = - 0. 5107) . The more the acid rain released active iron and aluminum,the more active phosphorus adsorption and fixation of soils.

【中文关键词】紫花苜蓿; 刈割时期; 干草调制; 晾晒时间
【英文关键词】alfalfa; mow ingper iod; hay m odulation; drying time
【中文摘要】对不同刈割时期的紫花苜蓿干草品质的研究表明: 盛花期刈割的苜蓿干燥速度快于初花期和结荚期, 晾晒28h以上即可成功调制优质干草, 初花期和结荚期刈割的苜蓿成功调制干草需要晾晒32 h; 调制干草的适宜含水量是20%左右; 初花期苜蓿叶的蛋白质含量是茎的2. 41~ 2. 95倍, 苜蓿干草的叶量是决定苜蓿品质的主要因素; 不同刈割时期调制的苜蓿干草茎叶比差异较大, 结荚期明显高于盛花期和初花期, 是初花期的5~ 7倍。在初花期刈割, 调制干草中茎叶比变化较小, 叶损失少, 可获得高质量的干草。
【英文摘要】The quality of alfa lfa hay from d ifferen tm ow ing per iod w as stud ied. The results show that the dry ing speed of alfalfa m ow ed during full flowe ring stag e is faster than tha t m owed during in itia l flow ering stag e and pod　filling stage. For haym odu lation, it takes 28 h to dry a fterm ow ing during full flow ering stag e, but 32 h to dry after mowingdu ring initial flow ering stage or pod　filling stage. The proper water content of hay is 20%. The protein content of alfalfa leaves in in itia l flow ering stage is 1. 38~ 1. 95 tim es h igher than that o f stem, so leavesw e ight in alfalfa hay is a key factor to hay qua lity. Stem / lea f ratio o f the haym ow ed during different stag e showed b ig differences. Stem / leaf ratio of the haym owed during pod　filling stage is significantly higher than that m ow ed du ring full flow ering stage and about 5~ 7 tim es higher than that mow ed during in itia l flow er ing stage. The a lfalfa mow ed during initia l flow er ing stage with little change in stem / leaf ratio and leaves w eight is suitable fo r ga in ing high quality hay m odulation.

【题目】中国南亚热带森林不同演替阶段土壤呼吸的分离量化
【中文关键词】自养呼吸, 森林演替, 异养呼吸, 南亚热带森林, Q10
【英文关键词】autotrophic respiration, forest succession, heterotrophic respiration, lower subtropical forest, Q10
【中文摘要】量化森林土壤呼吸(RS)及其组分对准确地评估森林土壤碳吸存极其重要。该文以鼎湖山南亚热带季风常绿阔叶林及其演替系列针阔叶混交林和马尾松(Pinus massoniana)林为研究对象, 采用挖壕沟法结合静态气室CO2测定法对这3种林分类型的RS进行分离量化。结果表明: 鼎湖山3种森林演替系列上的森林RS及其组分(自养呼吸RA、异养呼吸RH)均呈现出明显的季节动态, 表现为夏季最高、冬季最低的格局。在呼吸总量上, 季风常绿阔叶林显著高于针阔叶混交林和马尾松林, 但混交林与马尾松林之间差异不显著; RA除季风常绿阔叶林显著大于针阔叶混交林外, 其余林分之间差异不显著; 对于RH来说, 3个林分之间均无显著差异。随着森林正向演替的进行, 由马尾松林至针阔叶混交林至季风常绿阔叶林, RA对土壤总呼吸的年平均贡献率分别为(39.48 ± 15.49)%、(33.29 ± 17.19)%和(44.52 ± 10.67)%, 3个林分之间差异不显著。方差分析结果表明, 土壤温度是影响RS及其组分的主要环境因子, 温度与RS及其组分呈显著的指数关系; 土壤含水量对RS的影响不显著, 甚至表现为轻微的抑制现象, 但未达到显著性水平。对温度敏感性指标Q10值的分析表明, 3个林分均为RA的温度敏感性最大, RH的温度敏感性最小。
【英文摘要】Quantifying forest soil respiration (RS) components is vital to accurately evaluate carbon sequestration of forest ecosystems. Our objectives were to determine (1) seasonal variations in RS and its components of autotrophic (RA) and heterotropic respiration (RH) in subtropical forests, (2) the relative contributions of RA and RH to RS in the three subtropical forests and (3) relationships between RS and temperature and water content.Methods We used the trenching-plot and infrared gas exchange analyzer approaches to determine RA and RH in the soil surface CO2 flux for monsoon evergreen broad-leaved forest (MEBF) and its early succession communities,coniferous and broad-leaved mixed forest (MF) and coniferous masson pine forest (MPF) in southern China.Rate of RS was measured twice a month in the hot, humid season (April-September) and once a month in the cool,dry season (October-March). Soil temperature and soil water content were measured at the same time.Important findings RS, RA and RH varied markedly during the year with high rates in the hot, humid season and low rates in the cool, dry season. RS rate measured in the trenched plots (RH) at these forests showed an increasing trend with succession, but the change was not statistically significant. RS and RA followed a similar seasonal trend and were highest in MEBF and lowest in MF. Contribution of RA to RS was (39.48±15.49)%, (33.29±17.19)% and (44.52±10.67)% in MPF, MF and MEBF, respectively. Repeated measurement ANOVA indicated that soil temperature was the main factor that affected RS and its components, and there was a significant exponential relationshipbetween them. While there was no significant relationship between soil water content and soil respirationflux, there appears to be a mild inhibition phenomenon. Soil Q10 values increased with succession, whereas autotrophic respiration (RA) is more sensitive to temperature in all stands.

【题目】不同紫花苜蓿品种可溶性糖、全氮、丙二醛含量动态变化及其抗寒性关系研究
【中文关键词】紫花苜蓿; 抗寒性; 聚类分析
【英文关键词】alfalfa; cold resistance; cluster analysis
【中文摘要】以国内外6个紫花苜蓿品种为试验材料, 研究了不同时间、不同品种根部可溶性糖含量、全氮含量及丙二醛含量的动态变化, 以了解它们与苜蓿抗寒性的关系, 并对这些指标进行了变异分析和聚类分析。结果表明, 苜蓿根内的可溶性糖含量从9月中旬开始升高, 11月中旬达到最高峰, 之后开始逐渐下降, 一直延续到次年5月中旬, 说明可溶性糖是一种低温保护物质, 能够提高苜蓿对低温胁迫的适应。各苜蓿品种根部全氮含量从9月到3月均保持在较高水平, 4月份有一个明

显的增高,而5月份显著下降,可见全氮含量不仅关系到苜蓿对低温的抵御能力,而且直接关系到苜蓿翌年春季的再生与返青。不同苜蓿品种根部丙二醛含量在9月份时较高,而后逐渐下降,到1月份出现最低值,1月份以后又表现出逐渐升高的趋势。另外,对各紫花苜蓿品种抗寒性研究表明,草原二号、龙牧803和润布勒苜蓿为高抗寒品种;准格尔苜蓿和德宝为中等抗寒品种;Euv er苜蓿为低抗寒品种。

【英文摘要】S ix different alfalfa var ieties at hom e and abro ad w ere acted as m ater ia ls. The dynam ic changes of solub lesugar, total nitrogen and m a londialdehyde was studied, so as to find out the ir re lationsh ips w ith co ld resistance, andthen variation ana lysis and cluster ana ly sis were perform ed . The resu lts indicated that the solub le sugar contentincreased from the m idd le o f Septem be r and reached the peak in the m idd le of Novem ber, then descended g radua llytill the m idd le o fM ay. It show ed that so lub le sug ar was a k ind of cryopro tectants, and cou ld im prove alfa lfa s coldres istance. The content o f tota l nitrogen in alfa lfa roo t w as ho lding a h igh leve l during Septem be r andM a rch, andincreased ev idently in Apri,l but decreased inM ay. Itw as obv ious tha t tota l n itrogen was not only related to a lfalfa sres istance, but a lso re lated to alfa lfa s regrow ing and reg reening in the nex t year. The content o fm alondia ldehyde was high in Septem be r, then dec reased g radua lly and reached them in imum in January, thereafter the content of malond ildehyde represented increasing trend.

【题目】Responses of Soil CO2 Efflux to Precipitation Pulsesin Two Subtropical Forests in Southern China
【中文关键词】无
【英文关键词】Climate change, Soil CO2 efflux,Subtropical forest , Precipitation pulse
【中文摘要】无
【英文摘要】This study was designed to examine the responses of soil CO2 efflux to precipitation pulses ofvarying intensities using precipitation simulations in two subtropical forests [i.e., mixed and broadleaf forests (MF and BF)] in southern China. The artificial precipitation event was achieved by spraying a known amount of water evenly in a plot (50 9 50 cm2) over a 30 min period, with intensities ranging from 10, 20, 50 and 100 mm within the 30 min. The various intensities were simulated in both dry season (in December 2007) and wet (in May 2008) season.We characterized the dynamic patterns of soil CO2 efflux rate and environmental factors over the 5 h experimental period. Results showed that both soil moisture and soil CO2 efflux rate increased to peak values for most of the simulated precipitation treatments, and gradually returned to the pre-irrigation levels after irrigation in two forests. The maximum peak of soil CO2 efflux rate occurred at the 10 mm precipitation event in the dry season in BF and wasabout 3.5 times that of the pre-irrigation value. The change in cumulative soil CO2 efflux following precipitation pulses ranged from -0.68 to 1.72 g CO2 m-2 over 5 h comparedto the pre-irrigation levels and was generally larger in the dry season than in the wet season. The positive responses of soil CO2 efflux to precipitation pulses declined with the increases in precipitation intensity, and surprisingly turned to negative when precipitation intensity reached 50 and 100 mm in the wet season. These findings indicated that soil CO2 efflux could be changed via pulselike fluxes in subtropical forests in southern China as fewerbut extreme precipitation events occur in the future.

【题目】Impacts of understory species removal and/or addition on soil respiration in amixed forest plantation with native species in southern China
【中文关键词】无
【英文关键词】Understory management Trenching Root respiration Q10
【中文摘要】无
【英文摘要】Although the removal or addition of understory vegetation has been an important forest management practice in forest plantations, the effects of this management practice on soil respiration are unclear.The overall objective of this study was to measure and model soil respiration and its components in a mixed forest plantation with native species in south China and to assess the effects of understory species management on soil respiration and on the contribution of root respiration (Rr) to total soil respiration (Rs). An experiment was conducted in a plantation containing a mixture of 30 native tree species and in which understory plants had been

removed or replaced by Cassia alata Linn. The four treatments were the control (Control), C. alata addition (CA), understory removal (UR) and understoryremoval with C. alata addition (UR + CA). Trenched subplots were used to quantify Rr by comparing Rs outside the 1-m2 trenched subplots (plants and roots present) and inside the trenched subplots (plants and roots absent) in each treatment. Annual soil respiration were modeled using the values measured for Rs, soil temperature and soil moisture. Our results indicate that understory removal reduced Rs rate and soil moisture but increased soil temperature. Regression models revealed that soil temperature was the main factor and soil moisture was secondary. Understory manipulations and trenching increased the temperature sensitivity of Rs. Annual Rs for the Control, CA, UR and UR+ CA treatments averaged 594,718, 557 and 608gCm − 2 yr − 1, respectively. UR decreased annual Rs by 6%, but CA increased Rs by about 21%. Our results also indicate that management of understory species increased the contribution of Rr to Rs.

【题目】水稻组蛋白乙酰转移酶基因的功能研究
【中文关键词】水稻;组蛋白乙酰转移酶;进化树;基因表达;RNA 干扰
【英文关键词】Rice, Histone acetyltransferase, Phylogenetic tree, Gene expression, RNA interference
【中文摘要】组蛋白乙酰转移酶(HATs)在真核生物的基因转录调控和响应外界刺激的过程中起着重要作用。水稻中的OsHATs 包含8 个成员,分属于以下四个蛋白家族: CBP 家族(OsHAC701 、OsHAC703 和OsHAC704)、TAFII250 家族(OsHAF701)、GNAT 家族(OsHAG702、OsHAG703 和OsHAG704)以及MYST家族(OsHAM701)。目前,针对OsHATs 的功

能研究还未见报道。本研究通过生物信息学、表达分析、转基因等方法研究了OsHATs的进化关系、结构、表达及可能的生物学功能,获得了以下结果:1. 对HATs的蛋白序列比对、保守结构域分析及蛋白三维结构预测的结果显示,OsHATs与拟南芥及玉米中的HATs有较高的相似性,推测这些蛋白可能有类似的生物学功能。进化树和保守结构域分析表明,单子叶和双子叶植物的CBP家族蛋白均可以被进一步划分成两个组,组间的蛋白存在着锌指结构域种类和数量上的差异。运用5种亚细胞定位预测工具分析HATs在水稻、拟南芥和玉米中亚细胞定位情况,结果显示水稻中部分OsHATs(OsHAC701、OsHAC703、OsHAF701、OsHAG703和OsHAG704)可能同时存在于细胞核和细胞质中,推测这些蛋白可能在细胞核和细胞质之间穿梭。运用Genevestigator软件分析水稻基因芯片中OsHATs表达情况,结果显示OsHATs的表达可被多种激素和胁迫条件所调节。2. 运用实时定量PCR对OsHATs的表达分析发现,8个OsHATs在水稻多种组织中均有表达,但在不同组织中的表达量有差别。进一步的表达分析发现OsHATs的表达能被水杨酸、脱落酸、盐、冷和热胁迫所调节。外源ABA处理会导致OsHAC701、OsHAC703、OsHAG702、OsHAG703和OsHAM701的表达上调,SA处理会导致OsHAC703和OsHAC704的表达下调,盐胁迫会导致OsHAC701、OsHAC703、OsHAC704、OsHAG703和OsHAM701的表达上调,冷胁迫处理会导致除OsHAG704之外的其它7个OsHATs的表达下调,而热胁迫处理会导致OsHAC701、OsHAG702和OsHAM701的表达上调,OsHAC704和OsHAG704的表达量下调,说明OsHATs可能参与水稻的激素信号转导及对非生物胁迫的响应过程。3. Western blot分析发现,水稻不同组织中组蛋白H3总的乙酰化水平不同,而水稻组蛋白乙酰转移酶基因的功能研究IVH3K9位点的乙酰化水平与之有相同趋势。此外,盐胁迫会导致水稻幼叶中组蛋白H3K18位点乙酰化水平的升高和H4K12位点乙酰化水平的降低。4. 构建了OsHAG702和OsHAG704的超表达载体,OsHAG702、OsHAG704、OsHAC701和OsHAC703的RNA干扰载体。对OsHAC703的RNA干扰株系进行分析,发现其在长日照条件下存在维持营养生长状态而不进入生殖生长阶段的表型,并且该转基因植株的GUS(β-glucuronidase)阳性率显著低于其它重组质粒转基因植株的阳性率。Western blot和实时定量PCR分析表明,在长日照条件下,干扰株系中组蛋白H3总的乙酰化水平和H3K23位点的乙酰化水平显著降低,OsHAC703的表达被干扰,另外7个OsHATs的表达未受影响,开花促进因子OsMADS50的表达量下调,而开花抑制因子OsSE5的表达量上调。上述研究结果表明,OsHATs在水稻生长发育和响应环境胁迫过程中发挥着重要的作用。

【英文摘要】Histone acetyltransferases (HATs) play important roles in eukaryotictranscription and plant defence responses. Eight HATs identified in rice (OsHATs)could be generally organized into four families, namely the CBP family (OsHAC701,OsHAC703 and OsHAC704), TAFII250 family (OsHAF701), GNAT family(OsHAG702, OsHAG703 and OsHAG704) and MYST family (OsHAM701). To date,the biological functions of OsHATs have not been addressed. In this study, systematicbioinformatics analyses, expression analyses and rice transformation were conductedto investigate the evolutionary relationships, domain architectures, expression patternsand potential functions of OsHATs. And the results are as follows.1. The high similarities of protein sequences, conserved domains andthree-dimensional models among OsHATs and their homologues in Arabidopsisthaliana and maize suggested they may share the similar biological functions.Based on phylogenetic and domain analysis, both monocotyledonous anddicotyledonous CBP family proteins are divided into two distinct groups. And theCBP family proteins from different groups differ in the type and number of thezinc fingers. Five subcellular localization prediction programs were used to detectthe possible localization sites of HATs from rice, Arabidopsis thaliana and maize.The results showed that some OsHATs (OsHAC701, OsHAC703, OsHAF701,OsHAG703 and OsHAG704) might be localized at both nucleus and cytosol,suggesting that these proteins might undergo nucleocytoplasmic transport.Assessing gene expression patterns via Genevestigator indicated that theexpression of OsHATs could be modulated by hormones and abiotic factors.2. Real-time quantitative PCR (RT-qPCR) was performed to examine the expressionof OsHATs in different rice tissues. The results showed that eight OsHATs wereexpressed in all tissues examined but with significant differences in the transcriptabundance. Further RT-qPCR analysis demonstrated that the expressions of水稻组蛋白乙酰转移酶基因的功能研究VIOsHATs were modulated by abscisic acid and salicylic acid as well as salt, coldand heat stresses. For example, the expression levels of OsHAC701, OsHAC703,OsHAG702, OsHAG703 and OsHAM701 were significantly elevated in responseto exogenous abscisic acid; the expression levels of OsHAC703 and OsHAC704were reduced in response to salicylic acid; the expression levels of OsHAC701,OsHAC703, OsHAC704, OsHAG703 and OsHAM701 were increased in responseto salt stress; the expressions of OsHATs were decreased after cold treatmentexcept for OsHAG704; the expression levels of OsHAC701, OsHAG702 andOsHAM701 were induced in response to heat treatment. Conversely, theexpression of OsHAC704 and OsHAG704 decreased. Taken together, theseproteins may play an important role for rice hormone signal transduction andresponse to abiotic stress conditions.3. Western blot analysis showed that the histone H3 acetylation levels differed withindifferent tissues, and the same trend was found in acetylated histone H3K9. Inaddition, Western-blot analysis showed that histone H3K18 acetylation wasincreased after salt treatment, while histone H4K12 acetylation was suppressed.4. The constructs for overexpression studies (OsHAG702 and OsHAG704) and theconstructs for RNA interference studies (OsHAG702, OsHAG704, OsHAC701 andOsHAC703) were made. Compared to that of control plants, the notable phenotypeof OsHAC703RNAi transgenic lines under long day conditions is that transgeniclines remained at the vegetative growth phase and could not transit to thereproductive phase. And the GUS (β-glucuronidase)-positive rate ofOsHAC703RNAi

transgenic plants was strikingly lower than those of transgenicplants with other recombinant vectors. Furthermore, Western blot analysis showeda decrease of acetylation of histone H3 and histone H3K23 in OsHAC703RNAiplants, as compared to the control plants. RT-qPCR analysis indicated that inOsHAC703RNAi plants, the expression of OsHAC703 was repressed, while theexpressions of other OsHATs were unchanged. And the expression level of a floralactivator OsMADS50 was decreased, while that of a floral repressor OsSE5 wasincreased.Taken together, OsHATs may play important roles in rice growth anddevelopment as well as response to environmental stresses.

【中文关键词】水稻;组蛋白脱乙酰化酶;启动子;亚细胞定位;基因芯片
【英文关键词】Rice, Histone deacetylase, Promoter, Subcellular localization, Gene chip
【中文摘要】组蛋白乙酰化/去乙酰化是表观遗传学的一个重要组成部分,对基因的转录调控起着重要作用,这个过程是由组蛋白乙酰转移酶和组蛋白脱乙酰化酶共同决定的。水稻中组蛋白脱乙酰化酶家族共有18个成员。为了研究这些基因的功能,我们做了以下的工作:1. 成功构建了组蛋白脱乙酰化酶基因OsHDA704、OsHDA705、OsHDA702、OsHDA712、OsHDT701以及OsHDT702启动子与GUS融合表达载体、OsHDA704、OsHDA705、OsHDT701以及OsHDT702与GFP融合表达载体、OsHDA705、OsHDA712及OsSRT702超表达及RNAi载体,并将其转化水稻和烟草,获得相应的转基因植株。2. 构建OsHDA704和OsHDA705酵母双杂交的诱饵载体,发现这两个基因的全长cDNA不具有自激活能力以及其蛋白产物对酵母菌无毒害性;同时构建了水稻幼苗的cDNA文库。3. 亚细胞定位结果表明OsHDT701、OsHDT702编码的蛋白质定位于细胞核中。4. 通过生物信息学、RT-PCR及对转基因Promotor: GUS植株的GUS染色分析,发现OsHDT701基因在水稻的根、茎、叶、穗中均有表达,但在生殖期的根中的表达量低一些。半薄切片结果显示,GUS的表达主要集中在维管束附近;对Promotor: GUS植株进行胁迫处理发现,冷胁迫、黑暗处理以及干旱处理后GUS蛋白相对活性下降,高温处理后GUS蛋白相对活性上升。OsHDA705基因在水稻的根、茎、叶、穗中均有表达,但在成熟期的根中几乎不表达。5. 对OsHDT701超表达和RNAi植株的表型性状进行了初步的分析。基因芯片结果显示,OsHDT701基因超表达后对水稻的多个营养物质代谢有关的基因的表达有很大影响;另外,对T2代转基因植株的游离脯氨酸含量、可溶性糖含量以及种子千粒重进行了分析,结果表明,OsHDT701基因超表达后可溶性糖的含量比对照低,但另外两个指标与对照相比差别不大。综上所述,水稻组蛋白脱乙酰化酶基因在水稻生长发育过程中起着重要作用。

【英文摘要】Histone acetylation/deacetylation is an important component of Epigenetics and plays a key role in regulation of gene expression. This process is determined by histone acetyltransferases and histone deacetylases (HDACs). There are 18 members of histone deacetylase family in rice. We conducted the following work in order to analyze their functions:1. The plant expression vectors OsHDA704, OsHDA705, OsHDT701 and OsHDT702: GFP; OsHDA704, OsHDA705, OsHDA702, OsHDA712, OsHDT701 and OsHDT702 Promoter: GUS; OsHDA705, OsHDA712, OsSRT702 overexpression and RNAi vectors were constructed and transformated into rice and tobacco successfully.2. The bait vectors construction of OsHDA704 and OsHDA705 for yeast two-hybrid. We proved that the proteins of these two genes have no self-activation in yeast and no toxicity to yeast. Also we constructed cDNA library of rice seedlings.3. The results of subcellular localization showed that the proteins of OsHDT701 gene and OsHDT702 were in nucleus.4. OsHDT701 gene was expressed in root, stem, leaves and spike by bioinformatics, RT-PCR and transplants of promoter: GUS. In the mature plant the gene expression was lower in root than other organs. The result of semi-thin section showed that GUS staining mainly stayed near the vascular bundle, which may told us that the OsHDT701 gene take part in matters transport. Cold, dark and drought stresses made the GUS protein activity in transplants lower than wild type, while high-temperature treatment increased its activity. OsHDA705 gene was also expressed in root, stem, leaves and spike, but in mature root nearly had no expression. 5. Phenotypic characters analysis of overexpression and RNAi plants of osHDT701 gene. The gene chip results revealed that overexpression of osHDT701 gene affects many genes of matter metabolism. The content of free proline and thousand seeds weight of transgenic T2 single plants were no differences in overexpression, RNAi and control. The content of souble sugar lower in overexpression plant than wild type.In conclusion, histone deacetylseas may play important roles in rice growth and development.

【题目】添加玉米粉对甜菜渣青贮品质的影响
【中文关键词】甜菜渣;玉米面;青贮品质
【英文关键词】sugarbeet pulp;corn meal;silage quality
【中文摘要】以甜菜渣为青贮原料,研究玉米粉及其不同添加量(20、40、60、80、100 kg/t)对甜菜渣青贮品质的影响,以期为生产实践提供科学依据。结果表明:添加玉米粉后,甜菜渣青贮料的pH 值、粗蛋白质(CP)含量显著低于对照组(P < 0.05),干物质含量显著增加(P < 0.05)。添加100 kg/t 的玉米粉可显著降低氨态氮的含量(P < 0.05),且可溶性碳水化合物(WSC)含量为对照组的6 倍。各处理组的乳酸和乙酸含量均显著高于对照组(P < 0.05),丙酸和丁酸含量均显著低于对照组(P < 0.05)。
【英文摘要】The effects of maize meal (20,40,60,80,100 kg/t) concentration on the silage quality of sugarbeet pulp were studied.The results showed that maize meal treatments decreased the pH value and crude protein (CP) content of the sugarbeet pulp silage significantly (P < 0.05),but the dry matter (DM) content of the trentments was higher than that ofthe control (P < 0.05).Ammonia-N content of the 100 kg/t maize meal supplementation was significantly decreased (P <0.05) and water-soluble carbohydrate (WSC) content was 6 times more than that of the control (P < 0.05).Compared to the control,the content of lactic acid and acetic acid in all the treatments increased and the content of propionic acid and butyric acid were decreased(P < 0.05).

【题目】Subtropical plantationsarelargecarbonsinks:Evidencefromtwo
【中文关键词】无
【英文关键词】Net ecosystemproductivity(NEP) Soil CO2 flux Plantation Trenching Tree girdling
【中文摘要】无
【英文摘要】Quantifying the net carbon(C)storage of forest plantations is required to assess their potential to offset fossil fuel emissions.In this study,a biometric approach was used to estimate net ecosystem productiv-ity (NEP)for two monoculture plantations in South China: Acacia crassicarpa and Eucalyptus urophylla.This approac hwas based ons tand-level net primary productivity(NPP,based on direct biometric inventory) and heterotrophic respiration(Rh). In comparisonso f Rh determination based on trenching vs.treegirdling, both trenching and treegirdling changed soil temperature and soil moisture relative to undisturbed control plots,and we assess the effects of corrections for disturbances of soil moisture and soil moisture on the estimation of soil CO2 efflux partitioning.Soil microbial biomass and dissolved organiccarbon were significantly lower in trenched plots than in tree girdled plots for both plantations.Annual soil CO2 flux in trenched plots(Rh-t) was significantly lower than intree-girdled plots(Rh-g) in both plan-tations. The estimatesof Rh-t and Rh-g, expressed as a percentage of total soil respiration,were 58±4% and 74±6%, respectively,for A. crassicarpa, and 64±3% and 7 8±5%, respectively,for E. urophylla. By the end of experiment,the differencein soil CO2 efflux between the trenched plots and tree-girdled plotshad become small for both plantations.Annual Rh (mean oftheannual Rh-t and Rh-g) andnetprimaryproduction (NPP) were 470±25 and 800±118gCm − 2 yr − 1, respectively,for A. crassicarpa, and 420±35 and 2380±187gCm − 2 yr − 2, respectively,for E. urophylla. The two plantations in the developmentalstage were large carbon sinks:NE Pwas 330±76Cm − 2 yr − 1 for A. crassicarpa and 1960±178gCm − 2 yr − 1 for E. urophylla.

【题目】Effects of vegetation removal on soil properties and decomposer organisms
【中文关键词】无
【英文关键词】Nematode Microarthropod Plantation PLFA Understory
【中文摘要】无
【英文摘要】The removal of understory vegetation has been a common forest management practice, especially in plantations, but the effects of understory removal on soil physico-chemical properties and decomposer organisms is poorly known. In the present study, the effects of understory vegetation removal andremoval of all-plants (i.e. removal of understory vegetation and trees) on soil properties and soil biota were measured in a plantation of mixed native tree species in southern China. During the wet season,understory vegetation removal did not cause significant changes on soil microbial community and major soil faunal groups except for a marked reduction in the density of herbivorous nematodes. However, allplantsremoval significantly decreased the fungal biomass, the fungal:bacterial ratio, the density ofherbivorous nematodes, the structure of the nematode community, and the density of mites, collembola and total microarthropods. In the dry season, understory vegetation removal resulted in a marked reduction in the density of total and herbivorous nematodes. The effects of plant removal on soil biota were similar to that in dry season. For both seasons, understory removal had no significant effects on soil physico-chemical properties (soil water content, pH, total nitrogen and soil organic carbon) but removal of all-plants significantly decreased soil pH. In general, the effects of understory vegetation removal on soil biota and other soil properties were much less severe than those of all-plants removal. The soil biotadid not show significant response to understory removal, suggesting that this part of the vegetation maynot be a major governing factor on such biota.

【题目】Effect of understory fern (Dicranopteris dichotoma) removal on substrate utilization patterns of culturable soil bacterial communities in subtropical Eucalyptus plantations
【中文关键词】无
【英文关键词】Eucalyptus
Litter decomposition rate
Substrate utilization pattern
Understory fern removal
【中文摘要】无
【英文摘要】Although understory vegetation is known to play an important role in driving the processes and functions of forest ecosystems, little is known about how understory vegetation affects the composition and function of soil microbial communities in forest ecosystems, especially in subtropical and tropical forests.This study used the experimental removal of understory fern (Dicranopteris dichotoma) to investigate the effect of the fern on substrate utilization patterns of culturable soil bacterial communities in two subtropical Eucalyptus plantations. One year after treatment, the removal of understory fern significantly increased soil temperature by 2 – 3 ◦ C and retarded litter decomposition by 5.6 – 23.1%. However, understory fern removal did not affect the substrate utilization pattern of soil bacterial communities. Our studyprovides evidence that, although understory fern removal significantly alters soil temperature and litter decomposition rate, the disturbance caused by understory removal one year after treatment is too weak to cause detectable changes in substrate utilization pattern of culturable soil bacterial communities in subtropical Eucalyptus plantations.

【题目】First report of Corynespora cassiicola causing leaf spot of cassava in china
【中文关键词】木薯;叶斑病;多主棒孢;中国;首次报道
【英文关键词】cassava; leaf spot disease;corynespora cassiicola; china; first report
【中文摘要】2009年在中国广西武鸣、广东云浮和海南白沙首次发现由多主棒孢引起的木薯叶斑病。
【英文摘要】Cassava (Manihot esculenta) is a kind of important food crop in the tropical area of China. During the survey in Guangxi and Hainan on July and September of 2009, leaf spots were observed on three cassava plantations, located separately in Wuming(Guangxi Province), Yunfu(Guangxi Province) and Baisha(Hainan Province). Circular or irregular shaped black spots were appeared on the leaves of more than third of the plants, which severely reduced the bloom. Each spot has a dark-brown papery centre surrounded by a pitchy ring. A chlorotic halo surrounded the ring. Usually, the main vein or small veinlets adjacent to the spots become dark colored and giving rise to ‘ fishbone ’ appearances sometimes. ‘ railway-track ’ spots of the infected leaves were not observed during the survey. The mild defoliation phenomena were found on Wuming. Three isolates of C. cassiicola were isolated from symptomatic leaves came from three locations separately and named CCCGX01, CCCGX02 and CCCHN01. Single-spore cultures of these isolates were incubated with a 12/12 h light/dark cycle,at a temperature of 28±1°C, on potato dextrose agar (PDA) for 7 days. A

few of conidia sporulated on the surface of PDA plate. Conidia and conidiophores were collected and microscopically examined. The morphological characteristics of the specimen and of their conidia were similar to the descriptions for C. cassiicola by Ellis and Holliday (1). The isolate CCCGX01 was selected as a representative for molecular identification. Genomic DNA was extracted with the CTAB protocol (2) from mycelia of this strain and used as a template for amplification of the internal transcribed spacer (ITS) region of rDNA using primer pair ITS1/ITS4. The sequence (GenBank Accession No. GU138988) exactly matched several sequences of C. cassiicola (e.g., GenBank Accession No. FJ852715, EF198117 and AY238606) (3). The pathogenicity of three isolates on the host from which it was isolated was established by following Koch's postulates. Young, healthy and fully expanded green leaves of Cassava clone SC205 were taken from annuals cassava plants and surface sterilized. Ten cassava leaves were inoculated with 10 μL drops of the conidial suspension of 104 conidia/mL and five leaves were inoculated with same volume of sterile water served as controls. Underlay with sterile filter paper, the leaves were put upside up in individual moist boxes. The boxes with leaves were placed in the dark for 36 hours before being transferred to the light for 5 days. All inoculated leaves with isolates showed symptoms similar to those observed in natural conditions, whereas the controls remained symptom free. The shape and size of conidia that formed on the diseased parts were identical with the isolates. This species has been previously reported on Hevea rubber (Hevea brasiliensis) in China (4). To our knowledge, this is the first report of leaf spot caused by C. cassiicola on Cassava in China.

【题目】基于信息融合的温室co2调控量决策研究
【中文关键词】信息融合 光合作用 生菜价格 调控量
【英文关键词】Greenhouse; CO2 control quantity; Decision-making; Information fusion;
【中文摘要】温室中co2浓度直接关系着作物的产量及其经济效益,研究了温室温度、光强、co2浓度变化规律及温室生菜生长规律,分析了近几年凌家塘批发市场生菜价格季节性变化规律,并建立了以周数为自变量的生菜价格模型。运用信息融合技术建立温室生菜光合速率与二者的量化模型,以优化经济效益为目的,提出了一种新的co2调控方法,即通过预测生菜市场价格和不同co2浓度下光合速率来调控co2施肥浓度,使得经济效益最优。

【题目】河西 走廊紫花苜蓿干草调制技术研究
【中文关键词】紫花苜蓿; 干草调制; 质量
【英文关键词】Alfalfa; Hay curing; Quality
【中文摘要】紫花苜蓿(Med icago stativa L.) 是为建立河西走廊地区苜蓿干草调制技术, 于2004 年在河西走廊地区以种植3 年的紫花苜蓿为材料, 对第2 茬苜蓿进行了刈割时期、晾晒时间、打捆时间、翻晒对紫花苜蓿干草质量的影响研究。结果表明: 苜蓿干草调制成功与否主要决定于晾晒时间、翻晒和打捆时间, 而调制的苜蓿干草质量主要决定于刈割时期和打捆时间; 河西走廊紫花苜蓿在初花期刈割, 晾晒28 h- 32 h, 并进行翻晒作业, 16: 00- 17: 30 打捆,避开过早或过晚打捆, 可获得质量好、营养价值较高并可长期贮存的干草产品。该技术的提出对我国北方地区调制优质苜蓿干草提供了科学依据。
【英文摘要】Alfalfa is a productive and excel lent legume for ag e ex tensively planted in Nor th China and successful hay curing techno logy is impor tant to the alfalfa indust ry . In this art icle, the effect s o f cut period,sunning ho urs, baling t ime, and tedding on the second cutting alfalfa hay were studied with three year old alfalfa in 2004 in Hex i Corrido r area of China in or der to determine the appropriate curing technolog y of alfalfa hay . The results show that the key facto rs fo r the successful alfalfa hay curing w ere sunning hours,tedding time, and baling time; harv esting perio d and baling time had great effects on alfalfa hay quality.According to the experiment , hig her quality and nut rit ive alfalfa hay with possibility of long time reservation in the Hexi Corr idor area was achieved by alfalfa harvesting in initial flow er ing period, sunning for 28 32 hours w ith tedding, and baling at the time except early morning or evening .

【题目】萎蔫与添加剂青贮对白三叶发酵品质的影响
【中文关键词】白三叶;青贮;萎蔫;添加剂;青贮品质
【英文关键词】Trifolium repens;Silage; wilting; additives; silage quality
【中文摘要】本实验以白三叶为研究材料,探讨萎蔫和不同添加剂的处理对白三叶青贮品质的影响,试验设置了对照、萎蔫24h、MicrimanagerH(1g/Kg)/M-1、MicrimanagerH/MF(0.027g/Kg)、Lalsil Dry(0.01g/Kg)、Microbial(0.01g/Kg)、Siloguard(0.5g/Kg、1g/Kg)、纤维素酶(0.015g/Kg)、Lalsil Dry+纤维素酶(0.01g/Kg+0.015g/Kg)、Microbial+纤维素酶(0.01g/Kg+0.015g/Kg)MicrimanagerH/MF+纤维素酶(0.027g/Kg+0.015g/Kg)、12个处理组,调制青贮饲料,60d后开封并取样分析。结果表明,白三叶直接青贮发酵品质较差,萎蔫24h、添加乳酸菌制剂、纤维素酶制剂、发酵抑制剂均能获得优良的青贮发酵饲料;乳酸菌制剂MicrimanagerH/MF(0.027g/Kg)、和Microbial(0.01g/Kg)可显著增加乳酸菌含量(P<0.05)、明显降低丁酸和氨态氮含量(P<0.05);发酵抑制剂Siloguard(0.5g/Kg、1g/Kg)能有效促进乳酸菌发酵,乳酸含量显著高于对照组(P<0.05),而丁酸含量显著低于对照组(P<0.05),纤维素酶单独添加或与MicrimanagerH/MF、Microbial混合使用后,PH值、丁酸、铵态氮均显著低于对照组(P<0.05),乳酸含量明显提高(P<0.05),明显改善青贮发酵品质。
【英文摘要】In this experiment, white clover as research material, explore wilting and processing white clover silage quality of different additives, test set were wilting 24h MicrimanagerH (1g/Kg) / M-1, MicrimanagerH / MF (0.027 g/ Kg), Lalsil Dry (0.01g/Kg), Microbial (0.01g/Kg), Siloguard (0.5g/Kg, 1g/Kg), cellulase (0.015g/Kg), Lalsil of Dry + cellulase (0.01g / Kg +0.015 g / Kg), Microbial + cellulase (0.01g/Kg +0.015 g / Kg) MicrimanagerH / MF + cellulase (0.027g/Kg +0.015 g / Kg), 12 treated group, the modulation silagefeed, 60d Kaifeng and sample analysis. The results showed that, poor the White Clover direct silage fermentation quality, wilting 24h Add lactobacillus, cellulase preparation, fermentation inhibitors are able to get a good silage fermentation feed; lactobacillus MicrimanagerH / MF (0.027g/Kg), and Microbial (0.01g/Kg) can significantly increase the lactic acid bacteria content (P <0.05), significantly lower butyric acid and ammonia nitrogen content (P <0.05); the fermentation inhibitor Siloguard (0.5g/Kg, 1g/Kg) can effectively promote lactic acid fermentation, the lactic acid content was significantly higher than that in the control group (P <0.05), and

butyric acid content was significantly lower than the control group (P <0.05), cellulase alone add or with MicrimanagerH / MF, Microbial mix, PH value, butyric acid, ammonium nitrogen were significantly lower than the control group (P <0.05), lactic acid content was significantly increased (P <0.05), significantly improved the quality of silage fermentation.

【题目】Tissue and inducible expression of a rice glutathione
【中文关键词】水稻
【英文关键词】Arabidopsis; Flower; Glutathione transporter; Promoter; Rice; Root.
【中文摘要】為研究水稻穀胱甘肽轉運蛋白 (OsGT1) 基因在植物體內的表達譜,將該基因啟動子區 (AY338469) 與GUS 報告基因融合後轉化擬南芥菜。結果表明:OsGT1 基因編碼區前 1246 bp 的啟動子區已足夠啟動GUS 基因的表達,並且啟始密碼(ATG)前 257 bp 是必須具備的區域。OsGT1 啟動子啟動的 GUS 表達具有組織特異性,主要在根、子葉和花等器官的維管組織中表達。同時受外界鹽和低溫脅迫的誘導,以及激素 ABA 和 NAA 的誘導,然而 OsGT1 基因啟動子啟動的 GUS 活性被高濃度的重金屬 Cd 抑制。表明水稻 OsGT1 基因主要在根和花中表達,與水稻抗鹽與低溫脅迫相關。
【英文摘要】The promoter of a rice glutathione transporter (OsGT1) was fused to the reporter gene ß-glucuronidase(GUS) and introduced into Arabidopsis to analyze promoter and expression patterns. Deletion ofvarious length-promoter studies indicated that a 1246 bp fragment upstream of start codon (ATG) of OsGT1is sufficient to activate the expression of GUS gene. The GUS assays revealed that the OsGT1 promoter isexpressed in an organ and tissue-specific manner. GUS was being expressed in the root stele, the veins ofcotyledons, the anthers and flower petals, but not in leaves or stems under normal growth conditions. GUS expressionactivated

by the OsGT1 promoter was strongly stimulated by NaCl and low temperature, moderatelyby abscisic acid and naphthaleneacetic acid, and not at all by salicylic acid and gibberellic acid. Expressionwas inhibited by cadmium but not by copper. The function of OsGT1 in glutathione transport in normal orstress conditions is discussed.

【题目】温敏雄性不育水稻培矮64S花药发育过程中钙的变化
【中文关键词】水稻;雄性不育;花药;花粉;Ca2+
【英文关键词】Rice; Male-sterile; Anther; Pollen; Calcium
【中文摘要】采用焦锑酸钾沉淀法研究了温敏雄性不育水稻(Oryza sativa L.)培矮64S在高温引起雄性不育与正常可育花药发育过种中Ca2+的分布变化。结果表明,当培矮64S生长在较高温度条件下引起雄性不育,与可育花药相比,不育花粉母细胞中有较多的液泡、较多的Ca2+沉积和较少的线粒体,并且有较多的Ca2+沉积在不育花药的中间层、表皮层和绒毡层中。到四分体与单细胞花粉时期,不育花药的木质部细胞的次生加厚壁上有较多的Ca2+沉淀,连接组织中的Ca2+沉淀也大大增加,所有不育花粉外壁较厚而发育都不正常。在单核细胞早期,不育花粉的四分体细胞中有较明显的大液泡出现。不育花药中的Ca2+在花药发育的各时期均比可育花药要多。这些结果说明在高温生长条件下,花粉母细胞发育的异常、花药中Ca2+沉积的增加、绒毡层与花粉外壁发育的异常可能与培矮64S花粉败育相关。
【英文摘要】Peiai 64S (Oryza sativa L. subsp. indica), is a thermo-sensitive genic male-sterile (TGMR) rice. High temperature causes sterile pollens at the microsporogenesis stage. The anther morphology and the calcium precipitate were investigated in the fertile and sterile anthers of Peiai 64S under low or high temperature. There were more small vacuoles, more calcium precipitates and less mitochondria in the sterile pollen mother cells than those in the fertile pollen mother cells. More calcium precipitates were located in the epidermis, endothecium and tapetum of the sterile anther than in those of the fertile anther. Longitudinal inner cell wall of the sterile anther became thicker than that of the fertile anther at the dyad stage and uninucleate pollen stage. Some large vacuoles appeared in the tapetal cells of the sterile anthers at the early uninucleate pollen stage. All of the sterile pollens possessed malfunctioned exine. The results proposed that the abnormalities of pollen mother cell, the tapetum and the pollen exine, and more calcium precipitates in TGMR rice Peiai 64S under high temperature were related with the pollen abortion.

【题目】施用甘蔗酒精废液对土壤水解酶活性的影响
【中文关键词】甘蔗;土壤;酒精废液;农用;水解酶
【英文关键词】Sugarcane;Soil;Vinasse;Field application;H ydrolytic enzyme
【中文摘要】土壤酶参与土壤矿质化和腐殖化的转化过程,可作为评价土壤肥力和环境质量的重要参考指标。在广西扶绥蔗地上设计6个处理:CKl(不施肥),CK2(施常规化肥)和4个酒精废液处理45 t/hm2,75 t/hm2,75t/hm2CK,105 t/hm2,其中除处理75 t/hm2 CK外,其他处理都种植甘蔗,研究酒精废液的施用对土壤水解酶活性的影响机理。结果表明:随着酒精废液施用量的增加,甘蔗各生育期土壤蛋白酶活性没有表现出一致的增加趋势,而土壤蔗糖酶活性则一致增加;酒精废液各处理在苗期的土壤蛋白酶活性显著或极显著高于CKl,在苗期、分蘖期、成熟期的土壤蔗糖酶活性也显著或极显著高于CKl;酒精废液各处理土壤蛋白酶或蔗糖酶活性显著或极显著高于施N、K化肥前的CK2,在CK2施用N、K化肥后各处理与CK2的酶活性差异不显著;在酶促反应诱导阶段的苗期,土壤蛋白酶活性与N0f—N和全N、有机质分别呈极显著和显著正相关,蔗糖酶活

性与全N、有机质和NH≯一N、Nof—N分别呈极显著和显著正相关。说明45t,75 t,105 t(t/hm2)酒精废液的蔗地施用加快了土壤矿化和腐殖化进程,提高了土壤肥力。促进了土壤蛋白酶尤其是蔗糖酶活性的提高,其活性的提高与微生物数量、养分含量的增加关系密切。

【英文摘要】Transform process for soil enzyme to participate in mineralization and humification can be regarded as important reference indexes evaluating soil fertility and environmental quality. The 6 treatments of fertilization in Fusui County,Guangxi Province,i.e. CKl(without fertilizer),CK2 (with regular chemical fertilizer)and 4 treatments with vinasse 45t,75t,75tCK,105t(t/hm2),were designed to research on the influence mechanism of vinasse application to soil hydrolyze enzyme activity. All treatments were cultiVated with sugarcane except 75tCK.The results showed that protease activity of soil in each developing stage didn ’ t show consistent increase, invertase activity of soil increased coherently with vinasse dosage however;protease actiVity of soil in every treatment using vinasse was significantly higher than CK 1 at the seedling stage of sugarcane,so was invertase activity atthe seedling,tillering and mature stages of sugarcane. The results also indicated that protease or in Vertase actiVity of soil in every treatment applying Vinasse was significantly higher than CK2 without N,K chemical fertilizers,while CK2 with N,K fertilizers no significant differences were detectedcompared to CK2;protease activity was significantly correlated with N03一N,total N,organic matter positively;invertase activity was significantly correlated with total N,organic matter,N H4一N,N03一N positively at the seedling stage of induction time of enzyme catalyzed reaction. It was concluded thatvinasse application in sugarcane fiekl accelerated the process of soil mineralization and humification,enhanced soil fertility,and increased protease,especially invertase acti,jty,the increasement of enzyme activitiy was correlated with the increasement of microbe number and nutrient factors in soil closely.

【题目】利用陷阱法防治蔗根土天牛成虫的研究初报

【中文关键词】根土必牛;陷阱法;甘蔗;防治

【英文关键词】Dorysthenes granulosus(Thomson);Trap ways;Sugar cane;Control

【中文摘要】【目的】研究陷阱谤杀方法对蔗根土天牛成虫的诱杀效果。【方法】于2007年5月蔗根土天牛成虫发生期,在蔗田进行挖坑陷阱诱杀,设置3种陷阱诱杀方法,测定各陷阱诱集的成虫数量、各方法诱集成虫总量及雌雄比例。[结果】结果表明,3种方法都有较好的诱杀效果,分别为8.44、6.50和4.56头/d · 陷阱;第一防治办法优于其它两种,且诱得的雌虫比例较高,达42.06%。【结论】陷阱法谤杀简单实用且仅需劳力投入,值得在广大蔗农中推广。

【英文摘要】[Objective] The research aimed to study the trapped and killed effect of the trap ways on Dorysthenes granulosus(Thomson).[Method] Three trap ways were designed to trap and kill Dorysthenes granulosus(Thomson)when the pests were happened in May of 2007, the number of adult pests of luring, the total pests induced and the proportion of male and femalewere determined. [Result]The results showed that all the ways were well and trapped pests per dayswere 8.44、6.50 and 4.56 heads, respectively. The first method of cleaning and retreading trap every day was better than others, and the trapped females accounted for 42.06%.[Conclusion] Trap ways should be popularized in all farmers because it is simple, effective and economical.

【题目】Physiological response of Chinese cabbage to intercropping systems

【中文关键词】null
【英文关键词】Vegetables;Cropping system; Physiological response; Agronomy; Intercropping
; Chinese cabbage; Functional response; Physiological parameter
; Physiological condition;
【中文摘要】无
【英文摘要】The physiological indices of Chinese cabbage(Brassica chinensis L.) grown under different intercropping systems used for this study included total soluble protein content, soluble sugar content, reducing sugar content, nitrate content, and pigment concentration. The objective of the present study is to discover the physiological level changes in Chinese cabbage in intercropping systems. The intercropping systems studied involved Chinese cabbage- garlic (Allium sativum L.) (CG), and Chinese cabbage-lettuce (Lactuca sativa L.) (CL). Chinese cabbage monoculture served as control (CK). Overall, higher mean soluble protein content and nitrate content were found in Chinese cabbage grown in the intercropping systems than those in CK. Significantly higher chlorophyll a content was found in cabbages from CL than CK during the latter half of the growing season. No significant difference in soluble sugar concentrations was found in CG and CL, as compared with CK. Reducing sugar content varied over the growing period of the Chinese cabbage in CG and CL. These results suggest that Chinese cabbage intercropped with noncrucifer plants increase the plant nutrient content.

【题目】Effects of intercropping systems on community composition and diversity of predatory arthropods in vegetable fields
【中文关键词】null
【英文关键词】Intercropping;
Chinese cabbage;
Arthropod community;
Predators
【中文摘要】无
【英文摘要】Field trials were carried out on Langqi Island, Fujian, PR China in 2004, to determine the effects of intercroppingChinese cabbage (Brassica chinensis) with green cabbage (Brassica oleracea), garlic (Allium sativum)and lettuce (Lactuca sativa), on community composition and diversity of predatory arthropods invegetable fields. Two intercropping plots were designed and used in this study. In plot 1, two ridges ofChinese cabbage were intercropped with one ridge of garlic (CG1), lettuce (CL1) or green cabbage(CB1). In plot 2, the Chinese cabbage was planted in the center (100 cm wide) of the ridge, and undersownwith garlic (CG2), lettuce (CL2) or green cabbage (CB2) on both edges (25 cm wide) of the sameridge. A monoculture plot of the Chinese cabbage (CK) was arranged for comparison with plots 1 and2. The highest species richness was found in CG1, and the lowest in CK. The highest abundance was foundin CL1 (141.67 predators/plot), whereas the lowest was in CB1 (97.67 predators/plot). With the exceptionof CL1, significantly higher diversity indices were found in intercropping treatments than in CK. Themajority of spiders sampled from fields were from families Theridiidae (34.04%) and Lycosidae(30.57%). These findings suggest that Chinese cabbage intercropped with non-cruciferous crops mightincrease species richness, abundance and diversity of the arthropod community in general and predatorsin particular.Crown Copyright 2010 Ecological Society of China. 【题目】Occurrence of entomopathogenic fungi in migratory alate aphids in Yunnan Province of China
【中文关键词】null
【英文关键词】Aphid migration;Aphid trapping;Entomopathogenic fungi;
Fungal infection;Entomophthorales;Clavicipitaceae;Humidity effect
【中文摘要】无
【英文摘要】Occurrence of entomopathogenic fungi in migratory alate aphids wasinvestigated by trapping air-borne aphids on cabbage and wheat plants andobserving the insects for fungal infection. Potted cabbage and wheat plants put 30 mapart on yellow cloth, were placed on the top of a tall building (six-story building) inYunnan Province, China away from cultivated fields or other vegetation. Sevenspecies of aphids trapped on the plants collected and monitored for fungal infectionin the laboratory at a daily basis from 19 February to 31 December, 2003. Aphidswere trapped every day during the experimental period. A total of 3,681 aphids weretrapped on cabbage and 3,028 on wheat. Myzus persicae (Sulzer), Brevicorynebrassicae (L.), and Sitobion avenae (F.) were the major aphid species accounting for94.7 and 93.1% of the insect specimens landing on cabbage and wheat, respectively.Other aphis species encountered included, Acyrthosiphon pisum (Harris), Lipaphiserysimi (Kaltenbach), Pemphigus sinobursaris Zhang, and Rhopalosiphum padi (L.).Preference for host plant played significant role in attraction of aphids, especially ofthe three major species. Accumulated over the whole experimental period nearly33% of the aphids landing on cabbage and 37% landing on wheat were infected withfungi. Erynia neoaphidis Remaudiere and Hennebert, Entomophthora planchonianaCornu, and Beauveria bassiana (Balsamo) Vuilemin were the major fungal pathogensencountered and accounted for nearly 95% of the infested aphids oncabbage and 97% on wheat. Other entomopathogenic fungi encountered includedZoophthora radicans (Brefeld) Batko, Conidiobolus obscurus (Hall and Dunn)Remaudiere, and Neozygites fresenii (Nowakowski), Paecilomyces fumosoroseus(Wize) Brown and Smith, and Aspergillus flavus Link. Although the number ofaphids trapped throughout the experimental period did not vary consistently withtemperature or humidity, the fungal was directly related to relative humidity. Higherinsect mortality, especially due to Entomophthorales, positively related relativehumidity.

【题目】不同有机肥对小弓棚西瓜生长发育及土壤理化性质的影响
【中文关键词】有机肥, 小拱棚西瓜, 土壤
【英文关键词】organic fertilizers, small arch shed watermelon,soil
【中文摘要】试验研究三种不同类型有机肥的肥效特点以及对小拱棚西瓜生长发育的影响。结果表明:施用有机肥处理的土壤盐分含量、速效氮低于化肥对照,有机质、速效磷钾含量高于对照,西瓜长势和产量低于使用化肥的处理,但西瓜品质明显优于对照。其中菌肥处理的土壤肥力指标在西瓜结果初期表现最高,其他时间处于中等水平,鸡粪处理的土壤肥力在西瓜整个生育期变化幅度都很小,性质比较稳定,施用饼肥处理的土壤理化指标在西瓜坐果期后含量均较低。比较三种有机肥使用效果,以微生物菌肥处理的西瓜产量最高,品质最优,其次为商品鸡粪,再次为饼肥。
【英文摘要】In this experiment, the characteristics and the effect on the growth of watermelon of three organic fertilizers were compared. The results indicated that the soil salt and available nitrogen content of organic fertilizers treatment were significantly lower than control, Meanwhile the soil organic matter 、 available phosphorus and available potassium were higher than control. The watermelon growth vigor of treatment were weaker, but the quality were batter. Among them, the soil fertility of bacterial manure treatment was highest during fruit setting stage and was at moderate level in other stage; the change range of soil fertility was litter at whole growth period in chicken manure treatment; the soil Physicochemical Index of cake fertilizer was all lower after fruit setting stage. Comparison of application effects, the yield of bacterial manure treatment was highest and the quality was best, followed by chicken matter、 cake fertilizer.

【题目】套种三叶草对日光温室樱桃番茄生长及根际土壤环境的影响
【中文关键词】三叶草;套作;根际环境;樱桃番茄;日光温室
【英文关键词】:Clover;Interplanting;Rhizosphere environment;Cherry tomato;Greenhouse
【中文摘要】通过研究套种三叶草对樱桃番茄生长及根际土壤环境的影响,探索生物多样性栽培模式,改变日光温室单一栽培制度。结果表明,随着三叶草生长量的增加,对土壤养分环境的影响逐渐明显,到樱桃番茄收获时,处理土壤的pH、全盐、速效氮、磷、钾质量分数分别下降2.68%、8.73%、10.78%、19.5%和7.54%;处理土壤脲酶和脱氢酶活性在樱桃番茄生育初期就显著增加,在整个生长期内,平均较对照高17.94%和60.62%;相对于对照,套种三叶草的樱桃番茄产量增加14.44%,果实中可滴定酸减少12.83%,亚硝酸盐减少14.38%,糖质量分数增加16.37%,维生素C质量分数增加17.66%;表明日光温室樱桃番茄套种三叶草能够改善根际土壤酶环境减轻根层土壤磷钾肥的富集,提高樱桃番茄养分利用效率,增加产量,是一种可行的增加生物多样性的栽培方式。
【英文摘要】For exploring biodiversity cultivated model and changing single culture system in greenhouse,the effects of interplanting clover treatments on growth and rhizosphere environment of cherrytomato in greenhouse were studied.The results showed that the effect of interplanting clover on soilphysical and chemical properties of cherry tomato rhizosphere was more and more significantly withthe clover growing,at the tomato harvest stage,the soil pH,salt,available nitrogen,phosphorusand potassium were reduced by 2.68%,8.73%,10.78%,19.5%,and 7.54% respectively comparewith the control soil.The activities of the treatment soil urease and dehydrogenase were remarkablyincreased in cherry tomato earlier stage,and were 17.94%and 60.62%higher than that of the controlin whole growth period.Intercropping clover could also improve the plant growth,increase yield by14.44%and promote fruit quality of cherry tomato setting in greenhouse compared with the control.The content of fruit titratable acid and nitrite were reduced 12.83%and 14.38%,while the solublesugar and Vc were increased 16.37%and 17.66%under interplanting cultivated way.So this culturalmethod of inteplanting clover with cherry tomato is feasible measures of increased biodiversity in solargreenhouse that could improve nitrogen use efficiency of rhizosphere soil,reduce the degree of soilstalinization,alleviate enrichment of rhizosphere soil phosphorus and potassium fertilizer

【题目】Effect of intercropping of pepper with sugarcane on populations of Liriomyza huidobrensis (Diptera: Agromyzidae) and its parasitoids
【中文关键词】null
【英文关键词】Liriomyza huidobrensis;Intercropping;Pepper;Sugarcane
【中文摘要】无
【英文摘要】The effect of intercropping pepper with sugarcane on populations of the leafminer Liriomyza huidobrensisBecker was investigated over two seasons (2007, 2008) in Yunnan, China. Populations of adults, thefemale:male sex ratios and the densities of larval mines were significantly higher in pepper monoculturethan in intercropping in a 2:2 pattern (2 rows of pepper to 2 rows of sugarcane), which in turn weresignificantly higher than intercropping in a 1:2 pattern (1 row of pepper to 2 rows of sugarcane). Thedensities of the parasitoids of the leafminer were significantly higher in intercropping than in the peppermonoculture. The total parasitism rates were

71.6%, 22.5% and 5.9% in 2007, and 69.5%, 20.6% and 5.9% in2008, in the 1:2, 2:2 and pepper monoculture, respectively. The lower densities of leafminer adults, thelower female:male sex ratio, and smaller numbers of larval mines in the intercropping systems wereattributed to the intercropping pattern and the growth of pepper. These results indicate that intercroppingis suitable for the control of L. huidobrensis on pepper plants. These results demonstrate theutility of intercropping of pepper with sugarcane in the management of L. huidobrensis.

【题目】节水控氮对黄河上游地区设施菜田氮素时空分布的影响
【中文关键词】黄河上游地区;日光温室;节水减氮;氮素运移;时空分布
【英文关键词】words:the upper stream of the Yellow River;solar greenhouse;water saving and nitrogen controlling;nitrogen migration;temporal and spatial distribution
【中文摘要】:为了探索黄河上游地区日光温室节水控氮对氮肥利用效率及氮素运移规律的影响,以不同施氮量和灌水量为试验处理,采用随机区组处理方式,通过在西芹不同生长阶段、0~160cm土壤剖面获取土壤氮素的动态变化信息,以评价日光温室栽培条件下土壤氮素运移规律和硝态氮的淋溶情况。试验表明:在耕层土壤(0~60cm)内全氮质量分数变化较大且规律明显;硝态氮质量分数变化在整个生长周期内呈规律性明显变化,且土壤中硝态氮质量分数变化与灌水量呈负相关关系,与施氮质量分数呈正相关关系,节水控氮能够有效减轻土壤中上层中(0~60cm)硝态氮淋洗,降低土壤硝态氮积累量,有效减轻对农田周围水体污染。
【英文摘要】Abstract:In order to explore effect of water saving and nitrogen controlling on nitrogen use efficiency and nitrogentransport law,adopting randomized block designs,to obtain dynamic change information on soil nitrogen to evaluate soilnitrogen transport law and nitrate leaching in different growth stages of celery,in 0~160cm soil profiles in greenhouse inthe upper reaches of the Yellow River.The results showed that at the same nitrogen application rate,soil total nitrogengradually increased(treatment 1<treatment 2<treatment 5)in 0~20cm and soil total nitrogen gradually decreased(treatment 1>treatment 2>treatment 5)in 20~40cm and in 40~60cm,with the decrease of irrigation quota,totalnitrogen mass fraction,and the law was changed greatly in the topsoil(0~60cm);NO3-N changed regularly,which wasa negative correlation with irrigation quantity,which was a positive correlation with nitrogen application rate duringgrowing periodicity

【题目】Effects of nitrogen application on beetle community in tea plantations
【中文关键词】null
【英文关键词】beetle community, diversity, abundance, nitrogen application
【中文摘要】无
【英文摘要】In contrast to grassland and forest ecosystems, little is known about insectresponse to nitrogen deposition in agricultural ecosystems. This study was carried out toinvestigate the effects of short-term (1-2 years) nitrogen application (0, 172.5, 345.0, 690.0,and 1035.0 kg · N ha-1 · y-1) on beetle communities in tea plantations. A collection of 34families, 89 species of beetles, was obtained from a tea plantation in Wuyishan, China.Among them, herbivores, predators and detritivores had 52, 29, and eight species, respectively.Species richness, effective diversity and abundance (measured as the number of individualsand insect biomass) of the beetle

community were not significantly related to the rate ofnitrogen application. However, nitrogen application changed the species distribution andweakly increased the evenness of species distribution, while this did not significantly changethe species evenness. Species richness and abundance of herbivores and predators were notsignificantly related to the rate of nitrogen application. However, there were some variationsin trophic responses to nitrogen. Species richness and abundance of detritivores increasedwith increasing nitrogen application.

【题目】A characterization of rice pests and quantification of yield losses in the japonica rice zone of Yunnan, China
【中文关键词】null
【英文关键词】Multiple pest system;
Injury;
Yield loss assessment;
Correspondence analysis;
Multiple regression analysis
【中文摘要】无
【英文摘要】Within any geographic area where pest management is to be improved or adapted to agricultural changes, there is a need for characterization to define constraints to crop production. The objective of this study was to assess pest injuries (diseases, insects and weeds) in farmers' fields in the japonica rice zone of Yunnan, China, explore characteristics of rice injury profiles, analyse the relationships between injury profiles and yield levels, and estimate yield losses caused by individual injuries. Seven pest injury profiles (abbreviated as IN) were determined using cluster analysis; IN1, IN2 and IN3 were lower injury levels of pest combinations in seven profiles, while IN5, IN6 and IN7 were higher injury levels. Correspondence analysis based on patterns of injury profiles yielded a path of increasing yield levels associated with varying combinations of injuries. The use of principal component analysis with multiple regression generated estimates of yield reductions due to rice diseases, insects and weeds. The analysis indicated that injuries caused by weeds that are taller than the rice canopy, white heads, leaf folder, bacterial leaf blight, army worms, leaf blast and plant hoppers should be considered as potentially most damaging in this region. Results of this study will provide some foundations for developing pest management strategies and improving rice production at the regional scale.

【题目】Acidic buffering ability and regulation in latosolic red soil of sugarcane fields
【中文关键词】酸缓冲性能;土壤;蔗地;赤红壤;广西
【英文关键词】acidic bufffering ability; soil;sugarcane fields; latosolic red soils; Guangxi
【中文摘要】:采用酸滴定土壤酸度的方法研究广西蔗地土壤对酸的缓冲性能,结果表明,广西赤红壤蔗地土壤酸缓冲能力不强且对酸敏感,其土壤酸化转折点在加入模拟酸雨pH值3.0—3.5之间。酸雨会造成蔗地土壤严重酸化,而年施用75t/hrn2酒精废液对蔗地土壤酸化影响较小。影响土壤酸缓冲性能因素主要为有机质、物理性粘粒、盐基总量和交换钙。据此可采取增施有机肥,施用碱性物质如石灰或碱性肥料如钙镁磷肥,以及增加土壤覆盖如蔗叶还田,或采取等高种植等措施,增加土壤有机质和交换性阳离子含量,减少土壤粘粒及阳离子流失,降低土壤酸度,从而提高蔗地土壤酸缓冲能力,改善

蔗地土壤生态环境。
【英文摘要】To study the acidic buffering ability in the latosolic soil of sugarcane producing regions of Guangxi,a method for soil acidity determination by titration with 0.1mol/L suphuric acid was used.The results showed that the soil acid buffering ability of sugarcane fields in Guangxi were weak and sensitive to acid,the turning point of the soil acidification in sugarcane fields was pH3.0-3.5 for added acid rain.Acid rain falling into the soil could acidify it,and the effect of using 75 t/hm2 vinasse on the soil acidificationg in the soil of sugarcane soils was much less.The factors affecting the siol acid buffering ability were mainly organic matter,physical clay,totai salt and exchangeable Ca.based on the results of the present study,three basic measures are put forward to increase the soil acid buffering ability and improve soil fertility:applying organic fertilizer and alkaline matter such as lime or alkaline fertilizer such as fused calcium-magnesium phosphate,covering soil with sugarcane leaves or grass,and planting along contour line,etc.,which could increase the contents of soil reganic matter and exchangeable cationgs,decrease the loss of soil caly and cations,and the soil acidity,increase the soil acid buffering ability,and improve the siul ecological environment.

【题目】Role of photoperiod and temperature in diapause induction of endoparasitoid wasp Microplitis mediator (Hymenoptera: Braconidae,
【中文关键词】null
【英文关键词】Microplitis mediator, diapause induction, photoperiod, temperature
【中文摘要】无
【英文摘要】Diapause in Microplitis mediator Haliday (Hymenoptera: Braconidae) is manifested during the pupal stage and normally occurs during the winter season because of a photoperiodic response that is highly dependent on temperature. No diapause was observed at temperatures above 20 ° C regardless of the photoperiod. Only a small part of the population entered diapause at 20 ° C under short daylengths of light:dark 8:16 – 12:12. In contrast, when larvae were exposed to 16, 18, and 20 ° C combined with a photoperiod of 10:14, the percentages of parasitoids that entered pupal diapause was 97.9, 87.8, and 26.2%, respectively. Critical photoperiods were determined to be 7.03:16.97 and 12.21:11.79 at 16 ° C and 6.75:17.25 and 12.03:11.97 at 18 ° C. The second instar of the parasitoid was the most sensitive to diapause induction for the photoperiods and temperatures tested.

【题目】Can polycultural planthoppers in rice-bmanipulation effectively control rice ased ecosystems
【中文关键词】null
【英文关键词】Mosaic arrangement; Nilaparvata lugens (St å l); Sogatella furcifera Horvath; Ecologically-based pest management; Resource concentration; Associational resistance
【中文摘要】无
【英文摘要】Rice planthoppers (mainly Nilaparvata lugens (St å l) and Sogatella furcifera Horvath) are the most destructive rice pests throughout southeastern and eastern Asia. Planthopper feeding often causes “ hopper burn ” and reduces rice yields. Currently, insecticide use is the sole pest management option available to most Chinese farmers. Because pesticide use may have undesirable effects, environmentally sound and sustainable management alternatives are urgently needed. In a two-year field study at the Wuyishan Experimental Station of the Institute of Applied Ecology (IAE), Fujian Agriculture and Forestry University (FAFU), we evaluated the effects of polycultural manipulation on the abundance, sexual differentiation and wing dimorphism of rice planthoppers. The polycultural manipulation was arranged in mosaic patterns of paddy plots intercropped with non-paddy plots including chili pepper, ginger, maize and peanut plants. Monocultural fields of paddy plants were used as controls. Polycultural manipulation significantly reduced the abundance of total planthoppers and nymphs of N. lugens and S. furcifera. The number of overall planthoppers decreased on average by 49% and 55% in 2007 and 2008, respectively. However, polycultural manipulation had no impact on the proportions of female or macropterous planthoppers. The resource concentration and associational resistance hypotheses may explain these results. In polycultural fields, non-rice species may mask the chemical or visual attractants of rice, making them less apparent, and microhabitat differences in the levels of secondary compounds or in plant quality may also disrupt planthopper orientation.

【题目】赤霉素诱导甘蔗GA20一Oxidase基因实时荧光定量PCR分析
【中文关键词】甘蔗,GA20一氧化酶,赤霉素,定量PCtL基因表达
【英文关键词】Sugarcane,GA20-oxidase,Gibberellic acid,Real-time PCR,Gene expression
【中文摘要】究以喷清水甘蔗幼茎作为对照(即未处理),经过赤霉素处理后6h、12h、24h和48h的甘蔗幼茎为处理,分别进行取样并提取RNA,反转录获得eDNA作模板,利用SYBRGreen I成功构建了目的基因(GA20一oxi—das晰口内参基因(GAPDH)的标准品和标准曲线。结果表明:内参基因与目的基因的起始模板浓度与Ct之间呈良好线性关系,决定系数分别为r2=0.998、rZ-_0.995;溶解曲线均显单峰型,证明扩增的特异性比较好,可对基因表达进行相对定量。定量结果表明:目的基因未处理的表达量最大,赤霉素处理后表达量持续下降,在6h达到最低值,12h后逐渐上升,但到48h又明显下降,且所有处理的表达量均低于未处理,6h、12h、24h和48h比对照的表达量分别下降了24.75%、13.18%、1023%和20.34%。本实验研究GA20-oxidase基因在赤霉素处理后的表达J隋况,为进一步克隆甘蔗GA20氧化酶基因全长序列、研究该基因在甘蔗节间伸长过程中的表达调控及甘蔗茎间伸长中的作用机理提供理论依据。
【英文摘要】In this research,the stemlets of sugarcane sprayed by gibberellic acid(GA3)after separately treatment at 6h,12h,24h and 48h,were employed to be as experimental materials as well as the stemlets of sugarcane sprayed only by water as reference.We extracted RNA,from treated samples for obtaining eDNA template by reverse transcription,and then making the standard sample and standard curve of target gene GA20一oxidase and the reference gene GA PDH by using SYBR Green I system.The results showed that there is a well linear relationship between initial template concentration and Ct of the reference gene and the target genes.and the correlation coefficients(r2) were 0.998 and 0.995,respectively.The dissolution curves both exhibited single-peak curve which proving that the amplification systems were specific and the relative quantitative analysis of gene expression could be carfled out.The quantitative expression results showed that the expression of target gene got the highest level in thereferences,that in the GA3 treatments declined continuously,it reached the minimum level in 6h,subsequently increased gradually after 12h,and again decreased significantly at 48h,the expression level of target gene in all the treatments were lower than that in the references。the target gene expressions level at

6h,12h,24h and 48h intreatments were scaled down 24.75%,13.18%,10.23%and 20.34%contrast with that in references,respectively.These results offer the theoretical foundation for cloning full-length sequence of GA20 oxidase gene and researchingthe gene expression regulation in internode growth and mechanism in stems elongation of sugarcane.

【题目】Genetic Diversity of planthopper, Sogatella furcifera in the Great Mekong Subregion detected by inter-simple sequence repeats (ISSR) markers
【中文关键词】null
【英文关键词】genetic relationship, ISSR-PCR, migration
【中文摘要】无
【英文摘要】The white backed planthopper, Sogatella furcifera (Hemiptera: Delphacidae), is a serious pest of rice in Asia. In the present study, inter-simple sequence repeat (ISSR) markers were employed to investigate the genetic diversity and differentiation of 47 populations sampled from 14 prefectures of the Greater Mekong Subregion. A total of 14 selected primers yielded 121 bright and discernible bands, with an average of 8.6 bands per primer. According to the hierarchical analysis of molecular variance (AMOVA), the genetic variation among geographic regions (79.84%) was higher than that of among populations within region (20.16%), and the FST value was 0.72, indicating a high level of genetic differentiation. Neighbor-Joining cluster analysis of the 47 populations showed two major clusters, one consisting of mostly southwestern Yunnan Province and Myanmar populations; and the other one consisting of southeastern and central of Yunnan Province plus Vietnam and Laos populations. No significant positive correlation was observed between genetic and geographic distances by Mantel test (r = 0.2230, p = 0.8448), indicating the role of geographic isolation did not shape the genetic structure of the sampled S. furcifera populations. This paper provides useful data for understanding and speculating the migration of S. furcifera and reveals available information to develop sustainable strategies for manage this long-range migratory pest.

【题目】甘蔗酒精废液对土壤理化性状及氧化还原酶的影响
【中文关键词】甘蔗; 酒精废液; 土壤理化性状; 氧化还原酶
【英文关键词】Sugarcane, Vinasse, Soil physicochemical property, Oxidoreductase enzyme
【中文摘要】在蔗地上设计不施肥(CK1)、施化肥(CK2)和4 个直接喷施甘蔗酒精废液处理, 研究不同用量废液施用对土壤理化性状及两种氧化还原酶活性的影响。结果表明: 蔗地施用废液提高了土壤全氮、Cl－、有机质、腐殖质含量, 使甘蔗苗期土壤过氧化氢酶和多酚氧化酶活性异常升高, 随后迅速下降, 成熟期下降到接近或小于CK2 的土壤酶活性水平。甘蔗苗期土壤过氧化氢酶活性与全氮、有机质、腐殖质呈极显著正相关, 与富里酸、胡敏酸、Cl－呈显著正相关(r0.05=0.811, r0.01=0.917, n=6); 土壤多酚氧化酶活性与有机质、腐殖质、Cl－呈显著正相关。与不种植甘蔗的75 tCK 废液处理相比, 种植甘蔗的75 t 废液处理甘蔗生长后期土壤全氮、有机质、Cl－含量和多酚氧化酶活性较低。说明与施用化肥或不施肥处理相比, 蔗地施用废液有提高土壤肥力和有机质、腐殖质含量的作用, 但也使施用初期过氧化氢酶和多酚氧化酶活性异常升高, 施废液的土壤种植甘蔗对废液养分吸收和环境净化有一定作用。
【英文摘要】An experiment was conducted in sugarcane field to study the effect of six treatments [vinasse application (four application rates), CK1 (non-fertilizer) and CK2 (chemical fertilizer)] on soil physicochemical properties, catalase and polyphenol oxidase activity. The results show that total N, Cl－, organic matter (OM), humic acid (HA) content of soil improves under vinasse treatments. Catalase and polyphenol oxidase activity increase abnormally at sugarcane settling stage and then sharply decrease to CK2 level at sugarcane maturity stage. Catalase activity has extremly significant positive correlations with total N, OM, HA, and significant positive correlations with fulvic acid fraction(FAF), humic acid fraction (HAF) and Cl－ (r0.05=0.811, r0.01=0.917, n=6). An obvious significant correlation also exists between polyphenol oxidase activity and OM, HA and Cl－ content. At the latter stage of sugarcanegrowth, total N, OM, Cl－ and polyphenol oxidase activity in soils under 75 ton CK treatment in non-sugarcane fields are lower than in 75 ton treatment in sugarcane fields. Soil fertility, OM and HA content, and catalase and polyphenol oxidase activity are higher inthe four vinasse treatments than in CK1 and CK2 treatments. Sugarcane plantation absorbs vinasse nutrient and purifies soil environment when treated with vinasse.

【题目】Effects of six sugars on the longevity, fecundity and nutrient reserves of Microplitis mediator
【中文关键词】null
【英文关键词】Sugar;
Glycogen;
Lipid;
Energy cost;
Microplitis mediator;
Cotton bollworm
【中文摘要】无
【英文摘要】Parasitoid adults can directly feed on floral nectar and honeydew containing monosaccharides and disaccharides. Oligosaccharides such as maltose, melezitose and raffinose are also found in honeydew but are rare in floral nectar. The effects of six different sugar resources on the longevity, fecundity and nutrient reserves of Microplitis mediator, a larval endoparasitoid in the cotton bollworm Helicoverpa armigera (H ü bner) were determined in our laboratory. The results showed that both food and sex affected longevity of this wasp. Females and males of M. mediator fed with 1 M sucrose solution survived longer than controls fed with water (5.7- and 3.7-fold longer, respectively). When provided with sucrose, glucose or fructose solutions, the parasitoid generated 3.6- to 3.7-fold more offspring than controls, and 60 – 75% of these progenies were produced during the first 5 days. When separately given fructose, sucrose or glucose, this wasp accumulated fructose and total sugar at the highest level, which means a high sugar levels might lead to prolonging longevity and more offspring in M. mediator. In addition, compared with organisms fed galactose or raffinose, M. mediator fed sucrose or fructose accumulated high glycogen levels. Furthermore, in M. mediator, the lipid content declined with the advancing age. Females showed the slowest lipid metabolic rates when fed with sucrose, glucose, fructose, mannose and galactose solutions versus when fed with raffinose and control. In addition, only sucrose had a significant effect on lipid levels in males nearing the end of life.

【题目】Interspecific and intraspecific comparisons of ejaculates in the cotton bollworm Helicoverpa armigera and the tobacco budworm H

【中文关键词】null
【英文关键词】Helicoverpa armigera Helicoverpa assulta Ejaculate size Reproductive isolation Lepidoptera
【中文摘要】无
【英文摘要】The evolution of reproductive isolation is a prerequisite in the formation of new species. Although there are numerous studies on ejaculates in lepidopteran insects, ejaculate comparisons among sibling species have not been adequately addressed to understand possible reproductive barriers to hybridization. Here, we examined the interspecific and intraspecific variations of ejaculates in the sibling noctuid moths Helicoverpa armigera and Helicoverpa assulta. We found that there were considerable variations in the number of apyrene and eupyrene sperm and the length of eupyrene sperm. Male pupal mass explained not only a significant proportion of the variation in apyrene sperm number in both H. armigera and H. assulta, but also a significant proportion of the variation in eupyrene sperm number in H. assulta. There was a significant positive relationship between the number of eupyrene sperm and the number of apyrene sperm in both species. No difference in the length of eupyrene sperm was found between them; however, ejaculates of H. armigera had many more eupyrene sperm than H. assulta had. In H. armigera, large males generally mated with large females. The evolutionary consequences of these differences are discussed in this paper.

【题目】Effect of the secondary substances from wheat on the growth and digestive physiology of cotton bollworm Helicoverpa armigera (Lepidoptera:Noctuidae)
【中文关键词】null
【英文关键词】Pyrocatechol, ferulic acid, gramine, nutritional index, cotton bollworm, Helicoverpa armigera

【中文摘要】无
【英文摘要】Three secondary compounds, pyrocatechol, gramine and ferulic acid from wheat were separately incorporated into artificial diets and fed to cotton bollworm Helicoverpa armigera (H ü bner) larvae to determine their effects on larval and pupal weights and the nutritional indices of the larvae. The results show that these three secondary compounds can decrease the mean larval and pupal weights of cotton bollworm, with the mean larvae weights differing significantly between treatments. Mean pupal weight was only significantly reduced by ferulic acid and gramine, but not pyrocatechol. There were significant correlations between mean larval weight and concentration of the three secondary compounds tested, and between mean pupal weight and concentration of ferulic acid and gramine. The three secondary compounds tested affected the nutritional indices of cotton bollworm larvae differently. Compared with the control, ferulic acid and gramine significantly decreased RGR (the relative growth rate), AD (approximate digestibility) and ECD (conversion efficiency) of cotton bollworm larvae, and pyrocatechol only reduced ECD. All three indices were the lowest for cotton bollworm larvae fed on the diet with gramine (0.0984 ± 0.0114 g/g/day, 14.2670 ± 1.1541% and 31.1337 ± 1.1213%).

【题目】The three dimensions of species diversity
【中文关键词】的
【英文关键词】assessment, biodiversity, community, evenness, species abundance, species diversity
【中文摘要】的
【英文摘要】The concept of biodiversity can be simply defined as the sum of all biotic variation from the level of genes to ecosystems. Biodiversity at the species level, frequently called "species diversity", is a core concept of ecological community and conservation research. To date, however, no single number can fully capture such a concept without loss of information, although many attempts have been made to quantitatively express species diversity. Three aspects of species diversity have received considerable attention in the literature: species richness, evenness and abundance. Current diversity indices often emphasize evenness at the expense of richness or abundance. In this paper, we propose to express species diversity of communities as their position in a three-dimensional volume along the axes of richness, abundance, and evenness. With hypothetical as well as actual examples from our own studies, we discuss the usefulness of this three-dimensional approach. We believe that expressing species diversity as a volume is biologically intuitive, easy to interpret numerically and ecologically, and very useful in the assessment and management of biodiversity at the species level.

【题目】大蒜-小白菜间作套种对菜田节肢动物功能团的影响
【中文关键词】间作套种; 节肢动物群落; 功能团; 生物多样性;
【英文关键词】intercropping; arthropod community; guild; biodiversity;
【中文摘要】2004年9-11月于福建省琅岐岛针对大蒜与小白菜间作(CG1)套种(CG2)对节肢动物群落功能团影响进行调查和分析。结果显示:CG1提高了植食性昆虫、寄生性和捕食性天敌丰盛度,CG2可在降低植食性昆虫数量的同时提高寄生性天敌的数量;多作田寄生性天敌物种丰富度、丰盛度和多样性指数均高于单作田;优势类群动态表现为菜蚜茧蜂与蚜虫种群在CG1出现"天敌跟随现象",多作田在整个生长期都有利于提高捕食者球腹蛛的控制效能;中性昆虫在生长前期和中期是菜蚜虫茧蜂和球腹蛛的替代寄主或猎物。因此合理的间作或套种,有利于提高菜田生境的多样化,强化自然天敌对害虫的

生态控制作用。
【英文摘要】Field trials were carried out at Langqi,Fujian,P.R.China,in 2004,to determine the effects of intercropping Chinese cabbage(Brassica chinensis)with garlic(Allium sativum)(CG1 and CG2)on the abundance and diversity of various arthropod guilds.The results generally demonstrated a higher abundance and diversity of herbivores,predators and parasitoids in the intereropping treatments.There was a higher abundance of herbivores,parasitoids and predators in CG1 than in the control(CK)and a higher abundance,richnes...

【题目】间作牧草对茶园螨类群落多样性的影响
【中文关键词】间作, 蜱螨目, 百喜草, 圆叶决明
【英文关键词】intercropping, Acarina, Paspalum notatum, Cassia rotundifolia
【中文摘要】螨类是茶园生态系统中重要且复杂的类群之一。为了了解不同植物间作后对茶园螨类群落的组成结构和多样性的影响, 2006年3月至2008年4月, 在武夷山市星村镇大坪洲茶园通过间作百喜草(Paspalum notatum)或圆叶决明(Cassia rotundifolia)、留养杂草和除杂草4种不同处理, 对茶园茶冠层(采用盆拍法及剪枝条法)和凋落层(采用捡取凋落物法)的螨类进行系统采样、标本鉴定和统计分析。结果表明: 与留养杂草对照相比, 间作百喜草或圆叶决明均显著增加了茶冠层和凋落层捕食螨的物种丰富度(S)、有效多样性指数(eH′)、个体数(N)和绝对丰度(n)。与留养杂草和除杂草这两种对照相比, 间作百喜草或圆叶决明均显著增加了茶冠层和凋落层优势种圆果大赤螨(Anystis baccarum)的个体数(N)。茶冠层植食螨和腐食螨及凋落层腐食螨的所有群落指标在不同处理茶园间均无显著差异。茶冠层和凋落层螨类群落物种丰富度(S)和个体数(N)季节性变化明显, 物种组成相似性高。间作茶园和留养杂草茶园茶冠层的螨类总个体数与其对应的凋落层螨类总个体数呈显著正相关。多样化茶园有利于保护和利用捕食螨, 从而对茶园有害生物进行生态控制, 促进有机茶叶可持续生产。
【英文摘要】Mites form one of the most important and complex communities of arthropods in tea plantations.We examined the responses of mite communities in terms of species composition, structure and diversity intea plantations subjected to two types of intercropping. Samples were collected between March 2006 andApril 2008 from tea canopies using both knock-down and pruning methods, and from ground litter in fourdifferent treatments in tea plantations in the Wuyi Mountains. Results from both canopy and litter samplesshowed that tea plantations intercropped with Paspalum notatum or Cassia rotundifolia had significantlyhigher species richness (S), effective diversity index (eH′), number of individuals (N), and absolute abundance(n) of predatory mites than in control tea plantations with natural vegetation. Plantations intercropped withP. notatum or C. rotundifolia displayed a significantly higher number of individuals (N) of Anystis baccarum,a common predatory species, for both canopy and litter samples versus the tea plantation with natural groundcover and on bare ground. Species richness, number of individuals, and diversity indices of both phytophagousand saprophagous mite communities collected from tea canopies and of saprophagous mite communitiesin litter were not different among the various intercropping treatments. Seasonal dynamics in mite speciesrichness (S) and number of individuals (N) were apparent for all treatments. Czekanowski similarity indicessuggested that these communities were highly similar to each other. For the tea plantation intercroppedwith P. notatum or C. rotundifolia, or with natural ground cover, the total number of mites in tea canopieswas positively associated with the total number of mites in the litter. We suggest that diversifying teaagroecosystems by using intercrops can bolster predatory mite densities, thus providing a viable strategy for pest management and promoting the environmentally benign production of tea products.

【题目】云南省稻飞虱发生原因及其治理对策
【中文关键词】稻飞虱 云南省 治理 原因 成灾面积 发生面积 直接损失 发生特点
【英文关键词】null
【中文摘要】2007年稻飞虱在云南省特大发生。各项指标均超过农业部颁发的大发生标准,是新中国成立以来最严重的1年.发生面积突破历史最高.达86.67万hm^2次,为2006年的3倍。表现出田间虫量高、为害重、落地成灾的特点。经过全力防治之后,成灾面积仍然达到2.67万hm^2,造成粮食直接损失约19万t。笔者结合云南省的气候特点对稻飞虱的发生特点、原冈进行分析并提出治理对策。

【题目】农业景观多样性与害虫生态控制
【中文关键词】农业景观;生物多样性;生境破碎化;溢出效应;害虫生态控制
【英文关键词】agricultural landscape; biodiversity; habitat fragmentation; spillover effect; sustainable pest management

【中文摘要】现代农业的一个重要特征就是人类对农田生态系统的干扰强度及频率不断增加,严重影响农业景观的结构及其生物多样性.农业景观结构的变化及其生物多样性的丧失,必然引起生态系统服务功能的弱化,不利于实施以保护自然天敌为主的害虫生态控制.农业的集约化经营导致自然生境破碎化,减少了农业景观的复杂性,使得作物和非作物变成一种相对离散化的生境类型和镶嵌的景观格局;破碎化的生境不仅会减少某些物种的丰度,还会影响物种之间的相互关系及生物群落的多样性和稳定性.非作物生境类型如林地、灌木篱墙、田块边缘区、休耕地和草地等,是一种比较稳定的异质化环境.非作物生境较少受到干扰,可以为寄生性和捕食性节肢动物提供适宜的越冬或避难场所以及替代猎物、花粉和花蜜等资源,因此,非作物生境有利于自然天敌的栖息和繁衍,也有利于它们迁入邻近的作物生境中对害虫起到调节和控制作用.景观的格局-过程-尺度影响农田生物群落物种丰富度、多度、多样性以及害虫与天敌之间的相互作用.从区域农业景观系统的角度出发,运用景观生态学的理论和方法来研究作物、害虫、天敌等组分在不同斑块之间的转移过程和变化规律,揭示害虫在较大尺度和具有异质性的空间范围内的灾变机理,可为利用农业景观生物多样性来保护农田自然天敌,实施害虫的区域性生态控制提供新的研究思路和手段.

【英文摘要】Agricultural intensification has resulted in simplification and fragmentation of natural landscape. Such expansion has been characterized by larger agricultural fields and the removal of natural habitats. These changes have had as consequences a rapid decline in biodiversity with most remaining species mostly located in ecotones and natural undisturbed habitats. This mosaic landscape also influences the ecosystem functions such as the presence and migration of natural enemies that can control pest in agricultural fields. Due to their stability and heterogeneity, natural habitats can provide shelters and alternative food for these species thus maintaining their critical roles in agroecosystems. Considering the need for such diversity in these ecosystems, sustainable pest management requires a landscape management approach.. Sustainable pest management can only be achieved if conservation of biodiversity takes into account the mosaic pattern of this landscape, thus reducing distances between habitats for poorly-dispersed and specialized natural enemies. Structurally complex landscapes with high habitat connectivity may enhance the roles of beneficial species by efficiently regulating pest populations. Their heterogeneity allows for greater level of species diversity where natural habitats compensate the homogeneity and reduction in diversity in agricultural fields. Complex landscapes characterized by highly connected crop and non-crop mosaics may be best for the survival of natural enemies and long-term conservation of biodiversity. However, further studies are required to better design agricultural landscapes that optimally maintain biodiversity of natural enemies in support of regional ecologically pest management.

【题目】石榴园西花蓟马种群动态及其与气象因素的关系
【中文关键词】西花蓟马; 种群动态; 气象因素; 石榴
【英文关键词】Frankliniella occidentalis; population dynamics; meteorological factors; pomegranate
【中文摘要】2007—2008年,对云南省建水石榴园西花蓟马种群动态进行了系统调查,并采用回归分析(逐步回归分析、通径分析)、主成分分析及灰色系统分析就气象因子对该虫种群动态的影响进行了系统分析。结果表明,西花蓟马在建水石榴园常年发生,冬季较低,夏季最高,成虫全年种群消长呈单峰型,高峰期为5月份。相关性分析结果表明,西花蓟马种群数量与月相对湿度间呈极显著正相关性(P<0.01),与月均气温和月最低气温间呈显著正相关性(P<0.05),与月最高气温、月均降雨量和月均蒸发量间无相关性(P>0.05)。回归分析结果表明,石榴园西花蓟马种群动态的决定因子中影响最大的气象因素是月最低气温,而月均气温和月相对湿度是影响种群数量变动的主要因素。主成分分析表明,月最低气温是主要成分,其累积方差贡献率达73.03%。灰色系统分析结果表明,影响石榴园6种蓟马种群动态最关键的因子是月相对湿度;年度间影响最大的是年总降雨量;石榴花期各蓟马的种群数量与气象因素间关联度最大的是月最低温;果期各种蓟马的种群数量与气象因素间关联度最大的是月均降雨量。
【英文摘要】The western flower thrips Frankliniella occidentalis (Pergande) has been a major pest of agricultural and hotricultural crops in fields and greenhouses worldwide. Since its found in Beijing Municipality of China in 2003,and now it is the serious pest in pomegranate tree of Jianshui County,Yunnan Province in recent years. The population dynamics of the F. occidentalis in pomegranate orchards was surveyed by using gathering thrips in different positions of pomegranate including flower,leaf,shoot and young fruit and using blue sticky cards from 2007 to 2008 in Jianshui County,Yunnan Province. The relationship between meteorological factors including monthly mean temperature,monthly maximum temperature,monthly minimum temperature,monthly rainfall,monthly relative humidity (RH) and monthly evaporation and population dynamics were analyzed using the regression analysis (stepwise regression analysis and path analysis) ,the principal component analysis and the grey system analysis. The results indicated that during

the study periods,adults of the F. occidentalis occurred throughout the year,the lowest population was in winter season and the highest population was in the summer season in each year. The population dynamics was single-peaked,the most serious injury stage was from March to July,with the peak in May. The correlativity results showed that the population of F. occidentalis was significantly positively corrlelated to monthly RH (P < 0.01) ,and it was positively corrleated to monthly mean temperature,monthly minimum temperature (P < 0. 05) ,followed the regression equation as Y = - 131. 15 + 0. 04 X1 + 22. 71 X3 - 15. 76 X5,(P = 0.002) ,the multiple realtice coefficient was 0. 875,the X1,X3 and X5 was monthly mean temperature,monthly minimum temperature and monthly RH. No significant correlation was found between the population of F. occidentalis and monthly maximum temperature,monthly rainfall amounts,monthly evaporation capacity (P > 0. 05) . Use the stepwise regression analysis,path analysis and decision coefficient analysis on the relations between the population of F. occidentalis and monthly mean temperature,monthly minimum temperature and monthly RH. The results described that the monthly minimum temperature was the major decisive factor,whose the decision coefficient was R2(3) = 3. 662,and the monthly mean temperature and the monthly RH were the primary limiting factors,whose the decision coefficient respectively were R2(1) = - 0.484 and R2(5) = - 2.621. The principal component analysis indicated that the monthly minimum temperature of the first principal component was the primary decisive factor,whose cumulative variance proportion was 73. 03% and monthly RH of the second principal component was also the primary decisive factor,whose Load was 0. 978. The total cumulative variance proportion of previous two principal components was 95.30%. It could be the comprehensive index of meteorological factors to analysis the population dynamics of F. occidentalis. The grey system analysis on the relationship between the population and the meteorological factors showed that the monthly RH was the key factors of seasonal dynamics, whose integral was 10. And the total annual rainfall amounts was the key factors of annual dynamics,whose degreeofrelation was 1. 012,and that all the meteorological factors ranked as the Toal Annual Rainfall > Annual Mean RH > Annual Maximum Temperature > Annual Minimum Temperature > Annual Mean Temperature.

【题目】小麦收获期对麦套棉田捕食性天敌和棉花苗蚜的影响
【中文关键词】麦棉套种;捕食性天敌;麦蚜;棉蚜;小麦收获期

【英文关键词】Wheat-cotton intercropping; Predators; Wheat aphids; Cotton aphids; Wheat-cutting dates

【中文摘要】2004—2005年在冀南棉区研究了小麦收获期对麦套棉田中捕食性天敌和棉花苗蚜的影响。小麦收获期共设3个水平,分别是6月5日、6月10日和6月15日收获小麦。结果表明:2004年3个时期收获小麦对棉田的益害比(天敌和棉蚜的比值)无显著影响(t〉0.05);2005年6月5日收获小麦,显著增加了棉田的益害比(t〈0.05),6月10日和6月15日收获小麦对棉田的益害比无显著影响(t〉0.05)。说明在麦套棉田中,麦田天敌到棉田的有效转移受麦蚜-天敌-棉蚜三者发生高峰期的影响,不同年份天敌的转移情况有所不同。麦蚜发生高峰期早则小麦天敌向棉田转移早,并能有效控制苗期蚜虫的危害,在麦熟期收获小麦,对棉田天敌的数量影响不大;反之,若麦蚜发生高峰期晚,麦田天敌发生期也会相应延后,在麦熟期收获小麦则会引起棉田天敌的增加。因此,棉田天敌数量变化受小麦收获期的影响,但与麦蚜和麦田天敌的发生动态有直接关系。

【英文摘要】Systematic studies were conducted on predators and cotton seedling aphids in wheat-cotton intercropping field in North China in 2004 - 2005. Three treatments of wheat-cutting dates were designed on 5 June, 10 June and 15 June respectively to investigate the influence of wheat-cutting dates on predators and cotton seedling aphids. The results showed that there was no significant difference in predator/cotton aphid ratio between treatment field and control field during different wheat-cutting dates in 2004(t〉 0.05). A significant difference was observed in predators/cotton aphids between treatment field and control field on 5 June in 2005 (t 〈0.05), but no significant difference was found in other wheat-cutting dates in 2005 (t〉 0.05). Wheat-cutting could obviously increase predator populations into cotton. The results suggested that the peak time of wheat aphids, predators and cotton aphids determined the efficient movement of predators from wheat field into cotton field. The earlier peak day of wheat aphids made it possible that predators move into cotton field earlier, and predators can effectively suppressed cotton seedling aphids. Thus, few predators increased in cotton during wheat-cutting period. The later peak day of wheat aphids delayed the movement time of predators from wheat field into cotton field, and cotton predators increased obviously when wheat is harvested during wheat maturation period. The occurrence c of predators and cotton seedling aphids in cotton fields were affected by wheat-cutting dates, but it was directly related to the occurrence of wheat aphids and predators in wheat.

【题目】麦套Bt棉的经济效益和对棉蚜及天敌的影响

【中文关键词】棉花;小麦;棉蚜;套种

【英文关键词】Cotton; wheat; cotton aphids; intercropping

【中文摘要】2004~2005年,在冀南棉区调查了麦套Bt棉田对棉花苗期蚜虫和天敌的影响及其经济效益.结果表明,麦套棉田的棉蚜数量均显著低于对照田(P<0.05),其高峰期的蚜虫种群数量低于防治指标,且受棉蚜的危害程度小于对照田.麦套棉田中的瓢虫和僵蚜的种群数量显著高于对照田和化防田,与对照田相比,麦套棉田中的瓢虫发生高峰期提前l0天左右.化防田的籽棉产量高于麦套棉田和对照田,但麦套棉田2004和2005年的综合经济效益分别为1.7万元/hm2和2.08万元/hm2,比化防田多0.53万元/hm2和0.57万元/hm2.试验结果还表明,棉花苗期蚜虫能够显著影响棉花产量,采用套种等多熟种植模式可以作为Bt棉有害生物综合治理的重要组成部分.

【英文摘要】Field studies were conducted to investigate economic profit of intercropping system of wheat and Bt cotton and its effect on cotton aphids and natural enemies at seedling stage during 2004-2005 in south of Hebei Province. The field experiments consist of wheat intercrop transgenic Bt cotton field (W/CF), transgenic Bt cotton field used chemical insecticides to control cotton aphids only at seedling stage (CCF), and transgenic Bt cotton control field without pesticide use (CF). Each treatment plot was 667 m2. Treatments were replicated three times in a completely randomized design. The arthropod collected included cotton aphids (Aphis gossypii Glover), and natural enemies (ladybeetles, spiders and mummified aphids). Wheat and seed cotton yield were also investigated. The results indicated that W/CF significantly suppressed cotton aphids density compared with CF (P<0.05), and obviously reduced the cotton damage by cotton aphids. More natural enemies, especially ladybeetles and mummified aphids, were observed in W/CF than those in CF and CCF, and the peak day of ladybeetle was earlier about 10 days in W/CF than CF. CCF had the highest seed cotton yield, followed by W/CF and CF. However, the total economic income of W/CF was 1.7×104 yuan/hm2 (2004) and 2.08×104 yuan/hm2 (2005), respectively, which were higher than that of CCF and CF. The cotton aphids at seedling stage can significantly reduce cotton yield and intercropping model could serve as a key tactic in IPM of Bt cotton in northern China. 18 Refs. In Chinese.

【题目】云南元阳梯田水稻田白背飞虱若虫空间分布型及理论抽样数
【中文关键词】白背飞虱;空间分布型;负二项分布;分布型参数;元阳梯田;云南
【英文关键词】null
【中文摘要】采用Taylor幂法扩散法和Iwao回归法分析了云南元阳哈尼梯田1400~2000m海拔16个哈尼族传统水稻品种田白背飞虱Sogatella furcifera(Horvath)1~3龄若虫的空间分布特征。结果表明,白背飞虱1~3龄若虫在不同海拔、不同水稻品种田均呈聚集分布中的负二项分布,其负二项分布的公共K值为3.53,聚集原因主要是由白背飞虱生物学特性和环境因素引起。Iwao直线回归方程拟合公式为m*=3.96+1.09m(R=0.97),Taylor幂拟合公式为lg(V)=0.28+1.34×lg(m)(R=0.85)。其中,在1400~1500、1501~1600、1601~1700、1701~1800、1801~1900和1901~2000m海拔梯田稻田中,白背飞虱若虫平均拥挤度分别为10.74±0.83、23.67±3.50、21.64±6.02、47.10±5.71、52.59±12.75、13.72±3.14,差异显著(F=5.77,P0.01),其中在1701~1800和1801~1900m海拔稻田中白背飞虱平均拥挤度最高,表明在该海拔处白背飞虱在稻丛上分布较为集中,而在1400~1500和1901~2000m海拔稻田中平均拥挤度最低。根据空间分布型参数,建立了精度分别为0.1和0.2时的理论抽样数模型,分别为n=1905.43x+34.57,n=476x.36+8.64,该模型适用于不同虫口密度下的田间抽样。当白背飞虱虫口密度为5、10、20头/丛时,分别取样30、20和15个样方。

【题目】非作物生境在作物害虫天敌调控制中的作用研究进展
【中文关键词】非作物生境; 天敌; 调控
【英文关键词】non-crop habitats; natural enemies; control
【中文摘要】农田生态系统可以区分为作物生境和邻近作物的非作物生境。许多研究表明,与特定作物田块相联系的植被类型和结构可影响害虫的天敌迁居的种类、数量和时间。因此,可通过改变大田周围非作物生境的植被组成及特征来调控农业生态系统中害虫与天敌的相互关系,提高天敌对害虫的控制作用。当作物遭到破坏或天敌的寄主稀少时,天敌则迁向邻近的生境以获取合适的食物及寄主。作物周围的非作物生境对保护利用天敌十分重要。
【英文摘要】An agro-ecosystem can be identified as all area which includes crop habitat and non-crop habitat.Many studies shows,the vegetational settings and structure associated particular crop fields can influence the kind,abundance,and time of colonization of natural enemies.Therefore,we Gall change the non-crop vegetation composition and characteristics around the filed to control the relationship between the pests and natural enemies in agro-ecosystems,improve the effectiveness of natural enemies to pest.When the crops suffered with damaging or the scarcity of natural enemies of the host,the natural enemies will move to nearby suitable habitat for food and hosts.The non-crop habitats have important to protect and use of natural enemies.

【题目】应用中性理论分析局域群落中的物种多样性及稳定性
【中文关键词】群落中性理论;物种多样性;群落稳定性;局域群落;集合群落;马尔可夫链
【英文关键词】community neutral theory; species biodiversity; community stability; local community; meta-community; Markov Chain
【中文摘要】如何解释群落中物种的丰富与稀少,并对物种多样性和群落稳定性进行合理的量化评价是群落生态学研究中的一个热点问题.20世纪中期,MacArthur将影响自然群落稳定性的因素归结为物种数量多少以及物种间相互作用的大小,20世纪末Doak等学者提出群落的容纳能力和物种间的维持机制是决定群落稳定性的关键因素.同时对群落结构及物种间维持机制的研究也有了新的突破,Hubbell提出"生物多样性与生物地理学统一的中性理论(Unified Neutral Theory of Biodiversity and Biogeography)"为群落生态学研究提供了新的思路和方法.从群落中性理论的基本假设出发,对Hubbell中性理论中局域群落的物种多度动态模型进行分析,归纳得出群落中性理论中物种多样性与群落稳定性之间的量化关系.封闭的局域群落中,出现物种灭绝或单物种独占的时间与群落大小及物种相对多度成正比,物种多样性程度的增加可延长物种灭绝或独占的时间;开放的局域群落中,物种多度期望值与局域群落大小、物种在集合群落中的物种相对多度成正比,周围群落中物种的灭绝会引起局域群落中相应物种的灭绝,最终导致整个生态群落物种多样性的降低;群落中物种多度的方差与局域群落大小、迁移率、物种在集合群落中的物种相对多度相关,局域群落物种多度的波动幅度随着群落间生态隔离的减弱或物种多样性程度的增加而减小.由此,集合群落物种多样性是影响局域群落物种多样性的重要因素,生态隔离程度的减弱及物种多样性的增加都将增强群落的稳定性.
【英文摘要】How to explain the causations of the diversity and the rarity,and how to measure the relations reasonably between the species diversity and the community stability are still the controversial problems in the community ecology.MacArthur contributed the factors affecting community stability to the species abundance and the interactions inside the community.In 1990s,researchers including Doak put forward that the community population capacity and the maintain mechanism are the crucial factors influencing the community stability.At the same time,great advances had been achieved in the study on the structure and the maintain mechanism of the community.In 2001,Hubbell and other ecologists introduced a now neutral theory (Unified Neutral Theory of Biediversity and Biogeography) to explain the species coexisting in community:this theory provided a new quantifiable way to measure the relations between the species diversity and the community stability.This paper analyzed the dynamics model of the species abundance in local community according to Hubbell's neutral theory based on the neutral hypothesis of the community theory,concluded that the ecological quantify relations between the species diversity and the community stability in neutral theory.Firstly,the time to extinction or mono-dominance of the species is positively related with the community size and the relative species abundance in the isolated local community from meta-community.Thus,the time to extinction or mono-dominance of the species in the local community will be prolonged and the community stability will be improved when the community diversity increased.Secondly,in the local community that open to immigration from the recta-community,the expected abundance of an arbitrary species is positively related with the local community size and its relative species abundance in the rectacommunity.So the species extinction in the meta-community will provoke the extinction of the same species in local community and finally will reduce the community diversity.The abundance variance is related with the local community size,immigration,and the relative species abundance in the recta-community.So,the community stability will be improved with the decrease of the abundance variance while the ecology isolation is weakened or the community diversity is increased.Therefore,species diversity of the meta-community is one of the factors affecting the species diversity of the local community,the decrease of the ecology isolation and the increase of the species diversity are factors affecting the community stability.

【题目】温度与接蜂密度对管氏肿腿蜂寄生的联合干扰反应研究
【中文关键词】管氏肿腿蜂;温度;接蜂密度;干扰反应
【英文关键词】Scleroderma guant xiao et wu; Temperature; Parasitoid density; Interruption effect
【中文摘要】室内测定了不同温度与不同接蜂密度条件下对管氏肿腿蜂Scleroderma guani寄生的联合干扰反应.结果表明,肿腿蜂在温度15 ℃,接蜂量为1,2,3,4,5头时,其产卵量分别1.50±0.71,2.00±0.47,1.50±0.53,1.30±0.48,1.20±0.42,差异显著(F=3.44,P=0.02).在温度24 ℃,接蜂量为1,2,3,4,5头时,管氏肿腿蜂产卵量分别为32.80±1.61,36.40±1.43,34.60±2.01,27.50±1.96,16.40±1.51.其中温度在27 ℃条件下,接肿腿蜂1头时,管氏肿腿蜂产卵量为最高.不同温度下,管氏肿腿蜂对自身密度的干扰反应随着单位空间内密度的增加,其干扰作用增强,表现为随着寄生蜂密度增大,寄生率下降.肿腿蜂对黄粉甲蛹的寄生率在27 ℃下最高,达93.33±3.55 %.在温度24、27、30 ℃时,均以光周期为10L:14D的寄生成功率最高.在温度18和21 ℃时寄生成功率均以16L:8D条件下为最高.
【英文摘要】Combined interruption effect of the temperature and the parasitoid density on the parasitoids of the Scleroderma guani was evaluated in the laboratory.Results showed that the fecundity was low in 15 ℃,in which the difference was obvious,the fecundity was 1.50±0.71,2.00±0.47,1.50±0.53,1.3±0.48,1.20±0.42 under the inoculation of 1,2,3,4,5.The fecundity of S.guant xiao et wu was 32.80±1.62,36.40±1.43,34.60±2.01,27.50±1.96,16.40±1.5 at 24 ℃,with an inoculation of 1,2,3,4,5.So that the fecundity of S.guant xiao et wu was the highest at 24℃. On the condition of different temperatures, the in terruption effect was increasing when the densitywas increasing. The number of parasite and the parasite rate were falling with the density of parasitic bee increasing. The maximum Parasitoidismwas 93.33±3.55% under the 27℃. The successful Parasitoidism was varied with the different conditions of temperature and photoperiod combinations the maximum parasitoidsm was in the photoperiod of 10L:14D under the temperature of 24, 27, 30℃. M oreover, the parasitoidsm increased with the extend of the photoperiod under the temperature of 18 and 21℃, but the maximum parasitoidsm was in the photoperiod of 16L: 8D.

【中文关键词】绿豆象;生长发育;豆类作物;产卵
【英文关键词】bean weevil(Callosobruchus chinensis); growth and development; legume crops; oviposition
【中文摘要】在室内25℃恒温条件下,饲养观察了绿豆象[Callosobruchus chinensis(Linn.)]对不同豆种的产卵选择性、产卵量、卵的孵化率、幼虫和成虫的生长发育历期.结果表明,供试的17种豆粒上绿豆象的着卵率均达80%以上,且不同豆种粒上产卵量差异显著(P<0.01),卵在不同豆种上的孵化率间也存在显著差异(P<0.05),卵孵化后,幼虫仅在蚕豆、绿豆、红皮豇豆、豌豆、黑豆、红小豆、大豆上可蛀入危害,蛀孔数分别为3.00±0.25,2.00±0.18,3.50±0.09,2.50±0.21,4.50±0.10,2.00±0.22,2.50±0.17蛀孔/豆,差异显著(P<0.05).在蚕豆、绿豆、红小豆、红皮豇豆、黑豆、大豆粒上的世代存活率分别为(0.63±0.12)%,(54.84±0.09)%,(44.40±0.08)%,(46.33±0.11)%,(66.88±0.10)%,(45.71±0.11)%,(21.59±0.21)%;雌虫的产卵期分别为(4.24±1.58)d,(5.10±0.22)d,(5.40±0.26)d,(5.21±1.25)d,(5.30±0.38)d,(4.63±0.41)d和(4.30±0.80)d,差异不显著(P>0.05),卵历期分别为(5.01±0.15)d,(4.30±0.05)d,(4.10±0.08)d,(5.10±0.18)d,(4.30±0.07)d,(4.20±0.14)d及(4.51±0.16)d,差异不显著(P>0.05);幼虫的平均历期分别为(33.40±4.85)d,(31.60±1.78)d,(28.22±3.56)d,(30.91±2.49)d,(27.30±1.98)d,(29.50±1.93)d及(36.70±4.97)d,差异显著(P<0.05).不同豆种上绿豆象雄虫寿命间差异不显著(P>0.05),而雌虫寿命差异显著(P>0.05).
【英文摘要】The influence of the legume varieties on the oviposition preference,growth and development of Callosobruchus chinensis(L.)was studied in laboratory under the temperature of 25℃.All the 17 legume varieties were planted in Yunnan province.The adult of the C.chinensis showed a preference of legumes for oviposition in 17 varieties of bean seeds,significant difference was found

among the oviposition seeds in the 17 varieties(P<0.01),and the adult of C.chinensis oviposited for more than 80%of the seeds.The hatchability was significantly different in the different varieties(P<0.05),the larvae only could feed on the following 7 varieties,including Vicia faba,Vigna radiate,Vigna sinensis,Pisum sativum,Vigna mungo,Vigna angularis,and Glymine max,and the average puncture hole numbers were 3.00±0.25,2.00±0.18,3.50±0.09,2.50±0.21,4.50±0.10,2.00±0.22,2.50±0.17 seed on them,respectively,and with significant difference(P<0.05).The survival rates on V.faba,V.radiate,V.angularis,V.sinensis,P.sativum,V.mungo and G.max were (0.63±0.12)%,(54.84±0.09)%,(44.40±0.08)%,(46.33±0.11)%,(66.88±0.10)%,(45.71±0.11)%,(21.59±0.21)%,respectively.The duration of oviposition was (4.24±1.58)d,(5.10±0.22)d,(5.40±0.26)d,(5.21±1.25)d,(5.30±0.38)d,(4.63±0.41)d and (4.30±0.80)d,and with no significant difference(F=2.03,P>0.05).The duration of the egg was (5.01±0.15)d,(4.30±0.05)d,(4.10±0.08)d,(5.10±0.18)d,(4.30±0.07)d,(4.20±0.14)d,(4.51±0.16)d,and with no significant difference(F=3.82,P>0.05).The average duration of the larvae was (33.40±4.85)d,(31.60±1.78)d,(28.22±3.56)d,(30.91±2.49)d,(27.30±1.98)d,(29.50±1.93)d,and (36.70±4.97)d,with no significant difference(P<0.05).the longevity of the male adults showed no significant different among the different varieties of legumes(P>0.05),but significant difference was found for the longevity of females(P>0.05).

【题目】宗谱学群落中性理论模型及其在昆虫物种多样性评价中的应用
【中文关键词】物种多样性;中性理论;贝叶斯理论;马尔科夫链蒙特卡洛算法(MCMC);宗谱学方法;昆虫群落
【英文关键词】null
【中文摘要】物种多样性是群落的基本特征之一,群落中物种的组成、结构、发展演变及物种间的相互作用等一直是研究群落稳定性的基础和前提。群落中性理论自提出以来,在生态学界引起了广泛的重视,之后Etienne和Olff从宗谱学角度对群落物种结构的动态变化进行了分析,提出了宗谱学群落中性理论模型。本文结合贝叶斯理论和马尔科夫链蒙特卡洛(MCMC)算法对基于宗谱学的中性理论动态模型进行分析,并以2004-2005年黑光灯诱捕的鳞翅目昆虫群落结果为数据,利用该新模型参数估计方法进行验证和对比。结果表明,贝叶斯理论和MCMC算法是群落物种多样性研究中分析群落维持机制的有效途径;宗谱学群落中性理论模型为检验中性理论和参数估计提供了新的方法;新模型对昆虫群落物种多样性评价有一定价值和意义。

【题目】云南酸甜石榴园Malaise网诱捕昆虫群落及其季节性动态
【中文关键词】石榴园;昆虫群落;马氏网;季节性动态
【英文关键词】pomegranate orchard; insect community; Malaise trap; seasonal variation
【中文摘要】2007~2008年,以云南省建水县酸石榴园为基地,采用Malaise网诱捕器对园内昆虫群落结构进行了调查,根据节肢动物群落中物种的营养和取食关系将总群落划分为天敌亚群落、害虫亚群落、中性昆虫亚群落,利用群落多样性指标对石榴不同生育期昆虫群落结构及其动态进行了分析比较.结果表明,从2007年5月~2008年9月,共诱捕获得昆虫纲12目75科375种1708头.物种丰富度、多样性指数和均匀度分别为50.25,5.08,0.86.其中寄生性天敌有79种300头,捕食性天敌有46种162头,害虫有193种959头,中性昆虫有57种287头.害虫亚群落、天敌亚群落和中性昆虫亚群落物种丰富度分别为

27.96,20.21,9.89,多样性指数分别为4.23,4.36,3.26.天敌昆虫群落与害虫群落及中性昆虫群落相对多度呈互补关系.
【英文摘要】The community structure of insect communities in sweet-soul pomegranate orchard was surveyedby using the Malaise trap in pomegranate orchard in Jianshui county,Yunnan province,China.Results showed that,there were 1708 insects belonging to 12 orders and 75 families of insect captured in the Malaise trap from May,2007 to the September,2008.The richness and Shannon—Wiener index and Evenness index was 50.25,5.08,0.86,respectively.Among of them,there were 79 species of 300 individuals were parasitoid,there were 46 species of 162 individuals of predator,and 193 species of 959 individuals of pest insects of pomegranates.The species richness was 27.96,20.21,9.89 for pest insects,natural enemies and neutral insects,respectively,and the Shannon-Wiener index was 4.23,4.36,3.26,respectively.The abundance of the natural enemies was complementary with the pests and neutral insects in the pomegranate orchard.

【题目】云南元阳梯田稻作传统农业生态系统中鞘翅目昆虫多样性研究
【中文关键词】鞘翅目昆虫;梯田;帐幕诱捕器;群落多样性
【英文关键词】Coleoptera insect; Terrace; Malaiseent trap; Community diversity
【中文摘要】2007年和2008年4~10月,采用马氏帐幕诱捕器对云南元阳梯田稻田生态系统中鞘翅目昆虫进行了调查。结果表明,元阳梯田生态系统,鞘翅目昆虫有22科130种984头。物种丰富度、Shannon weaver多样性指数、均匀度和优势度指数分别为18.7,5.27,0.75,4.99。从物种多样性来看,诱捕的鞘翅目昆虫物种丰富度依次为叶甲科瓢虫科天牛科鳃金龟科丽金龟科叩甲科=步甲科象甲科负泥虫科绒金龟科拟步甲科=花金龟科。根据鞘翅目昆虫的食性,将鞘翅目昆虫分为植食性、捕食性和腐食性3类。其中捕食性鞘翅目昆虫有34种139头,其物种丰富度、Shannon Wiener指数、均匀度指数分别为6.69,4.48,0.88。植食性鞘翅目昆虫有94种843头,其物种丰富度、Shannon Wiener多样性指数、均匀度指数分别为13.80,4.70,0.72。腐食性有2种2头。根据4~10间鞘翅目昆虫的群落动态的系统聚类结果,昆虫群落种群消长分为3类,第1类为4月和8月,第2类为7,9,10月,第3类为5,6月。其中第3类的5,6月份鞘翅目昆虫群落中种群数量较高。
【英文摘要】The diversity of Coleoptera insects was invested in rice planting traditional ecosystem in Yuanyang Terrace, Yunnan, by using Malaiseent traps from April to October in 2007 and 2008. There were 130 species 22 families and 984 individuals of Coleoptera insects were trapped. The Species richness, Shannon wiener index of diversity, evenness and dominance index were 18.7,5.27,0.75,4.99, respectively. The diversity index of insect communities in the terrace with a rank of the following: Alleculidae 〉 Ceccinellidae 〉 Cerambycidae 〉 Melolonthinae 〉 Rutelinae 〉 Elateridae = Carabidae 〉 Curculionidae 〉 Crioceridae 〉 Sericcidae 〉 Tenebrionidae = Cetoniinae. Trapped coleoptera insects were phytophages, predators, saprophages, among of them, 139 individuals from 34 species were predators, the species richness, Shannon weaver index of diversity and evenness was 6.69,4.48,0.88, respectively. There are 94 species of 843 individu- als of phytophages, the species richness, Shannon wiener index of diversity, and evenness was 13.80,4.70,0.72. Moreover, 2 species of 2 individuals were saprophages. The community dynamic were clustered to 3 groups according to cluster analyses, the first group was in April and August, the second in July, September and October, the third group was in the May and Jun. The highest population was in the third group, as that from April to October throughout the rice growth season.

【题目】干旱胁迫下甘蔗叶类黄酮及相关酶活性的变化
【中文关键词】甘蔗;聚乙二醇胁迫;类黄酮;苯丙氨酸解氨酶;多酚氧化酶;过氧化物酶
【英文关键词】sugarcane ; PEG stress ; flavonoids ; phenylalanine ammonialyas ; polyphenol oxidase ; peroxidase
【中文摘要】以两个抗旱性不同的甘蔗品种ROC22 和ROC16 为试材,采用聚乙二醇模拟干旱胁迫,研究了甘蔗幼苗在干旱胁迫下叶片中类黄酮含量及相关酶活性的变化。结果表明,与对照相比,10 % PEG胁迫2 h 至14 h ,耐旱性强的ROC22 品种类黄酮含量降低,耐旱性弱的ROC16 品种类黄酮含量先降后升;2 个品种幼苗叶片中苯丙氨酸解氨酶活性呈现先降低后升高的变化规律。ROC22 叶片多酚氧化酶活性呈先升后降的变化,ROC16 叶片多酚氧化酶活性下降;2 个品种甘蔗叶过氧化物酶活性持续下降。
【英文摘要】The content of flavonoids and related enzyme activities in the young plants were studied in order to analyze the effect of PEGtreatment on drought resistance of two sugarcane cultivars ROC22 and ROC16. The results indicated as follows : PEG stress could decrease the content of flavonoids in ROC22 with high drought2resistance , whereas the content of flavonoids in ROC16 with low drought2resistance showed decreasing first and increasing later. During the course of PEG stress , the phenylalanine ammonialyase activity in ROC22 and ROC16 decreased for some time but increased afterwards. The polyphenol oxidase activity showed rising first and dropping later in ROC22 but always decreasing in ROC16. The peroxidase activities in ROC22 and ROC16 decreased continuously.

【题目】乙烯利对聚乙二醇胁迫下甘蔗叶类黄酮及相关酶活性的影响
【中文关键词】甘蔗; 乙烯利; 聚乙二醇胁迫; 类黄酮; 苯丙氨酸解氨酶; 多酚氧化酶; 过氧化物酶
【英文关键词】sugarcane; ethephon; PEG stress; flavonoids; phenylalanine ammonialyas (PAL) ; polyphenol oxidase(PPO) ; peroxidase(POD)
【中文摘要】为探讨乙烯利对甘蔗抗旱性的影响, 以2 个抗旱性不同的甘蔗品种ROC22 和ROC16 为试材, 沙培育苗至苗期茎高约25 cm, 采用含10%聚乙二醇6000 (PEG6000) 的H oag land 营养液进行模拟干旱胁迫处理,并同时进行干旱胁迫处理条件下叶面喷施乙烯利处理, 处理不同时间段采叶样, 研究甘蔗幼苗在干旱胁迫与乙烯利处理下叶片中类黄酮含量及相关酶活性的变化。结果表明, 乙烯利处理可提高2 个品种甘蔗幼苗叶片聚乙二醇胁迫一定时期的类黄酮含量, 并使聚乙二醇胁迫处理引起的苯丙氨酸解氨酶活性降低恢复到对照水平; 乙烯利处理能诱导聚乙二醇胁迫下ROC16 品种甘蔗叶多酚氧化酶与过氧化物酶活性增强。
【英文摘要】To analyze the effect of ethephon treatment on the drought resistance of the plants, the changes of the content of f lavonoids and several related enzyme activities in sugarcane leaves were studied under drought stress and ethephon treatment to analyze the effect of ethephon on the drought resistance of sugarcane using two sugarcane cultivars ROC22 and ROC16 w ith relatively high and low droughtre sistance, which were cultivated in sand bed until their stem were about 25cm high. The plants were treated with ethephon and nutrient solution containing 10% polyethylene glycol 6000 (PEG6000) for simulat ing droughtst ress, then taking samples of leaf at different treated stages respectively . The results showed that the ethephon treatment increased the contents off lavonoids at the special time of PEG stress and altered the decreased phenylalanine ammonialy aseactivity to the control level. Moreover, the ethephont reatment significantly increased the activities of polyphenol oxidase and peroxidase in the leaves of ROC16 under PEG stress.

【中文关键词】割手密; 初生增粗分生组织; 微管骨架; 有丝分裂
【英文关键词】Saccharum spontaneum ; primary thickening meristem; microtubule cytoskeleton ; mitosis
【中文摘要】利用冰冻切片法结合间接免疫荧光标记技术对割手密茎尖细胞有丝分裂过程中微管骨架的变化进行了研究。结果表明:在割手密茎尖细胞有丝分裂过程中存在4 种循序变化的典型微管列阵,即周质微管、早前期微管带、纺锤体微管及成膜体微管。在割手密初生增粗分生组织细胞中观察到的大多数是周质微管列阵,很少观察到其它3 种典型的微管列阵,这可能这是割手密茎较小的原因之一。
【英文摘要】The microtubule cytoskeleton was investigated by using cryosectioning and indirect immunofluorescence staining in the shoot apex of S accharum spontaneum. The results indicated that :there were four basic types of microtubule arrays :cortical microtubule,preprophase-band ,spindle and phragmoplast microtubule arrays. Cortical microtubule arrays were predominant in the primary thickening meristem of S. spontaneum ,while other three arrays wererarely observed. It may be one of the reasons why S.

spontaneum has a narrower stem than other cultivars.

【题目】糖厂酒精生产废液施用对蔗地水分、铜和氯利用及流失的影响
【中文关键词】酒精废液; 肥料资源; 水环境污染
【英文关键词】sugarcane vinasse ; fertilizer resource ; pollution of water environment
【中文摘要】为促进甘蔗酒精生产废液的资源化利用,为农作物提供有效的肥料资源及相关水肥管理模式,对比研究了甘蔗地上施用甘蔗酒精生产废液、化肥及不施肥等处理对水分、铜和氯养分吸收及流失的影响,并对施用甘蔗酒精生产废液的食品安全性和对地表水环境污染的影响进行了评价。结果表明,与化肥处理CK2 相比,甘蔗酒精生产废液的施用提高了土壤的水分利用率,降低了甘蔗中铜的含量及铜的径流流失,提高了甘蔗中氯的含量,但各处理蔗汁或径流水中的铜、氯含量或浓度远低于国家标准值。认为在该试验条件下富含有机质的甘蔗酒精生产废液在蔗地上施用,对蔗糖及地表水环境质量没有不良影响,值得推广应用。
【英文摘要】This study was conducted in a sugarcane field in order to promote vinasse application as an effective fertilizer resource and develop a mode of water and nut rient management in sugarcane fields. Three treatments were designed as follows : CK1 (no fertilizert reatment) , CK2 (chemical fertilization t reatment) , vinasse (75t/ hm2 vinasse treatment) . The effects of three treatments on soil moisture , Cu , and Cl uptakes by sugarcane and runofflosses were investigated and food safety or environmental contamination in surface runoff water was assessed. Result s showed t hat t he application of vinasse increased soil moist ure utilization rate and decreased Cu content in sugarcane and surface runoff , as compared with treatment CK2 . However , the application of vinasse increased Cl content in sugarcane and Cl contents or concentrations in sugarcane juice or runoff for all treatments were far less than GB value. It is concluded that in this experimental condition vinasse (containing much orgnic matter) application to sugarcane field decreases water and copper loss , but no serious consequence is found on quality of sucrose and surface water environment. Vinasse is suitable for sugarcane field application.

【题目】甘蔗GA20氧化酶基因片段克隆及序列分析
【中文关键词】GA20 氧化酶; 基因克隆; 序列分析; 甘蔗
【英文关键词】GA20-oxidase; gene cloning; sequence analysis; sugarcane
【中文摘要】以甘蔗茎尖为材料, 根据其它植物的GA20 氧化酶基因(GA20-oxidase)氨基酸保守区, 设计一对简并引物。通过RT-PCR 扩增得出1 条约740 bp 大小的DNA 片段, 将其克隆至pMD18-T 载体上, 而后对重组克隆进行测序, 结果表明所获得的甘蔗GA20 氧化酶基因片段由740 碱基组成, 编码246 个氨基酸。该基因片段具有其它植物GA20 氧化酶基因中存在的保守区; 同时, 与多种单子叶植物的GA20 氧化酶基因的核苷酸和氨基酸序列的同源性在80%和75%以上。聚类分析显示, 甘蔗和玉米最先聚类, 推测在进化上具有较近的亲缘关系, 其次与高粱、结缕草聚类, 然后再与水稻聚类, 其中进化关系最远的是簇毛麦和小麦。
【英文摘要】The cDNA encoding GA20-oxidase in sugarcane with the cane tip as material was cloned and its sequence was analyzed. According to the conserved acid sequence for GA20-oxidase in other plants, a pair of degenerate oligonucleotide primers was designed. Using RT-PCR method, one cDNA fragment about 740 bp was amplified and then cloned into pMD18 -T vector. Then, it was sequenced and the result suggested that sugarcane GA20-oxidase gene was 740 bp long and encoded 246 amino acids. The cloned cDNA fragment in sugarcane had the same conserved amino acid sequences for GA20-oxidase as those in other monocotyledon plants, and shared respective homologies of more than 80% and more than 75% in the nucleotide and amino acid sequences with many other monocotyledon plants. Phylogenetic analysis showed that sugarcane was firstly clustered with maize, then with sorghum and Zoysia japonica, and then with rice. As can be deduced from the phylogenetic analysis, sugarcane was closely related with maize in evolution, farther with barley and ryegrass (Lolium perenne) and farthest with Dasypyrum villosum and wheat.

【题目】赤霉素诱导甘蔗节间伸长与内源激素变化的关系
【中文关键词】赤霉素; 甘蔗; 伸长; 激素
【英文关键词】gibberellin; sugarcane; elongation; hormone
【中文摘要】探讨外源赤霉素对甘蔗节间伸长的效果及其与茎尖内源激素的变化关系。试验以新台糖22 号为材料, 在伸长初期以200mg/L 浓度的赤霉素进行叶面喷施, 对照喷清水。结果表明, 赤霉素处理的株高在各个时期显著高于对照, 而且在处理后7, 14 和28d 分别比对照提高了17.32%、14.50%和8.35%, 赤霉素处理引起植株表现的高度优势一直保持到后期, 节间伸长效果主要集中在中部。赤霉素处理的GA3含量显著高于对照; ABA 含量则相反, 赤霉素处理的均显著低于对照。赤霉素处理的乙烯释放量稍低于对照, IAA 含量从第7 d 开始稍高于对照的; 赤霉素处理对ZR 含量的影响不明显。赤霉素处理的ABA/IAA 的比值显著下降, ZR/IAA 和EH/IAA 的比值也有一定程度的下降, 而提高了GA3/IAA 的比值。这说明外源赤霉素促进甘蔗节间的伸长可能主要通过调节ABA 和赤霉素含量, 其次是乙烯释放量和生长素含量, 最终达到调节节间伸长效果。
【英文摘要】The sugarcane cultivar ROC22 was treated with giberrellin to investigate the relationshipbetween internode elongation and the changes of endogenous hormone in sugarcane. The ROC22 plants were sprayed with 200mg/L of gibberellin at the early

elongation stage, with water spray as control. The results showed that the plant height at different stages was significantly higher in the gibberellin treatment than in the control, increasing by 17.32%, 14.5% and 8.35% respectively at days 7, 14 and 28 after spraying. The plants treated with gibberellin maintained taller than the control until at the late stage, and the internode elongation induced by gibberellin was mainly concentrated in the central part of the stem.The content of GA3 in the stem tip was significantly higher in the gibberellin treatment than in the control,whereas opposite changes were observed for the content of ABA, which decreased by 4.94% in the gibberellin treatment and was significantly lower than that in the control. The ethylene production was slightly lower in the gibberellin treatment than in the control, while the content of IAA was slightly higher in the gibberellin treatment since the 7th day after treatment, and the content of ZR were not significant between the control and the gibberellin treatment. After gibberellin treatment, the ratio of ABA / IAA was significantly lower than that of the control, and the ratios of ZR/ IAA and EH/ IAA were a bit lower thanthose of the control, but the ratio of GA3 / IAA was increased in the treatment than in the control. These results suggest that the internode elongation might mainly be regulated by the contents of ABA and gibberellin, followed by the content of IAA and ethylene releasing rate in sugarcane.

【题目】Overexpression of SGR Results in Oxidative Stress and Lesion-mimic Cell Death in Rice Seedlings
【中文关键词】永绿色基因,氧化胁迫,细胞死亡
【英文关键词】Rice Stay-green, Oxidative Stress; Cell death
【中文摘要】超表达SGR1基因能够通过促进叶绿素及其代谢产物积累造成活性氧积累形成,并诱导水稻幼苗叶片产生类病斑的细胞死亡表型。并通过Ov-SGR/alb株系,自然光周期,全黑暗(黄花苗)和全光照处理,确定该细胞死亡表型依赖于叶绿素和光照。无叶绿素(alb)的Ov-SGR株系和黄花苗没有死亡表型,而全光照加速叶片死亡。通过水稻芯片分析发现ROS调节基因和防御基因的特异表达,说明Ov-SGR水稻材料是水稻幼苗活性氧响应和细胞死亡的一个很好的研究材料
【英文摘要】It is thought that the Stay Green Rice (SGR) gene is involved in the disaggregation of the light harvesting complex and in the subsequent breakdown of chlorophyll and apo-protein during senescence. In this study, we found that overexpression of SGR (Ov-SGR) resulted in the generation of singlet oxygen and other reactive oxygen species and produced a chlorophyll-dependent regional cell death phenotype on leaves of rice seedlings. Transcriptome analyses using Affymetrix Rice GeneChips revealed that Ov-SGR rice seedlings exhibited a number of signs of singlet oxygen response. The genes and their associated biochemical pathways identified provide an insight into how rice plants respond to singlet oxygen at the molecular and physiologic level.

【题目】甘蔗酒精废液对甘蔗农艺性状的影响机理研究
【中文关键词】甘蔗;酒精废液;农艺性状;机理
【英文关键词】Sugarcane; Vinasse; Agronomic characters; Mechanism
【中文摘要】试验研究甘蔗酒精废液的施用对甘蔗农艺性状的影响机理。结果表明,酒精废液的施用:(1)降低了甘蔗的发芽率,与CK1 和CK2 相比,处理75t 和105t 分别达到了显著和极显著水平;(2)提高了甘蔗的分蘖率,其中处理75t 与CK1 相比达到了显著水平;(3)综合起来,酒精废液处理的甘蔗总苗数还有所提高,但处理间不显著;(4)另外,酒精废液的施用降低了甘蔗十月份的株高;(5)各处理的茎径都比CK1 的大,75t 处理的茎径大于CK2,但十月份的株高和茎径各处理间都没有达到显著水

平。各处理的甘蔗出苗率与施肥处理后土壤有效Cu和Cl- 含量呈显著负相关;分蘖率与土壤NO3- - N、胡敏酸含量呈显著正相关;总苗数与土壤胡敏酸含量呈显著正相关;株高与NO3- - N、土壤胡敏酸和有效Cu 含量分别呈显著和极显著负相关。说明土壤NO3- - N、胡敏酸、有效Cu、Cl- 在甘蔗出苗、分蘖和生长中分别起到了关键性的作用。

【英文摘要】The experiment was designed to study the effects of vinasse on the agronomic characters of sugarcane. The results showed that the sugarcane vinasse brought about the effects to sugarcane as following:(1) The vinasse reduced the germination percentage compared with CK1 and CK2,the germination percentages in the treatments applied 75t and 105t were significantly or extremely significantly lower than those in CK1 and CK2 respectively;(2) It enhanced the percentage of sugarcane tillering, and that of the treatment with 75t was higher than that of CK1 obviously. (3)The total number of sugarcane seedling little increased. (4) It reduced the height of sugarcane in October. (5) Stem diameters of every treatment were higher than that of CK1, and that of treatment with 75t was higher than that of CK2, but the sugarcane height and stem diameter between 5 treatments were no significant difference.After fertilization, the germination percentage was correlated negatively with the content of available Cu and Cl- in the soil. The percentage of tillering was correlated positively with the content of NO3-- N and HA in the soil obviously. Total seedling number was correlated positively with the content of HA clearly. The height of sugarcane was correlated negatively with the contentof NO3-- N, HA and Cu in the soil. So the contents of NO3-- N, HA, available Cu, Cl- in soil played a key role during the period of germination, tillering and growth.

【题目】绿僵菌的研究现状及进展

【中文关键词】绿僵菌;分类;分离鉴定;生物学特性;应用;研究进展

【英文关键词】Metarhizium spp.; classification; separation; identification; biological characteristics; application

【中文摘要】介绍了近年来国内外在绿僵菌的分类、分离与鉴定方法、生物学特性和应用等方面的研究进展,指出绿僵菌在分子系统学研究、基因遗传育种、剂型的改进和扩大防治对象上已取得较大的进展,但与Bt等杀虫微生物的研究相比还有较大差距。提出应加强对高毒力绿僵菌菌株的筛选;在防治害虫时尽量减少湿度、紫外线以及土壤微生物和土壤物理、化学性质等对绿僵菌防效的影响,以提高绿僵菌对靶标害虫的防治效果。

【英文摘要】The present study summarizes the researches on classification, separation and identification method, biological characteristics and applications of Metarhizium spp., at China and abroad during recent years. Recently, the molecular systemic research, genic inheritance breeding, improving dosage formulation and enlarging control objects in Metarhizium spp. made a great progress, but there is still a large gap compared to that of insecticidal microorganism such as Bt. Therefore, the screening of highly toxic strain of Metarhizium spp. should be explored, and the influence of humidity,ultra-violet radiations, soil microorganism, and soil physical and chemical characteristics affecting Metarhizium spp.should be studied to enhance the controlling effects of Metarhizium spp.on target insect pests.

【题目】灯光诱杀蔗根土天牛成虫试验初报
【中文关键词】蔗根土天牛;灯光诱杀;防治试验
【英文关键词】Dorysthenes granulosus; trapping and killing by light; control
【中文摘要】2006-2007年,利用频振式杀虫灯和高压汞灯对蔗根土天牛成虫进行田间诱捕试验。结果表明,蔗根土天牛成虫出土时期比较集中在4-6月,不同年份不同气温出土时期略有差异,气温高的年份出土时期提前;蔗根土天牛成虫在19:00-21:00时段活动频繁,扑灯率较高;成虫对光源选择不严格,但跟光源强弱有关。
【英文摘要】The present experiment was conducted to study the effects of frequency vibration-killing lamp on trapping and killing the adults of Dorysthenes granulosus during the whole period of adult growth in 2006-2007. The results showed that the adults of Dorysthenes granulosus came out of soil concentrating from April to June, and has a little difference in different years when the temperature are varied, and would be ahead of time in high-temperature years. It was found that the activity of Dorysthenes granulosus adults at 19:00-21:00 were in high frequend and had a higher rate of flying towards lights. It was found that the adults had no strict selection for the source of light but there was correlation with the strength or weakness of light source.

【题目】Molecular cloning and function analysis of the stay green gene in rice
【中文关键词】水稻, 永绿色基因, 叶绿素降解, 类囊体, 衰老
【英文关键词】Oryza sativa L., stay green, Chl breakdown, thylakoid, senescence.
【中文摘要】本课题确定了水稻永绿色突变体(stay-green rice1, sgr1)是不维持高光合作用的“非功能型永绿色突变体”类型。即水稻叶片的衰老,虽然叶绿素水平变化不大,但是光合作用速度与正常水稻一样同步下降。通过图位克隆的方法确定了突变基因位于水稻的第九条染色体上,由单碱基突变导致了一个保守氨基酸突变。并通过免疫杂交方式确定蛋白产物定位于叶绿体膜。启动子接GUS基因转基因水稻分析表明SGR1基因在水稻各组织都有表达。并通过(半)定量RT-PCR方法确定该基因的表达受衰老(暗诱导衰老和自然衰老)促进,并受植物激素ABA促进而受细胞分裂素的抑制,而且还受低温和

伤害促进表达。显微结构通过比较发现,在衰老过程中突变体类囊体的解体和色素-蛋白复合体的解离受到阻滞,叶绿素降解缓慢;而超表达该基因则导致水稻叶片类囊体基粒片层减少,同时光系统I, II相关蛋白含量和叶绿素含量降低。说明该基因的功能是促进衰老叶片光合膜上色素-蛋白的解体,促进蛋白和叶绿素的分解代谢,从而促进氮素的转移和再利用

【英文摘要】Chloroplasts undergo drastic morphological and physiological changes during senescence with a visible symptom of chlorophyll (Chl) degradation. A stay green mutant was identified and then isolated from the japonica rice (Oryza sativa) cv. Huazhiwu by gamma-ray irradiation. The stay green mutant was characterized by Chl retention, stable Chl-protein complexes, and stable thylakoid membrane structures, but lost its photosynthetic competence during senescence. The gene, designated Stay Green Rice (SGR), was cloned by a positional cloning strategy encoding an ancient protein containing a putative chloroplast transit peptide. SGR protein was found in both soluble and thylakoid membranes in rice. SGR, like the gene for pheophorbide a oxygenase (PaO), was constitutively expressed, but was upregulated by dark-induced senescence in rice leaves. Senescence-induced expression of SGR and PaO was enhanced by ABA, but inhibited by cytokinin. Overexpression of SGR reduced the number of lamellae in the grana thylakoids and reduced the Chl content of normally growing leaves. This indicates that upregulation of SGR increases Chl breakdown during senescence in rice. A small quantity of chlorophyllide a accumulated in sgr leaves, but this also accumulated in wild-type rice leaves during senescence. Some pheophorbide a was detected in sgr leaves in the dark. According to these observations, we propose that SGR may be involved in regulating or taking part in the activity of PaO, and then may influence Chl breakdown and degradation of pigment-protein complex.

【题目】蔗田农业废弃物资源化利用对土壤养分的影响

【中文关键词】甘蔗:蔗叶还田;土壤肥力

【英文关键词】Sugarcane; Cane leave residue return to the field; Soil fertility

【中文摘要】采用连续多年观察和跟踪检测的方法,对广西甘蔗研究所试验农场经过连续9 年机械粉碎蔗叶还田后定点检测土壤的有机质含量及氮、磷、钾三大元素含量的变化,研究蔗叶还田对土壤肥力的影响,养分量化变化趋势,对产量的贡献。跟踪测试验结果表明,3 个品种半干叶片叶茎率平均为14.6%, 初步估测每公顷残留氮磷钾总量为36.60kg、3.75kg 和17.25kg。土壤有机质含量平均提高了3.32g/kg,折合每年提高0.42g/kg,相当于每年每公顷蔗地净递增土壤有机质含量1245kg。氮、磷、钾三大元素中,增加幅度最大的是钾,土壤全钾提高0.408 个百分点,增幅达到43.3%相对值;虽然土壤全氮绝对值含量提高不多,但速效氮含量提高了28.87mg/kg,占相对值为31.9%,说明供氮能力大大提高;全磷和速效磷变化水平都较低,速效磷只提高了5.97mg/kg,占相对值为16.7%。蔗叶还田除了当造可获得180~210元/hm2 的经济效益之外,更重要的还有使土壤环境进入良性的生态循环,既可以获得增产,提高经济效益,降低生产成本,又可以减少对矿物资源的消耗,具有多重的良好社会效益。

【英文摘要】Effects of leaving cane residues to the cane field after harvested were studied as the scientific basis and technology to establish Guangxi sugarcane favorable soil ecology circle. By 9 years continuously tracking testing on content change of organic matter, nitrogen, phosphorus and potassium were determined in Guangxi Sugarcane Research Institute Farm field in where cane leave residues were put on the land by mechanical roll crush. The results showed that the average leave-stem rate with semi-dried of three varieties was 14.6%, andresidues of nitrogen phosphorus and potassium were 36.60 kg, 3.75 kg, and 17.25 kg per hectare. Content oforganic matter in the cane field was increased by 3.32 g/kg, amount to 0.42 g/kg and 1245 kg/ha increasedyearly. The total potassium was increased by 0.408 percentages, as 43.3% maximum change among three elements. Although total nitrogen was only slight variations in content, the available nitrogen was increased by 28.87 mg/kg, as 31.9% changed relatively. Both of total and available phosphorus showed slight variations. 9 years practice of leaving residues to the cane field after harvested manifested evident effects of soil more and more fertilizing, even if continuous cane cropping. In addition, 180 -210 yuan (RMB) per hectare economic benefit earned, the favorable soil ecology circle was built, of which should be increased output, decreased cost and mineral consumption.

【题目】赤霉素处理对甘蔗节间伸长及产质量的影响
【中文关键词】甘蔗;赤霉素;产质量;影响
【英文关键词】Sugarcane; Gibberellin; Yield and quality; Effect
【中文摘要】以甘蔗品种新台糖22 号为试验材料,通过智能温室桶栽和大田栽培,在伸长初期以200mg/L GA3 进行叶面喷施处理,对照喷清水,研究GA3处理后对甘蔗节间伸长及产质量产生的效应。结果表明:(1)GA3处理后的株高在各个时期均显著高于对照;中部茎的长度得到显著提高,上、下部茎的长度差异不明显。(2)GA3处理后茎粗均稍有下降;单茎重和产量得到显著提高。(3)GA3处理后甘蔗蔗糖分得到提高;而还原糖下降;重力纯度、纤维分、锤度和转光度均有不同程度的提高。由此可说明,GA3处理主要促进甘蔗茎伸长,通过增加茎长和单茎重来提高产量;甘蔗蔗糖分主要集中在茎部,而茎长得到提高后蔗糖分也得到提高。
【英文摘要】The variety ROC22 was employed to investigate the internode elongation of sugarcane and effect of the yield and quality by the cultivation of barreled and field, and the plants were sprayed with 200mg/L gibberellin (GA3) at early elongation stage while spaying water as the control. The results showed that: (1) the plant height of the gibberellin treatment at different stages was significantly higher than that of the control, and the internode elongation effect mainly took place in the central stem, the upper and basilar stems was nosignificant difference in the gibberellin treatment than and the control. (2) The stem diameter was slightly decreased; both single stem weight and yield were significantly increased in GA3 treatment. (3) The sugar content was increased; and reducing sugar was decreased; gravity purity, fiber content, Brix and polarimeter reading in juice were a little increased, but the differences were not significant in GA3 treatment. There are, the yieldincreasing due to increasing the stem length and single stem weight in GA3 treatment; The sugar concentrated in the stems, with the stem length increasing the sugar content improved in GA3 treatment.

【题目】低温胁迫下甘蔗抗寒相关基因的cDNA2SCOT差异显示
【中文关键词】甘蔗 cDNA2SCOT 差异显示
【英文关键词】Sugarcane cDNA2SCOT Differential disp lay
【中文摘要】为探寻甘蔗在低温协迫下相关基因表达差异的分子基础,探索cDNA2SCOT差异显示的可行性,选用了桂糖28号(抗寒性强)和新台糖22号(抗寒性弱)两个甘蔗品种,分别构建了低温处理与对照的RNA混合池,利用cDNA2SCOT法进行了差异显示研究。102条SCOT引物扩增出600多条带,长度在100 - 1 800 bp之间。选择其中7条差异片段(TDF) ,进行回收、克隆和测序。结果表明,利用SCOT方法可以对甘蔗cDNA混合池进行差异显示研究,两个甘蔗品种在低温下有部分相同的基因表达, 5个TDF分别与脱水素、半胱氨酸型肽酶、多胺氧化酶、C4磷酸羧化酶和过氧化氢酶基因具有很高的同源性,只在抗寒品种中稳定出现的2个TDF功能未知,可能与甘蔗的抗寒基因表达相关。
【英文摘要】To exp lore the molecularmechanism of the differential exp ression in sugarcane under low temperature stress and demonstrate the feasibility of cDNA2SCOT for differential disp lay, 2 sugarcane varieties of GT28 (high cold resistance) and ROC22 (low cold resistance) were used for constructing the RNA pools of cold treatment and control. SCOTmarkerswere used to analyze the different cDNA pools transcribed from the RNA pools. 600 amp lified bandswith length of 100 - 1 800 bp were obtained with 102 SCOT primers. 7 (transcrip ts derived fragments) TDFs were sorted out, cloned and sequenced. The results indicated that cDNA pools with SCOTmarker could be used for differential disp lay in sugarcane under low temperature stress. Sequence analysis revealed that 5 TDFs were significantly homologous in nucleotide sequence with dehydrin, cysteinetype endopep tidase, polyamine oxidase, C4

phosphoenolpyruvatecarboxylase and catalase. The other 2 TDFs ′ functionswere still unknown,which may be related to the cold resistant gene exp ression in sugarcane.

【题目】不同种植模式蔗茎伸长特性分析
【中文关键词】蔗茎伸长; 种植模式; Logistic 方程
【英文关键词】sugarcane stem elongation; plant pattern; logistic equation
【中文摘要】在大田条件下,以甘蔗品种新台糖22 为试验材料,采用Logistic 方程拟合了窄行宽株等行距、宽行窄株等行距、宽窄行窄株距和宽窄行宽株距4 种种植模式下蔗茎的伸长特性。结果表明:(1)Logistic 方程能够可靠的估计不同种植模式蔗茎伸长的进程。(2)不同种植模式蔗茎伸长的潜力值存在一定的差异,以宽窄行窄株距种植模式最大,且该差异的产生体现在蔗茎伸长持续时间或伸长速率上。(3)不同种植模式蔗伸长快增期的持续时间最短,但贡献率最大。因此,选择合理的种植模式和加强快增期的田间管理对蔗茎伸长具有重要的意义。
【英文摘要】Sugarcane stem elongation characters of cv. ROC 22 were analyzed by logistic equation in ‘ Ton-Sucrose Field ’ under 4 planting patterns,narrow row & broad plant, broad row & narrow plant, broad-narrow row & broad plant and broadnarrow row & narrow plant. And the results were shown as followed. (1)Sugarcane stem elongation processes in ‘ Ton-Sucrose Field ’ under 4 planting patterns could be reliably estimated by Logistic Equation. (2) There was different stem elongation potential among 4 planting patterns, of which the broad-narrow row & narrow plant pattern was the highest; and the difference came from elongation duration and elongation speed. (3)For all patterns, duration of Fast-increasing Period of stem elongation was the shortest, while its contribution was the highest. Therefore, appropriate plant pattern and good management in Fast -increasing Period is important for stem elongation.

【中文关键词】缺氮处理;氮再利用;衰老;水稻
【英文关键词】Nitrogen deficiency treatment; N remobilization; senescence; rice
【中文摘要】永绿色基因 (Stay-green Rice,SGR)作用于叶绿体类囊体上色素-蛋白复合体的解离,进而加速叶绿素和色素结合蛋白的降解。本文研究了永绿色基因 (Stay-green Rice,SGR) 突变和超表达对水稻叶片氮碳代谢的影响。结果表明,在正常生长条件下,SGR基因超表达降低了水稻叶片可溶性蛋白、叶绿素及淀粉的含量,但增加了可溶性糖和游离氨基酸含量,并提高了谷氨酰胺合成酶活性 (GS) 和谷氨酸合成酶活性 (GOGAT)。SGR基因突变增加水稻叶片淀粉和可溶性蛋白质含量和硝酸还原酶 (NR) 活性。在缺氮条件下,SGR基因超表达叶片各生理指标的变化趋势与野生型一致,但是SGR基因突变体叶片中淀粉含量呈先降低后升高的趋势。本研究结果说明,SGR蛋白水平对色素-蛋白复合体含量的影响改变了水稻叶片碳氮代谢的部分特性。
【英文摘要】This study analyzed the effects of the Stay-Green Rice gene (SGR) overexpression and mutation on carbon and nitrogen metabolism in rice. The results showed that overexpression of SGR reduced the content of soluble protein, chlorophyll and starch, but improved the content of soluble sugar and free amino acid and the activities of glutamine synthetase (GS) and glutamate synthetase (GOGAT) under normal growth condition in rice leaves. However, mutation in SGR increased the content of starch and soluble protein and improved nitrate reductase (NR) activity. Under nitrogen deficiency treatment, the change tendency of physiology

parameters in SGR overexpression rice leaves was in consistent with wild-type rice, but the starch content in SGR mutation rice showed first decreasing, then increasing. These results indicated that increasing the expression of SGR promoted the nitrogen remobilization and amino turnover in rice leaves, whereas mutation in SGR promoted nitrogen assimilation and improved soluble protein content and starch cumulant.

【题目】水稻永绿色基因对类囊体蛋白降解的影响
【中文关键词】蛋白印迹杂交;类囊体蛋白;衰老;水稻
【英文关键词】Protein immunoblot; Thylakoid; proteins degradation; senescence; rice
【中文摘要】本研究应用蛋白印迹杂交技术分析了永绿色基因(Stay-green Rice, SGR)突变和超表达对水稻叶片类囊体蛋白质降解的影响。结果表明在正常生长条件下,SGR基因超表达不仅降低了类囊体光系统II(PSII)中蛋白质的含量,也降低了光系统I(PSI)和电子传递链等蛋白质的含量。暗诱导衰老处理时,SGR基因突变延缓光系统I和光系统II蛋白降解,对电子传递相关蛋白的降解没有影响。在缺氮胁迫条件下,SGR基因超表达加快了类囊体PSII 和PSI蛋白降解,而SGR基因突变也延缓类囊体蛋白的降解。本研究结果说明增加SGR的表达能够促进类囊体PSI,PSII和光合电子传递链蛋白质的降解。同时进一步证明SGR蛋白在水稻叶片衰老过程中氮素的再利用方面具有重要作用。
【英文摘要】This study analyzed the effects of the Stay-Rreen Rice gene (SGR) on thylakoid proteins degradation in rice leaves via protein immunoblot technology. The results showed that overexpression of SGR reduced the level of proteins in chloroplast photosystem II (PSII), as well as in PSI and electron transport chain under normal growth condition. During dark induction senescence, mutation in SGR delayed the degradation of PSII and PSI proteins, but had no effects on the electron transport chain related proteins. Under nitrogen stress, overexpression of SGR promoted thylakoid proteins degradation, whereas mutation in SGR delayed thylakoid proteins degradation. These results indicated that increasing the expression of SGR promote the degradation of thylakoid proteins in both photosystem and electron transport chain. It suggested that SGR protein played an important role in nitrogen remobilization during rice leaves senescence.

【题目】水分胁迫对甘蔗根系蛋白质差异表达的影响
【中文关键词】甘蔗; 根; 水分胁迫; 差异蛋白; SDS PAGE
【英文关键词】Sugarcane; Roots; Drought stress; Differential expression proteins; SDS PAGE
【中文摘要】从蛋白质角度对水分胁迫下甘蔗苗期根系蛋白质SDS PAGE 电泳图谱的变化进行研究, 以揭示水分胁迫下甘蔗苗期根系蛋白质的表达差异。甘蔗品种新台糖16号砂培育苗至苗期茎高约25 cm 进行处理, 将幼苗根系放入含100 g /L聚乙二醇6000的H oag land营养液中进行模拟干旱胁迫处理, 处理不同时间段采取根样品, SDS PAGE 电泳分析法探讨水分胁迫对供试甘蔗品种根系蛋白质变化与水分胁迫强度的关系。与对照相比, 在水分胁迫处理的24 h内, 稳定出现的新诱导合成蛋白条带分子量为14. 2KDa蛋白; 对胁迫响应最快的是81. 7和52. 6 KDa蛋白条带, 胁迫开始2 h就显著下调; 而33. 8 KDa蛋白条带在胁迫后相当长时间保持稳定, 后期才显著上调; 60. 3、26. 1、16. 2KD a蛋白条带胁迫后期变化活跃; PEG 胁迫5 h 处理蛋白质条带变化最大, 既有新增蛋白条带(88. 7、65. 9、31. 9、14. 2 KDa)与消失蛋白条带(64. 9 KDa) , 又有上调表达蛋白条带(60. 3 KDa)与下调表达蛋白条带(81. 7、52. 6、26. 1 KDa)。甘蔗根系蛋白质在响应PEG 胁迫的基因表达调

控中扮演重要角色, 上述蛋白条带的变化可能与甘蔗水分胁迫密切相关。
【英文摘要】The present study was carried out to investigate the effect of drought stress on the differen-tial protein expression in sugarcane roots by SDS PAGE. The plants of the sugarcane variety ROC16w ere used as the experim en talm aterials, which were cultivated in sand bed. Sugarcane plants were treated with nutrient solution containing 10% (W /V) polyethy lene glycol 6000 (PEG 6000) for simulating drought stress at their 25cm height. The proteins from different samples were separated by SDS-PAGE. Compared with the control the stable existence of the new prote in band was 14.2 KD a protein during 24 h PEG stress, which may be the main new regulatory protein responding drought stress. The fastest responding protein bands were 81.7 and 52.6KDa ones, which decreased markedly at the early PEG stress stage of 2h. But the relat- ive content of 33.8KDa protein b and remained stable for a long time before declining at the late PEG stressstage. The relative content of 60.3, 26.1 and 16.2 KDa protein bands changed actively during the late PEG stress. The protein bands showed themost at 5h ofPEG stress. Four new prote in bands (88.7, 65.9, 31.9 and 14.2KDa) were found and a protein band (64.9KDa) was disappeared. Mean while, the protein bands of 81.7, 52.6 and 26.1KDa were down regulated while the 60.3 KDa protein band was up-regulated markedly in roots at 5h of PEG stress. Proteins in sugarcane roots play an important role in gene expression and regulation, and their changes should be related with the occurrence of drought stress.

【题目】利用SSR标记与毛细管电泳对甘蔗属进行的遗传分析
【中文关键词】简单重复序列(SSR) ; 甘蔗; 毛细管电泳
【英文关键词】Simple Sequence Repeat s(SSR) ; sugarcane ; capillary electrophoresis
【中文摘要】为探讨甘蔗属内不同种之间的遗传多样性,利用SSR 标记与毛细管电泳技术,对来自甘蔗属3个不同种的12个材料19 对引物进行检测,共检测到229个DNA 多态性条带,19对引物扩增的DNA 条带范围集中在100~260bp之间。12个甘蔗材料的Jaccard 遗传相似度,最小0.09 ,最大0.65 ,平均为0.26 。通过遗传相似性系数分析,UPGMA 聚类图内12个甘蔗材料可分为两个群,三个割手密种材料分为一个亚群,甘蔗栽培品种与甘蔗热带种合为一个亚群。结果表明:热带种比割手密种具有和甘蔗栽培品种更亲近的遗传关系;SSR 分子标记与毛细管技术结合,相比别的分子标记技术或电泳技术,具有更准确、简便、自动化等优点。
【英文摘要】This study was conducted to assess the genetic diversity amongst 12S accharum clones from 3 species using 19 SSR markers and capillary electrophoresis (CE) . A total of 229 DNA bands were generated showing a size range between 100 and 260 bp. Based on the SSR data ,the Jaccard ’s genetic similarity coefficient s ranged from a minimum of 0. 09 between CP7221210 (cultivar) and In812142(S. spontaneum) to a maximum 0. 65 between GX87 (S. spontaneum) to GX86 (S. spontaneum) . In the dendrogram using UPGMA method ,the 12S accharum clones were clustered into two groups. The three S. spontaneum clones formed a single group ,while the three S. of f icinarum clones clus2tered with the six cultivars ,which demonstrated that S. of f icinarum had a closer genetic relationship with cultivars than S. spontaneum. The SSR markers data generated based on capillary electrophoresis are more accurate ,simpler and automatic as compared to other molecular markers or electrophoresis.

【题目】新疆主要栽培杏品种制汁相关性状评价

【中文关键词】杏;果汁;性状;评价
【英文关键词】Apricot;Juice;Characteristics;Evaluation
【中文摘要】为探讨新疆南疆地区加工用杏品种制汁相关性状的评价标准,以轮台国家果树资源圃的库尔勒托永、小白杏、赛买提等18 个品种果实为试材,比较南疆加工用杏品种制汁相关性状,结果显示18个杏品种平均单果质量为14.4~52 g,出汁率为44.6%~62%,可溶性固形物含量为13.2%~25.4%,可滴定酸含量为0.67%~1.59%,维生素C 含量为26.7~146.5 mg/kg,糖酸比为4.35~17.09,可溶性糖含量为6.64%~15.52% 。以目前生产中仅15%~25%的品种能达到的性状为特级指标,我们提出南疆制汁用杏品种的特级标准为:单果质量≥40 g、出汁率≥58%、可溶性固形物含量≥21%、维生素C 含量≥100 mg/kg、糖酸比达到8.31~12.19 且可溶性糖含量为7.81%~15.11%。
【英文摘要】In order to evaluate the juicing characteristics of the leading apricot cultivars cultivated in Xinjiang, 18 apricot cultivars including Kuerletuoyong, Xiaobaixing and Saimaiti from the State Fruit Tree Germplasm Repository located at Luntai were evaluated. Results showed that their average fruit weight were 14.4~52.0 g, juicing ratio were 44.6%~62%, soluble solids content (SSC)were 13.2%~25.4%, titrable acid content (TAC)were 0.67%~1.59%, Vc content were 26.7~146.5 mg/kg, the ratio of soluble sugar content to titrable acid content ranged from 4.35 to 17.09, and soluble sugar content was between 6.64% and 15.52 %. Based on our evaluation results we would suggested that for juice processing the cultivar should have the average fruit mass≥40 g, juice ratio≥58%, SSC≥21%, Vc≥100 mg/kg, the ratio of soluble sugar content to titrable acid content ranged from8.31 to 12, and soluble sugar content was between 7.81% and 15.11 %.

【题目】新疆主要栽培杏品种香气成分的研究
【中文关键词】杏;香味物质;气相色谱—质谱
【英文关键词】ap ricot;aromatic substances;GC - MS
【中文摘要】采用自动顶空萃取和气相色谱—质谱联用技术(GC - MS) 分析了新疆主要栽培杏品种库车小白杏等14个杏品种的香味成分。结果显示:一共检测到208种香味物质,其中包括酯类物质80种、醛类物质25种、酮类物质21种、醇类物质39种、烯烃类物质27种、酸类物质1种以及15种含量较低的其他物质;乙酸丙酯、乙酸- 3 - 甲基- 1 - 丁酯、(Z) - 乙酸- 3 - 己烯- 1 - 醇酯、D - 柠檬烯、β - 芳樟醇、己醛、乙酸己酯、乙酸丁酯、β - 月桂烯、丁酸乙酯、β - 顺式- 罗勒烯等11种香味物质为参试品种的主要香味物质;不同品种的挥发性香味物质组分及其相对含量不尽相同,分属于华北和中亚种群的不同品种间无明显差异。
【英文摘要】Volatile constituents of main apricot cultivars in Xinjiang were studied to provide basic information for production and breeding. The aromatic substances in the fruits of 14 apricot cultivars, including Kuche Xiaobaixing, Guoxiyul ü ke, Kuerle Tuoyong, Dayoubai, Heiyexing, Danxing, Kuche Tuoyong, Kuikep iman, Dayoujia, Saimaiti, Kumaiti, Luotuohuang, Mulongxing and Ake Tuoyong, were identified by using headspace solid phase micro extraction and GC - MS. Results showed that 208 aromatic components were identified, including 80 kinds of esters, 25 kinds of aldehydes, 21 kinds of ketones, 39 kinds of alcohols, 27 kinds of alkyl substances, one kind of acid substances and 15 kinds of other substances. The main volatile constituents were propyl acetate, 3-methyl-1-butanol, acetate, 3-hexen-1-ol, acetate, (Z)-, D-limonene, β-linalool, hexanal, hexyl acetate, butyl acetate, β-myrcene, ethyl butanoate, β-cis-ocimene. Main volatile components and their relative contents were main differences among these cultivars, and there were no significant difference between the Northern China group and The Central Asian group varieties.

【题目】新疆杏品种自交不亲和S-RNase基因特异PCR扩增引物的筛选
【中文关键词】杏;自交不亲和;S-RNase基因;引物筛选
【英文关键词】apricot;self-incompatibility;S-RNase gene;primer selection
【中文摘要】【目的】筛选鉴定新疆杏自交不亲和相关S-RNase基因的有效引物。【方法】以新疆30个杏品种为试材,选用已报道的蔷薇科李属通用的5对引物组合进行S-RNase基因特异PCR扩增,并依据扩增系数和扩增成功率两个指标对扩增效果进行评价。【结果】(1)5对引物组合对30个杏品种均扩出了条带,除了洛浦2号只扩出l条带之外,其余的29个品种都扩增出了两条带;(2)5对引物组合对新疆主栽杏的扩增效果差异较大,其中EM-PC2consFD+EM-PC3consRD的扩增成功率和扩增系数均为最高(86.67%,95.00%),扩增出两条带的品种有25个;其次,引物组合PaCons 1I-F+PaCons II-R的扩增成功率达66.67% ,扩增系数达83.33% ,扩出两条带的品种有20个。【结论】5对引物中EM-PC2consFD+EM-PC3consRD对新疆杏品种s-RNase基因的鉴定效果最好。
【英文摘要】【Objective and Method】In order to select the primer for identifying S—RNase gene associated with self-incompatibility of apricots cultivated in Xinjiang,30 apricot cultivars were used for S-RNase specific PCR with 5 pairs of primer combinations which had been published for prunus consensus.【Result】The results showed:(1)The S-RNase pecific bands were amplified in all the 30 cultivars by the 5 pairs of primers,and 29 cultivars except the “ Luopu NO. 2 ” showed two bands amplified.(2)The effect of amplification was significantly different among the 5 pairs of primers .The primer combination of EM-PC2consFD + EM-PC3 consRD had the highest amplification coefficient (86.67%) and efficiency (95.00%),and two S-RNase specific bands were obtained in 25 cultivars.The amplification coefficient and efficiency of the primer combination PaCons 1I-F+PaCons II -R were 66.67% and 83.33% respectively,and two S-RNase specific bands were obtained in 20 cuhivars.【Conclusion】Therefore,among the 5 pairs of primer combinations,EM-PC2consFD+EM-PC3consRD had the best identification effect for S-RNase gene for Xinjiang apricot cultivars.

【题目】染色对海水珍珠结构和光泽的影响
【中文关键词】海水珍珠; 染色; 珍珠结构; 珍珠光泽
【英文关键词】seawater cultured pearl; dyeing; pearl structure; pearl luster
【中文摘要】为了研究染色对海水珍珠结构和表面光泽的影响以及染料的主要渗透途径与结合部位, 通过对比染色实验、扫描电子显微镜和宝石显微镜, 对染色前、后的海水珍珠样品表面和内部特征进行了观察与分析,采用显微分光光度- 偏光显微镜测量染色前、后海水珍珠样品的表面反射率变化以及运用红外光谱测定染色前、后海水珍珠样品的成分。结果表明, 在染色过程中, 染料是通过海水珍珠珠孔处珠核和珍珠层间的有机质空隙以及漂白造成海水珍珠表面有机质疏松结构而渗透到珍珠的内部, 主要与海水珍珠内的有机成分作用而使其着色。染色后海水珍珠样品的砖墙型层状结构未改变; 染料对海水珍珠表面的有机质疏松结构具有填充作用, 增强了其表面的镜面效应, 使光泽度增强。
【英文摘要】To study the influence of dyeing on the structure and luster of seawater culturedpearls and to explore the penetration ways of dye liquor in the dyeing process of seawater cultured pearls, the present paper observes and analyzes the surface structure and internal characteristics of the seawater cultured samples before and after dy eing by using the dyeing experiment, scanning elect ro n microsco py and g emmo logical microsco pe, measures the changes in surface reflect ivity of the samples before and af ter dy eing by micro scopic spect ropho tometerpolarizing microscope, and idenifies the compo nents of the samples before and after dyeing by infrared spect roscopy. T he results show that the dyes penet rate into the interior of pearls during the dyeing pr ocess mainly thr ough the gap betw een the bead nucleus and the nacreous layers and the loose organic parts of the pearl surface, and then the dyes interact with the organic matter of the pearls. The brick-and-mortar st ructure of the pearl samples after dyeing remains unchang ed. T he dye particles combined with the organic matter between the crystal layers of pearl surface could fill in the gap caused by bleaching, thus the mirroref fectiveness of pearl surface could be enhanced, and pearl surface luster could be improved after dyeing.

【中文关键词】杏;糖;酸;Vc;褐化值;果浆
【英文关键词】apricot; sugar; acid; Vc; OD; fruit pulp
【中文摘要】为从新疆主栽杏品种中选择出适宜加工的优良品种,对杏原浆品质及稳定性进行探讨,选用了库车小白杏等10个新疆地区种植面积较大的主要栽培品种作为试材,分别在杏浆加工完成当天及室温贮存至第5、10、15、20、25、30、35天取样测定了总糖度、总酸度、Vc含量和褐化度(用波长420 nm时OD值表示)等与加工性状相关的指标。参试品种35 d内所测数据显示:糖含量呈缓慢下降趋势,平均损失率为12.41%;酸含量呈缓慢增加趋势,平均增加了9.35%;Vc含量呈明显下降趋势,平均损失率是80.76%,且下降趋势随时间的推移逐渐放缓;OD值呈缓慢上升的趋势,OD值平均增加了6.73%。通过聚类分析可将参试杏品种分成3类,其中第2类(大果胡安娜、阿哥亚格勒克、脆佳娜丽)平均糖含量最低为8.40%,平均含酸量最高0.912%,Vc平均含量最高0.427 mg/100 g,OD平均值最小0.319,是最适宜的杏浆加工品种。
【英文摘要】In order to study the fruit pulp quality of leading apricot cultivars in Xinjiang, 10 apricot cultivars, including Kuchexiaobaixing etc. from the State Fruit Tree Germplasm Repository located at Luntai were chosen to measure fruit pulp's sugar content, acid content, Vc conten, OD value during 35 days. Results showed that the descending trend was monitored in sugar contents with an average loss rate of 12.41%, and there was an ascending trend in acid contents with an average increase rate of 9.35%. Vc contents was clear downward with an average loss rate of 80.76%, which gradually slow down over time. OD values was slow upward with an average increase rate of 6.73%. These apricot cultivars can be divided into three categories by cluster analysis. Compare with others, the second category, including Daguohuanna, Ageyageleike and Cuijianali, was highest in average acid content (0.912%) and Vc average content (0.427 mg/100 g), and was lowest in average sugar content (8.56%) and OD average value (0.319), so the second category apricot should be the most suitable varieties for the processing fruit pulp.

【题目】珍珠抛光乳化蜡的研制
【中文关键词】珍珠抛光;乳化蜡;有机概念图
【英文关键词】pearl polishing;emulsified wax;organic conceptional diagram
【中文摘要】以巴西棕榈蜡、川蜡、蜂蜡、石蜡等为原料,利用有机概念图原理,设计了珍珠抛光用蜡乳液的配方,探讨了乳化温度、乳化时间、相同配方时不同乳液类型等对乳化蜡的稳定性的影响,制作出了适合珍珠抛光的蜡乳液。结果表明:利用均质机乳化,在乳化温度95℃、乳化时间30 min、转速为1 000~2 000 r/min时,所配制的珍珠抛光乳液稳定性较好,对提高珍珠光泽具有明显效果。
【英文摘要】Adopting the principle of organic conceptual diagram, using carnauba wax, beeswax, paraffin wax as raw materials, the formulation of pearl polishing wax emulsion was designed. Also discussed was the influence of temperature and time of emulsification as well as types of emulsion on the stability of emulsified wax. The results indicated that the stability of emulsified wax is good when it is made under the conditions of emulsion temperature of 95℃, emulsifying time of 30min, stirring speed of 1000-1500 r / min by using phase inversion methods.

【题目】新疆地产杏仁中杏仁油的超声波法提取工艺研究
【中文关键词】关键词: 杏仁油;提取剂;超声波法;提取率
【英文关键词】almond oil; extraction solvent; ultrasonic wave; extraction rate
【中文摘要】【目的】研究杏品种杏仁油提取率, 为新疆杏仁资源的开发利用以及杏仁油的生产加工提供理论依据。【方法】采用超声波提取法对新疆主栽杏及产量较大的小白杏进行单因素和正交试验, 对超声波提取工艺进行了优化。【结果】得出杏仁油的最佳提取条件是: 提取溶剂为石油醚、提取时间25 min、提取温度25℃、提取功率250W、料液比为1:6、提取次数为1 次。【结论】最佳试验提取条件下甜仁红杏、小白杏、大红杏、大果胡、树上干、早熟黑叶杏和阿克玉里克杏仁油提取率分别为80.97%、78.02%、76.54%、75.27%、72.87%、72.13% 和71.11%。与传统提取方法相比, 超声波提取法具有节省时间、环保节能、提取效率高和控制方便等优点。
【英文摘要】【Objective】The extraction rates of almond oil of different kind from apricot cultivars in Xinjiang were studied to provide a theoretical basis for the exploitation of Xinjiang apricot resources and almond oil production. 【Method】 the single factor and orthogonal experiment design were used to study the optimization extraction conditions of Xiaobaixing almond oil by using ultrasonic extracting technology and to improve the ultrasonic almond oil extracting technology. 【Result】The optimum extraction conditions were as follows: extraction solvent is petroleum ether, extract ion time is 25min, extract ion temperature is 25℃, ultrasonic power is 250 W, the ratio of solid to liquid is 1:6 and extraction times is 1 time. Conclusion! the extraction rates of almond oil of Tianrenhongxing, Xiaobaixing, Dahongxing, Daguohu, Shushanggan, Zaoshuheiyexing, Akeyukeli were 80.97%, 78.02%, 76.54%, 75.27%, 72.87% , 72.13%, 71.11% respectively under the optimum conditions. Compared with the traditional ethanol extraction, the Ultrasonic wave extraction has much superiority such as saving time and energy, more efficient, easy control and so on.

【题目】新疆不同品种杏酿酒性能的探讨
【中文关键词】杏,品种,酿酒性能
【英文关键词】apricot; species; wine fermentation properties
【中文摘要】对新疆40个不同品种杏进行杏酒的发酵实验,通过对发酵过程中酒体的重量变化,发酵结束后杏酒的酒精度、残糖、干浸出物和总酸的测定以及感官评价,筛选出最佳的酿酒品种。结果表明:“ 圆旦杏 ”、“ 树上干 ”、“ 甜仁杏 ”、“ 大果杏 ”这四个品种杏酿制的杏酒酒精度分别为9.6%(v/v)、8.8%(v/v)、6.7%(v/v)、7.6%(v/v)、,总酸含量分别为5.7、4.9、6.5、8.3 g/l,干浸出物含量分别为22.9、35.1、18.5、23.3 g/l,残糖含量分别为6.3、3.8、3.7、3.6 g/l。“ 圆旦杏 ”为酿制杏酒的最佳品种,其酿制的杏酒色泽呈麦秆黄或金黄色,澄清透明,有悦人的杏果香及醇香,酒体柔和丰满,稳定性好,典型性强。其次为“ 树上干 ”、“ 甜仁杏 ”、“ 大果杏 ”,而“ 黑叶杏 ”、“ 皮乃孜 ”、“ 何谢克 ”、“ 短枝杏 ”所酿制的杏酒也具有较好的感官评价,为酿酒的良好品种。
【英文摘要】40 different species of apricot in Xinjiang were fermented in order to choose the good species for apricot wine making. The weight of wine body in the process of brewing,the content of alcohol,total sugar dry extract and total acid of apricot wine were determined. The sensory evaluations of all varieties of apricot were carried out. The results showed that the content of above indexes of “ Yuandan ”, “ Shushanggan ”, “ Tianren ” and “ Daguo ” were as follows: alcohol: 9.6%(V/V),8.8%(V/ V),6.7% (V/V),7.6% (V/ V); total acid: 5.7,4.9,6.5,8.3g/L; dry extract: 22.9,35.1,18.5, 23.3g/L; total sugar: 6.3, 3.,3.7,3.6 g/L respectively “ Yuandan ” had best qualities for apricot wine making. The wine of “ Yuandan " was clarifying,stable and had intense fruit aroma and flavor. The body of the wine was soft and full. These species, “ Shushanggan ”, “ Tianren ” and “ Daguo ”,had better qualities for apricot wine making.

【题目】新疆17 个杏品种的抗氧化指标与总酚含量的测定
【中文关键词】杏;抗氧化性;多酚;自由基
【英文关键词】Apricot;Antioxidant activity;Phenolics;Free radical
【中文摘要】为了研究新疆杏的遗传多样性,寻找抗氧化能力较强的功能性杏品种,为保护利用杏资源提供基础,试验采用铁离子还原法(FRAP)、二苯代苦味酰基自由基法(DPPH・)清除法和邻二氮菲-Fe2+氧化法3种方法从总抗氧化能力、DPPH・自由基清除能力和羟基自由基清除能力的角度测评了不同杏品种的抗氧化活性;用Folin-Ciocalteau 法测定总酚含量。3种抗氧化指标显示:17个参试杏品种都具有强抗氧化性,并且大多数品种间差异显著,其中骆驼黄和奎克皮曼的抗氧化

能力最强,不同品种间的总酚含量差异较大,变化值为1554.47 μg/g,最大含量是最小含量的6.05倍,其中骆驼黄的总酚含量最高为186 2.18 μg/g,黑叶杏的总酚含量最低为307.71 μg/g。各种抗氧化指标与总酚含量呈显著正相关,多酚类物质应该是其抗氧化的主要物质基础。

【英文摘要】In order to provide basic information for exploring strong antioxidant apricot resources in Xinjiang, three different methods were used to evaluate antioxidant activities of 17 apricot cultivars including total antioxidant activity, hydroxyl radical scavenging and DPPH• radical scavenging. Results showed that 17 apricot cultivars had strong antioxidant capacities,and there was significant difference among most cultivars. Luotuohuang and Kuikepiman’s antioxidant capacity were the strongest in all cultivars. Total phenolic contents varied considerably among cultivars by Folin-Ciocalteau method,and Luotuohuang having the most 1862.18 μg/g was 5 times more than Heiye apricot with the least 307.71 μg/g. Three indexes of antioxidant activity and total phenolic contents were significantly correlated,so phenolic should be responsible for the antioxidant activity of apricot.

【题目】小白杏杏核开口压力的线性回归建模及验证

【中文关键词】小白杏杏核;开口;机械加工;线性回归;建模

【英文关键词】Xiaobaixing stone; open; machining; linear regression; modeling

【中文摘要】【目的】建立关于小白杏杏核开口压力合理、有效的线性回归模型,确定开口的应力范围,为杏核开口的自动化机械加工提供优化参数、方法和途径。【方法】应用万能材料测试仪测定小白杏开口应力,利用SPSS软件的多元线性回归分析方法,建立初步的线性回归模型并验证分析模型的输出结果。通过计算参考值范围并进行基本参数估计,确定开口的应力范围。【结果】初步回归方程为Y = 412.917 - 9.185 X1 + 25.486 X2 +17.591 X3 + 9.211 X4 。经计算,开口压力预测值的双侧95 %界限为397.1061~511.0139,平均数95 %的置信区间为440.4604~467.6596。这与实测值的双侧95 %界限:394.3706~513.7494,平均数95 %的置信区间:439.8072~468.3128 基本一致。【结论】理论上可以通过应用建立线性回归模型的方法为自动化机械加工提供优化参数,实现杏核开口的自动化机械加工,并且可以为其它品种的杏核开口应用自动化机械加工提供解决方法和途径。

【英文摘要】【: Objective】To provide optimal parameter and methods for the machining of Xiaobaixing stone, the study was conducted to establish linear regression model and obtain parameter range about the open pressure of Xiaobaixing stone.【Method】The open pressure is menstruated by multifunctional material testing instrument . A Primary linear regression equation was established with stone shell thickness , stone lengthwise diameter , stone transverse diameter, stone lateral diameter , as independent variable , open pressure as dependent variable, analyzing and validating the output results of mathematical model by SPSS. In addition, it confirms

parameter range of open pressure by calculating reference range and estimating basic parameter【. Result】The results showed that the primary linear regression equation is Y = 412. 917 - 9. 185 X1 + 25. 486 X2 + 17. 591 X3 + 9. 211 X4. 95 % double - sided bound for predicted value is 397. 1061~511. 013 9 , and 95 % confidence interval for its average is 440. 460 4~467. 659 6. It is basically consistent with the result of measured value , 95 % double - sided bound for measured value is 394. 370 6~513. 749 4 , and 95 % confidence interval for its average is 439. 807 2~468. 312 8. 【Conclusion】In terms of theory , this mathematical model provided optimal parameter for the machining open of Xiaobaixing stone , farther provide effective method for machining open of other apricot varieties stone.

【题目】沙尘对杏树座果率的影响及应对措施研究
【中文关键词】沙尘; 杏树; 座果率; 防御措施; 人工模拟
【英文关键词】sand dust; apricot; percentage of fertile fruit; relieving way; mimesis
【中文摘要】【目的】沙尘对杏树座果率的影响及相应的防御措施。【方法】杏树安江胡安娜为试验材料, 通过人工模拟南疆沙尘现象对盛花期的杏树进行沙尘及药剂干预试验。【结果】沙尘可使盛花期杏树减产26.6%。在杏树盛花期喷施硼酸 (0.15%)、赤霉素 (30 mg/L)、2, 4-D (1.8 mg/L)、花粉 (0.8 g/L)时,和自然授粉杏树的座果率(5.68%) 相比,其提高效果分别为:花粉(4.11%) > 赤霉素 (1.84%) > 2, 4- D (1.64%) > 硼酸 (1.01%)。在模拟沙尘条件下, 喷施同样浓度的处理, 座果率均高于自然授粉杏树的座果率 (5.68%),且提高杏树座果率的高低顺序相同, 提高最高的是喷花粉处理(2. 23%)。模拟沙尘条件下,喷施药剂中分别加入0.8 g/L 的花粉,和自然授粉杏树相比均可以提高杏树的座果率, 其效果和前两个提高杏树座果

率的高低顺序相同,且座果率均高于晴好天气杏树的座果率。【结论】沙尘对盛花期杏树的座果有很大危害,通过人工干预措施可以提高杏树的座果率,降低危害。

【英文摘要】【Objective】The paper studied effect of sand dust on fruit set rate of apricot and its defensive measures. 【Method】Test of mimesis phenomenon of sand dust on Anjiang-huanna apricot of blooming period were done in Luntai National Pomology Germpasm Garden of Xinjiang Academy of Agricultural Science(LTP) in 2009. 【Result】The yield of apricot at full bloom stage could be reduced with sand dust by 26. 6%. The fruit set rate could be increased when spraying with boracic acid (0.15%) , activol (30 mg/L) , 2, 4- D (1.8 mg/L), pollen (0.8 g/L) in blooming period of apricot. When sand dust occurred, spraying with the same concentration of fungicide could help to increase the fruit set rate of apricot, which were higher than that of the control. When sand dust occurred, the fungicide were added by pollen (2.23%), the fruit set rate of apricot was increased, whose result were the same as that of the former. The fruit set rate of apricot were higher than that of apricot in fine day.【Conclusion】The sand dust had great damage to the fruit set rate of apricot at full bloom stage.

【题目】杏树光合特性与小蠹虫为害关系的分析

【中文关键词】杏;小蠹虫;光合特性。

【英文关键词】Apricot;bark beetle;photosynthetic characteristics

【中文摘要】【目的】揭示杏树的光合能力与小蠹虫为害之间的关系。【方法】以赛买提品种为试材,对健康树、弱势树和初期受小蠹虫为害杏树的光合性能进行测定。【结果】健康树叶片的净光合速率(Pn)、气孔导度(Gs)和蒸腾速率(Tr)极显著高于弱势树和受害树;健康树的光合速率最大可达到18.178 μ molCO2/(m2・s),而弱势树和受害树分别仅为1.441 μ mol CO2/(m2・s)、0.806 μ molCO2/(m2・s);弱势树和受害树的叶面积均小于健康树,且二者的叶绿素含量也均低于健康树。【结论】弱势树和受害树的光合能力远远低于健康树,其光合作用受到明显抑制,杏树各项生理指标的变化对光合作用产生一定程度的影响,光合速率降低,有利于小蠹虫的为害。

【英文摘要】【Objective and Method】In order to reveal the relationship between the photosynthetic capacity of apricot and the harm of bark beetle. Sai maiti apricot were used as the trial material. The characteristics of photosynthesis in leaves of healthy tree, vulnerable tree and initial stage harm of bark beetle tree were determined. 【Result】The results showed that, the net photosynthetic rate (Pn), the stomatal conductance(Gs) and the transpiration rate(Tr) of healthy tree were significantly higher than vulnerable tree and harmed tree; The net photosynthetic rate of healthy tree could reach 18.178 μ molCO2 /(m2・s), but vulnerable tree and harmed tree were only 1.441 μ mol CO2/(m2・s) and 0.806 μ molCO2/(m2・s); The leaf area of vulnerable tree and harmed tree are smaller, and the SPAD value in leaf were lower, too. 【Conclusion】The photosynthetic capacity of the vulnerable tree and harmed tree were far lower than healthy tree. The variation of various physiological indexes of apricot are make a certain degree influence of photosynthesis, photosynthetic rate reduce is beneficial to the harm of bark beetle.

【题目】小白杏不同树体部位果枝和花器官形成的规律

【中文关键词】杏树;树体部位;结果枝;花芽;花器官

【英文关键词】apricot; parts of limb; bearing shoot; flower bud; floral organ
【中文摘要】为探明杏树结果枝及花芽形成规律, 选取栽植密度为2 m×4 m 和5 m×6 m 的小白杏树, 对其行间两侧主枝上不同部位的结果枝类型、花芽和花器官的形成情况进行调查。结果表明, 在主枝的不同部位,2 m×4 m和5 m×6 m 栽植密度下的结果枝形成自下而上大致呈‘少-多-少’的趋势, 其中形成比例最多的部位为100~150 cm 的长度范围内; 2 m×4 m 栽植密度下主枝上花芽的形成自上而下亦呈现‘少-多-少’的趋势,主要集中在枝条的50~200 cm,5 m×6 m 栽植密度下花芽的形成分别以主枝的100~150 cm 和200~250 cm 为主;2 m×4 m栽植密度下杏树花芽的越冬存活率自下而上不断提高,并在150~200 cm达到最高值,然后下降,5 m×6 m栽植密度下杏树主枝50~100 cm和150~200 cm 花芽的越冬存活率较高。2 m×4 m 和5 m×6 m 栽植密度下主枝各部位的可育花比例均高于败育花,以雌雄蕊等长的比例最高, 并且5 m×6 m 栽植密度下可育花的比例要普遍高于栽植密度2 m×4 m。小白杏树不同部位结果枝和花器官形成呈现规律分布, 不同栽植密度杏树间的结果枝形成、花器官质量表现出一定的差异。
【英文摘要】In order to research forming regulation of bearing shoot and floral organ in apricot, taking little white apricot in 2 m×4 m and 5 m×6 m planting densities as the subjects, the types of bearing shoots and forming status of flower buds and floral organs in limbs of apricot were investigated at the two sides of the rows. The results showed that the formation of bearing shoots in the two planting densities presented the trend of low-high-low at different parts of limb from high to low, and the ratio of that in limb at 100-150 cm length range was the highest. The formation of flower buds in 5 m×6 m planting density presented the same regulation as bearing shoots, and the flower buds were mainly distributed in limb at the length range of 50- 200 cm; The flower buds in 5 m×6 m planting density were mainly distributed in limb at the length ranges of 100- 150 cm and 200- 250 cm. The survival rate of flower buds living through the winter in 2 m×4 m planting density was increased gradually from high to low, that in limb at the length rang e of 150-200 cm was the highest, and then descend. The survival rates of flower buds living through the winter in 5 m×6 m planting density w ere hig her in limb at the length ranges of 50-100 cm and 150-200 cm. The ratio of fertile flower was higher than abort ion f lower, that of pistil equal to stamen type was the highest at any parts of limb in the two planting densities, and the ratio of fertile f lower in 5 m×6 m planting density was higher than that in 2 m×4 m planting density. The result indicated that formation of bearing shoot and floral organ at different parts of little white apricot regulation had some regulations, and there were some differences in the forming regulation of bearing shoo t and floral organ of little white apricot in 2 m×4m and 5 m×6 m planting density.

【题目】新疆轮台县和乌什县不同杏品种果实性状差异性分析
【中文关键词】杏;单果重;可溶性固形物;果实硬度
【英文关键词】apricot; weight per fruit; soluble solids; fruit hardness
【中文摘要】【目的】掌握新疆不同地区杏品种果实性状的差异和特点。【方法】对新疆乌什县176个和轮台县104个杏品种的单果重、可溶性固形物、果实硬度等指标进行测定。【结果】轮台县杏品种的单果重主要分布在20~30 g级次,乌什县主要分布在31~40 g级次;两地品种的可溶性固形物均集中在16.0~18.9级次,但乌什县要高于轮台县;果实硬度轮台县主要集中在1.0~1.1 g/cm2,乌什县集中在 < 0.9 g/cm2。同一品种的单果重乌什县比轮台县大;可溶性固形物是乌什县高于轮台县;果实硬度是轮台县大于乌什县。【结论】轮台县和乌什县不同杏品种果实性状存在着差异性。
【英文摘要】【Objective】In order to comprehend the difference and characteristics of different varieties of apricot fruit in the different areas of Xinjiang.【Method】The indexes of weight per fruit , the soluble solid content , the fruit hardness of 176 apricot varieties from Ushi County and 104 apricot varieties from Luntai County were determined. 【Result】The results showed that : The weight per fruit of Luntai County was mainly between 20- 30 g grades and it was mainly between 31- 40 g grades in the Ushi County. The total soluble solids content of the two areas were concentrated in 16.0-18.9 grades, but it was higher in Ushi County than that in Luntai County at this grades. The fruit hardness of Luntai County mainly concentrated in 1.0 - 1.1 g/cm2 grades, it was mainly concentrated below 0.9 g/cm2 grades in Ushi County. The weight per fruit of Ushi County was heavier than that of Luntai County under the condition of the same varieties of apricot fruit. The soluble solid content of Ushi County was higher than that of Luntai County. The fruit hardness of Luntai County was higher than that of Ushi County. 【Conclusion】There were some significant differences in different varieties of apricot fruit in Luntai County and Ushi County of Xinjiang.

【题目】新疆33个品种杏酿酒性能的探讨
【中文关键词】杏;品种;酿酒性能
【英文关键词】apricot; variety; wine fermentation properties
【中文摘要】对新疆33个不同品种杏进行杏酒的发酵试验,通过对发酵过程中酒体的重量变化,发酵结束后杏酒的酒精度、残糖、干浸出物和总酸的测定以及感官评价,筛选出最佳的酿酒品种。结果表明:“北山”、“乔儿脾”、“赛买提”这3个品种杏酿制的杏酒酒精度分别为7.2%vol、9.8%vol、8.9%vol;残余总糖含量分别为7.6g/L、3.2 g/L、3.3 g/L;总酸含量分别9.2g/L、6.2g/L、5.8g/L;干浸出物含量分别为22.4g/L、26.9g/L、21.7g/L。"北山"为酿制杏酒的最佳品种,其酿制的杏酒色泽呈麦秆黄或金黄色,澄清透明,有悦人的杏果香及醇香,酒体柔和丰满,稳定性好,典型性强。其次为“乔儿脾”、“赛买提”,而“玛瑙杏”“卡巴克西米西”所酿制的杏酒也具有较好的感官评价。
【英文摘要】Fermentation was carried out with 33 varieties of apricot in Xinjiang for apricot wine making. With analysis of changes of weight of wine body in brewing, concentration of alcohol, residual sugar, dry extract and total acid of apricot wine and sensory evaluation, the optimum variety was determined. The results showed that concentrations of alcohol were 7.2%vol, 9.8%vol and 8.9%vol; residual sugar: 7.6g/L, 3.2g/L and 3.3g/L; total acid: 9.2g/L, 6.2g/L and 5.8g/L; dry extract: 22.4g/L, 26.9g/L and 21.7g/L were respectively for “Beishan”, “Qiaoerpang” and “Saimaiti”. “Beishan” is the optimum variety for apricot wine making. The wine of “Beishan” was clarifying, stable and had intense fruit aroma. The body of the wine was soft and full with good stability. Wine prepared with varieties of “Qiaoerpang”, “Saimaiti”, “Manao” and “Kabakeximixi” also had good sensory quality, which indicated that these varieties were also good for apricot wine making.

【题目】杏酒酵母的筛选及发酵性能的研究
【中文关键词】高寒香菊花黄酮;固体脂质体;乙醇注入法;制备条件;优化
【英文关键词】coreopsis flower flavonoids; solid liposome; ethanol injection method; preparation conditions; optimization.
【中文摘要】采用乙醇注入法制备高寒香菊黄酮固体脂质体。以包封率为考察指标,通过单因素试验和正交试验,对壁材的配比,乳化剂的用量,冷冻保护剂甘露醇等工艺条件进行了优化。结果表明,最优制备工艺条件为壁材配比2∶1,乳化剂6%,冷冻保护剂3%。在此工艺条件下制得的高寒香菊花黄酮固体脂质体的包封率为39.69%。高寒香菊花黄酮固体脂质体外观为椭圆形,粒度多分布在450nm~500nm之间,高寒香菊花黄酮固体脂质体是大单室脂质体。
【英文摘要】The coreopsis flower flavonoids liposomes were prepared by ethanol injection method. The effects of wall material ratio, amount of mannitol as a cryoprotectant on entrapment efficiency were investigated through single factor and orthogonal experiment. The results showed that the optimal preparation conditions of coreopsis flower flavonoids liposomes were obtained as follows: ratio of lecithin to cholesterol 2∶1, amount of tween-20 was 6%, amount of mannitol was 3%. Under these optimum conditions, the entrapment efficiency was up to 39.69%. Coreopsis flower flavonoids solid liposomes was elliptical shaped, and its particle size was distributed between 450nm and 500nm. Coreopsis flower flavonoids solid lipid was a kind of large unilarnellarvesicles.

【题目】新疆杏品种果实鲜食品质主要评价指标的选择
【中文关键词】杏;鲜食品质;评价指标;主成分分析;聚类分析
【英文关键词】apricot;table quality;evaluation index;principal component analysis;cluster analysis
【中文摘要】为确定新疆杏鲜食品质评价指标,分析、测定了新疆南疆地区58 个杏品种的单果重、果形指数、硬度、可溶性固形物、可滴定酸、风味等10 项果实品质指标,并采用主成份分析和聚类分析法对各品质指标进行分析。结果表明,在杏多个品质指标之间存在着相对独立性和密切相关性。经主成份分析,前6 个主成分的累计贡献率已达到85.213%,可反映鲜食杏果实品质的绝大部分信息;通过因子聚类分析,10 个主要品质指标聚成了6 类,最终将品质指标简化为单果重、果形指数、可滴定酸、Vc含量、风味、色泽6个具代表性的指标。
【英文摘要】To study the quality evaluation indexes of table apricot in Xinjiang. The main evaluation indexes of 58 varieties of Apricot in the South of Xinjiang, including fruit weight, fruit shape index, flesh firmness, total soluble solids (TSS), titratable acid (TA), flavor, etc, were measured. The data were analyzed by principal component analysis and systematic cluster analysis. The results showed that there was either relative independence or close correspondence among the evaluation indexes of apricot fruit quality. Principal components analysis showed that the first six principal components variance accumulation contribution rate amounted to 85.213%, which reflected most of the quality of apricot. According to their cluster analysis,the tested 10 indexes were divided into 6 types, finally 6 indexes predigested for evaluating apricot table quality were obtained, which were fruit weight, fruit shape, TA, Vc, flavor and colour.

【题目】赤霉素诱导甘蔗节间伸长的效应与相关酶活性的关系
【中文关键词】赤霉酸;甘蔗;伸长;糖苷酶;过氧化物酶;过氧化氢酶
【英文关键词】gibberellin ; sugarcane ;elongation ;glycoside hydrolase ; POD ;CAT
【中文摘要】以甘蔗品种‘新台糖22 号’为试验材料,在伸长初期以200 mg/L GA3 进行叶面喷施处理,对照喷清水,研究GA3 处理后甘蔗节间糖苷酶、过氧化物酶、过氧化氢酶的变化,以揭示赤霉素诱导甘蔗节间伸长与相关酶活性的关系. 结果表明: (1) GA3 处理的株高在各个时期显著高于对照,而且在处理后7、14和28d 分别比对照提高了17.32%、14.50%和8.35% ,GA3处理引起甘蔗植株表现的高度优势一直保持到后期,节间伸长效果主要是在茎的中部(5~10节) . (2) GA3 处理后α2葡萄糖苷酶和α2甘露糖苷酶的活性较对照显著下降; POD 和β2半乳糖苷酶的活性也略有下降;α2半乳糖苷酶、β2N2乙酰氨基已糖苷酶、过氧化氢酶的活性显著提高;β2葡萄糖苷酶的活性也有一定程度提高. 由此推测,外源GA3 主要通过调节α2葡萄糖苷酶活性、α2甘露糖苷酶、α2半乳糖苷酶、β2N2乙酰氨基已糖苷酶活性和过氧化氢酶,其次是POD、β2半乳糖苷酶和β2葡萄糖苷酶活性,最终达到节间伸长效果.
【英文摘要】To investigate the changes of the contents of glycoside hydrolase,peroxidase (POD),and catalase(CAT) in the internode of the sugarcane ,and illust rate the relationship between internode elongation and the changes of related enzyme activities,the sugarcane variety ROC22 was employed and the plants weresp rayed with 200mg/L gibberellin at early elongation stage while using water spray as control. The results showed that:(1)the plant height at different stages was significantly higher in the gibberellin treatment than that in the control,and the increase reached 17.32%,14.50% and 8.35% in 7,14 and 28 days after spraying, respectively. The advantage of gibberellin in sugarcane stem elongation performance would been maintained until maturity ,and the internode elongation effect mainly took place in the central stem (5~10knot) . (2) The activities of α-glucosidase and α-mannosidase in the stem tip was significantly

lower in the gibberellin treatment than that in the control.After treatment, the POD and β-galactosidase activities were also slightly lower than that of the control ,and the inhibitory effect mainly maintained for about 1 month.The activities of α-galactosidase, β-N-Acetyl-D-hexosaminidase and CAT in the stem tip was significantly higher in the gibberellin treatment than those in the control.At the same time, β-glucosidase activity was also slightly higher than that of the control, and the promoting effect could be maintained for about 1 month. These results suggest that the exogenous GA3 make effect on the internode elongation mainly by regulating the α-glucosidase, α-mannosidase,a-galactosidase, β-N-acetyl-D-activity and CAT,and then POD, β-galactosidase and β-glucosidase production in sugarcane.

【题目】甘蔗属不同种及优良甘蔗栽培品种的SSR标记遗传多样性分析
【中文关键词】简单重复序列(SSR);甘蔗属;指纹图谱;毛细管电泳;遗传多样性
【英文关键词】Simple sequence repeat(SSR);Saccharum;fingerprinting;Capillary Eleetrophoresis;genetic diversity
【中文摘要】应用21对SSR引物与毛细管电泳技术,分析了52个甘蔗属品种的遗传多样性。共检测出327个SSR标记,平均每对引物检测15.6个。选择141个共显性标记构建SSR标记指纹图谱数据库,利用DNAMAN软件与UPGMA统计方法分析参试材料遗传多样性。DNAMAN软件同源分析显示,新台糖16号与台优1号之间的同源性最高(87%),品种之间最小的同源性为55%;利用UPGMA统计方法可把参试材料分成4个遗传相似性较高的类群。结果表明,SSR标记与毛细管技术的结合,可构建甘蔗种质资源SSR标记指纹图谱、分析甘蔗种质资源遗传多样性。聚类分析显示参试甘蔗材料的遗传基础相近,为了提高甘蔗选育种效率,应拓宽甘蔗选育种亲本的遗传基础,提高杂交栽培品种的抗虫、抗病等特性。
【英文摘要】Genetic diversity amongst 52 sugarcane clones including Saccharum species and cultivars(used for breedingand commercial production since the beginning of 20th century)had been assessed using 21 Simple Sequence Repeat(SSR)markers and capillary electrophoresis(CE)technique.Use of 21 SSR primers resulted in amplification of 327 distinguishable SSR markers with an average of 15.6 bands per primer.A total of 141 distinctive SSR alleles were scored,which have been used for construction of fingerprinting database and assessment of the genetic diversity using DNAMAN analyzing software and UPGMA algorithm methods。The highest genetic homology was 87%,observed between ROC 16 and TY 1,the lowest genetic homology was 55%.The UPGMA algorithm with SSR markers showed four distinguishable clusters of genetically similar species and varietal clones.The results indicated that using SSR markers in combination with CE is an efficient tool for fingerprinting database construction and assessment of genetic diversity.Occurrence of most cultivated clones in just 4 clusters indicated the exploitation of similar genetic database for the breeding purposes.The breeding programs should be tailored tO exploit the wide range of germplasm using Saccharum species tO get good varieties especially for disease or insect-pest resistance.

【题目】甘蔗茎尖原生分生组织区域化
【中文关键词】甘蔗; 茎尖; 原生分生组织; 原套原始细胞区; 原体原始细胞区; 周缘分生细胞区; 髓分生区
【英文关键词】sugarcane; stem; protomeristem; tunica-primary; corpus; peripheral meristem; pith zone
【中文摘要】甘蔗茎尖原生分生组织是甘蔗地上部分一切形态组织的发源中心, 通过对6 个不同茎径甘蔗品种4 个不同营养发育时期的茎尖原生分生组织显微和超微结构观察研究发现: 甘蔗茎尖原生分生组织呈半卵型结构,明显分为原套原始

细胞区、原体原始细胞区、周缘分生细胞区、髓分生区, 其区域化符合原套- 原体学说。原套原始细胞区为最外一层细胞, 原套细胞之间胞间连丝丰富, 而原套与原体细胞之间胞间连丝极少, 细胞以垂周分裂为主, 扩大原生分生组织表面积; 原体位于原套下的分生组织的中央区域, 细胞可以进行各个方向的分裂, 不断增加体积, 原体原始细胞区呈一个球体; 周缘分生区位于原套、原体下方两侧, 细胞活跃产生叶原基和原形成层细胞; 髓分生区细胞位于原体下方周缘分生区内侧, 细胞横向分裂纵向排列, 使甘蔗茎伸长。

【英文摘要】All organization of sugarcane stem and leaf or igined from stem tip protomer istem. The stem tip protomer is tem of six sugarcane cuctivars at four different developing stages was investigated using microstructural and ultra structural techniques. The results showed that sugarcane stem tip protomer istem had four zones: tunica- primary cell zone, corpus primary cell zone, per ipheral mer istem zone and pith zone. The tunica primary cell zone had only one layer of tunica cells and many of plasmodesmus crossed between the tunica primary cells, but few plasmodesmus crossed between the tunica primary cells and the corpus primary cells. Most of tunica pr imary cell were anticlinal division in order to enlarge protomeristem super ficial area. The corpus zone located in the central region of the meristem below the tunica, where the cell divisions were in all directions to increase both the width and length of the apex. The corpus primary cell zone appeared to be a sphere. The peripheral meristem zone located the two sides under the tunica primary and the corpus, which cells were very active and generate phyllopodium and protocambium cells. The pith zone was at the inner side of peripheral meristem under the corpus, and the cell division was transverse andend to endar rangement to elongate the stem.

【题目】利用间歇浸没式生物反应器进行果蔗组培快繁
【中文关键词】间歇浸没式生物反应器(TIBs); 甘蔗; 组培快繁
【英文关键词】Temporary immersion bioreactors system; Saccharum sinensis Roxb; Rapid propagation
【中文摘要】以果蔗(Badila)茎尖脱毒组培苗为材料, 利用间歇浸没式生物反应器(Temporary immersion bioreactors TIBs)进行组培快繁的技术体系的研究。结果表明: (1)使用TIBs 系统进行甘蔗组织培养一代增殖较传统方法高出10 倍以上; (2)TIBs 系统以第4 代继代材料为宜; (3)接种密度在10~15 株/L 培养基最有利于甘蔗组培苗的增殖和生长;(4)TIBs 系统中6-BA 浓度为0.5~1.0 mg/L 时适合于增殖培养, NAA 浓度为4 mg/L 时有利于根的诱导; (5)浸没间歇频率在1 min/3 h 时增殖和生长表现较为优异, 1 min/6 h 时有利于根的诱导和根的生长。

【英文摘要】A new protocol was established for sugarcane (Badila) rapid propagation in a temporaryimmersion bioreactors system (TIBs). It was revealed that a multiplication rate of 46 times in one subculture was obtained in TIBs, and the most suitable starting material was the fourth subcultured plantlets and the most suitable density inoculums was 10-15 plantlets per liter medium for TIBs culture. It also demonstrated that 0.5-1.0 mg/L 6-BA was suitable for multiplication and 4 mg/L NAA was better for rooting.The suitable immersion frequency was 1 min/3h for multiplication and that for rooting was 1 min/6h.

【题目】1 株有固氮能力的甘蔗克雷伯氏菌的分离鉴定及固氮特性
【中文关键词】甘蔗; 克雷伯氏菌; 固氮; 15N; 16SrDNA

【英文关键词】Sugarcane; Klebsiella; Nitrogen fixation; 15N; 16S rDNA
【中文摘要】采用无氮Dobereiner 培养基, 从广西本地甘蔗品种桂糖28 号根系分离筛选到1 株高固氮活性的细菌菌株L03, 对其进行形态、生理生化、16SrDNA 序列的系统发育分析和固氮特性研究。结果表明, L03 为植生克雷伯氏菌(Klebsiella plantica), 将该菌用蛋白胨含量为0.4g/L 的Dobereiner 培养基培养, 当培养瓶中O2含量为2mL、温度为33 ℃的条件下固氮活性最高, 固氮百分率达29.2%。并在连续继代13 次后保持固氮能力不变。
【英文摘要】The present study was conducted to investigate the nitrogen fixation characteristics of a nitrogen fixation bacterium isolated from sugarcane. A nitrogen fixation bacterium was isolated from sugarcane variety GT28 by N-free Do · · bereiner medium. The 16S rDNA sequence, physiological and biochemical properties, and nitrogen fixation conditions required of the bacterium were analyzed. The strain was identified as the genus Klebsiella and named as Klebsiella sp. L03. The optimum conditions of nitrogen fixation by the bacterium were peptone 0.4g/L, O2 2mL and reaction at 33 °C.The maximal nitrogen -fixing percertage reached 29.2%, and the nitrogen fixation activity kept constantly after 13 generations.

【题目】水分胁迫下外源ABA 提高甘蔗抗旱性的作用机制
【中文关键词】ABA; 甘蔗; 抗旱性; H2O2; 抗氧化酶; 叶绿素荧光
【英文关键词】ABA; Sugarcane; Drought tolerance; Antioxidative enzyme; H2O2; Chlorophyll fluorescence
【中文摘要】以抗旱甘蔗品种ROC22 为材料, 调查水分胁迫及胁迫加喷施脱落酸(ABA)对甘蔗内源ABA合成及相关生理生化作用的影响。结果表明, 干旱及干旱加外施ABA 的条件下, 甘蔗内源ABA 合成水平上升, 但干旱加ABA 处理增幅更显著, 甘蔗叶内的脯氨酸(Pro)、H2O2、丙二醛(MDA)含量增加, 而ABA 处理能缓解MDA 的积累, 使其含量处于低水平, ABA 处理能防止叶绿素降解并对干旱引起的最大光能转化效率(Fv/Fm)、PSII 实际量子效率(ΦPSII)下降有明显的缓解作用。干旱条件下, H2O2 的积累伴随着抗氧化作用的酶CAT、GPX、GR 和APX 的活性提高, 而ABA 处理能进一步提高这些相关酶的活性而逐渐降低H2O2 的含量, 表明干旱条件下, 外施ABA 能增强甘蔗的抗氧化防护系统, 提高抗旱性。
【英文摘要】Drought is a major limiting factor for sugarcane growth. Abscisic acid (ABA) regulates much important plant physiological and biochemical processes, and induces tolerance to different stresses including drought. Understanding the mechanism of tolerance to drought in sugarcane plant with foliage dressing of ABA under water stress would facilitate breeding and field management for improving drought resistance. Thus, an experiment was set up to investigate the interrelationship between drought induced ABA biosynthesis and antioxidative defense system, and to confer the farther role of foliar application of ABA in imparting drought tolerance to the sugarcane plant. The treatments were: T1 (drought), T2 (drought + foliar application of 15 μ mol L – 1 ABA) and C (control, normal irrigation) using a drought tolerant cultivar ROC22. The results showed that drought treatment (T1)enhanced the ABA concentration in leaf that was significantly higher in combined treatment (T2),suggesting the ABA biosynthesiswas triggered in leaf by the ABA application. Both T1 and T2 resulted in an increase in proline, H2O2 and MDA contents while the exogenous ABA alleviated the increase in MDA content. ABA application decreased the degradation of chlorophyll, and counteracted, at least in part, the decrease in maximal PSII efficiency (Fv/Fm) and quantum efficiency of PSII (ΦPSII). Overproduction of H2O2 in T1 was followed by increasing activities of CAT, GPX, GR, and APX, which was further improved by the ABA treatment (T2). A decrease in H2O2 level with increasing stress in T2 showed that ABA highly induced antioxidative defense system which was found to be vanished progressively in T1. The results clearly suggest that the tolerant cultivar showed an enhanced protective system against drought conditions, and the foliar application of ABA further improved its tolerance by triggering the over expression of antioxidative defense system.

【题目】赤霉素诱导甘蔗节间伸长基因的cDNA-SCoT 差异表达分析
【中文关键词】赤霉素; 甘蔗; cDNA-SCoT; 差异表达
【英文关键词】Gibberellin; Sugarcane; cDNA-SCoT; Differential expression
【中文摘要】以甘蔗ROC22 为材料, 在伸长初期进行叶面喷施200 mg L－1 浓度的赤霉素为处理, 以喷施清水为对照, 在不同时间取幼茎样品, 用cDNA-SCoT 进行基因差异表达分析。结果表明, 通过46 条引物筛选了约700 个cDNA 片段, 获得差异片段30 个。有18 个基因片段受赤霉素上调而12 个基因片段下调; 其中16 个TDFs 序列和NCBI 数据库中已录入的基因具有较高的相似性, 按照其功能可分为6 类, 即能量与代谢相关基因(占总数的20.0%)、未知功能蛋白(占总数的20.0%)、未知基因(占总数的46.7%)、信号传导相关基因(占总数的6.7%)、转录因子相关基因(占总数的3.3%)和细胞凋亡基因(3.3%)。这说明利用SCoT 方法可以进行蔗茎基因差异表达研究, 分离到的一些差异片段可能是与甘蔗节间伸长相关的基因。
【英文摘要】The present study was conducted to investigate the molecular mechanisms of gibberellin-induced stalk internodes elongation in sugarcane. Using sugarcane variety ROC22, the plant leaves were treated with spraying gibberellic acid (GA3) at 200 mg L－1 at early elongation stage, and spraying water as a control. Samples of young stalks were taken and the differen-tially expressed genes were analyzed with cDNA-SCoT technique. The results showed that 30 fragments of differentially expressed genes were obtained by screening 700 cDNA fragments with 46 single primers. The expressions of 18 genes were up-regulated, and 12 genes down-regulated by GA3 induction, and the sequences of 16 TDFs showed high similarity to the registered genes in the NCBI database. These genes were divided into six categories by functional analysis, including energy and metabolism-related genes (accounting for 20.0%), unknown functional proteins (accounting for 20.0%), unknown genes (accounting for 46.7%), signal transduction-related genes (accounting for 6.7%), transcription factor-related genes (accounting for 3.3%), and cell apoptosis (accounting for 3.3%). This suggested that the differential expression of genes in the stalks can be analyzed with SCoT technique,and some fragments may be related to the stalk elongation of surgarcane.

【题目】机械化深耕深松栽培对甘蔗生长及产量的影响
【中文关键词】机械化;深耕深松;甘蔗;生长;产量
【英文关键词】mechanized; deep ploughing and scarification; sugarcane; growth; yield
【中文摘要】为评价机械化深耕深松栽培模式的保水保肥效果和对甘蔗生产的影响,进行了机械化深耕深松栽培和常规耕作栽培对甘蔗生长及产量的影响试验。结果显示,机械化深耕深松栽培能明显增加土壤的含水量;深耕深松栽培比常规耕作栽培的甘蔗出苗率高17.8%,分蘖率高13.4%;甘蔗生长速度加快、根系发达;甘蔗成熟期的株高、茎径、蔗糖分、青叶数提高;每公顷增产原料蔗7.22 t,增收2346.5元,增糖1.35 t。机械化深耕深松栽培甘蔗增产增收效益显著,可在甘蔗生产中推广应用。
【英文摘要】The present experiment has been conducted to study the effects of mechanized deep ploughing and scarification cultivation technology on growth and yield of sugarcane in order to evaluate the effects of fertilizer and water conservation and growth of sugarcane. The results showed that soil moisture content significantly increased with mechanized deep plough-ing and scarification cultivation treatment,and emergence and tillering rates increased by 17.8% and 13.4%, respectively,compared to conventional tillage cultivation treatment. The plants grew more rapidly along with more developed roots, thick stem, more leaves and sucrose content. Its millable cane yield, income and sugar yield increased by 7.22 ton,2346.5 yuan and 1.35 ton per hectare, respectively. It is recommended that mechanized deep ploughing and scarification cultivation technique should be popularized widely for cost saving and improv-ement in benefits from sugarcane production.

【中文关键词】甘蔗;地埋式滴灌;产量;品质
【英文关键词】sugarcane; buried drip irrigation; yield; quality
【中文摘要】以甘蔗品种新台糖28号为试材,进行不同施肥处理(滴灌施肥、常规施肥+无滴灌、常规施肥+滴灌、不施肥+滴灌)对比试验,探讨地埋式滴灌施肥对甘蔗产量和品质的影响。结果表明,在施肥量相同的条件下,滴灌施肥和常规施肥+滴灌处理能促进甘蔗早生快发,增加有效分蘖,生长后期能促进甘蔗茎伸长、增粗,提高甘蔗产量,与无滴灌处理相比,分别增产31.9%、22.8%,增收2205.6、78.2元/ha。可见,滴灌施肥应用于甘蔗生产能够获得显著的经济效益,是旱地甘蔗高效节本栽培重要措施之一。
【英文摘要】Sugarcane variety ROC28 was used to investigate the effects of sub -soil drip fertigation on yield and quality of sugarcane. Four different fertilization treatments, viz., drip fertiga-tion, conventional fertilization without drip irrigation, conventional fertilization with drip irrigation and drip irrigation without fertilization were designed in sugarcane field. The fertilizer amount used was as follows: N @ 375 kg/ha, P2O5 @ 195 kg/ha, K2O @ 420 kg/ha, ZnSO4 · 7H2O @15kg/ha and borax @15 kg/ha. The treatments of drip fertigation and conventional fertilization with drip irrigation promoted faster and earlier growth of sugarcane, increased number of tillers, improved elongation and widening of stalk at later growth stage, and increased yield with 31.9 and 22.8% with 2205.6 and 78.2 Yuan RMB/ha of income as compared to the conventional fertilization without drip irrigation. Therefore, application of drip fertigation may be recommended as one of important measures for highly effective cost-saving sugarcane cultivation in upland.

【题目】地下滴灌条件下氮磷钾配施对甘蔗产量及其构成因素的影响
【中文关键词】地下滴灌;氮磷钾配施;甘蔗;产量构成因素
【英文关键词】subsurface drip irrigation;combined application of nitrogen,phosphorus and potassium;sugarcane;eomponents of sugarcane yield
【中文摘要】采用农业部《测土配方施肥技术规范》推荐的“ 3414 ”方案设计,研究了地下滴灌条件下氮磷钾配施对甘蔗产量及其构成因素的影响。结果表明:在试验条件下,甘蔗产量最高的是处理N2PoK2达114.0 t/ha,比不施肥处理N2PoK2增产28.4%,达显著差异水平;氮肥对甘蔗有效茎数和下部茎径影响最大,其中对下部茎径的影响达显著差异水平,磷、钾肥对甘蔗产量构成因素也有一定影响;地上部分干重、有效茎数与甘蔗产量呈显著正相关,是决定甘蔗产量的主要因素。因此,实际生产中应重视地下滴灌与氮磷钾配方施肥技术的合理运用,以提高甘蔗产量和效益,促进甘蔗产业跨越式发展。
【英文摘要】A field experiment was conducted to study the efects of combined application of nitrogen(N),phosphorus(P)and potassium(K)on sugarcane yield and its components under subsurface drip irrigation using ‘ 3414 ’ project design which was recommended by the technical rule of soil testing and formulated fertilization.The results showed that under experimental conditions the highest sugarcane yield(114.0 t/ha)was obtained in the treatment of N2P0K2,(375.00,0 and 420.00 kg/ha N,P205 and K2O,respectively)and 28.4% significantly higher than the treatment of N (No N,P and K fertilizer).Nitrogen fertilizer was the most important factor which afected the number of millable stalks and diameter of bot.tom intemodes.The influence of nitrogen on diameter of bottom interuodes was significant.Phosphorus and potassium fer-tilizers also showed influences on the components of sugarcane yield.Th e sugarcane yield was positively correlated with the aboveground dry weight and millable stalks and they were the main factors

that have the greatest efects on the sugarcane yield.Therefore,proper use of subsurface drip irrigation and combined application of N,P and K were conducive to in-crease sugarcane yield and impel the sugarcane industry to implement leap-forwarddevelopment.

【题目】利用cDNA-SRAP 分析赤霉素诱导甘蔗节间伸长的差异表达
【中文关键词】赤霉素;甘蔗;cDNA-SRAP;差异表达
【英文关键词】gibberellin; sugarcane; cDNA-SRAP; differential expression
【中文摘要】【目的】探寻赤霉素诱导甘蔗节间伸长基因表达差异的分子基础,为分离节间伸长相关基因奠定基础。【方法】以新台糖22 号为材料,在伸长初期以浓度为200 mg · L-1 的赤霉素进行叶面喷施,以喷施清水为对照,分别提取总RNA进行等量混合,获得2 种不同处理的样品池,采用cDNA-SRAP 技术进行基因差异表达分析。【结果】700 对引物组合共扩增到约15 000 条、大小在50—750 bp 的cDNA 片段。在GA3 处理组和对照组中,甘蔗幼茎中的转录水平具有很大的差异,获得134 条差异条带。从反向Northern 杂交结果阳性的S-TDFs 中选取24 个片段进行克隆和序列分析,按照功能可以将24 个差异表达基因片段S-TDFs(cDNA-SRAP transcript derived fragments)分为6 类,分别为能量与代谢相关基因(4 条,占总数的16.67%)、未知功能蛋白基因(6 条,占总数的25%)、未知基因(10 条,占总数的41.66%)、细胞壁生物合成与修饰相关基因(1条,占总数的4.17%)、信号传导相关基因(2 条,占总数的8.33%)和转录因子相关基因(1 条,占总数的4.17%)。【结论】cDNA-SRAP 完全适用于差异表达分析,从中获得一些与甘蔗节间伸长相关的差异基因片段,这些基因可用于甘蔗节间伸长的分子机理研究。
【英文摘要】【Objective】 The research was carried out to explore the molecular basis of the differential expression of GA-induced stem elongation genes of sugarcane and isolation of elongation related genes. 【Method】 The plants were sprayed with gibberellin (GA3) at concentration of 200 mg · L-1 at early elongation stage, with water spraying as control. After extraction,equal quantity of the total RNAs of the same treatment was mixed to get two different mixed RNA pools for the GA3 treatment and the control.By cDNA-SRAP technique, different expressions of the genes were analyzed. 【Result】 Using 700 pairs of primers,about 15 000 cDNA fragments in size between 50-750 bp were amplified. Some fragments were different between the GA3treatment and the control for different gene transcriptions in the young stem of sugarcane. Among them, 134 different cDNA fragments were selected. After reverse Northern blot analysis, 24 positive S-TDFs (cDNA-SRAP transcript derived fragments) were selected for cloning and sequencing analysis. After BLAST analysis, the 24 S-TDFs were divided into six categories according to gene function: energy and metabolism-related genes (4, accounting for 16.67%), genes of unknown functional proteins (6,accounting for 25%), unknown genes (10,accounting for 41.66%), cell wall biosynthesis and modification related genes (2, accounting for 8.33%), and transcription factor-related genes (1, accounting for 4.17%). 【Conclusion】 This study shows that the cDNA-SRAP technique is applicable to the analysis of gene differential expression. Some fragments of differentially expressed genesassociated with sugarcane stem elongation were obtained, and may be used for investigating the molecular mechanism of sugarcane stem elongation.

【题目】EFFECTS OF DIRECT APPLICATION OF VINASSE ON SUGARCANE AT MULTIPLE LOCATIONS IN CHINA
【中文关键词】无
【英文关键词】Sugarcane, vinasse, application
【中文摘要】无
【英文摘要】Aims:The present study was performed to determine the effect of vinasse application in upland sugarcane field.Methods and results: The experiments were conducted with the technique of direct rational application of vinasse developed by Guangxi Academy of Agricultural Sciences at five locations, viz., Shang-si, Fu-sui, Wuxuan,You-jiang and Long-an in Guangxi, China. The results of the 2 years multiple location experiments showed 90.58, 93.21 and 94.15 t/ha average cane yield at 45, 75 and 105 t/ha vinasse application, respectively. This was 10.39, 13.60 and 14.74% higher than that of non-fertilizer, and 5.64, 8.71 and 9.8% higher than that of the conventional fertilizer controls, respectively. The results of cane quality analysis showed 14.27, 14.43 and 14.33% sucrose content in the vinasse treatments, which were 0.17, 0.33 and 0.23% higher than non-fertilizer, and 0.10,0.26 and 0.16% higher than that of the conventional fertilizer control, at 45, 75 and 105 t/ha vinasse application,respectively..Significance of study: It is confirmed that fresh vinasse could be applied directly in sugarcane fields with the technique of direct rational application system. Among the three treatments, 75 and 105 t/ha vinasse showed better results. Rational vinasse application in sugarcane in the upland areas improved both cane tonnage and sucrose content, reduced production cost, and reduced the environmental pollution.

【题目】CHANGES OF MICROTUBULE CYTOSKELETON IN THE STEM TIP CELLS OF SUGARCANE DURING MITOSIS
【中文关键词】无
【英文关键词】microtubule cycles, microtubule cytoskeleton, mitosis, sugarcane
【中文摘要】无
【英文摘要】Aim: The study is an attempt to investigate the changes in arrangement and transformation of microtubule array and its relation with chromosome movement in sugarcane stem tip cells.Methods and results: Freezing microtome, indirect immunofluorescence, DAPl staining and fluorescence microscopy were applied for detection of the changes in microtubules insugarcane stem tip cells during mitosis. The results showed the presence of intact nucleolus until the formation of cortical microtubules, and the cortical microtubules were changed into phramoplast microtubule bands at mitosis prophase. When the formation of phramoplast microtubule started, the nuclear membrane was ruptured and the chromosomes were arranged atthe position of cell plate. Phramoplast microtubules were short initially but started to increase gradually on the sides of cell plate. During this course, sister chromatid was separated by microtubules at cell plate and moved to different poles, forming phramoplast microtubules. This was followed by the formation of nucleoli for two daughter cells which get separated at the end of mitosis.Significance of study:Cell division orientation may be judged from the arrangement of cell microtubules in different growth periods.

【题目】EFFECT OF ETHEPHON ON CARBON AND NITROGEN NUTRITION AT TILLERING STAGE OF SUGARCANE
【中文关键词】无
【英文关键词】sugarcane, ethephon, tillering, nutrition
【中文摘要】无
【英文摘要】Aims: The present work was carried out to investigate the effects of ethephon on the dynamic changes in soluble sugars and the water soluble proteins facilitating high tillering in sugarcane. We have also tried to investigate the mechanism of its stimulation due to ethephon application.Methods and Results: The experiment was carried out using the foliar spray of ethephon at four concentrations, viz., 0, 100, 200 and 400 mg/l, on leaves of sugarcane varieties ROC22 and ROC10 at the young shoot stage (four to five leaves). The results showed that the ethephon treatments increased the soluble sugar content in the basal part of stems, but it showed the opposite effect in the leaves. The ethephon treatments initially showed aninhibitory effect on the water soluble protein content which later on diminishes with the growth of plant.Significance of study: It can be concluded that the changes in the soluble sugar and water soluble protein content in the leaves and basal portions of mother shoot helped in the tillering process.

【题目】猪链球菌2型血清混浊因子基因的鉴定及其结构特征分析
【中文关键词】Ⅱ型猪链球菌;血清混浊因子;多态性

【英文关键词】Streptococcus suis type 2, serum opacity factor, polymorphisms

【中文摘要】猪链球菌是猪的主要病原,也可导致人感染,其致病机理尚未明确。作者设计了1对特异性引物,采用特异性PCR从2株猪链球菌血清2型606中国分离株和607日本分离株的基因组中,分离出2种血清混浊因子(ofs)基因,全长3016bp,编码938个氨基酸,其中日本分离株607的ofs基因序列与已知基因完全相同。中国分离株606的ofs基因与已知基因相差7个碱基,导致3个氨基酸替换,其中1个突变(Asp353Gly)位于蛋白的N端功能区,可能影响其血清混浊功能;另外2个氨基酸突变位于蛋白的C端重复区内。从2种OFS蛋白中,找出了细菌黏附因子共有的结构特征,2种OFS蛋白C端区含有保守的LPXTG结构,使OFS蛋白可固定于细菌的表面,但其中的3个重复序列与纤黏蛋白结合蛋白A等的相似性很低,两种OFS蛋白可能通过特殊的途径协助猪链球菌的黏附。猪链球菌ofs基因中重复序列和突变使得编码的蛋白表现出丰富的长度多态性。本研究获得的2种OFS属于中等长度的蛋白,均来自强毒力型猪链球菌。这些结果提示菌株606和607携带的ofs基因可能是猪链球菌的毒力基因,对猪链球菌的致病机理及其防治具有重要的意义。

【英文摘要】Streptococcus suis is a swine pathogen which causes serious inflammation of piglets. It can infect people in contact with diseased pig or its by-products. The mechanisms of S. suis pathogenesis are poorly understood. Taking two S. suis serotype 2 strains 606 isolated from China and 607 from Japan as samples, opacity factor of S. suis (ofs) genes were amplified from the genomic DNA of these bacteria by PCR method. The ofs genes contained 3016 bp which encoded fro 938 aa based on alignment analysis. The identity of nucleotide sequence of ofs gene from SS2 strain 607 was 100% to the reported SS2 genes while seven nucleotides in ofs of SS2 strain 606 were different and resulted in three amino acids substitution. One of the substitutions located at the N-terminal region of OFS protein in which glycin (without charge) was changed to be aspartic acid (with negative charge). It was proposed that the change would have an effect on the OFS ability to opacify serum of mammals. The other two substitutions were found from the repeats in C-terminal region of OFS in SS2 strain 606. Furthermonre, the length and amino acid constitute of three repeats in OFS of SS2 strain 606 and 607 was very divergent from that of fibronectin-binding protein A (FnBA) of Streptococcus dysgalactiae. It was suggested that the pathway of OFS protein binding to fibronectin of host cells might be different from that of FnBA. However, OFS proteins did carry the typical structural elements of MSCRAMMs (microbial surface components recognizing adhesive matrix molecules) with a large N-terminal region, specific repeats and LPXTG domain elements in the C-terminal region. It could be presumed that OFS of SS2 strain 606 and 607 function as an adhesion combined on the surface of bacteria and bind the fibronectin with its repeats at the C-terminus. The correlation between the OFS with moderate size (938 aa) and the high virulence of streptococci implied that ofs gene was a pivotal virulent gene of SS2 strain 606 and 607.

【题目】糯谷猪瘦肉率相关基因的表达与骨骼肌细胞生长的相关性

【中文关键词】糯谷猪; MSTN; CDK2; IGF2; HSL; 骨骼肌细胞

【英文关键词】Nuogu pig; MSTN; CDK2; IGF2; HSL; Skeletal muscle cells

【中文摘要】本试验旨在探讨肌肉生长抑制素(my ostatin, MSTN) 、细胞周期蛋白依赖性蛋白激酶2(cyclin dependent kinase 2, CDK2) 、胰岛素样生长因子2(insulin like growth factor 2, IGF2) 和激素敏感脂肪酶(hormone sensitive lipase, HSL) 对地方猪品种骨骼肌细胞生长及脂肪代谢的调节作用。选用贵州省地方优良品种糯谷猪为试验材料,外二元杂交猪(长X 大) 为对照, 应用RT-PCR 和免疫组织化学方法研究骨骼肌MSTN、IGF2 及HSL 基因的表达,及其蛋白在肌细胞中的定位和分布, 并测定肌细胞中CDK2 的活性。结果表明: 糯谷猪骨骼肌MSTN mRNA 的表达量略高于外二元杂交猪(P > 0. 05) , IGF2 基因表达量极显著高于对照(P < 0. 01) , HSL 基因表达量低于对照(P < 0. 05) 。骨骼肌细胞中MSTN、I GF2、HSL 阳性信号均定位于细胞质, 与外二元杂交猪相比, 糯谷猪骨骼肌细胞中MSTN 和IGF2 的表达量较高(P< 0. 05) , HSL 的表达量较低(P< 0. 01) , CDK2 的活性较低(P< 0. 01) 。相关性分析结果提示, MSTN 和IGF2 基因的高表达、CDK2 的低活性使糯谷猪骨骼肌细胞的数量减少, MSTN 和IGF2协作使糯谷猪肌细胞出现一定的增生效应, HSL 和IGF2 共同促进糯谷猪的脂肪沉积, 这些因子综合作用导致糯谷猪的瘦肉率较低。

【题目】猪水肿病大肠杆菌贵州分离株毒素Stx2e对Vero细胞的毒性作用
【中文关键词】大肠杆菌; 志贺毒素; 细胞毒性; Vero细胞; 细胞凋亡
【英文关键词】Escherichia coli; Stx2e; cytotoxicity; Vero cell; apoptosis
【中文摘要】猪水肿病毒素即II型志贺毒素变异体e亚型(Shiga toxin 2e, Stx2e)。采用吖啶橙/溴化乙锭(AO /EB) 双荧光染色法和四甲基偶氮唑盐(MTT) 比色法, 比较了从患水肿病猪粪便样品中分离的28株大肠杆菌所产志贺毒素对Vero细胞的毒性作用。结果显示, MTT 比色法检测的细胞比活力与AO /EB染色法检测的正常细胞与早期凋亡细胞比率之和呈正相关。将28株菌株产生的Stx2e作用于Vero细胞, 均能抑制Vero细胞的生长, 并诱导Vero细胞的凋亡; 其中8株病原菌所产Stx2e毒素对Vero细胞的毒性作用强于O157: H7。这些毒素的毒力差异可能与其A 亚基基因的结构变异有关。结果提示, 贵州分离的产Stx2e大肠杆菌的毒力存在一定差异, 其中部分菌株的毒力作用较强, 应加强对养殖场仔猪的保护。

【中文摘要】无
【英文摘要】Aims: The present study is an attempt to investigate the effects of ethephon application on tillering, gas exchange characteristics and yield of the sugarcane under drought conditions.Methods and results: Two sugarcane varieties viz., ROC22 and ROC16, which have different tillering ability and responses to drought stress, were grown in pots and field conditions. The Ethephon application (40%) and water withholding treatments (Drought- controlling the relative water content of soil at 40-45% for three days) given in pots are as follows: (i) CK1-0 mg/l ethephon [foliar spray of water] + Normal irrigation, (ii) CK2-0 mg/l ethephon+ drought, (iii) 100 mg/l ethephon + drought, (iv) 200 mg/l ethephon + drought and (v) 400 mg/l ethephon + drought. In field same treatments has been followed except (ii). Results showed an increase in net photosynthesis,stomatal conductance and decreased water use efficiency in plants imposed to drought stress. The ethephon treatments also resulted in increased tiller production and yield of the sugarcane.Significance of study: Ethephon treated at tillering stage improved the drought resistance of sugarcane by decreasing water use efficiency and promoted the tillering, thus increased the millable stalks of sugarcane. The treatments with 100-200 mg/l ethephon improved the gas exchange and cane yield of sugarcane under drought and low light conditions. Early application of ethephon might improve the yield of sugarcane under drought conditions.

【题目】SDS-PAGE PROTEIN PROFILE OF SUGARCANE PLANTLETS UNDER DROUGHT STRESS CONDITIONS
【中文关键词】无
【英文关键词】Sugarcane, drought stress, stress proteins, SDS -PAGE
【中文摘要】无
【英文摘要】Aims: This research work was carried out to investigate the changes in SDS-PAGE protein profile in sugarcaneplantlets subjected to drought stress conditions.Methods and Results: The plants of sugarcane variety ROC16 were grown in sand culture until their stalks grew to about 25 cm height. The plants were treated with nutrient solution containing 10% (W/V)polyethylene glycol 6000 (PEG 6000) for simulating drought stress. The samples of root, stem and leaf were taken at different times.The proteins from different tissue samples were extracted with Tris-saturated phenol and were separated by SDSPAGE.The results showed that: the expression of proteins at molecular weight of 52, 40, 37, 31, 25 and 18.4 KDa in leaf increased in the early drought stress (i.e., at 2 and 5h), while it generally decreased at 8, 11, 14 and 24hstress. For the stems, the protein expression were quite different from leaves, the proteins with 91, 66, 52, 40, 35,30, 25, 18.4 and 16 KDa increased markedly at 2 and 5h, and generally declined after 8, 11 and 14h drought treatment, A new protein band (60KDa) was found in roots at 5h PEG stress, which may be related to the drought resistance.Significance of study: Sugarcane is the most important sugar crop in China, and is also one of the most promising regenerative energy crops. Drought is one of major stresses limiting sugarcane and sugar productivity.The study of protein expression under water deficit is to help understanding the mechanism of drought-resistance and breeding new drought-tolerant varieties of sugarcane.

【题目】EFFECTS OF SEED SOAKING IN ETHEPHON SOLUTION ON POLYAMINE CONTENT IN SUGARCANE ROOTS
【中文关键词】无
【英文关键词】water stress, ethephon, sugarcane, polyamine, water potential
【中文摘要】无
【英文摘要】Aim: The present study was conducted to elucidate the mechanism of drought resistance in sugarcane due to ethephon application.Methods and Results: The setts of three sugarcane varieties viz., ROC22, GT17, and ROC10 were soaked in three different solutions containing ethephon (0, 100 and 200 mg/l) for 10 minutes before planting. The changes of polyamine in root, water potential of leaf and water content of soil were analyzed. The results showed accumulation of polyamines viz., spermine (Spm), spermidime (Spd) and putrescine (Put) in root of sugarcane under water stress. Varieties, ROC22 and ROC10 had higher polyamine concentration compared to GT17 at 100 and 200 mg/l ethephon. However, the activity of polyamine oxidase (PAO) in roots was found lower compared to control at both levels of ethephon. The 100 and 200 mg/l ethephon treatments helped in reducing the decreased waterpotential in leaves due to water stress, more pronouncedly at 200mg/l ethephon.Significance of study: Results revealed that soaking setts in ethephon increased the drought resistance in sugarcane.The application of ethephon in rainfed upland areas may be recommended forsustaining sugarcane productivity.

【题目】稻果皮色泽近等基因系的构建及近等性评价
【中文关键词】果皮色泽; 近等基因系; 农艺性状; 分子标记; 近等性; 水稻
【英文关键词】pericarp color; near isogenic line; agronomic trait; molecular marker; near isogenicity; rice
【中文摘要】以紫香糯和春江糯2号为亲本,利用F2、BC1F1和F3分离群体对果皮色泽性状进行遗传分析,并构建了7对果皮色泽近等基因系。遗传分析结果表明紫香糯果皮的色泽性状由两对互补基因控制。对7对近等基因系进行的性状相似性和遗传背景的SSR分子标记检测结果表明,近等基因系间在农艺性状上除了千粒重外,其他性状差异均不显著。利用34对亲本间多态性SSR分子标记,发现5对黑、白近等基因系仅在目标基因区段检测到了多态性标记,近等性比较理想;2对黑、褐近等基因系除了目标区段外,还分别在第11、12染色体检测到了多态性标记,近等性较差。
【英文摘要】The inheritance of purple pericarp was studied through genetic analysis using F2,BC1F1 and F3 from a cross between a purple pericarp rice variety Zixiangnuo and a white pericarp rice variety Chunjiangnuo 2. Seven pairs of near isogenic lines(NILs) for pericarp color of rice were further constructed. The genetic analysis indicated that the purple pericarp was controlled by two complementary genes (Pb and Pp). Analyses on agronomic traits showed that no significant differences on agronomic traits were found among NILs except grain weight. The polymorphic SSR markers for the two parents were detected only in target segments of the five pairs of NILs different in Pb,which revealed that the near isogenicities of them were fine. However,for the two pairs of NILs different in Pp,the polymorphic markers for the two parents were detected as well as in non-target segments of chromosomes 11 and 12,respectively.

【题目】一新的水稻多蘖矮秆突变体的分离及基因的精细定位
【中文关键词】水稻　多蘖矮秆　株型　TDDL(T)基因　精细定位　赤霉素　矮秆突变体　染色体长臂　基因控制　分子机制
【英文关键词】水稻　多蘖矮秆　株型　TDDL(T)基因　精细定位　赤霉素　矮秆突变体　染色体长臂　基因控制　分子机制
【中文摘要】水稻株型是影响稻米产量的重要农艺性状,而株高和分蘖是水稻株型的两大构成因素,因此对水稻多蘖矮秆突变体的研究不仅能为植物生长发育分子机制的阐明奠定基础,而且具有潜在的农业生产价值.我们从EMS化学诱变的籼稻IR64的后代筛选得到一稳定遗传的多蘖矮秆且叶色加深突变体,暂命名为tddl(t),它与已发现的多蘖矮秆突变体非等位.该突变体属于dn型矮秆,其矮秆性状与赤霉素、油菜素内酯和萘乙酸无关,因此推断其控制基因可能参与其他激素途径.组织细胞学分析表明,维管束薄壁细胞的减小导致了茎秆变细.遗传分析显示,该性状受单隐性核基因控制,精细定位将TDDL(T)基因锁定在水稻第4号染色体长臂85.51kb的物理距离内,在该区域共预测到20个候选基因.对该基因的进一步克隆将有助于水稻多蘖矮秆分子机制的阐明和应用于分子标记辅助育种.

【题目】水稻白叶枯病抗性基因的发掘及在育种中的应用
【中文关键词】水稻; 白叶枯病; 抗性基因; 分子标记辅助选择
【英文关键词】水稻; 白叶枯病; 抗性基因; 分子标记辅助选择
【中文摘要】白叶枯病是水稻生产中最具危害性的病害之一。控制白叶枯病最有效的方式就是培育抗病品种。一直以来,生产中利用的抗白叶枯病品种其抗性基本上都是由主基因控制,然而由于白叶枯病菌的小种专化性,携有垂直抗性基因,特别是单基因的品种容易丧失抗性,所以只有采取基因轮换、多基因聚合等方式才能有效防止抗白叶枯病品种丧失抗性,而不断进行抗白叶枯病新基因的发掘则是开展相关工作的前提。本文对白叶枯病抗性基因的发掘、定位及分子标记开发的最新进展进行了概述;并介绍了国内外在分子标记辅助选择利用白叶枯病抗性主基因改良水稻抗白叶枯病方面的进展;最后鉴于目前在利用白叶枯病抗性主基因方面存在的问题进行了归纳,并提出了相应对策。

【题目】EFFECTS OF MOLYBDENUM ON NITROGENASE ACTIVITY OF NITROGEN-FIXING BACTERIA IN SUGARCANE
【中文关键词】无
【英文关键词】Sugarcane, molybdenum, nitrogen-fixing bacteria, nitrogenase activity
【中文摘要】无
【英文摘要】Aims: The present study was conducted to investigate the effects of molybdenum on nitrogenase activity of nitrogen-fixing bacteria of sugarcane under greenhouse condition.Methods and Results: Two Brazilian nitrogen fixing sugarcane varieties viz., RB72/454 and RB86/7575 (B1 and B8) were used for pot culture in greenhouse conditions. Mo was applied with Hoagland ’ s solution at 4 graded levels viz., 0.0, 0.01, 0.02, and 0.04 mg/l. The results showed that, under nitrogenous conditions, low Mo promoted the nitrogenase activity of nitrogen-fixing bacteria in roots, while high Mo increased that in stems of both two sugarcane varieties, and leaves of the variety RB72/454. Under non-nitrogenous conditions, however, all Mo treatments increased the activities of nitrogenase of nitrogen fixing bacteria in leaves and stems of RB72/454, but decreased that in leaves, stems and roots of RB86/7575 as well as that in roots of RB72/454 as compared with the control. The nitrogenase activity in roots was found negatively correlated with activity in leaf and stem.Significance of study: Braziliansugarcane varieties also showed their nitrogen-fixing capacity in Guangxi. Mo was propitious to regulate nitrogenase activity of nitrogen-fixing bacteria in sugarcane under nitrogenous conditions and promoted nitrogen fixation but not under non-nitrogenous conditions.

【题目】EFFECT OF VINASSE ON PHOTOSYNTHESIS, NITROGEN METABOLISM AND YIELD OF SUGARCANE
【中文关键词】无
【英文关键词】Key words: Sugarcane, vinasse, photosynthesis, nitrogen metabolism, physiological characteristics, productivity
【中文摘要】无
【英文摘要】Aims: The present study was carried out to investigate the effect of vinasse application on photosynthesis and nitrogen metabolism and their relationship with the cane productivity at different growth stages, in order to understand the physiological and biochemical mechanism of yield increase by vinasse application.Methods and Results: Different rates of vinasse were applied as liquid fertilizer at planting of sugarcane with the routine fertilizer application and no fertilizer as the controls. The results indicated that, application of vinasse @ 45 and 75 t/ha increased the cane yield compared to routine fertilization treatment, although the differences were not statistically significant. However, the treatment with 105 t/ha vinasse significantly improved the cane yield.The content of chlorophyll a, water soluble protein, nitrogen and the activity of nitrate reductase, NADP-malic enzyme and amylase in the 45 t/ha vinasse treatment did not significantly differed from those in the treatment with routine fertilization at four stages. The photosynthesis and nitrogen metabolsm parameters were significantly higher in the 75 and 105t/ha vinasse treatment compared to 45 t/ha vinasse and the routine fertilizationtreatments at grand growth and early maturity stages. The physiological indices were all positively correlated to the cane yield,among which the nitrate reductase activity and water soluble protein content were significantly correlated to the cane yield.Significance of study: The high concentration of nitrogen and potassium in vinasse is readily available and absorbed sugarcane plants, which enhanced photosynthesis and nitrogen metabolism of the plants, and finally improved the cane productivity. The findings of the study provide justification for use of vinasse application to sustaining sugar and sugarcane productivity.

【题目】CRYOSECTIONING METHOD FOR THE OBSERVATION OF MICROTUBULE CYTOSKELETON IN PLANT CELLS
【中文关键词】无
【英文关键词】Cryosectioning, microtubule cytoskeleton; fluorescence microscopy; immunofluorescence staining,sugarcane
【中文摘要】无
【英文摘要】Aims: The present work was conducted to investigate sugarcane microtubule cytoskeleton using improved cryosectioning method for the first time.Methods and Results:The general cryosection-ing protocol was improved for observing sugarcane microtubule cytoskeleton. After fixation, microtubule arrays in various cells of young leaves of sugarcane could be stained by using the improved cryosection method. Transverse cortical array towards the axis of cells was the main form for microtubules in the developing young leaves, and longitudinal array to the long axis of the cells in the young leaf base, especially in the third young leaf base. Signifi-cance of study: This improved cryosectioning method will be useful in getting information on plant microtubule cytoskeleton system in sugarcane.

【题目】STATUS OF THE SUGAR INDUSTRY DEVELOPMENT IN CHINA
【中文关键词】无
【英文关键词】Sugar productivity, sugarcane, sustainable development, limitations, China
【中文摘要】无
【英文摘要】Aims: In the present paper we have discussed about the novel development strategies for sustaining China sugar industry.Methods and Results: The sugar production attained a boost in 2006-08 milling years due to the rise in sugar price and millable cane, and significant improvement in sugarcane productivity. During 2007-08 milling year, the total sugar output in China reached 14.83 million tons, which was 24.04% higher compared to previous milling year; and cane sugar output reach 13.67 million tons, which occupied 92.18% of the total. Guangxi is the largest sugarcane and sugar producer province in China, and during 2006-07 and 2007-08 milling years, it produced 7.09 and 9.37 million tons of sugar which occupied 65.96% and 68.54% of the total cane sugar output and 59.01% and 63.18% of the total sugar in the country, respectively. The millable cane productivity in Guangxi was 68.7 and 83.6t/ha, respectively in the past two milling years. However, the severe low temperature spells from January to February 2008 delayed the sugarcane growth by 15 to 25 days, which caused unfavourable upshots to the cane productivity in the subsequent time in Guangxi.Significance of study: Drought inflicted the major limitation for sugar productivity in China.Comprehensivemanagement measures are being studied and applied to achieve a sustainable sugar production.

【题目】不同温度条件下新菠萝灰粉蚧实验种群生命表
【中文关键词】新菠萝灰粉蚧; 温度; 实验种群; 生命表
【英文关键词】Dysmicoccus neobrevipes(Beardsley); temperature; experimental population; life table.
【中文摘要】在20、24、28、32、36 ℃不同温度条件下, 观察温度对新菠萝灰粉蚧[Dysmicoccus neobrevipes(Beardsley)]生长、 发育和存活的影响。组建相应温度条件下新菠萝灰粉蚧实验种群生命表。 实验结果表明, 在 20~32 ℃温度范围内, 新菠萝灰粉蚧各虫态的发育历期随温度的升高而缩短。若虫期、 产虫前期和世代历期的发育起点温度为 9.47、 11.36、 10.61 ℃; 有效积温为 531.29、 748.35、 1 128.72 日度。 种群趋势指数(I)均大于 1, 内禀增长力(rm)均大于 0,新菠萝灰粉蚧种群呈增长趋势。 该虫发育适宜温度为 24~28 ℃。
【英文摘要】Experimental population of Dysmicoccus neobrevipes(Beardsley) was observed in terms of developmentand mortality under different temperatures, 20 ℃, 24 ℃, 28 ℃, 32 ℃ or 36 ℃, based on which its life tablewas set up. The results showed that the developmental rate increased with the temperatures from 20 ℃ to32 ℃. The threshold temperatures for the development of nymphal, preoviposition and a generation of theD. neobrevipes (Beardsley) were 9.47 ℃, 13.25 ℃ and 10.61 ℃ , respectively, and the effective cumulativetemperatures were 531.29 degree day, 748.35 degree day and 1128.72 degree day, respectively. The innatecapacity of natural increase (rm) was higher than 0, and the population trend index was higher than 1.The population of D. neobrevipes(Beardsley) increased at the temperatures from 20 ℃to 36℃. The suitabletemperature for development of D. neobrevipes(Beardsley) was found to be between 24 ℃ to 28 ℃.

【题目】渝棉1 号优质纤维 QTL 的标记与定位
【中文关键词】陆地棉; 纤维品质; QTLs; 分子标记
【英文关键词】Upland cotton; Fiber quality; QTLs; Molecular marker
【中文摘要】利用陆地棉遗传标准系TM- 1 和优质品种渝棉1 号组建了(TM- 1@ 渝棉1 号) F2 和F2: 3 分离群体。通过5 544 对SSR 引物对亲本进行筛选, 获得178 个多态性标记, 用其中138 个构建了总长为9591 7 cM 的遗传图谱, 覆盖棉花基因组的19%。应用复合区间作图法分析了该组合的F2 单株和F2: 3 家系纤维品质性状, 共检测到12 个纤维品质数量性状基因座(QTL) , 包括1 个纤维长度的、4 个纤维强度的、3 个马克隆值的、3 个整齐度的和1 个伸长率的, 分别解释各性状表型变异的611%、5131%~ 14162%、7188%~ 19117%、714%~ 11171%和8126%。研究还发现Chr1 23 和Chr124 是优质纤维QTLs的富集区。

【题目】盐胁迫下不同耐盐性的陆地棉品种脱落规律及机理
【中文关键词】陆地棉; 盐胁迫; 耐盐性; NaCl; 脱落
【英文关键词】cot to n; saline st ress; salt tolerant; NaCl; abscissio n
【中文摘要】NaCl 胁迫下研究了三个不同耐盐水平(不耐盐、稍耐盐、较耐盐) 的棉花材料的蕾、花、铃脱落及其规律。低浓度NaCl(0. 20%) 仅对耐盐性差的材料的脱落率的有显著影响, 不耐盐材料的脱落率的次序是蕾> 花> 幼铃> 大铃, 对

稍耐盐材料的蕾、花也存在显著影响。在高浓度NaCl(0. 40%) 下, 脱落率取决于材料的耐盐性, 其脱落率次序是: 不耐盐材料> 稍耐盐材料>较耐盐材料, 耐盐性与脱落率呈负相关, 耐盐性高的材料其脱落率较低。不同耐盐性能的材料的蕾、花、铃脱落率存在显著差异; 不耐盐材料的脱落率依次为: 蕾= 花> 幼铃> 大铃; 较耐盐材料的脱落率依次为: 蕾> 花= 幼铃> 大铃; 较耐盐材料的脱落率依次为: 蕾> 幼铃> 花, 在NaCl(0. 40%) 以下的浓度都不会对较耐盐材料的大铃产生影响。

【题目】新菠萝灰粉蚧雌成虫空间分布型的初步研究
【中文关键词】新菠萝灰粉蚧; 空间分布型; 聚集度; 剑麻
【英文关键词】Dysmicoccus neobrevipes; spatial distribution; aggregation degree; sisal
【中文摘要】本文通过对新菠萝灰粉蚧的雌成虫进行田间调查,应用David和Moore的聚集性指标、Cassie的指标C和Kuno的指标CA、Lloyd的平均拥挤度m*及聚块性指标m*/m3个聚集性指标及Taylor的幂法则和Iwao的m*-m的回归法对新菠萝灰粉蚧雌成虫的空间分布型进行了分析和检验。结果表明,其在剑麻株内的空间分布为聚集、分布,且具有密度依赖性,引起聚集的原因主要是新菠萝灰粉蚧雌成虫自身习性,与环境因素也有一定关系。
【英文摘要】The spatial distribution pattern of the larvae ofDysmicoccus neobrevipes(Beardsley) female adults was studied by 3 aggregation indices and regressional analysis. The results showed that the spatial distribution pattern of the larvae was aggregated distribution in individual plants of the sisal, and density-dependent. The aggregation of the populations of this insect was due to their behavior and some environmental factors.

【题目】Removal of nitrobenzene from aqueous solution by adsorption on nanocrystalline hydroxyapatite
【中文关键词】羟基磷灰石,吸附,硝基苯
【英文关键词】Nitrobenzene; Adsorption; Nanocrystalline hydroxyapatite; Isotherm; Biocompatible adsorbent
【中文摘要】通过羟基磷灰石吸附去除水溶液中的硝基苯
【英文摘要】In this study, the nanocrystalline hydroxyapatite (HAP) prepared by thermal decomposition of precursors was used as the adsorbent, and the potential of nanocrystalline HAP for nitrobenzene removal from aqueous solution was evaluated. Results indicated that nitrobenzene adsorption was initially rapid and the adsorption process reached a steady state after 1 min. The adsorption isotherms were well described by the Langmuir and the Freundlich models, the latter being found to provide the better fit with the experimental data. The nitrobenzene adsorption capability of the nanocrystalline HAP was investigated as a function of temperature, pH, ionic strength, fulvic acid, and the presence of solvent. According to the experimental results, decrease in pH and temperature resulted in increase in nitrobenzene adsorption capacity; Increasing ionic strength and the presence of fulvic acid decreased the adsorption of nitrobenzene by nanocrystalline HAP; Acetone appeared to inhibit nitrobenzene adsorption to an extent greater than the presence of methanol. Thermodynamics studied revealed that the adsorption of nitrobenzene by nanocrystalline HAP was physisorption, spontaneous and endothermic in nature. This study showed that nanocrystalline HAP could be used as an efficient adsorbent material for the removal of nitrobenzene from aqueous solution.

【题目】棉花耐盐性的SSR标记研究
【中文关键词】棉花;耐盐;SSR
【英文关键词】cotton; salinity-tolerance; SSR
【中文摘要】针对两个典型的棉花耐盐材料(中07和中棉所35)和两个典型的盐敏感材料(新研96-48和中棉所12),开展了寻找与棉花耐盐有关的SSR标记的研究。利用3528对引物,最终筛选出274对引物在4个材料间具有SSR多态性。其中,有10对引

物Y01、Y02、Y03、Y04、Y05、Y06、Y07、Y08、Y09、Y10在耐盐性不同的材料中扩展出差异性片段。扩增图谱显示,同一引物在耐盐的中07和中棉所35中扩出的片段与盐敏感的新研96-48和中棉所12扩出的片段不同。初步研究结果认为,这10对引物有望成为鉴定棉花耐盐性的标准引物,从而将耐盐材料与盐敏感材料从分子角度鉴别开来,为棉花耐盐性分子鉴定等研究提供参考。

【题目】The study on fishing ground of neon flying squid,Ommastrephes bartrami, and ocean environment based on remote sensing data in the Northwest Pacific Ocean
【中文关键词】/
【英文关键词】Ommastrephes bartrami; generalized additive models; sea surface temperature; chlorophyll-a
【中文摘要】/
【英文摘要】The relationships between the neon flying squid, Ommastrephes bartrami, and the relative ocean environmental factors are analyzed. The environmental factors collected are sea surface temperature (SST), chlorophyll concentration (Chl-a) and sea surface height (SSH) from NASA, as well as the yields of neon flying squid in the North Pacific Ocean. The results show that the favorable temperature for neon flying squid living is 10 ° C – 22 ° C and the favorite temperature is between 15 ° C – 17 ° C. The Chl-a concentration is 0.1 – 0.6 mg/m3. When Chl-a concentration changes to 0.12 – 0.14 mg/m3, the probability of forming fishing ground

becomes very high. In most fishing grounds,the SSH is higher than the mean SSH. The generalized additive model (GAM) was applied to analyze the correlations between neon flying squid and ocean environmental factors. Every year, squids migrate northward from June to August and return southward during October – November, and the characteristics of the both migrations are very different. When squids migrate to the north, most relationships between the yields and SST are positive. The relationships are negative when squids move to southward. The relationships between the yields and Chl-a concentrations are negative from June to October, and insignificant in November. There is no obvious correlation between the catches of squid and longitude,but good with latitude.

【题目】采用耳石研究印度洋西北海域鸢乌贼的年龄、生长和种群结构
【中文关键词】鸢乌贼; 耳石; 年龄和生长; 印度洋西北海域
【英文关键词】Sthenoteuthis oualaniensis; statolith; age and growth; northwest Indian ocean
【中文摘要】利用2004—2005年中国鱿钓渔船资源探捕期间在印度洋西北部采集的104枚鸢乌贼Sthenoteuthisoualaniensis耳石样本,对其年龄和生长进行了研究。鸢乌贼的生命周期约为1年,样本年龄为88~363 d,优势年龄组为180~270 d,占总体的81.3%。样本孵化日期为2004年1—11月,几乎为全年性,但存在两个峰值:3—5月和9—10月,分别占总体的57.8%和14.4%。根据孵化日期可将鸢乌贼分为春季和秋季两个产卵群体。两产卵群体胴长与年龄符合线性方程,而体重与年龄符合指数方程模式。各胴长组间的瞬时相对生长率和绝对生长率存在变化,不同群体之间的瞬时相对生长率和绝对生长率差异明显。
【英文摘要】The age and grow th of squid Sthenoteuth is oualaniensis were studied using 104 statoliths collected in the Chinese squid jigging surveys from O ctober 2004 to January 2005. It was found that the squid had a life span of about one year, the samples being 88 to 363 day old, 81.3% ranging from 180 to 270 day old. The incubation samples were found almost throughout the year from January to November in 2004, with two peaks of March to May and September to October, accounting for 57.8% and 14.4% of the total respectively. Two distinct spawning groups were observed in spring and autumn. There ationship between mantle length and age was described by the linear function and the relationship between body weight and age the exponent functions in the two spawning groups. The instantaneous relative grow thrate and absolute growth rate were found to be varied with the sizes, with significant difference between the groups of squid with the same age

【题目】东黄海鲐鱼生物经济模型及管理策略探讨
【中文关键词】鲐鱼; 生物经济模型; 大型灯光围网渔业; 东黄海
【英文关键词】chub mackere;lbio-economic model; the EastChina Sea and Yellow Sea; light purse seine fisheries
【中文摘要】鲐鱼是我国近海重要经济鱼类, 如何综合考虑生物、经济和社会效益来科学制定渔业管理目标是确保该资源可持续利用的重要研究内容。根据中、日、韩三国鲐鱼围网生产作业数据及相关经济数据, 构建基于Schaefer剩余产量的生物经济模型, 探讨不同管理目标下的产量及其对应捕捞努力量, 以及1年(短期)、5年(中期)和10年(长期)的经济效益和资源状况。结果表明, 最大持续产量(M SY)、最大经济产量(MEY)和生物经济平衡点(BE)对应的捕捞努力量(以我国大型灯光围网的单位网次产量为准) 分别为23 964网次,13 816网次和27 631网次, 其对应的第1年产量和利润分别为39. 29万t和5. 56亿元, 22. 65万t和3. 20亿元, 及45. 30万t和6. 41亿元; 前5年累计的产量和利润分别为181. 88万t和19. 78 亿元, 131. 04万t和25. 81亿元, 及192. 10万t和13. 12亿元; 前10年累计的产量和利润分别为354. 62万t和34. 53亿元, 272. 32万t和57. 24亿元, 及

362. 08万t和14. 07亿元。研究表明, 以BE 为管理目标则其短期经济效益为最大, 而以MEY为管理目标则其长期经济效益为最大。探讨了不同管理方法对鲐鱼渔业所产生的影响。

【英文摘要】Chub mackerel is an important commercial fish in the coast aters of our country. How to determ in the goal of fisheries m anagement by considering the biology, economic and society is one of the important contents in the sustainable utilization of fishery. A ccording to the yield data of light purse seine fisheries of China, Japan and South Korea and the relative economic data, the Schaefer B io-economic model is used to estimate the yield and corresponding CPUE on the basis of differentmanagement goal and the economic benefitand resource conditions under the shor-t term aim (1year) , mid-term (5years) and long-term aim (10years) . The result shows that on the basis of Maximum Sustainable Yield (MSY) , Maximum Economic Yield(MEY) and B ionomic Equilibrium(BE),the fishing effort should be limited to 23. 96 thousandmnets, 13.82 thousand nets and 27.63 thousand nets respectively, and the corresponding yield and benefit in the first year are 392.9 kiloton and 0.56 billion yuan , 226.5 kiloton and 0.32 billion yuan and 450.3 kiloton and 0.64 billion yuan; the accumulative yield and benefit in 5 years are 1.82 megaton and 1.98 billion yuan, 1.31 megaton and 2. 58 billion yuan and 1.92megaton and 1.31 billion yuan, the accumulative yield and benefit in 10 years are 3.55megaton and 3.45 billion yuan , 2.72 megaton and 5.72 billion yuan and 3.62m egaton and 1.41 billion yuan. The results have shown that the shor-t term economic benefits are the largest when the BE is considered as themanagement goal while the long-term economic benefits are largestw hen the MEY is recognized as the management goal. This article also discussed the impact of fisheries under somem anagement methods

【题目】多变量分位数回归构建印度洋大眼金枪鱼栖息地指数

【中文关键词】大眼金枪鱼;栖息地指数;分位数回归;多变量;印度洋

【英文关键词】Thunnus obesus; habitat suitability index; quantile regression; multivariate; Indian Ocean

【中文摘要】以0~300m 水层加权平均水温、50~150m 水层的温差和氧差及其交互变量为影响因子,运用分位数回归法,寻找出环境变量与大眼金枪鱼(Thunnus obesus)延绳钓钓获率的最佳上界分位数回归方程,计算出栖息地指数(HSI),并应用地理信息系统(GIS)软件绘制各月HSI 空间分布图。研究表明:大眼金枪鱼延绳钓钓获率(HR)依加权平均水温(x)、温差(y)、氧差(z)与的最佳上界分位数回归方程为HR0.70=-15.596+2.124x -0.003x 3+0.033xyz- 0.036y2z+0.107yz2-0.337z3;HSI 空间分布为:16 ° S—10 ° N 印度洋海域HSI 高于0.7,HSI>0.8 的海域随季节发生显著变化,马达加斯加外海至100 ° E、16 ° S—26 ° S 海域常年存在一片HSI<0.4 的区域,26 ° S—40 ° S 海域的HSI 介于0.4~0.5,40 ° S 以南海域HSI<0.4,东非外海季节性地出现一片HSI<0.6 的海域。利用多个环境变量的栖息地指数模型来预测分析大洋金枪鱼资源分布效果较好。

【英文摘要】Some important variables are selected to carry out quantile regression including weighted average water temperature in the 0~300m water layer, temperature difference and dissolved oxygen difference between 50m and 150m water layer and their interactions. The optimum upper boundary equation is regressed for these variables against bigeye tuna Thunnus obesus longline hooking rate to compute habitat suitability index (HSI). The computation results are visualized by geographical information system. It shows that the optimum upper boundary equation of weighted average water temperature(x), temperature difference(y), dissolved oxygen difference (z) against bigeye tuna longline hooking rate(HR) is as follows: HR0.70=-15.596+2.124x-0.003x3+0.033xyz-0.036y2z +0.107yz2-0.337z3. The GIS maps illustrate that HSI is greater than 0.7 within 16 ° S—10 ° N in the Indian Ocean.Area significantly varies seasonally where HSI is greater than 0.8. HSI ranges from 0.4~0.5 between 26 ° S~40 ° S. There is an area of HSI less than 0.4 that exists within Madagascar to 100 ° E and 16 ° S~26 ° S throughout the year. Area of HSI less than 0.6 seasonally appears away off East Africa. It is found that the better results of resources distribution could be predicted by use of multi-environmental variables in the estimation of HSI.

【中文摘要】种类选择性研究是减轻拖网渔业兼捕和抛弃问题的重要方法, 利用参数化的模型实现拖网渔具选择性装置渔获性能的解析, 不仅有利于装置性能的评价和比较, 而且对于优化选择性装置结构、提高装置性能具有重要的意义。根据SELECT 模型原理, 认为渔获对象接触分隔装置的概率与个体尺寸有关, 并使用S型曲线(Log istic曲线)表示接触概率曲线, 结合分隔装置的选择曲线, 为评价桁拖网分隔装置的分隔效率建立了模型。模型对分隔式桁拖网渔具(60mm 分隔网片)捕获的哈氏仿对虾和短吻舌鳎的渔获数据进行拟合, 结果表明, 该模型能较好地分析分隔网片的分隔效率。通过对模型的分析, 认为模型具有较好的应用性, 且模型可根据实际情况进行适当简化; 将捕捞对象的接触概率独立于选择性装置选择性能的做法, 对于研究网具内捕捞对象行为特性具有一定的参考意义。
【英文摘要】Research on species selection is one of important potential measure to alleviate the by-catch and discard problem of trawl fisheries. More and more research showed that parametric models, which have been widely used in analysis of selective devices of trawls, were not only important to assess and compare the performance but indicative to improve the onstruction of these lective devices. In this paper, a model for assessing the separating efficiency of separator devices rigged in mult-ilevel beam trawl fishing of fshore of the East China Sea, in which the size selection of separator panel was taken into account and encounter probability (presented by ogive, Logistic curve) of individual entering trawl was regarded as dependent upon the individual size and then presented by ogive (Log istic curve) , was developed based on the principle of Select model.Fitness of model for size frequency of P ara penae posis hard wickii and Cynog lossus abbreviatus caught by mult-ilevel beam trawl rigging separator panel with 60 mm mesh size and the maximum like lihoodestim ates of parameters showed the model was applicable to assess the separating efficiency of panel.According to the discussion, the model could be applied to the other selective devices and simplified by hypothesis test method according to different situation. Additionally, we think the encounter probability of individual,which was independent of size selection of selective device, could be used to analyse the responding behavior of aquaticanimal.

【题目】国内外拖网减少副渔获物的研究进展
【中文关键词】拖网渔具; 副渔获物; 装置; 选择性
【英文关键词】Trawl gear; by-catch; device; selectivity
【中文摘要】拖网渔业的兼捕是一个世界性难题, 每年因兼捕而产生的渔获物抛弃对渔业资源的持续发展产生较大影响。目前世界各国针对本国拖网渔业的特点、主捕对象开展了卓有成效的选择性研究, 并取得了较为理想的效果。但在推广及应用过程中反映出较多的实际问题, 有待进一步完善、提高。笔者综合了国内外在开展拖网渔具选择性研究中具有代表性的成功经验, 表明单纯的网囊网目很难对副渔获复杂的拖网产生理想的选择效果; 选择性装置及其与网片的组合是解决拖网渔具兼捕的有效手段之一。
【英文摘要】The by-catch in the trawl fishery is a world wide problem, and lots of discards have a greater impact on the sustainable development of fishery resources. At present ,many countries have researched on the selectivity of trawl gearon the basis of the features and the main catch targets of their own, and have achieved good results. Some problems, however, need to be further solved for the extension and application. This paper summed up the representatively successful experience of trawl gear selectivity research, and pointed out that simple mesh size is very difficult to have ideal selective effect on the complicated by-catch in the trawl, while selective devicew ith the assembly o fmesh is one of the effectivemethods to solve by-catch in the trawl gear.

【题目】桁拖网渔具刚性栅栏对虾类的分隔性能
【中文关键词】刚性栅栏; 分隔性能; 多囊桁拖网; 哈氏仿对虾; 葛氏长臂虾
【英文关键词】sorting grid; separating performance; beam trawl with several codends; P arapenaeopsi shardw ickii; Palaemon gravieri
【中文摘要】刚性栅栏是实现拖网渔具种类选择性捕捞的主要装置。通过海上生产试验, 结合SELECT模型分析不同栅条间距(15 mm、20mm 和25 mm) 的刚性栅栏对哈氏仿对虾(Parapenaeop sis hardw ick ii) 和葛氏长臂虾(Palaemon gravieri)的分隔性能。试验结果显示, 随着栅条间距的增大, 栅栏对虾类的重量分隔率逐渐增大;个体接触分隔栅栏的概率可使用常数来表示, 即接触概率与个体尺寸无关; 比较不同虾类对分隔栅栏的接触概率后发现, 接触概率不存在种类间、栅栏间的显著性差异(P > 0. 05) ; 个体接触分隔栅栏的概率均大于0. 9,说明大多数个体都接触到分隔栅栏, 但拒绝全部接触栅栏的假设, 这主要与桁拖网结构和分隔栅栏的安装有关; 随着栅条间距的增大, 栅栏对虾类的50%选择体长(L50)逐渐增大, 但选择范围(SR)没有显著差异。
【英文摘要】It is sorting grids that could separate catch retained in non-selective codends effectively in trawl fisheries. The separating performance of sorting grid with different bar spaces (15 mm, 20 mm and 25 mm)for spear littoral shrimp (Parap enaeopsis hardw ickii) and Chinese ditch prawn (Palaemon gravieri) was analyzed based on the SELECT model.The results showed the separating ratio of catch weight of shrimps increased with the bar space. The probability contacting grid of shrimps could be indicated by a constant,which means the contact probability was independent of individual size. There was no significant difference of contact probabilities in different shrimps and grids with different bar spaces. The maximum likelihood estimates of contact probabilities were all larger than 0.9, which suggested majority, but not all of ind ividuals would encounter the sorting grid, which could be attributed to the special construction of beam trawls and the rigging method of the sorting grid. The 50% retention leng ths of different grids for shrimps would increase with the bar space, but the selection ranges were not different significantly.

【题目】基于Kriging方法Argo数据重构太平洋温度场研究
【中文关键词】Argo浮标数据; 太平洋; 温度场; Kriging方法
【英文关键词】Argo floats data; Pacific; temperature fields; Kriging methods
【中文摘要】采用Kriging 算法, 将2007年1~12月份期间获得的太平洋海域的Argo 剖面浮标资料重新构成3 ° *3 ° 的月平均海温场。重构的温度场能较好地揭示太平洋暖流区、西边界流系的季节性变化和西边界流系强温度锋面。将插值数据与同一时期的实测数据进行比较。结果表明Kriging算法得到的海表温度最大误差0.7 ° , 平均误差0.3 ° , 平均相对误差0.7%, 平均标准误差0.06 ° ,计算结果令人满意。进一步利用重构的太平洋表层及水下4个断面的温度场分析了太平洋海域的温度分布格局及季节变化, 赤道海区表层暖水占主体, 随着水深增加, 东部冷水迅速往东扩展, 在200 m 时冷水基本把北上的太平洋暖水切断。
【英文摘要】Present paper deals with using the Argo profiles in the Pacific to reconstruct a 3 ° *3 ° grids of monthly temperature by means of the Kriging method. The reconstructed Pacific temperature arena could reveal the seasonal variation of Pacific warm pool and western boundary currents, as well as western boundary currents temperature front。 As compared with interpolate data and

actualmeasures in same period, the results show that the maximum error is 0.7 ° , the mean error is 0.3 ° , the mean relative error is 0.7%, the standard error is 0.06 ° . The results are satisfying.

【题目】基于表温的中西太平洋鲣栖息地适应指数的研究
【中文关键词】鲣; 栖息地适应指数; 中西太平洋; 表温
【英文关键词】skipjack; habitat suitability index; western- central Pacific Ocean; sea surface temperature
【中文摘要】根据1990-2001年中西太平洋海域(20 ° N~ 25 ° S, 175 ° W 以西) 鲣Katsywonus pelamis 围网作业产量和作业频次, 结合海水表面温度(SST) 数据, 以高产频次的相对比值表示栖息地适应指数(HSI), 采用3种方法建立HSI- SST模型。根据建立的3个模型, 利用1990-2001年各月HSI值与实际作业产量进行比较, 以选择最优HSI- SST 模型; 最后, 利用2003 年SST数据计算其各季度HSI值, 用来验证预测中心渔场的可行性。结果表明: 采用模型A 时, 主要产量分布在HSI>0.14的区域; 采用模型B 时, 主要产量分布在HSI>0.16的区域; 采用模型C 时, 主要产量分布在HSI>0.18的区域, 因此认为模型C 更符合鲣资源分布的特征。利用模型C估算2003年各季度HIS值, 高产主要分布在HSI>0.18的区域, 这进一步说明, 模型C能较为准确地预报鲣中心渔场的位置。
【英文摘要】The habitat suitability index (HSI) was estimated using the relative ratio of actual fishing times to maximum fishing times with monthly high yield according to the catch data and number of fishing in purse seine and the data of sea surface temperature (SST) in the western- central PacificOcean(20 ° N-25 ° S,120 ° E-185 ° E)from 1990 to 2001. Firstly, three methods were used to establish the HSImodel.Then, the models were tested and compared by overlaying themonthly catch and HSI spatial distribution to select the optimum HSI model.Finally,the optimum HSI model was used to forecast fishing ground based on the SST data in 2003. The results showed that the yield was mainly obtained in the area with HSI> 0.4 estimated by the model A, the area with HSI> 0.6 estimated by the model B and the area with HSI> 0.8 estimated by model C.Therefore, the model C was the best which may be consistent with the skip jack distribution. The HSI in 2003 was estimated by model C, and the area with high yield was distributed in the region with HSI> 0.8, which further demonstrated the feasibility of forecasting fishing ground using the HSI model.

【题目】基于理想自由分布理论对CPUE与渔业资源关系的探讨——以我国近海鲐灯光围网渔业为例
【中文关键词】理想自由分布; CPUE; 渔业资源量
【英文关键词】ideal free distribution; CPUE; fish abundance
【中文摘要】单位捕捞努力量渔获量(CPUE) 常用作渔业资源的丰度指数, 通常假定CPUE与渔业资源量存在正比关系, 但基于商业性捕捞数据的CPUE与渔业资源量的关系受渔民捕捞行为的影响。作者基于理想自由分布理论和中国大型鲐灯光机轮围网捕捞数据, 对南、北渔场捕捞量与捕捞努力量的空间分布关系进行了分析。结果表明: 北渔场没有显著偏离理想自由分布理论的预测结果, 即北渔场的CPUE 存在被均匀化的现象, PUE 不能正确反映渔业资源量的大小; 南渔场虽然显著偏离理想自由分布理论的预测结果, 但当捕捞努力量大于26网次时, CPUE随捕捞努力量的增加而减少, 这表明南渔场也存在干扰竞争, 南渔场的CPUE与渔业资源量的关系被弱化。因此, 在应用商业捕捞数据进行渔业资源研究时, 需注意CPUE 在空间被均匀化的现象。

【英文摘要】Catch per unit effort(CPUE) remains a common index of abundance in fisheries and CPUE in proportion to fish abundance is always taken as avalid assumption, but the relationship between CPUE and fish abundance derived from fishery dependent data will be influenced by behavior of fishermen. In this paper, we analyze the relationship between the proportion of catch and effort allocated to different location in same time based on ideal free distribution theory and data in the large light purse seine fishery of mackerel in Yellow Sea and East China Sea. The results showed the prediction of ideal free distribution was approx imately supported in north fishing ground,.ie.to a certain extent,the CPUE was equalized and was independent of the fish abundance, and, on the contrary, the effort may be in proportion to the abundance. Although the prediction was not supported in south fishing ground, the CPUE decreased with the standardized effort increasing as its va luew as larger than 26, which implied the in terference competition was present and the relationship between CPUE and fish abundancemay bew eakened, even break down. Finally, we suggest we need to keep an eye on CPUE equalized when using the fish dependent data to research dynamic of fish resource.

【题目】基于信息增益技术的影响渔场环境因子的选定
【中文关键词】熵; 信息增益技术; 渔场预测; 关键环境因子; 北太平洋; 柔鱼; K-S检验
【英文关键词】entropy; information gain technology; fishery forecas;t key environment factors; North Pacific;Ommastrephes batramil; K-S test
【中文摘要】在渔场分析中, 需要确定影响中心渔场的海洋关键环境因子, 通过建立模型对中心渔场进行预测。海洋关键环境因子的选取直接影响着预测模型的精确度。文中利用信息增益技术, 通过计算北太平洋150b以西海域柔鱼的产量和CPUE(单船平均日产量)对海洋环境中的垂直温度因子(即5 m、45 m、95 m、205 m 水层的温度, 以及5~ 45 m、45~ 95 m、95~ 205 m 水层的垂直梯度) 的信息增益值, 获得其中影响渔场分布的关键环境因子。分析结果显示: 关键环境因子是5 m 水层温度、45 m 水层温度、95 m 水层温度、205 m 水层温度和95~ 205 m 温度梯度。K- S检验表明, 利用信息增益技术得到的各个关键环境因子是适合的。
【英文摘要】In the fishery analysis, the key marine environment factors, which determine the central fishing ground, are needed to be identified to establish themodel and then to predict the central fish ing g round. The selected key marine environment factors have a

direct influence on the accuracy of the forecast model.In the paper, by the inform ationgain technology, the information gaining values which are determined by the output and CPUE (average output per vessel in a day) , of vertical temperature factors in themarine environment(the water temperature at 5m, 45m, 95 m, 205m and the temperature gradient in 5-45m, 45-95m, 95-205m) in the western waters 150 ° E of North Pacific are calculated. Its main purpose is to discover the key environment factors which affect the fishing ground distribution. The result shows that the key environment factors are the water temperature at 5m, 45m, 95m, 205m and the temperature gradient in 95-205m. The K-S test indicates that each key environm ent factor obta ined by the information gain technology is appropriate.

【题目】秘鲁外海茎柔鱼渔场分布和水温结构的关系

【中文关键词】茎柔鱼; 表温; 表温水平梯度; 水温垂直结构; 渔场分布; 秘鲁外海;

【英文关键词】Dosidicus gigas; sea surface temperature; horizontal gradient of temperature; vertical temperature structure; distribution of fishing ground; waters off Peru;

【中文摘要】分布在东南太平洋海域的茎柔鱼是重要的经济性头足类,是我国鱿钓船队的主要捕捞对象之一。研究茎柔鱼渔场分布及其与水温的水平、垂直结构等关系,是探索渔场形成机制及其规律的重要内容。本文根据2006年1-12月我国鱿钓船在秘鲁外海的渔捞记录、表温(SST)和5~180 m垂直水温等资料,用3种方法计算SST的水平梯度(Dm ax,Dsquare和Dm ean),用A rcG IS 9.0和Sufer 8.0软件分析绘制单船平均日产量(CPUE)和SST、SST水平梯度关系的分布图、水温垂直结构分布图,分析茎柔鱼渔场分布及其与水温结构的关系。结果表明,全年中心渔场分布在80~85 ° W、10~17 ° S,SST为18~28℃,产量分布呈现明显的空间变化。其中,6-8月为全年最高产时期,其中心渔场分布在81~83 ° W、12~13 ° S,相应的SST为18~23℃。SST水平梯度与渔场分布关系密切,水平梯度Dsquare和产量的拟合度为最优(P<0.001),中心渔场相应的Dsquare为0.6~1.7℃。水温垂直结构分析认为,6-8月通常在81 ° W、12~13 ° S附近形成上升流中心,中心渔场基本位于上升流冷水团边缘81 ° 30 ′ ~82 ° 30 ′ W。研究认为,该渔场因上升流而形成,主要分布在上升流引起冷水与外洋暖水的交汇区,与SST、SST水平结构、水温垂直结构关系极为密切。

【英文摘要】Jumbo flying squid(Dosidicus gigas) distributed in the southeastern Pacific is not only an important economic oceanic squid,but also one of the important fishing targets for Chinese jigging fleets.The researches on distribution of this squid and its relationship with environmental conditions such as water temperature and its structure are the key content in searching for the mechanism of fishing ground and inherent laws.In this study,based on the fishing data from Chinese squid jigging fleets in the waters off Peru from January to December 2006,and the environmental data including sea surface temperature(SST),the water temperatures between 5 and 180 m,and the horizontal gradient of temperature(D) calculated by three different methods(D max,D square and D mean),the spatial plots of CPUE,SST,D and the vertical temperature structure are drawn respectively by use of software ArcGIS 9.0 and Sufer 8.0 to analyze the distribution of fishing ground and its relationship with structure of sea water temperature.The result indicated that the main fishing ground was around 80-85 ° W and 10-17 ° S with the range of 18-28℃ SST,and the spatial variations in the catch distribution were evident.From June to August,the monthly catch was relativly high in the waters of 81-83 ° W and 12-13 ° S with the range of 18-23 ℃.The distribution of fishing ground was closely related to the D,the indicator D square(P <0.001) was better than the two others,and the range of D square was 0.6-1.7 ℃ in the main fishing ground.The results also showed that the upwelling was centralized around 12-13 ° S and 81 ° W during June to August,and the fishing ground was mainly distributed at the edge of upwelling between 81 ° 30 ′ -82 ° 30 ′ W.Therefore,it could be concluded that the fishing ground was formed by the upwelling,which was distributed at the mixed region between oceanic warm water and cool water caused by upwelling,and was closely related with the optimum SST,D and vertical temperature structure

【题目】秘鲁外海茎柔鱼渔场分布与表温及表温距平值关系的初步探讨
【中文关键词】茎柔鱼; 渔场分布; 表温; 表温距平值; 秘鲁外海; K-S检验;
【英文关键词】Dosidicus gigas; distribution of fishing ground; sea surface temperature; sea surface temperature anomaly; off Peru; K-S test;
【中文摘要】根据2006年6~11月我国远洋船队秘鲁茎柔鱼生产统计及其表温(SST)、表温距平值(SSTA)数据,利用GIS软件ArcGIS9.0,对各月平均日产量(CPUE)和SST、SSTA关系的分布图进行绘制并分析,计算作业渔场重心。结果表明,6~8月的产量和CPUE比其他月份高。6~11月作业渔场在80°W~85°W,10°S~15°S,渔场重心在81°W~84°W,11°S~14°S。产量主要集中在12°~14°S海域,约占年总产量的72.72%,与2004-2005年有较大差异。6月作业渔场的SST为21~23℃,7、8月分别为19~21℃和18~20℃,9~11月为18~21℃。6月作业渔场的SSTA为0.1~0.2℃,7、8月分别为0.5~0.7℃,9~11月分别为0.2~0.6℃、1.0~1.4℃和0.4~0.7℃。研究认为,茎柔鱼渔场分布与SST、SSTA关系密切,可作为寻找中心渔场的海洋环境指标。
【英文摘要】Based on production data of jumbo flying squid Dosidicus gigas in the waters off Peru from June to November in 2006,the monthly spatial CPUE distribution is drawn by the software ArcGIS9.0 and their relationships with sea surface temperature(SST) and sea surface temperature anomaly(SSTA) are analyzed.The monthly gravity of fishing ground is also calculated.The results indicated that the catch and CPUE from June to August are higher than other months.The fishing ground is distributed around 80-85 W and 10-15 S,the gravity of fishing ground is distributed around 81° -84° W and 11° -14° S from June to November.The catch is mainly located in the waters of 12° -14° S accounting for 72.72% of the total catch in a year,which greatly differs with that in 2004 and 2005.The optimum SST ranged from 21 to 23°C in June,from 19 to 21°C in July to Auguste,from 18 to 20°C in August,from 18 to 21°C during September to November respectively.The optimum SSTA also ranged from 0.1 to 0.2°C in June,from 0.5 to 0.7°C in July and August,0.2 to 0.6°C in September to November,from 1.0 to 1.4°C in October and from 0.4 to 0.7°C in November respectively.The results were checked by K-S test.The results show that the monthly distribution of fishing ground is closely related with SST and SSTA,which may be considered as environmental indicators to search for fishing ground. 更多

【题目】头足类发光器及其在分类学上的应用
【中文关键词】头足类; 发光器; 分类学;
【英文关键词】Cephalopod; light organ; taxonomy
【中文摘要】发光器是一些头足类的重要组织之一。据不完全统计,头足类中具有发光器的种类有6目23科57属198种,占世界头足类总数的26%,其中又以大洋性的开眼亚目为最多,近海生活的闭眼亚目和乌贼类较少。头足类发光器通常可分为本体发光器和腺体发光器两类,前者位于体表,后者位于外套腔内。发光器不仅具有照明、求偶、诱捕食物、迷惑和警告捕食者的作用,也在科、属、种的分类中得到广泛的应用。重点以科、属为基本单元,描述头足类发光器的类型、部位、大小、数量以及排列方式等特征,同时列举其在分类中的应用。最后,建议有必要细化不同科、属间的发光器特征,建立发光头足类的检索表,以便为国内外头足类研究者提供参考。
【英文摘要】Light organ is one of the impotant tissues for some Cephalopods.There are 198 species with light organs belonging to 6 orders 23 families 57 genus occupying 26 percent of the total cephalopods.And among these species,most of them are Oegopsida squid inhabiting in ocean but minors are Myopsida squid and cuttlefish in Coastal waters.The light organs can be sorted as two types mainly in cephalopods,one is intrinsic photophore on body surface and the other is glandulose photophore within mantle cavity.Light organ of Cephalopods not only play an important role in illumination,courtship,trapping food,signal to confuse or warn predators,but also is

applied into the taxonomy at family,genus and species level.In this paper the characteristics of cephalopods light organ from family and genus level have been described as well as their photophore type,position,size,quantity,arrangement and so on.Meanwhile,their application to taxonomy is taken as example.Finally,it is necessary for us to describe the detailed features of light organ from different family and genus,and establish the searching table of cephalopods with light organ,which will provide reference for the domestic and international cephalopod researchers.

【题目】我国东、黄海鲐鱼灯光围网渔业CPUE标准化研究
【中文关键词】日本鲐; 单位捕捞努力量; 大型灯光围网; 广义线型模型; 广义加性模型;
【英文关键词】Scomber japonicus; catch per unit effort(CPUE); Chinese large lighting-purse seine; generalized linear model(GLM); generalized additive model(GAM)
【中文摘要】日本鲐是我国近海重要的中上层鱼类资源之一,评估其资源量需要对单位捕捞努力量渔获量(CPUE)进行标准化。影响CPUE标准化的因素很多,包括季节、区域和海洋环境等。本文利用广义线型模型(GLM)和广义加性模型(GAM),结合时空、捕捞船、表温等因子,对1998-2006年东、黄海大型灯光围网渔业鲐鱼CPUE进行标准化,并评价各因子对CPUE的影响。首先应用GLM模型评价时间、空间、环境以及捕捞渔船参数对CPUE的影响,并确定显著性变量。其次,将显著性变量逐一加入GAM模型,根据Akaike信息法则(AIC),选择最优的GAM模型。最后,利用最优的GAM模型对CPUE标准化,并定量分析时间、空间、环境以及捕捞渔船参数对鲐鱼CPUE的影响。GLM模型结果表明:8个变量对CPUE有重要影响,依次为年、船队、船队与年的交互效应、月、船队与月份的交换效应、经度、纬度和海表温。根据AIC,包含上述8个显著性变量的GAM模型为最优模型,对CPUE偏差的解释为27.78%。GAM模型结果表明:高CPUE分别出现在夏季海表温为28~31℃的东海中部和冬季海表温为12~16℃的黄海;1998-2006年,标准化后的CPUE呈逐年下降趋势,与持续增长的捕捞努力量有关。 更多
【英文摘要】Chub mackerel (Scomber japonicus) is one of the important pelagic fishery resources in the China ’s coastal waters. It is needed to standardize the catch per unit effort (CPUE) in the stock assessment. Many factors including seasonal,regional and marine environmental conditions affect the CPUE. In this paper,generalized linear model (GLM) and generalized additive model (GAM),by which temporal,spatial,environmental,and fisheries vessels variables were chosen for analysis,were used to standardize CPUE of chub mackerel for Chinese large lighting-purse seine fishery in the East China Sea and Yellow Sea from 1998 to 2006,and evaluate impacts of environmental variables on CPUE. Firstly,GLM was applied to evaluate impacts of temporal,spatial,environmental,fisheries operational variables on the CPUE,and the significant factors. Then the significant variables were used in the GAM one by one to select an optimal GAM by using the Akaike Information Criterion (AIC). The derived GAM was used to quantify the effects of temporal,spatial,environmental,and fisheries operational variables on the Chub mackerel catch rates and to derive standardized CPUE. The GLM analysis revealed the importance of eight variables ranked by decreasing magnitude: Year,Fleet,Fleet × Year,Month,Fleet × Month,Longitude,Latitude and Sea surface temperature. The final GAM including eight significant variables derived from GLM analysis was the optimal model based on AIC and explained 27.78% of the variance in nominal CPUE. GAM analysis indicated that high CPUEs were found in the central East China Sea at sea surface temperatures ranging from 28 to 31 °C in summer and in the Yellow Sea at sea surface temperatures from 12 to 16 °C in winter. The standardized CPUE tended to decrease from 1998 to 2006,which might result from increased fishing efforts.

【题目】西北太平洋柔鱼资源丰度与栖息环境的关系及其时空分布
【中文关键词】柔鱼; 栖息环境; 广义加性模型; 资源丰度; 西北太平洋
【英文关键词】Ommastrephes bartramii; environment of habitat; generalized additive models; abundance index; Northwestern Pacific Ocean
【中文摘要】海洋环境决定着鱼类资源的空间分布,利用栖息地环境来推测鱼类资源的空间分布是当前渔业资源学的研究前沿。利用广义加性模型(generalized additive models,GAM)和地理信息系统(geographicalinformation system,GIS)方法,根据1995-2004年我国西北太平洋鱿钓生产统计数据和卫星遥感所获得的海洋环境数据(温度、盐度和海平面高度),分析各海洋环境因子与西北太平洋柔鱼资源丰度时空分布的关系,推测不同月份柔鱼资源丰度空间分布情况。结果表明:6月在175°E、40°N,175°W、41°N以及178°W、43°N附近海域资源丰度相对较高,而在165°E以西传统作业渔场(40°N~45°N,145°E~165°E)资源丰度极低;7月在153°E~173°E、43°N~45°N海域资源丰度水平相对较高;8月资源丰度较高海域分布在150°E~157°E、40°N~45°N;9月资源丰度较高海域分布在145°E~152°E、40°N~45°N和158°E~165°E、41°N~45°N;10月资源丰度较高海域分布在154°E~158°E、41°N~44°N;11月资源丰度较高海域分布在145°E~155°E、39°N~42°N海域。
【英文摘要】The spatial distribution of fish resources is determined by marine environment.It is a hot topic in the science of fishery resources how to use the related environmental factors of fish habitat to speculate the distribution of fishery resources.In this study,according to Chinese squid jigging fisheries data and satellite remote sensing data which included temperature,salinity and sea surface height in the Northwestern Pacific Ocean from 1995 to 2004,Generalized additive models(GAM) and Geographical Information System(GIS) were applied to analyze the relationship between the abundance index of neon flying squid Ommastrephes bartramii and the related environmental factors and predict the monthly spatio-temporal distribution of this squid from June to November.The results showed that the higher abundance index is distributed near the waters of 175° E and 40° N,175° W and 41° N or 178° W and 43° N in June,while the lower abundance index of this squid is the traditional fishing ground(40° N-45° N and 145° E-165° E).In July,the higher abundance index is distributed in the areas of 153° E-173° E and 43° N-45° N.In August,the higher abundance index is distributed in the waters of 150° E-157° E and 40° N-45° N.In September,the higher abundance index is distributed in the areas of 145° E-152° E and 40° N-45° N,158° E-165° E and 41° N-45° N.In October,the higher abundance index is distributed in the areas of 154° -158° E and 41° N-44° N.In November,the higher abundance index is located in the waters of 145° E-155° E and 39° N-42° N.

【题目】西南大西洋阿根廷滑柔鱼耳石外部形态特性分析
【中文关键词】阿根廷滑柔鱼; 耳石形态特征; 西南大西洋;
【英文关键词】Illex argentinu; morphology characteristic of statolith; Southwest Atlantic Ocean;
【中文摘要】2008年1-5月我国鱿钓船在西南大西洋采集了259尾阿根廷滑柔样本(胴长范围为193~364 mm),对其耳石形态特征进行观察与测量。结果表明,阿根廷滑柔鱼耳石的形态上,翼区最大,侧区稍小,背区最小。耳石总长TSL、最大宽度MW、侧区长LDL与胴长ML呈幂函数关系(P<0.05),背侧区长DLL、侧区LDL和吻侧区长RLL与胴长ML呈指数函数关系(P<0.05);而各参数与体重W则全部呈指数函数关系。随着胴长增加,虽然耳石绝对尺寸都逐渐增大,但相对尺寸逐渐减小,耳石的形态结构比例基本不变,即最大宽度、吻区宽度,背区、侧区、吻侧区、翼区的长度以及吻区宽度与耳石总长之比基本保持一致,分别为56.28%、34.36%、63.57%、60.46%、80.56%、15.34%。
【英文摘要】The morphology and microstructure of statolith of Illex argentinus were studied for the 259 samples(ranged in size from 193-364 mm in mantle length),which were collected by Chinese jigging fleets in the Southwest Atlantic Ocean from January to May 2008.The study indicated that its statolith has the structure with biggest rostrum and greater lateral dome length while small dorsal dome.Six most important featured parameters including total statolith length(TSL),maximum width(MW),lateral dome length(LDL)

were best described by power functions with mental length(ML)(P<0.05),while dome length(FDL),ventral dorsal dome length(DLL) and rostrum lateral dome length(RLL) were best described by power functions with ML(P<0.05),and all of the six featured parametes were best described by power functions with body weight.With the squid growth,the size of statolith gradually develops,while the ratio of each featured parameter to ML slowly decrease,and the ratio of MW,FDL,LDL,RLL,WL,RW to TSL almost remain the same level,corresponding to 56.28%,34.36%,63.57%,60.46%,80.56% and 15.34%

【题目】夏季黄海南部沿海表层流刺网渔获物组成分析
【中文关键词】三层表层流刺网; 渔获物; 灰鲳(Stomateoides nozawae Ishikawa); 银鲳(Stromatecoides argenteus);
【英文关键词】float-trammel net; catches; Stomateoides nozawae Ishikawa; Stromatecoides argenteus;
【中文摘要】结合银鲳和小黄鱼流刺网网目选择性试验,对夏季黄海南部沿海三层表层流刺网渔获物组成进行了调查分析。总共鉴定出渔获品种25种,其中优势种为梭子蟹(Portunus triuberbuculatus)、灰鲳(StomateoidesnozawaeIshikawa)和银鲳(Stromatecoides argenteus),分别占总渔获量的59.2%,21.5%和11%,灰鲳体长分布范围为17~30 cm,优势体长范围为21~24 cm,占71.6%;银鲳体长分布范围为13~23 cm,优势体长范围为15~21 cm,占95.8%。数据分析表明,三重流刺网作业网具选择性较差,渔具兼捕种类多,捕获量大,占总渔获量的66.5%;渔获的灰鲳和银鲳处于生长型捕捞期,不利于资源的可持续利用,建议适当改良渔具,避免对其资源造成过度破坏。
【英文摘要】Combining with the selectivity research of gill-net,the authors investigated the catches’components of floated-trammel net used by gill-net fishery in the south region of the Yellow Sea,and discriminated 25 species from catches,the dominant species is swimming crab,silver butter-fish and Silvery pomfret,the weights of the three species take account for 59.2%,21.5% and 11% of the total production respectively.The length ranges of silver butter-fish are among 17~30 cm,the dominant ranges are 21~24 cm and take account for 71.6% of all the sample;the length range of silver butter-fish are 13~23 cm,the dominant range is 15~21 cm and takes account for 95.8% of all the sample.Based on the datebase,the selectivity of the trammel net fishery is poorver, the species number and the amount of by-catch are too lager.It wassuggested to take some feasible modification on fishery nets for protecting fishery resource.

【题目】星康吉鳗笼网目选择性研究
【中文关键词】星康吉鳗; 网目尺寸; 选择性; 模拟套网法;
【英文关键词】Conger myriaster; mesh size; selectivity; simulated cover-net method;
【中文摘要】研究不同网目尺寸的笼网对星康吉鳗(Conger myriaster)的选择性。在实验室水槽中,模拟套网法实验获得星康吉鳗的生物学特征参数,使用Logistic曲线作为研究笼具的选择性模型,求得不同网目尺寸笼网对星康吉鳗的体长选择性曲线,并用极大似然法估算选择性参数,为探讨捕捞星康吉鳗的最适网目尺寸进行基础性研究。结果表明:网目尺寸为33mm、40mm、55mm的笼网目选择率分别在星康吉鳗体长l(0,39cm)、l(0,42cm)、l(0,48cm)时,体长选择率几乎为0;网目尺寸为26mm、33mm、40mm的笼网目选择率在星康吉鳗体长lH48cm、lH60cm、lH66cm时,体长选择率接近于100%;而网目尺寸为55mm的笼网对星康吉鳗的选择率最大只达到50%。网目尺寸为26mm、33mm、40mm、55mm时,星康吉鳗的50%选择体长L50分别为40.083cm、48.212cm、55.874cm、66.500cm;选择范围SR分别为5.419cm、11.578cm、14.354cm、18.000cm;选择系数SF为1.542、1.461、1.397、1.209。通过比较发现,随着笼网网目尺寸的增加,L50和SR逐渐增大,选择系数

SF则呈递减趋势。
【英文摘要】The study investigated selectivity of Conger myriaster pot with diffirient mesh sizes to find out the optimal mesh size for C.myriaster fishing.By using simulated cover-net method in a laboratory flume,biological features of Conger myriaster was obtained.Size selectivity curves of C.myriaster pot were drawn by using Logistic curve as a selectivity model.Parameters of selectivity were estimated according to the maximum likelihood method.The results are as follows:Length selective rate of the C.myriaster pot is nearly 0 when the mesh size is 33 mm,40 mm,55 mm for the C.myriaster with the body length range of 0-39 cm,0-42 cm,0-48 cm,respectively;and the length selective rate is 100%when mesh size is 26 mm,33 mm,40 mm for C.myriaster whose body length range is lH48 cm,lH60 cm,lH66 cm,respectively,while the maximal length selective rate for C.myriaster is 50%when the mesh size is 55 mm.When the mesh size is 26 mm,33 mm,40 mm and 55 mm,its L 50(the corresponding body length with 50% retention) is 40.083 cm,48.212 cm,55.874 cm,66.500 cm,while SR(selection range) is 5.419 cm,11.578 cm,14.354 cm,18.000 cm and SF(selection factor) is 1.542,1.461,1.397,1.209,respectively.By comparison,when the pot mesh sizes increase,L 50 and SR increase,while SF reduces. 更多

【题目】印度洋大眼金枪鱼、黄鳍金枪鱼延绳钓渔场重心变化分析
【中文关键词】大眼金枪鱼; 黄鳍金枪鱼; 渔场重心; 印度洋; 延绳钓
【英文关键词】Thunnus obesus; Thunnus olbacres; barycenter of fishing ground; Indian Ocean; long-line
【中文摘要】大眼金枪鱼和黄鳍金枪鱼是印度洋金枪鱼延绳钓的主要渔获种类。通过计算以渔获量为权重的经度和纬度的加权平均值即渔场重心和利用空间距离分析方法,分别对1967-1987年、1988-2004年两个时间段的印度洋大眼金枪鱼、黄鳍金枪鱼延绳钓渔场重心的年内、年际变化规律和各月渔场重心空间聚类情况进行研究。研究表明,渔场重心在年内呈现出规律性变化,大眼金枪鱼月重心变化1-4月向西北移动,5-8月向东南方向移动,9-12月向东北方向移动;黄鳍金枪鱼月渔场重心变化1月向西北移动,2-4月向西移动,5-8月份向东南移动,9-12月份向东北移动,这在一定程度上反映了印度洋大眼金枪鱼、黄鳍金枪鱼的洄游规律。渔场重心的年间变化受到了海洋环境条件变化所引起的南方涛动现象(ENSO)的影响,大部分发生ElNio的当年或次年,年渔获量分布重心会向南、向西移;发生LaNia的年份前后渔获量分布重心会向北、向东移。同时捕捞行为也对渔场重心的年间变化产生影响。
【英文摘要】Bigeye tuna(Thunnus obesus) and yellowfin tuna(Thunnus albacares) are major fishing targets by longline in the Indian Ocean.Through the weighted average of catch in latitude and longtitude(barycenter of fishing ground) and analysis of spatial distribution,it is studied on the laws of annual and inter-annual change of barycenter of fishing ground and the analysis of barycenter of fishing ground in each month by cluster of bigeye tuna and yellowfin tuna longline fisheries in the Indian Ocean during 1967-1987 and 1988-2004.The barycenter of fishing ground for bigeye tuna turns to the northwest from January to April,to the southeast from May to August,to the northeast from September to December and the barycenter of fishing ground for yellowfin tuna turns to the northwest in January,to the west from Feberary to April,to the southeast from May to August,to the northeast from September to December,which show that the change law of barycenter during the year,to a certain extent,reflects the migratory pattern of bigeye tuna and yellowfin tuna in the Indian Ocean.The change law of barycenter inter-annually moving to the west and the south in the same year or in the next year of the El Ni o and moving to the east and the north in the same year or in the next year of the La Ni a had been influenced by the effect of Southern Oscillation(ENSO) caused by the changes of marine environment conditions and the fishing practice is another factor. 更多

【题目】印度洋黄鳍金枪鱼渔业资源开发策略评价
【中文关键词】黄鳍金枪鱼; 资源评估; 策略模拟; 印度洋
【英文关键词】yellowfin tuna; stock assessment; strategy modelling; the Indian Ocean
【中文摘要】运用单位补充量模型和Schaefer剩余产量模型,对印度洋黄鳍金枪鱼渔业的开发策略进行了评价。单位补充量模型指示的生物学参考点Fmax、F0.1、F20%SPR、F40%SPR分别为0.76、0.44、0.56、0.32,相应的产量控制参考值分别为36.7万t、34.6万t、36.1万t和34.2万t。随着捕捞死亡系数增加,未来10 a的相对渔获量将逐渐增加,但相对剩余亲体量却逐渐下降。捕捞死亡系数控制在0.3以内,未来10 a内相对剩余亲体量下降20%以下的概率将低于10%;捕捞死亡系数在0.6以上时,发生该事件的概率达到90%以上。当总许可捕捞产量分别为30万t、35万t、40万t和45万t时,未来10 a内的黄鳍金枪鱼资源量将分别呈增长、稳定、缓慢下降和快速下降趋势。从模拟的结果来看,应把捕捞死亡系数降低到0.5以下、总产量控制在35万t以内,才能保证渔业产量的长期稳定。图2,表4,参27。
【英文摘要】Exploitation strategy of yellowfin tuna in the Indian Ocean was evaluated using per recruit model and Schaefer production model.Fmax、F0.1、F20%SPR、F40%SPR inferred from per recruit model was 0.76,0.44,0.56,0.32 and the corresponding referrence catch was 367,346,361,342 thousand tons.The relative catch will increase with fishing mortality in the next ten years,but vice versa with relative residual spawner biomass.The probablity of relative residual spawner biomss below 20% will be lower than 10% if the fishing mortality is controled within 0.3,but greater than 90% if the fishing mortality is greater than 0.6.The biomass will show increscent,stable,slowly descendent,and quickly descendent trend in the next ten year when total allowable catch is set at 300,350,400,and 450 thousand tons.It is suggested that the production would be stable if fishing mortality was controlled below 0.5 and total catch was limited within 350 thousand tons. 更多

【题目】应用栖息地指数对印度洋大眼金枪鱼分布模式的研究
【中文关键词】大眼金枪鱼; 分位数回归; 栖息地指数; 印度洋
【英文关键词】Thunnus obesus; quantile regression; habitat suitability index(HSI); Indian Ocean
【中文摘要】运用分位数回归方法对温度、温差、氧差与印度洋大眼金枪鱼延绳钓钓获率进行二次回归分析,找出最佳上界方程,以最佳上界方程拟合的数值来建立栖息地指数(HSI)模型,从而揭示印度洋大眼金枪鱼栖息地的分布模式。研究表明,温度、温差、氧差与印度洋大眼金枪鱼延绳钓钓获率的最佳上界分位数回归方程分别为HRT0.9=-44.803+7.685T0.9-0.255T0.92,HRdT0.9=6.234+0.953dT0.9-0.026dT0.92和HRdO0.88=7.422+4.25dO0.88-0.727dO0.882。10°N~10°S间印度洋海域大眼金抢鱼HSI指数达到0.9以上;10°N以北的波斯湾及10°S~15°S海域的HSI指数为0.8~0.9;15°S~40°S之间海域HSI指数介于0.7~0.8,其中50°E~90°E、15°S~25°S间存在一片季节性HSI指数<0.7的区域;40°S以南的海域HSI指数<0.6。
【英文摘要】Bigeye tuna Thunnuns obesus is one of key species caught by Chinese tuna longline fleets.Its spatial distribution in relation to environmental factors is highlighted by international organizations and researchers.The aim of this study is to present the analysis of correlation between hooking rates of bigeye tuna longline and environmental factors in the Indian Ocean.Three environmental variables including temperature,temperature difference and dissolved oxygen difference are used to fit habitat suitability model in order to explain the distribution pattern of bigeye tuna in the Indian Ocean.Function expressions of hooking rates and environmental factors are estimated by quantile regression.Data predicted by optimum upper boundary quantile curves are fitted to the habitat suitability model to display quarterly distribution of bigeye tuna via visualization of Surfer 8.0.The optimum upper boundary quantile curves for temperature (T)-hooking rate(HR),temperature difference(dT)-HR and dissolved oxygen difference(dO2)-HR are in the following HRT0.9=-44.803+7.685T0.9-0.255T0.92,HR(dT)0.9=6.234+0.953dT0.9-0.026dT0.92 and HR(dO)0.88=7.422+4.25dO0.88-0.727dO0.882,respectively.Habitat suitability index is above 0.9 within 10°N-10°S,0.8-0.9 in the north of 10°N and within 10°S-15°S,0.7-0.8 within 15°S-40°S,and below 0.6 in the south of 40°S.However,a mass of waters occurs seasonally

within 50 ° E-90 ° E,15 ° S- 25 ° S where habitat suitability index is less than 0.7.The habitat suitability model indicates the reliable results and could be improved by integrating more interactive variables.It is proved in this study that quantile regression is a useful way to investigate correlation between organism and limiting ecological factors. 更多

【题目】中西太平洋金枪鱼围网黄鳍金枪鱼产量的时空分布及与表温的关系
【中文关键词】黄鳍金枪鱼; 渔获量时空分布; 金枪鱼围网; 中西太平洋; 海表温度
【英文关键词】Thunnus albacares; spatio-temporal distribution of catch; tuna purse seine; Central and Western Pacific; sea surface temperature
【中文摘要】黄鳍金枪鱼是中西太平洋金枪鱼围网渔业中的重要捕捞种类之一。本文根据2003年中西太平洋金枪鱼围网生产统计及其表温数据,利用频次统计分析和地理信息软件Marine Explorer 4.0对黄鳍金枪鱼产量和单位日产量(CPUE)的时空分布进行分析,探讨其与海水表温的关系。结果显示,产量和CPUE最高的是2月份,其次是9月份,5月份为最低。高产量的范围为140~160 ° E、0 ° ~5 ° S;CPUE高值区分布在130 ° E、0 ° ~15 ° S,140 ° ~160 ° E、0 ° ~15 ° S和175 ° W、0 ° ~15 ° S;产量经纬度重心分别为150 ° 30 ′ E和3 ° 48 ′ S。产量主要分布在海表温为28~31℃的海域,产量比重高达95.45%,其中29~30℃产量为最高,占69.54%。

【英文摘要】Yellow-finned tuna Thunnus albacares is an important target species of the tuna purse seine fishery in the Central and Western Pacific.Present paper deals with the analyses on the spatio-temporal distribution of the catch and CPUE of yellow-finned tuna based on the catch data and sea surface temperature(SST) during 2003,and by using the method of frequency stastics together with GIS software Marine Explorer 4.0 to inquire into its relationship with SST.The results showed that the highest catch and CPUE were in February,next in September and the lowest in May.The area with high catch was located in the waters of 140 ° -160 ° E,0 ° -5 ° S,the area with high CPUE were distributed in the waters of 130 ° E,0 ° -15 ° S,140 ° -160 ° E,0 ° -15 ° S,175 ° W,0 ° -15 ° S.The gravity centre of the annual catch was located in the water of 150 ° 30 ′ E and 3 ° 48 ′ S.The optimum SST for yellow-finned tuna ranged from 28 ℃ to 31 ℃,the catch propotion in total highly occupied up to 95.45%,in which the highest catch was distributed in the waters with 29 ℃-30 ℃ SST,its propotion occupied 69.54% in total.

【题目】不同尺寸虾拖网网囊网目对副渔获物的选择性研究
【中文关键词】虾拖网; 副渔获物; 选择性
【英文关键词】shrimp trawl; by-catch; selectivity;
【中文摘要】为了分析黄海区虾拖网网囊网目对副渔获物的选择性,运用套网法对30,33,40 mm 3种网目尺寸的网囊进行了选择性试验。用统计学方法求得几种优势副渔物的逃逸率,并用极大似然法对渔获数据进行处理求得相关的选择性参数。结果表明,大部分副渔获物的逃逸率随着网囊网目尺寸的增大而增大,在网目尺寸为30,33,40 mm时矛尾虎鱼(Chaeturichthys stigmatias)的逃逸率分别为48.3%,59.7%和62.6%;细巧仿对虾(Parapenaeopsis tenella)的逃逸率分别为67.0%,68.2%,68.7%。矛尾虎鱼的选择性参数也随着网目尺寸的增大而增大,在网目尺寸为30,33,40 mm时,矛尾虎鱼的50%选择体长L50分别为81.858,86.715和88.028 mm,选择范围SR分别为41.097,45.007和50.423 mm。研究表明,单靠放大网囊网目尺寸来释放虾拖网中副渔获物,效果不甚理想。

【英文摘要】In order to reveal the selectivity to by-catch species by shrimp trawls,which is operated in the Yellow Sea,experiments of codends with mesh sizes,30,33,or 40 mm were conducted using the cover-net method.The escape rates of main by-catch species were measured,and the selectivity parameters of Chaeturichthys stigmatias were estimated by using the maximum likelihood method.The results indicated that the escape rates of main by-catch species increased as the mesh sizes were increased.For mesh sizes of 30,33,and 40 mm the escape rates of C.stigmatias were 48.3%,59.7%,and 62.6%,respectively;the escape rates of Parapenaeopsis tenella are 67.0%,68.2% and 68.7%,respectively.The selectivity parameters of C.stigmatias also increased as mesh sizes were in-creased.For the mesh sizes of 30,33,40 mm,the of C.stigmatias were 81.858,86.715,and 88.028 mm,re-spectively;while the SR were 41.097,45.007,and 50.423 mm,respectively.Based on the results,we concluded that the effect of releasing by-catch species were not very good only by enlarging mesh sizes

【题目】不同名义 CPUE 计算法对 CPUE 标准化的影响

【中文关键词】CPUE标准化; 广义加性模型; 西南大西洋; 阿根廷滑柔鱼;

【英文关键词】CPUE standardization; generalized additive model; Southwest Atlantic Ocean; Illex Argentinus fishery

【中文摘要】CPUE标准化是渔业资源评估的重要研究内容。不同名义CPUE计算方法通常会影响到CPUE的标准化,进而影响到对资源丰度的评价。在CPUE标准化过程中,首先对名义CPUE进行计算,通常有以下3种方法:(1)直接将每个记录的产量除以其对应的捕捞努力量计算出CPUE值,然后输入模型;(2)先对所有的记录计算出CPUE,然后以一个空间尺度(小渔区,如0.5°×0.5°)统计数据,对每个小渔区内所有的CPUE直接求平均值(所有CPUE求和再除以记录的数量)输入模型;(3)以一个空间尺度统计数据,用小渔区内的所有记录的总产量除以总捕捞努力量计算的CPUE输入模型。本文以我国在西南大西洋的阿根廷滑柔鱼鱿钓渔业为例,分别使用上述3种CPUE计算方法,运用广义加性模型(Generalized Additive Model,GAM)模型进行CPUE标准化(对应的模型分别为GAMa、GAMb和GAMc),比较不同模型的结果。研究发现,3种模型得出的年标准化CPUE和月标准化CPUE存在差别,GAMa与GAMb、GAMc的结果相差较大,GAMb和GAMc所得的结果相差较小,而GAMa与GAMb、GAMc的标准化CPUE值、变异系数以及模型的各因子方差贡献率等相差较大。3种模型之间的差别主要由于样本数、捕捞努力量的假设、数据记录的时空尺度和模型中因子的选择等因素影响。因此在使用商业性渔业数据分析渔业资源状况时,需要考虑由于CPUE计算方法的不同带来的不确定性

【英文摘要】CPUE standardization is a role in fisheries stock assessment.Different calculating methods for nominal CPUE can affect standardized CPUE which usually is used to index fisheries abundance.In CPUE standardization modeling,nominal CPUE is as a response variable which usually can be calculated in three methods:(1) for every record,CPUE is calculated by catch dividing the corresponding effort,and the all CPUEs were input the model;(2) all fisheries data records are first grouped by one spatial scale(fishing grid,such as 0.5°×0.5°),then for every grid,average CPUE is calculated by all CPUE dividing the number of records,all average CPUEs of fishing grids are as the model input;(3) the fisheries data grouping and the model input are same as(2),but the average CPUE for every grid is calculated by total catch dividing total fishing effort.For evaluating impacts of different nominal CPUE inputs on CPUE standardization modeling,Chinese Illex argentinus fishery in the South Atlantic Ocean was,as a study case,the three above-mentioned nominal CPUEs calculated from this fisheries data were input generalized additive models which were used to standardize these CPUEs.The corresponding models were GAMa,GAMb and GAMc,respectively.The results derived from the GAMs were compared.From these analysis,there were differences among these standardized CPUEs derived from the three GAMs.GAMb and GAMc showed similar trends in standardized CPUEs.But there were significant variances between GAMa and the latter two GAMs in the values of standardized CPUE,coefficient of variance and the variance contribution rate of each explanatory variable in the models.The differences among these GAMs were mainly owing to sample numbers,the assumption for calculating fishing effort,the spatio-temporal scale for grouping fisheries data and model selection,etc.On the summary,the certainties due to different calculating methods for CPUE should be considered when commercial fisheries data were used to analyze the status of fisheries stock.

【题目】多囊桁拖网选择性研究中对照网囊网目尺寸的选择
【中文关键词】尺寸选择性; 对比试验法; 对照网囊; 网目尺寸; 多囊桁拖网;
【英文关键词】size selectivity; comparative fishing method; control codend; mesh size; multi-codends beam trawl;
【中文摘要】对比作业法是拖网渔具选择性研究中重要的试验方法之一,而对比试验中对照网囊网目的选择至关重要。研究利用多囊桁拖网不同网目尺寸(20、30、35和40mm)网囊捕获的哈氏仿对虾、小黄鱼和棘头梅童鱼渔获体长分布数据,应用几何相似原理,分析过滤性渔具的选择性,并按不同假设条件下(假设1:符合几何相似原理对渔获具有一定的选择性;假设2:对渔获种类没有选择性),探讨如何合理选择对照网囊网目尺寸。结果表明,对照网网囊网目尺寸为20mm,在上述2种假设下,对选择性模型的拟合、简化及对其它网囊的选择性参数没有显著的影响;在考虑了桁拖网渔具各网囊具有相同相对作业强度,以及桁拖网渔具与普通拖网渔具选择性分析方法上的差异等因素后,认为在此项研究中,将小于20mm网目尺寸的网囊视为没有选择性的对照网囊是可行的。 更多还原
【英文摘要】In comparative fishing method,one of important experimental methods in research on size selectivity of trawls,the control codend mesh size is crucial and a possible upper limit is generally suggested to be half the mesh size of the test codend. However,the suggestion is unavailable when the body size of target specie of trawl is small enough,especially in shrimp or prawn trawl fisheries. In order to discuss how to choose a rational mesh size of control codend,experiments,in which test codends with different mesh sizes (20,30,35 and 40 mm) were rigged in a same multi-codends beam trawl and fished simultaneously,were carried out in Lvsi Fishing Ground. The catch frequency of Parapenaeposis hardwickii,Pseudosciaena polyactis and Collichthys lucida retained by codends were fitted to a selectivity analysis model in which the selectivity curves of different codends were regarded as geometrical similar under two contrary hypotheses (hypothesis 1:the 20 mm mesh size codend is regarded as test codend and selective for catch species and,hypotheses 2:as control codend and non-selective for species). The result demonstrated that the goodness of model fit and the selective parameters of different test codends were not affected significantly by the two contrary hypotheses. Taking the difference in relative fishing intensity and statistical method of analyzing size selection between multi-conends trawl and conventional trawls into account,authors suggest that the assumption of non-selectivity of 20 mm mesh size control codend is acceptable in analysis of size selectivity in the experiemts,which means that the general upper limit of control codend mesh size could be broken.

【题目】基于 Argo 数据的中西太平洋鲣渔获量与水温, 表层盐度关系的初步研究
【中文关键词】鲣; 中西太平洋; Argo; 水温; 表层盐度; K-S检验; Shapiro-Wilk正态性检验
【英文关键词】Katsuwonus pelamis; west-central Pacific Ocean; Argo; water temperature; surface salinity; K-S test; Shapiro-Wilk normality test;
【中文摘要】根据上海金汇远洋渔业公司2007年度在中西太平洋海域进行鲣Katsuwonus pelamis围网作业的生产数据以及Argo剖面浮标数据,利用地理信息系统软件Arcview,按1°×1°的格式绘制了各月产量、表层温度、表层盐度以及50 m和200 m水层温度等,并对数据进行了综合分析。结果表明:鲣的高渔获量区域主要分布于150°~153°E、160°~161°E,0°~2°S的水域;2007年最高月产量和最高单网平均日产量(CPUE)的月份分别为8月和2月;通过K-S检验,2007年最适表层温度为29.3~30.1℃,最适表层盐度为34.0~35.2;0~200 m、50~200 m水层的垂直温差为11℃时,渔获量达到最大。Shapiro-Wilk正态性检验结果表明,渔获量与0~200 m、50~200 m水层的垂直温差服从正态分布关系。上述结论符合生产实践中获得的情况,表明Argo数据可以应用于渔业生产和科研中。
【英文摘要】The distribution maps with format of 1° latitude by 1° longitude include month production maps of skipjack Katsuwonus pelamis and distribution maps were drawn by Arcview,showing the relationship between monthly production and surface temperature,and surface salinity in depth of 50 m,and 200 m every month,based on skipjack purse data in the west-central Pacific Ocean by Shanghai pelagic fishery company and Argo profile data in 2007.The results showed that the high catch was mainly observed in 150-153° E,160-161° E,0°-2° S in 2007.The maximal catch was found in August,but the highest CPUE in February.With Kolmogorov-Smirnov two sample test methods,the most optimum surface temperature was 29.3-30.1 °C and the optimum surface salinity 34.0-35.2.The maximal catch appeared at difference temperature of 11 °C between 0-200 m and 50-200 m.The Shapiro-Wilk normality test showed that the distribution of difference temperature in production followed norm school.The above results are accorded with the instance of production practice,indicating that Argo data can be used in fishery production and research. 更多

【题目】基于贝叶斯方法的东, 黄海鲐资源评估及管理策略风险分析
【中文关键词】鲐; 资源评估; 决策与风险分析; 贝叶斯方法; 剩余产量模型; 东、黄海;
【英文关键词】Scomber japonicus; stock assessment; decision and risk analysis; Bayesian approach; surplus production model; East China Sea and Yellow Sea;
【中文摘要】运用基于贝叶斯的剩余产量模型,对东、黄海鲐资源进行评估,确定了当前鲐资源开发利用状态,估算了在不同收获率水平下未来5年鲐资源量和年总可捕捞量,分析了管理策略实施后鲐资源崩溃的风险。结果表明,2006年东、黄海鲐正遭受过度捕捞,但其资源量并未处于过度捕捞状态。决策分析表明,收获率为0.3是最适预防性的管理策略,在该策略下,鲐平均资源量将从2006年的451千吨将增加到2011年的871千吨,2011年资源量恢复到BMSY的概率为0.48,而过度捕捞的概率为0。
【英文摘要】Chub mackerel (Scomber japonicus) is an important commercial fish species in the East China Sea and Yellow Sea. Since 1997,the annual catch of chub mackerel has been decreasing. It is necessary to assess its stock size and manage it properly. The stock assessment and risk analysis of the management strategy for chub mackerel was carried out using a Bayesian surplus production

model,and the stock status was determined. The stock biomass,annual total allowable catch and probability that the stock would collapse in the next 5 years were also estimated. The results indicated that the stock of chub mackerel in the East China Sea and the Yellow sea was in the state of"overfishing",but not overfished in 2006. The decision analysis showed that harvest rate of 0. 3 was the optimum management regulation with precautionary approach,under this harvest rate the average stock biomass would increase from 451 thousand tons in 2006 to 871 thousand tons in 2011,the probability that stock biomass in 2011 reaching BMSY would be 0. 47,and the probability of having an overfished stock would be 0

【题目】基于分位数回归的西南太平洋阿根廷滑柔鱼栖息地模型研究
【中文关键词】阿根廷滑柔鱼; 分位数回归; HSI模型; 西南大西洋;
【英文关键词】Illex argentinus; quantile regression; habitat suitability index; southwest Atlantic;
【中文摘要】阿根廷滑柔鱼是西南大西洋重要头足类资源,研究其变动、渔场分布与海洋环境的关系是其可持续利用的基础。本文利用分位数回归方法对表温(5m)、表层盐度(5m)、57m盐度及其盐度差、海面高度、叶绿素与阿根廷滑柔鱼钓获率进行回归分析,在中位数和高位数2种情况下分别建立阿根廷滑柔鱼的栖息地指数(HSI)模型,从而揭示西南大西洋阿根廷滑柔鱼栖息地的分布模式。研究表明,本文建立的各分位数回归方程均能较好地解释自变量与应变量的关系(P<0.05)。1~5月在60°W以西、42°S~53°S阿根廷沿海的大部分海域,其HIS值基本上在0.7以上;而58°W以东海域的HIS在0.4以下。阿根廷滑柔鱼适宜栖息地分布(HIS大于0.6)有明显的季节变化。 更多还原
【英文摘要】Illex argentinus is an important cephalopod resource in the southwest Atlantic,the relationship between its resources change,distribution of fishing ground and marine environment is the basis for its sustainable exploitation.In this paper,the regression between sea surface temperature(5m),sea surface salinity(5m),57m salinity and their salinity difference,sea surface height,chlorophyll and jigging rates are analyzed by using the method of quantile regression,the habitat suitability index(HSI) models are established under the two kinds of median and high quantile,which revealed the distribution pattern of Illex argentinus ’ habitat in the southwest Atlantic.The study indicated that the median regression equations based on HSI can be used to explain the relationships between variables and results(P<0.05).During January to May,the HIS more than 0.7 is basically distributed in the west water of 60 ° W and 42 ° ~53 ° S,while its HIS less than 0.4 is located in the east waters of 58 ° W.The suitable habitat with more than 0.6 HIS of Illex argentinus has an obvious seasonal variation on the spatial distribution.

【题目】水温变动对 2009 年西北太平洋柔鱼产量下降的影响
【中文关键词】柔鱼; 渔场; 深层水温; 产卵场; 西北太平洋;
【英文关键词】Ommastrephes bartramii; fishing ground; deep-water temperature; spawning ground; northwestern Pacific Ocean;
【中文摘要】分布在西北太平洋的柔鱼是我国远洋鱿钓渔业的重要捕捞对象,近些年来其产量一直处在稳定的水平。然而,2009年8~10月旺汛期间在传统作业渔场(150°E~165°E、38°E~46°E)柔鱼产量出现大幅度下降,其日产量仅为正常年份的一半。为此,根据2007~2009年8~10月我国在西北太平洋鱿钓生产数据,以及产卵场表层水温,探讨2009年柔鱼产量下降及渔场变动的原因。研究表明,其产量出现下降的原因可能有2个:(1)柔鱼产卵场(20°N~30°N,130°E~170°E)黑潮大弯曲的发生,使得21℃等温线向南偏移,使得柔鱼资源补充量受到影响,从而使得渔汛期间柔鱼产量的下降;(2)旺汛期间(8~9月

)传统作业渔场(42 ° N~46 ° N,150 ° E~165 ° E)的100m水层有一个明显冷水南下,分布位置为154 ° E~156 ° E,将传统作业渔场(150E~165 ° E)一分为二,向南的前锋(水温低于5°C)到达42 ° N,明显不同于正常年份,使得作业渔场的范围明显缩小,不适合柔鱼的集群,导致产量出现大幅下降。

【英文摘要】The red flying squid (Ommastrephes bartramii) widely distributed in the North Pacific Ocean is a main fishing target for Chinese distant-water squid jigging fisheries.The production has maintained a steady level in the recent years.However,it declined sharply in the traditional fishing ground during the main fishing season (from August to October) in 2009,and the daily catch was only half of that in the normal years.Therefore,based on the catch from the Chinese squid jigging vessels and environment data in the northwestern Pacific ocean from August to September during 2007 to 2009,the study on the decline of catch for O.bartramii and variability of fishing ground in 2009 were made.The results indicated that there maybe two reasons causing a sharp decline in catch:(1) The occurrence of the big bending of Kuroshio at the spawning ground (20-30 ° N,130-170 ° E) caused a sharp decline in squid recruitment;(2)During the main fishing season (August-September),the cold water (located at 154-156 ° E) at 100 m depth intruded southward into the traditional fishing ground (42-46 ° N,150-165 ° E),which split the traditional fishing ground into two parts.And its southerly front (temperature at 100 m layer < 5 °C) reached at 42 ° N,which was distinctly different from that in normal years.Since the above reasons,the fishing ground has been significantly narrowed and not suitable for squid to aggregate.

【题目】表温和黑潮年间变化对西北太平洋柔鱼渔场分布的影响

【中文关键词】柔鱼;渔场时空分布;表温标准差;黑潮;西北太平洋

【英文关键词】Ommastrephes bartramii;spatial-temporal distribution;sea surface water temperature;kuroshio current;Northwest Pacific

【中文摘要】根据1998) 2007年6) 11月西北太平洋中国鱿钓船的生产统计数据, 结合黑潮及表温等海洋环境资料, 分析了近10年来表温和黑潮年间变化对西北太平洋柔鱼渔场分布的影响。结果表明, 各月经度向作业船次所占比重超过5%的海域: 6月为171b~ E 和179b ~ 180bE; 8月为151b ~ 158bE; 9月为152b ~ 160bE; 10月为146b ~ 147bE、151b ~ 160bE; 11 月为145b ~ 148bE、150b ~ 156bE。各月纬度向作业船次所占比重均超过20%的海域: 6月为39b ~ 41bN; 7月为40b ~ 42bN; 8月为41b~ 44bN; 9月为42b ~ 45bN; 10月为42b ~ 44bN; 11月为40b~ 42bN。渔场分布变化纬度向远比经度方向大。研究认为, 作业渔场年间变化的原因可能来自其表温年间变化(同一月份的水温年标准差大) 和黑潮等因素。黑潮大弯曲年份, 主要作业渔场150b ~ 160bE 海域表温通常较低, 作业渔场分布广泛, 但CPUE较低; 而黑潮小弯曲年份则情况相反。

【英文摘要】In this paper, effect of inter- annual change in sea surface water temperature and Kuroshio on fishing ground of squid Ommastrephes bartramii was studied based on the fishing data by Chinese squid jigg ing boats between June and November from 1998 to 2007. The results showed that the areaw ithmore than 5% of the total catch was distributed in the long itude direction as follows: 171 ° - 174 ° E and 176 ° - 180 ° E in June, 157 ° - 161 ° E, 167 ° - 169 ° E and 179 ° - 180 ° E in July, 151 ° - 158 ° E in August, 152 ° - 160 ° E in September, 146 ° - 147 ° E and151 ° - 160 ° E in October, 145 ° - 148 ° E and 150 ° - 156 ° E in November. In the latitude d irection, how ever, the area with more than 20% of the tota l catch was found in the wa ters as follow s: 39 ° - 41 ° N in June, 40 ° - 42 ° N inJu ly, 41 ° - 44 ° N in August, 42 ° - 45 ° N in September, 42 ° - 44 ° N in October and 40 ° - 42 ° N in November. The more change in fishing g round w as observed in the latitude than that in the long itude. The reasons for changeable fishing ground w ere attributed to the in ter- annual change in SST (the large standard dev iation of SST in the same month) and the Kurosh io. When therew as a large bending w ith Kurosh io, the sea surface temperaturew ere generally lower in thew aters from 150 ° to 160 ° E, the fish ing g round w ere widely distributed, with a low erCPUE. How ever,when there has been a sma ll bend w ith Kurosh io, the case w as the opposite.

【题目】黄海区虾拖网网囊网目选择性研究
【中文关键词】虾拖网;网目选择性;鹰爪虾
【英文关键词】shrimp trawl;mesh size selectivity;Trachypenaeus curvirostris
【中文摘要】在黄海区的山东近海,采用套网法对网目尺寸为30,33 和40 mm 的虾拖网网囊进行了选择性试验。使用Logistic 曲线作为选择性模型,求得不同网目尺寸的网囊对鹰爪虾(Trachy p enaeus curvirostris) 的体长选择性曲线,并运用极大似然法对渔获数据进行处理,同时估算选择性参数。结果表明,在网目尺寸为30,33 和40 mm 时主捕虾类鹰爪虾的选择体长L50 分别为59. 8,60. 1 和63. 2 mm,选择范围SR 分别为14. 4,16. 0 和22. 9 mm,选择性参数随网目尺寸的增加呈线性增大。鹰爪虾的选择体长L 50 与网囊网目尺寸m 的线性回归方程为L 50 = 0. 353m+ 48. 944,R2 = 0. 956。根据试验结果并结合历史资料,认为目前33 mm 的网囊网目尺寸对于保护鹰爪虾类资源是比较合适的。
【英文摘要】The selectivity of codends with mesh sizes, 30mm, 33mm, and 40mm, has been tested in theYellow Sea by using the cover-net method. Based on the Logistic equation model, curves about the selectivity of the three codends to the target species, Trachypenaeus curvirostris, were obtained. The catching data was analyzed and selectivity parameters w ere estimated by using the maximum likelihood method. The result shows that when the mesh sizes were 30 mm, 33 mm, and 40 mm, the 50% select ion lengths(L50) were 59. 8 mm, 60. 1 mm, and 63. 2 mm, r espectively; while the select ion ranges (SR) w ere 14. 4mm, 16. 0 mm, and 22. 9 mm, respectively. Both selectivity parameter s increase as the mesh sizes enlarge. The linear regression equation of the Trachypenaeus curvirostris between the 50% select ion length(L50)and the mesh size of the codend (m) is L 50= 0. 353m+ 48. 944, R2= 0. 956. Based on this result and the previous research, the author conclude that the 33 mm mesh size is more suitable for protecting the Trachy penaeus curvirostris resources.

【题目】利用广义线性模型分析印度洋黄鳍金枪鱼延绳钓渔获率
【中文关键词】广义线性模型;黄鳍金枪鱼;印度洋;渔获率;标准化
【英文关键词】Generalized linear model;yellowfin tuna;Indian Ocean;catch rate;standardization
【中文摘要】利用广义线性模型,以年、季节、海区、渔具结构以及渔具材料等效应为主要因子,假设5种方案对日本在印度洋的黄鳍金枪鱼(Thunnus albacares)延绳钓渔获率进行标准化。结果显示,这5种方案对渔获率的变化都具有较好的解释率。其中方案3 的解释率最高,达到68%。主效应中,渔区、季节、年份具有最大的F值,表明它们能够解释剩余方差中的最大部分;交互项中,渔区与季节、主绳材料和支绳材料也具有较大的F值。这种情况与日本大眼金枪鱼延绳钓数据标准化的结果很相似。考虑每栏钩数的信息时,可使总方差的解释率提高8%~9%。当分别用每月每次投钩数≥5 000钩和≥10 000钩筛选的数据拟合模型时,可使总方差的解释率分别提高3%和2%,预测残差也更趋正态分布。但本标准化结果仍待进一步完善,在资源评估时,应审慎运用。
【英文摘要】Catch rate analysis of Japanese longline fishery in the Indian Ocean was conducted using generalized linear model with main factors of year,area,quarter,gear structure and materials. The results indicated that the five scenarios tested all had good explanation rate and the third scenario had the highest variance explanation of 68%. Effects of year,quarter and area had the highest F values,which indicated that they could explain the majority of variance,while interactions of area-quarter,mainline-branchline materials also had higher F values. This pattern was similar to the standardization on Japanese bigeye tuna fishery data. Explanation rate could increase by 8% to 9% when considering hooks per basket information. While data were selected by monthly shoot ≥5 000 hooks and ≥10 000 hooks,the explanation rate could increase by 3% and 2%,respectively. Residual distribution inclined to be normal. It should be cautious when applying the results to stock assessment owing to the potential improvement of the standardization.

【中文关键词】南极磷虾;策略;捕捞;商业化开发
【英文关键词】Antarctic krill;strategies;fishing;commercial exploration
【中文摘要】由于南极磷虾(Euphausia superba)资源丰富,可捕量是世界现有渔业产量的1倍以上,因而参与南极磷虾资源开发是中国远洋渔业可持续发展的重要途径。由于南极磷虾资源开发面临困难较多,如远离港口、远离补给、远离市场、航行距离长等,加之捕捞技术和加工技术仍存在问题,与其他渔业相比,具有较大的成本压力。尽管如此,由于南极磷虾属于寒带海洋生物,具有其特殊的营养学特征,形成高附加值产品的潜力较大,因此在进行南极磷虾开发的准备过程中,应以最终产品的设计为导向,如提高产品的附加值,发展产品综合开发能力等以化解高成本的压力;从相关加工设备、加工工艺的研究和捕捞技术改进为出发点,重视项目的经济技术和盈利前景分析。由于南极磷虾的商业开发是高风险、高投入的项目,因此在没有把握获得商业利润以前,应以技术准备为主,不宜盲目投入大量资金直接进行商业化开发。建议以此作为制订中国南极磷虾资源开发策略的主要考虑因素。
【英文摘要】The resource of Antarctic krill(Euphausia superba)is very abundant. Engaging in the exploitation Antarctic krill is one of the most important blueprint for offshore fishery sustainability of China. Although the resource of Antarctic krill is theoritically abundant,its exploration is declining. Thus,it is necessary to look for the problems of exportation backwards. The cost for exploration of Antarctic krill was obviously higher than other fishery resources due to its remote location-far from major ports-and very inhospitable water where it takes place. However,the high exportation expense can be compensated by improving decomposing overhead and improving its addition value. In short,the exportation of Antarctic krill is characterized by the high-risk and high expense,which always need to notice and concern. Therefore,the exploration of Antarctic krill should be guided by end-products designing and researching relative processing machines and technology. Meanwhile,the profitability analysis should be done prudently in order to maximally avoid capital loss on investment. Given profitability of expectation is uncertain,large scale investment on exploration was not advocated.

【中文摘要】/
【英文摘要】With the decline of traditional world economic fisheries resources, the exploitation and utilization of cephalopod resource s have been recognized generally in the world and many researches on cephalopod resources and biology were made. Beak with the features of steady structure, erosion- resistant and better information storing, is one of hard and main predation organs of cephalopods, and it not only plays an important role in taxonomy but also as a good material to study cephalopod biology and taxonomy. Based on the studies conducted by the authors a t home and abroad, the paper described the morphological characteristics of beak and the studies of beaks were reviewed, which were applied in cephalopod biology, taxonomy, stock estimation and feeding habits of predators. The results show that the fixed term " beak" has been formed in the morphology, and has played an important role

in cephalopod taxonomy. A new approach on analyzing food com position and diet change was also provided by the analysis o f pigmentation in the beak, and analyzing pigmentation has become one of the key problem s in studying age and growth of cephalopod. The results show that some problems still exist in age identifying and stock estimating, which should be solved in the future, although certain progress has been made.

【题目】西北太平洋柔鱼耳石形态特征分析
【中文关键词】柔鱼;耳石;形态特征;西北太平洋
【英文关键词】Ommastrephes bartramii;statolith;morphologic feature;northwest Pacific Ocean
【中文摘要】耳石是头足类生态的重要信息载体,掌握其形态特征是渔业生物学研究的基础。根据2007 年7-10月我国鱿钓船在西北太平洋海域连续采集的202尾柔鱼,对其耳石形态特征进行观察与测量。研究发现,柔鱼耳石具有宽大的翼区和长窄的吻区。对耳石9项形态参数进行主成分分析,结果显示,耳石总长(TSL)、吻区长(RL)、翼区长(WL)可以作为耳石长度特征的代表,吻区宽(RW) 、翼区宽(WW)则可代表耳石宽度特征。耳石长度参数 TSL、RL 和WL与胴长存在显著的幂函数关系(P< 0. 05),而耳石宽度参数 RW和 WW与胴长之间则无显著函数关系(P> 0. 05)。性成熟对耳石生长有一定的影响。性成熟等级为Ⅰ-Ⅱ期的个体,其TSL增长较快,而Ⅲ-Ⅴ期个体的TSL增长不明显。
【英文摘要】Statolith in the cephalopod is an important source of ecological information, and mastering the mor-phologic features of the statolith is fundamental to fisheries biology. A tot al of 202 squids, Om mastrephes bar-tramii , were collected by a Chinese squid jigging boat during July to October in 2007 in the northwest Pacific Ocean. The morphologic features of their statoliths were observed and measured. The results indicated that the statolith of O. bartramii has a structure with wide wings and long, narrow rostrum domes. The result of principal component analysis on 9 morphologic indices show that the total statolith length (TSL), rostrum length(RL)and wing length (WL) can be used to represent the length features of the statolith, the rostrum width (RW) and wing width (WW) may reflect its width features. The relationship between the featured-length of statolith including T SL , RL and WL , and mantle length w ere best described by power functions (P< 0. 05) , while its featured- width such as RW and WW has no significant relations w it h the m ant le length (P> 0. 05) . The results also indicated that the sexual maturity has an obvious effect on the growth of the sta-tolith. When the sexual maturity stage of squid was between stages Ⅰ and Ⅲ,its TSL increased obviously, while for their squid with their sexual maturity stages from Ⅲ toⅣ, its TSL increased slowly.

【题目】西北太平洋柔鱼渔场变化与黑潮的关系
【中文关键词】柔鱼; 黑潮; 北太平洋; 渔场变化;
【英文关键词】Ommastrephes bartramii;Kuroshio current;north Pacific;variation of fishing ground
【中文摘要】柔鱼是北太平洋海域的重要经济头足类,黑潮的变化直接影响着柔鱼渔场形成及其空间分布。利用1998-2007年黑潮分布类型,结合同期8-10月我国鱿钓渔船生产数据,分析北太平洋柔鱼渔场变化与黑潮分布的关系。在25°~40°N、125°~150°E海域内,以空间分布率经纬度5°×5°为一个空间单元,共分A(140°~145°E、35°~40°N)、B(145°~150°E、35°~40°N)、C(135°~140°E、30°~35°N)、D(140°~145°E、30°~35°N)和E(145°~150°E、30°~35°N)5个区,将黑潮分布类型分为大弯曲型、小弯曲型和平直型3种。利用渔场重心的纬度向变化作为柔鱼渔场变

动的指标。研究认为,A区黑潮分布特征对柔鱼渔场重心纬度影响最大,其次为B区和C区,而其它区影响则不明显。A区出现黑潮大弯曲型时,柔鱼渔场重心明显偏北且概率高;小弯曲型或平直型时,柔鱼渔场重心明显偏南。研究认为,黑潮流轴的走向影响着柔鱼渔场的空间分布。

【英文摘要】Ommastrephes bartramii is one of the important economic cephalopod in the north Pacific,and Kuroshio current has a great impact on the forming of fishing ground for Ommastrephes bartramii.Based on the data of Kuroshio current and squid jigging of Chinese mainland fishng fleet during August to October from 1998 to 2007,the variation of the fishing ground mainly concerning with the distribution of the Kuroshio current is analyzed.In the area of 25 ° -40 ° N and 125 ° -150 ° E,five sub-areas were set up based on spatial resolution 5 degrees latitude and 5 degrees longitude,i.e,140 ° -145 ° E and 35 ° -40 ° N(area A),145 ° -150 ° E and 35 ° -40 ° N(area B),135 ° -140 ° E and 30 ° -35 ° N(area C),140 ° -145 ° E and 30 ° -35 ° N(area D),145 ° -150 ° E and 30 ° -35 ° N(area E).Three types of Kuroshio distribution have been classified as big bending,small bending and straight patterns..The variation on gravity center of fishing ground in the latitude is recognized as an indicator reflecting the changes of fishing ground for O.bartramii.The results indicated that the distribution type of Kuroshio in the A area seriously affected fishing ground,the next is areas B and C,while the other areas have no significant relationship with fishing ground.While a big bending pattern occurs in the A area,the fishing ground will generally shift more northwards.While small gending or straight pattern of Kuroshio occurs in the A area,the fishing ground will generally shift towards south.This paper concluded that the bending pattern of Kuroshio affects the spatial distribution of fishing ground of O.bartramii.

【题目】霞水母机械加工方法的探究
【中文关键词】霞水母; 机械加工; 海上实验
【英文关键词】Cyanea nozakii; mechanical processing; experiment onboard
【中文摘要】霞水母的大范围暴发不仅严重影响了张网等渔业的作业,而且对沿海海域造成了生态危机。利用机械手段代替手工方法实现霞水母的加工、开发,不仅可提高渔民的经济收益,而且有利于霞水母资源得到进一步开发。在海蜇加工原理基础上,通过设计、开发霞水母切丝装置、脱水装置,实现了霞水母去污与清洗→机械切丝→机械脱水→腌制→装箱上市的加工工艺。实验表明,机械加工霞水母具有较好的加工性能,具有广泛的社会和应用价值。
【英文摘要】Breaking out of jellyfish(Cyanea nozakii) in wide range has been not only effected on the stow net fisheries,but also resulted in the offshore ecological crisis.The processing and exploitation of Cyanea nozakii by mechanical processing method,instead of the traditionally handmade method,would increase fishermen ’s income and be beneficial for the further exploitation of Cyanea nozakii resources.In this paper,a new processing craft for processing of Cyanea nozakii,including cleaning,mechanical chipping,mechanical dehydrating,bloating and packing,has been developed and introduce here based on the design and development of the chipping and dehydrating machines for Cyanea nozakii.The results of processing experiment onshore and onboard showed that the processing machines performed well and processing craft were effective.It could be said that the processing machines and craft had widespread social and applicable perspective.

【题目】夏季东海渔场鲐鱼产量与海洋环境因子的关系
【中文关键词】鲐鱼; 渔场; 海表面温度; 海面高度; 叶绿素a浓度; 东海
【英文关键词】Mackerel; fishing ground; SST; SSH; Chlorophyll a; the East China Sea
【中文摘要】根据2002~2004年7~9月我国东海灯光围网渔业生产统计数据,结合卫星遥感获取的海表面温度(Sea surface temperature,SST)、叶绿素a浓度及海面高度数据(Sea surface height,SSH),分析鲐鱼渔场分布与其SST、叶绿素a浓度和SSH之间的关系。统计各月鲐鱼产量在SST、叶绿素a浓度上的频次分布,以确定各月中心渔场的最适SST和叶绿素a浓度范围,并对不同月份鲐鱼产量与SST和叶绿素a浓度关系进行分析和比较。利用Marine Explore4.0软件将每日鲐鱼产量和SSH图像进行空间展布,分析中心渔场形成与SSH分布的内在规律。研究结果显示,鲐鱼产量和当年SST成正比,东海SST的高低基本上决定了当年鲐鱼产量的高低,但并未发现叶绿素a浓度越高渔获产量也越高的规律,说明叶绿素a浓度并非鲐鱼渔场形成的最主要因素。夏季东海SST、叶绿素a浓度分布状况及其分布的季节变化决定了夏季东海鲐鱼作业渔场在东海南部和北部适宜SST、叶绿素a浓度不同的范围,但各年渔场SST以及叶绿素a浓度分布的总体趋势一致,鲐鱼产量集中分布在叶绿素a浓度较低、SST较高的东海南部渔场和叶绿素a浓度较高、SST较低的东海北部长江口渔场:7、8月鲐鱼中心渔场分布在东海南部海域,最适SST分别为27~29℃和28~30℃,最适叶绿素a浓度均为0.10~0.30mg/m3;9月东海南部渔场最适SST为27~28℃,最适叶绿素a浓度为0.10~0.30mg/m3,东海北部渔场最适SST为26~27℃,最适叶绿素a浓度为1.00~3.00mg/m3。鲐鱼渔场和SSH之间有很好的匹配关系,中心鱼场通常位于SSH极大值和极小值交汇的海域、并靠近极大值海域一侧,即出现在冷水团和暖水团交汇区靠近暖水团一侧。研究表明,渔场最适SST和叶绿素a浓度以及SSH作为确定潜在中心渔场的指标各具优势,将三者结合、综合分析,预报潜在渔场的位置更为可靠。
【英文摘要】Mackerel is one of the most important economic marine fish species and the target species of the light purse seine fishery in China. Study of the relationship between the mackerel fishing ground and the marine environmental factors is the basis of the fishing condition forecast for the light purse seine fishery. Based on the catch data of the Chinese light purse-seine fishery and remote sensing

data from July to September during the period of 2002~2004,the relationships between the distribution of mackerel fishing ground and sea surface temperature (SST),concentration of chlorophyll a (Chl-a) and sea surface height (SSH) in the East China Sea were analyzed. The frequency distribution of the monthly catch on the SST and Chl-a was statistically studied to confirm the optimal SST and Chl-a for the central fishing ground of the mackerel light purse seine fishery,and then the relation between the distribution of the fishing ground and the SSH field was analyzed by overlapping the weekly catch and SHH using GIS software. The results shows that the catch of light purse seine fishery is in direct proportion with SST but not with the concentration of Chl-a,which shows that Chl-a is not the most important factor that affects the formation of the fishing ground. The distribution trend of SST/Chl-a of the fishing ground in different years basically showed no difference in summer,and the catch was mainly distributed in southern East China Sea with low Chl-a and high SST and in the northern East China Sea with low SST but high Chl-a. In July and August,the central fishing grounds were in the southern part of the East China Sea with the most favorable SST of 27~29 ℃ and 28~30 ℃ respectively and the most favorable concentration of Chl-a from 0.10 mg/m3 to 0.30 mg/m3. But in September the fishing grounds distribute either in the northern or in the southern parts of the East China Sea. The most favorable SST was 27~28 ℃ in the southern part and 26~27 ℃ in the northern part,while the most favorable concentration of Chl-a was also from 0.10 mg/m3 to 0.30 mg/m3 in the south but from 1.00 mg/m3 to 3.00 mg/m3 in the north. The central fishing ground were usually located in the transition area where the maximum and minimum SSH and the warm and cold water meets,at the side of maximum SST,i.e. at the side of warm water mass. SST,Chl-a and SSH has their individual advantage in forecasting potential fishing zone,but it is more reliable to combine these 3 factors when doing so.

【题目】已充分开发渔业中估计最大可持续产量的一种近似方法
【中文关键词】资源评估; 渔获量年相对增长率; 最大可持续产量; 黄鳍金枪鱼; 印度洋
【英文关键词】stock assessment; relative rate of catch increment; maximum sustainable yield; yellowfin tuna; the Indian Ocean
【中文摘要】以印度洋黄鳍金枪鱼渔业为例,应用Grainger和Garcia提出的年渔获量相对增长率(RRCI)的概念,估算其最大可持续产量(MSY)近似值,并与利用其它方法估算的结果进行比较。研究结果表明,当RRCI=0时,印度洋黄鳍金枪鱼渔业MSY近似值为33.75 t,比Pella-Tomlinson模型的预测结果低3%。用本文方法只需计算年渔获量相对增长率,即可获得MSY的近似值,因此本方法可作为对常规评估模型方法的有益补充。

【英文摘要】Estimation of the maximum sustainable yield(MSY) is very important in fish stock assessment and management,but the MSY can not often be estimated from the incomplete catch data of commercial fisheries.The MSY was calculated on the data of yellowfin tuna(Thunnus albacares) fishery in the Indian Ocean by the yearly relative rate of catch increment(RRCI) proposed by Grainger and Garcia and compared with the results obtained from the other methods.The MSY for yellowfin tuna fishery was found to be 33.75×104 t when yearly RRCI equals zero,3% lower than the MSY estimated through Pella and Tomlinson model.Our results supported the fact that a rough MSY can be obtained by this method as a useful supplementary tool to conventional stock assessment models by calculating RRCI.

【题目】应用水温数据对印度洋黄鳍金枪鱼亲体-补充量Ricker模型的扩展
【中文关键词】黄鳍金枪鱼;亲体与补充量关系;海水温度;模型优化;印度洋
【英文关键词】Thunnus albacares;stock-recruit relationship;sea water temperature;model optimization;Indian Ocean
【中文摘要】海洋环境是影响印度洋黄鳍金枪鱼(Thunnus albacares)资源量的重要原因之一。本文根据1960-2002年印度洋黄鳍金枪鱼亲体-补充量数据,基于以0-40m海水垂直平均温度(Verticalaverage sea temperature,VAST)为代表的环境因子对Ricker式亲体补充量模型进行了优化。分析表明,印度洋4月0-5°N、80°E-85°E,5月、6月0-5°N、45°E-50°E,7月、8月5°N-10°N、90°E-95°E,12月5°N-10°N、70°E-75°E等海域的VAST对印度洋黄鳍金枪鱼的补充量影响最为显著,加入这些VAST环境因子的Ricker模型,其AIC(Akaike information criterion)值明显降低,拟合效果得到明显提高,这表明水温等环境因子对黄鳍金枪鱼的种群补偿过程产生了干扰。
【英文摘要】Marine environment is important in affecting on yellowfin tuna stock in the Indian Ocean.It is optimized in this paper the Ricker type stock-recruitment model by using stock-recruitment data for yellowfin tuna(Thunnus albacares) in the Indian Ocean and related to the environmental factor represented by 0-40m vertical average sea temperature(VAST) from 1960 to 2002.An exploratory correlation analysis indicated that VAST of April(0-5° N and 80° E-85° E),May and June(0-5° N and 45° E-50° E),July and August(5° N-10° N and 90° E-95° E),December(5° N-10° N and 70° E-75° E) influenced the recruitment of T.albacares significantly.Adding the water temperature information into stock-recruitment model,an optimized model were indicated by the better goodness of fit according to AIC value,which indicated that water temperature and other environmental factors interfere compensation process of yellowfin tuna population.

【题目】应用一般线性模型估算鲐、鲹大型灯光围网渔业的捕捞效率
【中文关键词】鲐; 鲹; 大型灯光围网; 捕捞效率; 一般线性模型; 德耳塔方法的一般线性模型
【英文关键词】mackerel; scad; large light purse seine; fishing efficiency; generalized linear model(GLM); Delta-GLM
【中文摘要】大型灯光围网是我国近海捕捞鲐、鲹的主要作业方式之一,探讨和估算捕捞效率对其渔业资源评估和管理有着重要的意义。根据1998-2003年东黄海我国鲐、鲹大型机轮灯光围网生产统计数据,利用一般线性模型对其捕捞效率进行了估算,讨论了线性模型误差结构的选择及数据变换对结果的影响。根据鲐、鲹单位捕捞努力量的渔获量(CPUE)数据呈正偏,以及CPUE均值与方差在对数尺度下的线性关系,选择了负二项分布、伽马分布与对数正态分布作为误差分布。研究表明,由于CPUE零值的存在,其对误差分布结构有很大影响。当采用最大似然估计时,对数正态分布与伽马分布的CPUE需加一常数(δ),δ取值对结果有较大影响,随δ增大将使估计的捕捞效率对比度得到压缩。为了避免δ取值的影响,同时采用了Delta-GLM方法。通过不同模型的比较,选择了Delta-负二项或Delta-伽马方法。根据Delta-负二项或Delta-伽马方法估算结果,各渔业公司间的捕捞效率存在很大的差异,且具有明显的区域性。32°N以北海区,捕捞效率高低依次为苏渔、辽渔、青渔、舟渔、宁渔、沪渔;台湾东北部海区,捕捞效率高低依次为苏渔、辽渔、舟渔、沪渔、宁渔、青渔。
【英文摘要】Reliable estimation of effective fishing effort,which is proportional to fishing mortality,can provide information critical to the assessment and management of fisheries resources.To estimate effective fishing effort,we need to understand fishing efficiency and factors that may influence it.In this study fishing efficiency was estimated for mackerel and scad purse seine fisheries using generalized linear model.This was done for different companies involved in the fisheries.Different choices of error structures were considered in the estimation and their impacts on the estimation were discussed.The negative binomial distribution,gamma distribution,and log-normal distribution were chosen as error distributions according to log-linear regression of variance versus log-mean of CPUE(catch per unit effort).Zero CPUE values had great impacts on the assumed error structure and adding a constant(δ) to CPUE was needed for gamma distribution and log-normal distribution in maximum likelihood estimation. As δ increased,the contrast of estimated fishing efficiency was reduced greatly.Delta approaches were also chosen as an alternative way to deal with zero CPUE value in this study.Comparing the results of different models,we considered Delta-negative binomial and Delta-gamma as most appropriate error distributions for this study.The results showed that the fishing efficiency differed greatly among fisheries companies and among different areas.

【题目】世界头足类资源开发利用现状及其潜力
【中文关键词】/
【英文关键词】Cephalopod; resources exploitation; developing potential
【中文摘要】我国是生产头足类的主要国家之一, 2001~ 2005年头足类年产量为(50~ 145) @ 104 t[13] , 主要作业渔场分布在西北太平洋、西南大西洋、东南太平洋、西印度洋和中东大西洋等海域, 作业方式以光诱鱿钓和拖网为主, 其中鱿钓产量约占60%。头足类渔业已成为我国远洋渔业的重要组成部分, 因此, 及时掌握世界头足类资源开发利用状况, 评价其开发利用潜力, 对我国远洋鱿钓渔业可持续发展具有重要的意义。

【题目】利用水温垂直结构研究中西太平洋鲣鱼栖息地指数
【中文关键词】鲣鱼;栖息地指数;中西太平洋;水温垂直结构;产量分布;最大值法;中心渔场;几何平均法;算术平均法;高产
【英文关键词】Katsywonus pelam is; Habitat suitability index; WCPO; vertical temperature structure
【中文摘要】根据1990~2001年中西太平洋海域(20°N~25°S、175°W以西)金枪鱼围网鲣鱼作业产量和作业次数,结合不同水层的水温及其温差数据(海表温度SST,12.5 m、237.5 m和287.5 m温度,137.5 m与287.5 m温差),以高产频次的相对比值分别建立各因素的栖息地指数SI,建立单因素一元非线形回归模型。采用连乘法、最小值法、最大值法、算术平均法和几何平均法建立综合栖息地指数HSI,并对1990~2001年各月HSI值与实际作业产量进行验证。结果表明,采用连乘法和最小值法时,主要产量分布在HSI0.5以下的区域;采用算术平均法和几何平均法时,主要产量分布在0.3HSI0.8的区域;采用最大值法,主要产量分布在HSI0.7的区域,其产量占总产量的87%。五种模型结果比较,认为最大值法能更好地反映中心渔场分布和符合鲣鱼的分布特征。采用最大值法推算2003年各月HSI值,并与实际产量分布进行实证分析,发现其各月产量主要分布在HSI0.8的区域,说明利用HSI模型来预测中心渔场是可行的。
【英文摘要】According to the catch data and fish ing times o f sk ipjack in the purse-se ine fishery in theW esterncentral Pacific Ocean (WCPO) (20bN-25bS, 120bE-175bW) , and the environm ent data of d ifferen t w ater layer temperature (sea surface temperature, w ater temperatures of 12. 5 m, 237. 5 m and 287. 5 m layer,temperature d ifference permeter betw een 137. 5m and 187. 5m layer), the re lative ratio of fishing timesw ithhigh yie ld w as considered as the hab itat su itab ility index (SI) , and SI model w ith sing le variable isestab lished by non linear reg ression methods. F ive m ethods (Cont inued produc,t M inimum, M ax imum,A rithmet icmean and G eometricmean) w ere used to estab lish the mult-i factor hab itat su itab ility index (HSI)mode.l The results ind icated that when Cont inued product andM inimum method w ere app lied, the y ie ld o fsk ip jack w asm ainly located in the areaw ithH SI< 0. 5. When G eometricmean and A rithmetic meanm ethodw ere app lied, the y ield o f sk ip jack w asm ainly d istributed in the areaw ithHSI rang ing from 0. 3 to 0. 8. 【题目】桁拖网渔具刚性栅栏对鱼类的分隔效率研究
【中文关键词】分隔栅栏;分隔效率;多囊桁拖网;短吻舌鳎;小黄鱼;棘头梅童鱼
【英文关键词】Sorting grid;Separating efficiency;Beam trawl with several codends;Cynoglossus abbreviatus;Pseudosciaena polyactis;Collichthys lucida
【中文摘要】东海捕虾桁拖网选择性能不佳, 对渔业资源的保护和渔业的合理管理带来了负面的影响。刚性栅栏是实现拖网渔具种类选择性捕捞的主要装置, 本文根据在吕四渔场开展刚性栅栏海上生产试验, 结合SELECT 模型分析不同栅条间距(15、20 和25mm)的刚性栅栏对短吻舌鳎、小黄鱼和棘头梅童鱼的分隔效率。结果表明, 随着栅条间距的增大, 栅栏对鱼类的重量分隔率逐渐减小, 分隔栅栏对鱼类的50%选择体长(L50S)逐渐增大; 对于短吻舌鳎, 个体接触分隔栅栏的概率可使用常数来表示, 即接触概率与个体尺寸无关, 接触概率在0.2—0.4 之间, 并随着栅条间距的增大而增大(不显著,P>0.05); 对于小黄鱼和棘头梅童鱼, 所有进入网囊的个体都将接触刚性栅栏; 不同鱼类接触栅栏概率的显著差异说明不同鱼类在网囊中的不同行为习性。
【英文摘要】Poor selection of the beam trawl fishing in the East China Sea has exerted negative influences on conservationof fish resources and management of fisheries. To solve the issue, sorting grid was developed to separate catch effectivelyby species retained in non-selective codends in trawl fisheries. In this paper, the separating efficiency of sorting gridof different bar spacings (15, 20, and 25mm) for three-lined tongue sole Cynoglossus abbreviatus, little yellow croakerPseudosciaena polyactis, and spinyhead croaker Collichthys lucida was analyzed in sea trials carried out in Lvsi FishingGround in the SELECT model. The results show that the separating ratio of catch weight of fishes decreases with the increasein bar spacing. The 50% retention length of different grids increases

with the bar spacing. For three-lined tonguesole, the probability of contacting grid of shrimps is indicated by a parameter, which means the contact probability is independentof individual size. The maximum likelihood estimates of contact probability for sorting grids of different barspacings are between 0.2 and 0.4 and increase insignificantly (P>0.05) with the bar spacings. For little yellow croaker andspinyhead croaker, all individuals entering codends would encounter the sorting grids. The difference in contact probabilityfor different fishes indicates distinct swimming behavior patterns in trawl.

【题目】印度洋大眼金枪鱼栖息地指数研究及其比较
【中文关键词】大眼金枪鱼;栖息地指数;印度洋;实证研究
【英文关键词】Thunnus Obesus;habitat suitability index;Indian Ocean;empirical study
【中文摘要】根据商业性大眼金枪鱼延绳钓渔业数据、环境数据结合专家知识绘制了印度洋大眼金枪鱼(Thunnuso bseus)对温度、盐度、溶解氧和温跃层深度的适应性指数曲线,运用4种关联建模方法计算综合栖息地指数。用AIC值检验不同建模方法的拟合度,并对不同建模方法的输出结果进行空间分析。最后用实证研究的方法探索其在渔场选择上的可行性。结果表明,最小值法在4个模型方法中拟合度最好,给出了较为严格的栖息地适宜度估计,算术平均法则给出了较为粗略的栖息地适宜度估计。不同方法计算得出的栖息地指数(HSI)在空间分布上存在明显的差异。连乘法指示的HSI0.9的区域局限于赤道附近55°E~68°E间;最小值法指示的HSI0.9的区域分布于赤道附近50°E~75°E小块水域;算术平均法和几何平均法指示的HSI0.9区域终年分布在50°E~85°E、5°N~5°S间的广大热带印度洋海域。最小值法和算术平均法指示的HSI等值线分布具有一定的相似性,两者相比较发现,最小值法指示的HSI=0.4等值线相当于算术平均法指示的HSI=0.7等值线;最小值法指示的HSI=0.6等值线相当于算术平均法指示的HSI=0.8等值线;最小值法指示的HSI=0.7等值线相当于算术平均法指示的HSI=0.9等值线。实证研究发现,算术平均法和几何平均法指示的HSI值对大眼金枪鱼的渔获地点和渔获频次有较好的估计,平均渔获频次比重分别达到96.10%和85.51%。研究认为发展实时的栖息地动态预测模型有助于渔场的探索。
【英文摘要】Suitability index curves about water temperature,salinity,dissolved oxygen and thermocline depthfor bigeye tuna,Thunnus obesus in the Indian Ocean were drawn based on the commercial tuna longline fisherydata and environmental data as well as expertise knowledge. Integrated habitat suitability index was computedusing four conjunction equations,i.e. continued product model(CP),minimum model(Min),arithmetic meanmodel(AM) and geometric mean model(GM). Goodness of fit of the four modeling methods was tested byAkaike Information Criterion(AIC)and the results of different modeling methods were compared using spatialanalysis. The best goodness of fit was given by minimum model which gave rigorous estimation whereas theworst was given by arithmetic mean model which gave coarse estimation. Area distribution of habitat suitabilityindex (HIS) are greatly differently indicated by various methods. Contour of HSI>0.9 concentrated at equatorialwaters of 55° E~68° E which come from the continued product model. Contour of HSI>0.9 concentrated atequatorial waters of 50° E~75° E which resulted from the minimum model. Contour of HSI>0.9 distributed in therange of 50° E~85° E and 5° N~5° S throughout the year which was indicated by the arithmetic mean model and thegeometric mean model. Contour of HSI=0.4 indicated by the minimum model was equivalent to that of HSI=0.7by the arithmetic mean model. Contour of HSI=0.6 indicated by the minimum model was equivalent to that ofHSI=0.8 by the arithmetic mean model. Contour of HSI=0.7 indicated by the minimum model was equivalent tothat of HSI=0.9 by the arithmetic mean model. An empirical study confirmed that the arithmetic mean model andthe geometric mean model could give a reliable estimation for fishing area and fishing frequency with the fishingfrequency percentages reaching 96.10% and 85.51%,respectively. It is helpful to develop a real-time habitatdynamic model for detection of fishing ground in the future. [Journal of Fishery Sciences of China,2008,15(2):269-278]

【题目】太平洋延绳钓大眼金枪鱼及渔场表温关系研究
【中文关键词】太平洋;延绳钓;大眼金枪鱼;海表温度
【英文关键词】Pacific Ocean; longline; bigeye tuna; sea surface temperature
【中文摘要】根据收集到的太平洋延绳钓大眼金枪鱼捕捞产量、海水表层温度 (SST) 数据等,研究了太平洋延绳钓大眼金枪鱼捕捞产量及渔场区 SST 的统计特征。结果表明:太平洋延绳钓大眼金枪鱼渔场主要分布在较高温度的热带海域,整

个太平洋渔场区平均 SST为 26.56 ℃,中位数为 27.28 ℃,高产渔区 SST 相对较高,其主要渔场区平均表层水温主要位于 23.8 ℃ ~ 29.3 ℃。渔场区 SST数据分布为负偏,而产量数据分布为正偏。平均 CPUE 分布呈双峰分布,但主要捕捞产量多数在大于 25 ℃ 海域捕捞。时间序列分析结果显示:太平洋大眼金枪鱼 CPUE 呈下降趋势,SSTA 自 1970 年代末开始增加,表明太平洋热带海域处于变暖阶段,CPUE和MEI 指数与 SSTA 的周期变化具有较好的一致性。

【英文摘要】The longline bigeye tuna is one of the important fisheries in the Pacific Ocean. According to thecollected catch data of bigeye tuna, sea surface temperature derived from satellite 3-level data production,and thestatistical characteristics of longline bigeye tuna and SST were studied. The results showed that thefishing-grounds of longline bigeye tuna are mainly located at the tropical Pacific Ocean, and the SST is relativelyhigher than that in other areas. The average SST and median SST of fishing grounds are 26.56 °C and 27.28 °Crespectively, and SST of high-catch fishing grounds is higher than that in other areas. SST in most fishing groundsareas ranges from 23.8 °C to 29.3 °C. The distribution shape of SST is negative skew and the distribution shape ofcatch is positive skew, but average CPUE is bimodal distribution. In addition, most bigeye tuna were captured atthe area with SST > 25°C. According to time series analysis, the CPUE of longline bigeye tuna in the PacificOcean is decreased gradually. SSTA began to increase from the late 1970 ’s , indicating that the tropical PacificOcean is at the period of warming. The fluctuation period of CPUE, multivariate ENSO index (MEI) and SSTAhave good relative.

【题目】2006年北太平洋柔鱼作业渔场时空变化及其与表温的关系

【中文关键词】/

【英文关键词】Ommastrephes batramii;catch distribution;SST;North Pacific Ocean;K-S test

【中文摘要】/

【英文摘要】Ommastrephes bartramii is one of the important fishing targets in the Chinese squid jiggingfishery, It plays a significant realistic role and has practical value to study the spatio-temporaldistribution of fishing ground and its relationship with sea surface temperature (SST). Based on thecatch data from Chinese squid jigging vessels in the North Pacific Ocean from May to November in2006, the production and catch per day distribution and their relationship with SST with the format of 1 ° latitude by 1 ° longitude were analyzed by software of marine GIS. The results indicated that the catchwere mainly concentrated in the waters near 39 ° N~42 ° N,170~172 ° E in June, and the SST rangedfrom 14 to 15 ℃. The catch were mainly concentrated in the waters near 40 ° N~42 ° N,159 ° E~161 ° E,and the SST ranged from 14 ℃ to 15 ℃ in July. From August to November, the catch were mainlyconcentrated in the waters near 41 ° N~44 ° N,151 ° E~156 ° E, and the optimum SST was 17~18 ℃ inAugust, 15~16 ℃ in September, 13~14 ℃ in October, and 11~13 ℃ in November. The K-S testindicated that there had a significant relationship between SST and daily catch (P<0.05).

【题目】利用基于表温因子的栖息地模型预测西北太平洋柔鱼(Ommastrephes bartramii)渔场

【中文关键词】柔鱼, 栖息地模型, 表温, 表温水平梯度, 渔场, 西北太平洋

【英文关键词】Ommastrephes bartramii, Habitat suitability model, Sea surface temperature, Horizontal gradient of SST, Fishing ground, The Northwest Pacific

【中文摘要】根据1999—2004年8—10月主渔汛期间我国鱿钓船在150—165 ° E海域的鱿钓生产数据,结合其表温及表温梯度,分别将作业次数百分比和单位渔船日产量作为适应性指数,利用算术平均法(AM)和联乘法(GM)分别建立基于表温因子

(表温和表温水平梯度)的综合栖息地指数模型。结果表明,AM栖息地指数模型和GM栖息地指数模型均拟合较好,在HSI大于0.6的海域,1999—2004年间其作业次数平均比重分别在70%以上,平均日产量均在2t/d以上。但AM模型稍优于GM模型。利用2005年8—10月生产数据及表温资料对AM模型进行验证,分析认为作业渔场主要分布在HSI大于0.6海域,其作业次数比重达到80%以上,各月平均CPUE均在3.0t/d以上。研究表明,基于表温和表温水平梯度的AM栖息地模型能获得较好预测西北太平洋柔鱼中心渔场。

【英文摘要】Ommastrephes bartramii is an important squid species in Chinese jigging fishery in the Northwest Pacific.Accurate forecasting can provide a clue scientific guidance for fishery production. Using Chinese squid fishing productiondata during the main fishing season (August to October) from 1999 to 2004 in the waters of 150—165 ° E, the present studycombines the sea surface temperature (SST) with the horizontal gradient (GSST) and the percentage of fishing times anddaily catch (CPUE) as the suitability index (SI). Using arithmetic mean model (AM) and geometric mean model (GM), theintegrated habitat suitability index (HSI) is established based on SST and GSST. The results indicate that AM model andGM model are fitted better. In the waters with the HSI greater than 0.6, the percentage of fishing times obtained is greaterthan 70% and the average daily catch is above 2 t/d from 1999 to 2004. However, AM model is slightly better than GMmodel. With the data obtained during August to October in 2005, it is found that the main fishing ground distributed in thewaters with HSI greater than 0.6 in the AM HSI model, and its percentage of fishing times reached more than 80% and itsaverage CPUE were above 3.0 t/d. The results show that the AM HSI model based on SST and GSST can better predict thefishing grounds of squid in the Northwest Pacific.

【题目】桁拖网渔具分隔网片对虾类的分隔效率研究
【中文关键词】桁拖网;分隔网片;分隔效率;哈氏仿对虾;葛氏长臂虾
【英文关键词】beam trawl;separator panels;separating eficiency;Parapenaeopsis hardwickii;Palaemon gravieri
【中文摘要】利用分隔网片将桁拖网渔具网囊分为上下2层(虾囊和鱼囊)以实现虾类和鱼类渔获分离,对于改善桁拖网渔具作业性能、提高目标种类渔获质量以及实现选择性捕捞具有重要的意义。为分析不同网目尺寸(60mm、75mm和90mm)分隔网片对主要渔获种类的分隔效率,在吕泗渔场开展了2个航次的海上生产实验。利用分隔装置性能分析模型,对哈氏仿对虾(Parapenaeopsis hardwickii)和葛氏长臂虾(Palaemon gravier)的渔获数据进行拟合。结果表明,不同虾类接触分隔网片的概率没有显著性差异;虾类个体50%接触概率体长约为40mm,表明大多数进入网具的虾类都能接触分隔网片。随着分隔网片网目尺寸增大,50%选择体长也逐渐增大。因此,分隔网片的分隔效率随之提高。鱼囊和虾囊的网目尺寸相同,但结构有所差异。比较在不同网囊尺寸选择性假设条件下渔获数据的拟合结果后发现,鱼囊和虾囊具有相同选择性的假设更为合理;通过比较发现,分隔网片对虾类的尺寸选择性与相同网目尺寸的网囊选择性具有较大的差异。本研究还对产生这一差异的原因进行了探讨。
【英文摘要】Research on development of separating beam trawl is important not only to improving the fishingeficiency and quality of catch,but also to achieving the idea of species—selective fishing.The codend of beamtrawl could be divided into two levels(the upper for shrimp catch and lower for fish catch)by inserting aseparator panel into the codend and extension.In order to analyze separating efi ciency of the separator panelswith different mesh sizes(60mm,75mm and 90mm),experiments in 2 sea trials were carried out in theLvsi Fishing Ground.A model for separating efi ciency assessment was fitted to the size frequency of spearlittoral shrmip(Parapenaeopsis hardwickii)and Chinese ditch prawn(Palaemon gravieri)catch.The resultsdemonstrate that the contact probability parameters are not significantly diferent between the two shrimp speciesand the 50%contact probability length is approximatey 40 illnl,which indicates majority of shrimp individualscontact the panels.With the increase of mesh size of separator panels,50% retention lengths increase and the sizeselectivity and separating eficiency for shrimps of the panels will be improved correspondingly.Th e hypothesisthat the size selectivities of diferent codends(codends for shrimps and fishes)for shrimps were identical andcan be verified according to model fitness in diferent hyp othesises,though the constructions of diferent levelcodends are identifiably diferent.The sign ificant diference betw een

size selectivity of codend and separatorpanels is found and the reasons for the diference are discussed

【中文关键词】日本鲐;澳洲鲐;群体;RAPD;遗传多态性;东黄海
【英文关键词】Scomber japonicus; Scomber australasicus; random amplified polymorphic DNA (RAPD); genetic polymorphism; Yellow Sea; East China Sea
【中文摘要】利用随机扩增多态DNA(RAPD)技术分别分析了五岛西部日本鲐、东海西部日本鲐和澳洲鲐三群体的样本,共产生226个分子标记,其中143个为多态性标记,多态百分率达到63.3%,每条引物产生的平均标记数为7.29。五岛西部日本鲐、东海西部日本鲐和澳洲鲐群体内遗传相似度分别为0.949、0.877和0.936,而群体间遗传距离依次为:五岛西部日本鲐-东海西部日本鲐(0.2357)〈东海西部日本鲐-澳洲鲐(0.3030)〈五岛西部日本鲐-澳洲鲐(0.3528),五岛西部日本鲐与东海西部日本鲐个体在UPGMA系统树独立聚类为两个类群,初步支持东、黄海的日本鲐存在东海西部和五岛西部的两个种群的观点。Shannon多榨性指数表明,其遗传多样性大小依次为东海西部日本鲐、澳洲鲐、五岛西部日本鲐。
【英文摘要】Thirty-one primers were screened from 78 random primers by RAPD (random amplifiedpolymorphic DNA) technique, and 10 randomly selected samples from each population (includingScomber japonicus from the west of Goto Islands and the west of East China Sea, respectively and Saustralasicus from the East China Sea) were analyzed. After amplification, thirty-one primers consistentlygave a total of 226 recognizable markers, of which 143 bands were polymorphic markers and accountedfor 63.3% of the total. Each primer generated a mean of 7.29 bands. The intra-population geneticsimilarity of these 3 groups was 0.949, 0.877 and 0.936, respectively. The genetic distance between twopopulations of S. japonicus (0.2357) was smaller than that between S. japonicus and S. australasicus(0.3030) which was in turn smaller than that between the S. japonicus population in the west of the GotoIslands and S. australasicus population (0.3528). UPGMA analysis revealed that there were twopopulations of S. japonicus, i.e. the one of west of the Goto Islands and one of the west of the East ChinaSea, which supported the traditional population structure. Shannon genetic diversity analysis showed thatthe degressive order of genetic diversity among the three groups was S. japonicus population in the west ofGoto Islands, S. australasicus, and the S.japonicus population in the west of the East China Sea.

【题目】南海北部张网主要技术参数的变化分析
【中文关键词】张网渔具;技术参数;南海北部沿岸
【英文关键词】stow—net gears;technical parameter;coast of northern South China Sea

【中文摘要】根据2000~2005年和1983~1985年渔具渔法调查资料,对南海北部张网主要技术参数进行了比较分析。结果表明,与1983~1985年相比,现阶段张网网口纲长、网口网目尺寸和网身末段网目尺寸等稍有增大,网衣拉直长、网囊长和网囊网目尺寸等略有减小,网身长与网囊长之比、网身大头宽与小头宽之比等明显增大,其平均值分别由原来的5.8:1、19.8:1增至现在的13.8:1和26.2:1。张网主要技术参数的变化反映了张网渔具结构已经随着渔业资源的衰退发生了变化,但这种变化并不是积极的、革命性的改革。为合理利用渔业资源和促进张网渔业可持续发展,应根据南海北部渔业资源的特点研究相适应的选择性张网捕捞技术或装置,减少对幼鱼、幼虾资源的损害。

【英文摘要】In this paper,the main technical parameters of stow nets were analyzed based on the investigation of fishing gears and meth—ods along the coast of the northern South China Sea during 2000~2005 and 1983~1985,respectively.Comparing with the data of stownets investigated during 1983~1985,the mouth line length(C),mouth mesh size and mesh size of extension piece of the nets during2000~2005 increased slightly,but stretched netting length(L),cod—end length(L)and cod—end mesh size decreased slightly.TheLb/L (Lb:body length)and the Wb/w (Wb:mouth width,W :extension piece width)increased averagely from 5.8:1 to1 3.8:1 and from 19.8:1 to 26.2:I,respectively.With exhaustion of fishery resources in the coast of northern South China Sea,the main technical parameters of stow nets have changed for the net configuration,but the changes is not positive and revolutionary.Toexploit rationally the coast fishery resources and to promote sustainable fishery development,based on behaviors and characteristics offishery resources in the coast of northern South China Sea,the more advanced selective fishing techniques or devices for stow netsshould be developed to reduce the damages to fries and young fishes and shrimps.

【题目】基于广义可加模型的时空和环境因子对东南太平洋智利竹筴鱼渔场的影响
【中文关键词】智利竹筴鱼;时空因子;环境因子;广义可加模型;东南太平洋
【英文关键词】Chilean jack mackerel (Trachurus murphyi); spatiotemporal factor; environmental factor; generalized additive model; Southeast Pacific Ocean
【中文摘要】根据2001—2007年我国渔船在东南太平洋海域的智利竹筴鱼生产统计数据、时空因子以及海表温度、叶绿素浓度、海表温度梯度等环境数据,利用广义可加模型(GAM)分析了智利竹筴鱼资源变动情况及其与时空和环境因子的关系.结果表明:GAM模型对单位捕捞努力量渔获量(catch per unit effort,CPUE)总偏差解释率为31.47%;竹筴鱼生产具有明显的季节变化,主要集中在第17~41周,其中第25~31周的CPUE较高;东南太平洋智利竹筴鱼作业渔场集中在78°—98°W,30°—43.5°S之间,适宜海表温度为12℃~18℃,14℃~16℃最适宜,适宜叶绿素浓度在0.09~0.18mg·m-3,海表温度梯度在0.3℃~1.9℃.逐步建模法结果表明,影响竹筴鱼资源丰度的因子按重要性从大到小依次为周次、年份、海表温度、经度、纬度、叶绿素浓度和海表温度梯度.
【英文摘要】Based on the 2001 - 2007 Chilean jack mackerel (Trachurus murphyi) fishing data fromChinese vessels,as well as the spatiotemporal factors and the environmental factors such as sea surfacetemperature (SST),chlorophyll concentration,and temperature gradient (TGR) in the SoutheastPacific Ocean,this paper analyzed the resource variation of T. murphyi and its relationshipswith the spatiotemporal and environmental factors in the Ocean by using generalized additive model(GAM). The results showed that the rate of deviance explained about CPUE (catch per unit effort)was 31. 47%. The fishing production of T. murphyi had distinct seasonal variation,and mainlyconcentrated in the 17th - 41st weeks of the year,with the CPUE reached the highest in the 25th -31st weeks. The fishing ground of T. murphyi in the Ocean was mainly located in the waters of 78 ° - 98 ° W and 30 ° - 43. 5 ° S. The suitable sea surface temperature was in the range of 12 ℃ - 18℃,and the optimum temperature was 14 ℃ - 16 ℃. The appropriate chlorophyll concentrationrange and temperature gradient were 0. 09 - 0. 18 mg · m - 3 and 0. 3 ℃ - 1. 9 ℃,respectively.The results of stepwise GAM showed that the relative importance of the seven variables affecting theCPUE of T. murphyi was in the order of: weeks of the year,year,sea surface temperature,longitude,latitude,chlorophyll concentration,and temperature gradient.

【题目】秘鲁外海夏季渔业资源与水温分布特征
【中文关键词】渔场;渔业资源;水温;秘鲁外海
【英文关键词】Fishing ground;Fisheries resource;Water temperature
Hig h seas off Peru
【中文摘要】根据2006年12月~2007年1月在秘鲁200海里专属经济区外海渔场的探捕调查,对该海域夏季的渔业资源和水温分布特征进行了初步探讨。结果显示,南半球夏季调查海域(13°~22°S,78°~90°W)受秘鲁寒流的影响,存在一大范围的低温水舌,表层水温分布范围为19·37~23·26℃,由南向北递升。北部温跃层顶界较浅,厚度较小,强度较大;而南部温跃层顶界较深,厚度较大,强度较弱。拖网的平均CPUE为38·4kg/h,渔获物以茎柔鱼Dosidicus gigas为主,占总渔获量85·2%;秘鲁鳀Engraulis ringens仅分布于调查海域东南部的秘鲁专属经济区外缘水域,资源密度指数为3·7kg/h。秘鲁外海除茎柔鱼外,其他中上层鱼类的资源少,集群性差,不适合作为大型拖网加工船的作业渔场来开发。建议我国的东南太平洋竹筴鱼Trachurus murphyi拖网渔业向智利外海南部(45°~50°S)和西部(95~110°W)海域发展。
【英文摘要】Bas ed on t he test fishing survey out side the Peru 200-mile Ex clusive EconomicZone in Dec. 2006 to Jan. 2007, the character ist ics of fisher ies resource and water temperature distr ibution were invest igat ed. T he result s revealed a larg e-scale coldwater t ongue ex tended t oward the survey area (13b~ 22bS, 78b~ 90bW) , as induced bythe Peru Cur rent, wit h an increasing sea surface temperature (SST) of 191 37~ 231 26 efrom sout h t o nor th. T he thermocline in t he nor th was st ronger wit h a shallow topboundary (35~ 40 m) and deeper bot tom boundary (100~ 130 m) ; while the southernthermocline was weaker wit h a top boundary at 45~ 100 m and a bottom boundary at 140~ 190 m. The average CPUE was 381 4kg/ h in trawling survey, and Dosidicus gigaswas predominant in the catches, accounting for 851 2% in weight. Engraulis r ingensmerely dis tr ibut ed in the sout h-eastern area close to t he EEZ of Peru, and its resourceindex was only 31 7kg/ h. The high seas off t he coast of Peru were unsuit able f or t rawlfishing becaus e the resource of pelagic fish except Dos idicus gigas was of little commercialfishing value. It is suggested that Chinese trawl fishing ground of T rachurus murphyi be enlarged towards southern waters of 45b~ 50bS and western waters of 95~ 110bW out side the Chilean EEZ.

【题目】拖网选择性对鱼类表型性状的选择作用研究
【中文关键词】拖网选择性;表型性状;和协系数
【英文关键词】Trawl mesh selectivity;Phenotypic traits;Hcoefficient
【中文摘要】参照渔业生物学、渔业资源解析学、数量遗传学等有关理论模型,并应用数值模拟方法,对长期选择性捕捞(重点为渔具选择性)是否参与造成了渔业资源的生物学变化(体长、性成熟等)进行某些基础性探索。设计了一个具有一定体长遗传特征的模拟鱼类种群,并利用一种具有固定选择性参数的拖网对其进行长期捕捞。结果表明,多年的持续的捕捞压力使得模拟种群中鱼类体长逐渐减小,减小的幅度随开发率的增大而增大,而终止捕捞后种群的体长并没有发生恢复的迹象,说明这种变化很可能伴随种群遗传的变化,具有自然不可逆性。
【英文摘要】Constant long-time use of a certain fishing net selectivity may affect the phenotypic traits of fish population,such as body length and sex maturity. By referring to several models in fishery biology, fishery resource analytics, andquantitative genetics, a numeric simulation was conducted. A fish population having long-standing body length was designedfor the simulation, upon which a trawl net of a certain mesh size and selectivity parameters was applied forlong-period fishing. The result shows that, under such operation for several years, the statistic body length of the fishpopulation had been reduced. Furthermore, the size reduction may become a genetic adaptation for the whole population,which is probably, unfortunately, irreversible.

【题目】东南太平洋智利竹筴鱼三群体遗传关系RAPD分析
【中文关键词】智利竹筴鱼; 遗传多样性; 亲缘关系; RAPD 分析
【英文关键词】Trachurus murphyi;genetic diversity;relationship;RAPD analysis
【中文摘要】利用RAPD分子标记技术对智利外海3个群体(IEZ1、OEZ1和OEZ2)的53条竹筴鱼进行群体遗传结构及遗传多样性的分析。研究结果表明:在可供试验引物中筛选到具有多态性的RAPD引物3个。每个引物扩增1~7个可辨认片段,3个随机引物在竹筴鱼3个群体中共检测到13条带片断,其中9个(69.2%)片断显多态性。OEZ1的多态性最高,达23.08%,IEZ1、OEZ2的多态性为15.38%。经济区内外的群体多样性差别不大。IEZ1的Shannon信息指数为0.0930,OEZ1为0.1396,OEZ2为0.0930。IEZ1 Nei’s基因多样性为0.0637,OEZ1为0.0956,OEZ2为0.0637。Nei’s遗传距离表明IEZ1与OEZ1最大,IEZ1与OEZ2稍小,OEZ1和OEZ2最小。Shannon信息指数和Nei’s遗传距离表明,经济区外的2批群体与经济区内的群体遗传关系差距并不显著。
【英文摘要】The geneticst ructure and genetic diver sity of the three po pulations of Chilean jack mackerelTr achurus mur p hy i co llected f rom inter-EEZ and outer-EEZ co ast of f Chile in 2005 and 2006 w er e analysedby RAPD-PCR markers. T hr ee polymorphic primers w er e chosen among the experimental primers.There w er e 13 bands in the thr ee po pulatio ns by RAPD-PCR w ith thr ee 3-base primers, and 1~ 7 bandsw ere detected fo r o ne primer. Nine primers w ere po lymo rphic, account ing for 69. 2%. The group OEZ1had the maximal polymorphism o f 85. 19%, fo llow ed by gro ups IEZ1 & OEZ2, w ith the polymorphism of15. 38%. T here w ere no sig nif icant differ ences in g enet ic diversity among the three gro ups. POPGENEsof tw ar e revealed that Shannon. s Information index of IEZ1 and OEZ2 w er e 0. 0930, w hile that for OEZ1w as 0. 1396. Nei. s gene diversity of IEZ1 and OEZ2 w er e 0. 0637, w hile that for OEZ1 w as 0. 0956. Therew as the max imum genet ic distance between IEZ1 and OEZ1, fo llow ed by IEZ1 and OEZ2, and the min-imum for OEZ1 and OEZ2. The Shannon. s Informat io n index and Genet ic Distance indicated that thedif ference in genet ic diversity betw een inter-EEZ g roup and outer-EEZ g roup w as not significant .

【题目】A new algorithm for estimating gillnet selectivity
【中文关键词】/
【英文关键词】algorithm; gillnet selectivity; Kitahara method
【中文摘要】/
【英文摘要】The estimation of gear selectivity is a critical issue in fishery stock assessment andmanagement. Several methods have been developed for estimating gillnet selectivity, but they all havetheir limitations, such as inappropriate objective function in data fitting, lack of unique estimates due tothe difficulty in finding global minima in minimization, biased estimates due to outliers, and estimationsof selectivity being influenced by the predetermined selectivity functions. In this study, we develop a newalgorithm that can overcome the above-mentioned problems in estimating the gillnet selectivity. Theproposed algorithms include minimizing the sum of squared vertical distances between two adjacentpoints and minimizing the weighted sum of squared vertical distances between two adjacent points in thepresence of outliers. According to the estimated gillnet selectivity curve, the selectivity function can alsobe determined. This study suggests that the proposed algorithm is not sensitive to outliers in selectivitydata and improves on the previous methods in estimating gillnet selectivity and relative populationdensity of fish when a gillnet is used as a sampling tool. We suggest the

proposed approach be used inestimating gillnet selectivity.

【题目】A review of the development of Chinese distant-water squid jigging fisheries
【中文关键词】/
【英文关键词】squid jigging fisheries; china; ommastrephes bartramii; illex argentinus; dosidicus gigas; todarodes pacificus; sthenoteuthis oualaniensis
【中文摘要】/
【英文摘要】China has developed a major fishing fleet for oceanic squid since 1989, currently having more than 400 squid jigging boats with an annual catch of 250-300 thousand metric tonnes and accounting for about one-sixth of the global oceanic squid production. The main fishing target species include Ommastrephes bartramii in the northwestern Pacific, Illex argentinus in the southwestern Atlantic, Dosidicus gigas in the southeastern Pacific, Sthenoteuthis oualaniensis in the northwestern Indian, and Todarodes pacficus in the Sea of Japan. The ommastrephidae squid is an opportunist species and vulnerable to environmental fluctuations, making its abundance difficult to assess, forecast and manage. This calls for sharing of scientific information worldwide for better understanding and management of squid fisheries. This study reviews biology, fisheries and resource status of important commercial oceanic squid for the Chinese squid jigging fisheries with a focus on recent literatures published in China. 【题目】Influence of surface oceanographic variability on abundance of the western winter-spring cohort of neon flying squid Ommastrephes bartramii in the NW Pacific Ocean
【中文关键词】/
【英文关键词】Sea surface temperature; Abundance index; Ommastrephes bartramii; Northwest; Pacific Ocean
【中文摘要】/
【英文摘要】Abundance of the Ommastrephes bartramii winter-spring cohort fluctuated greatly from 1995 to 2004. To understand how abundance was influenced by sea surface conditions, we examined the variations in the proportion of thermal habitats with favourable sea surface temperature (SST). The SST data of both the spawning and feeding grounds were used to calculate the monthly proportion of favourable-SST areas (PFSSTA). Catch per fishing day per fishing boat (catch per unit effort, CPUE) of the Chinese mainland squid-jigging fleet was used as squid abundance index. The relationships between CPUE and monthly PFSSTA at spawning and feeding grounds were analyzed, and the relationship between CPUE and selected PFSSTA was quantified with a multiple linear regression model. Results showed that February PFSSTA at the spawning ground and August to November PFSSTA at the feeding ground could account for about 60% of the variability in O. bartramii abundance between 1995 and 2004, that February was the most important period influencing squid recruitment during the spawning season, and that feeding ground PFSSTA during the fishing season would influence CPUE by causing squid to aggregate. Our forecast model was found to perform well when we compared the model-predicted CPUEs and the average CPUEs observed during August to November in 2005 and 2006 from the Chinese squid-jigging fishery.

【题目】Habitat suitability index of Chub mackerel (Scomber japonicus) from July to September in the East China Sea
【中文关键词】/
【英文关键词】Habitat suitability index; Scomber japonicus; East China Sea; Chinese purse seine fishery
【中文摘要】/
【英文摘要】The habitat quality of Chub mackerel (Scomber japonicus) in the East China Sea has been a subject of concern in the last 10 years due to large fluctuations in annual catches of this stock. For example, the Chinese light-purse seine fishery recorded 84000 tons in 1999 compared to 17000 tons in 2006. The fluctuations have been attributed to variability in habitat quality. The habitat suitability Index (HSI) has been widely used to describe fish habitat quality and in fishing ground forecasting. In this paper we use catch data and satellite derived environmental variables to determine habitat suitability indices for Chub mackerel during July to September in the East China Sea. More than 90% of the total catch was found to come from the areas with sea surface temperature of 28.0A degrees-29.4A degrees C, sea surface salinity of 33.6-34.2 psu, chlorophyll-a concentration of 0.15-0.50 mg/m(3) and sea surface height anomaly of -0.1-1.1 m. Of the four conventional models of HSI, the Arithmetic Mean Model (AMM) was found to be most suitable according to Akaike Information Criterion analysis. Based on the estimation of AMM in 2004, the monthly HSIs in the waters of 123A degrees-125A degrees E and 27A degrees 30'aEuro"28A degrees 00' N were more than 0.6 during July to September, which coincides with the catch distribution in the same time period. This implies that AMM can yield a reliable prediction of the Chub mackerel's habitat in the East China Sea.

【题目】Molecular cloning and tissue specific expression of an elongation factor 1A gene in sugarcane stalks
【中文关键词】无
【英文关键词】Saccharum officinarum L. hybrid, elongation factor 1-alpha, ethephon, tissue specific expression, stalk, internodes
【中文摘要】无
【英文摘要】Genomic reconstruction done by using the cDNA insert containing the ORF of GZ-1-alpha as the probe indicated the presence of about 5 copies of eEF1A gene per haploid sugarcane genome. Northern hybridization studies revealed the presence of eEF1A transcripts in Saccharum officinarumstalks at late growth stage. A full-length cDNA clone (GZ-1-alpha) encoding elongation factor 1-alpha has been isolated from stalks of S. officinarum L. (accession number EF581011).The 1736 bp nucleotide sequence and the deduced 447 amino acid sequence shared 65-92 % and 95-99 % identity,respectively, to the other plant elongation factor 1As. The 400mg/L ethephon treatment significantly induced the expression of GZ-1-alpha and maintained higher level in the top internodes for a long time, but did not induce the expression in the midand bottom internodes. The results suggest that ethephon mediates the tissue and growth stage specific expressions of eEF1A gene isolated from S.officinarum stalks.

【题目】Transformation of sugarcane with ACC oxidase antisense gene
【中文关键词】无
【英文关键词】ACC oxidase, anti-sense gene, sugarcane, genetic transformation
【中文摘要】无
【英文摘要】The present study is an attempt to validate the function of sugarcane ACO by construction of plant expression vectors for sugarcane ACO sense and anti-sense genes and their effective transformation.Plant expression vectors for sugarcane ACO anti-sense gene was constructed and then transformed into sugarcane variety ROC22 mediated by Agrobacterium tumefaciens. The transgenic shoots were screened under the selective pressure of 40 mg/l G418 and 300mg/l cefalexin and 19 resistant plants were obtained, two of which were further proved to be positive through detecting NPTII by PCR. The transformation rate was found 10.5%.The positive plants were found to grow slowly and were more dwarf compared to non-transgenic ones. The present work reveals the efficient genetic transformation system and development oftransgenic sugarcane plant with ACO antisense gene. This work will help in understanding the ethyleneand growth relationship and will also help breeders in breeding programs tailored to develop new varieties using molecular approaches.

【题目】Combined application of NPK on yield quality of sugarcane applied
【中文关键词】无
【英文关键词】Sugarcane, combined application, nitrogen,phosphorus, potassium, nutrient balance, yield
【中文摘要】无
【英文摘要】Field experiments were conducted to study the effects of combined application of nitrogen (N), phosphorus (P) and potassium (K) on growth, yield quality and nutrient balance of sugarcane with subsurface drip irrigation by using the sugarcane variety ROC89/1626 and adopting “3414” project design. It was observed that the appropriate rate of N,P2O5 and K2O increased the plant height,cane yield and cane quality of sugarcane under the experimental conditions. The fertigation model recommended for highest cane yield was 367.2 kg N,162.6 kg P2O5 and 423.3 kg K2O per ha. The highest cane yield recorded with this dose was 101.8 t/ha. The best fertigation model recommended was 340.1 kg N, 141.9 kg P2O5 and 401.1kg K2O per ha for the cane yield of 101.6 t/ha.

【题目】Isolation and characterization of a gene encoding the Δ1-pyrroline-5- carboxylate synthetase in sugarcane (Saccharum spp. hybrid var. ROC22)
【中文关键词】无
【英文关键词】sugarcane, Δ1-Pyrroline-5- Carboxylate Synthetase (P5CS) Gene; Proline, Water Stress.
【中文摘要】无
【英文摘要】SUGARCANE variety ROC22 was used as the experimental material. Water stress treatment was performed on 4 to 5-leaf stage plants with a 25% polyethylene glycol (PEG) 6000 solution. A cDNA sequence for the ScP5CS sugarcane gene was isolated by homologous cloning. The sequence contained 2151 bp and an open reading frame of 716 amino acids (GenBank accession number EU005373). Comparing the sequence of ScP5CS with that of sugarcane P5CS reported in GenBank, the nucleotide sequence(EF155655) showed high identity (98%), but the deduced amino acid was only 92% identical. The deduced protein contained a putative ATP-binding site, putative leucine domains, a Glu-5-kinase domain, a putative NADPH-binding domain, a conserved GSA-DH domain and a feedback inhibition site. Besides, there were differences in the Glu-5-kinase domain from the reported deduced amino acid sequence of P5CS (ABM30223), but less for the P5CSs from rice (Oryza sativa) and wheat (Triticum aestivum). So we believe this gene to be a new gene of sugarcane P5CS.

【题目】Effect of long-term vinasse application on physical properties of soil in sugarcane fields
【中文关键词】酒精发酵液;土壤物理特性;蔗地
【英文关键词】vinasse; soil; physical properties; sugarcane field

【中文摘要】为研究蔗地施用酒精发酵液对土壤物理学肥力特性的影响,2005~2007、2006~2007年分别在广西扶绥县昌平甘蔗试验基地两个点连续进行清水105.0 t/ha(CK)、习惯施肥+清水105.0 t/ha(CF)和酒精发酵液75.0 t/ha +清水30.0 t/ha处理试验。结果表明,在蔗地连续2~3年施用酒精发酵液,蔗地耕层土壤容重下降,总孔隙度和毛管孔隙度增加,土壤水稳性团聚体含量提高,土壤粘粒含量下降,蔗地土壤物理肥力特性得到改善,蔗地土壤未见板结。

【英文摘要】To study the effects of vinasse application on physico-chemical properties of soil, different treatments viz.,(i) spraying water @105.0 t/ha (CK),(ii) conventional fertilization+spraying water @ 105.0 t/ha (CF) and (iii) soil applicationof vinasse @ 75.0 t/ha + spraying water @ 30.0 t/ha, have been applied in two sugarcane fields in Fusui County,Guangxi, during 2005-2007 and 2006-2007, respectively. The results showed that, after 2-3 years of continuous vinasse application to sugarcane fields, the soil bulk density declined, while the total porosity and capillary porosity increased in the plow layer of soil. The soil water stable aggregate content enhanced, but the soil clay content decreased. The vinasse application in sugarcane field resulted in improved physical properties of soil and soil hardening was not detected in the field.

Agro-pastrol ecotone

【中文摘要】Effects of grassland conversion to cropland and forest on soil organic carbon (SOC), dissolved organic carbon(DOC) in the farming-pastoral ecotone of Inner Mongolia were investigated by direct field sampling.SOC content and DOC content in soil decreased after grassland were shifted to forest or cropland, in thesequence of grassland soil > forest soil > cropland soil. SOC stock declined by 18% after grassland shiftedfrom to forest. Reclamation of cropland for 10 years, 15 years and 20 years lost SOC in 0 – 30 cm soil layer,by 34%, 14% and 18%, respectively, compared with that of grassland. DOC in 3 soil layers was within 21.1 – 26.5 mg/L in grassland, 12.1 – 14.6 mg/L in forest soil, and 8.0 – 14.0 mg/L in cropland soil. Correlation analysisindicated that SOC content and DOC content were positively dependent on total nitrogen content($p < 0.05$), but negatively on bulk density or land use type ($p < 0.05$). DOC was positively correlatedSOC ($p < 0.01$). Moreover, SOC content could be quantitatively described by a linear combination of landuse types ($p = 0.000$, $r2 = 0.712$), and DOC content by a linear combination of two soil-related variables,land use types and SOC ($p = 0.000$, $r2 = 0.861$).

【题目】Current Situation and Prospect of GrasslandManagement Decision Support Systems in China

【中文关键词】3S(GIS,RS and GPS) and virtual technology
【英文关键词】3S(GIS,RS and GPS) and virtual technology

【中文摘要】China, with wide grassland areas of the second rank throughout theworld, is faced with a severe challenge on how to manage its vast anddegenerating/degenerated grassland. Computer and network technologies aremore and more widely applied in grassland production, research and education,which is just a greatly encouraging field. Tremendous achievements have beenmade in grassland management decision support system (GMDSS) research indeveloped countries at present, but there is still a long way to obtain a greatdevelopment for developing countries, such as China. This paper reviewed theresearch progress and current situation in the GMDSS research and application in China. Concept models and empirical models are still hugely focused on the corresponding research fields in China, but the integrated GMDSS has not been well developed. Therefore, Chinese scientists must develop the integrated models from the existing models, and accordingly sinicize the GMDSS of models used in the developed countries for availably application. In the other hand, there is a same direction of research and development about the GMDSS not only for developed countries but also for China, which is going to be combined with internet, 3S (GIS, RS and GPS) and virtual technology.

【英文摘要】China, with wide grassland areas of the second rank throughout theworld, is faced with a severe challenge on how to manage its vast anddegenerating/degenerated grassland. Computer and network technologies aremore and more widely applied in grassland production, research and education,which is just a greatly encouraging field. Tremendous achievements have beenmade in grassland management decision support system (GMDSS) research indeveloped countries at present, but there is still a long way to obtain a greatdevelopment for developing countries, such as China. This paper reviewed theresearch progress and current situation in the GMDSS research and application in China. Concept models and empirical models are still hugely focused on the corresponding research fields in China, but the integrated GMDSS has not been well developed. Therefore, Chinese scientists must develop the integrated models from the existing models, and accordingly sinicize the GMDSS of models used in the developed countries for

availably application. In the other hand, there is a same direction of research and development about the GMDSS not only for developed countries but also for China, which is going to be combined with internet, 3S (GIS, RS and GPS) and virtual technology.

【题目】Effects of land use and land cover change on ecosystem service valuesin oasis region of northwest china
【中文关键词】remote sensing; LUCC; ecosystem service values; mountain – oasis-desert system; arid region; Qiemo oasis; China
【英文关键词】remote sensing; LUCC; ecosystem service values; mountain – oasis-desert system; arid region; Qiemo oasis; China
【中文摘要】Ecosystem services are “ the benefits of nature to households, communities, and economies ”, which can be obtained directly or indirectly from ecosystem structure, functions or process. Land use and land cover change (LUCC) directly affects ecosystem functions and ecosystem service values with far-reaching consequences. Located in a typical Mountain-Oasis-Desert System of arid region, Qiemo oasis is one of the most important oases in Tarim River Basin,China. Taking Qiemo oasis as a case study, this paper analyzed land use and land cover change from 1989 to 2004 using remote sensing images of 1989 and 2004. Furthermore, based on Chinese ecosystem service values of unit area of different ecosystem types, the dynamic changes of ecosystem services value caused by LUCC were evaluated. Theresults indicated that the area of forest, Gobi desert and Salina land decreased from 1989 to 2004. On the other hand, the area of farmland, water land and building land increased, in which the forest land and farmland changed the most. Area of forest land decreased 41.73% and farmland increased 58.04%. The total ecosystem services value had decreased from 22 265 104 US$ to 21 373 104 US$ during the past 15 years. The reduction of forest land was responsible for the reduction of the ecosystem service value. Population increasing and economic development were main driving forces forthese changes. At last, some measures were put up for a sustainable development in this region.

【题目】Landscape pattern dynamic change analysis based on eco-hydrological process in the lower reaches of Tarim River, China
【中文关键词】Eco-hydrological process, emergency water transportation, landscape pattern, remote sensing, lowers reaches of Tarim River, China
【英文关键词】Eco-hydrological process, emergency water transportation, landscape pattern, remote sensing, lowers reaches of Tarim River, China
【中文摘要】Landscape pattern and eco-hydrological process had changed greatly after seven times emergency water transportation in the lower reaches of Tarim River, Xinjiang, China. After analyzing the changes of eco-hydrological process, ground water level, soil moisture and vegetation growth etc. of emergency water transportation, remote sensing images in 2000 and 2005 year which present the situation before and after the emergency water transportation were processed and dynamic change characteristics of landscape pattern were analyzed. The changes of landscape pattern were described as follows: The forest land, waters, farmland and construction landscape area increase, and forest land increases the biggest, which increased by 23.03% during last 5 years. Waters landscape change is only inferior to forest land, which increased by 16.04%. The lawn, sand and Gobi saline-alkali land landscape area reduced; lawn and farmland had made the biggest contribution to the increase of forest land by 6.46% and 4.79% in the year 2005. Landscape diversity index, evenness index, fractal dimension and general fragmentation increased, but dominance index reduced. The results indicate that RS plays the vital role in the macroscopic dynamic change analysis of landscape pattern and seven times emergency water transportation has greatly influenced eco-hydrology process and landscape pattern changes in the lower reaches of Tarim River.

【题目】An Intelligent Inter Database Retrieval System Based on Multi-agent
【中文关键词】Inter Database Retrieval; Search Engine; Interface Agent; Cooperation Agent; Meta data
【英文关键词】Inter Database Retrieval; Search Engine; Interface Agent; Cooperation Agent; Meta data
【中文摘要】This paper demonstrates the design of inter database retrieval system based on Multi-Agent. Interface agent, cooperation agent, collection agent, retrieval agent are used to realize intelligence in this system. A mobile agent is adopted to communicate with other agents. They coordinate with each other to complete retrieval tasks. The system is an important research project in the field of Web database retrieval. It can meet the user ’ s demand of inter database retrieval. At the same time the hotspot issues in the system are studied and discussed.

【题目】海南省槟榔主要病害调查研究
【中文关键词】海南省;槟榔;病害调查;鉴定
【英文关键词】Hainan;Arecanut;Diseases Investigation;Identification
【中文摘要】2007-2009年在海南省琼海、万宁、陵水、三亚、屯昌、文昌等地槟榔主要种植区,对目前槟榔生产上的主要病害种类及其发生情况进行了调查研究。结果共采集到槟榔病害标本140余份,对主要病害病原进行分离培养,并在显微镜下以形态特征为主进行鉴定,共鉴定出8种主要病害,其中危害最严重的病害为黄化病,其它7种病害为炭疽病、细菌性条斑病、藻斑病、煤烟病、大茎点霉叶斑病、镰刀菌根腐病和生理性黄化病。
【英文摘要】The varieties and occurrence of major diseases from main arecanut planting areas of Hainan Province, such as Qionghai, Wanning, Lingshui, Sanya, Tunchang, Wenchang, were investigated and studied. The results showed that 8 main diseases were identified and studied from 140 specimens. The most serious disease was yellow leaf disease, other minor diseases were anthracnose, bacterial leaf stripe, red rust, dark mildew, Macrophoma leaf spot, Fusarium root rot and physiological yellow leaf.

【题目】Effects of fiber wax and cellulose content on colored cotton fiber quality
【中文关键词】彩色棉 蜡质含量 纤维素含量 纤维品质

【英文关键词】Colored cotton ; Cellulose content ;Fiber quality Wax content
【中文摘要】通过对48个彩色棉品种(系)及F1代材料的蜡质、纤维素含量,纤维品质等测定和分析,结果表明同一色泽彩色棉品种间蜡质、纤维素含量和衣分没有显著差异,但在不同色泽的彩色棉品种间则有极显著差异。绿色棉蜡质含量是白色棉的5-8倍, 棕色棉中,纤维色泽越深,蜡质含量越高,深棕色棉的蜡质含量为白色棉的2倍,白色棉蜡质含量最低。然而,纤维素含量以白色棉最高,棕色棉其次,绿色棉含量最低。彩色棉不同品种间的纤维长度、强度和纤维整齐度有极显著差异,不同色泽的彩色棉间也有极显著差异。彩色棉的纤维素含量与蜡质含量和伸长率都呈极显著负相关,与衣分、铃重、纤维长度、纤维强度、纤维细度和纤维整齐度都呈极显著正相关。本实验通过彩色棉蜡质和纤维素含量等的研究,为彩色棉的品种选育和分子生物学的研究提供科学的依据,将有助于彩色棉纤维及其纺织品的色泽稳定性的提高。
【英文摘要】Forty-eight colored cotton lines and hybrids were studied on the wax, cellulose content and fiber quality. The result were as follow: The wax content of green cotton was five to eight times greater than that of white cotton. As for the brown cotton lines, the darker the brown fiber color, the greater the content of the fiber wax. The wax content of dark brown cotton was two times greater than that of white cotton. However, the content of the cellulose of white cotton was the greatest, next was that of the brown cotton, and the content of the cellulose of green fiber was the lowest. There were differences in fiber length, fiber strength, and fiber uniformity, not only among different varieties with the same color fiber,but also among different coloring types. The content of cellulose had a significantly negative correlation with the content of wax and fiber elongation, but significantly positive correlations between the content of cellulose and fiber length, fiber strength, fiber fineness, lint index, boll weight, and fiber uniformity were observed in the color cotton lines used in this experiment. The study on wax and cellulose contents will give constructive advice for the breeding and molecular research of the colored cotton, and help increasing the color stability of the fiber and its textiles.

【题目】Mutation in the porcine SERPINA7 gene and its association with boar fertility
【中文关键词】SERPINA7;公猪繁殖性状;起源
【英文关键词】SERPINA7;boar fertility;origin
【中文摘要】Serpina7是X染色体影响睾丸重QTL的一个位置候选基因,本研究搜寻了Serpina7基因的SNP,分析了SNP位点与睾丸重、附睾重的关联性。研究结果对了解Serpina7基因的功能具有重要作用。
【英文摘要】The porcine SERPINA7 gene is considered as a positional candidate gene responsible for testis size for its location on X chromosome and its biologically critical role in the development of testis. A nonsynonymous polymorphism (His226Asn or C678A) in the ligand-binding domain of SERPINA7 has been identified, which alters SERPINA7' s affinity to thyroxine and is closely associated with testis size. In this study, a primer mutagenesis strategy was developed to genotype this polymorphism in Chinese indigenous pigs and some western commercial pigs. The C allele existed in all tested Chinese indigenous and wild pigs, while the A allele is specific for western commercial breeds, indicating the occurrence of the mutation is of western origin. The correlation of this polymorphism with different boar fertility traits was assessed using a White Duroc × Erhualian intercross which included 110 F2 mature boars. The results showed that the C678A polymorphism was closely associated with testis weight and epididymis weight($P<0.0001$ and $P = 0.0016$, respectively) with significant heavier testis weight and epididymis weight in boars carrying the A allele than boars with the C allele. A significant correlation was also observed between this polymorphism and total sperm in the ejaculate ($P<0.01$) as well as semen volume ($P<0.05$). No statistically significant association of the C678A polymorphism with sperm concentration and sperm motility was found.

【题目】Maternal infanticide in sows: Incidence and behavioural comparisons between savaging and non-savaging sows at parturition
【中文关键词】猪;攻击行为;F2资源家系;母性行为
【英文关键词】Pig; Savaging; F2 resource family; Maternal behaviour
【中文摘要】本研究测定了200多头F2母猪分娩前后的母性行为,分析了杀婴行为的发生率,比较了杀婴行为母猪和正常 母猪分娩前后母性行为的差异。本研究结果对了解不同母猪母性行为的差异具有重要意义。
【英文摘要】Aggressive behaviour by newly farrowed sows towards their own offspring, known as savaging, occurscommonly in the domestic pig, with a significant impact upon both the agricultural economy and animalwelfare. The aims of this study were to investigate the incidence and nature of this behaviour and to compareother behaviours between savaging and non-savaging sows around parturition in 226 F2 sows that wereproduced by two highly divergent pig breeds of Chinese Erhualian and western Duroc with significantlygenetic difference on maternal behaviours and were raised at three different pig farms. Each of these sowswas housed in individual 2 m 2.5 m pens with concrete floors. Three kilograms of fresh straw wasprovided to sows before parturition. Behaviour observations were made from 5 h before parturition to 24 hafterward using real time 1:0 sampling. Savaging sow was defined as an apparently deliberate attack on oneor more piglets that resulted in the death, by biting, of at least one piglet. The incidence of savaging was:farm 1, 10.7% in gilts (n = 103) and 5.3% at the second farrowing (n = 94); farm 2, 14.6% (n = 48) and6.25% (n = 16), respectively; farm 3, 6.8% (n = 44) at the second farrowing and 3.2% (n = 31) at the thirdfarrowing. The incidence of savaging tended to be higher in gilts (P = 0.058) although some savaging gilts were killed before their second litters. There was no effect of the different farms on incidence of savaging.Prepartum nest building behaviours were not a predictor for savaging, but savage sows had a greaterfrequency of posture change from before parturition through the expulsive phase. This restlessness includedan increase in rearing behaviour and a reduced ability to lie down carefully without endangering piglets.Wesuggest that savaging is part of a more generalized behavioural pathology that includes increasedexcitability and is not specifically piglet directed.

【题目】FosB基因在白色杜洛克×二花脸资源家系中的遗传变异及其与分娩母猪母性行为的相关性
【中文关键词】FosB基因;母性行为;遗传变异;相关性
【英文关键词】FosB;maternal behavior;genetic variation;association
【中文摘要】本研究根据FBJ骨肉瘤原癌基因同源物B(FosB)在动物母性行为发生过程中的重要作用,选择其作为影响母猪母性行为的候选基因,以白色杜洛克×二花脸F2资源群体为材料,分析了FosB基因在此群体中的遗传变异及其与分娩母猪母性行为的相关性。采用PCR产物直接测序法搜寻了FosB基因488、806 bp 2个片段的单核苷酸多态位点(SNPs),鉴别到FosB-EU163403一g.187A> T,FosB-EU163403一g.188A> C和FosB-EU163403一g.297C~G 3个SNPs。采用PCR—Mbi I-RFLP法分析了G297C位点在资源群体中的多态及与母猪母性行为的相关性。传递不平衡检测(TDT)表明该多态位点与母猪杀婴行为、衔草做窝、哺乳、踩仔猪、压仔猪等母性行为均无显著相关性(P>o.364)。FBAT分析结果也证实了这一点(P>O.236)。考虑到母性行为属于复杂性状,可能由微效多基因控制,因此有必要在更大规模群体进行分析或搜寻其他候选基因的突变位点。
【英文摘要】In this study,FosB was chosen as a candidate gene affecting SOW maternal behaviorsfor its important role on process of animal maternal behaviours. Genetic variations of FosB andtheir association with SOW maternal behaviours were analyzed in a W hite Duroc× Erhualian resourcepopulation.Single nucleotide polymorphisms(SNPs) were screened in two FosB ampliconsof 488 and 806 bp by directly sequencing the PCR products.Three SNPs including FosB—EU163403一g.187A> T,FosB-EU 163403一g.188A~ C and FosB—EU163403一g.297C> G were iden—tifed.The association of the g.297C~ G polymorphism with SOW maternal behaviours was evalu—ated in the W hite Duroc× Erhualian intercross using PCR—M bi I~RFLP.Transmittion disequilibri—um test(TDT)results showed that there was no significant association between this polymor—phism and SOW maternal infanticide,nest building,nurturing,piglets squashing and trampling(P> 0.364).The result was confirmed by Family—Based Association Tests(FBAT,P>

0.236).Considering that maternal behaviours are complex traits and controlled by polygene,further anal—ysis in a larger population and(or)in other candidate genes are worthwhile

【题目】Characterization of the porcine Kisspeptins receptor gene and evaluation as candidate for timing of puberty in sows
【中文关键词】初情期;KISS1R;猪
【英文关键词】age at puberty; KISS1R; pig
【中文摘要】本研究分离了猪KISS1R基因全长DNA和cDNA序列,搜寻了SNP,使用RT-PCR技术分析了KISS1R基因在不同发情时期母猪卵巢中的表达差异,分析了SNP位点与母猪初情期的关联性。本研究结果对了解KISS1R基因的的功能具有重要作用。
【英文摘要】Kisspeptins receptor (KISS1R), also called GPR54, is a key regulator of puberty in many species. KISS1R and its genetics in pigs remain unexplored. The objective of this study was to characterize the porcine KISS1R gene and evaluate the association of KISS1R mutations with age at puberty in sows. KISS1R was assigned to pig chromosome 2q21-24 by radiation hybrid mapping. It has a 1438 bp full-length cDNA and spans 3349 bp genomic sequence consisting of five exons and four introns. Semi-quantitative RT-PCR showed that KISS1R transcripts was particularly abundant in the adrenal, prostate, testis, thymus, pituary and hypothalamus. KISS1R mRNA content in the hypothalamus was determined by real-time quantitative RT-PCR, and it fluctuated during the oestrous cycle with the highest level in the luteal phase. Anoestrus sows had markedly lower hypothalamic KISS1R mRNA content than cyclic animals. Seven KISS1R SNPs were identified in the founder animals of a White Duroc x Erhualian intercross. One missense mutation (T/C(245)) showed quite different allele distribution in Chinese and Western breeds. All F(0), F(1) animals and 367 detailed phenotyped cyclic F(2) sows in the White Duroc x Erhualian intercross were genotyped for three KISS1R polymorphisms. No significant association of KISS1R haplotypes and haplotype pairs with age at puberty was observed in the resource population, indicating that mutations in KISS1R are not responsible for divergent age at puberty in White Duroc and Erhualian pigs.

【题目】Genome—wide identification of QTL for age at puberty in gilts using a large intercross F2 population between White Duroc × Erhualian
【中文关键词】初情期;数量性状位点;白色杜洛克;二花脸
【英文关键词】age at puberty;quantitative trait loci ;White Duroc;Erhualian
【中文摘要】本研究测定了454头F2母猪的初情期,使用183个微卫星标记进行了母猪初情期QTL定位。结果在SSC1和SSC7染色体分别定位了1个1%基因组显著水平和0.1%基因组显著水平影响母猪初情期QTL,在SSC8、SSC17分别定位了一个建议水平QTL。本研究结果对了解母猪初情期遗传机制具有重要意义。
【英文摘要】Puberty is a fundamental development process experienced by all reproductivelycompetent adults, yet the specific factors regulating age at puberty remain elusive inpigs. In this study, we performed a genome scan to identify quantitative trait loci (QTL)affecting age at puberty in gilts using a White Duroc X Erhualian intercross. A total of183 microsatellites covering 19 porcine chromosomes were genotyped in 454 F2 gilts andtheir parents and grandparents in the White Duroc X Erhualian intercross. A linearregression method was used to map QTL for age at puberty via QTLexpress. One1% genome-wise significant QTL and one 0.1%

genome-wise significant QTL weredetected at 114 cM (centimorgan) on SSC1 and at 54 cM on SSC7, respectively.Moreover, two suggestive QTL were found on SSC8 and SSC17, respectively. This studyconfirmed the QTL for age at puberty previously identified on SSC1, 7 and 8, and reportsfor the first time a QTL for age at puberty in gilts on SSC17. Interestingly, the ChineseErhualian alleles were not systematically favourable for younger age at puberty.

【题目】A genome scan for quantitative trait loci affecting male reproductive traits in a White Duroc × Chinese Erhualian resource population
【中文关键词】公猪;数量性状位点;繁殖性状
【英文关键词】boar, quantitative trait loci, reproductive trait
【中文摘要】本文报道了在347个F2公猪中睾丸重、睾酮浓度、曲细精管直径和附睾重的QTL定位情况。结果在9条染色体共检测到16个QTL,包括X染色体1%基因组显著水平影响睾丸重和附睾重QTL,SSC1和SSC16分别影响睾丸重、附睾重5%基因组显著水平QTL。本文研究结果对了解公猪性腺发育的遗传机理具有重要作用。
【英文摘要】Chinese Erhualian boars have dramatically smaller testes, greater concentrations of circulating androgens, and fewer Sertoli cells than Western commercial breeds. To identify QTL for boar reproductive traits, testicular weight, epididymal weight, seminiferous tubular diameter at 90 and 300 d, and serum testosterone concentration at 300 d were measured in 347 F(2) boars from a White Duroc x Chinese Erhualian cross. A whole genome scan was performed with 183 microsatellites covering 19 porcine chromosomes. A total of 16 QTL were identified on 9 chromosomes, including 1% genome-wide significant QTL for testicular weight at 90 and 300 d and seminiferous tubular diameter at 90 d on SSCX, and for epididymal weight and testosterone concentration at 300 d on SSC7. Two 5% genome-wide significant QTL were detected for testicular weight at 300 d on SSC1 and seminiferous tubular diameter at 300 d on SSC16. Nine suggestive QTL were found on SSC1, 2, 3, 5, 7, 13, and 14. Chinese Erhualian alleles were not systematically favorable for greater reproductive performance. This study confirmed the previous significant QTL for testicular weight on SSCX and for epididymal weight on SSC7, and reported QTL for seminiferous tubular diameter and testosterone concentration at the first time. The observed different QTL for the same trait at different ages reflect the involvement of distinct genes in the development of male reproductive traits.

【题目】Quantitative trait loci for traits related to sperm quality and ejaculation in a White Duroc × Erhualian intercross
【中文关键词】QTL;精液品质;射精;猪
【英文关键词】QTL, Semen quality, Ejaculation, Pig
【中文摘要】本文在白色杜洛克X二花脸F2资源群体中进行了射精量、精子密度、精子活力、精子畸形率等公猪繁殖性状的QTL定位,结果共检测到18个QTL,本文研究结果第一次在大规模的公猪群体中进行了繁殖性状的QTL定位。对后续的公猪繁殖性状遗传学研究奠定了基础。
【英文摘要】To identify quantitative trait loci (QTL) for traits related to semen and ejaculation, phenotype data including semen volume, sperm concentration, total sperm per ejaculate, sperm motility, sperm abnormality rate, semen pH value, ejaculation times and ejaculation duration were measured on 206 F(2) boar at 240 days in a White Duroc x Erhualian intercross. A genome-wide scan was

performed and the entire White Duroc x Erhualian intercross was genotyped for 183 microsatellite markers covering the whole pig genome. QTL analysis was performed using a composite regression interval mapping method via QTLExpress. A total of 18 QTL were detected, including 4 genome-wide significant QTL each for semen pH on pig chromosome (SSC) 2 and SSC12, for semen volume on SSC15, and for ejaculation times on SSC17. Fourteen suggestive QTL were found on SSC1, 2, 3, 4, 6, 9, 17 and 18. To our knowledge, this is the first report about the QTL for semen and ejaculation traits in pigs, providing a start point to decipher the genetic basis of these complex traits.

【题目】Quantitative trait loci for porcine baseline erythroid traits at three growth ages in a White Duroc × Erhualian F2 resource population
【中文关键词】QTL,红细胞计数,F2资源家系
【英文关键词】QTL,Baseline erythroid,F2 resource population
【中文摘要】本研究在F2资源群体中进行了多个发育阶段血液生理指标的测定,利用微卫星标记进行了全基因组扫描和QTL定位,结果共定位到了101个影响红细胞压积、血红蛋白含量、平均红细胞宽度,平均红细胞体积、平均血红蛋白含量等多个生理指标的QTL,其中46个QTL达基因组显著水平。本研究结果对了解血液生理指标的遗传特性具有重要意义。
【英文摘要】Baseline erythroid indices are increasingly involved as risk factors for common complex diseases in humans. However, little is known about the genetic architecture of baseline erythroid traits in pigs. In this study, hematocrit (Hct), hemoglobin (Hgb), mean corpuscular hemoglobin (MCH), mean corpuscular hemoglobin concentration (MCHC), mean corpuscular volume (MCV), red blood cell (RBC), and red cell distribution width (RDW) were measured in 1420 (day 18), 1410 (day 46), and 1033 (day 240) F2 pigs from a White Duroc × Erhualian intercross resource population. The entire resource population was genotyped for 183 microsatellite loci across the pig genome, and the quantitative trait loci (QTL) analysis was performed for all erythroid-related traits measured with QTL Express based on a least-squares method. A total of 101 QTL, including 46 genome-wide significant QTL and 55 chromosome-wide significant QTL, regulating erythroid traits were found on all pig chromosomes (SSC) except for SSC15 and SSC18. The genome-wide significant QTL were mainly localized on SSC1, 7, 8, 10, and X. These results confirmed most of QTL previously identified in the swine. More importantly, this study detected age-specific QTL for baseline erythroid traits in pigs for the first time. Notably, the QTL for MCV and MCH on day 18 on SSC8 with small intervals of 3 and 4 cM, respectively, provided a good starting point for identifying causal genes underlying MCV and MCH in the future.

【题目】猪精子黏合分子1(SPAM1)基因在白色杜洛克×二花脸F2资源群体中的遗传变异及其与母猪产仔数的关联性
【中文关键词】SPAM1 基因;SNPs;单倍型;产仔数;猪
【英文关键词】SPAM1; SNPs; haplotype; litter size; pig
【中文摘要】【目的】猪精子黏合分子1(SPAM1)基因在精卵结合过程中发挥重要作用,是影响产仔数的重要候选基因。本试验分析SPAM1 基因的遗传变异及其与母猪产仔数的相关性。【方法】以305 头白色杜洛克×二花脸资源群体F2 母猪为材料,记录连续3 胎的产仔性状,利用PCR-RFLP 检测intron1 g298 C>T 、intron1 g357 C>T 和intron3 g380 C>T 共3 个SNP 位点在F2 群体中的多态性,构建单倍型,分析各SNP 基因型和单倍型与母猪产仔数、产活仔数、产死胎数的相关性。【结果

】intron1 g298 C>T 位点CC 型母猪的总产仔数显著低于CT、TT 型母猪(P<0.05),CT 基因型母猪产死胎数显著多于TT 型(P<0.05)。intron1 g357 C>T 位点CT 基因型母猪产死胎数显著多于CC、TT 基因型(P<0.05)。intron3 g380 C>T 位点CC 基因型母猪产活仔数显著低于CT 型,产死胎数显著高于CT 型(P<0.05)。在6 种单倍型中,TTT 单倍型母猪的总产仔数和产活仔数明显高于其它5 种(P<0.05);TCT、TTC 单倍型母猪产死胎数显著低于CTC、TTT 和TCC(P<0.05)。【结论】SPAM1 基因与母猪产仔数存在显著相关性。

【英文摘要】【Objective】 Porcine sperm adhesion molecule 1 (SPAM1) gene plays an important role in fertilization. It is animportant candidate gene for porcine litter size. In this study, identification of genetic variation of SPAM1 gene and association study with litter size were carried out. 【Method】 Detection of polymorphisms of intron1 g298 C>T, intron1 g357 C>T and intron3 g380C>T and construction of haplotypes were carried out in 305 F2 sows from a white Duroc × Erhualian resource population, whoselitter size was recorded in detail in 3 subsequent parities. Association study of genotypes of each SNP and haplotypes with totalnumber born (TNB), number born alive (NBA) and number stillborn (NSB) was also performed. 【Result】 The results showed that,compared to individuals of CT and TT at SNP intron1 g298 C>T, individuals of CC had significantly less TNB and NBA (P<0.05).Sows of CT had significantly higher number of NSB than sows of TT (P<0.05). For SNP intron1 g357 C>T, the CT sows producedsignificantly more NSB compared to CC and TT individuals. And for SNP intron3 g380 C>T, CC individuals had significantly lessNBA and more NSB than CT individuals. Six haplotypes were constructed in this study. Haplotype TTT showed significantly higherTNB and NBA than the other 5 haplotypes. Individuals of TCT and TTC had significantly less NSB than individuals of CTC, TTTand TCC (P<0.05). 【Conclusion】 SPAM1 gene has significant association with porcine litter size.

【题目】A Genome Wide Detection of Quantitative Trait Loci on Pig Maternal Infanticide Behavior in a Large Scale White Duroc × Erhualian Resource Population

【中文关键词】母性杀婴行为;QTL;母猪;F2资源群体
【英文关键词】Maternal infanticide; QTL; Sow; F2 resource population

【中文摘要】本文利用183个微卫星 标记进行全基因组扫描,利用非参数连锁分析进行了母猪杀婴行为QTL定位,结果在SSC2、SSC16、SSCX等染色体定位到了母猪杀婴行为QTL,其中SSCX的QTL最显著并可能存在多个QTL。本研究对了解母猪杀婴行为遗传机理、母猪杀婴行为候选基因的分离奠定了基础。

【英文摘要】Maternal behavior around parturition is important to piglet survival. An extreme form of failure of maternal behavior, also called maternal infanticide, often occurs in some sows. This is defined as an active attack to piglets using the jaws, resulting in serious or fatal bite wounds within 24 h of birth. It leads to considerable economic losses to the pig industry and severe problems in pig welfare. In this study, maternal behaviors from 5 h before to 24 h after parturition were recorded in detail on 288 White Duroc x Erhualian intercross F(2) sows over their three continuous farrowings. In the F(2) population 12.8% gilts showed maternal infanticide in their first litter, while the incidences of maternal infanticide at their second and third farrowing reduced to 7.5% and 4.5%, respectively. All F(2) sows were genotyped for 194 microsatellite markers spanning the whole pig genome. A whole genome linkage analysis was performed using the non-parametric linkage test by SimWalk2 software. The results identified that seven chromosome regions on SSC2, SSC6, SSC14, SSC15 and SSCX were significantly linked with maternal infanticide ($P < 0.05$). The quantitative trait loci (QTL) on SSC2 and SSCX achieved $P < 0.01$ significance level. The most promising QTLs, however, were detected on X chromosome where three peaks of negative logarithm of P-value located at marker SW980, SW2456 and SW1608. QTLs on SSC2 and SSCX from this experiment were consistent with published results from the Western commercial lines.

【题目】Quantitative trait loci for litter size and prenatal loss in a White Duroc × Chinese Erhualian resource population
【中文关键词】产仔数;死胎数;QTL;数量性状位点;猪
【英文关键词】litter size;pig;prenatal loss;quantitative trait loci
【中文摘要】本文在白色杜洛克X二花脸F2资源群体中进行了母猪产仔数QTL定位,测定了299头F2 母猪的总产仔数、产活仔数、产死胎数等产仔性状,全基因组扫描在SSC5定位到了5% 基因组显著水平影响产活仔数QTL,在SSC6、7、8和15定位到了建议水平总产仔数、产活仔数、产死胎数QTL。本研究对产仔性状的遗传机理研究及提高母猪产子数的遗传改良奠定了基础。
【英文摘要】To detect quantitative trait loci (QTL) for litter size related traits, the total number of born piglets (TNB), the number of born alive piglets (NBA), the number of stillborn piglets (NSB) and the number of mummies (NM) at the first parity were recorded in 299 F2 sows in a White Duroc × Chinese Erhualian intercross resource population. A whole genome scan was performed with 183 microsatellites distributed across 19 porcine chromosomes in the resource population, and the QTL analysis was performed with a least-squares method. A 5% genome-wide significant QTL was detected at 88 cM on pig chromosome (SSC) 15 for NBA, which also showed suggestive effect on TNB. In addition, four suggestive QTL were detected on SSC 6, 7, 8 and 15 for TNB, NBA or NSB. Two of the five QTL detected showed accordance with previous reports. No QTL was found for NM.

【题目】Genome-wide QTL mapping for three traits related to teat number in a White Duroc × Erhualian pig resource population
【中文关键词】乳头数;QTL;F2 资源群体;猪
【英文关键词】teat number; QTL; F2 reource population; pig
【中文摘要】本研究在白色杜洛克X二花脸F2资源群体中定位了乳头数QTL,结果在SSC1, 3, 4, 5, 6, 7, 8 和12定位了11个基因组显著水平影响总乳头数QTL,同时本研究还揭示了左右乳头数不平行传递机理。
【英文摘要】BackgroundTeat number is an important fertility trait for pig production, reflecting the mothering ability of sows. It is also a discrete and often canalized trait presenting bilateral symmetry with minor differences between the two sides, providing a potential power to evaluate fluctuating asymmetry and developmental instability. The knowledge of its genetic control is still limited. In this study, a genome-wide scan was performed with 183 microsatellites covering the pig genome to identify quantitative trait loci (QTL) for three traits related to teat number including the total teat number (TTN), the teat number at the left (LTN) and right (RTN) sides in a large scale White Duroc × Erhualian resource population.ResultsA sex-average linkage map with a total length of 2350.3 cM and an average marker interval of 12.84 cM was constructed. Eleven genome-wide significant QTL for TTN were detected on 8 autosomes including pig chromosomes (SSC) 1, 3, 4, 5, 6, 7, 8 and 12. Six suggestive QTL for this trait were detected on SSC6, 9, 13, 14 and 16. Eight chromosomal regions each on SSC1, 3, 4, 5, 6, 7, 8 and 12 showed significant associations with LTN. These regions were also evidenced as significant QTL for RTN except for those on SSC6 and SSC8. The most significant QTL for the 3 traits were all located on SSC7. Erhualian alleles at most of the identified QTL had positive additive effects except for three QTL on SSC1 and SSC7, at which White Duroc alleles increased teat numbers. On SSC1, 6, 9, 13 and 16, significant dominance effects were observed on TTN, and predominant imprinting effect on TTN was only detected on SSC12.ConclusionThe results not only confirmed the QTL regions from previous experiments, but also identified five new QTL for the total teat number in swine. Minor differences between the QTL regions responsible for LTN and RTN were validated. Further fine mapping should be focused on consistently identified regions with small confidence intervals, such as those on SSC1, SSC7 and SSC12.

【题目】Evaluations of gonad development, spermatogenesis, semen characteristics, libido and serum testosterone levels in White Duroc × Chinese Erhualian crossbred boars
【中文关键词】公猪性腺发育;生精;性欲;血清睾酮浓度;公猪
【英文关键词】Boar Gonad Development;Spermatogenesis;Libido; Serum Testosterone Levels;boar
【中文摘要】本研究在白色杜洛克X二花脸F2资源群体中测定了60、90和300日龄三个阶段的公猪睾丸重、附睾重、生精小管直径。分析了各性状与公猪生精能力的关联性。本研究结果第一次在大规模公猪群体中分析了公猪繁殖器官的发育情况,并了解了繁殖器官的发育与公猪生精能力的关系。
【英文摘要】Chinese Erhualian pigs are known for prolificacy with distinct reproductive traits compared with Western commercial breeds. In this study, a four-generation intercross resource population was constructed using White Duroc boars and Chinese Erhualian sows as founder animals, and a total of 14 male reproductive traits were recorded in 411 F2/F3 boars including the testis and epididymis weights, the seminiferous tubular diameter and spermatogenesis at 60, 90 and 300 days of age, semen characteristics, serum testosterone concentration and libido level at 300 days of age. The White Duroc-Erhualian boars showed remarkable segregations in the traits measured except for the seminiferous tubular diameter and had high ratio (13.9%) of the abnormality of spermatogenesis, providing a good experimental population for detecting quantitative trait loci affecting these male reproductive traits. Furthermore, the correlations among nine male reproductive traits at 300 days of age indicated that the testis weight and the body weight were strongly correlated with the sperm production, supporting the two traits as important parameters for boar selection to increase sperm production and ultimately improve boar fertility. The libido level in the White Duroc-Erhualian boars that was evaluated by a new and easily recorded scoring system showed a significant correlation with serum testosterone concentration. Yet, both libido and serum testosterone concentration were not correlated with the sperm production. Results of this study provided new information on the male reproductive physiology and genetics in Chinese Erhualian and White Duroc boars.

【题目】Quantitative trait loci for porcine white blood cells and platelet-related traits in a White Duroc × Erhualian F2 resource population
【中文关键词】白细胞;血小板;猪;数量性状位点
【英文关键词】leucocyte;pigs;platelet;quantitative trait loci
【中文摘要】本研究在白色杜洛克X二花脸F2 资源群体中定位了白细胞和血小板性状的QTL,结果共定位到了33个影响这些性状的QTL,其中8个QTL达基因组显著水平。本研究结果对了解影响白细胞和血小板数量的遗传机制具有重要意义。
【英文摘要】White blood cell count and platelets are implicated as risk factors for common complex diseases. Genetic factors substantially affect these traits in humans and mice. However, little is known about the genetic architecture of these traits in pigs. To identify quantitative trait loci (QTL) for leucocyte- and platelet-related traits in pigs, the total leucocyte number and differential leucocyte counts including the fraction of basophils, eosinophils, lymphocytes, monocytes, neutrophils, and a series of platelet parameters including platelet count, mean platelet volume, platelet distribution width and plateletcrit were measured in 1033 F(2) animals on 240 days from a White Duroc x Erhualian intercross resource population. A total of 183 informative microsatellites distributed across 19 pig chromosomes (SSC) were genotyped across the entire resource population. Thirty-three QTL were identified

for the examined traits, including eight genome-wide significant QTL for white blood cells and differential leucocyte counts on SSC2, 7, 8, 12 and 15 and six significant QTL for platelet-related traits on SSC2, 8, 13 and X. Erhualian or White Duroc alleles were not systematically associated with increased phenotypic values. These results not only confirmed many QTL identified previously in the mouse and swine, but also revealed a number of novel QTL for the traits recorded. Moreover, it is the first time that QTL for platelet-related traits in pigs have been reported.

【题目】A linkage map of the porcine genome from a large-scale White Duroc × Erhualian resource population and evaluation of factors affecting recombination rates
【中文关键词】交叉;遗传标记;连锁图谱;猪
【英文关键词】crossover;genetic marker;linkage map;pig
【中文摘要】本研究利用分布于全基因组的194个多态微卫星标记,在白色杜洛克X二花脸F2 资源群体中构建了猪遗传图谱,结果显示猪性别平均遗传图谱长度为2344.9 cM,重组率存在显著的性别间差异,同时发现年龄和胎次对重组率影响不显著。
【英文摘要】A porcine genome linkage map composed of 194 microsatellite markers was constructed with a large-scale White Duroc x Erhualian resource population. The marker order on this linkage map was consistent with the USDA-MARC reference map except for two markers on SSC3, two markers on SSC13 and two markers on SSCX. The length of the sex-averaged map (2344.9 cM) was nearly the same as that of the USDA-MARC and NIAI map. Highly significant heterogeneity in recombination rates between sexes was observed. Except for SSC1 and SSC13, the female autosomes had higher average recombination rates than the male autosomes. Moreover, recombination rates in the pseudoautosomal region were greater in males than in females. These observations are consistent with those of previous reports. The recombination rates on each paternal and maternal chromosome of F(2) animals were calculated. Recombination rates were not significantly affected by the age (in days) or parity of the F(1) animals. However, recombination rates on paternal chromosomes were affected by the mating season of the F(1) animals. This could represent an effect of environmental temperature on spermatogenesis.

【题目】催乳素(PRL)和催乳素受体(PRLR)基因在白色杜洛克×二花脸F2资源群体中的遗传变异及其与母猪杀婴行为和产仔数的关联性
【中文关键词】PRLR 基因;PRL 基因;杀婴行为;产仔数
【英文关键词】PRLR; PRL; maternal infanticide; litter size traits
【中文摘要】【目的】研究PRL、PRLR 基因在白色杜洛克×二花脸F2 资源群体中的遗传变异及其与母猪杀婴行为和产仔数的关联性。【方法】PRL 基因的g.1317T>A、g.8905C>T、g.9056C>T 位点,PRLR 基因的g.1217C>T、g.1283C>A、g.1439G>A、g.1528G>A 和g.1600T>A 位点采用SNaPshot 法对资源群体所有F0、F1和288 头F2母猪进行基因型判定,分别利用传递不平衡检测(TDT)和最小二乘法分析这些位点与母猪杀婴行为和产仔性状的关联性。【结果】TDT 分析发现,PRL 和PRLR 基因所有检测SNP 位点,无论基因型还是单倍型均与母猪杀婴行为无显著相关。与母猪产仔数相关性分析表明:PRLR 基因 5 个SNP 位点的基因型及单倍型与总产仔数、产活仔数、产死胎数、断奶仔猪数和断奶窝重均未达到显著相

关;PRL 基因的3 个SNP 位点与母猪的总产仔数和产活仔数达到显著相关(P <0.05),单倍型ACC 个体的总产仔数(P = 0.0005)和产活仔数(P = 0.001)极显著低于其它单倍型个体;单倍型TTT 个体的产活仔数显著高于其它单倍型个体(P = 0.003)。【结论】白色杜洛克×二花脸F2 资源群体中,PRL、PRLR 基因与母猪杀婴行为无关联性,PRL 基因与母猪总产仔、产活仔数显著相关。

【英文摘要】【Objective】 The aim of the experiment is to investigate the genetic variation of porcine prolactin (PRL) andprolactin receptor (PRLR) gene and its association with sow maternal infanticide behavior and litter size in a White Doruc × ErhulianF2 resource population.【Method】 g.1317T>A, g.8905C>T and g.9056C>T of PRL gene and g.1217C>T, g.1283C>A, g.1439G>A, g.1528G>A and g.1600T>A of PRLR gene were genotyped by SNaPshot in the F0, F1 individuals and 288 F2 sows. Theassociation of these SNPs with sow maternal infanticide behavior and litter size was studied by transmission disequilibrium test(TDT) and least square method, respectively. 【Result】 The results of TDT analysis showed that neither alleles nor haplotypes havesignificant associations with maternal infanticide behavior in all genotyped SNP loci of PRL and PRLR gene. The results ofassociation study with litter size showed that there were no significant associations of genotypes and haplotypes of five SNPs ofPRLR gene with total number born (TNB), number born alive (NBA), number still born (NBS), weaning number (WN) and weaninglitter weight (WLW). But to PRL gene, three SNPs genotypes showed significant associations with TNB and NBA (P<0.05).Individuals with haplotype ACC had extremely significant lower TNB (P = 0.0005) and NBA (P =0.001) than those with otherhaplotypes. TTT individuals had significant higher NBA than those of other haplotypes (P = 0.003). 【Conclusion】 PRL and PRLRgene had no significant associations with maternal infanticide behavior, but PRL gene significantly associated with TNB and NBA inthe White Doruc × Erhulian F2 resource population.

【题目】Mapping and Molecular Characterization of Porcine Progesterone Receptor Membrane Component 2 (PGRMC2) gene

【中文关键词】表达量;分子特征;物理图谱

【英文关键词】expression profile, molecular characterization, physical mapping

【中文摘要】本研究分离了猪PGRMC2基因全长DNA和cDNA序列,发现在猪中存在PGRMC2基因的两种转录本,分析了PGRMC2基因在猪12种组织的表达谱,搜寻了基因的SNP。本文报道的结果对了解PGRMC2基因的结构和功能具有重要意义。

【英文摘要】Progesterone plays an important role in sow reproduction by stimulating classic genomic pathways via nuclear receptors and non-genomic pathways via membrane receptors such a progesterone receptor membrane component 2 (PGRMC2). In this work, we used radiation hybrid mapping to assign PGRMC2 to pig chromosome 8 and observed that this receptor has two transcripts in pigs. The full-length cDNA of the large transcript is 1858 bp long and contains a 669-bp open reading frame (ORF) encoding a protein of 223 amino acids. The shorter transcript encodes a protein of 170 amino acids. The porcine PGRMC2 gene consists of three exons 446 bp, 156 bp and 1259 bp in length. The promoter sequence is GC-rich and lacks a typical TATA box. Several putative cis-regulatory DNA motifs were identified in the 208-bp upstream genomic region. Five single nucleotide polymorphisms (SNPs) were detected in introns* and the 3' UTR. RT-PCR indicated that the PGRMC2 gene is expressed ubiquitously in all pig tissues examined.

【题目】A whole genome scan to detect quantitative trait loci for gestation length and sow maternal ability related traits in a White Duroc × Erhualian F2 resource population

【中文关键词】妊娠长度;母性相关性状;QTL;资源群体

【英文关键词】gestation length; maternal ability related traits; QTL; resource population

【中文摘要】本文在200头母猪中分析了产仔数与母猪妊娠长度的关系,进行了母猪妊娠期长度和母性能力的QTL定位。结果发现母猪的妊娠期长度和总产仔数显著相关。在SSC2、8和12定位到了影响妊娠期长度的QTL,其中SSC2上的QTL达基因组显著水平。在SSC3、8和13定位到了建议水平影响母性能力的QTL。本文研究结果对了解母猪妊娠期和母性能力的遗传基础具有重要意义。

【英文摘要】Gestation length and maternal ability are important to improve the sow reproduction efficiency and their offspring survival. To map quantitative trait loci (QTL) for gestation length and maternal ability related traits including piglet survival rate and average body weight of piglets at weaning, more than 200 F2 sows from a White Duroc × Erhualian resource population were phenotyped. A genome-wide scan was performed with 194 microsatellite markers covering the whole pig genome. QTL analysis was carried out using a composite regression interval mapping method via QTL express. The results showed that total number of born piglets was significantly correlated with gestation length ($r = -0.13$, $P < 0.05$). Three QTL were detected on pig chromosome (SSC)2, 8 and 12 for gestation length. The QTL on SSC2 achieved the 5% genome-wide significant level and the QTL on SSC8 was consistent with previous reports. Four suggestive QTL were identified for maternal ability related traits including 1 QTL for survival rate of piglets at weaning on SSC8, 3 QTL for average body weight of piglet at weaning on SSC3, 11 and 13.

【题目】Isolation and molecular characterization of the porcine SLC6A14 gene excludes it as a candidate gene for fat deposition and growth

【中文关键词】关联性;生长和肥育;分子特征;猪;SLC6A14.

【英文关键词】association, growth and fatness, molecular characterization, pig, SLC6A14.

【中文摘要】本文分离了猪SLC6A14基因的全长DNA和cDNA序列,分析了SLC6A14基因在猪各组织中的表达量,搜寻了该基因的SNP,分析了SNP与猪出生重、46日龄重、210日龄重和240日龄重的关联性,本研究结果对了解SLC6A14基因的结构和功能具有重要意义。

【英文摘要】The gene encoding solute carrier family 6 member 14 (SLC6A14) has been considered as a candidate gene affecting human obesity. In this study, full-length cDNA (2237 bp) and DNA sequence (24 541 bp) of the porcine SLC6A14 gene were isolated. The porcine SLC6A14 cDNA contains a 5’-untranslated region of 57 bp, a 3’-untranslated region of 254 bp, and an open reading frame of 1926 bp, encoding a deduced protein of 642 amino acids with a molecular mass of 72. 475 kDa and an isoelectric point of 7.82. The genomic structure of the porcine SLC6A14 gene is similar to mammalian orthologs, particularly in terms of exon size and exon/intron boundaries. It comprises 14 exons and 13 introns. A semi-quantitative RT-PCR showed that the porcine SLC6A14 mRNA expression was tissue-specific. Four SLC6A14 single-nucleotide polymorphisms (SNPs) were identified, and 3 informative SNPs were chosen for genotyping in a White Duroc × Erhualian resource population with phenotype data of growth and fatness traits. The association analysis showed that the c.1438 G>A nonsynonymous polymorphism was associated with birth weight and 21-day body weight ($P < 0.05$), while g.7944 A>T was associated with 46-day body weight. Linkage and radiation hybrid mapping assigned SLC6A14 to a region around SW1522 on SSCXp13, which did not fall in the confidence interval of the quantitative trait locus (QTL) for growth and fatness traits on SSCX in the resource population. These results indicate that SLC6A14 is not a positional candidate gene for the QTL affecting fatness and growth traits in pigs.

【题目】A genome scan for quantitative trait loci affecting the length of small intestine in a White Duroc × Chinese Erhualian intercross resource population. Journal of Animal Breeding and Genetics
【中文关键词】长度;猪;数量性状位点;小肠
【英文关键词】Length;pig;quantitative trait loci;small intestine
【中文摘要】小肠是重要的消化器官,本文在1034头白色杜洛克X二花脸F2个体中测定了小肠长度,利用194个多态微卫星标记进行全基因组扫描和QTL定位,结果在8条染色体共定位了10个影响小肠长度的QTL,其中 SSC2, 4, 7 和8上的QTL达1% 基因组显著水平,在SSC5, 7, 13 和14上的5个QTL达5% 基因组显著水平。本研究结果对了解小肠长度的遗传机制具有重要的科学意义。
【英文摘要】The small intestine is a vital organ in animal gastrointestinal system, in which a large variety of nutrients are absorbed. To identify quantitative trait loci (QTL) for the length of porcine small intestine, phenotypic values were measured in 1034 individuals at 240 d from a White Duroc x Chinese Erhualian intercross F(2) population. The length of small intestine showed strong correlation with growth traits and carcass length in the F2 population. A whole-genome scan was performed based on 183 microsatellites covering the pig genome in the F(2) population. A total of 10 QTL for this trait were identified on 8 pig chromosomes (SSC), including four 1% genome-wide significant QTL on SSC2, 4, 7 and 8, one 5% genome-wide significant QTL on SSC12, and five 5% chromosome-wide significant QTL on SSC5, 7, 13 and 14. The Erhualian alleles were generally associated with shorter length of the small intestine except the alleles on SSC7 and 13. The QTL on SSC4 overlapped with the previously reported QTL for the length of small intestine. Several significant QTL on SSC2, 8, and 12 were consistent with previous reports. The significant QTL detected on SSC7 was reported for the first time. All QTL identified in this study corresponded to the known region significantly associated with growth traits, supporting the important role of the length of small intestine in pig growth.

【题目】A 6-bp deletion in the TYRP1 gene causes the brown colouration phenotype in Chinese indigenous pigs
【中文关键词】因果突变;毛色;全基因组关联;猪;TYRP1
【英文关键词】causal mutation, coat colour, genome-wide association, pig, TYRP1
【中文摘要】本文是国际上首次应用猪60KSNP芯片进行全基因组关联分析,分析藏猪、大河猪和可乐猪红毛的遗传机制,结果发现TYRP1基因的一个6-bp的缺失突变是导致中国地方猪种红毛表型的因果突变。本文的研究结果对了解中国地方猪种毛色表型的遗传机理具有重要意义,对中国地方猪种的开发利用也具有一定的意义。
【英文摘要】Brown coat colour has been described in Chinese-Tibetan, Kele, and Dahe pigs. Here, we report the identification of a causal mutation underlying the brown colouration. We performed a genome-wide association study (GWAS) on Tibetan and Kele pigs, and found that brown colours in Chinese breeds are controlled by a single locus on pig chromosome 1. By using a haplotype-sharing analysis, we refined the critical region to a 1.5-Mb interval that encompasses only one pigmentation gene: tyrosinase-related protein 1 (TYRP1). Mutation screens of sequence variants in the coding region of TYRP1 revealed a strong candidate causative mutation (c.1484_1489del). The protein-altering deletion showed complete association with the brown colouration across Chinese-Tibetan, Kele, and Dahe breeds by occurring exclusively in brown pigs (n=121) and lacking in all non-brown-coated pigs (n=745) from 27 different breeds. The findings provide the compelling evidence that brown colours in Chinese indigenous pigs are caused by the same ancestral mutation in TYRP1. To our knowledge, this study gives the first description of GWAS identifying causal mutation

for a monogenic trait in the domestic pig.

【题目】Correlations between fat depot traits and fatty acid composition in abdominal subcutaneous adipose tissue and longissimus muscle: results from a White Duroc × Erhualian intercross F2 population.
【中文关键词】腹脂;关联性;脂肪沉积;脂肪酸组成;背最长肌;猪
【英文关键词】abdominal subcutaneous adipose tissue, correlation, fat depot trait, fatty acid composition, longissimus muscle, pig
【中文摘要】研究猪肉的脂肪酸组成具有重要的意义,本研究在639F2个体中分析了腹脂、背最长肌中脂肪酸的组成与脂肪沉积的关系。结果发现更肥的猪中具有更高比率的SFA 、 MUFA脂肪酸含量和更低的PUFA脂肪酸含量。
【英文摘要】The aim of this study was to quantify the partial correlation coefficients (r(p)) between fat depot traits (FDT) and the fatty acid composition of abdominal subcutaneous adipose tissue and LM intramuscular fat in 639 F(2) pigs derived from a White Duroc × Chinese Erhualian cross. Fat depot traits are classified into 2 groups: 1 is adipose tissues (abdominal subcutaneous adipose tissue weight, mesenteric adipose tissue weight, perirenal adipose tissue weight, and backfat thickness at 4 locations); the other is LM [intramuscular fat content (IMF) and marbling score]. Correlations of FDT within classification groups were markedly greater ($P < 0.001$) than those observed between the 2 groups ($r(p) = 0.62$ vs. 0.26), indicating variability in fat content of muscle is relatively independent of amount of carcass fat. In general, fatter pigs had greater ($P < 0.05$) proportions of SFA and MUFA, and less PUFA, than leaner pigs. However, the relationships of individual fatty acids with FDT varied. We found that the amounts of some fatty acids regarded as neutral (e.g., stearic acid) or beneficial (e.g., palmitoleic acid and linolenic acid) for human health were associated with smaller amount of adipose tissues, or merely with greater IMF ($P < 0.05$). Therefore, we conclude that increasing the proportions of these neutral or healthy fatty acids can be achieved without reducing the IMF of LM, which is positively related to eating quality.

【题目】High throughput analyses of epistasis for swine body dimensions and organ weights
【中文关键词】体尺;上位效应;高通量;器官大小;猪;QTL
【英文关键词】body dimension;epistasis;high-throughput;organ weight;pig;QTL
【中文摘要】对复杂性状,其遗传机理不仅受微效多基因影响,而且受基因与基因之间的互作影响。本研究分析了17个体尺和器官大小性状的上位QTL。本研究结果对了解复杂性状的遗传机理具有重要意义。
【英文摘要】High throughput analyses were performed to detect epistatic QTL in 17 body dimension and organ weight traits from a large F(2) pig population derived from a White Duroc and Erhualian intercross. The analyses used a nested test framework to handle multiple tests and a combined search algorithm to map epistatic QTL with empirical genome-wide thresholds derived via prior permutation. Alternative statistical models (e.g. including vs. excluding carcass weight as a covariate) were tested to develop an in-depth understanding of the role of epistasis in these kinds of traits. Epistasis signals were detected in only two or three traits under each statistical model studied. The interaction component of each pair of epistatic QTL explained a small proportion (0.7 to 2.1%) of the phenotypic variance in general. About half of the detected epistatic QTL pairs involved one of the two major QTL on porcine chromosomes 7 and 4. In those traits, the Erhualian allele consistently increased the phenotypes for the chromosome 7 QTL but

decreased them for the chromosome 4 QTL. Models including carcass weight as covariate detected epistasis in body dimension traits whereas those excluding carcass weight found epistasis in organ weight traits. In addition, the epistasis results suggested that a QTL on chromosome 14 could be important for a number of organ weight traits. Using the high-throughput analysis tool to examine different statistical models was essential for the generation of a complete picture of epistasis in a whole category of traits.

【题目】The porcine MUC20 gene: molecular characterization and its association with susceptibility to enterotoxigenic Escherichia coli F4ab/ac
【中文关键词】猪;MUC20;易感性;大肠杆菌F4ab/ac
【英文关键词】Pig; MUC20; Susceptibility; ETEC F4ab/ac
【中文摘要】本文分离了猪MUC20基因的全长DNA和cDNA序列,分析了MUC20基因在猪各组织中的表达量,搜寻了该基因的SNP,分析了SNP与与仔猪断奶前大肠杆菌F4腹泻的易感性的关联性,本研究结果对了解MUC20基因的结构和功能具有重要意义。
【英文摘要】Enterotoxigenic Eschoerchia coli (ETEC) F4 is a major cause of diarrhea in neonatal and young pigs. The locus encoding intestinal receptor for ETEC F4ab/ac has been mapped to pig chromosome (SSC) 13q41. We previously assigned mucin 20 (MUC20) to SSC13q41 and considered it a candidate for the ETEC F4ab/ac receptor. In this study, the full-length mRNA sequence of the porcine MUC20 gene was determined, revealing two MUC20 alternative transcripts differing in an 18-bp deletion in the open reading frame (ORF). The longer isoform is 1,927-bp long and contains a 1,572-bp ORF encoding a protein of 523 amino acids. RT-PCR analysis showed that MUC20 mRNA was expressed most highly in the kidney, prostate, epididymis and bladder. Seven single nucleotide polymorphisms in MUC20 were identified in founder animals of a White Duroc × Erhualian cross, and the entire cross population (n = 842) was genotyped for two MUC20 polymorphisms: g.191C>T in intron 5 and c.1600C>T in exon 6. The transmission disequilibrium test (TDT) results revealed that both polymorphisms were significantly associated with in vitro ETEC F4ab/ac adhesion phenotypes in the intercross population, and the most significant association was found between g.191C>T and F4ac adhesion phenotype (P = 1.02 × 10(-9)).

【题目】Association and Haplotype Analysis of Positional Candidate Genes in Five QTL Regions Linked to Sow Maternal Infanticide in a White Duroc × Erhualian Resource Population
【中文关键词】母性杀婴行为;候选基因;F2资源群体
【英文关键词】Maternal infanticide; candidate gene; Sow; F2 resource population
【中文摘要】本研究在白色杜洛克X二花脸F2 资源群体中分析了母猪杀婴行为QTL区域内5个候选基因与母猪杀婴行为的关联性,结果发现EAAT2、ESR2等基因与母猪杀婴行为显著关联。本研究结果对进一步分析母猪杀婴行为的因果基因具有重要意义,为母性好母猪的培育奠定了基础。
【英文摘要】BACKGROUND:Maternal infanticide is an extreme and failed maternal behavior, which is defined as an active attack on piglets using the jaws, resulting in serious or fatal bite wounds. It brings big economic loss to the pig industry and severe problems to piglets' welfare. But little is known about the genetic background of this behavior. Quantitative trait loci (QTL) for maternal infanticide

were identified in a White Duroc × Erhualian intercross by a non-parametric linkage analysis (NPL) in our previous study. In this study, associations of 194 microsatellite markers used in NPL analysis with maternal infanticide behavior were further analyzed by transmission-disequilibrium test (TDT). On this basis, seven genes (ESR2, EAAT2, BDNF, OXTR, 5-HTR2C, DRD1 and GABRA6) at five genomic regions were selected and further analyzed. Associations of single nucleotide polymorphisms (SNPs) and haplotypes in each gene with maternal infanticide behavior were evaluated.RESULTS:Microsatellite markers on pig chromosome (SSC) 2, 13, 15, and X displayed significance at P < 0.05 by both TDT and NPL. Of the seven candidate genes, three ESR2 SNPs had nominal evidence for association (P < 0.05). Allele A at EAAT2 g. 233G > A and allele T at DRD1 g.1013C > G > T also showed evidence of overtransmission to infanticidal sows. In the overall tests of association of haplotypes, candidate genes of ESR2, EAAT2 and DRD1 achieved overall significance level (P < 0.05). Haplotype [A; A; G], [G; A; G], [A; G; G] and [C; C], respectively, from ESR2, EAAT2 and DRD1 showed higher frequencies to infanticidal sows (P < 0.05). Alleles among haplotypes and SNPs which showed an overtransmission to infanticidal sows were from White Duroc.CONCLUSIONS:From association tests of SNPs and haplotypes, ESR2, EAAT2 and DRD1 showed significant associations with maternal infanticide. This result supported the existence of QTL for maternal infanticide behavior on SSC1, SSC2 and SSC16.

【题目】Recombinational landscape of porcine X chromosome and individual variation in female meiotic recombination associated with haplotypes of Chinese pigs

【中文关键词】重组率;单倍型;X染色体;猪

【英文关键词】recombination fraction;haplotype; x chromosome; pig

【中文摘要】本文通过利用细胞遗传图谱、放射性杂交图谱、遗传图谱、X染色体克隆图谱和人X染色体物理图谱的比对,确定了猪X染色体60个标记的最可能位置顺序,发现X染色体平均重组率为1.27 cM/Mb,发现从X染色体中心粒到 Xq21几乎没有重组发生等等。本文首次分析了重组变异与单倍型多态的关系。

【英文摘要】BACKGROUND:Variations in recombination fraction (theta) among chromosomal regions, individuals and families have been observed and have an important impact on quantitative trait loci (QTL) mapping studies. Such variations on porcine chromosome X (SSC-X) and on other mammalian chromosome X are rarely explored. The emerging assembly of pig sequence provides exact physical location of many markers, facilitating the study of a fine-scale recombination landscape of the pig genome by comparing a clone-based physical map to a genetic map. Using large offspring of F1 females from two large-scale resource populations (Large White male symbol x Chinese Meishan female symbol, and White Duroc male symbol x Chinese Erhualian female symbol), we were able to evaluate the heterogeneity in theta for a specific interval among individual F1 females.RESULTS:Alignments between the cytogenetic map, radiation hybrid (RH) map, genetic maps and clone map of SSC-X with the physical map of human chromosome X (HSA-X) are presented. The most likely order of 60 markers on SSC-X is inferred. The average recombination rate across SSC-X is of approximately 1.27 cM/Mb. However, almost no recombination occurred in a large region of approximately 31 Mb extending from the centromere to Xq21, whereas in the surrounding regions and in the Xq telomeric region a recombination rate of 2.8-3.3 cM/Mb was observed, more than twice the chromosome-wide average rate. Significant differences in theta among F1 females within each population were observed for several chromosomal intervals. The largest variation was observed in both populations in the interval UMNP71-SW1943, or more precisely in the subinterval UMNP891-UMNP93. The individual variation in theta over this subinterval was found associated with F1 females' maternal haplotypes (Chinese pig haplotypes) and independent of paternal haplotype (European pig haplotypes). The theta between UMNP891 and UMNP93 for haplotype 1122 and 4311 differed by more than fourteen-fold (10.3% vs. 0.7%).CONCLUSIONS:This study reveals marked regional, individual and haplotype-specific differences in recombination rate on SSC-X. Lack of recombination in such a large region makes it impossible to narrow QTL interval using traditional fine-mapping approaches. The relationship between recombination variation and haplotype polymorphism is shown for the first time in pigs.

【题目】Investigation on in vitro adhesion phenotypes of ETEC strains expressing K99, 987P and F41 fimbriae in pigs of 15 Chinese and Western breeds and a White Duroc × Erhualian intercross
【中文关键词】黏附表型;产肠毒素大肠杆菌;K99; F41;猪
【英文关键词】adhesion phenotypes; enterotoxigenic Escherichia coli; K99; F41; pig
【中文摘要】本文在3个西方商业猪种和12个中国地方猪种6-8周龄的仔猪中系统分析了大肠杆菌 K99(F5), 987P(F6)和F41(F7)黏附表型,发现大多数纯种或杂交仔猪无ETEC K99 和987P菌株的黏附表型,34.9%的纯种仔猪存在F41黏附 表型,65.1%则不存在,和中国地方猪种相比,西方猪种中存在显著高比率的F41黏附表型。本文的研究结果对仔猪断奶前腹泻发生原因和 病理机制具有重要的指导作用。
【英文摘要】OBJECTIVE:To investigate adhesion phenotypes of pigs of Chinese and Western breeds and a specific crossbreed with regard to enterotoxigenic Escherichia coli (ETEC) with fimbrial adhesins K99 (F5), 987P (F6), and F41 (F7).ANIMALS:Purebred 6- to 8-week-old pigs of 3 Western breeds introduced into China (n = 144) and 12 Chinese breeds (148) and 1,330 adult White Duroc-Erhualian crossbred pigs.PROCEDURES:Brush border preparations were prepared from jejunal specimens collected from each pig following euthanasia. Each preparation was incubated with ETEC strains that had fimbrial adhesins K99, 987R or F41; an ETEC K88(-) strain was used as a negative control sample. The mean number of brush border-bound bacteria in aliquots of the bacteria-brush border suspensions (determined via phase-contrast microscopy) was used to determine each pig's adhesion phenotype for ETEC K99, 987R and F41 strains; the phenotype was classified as adhesive (susceptible) if ≥ 10% of examined brush borders bound > 2 bacteria.RESULTS:Most purebred and crossbred pigs had nonadhesive phenotypes with regard to ETEC K99 and 987P strains. For the F41 strain, 34.9% and 65.1% of all purebred pigs had adhesive and nonadhesive phenotypes, respectively; among crossbred pigs, these values were 39.2% and 60.8%, respectively. The percentage of pigs with the F41 adhesive phenotype was higher among Western breeds than it was among Chinese breeds (38.9% vs 31.1%).CONCLUSIONS AND CLINICAL RELEVANCE:Results suggested that the ETEC F41 strain, but not the K99 or 987P strain, might be a cause of diarrhea in 6- to 8-week-old pigs in China.

【题目】浙江居民毒死蜱和氯氰菊酯的长期膳食暴露与风险评估
【中文关键词】膳食暴露;风险评估;毒死蜱;氯氰菊酯;残留;浙江省
【英文关键词】dietary exposure;risk assessment;chlorpyrifos;cypermethrin;residue;Zhejiang province
【中文摘要】基于2007- 2008年浙江省市场销售农产品中毒死蜱和氯氰菊酯残留的监测数据及浙江不同人群的各类食物摄入量和体重数据, 采用分布点评估的方法, 评估了浙江省20个不同年龄、性别组人群毒死蜱和氯氰菊酯的长期膳食暴露风险水平。结果表明, 浙江省不同年龄、性别组人群毒死蜱长期膳食暴露带来的慢性风险仍控制在较低水平范围内, 只有当长期食用毒死蜱残留超过监测资料中的99th百分位点值(蔬菜、水果和大米分别为0.395, 0.165和0. 011m g /kg)的食物时, 才可能产生不可接受的较大风险。而氯氰菊酯的膳食暴露风险更低, 即使长期持续食用的果蔬产品中氯氰菊酯残留都达到监测资料中的最大残留值(蔬菜和水果分别为1. 830和0. 519 mg /kg), 其膳食暴露风险仍属于可接受水平。对膳食暴露的贡献率分析结果显示, 蔬菜类食品仍是浙江居民毒死蜱和氯氰菊酯膳食暴露的主要来源, 控制蔬菜[特别是青菜(g reeng rocery)、芹菜(ce lery)和白菜(Ch inese cabbage)]中毒死蜱和氯氰菊酯残留是降低这2种农药膳食暴露风险的关键。
【英文摘要】Based on the monitoring data of chlorpyrifos and cypermethrin residue in agricultural products in 2007-2008, the intake of varieties of foods and body weight of different population in Zhejiang Province, the long-term dietary exposure risk levels of chlorpyrifos and cypermethrin in 20 different age and sex groups are estimated with the distribution point estimation method. The result showed that the chronic risk level of chlorpyrifos is much low for different age and sex groups in Zhejiang, and the unacceptable risk would be resulted only when the residue exceeding 99th percentile of the monitoring data (vegetable, fruit and rice is 0.395, 0.165 and 0.011 mg/kg, respectively) in long time. The risk level of cypermethrin is lower than chlorpyrifos, and acceptable even the residue of the great mass of his food arrived at maximum of the monitoring data (vegetable and fruit is 1.830 and 0.519 mg/kg, respectively). Vegetable is shown to be main source of dietary exposure of chlorpyrifos and cypermethrin for the residents in Zhejiang province, and the key point to decrease the exposure is to control the residue of chlorpyrifos and cypermethrin in vegetables (especially in greengrocery, celery and Chinese cabbage).

【中文关键词】三唑磷; 稻米; 残留; 加工; 暴露评估; 风险商
【英文关键词】triazophos; rice; residue; processing; dietary exposure assessment; risk quotient
【中文摘要】采用田间喷药、室内模拟加工和气相色谱检测的方法,研究三唑磷在稻米中的残留,蒸煮的影响及其膳食暴露评估。研究结果表明,三唑磷在稻米中的残留量与喷药剂量、次数和间隔期有关,如在推荐剂量时,三唑磷在糙米和精米中的残留量范围分别是0.020~0.214 mg/kg 和0.007~0.074 mg/kg; 而1.5 倍剂量时, 分别为0.041~1.404 mg/kg 和0.01~0.075 mg/kg。淘洗、电饭煲、微波炉和高压锅蒸煮能够降低稻米中三唑磷残留量,与糙米原料的残留量差异显著(p<0.05)。不同蒸煮方式间的影响差异性不显著(p>0.05)。一般是低龄人的膳食风险商高于年龄大的,男性膳食风险商范围为2.71%~68.24%,而女性为2.55%~71.67%。考虑到淘洗和蒸煮因素,风险商降低6.6%~34.1%。糙米中三唑磷残留量高于精米的, 各处理间隔期为60 d 时的残留量低于国家标准(0.05 mg/kg)。淘洗和蒸煮能够降低稻米中三唑磷残留量。通过稻米膳食摄入三唑磷的风险商在安全范围内。
【英文摘要】With the rice sprayed pesticides in field, processing stimulated in lab and detection by gas chromatography(GC-FPD), the residue of triazophos in brown rice and polished rice, the effects of processing and its dietary exposure assessment were studied. The results showed that the residue of triazophos in rice was related with the dose, time and interval. For the recommended dose,the range of triazophos in brown rice and polished rice was 0.020~0.214 mg/kgand 0.007~0.074 mg/kg, respectively; however, for the 1.5 times dose, which was 0.041~1.404 mg/kg and 0.01~0.075 mg/kg, respectively. The elutriating and steaming of rice cooker, microwave oven and autoclave could significantly reduce the residue of tirazophos in brown rice (p<0.05). The effect of different steaming methods on the residue of triazophos insteamed rice was no significant different(p>0.05). The risk quotient value was higher for the youth than for the old,and the max value was about 2.5 times for the min value. The range of risk quotient for the male and the female was 2.7%~68.2% and 2.6%~71.7%, respectively, which would be reduced about 6.6%~34.1%, taken into account of the factor ofelutriating and steaming. The conclusion is that the residue of triazophos in brown rice was higher than in polished rice,which was all below the MRL of 0.05 mg/kg when the pre-harvest interval is 60 d for different treatment, and the elutriating with steaming step could reduce the residue, the risk quotient of its dietary exposure was safe for all the consumers.

【题目】模拟加工对菠菜中农药残留量及膳食暴露评估的影响
【中文关键词】毒死蜱; 氯氰菊酯; 氰戊菊酯; 菠菜加工; 农药残留; 暴露评估
【英文关键词】chlorpyrifos; cypermethrin; fenvalerate; spinach processing; dietary exposure assessment
【中文摘要】采用田间喷药、室内模拟加工和气相色谱检测方法,研究了水洗、漂烫和烘干处理对菠菜中毒死蜱、氯氰菊酯和氰戊菊酯残留量的影响。结果表明: 在田间推荐剂量下,当毒死蜱、氯氰菊酯和氰戊菊酯的有效成分用量分别为0.0388、0.001 和0.01 g /m2 时,经水洗和漂烫处理,菠菜中上述3 种农药的残留量分别降低22.6%、53.8% 和50.8%; 而加倍剂量处理时,则分别降低8.5%、61.4%和40.2%; 烘干处理对毒死蜱的去除作用大于50%,但对氯氰菊酯和氰戊菊酯的去除作用仅为10%左右。对新鲜菠菜和干制菠菜的农药残留量进行膳食暴露评估的结果表明,合理的加工方式可以降低农药膳食摄入估计量的62.1% ~ 76.7%。研究结果表明: 毒死蜱的残留受水洗和漂烫影响较小,受烘干影响较大; 而氯氰菊酯和氰戊菊酯的残留受水洗与漂烫影响较大,受烘干影响较小; 引入加工因子后膳食暴露评估结果更接近真实值。
【英文摘要】The effect of processing of spinach sprayed pesticides in field,processing stimulated in lab and detection by GC on the residues of chlorpyrifos,cypermethrin and fenvalerate and its dietary exposure assessment in spinach were studied. The results showed that washing and blanching step could reduce 22.6%,53. 8% and 50. 8%, respectively for the pesticides mentioned above with recommended dose used in field(which was 0. 0388 g /m2 for chlorpyrifos,0. 001 g /m2 for cpermethrin and 0. 01 g /m2 for

fenvalerate) ,and with double dose which was 8. 5%,61. 4% and 40. 2%,respectively. The air dry step could eliminate the residue above 50% for chlorpyrifos,however,about 10% for cypermethrin and fenvalerate.The dietary exposure assessment was carried out for the residue in the fresh spinach and the dry spinach,respectively,and the processing factor could reduce the dietary intake with the range from 62. 1% to 76.7%. The conclusion is that the loss of pesticide is less affected by washing and blanching,and more affected by dry for chlorpyrifos,however it is on the contrary for cypermethrin and fenvalerate. The dietary intake assessed with processing factor would be greatly reduced,near to the real intake.

【题目】食品中农药残留的风险评估研究进展

【中文关键词】风险评估; 暴露评估; 农药残留; 食品

【英文关键词】risk assessment; exposure assessment; pesticide residue; food

【中文摘要】开展食品中农药残留的风险评估有助于食品安全的风险管理、风险交流和消费者健康。文章综述了欧盟、美国和日本及国际组织有关风险评估的法规基础、评估类型和应用软件研究的最新进展,比较分析了各自的优势与不足。并针对我国风险评估的现状,提出加强职能部门协调、开展风险评估的基础研究和建立相关数据库等建议,为我国食品中农药残留的风险评估提供借鉴。

【英文摘要】Risk assessment for pesticide residue in foods is confirmed to be useful for risk management,risk communication and consumer health. The regulations,types and softwares of risk assessment in EU,USA,Japan and other international organization were reviewed. The advantages and disadvantages of each method were also discussed.Based on the current situation of risk assessment in China,some suggestions were proposed to strengthen the coordination among different regulatory agencies,the fundamental study of risk assessment was carried out,and the relevant database for risk assessment was established,which would provide a useful reference for China to carry out the risk assessment of pesticide residue in food.

【题目】Determination of pesticide residues in complex matrices using multi-walled carbonnanotubes as reversed-dispersive solid phase extraction sorbent
【中文关键词】无
【英文关键词】Complex matrices;GC-MS; Multi-walled carbon nanotubes;Pesticides multi-residue analysis
【中文摘要】无
【英文摘要】A modified quick, easy, cheap, effective, rugged and safe (QuEChERS) method with multiwalledcarbon nanotubes (MWCNTs) as a reversed-dispersive solid-phase extraction(r-DSPE) material combined with gas chromatography-mass spectrometry was developedfor the determination of 14 pesticides in complex matrices. Four vegetables (leek, onion,ginger and garlic) were selected as the complex matrices for validating this new method.This technique involved the acetonitrile-based sample preparation and MWCNTs wereused as the r-DSPE material in the cleanup step. Two important parameters influencingthe MWCNTs efficiency, the external diameters and the amount of MWCNTs used, wereinvestigated. Under the optimized conditions, recoveries of 78 – 110% were obtained forthe target analytes in the complex matrices at two concentration levels of 0.02 and 0.2 mg/kg. In addition, the RSD values ranged from 1 to 13%. LOQs and LODs for 14 pesticidesranged from 2 to 20 mg/kg and from 1 to 6 mg/kg, respectively.

【题目】Simultaneous Determination of Chloroacetanilide Herbicide Residues in Crops with Gas Chromatography-Mass Spectrometry
【中文关键词】无
【英文关键词】Chloroacetanilide herbicides, pesticide, multiresidue, QuEChERS, gas chromatography-mass spectrometry
【中文摘要】无
【英文摘要】A rapid and sensitive method was developed for the simultaneous determination of eightchloroacetanilide herbicides in crops (soybean, rice, and wheat). Herbicides including alachlor,acetochlor, pretilachlor, butachlor, metolachlor, napropamide, diflufenican, and propanil were extracted from samples using a modified QuEChERS method. Acetonitrile containing 0.5% acetic acid was used as extraction solvent, and the extracts were analyzed by gaschromatography-mass spectrometry after being subjected to a simple clean-up procedure usingC18 sorbent instead of the primary – secondary amine (PSA). The average recoveries for all eight herbicides were higher than 80% with relative standard deviations lower than 9% in the spiked concentration range of 16~800 μg kg-1 and limits of detection (LODs) ranged from 1 to 4 μg kg-1. The method was applied to analyze some samples obtained from various sources (fields,markets, and families) and a lower residue level of chloroacetanilide herbicides in crops was found. The results showed that the new method is efficient, sensitive, and effective for monitoring residual chloroacetanilide herbicides in crops.

【题目】Enantiomeric Separation of Triazole Fungicides with 3- μ m and 5- μ m Particle Chiral Columns by Reverse-Phase High-Performance Liquid Chromatography
【中文关键词】无
【英文关键词】enantiomeric separation; triazole fungicide; HPLC; CDMPC; elution order
【中文摘要】无
【英文摘要】This study used chiral columns packed with 3-lm and 5-lm particles to comparativelyseparate enantiomers of 9 triazole fungicides, and Lux Cellulose-1 columns with chiralstationary phase of cellulose-tris-(3,5-dimethylphenylcarbamate) were used on reverse-phasehigh-performance liquid chromatography with flow rates of 0.3 and 1.0 mL min21 for 3-lm and5-lm columns, respectively. The (1)-enantiomers of hexaconazole (1), tetraconazole (4),myclobutanil (7), fenbuconazole (8) and the (2)-enantiomers of flutriafol (2), diniconazole (3),epoxiconazole (5), penconazole (6), triadimefon (9) were firstly eluted from both columns, the elution orders identified with an optical rotation detector didn ' t change with variety of column particles and mobile phases (acetronitrile/water and methanol/water). The plots of natural logarithms of the selectivity factors (ln a) for all fungicides except penconazole (6) versus the inverse of temperature (1/T) were linear in range of 5 – 408C. The thermodynamic parameters (DH8, DS8, DDH8 and DDS8) were calculated using Van ' t Hoff equations to understand the thermosynamic driving forces for enantioseparation. This work will be very helpful to obtain good enantiomeric separation and establish more efficient analytical method for triazole fungicides.

【题目】Stereoselective separation and determination of triadimefon and triadimenol in wheat, straw, and soil by liquid chromatography – tandem mass spectrometry
【中文关键词】无
【英文关键词】Enantioseparation;Environment ; LC-MS/MS ;Triadimefon;Triadimenol
【中文摘要】无
【英文摘要】A sensitive and rapid analytical method was developed for simultaneous determination of triadimefon (TF) and triadimenol (TN) stereoisomers in wheat, straw, and soil by liquid chromatography coupled with triple quadrupole mass spectrometry (LC-MS/MS). The direct enantioseparation of TF and TN was performed on a Lux cellulose-1 column packed with cellulose-tris-(3,5-dimethylphenylcarbamate). The effects of mobile-phase composition on the separation were investigated and stereoisomeric elution orders were confirmed with a polarimeter detector. The pesticides were extracted from samples with acetonitrile and cleaned up by solid-phase extraction or activated carbon. Based on the developed stereoselective LC-MS/MS method, for TF and TN stereoisomers, good linearities were obtained over the concentration range of 0.003-4 mg/L; recoveries were 84.2-102.7% in wheat, 84.0-104.0% in straw, and 85.2-106.8% in soil at spiked concentrations of 0.007-2.0 mg/kg; intra-day and inter-day assay precisions were below 12.2%. Limits of detection (LODs) and limits of quantification (LOQs) in wheat, straw, and soil were 0.001-0.005 mg/kg and 0.007-0.02 mg/kg, respectively. Finally, the method was successfully applied to detect TF and TN stereoisomers in wheat, straw, and soil samples from residual trials in farm.

【题目】方形箱网结构减流效果试验
【中文关键词】养殖网箱; 方形箱网结构; 减流效果
【英文关键词】N/A
【中文摘要】根据降低流速对深水网箱养殖的影响这一需要,依据目前深水网箱的尺寸和渔具模型试验方法,设计并制作一个浮式箱网结构模型,同时进行水槽实验。实验在箱网的尾部设定一系列的断面和测量点, 通过三维流速仪测量各点在不同实验流速下的流速, 通过分析相关数据, 探讨了该箱网减流结构尾部的流速分布和减流效果。实验流速采用了32123cm/ s、50.19 cm/s、67.79 cm/s, 分别相当于实际流速45.58cm/s、70.79cm/s、95.67cm/s。实验测量了减流装置尾部减区域50cm 到125cm 处的流速分布, 相当于实际海域中距离减流装置尾部15 m 到37.5 m 处的流速分布。实验结果显示,箱网尾部的流速减小区域是在网箱网袋与来流垂直的投影面上, 减流百分比在20%- 45% 左右, 而箱网两侧的流速略有增加。从实验结果来看, 这一结构能有效减小流速, 通过合理的设计和在海域中布设, 能够满足深水网箱养殖的减流需要。
【英文摘要】A model square net structure w as desig ned according to the dimension of deep-sea cage. The experiment was carried out in circular f lume. The current velocity w as surveyed using a 3D velocimeters set in front of the st ructure. T he velocities at the posit ions behind the structure w ere also measured using the velocimeters.Then the data w as analyzed, the ef fect of reducing current velocity w as found out. The conclusions are:(1) The area of reducing current is located at the projection of net vertical to the current direct ion.The current velocity of both sides of cage increases a bit .(2) Test ing velocit ies are 32123 cm/s, 50.19 cm/ sand 67.79 cm/s, w hich equal actual velocities 45.58 cm/s, 70.98 cm/s and 95.67 cm/s. The percentage of reducing velocity behind the square net st ructure is betw een 20% and 45% , which is close to the relative collusions.(3) Surveyed range is from 50 cm to 125 cm behind the st ructure, w hich equals actual range from 15 m to 3715 m. The effect of reducing current velocity is apparent.

【题目】圆形重力式网箱不同排布方式受力变化的模型试验
【中文关键词】模型试验; 受力变化; 深水网箱; 排布方式
【英文关键词】Model test; different stress; deep sea-cage; marshalling pattern
【中文摘要】以目前使用较多、主尺度为周长50 m、深8 m 的HDPE 圆形重力式网箱为研究对象, 通过在主尺度为90 m × 6 m ×3 m 的试验水池内的模型试验, 研究其在不同配重、两种排布方式、不同排布间距条件下网箱的受力变化。结果表明: 不论“ 一字形 ”还是“ 田字形 ”排布, 在其它条件相同的情况下, 模型网箱阻力随着箱体配重增加而增大,且随着流速的增加而增大。在其它条件相同的情况下, 除“ 一字形 ”排布的第四只网箱在0%间距排布的模型网箱在高流速下受力大于25%和50%排布间距的受力外, 其它排布的模型网箱阻力均随排布间距的增大而增大。在其它条件相同的情况下, 随着流速的增加, “ 田字形 ”排布第二只网箱受力由小于“ 一字形 ”排布逐渐大于“ 一字形 ”排布。从模型网箱的受力情况分析, “ 一字形 ”排布25%间距的网箱受力最小。
【英文摘要】The HDPE doule-pipe line round gravity cage as made as cage model and made experiments influme tank with the size of 90 m × 6m × 3m, wh ich circum ference was 50m and depth was 8m. The loading of the round gravity cage was researched at different balance weights,different marshalling patterns and differentmarsha lling intervals. The resu lts showed that not only in "一 "model but also in"田" model marshalling patterns, the loadings of the cage respective ly increased a long with increasing the balance weight and the velocity of flow under the definite circum stance. Under the definite circum stance, except for the fourth cage loaded at 0% marshalling intervals was larger than those at 25% and 50% marsha lling intervals for high flow rate, the loadings of the other cages increased a long with increasing marshalling intervals at bo th"一" model and"田" model marshalling pattern.Under the definite circumstance, the load ings of the cage in"田"model mrshalling pattern were first less and then larger than those in"一" modelm arshalling pattern with velocity of flow increasing. From analysis on the loadings of the cage,the loading of 25% marsha lling interval and"一" model marshalling pattern was sma llest.

【题目】不同排布方式圆形重力式网箱容积保持率的模型试验

【中文关键词】模型试验; 容积保持率; 深水网箱; 排布方式
【英文关键词】Model test; volumetric maintenance rate; deep sea-cage; marshalling pattern
【中文摘要】以目前使用较多、主尺度为周长50 m、深8 m 的HDPE 圆形重力式网箱为研究对象, 通过在主尺度为90 m × 6 m × 3 m 的试验水池内的模型试验, 研究其在不同配重、两种排布方式、不同排布间距条件下网箱的容积保持率变化。结果表明: “ 一字型 ” 的网箱排布方式时, 不同的排布间距对第一只网箱的受流影响不大; 第二、第三和第四只网箱由于前一只网箱的减流作用, 网箱间距越小, 其作用越明显, 容积保持率越高。 “ 田字型 ” 的网箱排布方式时, 由于并排网箱产生的涡流的影响, 第一只和第二只网箱在相同流速下其容积保持率较 “ 一字型 ” 排布方式减小, 且网箱排布间距越小, 涡流的作用越明显, 容积保持率越低。模型网箱的容积保持率均随着配重的增加而增加, 高流速下配重的调节作用减弱。根据实验数据以及在实际海上作业情况, 建议 “ 一字型 ” 排布、25%间距方式设置网箱, 可适当增加迎流第一只网箱的配重, 其它网箱建议可采用700 kg配重。
【英文摘要】Present paper dealed w ith the tests concern ing the volumetric maintenance rate of round gravity cages in the different marshalling patterns.The HDPE doub le-pipe line round gravity cages have been used as the cage model,the circumference and depth of each and all were 50 m and 8 m respectively.Test were conducted in the flunk tank with the size of 90 m× 6m × 3 m. The cubical maintenancerate of the cage has been tested at different balance weights, different marshalling patterns and d ifferent marshalling interva ls. The results showed that at "一" shaped model marshalling pattern, the different marshalling interval could slightly in fluence on the cubical maintenance rates of the 1st cage, and then from 2nd to 4th cage, the cubical maintenance rate of them would be increased a long with the decrease of them arshalling interval because of the flow reduced by the anterior one. At "田" shapedmode lm arshalling pattern, the cubical maintenance rates of the 1st and the 2nd cagew ere less than those at "一" shapedmode lmarshalling patterns owing to be effected by eddy from the cages arranged side by side, and decreased a long w ith decrease of marshalling intervals. The cub ical main tenance rates of all cages would be increased with the increase of the balance w eight,but the regulating function of the balance weight would be weakened under the high velocity of the flow. According to the experimental data and actual opera ting state on the sea, it is herew ith suggested to adopt"一" shaped mode lmarshalling pattern and 25% marsha lling interval, the ba lance weight of the first cage could be suitably increased and 700 kg could be used for the balance weight of the other cages.

【题目】波流共同作用下单体网格式锚碇网箱水动力特性研究
【中文关键词】网格式锚碇;波流作用;数值模拟;水动力特性
【英文关键词】grid mooring; wave-current action; numerical simulation; hydrodynamic behaviors
【中文摘要】运用刚体运动学原理和集中质量方法,建立了计算重力式网箱浮架、网衣和锚碇系统受力和运动的数学模型。利用此数学模型获得了波流作用下网箱在网格式锚碇情况下锚碇锚绳受力、浮架运动的计算结果。在此基础上,计算并分析比较了不同设计流速与波况组合作用情况下,单体网箱各类锚绳(锚碇锚绳,连接锚绳和网格锚绳)受力、浮架运动及网衣变形情况。讨论结果表明,在相同工况下,各类锚绳中锚碇锚绳受力最大,连接锚绳受力次之,网格锚绳受力最小。锚碇锚绳、连接锚绳受力随波高、周期、流速的增加有不同程度的增加;网格锚绳受力随波高的增加有一定程度的增加,随流速的增加有较小幅度的减少,与周期变化关系不明显。浮架水平方向运动幅度随波高、周期及流速的增加而有不同幅度的增加;浮架竖直方向运动幅度随波高、周期的增加有不同程度的增加,随流速的增加有较小程度的减小。各种波流工况作用下,浮架倾角随流速的增加有一定程度的减少,随波高的增加有较小程度的增加,与周期变化关系不明显。网衣体积损失率随流速、波高及周期的增加有较小程度的增加。
【英文摘要】In this paper, based on rigid kinematics theory and lumped mass method, a mathematical model of the single grid mooring net cage under combined wave-current action was developed by setting up the motion equations of floating system, net system, mooring system and floaters. According to the model the forces on main ropes and the floating collar movement were calculated and the simulated results agree well with the experimental data. Then, the forces on mooring lines,the floating collar movement and the net deformation were calculated too. The numerical results show that under the same condition, forces on the main ropes are the largest, followed by forces on bridle ropes and grid ropes. Forces on main ropes and bridle ropes increase as the current speed, the height and the period of waves increase; while forces on grid ropes increase as the wave height increase, while decrease as the

current speed increase, and are hardly influenced by the period of waves. The horizontal amplitude of the floating collar increases as the current speed, the height and the period of waves increase; the vertical amplitude increase as the height and period of waves increase, while decrease as the current speed increase but the influence degree is small. Under each condition, the floating collar inclination increases with the increase of the current speed,and decreases with the increase of the wave height, and has little relevance to the wave period. The rate of net deformations increases lightly as the current speed and the height of waves increase.

【题目】基于有限元方法对波流场中养殖网箱的系统动力分析
【中文关键词】有限元;养殖网箱;数值模拟;动力分析;波流场
【英文关键词】finite element methods; fish cage; numerical simulation; dynamic analysis; wave and current
【中文摘要】养殖网箱系统在海中除承受静载荷以外还受到波流等动载荷的作用,为确保安全有必要对网箱系统进行动力分析。为此提出一种基于有限元原理的养殖网箱系统动力分析方法,分别对圆形重力式网箱在水流、波浪以及波流联合作用下的网衣变形与锚绳受力进行了数值模拟,并与实验结果进行了比较分析。结果表明:该方法具有解的稳定性,计算值与实验值比较吻合,较好地反映了网箱系统在波流场中的动力响应特性。
【英文摘要】The fish cage in sea is affected by the hydrostatic effects and hydrodynamic effects. To ensure the safety of net cage system, it is necessary to carry out transient dynamic analysis. Therefore a finite element method is employed to determine the dynamical response of the fish cage. The fish net deformation and mooring line force are simulated for the cage in current and wave, and then the simulation results are compared with the experimental results. The results show that the method has good accuracy as compared with the measured results of physical modeling test in the wave-current flume. The computer simulation reveals the dynamical response characteristics of the fish cage in current and wave well.

【题目】波流射入方向对网络格式锚碇网箱水动力特性的影响
【中文关键词】网格式锚碇;波流作用;数值模拟;水动力特性
【英文关键词】N/A
【中文摘要】运用集中质量方法和刚体运动学原理,建立了单体网格式网箱在波流联合作用下浮架、网衣和锚碇系统受力和运动的数学模型。利用物理模型试验对本数学模型的正确性进行了验证。在此基础上计算了2种波流作用方向、各工况下单体网格式网箱3类锚绳(锚碇锚绳、连接锚绳、网格锚绳)受力、浮架运动及网衣变形的结果,并分析了波流作用方向对网格式锚碇网箱水动力特性的影响。结果表明,当波流作用方向由正向变为斜向(45 °)时,锚碇锚绳与连接锚绳受力有较大程度的增加,网格锚绳受力有较小程度的增加;浮架水平方向、竖直方向运动幅度有一定程度减小,浮架倾角及网衣变形变化不明显。

【题目】波浪作用下网格锚泊的单个重力式网箱缆绳张力试验研究
【中文关键词】重力式圆形网箱; 最大缆绳张力; 波浪; 水流
【英文关键词】gravity cylindrical cages; the maximal tension of anchor line; wave; current
【中文摘要】以中国沿海常用的周长40 m×10 m的HDPE 重力式网箱作为研究对象, 采用渔具模型试验狄克生准则, 选用大比例尺(λ = 1/10)和小比例尺(λ ′ = 1/2)设计制作模型网箱。网箱锚泊系统采用的网格形式与实际使用一致。模型试验于日本东京大学生产技术研究所海洋环境工程实验室风浪流水槽[50 m(L)×10 m(W)×5 m(D)]进行。实验时前端缆绳水平方向与波流夹角为0 °, 波浪周期1-2.2 s, 波高10-30 cm, 对流速0 cm、10 cm 和15 cm 作用下主缆绳、系框绳以及浮框绳的张力特性进行了研究。结果表明: (1)在纯流作用下,前端缆绳张力最大; (2)在纯波作用下, 后侧缆绳张力最大, 最大张力(Tmax)与波高(H)的关系为: T(max) = C1H + C2 (C1、C2 为常数); (3)在波流联合作用下, 前端缆绳张力最大, 缆绳最大张力(Tmax)与波高(H)的关系为: T(max) =C3eC4H (C3、C4 为常数); (4)在波流作用时, 左右前端缆绳一般会产生差异, 最大差值约30%。
【英文摘要】The characters of tension in the mooring lines of a single HDPE gravity cylindrical cage were studied by experimental tests. The proto type of cage had a perimeter of 40 m and a height of 10 m. Based on the Dixon rule of gear tests, two scales were chosen for the experimental model, i.e. λ = 1/10 and λ ′ = 1/2. The experiments were carried out in Ocean Engineering Basin of Institute of Industrial Science of the University of Tokyo. The grid mooring system used in the experiments was geometrically similar to the proto type. The horizontal projections ofthe front mooring lines were in the same direction of current or incident waves. Uniform current was produced in the whole basin at a velocity of 0 cm/s, 10 cm/s and 15 cm/s. Regular waves with a period of the range from 1s to 2.2 s and a height varying from 10 cm to 30 cm were generated. Tension in the mooring lines wwa measured. The following conclusions were made from the analysis of measured data: (1) Under the actions of current only, thetension in the front mooring lines was greater than that in rear mooring lines. (2) Under the actions of waves only, the tension in the rear mooring lines was greater than that in the front mooring lines. An empirical formula for the maximum tension(Tmax) in the rear mooring lines was deduced. It turned out that the maximum tension was linearly related to the wave height(H), i.e. Tmax=C1H+C2 (C1 and C2 are constants). (3) Under the combining effects ofwaves and current, the tension of the front anchor line was again greater than that in the rear one. Another empirical formula was deduced. It showed that the maximum tension in the front mooring lines was exponentially increased with the wave height, i.e.T(max) =C3eC4H (C3 and C4 are constants).

【题目】魔芋新品种渝魔1号的选育
【中文关键词】魔芋;渝魔1号;品种选育
【英文关键词】Konjac; ‘ YumoNo · 1 ’ ; Variety breeding
【中文摘要】渝魔1号是从云南花魔芋栽培群体中优选出的一批变异单株,经过多年的复选、组培快繁、品种比较试验、区域试验以及生产试验筛选出的优良品种。生长势强,生育期约130 d (天),三年生植株株高84.5 cm,开展度68.9 cm,叶柄长

45.7 cm,直径2.5 cm;叶绿色,三全裂,裂片羽状分裂或二次羽状分裂,茎秆具青底黑斑;球茎近圆形,表皮黄褐色,球茎内部组织白色;鲜魔芋干物质含量21.5% ~22.2%,葡苷聚糖含量59.8% ~60.2%,每667 m2产量2000 kg左右,适应性较广,可作为西南魔芋产区的主栽品种。

【英文摘要】‘Yumo No.1’is a new konjac variety which was systematically selected from a series of plants came from Yunnan province. It grows about130 days. The triennium plant is 84.5 cm in height , 68.9 cm in width. The leafstalk is 45.7 cm in length and 2.5 cm in diameter. The green laminae are pinnate splitor second pinnate split ,the stalk is cyan and with black spot ,the corm is round with snuff color and white flesh. It has excellent characteristics such as dry matter content is about 21.5% -22.2%, konjac glucomannan content is about 59.8% -60.2%. Its yield is30 t · hm-2. It is suitable to be cultivated in southwest of China.

【题目】对4种魔芋花器的观察分析

【中文关键词】魔芋;花器;开花;习性;性状

【英文关键词】Konjac; flower organ; flowering; habit; character

【中文摘要】对4种魔芋的开花习性和性状进行了系统观测研究,结果表明:花魔芋开花最早、花期短,滇魔芋与白魔芋次之,西盟魔芋开花最晚、花期最长。通过对魔芋花器的形态性状的比较分析,佛焰苞性状、肉穗花序比佛焰苞、附属器性状、有无中性器官、附属器散发的气味及成熟期果实颜色等几个形态性状种间的差异大;魔芋花器性状种内表现较为稳定,仅花序柄的颜色和斑纹以及附属器颜色有一定差异。

【英文摘要】The flowering habits and characters of four species of Amorphophallus were observed and analyzed systematically. The results showed that the earliest flowering species is A.konjac and its blooming duration is the shorest, which is followed by A.yunnanensis and A.albus. In addition, A..krausei has the latest flowering time and the longest flowering period. Based on comparison and analysis, markes interspecific differences were noticed in the morphological characters of konjac flower organ, including the shape of spathe, the shape of appendices, presence or absence of neutral organs, the odor produced by appendices and the color of ripening fruit. The intraspecific characters of konjac flower organ are relatively stable except for some difference in the mottling and the color of peduncle and appendix.

【题目】过氧化氢法测定魔芋凝胶食品中二氧化钛的研究

【中文关键词】魔芋凝胶食品;二氧化钛;过氧化氢;二安替比林甲烷

【英文关键词】konjac products; titanium dioxide; hydrogen peroxide; diantipyrylmethane

【中文摘要】建立过氧化氢法测定魔芋凝胶食品中二氧化钛含量的检测方法。样品经硫酸—硝酸—硝酸铵消化完全后,以过氧化氢作为显色剂,在410nm波长下测定吸光度,二氧化钛含量和吸光度呈正比例关系。结果表明,该方法平均回收率为102.76%,相对标准偏差为1.55%。该方法重复性好,准确度高,操作简单。

【英文摘要】The method of determination of titanium dioxide in konjac products by hydrogen peroxide process was established. The sample was completely digested by sulfuric acid-nitric acid-ammonium nitrate. It was determinated with hydrogen peroxide as a reagent at410nm wavelength. The content of titanium dioxide and absorbance was direct proportion relationship. The results showed that the average recovery of the method was 102.76%, relative standard deviation was 1.55%. This method was reproducible, high

accurate and easy for operation.

【题目】魔芋葡甘聚糖的增稠特性及其在食品中的应用
【中文关键词】魔芋;葡甘聚糖;增稠剂;食品
【英文关键词】Konjac;Konjac Glueomannan;thickener;food
【中文摘要】魔芋葡甘聚糖是目前所发现植物类水溶性食用胶中粘度最高的一种高分子多糖,是世界公认的天然健康食品和食品添加剂,具有胶凝性、增稠性、粘结性、悬浮性和乳化性等多种特性,和绝大多数阳离子型、阴离子型和非离子型食用胶类都有互溶性、协同性或增效性,作为天然、健康、安全的食品增稠剂,可广泛应用于饮料、果冻、冰淇淋、肉制品、面制品等食品中。本文综述了魔芋葡甘聚糖的结构、食用安全性、增稠特性及其在食品中的应用,并对其应用前景进行了展望。
【英文摘要】Konjac Glucomanan(KGM) is polysaccharide polymer and has the strongest viscosity among the plant-based water-soluble geling agents. It is universally accepted healthy food and food additive. It has many characteristics such as gelling property, thickening properties, cohesiveness, suspension property emulsifying property. Konjac gum interacts synergistically with most of cationic, anionic and non-ionic type of gel which can be widely used in soft drinks, jelly, ice cream, meat products.The structure, safety, thickening properties and the application of Konjac gum industry and its application prospect.

【题目】一种新的多叶花魔芋资源
【中文关键词】花魔芋;多叶;资源
【英文关键词】Amorphophallus konjac; Multi-leaves; Resource
【中文摘要】魔芋是西南山区的重要经济作物,主要的栽培种为花魔芋和白魔芋。这些栽培魔芋在1 a的生长周期内一般均只生长一片复叶,这一生物学特性影响了魔芋的产量。本文报道了在湖北省利川市发现的一种新的花魔芋资源,其具有很高频率的多叶现象。这一花魔芋资源将成为进行多叶魔芋育种的重要材料。
【英文摘要】Konjak is an imponant economic plant in south-western China.The main cultivated species are Amorphophallus konjac and A.albus, which only grow one leaf in one year. The biological become a bottleneck to increase the konjak production. In this paper, a A.konjac in Lichuan, Hubei Province, which showed multi-leaf phenomenon in a considerablely high level, was reported. This new resource could be the useful material for multi-leaf konjak breeding.

【题目】Infection Pathways of Soft Rot Pathogens on Amorphophallus konjac.
【中文关键词】魔芋;软腐病;感染途径
【英文关键词】Amorphophallus konjac, bacterial soft rot, infection pathways.
【中文摘要】随着耕地面积的快速扩张,魔芋软腐病是越来越严重。软腐病的主要病原是软腐欧文氏杆菌。一些研究人员认为,魔芋感染的主要途径是伤口。从宏观观察,软腐病菌不能直接侵入完整的球茎,但它可以通过伤口侵入感染的球茎。同时,芽鳞,根和受伤的球茎可以直接感染。从微观观察,球茎表皮的气孔和皮孔,气孔,芽鳞聚集在没有病原体,病原体打破了被感染的根和芽鳞细胞层。结果表明,软腐病原体入侵魔芋主要是通过伤口和各组织的生长,而不是自然开口部。
【英文摘要】With the rapid expansion of cultivated land, bacterial soft rot of konjac is more and more serious. The main pathogen is Erwinia carotovora subsp. carotovora. Some researchers think the natural openings and wounds are the main infection pathways on konjac. In this study, the infection pathways are investigated. From macro-observation, the soft-rot pathogens could not

directly invade the intact corms, but it could invade the infected corms through the new rots. At the same time, bud scales, roots and wounded corms could be directly infected. From micro-observation, the epidermis of the corm had no stomas and lenticels, the stomas of the bud scales had no pathogens gathered around, and the pathogens broke down the infected roots and bud scales cells layer by layer. The results showed that soft rot pathogens invaded Amorphophallus konjac through the wounds and the growth of the organizations rather than the natural openings.

【题目】葡甘聚糖等碳源对魔芋软腐病病原菌生长的影响
【中文关键词】碳源,软腐病原菌,魔芋
【英文关键词】Carbon source;soft rot pathogens;Amorphophallus konjac
【中文摘要】魔芋软腐病主要由胡萝卜软腐欧文氏菌胡萝卜软腐亚种(Erwinia carotovora subsp. carotovora,E.c.c.)和菊欧文氏杆菌(Erwinia chrysanthemi,E.ch.)引起,此研究通过稀释平板计数法,明确了葡萄糖、淀粉、甘油、甘露醇、蔗糖、葡甘聚糖、麦芽糖这7种碳源对魔芋软腐病病菌两个亚种生长的影响。结果表明, 这2个亚种都能很好的利用蔗糖,且在清水生长情况与在含魔芋粉、淀粉的培养液中生长情况之间没有显著差异,但在葡萄糖培养液中生长情况还没有清水的好。
【英文摘要】Soft rot in Amorphophallus konjac was mainly caused by Erwinia carotovora subsp. carotovora (E.c.c.)and Erwinia chrysanthemi (E.ch.).This study was explicit about the effects of seven kinds of carbon sources(glucose,starch,glycerin,mannitol,sugar,glucomannan and maltose)for the growth of the two subspecies of soft rotbacteriain Amorphophallus konjac, through the conventional plate countmethod.The results showed that the two subspecies of pathogens can be good use of sucrose, and there was no significant difference between growth in water and growth in medium containing konjak glucomannan or starch.But the growth in medium containing glucose was not as good as in water.

【题目】云南枇杷野生种质资源叶片性状多样性分析
【中文关键词】陈秀萍; 蒋际谋; 邓朝军; 林旗华; 张守梅; 许奇志; 郑少泉
【英文关键词】Yunnan Loquat Wild Germplasm resources Leaf characters Diversity analysis
【中文摘要】对147份云南枇杷野生资源叶片表型性状进行了调查分析,结果表明,这一群体枇杷种质资源的叶姿、叶形、叶片长度、叶片宽度、叶形指数、叶背茸毛、叶面形态、叶片横切面形状、叶面光泽、叶片颜色等性状均存在丰富的多样性。其中,叶背无茸毛的种质占77.62%,初步断定这个群体中的多数种质不是普通枇杷类型。
【英文摘要】The leaf characters of 147 loquat accessions of wild germplasm resources collected from Yun nan Province as well as their diversity were investigated. The results indicated that there were abundant diversity in leaf attitude, phylliform, leaf length, leaf width, leaf shape index, pubescence of leaf back, shape and luster of leaf surface, shape of cross section and leaf color in these germplasm resources. Among them, the germplasm accessions without pubescence in leaf back accounted for 77.62%. It was preliminarily concluded that most of the germplasm accessions were not belong to Eriobotrya japonica type.

【题目】温度对龙眼体胚发生早期POD活性及同工酶的影响
【中文关键词】陈义挺; 赖钟雄; 林玉玲; 李焕苓; 何园; 邵巍; 蔡英卿
【英文关键词】longan, early somatic embryogenesis, peroxidase, activity, isozyme
【中文摘要】以龙眼品种红核子LC2胚性细胞系诱导获得的体胚发生早期过程中不同发育阶段的同步化胚性培养物为材料,2个温度梯度(20℃、30℃)处理,以25℃为对照,初步研究了POD活性及同工酶在龙眼体胚发生早期的变化规律。结果表明:不同温度处理的胚性培养物,随着胚性细胞的分化,POD活性总体呈下降趋势,且无论高温(30℃)或低温(20℃)处理后龙眼体胚发生早期各阶段胚性培养物的POD活性均明显大于对照(25℃);温度处理对龙眼体胚发生早期POD同工酶谱影响也较大,表现为新谱带的出现。推测POD活性与同工酶谱的规律变化与龙眼体胚发生早期细胞分化以及维持体胚正常发育有密切关系。
【英文摘要】The LC2 embryogenic cell line of the cultivar Honghezi of longan was used as materials for obtaining the synchronized embryogenic cultures of early somatic embryogenesis at different developmental stages which were treated with different temperatures (20°C and 30°C,compared with 25°C) for analyses of the peroxidase(POD) activities and isozymatic patterns during longan early somatic embryogenesis. The results showed that with the differentiation of embryogenic callus,all the POD activities of the embryogenic cultures treated with three different temperatures decreased, and the POD activitives of the embryogenic cultures treated with high(30°C) or relatively low (20°C) temperatures at the successive developmental stages during early somatic embryogenesis showed higher than the comparison (25°C); the treatment of the temperature also had a great impact on the POD isozymatic patterns with the performance of the new bands for the emergence, which might be concluded that the changes of POD activities and isozymatic patterns in a law played a key role in the differentiation of early somatic embryogenesis, and keeping the normal development of somatic embryogenesis in longan.

【题目】云南部分野生枇杷种质资源的数量分类研究
【中文关键词】胡文舜; 陈秀萍; 李韬; 张守梅; 林旗华; 邓朝军; 郑少泉
【英文关键词】Loquat Genetic resources Morphological traits Numerical taxonomy
【中文摘要】调查了145份云南野生、半野生枇杷种质资源的29个枝梢及叶片性状,采用数量分类学的方法对该群体进行研究。Q型聚类分析可以比较理想地将145份种质在L1=20.64水平上分为5个组,实验表明老叶叶背茸毛脱落与否、叶柄长度、叶脉对数和叶片长度在枇杷属植物分类中起着重要作用。R型聚类分析探讨了29个性状的相关性,结果表明多数性状具有相对独立性。主成分分析表明,29个性状可综合分为10个主成分,其累积贡献率达71.8%,根据前10个主成分与性状间的相关性,选出了影响力比较大的17个性状,并分为3个分类等级。
【英文摘要】Twenty-nine characteristics of shoot and leaf in 145 accesions of wild,semi-wild loquat (Eriobotrya japonica Lindl.)collected from Yunnan province,were investigated and analysed by numerical taxonomic methods. All the plants can be grouped into 5 groups at the level of L1=20.64 by Q cluster analysis; the pubescence fall or not of old leaf back, length of leaf stalk,number of veins and length of leaf blade were of great valve in classification. R cluster anaylsis showed that the 29traits had independent influence on the genetic relationship. The principal component analysis showed that the 29 traits were intergrated into 10 principal components (PC), their accumlative contribution ratio amounted to 71.8%.Key words: Loquat; Genetic resources; Morphological traits; Numerical taxonomy.

【中文摘要】对保存于国家果树种质福州枇杷圃备份圃的来源于云南、贵州的30份野生枇杷种质花序性状进行观察,结果表明:(1)各种质的花序长度、花序宽度、花序支轴数、花序花朵数、花冠直径的次数分布存在差异,两两间均表现为极显著正相关,变异系数22.7%~85.1%;(2)花序形状、花序支轴姿态、花序支轴紧密度和花瓣颜色等4个描述性状也表现丰富的多样性;(3)112号野生枇杷花瓣表现特异,其花瓣数平均为6.3瓣(其他种质均为5瓣)。
【英文摘要】In this paper, inflorescence traits of 30 wild loquat accessions in the national preparing nursery for loquat in Fuzhou origined in Yunnan and Guizhou, were evaluated. The results showed:(1) The distribution of the inflorescence length, the inflorescence width, the number of inflorescence branch-axis, the number of inflorescence flowers and corolla diameter in loquat germplasm accessions were different and the variation coefficient were 22.7%-85.1%. It showed high significant positive correlation between every two of them. (2) There was diversity on the description characters of in florescence in loquat germplasm, including the shape of flower cluster, attitude of secondary peduncle, density of flower cluster and color of f lower axis. (3) No.112 was a special germplasm resource with Petal number of 6.3 on average, while the Petal number of others was 5.

【题目】优质大果晚熟枇杷新品种‘艳红’的选育研究
【中文关键词】黄金松; 郑少泉; 许家辉; 许玲; 刘惠玉; 姜帆; 蒋际谋; 李韬; 黄爱萍; 陈志峰; 陈秀萍; 邓朝军; 张立杰; 张小艳; 章希娟; 郑姗
【英文关键词】Eriobotrya japonica Lindl New Cultivar ‘Yanhong’ Cross breeding Superior quality Late ripening Large type
【中文摘要】‘艳红’枇杷新品种,系福建省农业科学院果树研究所福建省龙眼枇杷育种工程技术研究中心以我国超大果型品种‘解放钟’为母本、美国枇杷‘黄金块’(Gold Nugget)为父本,通过有性杂交选育而成。多年观察结果表明,该品种具有优质(可溶性固形物含量13.1%,总酸含量0.57%)、外观鲜艳、晚熟(福州地区5月中旬成熟)、大果(单果重68.6 g)、抗性强和较丰产等特点。其综合经济性状明显优于亲本和现有的主栽枇杷良种,可作为枇杷升级换代的新品种。
【英文摘要】‘Yanhong’, a new loquat cultivar, was selected from across-combination of ‘Jiefang-zhong’ as female parent and ‘Gold Nugget’ as pollen parent in 1995. It was characterized by high quality (TSS 13.1% and total acid 0.57%), good appearance, late ripening (mid-May in Fuzhou city), large fruit (68.6g), strong resistance to stresses and higher yield, which is superior to the parents and main loquat cultivars. Therefore ‘Yanhong’ loquat might have a good potential for loquat cultivar renewal.

【题目】优质早熟大果型锥栗新品种——八月香的选育
【中文关键词】黄新忠; 范辉华; 陆修闽; 陈小明; 蔡盛华; 陈柳英; 陈林生; 雷龑
【英文关键词】Castanea henryi New cultivar Bayuexiang
【中文摘要】八月香系实生优株选育而成。属长枝型,树势强健,枝梢生长旺,分枝角度小;以粗壮结果母枝结果为主,连续结果能力强。坚果圆锥形、单果质量13.5 g、果皮红褐色、果肉黄白色,鲜食熟食品质皆佳;成熟期9月上旬,较黄榛提早20~25 d;早实丰产,盛产期666.7 m2产量200 kg以上。
【英文摘要】Bayuexiang was selected from the open pollinated superior seedlings. It belongs to long branch type and has strong tree vigor and thriving branches with small branching angle; Fruits mainly come from thick bearing branches with strong continuous bearing ability. The fruit shape is of cone, weighing 13.5 g on average, with a reddish brown skin and the flesh is yellow white in color and good for fresh consumption and cooking. It ripens in early September,20 to 25 d earlier than Huangzhen cultivar. The trees are productive. The production could reach more than 3 t • hm2.

【题目】应用超声波技术强化提取余甘多糖
【中文关键词】李永裕; 陈建烟; 温凤英; 关夏玉; 王曾金; 吴少华
【英文关键词】Phyllanthus emblica Polysaccharides Ultrasonic Extraction FT-IR(Fourier transform infrared spectroscopy)
【中文摘要】通过单因素和正交实验研究了超声波时间、超声波功率、超声波提取温度和料液比对余甘(Phyllanthus emblica L.)多糖收率的影响。结果表明,多糖收率的主要影响因素为超声波功率、超声波时间、料液比、超声波提取温度。余甘多糖的最佳提取工艺条件为:超声波功率475W、超声波时间70min、料液比1:20、超声波提取温度80℃,余甘多糖收率为95.86mgg-1DW。紫外和红外光谱分析表明,余甘多糖是含有糖醛酸的α型吡喃酸性杂多糖,超声波处理没有改变多糖结构。
【英文摘要】Emblica polysaccharides(EPS) have biological activities on free radical scavenging, ant-ioxidation and ant-itumor. The effect factors on yield of emblica polysaccharides from Phyllanthus emblica extracted by ultrasound were studied. The results showed that the factors included ultrasonic power, ultrasonic time, solid-liquid ratio, ultrasonic extraction temperature. The optimal extraction condition were ultrasonic power of 475W with solid(g) to liquid(mL) ratio of 1: 20 at 80℃ for 70min, with the yield of 95.86mg g-1 DW. Ultraviolet spectrum and FTIR(fourier transform infrared spectroscopy) analysis showed that EPS was a α type acidic heteropolysaccharide containing pyran and glycuronic acid. The structural modification of EPS by ultrasonic radiation was not observed.

【题目】中国水仙BAC文库构建的研究
【中文关键词】王江波; 潘东明; 潘腾飞; 郭志雄
【英文关键词】Narcissus high molecular weight DNA (HMW-DNA) BAC library pulsed-field gel electrophoresis
【中文摘要】为更深入地挖掘中国水仙的基因组信息,筛选与中国水仙品质相关的功能基因,以中国水仙品种‘金盏银台’的黄化叶片为材料,采用改良Zhang法获得高分子量核DNA,经酶切、连接和转化,首次构建了中国水仙基因组BAC文库。结果表明,采用改良zhang法获取的核DNA分子量大于1 Mb,适合BAC文库的构建;优化了连接、转化体系,发现载体和插入片段的摩尔比为5:1时,连接、转化效率最高;经检测,该文库包括69120个克隆,插入片段的平均大小约87 kb,空载率小于1%,大约50%的克隆大小在80~90 kb之间;Southern blot结果表明该文库未受到细胞器DNA的污染。
【英文摘要】To further study Narcissus genome and screen functional genes, a BAC library was constructed for the first time in the world. The high molecular weight DNA(HMW-DNA) was isolated from Narcissus etiolation leaves used improved Zhang's method. The HMW-DNA was cut by Hind III and ligated to BAC vectors; the ligations were transformed into Escherichia coli DH10B.The results showed that the DNA isolated by improved Zhang's method was higher than 1 Mb, which was suitable for BAC library

construction. The ligation and transform methods were improved; the optimum mole ratio between vectors and DNA fragments was 5:1.The library consists of 69120 clones with an average insert size of 87 kb, about 50% clones contain 80 to 90 kb insert DNA, and less than 1% of the clones do not contain inserts. Screening of BAC library with chloroplast DNA probes by Southern blot indicated that less than 1% of the clones contained organelle-derived DNA.

【题目】中国水仙高分子量核DNA提取方法的建立
【中文关键词】王江波; 潘东明; 潘腾飞; 郭志雄; 钟娴; 王金英
【英文关键词】Narcissus High Molecular Weight DNA(HMW-DNA) BAC library Pulsed-field gel electrophoresis
【中文摘要】以中国水仙(Narcissus tazetta L.var.Chinensis Roem)黄化叶片为材料,比较了2种提取方法对高分子量核DNA(HMW-DNA)制备效果的影响。结果表明,改良Zhang法与Peterson法相比,前者更适合于中国水仙叶片HMW-DNA的提取。将得到的细胞核用低熔点琼脂糖包埋,琼脂糖小块用蛋白酶K最适消化时间为24h,脉冲场凝胶电泳分析结果表明,所获得的HMW-DNA大于1 Mb,这些核DNA能够被限制性内切酶消化;用Southern blot检测,结果表明没有其它细胞器DNA的污染;适合于中国水仙BAC基因组文库的构建。
【英文摘要】High molecular weight nuclear DNA (HMW-DNA)from the leaves of Narcissus tazetta L.var. Chinensis Roem was prepared by two methods(Zhang's and Peterson's method)and the extracting effects of the two preparing methods were compared. The results showed that Zhang's method was more suitable for preparation of HMW-DNA in Narcissus. The isolated nuclei were embedded with low-melting-point agarose. The optimal digestion time of plugs was 24 hours by Proteinase K. The pulse field gel electrophoresis (PFGE)results showed that the isolated HMW-DNAs were more than 1 Mb in size and were digested completely or partially by restriction enzymes. The results showed that there were no others organelle DNA in plugs by Southern blot analysis. Therefore, Zhang's method was suitable for the construction of a BAC library in Narcissus.

【题目】叶片结构与柑橘溃疡病抗性的初步研究
【中文关键词】温寿星; 黄镜浩; 陈瑾; 蔡子坚; 包榕; 张凌媛
【英文关键词】stomatal density leaf anatomical structure sponge tissue palisade tissue
【中文摘要】以稻叶温州蜜柑[Citrusunshiu (L.) var.Inaba]、春见[(C. reticulata×C. sinensis)var.Okitsu No.44]、卡拉卡拉红肉脐橙[C.sinensis(O.)var.Cara Cara]、玫瑰橙[C.Sinensisvar.Meiguicheng]和HB柚[C.grandis(L.)var.HB]等5个柑橘品种的夏梢老熟叶片为材料,采用表皮撕取法及常规石蜡切片法对气孔及叶片显微结构进行解剖构造的观察和测定,并就结构与品种的溃疡病抗性进行了相关性分析。结果表明:不同品种间叶片的气孔密度差异显著,并且与品种抗病性成正相关,其相关系数为0.888;不同品种间叶片的显微结构特征差异不显著,与品种抗病性相关性不显著,品种间变化规律性不强。叶片气孔的密度可作为抗柑橘溃疡病的形态结构的初步鉴定指标。
【英文摘要】The anatomic structure of the summer leaves and the microstructure in 5 cultivars of citrus were studied. The experimental results showed that the leaf stomata density in lower epidermis was significant different among cultivars and in positive correlation with the disease resistance to Xanthomonas axonopodis pv. citri (r=0.888). The microstructure of leaf was not significant different among the cultivars and showed no correlation with disease resistance. The stomatal density in leaf tissues could be one of the

criteria for canker resistance of citrus.

【题目】真菌对芒果花序侵染过程的细胞学观察
【中文关键词】温寿星; 黄镜浩; 马蔚红; 王松标; 武红霞; 梁国鲁
【英文关键词】fungus invasion mango
【中文摘要】为采用适当的方式解决病原真菌侵染芒果花序的问题,采用荧光显微镜观察法和石蜡切片法对真菌侵染芒果花序的过程进行观察,结果显示:不同年份受真菌感染率不同,感染率与取材年份的气候状况有关;低温(日均气温10~20℃)条件下,芒果花蕾受真菌感染率由常温(25~30℃)下的37.80%上升至68.18%;不同种类的真菌对芒果花序具有协同侵染作用;真菌分生孢子在花蕾表面及内部空腔萌发,菌丝体经花瓣分泌组织侵入体内,沿细胞间隙生长,在组织内形成分生孢子囊并导致组织病变坏死。
【英文摘要】With paraffin section technology and fluorescence microscope, the process of fungal invasion into mango inflorescence was observed. Results were as follow: Fungal infection rate of different year was different from each other, and was highly correlated to the weather condition while materials were chosen. The infection rate of mango buds by fungus rose from 37.80% of normal condition to68.18% under low temperature. Some fungal conidiophores germinated and grew in flower lacuna and then invaded into interfloral nectary through interspace among cells to produce sporangium. While some germinated on calyx surface then invaded inside to cause putrescence.

【题目】台湾番木瓜品种在漳州地区引种栽培及适应性比较
【中文关键词】伍洋; 陈清西; 林玉芳
【英文关键词】Taiwan papaya botanical characteristics agronomic traits fruit quality disease resistance
【中文摘要】对新引进的马来9号、马来10号、金峰和台农2号4个台湾番木瓜品种在漳州地区进行试栽,并进行植物学性状、农艺性状、果实品质和抗病性等综合比较试验。结果表明,马来9号和马来10号品种具有高产、稳产、优质、抗病等优点,适合在漳州地区推广种植。金峰品种产量偏低,果实品质一般;台农2号品种极易感染病害,不适合在漳州地区推广种植。
【英文摘要】Four varieties of papaya, i e. , Malay No. 9, Malay No. 10, Jinfeng and Tainong No. 2, from Taiwan were introduced and cultivated in Zhangzhou area. Their botanical characteristics, agronomic traits, fruit quality and disease resistance were studied. The results showedthat Malay No. 9 and Malay No. 10 had high and stable yields, high quality and good disease resistance. On the other hand, Jinfeng were poor on fruit yield with average quality, while Tainong No. 2 was easily infected by viruses. Therefore, it was concluded that Malay No. 9 and No.10 would be more suitable for planting in Zhangzhou area than the other two varieties.

【题目】套袋枇杷果面微域环境变化对果实品质的影响
【中文关键词】张丽梅; 陈熹; 李韬; 许家辉; 胡文舜; 熊月明
【英文关键词】Loquat frut bagging microenvironment fruit quality
【中文摘要】以贵妃枇杷为试材,用3种果袋进行套袋,对袋内微域环境的光照强度(简称光强)、温湿度和透气性进行测定,并分析不同果袋内微域环境变化和果实品质及两者之间的相关性。结果表明:套袋使微域环境中的日均光强下降,果实外观品质有不同程度的提高,表现在光洁度好、着色均匀、果粉和茸毛较完整、日灼果率和锈斑病下降;内在品质表现在可溶性固形物含量和总糖含量下降,可滴定酸含量和Vc含量增加,风味偏酸偏淡;日均光强对果实的可溶性固形物含量、总糖含量的影响均呈正相关,但对可滴定酸含量、Vc含量的影响均呈负相关,对可滴定酸含量的影响最大,相关系数为-0.9766,相关性显著 -0.9766(P<0.05)。
【英文摘要】Using three different kinds of bags to enclose Gui-fei loauat fruits, the light intensity, temperature, humidity and ventilation in the microenvironment wer determined. The relationship between the conditions inside the bag and the fruit quality was established. The results showed that the bagging caused decreases in sunlight intensity, while improving the fruit ’ s exterior and flesh qualities in varying degrees. Externally, the fruit skin had a clean, shiny appearance with even, attractive color, powdery and fuzzy coatings, and few burned or rust spots. The flesh showed decreases in soluble solids and sugar contents, increases in titratable acids and vitamin C, as well as an increased sour taste and somewhat reduced flavor. The soluble solids and total sugar contents were positively related to the average daily sunlight intensity; whereas, the titratable acids and vitamin C were negatively related to the sunlight intensity. Among the factors investigated, their greatest effect was on the content of titratable acid, with a correlation coefficient of -0.9766(P<0.05).

【题目】野生香蕉叶片总RNA提取方法研究
【中文关键词】张妙霞; 赖钟雄; 赵巧阳
【英文关键词】wild banana leaf total RNA improved CTAB TRIZOL Regent kit RNAsio Regent
【中文摘要】野生香蕉; 叶片; 总RNA; 改良CTAB法; TRIZOL试剂盒法; RNAsio试剂法{Abstract}: 采用TRIZOL试剂盒法、RNAsio试剂法和改良CTAB法提取香蕉叶片总RNA,并通过凝胶电泳、紫外分光光度法检测提取的RNA样品的质量。研究结果表明:改良CTAB法提取的RNA具有28SrRNA和18SrRNA两条清晰的条带,OD260/OD280在1.80~1.95之间,OD260/OD230在1.75~2.10之间,具有较高的纯度;其他两种方法获得的RNA纯度不够,降解严重。将提取的RNA分别逆转录成cDNA,经RT-PCR扩增,只有改良CTAB法出现清晰的条带,进一步证明改良CTAB法提取的RNA具有很高的纯度,可以满足进一步分子生物学研究的要求。
【英文摘要】Total RNA was isolated from wild banana leaves by using the methods of TRIZOL Regent kit , RNAsio Regent and improved CTAB. The quality of total RNA was analyzed through gel electrophoresis and UV spectrometer. The results indicated that the RNA isolated by the method of improved CTAB showed clear bands of 28SrRNA and 18SrRNA ,and the value of OD260/OD280 was 1.80to 1.95,the value of OD260/OD230 was1.75to 2.10. RNA isolated by the other two methods degraded seriously .RNA could be reverse to cDNA. The cDNA was used for RT-PCR amplifying,but the electrophoresis figure by RT-PCR showed that there was one distinct band using the RNA temples isolated by the method of CTAB. These results demonstrated that the quality and purity of the RNA obtained by the method of improved CTAB could meet the demands of molecular biology experiment.

【题目】锥栗叶片两种提取蛋白方法的比较
【中文关键词】郑诚乐; 刘小芝; 钟凤林; 潘东明
【英文关键词】Castanea henryi (Skam) Rehd. et Wils
【中文摘要】比较三氯乙酸/丙酮沉淀法、酚抽提法两种方法对锥栗叶片总蛋白的提取效果。结果表明:酚抽提法获得的蛋白质产率高、纯度高;且其提取蛋白质所得电泳图谱背景浅、拖尾轻、蛋白点分散且性状规则,适合锥栗叶片蛋白质的提取。试验为锥栗胚胎发育期蛋白质组学研究提供参考,也对其他干扰物质含量高的植物组织蛋白提取有一定的参考价值。

【题目】锥栗雌配子体形成与胚胎发育

【中文关键词】郑诚乐; 俞晓曲; 潘东明; 林昌
【英文关键词】chinquapin megasporogenesis female gametophyte embryo development
【中文摘要】以锥栗品种黄榛为材料,采用石蜡切片技术对其大孢子发生、雌配子体形成和胚、胚乳发育过程进行了研究.结果表明:锥栗为雌雄异花同株果树,多心皮复合雌蕊,中轴胎座,通常有8-10个子房室,每室倒生2枚胚珠;珠心组织中的一个孢原细胞直接发育形成大孢子母细胞,经减数分裂形成的大孢子四分体呈线形,其中靠近合点端的功能大孢子发育成为成熟胚囊;胚囊发育类型为单孢子蓼型胚囊;双受精后,原胚经过球胚、心型胚、鱼雷胚和子叶胚等阶段发育为成熟胚,胚乳呈核型,种子无胚乳。
【英文摘要】Embryological studies were carried out on them egasporogenesis, female gametophyte formation, the development of embryos andendosperm by using Huangzhen as them aterial and taking advantage of paraffin section technology. The results showed that chinquap in(Castanen henryi Rehd&Wils.) was diclinous with polycarpous compound pistils, axile placentas, commonly 8 to10 loculaments and 2 anatropous ovules in each loculament. An archesporial cell in the nucellus tissue would directly develop into the megaspore mother cell that subsequently formed linearmegaspore tetrads. The functionalm egaspore near the chalazal end developed into mature embryo sac, which was monosporic polygonum-type. After double fertilization, the proembryo would develop into a mature embryo going through globular, heart, torpedo and cotyledon stages. Endosperm is nuclear endosperm and it doesn ’ t exist in seeds.

【题目】锥栗果实双向电泳体系的建立
【中文关键词】郑诚乐; 钟凤林; 潘东明; 刘小芝
【英文关键词】chinquapin(Castanea henryi Rehd. & Wils.); proteome; two-dimensional electrophoresis
【中文摘要】通过对传统双向电泳技术进行改进和优化,包括对锥栗果实蛋白不同提取方法的优化和不同pH值范围IPG胶条的比较等,以建立适于锥栗果实蛋白质组分析的双向电泳方法.结果表明,使用裂解液直接提取蛋白的方法所获得的双向电泳图谱稳定性和重复性较好,分辨率较高,经银染后可分辨出400多个蛋白点,其等电点主要分布于pH 4-7.
【英文摘要】The conventional two-dimensional electrophoresis technology was improved in order to develop an appropriate approach for proteomics of chinquap in fruits. The study was done by optimizing different protein extraction methods and comparing IPG strips at different pH values. With the improved protein extraction method, a stable, reproducible and high resolution 2-D electrophoresis map was obtained. After silver staining, more than400proteinspotswere detected, with their isoelectric points (pI) mainly at pH 4-7.

【题目】三角梅种质资源的ISSR分析
【中文关键词】李房英　黄彦晶　吴少华
【英文关键词】Bougainvillea　ISSR　Genetic diversity　Genetic relationship
【中文摘要】应用ISSR 分子标记技术对68 份三角梅种质进行分析,从100 个引物中筛选出14 个多态性丰富、重复性好的引物,对68 份三角梅种质资源的DNA 多态性检测共获得了195 条谱带,其中多态性条带182 条,多态性比率为93.3%。聚类分析结果表明,三角梅品种间的遗传相似系数在0.50~0.97 之间,平均相似系数为0.67,这说明供试的68 份材料间的遗传多样性不是特别丰富、亲缘关系较近。在0.64 水平处将三角梅种质资源分为A 类群和B 类群,A 类群可分为2 亚类,B 类群还可分为6 亚类。本研究从分子水平上揭示了三角梅不同种质资源之间的亲缘关系,进一步明确种质资源间的遗传距离,为三角梅优良品质性状的选择、杂交育种亲本选配和良种繁育,提供了DNA 分子水平上的理论依据。
【英文摘要】Sixty -eight bougainvillea samples were analyzed using ISSR technique to study their taxonomic and phylogenetic relationships. Fourteen ISSR primers were used in the ISSR analysis of 68 bougainvillea individuals. A total of 195 ISSR bands were

scored, corresponding to the polymorphic bands were 182, and the percentage of polymorphic was 93.3%. According to ISSR-PCR results, a cluster analysis (UPGMA) was used to generate a dendrogram among all 68 individuals. The results showed that genetic similarity among individuals was between 0.50 and 0.97, the average was 0.67. It was indicated that the relationship among all individuals was close and the genetic diversity was poor. According to dendrogram, 68 individuals could be divided into 2 groups at geneticsimilarity 0.64. The A group could be divided into 2 subgroups and B group could be divided into 6 subgroups.This study revealed the genetic relationship and confirmed the genetic distance among 68 bougainvillea individuals using molecular marker technology.

【题目】枇杷试管苗限制生长保存过程中叶肉细胞超微结构变化的研究
【中文关键词】周红玲, 郑加协, 赖钟雄, 陈石
【英文关键词】Loquat (Eriobotrya japonica)　Restricting growth preservation　Mesophyll cell　Chloroplast　Mitochondrium　Ultrastructure
【中文摘要】本试验以早钟6号枇杷试管苗为材料, 将其分别保存在MS+5 mg/L PP333 培养基上和MS 培养基(对照)上, 采用超薄切片透射电镜对保存的试管苗成熟叶片叶肉细胞进行观察。结果表明: 与对照相比, 添加5 mg/L 的PP333, 保存6 个月时, 明显推迟了叶绿体的变形、移动、叶绿体和线粒体的镶嵌及叶绿体的解体;保存9 个月时, 叶肉细胞叶绿体结构完整, 少数出现解体, 淀粉粒明显增大、增多, 线粒体和细胞核结构正常。
【英文摘要】.The ultrastructural changes of the mesophyll cells in response to invitro plantlets of the loquat cultivar Zaozhong No.6 preserved on MS+5 mg/L PP333 were investigated. The results showed that the deformation, shift and disintegration of chlorolplasts and the mosaic of mitochondria were significantly delayed during restricting growth preserved for 6 months. The structure of the chloroplasts in the mesophyll cells was intact, only a few of that disintegrated. The starch grain significantly became larger and numerous. The structure of mitochondria and cell nuclear was normal when preserved for 9 months.

【题目】枇杷胚性培养物ACC氧化酶基因的克隆及序列分析
【中文关键词】音建华, 赖钟雄, 林玉玲, 李惠华, 李丽秀
【英文关键词】Eriobotrya japonica embryonic cultures　ACC oxidase　Gene cloning　Genomic DNA　Sequence analysis
【中文摘要】以枇杷胚性培养物(Eriobotrya japonica embryonic cultures)为材料, 采用同源克隆方法, 从其mRNA 中分离得到ACC 氧化酶(ACO) 基因EjACO-1, 在GenBank 中登录号为GQ377219。结果表明: EjACO-1 大小为1 160 bp, 编码322 个氨基酸。枇杷EjACO-1 与苹果、桃和梨等蔷薇科植物同源性较高, 而与水稻、石斛兰等单子叶植物距离较远。此外, 从枇杷基因组DNA 中分离了转录为EjACO-1 mRNA 的基因gACO, 大小为1 517 bp,在GenBank 中的登录号为GU233743。生物信息学分析显示, gACO 基因中含有3 个内含子, 大小分别为114、240、194 bp, 均符合真核生物内含子通用的GT-AG 法则。EjACO 基因的克隆为以后研究乙烯在枇杷中的功能奠定基础。
【英文摘要】Homologous cloning method was used to clone the 1 -aminocyclopropane -1 -carboxylic acid oxidase(ACO)gene, EjACO-1, Eriobotrya japonica embryonic cultures. The gene, GenBank accession number GQ377219,was of 1160 bp, encoding 322 amino acids, and highly homologous to other rosaceous plants origins (Malus xdomestica, Prunus persica, Pyrus pyrifolia and so on), and was distant from that of monocotyledons(Oryza sativa,Dendrobium and so on) . Moreover, gACO, which encoding EjACO -1 mRNA, was obtained from the genomic DNA. The length of gACO was 1517 bp, and the accession number was GU180353 in GenBank. The gACO gene contained 3 introns consistent with the GT-AG dogma for eukaryotic introns, with lengths 114, 240 and 194 bp,respectively. The cloning of EjACO provides a foundation for further study of ethylene function in Eriobotrya japonica.

【题目】枇杷种质资源数量分类研究
【中文关键词】陈秀萍 黄爱萍 蒋际谋 郑少泉 邓朝军 魏秀清 胡文舜 姜 帆
【英文关键词】Eriobotrya japonica germplasm numerical classification cluster analysis principal component analysis
【中文摘要】对国家果树种质福州枇杷圃的199 份枇杷[Eriobotrya japonica(Thunb.)Lindl.]种质资源,应用数量分类学中的Q 型聚类分析方法进行分类,并对86 个性状进行R 型聚类分析和主成分分析。Q 型聚类分析将199 份种质资源在L = 87.31 水平分为栽培品种和野生资源两大类,在L = 34.92 水平分为5 个组群,组群内来源地相同的种质资源多聚为小组,显示出较近的亲缘关系;R 型聚类分析结果将86 个性状明显聚为3 组,多数性状表现两两相关或关系密切;主成分分析表明,86 个性状可简化为28 个主因子,其累积贡献率达74.7%,根据28 个因子载荷量,选出影响力比较大的性状58 个。
【英文摘要】Divisions of 199 loquat [Eriobotrya japonica(Thunb.)Lindl.] genetic resources and 86 germplasm characters were investigated in the resources of Fuzhou National Fruit Germplasm. Q cluster analysis showed that 199 loquat germplasm resources were seperated into cultivar and wild germplasm when L = 87.31;Five groups were seperated when L = 34.92,the germplasm resources in the same group were most came from the same origin region showing the nearest genetic relationship. R cluster analysis showed 86 characters closely related were significantly clustered into 3 groups. Principal component analysis suggested that,86 characters can be simplified to 28 main factors,the cumulative contribution rate of 74.7%,and the relatively large influence of 58 characters based on the amount of 28 factors loading.

【题目】枇杷种质资源果肉硬度影响因素分析
【中文关键词】张泽煌,林旗华,陈志峰,魏秀清,张立杰,张小艳,郑少泉
【英文关键词】Loquat germplasm resources flesh firmness
【中文摘要】对国家果树种质福州枇杷圃内枇杷种质资源的果肉硬度与果肉化渣程度、果肉质地、果实汁液、单果重、果肉厚度、可溶性固形物含量、果皮厚度、果面茸毛密度、果面茸毛长度、来源地、果肉颜色和果皮颜色等14 个性状的关系进行分析。结果表明,枇杷种质果肉硬度与果肉化渣程度、果肉质地、果实汁液、果面茸毛密度、果肉颜色关系较密切,果肉不化渣、果肉质地致密、果肉汁液少、果面茸毛稀疏、果肉黄色和橙黄色和果实成熟期较早的枇杷种质果肉硬度较高。枇杷种质果肉硬度与单果重、果肉厚度、果皮厚度、来源地、可溶性固形物含量、果面茸毛长度、果皮颜色未见明显的内在联系。
【英文摘要】In order to investigate the influencing factors on flesh firmness of loquat germplasm resources,the flesh dregs degree,flesh texture,flesh juice,fruit weight,flesh thickness,total soluble solids of juice,peel thickness,density of floss on fruit surface,length of floss on fruit surface,origin region,flesh color,peel color and flesh firmness of loquat germplasm resources in Loquat Resource Nurseries of Fuzhou National Fruit Gene-pool were studied and analyzed. The results indicated that the flesh dregs degree,flesh texture,flesh juice,flesh color and density of floss on fruit surface and fruit maturity stage had great influence on flesh firmness,and the flesh firmness of loquat germplasm resources with dreggy flesh dregs degree,tight flesh texture,few flesh juice,yellow and orange yellowflesh color,sparse density of floss on fruit surface and early fruit maturity stage were relatively higher.The fruit weight,flesh thickness,pericarp thickness,origin region,total soluble solids of juice,length of floss on fruit surface and peel color had no significant internal relations with the flesh firmness.

【题目】枇杷属植物4个种的花序性状多样性研究
【中文关键词】陈秀萍, 黄爱萍, 蒋际谋, 林旗华, 魏秀清, 张小艳, 许奇志, 郑少泉
【英文关键词】Eriobotrya plants　Germplasm resources　Flower cluster　Diversity index
【中文摘要】在相同的种植和管理条件下, 对普通枇杷、栎叶枇杷、大瑶山枇杷和南亚枇杷等4个种210份种质资源的8个花序性状多样性进行鉴定, 旨在为进一步的分类鉴定、利用研究提供参考依据。结果表明: (1) 枇杷属种质资源的花序支轴姿态、花序支轴密度、花序支轴数、花序形状、花序长度、花序宽度、花瓣颜色、花冠直径Shannon-W eaver 多样性指数1. 352~ 2. 951,存在丰富的多样性。(2)不同来源地的种质资源花序性状多样性水平差异较大, 多样性指数最高的为云南(2. 108), 其次是贵州(1. 962)、四川(1. 953)、福建(1. 900), 美国的最低(1. 137) 。(3)云南、贵州的枇杷种质资源花序长度、宽度显著或极显著地大于其他地区; 野生资源的花序长度、花序宽度和花冠直径均极显著地大于地方品种、选育品种。
【英文摘要】Diversity of eight flower cluster characters (attitude of latera l in relation to peduncle, density andnumber of lateral peduncles, shape, length, width of flower cluster, petal color and corolla diameter) of 210 loquat germplasm resources (E riobotrya jap onica (Thunb.) Lind1. , Eriobotrya prinoides Rehd. & W ils. , E riobo trya dayaoshanensis Chen. and Eriobotrya bengalensis (Roxb.) H ook.f) were studied and analyzed under the same planting conditions. The results show ed: (1) therew as abundant diversity among them. (2) Diversity index of loquat germplasm resources from different sources varied g reatly w ith the h ighest of 2.108 (from Yunnan), the lowest of 11137 (from America). (3) Variance analysis showed that flower cluster length of loquat germplasm from Yunnan and Guizhou were sign ificantly longer than others, flower cluster width of loquat germplasm from Yunnan and Gu izhou were very sign if icantly wider than others, both length and width of flower cluster of wild loquat germplasm were very sign ificantly bigger than those of cultivated species and wildre latives.

【题目】气象因子对福建枇杷果实锈斑病发生的影响
【中文关键词】刘友接 许家辉 蒋际谋 陈秀萍
【英文关键词】Eriobotrya japonica Lind.l　Germplasm resource
【中文摘要】调查分析福建省福州市、云霄县和仙游县等3 个早钟6 号枇杷产区的果实锈斑病发生情况、当地气温、降雨量和日照时数。结果表明, 不同地区枇杷幼果发育期、黄熟期、成熟期的气温、降雨量、日照时数等气象因子不同, 枇杷果实锈斑发生情况也各异; 总体上, 枇杷果实锈斑病发生程度从重至轻依次为云霄县> 仙游县> 福州市。
