【题目】鹿角海萝的繁殖生物学及室内培养的研究
【中文关键词】鹿角海萝; 繁殖生物学; 室内培养
【英文关键词】无
【中文摘要】在鹿角海萝G loiop eltis tenax 藻体生育期内, 观察了大连沿海鹿角海萝的自然生态及藻体生长过程;在繁殖期内定期采集种藻进行孢子放散, 测定了藻体生长、孢子放散量与水温的关系; 使用培养皿、贝壳等附着基采集四分孢子和果孢子并在室内进行培养。结果表明: 1) 鹿角海萝在大连沿海的生育期为10 月至翌年7月, 藻体在4月下旬至5月上旬生长最快, 此阶段水温为6~ 9 。2) 鹿角海萝的繁殖期为4 月下旬至6月下旬(水温6~ 12) , 其中果孢子体在4月下旬至5月中旬(水温6~ 10) 放散, 放散高峰为5月上旬, 最高放散量为0 9 106个/g; 5月上旬至6月下旬(水温9~ 12) 四分孢子体开始放散,高峰期为6月上旬, 最高放散量为1 65 106个/ g。3) 四分孢子和果孢子附着后均可萌发形成盘状体, 盘状体直径达250 m 左右时形成直立枝, 盘状体和直立枝在每天上午和下午各干露2 h条件下, 生长速度明显快于对照组, 直立枝经在室内培养成为鹿角海萝幼苗。

【题目】温度和光照强度对鼠尾藻生长和生化组成的影响
【中文关键词】鼠尾藻 温度 光照强度 生长 生化组成
【英文关键词】Sa rgassum thunberg ii; temperature; light intensity; growth; biochemical composition
【中文摘要】在实验室条件下,研究了温度(10、15、20、25 ℃) 和光照强度(20、60、100、140、180 μE · m- 2 · s- 1)对鼠尾藻生长和生化组成的影响. 结果表明,温度、光照强度及两者的交互作用对鼠尾藻生长均具有极显著影响. 鼠尾藻在15 ℃和20 ℃下生长速率较高,随着温度的升高,达到最大生长速率所需要的光照强度有上升趋势. 在10 ℃和15 ℃下,较高的光照强度对鼠尾藻生长产生了一定抑制作用,而在20 ℃和25 ℃下,其生长速率总体随光照强度的增加而增加. 温度和光照强度对鼠尾藻叶绿素a、墨角藻黄素的含量影响极显著,其中光照强度的影响大于温度. 总体上,叶绿素a和墨角藻黄素的含量均随着光照强度的升高而显著下降,随着温度的升高而升高. 鼠尾藻碳水化合物含量随着光照强度的升高而显著升高,而温度对碳水化合物含量影响不显著. 鼠尾藻蛋白质含量随着光照强度的增加而显著下降,在10 ℃和15 ℃下含量较高,随着温度的继续升高,蛋白质含量呈下降趋势. 光照强度和温度的变化可改变鼠尾藻的藻体成分含量,这种改变可能是鼠尾藻为了适应环境因子改变而做出的积极的生理调节,对其生长和生存具有重要的生态意义.
【英文摘要】A two2factorial experimentwas designed to study the effects of temperature (10, 15, 20,and 25 ℃) and light intensity (20, 60, 100, 140, and 180 μE · m- 2 · s- 1) on the growth andbiochemical composition of Sargassum thunberg ii. The results showed that temperature, light inten2sity, and their interactions had significant effects on the growth of S. thunbergii. A higher growthrate of S. thunberg iiwas observed at 15 ℃- 20 ℃, and, with the increase of temperature, the lightintensity for the maximum growth rate of S. thunbergii had an increasing trend. At 10 ℃ and15 ℃, higher light intensity had definite inhibition effect on the growth of S. thunbergii; while at20 ℃ and 25 ℃, the growth rate was generally increased with increasing light intensity. Both tem2perature and light intensity had significant effects on the chlorophyll a and fucoxanthin contents ofS. thunbergii, and the effects of light intensity was greater than those of temperature. In general,the chlorophyll a and fucoxanthin contents of S. thunbergii decreased significantly with increasinglight intensity but increased with increasing temperature. The carbohydrate content of S. thunbergiiincreased with increasing light intensity, while no significant difference was observed at differenttemperature. The p rotein content of S. thunberg ii decreased with increasing light intensity, and washigher at 10 ℃ and 15 ℃ but tented to decrease with increasing temperature. The variation of lightintensity and temperature induced the changes in the biochemical composition of S. thunberg ii, andthese changes could be an active physiological adjustment for the adap tation to the variation of envi2ronmental factors, which was of ecological significance to the growth and survival of S. thunbergii.

【题目】鼠尾藻生长、藻体成分及其生境的初步研究
【中文关键词】鼠尾藻;生长;藻体成分;氮;磷
【英文关键词】无
【中文摘要】对威海小石岛附近海区鼠尾藻(Snrgnss姗 旃“ rg)的生长、藻体成分和水体中氮、磷等营养元素的月份变动情况进行了初步研究。结果表明,研究海区水体中硝酸氮的含量具有明显的月份变化,5~lO月含量较低,l1~4月含量较高;相对于硝酸态氮,氨氮的含量较低,随月份变动也较小;总无机氮的含量变化与硝酸氮含量变化趋于一致;总无机磷含量随月份的变动也较大,在2~ 6月含量较低,1l~1月含量较高。鼠尾藻生长有着明显的月份变化,4~5月生长最快,6~7月藻体达到最大长度;侧枝一般在4月开始出现,7月达到最长。对鼠尾藻体内的碳、氮、磷、碳水化合物以及色素进行测定的结果表明.鼠尾藻体内的碳含量变化较小,一般在25.6 ~33.O 之间;氮的含量变化较大,12~ 5月含量较高,超过3 ,7~ 11月含量较低,低于3 ;磷的含量也具有很大的波动,在1l~4月含量较高,5~ 1O月含量较低。色素含量具有明显的月份变化,l2~3月含量较高,7~1O月含量较低。碳水化舍物含量在4~7月时较高,最低出现在8~9月。

【题目】干出对潮间带不同垂直位置海藻的生长
【中文关键词】干出;海藻;生长;光合作用
【英文关键词】无
【中文摘要】研究了青岛潮间带地区的4 种海藻:叉枝藻(Gymnogong rus f label l i f ormis Harvey ,高潮带) 、孔石莼(Ul va pertusa kjellm ,中潮带) 、缘管浒苔(Enteromorpha l inz a (L.) J . Agar2dh ,中潮带) 和扁江蓠(Graci laria te x tori i (Suring) De Toni ,低潮带) 在干出状态下的脱水率及每天干出0 、0. 5 、1 、2 、4 和6h 下的生长和光合作用。结果表明:干出状态下缘管浒苔的脱水率最小,因为它具中空管状构造;其余3 种海藻的脱水率依次为扁江蓠> 孔石莼> 叉枝藻,但三者差异不大。与水中对照(0h) 相比,高潮带的叉枝藻在不同干出处理下的生长和光合作用速率下降(P < 0. 05) 。中潮带的孔石莼在一定干出时间内促进其生长和光合作用(P < 0.05) ,缘管浒苔则未见显著的促进作用。低潮带的扁江蓠在干出处理下几乎不能生长和存活。

【题目】仿刺参摄食砂砾粒度的选择性研究
【中文关键词】仿刺参; 摄食; 粒度选择
【英文关键词】无
【中文摘要】在对自然海区和池塘养殖的仿刺参消化道内含物中砂砾粒度调查的基础上, 选择不同粒度的砂砾作为试验材料, 对苗种培育阶段不同规格仿刺参的摄食行为进行了研究。结果表明: 仿刺参对摄食的砂砾粒度的选择性十分显著, 自然海区仿刺参依生存环境的差异, 其消化道内砂砾粒度组成比例略有差异, 但其60%粒度组成区间为010625~015 mm; 池塘养殖仿刺参消化道内砂砾粒度组成60%粒度区间为< 0125mm; 室内试验中, 在各粒级砂砾比例相同的条件下各试验组仿刺参均表现出一致的粒度选择性, 在其选择的砂砾颗粒粒度中, 60%以上的颗粒粒径为01125~015 mm。因此可认为仿刺参摄食砂砾粒度的选择范围为01125~0125 mm。

【题目】温度和盐度对半滑舌鳎幼鱼消化酶活性的影响
【中文关键词】半滑舌鳎; 蛋白酶; 淀粉酶; 脂肪酶; 盐度; 温度; 比活力
【英文关键词】无
【中文摘要】以半滑舌鳎(Cynoglossus semilaev is G nther) 幼鱼为实验对象, 分别设置3 个盐度水平(22、2 6 和30) 和4 个温度水平(18, 21, 24 和27) , 采用酶活性分析的方法比较研究了在不同温度和盐度的养殖环境下, 半滑舌鳎肝胰脏和肠道内不同部位蛋白酶、淀粉酶和脂肪酶3 种消化酶活性的差异。结果表明, 盐度和温度对半滑舌鳎消化酶活性影响均显著(P< 0. 05) 。不同温度和盐度组合下, 3 种消化酶活性变化有所差异。总体比较, 肝胰脏和肠道内3 种消化酶比活力均以盐度26、温度21 和24 组合下活性较高。在相同温度和盐度下, 肝胰脏和肠道的不同部位的3 种消化酶活性有所差异, 其中, 蛋白酶比活力以肝胰脏和后肠最高, 显著高于前肠和中肠(P< 0. 05) ; 淀粉酶比活力以肝胰脏内最高, 各肠段之间淀粉酶比活力差异不显著(P > 0. 05) ; 淀粉酶比活力也以肝胰脏内最高, 其次分别为前肠、后肠和中肠, 各部位脂肪酶比活力差异显著(P > 0. 05) 。本研究发现半滑舌鳎幼鱼体内淀粉酶比活力相对比较高, 说明半滑舌鳎幼鱼对淀粉具有较强的消化能力, 建议在配制半滑舌鳎幼鱼饲料时可适当提高淀粉比例, 以降低饲料成本。

【题目】日粮水平对周期性变温模式下刺参生长和能量收支的影响
【中文关键词】刺参; 周期性变温; 日粮水平; 能量收支
【英文关键词】无
【中文摘要】变温对不同水生生物生长的影响有所不同, 对部分种类具有明显的促进作用, 而由于种类或温度设置等差异, 研究结果各有差异。刺参(Ap ostichop us jap onicus) 在生长和生理水平上对一定程度上的符合自然水域温度波动曲线的周期性变温具有积极响应, 作者研究在2 个变温平均温度(均温15, 18) , 5 个日粮水平(饥饿; 0. 3%初始体重; 0. 6%初始体重; 0. 9%初始体重; 1. 4%初始体重) 下刺参幼参的生长、摄食和能量收支。结果表明, 在饱食条件下, 刺参在变温条件下生长率高于相应的恒温对照, (15 3) 下差异达到显著水平。在各日粮条件下, (15 3) 下刺参的生长率均高于(18 3) 下对应日粮组。随日粮水平的升高, 食物吸收率(FI) 和食物转化率(FCE) 显著升高。食物转化率变温组均大于恒温处理组, 且在均温15 下变温组显著高于恒温组(P< 0. 05) 。在能量分配模式中呼吸能占比例最大, 且随变温均温升高而显著增加, 是造成不同温度下刺参生长率变化的主要因素之一。在(15 3) 和(18 3) 下, 刺参以能量表示的维持日粮值分别为0. 39%和0. 51%, 与相关资料报道的恒温状态下维持日粮相比, 一定程度上的变温并不会提高刺参的维持代谢。

【题目】缢蛏致病菌假单胞菌的分子生物学分析
【中文关键词】缢蛏;假单胞菌; 16SrDNA
【英文关键词】Sinvnovacula constricta; Pseudomonas sp; 16SrDNA
【中文摘要】从患病缢蛏(S invnovacula constricta)中分离到一株病原菌,命名为1#菌株。采用传统方法提取菌株DNA,PCR扩增其16SrDNA基因片段、测序,得到该菌基因片段序列长度为1438bp。用MegAlign软件进行比对5种不同种细菌基因序列,构建进化树。16SrDNA产物序列分析结果表明: 该菌株的16SrDNA的核苷酸序列与多株假单胞菌(Pseud2om onas sp)的同源性为99% ,在系统发育树上构成一个分支。在细菌系统发育分类学上,该菌株属于假单胞属,但与已定名的假单胞菌有一定的差异,与几种未定名的假单胞菌的亲缘关系最接近。对其分类地位的最后确定还需进一步的系统发育学分析。
【英文摘要】There was one pathogenic strain isolated from Sinvnovacula constricta, which was named 1#. The DNA was extrac2ted with the tradition method. The 16SrDNA fragment was amp lified from strain 1 # by PCR. Its gene fragments contains1438bp. Using the MegAlign software, the homologus sequences were compared and the molecular phylogenetic tree wasconstructed. The 16SrDNA sequence homology and phylogenetic analysis indicated that strain 1# shared 99% 16SrDNA se2quence homology with Pseudomonas sp and these sequences constituted a branch in phylogenetic tree. In the phylogeneticframework of bacterial classification, the strain 1# belongs to Pseudomonas sp. But the results showed that the strain 1# wasdifferentiated from any of the named Pseudomonas species. Based on the phylogenetic analysis, the strain 1# exhibited thehighest levels of similarity to Pseudomonas sp. Therefore, their taxonomic p lacement needs more informationon genes level.

【题目】4 种海参16S rRNA 和COI 基因片段序列比较及系统学研究
【中文关键词】海参;16S rRNA 基因;COI 基因;序列比较;系统发育分析
【英文关键词】无
【中文摘要】采用PCR 技术对来自山东荣成、长岛、俄罗斯和日本的刺参(Apostichopus japonicus),来自澳大利亚的黄乳海参(Holothuria fuscogilva),来自冰岛的北大西洋瓜参(Cucumaria frondosa) 和来自福建的二色桌片参(Mensamaria intercedens)的16S rRNA 和COI 基因片段进行了扩增和测序,分别得到了长度约为500 bp 和540 bp 的片段。通过统计变异位点、平均核苷酸差异数和核苷酸多样性指数进行基因序列变异分析。结果表明,根据16S rRNA、COI 基因片段进行刺参种内差异比较时,长岛和荣成刺参序列差异最小,和日本刺参序列差异最大;刺参和其他科3 种海参种间的序列差异远远高于刺参种内差异。从GenBank 中选取7 条海参序列与本研究所测序列一同构建了NJ 和ME 系统树。根据2 种基因片段的系统学分析均表明,刺参属和拟刺参属亲缘关系很近,可能有共同的起源。而海参科未与同属于楯手目(Aspidochirolida)的刺参科聚类,而与枝手目瓜参科和沙子鸡科聚为一支,与形态学的分类不一致

【题目】三疣梭子蟹分子生物学研究进展
【中文关键词】三疣梭子蟹;分子生物学;分子标记技术;mtDNA
【英文关键词】无
【中文摘要】三疣梭子蟹作为重要的海洋经济动物,在基础生物学方面有较为全面的研究和总结,但在分子生物学方面的研究还处于起步阶段,相关研究主要集中在同工酶谱分析、RAPD分子标记研究和线粒体基因组序列分析等方面。本文对

三疣梭子蟹分子生物学,尤其是分子标记技术的应用研究取得的进展情况进行了阐述,探讨了三疣梭子蟹的研究发展方向,为今后更为系统地研究三疣梭子蟹提供理论依据。

【题目】薄片镜蛤人工育苗技术的初步研究
【中文关键词】薄片镜蛤; 附着基; 人工育苗
【英文关键词】无
【中文摘要】于2007年5月—9月, 对薄片镜蛤Dosinia lam inata的室内人工育苗技术进行了初步研究, 并成功培育出壳长112~115 mm的稚贝300万粒。平均壳长为(60190 ±2124) mm的雌性个体每次产卵量为200万粒; 在水温2415~2515 ℃、盐度27、pH 715的条件下, 受精卵约经过22 h 40 min发育为D形幼虫; 薄片镜蛤的卵径、D形幼虫、变态规格、单水管稚贝和双水管稚贝大小(壳长×壳高, 下同) 分别为(70133±1106) μm、(100133 ±1130) μm × (81107 ±1172) μm、(213133 ±8102) μm × (202100 ±5196) μm、(309117 ±9117) μm × (301167 ±10181) μm、(1158133 ±9131) μm × (1067150 ±10184) μm。浮游期间(0~10日龄) , 幼虫壳长、壳高的生长速度分别为(8128 ±0170) μm /d、(9119 ±0176) μm /d, 存活率为(3618 ±3178) %; 变态期间(10 ~14 d) , 幼虫壳长、壳高的生长速度分别为(8146 ±0142) μm、(8104 ±0145) μm, 变态率为(510 ±1125) % , 变态持续时间为4~5 d; 稚贝期间(14~40日龄) , 单水管、双水管稚贝的生长快于幼虫期, 单水管稚贝壳长、壳高生长速度分别为(32119 ±2106) μm /d、(28175 ±1197) μm /d, 双水管稚贝壳长、壳高生长速度分别为(53107 ±40143) μm /d、(47186 ±38122) μm /d, 存活率为(8112 ±3136) %。以海泥为附着基采苗效果较好。

【题目】饥饿对长牡蛎能量储存和配子发生的影响
【中文关键词】长牡蛎; 饥饿; 能量储存; 配子发生
【英文关键词】无
【中文摘要】海洋贝类的繁殖周期与能量储存、利用的季节变化和环境因素密切相关。为了弄清长牡蛎配子发生时的能量来源,自2005 年11 月~2006 年4 月,在限制食物条件下研究了饥饿对长牡蛎(Crassost rea gigas) 能量储存及配子发生的影响。结果显示,实验初期饥饿组长牡蛎性腺,闭壳肌和外套膜中的糖原含量即出现下降,随后闭壳肌和外套膜中的脂肪含量开始逐渐降低,而各组织中的蛋白质含量在整个实验过程中一直较稳定。这表明长牡蛎在食物限制的初始阶段主要利用糖原作为能量,当糖原消耗到一定程度时则开始利用脂肪作为代谢能源。实验期间,饥饿组长牡蛎的条件指数逐渐降低,水分和灰分含量逐渐升高,表明长牡蛎通过分解自身的贮能物质提供能量,使体内有机物含量减少,从而导致水分和灰分含量上升。饥饿组长牡蛎各组织中的RNA/ DNA 比值在实验过程中均呈下降趋势,表明其可作为1 个很好的生理指标用于评价长牡蛎的营养状况。组织学观察显示,对照组长牡蛎性腺在4 月开始进入增殖期,而饥饿组性腺则处于发育停滞状态,表明长牡蛎的性腺发育需要外界食物供应。

【题目】重金属铅在刺参组织的蓄积、分配、排放规律研究
【中文关键词】铅; 刺参; 蓄积; 排放; 多糖
【英文关键词】lead; Apostichopus japonicus Liao; accumulation; elimination; amylase
【中文摘要】采用暴露实验方法, 研究了海水中铅在刺参内脏、纵肌、体壁组织内吸收、积累和排放规律。结果表明, 铅浓度为0.5 mg · L- 1时, 在不投喂的情况下, 各组织中铅蓄积量随暴露时间增加而增大, 第12 d 达到吸收平衡, 此时铅蓄积量(mg · kg- 1 干重) 为内脏(162.76) >纵肌(138.61) >体壁(71.14) 。蓄积速率为内脏团>纵肌>体壁, 这表明内脏是铅蓄积的主要部位。染毒18 d 后将刺参分为两组均移入清洁海水中, 分别在投喂普通饵料和投喂添加海藻多糖的普通饵料的条件下, 进行排放实验, 结果表明, 随排放时间增加各组织铅蓄积量明显下降, 第24 d 时各组织中铅大部分排出。未添加多糖一组排放率为纵肌(59.12%) >内脏团(52.02%) >体壁(47.86%) , 添加多糖组各组织铅排放率要高于未添加多糖组, 为内脏团(80.29%) >纵肌(67.85%) >体壁(51.41%) 。表明, 受铅污染的刺参在清洁海水暂养一段时间后, 各组织器官均能排放出一部分重金属, 其中可食用部分体壁可排出大约50%, 饵料中添加海藻多糖对重金属铅的排放有明显促进作用。
【英文摘要】With exposure experiment, this paper studied the accumulation and elimination of lead(Pb) in the viscera , longitudinal musclebands and body wall of Apostichopus japonicus Liao. It was demonstrated that when the lead concentration was 0.5 mg · L- 1, each tissue ’s leadaccumulation increased with the elapse of time, on the 12th day the tissues ’ lead accumulations reached equilibrium. At that time, the accumulationof lead in the tissues were in the sequences of viscera (162.76 mg · kg- 1) >longitudinal muscle bands (138.61 mg · kg- 1) >body wall(71.14 mg · kg- 1) . Uptake rates were in the sequences of viscera> longitudinal muscle bands> body wall, which meant that viscera was themain target for Pb accumulation. Then, remaining animals were transferred to clean seawater for the elimination phase of 24 days. These animalsmentioned above were divided into two groups. One group was fed with common diet, the other group was fed with common diet addingamylase. It was demonstrated that the Pb accumulations in the tissues decreased with the elapse of time. On the 24th day after moving, the Pbeliminations were nearly at the end. The elimination rates of the group adding amylase in the common diet were in the sequences of viscera(80.29%) > longitudinal muscle bands(67.85%) > viscera(51.41%) , and they were greater than the other group. It was suggested that addingamylose in the common die could accelerate the elimination rates of lead in the tissues of Apostichopus japonicus Liao.

【题目】饥饿和再投喂对青蛤(Cyclina sinensis)幼虫生长、存活及变态的影响
【中文关键词】饥饿; 青蛤幼虫; 补偿生长; 不可逆点; 存活; 变态
【英文关键词】starvat ion; Cyclina sinensis larvae; compensatory grow th; po int of no return; surviva;l m etam orphos is
【中文摘要】在温度18. 2~ 20. 6 , 盐度23~ 25, pH 7. 96~ 8. 14 的条件下, 研究了饥饿和再投喂对青蛤幼虫生长、存活及变态的影响。结果表明: 在饥饿状态下, 幼虫具有生长现象, 且随着饥饿时间的延长, 壳长逐渐接近一个常值而不再生长; 幼虫可以由面盘幼虫发育到足面盘幼虫。随饥饿时间延长存活率下降; 且足面盘幼虫及其变态规格、单水管稚贝规格随着饥饿时间延长而减小;幼虫的不可逆点(PNR)为12. 48d; 延迟变态时间长达12. 7d。饥饿后再投喂相同的时间, 幼虫能够恢复生长, 存活的幼虫能够变态; 稚贝表现出补偿生长现象, 以壳长作为衡量标准, 完全补偿生长能力依次为: S10 > S11 > S12 > S1 > S2 > S3; 超补偿生长能力依次为: S9 > S8 > S7 > S6 > S5 > S4。

【英文摘要】The mi pact of starvation and refeed ing on larval grow th, surviva,l and m etam orphosis o f clam Cyclina S inensisw as investigated at 18. 2- 20. 6 , salin ity 23- 25, and pH 7. 96- 8. 14. T he larvae w ere not fed for up to 13 days at 1 day intervals, followed by refeeding for the rem aining o f a 28 day period. The results show ed that unfed clam larvae grew forabout 7 days to 139. 5 m by us ing endogenous nutrients and then the shell length plateaued. T he larvae thatw ere not fedfor 13 days were able to develop from the umbo vellger to plantigrade larvae. How ever, as the starvation period pro longed,larval surv ival rate and the s ize of plant igrades, metamorphosed larvae, and s ingle s iphon juveniles decreased. T hecalculated po int of no return (the thresho ld during starvation after wh ich larvae can no longermetamorphose even if food isprovided) for the larvae was 12. 48 days, and the duration of delayed m etamorphos is reached 12. 7 days. During therefeeding phase follow ing various starvation periods, the larvae were able to recover grow th and metamorphos is, exhibitingthe compensatory grow th. Juveniles thatw ere not fed for 1, 2, 3, 10, 11, or 12 days during the larval stage w ere able tocatch up the size of juveniles that were fed daily during the 28 day period. How ever, juveniles thatw ere not fed for 4- 9days during the larval stage surpassed the size of juveniles that were fed daily. During the 4- 9 days of starvat ion, grow thrate of juveniles increased w ith increas ing days of starvation. These results indicate that Cyclina S inensis larvae andjuveniles have the capac ity to com plete ly compensate for loss of grow th and metamorphos is for up to 12 days (post hatch) ofstarvation. H ow ever, starvation during this early life stage dram atically dmi inishes surviva.l

【题目】硬骨鱼类雌激素受体及其在生殖调节中的作用研究
【中文关键词】雌激素受体; 激素; 生殖
【英文关键词】无
【中文摘要】在脊椎动物中,雌激素的生理作用是通过雌激素受体(ER) 介导的,这种转录因子属于类固醇激素核受体家族成员。从哺乳动物到硬骨鱼类,均存在2 种ER 类型,即ERα和ERβ。与高等脊椎动物不同的是,由于基因重复等原因,硬骨鱼类ERβ存在异型体结构,称为ERβ1 和β2 或者ERβ和γ,它们在鱼类胚胎发育和性腺发育过程中表现为不同的组织分布和表达类型。一般认为,雌激素主要调节雌性个体的生理功能。然而,鱼类的精巢也表现明显的雌激素受体活性,说明雌激素也参与调节硬骨鱼类精巢的生理功能。

【题目】温度、盐度和光照强度对鼠尾藻氮、磷吸收的影响
【中文关键词】鼠尾藻,温度,盐度,光照强度,氮,磷,吸收速率
【英文关键词】无
【中文摘要】在实验室条件下,研究了不同的温度和盐度组合,温度和光照强度组合对鼠尾藻(Sargassum thunbergii) 氮、磷吸收速率的影响。结果表明,上述3 个环境因子对鼠尾藻氮、磷吸收速率均有显著影响。其中,温度和盐度对鼠尾藻氮、磷吸收速率有极显著影响(P<0.01),二者交互作用也极显著(P<0.01)。在盐度20、温度25°C条件下和盐度30、温度30°C条件下,鼠尾藻对氮有较高吸收速率,分别为11.26 μmol/[g(dw)·h] 和11.01 μmol/[g(dw)·h];在盐度40、温度15~30°C范围内对磷的吸收速率较大,达到1.5 μmol/[g(dw)·h] 以上。温度和光照对鼠尾藻氮、磷吸收速率均有极显著影响(P<0.01),二者交互作用极显著(P<0.01)。在温度15°C和光照强度140~180 μE/(m2·s) 以及温度20~25 °C和光照强度60~100 μE/(m2·s) 条件

下,鼠尾藻对氮有较高吸收速率,均在9.60 μmol/[g(dw)·h] 以上;在温度25 ℃和光照强度60 μE/(m2·s) 条件下,鼠尾藻对磷的吸收速率达到最大,为1.30 μmol/[g(dw)·h]。本研究结果表明,鼠尾藻总体上对水体中的氮、磷均具有较高的吸收速率,且能较好地同时吸收NH4+-N 和NO3--N,显示了它对海水环境中营养盐具有较强的吸收能力。

【题目】鱼类内源性生长激素释放肽的研究进展
【中文关键词】鱼;生长激素释放肽;内分泌;生理功能
【英文关键词】无
【中文摘要】:生长激素释放肽(Ghrelin)是在哺乳动物中发现的第一个生长激素促分泌素受体的内源性配体,部分鱼类的Ghrelin 基因和肽链结构已经被确定。与哺乳动物相似,鱼类Ghrelin 的主要分泌部位也在消化道,但在脑、肾脏、鳃、心脏等组织中也有少量分泌。鱼类的Ghrelin 参与多种生理功能的调节,包括促进摄食以及调节脑垂体内多种激素的分泌,可促进脑垂体分泌LH 和GH,某些鱼类Ghrelin 可能具有促进脑垂体分泌PRL 的功能。本文综述了近年来鱼类Ghrelin 结构与生理功能研究概况,旨在为丰富鱼类内分泌生理学研究提供参考资料。

【题目】低温对不同群体仿刺参幼参某些生理现象的影响
【中文关键词】仿刺参; 不同群体; 低温; 耐受能力
【英文关键词】无
【中文摘要】在实验室条件下研究了低温对仿刺参的中国群体(C ×C) 、俄罗斯群体(R ×R) 、中俄杂交群体(R ×C) 和韩国群体(K ×K) 幼参的影响。试验最低温度为- 2 ℃, 各试验组仿刺参幼参在0 ℃以下持续时间分别为48~57 d。试验期间, 溶解氧为715~1015 mg/L, pH为7130~8120。结果表明: 低温下不同群体仿刺参都出现排脏、皮肤溃烂(化皮) 和死亡等现象; 在118~110 ℃以下, 仿刺参幼参紧缩不动并停止摄食活动; 体重为(01813 ±01043) g的不同群体仿刺参, 低温下平均死亡率最高的是仿刺参的韩国群体(9518%) , 最低的是仿刺参中俄杂交群体(R♀ ×C♂) (2018%) , 对低温耐受能力的顺序是: R♀×C♂ >C♀ ×R♂ >R ×R >C ×C > K ×K; 平均体重为0121、0180、2100 g 3个规格仿刺参的中国群体,其平均死亡率分别为7315%、1617%和1010% , 说明大规格的仿刺参比小规格的耐低温能力强。低温过程以后, 当温度缓慢上升到1410 ℃时, 仿刺参恢复活力, 轻度溃烂的皮肤可再生、痊愈。

【题目】pH 不同处理时间的周期性变动对凡纳滨对虾生长的影响
【中文关键词】pH; 周期性变化; 凡纳滨对虾; 生长
【英文关键词】无
【中文摘要】探讨不同的pH 变动模式对对虾生长的影响, 设计2 个独立的实验, 分别研究pH 值为8. 9 和4. 0 的不同时间的处理条件下, 酸碱度的周期性变化对凡纳滨对虾的生长的影响, 实验1 设置了2 个恒定pH 组(7. 9 0. 15 和4. 0 0. 10) 和5 个pH 周期性变动的处理: 对虾每2 天在pH = (4. 0 0. 10) 下分别处理0. 5, 1, 2, 4 或12 h, 其它时间处在正常pH= 7. 9 中。结果表明, 每2 天1 h 以上的pH= 4. 0 的处理就能显著阻碍对虾的生长, 而每2 天12 h 以上的pH = 4. 0 的处理就能显著影响对虾的成活率。实验2 设置了两个恒定pH 组(分别为7. 9 0. 15 和8. 9 0. 10) 和6 个pH 周期性变动的处理: 对虾每天在pH= 8. 9 0. 10 下分别处理0. 5, 1, 2, 4, 8 或12 h, 其它时间处在正常pH 中(7. 9) 。结果表明恒定的高pH(8. 9 0. 10) 显著抑制了对虾的生长, 而每天给予凡纳滨对虾2 h 和4 h 的pH= 8. 9 的刺激则能提高其摄食率和食物转化率, 并显著促进其生长。总之, pH 值周期性地向酸性环境方向波动会明显妨碍对虾的生长, 而向碱性环境方向的波动则会促进对虾的生长, 而且这一影响的强度与波动持续的时间长短有关。

【题目】几种虾、贝、藻混养模式能量收支及转化效率的研究
【中文关键词】能量收支; 能量转化效率; 生态效率; 混养
【英文关键词】无
【中文摘要】实验采用围隔实验方法, 对凡纳滨对虾(Litopenaeus vannamei) 、青蛤(Cyclina sinesis) 、菊花心江蓠(Gr acilar ialichevoides) 和活菌净水剂的不同单、混养生态系统的能量收支和转化效率进行了研究。实验结果表明, 实验期间系统接受的总太阳光辐射能为1 983. 2 MJ/ m2。浮游植物对光能的利用效率在各处理间无差异(0. 147? 0. 007) %, 混养江蓠显著地提高了总利用效率(0. 308? 0. 019)%。总能量的转化效率, 虾藻混养(28. 36%) 和江蓠单养(27. 65%) 最高, 其次是虾贝藻混养(26. 70%) , 对虾单养(12. 24%) 最低。单位净产量对饲料能的消耗, 对虾单养(21. 24 MJ/ kg) 最多, 虾菌、虾贝混养(18. 76~18. 97 MJ/ kg) 次之, 而虾藻、虾贝藻混养(2. 64~ 3. 24 MJ/ kg) 则显著地降低了饲料消耗量。实验中投喂组都有较多的能量沉积, 对虾单养沉积量达到1. 10 MJ/ m2, 虾贝混养(1. 30 MJ/ m2) 稍高, 而虾贝藻、虾菌、虾藻混养平均为0. 53 MJ/ m2, 显著地低于对照。结果表明, 混养青蛤和菊花心江蓠显著地提高了对虾养殖中的光能利用率和能量转化效率, 减少了能量沉积, 从而大大地提高了能量的利用效率。

【题目】盐度日节律性连续变化对孔石莼生长和生化组成的影响
【中文关键词】盐度变化; 孔石莼; 生长; 生化组成
【英文关键词】无
【中文摘要】利用实验生态学的方法, 探讨盐度日节律性连续变化对孔石莼(Ulva p ertusa) 生长和生化组成的影响, 旨在查明潮间带大型海藻对盐度日节律性连续变化的适应性。实验共设5 个盐度日节律变化处理(30 3, 30 6, 30 9, 30 12 和30 15) 和1 个恒盐(30 0) 对照处理。实验结果表明: 孔石莼能够耐受较大范围的盐度日节律性连续变化, 这种变化虽然对孔石莼的生长不利, 但是仍然能够使孔石莼的相对生长率保持在12%以上; 盐度变化幅度 3~ 15 与恒盐对照相比明显不利于孔石莼的生长, 盐度变化幅度越大, 孔石莼生长越缓慢。同恒盐处理相比, 盐度日节律连续变化对孔石莼叶绿素含量的影响不明显, 但叶绿素a 和叶绿素b 含量都有随着盐度变化幅度的增大而逐渐减少的趋势。盐度日节律性连续变化使孔石莼蛋白质和可溶性糖的相对含量显著增加(P< 0. 05) , 随着盐度变化幅度的增大, 蛋白质和可溶性糖增加的趋势越明显, 并且在盐度日节律性连续变化下, 蛋白质增加的速度比可溶性糖增加的速度要快。同时, 游离脯氨酸的相对含量随着盐度变化幅度的增加而增加, 但是在缓和的盐度日节律性连续变化下(30 3) 孔石莼游离脯氨酸的含量却显著小于恒盐对照组(P <0. 05) 。盐度日节律性连续变化同恒定盐度相比, 虽不利于孔石莼的生长, 却促进了孔石莼生化产物的合成, 是海藻干露时品质得以提高的原因之一。

【题目】虾类消化道菌群研究进展
【中文关键词】虾类; 消化道菌群; 影响因素; 作用
【英文关键词】无
【中文摘要】虾类消化道内生活着大量的细菌,它们成为虾体内不可或缺的重要组成部分,影响着机体的生长与健康。文章综述虾类消化道菌群的来源、组成以及作用。这些细菌主要来源于水体和食物中,常见的优势菌主要有发光杆菌属、弧菌属、气单胞菌属、假单胞菌属等。消化道菌群既可以为宿主提供营养、辅助消化,又能够拮抗病原、影响宿主的健康。它们的组成与变化既与虾类自身的种类、发育时期以及健康状况等因素有关,也受到包括水环境的盐度、温度、氧气浓度、饵料和药物等因素的影响。

【题目】奶牛规模化健康养殖关键技术措施
【中文关键词】奶牛, 规模化, 健康养殖
【英文关键词】无
【中文摘要】健康养殖是一种带有以畜为本、动物福利观念的养殖概念,它把现代化畜牧业的四大支柱——遗传育种、动物营养、家畜环境工程和兽医防疫等最先进的养殖科学技术,与动物的生理、行为要求有机地结合在一起,体现了动物与自然的和谐。发展畜牧业不仅要保持动物的健康状态,更要追求畜产品的最佳生产状态,而健康养殖正是人类考虑到与动物和谐相处,以畜为本,在其最佳心理、生理状态下高效、优质生产畜产品的最佳模式。从引种繁育、疫病防治、动物营养、环境工程等方面实施奶牛的健康养殖技术,即保证牛群的健康,又减少对牛奶品质的影响。尽管健康养殖的观念刚刚提出,但它代表了畜牧业发展的趋势。在推动具有可持续性的生态标准化养殖方面发挥重要示范带动作用,能够推进我国集约化、规模化奶牛养殖业的健康发展,促进奶牛养殖业向数量与质量、效益与生态并重的方向转变,提高奶牛养殖业的综合效益。

【题目】Effects of diel temperature fluctuations on growth, oxygenconsumption and proximate body composition in thesea cucumber Apostichopus japonicus Selenka
【中文关键词】无
【英文关键词】Sea cucumber; Apostichopus japonicus; Fluctuating temperature; Growth; Body composition; Oxygen consumption
【中文摘要】无
【英文摘要】We studied the effects of constant temperatures (12, 15, 18, 21 and 24 ° C) and diel fluctuating temperatures (15±2, 18±2 and21±2 ° C) on growth, proximate body composition and oxygen consumption of juvenile sea cucumbers (oxygen consumption wasnot measured at 12 and 24 ° C). Growth of juveniles varied at different constant temperatures (Pb0.05) and the maximum specificgrowth rate (SGR) was 1.48% day − 1 at 16 – 18 ° C. SGR was significantly decreased at 24 ° C in comparison with the other fourconstant temperatures. Compared to the corresponding constant temperatures, growth rate increased at the fluctuating temperatureswith mean temperature below the constant temperature optimum for growth (18 ° C) and decreased at the fluctuating temperatureswith mean temperature above 18 ° C. Body crude lipid content increased with the increase in final body weight, both at the constanttemperatures and fluctuating temperatures. Crude lipid contents under the fluctuating temperatures were lower than those under thecorresponding constant temperatures. Under fluctuating temperatures, oxygen consumption rates increased, but not significantly,compared to those in the corresponding constant temperatures. The fluctuating temperature mode, derived from this research, couldbe applied to the large-scale culture of sea cucumber

【题目】Growth and oxygen consumption of the juvenile seacucumber Apostichopus japonicus (Selenka) at constant and fluctuating water temperatures
【中文关键词】无
【英文关键词】Apostichopus japonicus, growth, oxygen
consumption, temperature £ uctuation, thermal
amplitude

【中文摘要】无
【英文摘要】The e ¡ ects of thermal amplitudes of diel £ uctuatingtemperature on growth and oxygen consumption ofthe juvenile sea cucumber Apostichopus japonicus(Selenka) were studied at the average temperaturesof 15 and 18 1C with three diel di ¡ erent £ uctuatingamplitudes of 2, 4 and 6 1C. The optimumthermal amplitudes for growth of the juvenile seacucumber at the sizes of this experiment, at averagetemperatures of 15 and 18 1C, were estimated to be 1.38 and 1.67 1C respectively. In the constanttemperature regimes, the growth rate at 15 1C washigher than that at 18 1C. However, the growth rateat 18 2 1C was higher than that at 15 2 1C. Theresults from this study suggested that £ uctuatingtemperatures enhanced the optimum temperaturefor the growth of sea cucumbers compared with thatat constant temperatures.Therefore, accurate predictionsof the optimum temperature of sea cucumbersin the natural environment, in whichwater temperatures £ uctuate daily and seasonally, should be madefrom data obtained at £ uctuating temperatures

【题目】The effects of thermal amplitude on the growth of Chinese shrimp Fenneropenaeus chinensis (Osbeck, 1765)
【中文关键词】null
【英文关键词】Diel fluctuating temperature; Specific growth rate; Food consumption; Food conversion efficiency; Fenneropenaeus chinensis (Osbeck)
【中文摘要】无
【英文摘要】Effects of thermal amplitude of diel fluctuating temperature on the growth, food consumption, food conversion efficiencyand apparent digestibility coefficient of Chinese shrimp, Fenneropenaeus chinensis (Osbeck), with initial body weight of0.36F0.04 g were studied at average temperature 25, 28 and 31 8C from May to July, 2000. Among four diel differentfluctuation amplitudes of F1, F2, F3 and F48C, the growth rate of shrimp at 25F2, 25F3, 28F2 and 31F1 8C weresignificantly higher than those at corresponding constant temperatures of 25, 28 and 31 8C, respectively, while growth rate at31F4 8C was significantly lower than at 31 8C. There is a trend that the optimal thermal amplitude for shrimp growth decreasedwith the increase of average temperature in the present study. The growth rate of Chinese shrimp was a quadratic function of thethermal amplitude at the same average temperature. Such a growth model may be described byG ¼ b0 þ b1 ð TA Þ þ b2 ð TA Þ 2where G represents the specific growth rate on a 33-day basis, TA is thermal amplitude in degree Celsius, b0 is intercept on Gaxis, and b1 and b2 are the regression coefficients. The optimal thermal amplitude for the growth of shrimp at sizes of thisexperiment at average temperature of 25, 28 and 31 8C was estimated to be F2.0, F2.2 and F1.4 8C, respectively. The changesof food conversion efficiency were similar to the growth rate, while the trends of food consumption of shrimp betweenfluctuating temperature and constant temperature were variable at different average temperatures. There was no significantdifference in apparent digestibility coefficient between diel fluctuating temperatures and corresponding constant temperatures.Therefore, more food consumption, high food conversion efficiency and more energy partitioned into growth might account forthe enhancement in the growth of shrimp at the diel fluctuating temperatures in the present study.

【题目】Effects of seawater potassium concentration on the dietary potassium requirement of Litopenaeus vannamei

【中文关键词】null
【英文关键词】Potassium; Dietary requirement; Litopenaeus vannamei; Inland; Growth
【中文摘要】无
【英文摘要】Effects of seawater potassium concentration on the dietary potassium requirement of Litopenaeus vannamei were studied underthe condition of artificial seawater at salinity 30‰. Three potassium concentrations in the water were set: 332, 156 and 104 mg l − 1.And the potassium contents of the casein-gelatin-based experimental diets were 1.09%, 1.53%, 2.49% and 3.46%, respectively. Thefeeding trial lasted for 56 days. Growth, feeding, nutrient retention and feed conversion efficiency of the shrimp were significantlyaffected by the potassium concentration in the seawater (Pb0.05), but the dietary potassium levels showed little effect .The finalbody weight, specific growth rate, protein efficiency ratio and feed conversion efficiency of shrimp exposed to 104 mg l − 1 waterpotassium level were, respectively, more than 37%, 26%, 25% and 27.5% lower than of those exposed to higher water potassiumlevels (Pb0.05). No significant interaction effects were found between seawater potassium concentration and dietary potassiumlevel. Neither seawater potassium concentrations nor dietary potassium levels influenced the body potassium content. It indicatedthat L. vannamei may have poor ability of assimilating potassium from dietary sources efficiently at salinity 30‰, and dietarysupplementation of potassium had limited effect on improving growth of the shrimp while environmental potassium was sufficient

【题目】Functional characterization of a wheat plasma membrane Na+/H+ antiporter in yeast
【中文关键词】Na+/H+ 反转运蛋白,原生质膜,酿酒酵母,小麦
【英文关键词】Na+/H+ antiporter,Plasma membrane,Saccharomyces cerevisiae,Salt stress, Triticum aestivum
【中文摘要】TaSOS1,是来自小麦的盐转换因子,使用酿酒酵母作为异源表达系统对其进行进行功能分析。TaSOS1在根和叶重含量丰富,与来自拟南芥和水稻种的SOS1盐转换因子有显著的序列同源性,对其进行盐胁迫诱导处理。TaSOS1通过降低细胞中Na+含量提高K+含量从而抑制缺乏主要Na+输出系统的酵母菌株的盐敏感性。纯化后的酵母细胞质膜的Na+/H+ 转换活性高于对照空载体。以上结果表明TaSOS1有助于质膜中Na+/H+的转换。
【英文摘要】The functional analysis of the sodium exchanger SOS1 from wheat, TaSOS1, was undertaken using Saccharomyces cerevisiae as a heterologous expression system. The TaSOS1 protein, with significant sequence homology to SOS1 sodium exchangers from Arabidopsis and rice, is abundant in roots and leaves, and is induced by salt treatment. TaSOS1 suppressed the salt sensitivity of a yeast strain lacking the major Na+ efflux systems by decreasing the cellular Na+ content while increasing K+ content. Na+/H+ exchange activity of purified plasma membrane from yeast cells expressing TaSOS1 was higher than controls transformed with empty vector. These results demonstrate that TaSOS1 contributes to plasma membrane Na+/H+ exchange.

【中文关键词】细菌人工染色体;物理图谱;鲤鱼基因组
【英文关键词】BAC;physical map;common carp genome

【中文摘要】背景:鲤鱼是世界上一种重要的水产养殖鱼类,鲤鱼和其他与其亲缘关系较近的鲤科鱼类为全世界提供30%的水产养殖量,然而,鲤鱼基因组资源仍然相对薄弱。在BAC标记的发展,连锁图与物理图谱的构建,全基因序列的装配中BAC末端序列是基因研究的重要资源。结果:在鲤鱼中开发这种宝贵的资源,共有40224个BAC克隆用双末端测序测得,生产65720个平均长度为647bp的BES,代表了42522168bp或2.5%的鲤鱼基因。鲤鱼基因组的第一代测序采用生物信息学工具。鲤鱼基因组包含超过17.3%的GC重复序列,包含36.8%和518个开放阅读框转座子。鉴定和发掘BAC微卫星标记,从10355个BES中共检测到13581个微卫星。从9443个BES中的7453个BACs中,有7127个基因的编码区被公认,有1990个BACs两端都有基因。评估与斑马鱼密切相关基因的相似性,鲤鱼的BES与斑马鱼的完全不同。共有39335个鲤鱼的BES保存同系物在斑马鱼基因组中,就可证明斑马鱼与鲤鱼基因组有较高的同源性。一旦我们有了鲤鱼物理图谱,就可做鲤鱼与斑马鱼之间的比较。结论:对于鲤鱼第一代基因资源的广泛调查,BAC末端序列是宝贵的资源。鲤鱼基因组中大约有28%的重复DNA,包括较高复杂性的基因组。通过比较分析已有40000个BES映射到斑马鱼基因组,已经确定超过3100个微观共线性,覆盖了斑马鱼基因组的50%以上。鲤鱼的BES是比对两个亲缘关系较近的物种鲤鱼和斑马鱼,以及鲤鱼功能和结构的分析有重要作用。

【英文摘要】BackgroundCommon carp (Cyprinus carpio), a member of Cyprinidae, is the third most important aquaculture species in the world with an annual global production of 3.4 million metric tons, accounting for nearly 14% of the all freshwater aquaculture production in the world. Apparently genomic resources are needed for this species in order to study its performance and production traits. In spite of much progress, no physical maps have been available for common carp. The objective of this project was to generate a BAC-based physical map using fluorescent restriction fingerprinting. ResultThe first generation of common carp physical map was constructed using four- color High Information Content Fingerprinting (HICF). A total of 72,158 BAC clones were analyzed that generated 67,493 valid fingerprints (5.5 × genome coverage). These BAC clones were assembled into 3,696 contigs with the average length of 476 kb and a N50 length of 688 kb, representing approximately 1.76 Gb of the common carp genome. The largest contig contained 171 BAC clones with the physical length of 3.12 Mb. There are 761 contigs longer than the N50, and these contigs should be the most useful resource for future integrations with linkage map and whole genome sequence assembly. The common carp physical map is available at http://genomics.cafs.ac.cn/fpc/WebAGCoL/Carp/WebFPC/ webcite. ConclusionThe reported common carp physical map is the first physical map of the common carp genome. It should be a valuable genome resource facilitating whole genome sequence assembly and characterization of position-based genes important for aquaculture traits.

【题目】鲤鱼基因组中一个新的Tc1类转座子的发现和鉴定

【中文关键词】Tc1; 转座子; 鲤; 拷贝数; 重复序列

【英文关键词】Tc1;transposons;Cyprinus carpio;copy number;repetitive sequence

【中文摘要】在鲤(Cyprinus carpio)基因组中鉴别出一个新的具有潜在转座活性的Tc1 类转座子,并命名为CCTN 转座子(Cyprinus carpio Transposon, CCTN)。CCTN 转座子全长1 611 bp, 由两端约214 bp 的反向重复序列(Inverted Repeat, IR)和中间不间断的996 bp 的转座酶开放阅读框(Open Reading Frame, ORF)组成。CCTN 转座子推测的转座酶序列中存在完整的DD(34)E 结构域, 此结构域是Tc1 类转座酶作用的必需位点之一。采用实时荧光定量PCR 评估CCTN转座子在鲤基因组中的拷贝数约为2.28×103, 占全基因组的0.21%。分子系统学研究表明, CCTN 转座子是一个新的鱼类Tc1 类转座子, 其与斑马鱼(Danio rerio)Tzf-28 、大西洋鲑(Salmo salar)SALT1 和鲽(Pleuronectes platessa)PPTN2 等Tc1 类转座子亲缘关系较近。

【题目】Studies on the rotifer (.Brachionus urceus Linnaeus, 1758) as a vector in white spot syndrome virus (WSSV) transmission
【中文关键词】null
【英文关键词】White spot syndrome virus; Rotifer; Vector; Transmission; .Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】The rotifer .Brachionus urceus (Linnaeus, 1758) was experimentally infected with the white spot syndrome virus (WSSV) bythe virus – phytoplankton adhesion route in order to assess the possibility of rotifer acting as a vector of WSSV to infect the shrimp.Fenneropenaeus chinensis (Osbeck, 1765) larvae at zoea stage III. The nested-PCR test revealed WSSV-positive results in therotifers exposed to WSSV by the virus – phytoplankton adhesion route. Among 10 replicates in the infection treatment, 40% of .F.chinensis larvae became WSSV-positive when fed with WSSV-positive rotifers, whereas all were WSSV-negative for.F. chinensiswhen fed with WSSV-free rotifers. Though the mortality of shrimp larvae in the infection treatment (39.47±15.44%) was higherthan that in the control treatment (34.67±15.11%), there was no significant difference in the mortality between them (.P.N0.05).These results indicated that the rotifer could serve as a vector in WSSV transmission when ingested.

【题目】显微介导的远缘基因渐渗技术在鲤育种中的应用
【中文关键词】显微介导;远缘基因 ; 总DNA; 渐渗杂交; 中国明对虾; 鲤
【英文关键词】Microscopic mediated;Distant gene;total DNA;introgressive hybridization;Fenneropenaeus chinensis;Cyprinus carpio L.
【中文摘要】以中国明对虾(Fenneropenaeus chinensis)为外源DNA 供体, 运用显微介导的远缘杂交技术, 将中国明对虾总DNA 直接导入鲤(Cyprinus carpio L.)受精卵内, 创建鲤外源DNA 导入系, 并利用AFLP 分子标记技术和肌肉营养成分分析, 对显微介导中国明对虾基因鲤进行外源DNA 检测与蛋白质和氨基酸含量进行测定, 结果表明: (1)在30 对AFLP 引物中, 有8 对所扩增带, 其显微介导中国明对虾基因鲤亲本和子代中都有和中国明对虾基因相同而对照鲤没有的带。说明受体鱼中, 肯定有一段序列与目的基因序列一致, 研究证明了亲缘关系甚远的异源DNA 片段的超远缘杂交的可行性。(2)导入中国明

对虾总DNA 片段的显微介导中国明对虾基因鲤的蛋白质含量分别为18.37%、18.47%、17.99%, 均高于对照组(17.06%); 而氨基酸的总量分别为17.16%、17.56%、16.92%, 也高于对照组(16.13%), 其中天门冬氨酸、谷氨酸、甘氨酸、丙氨酸等4 种鲜味氨基酸含量明显超过对照组, 经数理统计分析, 均有显著差异(P<0.05)。说明直接导入中国明对虾总DNA 对显微介导中国明对虾基因鲤的营养成分和氨基酸含量均产生影响, 这可对鲤的品质改进, 丰富鲤的遗传基础, 为显微介导的超远缘杂交技术的应用提供思路。

【题目】White spot syndrome virus (WSSV) transmission from rotifer inoculum to crayWsh
【中文关键词】null
【英文关键词】Rotifer; Resting egg; White spot syndrome virus
【中文摘要】无
【英文摘要】To test the possibility that shrimp pond rotifer resting eggs and hatched rotifers could transmit white spot syndrome virus (WSSV) tocrayWsh (Procambarus clarkii), we injected crayWsh with rotifer and resting egg inocula that were WSSV-positive only by dot-blot analysisof PCR products. No crayWsh became WSSV-positive after challenge with the resting egg inoculum. However, 1/15 crayWsh becameWSSV-positive after challenge with the rotifer inoculum. The results demonstrated that rotifers constitute a potential risk for WSSVtransmission to crayWsh and other cultivated crustaceans. However, the actual quantitative risk of transmission in an aquaculture settingdepends on many variables that remain untested.

【题目】干旱胁迫对小麦农艺性状的影响
【中文关键词】小麦,干旱胁迫,农艺性状,抗旱指数,通径分析
【英文关键词】wheat, drought stress, agronomic traits, drought index, path analysis
【中文摘要】了研究干旱胁迫对小麦主要性状的影响及其机理,选用8 个抗旱性不同的小麦品种,在干旱胁迫和正常灌溉两种水分环境下,进行随机区组试验,用方差分析、t测验、和通径分析等方法分析试验结果。结果表明:干旱胁迫导致小麦株高降低,单株产量和千粒重下降, 单株穗数、总小穗数和穗粒数减少,穗长缩短,不育小穗数增多;各性状对干旱胁迫敏感程度都存在显著的品种间差异;除千粒重外,各性状的环境间差异均达到极显著水平;千粒重和单株产量的品种与环境互作达显著或极显著水平;各品种的抗旱指数差异显著;通径分析表明,各性状对单株产量的直接影响: 穗粒数>单株穗数>千粒重>穗长>不育小穗数>总小穗数>株高。干旱胁迫对小麦主要性状的影响显著,晋麦47、新旱1号和洛旱3号对干旱胁迫的抗耐性较好。
【英文摘要】The effect of drought stress on wheat main agronomic traits were analyzed using eight wheat varieties which had different drought sensitivity. The experiment was conducted on drought and irrigated conditions using randomized complete block design. The data were analyzed by means of ANOVA analysis, t tests and path analysis. The result indicated that under drought stress condition most of yield traits were decreased including plant height, yield, weight of the grains, number of spikelet, number of heads per unit area, number of grains per spikelet and length of the spike. While the sterile spikelet was increased. Most of agronomic traits between varieties were significant different to drought sensitivity. The agronomic traits were significantly different on drought and

irrigated conditons except weight of the grains. There were interaction effect between varieties and environment at significant or significantly level. Each trait has the direct effect on yield by mean of path analysis and the effect was as following: number of grains per spikelet >number of spikelet>weight of the grains >length of the spike> number of sterile spikelet> number of heads per unit area>plant height. The drought stress has the significant influence on wheat main agronomic traits. The wheat varieties Jinmai 47, Xinhan 1 and Luohan 3 had the better performance on drought stress environment.

【题目】THE INTERACTION OF SALINITY AND NA/K RATIO IN SEAWATER ON GROWTH, NUTRIENT RETENTION AND FOOD CONVERSION OF JUVENILE LITOPENAEUS VANNAMEI
【中文关键词】null
【英文关键词】salinity, Na/K ratio, interaction, Litopenaeus vannamei, growth
【中文摘要】无
【英文摘要】The effects of salinity, Na/K ratio and their interaction on growth, molting, nutrient retention and food conversion ofLitopenaeus vannamei were investigated. The test shrimp were reared in artificial seawater and fed fresh polychaete worms, Neanthesjaponica (Izuka) for 30 days. Two salinities (30 and 15 ppt) and 5 Na/K ratios (25.6, 34.1, 47.3, 102.1 and 153.3, mmol/mmol) wereset, and each treatment had four replicates. During the feeding trial, the molting frequency (MF) was affected by neither salinity norinteraction effects, but Na/K ratio had an effect ($P < 0.05$). And there was a tendency that MF rose with the increment of Na/K ratioat both salinities. Final body weight, weight gain (WG) and specific growth rate (SGR) were significantly influenced by salinity, Na/Kratio and interaction effects ($P < 0.05$), whose mean values at salinity 15 ppt were significantly higher than those at 30 ppt. At 30 ppt,WGs and SGRs of shrimp exposed to Na/K ratio 34.1 and 47.3 were respectively more than 26% and 15% higher than of those exposedto the other ratios ($P < 0.05$), but no significant differences in growth were found among treatments at 15 ppt ($P > 0.05$). Na/K ratioand interaction effects significantly affected the nutrient retention (PR and ER), food conversion (FCE) and protein utility (PER) ofthe shrimp ($P < 0.05$), whereas salinity showed little impact. At 30 ppt, the PR and ER of shrimp exposed to Na/K ratio 153.3 weremore than 30% lower than of those exposed to the other 4 ratios ($P < 0.05$); the FCEs of shrimp exposed to Na/K ratio 34.1 and 47.3were more than 20% higher than of those exposed to Na/K ratio 25.6 and 102.1 ($P < 0.05$), and the FCE of shrimp exposed to

Na/Kratio 153.3 was even lower (P < 0.05). At 15 ppt, no significant differences in FCE among treatments were found (P > 0.05). PERshowed the similar tendency as FCE at both salinities. It was indicated that the shrimp were more adaptable to abnormal Na/K ratiosat low salinity than at higher salinities, and good growth could always be obtained within a Na/K range of 34.1 – 47.3 (mmol/mmol)regardless of salinity.

【题目】小麦白粉病抗病新基因PmHNK的遗传分析和分子标记定位
【中文关键词】小麦;白粉病;微卫星标记;周98165;基因定位
【英文关键词】common wheat; powdery mildew; microsatellite marker; Zhou 98165; gene mapping
【中文摘要】周98165对河南省当前流行白粉菌生理小种具有较好的抗性,并且综合农艺性状优良。明确其抗白粉病基因及遗传特性,筛选与其紧密连锁的分子标记,为抗白粉病育种提供抗源和理论支撑。【方法】将周98165与中国春杂交、自交、测交,对双亲及其杂交后代进行苗期鉴定,用小麦白粉病菌08B1进行遗传分析,利用SSR、EST-SSR技术对双亲及抗感池进行筛选和电泳分析,并结合中国春缺四体材料进行染色体定位。【结果】周98165对3个白粉菌高毒力小种抗性良好,其抗病性受1对显性核基因控制,将该基因暂命名为PmHNK。筛选了与PmHNK连锁的5个微卫星标记,在遗传图谱上的顺序为Xbarc77、Xgwm547、Xwmc326、Xgwm299、PmHNK、Xgwm108,Xgwm299和Xgwm108分别为PmHNK 两侧距离最近的标记,图距分别为4.2cM、5.6cM,最远标记Xbarc77与PmHNK图距为10.6cM,并将PmHNK定位于3BL。【结论】抗病鉴定、遗传分析结合分子标记分析结果表明,PmHNK 是一个白粉病抗病新基因。
【英文摘要】【Objective】 Powdery mildew is one of the most important diseases of wheat worldwide. Zhou 98165, a winter wheat provided by wheat research center of Henan Academy of Agricultural Sciences, is a novel line which has highly resistant, high yield and excellent comprehensive agricultural characteristics. Inheritance of powdery mildew resistance gene and mapping of that in Zhou 98165 with simple sequence repeat (SSR) markers were studied to formulate efficient resistance gene and strategies for breeding cultivars resistant to powdery mildew.【Method】F1, F2, BC1 populations were constructed on the basis of the hybridization between Zhou 98165 and a susceptible wheat variety Chinese Spring. Powdery mildew strains LY2-1, ZZ1-1 and 02B1 were used for the test the resistance and genetic analysis of those populations with the SSR and EST-SSR primers. The location of this gene onchromosome was confirmed by the materials of monosomic CS.【Result】Genetic analysis of Zhou 98165 indicated that the resistance to powdery

mildew race 08B1 was controlled by a single dominant karyon gene, temporarily designated as PmHNK. Five SSR markers , Xbarc77, Xgwm547, Xwmc 326,Xgwm299, and Xgwm108 were linked to PmHNK as they were all located on chromosome 3BL. PmHNK, located on 3BL,closely linked to Xgwm299 and Xgwm108 with genetic distances of 4.2 cM and 5.6 cM, respectively.The farthest marker Xbarc77 was 10.6 cM to PmHNK. 【Conclusion】Genetic analysis and resistance identification with powdery mildew isolates to Zhou98165 combined with SSR markers supports the conclusion that the highly resistance gene PmHNK is a novel gene for powdery mildew in wheat.

【题目】The clam, Xishi tongue Coelomactra antiquata (Spengler) a promising new candidate for aquaculture in China

【中文关键词】null

【英文关键词】Xishi tongue Coelomactra antiquata (Spengler); Artificial reproduction; Nursery; Field cultivation

【中文摘要】无

【英文摘要】Methods and results of recent hatchery studies in rearing the clam, Xishi tongue, Coelomactra antiquata (Spengler) aredocumented in this paper. About 17 million juveniles were produced using hatchery methods, the largest production ever reported.A summary of its biological and ecological characteristics and techniques for hatchery rearing and growout are reported. Becauseof good growth rate, ease of artificial breeding and growout, this famous Chinese delicacy is a promising new candidate foraquaculture. This indigenous Chinese species has excellent potential for aquaculture; and due to its decline in natural abundance,hatchery rearing and growout may help the conservation of this species in the wild.

【题目】Calcium carbonate supersaturation and precipitation in Chinese mitten crab (Eriocheir japonica sinensis) larval ponds in China: Mass mortality, crystal form analysis, and safety saturation index

【中文关键词】null

【英文关键词】Eriocheir japonica sinensis; Larvae; CaCO3 supersaturation and precipitation; CaCO3 crystal forms; Mortality

【中文摘要】无

【英文摘要】In recent years, mass mortalities of Chinese mitten crab (Eriocheir japonica sinensis) larvae have been reported in several crabculture regions in China and have resulted in great economic losses. The mass mortality usually occurs in seawater ponds in theafternoon of sunny days when water color suddenly changes from dark green or brown to cloudy white or light yellow, and mineralprecipitate occurs. Moribund and dead larvae are typically covered with debris. A series of experiments was conducted to examinethe cause of precipitation and mass mortality of crab larvae. Analysis of the precipitate from ponds with mass mortalities showedthat CaCO3 was the main component of the precipitate, accounting for 70.8% of the total weight. In an animal experiment,mortalities were observed within 48 h in all groups with CaCO3 precipitate, and generally increased as pH and CaCO3 saturationrates increased. Mortalities in groups with CaCO3 precipitate were greater than those in groups without CaCO3 precipitate($P \leq 0.05$). All larvae in groups with CaCO3 precipitate sank to the bottom of the beaker within 48 h. The animal experiment alsoshowed that increased pH (up to 9.4) alone without CaCO3 precipitate did not result in larval mortality within 48 h. Results fromthe present investigation indicate that mass mortalities of the crab larvae are caused by CaCO3 supersaturation and

rapidprecipitation possibly triggered by increased pH as a result of intensive photosynthesis of phytoplankton in the seawater ponds. Bycomparing mean Ca2+ and CO32 − ionic product obtained at the equilibrium with solubility product constants for various CaCO3crystal forms, it appears that CaCO3 · H2O is the main CaCO3 form. Based on the CaCO3 · H2O solubility product constant and ourfield investigations, we suggest that CaCO3 · H2O saturation indices of 2.5 and below be considered safe and 3.4 as warning signalfor CaCO3 precipitation. Since several factors may cause CaCO3 supersaturation and precipitation in crab larval ponds, preventivemeasures should be implemented to stabilize pH and reduce the CaCO3 saturation rate.

【题目】小麦低分子量谷蛋白亚基品质效应的研究
【中文关键词】小麦;低分子量谷蛋白亚基;品质效应
【英文关键词】Wheat;Quality effect;Low molecular weight glutenin subunit
【中文摘要】为了在小麦品质遗传改良中更好地利用低分子量麦谷蛋白亚基(LMW-GS)的品质效应,以35个小麦品种为材料,对17种LMW-GS的品质效应进行了研究。结果表明,在Glu-A3位点,对面筋数量的正向效应为A3c、A3b、A3d、A3e>A3a,对面筋强度的正向效应为A3c>A3b、A3d>A3a、A3e。在Glu-B3位点,对面筋数量的正向效应为B3i、B3d>B3f>B3e、B3h>B3g>B3j,对面筋强度的正向效应为B3d>B3h>B3j、B3e> B3i、B3f>B3g。在Glu-D3位点,对面筋数量的正向效应为D3e>D3c>D3d> D3b、D3a,对面筋强度的正向效应为D3a>D3c、D3e> D3b、D3d。综合各个亚基的品质效应,本研究提出了包含17种小麦LMW-GS的评分体系,品种品质类型与LMW-GS的对应分析结果验证了LMW-GS品质效应的分析结果。研究结果还表明,不同位点优异LMW-GS的品质效应具有累加作用。
【英文摘要】Effect of Low Molecular Weight Glutenin Subunits on Wheat QualitAbstract: Low molecular weight glutenin subunit(LMW-GS) plays an important role in wheat quality. Considerable attention has now been focused on identification of LMW-GS composition, while seldom application was performed in genetic improvement of wheat quality. In the current paper, quality effects of 17 LMW-GS from 35 wheat cultivars were studied. The positive effects of LMW-GSs on the quality traits were determined as: at Glu-A3, A3C, A3b, A3d and A3e>A3a for gluten quantity, and A3c>A3b and A3d>A3a and A3e for gluten strength. at Glu-B3, B3i and B3d>B3f>B3e and B3h> B3g>B3j for gluten quantity, and B3d>B3h>B3j and B3e>B3i and B3f>B3g for gluten strength;at Glu-D3, D3e>D3c>D3d>D3b and D3a for gluten quantity, and D3a>D3c and D3e>D3b and D3d for gluten strength.Based on the quality effects of glutenin subunit, the score system of l 7 LMW-GS was put forward,which was confirmed by quality traits of cultivars with different LMW-GSs. This study also indicated the accumulative effects of LMW-GS in different loci on quality traits.

【题目】Temperature effects on growth-ration relationships of juvenile sea cucumber Apostichopus japonicus (Selenka)
【中文关键词】null
【英文关键词】Temperature; Ration; Apostichopus japonicus; Growth; Energy budget

1. Introduction

The sea cucumber Apostichopus japonicus Selenka, a holothurian believed

【中文摘要】无
【英文摘要】We studied the effects of temperature (16, 18, 20 and 22 ° C) and ration (0%, 0.3%, 0.6%and 1.4%body weight day − 1) on the growthof juvenile sea cucumber Apostichopus japonicus (mean body weight 5.4±0.1 g) over 35days. For any given ration, food intake (FI),specific growth rate (SGR) and food conversion efficiency (FCE) decreased with increasing temperature. The relationship among SGRw(in terms of weight), SGRe (in terms of energy), temperature (T), and ration (% body weight) could be described by the regressionequations: SGRw=0.132 − 0.024 T+0.284 R (r2=0.724, n=64), and SGRe= − 0.014 − 0.030 T+0.312 R (r2=0.654, n=64). Theseequations showthat the minimumand maximumamount of energy required for maintenance occurred at 16 ° Cand at 22 ° C, respectively.Furthermore, the energy requirements for maintenance at high temperatures exceeded the energy intake. The patterns of energy allocationrevealed that energy required for respiration increasedwith increasing temperature. The aestivation of sea cucumbers in summermight bein response to a shortfall in energy intake with respect to an increase of energy consumed in respiration at high temperature.

【题目】The effect of stocking density of Chinese mitten crab Eriocheir sinensis on rice and crab seed yields in rice – crab culture systems
【中文关键词】null
【英文关键词】Eriocheir sinensis; Rice – crab culture; Stocking density
【中文摘要】无
【英文摘要】Normally Chinese mitten crab Eriocheir sinensis were cultured for 2 years, 1 year is cultured from crab larvae to seeds or buttonsized crab in ponds, tanks or rice fields, the another year is cultured from seeds to market size in ponds, reservoirs or other waters.The present study was conducted to determine the effect of stocking density (0, 3.75, 15, 30 and 60 inds. per m2, respectively) ofChinese mitten crab larvae on rice and crab seed yields in rice – crab culture systems using land-based enclosures (4 m × 7 m, withthree replicates for each stocking density) at the Panjin Guanghe Fisheries Co. Ltd, in the Liaohe Delta, China. Zoobenthosbiomass, production of crab and rice paddy, and economical profit among the treatments were determined. The experiment showedthat zoobenthos biomass in rice – crab culture systems was relatively variant and not significantly correlated to these stockingdensity. The biomass of aquatic plant declined significantly with increasing stocking density. Specific growth rates (SGR) andsurvival rates of the crab were significantly higher at the lower stocking density (Pb0.05); in addition, the ratio of precocious craband total crab significantly increased with the stocking density increasing (Pb0.05); There were not significant effect of presenceof crab on yields of rice straw and rice paddy (PN0.05). Net crab yield and net profit were the highest at the 15 treatment (Pb0.05),however, the net profits among 3.75, 15 and 30 treatments did not show significant difference (PN0.05) economically. Based onthe observations above, a stocking density of 3.75 to 30 inds. per m2 was considered reasonable in rice – crab culture system.

【题目】几种不同提取方法对小麦叶片总蛋白双向电泳的影响
【中文关键词】小麦,叶片蛋白质,提取方法,双向电泳图谱

【英文关键词】Wheat; Leaf protein; Eextraction methods;2-DE map
【中文摘要】为探索小麦叶片蛋白质提取的最优方法,以普通小麦品种石4185的叶片为材料,研究了三氯乙酸/丙酮法、裂解液法、尿素/硫脲法、KCl-醋酸铵甲醇法等四种不同蛋白质提取方法对小麦叶片蛋白双向电泳图谱的影响。结果表明,三氯乙酸/丙酮法获得的蛋白点形状规则、清晰,且重复性好;裂解液法拖尾现象较轻,但蛋白点数少且欠清晰,重复性也不如前者;尿素/硫脲法的蛋白点数很少,也较为弥散,且有明显的拖尾现象;KCl-醋酸铵甲醇法使大量蛋白丢失,蛋白点数非常少,且上部竖纹干扰较重。因此,三氯乙酸/丙酮法是提取小麦叶片蛋白的较优方法。
【英文摘要】In order to study the effect of different protein extraction methods on two-dimensional electrophoresis(2-DE) and explore an optimal protein extraction method of wheat leaves, we compared the effect on 2-DE of 4 different protein extraction methods, including TCA/acetone method, lysis-buffer method, urea/thiourea method and KCl-ammonium acetate-methanol method, using leaves of wheat cultivar Shi4185. T he results indicated that the optimal method w as TCA/ acetone method, which had stable, clear and repeatable protein spots. The second was lysis-buffer method with slight tailing phenomena, and lower the repeatability and clarity . T he 2-DE of urea/thiourea method has fewer and dispersed protein spots.The KCl-ammonium acetate-methanol method was the worst with more impurities and less protein spots.The result s showed that the TCA/acetone method is the most suitable protein extraction method for wheat leaves .

【题目】ENU-Induced Mutagenesis in Grass Carp (Ctenopharyngodon idellus) by Treating Mature Sperm
【中文关键词】ENU诱导;草鱼;成熟精子
【英文关键词】ENU-Induced;Grass Carp;Mature Sperm
【中文摘要】对于植物的遗传改良,ENU诱变是一种有效的方法,以及诱导功能突变体在动物模型包括老鼠和斑马鱼也为有效。在本研究中,草鱼成熟精子用一定浓度的ENU处理45分钟,然后与野生型卵细胞受精。结果表明在分裂期异常的形态与卵化期死亡的胚胎比例随ENU量的增加而增加直到10mM。选择一定剂量进行诱变,并且要有足够的鱼苗,利用1mM的ENU处理成熟精子并受精后有目的的筛选F1代。用ENU处理过的F1代在第一年出现了大量变种,正常个体很少。分析15条经过ENU处理过的FI代突变体的部分编码区域的igf-2a, igf-2b, mstn-1, mstn-2, fst-1和 fst-2基因座表明,许多ENU处理的点突变是GC被AT或AT被GC替代,同义突变和非同义突变导致其失去了意义。检测位点的平均突变频率是0.41%。这些结果表明在草鱼中用ENU处理成熟精子可以有效的诱发点突变,这可能是一个改良这些鱼的有用的方法。
【英文摘要】N-ethyl-N-nitrosourea (ENU) mutagenesis is a useful approach for genetic improvement of plants, as well as for inducing functional mutants in animal models including mice and zebrafish. In the present study, mature sperm of grass carp (Ctenopharyngodon idellus) were treated with a range of ENU concentrations for 45 min, and then wild-type eggs were fertilized. The results indicated that the proportion of embryos with morphological abnormalities at segmentation stage or dead fry at hatching stage increased with increasing ENU dose up to 10 mM. Choosing a dose that was mutagenic, but provided adequate numbers of viable fry, an F1 population was generated from 1 mM ENU-treated sperm for screening purposes. The ENU-treated F1 population showed large variations in growth during the first year. A few bigger mutants with morphologically normal were generated, as compared to the controls. Analysis of DNA from 15 F1 ENU-treated individuals for mutations in partial coding regions of igf-2a, igf-2b, mstn-1, mstn-2, fst-1and fst-2 loci revealed that most ENU-treated point mutations were GC to AT or AT to GC substitution, which led to nonsense, nonsynonymous and synonymous mutations. The average mutation rate at the examined loci was 0.41%. These results indicate that ENU treatment of mature sperm can efficiently induce point mutations in grass carp, which is a potentially useful approach for genetic improvement of these fish.

【题目】EFFECTS OF INTERMITTENT FEEDING OF DIFFERENT DIETS ON GROWTH OF LITOPENAEUS VANNAMEI
【中文关键词】null
【英文关键词】ecology, feeding, Litopenaeus vannamei, penaeids
【中文摘要】无
【英文摘要】Seven diet models offering were designed to investigate their effects on growth of the shrimp Litopenaeus vannamei, with a mean bodyweight of 1.380 6 0.005 g (mean 6 SE) at a temperature of 25 6 0.58C. The shrimps under different treatments were periodically fedwith polychaete worm (PW, Neanthes japonicus) and commercial formulated diet (FD) with the ratio of 0:1, 1:4, 1:2, 1:1, 2:1, 4:1, and 1:0in feeding frequency of PW followed by FD, respectively. Only one kind of food was offered each time and all the shrimps were fed twicedaily. The result of the 45-day experiment showed that the specific growth (SGRd) of shrimps fed with PW exclusively was 65% higherthan those fed with FD only (P , 0.05); and the shrimps fed with the ratio of 4PW: 1FD, grew 15% faster than those fed with PW only interms of SGRd (P , 0.05). The shrimps fed with the ratio of 4PW: 1FD spent a greater percentage of energy deposited for growth (G)from the energy consumed in food (C) and less percentage of energy lost for respiration (R) from C than those of shrimps fed with PWonly. In contrast to feeding mixed diets, intermittent feeding of different diets can improve food conversion efficiency and avoid the wasteof food caused by shrimp ’s food selection behavior. Therefore, the pattern of intermittent feeding on different diets was more practical andvaluable in aquaculture.

【题目】小麦条锈病抗性基因研究进展及分子标记辅助聚合育种
【中文关键词】小麦;条锈病;抗性基因;分子标记
【英文关键词】wheat, stripe rust, resistance genes, molecular marker
【中文摘要】概述了近年来已命名和暂命名的小麦条锈病抗性基因的来源、染色体定位、分子标记研究及基因克隆状况,回顾了我国抗性品种与生理小种对抗的演变,并从抗条锈病基因抗性表达的发育期、遗传方式、抗性状况、在生产中出现的频率及遗传研究方法几个方面对小麦抗条锈病基因加以评价,为小麦抗条锈基因的利用和研究提供参考。同时浅析了分子标记在小麦抗条锈基因聚合育种中的应用。
【英文摘要】Up to now, 40 gene loci (Yr1-Yr40) for resistance to stripe rust genes have been formally designated in wheat. And there are some resistance genes for stripe rust which have been temporarily designated.All there genes have been located on different chromosomes. Yr36 has been clone. The origin, chromosomal locationmolecular markers and gene clone of stripe rust resistance genes in wheat are summarized in this paper. The evolvement of resistance varieties and physiological race are reviewed. The stripe rust resistance genes are valued as the following: stripe rust resistance genes 's express time, heredity ways, resistance status, show the frequencies applied in wheat production and heredity studies methods. The results provide the references that The resistance to stripe rust genes have studies and utilizations. At the same time, the applications of molecular markers in wheat of resistance polymerize breeding are discussed.

【题目】Growth inhibition to three red tide microalgae by extracts of Ulva pertusa
【中文关键词】null
【英文关键词】growth inhibition, extracts, Ulva pertusa, Heterosigma akashiwo, Alexandrium tamarense, Prorocentrum micans
【中文摘要】无
【英文摘要】Growth inhibition effect of different concentration of distilled water extract and four polarorganic solvent (methanol, acetone, ether and chloroform) extracts of Ulva pertusa on three typical redtide microalgae (Heterosigma akashiwo, Alexandrium tamarense and Prorocentrum micans) were investigated.Liquid-liquid fractionation and HPLC amilysis for methanol extract of U. pertusa were carried out.Growth of the three microalgae was significantly inhibited by the distilled water extract of U. pertusa atrelatively higher concentration. However, the cells of the three microalgae did not die completely even athigh concentration. Methanol extract of U. pertusa showed the highest growth inhibition on the three microalgae,and all the cells of the three microalgae were killed at relatively high concentration. The otherthree organic solvent extracts of U. pertusa had no apparent effect on the three microalgae. The results ofbioassays and HPLC analysis suggested that the inhibitory substances in U. pertusa to the microalgalgrowth had relatively high polarities. H. akashiwo was the most sensitive one while A. tamarense was themost tolerant one to the growth inhibitory substances.

【题目】Genetic variation in Chinese hatchery populations of the Japanese scallop (Patinopecten yessoensis) inferred from microsatellite data
【中文关键词】null
【英文关键词】Genetic variation; Hatchery populations; Microsatellites; Patinopecten yessoensis
【中文摘要】无
【英文摘要】The Japanese scallop Patinopecten yessoensis was introduced to China about two decades ago from Japan. In aquaculture, thereare concerns as to whether genetic variability would have been lost in farmed populations during their subsequent hatcheryproduction. Using six microsatellite loci, three hatchery populations of P. yessoensis in China were compared with one another andwith two wild Japanese populations. The hatchery populations were substantially less variable than wild populations. For the hatcheryand wild populations, the average numbers of alleles per locus were 5.7 and 7.9, and the average expected heterozygosities were 0.582and 0.671, respectively. This loss of variation is attributable to about 20 years of isolation and genetic drift. Fst values showedsignificant genetic differentiation among the five populations. Genetic differences between the populations were also detected bypairwise comparison based on allelic distribution. The Neighbor-joining tree topology constructed on the basis of genetic distancesamong populations showed a clear division between the wild and hatchery populations. The information on the genetic variation anddifferentiation in cultured and wild populations of P. yessoensis obtained in this study is useful for setting up suitable guidelines forfounding and maintaining of cultured stocks, and for future genetic improvement by selective breeding.

【题目】Genetic variability of cultured populations of the Pacific abalone (Haliotis discus hannai Ino) in Chinabased on microsatellites
【中文关键词】null
【英文关键词】Haliotis discus hannai Ino, genetic variation,
cultured populations, microsatellite
【中文摘要】无
【英文摘要】The genetic diversity of cultured populations of thePaci ¢ c abalone (Haliotis discus hannai Ino) fromnorthern China was analysed using seven microsatellitemarkers. The microsatellite loci were polymorphicfor all the populations, with an average of8.7 alleles per locus (range 8.0^9.4). The mean observedand expected heterozygosities were 0.547(range 0.500^0.596) and 0.774 (range 0.754^0.787)respectively. The allelic diversity in terms of numberof alleles per locus was considerably lower than thatpreviously found in wild populations (range 21.8^23.0), indicating that bottleneck e ¡ ects occurredwhen each population was founded. Signi ¢ cant geneticdi ¡ erentiation among the ¢ ve cultured populationswas shown using Fst and Rst values, andpairwise comparison based on allelic distribution. Aneighbour-joining analysis of the genetic distancedid not show a consistent relationship between thegeographic and the genetic distances, suggesting theexistence of exchanges of breeds and eggs betweenthe hatcheries. The results obtained in this study areuseful for a number of areas of interest for ¢ sheriesmanagement and the aquaculture industry, espeespeciallywith regard to breeding programmes.

【题目】Genetic comparison of cultured and wild populations of the clam Coelomactra antiquata (Spengler) in China using AFLP markers

【中文关键词】null
【英文关键词】AFLP; Coelomactra antiquata; Cultured populations; Genetic diversity
【中文摘要】无
【英文摘要】AFLP markers were used to investigate levels of genetic diversity within cultured populations of the clam Coelomactraantiquata and to compare them with the wild source populations. Seven pairs of primers generated 365 loci among 125 individualsin three cultured and three wild populations. High polymorphism at the AFLP markers was found within both cultured and wild C.antiquata populations. Although not statistically significant, reductions in the expected heterozygosity and percentage ofpolymorphic loci were observed in the cultured populations (2.8% and 8.3% reduction, respectively), and higher frequency ofprivate alleles within the wild populations compared to the cultured populations indicated that rare alleles in some loci were lost inthe cultured populations. Significant genetic differentiation was observed between the cultured populations, and between thecultured and wild populations. Northern populations were genetically distinct from southern populations (FST=0.696 – 0.746). Theresults obtained in this study indicate that continued genetic monitoring of the cultured populations is warranted and the northernand southern populations of C. antiquata should be managed separately in hatchery practices for the preservation of geneticdiversity in wild populations.

【题目】Genetic and morphological differentiation in the clam Coelomactra antiquata (Bivalvia: Veneroida) along the coast of China
【中文关键词】null
【英文关键词】Allozyme; Coelomactra antiquata; Conservation; Genetic variation; Morphology
【中文摘要】无
【英文摘要】Coelomactra antiquata is a commercially exploited bivalve, and its populations have been severely declining in the coast ofChina during the last two decades. In order to provide guidelines for conservation strategies and management programs, fourpopulations of C. antiquata, representing the most important populations in China, were analysed morphologically and geneticallyto reveal the genetic structure by using 7 polymorphic allozyme loci and 12 morphological variables. The mean allele richnessranged from 2.79 to 3.53, while the mean heterozygosity ranged from 0.326 to 0.519. All genetic distance metrics revealed highlevel of genetic differentiation between the three northern populations and one southern population. The marked geneticdifferentiation can be explained by the freshwater outflow of Yangtze River and upwelling of Zhejiang province. Themorphological analyses were in accordance with the allozyme data, which also disclosed a high degree of differentiation betweenthe northern and southern populations. The results obtained in this study indicate that the northern and southern populations inC. antiquata should be treated as separate units for conservation management

【题目】Microsatellite Analysis of Japanese Sea Cucumber, Stichopus (Apostichopus) japonicus, Supports Reproductive Isolation in Color Variants
【中文关键词】null

【英文关键词】Color variation — genetic difference —
Holothuroidea — microsatellite — sea cucumber —
Stichopus japonicus
【中文摘要】无
【英文摘要】The genetic relationship among the three colorvariants (Red, Green, and Black) of the Japanesesea cucumber, S. japonicus, was investigated using11 microsatellite markers. Genetic differentiationtesting among the three sympatric color typesshowed the strong heterogeneity of Red (p G 0.001),while no significant difference was observed betweenGreen and Black (p = 0.301 to 0.961).UPGMA trees constructed from 10 sample lotsfrom 5 localities showed two distinct clusters, onefrom the Red types and the other from the Greenand Black types. In addition, the sympatric Greenand Black formed one subcluster with strong bootstrapsupport at each locality. These results indicatethe separate species status of Red and the othercolor types, and also support the population identityof sympatric Green and Black.

【题目】3 种奶牛布鲁氏菌病血清学检测方法的贝叶斯评估
【中文关键词】布鲁氏菌病;虎红平板凝集试验;间接酶联免疫吸附试验;荧光偏振分析法;贝叶斯分析
【英文关键词】Brucellosis; RBT ; I-ELISA ; FPA ; Bayesian analysis
【中文摘要】在无“ 金标准 ”的情况下,为评估虎红平板凝集试验(RBT)、荧光偏振分析法(FPA)和间接酶联免疫吸附试验(I-ELISA)用于奶牛布鲁氏菌病的抗体检测能力,作者分别以RBT、FPA、I-ELISA3种方法对采自某奶牛场的血清样品进行检测,通过贝叶斯分析法对检测结果进行分析,研究3种方法检测奶牛布鲁氏菌血清抗体的敏感性(Se)和特异性(Sp)。结果显示,RBT、FPA、I2ELISA3种检测方法的敏感性(Se)分别为91.81%、95.92%和95.98%;特异性(Sp)分别为98.80%、86.54%和98.65%。本研究表明,3种血清学检测方法中以I-ELISA的检测能力最好。
【英文摘要】The objective of our study was to evaluate the diagnostic performance of three serological tests for brucellosis. Serological test result s were used to compare the performance of Ro se Bengal Test (RB T), indirect ELISA (I-EL ISA) and Fluorescence Polarisation Assay (FPA) in diagnosing brucellosis in cattle. Their performance was evaluated using Bayesian analysis which allows the sensitivity (Se) and specificity (Sp) to be estimated in the absence of a gold standard. The sensitivity of RB T, FPA and I-EL ISA were 91.81%, 95.92 % and 95.98%, respectively; and specificity of RBT, FPA and I-ELISA were 98.80 %, 86.54 % and 98.65 %, respectively. The results demonstrated that the I-ELISA performing well in diagnosing brucellosis in cattle.

【题目】Genetic variability assessed by microsatellites in cultured populations of the Pacific oyster (Crassostrea gigas) in China
【中文关键词】null
【英文关键词】Genetic variation; Cultured populations; Microsatellites; Crassostrea gigas
【中文摘要】无
【英文摘要】Five cultured populations of Pacific oyster, Crassostrea gigas, were examined at seven polymorphic microsatellite loci to assessthe levels of allelic diversity and heterozygosity within and differentiation among the populations. The genetic variability of the sevenloci was high for all the populations. The average numbers of alleles per locus ranged from 19.1 to 26.0, while the average

observedand expected heterozygosity ranged from 0.474 to 0.616, and from 0.916 to 0.949, respectively. Fst and Rst values showed significantgenetic differentiation among the five cultured populations. Genetic differences between the populations were also detected bypairwise comparison based on allelic distribution. The Neighbor-joining tree topology constructed on the basis of genetic distancesbetween populations showed a clear separation of the northern three populations and southern two populations, suggesting thatgeographically separated cultured populations of C. gigas could be genetically differentiated unless seeds are transplanted amongthem. The useful information on the genetic variation and differentiation in cultured populations obtained in this study can be appliedfor future genetic improvement by selective breeding, and to design suitable management guidelines for the Pacific oyster.

【题目】Acute peristome edema disease in juvenile and adult sea cucumbers Apostichopus japonicus (Selenka) reared in North China
【中文关键词】null
【英文关键词】Ultra-pathology; Histopathology; Virus; APED
【中文摘要】无
【英文摘要】Acute peristome edema disease (APED) is a new disease that broke out in cultured sea cucumber along the Shangdong and Liaoningprovince coasts in China, PR, and has caused a great deal of death in Apostichopus japonicus (Selenka) since 2004. Here we report viruslikeparticles found in intestine epithelium of sea cucumbers reared in North China. It is the first time that sea cucumbers are reported tobe infected by virus. Histological examinations showed that the viral inclusion bodies existed in intestine epithelium cells.

Electron microscopicexaminations show that the virions were spherical, 80 – 100 nm in diameter, and composed of a helical nucleocapsid within an envelopewith surface projections. Detailed studies on the morphogenesis of these viruses found many characteristics previously described forcoronaviruses. Virus particles always congregated, and formed a virus vesicle with an encircling membrane. The most obvious cellularpathologic feature is large granular areas of cytoplasm, relatively devoid of organelles. Tubular structures within virus-containing vesicles,nucleocapsid inclusions, and double-membrane vesicles are also found in the cytopathic cells. No rickettsia, chlamydia, bacteria, orother parasitic organisms were found..

【题目】Electrochemical measurement of hydrogen peroxide in plasma: Evaluation of freshwater prawn (Macrobrachium rosenbergii) and crucian carp (Cyprinus carpio) phagocytes under natural conditions

【中文关键词】null

【英文关键词】Hydrogen peroxide; Phagocytes; Hydrogen peroxide electrode; Respiratory burst activity; Blood plasma

【中文摘要】无

【英文摘要】An electrochemical technique for the real-time detection of hydrogen peroxide (H2O2) was employed to describe respiratoryburst activity (RBA) of phagocytes in plasma which can be used to evaluate the ability of immune system and disease resistance.The method is based upon the electric current changes, by redox reaction on platinum electrode of extracellular hydrogen peroxide(H2O2) released from phagocytes stimulated by the zymosan at 680 mV direct current (d.c.). Compared with the control, activationof respiratory burst by zymosan particles results in a high amperometric response, and a current peak was obtained during the wholemonitoring process. The peak current was proved by addition of Cu2 þ and other controls, to be the result of intense release of H2O2from phagocytes. The peak area was calculated and used to evaluate the quantity of effective H2O2, which represents the quantity ofH2O2 beyond the clearance of related enzymes in plasma. According to Faraday ' s law, the phagocytes ' ability of prawns to generateeffective H2O2 was evaluated from 1.253 10 14 mol/cell to 6.146 10 14 mol/cell, and carp from 1.689 10 15 mol/cell to7.873 10 15 mol/cell. This method is an acute and quick detection of extracellular effective H2O2 in plasma and reflects the capacityof phagocytes under natural conditions, which could be applied for selecting species and parents with high immunity forbreeding in aquaculture.

【题目】Bioassay evidence for the transmission of WSSV by the harpacticoid copepod Nitocra sp

【中文关键词】null

【英文关键词】Harpacticoid copepod Nitocra sp.; WSSV; Vector; Transmission; Marsupenaeus japonicus

【中文摘要】无

【英文摘要】White Spot Syndrome Virus (WSSV) is now one of the most devastating and virulent viral agents threatening the penaeid shrimpculture industry and has been responsible for serious economic losses for shrimp farms worldwide. One remarkable characteristic ofWSSV is its wide reservoir range, which contributes to its wide geographical distribution. Among epizootiological surveys, there is substantialevidence for WSSV-positive copepods found in shrimp farming ponds. Therefore, copepods are suspected to be the vector ofWSSV. In the present study, nested-PCR analysis showed positive results in the harpacticoid copepod Nitocra sp.

exposed to WSSVby virus – phytoplankton adhesion route. Oral route and intramuscular injection were used to test the pathogenicity of WSSV isolatedfrom the WSSV-positive Nitocra sp. For the oral route of infection, Marsupenaeus japonicus postlarvae were fed with WSSV-positivecopepods. The shrimp postlarvae in the infected treatment became WSSV-positive and occurred 52.50 ± 5.00% mortality which was significanthigher ($P < 0.05$) than that in the control treatment (20.00 ± 0.00%) when postlarvae were fed with WSSV free copepods. In theintramuscular injection challenge, M. japonicus juveniles were injected with the copepods inoculum extracted from the WSSV-positiveNitocra sp., and showed 72.50 ± 9.57% mortality which was also significant higher ($P < 0.05$) than that in the control treatment(22.50 ± 5.00%) when juveniles were received mock injection of a tissue homogenate prepared from WSSV-negative Nitocra sp. Based on these laboratory challenge studies, it was confirmed that the copepods can serve as a vector in WSSV transmission

【题目】免疫单扩散法检测牛初乳IgG含量方法改良及牛初乳样品的检测
【中文关键词】琼脂免疫单扩散; 牛初乳; IgG
【英文关键词】Single immunediffusion; Bovine colostrums; IgG
【中文摘要】采用改良后的琼脂免疫单扩散法检测本地荷斯坦奶牛产后7d 的初乳样品中IgG 含量。结果表明, 母牛产犊后7d 内, 乳汁中IgG 含量变化很大, 变动范围为118.59~0.86mg/mL。每次挤乳IgG 含量下降都很快, 特别是前三次挤乳, 每次IgG 浓度下降率近50%; 到第8 次, 已经降到10mg/mL 以下。所以生产乳制品应以前7 次挤出的初乳为原料最佳, 若笼统地以3d、5d 或7d 内初乳为原料, 产品中IgG 含量不仅低, 而且每批次差异很大。
【英文摘要】Modified Single immunediffusion method was used to determine content of IgG in bovine colostrums of local holstein in seven days after parturition.The result showed that the content of IgG in bovine colostrums in seven day after parturition has large amounts changes.The content of IgG changed in the range of 118.59~0.86mg/mL. As the raw material of bovine colostrums products, the first 7 times milking after parturition is optimal. If the first 3d,5d or 7d milking after parturition were used as raw material of bovine colostrums products generally, the IgG content in products are low with great difference in different batch.

【题目】Effects of thermal and osmotic stress on growth, osmoregulation and Hsp70 in sea cucumber (Apostichopus japonicus Selenka)
【中文关键词】null
【英文关键词】Holothurian; Heat shock; Osmotic pressure; Na+/K+-ATPase; Heat shock protein
【中文摘要】无
【英文摘要】This study deals with the effect of thermal and osmotic stress on growth, osmoregulation and Hsp70 level in the sea cucumber Apostichopusjaponicus Selenka. Sea cucumbers were exposed to 30 ° C (Hs treatment) or 20 ° C (control) for 2 h, and then were challenged with osmotic shock,which was administered by transferring the sea cucumbers from natural seawater (about 32 ppt) to different salinities (20 ppt, 25 ppt, 30 ppt, and40 ppt). After a 30-day experiment, the specific growth rate (SGR) and survival rate of sea cucumbers were measured. To elucidate the underlyingphysiological mechanisms, osmotic pressure of the coelomic fluid, Na+/K+-ATPase and Hsp70 level of the sea cucumbers from Hs treatment andcontrol were measured at selected times (1 h, 2 h, 6 h, 24

h, and 48 h) after the osmotic shock. At the end of the 30-day experiment, SGR of Hs seacucumber was higher than that of the control at salinity of 20 ppt. However, SGR of Hs sea cucumber was lower than that of the control at salinityof 30 ppt, 40 ppt and natural seawater. At salinity of 20 ppt, the survival rate of A. japonicus was only 20%. These results indicted that a salinity of20 ppt exceeded the ecological tolerance for growth in juvenile A. japonicus. A prior heat shock could accelerate growth when the ambient salinitywas below the ecological tolerance for growth (salinity of 20 ppt); on the other hand, it could retard growth when the ambient salinity was withinthe ecological tolerance for growth (salinity of 25 ppt, 30 ppt, 40 ppt and natural seawater). The osmotic pressure of the coelomic fluid changedrapidly and stabilized by 6 h after the osmotic shock. The temporal change pattern of Na+/K+-ATPase activity increased initially and reached themaximum value within 6 h. These results indicated that A. japonicus was an osmotic conformer, and the activity of Na+/K+-ATPase had anadaptive response to the change of ambient salinity. Both thermal and osmotic stresses could induce the up-regulation of Hsp70, which mightpartly explain the differences in growth of sea cucumbers at different salinities.

【题目】The heat increment of feeding and heat loss relate to growth in Chinese shrimp, Fenneropenaeus chinensis (Osbeck 1765)
【中文关键词】null
【英文关键词】Chinese shrimp, heat increment of
feeding (HiE), energy budget, growth
【中文摘要】无
【英文摘要】Three experiments were designed to investigate theheat increment of feeding (HiE) in Chinese shrimp,Fenneropenaeus chinensis. (1) Four groups of shrimpwith di ¡ erent weight were fed at four rations to measureoxygen consumption in the following 24 h.(2) Four groups of shrimp with di ¡ erent weight werefedwith four rations for 28 days. (3) Fish £ esh, shrimp £ esh, clam foot, polychaette worm, formulated dietand mixed diet were provided to six groups of shrimpfor 30 days. The coe ⁄ cient of heat increment of feeding(CHiE) values within 24 h after ingesting1g digestibleprotein (DP) and1kJ digestible energy (DE) were18.57 kJ and 0.45. CHiE values of 1g DP and 1kJ DEachieved in the second experiment were 25.06 kJ and0.57. The energy cost of 1g wet weight gain, 1g proteingain and 1kJ recovered energy were 13.94, 32.16and 1.07 kJ. They accounted for 69.28%, 26.71% or40.23% of HiE of the meals needed for these growths.The present results indicated that HiE was a fundamentalproperty of the feed and the energy costof growth accounted for di ¡ erent fraction whendi ¡ erent feeds were ingested.

【题目】Growth and physiological responses in the sea cucumber, Apostichopus japonicus Selenka: Aestivation and temperature
【中文关键词】null
【英文关键词】Aestivation
Temperature
Sea cucumber
Metabolism
Antioxidant enzyme
Heat shock protein
【中文摘要】无
【英文摘要】Aestivation is an adaptation of the sea cucumber Apostichopus japonicus Selenka to high temperature,however, the causations and physiological responses of aestivation are not well understood. This study dealswith the relationship between temperature and aestivation. Sea cucumbers were allocated into fourtreatments. In two treatments of temperature elevation, the ambient temperature gradually was increasedfrom 16 ° C to 26 ° C linearly (treatment FA) or by a fluctuating temperature profile (treatment FB). Two controltreatments maintained constant temperatures of 16 ° C and 26 ° C, and were designated as optimumtemperature of growth and threshold of aestivation, respectively. During the 40-day experiment, bodyweight, oxygen consumption, daily food intake, catalase (CAT) and superoxide dimutase (SOD) activities andheat shock protein 70 (Hsp70) levels were determined periodically. When the temperature graduallyincreased from 16 ° C to 26 ° C, the body weight of the tested sea cucumbers decreased gradually. After theambient temperature reached 26 ° C, the tested sea cucumbers in treatments of FA and FB were reared at26 ° C for an additional twenty days. During this period, symptoms of aestivation appeared in the tested seacucumbers. Activities of antioxidases and Hsp70 levels increased when the ambient temperature increasedfrom 16 ° C to 26 ° C, and decreased when the temperature was kept at 26 ° C. These results indicate thataestivation in A. japonicus is an adaptive strategy to reduce the production of reactive oxygen species (ROS)and denatured proteins which were induced at high temperature

【题目】Microsatellite genetic variation in wild and hatchery populations of the sea cucumber (Apostichopus japonicus Selenka) from northern China
【中文关键词】null
【英文关键词】sea cucumber, Apostichopus japonicus,
genetic variation, hatchery stocks, microsatellites
【中文摘要】无

【英文摘要】Farming of the sea cucumber Apostichopus japonicus(Selenka) started 20 years ago and is still in rapid expansionin China. In order to assess the genetic statusof both wild and cultivated stocks of this species, weused eightmicrosatellitemarkers to estimate the levelof genetic diversity within ¢ ve hatchery stocks andtwo wild populations of A. japonicus, and comparedthe degree of genetic di ¡ erentiation between them.High levels of polymorphism were observed over allloci. The mean alleles and expected heterozygositiesover the seven stocks were10.4^12.3 and 0.735^0.783respectively. The results of the microsatellite surveyprovide no evidence to show that hatchery practiceof the sea cucumber in China to date has signi ¢ cantlya ¡ ected the genetic variability of the cultured stocks.Signi ¢ cant di ¡ erentiation was found between mostpairs of the hatchery stocks and wild populations(Fst range: 0.008^0.036), and no obvious di ¡ erencewas detected between the wild populations(Fst50.008). The information on the genetic variationand di ¡ erentiation obtained in this study can beapplied for future genetic monitoring of A. japonicusaquaculture stocks and will be useful for future geneticimprovement by selective breeding, and for designingsuitable management guidelines for these genetic materials

【题目】Effects of dietary sea mud and yellow soil on growth and energy budget of the sea cucumber Apostichopus japonicus (Selenka)
【中文关键词】null
【英文关键词】Sea cucumber
Apostichopus japonicus
Sea mud
Yellow soil
Growth
Energy budget
【中文摘要】无
【英文摘要】The effects of dietary sea mud or yellow soil (0, 20, 40, 60 and 80%) on growth and energy budget of the seacucumber Apostichopus japonicus Selenka were studied. The results showed that there was no significantdifference among growth of sea cucumbers fed diets containing the same proportion of sea mud and yellowsoil. Sea cucumbers fed 20% sea mud or yellow soil obtained better growth than the other treatments(Pb0.05). The ingestion rate (IR), feces production rate (FPR) and apparent digestive ratio (ADR) showed adescending trend as the percent of dietary sea mud or yellow soil increased, however, the specific growthrate (SGR) decreased when diets contained more than or less than 20% sea mud or yellow soil. The averageenergy budget formula was: 100C=4.27G+55.44F+3.69U+36.60R. The energy deposited for growth was verylow, and the energy loss in feces and energy for respiration accounted for the majority of the ingested energy.From economic and environmental points of views, it is feasible to add 20% yellow soil instead of sea mud todiets of sea cucumbers. This information should be helpful in the development of more appropriate diets forculture of holothurians.

【题目】Association of reproductive performance with SNPs of FOXL2 gene by SSCP in Japanese flounder (Paralichthys olivaceus)
【中文关键词】null
【英文关键词】Japanese flounder
FOXL2
SNPs
Diplotype
Reproductive performance
【中文摘要】无
【英文摘要】FOXL2 which is a putative winged helix/forkhead transcription factor gene and a sexually dimorphic markerof ovarian differentiation plays an important role in ovarian development, granulosa cell differentiation, andthus the proper maintenance of ovarian function. The aims of this study were to characterize polymorphismswithin the FOXL2 gene in a population of 52 female Japanese flounder and analyze the association of FOXL2polymorphisms with reproductive performance by polymerase chain reaction-single stranded conformationalpolymorphism (PCR-SSCP). Results indicated that five single nucleotide polymorphisms (SNPs), whichwere SNP1 [c.540ANC (p.Asn102His) and c.591ANG (p.Asn119Asp)], SNP2 [c.864GNA (p.Lys210Glu)andc.875GNA] and SNP3 (c.1169CNA), were identified in the FOXL2 gene. General Linear Model (GLM) analysisshowed that SNP1 in the forkhead domain was significantly associated with gonadosomatic index (GSI)(Pb0.05). SNP2 in the downstream of forkhead domainwas significantly associated with serum 17 β-estradiol(E2) level (Pb0.05). And SNP3 in the 3′-UTR was significantly associated with hepatosomatic index (HSI)(Pb0.05). Moreover, the evaluation of the genetic effects for both Testosterone (T) level of diplotype D3 andGSI of diplotype D5 suggested they were significantly higher than those of other four diplotypes (Pb0.05),respectively. These results implied that these SNPs could influence reproductive endocrinology of femaleJapanese flounder and be also used in marker-assisted selection (MAS) program to reproductive performancein female Japanese flounder in the future.

【题目】A genetic linkage map of the sea cucumber, Apostichopus japonicus (Selenka), based on AFLP and microsatellite markers
【中文关键词】null
【英文关键词】amplified fragment length polymorphism, Apostichopus japonicus, linkage map,
microsatellites, sea cucumber.
Introduction
The sea cucumber Apostichopus japonicus is a common
benthic detritus feeder of coastal sea habitats of East Asia,
including China
【中文摘要】无
【英文摘要】We present the first genetic maps of the sea cucumber (Apostichopus japonicus), constructedwith an F1 pseudo-testcross strategy. The 37 amplified fragment length polymorphism(AFLP) primer combinations chosen identified 484 polymorphic markers. Of the 21microsatellite primer pairs tested, 16 identified heterozygous loci in one or other parent, andsix were fully informative, as they segregated in both parents. The female map comprised163 loci, spread over 20 linkage groups (which equals the haploid chromosome number),and spanned 1522.0 cM, with a mean marker density of 9.3 cM. The equivalent figures forthe male map were 162 loci, 21 linkage groups, 1276.9 and 7.9 cM. About 2.5% of theAFLP markers displayed segregation distortion and were not used for map construction.The estimated coverage of the genome was 84.8% for the female map and 83.4% for themale map. The maps generated will serve as a basis for the construction of a high-resolutiongenetic map and mapping of the functional genes and quantitative trait loci, which willthen ospecies.pen the way for the application of a marker-assisted selection breeding strategy in this

【题目】A first-generation genetic map of the Japanese scallop Patinopecten yessoensis-based AFLP andmicrosatellite markers
【中文关键词】null
【英文关键词】AFLP, linkage map, microsatellites,
Patinopecten yessoensis
【中文摘要】无
【英文摘要】We constructed genetic linkage maps of the Japanesescallop Patinopecten yessoensis using AFLP and microsatellitemarkers.With 32 AFLP primer combinations,a total of 413 markers (209 from the femaleparent and 204 from the male parent) segregated ina 1:1 ratio, corresponding to DNA polymorphismswhich were heterozygous in one parent and null inthe other. Among the six microsatellite markers weused, there were four polymorphic loci. Two segregatedin the female parent, and the other two segregatedin both parents. In the maternal parent, 161framework markers were mapped in 20 linkagegroups, with a total coverage of 2198.8 cM. In thepaternal parent, 166 framework markers establisheda map with 21 linkage groups, spanning a genomelength of 2137.6 cM. The AFLP markers on the mapswere randomly distributed with an average spacingbetween markers of14.7^15.6 cM. The estimated coveragefor the framework maps are 77.9% both for thefemale and the male. These are the ¢ rst linkage mapsfor P. yessoensis, which constitute a basis for furthergenome studies and provide a useful framework forconsensus map construction by adding orthologousanchor markers developed in P. yessoensis.

【题目】Thermal resistance in sea cucumbers (Apostichopus japonicus) with differing thermal history: The role of Hsp70
【中文关键词】null
【英文关键词】Sea cucumber
Thermal resistance
Heat shock protein 70
Temperature acclimation
【中文摘要】无
【英文摘要】Thermal history can affect organisms' thermal resistance, however, effects of thermal history on thermalresistance and roles of heat shock protein 70 (Hsp70) in sea cucumber Apostichopus japonicus are not wellunderstood. In the present study, the lethal thermal limits and expressions of Hsp70 of sea cucumbers thatwere acclimated at different temperatures (22 ° C or 12 ° C) for 30 days were studied. The upper lethaltemperatures (ULTs50) for sea cucumbers acclimated at 22 and 12 ° C were 31.8 ° C (31.5 – 32.1 ° C) and 30.9 ° C(30.6 – 31.3 ° C), respectively. In heat shock experiments, sea cucumbers acclimated at different temperatures(22 ° C or 12 ° C) were exposed to several high temperatures (25, 27, 29, 31 and 32 ° C) for 2 h, followed by 2 hrecovery at 17 ° C, and the levels of hsp70 were measured using semi-quantitative RT-PCR and westernblotting. The maximum induction temperatures for sea cucumbers in 22 ° C and 12 ° C acclimation treatmentswere 31 ° C and 29 ° C, respectively. These results showed that the temperature acclimation could affect seacucumbers' upper thermal limit, which was related to the changed expression pattern of Hsp70 in the seacucumber. In practice, sea cucumbers that overwinter in southern China could acquire higher thermalresistance than those reared in the north.

【题目】Sediment-water Fluxes of Nutrients and Dissolved Organic Carbon in Extensive Sea Cucumber Culture Ponds
【中文关键词】null
【英文关键词】Nutrient fluxes; Pond sediment; Sea cucumber; Polyculture;
【中文摘要】无
【英文摘要】Sediment samples were collected from three seawater aquaculture ponds, and soilcharacteristics, sediment oxygen consumption (SOC), dissolved organic carbon (DOC)and nutrient fluxes were measured using chamber incubations at laboratory. Thethree ponds were each representing a specific monoculture or polyculture model ofsea cucumber. Total organic carbon (TOC) and total nitrogen (TN) contents in the drysediment ranged from 0.14 to 0.26% and 0.022 to 0.037%, respectively. Total phosphorus(TP) contents in the sediment were more spatially and temporally variable. SOCranged from 15.29 to 45.86 mmol m − 2 d − 1 and showed significant differences amongthe three ponds (p a 0.05). TOC, total carbon (TC) contents, and SOC of the sedimentin the pond polycultured with jellyfish increased with culture time, indicating thatjellyfish farming enhanced the accumulation of organic matter in the sediments tosome extent. Sediment showed net nitrate and ammonium uptake in most ponds andmonths, and significant differences were found among months (p a 0.05). Dissolvedinorganic phosphate (DIP) was released from the sediments in all ponds with low fluxrates. DOC was released from the sediment in all ponds and ranged from 0.67 to 1.74g DOC m − 2 d − 1. The results suggested that non-artificial-feeding sea cucumber cultureponds could not only yield valuable seafood products, but also effectively removenutrients from the aquaculture systems and consequently alleviate nutrient loadingsof the nearby coast.

【题目】Single nucleotide polymorphisms within the estrogen receptor beta gene are linked with reproductive indices in Japanese flounder, Paralichthys olivaceus
【中文关键词】null
【英文关键词】Japanese flounder
Estrogen receptor β
SNPs
Diplotype
Reproductive indices
【中文摘要】无
【英文摘要】The objectives of this study were to characterize polymorphisms within the coding region of estrogenreceptor β (ER β) gene in a population of 57 female Japanese flounder (Paralichthys olivaceus) and to analyzethe association of ER β polymorphisms with reproductive indices by polymerase chain reaction single-strandconformation polymorphism (PCR-SSCP). Two single nucleotide polymorphisms (SNPs), SNP1 (c.577delC)and SNP2 [c.A891T (p.Gln114Leu)], were identified in the ER β gene. A one-way ANOVA revealed that SNP1was significantly associated with the gonadosomatic index (GSI) in female Japanese flounder (Pb0.05). AndSNP2 was significantly associated with the serum 17 β -estradiol (E2) level and GSI (Pb0.05). Individuals withgenotype AB of SNP2 had significantly higher serum E2 level and GSI than those of genotype AA (Pb0.05).Moreover, the hepatosomatic index (HSI), a marker for genetic effects, was significantly higher for diplotypeD2 compared with the other three diplotypes (Pb0.05). These results obtained in this study suggested thatSNP2 could influence reproductive endocrinology of female Japanese flounder and be useful as a potential candidate genetic marker for the selection of reproductive indices in female Japanese flounder

【题目】Polymorphisms within promoter of Japanese flounder (Paralichthys olivaceus) ovary cytochrome P450-c19 (CYP19a) gene associated with reproductive traits
【中文关键词】null
【英文关键词】Japanese flounder CYP19a gene
promoter SNPs Diplotype Reproductive traits
【中文摘要】无
【英文摘要】Cytochrome P450 aromatase, which isencoded by the CYP19a gene, converts androgens toestradiol. Considerable evidence suggests that estrogensplay an important role in fish reproductiveprocess. Therefore CYP19a is an excellent candidategene for reproductive traits. Variants in the promoter ofthe CYP19a gene might also be involved in the controlof aromatase expression and affect regulatory mechanismlinking cholesterol metabolism to the synthesisof sex steroids. In this study, nine single-nucleotidepolymorphisms (SNPs) were detected with polymerasechain reaction-single stranded conformational polymorphism(PCR-SSCP), namely A-680G, G-672A,AGTAGT-649 inserting or deleting, T-623C, C-410A,T7-454A, T-402C, TTTCCAGACTGA-345 insertingor deleting, and G-297C. Nine SNPs within thepromoter of the CYP19a gene were tested for associationwith four reproductive traits [serum testosterone(T), serum 17b-estradiol (E2), hepatosomatic index(HSI), and gonadosomatic index (GSI)] in a populationof 50 female Japanese flounder individuals.Alocus, P3(TTTCCAGACTGA-345 inserting or deleting, G-297C), was significantly associated with 17b-estradiol(E2) level (P\0.05) in female Japanese flounder. In addition, there was significant association between onediplotype based on nine SNPs and reproductive trait.The genetic effect for E2 level of diplotype D3 wassignificantly higher than those of other diplotypes(P\0.05). Results indicate that these genetic effectsof those variants on E2 level may help to explainCYP19a

gene status in the reproductive endocrinologyof Japanese flounder.

【题目】Metabolic rates and biochemical compositions of Apostichopus japonicus (Selenka) tissue during periods of inactivity
【中文关键词】null
【英文关键词】Apostichopus japonicus; oxygen consumption rates; chemical composition; temperature,
periods of inactivity
【中文摘要】无
【英文摘要】Estivation, hibernation, and starvation are indispensable inactive states of sea cucumbersApostichopus japonicus in nature and in culture ponds. Generally, temperature is the principal factor thatinduces estivation or hibernation in the sea cucumber. The present study provided insight into thephysiological adaptations of A. japonicus during the three types of inactivity (hibernation, estivation, andstarvation) by measuring the oxygen consumption rates (Vo2) and biochemical compositions underlaboratory conditions of low (3 ° C), normal (17 ° C) and high (24 ° C) temperature. The results show that thecharacteristics of A. japonicus in dormancy (hibernation and estivation) states were quite different fromhigher animals, such as fishes, amphibians, reptiles, and mammals, but more closely resembled asemi-dormant state. It was observed that the shift in the A. japonicus physiological state from normal todormancy was a chronic rather than acute process, indicated by the gradual depression of metabolic rate.While metabolic rates declined 44.9% for the estivation group and 71.7% for the hibernation group,relative to initial rates, during the 36 d culture period, metabolic rates were not maintained at constantlevels during these states. The metabolic depression processes for sea cucumbers in hibernation andestivation appeared to be a passive and an active metabolic suppression, respectively. In contrast, themetabolic rates (128.90±11.70 μg/g h) of estivating sea cucumbers were notably higher(107.85±6.31 μg/g h) than in starving sea cucumbers at 17 ° C, which indicated that the dormancymechanism here, as a physiological inhibition, was not as efficient as in higher animals. Finally, theprinciple metabolic substrate or energy source of sea cucumbers in hibernation was lipid, whereas inestivation they mainly consumed protein in the early times and both protein and lipid thereafter.

【题目】Seasonal Variations in Biochemical Composition and Reproductive Activity of Venus Clam Cyclina sinensis (Gmelin) from the Yellow River Delta in Northern China in Relation to Environmental Factors
【中文关键词】null
【英文关键词】Venus clam, Cyclina sinensis, biochemical composition, reproductive cycle, environmental factors
【中文摘要】无
【英文摘要】The seasonal variations in biochemical composition and reproductive activity of the venus clam Cyclina sinensis(Gmelin) from the Yellow River delta in China were investigated from April 2007 to March 2008 in relation to environmentalfactors. According to histological observations, gametogenesis began in January when the water temperature was low. Gametesmatured mainly in June and July when the condition index (CI) and mean oocyte diameter peaked. Spawning occurred primarilyin August when the temperature was highest, and coincided with phytoplankton bloom. The CI and oocyte diameter decreasedsharply after spawning occurred, as mostly larger, mature gametes have been released. In autumn, the plentiful

phytoplanktonand higher water temperature were fit for the larvae to grow. Biochemical analysis indicated that gametogenesis took place at theexpense of reserves accumulated in the various tissues previously during winter. A slight increase in lipid and protein content infemale gonad – visceral mass during sexual maturation was observed, demonstrating that lipid and protein would be accumulatedas vitellin in oocytes. Conversely, the lipid and protein content in the male gonad – visceral mass decreased during sexualmaturation. The biochemical compositions in the adductor muscle and mantle varied during the study period, suggesting that theycould support reproduction and growth. Seasonal variation in the RNA-to-DNA ratio suggests that it cannot reflect the situationof gonad development in this species.

【题目】Effect of salinity and temperature on salinity tolerance of the sea cucumber Apostichopus japonicus
【中文关键词】null
【英文关键词】Apostichopus japonicus Salinity
Salinity tolerance Sea cucumber Temperature
【中文摘要】无
【英文摘要】Sea cucumber Apostichopus japonicus juvenilesacclimated to different environmental conditions (23,25, and 27 C combined with 25, 30, and 35 psu) wereassessed for tolerance to increasing and decreasing levelsof salinity at a rate of 2 psu h-1. They were also tested forthe LS50 (median lethal salinity) when transferred directlyinto a series of higher salinity (32 – 46 psu) and lowersalinity (9 – 25 psu). The CSMax (critical salinity maximum),CSMin (critical salinity minimum), USTL (uppersalinity tolerance limit), and LSTL (lower salinity tolerancelimit) were positively correlated to the acclimatedsalinity level but negatively correlated to temperature.The CSMax of A. japonicus was 6.2 – 10.0 psu higher thanthe USTL, and the CSMin was 5.5 – 8.5 psu lower than theLSTL, indicating that gradual changes in salinity resultedin the wide range of salinity tolerance that was observed,but that abrupt changes in salinity resulted in the narrowrange of tolerance. Two-way analysis of variance revealedthat salinity and temperature had a significant effect on50% CSMax, 50% CSMin, USTL, and LSTL (P\0.001).The information obtained in this study will be valuable forthe further development of the sea cucumber aquacultureindustry in China.

【题目】The Effect of Different Substrates on Larvae Settlement in Sea
【中文关键词】null
【英文关键词】null
【中文摘要】无
【英文摘要】In this study, the effect of various substrata on the settlement of sea cucumber, Apostichopusjaponicus, was evaluated. The settlement of the larvae in the experiments with three differentsubstrata was compared and showed that a polyethylene plastic sheet attracted significantly morelarvae ($P < 0.05$) than plastic film and monofilament nylon. In addition, the highest setting rate wasachieved for the plastic sheet with diatom-based films, followed by effective microorganisms (EMs)-based films and natural microbial films, and the least recorded was on the plastic sheet withoutbiofilms. There was a significant difference ($P < 0.05$) in the mean setting rates of the treatments,except between the diatom-based films and the EM-based films. Plastic sheets also appeared attractiveto setting larvae when

coated with tissue extracts of the same species. The number of settled larvaeon substrates with tissue extracts was significantly greater ($P < 0.05$) than that on the control.

【题目】Seasonal changes in reproductive activity and biochemical composition of the razor clam Sinonovacula constricta (Lamarck 1818)
【中文关键词】null
【英文关键词】Biochemical composition, environmental factors, reproductive cycle, Sinonovacula constricta,seasonal variations
【中文摘要】无
【英文摘要】The reproductive cycle and seasonal variations in biochemical composition of the razor clam Sinonovacula constricta(Lamarck) from the Yellow River delta in China were investigated from April 2007 to March 2008 in relation toenvironmental factors. Histological analysis indicated that the gametogenesis of the S. constricta comprised two phases: aresting phase (February May) and gametogenesis, including ripeness and spawning, during the rest of the year.Gametogenesis of S. constricta began in June July and was completed during September October when food was abundant.A significant decrease in the glycogen content of all tissues both in the female and male during sexual maturation suggeststhat carbohydrates play the most important role in reproduction of this species. The protein and lipid content increased inassociation with the gametogenesis in the female gonads, indicating that they are the major organic component of oocytes.Conversely, the protein and lipid decreased in the male gonads and other tissues, demonstrating that they also supportreproduction after the glycogen is depleted. The RNA/DNA ratio is a valuable indicator of maturation both in the femaleand male. The results obtained in this study provide useful information for developing management strategies of S. constrictapopulations in this area, and for optimizing the hatchery-based seed production.

【题目】Effects of stocking density, temperature, and salinity on larval survival and growth of the red race of the sea cucumber Apostichopus japonicus (Selenka)
【中文关键词】null
【英文关键词】Sea cucumber Apostichopus japonicus Red race Larval rearing Stocking density Salinity Temperature
【中文摘要】无
【英文摘要】The red race of the sea cucumber Apostichopus japonicus was introduced intoChina from Japan for large-scale seed production because of its economic value. Thispaper reports the effects of stocking density, temperature, and salinity on survival andgrowth of early larvae before and after feeding, in order to establish conditions for optimallarval growth and production. To maximize the yield per unit of space, densities of 0.5 – 1larvae/ml are recommended for non-feeding larvae, while 0.1 – 0.2 larvae/ml are best forfeeding larvae. Higher survival and growth values were obtained for both non-feeding andfeeding larvae at temperature ranges from 21 to 24 C. Larvae reared at a salinity of 30%always showed maximum growth and survival. Based on results of this study, a temperaturerange from 21 to 24 C and a salinity of 30 are considered optimal for early developmentof the red A. japonicus.

【题目】Effect of yeast polysaccharide on the immune function of juvenile sea cucumber, Apostichopus japonicus Selenka under pH stress
【中文关键词】null
【英文关键词】Apostichopus japonicus Yeast polysaccharide pH stress Immune function
【中文摘要】无
【英文摘要】In the present study, we evaluated the effect of yeast polysaccharide (YSP) onthe immune function of Apostichopus japonicus at different pH levels. Juvenile seacucumbers were fed artificial feed containing 0.5% YSP. Phagocytic activity and activityof lysozyme (LSZ), acid phosphatase (ACP) and alkaline phosphatase (ALP) were measuredunder pH stress after 24 h. The results showed that the phagocytic index, the activityof LSZ and ACP in the intestines increased at pH 10.0, and ACP activity in the body walldecreased. The phagocytic rate and ALP activity in the intestines were not different fromthe control group. The phagocytic index was also not different from the control group atpH 5.5. The activity of LSZ and ACP in the intestines and the activity of ALP

increased,while the activity of ACP in the body wall decreased. The phagocytic rate of YSP groupincreased and the phagocytic rate of control group decreased. Thus, this study indicatedthat YSP can modulate the non-specific immunity of A. japonicus, and the reasonable doseof YSP might be used as the immunostimulants in sea cucumbers farming under pH stress.

【题目】Role of animal pole protuberance and microtubules during meiosis in sea cucumber Apostichopus japonicus oocytes
【中文关键词】null
【英文关键词】Apostichopus japonicus; oocyte protuberance; oocyte maturation; microtubule organizing center; polar body formation
【中文摘要】无
【英文摘要】Fully grown oocytes of Apostichopus japonicus have a cytoplasmic protuberance where theoocyte attaches to the follicle. The protuberance and the oolamina located on the opposite side of theoocyte indicate the animal-vegetal axis. Two pre-meiotic centrosomes are anchored to the protuberance bymicrotubules between centrosomes and protuberance. After meiosis reinitiation induced by DTT solution,the germinal vesicle (GV) migrates towards the protuberance. The GV breaks down after it migrates to theoocyte membrane on the protuberance side. The protuberance then contracts back into the oocyte and thefirst polar body extrudes from the site of the former protuberance. The second polar body forms beneaththe first. Thus the oocyte protuberance indicates the presumptive animal pole well before maturation ofthe oocyte.

【题目】The influence of water temperature and ration on the growth, body composition and energy budget of tongue sole (Cynoglossus semilaevis)
【中文关键词】null
【英文关键词】Temperature
Ration
Growth
Body composition
Energy budget
Cynoglossus semilaevis
【中文摘要】无
【英文摘要】The influence ofwater temperatures (16, 22 and 28 ° C) and ration levels (0%, 25%, 50%, 75% and 100% of satiation)on the growth, body composition and energy budget in juvenile tongue sole (Cynoglossus semilaevis) wasinvestigated over 60 days. The specificgrowthratesof fish increased with increasing ration levels. Fish fed to 100%satiation at 22 ° C exhibited better growth than other treatments. The relationship among SGRw, SGRe,temperature (T) and ration (RLw, inweight and RLe, in energy) could be described by the regression equations:SGRw=20.778 log(RLw+5) − 0.0767T − 13.628, SGRe=11.016 log(RLe+5) − 0.152T − 6.730. The maintenanceration levels were 0.19%, 0.46% and 0.74% of body weight, while 1.79%, 3.21% and 4.94% of body energy at16, 22 and 28 ° C, respectively. Ration level from50% to 100% satiation did not influence food conversion efficiency.There is no significant

difference in apparent digestion rate between fish fed to 75% and 100% satiation. Thecontent of lipid in fish tended to increase with increasing ration levels, while tended to decreasewith increasingwater temperature. The crude protein content in fish tended to decrease with increasing ration levels at lowtemperature (16 ° C),while tended to increase at high temperature (22 and 28 ° C). The proportion of food energyassimilated in growth and the proportion consumed for respiration dominated the mode of the energy allocationof juvenile tongue sole. In the temperature range of this experiment, the proportion of food energy allocated togrowth decreased with increasing temperature, and was not affected significantly by ration level from 50% to100% satiation at the same temperature. The proportion of food energy consumed for respiration decreased withincreasing ration, while increased with increasing temperature. The maximum specific growth rate occurred infish fed to satiation at 22 ° C,which suggested that commercial farmers could feed juvenile tongue sole to satiationat 22 ° C to obtain higher growth rate.

【题目】Sedimentation and sediment characteristics in sea cucumber Apostichopus japonicus (Selenka) culture ponds
【中文关键词】null
【英文关键词】sea cucumber, ponds, sedimentation,
sediment, chlorophyll, pheophytin, POC, PON,TP
【中文摘要】无
【英文摘要】Annual sedimentation, re-suspension rates and contentsof particulate organic carbon (POC), particulateorganic nitrogen (PON) and total phosphorus (TP) inthe sediment were investigated in two sea cucumberculture ponds at Rongcheng, Shandong Province,China. The results showed that the average £ ux of totalparticulatematter inthe pondswas 22.1gm2 d 1.The average re-suspension rate of the sediment in theponds was 81.7%. The re-suspension rates in springand autumn were higher than those in summer andwinter.The mean contents of POC, PONandTP in thesediment of the ponds were 4.4,0.5 and 0.6 (mg g 1),respectively, and the mean contents of Chlorophyll a(Chl a) and pheophytin in the sediment were 8.1and12.1 mgg 1 respectively. The POC, PON and TP contentsin the sediment of the ponds increased duringthe period of sea cucumber aestivation (summer)and hibernation (winter), while they decreased duringthe feeding periods. The organic matter accumulationrate and the contents of POC, PON, TP, Chl aand pheophytin in the sediment were even lowerthan those in the pond without sea cucumber(Po0.05). The results demonstrated that sea cucumberculture can e ¡ ectively stop nutrient accumulationat the bottomof the cucumber culture ponds.

【题目】Intra-specific effects of sea cucumber (Apostichopus japonicus) with reference to stocking density and body size
【中文关键词】null
【英文关键词】sea cucumber, Apostichopus japonicus,
stocking density, body size, growth, energetics
【中文摘要】无
【英文摘要】The present studies deal with the intra-speci ¢ c e ¡ ectsof sea cucumber Apostichopus japonicus with unlimitedfood resources, especially the e ¡ ects of stockingdensity on growth variation of the animal and energeticchanges of small individuals under the stress oflarge individuals. The results showed that with theinitial body weight of 5.12 0.09^6.11 0.26 g ofsea cucumber among

the densities of 5,10, 20,30, 40and 50 ind./100 L, the density of 20 ind./100 L wasthe optimum stocking density because of its highestspeci ¢ c growth rate, crude protein content and crudelipid content in tissue. Individual growth variation ofA. japonicus increased with the increase of stockingdensities, whereas no signi ¢ cant di ¡ erences in variationwere found when the density was over 30 ind./100 L (P40.05). The low-weight individuals underthe stress of heavy-weight individuals exhibited obviouschanges in energetics, such as lower ingestionrate, lower energy deposited as growth but higher respirationand excretion.The coe ／ cient of variation ingrowth of the animals was over 70% due to the simultaneousaction of aggression and maybe a factorof chemical mediator, and led to signi ¢ cant changesin the energetics of small-sized individuals.

【题目】Genetic variability analysis in five populations of the sea cucumber Stichopus (Apostichopus) japonicus from China, Russia, South Korea and Japan as revealed by microsatellite markers
【中文关键词】null
【英文关键词】Genetic structure; microsatellite; populations;
Stichopus japonicus
【中文摘要】无
【英文摘要】The genetic structure of populations of the sea cucumber Stichopus (Apostichopus)japonicus was investigated using 10 microsatellite markers. In all, 152individuals from five natural populations were collected from Aomori, Japan(JA and JR), Yosu, South Korea (KY), Dalian, China (CD) and Vladivostock,Russia (RV). A total of 145 alleles were found at 10 loci. The number of allelesper locus ranged from 9 at PSC03 to 20 at SCZ06, with an average of 14.5.Average Ho and He ranged from 0.260 (JR) to 0.434 (JA) and from 0.654(RV) to 0.778 (KY), respectively. No significant differences at A, Ho and Hewere found, indicating similar genetic diversity in the five populations. A singleallele was found at the PSC05 locus in the RV population. Of the 50 loci,42 significantly deviated from Hardy – Weinberg equilibrium, all showing heterozygotedeficiency. The genetic distances were all relatively great, rangingfrom 0.497 (between JA and KY) to 1.029 (between KY and JR). This suggeststhe five populations are genetically distinct. Cluster analysis indicated that JA,KY and CD form one branch and RV and JR another in the UPGMA tree. Ahypothesis is proposed for the evolution of the Japanese red sea cucumbersand the genetic relationship among the populations.

【题目】Difference in Thermotolerance Between Green and Red Color Variants of the Japanese Sea Cucumber, Apostichopus japonicus Selenka: Hsp70 and Heat-Hardening Effect
【中文关键词】null
【英文关键词】null
【中文摘要】无
【英文摘要】We studied thermal tolerance limits, heat-hardening,and Hsp70 to elucidate the difference in thermotolerancebetween two color variants of the sea cucumberApostichopus japonicus. Green and Red variants occupydifferent habitats and have different aestivation responses tohigh temperature in summer. In the absence of heat-hardening,the variants showed no difference in the temperatureat which 50% of the individuals died: Green, 31.49 ° C; Red,31.39 ° C. However, Green specimens acquired higher

thermotolerancethan Red after a prior sublethal heat exposure.After 72 h of recovery from a heat-hardening treatment(30 ° C for 2 h), the survival of Green variants was more than50% and that of Red was less than 5% when they weretreated at 33 ° C for 2 h. Levels of mRNA and protein forHsp70 were significantly higher in Green than Red after theheat shock of 30 ° C, and the stability of hsp70 mRNA ofGreen was significantly higher than that of Red. Our findingssuggest that within the same species, different variantsthat have similar thermal limits in the absence of heathardeningcan acquire different thermotolerances after aprior sublethal heat shock. The difference in induced thermotolerancebetween Green and Red is closely related to theexpression pattern of Hsp70, which was partly governed bythe stability of hsp70 mRNA.

【题目】Comparative mitochondrial genomics within sea cucumber (Apostichopus japonicus):Provide new insights into relationships among color variants
【中文关键词】null
【英文关键词】Apostichopus japonicus
Mitochondrial DNA
Color variants
Sea cucumber
【中文摘要】无
【英文摘要】To investigate genetic relationships among three color variants (Red, Green and Black) of sea cucumberApostichopus japonicus, complete mitochondrial (mt) genomes of two Red and one Green individuals of A.japonicus were sequenced and compared with those of other eight individuals (two Red, two Black and fourGreen) from GenBank. All the eleven A. japonicus mitogenomes share an identical gene complement,consisting of 13 protein-coding genes, 22 tRNA genes and 2 rRNA genes, arranged in the same order.Comparative genomic analyses reveal that non-coding intergenic regions have the highest mutation rate(7.36% of sites were variable), while tRNA genes have the lowest mutation rates (0.99%). Three hundred andeighty-six single-nucleotide polymorphism sites are observed in protein-coding genes across the eleven mtsequences. The overall mean genetic distance for the complete mtDNA of the eleven individuals is 0.76% (pdistance).For all protein-coding genes, the pairwise p-distances among the eleven A. japonicus range from0.04% to 1.55%. As the consequences of extremely low levels of divergence, they strongly support that the assertion that the three color variants of sea cucumber belong to a single species A. japonicus.

【题目】Effects of Environmental Factors on Larval Settlement of Sea Cucumber, Apostichopus japonicus (Selenka)
【中文关键词】null
【英文关键词】null
【中文摘要】无
【英文摘要】In this study, a series of experiments wereconducted to evaluate the influence of environmental factorson larval settlement of sea cucumber, Apostichopus japonicus(Selenka). These experiments examined the followingfactors: temperature (18, 21, 24, and 27 C), salinity (20,25, 30, and 35 ppt), and diet supply (micro-algae, macroalgae,sea mud, and a mixture of macro-algae and sea

mud).Results indicated that larval settlements were significantlydifferent among different temperatures, salinities, and dietsupplies (P <0.001). Lower temperature between 18 and21 C and a salinity of 30 ppt were the optimum for larvalsettlement of A. japonicus. The sediments (macro-algaeand sea mud) replaced micro-algae as a food source for thenewly settled juveniles with an increase in metamorphosisand early settlement.

【题目】Biological characteristics and pathogenicity of a highly pathogenic Shewanella marisflavi infecting sea cucumber,Apostichopus japonicus

【中文关键词】null

【英文关键词】null

【中文摘要】无

【英文摘要】Shewanella marisflavi isolate AP629 is described as anovel pathogen of sea cucumber. The LD50 values(14 days) in sea cucumber, mice and swordtail fishwere 3.89 · 106, 6.80 · 104 and 4.85 · 104 CFUg)1 body weight, respectively. Studies on S. marisflaviwere conducted, including morphology,physiological and biochemical characteristics,haemolysis, whole-cell protein and 16S rDNA genesequence. Colonies of S. marisflavi appeared faintred on marine agar and green on thiosulphate – citrate – bile salt – sucrose media. Shewanella marisflavihad polar flagella. The cells were Gram-negative,oxidase- and catalase-positive and not sensitive to O/129. The bacterium exhibited b-haemolysis onsheep blood agar and produced H2S. Shewanellamarisflavi survived and grew at 4 – 35 C, pH 6.0 – 9.2 and in the presence of 0 – 8% NaCl. The wholecellproteins included 13 discrete bands, andproteins of molecular weight 87, 44 and 39 kDawere found in all five strains of Shewanella spp. Thedifference in 16S rDNA gene sequences in S. marisflaviwas at the 446 bp site: S. marisflavi (KCCM41822) – G, isolate AP629 – A. This is the firstreport that Shewanella is pathogenic to seacucumber.

【题目】Phenotypic and genetic characterization of bacteria isolated from diseased cultured sea cucumber Apostichopus japonicus in northeastern China

【中文关键词】null

【英文关键词】Sea cucumber · Apostichopus japonicus · Bacterial pathogen · Vibrio splendidus · Shewanella sp. · Pseudoalteromonas tetraodonis

【中文摘要】无

【英文摘要】During the winter – spring from 2004 to 2006 in northeastern China cultured Japanesesea cucumber Apostichopus japonicus suffered from a serious disease. Clinical signs includedswollen mouth, skin ulceration and massive mortality. Clinical samples taken during this period werestudied. Thirty-one bacterial samples were isolated from diseased sea cucumbers and identifiedthrough biochemical tests, 16S rRNA gene sequence analysis and PCR amplification, followed bypathogenicity determination. The results showed that the 31 isolates belonged to the genera Vibrio(64.5%), Shewanella (12.9%), Serratia (12.9%), Pseudoalteromonas (6.4%) and Flavobacterium(3.2%). The 3 prominent strains were Vibrio splendidus (41.9%), Shewanella (12.9%) and Serratiaodorifera biogroup I (12.9%). Pathogenicity tests demonstrated that 13 out of 31 isolates were pathogenic,including 8 strains of V. splendidus, 3 strains of Shewanella sp. and 2 strains of Pseudoalteromonastetraodonis. The pathogenic V. splendidus showed the highest frequency of

appearance.Median lethal dose (LD50) values (14 d) of V. splendidus, Shewanella sp. and P. tetraodonis were 1.74× 107, 7.76 × 106, 7.24 × 107 CFU g − 1 body weight of sea cucumber, respectively. The virulences differedby species: Shewanella sp. > V. splendidus > P. tetraodonis. This is the first report of Shewanellasp. virulence in sea cucumber.

【题目】Production, characterization and application of monoclonal antibody to spherulocytes: A subpopulation of coelomocytes of Apostichopus japonicus
【中文关键词】null
【英文关键词】Apostichopus japonicus
Coelomocyte
Spherulocyte
Monoclonal antibody
【中文摘要】无
【英文摘要】One monoclonal antibody (mAb 3F6) against coelomocytes of sea cucumber Apostichopus japonicus wasdeveloped by immunization of Balb/C mice. Analyzed by indirect immunofluorescence assay test (IIFAT),immunocytochemical assay (ICA),Western blotting and fluorescenceactivated cell sorter (FACS), mAb 3F6showed specific for spherulocytes of A. japonicus. The mAb 3F6 recognized an antigen of molecular weight136 kDa in Western blotting. Isotype analysis revealed mAb 3F6 as IgG type. The flow cytometry assayconfirmed the microscopy observations and showed coelomocytes positive to mAb 3F6. The antigencity ofhaemocytes or coelomocytes of Hemicentrotus pulcherrimus, Scapharca subcrenata, Asterina pectinifera,Asterias rollestoni, Ruditapes philipinarum, Patinopecten yessoensis and Mytilus eduliswas compared and theresult showed that none of them was positive with mAb 3F6. Most of cells free in polian vesicle werepositive with mAb 3F6. The positive cells are in spherical shape, 5e7 mmin diameter, smaller than coelomicspherulocytes of A. japonicus. The result of immunofluorescent staining with cells in hemal vessel showedthat there were strong positive signals on cytoplasm of some spherical cells with diameter of 7e8 mm.Some other cells with higher nucelo-plasmic ratio, about 5e6 mm in diameter showed weak positivesignals on membrane. Immunohistochemistry assay revealed that positive signals were mostly observedin the lumen structure of rete mirabile and haemocoel of the respiratory tree. In addition, the outerepidermis of body wall and tentacle also showed positive

【题目】Comparative study on thermotolerance of Artemia resting eggs from Qinghai – Xizang Plateau, China
【中文关键词】null
【英文关键词】Artemia resting eggs
Biochemical composition
Outer cuticular membrane (OCM)
Permeability
Thermotolerance
Water content

【中文摘要】无
【英文摘要】Artemia resting eggs are well-known to be extremely tolerant to harsh conditions. However, eggs from somehypersaline waters in Qinghai – Xizang Plateau (Q-XP) have recently been reported to be very sensitive tohigh temperatures. Thus, the thermotolerant capacity of Artemia eggs from four hypersaline waters [(Gai Hai(GH), Aqqikkol Hu (AQK), Xizang (XZ), Jingyu Hu (JYH)] in Q-XP were studied by comparing their structure,biochemical composition and physiology. Thermotolerance was markedly different among eggs of the foursites. GH eggs were found to be more thermotolerant than AQK eggs. Both eggs were much more tolerantthan those from JYH and XZ. Water content had significant effect on heat resistance of “ dry ” eggs. Rate ofwater loss of GH eggs was markedly slower than that of AQK eggs; the latter slower than XZ and JYH eggs.The water loss from inner embryo (and the first embryonic cuticle) appeared not to be related to the natureof the tertiary envelope. Volatile factor(s) releasing from (or/and entering into) the eggs might play crucialrole on the viability of encysted embryos under thermal stress. The thermotolerant capacity of Artemia eggsis likely to be negatively related to the permeability of egg shell/underlying membranes. The hypoplasticouter cuticular membrane (OCM) found in some eggs from Q-XP might be responsible for their thermalsensitivity.

【题目】Effects of light intensity on daily activity rhythm of juvenile sea cucumber, Apostichopus japonicus (Selenka)
【中文关键词】null
【英文关键词】Apostichopus japonicus, daily behaviour,
light, sea cucumber
【中文摘要】无
【英文摘要】Eight light-intensity treatments (natural light, continuousdarkness, and 15, 30, 60,125, 250 and 500 lxunder LD12:12 cycle) were used to investigate the effectsof light intensity on the daily activity of30.27 3.08 g sea cucumber Apostichopus japonicus(Selenka). Cyclic nocturnal activity patterns of behaviourwere observed at di ¡ erent light intensities inthe range of 15^500 lx under LD 12:12 cycle. And anongoing nocturnal cycle persisted in DD cycle for upto 8 days, but longer feeding time and less markedrhythm occurred at continuous darkness. Underpoor light conditions (Io5.18 lx), the daily activityrhythm of A. japonicus was governed by an innatebiological clock and the e ¡ ect of light intensity wasnot signi ¢ cant among di ¡ erent treatments. Andmoreindividuals tended to retreat to shelters (from 56.04%to 91.83%) with the increase of light intensity withinthe weak light condition (from 5.18 to 278 lx). However,the daily behaviours of A. japonicus were in £ uencedunder strong light conditions (4278 lx). Lessthan 8.17% individuals kept actively feeding and theproportion was not decreased with the increase oflight intensity

【题目】Effects of starvation and recovery on the growth, metabolism and energy budget of juvenile tongue sole (Cynoglossus semilaevis)
【中文关键词】null
【英文关键词】Cynoglossus semilaevis
Growth
Body composition

Metabolism
Energy budget
【中文摘要】无
【英文摘要】The effects of starvation and re-feeding on compensatory growth, body composition, metabolism and energybudget were examined in juvenile tongue sole, Cynoglossus semilaevis, at 22 ° C for 64 days. Fish were dividedinto six groups including control group (continuously fed ad libitum group, C), starvation group (S0) and otherfour groups with food deprivation for 4 days (S1), 8 days (S2), 16 days (S3) and 32 days (S4), respectively.Fish in S1, S2, S3 and S4 resumed feeding after the corresponding starvation period. At the end of theexperiment, the weight of S1 fish was highest but not significantly different with that of the control fish(PN0.05), indicating complete compensatory growth occurred. Although the specific growth rate in S2, S3 andS4 fish was greater than that in the control fish after re-feeding, S2, S3 and S4 fish did not reach the same bodyweight of the control fish at the end. Food conversion efficiency of tongue sole was significantly higher in S1than that in the control fish (Pb0.05). The feeding rate and apparent digestion in S2, S3 and S4 fish weresignificantly higher than those in the control fish, while no significant difference was found between S1 andthe control fish. There was no significant difference among S1, S2 and C in the content of moisture, lipid,protein, ash and energy (PN0.05) at the end of the experiment. Upon re-feeding, metabolic rates of juveniletongue sole increased rapidly except a time lag in nitrogen excretion for the fish starved for 32 days, and thepeaks of these increases were directly proportional to the length of the starvation period. Estimated to energybudget during the period of the experiment, S1 fish exhibited significantly higher proportion of food energyassimilated in growth and lower proportion consumed for respiration than the control fish (Pb0.05). Based onthe results of the present study, the underlying mechanisms for complete compensatory growth in juveniletongue sole could be attributed to an improved energetic efficiency resulting from reduced metabolicexpenditure during the period of recovery.

【题目】Identification of the pathogens associated with skin ulceration and peristome tumescence in cultured sea cucumbers Apostichopus japonicus (Selenka)
【中文关键词】null
【英文关键词】Apostichopus japonicus
Bacterial isolation and identification
Virus
Experimental infection
【中文摘要】无
【英文摘要】The aquaculture of sea cucumbers Apostichopus japonicus (Selenka) has developed rapidly in China inrecent years, but is increasingly affected by diseases such as skin ulceration and peristome tumescence.Previous studies on the pathogens causing these diseases focused largely on bacterial causes. In December2008, we isolated four dominant bacterial species from lesions present in A. japonicus with the aforementioneddiseases, from a farm in Yangkou (Qingdao, China). With two of these bacterial species,experimental infection of healthy A. japonicus resulted in the same disease symptoms that occurred innaturally infected A. japonicus. These two species were identified as Pseudoalteromonas sp. and Pseudoalteromonastetraodonis. The early symptoms of infection for these bacterial species were ulcer spots on thedorsal skin and abdominal parapodia, followed by an increase in the number of ulcer spots or their merginginto larger spots. Additionally, we isolated a spherical virus 100 – 250 nm in diameter and with abilayer capsule, from A. japonicus with another disease from four different farms. By experimental infectionwith crude extracts of the virus, healthy laboratory-acclimatized A. japonicus developed the samesymptoms as in natural infected cases. The early symptoms of viral infection comprised a decrease in tentacleactivity, decay of dorsal papillate podia, peristome tumescence and abdominal ulceration. Our studydemonstrates that the bacteria and virus were both responsible for skin ulceration and peristome tumes tumescencein A. japonicus, but resulted in different early disease symptoms

【题目】减源对超高产夏玉米物质积累及氮素利用的影响
【中文关键词】减源; 夏玉米; 物质积累; 氮素利用
【英文关键词】Leaf-cutting; Summer maize; Matter accumulation; Nitrogen utilization
【中文摘要】通过不同减源处理,研究了在超高产条件下减源对夏玉米物质积累和氮素利用的影响。结果表明:在超高产条件下剪叶1/4和1/2后地上部生物量和籽粒产量未出现显著性下降;减源后玉米植株对氮素的积累量增加;超高产条件下剪叶1/4和1/2都可以提高氮素收获指数,且随剪叶程度加大,氮素收获指数呈现升高的趋势。选育高产条件下叶面积相对小的高产夏玉米品种,是解决高产条件下氮素利用率低的有效途径。
【英文摘要】The effects of different leaf-cutting treatments on the matter accumulation and nitrogen utilization of the super-high-yielding summer maize were studied.The results showed that under the condition of super high yield,the above-ground biomass and the grain yield did not reduce significantly after cutting 1/4 and 1/2 of the leaf.The nitrogen accumulation of maize plants increased after leaf-cutting.The treatments of cutting 1/4 or 1/2 leaf could improve the nitrogen harvest index;with the increase of leaf cu...

【题目】IGF binding protein 1 is correlated with hypoxia-induced growth reduce and developmental defects in grass carp (Ctenopharyngodon idellus) embryos
【中文关键词】草鱼;IGFBP1;高表达;低氧;胚胎发育
【英文关键词】Ctenopharyngodon idellus ;IGFBP1 ;Overexpression ;Hypoxia ;Embryo development
【中文摘要】在硬骨鱼中低氧的影响对于胚胎发育的细胞的分子机制报道很少,然而在斑马鱼中低氧对胚胎生长和发育已有报道。本研究中我们发现低氧对草鱼胚胎的增长和延迟有重要影响。将不同发育阶段的胚胎至于低氧条件下,诱导胰岛素生长因子结合蛋白1的mRNA强烈表达,一种抑制蛋白与IGF结合抑制其表达。进一步的功能分析结果为这个假设提供了支持,IGFBP1在调停低氧诱导的生长和发育缺陷方面起重要作用。IGFBP1的高表达在一定程度减少了类似缺氧的增长速度。此外,IGFBP1的高表达能够引起在中线形成、体节和后脑结构的缺陷在草鱼胚胎发生阶段。总的来说,我们认为在草鱼中调节低氧诱导的胚胎发育阶段和发育迟缓方面IGFBP1起到了重要作用。
【英文摘要】The effects of hypoxia on embryonic development and the underlying cellular and molecular mechanisms are poorly understood in teleost fish, although the hypoxic effects on embryonic growth and development have been reported in the zebrafish model. Here, we found that hypoxia caused significant developmental delay and growth retardation during grass carp embryogenesis. Placing the embryos in hypoxic conditions at different developmental stages strongly induced the mRNA expression of insulin-like growth factor-binding protein 1 (IGFBP1), an inhibitory protein that binds to IGF and inhibits its subsequent actions in vivo. Further gain-of function analysis results provided strong evidence to support the hypothesis that IGFBP1 plays an important role in mediating hypoxic-induced growth and developmental defects. Overexpression of IGFBP1 mRNA reduced the growth rate to a degree that was similar to hypoxia. Additionally, overexpression of IGFBP1 caused significant developmental defects in the formation of midline, somite and hindbrain structures during grass carp embryogenesis. Taken together, our studies suggest that IGFBP1 plays a key role in mediating these hypoxia-induced embryonic growth retardation and developmental delay in grass carp.

【题目】HIF-1alpha and -2alpha genes in a hypoxia-sensitive teleost species Megalobrama amblycephala: cDNA cloning, expression and different responses to hypoxia
【中文关键词】武昌鱼;HIF-1α;HIF-2α;缺氧;基因表达
【英文关键词】Megalobrama amblycephala ; HIF-1α ; HIF-2α ; Hypoxia; Gene expression
【中文摘要】低氧转录应答主要由低氧诱导因子α介导,包括HIF-1α, -2α和-3α。在鱼类中HIF-α的分子结构,表达特性和低氧调节目前还不清楚,我们鉴定了低氧敏感武昌鱼的HIF-1α, HIF-2αcDNA全长,HIF-1αcDNA全长是3815 bp包含编码774个氨基酸残基开放的阅读框。HIF-2αcDNA全长是3121 bp包含编码835个氨基酸残基的开放阅读框。武昌鱼的HIF-1α和HIF-2α亚基在DNA在二级结构域有相似性,但是在反式激活结构域上不同。在成年鱼中,在含氧量正常的条件下HIF-1α和HIF-2α的mRNAs在各个组织中都能检测到。HIF-1α的mRNA在肝、鳃、精子中高量表达,HIF-2α的mRNA在武昌鱼的大部分组织中都表达丰富。HIF-1α和HIF-2α的mRNAs在胚胎的各个阶段都能检测到,显示出无处不在。与HIF-1α相比,HIF-2α的mRNA水平在不同时期上下波动,而且在受精后的8-、28-48、52-小时高量表达。在低氧处理期间,HIF-2α的mRNA显著上升,在肝内上升了910%,在肾内上升了320%,而在相应组织内HIF-1α的mRNA则无明显变化。结果表明武昌鱼的HIF-1α和HIF-2α参与不同的调节在低氧或缺氧条件下。
【英文摘要】Transcriptional responses to hypoxia are primarily mediated by hypoxia-inducible factor (HIF) α subunits, i.e. HIF-1α, -2α and -3α. In fish, the molecular constructions, expression characteristics and hypoxic regulation of HIF-α subunits are still not well known. In this study, we identified the HIF-1α and HIF-2α fulllength cDNAs in a hypoxia-sensitive fish species Wuchang bream, Megalobrama amblycephala. The whole length of HIF-1α cDNA was 3,815 bp, consisting of an open reading frame (ORF) encoding 774 amino acid (aa) residues. The HIF-2α cDNA totaled 3,121-bp including an 835-aa ORF. The Wuchang bream HIF-1α and HIF-2α subunits were structurally similar in the DNA-binding and dimerization domains, but differed in the transactivation domain. In adult fish, both HIF-1α and HIF-2α mRNAs were detected in different tissues under normoxic conditions. HIF-1α mRNA was highly expressed in the liver, gill and testis, whereas HIF-2α mRNA was abundantly expressed in most of the Wuchang bream tissues. Both HIF-1α and HIF-2α mRNAs were detected in all stages of embryogenesis and expressed in a ubiquitous pattern. In contrast to HIF-1α, the mRNA levels of HIF-2α fluctuated in different stages, with higher expression in the zygote, 8-, 28-, 48- and 52-hr post fertilization (hpf) embryos. During hypoxic treatment, the mRNA levels of HIF-2α were significantly (pb0.01) up-regulated to 910% in the liver and 320% in the kidney, whereas no significant changes of HIF-1α mRNA were observed in the corresponding tissues. These results suggest that the Wuchang bream HIF-1α and -2α would be involved in different physiological functions under normoxia and hypoxia situations.

【题目】Identification, characterization and functional analysis of a GH-18 chitinase from Streptomyces roseolus
【中文关键词】几丁质酶;GH-18;链霉菌;杀菌活性
【英文关键词】Chitinase; GH-18; Streptomyces; Antifungal activity
【中文摘要】一种来自链霉菌的40 kDa的几丁质酶通过培养基精制提纯。N端序列是TPPPAKAVKLGYFTNWGVYG,有较高的同源性对于链霉菌糖苷水解酶18个保守区域并包含两个重要的色氨酸和酪氨酸位点。纯化酶在温度为60°C、pH值为6.0的条件下表现出良好的活力和pH稳定性。这种酶在胶体和几丁质中显示出严格的底物特异性。它可被Mg2+, Ba2+和Ca2+激活,可被Cu2+, Co2+, Mn2+抑制,Zn2+和乙二胺四乙酸显示出较小的抑制效果。通过扫描电子显微镜观察其形态学变化表明在几丁质酶的变化中其表面出现了常规空隙。此外,GH-18几丁质酶在真菌菌丝的扩展上有显著的抑制作用。因此,几丁质酶在几丁质的降解上有巨大的潜力。

【英文摘要】A 40 kDa chitinase from Streptomyces roseolus DH was purified to homogeneity from culture medium. The N-terminal sequence was TPPPAKAVKLGYFTNWGVYG, which was highly homologous to the glycoside hydrolase (GH) 18 conserved domain of Streptomyces chitinases and included the two crucial Trp and Tyr sites. The purified enzyme showed maximal activity at 60 ◦ C, pH 6.0 and exhibited good thermal and pH stabilities. The enzyme displayed strict substrate specificity on colloidal or glycol chitin, but not on chitosan derivatives. It was activated by Mg2+, Ba2+ and Ca2+, and inhibited by Cu2+, Co2+, Mn2+, whereas Zn2+ and ethylenediamine tetraacetic acid showed little inhibitory effects. Morphological changes observed by scanning electron microscopy revealed the occurrence of regular pores on the surface with the progress of enzymatic chitinolysis. Additionally, this GH-18 chitinase had a marked inhibitory effect on fungal hyphal extensions. In conclusion, this chitinase may have great potential for the enzymatic degradation of chitin.

【题目】Functional conservation and divergence of duplicated IGF-2 genes in grass carp (Ctenopharyngodon idellus)
【中文关键词】草鱼;igf2;基因复制;功能分析
【英文关键词】Ctenopharyngodon idellus ;igf2 ;Gene duplication ;Functional analysis
【中文摘要】在动物中胰岛素生长因子2(IGF2)是一个有效的促有丝分裂和调控生长、发育、与繁殖的因子。在哺乳动物中只存在一个IGF2基因。最近,在斑马鱼中鉴定出两个igf2基因,推测可能是基因复制所致。然而,复制出的ifg2序列信息和他们的功能作用在其他硬骨鱼中却未曾得知。本研究中,我们鉴定出两种igf2 cDNA在草鱼中。与人类同源的igf2相比,草鱼igf2a 和igf2b mRNAs 编码两个结构不同的IGF多肽。他们两个在胚胎发育的整个时期都能用RT-PCR检测到。在胚胎阶段igf2b mRNAs一直表达,igf2a mRNAs主要在脊索和脑中表达。在成年鱼中,igf2b mRNAs在多处组织中转录,igf2a mRNAs只在肝中发现。注射荷尔蒙后肝中igf2a 和igf2b的转录水平都上调。当禁食和在喂养后肝中igf2a 和igf2b转录水平都明显降低。我们认为复制的igf2基因是进化分歧造成,在调节草鱼生长和发育阶段起到了重叠的作用。
【英文摘要】Insulin-like growth factor 2 (IGF2) is a potent mitogenic and survival factor involved in the regulation of growth, development and reproduction in animals. Only one IGF2 gene exists in mammals. Recently, two igf2 genes have been identified in zebrafish, which presumably resulted from gene duplication. However, sequence information of duplicated igf2s and their functional regulation in other teleost fish is still unknown. Here, we report the identification of two igf2 cDNAs in grass carp, Ctenopharyngodon idellus. Like their human ortholog, grass carp igf2a and igf2b mRNAs encoded two structurally distinct mature IGF peptides. Both of them were detected by RT-PCR throughout embryogenesis. Ubiquitous expression of igf2b mRNAs was observed in embryos, whereas igf2a mRNAs were expressed mainly in the notochord and brain with in situ hybridization. In adult fish, igf2b mRNAs were transcribed in multiple tissues, whereas igf2a mRNAs were detected mainly in the liver. Hepatic levels of igf2a and igf2b transcripts were both up-regulated by growth hormone injection. Furthermore, the levels of hepatic igf2a and igf2b mRNAs decreased significantly during starvation and were rebounded rapidly after re-feeding. Our results suggest that duplicated igf2 genes have evolved divergent yet played an overlapping biological role in regulating grass carp growth and development.

【题目】金鱼hAT家族转座子Tgf2的克隆及其结构

【中文关键词】金鱼; hAT 家族; Tgf2 转座子; 转基因; 基因捕获
【英文关键词】Tgf2; goldfish; Carassius auratus; transposon
【中文摘要】hAT 家族转座子以果蝇hobo、玉米Ac 和金鱼草(Ceratophyllum demersum L.) Tam3 为代表, 以“ 剪切-粘帖 ”方式进行DNA 转座。1996 年, 日本学者首次在白化青鳉(Oryzias latipes)中发现具有天然活性的脊椎动物hAT 家族转座子, 即青鳉Tol2 转座子, 该转座子已在模式生物斑马鱼转基因、基因和启动子捕获方面进行了广泛应用。文章根据玉米Ac 与青鳉Tol2 转座子序列保守区设计一对引物, 在19 种不同鱼类物种或品系中进行PCR 筛选, 最后发现此类hAT 家族转座子在我国不同品系金鱼中存在, 命名为金鱼Tgf2 转座子。金鱼Tgf2 转座子全长4 720 bp, 由4 个阅读框组成, 与青鳉Tol2 转座子的相似度为97%。金鱼Tgf2 与青鳉Tol2 转座子在末端倒位重复和亚末端重复上存在一定差异, 此外, 金鱼Tgf2 转座子的中间反向重复序列(1 453 bp 到2 091 bp)可形成一种“ 十 ”字结构, 明显有别于青鳉Tol2 转座子形成的茎环结构, 这些区域与转座活性密切相关。文章预示金鱼Tgf2 转座子可能具有更高的天然转座活性, 构建高效金鱼Tgf2 转基因元件可供鱼类转基因和基因捕获研究。

【题目】Speciation of polyploid Cyprinidae fish of common carp, crucian carp and silver crucian carp derived from duplicated Hox genes
【中文关键词】物种形成;鲤鱼;鲫鱼;银鲫;Hox
【英文关键词】Speciation;Common Carp;Common Carp;Silver Crucian Carp;Hox
【中文摘要】近代在比较基因组学上的研究表明许多特定鱼类的全基因组复制发生在226-316百万年前的鳍刺类鱼。基因组的复制,特别是在鲤科鱼,分歧可能发生在硬骨鱼,但是发生的具体时期不知。为了解决这个问题,我们测定了多倍体鲤科鱼分类单元的四种Hox基因,鲤鱼、鲫鱼、银鲫鱼。并把他们与已知序列的二倍体鲤科鱼作比较。我们的结果显示存在两种不同的Hox基因复制在鲤鱼与鲫鱼基因组中。有三个不同的Hox序列,一个是鲤鱼的直系同源Hox基因,另外两个是鲫鱼的直系同源Hox基因,但他们都与银鲫鱼隔离,表明银鲫鱼可能来自于鲤鱼与鲫鱼的杂种。鲤鱼和鲫鱼共同的祖先基因复制的结果发生在10.9-13.2百万年前。鲤鱼与鲫鱼、鲫鱼与银鲫鱼的物种进化分别发生在8.1-11.4和2.3-3.0百万年前。一些Hox基因编码区的点突变导致了非功能化。因此,结果指明了多样化的多倍体鱼与物种形成的进化模型。
【英文摘要】Recent studies on comparative genomics have suggested that a round of fish-specific whole genome duplication (3R) in ray-finned fishes might have occurred around 226 – 316Mya. Additional genome duplication, specifically in cyprinids, may have occurred more recently after the divergence of the teleosts. The timing of this event, however, is unknown. To address this question, we sequenced four Hox genes from taxa representing the polyploid Cyprinidae fish, common carp (Cyprinus carpio, 2n5100), crucian carp (Carassius auratus auratus, 2n5100), and silver crucian carp (C. auratus gibelio, 2n5156), and then compared them with known sequences from the diploid Cyprinidae fish, blunt snout bream (Megalobrama amblycephala, 2n548). Our results showed the presence of two distinct Hox duplicates in the genomes of common and crucian carp. Three distinct Hox sequences, one of them orthologous to a Hox gene in common carp and the other two orthologous to a Hox gene in crucian carp, were isolated in silver crucian carp, indicating a possible hybrid origin of silver crucian carp from crucian and common carp. The gene duplication resulting in the origin of the common ancestor of common and crucian carp likely occurred around 10.9 – 13.2Mya. The speciations of common vs. crucian carp and silver crucian vs. crucian carp likely occurred around 8.1 – 11.4 and 2.3 – 3.0 Mya, respectively. Finally, nonfunctionalization resulting from point mutations in the coding region is a probable fate for some Hox duplicates. Taken together, these results suggested an evolutionary model for polyploidization in speciation and diversificationof polyploid fish.

【题目】草鱼两个肌肉生长抑制素cDNA 克隆、表达及过量表达对胚胎发育的影响
【中文关键词】草鱼;肌肉生长抑制素;克隆;过表达
【英文关键词】Grass crap; Myostatin(MSTN); Cloning ;Overexpression
【中文摘要】肌肉生长抑制素(MSTN) 是抑制肌肉生长和发育的重要生长调控因子。通过cDNA 末端快速扩增法(RACE) 克隆草鱼MSTN-1 型和MSTN-2 型全长cDNA。RT-PCR 分析结果表明,MSTN-1 在草鱼肌肉、脑和眼中的转录量较高,在肝胰脏、脾脏和心的转录量较低,在肠、腮、性腺和肾中无表达;MSTN-2 只在脑和肌肉中有表达。在草鱼胚胎发育的0 -36 hpf 期间,MSTN-1 的转录量较低; 在胚胎发育的36 -48 hpf 期间,其转录量呈逐渐升高的趋势;MSTN-2 各时相均无表达,可能因为该基因在草鱼胚胎发育过程中不起重要作用。通过分别显微注射MSTN-1 型和MSTN-2 型mRNA 至斑马鱼1 -2 细胞期胚胎。结果显示,注射MSTN-1 型mRNA 过表达可导致斑马鱼体节发生期胚胎的前- 后轴拉长,背- 腹轴变短,脊索轻微扭曲,以及体节发育受到强烈抑制而不分化等现象。注射MSTN-2 型mRNA 胚胎早期发育有所延迟并未发生明显变化,但发育至60 h 之后尾部明显发生严重弯曲。

【题目】外源性红色荧光蛋白基因在转基因唐鱼中的整合分析
【中文关键词】转基因鱼,唐鱼,红色荧光蛋白,整合,侧翼序列

【英文关键词】Transgenic fish, Tanichthys albonubes, Red fluorescent protein, Integration, Flanking sequence
【中文摘要】转红色荧光蛋白(red fluorescent protein, RFP)基因唐鱼(Tanichthys albonubes)的遗传符合孟德尔分离定律,为进一步了解RFP 基因在转基因唐鱼基因组上的整合特点,采用PCR 和Southern 印迹检测转植基因的拷贝数和连接方式。结果表明,转植基因是以单位点、多拷贝(2~3 个拷贝)、头尾相接(head-to-tail)的串联体形式整合。应用基因组步移技术分别克隆出1.0 和1.2 kb 的转植基因整合位点5' 和3' 侧翼区序列。序列分析表明,5' 侧翼区为宿主唐鱼基因组序列,在GenBank 数据库中经BLAST 分析后未发现有同源序列;3'侧翼序列与P1 噬菌体部分基因组序列同源性达到99%,非转基因唐鱼基因组中未检测到该侧翼序列。研究结果为转红色荧光蛋白基因唐鱼的遗传稳定提供了评价依据。

【题目】Shoaling and mate choice of wild-type Tanichthys albonubes in the presence of the red fluorescent transgenic conspecifics
【中文关键词】体色;鲦鱼;蛋白;性行为
【英文关键词】body colouration; minnow; protein; sexual behaviour
【中文摘要】在实验室条件下,利用红色荧光的转基因同种个体检测白云山鲦鱼(唐鱼属)的浅水和性行为。野生型雌鱼没有显现出特殊的行为,然而野生型雄鱼更倾向于接近转基因鱼而不是野生型鱼。当被放置在一个潜在生殖的环境中,野生型雄鱼比转基因雄鱼的竞争力更大;野生型雌鱼则需要花费更多的时间在视觉介导的实验中,但是野生型雄鱼更倾向于向转基因雌鱼展现求偶的行为。这些结果表明了在野生型和转基因型的唐鱼属之间的浅水行为红体色不能干扰交流信号;转基因雄鱼比野生型雄鱼没有交配优势,但是红体色可能会影响野生型雄鱼的求偶选择。
【英文摘要】Shoaling and sexual behaviour of wild-type male and female white cloud mountain minnow Tanichthys albonubes were measured in the presence of the red fluorescent transgenic conspecifics under laboratory conditions. Wild-type female test fish showed no significant preference, whereas wild-type male test fish preferred to be near a shoal of red transgenic fish rather than wild-type fish. When placed in a potentially reproductive context, wild-type males had a higher competitive ability over transgenic males; wild-type females spent more time with wild-type males in visually mediated experiments, but wild-type males performed more courtship displays towards transgenic females. These results suggest that the red body colouration does not appear to disturb signal communication between wild-type and transgenic T. albonubes in shoaling behaviour; transgenic males have no mating advantage over wild-type males, but the red body colouration of transgenic females may affect mate choice of wild-type males.

【中文关键词】转基因鱼,唐鱼,红色荧光蛋白,整合,侧翼序列
【英文关键词】Transgenic fish, Tanichthys albonubes, Red fluorescent protein, Integration, Flanking sequence
【中文摘要】选取雄性杂合子转红色荧光蛋白基因唐鱼(Tanichthys albonubes)(简称:转基因唐鱼)与雌性非转基因唐鱼交配产卵,出膜7d后,在水温(25.0 ±2.0)℃条件下,选择健康仔鱼进行饱食(食物供应量高)、半饥饿(食物供应量中)和饥饿(食物供应量低)3种处理,结果显示:(1)出膜后7~72 d的唐鱼饱食组与半饥饿组死亡率无显著差异(P>0.05),但饥饿组唐鱼死亡率均显著高于饱食组和半饥饿组(P<0.01),表明食物供应量影响唐鱼的生存能力;(2)红色荧光蛋白基因在唐鱼体内表达,肉眼观察,最早出现在出膜后第30天.在出膜后的72 d,对3个处理组中没有表达红色荧光蛋白的唐鱼进行PCR验证,均没检测到沉默表达个体,此时3个处理组转基因唐鱼与非转基因唐鱼数量比均接近1:1,符合经典的孟德尔单显性基因遗传模式,说明食物供应量多寡对转基因唐鱼与非转基因唐鱼生存影响效应是一致的;(3)出膜后28、42、57和72 d,对3个不同处理组的唐鱼幼鱼体长进行比较,结果均是饱食组>半饥饿组>饥饿组,且组间差异显著或极显著(P<0.05或P<0.01).而对72 d唐鱼幼鱼3个处理组内转基因唐鱼和非转基因唐鱼体长进行统计分析表明,3个处理组内转基因唐鱼和非转基因唐鱼体长差异均不显著(P>0.05),表明食物供应量多寡对转基因唐鱼与非转基因唐鱼生长影响效应也是一致的.综上所述,食物供应量对唐鱼生存和生长是有影响的,但对转基因唐鱼和非转基因唐鱼影响效应是一致的,可见转基因唐鱼在食物供应量缺乏条件下并没有生存竞争优势。

【题目】转红色荧光蛋白唐鱼和野生唐鱼肌肉营养成分比较
【中文关键词】唐鱼; 营养成分; 游离氨基酸; 脂肪酸
【英文关键词】Tanichthys albonubes; nutritional ingred ients; free am ino acid; fatty acid
【中文摘要】对含有外源基因的转红色荧光蛋白基因唐鱼(简称: 转基因唐鱼) 和同胞家系中不含有外源基因唐鱼(简称: 非转基因唐鱼)肌肉中的一般营养成分、游离氨基酸和脂肪酸的组成和含量进行分析和比较。结果表明: 转基因唐鱼肌肉水分、粗蛋白含量和粗灰分含量高于非转基因唐鱼, 粗脂肪含量低于非转基因唐鱼, 但差异均不显著(P > 0. 05) ; 转基因唐鱼和非转基因唐鱼肌肉游离氨基酸总量分别为262. 3 mg /100 g 和492m g /100 g, 其中必需氨基酸分别为161. 6 m g /100 g和314. 8 m g /100 g, 鲜味氨基酸分别为74. 3 mg /100 g 和127. 8 m g /100 g; 按照GC /M S面积归一化法检测转基因唐鱼和非转基因唐鱼肌肉脂肪酸组成及含量, 均检测到28种脂肪酸, 其中饱和脂肪酸分别为29.47%和31. 59%, 单不饱和脂肪酸分别为39. 14%和42. 45%, 多不饱和脂肪酸分别为31. 40%和25. 96%。可见外源红色荧光蛋白基因插入和表达对宿主唐鱼肌肉中一般营养成分、游离氨基酸和脂肪酸组成的影响均不大。

【题目】利用遥感技术监测水稻群体长势
【中文关键词】水稻;TM影像;抽穗期;长势;监测
【英文关键词】rice, TM image; growth condition; monitoring
【中文摘要】利用TM影像信息结合地面试验数据,分析了水稻抽穗期叶面积指数、生物量以及植株氮素含量三个群体质量指标与植被指数之间的关系,建立了基于归一化植被指数(NDVI)、比值植被指数(RVI)的水稻群体质量指标监测模型。结果表明,NDVI与叶面积指数呈现显著的非线性正相关关系(R2=0.8202),与植株氮素含量呈线性正相关关系(R2=0.6364)。RVI与地上部生物量呈线性正相关关系(R2=0.7676)。因此,在抽穗期可以利用NDVI对叶面积指数和植株氮素含量进行监测,对地上部生物量的监测则以利用RVI数据较好。

【题目】冬小麦花期生理形态指标与卫星遥感光谱特征的相关性分析
【中文关键词】冬小麦;花期;长势;生理形态指标;遥感信息;监测
【英文关键词】Winter wheat; Flowering stage; Growth condition; Eco-physiology index; Remote sensing; Monitoring
【中文摘要】为提高冬小麦花期长势遥感监测的精确性与普适性,在集丘陵地、河滩地及平原地为一体的冬小麦种植区域设计了田间试验,利用卫星影像信息结合地面GPS定点试验数据,在分析利用遥感技术监测冬小麦花期LAI和生物量两个主要群体长势指标可行的基础上,对卫星遥感光谱信息与冬小麦花期的主要生理生化指标(叶片叶绿素含量、叶片类胡萝卜素含量、叶片水分含量和叶片氮素含量)进行了综合分析。结果表明,NDVI与LAI、叶片氮素含量和叶片水分含量的相关性较好,RVI与生物量和叶片类胡萝卜素含量的相关性较好,GVI与叶片叶绿素含量的相关性较好,且均到达显著水平。说明NDVI、RVI及GVI是较为理想的可用于监测冬小麦花期生理形态指标的敏感遥感指数。进一步以这些敏感遥感指数作为因变量建立了冬小麦花期生理形态指标的遥感监测模型。利用本模型可以反演多个生理形态指标,便于对冬小麦花期的长势情况进行综合分析与判断。
【英文摘要】Flowering stage is the most impressible stage to soil water and air temperature, in which winter wheat growth condition may greatly affect the formation of grain number and grain weight. To achieve the objective of high yield and good quality, some management measures need to be framed and adopted depending on timely winter wheat growth condition information monitored by remote sensing technology in flowering stage. The field experiments were carried out in Mengzhou county of Henan province, where there are many land types such as upland, bottomland and plain. Using satellite remote sensing images and the experiment data of different sites decided by GPS, this study analyzed the relationships between LAI, plant biomass weight(PBW, kg/hm2) and remote sensing spectral information, confirmed the primary vegetation indexes NDVI and RVI which can be used to monitor dynamic change of LAI and PBW, respectively. In addition, analyzed the correlation between remote sensing spectral information and some eco-physiology indexes such as leaf chlorophyll(LChC, mg/gFW), leaf carotenoids(LCaC, mg/gFW), leaf nitrogen(LNC, %) and leaf water content(LWC, %) of winter wheat in flowering stage. The results indicated that the correlations of NDVI, RVI and GVI to LAI, LNC and LWC, to PBW and LCaC, and to LChC were significant, respectively. NDVI, RVI and GVI were better vegetation indexes used monitoring the eco-physiology indexes of winter wheat on the flowering period. Based on these vegetation indexes, the monitoring models were established for those eco-physiology indexes: LChC = 3.711GVI + 2.686, LCaC = 0.0451RVI + 0.1215, LNC = 5.3263NDVI + 0.3811, LWC = 21.902NDVI + 62.278. Yet, more remote sensing experimental data in different environments are required for wider the model testing.

【题目】基于生态因子的冬小麦产量遥感估测研究
【中文关键词】冬小麦;产量;预测;遥感;生态条件
【英文关键词】Winter wheat; Yield; Estimating; Remote sensing; Ecological condition
【中文摘要】为提高冬小麦遥感估产的精确性与适用性,在河南省的孟州市和沁阳市利用GPS定位布设田间试验,利用P-6卫星数据进行了冬小麦遥感估产研究。通过对遥感植被指数和冬小麦长势与产量GPS定位数据的综合分析,基于遥感影像信息获取的瞬时性和准确性,结合小麦灌浆期生态条件对小麦产量形成的影响,建立了利用开花期遥感影像归一化植被指数(NDVI)和灌浆期生态因子(气温、日照、氮素营养、土壤水分)的冬小麦产量遥感估测模型,并检验了模型的可靠性。结果表明,模型监测值与实测值较为一致,利用开花期遥感影像NDVI和灌浆期生态数据估测冬小麦产量的RMSE值为369.27 kg · ha-1,相对误差为6.45%。模型估测性能好,且具有一定解释性。

【英文摘要】To advance the accuracy and the applicability of estimating winter wheat yield by remote sensing technology, the field experiments were carried out in Mengzhou and Qinyang county of Henan province. The relationships between winter wheat yield and ecological factors including average temperature(T), solar radiation(S), nitrogen nutrition(N), and soil water(W)during grain filling period were analyzed, then the ecological factor-driven equations with TF, SF, NF and WF were established. By correcting the impacts of ecological factors on winter wheat yield formation, a monitoring model for winter wheat yield was developed as WYW=(WBW×HI) × , where HI is cultivar harvest index, and WBW is the aboveground biomass which was calculated with NDVI in early anthesis. The model was validated using the data sets of NDVI with the root mean square error (RMSE) of 369.27 kg · ha-1 for winter wheat yield. The results indicated that the model was accurate and applicable for estimating winter wheat yield under different conditions. Yet, more experiment data in different ecological condition are required for wide testing of the present model.

【题目】基于CBERS遥感的冬小麦长势分级监测
【中文关键词】冬小麦; CBERS-02影像; 长势分级
【英文关键词】winter wheat; images of CBERS-02; Classification of growth situation
【中文摘要】应用遥感信息技术,实时对冬小麦长势进行分级监测预报,便于农业部门及时制定和实施相应的管理措施,达到目标化生产的目的。以江苏省姜堰市为例,进行了基于中巴资源卫星(CBERS-02)遥感的冬小麦拔节期长势分级监测研究

。经过计算机分类和人机交互式判读解译,结合GPS样点信息校验,冬小麦面积解译精度在90%以上。利用遥感植被指数反演叶面积指数(LAI)等长势信息,对整个区域的冬小麦长势状况进行分级监测。叠加样点的实测数据校验,监测精度达到85%以上,最终制作区域的冬小麦长势分级专题图,并对各长势状况进行了分析。结果说明,中巴资源卫星影像数据可以满足区域冬小麦长势监测要求,并可在实际生产中进行推广应用。

【英文摘要】In order to improve the winter wheat growth situation monitoring assessment of operational efficiency and low operating deficiencies and problems,a set of optimized growth condition of winter wheat classification and grading methods was established which based on the winter wheat growth model and computer classification techniques of remote sensing images. CBERS-02 satellite remote sensing technology and wheat growth monitoring model was used to monitor the winter wheat in Jiangyan City, Jiangsu Province. Sample point data had been measured by the hand-hold GPS involved in the whole classification process. The accuracy of interpret information is more than 90%. Used the remote sensing vegetation index(VI) and remote sensing model inversion of winter wheat growth monitoring, Leaf Area Index (LAI) can be derived, and then the whole region growth status of the winter wheat could be monitored. Compared with the Growth information data of sample sites and areas, the accuracy of the monitoring have been more than 85%. This method can be used to guide the actual agricultural production. The results show that CBERS image data can basically meet the winter wheat growth monitoring needs, be able to promote the use of actual production work.

【题目】利用HJ-1A卫星遥感影像进行水稻产量分级监测预报研究

【中文关键词】水稻;产量;环境卫星;估产模型

【英文关键词】rice; yield; HJ-A satellite; estimation model

【中文摘要】对水稻产量进行遥感分级监测预报,有利于农业管理部门及时获取水稻区域产量信息,便于其制定有效的栽培管理措施,达到增产的目的。以江苏省盱眙县、金湖县和洪泽县为例,利用HJ-A/B卫星遥感影像,开展了水稻产量分级监测预报研究。在利用GPS实地取样调查和建立解译标志的基础上,进行HJ-1A卫星影像精校正,将GPS样点数据校验贯穿到整个水稻种植面积分类与解译过程中,面积信息解译精度在90%以上。分别利用水稻抽穗期归一化植被指数(NDVI)和比值植被指数(RVI)反演了叶面积指数(LAI)和生物量数据信息。结合水稻遥感估产模型进行产量估算,并叠加样点产量信息验证,估产精度达到85%以上;依据预测的水稻产量数据进行产量分级预报,制作了盱眙县、金湖县和洪泽县水稻产量遥感分级监测预报图。结果说明,环境减灾卫星影像基本能满足水稻种植面积提取和产量预报的需求,能够在实际生产中推广应用。

【英文摘要】Monitoring and forecasting rice yield by remote sensing technology is conducive to timely get information for agricultural management departments on rice production in the region and facilitate the development of effective cultivation and management measures and achieve the purpose of increasing production. Xuyi County, Jinhu County and Hongze County in Jiangsu Province, for example, using HJ-1A satellite remote sensing images, carried out monitoring and forecasting of rice production in classification research. The handhold GPS machines had measured the geographical position and some other information of these samples such as areas' shapes. The GPS data and the interpretation mark are used to correct HJ-A/B image, assist human-computer interactive interpretation, and other operations. The test data had been participated the whole classification process. The accuracy of interpreted information on rice planting area is more than 90%. The leaf area index (LAI) got from the Normalized Difference Vegetation Index (NDVI) inversion, and the biomass got from the Ratio Vegetation Index(RVI) inversion, combined with the rice yield estimation model and estimated the rice yield. Further the rice crop production Grading thematic map was made based on the rice yield data. Compared with the yield information data of sample sites and areas, the accuracy of the yield estimation have been more than 85%. The results show that HJ-A/B images can basically meet the rice growth monitoring and yield forecasting demand, can be widely applied in the actual production work.

【题目】新型光谱曲线特征参数与水稻叶绿素含量间的关系研究
【中文关键词】光谱曲线特征;变化速率;夹角;叶绿素含量
【英文关键词】characteristic parameter of spectral curve; velocities of change; angle; chlorophyll content
【中文摘要】利用高光谱信息检测作物叶绿素含量信息是田间作物长势诊断的重要研究内容。利用水稻光谱和叶绿素含量田间实测数据,从作物叶绿素含量不同,光谱曲线峰谷波形有“高矮胖瘦”形态变化的观点出发,提出光谱曲线峰谷波形中特征边的上升、下降速率以及组成峰谷波形两边的夹角等新型特征量,利用归一化光谱信息,分析了这些变量与水稻叶绿素含量间的相关关系。研究结果显示:(1)可见光波段范围520~740nm 之间的归一化光谱反射率与叶绿素含量间呈良好的负相关关系;(2)绿峰反射光谱曲线特征边的变化速率及绿峰两边的夹角等变量与水稻叶绿素含量具有较好的相关性,表明利用这些新型变量开展叶绿素含量高光谱无损监测成为可能,这将为利用高光谱信息开展作物长势与营养诊断提供新的思路和方法。
【英文摘要】It is of significance to monitor chlorophyll content with hyperspectral data for crop growth diagnosis in field. In the study, with the point of view that spectral curve shapes display "tall, low, fat and thin" morphological changes, we proposed some new characteristic parameter from spectral curve such as the ascensive or degressive velocities of segments composing peak or valley shapes in spectral curve, and angles formed by the lines fitting the segments of two sides of peak or valley curves, and used the normalized spectra to analyze correlation between these parameters and rice chlorophyll content. The result shows that (1) there is good negative correlation between rice chlorophyll content and normalized reflectance spectra for 520 - 740 nm; (2) characteristic parameters form green peak region of spectral curve display better correlation with rice chlorophyll content, which makes it possible to utilize the parameters to monitor crop chlorophyll content, and will provide new ideas and methods for carrying out crop growth diagnosis with hyperspectral data.

【题目】干旱区成龄红枣微灌技术研究
【中文关键词】红枣;微灌;湿润比;生理性状;根系分布;土壤水分
【英文关键词】red jujube; micro-irrigation; wet ratio; physiological characters; root distribution;soil moisture
【中文摘要】针对干旱区红枣微灌技术发展需求,采用目前最常用的滴灌、涌泉灌、微喷灌三种微灌技术进行田间试验,从产量、品质、生理性状、根系分布及土壤水分状况分析表明,微喷是成龄红枣最适宜的微灌技术形式,其次为滴灌,涌泉灌的效益最差,其中微喷、滴灌三管、滴灌双管处理与地面灌相比,均能增产10%以上,减少灌溉定额40%以上。同时初步确定成龄红枣微灌适宜湿润比为40%~70%,微喷灌采用70%的湿润比,滴灌采用40%~50%的湿润比效果较佳。
【英文摘要】The experiment was conducted to apply the most effective method of micro- irrigation such as drip irrigation, gush-spring irrigation and micro jet were field test according to the development demand of micro-irrigation method for grown red jujube in drought area. From the yield, quality, physiological characters, root distribution and soil moisture etc regression analysis, it showed that micro jet was the optimum method of micro-irrigation for grown red jujube, and then drip irrigation, the worst was gush-spring irrigation. Compared with surface irrigation, the micro jet, three-drip irrigation and two-drip irrigation increased yield over ten percent and decreased irrigation quota over forty percent. And it was preliminarily identified that the optimal wet ratio irrigation of grown red jujube was forty to seventy percent, and the ratio of micro-irrigation was seventy percent and forty to fifty percent for drip irrigation.

【题目】模糊数学在红枣微灌技术筛选的应用
【中文关键词】模糊数学;模糊矩阵;权重;红枣;微灌;相对优属度
【英文关键词】fuzzy-mathematics; fuzzy matrix; weight; red jujube; micro-irrigation; relative importance degree
【中文摘要】微灌节水灌溉的方式较多,实际应用中必然会遇到选择一种或几种节水灌溉方式的问题,而选择时必须综合考虑诸多因素的影响,模糊数学相对优属度综合评判法是解决这类问题较为有效的方法,它使选择的节水灌溉方式更为经济、合理。结合干旱区红枣微灌中可行的滴灌、涌泉灌、微喷灌等布置了7种方式,综合考虑了经济、技术和社会三大因素以及各大要素中的子因素,利用模糊数学方法综合评判初步得出微喷灌为干旱区红枣最适宜微灌方式。
【英文摘要】Water-saving irrigation is the development direction of future agricultural irrigation and micro-irrigation is the main form.Because micro-irrigation has a few modes, so it is inevitable to select one or more of them in actual application and many factors should be comprehensively taken into account. Fuzzy-mathematics relative importance degree comprehensive evaluation method is an effective way for this kind problem. The water saving irrigation mode selected through it is more economical and reasonable. In this paper, 7 irrigation modes suitable for red jujube in drought area, including drip irrigation, surge irrigation and micro sprinkler irrigation, are collocated. Through comprehensively considering three major factors, namely economy, technology and social and theirsub-factors, it is preliminarily concluded that the optimum micro-irrigation mode for red jujube in drought area is micro sprinkler irrigation by using fuzzy-mathematics method.

【题目】滴灌和喷灌对核桃耗水量、产量及坚果品质的影响
【中文关键词】核桃;滴灌和喷灌;耗水量;产量;品质
【英文关键词】walnut; irrigation methods; water consumption; yield; quality
【中文摘要】本文通过大田试验,采用相同的灌溉制度,对滴灌、微喷灌水方式下的成龄核桃(9年生)耗水规律、产量及品质进行了研究分析,通过一年试验结果表明:(1)2种灌溉方式中,3管与微喷的灌溉量一样,阶段耗水模数一致。(2)从产量和品质来看,3管的产量高于喷灌,水分利用效率也较高,可以在成龄核桃树灌溉中运用。
【英文摘要】The effect of different irrigation methods on water consumption, yields and quality of walnut in arid region were studied. In the field experiment, 4 irrigation methods(include 3 laterals under the trees、 2 laterals under the trees、 micro-sprinkle irrigation and irrigation with small tubes) were arranged. Through experiment in 2008.4 to 2008.10, get the results: (1) throughout the growth period, walnut's water consumption of 3 laterals under the trees is similar to that of micro-sprinkle irrigation. Compared with micro-sprinkle irrigation, 2 laterals under the trees and irrigation with small tubes saved water by 43.46% and 24.6% respectively. (2) The yields of 4 irrigation methods were analyzed, which is the highest 2 laterals under the trees and WUE is also higher. In conclusion, 2 laterals under the trees is a proper irrigation method for walnut trees in arid region.

【题目】西北地区微灌标准体系的意义和作用
【中文关键词】标准体系,微灌
【英文关键词】sdandard system, micro irrigation
【中文摘要】微灌技术是当今节水技术中节水效率最高的的技术。本文旨在通过对国内、国外微灌节水技术发展现状和发展趋势的调研了解,在系统分析研究国内外全部微灌标准后,构建一个层次分明、结构合理、内容完整、技术先进的微灌节水标准体系框架。规范微灌产品质量标准,制定一系列技术标准,提高微灌技术的标准化水平
【英文摘要】Micro-irrigation was one of the water saving irrigation technology which had highest efficiency in water saving. This article investigated development situation and tendency of micro-irrigation in domestic and abroad, after analysis all the micro-irrigation technology standards both in domestic and overseas systematically, we put forward the framework of micro-irrigation technology standards which was well arranged, rational construction, complete contents and advanced technology. Standard of micro-irrigation product quality standard, set of technical standard, improve the level of standardization of micro-irrigation technique.

【题目】微灌方式对成龄香梨生长效应的影响
【中文关键词】微灌, 香梨树, 耗水, 果实、枝条、根系
【英文关键词】Micro-irrigation, Fragrant pear, water consumption, fragrant pear fruit, shoot, root system
【中文摘要】随着水资源的短缺和人们对农业可持续发展的认识, 微灌技术成为研究的热点; 新疆库尔勒香梨一直沿用传统的地面灌溉, 具有很大的节水潜力。本文研究不同微灌方式对24年生成龄香梨树生长的影响及其耗水规律。田间试验

设置了3个处理: (l) 湿润比为40%地面滴灌; (2) 地下滴灌; (3)微喷灌。对照为当地果园传统的漫灌。在整个生育期内,3个处理均以美国A 级蒸发皿蒸发量的80 % 进行灌溉, 每周灌溉1次。利用石膏块水分传感器测量根区土壤水势变化, 并监测了果实生长, 枝条生长, 光合速率及产量等。试验结果表明, 各不同微灌方式的香梨果园耗水量为70~750mm,与地面漫灌相比,节约灌水量超过50%;而对香梨产量和品质并没有显著影响, 其中微喷灌处理的果实VC含量为0.24 mg/100g,超过对照和其他处理60 % 以上。因此, 对于长期利用传统漫灌的香梨树果园,改用节水的微灌形式, 是完全可行和必要的。

【英文摘要】Micro-irrigation technology is being the key research topics as People realized the serious situation of shortage of water resources and the importance of sustainable development of agriculture. Up to now, the Korla fragrant pear trees have been irrigated by traditional flood irrigation, which causes a lot of problems, such as waste of water resource, of orchard soil salinization, Pollution to the groundwater etc. So there is a great potential to save irrigation water there. The effects of micro-irrigation methods on the growth of shoots, fruits and root system of the mature Korla fragrant pear trees and the water consumption patterns were studied in this paper. There were three types of micro-irrigation methods used in the experiment, i.e. surface drip irrigation; subsurface drip irrigation; and micro-sprinkler irrigation. While the traditional flood irrigation was treated as control. All cases were fully irrigated to the 80% evaporation of US Class A pan, and irrigated once every week. The soi1 water Potential at different depth was monitored by Gypsum Block, and the fruit growth, shoot growth,photosynthesis,and yields were also measured in the experiment. The results show that the water consumption of Korla fragrant pear trees under different micro-irrigation methods is 700 to 750mm, which about 50% of water use is reduced compared with the flood irrigation. Mean while, the fruit yield and quality are not affec ted obviously by micro-irrigation patterns. The VC content of pear at micro- sprinkler treatment was 0.24mg/100g, which was 60% more than the other treatments and control. The shoot growth was inhibited under micro-irrigation Patterns compared with that under control. Thus, it is reasonable and necessary for changing the traditional flood irrigation to effieient irrigation patterns in the Korla fragrant pear tree orchards.

【题目】滴灌灌溉制度对核桃产量及品质的影响研究
【中文关键词】滴灌;灌溉制度;核桃;果实品质
【英文关键词】igation; irrigation schedule; walnut; fruit quality
【中文摘要】通过田间试验,研究了滴灌灌溉制度对9年生成龄核桃产量及品质的影响规律。结果表明:①从对核桃产量影响分析的角度来看,土壤水分下限在果实膨大期对核桃产量影响最大,其次是硬核期,开花期影响最小。②从对核桃蛋白质含量影响分析的角度来看,土壤水分下限在开花期对核桃产量影响最大,其次是硬核期,果实膨大期影响最小。③从对核桃脂肪含量影响分析的角度来看,土壤水分下限在硬核期对核桃脂肪含量影响最大,其次是果实膨大期,开花期影响最小。

【英文摘要】Through field experiment, we have studied the influence to the walnut yield and fruit quality of 9-year's walnut trees by drip irrigation schedule. The results showed that: 1.soil moisture during fruit enlargement made the greatest impact on walnut yield, followed by the hard core of the flowering stage,and the least was the flowering stage;2.soil moisture in the flowering stage on the protein content of walnuts has greatest impact on walnut yield, followed by the hard core of the flowering stage,and the least was the fruit enlargement stage;3.soil moisture in the hard core of the walnut has the greatest impact on the walnut fat content, followed by the stage of fruit enlargement, flowering was the least.

【题目】不同微灌灌水技术下成龄核桃耗水规律的研究
【中文关键词】红枣;坐果率;相对湿度;微喷灌
【英文关键词】walnut; drip irrigation; rule of water consume; water use efficiency;
【中文摘要】采用水量平衡原理,通过大田小区试验与理论分析,对十年生核桃耗水规律进行了研究。得出了不同生育期不同灌水技术下成龄核桃全生育期的耗水规律,从耗水角度研究发现,微灌条件下成龄核桃全生育期日均耗水量的变化与地面灌的单峰曲线不同,呈双峰曲线,分别出现在6月10日及8月20日左右;微灌各处理的累积耗水量在585.6mm~840.3mm间变化,较地面灌处理核桃的累积耗水量993.3mm减少15.4%~41.0%;微灌各处理核桃产量在4204.5kg/hm2~5743.5kg/hm2间变化,较地面灌的5550kg/hm2亩高-24.1%~3.4%,水分生产效率较地面灌高3.5%~28.6%,建议核桃微灌宜采用环灌和三管布置。
【英文摘要】Rule of ten years walnut water consume that irrigated by different micro-irrigation method was studied based on water balance principle and field experiment. As far as water consume was concerned that average daily water consume change rule of matured walnut which irrigated by micro-irrigation method is different from ones that irrigated by flood irrigation method. Bactrian curve in ones that irrigated by micro-irrigation and chieftain curve in ones that irrigated by flood irrigation can be seen obviously, Peak value of Bactrian curve appeared at 10th June and 20th August. Cumulated water consume of micro-irrigated ones ranged from 585.6mm to 840.3mm,which decreased by 5.4%~41.0% compare to 993.3mm of flood irrigated ones. Yield of micro-irrigated ones ranged from 4204.5kg/hm2 to 5743.5kg/hm2,which increased by -24.1%~1.0% compare to 5550kg/hm2 of flood irrigated ones. Water use efficiency (WUE) of micro-irrigated ones increased by 3.5%~28.6% compare with flood irrigated ones, suggest that circle and three laterals layout is appropriate in matured walnut irrigation under micro-irrigation condition.

【题目】干旱区提高幼龄红枣保花保果试验研究
【中文关键词】红枣;坐果率;相对湿度;喷水方式
【英文关键词】Chinese jujube; fruit-setting; relative humidity; spraying mode
【中文摘要】为研究花期喷水与微喷灌技术结合对枣树的坐果率、产量、品质的影响,为绿洲枣树节水灌溉提供依据。处理5、6的相对湿度比ck增加;②对处理5、6的坐果率比处理7、8、9、ck增加;③对产量的影响,处理6比处理7、8、9、ck差异极显著;④果实单果重与品质方面的可滴定总糖、可滴定酸及Vc含量各处理差异不显著。由以上得出:在干旱区对夜开型枣树,处理6即盛花期每天傍晚在树冠中部喷水40-60min可以显著提高坐果率、增加产量。
【英文摘要】In order to research the impact of the combination of spraying water at flowering stage and water-saving irrigation technique on fruit-setting and quality of Chinese jujube, the experiment with different height of water jet, including at the low, center, high parts of trees, and different spraying time, including 20min, 40min, 60min,is carried out. The results show that the relative humidity and fruit-setting ratio of the treatment with spraying in the center part of trees and 60min is remarkably superior than the comparative treatment, its yield is higher than that of comparative treatment by 80%. The differences of jujube quality among different treatments are not notable. It can be concluded that for the nyctanthous jujube, the treatment with spraying 40~60 min in the center part of trees at dusk of flowering stage can increase the fruit-setting and the yield of Chinese jujube.

【题目】干旱区枣园土壤水分运动及深层渗漏数值模拟
【中文关键词】枣树;HYDRUS-1D;土壤水;深层渗漏
【英文关键词】Jujube; HYDRUS-1D;soil water; deep seepage
【中文摘要】根据TRIME与Hydra土壤水分监测仪监测枣园土壤含水率、TRAC冠层仪测定叶面积指数、Vantagepro2气象站监测气象数据等资料,开展了枣园土壤水渗漏试验。借助HYDRUS-1D模型对枣园传统地面灌条件下的土壤水渗漏规律进行模拟,经检验,模型模拟土壤层20,40,60,80 cm时,土壤含水率模拟值与实测值相关系数分别为0.94,0.94,0.92,0.71。利用模型分析了研究区地面灌条件下的土壤水渗漏特征和田间灌溉水量的转化关系,改进灌溉模式可大幅减少灌溉水量,提高水分的利用效率。
【英文摘要】Based on the soil water content data measured by TRIME and Hydra system, the LAI data measured by TRAC, meteoro-logical factors data measured by Vantage pro2 automatic meteorological station and other data, do the experiment of deep percolation, the experiment on soil water seepage is conducted. The soil water seepage rule of a Jujube Orchard under traditional surface irrigation is simulated with the HYDRUS-1D model, and the results were verified by the measurement of soil water content. The result shows that the correlation coefficient is 0.94, 0.94, 0.92, 0.71, respectively, between the value of simulation and measurement of soil water content at 20, 40, 60,80cm in the soil profile. The characteristic of deep seepage and the distribution of irrigation water under the surface irrigation were analyzed, and the results show that the modified irrigation pattern can save irrigation water largely and improve the of water use efficiency.

【题目】干旱区幼龄红枣节水灌溉方式优选研究
【中文关键词】红枣;节水灌溉;优选
【英文关键词】Chinese Jujube; saving-water; optimal choice
【中文摘要】环塔里木盆地具有发展红枣种植的独特优势,也是对红枣节水灌溉技术需求大的地区。采用干旱区最常用的滴灌、低压软管灌、微喷灌、沟灌4种灌水技术进行田间试验,从红枣的叶温、地温、坐果率、产量、品质、气候特点和田间管理等几个方面进行了比较。结果表明滴灌在叶温、品质、适应气候、田间管理等主要的方面最优,微灌在坐果率和产量方面最优;干旱区幼龄红枣最适宜的灌溉技术是滴灌+花期微喷。
【英文摘要】Surrounding Tarim basin has particularly advantages of developing Chinese Jujube planting, where water saving irrigation technique is urgently needed too. Field test are conducted with drip irrigation, micro-sprinkler irrigation, low-pressure penstock irrigation and channel irrigation. The four irrigation modes are compared from the aspects of the leaf temperature, ground temperature, yield, fruit-setting, yield, fruit quality and climate, etc. The results showed that the drip irrigation mode is the best in the leaf temperature, fruit quality, climate adjustability and field management, etc. While the micro-sprinkler irrigation mode is the best in the fruit-setting, yield of sprinkle irrigation. The best irrigation mode is drip irrigation in the whole growth period and sprinkle irrigation in the florescence period.

【题目】滴灌条件下水肥耦合对干旱区红枣产量的影响
【中文关键词】红枣;滴灌;水肥耦合;产量
【英文关键词】Chinese Jujube; drip irrigation; coupling effects of water and fertilizer; yield
【中文摘要】在环塔里木盆地的阿克苏地区,采用随机区组布置方案,进行田间小区试验,研究了滴灌条件下水肥耦合对红枣产量的影响。试验结果表明,施肥量固定时,灌水量与产量相关性较好;灌水量固定时,施肥量与产量相关性较好。水对生育期红枣产量的效应大于肥料,水肥合理时,水肥为协同作用,交互效应使红枣产量明显增加。红枣生育期水肥耦合的最佳模式为“灌水量5 248 m3/hm2+施肥量1 572 kg/hm2”。滴灌与水肥耦合节水技术集成的最佳模式为“灌水量5 248 m3/hm2+施肥量1 048 kg/hm2”。
【英文摘要】Coupling effects of water and fertilizer on Chinese Jujube yield under drip irrigation were studied by field test, which based on design of random section in the Akesu area of Surround Tarim basin. The results showed that it have a better correlation between irrigation amount and yield under constant fertilizer, between fertilizer and yield under constant irrigation amount. Water effect is greater than fertilizer effect in the whole growth period. Coupling effects of water and fertilizer is synergistic effect when water and fertileizer is appropriate, can increasing Chinese Jujube yield. The best pattern is 5 248 m3/hm2of irrigation and 1 572 kg/hm2of fertilizer on coupling effects of water and fertilizer. The best pattern is 5 248 m3/hm2 of irrigation and 1 048 kg/hm2of fertilize on integration pattern of water and fertilizer, drip irrigation and saving-water.

【题目】果农间作条件下滴灌大豆耗水规律试验研究
【中文关键词】果农间作;滴灌;大豆;耗水规律;叶绿素;
【英文关键词】fruit-crop intercropping; drip irrigation; soybean; rule of water consume; chlorophyll;
【中文摘要】采用水量平衡原理,通过大田小区试验与理论分析,对与十年生核桃间作的滴灌大豆耗水规律进行了研究。结果表明,果农间作的滴灌大豆花夹期、鼓粒期、鼓粒成熟期的平均日耗水强度分别为:3.2mm,3.3mm,2.3mm,累积耗水量为277.2mm,较非间作滴灌大豆各生育期的日均耗水量显著减小,总耗水量减小26.5%,日均耗水量变化也更为平缓;果农间作的滴灌大豆在观测生育期内的平均叶绿素含量较非间作大豆减少24.6%。
【英文摘要】Rule of soybean water consume that irrigated by drip irrigation method was studied based on water balance principle and field experiment. Result turned that under condition of experiment, daily water consume of soybean in flowering-poding phase, seed-filling phase and maturity phase are 3.2mm, 3.3mm, 2.3mm. Cumulated water consume of growth phase are 277.2mm. Obvious decrease of daily water consume can be seen, total water consume reduced by 26.5% and variation of daily water consume is more smooth compare with soybean under drip irrigation method and non-intercropping condition. 24.6% decrease of average chlorophyll content of soybean in growth phase can be seen compare to non-intercropping ones.

【题目】软管灌条件下核桃树光合作用日变化及果实品质初步研究
【中文关键词】软管灌;地面灌;核桃树;光合作用;果实品质
【英文关键词】Abstract:Based on field experiment, the photosynthetic parameter daily variation of walnut trees during the stage of seeds development and oil transform under the condition of ground irrigation and surface irrigation is observed and compared by using

LI-6

【中文摘要】以大田试验为基础,在核桃树硬核及油脂转化期采用LI-6400便携式光合作用仪观测了软管灌和对照地面灌溉条件下核桃树光合作用参数的日变化,研究了软管灌对核桃树光合作用日变化及果实产量和品质的影响。结果表明:①与地面灌溉条件下相比,软管灌条件下核桃树的净光合速率、气孔导度、水分利用效率均增加,蒸腾速率除了在10：30~12：30时段与地面灌条件下较为接近,其他时段都比地面灌条件下的大。②在软管灌和地面灌条件下核桃的品质及单株产量均无显著性差异。

【英文摘要】Abstract:Based on field experiment, the photosynthetic parameter daily variation of walnut trees during the stage of seeds development and oil transform under the condition of ground irrigation and surface irrigation is observed and compared by using LI-6400 instrument, and the effects of hose irrigation on photosynthetic daily variation and fruit quality of walnut trees are studied in this paper. The results show that contrasting with ground irrigation, the net photosynthesis rate, stomata conductance and water use efficiency increase under hose irrigation, the transpiration rate is higher except for the period of 10：30 to 12：30, in which it is close to ground irrigation. The quality and yield of walnut have not obviously difference under the condition of ground irrigation and hose irrigation.

【题目】滴灌条件下成龄核桃树叶水势变化规律研究

【中文关键词】滴灌;核桃;叶水势;土壤含水量;气象因子

【英文关键词】drip irrigation; walnut; leaf water potential; soil moisture content ;meteorological factor;

【中文摘要】通过田间试验,研究了滴灌成龄核桃叶水势变化规律及其与气象因子间的关系,结果表明:滴灌成龄核桃叶水势日变化呈单峰曲线变化,在14:00-16:00达到一天中的最低值;试验条件下不同生育期核桃露点叶水势与土壤含水量的关系不尽相同,在果实膨大期、硬核期和油脂转化后期呈正相关关系,油脂转化前期呈负相关关系,通过回归分析建立了不同生育期二者的函数关系;滴灌成龄核桃叶水势日变化与太阳辐射和大气温度负相关,与相对湿度正相关,通径分析表明,影响核桃叶水势日变化的主要气象因子是大气温度,其次是大气相对湿度、太阳辐射;建立了滴灌成龄核桃叶水势日变化与气象因子之间的函数关系。

【英文摘要】Field experiment was carried to study the relationship between leaf water potential of matured walnut(LWPOMW) and meteorological factor under drip irrigation condition. Results showed that LWPOMW diurnal change which is a single peaked curve comes to the minimum value at14:00-16:00 PM. under experimental condition, the relationship of dew point LWPOMW and soil moisture content was different in different growth period. There ’s positive correlation between them in Fruit swollen period、Hardcore period and anaphase of fat conversion period, but negative correlation in Prophase of fat conversion period. After regression analysis established a regression equation of them in different growth period. There ’s negative correlation between LWPOMW and atmospheric temperature and solar radiation, positive correlation between LWPOMW and atmospheric relative humidity. Path analysis of them showed that Solar radiation is the key factor to LWPOMW diurnal change, followed by more important factor than atmospheric relative humidity and atmospheric temperature. established a regression equation between LWPOMW and meteorological factor under experimental condition as well.

【题目】滴灌湿润比对成龄库尔勒香梨生长及耗水规律的影响
【中文关键词】滴灌;湿润比;成龄库尔勒香梨;耗水规律;果实生长
【英文关键词】drip irrigation; wetted percent; mature Korla fragrant pear; water consumption pattern; fruit growth
【中文摘要】田间试验采用3种滴灌湿润比(20%、40%、60%),并以传统漫灌(土壤湿润比为100%)为对照,利用负压计和石膏块监测果树根区土壤水势,观测不同生育阶段内果树的生长指标;用水量平衡法计算不同处理梨树不同生育期的日均耗水量、作物系数与蒸发皿系数。试验结果表明,充分灌溉条件下,滴灌湿润比为20%、40%、60%的成龄香梨树生育期内的耗水量较漫灌分别减少了69.11%、63.91%、55.05%; 20%、40%和60%滴灌湿润比均对果树的枝条生长产生抑制作用,枝条最终生长量分别减少了9%、5%、3%;3种湿润比灌溉处理的果实均较漫灌的果实体积大,且果实品质得到一定程度的改善。成龄库尔勒香梨灌水方式由漫灌改为地表滴灌的初期,滴灌湿润比设计为40%比较合适。
【英文摘要】The wetted soil percentages included 3 levels (20%, 40% and 60%) and the traditional flood irrigation (100% of wetted percentage) was used as control. Soil water potential in the root zone was monitored by a tensionmeter and gypsum blocks. The growth indices of fruit trees were recorded at different growth stages. The daily water use, crop coefficients and pan coefficients under different drip irrigation treatments were estimated by water balance method. Theresults indicated that the tree water uses under wetted percentage of 20%, 40% and 60% decreased by 69.11%, 63.91% and 55.05% respectively as comparedwith that under flood irrigation, while the shoot growth reduced slightly, by 9%, 5% and 3%. Comparedwith flood irrigation, the fruit volumes under drip irrigation treatments of different wetted percentage were all bigger, with the largest under 40% treatment. Moreover, the fruit quality under drip irrigation treatments was improved to certain extent. It is suggested that at the transient stage of flood irrigation into drip irrigation, a wetted percentage of 40% should be used. This study should be meaningful to drip irrigation system design and management.

【题目】滴灌湿润比对成龄库尔勒香梨树根系分布影响
【中文关键词】滴灌; 湿润比; 成龄库尔勒香梨; 吸水根; 分布; 根系密度
【英文关键词】drip irrigation; wetted percentage; mature Kolra fragrant pear; fine roots; root redistribution;root density

【中文摘要】在充分灌溉条件下采用3 种滴灌湿润比(20%、40%、6 0%) , 以漫灌为对照, 研究库尔勒成龄香梨吸水根(根直径1 mm) 在0~ 70 cm 土层内分布的变化, 探讨滴灌湿润比对根系分布的影响。结果表明, 漫灌成龄库尔勒香梨树吸水根水平方向上在距树体1~ 2 m 内从树行由内向外呈递增趋势; 垂直方向上根系随深度呈递增趋势。滴灌对成龄库尔勒香梨树根系分布具有显著的影响: 水平方向上吸水根有向滴灌湿润区集中的趋势, 并且湿润体内的根系密度随滴灌湿润比增大而递增; 非湿润体内, 吸水根系数量减少, 根系密度随滴灌湿润比增大呈递减趋势。垂直方向, 滴灌湿润区吸水根有向20~ 40 cm 土层集中的趋势, 其中湿润比20%趋势最明显, 湿润比60% 次之, 湿润比40%影响最小。成龄库尔勒香梨在由漫灌改为地表滴灌初期, 滴灌湿润比采用40%较合适。研究结果对库尔勒成龄香梨滴灌系统的设计和管理具有一定的指导意义

【英文摘要】The wetted percentage was an important parameter for drip irrigation design, for the purposes of improving water use efficiency while maintain normal tree growth. The distribution of fine roots (diameter66≤1 mm) of mature Kolra fragrant pear trees as affected by wetted percentage was investigated is studied under sufficient drip irrigation. The soil samples were taken from different soil layers to get root samples.The wetted percentages included 3 levels as 20%, 40% and 60% with flood as control. The results showed that, under flood irrigation, the fine roots increases with the distance from tree trunk within 1 to 2 m. In the vertical direction, the density of fine roots increased progressively with soil depth, with highest root density of 2.9 mm/cm3at 40~70 cm soil layer. Compared with that under flood irrigation (the control), the fine root distribution under drip irrigation treatments was readjusted. In the horizontal direction, the more fine roots were found in wetted zone under the drippers. This showed the absorption of roots to soil water. This indicates more water absorbed from the wetted zones which can reduce deep percolation of water and evaporation so as to improve water use efficiency. In the vertical direction, the fine roots concentrated in the 20 to 40 cm soil layer. Most obvious readjustment of root distribution was found under 20% treatment, followed by those under 60% and 40%. In conclusion, at the initial stage when the irrigation of mature Kolra fragrant pear trees is shifted from flood irrigation to drip irrigation in arid area, the wetted percent of 40% is more appropriate. The results had a certain significance to guide the drip irrigation system design and management for mature Kolar fragrant pear.

【题目】滴灌施肥条件下核桃树早衰叶片矿质元素含量分析
【中文关键词】滴灌;核桃;早衰叶片;矿质元素
【英文关键词】drip irrigation; walnut; premature senescence leaves; mineral element
【中文摘要】通过对滴灌及地面畦灌核桃叶片矿质元素含量对比分析表明:滴灌成龄核桃早衰叶片除磷、钙、铁含量较地面灌正常叶高111.1%,9.6%、11.1%外,其他矿质元素均不同程度的低于地面灌正常叶片的含量,其中微量元素含量表现尤为明显;核桃叶片早衰主要是由于中微量元素中锌、锰、镁缺少所致,与其他微量元素的缺乏也有一定关系;滴灌灌溉方法对核桃养分吸收有一定的影响,建议核桃从地面灌改为滴灌后适当增加中微量元素的补给。

【英文摘要】Mineral element content of walnut leaves were comparatively analysised under the condition of drip irrigation and flood irrigation. The result showed that except content of Phosphorous, Calcium and Ferrum in premature senescence walnut leaves under the drip irrigation condition were 111.1%, 9.6% and 11.1% higher than that in normal walnut leaves under the flood irrigation condition, Content of others mineral elements were lower in varying degrees than that in normal walnut leaves under the flood irrigation condition, which were particularly so with content of microelements. Premature senescence of walnut leaves was caused by short of Zincum, Manganese and Magnesium mainly, It had certain relations with shorting of others microelements.Drip irrigation method has an effect to walnut trees ’s absorption of nourishment, Application amount of trace elements of walnut tree should be increased while irrigation method changed from flood irrigation to drip irrigation.

【题目】滴灌条件下核桃树液流规律研究
【中文关键词】核桃树,液流,参考作物蒸发蒸腾量,气象因素
【英文关键词】Juglans rejia L. trees; sap flow; evapotranspiration; meteorological factors
【中文摘要】利用包裹式茎流仪(Dynagamax)监测核桃树的液流量,并用watchdog自动气象站和土壤水分观测仪(TRIME-IPH)对气象因素和土壤水分进行同步观测。分析了核桃树液流速率的日变化规律,及其与太阳辐射和大气温度的关系。分析核桃树液流Tr与参考作物蒸发蒸腾量的相似性,以及Tr/ETo和100cm平均土壤相对含水量AW的关系。运用SPSS软件建立了液流量Tr与气象因子的回归方程。
【英文摘要】Dynagamax was used to monitor sap flow of Juglans rejia L.trees. Meanwhile, watchdog Automatic Weather Station and TRIME-IPH were used to measure meteorology factors and soil water content. Daily variation regularity of sap flow of Juglans rejia L.trees, relationship between sap flow of Juglans rejia L. and solar radiation, relationship between sap flow of Juglans rejia L.and atmosphere temperature were analyzed. Similarity between evapotranspiration(ET0) and sap flow of Juglans rejia L. (Tr), relationship between Tr/ET0 and average relative water content of 100cm depth were analyzed as well. SPSS 13.0 was used to establish regression equation about sap flow of Juglans rejia L. and meteorology factors.

【题目】运用投影寻踪法建立苹果树蒸腾量的预测模型
【中文关键词】苹果树;叶水势;气象因子;苹果树蒸腾量
【英文关键词】Apple trees;Leaf water potential;Meteorological factors;Apple tree transpiration
【中文摘要】运用投影寻踪回归分析法建立苹果树蒸腾量的预2009年5~9月气象站观测数据,对气温、相对湿度、风速、太阳辐归分析法建立了各气象因子与苹果树蒸腾量的预测模型。 温降低和湿度增加而增加。气温、净辐射与作物叶水势均呈抛物水势与土壤含水率关系可知,当土壤含水率减少时,苹果根系难以偏低,叶水势也随着下降。苹果叶水势随着土壤含水率的降低而量的预测模型,且预测精度较高
【英文摘要】The aim was to establish prediction model for apple tree transpiration by using projection pursuit method,and provide guidance for better predicting the transpiration. According to weather station observation data during May-Sep.2009,the temperature,relative humidity,wind speed,solar radiation,atmospheric pressure and soil temperature,leaf temperature,water evaporation were analyzed,the prediction model between each weather factor and apple tree transpiration was established by using projection pursuit regression analysis method. The meteorological data analysis showed that the air water potential decreased with the temperature increased,andincreased with temperature decrease and humidity increase.The temperature,crop water consumption increased,and the leaf water potential decreased.From the relationshipnet radiation andcrop leaves were in the water parabola relation.Along with the increase of the net radiation,thebetween leaf water potential and soil moisture content,it was known that when the soil moisturecontent is declined,apple root couldn ’ t absorb enough moisture,and meet the demand ofconsumption,which lead to leaf in low water content,water potential leaf blade declined.Apple leaf water potential decreased with the soil moisture content decrease.The prediction model of meteorological factor to apple tree transpiration was established by using projection pursuit method,and the prediction precision was high.

【题目】干旱区不同水分指标下限对成龄红枣生长和产量的影响
【中文关键词】水分下限;日均耗水量;产量;红枣
【英文关键词】moisture limit; average dailywater consumption; yield; dates
【中文摘要】探明新疆成龄红枣主要生育期的适宜水分范围。通过控制土壤不同水分下限的田间正交试验,研究土壤不同水分下限对成龄红枣的生理生长及产量的影响。不同水分下限灌溉对成龄红枣的新梢增长量、叶宽等生理生长影响不明显,但随着土壤水分下限的提高果实膨大速度也随之提高。产量比较表明,处理1(土壤水分下限占田间持水量75%)产量明显高于其它两处理,而处理2、处理3产量之间差异不显著。总体来讲75%田间持水量处理对红枣的生理生长、产量及其它各生理指标都优于其它处理。依据合理的水分指标进行灌溉,可以有效提高红枣的产量。
【英文摘要】To verify the range of suitable water of mature red Jujube growth stage in Xinjiang.The soil moisture and lower limits of different orthogonal field experiment were controlled to study the effect of the lower limit of soil different moisture on the physiological growth and yield of mature jujube.The results obtained from the three kinds of soil moisture controlled irrigation experiment were as follows: the different water irrigation had little influence on mature dates limit the amount of shoot growth, leaf width and other physiological growth, but the speed of fruit expansion increased with the increase of lower limits of soil moisture. In comparison with the production, processing one (soil moisture accounted for75% of field capacity): production was significantly higher than that of other two treatments, while there were no significantly different yield between treatment two and treatment three .In brief, the physiological indexes of growth, yield and different physiological indeves of jujube were superior to those of other treatments by75%. Based on reasonable indicator for irrigation water, the red jujube yield can be effectively improved.

【题目】滴灌条件下核桃土壤水分时间变异性分析
【中文关键词】时间变异性;土壤含水率;滴灌;时间尺度
【英文关键词】temporal variability; soil moisture; drip irrigation; temporal scale
【中文摘要】利用地统计学方法,研究了核桃在滴灌条件下田间土壤水分的时间异质性规律,以便为核桃滴灌自动化灌溉系统中的墒情预测提供理论依据。结果表明,在不同的时间尺度上,实验区土壤水分表现出不同程度的时间异质性,15 d尺度总的时间相关性程度远小于1 d尺度。1 d尺度基本可以揭示土壤水分时间上的微观变化结构特征,而15 d尺度不能全面揭示更微观变化的结构特征。
【英文摘要】The article analyses the temporal variability of soil moisture under drip irrigation in walnut fields by geology-statistical methods to provide theoretical basis for the soil moisture forecast in walnut automation drip irrigation system. The results indicated that the soil moisture in the research area has different temporal variability to different extent. From the point of view of time, the time correlation in 15 day' s scale is farther than that in 1 day's scale. One day scale can basically show the structural characteristics of time micro-change in soil moistrue. But 15 days scale cannot show the structural characteristics with less micro-change.

【题目】滴灌条件下核桃土壤水分空间变异性
【中文关键词】空间变异性;土壤含水率;滴灌;核桃
【英文关键词】spatial variability; soil moisture; drip irrigation; walnut
【中文摘要】在新疆阿克苏地区温宿县核桃林场30 m×60 m(一根支管控制)的范围内,布置土壤水分监测点共计435个。利用地统计学方法,研究了核桃在滴灌条件下田间土壤含水率在空间上的变异规律,以便为核桃滴灌自动化灌溉系统中墒情监测传感器的合理布设及墒情预测提供理论依据。结果表明,滴灌条件下的采样幅度一定时,增大采样间距对土壤水分变异系数没有影响;各采样间距的土壤水分具有中等程度的空间相关性,且随着采样间距的增大,空间相关度变化不大,说明滴灌条件微尺度上的空间变异性受采样间距的影响不太显著;沿滴灌带方向的空间相关度明显大于垂直滴灌带方向,即沿滴灌带方向由结构性因素引起的变异更大,具有强烈的空间带状结构。
【英文摘要】A total of 435 soil moisture monitoring points in 30 m×60 m (a branch controls) were layout in Walnut Forestry Centre of Aksu district of Xinjiang. The spatial variability of soil moisture under drip irrigation of walnut fields was analyzed by using geology-statistics method to provide guideline for the soil moisture monitoring program and soil moisture prediction. The results indicated that augmenting the sampling spacing made no difference with variance coefficient of soil moisture while sampling extent was invariable under drip irrigation. The field soil moisture was moderate spatial autocorrelation under different sampling spacing. As the sampling spacing was augmenting, spatial autocorrelation had few diversification. It indicated that the sampling spacing has inapparent influence to spatial variability on micro-scale of drip irrigation. The spatial autocorrelation under the direction of the capillary was obviously bigger than that of branch pipe. Namely the variety under the direction of the capillary caused by structural factor was more evidence and the variability had a strong spatial zonal structure.

【题目】滴灌条件下干旱区枣树根区的土壤水分动态模拟
【中文关键词】滴灌;枣树;HYDRUS模型;土壤水分动态;数值模拟
【英文关键词】drip irrigation; jujube; HYDRAUS model; Soil water dynamic; numerical simulation.
【中文摘要】探明干旱区滴灌条件下枣树根区土壤水分的动态变化规律。【方法】以根系分布和土壤水分动态资料为基础,用考虑二维根系吸水的HYDRUS模型对滴灌条件下枣树根区土壤水分动态进行模拟,用含水率的模拟值与实测值的均方根误差(RMSE)和相对均方误差(RMAE)检验模拟效果.(1)各层土壤水分90d内的动态模拟结果显示,RMSE小于0.024cm3/cm3,RMAE小于14.2%;(2)典型灌溉周期剖面含水率分布的模拟结果显示,RMSE小于0.016cm3/cm3,RMAE小于5.6%。模拟结果表明,试验灌溉定额(450m3/hm2)合理,灌溉周期需调整,说明该模型可以准确反映干旱区滴灌枣树土壤水分的动态分布,可为灌溉制度的制定提供理论依据。
【英文摘要】The study explores the soil water dynamic rules in jujube root zone under drip irrigation in the arid area. Based on data of jujube roots density and soil water content, HYDRUS model is chosen to simulate the soil water dynamics in the root zone considering the two-dimensional root water uptake. The goodness of fit between simulation and measurement is measured by using root-mean-square-error (RMSE) and root-mean-absolute-error(RMAE) for the simulation with measured volumetric soil water contens. The results show that the RMSE Values for simulating the 90 day ’s soil water dynamics at the section of soil layers apiece below drip tube are less than 0.024cm3/cm3,and the RMAE values are less than 14.2% as well. The RMSE values for simulating the distribution of soil moisture content in the section of root zone during the typical irrigation cycle are less than 0.016cm3/cm3, and RMAE value are less than 5.6%. The simulation of the soil water dynamics indicates that the irrigation ration of experimental is scientific, however the irrigation cycle should be adjusted. It proves that the model performs well in simulating soil water dynamic in jujube root zone under drip irrigation.

【题目】调亏灌溉对滴灌成龄香梨果树生长及果实产量的影响
【中文关键词】灌溉,土壤水分,品质控制,调亏,水分利用效率,营养生长,果实生长
【英文关键词】irrigation, soil moisture, quality control, regulated deficit, water use efficiency, vegetative growth, fruitgrowth
【中文摘要】调亏灌溉对果树节水、提高果实产量和品质具有一定效果。2009-2010 年,在新疆库尔勒巴州农业科学研究所进行试验,研究滴灌调亏时间及土壤水分亏缺程度对树龄24 a 的成龄库尔勒香梨果树生长及产量的影响。果实细胞分裂期、果实缓慢膨大期、果实细胞分裂期至缓慢膨大期,分别进行中度土壤水分亏缺与重度土壤水分亏缺灌溉。中度土壤水分亏缺的灌水量为美国A 级蒸发皿蒸发量(Ep)的60%,重度土壤水分亏缺的灌水量为Ep 的40%。其它时段灌水量与对照相同,为Ep 的80%;对照处理整个生育期灌水量均为Ep 的80%。灌溉周期为7 d。结果表明,前2 个生长阶段的调亏灌溉均抑制了香梨树的营养生长,提高了香梨果实产量和灌溉水利用效率。各调亏处理的夏季修剪量比对照减小了8.4%~43.2%。2 a 内,细胞分裂期重度调亏处理,产量分别比对照增加了15.5%和19.2%,较对照节水9.7%和8.1%;果实缓慢膨大期中度调亏处理,产量分别比对照增加了14.0%和18.0%,较对照节水13.2%和11.3%;果实细胞分裂期及果实缓慢膨大期的重度调亏处理,产量分别比对照减少了15.4%和13.2%,较对照节水34.7%和28.4%。调亏灌溉对香梨果实品质无显著影响。结果对成龄库尔勒香梨灌溉管理具有指导意义。
【英文摘要】Regulated Deficit Irrigation (RDI) is known to have higher water use efficiency, and higher fruit yield with better quality. Field experiments were conducted during 2009 and 2010 in Korla city, Xinjiang autonomous region, to investigate the effects of RDI applied in different growth stages and with different levels of water deficit on vegetative, fruit growth and yield of mature fragrant pear trees of 24 years old. The experimental treatments involved moderate and severe water deficit, in either the cell division period or in the slow fruit growth period or in both periods. Trickle irrigation, with 2 driplines, one on each side of the trees was adopted. The moderate RDI used 60% and the severe used 40% replacement of US Class A pan evaporation, respectively. Irrigation amount during non-deficit stages was the same as in the control treatment. The control treatment was irrigated at 80% of pan evaporation during the whole growth season and all treatments were irrigated weekly. The results showed that the water deficit applied during both cell division and/or slow fruit enlargement stage inhibited the vegetative growth. Compared with the control, the summer pruning of the RDI treatments was reduced by 8.4%-43.2%. In both years, as compared with the control, the severe water deficit irrigation during cell division stage significantly increased yield by 15.5%-19.2%, and reduced the irrigation water by 9.7%-8.1%. The yield of moderated water deficit irrigation in slow fruit enlargement stage was increased by 14.0%-18.0%, and the irrigation water was reduced by 13.2%-11.3%. The yield of severe water deficit irrigation during both cell division and slow fruit enlargement stages was decreased by 15.4%-13.2%, and the irrigation water reduced by 34.7%-28.4%. Fruit quality had no significant differences among the treatments. The results are meaningful to guide the irrigation management of mature Korla fragrant pear trees.

【题目】调亏灌溉对库尔勒香梨光合速率及叶片水分利用效率的影响
【中文关键词】库尔勒香梨 调亏灌溉 蒸腾速率 气孔开度 水分利用效率
【英文关键词】Deficitirrigation,Dripirrigation,Waterstress,Fruitgrowth,Rootlengthdensit
【中文摘要】研究了亏缺灌溉对成龄库尔勒香梨树营养生长、果实生长与吸收根系分布的影响。香梨的生育中期,设计了4种土壤水分亏缺(灌前土壤水势下限):轻度胁迫(-100kPa)、中度胁迫(-200kPa)、重度胁迫(-300kPa)和对照(-50kPa)。灌溉系统为地表滴灌。试验结果表明,亏缺灌溉显著地减少了夏季剪枝量,提高了果实产量。充分灌溉条件下,香梨树根长密度从树行由内向外呈递减趋势,滴灌促进了湿润体内的吸收根系的发育;距树行0　5m,根长密度随着深度的增加而减少;距树行1m至1　5m,根长密度随着深度的增加而增加;距树行2m的非灌溉区,根长密度在垂直方向上变化不显著。为适应滴灌湿

润体内水分胁迫,香梨树在湿润体内及非灌溉区的吸收根系的分布均发生了显著的调整。适度水分胁迫下的根长密度增加对香梨产量有促进作用。
【英文摘要】Theexperimentincludedfourlevelsofthesoilwaterdeficit(thresholdofsoilwaterpotentialbeforeirrigation) applied in themiddleperiod offragrantpeargrowth: slight(-100kPa), moderate(-200kPa),severe(-300kPa)waterstressandthecontrol(-50kPa).Theirrigationsystem was surfacedripirrigation.Theresultsindicatedthatthewaterstressirrigationsignificantlyreducedthesummerpruningweight,improvedtheyield.Underfullirrigation,therootlengthdensity(RLD) decreasedwiththeincrementofdistancefrom thetreerow,androotdevelopmentinthewettedzoneof dripirrigatedpeartreewasenhanced.TheRLDat0 5m from thetreerowdecreasedwiththedepth; however,theRLDintherangefrom1mto1 5mfromthetreerowincreasedwiththedepth;inthenon irrigatedzoneat2mfromthetreerow,thedifferencesofRLDamongthedepthswerenotobvious.The RLDinthewettedandnon irrigatedzoneadjustedsignificantlyduetothewaterstressinthewettedzone,ascomparedtothecontrl.IncreaseofRLDduetothemoderatesoilwaterdeficitshowedsomepositiveeffectstotheyieldimprovement.

【题目】Yield and Water Use Efficiency of Pear Trees under Drip Irrigation with Different Surface Wetted Percentage
【中文关键词】微灌;营养生长;果实生长;蒸发皿系数;果实品质
【英文关键词】microirrigation vegetative growth, fruit growth, pan coefficient, fruit quality.
【中文摘要】通过在新疆库尔勒地区连续两年的田间试验,研究了香梨树在滴灌不同湿润比情况下反应。24年树龄的香梨树每周关一次,灌水量为美国A级蒸发皿水面蒸发量的80%。试验设置了三种不同的湿润比:16%,32%,和43%,对照处理为地面灌香梨,每月灌一次水,灌水定额300mm。所有滴灌处理均比对照处理少灌溉了约50%的水量。较地面灌,43%湿润比的产量产量最低(两年平均减产17%),其他两种湿润比处理的香梨产量没有明显下降。32%湿润比的处理灌溉水利用系数最高(两年的平均值为3.02Kg/m3)。对于滴灌处理在新梢生长量较地面灌处理有明显地减少。对于极端干旱的气候条件下,当成龄香梨由地面灌转为滴灌的初期32%的湿润比最适宜。
【英文摘要】Field studies were conducted for two consecutive years in Korla, XinJinag, China,to investigate the response of pear trees to different surface wetted percentages under drip irrigation on an oasis around Taklimakan desert. The 24-Years-old pear trees were weekly irrigated at a level to replace 80% of US Class A pan evaporation, with three different surface wetted percentages: 16%, 32% and 43%. A control (CK) was flood irrigated with a monthly applied amount 0f 300 mm. All drip irrigated treatments applied about 50% water less than control. A larger(43%)surface wetting had a significantly low yield(two year average 17% reduction) than the flood irrigation treatment, but there were no significant yield differences among the other treatments. Maximum irrigation water use efficiency was observed in 32% surface wetting (on an average 3.02Kg/m3).However, there was a significant reduction in the mass of new shoots with drip irrigation. Under the extremely arid climatic conditions of this study, during the initial period,32% surface wetted percentage proved optimal for mature pear trees that had been transferred from flood irrigation into drip irrigation

【题目】无刺水果型黄瓜杂交种“绿翠”的选育

【中文关键词】水果型黄瓜;绿翠;杂交种
【英文关键词】Mini-cucumber, Cuil ü , Hybrid F1
【中文摘要】黄瓜新品种“绿翠”是针对我国缺乏专用黄瓜品种而育成的一代杂种。母本是从华南型优良品种‘002261’经超低能离子束诱变后代中选育出的自交系P66,父本是以欧洲品种‘荷兰121’为材料经系统选育获得的优良自交系Z38。适合黄淮地区春秋保护地和春夏露地栽培。果实棒状, 瓜长19.0cm左右(冬季栽培15.0cm 左右),横径2.2cm,整齐度高,果皮墨绿色,无刺瘤,无瓜把,着色均匀,果面有光泽,清香味浓,口感好。单瓜质量100~120g, 心腔小于瓜粗的1 /2,维生素C 11.3 mg/100g, 可溶性糖1.76%,可溶性固形物含量3.54%。果实整齐、商品性好, 标准瓜率在85%以上。
【英文摘要】Based on shortage of cucumber varieties for special use, a new cucumber hybrid F1 “ Cuil ü ” was developed by crossing P66 as female with Z38 as male. Female P66 is an inbred line by mutating Hua ’ nan-type cucumber variety No. 002261 with low-energy ion beams. And male is also an inbred line developed from an European variety “ Netherlands No. 121 ”. “ Cuil ü ” is suitable for protected spring and autumn cultivation, and open field spring and summer cultivation in Huanghuai zone. The fruit is stick-like, spineless, without fruit end, orderly, deep green, tasty. It is about 19.0cm long (about 15.0cm long for winter fruits), 2.2cm wide, averagely 100-120g weighty, and has a small cavity less than 1.1cm, 11.3mg. (100g)-1 vitamin C, 1.76% soluble sugar, and 3.54% soluble solids. In addition, the standard fruits account for over 85%.

【题目】海水养殖池塘浮游植物碳的计算机模拟
【中文关键词】养殖池塘; 浮游植物; 碳; 模型; 敏感性参数
【英文关键词】mariculture pond; phy to plankton; carbon; model; sensitivity parameter
【中文摘要】应用光学显微镜法对实验系统浮游植物进行了野外定量研究,测定了系统中浮游植物的种类组成和生物碳素变动,为模型有效性验证提供了野外数据;根据Ecopath能量平衡模型原理建立了海水养殖池塘浮游植物碳的计算机模型,初步确定了包括15个参数的浮游植物模块参数库,通过单因子分析法进行参数敏感性检验,确定了3个敏感性参数,并利用野外实际测定数据进行了模型验证。模拟结果表明本模型成功模拟了海水养殖系统浮游植物碳变动。在建模过程中,光限制因

子与水温为影响浮游植物碳的主要内源因素,浮游动物捕食作用为外源影响因素。
【英文摘要】The species and the carbon of phy toplankton are studied in the intensive shrimp culture eco-system with the use of the optical microscope, for provided the field data to the validation of the dynamical model of phytoplankton carbon. A computer model is built up according to the Ecopath model method. A module stock which consisted of 15 parameters is primarily established, and 3 sensitivity parameters are found by sensitivity analysis. The results show that the simulated data are inaccordance with the field data of phytoplankton carbon well. In simulation, the factors of light limit and water temperature are the interior factors of model building , and the predation of zooplankton is the exterior ones.

【题目】养殖水质在线监测采样方式对测定结果的影响
【中文关键词】水产养殖;水质;在线监测;采样;修正
【英文关键词】aquacuhure;water quality;online monitoring;sampling;corection
【中文摘要】为了节省昂贵的在线检测仪表使用数量,使用一组仪表轮流检测多组养殖水体是行之有效的方法之一。但由于相应的水样采取方式发生了变化,往往不符合仪表传感器的最佳采样方式,可能造成额外误差。通过分析常用水质在线检测仪表在多路取样条件下可能产生的误差,证明该方法对pH、氧化还原电位等化学性水质指标检测结果影响不显著,对温度、溶解氧等物理性水质指标检测结果有一定的影响。在此基础上.提出了实际应用该方法时需采取的修正措施。
【英文摘要】The aquaculture water quality online monitoring system,which mainly integrates multi-parameter water quality online detecting instrument,the industrial control elements and industrial control software that supports system work,provides real-time water quality monitoring means for intensive aquaculture.Relatively speaking,water quality online detecting instrument is very expensive,which limits the popularization and application of the system in aquaculture.One of the feasible and effective methods of reducing the number of the expensive online detecting instrument is making a group of instrument detect multiple aquaculture water bodies by turns.However,due to the change of the corresponding sampling method,the optimal sampling method of instrumentation sensor is generally can not be adopted,which may cause extra e~ors.The erors of common water quality online detecting instrument that may be caused under the condition of multi.channel sampling are ana1yzed in the paper.The experimental result shows that the method has no obvious influence on such chemical water quality index detection result as pH value and oxidation-reduction potential, and the influence on such physical water quality detection result as temperature and dissolved oxygen is obvious. In addition,corrective measures adopted for practical application of the method are put forward based on this.

【题目】沙地土壤磷循环研究
【中文关键词】关键词 沙土; 土壤磷库; 土壤磷平衡; 土壤磷收支
【英文关键词】Key words:Horqin sandy land;sand-stabilizing;straw check boards;soil nutrients;vegetation
【中文摘要】摘 要 磷素是干旱半干旱地区沙地生态系统的限制性养分因子, 沙地土壤磷循环对沙地生态系统生产力维持至关重要,越来越受到人们的关注。本文根据国内外研究成果, 对沙地土壤磷的来源、 磷库容量、 磷循环途径和影响磷循环的因素等关键问题进行综述, 认为磷循环研究方向可归纳为以下几个方面: 1)影响沙地土壤磷循环各因素的作用机制; 2)不同磷循环途径的磷收支通量; 3)不同土壤利用状态下,磷平衡状况; 4)不同土壤利用状态下,土壤生产力的可持续性;

5)维持土壤磷平衡采用的生态恢复手段。上述研究,对于维持沙地生态系统稳定的生产力,解决人与资源和环境的矛盾均有指导作用。

【英文摘要】Abst ract : Phosphorus (P) is one o f l i m i ting nutrient e le m ents i n sandy land ecosyste m s o f ari dand se m - i arid areas , and t he so i l P cyc li ng on sandy lands is of great si gn i f icance inma i ntainingecosystem productiv i ty o f sandy land , being paidmore andmore attention by the people . The above research as -pects would g ive references to thema i n tenance o f sandy land ecosystem productiv i ty and them i t- iga ti on of the contrad icti ons bet w een hu m an be i ngs and natural resources and envir onmen. tKey words : sandy so i ; l so i l phospho r us poo; l soil phosphorus ba lance ; so i l phospho r us budge. tAbstract:Applying biology and engineering measures to restoring the vegetation of shifting sand in western region of Horqin sandy land, and sand-stabilizing and restore effect were assessed through sand monitoring and vegetation investigation. 1.0×1.0m size straw check boards with suited sand-stabilizing plants could achieve the best wind break and sand-stabilizing effect. As the time goes by after shifting sands were stabilized, soil water conservation capacity, and the available nutrients, total C, available K, N, and P were increased, soil chemical property was improved obviously. Vegetation coverage was increased and plant ecology system was inclined to reach stabilization condition relatively.

【题目】A studies on the contribution of different food sources for shrimp growth in intensive fenneropenaeus Chinensis pond

【中文关键词】对虾池塘;营养利用;稳定同位素;作用;精养

【英文关键词】shrimp pond; nutrition utilization; stable isotope; contribution; intensive

【中文摘要】稳定同位素法可以用于准确可靠地研究水生生物的食物来源和捕猎对象。本研究利用碳、氮同位素研究了在中国明对虾精养池塘中,人工饲料(配合饲料和卤虫)和天然饵料分别对中国明对虾生长的相对贡献。结果表明饲料中氮和碳的转化率分别为33.18%和21.73%。稳定同位素研究结果表明,对象生长所需营养93.5%来自人工饲料,6.5%来自天然饵料。每公顷池塘收获对虾14.5吨,但其中只有0.94吨来源于投喂天然饵料,13.56吨来源于投喂人工饲料。因此单位面积产量可通过增加投喂天然饵料提高。

【英文摘要】Stable isotope methods can be used to determine the food sources and prey items of aquatic organisms accurately and reliably. This study examined the relative contribution of artificial foods (the formulated feed and Artemia) and natural foods to shrimp growth in an intensive Fenneropenaeus chinensis pond by using carbon and nitrogen stable isotopes. The results showed that the nutrition utilization efficiency of the harvested shrimp was low, only 33.18% of feed nitrogen and 21.73% of feed carbon being converted to shrimp flesh. Our stable isotope results showed that the shrimp obtained nutrition for maximum growth from artificial foods, whose contribution was 93.5%, with the remaining attributed to the natural foods. However, there was 0.94 t harvested shrimp derived from natural foods (the rest of 13.56 t harvested shrimp derived from artificial foods) in 1ha intensive pond with a shrimpproduction of 14.50 t ha-1. Therefore, unit area shrimp production can be increased by increasing the contribution proportion of natural foods in intensive shrimp farming.

【题目】中国明对虾精养池塘氮、磷和碳收支的研究
【中文关键词】营养盐收支;磷;氮;碳 沉积积累;中国明对虾
【英文关键词】nutrient budget ; phosphorus; nitrogen ; carbon ; sedimentation ; Fenneropenaeus chinensis
【中文摘要】系统化学收支的研究可以说明进入池塘生态系统各营养物质的归宿,文章应用营养盐收支法分析了池塘生态系统的物质流通。结果表明,对虾生产利用营养盐所占比例依次为氮(N),27.40%;磷(P),20.69%;碳(C),17.32%。在营养盐支出中,P的沉积作用明显,占总支出的52.04%;N在水体的悬浮和溶解较多,占61.06%;C在养殖系统的呼吸作用消耗最大,占40.86%。在封闭式池塘系统中,对虾养殖中营养盐的低利用效率为系统环境中营养盐积累的直接原因,除C通过呼吸作用得到有效释放外,大部分N、P污染元素滞留或沉积在池塘系统。
【英文摘要】Chemical budgets can be formulated to account for all sources of nutrient gains and losses in aquicolous ecosystem. Therefore, nutrient budget was used in this study to assess the material circulation in shrimp pond ecosystem. The results showed that the ratio of nutrient utilized by shrimp production ranked as follows: N (27.40%) , P (20. 69%) and C (17. 32%) ; as for the nutrient losses, most phosphorus was sediment to the pond bottom, occupying 52. 04% in gross P losses; maximum nitrogen suspended or dissolved in water, occupying 61.06% in gross N losses; carbon was consumed mostly by pond respiration, occupying 40. 86% in gross C losses. Thus, in closed pond ecosystem, shrimp production had so inefficient utilization to nutrition that N and P accumulated or subsided in shrimp pond, except that C released mostly by pond respiration.

【题目】温度盐度交互作用对凡纳滨对虾耗氧和氨氮、磷排泄的影响
【中文关键词】凡纳滨对虾; 耗氧率; 氨氮; 磷; 排泄
【英文关键词】Litopenaeus vannamei; oxygen consumption rate; ammonian itrogen; phosphate; excretion
【中文摘要】以凡纳滨对虾(Litopenaeus vannamei)成虾为研究对象,设计了4个盐度梯度和4个温度梯度,采用正交试验,研究了温度、盐度及其交互作用对凡纳滨对虾耗氧率和氨氮、磷排泄率的影响。凡纳滨对虾在温度和盐度交互作用下耗氧率为0.266~0.582mg/(g.h),平均为0.419mg/(g.h);磷排泄率为0.935~2.279 μg/(g.h),平均为1.532 μg/(g.h);氨氮排泄率为1.222~2.656 μg/(g.h),平均为1.854 μg/(g.h)。统计分析显示,温度和盐度对耗氧率和氨氮、磷排泄率都有极为显著的影响(P0.01),且两者之间交互作用极其显著(P0.01)。
【英文摘要】Taking white pacific adult shrimp (Litopenaeus vannamei) as the research object,the orthogonal experiment between 4 salinity levels and 4 water temperature levels is designed in this paper. The interaction effect of water temperature and salinity on oxygen consumption rates, ammonia nitrogen excretion rates and phosphate excretion rates for white pacific shrimp (Litopenaeus vannamei) were studied. In the interaction effect of above mentioned factors, the rate of oxygen consumption varied from 0.266 to 0.582mg /(g. h) , the average value is 0.419mg /(g.h). And the rate of phosphorous excretion varied from 0.935 to 2.279g /(g.h) , the average value is 1.532g /(g.h). Meanwhile the rate of ammonia nitrogen excretion varied from 1.222 to 2.656g /(g.h) , the average value is 1.854g /(g.h) . The statistical analysis showed, the effect of temperature and salinity on oxygen consumption rates, ammonia nitrogen or phosphate excretion rates for white pacific shrimp (Litopenaeus vannam ei) are significant (P<0.01) , and the interaction effect is remarkable too (P<0. 01) .

【题目】科尔沁沙地小叶锦鸡儿人工林防风固沙及改良土壤效应研究
【中文关键词】固沙林; 土壤养分; 土壤酶; 土壤微生物; 小叶锦鸡儿(Caragana microphylla); 科尔沁沙地;
【英文关键词】sand-fixation plantation; soil nutrient; soil enzyme; edaphon; Caragana microphylla.;
【中文摘要】【摘要】 为探讨小叶锦鸡儿防风固沙、改良土壤养分状况和生物活性的能力,选取6年和11年生小叶锦鸡儿人工固沙林为对象,以流动沙丘为对照,研究不同年龄固沙林降低风速和风沙流结构特征、土壤有机质和N,P含量、土壤酶的活性以及微生物生物量C,N,P含量的变化特征。结果表明:在小叶锦鸡儿灌木林内,各个高度风速和输沙量均显著低于流动沙丘,防风固沙效果明显。随着小叶锦鸡儿固沙群落发育时间的增长,其综合防风性能提高,土壤有机质、N,P,K含量和生物活性逐渐得到改善。O~30 cm土层中磷酸单酯酶、蛋白酶、脲酶、蔗糖酶、硝酸还原酶、多酚氧化酶、脱氢酶的活性和土壤微生物生物量C,N和P含量均大幅度提高,其中0~10 cm土层增幅最大。土壤酶中蔗糖酶的活性增加最为迅速,6年和11年生固沙林0~10 cm土层分别是流动沙丘的28.58倍和55.2l倍。小叶锦鸡儿不仅具有较好的防风固沙性能,而且表现出强大的改善土壤养分和生物活性的能力,可作为优良的固沙植物材料在科尔沁沙地大面积推广应用。
【英文摘要】Abstract】 In order to approach the effects of Caragana microphylla plantations in protection against wind, sand-fixation and improvement of soil nutrient conditions and biological activity, in this study the 6- and 11-year C. mi-crophylla plantations are selected to research the characteristics of the plantations in wind velocity reduction, sand-fixation and sand-driving wind and the change characteristics of edaphons, enzyme activity and contents of soil or-ganic matter, N, P and K at soil depths of 0-10, 10-20 and 20-30 cm. The results show that the effects ofprotection against wind and sand-fixation of C. microphylla plantations are obvious, such effects and the contents ofsoil organic matter, N, P and K are gradually increased with the growth of C. microphylla plantations. Moreover,the activities of phosphomonoesterase, saccharase, protease, urease, dehydrogenase, polyphenol oxidase and ni-trate reductase and the contents of edaphon C, N and P are significantly increased at soil depth of 0 ~ 30 cm, espe-cially at soil depth of 0-10 cm. In the enzyme activities, the increase of saccharase activity is the most significant,and the soil content at depth of 0-10 cm under the 6-and 11-year C. microphylla plantations are 28.58 and 55.21times of those on mobile dunes. Therefore, C. microphylla can be regarded as a fine plant species to plant for pro-tection against wind and sand-fixation in the Horqin Sandy Land.

【题目】养殖水体水质的神经网络预测模型研究
【中文关键词】神经网络;BP算法;水产养殖水体
【英文关键词】neural networks; BP algorithm; aquaculture water
【中文摘要】以池塘养殖水体常规水质指标作为训练样本,在分析传统水质预测模型的基础上,构建神经网络水质预测模型。运用改进的BP算法对在线监测的水质指标进行分析、分类和预测,确定水质指标与其影响因子间的非线性关系,研究养殖水体水质指数变化梯度和分布规律,同时对水质状况进行模糊判别,为养殖生产提供预警控制,并对不同情况下的输出结果做出了比较。结果表明:该网络具有较好的泛化能力,预测平均误差在3%以内,实现了水质指标的准确预测和判别,收敛速度快,具有较好的实用性和较高的预测精度,基本满足环境管理的需要。
【英文摘要】A novel neural network model for water quality prediction is constructed with aquaculture water quality indexes in ponds as the training samples for the network after analyzing classical water quality prediction models. The water quality indexes monitored online are analyzed, classified and predicted with improved BP algorithm so as to confirm the nonlinear relationship between the indexes and their impact factors. The movement gradient and distribution regulation of water quality index in aquaculture water is studied while the fuzzy differentiation for the water condition is done in the meantime in order to provide pre-warning for next step in aquaculture. The results in different conditions are compared, which shows that the network has great generalization capability and high convergent speed with accurate prediction and differentiation of water quality indexes, the average forecast error was less than 3 percent. Simulation results prove that the proposed approach has high precision, good practicability and extensive applicability for engineering application. The arisen problems and solutions in the process of realizing the algorithm are also discussed.

【题目】科尔沁沙地灌丛改造的工程措施及效果
【中文关键词】沙地灌丛; 改造效果; 地上生物量;
【英文关键词】sand shrubs; transformation effects; aboveground biomass;
【中文摘要】【摘要】 为了发挥沙生灌木防风固沙和改善生态环境的更大的作用,采用了围封、平茬和补植等工程措施对沙生灌木进行了改造,其改造结果表明:围封2.5年后,所有灌木植物的地上生物量、平均株高和基径均有明显增加,以小黄柳(salix gordejevii)增长最大,围封是未围封的4倍;平茬当年生长量非常明显,地上生物量接近或超过未平茬的植株,未平茬的年生长高度均小于平茬;直播、植苗和扦插是增加灌木分布和覆盖面积的较好的方法,补植2~3年后,随着草本植物的入侵,沙面开始稳定。经过改造,可以增加植物覆盖度,提高灌木和草本生长量,达到改善生态环境的效果。 更多还原
【英文摘要】【Abstract】 Sand shrubs are the important plants for wind break.In order to have the effect on sand fixation and improvement of ecological environment,the engineering measures including sand dune enclosure,stump and replacement are taken to transform the sand shrubs.After 2.5 years of enclosure,the aboveground biomass,average plant height and basal diameter of all shrubs increase significantly.The aboveground biomass of salix gordejevii of enclosure is 4 times as much as that of unenclosure.The increments are obvious in current year after stump.The aboveground biomass of stump is close to or exceed that of unstump.The year growth height of unstump is less than that of stump;direct seeding,planting and cottage are the methods of increasing the distribution of shrubs and coverage area.After 2~3 years of replacement,the sand dune begin to become stable with the encroachment of herbs.It is

concluded that the engineering measures taken on the shrubs could increase plant coverage,improve the increment of shrubs and herbs and have significant effects on ecological environment

【题目】不同滤料加挂膜方式对养殖污水处理效果的研究
【中文关键词】生物滤料;养殖水处理;挂膜方式;挂膜时间
【英文关键词】biological filtermedia; aquaculture water treatment;membrane forming method; membrane forming time
【中文摘要】实验研究了填装不同滤料的4种生物滤池在3种挂膜方式下生物功能启动的情况。结果表明,相同挂膜方式下不同生物滤池中,氨氮浓度都随着系统运行时间的延长而逐渐下降,亚硝态氮浓度先上升达到峰值后下降,但悬浮球形滤料处理污水的效果明显优于其他滤料。悬浮球形滤料下不同挂膜方式,系统稳定时间不同,自然挂膜、活性污泥挂膜、优势菌挂膜三者依次约为39、30和21 d,但采用优势菌挂膜由于生物膜容易脱落,氨氮的处理效果较差。采用活性污泥法加入悬浮球形生物滤料是处理养殖污水行之有效的方法。系统运行27 d可使氨氮的浓度降低到0.033 mg/L,系统运行33 d,亚硝态氮浓度可下降到0.045 mg/L左右。
【英文摘要】This experiment studied different biological functions establishments of four kinds of biological filters, using three different methods of membrane forming. Results showed that the stability time of systems was different using different membrane forming methods: natural membrane forming needed about 39d, active sludge about 30d and predominant bacteria about 21d. However,the effect of NH+4-N treatment by predominant bacteriamembrane forming was the worst among the three, as the biological membrane shed easily. In the four kinds of biological filters, the NH+4-N concentration gradually decreased, while the NO2-N concentration increased to the peak at first and then declined. However, the NO2-N concentration using predominate bacteria membrane forming decreased faster than that using the other two methods. The filter packed with spherical suspension filter media by predominant bacteria membrane forming treated aquaculture water more effectively. Under this condition, the NH+4-N concentration decreased to 0.033mg /L after 27 d and the NO2-N concentration decreased to about 0.045mg /L after 33 d.

【题目】Soilchemical and microbiological properties alonga chronosequence of Caragana microphylla Lam. plantations in the Horqin sandy land of Northeast China

【中文关键词】无
【英文关键词】Soil properties; Plantation chronosequence; Soil enzyme; Microbial biomass; Desertified sandy land; Caragana microphylla Lam
【中文摘要】无
【英文摘要】AbstractCaragana microphylla Lam., a leguminous shrub, is a dominant native plant species widely planted to stabilize the moving and semi-moving sand dunes in the semi-arid Horqin sandy land of Northeast China. The objective of this study was to determine how C. microphylla plantations affected the physical, chemical and microbiological properties of a sandy soil. Soil samples at the depths of 0 – 10, 10 – 20, 20 – 30, 30 – 40, and 40 – 50 cm were collected from the C. microphylla plantations with an age sequence of 0, 5, 10, and 23 years. The results showed that shrub growth altered microclimate, increased litter input, and hence, improved soil water holding capacity, contents of total carbon, total N and microbial biomass C and N, electrical conductivity, and activities of urease, phosphomonoesterase, protease, dehydrogenase and polyphenol oxidase, and decreased soil bulk density. These trends increased with increasing plantation age but decreased with increasing soil depth. C. microphylla establishment could be an effective and applicable measure to restore vegetation and control desertification in the Horqin sandy land, and recommended for adoption in semi-arid sandy areas on a large scale.

【题目】不同年龄小叶锦鸡儿固沙群落土壤酶活性及微生物生物量的变化
【中文关键词】土壤生物活性; 微生物生物量; 土壤酶; 固沙群落; 小叶锦鸡儿(Caragana microphylla);
【英文关键词】soil biological activities; microbial biomass; soil enzyme; sand-fixation community; Caragana microphylla;
【中文摘要】小叶锦鸡儿(Caragana microphylla)是科尔沁沙地广为采用的豆科固沙植物。为探讨采用小叶锦鸡儿固定流沙后,土壤生物活性的变化特点和发展趋势,选取5、10、22年生小叶锦鸡儿人工固沙群落为对象,以半流动沙丘和天然群落为对照,研究了人工固沙群落发育过程中土壤磷酸单酯酶、蔗糖酶、蛋白酶、脲酶、脱氢酶的活性和微生物生物量C、N、P质量分数的变化特征。土壤按5层取样:0~10,10~20,20~30,30~40,40~50cm。结果表明,随着小叶锦鸡儿固沙群落发育时间的增长,群落内土壤生物活性逐渐改善,沙土中5种酶的活性和土壤微生物生物量C、N和P质量分数均大幅度提高,其中0~10cm土层增幅最大。土壤酶中蔗糖酶的活性增加最为迅速,5、10和22年生群落0~10cm土层中蔗糖酶的活性分别是半流动沙丘的76.80,167.27和261.63倍。22年生群落的土壤生物活性已接近于天然群落,处于相对稳定的状态。小叶锦鸡儿群落中土壤酶和微生物生物量之间存在极显著的正相关关系。以上表明,小叶锦鸡儿不仅具有较好的防风固沙性能,而且表现出强大的改善土壤生物活性的能力,可作为优良的固沙植物材料在本地区大面积推广应用。
【英文摘要】Caragana microphylla, a leguminous shrub, is widely used in stabilize moving and semi-moving sand dune in Horqin Sandy Land. The purpose of this study is to reveal the change characteristics of biological properties of sandy soil and its development trend under the establishment of C. microphylla plantations in flowing sand dune. With semi-moving sand dune and natural community as controls, the activities of phosphomonoesterase, saccharase, protease, urease, dehydrogenase and the contents of microbial biomass C, N, P of the soil in an age sequence (5-, 10-, 22-year) of C. microphylla plantations were studied. Soil samples were taken from each and every plant community at 5 depths (0~10, 10~20, 20~30, 30~40, 40~50 cm). The results showed that the soil biological activities in sand fixation plantation were all well improved with the age increasing; the activities of the 5 enzymes and the contents of microbial biomass C, N, P were gradually increased. Among the 5 enzymes, the increase of activity of saccharase was most significant, whose measurements in 0~10 cm soil of 5, 10 and 22 age plantations were 76.80, 167.27 and 261.63 times respectively of the semi-moving sand dune. The soil biological activities in 22-year plantation were already close to that in the natural community. There existed significant positive correlation between the soil enzyme activities and the microbial biomass contents. The C. microphylla thus shows the high abilities not only for sand-fixation and wind-protection, but also for the improvement of soil biological activities, and is available to be recommended for wide use in fixing moving sand dune in the semi-arid region

【题目】压砂地土壤微生物群落功能多样性分析
【中文关键词】压砂地;Biolog;微生物群落;功能多样性
【英文关键词】Key words: Gravel-mulched field; Biolog; Microbial community; Functional diversity
【中文摘要】摘 要: 为了掌握荒地压砂对土壤微生物群落功能多样性及理化性质的影响, 对荒地及不同年限压砂地土壤进行了 Biolog微生物群落功能多样性和理化性质分析。Biolog 分析结果表明, 1 年压砂地微生物群落生理活性最高, 荒地微生物群落生理活性最低, 其它各年限压砂地微生物群落生理活性随压砂年限增加而缓慢下降。微生物群落功能多样性指数分析表明压砂对微生物群落功能结构影响并不显著。通过微生物群落利用碳源类型分析明确了荒地和各年限压砂地土壤微生物群落利用的主要碳源类型。土壤理化性质分析表明, 压砂第 1 年各项理化性质指标均有明显的下降; 此后随压砂年限增加, 有机质含量呈上升趋势, 速效氮、 速效磷和速效钾含量缓慢下降, 全盐、 全氮、 全磷、 全钾含量及土壤pH 值变化不大。
【英文摘要】Abstract: To confirm effect of mulching gravel on soil microbial community functional diversity and physical-chemicalproperties, the soil Biolog and physical-chemical properties were analyzed for wilderness and gravel-mulched field.The results of Biolog showed that physiological action of microbial community in1 year gravel-mulched field was thebest, others declined slowly with the increase of gravel-mulched years. The result of soil microbial communityfunctional diversity indices showed that the effects of gravel-mulched to soil microbial community functional wasindistinctive. The major carbon source used by microbial community of wilderness and gravel-mulched field had beenknown. The result of soil physical-chemical properties showed that all physical-chemical indices declined in 1 yeargravel-mulched field.

【题目】一种新型根用控释农药片剂防治瓜蚜技术研究
【中文关键词】关键词: 根用农药片剂; 瓜蚜; 防治效果
【英文关键词】Key words: Key words: control-releasing imidacloprid tablet of root using; Aphis gossypii Glover; control effect
【中文摘要】摘要: 介绍了一种对瓜蚜具有很好的控制作用的根用吡虫啉控释片剂。 2009年中宁大青山地区瓜蚜严重发生,7月6日瓜蔓上瓜蚜虫口数量为485.2头/株, 对西瓜造成较明显危害, 而根用控释农药片剂施药区的虫口数量仅为5.12头/株。 供试根用控释农药片剂对瓜蚜具有很好的控制作用, 每株1粒的施药量, 在播种时随种子施药, 对瓜蚜具有70 d以上的控制作用, 控制效果在95%以上, 且经检测对压砂瓜安全。
【英文摘要】Abstract: Abstract: A controlling technology of control-releasing imidacloprid tablet for root using against Aphis gossypii Glover was introduced. Aphis gossypii Glover occurred seriously in 2009 at daqing mountain of zhongning county. Amount of Aphis gossypii Glover in each tendril was 485.2, which caused obvious damage. While number of Aphis gossypii Glover was 5.12 in controlled area by control-releasing pesticide tablet. Control-releasing pesticide tablet for root using had good control effect against Aphis gossypii Glover. The dosage of Control-releasing imidacloprid tablet was one granule in an individual plant of watermelon and imposing it with seed down. The control time was over 70 days and the control effect was over 95%. These tablets were safe to watermelon.

【题目】基于GIS的瓜蚜种群空间结构和分布模拟
【中文关键词】瓜蚜 GIS 种群 空间结构 分布模拟
【英文关键词】Key words: Aphis gossipii Glover; GIS; population; spatial structure; distribution simulation.
【中文摘要】摘 要 运用地理信息系统(GIS) 和地统计学分析方法, 对2008 年宁夏环香山地区压砂西甜瓜瓜蚜种群空间结构进行分析, 并基于不同模型的普通 Kriging 插值法模拟了瓜蚜种群空间分布格局. 结果表明:研究区瓜蚜数量在不同发生时期(初发期 盛发期和盛末期) 均显示出明显不同的空间结构, 其半变异函数均为指数型或高斯型, 田间种群空间格局均呈聚集分布, 不同时期的聚集程度(1 -变异程度) 均大于45%, 空间相关范围在10. 37 ~ 29. 11 km, 空间变异主要受空间自相关影响; 空间分布模拟较好地从时间 空间两个角度直观地模拟不同时期瓜蚜种群的动态变化, 易于确定瓜蚜的发生范围和发生程度.
【英文摘要】Abstract: Based on geographic information system (GIS) and geostatistical analysis,this paperstudied the spatial structure of Aphis gossipii Glover population in Xiangshan District of ZhongweiCity,Ningxia Province,with the spatial distribution of the population simulated by ordinary Kriginginterpretation. The spatial structure of A. gossipii population varied with its occurrence stage (ini-tial,blossom,and final stage) . The semivariograms of A. gossipii could be described by exponen-tial or Gaussian model,indicating that A. gossipii had an aggregated spatial arrangement. The ag-gregation degrees at different occurrence stages were all beyond 45%,and the spatial correlationranged from 10. 37 km to 29. 11 km. The spatial variance was greatly affected by spatial autocorre-lation. The population dynamics of A. gossipii at its different occurrence stages could be easily ana-lyzed and intuitively simulated from the two aspects of time and space by spatial distribution simula-tion,and thus,the occurrence position and degree of A. gossipii could be easily determined.

【题目】Determination of Chloramphenicol Residues in Milk by Enzyme-Linked Immunosorbent Assay: Improvement by Biotin-Streptavidin Amplified System
【中文关键词】扫描; ELISA;杀虫剂残留;果汁;蔬
【英文关键词】screening; ELISA; pesticide residues; fruit juices; vegetable
【中文摘要】本文建立了一种灵敏的生物素-链霉亲和素酶联免疫实验(BA-ELISA)来检测牛奶中氯霉素的残留。应用生物素-链霉亲和素系统加强反应的灵敏度。优化反应条件后,该方法的检出限为0.042 ±0.006 ng mL-1,这比传统的使用了相同的抗体和抗原的ELISA方法灵敏8倍。本文也讨论了生物素-链霉亲和素系统的扩大机制以及影响实验灵敏度的主要影响因素。该方法也成功应用于检测牛奶样品中氯霉素残留中,它有简单快速的操作程序以及好的回收率(85.66-109.67%)。这个结果表明,生物素-链霉亲和素系统是提高特定检测痕量兽药残留检测的很有价值的工具,且其能广泛应用于食品样品的常规检测。
【英文摘要】A sensitive biotin-streptavidin amplified enzyme-linked immunosorbent assay (BA-ELISA) method was developed for the determination of chloramphenicol residues in milk. The biotin-streptavidin system was applied to enhance the sensitivity. After optimization, the detection limit of the method was found to be 0.042 (0.006 ng mL-1), which is 8-fold more sensitive than the traditional competitive ELISA using the same antibody and coating antigen. The amplification mechanism of the biotin - streptavidin system and the major factors affecting the sensitivity of detection are discussed. This method was successfully applied to determine the chloramphenicol residues in milk samples with a simple and rapid extraction procedure, and good recoveries(85.66- 109.67%) were obtained. The result indicated that the biotin- streptavidin system may be a valuable tool to improve the specific detection of trace veterinary drug residues and could be widely used for routine monitoring of food samples.

【题目】镉、 铅对沙打旺种子萌发及早期生长发育的毒性效应
【中文关键词】Cd2+; Pb2+; 胁迫;发芽率;生理指标; 沙打旺
【英文关键词】无
【中文摘要】摘要: 采用溶液培养和盆栽实验研究了镉(Cd2+)和铅(Pb2+) 对沙打旺种子萌发、 幼苗生长、 幼苗叶绿体色素含量、脯氨酸含量、 抗氧化系统中的 2 种抗氧化酶(SOD、 CAT)活性的影响。Cd2+、 Pb2+实验梯度分别为: 0, 1, 2, 3, 10, 20和 0, 500, 1 000, 1 500 mg/ kg。结果表明, 随着 Cd2+浓度的增大, 种子发芽率、 发芽势、 发芽指数总体上呈先下降后上升的趋势; 随着 Pb2+浓度的增大, 种子发芽率、 发芽势、 发芽指数均呈下降趋势,种子发芽进程受到严重抑制。Cd2+和 Pb2+对沙打旺幼苗的株高、 根长、 根重和地上重产生明显的抑制作用。浓度越高, 植物生长受到的影响越大。在同一浓度下, Cd2+、 Pb2+对沙打旺胚根伸长抑制率大于对芽伸长的抑制率。随着 Cd2+、 Pb2+浓度的增大,叶绿素含量总体呈下降趋势但Pb2+对叶绿素的影响大于 Cd2+。脯氨酸含量、 SOD 和 CAT 的活性均出现低浓度(Cd2+浓度 1 mg/ kg , Pb2+浓度 500 mg / kg) 上升,高浓度(Cd2+浓度\10 mg/ kg , Pb2+浓度\1 000 mg / kg) 下降的趋势。

【题目】山竹岩黄蓍固沙群落对土壤养分及生物活性的改良效应
【中文关键词】土壤生物活性; 土壤酶; 土壤微生物生物量; 土壤养分; 固沙群落; 山竹岩黄蓍;
【英文关键词】soil biological activity; soil enzyme; soil microbial biomass; soil nutrient; sand-fixing community; Hedysarum fruticosum;
【中文摘要】以半流动沙丘为对照,对5、10和22年生山竹岩黄蓍人工固沙群落不同层次(0~10、10~20和20~30cm)土壤的养分状况、微生物生物量和土壤酶活性进行了对比研究.结果表明:采用山竹岩黄蓍固定流沙后,随着群落年龄的增长,土壤中C、N、P、K含量及生物活性均明显提高.其中,0~10cm土层的增长幅度显著高于10~30cm土层.0~30cm土层中C/N由7.3增加到8.5;土壤微生物生物量碳、氮、磷含量以及土壤脲酶、磷酸单酯酶、蔗糖酶、蛋白酶、脱氢酶、硝酸还原酶和多酚氧化酶的活性均有所提高.其中,0~10cm土层中蔗糖酶的活性是对照的49.7~284.5倍.土壤微生物生物量碳、氮、磷分别与土壤有机碳、全氮、全磷以及微生物生物量与酶活性之间存在显著的正相关关系. 更多还原
【英文摘要】With adjacent semi-moving dune as the control, this paper studied the effects of 5-, 10-and 22-year old Hedysarum fruticosum plantations on the nutrient status, microbial biomass, and enzyme activities at the soil depths 0-10, 10-20 and 20-30 cm. The results showed that with the establishment of H. fruticosum plantation on moving dune, soil C, N, P and K contents and biological activities increased obviously with the increasing age of the plantation, and the increment was much higher at 0-10 cm than at 10-20 and 20-30 cm. At 0-30 cm, soil C/N increased from 7.3 to 8.5, and microbial biomass C, N and P as well as the activities of urease, protease, saccharase, phosphomonoesterase, dehydrogenase, polyphenol oxidase and nitrate reductase all increased. Among the test enzyme activities, saccharase activity had the most significant increase, with its value at 0-10 cm being 49.7-284.5 times of the control. There

were significant positive correlations between soil microbial biomass C, N and P and organic C, total N and total P, respectively, and between soil microbial biomass and enzyme activities.

【题目】铜、镉对三种豆科植物生长及氮磷钾含量的影响
【中文关键词】Cu2+; Cd2+; 生长; 氮磷钾含量; 豆科植物;
【英文关键词】Cu2+; Cd2+; growth; N, P and K contents; leguminous plant.;
【中文摘要】为了解豆科植物在Cu、Cd单一污染土壤中的生长状况及对土壤养分的吸收利用特点,采用盆栽实验研究了Cu2+、Cd2+单一污染下紫花苜蓿、红三叶、沙打旺3种豆科植物的株高、根长、生物量和叶、茎部N、P、K、Cu和Cd含量的变化情况。Cu2+、Cd2+处理浓度分别为:0、400、800、1200mg.kg-1和0、1、10、20mg.kg-1。结果表明,3种豆科植物对Cu和Cd均有较强的吸收能力,除红三叶叶片中Cu含量外,3种豆科植物根、茎、叶中Cd和Cu的含量均与土壤中重金属添加量呈显著正相关。3种豆科植物在严重Cd2+污染的土壤中均能正常生长。在Cu2+添加量≤1200mg.kg-1时,红三叶能正常生长,而紫花苜蓿的生长则受到显著抑制作用,沙打旺在Cu2+添加量≥800mg.kg-1时生长受到抑制。土壤Cu2+添加量≤1200mg.kg-1时,能促进紫花苜蓿对N、P、K的吸收;Cu2+添加量≤800mg.kg-1时,对红三叶N、P、K含量没有明显影响;Cu2+添加量≤400mg.kg-1时,可提高沙打旺中N、P、K含量,但当Cu2+添加量≥800mg.kg-1时则显著降低。土壤Cd2+添加量≤20mg.kg-1时,对紫花苜蓿和红三叶茎叶以及沙打旺茎部的N、P、K含量有促进作用,但对沙打旺叶片的N、P、K含量起抑制作用。总体来看,3种豆科植物对Cu2+和Cd2+均有一定的耐性,红三叶对Cu2+的耐性较好,紫花苜蓿对Cd2+的耐性较好。
【英文摘要】Aimed to understand the growth status and nutrient uptake of leguminous plants u nder soil copper- or cadmium contamination, a pot experiment with Medicago sa tiva, Trifolium pretense, and Astragalus adsurgens was conducted, with th eir plant height, root length, plant biomass, and N, P, K, Cu and Cd contents in leaf and stem measured. The application amounts of Cu2+ and Cd2+ we re 0, 400, 800, and 1200 mg · kg-1, and 0, 1, 10, and 20 mg · kg-1, re spectively. All the test three leguminous plants had strong capability of absorb ing Cu and Cd. The Cu and Cd contents in their roots, stems, and leaves, except the Cu content in T. pratense leaf, were significantly positively cor related with the application amounts of Cu2+ and Cd2+. Under the app lication of Cd2+, all the three leguminous plants grew normally. When the application amount of Cu2+ was ≤1200 mg · kg-1, T. pratense grew norma lly, while the growth of M. sativa was significantly inhibited. The growth o f A. adsurgens was inhibited when the application amount of

Cu 2+ was ≥ 800 mg · kg-1. An application amount of ≤1200 mg · kg-1 of Cu2+ promoted the N, P and K absorption of M. sativa, but applyi ng ≤ 800 mg · kg-1 of Cu2+ had little effects on the N, P and K abso rption of T. pretense. The N, P and K contents of A. adsurgens increased when the application amount of Cu2+ was ≤400 mg · kg-1, but decrea s ed significantly when the Cu2+ application amount was ≥800 mg · kg-1 . When the application amount of Cd2+ was ≤20 mg · kg-1, the N, P an d K contents in M. sativa and T. pratense stems and leaves and in A. a dsurgens stem increased, while those in A. adsurgens leaf decreased. As a whole, the three leguminous plants all had certain tolerance to Cu2+ and C d2+ stresses, especially T. pratense to Cu2+ and M. sativa t o Cd2+.

【题目】Effects of salinity fluctuation on the growth and energy budget of Juvenile Litopenaeus vannamei at different temperatures

【中文关键词】能量收支;食物摄取;生长;南美白对虾;盐度波动
【英文关键词】energy budget; food intake; growth; Litopenaeus vannamei; salinity fluctuation
【中文摘要】本文研究了在温度为20,25,30摄氏度,盐度控制在20gL(-1),波动振幅为+/-0, +/-5, +/-10, +/-15gL(-1)情况下,盐度波动对幼体南美白对虾生长,蜕皮,能量收支的影响。经过48天投喂,发现幼体南美白对虾在每个温度组盐度波动为 +/-15gL(-1)时的成活率最低;在温度为25和30摄氏度,盐度波动为 +/-5到+/-10gL(-1)时生长最快,盐度波动影响食物转化率而不影响对虾的摄食。在温度为25和30摄氏度,盐度波动为 +/-5到+/-10gL(-1)时,对虾大部分能量用于生长而少部分能量用于呼吸和排泄。因此,盐度为20+/-5到20+/-10gL(-1)时,幼体南美白对虾通过提高食物转化率,降低呼吸和排泄能量损失,从而获得比盐度为20gL(-1)时更高的生长率。
【英文摘要】The effects of salinity fluctuation on the growth, molting and energy budget of juvenile Litopenaeus vannamei was investigated at the temperatures of 20, 25, and 30 degrees C. Salinity fluctuation regimes were set in different amplitudes of +/-0, +/-5, +/-10 and +/-15 gL(-1) from a control salinity of 20 gL(-1). After a 48-day feeding trial, the lowest survival occurred at a salinity fluctuation of +/-15 gL(-1) for each temperature investigated. The best growth of shrimp was obtained at salinity amplitudes of +/-5-10 gL(-1) at 25 and 30 degrees C. The salinity fluctuation influenced food conversion efficiency but not food intake. The shrimp maintained at salinity amplitudes of +/-5-10 gL(-1) expended most of the energy for growth and spent less energy on respiration and excretion at 25 and 30 degrees C. Therefore, salinity fluctuating amplitudes of +/- 5-10 gL(-1) result in higher growth rates than constant salinity conditions (20 gL(-1)) through enhanced feed assimilation and reduced energy loss in respiration and excretion.

【题目】铜对三种豆科植物萌发及早期生长发育的抑制效应
【中文关键词】铜; 豆科植物; 种子萌发; 植物生长; 抑制率; 土壤污染;
【英文关键词】copper; leguminous plant; seed germination; plant growth; inhibition rate; soil pollution;
【中文摘要】采用水培实验研究了Cu2+对种子萌发和胚根胚芽伸长的抑制效应;采用盆栽实验研究了土壤中不同含量Cu对植物地上、地下部分长度和质量以及叶绿素含量的影响.结果表明:质量浓度≥400mg.L-1的Cu2+水溶液对三种植物种子的萌发产生显著的抑制作用,质量浓度越高阻抑越明显,对紫花苜蓿的抑制效应小于红三叶和沙打旺;对胚根伸长的抑制作用大于芽.过量Cu2+可显著降低植物叶绿素的含量,并对地上部分的生长产生明显的抑制作用;对紫花苜蓿及红三叶根系长度和质量有明显的促进作用,而对沙打旺则有明显的抑制作用.总体来看,紫花苜蓿对Cu污染的耐受程度大于红三叶和沙打旺.
【英文摘要】The inhibition effects of Cu2+ on seed germination and radicle/germ elongation were studied via hydroponical experiment,and the effects of different Cu2+ contents in soil on the length,weight and chlorophyll content of above-ground and underground parts of plants were studied via pot culture experiment.The results revealed that the aqueous solution in which the Cu2+ mass concentration≥400 mg · L-1 obviously inhibits the seed germination of the three plants:Medicago sativa,Trifolium pratense and Astragalus adsurgens.The higher the Cu2+ mass concentration,the more obvious the inhibition effect,and the inhibition effect on the first one is lower than that on the other two.In addition,the inhibition effect on the elongation of radicle is higher than that on germ.Excessive Cu2+ content will lower the chlorophyll content in plants with obvious inhibition effect on the growth of above-ground parts of plants.However,the Cu2+ content clearly accelerates the growth of length and weight of the root system of M.sativa and T.pratense,but it inhibits that of A.adsurgens obviously.As a whole,the endurability of M.sativa to Cu pollution is higher than that of the other two plants

【题目】农村劳动力与粮食生产—基于黑龙江省和内蒙古自治区的调研
【中文关键词】劳动力 粮食生产
【英文关键词】labor;food production
【中文摘要】本文在黑龙江省和内蒙古自治区部分农业生产大县农村劳动力实地调研的基础上,研究分析了农业生产及农村劳动力从业现状、存在问题并提出了相应的政策措施。调研结果表明:在农业生产规模相对较大的地区,青壮年仍旧是劳动力的主体,机械化的普及减轻了劳动强度,当地采取的场县共建和农民合作等方式促进了农业生产效率的提高;但是仍旧存在农民就业不充分,生产规模较小和组织化程度较低的问题。在现状和问题分析的基础上,提出加大补贴力度、适度规模经营、加大农业保险支持、充分利用隐性失业资源和大力发展农业经济合作组织等政策建议。

【题目】基于功能系统分析的现代农业园区规划方法研究
【中文关键词】农业园区;功能体系;规划内容;案例
【英文关键词】agricultural garden; functional system; planning content; case study
【中文摘要】立足于我国现代农业园区的发展现状,提出我国农业园区基本功能包括生态功能、生产功能、游憩功能和生产服务功能,在此基础上提出了具有中国特色的农业园区发展建设规划的逻辑构架。农业园区发展建设规划的具体内容包括前期研究、发展策略、空间规划和实施策略等4个方面。上述规划方法在新疆昌吉国家农业科技园区现代农业示范区发展建设规划中的应用取得了良好的社会、经济和生态效益。
【英文摘要】Based on the current development situation of the agricultural garden in China,the basicfunctions of the agricultural garden are put forward as ecological,productive,recreative and service func-tion.From that,the logic framework and the specific content of agricultural garden planning with Ch-inese characteristics is proposed.A development construction plan of the agricultural garden should in-clude the preliminary study,the development strategy,the spatial plan and the implementation strategy.The application of planning ideas mentioned above in the planning practice of the modern agriculturedemonstration area in Changji National Agricultural Science and Technology Garden,Xinjiang has ob-tained favorable social,economic and ecological effect.

【题目】Development of chemiluminescence enzyme-linked immunosorbent assay for the screening of metolcarb and carbaryl in orange juice, cabbage and cucumber
【中文关键词】氯霉素;生物素-链亲和素放大系统;ELISA;牛奶
【英文关键词】Chloramphenicol; biotin-streptavidin-amplified system; ELISA; milk
【中文摘要】本文介绍了一种用化学发光加强信号的直接竞争酶联免疫实验(ELISA)同时检测农产品中速灭威和西维因的方法。考虑了包被抗体和酶示踪物的浓度,pH以及甲醇浓度的影响。在最适宜条件下,速灭威和西维因的IC50分别为4和0.3 ug kg-1。笔者用简单、快速和有效的方法检测了果汁和蔬菜中速灭威和西维因。样品中速灭威和西维因的回收率(n=3)分别为75 – 108%和74 – 98%。化学发光免疫实验的结果用高效液相色谱法进行了验证。用化学发光ELISA法和高效液相色谱法获得的数据的相关性(n=9)很好。因此,化学发光ELISA法可用于同时定量检测农产品中速灭威和西维因的残留。
【英文摘要】A direct competitive enzyme-linked immunosorbent assay (ELISA) with enhanced chemiluminescent detection for simultaneous detection of metolcarb and carbaryl in agricultural products is reported. The concentrations of coating antibodies and enzyme tracer, as well as the effects of pH and methanol concentrations, were investigated. Under optimum conditions, the IC50 of metolcarb and carbaryl were 4 and 0.3 mgkg-1, respectively. Detection of metolcarb and carbaryl in fruit juices and vegetables was accomplished using simple, rapid and efficient extraction methods. Recoveries (n ¼ 3) of spiked samples ranged 75 – 108% for metolcarb and 74 – 98% for carbaryl. Validation of the enhanced chemiluminescent immunosorbent assay was conducted by comparison of results with HPLC. The correlation between the data obtained using ELISA with enhanced chemiluminescent detection and HPLC was good (n ¼ 9). Therefore, the enhanced chemiluminescent ELISA was suitable for quantitative simultaneously determination of metolcarb and carbaryl residue in agricultural products

【中文关键词】酶联免疫法吸附测定,同步测定,西维因,速灭威,基体效应,农产品
【英文关键词】Enzyme linked immunosorbent assay;Simultaneous determination;Carbaryl;Metolcarb;Matrix effects;Agricultural products
【中文摘要】本文介绍了一种多酶示踪剂直接竞争酶联免疫实验同时检测农产品中西维因和速灭威的实验方法。本文研究了包被抗体和酶示踪剂的浓度。在最优条件下,西维因和速灭威的检出限分别为0.15 ug L − 1和1.2 ug L − 1。用简单、快速、和高效的方法检测了果汁和蔬菜中的西维因和速灭威。样品的回收率超过了70%。免疫试实验的结果用高效液相色谱法进行了验证。用多酶示踪物的酶联免疫实验法和高效液相色谱法获得的数据的相关性很好。结果表明,这种新的酶联

免疫实验法可用于同时定量检测西维因和速灭威的残留。
【英文摘要】A direct competitive enzyme linked immunosorbent assay in multi-enzyme tracers format for the simultaneous analysis of carbaryl and metolcarb in agricultural products is described in this study. The concentrations of coating antibodies and enzyme tracer were studied. Under the optimum conditions, the limits of detection of carbaryl and metolcarb were 0.15 gL 1 and 1.2 gL 1, respectively. Determination of carbaryl and metolcarb in fruit juices and vegetables was accomplished by simple, rapid and efficient extraction methods. Recoveries of spiked samples were great than 70%. Validation of the immunosorbent assay was conducted by comparison of results from high performance liquid chromatography (HPLC). The correlations between the data obtained using multi-enzyme tracers enzyme linked immunosorbent assay and high performance liquid chromatography were good. Results indicated that the new strategy for developing immunoassay for simultaneous quantitative determination of carbaryl and metolcarb residues was suitable in this study.

【题目】Development of an Enzyme-Linked Immunosorbent Assay To Detect Benzylpenicilloic Acid, a Degradation Product of Penicillin G in Adulterated Milk
【中文关键词】苄青霉噻唑酸;盘尼西林降解产物;抗体;ELISA
【英文关键词】Benzylenicilloic acid; degradation product of penicillin; antibody; ELISA
【中文摘要】为了避免检出青霉素G,一些生产商和商人非法将β-内酰胺酶添加到牛奶中来降低BPA。这种降解产物能引起人体内的变态反应。因此,是危害人类健康的潜在危害物。为了检测出牛奶中的BPA,我们建立了一种快速直接竞争酶联免疫实验(ELISA)。其IC50为0.32±0.01 ug L-1,检出限为0.030±0.002 ug L-1。牛奶样品中的基体效应可以通过离心和稀释消除。回收率为72.75-93.25%。为原料乳加热处理也不会影响BPA的检测。为了证实BPA-ELISA,牛奶样品用ELISA和LC-MS(液相色谱/质谱联用)的方法进行验证;结果表明有很强的相关性(r2 = 0.99)。用BPA-ELISA的方法检测了从天津进出口检疫检验局获得的样品。结果表明用天津进出口检疫检验局获得的结果有几乎100%的相关性(r2 = 0.99)。
【英文摘要】To avoid detection of penicillin G , some p roducer s/merchants illegally add β-lactama se to mil k to degrade it into benzyl penicilloic acid (BPA). Thi s degradation product can use allergic re action s i n h um a ns and, therefore, is a potential hazard to human health. To detect BPA in milk, we established a rapid direct competitive enzyme-linked immunosorbent assay (ELISA) with an IC50 of 0.32(0.0 1 μgL-1,and a detection limit of 0.030 (0.00 2 μgL-1. Matrix effects in t he milk samples were easily eliminated by centrifugation and dilution. Recoveries were 7 2.7 5 - 9 3.2 5%. Al so heat treatments of raw milk did not affect the detection of the BPA. To validate BPA -E LIS A, the spiked milk samples were analyzed by E LIS A and LC- MS ; the results showed a strong correlation(r2=0.99). Incurred samples obtained from Tianjin Entry- Exit Inspection and Quarantine Bureau (TJCIQ) we retested by BPA- ELISA . The results showed an almost 100% correlation (r2=0.99) with the results supplied by the TJCIQ.

【题目】Antigens Synthesis and Antibodies Preparation for Furazolidone and Its Metabolite 3-amino-2-oxazolidinone
【中文关键词】呋喃唑酮;呋喃唑酮代谢物;抗体;ELISA
【英文关键词】Furzolidone; AOZ; Antigen; Antibody; ELISA

【中文摘要】合成了两种半抗原FZ-NH2和CPAOZ。对于FZ-NH2来说,通过戊二醛和重氮盐方法合成免疫原。对于CPAOZ来说,通过活化酯法和混合酸酐法合成免疫原。用戊二醛合成的FZ- NH2-OVA以及用活化酯法合成的CPAOZ-KLH,来建立间接竞争酶联免疫实验(ic-ELISA)。对于呋喃唑酮和它的代谢物AOZ(NPAOZ为代谢物)来说,灵敏度(IC50)为2.0 ug/L和2.5 ug/L检出限(IC15) 分别为0.09 ug/L和0.25 ug/L。我们建立了一种同时检测饲料中呋喃唑酮和它的代谢物AOZ的灵敏的实验方法。

【英文摘要】Two haptens of 3-[(5-amino-furan-2-ylmethylene)amino]oxazolidin-5-one(FZ-NH2) and 3-{[(4-carboxyphenyl)methylene]-amino}-2-oxazolidinone(CPAOZ) were synthesized. For FZ-NH2, immunogens were prepared by glutaraldehyde and diazo salt methods. For CPAOZ, immunogens were connected by the methods of the active ester and mixed acid anhydride. Compared with the combination, indirect competitive enzyme-linked immunosorbent assay (ic-ELISA) was developed with coating antigen of FZ-NH2-OVA via the glutaraldehyde method and immunogen of CPAOZ-KLH via active ester method. For furazolidone and its metabolite AOZ (NPAOZ as derivative), the sensitivities (IC50) were 2.0 mg/L and 2.5 mg/L, limits of detection (IC 15) were 0.09 mg/L and 0.25mg/L, respectively. A sensitive method was developed for the simultaneous determination of furazolidone in feed and its metabolite AOZ in tissue.

【题目】Preparation, Characterization, and Application of A New Thiol-Functionalized Ionic Liquid for Highly Selective Extraction of Cd(II)

【中文关键词】提取;镉;原子吸收光谱

【英文关键词】Thiol-functionalized ionic liquid;Extraction ;Cadmium;Flame atomic absorption spectrometry

【中文摘要】一个高度选择性硫醇功能化离子液体(硫醇FIL)通过　FT-IR和ESI质谱合成。评价了硫醇功能化离子液体能提取Cd(II)、镍(II)、铬(iii)和Pb(II)能力。结果表明,硫醇功能化离子液体对Cd(II)具有高选择性,即确定用火焰原子吸收光谱法结合Cd(II)的方法,此法没有1000倍超额Na(I)、镁(II),Ca(II)、锰(II)、铁(III),Al(III)、铜(II)、锌(II)、镍(II)、铬(iii),Co(II),(III),Pb(II),和汞(II)的干扰。将萃取平衡时间定为1分钟,可得到了一个好的线性(r = 0.9998)和检测限为0.39 μ gL-1。精度(RSD)的测量1是重复测量11个10 μ gL-1 Cd的样品是结果为1.6%。该方法验证使用合格的参考资料。镉的添加回收率在添加的样本范围从97%到102%。

【英文摘要】A highly selective thiol-functionalized ionic liquid (thiol-FI L) was synthesized and characterized by FT-IR and ESI mass spectroscopy. The capability of thiol-FIL t o extract Cd(II), Ni(II), Cr(III) and Pb(II) wasevaluated. It is found that thiol-FIL possesses high selectivity for Cd(II), and this has led to a method for determination of Cd(II) by flame atomic absorption spectrometry that is free of interferences by up to a 1,000-fold excess of Na(I), Mg(I I), Ca(II), Mn(II), Fe(III), Al (III), Cu(II), Zn(II), Ni(II) , Cr(III), Co(II), As(III), Pb(II), and Hg(II). With extraction equilibrium time of 1 min , a good linearity (r = 0.9998) and a detection limit of 0.39¼ gL　1 were obtained. The precision (RSD) fo r 11 replicatemeasurements of 10 ¼ gL　1 Cd was 1.6%. The method was validated using certified reference materials. The recoveries of cadmium in spiked real samples ranged from 97% to 102%

【题目】Development of a sensitivity-improved immunoassay for the determination of carbaryl in food samples

【中文关键词】免疫分析、灵敏度、西维因、食品样品、预处理
【英文关键词】immunoassay; sensitivity; carbaryl; food sample; pre-treatment
【中文摘要】背景:为了建立一种检测西维因的高灵敏度免疫实验,用一种更安全实用的方法合成与西维因高度相似的半抗原。当其连接到辣根过氧化物酶(HRP)后,优化和表征了直接竞争酶联免疫实验(CD-ELISA),详细地评价了实验的性能条件。在初步研究中,也应用了增强的化学放光ELISA(ECL-ELISA)实验方法。结果:实验得到的IC50(抑制率为50%时的浓度)为2 ug kg－1,这比之前相似的CD-ELISA实验得到的结果灵敏12倍。在ECL-ELISA中,the IC50减小了10倍,到达了0.2 ug kg－1。CD-ELISA建立了一种更加广泛的实验条件,经过更加方简单的前处理可以应用到多种食品样品中。平均回收率在88.3－101.7%。结果与高效液相色谱法得到的结果有很好的相关性(R2 = 0.989)。结论:ELISA方法对于检测西维因做出了很大的提高,这表明,免疫实验是一种快速、有效地方法,可以应用于食品中西维因的快速定量或者定性检测。
【英文摘要】BACKGROUND: With the aim of developing a highly sensitive immunoassay for carbaryl, a hapten which had high similarity to carbaryl was synthesised using a safer and more practical approach. After it was conjugated to horseradish peroxidase, direct competitive heterologous enzyme-linked immunosorbent assay (CD-ELISA) was optimised and characterised. The assay performance conditions were investigated in details. Enhanced chemiluminescence ELISA (ECL-ELISA) was also used in preliminary studies.RESULTS: The assay obtained an IC 50 value (the concentration causing 50% inhibition) of 2 μgkg－1, which was 12-fold more sensitive than previous results of homologous CD-ELISA. In ECL-ELISA, the IC 50 was further decreased 10-fold to 0.2 μgkg－1The CD-ELISA developed was applicable for broad conditions, and could be applied on various food samples with a more convenient pre-treatment. Average recoveries were in a range of 88.3 － 101.7%. The results correlated well with those obtained using high-performance liquid chromatography (HPLC) analysis (R2= 0 .989).CONCLUSION: The ELISA developed was a great improvement in thedetermination of carbaryl, showing that the immunoassay developed was a simple, rapid and efficient method that was re liable for the detection of carbaryl and suitable for rapid quantitative or qualitative determination in food samples.

【题目】Preparation of Iminodiacetic Acid Functionalized Multi-walled Carbon Nanotubes and its Application as Sorbent for Separation and Preconcentration of Heavy Metal Ions
【中文关键词】多壁碳纳米管;ICP-MS;在线固相萃取;金属离子分析;ICP-MS
【英文关键词】Functionalized multi-walled carbon;Nanotubes;On-line solid-phase extraction;Metalions analysis
【中文摘要】这篇论文主要讲述用亚氨基二乙酸(IDA)和通过傅立叶变换红外光谱表征制备多壁碳纳米管(MWC-NTs)的一种新型的材料。等温线和吸附动力学进行了研究和实验数据非常好地拟合了朗缪尔模型和伪二阶方程。一个联机法同时测定微量V (V), Cr (VI), Pb (II), Cd (II), Co (II), Cu (II) and As (III),生物样品使用了这种材料作为吸附剂加上电感耦合等离子体质谱(icp - ms)。研究了一系列的实验参数,包括样品的pH值、样品流速和加载时间、淋洗的解决方案所产生的影响和干扰离子。在最佳实验条件下,浓缩因素对以上金属离子是介于66至101。检测极限(3 s)分别达到了1.3,1.2,0.70,0.40,2.5,3.4,0.79 ng L-1。在1.0 gL-1条件下,11个平行样品的精密度(RSD,%)是1.0到4.0。添加的生物样品的添加回收率(n = 3)在90 - 110%的范围。这些结果已经证明,所提出的方法具有良好的精度,可以应用于分析生物样品中的痕量金属离子。
【英文摘要】In this paper, a novel material was prepared with functionalizing multi-walled carbon nanotubes (MWC-NTs) using iminodiacetic acid (IDA) and characterized by FT-IR. Isotherm and kinetics of adsorption were studied and the experimental data fitted the Langmuir model and pseudo-second-order equation very well. An on-line method for simultaneous determination of trace V (V), Cr (VI), Pb (II), Cd (II), Co (II), Cu (II) and As (III) in biological samples was developed using this material as sorbent coupled with inductively coupled plasma mass spectrometry (ICP-MS). A series of experimental parameters, including sample pH, sample flow rate and loading time, eluting solution and the effect of interfering ions have been investigated systematically. Under the optimum experimental conditions, the enrichment factors for above metal ions were ranged from 66 to 101. Detection limit (3 s) was achieved at 1.3, 1.2, 0.70, 0.40, 2.5, 3.4, 0.79 ng L－1, respectively. At the 1.0 gL－1 level, the precision (RSD, %) for 11 replicate measurements was from 1.0 to 4.0. In spiked biological samples, good recoveries (n = 3) were obtained in the range of 90 – 110%. These results had proved that the proposed method was with good accuracy and could be applied to the analysis of trace metal ions in biological samples.

【题目】A Sensitivity-improved Enzyme-linked Immunosorbent Assay for Fenvalerate: A New Approach for Hapten Synthesis and Application to Tea Samples
【中文关键词】氰戊菊酯;多克隆抗体;ELISA;基体效应;交叉反应性
【英文关键词】fenvalerate; polyclonal antibody; ELISA; matrix effect; cross-reactivity
【中文摘要】背景:氰戊菊酯广泛应用于杀虫剂中,但是在一些农作物中发现了其残留物。中国式茶产品出口的大国,因此,控制茶产品中的杀虫剂残留已经变得越来越重要。本文建立了一种快速检测茶样品中氰戊菊酯的直接竞争酶联免疫实验方法(CD-ELISA)。结果:氰戊菊酯(FEN)多克隆抗体是由FEN半抗原特有的部分产生的。在酸化后,用2-(4 - 氯苯基)-3 - 甲基 – 丁酸和氨基乙酸甲酯合成半抗原。建立的CD-ELISA方法的检测灵敏度很高:IC50为9 ug L − 1,IC15为0.5 ug L − 1。氰戊菊酯用0.5mmol L − 1 NaOH-甲醇异构化来提高它的溶解度。在茶样品中,氰戊菊酯的检出限为0.16 mg L − 1,回收率为76.67 – 91.43%. CD-ELISA的可靠性比气象色谱分析的更好(R2 = 0.9968)。结论:本文建立了一种简单有效地免疫实验方法。该方法同样适用于快速检测茶样品中氰戊菊酯的残留。
【英文摘要】BACKGROUND: Fenvalerate has been widely used for t he control of m any common pests, but residues of this pesticide have been found in some agricultural crops. China is a large exporter of tea products; thus monitoring of pesticide residues in tea products has become increasingly important. In this study, a method of competitive direct enzyme-linked immunosorbent assay (CD-ELISA) for the rapid detection of fenvalerate in tea s ample was developed.RESULTS: A polyclonal antibody against fenvalerate (FEN) was produced by t he hapten with the charact eristic moiety of fenvalerate. After acidification, the hapten was synthesized from 2 -(4-chloro-phenyl)-3-methyl-butyric a cid a nd aminocaproic acid methylester. The CD-ELISA method developed has a high sensitivity of detection: 9 μ gL − 1 for I C 50 and 0 .5 μ gL − 1 for IC15. Fenvalerate was treated with 0.5 mmolL − 1 NaOH – methanol solution to improve its solubility by isomerization. In the tea sample, the detection limit of fenvalerate was 0.16 mg L − 1. A recovery rate of 76.67 – 91.43% was obtained from spiked tea. The reliability of t he CD-ELISA method is better in comparison with t he gas chromatographic method (R2= 0 .9968).CONCLUSION: In this study, a simple and efficient immunoassay method was developed. It is preferable for the rapid determination of fenvalerate residues in tea samples.

【题目】Enzyme-linked immunosorbent assay and colloidal gold-based immunochromatographic assay for several (fluoro)quinolones in milk
【中文关键词】酶联免疫;基因抗体;半抗原;分子模拟;综述;同时分析
【英文关键词】Enzyme-linked immunosorbent assay (ELISA);Generic antibody;Hapten;Molecular modeling;Review;Simultaneous analysis
【中文摘要】本文建立了一种直接竞争酶联免疫实验(ELISA)以及科室的胶体金为基础的免疫色谱层析实验(CGIA),用多克隆抗体同时检测牛奶中氧氟沙星、麻保沙星、氟罗沙星残留。氧氟沙星、麻保沙星、氟罗沙星的IC50和IC15值分别为0.20和0.53 ng mL－1以及0.02和0.05 ng mL－1。平均回收率为78% 至113%,批内和批间的变异系数分别为2~11%, 3~19%。牛奶中的氧氟沙星、麻保沙星、氟罗沙星的检出限在3.5~8.9 ng mL－1之间。优化好的CGIA牛奶中的的最小可视检出限为2 ng mL－1。检测过程可以在10min内完成。可以在4 ° C中贮藏8周而不会失活。对样品分析的结果显示CGIA能应用于初步、快速的检测牛奶样品。ELISA和CGIA的实验方法有着快速、灵敏、低成本的优点,可以应用于检测牛奶样品中(氟代)喹诺酮残留。
【英文摘要】We have developed a heterologous direct competitive enzyme-linked immunosorbent assay (ELI SA) and a visual c olloidal gol d-based immunochromatographic assay (CGIA) for simult aneous deter minati on of ofloxacin, marbofloxacin, and fleroxacin resid ues i n m ilk usingpolycl onal antibodies . The half- maximum inhibit ion concentrations (IC50) of ofloxacin, marbofloxacin, fleroxacin , and limits of detection (L ODs; calculated a s IC15 values)are between 0.20 and 0.53 ng mL 1, and between 0.02 and0.05 ng mL 1, respectively. The average recoveries range from of 78% to 113%, and the coefficients of variation of intra- and inte r-assays are between 2 and 11%, and 3 to 19%, respectively. The LODs for ofloxacin, marbofloxacin, fleroxacin in milk are between 3.5 and 8.9 ng mL 1.The visua l min detection limit of the op timized CGIA is 2ngmL 1 for milk samples. The detection process can be completed with in 10 min . The strips can be stored at 4 ° C for 8 weeks without significant loss of activity. The results of the analysis of spiked samples showed that the CGIA can be applied to preliminary, fast, and on-site screening of milk samp les. The ELISA and CGIA allow for a rapid ,sensiti ve, and low-cost determination of (fluoro) quinolones residues in milk samples.

【题目】Development of an Enzyme-Linked Immunosorbent Assay Based a Monoclonal Antibody for the Detection of Pyrethroids with Phenoxybenzene Multiresidue in River Water
【中文关键词】拟除虫菊酯,二苯醚官能团,ELISA,河水
【英文关键词】pyrethroid,,phenoxybenzene group, monoclonal antibody, ELISA, river water
【中文摘要】本文建立了一种利用单克隆抗体灵敏有选择性的直接竞争酶联免疫实验方法(ELISA)来检测含有苯氧基的拟除虫菊酯。得到了一种单克隆抗体2G2E7。在BALB/c小鼠的骨髓瘤细胞和脾细胞融合后,2G2E7抗体得到了表征。实验

优化了含有苯氧基的一类拟除虫菊酯的选择性。实验优化后的IC50值分别为溴氰菊酯:1.8 ug L-1,氯氰菊酯:1.5 ug L-1,氟胺氰菊酯和氰戊菊酯:1.5 ug L-1,苯醚菊酯:2.2 ug L-1,氟氰戊菊酯:2.4 ug L-1,甲氰菊酯:3.0 ug L-1,百灭宁:5.0 ug L-1。用ELISA来分析检测用拟除虫菊酯强化的河水样本来评价实验的准确性。河水样本中拟除虫菊酯的回收率为74~108%。结果表明ELISA课准确地同时检测水样品中含有苯氧基的拟除虫菊酯。

【英文摘要】A sensitive and bro ad class selective direct competitive enzyme -linked immunosorbent assay (ELIS A) using monoclonal anti body (McAb) has been described for the detection of pyrethroids with phenoxybenzene group. One monoclonal antibody, 2G2E7, was obtained and characterize d after fusion of myeloma cells with spleen cells isolated from BA LB/c mice . The assay with the most selectivity for the family pyrethroids with phenoxybenzene group was optimized . The IC50 value s of the optimized immuno assay were 1.8 μgL-1 for deltamethrin, 1.5 μgL-1 for cypermethrin, 2.0 μgL-1 for fluvalinate and fenvalerate ,2.2 μgL-1 for phenothrin, 2.4 μgL-1 for flucythrinate, 3.0 μgL-1 for fenpropathrin, and 5.0 μgL-1 for permethrin. River water samples fortified with pyrethroids were analyzed with the ELISA to evaluate the accurancy of the as say. The recoveries of pyrethroids in spiked water samples ranged from 74 to 108%. The results indicate the ELISA developed can accurately simultaneously determine pyrethroids with phenoxybenzene group in water samples

【题目】水产基因组学技术
【中文关键词】硬骨鱼;基因组
【英文关键词】Osteichthyes;genome
【中文摘要】本书目的是为将来的水产养殖和渔业科学家介绍基因组技术,也为农业科学专业的学生提供合适的参考书。写这本书,有这样几个紧迫的原因。首先,你很容易找到有关基因组学的书籍,但很难发现非常详尽介绍基因组学技术概念和基本原理的书籍。本人的学术背景是农业,但我近年来主要从事基础基因组学的研究,本人的经验,加上为研究生讲授农业基因组学课程的经历,使我能有效地抓住基因组学的关键问题,即对基因组技术的理解是必需的,假如能对基因组技术的基本原理有非常清楚的解释,将会更加有帮助,因为许多学生没有系统地学习过分子生物学、遗传学、生物化学、生物信息学等。其次,大多数基因组学书籍利用经典的模式动物来介绍纯粹的基因组学方法,没有考虑到基因组技术在某些实际情况下潜在的应用前景,在如何把基础的基因组学运用到人类健康研究之外的领域方面,亦存在严重的不足;本书详尽介绍了基因组技术以及这些技术在水产养殖和渔业上的应用。最后,水产养殖和渔捞对象有其独特的生物学特性,目前的基因组技术需要适当的改进和调整以后才能更好地运用。尽管本书没有任何章节是有关起源于水产养殖或渔捞对象的全新的基因组技术,但几乎每一章节都是介绍基因组技术在水产养殖和渔业或农业上的具体运用。

【题目】Enzyme-linked immunosorbent assay for detection of organophosphorylated butyrylcholinesterase: A biomarker of exposure to organophosphate agents
【中文关键词】夹心酶联免疫吸附分析;磷酸化丁酰胆碱酯酶;丁酰胆碱酯酶;有机磷杀虫剂及神经毒剂
【英文关键词】Sandwich ELISA, organophosphorylated butyrylcholinesterase, Butyrylcholinesterase, organophosphate insecticides and nerve agent
【中文摘要】丁酰胆碱酯酶(BChE)作为一种潜在的生物标记来检测人受有机磷杀虫剂及神经毒剂的危害程度,在本文中利用夹心式酶联免疫分析方法(sELISA)对检测磷酸化的BChE进行检测。通过系统筛选一系列不同源头的抗-丁酰胆碱酯酶抗体,得到一对能特异性结合磷酸化的丁酰胆碱酯酶抗体(抗-BChE)和特异性结合磷酸化的丝氨酸的抗体(抗-Pser)。筛选出的抗-BChE抗体可识别磷酸化及非磷酸化BChE,因此可用于捕获样本中的BChE及OP-BChE。抗-Pser抗体(作为检测抗体)被用来识别OP-BChE复合物。同时使用这两种抗体,优化一些关键成分(例如抗-BChE抗体、抗-Pser抗体和封闭液浓度),可以提高sELISA的灵敏度和选择性。在优化条件下,sELISA有 0.03nM-30nM的线性范围,检测限可达0.03nM。此外,sELISA成功地应用于OP-BChE的体外生物样品检测,例如对大鼠含OP-BChE的血浆具有很好的检测效果(z>99%)。这些结果表明这种新方法展示了酶联免疫试纸盒良好的应用前景,并提供了一种预防和评估有机磷杀虫剂和神经毒剂的简单、廉价的工具。
【英文摘要】A sandwich enzyme-linked immunosorbent assay (sELISA) has been developed for detection of organophosphorylated butyrylcholinesterase (OP-BChE), a potential biomarker for human exposure to organophosphate insecticides and nerve agents. A pair of antibodies specific to OP-BChE adduct were identified through systematic screening of several anti BChE antibodies (anti-BChE) and antiphosphoserine antibodies (anti-Pser) from different sources. The selected anti-BChE (set as capture antibody) antibodies recognize both phosphorylated and nonphosphorylated BChE. These antibodies can therefore be used to capture both BChE and OP-BChE from the sample matrices. The anti-Pser (set as detecting antibody) was used to recognize the OP moiety of OP-BChE adducts. With the combination of the selected antibody pair, several key parameters (such as the concentration of anti-BChE and anti-Pser, and the blocking agent) were optimized to enhance the sensitivity and selectivity of the sELISA. Under the optimal conditions, the sELISA has shown a wide linear range from 0.03nMto 30 nM, with a detectionlimit of 0.03 nM. Furthermore, the sELISA was successfully applied to detect OP-BChE using in vitro biological samples such as rat plasma spiked with OP-BChE with excellent adduct recovery (z > 99%). These results demonstrate that this novel approach holds great promise to develop an ELISA kit and offers a simple and cost-effective tool for screening/evaluating exposure to organophosphate insecticides and nerve agents.

【题目】A novel immunochromatographic electrochemical biosensor for highly sensitive and selective detection of trichloropyridinol, a biomarker of exposure to chlorpyrifos
【中文关键词】免疫层析电化学传感器;生物标记;有机磷杀虫剂;三氯吡啶醇;竞争免疫反应
【英文关键词】Immunochromatographic electrochemical biosensor; Biomarker; Organophosphorus insecticides; Trichloropyridinol; Competitive immunoreaction
【中文摘要】本文提出了一种新颖的便携式免疫层析电化学传感器(IEB)用于简单、快速、灵敏地检测三氯吡啶醇(TCP),TCP是有机磷杀虫剂的一种代谢性生物标记物。这种新方法利用免疫层析试纸条来完成快速竞争免疫反应,捕获的HRP标记物通过一次性丝网印刷碳电极用电化学手段来完成快速、灵敏检测。一些关键的实验参数(例如免疫反应时间,标记TCP的HRP的量,电化学检测的底物浓度以及硝酸纤维素膜的封闭物)都经过优化以提高灵敏度、选择性和稳定性。在最佳优化条件下,IEB有一个较宽的线性范围(0.1-100ng/ml),检测限达0.1ng/ml TCP。此外,IEB已被成功应用于生物监测接触过有机磷杀虫剂如毒死蜱(CPF-oxon)的老鼠血浆样品中的TCP。因此,IEB为设计能简单、快速、应用于临床定量检测TCP的工具提供了新思路,同时,为人类接触有机磷杀虫剂后筛选代谢生物标记如TCP预示了良好的前景。
【英文摘要】We present a novel portable immunochromatographic electrochemical biosensor (IEB) for simple, rapid, and sensitive biomonitoring of trichloropyridinol (TCP), a metabolite biomarker of exposure to organophosphorus insecticides. Our new approach takes the advantage of immunochromatographic test strip for a rapid competitive immunoreaction and a disposable screen-printed carbon electrode for a rapid and sensitive electrochemical analysis of captured HRP labeling. Several key experimental parameters (e.g. immunoreaction time, the amount of HRP labeled TCP, concentration of the substrate for electrochemical measurements, and the blocking agents for the nitrocellulose membrane) were optimized to achieve a high sensitivity, selectivity and stability. Under optimal conditions, the IEB has demonstrated a wide linear range (0.1 – 100 ng/ml) with a detection limit as low as 0.1 ng/ml TCP. Furthermore, the IEB has been successfully applied for biomonitoring of TCP in the rat plasma samples with in vivo exposure to organophosphorus insecticides like Chlorpyrifos-oxon (CPF-oxon). The IEB thus opens up new pathways for designing a simple, rapid, clinically accurate, and quantitative tool for TCP detection, as well as holds a great promise for in-field screening of metabolite biomarkers, e.g., TCP, for humans exposed to organophosphorus insecticides.

【题目】Development of an immunochromatographic assay for the rapid detection of chlorpyrifos-methyl in water samples
【中文关键词】甲基毒死蜱;胶体金免疫层析;胶体金一步性试纸条检测;农药残留

【英文关键词】Chlorpyrifos-methyl;Gold immunochromatographic assay;Colloidal gold One-step strip test;Pesticide residue
【中文摘要】一种用胶体金-抗体复合物探针快速(少于10分钟)、定性和半定量免疫层析技术被成功地开发并应用于检测水样中的甲基毒死蜱(一种广谱型有机磷农药)。用免疫层析的方法定性检测甲基毒死蜱的浓度为0.6g/ml。在半定量实验中,检测甲基毒死蜱的结果用读条仪读数,然后得到代表扫描数据平均数的检测曲线。经转换后,我们观察到在50-12150ng/ml范围内,图上logit(B/B0)和甲基毒死蜱的对数浓度有线性关系,获得线性方程(y= − 2.5229x + 7.5951, R2 = 0.9889)和IC50值(1024.39 ng/ml)。同时,通过B0-2SD外推法算出检测限为132.91ng/ml。此外,用类似复合物检测发现交叉反应率小于1%,可以忽略不计。向水样中加标准甲基毒死蜱,其检出率为102.5-107.6%。总之,据我们所知,这是第一次报道用免疫层析法定性及半定量检测甲基毒死蜱。
【英文摘要】A rapid (less than 10 min), qualitative and semi-quantitative immunochromatography using colloidal gold-antibody probe was successfully developed and applied in determination of chlorpyrifos-methyl (a wide-spectrum organophosphorus pesticide) in water samples. The qualitative detection limit of chlorpyrifos-methyl was determined as 0.6_gml − 1 by using immunochromatography. In the semiquantitative experiment, the detection results of chlorpyrifos-methyl were scanned by a membrane strip reader, and a detection curve representing the scanned data average was obtained. After conversion, it was observed that in the range of 50 – 12,150 ng ml − 1, the graph between logit(B/B0) and logarithm of concentration of chlorpyrifos-methyl was linear, from which, the regression equation (y = − 2.5229x + 7.5951, R2 = 0.9889) and IC50 value (1024.39 ng ml − 1) was obtained, respectively. Meanwhile, the detection limit was calculated as 132.91 ng ml − 1 by the extrapolation of B0 − 2SD. In addition, the cross-reactivities were less than 1% with tested analog compounds and regarded as negligible. The recoveries obtained by standard chlorpyrifos-methyl addition to water samples were 102.5 – 107.6%. Overall, to our knowledge, this is the first report of qualitative and semi-quantitative detection of chlorpyrifos-methyl by immunochromatography.

【题目】Development of a specific enzyme-linked immunosorbent assay (ELISA) for the analysis of the organophosphorous pesticide fenthion in real samples based on monoclonal antibody
【中文关键词】抗体;包被-半抗原复合物;交叉反应;酶联免疫吸附反应;单克隆抗体
【英文关键词】Antibody;coating-hapten combination; Cross reactivity; ELISA; Monoclonal antibody
【中文摘要】根据之前的研究,我们获得了一种新的特异性针对有机磷农药——倍硫磷的单克隆抗体。基于新的免疫/包被半抗原复合物,我们研发了一种灵敏地、特异性针对倍硫磷酶联免疫吸附反应。在本研究中,裸露芳香烃环的H1与牛血清蛋白(BSA)偶联成免疫原。所有的半抗原都与卵清蛋白(OVA)偶联成包被原。筛选出有效价的抗体/包被原复合物,并优化ELISA条件。在优化条件下,IC50值为5.8ng/ml,检测限IC20值为0.028ng/ml。与其他监测点农药的交叉反应率小于0.5%。此外,该系统还可检测实际样品如土壤、水、水稻和大白菜中的倍硫磷。
【英文摘要】A new specific monoclonal antibody against the organophosphorous pesticide fenthion was produced based on our previous study. A sensitive and specific Enzyme-Linked Immunosorbent Assay (ELISA) for fenthion based on the new immunizing/coating hapten combination was developed. In this study, the H1 which attempts to expose the aromatic ring group was conjugated with bovine serum albumin (BSA) for the immunogen. All of the haptens that have been synthesized were conjugated with ovalbumin (OVA) for the coating antigen. The efficient antibody/coating conjugated combinations were selected, and the optimized ELISA was developed. In the optimized system, the IC50 value was 5.8 ng _mL_1 with the detection limit (IC20) of 0.028 ng _mL_1. The cross reactivity with all of the tested pesticides was lower than the 0.5%. Also, the system can detect the fenthion addition to the real samples such as soil, water, rice, and Chinese cabbages.

【题目】Selective sample cleanup by immunoaffinity chromatography for determination of fenvalerate in vegetables
【中文关键词】免疫亲和色谱;氰戊菊酯;蔬菜;气相色谱
【英文关键词】Immunoaffinity chromatography;Fenvalerate;Vegetables;Gas chromatography (GC)
【中文摘要】本文建立了一种选择性捕获蔬菜样品中氰戊菊酯的免疫亲和色谱。该免疫亲和色谱柱采用溴化氰活化的琼脂糖凝胶4B和氰戊菊酯单克隆抗体共价偶联并填入柱中制成。提取条件优化包括上样、淋洗和洗脱缓冲液。该色谱柱采用优化条件最大柱容量可达4000ng,平均回收率94.5%,6支免疫亲和柱分别在6天测定,其RSD值为8.8%。该免疫亲和柱和和气相色谱-电子捕获器方式联用,检测添加了4种不同浓度的3种蔬菜样品,提取回收率和RSD分别为74.7-96.5%和2.5-5.2%,整个方法经计算检测限为0.008-0.012 ng g − 1。
【英文摘要】This paper describes the establishment of an immunoaffinity chromatography (IAC) for selective extraction of fenvalerate from vegetable samples. The IAC column was constructed by covalently coupling monoclonal antibody (mAb) against fenvalerate to CNBr-activated Sepharose 4B and packed into a cartridge. The extraction conditions were carefully optimized, including loading, washing and eluting solutions. Under the optimal conditions, the IAC column was able to capture fenvalerate with the maximum capacity of 4000 ng. An average recovery of 94.5% and a RSD of 8.8% were obtained with six IAC columns prepared on six different days. Three vegetable samples spiked with fenvalerate at four different concentrations were extracted with IAC column and determined by gas chromatography with electron capture detection (GC – ECD). Chromatograms of final extracts were clean and fenvalerate could be easily detected without the interferences. The extraction recoveries and RSD were 74.7 – 96.5% and 2.5 – 5.2%, respectively, and the calculated limit of detection of the whole method was 0.008 – 0.012 ng g − 1.

【题目】Development of a Monoclonal Antibody-Based Enzyme Immunoassay for the Pyrethroid Insecticide Deltamethrin
【中文关键词】拟除虫菊酯类农残;溴氰菊酯;半抗原;单克隆抗体;酶免疫分析
【英文关键词】Pyrethroid insecticide; deltamethrin; hapten; monoclonal antibody; enzyme immunoassay (EIA)
【中文摘要】采用选择性半固体干细胞培养基,筛选出了4株阳性单克隆杂交瘤细胞株2B12, 2C1, 2F1, 和3D4,并制备出相应的抗拟除虫菊酯杀虫剂溴氰菊酯的单克隆抗体。这些单克隆抗体的I50值在17-94 ng mL-1范围内,并选择其中I50值最小的抗体2B12优化建立了ELISA方法。建立的ELISA法I50为17.0±3.3 ng mL-1,检测限为1.2 ± 1.3 ng mL-1,与其他供试拟除虫菊酯及其代谢物的无交叉反应或交叉反应很小。为了验证该分析方法,采用该ELISA方法和GC方法同时测定了添加了溴氰菊酯的环境水样品,ELISA法回收率为82-117%,接近GC方法(94-103%)。这些结果表明,基于单克隆抗体2B12建立的ELISA方法可满足环境水样品中溴氰菊酯的快速灵敏的检测。
【英文摘要】With a screening hemisolid stem-cell culture, four positive hybridomas 2B12, 2C1, 2F1, and 3D4 were screened and used to prepare four correspondent monoclonal antibodies (McAbs) against the pyrethroid insecticide deltamethrin. These McAbs showed I50 values in a range of 17-94 ng mL-1, from among which the antibody 2B12 with the lowest I50 value was selected to develop an optimized enzyme-linked immunosorbent assay (ELISA). In the developed ELISA, the I50 of deltamethrin was 17.0±3.3 ng mL-1 and the limit of detection (LOD) was 1.2 ± 1.3 ng mL-1. There seemed to be little or no cross-reactivity with other tested pyrethroids and their metabolites. For validation of the assay method, environmental water samples fortified with deltamethrin were analyzed with the ELISA and gas chromatography (GC) methods. The recoveries of the developed ELISA ranged from 82 to 117%, which were close to those of the GC method (94-103%). These results suggested that the developed ELISA based on the McAb 2B12 could be used for the rapid and sensitive determination of deltamethrin in environmental water.

【题目】Development of indirect competitive immunoassay for highly sensitive determination of ractopamine in pork liver samples based on surface plasmonresonance sensor
【中文关键词】表面等离子体共振,莱克多巴胺,免疫传感器,间接竞争分析,条件优化
【英文关键词】Surface plasmon resonance Ractopamine Immunosensor Indirect competitive assay Condition optimization
【中文摘要】在这项工作中,我们展示了发展的一个高灵敏度和高选择性的表面等离激元传感器检测猪肝样品莱克多巴胺(RCT),灵敏度低至0.12 ppb。RCT是一种肾上腺素能受体激动剂,它带有N-烷基苯基的取代基,开发的高性能检测方法RCT是一个关键的问题,因为RCT在人体代谢的重要作用。为了构建免疫传感器的系统,在生物传感器的表面形成由固定的莱克多巴胺 - 卵清蛋白(RCT-OVA)共轭体结合 上的Au-硫醇盐的自组装的SPR传感器芯片,通过共价酰胺结合途径,并基于间接竞争抑制原进行检测。优化的条件可影响免疫敏感性,包括固定缓冲液,免疫结合缓冲,RCT-OVA浓度,抗体浓度,活化时间,再生缓冲液等方式,以确定最佳的抗体浓度,并与其他报告的研究进行比较。在最佳条件下,该传感器具有线性检测范围为0.28-4.29ng/ml,检测限为0.12ng/mL,IC50为1.17ng/ml。与其他的研究报告相比,它进一步提高了SPR检测RCT灵敏性。
【英文摘要】In this work, we demonstrate the development of a highly sensitive and selective surface plasmon res-onance (SPR) immunosensor for label-free detection of ractopamine (RCT) as low as 0.12 ppb (ng mL − 1) direct from pork liver samples. RCT is a kind of the -adrenergic agonist with N-alkylphenyl substituent,and the development of high performance sensing methods for RCT is a critical issue because of its vital role in human metabolism. To construct the immunosensor system, the biosensor surface was formed by immobilization of ractopamine – ovalbumin (RCT – OVA) conjugate onto an Au-thiolate self-assembled SPR sensor chip by covalent amide binding, and the detection of RCT was performed based on indirect competitive inhibition principle. Detailed works were arried out focusing on optimizing the conditions that affect immunosensitivity, including immobilization buffer, immunobinding buffer, RCT – OVA concentration, antibody concentration, activation time, regeneration buffer, etc. A preferable way to determine the optimal antibody concentration was performed comparing with that used in most other reported researches. Under the optimal conditions, the biosensor exhibits a linear detection range of 0.28 – 4.29 ng mL − 1, LOD of 0.12 ng mL − 1 and IC50 of 1.17 ng mL − 1. It improved that the developed SPR immunosensor is more sensitive for detection of RCT against other reported ones.

【题目】Simultaneous detection of five antibiotics in milk by high-throughput suspension array technology
【中文关键词】悬浮阵列,xMAP,抗生素,牛奶
【英文关键词】Suspension array xMAP Antibiotics Milk
【中文摘要】同时定量测定抗生素泰乐菌素,四环素,庆大霉素,链霉素,氯霉素牛奶中提出了一个新的悬浮阵列技术。一种新颖的处理牛奶样品用二乙醚的悬浮阵列进行,这大大降低了干扰组分在牛奶上的反应结果,检测灵敏度没有明显影响。相比,使用生物素标记的单克隆抗体,使用二次抗体 - 生物素使检测灵敏度进一步提高。泰乐菌素,四环素,庆大霉素,链霉素,和氯霉素的样品中,最低检测浓度分别为0.3, 1.5 , 4 , 20 ,和25毫微克/毫升,分别和样品的工作范围分别为6-400 , 7-300 ,8 -200, 90-3000和70-8000 ng / ml时,分别。平均回收率为89.38-113.73 % , 6.62% ,标准差之内。的悬浮液测定技术是强大的多抗生素残留的牛奶中的快速定量分析。
【英文摘要】A new suspension array technology is proposed for the simultaneous quantitative determination of five antibiotics—tylosin, tetracycline, gentamicin, streptomycin, and chloramphenicol in milk. A novel treatment of milk samples for suspension array with diethyl ether was performed which greatly reduced the interference of the disturbing components in milk on the reaction results with no significant effecton detection sensitivity. Compared with using biotin labeled monoclonal antibody, using of secondary antibody – biotin make the detection sensitivity further improved. The minimum detectable concentration in samples of tylosin, tetracycline, gentamicin, streptomycin, and chloramphenicol were 0.3, 1.5, 4, 20,and 25 ng/ml, respectively, and the working ranges of samples were 6 – 400, 7 – 300, 8 – 200, 90 – 3000 and 70 – 8000 ng/ml, respectively. The mean recovery was 89.38 – 113.73% with a standard deviation within 6.62%. The suspension assay technology is powerful for the fast quantitative analysis of multi-antibiotics residue in milk.

【题目】Simultaneous Detection of Eight Food Allergens Using Optical Thin-Film Biosensor Chips
【中文关键词】食品过敏源,可是薄膜生物传感器芯片,PCR,检测
【英文关键词】food allergen, optical thin-film biosensor chip, PCR, detection
【中文摘要】如今,食物过敏是重要的食品安全问题。为保证过敏的人的安全,许多国家要求食品贴标签注明并且要求可靠和有效的检测方法。本文报道了一种新的方法,通过使用硅为基础的光学薄膜与生物传感器芯片可感知颜色的变化的结果,没有任何额外设备的情况下通过肉眼对食物过敏的快速鉴定。整个系统可以同时检测到8个食物过敏原包括大豆,小麦,花生,腰果,虾,鱼,牛肉和鸡肉。这种方法检出的腰果DNA的绝对检出限为0.5 pg,实际检出限是0.001%。生物传感器芯片在PCR扩增后检测时间约30分钟,这种分析方法作为一种敏感,特异,随时可以应用的工具用来检测8种过敏原是否存在。
【英文摘要】Food allergies are important food safety issues nowadays. To maintain the safety of people who experience allergic reactions, labeling is required in many countries and efficient and reliable detection methods are necessary. This paper reports a novel method for the rapid identification of food allergens through the use of a silicon-based optical thin-film biosensor chip with which color change results can be perceived by the naked eye without any extra equipment. The whole system can detect eight food allergens including soybean, wheat, peanut, cashew, shrimp, fish, beef, and chicken simultaneously. Sensitive and specific detection of the absolute detection limit of this method was 0.5 pg of cashew DNA, and the practical detection limit of 0.001%. The biosensor chip detection time was about 30 min after PCR amplification. The assay is proposed as a sensitive, specific, high-throughput, and ready-to-use analytical tool to detect the presence or confirm the absence of eight food allergens.

【题目】超高产夏玉米养分限制因子及养分吸收积累规律研究
【中文关键词】超高产; 夏玉米; 养分限制因子; 养分积累; 养分回收率
【英文关键词】super 2high2yield; summer maize; nutrient res trictive factor; yield; nutrient accumulation; nut rient recovery rate
【中文摘要】2007年和 2008年通过大田试验研究了超高产夏玉米养分限制因子和植株养分吸收积累规律。结果表明:用 ASI法推荐的氮、 磷、 钾平衡施肥产量最高, 分别达到 12051 12 kg/ hm2和 13246 13 kg/ hm2, 施用氮肥平均增产8 192%,钾肥平均增产 7 114%,增产效果显著,氮和钾为超高产夏玉米养分主要限制因子。超高产夏玉米植株体内氮、 磷、 钾的积累量均随生育期的延长而增加,到成熟期达到最大值,养分积累量的大小顺序为氮> 钾> 磷,每生产100 kg 经济产量吸收养分比例 NBP2O5BK2O为 2 1 40B1B2 173。拔节期至吐丝期是养分吸收的关键时期,养分吸收速率大, 积累量高,吐丝后植株仍能吸收较多的氮、 磷。从出苗到吐丝期, 叶片是氮、 磷的分配中心, 生育后期茎叶中氮、 磷的转运率较高, 而钾转移比例较小。超高产夏玉米整个生育期能持续吸收养分,吐丝后适当追肥保证灌浆期养分充足供应对夏玉米超高产至关重要。
【英文摘要】A field experiment was conducted to study soi l nutrient res trictive factors and plant nutrient uptake and accu2mulation of super2high2yield summer maize in 2007 and 20081 The resul ts show that the maize yields are highes t underthe OPT treatment (B y ASI) , 1205112 kg/ ha and 1324613 kg/ ha in 2007 and 2008 respect ively. The ni trogen andpotas sium fertilization could evidently increase the yields by 8192% and 7114% , which indicates N and K are main nu2trient res trictive factors. The accumulations of ni trogen, phosphorus and potassium of super2high2yield summer maizeplants are increasedwith the e xtension of the bearing period, and

the nutrient accumulation amounts are ma ximum at thematuri ty sta ge. The order of nutrient accumulations is K2O> N> P2O5, and the absorbed nut rient ratiowi th 100 kilogrammaize of N, P2O5 and K2O are 2140B 1B21731 The key period of nutrient absorpt ion is from the jointing stage to silkingstage, and the absorbed nutrient rates are the highest. After the silking stage, maize plant absorbs more ni trogen andphosphorus. Leaf is distribut ion center of nitrogen and phosphorus from the seeding s tage to silking stage, and the transferef ficiency of ni trogen and phosphorus are higher in stems and leaves at the late stages, whi le the trans fer proportion ofpotas sium is smal l. Nutrients are absorbed continuously at the whole growth period of super 2high 2yield summer maize, i tis essent ial to super 2high2yield topdressing after the silking stage that ensure adequate nutrients at the grain fi lling s tage.

【题目】Optical thin-film biochips for multiplex detection of eight allergens in food
【中文关键词】食物过敏源,可视薄膜生物传感器芯片,PCR,检测
【英文关键词】food allergen, optical thin-film biosensor chip, PCR, detection
【中文摘要】一个创新的食物过敏原的快速检测方法被开发和验证。在这里,我们报道了在两个四聚体基础上同时检测8种食物过敏原,包括芹菜,杏仁,燕麦,芝麻,芥末,羽扇豆,核桃和榛子这种基于硅的光学的薄膜生物芯片技术的发展。生物芯片检测时间在PCR扩后增约30分钟。简要地说,光学薄膜生物芯片检测的PCR片段的目标的存在下,通过酶促转化形成的核酸杂交分子薄膜。由薄膜提供的质量改变的生物芯片表面上的光的干涉形状,从而导致在芯片的表面上的一个可见的颜色变化。因此,这种方法可以敏感、特异的检测食品中的过敏原。
【英文摘要】An innovative method for the rapid detection of food allergens is developed and validated. Here we reported the development of silicon-based optical thin-film biochip technology that simultaneously permits visible detection of eight food allergens including celery, almond, oat, sesame, mustard, lupine, walnut and hazelnut on the basis of two tetraplex PCR systems. The biochip detection time was about 30 min after PCR amplification. Briefly, the optical thin-film biochip detects the presence of PCR fragment targets by enzymatically converting the formation of nucleic acid hybrids to molecular thin films. The mass contributed by the thin film alters the interference pattern of light on the biochip surface, resulting in a visible color change on the chip surface. Therefore, this assay permits sensitive, specific and high-throughput detection of allergens in food samples.

【题目】Development of Gold Nanoparticle-Based Rapid Detection Kit for Melamine in Milk Products
【中文关键词】三聚氰胺,金纳米粒,快速检测
【英文关键词】melamine (Mel), gold nanoparticles (Au NPs), rapid detection kit
【中文摘要】一个可靠的和敏感的三聚氰胺(MEL)的快速检测试剂盒的开发。该套件基于纳米金(金NP)探针,并包括一个标准比色卡。金奈米粒子的制备硼氢化钠减少和其特征在于通过透射电子显微镜,它揭示了粒径约5nm 。聚集动力学,交叉反应性,抗干扰性,和样品预处理方面的试剂盒的性能进行了研究。该标准比色卡制作了一系列的标准梅尔加标牛奶的5纳米金粒子发生反应的色差。该试剂盒的工作范围是1 120 mg / L时,其性能是明显更快速和可靠的比较,与标准比色卡。为1 mg / L的梅尔牛奶中,只有大约10分钟,包括样品前处理中的分析,可确定。该试剂盒可在室温下贮存一年。样品检测试剂盒,得到高性能液相色谱/质谱法通过以下方式获得的结果接近。因此,该工具包是适用于定性和半定量的现场检测,以及不借助任何仪器仪表肉眼检查。
【英文摘要】A reliable and sensitive kit for the rapid detection of melamine (Mel) was developed. The kit is based on gold nanoparticle (Au NP) probe and includes a standard colorimetric card. The Au NPs were prepared by sodium borohydridereduction and characterized by transmission electron microscopy, which revealed particle sizes of approximately 5 nm. The performance of the kit in terms of aggregation kinetics, cross-reactivity, anti-interference, and sample pretreatment was investigated. The standard colorimetric card was then fabricated by chromatic aberration of a series of standard Mel-spiked milk reacts with the 5 nm Au NPs. The

working range of the kit is 1 120 mg/L, and its performance is visibly more rapid and reliable by comparisonwith the standard colorimetric card. As low as 1 mg/L of Mel levels in milk can be determined, with the assay taking only about 10 min, including sample pretreatment. The kit can be stored for a year at room temperature. Samples were also detected by the kit, yielding results close to those obtained by high-performance liquid chromatography/mass spectrometry. Thus, the kit is applicable to qualitative and semiquantitative fi eld detection, as well as naked-eye screening without the aid of any instrumentation.

【英文关键词】Winter wheat;Yield;Nitrogen recovery rate;Nitrogen absorption efficiency;Nitrogen harves/index:
Soil nitrogen dependence rat
【中文摘要】为确定 高产冬小麦生产过程 中氮肥 的合理施用 时期及 比例,实现氮肥 资源高效 利用。采用 田间试验方法,研究 了豫北超高产 田总施 氮量 240 kg/hm。条件 下,不 同氮肥运筹 模式对 冬小麦产量 、 地 上部氮 素吸收 与积累及 氮素 效率 的影响。结果表 明,同一施氮量下,与氮肥 全部基 施处理相 比,氮肥 分次施用 可增加冬 小麦产量 、 氮素积累量,提 高氮素 回收率 、 农 学效率 、 吸收效率 和收获指数,降低土壤氮素依存率,其 中 N3处理最佳 。冬小麦返青期前对 氮的积 累量约 占总积累量 的 9.4%~11.2%,返青期后 对氮的需求量 大,返青至 灌浆期 可吸 收氮素 63.3%~66.6%,灌浆 期 后可吸收氮素 23.5%~25.9%;N 3处理植株 各生育阶段氮积 累量 较高 。氮肥 1/3底 施 +1/3返青期追施 +1/3拔 节 期追施是本试验条件下兼顾小麦产量及 氮素效率 的最佳运筹方式 。
【英文摘要】The objectives of this study were to determine the reasonable nitrogen applying regimes for profitable yields and high efficient nitrogen utilization in high yield winter wheat production. Field experiments were conducted to investigate the effects of nitrogen application at different stages and rates on grain yield, nitrogen accumulate and nitrogen efficiency of winter wheat in north Henan super high yield field with the total pure N 240 kg/ha. The results showed that compared with the total nitrogen fertilizer basal dressing, grain yield of winter wheat, the amount of nitro- gen accumulation, nitrogen recovery rate, nitrogen agronomic efficiency, nitrogen absorption efficiency, nitrogen harvest index of nitrogen fertilizer were increased with mult-application of nitrogen fertilizer at the same amount of nitrogen, but soil nitrogen dependence rate was decreased. Percentage of nitrogen accumulation in winter wheat plants until greening stage to total nitrogen accumulation in whole growth stage was 9.4%一1 1.2%. After greening stage winter wheat demanded more nitrogen, nitrogen absorbed by plant from greening to filling stage and after filling stage aceoun— ted for 63.3%一66.6% and 23.5%一25.9%. respectively. Under the condition of this experiment. as far as grain yield, nitrogen fertilizer use efficiency and the amount of nitrogen accumulation in plant were concerned, 1/3 nitrogen fertilizer basal dressing, 1/3 nitrogen fertilizer top dressing at greening stage and 1/3 nitrogen fertilizer top dressing at jointing stage was the best nitrogen application mode1

【题目】草原生态旅游非物质文化遗产资源的保护性开发研究
【中文关键词】非物质文化遗产; 草原; 生态旅游; 资源; 保护; 开发;
【英文关键词】Intangible Cultural Heritage; grassland; ecotourism; resources; protection; exploring;
【中文摘要】非物质文化遗产是十分重要的草原生态旅游资源。发挥非物质文化遗产资源优势,将草原生态旅游做出特色,是草原地区尤其是西部地区各级党委、政府着力探索与实践的重要课题。草原生态旅游开发对非物质文化遗产保护既有积极作用,也有消极影响。如何实现非物质文化遗产保护和旅游开发的双赢成为社会关注的热点。从分析非物质文化遗产资源对发展草原生态旅游的可行性、必要性入手,论述了保护性开发利用非物质文化遗产资源对提升草原生态旅游的积极意义及开发策略。 更多还原
【英文摘要】Intangible Cultural Heritage is abundant in China,especially in the minority area,which also is a kind of very important grassland ecotourism resource.It is an essential research project for the Western Governments of China to take advantage of the Minority Intangible Cultural Heritage and build grassland tourism stronger and more characteristic.The development of grassland tourism and Intangible Cultural Heritage protection are the major task in modern society,but the two of them are opposite and uniform in some measure.Tourism development not only has positive effects but also negative effects on Intangible Cultural Heritage.The government and society should pay attention to this problem,enhance understanding and manage in a scientific way,so that Intangible Cultural Heritage conservation and tourism development achieve a double-win situation.Based on the necessity and feasibility of the Intangible Cultural Heritage for grassland tourism developing,We discussed the positive significance and approach to increase grassland tourism by protective developing and utilizing the Intangible Cultural Heritage resources.

【题目】呼伦贝尔沙化草地人工固沙植物种间生态位关系研究
【中文关键词】呼伦贝尔; 人工固沙植物; 生态位;
【英文关键词】Hulunbeir; Artificial sand-fixation plants; Niche;
【中文摘要】采用样方法对呼伦贝尔地区沙化草地不同恢复年限人工播种固沙区进行调查,并计算其主要植物的重要值、生态位体积及生态位重叠值,以研究呼伦贝尔沙化草地人工固沙植物群落特征及演替状况。结果表明:人工固沙植物冰草(Agropyron pectinatum(Bieb.)Beauv.)的平均生态位体积在时间尺度上,呈持续增加趋势,是改良沙化草地的优良草种;小麦(Triticum aestivumL.)与小叶锦鸡儿(Caragana microphyllaLam.)、冰草与羊柴(Hedysa-rum laeveMaxim)生态位重叠值为0.9213和0.7512,在演替过程中具较强的竞争作用。自然恢复植物与人工播种植物间,多数生态位重叠值不高。自然恢复多年生植物大针茅(Stipa grandisP.Smirn.)、糙隐子草(C1eistogenessquarrosa(Trin.)Keng)等逐渐出现,表明该地区植被群落结构向稳定共存的人工-天然植被群落结构方向发展。 更多还原
【英文摘要】It is necessary to study on plant community condition and its succession in artificial sand-fixation plants in order to restore grassland productivity and maintain sustained and steady development of artificial vegetation community in Hulunbeir desertification grassland.The method adopted in this paper was to survey the artificial sand-fixing areas of Hulunbeir desertification grasslands with different recovery periods(1,3,4,and 5 years) and the important value,ecological volume,and niche overlap of main plant species were calculated.The results show that Agropyron pectinatum(Bieb.) Beauv.was the dominance species for the improvement of desertification grassland in this area and its average niche volume presented a continually increasing trend along with temporal scale.The niche overlap value was 0.9213 between Triticum aestivum L.and Caragana microphylla Lam.and 0.7512 between A.pectinatum and Hedysarum laeve Maxim indicating they had strong competitive capacities in community succession.But the niche overlap values between the nature resume plants and artificially seeded plants were not high.The gradual appearances of C1eistogenes squarrosa(Trin.) Keng and Stipa grandis P.Smirn.indicate the community of this area was stably developing to a coexisted artificial-natural state

【题目】温度变化下两种冰草种子萌发的动态特征
【中文关键词】种子萌发格局; 发芽率; 发芽指数;
【英文关键词】seed germination; germination rate; germination index;
【中文摘要】种子萌发行为在沙漠植物的持续存在与种群动态中具有关键作用。本研究以沙地广布种米氏冰草和冰草为研究对象,分析温度变化对种子萌发格局的影响。结果表明,米氏冰草和冰草的发芽率均在25°C时最高,且呈单峰连续曲线。在25°C及以上时,米氏冰草的发芽率高于冰草,25°C以下则相反。发芽指数均随培养时间的延长呈降低趋势,米氏冰草萌发持续25 d,冰草持续8~21 d,且发芽指数的格局变化为:前期,冰草显著高于米氏冰草;中期,米氏冰草显著高于冰草;后期,无显著差异;米氏冰草的累积发芽率随培养时间延长呈缓慢增长趋势,冰草的累积发芽率则在萌发初期迅速增长,然后趋于平稳状态。二者的日发芽率高峰都出现在第3天,但米氏冰草的发芽率远远低于冰草。 更多还原
【英文摘要】The germination of seeds is crucial for protecting sandy plant and population dynamics.The research used the wild Agropyron michnoi and cultivated Agropyron cristatum widely distributed in sandy land as research object to study the Dynamic Characteristics of Seed Germination in changing temperature condition.The results indicated that both A.michnoi and A.cristatum had the highest germination rate at 25 °C and an Arabian continuous curve.Over 25 °C,the germination rate of A.michnoi was higher than that of A.cristatum,when it was below 25 °C,the outcome was different.Their germination index was all decreased step by step with the extension of incubation period.Seed germination of A.michnoi extended 25 days,while that of A.cristatum was nearly 22days.Changes of germination index pattern was clearly,in the first-phase A.cristatum was distinctly higher than A.michnoi,when in the mid-time,A.michnoi was significantly greater than A.cristatum,but in the late states,there was no marked difference between the two.Accumulating germination rate of A.michnoi was slowly increasing with the extension of incubation period,while that of A.cristatum was growing fast during the initial period of germination,then stable state was reached.The germination rate for both of them approached a climax at the third day,yet the germination rate of A.michnoi was much lower than that of A.cristatum.

【题目】Sensitive detection of glucose based on gold nanoparticles assisted silver mirror reaction
【中文关键词】葡萄糖,纳米金,银镜反应
【英文关键词】glucose, gold nanoparticles, silver mirror reaction
【中文摘要】我们开发了一个简单的,非酶纳米金(金源)辅助银镜的反应(AuSMR)比色检测葡萄糖。的葡萄糖浓度的线性范围是从0.04毫米至1毫米,并且,可以通过肉眼区分的最低浓度是10纳米。这种方法已被成功地用于检测血清中的葡萄糖。
【英文摘要】We developed a simple, non-enzymatic approach for the colorimetric detection of glucose based on a gold nanoparticles (Au NPs) assisted silver mirror reaction (AuSMR). The linear range of the concentration of glucose is from 0.04 mM to 1 mM, and the lowest concentration that can be distinguished by the naked eye is 10 nM. This approach has been successfully used for detecting glucose in serum.

【题目】Determination of deoxynivalenol in cereals by immunoaf fi nity clean-up and ultra-high performance liquid chromatography tandem mass spectrometry
【中文关键词】脱氧雪腐镰刀菌烯醇,免疫亲和柱,UPLC-MS/MS,谷物
【英文关键词】Deoxynivalenol Immunoaf fi nity column UPLC-MS/MS Cereals
【中文摘要】制备了一种具有新的脱氧雪腐镰刀菌烯醇(DON)单克隆抗体的免疫亲和柱,被用作在分析超高效液相色谱 - 串联质谱(UPLC-MS/MS)DON的谷物之前的清洁工具。发达的IAC清理方法表现出较高的回收率对DON。它们的范围从61%到103%,小麦,大米和小米的日内和日间变化分别低于19 %和17%。柱容量为2.86 lg DON 每毫升凝胶,它维持在高于0.68 lg /毫升的凝胶,使用10次后,在2天的时间间隔。检测限(LOD)和定量限(LOQ)分别为0.3和0.8 lg /公斤。40种中的21种商业谷物样品呈阳性,DON浓度从7到534 lg /公斤。
【英文摘要】An immunoaf fi nity column (IAC) was prepared with a new deoxynivalenol (DON) monoclonal antibody and used as a clean-up tool before ultra-high performance liquid chromatography tandem mass spec-trometry (UPLC-MS/MS) analysis of DON in cereals. The developed IAC clean-up method showed high recoveries for DON. They ranged from 61% to 103% in wheat, rice, and millet with intra-day and inter-day variations below 19% and 17%, respectively. The column capacity was 2.86 lg DON per mL of gel,and it maintained above 0.68 lg/mL of gel after 10 cycles of usage at 2 days intervals. The limit of detection (LOD) and limit of quanti fi cation (LOQ) were 0.3 and 0.8 lg/kg, respectively. Twenty-one out of 40analyzed commercial cereal samples were positive at DON concentrations from 7 to 534 lg/kg

【题目】Simultaneous detection of multiple chemical residues in milk using broad-specificity antibodies in a hybrid immunosorbent assay
【中文关键词】ELIS,FLISA,三聚氰胺,量子点,喹诺酮类,磺胺类
【英文关键词】ELISA, FLISA, Melamine, Quantum dots, Quinolones, Sulfonamides
【中文摘要】在这项研究中,一种新的免疫测定法,同时使用2种类型的传感器(量子点和一种酶),用于检测牛奶中的多个结构不同的分子。荧光酶联免疫吸附测定(吸光度)使用QD605 QD655作为探针,使用辣根过氧化物酶(HRP)标记的第二抗体的酶联免疫吸附试验(ELISA) 。吸光度,用于同时检测6磺胺类药物和11种喹诺酮类药物产生抗 - 磺酰胺和喹诺酮抗广泛的特异性单克隆抗体(MAbs) 。结合的吸光度,用于从相同的奶粉样品中三聚氰胺检测的酶联免疫吸附试验。单克隆抗体的交叉反应性被保留约束力的量子点时,通过使用抗生物素蛋白和二次抗体的桥梁。使用这种混合的免疫测定法,检测限(LOD),喹诺酮类(0.18 ngmL -1) ,磺胺二甲异嘧啶(0.17 ngmL -1)和三聚氰胺(7.5 ngmL -1)分别检测到的牛奶样品。结果表明的综合方法的检出限得比要求的更好,简化了样品的前处理过程。所开发的免疫测定法是适合于高通量筛选的低分子量的污染物。
【英文摘要】In this study, a novel immunoassay using 2 types of sensors (QDs and an enzyme) were simultaneously used for detecting multiple structurally different molecules in milk. The method integrates the fluorescence-linked immunosorbent assay (FLISA) using QD605 and QD655 as probes and an enzymelinked immunosorbent assay (ELISA) using horseradish peroxidase (HRP) labeled secondary antibody. The FLISA was produced by anti-sulfonamide and anti-quinolone broad-specificity monoclonal antibodies (MAbs) for simultaneously detecting 6 sulfonamides and 11 quinolones. Combined with the FLISA, an ELISA was utilized

for detecting melamine from the same milk samples. The cross-reactivity of the MAbs was retained while binding the QDs by using avidin and a secondary antibody as bridges. Milk samples were detected using this hybrid immunoassay, with limits of detection (LOD) of the quinolones (0.18 ngmL − 1), sulfonamides (0.17 ngmL − 1) and melamine (7.5 ngmL − 1), respectively. The results demonstrated that the detection limits of the integrated methods were better than required and simplified the sample pretreatment process. The developed immunoassay is suitable for high-throughput screening of low-molecular weight contaminants.

【题目】Enzyme-linked immunosorbent assay and immunochromatographic strip for rapid detectionof atrazine in water samples
【中文关键词】阿特拉津,ELISA,胶体金,试纸条,水样
【英文关键词】Atrazine . ELISA . Colloidal gold . ICG strip .Water sample
【中文摘要】本研究建立了一种异源直接竞争酶联免疫吸附分析法和一种胶体金免疫层析试纸条法,用来检测水中的阿特拉津除草剂。Elisa法的IC50值为0.12ng/mL,检测限为0.01ng/mL。标品添加在水样品中的平均回收率为96.5%。使用这种ELISA方法检测出的数据与使用高效液相色谱法检测出的数据有很好的对应关系(r2=0.996)。胶体金免疫层析试纸条法的视觉检测限为2ng/mL。检测所需时间为10min,且不需要进行预处理。胶体金免疫层析试纸条法特异性高、灵敏度强、所需时间短,使它很适合水样品中阿特拉津的现场检测。上述两种检测方法都能够以较经济的方式对大量的水样品进行快速检测。
【英文摘要】We have developed a heterologous direct competitiveenzyme-linked immunosorbent assay (ELISA) and a colloidal gold-based immuno- chromatographic (ICG) strip for the determination of the herbicide atrazine in water samples. The ELISA had a half-maximum inhibition concentration(IC50) of 0.12 ng mL − 1 and a limit of detection (LOD,calculated as the IC15 value) of 0.01 ng mL − 1. The average of recoveries for all spiked water samples was 96.5%. There wasa good correlation between the data determined by this ELISA and those obtained by high performance liquid chromatography(HPLC) (r200.996). The visual LOD of the ICG strip assay was 2 ng mL − 1. The assay process only took 10 min, and no sample pretreatment was required. Its high specificity, sensitivity and fast detection made the strip well suited for on-site screening of atrazine in water samples. Both the ELISA and the ICG strip assay are useful for rapid analysis of a large number of water samples at low cost.

【题目】A Biotin – Streptavidin Amplified Enzyme-Linked Immunosorbent Assay with Improved Sensitivity for Rapid Detection of Ractopamine in muscular tissue
【中文关键词】莱克多巴胺,生物素-链霉素亲和素ELISA,非特异性吸附
【英文关键词】Ractopamine.Biotin – streptavidin amplified ELISA . Nonspecific adsorption
【中文摘要】本研究优化并表征了一种生物素-链霉亲和素放大酶联免疫吸附分析法,用来对肌肉组织中残留的莱克多巴胺进行快速检测。使用protein A-Sepharose 4B而后再用BSA-Sepharose 4B亲和层析柱对莱克多巴胺抗体进行纯化后,抗体的敏感性有所提高而背景吸附有所下降。使用0.5%的脱脂乳粉封闭并且用0.5%的BSA/PBS溶液稀释链霉亲和素-辣根过氧化物酶偶联物能够有效地消除生物素-链霉亲和素放大酶联免疫吸附分析法系统中的非特异性吸附。实验所建立的检测方法其IC50值为0.3±0.02 ng/mL,检测限为0.02±0.003 ng/mL,优于之前文献的报道。板间和板内变异系数都小于7%。猪肌肉组织中残留的莱克多巴胺在进行完5倍提取和2倍稀释后,可以在消除基质影响的前提下定量化。猪肌肉组织中的莱克多巴

胺回收率范围为75%到82.75%。结果还与高效液相色谱法进行了对比,并得到了很好的相关性(r2=0.9822)。各项表征显示所建立的生物素-链霉亲和素放大酶联免疫吸附分析法在动物性食品中的莱克多巴胺的快速检测中有很大的应用潜力。
【英文摘要】An effective biotin – streptavidin amplified enzyme-linked immunosorbent assay(BA-ELISA) was optimized and characterized for the rapid detection of Ractopamine(RAC) residue in muscular tissue. Purification of the RAC antiserum by protein A-Sepharose 4B followed with bovine serum albumin (BSA)-Sepharose 4B affinity chromatography enhanced the sensitivity and reduce the background adsorption. Blocking with 0.5% skimmed milk power and diluting streptavidin – HRP conjugates with 0.5% BSA / phosphate-buffered saline (PBS) effectively removethe nonspecific adsorption in biotin – streptavidin amplified ELISA system. The established method allowed RAC determination with an IC50 value of 0.3±0.02 ng ml − 1 and alimit of detection of 0.02±0.003 ng ml − 1, more sensitive than the other reported methods. The variation coefficients of intraassay and inter-assay were all below 7%. RAC residue in pig muscular tissue could be quantified without matrix effects after a 5-fold extraction and 2-fold dilution with PBS. Recoveries of RAC in pig muscular tissue ranged from 75% to 82.75%. The results were also compared with those from HPLC and a good correlation was obtained (r200.9822).The characters show that the established biotin – streptavidin amplified ELISA could be potentially useful in rapid detection of RAC in animal - derived foods.

【题目】半滑舌鳎促滤泡激素受体基因克隆及其在雌鱼生殖周期中的表达
【中文关键词】半滑舌鳎; 促滤泡激素受体; 基因克隆; mRNA 表达; 雌二醇
【英文关键词】null
【中文摘要】通过简并引物扩增及RACE 技术,首次克隆了半滑舌鳎促滤泡激素受体(FSHR) 基因cDNA 全长序列。该基因全长3 105 bp,编码704 个氨基酸,含有典型的跨膜螺旋结构区域(TM helix) ,属于糖蛋白激素受体(GHR) 家族。该基因编码区共有19 个Ser,4 个Thr 和5个Tyr 磷酸化位点; 3 个潜在的N 基端糖基化位点,分别是62NISS,226NGIK 和356NSTS; 441 T为潜在的PKC 位点。基酸序列比对结果表明,半滑舌鳎FSHR 含有GpHR 家族的特殊信号序列,如82CCAF,481ERW,594FTD 和667NPFLY,含有10 个LRRs(LRR1-10) 。组织表达分析表明,FSHR 表达广泛,除在性腺中大量表达外,其他非性腺组织也有表达,尤其以脾、肾、头肾表达最较高。采用125 I 标记放射免疫分析法(RIA) 测定雌鱼血清中E2含量的季节变化,发现4 月时E2含量最低,10 月时含量最高。卵巢中FSHR mRNA 在10 月表达量最高,1 月最低。

【题目】拟除虫菊酯类农药通用人工抗原的合成与鉴定
【中文关键词】拟除虫菊酯;通用人工抗原;合成;鉴定
【英文关键词】pyrethroid insecticide; generic artificial antigen; synthesis; identification
【中文摘要】根据拟除虫菊酯公共结构设计合成一种拟除虫菊酯通用半抗原,所有中间体及半抗原经电喷雾电离质谱(ESI-MS)、红外光谱(IR)和核磁共振(1H NMR)鉴定确定结构。通过活化酯法将通用半抗原与钥孔血蓝蛋白(KLH)偶联制备出免疫原,紫外吸收法鉴定表明免疫原偶联成功,研究为建立拟除虫菊酯多残留免疫分析方法奠定了基础。

【英文摘要】A generic hapten was synthesized based on the common structure of pyrethroid insecticides. All intermediates and hapten were verified by ESI-MS, IR, and 1H NMR spectrometry. By active ester method, the hapten was conjugated with KLH to prepare the immunogen. From the UV ansorption spectroscopy the conjugate were successfully prepared. It is a base for development of multi-residue immunoassay for pyrethroid insecticides detection.

【题目】双抗体夹心ELISA 定量检测牛乳中酪蛋白方法的建立
【中文关键词】夹心ELISA;多克隆抗体;单克隆抗体;酪蛋白
【英文关键词】sandwich ELISA; polyclonal antibody; monoclonal antibody; casein
【中文摘要】实验使用酪蛋白标品为抗原,免疫新西兰大白兔制备抗酪蛋白的多克隆抗体,并免疫BALB/C 小鼠制备抗酪蛋白单克隆抗体,以单克隆抗体包被,HRP 标记多抗,成功地建立了检测牛乳中酪蛋白的双抗体夹心ELISA 法,标准曲线在6~1666 ng/mL 范围内线性良好,r2=0.9949,最低检出限为7 ng/mL,具有很好的特异性。通过建立双抗体夹心ELISA 法测定酪蛋白含量,可为牛乳掺假和食物过敏原的检测及标签管理提供理论及技术基础。
【英文摘要】Casein was used as the antigen to immune the New Zealand rabbits and BALB/C mice respectively in the experiment. The anti -casein polyclonal antibodies and monoclonal antibodies were prepared. The monoclonal antibody was used as the coating antibody, and HRP -polyclonal antibody was retained. The sandwich ELISA to detect the casein of milk was developed successfully, which had a standard curve in the 6~1666 ng/mL range of good linearity with r2=0.9949. The detection limit of the method was 7 ng/mL. The method could be use as a theory and technological base of casein detection of milk adulteration and food allergen test.

【题目】克百威分子印迹聚合物的合成及其性能评价
【中文关键词】克百威; 分子印迹聚合物; 固相萃取; 吸附性能
【英文关键词】carbofuran; molecularly imprinted polymer(MIP); solid phase extraction(SPE);absorption feature
【中文摘要】以克百威为模板分子, 甲基丙烯酸(MAA)为功能单体, 二甲基丙烯酸乙二醇酯(EGDMA) 为交联剂, 采用沉淀聚合的方法制备了克百威分子印迹聚合物。通过红外光谱分析得到模板和功能单体的最佳配比为n(ca rbo furan) :n(MAA) = 1 :6。印迹聚合物的红外光谱测定结果表明, 聚合物中存在与模板分子相互作用的特征基团; 从印迹聚合物的扫描电镜图观察到分子印迹聚合物(M IP)与空白聚合物(NIP)的表面形态不同, 可推论M IP存在与模板分子相互识别的结合位点。通过静态平衡结合法研究了模板分子聚合物的吸附能力、结合动力学和选择特性。结果表明, 与非印迹聚合物相比, 印迹聚合物对克百威具有较强的吸附特性和很好的专一选择性, 3 h后基本达到最大吸附量。采用固相萃取柱预处理样品, 用高效液相色谱法测定自来水中10、50、100 mg /L克百威的加标回收率为94% ~ 117% , 相对标准偏差(n = 3)为2 5% ~ 4 7% 。
【英文摘要】A mo lecu larly imprinted po lymer (M IP) w ith spec ial molecu le recogn ition propert ies for carbo furan w as prepared by prec ipitation po lymerizat ion using carbofuran as temp latemo lecu le, meth-acry lic ac id(MAA) as funct iona lmonomer and ethy lene g lyco ld imethacry late(EGDMA) as the cross-linker. The optim ized ratio w as obtained to be n (carbo furan) n (MAA) = 1 6 by the analysis of in frared spectroscopy. The infrared spectrum of the po lymer a lso ind icated tha t therew ere some char-acteristic groups in theM IP wh ich cou ld interactw ith the template. The SEM graph o f imprinted po l-ymer show ed that the bind ing sites recognized w ith templatemo lecules ex isted in the surface of poly-mer. The template polymer adsorption capacity, b ind ing k inetics and se lectiv ity o fM IP w ere investi-gated by equ ilibrium bind ing experimen.t The resu lts show ed that compared w ith non imprinted poly-mer, imprinted polymer carbo furan show ed strong absorption features and good spec ific ity, and could get themaxmi um adsorpt ive capac ity in 3 h. Thew ater samples spiked at three concentration levels o f10, 50 and 100mg /L carbofuran w ere prepared by so lid phase ex tract ion (SPE) column and determ ined by HPLC w ith recoveries of 94% - 117% and relative standard dev iat ions(n= 3) of 2.5% - 4.7% .

【题目】抗吡虫啉单克隆抗体的制备及鉴定
【中文关键词】吡虫啉,分子模拟,单克隆抗体,酶联免疫吸附法
【英文关键词】imidacloprid, molecular modeling, monoclonal antibodies, ELISA
【中文摘要】为制备灵敏度高,特异性强的抗吡虫啉单克隆抗体,建立经济、快速、准确的吡虫啉残留免疫学分析方法,采用分子模拟技术分析吡虫啉及其类似农药的电荷分布后,选择1-[6-(2-羧乙硫基-3-吡啶)甲基]-N-硝基-2-咪唑啉亚胺(H1)作为免疫半抗原,1-(6-氯-3-吡啶甲基)-3-羧丙基-N-硝基-2-咪唑啉亚胺 (H2) 作为包被半抗原,利用NHS 酯法将H1 和H2 分别与牛血清蛋白 (BSA) 和卵清蛋白 (OVA) 偶联合成免疫原与包被原。免疫BALB/c 小鼠后,采用常规杂交瘤技术共获得2 株稳定分泌抗吡虫啉单克隆抗体的细胞株2F11/A9 和2G6/G12,其分泌的抗体类型分别为IgG3 和IgG1,两细胞株的腹水抗体效价均达到了1∶128 000,IC50 分别为5.3 ng/mL 和28.3 ng/mL,检测限分别为1.1 ng/mL和7.7 ng/mL,两种抗体与6 种吡虫啉的结构类似物均无明显的交叉反应。抗吡虫啉单抗的制备为吡虫啉残留免疫学检测方法的建立及免疫检测产品的研发奠定了基础。
【英文摘要】To produce high-affinity monoclonal antibodies against pesticide imidacloprid, we synthesized the haptens 1-[(6-Carboxylethylthio-3-pyridinyl) methyl] -N-nitro-imidazolidinimine (named as H1) and 1-[(6-Chloro-3-pyridinyl) methyl]-3-carboxylpropyl-N-nitro-2-imidazolidinimine (termed as H2). And then the haptens were coupled to bovine serum albumin (BSA) and ovalbumin (OVA) for immunogen (H1-BSA) and coating antigen (H2-OVA) respectively by NHS ester method. BALB/c mice were immunized with H1-BSA conjugate. We obtained two hybridoma cell lines 2F11/A9 and 2G6/G12 secreting antibody specific for imidacloprid from the conventional hybridoma technology. The result showed that the subtypes of obtained monoclonal antibodies were IgG3 and IgG1, respectively, and the titers of ascites were up to 1:128 000. The indirect competitive ELISA indicated the IC50 values of 5.3 and 28.3 ng/mL with detection limits of 1.1 ng/mL and 7.7 ng/mL, respectively. Two monoclonal antibodies had no apparent cross reactivity with six analogous compounds. Thus, two prepared monoclonal antibodies had a very high affinity and specificity, and it could be used to develop ELISA for rapid determination of imidacloprid residue and laid a solid foundation for research and development of products for immunoassay.

【题目】芥末等8种食物过敏原的多重PCR检测技术
【中文关键词】多重PCR,食物过敏原,检测
【英文关键词】multiplex PCR;food allergens;detection
【中文摘要】依据芥末Sina I 基因、羽扇豆核糖体内转录间隔区(ITS)基因、胡桃Jugr 2基因、榛果Oleosin 基因、芹菜Mtd基因、杏仁Prudu1基因、燕麦Avenin基因和芝麻2S albumin mRNA基因设计的特异性引物序列,在普通PCR方法的基础上,通过2组4重PCR扩增,建立了同时检测芹菜、杏仁、燕麦、芝麻、芥末、羽扇豆、胡桃和榛果等8种食物过敏原的方法。该方法特异性强,灵敏性高,可应用于食品中多种食物过敏原的快速检测和监控。
【英文摘要】Eight pairs of primers were selected according to the sequence of Sin a I gene from mustard,ITS(18S~ 26S) gene from lupine,Jug r 2 gene from walnut,Oleosin gene from hazelnut,Mtd gene from celery,Pru du 1 gene from almond,Avenin gene from oat and 2S albumin mRNA gene from sesame. Two tetraplex PCR assays for simultaneously detection of

celery,almond,oat,sesame,mustard,lupine,walnut and hazelnut were established on the basis of conventional PCR. It could be demonstrated to be a highly sensitive,specific method,which can be applied for rapid detection and monitoring of many kinds of food allergens.

【题目】食品中腰果过敏原成分PCR检测方法建立
【中文关键词】腰果过敏原;PCR;检测;致敏蛋白AnaO
【英文关键词】cashew allergen;PCR;detection;allergen ic protein AnaO
【中文摘要】目的 建立食品中腰果过敏原成分的PCR检测方法。方法 采用溴化十六烷三甲基胺(CTAB) 法和磁珠法提取的坚果DNA,根据GenBank中腰果3种主要致敏蛋白AnaO1、AnaO2、AnaO3的基因序列,设计9对引物;通过扩增效果和特异性,筛选腰果最佳扩增引物对;采用腰果特异性引物对AnaO3 F3R3和植物通用引物对Plant 159,对腰果、杏仁、开心果等13种坚果成分进行双重PCR 扩增,确定方法特异性;通过腰果DNA 梯度稀释确定该检测方法灵敏度;通过样品添加试验模拟食品中腰果过敏原成分的检测。结果 采用CTAB法提取坚果DNA 的A260/A280比值普遍<1.8,说明存在蛋白质污染,采用磁珠法提取DNA的比值>1.8,说明去除蛋白质较干净;9 对引物中,引物对AnaO3 F3R3特异性最好,其最佳退火温度为55. 4 °C;采用该引物与植物通用引物对Plan t 159,对腰果、杏仁、开心果等13种坚果DNA 进行双重PCR,只有腰果样品能扩增出312 bp的特异性条带;采用该PCR法检测腰果过敏原成分的灵敏度为0.1 pg / μ L;可以检出食品中>0. 001% 的腰果成分。结论 建立了一种食品中腰果过敏原成分的双重PCR检测方法,该方法特异性好,灵敏度高,与其他12种坚果不存在交叉反应。
【英文摘要】To develop a PCR method for detection o f cashew allergen in food. M ethods Nut DNA was extracted with alkyltrimethyl ammonium bromide(CTAB) and magnetic microspheres. Nine pairs of primers were designed according to cashew allergenic protein gene sequences from NCB IG enBank and a pair of specific primers was screened out by am plifying results. Thirteen nut samples were determined using double PCR with the cashew specific primer pair AnaO3F3R3 and plant universal primer pair Plant159. The sensitivity of the PCR metho d wa s detected by DNA g radient dilution experiment and the detection of cashew allergen in food was simulated by stimulated sample experiment Results A260 /A280of DNA extracted by CTAB method was lower than 1.8, w

hich meant there was protein contamination. While A260 /A280 of DNA extracted by magntic bead method was higher than 1.8, which meant the protein was cleaned. The specificity of primer pair AnaO3F3R3 was best among the 9 primer pairs and the best anneal temperature was 55.4°C. Double PCR method was established to detect cashew and the other 12 kind s of nuts with primer plant 159 and AnaO3F3R3. Only for cashew the312bp specific band was amplified. The sensitivity of the method was 0.1pg /ul And 0.001% cashew allergen in food could be detected. Conclusion A PCR method for detection of cashew allergen was developed and the method can be used to detect cashew allergen effectively, rapidly, differentially, and sensitively.

【题目】食品中过敏原胡桃蛋白间接竞争ELISA检测方法研究
【中文关键词】过敏原;胡桃总蛋白;ELISA;检测
【英文关键词】Allergen;walnut protein;ELISA;detection
【中文摘要】胡桃是坚果类食品中引起过敏反应的首要食品。采用胡桃总蛋白产生的多克隆抗体,建立检测胡桃成分的间接竞争ELISA方法,并通过特异性试验和样品回收试验对该方法进行验证。结果表明:该方法对胡桃蛋白的定量检测限(LOQ,相当于IC80)为94 ng/mL;在特异性试验中,只有美洲山核桃出现交叉反应,其它植物样品均未出现交叉反应;将50-1000 ng/mL〔相当于10-200 μg/g〕的胡桃蛋白添加到小麦蛋白中,胡桃蛋白的回收率在78%~93%之间。
【英文摘要】Walnut is one of the most common allergenic foods in nuts. In this article, a indirect competitive ELISA was developed to detect walnut protein by using polyclonal antibodies generated against a protein extract of walnut. The method was verified by specific experiments and recovery experiments. The results showed only one cross-reactivity was observed in tests against Pecan and no cross-reactivity was observed in tests against the other plant samples; Walnut protein standard solutions at 94 ng/mL〔inhibition concentration(IC80) of the competitive test were clearly identified by the ELISA; recovery results were generated with blank matrixes spiked at 4 levels from 50 to 1 000 ng/mL (according to 10~200 μg/g) walnut protein, walnut proteins were recovered at 78%~93% from wheat proteins.

【题目】固相萃取-全二维气相色谱/飞行时间质谱同步快速检测蔬菜中64 种农药残留
【中文关键词】全二维气相色谱-飞行时间质谱; 农药残留; 蔬菜
【英文关键词】Comprehensive two-dimensional gas chromatography-time-of-flight mass spectrometry; Multiple pesticide residues; Vegetable
【中文摘要】建立了蔬菜中64 种农药残留固相萃取-全二维气相色谱-飞行时间质谱(GC × GC-TOF-MS) 的测定方法。用乙腈提取样品,NH2-SPE 固相萃取柱净化,甲醇-二氯甲烷溶液(5： 95,V/V) 洗脱,氮气吹扫浓缩,丙酮定容,全二维气相色谱(HP-5MS 柱和DB17ht 柱) -飞行时间质谱检测,基质曲线外标法定量。本方法的检出限(S /N = 3) 和定量限(S /N = 10) 范围分别为0. 010 ~ 6. 032 !g /kg 和0. 035 ~ 20. 107 !g /kg。64 种农药在油菜薹、黄瓜、茄子、四季豆和辣椒中的回收率范围为68. 3% ~ 117. 8%,相对标准偏差为0. 6% ~ 9. 1%。采用本方法检测市场中样品,发现2 例样品中含乙酰甲胺磷和氯氰菊酯残留,测定值分别为0. 036 和0. 107 mg /kg。
【英文摘要】A solid phase extraction-comprehensive two-dimensional gas chromatography coupled with time-offlight mass Spectrometric (GC × GC-TOF-MS) method for analysis of 64 pesticides in vegetables wasdeveloped and validated. After extracting with acetonitrile,cleaning-up with NH2-SPE cartridge and concentrating with nitrogen,the pesticide residues were redissolved in the acetone and analyzed by GC × GC-TOF-MS coupled with HP-5MS and column DB-17 column. Sample matrix-matched calibration was used to determine the residue contents by external standard. The method was validated by the real samples,such as Brassica campestris,cucumber,eggplant,kidney bean and capsicum. The limits of detection (S /N = 3) and the limits of quantification (S /N = 10) were from 0. 010 to 6. 032 !g /kg and from 0.035 to 20. 107 !g /kg,respectively.The overall recoveries ranged from 68.3% to 117. 8% with the relative standard deviations (RSD) of 0.6% - 9.1%.Two positive samples,polluted by acephate and cypermethrin with a residual concentration of 0.036 and 0.107 mg /kg,were screened by the developed method as detecting markets samples.

【题目】己烯雌酚阳离子牛血清白蛋白免疫原的合成及鉴定
【中文关键词】己烯雌酚; 阳离子BSA; 合成; 鉴定
【英文关键词】diethylstilbestrol; cationized BSA; synthesis; identification
【中文摘要】合成免疫原(DES-HS-BSA 和DES-HS-cBSA) , 采用SDS-PAGE 电泳和质谱法对其鉴定, 经动物免疫制备多克隆抗体, ELISA 测定抗体效价和抗体灵敏度。结果成功合成己烯雌酚免疫原, 4 次免疫后, DES-HS-cBSA 组小鼠血清中针对DES-HS的抗体效价(1:12 000) 明显高于DES-HS-BSA 组小鼠(1:4000) ,表明cBSA 能增加与小分子结合时的偶联比, 作为免疫原的载体蛋白能明显提高抗体效价。
【英文摘要】To synthesize cationized bovine serum albumin(cBSA) and to prepare polyclonal ant-ibody, so as to provide technical support for rapid detection of animal food safety.Methods Diethylstilbestrol hemisuccinate(DES-HS) was reconstructed, and immunogen (DES-HS-BSA and DES-HS-cBSA) was synthesized by EDC method. The results were ident ified by mass spectrography and SDS-PAGE, and quant itated by Bradford kit . The polyclonal ant ibody was obtained by animal immunization. ELISA was used to characterize the antibody. Results The immunogens of DES were synthesized successfully. The t itre of DES-HS-cBSA group (1 12 000) was obviously higher than that of DES-HS-BSA group(1:4000) after four times of immunization. Conclusion The conjugation rat io can be increased when cBSA binding to hapten, instead of BSA.The titre of antibody can be improved as cBSA is the carrier protein of immunogen.

【题目】抗噻菌灵单克隆抗体的制备及异源IC-ELISA 检测方法的建立
【中文关键词】噻菌灵; 单克隆抗体; IC-ELISA; HPLC
【英文关键词】thiabendazole; monoclonal antibodies; IC-ELISA; HPLC
【中文摘要】为建立噻菌灵酶免疫检测方法,制备3 种噻菌灵的半抗原(H1、H2 和H3) 。利用活泼酯法制备免疫抗原H1-BSA、H3-BSA 和包被抗原H1-OVA、H2-OVA、H3-OVA。采用杂交瘤细胞融合方法获得4 株稳定分泌抗噻菌灵单克隆抗体的细胞株,分别命名为1-4G9、1-6D3、3-1F9 和3-5D4。采用间接竞争酶联免疫法(IC-ELISA) ,将上述4 株抗体分别与3 种包被抗原进行组合,从中选择出一个最优组合: H3-OVA/1-6D3。据此建立的异源IC-ELISA 检测方法对噻菌灵的IC50为10. 9 μg·L-1,检测限(IC10) 为2. 2 μg·L-1 ,与3 种噻菌灵类似物的交叉反应率均小于0. 1%; 在自来水、苹果、梨的添加回收试验中, ICELISA法测定的回收率依次为95. 9% ~ 118. 1%、90. 0% ~ 117. 6%、74. 9% ~ 95. 6%; HPLC 法测定的回收率依次为92. 7% ~97. 6%、98. 9% ~ 100. 9%、91. 6% ~ 105. 4%,IC-ELISA 法与HPLC 法测定结果基本一致。上述结果表明: 抗噻菌灵单克隆抗体酶免疫检测具有很强的特异性和准确性。
【英文摘要】In order to establish the immunoassay method of thiabendazole,three haptens had been prepared(H1,H2,H3) . The immunogen haptens(H1-BSA,H3-BSA) and coating antigens(H1-OVA,H2-OVA,H3-OVA) were prepared by using the active ester method.Four hybridoma cell lines which secreted monoclonal antibody(McAb) were obtained by cell fusion method. They were designated as 1-4G9,1-6D3,3-1F9 and 3-5D4,respectively. H1-OVA,H2-OVA,H3-OVA as coating antigens were combined with the mentioned four hybridoma cell lines by indirect competitive enzyme-linked immunosorbent assay(IC-ELISA) . Among the combinations,the best one was selected for detailed study: H3-OVA/1-6D3. Based on it,a heterologous IC-ELISA was developed for the determination of thiabendazole,and the detection limits(IC10) and IC50 of thiabendazole were 2.2 μg·L-1 and 10.9 μg·L-1, respectively.The cross-reactivities (CRs) were all less than 0.1% with some analogues of thiabendazole. In recovery test of tap water,apple and pear,the results of ICELISA were in the range of 95. 9%-118. 1%,90. 0%-117. 6%,74. 9%-95. 6%,respectively; the results of HPLC,in the range of 92.7%-97. 6%,98. 9%-100. 9%,91. 6%-105. 4%,respectively. The results of IC-ELISA and HPLC had good consistency. The results showed that the immunoassay of thiabendazole had strong accuracy and specificity.

【题目】基于R语言的中国柑橘主要病虫害空间分布图
【中文关键词】R语言;柑橘;病虫害;空间分布图;地理信息系统
【英文关键词】R—language; Citrus; Disease and pests; Spatial distribution; GIS
【中文摘要】运用R语言的GIS功能包生成了中国柑橘主要病虫害的空间分布图,结果发现:中国柑橘主要病虫害呈现出各种不同的空间分布规律,其形成的原因除了病虫害本身的生物学特性外,还与气候因子的空间规律有关;R语言生成的病虫害空间分布图直观明显,作图质量较佳。
【英文摘要】The spatial distribution maps of the main disease and pest insects on citrus in China were made with GIS packages in R-language. The results indicated that different diseases and pests showed different spatial distribution patterns not only due to their biological characteristics, but also due to the spatial laws of climate factors. R-language-based GIS maps were visually distinct their quality was comparable to that of commercial GIS software.

【题目】滴灌和微喷对核桃耗水量_产量及坚果品质的影响
【中文关键词】核桃;滴灌和微喷;耗水量;产量;品质
【英文关键词】walnut; drip irrigation and micro-sprinkler irrigation; water consumption; yield;quality
【中文摘要】通过大田试验, 采用相同的灌溉制度, 研究了滴灌和微喷两种灌溉方式对成龄核桃树耗水量、产量及坚果品质的影响。试验结果表明:滴灌条件下核桃树在萌芽及开花期、果实膨大期、硬核期及成熟期的平均日耗水强度分别为2. 9 mm、3. 97mm、5. 55mm 及3. 39mm,微喷核桃树的耗水规律与滴灌略有不同,果实膨大期及成熟期稍大; 两者的累积耗水量相同。滴灌的平均水分利用效率比微喷高, 滴灌的产量比微喷高15%。两种灌溉方式下, 滴灌核桃蛋白质含量、出仁率均较微喷高, 其他指标无明显差异。
【英文摘要】Field experiment was conducted to study the effect of drip irrigation and micro- sprinkler irrigation on Water Consumption, Yields and Quality of aged Walnut trees, which used the same irrigation schedule. The experiment results showed: [1] Under the condition of drip irrigation , the average of daily water consumption in blooming stage, fruit accelerated growth stage crust stage and maturity stage were 2.9 mm,3.97mm,5.55mm and 3.39mm respectively. Water consumption of micro-sprinkler irrigation w as different from drip irrigation, but in fruit accelerated growth stage and maturity stage the cumulation of water consumption of both irrigations had no difference. The water use efficiency of drip irrigation w as about 15% higher than micro-sprinkler irrigation. The yield of drip irrigation was higher than that of sprinkler irrigation .Under the condition of two Irrigation methods, the content of protein of drip irrigation w as higher than micro-sprinkler irrigation and a same as the ratio of bared kernel. Other indexes made no difference.

【题目】干旱区幼龄枣树滴灌耗水规律研究
【中文关键词】滴灌; 耗水规律; 幼龄红枣树; 干旱区; 环塔里木盆地
【英文关键词】drip irrigation; consumption law; young jujube trees; arid region; Circum-Tarim Basin
【中文摘要】结合环塔里木盆地干旱区的气象条件, 采用525、450、375 m3/hm2 共三种试验灌水定额, 研究了幼龄红枣树生育期的耗水规律, 并对不同耗水量的枣树产量和水分生产率进行了比较。结果表明: 525、450、375 m3/hm2 三种灌水定额下的耗水量分别为596、503、435 mm。不同处理的耗水量和耗水强度均呈现出盛花期> 幼果期> 初花期> 果实膨大期>成熟期> 萌芽期的耗水规律。耗水量503 mm 处理的产量为506 kg/hm2、水分生产率为1.67kg/m3,均为最优,因此该区适宜的灌水定额为450m3/hm2。
【英文摘要】The paper studies the consumption law of young jujube trees during growing period and compares the output o f jujube trees with different consumption and water productivity by using three irrigation quotas of 525, 450 and 375 m3 /hm2 for test and

considering the meteorological l conditions of arid area of Circum-Ta rim Basin. The outcomes show that the consumption under the above three irrigation quotas is 596, 503 and 435 mm respectively. The water consumption and consumption rate with different treatment show the consumption law of full bloom stage > young fruit stage > initial bloom stag e > expanding period > mature period > germination stage. The output of 503 mm consumption is 506 kg /hm2 and water productivity 1. 67 kg /m3, showing the best.Thus, the suitable irrigation quota of the region is 450m3 /hm2.

【题目】基于模糊_动态聚类法的新疆节水区划探讨
【中文关键词】节水区划;模糊-动态聚类;喷灌区;微灌区
【英文关键词】water-saving district programming ; fuzzy-dynamic clustering; sprinkler irrigat ion area; micro-irrigation area
【中文摘要】农业节水区划是农业水资源高效利用规划和实施的重要依据。根据新疆地理位置、地貌形态、气候特征、缺水程度、灌区类型等指标组成农业节水区划的分区指标体系。采用模糊- 动态聚类法进行节水灌溉分区, 将新疆的节水灌溉工程划分为两级区,4个一级区和10个二级区,作为指导各个灌区节水灌溉实施的参考。
【英文摘要】Agricultural water saving district programming is the important basis for the planning and implementation of high efficient use of water resources. Based on natural and social situation of Xinjiang autonomous region, an index system is built in this paper,which includes location, topography patterns, climatic characteristics, the degree of water shortage, irrigation district type, and so on. The fuzzy-dynamic clustering method is adopted for the water-saving district programming of Xinjiang auto nomous region, which is divided to two grades districts , including 4 grade iv districts and 10 grade districts. These results can be a reference to guide the implementation of water-saving irrigation in each irrigation district.

【题目】基于区域水盐平衡的阿瓦提灌区水土资源优化配置研究
【中文关键词】优化配置; 水土资源; 供需平衡; 水盐平衡模型; 阿瓦提灌区
【英文关键词】optimal allocation; water- soil resources; supply and demand balance; water - salt balance mo del; Awati irrigation area
【中文摘要】为了探讨限额配水条件下阿瓦提灌区水土资源的可持续利用, 根据灌区的现状和规划, 设置了4个方案结合RS、GI S 技术应用水盐平衡模型从区域的四个水平衡(地表水平衡、地下水平衡、供需水平衡、耗水平衡) 和盐平衡等多个角度分析了各个子灌区的水土资源平衡, 并提出优化配置建议。分析表明: 保持现有耕地的情况下, 必须在灌区内因地制宜合理开发利用地下水资源, 与地表水统一调配才能满足该灌区新的水土资源平衡。而且, 还需改善排水, 最好是结合暗管或竖井排水, 才能达到合理的灌排比, 从而满足盐渍化严重农区的排盐要求。由此, 从社会发展和环境保护的角度进一步提出, 恢复弃耕地, 逐年分阶段开发利用已开垦的未耕地, 调整种植结构错开用水高峰, 推广节水灌溉方式降低灌溉定额, 地下水与地表水统一调配、统一管理、统一水价、实施"井灌井排" 措施的干旱内陆区农业水土管理模式。
【英文摘要】In order to explore the sustainable utilization of water - soil resources in Aw at iirrigation area on condition of limited surface water diversion from Akesu river, w e analyzed water- soil resources balance o f sub- irrigation- area from multi- angles of regional four - water- balance (Surface water balance, Ground water balance, Supply and demand water balance, Consumptions water balance) and salt balance. And then, some suggest ions of optimal allocation of water - soil resources w ere put forward.Four projects were set up according to present situation and long- term planning of Aw at iirrigation area.Integrating with RS and GIS, it forecasted the situation of water- salt balance using water- salt balance model. In case of keeping the current situation of farmland, it must exploit and utilize reasonably ground water resources according to local conditions. And, only unified allocation of g round water and surface water can satisfy the new water - soil resources balance in Aw at irrigation area. In order to reach the reasonable ratio of irrigation and drainage to satisfy the requisition of desalination in the farming region of serious soil salinization, it must improve the system of drainage. It is drainage by subsurface pipe or shaf t w ell that is the best measure. And then, considering the social development and the environmental protection, w e carried out some suggest ions of agricultural water- soil resources utilization. There are as follow s: (1) the abandoned farmland must be restored. The uncultivated land which have been reclaimed can be exploited and utilized stage by stage and year by year. (2) It must be adjusted the regional planting structure and popularized easy- operated irrigation technology of water - saving.(3) It realizes that ground water and surface water must be unified- allocation, unified- management, unified- water- price, and so on. And, it adopts the measure of well irrigation and drainage.

【题目】膜下滴灌下土壤水盐动态对棉花根系时空分布特征的影响
【中文关键词】膜下滴灌;根长密度;水盐动态
【英文关键词】mulch drip irrigation; root length density; water salt dynamics
【中文摘要】为讨论在膜滴灌条件下水分和盐分的运移对棉花根系时空分布的影响, 选择淡水和咸水2 个处理, 在其3个不同生育期(蕾期、花铃期和吐絮期) 采集距滴头不同距离和深度上的根系, 并监测各剖面的水分、盐分及地上植株的农艺性状。对其根长密度与地上部分、水分和盐分的运移进行分析, 研究表明根系对水分和盐分的胁迫表现明显, 当土壤体积含水率在20%以上, 电导率在2 000 LS/ cm 以下时可以满足根系的正常生长发育, 根系在这个范围内集中向水分高且盐分低的区域发育。
【英文摘要】To discuss the effect of the movement of water- salt under t he mulch drip irrigation condition on the temporal and spatial distribute of cotton root, two treatments irrigated with fresh water and saline water are chose, and cotton roots in different length and depth in different growing stage (the flower bud stage, flower boll stage and catkin stage) are collected, at the same time, the water content, salt content and agriculture of the cotton are monitored. The result of analysis o f the relations among the root length density, the ground part, the water and salt content shows that the stress of water and salt plays a leading role on the root development, When the volumetric water content of soil is larger than 20% and the electric conductivity is smaller than 2000 Ls/ cm, the root can grow and develop normally, and the root fastens to the concentrate filed with high rate of water and low rate of saltt in this scope.

【题目】农田明渠排水条件下土壤水盐运移规律研究
【中文关键词】水盐运移; 水盐监测; 农田排水
【英文关键词】water salt transportin soil; water salt monitoring ; drainage canal
【中文摘要】土壤水分、盐分、地下水埋深是表征当地土壤质量的重要状态变量, 研究其动态变化过程是研究土壤质量演变规律和赖以防治土壤盐渍化的重要方面。在农田明渠排水条件下, 土壤中发生的各种物理、化学和生物过程尤为复杂。因此通过对农田土壤盐分的定点实时监测, 能够定量表征农田生态环境状况优劣; 地下水位埋深变化, 可警示农田盐渍化的演变, 对调整灌溉定额采取预防措施有指导意义。同时通过实验计算确定了农田斗排的合理间距。
【英文摘要】Soil moisture, salinity, groundwater depth are the important state variable of symptom local soil quality and studying its development change course is mainly concentrated in soil quality changes and its prevention of soil salinization. In farmland drainage condition, the various physical, chemical and biological courses that occur in soil are particularly complex. Therefore, the fixed point and real time monitoring can be able to quantitative characterization of the merits of farmland ecological environment. Groundwater fluctuation can warn development of agricultural field salinization. It can help leader adjust irrigation quota and adopt preventing measures. At the same time, we find the proper interval of drainage canal based on experiment.

【题目】无核白葡萄叶面积及一年生枝条干物质质量简易测定方法研究
【中文关键词】无核白葡萄; 叶面积; 干物质质量; 测定方法
【英文关键词】Thompson seedless grape; leaf area; the mass of dry matter; measuring technique
【中文摘要】葡萄叶面积及地上一年生枝条干物质质量是研究葡萄生长发育状况的重要指标, 但在测定中工作量大而且精度难以保证, 研究旨在取得一种简便、快速、正确估算的简易测定方法。方法利用数理统计与数字成像技术, 对葡萄叶片与枝条进行回归分析, 建立估算的数学方程。 结果 无核白葡萄叶面积与叶长、叶宽、长宽乘积都存在高度的正相关; 一年生枝条干物质质量与枝条长度、叶片数及枝条叶面积也存在较好的相关关系。结论:考虑野外生产实际中测量操作的便利性, 在科研及生产实践中建议采用叶面积与叶脉长的乘幂方程。同时可利用叶面积的累积量代替葡萄树一年生地上枝条干物质量, 可大大简化研究工作量。
【英文摘要】Grape leaf area and the mass of dry matter of one- year branch above the ground are important indexes to study the growth of grape. The problem is that it is hard to guarantee the accuracy of them in the process of measurement due to large quantity of workload. This paper is aimed at finding out an easy, quick and correct way to measure the above mentioned two indexes. Method Mathematical statistics and digital imaging technology have been utilized to conduct regression analysis on grape leaves and branches and establish mathematical estimation formula. Result The research shows that there is high positive correlation between single leaf area and other variables such as leaf length, leaf width and product of length- breadth, and that there is fairly positive correlation between the variables of the mass of dry matter in one- year branch and of branch length, the number of leaves as well as leaf area. Conclusion Considering the operational convenience in field, it is suggested that power equation model between leaf area and the length of leaf veins should be adopted in research and production practice. At the same time, workload will be greatly reduced with the accumulation of leaf area to replace the mass of dry matter from one- year branch above the ground.

【题目】SUSTAINABLE WATER SAVING: NEW CONCEPT OF MODERNAGRICULTURAL WATER SAVING, STARTING FROM DEVELOPMENT OF XINJIANG ' S AGRICULTURAL IRRIGATION OVER THE LAST 50 YEARSy
【中文关键词】无
【英文关键词】sustainable water saving; modern agriculture; water-saving irrigation; water and land exploitation; eco-environment
【中文摘要】无
【英文摘要】This paper analyses first the state of water land exploitation and water saving irrigation in Xinjiang over the last 50 years. A fairly severe situation of water resources utilization exists in Xinjiang, and so agricultural water saving provides an important way of solving the problem. Taking a comprehensive view of development of agricultural irrigation in Xinjiang over the last 50 years, surface irrigation and new high water-saving technologies have both been present. Despite these two kinds of irrigation technologies, it is difficult to realize the effect of water saving and increasing production using the former, which is an engineering water-saving mode using a canal anti-seepage technique. To some degree, it inhibits ecological water use. The latter, which is an agronomic water-saving mode laying emphasis on crop growth mechanisms, can realize the effect of water saving and increasing production. But, on the other hand, it is unable to improve soil characteristics. On the contrary, it might even aggravate soil salinization. Therefore, both engineering water saving and agronomic water saving must reconsider the sustainability of water saving. Can it realize reasonable water resources allocation of the whole watershed? Can it realize sustainable utilization of water resources in the whole watershed? This paper advances a new concept of modern agricultural water saving – sustainable water saving – which is different from real water saving.

【题目】彭曼-蒙太斯法制定阿克苏红枣根渗灌灌溉制度
【中文关键词】彭曼-蒙太斯; 红枣; 根渗灌; 灌溉制度;
【英文关键词】Penman-Monteith; red-jujube; root-irrigation by infilitration; irrigation schedule
【中文摘要】【目的】为控制土壤水分、提高水分生产率和实现节水与高效提供科学依据。【方法】利用彭曼-蒙太斯法对2年的气象资料间接计算出阿克苏地区全生育期红枣日平均耗水量,并分析其变化规律。【结果】试验区红枣树耗水规律:3月初~5月中旬日耗水量保持在2~4 mm,从5月下旬~8月下旬日耗水量增加到4~6mm,从8月下旬~10月中旬日耗水量又下降到2~3 mm。【结论】确定根渗灌红枣适宜的灌溉制度为:灌溉定额5 865 m3/hm2,灌水定额为255 m3/hm2,整个生育期灌水21次。
【英文摘要】【Objective】To provide a scientific basis for controlling soil moisture content,improving moisture content efficiency,and realizing water-saving and high-efficiency.【Method】In this paper,the evaporation of red-jujube in the Akesu irrigation area was indirectly gained from weather information of two years based on the equation of Penman-Monteith,and the laws of change has been analysed.【Result】The water consumption pattern of the red jujube trees in the test area was obtained from the analysis:from the beginning of March till mid-May the daily consumption amount of water maintains between 2-4 mm,from the end of May till the end of August the daily consumption amount of water increased 4-6 mm,from the end of August till mid-October the daily consumption amount of water descended to 2-3 mm.【Conclusion】For root-irrigation by infiltration,the suitable irrigation schedule is the follwing:the irrigation quota is 5 865 m3/hm2,the irrigation water quota is 255 m3/hm2,and 23 times of irrigation during the whole growth period.

【题目】Preparation and evaluation of molecularly imprinted ionic liquids polymer as sorbent for on-line solid-phase extraction of chlorsulfuron in environmental water samples
【中文关键词】离子液体,分子印迹聚合物,氯磺隆,固相萃取,高效液相色谱柱
【英文关键词】Vinylimidazolium ionic liquid,Molecularly imprinted polymer Chlorsulfuron,On-line solid-phase extraction,High performance liquid chromatography
【中文摘要】本文首先研究了vinylimidazolium离子液体作为功能单体制备氯磺隆分子印迹聚合物。该印记材料具有对CS的高灵敏性,5min内达到吸附动力学平衡。这些材料协同HPLC富集已经用来进一步检测水样中痕量的CS,对于痕量CS固相萃取,该吸附剂具有良好的线性(0.005 – 30 μg L − 1, r2 > 0.99)。在最佳适用实验条件下,水样中CS的回收率在81.0 – 110.1%,且RSDs在1.2 - 7.6%范围内。
【英文摘要】In this report, vinylimidazolium ionic liquid as a functional monomer for preparation of chlorsulfuron(CS) imprinted polymers were first studied. The imprinted materials showed high selectivity for CS, and fast kinetics so that adsorption equilibrium was achieved within 5 min. These materials have been further employed to detect trace CS from water samples by online preconcentration coupled with HPLC.The sorbent offered good linearity (0.005 – 30 μg L − 1, r2 > 0.99) for on-line solid-phase extraction of trace chlorsulfuron. Under the optimal experimental conditions, the recovery for chlorsulfuron was in the range of 81.0 – 110.1% for the water samples, with RSDs ranging from 1.2 to 7.6%.

【题目】巴里坤草场不同草地类型MODIS-NDVI的时空变化
【中文关键词】巴里坤;草地;MODIS;NDVI
【英文关键词】Barkol;Grassland;MODIS;NDVI
【中文摘要】利用ESO/MODIS卫星遥感数据,以2005、2006年4-10月的NDVI月度变化和野外实测样方数据为例,分析了巴里坤草场高寒草原类、温性草原类、温性草原化荒漠类、温性荒漠草原类和低平地草甸类等5种草地类型的植被指数(NAVI)在各个生长阶段的变化. 结果表明,5种草地类型在生长季(4-10月) 的NDVI数值由大到小依次为:低平地草甸、高寒草原、温性草原、温性草原化荒漠和温性荒漠草原;低平地草甸、高寒草原、温性草原和温性荒漠草原的全年最大值出现在7月,温性草原化荒漠年最大值出现时间不稳定。
【英文摘要】Taking monthly change from April to October in 2005 and 2006 as the example , the NDVI (Normalized Difference Vegetation Index) for five typical grasslands of alpine steppe,temperate meadow,temperate steppe-desert,temperate desert-eteppe and low-land meadow were analyzed in growth stages by using of remote sensing data of MODIS,which reflected its growth status and characteristics.The results showed that the NDVI values of the five typical grasslands from max to min were:low-land meadow,alpine steppe,temperate meadow,temperate steppe-desert,temperate desert-steppe.The date of the maximum NDVI for low-land meadow,alpine steppe,temperate meadow,temperate desert-steppe and low-land meadow were all existed in July,the date of the maximum NDVI for temperate steppe-desert was unsteadiness.

【题目】氮硅配施对夏玉米抗倒性和产量的影响
【中文关键词】夏玉米;氮硅配施;抗倒性;产量
【英文关键词】Summer corn; Nitrogen application combined with silicon; Lodging- resistance; Yield
【中文摘要】试验采用 N、 Si(3×2)完全均衡方案和田间裂区设计,氮肥设 120 kg/hm2(N1)、 180 kg/hm2(N2)、 240 kg/hm2(N3)3 个水平,硅(SiO2)设 0、 75 kg/hm2两个水平,研究氮硅配施对夏玉米抗倒性和产量的影响。结果表明,施氮量为 120~240 kg/hm2,玉米平均株高、 茎粗、 茎皮厚、 室内横折强度、 田间抗拉弯强度、 穗长、 穗粗、 穗粒数、 百粒重、 理论产量和实际产量均随施氮量的增加而提高,不同施氮水平间上述各指标均达极显著差异(P<0.01)。氮硅配施对玉米茎粗、 茎皮厚、 室内横折强度和田间抗拉弯强度影响的交互效应达显著水平(P<0.05), N1、 N2 水平下,施硅与不施硅处理相比茎粗、 茎皮厚、 室内横折强度、 田间抗拉弯强度差异达显著水平; N3 水平下,除室内横折强度达显著水平外,其他各指标差异均不显著。氮硅配施对玉米穗长、 穗粗、 穗粒数、 百粒重、 理论产量和实际产量影响的交互效应亦达显著或极显著水平, N1、 N2 水平下,施硅与不施硅处理相比穗长、 穗粒数、 理论产量、 实际产量差异达显著水平; N3 水平下,各指标差异不显著。
【英文摘要】Field experiment was conducted under three nitrogen levels of 120 kg/ha(N1), 180 kg/ha(N2) and 240kg/ha(N3), two silicon(SiO2) levels of 0 kg/ha and 75 kg/ha and with split- plot design to investigate the effect of nitro-gen application combined with silicon on lodging- resistance and yield of summer corn. The results showed that withthe increase of nitrogen application rate from 120 to 240 kg/ha, the plant height, stem diameter, bark thickness,cross- breaking strength and tensile strength, spike length, spike diameter, kernel number, 100- grain weight, theoreticyield and actual yield increased significantly(P<0.01). The interactive effects of nitrogen and silicon on the stem diam-eter, bark thickness, cross- breaking strength and tensile strength were significant(P<0.05), the indexes above showsignificant difference(P<0.05) between +Si and - Si treat under N1 and N2 levels but not under N3. The interactive ef-fects of nitrogen and silicon on the spike length, spike diameter, kernel number, 100- grain weight, theoretic yield andactual yield were also notable(P<0.05 or P<0.01), the indexes above show significant difference(P<0.05) between +Siand - Si treat under N1 and N2 levels but not under N3.

【题目】氮磷钾配比对高产夏玉米产量、 养分吸收积累的影响
【中文关键词】夏玉米; 产量; 超高产; 养分限制因素; 养分积累; 养分回收率
【英文关键词】Summer maize;Yield;Super-high yield;Nutrient limiting factor;Nutrient accumulation;Nutrient
recovery
【中文摘要】通过大田试验研究了高产夏玉米土壤养分限制因素及植株养分吸收积累规律。结果表明: 各施肥处理 均比不施肥显著增产, 增产 7.3%~15.9%, 氮磷钾推荐施R~(OPT)处理产量最高, 达到12 051.2 kg/hm2, 增产1 651.2 k m ; 施用氮肥、 钾肥能显著提高夏玉米的产量, N、 K是高产夏玉米主要养分限制因素。高产夏玉米植株体内氮、磷、 钾的积累量均随生育期的延长而增加, 养分积累量的大小顺序为N > K > P, 从拔节期至大喇叭E1期是氮素、 磷素和钾素吸收量和吸收速率最大的时期, 整个生育期, 高产夏玉米能持续吸收N、 P、 K养分。 N当季回收率为18.05%, D5为14.55%, K20为18.34%, 每生产100 kg经济产量需吸收的N、 P2O 、 K2O的量分别为1.62、 0.69、 1.83 kg。
【英文摘要】A field experiment was conducted to study the soil nutrient limiting factors and plant nutrient uptake and accumulation.The results showed that the yield of the treatment with fertilizers were increased observably,the in- crease rate was from 7.3%to 15.9%.The OPT treatment got the highest yield with 12 051.2 ks/ha.with yield in- creased 1 65 1.2 kg/ha.The nitrogen and potassium fertilizer could increase yield of high-yield summer maize evi-dently;N and K were chief soil nutrient limiting factors.The accumulations of nitrogen,phosphorus and potassium of hi 一yield maize plants were increased with the extended of bearing period.The order of nutrients accumulation WasN>K>P.It Was the greatest period of nitrogen, phosphorus and potassium absorption amount and d rate from jointing stage to the large bugle stage,the N,P and K nutrients were absorbed at the whole stage.Under the conditions of rec— ommended fertilization(OPT),the increasing yield per kg nutrient of N,P2O5,K2O were 3.73,5.20,6.76 kg,the recov— ery rate of N,P205,K2O were 1 8.05%,14.55%,1 8.34%,and the absorbed nutrient with 100 kilogram maize of N, P2O5,K20 were 1.62 kilogram,0.69 kilogram and 1.83 kilogram.

【中文摘要】为了研究外源物质对小麦抗旱性的诱导作用, 水培条件下研究了外源腐胺对干旱胁迫(15% PEG - 6000) 条件下冬小麦幼苗叶片膜脂过 氧化及抗氧化酶活性的影响 。结果表明, 干旱胁迫 48h 后冬小麦幼苗叶水量下降了 27.43,O的产生速率 、 丙二醛 (MDA) 和 H2O2 含量随 时间的推移 均呈增加 的趋势 , S0D、 POD、 CAT活性分别下降 了 23、 37 、 7O 。外源腐胺 处理 下叶片含水 量仅 下降 了 7 . 6 2 ; 叶 片 MDA含量 降低 8 O %左右 , H2O2 的含 量 下降 50% 左右 , O的产 生速率 降低 了 1 / 3, 而 叶片 SOD、 POD、 CAT分 别提 高 了 41%、 165.8%、 246%。 因此 认 为, 外源 腐胺 可通过抑 制活性氧 (0, H202) 的产 生 , 降低 MDA 含 量, 提 高抗氧化酶 (SOD、 POD、 CAT) 的活性, 缓解干旱胁迫造成的冬 小麦幼苗叶片细胞膜脂过氧化损伤 , 提 高冬小麦的抗旱性。
【英文摘要】冬小麦; 干旱胁迫; 外源腐胺; 膜脂过氧化 ; 抗氧化酶活性

【题目】控释尿素对小麦品种郑麦366 产量及氮肥利用率的影响
【中文关键词】控释尿素; 普通尿素; 小麦; 氮肥利用率; 增产效果
【英文关键词】无
【中文摘要】以控释尿素和普通尿素为供试肥料,在驻马店市驿城区水屯镇新坡村和驻马店市农科所进行优质小麦品种郑麦 366 肥效试验。结果表明: 100% 控释尿素处理产量最高, 分别为8173kg/ hm2、 8 264kg/ hm2, 较同等氮素用量的普通尿素处理增产 877kg/ hm2、 837kg/ hm2, 增幅12. 02%、 11. 27%,达极显著水平; 控释 BB 肥处理产量位居第2。控释尿素用量为 70% ~ 100%时,小麦产量随氮肥用量的增加而增加, 普通尿素也呈同样趋势。70%控释尿素处理与100%普通尿素处理产量差异不显著,说明施用控释尿素可以比普通尿素减少1/ 3 的纯氮用量。100%控释尿素处理的氮肥利用率最高,其次为 70%控释尿素处理, 控释BB 肥第3, 控释肥处理氮肥利用率均高于普通尿素和复合肥处理。

【题目】砂姜黑土区麦田土壤有效钾施肥指标及小麦施钾研究
【中文关键词】小麦; ASI土壤分析方法;土壤有效钾;丰缺指标
【英文关键词】Whea; t ASI ; Potas si um; Abundance and deficiency indices
【中文摘要】为砂姜黑土区小麦测土配方施肥技术的推广提供技术支撑。 2004- 2008年连续 4年在砂姜黑土区进行小麦肥料效应田间试验, 并利用土壤样品分析方法 (ASI方法)对土壤样品进行测试分析,同时以施氮磷肥处理区 (即缺钾素区 NP)冬小麦产量占推荐施氮磷钾肥区 (NPK)冬小麦产量的相对产量百分数, 划分为 4个梯度: < 50%、 50% ~75%、 75% ~ 95%和 > 95%,将小麦产量的相对产量百分数所对应的用 AS I方法分析的土壤有效钾测试值分成 极低 、 低 、 中 和 高 4级, 两者建立相关性。砂姜黑土区麦田土壤运用 AS I方法测定的土壤有效钾测试值与小麦相对产量百分数呈显著正相关关系。根据小麦相对产量百分数的划分区间, 对应土壤有效钾测试值分级指标, 可以得出, 砂姜黑土区麦田土壤有效钾测试值 极低 指标范围为 < 67 4 mg /L, 低 指标范围为 67 4 ~ 97 1 m g /L , 中 指标范围为 97 1~ 130 0 mg /L , 高 指标范围为 > 130 0 m g /L。在上述 4级指标下, 小麦推荐施钾量依次为: 150 , 120 ,90 , 45 kg /hm2。砂姜黑土区麦田土壤运用 ASI方法测定的土壤有效钾测试值与小麦相对产量百分数呈显著正相关关系。根据此分析方法建立的麦田土壤养分丰缺指标, 完全可以指导砂姜黑土区小麦生产中的测土配方施肥实践。

【题目】根渗灌条件下施肥对红枣产量构成因素的影响

【中文关键词】灰枣; 施肥; 形态指标; 产量
【英文关键词】red jujubes; fertilizer; morphological indexes; output
【中文摘要】【目的】研究施肥对红枣花、果及产量的影响,探讨适宜成龄红枣的施肥量和追肥次数。【方法】在根渗灌条件下通过不同施肥量和不同追肥次数的试验,研究施肥对红枣花、果及产量的影响。【结果】增加施肥量和追肥次数均可以有效提高灰枣平均单个枣吊开花数量和结果数量,同时可以增加灰枣果实体积,进而提高了红枣产量;但追肥次数少时,需要在红枣关键期施肥,否则容易造成红枣关键需肥期供肥不足,导致花果数量减少,影响产量;追肥总量较高时,适当调整氮肥追肥配比,少量多次追肥效果最好。【结论】增加施肥量和追肥次数均可以有效提高灰枣平均单个枣吊开花数量、结果数量、果径和产量。 更多还原
【英文摘要】[Objective]This study was carried out to reveal the effect of fertilizer on flower,fruit and yield of red jujubes,and determine the appropriate fertilizer and topdressing frequency.[Method]Under the conditions of infiltrating irrigation around root,a field experiment was carried out to study the relation between fertilizer and yield formation factors of jujubes;[Result]Increasing fertilizer and topdressing frequency both can effectively increase quantity of blossom and bear fruit of average single hanging jujubes,also can increase the fruit volume,therefore,increase the yield of red jujube;but when frequency of topdressing fertilizer were reduced,red jujube need to be fertilized in the key period.Otherwise it will be easier to cause red jujube to be short of fertilizer during the key growth period and to reduce quantity of blossom and bear fruit,and yield.When total of topdressing is higher,the formulated fertilization should be properly adjusted.[Conclusion]Adding fertilizer and topdressing frequency can increase quantity of blossom,bear fruit,the fruit volume,and yields.

【题目】土壤水分在根渗灌条件下的动态变化规律研究

【中文关键词】根渗灌; 土壤水分动态; 土壤水分再分布

【英文关键词】root-irrigation; soil moisture dynamic state; soil water redistribution

【中文摘要】对根渗灌新型节水灌溉技术水分动态变化进行研究,利用Watch Dog 2800水分测试仪的水分传感器SM100进行监测,材料采用直径25 cm的根渗管。分析灌水过程中和停灌后土壤水分动态变化和规律。通过大田试验,结果表明:在根渗灌条件下,水分是以线源入渗土壤,在渗灌速率为87.86 L/(h.m),灌水时间为100 min时湿润锋径向移动速率远小于垂向移动速率,移动过程呈椭圆形分布扩散。根据不同模型拟合的土壤湿润锋的动态变化,认为二次多项式模型的拟合程度较好。

【英文摘要】Study on soil water dynamic state was conducted with a new type of water-saving root-irrigation,adopting soil moisture testing instrument Watch Dog 2800 and its transducer SM100 and root-irrigation pipe which has a diameter of 25 centimeters.And the dynamic change and laws of soil water during infiltration period and after Irrigation were analysed.The results of the field irrigation experiment showed that the water permeate soil by a line infiltration under the state of root-irrigation.The speed of wetting front radial movement wasmuch less than that of vertical movement when root-irrigation speed reached 87.86 L/(h · m) and irrigation time was 100 min and wetting front was distributed by elliptoid shape.Based on the dynamic transformation of soil moisture under different models of root-irrigation.The fitting function of the secondary multinomial model was found to be the most satisfactory.Thus,it provides theoretical foundation for root-irrigation system.

【题目】长期施钾对玉米连作土壤 - 作物系统钾素特征的影响
【中文关键词】长期施钾;玉米;土壤- 作物系统;钾素
【英文关键词】Long - term application of K fertilizer; Maize; Soil- crop system; Potassium
【中文摘要】通过在东北三省代表型土壤上连续 13 年的长期钾肥定位试验,研究施钾对大田玉米和耕层土壤钾素系统特征的影响。 结果表明:施钾可明显增加玉米植株各部分含钾量,对秸秆钾含量的提高尤其明显。 施用钾肥可显著提高玉米籽粒产量,施钾量增加籽粒产量没有进一步提高从而使钾肥效益降低。各定位点 NP和 NPK1 处理的土壤钾素显现出一定的表观亏缺,年均亏缺量在4.7~135.5 kg K2O hm- 2, NPK2 处理则表观盈余。 施钾可提高土壤速效钾含量,施钾量增加速效钾含量升高,相比 NP处理施钾总体增加了土壤缓效钾和全钾的含量;施钾增加速效钾和缓效钾在全钾中的比例,降低矿物钾的比例。与1993年定位时相比: NP处理速效钾含量下降,其余施钾处理含量表现上升;各处理缓效钾含量略有增加;全钾含量则有不同幅度的下降,东北三省的土壤表现一致。可考虑玉米秸秆还田来缓解农田土壤钾素的逐年下降。
【英文摘要】Based on long- term application of K fertilizer on selected soils of three provinces in northeastern China forcontinuous 13 years, effect of K fertilizer on status of field maize and soil potassium system in the plough layer werestudied. Results showed that K fertilizer could increase potassium content of different organs in plant distinctly,especially in straw. Application of K fertilizer could increase yield of grain but yield didn't increase with K fertilizerquantity's increasing and then K fertilizer's efficiency decreased. Soil potassium appeared apparent wane in thetreatment of NP and NPK1, and potassium deficit rate ranged from 4.7 to 135.5 kg K2O hm2annually, however therewas a surplus in NPK2 treatment. Application of K fertilizer could increase content of available potassium and itscontent increased with K fertilizer quantity's increasing, K fertilizer application increased content of slowly available Kand total K collectively compared to NP. Application of K fertilizer improved proportion of available K and slowlyavailable K and reduced proportion of mineral K. Compared to 1993, content of available K in treatment of NPdecreased, however others showed a rise, and content of slowly available K in each treatment increased a little, butcontent of total K decreased. It behaved consistent in three sites. In order to postpone soil potassium's decline, theapplication of maize straw's returning should be considered.

【题目】利用硬度、脆性和黏着性对火腿肠等级的判别分析
【中文关键词】感官评定;质构分析;硬度;脆性;黏着性;判别分析
【英文关键词】sensory evaluation; texture profile analysis; hardness; fracturability; adhesiveness; discriminant analysis
【中文摘要】研究利用质构指标代替感官评分在火腿肠等级验证判别方面应用的可行性。【方法】利用质构分析(texture profile analysis, TPA)和感官评分法对不同等级火腿肠的硬度、黏着性和脆性进行评定,并用判别分析方法研究以感官评分和质构数据建立的判别函数判断火腿肠等级的能力。【结果】利用硬度、脆性和黏着性的感官评分和质构数据建立的火腿肠等级判别函数,对火腿肠等级的判别正确率分别为92.2%和100.0%;以进入模型的硬度感官得分(X1)、脆性感官得分(X2)和黏着性感官得分(X3)为基础,建立的特级(Y1)、优级(Y2)和普通级(Y3)火腿肠的Fisher 线性判别函数为:Y1=6.548 X1+ 3.498 X2+ 7.525 X3 – 68.989,Y2=4.608X1+ 2.652 X2+ 6.457 X3 – 44.049,Y3=3.162 X1+ 1.392 X2+ 3.459 X3 – 15.176;以进入模型的硬度值(X4)、脆性值(X5)和黏着性值(X6)为基础,建立的3 个等级火腿肠的Fisher 线性判别函数为:Y1=1.009 X4-0.255 X5-10.866X6-3377.048, Y2=0.867 X4-0.233 X5-9.026 X6-2671.609, Y3=0.976 X4-0.244 X5-10.799 X6-3582.754,将待测样品的质构特性代入对应方程,根据分值大小判断其所属类别,哪个分值大就属于哪一类。【结论】仅从火腿肠的物理特性考虑,在判别火腿肠的等级时可以用质构指标取代感官评定。
【英文摘要】The possibility of the application of texture profile analysis in distinguishing the grades of ham sausages replacing sensory evaluation was discussed. 【Method】 The hardness, fracturability and adhesiveness of ham sausages of different grades were measured using sensory evaluation and instrumental measurement (texture profile analysis, TPA), and thecapability of discriminating the grades of ham sausages by using discriminat functions established on data of the fracturability and adhesiveness was studied. 【Result】 The results showed that the discriminant accuracies of the established discriminant functions byhardness,fracturability and adhesiveness were 92.2% and 100.0%, respectively. The Fisher linear functions of premium, excellent and general class ham sausages founded were Y1=6.548 X1+ 3.498 X2+ 7.525 X3-68.989, Y2=4.608 X1+ 2.652 X2+ 6.457 X3-44.049,Y3=3.162 X1+ 1.392 X2+ 3.459 X3-15.176, respectively, based on sensory evaluation of hardness, fracturability and adhesiveness,and the Fisher linear functions based on hardness, fracturability and adhesiveness values were Y1=1.009 X4-0.255 X5-10.866X6-3377.048, Y2=0.867 X4-0.233 X5-9.026 X6-2671.609, Y3=0.976 X4-0.244 X5-10.799 X6-3582.754. The grade distinguished as follows: the texture characteristics of sample were put into the functions , the grade was determined by the Y value,the biggest valuerepresented the grade of sample. 【Conclusion】 It is suggested that the current sensory evaluation methods could be replaced by instrumental measurement in distinguishing the grades of ham sausages, when considered physical properties only.

【题目】压缩比对火腿肠制品质构特性的影响
【中文关键词】火腿肠;质构;压缩比
【英文关键词】ham sausage;texture;compression ratio
【中文摘要】为在测定火腿肠质构特性时选择合理压缩比,研究30%~80%范围压缩比对不同等级火腿肠质构特性的影响。结果表明:脆性指标检出与否是确定压缩比的重要参考依据;在火腿肠制品的凝胶系统达到一定强度时,采用的压缩比趋于一致。
【英文摘要】To explore textural characteristics of ham sausage, the effect of compression ratio within the range of 30% to 80% on textural characteristics of ham sausage was investigated. Results indicated that fracturability property provided an important reference to compression ratio. Compression ratios tended to be consistent when an appropriate strength of gelatin system for ham sausage

preparation was reached.

【题目】接种秸秆降解真菌对玉米苗期生长的影响
【中文关键词】玉米幼苗; 丝状真菌; 发芽率; 促生菌;
【英文关键词】Maize seedlings; Filamentous fungi; Germination rate; Promoting bacteria
【中文摘要】利用盆栽试验接种44株可降解秸秆的丝状真菌,研究真菌对玉米发芽和苗期生长的影响。结果表明:8株真菌(F6、F7、F9、F11、F16、F17、F18和F36)可显著降低玉米发芽率(P<0.05),其中极显著两株为F6和F36,分别降低45.0%和32.5%;真菌F36同时也显著降低单株生物量,降低率为48.0%;两株真菌F5和F45可显著提高玉米苗期单株生物量(P<0.05),分别提高35.0%和48.0%。真菌F5和F45经初步鉴定分别为Fusarium sp.和Trichoderma sp.,两种真菌显著促进玉米苗期生长。
【英文摘要】Pot experiment effects of degradation fungi inoculated with each of the 44 filamentous fungi on maize germination and seedling growth were investigated.The results indicated that germination rate of the maize significantly(P<0.05) reduced by inoculating with 8 straws of fungi(F6,F7,F9,F11,F16,F17,F18 and F36),including the two most significantly treatments inoculated with F6 and F36,which 45.0% and 32.5% decreased.The seedling biomass were also reduced 48.0% by inoculating with fungus F36,the seedling biomass of maize prominently increased by inoculating with two straws F5 and F45,which 35.0% and 48.0% increased.The fungi F5 and F45 were identified as Fusarium sp.and Trichoderma sp.In conclusion,the seedling growth of maize were significantly promoted by inoculating with two fungi that could degrade straws.

【题目】一种降解秸秆的丝状真菌的分离和定性方法
【中文关键词】秸秆降解; 丝状真菌; 分离方法; 定性方法;
【英文关键词】stalk degradation; filamentous fungi; method of isolation; method of determination;
【中文摘要】建立了一种新的简单的分离秸秆降解丝状真菌的方法,用此方法从东北寒地黑土中分离出真菌56株,其中丝状真菌46株。这种分离方法简述为:先用土壤或者堆肥浸渍秸秆至接近腐烂,再用酒精对接近腐烂秸秆进行表面灭菌,最后用土豆葡萄糖琼脂培养基培养并分离秸秆中微生物,这样分离的微生物大多为产丝真菌。用添加或者不添加硝酸铵、酵母粉和黑土浸液等辅助物的秸秆粉制成不同培养基,这些培养基用来比较其对分离的微生物的生长的影响。结果表明,同一微生物在不同培养基中生长区别很小,同一培养基不同微生物生长区别较大。选择了只含秸秆粉而不添加辅助物的培养基作为微生物是否降解秸秆的定性培养基,对分离的56株真菌以水稻、大豆和玉米3种秸秆进行降解定性鉴定,结果显示:该方法筛选的46株丝状真菌都能降解3种供试秸秆。
【英文摘要】A new simple method to isolate filamentous fungi that could degrade stalks were built.Fifty-six strains of fungi include 46 strains of filamentous fungi were isolated from the black soil in the northeast frigid zone in China by the method.The isolation method could be summarized as:Stalks were nearly rotten after being covered with soil or compost suspension for a few days, ethanol were used to disinfect the surface of the stalks, the culture medium(Potato Dextrose Agar,PDA)were used to isolate the microorganisms in the stalks, most of the microorganisms isolated by the method are filamentous fungi.Three dry stalks include straw, soybean stalk and corn stalk are collected to be pulverized to made stalk powder.Stalk powder added with different matter(NH4NO3, yeast abstract, black soil solution)or not were recruited to made solid culture media to compare the growth of the microorganisms isolated.Results showed

that there are little differences between the growth of the same strain on different media but varified differences between the growth of the different strains on the same medium.The simple medium made by stalk powder without any of the adding matters were chosen to determine whether the three stalks were degraded by the 56 strains of fungi.Results showed that all of the 46 strains of filamentous fungi isolated by the method could degrade the three stalks.

【题目】灌淤土区长期施钾对作物产量与养分及土壤钾素的长期效应研究
【中文关键词】长期施钾;秸秆还田;作物产量;作物养分;土壤钾素;灌淤土
【英文关键词】Long-term K fertilizer application, Wheat straw return to soil, Crop yield, Crop nutrition, Soil potassium, Irrigated soi
【中文摘要】通过在宁夏灌淤土区长达 14 年的连续施钾和小麦秸秆还田试验, 研究钾素投入对作物产量、养分和土壤钾素状况的影响。 结果表明:小麦秸秆还田和长期施用钾肥均可不同程度提高小麦和玉米的经济产量, 其中施钾年平均增产小麦 244 kg · hm − 2, 玉米 397 kg · hm − 2, 处理之间产量表现为氮磷钾肥配合秸秆还田>施用氮磷钾肥>氮磷肥配合秸秆还田>只施用氮磷肥。 定位后8~10年施钾肥开始显著有效, 玉米显效时间早于小麦;秸秆还田和钾肥的投入均可提高籽粒和秸秆的钾素吸收量, 秸秆含钾丰富, 籽粒钾含量仅占植株钾总量的13%~17%;施用钾肥可提高作物籽粒大中微量元素含量而降低秸秆中、微量元素含量, 促进籽粒对大部分元素的吸收; 长期不施钾肥处理(NP 和 NP+St)0~20 cm 土层土壤速效钾和缓效钾含量较定位开始时下降; 所有处理土壤全钾含量均表现下降, 下降幅度为 0.8~1.2 g · kg − 1。
【英文摘要】An experiment on the long-term application of potassium (K) fertilizer and wheat straw in irrigated soils of Ningxia, northwestern China began in 1993. The objective of the experiment was to determine the effect of K fertilizer application and wheat straw return to soil on crop nutrient content and yield and the status of soil K in plowed soil layers. The results show that K fertilizer and wheat straw increase yield of wheat and maize. K fertilizer treatments increase wheat yield by 244 kg · hm − 2 and maize yield by 397 kg · hm − 2 annually. The order of all treatments effect on yield is as follows: NPK+straw > NPK > NP+straw > NP. K fertilizer has a significant effect on crop yield when it is continuously applied for 8~10 years. Significant response of yield to K application occurs earlier in maize than in wheat. Furthermore, K fertilizer and wheat straw return to soil increase potassium content in the kernel and straw of the crops. There is a higher potassium content in straw, while it in kernels accounts for only 13%~17% of the total potassium content of plant. Furthermore, K fertilizer enhances the elements contents of kernels and accelerates element absorption by kernels. However, K fertilizer reduces trace- and micro-elements in straw. The content of 0~20 cm soil available K and slowly available K in non-potassium (NP and NP+Straw) treatments for long-term application decrease. Total K content in all treatment declines at a rate of 0.8~1.2 g · kg − 1.

【题目】减数分裂期高温对水稻颖花结实率影响的定量分析
【中文关键词】水稻; 高温; 减数分裂期; 结实率; 定量分析
【英文关键词】Rice; High temperature; Seed setting rate; Meiosis stage; Quantitative analysis
【中文摘要】以华粳1号和特优559为材料, 于减数分裂期, 设置高温(31℃、33℃、35℃、37℃、39℃、41℃)及历期(1 d、3 d、5 d)处理, 每日高温持续时间5 h (8:40—13:40), 另设自然环境对照, 分析了高温及其持续期对水稻颖花相对结实率的影响。结果表明, 33℃以下的温度对两供试材料的结实率无明显影响, 此后随温度及持续天数的增加结实率将逐步降低; 高温下日相对颖花结实率与温度的关系可用二次方程描述, 而减数分裂期高温对颖花结实率的总影响为逐日相对颖花结实率的乘积。进一步结合温度日变化规律, 讨论了温度日变化下日相对颖花结实率的定量方法。
【英文摘要】High temperature, especially happened at flowering stage and meiosis stage, would cause sterility of rice florets and became one of restricting factors of rice yield. With the global warming, the high temperature events will increase during crop growth process. In order to evaluate the effect of high temperature on yield quantitatively, it is important to quantify the relationship between temperature and seed-setting rate. Previous studies have focused on the above relationship during flowering stage, but litter discussed the relationship during meiosis stage. In this study a controlled experiment during meiosis stage was conducted at Jiangsu Academy of Agricultural Sciences, China with two cultivars, TY559 and HJ1 under six temperature levels (31, 33, 35, 37, 39, and 41°C) and three durations (1, 3, and 5 d). High temperature lasted five hours from 8:40 to 13:40 each day, and natural environment was set as CK. The effect of high temperature on seed setting rate and the quantitative relationship between seed setting rate and temperature were analyzed. The results showed that temperature below 33°C had no significant effect on seed setting rate, but with the increase of temperature and its duration the seed setting rate decreased gradually. The daily relative seed setting rate could be expressed in terms of temperature with a quadratic equation, and the total effect of high temperature during meiosis stage on relative seed setting rate could be expressed in the product of daily relative seed setting rates. Further, combining the diurnal change of temperature, the quantitative effect factor under the nature diurnal change pattern of temperature was dis-cussed. This study provided a quantitative method for calculating the effect of high temperature at meiosis stage on seed setting rate of rice, and would help to improve high temperature-induced sterility model in rice.

【题目】农肥和化肥对东北黑土土壤氮素转化作用的研究
【中文关键词】氮循环; 反硝化损失; 氨挥发; NO3--N淋失;
【英文关键词】nitrogen cycling; denitrification loss; ammonia volatilization; nitrate leaching;
【中文摘要】在不同施肥处理条件下,分别定量测定了玉米田土壤氮素自生固氮作用、氨化作用、硝化作用、反硝化损失、氨挥发、NO3--N淋溶损失等氮素循环转化途径。研究结果表明,不施肥的土壤生态系统每年土壤全氮将减少-110.5kg/hm2。施肥能够有效地提高土壤氮素转化能力,农肥的氮素转化作用明显高于化肥的氮素转化作用。各处理反硝化损失的氮量为7.26~21.66kg/hm2,淋溶损失量为0.09~0.21kg/hm2,氨挥发损失的氮量为0~15.23kg/hm2。玉米田施肥处理总的氮素平衡处于盈余状态,不施肥处理的氮素平衡处于亏缺状态。单施农肥的盈余量高于单施化肥及农肥化肥配比处理的盈余量,低量施肥模式土壤中氮素的输入和输出基本处于平衡状态,高量施肥模式土壤中氮素处于盈余状态,虽有利于培肥地力,但却造成了肥料的浪费。 更多还原
【英文摘要】The main nitrogen cycling pathways,such as autogenic nitrogen fixation,ammonification,nitrification,denitrification,ammonia(NH3) volatilization,nitrate (NO-3-N) leaching and N uptake by crops,were monitored under different fertilizer treatments in maize field. The main results showed that total nitrogen annually in soil ecosystem without fertilizers was decreased 110.5 kg/hm2. Fertilizers application could advance the nitrogen transformation and the nitrogen transformation of manure fertilizer treatments was better than that of chemical fertilizer treatments. The annual denitrification loss of different treatments was 7.26~21.66 kg/hm2,NO-3-N leaching loss of different treatments was 0.09~0.21 kg/hm2,NH3 volatilization loss was 0~15.23 kg/hm2. Nitrogen of fertilizers treatments in maize field was oversupplied,but the nitrogen balance

without fertilizer treatment was wane. The surplus quantities of only manure fertilizers were higher than those of chemical fertilizers. The N of input and output of low fertilizer pattern was in balance,but the N of high fertilizer pattern was oversupplied. Although this was benefit to increasing the soil nutrients,the superfluous fertilizers were wasted.

【题目】Effect of High Temperature at Meiosis Stage on Seed-Setting Rate in Rice
【中文关键词】无
【英文关键词】rice; high temperature; seed-setting rate; meiosis stage; fitting equation
【中文摘要】无
【英文摘要】High temperature, especially at flowering stage and meiosis stage, causes sterility of florets and yield reduction in rice (Oryza sativa L.). To evaluate the effect of high temperature at meiosis stage on rice yield quantitatively, 2 rice cultivars, Huajing 1 (japonica) and Teyou 559 (indica hybrid) were treated with ladder temperatures (31, 33, 35, 37, 39, and 41 ° C) for 1, 3, and 5 d at meiosis stage in Artificial Climate incubators. The high temperature stress was conducted for 5 h (8:40 – 13:40) at each treatment day. The natural temperature treatment was set as the control. The seed-setting rates of both cultivars were slightly affected (P>0.05) when temperature was lower than 33 ° C. But with the increase of temperature and its duration, seed-setting rate decreased gradually. The relationship between daily relative seed-setting rate (RSS) and temperature was fitting with a quadratic equation. The total effect of high temperature at meiosis stage on relative RSS was described with the products of daily RSS.

【题目】农肥和化肥对黑土农田生态系统氮素循环与平衡影响的研究
【中文关键词】氮循环; 反硝化损失; 氨挥发; NO3--N淋失;
【英文关键词】nitrogen cycling; denitrification loss; ammonia volatilization; nitrate leaching;
【中文摘要】在不同施肥处理条件下,分别定量测定了玉米田土壤氮素自生固氮作用、氨化作用、硝化作用、反硝化损失、氨挥发、NO3--N淋溶损失等氮素循环转化途径。研究结果表明,不施肥的土壤生态系统每年土壤全氮将减少-110.5kg/hm2。施肥能够有效地提高土壤氮素转化能力,农肥的氮素转化作用明显高于化肥的氮素转化作用。各处理反硝化损失的氮量为7.26~21.66kg/hm2,淋溶损失量为0.09~0.21kg/hm2,氨挥发损失的氮量为0~15.23kg/hm2。玉米田施肥处理总的氮素平衡处于盈余状态,不施肥处理的氮素平衡处于亏缺状态。单施农肥的盈余量高于单施化肥及农肥化肥配比处理的盈余量,低量施肥模式土壤中氮素的输入和输出基本处于平衡状态,高量施肥模式土壤中氮素处于盈余状态,虽有利于培肥地力,但却造成了肥料的浪费。
【英文摘要】The main nitrogen cycling pathways,such as autogenic nitrogen fixation,ammonification,nitrification,denitrification,ammonia(NH3) volatilization,nitrate (NO-3-N) leaching and N uptake by crops,were monitored under different fertilizer treatments in maize field. The main results showed that total nitrogen annually in soil ecosystem without fertilizers was decreased 110.5 kg/hm2. Fertilizers application could advance the nitrogen transformation and the nitrogen transformation of manure fertilizer treatments was better than that of chemical fertilizer treatments. The annual denitrification loss of different treatments was 7.26~21.66 kg/hm2,NO-3-N leaching loss of different treatments was 0.09~0.21 kg/hm2,NH3 volatilization loss was 0~15.23 kg/hm2. Nitrogen of fertilizers treatments in maize field was oversupplied,but the nitrogen balance without fertilizer treatment was wane. The surplus quantities of only manure fertilizers were higher than those of chemical fertilizers. The N of input and output of low fertilizer pattern was in balance,but the N of high fertilizer pattern was oversupplied. Although this was benefit to increasing the soil nutrients,the superfluous fertilizers were wasted.

【题目】水稻逐日开花量与结实率的估算方法
【中文关键词】水稻;逐日开花量,结实率,估算
【英文关键词】Rice; daily flowering amount; daily seed-setting; estimation
【中文摘要】根据稻穗开花习性、结实率动态变化规律,结合稻田逐日始花穗数及其平均穗粒数和结实率等特征,提出了稻田逐日开花量和结实率的估算方法。并以华粳1号为试验材料,观察了其稻穗逐日开花量百分率及稻田逐日始花穗数、总颖花数和结实率,估算了稻田逐日开花量及结实率。结果表明:华粳1号稻田开花量呈左偏态分布,开花高峰期出现在始花后的4-9天,日均开花量占总颖花的15%以上;而颖花结实率随花后天数呈衰减变化。
【英文摘要】According to flowering habit of rice panicle and daily panicle number of first flowering and its mean grain number and seed-setting, a calculation method on daily flowering amount and its seed-setting of rice filed was proposed. Then HG1 as experiment material, the flowering habit of its panicle and daily panicle number of first flowering and its mean grain number and seed-setting were observed, and the daily flowering amount and seed-setting was estimated. The results showed the daily flowering number of HG1 could be expressed in left-distribution, and the highest stage appeared at 4-9 days after the starting flower and the daily flowering amount was up 15%. The seed-setting of florets declined with the days generally.

【题目】利用DGGE-cloning技术分析农肥和化肥施用对黑土细菌多样性的影响
【中文关键词】农肥; 化肥; 黑土; 细菌多样性; DGGE-cloning;
【英文关键词】manure fertilizer; chemical fertilizer; Black Soil; bacterial diversity; DGGE-cloning;
【中文摘要】本试验以东北黑土为研究对象,采用DGGE-cloning测序技术,研究了不同施肥制度和肥料用量对黑土土壤细菌多样性的影响。本实验共设六个处理,分别为:对照,施用农肥低量,施用农肥高量,施用化肥低量,施用化肥高量和农肥和化肥1:1的处理。试验得出的DGGE图谱分析表明,施用较高量的农肥处理中土壤细菌16SrDNA条带数、多样性指数及均匀度指数均要高于其他处理,聚类分析显示,施用化肥的土壤与其他处理相比土壤细菌群落结构差异较大,相似性只有53%,说明施用化肥与施用农肥比较,可以显著的改变土壤细菌的群落结构。从DGGE凝胶上切取9条带进行DGGE-cloning测序,结果表明,施用农肥和化肥均可对土壤的细菌群落结构产生影响,且施肥制度对细菌群落结果的影响要大于施肥量,施用农肥可以提高细菌多样性。
【英文摘要】The DGGE-cloning sequencing method was used to study the bacteria diversity under different fertilization treatments in Black Soil in Songnen Plain.DGGE fingerprint indicated that the number of bands of bacterial 16SrDNA,the bacterial diversity indexes and homogeneous degrees indexes in the treatment of higher application amount of manure fertilizer were all higher than those of other treatments.Cluster analysis demonstrated that fingerprint of application of chemical fertilizer were different from others with similarity being only 53%,which indicated that chemical fertilizer is better than manure fertilizer in changing the bacterial communities in the soil.The nine bands are selected from DGGE gel and DGGE-cloning sequenced,the results showed that application of manure and chemical fertilizer both have effect on the community structure of soil bacteria,and fertilization systems more than fertilization rate.And application of manure fertilizer could increase the diversity of bacteria in the Black Soil.

【题目】漫岗丘陵区黑土村级农田土壤养分空间变异研究
【中文关键词】农田黑土; 土壤养分; 空间变异; 地统计学; GIS
【英文关键词】Black soil; Soil nutrients; Spatial heterogeneity; Geostatistics; GIS;
【中文摘要】基于地理信息系统(GIS)和地统计学方法,对黑龙江省漫岗丘陵区的拜泉县富业村农田黑土耕层采集的180个样本的有机质、碱解氮、速效磷和速效钾四种养分要素的空间变异规律进行了分析和探讨。研究表明,有机质变异函数曲线的理论模型符合高斯模型,碱解氮、速效磷和速效钾的理论模型表现为指数模型。碱解氮、速效磷和速效钾属于中度空间相关,受结构性因子和随机因子的影响,但程度有所差异。有机质属于高度空间相关,其变化主要受结构性因子的影响。碱解氮的相关距离最大为4405 m,有机质的相关距离最小为234 m,速效磷和速效钾的相关距离分别为543 m和1128 m。施肥是导致该村土壤养分空间变异性的主要原因。基于土壤养分状况和空间分布特征,目前需要考虑对该村土壤氮、磷、钾进行分区管理。利用地统计学分析的方法,对合理利用土地、综合治理水土流失的以及指导当地合理施肥等都有重要的意义。
【英文摘要】Geostatistics combined with geographical information system(GIS) were applied to treatment and analyze the spatial variability of 180 samples of soil nutrients in topsoil in Fuye village of Heilongjiang Province.Soil nutrient data in this study included organic matter,available N,P and K.The results indicated that the semivariograms of organic matter were best described by the Gaussian model,available N,P and K were best described by exponential model.The spatial variability of available N,P and K were moderately dependent and affected by both structural and random factors.However,their spatial heterogeneity degree was different.The spatial correlation of organic matter was highly dependent therefore,changes in organic matter mainly affected by structural factors.AvailableN had the longest correlation range(4405 m),and organic matter had the shortest(234 m),whereas available P was 543 m and available K was 1128 m.Spatial variability of soil nutrients could be contributed to the unbalance fertilization in this area.Based on the p resent

situation and spatial distribution characteristics of soil nutrients,the elements in nutrient management were N、K and P in the study village.The analysis was useful to inform strategic planning of using farmland,to guide fertilizer application and to control soil erosion land degradation of Blacksoil in in the locality. 更多

【题目】砂姜黑土区控释尿素与普通尿素掺混对小麦-玉米轮作定位产量及氮肥利用率的影响
【中文关键词】控释尿素;普通尿素;掺混比例;小麦;玉米;产量;定位试验
【英文关键词】controlled-release urea;conventional urea;blend ratio;wheat;corn;yield;location test
【中文摘要】在驻马店新坡村进行了小麦-玉米轮作制下的控释尿素与普通尿素掺混比例定位试验研究。结果表明:控释尿素与普通尿素掺混处理的小麦、玉米产量均以70%控释尿素+30%普通尿素处理最好,第1年和第2年的小麦产量分别比100%普通尿素处理增产17.0%和21.1%,玉米产量分别比普通尿素处理增产16.2%和16.2%;氮肥利用率与产量结果一致,均以70%控释尿素+30%普通尿素处理最高,分别为53.9%和54.5%。
【英文摘要】The location tests of different blend ratio between controlled-release urea and conventional ureain wheat-corn crop rotation system in Xinpo Village Zhumadian city are studied. The results show that: theyield with the blend ratio between 70% controlled-release urea and 30% conventional urea is the best. Inthe first and second year,the yields of wheat increase 17.0% and 21.1% compared with the 100%conventional urea test, the yields of corn increase 16.2% and 16.2% compared with the conventionalurea test. The same results of nitrogen utilization efficiency and yield are the highest on 70% controlled-release urea and 30% conventional urea treatment, respectively, 53.9% and 54.5%.

【题目】一株琼脂粉降解细菌的分离
【中文关键词】细菌; 活菌数; 琼脂粉; 降解;
【英文关键词】bacterium; alive bacteria consentration; agar; degradation;
【中文摘要】用画线接种的方法把58株从堆肥中分离的细菌接种于只含琼脂粉和水分的平皿上,室温培养数天后发现有1株细菌(BR5-1)能明显长出菌落。用这株细菌接种于含琼脂粉(2、8g·L-1)的无菌水悬液以及对照生理盐水和LB中,摇床培养48h后稀释倒平皿测活菌数。结果表明,活菌浓度在含琼脂粉的液体中(6.5×103、6.0×103cfu·mL-1)明显比在对照处理生理盐水(6.1×102cfu·mL-1)中高,但是明显比在对照处理LB培养基(1.1×108cfu·mL-1)中低。试验表明这株菌能够降解琼脂粉。
【英文摘要】One among 58 strains of bacteria isolated from compost showed clear colonies after a few days of growth on the plates containing medium made of only agar and water.Water suspention contained only agar(2,8 g·L-1) with the two controls(normal saline,LB medium) was inoculated with the bacteria(BR5-1) to see whether there were increasement of the alive bacteria consentration after 48 h of growth.Results showed that there were clear increasement of the alive bacteria concentration in the agar suspention(6.5×103,6.0×103 cfu·mL-1) compared to that in the normal saline control(6.1×102 cfu·mL-1),and far lower than that in LB control(1.1×108 cfu·mL-1).In conclusion,the bacteria strain(BR5-1) could degrade agar.

【题目】不同施氮运筹对夏玉米产量、 净收益及氮肥利用率的影响
【中文关键词】夏玉米; 氮肥运筹; 产量; 净收益; 氮肥利用率
【英文关键词】Summer maize; Nitrogen distribution; Yield; Net return; Nitrgen use efficiency
【中文摘要】氮肥管理是农业可持续发展面临的重大挑战。在测土提出合理施肥量OPT(N 210,P O 90,K20 60 k加mz)的前提下,在襄汾县通过田间试验研究了5种氮肥运筹方式对夏玉米产量、 净收益及氮肥利用率的 影响,结果表明,与对照(OPT-N)相比,不同氮肥运筹均明显提高夏玉米产量、 净收益,提高玉米籽粒和秸秆 的含氮量及玉米的吸氮量;OPT3处理可以获得10 102 kg/hm 的产量,较不施氮肥增产23.4%,每千克纯氮 可以生产9.1 kg的籽粒,净收益可达15 319元/hm ,较对照增收19.3%,同时肥料利用率可达47.O%,是最 适宜的氮肥运筹方式;OPT1也可获得较高的产量和净收益,分别为9 897 k m 和14971元/hm ,氮肥的农 学效率为8.2 kg,产量较对照增产20.9%,净收益较对照增收16.6%,但氮肥的利用率相对较低,为38.6%,也 是可以接受的氮肥运筹方式。该研究成果可为山西省夏玉米生产提供理论支撑和实践指导。
【英文摘要】Nitrogen management remains one of the most challenrng tasks for sustainable agriculture.Based on soil analysis and fertilizer recommendation OPT(N 210,P105 90,K20 60 kg/hm),field experiment was conducted in a randomized design with six treatments and three replicates to study the influence of the distribution of nitrogen application on summer maize yield,net re- turn,and agronomic efficiency of nitrogen application as well as nitrogen use efficiency.The results showed that the distribution of nitrogen application had a significant effect on summer maize yield,net return,the nitrogen content of grain and stalk as well as ni- trogen uptake.The treatment of OPT3(1/2 N applied at V 5-6 stage and 1/2 N as topdressing at jointing stage of maize growth) produced the highest yield and net return by 10 102 kg/hm。and 15 3 19 yuan/hm ,respectively.Comparing with the treatment of without ni~ogen application(OPT—N),yield and net return increased by 23.4%and 19-3%,respectively.At mean time,agronomic efficiency of nitrogen and nitrogen use efficiency were 9.1 kg and 47.0%.respectively.This indicated that OPT3 was optimummanner of nitrogen distribution.The treatment of OPT1(N applied at jointing stage of maize growth)helped produce better yield(9 897 kg/hm)and net return(14 971yuan/hm).Compared with OPT—N,yield and net return increased by 20.9%and 16.6%,re— spectively.But ni~ogen agronomic efficiency(8.2 kg)and nitrogen use efficiency(38.6%)were lower than OPT3.OPT1 also was an option manner.These results will provide theoretic and practice guide for rational fertilization of summer maize in southern region of Shanxi province.

【题目】Design and validation of a low cost surface plasmon resonance bioanalyzer using microprocessors and a touch-screen monitor
【中文关键词】无
【英文关键词】Bioanalyzer
Surface plasmon resonance
Micro-flow cell
Touch-screen monitor
【中文摘要】无
【英文摘要】An economical and high-performance bioanalyzer, with no use of laptop computer, based on the use ofTSPR1k23 biosensorswas systematically designed, and validated experimentally for its high performance.The analyzer is composed of a micro-flow cell, a thermoelectric cooler (TEC), a clamp, a touch-screenmonitor, and an electronic control unit (ECU) incorporated with photoelectric conversion device. Themicro-flow cell is made of stainless steel with high thermal conductivity, and the micro-flow system isbased on PID temperature-controlled algorithm to keep the constant temperature (25 ◦ C) of the liquidsample via thermal exchange with the clamp. With a peristaltic pump implemented by an injection loopflowsystem, the bioanalyzer allows the core sensor tobecompletely exposedtosamples. The touch-screenmonitor displays the normalized response signal values updated every 0.25 s, with a typical noise levelless than 5 RU (response unit) within 2 h. The bioanalyzer was validated using hepatitis B surface antigen(HBsAg) as an example. Anti-HBsAg monoclonal antibody is adhered to the surface of the sensor chip by abifunctional cross-linker with the technology of self-assembly. The duration of the HBsAg measurementonly lasts 5 min with a dilution factor ranging from 200 to 1200, optimized with a R-squared value 0.998.The results suggested that the bioanalyzer has higher selectivity, lower cost, expanded detection limit,and shorter measuring time as compared with the HBsAg ELISA kit, especially for low concentrations ofanalyte.

【题目】Novel design of a data acquisition and analysis system for surface plasmon resonance bioanalyzer using labview virtual instrument
【中文关键词】无
【英文关键词】Virtual Instrument; LabVIEW; bioanalyzer;
single chip
【中文摘要】无
【英文摘要】A novel data acquisition and analysis system hasbeen developed for a surface plasmon resonance (SPR)bioanalyzer, which is based on the use of TSPR1k23 biosensorand composed of a microflow cell, a clamp, and aphotoelectronic conversion device. A virtual instrumentconsists of a computer-based platform that is equipped withpowerful application software and cost-effective hardware,which outperform the functions of the instrument for obtainingdata from the biosensor. In this system, ThePIC24HJ32GP302 microprocessor interfacing with a 16bitADS8326 analog-to-digital converter is used to transform thephotoelectronic signals from the CCD photodetector and thecommunication between the microprocessor and the computeris achieved through the USB-RS232C serial port converteradapter designed by CP2102 chip. The system software fordescribing the biomolecular interaction and sampleconcentration is programmed with LabVIEW graphicprogramming environment, which be mainly introduced in thispaper. The software modules reveal important information forsensor golden surface that SPR signal can be identified aswell and the values of response unit (RU), refractive index (RI)and sample concentration can be computed correspondingly.Because it is based on computer, the system ’ s function isflexibly defined and meets user ’ s requirement easily. This dataacquisition and analysis system is more

directviewing,economical , high efficient, friendly in comparison with otherdata acquisition and analysis system based on VB language orassemble language. Some biochemistry experimental resultsshow that it is a highly performance data acquisition andanalysis system.

【题目】Novel plating solution for electroless deposition of gold film onto glass surface.
【中文关键词】无
【英文关键词】Electroless plating; Gold film; HAuCl4/H2O2
【中文摘要】无
【英文摘要】In this paper, a simple and environmentally friendly electroless plating solution of chloroauric acid (HAuCl4) and hydrogen peroxide (H2O2)for depositing gold film onto (3-aminopropyl)-trimethoxysilane (APTMS) -coated glass surface has been developed. APTMS as an adhesivereagent was used to attach the gold nanoparticles (AuNPs) onto the glass substrate. These AuNPs could be regarded as the preferential nucleationor catalytic sites for gold electroless reduction, which accelerated the reduction of Au3+ on the glass surface and effectively prevented theformation of gold metal in the bulk solution. During the gold plating process, H2O2 as the reducing agent was thermodynamically capable ofreducing Au3+ ions from the HAuCl4 precursor to gold atoms, which deposited onto the glass surface and finally formed the continuous gold film.The resulting gold film was characterized with X-ray diffraction (XRD), X-ray photoelectron spectroscopy (XPS), scanning electron microscope(SEM) and atomic force microscope (AFM), respectively

【题目】Retrocyclin 2: a new therapy against H5N1 virus in vivo and vitro
【中文关键词】无
【英文关键词】Avian influenza virus Chicken embryos H5N1 virus Influenza virus MDCK cells Retrocyclin 2
【中文摘要】无
【英文摘要】We tested the ability of retrocyclin 2, atype of h defensin, to protect cells and chickenembryos from infection by H5N1 highly pathogenicavian influenza virus. A gene fragment of retrocyclin2 was designed based on the protein sequence ofretrocyclin 2 and cloned into the eukaryotic expressionvector pcDNA4.01 (HismaxA), named pcDNA4-RC2. The expression vector pcDNA4-RC2 protectedMDCK cells and chicken embryos from infection bythe H5N1 virus through inhibition of virus replicationand viral mRNA transcription. Retrocyclin 2 istherefore effective in preventing H5N1 virus infectionin vivo and in vitro and could be considered as anew therapy for H5N1 influenza and other diseases

【英文关键词】Porcine circovirus type 2; Nuclear localization signal-truncated capsid protein; ELISA; Antibody detection
【中文摘要】无
【英文摘要】Porcine circovirus type 2 (PCV2) has been recently associated with a number of disease syndromes, especially postweaning multisystemicwasting disease (PMWS). Herein, an alternative indirect enzyme-linked immunosorbent assay (ELISA) for detection of PCV2 antibodywas developed using nuclear localization signal-truncated capsid protein of PCV2 produced in Escherichia coli (CAP ELISA). Thisassay was validated by comparison with an indirect immunofluorescence assay (IIF) and a PCV2-based ELISA. The diagnostic sensitivity(DSN), specificity (DSP) and accuracy of the CAP ELISA were 95.3%, 93.9% and 95.1%, compared with IIF on 1080 field serumsamples, and 93.3%, 84.2% and 91.1%, compared with the PCV2-based ELISA on 79 field sera, respectively. Cross-reactivity assayshowed that this assay was PCV2-specific. Repeatability tests revealed that the coefficients of variation of positive sera within andbetween runs were less than 15%. This ELISA is simpler to produce and perform, time-saving and suitable for large scale surveys ofPCV2 infection at low cost and the evaluation of the efficiency of various vaccines against PCV2.

【题目】A multiplex PCR for rapid and simultaneous detection of porcine circovirus type 2, porcine parvovirus, porcine pseudorabies virus, and porcine reproductive and respiratory syndrome virus in clinical specimens
【中文关键词】无
【英文关键词】Multiplex PCR (mPCR) Porcine circovirus type2 (PCV2) Porcine parvovirus (PPV) Porcine pseudorabies virus (PRV) Porcine reproductive and respiratory syndrome virus (PRRSV)
【中文摘要】无
【英文摘要】A multiplex PCR (mPCR) assay was developedand evaluated for its ability to simultaneously detect multipleviral infections of swine. Specific primers were designed foreach of the following four DNA or RNA viruses: porcinecircovirus type 2 (PCV2), porcine parvovirus (PPV), pseudorabiesvirus (PRV), and porcine reproductive andrespiratory syndrome virus (PRRSV). Each target produceda specific amplicon with a size of 353 bp (PCV2), 271 bp(PPV), 194 bp (PRV), or 434 bp (PRRSV). The assay wassensitive and specific in detecting each target agent incomposite cell cultures and clinical specimens. Results frommPCR were confirmed by PCR for individual viruses and byvirus isolation. In conclusion, the mPCR has the potential tobe useful for routine molecular diagnosis and epidemiology

【题目】Development and validation of reverse transcription loopmediated isothermal amplification for detection of PRRSV
【中文关键词】无
【英文关键词】Porcine reproductive and respiratory
syndrome virus Reverse-transcription loop-mediated
isothermal amplification
【中文摘要】无
【英文摘要】To establish a reverse-transcription loop-mediatedisothermal amplification (RT-LAMP) method for rapiddetection of porcine reproductive and respiratory syndromevirus (PRRSV), four primers specific to six regions of the Ngene were designed. After amplification in an isothermalwater bath for 1 h, samples containing PRRSV generatedthe expected ladder-like products while porcine parvovirus,porcine circovirus, classic swine fever virus, pseudorabiesvirus, and swine testis cells generated no product. Thesensitivity and specificity of the RT-LAMP assay wereevaluated by comparison with reverse-transcription polymerasechain reaction (RT-PCR) and real-time PCR.Because it is specific and simple, the RT-LAMP assay willbe useful for the diagnosis of PRRSV infection.

【题目】Development and validation of an immunogold chromatographic test for on-farm detection of PRRSV
【中文关键词】无
【英文关键词】Immunochromatographic test strip
Porcine reproductive and respiratory
syndrome virus
【中文摘要】无
【英文摘要】An immunochromatographic test strip was developed to detect porcine reproductive and respiratorysyndrome virus (PRRSV). The test uses two gold-labeled monoclonal antibodies: D5 against recombinantnucleocapsid protein (rN) and E9 against recombinantMprotein (rM). In the test, PRRSVbinds to a mixtureof D5 and E9 labeled with colloidal gold; the complexes move through a membrane and are captured byrabbit anti-rM and anti-rN antibodies at a test line, producing a reddish-purple band because of theincreased concentration of gold. Unbound monoclonal antibodies move past the test line to be capturedby goat anti-mouse antibodies, producing a band at a control line. In samples without PRRSV or withlow virus concentration, a band appears only at the control line. A crossover-trial demonstrated that thetest strip was highly specific for PRRSV. The test strip detection limit was between 7.8×103 and 1.6×104TCID50/ml. Analysis of 100 clinical samples indicated that the sensitivity, specificity, and accuracy of theimmunochromatographic test strip relative to reverse transcription polymerase chain reaction (RT-PCR)were 97.0, 93.9, and 96.0%, respectively. Because the test is simple and rapid, it can be used by an unskilledperson to detect PRRSV in the field.

【题目】Development of an immunochromatographic strip for the detection of antibodies against foot-and-mouth disease virus serotype O.

【中文关键词】无
【英文关键词】Foot-and-mouth disease
ELISA
Immunochromatographic strip
【中文摘要】无
【英文摘要】An immunochromatographic strip was developed for the serological detection of type O foot-and-mouthdisease (FMD) in swine. In the strip, the expressed protein of VP1, the main protective antigen of FMDV,labeled with colloidal gold was used as the detector, the staphylococcal protein A (SPA) and swine antifoot-and-mouth disease virus (FMDV) antibody were blotted on the nitrocellulose membrane for the testand control lines, respectively. 296 swine serum samples were collected to evaluate the characteristics ofthe strip in comparison with existing commercial liquid-phage blocking ELISA (LPB ELISA) kit and peptideELISA kit. The strip was shown to be of high specificity and sensitivity. Furthermore, the dipstick assaybased on the strip is rapid (5 min) and easy to perform with no requirement of professional skills, reagentsnor equipment. This suggests that the immunochromatographic strip is an acceptable alternative for usein clinical laboratories lacking specialized equipment and for field diagnosis.

【题目】Development of a peptide-based immunochromatographic strip for differentiation of serotype O Foot-and-mouth disease virus – infected pigs from vaccinated pigs
【中文关键词】无
【英文关键词】Foot-and-mouth disease; immunochromatographic strip; nonstructural protein; peptide
【中文摘要】无
【英文摘要】An immunochromatographic strip for discriminating Foot-and-mouth disease virus (FMDV)infected from vaccinated pigs was developed based on synthetic peptide. Five peptides designed from theamino acid sequences of nonstructural proteins (NSP) of FMDV were synthesized, and pep5 located in NSP3B reacted strongly with serum from FMDV-infected pigs but did not react with serum samples from healthyvaccinated pigs. An immunochromatographic strip was developed by using colloidal gold labeled with pep5 asthe detector. Staphylococcal protein A and rabbit against peptide-conjugated ovalbumin antibodyimmunoglobulin G were blotted on the nitrocellulose membrane for the test and control lines. In comparisonwith 2 commercial NSP enzyme-linked immunosorbent assays, the peptide-based strip showed good specificityand sensitivity. The apparent agreements of this new assay with CeditestH ELISA and UBIH ELISA were98.59% and 96.63%, respectively. These results indicate that the strip can be adequately used to discriminateFMDV-infected animals from vaccinated animals.

【题目】Expression, purification, and characterization of recombinant NS-1,the porcine parvovirus non-structural protein
【中文关键词】无
【英文关键词】Expression
NS-1 protein
Porcine parvovirus

Purification
Differentiation
【中文摘要】无
【英文摘要】The non-structural protein NS-1 of porcine parvovirus (PPV) could be a useful antigen for differentiatingpigs infected with PPV from those vaccinated with inactivated whole virus. NS-1 was expressed inEscherichia coli using the pET-32a (+) vector. The fusion protein, which was expressed at a high level, wassimilar antigenically to the native NS-1 protein as determined by Western blot assay using polyclonalantibodies from pigs vaccinated with alive PPV vaccine. A simple procedurewas used to purify the fusionprotein.This research lays the foundation for using the NS-1 protein for clinical diagnosis of pigs infectedwith PPV vs. those vaccinated with inactivated whole virus vaccine.

【题目】Expression of porcine parvovirus VP2 gene requires codon optimized E. coli cells
【中文关键词】无
【英文关键词】Expression Porcine parvovirus
Purification VP2 protein
【中文摘要】无
【英文摘要】Porcine parvovirus (PPV) is a widespreadinfectious virus that causes serious reproductive diseases ofswine and death of piglets. The gene coding for the capsidprotein VP2 of PPV was amplified and inserted into theplasmid pET-32a (?), which was then used to transformEscherichia coli Rosetta, the capsid protein of PPV wasfused to a polyhistidine tag, and the position of the affinitytag is in N-terminus. VP2 was expressed using differentexpression host bacteria, including E. coli BL21, andRosetta, and different plasmid vectors, including pET-30a(?), pET-32a (?), and pGEX-6p-1. After selection, only thefusion protein inserted into pET-32a (?) was expressed wellin E. coli Rosetta. The recombinant bacterium producedhigh quantities of the fusion protein VP2, about 8% in total.The expressed VP2 was antigenically similar to the nativecapsid protein according to a Western blot assay performedwith polyclonal antibodies obtained from pigs vaccinatedwith PPV. A simple, easily commercialized procedure wasused to purify this protein. This study provides a foundationfor the application of VP2 protein in the clinical diagnosis ofPPV and in the vaccination against PPV.

【题目】Development of an immunochromatographic strip for rapid detection of antibodies against classical swine fever virus
【中文关键词】无
【英文关键词】Classical swine fever virus
Immunochromatographic strip
Chimeric protein
Rapid antibody detection
【中文摘要】无
【英文摘要】The genes encoding the Erns and E2 antigen epitopes of classical swine fever virus (CSFV) were expressedas a chimeric protein in Escherichia coli BL21 by pET expression system. The antigenicity of the expressedprotein CnC2 was identified by indirect

enzyme-linked immunoabsorbant assay (ELISA) and immunoblotwith anti-CSFV antibodies. Based on the CnC2 protein, an immunochromatographic strip was developedto evaluate the antibody titer of serum samples from swine vaccinated with CSFV vaccine rapidly. Thechimeric protein used as a detector was labeled with colloidal gold. Staphylococcal protein A (SPA) andanti-CnC2 monoclonal antibodies (mAbs) were blotted onto the nitrocellulose membrane as the test andcontrol lines, respectively. The strip assay could be performed within 5 min, which did not require anyspecial equipment or skills. Through testing sera against various strains of CSFV, the sensitivity of thestrip was determined to be 97.0% (65/67) and the specificity was 100% (98/98). The strip results wereconsistent with those of the existing commercial ELISA kit, and their correlation coefficient was 0.935. Inconclusion, the immunochromatographic strip was an acceptable method for surveying CSFV-antibodytiters in pigs.

【题目】猪圆环病毒2型(PCV2)河南分离株进化分析及ORF2基因的表达
【中文关键词】猪圆环病毒2 型(PVC2);ORF2 基因;序列分析;表达
【英文关键词】Porcine circovirus 2(PCV2);ORF2; sequence analysis; gene expression
【中文摘要】根据GenBank 中猪圆环病毒2 型(Porcine circovirus 2,PCV2)的核苷酸序列设计2 对引物,使用扩增全基因的引物对来源于河南省焦作、开封和滑县的3 株PCV 2 型JZ 株、KF 株和HX 株的ORF2 基因进行扩增,扩增片段克隆到pMD18 T 上,获得重组质粒pMD18-T-ORF2,并对其进行测序,测序结果登录在GenBank 上,登录号分别为EF028202、EF064149 和EF467928。序列分析表明,PCV2 河南分离株ORF2 基因与其它PCV2ORF2 基因核苷酸序列同源性为92.4%~99.6%,氨基酸序列同源性为90.6%~97.9%,进化分析表明,河南分离株处于同一分支,与欧洲株亲缘关系较近。应用另一对引物从重组质粒pMD18-T-ORF2 中PCR 扩增出587 bp 不包含核定位信号序列的ORF2 基因,克隆到表达载体pET-32a,成功构建了重组质粒pET-32a-ORF2,经IPTG 诱导表达了ORF2 基因编码的结构蛋白,经SDS-PAGE 和Western blotting 检测,表达的重组蛋白分子量约为40 kD,可被PCV2 阳性血清识别,说明PCV2ORF2 基因得到成功表达
【英文摘要】Two pairs of primers were designed according to the published ORF2 gene sequence of Porcine circovirus 2(PCV2),and ORF2 genes was amplified from PCV2 strain JZ, KF and HX isolated from Henan Province. The PCR products were

cloned intopMD18 T easy vector and the recombinant plasmids named pMD18-T-ORF2 were obtained and sequenced. The sequences had beensubmitted to GenBank databases and the accession numbers were EF028202, EF064149 and EF467928, respectively. The sequenceswere analyzed and compared. The results indicated that the ORF2 gene of PCV2 Henan isolates had similarities ranging from 92.4% to99.6% at nucleotides level and 90.6% to 97.9% at amino acids level with other PCV2 isolates in GenBank. 587 bp truncated ORF2gene without nuclear localization signal (NLS) sequence was amplified by PCR from pMD18-T-ORF2 of PCV2 JZ strain andsubcloned into pET-32a vector. The recombinant plasmid pET-32a-ORF2 was successfully expressed in Escherichia coli BL21 byinduction of IPTG. SDS-PAGE and Western blotting analysis indicated that the fusion protein was approximately 40 kD in molecularweight and could be recognized by antiserum against PCV2.

【题目】禽流感与猪流感病毒:跨越物种传播的新认识
【中文关键词】禽流感,猪流感,基因重排,种间屏障
【英文关键词】avian influenza,swine influenza,gene recombine,species barrie
【中文摘要】今年在墨西哥暴发的流感疫情来源于一种新的流感病毒:甲型H1N1病毒.这种病毒包括人源,禽源和猪源等甲型流感病毒基因片段,为混合毒株.比较了禽、猪和人的流感病毒在其天然宿主中的致病机理,主要目的是评估猪和禽的流感病毒成为人兽共患病的可能性,同时还评估猪在禽流感病毒传入人的过程中可能起到的作用.禽流感和猪流感作为人畜共患疾病,在流感病毒从动物到人的传播过程中起到关键的作用.猪作为流感病毒的中间宿主,具有混合器作用,人、猪、禽流感病毒可在其体内进行基因重排产生新病毒,并可能跨越种间屏障感染人类.但是流感病毒本身的跨越种间障碍传播不足以引起人流感的大暴发,动物流感病毒必须经过显著的遗传变异后才能使其在人群中长期存在.
【英文摘要】This year an outbreak of influenza in Mexico comes from a new epidemic of influenza viruses:A/H1N1 influenza virus.This virus is a kind of virus mixture,including human,avian and swine influenza virusgene fragments.The pathogenic mechanism of avian,swine and human influenz a virus in its natural host werecompared.The main purpose is to assess the risk of which pigs and poultry has the possibility to become one ofzoonotic disease and to assess the possible role in process of avian flu transmission from pigs to people.Aszoonotic disease,avian influenza and swine influenza virus have the key role in the process of human infection.But the influenza virus spread of crossing species barrier is not sufi cient to cause a large outbreak of humaninfluenz a.Animal influenz a viruses must have a significant genetic variation before they could live for a long termin the crowd

【中文关键词】口蹄疫病毒; VP1 基因; 原核表达; 蛋白复性
【英文关键词】FMDV; VP1 gene;Prokaryotic expression; Protein renaturation
【中文摘要】为获得具有免疫原性的FMDV VP1 蛋白, 以O 型FMDV 重组质粒PMD18T VP1 为模板, 利用PCR 技术扩增得到O 型FMDV VP1 基因片段, 将此基因片段与原核表达载体pET32a 连接, 构建重组表达载体, 命名为pET VP1, 经PCR和测序鉴定后, 用IPTG 诱导表达, 收集诱导的菌液进行SDS PAGE 电泳和Western Blot 分析。结果显示, 在分子量约为45 ku 处有1 条明显的蛋白条带, 且能被口蹄疫阳性血清识别, 表达产物通过包涵体纯化后用透析法复性; ELISA 检测结果显示, 所复性的蛋白具有较高的活性。结果表明, FMDV VP1 蛋白在大肠杆菌中得到高效表达, 为开发诊断制剂和疫苗的研制打下基础。
【英文摘要】The objective of this research is to get the FMDV VP1 protein which be of antigenancy activity.The re combinant expression vector pET VP1 was constructed by cloning VP1 gene of FMDV into the prokaryotic expressionplasmid pET32a from PMD18T VP1.After the recombinant plasmid was verified by PCR and sequenced analysis, the re sult showed that VP1 gene was successfully cloned into expression plasmid pET32a,The protein corresponding to the VP1gene was expressed after induct ion with

IPTG. SDS PAGE and Western blot with the product of bacterial culture in differ ent time showed that the molecular mass of the protein was approximately 45 ku, which was identif ied by positive sera ofFMDV; The protein was refolded by dialysis method, and was assayed by ELISA, the result showed that it demonstrateshigh activity. So we can say that VP1 protein was expressed efficiently in E . coli , and the renaturat ion VP1 protein can bedeveloped as diagnosis antigen or vaccine.

【题目】插入式地下滴水器的研制与水力性能试验分析
【中文关键词】插入式; 地下滴灌; 移动滴灌; 滴水器; 流量均匀性
【英文关键词】inserted; subsurface drip irrigation; movable drip irrigation; emitter; uniformity coefficient of discharge flow
【中文摘要】在对现有滴头、滴箭等产品结构改进与优化设计的基础上,研制开发出一种具有快速装拆、移动灵活、抗堵塞功能的插入式地下滴水器产品,通过产品的具体结构组成与工作原理分析,进行了其流量均匀性、压力-流量关系的试验研究,结果表明:插入式地下滴水器所需起始工作压力低,额定流量小,具有较稳定的水力性能,适合用于对缺水区非密植作物的补充性抗旱灌溉,起到提高设备利用率、有效降低灌溉系统投资的作用,且能成功地把地表滴灌转化为地下滴灌的应用模式。
【英文摘要】Based on structure improvement and optimization design of existing emitter,such as drip arrow and drip production,a new kind of insertion subsurface emitter is researched and developed,which has the advantages of assembling and disassembling quickly,moving easily,anti-jamming.Through analysis of concrete structure and work principle of the insertion subsurface emitter,the uniformity coefficient of discharge flow and the relation between pressure and discharge are tested.The results show that the insertion subsurface emitter has more stable hydraulic characteristics,its rated flow is small and the needed beginning pressure is low.So the emitter is suitable for the compensatory irrigation of the non-close planting crops to resist drought in areas of water-lacking,and will play an active role in improving the equipment utilization and reducing the total investment of irrigation system.It also successfully transformed the application pattern from surface drip irrigation to subsurface drip irrigation

【题目】晋南冬小麦一夏玉米轮作体系的氮肥运筹
【中文关键词】冬小麦—夏玉米轮作; 氮肥; 产量; 氮肥利用率
【英文关键词】Key words:the rotation of winter wheat and summer maize;nitrogen fertilizer;yield;nitrogen fertilizer use recovery
【中文摘要】冬小麦一夏玉米轮作是晋南的主要种植制度。 通过田间小区试验, 研究了冬小麦一夏玉米轮作体系 内氮肥分配(控制氮肥总量 420 kg/hm2) 对作物产量、 农学效率和纯收益及肥料利用率的影响。结果表明, 冬 小麦一夏玉米轮作体系内氮肥分配量及比例显著影响作物产量、纯收益和氮肥的效率 ,冬小麦季施总氮 55%(231 kg/hm2) 、 夏玉米季施总氮 45%(189 kg/hm2) 时, 可获得最高的轮作总产量(13 026 kg/hm2) 和最大的 净收益(22 146元/hm2) , 氮肥的农学效率和利用率较其他分配方式均有提高, 是晋南地区冬小麦一夏玉米 轮作氮肥分配的适宜比例。 值得指出的是, 由于作物生长期间受春寒和夏旱的影响, 冬小麦一夏玉米轮作体 系内的氮农学效率和氮肥利用率均较低, 仅分别为 4.6 kg/kg和20.8%。

【英文摘要】The rotation of winter wheat and summer maize is a major planting system in southern Shanxi.This field experiment was conducted in a randomized design with four replicates to study the influence of nitrogen distribution on yield,net return,nitrogen agronomic efficiency and nitrogen use recovery in rotation of winter wheat and summer maize based on the amount of nitrogen controlled(420kg/hm2).The results showed that the proportion of nitrogen distribution significantly affected the yield, net return and nitrogen use efficiency in the rotation.Under the condition of 420 kg/hm2nitrogen fertilization,the proportion of 55%(23 1 kg/hm2)applied on winter wheat and 45%(1 89 kg/hm2)for summer maize could help obtain the highest production (13 026 kg/hm2)and net retum(22 146 /hm2),and the agronomic efficiency and recovery of nitrogen fertilizer was increased. This indicated that the proportion of nitrogen distribution in the rotation was feasible for southern Shanxi province.It was important to point out that as crop suffered from adverse weather at growth stage,it led low nitrogen agronomic efficiency and nitrogen use recovery with the average value only 4.6 kg/kg and 20.8%.respectively.

【题目】山西褐土长期施钾和秸秆还田对冬小麦产量和钾素平衡的影响

【中文关键词】钾肥; 褐土; 秸秆还田; 产量; 土壤钾素平衡

【英文关键词】potassium fertilizer; cinnamon soil; straw return to soil; yield; soil potassium balance

【中文摘要】在山西石灰性褐土一年一作条件下,通过 16年的田间定位试验, 研究了长期施钾和秸秆还田对小麦产量和土壤钾素平衡的影响。结果表明,只施用氮、 磷肥, 冬小麦年平均产量 5.5 t/hm2,土壤钾素养分严重亏缺, 年平均亏缺 104.3 kg /hm2,与试验前的初始值比较,土壤速效钾和缓效钾含量分别下降 23.6%和 14.3 %。在施用氮、 磷肥的基础上每年施用钾肥 (K2O 150 kg /hm2) ,平均增产 10.2%以上; 小麦秸秆还田平均增产 6.6%以上, 二者配合平均增产 17.6 %, 年平均吸钾量提高 32.0 kg /hm2。与试验初始值比较, 土壤速效钾、 缓效钾分别提高 38.6% 和11.0%。在施用氮、 磷肥的基础上,长期施用钾肥和秸秆还田在显著增加冬小麦的经济产量、 生物产量和吸钾量的同时,也减少年度间因气候因素等影响引起的产量变异,提高年度间产量和植物吸钾量的稳定性。

【题目】Study on the Effect of Water-Storage Irrigation Technology in Korla Fragrant Pear Planting
【中文关键词】null
【英文关键词】Water-Storage Irrigation; Korla Fragrant Pear;
Growing characteristics; Yield and quality
【中文摘要】无
【英文摘要】Applying the system of water storage irrigation to Korlafragrant pear yielding according to it ’ s principle, we studied thechange of soil water in field, growth characters of tree and the effectof yield and fruit quality under water storage irrigation andconventional flood irrigation. The results showed that the soil watercontent of the root zone of fragrant pear was notably increased inthe way of water storage irrigation especially in 0 60cm layers, inwhich higher than flood irrigation in whole growing stages.Capacity of tree absorbing water from soil enhanced with soil watercontent increased, so chlorophyll content and leaf water contentwere notably increased and appeared positive linear correlationbetween them. Growing stage of tree advanced and nutritionalcharacters markedly improved under water storage irrigation, fruitsetting percentages and single fruit weight were increased, also fruitshape index is improved. The first order fruit rate increased by17.19% compared to flood irrigation, yield is increased 16.37%, andWUE increased by 45.26%. Fruit sugar acid ratio is promoted underwater storage irrigation, and fruit hardness was decreased, soimproved the fruit savor.

【题目】新疆灌区灌溉水利用系数影响因素研究

【中文关键词】灌溉水利用系数; 影响因素; 节水灌溉; 新疆灌区

【英文关键词】water transport index in canal system; influence factor; water saving irrigation; irrigation area in Xinjiang

【中文摘要】新疆地区各灌区灌溉水利用系数的影响因素有灌区渠系防渗长度、高效节水灌溉面积、井灌排面积、渠道建设长度、总灌溉面积、渠道防渗率等。基于柯布-道格拉斯模型方法,分析计算了各灌区主要因素对灌溉水利用系数的影响效应,并对其发展预期进行了评估。结果表明:节水灌溉面积、渠道防渗长度和井灌排面积三个生产要素,对新疆绝大多数灌区灌溉水利用系数产生正效应,即边际收益大于边际投入;新疆2015年、2020年规划灌溉水利用系数分别为0.520和0.570,已超过国家大型灌区灌溉水利用系数不应低于0.50的要求。

【英文摘要】There are many influence factors to water transport index in canal system in many irrigation area in Xinjiang,such as the length of channels with concrete lining,area with high and new irrigation technology,area of field irrigated with well water,length of channels,total irrigation area,rate of concrete lining for channels,etc.Based on the model of Cobb-Doug,the influential effect to water transport index caused by the main influence factors is analyzed and also the expectation development of the effect is accessed.As a conclusion,the three variable factors that include area of water-saving irrigation field,length of channels with concrete lining and area of

field irrigated with well water,will give positive-effect to the water transport index in canal system in most of the irrigation area in Xinjiang.That is to say,the margin profit is greater than the marginal input.The water transport indexes in canal system in Xinjiang irrigation area are respectively 0.52 and 0.57 in 2015 and 2020 respectively.The data meet the governmental request of not less than 0.50 in large irrigation area.

【题目】蓄流灌水器灌水均匀度试验分析
【中文关键词】蓄流灌溉; 灌水器; 灌水均匀度
【英文关键词】storing irrigation; irrigation emitter; irrigation uniformity
【中文摘要】蓄流灌水器水头压力、管径、灌水器长度、孔径、孔数是影响滴灌灌水均匀度的重要参数。室内试验研究结果表明,低压条件下压力水头的变化对灌水均匀度的影响并不明显,只要管径选择适宜,降低压力并不会对灌水均匀度产生很大影响;灌水器管径的变化对灌水均匀度的影响较为明显,灌水均匀度随着管径的增大而增大,但当管径增大到一定程度后,灌水均匀度随管径增大反而呈现减小趋势;灌水均匀度随着灌水器长度的增大呈降低趋势;灌水器孔径越大,灌水均匀度越好;灌水均匀度随着灌水器孔数的增加反而减小。
【英文摘要】The flow pressure,pipe diameter,irrigation emitter length,diameter of hole,and quantity of hole are important influencing parameters for the irrigation uniformity.The indoor experimental research results show that the influence of pressure change on irrigation uniformity is inconspicuous under low pressure condition.If appropriate pipe diameter is selected,the decrease of pressure has little influence on irrigation uniformity,while the change of pipe diameter of emitter has obvious influence on irrigation uniformity.The irrigation uniformity increases with the increase of pipe diameter,but decreases with the increase of pipe diameter when the pipe diameter reaches certain degree.It decreases with the increase of irrigation emitter length.The larger the diameter of hole is,the

better the irrigation uniformity is.It also decreases with the increase of quantity of hole.

【题目】变量施肥对改善土壤养分空间差异性的综合评价
【中文关键词】模糊聚类; 土壤; 养分; 变量施肥; 空间差异;
【英文关键词】"fuzzy clustering; soil; nutrients; variable rate fertilization; spatial difference;

"

【中文摘要】"精准农业中一个非常重要的环节就是变量施肥,其核心思想是根据土壤中养分含量的多少来决定施肥量,以达到土壤养分平衡。目前通常对土壤养分情况评价的做法是分别考察每种土壤养分的变异情况,不能综合分析。因此,该文提出利用一种加权模糊聚类算法,综合评价经过变量施肥作业后土壤养分空间差异性的变化情况。通过对榆树市弓棚镇十三号村3号地未变量施肥、连续变量施肥2年和连续变量施肥5年的土壤养分进行综合分析比较,可知经过连续变量作业后土壤养分空间差异明显减小。

【英文摘要】Variable rate fertilization is very important part of precision agriculture.Its core idea is based on that according nutrient content in soil to determine fertilizer amount,so as to achieve balance of soil nutrients.Now the conventional method for evaluating the soil nutrients is based on inspecting variations of each kind of soil nutrient separately,and this method can not comprehensive analysis.Therefore,the soil nutrients spatial difference after the variable rate fertilization was comprehensive evaluated by using a weighted fuzzy clustering algorithm.In 3rd field of 13th village in Gongpeng Town of YuShu city,comprehensive comparing of the soil nutrients of the field with no variable rate fertilization,with continuous variable fertilization for two years or five years was conducted.Result showed that the soil nutrients spatial difference was reduced obviously after continuous variable rate fertilization.

【题目】一种简单凹形区域间拓扑关系的表示模型

【中文关键词】拓扑关系; 简单凹形区域; 凸壳; RCC23; 9-交集;

【英文关键词】"topological relation; simple concave region; convex hull; RCC23; 9-intersection;
"
【中文摘要】通过研究El-Geresy提出的一种空间推理方法,扩展了经典9-交集矩阵,得到16-交集矩阵,基于16-交集矩阵对RCC23的基本关系进行细化,定义了两个简单凹形区域间的62种拓扑关系,得到RCC62并给出其概念邻域图和最近拓扑关系图.RCC62比RCC23新增了39种拓扑关系,表达力更强.将RCC62模型应用于空间查询领域不仅能增加查询的准确度,而且也提高了查询效率
【英文摘要】Based on El-Geresy ’s general approach in spatial reasoning, 9-intersection matrix is extended to 16-intersection matrix. With 16-intersection matrix as a representation structure, the relations in RCC23 are refined to 62 topological relations between two simple concave regions, thus derived RCC62. RCC62 is more expressive than RCC23, since it has 39 more topological relations than RCC23. By applying RCC62 to practical field of spatial query, both the accuracy and efficiency of querying operation are improved. In order to further research the reasoning and composition table of RCC62, the conceptual neighborhood graph and the closest topological relation graph of RCC62 are given

【题目】基于传感器的变量施肥机定位方法
【中文关键词】"变量施肥机; 传感器; 定位;

"
【英文关键词】" Variable rate fertilizer applicator; Sensor; Positioning;

"

【中文摘要】"简述了一种应用传感器代替GPS的变量施肥机定位方法。控制器读取传感器的脉冲信号,计算施肥机的行走距离,由自动网格识别算法实现施肥机自动网格识别。本文给出了传感器测距累积误差校正方法以提高定位精度。对于垄长为40m的网格,要使定位误差小于6%,累积误差应小于2.4m。实验结果表明,经过校正,拖拉机行走距离为250 m的时候,光电编码器和接近开关传感器测距累积误差分别为2.32 m和2.34 m(定位误差小于6%)。如果在此定位误差条件下,增加操作单元垄长方向划分的距离,可满足更长地块作业的定位要求。

【英文摘要】A positioning method of a variable rate fertilizer applicator with sensors is introduced,to replace GPS in precision agriculture.In the positioning system,the controller receives pulse signals from the sensor and calculates the working distance of the variable rate fertilizer applicator,thus the grid in which the fertilizer applicator is working is identified by the algorithm of automatic grid recognition. The accumulative error of the system from the sensor is corrected by the error revising algorithm,and the correction results were tested in field.The experiment results showed that the accumulative errors for the photoelectric encoder and the proximity transducer are 2.32 m and 2.34 m,within 250 m of working distance,respectively,i.e.the positioning errors is less than 6%.Under the above conditions,a variable rate fertilizer applicator can be applied in a larger working field if the working grid is divided longer.

【中文摘要】"以东北典型黑土区为研究对象,测定土壤不同粒级有机无机复合体、矿物颗粒和有机碳含量,探讨土壤有机无机复合体组成及其空间分布特征,分析土壤对有机碳的复合机制。结果表明:东北黑土有机无机复合体组成主要以细砂粒复合体为主,黏、粉粒复合体次之,其含量均随剖面发生层向下呈减少趋势,南北区域上,也呈降低趋势。有机碳在各级复合体中及土壤中的含量均随着复合体的粒径增大而减少。各级复合体有机碳在土壤中均呈随剖面发生层向下由A层呈指数函数下降,在区域上,因东北黑土剖面有机碳含量及南北温度差异有机无机复合体含量曲线随区域差异有所不同。同时也说明东北黑土黏粒仍有较大的碳库容量。从其组成和组分间的相关分析,黏粒是形成和增加粉粒复合体的基础,从而利于增加土壤有机碳储量和改善土壤团聚结构。
【英文摘要】The black soil of northeast China was selected in a case study to analyze composition and spatial distribution of soil organic mineral complex,and to explain complexion mechanism of organic and mineral on soil by measuring contents of organic mineral complexes,mineral particles organic character of different size. Results showed that organic mineral complexes in black soil primarily compose by the fine sand organic mineral complex,next clay ’s and silt ’s. Each of their contents decreasing with profile development layer forward down,in the black soil region show low trendy from south to north. Content of organic carbon in each fraction complexes and soil decrease with size of complexes increasing. Organic carbon of every complex decrease by exponential function with profile development layer of black soil forward down. In spatial distribution,content plot of organic mineral complex are different with different region for different content of organic carbon in soil profiles and temperature at south and north,therefore it suggest that the clays still to have bigger capacity of carbon pool in the black soil of northeast China. By correlation analysis of fractions and components of complex,clay is basis of forming and increasing slit complex,and is good for increasing content of soil organic carbon and improving soil aggregation structure

【题目】自组织分治求解分布式约束优化问题
【中文关键词】"分布式约束优化问题; 多Agent系统; 自组织; 分散式算法; 分治法;

"
【英文关键词】" distributed constraint optimization problem DCOP; multi-agent system; self-organization; decentralized algorithm; divide and conquer;

"
【中文摘要】"分布式约束优化问题(DCOP)是在大规模、开放、动态网络环境中的优化问题,在计算网格、多媒体网络、电子商务、企业资源规划等领域中都有广泛应用.除了具有传统优化问题的非线性、约束性等特点,DCOP还具有动态演化、信息区域化、控制局部化、网络状态异步更新等特点.寻求一种解决DCOP的大规模、并行、具有智能特征的求解方法已成为一个具有挑战性的研究课题.目前已提出多种求解DCOP的算法,但大多不是完全分散的算法,存在集中环节,需要网络的全局结构作为输入,不适合处理由规模巨大、地理分布、控制分散等因素导致的全局结构难以获取的分布式网络.针对该问题,提出一个基于自组织行为的分治策略求解DCOP.在不具有全局网络知识的情况下,分布在网络中的多个自治Agent基于局部感知信息、采用自组织的方式协作求解.与已有算法相比,它是一个完全分散式算法,并在求解效率和求解质量方面都展现出很好的性能.
【英文摘要】Distributed constraint optimization problem (DCOP) is a kind of optimization problem oriented to large-scale, open and dynamic network environments, which has been widely applied in many fields such as computational grid, multimedia networks, e-business, enterprise resource planning and so on. Besides the features such as non-linear and constraint-satisfaction which the traditional optimization problems have, DCOP has its distinct features including dynamic evolution, regional information, localized control and asynchronous updating of network states. It has become a challenge for computer scientists to find out a large-scale, parallel and intelligent solution for DCOP. So far, there have been a lot of methods for solving this problem. However, most of them are not completely decentralized and require prior knowledge such as the global structures of networks as their inputs. Unfortunately, for many applications the assumption that the global views of networks can not be obtained beforehand is not true due to their huge sizes, geographical distributions or decentralized controls. To solve this problem, a self-organizing behavior based divide and conquer algorithm is presented, in which multiple autonomous agents distributed in networks work together to solve the DCOP through a proposed self-organization mechanism. Compared with existing methods, this algorithm is completely decentralized and demonstrates good performance in both efficiency and effectiveness

【题目】混合维拓扑和尺寸关系的定性空间推理
【中文关键词】"定性空间推理; 混合维空间关系; 约束满足问题; 区域连接演算; 结合空间关系;

"
【英文关键词】"qualitative spatial reasoning; multi-dimensional spatial relation; constraint satisfaction problem; region connection calculus; integrated spatial relation;
"
【中文摘要】"定性空间推理(QSR)研究空间关系,多数工作集中在单维空间关系,但在地理信息系统(GIS)中多维对象很常见.混合维对象空间关系是指点、线和区域3类对象出现在同一场景的情况,该类问题对定性空间推理研究有着重要的理论意义和应用价值,但这方面的研究工作还比较少.在已有的混合维区域连接演算的基础上进行完善,提出了MRCC5混合维拓扑模型,并研究了其上约束满足推理问题的复杂度.对定性尺寸关系进行了混合维扩展,给出了MDS模型,进而研究了其推理

问题.在以上工作基础上,提出了RCC5和MDS的结合模型,给出并分析了结合模型的推理算法.将定性空间推理相关研究推广到混合维领域,深入研究了混合维拓扑关系推理,提出了混合维尺寸以及混合维拓扑尺寸结合模型.

【英文摘要】Qualitative spatial reasoning(QSR) studies the spatial relations of objects in the space.Most QSR research work aims at the spatial relations between single dimensional objects(i.e.region-region relation or line-line relation).Spatial relation of multi-dimensional objects is the situation that point,line and region objects appear in one scene at the same time.Spatial relation of multi-dimensional objects is very common in geographical information systems(GIS).Qualitative spatial relation of multi-dimensional objects has very important theoretical meaning and practical value,but very few work in QSR was focused on it before.By improving the previous research on multi-dimensional region connection calculus model,a multi-dimensional topological model(i.e.MRCC5) is given,and the complexity of its constraints satisfaction problem is studied.The multi-dimensional extension of qualitative size relation called MDS model is proposed,its reasoning problem is also investigated.Based on the above work,a model which combines RCC5 and MDS is proposed,so does its reasoning algorithm.This work extends the related work in qualitative spatial reasoning to the multi-dimensional field.The reasoning of multi-dimensional topological relation is improved.It is the first time that multi-dimensional size relation model and relation model integrating topology and size are studied.

【题目】基于缓冲区的扩展拓扑关系模型及应用

【中文关键词】" 定性空间推理; 区域连接演算; 缓冲区; 约束满足问题; 结合空间关系;

"

【英文关键词】"qualitative spatial reasoning; region connection calculus; buffer; constraint satisfaction problem; integrated spatial relation;

"

【中文摘要】" 定性空间推理在人工智能等领域有着广阔的应用前景,但目前单方面空间关系研究较多,多方面结合研究较少,这与实际应用需求不符.由于各类空间关系具有独立性,需要找到适当的理论将它们融合,目前对于拓扑、距离结合模型的研究还不够充分.针对缺乏基本关系可处理且易于在GIS系统中实现的模型等情况,提出了一种扩展拓扑关系模型BERCC.BERCC源于RCC理论,其主要思想是通过考虑缓存区之间的拓扑关系来提高模型表达能力,同时能表达一定程度的距离信息.推导了BERCC的弱复合表,证明了BERCC基本关系是可处理的,给出了一个包括全集关系和基本关系的可处理子集,在此基础上实现了约束满足推理算法.最后,基于该理论和方法实现了一个实验系统,进一步验证了模型及算法的正确性和实用性.

【英文摘要】Qualitative spatial reasoning (QSR) is promising for applications in artificial intelligence and other fields. Much research work bas been done on single spatial relation aspect,while little research focused on integration of two or more aspects. This does not accord with the real world applications,where several aspects are usually involved together. Since different aspects of space are often dependent,it is needed to establish more elaborate formalisms that combine different types of information. The researches on combining topology and distance are not sufficient now. And the model which is tractable in basic relations and easy to implement in GIS is lacking. An extensional topology relation model,BERCC,is proposed based on RCC theories. Its main idea is to improve express ability by using the topological relation of buffers. Some distant information is included in the model. The weak composition table of BERCC is deduced. The basic relations of BERCC are proved to be tractable. The tractable subset of BERCC including basic and full relations is given. A constraint satisfaction reasoning algorithm of BERCC is implemented. Finally,an experimental system is developed with the above theories and methods. The correctness and practicability of the model and the algorithm are validated by the system.

【题目】不同施钾量对玉米钾素吸收利用的影响研究
【中文关键词】玉米; 不同施钾量; 钾素吸收;
【英文关键词】Maize; Different potassium rates; Potassium absorption;
【中文摘要】采用田间试验研究了不同施钾量对玉米钾素吸收利用的影响。结果表明:玉米产量随钾肥用量提高呈缓慢上升趋势。当钾肥用量达156kg/hm2时玉米产量最高,为11177kg/hm2,与不施钾肥处理相比增产20.53%,产量差异达显著水平;不同施钾处理玉米收获后土壤速效钾含量比播种前有所降低,土壤缓效钾随钾肥施用量的增加而明显提高,土壤全钾含量变化不大;不同施钾处理,随着钾肥的施用量提高,玉米从土壤中带走钾量明显增加,当钾肥施用量在117kg/hm2以下时,土壤中的钾素亏损,不能保持土壤中钾素平衡;各处理玉米子粒中钾素含量均比其茎秆钾素含量低,随着钾肥施入量的增加,子粒茎秆中钾素含量也相应增加;不同施钾处理,钾素的利用率随钾肥的施用量的增加而减少。
【英文摘要】"This paper used the method of field experiment, analysis and different application of potassium fertilizer for black soil region of middle of Jilin to study the effects of use of nitrogen from maize. The results showed that the output increased slowly with the dosage of potash fertilizer through different ways. When the dosage of potash fertilizer was 156kg/ha, the output of maize was highest. The highest output was 11 177 kg/ha. Compared with NPK0 disposing, the output was increasing by 20.53%, and production volume variance reached significance level. Cultivated land soil available potassium content was lower than pre-sowing, with the increasing of potassium application rate, the slowly available potassium was increasing obviously, but there was little change of soil total potassium content. Different treatment of potassium, along with the application of potassium, maize absorb more potassium from soil when application of potassium blow 117 kg/ha, the potassium status in soil lost so that it could not keep soil potassium balanced. Determination of potassium element in maize kernel was lower than its straw. Along with the application of potassium, potassium element in maize kernel also increased. Different treatment of potassium fertilizer, recovery of potassium fertilizer decreased along with the increasing of potassium application rate. "

【题目】基于服务组链的Web服务组合方法
【中文关键词】计算机应用; Web服务; 服务组; 服务组链; 服务组合;
【英文关键词】computer application; Web service; service community; service community chain; service composition;
【中文摘要】针对带有分支和汇合结构的并发服务组合问题,提出了一种Web服务组(WSC)模型。WSC模型除了能够描述多个前驱服务或多个后继服务同时需要被组合的并发组合关系和顺序组合关系外,还能保证被组合服务的可执行性。在此基础上,扩展基于服务链组合方法,提出一种基于服务组链的服务组合方法。该方法能够采用统一的方式处理顺序服务组合问题和并发服务组合问题。最后通过实验和实例证明了本文方法的有效性。
【英文摘要】A Web service community(WSC) model to deal with the simultaneously occurred service composition problem with branching and merging structures. The WSC model can not only describe the parallel and the sequential composition relations where

the multiple forerun and follow-up services need to be combined but also guarantee the implementation of each combined service. Moreover,spreading the service community chain based composition approach,a Web service composition approach was proposed based on the service community chain. The approach can deal with the sequential and the parallel service composition problems in a unified way. The proposed approach was verified by experiments and case studies

【题目】磷对不同基因型玉米生长及氮磷钾吸收的影响
【中文关键词】磷; 玉米; 生长; 氮磷钾吸收
【英文关键词】phosphorus ; maize ; growth ; uptake of N, P and K
【中文摘要】采用田间试验法, 在高磷和低磷土壤上分别设置施磷和不施磷处理, 研究磷对 9个玉米基因型生物量、产量、氮磷钾养分吸收量的影响及其各基因型间的异同, 为磷肥合理施用提供科学依据。结果表明, 在高磷土壤上, 不施磷对各玉米基因型的生物量、产量、产量构成因素和多数玉米基因型的氮磷钾吸收量影响不大; 在低磷土壤上, 不施磷降低各玉米基因型的生物量、穗粒数、产量及氮磷钾吸收量。两个磷水平下, 均以鑫玉 16的生物量和产量最大, 冀单 28最小, 这与前者具有较多的养分吸收量有关。不同玉米基因型间有明显差异, 在玉米生产中应该因地制宜合理施用磷肥。
【英文摘要】On the higher and lower available P soils , treatments o f P fertilize r application we re designed in the field condition. Effects of P fertilizer application on the plant biomass , y ield , nutrient uptake o f N, P and K in nine maize cultivars , and their differences were studied . This provided the scientific basis for P fertilizer reasonable application . The results showed that on the higher available P soil, P fertilizer applicati on hardly infl uenced the maize biomass , yield and its constitute , and nutrient uptake of N, P and K. On t he lower available P soil, without P fertilizer application decreased maize biomass , seed numbe r per ear , yield , and uptake of N, P and K. Because of the higher nutrient uptake , liyu16 had higher biomass and yield under the condition o f two P levels . Nine maizecultivars had significant difference . Therefore , according to soil available P content , reasonable P fertilizer application should be suggested in the maize produce.

【题目】用增稳系数评价钾肥配合秸秆还田对作物的增产稳定性效应
【中文关键词】增产稳定性;增产稳定性系数;钾肥配合秸秆还田;小麦;玉米
【英文关键词】stability of durative yield increasing;yield increase stability coefficient(YSIC);potassium(K)fertil-ization and straw recycling;wheat;corn
【中文摘要】据长期定位试验结果,提出增产稳定性系数(增稳系数)指标,据此研究化学钾肥和秸秆配合施用对小麦玉米产量的持续增产稳定性效应,以期更合理评价钾肥配合秸秆还田这一施肥方式对作物增产稳定性的影响。试验共设4个处理,分别为:(1)只施氮磷肥的对照(NP);(2)在对照基础上加施秸秆(NPst);(3)在对照基础上加施钾肥(NPK);(4)在对照基础上加施秸秆和钾肥(NPKSt)。结果表明:增稳系数可以作为评价施肥方案对作物产量长期持续增产效应的综合指标;不同施肥方案的长期持续增产效应定量分析表明,钾肥配合秸秆还田方案不但促进作物增产,还能提高增产的持续稳定性。
【英文摘要】ording to long-term sited fertilization experiment,this paper put forward yield increase stability eoeffi · cient(YISC)index,in order to study and quantitative analyze stability of durative yield-increasing effect of potassium(K)fertilization and straw recycling on wheat and cornyields.The experiment includes 4 treatments鸹:(1)CK,onlyproviding

N and P fertilizer;(2)CK+wheat straw recycling;(3)Optimum rate of N,P and K fertilizer;(4)N,Pand K fertilization+wheat straw recycling.The results show that YISC is available for evaluating stable yield-increasingeffect of the fertilization design.By quantitative analysis for long-termyield-increasing effect of different fertilization de-signs we know that long-term K fertilization and straw recycling can both increase grain yield and stability of durative yieldincreasing.

【题目】长期施肥潮土在玉米季施肥初期的有机碳矿化过程研究
【中文关键词】长期不同施肥;土壤呼吸;土壤潜在可矿化有机碳;易矿化性有机碳量
【英文关键词】Long-term different fertilization, Soil organic carbon mineralization, Potentially mineralized C, Easily mineralized C
【中文摘要】以黄淮海平原长期定位试验地2007 年玉米播种期土壤为研究对象,通过室内37 天的培养实验并选择4 个应用比较广泛的方程对土壤有机碳矿化过程进行拟合,其目的主要是为了比较研究长期不同施肥土壤在玉米季施肥初期有机碳矿化过程及主要矿化参数的差异, 并评估矿化参数和主要土壤性质之间的相关关系。 结果表明, 37 天培养期内各施肥处理土壤CO2-C累积释放量与土壤有机碳、全氮含量和微生物活度均呈显著正相关,大小依次为OM>1/2OM+1/2NPK>NPK>NP>PK>CK>NK,有机碳矿化过程均呈曲线形式,与 Jones(1984)改进的一级动力学方程拟合效果最好。拟合所得土壤潜在可矿化有机碳量(C0) 、易矿化有机碳量(C1)和初始潜在矿化速率(C0k)均表现出有机肥处理高于化肥处理,施肥处理高于不施肥处理(NK处理除外) ,与土壤有机碳、全氮和土壤微生物活度均呈显著正相关;有机碳矿化速率(k)和土壤潜在可矿化有机碳占土壤总有机碳的比例在处理间差异均不显著,除 k 与有机碳呈显著负相关外,其他与土壤性质均无显著相关性。因此,我们推测有机肥和化肥的平衡施用均能显著增强土壤有机碳的矿化作用,有利于土壤无机养分的释放,同时使部分有机碳在土壤中积累。
【英文摘要】In a 37-day laboratory incubation study soil organic C mineralization was determined in soil samples obtained from initial stage of maize growth in an 18 year long-term field experiment which was carried out to evaluate nutrition equilibrium in a fluvo-aquic soil under different fertilization treatments. During the incubation time, cumulative CO2-C released from soil was positively correlated to soil organic carbon, total nitrogen and microbial activity, which with a general decrease order of OM>1/2OM+1/2NPK>NPK>NP>PK>CK>NK. A modified first-order model best described C mineralization in the soil. Potentially mineralized C (C0), easily mineralized C (C1) and the initial potential rate of C mineralization (C0k) were significantly different among the treatments with a general decline order of organic manure treatments>mineral fertilizer treatments>control, which were positively correlated to soil organic carbon, total nitrogen and microbial activity. Mineralization rate (k) and potentially mineralized C divided by organic C (C0:Organic C) were not significantly different among treatments, which were not correlated to soil organic carbon, total nitrogen and microbial activity except k was negatively correlated to organic carbon. Consequently, we conferred that long-term application of both organic manure (OM or 1/2OM+1/2NPK) and mineral fertilizers (except NK) to soil could significantly increase the mineralization of soil organic carbon, reflecting the differences in soil properties, thus increase the availability of soil mineral nutrients to crops and soil organic carbon content.

【题目】长期施肥处理对玉米生长期潮土微生物生物量和活度的影响

【中文关键词】施肥处理;微生物生物量碳;微生物生物量氮; 微生物活度
【英文关键词】Fertilization treatment ; Microbial biomass carbon ; Microbial biomass nitrogen ; Microbial activity
【中文摘要】以1989年建立的中国科学院封丘农田生态系统国家试验站的长期定位试验为平台, 研究经18a连续不同施肥处理后玉米季土壤微生物生物量碳氮和微生物活度的动态变化及其与土壤有机碳之间的相互关系,并探讨施肥措施对土壤微生物及其活性的影响。施肥处理包括: (1)有机肥 (OM); (2) 1 /2化肥和1 /2有机肥 (1 /2OM+ 1 /2NPK); (3)氮磷钾肥 (NPK) ; (4)氮磷肥 (NP); (5)磷钾肥 (PK); (6)氮钾肥 (NK);(7)不施肥,即对照 (CK) 7个处理。结果表明,微生物生物量碳氮和微生物活度在玉米生长期内均有明显的时间变异性,其中微生物生物量碳与微生物活度的动态变化比较一致, 其间的极显著相关关系表明潮土微生物生物量碳的变化可以在很大程度上代表土壤微生物活度的变化。施肥制度显著影响微生物生物量碳氮和微生物活度的变化,总体趋势为 OM> 1 /2OM+ 1 /2NPK > NPK > NP> PK > NK > C K,表明 OM 有利于保持土壤的生物化学环境及促进土壤的生物学活性; 与 OM处理相比,化学肥料的长期施用有降低土壤微生物生物量和微生物活度的趋势,尤其是缺素处理的表现更为明显, 其中以缺磷处理的表现最为严重。土壤微生物生物量碳氮、 微生物活度与土壤有机碳变化均呈极显著正相关。

【题目】Immunomodulation of RAW264.7 macrophages by GLIS, a proteo ¬ polysaccharide from Ganoderma lucidum
【中文关键词】无
【英文关键词】cytokines; Ganoderma lucidum (GL); immunoactivation
【中文摘要】无
【英文摘要】The immunomodulatory effect of Ganoderma lucidum immunomodulating substance (GLIS) on macrophages has been investigated as part of on-going research into the anti-cancer properties of Ganoderma lucidum. Proliferation of bone marrow macrophages (BMMs) was enhanced by GLIS in a dose-dependent manner. Microscopic examination revealed that numerous GLIS-treated RAW264.7 macrophages were enlarged and formed pseudopodia. Exposure of RAW264.7 macrophages to GLIS resulted in significant increases in NO production, induction of cellular respiratory burst activity, and increased levels of IL-1 beta, IL-12p35 and IL-12p40 gene expression. Our data indicate that GLIS activates the immune system by modulating cytokine production

【题目】诱导性多潜能干细胞的研究进展
【中文关键词】诱导性多潜能干细胞;哺乳动物;研究进展
【英文关键词】induced pluripotent stem cells, mammal, research progress
【中文摘要】作为生命科学界一大热点领域的干细胞研究一直备受关注,而诱导性多潜能干细胞(,简称iPSC或iPS细胞)的产生具有里程碑的意义。从2006、2007年日本美国科学家先后发表对小鼠与人诱导性多潜能干细胞的研究成果至今,短短三年时间,iPS细胞的研究领域以惊人的速度和影响范围发展,又有了很多新的进展与突破,并荣登2007年 Natuer Science times 年度十大科学成果突破榜及2008年Science 年度十大科学成果突破榜榜首。本文概述了诱导性多潜能干细胞的研究背景、研究方法和进展、在哺乳动物中的研究范围和应用现状,最后提出了展望和有待解决的问题,以期为诱导性多潜能干细胞研究者进行更深入的研究提供一定的借鉴。
【英文摘要】the recent success on induced pluripotent stem cells (iPSC,iPS cells)is a significant landmark for Stem Cell research, which has been a hot topic in life science field. Japanese and American scientists successfully established mouse and human iPS cell lines in 2006 and 2007 respectively and only three years later, iPS cells research has been developed at tremendous rapid and numerous relative improvements and breakthroughs have been achieved in both of basic and application fields. iPS cells ranked number 1 of top 10 science stories in Nature Science times (2007) and Science(2008). This review summarizes the background of iPS cells research, the different strategies used to generate iPS cells and their developments, application status on mammals and the prospects and problems of current iPS cells techniques. This review might be helpful for related scientists to furgher investigate iPS cells.

【题目】风干土保存时间和湿土培育时间对黄淮海平原潮土酶活性的影响
【中文关键词】风干土保存时间;湿土培育时间;土壤酶活性
【英文关键词】Storage time,Air-drying soil,Incubation time,Rewetted soil,Soilenzyme activity
【中文摘要】摘要: 以经历18年不同施肥管理的土壤为研究对象,阐明它们经过4个不同时间保存或处理后的土壤脲酶、转化酶、脱氢酶、及FDA酶活性的动态变化.处理包括:风干保存30天或鲜土状态、风干保存210天、风干土湿润至田间持水量(25℃)条件下分别培育15天和5l天;同时评估这些酶活性的变化程度与土壤本身有机碳含量之间的关系。结果表明,风干土保存时间和风干土湿润后短期培育均对脲酶活性影响很小,但风干土湿润培养5l天后其活性则显著降低;随风干土保存时间延长,转化酶活性显著降低;与鲜土相比,风干土湿润培养15天后,脱氢酶活性显著提高,但继续湿润培养至5l天后,其活性又降至与鲜土相当,因此风干土湿润培育一定时间后测定的脱氢酶活性可用来代表其田间自然湿度时的状态:FDA酶活性的变异程度最大,与其从鲜土状态至风干状态的活性急剧下降有关.土壤本身有机碳含量与脲酶和脱氢酶的活性变化程度成显著负相关关系.说明土壤有机碳含量是决定它们随环境条件改变而变化的主要因素之一.另外,土壤NH,.-N、N03'-N和可溶性有机碳含量对上述4种处理的响应程度也存在差异.其中风干状态土壤经湿润培育处理后,NH.+-N含量呈先降后升趋势.正好与脲酶活性变化趋势相反;而N03"-N含量整体上呈上升趋势,可溶性有机碳含量则正好相反.
【英文摘要】Soil samples that have exposed to different fertilizationmanagement practices for 18 years were used to examine the variations ofvarious enzyme activities,including urea.invertase,dehydrogenase activity,and fluorescein diacemte hydrolysis,with storage time of air-dryingsoil and incubation period after rewetting.Soil enzyme activities were determined,respectively,on fresh samples or samples that have air-dried andstored for 30 d.samples that have air-dried and stored for 210 d,and on rewetted samples that have incubated for 15 or 51 d at feld capacity(25°C).Relationship between the content of soil organic curbon and the change in enzyme activities after storageand incubation was also evaluated.Theresults showed that urease activity was relatively stable during the storage

time of air-drying soiland subsequent 15d incubation at field capacity,while the activity significantly shifted down 51 d after rewetting.A considerable decline in invertase activity Was observed during the storage time ofair-drying soil.Relative to the fresh soil,dehydmgenase activit was significantly shifted up 15 d after rewetting,however,the activity shifted downagain and was comparable to the fresh soil when the incubation time expanded to 51 d,indicating that dehydrogenase activities determined in the laterconditions were representative of fresh soil values.Among the four determined enzyme activities,FDA showed largest fluctuations during theexperimental period,pmbably because of its greater decline when the soil changed from fresh sgatc to air-dried state.The significantly negativerelationship between the content of soil organic carbon and the variation coefficient of Oreasc or dehydrogenase activity suggested that soilorganiccarbon Was one of the most important factors in controlling their fluctuations with environment.Inaddition,the responses of soil NH4+-N,N03--Nand DOC contents to four kinds oftreatments were different.During the incubation period ofsoil rewetted after drying,the fiend of NH4+-N contentdescendcd first and then ascended,which was opposite to urease activity,and NO3--N content ascended during the wholeincubation.which wasopposite to DOC content.

【题目】主成分分析方法在长期施肥土壤质量评价中的应用
【中文关键词】长期不同施肥;土壤质量;主成分分析
【英文关键词】Long-term different fertilization, Soil organic carbon mineralization, Potentially mineralized C, Easily mineralized C
【中文摘要】以长期定位试验玉米季成熟期6 种土壤微生物活性和9 种土壤化学性质指标组成的土壤生物肥力性质为评价指标对不同施肥条件下的土壤质量水平进行主成分分析。结果表明,经18年连续不同施肥处理后,各土壤性质在处理间均产生显著差异,但各土壤性质在处理间的变化趋势并不完全一致。上述15 个土壤性质指标最终可以用两个主成分来综合表征土壤质量,其中有机C、全N、碱解N、pH 值、微生物生物量C、微生物生物量N、脲酶、转化酶、FDA 酶和脱氢酶活性等10 个土壤性质在第一主成分(PC1)上有较高因子负荷;全P、全K、速效N 和速效P在第二主成分(PC2)上有较高的因子负荷。同时各施肥土壤质量水平在主成分1上的分异程度大于主成分2。根据两个主成分的综合得分结果显示,长期不同施肥土壤质量水平高低依次表现为OM>1/2OM>NPK>NP>PK>NK>CK。
【英文摘要】In a 37-day laboratory incubation study soil organic C mineralization was determined in soil samples obtained from initial stage of maize growth in an 18 year long-term field experiment which was carried out to evaluate nutrition equilibrium in a fluvo-aquic soil under different fertilization treatments. 【题目】定位水氮组合对冀5265小麦叶片硝酸还原酶、可溶性蛋白及产量的影响
【中文关键词】小麦;水氮定位;硝酸还原酶活性;可溶性蛋白;产量
【英文关键词】Winterwheat ;Water and nitr ogen l ocati on study;NRA; Soluble protein; Yield
【中文摘要】为生产中水氮高效利用提供依据,在3年定位水氮处理的基础上,于2008 - 2009年在大田条件下研究水氮组合对小麦叶片硝酸还原酶活性(NRA)、叶片可溶性蛋白含量及产量的影响。结果表明,在同一施氮水平上,开花期灌水显著提高NRA、可溶性蛋白含量和产量。灌1水条件下,随施氮量的增加叶片NRA、可溶性蛋白含量呈线性增长,在水分较适宜的2水灌溉条件下,叶片NR活性、可溶性蛋白含量均呈抛物线趋势,NRA在全年施氮240 kg/hm2时最高、可溶性蛋白含量在施氮480 kg/hm2最高,增加施氮量呈下降趋势。在灌2水全年施氮480 kg/hm2时产量最高,说明增加灌水有利于氮素增产效应的发挥。
【英文摘要】Field experi mentwas conducted during 2008 - 2009, the effects of water and nitr ogen on leave nitratereductase activity(NRA) , s oluble protein content and yield of winter wheat Jimai 5265 were studied in order to provide the framework for reas onable irrigati on and fertilizati on, based on a 3 years location study. The result indicated that the NRA, content of soluble protein of the flag leaves and grain yield were remakably improved by the anthesis irrigati on under the same nitr ogen amount. The NRA and the content of soluble protein showed an increasing trend withnitrogen amount,when it was irrigated one time in winter wheat . Under the two times irrigatation conditi ons with approp riate moisture content,NRA and the content of soluble protein all showed a parabola type with the highest NRAand the content of soluble protein appeared in nitrogen amount of 240 kg/ha and 480 kg/ha, respectively, and decreased when t oo much nitrogen applied . It had the highest yield when it was irrigated two times and fertilized 480kg/ha in the whole year . The result indicated that increasing irrigation showed a good effect on nitrogen effectivenessin high yielding wheat production .

【题目】Fingerprint analysis of Lingzhi (Ganoderma) strains by high-performance liquid chromatography coupled with chemometric methods
【中文关键词】暂无
【英文关键词】chromatographic fingerprint; discriminant analysis; Ganoderma spp; Hierarchical cluster analysis; Lingzhi
【中文摘要】暂无
【英文摘要】A high-performance liquid chromatography (HPLC)-based system has been developed for generating chemical fingerprints of Lingzhi (Ganoderma). Data were evaluated statistically using hierarchical cluster analysis (HCA) and discriminant analysis (DA) in order to classify the samples and to identify key categorizing parameters. Fifteen representative Lingzhi strains (13 Ganoderma lucidum strains and one strain each of G. sinense and G. resinaceum), were separated into three groups using HCA at a rescaled distance of 10, thereby confirming divisions based on morphological characteristics. Furthermore, the 13 G. lucidum strains were separated into three groups at a rescaled distance of 5, which was consistent with previous results based on antagonism tests. Two types of discriminant functions were generated using six selected predictor variables. To our knowledge, this is the first demonstration of the feasibility and advantages of employing chromatographic fingerprinting, combined with HCA and DA, for the accurate identification and validation of feedstock strains used in the production of Lingzhi-based health foods and supplements.

【题目】Structural elucidation of the polysaccharide moiety of a glycopeptide (GLPCW-II) from Ganoderma lucidum fruiting bodies
【中文关键词】暂无
【英文关键词】Ganoderma lucidum; glycopeptide; NMR spectroscopy; polysaccharide moiety; structural analysis
【中文摘要】暂无
【英文摘要】A water-soluble glycopeptide (GLPCW-II) was isolated from the fruiting bodies of Ganoderma lucidum by DEAE-Sepharose Fast-Flow and Sephacryl S-300 High Resolution Chromatography. The glycopeptide had a molecular weight of 1.2 x 10(4) Da (determined by HPLC), and consisted of similar to 90% carbohydrate and similar to 8% protein as determined using the phenol-sulfuric acid method and the BCA (TM) protein assay reagent kit, respectively. The polysaccharide moiety was composed mainly of D-Glc, L-Fuc, and D-Gal in the ratio of 1.00:1.09:4.09. To facilitate structure-activity studies, the structure of the GLPCW-II polysaccharide moiety was elucidated using H-1 and C-13 NMR spectroscopy including COSY, TOCSY, HMBC, HSQC, and ROESY, combined with GC-MS of methylated derivatives, and shown to consist of repeating units with the following structure

【题目】利用Century 模型模拟不同农业经营模式下黑土农田土壤有机碳的演变
【中文关键词】Century模型; 黑土; 土壤有机碳; 农业经营模式; 预测;
【英文关键词】Century Model; black soil; soil organic carbon; farming systems; prediction.;
【中文摘要】Century模型是用来预测土壤有机碳趋势的重要模型之一,近20年来在农林生态系统上得到广泛应用。本文运用该模型对不同农业经营模式下的黑土农田土壤有机碳变化进行了比较与预测。结果表明:Century模型可以预测黑土农田土壤有机碳的演变;100年内(2006—2105年)土壤有机碳含量,在移耕农业模式下呈下降趋势,预计年均下降0.063g · kg-1;有机农业模式下呈缓慢下降趋势,预计年均下降0.027c;"石油农业"模式下亦呈下降趋势,预计年均下降0.045g · kg-1;有机-无机结合农业模式下降趋势得到控制,土壤有机碳含量维持在34.00g · kg-1左右,基本处于平衡状态。

【英文摘要】Century model is one of the main models in predicting the changing trend of soil organic carbon(SOC),and has been used extensively for agricultural and forest ecosystems in recent two decades.In this paper,this model was used to predict the changing trend of organic carbon in black soil under different farming systems.The results showed that Century model was available in predicting the changing trend of organic carbon in farmland black soil.According to the prediction,the annual decrement of SOC content in 2006-2015 would be 0.063 g · kg-1 under shift farming,0.027 g · kg-1 under organic farming,and 0.045 g · kg-1 under ’petroleum’ farming.The decreasing trend of the SOC content could be controlled when a combined ’petroleum’-organic farming system was implemented,under which,the SOC content could be maintained at a level of around 34.00 g · kg-1,being in a balance status.

【题目】Purification, NMR Study and Immunostimulating Property of a Fucogalactan from the Fruiting Bodies of Ganoderma lucidum
【中文关键词】暂无
【英文关键词】Ganoderma lucidum; Ganodermataceae; polysaccharide; fucogalactan; NMR; immunostimulating property
【中文摘要】暂无
【英文摘要】A water-soluble polysaccharide (LZ-D-1) was isolated from Ganoderma lucidum fruiting bodies by DEAE-Sepharose Fast Flow and Sephacryl S-300 high-resolution chromatography. The polysaccharide had a molecular weight of 2.8 x 10(4) Da and was mainly composed Of (L)-Fuc, (D)-Glc and (D)-Gal in a molar ratio of ca.1 : 1 : 5. LZ-D-1 had a sugar content of 98.7% as measured using the phenol-sulfuric acid method. On the basis of methylation analysis, FT-IR spectrum and NMR experiments, the Structure of the repeating unit of the polysaccharide was established. LZ-D-1 had a backbone composed of 1,6-disubstituted alpha-D-galactopyranosyl, 1,2,6-trisubstituted alpha-D-galactopyranosyl and had a branch composed of fucose attached to 0-2 of a 1,2,6-trisubstituted (x-L)-galactopyranosyl residue. At the same time, the polysaccharide contained some 1,6-disubstituted glucopyranosyl residues and 1,3-disubstituted glucopyranosyl residues. An immunostimulating experiment in vitro indicated that D-1 stimulated proliferation of mouse spleen lymphocytes

【题目】Preparation of a novel sulfated glycopeptide complex and inhibiting L1210 cell lines property in vitro
【中文关键词】暂无
【英文关键词】Ganoderma lucidum; Glycopeptide; Sulfated derivative; Composition; Anti-tumour
【中文摘要】暂无
【英文摘要】A native glycopeptide, LZ-D-4, was purified from the fruiting bodies of Ganoderma lucidum, and its derivative, LZ-D-9, was prepared using sulfated agent (CSA: Pyr = 1:6). HPLC experiment showed that both of them were homogeneity and had molecular weights of 1.56 x 10(4) and 1.30 x 10(4) Da, respectively. Some properties including amino acid and monosaccharide compositions were investigated for the two compounds, along with anti-tumour bioactivity in vitro. The results indicated that two monosaccharides (Xyl and Ara) were completely destroyed and most of amino acids in LZ-D-4 were broken during sulfated process. Anti-tumour test in vitro showed that both complexes have properties to inhibit growth of L1210 cell lines and have similar bioactivities, but might have different mechanism

【题目】定位培肥对黑土农田生态系统中土壤微生物活性的影响
【中文关键词】农肥; 化肥; 微生物活性; 黑土;
【英文关键词】manure; chemical fertilizers; microbial activity; black soil;
【中文摘要】通过定位培肥试验对不同培肥方式下黑土生态系统中的土壤微生物活性进行了研究。研究结果表明,不同培肥处理均提高了土壤细菌、富营养菌和寡营养菌的数量,且农肥处理优于化肥处理,单施化肥处理土壤的富营养菌数量苗期最高,而农肥处理和农肥化肥等量处理为先升高后降低,至鼓粒期土壤中的富营养菌数量降至最低。施肥处理土壤微生物量的含量高于对照,农肥处理和农肥化肥等量处理的土壤中微生物量碳、氮含量高于单施化肥处理。不同培肥处理均提高了土壤脲酶的活性,施肥处理土壤脲酶的活性的变化范围为79.56~139.90mg/100g土,农肥低量和农肥高量处理土壤过氧化氢酶之间差异不显著,但显著高于对照,农肥处理土壤过氧化氢酶的含量始终是最高的,平均为0.41ml KMnO4/g干土,农肥化肥等量处理、化肥低量处理和化肥高量处理之间差异不显著,土壤过氧化氢酶含量平均为0.37ml KMnO4/g干土。因此,施用农肥是增加土壤微生物活性的有效途径,有利于提高退化土壤的质量。
【英文摘要】In this study,we researched the effects of location fertilization on microbial activity in black soil ecosystem.The main results showed that numbers of bacteria,copiotrophic bacteria and oligotrophic bacteria were improved and the numbers of bacteria,copiotrophic bacteria and oligotrophic bacteria of manure fertilizer treatments were higher than those of chemical fertilizer treatments.Numbers of copiotrophic bacteria of chemical fertilizer treatments were the highest in seedling stage.But numbers of copiotrophic bacteria of manure fertilizer treatments and manure and chemical fertilizers in equal ratio treatment first rose,then fell down and were the lowest till seed expanding period.Microbial biomass contents of fertilizers treatments were higher than those of CK and microbial biomass contents of manure fertilizer treatments and manure and chemical fertilizers in equal ratio were higher compared to chemical fertilizers treatments.The urease activities of soil were advanced by fertilizers.The urease activities of different fertilizer treatments ranged from 79.56 mg/100 g dry soil to 139.90 mg/100 g dry soil.ANOVA showed no differences of catalase activities in soil between low manure fertilizer treatment and high manure treatment,but higher compared to CK.The catalase activities of manure fertilizers treatments were 0.41 ml KMnO4/g dry soil and always the highest.ANOVA showed no differences of catalase activities in soil among manure and chemical fertilizers in equal ratio treatment,low chemical fertilizer treatment and high chemical fertilizer treatment and the average catalase activity was 0.37 ml KMnO4/g dry soil.Thus manure fertilizers application is a valid pathway to improve soil microbial activity and useful to advance qualities of degenerate soil.

【题目】Structural characterisation of a heteropolysaccharide by NMR spectra
【中文关键词】暂无
【英文关键词】Ganoderma lucidum; Polysaccharide; Structural elucidation; NMR
【中文摘要】暂无
【英文摘要】An undocumented water-soluble polysaccharide, LZ-C-1, was isolated from the fruiting bodies of the fungus, Ganoderma lucidum. The polysaccharide had a molecular weight of 7 x 10(3) Da, and was mainly composed of L-Fuc, D-Glc and D-Gal. LZ-C-1 had a sugar content of similar to 96.4% as measured using the phenol-sulphuric acid method. As a precondition to

understand the bioactivity, structural features of LZ-C-1 were investigated by a combination of total hydrolysis, methylation analysis, FT-IR and NMR studies. The results indicated that LZ-C-1 had a backbone of 1,6-disubstituted-alpha-galactopyranosyl, 1,2,6-trisubstituted-oc-galactopyranosyl, 1,3-disubstituted-beta-glucopyranosyl and 1,4.6-trisubstituted-beta-glucopyranosyl residues. The branches were mainly composed of 1-substituted-beta-glucopyranosyl and 1-substituted-alpha-fucopyranosyl residues.

【题目】农肥和化肥对黑土氮素淋溶的影响
【中文关键词】氮素; 淋溶; 农肥; 化肥; 黑土;
【英文关键词】nitrogen; leaching; manure fertilizer; chemicalfertilizer; black soil;
【中文摘要】采用树脂袋法,研究了培肥措施对黑土氮素淋溶的影响。结果表明,①2006年和2007年施化肥的3个处理土壤NO3--N淋失量显著高于施农肥处理,其中2006年化肥高量、化肥低量和农化1:1的3个处理分别是对照的36.88、28.91和27.06倍,是农肥高量处理的8.29、6.49和6.08倍;2007年不同培肥处理总体表现为化肥高量>化肥低量>农肥高量>农化1:1>农肥低量>对照,各处理60 cm土层NO3--N淋溶量均大于30 cm土层NO3--N淋溶量;②不施肥处理比施肥处理土壤NO3--N淋溶量低,在施用等量氮素条件下,农肥施用处理的淋失率要远远小于化肥施用处理,玉米氮的平均淋失损失占所施氮肥的1.4%~13.6%,单施用农肥NO3--N淋失率才只有1.4%~5.2%,而使用化肥的处理NO3--N淋失率则高达12.5%~15%;大豆氮的平均淋失损失占所施氮肥的0.5%~4.3%,单施用农肥NO3--N淋失率只有0.5%~0.81%,而使用化肥的处理NO3--N淋失率则高达2.97%~4.3%;③土壤pH与土壤NO3--N淋失量呈负相关;④土壤NO3--N含量与土壤NO3--N淋溶量呈正相关,随着土层的加深,土壤NO3--N含量降低,深层土壤NO3--N含量对土壤NO3--N淋溶影响更显著;⑤土壤NO3--N淋溶量随土壤硝化强度的增强而增加,硝化作用强度是影响土壤NO3--N淋溶主要因素。
【英文摘要】The effects of manure and chemical fertilizers application on nitrogen leaching in Black soil were studied by using the resin bags method.The main results were as follows: ① NO3--N leaching contents of three chemical fertilizers treatments in 2006 and 2007 were much higher than those of manure treatments.In 2006,the high chemical fertilizer treatment,the low chemical fertilizer treatment and the manure and chemical fertilizers in equal ratio treatment were higher than those of CK which were 36.88,28.91 and 27.06 times and the same higher than the high manure treatment were 8.29,6.49 and 6.08 times.In 2007,different fertilizer treatments were the high chemical fertilizer>low chemical fertilizer>high manure fertilizer>manure and chemical fertilizers in equal ratio>low manure fertilizer>CK.② NO3--N leaching contents of CK were lower than those of fertilizers treatments.The manure fertilizer rate of NO3--N leaching loss was much lower than that of the chemical fertilizer in the same nitrogen content conditions.The average rate of NO3--N leaching loss of maize was from 1.4% to 13.6%.The rate of NO3--N leaching loss with single manure fertilizer was only from 1.4% to 5.2%,but the rate of NO3--N leaching loss with chemical fertilizer was from 12.5% to15%.And this was the same as that of the soybean.The average rate of NO3--N leaching loss of soybean wasfrom 0.5% to 4.3%.The rate of NO3--N leaching loss with single manure fertilizer was only from 0.5% to 0.81%,but the rate of NO3--N leaching loss with chemical fertilizer was from 2.97% to 4.3%.③ A negative correlation was found between pH and NO3--N leaching contents.④ The correlations between NO3--N contents and NO3--N leaching contents were positive.The deeper soil layers,the lower NO3--N contents.The impacts of NO3--N contents of deep soil layers on NO3--N leaching contents were more remarkable.⑤ NO3--N leaching contents of soil were increased with the improvements of nitrifying capacity.The main factors to influenceNO3--N leaching contents was the nitrifying capacity.

【题目】农肥和化肥对黑土土壤氮素转化功能菌的动态影响
【中文关键词】农肥; 化肥; 氮素转化; 黑土;
【英文关键词】manure; chemical fertilizer; nitrogen transformation; black soil;
【中文摘要】通过3年定位试验对不同培肥方式下黑土土壤中与氮素转化有关的功能菌动态变化进行了研究。结果表明,农肥处理和农肥化肥等量配比处理提高了土壤中好气性自生固氮菌数量,单施化肥的处理抑制了好气性自生固氮菌生长;农肥高量处理土壤中氨化细菌数量最高,是对照的108.87%,化肥低量处理氨化细菌数量最低,平均比对照高43.79%;农肥处理土壤亚硝酸盐细菌数量显著高于化肥处理,纯化肥处理土壤中反硝化细菌数量高于农肥处理,因此长期合理地施用农肥对降低土壤的反硝化作用,从而减少黑土氮素的损失有良好的作用。
【英文摘要】Orientation experiments for three years were conducted to study the effects of manure and chemical fertilizers on the amounts of edaphon related with nitrogen transformation in black soil ecosystem.The main results were as follows: the numbers of aerobic nitrogen-fixing bacteria of manure fertilizer treatment and manure and chemical fertilizers in equal ratio treatment were improved.Only chemical fertilizers could reduce the numbers of aerobic nitrogen-fixing bacteria.The numbers of ammonifying bacteria of high manure fertilizer treatment were 108.87% higher than those of CK,which was the highest.The numbers of ammonifying bacteria of low chemical fertilizer treatment were the lowest,which were 43.79% higher than those of CK.The numbers of nitrite bacteria of manure fertilizer treatments were higher than those of chemical fertilizer treatments.The numbers of denitrifying bacteria of chemical fertilizer treatments were higher than those of manure fertilizer treatments.Thus,years of manure fertilizer applications could reduce the denitrification in soil and be benefit to the decrease of nitrogen losses in black soil.

【题目】Inoculation with phosphate-solubilizing fungi diversifies the bacterial community in Rhizospheres of maize and soybean
【中文关键词】bacterial community; diversity; PCR-DGGE; phosphate-solubilizing fungus; rhizosphere;
【英文关键词】bacterial community; diversity; PCR-DGGE; phosphate-solubilizing fungus; rhizosphere;
【中文摘要】Application of phosphate-solubilizing microorganisms (PSMs) has been reported to increase P uptake and plant growth. However, no information is available regarding the ecological consequences of the inoculation with PSMs. The effect of inoculation with phosphate-solubilizing fungal (PSF) isolates Aspergillus niger P39 and Penicillium oxalicum P66 on the bacterial communities in the rhizospheres of maize (Zea mays L. ’Haiyu 6’) and soybean (Glycine max Merr. ’Heinong 35’) was examined using culture-dependent methods as well as a culture-independent method, polymerase chain reaction-denaturing gradient gel electrophoresis (PCR-DGGE). Compared with the control, the number of culturable microbes for soybean was significantly greater with P39, whereas for maize, the same was significantly greater with P66. In addition, a greater number of microbes were found in the rhizosphere of maize compared with soybean. The fingerprint of DGGE for 16S rDNA indicated that inoculation with PSF also increased bacterial communities, with the P66 treatment having higher numbers of DGGE bands and a higher Shannon-Weaver diversity index compared with P39; the composition of the microbial community was also more complex with the P66 treatment. Overall, complex interactions between plant species and exotic PSMs affected the structure of the bacterial community in the rhizosphere, but plant species were more important in determining the bacterial community structure than the introduction of exotic microorganisms.

【题目】NMR characterization for polysaccharide moiety of a glycopeptide
【中文关键词】暂无
【英文关键词】Ganoderma lucidum; Polysaccharide; NMR; Structural analysis
【中文摘要】暂无
【英文摘要】Ganoderma lucidum is a traditional medicinal herb used to treat various diseases in China and Southeast Asia for thousands of years. An aqueous glycopeptide, LZ-B-1, was prepared by successive chromatography and exhibited an immunostimulating potential. To better understand the mechanism of bioactivity for this compound, the polysaccharide moiety of glycopeptide LZ-B-1 was studied by NMR spectroscopy. The results indicated that the polysaccharide moiety had a backbone of 1,6-disubstituted-alpha-galactopyranosyl, 1,2,6-trisubstituted-alpha-galactopyranosyl, 1,3-disubstituted-beta-glucopyranosyl and 1,4,6-trisubstituted-beta-glucopyranosyl residues. The branches were mainly composed of 1-substituted-beta-glucopyranosyl and 1-substituted-alpha-fucopyranosyl residues.

【题目】Composition Analysis and Immunomodulatory Capacity of Peptidoglycan from Ling Zhi or Reishi Medicinal Mushroom, Ganoderma lucidum (W. Curt.: Fr.) P. Karst. Strain 119 (Aphyllophoromycetideae)
【中文关键词】暂无
【英文关键词】medicinal mushrooms; Ling Zhi; Reishi mushroom; Ganoderma lucidum; composition analysis; water-soluble peptidoglycan; immunomodulatory activity; gas chromatography-mass spectrum
【中文摘要】暂无
【英文摘要】LZ-B-1, a water-soluble peptidoglycan, was prepared from the fruiting bodies of Ling Zhi or Reishi medicinal mushroom, Ganoderma lucidum, by ultrafiltration, DEAE-Sepharose Fast-Flow column, and Sepharose CL-6B column. To develop functional food or pharmaceuticals using LZ-B-1 and to investigate the relationship between the structure and bioactivity of LZ-B-1, the composition and immunomodulatory capacity of LZ-B-1 were studied herein. The peptidoglycan had a relative molecular weight of 1.12 x 10(4) Da, and total carbohydrate and peptide percentages were determined to be similar to 94.2% and similar to 5.4%, respectively. The carbohydrate moiety was mainly composed of L-fucose, D-galatose, and D-glucose in a molar ratio of approximately 1:5:2, together with small amounts of L-arabinose and D-mannose. The peptide moiety mainly contained arginine, threonine, glycine, serine, and aspartic acid in a molar ratio of approximately 1:1:2:2:1. Methylation reaction and GC-MS analysis indicated that the carbohydrate moiety mainly consisted of 1,6-disubstituted-galactopyranosyl, 1,2,6-trisubstituted-galactopyranosyl, 1-substituted-fucopyranosyl, 1,3-disubstituted- glucopyranosyl, 1,4,6-trisubstituted-glucopyranosyl, and 1-substituted-glucopyranosyl. Mouse spleen cell proliferation assay in vitro showed that a concentration of 200 mu g/mL of LZ-B-1 was the optimum concentration to promote the proliferation of mouse spleen lymphocytes (MSLs). In general, the higher the mouse spleen cell proliferation rate, the stronger the immunomodulatory activity. How the peptidoglycan stimulates the proliferation of MSLs and the bioactivity-structure relationship requires more research.

【题目】拮抗化疗药物体外免疫抑制模型的建立及活性成分筛选
【中文关键词】免疫抑制 化疗药物 多糖
【英文关键词】Immunosuppression, chemotherapeutic agent, polysaccharide
【中文摘要】以小鼠脾淋巴细胞为试验材料,将有丝分裂原刀豆蛋白A(ConA)或细菌脂多糖(LPS)与化疗药物5-氟尿嘧啶(5-Fu)联合使用建立了体外免疫抑制模型,并比较了多糖样品对5-Fu抑制淋巴细胞增殖的拮抗作用。结果表明,在供试样品中,F1-1[龙须菜(Gracilaria lemaneiformis)中分离多糖]和BW[沪农灵芝1号(Ganoderma lucidum)子实体中分离]对5-Fu产生的轻度抑制有完全拮抗作用,19号[沪农灵芝1号(G.lucidum)子实体中分离]样品刺激淋巴细胞增殖活性最好,但对5-Fu产生的抑制基本无拮抗作用,表明样品刺激淋巴细胞增殖的活性与拮抗化疗药物抑制淋巴细胞增殖的活性无正相关性。
【英文摘要】National Research Center for Edible Fungi Biotechnology and Engineering; Key Laboratory of Applied Mycological Resources and Utilization,Ministry of Agriculture,the People's Republic of China; Key Laboratory of Agricultural Genetics and Breeding of Shanghai; Research Center of Natural Medicinal Resources,Institute of Edible Fungi,Shanghai Academy of Agricultural Sciences,Shanghai 201106,ChinaWe have developed an in vitro immunosuppression model based on the cell proliferation enhancing effects of the mitogens concanavalin A and lipopolysaccharide combined with the 5-fluorouracil (5-Fu)-induced inhibitory effect on mouse spleen lymphocyte proliferation. The model was used to compare the antagonistic effects of different polysaccharide preparations on 5-Fu-induced suppression of mouse spleen lymphocyte and mixed lymphocyte proliferation. Polysaccharide preparations F1-1 (from Gracilaria lemaneiformis) and BW (from Ganoderma lucidum) completely neutralized the mild inhibition of lymphocyte proliferation induced by 0.02 μg/mL 5-Fu. However,no positive correlation was found between the stimulating effect of a given polysaccharide on lymphocyte proliferation and the antagonistic effect of that polysaccharide on 5-Fu-induced suppression of lymphocyte proliferation. Thus,polysaccharide 19 (from G. lucidum) was most effective in stimulating lymphocyte proliferation but had no antagonistic effect on 5-Fu-induced suppression of lymphocyte proliferation

【中文摘要】暂无
【英文摘要】A fraction, LZ-D-7, was isolated from the fruiting body of the edible mushroom Ganoderma lucidum using a series of chromatographic steps. Biochemical experiments showed that the complex is a proteoglycan and has a carbohydrate percentage of 95.3%, along with a protein percentage of 33%. Methylation analysis showed the polysaccharide moiety of LZ-D-7 had a backbone of 1,4-disubsituted-glucopyranosyl and 1,2,6-trisubstituted-glucopyranosyl residues. The branches were mainly composed of 1-substituted-glucopyranosyl residue, which was attached to 1,2,6-trisubstituted-glucopyranosyl residue via 2 or 6 position. Investigation of modulation of LZ-D-7 on BALB/c mouse spleen lymphocytes cells resulted in a three to four-fold increase of MSLs percentage. Analysis of activation and proliferation of MSLs indicated that LZ-D-7 activating most of the activated cells were B cells. The B cells were enlarged, expressed CD(71+) and CD(25+) on the cell surface. Crown Copyright (C) 2010 Published by Elsevier Ltd. All rights reserved

【题目】国内外可食性与全降解食品包装材料发展现状与趋势
【中文关键词】食品包装; 生物降解; 现状; 趋势
【英文关键词】food packaging; biodegradable; status; trend
【中文摘要】食品包装业是包装工业的重要组成部分,它带来的环境污染问题也日益严重。本文就国内外可食性与全降解食品包装材料的研发与生产现状进行了综述。分析了石油基塑料包装带来的社会问题和国内外全降解食品包装材料研发现状与趋势,指出了大力发展全降解食品包装材料的必要性和紧迫性。
【英文摘要】Food packaging is one of the most important parts in packaging industry,which leads to increasingly serious environment pollution.This paper reviewed the global development status and trend of edible and biodegradable food packaging materials.It analyzed the social problems resulted from petrochemical-based plastic packaging and research status and trend in developing biodegradable food packing materials.It also pointed out the necessity and urgency for energetically developing full biodegradable food packaging materials.

【题目】普鲁兰多糖对挤压流延法制备淀粉膜性能的影响
【中文关键词】普鲁兰多糖,挤压流延法,淀粉膜,性能
【英文关键词】pullulan,extrusion casting,starch films,properties
【中文摘要】对普鲁兰多糖改善淀粉基可食性膜的性能进行研究,并用光学显微镜对膜表面进行观察。结果表明:添加普鲁兰多糖后有效的改善了淀粉膜的拉伸性能;随着普鲁兰多糖添加量的增加,降低了淀粉膜的水溶解时间和O2透过率;当普鲁兰多糖添加量在5%~9%时,淀粉膜具有较低的透湿性,且淀粉膜的白度较高,黄色值较低。光学显微分析膜表面,当普鲁兰多糖添加量为9%时,普鲁兰多糖与淀粉能较好的融合。综合膜的各项性能得出,普鲁兰多糖的添加量不宜超过9%。
【英文摘要】The property improvement of starch-based edible film by pullulan was studied.The surface of the film was observed with the optical microscope.The result showed that the tensile strength of the starch film was improved effectively by adding pullulan;water dissolution time was shortened and oxygen permeability of the starch film was reduced.When pollulan was 5%~9% in the solution,water permeability was also decreased;the whiteness value of the film was increased and the yellowness value was lower.

【题目】GLIS, a bioactive proteoglycan fraction from Ganoderma lucidum, displays anti-tumour activity by increasing both humoral and cellular immune response

【中文关键词】暂无
【英文关键词】Ganoderma lucidum (G. lucidum); Traditional Chinese medicine (TCM); B lymphocytes; Macrophages; Anti-tumour; Proteoglycan
【中文摘要】暂无
【英文摘要】Aims: Ganoderma lucidum, a traditional Chinese medicine, is well known as a modulator of functions of the immune system as well as an anti-tumour agent. However, its active compounds and their molecular mechanisms of action are not well established. GLIS, a proteoglycan isolated from the fruiting body of G. lucidum, stimulates directly the activation of B lymphocytes. In this work, the immunoactivation capacities of GLIS as well as its anti-tumour effect were investigated in vitro and in vivo. Main methods: Tumour-bearing mice were prepared by inoculation of mouse sarcoma S180 cells into BALB/c mice. Lymphocytes and bone marrow-derived macrophages were isolated from spleen and tibia/femurs, respectively. After stimulation with GLIS different immune responses of these cells were analysed. Antitumour effect of GLIS was determined. Key findings: After treatment with GLIS, spleen-derived B lymphocytes from tumour-bearing mice became activated, proliferated and produced large amounts of immunoglobulins. Bone marrow-derived macrophages from tumour-bearing mice also became activated after exposure to GLIS, and they produced important immunomodulatory substances, such as IL-1 beta, TNF-alpha and reactive nitrogen intermediates, like NO. GLIS markedly increased phagocytosis of macrophages, and very importantly, it markedly raised the macrophage-mediated tumour cytotoxicity. Treatment of mice with GLIS caused an inhibition of mouse sarcoma S180 tumour growth by 60% in vivo. Significance: These results indicate that GLIS exhibits a capacity to increase remarkably both humoral and cellular immune activities of tumour-bearing mice and inhibits tumour growth significantly. The anti-tumour effect of GLIS results from its capacity to increase the host's immune activity

【题目】壳聚糖在蒜米涂膜保鲜中的应用研究
【中文关键词】壳聚糖; 涂膜; 保鲜; 蒜米
【英文关键词】chitosan; coating; preservation; garlic clovesq
【中文摘要】以壳聚糖为主剂,加入不同助剂配制成涂膜液,于常温下对蒜米进行涂膜保鲜试验,研究壳聚糖涂膜对蒜米贮藏效果的影响。试验结果表明:配制壳聚糖涂膜液的最适助剂为乙酸1.0%、甘油0.5%、吐温20 0.2%。壳聚糖涂膜处理可降低蒜米贮藏期间的失重率,抑制呼吸、发芽、MDA 的生成,降低总糖的消耗,延长蒜米的贮藏期,保鲜效果以1.5%的壳聚糖为最好。
【英文摘要】Influences on storage effect of garlic cloves with chitosan coating were studied by the test of coating preservation at ambient temperature, with the coating solution auxiliary that prepared by main agent of chitosan and other different auxiliary agent. The results showed that the optimal agent concentrations of chitosan coating solution were acetic acid 1.0%, glycerol 0.5%and tween 200.2%. With the chitosan coating, the weight loss rate of garlic cloves during storage was decreased, respiration, germination MDA production and total sugar consumption were inhibited, storage life of garli stoves was prolonged, and the optimal concentration of chitosan was 1.5%.

【题目】利用RAPD标记对不同秋眠级苜蓿种质的聚类和评价
【中文关键词】RAPD; 秋眠级; 苜蓿; 聚类分析;
【英文关键词】RAPD; Fall dormancy level; Alfalfa; Clustering analysis;
【中文摘要】利用RAPD标记对25份不同秋眠等级的苜蓿材料进行分析,构建了25份苜蓿材料的DNA指纹图谱,用两种方法(特异的谱带类型和不同引物谱带类型的组合)可以有效的鉴别苜蓿单株,说明RAPD标记是鉴定苜蓿的一种有效方法。通过计算25份苜蓿材料的遗传距离,进行聚类分析,探讨它们之间的亲缘关系。结果如下:25份苜蓿材料间的遗传距离介于4.69-8.14之间,说明材料间的遗传距离较大,亲缘关系较远,遗传基础较宽;从50条RAPD引物中筛选出19条引物,总共扩增出144条带,其中134条呈多态性,占93.05%,10条为单态性带,占6.94%;遗传距离为7.39时,试验材料可以分为差异明显的4类,苜蓿材料间有较大的遗传差异,这为苜蓿引种、亲本选配,分子标记辅助选择育种提供良好的理论基础和科学依据。
【英文摘要】RAPD technology was employed to analyze the 25 alfalfa accessions with different fall dormancy levels and the RAPD fingerprinting were constructed.Two independent and effective ways,including unique band types and combination of the band types of different primers,in identification of the alfalfa individuals were proved,which indicates that RAPD is very effective to identify alfalfa germplasms.The genetic distance in tested alfalfa materials was between 4.69 and 8.14,which suggested that the genetic diversity of alfalfa was high and the genetic base was wide.Totally 144 bands were generated with 19 RAPD primers,of which 134(93.05%) were polymorphic,10(6.94%) were monomorphic.The cluster analysis based on RAPD markers revealed that the tested materials belonged to four groups by λCD=7.39.There was a wide genetic difference among the tested materials,which would provide the theoretical base for genetic improvement and selection of cross-bred parents in alfalfa.

【题目】苜蓿秋眠标准对照品种的幼苗形态与秋眠性、越冬率的关系
【中文关键词】苜蓿; 秋眠标准对照品种; 越冬率; 子叶到第1真叶节间距; 第1~2真叶节间距;
【英文关键词】Alfalfa; Fall dormancy standard checks varieties; Winter-survival rate; The distance between cotyledon to the 1st leaf; The distance of 1st-2nd leaf;
【中文摘要】为了寻找快速测定苜蓿秋眠性的方法,利用来自美国的11个苜蓿秋眠标准对照品种,分析了不同品种的幼苗子叶到第1真叶、第1、2真叶间距离与苜蓿的秋眠性、抗寒性的关系,发现苜蓿的秋眠级与子叶到第1真叶节间距极显著正相关,与第1~2真叶节间距也极显著正相关(P<0.01),与越冬率也极显著正相关;子叶到第1真叶节间距与越冬率极显著负相关(P<0.01),第1~2真叶节间距也与越冬率极显著负相关(P<0.01);以子叶到第1真叶节间距、第1~2真叶节间距可评价苜蓿品种的秋眠性与抗寒性。苜蓿不同秋眠类别组之间的子叶到第1真叶节间距、第1~2真叶节间距存在显著差异,可以用子叶到第1真叶节间距、第1~2真叶节间距大致测定苜蓿的秋眠类别,但是不同秋眠类别组内子叶到第1真叶节间距、第1~2真叶节间距在不同品种间多不存在显著差异,说明以子叶到第1真叶节间距、第1~2真叶节间距不能精确测定苜蓿的秋眠级。
【英文摘要】For searching rapid testing alfalfa fall dormancy method,11 fall-dormancy standard checks of alfalfa varieties were measured in the distance of cotyledon to the first leaf,the distance between 1st-2nd leaf,and winter-survival rate in seedlings stage in this paper.The results showed there were extremely significant positive correlation not only between fall-dormancy and the distance of cotyledon to the first leaf,but also extremely significant(P<0.01)positive correlation between fall-dormancy and the distance of 1st-2nd leaf;which showed there were relationship between fall dormancy and the distance of cotyledon to the 1st leaf,the distance of 1st-2nd leaf.The correlation of distance of cotyledon to the 1st leaf and the winter-survival rate was extremely significant negative,the distance of 1st-2nd leaf and the winter-survival rate was also extremely significant negative also;which suggest the distance of cotyledon to the 1st leaf and the distance of 1st-2nd leaf could be indexes to estimate alfalfa winter survival rate.Although there were significant differences between different fall dormancy groups,but there were no significant differences in alfalfa cultivars among fall dormancy groups;some varieties with higher fall dormancy,but with lower the 1st leaf to cotyledon distance and the distance of 1st-2nd leaf;which suggested that

the 1st leaf to cotyledon distance and the distance of 1st-2nd leaf could be used as index to estimate alfalfa fall-dormancy in which group,but could not be used as index to measue fall dormancy accurately.

【题目】野生黄花苜蓿冷诱导基因克隆及序列分析
【中文关键词】黄花苜蓿; 冷诱导基因; 克隆; 序列分析;
【英文关键词】Medicago falcata Cold resistance gene Clone Sequence analysis;
【中文摘要】根据紫花苜蓿抗寒基因cas15B(登录号:L12462)的cDNA序列,设计1对特异引物,以经过低温胁迫的黄花苜蓿总RNA为模板,采用RT-PCR方法克隆获得了550bp的cDNA片段。测序和序列分析结果表明,扩增片段长度为550bp,编码159个氨基酸。主要由Gly(甘氨酸)、Glu(谷氨酸)、His(组氨酸)、Lys(赖氨酸)这4种氨基酸组成,占总量的70%。含1个重复了5次的10肽基序,其序列为Lys-Gly-Glu-Gln-His-Gly-His(Phe)-Val(Leu)-Gly-Gly。经序列比较分析,该片段与紫花苜蓿冷诱导基因CAS15B的核苷酸、氨基酸的同源性均为90%,命名为MfCAS15-1。亚细胞结构定位分析结果显示,MfCAS15-1是一种定向到核的蛋白,在调节或维持核的结构与功能方面起作用。本研究在黄花苜蓿中成功获得了抗寒基因同源序列,为最终克隆黄花苜蓿MfCAS15-1抗寒基因全长奠定了基础。
【英文摘要】According to cDNA sequence of cas15B (Accession number:L12462) of Medicago sativa,a pair of specific primers were designed,by which a new cDNA fragment of 550 bp was amplified by RT-PCR from total RNA of Medicago falcate that suffered from cold stress.Sequencing result and sequence analysis showed that this amplified fragment encoded 159 amino acids,four of which were Gly,Glu,His and Lys,accounting for 70% predicted.The polypeptide contains a decapeptide motif repeated five times at regular intervals with the following consensus sequence Lys-Gly-Glu-Gln-His-Gly-His(Phe)-Val(Leu)-Gly-Gly.The amplified fragment which of the homology of nucleotide sequences and deduced amino acids sequences were both 90% with the cold-induced gene cas15B of Medicago sativa,was named as Mf CAS15-1,and the encoded protein was directed to the nuclear due to the subcellular location analysis.Mf CAS15-1 may play an important roles in gene regulation and the stabilization of nuclear structure and function in the process of cold acclimation.In this study,homologous sequences of cold resistance gene were received from Medicago falcata,which could provide the foundation for cloning the full length of cold resistance gene(Mf CAS15-1) of Medicago falcata.

【题目】Properties and antimicrobial activities of starch – sodium alginate composite films incorporated with sodium dehydroacetate or rosemary extract
【中文关键词】antimicrobial films;starch;FTIR;sodium dehydroacetate;rosemary extract
【英文关键词】antimicrobial films;starch;FTIR;sodium dehydroacetate;rosemary extract
【中文摘要】随着脱氢醋酸钠添加量的增加,膜对大肠杆菌与黑曲霉的抑制效果增加,最大的抑菌圈面积分别为46.21 mm2和986.79 mm2。添加迷迭香提取物和葡萄籽提取物的膜只能抑制大肠杆菌,最大的抑菌圈面积分别为74.77 mm2和39.51 mm2。随着抗菌剂添加量的增加,膜的机械性能均有不同程度的降低。添加脱氢醋酸钠的膜,抗拉强度从3.66 MPa 降到0.66 MPa,断裂伸长率从56.42%降到33.62%。添加迷迭香提取物的膜抗拉强度从3.66 MPa降到1.33 MPa,断裂伸长率从56.42%降到 43.47%,葡萄籽提取物对膜机械性能影响不大。
【英文摘要】Antimicrobial films were prepared with oxidized and acetylated corn starch – sodium alginate by incorporating sodium dehydroacetate or rosemary extract. Films incorporated with sodium dehydroacetate ≥ 0.1% or rosemary extract ≥ 0.3% had an anti-Escherichia coli effect. Aspergillus niger could be effectively inhibited by the incorporation of sodium dehydroacetate ≥ 0.3%. Rosemary extract showed no inhibitory effect on Aspergillus niger. Sodium dehydroacetate and rosemary extract reduced the tensile strength and elongation at break, and increased the water vapor permeability of the films. Sodium dehydroacetate made the films more greenish – yellow with the increase of sodium dehydroacetate concentration. The color of the films became darker and more reddish – yellow as rosemary extract was increased. Fourier transform infrared (FTIR) spectra analysis revealed that sodium dehydroacetate and rosemary extract reduced starch crystallinity. The surface of the films became rougher as a result of an addition of sodium dehydroacetate and rosemary extract. These findings had potential applications in prolonging food shelf life based on different needs.

【题目】不同品系扁蓿豆种子蛋白指纹图谱研究
【中文关键词】扁蓿豆; 不同品系; 种子贮藏蛋白; 指纹图谱;
【英文关键词】Melilotoides ruthenica; Different strains; Seed storage proteins; Fingerprints;
【中文摘要】采用10%SDS-聚丙烯酰胺凝胶电泳,对扁蓿豆4个品系的种子可溶性蛋白和盐溶蛋白进行了研究,结果表明:扁蓿豆4个品系种子可溶性蛋白和盐溶蛋白总带数分别为62和31;相对迁移率分别在11.3%~92.6%和7.4%~92%之间;谱带分子量分别在5.90~107.62KD和14.64~107.38KD之间。4个品系在种子可溶性蛋白电泳图谱上都具有自己的特征带,品系之间在谱带数目、位置、宽窄和颜色深浅方面存在不同程度的差异。盐溶蛋白指纹图谱谱带数目相对较多,但依据带的出现、缺失、宽窄和颜色深浅差异,同样可以鉴定扁蓿豆不同品系。可溶性蛋白和盐溶蛋白指纹图谱一致表明,品系90-36具有较高的品系特异性。
【英文摘要】Using 10% gel SDS-PAGE,the seed dissoluble proteins and seed salt soluble proteins of four Melilotoides ruthenica strains were studied.The results showed that the total dissoluble protein bands and total salt soluble protein bands of the strains were 62 and 31,respectively;the relatively mobile rates were 11.3%~92.6% and 7.4%~92%,respectively;and the molecular weight of bands were 5.90~107.62KD and 14.64~107.38KD,respectively.All of the four strains have its own characteristic bands of seed dissoluble

proteins.Bands were different in number,distribution,width,and concentration among strains.The band number of the seed salt soluble proteins were less than the seed dissoluble proteins,while the four strains could also be identified based on the appearance,lose,width and concentration of the bands.Both the seed dissoluble proteins and seed salt soluble proteins showed that the strain 90-36 was more distinctive.

【题目】Effects of extrusion and glycerol content on properties of oxidized and acetylated
【中文关键词】Oxidized and acetylated corn starch,Biodegradable film, Extrusion, Properties
【英文关键词】Oxidized and acetylated corn starch,Biodegradable film, Extrusion, Properties
【中文摘要】熔融挤出处理的膜与未处理的膜相比,抗拉强度减小,断裂伸长率增大,水蒸气透过系数、透油系数及透光率增大,热封性能下降,综合所有性能可得,未熔融挤出处理的淀粉膜性能优于熔融挤出处理的膜。随着甘油添加量的增大,膜的抗拉强度减小,断裂伸长率增大,水蒸汽透过系数和透油系数增大,热封性能下降。
【英文摘要】Oxidized and acetylated corn starch-based films were prepared by casting with glycerol as a plasticizer.The present study investigated the effects of extrusion prior to film-making and glycerol content on the properties of starch films. The films with extrusion exhibited lower tensile strength, higher elongation at break, higher water vapor permeability and higher oil permeability than those without extrusion. Extrusion reduced heat sealability of the films. With the increase of glycerol content, the films became more flexible with higher elongation at break and lower tensile strength. Water vapor permeability, oil permeability and the range between the onset temperature and the melt peak temperature rose as glycerol content ncreased. The thermograms indicated that plasticizers and biopolymers were compatible. Theseresults suggested that extrusion did no good to starch films while glycerol content had apparent effect on the mechanical and barrier properties of the films.

【题目】扁蓿豆不同品系ISSR标记遗传差异和遗传多样性
【中文关键词】扁蓿豆; 品系; ISSR; 遗传差异; 遗传多样性;
【英文关键词】Melilotoides ruthenica; Srtains; ISSR; Genetic difference; Genetic diversity;
【中文摘要】采用ISSR分子标记技术对扁蓿豆4个品系的遗传多样性、遗传差异和遗传结构进行了研究。用7个有效引物对4个品系进行PCR扩增,共获得73个等位基因位点,每条引物平均检测出10.4个位点,其中多态性位点69个,多态位点百分率为94.5%。各品系的Nei’s遗传多样性为0.2569,Shannon’s信息指数为0.4046。Nei’s指数估算和分子方差分析均表明,扁蓿豆4个品系的遗传多样性主要存在于品系内,4个品系间亦出现了较大的遗传分化(Gst=0.1324)。品系00-61、90-36、00-81和93-21的多态位点百分率分别为73.97%、79.45%、82.19%和83.56%;Nei’s遗传多样性(H)分别为0.2050、0.2153、0.2264和0.2474;Shannon’s信息指数(I)分别为0.3222、0.3396、0.3538和0.3821。各品系的遗传参数大小排序均为品系93-21>品系00-81>品系90-36>品系00-61。采用系统聚类和主坐标分析(PCA)两种方法所获得的聚类结果一致,即品系00-61和00-81遗传差异相对较小,其次是品系90-36,品系93-21与各品系的遗传差异较大。
【英文摘要】The genetic diversity,genetic difference and genetic structure of four strains of Melilotoides ruthenica were investigated with ISSR marker.Seven ISSR primers generated highly reproducible and stable DNA fragments.69 of 73 loci were polymorphic(PPB=94.5%).The results of Popgen32 analysis indicated that Nei’s gene diversity(H) was 0.2569,Shannon information

index(I) was 0.4046.Nei ’ s analysis and AMOVA analysis both indicated that the majority genetic variation of M.ruthenica strains occurred within strains,higher variations also occurred among the strains(Gst=0.1324).The PPB of strains 00-61,90-36,00-81 and 93-21 was 73.97%,79.45%,82.19% and 83.56%,respectively;Nei ’ s gene diversity(H) was 0.2050,0.2153,0.2264 and 0.2474,respectively;Shannon information index(I) was 0.3222,0.3396,0.3538 and 0.3821,respectively.The sequence of all genetic index above was 93-21>00-81>90-36>00-61.The results of cluster analysis and principal coordinate analysis(PCA) were similar.The genetic difference between strain 00-61 and 00-81 was relatively lower,second was strain 90-36,and strain 93-21 had higher genetic difference from other strains.

【题目】Effects of clays with various hydrophilicities on properties of starch – clay
【中文关键词】Oxidized and acetylated corn starch,Biodegradable film, Extrusion, Properties
【英文关键词】Clays,Hydrophilicity,Extrusion blowing,Nanocomposite film,Physical and mechanical properties,Hydroxypropyl distarch phosphate
【中文摘要】不同亲水性有机改性蒙脱土均不同程度的增大了淀粉膜的拉伸强度,提高了阻水性能。其中淀粉-DK3复合膜的拉伸强度达2.47MPa,水蒸气透湿系数4.31×10-10g.m/m2.s.Pa。XRD和TEM分析显示淀粉分子进入有机改性蒙脱土片层之间形成插层结构; FTIR分析表明有机改性蒙脱土的添加抑制了淀粉和甘油之间的塑化作用;DSC分析表明有机改性蒙脱土的添加降低了淀粉膜的玻璃化转变温度(Tg);SEM分析显示有机改性蒙脱土有利于淀粉膜微观形貌的均匀化。中等亲水性有机改性蒙脱土DK3(Cloisite Na+)更适合与羟丙基交联淀粉复合制膜。
【英文摘要】Effects of clays with various hydrophilicities on the physical and mechanical properties of hydroxypropyl distarch phosphate – nanoclay composite films by extrusion blowing were investigated. Five kinds of organically modified clays with different hydrophilic properties were used in the preparation of starch nanocomposite films. X-ray diffraction (XRD) and transmission electron microscopy (TEM) showed the formation of intercalated nanostructure to a certain extent. With the addition of clays, significantly greater tensile strength (TS, 2.51 MPa) and lower water vapor permeability (WVP, 3.69×10 − 10 gm/(m2 s Pa)) were obtained. Starch – clay composite films exhibited a lower glass transition temperature (Tg, − 23.8 ◦ C)and better heat endurance with differential scanning calorimetry (DSC). The addition of clays to starch had a negative effect on the interaction between starch and plasticizer by FTIR spectra. Organically modified clays were helpful in the melting and fracturing of starch granules in the extrusion revealed by a scanning electronic microscope (SEM). The clay with medium hydrophilic property was more suitable for the production of hydroxypropyl distarch phosphate – clay nanocomposite films as an intensifier among the five clays.

【题目】Properties of cast films of vicilin-rich protein isolates from Phaseolus legumes:
【中文关键词】Cast film, Vicilin,Phaseolus legume,Heat treatment,Mechanical property
【英文关键词】Cast film, Vicilin,Phaseolus legume,Heat treatment,Mechanical property
【中文摘要】The mechanical, hydrophobic and thermal properties of cast films of vicilin-rich protein isolates from three Phaseolus legumes were investigated and compared to that of soy protein isolate (SPI). The influence of heat curing at 85 C on the properties of these films was characterized. The films of vicilinrich protein isolates exhibited much less mechanical strength (TS) and elongation at

break (EB) and similar film surface hydrophobicity, as compared with those of the SPI film. The heating remarkably improved the TS of these films, and the extent of the improvement much higher than that of the SPI film, while the EB was only slightly affected. The thermal properties of these protein isolate films were variable, and much distinctly affected by the heating of the films, to a various extent, depending on the type of protein isolates. Protein solubility analyses indicated strengthened hydrogen and hydrophobic bondings of these films by the heating. The results suggest that those vicilin-rich protein isolates have good potential to form cast films with mechanical strength comparable to that of SPI film.

【题目】Internal structures and phase-transitions of starch granules during gelatinization

【中文关键词】Starch,Microstructure,Phase transition,CLSM
【英文关键词】Starch,Microstructure,Phase transition,CLSM

【中文摘要】The internal structures of corn starch granules with different amylose/amylopectin contents were studied using different microscopic techniques. The gelatinization phase transitions of the various starches were investigated by hot-stage confocal laser scanning microscopy (CLSM) and scanning electron microscopy (SEM). The influence of the amylose/amylopectin ratio on the internal structures and morphologies could be revealed by these techniques. Sharp growth ring structures could be clearly identified for highamylopectin starches by CLSM and SEM following acid treatment. CLSM allowed the visualization of cross-sections of starch granules without the need for sectioning techniques that lead to destruction of the microstructure of sample, allowing exploration of the gelatinization mechanism. Three-dimensional images of starch granules during gelatinization could be constructed to further explore phase transitionmechanisms. It was found that the granules of waxy maize and normal maize starch subsequently break through at their cavity and channels, when the granules became swollen during gelatinization, whilst the granules of G50 and G80 remain granular and break down to smaller pieces.

【题目】Effects of annealing on gelatinization and microstructures of corn starches with different amylose/amylopectin ratios
【中文关键词】Annealing,Gelatinization, Morphology,Corn starch,Different scanning calorimeter,Amylose Amylopectin
【英文关键词】Annealing,Gelatinization, Morphology,Corn starch,Different scanning calorimeter,Amylose Amylopectin
【中文摘要】Corn starches with different amylose/amylopectin ratios (waxy 0/100, normal corn 23/77, Gelose 50 50/50, Gelose 80 80/20) were annealed at below their gelatinization temperatures in excess water. The effects of annealing on the gelatinization and microstructures of the starches were studied using DSC, XRD and a microscope equipped with both normal and polarized light. In addition, a high-pressure DSC pan was used to study the effects of high-temperature annealing on the multiphase transitions of starches with different water contents. The granular size of the starches increased after the annealing process, but the size variation rates were different, with higher amylopectin contents resulting in a higher diameter growth rates and final accretion ratios. DSC results showed that annealing increased the gelatinization enthalpy of the amylose-rich starches. The increased enthalpy was mainly attributed to endotherm G – there were no significant changes to endotherms M1, M2 or Z – indicating that annealing mainly affected the helical length of shorter or sub-optional amylopectins, in particular the amylopectin in amylose-rich starches. The XRD traces of all starches after annealing remained unchanged.

【题目】木糖发酵产乙醇丝状真菌的鉴定及发酵特性
【中文关键词】木糖; 乙醇; 丝状真菌; 发酵
【英文关键词】Xylose; ethanol; filamentous fungus; fermentation
【中文摘要】针对目前对丝状真菌的木糖发酵研究较少的现状,应用杜氏管发酵法初筛和发酵测定法复筛对不同环境的土壤样品进行菌株的筛选,并采用显微镜观察和18S rRNA 序列扩增分析对菌种进行鉴定; 用重铬酸钾法对菌株的发酵特性进行研究. 结果表明: 筛选到一株能发酵木糖的丝状真菌,命名为cs - 28; 经形态学和生物学鉴定为尖孢镰刀菌(Fusarium oxysporum) ; 它不仅能发酵木糖,同时也能利用葡萄糖、蔗糖和玉米秸秆等多种发酵碳源; 其最适氮源为酵母提取物; 在温度为30 ℃、初始pH 值为6. 0、初始木糖质量浓度为20 g · L - 1时乙醇产率最高. 该研究结果为木质纤维素原料的生物转化提供新的菌种资源和工艺参数.

【英文摘要】At present,yeast is the main microorganism involved in ethanol production using xylose as carbon source. The filamentous fungi have been less studied compared to yeast. Duchenne tube and ethanol yield assay methods were applied to screen different microbes for xylose fermentation. The microorganism producing the highest amount of ethanol was identified by microscopy and 18s rRNA amplification and analysis. Fermentation assays of this microorganism were studied by the Potassium dichromate method. The screening results showed that the organism code named cs - 28 was Fusarium oxysporum. It was found that this fungus couldferment xylose,glucose,sucrose and corn stalk to produce ethanol. The optimal nitrogen source was yeast extract. The ethanol production rate was highest at initial pH 6. 0 and 30 °C,when initial xylose concentration was 20 g · L - 1 . Thus,cs - 28 can be used as a new strain for transformation of cellulose materials to ethanol.Moreover,characterization of cs - 28 on xylose fermentation can be applied in technological advancement.

【中文关键词】耐冷菌;生物表面活性剂;筛选
【英文关键词】psychrotrophic bacteria; biosurfactant; screening
【中文摘要】从常年堆积的秸秆堆下面的土样和牛场的堆肥中,筛选出13 株能产生生物表面活性剂的细菌。其中有6 株菌株为耐冷菌,其发酵液在低温环境下(0~10 °C)仍具有较低的表面张力,且均属于假单胞菌属(Pseudomonas),其余属于土壤杆菌属(Agrobacterium)。对一株耐冷菌G3-6 进行最佳发酵培养基组成和发酵条件进行了研究。经鉴定,其代谢产物是糖脂类。同时也对生物表面活性剂在作物生长中的作用进行了初步的研究。
【英文摘要】Thirteen biosurfactant-producing micro-organisms were isolated from the soil of cattlefarm and the soil under the heap of straw for all the years. Six strains were psychrotrophic bacteria in the thirteen, the fermentation liquid still had lower surface tension in low temperature (0-10 °C), and they all belonged to the Pseudomonas , the rest seven strains were Agrobacterium. In addition, the optimization forthe best fermented medium conditions of strain G3-6 was studied. The metabolites of G3-6 was proved as glycolipid. And also the article studied the role of biosurfactant in the plant growth.

【题目】Multi-residue determination of pesticides in water using multi-walled Q1 carbon nanotubes solid-phase extraction and gas chromatography-mass spectrometry.
【中文关键词】多残留; 农药; 碳纳米管; 固相萃取; 气相色谱-质谱
【英文关键词】Multi-residue; Pesticides; Multi-walled carbon nanotubes; Solid-phase extraction; Gas chromatography – mass spectrometry
【中文摘要】开发了一种可靠的多残留检测方法,它是基于以多壁碳纳米管(MWCNTs)作为吸附剂的固相萃取(SPE)通过气相色谱 - 质谱法(GC-MS)来测定和定量分析地表水中12种农药(呋喃丹,异稻瘟净,甲基对硫磷,扑草净,杀螟硫磷,乙基对硫磷,水胺硫磷,稻丰散,杀扑磷,异狄氏剂,乙硫磷,甲氧滴滴涕)。参数可能会影响提取效率,例如洗脱剂的体积、样品的流速以及样品装载量都要进行优化。实验结果表明,12种农药在超过0.04-4 μgL-1范围时有良好的线性(R2>0.99),在最佳条件下的精度(RSD)为3.1-15.1%。该方法的检出限基于基线噪音(S / N= 3)的比色谱信号可达到0.01-0.03 μgL-1。加标水样取得良好的回收率在82.0-103.7%的范围内。结果表明,多壁碳纳米管在对12中农药的测试中具有良好的吸附性。因具有较低的成本

,较少的分析时间和较少的溶剂耗12的农药,这种多残留检测方法可以用来同时检测水中的杀虫剂。
【英文摘要】A reliable multi-residue method which was based on solid-phase extraction (SPE) with multi-walled carbon nanotubes (MWCNTs) as adsorbent was developed for determination and quantitation of 12 pesticides (carbofuran, iprobenfos, parathionmethyl, prometryn,fenitrothion,parathionethyl,isocarbofos, phenthoate, methidathion, endrin, ethion, methoxychlor) in surface water by gas chromatography-mass spectrometry (GC – MS).Parameters that might influence the extraction efficiency such as the eluent volume, the sample flow rate and the sample loading volume were optimized. The experimental results showed the excellent linearity of 12 pesticides (R2>0.99) over the range of 0.04 – 4 μ gL − 1,and the precisions(RSD) were 3.1-15.1% under the optimal conditions. The detection limits of proposed method could reach 0.01 – 0.03 μ gL − 1 based on the ratio chromatographic signal to base line noise(S/N=3). Good recoveries achieved with spiked water samples were in the range of 82.0-103.7%.The results indicated that MWCNTs have good adsorbability to the 12 pesticides tested in this study. With less cost, less analytical time and less solvent-consuming, the developed multi-residue method could be used to determine multi-class pesticides in water simultaneously.

【题目】甲胺磷人工抗原的合成及光谱表征
【中文关键词】甲胺磷; 半抗原; 人工抗原; 红外光谱法
【英文关键词】methamidophos; hapten; artificial antigen; infrared spectroscopy
【中文摘要】通过化学方法合成了一种甲胺磷的半抗原62(O ,O2二甲基硫代磷酰基) 氨基己酸(MC) , MC 与N2羟基琥珀酰亚胺(NHS) 反应得到62(O ,O2二甲基硫代磷酰基) 氨基己酸活化酯(MCE) , 活化酯(MCE) 与匙孔血兰蛋白(KL H) 偶联得到第一种人工抗原(MC2KL H) ;直接用甲胺磷作为半抗原用重氮化法与牛血清蛋白(BSA) 偶联得到第二种人工抗原(M2BSA) 。通过质谱、红外和核磁表征, 证明所合成的半抗原是设计的目标产物; 并且对两种人工抗原进行了外光谱分析, 结果表明, 人工抗原1 的红外光谱中既有酰胺结构单元又有半抗原中的甲氧结构单元; 半抗原2 中不但具有酰胺结构单元又有甲胺磷的甲氧基和硫氧基结构单元,以此判断半抗原和蛋白偶合成功, 为红外光谱法用于人工抗原合成与否的鉴定研究提供了依据。
【英文摘要】A methamidophos hapten 62 (O, O2 dimethyl phosphoroamidothioate acyl) aminocaproic acid (MC) was synthesize by chemical methods. 62 (O,The O2 two methyl thiophosphoryl) amino-hexanoic acid activated ester (MCE) by MC reacting with N2 hydroxysuccinimide (NHS), then the first artificial antigen (MC2KL H) obtained by using the activated ester (MCE) couple with keyhole limpet ceruloplasmin (KL H); directly using methylaminephosphorus as a hapten coupled with bovine serum albumin (BSA) by diazotization method to get the second artificial antigen (M2BSA). Characterized by mass spectrometry , infrared and nuclear magnetic, the result proved synthetic hapten is the target product of the design and the two artificial antigen was analyzed by external spectrum. The results showed that both an amide structural unit and the hapten methoxy structural unit in first artificial antigen 1. In hapten 2 there not only has a structural unit of an amide structural unit but also have an methamidophos methoxy and sulfur oxy unit. Using these methods to judge the success of hapten and protein coupled and provides the basis for applying to the identification studies of the artificial antigen synthesis or not by infrared spectroscopy.

【题目】Enzyme-linked immunosorbent assay and colloidal gold immunoassay for ochratoxin A: investigation of analytical conditions and sample matrix on assay performance.
【中文关键词】赭曲霉毒素;多克隆抗体;ELISA ;胶体金免疫;基质效应
【英文关键词】Ochratoxin A . Polyclonal antibody. ELISA .Colloidal gold immunoassay . Matrix effect
【中文摘要】利用OTA-BSA偶联物免疫家兔产生抗赭曲霉毒素A(OTA)的多克隆抗体,开发了一种快速检测各种食品基质中OTA的直接竞争酶联免疫吸附方法(cdELISA)和通过导流形式测定的膜的胶体金免疫分析法。在cdELISA中,引起50%抑制率的浓度为0.07ngmL-1,并对不同的化学条件(离子强度,pH值,和有机溶剂)产生的影响进行了研究。该法的测定灵敏度高于以前所报道的。本研究开发了一种简单、快速、有效的提取方法,可获得74-110%的标品回收率。某些食品样品如大麦,小麦,燕麦,玉米,大米,葡萄干,其百分之五十的甲醇提取物可以在PBS中稀释后直接通过免疫测定法进行分析;葡萄果汁,啤酒样品用PBS稀释后可以直接分析;对于咖啡样品,需要一种复杂的方法来去有效的消除基质影响。基于膜的胶体金免疫测定法对OTA在检测时间在10min内的视觉检测限为10ngmL-1。用高效液谱分析法分析样品来验证的cdELISA法和基于膜的胶体金免疫检测法。利用微孔法和高效液相色谱法分析数据得到的相关性很好(R2 =0.984)。本法研究的免疫分析方法,适用于食品中赭曲霉毒素的快速定量或定性测定。
【英文摘要】A polyclonal antibody against ochratoxin A(OTA) was produced from rabbits immunized with the OTA – BSA conjugate. A competitive direct enzyme-linked immunosorbent assay (cdELISA) and a membrane-base colloidal gold immunoassay in flow-through format were developed for the rapid detection of OTA in various food matrices. In the cdELISA, the concentration causing 50% inhibition was 0.07 ng mL.1, and the effects of different chemical conditions (ionic strength, pH value, and organic solvent) were studied. The sensitivity of the assay was higher than those previously reported. A simple, rapid, andefficient extraction method was developed and 74 – 110% recoveries of spiked samples were obtained. Fifty percent me thanol extracts of some food samples such as barley,wheat, oat, corn, rice, and raisins could be analyzed directly by immunoassay after dilution in PBS; grape juice and beer samples could be analyzed directly after dilution with PBS;for coffee samples, a more complex method was used to remove the matrix effect effectively. Membrane-basedcolloidal gold immunoassays had a visual detection limit of 1.0 ng mL.1 for OTA with a detection time of less than 10 min. For the validation of the cdELISA and membranebased colloidal gold immunoassay, samples were analyzed by high-performance liquid chromatography. The correlationbetween data obtained using the microwell assay and HPLC was good (R2=0.984). The developed immunoassay methods are suitable for the rapid quantitative or qualitative determination of OTA in food samples.

【题目】Multi-walled carbon nanotubes as solid-phase extraction adsorbents for determination of atrazine and its principal metabolites in water and soil samples by gas chromatography-mass spectrometry.
【中文关键词】莠去津;代谢物;固相萃取;碳纳米管;气相色谱;光谱
【英文关键词】Atrazine;Metabolites;Solid-phase extraction;Multi-walled carbon nanotubes;Gas chromatography-mass;spectrometry
【中文摘要】发明了一种新的,简单,具有成本效益并且灵敏的方法,它是利用多壁碳纳米管作为固相萃取吸附剂结合气相-色谱质谱法来测定水及土壤样品中的阿特拉津及其主要代谢产物脱异丙基莠去津(DIA)和脱乙基莠去津(DEA)。研究对某些条件参数,如样品装载流速,洗脱液和洗脱体积,萃取剂和样品的提取溶剂比进行了优化,以得到分析物的提取和洗脱的高的灵敏度和精确度。用甲醇/水的溶液(50%,体积/体积),从土壤中提取阿特拉津,DIA和DEA。提取物以4 mL min-1的流速通过SPE柱(用多壁碳纳米管包裹)后,再用4mL乙酸乙酯在真空泵中以1mLmin-1流速洗脱。此法测定阿特拉津的检测限(S / N= 3)在水中为0.02 μg kg-1,在土壤中为0.3 μg kg-1。脱异丙基莠去津(DIA)的检出限在水中为0.04 μg kg-1,在土壤中为.0 μg kg-1。脱乙基莠去津(DEA)的检出限在水中为0.05 μg kg-1,在土壤中为0.8 μg kg-1。此法的平均回收率在72.27-109.68%范围内,并在最佳条件下被接受的可重复性为(RSD B13%)。此方法用于确测定实际环境样品,阿特拉津的浓度为0.77-10.83 μg kg-1时,DEA和DIA则未检测到。
【英文摘要】"A novel, simple, cost-effective, and sensitive method was developed for the determination of atrazine and its principalmetabolites namely deisopropyl-atrazine (DIA) and deethyl-atrazine (DEA) in water and soil samples using multi-walled

carbon nanotubes as solid-phase extraction (SPE) adsorbents coupled with gas chromatography-mass spectrometry (GC-MS). Several condition parameters, such as sample loading flow-rate, eluent and elution volume, extractant and ratio of extraction solvent to sample,were optimized to achieve good sensitivity and precision for the extraction and elution of analytes. A methanol/water solution (50%, v/v) was used to extract atrazine, DIA and DEA from soil. After the extracts went through SPE cartridges (packed with multi-walled carbon nanotubes) at a flow-rate of 4 mL min.1, the analyteswere eluted by 4mL ethyl acetate at the rate of 1mLmin.1 under a vacuumpump.The limit of detection (S/N=3) of the proposed method was 0.02 μg kg.1 for atrazine in water and 0.3 μg kg.1 in soil; 0.04 μg kg.1 for DIA in water and 1.0 μg kg.1 in soil; 0.05 μg kg.1 for DEA in water and 0.8 μg kg.1 in soil. Mean recoveries were in the range of 72.27 – 109.68%, and the reproducibility was accepted (RSD b13%) under the optimum conditions. This developedmethod was applied to determine the analytes in real environmental samples, and the concentrations of atrazine were 0.77 – 10.83 μg kg.1, while DEA and DIA were not detected."

【题目】Development of Flow-through and Dip-stick Immunoassay for Screening of Sulfonamide Residues.
【中文关键词】磺胺; 导流; ELISA 浸渍 ;ELISA 试纸条条技术
【英文关键词】Sulfonamide; Flow-through; ELISA Dip-stick ;ELISA Strip assay
【中文摘要】本实验研究了两种形式的膜基竞争酶免疫分析法(导流和浸渍)来筛选猪肌肉和牛奶中磺胺类药物的残留。膜上涂布抗-磺酰胺的抗体和用D2-辣根过氧化物酶偶合物(HRP)标记的磺酰胺半抗原用于竞争性测定的磺胺类药物。7种磺胺类药物在缓冲液中通过导流和浸渍测定的视觉检出限范围分别为1-5 μg L − 1或1-10 μg L-1。此分析方法用加单磺酰胺的标品进行验证,标品用本实验研究的试纸条分析检测,其结果与用高效液相色谱仪(HPLC)方法验证得到的结果进行比较。结果表明,两种试纸条的检测结果分别与HPLC的检测结果的相关性良好。对于导流式的方法和浸渍式的方法分别用5min和15min的分析时间,那么这些快速检测方法可以提供简单,快速,经济,有效的现场快速测试工具来检测猪肉中磺胺类药物。
【英文摘要】"Two formats of membrane-based competitive enzyme immunoassays (flow-through and dipstick) have been developed for the screening of sulfonamide residues in pig muscle and milk. Membrane was coated with anti-sulfonamide antibody and a sulfonamide hapten D2-horseradish peroxidase (HRP) conjugant was used as the labeled antigen for competitive assay of sulfonamides. Visual detection limits of the flow-through or dip-stick assay were 1 – 5 μg L − 1 or 1 – 10 μg L − 1 in buffer for seven sulfonamides, respectively. Assay validation was performed using samples spiked with single sulfonamide, spiked samples were tested using the developed strip assays and results were compared with those obtained by a validated highperformance liquid chromatograph (HPLC) method. Results showed that the two strip assays were correlated well with HPLC, respectively. With assay times of 5 min (flow-through) and 15 min (dip-stick), these rapid tests could offer simple, rapid and cost-effective on-sitescreening tools to detect sulfonamides in pig muscle(flow-through or dip-stick) or milk(only dip-stick)."

【题目】Validation and Comparative Studies of Four Sulfonamide Immunoassays Based on the Same Generic Polyclonal Antibody
【中文关键词】磺胺;免疫技术; 多克隆抗体;高效液相色谱法; 动物源食品

【英文关键词】Sulfonamide . Immunoassay . Generic polyclonal antibody .High performance liquid chromatography . Animal-derived food

【中文摘要】本研究通过高效液相色谱法对基于相同的通用多克隆抗体的四种不同的免疫测定法分别进行了验证。同时这四种方法也针对食物样本中的磺酰胺残留的定量和筛选在灵敏度,精确度和准确度方面进行了相互的比较。相关研究表明,免疫分析和液相色谱数据之间有良好的相关性。传统的试剂盒法有更好的精度并且其提高化学发光性使之具有较高的灵敏度。这两种方法都可以用作大量的样品的定量方法并作为实验室常规分析方法的补充。导流式的试纸条检测法具有较高的灵敏度,浸渍式的试纸条检测法的基质影响较小。这两种方法都可以用来作为动物源性食品样品中磺胺类药物残留的现场快速检测的有价值的工具。

【英文摘要】Four different immunoassays based on the same generic polyclonal antibody were validated by high performance liquid chromatography, respectively. They also were compared with each other in terms of sensitivity, precision, and accuracy for the quantification or screening of sulfonamide residues in food samples. Correlation studies showed that there was a good correlation between the immunoassays and liquid chromatography data. The conventional plate assay has better precision and the plateenhanced chemiluminescent assay has higher sensitivity. These two methods all could be used as quantification methods for large numbers of samples and complements of the conventional analytical methods in laboratory. The flow-through strip assay has higher sensitivity and the dip-stick strip assay was less affected by matrix effect. These two methods all could be used as valuable tools for the rapid on-site screening of sulfonamide residues in animal-derived food samples.

【题目】Development of Enzyme-linked Immunosorbent Assay (ELISA) for the Detection of Neomycin Residues in Pig Muscle, Chicken Muscle, Egg, Fish, Milk and Kidney

【中文关键词】新霉素; 多克隆抗体;直接竞争ELISA; 动物源食品;残留;

【英文关键词】neomycin; polyclonal antibody; competitive direct ELISA; animal-derived food products;residues;

【中文摘要】通过使用多克隆抗体技术,比色度直接竞争酶联免疫吸附法在检测动物器官中残留的新霉素的技术得到了发展。并且与其他的抗生素产生的抗体无交叉反应。这种方法的检出限为0.1 μg/kg。新霉素的回收率范围从75%到105%,建立了一个简单而且有效的样品提取方法。检出限在猪肉、鸡肉、鱼和牛奶中是5 μg/kg(L), 在肾脏中10 μg/kg,在鸡蛋中20 μg/kg。为了检测猪肉和鸡肉中新霉素的残留量,使用了化学发光方法。这种方法的检出限是0.015 μg/kg,在猪肉中的检出限是1.5 μg/kg,在鸡肉中的检出限是6 μg/kg。而且,该方法通过了高效液相色谱的验证,并且两种结果的相关性高达0.9。

【英文摘要】A colorimetric competitive direct enzyme-linked immunosorbent assay (ELISA) method was developed using polyclonal antibody to determine neomycin residues in food of animal origin. No cross-reactivity of the antibody was observed with other aminoglycosides. The limit of detectionof the method was 0.1 μg/kg. A simple and efficient sample extraction method was established with recoveries of neomycin ranged from 75 % to 105 %. The detection limits were 5 μg/kg(L) in pig muscle, chicken muscle, fish and milk, 10 μg/kg in kidney and 20 μg/kg in egg, respectively.Chemiluminescence assay was developed for detecting neomycin residues in pig muscle andchicken muscle. The limit of detection of the method was 0.015 μg/kg, and the detection limits were 1.5 μg/kg in pig muscle and 6 μg/kg in chicken muscle. The ELISA tests were validated by HPLC ,and the results showed a good correlation (r2) which was greater than 0.9.

【题目】Development of a Capillary Electrophoresis-Based Immunoassay with Laser-Induced Fluorescence for the Detection of Carbaryl in Rice Samples

【中文关键词】基于免疫的毛细管电泳; 激光感生荧光;西维因; 荧光标记西维因

【英文关键词】Capillary electrophoresis-based immunoassay; laser-induced fluorescence; carbaryl; fluorescently labeled carbaryl tracer

【中文摘要】本实验建立了一种通过毛细管电泳竞争免疫吸附和激光诱导荧光检测器连用来检测农药中西维因的方法。该方法是基于荧光标记甲萘胺示踪剂(Ag *)和有少量抗甲萘胺抗体自由甲萘胺(Ag)之间的竞争反应,并且分离两者,通过毛细管电泳连接一个激光诱导荧光检测器进行检测。使用CEIA,达到平衡时间是30分钟,并且分析结果在8分钟中就能获得。甲萘胺的线性范围和检出限分别是0.16-50 ng/mL和0.05 ng/mL。用相同的免疫试剂,连用LIF 的检测器CEIA的检测方法比普通ELISA方法提高了近14倍。这种方法只需要快速和简单的样品前处理,就能够应用于分析大米中的甲萘胺含量。因此人们认为这种方法是一种快速灵敏的检测甲萘胺方法。

【英文摘要】A capillary electrophoresis-based competitive immunoassay (CEIA) with a laser-induced fluorescence (LIF) detector for the determination of carbaryl was developed. The method was based on the competitive reactions between fluorescently labeled carbaryl tracer (Ag*) and free carbaryl (Ag) with a limited amount of anticarbaryl antibody (Ab), and the relative amounts of each were separated and determined by capillary electrophoresis (CE) with an LIF detector. Using CEIA, equilibrium was reached in 30 min, and the analytical results were obtained within a further 8 min. The linear range and the detection limit for carbaryl were 0.16-50 ng/mL and 0.05 ng/mL, respectively. The sensitivity of this CEIA with an LIF detector was almost 14 times greater than that of ELISA, which used the same immuno-reagents. The method was also applied to the analysis of carbaryl in rice with rapid and simple sample pretreatment. The method is thus proposed as a fast and sensitive assay for the detection of carbaryl.

【题目】Effect of hapten structure on specific and sensitive enzyme-linked immunosorbent assays for N-methylcarbamate insecticide metocarb.

【中文关键词】半抗原;多克隆抗体;酶联免疫技术;氨基甲酸酯类杀虫剂;速灭威

【英文关键词】Hapten;Polyclonal antibody;Enzyme-linked immunosorbent assay;N-Methylcarbamate insecticide;Metolcarb

【中文摘要】实验设计与合成了五种不同的氨基甲酸酯类杀虫剂半抗原。所有的半抗原都结合上OVA 作为包被原,一种包含了这种杀虫剂的所有结构的半抗原结合上BSA作为免疫原。制备2种BSA结合物多克隆抗体抗,并且选择10种抗体结合物来研究这种杀虫剂试验灵敏性和特异性。通过对除了抗蚜威之外的7种氨基甲酸酯类杀虫剂的测定,试验的I50值从0.64 gmL − 1 到 20.98 gmL − 1 ,证明了其具有特异性。考虑到抗血清效价,I50和所有抗体\包被原结合物的相关性,我们建立了一种间接竞争酶联免疫吸附法,其检出限可达到1.4 ngmL − 1。竞争ELISAs方法的结果表明,包被原的结构能够显著影响试验的灵敏性和特异性

【英文摘要】Five different haptens of the N-methylcarbamate insecticide metolcarb were designed and synthesized. All of the haptens were conjugated with ovalbumin (OVA) for the coating antigen,and one hapten containing all of the structure of metolcarb was conjugated with bovine serum albumin (BSA) for the immunogen. Two polyclonal antisera were raised against the BSA conjugate, and ten antibody/coating conjugate combinations were selected for studies of assay sensitivity and specificity for metolcarb. A class-specific combination was found, with the I50 of the assay ranged from 0.64 to 20.98 gmL − 1 for seven tested N-methylcarbamate insecticides except for pirimicarb. Considering titer, I50 and cross-reactivity of all combinations of antibody/coating conjugate, a competitive indirect enzyme-linkedimmunosorbent assay (ELISA) in a homologous system, whose limit of detection (LoD) reached 1.4 ngmL − 1, was presented. The results of competitive ELISAs indicated that coating hapten structure can significantly affect not only assay sensitivity but also its specificity.

【题目】Competitive immunoassay by capillary electrophoresis with laser-induced fluorescence for the trace detection of chloramphenicol in animal-derived foods
【中文关键词】动物源食品 ;毛细管电泳-激光感生荧光 ;氯霉素;酶联免疫技术
【英文关键词】Animal-derived foods ;Capillary electrophoresis immunoassay-laser-induced fluorescence ;Chloramphenicol;Enzyme-linked immunosorbent assay
【中文摘要】为了检测氯霉素,建立了一种CE和LIF检测器连用的竞争性免疫方法。这种方法是基于荧光标记的CAP和自由CAP之间的竞争反应,使用了很少量的抗CAP抗体。在分离缓冲液中加入聚(N-异丙基丙烯酰胺)水凝胶,能够作为减少吸附的动力助动剂并借能够增强重现性。CAP的线性范围和LOD分别是0.008 – 5 mg/L和0.0016 mg/L。使用了同样免疫方法的ELISA方法同样在分析CAP的应用中得到了发展,LOD是0.03 mg/L。这种方法的灵敏度要比普通的ELISA方法提高20倍。使用CEIA-LIF方法,平均时间是15分钟,并且通过CE分离,在5分钟内我们就能获得分析结果。CEIALIF样本的准备不耗时,而且基质影响很容易消除。在食品基质中的LOD很容易达到0.1 mg/kg CAP。因此把该方法作为一种快速和灵敏的检测动物性食品的CAP残留量的方法。
【英文摘要】A competitive immunoassay using CE with an LIF detector was developed for the detection of chloramphenicol (CAP). The method was based on the competitive reactions between fluorescently labeled CAP hapten and free CAP, with a limited amount of anti-CAP antibody. The poly(N isopropylacrylamide) (pNIPA) hydrogel was added in the separation buffer as a dynamic modifier to reduce adsorption and enhance reproducibility. The linear range and LOD for CAP were 0.008 – 5 mg/L and 0.0016 mg/L, respectively. An ELISA using the same immuno-reagents was also developed for the analysis of CAP, with an LOD of 0.03 mg/L. The sensitivity of this CE immunoassay (CEIA)-LIF was almost 20 times greater than that of the ELISA. Using CEIA-LIF, equilibrium was reached in 15 min and the analytical results were obtained within 5 min by CE separation. Sample preparation for CEIALIF was not time-consuming and the matrix effect was easy to remove. An LOD of 0.1 mg/kg CAP in food matrices was easily achieved. This method is thus proposed as a fast and sensitive means of detecting trace amounts of CAP residues in animal-derived foods.

【题目】Hapten Synthesis and Enzyme-Linked Immunosorbent Assay for Phosmet Residues: Assay Optimization and Investigation of Matrix Effects from Different Food Samples
【中文关键词】亚胺硫磷 ; ELISA ; 多克隆抗体;基质效应;交叉反应
【英文关键词】Phosmet ; ELISA ; Polyclonal antibody;Matrix effect ; Cross-reactivity
【中文摘要】在这项研究中,合成半抗原获得免疫偶联物,合成其他几种半抗原是为了标示不同的偶联物。获得了一个对有机磷杀虫剂具有高灵敏度的多抗,从而建立了一种针对杀虫剂的cd-ELISA方法。在这种方法中,检出限IC15是0.6 μg kg − 1,IC50是20 μg kg − 1。也对该方法在桃子、苹果、桔子汁、苹果汁中的农药检测适用性进行了研究。结果表明,平均回收率为78%和102.3%的,平局变异系数低于13.63%,具有较好的准确度和精确度。我们通过高效液相色谱法验证了这种ELISA方法。通过使用微孔试验和高效液相色谱法得到的数据相关性很好。这种先进的免疫方法很实用于快速定量和定性检测食品样本中的亚胺硫磷。
【英文摘要】In this study, a panel of haptens was synthesized for immunoconjugate preparation, and several haptens for heterologous tracer conjugates were also prepared. A highly sensitive polyclonal antibody against the organophosphorus insecticide

phosmet was obtained and competitive direct enzyme-linked immunosorbent assays (cd-ELISA) for this pesticide were developed. In the cd-ELISA, the limit of detection (IC15) was 0.6 μg kg − 1 and the sensitivity (IC50) was 20 μg kg − 1. The suitability of the ELISA for pesticide quantification in peach, apple, orange juice, and apple juice was also studied. Good accuracy and precision were obtained with mean recoveries between 78% and 102.3% and mean coefficients of variation below 13.63%. Validation of the ELISA was conducted by high-performance liquid chromatography.The correlation between the data obtained using the microwell assay and the high-performance liquid chromatography was good (R2=0.9849). The developed immunoassay methods were suitable for the rapid quantitative or qualitative determination of phosmet in food samples.

【题目】Current status and management of chemical residues in food and ingredients in China.

【中文关键词】食品安全控制系统;化学毒物;监控系统;对策

【英文关键词】the food safety control system ;Chemical poisoning;monitoring programs;countermeasures

【中文摘要】从二十世纪八十年代开始,中国的食品工业迅速发展。但是各种食物传染性疾病的频频发生,可以看到中国的食品安全控制系统还不完善。化学毒物对食品安全性的危害处于第二位,仅次于致病微生物所产生的食物传染性疾病。这一观点旨在重新审视中国的立法、管理、检查、食品安全、风险预警和风险评估系统,而且描述了一个对食品和原料中的化学残留的监控系统的实施。另外,这个观点讨论了在中国,食品中化学残留管理涉及到的问题及正在采取的对策。

【英文摘要】China ’s food industry has grownrapidly since the 1980s. Frequent outbreaks of foodborne illnesses are evidence that the food safety control system in China has deficiencies. Chemical poisoning is secondonly topathogenicmicroorganisms as foodsafetyhazards causing foodborne illnesses. This reviewprovides an overviewon the statutes, management, inspection, safety, risk alert, and risk evaluationsystems of China along with a description of the implementation of monitoring programs for chemical residues in foods and ingredients. In addition, this review discusses the problems involved and the countermeasures being undertaken in the management of chemical residues in food products in China.

【题目】Development of an Enzyme Linked Immunoassay for Metolcarb Residue Analysis and Investigation of Matrix Effects from Different Agricultural Products.

【中文关键词】速灭威;酶联免疫技术;多克隆抗体;基质影响

【英文关键词】Metolcarb ; Enzyme-linked immunosorbent assay ; Polyclonal antibodies .;Matrix effects

【中文摘要】建立了一种基于多抗的检测氨基甲酸酯类杀虫剂的直接酶联免疫方法。我们设计和合成了两种新的杀虫剂半抗原。这两种半抗原都结合上匙孔蛋白形成免疫原。我们免疫四只兔子,来得到抗速灭威杀虫剂的多克隆抗体。用非竞争间接酶联免疫方法测定相同包被原的抗血清效价。使用高效价的抗血清用于直接竞争酶联免疫方法来检测速灭威杀虫剂。对速灭威杀虫剂高选择性的抗原抗体结合被充分的利用,而且我们还考察其耐受性受化学条件(离子强度、pH值、有机溶剂)的影响。在最佳条件下,其灵敏度和检测限分别是22 μg L − 1和1.2 μg L − 1。通过简单、快速和有效的提取方法,我们能够监测在果汁和蔬菜中速灭威杀虫剂的含量。添加回收率范围是从80.5%到109.5%。这种新的免疫检测的方法通过与高效液相色谱所得结果的对比而被验证。使用这个新的免疫吸附方法和高效液相色谱法这两者有很高的相关性(R2=0.9884).。因此,试验建立的免疫吸附方法非常适合快速定量的检测农产品中速灭威杀虫剂的含量。

【英文摘要】The development of a direct competitive enzymelinked immunosorbent assay based on polyclonal antibodies for N-methylcarbamate insecticide metolcarb is described. Two new haptens for the metolcarb were designed and synthesized. Both haptens were conjugated with keyhole limpet hemocyanin to form the immunogens. Four rabbits were immunized with the immunogens for production of polyclonal antibodies against metolcarb. Antisera titers were tested on the homologous coating antigens using a noncompetitive indirect enzyme-linked immunosorbent assay. The high titer antisera were used to develop the direct competitive enzyme-linked immunosorbent assay for the detection of metolcarb. The antibody – antigen combination with the highest selectivity for metolcarb was further optimized and its tolerance to changes in chemical conditions (ionic strength, pH value, and organic solvent) was studied. Under optimum conditions, the sensitivity and the limit of detection were determined to be 22 μg L − 1 and 1.2 μg L − 1 respectively. Determination of metolcarb in fruit juices and vegetables was accomplished by simple, rapid, and efficient extraction methods. Recoveries of metolcarb from spiked samples ranged from 80.5% to 109.5%. Validation of the developed immunosorbent assay was conducted by comparison of results from high-performance liquid chromatography. The correlation between the data obtained using developed immunosorbent assay and high-performance liquid chromatography was high (R2=0.9884). Therefore, the developed immunosorbent assay in this study was suitable for the rapid quantitative determination of metolcarb in agricultural products.

【题目】Review on enzyme-linked immunosorbent assays for sulfonamide residues in edible animal products

【中文关键词】磺胺;ELISA;可食用动物食品;光谱特异性抗体

【英文关键词】Sulfonamide;ELISA;Edible animal products;Broad specificity antibody

【中文摘要】目前状态下,可以通过酶联免疫技术检测可食用的动物体内磺胺类药物的含量。注意力主要集中在半抗原的设计与合成,半抗原与载体蛋白的偶联,抗体的制备,同源与异源抗体的应用,及半抗原与磺胺药物的分子模型。研究表明,磺胺似乎可以特别抵抗产生特异性的光谱类特异性抗体。通过对可用的磺胺类ELISA的研究的总结,希望它可以成为进一步研究发展最有效检测方法的基础。

【英文摘要】The current status of enzyme-linked immunosorbent assays (ELISAs) for sulfonamides in edible animal products is reviewed. The attention was focused on the design and synthesis of haptens,conjugation to carrier protein, production of antibody, application of homologous and heterologous systems, as well as the molecular modeling of the haptens and sulfonamides.Researches have shown that sulfonamides seem to be particularly resistant to attempts to produce broad specificity antibodies. By summarizing the available research on sulfonamide ELISAs, it is hoped that it can be considered as a basis for further investigation aimed at developing the most efficient approaches for detection.

【题目】A rapid and Sensitive Chemiluminescence Enzyme Linked Immunosorbent Assay for the Determination of Metolcarb Residue in Agricultural Products.

【中文关键词】酶联免疫技术; 增强化学发光; 食品

【英文关键词】Enzyme linked immunosorbent assay; Enhanced chemiluminescence; food

【中文摘要】一种用增强的化学发光底物检测食品中的速灭威并以多克隆抗体为基础的酶联免疫吸附测定法正在逐渐发展起来.酶示踪稀释和包被抗体的浓缩已经进行了研究。在最适宜的条件下,实验测定的IC50值与IC15值分别是5ng/ml,0.2ng/ml.橙汁和蔬菜中的速灭威的检测可以通过简便迅速有效的萃取法来完成。标准样品中速灭威的回收率范围从79%到99%。通过与HPLC检测结果的比较,ECL-ELISA被证实是有效的。用ECL-ELISA和HPLC检测所得数据之间的相关性很高。因此,所研究的ECL-ELISA适用于快速定量分析农产品中的速灭威。

【英文摘要】An enzyme linked immunosorbent assay based on polyclonal antibodies with enhanced chemiluminescent (ECL) detection for metolcarb in food is developed. Enzyme tracer dilution and concentration of coating antibody were studied. Under the optimum conditions, the IC50 value and IC15 value of assay were determined to be 5 ng mL − 1 and 0.2 ng mL − 1 respectively. Determination of metolcarb in orange juice and vegetables was accomplished by simple, rapid and efficient extraction methods. Recoveries of metolcarb from spiked samples ranged from79% to 99%. Validation of the ECL-ELISA was conducted by comparison of results from high performance liquid chromatography (HPLC). The correlation between the data obtained using ECL-ELISA and HPLC was high. Therefore, the ECL-ELISA in this study was suitable for the rapid quantitative determination of metolcarb in agricultural products.

【题目】Development of General Immunoassays for Pyrethroids:A new approach for Hapten Synthesis using Pyrethroid Metabolite Analogue and Application to Different Food Samples.

【中文关键词】ELISA, 合成除虫菊酯类, 免疫技术,绿茶, 云台属油菜., 桃

【英文关键词】ELISA, pyrethroids, immunoassay, green tea, Brassica campestris L., peach

【中文摘要】这项研究描述了用免疫化学的方法检测拟除虫菊酯。这项研究的目的是为了发展一种用于检测这一类拟除虫菊酯的通用ELISA法,这种新方法用于半抗原的制备,这种半抗原的3碳间隔臂上连接了拟除虫菊酯的底物类似物即3-苯氧基苯甲酸。酶联免疫吸附测定法用于拟除虫菊酯类的检测,包括溴氰菊酯、氯氰菊酯、氟胺氰菊酯,氰戊菊酯和甲氰菊酯。检测显示溴氰菊酯、氯氰菊酯、氟胺氰菊酯,氰戊菊酯和甲氰菊酯的IC50值分别为20 μg/L, 16 μg/L, 11 μg/L, 15 μg/L and 20 μg/L。对油菜,桃子和绿茶当中的拟除虫菊酯的峰值与回收率也进行了研究。高精度获得了良好的回收率。用免疫化学方法与GC/ECD检测绿茶所得到的数据相关性很好(R2=0.9968)。因此,已经开展的免疫化学检测方法适用于快速定量分析食品样品中的拟除虫菊酯。

【英文摘要】This study describes immunochemical approach for the detection of pyrethroids. With the aim of developing a generic ELISA for the class of pyrethroids, a new approach was used for the hapten preparation in which the 3-carbon spacer arm was attached to the pyrethroids metabolite analogue, 3-phenoxybenzoic acid. Enzyme-linked immunosorbent assay was developed for the detection of the class of pyrethroids, including deltamethrin, cypermethrin, fluvalinate, fenvalerate and fenpropathrin. It was showed that IC50s were 20 μg/L for deltamethrin, 16 μg/L for cypermethrin, 11 μg/L for fluvalinate, 15 μg/L for fenvalerate and 20 μg/L for fenpropathrin respectively. Spike and recovery for pyrethroids in Brassica campestris L., peach and the green tea were also studied. The high precision was obtained with good recoveries. The correlations between immunoassay and GC/ECD data in the green tea were good (R2=0.9968). Therefore, the developed immunoassay method was suitable for the rapid quantitative determination of pyrethroids in food samples.

【题目】Construction and quality examination of murine naive T7 phage display antibody library.
【中文关键词】鼠类,单链抗体, T7, 噬菌体展示, 自然抗体图书馆
【英文关键词】Murine, scFv, T7, phage display, naive antibody library
【中文摘要】BALB/c老鼠的单链抗体库由T7噬菌体构建并且质量已被检验。五十五种引物被用来克隆非免疫小鼠的抗体基因轻链和重链的可变区域。经过重叠延伸PCR单链抗体片段获得820bp.达到1.74×107pfu滴度的初级抗体库是在包装之后构建的。经过扩增以后滴度达到了1.78×1011 pfu/ml.十个随机的克隆被扩增以及五个克隆被测序用来测定这个抗体库的质量。随机的扩增显示90%噬菌体含有我们所需的片段。这五个被测序的单链抗体片段的显著差异表明这个抗体库的质量很好。共轭亚胺硫磷与载体蛋白作为配体用来筛选抗体库和可能被孤立的特异性斑块。这些结果表明抗体库能够作为有效地平台在某些分子上来筛选特异性抗体。
【英文摘要】A naive scFv antibody library of BALB/c mouse was constructed using T7 phage and the quality was examined. Fifty-five primers were designed to clone variable regions of light (440bp) and heavy (450bp) chains of antibody genes from non-immune mice. After overlap extension PCR scFv fragments about 820 bp were obtained. Primary antibody library which titer reached 1.74 × 107 pfu was constructed after package. After amplification the titer reached 1.78×1011 pfu/mL. Ten random clones were amplified and five clones were sequenced to determine the quality of the library. Random PCR indicated that 90% phages contained desired fragments. Distinct difference among the five sequenced scFv fragments indicated good quality of the library. Phosmet conjugated with carrier protein was used as ligand to screen the library and specific plaques could be isolated. These results demonstrated that the library could be used as an effective platform to screen specific antibodies against certain molecules.

【题目】Immunoassay development for the class-specific assay for types I and II pyrethroid insecticides in water samples
【中文关键词】抗体; 特异性抗体; 灵敏度;免疫技术; 拟除虫菊酯
【英文关键词】hapten; class-specific antibody; sensitivity; immunoassay; pyrethoid
【中文摘要】设计和合成了拟除虫菊酯杀虫剂的五个泛用半抗原,它被分为三种类型:第一,半抗原1是第一种类型没有氰基;第二,半抗原2和XQ是第二种类型有一个氰基:第三,半抗原4和5这两种没有酯基。半抗原的结构由MS和1H-NMR确认。半抗原1,2分别与BSA结合,并且半抗原1-5分别与OVA结合。与BSA共轭相对的四种多克隆抗血清选出用来研究拟除虫菊酯的灵敏度与特异性,其包括一种混合共轭结合和二十种抗体或包被共轭结合。这项研究发现了最佳组合,这个组合对这两种类型的拟除虫菊酯有同样高水平的灵敏度。这个免疫试验表明,针对一批杀虫剂,连接了混合物的多克隆抗体可以用来做多残留试验测定。
【英文摘要】"Five generic haptens of pyrethoid insecticides, which were classified as three types, were designed and synthesized: the first (hapten 1) is for type I pyrethroids without a cyano group, the second (hapten 2 and XQ) for type II pyrethroids with a cyano group,and the third (hapten 4 and 5) for both types of pyrethroids with loss of the ester group. The hapten structures were confirmed by MS and 1H-NMR. Hapten 1 and 2 were conjugated with BSA respectively and haptens 1-5 were conjugated with OVA. Four polyclonal antisera were raised against BSA conjugates including a mixture conjugate, and twenty antibody/coating conjugate combinations were selected for studies of assay sensitivity and specificity for pyrethroids. The study revealed the best combination, which showed equal high sensitivities (I50 is around 0.02 μg mL-1) to both types of pyrethroids. The immunity results suggest that, with a mixture conjugates, a polyclonal antibody against a group of insecticides can be prepared for multi-residue assays."

【题目】Preparation, characterization and preliminary application of monoclonalantibody against the pyrethroid insecticide fenvalerate
【中文关键词】杀虫菊酯, 拟除虫菊酯,半抗原, 单克隆抗体,酶联免疫技术
【英文关键词】Fenvalerate, pyrethroid insecticide, hapten, monoclonal antibody,enzyme-linked immunosorbent assay (ELISA)
【中文摘要】针对拟除虫菊酯杀虫剂23氰戊菊酯的单抗已经产生,认定并且应用于环境用水的检测。小鼠被连接BSA的新型半抗原免疫。三个阳性单抗通过细胞融合和杂交瘤细胞的筛选获得,其中单抗-2对氰戊菊酯显示了高度的活性。它的IC50值是94.5ng/ml,此外,表明它与其他的拟除虫菊酯例如联苯菊酯,胺菊酯,溴氰菊酯和高效氯氰菊酯的交叉反应程度低。酶联免疫吸附测定法的优化已进行了研究。这个实验的检测限值是8.8ng/ml并且检测范围是0.017-27.33μg/ml.对于它的初步应用是在水样的加标回收试验中进行的。三种样品的回收率从90.6%到108.7%不等以及变异系数从0.5%到5.3%。这个结果表明单抗-2可以被用于环境用水中氰戊菊酯的测定。
【英文摘要】"Monoclonal antibodies (MAbs) against pyrethroid insecticide 23 fenvalerate were achieved, identified and applied in environmental water. Mice were immunized with a novel synthesized hapten conjugated with bovine serum albumin (BSA). Three positive clones of MAbs were obtained after cell fusion and hybridoma selection, among them MAb-2 (5B10) showed the highest activity toward fenvalerate. The IC50 of MAb-2 was 94.5 ng mL-1, moreover, it showed lower cross-reactivity with other pyrethroids such as bifenthrin, tetramethrin, deltamethrin and beta-cypermethrin. Optimization of enzyme-linked immunosorbent assay (ELISA) was studied. The limitof detection(LOD) of the assay was 8.8 ng mL-1 and the detection range was 0.017-27.33 μg mL-1. For preliminary application, spiked recovery experiments in water samples were performed. The mean recoveries of three kinds of samples variedfrom 90.6% to 108.7% and the coefficients of variation ranged from 0.5% to 5.3%.The results showed that MAb-2 could be used for the detection of fenvaleratecontamination in environmental water."

【题目】一种新型溴氰菊酯农药半抗原的合成及应用效果
【中文关键词】溴氰菊酯;半抗原;人工抗原;合成;抗血清
【英文关键词】decamethrin;hapten; artificial antigen;synthesis;antiserum
【中文摘要】利用化学方法合成了一种溴氰菊酯新型半抗原,并通过核磁共振鉴定;用活泼酯法和EDC 法将溴氰菊酯半抗原分别与牛血清白蛋白(BSA) 和卵清白蛋白(OVA) 偶联制备免疫抗原和包被抗原,紫外吸收法鉴定表明吸收峰出现在305nm ,发生了红移,计算偶联比分别为7∶1 和6∶1 ;免疫小鼠后获得抗体的效价为64 000 , IC50为0116 μg/ mL。研究为研制溴氰菊酯农药残留免疫速测试剂,建立免疫速测技术奠定了基础。
【英文摘要】A new decamethrin hapten was synthesize by chemical methods;and identified by nuclear magnetic resonance; deltamethrin hapten with ova of bovine serum albumin BSA and egg albumin preparation of coupling immune antigen and coating antigen,with lively Ester and EDC methods ,Ultraviolet spectrometric identificate that absorption appears in 305nm,red shift happened,alculation of coupling proportion is 7:1 and 6:1;Get the titer of antibody is 64 000 after the immunization of mice,IC50is 0116 μg/ mL。The study developed the deltamethrin immunity of pesticide residues testing agent,and establishment the foundation technology for immune fast testing.

【题目】黄花苜蓿MfNHX基因和MfP5 CS基因的克隆和序列分析
【中文关键词】黄花苜蓿; MfNHX; MfP5 CS; 克隆; 序列分析;
【英文关键词】Medicago falcata L.; MfNHX; MfP5 CS; clone; sequence analysis;
【中文摘要】【目的】获得黄花苜蓿(Medicago falcata L.)的MfNHX基因和MfP5CS基因,并对这两个基因进行序列分析。【方法】利用Trizol总RNA提取试剂盒提取了新疆野生黄花苜蓿的总RNA,并用特异引物对其进行RT-PCR扩增,将得到的cDNA片段连接到pMD19-T载体上,最后将该载体转化大肠杆菌DH5α,并对阳性克隆进行了序列分析。【结果】MfNHX基因全长1 626 bp,Genbank登录号为GU265772;MfP5CS基因全长2 148 bp,Genbank登录号为GU180149。它们与紫花苜蓿核苷酸序列的同源性分别为99.63%和97.63%,与新牧1号杂花苜蓿核苷酸序列的同源性分别为99.45%和98.84%。【结论】研究已经获得MfNHX基因和MfP5CS基因,为进一步进行苜蓿抗逆境胁迫的研究奠定了基础。
【英文摘要】【Objective】To obtain MfNHX and MfP5CS genes in Medicago falcata L.and analyze their sequences.【Method】The total RNA of wild Medicago falcata L.in Xinjiang was extracted with Trizol Total RNA Extracting Reagent Kit and amplified to cDNA by RT-PCR using special primer.The pMD19-T vector linked with the cDNA fragment was transformed into Escherichia coli DH5α,and the positive clone was sequenced.【Result】The MfNHX(GenBank accession number: GU265772) is 1 626 bp,the MfP5CS(GenBank accession number: GU180149) is 2 148 bp.Compared with Medicago.sativa on NCBI,the MfNHX homology of nucleotide sequence is 99.63%,and the MfP5CS is 97.63%.Compared with Medicago.varia.Xinmu No.1 on NCBI,the MfNHX homology of nucleotide sequence is 99.45%,and the MfP5CS is 98.84%.【Conclusion】The MfNHX and MfP5CS genes have been obtained,which lays the foundation for further research on stress tolerance in alfalfa.

【题目】扁蓿豆育成品系遗传多样性的RAPD研究
【中文关键词】扁蓿豆; RAPD; 遗传多样性; 聚类分析; 主坐标分析;
【英文关键词】Medicago ruthenica; RAPD; genetic diversity; cluster analysis; principal coordinate analysis;
【中文摘要】用RAPD分子标记对4个扁蓿豆育成品系进行遗传多样性分析。结果表明:筛选的12条多态性RAPD引物共检测出126个等位基因位点,平均每条引物检测到10.5个位点,多态位点比率占94.4%。扁蓿豆品系的Nei’s遗传多样性指数(H)为0.266 2,Shannon多样性指数(I)为0.414 5。Nei’s指数估算和分子方差分析(AMO-VA)均证实扁蓿豆品系的遗传多样性主要存在于品系内,品系间有一定的基因交流(基因流为2.756 7)。聚类结果表明,品系00-61和00-81遗传差异相对较小,品系90-36与前两者之间的遗传差异较大,品系93-21与各品系的遗传差异最大。
【英文摘要】Four Medicago ruthenica breeding strains were studied for the analysis of genetic diversity by RAPD markers.Twelve effective primers were screened and totally 126 alleles were detected.The average number of alleles amplified by per primer was 10.5,and the polymorphism percentage was 94.4%.The result indicated that Nei’s gene diversity(H) was 0.266 2,Shannon information index(I) was 0.414 5.Nei’s analysis and AMOVA analysis both indicated that the majority genetic variation of M.ruthenica strains occurred within strains.Gene flow among strains(Nm) was 2.756 7,which proved that there was some gene intercommunion among M.ruthenica strains.The result of cluster analysis indicated that the genetic difference between strain 00-61 and 00-81 was relatively lower,second was strain 00-61 and 00-81 with strain 90-36,and strain 93-21 has high genetic difference with other strains.

【题目】根蘖型苜蓿根部RNA提取方法的比较
【中文关键词】根蘖型苜蓿; 总RNA; 提取方法;
【英文关键词】creeeping-rooted alfalfa; total RNA; extract methods;
【中文摘要】以根蘖型苜蓿Medicago sativa的根、茎、叶为材料,利用紫外分光光度计和凝胶电泳法比较了改良CTAB法和TRNzol试剂盒法等4种方法提取的苜蓿总RNA的产率和纯度。结果表明:改良CTAB法提取的RNA的OD260nm/OD230nm大于2.0,并且OD260nm/OD280nm接近1.8,具有较高的纯度。凝胶电泳结果表明,改良CTAB法有28S rRNA和18S rRNA 2条清晰的条带,且很少有降解;TRNzol试剂盒法获得的RNA品质也较好,但存在降解和弥散现象;其他2种方法提取效果较差。这证明改良CTAB法提取的总RNA具有很高的纯度,可以满足进一步分子生物学研究的要求;TRNzol试剂盒法也可以满足实验的下一步要求,但需要进一步纯化。
【英文摘要】Total RNA from root,stem and leaf of Creeeping-rooted alfalfa were extracted with four methods,including a modified CTAB method,TRNzol method and other two methods,and its quality and quantity were compared.The results indicated that the modified CTAB method was better than the original method since the value of OD260 nm/OD230 nm and OD260 nm/OD280 nm were 2.0 and 1.8,the purities were great higher,the bands of 28S and 18S rRNA on Gel eletro pH oresis were very clear and did not degradated.Comparably,TRNzol method was not very good as the first method because RNA was easy degraded and dispersed although the value is higher,and other two methods were not fit the requirement of RNA extraction. 更多

【题目】自组装海藻酸钠纳米粒在正常小鼠体内分布的研究
【中文关键词】海藻酸钠纳米粒;荧光标记;体内分布;FITC;维生素D3
【英文关键词】Sodium alginate nanoparticles; fluorescent marker biodistribution; FITC; vitamin D3
【中文摘要】目的:研究自组装海藻酸纳米粒(sSAN)在小鼠的体内分布情况,探讨sSAN 作为维生素D3 药物载体的可行性。方法:用异硫氰基荧光素(FITC)标记sSAN 和负载维生素D3 的海藻酸纳米粒(sSAN-VD3),将两种标记好的纳米粒分别给予小鼠灌胃,在不同的时间将小鼠处死,分别取血清和肝、肺、肾、脾,各脏器经匀浆后,用荧光分光光度计测定其荧光强度,计算血清和各组织中sSAN 和sSAN-VD3 的含量。结果:经灌胃给药后在小鼠血清、肝、肾、肺中均检测到上述药物,而脾中没有检测到。给药后0.5h 和1h,sSAN-VD3-FITC 及sSAN-FITC 在肝、肺和血清中的含量持续增加,以1h 时达峰值浓度,给药2h、4h 后,两种制剂的浓度逐渐降低。在肾脏中的含量随着时间的延长逐渐增加,于2h 时达峰值浓度,随后逐渐降低。结论:sSAN 及sSAN-VD3 经小鼠灌胃给药后均可吸收入血,而且口服吸收后在肝、肺、肾和血清中均有一定的分布。
【英文摘要】Abstract Objective:To study on the distribution of self-assembled sodium alginate nanoparticles in mice,to discuss the possibility of sSAN being drug carrier of Vitamin D3. Method:sSAN and sSAN-VD3 were labeled with FITC. The rats were intragastric administeredby sSAN-FITC and sSAN-VD3-FITC and were executed at different times, and serum, liver, kidney, spleen, lung were made into tissue homogenates, determined fluorescence intensity of serum and tissue homogenates. Results:sSAN and sSAN-VD3 could be detected inserum, live, kidney and lung at different times, but not in spleen. sSAN-VD3-FITC and sSAN-FITC increased continuously in liver lungand serum after administered and reached max concentration at 1h. sSAN-VD3-FITC and sSAN-FITC increased gradually in kidney, and reached max concentration at 2h, then decrease gradually. Conclusions:Both of sSAN and sSAN-VD3 could be absorbed into the blood after intragastric administration, and could distribute in the liver, lung, kidney and serum.

【题目】人结肠癌Caco-2细胞对自组装海藻酸钠纳米粒摄取的体外研究
【中文关键词】Caco-2 细胞;自组装海藻酸钠纳米粒;摄取
【英文关键词】Caco-2 cell ; Self-assembled sodium alginate nanoparticles; Uptake
【中文摘要】摘要目的: 研究人结肠癌Caco-2 细胞对异硫氰基荧光素(FITC) 标记的自组装海藻酸钠纳米粒(sSAN-FITC)的摄取及影响因素。方法:Caco-2 细胞加入sSAN-FITC 孵育后采用荧光显微镜检测细胞对sSAN-FITC 的摄取情况;通过采用荧光酶标仪检测细胞内FITC的荧光强度,观察sSAN 浓度、作用时间、环境pH值对细胞摄入sSAN 的影响,并与空白对照组比较。结果:sSAN 可以被Caco-2细胞摄入;与空白对照组比较,3种影响因素中,随着sSAN 浓度升高及作用时间延长,荧光强度增强(P<0.01),当pH 值低于或高于7.0 时,荧光强度均增强(P<0.01或P<0.05)。结论:sSAN 可被Caco-2 细胞摄取,且呈浓度、时间依赖性,并受pH值的影响。
【英文摘要】ABSTRACT OBJECTIVE: To investigate the uptake of self-assembled sodium alginate(SA)nanoparticles labeled by FITC(sSAN - FITC)in Caco-2 cells and the influencing factors. METHODS: Fluorescence microscope was utilized to exam the uptake of sSAN-FITC in Caco-2 cells. Multifunction continuous spectrum enzyme-linked immunosorbent assay system wasused for the detection of the fluorescence intensity of FITC in the cells and quantitative assay of the effect of sSAN concentration,it s action time and pH on the uptake of sSAN-FITC in Caco-2 cells, with blank group as control. RESULTS:Pictures of Caco-2 cells taken by fluorescence microscope showed uptake of sSAN-FITC by Caco-2 cells. As compared withblank control group, among the 3 factors, the fluorescence intensity increased with the increase of the sSAN concentration and the prolonging of the action time(P<0.01).And the fluorescence intensity increased in cells when pH was noted her higher or lower than 7.0(P< 0.01 or P<0.05). CONCLUSIONS:Uptake of sSAN by Caco-2 cells was noted in a concentrationand time dependent manner, and the uptake is also influenced by the pH of the culture solution.

【题目】A set of new microsatellite loci isolated from Chinese mitten crab, Eriocheir sinensis
【中文关键词】中华绒螯蟹;微卫星;磁珠富集
【英文关键词】Chinese mitten crab, enriched library, germplasm resource, microsatellite loci
【中文摘要】中华绒螯蟹在中国作为食物较其他物种具有较高的商业价值。分子标记的开发对其种质资源保护、评估生态环境对其影响,分析种群结构特点,并确定亲缘关系等是非常必要的。我们新开发了18个中华绒螯蟹的微卫星标记,观察等位基因数介于8到30,观察杂合度范围从0.140到0.900。这些增加分子可为分析中华绒螯蟹的群体结构提供新的资源。
【英文摘要】Eriocheir sinensis has higher commercial value as food source than any other species of,Eriocheir in China. To protect its germplasm resources and evaluate impact on local ecology,molecular tools to characterize the population structure and identify kinships from different water systems are highly needed. We have newly identified a set of 18 microsatellite markers with the observed number of alleles at each locus ranges from 8 to 30, the observed heterozygosity ranges from 0.140 to 0.900. These newly isolated markers increase the available molecular resources that can be used to analyse population structure of Chinese mitten crab.

【题目】微卫星评价牙鲆雌核发育二倍体纯合性
【中文关键词】牙鲆;雌核发育;纯合性;微卫星
【英文关键词】Japanese flounder; Gynogenesis; Homozygosity; Microsatellite marker
【中文摘要】采用8个微卫星座位分别对牙鲆减数雌核发育二倍体家系和卵裂雌核发育二倍体家系的纯合性进行检验。卵裂雌核发育二倍体在所有检测座位全部纯合。减数雌核发育二倍体在部分座位发生纯合,但未发现在所有座位全部纯合的个体,在 Poli23TUF、Poli9-8TUF、Poli11TUF、Poli13TUF、Poli23TUF、Poli30TUF、Poli123TUF和Poli130TUF座位,、杂

合子比例分别为1·0000、1·0000、0·1944、0·9459、0·8611、1·0000、0·7778和0·8000,平均杂合子比例为0·8224。由此表明,牙鲆除了Poli11TUF外,在其余7个座位均具有很高的重组率。研究结果显示,牙鲆卵裂雌核发育二倍体一代即可形成纯合子;而减数雌核发育二倍体由于具有较高的重组率,使其与母本的遗传同质性较高。

【英文摘要】Gynogenesis was thought to be a useful method to generate inbred lines in fish. In this study,analysis of 5-8 heterozygous loci in Japanese flo under (Paralichthy s olivaceus) was used to measure the increment of homozygosity in meiogynogenetic diplo id (Meiotic-A & Meiotic-B) and mit ogynogenetic diploid (Mitotic-A) . The result showe d all homozygosity in Mitotic-G1, while a high percentage of heterozygosity in Meio sis-A and Meiosis-B except Poli11TUF. The rate of heterozygosity in meiogynogenetic progenies at the locus of Poli9TUF, Poli9-8TUF,Poli11TUF, Poli13 TUF, Poli23TUF,Poli30TUF, Poli123TUF and Poli130TUF were 1.00 00,1.0000,0.1944,0.9459,0.8611,1.0000,0.7778 and0.8000,respectively.The average recombination rate of these eight loci is 0.8224. The high proportion of heterozygotes for seven loci demonstrates that it is not a practical method for producing homozygous inbred lines in the gynogenetic fish produced by retention the second polar body,and treatments of suppressing the first cell division were more promising for this purpose.

【题目】Genetic diversity of common carp from two largest Chinese lakes and the Yangtze River revealed by microsatellite markers

【中文关键词】--

【英文关键词】common carp (Cyprinus carpio L.), the Yangtze River, microsatellites, genetic diversity, heterozygosity,population genetic structure

【中文摘要】--

【英文摘要】Six polymorphic microsatellites (eight loci) were used to study the genetic diversity and population structure of common carp from Dongting Lake (DTC), Poyang Lake (PYC), and the Yangtze River (YZC) in China. The gene diversity was high among populations with values close to 1. The number of alleles per locus ranged from 2 to 11, and the average number of alleles among 3 populations ranged from 6.5 to 7.9. The mean observed (Ho) and expected (He) heterozygosity ranged from 0.4888 to 0.5162 and from 0.7679 to 0.7708, respectively. Significant deviations from Hardy-Weinb erg Equilibrium expectation were found at majority of the loci and in all three populations in which heterozygote deficits were apparent. The a nalysis of molecular variance (AMOVA) indicated that the percent of variance among populations and within populations were 3.03 and 96.97, resp ectively. The Fst values between populations indicated that there were significant genetic differentiations for the common carp populations from the Yangtze River and two largest Chinese freshwater lakes. The factors that may result in genetic divergence and significant reduction of the observed heterozygosity were discussed.

【题目】Genetic Polymorphism of Microsatellite DNA in Two Populations of Northern Sheatfish (Silurus soldatovi)

【中文关键词】--

【英文关键词】Silurus soldatovi; microsatelliteDNA; geneticpolymorphism

【中文摘要】--

【英文摘要】In this article, population variations and genetic structures of twopopulations of northernsheatfish (Silurus soldatovi) were analyzed using 24 microsatellite loci enriched from southern catfish (S. meriaionalis Chen) by magnetic beads. Gene frequency (P), observed heterozygosity (Ho), expected heterozygosity (He), polymorphism information contents (PIC), and number of effective alleles (Ne) were determined. One population was wild, ripe individuals collected from Heilongjiang River (HNS); the other was cultured fry collected from Songhuajiang River (SNS). The Hardy-Weinberg equilibrium (HWE) was tested by the genetic departure index (d). The coefficient of gene differentiation GST and ΦST by AMOVA (Analysis of Molecular Variety) was imputed using Arlequin software in this study. In addition, a phylogenetic tree was constructed by UPGMA method based on the pairwise Nei's standard distances using PHYLIP. A total of 1 357 fragments with sizes ranging between 102 bp and 385 bp were acquired by PCR amplifications. The average number of alleles of the twopopulations was 8.875. Results indicated that these microsatellite loci were highly polymorphic and could be used as genetic markers. The mean values of the parameters P, Ho, He, PIC, and Ne were 0.165, 0.435, 0.758, 0.742, and 5.019 for HNS and 0.147, 0.299, 0.847, 0.764, and 5.944 for SNS, respectively. Although there were differences, there were no significant diff erentiations except for the locus HLJcf37. These populations to a certain extent deviated from HWE, such as excessive and deficient heterozygote numbers. The value of GST was 0.078 and above 98% of the variation were differences among individuals within the population, so the variation between populations was insignificant. Cluster analysis also showed that the relationships among individuals were very close. In conclusion, the microsatellite markers that were developed through this study are useful for genetic analysis and the genetic culture that was proposed in this study has no significant impact on S. soldatovi.

【题目】Isolation and characterization of microsatellite markers from Fangzheng silver crucian carp(Carassius auratus gibelio (Bloch)) and cross-amplification in the closely related species crucian carp(C. auratus auratus(Linnaeus))
【中文关键词】--
【英文关键词】Crucian carp;microsatellites;primers
【中文摘要】--
【英文摘要】We report the development of 20 microsatellite markers for Fangzheng silver crucian carp,Carassius auratus gibelio(Bloch). Nineteen out of 20 showed polymorphism with alleles ranging from two to 14. These loci were screened to amplify the closely related species crucian carp,Carassius auratus auratus(Linnaeus) and all of them can amplify DNA with the size similar to the former. The origin of silver crucian carp is in issue and the population genetic structure is still unclear. Microsatellite markers isolated from the silver crucian carp and their utility in the crucian carp will be useful for these researches.

【题目】Isolation and characterization of microsatellite markers from pacific white shrimp(Litopenaeus vannamei)
【中文关键词】--
【英文关键词】Litopenaeus vannamei;microsatellites;primers;white shrimp
【中文摘要】--
【英文摘要】We report the development of 11 polymorphic microsatellite loci in pacific white shrimp (Litopenaeus vannamei) using an unenriched genomic lib rary. The number of the alleles ranged from two to 18 and observed hererozygosity ranged from 0.0286 to

0.9429, indicating that these markers will be useful for population studies and mapping in pacific white shrimp. Seven loci were detected deviated from Hardy – Weinberg, caused by deficiency of heterozygote, suggesting population genetic structure across the sampled population. No evidence for linkage disequilibrium was found.

【题目】Sox genes in grass carp (Ctenopharyngodon idella) with their implications for genome duplication and evolution
【中文关键词】--
【英文关键词】grass carp (Ctenopharyngodon idella) , Sox ,genome duplication , co-ortholog , molecular clock
【中文摘要】--
【英文摘要】The Sox gene family is found in a broad range of animal taxa and encodes important gene regulatory proteins involved in a variety of developmen tal processes. We have obtained clones representing the HMG boxes of twelve Sox genes from grass carp (Ctenopharyngodonidella), one of the four major domestic carps in China. The cloned Sox genes belong to group B1,B2 and C. Our analyses show that whereas the human genome contains a sing le copy of Sox4,Sox11 and Sox14, each of these genes has two co-orthologs in grass carp, and the duplication of Sox4 and Sox11 occurred before the divergence of grass carp and zebra fi sh, which support the " fi sh-speci fi c whole-genome duplication " theory. An estimation for the origin of gr ass carp based on the molecular clock using Sox1, Sox3 and Sox11 genes as markers indicates that grass carp (subfamily Leuciscinae) and zebrafi sh (subfamily Danioninae) diverged approximately 60 million years ago. The potential uses of Sox genes as markers in revealing the evolutionary history of grass carp are discussed.

【题目】斑马鱼微卫星分子标记检测鲤鱼种间多态性
【中文关键词】微卫星;斑马鱼;鲤鱼;种间多态性;分子标记
【英文关键词】microsatellite;Danio rerio;common carp;interspecies variation;molecular marker
【中文摘要】用6072对斑马鱼(Danio rerio)微卫星引物对黑龙江鲤(Cyprinus carpio haematopterus Temminck et Schlege1)、荷包红鲤(Cyprinus carpio var.wuyuanensis)和柏氏鲤(Cyprinus pellegrini Tchang)进行种问遗传差异分析,共发现563个斑马鱼微卫星标记在鲤鱼种间表现出多态性。从中随机抽选25个标记,对斑马鱼和3种鲤伍的遗传多样性进行分析,使用Phylip3.63软件按照Nei氏标准遗传距离计算种间遗传距离,再用MEGA3.0软件绘制NJ系统发生树,并进行1000次bootstrap检验系统树。结果显示,黑龙江鲤与荷包红鲤首先聚类,然后是柏氏鲤、斑马鱼。这些具有多态性的斑马鱼微卫星标记可用于鲤鱼种间种质鉴定,同时,借用模式生物斑马鱼的丰富遗传标记资源,增加同科的鲤鱼遗传连锁图谱上遗传标记的密度,必将对鲤鱼遗传育种进入分子育种时代起到促进作用。
【英文摘要】Using 6072 pairs of zebrafish(Danio rerio)microsatellite primers to analyze the genetic variances between three species of common carp collected from the Heilongjiang River (Cyprinus carpio haematopterus Temminck et Schlegel,Cyprinus carpio var. wuyuanensis)and Yunnan province(Cyprinus pellegrini Tchang),totally 563 zebrafish microsatellites reveal inheritance polymo rphism,which could be used in genotyping of these common carp.25 pairs of zebrafish microsatellite primers were randomly selected from these 563 primers to identify the genetic diversities.The Nei genetic distances were computed by the software package of Phylip3.63,and the evolutionary tree based on Neighbor-Joining method of Saitou and Nei(1987) were drawn by the software of MEGA3.0.Also l000 times of bootstrapping were tested using the maximum likelihood method,the UPGMA method and NJ method.The results show that Cyprinus carpio haematopterus Temminck et Schlegel and Cyprinus carpio var.wuyuanensis cluster first and then Cyprinus pellegrini Tchang and Danio rerio.The polymorphic microsatellites can be used as genetic markers of these species,so as to increase the molecular markers of the carp genetic linkage map.Screening interspecies microsatellite primers, especially from a model organism can advance the relative research rapidly.Then we can compare genetic data convenie ntly,in order to breed carps at a molecular level more quickly.

【题目】磁珠富集法筛选虾夷扇贝微卫星序列
【中文关键词】磁珠富集;虾夷扇贝;微卫星
【英文关键词】enrichment by magnetic beads;Japanese scallop;microsatellite
【中文摘要】采用生物素-磁珠吸附微卫星富集法,筛选虾夷扇贝(Patinopecten yessoensis)微卫星分子标记,并用同位素法进行二次筛选。结果在筛选的192个菌落中获得136个阳性克隆,经测序分析,获得微卫星序列179个,其中完美型占50.8% ,非完美型43.0%,混合型占6.1%。除探针中使用的CA重复外,还得到TC、AG、ACA、CTAT的重复序列。用引物设计软件PrimerPremier5.0设计引物85对,挑选其中的40对合成并进行筛选。
【英文摘要】Japanese scallop(Patinopecten yessoensis)is one of the most important cultured seashells in the world.It is distributed widely over the cold seas along the coastline of the northern islands of Japan,the northern part of the Korean Peninsula,Sakhalin,and the Kuril Islands,and was introduced to China from Japan more than 20 years ago.Along with nearly 20 years ’ artificial cultu re.available

DNA markers are needed for its genetic research.Microsatellites recently have become an extremely popular marker in a wide variety of genetic investigations.In this resea rch.genomic DNA was extracted from muscle of Japanese scallop by norma1 methods and digested with restriction enzyme Sau3AI.Fragments of 400- 900 bp were iso1ated and then ligated short linkers(20 bp).They were to create a " whole genome PCR library ".Microsatellite isolated from gen omic DNA was hybridized with a biotin-labeled SRS(simple repeat sequence)probe(CA)15,and the hybrid mixture was incubated with magnetic beads coated with streptavidin.After washing to remove the non-SRS fragments.the eluted single-stranded DNA contains the selected microsatell ite DNA.The selected DNA are then amplified using primers designed complementary to the linkers.cloned into the pGEM—T vect or and transforrn into competent E.coli DH5a.Then the genomic library was second-screened for microsatellite DNA using(CA)15 probes labeled with r32P—ATP at 5 ' end the probes hybridized with bacterial colonies.As a result,136 positive clones were identified from 192 clones,and 179 microsatellites we re found.Among the 179 microsatellites,50.8% were perfect,43.0% were imperfect and the rest were compound type(6.1%).Except the biotin-labeled SRS probes CA,there were TC,AG,ACA and CATA in the microsatellites Finally,85 microsatellite primers were designed by software Prem ier Primer5.0,and 40 pairs were screene d,34 pairs were amplified.They made positive contribution to exploring genomes,and developing gen etic linkage maps,as well as made possible the systematic search for quantitative trait loci(QTL)of the Japanese scallop.

【题目】磁珠富集法制备大口鲶的微卫星标记

【中文关键词】大口鲶;微卫星;磁珠富集
【英文关键词】Silurus meriaionalis ;microsateUite;enrichment by magnetic bead

【中文摘要】通过磁珠富集的方法分离大口鲶(Silurus meriaionalis)的微卫星分子标记。将基因组DNA酶切,梯度离心收集4OO~900 bp片段并纯化,连接Brown接头,用生物素标记的寡核苷酸(CA)15作探针与其杂交,杂交复合物结合到包被有链霉亲和素的磁珠上,然后将这些片段洗脱,PCR扩增,进行克隆构建" 基因组文库 ",再通过同位素标记的探针(CA)15进行2次杂交筛选,所得到的阳性克隆测序。从所获得593个阳性克隆中选取178个经测序,97.19%(173个)含有微卫星序列,90.60%重复数在l0以上,75.98%为完美型。除探针中使用的CA重复单元外,还观察到CT、GA、ATG的重复序列。设计获得120对微卫星引物,合成40对经PCR筛选,结果3l对引物扩增出多态性条带。显示出,磁珠富集法是获得微卫星分子标记的一种有效的方法,可成为今后发展该标记的主要方法。同时,制备出的微卫星标记可为今后研究大口鲶的分子遗传育种提供有用的遗传标记。

【英文摘要】Microsatellite enrichment by magnetic beads is a fast and efficient method for isolating this molecular genetic marker.Some microsatellite mark ers of Silurus meriaionalis were obtained by using the method.First.the genomic DNA was cut by the enzyme of Sau3AI targeted segments were col lected with the size of 400—900 base pairs by centrifugation of sucrose density gradi ent.Then the segments were purified in a low melting ag arose gel and ligated with a short linkers(20bp),from which,the " gen omic PCR library " was created.These genomic DNA fragments were hybridiz ed with a biotin-labeled SRS(simple repeat sequence) probe(CA)15.The hybrid mixture was incubated with magnetic beads coated with streptavidin .After washing to remove the non-SRS fragments,the eluted single-stranded DNA contained the selected microsatellite DNA.The selected DNAs were then amplified using primers designed complementary to the linkers,cloned into the pMD18一T vector and transformed into competent E.coli DH5a. In this experiment,we performed the second screening with a radio labeled(CA)l5 probe and obtained 178 positive clones.From these clones,173 microsatellite sequences(about 97.19%)were isolated,among which 90.60% microsatellites repeated more than l0 times and 75.98% microsatell ites were perfect repeats.This allowed us to design 120 pairs of primers with the software Primer Premier5.0.In addition,40 pairs of primers were composed and screened.38 pairs were used successfully to amplify special fragments,among which 31 pairs were polymorphism within species .These show microsatellite enrichment by magnetic beads is a suitable method to acquire microsatellite and it should become a main way to devel op this molecular maker.At the same time,the microsatellite obtained can offer useful genetic markers for studying Silurus meriaionalis in the future.

【题目】虹鳟6个养殖群体的遗传多态性的微卫星分析
【中文关键词】虹鳟;养殖群体;遗传多样性;微卫星
【英文关键词】Oncorhynchus mykiss ; cultured population ; genetic diversity ; microsatellite
【中文摘要】利用14 对微卫星分子标记对虹鳟的6个养殖群体进行遗传多样性分析。结果表明:6个群体的平均等位基因数A为2.89~4. 22 ,平均有效等位基因数Ne 为2.15~2.78 ,平均观察杂合度H0为0.4801~0. 6786 ,平均期望杂合度He为0.5052~0. 6211 ,平均多态信息含量PIC 为0.4298~0.5762;其中渤海站群体的等位基因数最多、多态信息含量最高,有效种群最大,通过基因型的P值发现6个群体只在位点AF375034 符合Hardy-Weinberg 平衡,在其他位点都不同程度的偏离平衡,同时对6个群体的遗传距离进行了估算,聚类分析发现挪威群体与其他群体遗传距离最远。
【英文摘要】Rainbow trout are cultured widely throughout the world for supplementation in natural ecosystems and for commercial aquaculture .In 1959 it was firstly introduced to China from Korea. After introduction from America and other countries such as Norway,Den mark,and so on,rainbow trout were now cultured in about 20 provinces in China. In this study , microsatellite DNA was employed to assess the genetic variations between 6 cultured populations of rainbow trout (American golden trout , American Donaldsons , Norway,Denmark,Finland,and Bohaizhan).The results showed that in the se 6 cultured populations the average number of allele (A) was 2.89 to 4.22;average number of effective allele (Ne) was 2.15 to 2.78;the value of average observed heterozygosity(Ho) in six populations was 0.4802to0.6786;the value of average excepted heterozygosity (He) was 0.5052 to 0.6 211;and the value of average polymorphism information content (PIC) was 0.4298 to 0.5762. Hardy-Weinberg equilibrium analysis revealed that all of these 6 populations showed a remarkable genetic disequilibrium at loci AY039634,AY039638,AY0396466. Only at locus AF375034 all of 6 populati ons showed equilibrium. The genetic distance of six cultured populations wa s calculated and cluster analysis was also carried out.

【题目】精子膜蛋白在精子雌核发育银鲫中的作用
【中文关键词】银鲫;精子膜蛋白;异精雌核发育;雄核发育
【英文关键词】Carassius auratus gibelio;sperm memb rane protein;allogynogenesis;androgenesi
【中文摘要】通过对雄性银鲫的新鲜精液进行分级抽提得到精子的不同组份,包括精浆、精头的膜、鞭毛和脱膜精头等,在荷包红鲤和雌性银鲫杂交时加入其中的可溶性精头膜蛋白组分,研究精子膜蛋白在雌核发育银鲫异源受精中的作用。研究发现,加入同源精子膜蛋白后的雌核发育银鲫异源受精卵的孵化率比对照组低很多,并且在子代培育过程中,发现了生长速度快、表型和父本相似、基因型基本和父本基因型相同的特殊子代。在某种程度上表明:精子膜蛋白可能是雌核发育银鲫卵子进行雄核发育的关键因素。
【英文摘要】The sperm proteins were extracted from the fresh spermatic fluid of male gynogenefic silver crucian carp(Carassius auratus gibelio),and various fractions were collected,the fractions include sperm plasma,sperm head membrane,flagella,and dememb ranated sperm head,etc.in order to reveal the roles of the homologous sperm head membrane proteins to allogenetic fertilization in gynogenetic silver crucian carp.The soluble protein co mponents of the sperm head memb rane were,mixed with sperms of purice red carp(Cyprinus carpio var vuyuanensis)and then this cocktail was ferti lized to eggs of silver crllcian carp.The obtained results show that the hatching ratio of the experimental group is lower than that of the con trol group.Furthermore during the filial generation breeding

,two special individuals which grow faster were found,the special individuals ha ve the similar phenotype and genotype to their father.To a certain degree, sperm head memb rane ma ybe is the key factor to the androgenesis of the gynogenetic silver Crllcian carp eggs.

【题目】利用17个微卫星标记分析鳙鱼的遗传多样性
【中文关键词】微卫星标记;鳙鱼;遗传多样性;等位基因频率
【英文关键词】microsatellite marker;Aristichthys nobilis;genetic diversity;allele frequency
【中文摘要】选用实验室克隆的17个鳙鱼微卫星分子标记分析四川泸州和江西鄱阳湖的两个种群鳙鱼的遗传多样性及种质特性,计算和统计了杂合度、多态信息含量(PIC)、有效等位基因数、等位基因频率、遗传距离、遗传相似系数、Hardy-Weinberg平衡偏离指数等方面内容。结果表明:选择使用17个微卫星标记,其中有4个为单态标记,13个为多态标记。江西和四川鳙鱼群体每个微卫星位点的平均等位基因数分别为3.325及3.882,平均有效等位基因数分别为3.531及2.676,多态位点百分率分别为82.4及70.5,17个微卫星标记共有等位基因71个,多态微卫星位点的PIC在0.077 -0.960之间变动,平均为0.417,两群体位点平均观测杂合度为0.385和0.360,平均期望杂合度为0.452和0.422,两个群体间的遗传相似系数为0.897,群体间的遗传距离为0.109。
【英文摘要】Seventeen microsatellite markers of Aristichthys nobilis previously discovered by our lab were selected to analyze the genetic diversity and cha racteristics of two populations of Aristichthys nobilis from Jiangxi and Sichuan provinces.The following parameters were calculated:heterozyg osity,polymorphism information content(PIC),valid allele number,allele frequency,genetic distance,genetic similarity coeficient,Hardy-Weinbe rg balance deflection index and so on.Results show that there are four monomorphic and 13 polymorphic markers among the 17 selected microsatel lite markers.The average of allele number in each microsatellite locus of the Jiangxi population and Sichuan populations is 3.325 and 3.882,r espectively;the average valid allele number is 3.531 and 2.676,respectivey:and the number of total alleles of the se 17 microsatellite loci is 71.The PIC of polymorphic loci varies between 0.077~0.960,and the average PIC is 0.417.The average observed heterozygosity(Ho)of two popula tions is 0.385 and 0.360,respectivelyand the average expected heterzygosity(He)is 0.452 and 0.422,respectively.The genetic simi1arity coefici ent of two population s of Aristichthys nobilis is 0.897 and the genetic distance of these populaions is 0.109.

【题目】同源雌核发育银鲫子代微卫星杂合位点的分离
【中文关键词】雌核发育;银鲫;杂合位点
【英文关键词】Carassius auratus gibelio;heterozygous loci;segregation
【中文摘要】使用14对银鲫 (Carassius autatus gibelio Bloch)微卫星引物对同源雌核发育的银鲫子代及其亲本进行多态性研究,探讨雌核发育银鲫的母本微卫星杂合位点 在同源传代中是否有分离的情况发生。在所选用的14对微卫星引物中,有8对在父母本间检测出不同的多态性,在所检测的第1组银鲫自交的子代中,只有1个个体在所检测的8个微卫星位点均存在变异,有明显的父本特异性条带出现,表现出了大量父本遗传信息,出现率为4.55%;在第2组检测到1个个体只在SCM13位点出现母本部分特异性条带的缺失、弱化,而在其他位点上没有发现变异,出现率为1.52%。此结果表明,雌核发育银鲫卵子大部分在配子发生过程中没有发生减数分裂,即使用同源精子刺激,也行雌核发育生殖;但是,有极少数卵子在配子发生过程中,可能发

生了部分减数分裂,具有部分融合同源精子的能力,从而在子代中检测到父本以及在融合过程中重组来的特异条带,用微卫星分于标记证实了银鲫两种牛殖方式的存在,即雌核发育生殖和两性融合生殖

【英文摘要】The silver crucian carp(Carassius auratus gibelio Bloch)is a triploidy gynogenetic species,which provides a unique model system for understand ing evolutionary genetics and for elucidating the regulatory mechanisms underlying diverse reproduction modes in vertebrates.In this study,PCR was performed on homologous gynogenetic parents and its offspring by 14 pairs of microsate llite primers,which was expeered to disclose the segregation Of maternal heterozygous loci in generation passage.There were two groups of parents and its offspring to test in this study.Eight microsatellite loci showed different polymorphism between father and mother in selected 14 loci.In group I,only one individual,that occupied 4.55% of the population,was detected to show the obvious specific bands of paternal in each of the 8 loci,which showed abundant paternal gen etic information.Meanwh ile,an individual represented the deletion and weakening of partly maternal specific bands in microsatellite locus SCM13 in group II,which occupied 1.25% of the population.It was concluded that meiosis did not happen during the most process of gametgenesis in gynogenetic silver crucian carp eggs,even when they were stimulated by homologous sperms.However,minority eggs maybe complete meiosis partly at gametogenesis that can lead to fusing the homologous sperm s partly.In this csse,the specific bands from pater and recombination during the fusion can be detected in filial generation.It is confirm ed that there exist two reproduction modes in silver crucian carp including gynogen esis and amphimixis by microsatellite molecular markers.

【题目】团头鲂微卫星标记的快速制备

【中文关键词】团头鲂;微卫星;磁珠富集

【英文关键词】Megalobrama amblcycephala;microsatellite;magneticbeads enrichment

【中文摘要】采用磁珠富集法与放射性杂交相结合开发团头鲂(Megalobrama amblycephala)基因组微卫星资源。以团头鲂基因组DNA为材料,经Sau 3AI限制性内切酶消化后,选取400~900 bp的片段进行PCR全基因组扩增,并利用生物素标记的(CA)l5探针进行微卫星片段的富集。将得到的片段与T载体连接后转入DH5α大肠杆菌中,然后利用γ-32p标记的放射性同位素探针进行第二轮杂交。结果表明,共获得微卫星基因组文库2000个菌,杂交前菌落PCR榆测阳性克隆率为50%;杂交后得到的阳性克隆为230个,占11.5%。从得到的230个阳性克隆中挑出120个进行测序,有94个克隆含有重复次数大于5次的微卫星序列,其中46个(48.94%)有随机侧翼区,可以设计引物;14个缺乏足够的侧翼序列。在得到的微卫星序列中,重复单元除CA/GT外,还观察到CT、AG、CG、CAA、CTCA等重复单元。在单一型标记中,完美占53.15%,非完美型为37.84%;混合型标记占9.01%。另外,微卫星蕈复次数主要集中在5-30次,占75.68%。本研究旨在对团头鲂基因组资源的开发利用起到一定的促进作用,并为团头鲂养殖品系的优化、遗传多样性的检测及遗传谱的构建等奠定基础。

【英文摘要】The CA DNA sequnces in Bluntnose black bream (Megalobrama arnblycephala)were isolated through combining biotin capture method and radioactive labeling hybridization,and the characteristics of the microsatellites were analyzed.DNA was extracted from a Bluntnose black bream,and diges ted with Sau3AI,and 400—900 bp fragments were selected and ligated to different adaptors(Brown and Whitney).Then the purified ligated-DNA was hybridized with biotin-labeled simple sequence repeats(SSR) probes(CA)l5. After capture of target fragments by magnetic beads and PCR amplif ication,a microsatellite genomic library containing 2000 col onies was constructed.Two hundred and thirty positive colonies(11.5%)were obtaine d through twice screens by radioactive r-32P- ATP labeling hybridization.Sequencing of 120 positive colonies confirmed that 94 contained 11l mi crosatellite 1oci(number of repeats>5).Of the 94 sequences,only 10 contained compound repeat motifs(9.01%),and of the remaining sequences,59 perfect (53.15%)and 42 imperfect(37.84%)repeat motifs were included.Fourty-six(48.94%)pairs of PCR primers were designed through software pa ckage,while the remaining sequences were not chosen because of their insufficient flanking sequences.Besides the motif of CA/GT contained in t he colonies,there were also CT/AG,CG,CAA and CTCA repeat motifs.In addition,the microsate llites with repeat times at 5-30 were more abunda nt than others.This research makes a positive contribution to explore genomes of B1untnose black bream.offer genetic tools to check the genetic variations and construct genetic linkage map.

【题目】微卫星DNA标记探讨镜鲤的种群结构与遗传变异
【中文关键词】微卫星;群体多样性;镜鲤;分子标记
【英文关键词】microsatellite;population variety;genetic structure;mirror carp
【中文摘要】采用30个微卫星分子标记,对5个镜鲤群体的观测杂合度(H0)、期望杂合度(He)、多态信息含量(PIC)和有效等位基因数(Ae)等进行了遗传检测,根据基因频率计算遗传相似系数和Nei氏标准遗传距离,以χ2检验估计Hardy—Weinberg平衡,以近交系数(FST)和基因流(Nm)分析群体的遗传分化。同时,使用PHYLIP3.63软件绘制基于Nei氏标准遗传距离的UPGMA聚类图,并进行bootstrap自举检验验证进化树的可靠性。在德国镜鲤选育系(Scattered Cyprinus carpio L.)和来自4个不同养殖场(松浦、东岗、奉城和辽中)的德国镜鲤群体中共检测到7083个扩增片段,长度在102~446 bp之间,在群体内扩增出等位基因1~16个不等,共计356个等位基因。结果表明:(1)5个群体检测的有效等位基因数在1.07~12.30个不等,平均多态信息含量为0.74、0.74、0.69、0.75和0.75,无偏期望杂合度的平均值为0.74 、0.78 、0.70、0.76和0.78,说明这几个群体属于高度多态,遗传多样性水平较高。(2)群体间相似系数在0.52以上,相似性较高。聚类分析显示,东岗、奉城和辽中3个养殖场的德国镜鲤群体聚类成一个分支,而德国镜鲤选育系与松浦群体聚类成另一分支。聚类的先后与它们在地理分布上距离远近有一定的相关性。(3)在与功能基因相关的多个微卫星基因座位上,扩增产物呈现不同程度的缺失现象,这些无效等位基因的产生可能与结构基因在育种中受到人工选择的影响较大有关。
【英文摘要】In this paper,population genetic variability and genetic structure of five populations of an important cultivation species,mirror carp(Cypri nus carpio L.)were analyzed using 30 microsatelllte loci.The observed(Ho)and expected(He) heter ozygosity values,polymorphic information cont ent(PIC) and number of effective alleles(Ae)were all determined.The genetic similarity coefficient and Nei ’ s standard genetic distance were co mputed based on the allele frequencies.The Hardy-Weinberg equilibrium was checked by x2 test.Genetic diferentiation and hierarchical partition of genetic diversity were evaluated by Fst and Nm,A dendrogram was constructed based on UPGMA methods using PHYLIP software package supposed by a bootstrap value of 91.0%.Totally 7083 fragments were procured.Their lengths were from 1O2 bp to 446 bp.For each locus,1-16 alleles were am plified,adding up to 356 alleles in all the 5 populations.We found the genetic variability level was relatively high in all five populations. a s shown by Aa=1.07-2.30,Ho=0.70一O.78 and PIC=O.69-0.75.respectively.The genetic similarity coefficients were all above 0.52,indicating thei r close genetic relationships.The UPGMA phylogenetic tree showed mirror carps sampled from Donggang,Fengcheng and Liaozhong were clustered int o one group and the other two populations,both collected from Songpu,were grouped together.There were obvious relations between genetic distan ces and geographical distributions of the five populations.No fragments were amplified from some loci of EST—SSRs.which may suggest the loss of these loci in mirror carp genome or seque nce divergence at the primer binding sites.These null alleles may result from selection because fun ctional genes are under more selection pressure than non-encoding loci.Overall,population genetic variation is high for each of the five mirr or carp,and the diferentiations are also significant among populations.

【题目】虾夷扇贝的多态性微卫星座位
【中文关键词】虾夷扇贝; 微卫星

【英文关键词】Japanese scallop,Patinopecten yessoensis,Microsatellite
【中文摘要】--
【英文摘要】Japanese scallop is one of the most important cultured seashells in the world. Following about 20 years ’ artificial culture, we need DNA mark ers for genetic research. Microsatellites recently have become popular markers in a variety of genetic investigations. In this research, we isol ated microsatellite DNAs from the Japanese scallop Patinopecten yessoensis genome with magnetic beads. As a result, 136 positive clones were ide ntified from 192 clones,and 179 microsatellites were found. Among the 179 microsatellites, 50.8% were perfect, 43.0% were imperfect and the rest were compound type (6.1%). Finally, 85 microsatellite primers were designed by software Primer Premier 5.0, and 40 pairs were screened; 15 loci showed polymorphism. In these microsatellite loci, genetic diversity was analysed in 2 cultured populations. The average number of allele (A) ra nged from 3.27 to 3.40; the average heterozygosity (Ho) in 2 populations was 0.447 to 0.540; average excepted heterozygosity (He) was 0.468 to 0.493; and average polymorphism information content (PIC) was 0.443 to 0.463. The genetic distance was 0.1155 and genetic identity was 0.8909. Thirteen microsatellite loci except HLJX-028 and HJLX-031 could be used for genetic analysis .

【题目】Characterization of novel microsatellite loci in rare minnow (Gobiocypris rarus) and amplification in closely-related species in Gobioninae
【中文关键词】--
【英文关键词】Gobiocypris rarus,Microsatellite,Genetic diversity,Cross-species amplification,Conservation genetics
【中文摘要】--
【英文摘要】Rare minnow (Gobiocypris rarus) is an endangered small fish endemic to upper reach of the Yangtze River. From a (GT)n enriched genomic library, 32 microsatellites were isolated and characterized. Nineteen of these loci were polymorphic in a test population with alleles ranging from 2-7, and observed and expected heterozygosities from zero to 0.8438, and 0.2679 to 0.8264, respectively. In the cross-species amplifications, 13 out of 19 polymorphic loci were found to be also polymorphic in at least one of the 7 closely related species of the subfamily Gobioninae. These pol ymorphic microsatellite loci should provide sufficient level of genetic diversity to evaluate the fine-scale population structure in rare minnow and its closely related species for the conservation purpose.

【题目】Development of EST-SSRs by an efficient FIASCO-based strategy: a case study in rare minnow (Gobiocypris rarus)
【中文关键词】--
【英文关键词】cDNA library; Expressed sequence tag; FIASCO; Fish; Microsatellite
【中文摘要】--
【英文摘要】Type I markers are useful for comparative mapping and other genetic analyses, but relatively difficult to develop. In the present study a micros atellite (SSR)-enriched cDNA library was constructed for the first time using the fast isolation by AFLP of sequences containing repeats (FIA SCO) method in a small fish, Chinese rare minnow (Gobiocypris rarus). A total of 97.4% of the expressed sequence tags (ESTs) contained targeted CA-repeats, in which 29 unique EST-SSRs were identified. Ten out of the 28 loci for which primer pairs were designed were polymorphic with alle les ranging from three to seven (mean 4.50). Some of these EST-SSRs can be amplified in other species. These results proved that cDNA-FIASCO is an efficient way to isolate novel EST-SSRs in a fish.

【题目】Development of novel EST-SSR markers from common carp by data mining from public EST sequences
【中文关键词】--
【英文关键词】Expressed sequence tag (EST); Datamining; EST-SSRs; Polymorphism; Cross-species amplification; Cyprinus carpio
【中文摘要】--
【英文摘要】Expressed sequence tags (ESTs) are a source for microsatellite development. In the present study, EST-derived microsatelltes (EST-SSRs) were ge nerated and characterized in the common carp (Cyprinus carpio) by data mining from updated public EST databases and by subsequent testing for po lymorphism. About 5.5% (555) of 10,088 ESTs contain repeat motifs of various types and lengths with CA being the most abundant dinucleotide one. Out of the 60 EST-SSRs for which PCR primers were designed, 25 loci showed polymorphism in a common carp population with the alleles per locus ranging from 3 to 17 (mean 7). The observed (H-O) and expected (HE) heterozygosities of these EST-SSRs were 0.13-1.00 and 0.12-0.91, respective ly. Six EST-SSR loci significantly deviated from the Hardy-Weinberg equilibrium (HWE) expectation, and the remaining 19 loci were in HWE. Of the 60 primer sets, the rates of polymorphic EST-SSRs were 42% in common carp, 17% in crucian carp (Carassius auratus), and 5% in silver carp (Hypop hthalmichthys molitrix), respectively. These new EST-SSR markers would provide sufficient polymorphism for population genetic studies and genome mapping of the common carp and its closely related fishes.

【题目】Isolation and characterization of polymorphic microsatellite loci in Wuchang bream (Megalobrama amblycephala)

【中文关键词】--
【英文关键词】cross-species amplification, genomic library, Megalobrama amblycephala, microsatellite,Parabramis pekinensis, polym orphism
【中文摘要】--
【英文摘要】Wuchang bream (Megalobrama amblycephala) is an economically important fish in China. From a (GT)(13)-enriched genomic library, 20microsatellites were developed. Nine of these 20 loci were polymorphic in a test population with allele numbers ranging from two to four, and the observed and expected heterozygosities ranging from 0.2609 to 0.7826 and from 0.3739 to 0.7546, respectively. In the cross-species amplifications, six of these nine loci were also polymorphic in white amur bream (Parabramis pekinensis). These polymorphic microsatellite loci are potentially useful for population genetics of Wuchang bream and its closely related species.

【题目】Microsatellite diversity and population genetic structure of redfin culter (Culter erythropterus) in fragmented lakes of the Yangtze River
【中文关键词】--
【英文关键词】Genetic diversity , Habitat fragmentation , Microsatellites , Population structure , Redfin culter (Culter erythropterus)
【中文摘要】--
【英文摘要】Redfin culter (Culter erythropterus) is a small lethic freshwater fish and widely distributed in the adjacent lakes of the Yangtze River of Chi na. Five microsatellite loci were applied to investigate the genetic variation and population structure of redfin culter from seven lakes in the middle-and-lower reaches of the Yangtze River. The gene diversity was high among the populations (H > 0.9), the average number of alleles among seven populations was low with a range from 2.00 to 3.87. The mean observed (H O) and expected (H E) heterozygosity ranged from 0.111 to 0.419 and from 0.162 to 0.750, respectively. Significant deviations from Hardy-Weinberg Equilibrium expectation were found in 50% of the total locus-population combination tests in which heterozygote deficits were apparent. The analysis of molecular variance (AMOVA) indicated that the percen tage of variance among and within these populations were 6.18 and 93.82, respectively. The Fst values (0.062, P<0.001) among studied populations indicated that there were

significant genetic differentiations among redfin culture populations from the scattered lakes with different connect ions to the Yangtze River. These results are useful for the evaluation and conservation of small freshwater fishes. The factors that may be invo lved in low intra-population polymorphism and the pattern of the population genetic structure of redfin culter from the Yangtze River were discu ssed.

【题目】Microsatellite DNA Maker Analysis of Genetic Diversity in Wild Common Carp (Cyprinus carpio L.) Populations
【中文关键词】--
【英文关键词】molecular marker; microsatellite; population variety; common carp
【中文摘要】--
【英文摘要】Thirty microsatellite loci were used for analyzing six wild populations of common carp (Cyprinus carpio L.). Observed(Ho) and expected (He) het erozygosity values, polymorphic information content (PIC), and number of effective alleles (Ae) were all detected. Genetic similarity index and genetic distance were computed based on the allele frequency. The Hardy-Weinberg Equilibrium was checked according to the test of χ 2. Geneti c differentiation and hierarchical partition of genetic diversity were evaluated by FST and Nm. A clustering dendrogram was made based on the res ults of UPGMA methods using the PHYLIP software package(version 3.63). There were totally 8,136 fragments ranging from 125 bp to 414 bp in leng th. Three to thirteen alleles were amplified in 30 loci and 210 alleles in all six populations. The average number of alleles in each locus was seven. The result showed that 1)the level of genetic variability was moderate in the six populations. Polymorphic information contents of the six wild common carp populations were 0.44, 0.52, 0.53, 0.57, 0.63, and 0.64 respectively. Effective alleles were from 1.04 to 4.72, the average numbers in each population were 2.19, 2.60, 2.42, 2.43, 2.45, and 2.33. The average expected heterozygosity values were 0.50,0.59,0.56,0.56,0.5 7,and 0.54 respectively; 2) the highest genetic similarity index that came from the populations of BR and ZL was 0.8511 and the lowest index was 0.6688, and it came from the populations of BR and HN. There was a correlation between the clustering result and the geographical distribution.

【题目】Microsatellite variations among fore populations of Eriocheir sinensis
【中文关键词】中华绒螯蟹;微卫星;群体多样性
【英文关键词】Eriocheir sinensis;Microsatellite;Population polymorphism
【中文摘要】利用本实验室克隆的16个和国际上发表的8个微卫星标记,对4个中华绒螯蟹群体(江苏、安徽、辽宁、天津)的遗传多样性进行检测。所检测到的扩增片段长度为8O一4_45 bp,在群体间扩增出2— 1O个等位基因,共计155个等位基因,平均等位基因6.458个。4个中华绒螯蟹群体的平均有效等位基因数(IVe)为4.349l—4.7234,平均观察杂合度(o)为0.569o_ .6722,平均期望杂合度(He)为0.7238—O.7546,并通过基因型的P值,确定了7个座位处于Hardy—Weinberg平衡;同时对4个群体的遗传距离进行了估算,聚类分析结果表明,安徽、江苏、天津聚为一支,属于长江河蟹类型,辽河种群单独聚为一支。
【英文摘要】Using microsatellite markers,we analysed genetic polymorphism in four populations of Eriocheir sinensis,sampled from Jiangsu,Anhui,Liaoning and Tianjin.Twenty—four pairs of primers were used to amplify the target frag • ments ranging from 80 bp to 445 bp,which included 16 pairs designed in our laboratory and eight pairs published interna—tionally.Two to 10 alleles per locus in

four populations were amplified,and there were 155 alleles in all populations.The average number of alleles per locus was 6.458.The average number of effective alleles per locus(Ne)was 4.349 1 to 4.7234;the average observed heterozygosity(Ho)Was 0.5690 to 0.6722;and the average expected heterozygosity(He)Was 0.7238 to 0.7546.Hardy—Weinberg equilibrium analysis(test,P<0.05)revealed that seven loci in the four populations were in equilibrium .Th e genetic distan ces between the four po pulations were calculated and revealed that the Anhui,Jiangsu and Tianjin crabs belong to a Yangtse River population,while the Liaohe crabs fo13TI another branch.

【题目】polymorphic Microsatellite loci for population studies of the Japanese scallop (Patinopecten yessoensis)

【中文关键词】--

【英文关键词】genetic diversity, Japanese scallop, microsatellite

【中文摘要】--

【英文摘要】Fifteen microsatellite loci were developed to examine the population structure of Japanese scallop,Patinopecten yessoensis. These markers were tested in samples from two geographically distant populations: the Sakhalin Island (Russia) and Dalian City (China). The mean numbers of allel es, observed and expected heterozygosities between the two populations were summarized by locus, but none of them show significant divergence be tween the two populations. Most loci conformed to Hardy – Weinberg expectation with the exception of loci HLJX-06, HLJX-12, HLJX-13 and HLJX-28, which had heterozygote deficits.

【题目】Polymorphic microsatellites in largemouth bronze gudgeon (Coreius guichenoti) developed from repeat-enriched libraries and cross-species amplifications

【中文关键词】--

【英文关键词】Coreius guichenoti;Yangtze River;microsatellite;cross-species amplification

【中文摘要】--

【英文摘要】Largemouth bronze gudgeon (Coreius guichenoti) is a medium-sized fish endemic from the upper Yangtze River of China and its survival is threaten ed by the construction of the Three Gorges Dam. This study reports 20 new polymorphic microsatellites from a repeat-enriched genomic library wi th a mean number allele of 5.2, and observed and expected heterozygosities ranging from 0.035 to 1, and from 0.13 to 0.917, respectively. In a cross-species amplification test, nine of the 37 tested loci were found to be also polymorphic in a congeneric species, brass gudgeon (C.hetero don). In addition, other four loci from common carp (Cyprinus carpio) were also polymorphic in C. guichenoti. Out of these 24 polymorphic micr osatellites, only three loci significantly deviated from Hardy – Weinberg equilibrium in the sampled population (P<0.0025),and all pairwise test s for linkage disequilibrium among loci were nonsignificant after applying sequential Bonferroni correction (P>0.0026).These novel microsate llites provide sufficient levels of polymorphism for studies on population genetics and conservation in C. guichenoti and its related species.

【题目】草鱼基因组中微卫星分子标记的制备及筛选
【中文关键词】草鱼;生物素;磁珠;微卫星
【英文关键词】grass carp(Ctenopharyngodon idella);biotin;magnetic beads;microsatelli
【中文摘要】采用新型的生物素-磁珠吸附微卫星富集法与传统的放射性同位素杂交法相结合的方式,研究了草鱼(Ctenopharyngodon idella)基因组中存在的微卫星资源。结果,从1000个细菌中,挑出90个阳性克隆,把其中45个进行测序分析,在这些序列中共含有68个微卫星核心序列,有55个含有重复次数大于5次的微卫星核心序列.其中,单一型标记49个,占72%,包括CA重复单元共22个,GT重复单元共18个,其他重复单元为9个;在72%的单一型标记中,完美单一型微卫星标记为44个,占65%.另外,混合型标记共19个,13为完美混合型;在所有微卫星标记中,CA重复类型最普遍,依次为GT、GA等.在68个微卫星标记中,有15个依据引物设计原理设计了引物。
【英文摘要】Enrichment by magnetic beads is a kind of method for isolation of microsatellite DNAs.Microsatellite DNAs were isolated from grass carp (Cten opharyngodon idella)genome with the method.In this experiment,partial microsatellite genomic library containing 1000 colonies was constructe d.About 90 positive colonies were obtained.Sequencing of 45 positive colonies confirmed that it contained 68 microsatellite loci(number of rep eats>5 times).From these sequences,49 repeat motifs(about 72%)were unique,including 22 CA,18 GT and 9 other kinds of repeat motifs,while 44 sequences(about 65%)were perfect repeat motifs.The remaining 19 sequences are compound repeat motifs containing 19%perfect repeat motifs.Among all the microsatell ites,CA repeat motifs is the widest,and then GT,GA.15 pairs of primem were designed with the software Primer 3.0.

【题目】雌核发育银鲫子代中微卫星特异序列分析
【中文关键词】银鲫;同源;特异序列
【英文关键词】Silver crucian carp, Carassius autalus gibelio Bloch,Homologous,Specific seauence
【中文摘要】雌核发育个体的基因型基本上完全与母本相同,这是源于卵子发生过程中没有经过减数分裂。父本的遗传物质是在随机水平、亚基因组水平或基因组水平参与到子代的遗传重组过程,从而对长期突变积累的雌核发育生物基因组进行补偿,一直是遗传学家关注的问题。本文对雌核发育银鲫特异个体及父母本5个微卫星位点的扩增条带进行了克隆测序,相似性比对结果显示,特异个体所表现的父本特异DNA条带,序列结果与父本完全相同或相似(SCM4、SCM9、YJ5),并在某些位点上保留了母本的特异条带(YJ5),而个体本身特异的DNA条带与父母本的相似性均较高(SCM13)。同时,所检测到的个体经越冬后查验为雌性个体,进一步进行同源繁育,研究变异条带在繁殖中的命运。连续2代的繁育检测结果表明,融合了父本特异性条带的银鲫个体在繁殖过程中仍行雌核发育的生殖方式,变异来的条带能够传递给子代,进一步证实同源雌核发育银鲫通过小概率两性融合事件丰富银鲫种群的遗传多样性。
【英文摘要】The genomes of offspring of homologous gynogenetic silver crucian carp (Carassius autalus belio Bloch)were screened using micro satellite marke rs.As a result,a specific individual(F1,No.5)showed much genomic information similar to the paternal fish.For tunately.this special fish was a female which became sexually mature and produced offspring successfullv in the following year.Subsequently,the genotypes of this fish.its paren ts and offspring were analyzed continually via five microsatellite markers.Meanwhile,the PCR products were cloned and sequenced. A variety of new genomic information was uncovered through DNA sequence alignments.This unique fish showed more genomic similarities with its father as reve aled by loci SCM4,SCM9 and YJ5.Likewise,it also inherited some allelic genes from its mother as shown by locus YJ5.Finaily it possesses some new genes neither

inherited from its father nor its mother as revealed by locus SCM13.In order to detect the stability of alleles characterized to this fish,offspring of two succesive generations were rescreened using the same microsatellite markers.The results revealed that the individ uals inherited some paternal alleles still produce descendants with gynogenesis mode,and the variant bands can transfer to offspring steadily. All above indicated silver crucian carp can enrich genetic diversitv by amphi mixis of small probability event.

【题目】呼玛河哲罗鱼遗传多样性的AFLP分析
【中文关键词】哲罗鱼;AFLP;遗传多样性
【英文关键词】Hucho taimen Pallas;AFLP;genetic diversity
【中文摘要】2002年4月在黑龙江水系呼玛河塔河河段100km范围内,用三刺网捕获索饵洄游哲罗鱼(Hucho taimen Pallas)个体20尾,用12对引物对其进行AFLP分析,每对引物组合扩增的位点在39-53之间,共扩增出了565个位点,多态性位点为477个,多态性比例为84.43%,平均Nei氏基因多样性指数H为0.3867,平均Shannon氏指数I为0.5102,个体间平均遗传距离为0.4552,UPGMA聚类结果显示呼玛河水系哲罗鱼群体内有严重的近亲交配现象。研究结果表明,呼玛河水系哲罗鱼具有适度的遗传多样性,这对呼玛河水系哲罗鱼资源量的恢复有着至关重要的作用。
【英文摘要】Hucho taimen is the biggest salmonid species and endemic to cold water systems around China,especially widely distributed in Amur Basin and water systems in Xinjiang Autonomous Region in 1960s.In the recent decades,the census size of the whole populations has dramatically decreased and its habitat has become narrow,resulting from habitat damage,overfishing and climate change as well as its propagating characteristics of later maturity and weak fecundity.In order to protect this precious species,Hucho tainmen has been listed in Red Book as endangered fish species n China since 1998.Additionally.some researchers not only evaluated the current status of its habitats but made some progresses on evolution,genetic diversity and population structure using biological methods.Huma River,a branch of Amur River,was authorized to nature protection region for Hucho taimen.However,documents about population structure and genetic diversity of H.taimen in Huma River are very limit ed.Amplified fragment length polymorphism of DNA (AFLP)is a kind of molecular markers famous for its higher sensitivity and capability.In our study,we use 12 primer pairs to amplify genomic DNA samples from 20 wild individuals captured in Huma River with AFLP method.As a result,a total number of loci detected are 565 with 39—53 loci per primer pair.Of the 565 loci,477 loci are polymorphic and the percentage of polymorphisms is 84.43%.The mean Nei ’ s genic diversity index(H)is 0.3867,the mean Shannon ’ s information index(I)is 0.5102,showing a relative higher genetic polymorphism.The mean genetic distance among individuals is 0.4552.UPGMA dendrogram shows that 20 individuals are divided into two groups.It is noteworthy that the phylegenetic tree also demonstrates that there is serious inbreeding within taimen population.which is a disadvantageous factor for stock enhancement.Although the genetic diversity of taimen in Huma River is moderate based on our results,the inbreeding degeneration cannot be ignored.And further more it is necessary to investigate the habitat and spawning sites of H .taiman in detail.In this case,the chances of propagation for individuals from different genetic backgrounds will be increas ed by human ’ s intervention,which will play a vital role for population recovering.

【题目】镜鲤两个繁殖群体的遗传结构和几种性状的基因型分析
【中文关键词】镜鲤;繁殖群体;遗传结构;基因型

【英文关键词】mirror carp;breeding population;genetic structure;genotype
【中文摘要】利用扩增效果好、在群体中具有多态性的28个微卫星标记,检测国家换新良种场的镜鲤繁殖群体和黑龙江水产研究所松浦实验场的镜鲤繁殖群体的遗传组成,计算了两个群体的有效等位基因数,期望杂合度和多态信息含量等遗传参数,换新与松浦两个群体的有效等位基因数分别为2.874和3.102,期望杂合度分别是0.565和0.603,多态信息含量分别是0.534和0.568;遗传结构分析研究结果表明这两个群体的多样性较高,信息含量丰富,具有进一步筛选出优良品种的遗传基础。但连锁不平衡分析表明这两个群体在较大的选择压力下,已严重偏离Hardy—Weniberg平衡,要保持群体的优良性状相关的遗传基础,应该在进一步的选种中注意增加群体的遗传多样性。也用28个基因座的不同基因型与换新208个亲本的体重值进行了连锁分析,得到12个与镜鲤体重相关的基因型,其中紧密相关的基因型3个;分析了一些严重偏离平衡的基因型,并分析了出现这种现象的可能原因,同时探讨了一些基因型与胚胎期致死或易感病基因连锁的可能性。为描述基因型偏离程度,创造了基因型偏离指数,并用其对群体中一些基因型出现的偏离现象进行了探讨。
【英文摘要】The genetic composition of populations for a species is mainly collection of its diferent genotypes in all loci.In this paper, 26 microsatellite markers which had been identified with amplification reaction very well and with polymorphism were used.Two breeding population of mirror carp that one is in National Level Tianjin Huanxin Quality Fish Farm another one is in Songpu Fis hery Station of Heilongjiang Fishery Institute were analyzed by those markers.Gene frequency(P),observed heterozygosity(Ho), expected heterozygosity(He),polymorphism information contents(PIC),and number of effective alleles(Ne)were determined.The link age analysis was done between 26 loci and data from body weight of 208 individuals of Huanxin population,and 12 loci seems associated with body weight.Of those 12 loci,3 are high significant linkage.Some significant deviate genotypes were also anal yzed,and discuss the cause of this kind of deviation.It was discussed that whether those significant deviate genotypes linked with is a major determinant of fatal or near-fatal gene in early development of embryo of mirror carp,and that the possibili ty of those markers link ed with genes sensitive to some diseaSes.For describe the content of those genotype deviation,an index named genotype deviate index WaS made. Few phenomenon of some genotypes deviation were studied using this new index.

【题目】利用30个微卫星标记分析长江中下游鲢群体的遗传多样性
【中文关键词】鲢;微卫星;野生群体;遗传多样性
【英文关键词】silver carp;microsatellite;wild population;genetic diversity
【中文摘要】利用30对微卫星分子标记对长江中下游5个鲢群体进行了遗传多样性分析。结果表明:在30个基因座中,共检测到144个等位基因,每个座位检测到的等位基因数为1~l0个,其中有25个座位具有多态性,多态位点百分率为83.335个群体的平均等位基因数A为4.0/4.1,平均有效等位基因数Ne为2.4445~2.6332,平均观察杂合度H0为0.3233-0.3511,平均期望杂合度He为0.421-0.4704,平均多态信息含量PIC为0.4068—0.4286。对数据进行F-检验,Fst值表明群体间的遗传分化程度中等,并对基因型进行了基于Hardy-Weinberg平衡的卡方检验,所得P值说明5个群体均一定程度上偏离了平衡。5个群体间的遗传相似系数为0.8466~0.9146,遗传距离为0.0893~0.1665,并根据Nei氏标准遗传距离用UPGMA方法对5个鲢群体进行亲缘关系聚类。
【英文摘要】Thirty microsatellite markers were used to analyze the genetic diversity of five Silver carp populations in the middle and lowe r reaches of the Yangtze River.A total of 144 diferent alleles were found and the number of alleles in each locus ranged from 1 to 10.Twenty-five 1oci(83.33%)were polymorphic.In the five populations,the average number of alleles was 4.0to4.1,the number of mean valid alleles was 2.4445 to 2.6332,the value of average observed and expected heterozygosity ranged from 0.3233 to 0.3511 and 0.421 to 0.4704,and the mean PIC was 0.4068 to 0.4286.Fst value indicated that the populations were moderately diferentiated .Chi-square test was used to analyze the genotypes based on Hardy-Weinberg equilibrium,the P value denoted that the five populations deviated equilibrium partially.The genetic simi1arity coeficient of the five populations was 0.8466 to 0.9146 ,and the genetic distance of the populations was 0.0893 to0.1665.A UPGMA dendrogram was constructed based on Nei ’s standard genetic distance for the five Silver carp populations.

【题目】三个虹鳟养殖群体遗传结构的微卫星分析
【中文关键词】虹鳟;微卫星;遗传多样性
【英文关键词】Rainbow Trout (Oncorhynchus mykiss) ; Microsatellite ; Genetic diversity
【中文摘要】利用20个微卫星标记对3个虹鳟(Oncorhynchus mykiss) 养殖群体进行遗传结构分析。结果表明:(1) 3个群体检测的平均等位基因数为3.6~4.1 ,平均观测杂合度为0.5224~0.6328 ,平均期望杂合度为0.4736~0.5522 ,平均多态信息含量为0.4354~0.5084 ,说明这几个群体多态性属于偏高水平,遗传多样性高。通过d值,确定了Hard-Weinberg 平衡的偏离情况,发现AY039638、AY039646 在3个群体中都表现为不平衡。对3个群体的遗传距离进行了估算,并进行聚类分析,本溪的两个群体先聚为一支,再与渤海群体相聚,显示出明显的地理特征。(2) 本溪虹鳟群体在位点AF352770出现部分等位基因消失的现象;AF352754 在本溪群体中表现为位点消失,可作为区分本溪群体和渤海群体的分子标记。(3) 综合评价3个群体,渤海站虹鳟群体的遗传多样性最高,与前人研究结果一致。
【英文摘要】By using 20 microsatellite markers we determined polymorphism of three cultured Rainbow Trout(Oncorhynchus mykiss)populations. The average number of alleles was 3.85;the value of average observed heterozygosity (H) was 0.5224 - 0.6328;the value of avera ge expected heterozygosity (He) was 0.4736-0.5522;and the value of average polymorphism information content (PIC)

was 0.4354 -0.5084.Hardy-weinberg equilibrium (d test) analysis revealed that the locus of AY039638 and AY039646 were lopsided in three populations.The genetic distance among the three cultured populations was calculated and the cluster analysis was also carried out. The phylogenetic tree showed that the two populations of Benxi had close relationship. In Benxi populations,the locus AF352754 and some alleles on AF352770 were lost. Benxi populations and Bohai population could be distinguished by locus AF3527 54.The Bohai population had the highest genetic diversity.

【题目】微卫星DNA标记分析德国镜鲤的遗传潜力
【中文关键词】德国镜鲤;经济性状;遗传标记;遗传潜力
【英文关键词】Germany mirror carp;economic characters;genetic markers;genetic potential
【中文摘要】结合体重、体长、体高等数量性状,用30个微卫星分子标记,评估了3个德国镜鲤群体的遗传潜力,共检测到287个等位基因,559种基因型,片段长度109~400 bp,有效等位基因数1.1014~6.4665,观察杂合度0.0968~0.9892,期望杂合度0.0926~0.8554,位点多态信息含量0.08787~0.8559,其中中度多态(0.25≤PIC≤ 0.5)l3个,高度多态(PIC≥0.5)13个。统计结果显示:3个群体的遗传潜力处于中度水平,双来养殖群体的遗传潜力比换新和松浦繁殖群体低。同时,用30个基因座的不同等位基因和基因型与双来群体的体重、体长、体高进行了连锁分析,得到2个与镜鲤体长相关的微卫星分子标记(HLJ319,HLJ693)和1个与体高相关的位点(HLJ677),与体长相关的1个位点(HLJ693)还与体重连锁。将此遗传标记在鲤鱼重组自交系中验证,结果显示:主要经济性状相连锁的3个遗传标记中HLJ319与鲤鱼体长性状的QTL定位结果基本一致。
【英文摘要】Using 30 microsatellite markers and combining quantity characters such as body weight,body size and body width,we evaluated the genetic pot ential of 3 Germany mirror carp populations.Number of efective alleles (Ae),observed(Ho)and expected(He) heterozygosity values and polymorphic inform ation contents(PIC) were all caculated.287 alleles and 559 genotypes were detected .The DNA fragment length was 109-400 bp.The Hardy-Weinberg Equilibrium was checked and phenomenon of some disequil ibrium were studied according to the test of x2.The result showed that the level of genetic variability was moderate,but genetic potential of Shuanglai population was much lower than that Huan xin and Songpu breeding populations.Polymorphic Information Contents(P10 of the 3 populations of Germany miror carp were between 0.08787 and 0.5377.both of highly and moderately polymorphic markers were 13.The number of effective alleles(Ae)were between 1.1014 and 6.4665.The observed (Ho)and expected(He) heterozygosity values were 0.0968-0.9892 and 0.0926-0.8554 respectively.The linkage corelation was analyzed using data of body weight,body size and body width and 30 loci.The result shown that there existed 2 loci.HLJ319 and HLJ693 associated with body size.The HLJ693 locus significantly correlated with body weight character.The HLJ677 locus linked with body width.And then the result were verified in Recombinant Inbred Lines(RIL)of common carp.It shown that the HLJ319locus was significantly linked with body size,the same as the result of common carp QTL location.

【题目】用鲤鱼EST-SSRs分子标记分析长江黑龙江鲤种群结构
【中文关键词】鲤鱼EST-SSRs;微卫星;遗传多样性
【英文关键词】EST—SSRs of common carp;microsatellite;genetic diversity

【中文摘要】从鲤鱼(Cyprinus carpio)ESTs的数据库(10 691个)中进行微卫星序列筛选,共发现微卫星序列127个,占整个ESTs数据库的1.19%;另外从本研究室构建的鲤鱼脑组织cDNA文库中筛选到微卫星序列20个。根据筛选得到的微卫星序列设计引物68对,合成引物40对,其中27对引物能够获得预期的目的片段,20对引物在所检测的群体内及群体间表现出多态性。用此20对引物标记的多态性分析了长江鲤(Cyprinus carpio)和黑龙江鲤(C.carpio var haematopaerus.Temminck et Schlegel)的群体遗传结构,结果表明:长江鲤和黑龙江鲤在多数位点表现出较高的遗传多样性,20个位点的平均有效等位基因数分别为3.9135和3.4820;平均观察杂合度为0.6067和0.5667;平均期望杂合度为0.6737和0.6194;平均多态信息含量为0.6308和0.5714。长江鲤的遗传结构好于黑龙江鲤,两个群体的Hardy—Weinberg偏离指数较小,群体基本保持平衡,群体结构较合理;其中HLJE1和HLJE10位点在长江鲤和黑龙江鲤的扩增结果相差较大,长江鲤的多态性明显高于黑龙江鲤,位点多态信息含量相差1倍以上,可用于群体的鉴别。

【英文摘要】One hundred and twenty seven microsatellite sequences were found from ESTs database(10691 item)of common carp(Cyprinus carpio),which occupied 1.19% of ESTs database.In addition,20 microsatellite sequences were isolated from constructed cDNA library for common carp,According to these microsatellite sequences,68 pairs of primers were designed with Primer Premier 5.0.Twenty seven primer pairs obtained expected product, and 20 of which showed polymorphism among populations in synthesized 40 primers.These 20 polymorphic markers were used for analyzing genetic structure of two geography populati ons,Yangtze River(C.carprio)and Heilongjiang River(C.carpio var.haematopaems Temminck et Schlege1).The results showed that the average efect alleles numbers were 3.9135 and 3.4820;the average observed heterozygosity was 0.6067 and 0.5667;the average expected heterozygosity was 0.6737 and 0.6194;the average polymorphism information content was 0.6308 and 0.5714, respectively. Population structure of Yangtze River was better than that of Heilongjiang River.Hardy—Weinberg deviation index of the two populations were small,indicating that the populations were equilibrium.Amplified results in HLJE1 and HLJE 10 were very diferent between Yangtze River and Heilongjiang River,and polymorphism in Yangtze River was much higher than that in Heilongjiang River.The two loci can be used for common carp population identification of Yangtze River and Heilongjiang River.

【题目】Development of 10 tri- and tetranucleotide microsatellite loci for population studies in the common carp

【中文关键词】--

【英文关键词】common carp, Cyprinus carpio L., Cyprinus carpio var. xingguonensis, Cyprinus carpio var.wananensis, genetic potential, microsatellites

【中文摘要】--

【英文摘要】Ten tri- and tetranucleotide microsatellite DNA markers were isolated and characterized from common carp (Cyprinus carpio L.) to estimate genet ic potential. These markers were tested in the samples from two closely related carp populations (Cyprinus carpio var. Xing-guonensis and Cypr inus carpio var. wananensis). The number of the alleles ranged fromthree to nine, and observed and expected hererozygosities varied from 0.207 to 1.000 and from 0.499 to 0.900 in each population, respectively. No evidence for linkage disequilibrium was found, indicating that these mar kers will be useful for population studies.

【题目】Genome Evolution Trend of Common Carp (Cyprinus carpio L.) as Revealed by the Analysis of Microsatellite Loci in a Gynogentic Family
【中文关键词】--
【英文关键词】common carp; genome duplication; genome diploidization
【中文摘要】--
【英文摘要】Genome evolution arises from two main ways of duplication and reduction. Fish specific genome duplication (FSGD) may have occurred before the radiation of the teleosts. Common carp (Cyprinus carpio L.) has been considered to be a tetraploid species, because of its chromosome numbers (2n=100) and its high DNA content. Using 69 microsatellite primer pairs, the variations were studied to better understand the genome evolution (genome duplication and diploidization) of common carp from a gynogenetic family. About 48% of primer pairs were estimated to amplify duplicates based on the number of PCR amplification per individual. Segregation patterns in the family suggested a partially duplicated genome structure and disomic inheritance. This indicates that the common carp is tetraploid and polyploidy occurred by allotetraploidy. Two primer pairs (HLJ021 and HLJ332) were estimated to amplify reduction based on the number of PCR amplification per individual. One allele in HLJ002 locus and HLJ332 locus was clearly lost in the gynogenetic family and the same as in six wild populations. Segregation patterns in the family suggested a parti ally diplodization genome structure. A hypothesis transition (dynamic) and equilibrium (static) were proposed to explain the common carp genome evolution between genome duplication and diploidization.

【题目】Inheritance of microsatellite DNA in bisexual gynogenesis complex of Fangzheng silver crucian carp, Carassius auratus gibelio (Bloch)
【中文关键词】--
【英文关键词】genetic exchange; gynogenesis; microsatellite DNA; sex ratio; silver crucian carp.
【中文摘要】--
【英文摘要】Five gynogenetic progeny groups of silver crucian carp Carassius auratus gibelio were produced and sex ratios (males:total progeny) of each of the progeny groups were analysed. About 110 males and 366 females were genotyped at 15 microsatellite loci for comparison with their parents to (1) verify the gynogenesis status of Fangzheng C. auratus gibelio, (2) detect the incorporation of paternal genetic material into the offspring and (3) study the possible association of genetic exchange at microsatellite loci with the existence of sex. The sex ratios in progenies of five groups were highly variable, but all had significant female bias. The sex ratio ranged from 0 to 0.37. Significant differences in the sex ratio within and between groups were also found. Microsatellite genotyping at 15 loci showed that 100 and 97% of the progeny shared the same genotype with the mother in four groups and in one group, respectively, confirming that gynogenesis is the general mechanism of reproduction in C. auratus gibelio. However,0.63% of all offspring did show incorporation of paternal genetic material. No single loci tested were associated with the occurrence of male progeny, indicating unknown genetic mechanisms for sex determination in C. auratus gibelio.

【题目】Searching for Protein-coding Genes Using Microsatellites in Common Carp by Comparing to Zebrafish EST Database
【中文关键词】--
【英文关键词】Cyprinus carpio;In silico;Microsatellites;Blast
【中文摘要】--
【英文摘要】In this study, an in silico approach was utilized to identify homologies existing between common carp microsatellite sequences and GenBank database using Blastn and Blastx searches. About 875 microsatellite sites with flanking sequences over 50 bp of common carp were first compared to the zebrafish EST database. The results showed that 121 homologies were found using Blastn. Subsequent Blastx searches confirmed 94 sites recorded in the protein database. Except for 33 hypothetical proteins and three unknown proteins, seven out of 58 characterized proteins have been mapped to two linkage maps. In addition, two polymorphic STS markers were developed using matched zebrafish EST sequences by PCR-SSCP method, of which one marker HLJZe33 was mapped successfully. This study was a pilot for comparative studies between common carp and zebrafish, and the results demonstrated that more genetic and genomic resources of zebrafish can be used for the genome research of common carp.

【题目】Sixteen polymorphic microsatellites in bighead carp (Aristichthys nobilis), and cross-amplification in silver carp
【中文关键词】--
【英文关键词】Aristichthys nobilis;cross-species amplification;genomic library;Hypophthalmichthys molitrix;microsatellite
【中文摘要】--
【英文摘要】A (GT)n enriched partial genomic library of bighead carp (Aristichthys nobilis) was constructed by employing the (fast isolation by AFLP of sequences containing repeats) FIASCO protocol. Sixteen loci exhibited polymorphism with two to seven alleles/locus (mean 3.263) in a test population and the observed heterozygosity ranging from 0.100 to 0.690 (mean 0.392). Eleven of the 16 bighead carp microsatellites were found to be also polymorphic in silver carp. These polymorphic loci should provide sufficient level of genetic diversity to evaluate population structure of bighead carp.

【题目】镜鲤繁殖群体的遗传结构及微卫星标记与经济性状的相关性分析
【中文关键词】镜鲤;遗传结构;相关分析;微卫星
【英文关键词】mirror carp;genetic structure;correlation analysis;microsatellite
【中文摘要】选用35个多态性微卫星分子标记对天津换新良种场镜鲤一个繁殖群体的有效等位基因数(Ae)、观测杂合度(Ho)、期望杂合度(He)、多态信息含量(PIC)等进行了检测,以卡方检验估计群体Hardy-Weinberg平衡。结果表明:在35个基因座共检测到118个等位基因,平均等位基因数为3.37个,每个座位检测到的等位基因数2~7个不等,平均有效等位基因数为2.16,观测杂合度平均值0.431,无偏期望杂合度的平均值为0.4736,平均多态信息含量0.42,说明这个群体属于中度多态,遗传多样性水平不高。卡方检验的P值显示多于半数的位点都发生了偏离。并将35个基因座的不同基因型与个体的体重、体长值进行了连锁分析,得到了4个与体重、体长连锁的基因型,并将所得结果与鲤鱼体长性状QTL定位结果进行对比,其中HLJ319标记与QTL定位结果基本一致。分析了几个严重偏离平衡的基因型,并讨论出现这种现象的可能原因。
【英文摘要】The genetic structure of one breeding population of mirror carp(Cyprinus carpio L.)was analysed using thirty-five polymorphic microsatellite markers.The effective number of alleles(Ae),observed heterozygosity(Ho),expected heterozygosity(He)and polymorphism information content (PIC)were all determined.The Hardy-Weinberg equilibrium was checked by chi-square test.For each locus,2-7 alleles were detected,with a total of 118 alleles for 35 loci.The value of Ae,Ho,He and PIC showed that the genetic variation of the population was not high.The average effective number of alleles and the mean polymorphism information content were 2.16 and 0.42.respectively,and the observed and expected heterozygosity were 0.431 and 0.4736,respectively.The probability value of chi-square test showed that more than half of the thirty-five loci have significa ntly(P<0.01)deviated from Hardy—Weinberg equilibrium.The correlation of genotype of each locus and individual phenotype data was analysed ,and 4 loci seemed associated with body weight and body size.When compared with the result of QTL mapping of common carp,HLJ319 locus was consistent with the mapping result approximately,which was significantly correlated with body size.Several significantly dev iated loci were also analysed,and the possible cause of the kind of deviation was discussed.

【题目】鲤和牙鲆的两种雌核发育子代的基因型分析
【中文关键词】养殖鱼类;基因型分析;雌核发育
【英文关键词】aquatic fish species;genotyping;gynogenetic technique
【中文摘要】研究调查了鲤和牙鲆经两种雌核发育操作获得的子代的基因型纯合情况。结果显示,多数子代在母本杂合基因座上的纯合速率并不快,如鲤抑制第一次卵裂的44尾子代平均纯合化程度为30.2% ,纯合化程度最高的个体为53.3%,纯合化程度最低的仅有13.3%,没有得到纯合个体;牙鲆抑制第一次卵裂22个子代中有3个纯合个体;而抑制第二极体的牙鲆4个家系中纯合化最高的个体是C家系的第18号子代为56%,平均纯合度为19%,14个子代的纯合化速率为零。结合鲤抑制第二极体和牙鲆抑制第一次卵裂的实验结果对两种雌核发育产生的纯化作用进行了分析和评价;并针对育种过程中的雌核发育技术进行了讨论。
【英文摘要】Some fishes have the genetic characteristic of gynogenesis.Copying natural gynogenesity of fish and making use of the supe riority of fertilization and hatching out of body for fishes,two artificial gynogenetic techniques have been developed 40 years ago,meanwhile these two gynogenetic techniques were used in fish breeding researches.In this paper,we investigated the increas ing of homozygosity of progenies from the inhibition of first mitosis in common carp(Cyprinus carpio L.),and also investigated the homozygosity of progenies from the inhibition of the second meiotic division in Chinese flounder(Paralichthys olivaceus). The results showed that the increasing of homozygosity of progenies is not quick in most heterozygous loci,for example,from 44 progenies of

mitogynogenesis of common carp,mean homozygosity is 30.2%and the highest homozygosity is 53.3%.the lowest homozygosity is 13.3%.none of homozygous progenies were found;19 progenies were gotten from mitogynogenesis of Chinese flounder,and only 3 are homozygous;4 families of progenies of the meiogynogenesis of Chinese flounder,the mean homozygosity is 19%,the highest homozygosity is 56%,the 14 progenies have 0 homozygosity.Meanwhile,the function of two kind of gynogenetic technoques in fish breeding was discussed recombinant among our other results including the progenies from carp homozygosity and flounder homozygosity. This paper also discusses and compares the results on similar experiments from other investigator.

【题目】鲤鱼多态性EST标记的筛选与特性分析

【中文关键词】鲤鱼;EST标记;遗传图谱;单链构象多态性(SSCP)

【英文关键词】Common carp(Cyprinus carpio L.); Genome mapping; Expressed sequence tag(EST); Single-strand conformation polymorphism(SSCP)

【中文摘要】表达序列标签(Expressed sequence tag,EST)标记在基因组作图和分子标记辅助育种研究中具有重要价值。筛选和开发可用于遗传作图的鲤鱼多态性EST标记,对研究鲤鱼的基因组结构、遗传多样性研究和遗传育种有重要意义。本研究根据GenBank数据库中鲤鱼EST序列设计了67对EST引物,有47对在鲤鱼基因组DNA中成功扩增得到稳定的特异性条带,经单链构象多态性(SSCP)分析,12对(25.5%)引物扩增的EST在1个鲤鱼回交家系中具有多态性,其中6个为鲤鱼功能基因,5个与斑马鱼(Daniorerio)功能基因具较高相似性,1个与斑点叉尾鮰(1ctalurus punctatus)功能基因具较高相似性。这些多态性的EST在鲤鱼二倍体家系和单倍体群体中的等位基因分离均符合孟德尔规律(1:1或3:1),单倍体中的SSCP条带数目为二倍体的二分之一。选用其中4对多态性的EST引物对洞庭湖鲤鱼进行初步群体遗传分析,结果显示基因多样性(H)为0.437,远低于微卫星标记所揭示的该群体基因多样性(接近于1)。结果表明,多态性的EST-SSCP标记尽管遗传变异性较低,但是作为来源于编码区的Ⅰ型遗传标记,在遗传作图和种群遗传适应性等研究中有较好的应用潜力。

【英文摘要】Expressed sequence tags(ESTs) are of high value in genome mapping and marker-assisted selection(MAS).This study aims to develop EST markers for genome mapping and other studies of common carp(Cyprinus carpio L).A total of 7381 EST sequences(400-3500bp) were downloaded from the EST data base of the GenBank as the source data of the present analyses.Sixty-seven pairs of primers(designated as HB1-67) were designed in the 3′ untra nslated region(UTR) of the common carp ESTs,47 of which can successfully amplify specific products from genomic DNA.Twelve polymorphic EST markers were identified in a backcross mapping family of common carp by single-strand conformation polymorphism(SSCP) analysis.Six of the 12 polymorphic EST markers were derived from common carp genes of known function,and the rest were from common carp ESTs homologous to putative genes in zebrafish(Danio rerio) or channel catfish(Ictalurus punctatus).Allele distribution of these polymorphic EST markers was found to follow the Mendelian segregation(1∶1 or 3∶1) in both the backcross family and gynogenetic haploids,and the number of SSCP bands in haploid population was half of that in diploid family.The gene diversity(H=0.437) of Dongting Lake population of common carp revealed by 4 polymorphic EST markers is much lower than that by previous microsatellite analysis(close to 1).The results of present study indicated that EST-SSCP markers,with codominant inheritance,can be used as a powerful tool in the genetics of not only diploid but also haploid common carp.As Type I marker derived from coding region with relatively lower genetic variability,EST-SSCP markers are still of high potentials in such studies as genome mappi ng(including genetic linkage maps and gene maps,as well as comparative mapping),genetic structure,and genetic adaptability of fish populations.

【题目】水产生物微卫星标记技术研究进展及其应用
【中文关键词】水产生物;微卫星标记
【英文关键词】aquatic animal;microsatellite markers
【中文摘要】微卫星标记的发展和利用极大地扩展了DNA分子标记应用的深度和广度,使探索生物性状遗传本质的研究发生了革命性变化。本文简要介绍了微卫星标记技术的发展及其在水产遗传与育种研究中的应用。首先回顾了微卫星克隆技术的发展,尤其是水产生物微卫星标记及技术的发展过程,以及水产生物微卫星序列的主要来源,并对微卫星标记与其他DNA分子标记在使用范围、难易程度等方面做了比较;其次探讨了微卫星标记在遗传连锁图谱的制备、性状分析及QTL定位、群体遗传学、进化遗传、种质鉴定与亲权分析、品种培育等6个研究领域的应用;本文还对几种DNA分子标记在操作上的难易程度、多态性程度、重复性与可比性等方面进行了比较,同时还分别阐述了微卫星和其他DNA分子标记应用于水产生物研究中的适用性,并对微卫星标记的应用前景做了展望。本文旨在为微卫星标记技术在水产生物中的有效应用提供理论依据。
【英文摘要】The development and application of microsatellite markers largely expands the depth and breadth of DNA markers application in the aquatic industry,and brings about a revolutionary change to researches on the genetic nature of biological traits.In this paper,the progress of microsatellite markers and their application in aquatic species genetics and breeding were introduced. The development course of the microsatellite markers cloning was presented.In particular,the technology of cloning microsate llite sequences in aquatic species was introduced,and the main resources of microsatellite markers in aquatic species were als o reviewed.A comparison was conducted between microsatellite markers and other DNA molecular markers including AFLP,RFLP,RAP D and SNP in diferent aspects such as application scope and degree of difi culty in use.The application of microsatellite markers in aquatic researches were also presented,including making genetic linkage maps,studying biological traits and quantitative trait loci(QTL),population genetics,germplasm identification,evolutionary genetics,fish breeding etc.Another comparison was conducted by using some tables and figures to show the degree of dificulty in application,polymorphism infor mation contents(PIC),repeatability and communication etc.between microsatellite markers and other DNA molecular markers. Con sequently,suitability of diferent DNA markers used in aquatic researches were shown.Finally,future prospects on using microsatellite markers in fish breeding,germplasm

identification and evaluation were presented.

【题目】微卫星分子标记对德国镜鲤两家系遗传多样性的比较分析
【中文关键词】镜鲤;微卫星;遗传多样性;遗传不平衡
【英文关键词】mirror carp;microsatellite;genetic variety;genetic disequilibuium
【中文摘要】利用35个微卫星分子标记对黑龙江松浦实验站2个家系德国镜鲤的观测杂合度(Ho)、期望杂合度(He)、多态信息含量(PIC)和有效等位基因数(Ae)等进行遗传检测,根据基因频率计算遗传相似系数和Nei氏标准遗传距离,χ2检验估计Hardy—Weinberg平衡,并与其亲本的各项遗传指标进行比较。2个家系共检测到108个等位基因,平均每个基因座扩增得到3.085 7个等位基因,片段长度在136~383 bp之间。结果显示,2个家系的多态性指标均适中,多态信息含量分别为0.437 6、0.325 4,多态性扩增的基因座的有效等位基因数在1.033 9-4.699 7个不等,平均有效等位基因数依次为2.270 6、1.843 2,无偏期望杂合度在0.183 1~0.800 6之间,平均值分别为0.512 3、0.388 1。但连锁不平衡分析表明,这2个家系在较大的选择压力下,已偏离Hardy—Weinberg平衡,讨论了出现这种现象的可能原因。
【英文摘要】Thirty five microsatellite loci were used for analyzing two families of mirror carp(Cyprinus carpio L.),namely,SX,YX.Observed (Ho)and expected(He)heterozygosity values,polymorphic information content(PIC)and number of effective alleles(Ae)were all cal culated,the Hardy—Weinberg Equilibrium was checked according to the test of X2,and genetic indices with their parents were compared.Totally 108 alleles were procured.The lengths are between 136 bp and 383 bp.The number of alleles in each locus is 3.0857 on an average.The result shows that the level of genetic variability is moderate in two families.Polymorphic informati on contents(PIC)of the two miror carp families are 0.437 6 and 0.325 4,respectively.Effective alleles(Ae)are from 1.0339 to4.6997,number on average in each family are 2.2706 and 1.8432.The average expected heterozygosity values(He)are 0.5123 and 0.3881,respectively.The analysis of linkage disequilibrium indicated that the two families have deviated from Hardy—Weinberg Equilibrium,and the cause of this kind of deviation phenomenon was discussed.

【题目】微卫星分子标记辅助镜鲤家系选育
【中文关键词】微卫星;镜鲤;家系选育
【英文关键词】microsatellite;miror carp(Cyprinus carpio L.);family selection
【中文摘要】用微卫星标记辅助进行镜鲤(Cyprinus carpio L.)家系的建立及选育,通过对亲本遗传结构及遗传差异的分析,预测产生优良家系的最佳配组。用28个微卫星分子标记评估松浦镜鲤亲本群体的遗传潜力,结果显示,群体的多态信息含量(PIC)达到0.5627,处于高度的遗传多样性水平,具备进一步繁育筛选优良群体的潜质。用χ2检验和遗传偏离指数(d)估计Hardy-Weinberg平衡,结果表明群体处于平衡状态,但在16个位点表现出杂合子缺失,这可能跟长期的人工选择有关。依据个体间的遗传距离,连续2年共建立1对1亲本的繁育家系70个,用网箱分别养殖,2月龄家系体长均值为7.24~10.60 cm,体质量均值为14.02-40.63 g,方差分析显示家系间体长、体质量差异均极显著;对其中4个家系1龄鱼种生长情况及遗传结构分析也表明家系间的遗传分化较大,近交系数(Fst)达到0.1537,家系的多态信息含量在0.305 6-0.4077之间,保持中度多态水平。由子代家系的生长和遗传结构两方面的实验结果证实了微卫星在辅助家系建立尤其是亲本选配方面具有较好的预测性,所获得的家系差异较大,具备进一步选育优良家系的潜力,从而证实了用此方法对现有镜鲤种质进行遗传改良是可行的。

【英文摘要】Superior family can be established and selected from optimum breeding pairs by means of microsatellite markers to analyze genetic structure of reproductive population.In this study,twenty-eight markers were used to evaluate the genetic potential of reproductive population including 1 3 1 samples(76 females and 55 males)of mirror carp(Cyprinus carpio L.).Totally 146 alleles were detected ranging from 108 bp to 400 bp. Several genetic parameters were used to evaluate the parental population. The average number of alleles was 5.2143 and the efective alleles mean was 3.0585.The value of mean observed heterozygosity was 0.572 2 and the value of mean expected heterozygosity was O.5972.The mean value of polymorphic information content was 0.5627,which indicates that the genetic variability was relatively high and selection of excellent population is possible.The population accorded with Hardy-Weinberg equilibrium checking by x test and genetic departure index,but heterozyg ote deficit of sixteen loci occurred such as HLJ049,HLJ057 and HLJ343 after a long time's artificial sele ction.A total of seventy families were established based on genetic distance of breeding pairs after two consecutive years.The offspri ng of each family were cultured separately in net-cage.The body length of the two months old family ranged from 7.24cm tol0.60cm and body weight were from 14.02 g to 40.63 g.The differences of body length and body weight were significant among families.The later study results of growth and genetic structure to the four families of one year old from 2006 indicated that there were signifi cant genetic diferentiation and the t Fst value was 0.1537.The PIC ranged from 0.3056 to 0.4077,which revealed that the four families were detected in medimn diversit y.These results demonstrated that microsa tellite could be used for assisting families selection due to its capacity to predict growth superiority of offsprings.It was feasible to use this method for genetic improvement ofthe miror carp.

【题目】样本容量对养殖群体主要遗传结构分析参数的影响

【中文关键词】样本容量;养殖群体;遗传结构;参数

【英文关键词】sample size;culture population;genetic structure;parameter

【中文摘要】用微卫星标记评估养殖群体的遗传结构,设置8个取样量梯度,5个标记量梯度,统计分析了各遗传参数的变化。结果:群体等位基因数(A)随样本量的增加而呈现上升趋势,但上升幅度由0.6667~0.9615(10<n<30)下降到0.2308~0.3333(30<n<50);46.15%的位点出现高频率等位基因即等位基因纯合化趋势,这可能与养殖群体长期受选择压力的影响有关。等位基因纯合化使多数位点的有效等位基因数(Ae)、期望杂合度(Ho)及多态信息含量(PIC)在样本量大于40时,在多个标记量梯度其变动范围均变小,并出现平台现象。样本量、微卫星标记的数量和多态性水平对群体遗传结构均有较大的影响,建议在用微卫星进行群体遗传评估时,标记的数量在20个以上,样本容量大小在40~50之间较为适合。

【英文摘要】This study examines the effects of sample size on various genetic structure parameters.The population genetic structure of cultured mirror carp (Cyprinus carpio) was estimated using microsatellite markers.8 different sample sizes and 5 marker numbers were set uP tO ana1vze most genetic parameters including population alleles distribution,allele numbers(A),effect allele numbers(Ae),observed heterozygosity (Ho),expected hete rozygosity (He)and polymorphism information content(PIC).As a result,population allele numbers rise dramatically along with sample sizes from 10 to 40 and then held a steady increase trends.Meanwhile 46.15% of loci showed high freauency allele.The results indicate that cultured popu lation show predominant alleles in most loci because of selection pressure. Due to many homozygosity, the change of effect allele numbers, expected heterozygosity and polymorphism information content are iittle when the sample size is more than 40.In addition,the number of micr osatellite markers and polymorphism level also have a little effect on the estimation of population genetic structure. So,we suggested that the numbers of markers is more than 20 and sample size is 40 to 50 when using microsatellite markers to estimate population genetic structure.

【题目】Development and characterization of new microsatellite loci from Chinese mitten crab (Eriocheir sinensis)
【中文关键词】--
【英文关键词】Microsatellites; Germplasm resource; Chinese mitten crab;Primers
【中文摘要】--
【英文摘要】A set of new microsatellite loci were isolated from Chinese mitten crab and characterized in two Chinese mitten crab populations. The number of the alleles ranged from 3 to 8 and observed and expected heterozygosity varied from 0.0870 to 0.9565 and 0.3092 to 0.8367 in each population, respectively. Loci HLJEsin1, HLJEsin4, HLJEsin30 in CLN population and HLJEsin6 in CJS population presented significant deviation from Hardy – Weinberg equilibrium (PHWE < 0.001). These markers will be useful for population studies.

【题目】草鱼种群SSR分析中样本量以及标记数量对遗传多度的影响
【中文关键词】样本容量;标记量;草鱼;自然群体;遗传多样性;微卫星分子标记
【英文关键词】Sample size; Loci number; Grass carp; Wild population; Genetic diversity; Microsatellite DNA marker
【中文摘要】利用45 对微卫星分子标记(SSR),以草鱼(Ctenopharyngodon idellus)自然群体为实验材料,探讨野生群体遗传多样性研究中所需的最适样本量与标记量。实验设置6个样本量梯度,9 个标记量梯度。对等位基因数(Na)、有效等位基因数(Ne)、观察杂合度(Ho)、期望杂合度(He)等遗传多样性指标的变化趋势进行统计分析。结果表明,样本量、微卫星标记的数量和多态性水平对群体遗传多样性均有较大的影响,其中等位基因数与样本量大小呈显著正相关,而杂合度随标记量的增多而剧烈波动。当取样量大于40,标记量大于25 时,各遗传参数值趋于稳定。因此,在应用微卫星标记对水产动物自然群体的遗传学研究中,要根据所研究种类的特点,尽可能采样40 尾以上,采用25个以上标记,避免由人为选择的偏差对群体遗传多样性水平的正确评估所造成的影响。同时根据上述研究结果,对陕西草鱼自然群体进行了遗传多样性的评估,结果显示该群体平均等位基因数(MNA)、平均有效等位基因数、平均观测杂合度、平均期望杂合度分7.26、4.21、0.73、0.68,认为该群体具有较高的遗传多样性。
【英文摘要】Sample collection and marker selection are of primary importance in population genetic studies,and can greatly influence the analysis and interpretation of the data obtained. Microsatellite DNA sequences are the most revealing DNA markers available so far for inferring population structure and have been widely employed in genetic studies of populations.Nevertheless,few studies have specifically examined the effects of sample size and loci number on various genetic diversity measures in population genetic work using these markers.Here,we examined this issue using experimental data from an analysis of genetic diversity of wild populations of grass carp at 45 polymorphic microsatellite loci.The following genetic diversity measures were studied: number of alleles per locus (Na), effective number of allele per loci (Ne),observed hererozygosity (Ho) and expected heterozygosity (He).We also tried to infer the theoretical minimum sample size and loci number needed for population genetic studies with microsatellite loci. The results are as follows: (1) Na and Mean number of allele over loci (MNA) are significantly affected by sample size. It increase according to the raise of the sample size, only when the sample size exceeds 40 it tends to be stable. The significant correlation between sample size and Na was observed and the correlation curve is Y=3.8403+0.6376,r2=0.967.However, there is no significant correlation between the mean value of Ne, Ho, He and the sample size. Mean value of Ho,,He fluctuate with the raise of the sample size, only when the sample size exceeds 40 it manifest a stable trend. (2) Evaluating of different genetic parameters with the makers of different polymorphism information content, a significantly different result were acquired. When PIC>0.5, Na, Ne, Ho, He were 3.6, 1.5934, 0.2824, 0.3540, While PIC<0.5, Na, Ne, Ho, He were 9.5,5.9209, 0.8497, 0.8242 respectively. Accordingly, marker selecting strategy has much greater impact on evaluation of genetic diversity. (3) According to the rise of loci number, the value of genetic parameter could be divided into threestages: ① Descending stage: loci number between 0 − 5, values of Na, Ne, Ho, He indicated descending trend. ② Loci number

between 5 − 10, values of Na, Ne, Ho, He demonstrate ascending trend. ③ When loci number exceeded 15 values of Na, Ne, He tend to be stable, while only when loci number exceeded 25 the value of Ho tend to be stable. Analysis above proved that not only the sample size and loci number but also the polymorphism information of microsatellite markers have significant effect on the estimation of population genetic diversity. So, we suggested that when microsatellite markers were used to estimate genetic diversity of population the minimum loci number and sample size are needed to exceed 25 and 40, respectively. Moreover, the conclusion above has been used to evaluate the genetic diversity of wild population of grass carp, values of the parameter were Na=7.26、Ne =4.21、Ho=0.73、He=0.68, which demonstrated that has a relatively high diversity, a totally different conclusion from the former studies. Therefore, further researches arenecessary for the evaluation of genetic diversity of geographically different population of grass carp.

【题目】长江、珠江、黑龙江水系野生鲢遗传多样性的微卫星分析
【中文关键词】鲢; 微卫星; 遗传多样性
【英文关键词】Hypophthalm ichthys molitrix; microsatellite; genetic diversity
【中文摘要】采用34个微卫星分子标记,对长江(湘江、监利、枞阳) 、珠江、黑龙江(抚远)鲢共5个群体的观测杂合度(Ho) 、期望杂合度(He) 、多态信息含量(PIC)和有效等位基因数(Ne)等进行了遗传检测,根据基因频率计算遗传相似系数和N e i氏标准遗传距离,以卡方检验估计Ha rdy-Weinbe rg平衡,以近交系数(FST)和基因流(Nm)分析群体的遗传分化。同时,基于N e i氏标准遗传距离获得NJ聚类图。共检测出154个等位基因,其中有80个共有基因。位点等位基因1~9个不等,平均等位基因4. 666 7,平均有效等位基因2. 948 9。5群体平均观测杂合度为0. 329 5~0. 461 9,平均期望杂合度为0. 500 2~0. 552 9,平均多态信息含量为0. 443 5~0. 493 0。表明5群体为中度多态,遗传多样性较低,且长江不同地理群体的遗传多样性也有差异,但差异不显著。通过群体间遗传相似性和遗传距离比较显示:长江3个群体间遗传相似系数最大,遗传距离最小;黑龙江与长江鲢群体间相似系数较大(平均0. 871 8) ,遗传距离较小(平均0. 137 4) 表明二者遗传分化亦最小; 珠江鲢与长江鲢间的相似系数最小(平均0. 831 0) ,遗传距离最大(平均0. 185 2) ,其遗传分化差异较大,结果未显现出群体间遗传差异的大小与其地理距离远近呈正相关。
【英文摘要】In this paper,genetic diversity of five wild silver carp (Hypophthalm ichthys molitrix) populations,collected from the Yangtze River, Pearl River and Heilong jiang River was analyzed using 34 microsatellite markers.The observed (Ho) and expected heterozygosity(He),polymorphism information content (PIC) and number of effective alleles (Ae) were all de termined.The genetic similarity coefficient and Nei'S standard genetic distance were computed based on the allele frequencies. The Hardy-Weinberg equilibrium was checked by X2 test.Genetic differenti ation and hierarchical partition of genetic diversity were evaluated by Fst and Nm.A dendrogram was constructed based on NJ method using M EGA3 software package.For each locus, 1-9 alleles were amplified with an average of 4.6667, adding up to 154 alleles in all five populat ions, of which the mean valid alleles were 2.9489. We found the genetic variability level was moderate in the five populations, as show n by Ho (0.3295-0.4619),He (0.5002-0.5529) and PIC (0.4435-0.4930),respectively. Based on the genetic sim ilarity coefficients and genetic dis tance, the genetic diversity between the two groups of Yangtze and Pearl Rivers (Ds=0.1852) was higher than that of the two populations of Heilongjiang and Pearl Rivers (Ds=0.1558).There were no obvious relations between genetic distance and geographical distribution of the five populations.

【题目】镜鲤体重相关分子标记与优良子代的筛选和培育
【中文关键词】镜鲤;生长;分子标记;筛选;培育
【英文关键词】mirror carp; growth; molecular markers; selection
【中文摘要】根据性状相关分子标记的Q TL 分析结果进行品种培育是分子标记用于水产育种研究的重要方向之一。利用镜鲤与体重相关的3个基因座(HLJ302, HLJ338, HLJ343)作为快速生长的标记,筛选出一批镜鲤亲本进行繁殖,对得到的子代进行基因分型,并将基因分型结果与检测的最大10尾个体与最小10尾个体进行比较。结果表明,最大10尾具有优势基因型为每尾1. 7个,最小10尾具有优势基因型为每尾0. 7个,生长速度快群体与生长速度慢群体在体重相关基因型的富集上呈现显著性差异。同时选出具有富集体重相关优势基因型的子代且生长速度快的群体一个, 2008年生产出子二代。综合性状好生长速度更快的镜鲤新品系正在培育之中。
【英文摘要】It is the one of main directions for aquaculture breeding using molecular markers that stocks were selected by the results of quantitative tra its loci of economic traits. The main goal of our long term project is to get a good variety with most economic traits in high quality by m arker-assisted selection. We have identified 6 microsatellite loci linked with body weight at high explained variation, and also found three of these 6 loci are homozygous in experimental population in our previous works.In this paper, using other three loci (HLJ302,HLJ338 , HLJ343) which associated with body weight of mirror carp in breeding population, a group of mature mirror carp were selected and their p rogenies were also gotten. When the progenies grow up,the genotypes of those progenies were analyzed with these three loci.This paper co mpared the genotypes between 10 biggest fish and 10 smallest fish,the results showed that there are significant difference on dominant genotype linked body weight between fast-growth population and slow-growth population.The results showed that 10 biggest fish have the mean positive genotypes 1.7 for body weight. Meanwhile,which p roved these m arkers are effect for breeding again. A big population w ith these positive dom inant genotypes has been selected (also selected by good phenotypes such as good color, good body figure etc),and a big group of progenies of second generation has been produced. A new strain of fast-grow ing and good-quality mirror carp has been raised.

【题目】鲤雌核发育子代基因的杂合度分析
【中文关键词】鲤;雌核发育;杂合位点;微卫星
【英文关键词】common carp;gynogenesis;heterozygosis locus;microsatellite
【中文摘要】通过热休克法抑制第一次有丝分裂(抑制第一次卵裂) 和减数分裂(抑制第二极体排除),分别获得鲤(Cyprinus carpio L.) 的2 个雌核发育家系。利用13 对具有高多态性的微卫星分子标记,分别对2 个雌核发育家系的观测杂合度(Ho)、期望杂合度(He)、等位基因频率(P) 和有效等位基因数(Ne) 等进行遗传背景调查。结果表明,抑制第一次有丝分裂家系的等位基因频率为0.063 ~ 1.000,平均观测杂合度为0.22,平均期望杂合度为0.24,平均有效等位基因数为1.41,该家系在6 个微卫星座位上表现为纯合子,在7 个微卫星座位上表现为杂合子,其中位点MFW4完全表现为杂合子;抑制减数分裂的等位基因频率为0.056 ~ 0.889,观测杂合度的平均值为0.37,期望杂合度的平均值为0.47,平均有效等位基因数为1.93,该家系中没有得到完全纯合的个体,其中在2 个位点上全部表现为杂合子。在所分析的鲤雌核发育群体中,有3个基因座位(HLJ034、HLJ044和HLJ071) 有重组现象,重组率为20.00%。综合上述结果推断,鲤2 个雌核发育家系在个体和群体上都具有一定的基因杂合性。
【英文摘要】Gynogenesis is a developmental manipulation facilitating the inheritance of maternal genetic material alone,which has been accomplished in several fish species. This powerful technique is often employed to obtain homozygosis,which is essential to eliminate the load of deleterious or recessive alleles in the genetic pool of a domesticated stock from cultured species.Recently in China,mito-gynogenesis and meio-gynogenetic have also been well applied in aquaculture breeding,which were generated by suppression of the first mitotic division in haploid embryos and inhibition of exclusion of the second polar bodies respectively.However,it is difficult to identify the homozygosis by techniques of phenotype and chromosome. So in this study,thirteen polymorphic microsatellite markers were used to investigate homozygosity of two gynogenetic lines. Allelie frequencies,Ho,He and

effective number of alleles showed in the mito-gynogenetic line,,was0.063-1.000,0.2 2,0.24 and 1.41respectively.Only six loci were homozygosis and the others were still heterozygosis. Moreover,locus MFW4 was homozygosisty in all the individuals of mito-gynogenetic line. Homozygosity of this line was 78%. In the meio-gynogenetic line,allelie frequencies ranged 0.056-0.889,Ho,He and effective number of alleles was 0.37,0.47and1.93 separately. No complete homozygosis individual in this line was found and a total of two loci,HLJ030 and MFW23,were complete heterozygosity. Homozygosity of meio-gynogenetic line was only 63%.Recom bination was observed among these loci with rate of 20.00%. All the results demonstrated that the two gynogenetic lines of common carp were heterozygosis to some extend. The individuals from mito-gynogenetic line could be used in building homozygosis line through selecting complete homozygosis animals revealed by with more microsatellite markers. However,meio-gynogenetic line with higher heterozygosity was not appropriate to construct homozygosis line.

【题目】鲤生长性状相关的EST-SSRs标记筛选

【中文关键词】鲤;EST-SSRs;生长性状;BLAST;冷诱导基因RNA结合蛋白;DAZ相关蛋白1;核糖体蛋白L6

【英文关键词】common carp;EST-SSRs;growth traits;BLAST;cold-inducible RNA binding protein;DAZ associated protein 1;ribosomal protein L6

【中文摘要】以大头鲤(Cyprinus pellegrini Tchang)(母本) 与荷包红鲤(Cyprinus carpio wuyuanensis) 抗寒品系(父本) 杂交产生的F1 作为亲本,以其自交F2 作为分离群体,结合“ 拟测交 ”策略,用EST-SSRs 标记对其中92 个个体进行基因型检测。利用Windows Map Manager 2.0 的标记回归法对符合拟测交分离的70 个EST-SSRs 标记进行单标记回归分析,检测出8 个与鲤体长、体高、体厚性状相关的标记。对同一标记不同基因型个体间生长性状进行显著性比较,通过t检验,找到与生长性状相关的基因型。将上述8 个EST序列与GenBank 数据库进行BLAST比对,有3 条EST序列与蛋白库中已知功能的序列高度同源。其中HLJE225 与编码斑马鱼(Denio rerio) 冷诱导基因RNA结合蛋白的基因同源性水平高达97%,HLJE222 与编码斑马鱼DAZ相关蛋白1 基因同源性水平也高达97%,HLJE599 与编码斑点叉尾鮰(Ictalurus punctatus) 核糖体蛋白L6 基因的同源水平为87%。本研究鉴定的与鲤生长性状相关的功能基因及有利用价值的基因型,为鲤重要生长性状的QTL(数量性状基因座) 定位和分子标记辅助育种提供了一定的依据。

【英文摘要】Common carp (Cyprinus carpio L.) is one of the most economically important fish species all over the world,whose economical traits are mostly quantitatively controlled by polygene. Screening of the genes and markers which control the quantitative traits has strong practical value. Expressed sequence tags (ESTs) are parts of complementary DNAs (cDNAs) with certain gene function. It provides us more information than other neutral markers. The association of EST markers with phenotypes can increase our understanding of the biochemical pathways and mechanisms affecting economically important traits. Thus,traditional marker assisted selection(MAS) can be replaced by direct gene selection for targeted traits. In this study,EST-SSRs were used to analyze the genomic DNA of 92 progenies which derived from F2 of the cross Barbless carp×Hebao-cold tolerance red carp by using “ Pseudo Testcross ” strategy. F1 were used as the parents of the 92 full-sib progeny. A total of 8 ESTSSRs markers were found from the 70 polymorphic EST-SSRs to be closely related to growth traits of common carp by single marker regression in Windows Map Manager 2.0 software. Results uncovered HLJE203,HLJE335 and HLJE222 had a significant impact on body length HLJE225,HLJE231,HLJE599,HLJE 203 and HLJE222 had a significant impact on body height,and HLJE339,HLJE225,HLJE269 and HLJE599 significantly correlated with body width. The variance explained by these loci,ranged 4.00% to 12.00%. HLJE222 and HLJE225 at 0.1%significant level closely linked to the gene related to body height and width of common carp. The number of alleles and genotypes in each locus were 2-3 and 2-4 respectively. In addition,the geno types of these correlative loci were determined by t-test.The result showed that there existed some genotypes at each locus which had positivecorrelation with growth traits and some had negative correlation with growth traits. The significantly positive correlation genotypes of each locus may be preferred in carp molecular marker assistant breeding selection and the negative correlation genotypes of each locus may be eliminated through selection. This provided us valuable information for carp molecular marker assistant breeding selection. The homology identity of the 8 correlative ESTs was determined by GenBank of NCBI blast programmer on the amino acid levels. It was found,through BLAST analysis,that 3 ESTs with significant similarity to the known functional sequences in GenBank. was highly homologous to the known coldinducible

RNA binding protein of Danio rerio with an identity of 97%.HLJE222 was highly homologous to the known DAZ associated protein 1 of Danio rerio with an identity of 97%.HLJE599 was highly homologous to the known ribosomal protein L6 of Ictalurus punctatus with an identity of 87%. The other 5 ESTs were not significantly homologous to any of the known functional genes from GenBank.It was reported that cold-inducible RNA-binding proteins (CIRP) as well as CBF (c-repeat-binding factor) could increase the freezing tolerance,meanwhile they had negative impact on the growth. It's also presumed that the genes coding DAZ associated protein 1 and ribosomal protein L6 were associated with growth traits of common carp. These functional genes and genotypes might be used for the QTL mapping and marker assisted selection for important growth traits.

【题目】鲤鱼(Cyprinus carpio L.)头长、眼径、眼间距QTL的定位
【中文关键词】鲤鱼; 头长; 眼径; 眼间距; QTL
【英文关键词】--
【中文摘要】用 265 个AFLP 标记、127 个微卫星分子标记、37 个EST-SSR 标记和16 个RAPD 标记对大头鲤/荷包红鲤抗寒品系的F2 雌核发育群体44 个个体进行基因型检测, 构建鲤鱼遗传连锁图谱。利用软件WinQTLCart2.5采用复合区间作图法对头长、眼径、眼间距3 个性状进行了QTL 分析。结果显示, 共检测到5 个与头长性状相关的QTL, 分别定位于鲤鱼连锁图谱的LG2(qHS-2-1)、LG3 (qHS-3-1)、LG40(qHS-40-1)和LG4 (qHS-4-2 和qHS-4-3) 上。其中qHS-40-1 拥有最大的 LOD 值, 为7.94, 可解释的表型变异为 34.29%。qHS-4-2 的LOD 值最小, 为5.03, 可解释的表型变异为11.52%。5个与头长性状相关的QTL 加性效应值均为负值。检测到两个与眼径性状相关的QTL, 分别定位于鲤鱼连锁图谱的LG39 连锁群(qED-39-1)和LG40 连锁群(qED-40-1)上, 其中qED-40-1 的LOD 值比较大, 为2.76, 其加性效应值为负值, 可以解释5.62%的表型变异; qED-39-1 的LOD值为2.72, 加性效应值为正值, 可以解释9.77%的表型变异。检测到两个与眼间距性状相关的QTL, 分别定位到鲤鱼连锁图谱的LG20 连锁群(qEC-20-1)和LG28 连锁群(qEC-28-1)上。其中qEC-20-1 的LOD 值比较大, 为3.77, 加性效应值为正值, 可以解释8.29%的表型变异; qEC-28-1 的LOD 值为2.79, 对应的加性效应值为负值,可以解释8.88%的表型变异。
【英文摘要】A common carp gynogenetic line including 44 individuals derived from the cross Barbless carp×Hebao-cold tolerance red carp was used to construct a linkage map using 445 markers (265 AFLP markers,127 SSR markers, 37 EST-SSR markers and 16 RAPD markers).Then quantitative traits loci (QTLs)associated with body weight, full size were identified by the composite interval mapping of the software Cartgrapher V.2.0.Two QTLs were identified for body weight on the linkage groups 24 and 20, which explained 7.98% and 20.05% of the total variation of the body weight, respectively. Both of the additive effects were negative.Two QTLs were identified for full size on the linkage groups 2 and 20, explaining 5.69% and 12.69% of the total variation of the full size, respectively. The additive effects were negative values.

【题目】鲤鱼乳酸脱氢酶活性的QTL检测
【中文关键词】鲤鱼; 标记回归分析; 乳酸脱氢酶; 拟测交策略; EST-SSR
【英文关键词】common carp(Cyprinus carpio); marker regression; lactate dehydrogenase; double pseudo-testcross strategy;EST-SSR

【中文摘要】利用SSR 分子标记结合“ 拟测交 ”策略, 以荷包红鲤抗寒品系和柏氏鲤远缘杂交所产生F1代为亲本及其F2代为作图群体, 应用Windows Map Manager 2.0 软件的标记回归法进行乳酸脱氢酶(Lactate dehydrogenase,LDH)活性数量性状基因座单标记定位分析。在乳酸脱氢酶性状的标记回归研究中, 共发现12 个标记与LDH 性状关联, 对性状的贡献率为4.00%~10.00%, 其中HLJE222 达到极显著水平(P<0.01)。为了进一步验证, 利用已有的生物信息学工具, 将与性状连锁的EST序列与公共数据库中的核酸序列进行同源搜索分析, 发现标记HLJE222 的EST 序列与斑马鱼DAZ associated protein 1 的mRNA 序列相匹配(相似性为94%), 与公共数据库中的已知蛋白序列进行相似性比较, 同样发现HLJE222 的EST 与斑马鱼DAZ associated protein 1 相匹配(相似性为97%)。结果表明HLJE222 位点与影响乳酸脱氢酶活性相关的基因连锁
【英文摘要】Microsatellite markers were used to make marker regression analysis on activity of lactate dehydrogenase based on double pseudo-testcross stra tegy using Windows Map Manager2.0 software. The parents that came from the cross between progenies of Hebao-cold tolerance red carp and Barbless carp and F2 progenies were used as segregating populations.For maker regression, a total of 12 markers associated with activity of lactate deh ydrogenase were significant atP<0.05 and HLJE222 was significant at P<0.01. The variance explained by these loci, ranged from 4.00% to 10.00%. Locus HLJE222 was closely linked to the gene related to activity of lactate dehydrogenase of common carp. For further identification,EST-SSR markers were used to screen the protein and nucleotide database using bioinformatics tools in order to find the homologies. High sequen ce similarities of HLJE222 marker were observed with the nucleotide sequence of DAZ associated protein 1mRNA of zebrafish(94%), and protein se quence of DAZ associated protein 1(97%). DAZ protein is on eof the short chain dehydrogenases, which is an important enzyme in the process of glucose metabolism in the organisms.This family contains a wide variety of dehydrogenases. This indicates that locus HLJE222 was closely linked to the gene associated with activity of lactate dehydrogenase of common carp.

【题目】利用EST-SSR分子标记研究鲤的饲料转化率性状
【中文关键词】鲤; EST-SSR;饲料转化率;标记回归分析
【英文关键词】common carp; EST-SSR; feed conversion efficiency; marker regression
【中文摘要】饲料转化率是重要的经济性状,通过QTL定位获得的紧密连锁标记以及相关基因,是遗传育种的重要工具。本文利用70个鲤的EST-SSR,对鲤全同胞家系92个体的基因组DNA进行扫描,得到符合1∶1孟德尔分离类型的位点48个,3∶1孟德尔分离类型的位点22个。采用拟回交策略对符合1 ∶1 分离的标记与鲤饲料转化率性状进行单标记回归分析。结果表明:HLJE335、HLJE253、HL E547、HLJE92、HLJE203、HLJE231等6个标记与饲料转化率性状相关(P < 0. 05) 。其中, HLJE547 和HLJE203 两个标记与饲料转化率相关性达极显著水平(P <0. 001) ,分别解释了表型变异的11. 00%、11. 00%。应用NCB I数据库,分别对与性状极显著相关的2 个EST-SSR 标记进行同源性比对, 发现标记HLJE547 与斑马鱼基因组中编码A TPase, H + transporting, lysosom al的核酸序列同源(同源性为74%) , 与斑马鱼编码的A TPase, H + transporting, lysosom al的蛋白序列同源(同源性为92%) 。推测A TPase可能通过影响鲤消化与吸收等生物学机制,从而影响鲤的饲料转化效率。
【英文摘要】Feed conversion ratio is very important economic traits. The improvement of it can not only save the feed, reduce the cost, but can also imp rove the ecomonic efficiency.There were a great deal of studies relating to feed conversion ratio of QTL in the field of farming. But few w ere reported on fish, especially on common carp.The linked markers and genes from the analys is of QTL are very important tools for fish bre eding. Seventy EST-SSR markers were selected to analyze the genomic DNA of ninety-two progenies derived from the common carp (Cyprinus carpio L.) full-sib family,which come from the cross between progenies of Barbless carp and Hebao-cold tolerance red carp. 70 makers segregate according to Mendel's Law, of which 48 segregate in 1∶1 model and other 22 in 3∶1 model.Makers of “ 1∶1 ” segregation model were used to m ade marker regre ssion analysis based on pseudo-testcross strategy using Windows Map Manager2.0. Six loci were discovered that had impact on feed conversion efficiency(HLJE335, HLJE25,HLJE547, HLJE92, HLJE203, HLJE231) and two of them had a significant impact on this traitEST-SSR markers were used to screen the nuc leotide and protein database in the National Center for Biotechnology.Information (NCBI) in order to find the homologies. High sequence homologies of HLJE547 marker were observed with the nucleotide sequence of ATPase,H + transporting,lysos omal gene of zebra fish and protein sequence of zebra fish A TPase, H + transporting, lysosomal protein. Homologous were 74% , 94%respect ively. A TPase, H + transporting, lysosomal protein is a component of vacuolar A TPase (V-A TPase) , which were detected in

iontransporting epithe lium of the a blow fly rectum .In addition, there were a great deal of lysosome in epithelium of the Tachypleus tridentatus Leach rectum. Fish as the first key link of craniota may have some similar function with invertebrate. This indica tes that V-A TPase may affect the function of digestive system through affecting the H+ transporting on lysosomal, which needs to be proved for further study.

【题目】两个镜鲤半同胞家系的遗传多样性及经济性状分析
【中文关键词】微卫星标记;镜鲤;遗传多样性;经济性状;相关分析
【英文关键词】Microsatellite marker; Mirror carp; Genetic diversity; Economic characters; Correlation analysis
【中文摘要】在两个镜鲤半同胞家系中,各随机选取47尾作为实验鱼,测量体重、体长、全长等数量性状,利用24个微卫星分子标记对其进行遗传检测,共检测到57个等位基因,每个基因座的等位基因数为1-6个不等,平均等位基因3.21个,片段长度在134—371bp之间,有效等位基因数N e为1.00—2.89, 平均观察杂合度Ho为0.00—0.83,平均期望杂合度He为0.00—0.66,平均多态信息含量PIC为0.00—0.58。结果表明: 2个家系的遗传多样性处于中度水平,但连锁不平衡分析表明这两个家系在较大的选择压力下,已严重偏离Hardy-Wenberg平衡。利用SPSS程序下的GLM过程对24个微卫星位点与主要经济性状的相关性进行分析,结果发现: HLJ519、HLJ848、HLJ855、HLJE84个微卫星位点对镜鲤体重显著影响(p < 0.05) ,其中,位点HLJ519、HLJ848、HLJ855还对体长和全长存在显著影响(p < 0.05) 。对这些位点基因型所对应的表型均值进行了多重比较,找到了一些对主要经济性状有利的基因型。
【英文摘要】Mirror carp (Cyprinus carpio L.) is one of the most important traditional domestic freshwater aquaculture fish in China. The seeding of mirror carp for aquaculture has come from the Heilongjiang River because germplasm resource of mirror carp is superior to those from other rivers and lakes. But advanced biological characteristic for aquaculture germplasm of mirror carp was obviously decreased during past years after multigene rations artificial propagation.The growth became slowly and the ability of antidisease reduced.Therefore,it is necessary to analyze and study genetic diversity and correlation analysis of microsatellite DNA markers with economic characters in mirror carp. In the p resent study,the genetic diversity and population structure of mirror carp from Heilongjiang River system were investigated using microsatel lite DNA markes.The genetic examination on 24 microsatellite markers and combined quantity characters such as the body weight, body length and full length was carried out among the random samples in two semi-sib families of mirror carp, a total of 57 different alleles were found and the number in each locus ranged from 1 to 6.The average number of alleles was 3.21.The DNA fragment lengths were from 134 bp to 371 bp. In the two semi-sib families, the number of mean valid alleles (Ne)was 1.00 to 2.89, the value of average observed (Ho) and expected heteroz ygosity (He) ranged from 0.00 to 0.83 and0.00 to 0.66, respectively, and the mean PIC was 0.00 to 0.58.The result showed that the level of genetic variability was moderate. Chi-square test was used to analyze the genotypes based on Hardy-Weinberg equilibrium, the P value denoted that the 2 families deviated equilibrium partially.A GLM procedure was used to analyze the effects of these 24 microsatellites on economic characters. Results uncovered that there existed 4 loci, HLJ519, HLJ848, HLJ855 and HLJE8, which had a significant impact on body weight (p< 0.05).The HLJ519, HLJ848 and HLJ855 loci correlated with length and full length character significantly (p<0.05).Genotypes of that favora bly affect economic characters were determined. Multiple comparisons of economic characters among microsatellite loci genotypes showed that allele 281 in locus HLJ519, allele 279 in locus HLJ848, allele 209 in locus HLJ855 and allele 189 in locus HLJE8 closely linked to the major gene related to body weight, body size and whole size of economic characters in mirror carp.

【题目】中华绒螯蟹部分基因组文库构建和微卫星位点的筛选
【中文关键词】中华绒螯蟹;微卫星;磁珠富集
【英文关键词】Chinese mitten crab (Eriocheir sinensis) ; microsatellite; enrichment by magnetic beads
【中文摘要】利用磁珠富集和放射性杂交相结合构建了中华绒螯蟹基因组微卫星文库。并利用生物素标记的(GA) 12探针进行微卫星片段的富集。将得到的片段与pGEM-T载体连接后转入DH5α大肠杆菌中,然后利用γ- 32 P同位素标记的(GA) 12探针进行第二次筛选。结果共获得微卫星基因组文库1500个菌,杂交前菌落PCR检测阳性克隆率为62. 5 %;杂交后得到的阳性克隆为447个,占29. 8%。经测序,有248个克隆含有重复次数大于5次的微卫星序列。在得到的微卫星序列中,重复单元除GA /CT外,还观察到三碱基、四碱基重复单元。根据侧翼序列设计引物164对,选择合成50对,通过优化PCR反应条件,结果有21对引物可扩增出清晰可重复的目的条带, 15对具有多态性。本研究对中华绒螯蟹基因组资源的开发利用提供了相关资料。
【英文摘要】In this experiment, microsatellite DNAs were isolated from Chinese mitten crab (Eriocheir sinensis)genome by combining biotin capture meth od and radioactive labeling hybridization.The purified ligated-DNA was hybridized with biotin-labeled simple sequence repeats(SSR) probes(GA)12 ,and the mixture was incubated with strep tavidin-coated magnetic beads.The selected single-strand microsatellite DNA was obtained by removing the SSR-uncombined fragments.After capture of target fragments by magnetic beads and PCR amplification, the PCR products were ligated to T ve ctor and transformed to E.coli competent cells. A microsatellite genomic library 1500 colonies was constructed. 447 positive colonies (29.8%) were obtained through twice screens by radioactive γ- 32 P labeling hybridization.Sequencing of 447 positive colonies co nfirmed that 248 contai ned 266 microsatellite loci. Besides the motif of GA /CT contained in the colonies,there were also CCT, TCC and AAGG, TTCC repeat motifs. 164 pairs of primers were designed with the software primer premier 3.0. In addition,50 pairs of primers were composed and screened. 21 pairs were used successfully to amplify special fragments, among which 15 pairs were polymorphism within species. This research offers relevant data to explore genomes of Chinese mitten crab Eriocheir sinensis.

【题目】A linkage map of common carp (Cyprinus carpio) based on AFLP and microsatellite markers
【中文关键词】--
【英文关键词】AFLP;common carp (Cyprinus carpio);haploids;linkage map;microsatellite (SSR)
【中文摘要】--
【英文摘要】Common carp (Cyprinus carpio) is an important fish for aquaculture, but genomics of this species is still in its infancy. In this study, a lin kage map of common carp based on Amplified Fragment Length Polymorphism (AFLP) and microsatellite (SSR) markers has been generated using gynoge netic haploids. Of 926 markers genotyped, 151 (149 AFLPs, two SSRs) were distorted and eliminated from the linkage analyses. A total of 699 AFLP and 20 microsatellite (SSR) markers were assigned to the map, which comprised 64 linkage groups and covered 5506.9 cM Kosambi, with an average interval distance of 7.66 cM Kosambi. The normality tests on interval map distances showed a non-normal marker distribution. Visual inspection of the map distance distribution histogram showed a cluster of interval map distances on the left side of the chart, which suggested the occu rrence of AFLP marker clusters. On the other hand, the lack of an obvious cluster on the right side showed that there were a few big gaps which need more markers to bridge. The correlation analysis showed a highly significant relatedness between the length of linkage group and the number of markers, indicating that the AFLP markers in this map were randomly distributed among different linkage groups. This study is helpful for research into the common carp genome and for further studies of genetics and marker-assisted breeding in this species.

【题目】植物生长调节剂在香梨滴灌上的应用研究
【中文关键词】滴灌;植物生长调节剂;香梨品质
【英文关键词】drip irrigation;plant growth hormone;quality of fragrant pear
【中文摘要】通过对库尔勒香梨进行叶面喷施多效唑和黄腐酸制剂,研究了两种植物生长调节剂对树体生长发育的抑制和促进作用,以及对果实品质影响,结果表明:多效唑与黄腐酸制剂混合叶面喷施,对香梨新梢伸长的抑制效应和香梨新梢横向生长的促进效应显著于单独喷施多效唑的效应,但对叶面积生长的抑制效应却小于单独喷施多效唑的效应。喷施黄腐酸制剂有助于叶片含水量和叶绿素含量的提高,在同一生长期,叶绿素含量与叶片含水量成正相关关系。多效唑与黄腐酸制剂混合喷施,更好地改善了果实品质,提高了果形指数。
【英文摘要】This paper studied the accelerate and inhibit effect of Korla fragrant pear growth and fruit quality through spray PP333 and yellow humic acid on leaf, the experimental results indicated that the inhibit and accelerate effect of branch strench and thicken through mixed spray PP333 and yellow humic acid on leaf superior to spry PP333 alone, but it contrast to the effect of leaf area growth. Yellow humic acid incrased the leaf water content and chloroptyll content and they positive correlation at same growth stage. Fruit quality well improved and fruit shape index increased through mixed spray PP333 and yellow humic acid on leaf.

【题目】不同栽培条件对膜下滴灌棉花叶面积指数及品质和产量的影响
【中文关键词】膜下滴灌;栽培条件;叶面积指数;纤维品质;棉花产量
【英文关键词】plastic mulching by drip irrigation;cultivation condition;LAI;fiber quality;
cotton Yield
【中文摘要】在不同的栽培条件下,对新疆库尔勒市膜下滴灌棉花生育期间叶面积指数动态变化和品质及产量进行了系统的研究。结果表明,棉花全生育期叶面积指数呈单峰曲线变化,峰值在盛铃期。通过深翻耕有机肥促进了叶面积指数和株高的增大,但缺少一定的化控等措施,造成后期植株的凸长,导致有效光合面积减小,产量有所下降。而在生育期随水滴施多效唑适当地降低了株高和减小了叶面积指数,优化了株型,在没有降低单铃重的情况下增加了铃数,产量分别较深翻耕和常规漫灌提高了5.5%和30.6%,衣分率达到了44.70%,增产效益显著。叶面喷施缩节胺和随水滴施多效唑在品质上具有互补效应。
【英文摘要】The dynamic change of cotton plastic mulching by drip irrigation LAI and quality and yield was studed under different cultivation conditions during growth in Korla city. The results showed that LAI of cotton changed as a curve and its peak emerged at fool-boll stage. LAI and height are increased through deep tillage fertilixation but because without chemistry control measures lead to plant rapidly growth in late stage and effective photosynthetic decreased so yield is decreased slightly. While height and LAI are decreased properly and the plant shape is optimized through drip paclobutrazol(PP333)follow water measures in growth stages, single boll weight is not decreased but boll number per plant is increased. Yield is increased 2.4%、5.5% and 30.6% compared with spraying DPC on leaf and deep tillage and conventional flood irrigation respectively, lint button percent comes to 44.70%..So the yield effect of drip paclobutrazol(PP333)follow water is superior to spraying DPC on leaf, but they have mutual complementary quality effect.

【题目】大田地下滴灌土壤水分分布均匀度评价方法
【中文关键词】地下滴灌;土壤水分;大田;取样数目;均匀度
【英文关键词】subsurface drip irrigation; soil moisture; field; sampling number; uniformity
【中文摘要】灌水均匀度是评价灌水质量的一个重要指标,灌水后的土壤水分布均匀度是灌水均匀与否的最终体现,选择最佳的土壤水分取样点数是进行经济、准确评价灌水后土壤水分分布均匀度的基础。在新疆地下滴灌棉花田中,在灌水后2天土壤水分达到相对稳定后进行取样,实测田间土壤水分分布,抽样分析样本数与土壤水分分布特征及均匀度之间的关系。结果表明,随样本数的增加,对应的土壤水分布均匀系数(克里斯琴森均匀系数Cu)的变幅缩小,并向其均值位置集中。从样本数量上分析,样本数在15到60之间,其Cu的均值变化并不明显;Cu和配水均匀度(Du)之间存在较好的相关性,但用实测结果拟合得出的系数与相关手册的推荐值间存在一定的偏差,在互算时应加以考虑;在试验条件下,进行大田土壤水分监测评价时,均匀分布的取样点个数应不少于25个。采用均匀25点取样,对大田棉花地下滴灌的土壤水分分布均匀度进行了评价,结果表明,地下滴灌条件下,毛管附近的土层土壤含水量变幅最大;与上、下土层相比,灌水前毛管附近(20~40 cm)处的土壤水分均匀度较低,灌水后其均匀度大幅提高。
【英文摘要】Uniformity is one of the important indicators for the evaluation of irrigation quality. Selection of optimal sampling point is the base for economical and accurate evaluation of the irrigation quality. Soil moisture distribution for 120 points were measured in cotton field under subsurface drip irrigation in XinJiang Uygur Autonomous Region. Relations between sampling number and soil moisture distribution characteristics, and its uniformity of the selected sample were analyzed. The results show that the coefficient Cu of soil water distribution closed to its mean value with the increasing of samples number. From the quantitative analysis of samples, the mean of Cu did not significantly change as sample number increase from 15 to 60. There is a high relevance between Cu and the distribution uniformity (Du). But there is a certain deviation between the coefficients derived from the measured data and that recommended by the United States Department of Agriculture. And it should be taken into account when such formula is used. Under the condition of experiment, the desirable number of sampling points should more than 25 in field soil moisture monitoring and evaluation. Using uniform 25-point sampling method, soil water distribution uniformity of subsurface drip irrigation on cotton fields was evaluated. Results show that under the conditions of subsurface drip irrigation, compared with the upper and lower layers, soil moisture uniformity vicinity of drip line (20 ~ 40 cm) are lower before irrigation, even after irrigation it has a substantial increase. So in the layers near the drip line, soil moisture variation is the largest.

【题目】纳米粒载体研究进展
【中文关键词】纳米粒载体;制备;应用;研究进展
【英文关键词】Nanoparticle carrier; Preparation; Application; Research progress
【中文摘要】摘要 目的:介绍纳米粒载体的制备、优点和应用进展,为纳米粒在新的领域的应用提供依据。方法:以纳米粒制备方法和基质材料的不断发展以及各个领域的应用为线索来综述。结果:纳米粒的制备方法有离子交换法、乳化法和自组装法,基质材料有蛋白质和多糖等,纳米粒本身无毒性,能增加所载物的溶解度和生物利用度,提高靶向性及效率,在抗肿瘤治疗、神经系统治疗和药物检测等多方面有广泛的应用。结论:纳米粒作为一种载体,在药物临床研究、药理研究和生物分析等方面都得到了广泛应用,并有可能开发为其他领域的运送体系,有广阔的应用前景

【英文摘要】ABSTRCT Objective:To recommend the application advances, advantages and preparation methods of Nan particles, so as to provide reference for further research on application in new fields. Methods:The summary was obtained in terms of analysis on the preparation methods, base materials and application. Results:The preparation methods of Nan particles were numerous, the base materials were various and advantages of nanoparticles were obvious. The preparation methods included ion exchange methods, the emulsification methods, the self-assembly methods. Protein and polysaccharides were the most commonly used base materials. Nanoparticle itself was not poisonous, but it can increase the dissolvability of the object that it carried, and enhance bioavailability, targeting property and efficiency. It has been widely used in many areas, such as anti-tumor therapy, nervous system therapy and drug resting. Conclusion: Nanoparticles as a kind of carrier has been widely used in drug clinical research, pharmacology research, bioassay and so on, showing a wide application prospect.

【题目】Tomato and cowpea evapotranspiration in an unheated greenhouse
【中文关键词】crop evapotranspiration; pan evaporation; unheated greenhouse; tomato; cowpea
【英文关键词】crop evapotranspiration; pan evaporation; unheated greenhouse; tomato; cowpea
【中文摘要】With the development of protected cultivation of vegetables in China, it is necessary to study thewater requirements of crops in greenhouses. Lysimeter experiments were carried out to investigate tomato(2001) and cowpea (2004) crop evapotranspiration (ETc) in an unheated greenhouse in Eastern China. Resultsshowed remarkably reduced crop evapotranspiration inside the greenhouse as compared with that outside. ETcincreased with the growth of the crops, and varied in accordance with the temperature inside the greenhouse and20-cm pan evaporation outside, reaching its maximum value at the stage when plants ’ growth was most active.Differences between the variation of crop evapotranspiration and pan evaporation inside the greenhouse werecaused by shading of the pan in the later period when the crops were taller than the location where the pan wasinstalled, 70 cm above ground. The ratio of crop evapotranspiration to pan evaporation was not constant asreported in previous studies, and the variation of the inside ratio α inlagged behind that of the outside ratio α out.Simulation of crop evapotranspiration based on 20-cm pan evaporation inside the greenhouse is morereasonable than that based on 20-cm pan evaporation outside, although pan evaporation outside is moreconsistent with ETcthan that inside. The value of α in, calculated based on air temperature, relative humidity, andground temperature inside, plays a dominant role in the calculation of ETc. As the crop height increases, alteringthe location of the inside pan and placing it above the canopy, out of the shade, would help to achieve morereasonable values of crop evapotranspiration.
【英文摘要】With the development of protected cultivation of vegetables in China, it is necessary to study thewater requirements of crops in greenhouses. Lysimeter experiments were carried out to investigate tomato(2001) and cowpea (2004) crop evapotranspiration (ETc) in an unheated greenhouse in Eastern China. Resultsshowed remarkably reduced crop evapotranspiration inside the greenhouse as compared with that outside. ETcincreased with the growth of the crops, and varied in accordance with the temperature inside the greenhouse and20-cm pan evaporation outside, reaching its maximum value at the stage when plants ’ growth was most active.Differences between the variation of crop evapotranspiration and pan evaporation inside the greenhouse werecaused by shading of the pan in the later period when the crops were taller than the location where the pan wasinstalled, 70 cm above ground. The ratio of crop evapotranspiration to pan evaporation was not constant asreported in previous studies, and the variation of the inside ratio α inlagged behind that of the outside ratio α out.Simulation of crop evapotranspiration based on 20-cm pan evaporation inside the greenhouse is morereasonable than that based on 20-cm pan evaporation outside, although pan evaporation outside is moreconsistent with ETcthan that inside. The value of α in, calculated based on air temperature, relative humidity, andground temperature inside, plays a dominant role in the calculation of ETc. As the crop height increases, alteringthe location of the inside pan and placing it above the canopy, out of the shade, would help to achieve morereasonable values of crop evapotranspiration.

【题目】Trade-Offs between the Metabolic Rate and Population Density of Plants
【中文关键词】Trade-Offs ; the Metabolic Rate ; Population Density of Plants
【英文关键词】Trade-Offs ; the Metabolic Rate ; Population Density of Plants
【中文摘要】The energetic equivalence rule, which is based on a combination of metabolic theory and the self-thinning rule, is one ofthe fundamental laws of nature. However, there is a progressively increasing body of evidence that scaling relationships ofmetabolic rate vs. body mass and population density vs. body mass are variable and deviate from their respectivetheoretical values of 3/4 and 23/4 or 22/3. These findings questioned the previous hypotheses of energetic equivalencerule in plants. Here we examined the allometric relationships between photosynthetic mass (Mp) or leaf mass (ML) vs. bodymass (b); population density vs. body mass (d); and leaf mass vs. population density, for desert shrubs, trees, and herbaceousplants, respectively. As expected, the allometric relationships for both photosynthetic mass (i.e. metabolic rate) andpopulation density varied with the environmental conditions. However, the ratio between the two exponents was 21 (i.e.b/d = 21) and followed the trade-off principle when local resources were limited. Our results demonstrate for the first timethat the energetic equivalence rule of plants is based on trade-offs between the variable metabolic rate and populationdensity rather than their constant allometric exponents.

【题目】Determinants of the geographical extent of invasive plants in China: effects of biogeographical origin, life cycle and time since introduction
【中文关键词】China Biogeographical origin Geographical distribution
【英文关键词】China Biogeographical origin Geographical distribution
【中文摘要】Plant invasions cause serious impacts to environment and human economy, andlots of researches have been paid to examine factors that determine the geographical extentof plant invaders. Many intrinsic species attributes, external environmental factors, andtime since introduction have all been proposed to explain invasive success. Data oninvasive plants distribution in province regions in China were collected, and speciesattributes and historical factors such as biogeographical origin, life cycle, and time sinceintroduction were determined. While some annuals may eventually occupy the wholecountry area, perennials are unlikely to do so, particularly those from Central and SouthAmerica. Time since introduction is significantly related to the number of provincesoccupied by an invader; nevertheless after control of certain residence time, annuals are notlikely to more provinces than the perennial herbs. High-impact invaders tend to spreadfaster than other invaders, but only when their life cycle is taken into account.

Thissuggests that other plant traits, instead of life cycle, along with extrinsic factors, greatlycontribute to invasive success and distribution area. Invasive plants in China are mainlydistributed in human-made habitats, and their long-distance dispersal is primarily associatedwith human activities. Future studies need to consider interactions between speciestraits, environmental conditions, and human activities for further insights in researchesalike.

【英文摘要】The effects of increased intraspecific competition on size hierarchies (size inequality) and reproductive allocation wereinvestigated in populations of the annual plant, spring wheat (Triticum aestivum). A series of densities (100, 300, 1 000,3 000 and 10 000 plants/m2) along a gradient of competition intensity were designed in this experiment. The results showedthat average shoot biomass decreased with increased density. Reproductive allocation was negatively correlated to Ginicoefficient (R2 =0.927), which suggested that reproductive allocation is inclined to decrease as size inequality increases.These results suggest that both vegetative and reproductive structures were significantly affected by intensive competition.However, results also indicated that there were different relationships between plant size and reproductive allocationpattern in different densities. In the lowest density population, lacking competition (100 plants/m2), individual reproductiveallocation was size independent but, in high density populations (300, 1 000, 3 000 and 10 000 plants/m2), where competitionoccurred, individual reproductive allocation was size dependent: the small proportion of larger individuals were winnersin competition and got higher reproductive allocation (lower marginal reproductive allocation; MRA), and the largerproportion of smaller individuals were suppressed and got lower reproductive allocation (higher MRA). In conclusion,our results support the prediction that elevated intraspecific competition would result in higher levels of size inequalityand decreased reproductive allocation (with a negative relationship between them). However, deeper analysis indicatedthat these frequency- and size-dependent reproductive strategies were not evolutionarily stable strategies.

【题目】Identifying the most noxious invasive plants in China: role of geographical origin, life form and means of introduction
【中文关键词】China Geographical origin Impact Invasive plants Life form
【英文关键词】China Geographical origin Impact Invasive plants Life form
【中文摘要】In a heterogenous world, invasive plants often differ in noxiousness and natureof impacts, and there is a difference between strong and weak invaders. That knowingwhich invaders are most noxious and their nature of impacts is of great value to invasiveecology and management. Here we show that in China the most notorious invasive plantsare with a perennial life cycle, clonal growth ability and from the American continent.They often form monocultural populations in land and water, replacing almost all otherplants, and are mainly distributed in Central and South China. Following are some accidentallyintroduced annuals. Annuals from the American continent are often common,dominant or in monocultural populations in ruderal and agricultural habitats whereas thosefrom Eurasia are highly noxious only in agricultural habitats. Annuals are not restricted indistribution and could spread fast to all of the country. There are also two perennial grassesfrom Europe and Mediterranean area and four intentionally introduced annuals from SouthAmerica that were identified in this study. Factors that may account for these patternsinclude relatedness between invasives and natives, vegetative propagation, and plantstrategies. The invasive plants identified in this study have caused significant negativeimpacts to native biodiversity, environment, economics and agriculture, with differentgroups being different in their extent and nature of impacts.

【题目】Plant height-crown radius and canopy coverage-density relationships determine aboveground biomass-density relationship in stressful environments
【中文关键词】abiotic stress; allometric growth;
aridity gradient; geometric model; self-thinning
【英文关键词】abiotic stress; allometric growth;
aridity gradient; geometric model; self-thinning
【中文摘要】Debate continues in theoretical ecology overwhether and why the scaling exponent ofbiomass – density (M – N) relationship variesalong environmental gradients. By developing anovel geometric model with assumptions ofallometric growth at the individual level andopen canopy at the stand level, we propose thatplant height – crown radius and canopy coverage – density relationships determine the above-groundM – N relationship in stressful environments.Results from field investigation along an aridity gradient (fromeasterntowesternChina) confirmedour model prediction and showed that the aboveground M – N scaling exponent increased withdrought stress. Therefore, the ‘ universal ’ scalingexponents (23/2 or 24/3) of the M – N relationshippredicted by previous models may not hold forabove-ground parts in stressful environments.

【题目】Spatial Distribution of Leaf form and the Self-thinning Exponent are Affected by the Sensitivity of the Response to Abscisic acid in an Arabidopsis thaliana Population
【中文关键词】ABA, abscisic acicl, ,Arabidopsis, fractal dimel~sion, self-thinning rule spatial distribution of [CCI: folnl

【英文关键词】ABA, abscisic acicl, ,Arabidopsis, fractal dimel~sion, self-thinning rule spatial distribution of [CCI: folnl

【中文摘要】The s~patial distribution of leaves is related to the expone~t of the self-thinning relationship in plant populations. In this study,we evaluated the fractal dimension of rosette leaves of wild-type (WT) Arabidopsis thalia~a and of ar~ abscisic acid (ABA) - insensitive mutant (abi2-1) to lest a model of the spatial distribution of leaf form in an Ara~,idopsis population based on subdivisi,~n of a cube surrounding the leaf into uniform boxes and to investigate ABA's affect en this model of the leaf. The valuesof the self.thinning exponent were -1.31 and -1.45 for WT and abi2-1. The mean dimensicms of the box used to m~del thespatial distribution of leaf form, estimated using our model,, were 2.08 and 2.03, respe,(tively. By assuming that the boxdimension equals the fractal dimension within tlSe populations, the predicted seif-thinni~g exponent equaled -1.40 for WTand -,I .49 for abi2-~. When exogenous ABA was applied to both genotypes, the self-thinning exponent became -1.26 and -1.43for WT and abi2-1, and the exponents predicted using the dimensions of the box were .1.37 and -1.46, respectively~ Theempirically predicted exponent equaled that predided using the dimensions of the box (fl~% confidence interval). Empiricalpredictien of the spatial pattern using the two genotypes with and without ABA showed t|~at ABA influenced the spatial formof the rosette leaves. Therefore, sensitivity to ABA can affect self-thinning through geneticalll}, determined changes in leaf formand its spatial distribution.

【题目】恒定水头井入渗Green-Ampt模型的改进与验证
【中文关键词】恒定水头井;模型;验证
【英文关键词】Constant-head well permeameter; Model; verification;

【中文摘要】在假定恒定水头井入渗近似为以井内积水表面积为入渗面的一维入渗基础上,用湿润体内平均体积含水率增量代替Green-Ampt活塞模型中的饱和含水率与初始含水率差值。用入渗率和累积入渗量倒数的线性关系间接推求Green-Ampt模型中的参数,用湿润锋平均基质吸力和土壤饱和导水率。从而建立了适用于恒定水头井入渗的Green-Ampt模型。同时根据体积等效原理,定义了三维入渗中难以直接测定的概化湿润锋深度。经3种类型土壤的室内试验检验,表明该模型具有较好的精度,能精确地计算不同累积入渗量时的湿润体体积。

【英文摘要】Based on the hypothesis that the parameter of three dimensional infiltration in constanthead well is similar to one dimensional infiltration,an improved Green-Ampt model,in which the ponded surface is adopted as the infiltration surfarce,is proposed.The increment of the average volumetric water content is used as the substitution for D-value between saturated water content and initial water content,and the linear relationship between infiltration rate and the reciprocal of cumulative infiltration water amount is used to calculate the average matric potential suction of the wetting front and general saturated hydraulic conductivity.In the meantime,the general wetting depth,which was difficult to measure directly in three dimensional infiltrations,was defined according to the volumetric equivalent principle.The precision of the model is verified by laboratory tests with three types of soil.This model can be used to calculate the soil wetted volume accurately according to the cumulative infiltration water amount.

【中文关键词】蒸散量; 吸水率; 作物; 覆盖度; 日均光照强度; 水分利用效率; 小白菜;
【英文关键词】evapotranspiration; water absorption; crops; coverage degree; average light intensity; water use efficiency(WUE); pakchoi;
【中文摘要】通过盆栽试验,研究了不同覆盖度条件下小白菜所处小环境的温湿度动态,以及作物蒸腾和盆栽基质蒸发的耗水规律。结果表明:植株生长点的温湿度随覆盖度的增大而增加。昼夜蒸散量随覆盖度的增大而减小,白天蒸散量变化显著,无覆盖处理白天蒸散量为最大,1/2圆覆盖处理仅次于无覆盖处理,15/16圆覆盖处理最小。小白菜从出苗到收获总的耗水量随覆盖度增大而减小,1/2圆覆盖、3/4圆覆盖、15/16圆覆盖处理的总耗水量分别为无覆盖处理的91.34%、69.03%和40.74%。无覆盖、1/2圆覆盖、3/4圆覆盖、15/16圆覆盖处理的地上部干物质质量的平均值分别为5.551、6.536、5.143、3.345g,其水分利用效率的平均值分别为1.53、1.97、2.05、2.25kg/m3。试验总结表明盆栽小白菜的水分利用效率随着覆盖度的增加而增加,15/16圆覆盖处理最高。

【英文摘要】Through pot experiment,dynamic changes of temperature and humity in micro-environment at growth period of pakechoi,and water consumption rules of crop transpiration and planting substrate evaporation were studied under different coverage degrees.The results showed that the air temperature and humidity increased with the coverage degrees increasing at growth point.During day and night,evapotranspiration decreased with increasing of coverage degrees.The variation of daytime evapotranspiration was significant,the order of evapotranspiration was the no-coverage treatment >1/2 coverage treatment >15/16 circle coverage.The total water consumptions tended to decrease with coverage degrees increasing during pakchoi growth period.Water consumption of 1/2 circle coverage,3/4 circle coverage,and 15/16 circle coverage were 91.34%,69.03% and 40.74% of the none coverage treatment,respectively.To none coverage,1/2 circle coverage,3/4 circle,and 15/16 circle,and their corresponding average dry weights of the aerial parts were 5.551,6.536,5.143,3.345 g,and their corresponding water use efficiency were 1.53,1.97,2.05,2.25 kg/m3.The above results indicated that the water use efficiency of pakchoi increased with the increasing of coverage degrees,the maximum value of water use effiieny appeared at 15/16 circle coverage treatment.

【题目】控制灌溉条件下寒区水稻茎秆抗倒伏力学评价及成因分析
【中文关键词】控制灌溉; 力学性质; 茎秆系数; 抗倒伏; 水稻茎秆;
【英文关键词】controlled irrigation; mechanical properties; stem coefficient; lodging resistance; rice stem;
【中文摘要】为了评价控制灌溉处理与常规灌溉处理下水稻抗倒伏能力的差异,寻求有利于水稻茎秆抗倒伏的灌溉处理方式,以水稻茎秆为研究对象,研究了不同灌溉条件下水稻茎秆抗倒伏性能。引入茎秆系数,对水稻茎秆进行力学分析,比较了2种控制灌溉和常规灌溉3种水分处理下水稻茎秆抗倒伏能力的差异。结果表明,控制灌溉(KI、KII)处理下的水稻节间充实度高于常规灌溉(CK),KI、KII处理的水稻茎秆壁厚分别比CK高出0.15mm和0.35mm;控制灌溉处理下的水稻茎秆系数显然低于常规灌溉处理,大小顺序为:CK>KI>KII;临界力的大小依次为:KII>KI>CK,因此控制灌溉处理的水稻茎秆更具抗倒伏性。
【英文摘要】In order to evaluate the differences of rice-stem lodging resistance between controlled irrigation and regular irrigation,and seek irrigation treatment which was beneficial to rice stem lodging resistance,rice-stem was taken as the research object,and the performance of rice-stem lodging resistance was studied under different irrigation treatments. Stem coefficient was introduced,and the mechanical analysis of rice-stem was carried out.The differences of lodging resistance ability under two kinds of controlled irrigations and one kind of regular irrigation were compared.The result showed that the values of internode plumpness of rice stem under controlled irrigations were bigger than that under regular irrigation,and the values of wall thickness of rice stem under KI and KII were much superior to that under regular irrigation by 0.15 mm and 0.35 mm.It also pointed out the values of rice stem coefficient under controlled irrigations were lower than that under regular irrigation,the order was CK>KI>KII,while the order of critical force was KII>KI>CK.Therefore,the rice stem under controlled irrigation is much better at lodging resistance.

【题目】节水灌溉条件下水稻气孔导度模型的改进
【中文关键词】节水灌溉; 气孔导度模型; 叶气温差; 水稻;

【英文关键词】water saving irrigation; stomatal conductance model; leaf-air temperature difference; rice;
【中文摘要】为了研究节水灌溉条件下水稻叶片气孔导度与相关因子的响应关系模型,于2006年在河海大学国家重点实验室昆山试验研究基地进行了田间试验。根据实测资料分析了水稻气孔导度与各影响因子的响应关系,引入了水稻叶片叶气温差改进了气孔导度模型,并对两类气孔导度改进模型进行了比较。结果表明:改进的气孔导度模型在节水灌溉条件下具有更高的模拟解释能力;基于Jarvis模型改进的气孔导度模型比Leuning-Ball改进模型具有更好的模拟效果。推荐Jarvis改进气孔导度模型作为节水灌溉条件下的水稻叶片气孔导度响应模型。 更多还原
【英文摘要】In order to investigate the response relation model of stomatal conductance of rice leaves and related factors under water saving irrigation treatment,the field experiment was conducted in Kunshan experimental station of the State Key Laboratory of Hohai University in 2006. According to the observed data,the response relation of different factors and stomatal conductance of rice was analyzed. Leaf-air temperature difference was introduced to improve the original models,and two types of representative models were compared as well. The results indicated that the improved model taken into account of leaf-air temperature difference under the water saving irrigation condition had superior interpretive simulation ability than the original one. The improved stomatal conductance model by Jarvis had better simulation results than the one improved by Leuning-Ball. The improved Jarvis stomatal conductance model is recommended under water saving irrigation treatment.

【题目】基于CERES-Maize模型的华北平原春玉米生产潜力的估算与分析
【中文关键词】CERES-Maize; 春玉米; 华北平原; 产量潜力; 播期;
【英文关键词】CERES-Maize; spring maize; North China Plain; potential productivity; sowing date;
【中文摘要】在对DSSAT4.0中CERES-Maize模型进行参数校正和验证的基础上,进一步利用华北地区具有代表性的10个气象站30年(1976~2005年)的气象资料以及华北地区典型的土壤数据展开模拟。结果表明,在一年一季的生产条件下,华北平原各地区玉米多年平均光温生产潜力为13.53~22.56t/hm2;各地区玉米产量在4月下旬至6月中旬的播期范围内均呈随播期的延迟而增加的趋势,对这一趋势和各气象指标进行相关分析表明,在华北北部主要驱动因子是灌浆期平均日辐射量,而华北中南部主要驱动因子是灌浆期的温度。华北平原自北向南,优化播期呈逐渐推迟的趋势:北部怀来地区5月上旬播种较为适宜,北京、乐亭和天津地区以5月下旬至6月初播种产量最高;中南部以6月中上旬播种(夏播)较适宜。 更多还原
【英文摘要】A field experiment with three nitrogen managements was conducted from 2005 to 2006 in Beijing Dongbeiwang experimental station to calibrate CERES-Maize model in DSSAT 4.0. Another two field experiments regarding irrigation amounts and sowing dates were conducted in 2006 to validate CERES-Maize model. After model validation, normal maize production and photothermal potential productivity were simulated by using 30 years weather data from 10 weather stations in the North China Plain (NCP). The results show that average photothermal potential productivity is in the range of 13.53 to 22.56 t/hm2 in the NCP under the condition of one crop one year. Maize photothermal potential yield increased by delaying sowing date in range of the end of April to middle of June, and the main driving factor of this trend was average daily radiation during grain filling stage in the north NCP, while that in the south and middle NCP was on daily temperature condition. There was a delaying trend about optimized sowing dates from north to south in the NCP. In the north NCP, optimized sowing date was around early May in Huailai region (40.23 oN Latitude), while it was late May in region of Beijing, Tianjin and Laoting (39.05oN~39.48oN Latitude). And in the south and middle NCP (35.34 oN~38.20 oN Latitude), maize sowed in early June could reach the maximum yield.

【题目】污水灌溉后土壤重金属汞和砷积累变化规律及对番茄的影响
【中文关键词】污水灌溉; 重金属; 积累; 番茄;
【英文关键词】Sewage irrigation; Heavy metal; Accumulation; Tomato;
【中文摘要】污水灌溉对土壤、作物的影响日益受到人们的关注。通过日光温室内的污水滴灌试验,分析了污水灌溉后重金属Hg、As在土壤中的集聚分布规律和污水灌溉对番茄生长、产量与品质的影响,同时探讨了在番茄果实中的残留状况。结果表明,污水灌溉后重金属Hg、As在不同土层集聚差异较大,Hg、As在根区10~30 cm土层出现了富集现象,且二者具有很好的相关性,说明土壤受灌溉外源污染影响较大;污水灌溉对番茄的果实产量和品质有一定的影响,与清水处理相比番茄的产量减少7.68%,果实中的可溶性固形物提高了46.2%、VC含量增加76.76%,酸度和可溶性总糖含量基本持平,蛋白质降低了55.84%;番茄果实检测表明,与清水处理相比,Hg的残留量增加了28%,As增加了112%,但含量均未超标。 更多还原
【英文摘要】Sewage irrigation has been paid more attention due to its adverse effects on soil and crops.An experiment was carried out in a greenhouse equipped with a drip irrigation system to investigate the distribution patterns of heavy metals(Hg and As) and tomato development,yield and fruit quality under sewage irrigation.Results showed that significant spatial variation of heavy metal contents was observed in soil profiles.Hg and As were enriched in the 10~30 cm layer,showing close correlation between them,which indicated that the soil environment was seriously affected by external pollutants.Generally,sewage irrigation influenced growth of tomato fruits and its quality,as shown by a lower growth rate,7.68% lower yield,46.2% higher soluble solid content,76.76% higher Vc content,55.84% lower protein content and similar contents of the acidity and total soluble sugar than with freshwater irrigation.Sewage irrigation also increased Hg content by 28% and As by 112%,but not above the food safety criteria.

【题目】节水栽培冬小麦光合器官遮光对籽粒蛋白质形成的影响
【中文关键词】冬小麦; 遮光; 粒重; 蛋白质及其组分;
【英文关键词】Winter wheat; Darkening photosynthetic organ; Grain weight; Protein and its components;
【中文摘要】为明确冬小麦光合器官与籽粒蛋白质形成的关系,通过大田试验和遮光的方法,研究了节水栽培条件下冬小麦石家庄8号不同光合器官对籽粒粒重、蛋白质及其组分含量的影响。结果表明,节水栽培条件下,穗遮光对粒重的降低效应最大,旗叶遮光次之,倒二叶遮光降低粒重的效应最小,且三者的降低效应均不同程度地受施氮量的影响。与不遮光相比,光合器官遮光增加了籽粒蛋白质含量,而降低了单穗蛋白质总量,遮光的调节效应也因器官和施氮水平而有差异。与不遮光相比,光合器官遮光增加了籽粒清蛋白、球蛋白含量,降低了麦谷蛋白含量,而穗遮光降低了籽粒醇溶蛋白含量,旗叶和倒二叶遮光增加了醇溶蛋白含量。可见,不同光合器官对籽粒蛋白质及其组分含量的影响是不同的。
【英文摘要】Many papers have reported that nitrogen fertilizer has significant effect on photosynthetic rate,the metabolism of C and N in leaf and non-leaf organ of winter wheat and nitrogen fertilizer or other factors may improve the nutrition quality and processing quality of grain.In order to define the relationship between grain protein development and photosynthetic organ,the effect of different organ on grain weight,concentration and components of protein of Shijiazhuang 8(a winter wheat cultivar with high yield) was investigated with the technique of darkening under water-saving cultivation.It indicated that negative effect of darkening ear on grain weight was higher than that of darkening flag leaf and the second leaf,and the negative effect of darkening different photosynthetic organ was affected by rate of nitrogen application under water-saving cultivation.Compared with no darkening,the protein concentration of grain increased but the protein content of ear decreased with darkening photosynthetic organs,and the effect was different at different nitrogen application rates.The concentration of albumin and globulin of grain increased and that of glutenin reduced while darkening photosynthetic organs.The concentration of gliadin of grain increased with darkening ear and decreased with darkening flag leaf or the second leaf.It was obvious that darkening different photosynthetic organs had different effect on grain weight and grain protein under water-saving cultivation.

【题目】调亏灌溉对温室小型西瓜水分利用效率及品质的影响
【中文关键词】调亏灌溉; 小型西瓜; 水分利用效率; 果实品质;
【英文关键词】regulated deficit irrigation; mini-watermelon; water use efficiency; fruit quality;
【中文摘要】以小型西瓜为试材,在日光温室内采用E601型蒸发器蒸发量值控制灌溉水量,在西瓜的不同生育阶段水分设置3个调亏水平。研究表明:在整个生育阶段,土壤含水率呈下降趋势,在果实膨大期低水分处理对植株的生长发育构成了严重的水分胁迫;不同生育阶段调亏处理,光合日变化及单叶水分利用效率变化趋势相同,低水分处理使气孔阻力增大,CO2扩散受阻,光合速率最低,但单叶水分利用效率最高;苗期采用低水分处理在一定程度上刺激了根系的生长,减少了植物的营养生长,有利于开花坐果期复水后植株的加速生长,而在果实膨大期和果实成熟期采用低水分处理不利于其产量和品质的形成。果实膨大期采用低水量的2个处理(0.5Ep)比对照处理(1.0Ep)可溶性总糖含量分别提高了19.68%和17.79%,但产量仅分别为对照的76.72%和72.43%。说明调亏灌溉能够调整作物营养生长与生殖生长的关系,减少作物生长冗余,调节光合产物在根冠间的分配,同时有利于改善果实品质、提高作物水分利用效率。 更多还原
【英文摘要】With controlled irrigation water by E-601 type evaporator,experiment included three levels of water supply at different growing stages of mini-watermelon in greenhouse was carried out.The results indicated that the soil water content declined gradually during the whole growing period.The serious water deficit(0.5Ep) had a great influence on plant growth during fruit spreading growth stage.Diurnal changes of photosynthesis rate and leaf water use efficiency were similar under regulated deficit irrigation at different growing stages of tested mini-watermelon.The soil water content was reduced,stomata resistance and leaf diffusion resistance

increased,leaf photosynthesis rate was the lowest because of hindered CO2 diffusion,but leaf water use efficiency reached the highest under low water content treatment.The serious water deficit in seedling stage was propitious to promote root growth and accelerate plant growth in blossoming and bearing fruit stage,but serious water deficit during fruit spreading stage and fruit maturing stage will decrease yield and quality of fruit.The total sugar in the two serious water deficit treatments increased 19.68% and 19.79% compared to control,but their yield reduced 23.28% and 27.57% respectively.The results indicated that the regulated deficit irrigation could regulate the distribution of photosynthesis products and ratio between root and shoot,and balance the relationship between vegetative and reproductive growing of plant.

【题目】供水吸力对温室黄瓜产量与水分利用效率的影响

【中文关键词】黄瓜; 负水头控水; 产量; 水分利用效率; 光合速率;

【英文关键词】cucumber; negative pressure water control; yield; water use efficiency; photosynthetic rate;

【中文摘要】【目的】研究不同供水吸力即不同土壤水分对温室黄瓜(CucumissativusL.)生长发育的影响,确定黄瓜不同生育期对水分的需求,为温室黄瓜灌溉决策提供理论依据。【方法】采用负水头供水控水盆栽装置,通过设定装置不同的供水吸力(WST)来持续稳定控制不同的土壤含水率,分析各供水吸力处理的黄瓜叶片光合、产量与水分利用效率的差异。【结果】负水头供水控水盆栽装置能通过调节供水吸力持续稳定控制土壤不同含水率;黄瓜植株在3—5kPa供水吸力范围内产量与商品瓜率最高,叶片净光合速率、干物质积累量也较高;3—13kPa处理范围内的黄瓜水分利用效率差异不明显,最高为7kPa处理的36.57,1kPa处理的黄瓜水分利用效率最低,与其它处理差异显著,表明对黄瓜各生育期进行分期水分调控才能显著提高水分利用效率;试验结果还表明,黄瓜随着生育进程需水量越来越大,供水不足会导致生长点枯死而停止生长,影响黄瓜产量与商品瓜率,黄瓜采收后期适当加大水分供应可以增加采收后期产量。【结论】3—5kPa的供水吸力较适合温室黄瓜的生长,此时土壤相对含水量为67%—81%;适当降低黄瓜苗期土壤水分、控制花期土壤水分和增加结果期土壤水分能进一步提高产量与水分利用效率。

【英文摘要】【Objective】 The effects of different water supply tension(WST) that is different soil moisture on the growth and development of greenhouse cucumber (Cucumis sativus L.) were studied. The demand of water at different growth stages of greenhouse cucumber was determined to provide a theoretical basis for the irrigation decision-making. 【Method】 A negative pressure water supplying and controlling pot device was used to control different soil water contents by setting the WST of the device at different values. The differences in photosynthetic rate,yield and water use efficiency(WUE) of cucumber under different WST were analyzed. 【Result】 The results showed that the negative pressure water supplying and controlling pot device can maintain soil water content in a enactment state by setting the WST. The leaf photosynthetic rate,biomass accumulation as well as yield and marketable fruit rate of cucumber were much higher at 3-5 kPa WST treatments,the highest WUE 36.57 appeared in WST of 7 kPa and a significant lower WUE was observed in WST of 1 kPa,differences in WUE for other 6 WST were not significant. The result shows that WUE can only by improved by control water supply at different growth stages of cucumber. The result also indicates that the water demand increase with the growing process. The growth will be restricted and yield will be reduced with the shortage of water supply,increase the yield at terminal fruiting stage can be obtained by increasing soil water content at fruiting stage of cucumber. 【Conclusion】 The above results indicate that the range of WST from 3-5 kPa are more suitable for greenhouse cucumbergrowth when the relative soil water content ranges from 67% to 81%. Reduce water supply at seedling stage,control water supply at flowering stage and increase water supply at fruiting stage of cucumber can increase yield and WUE.

【题目】无压灌溉日光温室番茄作物-皿系数研究
【中文关键词】无压灌溉; 作物—皿系数; 产量; 品质; 灌溉水利用效率;
【英文关键词】non-pressure irrigation; crop-pan coefficient; yield; quality; irrigation water use efficiency;
【中文摘要】以-25 kPa作为土壤水势临界值,将作物—皿系数(Kcp)设为0.2,0.4,0.6,0.8,1.0,1.2六个处理,研究了不同灌溉水量时的番茄产量、品质和灌溉水利用效率。通过经济效益评价,研究了杨凌地区无压灌溉温室番茄获得最高经济效益时的作物—皿系数。通过张力计读数变化规律,研究了利用张力计测量无压灌溉湿润体内土壤水势的特点。研究结果表明,Kcp为0.2~0.8时,灌溉水量的增加对番茄产量影响不大;Kcp为1.0~1.2时,灌溉水量的增加能显著提高番茄产量和果实大小;Kcp为0.2时的灌溉水量能极显著提高番茄的灌溉水利用效率。在综合考虑了杨凌地区水价、番茄使用目的和市场价格波动规律后,Kcp取值1.2能获得最高的经济效益。作物—皿系数法计算灌溉水量时的滞后性特点和张力计埋设位置,是判断利用张力计监测土壤水势临界值方法有效性的两个重要因素。 更多还原
【英文摘要】Crop-pan coefficientis the ratio between crop water consumption and pan evaporation.Using-25 kPa as the soil water potential threshold,and designing six treatments for crop-pan coefficient Kcp=0.2,0.4,0.6,0.8,1.0,1.2,study was made on tomato yield,quality and irrigation water use efficiency under different irrigation water amount.The crop-pan coefficient which acquired highest economic effectiveness was studied through the economic effectiveness analysis,while the measurement character of soil water potential using tensiometers was studied through the tensiometer reading.The results indicated that when Kcp values was from 0.2 to 0.8,the irrigation water amount had no influence on tomato yield,but when Kcp values was from 1.0 to 1.2,the irrigation water amount had significant effect on tomato yield.When Kcp value was 0.2,the irrigation water use efficiency was improved significantly.After considering water price,tomato using aim and market price in Yangling district,there was the highest economic effectiveness when Kcp was 1.2.The hysteresis quality of irrigation water amount calculation using crop-pan coefficient and the buried position of tensiometer were main factors to estimate the validity of tensiometer measuring the soil water potential threshold.

【题目】榆林市参考作物蒸发蒸腾量随时间序列变化的规律
【中文关键词】榆林市; FAO-Penman-Monteith公式; 参考作物蒸发蒸腾量; 时间序列;
【英文关键词】Yulin; FAO-Penman-Monteith method; reference crop evaporation; time series;
【中文摘要】根据选取的榆林市5个代表气象站1985~2006年22年的气象资料,应用FAO-Penman-Monteith公式计算了各站历年各月的参考作物蒸发蒸腾量(ETo),并分析了ETo随时间序列变化的规律。结果表明:榆林市5个代表站5、67、月份的ETo之和占全年的比例最大;各代表站的ETo主要在1996年以后随时间呈极显著增加趋势,在1985~1996年,定边、横山的ETo随时间呈极显著减少的趋势,绥德、榆阳、神木的ETo随时间呈极显著增加的趋势,但是增加的趋势线斜率均小于1996年以后的趋势线斜率;榆林市的ETo与平均气温、日照时数、风速呈极显著的正相关,与相对湿度呈极显著的负相关;ETo与最高气温呈显著正相关,与最低气温除了定边站呈极显著正相关外,与其它各站均呈极显著负相关;平均气温是影响榆林市ETo变化的主要气象因子。
【英文摘要】According to 22-year weather data from 1985 to 2006 from five selective weather stations in Yulin,FAO-Penman-Monteith method was adopted to calculate the monthly reference crop evaporation(ETo) in every station,and to analyze the law of ETo ′s variation with time series.It can be drawn that the sum of ETo in May,June and July in the five stations accounted for the largest proportion of the whole year.After 1996,the ETo in every station showed a trend of increase,which was very significant.From 1985 to 1996,the ETo in Dingbian and Hengshan stations showed a significant decreasing trend with time;and the ETo in Suide,Yuyang and Shenmu stations showed a significant increasing trend,however,the slope of the increase trend line was less than the slop of trend line after 1996.In Yulin,the ETo had a significant positive correlation with the average temperature,sunshine hours and wind speed,while the relative humidity had a significant negative correlation.ETo and high temperature were in positive correlation;Apart from Dingbian,in

other stations the minimum temperature had a significant negative correlation with ETo.The average temperature is the main reason for ETo ′s change in Yulin from 1985 to 2006. 更多

【题目】基于CROPWAT模型的非充分灌溉研究
【中文关键词】非充分灌溉; CROPWAT模型; 模拟;
【英文关键词】deficit irrigation; CROPWAT model; simulation;
【中文摘要】为验证FAO的CROPWAT模型在非充分灌溉中的适用性和精确性,将民勤棉花和春小麦非充分灌溉的试验方案及当地气象资料输入模型,分析CROPWAT模型在模拟作物蒸发蒸腾量和非充分灌溉对产量影响的模拟效果。结果显示,棉花各生育期日平均蒸发蒸腾量的模拟值和实测值表现出相同的分布规律,但模拟值整体高于实测值0.15~1 mm;模拟非充分灌溉对棉花和春小麦产量的影响时,模拟值和实测值显示出一致的变化规律,将结果进行统计分析,棉花和春小麦的RMSE、EF、CRM分别为20.62%和10.35%、0.98和0.856、-0.00051和-0.0155,说明CROPWAT模型总体模拟效果较好,但模型的执行值较实测值偏高。模拟结果表明,模型在非充分灌溉的研究中有着较好的适用性,但为了使模拟结果更准确,使用前需根据当地实测资料对Kc、Ky等参数进行校正。
【英文摘要】In order to verify the applicability and accuracy of FAO CROPWAT model in deficit irrigation study,both the deficit irrigation experimental scheme of cotton and spring wheat and the local meteorological data were input into the model.Then,analysis was made of the simulation effect of the application of CROPWAT model study in crop evapotranspiration and the impact of deficit irrigation on crop yield.The results showed that the simulated values and measured values of cotton ′s daily evapotranspiration showed the same distribution regulation,but the simulated values were 0.15~1 mm higher than the measured ones as a whole;the simulation of the impact of deficit irrigation on cotton and spring wheat yield indicated that the simulated values and measured values showed the same tendency,and the statistical analysis of the results showed that the RMSE、EF and CRM of cotton and spring wheat were 20.62% and 10.35%;0.98 and 0.856;-0.00051 and-0.0155 respectively,it meant that the simulated effect of CROPWAT model was preferably well,but the stimulated values were higher than measured values in general.Simulation results show that the model is applicable in deficit irrigation study,however,in order to obtain more accurate simulation results,it is necessary to correct the Kc and Ky parameters before using the model.

【题目】小麦花后土壤水分状况与籽粒灌浆过程关系分析
【中文关键词】冬小麦; 灌浆速率; 土壤水分; 产量;
【英文关键词】winter wheat; grain filling rate; soil moisture; yield;
【中文摘要】于2005~2006年在大田高产条件下研究了冬小麦水分运筹对籽粒灌浆过程及产量的效应,并重点分析了不同灌浆时段土壤水分状况与籽粒灌浆过程的关系。结果表明,花后0~14 d 土壤含水量偏高抑制该时段粒重的增加,品种间反应一致;花后14~28 d 石麦12品种对土壤水分需求旺盛,高土壤水分含量显著促进其灌浆速率的增高;石新733此时段对土壤水分适宜范围广;28d 至成熟适中的土壤水分对后期粒重增加有利水分过高严重抑制后期粒重的增加,品种间反应相似;灌浆水虽促进了石麦12灌水后14d内的灌浆速率,却抑制了其花后28d至成熟阶段的粒重增长,最终粒重和产量呈下降趋势。灌浆水对石新733灌后14d内灌浆速率促进作用微弱,但是却促进了其花后28d至成熟阶段的籽粒灌浆,最终千粒重和产量均

较高。初步总结了不同灌浆时段对小麦籽粒灌浆适宜的0-100cm土壤水分含量范围指标。
【英文摘要】The effcets of irrigation management on grain filling and yield were annalyzed in field study in 2005~2006 for high-yielding winter wheat, focusing on the relations between grain developing course and concurrent soil moisure status. The results showed that high soil moisure hindered grain growth during 0~14 days after anthesis. The two cultivars investigated responded similarly. During 14~28d, the cultivar SM12 required sufficient water supply for greater grain filling rate. However, the cultivar SX733 was relatively insensitive to variations in soil water conditions. At late grain filling stage between 28d and maturity, intermediate soil moisture facilitated grain-filling in both cultivars. Irrigation at 15~17d promoted greatly the grain filling rate within 14d after irrigation in SM12, but decreased significantly that of 28d to maturity, which resulted in decrease in final grain weight and yield. In contrast, irrigation at mid grain filling stage had little effect on SX733 within 14d after irrigation, but increased that of 28d to maturity, leading to higher grain weight and yield. Soil water moisture ranges favorable for grain filling at various grain filling periods were proposed based on the above results.

【题目】苗期土壤水分亏缺后玉米光合生理的恢复
【中文关键词】玉米; 土壤水分亏缺; 光合生理; 恢复;
【英文关键词】Maize; Water deficit of soil; Photosynthetic physiological; Recovery;
【中文摘要】通过模拟土壤水分亏缺试验,研究了玉米在土壤水分亏缺后光合生理的恢复机制。结果表明:不同处理玉米光合生理在复水后30 d内均可以恢复正常生长。轻度亏缺处理玉米叶片气孔导度和蒸腾强度在复水后0~10 d可恢复正常,光合速率和胞间CO2浓度在复水后10~20 d恢复正常,但叶绿素荧光参数(Fv/Fm、Fv/Fo、qP、qN)和叶片光合色素含量的恢复相对较为缓慢。重度水分亏缺处理玉米光合生理指标恢复滞后于轻度亏缺处理。轻度亏缺处理复水后玉米净光合速率的恢复主要受气孔因素影响,重度水分亏缺处理玉米净光合速率的恢复在复水0~10 d主要受非气孔因素影响,复水10 d后主要受气孔因素影响。

【英文摘要】A pot experiment was conducted to study the recovery mechanism of maize photosynthetic after water deficit during seedling stage.The results indicated that,maize leaves in different water deficit treatments could restore to normal growth within 30 d after re-water.Under mild water deficit,10 days was need to restore to normal stomatal conductance(Gs)and transpiration rate(Tr),20 days was need to restore to normal net photosynthetic rate(Pn)and intercellular CO2 concentration(Ci),longer duration was need to restore to normal chlorophyll fluorescence parameters of PS II (Fv/Fm,Fv/Fo,qP,qN)and photosynthetic pigment content.The recovery of different physiological indexesunder serious water deficit waslogged behind that under mild water deficit.Under mild water stress,the recovery of net photosynthetic rate mainly depends on stomatal factors.Under serious water deficit,the recovery of net photosynthetic rate mainly depends on non-stomatal factors within 10 days after re-water,while 10 days later stomatal factors still became main determinants.

【题目】水分运筹对不同冬小麦品种旗叶叶绿素含量的影响
【中文关键词】冬小麦; 土壤水分; 叶绿素含量;
【英文关键词】Winter wheat; Soil moisture; Chlorophyll content;
【中文摘要】在大田高产条件下,研究了水分运筹对6个冬小麦品种花后旗叶叶绿素含量的影响。结果表明,0~1 m土层较低的土壤水分(40%<RSWC<60%)对花后0~14 d旗叶叶绿素影响较小,但加速灌浆后期叶绿素降解;持续过高的土壤水分(RSWC>70%)(春季灌4水处理)降低多数品种灌浆中期旗叶叶绿素含量和Chla/b,叶绿素含量峰值提前,延缓灌浆后期叶绿素降解;适宜的土壤水分(60%<RSWC<70%)有利于花后旗叶叶绿素含量始终维持较高水平。石新733、石新703、石麦15、和石麦12旗叶叶绿素含量对灌水的反应较敏感,冀5579和石家庄8号不敏感。不同灌水处理之间花后旗叶叶绿素含量均值与籽粒产量相关性不显著,但花后28 d旗叶叶绿素含量与籽粒产量相关性较强。 更多还原
【英文摘要】The effects of irrigation management on chlorophyll(Chl)content of flag leaf were analyzed in a field study for six high-yielding winter wheat cultivars.The results showed that soil water deficit(0-100 cm,RSWC 40%-60%)had little effect on Chl content of flag leaf during 0-14 d after anthesis,but accelerated Chl degradation at late grain filling stage.RSWC higher than 70% of the 4-time-irrigation decreased Chl content and Chla/b,and slowed the degradation rate of Chl,which treatment resulted in earlier Chl content peak compared with the other treatments.RSWC range of 60%-70% was favorable for higher Chl content.Cultivars of SX733,SX703,SM15 and SM12 were sensitive to irrigation in terns of Chl content,but JM5579 and SJZ8 responded reversely.No significant correlation was found between mean post-anthesis Chl content of flag leaves and grain yield among different irrigation treatments.Stronger positive correlation relations were,however,revealed between 28 d Chl content of flag leaves and grain yield.

【题目】2种熟型玉米子粒灌浆特性及其与产量关系的比较研究

【中文关键词】玉米; 产量; 灌浆速率; 籽粒水分;

【英文关键词】Maize; Yield; Grain filling rate; Grain water;

【中文摘要】为了明确不同熟型玉米籽粒灌浆特性及其对产量的影响,比较研究了中晚熟品种农大108和中早熟品种石玉7号籽粒灌浆动态与产量表现,并对籽粒灌浆特性与籽粒水分的关系进行了分析。结果表明,石玉7号与农大108产量差异显著,百粒重是两品种产量差异的主要原因;石玉7号具有籽粒发育速度快、体积大等特点,前中期(0~45d)灌浆速率始终快于

农大108,生育后期(45 d以后)急剧下降。农大108后期灌浆速率则下降缓慢。籽粒发育速度快,灌浆盛期灌浆速度快、强度大是石玉7号百粒重高的主要原因;籽粒水分状况与籽粒灌浆速率关系密切。回归分析表明,籽粒含水百分率在59.47%左右时,石玉7号灌浆速率达到最大值,为9.28 mg/(粒.d);农大108则在57.92%左右时,灌浆速率达到最大值,为8.23 mg/(粒.d)。当籽粒含水百分率下降到某一临界值时,籽粒灌浆停止。两品种收获时,籽粒含水百分率尚远在籽粒灌浆终止临界值以上。

【英文摘要】A field experiment was conducted at Wuqiao research station of china agricultural university in 2006.The relationship between characteristics of grain filling and yield of two types of maturity in maize was studied;moreover,the relationship between characteristics of grain filling and grain water was further analyses.The main results were as fallows.In comparison with the hybrid cv.Nongda108,yield of the hybrid cv Shiyu7 was higher and significant at 0.05 level.100-kernel weight was the reason of the different yield.In comparison with Nongda108,it was found that Shiyu7 had faster grain development,higher grain filling rate.Grain filling rate of Shiyu7 was higher than Nongda108 in 45 da after pollination,later it was declining faster and becoming lower than that of Nongda108.The faster grain development and the higher grain filling rate is the reason of the larger 100-kernel weight of Shiyu7.There are close corrections between percentage of grain water and grain filling rate.By regression analysis it was known that when the percentage of grain water of Shiyu7 reached about 59.47%,its grain filling rate reached the maximum(9.28 mg(/kernel.d));but for Nongda108 it was about 57.92%,the maximum value was 8.23 mg/(kernel.d).The biomass accumulation stopped when the percentage of grain water decreased to a critical value,but the percentage of grain water was still far above the critical value at harvest for the two hybrid cultivars.

【题目】ET_0的主因子和主成分神经网络模型比较

【中文关键词】ET0;主成分分析;偏相关分析;神经网络

【英文关键词】principal component analysis; partial correlation analysis; neural network

【中文摘要】为了简化BP神经网络预测ET0的模型,将气象因子包括最高、最低和日平均温度、日照时数、相对湿度和风速进行主成分分析和偏相关分析,提取主成分和主因子,分别建立了基于主成分和主因子的三层BP神经网络模型,并对两种模型的训练和预测结果进行比较。选取湟水流域的乐都气象站2003年到2006年5月逐日的气象资料,采用Matlab神经网络工具箱进行模型训练与预测。结果表明主成分神经网络训练和预测模型的精度都优于主因子神经网络模型。主要是由于两种模型选取输入层的因子不同造成的。

【英文摘要】In order to simplify neural network model for the prediction ofET0, principal component analysis and partial correlation a-nalysis are applied to the weather data, including the maximum, minimum and average daily temperature, sunshine, relative humid-ity and wind velocity. And a three-layer BP(back-propagation)neural network model is constructed based on the principal componentsand principal factors, respectively. The training and prediction results are compared. Based on daily meteorological dates of Mayfrom 2003 to 2006 in LeDu Station in Huang river basin, the two models were trained and predicted with Matlab neural network too-lbox. The results show that the principa-l component-based BP network model is superior to the principa-l factor-based BP networkmodel in the training and prediction ofET0.The main reason is the different factors of input layer in two models.

【题目】土壤水分胁迫下冬小麦籽粒灌浆特性的研究
【中文关键词】水分胁迫;冬小麦;灌浆特性
【英文关键词】water stress; winter wheat; grain filling characteristic
【中文摘要】利用2008-2009年度田间小区冬小麦灌溉试验资料,研究了不同水分胁迫程度、不同水分胁迫时期对冬小麦籽粒灌浆进程以及籽粒产量的影响。研究结果表明:在不同水分调控条件下,冬小麦籽粒灌浆规律符合“慢-快-慢”的“S”型生长曲线,可以用Logistic曲线拟合;且水分调控对籽粒灌浆参数有不同程度地影响,进而对粒重有重大影响。随着水分胁迫的加剧,冬小麦灌浆起步时间愈早,达到峰值的时间愈快。而在孕穗、抽穗和灌浆期任一期内缺水处理都会缩短小麦灌浆持续时间,减少穗粒数,也降低粒重,最终影响产量。因此在冬小麦拔节期可允许轻度的水分胁迫,而灌浆期则应尽量避免任何程度的水分胁迫。
【英文摘要】Through using experimental data of grain filling of winter wheat planted in field plot in 2008 to 2009, the effects of different degree and period of water stress on the grain filling process of winter wheat and grain yield were studied. The results indicatedthat the grain filling regulation accorded with “S” type of growth curve of “slow-fast-slow” under the conditions of different watercontrol, which could be simulated by Logistic curve; water controlling brings different effect on grouting parameter, and has greateffect on grain weight. The less water, the earlier the winter wheat filling commence ,the quicker the filling reach peak value. In thebooting, heading and filling stage, to deal with any water shortage during the grain filling of wheat will not only shorten the durationand reduce the number of grains per spike, but also reduce the weight, and ultimately affect the output. Therefore, mild water stresscan be allowed in the jointing stage of winter wheat, but any degree of water stress should be avoided in grain-filling stage.

【题目】日光温室负压自动灌溉下番茄蒸腾规律研究
【中文关键词】负压;自动灌溉;茎流;番茄;蒸腾速率
【英文关键词】negative pressure; automatic irrigation; stem-flow; tomato; transpiration rate
【中文摘要】针对农业生产中蔬菜栽培灌溉费水费时的现状,采用一种自制负压自动灌溉系统,将供水压力设定在负值,利用土壤自动吸水的特性,达到自动灌溉和节水的效果。在此系统灌溉下采用茎热平衡技术测定番茄植株的茎流规律,分析了茎流变化规律与环境因子之间的关系,同时分析了番茄植株不同部位茎流差异以及剪叶对番茄植株茎流的影响。结果表明,在设定灌溉系统负压为60 hPa下,温室土壤含水量基本控制在阴天20.19%、晴天18.75%左右;茎流数据表明番茄植株蒸腾与太阳辐射值呈显著正相关,适当遮阴降温可以减少植株蒸腾。实验也进一步证明了叶片是植株蒸腾的主要器官,植株底层叶片蒸腾速率相对较微弱。
【英文摘要】Aiming at the problem of wasting water and time in the vegetable irrigation, an automatic negative pressure irrigation sys-tem, in which the water-supply pressure was set at negative pressure and the effect of automatic irrigation and water-saving was a-chieved based on the characteristic of auto-water-absorbing of soil, was designed in this paper. Under the irrigation of this system,the stem-flow law of tomato plant was measured through the stem heat balance technology, the relationship between stem-flow andenvironment factors, the difference of stem-flow in different stem section, and the influence of leaf-cutting on stem-flow of tomatoplant were analyzed. The results showed that the soil water content value was controlled at about 20.19% in cloudy weather and 18.75% in sunny weather when the negative pressure was set at 60hPa. The stem-flow data showed that the transpiration had signif-icant positive correlation to the solar radiation values and proper shading could reduce the transpiration of tomato plant. The exper-iment result also further proved that leaves were the main transpiration place of the plant and the transpiration of bottom leaves of theplant was relatively weak.

【题目】不同覆盖度下盆栽苋菜蒸腾规律的研究
【中文关键词】苋菜;覆盖度;蒸腾量;白天平均光照;干物质;水分利用效率
【英文关键词】amaranth; coverage degree; transpiration; daily mean illumination; dry matter; water use efficiency (WUE)
【中文摘要】通过盆栽试验,研究了不同覆盖度下苋菜所处小环境的温湿度变化以及苋菜的蒸腾耗水规律。结果表明:植株生长点的温湿度随覆盖度的增大而增加,蒸腾速率和昼夜蒸腾量随覆盖度的增大而减小。通过逐步回归分析,给出了不同覆盖处理下盆栽苋菜的蒸腾速率、白天蒸腾量与气象因子的相关关系。不同覆盖处理对温室盆栽苋菜的根冠比、叶绿素相对含量、蒸腾耗水量、干物质积累量以及水分利用效率均有极显著的影响,除了水分利用效率随覆盖度的增大而增加,其他均随覆盖度的增加而减小。15/16圆覆盖、3/4圆覆盖、1/2圆覆盖、无圆覆盖处理的蒸腾耗水量分别为对照处理的32.65%、54.64%、63.36%和69.98%。可见密封一部分空间,抑制了植株蒸腾耗水,同时也提高了水分利用效率,为设施农业水资源的节约利用提供依据。
【英文摘要】Through pot experiment, change rule of air temperature and humidity at growth point of amaranth and its transpiration ruleunder different surface coverage degree are studied in this paper. The results show that the air temperature and humidity increasewith the increase of the coverage degree, while the transpiration rate and quantity decrease with the increase of the coverage degree.The correlation among transpiration rate, daytime transpiration quantity and meteorological parameters under different surface cover-age degree is obtained through stepwise regression analysis. The effects of different surface coverage degree on root-top ratio, chlo-rophyll content, transpiration consumption, dry matter accumulation and water use efficiency of potted amaranth are extremely sig-nificant. Except that water use efficiency increases with the increase of the coverage degree, others all decrease with the increase ofthe coverage degree. Transpiration quantity of 15/16 circle coverage, 3/4 circle coverage, 1/2 circle coverage and non-circle coveragetreatment are 32.65%, 54.64%, 63.36% and 69.98% of the comparison treatment, respectively. It is indicated that transpirationcan be bated and water use efficiency can be enhanced at the same time through sealing the part of space. This study will provide abasis for the water-saving of facilities agriculture.

【题目】不同水肥模式的水稻叶面积修正系数试验研究
【中文关键词】水稻;叶面积修正系数;控制灌溉;控释肥;实地施肥;叶片长宽比
【英文关键词】paddy rice; leaf area correction coefficient; controlled irrigation; controlled-release fertilizer; site-specific nutrient man-agement; blade aspect ratio
【中文摘要】叶面积修正系数直接决定着长宽修正系数法测量叶面积的精确程度。为探讨水肥模式对水稻叶面积修正系数的影响,基于水稻实测叶面积及叶片长、宽数据计算叶面积修正系数,并分析其变化规律。结果表明,各处理生育前期水稻叶面积修正系数接近或超过经验值0.75,中期较小,抽穗开花期略有上升并稳定至0.7左右。常规灌溉处理上层叶片叶面积修正系数较控制灌溉大,叶片更加细长。不同肥料处理中,控释肥处理叶面积修正系数普遍偏低;常规肥及实地肥处理在生育前期可以采用经验值进行叶面积计算;抽穗开花及以后各生育期,各处理均可采用相同的叶面积修正系数;生育中期各处理叶面积修正系数较低。
【英文摘要】The leaf area correcting coefficient is the key parameter of the length-width method for rice leaf area measurement. Theleaf area correcting coefficients were calculated based on the measurement of rice leaf area, leaf length and width to explore the im-pact of water and fertilizer management for them. The upper leaf area correction coefficients of controlled irrigation managementswere lower than the ones of the traditional irrigation. Correcting coefficients went down with the continuation of the growth period.They

were focused on 0.7 at the heading and flowering stage, lower than the accustomed 0.75. Correcting coefficients of controlled-release fertilizer management were lower than the others. The accustomed correcting coefficients(0.75) could be used in the pro-phase of rice for the farmers ′ fertilization and site-specific nutrient management. In the heading and flowering stage ,the same correc-ting coefficients could be used to calculate the rice leaf area for different managements. The correcting coefficients were the lowest inthe middle term of the rice growth-period.

【题目】亏缺灌溉中土壤含水量的试验控制
【中文关键词】亏缺灌溉;土壤含水量;试验控制
【英文关键词】Deficit irrigation; Soil water; Experimental control
【中文摘要】[目的]分析不同亏缺灌溉中保持土壤含水量方法的优劣,为亏缺灌溉提供理论依据。[方法]收集亏缺灌溉常用的试验方法,分析它们的适用条件。[结果]垂直土柱吸渗法是根据土壤水吸力是随高度变化来控制土壤水分含量。分层供水法在保证水分均匀分布的同时,也遇到了土壤通气、封层的泄漏问题,以及根系的不均匀分布的问题等。薄层土壤种植箱法可把土壤维持在低于田间持水量的恒定水势条件下。氯化钠、硝酸钾、蔗糖和甘露糖醇等溶质可以模拟水分胁迫。聚乙二醇是最好溶质。表面灌水法采用的方式主要有不同灌水定额法和推迟灌溉法,现在后者利用较多。[结论]在亏缺灌溉中,应根据不同的试验目的与条件,选择适宜的灌溉方法。
【英文摘要】[Objective]Thestudywastoanalyzethegoodandbadofthemethodtokeepingsoilwatercontent indifferentdeficit irrigationandprovidethethe-oretical basis for deficit irrigation. [Method] The usual experimentmethods of deficit irrigationwere collected and their applicable conditionswere analyzed.[Result] The suctionandosmoticmethodbyvertical soil column capillary could control soilwater contentbythevariationofsoilmoisture suction changedwiththe height. The layered supplyingwatermethod could guarantee the uniformdistribution ofwater, while it alsomet the questions such as soil aeration, sealcoat leakage and the inhomogeneous distribution of root.Themethod of thin layer soil plantingbox could sustained the soil at the stablewater potential lowerthan field capacity.The solute such asNaCl, KNO3, sucrose andmannitol could simulate thewater stress.The polyethylene glycolwas the best solute.Themainsurface irrigationmethods usually usedwere 2 types such as different irrigation quota method and delaying irrigation

method. Nowthe latter was usedmore. [Conclusion] In deficit irrigation, it should select optimum irrigationmethod by the aimand conditions of different experiments.

【题目】不同降水年型节水小麦产量构成与效益分析
【中文关键词】小麦;节水;抗旱品种;综合效益
【英文关键词】wheat, water-saving, drought resistant variety, integrated efficiency
【中文摘要】为筛选适宜北京地区小麦抗旱品种,同时为北京小麦节水栽培推广决策提供参考,2003—2006年间 3 个不同降水年型,在大兴区以 28 个小麦品种为材料,采用只浇冻水的节水措施,比较品种间产量构成因素和农艺性状等方面的差异性,并与常规灌溉管理进行比较分析。结果表明:(1)以产量水平为指标,参试品种间抗旱性存在显著差异。“ 中麦 326 ”和“ 京农 02-2 ”在平水年表现出较好的抗旱性;“ 北农9580 ”、“ 中麦 12 ”、“ 京农 04-133 ”和“ 京冬 8 ”在枯水年表现出较好的抗旱性。(2)干旱条件下,小麦分蘖成穗过程受影响最大,分蘖成穗率可以作为小麦抗旱性筛选鉴定的较早期指标。(3)枯水年采取节水栽培比正常灌溉产量降低 48.89%以上。 效益综合分析结果认为,应用抗旱品种,即使在枯水年,北京地区小麦实施只浇冻水一水的节水栽培措施,也能取得明显的增效。
【英文摘要】To screen out proper drought resistant wheat varieties for Beijing area and provide references formaking extension decisions on water saving cultivation techniques for winter wheat in Beijing, the yield andagronomic characteristics of 28 wheat varieties under only one winter irrigation were compared with thoseunder normal traditional irrigations in three different precipitation years from 2003 to 2006. The results are:(1) The tested wheat varieties had significantly different resistance to drought according to the yield level. “ Zhongmai 326 ” and “ Jingnong 02-2 ” showed good drought resistance in normal precipitation years, where-as “ Beinong 9580 ” , “ Zhongmai 12 ” , “ Jingnong 04-133 ” and “ Jingdong 8 ” demonstrated good drought resis-tance in low precipitation. (2) Under drought stress, the formation of wheat spike from the tillers was influ-enced most, which could be used as the early appraisal and screening index for drought resistant wheat culti-vars. (3) In drought years, wheat yield under only one winter irrigation decreased more than 48.89% com-pared to normal irrigation even if water sving cultivation measures were adopted. Integrated efficiency analy-sis showed significant benefits of water saving cultivation techniques under only one winter irrigation.

【中文关键词】水稻; 水分亏缺; 补偿效应;
【英文关键词】rice; water deficit; compensatory effect;
【中文摘要】为探讨调亏灌溉对水稻苗期的光合产物分配及氮素积累的影响,采用人工气候室内盆栽实验,在水稻三叶一心期至分蘖前期为止设计持续干旱0 d、3 d、6 d、9 d和12 d五个处理组。结果表明:1)在水分胁迫条件下,光合速率和蒸腾速率均下降,前者下降略为缓慢使得水分利用效率得到提高。同化产物在叶片中的含量高于茎鞘,但叶片中的氮素含量低于茎鞘。2)恢复灌溉后,受到胁迫的处理组的光合速率、蒸腾速率都迅速升高,干旱3 d和6 d的处理组光合水平超过对照,然后又有所下降,水分利用效率因为蒸腾速率的骤然升高而降低,之后有所恢复。干旱处理组的叶片中积累的同化产物转移至茎鞘和其他部位供其生长,使得叶片占总干重的比例下降。所有干旱组的茎鞘含氮量都在复水后增加明显且均高于对照组。3)各亏水处理组均表现出一定的补偿生长,包括根系的吸收补偿和光合系统的生理补偿。其中干旱3~6 d的水稻苗期亏水阈值产生的补偿效应明显。苗期水稻干旱引起光合产物的分配和氮素的积累的改变,从而发生复水后的补偿效应,提高植株的素质,提高水稻的分蘖能力和结实能力。 更多还原
【英文摘要】In order to investigate the effect of regulated deficit irrigation on the distribution of assimilation products and the accumulation of nitrogen,we planted rice in buckets in Microclimate room and imposed five different water regimes were imposed on seedling rice.The results show:1)Both net photosynthetic rate and evaporation rate were decreased un-der water deficit groups,water use efficiency was increased because of slower decreasing of photosynthetic rate.More assimilation products were stored in sheathes than those in leaves.2)After rewaterring,net photosynthetic rate and evaporation rate came back quickly,especially D3 and D6 groups whose two photosynthetic indexes were higher than that of control group and then droped back to normal in serveral days.Water use efficiency was reduced for the enhancement of evaporation rate and got back to normal standard after 3 days.Nitrogen transferred from leaves to sheaths and stems so as to enhance the growth of these organs.3)Compensatory effect was found in every water deficit group,including assimilating compensatory in roots and physiological compensatory in photosynthetic system.This kind of effect in both D3 and D6 was more obvious than others.We can conclude that imposing drought on rice at late seedling stage may change the distribution of assimilation products and the accumulation of nitrogen and then induce compensatory effect happening.

【题目】气孔免疫的研究和利用,农业分子生态学新热点
【中文关键词】叶际微生物; 气孔振荡; 气孔免疫; 农业节水增产技术;
【英文关键词】phyllosphere microbes; stomata oscillation; stomata-based immunity; crop water-saving and product-increasing tech- nique;
【中文摘要】叶际微生物的定居、组成及其对宿主植物的益生和拮抗作用受到越来越多的关注。气孔不再被认为是微生物侵入植物的被动通道,而是植物先天免疫的一个重要组成部分,对植物气孔与微生物的免疫互作的分子机制研究也越来越详尽。本文综述了叶际微生物与植物的免疫互作机制,结合环境因素影响的气孔开闭振荡及其对作物的水分利用效率的影响研究,提出可利用植物气孔免疫过程中的气孔振荡行为来发展农业节水增产技术的观点。植物气孔-微生物免疫互作将成为分子生态与农业生态的交叉点和新焦点。 更多还原
【英文摘要】Phyllosphere microbes have received much attention. More and more studies have been conducted to know about the microbes species and how they colonize and interact with plants. Stomata were considered as passive portal of entry for plant pathogenic bacteria. However, recent studies suggest that stomata can play an active role in restricting bacterial invasion as one part of the plant innate immune system. The paper has summarized recent developments in molecular ecology on stomata-based immunity. And on the base of reports on the relationship between stomata closure and plant water use efficiency, studies to develop crop water-saving and product- increasing technique by making use of the stomata-based defense are feasible. Plant stomata-pathogen interaction will become the next focus of molecular ecology and agricultural ecology.

【题目】负水头供水控水盆栽装置及浇灌系统的研究与应用
【中文关键词】负水头灌溉; 控水; 盆栽; 自动供水;
【英文关键词】negative pressure irrigation; water controlling; pot device; automatic irrigation;
【中文摘要】如何持续精确控制土壤水分一直是国内外研究的重点,目前控制盆栽与大田水分的方法都会使部分水分达到过饱和,而影响试验效果。基于负压控制原理研制出的负水头供水控水盆栽装置和负水头灌溉系统解决了这一难题,试验证明负水头供水控水盆栽装置可将土壤含水量持续维持在理想状态。可以实现土壤含水量的持续稳定控制与日蒸散量监测,结合天平的使用获得盆栽植株的鲜重增长动态;负水头灌溉系统能使灌溉下的土壤含水量呈非饱和状态,抑制土表湿润导致的无效蒸发和地下渗漏导致的无效灌溉和养分流失,也不会破坏土壤结构,节省了大量人力、物力,提高了水分利用率,增加了作物产量提高的潜力。负水头供水控水盆栽装置及灌溉系统在设施栽培中及科学研究中,具有很大的推广价值。更多还原
【英文摘要】How to control soil moisture continued and precisely has been the focus of the research at home and abroad,part of the soil will be reach saturation under current water controlling methods,and the result of the experiment will not be so imprecise.Based on the principle of negative pressure,the negative pressure water supplying,controlling pot device and negative pressure irrigation system de- signed for solve this problem,the experiment result showed that the negative pressure water supplying,controlling pot device can maintain soil moisture of pot equipment in the enactment state,it has the function of sustained,stably controlling soil moisture and reading the val- ue of evapotranspiration,with a balance we can obtain the value of plant fresh weight growth;negative pressure irrigation can leading the soil moist to a Non-saturation status,restrain the surface soil invalid evaporation and nutrient loss caused by underground water leakage, and also will not damage the soil structure,saving a lot of manpower,resources,and improve water use efficiency,increasing the potential of increasing of crop yields,the negative pressure water supplying,controlling pot device and negative pressure irrigation system have a great generally value in the plant facilities cultivation and scientific research.

【题目】生育中期水分亏缺复水对水稻根冠及水肥利用效率的补偿影响
【中文关键词】根冠关系; 水分亏缺; 复水; 水肥利用率; 补偿效应; 水稻;
【英文关键词】root and shoot relation; water deficit; rewatering; water and fertilizer utilization efficiency; compensation effect; rice;
【中文摘要】为明确水分亏缺复水补偿效应,通过盆栽试验研究了不同施氮水平和不同生育阶段水分控制下限对水稻生长特性的影响.结果表明:不同水氮条件下,水稻根冠干物质累积、根冠异速性生长关系、产量构成因子和水肥利用效率均随胁迫阶段的推进差异显著.分蘖末期水分胁迫复水后能够产生明显的补偿效应,该阶段高氮施肥水平(300kg/hm2)下,重度水分亏缺(40%土壤饱和体积含水率)复水后能够较少影响水稻生长,可以看做是合理的水稻调亏控制指标. 更多还原
【英文摘要】In order to determine the compensation effects of rewatering of the water deficit,pot experiments were carried out to study the influences of the lower limit of soil moisture of around rice with different nitrogen levels at different bearing periods on growing characteristics. The results show that,with different nitrogen levels,the dry matter production of roots and shoots,allometric growth between roots and shoots,rice yield,and water and fertilizer utilization efficiency exhibit significant differences with the water stress stage. Rewatering of the water deficit at the late tillering stage results in significant compensation effects. The rewatering of severe water deficit (saturated water content of 40%) has lesser influence on the rice growth at the late tillering stage with a high nitrogen fertilization level (300 kg/hm2),and it may be regarded as a reasonable control index for rice.

【题目】基于温度资料的参考作物蒸发蒸腾量计算方法
【中文关键词】参考作物蒸发蒸腾量; 温度法; BP人工神经网络预测模型; 湿润气候区;
【英文关键词】reference crop evaportranspiration; temperature-based method; BP artificial neural network model; humid area;
【中文摘要】针对利用FAO56-PM法计算参考作物蒸发蒸腾量ET0时气象资料需求往往不易满足的问题,研究了温度法及基于温度资料的BP人工神经网络预测模型.以FAO56-PM法ET0计算值为标准,比较分析了Hargreaves法、改进的Thornthwaite法、简化的FAO56-PM法以及Mc cloud法在我国湿润气候区的应用效果,评价了校正后的温度法以及基于温度资料的BP人工神经网络预测模型在该气候区的适用性.结果表明,在ET0较小时,Hargreaves法、改进的Thornthwaite法和简化的FAO56-PM法计算值较FAO56-PM法偏大,在ET0较大时较FAO56-PM法偏小;改进后的Thornthwaite法与FAO56-PM法最为接近,Mc cloud法与FAO56-PM法的计算结果差异最大;除Mc cloud法外,校正后的温度法检验合格率较高,具有较好的地区适用性;基于温度资料的BP人工神经网络预测模型具有较高的预测精度,结果好于校正后的Thornthwaite法和Mc cloud法,可应用于只有温度资料时湿润气候区ET0的预测. 更多还原
【英文摘要】FAO56 Penman-Monteith equation(FAO56-PM) is the standard method for estimating reference crop evapotranspiration(ET0).However,the meteorological data required by FAO56?PM method are not always available at a given

station.In consideration of the above fact,the temperature-based methods were analyzed and the temperature data-based BP artificial neural network model was established. According to the result of FAO56-PM,the performances of four temperature-based methods,i.e.the Hargreaves method,the improved Thornthwaite method,the simplified FAO56-PM method,and the Mc cloud method,used in humid areas in China were compared,and the suitability of the improved temperature-based methods and the BP artificial neural network model to humid areas was evaluated.The result shows that,for relatively low ET0,the calculated results ET0 of the Hargreaves method,the improved Thornthwaite method and the simplified FAO56-PM method are greater than that of the FAO56-PM method;however the calculated results ET0 of the FAO56-PM method is relative large for high ET0.Moreover,the calculated result of the improved Thornthwaite method is the closest to that of the FAO56-PM method,and the difference between the calculated results of the Mc cloud method and FAO56-PM method is the greatest;except for the Mc cloud method,the improved temperature-based methods are of high suitability to humid climate with low error.The temperature data-based BP artificial neural network model is of high precision of prediction,and the predicted result of the model is superior to those of the improved Thorthwaite method and the Mc cloud method.Therefore,it can be used for prediction of ET0 for humid areas only with temperature data

【题目】负载维生素D3 的海藻酸纳米粒抗佝偻病作用研究

【中文关键词】海藻酸纳米粒;维生素D3;药物载体;佝偻病

【英文关键词】Sodium alginate nanoparticles; Vitamin D3; Medicine carrier; Rickets

【中文摘要】摘要 目的:观察负载维生素D3 海藻酸纳米粒和维生素D3 的抗佝偻病作用。方法:36 只SD 大鼠随机分组为正常对照组、佝偻病模型组、负载VD3 的自组装海藻酸钠纳米粒(sSAN-VD3)低剂量组(1.70 mg · kg-1 · d-1 含VD315.0 μg)、sSAN-VD3 高剂量组(4.2mg · kg-1 · d-1 含VD337.5 μg)、VD3 低剂量组(15.0 μg · kg-1 · d-1)、VD3 高剂量组(37.5 μg · kg-1 · d-1)6 组,每组6只。正常对照组大鼠在通光条件下用正常饲料饲养,其余各组大鼠置于暗室中,并喂养缺乏维生素D3 的饲料,同时各预防给药组按剂量连续灌胃给药35 天。观察记录大鼠的体重变化,检测大鼠血清中25 羟基维生素D3(25-(OH) VD3)、血清骨碱性磷酸酶(Bone Alkaline Phosphatase,BAP)活性及股骨骨密度(Bone Mineral Density BMD)。结果佝偻病模型组大鼠喂养5 周后体重明显低于正常对照组,血清BAP活性明显增高,血清25-(OH) VD3 含量及股骨BMD 则显著降低(P<0.05);与佝偻病模型组大鼠比较,各预防给药组大鼠体重及股骨BMD 均有所增加,sSAN-VD3 高、低剂量组和VD3 高剂量组大鼠血清BAP活性降低,25-(OH) VD3 水平明显升高,与模型组差异显(P<0.05);与同剂量的VD3 低剂量组比较,sSAN-VD3 低剂量组大鼠的血清BAP、25-(OH) VD3 及股骨BMD 等三项指标均显示出更明显的抗佝偻病作用(P<0.05)。结论:负载维生素D3 海藻酸纳米粒和维生素D3 均具有良好的抗佝偻病作用,以前者作用较强。

【英文摘要】ABSTRACT Objective: To observe Vitamin D3 imbedded by sodium alginate nanoparticles and Vitamin D3 's prevention effect on rats rickets. Method: 36 rats were randomly divided into control group rickets、model group、sSAN-VD3 high dose group (4.2mg · kg-1 · d-1 included VD337.5 μg)、sSAN-VD3 low dose group (1.70 mg · kg-1 · d-1 included VD315.0 μg)、VD3 high dose group (37.5 μg · kg-1 · d-1)、VD3 low dose group (15.0 μg · kg-1 · d-1). Control group rats were bred with control diet and sunlight, but the other groups were bred with Vitamin D3 deficiency diet and the room kept from sunlight. The rats in prevented groups were administered by Vitamin D3 imbed by sodium alginate nanoparticles and Vitamin D3 by stomach perfusion with each dose. Body weight, 25- (OH) VD3, BAP in serum and thighbone's density of each groups were determined. Results: The weight, 25-(OH) VD3 of serum and thighbone's BMD of rats in normal group, sSAN-VD3 high and low dose groups and Vitamin D3 high dose group were significantly decreased but BAP of serum was elevated as compared with rickets model group($p<0.05$). The rats in sSAN-VD3 low dose group were prevented from rickets significantlyin the results of BAP、25- (OH) VD3 of serum and thighbone's BMD ($p<0.05$) as compared with VD3 low dose group in the same dose of VD3. Conclusions: Vitamin D3 imbedded by sodium alginate nanoparticles and Vitamin D3 were both effectively prevented the form ofrickets, but Vitamin D3 imbed by sodium alginate nanoparticles had better effect.

【题目】Effect of linoleic-acid modified carboxymethyl chitosan on bromelain immobilization onto self-assembled nanoparticles
【中文关键词】菠萝蛋白酶;固定化;纳米粒
【英文关键词】bromelain;immobilization; nanoparticles
【中文摘要】亚油酸(LA)改性羧甲基壳聚糖(CMCS)在超声条件下,可以制备出水凝胶型纳米粒子。菠萝蛋白酶可以加载到纳米粒上。对固定化酶的活性的影响因素,包括温度,储存等,进行了研究。结果表明,菠萝蛋白酶的热和存储的稳定性在

固定到纳米粒子后提高。固定化酶米氏常数小于游离酶,表明固定化可以促进酶同底物的亲和性。
【英文摘要】Hydrogel nanoparticles could be prepared by using linoleic acid (LA) modified carboxymethyl chitosan (CMCS) after sonication. Bromelain could be loaded onto nanoparticles of LA-CMCS. Factors affecting the activity of the immobilized enzyme, including temperature, storage etc., were investigated in this study. The results showed that the stability of bromelain for heat and storage was improved after immobilization on nanoparticles. The Michaelis constant (K m) of the immobilized enzyme was smaller than that of free enzyme, indicating that the immobilization could promote the stability of the enzyme and strengthen the affinity of the enzyme for the substrate.

【英文关键词】Soil ;organic carbon; Agro-Ecology
【中文摘要】土壤有机碳(SOC)是土壤退化过程中的一个重要指标。在这项研究中,长期田纳西州的中国黑土农田土壤有机碳的演变进行了数值模拟和预测的验证,分析,处理和assorting conceming数据,澄清,Century模型需要的参数的基础上,结合田间管理记录数据的最佳使用,观察数据翁长期的实验,气候,土壤,生物,海伦农业生态试验站,中国科学研究院和取得的成果。结果表明:在此之前的填海工程,土壤有机碳含量大约为-J58.00克公斤。早年,土壤有机碳含量迅速下降,然后缓慢下降填海后。土壤有机碳含量大约是34.00克kg'i之前建立了长期的实验Ø减少,每年平均增长率为8.91%。经过长期的实验,SOC将根据不同的耕作制度。按住Shift键养殖系统改变如下:20年的模型模拟,土壤有机碳含量从34.03下降到wiffi30.19克kg.i,每年平均增长率为5.97%O;厕所年的模型模拟,土壤有机碳含量下降到24.31克公斤我,每年平均增长率为3.36%O。有机农业系统改变如下:20年的模型模拟,土壤有机碳含量呈缓慢下降趋势从34.03至33.39克的kg'i,每年平均增长率为0.959oo,5o/oo小于转变农业系统; IOO年模型模拟,土壤有机碳含量下降到32.21克kg.i,每年平均增长率为0.55%O。“石油”农业系统的改变如下:20年的模型模拟,土壤有机碳含量从34.03下降到32.88克kg.i,每年平均增长率为1.72%O,更比有机农业系统的厕所年模型模拟,土壤有机碳含量下降到30.89克kg.i,每年平均增长率为0.96%O。结合“石油”有机农业系统改变如下:20年的模型模拟,土壤有机碳含量略有上升;厕所年的模型模拟,SOC含量从34.03上升到34.41克kg'i的,每年平均增长率为0.11%O。上述结果提供了一个最佳的方式,为维护中国黑土农田土壤有机碳,尽可能地在农业生态系统,增加土壤 有机质,如作物残茬,croplitter返回。农作物秸秆或秸秆,粪便,除了应用化学氮,磷,,增加systemproductivity和保持土壤有机碳含量。此外,结果提供了一种有价值的方法为研究ofC02封存容量和目标生育率在中国黑土测定。关键词:Century模型,中国黑土农田土壤有机碳,各种养殖系统,预测。

【英文摘要】Soil organic carbon (SOC) is an important indicator of soil degradation process. In this study, the long-tenn SOC evolution in Chinese mollisol farmland was simulated and predicted by validating, analyzing, processing and assorting conceming data, based on clarifying parameters of Century model need, combined with best use of recorded data of field management, observed data of Iong-term experiments, climate, soil, and biology, and achieved results from Hailun Agro-Ecological Experimental Station, Chinese Academy of Sciences. The results were showed as follows: Before reclamation, SOC content was around 58.00 g kg-J. SOC content dropped quickly in early years, and then decreased slowly after reclamation. SOC content was around 34.00 g kg'i with a yearly average rate of 8.91%o decrease before long-term experiments was established. After a long-term experiment, SOC would change under different farming systems. Shift farming system changed as follows: By 20-year model simulation, SOC content decreased from 34.03 to 30.19 g kg.i, wiffi a yearly average rate of 5.97%o; by lOO-year model simulation, SOC content decreased to 24.31 g kg.i, with a yearly average rate of 3.36%o. Organic farming system changed as follows: By 20-year model simulation, SOC content decreased slowly from 34.03 to 33.39 g kg'i, with a yearly average rate of 0.959oo, 5o/oo less than that of shift farming system; by IOO-year model simulation, SOC content decreased to 32.21 g kg.i, with a yearly average rate of 0.55%o. "Petroleum" farming system changed as follows: By 20-year model simulation, SOC content decreased from 34.03 to 32.88 g kg.i, with a yearly average rate of 1.72%o, much more than that of organic farming system; by lOO-year model simulation, SOC content decreased to 30.89 g kg.i, with a yearly average rate of 0.96%o. Combined "petroleum"-organic farming system changed as follows: By 20-year model simulation, SOC content was increased slightly; by lOO-year model simulation, SOC content increased from 34.03 to 34.41g kg'i, with a yearly average rate of 0.11%o. The above results provided an optimal way for maintaining SOC in Chinese mollisol farmland: To increase, as much as possible within agro-ecosystem, soil organic matter returns such as crop stubble, croplitter. crop straw or stalk, and manure, besides applying chemical nitrogen and phosphorous, which increased systemproductivity and maintained SOC content as well. Also, the results provided a valuable methodology both for a study ofC02 sequestration capacity and for a target fertility determination in Chinese mollisol. Key words: Century model, Chinese mollisol farmland, soil organic carbon, various farming systems, prediction.

【题目】RT_PCR鉴别小反刍兽疫病毒疫苗株与强毒株方法的建立
【中文关键词】RT-PCR; 鉴别;小反刍兽疫病毒
【英文关键词】无
【中文摘要】根据GenBank中公布的小反刍兽疫病毒的H基因或全基因序列,利用软件Primer Premier 5. 0 设计引物,扩增片段长度为477 bp,建立区分小反刍兽疫疫苗毒与基因4系野毒的RT-PCR检测方法,并用于临床检测。结果表明,建立的RT-PCR鉴别诊断方法能特异性区分疫苗株Nigeria 75/1与基因4系PPRV,与基因3系、牛瘟病毒、犬瘟热病毒等同属病毒无交叉反应;最低可以检测到浓度为7.7×10-5ng/ uL 的RNA模板;该方法操作简单,耗时短,可以初步用于临床鉴别诊断。

【题目】非洲猪瘟病毒K205R蛋白基因原核表达的研究
【中文关键词】非洲猪瘟病毒;K205R蛋白;原核表达

【英文关键词】African swine fever virus;K205R protein;Prokaryotic expression
【中文摘要】本研究合成非洲猪瘟的K205R基因,将K205R基因克隆至pET-30c(+)质粒,构建重组原核表达质粒pET30C-K205R。该重组质粒的阅读框架正确,表达的融合蛋白的N 端和C 端均带6×组氨酸。pET30C-K205R-BL21菌株经培养和诱导表达后,可生产K205R可溶性蛋白,K205R可溶性蛋白可用Ni柱纯化。纯化表达K205R蛋白的ELISA试验证明,表达的K205R蛋白与猪阳性非洲猪瘟血清具有较好的特异性反应。
【英文摘要】K205R gene of AFSV was synthesized and cloned to the plasmid pET30C to construct the recombinant prokaryotic expressed plasmid pET30C-K205R with correct reading frame and with 6×histamine both on N and C terminals of the expressed fusion protein. The recombinant plasmid pET30C-K205R was then transformed into E.coli DH5α and then into BL21 and the pET30C-K205R-BL21 strain was obtained and expressed by induction with IPTG,resulting in soluable protein K205R. ELISA with the purified K205R protein showed that the expressed K205R protein demonstrated very good specific reaction with positive ASFV serum.

【题目】MS-222和丁香酚对中华鲟幼鱼耗氧率与排氨率的影响
【中文关键词】中华鲟;麻醉;麻醉剂浓度;温度;代谢
【英文关键词】Chinese sturgeon;immobilization;anesthetic concentration;temperature;metabolize
【中文摘要】研究了麻醉剂MS-222和丁香酚对中华鲟(Acipenser sinensis Gray)幼鱼呼吸与排泄的影响。结果表明,2种麻醉剂对中华鲟幼鱼的耗氧率和排氨率都有显著影响(P<0.05)。随着麻醉剂浓度的升高,中华鲟幼鱼的耗氧率和排氨率均先升高后降低。MS-222质量浓度为16 mg/L或丁香酚质量浓度为12 mg/L时均可以显著降低中华鲟幼鱼的耗氧量和氨氮的排放;随着2种麻醉剂浓度的进一步升高,耗氧率和氨氮的排放没有显著的降低。在2种麻醉剂的作用下,中华鲟幼鱼的耗氧率和排氨率随温度升高而增大,其回归关系可用指数函数表示,相关系数R2均大于0.9。方差分析表明,不同实验组4个温度梯度间的耗氧率和排氨率都有极显著差异(P<0.01)。在10-25 ℃的温度范围内,中华鲟幼鱼的O :N比值范围为12.37-23.21,表明在适宜的温度范围内,中华鲟幼鱼的代谢产物以蛋白质为主,脂肪和碳水化合物次之。结论认为,MS-222质量浓度为16 mg/L或丁香酚质量浓度为12 mg/L时可以使中华鲟幼鱼进入麻醉Ⅱ期,满足活鱼运输的要求,可以推荐为中华鲟幼鱼运输时的麻醉剂量,且运输时应以低温为宜。
【英文摘要】Abstract:MS-222 and clove oil are widely used for fish immobilization. Effects of MS-222 and clove oil on oxygenconsumption rate and ammonia excretion rate of juvenile Chinese sturgeon Acipenser sinensis were investigated in this paper. Experimental results showed that both MS-222 and clove oil significantly affected oxygen consumption rateand ammonia excretion rate of juvenile Chinese sturgeon(P<0.05). With increase of anesthetic concentration,oxygenconsumption rate and ammonia excretion rate firstly went up,and then went down. When concentrations of MS-222and clove oil reached 16 mg/L and 12 mg/L,respectively,oxygen consumption rate and ammonia excretion rate began to decrease significantly. If anesthetic concentration continued to increase,oxygen consumption rate and ammoniaexcretion rate did not significantly increase any more. Under treatment of MS-222 and clove oil,oxygen consumption rate and ammonia excretion rate increased with the increase of water temperature. Regression could be described by using exponential function with R2>0.9. Using variance analysis,it was showed that the oxygen consumption rate and ammonia excretion rate were extremely differrent(P<0.01) among four water temperiature treatment groups. Withinwater temperature range of 10 ℃ and 25 ℃,O :N rates of juvenile Chinese sturgeon were from 12.37 to 23.21. It might be infered that under appropriate water temperatures,metabolites of juvenile Chinese sturgeon were more of protein,and less of fat or saccharide. In conclusion,recommended concentrations of MS-222 and clove oil for immobilizationof juvenile Chinese sturgeon were 16 mg/L and 12 mg/L,respectively. Appropriate lower water temperature condition would be better when fish were immobilized for long distance transportation

【题目】非洲猪瘟病毒环介导等温扩增诊断方法的建立
【中文关键词】非洲猪瘟病毒;环介导等温扩增反应;诊断
【英文关键词】African swine fever virus;LAMP;diagnosis
【中文摘要】通过对GenBank中登录的非洲猪瘟病毒(ASFV)p72蛋白基因序列进行分析,根据p72保守区序列设计合成了内(FIP,BIP)、外(F3,B3)2对引物,其中外引物扩增片段的大小为184bp。通过对反应条件进行优化,建立了非洲猪瘟LAMP检测方法。结果显示,该方法在62℃保温60min即可完成,最低可检测到1×101 copies/μL的病毒DNA,与常规PCR方法相比灵敏度高100倍。对ASFV、猪圆环病毒2型、猪细小病毒、猪伪狂犬病病毒基因组DNA同时检测,结果仅有ASFV出现条带,而其他均未出现目的条带。表明,建立的ASFV-LAMP诊断方法具有较好的特异性和敏感性。
【英文摘要】According to p72 gene sequence of African swine fever virus(ASFV)in GenBank,two pairs of primers(external primers F3 and B3,and internal primers FIP and BIP)w ere designed and synthesized.The amplified fragment was 184 bp in size using th e external primers.After optimization of the reaction system,a loop-mediated is othermal amplification(LAMP)method for specific detection of ASFV was establish ed.It was carried out at 62 ℃ for 60 min,and its sensitivity was 1×101 copies/ μ L DNA,which was 100 times more than the traditional PCR method.The de tection of porcine circovirus-2,pseudorabies virus,porcine parvovirus by the de veloped LAMP was negative.These results showed that the developed assay was high ly specific and sensitive for the detection of ASFV.

【题目】中国小反刍兽疫病毒分离株China_Tib_07全基因组序列测定与分析
【中文关键词】小反刍兽疫病毒;麻疹病毒属;编码区;全基因组;核酸序列
【英文关键词】Peste des petits ruminants virus;morbillivirus;coding region;complete genome;nucleotide sequence
【中文摘要】小反刍兽疫病毒属于副黏病毒科麻疹病毒属成员。本研究对我国首次分离的小反刍兽疫病毒株China/Tibet/07进行了全基因组序列测定及分子生物学特征分析。根据GenBank公布的小反刍兽疫病毒基因组序列设计引物通过RT-PCR扩增病毒基因组内部序列,通过3′和5′-RACE获得病毒基因组末端序列。序列测定与分析的结果表明,China/Tib/07株全长15948bp,预测编码6种结构蛋白和2种非结构蛋白,与已发表小反刍兽疫病毒基因组的长度和结构相似;在系统进化上与西南亚流行毒株有很高的同源性(91.6%~98.1%);与麻疹病毒属的其它成员相比,与牛瘟病毒的同源性最高(64.3%)。
【英文摘要】Peste des petits ruminants virus is a member of Morbillivirus Paramyxoviridae.The complete genome of a Peste des petits ruminants virus(PPRV)isolate,China/Tib/07 was sequenced and molecular characteristics was analyzed.The internal sequences of the virus genome were amplified by RT-PCR with primers designed according to the published data in GenBank,while the sequences of the 3’ and 5’ ends of the genome were determined by RACE.Amplification products were directly sequenced,assembled and analyzed with DNAStar4.0.Results showed that China/Tib/07 genome consisted of 15 948 nucleotides in length,encoding six structural proteins and two non-structural proteins just like other known PPRV genomes.Phylogenetically,the virus genome shared homology of 91.6%~98.1% with Southwest Asian isolates among PPRV strains and the highest homology of 64.3% with rinderpest virus among morbillivirus members.

【题目】Development of chemiluminescence enzyme-linked immunosorbent assay for the screening of metolcarb and carbaryl in orange juice, cabbage and cucumber
【中文关键词】筛选; ELISA;农药残留物;果汁; 蔬菜
【英文关键词】screening; ELISA; pesticide residues; fruit juices; vegetables
【中文摘要】本文建立了一种直接竞争酶联免疫法和的增强的化学发光检测法同时检测农产品中的速灭威和胺甲萘。包被抗体和酶示踪的浓缩以及PH值与甲醇浓度的影响也进行了研究。在最佳条件下,速灭威和胺甲萘的IC50值分别是4mg/kg,0.3mg/kg.果汁和蔬菜中速灭威和胺甲萘的检测可以通过简便快速有效的萃取方法。加标样品的回收率,速灭威是75%-108%,胺甲萘的是74%-98%。与HPLC的实验结果相比较,增强的化学发光免疫吸附法被证实是有效地。用ELISA和增强的化学发光免疫吸附法检测所得数据之间的相关性好(n¼9)。因此,增强的化学发光免疫吸附法适用于同时检测农产品中的速灭威和胺甲萘。
【英文摘要】A direct competitive enzyme-linked immunosorbent assay (ELISA) with enhanced chemiluminescent detection for simultaneous detection of metolcarb and carbaryl in agricultural products is reported. The concentrations of coating antibodies and enzyme tracer, as well as the effects of pH and methanol concentrations, were investigated. Under optimum conditions, the IC50 of metolcarb and carbaryl were 4 and 0.3 mgkg 1, respectively.Detection of metolcarb and carbaryl in fruit juices and vegetables was accomplished using simple, rapid andefficient extraction methods. Recoveries (n¼3) of spiked samples ranged 75 – 108% for metolcarb and 74 – 98% for carbaryl. Validation of the enhanced chemiluminescent immunosorbent assay was conducted by comparison of results with HPLC. The correlation between the data obtained using ELISA with enhanced chemiluminescent detection and HPLC was good (n¼9). Therefore, the enhanced chemiluminescent ELISA was suitable for quantitative simultaneously determination of metolcarb and carbaryl residue in agricultural products.

【题目】长江口纹缟虾虎鱼的繁殖生物学特征
【中文关键词】纹缟虾虎鱼; 形态学; 产卵期; 繁殖习性; 受精卵; 胚胎发育
【英文关键词】Trid entig er trigonocephalus; morphological traits; r eproductive biology; spawn; oosperm; embryonic development
【中文摘要】研究了长江口水域纹缟虾虎鱼的繁殖生物学。结果如下: (1) 纹缟虾虎鱼雌雄亲鱼间形态学特征具有差异, 肥满度分别为31 47? 01 36 与21 17? 01 52, 体长/ 体高、体长/ 头长、头长/ 眼径、头长/ 眼间距等比值存在极显著差异; (2) 纹缟虾虎鱼产卵期为3~ 7 月份, 盛产期为4~ 6 月份。绝对生殖力平均为12 6891 2 粒, 体长相对生殖力平均为2061 9 粒/ mm; (3) 纹缟虾虎鱼成熟的卵为球形, 卵径01 482~ 01 606 mm, 卵中油球数量10~ 200 个, 精子较小, 由圆形头部和细长尾部(鞭毛) 两个部分组成; (4) 纹缟虾虎鱼产卵受精一般在洞穴内进行, 而且雄鱼具有护卵习性; (5) 纹缟虾虎鱼受精卵呈梨形或者梭形, 卵膜端具有由粘丝组成的附着盘, 动物极靠近附着盘。纹缟虾虎鱼人工催产与自然繁殖时的受精率分别为781 58%与831 84%。在17~ 25e 范围内, 纹缟虾虎鱼胚胎均能孵出仔鱼,随着水温上升发育速度加快, 温度与孵化时间呈正相关关系, 有效积温为3 1281 3 h # e 。长江口水域生态环境变动可能对纹缟虾虎鱼繁殖及其资源量产生一定影响。
【英文摘要】Char acteristics of r eproductive biology of Tr identiger trigonocephalus at the Yangtze estuary were studied. T he results show as follows: (1) Morphological traits between male and female T. tr igono2 cep ha lus are different. Relative fatnesses of male and female T . tr igonocephalus are 31 47 ? 01 36 and 21 17 01 52, respectively. The ratio value of body length and body height, body length and head length, head length and eye diameter, head length and eye distance have significantly different between male and female.(2)T . trigonocephalus spawns in the summer from March to July, and main from April to June. T he individual absolute fecundity is 12 6891 2 eggs and body length relative fecundity is 2061 9 eggs/ mm. (3) The egg is circular and its diameter ranges from 01 482 to 01 606 mm. T he sperm consists of r ound head with 01 98 01 12 Lm of the long diameter and 71 28 ? 11 06 Lm flagellum. (4) T . tr igonocep ha lus spawns in bur2r ows and the nest will be protected by male fish. (5) The shape of fertilized eggs looks like a pear or a shut2tle and there is an adhesive filament disc on the external egg2membrane of the animal pole. Fertilization rate under artificial and natural condition are 781 58% and 831 84% , respectively. Normally, embryo can de2 velop under the temperature condition from 17 to 25 e and hatch time depending on water temperature. In theory the sum of effective temperature of embr yonic development is 3 1281 3 h # e . Reproductive biology and abundance of T . tr igonocep ha lus may be affected by environment change of the Yangtze River estuary.

【题目】长江口纹缟虾虎鱼胚胎发育及早期仔鱼生长与盐度的关系
【中文关键词】纹缟虾虎鱼; 早期发育; 生态因子; 生存活力指数
【英文关键词】T ridentiger trigonocephalus; Early life stages; Ecolog ical factor; Survival activity index
【中文摘要】研究了长江口纹缟虾虎鱼(Tridentiger trigonocephalus)胚胎发育及早期仔鱼生长与盐度的相关性。纹缟虾虎鱼胚胎发育时,盐度4与6试验组效果较好,受精率分别达(76.28±2.73)%与(74.63±5.49)%,孵化率分别达(66.95±2.99)%与(62.15±2.18)%,出膜时间分别为(228.8±5.9)h与(221.5±5.2)h,器官发育特征较明显,畸形率较低。纹缟虾虎鱼仔鱼发育时,初孵仔鱼全长(2.534±0.078)mm,卵黄囊长径(0.421±0.047)mm,短径(0.369±0.038)mm,5日龄时卵黄囊基本消失,初步形成消化器官、循环器官和运动器官等。盐度8与10水体孵育的仔鱼畸形率达5%-20%,其他试验组略低。盐度4与6试验组仔鱼的器官发育速度快于其他3个试验组。盐度0-6试验组纹缟虾虎鱼仔鱼生存活力指数(SAI)为41.83-46.83,仔鱼活力较好,而盐度8-

10试验组SAI值为23.43-29.13,活力较差。综合各项指标表明,在盐度0-10范围内,长江口纹缟虾虎鱼胚胎发育的适宜盐度为4-6,早期仔鱼生长的适宜盐度为2-4。

【英文摘要】Tridentiger trigonocephalus w idely ex ists in coast o f the Pac ificOcean1There are very few reports about the character of their early life1F ish was sens itive to the change of env ironm ental factors in the early life1So embryo and larva can indicate the environm ental change1Salin ity is one of themost mi portant eco log icalfactors in the embryon ic and pre- larval development ofT1trigonocephalus1The construction of the ThreeGorges P ro ject on them ainstream m ay act on the environment not only in the reservo ir, them iddle and low reaches of the river, but also in the estuary1It is necessary to study the relationship between salin ity and fish early life1By observing the morpho log ical character of embryonic and pre- larval development ofT 1trigonocephalus w ith N ikon m icroscope, the total developm ent tmi e o f every deve lopment stage w as noted and calculated1T he characteristic mi ages were taken byN ikon cam era1The characters of early life stages and effects of salinityon the early developm ent ofT1trigonocephalus were studied1The expermi entation groups included salinities of 0, 2, 4,6, 8 and 10, respectively1Every group was put into 100 oosperm or 10 pre-larva under the water of temperature (18.0 ?015e) , deliquescent oxygen 616) 812 m g /L, pH 712) 7181The results showed fecundation rate and hatching rate w erethe highest at salinities of4 and 61F ecundat ion rate was (76128 ? 2173)% and (74163 ? 5149)%, and hatching ratew as(66195 ? 2199)% and (62115 ? 2118)%, respectively1Hatch ing tmi e w as the shortest and em bryon ic developm entw as them ost quickly at salinit ies of 4 and 61H atching tmi e was 22818 ? 519h and 22115 ? 512h, respectively1 It spent longertmi e from heart beat ing stage to hatch ing stage, 56 percent of the total tmi e1M eanwhile, pectoral fin, sw mi -bladder, k idney and bladder cam e into being before pre-stage of hatching stage1The deform ity rateswere from 5% to 20% at salin ities of8and 10 and the other salinities were low er1The larva w as (21534 ? 01078)mm in body leng th1T he long and short diameter of yo lk sac w ere (01421 ? 01047)mm and (01369 ? 01038)mm, respectively1The yo lk sac disappeared and organs beg in to form after five days1The organ developm ent o f larvalT 1trigonocephalus wasmore quickly at salinities of4 and 6 than theothers1The range of survival activ ity index w as from 41183 to 46183 and pre-larva vigor was high w ith water salinity from 0 to 61The range of survival activity index was from 23143 to 29113 and pre-larva v igor was low at salinity of8 and 101At low salinity range, the suitab le sa linity for hatching was from salinity 4 to 6 and for pre- larvae survival and grow th was from salinity of 2 to 4, respectively1

【题目】长江口中华鲟幼鱼趋光行为及其对摄食的影响

【中文关键词】中华鲟; 趋光行为; 栖息地; 光照强度; 摄食

【英文关键词】Acipenser sinensis; pho to tactic behav iour; habita;t illum ina tion intensity; feed ing

【中文摘要】研究了长江口中华鲟幼鱼对光照强度的选择及其对摄食的影响, 结果表明: 个体实验时,中华鲟幼鱼选择暗区(1~-2 lx)、过渡区(10- 12 lx)和亮区(200- 209 lx)的时间百分比分别是(1.32%±3.50%) 、(7.17%±13.5%)和(91.52% ± 14.9%) ; 群体实验时, 中华鲟幼鱼选择暗区、过渡区和亮区的数量百分比分别为(6.42% ± 4.13%)、(14. 20%±7.45%) 和(82. 38% ±15. 2%) , 个体实验的时间百分比和群体实验的数量百分比在3个不同亮度区内均存在显著差异(P < 0. 05) , 中华鲟幼鱼具有明显的趋光行为。幼鱼在亮区围绕光源作圆周运动, 其行为模式符合鱼类趋光的 信号适应 机制假说。中华鲟幼鱼猎食活体子陵吻虾虎鱼的摄食量(F c)、摄食强度(F i)、摄食率(F r) , 在光照(206 lx)条件下, 分别为(9. 67±2. 08)(尾/10尾・4 h)、(0. 97±0. 21) (尾/尾・ 4 h)、(0. 24 ±0. 05) (尾/尾・h) ; 黑暗条件下(0 lx) , 分别为(10. 67 ± 2. 31) (尾/10尾・ 4 h)、(1. 07 ±0. 23) (尾/尾・ 4 h)、(0. 27 ± 0. 06)(尾/尾・ h)。处理间(光照和黑暗之间), 3项指标均无显著差异(P > 0. 05)。这一结果表明,中华鲟幼鱼的猎食效率与光照强度无关, 即幼鱼不依靠视觉捕食, 属非视觉摄食类型鱼类, 因此, 认为中华鲟幼鱼趋光行为中, 光线的信号意义大于利用视觉捕食的意义, 幼鱼以光线作为信号来寻找食物丰富的栖息地。

【题目】A Novel Hydrolytic Dehalogenase for the Chlorinated Aromatic Compound Chlorothalonil
【中文关键词】百菌清,水解脱卤酶
【英文关键词】Chlorothalonil,Hydrolytic Dehalogenase
【中文摘要】脱卤酶在卤代芳烃类化合物的脱毒中起关键作用,有趣的是到目前为止只有一个卤代芳烃的水解脱卤酶的报道,为4-氯苯甲酰胺辅酶A脱卤酶。在苯文中,我们从百菌清降解菌株Pseudomonas sp. CTN-3中鉴定到另外一个全新的百菌清水解脱氯酶Chd。通过反向色谱、串联质谱和核磁共振技术首次用确切的证据证明百菌清水解脱氯酶Chd能将百菌清的4-位氯原子被脱氯生成4-羟基百菌清。Chd能在好氧和厌氧下对百菌清进行脱氯,而且不需要CoA和ATP的参与。Chd包含一个metallo-β-lactamase超家族的保守区域,和金属水解酶的最高同源性只有24-29%。Chd是一个单聚体(36kDa)、等电点为4.13。Chd对百菌清Km为0.112 mM,kcat值为 207 s-1。Chd能被1,10-邻菲二罗啉、diethyl pyrocarbonate和N-bromosuccinic acid完全抑制。点突变结果显示His128和157、Asp45、130和184、Trp241为Chd的催化功能所必需。Chd在氨基酸序列同源性和催化机制方面不同于以前报道的所有水解脱卤酶,该水解脱氯酶Chd是国际上第一个报道的不依赖于CoA和ATP的氯代芳香族化合物的水解脱氯酶。该研究为卤代芳烃化合物的水解脱卤的催化机制研究提供了一个非常好的材料。
【英文摘要】Dehalogenases play key roles in the detoxification of halogenated aromatics. Interestingly, only one hydrolytic dehalogenase for halogenated aromatics, 4-chlorobenzoyl – coenzyme A (CoA) dehalogenase, has been reported. Here, we characterize another novel hydrolytic dehalogenase for a halogenated aromatic compound from the 2,4,5,6-tetrachloroisophthalonitrile (chlorothalonil)-degrading strain of Pseudomonas sp. CTN-3, which we have named Chd. Chd catalyzes a hydroxyl substitution at the 4-chlorine atom of chlorothalonil. The metabolite of the Chd dehalogenation, 4-hydroxy-trichloroisophthalonitrile, was identified by reverse-phase high-performance liquid chromatography (HPLC), tandem mass spectrometry (MS/MS), and nuclear magnetic resonance (NMR). Chd dehalogenates chlorothalonil under anaerobic and aerobic conditions and does not require the presence of cofactors such as CoA and ATP. Chd contains a putative conserved domain of the metallo- -lactamase superfamily and shows the highest identity with several metallohydrolases (24 to 29%). Chd is a monomer (36 kDa), and the isoelectric point (pI) of Chd is estimated to be 4.13. Chd has a dissociation constant (Km) of 0.112 mM and an overall catalytic rate(kcat) of 207 s 1 for chlorothalonil. Chd is completely inhibited by 1,10-phenanthroline, diethyl pyrocarbonate,and N-bromosuccinic acid. Site-directed mutagenesis of Chd revealed that histidines 128 and 157, serine 126, aspartates 45, 130 and 184, and tryptophan 241 were essential for the dehalogenase activity. Chd differs from other reported hydrolytic dehalogenases based on the analysis of amino acid sequences and catalytic mechanisms. This study provides an excellent dehalogenase candidate for mechanistic study of hydrolytic dehalogenation of halogenated aromatic compound.

【题目】Random transposon vectors pUTTns for the markerless integration of exogenous genes into gram-negative eubacteria chromosomes
【中文关键词】革兰氏阴性,多拷贝整合,随机整合载体
【英文关键词】Gram-negative, Multiple integration,Random transposon vector,sacB,Markerless integration
【中文摘要】开发了一套随机整合载体可以实现在革兰氏阴性细菌染色体上无标记随机整合外源基因。
【英文摘要】A set of random transposon vectors pUTTns that facilitates the markerless integration of new functions into the chromosome of gram-negative bacteria has been developed. The vectors, which are derived from mini-Tn5 transposons, are located on a R6K-based suicide delivery plasmid that provides the IS50R transposase tnp gene in cis, but they are external to the mobile element. The vectors' conjugal transfer to recipients is mediated by RP4 mobilization functions in the donor. Internal to the mini-Tn5 element is a cassette that contains a selectable antibiotic resistance marker (kanamycin, chloramphenicol, or tetracycline resistance gene), a counter-selectable marker (sacB), a 430-bp repeat of the sacB gene 3 ′ end acted as the directly-repeated (DR) sequence, and modified multiple cloning sites (MCS). After two total rounds of transposon integration and recombination between the two DRs, only the exogenous DNA inserted into theMCS (passenger genes) and a single 430-bp scarsacBDR fragment remained in the chromosome after excision. The utility of these vectors was demonstrated by integrating the organophosphorus insecticide hydrolase gene (mpd) into the chromosome of Escherichia, Pseudomonas, Sphingomonas, andParacoccus species. Sequential integration of another organophosphorus insecticide hydrolase gene (oph) into the previously engineered bacteria, without bringing any selectablemarkers,was also successful. These engineered bacteria were relatively stable. Cell viability and original degrading characteristics were not affected comparedwith the original recipients. This shows that the developed systemis very useful for the markerless integration of exogenous genes into the chromosome of gram-negative eubacteria.

【题目】马铃薯生长后期叶片对产量的影响
【中文关键词】马铃薯; 叶片; 去叶; 产量
【英文关键词】Potato; Leaves; Defoliation; Yield
【中文摘要】[目的]研究马铃薯生长后期叶片对产量的影响。[方法]通过不同时期去叶处理方法,对马铃薯生长后期叶片对马铃薯结薯数、大薯率及产量的影响进行了探讨。[结果]马铃薯终花期后叶片对结薯数影响不大,而对大薯率和最终的产量影响较大。[结论]马铃薯终花期前马铃薯植株结薯数量已经确定,而大薯数及最终产量的形成与后期叶片仍有一定的关系。在生产上应综合利用各种措施,调控植株后期叶片生长, 延长叶片的功能期,为马铃薯丰产奠定基础。
【英文摘要】[Objective] The aim was to survey the effects of leaves on the yield of potato in late growing period. [Method] The tuber number, large tuber number and the yield of potato in late growing period were discussed. [Result] The effect of leaves on the tuber numberw as not significan, while that on the large tuber number and yield of potato in late growing period were significan. [Conclusion] The tuber number of potato had been confirmed before the late flowering, and the large tuber number and the yield of potato were related to leaves. In practical production, applying various measures to regulate the growth of leaves could prolong the functional period of leaves, which would provide basis for the high yield of potato.

【题目】体外转录法制备西尼罗河热病毒RNA片段
【中文关键词】西尼罗河热病毒;T7 启动子;体外转录
【英文关键词】West Nile virus ;T7 promoter;transcription in vitro
【中文摘要】目的 通过体外转录获得西尼罗河热病毒保守区基因的RNA 片段,为核酸快速检测方法的建立和改进提供阳性定量标准品。方法 设计西尼罗河热病毒基因保守区克隆引物,PCR 从合成的基因DNA 获得相应片段,连接至质粒PGEM-T-easy 上并筛选阳性重组质粒,测序鉴定后酶切线性化,用T7 RNA 聚合酶进行体外转录,得到固定长度的RNA 片段,DNase 酶处理后测定浓度,梯度稀释后用RT-PCR 验证。结果 获得含西尼罗河热病毒靶基因序列的准确定量拷贝数的RNA 片段,质量浓度分别为352.6 ng/μL,RT-PCR 验证均扩增出相应目的条带。结论 获得的RNA 片段可作为西尼罗河热病毒核酸快速检测方法的阳性定量标准品。
【英文摘要】Objective To prepare the positive standard substance containing the specifi c gene of West Nile virus (WNV) by in vitro transcription for the development and further improvement of the nucleic acid detection method of WNV. Methods Primers targeting the conservative segment of WNV were designed. The target gene was amplifi ed by PCR and connected into the pGEM-T-easy vector. The plasmids were sequenced and the correct positive plasmid was selected then cutted into lined plasmid by restriction enzyme used as in vitro transcription template. After transcribed by T7 RNA polymerase and treated by DNase I,the fi xed length RNA was generated. The concentration of RNA was assayed. The RNA was diluted and verifi ed by RT-PCR. Results The RNA fragment containing WNV gene was obtained. The detection limit of RT-PCR was 5.0×102copies/μL. Conclusion The RNA transcribed in vitro could be used as positive control in the detection of West Nile virus.

【题目】我国西藏小反刍兽疫病毒China/ Tib/ Gej/ 07-30 核衣壳蛋白基因和基因组启动子区的分子特征分析
【中文关键词】小反刍兽疫病毒;核衣壳蛋白;基因组启动子区;核苷酸序列
【英文关键词】Peste des petits ruminants virus;Nucleocapsid protein;Genome promoter region;Nucleotide sequence
【中文摘要】首次对我国西藏小反刍兽疫病毒China/Tib/Gej/07-30的核衣壳蛋白(N)基因和基因组启动子(GP)区进行序列测定和分子生物学特征分析。首先应用逆转录聚合酶链式反应从发病山羊病料中扩增出小反刍兽疫病毒N基因片段,用cDNA3′末端快速扩增方法获得基因组启动子区片段,对聚合酶链式反应产物进行直接测序,然后对测定的核苷酸和推测的氨基酸序列进行比较分析,绘制系统发生树。我国西藏小反刍兽疫病毒China/Tib/Gej/07-30的N基因由1689个核苷酸组成,编码525个氨基酸,与India/Jhansi/03等6个已知N基因全序列的PPRV毒株核苷酸和氨基酸序列同源性分别为91.7~97.6和94.9~98.5。小反刍兽疫病毒China/Tib/Gej/07-30N蛋白与磷蛋白作用的结构序列之一为495LFRLQAM501保守序列,N蛋白281-289位氨基酸含有一个T细胞表位,为281YPALGLHEF289保守序列。小反刍兽疫病毒China/Tib/Gej/07-30的GP区由107个核苷酸组成,与Tur-key2000等5株其他PPRV毒株同源性为91.8~98.2。N基因核苷酸序列和相应的氨基酸序列系统进化分析表明小反刍兽疫病毒China/Tib/Gej/07-30与亚洲国家分离株关系最近。
【英文摘要】The N gene and genome promoter nucleotide sequence of a Chinese Peste des petits rumiants virus(PPRV)("China/Tib/Gej/07-30") was firstly determined.The length of N gene was 1689 nucleotides with a single open reading frame(ORF).The nucleotide and deduced amino acid sequence was compared with the homologous region of other PPRV isolates.The nucleotide sequence of the "China/Tib/Gej/07-30" was 91.7%-97.6% identical to other PPRV isolates,while a homology of 94.9%-98.5% could be observed at the amino acids level.The N gene encoded a protein of 525 amino acids.Several sequence motifs were identified on the basis of conservation in the PPRVs and the morbilliviruses.The genome length of promoter region was 107 nucleotides with 91.8%-98.2% identity to other PPRV isolates.Phylogenetic analysis showed that the "China/Tib/Gej/07-30" belonged to the Asian lineage.

【题目】小反刍兽疫H蛋白主要抗原表位的原核表达
【中文关键词】小反刍兽疫;H基因;表达;抗原位点
【英文关键词】peste des petits ruminants (PPRV);H gene;express;antigen epitope
【中文摘要】目的表达小反刍兽疫病毒H蛋白的主要抗原位点用于检测与预防。方法用DNAStar分析小反刍兽疫病毒H基因的主要抗原位点,采用逆转录聚合酶链式反应(RT-PCR)技术,从病羊组织中扩增PPRV的H基因的主要抗原位点并克隆到原核表达载体PET-28b中,最后用PCR、酶切和测序分析对重组质粒进行鉴定;将重组质粒转化到大肠杆菌Rosetta中,经不同浓度的IPTG诱导表达PPRVH基因的主要抗原位点;用SDS-PAGE和Western-blotting分析所有蛋白的表达。结果将RT-PCR产物电泳,得到与预期大小相符的特异性片段;对重组质粒PET-28b-H66-249和PET-28b-H281-550酶切后,均出现预期相符的片段;DNA测序表明插入片段的序列与小反刍兽疫H蛋白基因完全一致,其大小分别为569bp和831bp;将重组表达的蛋白经SDS-PAGE和Western-blotting检测,证明所有的蛋白均得到表达。结论成功表达了PPRVH基因的主要抗原蛋白,为日后的检测与预防工作奠定了基础。
【英文摘要】Objective: Peste des petits ruminants virus (PPRV) H protein antigen epitopes were expressed for the disease detection and prevention. Methods: Peste des petits ruminants H gene antigen epitoes were analysised by DNAStar and were amplified by reverse transcription-polymerase chain reaction (RT-PCR) technology from disease goat tissue and were inserted into the prokaryotic expression vector PET-28a, finally, the recombinant plasmid were analysised by PCR 、 endozyme digestion and sequencing; The recombinant plasmid were transformed into E.coli.Rosetta and were induced to express with different concentration of ITPG and analysised H protein expression in E.coli.Rosetta as by SDS-PAGE and Western-blotting. Results: electrophoresis of the RT—PCR

product and acquired specific fragment; By restriction enzyme digestion, the recombinant plasmids were digested into the fragments in line with expectations; The DNA sequence of the 569bp, 831bp fragments were identical with H gene in Genebank. Conclusion: The success of expression the PPRV H gene antigen epitope provided foundation for detection and prevention in the future.

【题目】小反刍兽疫病毒_PPRV_N蛋白的表达与ELISA检测方法的建立
【中文关键词】PPRV;N蛋白;表达;ELISA
【英文关键词】PPRV;Expression;ELISA
【中文摘要】通过对下载的16株小反刍兽疫病毒(PPRV)N基因片段进行序列分析,合成了PPRV N基因。用NP1和NP2引物扩增。纯化的PPRV N基因在T4DNA连接酶的作用下,和PET32-a载体进行连接反应构建重组质粒pET-a-PPRV-N。经诱导表达和纯化后,得到了大量的PPRV N蛋白。用PPRV N蛋白制备免疫血清,经国际标准血清标化后作为参考阳性血清,同时以PPRV N蛋白为抗原建立间接ELISA(I-ELISA)方法。对山东省的467份羊血清检测,使用S/P(样品值/阳性值)平均值加3倍标准差的方法,计算出其临界点为0.28。应用间接ELISA和针对H蛋白的单抗为基础的C-ELISA检测来自于疫区的69份血清,结果两者的符合率为79.7%。
【英文摘要】PPRV N gene was synthesized by analyzing 16 strains PPRV ′s N gene.Using primer NP1 and NP2 PPRV N gene was amplified.The purified PPRV-N gene and plasmid PET32-a were sequenced by T4 DNA polymerase to construct plasmid pET-a-PPRV-N.Abundant PPRV N protein is expressed by inducing.Using PPRV N protein prepares immuno-sera,and produce positive control sera by standardizing the immuno-sera by reference positive sera of IAH(institute of animal health).Indirect ELISA test was developed by using PPRV N protein as coating antigen.467 sera of sheep and goats of Shandong province were detected,and sample ′s S/P value(sample ′s OD450/reference positive serum ′s OD450) was calculated to acquire cut-off value by S/P ′s average adding 3 times standard deviation with the threshold value of 0.28.Using PPRV-N indirect ELISA and C-ELISA which based on PPRV-H protein ′s mono-antibody 69 sera of PPRV infected area were detected.With the accordance rate of 79.7% between I-ELISA and C-ELISA.

【题目】小反刍兽疫病毒(PPRV)N基因体外转录与RT-PCR方法的研究
【中文关键词】PPRV;体外转录;RT-PCR
【英文关键词】PPRV;In vitro;Transcription RT-PCR
【中文摘要】小反刍兽疫(PPR)是由PPRV引起的主要是绵羊和山羊的一种热性病毒病。我们合成了PPRVN基因,连接到pGEM-T载体中,线性化处理后用T7转录酶启动体外转录,获取类PPRV的RNA作为阳性对照,参考国外文献设计一对合适的引物NP3和NP4,经PCR条件的优化,获得了预期的350bp目的片断,初步建立了检测PPRVN基因的反转录聚合酶链反应(RT-PCR)。
【英文摘要】Peste des petits ruminants virus (PPRV) N gene was synthesized and transformed into pGEM-T to construct the vector pGEM-T-PPRV-N. Then the lined PPRV N gene was transcribed by using T7 enzyme in vitro to acquire RNA of PPRV-N as positive control. A pair of primer NP3 and NP4 was designed in reference to the related literature, a 350bp fragment was amplified as anticipated after optimizing the factor of RT-PCR. A RT-PCR assay was developed preliminarily and it can be used to detect PPRV N gene.

【题目】小反刍兽疫病毒F蛋白抗原位点的克隆与表达
【中文关键词】小反刍兽疫病毒;F基因;原核表达;抗原位点
【英文关键词】Peste des petits ruminants virus(PPRV);F gene;Prokaryotic expression;Antigen epitope
【中文摘要】目的表达小反刍兽疫F蛋白的抗原位点用于检测与预防。方法用DNAStar分析小反刍兽疫的抗原位点,采用逆转录聚合酶链式反应(RT-PCR)技术,从病羊组织中PPRV的F基因的抗原位点并克隆到原核表达载体PET-28b中,最后用PCR、酶切和测序分析对重组质粒进行鉴定;将重组质粒转化到大肠杆菌Rosetta中,经ITPG诱导表达PPRVF基因的抗原位点;用SDS-PAGE和Western-Blotting分析抗原位点蛋白的表达。结果将RT-PCR产物电泳,得到与预期大小相符的特异性片段;对重组质粒PET-28b-F35-111(pZLW013)、PET-28b-F143-485(pZLW014)和PET-28b-F323-485(pZLW015)酶切后,均出现与预期相符的片段;DNA测序表明插入的片段的序列与小反刍兽疫F基因的抗原位点序列分别完全一致,其大小分别为251bp、1053bp和514bp;将重组表达的蛋白经SDS-PAGE和West-ern-Blotting分析,证明小反刍兽疫抗原位点F35-111没有表达、抗原位点F143-485和F323-485得到表达。结论成功表达了PPRVF基因的两段抗原位点蛋白,为日后检测与预防工作奠定了基础。

【英文摘要】Objective:To clone and express Peste des petits ruminants virus(PPRV) F protein antigen epitope in prokaryotic expression vector for use in PPR detection and prevention.Methods:Peste des petits ruminants F gene antigen epitop were analysised by DNAStar and were amplified by reverse transcription-polymerase chain reaction(RT-PCR) technology from disease tissue and were inserted into the prokaryotic expression vector PET-28a,finally,the recombinant plasmid were analysised by PCR,enzyme digestion and sequencing;The recombinant plasmid were transformed into E.coli Rosetta and were induced to express with different concentrations of ITPG and the results of F protein expression in E.coli.Rosetta were analysised by SDS-PAGE and Western-blotting.Results:the RT-PCR product was subjected to electrophoresis and specific fragment was obtained;By restriction enzyme digestion,the recombinant plasmids were digested into the fragments in line with expectations;The DNA sequence of the 251bp,1053bp and 514bp fragments were identical with F gene in Genebank;By SDS-PAGE and Western-blotting One recombinant protein-pZLW13 can not be expressed but another recombinant protein were ex-pressed in E.coli Rosetta.Conclusion:The success ful expression of two PPRV F gene antigen epitopes provided foundation for detection and prevention in the future.

【题目】Development of an Enzyme-Linked Immunosorbent Assay for Seven Sulfonamide Residues and Investigation of Matrix Effects from Different Food Samples

【中文关键词】磺胺类药物 ELISA 检测残留量
【英文关键词】Sulfonamides ELISA detection residues
【中文摘要】本实验研究了直接竞争酶联免疫吸附测定(ELISA)检测不同基质中磺酰胺类药物的残留。采取简单、快速的样品提取法即仅用磷酸盐缓冲液(PBS)提取猪肉,鸡肉,鱼肉和蛋中的此类抗生素。将20ml提取物溶液添加到4 g的样品中,对于缓冲液稀释的样品提取物,直接用ELISA方法分析,通过用PBS 5倍稀释猪肉,鸡肉和鸡蛋提取物,以及用含有1%牛血清白蛋白(BSA)的缓冲液5稀释鱼肉提取物的方法,可消除基质影响。对肝脏样品,这种提取方法更复杂一些。将2g样品加入20ml乙醇中,混匀然后均质离心。除去10ml的上清液,残留物溶解于10ml的PBS中,然后过滤。滤液用0.5%的BSA-PBS液两倍稀释。这些方法能够检测硫代异唑等七个磺胺剂残留(如在猪肉、肝脏、鸡肉、蛋和鱼中的磺胺噻唑,长效磺胺, 磺胺嘧啶以及磺胺氯达嗪残留物)。此方法的检出限是100 ug/kg. 对各种提取方法进行实验表明,各基质的回收率一般在77.3%到123.7%之间。
【英文摘要】Direct competitive enzyme-linked immunosorbent assays (ELISA) were developed to detect a broad range of sulfonamides in various matrices. Screening for this class of antibiotics in pig muscle, chicken muscle, fish, and egg extracts was accomplished by simple, rapid extraction methods carried out with only phosphate-buffered saline (PBS) buffer. Twenty milliliters of extract solution was added to 4 g of sample to extract the sulfonamide residues, and sample extracts diluted with assay buffer were directly analyzed by ELISA; matrix effects could be avoided with 1:5 dilution of pig muscle, chicken muscle, and egg extracts with PBS and 1:5 dilution of fish extract with 1% bovine serum albumin (BSA)-PBS. For liver sample, the extraction method was a little more complicated; 2 g ofsample was added to 20 mL of ethanol, mixed, and then centrifuged. The solvent of 10 mL of the upper liquid was removed, and the residues were dissolved in 10 mL of PBS and then filtered; the filtrate was diluted two-fold with 0.5% BSA-PBS for ELISA. These common methods were able to detect seven sulfonamide residues such as sulfisozole, sulfathiazole, sufameter, sulfamethoxypyridazine,sulfapyridine, sulfamethizole, and sulfachlorpyridazine in pig muscle, liver, chicken muscle,egg, and fish. The assay ’s detection limits for these compounds were less than 100 í g kg-1. Various extraction methods were tested, and the average recovery (n) 3) of 100 í g kg-1 for the matrices was found to range from 77.3 to 123.7%.

【题目】Development of ELISA for the determination of transgenic Bt-cottons using antibodies against Cry1Ac protein from Bacillus thuringiensis HD-73

【中文关键词】生物技术 PCR 转基因植物
【英文关键词】Biotechnology PCR Transgenic plants

【中文摘要】在中国以及其他国家,携带有Cry1Ac基因的bt棉花种植面积逐年增加。为了评估因释放Bt(苏云金杆菌)技术而产生的对环境的潜在负面影响,试图开发一种能方便检测出Cry1Ac毒素的方法。本研究的目的是开发一种双抗夹心的elisa方法来检测在bt棉花组织中的Cry1Ac蛋白。特异性抗体来自接种了由Bt代谢物hd – 73派生的Cry1Ac蛋白质的兔子体内,联有HRP的二抗可与 Cry1Ac HRP Bt蛋白质特异性结合。检出限是5ng/mL, 且在Cry1Ab,Cry1C,Cry2A,Cry3Bb1和Cry9C之间没有交叉反应。用棉花叶中提取的蛋白质来评估试验的适用性。tris-硼酸缓冲液和碳酸钠缓冲液用于提取蛋白质,吸光度检测限分别为0.134和0.449,后者会产生更高的背景值。结果表明GK 12,GK 22,抗虫棉花、二价转基因棉花、石远321实验呈阳性,NON呈阴性。PCR方法一般用于研究已建立的检测方法的有效性。尽管两种方法都会获得同样的结果,但是ELISA所需仪器简单而且耗时较少。这种先进的免疫测定方法对于Bt Cry1Ac蛋白质的检测也是十分可靠的。

【英文摘要】The area cultivated with Bt-cottons expressing Cry1Ac gene increases year by year in China and other countries. To evaluate any otential adverse impacts on the environment from the release of Bt (Bacillus thuringiensis) technology, the development of a method for easily detecting the activity of the Cry1Ac toxins is of particular interest. The aim of this study was to develop sandwich-ELISA for the detection of Cry1Ac protein in Bt-cotton tissues. A specific antibody was obtained from rabbits inoculated with Cry1Ac protein derived from Bt strain HD-73 and a secondary antibody conjugated to HRP could combine the Bt Cry1Ac protein specifically. The limit of detection was 5 ng/mL and there were no crossreactions between the positive control of Cry1Ab/1Ac, Cry1C, Cry2A, Cry3Bb1 and Cry9C. Extracts of proteins from cotton leaves were used to evaluate the suitability of the assay. Tris-borate buffer and sodium carbonate buffer were employed for the extraction of protein, the limit absorbance of detection was 0.134 and 0.449, respectively, and the atter produced a higher background. The results showed that cultivars GK-12, GK-22, insect-resistant cotton, bivalent transgenic cotton and shiyuan 321 assayed positively and NON was the negative sample. The PCR method was used for the validation of the developed assay. Although both methods allowed the same results to be obtained, ELISA needed simple equipment and took less time. The developed immunoassay method is considered reliable for the detection of Bt Cry1Ac protein.

【题目】Kinetic spectrophotometric method for rapid determination of trace formaldehyde in foods
【中文关键词】甲醛 分光光度法 动力学测定 玫瑰红b
【英文关键词】Formaldehyde Spectrophotometric method Kinetic determination Rhodamine B
【中文摘要】简单且灵敏的动力学分光光度法应用于测定在食物样品中的超痕量甲醛残留。该方法基于在硫酸介质中(甲醛作为催化剂)溴酸钾氧化罗丹明B(拉昔胡申)的反应原理。通过测量染料6分钟后,在515 nm处吸光度的减少量来监测反应。这种方法可以准确精密地测定10 - 100 g/L范围内的甲醛残留量,检出限为2.90g/L。检测残留量为10g/L、60g/L的两种样本,相关水平偏差分别为3.0% 和1.9% (n = 10)。结果表明,这种方法具有灵敏性、可选择性,应用于食品中甲醛残留的检测会有令人满意的效果。

【英文摘要】A simple and sensitive kinetic-spectrophotometric method was developed for the determination of ultra trace amount of formaldehyde in food samples. The method was based on the oxidation of rhodamine B (RhB) by potassium bromate in sulfuric acid medium (formaldehyde as catalyst).The reaction was monitored by measuring the decrease in absorbance of the dye at 515 nm after 6 min. The developed method allowed the determination of formaldehyde in the range of 10 – 100 gL − 1 with good precision, accuracy and the detection limit was down to 2.90 gL − 1. The relative standard deviations for the determination of 10 and 60 gL − 1 of formaldehyde were 3.0% and 1.9% (n = 10), respectively. The method was found to be sensitive, selective and was applied to the determination of formaldehyde in foods with satisfactory results.

【题目】Synthesis and characterization of a molecularly imprinted silica gel sorbent for the on-line determination of trace Sudan I in Chilli powder through high-performance liquid chromatography
【中文关键词】苏丹红 I 分子印迹 溶胶凝胶 在线固相萃取-HPLC
【英文关键词】Sudan I molecular imprinting sol-gel on-line solid-phase extraction high-performance liquid chromatography
【中文摘要】通过表面分子印迹技术结合溶胶-凝胶合成高度选择性印迹聚合物。通过傅立叶变换红外光谱和静、动态吸附实验,对印迹聚合物进行评估。结果表明,与未印迹的吸附剂相比,印迹吸附剂展现出更好的识别性和选择能力,并且提供更快的吸附和解析苏丹I的动力,饱和绑定能力(Qmax)达到33.47mg/g。采用固相萃取-高效液相色谱法(hplc -spe),可将配备好的吸附剂应用于微量苏丹I的测定。以1.5ml/min的加载流率取样50ml,可富集得到一个分子量为1266分子。检出限(S/N=3)为1.2ng/L,五组含量为0.01ug/L的苏丹I平行实验的峰区精确度为3.66%。实际数据显示,当地超市的辣椒粉末中检测出苏丹I 的含量为三个水平(0.25, 0.5, 1.0 ng/g),回收率在80.31%-94.02%的范围内。
【英文摘要】A highly selective imprinted polymer was synthesized by a surface molecular imprinting technique in combination with a sol-gel process. The imprinted polymer was evaluated by FT-IR and static and kinetic adsorption experiments. The results showed that the imprinted sorbent exhibited good recognition and selective ability, offered a faster kinetics for the adsorption and desorption of Sudan I than the non-imprinted sorbent, a saturated binding capacity (Qmax) that reached 33.47 mg g-1.The prepared sorbent was applied for the determination of trace Sudan I through on-line solid-phase coupled with high-performance liquid chromatography (SPE-HPLC). With a loading flow rate of 1.5 mL min-1 for sampling 50 mL, an enrichment factor of 1266 was achieved. The detection limit (S/N) 3) was 1.2 ng L-1, and the peak area precision (RSD) for five replicate detections of 0.01 í g L-1 Sudan I was 3.66%. The Sudan I in the chilli powder from the local market was determined at three levels (0.25, 0.5, and 1.0 ng g-1) with recoveries ranging from 80.31 to 94.02%.

【题目】Multi-residue determination of pesticides in water using multi-walled carbon nanotubes solid-phase extraction and gas chromatography – mass spectrometry
【中文关键词】农药多残留 多壁碳纳米管 固相萃取 GC-MS
【英文关键词】Multi-residue Pesticides Multi-walled carbon nanotubes Solid-phase extraction Gas chromatography – mass spectrometry
【中文摘要】本文研究了一种可行的检测地表水中的12种农药(克百威, 异稻瘟净、甲基对硫磷,扑草净,杀螟硫磷,对硫磷,水胺硫磷,稻丰散,甲巯咪唑、异狄氏剂,乙硫磷、甲氧氯)多残留的方法。即基于固相萃取(以多壁碳纳米管(热合)作为吸附剂)的气相色谱-质谱联用(GC – MS)的检测方法。一些参数对提取效率可能会有影响,诸如洗脱液量、示例流率和优化的样本装载量。实验结果显示,12种农药(R2 > 0.99)的最佳线性范围为在0.04-4g/L,并且在最佳条件下的精确度(RSD)为3.1 – 15.1%。根据基线噪声的色谱信号(S/N=3)的数率,检出限可达到0.01-0.03g/L。在水样品添加回收实验中,回收率为82.0 – 103.7%。结果表明,在研究中多壁碳纳米管对于12种农药有良好的吸附性。具备了成本小、耗时少以及溶剂消耗少的特点,先进的多残留检测方法可应用于同时检测水中多级农药的残留物。
【英文摘要】A reliable multi-residue method which was based on solid-phase extraction (SPE) with multi-walled carbon nanotubes (MWCNTs) as adsorbent was developed for determination and quantitation of 12 pesticides (carbofuran, iprobenfos, parathion-methyl, prometryn, fenitrothion, parathionethyl,isocarbofos, phenthoate, methidathion, endrin, ethion, methoxychlor) in surface water by gas chromatography – mass spectrometry (GC – MS).Parameters that might influence the extraction efficiency such as the eluent volume, the sample flow rate and the sample loading volume were optimized. The experimental results showed the excellent linearity of 12 pesticides (R2 > 0.99) over the range of 0.04 – 4 gL − 1, and the precisions (RSD) were 3.1 – 15.1% under the optimal conditions. The detection limits of proposed method could reach 0.01 – 0.03 gL − 1 based on the ratio of chromatographic signal to base line noise

(S/N = 3). Good recoveries achieved with spiked water samples were in the range of 82.0 – 103.7%. The results indicated that MWCNTs have good adsorbability to the 12 pesticides tested in this study. With less cost, less analytical time and less solvent-consuming, the developed multi-residue method could be used to determine multi-class pesticides in water simultaneously.

【题目】Enzyme-linked immunosorbent assay and colloidal gold immunoassay for ochratoxin A: investigation of analytical conditions and sample matrix on assay performance
【中文关键词】磺胺类药物 ELISA 化学发光检测 残留
【英文关键词】sulfonamides ELISA enhanced chemiluminescent detection residues
【中文摘要】背景:基于多克隆抗体的化学发光酶联免疫吸附检测法,在检测食品中磺胺类物质时具有更好的特异性。通过与16种磺酰胺类药物的交叉反应来评估检测的特异性。此研究的目的是发展一种高灵敏度检测磺酰胺类物质的方法。结果:荧光-酶联免疫吸附法比比色法-酶联免疫吸附法具有更好的灵敏度。检测五种磺酰胺类物质(硫代异唑,磺胺噻唑,长效磺胺和磺胺嘧啶)的灵敏度为0.73 -2.92 μg/L,检出限为0.10 – 0.43 μg/L。批间变异系数少于10%。鸡肉和猪肉的添加回收实验采用简单和快捷的提取方法。达到了良好的回收率(62.1 – 110.3%),并且结果与高效液相色谱法获得的分析结果一致。结论:此次研究提供了一种用于检测食品中残留物(硫代异唑,磺胺噻唑,长效磺胺和磺胺嘧啶)的一种高效分析技术,并具有很高的灵敏度。据作者所知,这是首篇有关荧光-酶联免疫吸附法检测磺酰胺类物质的文章。
【英文摘要】BACKGROUND: An enzyme-linked immunosorbent assay (ELISA) based on polyclonal antibodieswith enhanced chemiluminescent (ECL) detection of sulfonamides in food samples has been optimised and characterised. The specificity of the assay was assessed by determining cross-reactivities with a set of 16 sulfonamides. The aim of this study was to develop a method for determining sulfonamides with high sensitivity. RESULTS: The sensitivity of the developed ECL-ELISA was higher than that of colorimetric ELISA. The sensitivities of five of the sulfonamides (sulfisozole, sulfathiazole, sulfameter, sulfamethoxypyridazine and sulfapyridine) ranged from 0.73 to 2.92 μgL^{-1}, with limits of detection of 0.10 – 0.43 μgL^{-1}. The coefficients of variation of intra-assay and inter-assay studies carriedout over 5 days were mostly less than 10%. Recovery studies of chicken muscle and pig muscle were performed with simple and rapid extraction. Good recoveries (62.1 – 110.3%) were achieved and the results correlated well with those obtained using high-performance liquid chromatography analysis. CONCLUSION: This study has provided an effective analytical technique for the rapid and reliable determination of residues of sulfisozole, sulfathiazole, sulfameter, sulfamethoxypyridazine and sulfapyridine in food samples with high sensitivity. To the authors ’ knowledge, this is the first report on chemiluminescent ELISA for sulfonamide analysis.

【题目】Optimization and validation of enzyme-linked immunosorbent assay for the determination of endosulfan residues in food samples
【中文关键词】硫丹 免疫分析 残留物 基质效应
【英文关键词】Endosulfan immunoassay residue matrix effect
【中文摘要】在该项研究中,采用优化的酶联免疫吸附技术检测蔬菜、干制水果、茶叶和肉等二十种不同的食品样品中硫丹的残留。硫丹的检出限为0.8 μgkg^{-1},灵敏度为5.3 μgkg^{-1}。本研究开发了三种简单的样品提取方法,包括在250 r

min − 1条件下将样品旋转震荡过夜,旋转振荡1h然后充分混合2min。采用甲醇作为抽提溶剂。萃取液用含有0.5%鱼皮明胶的PBS磷酸盐缓冲溶液稀释不同倍数,以消除基体干扰。对于卷心菜(紫色和绿色),芦笋,日本蔬菜,大白菜,青葱,茼蒿,菠菜和大蒜,萃取液稀释10倍;对于胡萝卜和茶叶,萃取液分别稀释15倍和900倍。芹菜,赤豆和栗子的萃取液稀释20倍,以避免基体干扰;生姜,黄豆和花生的萃取液稀释100倍;羊肉和鸡肉萃取液稀释10倍;鳗鱼萃取液稀释40倍。平均回收率为63.13-125.61%。通过气相色谱法(GC)和气相色谱 - 质谱法(GC-MS)进行验证。这项研究的结果将有益于采用ELISA法快速测定食品中的农药的广泛应用。

【英文摘要】In this study, an enzyme-linked immunosorbent assay (ELISA)was optimized and applied to the determination of endosulfan residuesin 20 different kinds of food commodities including vegetables, dry fruits, tea and meat. The limit of detection (IC15) was 0.8 μg kg − 1 and the sensitivity (IC50) was 5.3 μg kg − 1. Three simple extraction methods were developed, including shaking on the rotary shaker at 250 r min − 1 overnight, shaking on the rotary shaker for 1 h and thoroughly mixing for 2 min. Methanol was used as the extraction solvent in this study. The extracts were diluted in 0.5% fish skin gelatin (FG) in phosphate-buffered saline (PBS) at various dilutions in order to remove the matrix interference. For cabbage (purple and green), asparagus, Japanese green, Chinese cabbage, scallion,garland chrysanthemum, spinach and garlic, the extracts were diluted 10-fold; for carrots and tea, the extracts were diluted 15-fold and 900-fold, respectively. The extracts of celery, adzuki beans and chestnuts, were diluted 20-fold to avoid the matrix interference; ginger, vegetable soybean and peanut extracts were diluted 100-fold; mutton and chicken extracts were diluted 10-fold and for eel,the dilution was 40-fold. Average recoveries were 63.13 – 125.61%. Validation was conducted by gas chromatography (GC) and gas chromatography-mass spectrometry (GC-MS). The results of this study will be useful to the wide application of an ELISA for therapid determination of pesticides in food samples.

【题目】Multi-walled carbon nanotubes as solid-phase extraction adsorbents for determination of atrazine and its principal metabolites in water and soil samples by gas chromatography-mass spectrometry

【中文关键词】阿特拉津 代谢物 固相萃取 多壁碳纳米管 GC-MS

【英文关键词】Atrazine Metabolites Solid-phase extraction Multi-walled carbon nanotubes Gas chromatography-mass spectrometry

【中文摘要】本研究开发了一种新颖,简单,低成本且灵敏度高的方法检测水和土壤样品中的阿特拉津以及其重要的代谢物(DIA)和(DEA)。采用多壁碳纳米管作为固相萃取(SPE)吸附剂与气相色谱 - 质谱法(GC-MS)连用。优化条件参数,例如进样量、洗提液、洗脱体积和样品的提取剂和提取剂的比率来实现提取和洗脱的分析物的良好的灵敏度和精确度。采用甲醇/水溶液(50%, v/v)提取土壤中的阿特拉津以及DIA 和DEA。提取物先过SPE柱(填充多壁碳纳米管),流速为4 mL min-1,然后用4 mL乙酸乙酯洗脱,流速为1mLmin-1。采用推荐方法测得水中阿特拉津的检测限(S/N=3)为0.02 μg kg − 1,土壤中阿特拉津的检出限为0.3 μg kg − 1;水中DIA的检出限为0.04 μg kg − 1,土壤中DIA的检出限为1.0 μg kg − 1;水中DEA的检出限为0.05 μg kg − 1,土壤中DEA的检出限为0.8 μg kg − 1。平均回收率在72.27 – 109.68%范围内,在适宜的条件下重现性(RSD b13%)良好。这种改进的方法适用于检测真实环境中的待测物,阿特拉津的浓度为0.77 – 10.83 μg kg − 1,DEA和DIA未检测到。

【英文摘要】A novel, simple, cost-effective, and sensitive method was developed for the determination of atrazine and its principalmetabolites namely deisopropyl-atrazine (DIA) and deethyl-atrazine (DEA) in water and soil samples using multi-walled carbon nanotubes as solid-phase extraction (SPE) adsorbents coupled with gas chromatography-mass spectrometry (GC-MS).Several condition parameters, such as sample loading flow-rate, eluent and elution volume,extractant and ratio of extraction solvent to sample,were optimized to achieve good sensitivity and precision for the extraction and elution of analytes. A methanol/water solution (50%, v/v) was used to extract atrazine, DIA and DEA from soil. After the extracts went through SPE cartridges (packed with multi-walled carbon nanotubes) at a flow-rate of 4 mL min − 1, the analyteswere eluted by 4mL ethyl acetate at the rate of 1mLmin − 1 under a vacuumpump.The limit of detection (S/N=3) of the proposed method was 0.02 μg kg − 1 for atrazine in water and 0.3 μg kg − 1 in soil; 0.04 μg kg − 1 for DIA in water and 1.0 μg kg − 1 in soil; 0.05 μg kg − 1 for DEA in water and 0.8 μg kg − 1 in soil. Mean recoveries were in the range of 72.27 – 109.68%, and the reproducibility was accepted (RSD b13%) under the optimum conditions.

This developed method was applied to determine the analytes in real environmental samples, and the concentrations of atrazine were 0.77 – 10.83 μg kg − 1, while DEA and DIA were not detected.

【题目】Molecularly Imprinted Polymer Online Solid-Phase Extraction Coupled with High-Performance Liquid Chromatography-UV for the Determination of Three Sulfonamides in Pork and Chicken
【中文关键词】磺胺类药物 溶胶凝胶 分子印迹聚合物 固相萃取 高效液相色谱
【英文关键词】Sulfonamides sol – gel molecularly imprinted polymers solid-phase extraction highperformance liquid chromatography
【中文摘要】结合表面分子印迹技术与溶胶凝胶合成一种有选择性印迹的氨基功能化硅胶,将其用于HPLC在线固相萃取来测定猪肉与鸡肉中的三种微量的磺胺类药物。印迹的氨基功能化硅胶显示出高的选择性以及快速的吸附和解析磺胺类药物的能力。进样后以4 mL min-1流速运行12.5min成功获取了其增强因子和三磺酰胺(S / N)3)的检出限。9次重复实验,在线吸附剂提取5 μg L-1的磺胺类药物的标准差的精确度要小于4.5%。吸附剂在固相萃取微量磺胺类药物的过程中表现出良好的线性关系。该方法适用于猪肉和鸡肉的肌肉样品中磺胺类药物的测定。本实验吸附剂聚合物的制备是HPLC在线固相萃取猪肉和鸡肉样品中微量磺胺类药物的关键。
【英文摘要】A selective imprinted amino-functionalized silica gel sorbent was prepared by combining a surface molecular imprinting technique with a sol – gel process for online solid-phase extraction-HPLC determination of three trace sulfonamides in pork and chicken muscle. The imprinted functionalized silica gel sorbent exhibited selectivity and fast kinetics for the adsorption and desorption of sulfonamides. With a sample loading flow rate of 4 mL min-1 for 12.5 min, enhancement factors and detection limits for three sulfonamides (S/N) 3) were achieved. The precision (RSD) for nine replicate online sorbent extractions of 5 μg L-1 sulfonamides was less than 4.5%. The sorbent also offered good linearity (r2 > 0.99) for online solid-phase extraction of trace levels of sulfonamides. The method was applied to the determination of sulfonamides in pork and chicken muscle samples. The prepared polymer sorbent shows promise for online solid-phase extraction for HPLC determination of trace levels of sulfonamides in pork and chicken samples.

【题目】Enzyme-linked immunosorbent assay and colloidal gold immunoassay for sulphamethazine residues in edible animal foods: investigation of the effects of the analytical conditions and the sample matrix on assay performance.
【中文关键词】磺胺二甲嘧啶 ELISA 胶体金免疫分析 食品基质影响
【英文关键词】Sulphamethazine ELISA Colloidal gold immunoassay Food Matrix effect
【中文摘要】本研究建立了直接竞争酶联免疫吸附技术和胶体金免疫分析方法来检测可食性动物食品(猪肉、鸡肉、鸡蛋、鱼、牛奶和内脏)中的磺胺二甲嘧啶(SMZ)残留。ELISA法和胶体金免疫分析法的检测限分别为0.02 和0.5 μg kg − 1。根据14种磺胺类药物的交叉实验结果表明,建立的检测SMZ的ELISA方法特异性高。为了获得更灵敏的免疫测定方法,在整个实验过程中优化缓冲溶液(30 mmol L − 1的磷酸盐缓冲液,含0.05%吐温20,pH 8.5)。建立了一种简单高效的用于快速监测食品中SMZ残留的提取方法,回收率为74 -117.5%。通过使用最佳缓冲溶液1:10倍稀释猪肉、鸡肉、鸡蛋、鱼、牛奶和内脏可以避免基体效应。内脏中SMZ的检出限为5 μg kg − 1,其他五种样品中的检出限为2 μg kg − 1。样品提取物同时采用ELISA方法和高效液相色谱法分析,以对ELISA方法进行验证。采用这两种方法得到的结果表现出很好的相关性(r2),相关值

大于0.9。该试验中提出的胶体金免疫分析方法可成功地应用于检测猪肉,牛奶和鱼中的SMZ低于或等于水平(20 μg kg − 1)的最大残留。

【英文摘要】To determine sulphamethazine (SMZ) residues in edible animal foods (pig muscle, chicken muscle, egg, fish,milk and liver), a competitive direct enzyme-linked immunosorbent assay (ELISA) and a colloidal gold immunoassay were established. The limits of detection of the ELISA and the colloidal gold immunoassay were 0.02 and 0.5 μg kg − 1,respectively. The specificity of the ELISA developed to the SMZ was high according to the results of cross-reactivity testing with 14 kinds of sulphonamides. To obtain a moresensitive immunoassay, buffer solution (30 mmol L − 1 phosphate-buffered saline with 0.05% Tween 20, pH 8.5) was optimized through the whole test procedure.A simple and efficient extraction method for the rapid detection of SMZ residues in foods was developed, with recoveries between 74 and 117.5%. Matrix effects can be avoided by 1:10 dilution of pig muscle, chicken muscle, egg, fish, milk and liver with optimal buffer. The detection limit of SMZ was 5 μg kg − 1 in liver and 2 μg kg − 1 in the other five samples. For thevalidation of the ELISA tests, sample extracts were analysed by ELISA and high-performance liquid chromatography. The results obtained by these two methods showed a good correlation (r2) which was greater than 0.9. The colloidal gold immunoassay presented in this assay was successfully applied to determine SMZ in pig muscle, milk and fish below or equal to the maximum residue level (20 μg kg − 1).

【题目】Development of Flow-through and Dip-stick Immunoassay for Screening of Sulfonamide Residues

【中文关键词】磺胺 流通 ELISA 测杆 ELISA 带分析

【英文关键词】Sulfonamide Flow-through ELISA Dip-stick ELISA Strip assay

【中文摘要】竞争酶联免疫法的两种基膜方式已能成熟检测猪肌肉和牛奶中磺胺类药物的残留。膜涂覆有抗 - 磺酰胺抗体,为了用于竞争检测磺胺类药物,而将磺酰胺半抗原D2-辣根过氧化物酶接合体用作标记的抗原。穿流或浸渍方法分别逐个检测缓冲液中的7种磺胺类药物,其相应的视觉检测范围分别是1-5 μg L − 1或1 – 10 μg L − 1。利用单磺酰胺标样进行含量校正,利用成熟的带检测方式对添加标样进行验证并将结果与校正过的高效液相色谱法进行比较。结果显示,两个带检测的结果分别与HPLC结果相符。由于分析时间为5min(穿流)和15min(浸渍),这些快速检测方法能够提供简单、迅速、经济的现场检测猪肌肉(利用穿流或浸渍的方法)或者牛奶中磺胺类药物(只能通过浸渍方法)。

【英文摘要】Two formats of membrane-based competitive enzyme immunoassays (flow-through and dipstick) have been developed for the screening of sulfonamide residues in pig muscle and milk. Membrane was coated with anti-sulfonamide antibody and a sulfonamide hapten D2-horseradish peroxidase (HRP) conjugant was used as the labeled antigen for competitive assay of sulfonamides. Visual detection limits of the flow-through or dip-stick assay were 1 – 5 μg L − 1 or 1 – 10 μg L − 1 in buffer for seven sulfonamides, respectively. Assay validation was performed using samples spiked with single sulfonamide, spiked samples were tested using the developed strip assays and results were compared with those obtained by a validated highperformance liquid chromatograph (HPLC) method. Results showed that the two strip assays were correlated well with HPLC, respectively. With assay times of 5 min (flow-through) and 15 min (dip-stick), these rapid tests could offer simple, rapid and cost-effective on-site screening tools to detect sulfonamides in pig muscle(flow-through or dip-stick) or milk(only dip-stick).

【题目】Development of a Chemiluminescent Enzyme-linked Immunosorbent Assay for the Determination of Five Sulfonamides Residues in Chicken Muscle and Pig Muscle
【中文关键词】磺胺 ELISA 化学发光检测 残留
【英文关键词】sulfonamides ELISA enhanced chemiluminescent detection residues
【中文摘要】背景:本研究优化和描述了检测食品样品中磺胺类药物的酶联免疫吸附技术(ELISA)。该技术以强化化学发光(ECL)的多克隆抗体为基础。通过16中磺胺类药物的交叉反应实验来评定该方法的特异性。本研究的目的是建立一种高灵敏度检测磺胺类药物的方法。结果:化学发光酶联免疫吸附技术的灵敏度高于比色酶联免疫吸附技术。五种磺胺类药物(磺胺异恶唑,磺胺噻唑,氨基磺酸,磺胺甲氧嗪和磺胺嘧啶)的灵敏度在0.73 到2.92 μg L－1之间,检出限为0.10 – 0.43 μg L－1。5天后测定的批内和批间的变异系数基本上小于10%。采用简单快速的提取方法进行猪肉和鸡肉样品的回收试验。试验得到了良好的回收率(62.1 – 110.3%),并且结果和采用高效液相色谱法得到的结果相符。结论:本研究提供了一种高效的分析技术,可以快速可靠高灵敏度的检测样品中的磺胺异恶唑,磺胺噻唑,氨基磺酸,磺胺甲氧嗪和磺胺嘧啶。据作者所知,这是第一篇采用化学发光酶联免疫吸附技术检测磺胺类药物的报道。
【英文摘要】BACKGROUND: An enzyme-linked immunosorbent assay (ELISA) based on polyclonal antibodieswith enhanced chemiluminescent (ECL) detection of sulfonamides in food samples has been optimised and characterised. The specificity of the assay was assessed by determining cross-reactivities with a set of 16 sulfonamides. The aim of this study was to develop a method for determining sulfonamides with high sensitivity. RESULTS: The sensitivity of the developed ECL-ELISA was higher than that of colorimetric ELISA. The sensitivities of five of the sulfonamides (sulfisozole, sulfathiazole, sulfameter, sulfamethoxypyridazine and sulfapyridine) ranged from 0.73 to 2.92 μgL－1, with limits of detection of 0.10 – 0.43 μg L－1. The coefficients of variation of intra-assay and inter-assay studies carriedout over 5 days were mostly less than 10%. Recovery studies of chicken muscle and pig muscle were performed with simple and rapid extraction. Good recoveries (62.1 – 110.3%) were achieved and the results correlated well with those obtained using high-performance liquid chromatography analysis. CONCLUSION: This study has provided an effective analytical technique for the rapid and reliable determination of residues of sulfisozole, sulfathiazole, sulfameter, sulfamethoxypyridazine and sulfapyridine in food samples with high sensitivity. To the authors ’ knowledge, this is the first report on chemiluminescent ELISA for sulfonamide analysis.

【题目】Determination of protein content in rice by the digital chromatic method
【中文关键词】数字色度测定 蛋白含量 大米
【英文关键词】digital chroma measurement protein content rice
【中文摘要】使用红,绿和蓝(RGB)的色度值,反映颜色变化的方法来对用数字色度测量确定在水稻的蛋白质含量的可行性进行了研究。大米样品中蛋白质的含量为5 g/100克至13 g/100克。大米中的蛋白含量和用缩二脲试剂处理相关的蛋白质溶液的色度值之间是一个显着的线性负相关(r <-0.98)。所有三色值,G值是反映蛋白质溶液的色度差异的最佳参数。和R或B值相比,G值有较高的相关系数(R <-0.99)并且对蛋白含量的微妙差异更敏感。具有相似的结构和相同的反应条件下,已知的蛋白质含量的大米样品被认为是更精确的校准物质。数字色度方法测定的结果与凯氏定氮法没有显着不同。作为精度高,操作方便,效率高的蛋白含量测定方法,该方法适用大米流通领域的质量评价和监督的做法。
【英文摘要】The feasibility of using digital chroma measurements to determine the protein content in rice was investigated using red, green and blue (RGB) chroma values to reflect color change. The protein content of rice samples ranged from 5 g/100 g to 13 g/100 g. There was a significant negative linear correlation (r < -0.98) between the protein content in rice and the chroma values of relevant protein solutions treated with biuret reagent. Of all the tricolor values, the G value was the optimal parameter to reflect the chromadifference of the protein solutions. It had a higher correlation coefficient (r < -0.99) and was more sensitive to subtle differences in protein content than R or B values. With a similar structure and the same reaction conditions, rice samples with known protein content were found to be more accurate calibrating substances. The results determined by the digital chromatic method are

notsignificantly different from that of the Kjeldahl method. With the advantages of high precision, easy operation and high efficiency, the method is suitable for applications in quality evaluation and supervising practice in the field of rice circulation.

【题目】Effect of protein on the rheological properties of rice flour
【中文关键词】流变性 大米粉 蛋白
【英文关键词】Rheological properties rice flour protein
【中文摘要】对在裱糊,冷却和再加热期间米粉的流变学特性进行了测定。在温度清扫过程中,蛋白质对流变学特性的影响也进行了研究。结果表明,与淀粉颗粒比较,在相同的时间,蛋白质开始糊化的温度下降,使得米粉糊化困难。在水稻中高蛋白质含量,是有利于提高耐热能力和保持温度被改变时,该凝胶的硬度和粘着性。推断温度变化时,和较低的蛋白质含量大米相比,具有高蛋白质含量的稻米需要更多的水,煮的米饭的硬度和粘着性更加稳定。
【英文摘要】The rheological properties of rice flour during pasting, cooling and reheating were measured. The effect of protein on the rheological characteristics during temperature sweeping was studied. The results indicated that protein decreased the temperature of the start of the pasting, at the same time making the pasting of the rice flour difficult through competition with starch granules. A high protein content in rice is helpful to increase heat-resistant capacity and keep the hardness and stickiness of the gel when the temperatureis changed. It was also deduced that rice with a high protein content needs more water to cook and the hardness and stickiness of the cooked rice were more stable than rice with a lower protein content when subjected to a change in temperature.

【题目】Quantitative analysis of acrylamide in tea by liquid chromatography coupled with electrospray ionization tandem mass spectrometry
【中文关键词】丙烯酰胺 茶 LC – MS/MS 定量分析
【英文关键词】Acrylamide Tea Liquid chromatography – tandem mass spectrometry (LC – MS/MS) Quantitative analysis
【中文摘要】对一种有效的样品制备过程进行了优化。并开发了利用液相色谱 - 串联质谱法(LC-MS/MS)茶叶中的丙烯酰胺进行定量分析的方法。 [13C3] - 丙烯酰胺用作内部标准。丙烯酰胺在25°C下用10毫升水提取20分钟,然后由10毫升乙腈,然后在彻底搅拌下,向上述混合物中加入4克硫酸镁,0.5克氯化钠。为了增加丙烯酰胺的响应,将9毫升乙腈层浓缩至0.5ml。用Oasis MCX盒进行固相萃取。检测限(LOD)和定量限(LOQ)分别为1和5 ng/mL。提取过程中的回收效率在74%和79%之间不等。 30个茶叶样品中的丙烯酰胺含量均小于100 ng/mL。黑色,乌龙茶,白茶和黄茶样品中有非常低的丙烯酰胺含量(<20纳克/克)。在烤,烤,晒干的绿茶样本中丙烯酰胺含量较高(46-94纳克/克)。
【英文摘要】An effective sample preparation procedure was optimized and a liquid chromatography – tandem mass spectrometry (LC – MS/MS) was developed for the quantitative analysis of acrylamide in tea. [13C3]-acrylamide was used as internal standard. Acrylamide wasextracted at 25 C for 20 min by 10 ml water followed by 10 ml acetonitrile, and then 4 g of magnesium sulfate and 0.5 g of sodium chloride were added to the above mixture under stirring thoroughly. In order to increase the response of acrylamide, 9 ml acetonitrile layer was taken and concentrated to 0.5 ml. Solid-phase extraction with an Oasis MCX cartridge was carried out for clean-up. The limit of detection (LOD) and limit of quantification (LOQ) were 1 and 5 ng/ml, respectively. The recovery efficiency of the extraction procedure ranged between 74% and 79%. The levels of acrylamide in 30 tea samples were less than 100 ng/g. Black, oolong,

white and yellow tea samples had quite low acrylamide contents (<20 ng/g). Higher acrylamide levels occurred in baked, roasted, and one sun-dried green tea samples (46 – 94 ng/g).

【题目】Column coated with cetyltrimethylammonium for simultaneous determination of nitrate and nitrite in pickles by ion chromatography
【中文关键词】硝酸盐 亚硝酸盐 发酵蔬菜 泡菜
【英文关键词】nitrate nitrite fermented vegetable pickles
【中文摘要】利用离子色谱法(IC)和紫外吸收检测法同时测定了中国传统泡菜中硝酸盐和亚硝酸盐的含量。使用涂敷十六烷基三甲基溴化铵(CTAB)的十八烷基键合的硅胶(ODS)柱分离阴离子。研究了涂布条件和流动相的性质对硝酸盐和亚硝酸盐分离效果的影响。分离硝酸盐和亚硝酸盐的最佳条件为:涂敷1mMCTAB的硅胶柱,涂敷温度25°C,缓冲液为pH =6.2的10mM的磷酸铵,流速为1毫升/分钟。硝酸盐和亚硝酸盐的检测限分别为5和10微克/ 升(S / N = 3)。重现性和回收率良好。
【英文摘要】A new application for simultaneous determination of nitrate and nitrite in Chinese traditional pickles with ion chromatography (IC) and UV absorbance detection was studied. The octadecyl-bonded silica (ODS) column coated with cetyltrimethylammonium bromide (CTAB) was used to separate anions. The effects of coating conditions and nature of mobile phase on the separation of nitrate and nitrite were investigated. The best separation of nitrate and nitrite was achieved in the optimized buffer with a column coating of 1 mM CTAB. The coating temperature was 25 degrees C. The optimized buffer was a 10 mM of ammonium phosphate with pH 6.2, and flow rate of 1 ml/min. The limits of detection for nitrate and nitrite were 5 and 10 mu g/l (S/N=3), respectively. Good reproducibility and recovery results were obtained.

【题目】Microbial changes during the salting process of traditional pickled Chinese cabbage
【中文关键词】腌制 白菜 微生物抑制
【英文关键词】salting cabbage microbial inhibition
【中文摘要】研究了腌制大白菜过程中微生物菌群的变化,尤其是盐浓度、腌制时间和温度的影响。总好氧菌、总芽孢菌、乳酸菌,肠道菌群和真菌作为控制参数。乳酸菌占总菌的0.1 – 1%。抑制不良微生物的最佳加工条件为:盐浓度8%(W / V),温度15°C,腌制时间8h。总好氧菌和肠道菌群在整个腌制过程中最高的密度超过105 cfu/g,90%的总耗氧菌被鉴定为革兰氏阴性。腌制12h后真菌、乳酸菌、总芽孢菌的密度分别在104, 103 and 102 cfu/g以下。
【英文摘要】Changes in microflora during salting Chinese cabbage were studied, with special attention given to the effects of salt concentration, time and temperature of the process. Total mesophilic aerobic bacteria (TMAB), bacterial endospores (B. endospores), lactic acid bacteria (LAB), Enterobacteriaceae and fungi were used as control parameters. LAB accounted for 0.1 – 1% of total bacteria. Best process conditions for highest undesirable microbial inhibition were: salt 8% (w/v), temperature 15 ° C, and salting time 8 h. High levels (105 cfu/g) of TMAB and Enterobacteriaceae were found in the whole salting time, and 90% of TMAB was identified as Gram negative. The levels of fungi, LAB and B. endospores after 12 h of the salting process were lower than 104, 103 and 102 cfu/g, respectively.

【题目】The application of direct orthogonal signal correction for linear and non-linear multivariate calibration
【中文关键词】直接正交信号校正 最小二乘支持向量机 偏最小二乘 非线性校正 近红外光谱
【英文关键词】Direct orthogonal signal correction (DOSC) Least square support vector machine (LSSVM) Partial least square (PLS) Non-linear calibration; Near
infrared (NIR) spectroscopy
【中文摘要】传统上,总是利用联合利用直接正交信号校正(DOSC)和潜变量的方法,如偏最小二乘(PLS)和主成分回归(PCR)等建立一个线性校正模型。本研究利用PLS和最小二乘支持向量机(LSSVM)分别研究光谱和组件之间的线性和非线性的关系。DOSC用于输入数据的预处理,研究了DOSC预处理对线性和非线性校正模型的效果。实验利用三个数据集完成。第一个是苹果的声光可调滤光器(AOTF-NIR)的近红外光谱,第二个是乙醇、水和2 - 丙醇的三元混合物的温度感应光谱,第三个是玉米的近红外光谱。对于所有的应用程序而言,通过DOSC预处理后都可以在谱图或评分图中清晰得到光谱和组件之间的关系。 DOSC改善了PLS模型的预测能力。然而,DOSC除去了相关组件有用的非线性的信息,因此,不能够提高LSSVM模型的性能。 DOSC预处理似乎并不适合非线性校正。
【英文摘要】Traditionally, the direct orthogonal signal correction (DOSC) is always used together with a latent variable method such as partial least square (PLS) or principal component regression (PCR), to build a linear calibration model. In this study, PLS and least square support vector machine (LSSVM) were used to develop the linear and non-linear relation between spectra and components, respectively. DOSC was used to preprocess the input data, and the effect of DOSC pretreatment on linear and non-linear calibration model was investigated. The experiment was performed with three data sets. The first one was the acousto-optic tunable filter near infrared (AOTF-NIR) spectra of apples, the second one was the temperatureinduced spectra of a ternary mixture of ethanol, water and 2-propanol, and the third one was the NIR spectra of corn. For all of the applications, the relation between spectra and components can be clearly observed in the spectra plot or the score plot after DOSC pretreatment. DOSC improved the predictive ability of PLS model. However, DOSC removed useful non-linear information that was related to components, thus, was not able to improve the performance of LSSVM model. DOSC pretreatment seems to be not suitable for non-linear calibration.

【中文关键词】近红外光谱法 可溶性固形物含量 偏最小二乘法 苹果
【英文关键词】near infrared spectroscopy soluble solids content iPLS Apple
【中文摘要】采用近红外光谱法,利用声-光调谐滤波技术测定完整苹果的可溶性固形物含量(SSC)。采用基因算法(GAs)选择1,065到1,625 nm的波长范围。比较基于基因算法的偏最小二乘法回归(PLSR)模型与不可变选择模型。此外,大部分选定波长产生的结果基于糖键和低噪声的波普信号对波的吸收 。通过GAs方法,所述频谱点从88减少到17。获得低相对标准偏差预测(RSDP)(6.02%)和高校准系数(0.914)。结果表明,GAs与PLSR模型结合简化和优化校准模式,而且还提高了预测校准模型的效果。得出的结论是基于GAs的方法,从特殊的光谱区域提取与SSC有关的信息和及无用的频谱点。
【英文摘要】The determination of soluble solids content (SSC) in intact apples was analyzed by means of near-infrared spectroscopy using an acousto-optic tunable filter technology. Genetic algorithms (GAs) were performed to select wavelengths within the range from

1,065 to 1,625 nm. Partial least squares regression (PLSR) model based on GAs was compared with the nonvariable selection. Furthermore, the majority of selected wavelengths that brought on that result have been analyzed with regard to the typical absorption bands ofsugars and the low-noise spectral signals.With the GAs approach, the spectral points were reduced from 88 to 17, and the low relative standard deviation of prediction (RSDp) (6.02%) and high coefficient of calibration (0.914) were achieved. The results showed that PLSR combined with GAs not only simplified and optimized the calibration model, but also improved the prediction effect of the calibration model. It was concluded that the GAs-based method extracted relevant SSC information from special spectral regions and left out the useless spectral points simultaneously.

【题目】Study of wavelet denoising in apple's charge-coupled devicenear-infrared spectroscopy
【中文关键词】苹果 近红外光谱 小波转变 消除噪音
【英文关键词】Apple CCD-NIR spectroscopy denoising
【中文摘要】使用离散小波变换消除苹果中近红外线光谱(CCD-NIR)的电荷耦合器件中的噪声。研究三个参数(小波函数,分解电平,和阈值)对的校准模型的预测能力影响。结果显示的DB,sym和bior效果良好,而coif,dmey,haar不能够有效滤除噪声。最好的分解水平为2。阈值默认情况下,Birge-Massart 和 Penalty具有良好的去噪效果,而SURE,Sqtwolog, Heuristic SURE,和 Minimax的细节系数为零,这是因为他们具有较高阈值。bior3.3小波函数,两个层次的分解,软阈值法,默认阈值选择规则组合可以得到的最好的去噪效果。构建最佳的测定可溶性固形物含量的模型。相对标准偏差从7.79至5.82%。
【英文摘要】Discrete wavelet transform was used to eliminate the noise in the charge-coupled device near-infrared (CCD-NIR) spectra of apple. The influence of three parameters (wavelet function, decomposition level, and threshold) on the predictive ability of the calibration model was investigated. The result showed that the db, sym, and bior wavelet families performed well, while the coif, dmey, and haarwavelets were not able to denoise effectively. The best decomposition level was 2. The threshold selection rules of the default, Birge-Massart, and Penalty had good denoising results, while SURE, Sqtwolog, Heuristic SURE, and Minimax set all detailed coefficients to zero due to their high threshold values. The best denoising result was obtained with the combination of the bior3.3 wavelet function,two levels of decomposition, default threshold selection rule, and the soft thresholding method. The optimal model of soluble solids content was constructed. The relative standard deviation of prediction decreased from 7.79 to 5.82% after wavelet denoising.

【题目】The Performance of ν-support vector regression on determination of soluble solids content by acousto-optic tunable filter near-infrared spectroscopy
【中文关键词】支持向量机器 ν-支持向量回归 苹果 可溶性固形物含量 近红外光谱
【英文关键词】Support vector machine ν-Support vector regression Apple Soluble solids content Near-infrared spectroscopy
【中文摘要】ν-支持向量回归(ν-SVR)用于建立苹果可溶性固形物含量(SSC)与近红外线光谱(AOTF-NIR)声光可调谐滤波器之间的校正模型 ν-SVR效果与偏最小二乘回归(PLSR)和反向传播人工神经网络(BP-ANN)进行了比较。 研究SVR参数的对模型的预测能力的影响。结果表明,参数ν有一个相当宽的最佳面积(对于苹果数据在0.35和1之间)。因此,我们可以事先确定的参数ν值并且专注于其他SVR参数的选择。分析苹果的SSC显示,ν-SVR优于PLSR和BP-ANN,特别是在更少

的样品和处理的噪声污染的情况下。正确的光谱预处理方法,如缩放,平均中心,标准正态变量(SNV)和波长选择方法(逐步多元线性回归和基因算法PLS为目标函数),可以大大提高产品ν-SVR模型的质量。

【英文摘要】The ν-support vector regression (ν-SVR) was used to construct the calibration model between soluble solids content (SSC) of apples and acousto-optic tunable filter near-infrared (AOTF-NIR) spectra. The performance of ν-SVR was compared with methods, such as scaling,the partial least square regression(PLSR) and the back-propagation artificial neural networks (BP-ANN). The influence of SVR parameters on the predictive ability of model was investigated. The results indicated that the parameter ν had a rather wide optimal area (between 0.35 and 1 for the apple data). Therefore, we could determine the value of ν beforehand and focus on the selection of other SVR parameters. For analyzing SSC of apple, ν-SVR was superior to PLSRand BP-ANN, especially in the case of fewer samples and treating the noise polluted spectra. Proper spectra pretreatment genetic algorithm with mean center, standard normal variate (SNV) and the wavelength selection methods (stepwise multiple linear regression and PLS as its objective function), could improve the quality of ν-SVR model greatly.

【题目】Effect of fermentation on the nitrate, nitrite and organic acid contents in pickled traditional Chinese cabbage

【中文关键词】泡菜 硝酸盐 亚硝酸盐 有机酸

【英文关键词】pickled Chinese cabbage nitrate nitrite organic acid

【中文摘要】本实验对中国泡菜和发酵液在发酵过程中硝酸盐、亚硝酸盐和有机酸含量进行检测。在自然发酵和接种发酵过程中,硝酸盐含量分别从1303.5mg/kg和1380.5mg/kg下降到245.7mg/kg和354.9mg/kg。在自然发酵的泡菜和发酵液中亚硝酸盐的含量达到最大值。在接种发酵的泡菜和发酵液中亚硝酸盐的含量较低。在7天的自然发酵过程中,乳酸含量从22.4mg/kg增加到3117.3mg/kg,醋酸含量从32.9mg/kg增加到254.6mg/kg,柠檬酸含量从8.3mg/kg增加到255.8mg/kg。在7天的接种发酵过程中,乳酸含量从27.9mg/kg增加到3559.9mg/kg,醋酸含量从40.5mg/kg增加到572.1mg/kg,柠檬酸含量从13.4mg/kg增加到268.0mg/kg。当发酵液的PH值低于4.5时,亚硝酸盐的最大值逐渐降低。

【英文摘要】The effect of fermentation on nitrate, nitrite and organic acid contents in pickled Chinese cabbage and brine was researched. The nitrate content in pickled Chinese cabbage decreased from 1,303.5 and 1,380.5 mg/kg to 245.7 and 354.9 mg/kg, respectively, during the natural and inoculated fermentation. The peak content of nitrite was formed in pickled vegetables and brine during the natural fermentation. The nitrite was at a low level in pickled Chinese cabbage and brine during the inoculated fermentation. During the7-day natural fermentation, lactic acid increased from 22.4 to 3,117.3 mg/kg, acetic acid increased from 32.9 to 254.6 mg/kg and citric acid increased from 8.3 to 255.8 mg/kg, and the responding results were 27.9 to 3,559.9 mg/kg, 40.5 to 572.1 mg/kg and 13.4 to 268.0 mg/kg, respectively, during the inoculated fermentation. When the pH of the brine was lower than 4.5, the peak content of nitrite gradually decreased.

【题目】Predicting soluble solid content and firmness in apple fruit by means of laser light scattering images

【中文关键词】可溶性固形物 硬度 激光漫反射

【英文关键词】Soluble solids firmness laser light backscattering

【中文摘要】本文对激光漫反射检测苹果可溶性固形物含量(SSC)和果实硬度的可行性进行了研究。利用5种不同波段激光对Elstar’和‘Pinova’两种苹果进行表面激光图像采集。利用图像处理算法对不同形状的苹果进行修正。首次利用图像灰度频率对苹果SSC和硬度进行建模。对‘Elstar’苹果,经过对原始数据的灰度频率修正后,SSC预测回归系数r=0.89,标准差SECV=4。14,果实硬度预测回归系数r=0.90,标准差SECV=5.49。经过内部交叉验证,SSC和果实硬度模型的预测标准差SEP<13%。

【英文摘要】Laser-induced light backscattering imaging was studied regarding its potential for analyzing apple soluble solids content (SSC) andfruit flesh firmness. Images of the backscattering of light on the fruit surface were obtained from ‘Elstar’ and ‘Pinova’ apples using laser diodes emitting at five wavelength bands. Image processing algorithms were tested to correct for dissimilar equator and shape of fruit. Particularly the frequencies of gray scale intensities obtained for selected wavelengths were used for the first time to calibrate on the fruit firmness and SSC using partial least squares regression. Calibration with highest performance for predicting ‘Elstar’ SSC was based on the corrected intensity frequency of raw data set with correlation coefficient of r = 0.89 and standard error of cross validation %SECV = 4.14. For evaluating ‘Elstar’ flesh firmness, corrected frequency gave the highest r = 0.90, and %SECV = 5.49. An inter-cultivar test-set validation of the method resulted in SEP < 13% for SSC and firmness prediction.

【题目】Wavelength selection for predicting physico-chemical properties of apple fruit based on near infrared spectroscopy

【中文关键词】波长选择 物化形式 近红外光谱

【英文关键词】Wavelength selection physicochemical properties NEAR-infrared spectroscopy

【中文摘要】水果质量监测评估工具对生产和采后处理以及市场营销很重要。在本研究中,应用近红外光谱仪(600-1100 nm)研究果实的可溶性固形物含量(SSC),水果硬度和苹果的水分含量(品种“富士”)之间的相关性。遗传算法和相关系数(r)方法被用来选择最适宜的波长组合,偏最小二乘回归分析用于校准果实品质参数。基于特征波长的验证模型具有良好的预测效果,对SSC的预测,回归系数r=0.94,交叉验证标准差secv=0.89,果实硬度预测,回归系数r=0.89,交叉验证标准差secv=7.54,水分含量预测,回归系数r=0.96,交叉验证标准差secv=0.92.利用特征波长选择较少建模数据可以有效提高对水果品质的预测能力。

【英文摘要】Instrumental evaluation tools for fruit quality monitoring are important in the production and postharvest processes as well as in marketing. In the present study, near-infrared spectroscopy (600 – 1,100 nm) was applied to study the correlation with fruit soluble solid content (SSC), fruit flesh firmness and water content of apples (cv. “Fuji”). Genetic algorithm and correlationcoefficient (r) method were used to select the most sensitive wavelength combinations, and partial least squares regression analysis was applied to calibrate fruit quality parameter. The validation of models based on the most sensitive wavelengths gave good predictions with an r value of 0.94 and a standard error of cross validation (SECV) of 0.85 ° Brix for SSC; r = 0.89 and SECV = 7.54 N/cm2 for firmness; and r = 0.96 and SECV = 0.92% for water content. The reduced data set of sensitive wavelengths were found feasible for predicting internal fruit quality.

【题目】Nondestructive Detection of Brown Core in Chinese Pear‘Yali’by Transmission Visible-NIR Spectroscopy

【中文关键词】中国鸭梨 可见光 - 近红外光谱仪 无损检测 棕色核
【英文关键词】Chinese pear Yali Grading Visible – NIR spectroscopy Nondestructive detection Brown core
【中文摘要】棕色核是梨在控温储藏下常见的一种内部变质状态。这种症状在表面通过肉眼是识别不了的,只有切开水果后才能发现。开发一种非损检测梨棕色核的手段能使生产商、加工人员和包装人员受益。我们开发出一种利用波长在651-1282nm范围的无损检测技术来识别中国鸭梨的棕色核。基于这个波长范围,利用马氏距离分析仪的差别分析能够区分棕色核和正常核,同时能够将棕色核分成三个等级——轻微、中等和严重。实验中,没有出现将棕色核误检为正常核的情况,也没有将正常核误检为棕色核的情况。在对66个正常核棕色核梨的混合检测实验中,我们用穷举法寻找最适合的单波长组合。发现在713nm和743nm下,检测模型的准确度最高。在以713nm与743nm的光密度差别进行检测时,分辨正常核棕色核的正确率达95.4%,只有5.3%的正常梨被误检为棕色梨,4.3%的棕色梨被误检为正常梨。
【英文摘要】Brown core is an internal disorder sometimes seen in pears under controlled atmosphere (CA) storage. The symptoms are notexternally recognizable and visible only after cutting the fruit. Development of nondestructive measurements of brown core of pearswould benefit producers, processors, and packers. A technique using body transmittance in the 651 – 1282 nm region was evaluatedas a nondestructive technique for identifying the Chinese pear Yali with brown core. Based on the 651 – 1282 nm region, discriminantanalysis with Mahalanobis Distance (MD) analysis can discriminate between brown core and normal pears and grade the brown core pears to three classes—slight, moderate, and severe. None of the good pears was misclassified as brown core, and none of pears with brown core was misclassified as normal pears. Exhaustive searches of the best combination of individual chrematistic wavelengths were performed on a set of 66 pears from two categories – good and brown core. The best modeling classification occurred for precisely aligned pears using the difference at two wavelengths, 713 and 743 nm. When optical density (OD) difference between 713 and 743 nm was applied to a test set, the classification model correctly identified the good or brown core with 95.4% accuracy. Only 5.3% of the good pears were incorrectly classified, 4.3% error of pear with brown core were classified as good fruit.

【题目】Determination of Soluble Solids Content in Fuji Apples Based on AOTF-NIR and Artificial Neural Networks.
【中文关键词】苹果 近似程度 近红外 主成分 可溶性固形物含量
【英文关键词】Apple Artificial neural networks degree of approximation near infrared principal components soluble solids content
【中文摘要】完整苹果中的可溶性固形物含量可通过声光可调滤波技术的近红外光谱方法来确定。利用遗传算法在1065nm—1625nm区间选择波长。基于遗传算法的偏最小二乘法回归模型用来和不可变选择进行比较。然后,在对糖的特征吸收谱带和低噪音的前提下,在所选能得到结果的大部分波长中优化分析。通过遗传算法风,光谱点由88个减少到17个,同时得到了最低的相对标准偏差(6.02%)和最高的矫正相关系数(0.914)。结果显示,结合遗传算法的PLSR不仅能够简化和优化曲线模型,而且能够提高曲线模型的预测效果。最后,我们得出,基于遗传算法的方法可以从特定光谱区域提取相关SSC信息,同时能去除没用的光谱点。
【英文摘要】Soluble solids content of intact apples has been predicted by artificial neural networks from their near-infrared spectra using an acousto-optic tunable filter. The principal components scores of spectral data were used as network input. The degree of approximation was performed to prevent over-fitting during network training. The optimum network topology was established with five input nodes, three hidden nodes, a learning coefficient of 0.2 and a momentum of 0.8. The corresponding best model had a correlation coefficient (r) of 0.877, a relative standard deviation of training (RSDc) of 7.59% and a relative standard deviation of prediction (RS Dp) of 8.38%. In addition, the network structure was more important for establishing the model than the parameters which did not have significant effect on the network. Compared with partial least squares regression after spectral pre-treatment (r=0.867, RSDC=7.86%, RSDP=8.76%), artificial neural networks had a little better prediction ability. Results showed that the methodology was satisfactory for rapid analysis of internal fruit quality.

【题目】小麦粉中过氧化苯甲酰数字色度检测方法的研究
【中文关键词】小麦粉 过氧化苯甲酰 检测
【英文关键词】Wheat flour benzoyl peroxide detection
【中文摘要】提出了一种基于计算机色度学的小麦粉中过氧化苯甲酰半定量检测方法。利用过氧化苯甲酰可使邻菲啰啉与Fe2+生成的橙红色络合物褪色的原理,用扫描仪获取褪色液的色度信息。研究结果表明,小麦粉中过氧化苯甲酰含量与褪色液的色度信息在一定范围内呈较好的线性相关关系。据此,可定性判定小麦粉中过氧化苯甲酰添加量是否超过国标,也可定量测定小麦粉中一定含量范围内的过氧化苯甲酰含量。该方法具有快速、简便、高效、成本低廉等优点,适合在基层质检单位推广使用。
【英文摘要】A semi-quantitative detection based on computer colorimetry were developed to detect benzoyl peroxide in wheat flour. The result was evaluated by scanner to get the chroma information of the fade-liquid based the special color reaction of benzoyl peroxide.The results shows good linearity between the contents of benzoyl peroxide in wheat flour and the chroma information of the fade liquid within a certain range.Therefore, it can be qualitatively determining whether the added amounts of benzoyl peroxide in wheat flour exceeds GB, the quantitatively determination of benzoyl peroxide content of the wheat flour coule be promising within a certain content range. With rapid, simple, efficient and less cost, the developed method could be promoted in grassroots quality control unit.

【题目】水果内部品质近红外光谱无损检测研究进展
【中文关键词】应用光学 近红外光谱 无损检测 化学计量学 光谱预处理 水果 内部品质
【英文关键词】applied optics near infrared spectroscopy nondestructive inspection chemometrics pretreatment fruit; interio r quality
【中文摘要】近红外(NIR) 光谱分级技术正越来越广泛地应用于水果的产后加工和质量评判中. 介绍了水果内部品质光学特性检测原理; 分析了规则反射、透射和漫反射3 种光特性测量方法在水果内部品质不同需求检测中的适用性;化学计量学方法是近红外光谱分析技术的一个重要部分, 对一些新的预处理方法和回归算法作了介绍; 探讨了水果状态对光谱影响及修正方法, 如温度补偿、大小修正等; 并阐述了水果的糖度、酸度、硬度等定量检测和褐变、黑心、水心、损伤等定性判别的国内外最新研究进展; 分析了近红外技术在水果品质检测和控制方面的应用前景.

【英文摘要】An overview of near infrared (NIR) spectroscopy for use in measuring quality attributes of horticultural produce is given. Nondestructive quality inspection and sorting technique based on NIR technique is widely used in post-harvest processing and quality control. Different spectrophotometer designs and measurement principles are compared, and novel techniques for the estimation of light absor pt ion and scatter ing pro per ties o f fruit tissue are reviewed. Chemometrics is an essential part of NIR spectroscopy, and some available preprocessing and regression techniques, including nonlinear ones, are discussed. The effects of orchard state on spectrum, and correction method, such as tem perature compensation, are addressed. Most applications of NIR spectroscopy have focused on the nondestructive measurement of soluble solids content of fruit where typically a root mean square error ofprediction of Brix can be achieved, and other applications involving texture, acidity or disorders of fruit have also been reported. Finally, the application prospects of this technology were analyzed.

【题目】直接竞争酶联免疫法检测大麦中玉米赤霉烯酮
【中文关键词】玉米赤霉烯酮 直接竞争酶联免疫 大麦
【英文关键词】Zearalenone ELISA Barley
【中文摘要】建立一种大麦中玉米赤霉烯酮的快速检测方法。采用酶联免疫吸附法(ELISA) 对玉米赤霉烯酮进行测定。该方法的最低检出限(IC15) 约为0.01 ug /kg, 灵敏度(IC15) 约为0.08 ug /kg, 大麦样品加标回收率在73.3% ~ 96.7%之间,最低检出限为4 ug /kg。此方法特异性强, 灵敏度高, 样品处理过程较为简单, 适用于大量样品的快速检测。
【英文摘要】To develop a method to determine the zearalenone(ZEN) in barley samples, enzyme-linked immunosorbent assay (ELISA) was adopted. The limit of detection (IC15) was about 0.01 μg /kg, and the sensitivity (IC15) was about 0.08 μg /kg. A simple and efficient extraction method for the rapid detection of ZEN residues in barley was developed.The method was effective and sensitive and the recovering rate of zearalenone in standard barley sample could range from 73. 3% to 96.7%.The limit of detection was 4 μg /kg in barley. The sample preparation was simple and the method is specific, which suited for the rapid analys is of a large number of samples.

【题目】基于遗传算法和间隔偏最小二乘的苹果硬度特征波长分析研究
【中文关键词】近红外光谱 硬度 遗传算法 间隔偏最小二乘法 苹果 果胶
【英文关键词】NIR Firmness GA iPLS Apple Pectics
【中文摘要】利用傅里叶近红外光谱(FT-NIRS)测定了苹果的硬度。通过使用几种基于遗传算法和间隔偏最小二乘法的特征波长选取方法,包括动态向后间隔偏最小二乘(dynamic backward version of interval PLS,dynamic biPLS)、动态向后间隔偏最小二乘结合遗传算法(dynamic biPLS & GA-PLS)和反复的遗传算法(iterative GA-PLS),分析了苹果硬度的特征波长。结果表明,运用遗传算法和间隔偏最小二乘选择特征波长后,不但可以降低模型的复杂度,同时能够达到提高模型预测精度的效果。在此基础上,研究分析了苹果硬度特征波长的物理化学意义。由于果胶是在苹果成熟过程中一种和硬度有很大关联的物质,通过比较苹果硬度的特征波长和果胶的特征吸收峰,发现两者具有有很好的一致性。因此,采用遗传算法和间隔偏最小二乘法得到的苹果硬度的特征波长能够反映果胶的吸收信息,从而解释了近红外技术检测苹果硬度的机理。

【英文摘要】In the present study,the fruit flesh firmness of apple was analyzed by near infrared(NIR)spectroscopy using an FT-NIR spectrometer.The sensitive spectral regions that provide the lowest prediction error were analyzed by different well-known variable selection methods,including dynamic backward interval partial least-squares(dynamic biPLS),sequential application of backward interval partial least-squares and genetic algorithm(dynamic biPLS & GA-PLS),and iterative genetic algorithm partial least-squares(iterative GA-PLS).Iterative GA-PLS,dynamic biPLS & GA-PLS led to a distinct reduction in the number of spectral data points with better predictive quality.Furthermore,the majority of selected wavelengths were content with the characteristic of the sorption bands of fruit flesh firmness.Pectin constituents,complex non-starch polysaccharides,which are related to texture change in apple,play an important role in their harvest maturity,ripening and storage.Comparing NIR characteristic wavelengths of apple flesh firmness and typical absorption bands for pectin,it was found that characteristic wavelengths of apple flesh firmness were consistent with the pectins relevant spectral regions.Therefore,the NIR characteristic wavelengths of apple firmness based on GA and iPLS reflected the chemical component of apple and the results were reasonable

【题目】基于中波近红外光谱的苹果汁品种产地鉴别研究

【中文关键词】苹果汁 近红外光谱 漫透射

【英文关键词】Apple juice near-infrared spectroscopy diffuse transmission classification SI MCA

【中文摘要】收集五种新鲜苹果(红富士、嘎拉、美国青苹果、美国加利果、国产青苹果)并榨汁, 利用浸入式光纤, 采集其透反射近红外光谱, 对苹果汁进行定性分析. 结果表明, 在1 00 一1 380 nln 波段内, 应用SI M-CA 法建立的近红外光谱判别模型可准确鉴别苹果汁的品种及产地。红富士与其他苹果汁、国产青苹果与其他苹果汁的分类模型中, 预测集的识别率均为10 %, 嘎拉、美国加利果等的识别率也较好。SNV 预处理能够显著提高模型的识别能力, 经SN V 处理后, 各分类模型的识别率均在85 %以上。本研究表明, 基于中波近红外的透反射光谱, 结合化学计量学方法, 为苹果汁品质的定性分析提供了一种快速无损的检测方法。

【英文摘要】Fresh apple juices were extracted from five categories of apples,containing Fuji,Chinese Gala,American green apple,AmericaIl Gala,and Chinese green apple. In order to quantitatively amlyze the apple juices,the immerging fiber was used to conlect the transnectance near infrared spectra of the juices.Results showed that in the wavelength rarlge of 1 000—1 380 nm,the combination of soft independent modeling 0f class analogy(SlMCA)could be used to discmimte the categories and producing area of the apple juices. The classification accuracies of Fuji juices,Chinese green apple juices and other juices,were all 100%.The classification Results of Chinese Gala and American Gala were also acceptable pretreannent could improve the discrim-ination ability of the model. After SNV processing,the classification accuracies of all binary models were over 85%.The results indicated that the middle wavelength NIR spectroscopy,combined with chemometrics,provided a fast and non-destructive method forquantitatively analyzing the quality of apple juices.

【题目】鸡蛋品质检测系统的图像处理的技术研究

【中文关键词】鸡蛋 图像处理 矢量中值滤波 边缘检测 阈值分割

【英文关键词】egg image processing vector median filtering edge detection threshold segmentation
【中文摘要】鸡蛋品质检测系统中的图像处理主要涉及图像平滑、边缘检测和图像分割三个方面。本研究采用矢量中值滤波的方法对鸡蛋的彩色图像进行平滑去噪,很好的保护了彩色图像色度信息。选用Prewitt算子检测图像边缘。经过反复试验,选取全局阈值进行图像分割,将目标鸡蛋图像从背景中分离出来。研究和实验结果表明,使用本实验的图像处理技术可以精确地提取鸡蛋品质检测的图像信息,为开发鸡蛋在线检测系统提供了技术基础
【英文摘要】The image processing in egg quality detection system mainly involves image smoothing,edge detection and image segmentation. In the present study,the vector median filtering method was applied to smooth the image to protect the information of the color image. The prewitt edge operator was used to detect the image edge. After repeated experiment,a overall image segmentation threshold was selected to separate the target egg image from the background. Results showed that the image processing technology presented in this study can be used to accurately extract image information of egg

【题目】小尾寒羊不同部位羊肉理化特性及肉用品质的比较
【中文关键词】小尾寒羊 理化特性 肉用品质 评价指标
【英文关键词】small-tail sheep physico-chemical properties meat quality index of evaluation
【中文摘要】以我国著名的优良品种小尾寒羊为研究对象,对其不同分割部位(脊背、腰窝、肋条、前腿、后腿、腱子)羊肉的理化特性进行测定,并对其熟制品(牙签肉)食用品质进行比较。结果表明,根据理化性质不同可将不同分割部位分成臀

腿部和躯干部两部分,肉品的脂肪含量、颜色、失水率、剪切力、肌纤维直径和密度有显著差异(p<0.05)。肌肉脂肪含量明显影响羊肉产品风味,可作为羊肉风味的评价指标。肌纤维的组织学特性和剪切力都可作为嫩度的评价指标。肋条和腰窝部位肌肉脂肪含量较高,肌肉肌纤维直径细、密度大,系水力较强,剪切力小,肉质较嫩,香气浓郁,因此具有较好的食用品质,是制作烧烤涮羊肉制品的最佳原料。

【英文摘要】The native breed small-tail han sheep was studied on composition,texture properties and meat quality in different parts of ovine carcass (back,lumbar,ribs,front legs,hind legs,and tendon). Sensory evaluation of the products processed by meat cuts was conducted. The results showed that the six anatomical parts can be classified to two groups: legs and trunk,according to physico-chemical properties and texture properties. Between two parts for legs and trunk,the fat content of meat,color,water-holding capacity,share force,muscle fiber diameter and density are significantly different (p<0.05). The fat content in muscle affects the flavor of mutton products,and it can be used as the main index for flavor evaluation. Shear force,muscle fiber diameter and density can be used as the main index for muscle tenderness evaluation. The parts of lumbar and ribs haves higher fat content and water-holding capacity,thinner muscle fiber diameter and smaller shear force,and they have good meat qualities such as intenderness and flavor. The parts of lumbar and ribs are the best raw materials for processing the products of barbeque or rinsed mutton.

【题目】砂梨糖度近红外光谱波段遗传算法优化

【中文关键词】近红外光谱 遗传算法 波段优化 糖度 砂梨 多品种模型

【英文关键词】FT-NIR spectroscopy Genetic algorithms Region optimization Soluble solid content (SSC) Pyrus pyrifolia Mixed model

【中文摘要】遗传算法不受搜索空间限制性假设的约束, 利用简单的编码技术和繁殖机制来解决复杂近红外光谱数据的优化问题。文章采用遗传算法的波段选择法(R-SGA) 对砂梨近红外光谱进行了波段优化, 得到丰水、圆黄、黄金三种梨的R-SGA最佳因子数分别为10, 12和16, 并分别建立了单一品种GA-PLS模型; 丰水梨和黄金梨的GA-PLS模型精度高于全谱PLS模型, 其模型的RMSEP分别为0.608 /0.632和0.524 /0.540;圆黄梨GA-PLS模型精度(RM SEP= 0.610) 与全谱PLS模型(RMSEP= 0.595)相当。经波段优化分析表明,使用552个数据点建立多品种砂梨混合模型, 具有较高稳健性和预测性(RMSEC= 0.627, RMSEP= 0.641)。结果表明: 基于遗传算法进行波段优化可以提高砂梨糖度模型精度, 提高建模效率, 同时说明建立多品种砂梨糖度通用模型是可行的。

【英文摘要】Genetic algorithm is widely used in NIRS data optimization, which is not limited by searching space. The region selecting by genetic algorithms(R-SGA) was applied in building calibration model of soluble solid content (SSC) of Pyrus pyrifolia, and the number of variables used to build calibration was further reduced from 2075 to 690 in all of 3 models. Studies were performed to build GA-PLS models by different R-SGA latent variables, and the optimal R-SGA latent variables of H osui, W onhwang and W hangkeumbae pear were 10, 12 and 16, respectively. The R-SGA procedure was found to perform well (RMSEP= 0.608 and 0.524 for H osui andW hangkeumbae pear respectively) , leading to ca libration models that significantly outperform those based on full-spectrum analyses (RM SEP =0.632, 0.540). The prediction precision of GA-PLS models was similar to FULL-PLS for W onhwang pear, with RMSEP of 0.610 /0.595. In addition, the selected regions from R-SGA methods were used to build mixed model of 3 Pyrus pyrifolia varieties. The results indicated that the prediction precision of GA-PLS model was close to that of the full spectrum model, with RMSEP of 0.641 and 0.645,respectively. This work proved that the R-SGA could find optimal values for several disparate variables associated with the calibration model and that the PLS procedure could be integrated into the objective function driving the optimization, and it was feasible to build a universal model of different Pyrus pyrifolia varieties.

【题目】芒果内部品质的CCD-NIR无损检测试验研究
【中文关键词】近红外 芒果 CCD 小波变换 内部品质
【英文关键词】The near infrared Mango wavelet transform internal quality
【中文摘要】以"台农"芒果为研究对象,使用CCD近红外光谱仪采集芒果的漫反射光谱信息,并应用近红外定量分析技术开展了芒果内部品质的检测研究。用偏最小二乘回归(partial least square repression,PLSR)方法在580~1000nm光谱范围内,分别建立了芒果可溶性固形物(糖度)和硬度的近红外定量分析模型。结果表明,糖度,硬度的相关系数(r)分别达到0.8629和0.8308,预测误差均方根(PMSEP)分别为1.3274(°Brix)和4.7757(N.cm -2).在此基础上,根据CCD光谱本身含噪声较大的特点,我们采用了小波变换来对谱图进行了去噪处理,以提高检测精度。通过分析haar,db,sym,bior,coif,dmey六族小波基,取不同的阶数,在不同分解尺度下,分别应用三种阈值(默认阈值、Birge-Massart阈值、Penalty阈值)进行去噪后,模型精度得到显著的提高。糖度,硬度的预测误差均方根(PMSEP)分别由1.3274(°Brix)和4.7757(N.cm -2)减少到1.2778(°Brix)和4.5284(N.cm -2).研究表明:可见/近红外漫反射技术可以应用于检测芒果的内部品质。
【英文摘要】The potential of near infrared spectroscopy (NIR) as a non-destructive method for determining the internal quality of mango fruits was studied.Quality of 108 mango fruits:soluble solids content (SSC),and firmness were determined. The spectra were obtained in the wavelength range from 580 to 1100 nm at two sites of each mango. On the basis of partial least square(PLS)regression,the models of SSC and fimmess of mango fruits were compared.The calibration model gave the correlation coefficients of 0.8629 and 0.8308 respectively,with the root mean square error of prediction(RMSEP)of 1.3274(°Brix)and 4.7757(N.cm-2)respectively.Discrete wavelet transfom Was used to eliminate the noise in the charge coupled device near-infrared((CCD-NIR)spectra of mango.The influence of three parameters(wavelet fuIlction,decomposition level,and threshold) on the predictive ability of calibration model was investigated.The RMSEP decreased from 1.3274 to1.2778 (°Brix)and 4.7757 to 4.5284(N.cm-2)respectively after wavelet denoisillg.NIR spectroscopy proved to be applicable to non-destructive determining the intemal quality attributes of mango fruits.

【题目】有机磷农药降解酶的基因克隆与重组表达
【中文关键词】有机磷 降解酶基因 克隆 重组表达
【英文关键词】Organophosphate Hydrolase gene Cloning Recombinant expression
【中文摘要】目的: 旨在从活性污泥中直接克隆有机磷农药降解酶基因, 使其在大肠杆菌中大量表达。方法: 利用土壤DNA提取技术从山东某农药厂活性污泥中提取DNA, 根据有机磷农药降解酶基因设计引物, 用巢式PCR 从活性污泥DNA中扩增特异性片段, 将该基因片段连接至表达载体pET- 30a(+)中, 并转化感受态细胞BL21(DE3), 经IPTG诱导表达重组蛋白, 并对诱导剂浓度和诱导时间进行优化。结果: 利用巢式PCR 从活性污泥DNA 中扩增出长度为1003 bp 的特异性片段, 将该片段测序并进行序列比对, 结果显示该片段与甲基对硫磷降解酶基因的同源性为99%, 且含有完整开放阅读框, 长度为993 bp; IPTG 诱导后获得分子量为411 7 kD 的重组表达蛋白; 经优化, IPTG 的最佳诱导浓度为01 1 mm o l/L, 最佳诱导时间

为5 h。结论: 成功克隆出有机磷农药降解基因并获得高效重组表达蛋白。
【英文摘要】Objective:To clone the organophosphate hydrolase gene (OPH) from activated sludge and express inE.coli.Methods: DNA was purified by soil DNA isolation kit from of a pesticide factory in Shandong Province.A DNA fragment was amplified by nested PCR with the primers designed according to organophosphate hydrolase genes.The open reading frame was subcloned into pET- 30a(+) plasmid and transferred into E.coli BL21 (DE3).After being induced by IPTG, a recombinant prote in protein was largely expressed in the cells, and recom binant expressing conditions (such as concentration of IPTG and inducing period) was studied and optimized.Results: A 1003 bp DNA fragment was amplified by nested PCR and sequencing result indicated that the fragment contained a 993 bp full open reading frame. Blast analys is showed that the homology between the fragment and methyl parathion hydrolase gene was high to 99% .After being induced by IPTG, a prote in with molecular weight of 4117 kD was largely expressed in the cells.The result of optimization of recombinant expressing conditions showed that the optimal concentration of IPTG was 0.1 mmol/L and the optimal inducing period was 5 hours.Conclusion: OPH has been successfully cloned and largely expressed in E.coli.

【题目】小反刍兽疫病毒N、H和F蛋白的真核表达
【中文关键词】小反刍兽疫病毒;真核表达;重组质粒;转染
【英文关键词】Peste des petits ruminants virus;eukaryotic expression;recombinant plasmid, transfection
【中文摘要】目的构建小反刍兽疫病毒(PPRV)H、N、F、NF重组真核表达质粒并观察其在真核细胞内的表达情况。方法采用逆转录聚合酶链式反应(RT-PCR)技术,从病羊组织中扩增PPRV的N、H、F基因序列并克隆到真核表达载体pIRES1neo中,最后用PCR、酶切和序列分析对重组质粒进行鉴定;将重组质粒以磷酸钙介导法转染Vero细胞,用免疫荧光方法鉴定其在细胞中的表达。结果将RT-PCR产物电泳,得到与预期大小相符的特异性片段;重组质粒经pIRES1-N、pIRES1-H、pIRES1-F和pIRES1NF酶切后,均出现预期相符的片段;DNA测序表明插入片段的序列与小反刍兽疫病毒N、H、F蛋白基因序列完全一致,其大小分别为1575bp、1830bp和1641bp;将重组质粒感染真核细胞,经免疫荧光检测,证明所有蛋白均得到表达。结论成功构建了重组真核表达质粒pIRES1-N、pIRES1-H、pIRES1-F和pIRES1NF,为继续进行基因免疫研究奠定了基础。
【英文摘要】Objective To construct recombinant eukaryotic expression plasmids carrying peste des petits ruminants virus (PPRV) H、N、F、NF gene and analyze their expression in eukaryotic cell line. Methods The PRRV N、H、F gene sequences were amplified by reverse transcription-polymerase chain reaction (RT-PCR) technology from the sick goat tissue and cloned into eukaryotic expression vector pIRES1neo. The recombinant plasmids were verified by PCR、restriction enzyme digestion and DNA sequencing. The recombinant vector was transfected into vero cell line with calcium acid phosphate transfection reagent. The expression of N, H, F and NF gene were analyzed by immunofluorescence. Results the RT-PCR product was subjected to electrophoresis and specific fragment was acquired; the recombinant plasmids were digested resulting in expected by restriction enzyme fragments. The DNA sequence of the 1575bp, 1830bp, 1641bp fragments were identical with N, H, F and NF cDNA in Genebank. The immunofluorescence result shows that N, H, F and NF were expressed successfully in vero cell line. Conclusion The recombinant plasmids pIRES1neo-N、pIRES1neo-H、pIRES1neo-F and pIRES1neo-NF were constructed successfully, which will provide the foundation for further research on gene immune.

【题目】山东沿海缢蛏的繁殖生物学研究
【中文关键词】缢蛏; 繁殖周期; 环境因子
【英文关键词】null
【中文摘要】自2007 年4 月~ 2008 年3 月对山东省黄河三角洲缢蛏的繁殖周期及其与环境因子(温度、盐度和叶绿素a 含量) 的关系进行了研究。环境因子的分析结果显示温度和叶绿素a 含量存在明显的季节变化, 而盐度则无明显变化。组织学观察显示, 配子发生开始于6~ 7 月, 水温为22. 0~ 27. 8 e , 大部分个体在9 至10 月成熟, 10 月后大规模产卵, 此时水温和叶绿素a 含量开始下降。结果表明, 水温和叶绿素a 的含量影响缢蛏的配子发育。缢蛏的卵细胞直径成显著的周年变化(P < 0. 05) , 从6 月(22. 6 Lm) 开始增加, 11 月达最大值(66. 3 Lm) 。随着产卵的发生, 卵径急剧减小, 至1 月, 卵径降低至29. 7 Lm。卵径周年变化与发育周期具有明显的相关性, 表明卵径可以作为判断缢蛏性腺成熟度的1 个良好指标。

【题目】Enrichment of a set of microRNAs during the cotton fiber development.
【中文关键词】棉花;miRNA;纤维
【英文关键词】cotton; miRNA; fiber
【中文摘要】Background: Cotton (Gossypium hirsutum) is one of the most important economic crops and provides excellent fibers for textile manufacture. In addition to its industrial and agricultural importance, the fiber cell (plant trichome) also is a biological model system for exploring gene expression and regulation. Small RNAs regulate many aspects of plant growth and development. However, whether small RNAs are involved in regulation of fiber cell development is unknown. Results: We adopted a deep sequencing approach developed by Solexa (Illumina Inc.) to investigate global expression and complexity of small RNAs during cotton fiber initiation and development. We constructed two small RNA libraries prepared from wild type (WT) and fuzz/lintless (fl Mutant in the WT background) cotton ovules, respectively. Each library was sequenced individually and generated more than 6-7 million short sequences, resulting in a total of over 13 million sequence reads. At least 22 conserved candidate miRNA families including 111 members were identified. Seven families make up the vast majority of expressed miRNAs in developing cotton ovules. In total 120 unique target genes were predicted for most of conserved miRNAs. In addition, we identified 2 cell-type-specific novel miRNA candidates in cotton ovules. Our study has demonstrated significant differences in expression abundance of miRNAs between the wild-type and mutant, and suggests that these differentially expressed miRNAs potentially regulate transcripts distinctly involved in cotton fiber development. Conclusion: The present study is the first to deep sequence the small RNA population of G. hirsutum ovules where cotton fibers initiate and develop. Millions of unique miRNA sequences ranging from 18~28 nt in length were detected. Our results support the importance of miRNAs in regulating the development of different cell types and indicate that identification of a comprehensive set of miRNAs in cotton fiber cells would facilitate our understanding of the regulatory mechanisms for fiber cell initiation and elongation.

【题目】Transcriptome profiling of early developing cotton fiber by deep-sequencing reveals significantly differential expression of genes in a fuzzless/lintless mutant
【中文关键词】棉花;转录本;miRNA
【英文关键词】cotton; transcriptome; miRNA
【中文摘要】棉花是重要的经济作物。棉花纤维是由胚珠外表皮细胞发育分化而成的一种单细胞结构,是研究植物表皮毛细胞分化和伸长的理想材料。但是棉纤维发育的基因表达调控机理进展缓慢。新兴的转录组表达谱测序技术成为研究纤维发育基因及其调控网络的有力工具。为了对棉纤维发育提供更多信息,本研究应用高通量的数字表达谱方法,利用陆地棉徐州142(野生型WT,Xu142)及其无绒无絮突变体(fuzzless/lintless: M),分析了棉纤维发育过程中基因的表达谱,从而为阐述棉纤维细胞初始发育和快速伸长的机理打下基础。分别构建4个基因表达文库,包括WT1(-2~1 DPA,days post anthesis)、WT2(2~8 DPA)、M1(突变体-2~1 DPA,)及M2(2~8 DPA)。对每个表达文库进行标签高通量测序(tag-sequencing或tag high throughput deep sequencing)。每个库测到3.5~3.8 M的总标签数,包含约0.7~1M的标签种类,去除低质量标签后分别得到2,973,104; 3,139,306; 2,943,654和3,392,103的序列数(WT1, WT2, M1和M2),包含357,852; 280,787; 372,952和382,503的标签种类数。将这些标签比对到TIGR数据库(http://www.tigr.org),约有15%的标签种类能够比对到参考基因库,31.4%的基因能够被测到。每个文库测到的基因数为:WT1: 23,854; WT2: 24,442; M1: 23,497; M2: 19,957。将上述比对得到的正义链基因在四个库中进行两两比对,寻找差异表达基因进行分析。从本实验数据上找到了以前已发表的27个纤维发育相关基因,并对其进行了表达谱分析。此外,本实验室2009年在棉胚珠及纤维中克隆到了111个保守miRNA并预测了99个靶基因,其中43个miRNA对应的62个靶基因在本次测序中被测到。在82对miRNA-潜在靶标中,有40对(~50%)存在负相关关系,包括33个基因,初步诠释了miRNA在该调控网络中的作用。
【英文摘要】Cotton fiber as a single-celled trichome is a biological model system for studying cell differentiation and elongation. However, the complexity of its gene expression and regulatory mechanism allows only marginal progress. Here, we report the high-throughput tag-sequencing (Tag-seq) analysis using Solexa Genome Analyzer platform on transcriptome of -2~1 (fiber initiation, stage I) and 2~8 (fiber elongation, stage II) days post anthesis (DPA) cotton (Gossypium hirsutum) ovules (wildtype: WT, Xuzhou 142 and its mutant: fuzzless/lintless or fl M, in the same background). To this end, we sequenced 3.5 to 3.8 million tags representing 0.7 to 1.0 million unique transcripts for each library (WT1, WT2, M1 and M2). After removal of low quality tags, we obtained a total of 2,973,104, 3,139,306, 2,943,654 and 3,392,103 clean sequences that corresponded to 357,852, 280,787, 372,952 and 382,503 distinct tags for WT1, WT2, M1 and M2, respectively. All clean tags were aligned to the publicly available cotton transcript database (TIGR, http://www.tigr.org). About 15% of the distinct tags were uniquely mapped to the reference genes and 31.4% of existing genes were matched by tags. The tag mapping to the database sequences generated 23,854, 24,442, 23,497 and 19,957 annotated genes for WT1, WT2, M1 and M2 libraries, respectively. Analyses of differentially expressed genes revealed the substantial changes in gene number and abundance between the wildtype and mutant libraries. Overall, our deep-sequencing analyses demonstrate the high degree of transcriptional complexity in early developing fibers and represent a major improvement over the microarrays for analyzing transcriptional changes on a large scale.

【题目】小反刍兽疫病毒RT_LAMP检测方法的建立
【中文关键词】小反刍兽疫病毒;逆转录环介导等温核酸扩增;检测
【英文关键词】Peste des petits ruminants virus;Reverse-transcription loop-mediated isothermal amplification;detection
【中文摘要】利用逆转录环介导等温核酸扩增技术(RT-LAMP)建立了小反刍兽疫病毒快速检测方法,同时评价了该方法的灵敏性和特异性。结果表明,根据小反刍兽疫病毒N基因保守区域设计的LAMP引物能够在63°C恒温下,1小时内实现目的核酸的大量扩增,由于在检测前加入荧光指示试剂,检测结果可以直接用肉眼判断,避免了由于开盖检验带来的扩增产物污染导致的假阳性。该检测体系具有较高的特异性,只能特异性地检测目的病毒,与其他同属的病毒或类似病毒等无交叉反应;具有较高的检测灵敏度,比普通RT-PCR灵敏性高10倍,与荧光RT-PCR的灵敏度相当。
【英文摘要】A one-step,single tube,reverse-transcription loop-mediated isothermal amplification(RT-LAMP) assay was developed for the detection of Peste des petits ruminants virus(PPRV).A set of primers were designed based on the N gene reference sequences of the PPRV.The assay was optimized to amplify PPRV RNA by incubation at 63°C for 60 min.Without gel electrophoresis,the LAMP amplicon was visualized directly in the reaction tube by the addition of fluorescent detection regent for naked-eye inspection.The assay was specific for PPRV to detect different PPRV isolates,and there was no cross-reaction with other related viruses including Rinderpest virus,Canine distemper virus,and et al.The detection limit of the assay was similar to that of real-time RT-PCR and 10-fold higher than the conventional RT-PCR.This RT-LAMP assay has potential applications for clinical diagnosis as well as surveillance of PPR.

【题目】小反刍兽疫病毒分离株China/Tib/07辅助质粒及微型基因组的构建和鉴定
【中文关键词】小反刍兽疫病毒;微型基因组;eGFP;N蛋白;P蛋白;L蛋白
【英文关键词】Peste des petits ruminants virus;minigenome;eGFP; N protein;P protein;L protein
【中文摘要】本研究旨在构建小反刍兽疫病毒(PPRV)的辅助质粒和微型基因组并验证其功能,为建立PPRV反向遗传操作平台奠定基础。首先构建表达PPRV分离株China/Tib/07的N、P和L蛋白的辅助质粒pCI-N、pCI-P和pCI-L。通过间接免疫荧光试验验证3个辅助质粒转染细胞后的蛋白表达情况,并从mRNA水平上验证蛋白表达的正确性;扩增PPRV基因组两末端序列和eGFP报告基因,三者通过overlap-PCR连接并克隆至转录载体pOL-TV5中构建微型基因组。将构建的微型基因组分别与辅助病毒和3个辅助质粒进行共转染。经鉴定各辅助质粒完全正确,构建的微型基因组不论与辅助病毒还是与3个辅助质粒共转染,报告基因均表达。本试验成功构建了PPRV分离株的表达N、P和L蛋白的3个辅助质粒以及微型基因组,并用微型基因组验证了3个辅助质粒可以作为PPRV反向遗传操作的辅助质粒,为该病毒感染性克隆的构建奠定了基础。
【英文摘要】The research was conducted to construct and identify the support plasmids and minigenome of Peste des petits ruminants virus(PPRV) in order to lay a foundation for the establishment of a reverse genetic system for rescue of PPRV.Support plasmids of pCI-N,pCI-P and pCI-L according to the PPRV isolate,China/Tib/07,were constructed and functions were identified by IFA and RT-PCR after transfection.At the same time,the two end sequences of the genome of the PPRV isolate,along with the reporter gene of eGFP were amplified,then the 3 fragments were connected by overlap-PCR and cloned into the transcription vector,pOLTV5,the minigenome was constructed and then co-transfected with the support virus and the 3 support plasmids respectively.As a result,the 3 support plasmids were identified to be correct and the reporter gene of eGFP expressed when the minigenome transfected with either the support virus or the 3 support plasmids.In conclusion,support plasmids of the N,P and L genes and minigenome of the PPRV were constructed successfully.Furthermore,the 3 plasmids worked well with the minigenome,which indicated that the 3 plasmids can work as the support plasmids for the study of reverse genetic operations of China/Tib/07.

【题目】一步法实时定量RT-PCR检测小反刍兽疫病毒方法的建立
【中文关键词】小反刍兽疫病毒; 一步法实时定量RT-PCR; 检测
【英文关键词】peste des petits ruminants virus; one-step real-time quantitative reverse transcriptase PCR; detection
【中文摘要】建立了检测小反刍兽疫病毒的快速、特异的基于Taqman的一步法实时定量RT-PCR方法。通过对GenBank已公布的小反刍兽疫病毒N基因序列进行序列比较分析,设计了一对特异性引物和一条Taqman探针。利用这对引物和探针对来自不同疫源地的小反刍兽疫病毒RNA样本进行检测,都获得了特异性扩增,但是,不与牛瘟病毒、海豚麻疹病毒等其他种的麻疹病毒属病毒发生交叉反应。本方法具有高度灵敏性,最低可检测到810拷贝的RNA模板。在模板浓度为8.1×102到8.1×108拷贝范围内,都呈现良好的线性关系,而且无论是组内和或组间重复的变异系数都很低。
【英文摘要】In this study, a rapid and specific TaqMan-based, one-step real-time quantitative reverse transcriptase PCR (qRT-PCR) is developed for the detection of peste des petits ruminants virus (PPRV). Primers and probe were designed based on the nucleocapsid protein gene sequence. The specificity of the assay was assessed by detecting PPRV isolates of different lineage. The analytical sensitivity of the real-time qRT-PCR assay was achieved through the construction of in-house PPRV cRNA standard for generation of a standard curve. The real-time qRT-PCR assay is capable to detect all PPR viruses and none of the other morbilliviruses. The sensitivity of the assay was found to be 810 RNA copies per reaction. And the assay has a linear range from 8.1×102 to 8.1×108 copies as well as excellent intra-assay and interassay reproducibilities.

【题目】中国西藏小反刍兽疫病毒China/Tib/Gei/07-30磷蛋白基因的分子特征及其编码蛋白特性分析
【中文关键词】小反刍兽疫病毒; 磷蛋白; C蛋白; V蛋白; 核苷酸序列; 基因编辑
【英文关键词】peste des petits ruminants virus;phosphoprotein;C protein;V protein;nucleotide sequence
【中文摘要】对我国西藏小反刍兽疫病毒野生株China/Tib/Gej/07-30进行磷蛋白基因序列测定,并进行分子生物学特征分析。首先应用逆转录聚合酶链式反应扩增出病毒磷蛋白基因片段,对聚合酶链式反应产物进行直接测序,然后对测定的核苷酸和推测的氨基酸序列进行比较分析。小反刍兽疫病毒China/Tib/Gej/07-30磷蛋白基因由1 655个核苷酸组成,编码2个相互交叠的开放阅读框(ORF)。第一个ORF长度为1 530个核苷酸,编码的P蛋白长度为509个氨基酸。第二个ORF长度为534个核苷酸,编码的C蛋白长度为177个氨基酸。第一个ORF通过基因编辑在751位插入1个G核苷酸,转录生成第二个mRNA,长度为897个核苷酸,编码的V蛋白长度为298个氨基酸。小反刍兽疫病毒China/Tib/Gej/07-30的P蛋白与其他分离株氨基酸序列同源性为86.1%~97.3%,C蛋白氨基酸序列相似性为84.3%~94.9%,V蛋白为82.9%~96.3%。China/Tib/Gej/07-30的P蛋白第315~387位氨基酸是一段高度保守的七肽重复序列。
【英文摘要】The nucleotide sequences of P gene from a field strain of peste des petits ruminants virus(PPRV)("China/Tib/Gej/07-30") was firstly determined.The P gene is 1,655 nucleotides long with two overlapping open reading frames(ORFs).The first ORF is 1,530 nucleotides long and would produce P protein of 509 amino acid residues.The second ORF is 534 nucleotides long and would produce C protein of 177 amino acid residues.The first ORF produces a second mRNA transcript of 897 nucleotides long with an extra G nucleotide at position 751.Translation from this mRNA would produce V protein of 298 amino acid residues.The nucleotide and deduced amino acid sequence were compared with the homologous region of other PPRV isolates.At the amino acid level,the "China/Tib/Gej/07-30" shares homology of 86.1%-97.3%,84.3%-94.9%,and 82.9%-96.3% for P,C,and V proteins respectively.Several sequence motifs in the P genes were identified on the basis of conservation in the PPRVs and the morbilliviruses.

【题目】中国西藏小反刍兽疫病毒野生株China-Tib-Gej-07-30基质蛋白基因和融合蛋白基因的分子特征分析
【中文关键词】小反刍兽疫病毒;野生株;基质蛋白;融合蛋白;非编码区;核苷酸序列
【英文关键词】peste des petits ruminants virus; field strain; matrix protein; fusion protein; untranslated region; nucleotide sequence
【中文摘要】对我国西藏小反刍兽疫病毒野生株China/Tib/Gej/07-30进行基质蛋白(M)和融合蛋白(F)基因序列测定,并进行分子生物学特征分析。首先应用逆转录聚合酶链式反应扩增出M和F基因片段,对聚合酶链式反应产物进行直接测序,然后对测定的核苷酸和推测的氨基酸序列进行比较分析。China/Tib/Gej/07-30的M基因由1483个核苷酸组成,编码335个氨基酸,与其他分离株核苷酸和氨基酸序列同源性分别为92.4%~97.7%和97.0%~98.2%。F基因由2411个核苷酸组成,编码546个氨基酸,与其他分离株核苷酸和氨基酸序列同源性分别为85.5%~96.1%和94.3%~98.2%。China/Tib/Gej/07-30的F蛋白含有信号肽序列和跨膜结构域,序列高度变异。F蛋白第104~108位和第109~133位氨基酸位点分别是高度保守的裂解位点和融合肽结构域。F蛋白还含有序列高度保守的三个七肽重复区。China/Tib/Gej/07-30的M基因3′端的非编码区(UTR)长度为443个核苷酸,GC含量高达68.4%,与其他PPRV毒株的同源性为82.4%~93.5%。China/Tib/Gej/07-30的F基因5′UTR区长度为634个核苷酸,GC含量高达70.0%,与其他PPRV毒株序列相似性为76.2%~91.7%。
【英文摘要】The nucleotide sequences of M and F genes from a field strain of peste des petits ruminants virus(PPRV)("China/Tib/Gej/07-30")was firstly determined.The M gene was 1 483 nucleotides in length with a single open reading frame(ORF),encoding a protein of 335 amino acids.The F gene was 2411 nucleotides in length,encoding a protein of 546 amino acids.The resulting nucleotide sequence and the deduced amino acid sequences were compared with the homologous regions of other PPRV isolates.The nucleotide sequences of M and F genes of the "China/Tib/Gej/07-30" was 92.4%-97.7% and 85.5%-96.1% identical to other PPRV isolates,respectively,while a homology of 97.0%-98.2% and 94.3%-98.2% could be observed at the amino acids level

respectively.Several sequence motifs in the M and F genes had been identified on the basis of conservation in the PPRVs and the morbilliviruses.The 3 ’ untranslated region of M gene was 443 nucleotides in length with 82.4%-93.5% identical to other PPRV isolates.The 5 ’ untranslated region of F gene was 634 nucleotides in length with 76.2%-91.7% identical to other PPRV isolates.

【题目】基于最小二乘支持向量机的人民胜利渠灌区灌溉用水量预测
【中文关键词】灌区;需水量;最小二乘支持向量机;径向基函数;预测
【英文关键词】irrigation district; water demand; least squares support vector machine; radial basis function; forecast
【中文摘要】基于最小二乘支持向量机(LSSVM)良好的泛化能力和特点,以人民胜利渠灌区需水量为研究对象,选用径向基函数(RBF)作为核函数,建立了最小二乘支持向量机预测模型,对灌区需水量进行了模拟计算,用检验样本与灰色预测和基于RBF的神经网络模型的预测结果进行了比较,LSSVM预测的最大误差8.78%,平均误差4.90%。结果表明最小二乘支持向量机模型有较高的预测精度和较强的泛化能力,可为灌区水资源规划提供科学依据。
【英文摘要】Based on the good generalization ability of Support Vector Machine model, water consumption for the People's Victory Canal Irrigation district was studied. Radial basis function (RBF) was chosen as the kernel function, a least squares support vector machine (LSSVM) prediction model was set up. The irrigation water demands of the People ’ s Victory Canal Irrigation district for 8 years were simulated. The test samples were compared with the results of gray prediction and RBF-based neural network model. The maximum predicted error of SVM was 8.78%, and the average error of 4.90%. The results show that support vector machine model has higher prediction accuracy and stronger generalization ability. It can provide a scientific basis for irrigation water resources planning.

【中文摘要】核苷酸结合位点(NBS)类型抗病基因是植物抗病基因中最大的一个类别,也是近年来植物抗病分子育种研究的一大热点。本研究对玉米自交系B73全基因组中含有NBS结构的候选抗病基因进行了基因总数、类型、系统进化关系等分析。在B73全基因组中含有165个NBS结构的基因,远远少于水稻中的同类基因,按照N.端结构和亮氨酸富集区(LRR)结构,将其分为153个标准结构和12个非标准结构NBS基因。其中,标准结构基因又分为CC.NBS.LRR、CC.NBS、NBS、NBS—NBS、NBS—LRR、NBS.NBS—LRR、NBS.X、X.NBS等8个类型。系统进化树分析表明,NBS类型抗病基因存在明显的两大分支,与水稻的星状发散型分布有很大差异。通过基因家族分析,还发现了玉米NBS类型基因的复制现象,但发生复制的基因比例低于水稻,可能足造成玉米NBS抗病基因数目较少的原因之一。

【题目】Expression of Methyl Parathion Hydrolase in Pichia pastoris
【中文关键词】甲基对硫磷水解酶,高效表达
【英文关键词】Methyl Parathion Hydrolase,Pichia pastoris
【中文摘要】12 拷贝的甲基对硫磷水解酶表达盒被整合到P. pastoris的染色体上,超过55mg/l的甲基对硫磷水解酶分泌表达。
【英文摘要】In the Pichia pastoris expression system, increasing the copy number of the expression cassette often has the effect of increasing the amount of protein expressed. To improve the expression level of methyl parathion hydrolase (MPH), we constructed two integration vectors with four and eight direct repeats of the expression cassette using an in vitro multimerization approach. After two successive integrations, at least 12 copies of the MPH expression cassette were integrated into the P. pastoris chromosome. Under

shake-flask conditions, over 55 mg active MPH/l was secreted into the medium by the multicopy clones. The extracellular enzyme activity was about 10-fold higher for the multicopy clones than for clones containing a single copy of the gene. Further investigations revealed that the multicopy MPH expression cassette could remain stably integrated and functional over five generations. Note that the expression vector pRF constructed in our study can be not only used to construct multiple copies of the expression cassette in vitro, but also integrated into the P. pastoris genome without introducing any antibiotic resistance gene, which is desirable for production of biotherapeutic proteins.

【题目】Comparison of in-situ biodegrading abilities of Pseudomonas putida mutants: leuB- auxotroph, fliC- non-motility, and cheA- non-chemotaxis

【中文关键词】甲基对硫磷,原位降解,营养缺陷型,非运动型,非趋化型

【英文关键词】Methyl parathion,leuB auxotroph,fliC non-motility,cheA non-chemotaxis,In-situ biodegradation

【中文摘要】比较了营养缺陷型、非运动型和非趋化型细菌在土壤原位中降解甲基对硫磷农药的能力。

【英文摘要】Bioremediation of pollutants in natural environments is affected by many factors, such as bacterial survival, motility, and chemotaxis. However, these roles in in-situ biodegradation of organophosphorus pesticides have not been examined extensively. In this paper, a highly effective methyl-parathion (MP) degrading strain, Pseudomonas putida DLL-1, which also demonstrates motile ability and chemotactic response toward MP, was selected as the research material. A leuB auxotroph mutant A3-27 and fliC non-motility mutant a4-8 were first constructed by random insertion of the kanamycin gene into the chromosome of P. putida DLL-1 with the mini-transposon system. Biodegradation of MP in liquid medium and soil microcosms by A3-27, a4-8 and a previously constructed cheA non-chemotaxis mutant P. putida DAK were compared. The kinetic parameters for MP degradation were all similar in the wellmixed liquid systems. However, in soil microcosms, all the three mutants had lower degrading rates compared with wild-type P. putida DLL-1. The auxotroph mutant A3-27 had the lowest degrading rate and could only degrade 25.7 – 34.2% MP in 5 days, and the non-motility mutant a4-8 and non-chemotaxis mutant DAK could only degrade 53.5 – 68.1% and 64.3 – 85.7% MP, respectively. This paper emphasizes, for the first time, the use of non-auxotroph bacteria for efficient removal of organophosphorus pesticides in contaminated sites, and also points out the importance of select microorganisms with specific motile or chemotactic affinities in optimizing pesticide bioremediation.

【题目】Isolation of an isocarbophos-degrading strain of Arthrobacter sp. scl-2 and identification of the degradation pathway

【中文关键词】水胺硫磷,降解,降解途径

【英文关键词】Isocarbophos, biodegradation, Arthrobacter sp.scl-2, degradation pathway

【中文摘要】分离筛选到一株水胺硫磷的降解菌株Arthrobacter sp.scl-2,并阐明了其代谢途径。

【英文摘要】Isocarbophos is a widely used organophosphorus insecticide that has caused environmental pollution in many areas. However, degradation of isocarbophos by pure cultureshas not been extensively studied, and the degradation pathway has not been determined. In this paper, a highly effective isocarbophos-degrading strain, scl-2, was isolatedfrom isocarbophos-polluted soil. The strain scl-2 was preliminarily identified as Arthrobacter sp. based on its morphological, physiological, and biochemical properties,as

well as 16S rDNA analysis. The strain scl-2 could utilize isocarbophos as its sole source of carbon and phosphorus for growth. One hundred mg/l isocarbophos could be degraded to a nondetectable level in 18 h by scl-2 in cell culture, and isofenphos-methyl, profenofos, and phosmet could also be degraded. During the degradation of isocarbophos, the metabolites isopropyl salicylate, salicylate, and gentisate were detected and identified based on MS/MSanalysis and their retention times in HPLC. Transformation of gentisate to pyruvate and fumarate via maleylpyruvate and fumarylpyruvate was detected by assaying for the activitiesof gentisate 1,2-dioxygenase (GDO) and maleylpyruvate isomerase. Therefore, we have identified the degradation pathway of isocarbophos in Arthrobacter sp. scl-2 for thefirst time. This study highlights an important potential use of the strain scl-2 for the cleanup of environmental contamination by isocarbophos and presents a mechanismof isocarbophos metabolism.

【题目】Biochemical degradation pathway of dimethoate by Paracoccus sp. Lgjj-3 isolated from treatment wastewater

【中文关键词】乐果,降解途径

【英文关键词】Dimethoate,Degradation pathway,Biodegradation, Paracoccus sp. Lgjj-3, MS/MS, GC-MS

【中文摘要】分离筛选到一株乐果降解菌株Paracoccus sp. Lgjj-3,并阐明了其代谢途径。

【英文摘要】Dimethoate is a widely used organophosphorus insecticide often detected in the environment. A highly effective dimethoate-degrading Paracoccus sp. strain Lgjj-3 was isolated from treatment wastewater. Strain Lgjj-3 can utilize dimethoate as its sole carbon source for growth and degrade an initial concentration of 100 mg l 1 dimethoate to non-detectable levels within 6 h in liquid culture. During the degradation of dimethoate, seven metabolites, including dimethoate carboxylic acid, 2-(hydroxy(methoxy)phosphorylthio)acetic acid, O,O,S-trimethyl thiophosphorothioate, O-methyl O,S-dihydrogen phosphorothioate, phosphorothioic O,O,S-acid, O,O,S-trimethylphosphorothiate and O,O,O-trimethyl phosphoric ester, were successfully detected and identified based on MS/MS and GCeMS analysis. A biochemical degradation pathway of dimethoate by Paracoccus sp. Lgjj-3 is proposed for the first time. Dimethoate is first hydrolyzed by the scission of the amide bond to form dimethoate carboxylic acid, which is subsequently decarboxylated into O,O,S-trimethyl thiophosphorothioate. The produced O,O,S-trimethyl thiophosphorothioate is oxidized to form O,O,S-trimethylphosphorothiate and then further oxidized to form O,O,O-trimethyl phosphoric ester. O,O,S-trimethylphosphorothiate can also be hydrolyzed at the C-O bond to release a CH3 group and cleavaged at the SeC bond through a hydrolytic pathway to form O-methyl O,S-dihydrogen phosphorothioate. Dimethoate carboxylic acid can also be oxidated at the P]S bond to form the corresponding oxon derivative. Next, hydrolysis can occur at the C-O bond to form 2-(hydroxy(methoxy)phosphorylthio)acetic acid, which can be further hydrolyzed at the SeC bond to form O-methyl O,S-dihydrogen phosphorothioate. Phosphorothioic O,O,S-acid is finally formed by the hydrolysis of the CeO bond of O-methyl O,S-dihydrogen phosphorothioate to lose another CH3 group.

【题目】Co-metabolism of DDT by the newly isolated bacterium, Pseudoxanthomonas sp. Wax

【中文关键词】DDT,共代谢,生物修复

【英文关键词】DDT, Co-metabolism, Bioremediation, Pseudoxanthomonas sp.

【中文摘要】分离筛选到一株DDT共代谢的菌株Pseudoxanthomonas sp.wax,并对其共代谢特性进行了研究。
【英文摘要】Microbial degradation of 1,1,1-trichloro-2,2-bis(p-chlorophenyl)ethane (DDT) is the most promising way to clean up DDT residues found in the environment. In this paper, a bacterium designated as wax, which was capable of co-metabolizing DDT with other carbon sources, was isolated from a long-term DDTcontaminated soil sample by an enrichment culture technique. The new isolate was identified as a member of the Pseudoxanthomonas sp., based on its morphological, physiological and biochemical properties, as well as by 16S rRNA gene analysis. In the presence of 100 mg l-1 glucose, the wax strain could degrade over 95% of the total DDT, at a concentration of 20 mg l-1, in 72 hours, and could degrade over 60% of the total DDT, at a concentration of 100 mg l-1, in 144 hours. The wax strain had the highest degradation efficiency among all of the documented DDT-degrading bacteria. The wax strain could efficiently degrade DDT at temperatures ranging from 20 to 37 ° C, and with initial pH values ranging from 7 to 9. The bacterium could also simultaneously co-metabolize 1,1-dichloro-2,2-bis(p-chlorophenyl)ethane (DDD), 2,2-bis(p-chlorophenyl)-1,1-dichlorethylene (DDE), and other organochlorine compounds. The wax strain could also completely remove 20 mg kg-1 of DDT from both sterile and non-sterile soils in 20 days. This study demonstrates the significant potential use of Pseudoxanthomonas sp. wax for the bioremediation of DDT in the environment.

【题目】Jeotgalicoccus huakuii sp. nov., a halotolerant bacterium isolated from seaside soil
【中文关键词】新种
【英文关键词】Jeotgalicoccus huakuii sp. nov.
【中文摘要】鉴定了一株新种Jeotgalicoccus huakuii sp. nov.
【英文摘要】A Gram-stain-positive, oxidase- and catalase-positive, non-motile, non-spore-forming,halotolerant, coccoid bacterium, designated strain NY-2T, was isolated from a seaside soil sample from Shandong Province, China. Strain NY-2T was able to grow in the presence of 0 – 23% (w/v) NaCl and at pH 4.5 – 10.0 and 5 – 42 6C; optimum growth was observed with 3 – 8% (w/v) total salts and at pH 6.5 – 8.0 and 28 – 37 6C. Chemotaxonomic analyses, including fatty acid profiles, menaquinones and polar lipids, supported the affiliation of strain NY-2T to the genus Jeotgalicoccus. The predominant menaquinone of strain NY-2T was menaquinone 7 (MK-7)(100 %) and the major cellular fatty acids were iso-C15 : 0 (49.0 %) and anteiso-C15 : 0 (19.6 %). Cellular polar lipids were phosphatidylglycerol, diphosphatidylglycerol and several unidentified phospholipids. The DNA G+C content of strain NY-2T was 36.8 mol%. Based on 16S rRNA gene sequence analysis, strain NY-2T formed a coherent cluster with Jeotgalicoccus marinus JSM 076033T, Jeotgalicoccus halotolerans YKJ-101T and Jeotgalicoccus psychrophilus YKJ-115T. Phylogenetic analysis, DNA – DNA relatedness data, phenotypic characteristics andchemotaxonomic data indicated that strain NY-2T (5CCTCC AB 208288T 5JCM 15687T) should be classified as the type strain of a novel species of the genus Jeotgalicoccus, for which the name Jeotgalicoccus huakuii sp. nov. is proposed.

【题目】Degradation of methamidophos by Hyphomicrobium species MAP-1 and the biochemical degradation pathway
【中文关键词】甲胺磷,降解途径

【英文关键词】Biodegradation pathway,Facultative methylotroph,Hyphomicrobium sp. MAP-1,Methamidophos
【中文摘要】分离筛选到一株甲胺磷的降解菌株Hyphomicrobium sp. MAP-1,并阐明了其降解途径。
【英文摘要】Methamidophos is one of the most widely used organophosphorus insecticides usually detectablein the environment. A facultative methylotroph, Hyphomicrobium sp. MAP-1, capable of high efficiently degrading methamidophos, was isolated from methamidophos-contaminated soil in China. It was found that the addition of methanol significantly promoted the growth of strain MAP-1 and enhanced its degradation of methamidophos. Further, this strain could utilize methamidophos as its sole carbon, nitrogen and phosphorus source for growth and couldcompletely degrade 3,000 mg l-1 methamidophos in 84 h under optimal conditions (pH 7.0, 30 C). The enzyme responsible for methamidophos degradation was mainly located on the cell inner membrane (90.4%). During methamidophos degradation, three metabolites were detected and identified based on tandem mass spectrometry (MS/MS) and gas chromatography-mass spectrometry (GC – MS) analysis. Using this information, a biochemical degradationpathway of methamidophos by Hyphomicrobium sp.MAP-1 was proposed for the first time. Methamidophos is first cleaved at the P – N bond to form O,S-dimethyl hydrogen thiophosphate and NH3. Subsequently, O,S-dimethyl hydrogen thiophosphate is hydrolyzed at the P – O bond to release – OCH3 and form S-methyl dihydrogen thiophosphate. O,S-dimethyl hydrogen thiophosphate can also be hydrolyzed at the P – S bond to release – SCH3 and form methyl dihydrogen and methyl dihydrogen phosphate are likely transformed into phosphoric acid.

【题目】Hydrolytic dechlorination of chlorothalonil by Ochrobactrum sp. CTN-11 isolated from a chlorothalonil-contaminated soil
【中文关键词】水解脱卤,百菌清
【英文关键词】Hydrolytic dechlorination,chlorothalonil,Ochrobactrum sp. CTN-11
【中文摘要】分离筛选到一株百菌清水解脱卤菌株Ochrobactrum sp. CTN-11,并研究了其在土壤降解百菌清的特性。
【英文摘要】A bacterial strain, designated as CTN-11, capable of degrading chlorothalonil (CTN), was isolated from a chlorothalonil-contaminated soil in China. Based on the morphological, biochemical characteristics and comparative analysis of the 16S rRNA genes, strain CTN-11was identified as Ochrobactrum sp. Strain CTN-11 could degrade 50 mg l-1 CTN to a non-detectable level within 48 h, and efficiently degrade CTN in a relatively broad range of temperatures from 20 to 40 C and initial pH values from 6.0 to 9.0. The new isolate differed from those previously reported CTN co-metabolic degraders by transforming CTN in the absence of other carbon sources. A glutathione S-transferase (GST) coding gene, which showed 88% sequence similarity with that from Ochrobactrum anthropi SH35B, was cloned from strain CTN-11.However, the gene was not functionally expressed in the presence of glutathione, indicating that CTN was not reductively dechlorinated by thiolytic substitution catalyzed by GST in strain CTN-11. The metabolite hydroxyltrichloroisophthalonitrile (CTN-OH) produced during CTNanaerobic degradation was identified based on tandem MS/MS, confirming that hydrolytic dechlorination was involved in the CTN degradation. The removal of CTN by strain CTN-11 in sterile and non-sterile soils was also studied. In both soil samples, 50 mg kg-1 CTN could bedegraded to an undetectable level within 3 days. This study highlights an important potential use of strain CTN-11 for the cleanup of CTN-contaminated sites and presents a hydrolytic dechlorination reaction of CTN by a pure culture.

【英文摘要】An aerobic, Gram-negative bacterial strain, designated CTN-1T, capable of degradingchlorothalonil was isolated from a long-term chlorothalonil-contaminated soil in China, and was subjected to a polyphasic taxonomic investigation. Strain CTN-1T grew at 15 – 37 6C (optimum 28 – 30 6C) and at pH 6.0 – 9.0 (optimum pH 7.0 – 7.5). The G+C content of the total DNA was 67.1 mol%. Based on 16S rRNA gene sequence analysis, strain CTN-1T was related mostclosely to Lysobacter daejeonensis DSM 17634T (97.1% similarity), L. soli DCY21T (95.7 %),L. concretionis Ko07T (95.5 %), L. gummosus LMG 8763T (95.3 %) and L. niastensis DSM18481T (95.2 %). The novel strain showed less than 95.0% 16S rRNA gene sequence similarityto the type strains of other Lysobacter species. The major cellular fatty acids of strain CNT-1T were iso-C16 : 0 (23.0 %), iso-C15 : 0 (21.4 %) and iso-C17 : 1v9c (15.3 %). The major isoprenoid quinone was Q-8 (99 %), and the major polar lipids were diphosphatidylglycerol,phosphatidylethanolamine and phosphatidylglycerol. These chemotaxonomic data supported theaffiliation of strain CTN-1T to the genus Lysobacter. Levels of DNA – DNA relatedness betweenstrain CTN-1T and L. daejeonensis DSM 17634T were 34.6 – 36.1 %. Phylogenetic analysisbased on 16S rRNA gene sequences, DNA – DNA hybridization data and biochemical and physiological characteristics strongly supported the genotypic and phenotypic differentiation of strain CTN-1T from recognized species of the genus Lysobacter. Strain CTN-1T is thereforeconsidered to represent a novel species of the genus Lysobacter, for which the name Lysobacterruishenii sp. nov. is proposed. The type strain is CTN-1T (5DSM 22393T 5CGMCC 1.10136T).

【题目】Luteibacter jiangsuensis sp. nov.: a methamidohps-degrading bacterium isolated from a methamidophos-manufacturing factory.
【中文关键词】新种Luteibacter jiangsuensis sp. nov,甲胺磷降解
【英文关键词】Luteibacter jiangsuensis sp. nov,Methamidophos-Degrading
【中文摘要】分离筛选到一株甲胺磷降解菌株Luteibacter jiangsuensis sp. nov,并鉴定为新种。
【英文摘要】A Gram-stain-negative, non-motile, rod-shaped bacterial strain, JW-64-1T, capable of degrading methamidophos was isolated from a methamidophos-manufacturing factory in China, and was subjected to a polyphasic taxonomic investigation. Strain JW-64-1T produced circular,smooth, transparent, yellow-colored colonies (1.0 – 2.0 mm) on LB agar after 2 days incubation. It grew optimally at 25 – 30 Cand pH 7.0 without the presence of NaCl. TheG?Ccontent of the total DNA was 63.6 mol%. A phylogenetic analysis based on 16S rRNA gene sequences showed that strain JW-64-1T fell within the cluster comprising Luteibacterspecies. The 16S rRNA gene sequence of strain JW-64-1T was most closely related to Luteibacter rhizovicinusDSM 16549T (98.6%), followed by Luteibacter yeojuensis DSM17673T (98.4%) and L. anthropi CCUG 25036T (98.2%). The major cellular fatty acids of strain JW-64-1T were iso-C15:0 (24.1%), iso-C17:0 (20.2%) and summed feature 9 comprising iso-C17:1 x9c and/or C16:0 10-methyl (20.3%). The major isoprenoid quinine was Q-8 (98%), and the majorpolar lipids were diphosphatidylglycerol, phosphatidylglycerol, phosphoaminolipid, aminolipids-1, aminolipids-2, and phospholipids. The values for DNA – DNA relatednessbetween strain JW-64-1T and the closest phylogenetic relatives of L. rhizovicinus and Luteibacter yeojuensis were 34.8 ± 2.6 and 25.6 ± 3.1%, respectively. On the basis ofthe phenotypic, chemotaxonomic, DNA – DNA relatedness and phylogenetic analysis based on the 16S rRNA gene sequences, strain JW-64-1T represents a novel species of the genus Luteibacter, for which the name Luteibacter jiangsuensis sp. nov. is proposed. The type strain is JW-64-1T(=CGMCC 1.10133T = DSM 22396T).

【题目】Biodegradation of Pentachloronitrobenzene by Labrys portucalensis pcnb-21 Isolated from Pentachloronitrobenzene-polluted Soil
【中文关键词】五氯硝基苯,Labrys portucalensis pcnb-21
【英文关键词】Pentachloronitrobenzene, Labrys portucalensis pcnb-21
【中文摘要】分离筛选到一株五氯硝基苯的降解菌株Labrys portucalensis pcnb-21,并研究了其在土壤中降解五氯硝基苯的动态。
【英文摘要】A bacterial strain, pcnb-21, capable of degrading pentachloronitrobenzene (PCNB) under aerobic and anoxic conditions, was isolated from a long-term PCNB-polluted soil by an enrichment culture technique and identified as Labrys portucalensis based uponits morphological, physiological and biochemical properties, as well as 16S rRNA gene sequence analysis. Effects of different factors, such as temperature and pH, on PCNB biodegradation were studied. Strain pcnb-21 efficiently degraded PCNB at temperatures from20 to 30 ◦ C and initial pH values from 4 to 7, which might be the first time that a Labrys strain was found capable of efficiently degrading PCNB. The degradation of PCNB was affected by oxygen, and the degradation decreased with increasing aeration. Exogenous electrondonors such as glucose, lactic acid and succinic acid promoted the biodegradation of PCNB, while electron acceptors such as sodium nitrite, sodium sulfate, sodium nitrate and sodium sulfate inhibited PCNB biodegradation. The degradation of PCNB in sterile and non-sterile soils by a green fluorescent protein (GFP)-labeled strain, pcnb-21-gfp, was also studied. Cells of pcnb-21-gfp efficiently degraded 100 mg kg − 1 PCNB in sterile and non-sterile soils and could not be detected after 42 days. Strain pcnb-21 might be useful in bioremediating PCNB-polluted soils and environment.

【题目】Diversity of chlorpyrifos-degrading bacteria isolated from chlorpyrifos contaminated samples
【中文关键词】毒死蜱,生物降解,多样性
【英文关键词】Chlorpyrifos,Biodegradation,Diversity,mpd gene
【中文摘要】从毒死蜱污染的土壤中分离筛选了7株毒死蜱降解菌株DSP-1—DSP-7,表明存在丰富的多样性。
【英文摘要】Chlorpyrifos as an agricultural insecticide has been widely used and caused great pollution. As the toxicity of chlorpyrifos in the environment, exploration of various chlorpyrifos-degrading bacteria to clean-up the pollutant is of immense importance. Seven chlorpyrifos-degrading bacteria, named Dsp-1 to Dsp-7, were isolated from organophosphate pesticide-contaminated soil and water using a culture method with chlorpyrifos as the sole carbon source. Comparative studies were performed to study their morphological, physiological and biochemical characteristics. Based on these analysis, strains Dsp-2, Dsp-4, Dsp-6 and Dsp-7 were identified as Sphingomonas sp., Stenotrophomonas sp., Bacillus sp. and Brevundimonas sp., respectively, while all other strains were members of Pseudomonas sp. ERIC (enterobacterial repetitive intergenic consensus)-PCR fingerprints were used to distinguish strains Dsp-1 and Dsp-3 which had only 1 bp difference in 16S rDNA sequences. Significant differences in the ability of the bacteria to degrade chlorpyrifos and other organophosphate pesticides were found. The organophosphate pesticide hydrolase gene mpd were cloned from strains Dsp-1 to Dsp-4 with the PCR technique. Differences in amino acid sequence of mpd gene from the four bacteria strains were compared. These results showed that there were diversities of chlorpyrifos-degrading strains in the contaminated environment, and the chlorpyrifos-degrading strains had the potential to clean up the organophosphate pesticide-contaminated

environment.

【题目】Facilitation of Bacterial Adaptation to Chlorothalonil-Contaminated Sites by Horizontal Transfer of the Chlorothalonil Hydrolytic Dehalogenase Gene
【中文关键词】Horizontal Transfer,Chlorothalonil Hydrolytic Dehalogenase Gene
【英文关键词】水平转移,百菌清水解脱卤酶基因
【中文摘要】百菌清水解脱卤酶基因的水平转移促进了百菌清降解菌株对污染环境的适应。
【英文摘要】Horizontal transfer of the chlorothalonil hydrolytic dehalogenase gene (chd) is proposed based on the high conservation of the chd gene and its close association with a novel insertion sequence, ISOcsp1, in 16 isolated chlorothalonil-dechlorinating strains belonging to eight different genera. The ecological role of horizontal gene transfer is assumed to facilitate bacterial adaptation to chlorothalonil-contaminated sites, through detoxificationof chlorothalonil to less toxic 2,4,5-trichloro-6-hydroxybenzene-1,3-dicarbonitrile.

【题目】An isofenphos-methyl hydrolase (Imh) capable of hydrolyzing the P – O – Z moiety of organophosphorus pesticides containing an aryl or heterocyclic group
【中文关键词】有机磷农药脱毒,甲基异柳磷水解酶,底物特异性
【英文关键词】Organophosphate detoxification,Organophosphorus pesticide hydrolase,Isofenphos-methyl hydrolase (imh),Substrate specificity
【中文摘要】从菌株Arthrobacter sp. scl-2中克隆了一个甲基异柳磷水解酶基因,对该酶的底物特异性进行了详细的研究。
【英文摘要】Organophosphorus pesticide (OP) hydrolases play key roles in the degradation and decontamination of agricultural and household OPs and in the detoxification of chemical warfare agents. In this study, an isofenphosmethyl hydrolase gene (imh) was cloned from theisocarbophos-degrading strain of Arthrobacter sp. scl-2 using the polymerase chain reaction method. Isofenphosmethyl hydrolase (Imh) showed 98% sequence identity with the isofenphos hydrolase from Arthrobacter sp. strain B-5. Imh was highly expressed in Escherichia coli BL21(DE3), and the His6-tagged Imh was purified (1.7 mg/ml) with a specific activity of 14.35 U/mg for the substrate isofenphos-methyl. The molecular mass of the denaturedImh is about 44 kDa, and the isoelectric point (pI) value was estimated to be 3.4. The optimal pH and temperature for hydrolysis of isofenphos-methyl were pH 8.0 and35 ° C, respectively. The secondary structure of Imh shows that Imh is a metallo-dependent hydrolase, and it was found that Imh was completely inhibited by the metalloproteaseinhibitor 1,10-phenanthroline (0.5 mM), and the catalytic activity was restored by the subsequent addition of Zn2+. Interestingly, Imh had a relatively broader substratespecificity and was capable of hydrolyzing 12 of the tested oxon and thion OPs with the P – O – Z moiety instead of the P – S(C) – Z moiety. Furthermore, it was found that the existence of an aryl or heterocyclic group in the leaving group (Z) is also important in determining the substrate specificity. Among all the substrates hydrolyzed by Imh, it was assumed that Imh preferred P – O – Z substrates still with a phosphamide bond (P – N), such as isofenphos-methyl,isofenphos, isocarbophos, and butamifos. The newly characterized Imh has a great potential for use in the decontamination and detoxification of agricultural and householdOPs and is a good candidate for the study of the catalytic mechanism

and substrate specificity of OP hydrolases.

【题目】Horizontal transfer of dehalogenase genes involved in the catalysis of chlorinated compounds: evidence and ecological role
【中文关键词】卤代化合物,脱卤酶,水平转移
【英文关键词】Chlorinated compounds, dehalogenase genes, horizontal gene transfer (HGT), mobile genetic elements (MGEs), community adaptation
【中文摘要】脱卤酶基因的水平转移在代谢途径进化和群落适应方面发挥关键作用。
【英文摘要】Horizontal gene transfer (HGT) of dehalogenase genes is considered an important mechanism of genomic evolution, the metabolic resilience of biotopes, and microbial community adaptation in chlorinated compound-contaminated ecosystems. In this review, we summarize the current evidence for the HGT of dehalogenase genes involved in the catalysis of various chlorinated compounds, such as chlorinated alkanes and alkanoic acids, chlorinated ethenes, chlorinated herbicide, and chlorinated aromatics. We also highlight the ecological role of HGT as it relates to the contribution to the diversification of dehalogenating microorganisms and the resulting facilitation of rapid microbial community adaptation to ecosystem contaminated with chlorinated compounds

【题目】Preparation and Characterization of Nanoparticles Based on Hydrophobic Alginate Derivative as Carriers for Sustained Release of Vitamin D3
【中文关键词】褐藻酸,油酰氯,纳米粒,胃肠道稳定性,维生素D3
【英文关键词】Alginate, oleoyl chloride, nanoparticles, gastrointestinal stability, vitamin D3
【中文摘要】在水相中通过海藻酸同油酰氯反应制备疏水性海藻酸衍生物。FT-IR和1 H NMR证明成功制备了油酰基化海藻酸钠酯(OAE)。 OAE的取代度(DS)由1H NMR,它介于0.84至3.85之间。在蒸馏水中,OAE形成自组装的纳米粒子。在

在低浓度水介质、模拟胃液(SGF),模拟肠液(SIF)纳米粒子保留它们的结构完整性。以维生素D3作为一种模型营养物质,对OAE纳米粒子载药量和释放特性进行了研究。随维生素D3的浓度的增加,负载能力(LC)增加,而包封率(LE)的下降。纳米粒子可在胃肠液中持续释放维生素D3。这些结果揭示了纳米粒可以作为持续释放维生素D3口服载体。

【英文摘要】ABSTRACT: Hydrophobic alginate derivative was prepared by modification of alginate by acid chloride reaction using oleoyl chloride without organic solvents. The conjugate of oleoyl alginate ester (OAE) was confirmed by FT-IR and 1H NMR. The degree of substitution (DS) of OAE was determined by 1H NMR, and it ranged from 0.84 to 3.85. In distilled water, OAE formed selfassembled nanoparticles at low concentrations in aqueous medium, and nanoparticles retained their structural integrity both in simulated gastric fluid (SGF) and simulated intestinal fluid (SIF). The loading and release characteristics of nanoparticles based on OAE were investigated using vitamin D3 as a model nutraceutical. As the concentration of vitamin D3 increased, the loading capacity (LC) increased, whereas the loading efficiency (LE) decreased. Nanoparticles could release vitamin D3 at a sustained rate in gastrointestinal fluid. These results revealed the potential of OAE nanoparticles as oral carriers for sustained release of vitamin D3.

【题目】Preparation and Characterization of Self-Assembled Nanoparticles of Hyaluronic Acid-Deoxycholic Acid Conjugates.

【中文关键词】纳米,透明质酸-脱氧胆酸缀合物

【英文关键词】Nanoparticles,Hyaluronic Acid-Deoxycholic Acid Conjugates

【中文摘要】由1-乙基-3 -(3 -二甲基氨基丙基)碳化二亚胺介导的,以透明质酸(HA)作为亲水性链段和疏水性的脱氧胆酸(DOCA)的偶联反应合成新型两亲性生物聚合物。利用1H NMR研究了HA-DOCA结合物的结构特点。使用动态激光光散射,透射电子显微镜(TEM),和荧光光谱对制备的基于HA-DOCA缀合物自组装纳米粒的特性进行了研究。在蒸馏水中平均粒径为293.5nm呈单峰粒度分布。TEM照片表明,HA-DOCA自聚集体的形状为球形。临界聚集浓度(CAC)在0.025-0.056毫克/毫升的范围内。平衡常数(Kv值)的芘自-聚集体的溶液中的时间是从1.45×104到3.64×104。使用氯化十六烷基吡啶荧光猝灭法确定了每个疏水微区的DOCA聚集数组,其数量随取代度的增加而增加。

【英文摘要】Novel amphiphilic biopolymers were synthesized using hyaluronic acid (HA) as a hydrophilic segment and deoxycholic acid (DOCA) as a hydrophobic segment by a 1-ethyl-3-(3-dimethylaminopropyl) carbodiimide mediated coupling reaction. The structural characteristics of the HA-DOCA conjugates were investigated using 1H NMR. Self-assembled nanoparticles were prepared based on HA-DOCA conjugates, and its characteristics were investigated using dynamic laser light scattering,transmission electron microscopy (TEM), and fluorescence spectroscopy. The mean diameter was about 293.5 nm with unimodal size distribution in distilled water. The TEM images revealed that the shape of HA-DOCA self-aggregates was spherical. Thecritical aggregation concentration (CAC) was in the range of 0.025 – 0.056 mg/mL. The partition equilibrium constant (Kv) of pyrene in self-aggregates solution was from 1.45 × 104 to 3.64 × 104. The aggregation number of DOCA groups per hydrophobic microdomain, estimated by the fluorescence quenching method using cetylpyridinium chloride, increased with increasing degree of substitution.

【题目】Self-aggregated nanoparticles from linoleic acid modified carboxymethyl chitosan: Synthesis, characterization and application in vitro

【中文关键词】壳聚糖;亚油酸;自组装纳米粒
【英文关键词】Chitosan Linoleic acid Nanoparticles Self-aggregates
【中文摘要】本研究工作的目的是研究亚油酸(LA)对羧甲基壳聚糖(LCC)改性。另一个目的是评价亚油酸的取代度对形成的纳米粒ADR的载药量(LC)、包封率(LE)和体外释放的影响。通过超声可以亚油酸改性羧甲基壳聚糖(LACMCS)为原料制备的水凝胶型纳米粒。通过测量荧光探针芘的荧光强度测定LA改性CMCS(LCC)的临界聚集浓度(CAC)。结果显示:CAC值在0.061-0.081毫克/毫升的范围。随着疏水性的LA的增加自聚集的纳米粒的LC和LE增加,缓释下降。 负载ADR的LCC纳米粒相对于游离(非包裹在纳米粒)ADR在体外对HeLa细胞表现出良好的抗癌活性。
【英文摘要】The purpose of the present research work was to study the formation of linoleic acid (LA) modified carboxymethyl chitosan (LCC). Another objectivewas to evaluate effect of linoleic acid degree of substitution on loading capacity (LC), ADR loading efficiency (LE) and in vitro release profile of LCC nanoparticles. The hydrogel nanoparticles can be prepared using linoleic acid modified carboxymethyl chitosan (LACMCS) after the sonication. The critical aggregation concentration (CAC) of the self-aggregate of LA modified CMCS (LCC) was determined by measuring the fluorescence intensity of the pyrene as a fluorescent probe. The CAC values were in the range of 0.061 – 0.081 mg/mL. Self-aggregated nanoparticles exhibited an increased LC and LE, decreased sustained release with an increasing ratio of the hydrophobic LA to hydrophilic CMCS. LCC nanoparticles loaded with ADR exerted in vitro anticancer activity against Hela cells that was comparable to the activity of free (non-entrapped in nanoparticles) ADR.

【中文关键词】犬瘟热病毒; h基因; 克隆; 原核表达
【英文关键词】canine distemper virus; h gene; cloning; prokaryocyte expression
【中文摘要】根据GenBank中登录的犬瘟热病毒h基因序列设计一对引物,利用RT-PCR方法扩增出犬瘟热病毒弱毒疫苗株的h基因,将其插入到克隆载体pMD18-T中,经蓝白斑筛选及Sal Ⅰ和Xho Ⅰ双酶切鉴定挑出阳性克隆进行序列测定,序列分析

结果表明,该基因与GenBank上标准代表毒株序列完全同源;与扬州分离株、长春分离株、新疆分离株、日本分离株D85755同源性分别为90.6%、91.3%、90.5%、91%;与Onderstepoort、Convac株、美国分离株98-2666-2同源性较高,分别为97.7%、97.2%、98.1%。再将其定向克隆于原核表达载体pET-32a(+)中,转化感受态E.coliBL21细胞,经IPTG诱导表达分子质量约64 ku的重组H蛋白。

【英文摘要】A pair of primers was designed based on the h gene sequence of canine distemper virus in GeneBank,the h gene of(CDV) strain isolated from an attenuated vaccine strain of canine distemper virus was amplified by reverse transcription polymerase chain reaction(RT-PCR).The amplified fragment was cloned into pMD18-T simple vector and the positive recombinants were identified by blue-white screening and restriction endonuclease digestion,and the h fragments were sequenced and analyzed.Sequencing analysis indicates that the gene was the same to the representive canine distemper virus h gene.h gene was 90.6%,91.3%,90.5%,91% identical to Yangzhou isolates,Changchun isolate,XinJiang isolate and Japanese isolateD85755 respectively.It was 97.7%,97.2%,98.1% indentical to Onderstepoort strain,Convac strain and American isolates 98-2666-2 respectively.Then the h gene was subcloned into Prokaryotic expression plasmid pET-32a(+).Recombinantplasmid carrying h gene(pET-32a-h) was transformed into E.coli BL21(DE3) and induced with IPTG.A fusion protein about 64 ku was expressed.

【题目】网孔孔径和转动方式对瘤胃活体外发酵参数的影响

【中文关键词】网孔孔径 转动方式 瘤胃体外连续培养系统

【英文关键词】wu

【中文摘要】试验采用 2 因素析因试验设计,设计 2 种搅拌方式,分别为单向转动和往复转动。每种搅拌方式下有 4 个不同的网孔孔径,网孔孔径分别为 200、100、80 和 60 目。每个网孔孔径为一组,每组设 3 个重复,活体羊为对照组。系统的稀释率设为发酵罐体积的 3 %/h,即缓冲液流速为 0.5 mL/min,日粮精粗料比30:70,日喂料量为 12 g,试验周期为 9 d。分别测定活体羊瘤胃内和发酵罐内的 pH、NH3-N 和挥发性脂肪酸质量浓度,以评定人工瘤胃体外连续培养系统的模拟效果。试验结果表明 : 当日粮精粗料比为 30:70 时,随着网孔孔径的增大,pH 和 NH3-N 质量浓度显著提高,200 目网孔孔径显著低于 100、80 和 60 目。乙酸和丁酸摩尔比例在网孔孔径间差异不显著,丙酸摩尔比例和总挥发性脂肪酸(TVFA)在网孔孔径间差异不显著。当搅拌方式由往复转动变为单向转动时,pH、NH3-N 质量浓度、乙酸摩尔比例和 TVFA 降低,丙酸和丁酸摩尔比例升高。在瘤胃体外连续培养系统中网孔孔径为 200 目和搅拌方式为单向转动的条件下,瘤胃体外培养的瘤胃发酵特性与活体羊体内环境更接近。

【题目】猪圆环病毒与口蹄疫病毒二联重组鸡痘病毒的鉴定和BALB_c小鼠的免疫试验

【中文关键词】PCV2; 重组鸡痘毒; BALB/c小鼠; 免疫

【英文关键词】PCV2; recombinant fowlpox viruses; BALB/c mice; immune

【中文摘要】以鸡痘病毒(FPV282E4)为活载体,用猪2型圆环病毒内蒙株的衣壳蛋白、与复制相关蛋白基因及O型口蹄疫结构蛋白基因作为目的基因,经同源重组的方法获得2个重组鸡痘毒,分别命名为:vUTALP1-ORF2-ORF1、vUTALP1-ORF2。在复制、转录和翻译水平对这2个重组毒进行鉴定,结果表明这2个重组毒均能表达目的蛋白。将它们免疫6~8周龄

BALB/c小鼠,每隔19d免疫1次,共3次;每10d尾跟采血1次,三免后10d杀鼠取脾。用ELISA方法检测小鼠血清抗体效价,流式细胞仪检测脾T淋巴细胞亚类CD4+、CD8+数量。结果发现2个重组毒试验免疫组均是从最后一次采集的小鼠血清能获得最高的抗体效价,与对照组FPV相比都能产生一定的体液免疫反应,且以vUTALP1-ORF2-ORF1重组毒免疫小鼠产生的血清抗体效价最高;脾T淋巴细胞亚类数量测定发现,免疫试验组的CD4+与CD8+的T细胞亚类总数显著高于对照组(P<0.05),并以vUTALP1-ORF2-ORF1数值较高。结果表明,这2个重组鸡痘毒既能较好的刺激细胞免疫又能产生一定的体液免疫,将作为候选活载体重组鸡痘毒进行本体动物免疫试验研究。

【英文摘要】Using fowlpox virus(wt 282E4) as live virus vector,PCV2(Inner Mongolis strain) capsid or replicon genes and FMDV capsid polypeptide genes of O/NY00 were interest genes.The two recombinant viruses which were named as vUTALP1-ORF2 and vUTALP1-ORF2ORF1 were gained by homologous recombination.The two recombinant viruses were identified from replication,transcript and translation level,and tested that they were capable of express interest proteins.Six/eight week-old BALB/c mices(12 mices each)were divided into three groups,one of which was control for inoculating by FPV(wt 282E4 strain) and the other two groups were injected by vUTALP1-ORF2,vUTALP1-ORF2ORF1,respectively.It lasted one week until mices received the first intramuscular injection.Mices were inoculated three times every 20 days.Mice sera gained before inoculation were used as negative control.Then,during the immunization,mice sera were from the mice ’s tails every 10 days.On the 10th day after the third inoculation,mices were killed by excising eyeballs ane removing spleens with sterility.Detecting sera antibody using ELISA and calculating mice spleen T lymphocytes subgroups(CD4+,CD8+) by flow cytometry.And find that the last collected sera has the highest titre among experimental groups;They all produced certain degree of humoral immunity compared with those from control group,and the vUTALP1-ORF2ORF1 is superior.In addition,the numbers of experimental groups ’ CD4+,CD8+ T lymphocytes subgroups are higher than the control group,the total number of T subgroups in vUTALP1-ORF2ORF1 group is also much higher.The results show vUTALP1-ORF2ORF1 can efficiently stimulate both cellular immunity and humoral immunity.It will be tested continually as a specific PCV2 vaccine candidate.

【题目】丛枝菌根真菌侵染番茄离体毛状根双重培养体系的建立
【中文关键词】外植体,根内球囊霉,双重培养
【英文关键词】explant, Glomus intraradices, dual culture
【中文摘要】:利用发根农杆菌Agrobacterium rhizogenes A4 诱导樱桃番茄Micro-Tom 产生毛状根,并在此基础上成功建立了丛枝菌根(AM)真菌根内球囊霉Glomus intraradices 与转移Ri T-DNA 番茄离体毛状根的双重培养体系。该真菌侵染14d 左右,菌丝开始形成多级分支,17-21d 时,一些菌丝顶端膨大,长出新生孢子。接种后3 个月时,每皿孢子数量达到600-800 个。新形成的孢子无需休眠,可直接侵染番茄离体根。成功的番茄双重培养为番茄菌根生理分子机制的研究提供了理想的实验体系。

【英文摘要】Agrobacterium rhizogenes A4 was used to induce Lycopersicon esculentum Micro-Tom hairy roots. An in vitro dualculturing system was established with Ri T-DNA transformed Micro-Tom roots and Glomus intraradices. Multilevel-branchedhyphae were observed in about 14 days, and some hyphal top became expanded, and gradually produced some newborn spores inabout 17-21 days of colonization. About 600-800 mature spores per dish were obtained in 3 months of dual culture. The harvestedspores were capable of germination and subsequently colonizing the host hairy roots immediately. The successful in vitro dual cultureof tomato hairy roots and mycorrhizal fungi provided the ideal experimental system for conducting the researches on physiologicaland molecular mechanism of tomato mycorrhiza.

【题目】新型单外流瘤胃体外连续培养系统
【中文关键词】内网孔径 搅拌方式 稀释率
【英文关键词】wu
【中文摘要】在总结前人研制的人工瘤胃基础上加以改进，自行设计制作了一套新的单外流瘤胃体外连续培养系统。该装置的特点是发酵罐独特的密封设计,发酵罐可更换式内网代替以往的尼龙袋,及独特的搅拌方式设计。通过内网孔径、搅拌方式及稀释率的调整,可提高人工瘤胃发酵的仿生性能。为了验证新设备的稳定性和可行性,设计了稀释率对瘤胃体外连续培养系统发酵参数的影响试验。试验采用对照试验设计,设计 2 个稀释率,每小时分别为发酵罐体积的 3 % 和 6 %,即缓冲液流量分别为 0.5 和 1 mL/min,日喂料量也随之分别为 12 和 18 g。每个稀释率为一组，每组设 3 个重复，活体羊为对照组。分别测定瘤胃和发酵罐内的 pH、NH3-N 和挥发性脂肪酸质量浓度,以评定人工瘤胃体外连续培养系统的模拟效果。系统运行的第3 天 ~ 第 5 天为样本采样期。试验结果表明:当日粮精粗料比为 30:70 时，随着稀释率的提高,pH 逐渐升高,NH3-N 质量浓度下降。乙酸、丙酸与丁酸的摩尔比例和总挥发性脂肪酸质量浓度间差异不显著。在试验条件下,日粮精粗料比为 30:70 时,瘤胃体外连续培养系统的稀释率为 3 % 时,与活体羊最接近。认为瘤胃体外连续培养系统的稀释率应与相应日粮类型及 (或) 营养水平的瘤胃食糜外排速度一致。

【题目】植物中丛枝菌根形成的信号途径研究进展
【中文关键词】丛枝菌根, 钙离子和钙调蛋白依赖蛋白激酶, 结瘤, 信号转导
【英文关键词】arbuscular mycorrhiza, calcium/calmodulin-dependent protein kinase, nodulation, signal transduction
【中文摘要】丛枝菌根(arbuscular mycorrhizal, AM)共生是丛枝菌根真菌与大多数陆地植物的根系之间形成的一种互利共生关系。植物给菌根真菌提供碳水化合物; 作为回报, 菌根真菌能够增强植物对矿质营养元素(尤其是磷)的吸收。菌根的形成过程是一系列信号交换和转导的结果, 具有严格并且一致的顺序。本文以植物中菌根形成的信号途径为主线, 对菌根真菌的形成过程和信号转导途径及其方式进行了分析和讨论。高等植物中菌根形成的信号途径与豆科植物的结瘤信号途

径部分共享, 并且与钙离子信号途径相关, 但前者更为广泛。尽管该途径中很多过程目前还不十分清楚, 但是相信在不久的将来就可以揭开菌根形成过程中的众多谜团。

【英文摘要】Arbuscular mycorrhizal (AM) symbiosis is the mutualistic association between AM fungi and most terrestrial plants: theplant roots offer carbohydrates to the fungi; in return, the fungi assist the plants with uptake of mineral nutrients, particularlyphosphate, from soil, and their subsequent transfer to the root cortical cells. The formation of AM symbiosis involves complicatedpathways of signal exchange and transduction, with stringent and coordinated programs. This mini-review focuses on the currentknowledge in the signal transduction pathways in AMplants. Such pathways in higher plants are similar, in part, to nodulation signalpathways in legumes and are related to calciumsignaling. Many detailed action models in AM signal transduction are not clear yetbut may be revealed soon.

【题目】电麻醉对西伯利亚鲟幼鱼行为特性与血清离子浓度的影响

【中文关键词】西伯利亚鲟幼鱼; 行为; 离子; 直流电; 鳃动频率; 电压强度

【英文关键词】Acipenser baeri; behav ior; iron; d irect curren;t opercu larmovement frequency; vo ltage intensity

【中文摘要】研究了不同强度电麻醉对西伯利亚鲟幼鱼行为特性与血清离子浓度的影响。西伯利亚鲟电麻醉阶段包括部分失去平衡期、完全失去平衡期、完全麻醉期和鳃动停止期等4个时期。电麻醉时西伯利亚鲟呈现趋阳性; 随着电压升高, 到达各麻醉阶段时间与恢复时间逐渐缩短。西伯利亚鲟到达完全麻醉期时间在15 V、20 V、25 V、35 V 组间均有显著差异, 在30 V 与35 V 时分别仅为97. 0 s和68. 8 s, 而恢复时间为0 s。各试验组西伯利亚鲟在电麻醉时鳃动频率均增加, 而恢复阶段均降低。电麻醉对西伯利亚鲟摄食与活动状态均无显著影响。随着电压升高, 钾离子与镁离子浓度先下降后上升, 钙离子则先上升后下降。钠离子与氯离子浓度变化较大, 均是15 V组时浓度最低, 20 V时浓度最高。磷离子浓度呈现增高趋势。pH 值在麻醉后降低, 对照组与其余各组均有显著性差异。因此西伯利亚鲟幼鱼适宜电麻醉强度为25-30 V, 电麻醉是种较好的麻醉方法, 具有广泛的应用前景。

【英文摘要】E ffects of e lectroanesthesia on behav ior and serum iron concentra tion o f juven ileAcipenser baeri have been studied. E lectroanesthesia phases could be div ided into four stages, including partia l loss o f equilibrium,comp le te loss o f equilibrium, complete anaesthesia and opercular movemen ts stop stage. A. baeri appeared positive reaction during electroanesthesia. The time ofA. baeri reach ing every anaesthesia stage and recoveringnatura l state w ould be gradua lly decreased a long w ith voltage increased. For A. baeri, it took only 97. 0 seconds to reach complete anaesthesia stage in 30 V group and 68. 8 seconds in 35 V g roup, wh ile recovering time w as 0 second. Opercular movement frequency of A. baeri increased in every group during electroanesthesia, w h ile frequency decreased during renew ing stage. There are no remarkab le effects on feeding behavior and activ ity o fA. baeri after electroanesthesia. K+ andMg2+ level firstly decreased and then increased, wh ile Ca2+ f irstly increased and then decreased. Na+ and C l leve l changed most greatly, both of them the low est w as in 15 V group and the h ighest w as in 20 V group. P3+ level increasedw ith voltage increased. The va lue of pH decreased after anaesthesia, and there was significant difference betw een control group and the other groups. Th is study show ed that electroanesthesia w as a good anaesthesia method. The opt imal vo ltage of e lectroanesthesia in A. baeri w as from 25 V to 30 V.

【题目】Proton pump OsA8 is linked to phosphorus uptake and
【中文关键词】无
【英文关键词】Knockout mutant, plasma membrane H+-ATPase, Oryza sativa, phosphorus, Tos17 retrotransposon, phosphate transporter.
【中文摘要】无
【英文摘要】The plasma membrane (PM) proton pump ATPases (H+-ATPases) are involved in almost all aspects of biology. They are plant specific and several members of this family are supposed to play a key role in nutrient acquisition. At present, only some members of this gene family in plants have been characterized. However, no nutrient uptake associated H+-ATPase gene in rice has been functionally analysed. It is reported here that OsA8, a typical PM H+-ATPases gene that was predominantly expressed in roots of rice, is down-regulated by nutrient deficiency. TheOsa8 mutant had a relatively smaller size and root to shoot biomass ratio, but higher ATPase activity than its wild-type counterparts under phosphorus (P) starvation conditions. Knockout of OsA8 affected the expression of several OsA genes and the high affinity phosphate transporter, OsPT6, and resulted in a higher P concentration in the roots and a lower amount of P in the shoots. These analyses demonstrate that OsA8 not only influences the uptake of P by roots, but also the translocation of P from the roots to the shoots in rice.

【题目】Conservation and divergence of both phosphate and mycorrhiza-regulated physiological responses and expression patterns of phosphate transporters in solanaceous species
【中文关键词】无
【英文关键词】divergence, evolution, genetic conservation, mycorrhiza, phosphate transporter, phosphorus (P) nutrition, plant gene expression, Solanaceae.
【中文摘要】无
【英文摘要】• Here, orthologous genes of six phosphate transporter (PiT) genes, which are members of thePht1and Pht2 families in tomato and potato, have been cloned from the solanaceous species pepper, eggplant and tobacco. • Overall, expressions of these genes in pepper, eggplant and tobacco showed similarpatterns to those in tomato and potato: P-starvation enhancement in both leaves and roots forPht1;1, P-depletion induction exclusively in roots for Pht1;2, mycorrhizal enhancement forPht1;3, and mycorrhizal induction for both Pht1;4 and Pht1;5. • In the roots of nonmycorrhizal eggplant,SmPht1;3,SmPht1;4 and SmPht1;5 were also expressed under extreme P starvation. Mycorrhizal symbiosis under high-P supply conditions reduced plant growth, with concurrent enhancement of Pht1;2 expression in the roots of pepper as well as eggplant. In addition, the mycorrhizal symbiosis down-regulated the expression of Pht2;1genes greatly in the leaves of pepper and tobacco. • The discrepancies between the evolutionary distances of the PiT genes and theirexpression patterns among the five species suggest greater complexity in functionof PiT in plants than previously expected.

【题目】Tomato sugar transporter genes associated with mycorrhiza and phosphate
【中文关键词】无
【英文关键词】Arbuscular mycorrhiza AM fungi Phosphate Sugar transporter genes
【中文摘要】无
【英文摘要】In arbuscular mycorrhizal (AM) symbiosis,there is a reciprocal nutrient exchange betweensymbiotic partners. AM fungi assist the plants with uptake of mineral nutrients from the soil, especially phosphate (Pi). The host plants, in return, provide the fungi with sugar. In contrast to the studies on the symbiotic transport of Pi in arbuscular mycorrhiza,there have been few investigations devoted specifically to sugar transport in AM symbiosis. Usingreverse transcriptase PCR (RT-PCR), we analyzed the effects of mycorrhiza and Pi on the expression of seven putative sugar transporter genes in tomato plants. The expression of LeSUT1 and LeHT2, classified, respectively, as putative sucrose and hexose transporter genes, were down-regulated in the roots inoculated with AM fungi Glomus caledonium or Glomus intraradices. Unexpectedly, the expression of LeST3, a putative monosaccharide transporter gene, was decreased by inoculation of Glomus caledonium, but was enhanced by inoculationof Glomus intraradices in both the roots and leaves.High-Pi in the tomato decreased the expression of LeHT2 and LeST3 in the roots, and enhanced that of LeHT2 in the leaves. The contradictory regulation of the expression of LeST3 in the AM symbiosis indicates that different interaction may take place during mycorrhizal colonization, and a quite complicatedregulation of expression of the sugar transporter genes exist in mycorrhizal tomato.

【中文关键词】氟;鱼;毒性;LC50;安全浓度
【英文关键词】fluorine;fish;toxicity;LC50;safe concentration
【中文摘要】:为检测氟对鱼类的生态毒性效应,在水温(17±1)°C的条件下,采用半静态式生物毒性试验方法研究了氟离子对西伯利亚鲟初孵仔鱼的急性毒性效应(氟离子浓度梯度设置为0、100、200、300、400、500、600mg·L-1). 结果表明,氟暴露后仔鱼出现焦躁不安、失去平衡、呼吸减弱等中毒症状,且随着暴露浓度的升高与暴露时间的延长,死亡率逐渐增加,存在明显的剂量效应关系和时间效应关系. 氟对西伯利亚鲟初孵仔鱼48h、72h、96h LC50分别为1014.10mg·L-1、288.28mg·L-1、181.18mg·L-1. 经计算得出氟对西伯利亚鲟初孵仔鱼安全质量浓度为1.81mg·L-1,低于我国部分高氟地区地下水、地表水及人为氟污染水域中氟的浓度,应引起高度重视.
【英文摘要】Fluoride ions caused widespread endemic fluorosis in humans, but little attention was paid to the effect of fluoride ions on aquatic organisms. Semi-static acute toxicity trial on larval Siberian sturgeon Acipenser baeri was carried out to explore the safe criteria of fluoride to fish. Toxicity symptoms of fluoride in larval Siberian sturgeon included abnormal motility, loss of equilibrium, changes in gill ventilation. The mortality rate of larval Siberian sturgeon raised with the exposure concentration increasing and exposure time prolonging. The 48h, 72h and 96h LC50 of fluoride ion to Siberian sturgeon were 1014.10mg · L-1, 288.28mg · L-1 and 181.18mg · L-1, respectively. The safe concentration of fluoride in water for larval Siberian sturgeon was 1.81mg · L -1. Based on the fluoride concentration in water bodies of China, our result highlights the necessity of management of fluoride in water to protect aquatic animals.

【题目】氟离子对西伯利亚鲟胚胎发育的影响

【中文关键词】氟; 西伯利亚鲟鱼; 胚胎发育; 延迟; 安全浓度
【英文关键词】fluoride; Siberian sturgeonAcipenser baeri; embryo developmen;t delay; sa fety concen tration
【中文摘要】本试验在水温17 ℃的条件下, 采用半静态式生物毒性试验方法, 探讨了氟离子(F2) 对西伯利亚鲟胚胎发育的影响。结果表明, 100-600 mg /L氟暴露会导致胚胎孵化延迟, 氟暴露组半数孵化时间(MHT)比对照组推迟9-22 h。氟暴露同时导致胚胎死亡率显著增加(P < 0. 05), 出膜仔鱼活力减弱、存活时间缩短、畸形率显著升高(P < 0. 05), 出现卵黄囊畸形、脊椎畸形、眼部充血等畸形症状。试验得出F2致西伯利亚鲟胚胎144 h半致死浓度(LC50)为447. 61 mg /L, 孵化安全浓度(SC)为4. 48 mg/L, 导致仔鱼畸形的半数效应浓度(EC50)为536mg /L。氟对西伯利亚鲟胚胎的安全质量浓度低于我国部分高氟地区地下水、地表水及人为氟污染水域中氟含量, 提示天然水体中氟可能会对鱼类胚胎产生负面影响, 应引起重视。
【英文摘要】Fluoride ions caused widespread endem ic fluorosis d isease to human beings. However, littleattentionwas pa id to the effect of fluoride ions on aquatic organ isms. The a im of th is study is to investigate the effect of fluoride ions on embryo development of Siberian sturgeon Acipenser baeri. In semi2static toxicity bioassays, Siberian sturgeon embryos (multi2cell stages) were exposed to six different concentrations of waterborne fluoride (100- 600mg/L) a t17°C . Embryo deve lopment and hatched larvaewere assessed in the experimen.t Fluoride resulted in increased embryo mortality, decreased hatching rate, and increaseddeformed rate of larva compared with the con trol group. Fluoride caused 9- 22 hour extended developmen t time (de layed hatch ing) to embryos, compared to the control group. 144 hmedian letha l concentration(LC50) was 447. 61 mg /L for Siber ian sturgeon embryo, Sa fety Concentration (SC) of hatching was 4. 48 mg /L, median effective concentration (EC50) of larva deformedwas 536mg /L. Study found that safety Concentration(SC) of hatch ingwas lower than water fluoride concentration in h igh fluorine area and h igh2fluoride sewage,which reminds us thatmore a ttention should be paid to the effect of fluoride on aquatic organisms

【题目】Expression analysis suggests potential roles of microRNAs for phosphate and arbuscular mycorrhizal signaling in Solanum lycopersicum
【中文关键词】无
【英文关键词】microRNA,phosphate,arbuscular mycorrhizal
【中文摘要】无
【英文摘要】MicroRNAs (miRNAs) have emerged as a class of gene expression regulatorsthat play crucial roles in many biological processes. Recently, several reportshave revealed that micoRNAs participate in regulation of symbiotic interactionbetween plants and nitrogen-fixing rhizobia bacteria. However, the role ofmiRNAs in another type of plant – microbe interaction, arbuscularmycorrhizal(AM) symbiosis, has not been documented. We carried out a microarrayscreen and poly(A)-tailed reverse

transcriptase-polymerase chain reaction(RT-PCR) validation for miRNA expression in tomato (Solanum lycopersicum)under varying phosphate (Pi) availability and AM symbiosis conditions. Inroots, miRNA158, miRNA862-3p, miRNA319, miRNA394 and miR399 weredifferentially regulated under three different treatments, Pi sufficient (+P), Pideficient (− P) and AM symbiosis (+M). In leaves, up to 14 miRNAs were upordown-regulated under either or both of the Pi treatments and AM symbiosis,of which miR158, miR319 and miR399 were responsive to the treatmentsin both roots and leaves. We detected that miR395, miR779.1, miR840 andmiR867 in leaves were specifically responsive to AM symbiosis, which isindependent of Pi availability, whereas miR398 in leaves and miR399 in bothroots and leaves were Pi starvation induced. Furthermore, miR158 in roots aswell as miR837-3p in leaves were responsive to both Pi deprivation and AMcolonization. In contrast, miR862-3p in roots was responsive to Pi nutrition,but not to AM symbiosis. Moreover, the group of miRNA consisting miR319and miR394 in roots and miR158, miR169g*, miR172, miR172b*, miR319,miR771 and miR775 in leaves were up- and down-regulated by Pi starvation,respectively. The data suggest that altered expression of distinct groups ofmiRNA is an essential component of Pi starvation-induced responses and AMsymbiosis.

【题目】Facilitated legume nodulation, phosphate uptake and nitrogen transfer by arbuscular inoculation in an upland rice and mung bean intercropping system

【中文关键词】无

【英文关键词】Arbuscular mycorrhizal fungi .Nutrient transfer . Hyphal links . 15N . Rice . Mung bean . Intercropping

【中文摘要】无

【英文摘要】Intercropping of upland rice with shortdurationgrain legumes has major advantages inincreasing crop yields and soil productivity. However,the contribution of arbuscular mycorrhizas, the commonmutualistic symbiosis between most crops andmycorrhizal fungi, is not fully understood in intercroppingsystems. We assayed the contribution ofinoculation of the arbuscular mycorrhizal fungus(AMF) Glomus caledonium on nutrient acquisitionand biomass yield. Using the method of plastic filmand nylon net partition and tracing 15N transferredbetween the intercropped upland rice (Oryza sativassp. Japonica Nipponbare) and mung bean (Vignaradiata L. Chuanyuan), we compared the intercropping,with separation of the whole root systems by aplastic film, with and without a barrier of nylon net toallow penetration of the fungal hyphae. Intercroppingsignificantly improved the formation of arbuscularmycorrhizas, particularly in the upland rice roots. Theimproved formation of mycorrhizas by the intercroppingincreased total P uptake by 57% in rice, total Pand N acquisition by 65% and 64% respectively inmung bean, and nodulation by 54% in mung bean.The percentage of total 15N transfer from mung beanto rice leaves was increased from 5.4% to 15.7% byinoculation with AMF. In contrast, there was only2.7% of 15N transfer from rice to mung bean and noAMF effect on N transfer. It is concluded that cerealand legume crop intercropping increase mycorrhizaformation, which in turn improves nodulation, N andP acquisition and N transfer in the legumes.

【题目】全人工繁殖西伯利亚鲟仔稚鱼发育的异速生长
【中文关键词】西伯利亚鲟; 仔鱼; 稚鱼; 体长生长; 体质量生长; 器官发育; 环境适应性
【英文关键词】Acipenser baeri; larvae; juvenile; full body length increase; body mass increase; organ deve lopmen;t environmenta l adaptation.
【中文摘要】西伯利亚鲟(Acipenser baeri)是中国主要的淡水养殖对象之一, 目前已经实现了苗种的全人工繁殖, 为了改善西伯利亚鲟苗种培育技术, 采用Im age Pro Plus 5 1软件显微拍照并对仔稚鱼的可量性状进行测量和数据处理, 研究了全人工繁殖西伯利亚鲟仔稚鱼(0-53日龄)发育的异速生长及器官优先发育在早期生存和环境适应性上的意义。结果表明:在9、28、37日龄时分别出现3个全长生长拐点。因此, 全长的生长可以分为4个阶段, 每个阶段的平均增长率分别为0.83、0.79、2.68和1.71 mm · d-1, 其中第3个阶段的生长率明显高于其他阶段; 体质量的增长可以用Gaussion方程进行拟合, 相关系数R2 = 0.99; 全长(FL)与体质量(BW)的关系为BW = 0.2×10- 5 (FL) 2.72, 为负异速生长; 在早期发育过程中, 仔鱼的许多关键器官的大小均存在异速生长现象, 眼径在3~ 4日龄时, 最先达到生长拐点, 这意味着眼部是优先发育的, 使其在出膜后就能有效地躲避敌害; 口宽在17-18日龄时出现拐点, 此时随着感觉器官和各鳍的不断完善, 主动摄食能力不断加强; 胸

鳍、背鳍、臀鳍的长度也分别在16-17、13-14、21-22日龄时出现生长拐点,标志着其游泳能力已比较完善,可以有效地躲避敌害和获得食物,为其早期的生存提供了保障。在育苗生产实践中,可以根据生长和发育的阶段性和优先性,适时地和针对性地创造必要的生长发育条件,保证其重要器官得到优先发育,提高早期的成活率。

【英文摘要】Siberian sturgeon Acipenser baeri is one of the most popular fresh w ater aquacu lturespecies in China, and its artificia l spawn ing is succeeded. In order to provide in fo rmation that may improve fry rearing techniques, the a llome tric grow th of A. baeri from new ly hatched larvae(age, 0 day) to 53 day old juven iles and the sign if icance of prior ity deve lopment of som e o rgans were stud ied by using digital photom icrography and computer softw are (Image Pro Plus 5.1) to measure and analyze the growth characteristics. The results show ed that there w ere 3 inflex ion po ints of full body length (FL) increase occurred at the ages of 9, 28 and 37 days, and thus, the FL increase m ight be divided into 4 periods. The mean FL increase rate of each period w as 0.83, 0.79, 2.68 and 1.71mm • d- 1, respect ive ly, w ith that of the th ird period being sign ificantly higher than those o f the rest periods. The relationsh ip betw een body mass (BW) increase and age could be characterized byG aussion equation (correlat ion coeff icient R2 = 0 99) . The relation sh ip betw een BW and FL w asBW = 0.2× 10- 5 FL2.72, w h ich meant that the bodym ass o fthe larvae and juveniles had a negative a llom etric grow th. Dur ing early developmen,t some important organs also grew in allometry. The eye diameter increase firstly reached to theinflexion point at the age o f 3- 4 days, wh ich m igh t infer that eyes had priority to deve lop, and thus,young f ishm igh t have ab ility to escape from predators imm ediately after hatching. Mouthw idth increase reached to the inflex ion po int at the age of 17- 18 days, wh ich implied that active feeding enhanced hereafter. The grow th inflex ion points of pectoral fin, dorsal fin, and pelv ic fin w ere at the ages o f 16- 17, 13- 14, and 21- 22 days, respectively, ind icating tha t the swimming ability of young fish improved since then. These priority deve lopments of impo rtant organs m ight he lp fish w ith active feed ing and escap ing from predato rs as early as possible, and thus, a higher surv iva l rate m ight achieved during early developmen.t To improve the art ific ia l fry rearing techniques o fA. baeri, spec ific conditions should be prov ided in time, according to the periodic ityand priority of o rgan developmen,t and consequently, impo rtan t organsm ight have priority to deve lop normally, and the survival rate of early life stagem ight increase

【题目】日粮营养水平对肉牛IGF-I及其受体基因表达的影响
【中文关键词】营养水平;IGF-I, IGF-IR表达
【英文关键词】无
【中文摘要】动物的生长发育受内分泌和营养的调控,生长激素(GH)一胰岛素样生长因子(IGF)轴是激素和营养实现生长调控的主要机制。GH的促生长作用主要是通过肝脏所产生的IGF-I来介导的,IGF-I必须与其受体结合才能发挥其促生长效应。因此,本试验以三个杂交牛品种(利杂、西杂、夏杂)为研究对象,随机分为三组,分别饲喂低、中和高三种营养水平日粮来研究营养水平对不同遗传基础的肉牛IGF-I, IGF-IRmRNA表达量的影响。日粮营养水平参照中国肉牛饲养标准(2004)按日增重0.8 kg, 1.0 kg, 1.2 kg设计。饲养期10个月。宰后立即取牛的肝和肌肉组织放入液氮中,然后于一80℃保存,采用实时荧光定量RT-PCR法测定肝脏和肌肉组织中IGF-I, IGF-IR基因mRNA的表达。试验结果表明,日粮营养水平对IGF-I, IGF-IR基因mRNA表达量影响显著。而不同品种间表达量差异不显著((P > 0.05)。高营养水平组IGF-I, IGF-IR基因mRNA表达量显著高于低营养水平组。在肝脏、半键肌组织中,IGF-I, IGF-IR mRNA表达量表现出相同的趋势。高营养水平组的IGF-I mRNA表达量显著高于低营养水平组((P < 0.05) ; IGF-IR mRNA表达量,高营养组极显著高于低营养组((P<0.01)。在背最长肌组织中,高营养水平组IGF-I mRNA表达量极显著高于低营养水平组((P<0.01); IGF-IR mRNA表达量,高低营养水平组显著显著((P<0.05)0且随着日粮营养水平的增加,IGF-I, IGF-IR mRNA表达量显著增加。此外,血液中IGF-I的浓度与血液中GH、尿素氮、总蛋白、白蛋白有一定的相关性,且与营养水平有关。随着营养水平的提高,血液中IGF-I的浓度与尿素氮、总蛋白、白蛋白的相关系数升高,而与GH,葡萄糖的相关系数降低。肝脏组织中IGF-ImRNA表达量与血液IGF-I浓度、屠宰率、净肉率、眼肌面积的相关系数随着营养水平的提高而增加,与全期增重、背膘厚度的相关系数降低,且随着日粮营养水平的增加,相关程度由弱变强。本试验结果表明可以通过调控日粮营养水平影响肝脏及肌肉组织中的IGF-I, IGF-IR mRNA表达进而影响动物的生长。

【中文关键词】纹缟虾虎鱼; 重金属污染; 毒性试验; 胚胎; 早期仔鱼
【英文关键词】Tridentiger tr igonocephalus; heavy metal pollution; toxicity, embryo; early larvae
【中文摘要】纹缟虾虎鱼广泛分布于长江口水域, 它摄食底栖生物, 同时又被大型鱼类所食, 在长江口水域食物链中处于重要地位。研究了Cu2+ 、Pb2+ 、Zn2+ 3 种重金属离子对长江口纹缟虾虎鱼从受精卵到出膜期、器官形成初期到出膜期、眼点形成期到出膜期等3 个早期发育阶段孵化率和初孵仔鱼畸形率的影响, 同时对早期仔鱼进行急性毒性试验。结果表明: 3 种重金属对胚胎及初孵仔鱼毒性大小依次为Cu2+ > Zn2+ > Pb2+ 。纹缟虾虎鱼胚胎在3 种重金属影响下出现身体弯曲、萎缩和残缺, 未能形成体节, 心包囊肿等症状, 还会出现较少见的胚体分叉、增生现象。纹缟虾虎鱼初孵仔鱼出现胸腔膨大、身体畸形等现象。仔鱼受重金属影响后, 短期内表现出运动加剧, 而后逐渐活力下降, 个别仔鱼出现头部或者身体中部弯曲症状。Cu2+ 、Zn2+ 、Pb2+ 对早期仔鱼的安全浓度分别为0.010、0.136 和0.167 mg/ L。研究结果可评估环境中重金属对纹缟虾虎鱼早期发育各个阶段的影响, 亦为长江口水质监测与净化、纹缟虾虎鱼的资源增值以及中华鲟幼鱼栖息地饵料资源的保障提供参考。
【英文摘要】T r identiger trigonocephalus, a small2sized fish species widely distributed in the Yangtze estuary,feeds on benthic organisms; contrarily it is preyed by large2sized carnivorous fishes. T hus, it plays an important role in the food chain of the Yangtze estuarine ecosystem. Ear ly life stages of many fish species are sensitive to heavy metal pollution. As industrial development, heavy metal pollution has become a problem in the Yangtze estuar ine ar ea. However, the studies of toxicology of heavy metal ions to the early life of T.trigonocephalus ar e scarce. In this study, the effects of Cu2+ , Zn2+ and Pb2+ on four early developmental periods, i. e. , fer tilized egg to hatching stage, organogenesis stage to hatching stage, eyed stage to hatchinstage and larval stage of T. tr ig onocep ha lus wer e investigated. Experimental r esults showed that the intensity of toxic effects of 3 heavy metal ions was Cu2+ > Zn2+ > Pb2+ . T oxic symptom of embryo was body curvature, body atrophy, body deformity and pericardial tumefaction. At the beginning of toxicosis larvaemoved acutely, and then gradually became weak. T he head and body of some experimental larvae appeared curving. T he safety concentration of Cu2+ , Zn2+ and Pb2+ to the early larvae was 0.010 mg/ L, 0.136 mg/ L and 0.167 mg/ L, respectively. T he purpose of this study is to provide information that may help to evaluate pollution effects on early life stages of fishes, and to provide guidance for the conservation of important fish species in the Yangtze estuary.

【题目】Rapid andsensitive detection of microcystin by immunosensor based on nuclear magnetic resonance
【中文关键词】无
【英文关键词】Detection;
Microcystin;
Immunosensor;
Nuclear magnetic resonance;
Sensitive;
Magnetic nanoparticles
【中文摘要】无
【英文摘要】A stable and sensitive toxin residues immunosensor based on the relaxation of magnetic nanoparticles was developed. The method was performed in one reaction and offered sensitive, fast detection of target toxin residues in water. The target analyte, microcystin-LR (MC-LR) in Tai lake water, competed with the antigens on the surface of the magnetic nanoparticles and then influenced the formation of aggregates of the magnetic nanoparticles. Accordingly, the magnetic relaxation time of the magnetic nanoparticles was changed under the effect of the target analyte. The calibration curve was deduced at different concentrations of the target analyte. The limit of detection (LOD) of MC-LR was 0.6 ng g(-1) and the detection range was 1-18 ng g(-1). Another important feature of the developed method was the easy operation: only two steps were needed (1) to mix the magnetic nanoparticle solution with the sample solution and (2) read the results through the instrument. Therefore, the developed method may be a useful tool for toxin residues sensing and may find widespread applications

【题目】遗传基础与日粮营养水平对肉牛LPL基因表达的影响
【中文关键词】LPL;营养水平;遗传基础;肉牛
【英文关键词】无
【中文摘要】脂蛋白脂酶(Lipoprotein Lipase,LPL)是动物组织脂肪沉积的关键酶,是甘油三酷(Triacylglycerol, TG)降解为甘油和游离脂肪酸(FFA)反应的限速酶,参与血浆中富含脂质的脂蛋白降解的代谢,并参与代谢调控,与机体的脂质代谢密切相关,在脂质代谢和转运过程中起重要作用。本研究以不同杂交组合肉牛为动物模型,通过饲喂不同营养水平的日粮,旨在找出LPL基因在肉牛不同组织中的表达规律,从分子水平上认识日粮营养水平和遗传基础对肉牛LPL基因表达及相关指标的影响。本实验采用3x3析因试验设计,一个因素是肉牛的遗传基础(8-10月龄西门塔尔一本地杂交牛、夏洛莱一本地杂交牛、利木赞一本地杂交牛),另一个因素是日粮营养水平(高、中、低),试验期10个月。于试验结束时每处理选4头屠宰,采用荧光定量PCR技术研究肉牛不同部位(背最长肌、背脂、大网膜)LPL基因表达量。试验结果:提高日粮营养水平,背脂中LPL表达量变化:西杂牛的在高营养水平比低或中营养水平有显著提高(P<0.05);利杂牛的显著增加(P<0.05),夏杂牛的高营养水平比低营养水平显著增加(P<0.05)。背最长肌中LPL表达量变化:三品种牛高营养水平比中、低营养水平均有极显著提高(P<0.01)。大网膜中LPL表达量变化:西杂牛、利杂牛的高营养水平比低营养水平有显著提高(P<0.05),夏杂牛的高营养水平比中营养水平显著提高(P<0.05),比低营养水平极显著提高(P<0.01)。提高营养水平有增高LPL基因表达的趋势,LPL表达量与甘油三酷呈负相关;与游离脂肪酸呈正相关,表明LPL基因的表达对大理石花纹的形成和肌内脂肪的沉积有一定的正向

调控作用;就遗传因素而言,利杂牛的LPL表达量在不同部位表现了一定的优势,显著或极显著高于其他两品种牛,利杂牛LPL基因表达和肌内脂肪,大理石花纹呈显著正相关,说明利杂牛更有利于脂肪的沉积。LPL基因的表达与胭体瘦肉率有一定的相关关系,这可能与三品种中不同部位中LPL的表达量变化有关,也可能与其脂肪沉积时间有关。

【题目】一种新型的单外流瘤胃体外连续培养系统
【中文关键词】瘤胃体外连续培养系统;网孔孔径;搅拌方式
【英文关键词】无
【中文摘要】试验采用两因素(搅拌方式和网孔孔径)析因试验设计。搅拌方式为单向或往复转动;发酵罐内胆网孔孔径分别为200目、100目、80目和60目。每个处理设三个重复,以活体羊为对照。本系统的稀释率依据日粮营养水平与食糜外排速度的关系,确定为发酵罐体积的3%/h,即缓冲液流速为O.SmI/min。试验日粮精粗比30:70,喂料量为12g/d(分2次投料),试验周期为9d。分别测定活体羊瘤胃内和发酵罐内的pH值、NH3-N和VFA浓度,以评定人工瘤胃体外连续培养系统的模拟效果。结果表明:随着网孔孔径的变小,pH值和NH3-N浓度显著提高,200目网孔孔径显著低于100目、80目、60目(P < 0.01)。乙酸、T酸、丙酸摩尔比例和TVFA在网孔孔径间差异不显著((P > 0.05)。当搅拌方式由往复转动变为单向转动时,,pH值、NH3-N浓度、乙酸摩尔比例和TVFA降低,丙酸和丁酸比例升高((P < 0.01)。在本研究中,当日粮精粗比30:70时,发酵罐内胆网孔孔径为200目、搅拌方式为单向转动的条件下,该系统的瘤胃发酵特性与活体羊体内环境更榕沂。存茸它日粮茶件下,该系统的的活宜内胆网孔孔径、搅拌方式和稀释率等参数尚需要研究确定。

【题目】遗传及营养因素对肉牛脂肪沉积与Leptin mRNA表达的影响
【中文关键词】遗传因素;营养水平;LEP;表达
【英文关键词】无
【中文摘要】Leptin是反应体脂量的主效基因,与脂肪沉积有关。本试验拟研究遗传因素和日粮因素对血浆leptin含量、月同体脂肪相关指标、各脂肪组织leptin mRNA表达的影响,探讨leptin与营养水平及遗传基础互作关系,为改善肉牛胭体品质提供理论依据。试验采用三个杂交牛品种,随机分为三组,分别饲喂低、中和高三种营养水平日粮。日粮营养水平参照中国肉牛饲养标准(2000按日增重0.8kg, 1.Okg, 1.2kg设计。试验期10个月。试验结束禁食后称重送往屠宰场,进行分割,记录各个部位可分离脂肪重。取胭体第12^}13胸腰椎部背最长肌新鲜肉样,称量、切碎、冷冻干燥、测定脂肪含量。采用实时荧光定量RT-PCR法测定LeptinmRNA表达量。试验结果表明:,肉牛可分离脂肪(月同体脂肪含量、肠系膜周围脂肪重、肾周围脂肪重、腔脂率)随着营养水平的升高都呈现增加趋势,利杂牛高于西杂牛和夏杂牛((P > 0.05)。随着营养水平的提高,高、中营养水平组肉牛的背膘厚度、背最长肌IMF都极显著高于低营养水平组((P<0.01),高营养水平组大理石花纹评分极显著高于中营养水平组和低营养水平组((P<0.01)。利杂牛、西杂牛背膘厚度都显著高于夏杂牛,但利杂牛与西杂牛之间背膘厚度差异不显著((P>0.05),利杂牛大理石花纹评分极显著高于西杂牛和夏杂牛((P<0.01),利杂牛肌内脂肪含量显著高于夏杂牛((P< 0.05),但西杂牛和夏杂牛之间差异不显著((P > 0.05)。血浆leptin浓度与日粮营养浓度呈线性关系,即日粮营养水平越高,血浆leptin浓度也越高。高营养水平组肉牛血浆中leptin浓度显著高于中、低营养水平组((P < 0.05),中、低营养组差异不显著(P > 0.05)。利杂牛血浆leptin浓度极显著高于西杂牛、夏杂牛((P<0.01),但西杂牛与夏杂牛之间差异不显著((P > 0.05)。血浆leptin与胭体脂肪含量、内脏脂肪重有关,且受营养水平与杂交牛品种的影响。高营养组三种杂交牛背长肌IMF的含量与血浆leptin含量都呈显著正相关((P<0.05)};中营养组西杂牛和夏杂牛的大理石花纹、低营养组夏杂牛背长肌IMF的含量、大理石花纹与血浆leptin显著正相关((P<0.05)}与利杂牛背膘厚度呈极显著相关((P < 0.01) o leptin mRNA表达量受营养和品种的影响。低营养水平条件下,背部皮下脂肪中利杂牛、西杂牛leptinmRNA表达量显著增加((P < 0.05);腹部皮下脂肪组织中西杂牛极显著高于利杂牛((P<0.01),利杂牛显著高于夏杂牛((P <0.05)。中营养水平条件下,西杂牛表达量最高,夏杂牛最低;腹部皮下脂肪组织中利杂牛、西杂牛极显著高于夏杂牛((P<0.01)。高营养水平条件下,背部皮下脂肪组织中利杂牛显著高于西杂牛和夏杂牛;腹部皮下脂肪组织中利杂牛极显著高于夏杂牛((P<0.01)。大网膜脂肪leptin表达量在低营养、中营养水平条件下,利杂牛表达量最高;高营养水平条件下,利杂牛极显著高于西杂牛((P<0.01)、显著高于夏杂牛((P < 0.05)。本试验结果表明可以通过调控日粮营养水平影响了leptinmRNA基因表达进而影响肌内脂肪沉积。

【题目】遗传和营养对肉牛背最长肌FAS和HsL mRNA表达的影响
【中文关键词】遗传因素;营养水平;FAS HSL;基因表达
【英文关键词】无
【中文摘要】脂肪酸合成酶(FAS)和激素敏感脂酶(HSL)是脂肪合成和分解的关键酶,在肉牛肌内脂肪的沉积过程中起着重要的作用。本试验拟研究遗传因素和营养水平对背最长肌中这两个基因表达的影响,并将其与肌内总脂含量进行相关分析,从基因表达水平揭示这两个基因与肌内脂肪沉积的关系,为发挥不同杂交肉牛优良的肉品性能,改善杂交牛肌内脂肪沉积提供依据。试验采用三个杂交牛品种(利杂26头、西杂35头、夏杂24头,平均始重为 249.67士34.51kg)随机分为三组,分别饲喂低、中和高三种营养水平日粮。日粮营养水平参照中国肉牛饲养标准(2004)按日增重0.8kg, 1.Okg, 1.2kg设计。饲养试验

于2008年6月至2009年3月于吉林省九台市疆宁肉业有限公司育肥舍内进行。试验结束后于长春皓月肉牛加工厂进行屠宰。宰后立即取各头牛左胭12-13胸椎处背最长肌组织一部分于一20°C保存;另一部分放入DEPC处理的冷冻管中,迅速放入液氮,于一80°C保存。采用索氏提取脂肪法测定肌内总脂含量;采用实时荧光定量RT-PCR法测定FAS和HSLmRNA表达量。本试验结果表明不同品种间背最长肌肌内总脂含量存在显著差异。与利杂的肌内总脂含量相比,西杂和夏杂分别比利杂低3.35%和5.09%(P < 0.05)。营养水平对背最长肌肌内总脂含量影响显著。与低营养组相比,中营养组和高营养组分别提高1.08%和12.96%(P < 0.05)0背最长肌FASmRNA表达量的测定结果表明:不同品种间背最长肌FASmRNA表达量无显著差异。营养水平对背最长肌FASmRNA表达量影响显著,与低营养组相比,中营养水平组和高营养水平组分别提高17.56%和31.08%(P < 0.05)。背最长肌HSLmRNA表达量的测定结果表明:不同品种间背最长肌HSLmRNA表达量无显著差异。营养水平对背最长肌HSLmRNA表达量影响显著,与低营养组相比,中营养水平组和高营养水平组分别降低31.74%和43.06%(P < 0.05)o FAS和HSL比值结果表明:与利杂相比,西杂和夏杂分别比利杂低34.72%(P < 0.05)和19.44% o FAS和HSL比值随营养水平升高而提高,与低营养组相比,中营养水平组和高营养水平组分别提高61.11%和127.77%(P < 0.05)。相关分析结果表明:肌内总脂含量与FAS mRNA表达量((P < 0.01)和FAS mRNA/HSL mRNA比值(P<0.05)均呈显著正相关,而与HSL mRNA表达量呈显著的负相关(P<0.05)。本试验结果表明可以通过调控日粮营养水平影响背最长肌中的FAS及HSL的mRNA基因表达进而影响肌内脂肪沉积。

【题目】Development and validation of an immunochromatographic assay for rapid multi-residues detection of cephems in milk.
【中文关键词】无
【英文关键词】Immunochromatographic,Colloidal gold, Cephems ,Polyclonal antibodies
【中文摘要】无
【英文摘要】A one-step immunochromatographic assay (ICA) was developed for the detection of seven kinds ofcephems inmilk. Polyclonal antibodies (PcAb)with group-speci fi c to cephemswere raised in rabbits after immunization with cephalexin – keyhole limpet hemocyanin (KLH) conjugate. The speci fi city of anti-sera was determined by indirect competitive enzyme-linked immunosorbent assay (icELISA), and the 50% inhibitions (IC50) of cephalexin and cefadroxil were obtained at 1.5 ngmL − 1;IC50 of cefatiofur, cefapirin,cefazolin, cefalothin and cefotaxine were 4, 3.7, 3.2, 4.5 and 5 ngmL − 1, respectively. The PcAb against cephems were conjugated to colloidal gold particles as the detection reagent for ICA strips to test for cephems. This method achieved semi-

quantitative detection of cephems in <5min, with high sensitivity to cephalexin and cefadroxil (both 0.5 ngmL − 1). At the same time, cefatiofur, cefapirin, cefazolin, cefalothin and cefotaxine were detected at <100 ngmL − 1 in spiked processed-milk samples. Thismethod was comparedwith an enzyme-linked immunosorbent assay by testing 40milk samples, and the positive samples were validated by a high-performance liquid chromatographic method, with an agreement rate of 100% for both comparisons. In conclusion, the method was rapid and accurate for the multi-residue detection of cephems in milk.

【题目】营养水平对杂交肉牛FABP3基因表达及IMF的影响

【中文关键词】杂交牛;

FABP3

基因;肌内脂肪

【英文关键词】crossbred cattle

;F

ABP3;

IMF

【中文摘要】为研究营养水平对杂交肉牛心脏型脂肪酸结合蛋白(FABP3)基因表达及肌内脂肪含量(IMF)的影响,以西门塔尔、利木赞和夏洛莱杂交肉牛为研究对象,利用实时荧光定量PCR技术,分别测定高、中、低营养水平的3种杂交肉牛背部脂肪中FABP3mRNA表达水平,并测定其背最长肌IMF。结果:(1)高营养组中夏洛莱牛IMF高于同营养组其他2种肉牛,其背部脂肪中FABP3mRNA水平也显著高于另外2种杂交肉牛(P<0.01);中营养组中西门塔尔和利木赞牛IMF均高于同营养组的夏洛莱牛,但FABP3mRNA的水平无显著差异(P>0.05);低营养组中夏洛莱牛IMF和FABP3mRNA水平均显著低于另外2种肉牛(P<0.01);(2)夏洛莱杂交肉牛背部脂肪中FABP3mRNA水平与IMF具有显著的相关性(P<0.05),而西门塔尔和利木赞牛中FABP3mRNA水平与IMF无显著相关性(P>0.05)。该结果表明提高营养水平影FABP3mRNA表达并在一定程度上影响IMF,但影响显著与否存在品种差异,在肉牛育种和牛肉生产中应当同时考虑营养因素和遗传因素。

【英文摘要】The experimental cattles were given low,medium and high TMR,FABP3mRNA expression level was de-tected in back fat by real-time PCR and IMF content in lonfissimus dorsal muscle was determined.Results:(1)IMFcontent was highest in Charolais crossbred cattle given high TMR,and FABP3mRNA expression level was also sig-nificantly highest in Charolais crossbred cattle(P<0.01).IMF content of Simmental and Limousin crossbred cattlewere higher than Charolais,while there was no difference between three crossbred cattle given medium TMR(P>0.05).IMF content and FABP3mRNA expression level of Charolais crossbred cattle were lower than other cattlegiven low TMR(P<0.01).(2)In Charolais crossbred cattle,the FABP3mRNA expression level was significantlycorrelated(P<0.05)with IMF content,but there was no significant relation between FABP3mRNA expression lev-el and IMF content(P>0.05).Conclusion:improving nutritional levels could influence FABP3mRNA expressionand IMF content partly.The results suggested that nutritional level and genetic factor should be considered in cattlebreeding and beef production.

【题目】cDNA Cloning, Bioinformatic and Tissue-specific Expression

【中文关键词】猪;JARID1C基因;cDNA克隆;生物信息学分析;基因表达
【英文关键词】pig; JARID1C gene; cDNA cloning; bioinformatic analysis; gene expression
【中文摘要】:JARID1C是高度保守的ARID蛋白家族的成员, 该家族的蛋白参与并引起一系列生物学效应, 如染色质重塑、细胞增殖与分裂、个体发育以及基因转录调控。JARID1C在人脑中表达丰富, 对脑的发育和维持正常功能具有重要作用, 突变可引起智力迟钝。本研究采用电子克隆(in silico cloning)的方法并结合5′末端快速扩增技术(RACE), 从猪卵巢中克隆到 JARID1C的全长cDNA序列(GenBank登录号: EF139241)。猪JARID1C基因的cDNA全长5,908 bp, 包括4,551 bp的开放阅读框(ORF)、522 bp的5′非翻译区(5′ UTR)和835 bp的3′非翻译区(3′ UTR), polyA加尾信号序列AATAAA位于5,881 bp和5, 886 bp之间。生物信息学分析揭示JARID1C蛋白含有1517个氨基酸残基, 定位于细胞核中, 该蛋白含有5个保守的结构域: JmjN结构域、ARID 结构域、JmjC 结构域、C5HC2锌指结构域和PHD锌指结构域。应用ClusterW程序分别对猪、狗、小鼠、大鼠、人和猿的JARID1C核苷酸序列和氨基酸序列进行多重序列比对, 发现猪的JARID1C与其他哺乳动物具有很高的相似性。借助Mega 3.1软件, 采用N-J算法构建JARID1亚家族蛋白的系统进化树, 揭示不同物种的进化关系。应用实时荧光定量PCR技术分析该基因在不同组织的表达差异, 结果表明该基因在各组织均不同程度地表达,其中在肺和骨骼肌表达水平最低, 而在脑和性腺表达水平最高
【英文摘要】Jumonji, AT-rich interactive domain 1C (JARID1C) protein belongs to the highly conserved ARID protein family, which is involved in chromatin remodeling and transcriptional regulation during cell growth, differentiation, and development. In humans, this gene plays a vital role in normal brain development and function. Using an in silico approach in combination with 5′ rapid am-plification of cDNA ends (5′ RACE), the full-length cDNA of JARID1C (GenBank accession No. EF139241) from porcine ovary, which contains 5,908 bp nucleotides, with an open reading frame (ORF) of 4,548 bp, has been cloned. The putative porcine JARID1C protein, which is located in the nucleus, encodes 1,516 amino acids with a molecular weight of 170 kDa and a pI of 5.44. Bioinformatic prediction indicates that the protein contains several conserved domains: a JmjN domain, an ARID domain, a JmjC domain, a C5HC2 zinc finger domain, and a PHD zinc finger domain. Similarity comparisons for nucleic and amino acid sequences reveal that the porcine JARID1C protein shares a high identity with its dog, mouse, rat, and human counterparts. The phylogenetic tree of the JARID1 subfamily proteins has been constructed to reveal the evolutionary relationship of various species. Real-time PCR analysis shows that the JARID1C gene is expressed in various tissues, but at different levels. The expression levels of this gene are higher in the brain and gonad than in other tissues, suggesting that the JARID1C protein plays a role in porcine brain and gonad functions.

【题目】遗传和营养对肉牛生长及肝脏GHR基因表达的影响
【中文关键词】营养水平;杂交牛;生长性能;GHR
【英文关键词】无
【中文摘要】品种和营养是影响肉牛生长的重要内、外因。而肉牛生长发育的调控主要是由生长激素通过与靶器官的生长激素受体(GHR)结合而进行。因此,肉牛的生长在很大程度上取决于靶器官的GHR及相关基因的表达,肝脏是GH重要的靶器官。为了研究遗传因素和营养水平对肉牛生长性能的影响及其分子机理。本试验采用三个杂交牛品种(利杂26头、西杂35头、夏杂24头,平均始重为249.67±34.51 kg)随机分为三组,分别饲喂低、中和高三种营养水平日粮。日粮营养水平参照中国肉牛饲养标准(2004)按日增重0.8 kg,1.0 kg, 1.2 kg设计。饲养试验于2008年6月至2009年3月于吉林省九台市疆宁肉业有限公司育肥舍内进行。饲养试验结束后测定试验牛空腹体重,计算日增重。屠宰试验于长春皓月肉牛加工厂进行。宰后立即取各头牛的肝组织放入DEPC处理的冷冻管中,迅速放入液氮,然后于一80°C保存,采用实时荧光定量RT-PCR法测定肝脏中GHRmRNA水平,并分析其与日增重的相关性。试验结果表明不同杂交牛的日增重差异显著,与西杂相比,利杂和夏杂分别比西杂低8.1%(P < 0.05)和5.32%。各品种在不同生长阶段的生长速度有差异,其中利杂在1012月龄生长速度最快,14月龄后生长速度下降;夏杂虽然开始体形较小,在1012月龄增长速度不如西杂、利杂;但12月龄后逐渐超过利杂,仅次于西杂。西杂在1012月龄增重速度不如利杂,在14月龄后均显著高于夏杂、利杂。三组杂交牛在17月龄后生长速度下降。营养水平对生长速度有显著影响。与低营养组相比,中营养组和高营养组分别提高9.75%和16.03%(P < 0.05)。不同杂交牛肝脏中GHRmRNA表达量存在一定差异,西杂>夏杂>利杂,但组间差异未达显著水平。而营养水平对肝脏中GHRmRNA表达量影响显著,与低营养组相比,中营养组和高营养组分别提高119.89%和224%(P< 0.05)。相关分析结果表明肉牛生长速度和肝脏

GHR基因表达量之间存在显著相关(P < 0.05)。本试验结果说明遗传因素和营养水平会影响生长激素受体基因表达量进而肉牛生长速度。

【题目】舌虾虎鱼肌肉营养成分与品质的评价
【中文关键词】舌虾虎鱼;肌肉;营养成分;营养品质;氨基酸;脂肪酸
【英文关键词】Glossogobius giuris; muscle; nutritional component; nutritive quality; amino acids; fatty acids
【中文摘要】对舌虾虎鱼的肌肉营养成分进行了分析,并对其营养品质进行了评价。结果表明,舌虾虎鱼肌肉(鲜样) 中水分、粗蛋白、粗脂肪和粗灰分的质量分数分别为79.92%±0.96%、16.76%±0.30%、0.91%±0.07% 和2.25%±0.14%。肌肉中含有18 种氨基酸,总量为78.70%±0.57% (质量分数,干样),其中8 种必需氨基酸(EAA)总量是32.26%±0.55%,占氨基酸总量的40. 99%,其必需氨基酸的构成比例符合联合国粮农组织/世界卫生组织(FAO/WHO)的标准。舌虾虎鱼的第一限制性氨基酸为色氨酸,第二限制性氨基酸为(蛋氨酸+胱氨酸),必需氨基酸指数(EAAI) 为63.88,4 种鲜味氨基酸(DAA) 总量为29.67%±0.30% (质量分数,干样)。脂肪酸中EPA 与DHA 质量分数分别为3.91%±0.11% 和8.10%±0.60%,明显高于其它几种淡水经济鱼类。研究表明,舌虾虎鱼含有丰富的氨基酸和脂肪酸营养,具有较好的食用价值与保健作用。
【英文摘要】In order to understand the nutritive quality and nutrient components in the muscle of Glossogobius giuris and to evaluate the potential of the species as a diet source for Chinese sturgeon that is an endangered species only found in the coastal China Seas and the Yangtze River,the main nutrient components in the muscle of G. giuris were analyzed in this paper. Samples body weight,(9. 07 ± 1. 87) g; body length,(8.17 ± 0. 63) cm were collected in the coastal area of Zhejiang Province. Analysis methods of nutrient components were based on the standards of GB 5009 - 85 and BT /T 14965 - 1994. Evaluation standards of the nutritive quality were based on the FAO/WHO ’ s standard mode. The general nutrient compositions weredetermined with routine methods. Amino acid compositions were determined with amino acid analyzer. Fatty acid compositions were inspected with GC. The results showed that

the content of moisture,crude protein,crude fat and crude ash in fresh muscle of G. giuris were 79. 92% ± 0. 96%,16. 76% ± 0. 30%,0. 91% ± 0.07% and 2. 25% ± 0.14% respectively. Eighteen common amino acids were found in the muscle of G. giuris including 8 kinds of essential amino acids (Thr,Val,Met,Phe,Ile,Leu,Lys and Trp),2 kinds of halfessential amino acid (His and Arg),8 kinds of nonessential amino acids (Asp,Glu,Ser,Gly,Ala ,Tyr,Cys and Pro). In dry sample,the total content of amino acids (TAA) was 78. 70% ± 0. 57%; the contents ofEAA,HEAA and NEAA were 32. 26% ± 0. 55%,7. 55% ± 0. 09% and 38. 88% ±0. 34% respectively.Four kinds of delicious amino acids (DAA) accounted for 29. 67% ± 0. 30% in dry sample; the ratio of total delicious amino acids to total amino acids (WDAA /WTAA) was 37. 70%. The essential amino acids index (EAAI) was 63. 88,the ratio of total essential amino acids to total amino acids (WEAA /WTAA) was 40. 99%,and the ratio of total essential amino acids to total nonessential amino acids (WEAA /WNEAA) was 82. 96%. It was clear that the content of the different amino acids was stable and the constitutional rate of the essentialamino acids met the Food and Agriculture Organization of the United Nations /Word Health Organization (FAO/ WHO) standards. According to nutrition evaluation in amino acids score (AAS) and chemical score(CS),the first limited amino acid was Trp,the second limited amino acid was (Met + Cys). 5 saturated fatty acids (SFA),5 mono-unsaturated fatty acids (MUFA) and 6 poly unsaturated fatty acids (PUFA) were found in the muscle of G. giuris. The contents of EPA and DHA in fatty acids were 3. 91% ± 0. 11% and 8.10% ± 0. 60% respectively,which were much higher than those of most fish species. In conclusion,the studyresults indicated that the muscle of G. giuris contains plenty of PUFA,EPA and DHA,thus,it is a high quality food fish for human. It is also a potential diet for the juvenile Chinese sturgeon,Acipenser sinensis,when they stay in the Yangtze Estuary area.

【题目】水暴露下氟在西伯利亚鲟稚鱼硬骨和软骨中的积累和消除
【中文关键词】氟;鱼;软骨;沉积
【英文关键词】fluorine;fish;cartilage;retention
【中文摘要】采用静态水暴露试验方法,设置0.26(对照)、3.1、7.8、18.7、51.8mg·L-1 氟离子(F-)5 个试验组暴露西伯利亚鲟稚鱼,暴露90d 后转移至清水中培养30d,检测了这2 个阶段鱼体硬骨和软骨中氟离子含量,探讨了氟离子在西伯利亚鲟稚鱼硬骨和软骨中的积累与消除规律,以及氟离子对鱼体生长的影响. 结果表明,随着氟离子浓度的增加和暴露时间的延长,氟在西伯利亚鲟稚鱼硬骨和软骨中的含量显著增加,暴露90d 时各暴露组硬骨和软骨中氟含量均显著高于对照组;西伯利亚鲟稚鱼暴露在较高浓度氟离子(7.8、18.7 和51.8mg·L-1)中90d,生长速度(体重)显著下降;经过30d 清水培养后,较高浓度暴露组(18.7 和51.8mg·L-1)西伯利亚鲟稚鱼硬骨的氟含量显著下降. 由此结论:氟在西伯利亚鲟稚鱼硬骨和软骨组织中具有较高的生物蓄积作用;转移至清水中饲养后,蓄积的高浓度的氟可从硬骨中排出.
【英文摘要】A 120-day growth trial was conducted to determine the accumulation and elimination of fluoride ions (F-) in juvenile Siberian sturgeon (Acipenser baerii). Fish were first exposed to each measured F - concentration of 3.1, 7.8, 18.7 and 51.8mg · L-1(added as NaF), along with a control group(0.26mg · L-1)for 90 days, followed by a 30-day fresh waterexposure period. Fish growth was determined and F - contents in bone and cartilage were analyzed in different tissues every 30 days. Results showed that fish growth was inhibited significantly for groups exposed to 7.8, 18.7 and 51.8mg · L -1 compared with the control group. F - concentrations in bone and cartilage showed dose -response and time -effect. After 90 -day exposure, significant increases in F - content were observed in bone and cartilage of Siberian sturgeon exposed to concentrations above 3.1mg · L-1. F- content in bone significantly decreased in the 18.7 and 51.8mg · L-1 exposure groups after 30 days reared in fresh water. It is summarized that F - can be accumulated in bone and cartilage in Siberian sturgeon from water and F- can be eliminated from bone after reared in fresh water.

【题目】西伯利亚鲟卵黄脂磷蛋白的分离纯化及性质
【中文关键词】西伯利亚鲟; 卵黄脂磷蛋白; 凝胶过滤层析; 氨基酸
【英文关键词】Acipenser baeri ; Lipovitellin; Gel filtration chromatography; Amino acids
【中文摘要】卵黄是鱼类胚胎发生期的主要营养物质, 卵黄的含量和质量对于早期幼体维持生命和生长发育至关重要。本研究采用Sephacryl S 300 凝胶过滤层析法和蛋白质电泳技术分离纯化西伯利亚鲟(Acipenser baerii) 卵黄脂磷蛋白(lipovitellin, Lv) , 层析洗脱共得到7 个蛋白峰。对每个峰进行SDS PAGE 电泳及油红O、甲基绿和Schiff 试剂特异染色, 峰b 蛋白均呈阳性, 表明峰b 蛋白为西伯利亚鲟卵中的一种卵黄脂磷蛋白, SDS PAGE 电泳分析表明, 其由3 个亚基构成, 相对分子质量分别为30.6 ku、40.8 ku 和76.7 ku。对西伯利亚鲟Lv 氨基酸组成进行分析, 证明是一种含有相对较多天冬氨酸、赖氨酸、谷氨酸、丝氨酸、缬氨酸和亮氨酸的蛋白, 并且所含鲜味氨基酸含量比其他鱼偏高。
【英文摘要】The yolk protein is the chief nutrition material during embryogenesis. The quantity and quality of yolk is crucial for early larval growth.We have used Sephacryl S 300 gel filtration chromatography to separate lipovitellin from the Acipenser baerii. There were seven protein chromatography peaks. The peak b protein was composed of three subunits with molecular weights of 30 6 ku, 40 8 ku and 76 7 ku, respectively as revealed by the SDS PAGE electrophoresis analysis. Oil red O, Methyl green and the Schiff staining showed that the peak b protein was rich in glucose, lipid and phosphorus. Lipovitellin of A . baerii contained rich asparagines acid, lysine acid, glutamic acid,serine acid, leucine acid and valine acid. The quantity of flavor amino acids such as glutamic acid and asparaginesacid in A. baerii was abundant when compared to that in other species.

【题目】Effects of exogenous enzymes (phytase, non-starch polysaccharide enzyme) in diets on growth, feed utilization, nitrogen and phosphorus excretion of Japanese seabass, Lateolabrax japonicus
【中文关键词】无
【英文关键词】Japanese seabass; Lateolabrax japonicus; Exogenous enzymes; Nitrogenous excretion; Phosphorus excretion; Growth; Feeding utilization; Feeding and nutrition
【中文摘要】无
【英文摘要】A feeding experiment was conducted to investigate the effects of exogenous enzymes (phytase, non-starch polysaccharide enzymes: WX and VP, supplied by DSM) on growth performance and excretion of Japanese seabass (Lateolabrax japonicus) (initial mass 6.26±0.10 g). A basal diet was used as a control that contained a mixed protein source, and lysine, methionine and valine were supplemented to simulate the essential amino acid pattern of fish meal. Four other diets were supplemented with 200 mg phytase (500 IU), 400 mg VP, 800 mg WX, or a combination of 800 mg WX and 400 mg VP per kg diet, respectively. Each diet was assigned to triplicate groups of fish in floating sea cages, and each cage was stocked with 60 fish. The results showed specific growth rate (SGR) and feed efficiency ratio (FER) were not significantly improved by the phytase supplementation. However, supplementations with WX and VP significantly enhanced the SGR and FER (Pb0.05). Phosphorus retention was significantly increased by the supplementation with phytase, whereas nitrogen retention was also enhanced by supplementations of non-starch polysaccharide enzymes (Pb0.05). The excretion experiment showed that the soluble phosphorus and ammonia nitrogen in starved fish were constant, irrespective of dietary treatments. The total phosphorus effluent in fish fed the diet with phytase supplementation was significantly lower compared with the control group after feeding to satiation (Pb0.05), but soluble phosphorus excretion was still independent of dietary treatments.The ammonia excretion in satiated fish significantly decreased with upplementations of non-starch polysaccharide enzymes.

【题目】The pig p160 co-activator family: Full length cDNA cloning,
【中文关键词】无
【英文关键词】IMF; Molecular cloning; p160 co-activators; Pig; qRT-PCR
【中文摘要】无
【英文摘要】Evidence has shown in mouse that the p160 co-activator family, consisting of nuclear receptor co-activators 1 (NCOA1), 2(NCOA2) and 3 (NCOA3) plays a critical role in adipogenesis. In the present study, we cloned these three porcine genes, identi fi edtheir transcript variants and analyzed their expression level in relation to intramuscular fat (IMF) content in Longissimus Dorsi (LD)muscle. Both in silico cloning and PCR ampli fi cation revealed a full length cDNA sequence of 6591 bp for NCOA1 (EU346671),7628 bp for NCOA2 (EU346672) and 5005 bp for NCOA3 (EU346674) in pigs, respectively. Interestingly, three transcript variantswere identi fi ed for the porcine NCOA1 and two for the porcine NCOA2 gene. In addition, the deduced amino acid sequencesindicated that isoform 2 of NCOA2 lacks the fourth LXXLL motif, the number of which has been shown to in fl uence the selectivityand af fi nity for different nuclear receptors. Finally, 15 animals with high IMF content and fi fteen animals with low IMF content($p < 0.05$) selected from 60 individuals were used to investigate how the family members and their variants affect the phenotypein pigs using real-time PCR. Our results showed that both NCOA1 transcript variant 2 ($r = -0.554$, $p < 0.01$) and total NCOA1($r = -0.516$, $p < 0.01$) expression levels were negatively correlated with IMF contents, while NCOA2 transcript variant 1 ($r = 0.605$,$p < 0.01$) and NCOA3 ($r = 0.435$, $p < 0.05$) were positively associated with IMF content in LD muscle. Overall, the present studyprovides evidence for the fi rst time that the p160 co-activator familymight have a concordant effect on lipidmetabolisminmammals.© 2008 Elsevier Inc. All rights reserved.

【题目】Expression of Frizzled 2 in the mouse ovary during oestrous
【中文关键词】无
【英文关键词】Frizzled 2, ovary, oestrous cycle, real-time
Q-PCR, in situ hybridization, Western blotting,
immunohistochemistry
【中文摘要】无
【英文摘要】The Wnt/b-catenin pathway is a conserved signalling pathway that reg-ulates gene expression and controls diverse developmental processessuch as cell fate speci fi cation, cell proliferation and cell differentiation.To our knowledge, the potential role of this pathway in the adult ovaryhas been poorly addressed. To this end, we investigated the expressionpattern of Frizzled 2 in the mouse ovary during oestrous cycle by real-time Q-PCR, in situ hybridization, Western blotting and immunohisto-chemistry. In this study, we used uterine wet weight and H3.2 mRNAlevel as two markers for classi fi cation of mouse oestrous cycle. Wefound that both uterine wet weight and H3.2 mRNA are the highest inthe proestrus and decrease from oestrus to diestrus. During oestrouscycle, Frizzled 2 mRNA and protein exhibited the highest level in theproestrus stage and rapidly reduced from oestrus to diestrus. In situhybridization results showed that the positive signals for Frizzled 2 arehighly detected in the oocyte and stroma in proestrus stage, while mod-erate or weak Frizzled 2 mRNAs are localized in the oocyte, granulosacells, stroma and corpus luteum from oestrus to diestrus. The localiza-tion pattern of Frizzled 2 protein is mostly consistent with its mRNA,but stronger Frizzled 2 proteins are present in the granulosa cells andmembrane of oocyte in oestrous cycle. Our data suggest that Frizzled 2may be involved in regulating follicle growth, oocyte maturation andluteinization during oestrous cycle.

【题目】Effects of dietary ß-1, 3 glucan on innate immune response of large yellow croaker, Pseudosciaena crocea.
【中文关键词】无
【英文关键词】Large yellow croaker; Pseudosciaena crocea; b-1, 3 glucan; Immunity; Bacteria challenge; Growth
【中文摘要】无
【英文摘要】The present study was conducted to investigate the effects of dietary b-1, 3 glucan on the innate immune response and protection against Vibrio harveyi infection in large yellow croaker, Pseudosciaena crocea. A basal diet was supplemented with 0% (control), 0.09% (low) and 0.18% (high) b-1, 3 glucan to formulate three experimental diets. Each diet was randomly allocated to triplicate groups of fish in floating sea cages (1.5 1.5 2.0 m), and each cage was stocked with 100 fish (initial average weight 9.75 0.35 g). Fish were fed twice daily (05:00 and 17:00) to apparent satiation for 8 weeks. The results of 8 weeks feeding trial showed that low glucan supplementation (0.09%) significantly enhanced fish growth, whereas high supplementation (0.18%) did not. The serum lysozyme activity was significantly increased with the increase of dietary glucan ($P < 0.05$), and fish fed the diet with high glucan had significantly higher lysozyme activity compared with low glucan. There were no significant differences in alternative complement pathway (ACP) activity between fish fed diets with and without supplementation of glucan. The phagocytosis percentage (PP) and respiratory burst activity in fish fed the diet with 0.09% glucan were significantly higher than those in fish fed with the control diet ($P < 0.05$), but both immunological parameters significantly decreased in fish fed the diet with high supplementation compared with low

supplementation and no significant difference was observed between the control and highsupplementation groups. The challenge experiment showed that fish fed the diet with low glucan had significantly lower cumulative mortality compared with the control and high glucan groups ($P < 0.05$), but no significant difference was observed between the control and high supplementation groups. These results suggested that low glucan could enhance growth and innate immunity of large yellow croaker with an 8-week oral administration, but higher supplementation did not influence growth, or further improve immunity of large yellow croaker.

【题目】Effects of dietary vitamin C on survival, growth, and immunity of large yellow croaker, Pseudosciaena crocea
【中文关键词】无
【英文关键词】Large yellow croaker; Pseudosciaena crocea; Vitamin C requirement; Survival; Immunity; Nutritional immunity
【中文摘要】无
【英文摘要】An 8 weeks growth experiment was conducted to determine the effects of dietary vitamin C on the survival, growth, tissue ascorbic acid contents and immunity of large yellow croaker (Pseudosciaena crocea) with initial weight of 17.82±0.68 g. Seven practical diets were formulated to contain 0.1, 12.2, 23.8, 47.6, 89.7, 188.5 and 489.0 mg ascorbic acid equivalent kg^{-1} diet, supplied as L-ascorbyl-2-polyphosphate (LAPP). Each diet was fed to triplicate groups of fish in seawater floating cages (1.5×1.5×2.0 m), and each cage was stocked with 120 fish. Fish were fed twice daily (05:00 and 17:00) to apparent satiation for 8 weeks. The water temperature fluctuated from 19.5 to 25.5 °C, the salinity from 25 to 28‰ and dissolved oxygen content was approximately 7 mg l^{-1} during the experimental period. Results showed that the specific growth rate (SGR) (from 1.80 to 1.96% d^{-1}) had an increasing trend with the increase of dietary vitamin C, but no significant difference was observed among dietary treatments. No gross deficiency signs were observed in any of the experimental fish. Survival rate, however, significantly increased with increasing dietary vitamin C (Pb0.05). The vitamin C contents in liver and muscle correlated positively with the vitamin C in diets. The vitamin C requirement was estimated to be 28.2 mg kg^{-1} based on survival, and 87.0 mg kg^{-1} on liver content of vitamin C. The activities of serum lysozyme and alternative complement pathway (ACP), phagocytosis percentage (PP) and respiratory burst activity of head kidney significantly increased with increasing dietary vitamin C. The challenge experiment with Vibrio harveyi showed that fish fed the diets with supplementation of vitamin C had significantly lower cumulative mortality compared to the control group (66.7%), and the cumulative mortality (16.7%) in fish with 489.0 mg kg^{-1} ascorbic acid was significantly lower than that (41.7%) in fish with 23.8 mg kg^{-1} ascorbic acid. These results suggested that vitamin C significantly influenced the immune response and disease resistance of large yellow croaker.

【英文关键词】Simultaneous,Sensitive,Determination,Multiplex chemical residues,Multicolor,Quantum dot,Probes
【中文摘要】无
【英文摘要】Biotinylated denatured bovine serum albumin (Bt-dBSA)-coated cadmium telluride (CdTe) quantum dot (QD) conjugates were prepared and used to develop the multiplexed fluoroimmunoassay for the simultaneousdetermination of five chemical residues. An immune complex was formed using avidin as the bridge to link the Bt-dBSA-QDs with the antibodies. Primarily,

individual quantitative determinations of five representative chemical residues were carried out based on the different emission properties of the QDs. Five antibodies were then conjugated with the corresponding QDs to establish the indirect competition fluorescent-linked immunosorbent assay (ic-FLISA) for the simultaneous detection of five chemicals in one well of a microplate. The linear range for dexamethason (DEX) was from 0.33 μg/kg to 10 μg/kg, 0.28 μg/kg to 10 μg/kg for gentamicin (GM), 0.16 μg/kg to 25 μg/kg for clonazepam (CZP), 0.17 μg/kg to 10 μg/kg for medroxyprogesterone acetate (MPA) and 0.32 μg/kg to 25 μg/kg for ceftiofur (CEF), respectively. The limit of detection (LOD) for the simultaneousdetermination of DEX, GM, CZP, MPA and CEF were as low as 0.13 μg/kg, 0.16 μg/kg, 0.07 μg/kg, 0.06 μg/kg and 0.14 μg/kg, respectively. This detection method was used to analyze samples of pork muscle and the recoveries ranged from 61.3% to 80.3% for DEX and from 74.0% to 87.2% for MPA. Further more, good correlation between the novel ic-FLISA and traditional ELISA was demonstrated during the determination of DEX and MPA residues in real samples. The QD-based protocol described here is less time consuming than the classical method and it may be sufficiently flexible to be used in other systems for the simultaneous multicolor detection of the drugs.

【题目】Heterologous expression of the Bacillus subtilis (natto) alanine dehydrogenase in Escherichia coli and Lactococcus lactis
【中文关键词】无
【英文关键词】Lactococcus lactis;
Alanine
dehydrogenase;
Ldh promoter;
Fermentation;
Alanine
【中文摘要】无
【英文摘要】The major objective of the present study is to change the alanine production of Lactic acid bacteria by expression of Bacillus subtilis (natto) alanine dehydrogenase (AlaDH), the gene that is not present in Lactic acid. B. subtilis AlaDH gene (ald) was cloned into a pGEX6p-1 and expressed in E. coli JM109. Its enzyme activity was 48.3U/mg at 30 degrees C and 45.2U/mg at 42 degrees C. This ald gene was then cloned into a vector pNZ8148 to generate a vector pNZ8148/ald. The same ald gene was placed downstream of the ldh promoter from Streptococcus thermophilus to generate pNZ273/ldhp/ald. The pNZ8148/ald and pNZ273/ldhp/ald were introduced separately in Lactococcus lactis NZ9000. As a result of over-expressed ald, the production of alanine detected by HPLC in L. lactis NZ9000 carrying pNZ273/ldhp/ald reached 52mug/ml, an approximately 26-fold increase compared to the parent strain L. lactis NZ9000, but not in L. lactis NZ9000 carrying pNZ8148/ald. This study would help strain improvement to be used in dairy fermentation for developing healthy yogurts with sweet taste or other fermented dairy foods.

【题目】Replacement of fish meal by meat and bone meal in diets for large yellow croaker
【中文关键词】wu

【英文关键词】Large yellow croaker; Pseudosciaena crocea; Fish meal; Replacement; Meat and bone meal; Feeding and nutrition
【中文摘要】wu
【英文摘要】A growth experiment was conducted to investigate the effects of replacement of fish meal (FM) by meat and bone meal (MBM) in diets on the growth and body composition of large yellow croaker (Pseudosciaena crocea). Six isonitrogenous (43% crude protein) and isoenergetic (20 kJ g.1) diets replacing 0, 15, 30, 45, 60 and 75% FM protein by MBM protein were formulated. Each diet was randomly allocated to triplicate groups of fish in sea floating cages (1.0×1.0×1.5 m), and each cage was stocked with 180 fish (initial average weight of 1.88±0.02 g). Fish were fed twice daily (05:00 and 17:30) to apparent satiation for 8 weeks. The water temperature ranged from 26.5 to 32.5 °C, salinity from 32 to 36‰, and dissolved oxygen content was approximately 7 mg l.1 during the experimental period. Survival decreased with increasing dietary MBM and the survival in the fish fed the diet with 75% protein from MBMwas significantly lower than other groups (Pb0.05). There were no significant differences in specific growth rate (SGR) among the fish fed the diets with 0 (the control group), 15, 30 and 45% protein from MBM. However, SGR in the fish fed the diets with 60 and 75% protein from MBM were significantly lower than other groups (Pb0.05). No significant differences in feeding rate were observed among dietary treatments. The digestibility experiment showed that the apparent digestibility coefficients (ADC) of dry matter, protein, lipid and energy of MBM were significantly lower compared with those of FM (Pb0.05). Essential amino acid index was found to be correlated positively with SGR in the present study, suggesting that essential amino acid balance was important. Body composition analysis showed that the carcass protein and essential amino acids were not significantly affected by dietary MBM. The lipid and n-3 highly unsaturated fatty acid (n-3 HUFA) in fish muscle, however, significantly decreased with increasing dietary MBM. These results showed that 45% of FM protein could be replaced byMBMprotein in diets of large yellow croaker without significantly reducing growth. It was suggested that the reduced growth with higherMBMwas due to lower digestibility and imbalance of essential amino acids.

【题目】Dietary methionine requirement of large yellow croaker, Pseudosciaena crocea R
【中文关键词】wu
【英文关键词】Large yellow croaker; Pseudosciaena crocea; Methionine; Dietary requirement; Feeding and nutrition; Fish
【中文摘要】wu
【英文摘要】A feeding trial was conducted to determine the dietary methionine requirement of juvenile large yellow croaker (initial body weight 1.23±0.02 g). The basal diet contained 43% crude protein from fish meal, soybean meal, yeast, wheat meal and crystalline amino acids with 0.65% methionine and 0.29% cystine on a dry diet basis. Six diets were formulated with six graded levels of methionine (0.66% to 1.89% in about 0.25% increment). Each diet was randomly assigned to triplicate groups of 180 juvenile fish in seawater floating net cages (1.0×1.0×1.5 m). Fish were fed twice daily (05:00 and 17:30) to apparent satiation for 10 weeks. The water temperature fluctuated from 27 to 30 °C, salinity from 25‰ to 28‰ and dissolved oxygen was approximately 7 mg l.1 during the experimental period. Specific growth rate (SGR), feed conversion efficiency (FCE) and protein efficiency ratio (PER) increased with increasing levels of methionine up to 1.41% diet (P<0.05), and thereafter, declined. No significant differences in body composition were found among dietary treatments. On the basis of either SGR or FCE, the optimum dietary methionine requirements of juvenile large yellow croaker were estimated to be 1.44% of diet (3.34% of dietary protein) and 1.39% of diet (3.22% of dietary protein), respectively, using second-order polynomial regression analysis. Hence, the corresponding requirements of this fish for total sulfur amino acids (Met+Cys) were calculated to be 1.73% of diet (4.02% of dietary protein) and 1.68% of diet (3.91% of dietary protein), respectively.

【题目】Dietary phosphorus requirement of large yellow croaker, Pseudosciaena crocea R.
【中文关键词】wu
【英文关键词】Fish; Large yellow croaker; Pseudosciaena crocea; Phosphorus requirement; Feeding and nutrition
【中文摘要】wu
【英文摘要】A study was conducted to estimate the optimum requirement of dietary phosphorus for large yellow croaker in floating sea cages (1.0 1.0 1.5 m). Five practical diets were formulated to contain graded levels (0.30%, 0.55%, 0.69%, 0.91% and 1.16%) of available phosphorus from dietary ingredients and monocalcium phosphate (MCP). Each diet was randomly assigned to triplicate groups of 180 juvenile fish (initial body weight, 1.88F0.02 g). Fish were fed twice daily (5:00 and 17:00) to satiation for 8 weeks. During the experimental period, the water temperature fluctuated from 26.5 to 32.5 8C, salinity from 32x to 36x and dissolved oxygen was more than 7 mg l 1. Specific growth rate (SGR) significantly increased with increasing available phosphorus from 0.30% to 0.69% of diet (P b0.05), and then leveled off. The body composition analysis showed that the whole-body ash and lipid, as well as phosphorus content in the whole body, vertebrae and scales were significantly affected by dietary available phosphorus level (P b0.05). Broken-line analysis based on SGR indicated the minimum available phosphorus requirement for the optimal growth of large yellow croaker was 0.70%. Based on the phosphorus content in either vertebrae or whole body, the requirements were 0.89% and 0.91%, respectively.

【题目】基于节能偏好的冲突多目标相容温室环境控制
【中文关键词】遗传算法;温室环境控制;节能偏好信息;相容控制算法
【英文关键词】genetic algorithm; greenhouse climate control; energy-saving preference information; compatible control algorithm
【中文摘要】在温室环境控制问题中,传统的控制方法追求精确的点目标控制,而精确的控制精度是以高的能量消耗为代价的。针对温室环境控制这一实际问题,采用多目标相容控制算法来进行控制。因为在相容控制算法中点控制目标被放宽到区间内,所以有很大的余地来协调控制精度和能耗。为了满足相容控制算法在控制过程中节能偏好的需要,对遗传算法进行了改进,把节能这一偏好信息引入到了优化过程中、参与进化寻优。通过对经典温室模型仿真,验证了新算法在节能降耗方面的优势。
【英文摘要】In the greenhouse climate control problem, classical control methods pursue precise point control; however, precise control is at the cost of high energy consumption. In this paper, the Multi-Objective Compatible Control (MOCC) algorithm is applied in the greenhouse climate. Because control point is enlarged to interval in MOCC, much more room can be used to compromise the control precise and energy consumption. In order to meet the MOCC ’s demand, GA is modified and energy-saving preference information is incorporated into the optimization process. In the classical greenhouse model, classical control method is compared with MOCC based on preference information, and the results show that MOCC has an overwhelming advantage over classical control with respect to energy-saving.

【题目】Possible promoter regions within the proteolytic system in Streptococcus thermophilus and their interaction with the CodY homolog
【中文关键词】无
【英文关键词】CodY homolog;
proteolytic system;
promoter;
Streptococcus thermophilus
【中文摘要】无
【英文摘要】Possible promoter regions preceding 14 genes belonging to the proteolytic system of Streptococcus thermophilus KLDS 3.0503 were predicted by a promoter analysis software nnpp. The 14 genes included an extracellular protease gene prtS, an oligopeptide ABC transport system gene amiA1, and 12 genes, respectively, encoding peptidases pepA, pepS, pepN, pepC, pepB, pepQ, pepV, pepT, pepM, pepXP, pepP, and pepO. These predicted promoter sequences were cloned and inserted into the upstream of a promoterless Escherichia coli gusA (beta-glucuronidase) gene in a promoter probe vector pNZ273. The resulting vectors were, respectively, introduced into S. thermophilus KLDS 3.0503 and all 14 predicted promoter sequences were able to drive gusA expression, which indicated that these sequences were functional promoters. These promoters were able to interact with the S. thermophilus CodY homolog in an in vitro DNA binding assay but they did not contain a conserved CodY-box sequence identified in Lactococcus lactis. These results were useful for further studies on the regulation of protein metabolism in S. thermophilus.

【题目】Effects of dietary squid viscera meal on growth and cadmium accumulation in tissues of Japanese seabass, Lateolabrax japonicus (Cuvier, 1828)
【中文关键词】wu
【英文关键词】Japanese seabass, Lateolabrax japonicus,
squid viscera meal, growth, cadmium accumulation
【中文摘要】wu
【英文摘要】Cadmium (Cd) is a toxic environmental pollutant with a long biological half-life and can produce both hepatic and renal injuries in mammals and h. Squid viscera meal (SVM), an e cts of dietary SVM on the growth and Cd deposition in tissues of Japanese seabass, Lateolabrax japonicus. Three practical diets were formulated to contain 0, 50 and100 g SVMkg 1 diet, respectively, containing 0.21, 7.26 and 12.08 mg Cd kg 1 diet. Each diet was randomlyassigned to triplicate groups of 80 Japanese seabass (mean initial weight, 10.89 0.21g) in ating sea cages (1.5 1.5 2.0m). Fish were fed twice daily (06:30 and16:30 hours) to satiation for 8 weeks. The results showed that therewere no signi ant differences in h survival among three dietary treatments, but signi ant higher speci growth rates (SGR) were observed in the h fed diets with 50 or 100 g SVMkg 1 diet than that from the control group (Po0.05). The Cd concentrations in the kidney, liver and gill were found in a decreasing order at each treatment, and positively correlated with dietary Cd levels. Fish fed diets with 50 and100 g SVMkg 1diet had signi antly higher Cd accumulations in the kidney (3.25, 5.85 mg kg 1), liver (0.76, 1.26mg kg 1) and gill (0.42, 0.58mg kg 1) compared with the control group (0.82, 0.34 and 0.32 mg kg 1 respectively) (Po0.05). The Cd concentration in h muscle; however, was undetectable in any treatment. Therefore, based on these results, accumulation of Cd in edible tissue (muscle) of farmed Japanese seabass is not a food safety issue. However, long-term feeding of diets with SVM may result in accumulation of Cd in the kidneys, liver and gills of ¢ sh.

【题目】Development of an Enzyme-Linked Immunosorbent Assay for the α-Cyano Pyrethroids Multiresidue in Tai Lake Water
【中文关键词】无
【英文关键词】α-Cyano pyrethroid; pesticide class; ELISA; tai lake water
【中文摘要】无
【英文摘要】A general and broad class selective competitive enzyme-linked immunosorbent assay (ELISA) for the detection of the α-cyano pyrethroids was developed. One class specific hapten, the 5-(3-benzylphenyl)-5-cyanopentanoic acid (CPBA-BE), was conjugated with BSA as an immunogen. Polyclonal antibodies, PY-antibodies, were generated. The assay with the most selectivity for the family α-cyano pyrethroids such as cyphenothrin was further optimized and tested for tolerance to cosolvent, pH, and ionic strength changes. The IC50 values of the optimized immunoassay were 4.58 μg L − 1 for cyphenothrin, 5.62 μg L − 1 for fenpropathrin, 7.08 μg L − 1 for deltamethrin, 10.72 μg L − 1 for cypermethrin, 19.95 μg L − 1 for flucythrinate, and 28.18 μg L − 1 for esfenvalerate. The cross-reactivities of cyphenothrin, fenpropathrin, deltamethrin, cypermethrin, flucythrinate, and esfenvalerate were 100%, 81.49%, 64.68%, 42.72%, 22.96%, and 16.25%, respectively. The low detection limit (LDL) of this assay was 0.107 μg L − 1 for cyphenothrin. This method was used for the detection of the α-cyano pyrethroids in Tai lake water.

【题目】不同杂交品种肉牛背最长肌LPL基因表达的发育性变化及其对IMF的影响
【中文关键词】肉牛;LPL基因;肌内脂肪;荧光定量PCR
【英文关键词】无
【中文摘要】肌内脂肪的沉积受多种因素的影响,遗传和营养是影响肌内脂肪沉积的重要因素,大多数研究者对营养影响IMF的沉积进行了广泛而深入的探讨,而对于遗传因素,尤其是不同月龄肉牛IMF的沉积规律以及影响IIvvIF沉积的分子调控机制尚未见报道。因此,为了研究不同杂交品种肉牛肌肉LPL基因表达的发育性变化及其对IMF沉积的影响,(方法)本试验选择体重相近的15-17月龄西杂、利杂,17-19月龄利草杂交共43头肉牛为研究对象,西杂、利杂、利一草杂牛分别为15头、16头和12头。以品种为单位分为三组,试验牛饲喂精粗比为50:50的饲粮,日粮营养水平参照中国肉牛饲养标准(2004)按日增重1.Okg设计。试验分为三个阶段,每个阶段为90天,各组牛于试验的第90天、180天、270天按比例屠宰,取背最长肌分别放入一20°C和液氮中,用于脂肪含量和LPLmRNA的测定。脂肪的测定采用索氏提取法测定,LPLmRNA的测定采用荧光RT PCR方法进行。(结果)结果表明:在第一屠宰阶段各杂交品种肉牛IMF含量差异不显著((P>0.05),利杂牛含量最高;在第二屠宰阶段利杂牛IMF沉积显著高于其它两个杂交品种牛(P<0.05),随着月龄的增加,脂肪沉积呈升高趋势;背最长肌LPL表达量在三个屠宰阶段各品种间差异不显著((P>0.05),但利杂牛表达量最高,并且随着月龄的增大,表达量呈升高趋势。相关性分析表明,利杂牛和利一草杂牛LPL表达量和IMF含量在第三屠宰阶段出现显著的正相关(P<0.05) o(结论)背最长肌LPL表达量对肌内脂肪沉积有显著的影响,LPL的表达量与IMF沉积呈显著正相关。

【题目】Dietary phosphorus requirement of juvenile Japanese seabass, Lateolabrax japonicus.
【中文关键词】无
【英文关键词】Fish; Japanese seabass; Lateolabrax japonicus; Phosphorus requirement; Feeding and nutrition
【中文摘要】无
【英文摘要】A feeding trial was conducted to estimate the optimum requirement of dietary available phosphorus for juvenile Japanese seabass in floating sea cages (1.5×1.5×2 m). Five practical diets were formulated to contain graded levels (0.31%, 0.56%, 0.70%, 0.93% and 1.17%) of available phosphorus from dietary ingredients and monocalcium phosphate (MCP). Each diet was randomly assigned to triplicate groups of fish, and each group was stocked with 60 fish (initial body weight, 6.28±0.1 g). Fish were fed twice daily (06:30 and 16:30) to satiation for 8 weeks. During the experimental period, the water temperature fluctuated from 26.5 to 32.5 °C, salinity from 32‰ to 36‰ and dissolved oxygen was approximately 7 mg l−1. Specific growth rate (SGR) significantly increased with increasing available phosphorus from 0.31% to 0.70% of diet (Pb0.05), and then leveled off. The body composition analysis showed that the carcass ash, lipid and protein, as well as phosphorus contents in the whole body, vertebrae and scales, were significantly affected by dietary available phosphorus (Pb0.05). The blood biochemistry analysis showed that plasma phosphorus and plasma alkaline phosphatase (ALP) activity increased with the increase of dietary available phosphorus levels (Pb0.05). Brokenline analysis based on SGR indicated that the minimum available phosphorus requirement for the optimal growth of juvenile Japanese seabass was 0.68%. Based on the phosphorus content either in whole body or vertebrae, the requirements were 0.86% and 0.90%, respectively.

【题目】Isolation and characterization of a novel virulent phage (phiLdb) of Lactobacillus delbrueckii
【中文关键词】无
【英文关键词】Lactobacillus delbrueckii
Bacteriophage
Phage morphology
Phage stability
Adsorption
【中文摘要】无
【英文摘要】A new virulent phage (phiLdb) of Lactobacillus delbrueckii subsp. bulgaricus was isolated from a Chinese yogurt sample showing slow acidification. It belonged to the Siphoviridae family with an icosahedral capsid of 47.7+/-0.9 nm in diameter and a long tail of 129.8+/-2 nm. The genome of phage phiLdb was estimated to be approximately 41kbp, and did not contain cohesive ends. One-step growth kinetics of its lytic development revealed latent and burst periods of 45 min and 75 min, respectively, with a burst size of 56+/-2 phage particles per infected cell. Phage phiLdb was highly specific for Lactobacillus delbrueckii subsp. bulgaricus. The presence of calcium or magnesium ions was necessary to accelerate cell lysis and improve plaque formation. Phage phiLdb was able to survive in a pH range between 2 and 10, and resist ethanol and isopropanol. However, a treatment of 90 degrees C for 40 min was observed to inactive phage phiLdb thoroughly. Calcium ions, pH as well as temperature did not show significant influence on phage adsorption, and the adsorption kinetics were similar on viable and nonviable cells. The characterization of this novel phage was helpful to establish a basis for adopting the most effective phage control strategies in industrial plants

【题目】Dietary lysine requirement of large yellow croaker, Pseudosciaena crocea R.
【中文关键词】无
【英文关键词】Fish
Large yellow croaker
Pseudosciaena crocea
Lysine requirement
Feeding and nutrition
【中文摘要】无
【英文摘要】A study was conducted to estimate the optimum requirement of dietary lysine for large yellow croaker in floating sea cages (1.0×1.0×1.5 m). Six isonitrogenous and isoenergetic practical diets were formulated to contain graded levels of lysine (1.27, 1.83, 2.41, 3.02, 3.60 and 4.22% dry matter) from dietary ingredients and lysine · HCl. Crystalline amino acid mixtures were supplemented to simulate the amino acid pattern of the whole-body protein of large yellow croaker except for lysine. Each diet was randomly assigned to triplicate groups of 180 juvenile fish (initial body weight, 1.23±0.02 g). Fish were fed twice daily (0500 and 1700 h) to satiation for 10 weeks. During the experimental period, the water temperature fluctuated from 27 to 30 ° C, salinity from 25 to 28‰ and dissolved oxygen was more than 7 mg l.1. The results showed that specific growth rate (SGR), feed efficiency ratio (FER), protein efficiency ratio (PER) and protein retention (PR), significantly increased with increasing lysine level from 1.27 to 2.41% of diet (Pb0.05), and then leveled off. Apart from the reduced growth, no external pathological signs were observed in the fish fed diets limiting in lysine. The whole-body protein (15.6 – 17.7%), as well as whole-body lysine, increased significantly with increasing dietary lysine level (Pb0.05). The body lipid content (5.9 – 5.4%) showed an opposite trend to that of body protein, while moisture, ash and other essential amino acids showed no significant differences among the dietary treatments. Broken-line analysis based on SGR, FER and PER indicated the optimum requirements of large yellow croaker for dietary lysine were 2.48, 2.45 and 2.43% of diet (5.77, 5.70 and 5.65% of dietary protein), respectively.

【题目】A Novel GFP-Fused Eukaryotic Membrane Protein Expression System in Lactococcus lactis and Its Application to Overexpression of an Elongase
【中文关键词】无
【英文关键词】无
【中文摘要】无
【英文摘要】Eukaryotic membrane proteins are often difficult to produce in large quantities, which is a significant obstacle for further structural and biochemical investigation. Lactococcus lactis has several properties that are ideal for enhanced expression of eukaryotic membrane proteins. In this article, a novel lactococcal vector was constructed, by inserting a green fluorescent protein (GFP) sequence into the vector pNZ8148. The resulting vector pKj-gfp was applied to the overexpression of an elongase-GFP fusion in L. lactis. After adding nisin, the expression of the fusion was confirmed via microscopy, the conditions were optimized by fluorescent spectroscopy, and the location of the fusion was monitored through in-gel fluorescence, indicating that the fusion was directed into the cytoplasmic membrane and no degradation was observed. The ELKJ-GFP fusion accounted for ~15% of the total membrane proteins using PDQuest software. These results indicate that the lactococcal system can be used for the overproduction and convenient detection of eukaryotic membrane proteins. Images

【题目】Enantioselective determination of cypermethrin in pig muscle tissue by immunoaffinity extraction and high performance liquid chromatography
【中文关键词】无
【英文关键词】Chiral;cypermethrin;high performance liquid chromatography;immunoaffinity;pork muscle
【中文摘要】无
【英文摘要】A high performance liquid chromatography method was developed to detect enantiomers of cypermethrin in pork muscle. Eight isomers of racemic cypermethrin were separated using a normal mobile phase of hexane – isopropyl alcohol (99.3 – 0.7, v/v) on a chiral CD-ph column in 25 min. The elution order of isomers was ascertained using enantiomer/diastereomer enriched cypermethrin standards. The extracts from pork samples were cleaned up by immunoaffinity column before detection. The recoveries from samples fortified levels of 0.1 and 1 mg kg − 1 ranged from 67.3% to 113.5% with a relative standard deviation 6.7 – 16.8%; sufficient to effectively measure cypermethrin enantiomer concentrations in pig muscle tissue samples in the future.

【题目】鱼类营养免疫研究进展
【中文关键词】鱼类;营养;免疫
【英文关键词】无
【中文摘要】随着集约化养殖模式的推广,鱼类养殖业得到了迅猛发展。然而,由于高密度养殖、投饲频率增加以及水体污染等问题,养殖鱼类感染疾病的几率大大升高,给养殖业造成了巨大损失。因此鱼类病害已经成为制约养殖业进一步发展的瓶颈。传统的用于防治鱼病的方法主要有两种,一是化学药物治疗法;一是疫苗预防法。化学药物治疗存在抗药性和药物残留等问题,而疫苗预防法则由于其特异性和操作困难而存在一定的局限性。因此寻找新的防治鱼类病害的方法就成为人们亟待解决的重大课题。研究证明营养和免疫之间密切相关,通过营养调控来提高鱼类的免疫力,不仅可克服传统方法所存在的缺陷,有利于健康养殖,减少对环境的污染,保证食品的安全,而且这已经被证明是一种行之有效的方法。因此,研究营养和免疫之间的关系已经成为了一门新的学科,有关该方面的研究在鱼类已有了一些报道,本文将对此作一综述。

【题目】Expression of the capsidprotein of porcinecircovirustype2 in Lactococcus lactis for oral vaccination
【中文关键词】无
【英文关键词】PCV2
Capsid protein
Lactococcus lactis
Oral vaccines
【中文摘要】无

【英文摘要】Diseases associated with porcine circovirus type 2 (PCV2) infections are becoming a major problem forthe swine industry worldwide. The capsid protein (Cap) of PCV2 is an antigen important for both earlydiagnosis and development of vaccines. In this study, Lactococcus lactis was used as vehicle to deliver thePCV2 antigen in an attempt to develop oral vaccine. A cap gene with a deleted nuclear localization signalsequence (dcap) was cloned into an Escherichia coli/L. lactis shuttle vector pSEC: LEISS under the controlof a nisin promoter. Intracellular and extracellular expression of the dCap was con fi rmed by Westernblot analysis.
Signi fi cantly higher levels of PCV2-speci fi c IgG in the sera of mice were observed upon oraladministration of strain cultures expressing the PCV2 antigen. These results suggest that it is feasible touse L. lactis as an antigen delivery vehicle for developing oral vaccines against PCV2 infection.

【题目】Interference RNA (RNAi)-Based Silencing of Endogenous Smad4 in Porcine Granulosa Cells Resulted in Decreased FSH-mediated GCs Proliferation and Steroidogenesis
【中文关键词】无
【英文关键词】MORPHOGENETIC PROTEIN SYSTEM; TGF-BETA; SIGNAL-TRANSDUCTION; GENE-EXPRESSION; FOLLICLE; MICE; SUPERFAMILY; ROLES; OVARY; LEADS
【中文摘要】无
【英文摘要】FSH plays a critical role in granulosa cell (GC) proliferation and steroidogenesis through modulation by factors including bone morphogenetic proteins family, which belongs to transforming growth factor beta (TGFB) superfamily. TGFBs are the key factors in maintaining cell growth and differentiation in ovaries. However, the interaction of FSH and TGFB on the GCs' proliferation and steroidogenesis remains to be elucidated. In this study, we have investigated the role of SMAD4, a core molecule mediating the intracellular TGFB/SMAD signal transduction pathway, in FSH-mediated proliferation and steroidogenesis of porcine GCs. In this study, SMAD4 was knocked down using interference RNA in porcine GCs. Our results showed that SMAD4-siRNA causes specific inhibition of SMAD4 mRNA and protein expression after transfection. Knockdown of SMAD4 significantly inhibited FSH-induced porcine GC proliferation and estradiol production and changed the expression of cyclin D2, CDK2, CDK4, CYP19a1, and CYP11a1. Thus, these observations establish an important role of SMAD4 in the regulation of the response of porcine GCs to FSH

【题目】Expression of BMP Receptors in Porcine Granulosa Cells (GCs) and Their Regulation by Luteinizing Hormone (LH)
【中文关键词】无
【英文关键词】porcine GCs; mRNA expression; BMP receptors; Smads; LH; E2; P4
【中文摘要】无
【英文摘要】Bone morphogenetic proteins (BMPs) play critical roles in follicle growth and development. BMPs initiate signaling by assembling BMP receptors and activating Smads, which in turn alter expression of target genes. The mechanism underlying the regulation of the expression of BMP receptors and Smads during follicle development in pigs is still unknown. By quantitative real-time PCR, the mRNA expression of BMP receptors and Smads in granulosa cells (GC) was investigated. Cells were obtained from small porcine follicles (SF; <3 mm diameter) and dominant follicles (DF; >6 mm diameter); ActR1A and BMPR2 mRNA levels in DF were significantly higher (P<0.05) than that in SF, whereas BMPR1B, Smad4 and Smad7 expression tended to decrease (P>0.05). The levels of BMPR1A, ActR2, Smad1, Smad5, and Smad8 mRNA did not differ between DFs and SFs. To investigate the effect of LH on BMP

receptors in GC, cells obtained from porcine DFs were cultured in medium supplemented with different doses of luteinizing hormone (LH). High doses of LH (4 IU mL(-1)) significantly decreased the concentration of estradiol (E2) and progesterone (P4) in medium and the expression of Cyp19a1 (P450 aromatase, P450arom) and Cyp11a1 (cholesterol side-chain cleavage enzyme P450, P450scc), while significantly increased viable cell numbers and up-regulated expression of cyclin dependent kinase-4 (CDK4) and cyclin D2. However, LH had no effect on the expression of BMP receptor genes. Thus, the present study indicates that the expression of members of the BMP signaling pathway in porcine GC is regulated during follicle development and the expression of BMP receptors are not regulated by LH in porcine GCs.

【题目】Identification and characterization of the two-component cell lysis cassette encoded by temperate bacteriophage ϕ PYB5 of Lactobacillus fermentum

【中文关键词】无

【英文关键词】endolysin;
holin;
lytic spectrum;
temperate bacteriophage;
two-component cell lysis cassette;
zymogram analysis

【中文摘要】无

【英文摘要】Aims: To characterize the two-component cell lysis cassette comprised of holin (Hyb5) and endolysin (Lyb5) encoded by Lactobacillus fermentum temperate bacteriophage ϕ PYB5, and illustrate the potential application of Lyb5 as therapeutic agents.Methods and Results: The hyb5 – lyb5 cassette was cloned from the genome library of ϕ PYB5, and the hyb5, lyb5 and hyb5 – lyb5 cassette were expressed in E. coli BL21, respectively. The molecular weight of Hyb5 indicated by SDS-PAGE was 19 kDa, and Lyb5 was 45 kDa. Both Hyb5 and Lyb5 protein could induce cell lysis alone, resulting in the leakage of β -galactosidase. However, the Hyb5 – Lyb5 cassette lysed the host cells more rapidly and extensively. By zymogram analysis, Lyb5 exhibited a broad lytic spectrum.Conclusions: Overexpression of hyb5, lyb5 and hyb5 – lyb5 cassette were carried out in E. coli and Lyb5 exhibited a broad lytic spectrum.Significance and Impact of the Study: The Lyb5 produced in E. coli exhibited a broad lytic spectrum against Gram-positive strains including Staphylococcus aureus as well as Gram-negative strains such as Salmonella typhi, suggesting that Lyb5 provides a potential alternative of diagnostic tools and therapeutic agents.

【题目】Effect of interrupted endogenous BMP/Smad signaling on growth and steroidogenesis of porcine granulosa cells

【中文关键词】无

【英文关键词】Porcine granulosa cells; Bone morphogenetic protein (BMP)/Smad; Smad4; RNA interference (RNAi); Growth; Steroidogenesis

【中文摘要】无
【英文摘要】Bone morphogenetic proteins (BMPs) play a critical role in the growth and steroidogenesis of granulosa cells (GCs). BMP signals act through membrane-bound heteromeric serine/threonine kinase receptors. Upon ligand binding, BMPs activate intracellular Smad proteins and regulate growth and apoptosis in various cell types. The objective of this study was to demonstrate the effects of BMP/Smad signal on growth and steroidogenesis of porcine GCs. A strategy of RNA interference (RNAi)-mediated 'gene silencing' of Smad4, a core molecule mediating the intracellular BMP/Smad signal transduction pathways, was used to interrupt endogenous BMP/Smad signaling. Results indicate that Smad4-small interfering RNA (siRNA) caused specific inhibition of Smad4 mRNA and protein expression after transfection. Interrupted endogenous BMP/Smad signaling significantly inhibited growth, and induced apoptosis of porcine GCs, while decreasing estradiol production. In addition, interrupted BMP/Smad signaling significantly ($P < 0.05$) changed the expression of Cyclin D2, CDK4, Bcl-2, and Cyp19a1. These findings provide new insights into how BMP/Smad signaling regulates the growth and steroidogenesis of porcine GCs.

【题目】Identification of a novel C20-elongase gene from the marine microalgae Pavlova viridis and its expression in Escherichia coli
【中文关键词】无
【英文关键词】Pavlova viridis . Elongase .Membrane protein .
Green fluorescent protein
【中文摘要】无
【英文摘要】Pavlova viridis, a species of a unicellular marine microalgae, is rich in the very-long-chain polyunsaturated fatty acids, such as eicosapentaenoic acid (EPA, 20:5n-3) and docosahexaenoic acid (DHA, 22:6n-3). A new elongase gene (elkj), with high identity with a functionally characterized C20-elongase of Pavlova lutheri, was isolated via reverse transcriptase-polymerase chain reaction using the primers designed from conserved motifs and 5'/3' rapid amplification of cDNA ends. The coding region of 314 amino acids predicted a protein of 34 kDa, which contained seven transmembrane domains with its C-terminal in the cytoplasm and located in the endoplasmic reticulum. The expression of ELKJ in Escherichia coli was carried out by using green fluorescent protein as an indicator, suggesting the correct insertion in cytoplasmic membrane. Functional analysis demonstrated that elkj encoded a C20-elongase that mediated the elongation of EPA into docosapentaenoic acid (22:5n-3), confirming the two-step conversion from EPA to DHA in marine microalga.

【题目】Identification of nisin-producing strains by nisin-controlled gene expression system.
【中文关键词】无
【英文关键词】endolysin;
holin;
lytic spectrum;
temperate bacteriophage;
two-component cell lysis cassette;

zymogram analysis
【中文摘要】无
【英文摘要】A specific method to identify nisin-producing strains was developed based on Nisin-Controlled gene Expression (NICE) vector pSec:Nuc. The plasmid pSec:Nuc was transformed into non-nisin-producing strain Lactococcus lactis NZ9000, a host commonly used for the NICE system. The generating strain L. lactis NZ9000/pSec:Nuc could sense extracellular inducer nisin and efficiently secrete a reporter protein Nuc, the staphylococcal nuclease (Nuc) into the medium. Instead of using purified nisin, the culture supernatants of nisin-producing strains were also used as inducers. Therefore, the NICE system could be used to identify nisin-producing strains. With this principle, 4 among 56 lactococci strains isolated from raw milk were identified as nisin producers. The results were further confirmed by polymerase chain reaction amplification with their genomic DNA as templates, and nucleotide sequencing revealed that three of them produced nisin A, and the others produced nisin Z. Those results made it possible to isolate and identify nisin-producing strains specifically and rapidly using NICE system.

【题目】An Improved MOCC with Feedback Control Structure Based on Preference
【中文关键词】无
【英文关键词】无
【中文摘要】无
【英文摘要】The optimal solution of multi-objective control problem (MOCP) isn ’t unique, so it is hard for traditional method to obtain these optimal solutions in one simulation process. Based on this background, Multi-Objective Compatible Control (MOCC) algorithm was presented by Lihong Xu in [2]. MOCC is acompromise method, which hunts for suboptimal and feasibleregion as the control aim rather than precise optimal point. The controller of MOCC is optimized by GA in its interval, namely its controller lacks concrete controller structure. Due to the controller without concrete structure, the system model must be accurate andwithout input disturbance; however, it is impractical in practice.Besides, the control problem is different from the optimization.Different user has different preference and users ’ preference information plays a key role in control performance. In this paper,the feedback control law u L and users ’ preference information are incorporated into MOCC algorithm. An improved MOCC (IMOCC) algorithm is presented. The simulation result demonstrates its superiority and advantage over the MOCC algorithm.

【题目】Improved determination of phoxim residue in stored wheat by HPLC with DAD
【中文关键词】无
【英文关键词】HPLC;
pesticide residue;
phoxim;
wheat grain samples
【中文摘要】无

【英文摘要】AbstractThis article presents an improved method to detect the phoxim residual in whole wheat grain (not milled). The authors used petroleum ether (PE) as solvent to extract phoxim in darkness, and then determined it with high-performance liquid chromatography (HPLC) with diode array detector (DAD) at 280 nm. Use of PE improved the extraction efficiency of phoxim from grain samples over those obtained using acetone, recovery of 83.3% and 65.9%, respectively. Light produced more side effect on the extraction of this pesticide than with darkness, recovery of 63.2% and 83.3%, respectively. The combination of PE with darkness yielded a higher recovery of phoxim in liquid-phase extraction. The peak area of phoxim compared with its absolute values of phoxim in standard solution concentration range from 0.005 mg/kg to 0.253 mg/kg showed a good linear calibration (R(2) = 0.9999). Recoveries, at spiked concentrations of 0.02, 0.05, and 0.10 mg/kg, varied between 83.3% and 106.3% with relative standard deviations (RSD) ranging from 6.5% to 8.0%. The present method provides sufficient sensitivity as reflected by the values of limit of detection (LOD) and limit of quantification (LOQ). LOD was 0.002 mg/kg (S/N 3), and the estimated LOQ was 0.006 mg/kg (S/N = 10). Use of the proposed method successfully detected phoxim residue in wheat grain from Beijing and Kunming City of China.

【题目】PCR-DGGE 技术在乳酸菌检测中的条件研究
【中文关键词】变性梯度凝胶电泳; 聚合酶链式反应; 乳酸菌; V3可变区域;
【英文关键词】denaturing gradient gel electrophoresis; polymerase chain reaction; lactic acid bacteria; variable V3 region;
【中文摘要】变性梯度凝胶电泳技术广泛应用于微生物生态学的研究,最近也渗透到食品微生物学领域。为了检测发酵乳制品中乳酸菌的组成及动态变化,本实验对PCR-DGGE技术在乳酸菌检测中所需要的条件如变性剂梯度、电泳时间进行研究。结果表明,变性剂梯度在30%~55%,电泳时间为200min时,能够有效分离乳酸菌的16SrRNA基因的V3区域。在此基础上,就PCR技术对染色体DNA混合模板的扩增效率进行分析,结果发现,常规PCR技术与降落PCR技术对乳酸菌16SrRNA基因V3区域的扩增没有差异,而细菌通用引物对乳酸菌模板DNA的识别和扩增具有优先和偏爱性,预示PCR-DGGE技术用于微生物群体检测时还应选用乳酸菌引物进行佐证。
【英文摘要】Denaturing gradient gel electrophoresis (DGGE) analysis was recently applied in the detection of food microbial diversities as well as of environmental microbial communities widely. To analyze the component and structure of lactic acid bacteria in food samples and dairy fermented products, DGGE conditions such as gradient of denaturant and run time for electrophoresis were firstly optimized. The results showed that 30%~55% was a suitable denaturant range of gradient for partially melting DNA fragments, and about 200 min was a proper time for the variable V3 region separation of 16S rRNA genes of lactic acid bacteria. Five chromosomes DNA mixture of lactic acid bacteria was used as template DNA for traditional PCR and touch down PCR to amplify the V3 region, respectively. The PCR production was subjected to DGGE analysis as described above. The different efficiencies of amplification during PCR by universal bacteria primer set were also observed. This suggested that the limit in the detection potential of PCR-DGGE is a consequence of DNA template competition during the amplification reaction.

【题目】Energy-saving Control of Greenhouse Climate Based on MOCC Strategy
【中文关键词】无

【英文关键词】Energy-saving, Optimal control, Greenhouse climate model,Multi-objective compatible control Strategy, MOEAs
【中文摘要】无
【英文摘要】The adjustment of greenhouse environment has heavy influence on the plants growth, production yield, quality and energy consumption. Moreover, classical methods used for solving greenhouse environment multi-objective control problems may be more reasonable by adopting "region" control objectives instead of "point" control objectives. In this pa-per, we propose a novel energy-saving control algorithm, and employ Multi-Objective Compatible Control(MOCC) strategy and an extant greenhouse model to optimize the con-trol parameters of greenhouse environment for short time-scale prediction(15 minutes). A series of optimization experiments using Multi-Objective Evolutionary Algorithms(MO-EAs) are presented to minimize energy consumption under certain compatible control "region" conditions. The results are encouraging, and show that the proposed method may be valuable and helpful to formulate environmental control strategies, to pursue less energy cost, and to gradually re-alize the ultimate objectives of environmental optimal control

【题目】Model-based Compromise Control of Greenhouse Climate using Pareto Optimization
【中文关键词】无
【英文关键词】Compromise control algorithm, Energy-saving, Greenhouse climate model, Weather forecast model, NSGA-II
【中文摘要】无
【英文摘要】Energy-saving is always in conflict with the control Errorminimizing for real-world engineering application in greenhouse.Moreover, the efficiency of plant production andenergy consumption depends largely on the adjustment of greenhouse environment. In order to achieve less energy consumption and higher control precision, this paper presents akind of compromise control algorithm for Pareto solutions of greenhouse environment control. The models of greenhouse and weather forecast used are described and derived. A seriesof optimization experiments are presented at any time of a day using Non-dominated Sorting Genetic Algorithm-II(NSGA-II). The results show the feasibility of the proposed method, and it may be valuable and helpful to formulate environmental control strategies, and to achieve high control precision and low energy cost.

【题目】乳酸菌有氧呼吸代谢研究进展
【中文关键词】乳酸菌; 有氧增殖; 呼吸代谢; 遗传学特征
【英文关键词】lactic acid bacteria; aerobic proliferation; respiration metabolism; genetic characteristics
【中文摘要】通过添加血红素,部分乳酸菌种(株)的细胞在有氧条件下可进行有氧呼吸代谢,细胞具有完整的呼吸链;遗传学证据表明,细胞色素氧化酶cydA基因可以在对数生长末期获得表达,代谢调控蛋白CcpA作为有氧代谢的"开关"进行代谢调控,此时乳酸菌细胞具有耐氧和耐酸性能力。相对于发酵条件而言,有氧代谢可促使乳酸菌细胞获得较高的生长量,培养介质的pH值维持在较高水平,使细胞具有较强的抗逆效果和生存能力。这意味着通过控制性地改变乳酸菌的培养条件,或许能改善乳酸菌细胞在有氧条件下的增殖潜力和生存能力,拓宽其在食品发酵工业中的应用范围。
【英文摘要】Several strains (species) of lactic acid bacteria (LAB) such as Lactococcus lactis can undergo respiration metabolism and thrive in the presence of both oxygen and a heme source. Genetic evidence suggests that cydA genes encoding cytochrome d oxidase

are expressed at the end of log phase, and aerobic respiration is regulated by the catabolite control protein A (CcpA) acting as "a switch" in LAB strains, therefore the strains present some oxygen and acid resistance. Compared to fermentation, aerobic respiration can prompt effectively the achievement of high biomass, the maintenance of high pH value of culture medium and the increases of adverse resistance and survival ability. It means that the controlled changes in cultivation conditions may increase the proliferation potential and survival ability of LAB, which can widen their application scope in food fermentation industry.

【题目】Non-even Spread NSGA-II and Its Application to Conflicting Multi-Objective Compatible Control
【中文关键词】无
【英文关键词】NSGA-II; evolutionary algorithm; non-even Pareto front spread;Multi-objective control
【中文摘要】无
【英文摘要】Non-dominated Sorting Genetic Algorithm-II (NSGA-II) is a sound method to deal with the multi-objective optimization problem, and even spread Pareto front preserving strategy is one of its two key principles. However, especially for some dynamic problems, the most interested area is certain special area among the Pareto front. To meet this requirement, the non-even Pareto front spread preserving principle is proposed and is taken as the optimization tool forthe multi-objective compatible control problem (MOCCP).To decrease the real-time computation load at every controlstep, based on the tight relation between the system states of the neighboring sampling instants, an iterative control algo- rithm is presented. The stability preference selection strat-egy in the algorithm tends to produce a stable controllerin face of the Pareto front with the divergent or oscillating segment. To further decrease the computation time, adaptable population corresponding with the control process is adopted. Comparative simulation example illustrates the validity.

【题目】饲料中不同水平n-3 HUFA对军曹鱼生长和脂肪酸组成的影响
【中文关键词】军曹鱼;脂肪酸需要;n一3 HUFA;摄食和营养
【英文关键词】Rachycentron canadum ;Fatty acid requirement;n一3 HUFA;Feeding and Nutrition
【中文摘要】:以鱼粉、豆粕和酪蛋白为蛋白源,通过调节饲料中的牛油和鱼油水平,使饲料中高度不饱和脂肪酸(n一3 HU—FA)的含量分别达到0.60、0.96、1,24、1.56、1.77和2.11% ,配制出6种等氮等能的实验饲料,并以此饲料投喂军曹鱼幼鱼(8.3±0、5g)8周。实验结果显示饲料中n一3 HUFA水平对实验鱼成活率没有显著影响,但却显著影响了军曹鱼的特定生长率(SGR)。随着饲料中n一3 HUFA水平的升高,SGR相应提高,但当饲料中n一3 HUFA水平高于1.24%时,各处理之间的生长没有出现显著差异。随着饲料中n一3 HUFA水平的升高,肌肉和肝脏中18:1n一9的含量逐渐下降,而22:6n一3的水平相应升高。根据实验结果,当以特定生长率为评价指标时,用折线模型估计出军曹鱼对饲料中n一3 HUFA的需求量约为1.49%
【英文摘要】Abstract:A feeding experiment was conducted in floating sea cages(1.0m x 1.5m×2.0m)to determine the requirement of juvenile cobia(Rachycentron canadum)for n一3 highly unsaturated fatty acids(n一3 HUFA).Six semi—purified diets were formulated to contain graded levels of n一3 HUFA,ranging from 0.6 to 2.11% .Juvenile fish(weighing 8.3±0.5g)were randomly divided into 18 cages of 20 fish,and fed one of 6 diets for 8 weeks.The water temperature fluctuated from 29 to 23.5°C ,the salinity from 20.9 to 23.9%v,and dissolved oxygen content was approximately 7mg/L during the experimental period.No significant

differences(ANOVA,P>0.05)in survival were observed among dietary treatments.However,specific growth rate (SGR)was significantly(P<0.05)affected by dietary n一3 HUFA.SGR significantly increased with increasing dietary n一3 HUFA from 0 to 1.24% .and reached a peak at 1.56% of n一3 HUFA.Then,SGR slightly decreased for the groups fed the diets containing higher than 1.56% of n · 3 HUFA.The content of 1 8:1 n一9 in muscle and liver decreased,while 22:6n一3 increased with increasing dietary n一3 HUFA.Based on SGR,the requirement for n一3 HUFA of juvenile cobia is about 1.49% of dry diet by broken—line analysis,

【题目】Detection of the Lactic Acid Bacteria in Commercial Yoghurts by PCR-denaturing Gradient Gel Electrophoresis
【中文关键词】乳酸菌; 聚合酶链式反应-变性梯度凝胶电泳; 酸奶; 16S rRNA基因可变区; 益生菌; 发酵乳制品;
【英文关键词】lactic acid bacteria; PCR-DGGE; yoghurt; variable region of 16S rRNA gene; probiotics; fermented dairy product;
【中文摘要】在食品发酵行业,需要一种简捷有效的方法检测发酵产品中的有益微生物.聚合酶链式反应-变性梯度凝胶电泳(Ploymerase chain reaction and denaturing gredient gel electrophoresis,PCR-DGGE)技术广泛应用于微生物生态学的研究.采用PCR-DGGE对5种含有乳酸菌的乳制品进行了菌群组成分析,并通过传统培养方法和核酸序列分析进行了验证.结果表明,所有测试样品中的活菌数量都在106~109 cfu/mL之间,通过平板培养法分离出了形态明显的杆状菌和链球状菌,对其进行16S rDNA核酸序列测定及同源性分析,将其鉴定为德氏乳杆菌(Lactobacillus delbrueckii)和嗜热链球菌(Streptococcus thermophilus).建立了由已知乳酸菌组成的DGGE参考阶梯(Reference ladder),可用其对相应菌株进行DGGE鉴定.用两对不同引物进行PCR-DGGE分析,除样品1外,试样中均检测到德氏乳杆菌和嗜热链球菌.对DGGE参考阶梯未能直接鉴定的样品1的电泳条带进行回收、序列分析,分别鉴定为卷曲乳杆菌(L.crispatus)和鼠李糖乳杆菌(L.rhamnosus).同时发现,引物R518-F357对嗜热链球菌模板的识别效率高于引物Lac1GC-HDA2.以上结果表明,RCR-DGGE技术可以对样品中的乳酸菌进行快速的分析和鉴定.图4表1参30
【英文摘要】For food fermentation industry,it is often desirable to monitor the probiotic microorganisms present in commercial products for quality control.Simple,reliable and rapid detection methods with low cost are required to achieve this goal.Denaturing gradient gel electrophoresis analysis of 16S rDNA has been widely used in identification of microbial communities without any culturing step.We have modified and tailored this technique,independently confirmed by sequencing and culture analyses,for detecting the lactic acid bacteria in commercial yoghurt products.All sampled yoghurt products contained bacteria ranging from 106 to 109-cfu/mL.Two strains,further identified as Streptococcus thermophilus and Lactobacillus delbrueckii,with typical morphological characters of Bacillus sp.and Streptococcus sp.were isolated.A reference ladder derived from amplification products of known lactic acid bacteria was constructed and characterized.L.delbrueckii and S.thermophilus were detected in four out of five yoghurt products by comparison of the reference ladder,while L.crispatus and L.rhamnosus were identif ied in another product by sequencing analysis.Furthermore,the preferential amplification was readily found between primers R518-F357 and Lac1GC-HDA2.Those results suggested that DGGE could be considered a reliable approach for rapid detection of bacteria in commercial yoghurt products.Fig 4,Tab 1,Ref 30

【题目】饲料中添加外源酶对大黄鱼和鲈氮磷排泄的影响
【中文关键词】大黄鱼; 鲈; 植酸酶; 非淀粉性多糖酶; 氮排泄; 磷排泄
【英文关键词】Phytase; Non starch polysaccharide enzyme; Large yellow croaker; Pseudosciaena crocea; Japanese seabass; Lateolabrax japonicus ; Nitrogen excretion; Phosphorus excret ion
【中文摘要】本研究以大黄鱼和鲈为实验对象, 探讨饲料中添加植酸酶(PY) 和非淀粉性多糖酶(WX 和VP) 对其氨氮和可溶性磷(PO3-4 P) 排泄的影响。以含植物蛋白的饲料为基础饲料, 分别向每千克饲料中添加200mg 植酸酶(酶的活性为2500IU/ g) 、800mg WX(主要包括葡聚糖酶、戊聚糖酶和纤维素酶, 各种酶的活性皆为50IU/ g) 、400mg VP(主要为木聚糖酶, 酶的活性为1000IU/ g) 以及800mg WX+ 400mg VP 配制出5 种实验饲料。实验鱼在海水网箱中经过8周的摄食驯养后, 转入室内水族箱中进行氮磷排泄测定实验。在水族箱中经2 天的适应后, 测定饥饿状态下氨氮及可溶性磷的排泄率。然后饱食投喂, 并连续测定摄食后48h 内鱼体氨氮和可溶性磷的排泄率。实验期间水温为26 5 32 5∀ , 盐度为32 5# 36# , 溶氧在7 mg/ L 以上。实验结果表明, 饥饿状态下实验鱼的氨氮和可溶性磷排泄不受实验饲料影响(p > 0 05) 。而在饱食条件下, 实验饲料中添加非淀粉性多糖酶(WX、VP 及WX+ VP) 显著降低了实验鱼的氨氮排泄率(p < 0 05) , 而

添加植酸酶组实验鱼的氨氮排泄率与对照组差异不显著。饲料处理对实验鱼可溶性磷的排泄率的影响不显著(p> 0 05) , 但添加植酸酶组实验鱼的可溶性磷排泄率有增加的趋势

【英文摘要】An experiment was conducted to evaluate the effects of dietary phytase (PY) and non starch polysaccharide enzyme (WX and VP) on ammonia nitrogen and soluble phosphorus excretion in large yellow croaker (Pseudosciaena crocea) and Japanese seabass (Lateolabrax japonicus) , respectively. Using soybean meal, rapeseed meal, peanut meal, fish meal and meat and bone meal as protein sources, fish oil and soybean oil as lipid sources, lysine, methionine and valine as supplements simulated the essential amino acid pattern of fish meal, five isonitrogenous and isoenergetic experimental dietswere formulated to contain 0, 200mg/ kg phytase (2500 IU per gram) , 800mg/ kg WX (mainly including glucanase, pentosanase and cellulosase, each with 50 IU per gram) , 400mg/ kg VP (mainly including xylanase, 1000 IU per gram) , and the combinat ion of 800 mg/ kg WX and 400mg/ kg VP, respectively. Each diet was randomly assigned to triplicate groups of fish, and each group was stocked with 180 large yellow croaker (initial body weight, (1. 88 & 0. 02) g) or 60 Japanese seabass [initial body weight, (6. 28& 0. 1) g] . Fish were fed twice daily (06: 30 and 16: 30) to sat iation for 8 weeks. During the experimental period, the water temperature fluctuated from 26. 5 ∀ to 32. 5 ∀ , salinity from 32# to 36 # and dissolved oxygen was approximately 7mg/ L. After feeding for 8 weeks in sea cages with experimental diets, fish from each cage (3 fishes per cage) were transferred into indoor tank (20L) to determine ammonia nitrogen and soluble phosphorus excretion rates in starvation and satiation condition. Each tank stocked with 1 large yellow croaker (12. 48 & 1. 02) g or 1 Japanese seabass (54. 87& 2. 34) g. The ammonia nitrogen was determined by the sodium hypobromite oxidation method. The soluble phosphorus was determined by phosphorus molybdenum bluemethod. The results showed that ammonia nitrogen and soluble phosphorus excretion rates of fish in starvation condit ion were not affected by the experimental diets (p > 0. 05) . However, the ammonia nitrogen excretion rates in satiation condition were significantly lower in fish fed with diets supplemented with the combination of WX and VP, WX or VP than that fed with basal diet and phytase supplemented diet (p< 0. 05) , and ammonia nitrogen excretion rates in fish fed with basal diet and phytase supplemented diet were not significantly different. Soluble phosphorus excretion rates of fish fed with different experimental diets were not significantly different (p> 0. 05) , but there was an upward trend of soluble phosphorus excretion rate in fish fed with phytase supplemented diet. These findings in the present study suggested that supplementation of 200 mg phytase per kilogram diet might degrade the dietary phytate and increase availabile phosphorus absorbability, but not significant effects on ammonia nitrogen excretion rates of large yellow croaker and Japanese seabass. The non starch polysaccharide enzymes (400 mg VP, 800 mg WX, or the combination of 800 mg WX and 400 mg VP per kilogram diet) were effective to degrade the ant i nutritional effect of non starch polysac charide and decrease ammonia nitrogen excretion rates of large yellow croaker and Japanese seabass, but not significant effects on soluble phosphorus excretion rates of experimental fish.

【题目】基于茎直径微变化的棉花适宜灌溉指标初步研究

【中文关键词】棉花; 茎直径微变化; 日出前叶水势; 株间变异; 灌溉指标;
【英文关键词】cotton; microchanges of stem diameter; predawn leaf water potential; plant-to-plant variability; irrigation indicator;

【中文摘要】在2004和2005年棉花生长季节,采用筒栽和大田小区试验相结合,对不同水分状况下茎直径微变化动态中日最大收缩量(M D S)、日增长量(D I)和当日复原所需时间(RT)等3个关键性指标进行了研究。结果表明,3个指标对植株体内水分状况变化的反应均非常敏感,随着日出前叶水势的降低,M D S明显增大;D I逐渐减小,在水势较高时变化幅度较小;RT则大幅度延长。当叶水势降低到-0.1M Pa时,D I变为负值,RT维持在24 h。3个指标的株间变异性测定结果表明,M D S和D I均存在较大的株间变异系数,RT的变异系数最小。对RT与土壤相对含水率进行相关分析发现,两者之间呈幂函数关系,相关程度达极显著水平。根据RT与叶水势和土壤相对含水率的关系,确定了RT对应于棉花适宜水分、轻度水分胁迫和重度水分胁迫的变化范围,而且,在对应的土壤含水率范围内,RT维持在一个相对稳定的区间,说明RT可作为指导棉花灌溉的适宜指标。M D S和D I由于影响因素较多,难以确定对应于水分胁迫的临界值,不适于单独作为灌溉指标。

【英文摘要】Both pot experiment and field experiment were conducted by continuous measurements of stem diameter variations,predawn leaf water potential and soil relative water content for growing cotton(Gossypium hirustum L. "Meimian 99B") in 2004 and 2005.The suitability of using parameters derived from stem diameter measurements,including maximum daily stem

shrinkage(MDS),daily increase(DI),and recovering time(RT) as indicators for irrigation scheduling of cotton was evaluated.The results show that the above three pa...

【题目】饲料中添加肽聚糖对大黄鱼生长和非特异性免疫力的影响
【中文关键词】大黄鱼; 肽聚糖; 特定生长率; 非特异性免疫力; 累积死亡率
【英文关键词】Pseudosciaena cr ocea ; pept idogly can; specif ic grow th ra te; no n specif ic immunity ; cumulat ive mo rtality
【中文摘要】以初始体重(30. 8 ! 1. 33) g 的大黄鱼(P seudosciaena crocea) 为研究对象, 探讨饲料中添加肽聚糖对其生长和非特异性免疫力的影响。分别向每千克基础饲料中添加0(对照组) 、100、500 mg 肽聚糖, 配制出3 种等氮等能的实验饲料, 进行为期8 周的摄食生长实验。实验在海水浮式网箱(1. 5 m ∀ 1. 5 m ∀ 2. 0 m) 中进行, 每个处理设3 个重复, 每个重复放养40 尾。实验采取饱食投喂方式, 每天投喂2 次(05: 00 和17: 30) , 实验期间海水水温为27. 5~ 30. 5 # , 盐度为29~ 33, 溶解氧含量在7 mg ∃ L- 1 以上。饲喂实验结束后测定实验鱼的生长及相关的免疫学指标, 同时每网箱取10 尾实验鱼转入室内300 L 水族箱内进行攻毒实验。实验结果表明,饲料中添加肽聚糖显著影响大黄鱼的成活和生长。当饲料中添加100 和500 mg ∃ kg- 1肽聚糖时, 成活率(分别为95. 8% 和95. 0%) 显著高于对照组(88. 3%) 。当饲料中添加100 和500 mg∃ kg- 1肽聚糖时特定生长率(分别1. 44% ∃ d- 1 和1. 41% ∃ d- 1) 显著高于对照组(1. 12 % ∃d- 1) (P < 0. 05) 。饲料中添加肽聚糖实验组大黄鱼血液白细胞吞噬活力和血清溶菌酶活力显著高于对照组(P< 0. 05) , 且添加肽聚糖的两实验组之间差异不显著; 而血清替代补体途径活力则随着饲料中肽聚糖添加水平的增加而显著提高(P < 0. 05) 。哈维氏弧菌攻毒实验结果表明, 饲料中添加肽聚糖实验组的累积死亡率(分别为25. 0% 和25. 7%) 显著低于对照组(64.3%) (P< 0. 05) 。因此, 饲料中添加适宜含量的肽聚糖可显著提高大黄鱼生长率和非特异性免疫力, 肽聚糖可以作为一种安全高效的口服免疫增强剂应用于大黄鱼的养殖生产。
【英文摘要】A feeding ex per iment w as conducted to ex amine the ef fects o f dietary pept ido gly ca n on growth, no n specif ic immunity and disease resistance for large y ellow cro aker, P seudosciaena cr ocea. 【题目】A black-streaked dwarf disease on rice in China is caused by a novel fijivirus
【中文关键词】水稻病毒病;斐济病毒属;双链RNA基因组片段
【英文关键词】rice virus diseases; Genus fijivirus; dsRNA Genome segments
【中文摘要】本研究围绕该病害并从典型的水稻病株上分离出一个植物呼肠孤病毒分离物,通过连接RT-PCR技术扩增并克隆该病毒基因组片段S7-S10,测序分析显示它在分子水平上与斐济病毒属第二组已知成员高度同源(42.7-85.1%)。进化树分析表明它应该为斐济病毒属第二组的一个新成员,随后对该病毒分离物的全基因组序列分析也支持该病毒属于一个水稻病毒新种的结论。根据该病毒的生物学特征将其暂定名为水稻黑条矮缩病毒2号,为该病毒的监测预警和高效防控提供了科学依据。此外,研究中有关基因组序列和p8蛋白一个高度保守新结构域的报道,为同类病毒基因功能的深入研究提供了重要的基础数据信息。
【英文摘要】An isolate of a plant reovirus causing severe stunting and dark leaf symptoms on rice from Guangdong, China, was similar in virion morphology and serologically related to rice black-streaked dwarf virus (RBSDV). The electrophoretic profiles of genome segments of the two viruses in agarose or polyacrylamide gel were indistinguishable. The four genome segments of the new isolate corresponding to RBSDV S7 – S10 were amplified by ligation RT-PCR and sequenced. The size and organization of each genome segment was very similar to its counterparts in RBSDV, maize rough dwarf virus (MRDV), and mal de Rio Cuarto virus (MRCV). Sequence identity was greatest to RBSDV and MRDV (ranging from about 60 – 85% depending on the protein), but identities were always much lower than those between RBSDV and MRDV. These comparisons and phylogenetic analyses suggested that the virus represents a new species in genus Fijivirus group 2, tentatively named Rice black-streaked dwarf virus-2.

【题目】充分灌溉和干旱胁迫对棉花茎直径变化的影响
【中文关键词】棉花; 干旱胁迫; 茎变化; 最大收缩量;
【英文关键词】cotton; drought stress; stem variation; maximum diameter shrinkage;
【中文摘要】以桶栽棉花为试验材料,采用随机区组试验设计,探讨充分灌水条件下(T0)和一个干旱周期中(TI)的茎直径变化量(RV)、最大收缩量(MDS)及每日生长量(DI)之间的差异。试验结果表明,由于受到土壤水分减少的影响,TI处理棉花的茎杆逐渐收缩得不到恢复,其RV曲线下降和T0处理RV曲线的差异逐渐变大,并且同是TI处理的植株其RV下降幅度也不同;二种条件下棉株的MDS和DI均呈负相关;水分胁迫的加剧导致棉花叶片气孔导度变小。经回归分析二处理MDS和气象因子中的有效辐射有较好的相关性,表明有效辐射是导致茎变化的主因。据此提出土壤相对含水量60%为RV产生差异的临界值,土壤相对含水量40%是棉花茎杆内可被用做蒸腾的水分被完全耗尽的临界值;同时提出标准茎变化的概念及其全回归方程。
【英文摘要】With those cottons planted in soil barrels,the distinguish of stem diameter s relative variation(RV),maximum diameter shrinkage(MDS) and daily increase(DI) between full irrigation treatment(T0) and drought treatment(TI) was researched by randomized block design experiment.The result indicate the cotton s stem of TI treatment shrinked with the decreasing of soil water content and couldn t recover its stem size at night as the stem of T0 treatment did,and its RV line declined sharply compared with the RV line...

【题目】PCR-DGGE技术在微生物物种多样性研究中的局限性及其解决措施
【中文关键词】变性梯度凝胶电泳; 微生物多样性; 微生物生态学; PCR; 局限性;
【英文关键词】DGGE; microbial diversity; microbial ecology; PCR; limitations;
【中文摘要】变性梯度凝胶电泳(denaturing gradientg elelectrophoresis,DGGE)技术目前已经成为研究微生物物种多样性和动态变化的分子检测工具之一。该技术不依赖于微生物的分离培养,便能快速、准确地获取复杂样品中微生物的菌群组成及其遗传信息,因此被广泛应用于微生物生态学、食品微生物学等领域。但DGGE技术存在一定的局限性,有时会造成分析结果的偏差。本文简单概述了DGGE技术的基本原理及其在微生物群落分析中的应用,重点对造成DGGE结果偏差的因素,如DNA提取、PCR扩增、DGGE条件以及DGGE图谱分析等进行讨论,并提出相应的解决措施,旨在对DGGE检测结果的分析提供参考。
【英文摘要】Polymerase chain reaction-denaturing gradient gel electrophoresis(PCR-DGGE) technique has been proven to be a powerful tool for analyzing microbial communities and their dynamics changes.As a fast and reliable molecular method,DGGE is used widely to investigate the microbial component and structure of complex communities without isolation and cultivation processes.However,potential causes resulting in limitations in DGGE analysis can be sometimes met.In this paper,the principle and application aspects,as well as the limitation of DGGE techniques for microbial ecology analysis were introduced,and the main causing factors addressed and discussed,such as DNA extraction,PCR amplification,DGGE conditions optimization,and DGGE profile analysis

【题目】大黄鱼幼鱼对锌的需要量
【中文关键词】大黄鱼;锌需要量;摄食生长
【英文关键词】Pseudosciaena crocea ; zinc requirement ; feeding and nutrition
【中文摘要】以初始体重为(1. 78 ±0. 02) g 的大黄鱼为实验对象,在室内流水系统(养殖桶规格:200 L)中进行为期8 周的摄食生长实验, 研究大黄鱼对饲料中锌的需要量。通过在基础饲料中添加ZnSO4 · H2O 使饲料中锌含量分别达到9. 68、30. 63、48. 94、91. 28、167. 49 和326. 81 mg · kg - 1 。每种饲料设3 个重复,每个重复放养40 尾大黄鱼。实验采取饱食投喂方式,每天投喂2 次(05 :30和17 :30) ,实验期间水温为26. 5~29. 5 ℃,盐度为25~28 ,溶解氧含量在7 mg · L - 1左右。实验结果表明各饲料处理组成活率(84. 2 %~96. 7 %) 无显著差异。随着饲料中锌含量的增加,大黄鱼的特定生长率(SGR) 显著升高[(2. 47~2. 77) % · d - 1 , P < 0. 05] ,且在91. 28 mg · kg - 1锌饲料组达最大值(2. 77 % · d - 1) ,然而,随着饲料中锌含量的进一步增加,SGR 维持在一相对稳定水平,各处理组间体蛋白(14. 0 %~15. 0 %) ,体脂肪(5. 4 %~6. 1 %) ,灰分(3. 7 %~4. 1 %) 及水分含量(76. 1 %~77. 9 %) 均无显著差异(P > 0. 05) 。饲料锌含量显著影响大黄鱼脊椎骨、全鱼和血清中锌的含量,而对肝脏锌含量无显著影响。以SGR 与骨骼锌含量为评价指标,根据折线模型得出大黄鱼对饲料中锌的需要量分别为59. 6 和84. 6 mg · kg - 1
【英文摘要】A growth experiment was conducted to determine the dietary zinc requirement for juvenile large yellow croaker [initial average weight (1. 78 ±0. 02) g] . Six semi2purified diets were formulated to contain 9. 68 ,30. 63 , 48. 94 , 91. 28 , 167. 49 and 326. 81 mg zinc per kg diet , supplied as ZnSO4 · H2O. Each diet was randomly assigned to triplicate groups of fish in flow2through system , and each tank was stocked with 40 juvenile fish. Fish were fed twice daily (05 : 30 and 17 : 30) to apparent satiation for 8 weeks . The water temperature fluctuated from 26. 5 to 29. 5 ℃, salinity from 25 to 28 and dissolved oxygen was approximately 7 mg · L - 1 during the experimental period. No significant differences in survival were found among dietary treatments .Specific growth rate (SGR) significantly increased with increasing dietary zinc from 9. 7 to 48. 9 mg · kg- 1 of diet (P < 0. 05) , and then leveled off . Zinc content in the vertebrae , whole body and serum was significantly affected by dietary zinc level (P < 0. 05) . No significant difference was

observed in body protein (14. 0 % - 15. 0 %) ,lipid (5. 4 % - 6. 1 %) ,ash (3. 7 % - 4. 1 %) and moisture (76. 1 % - 77. 9 %) among dietary treatment (P > 0. 05) . Broken2line analysis showed that the optimum dietary zinc requirement for large yellow croaker juveniles , using SGR and vertebrae zinc saturation as response criteria , was 59. 6 and 84. 6 mg zinc per kg diet ,respectively.

【题目】微颗粒饲料替代生物饵料对大黄鱼稚鱼生长,存活和消化酶活力的影响
【中文关键词】大黄鱼;稚鱼;微粒饲料;替代;生物饵料
【英文关键词】Pseudosciaena crocea ; larvae ; micro2diet ; substitution ; live prey
【中文摘要】以初始体重为(1. 93 ±0. 11) mg 的大黄鱼稚鱼(12 日龄) 为实验对象,以微粒饲料(micro2diet , MD) 分别替代0 %、25 %、50 %、75 %和100 %生物饵料(live prey , LP) ,探讨微粒饲料替代生物饵料对大黄鱼稚鱼生长、存活、体成分和消化酶活力的影响。30 d 的摄食生长实验表明:微粒饲料替代生物饵料显著影响大黄鱼稚鱼的生长、存活、体成分和消化酶活力。当微粒饲料替代50 %和75 %生物饵料时,两组间的特定生长率(SGR) 差异不显著(P > 0. 05) ,但均显著高于100 %替代水平(P < 0. 05) ; 同时,75 %替代水平SGR 显著高于0 %和25 %替代水平(P < 0.05) 。存活率在各处理组间的差异关系与SGR 的变化趋势类似。鱼体粗蛋白含量随替代水平的升高有下降的趋势,其中50 %、75 %和100 %替代水平鱼体粗蛋白含量显著低于0 %和25 %替代水平(P < 0. 05) ,而鱼体粗脂肪含量变化趋势与之相反。当微粒饲料替代100 %生物饵料时,其胰段和肠段淀粉酶活力显著高于其余各处理组(P < 0. 05) ,而其余各处理组之间淀粉酶活力差异均不显著;微粒饲料替代生物饵料对各处理组蛋白酶活力无显著影响。由此可以看出,大黄鱼苗种生产中,在12 日龄以后使用优质微粒饲料替代50 %~75 %的生物饵料是可行的。
【英文摘要】A 302day feeding experiment was conducted in tanks to examine the effects of substitution levels of live prey (LP) by micro2diet (MD) on growth , survival , body composition and digestive enzymes of large yellow croaker larvae , Pseudosciaena crocea. Five treatments with microdiet replacing 0 % (0 % MD) , 25 % (25 % MD) , 50 % (50 % MD) , 75 % (75 % MD) and 100 % (100 % MD) of live prey , were used. Each treatment was randomly assigned to triplicate groups of tanks , and each tank was stocked with 3 500 larvae. The results showed that the substitution of LP by MD significantly influenced the growth , survival , body composition and digestive enzymes of large yellow croaker larvae. The specific growth rates (SGR) of 50 % MD and 75 % MD were significantly higher than those of 100 % MD (P < 0. 05) , and the SGR of 75 % MD were significantly higher than those of 0 % MD and 25 % MD (P < 0. 05) . However , no significant differences were observed in SGR between 50 % MD and 75 % MD. The changes of survival rates among different tested groups followed the similar pattern as that of SGRs . Carcass protein content declined with the increasing of the substitution levels , and carcass protein contents of 50 % MD , 75 % MD and 100 % MD were significantly lower than 0 % MD and 25 % MD (P < 0. 05) . On the contrary , carcass lipid content increased with the increasing of substitution levels . The amylase specific activities of 100 % MD were significantly higher than those of the other groups (P < 0. 05) , but trypsin specific activities were not significantly different among dietary treatments . Therefore , these results indicate that substituting 50 % - 75 % of LP by MD after 122day hatching in fry production of large yellow croaker is appropriate.

【题目】保加利亚乳杆菌H+-ATPase缺陷型菌株的筛选
【中文关键词】德氏乳杆菌保加利亚亚种; H+-ATPase; 突变株; 后酸化;
【英文关键词】Lactobacillus delbrueckii subsp.bulgaricus; H~+-ATPase; mutant; post-acidification;
【中文摘要】【目的】从传统乳制品中筛选具有新霉素抗性的H+-ATPase缺陷的德氏乳杆菌保加利亚亚种自发突变株,为最终开发弱后酸化的酸奶发酵剂奠定基础。【方法】利用API 50 CH细菌鉴定系统和16SrRNA基因序列分析对菌株进行鉴定。新霉素作为筛选压力,筛选具有新霉素抗性自发突变菌株,比较亲本和突变菌株的H+-ATPase活力及其代谢情况。【结果】从内蒙古地区的传统发酵酸奶中分离鉴定出一株德氏乳杆菌保加利亚亚种(Lactobacillus delbrueckiisubsp.bulgaricus),并命名为KLDS 1.9201。以此为出发菌株,筛选出两株H+-ATPase缺陷的自发突变株,分别命名为KLDS 1.9201-1、KLDS 1.9201-4,它们的H+-ATPase活力分别比亲本KLDS 1.9201降低了46%和60%。在MRS培养基中生长24 h后,KLDS 1.9201、KLDS 1.9201-1和KLDS1.9201-4对初始葡萄糖的代谢率分别为65%、41%和31%,终产物中乳酸的浓度分别为26、18和15 g/L,突变菌株的生物量均低于亲本。【结论】H+-ATPase活力降低的德氏乳杆菌保加利亚亚种的自发突变株具有较低的生长速率和弱产酸能力,它们可被用于制作弱后酸化的酸奶发酵剂。
【英文摘要】[Objective] We identified a neomycin-resistant mutant with reduced membrane-bound H~+-ATPase activity from L.delbrueckii subsp.bulgaricus originated from the traditional dairy product to develop a yoghurt starter culture with low post-acidification capacity.[Methods] API 50 CH identification system and 16s rDNA sequence analysis were applied to identify the strain isolated from the indigenous yoghurt.Neomycin was used to screen spontaneous neomycinresistant mutants.H~+-ATPase activity and metabolic dynamics were evaluated between the parent strain and mutants.[Results] One strain was identified as L.delbrueckii subsp.bulgaricus by API 50 CH identification system and 16s rDNA sequence analysis,coded as KLDS 1.9201.Two mutant strains were mutated from KLDS 1.9201 and coded as KLDS 1.9201-1,KLDS 1.9201-4.Compared with the parent strain,the H~+-ATPase activity of the mutants KLDS 1.9201-1 and KLDS 1.9201-4 decreased by 46% and 60% respectively.After cultured in MRS broth for 24 h,metabolic efficiency of the initial glucose for the parent strain was 65%,the mutants were 41% and 31%,the lactic acid concentration in the culture for the parent strain was 26 g/L,the mutants were 18 g/L and (15 g/L) respectively.The cell density of the mutants was lower than that of the parent strain.[Conclusion] The mutants of L.delbrueckii subsp.bulgaricus with reduced membrane-bound H~+-ATPase activity had low growth and acid production,which could be applied to develop yoghurt starter culture with lower post-acidification.

【题目】基于计算机视觉与敲击振动融合技术检测鸭蛋壳强度
【中文关键词】鸭蛋 蛋壳强度 多传感器融合 数据关联 多元线性回归 模型
【英文关键词】Duck egg, Egg shell intensity, Multi-sensor fusion, Data association, Multi-dimensional linear regression, Model

【中文摘要】通过对敲击振动特征频率矩阵变异系数和测定有裂纹蛋壳强度的探索性分析,获得鸭蛋壳强度特征频率的分离阈值λ=0.02。通过传感器数据关联,确定了进入模型的特征变量。采用后向消去法进行多元线性回归建立了无裂纹鸭蛋壳强度预测模型,结合蛋壳强度分离阈值得出基于特征层多传感器融合鸭蛋壳强度的系统模型。验证性试验表明该模型有较好适应性,对于各种颜色、形态鸭蛋的蛋壳强度都有较好的预测效果,误差均值小于3.1%,误差标准差为0.003。
【英文摘要】Computer vision analysis and impact excitation frequency analysis were used to construct the duck eggs intensity model. By the analysis in the CV (coefficient of variation) of the duck eggs impact excitation frequency and the analysis of the crack eggs intensity, the threshold value (λ=0.02) which can be applied to distinguish the duck egg intensity at the level of 1 MPa (confidence at the level of 95%) was obtained. Then the characteristic variables were entered into the model. The backward elimination procedure was used to perform multi-dimensional linear regression in order to establish the forecast model of the non-crack duck eggs shell intensity. Combined with the threshold value which had been obtained, the system model of duck eggs shell intensity based on the multi-sensor fusion can be obtained. The confirmation experiment indicates that the model had good adaptability on duck-eggs with different color and mass, the model shows high accuracy (the mean of forecast error is 3.1%) as well as good stability (the standard deviation of forecast error is 0.003).

【中文摘要】为确定温室滴灌条件下番茄高产高效的适宜土壤水分控制指标,采用小区试验方法,在温室滴灌条件下研究了不同时期水分亏缺对番茄生长发育及生理特性的影响。研究结果表明,任何生育阶段发生水分亏缺均会降低番茄叶片光

合速率及气孔的开度,进而影响干物质的累积和运转,但不同时期水分亏缺的影响形式及程度有所不同;苗期水分亏缺会抑制番茄的正常生长发育,但水分过高会使植株徒长,不利于光合产物向产量的运移;开花坐果期水分亏缺不仅抑制了番茄的生长发育,而且降低了干物质的累积,并最终影响到产量的形成;成熟采摘期水分亏缺会加速番茄植株的老化,降低最终干物质量,对番茄产量的形成影响最为明显。在不影响番茄植株正常生长发育及生理需水情况下,适度水分亏缺(T1处理)可实现高产与高效用水的统一。

【英文摘要】In order to determine soil moisture control index with high yield and efficient water use for tomato under drip irrigation in greenhouse,effect of water deficit at different growth stages on tomato growth and physiological characteristics were studied in this paper.The results showed that water deficit reduced tomato leaf photosynthetic rate and stomatal aperture,and influenced dry matter accumulation and transportation,but influencing pattern and degree of water stress were not same in the different growth...

【题目】Characterization of siRNAs derived from rice stripe virus in infected rice plants by deep sequencing

【中文关键词】水稻条纹病毒;RNA干涉;病毒小RNA

【英文关键词】rice stripe virus (RSV);RNA interference;virus-derived small RNA(vsRNA)

【中文摘要】RNA干涉是植物一种天然的抗病毒反应,至今仅有正义RNA病毒siRNA被鉴定。本研究通过高通量测序技术鉴定了一种重要的负义RNA植物病毒,即水稻条纹病毒(RSV)的siRNA的特征:水稻条纹病毒的siRNA大多长20-22nt;且大多数siRNA由其基因组的5'-端和编码区产生;与其基因组碱基组成相比,RSV siRNA具有较高的GC碱基含量,但RSV siRNA的第一个碱基和最后一个碱基具有一定的偏好性,即其第一个碱基偏好A/U碱基,最后一个碱基偏好U碱基,这暗示水稻DCL蛋白有些作用于具有此特征的序列。

【英文摘要】RNA interference is a natural defense against viruses in plants. To date, the only viral siRNAs characterized have been those for positive-sense RNA viruses with one or two genome components. Here, we characterized siRNAs derived from rice stripe virus (RSV), a member of the genus Tenuivirus with four genomic RNAs and an ambisense coding strategy. Deep sequencing of small RNAs from infected rice leaves showed that siRNAs were derived almost equally from virion and complementary RNA strands and were mostly 20 – 22 nucleotides long. Most viral siRNAs were produced within the coding sequences and 5 ’ termini of the RSV genome. RSV siRNAs had a higher G and lower C content than the viral genome but a strong A/U bias at the first nucleotide and a U bias at the final one, suggesting preferential targeting of such sequences by rice Dicer-like proteins.

【题目】保加利亚乳杆菌胞外多糖合成条件的优化及其在发酵乳中的应用研究
【中文关键词】保加利亚乳杆菌 胞外多糖 合成条件

【英文关键词】Lactobacillus delbrueckii subsp. bulgaricus; exopolysaccharide(EPS);synthesis condition
【中文摘要】研究了不同碳源、氮源、碳氮比及发酵条件等因素对保加利亚乳杆菌Y5菌株产胞外多糖的影响。结果表明,以果糖为碳源时,胞外多糖的产量是55.46mg/L。显著高于用半乳糖作为碳源时的产量(29.59mg/L);以鱼蛋白胨作为氮源为时,胞外多糖产量可达到46.89mg/L,明显高于用胰蛋白胨作为氮源时的产量(P〈0.01);当碳氮比为2:1时,Y5菌株产生的胞外多糖最多,可这50.10g/L,显著高于碳氮比为1:2时的产量(P〈0.01)。培养温度为40°C,发酵时间为16h,初始pH值为6.0,葡萄糖添加量为2%的发酵条件是Y-5菌株产胞外多糖的最佳工艺条件,其胞外多糖水平可达105.36g/L。与采用ST和LB菌株的发酵乳相比,应用Y5菌株生产的发酵乳,其乳清析出量仅为7mL(P〈0.01):冷藏30d后,Y5菌株制备的发酵乳仍能维持10^7mL^-1以上的活菌数,明显高于对照菌株的存活数量(P〈0.01)。
【英文摘要】The factors,including carbon and nitrogen sources,the ratio of C to N ,temperature,incluation time and initial pH in medium affecting the level of exopolysaccharides(EPS) produced by Lactobacillus delbrueckii subsp.bulgaricus Y5 were studied .Strain Y5 preferred fructose to galactose as carbon source in producing EPS (P<0.01).In the presence of fructose ,EPS formed by strain Y5 reachde 55.46mg/L;whereas in the presence of galactose ,EPS was 29.59mg/L.EPS production by strain Y5 was higher in the persence of fish pepone than in the presence of tryptone ,and reachde 46.89mg/L Clearly,a 2:1 of C to N was better than a 1:2 of C to N in improving strain Y5 to produce EPS with 50.10mg/mL The combinationa of temperature at 40°C,16h of fermentation eime,initial pH in 6.0 and supplemented glucose of 2% significantly improved EPS production,up to 105.36g/L. Use of strain Y5 to manufuacture fermented milk produced significantly lower whey separation than strain ST and LB did(their fermented milks used as the control),and the amount of whey separated was only 7mL.The live cell counts of strain Y5 decreased slowly during a 30 d refrigerated storage at 4°C,but were higher than 10-7mL- and were significantly improved compared to those of the controlled samples.

【题目】基于可见光图像分析和支持向量机的鸭蛋新鲜度识别
【中文关键词】图像处理 识别模型 支持向量机 鸭蛋 色泽参数 新鲜度
【英文关键词】image processing,identification model,SVM,duck egg,color parameter,freshness
【中文摘要】研究鸭蛋内部的可见光图像信息(H和I)的变化来表征鸭蛋新鲜度的变化。采用可见光图像分析技术获取鸭蛋蛋心颜色参数, 将哈夫单位作为新鲜度的验证指标, 建立了基于支持向量机(SVM)的蛋心内部色泽参数的鸭蛋新鲜度预测模型。模型表明:当SVM类型为epsilon-SVR, 核函数为RBF模型特征参数C=27、σ=23时所建立的模型预测效果最好。其中模型预测效果参数RMSEC=0.9520, EMSEP=0.4205。鸭蛋新鲜度预测值与测定值之间具有良好的线性关系, 且预测值对实际值具有较大的搜索覆盖能力。该模型较好的解决了用普通的线性方法识别鸭蛋新鲜度存在的稳定性较差和置信度较小的问题。通过比较SVM和神经网络的识别结果可以发现:SVM对鸭蛋蛋心颜色的识别性能优于神经网络的识别性能(SVM: 98.92%>ANN: 93.77%)。
【英文摘要】This article applied the duck egg internal visible light image information (H and I) to characterize the freshness of duck egg. The visible light image analysis technology was applied to obtain the duck egg heart color parameters. The Hafu unit was used as the confirmation index of egg freshness through experiment, then established the forecast model based on SVM (support vector machines) which was developed using the egg heart color parameters to predicate the egg freshness. The model indicated that when we choose the SVM type as epsilon-SVR, the nuclear function as RBF ,the model characteristic parameter C=27, σ=23 ,then the model forecast effect is the best. The model forecast effect parameters RMSEC reached 0.9520, and the EMSEP reached 0.4205. The predicted value of egg freshness and the practical value has good linear correlation and predicted value has a large covering and searching ability on the practical value. This model showed better stability and confidence interval compared with the ordinary linear method. Through the comparison of SVM and neural network recognition results we can get the conclusions that SVM has a better duck-egg freshness recognition performance than ANN by egg heart color's analysis(SVM reach to 98.92%>ANN reach to 93.77%).

【题目】宁夏固原市马铃薯主栽品种对晚疫病的抗性
【中文关键词】宁夏; 马铃薯; 晚疫病; 品种; 抗病性
【英文关键词】Ningxia; potato; late blight; cultivar; disease resistance
【中文摘要】为了明确宁夏固原市马铃薯主栽品种对晚疫病的抗性,采用田间自然发病的方法对20个主栽品种开展了抗病性研究。结果显示,抗病性最强的品种是宁薯12号,其次为冀张薯5号、虎头、费乌瑞它、陇薯3号,它们在发病初期的病情指数为0.44~0.80,发病中期的介于0.98~1.50。综合抗病性、产量和商品薯率对品种优劣进行了排序,结果表明,综合性状表现最好的是冀张薯5号,其次为宁薯12号、陇薯3号、地希瑞、虎头。生产中应同时注重品种抗病性以及产量、商品薯率等经济性状,进行合理布局。
【英文摘要】This experiment investigated the disease resistance condition of 20 main potato cultivars to late blight in Guyuan,Ningxia,using the method of investigation in the field.The results indicated that Ningshu No.12 was the most resistant of all,followed by Jizhangshu No.5,Hutou,Feiwuruita and Longshu No.3.The disease index of the cultivars above was 0.44-0.80 in early stage,and 0.98-1.50 in middle stage.Then the study contrasted the composite characters of resistance,yield and commodity potato rate,and results indicated that Jizhangshu No.5 was the best of all in composite characters and the next was Ningshu No.12,and then Longshu No.3,Dixirui and Hutou.In production,famers should pay attention to disease resistance,yields,commodity potato rates and other economic traits of potato cultivars at the same time,to give rational distribution of cultivars.

【题目】基于计算机视觉和神经网络检测鸡蛋新鲜度的研究
【中文关键词】计算机视觉 分级模型 神经网络 鸡蛋 新鲜度 检测
【英文关键词】computer vision,grading mode,neural network,egg,freshness,detection
【中文摘要】为了实现鸡蛋新鲜度的无损检测和分级, 建立了利用计算机视觉检测鸡蛋内容物透射图像信息的装置, 通过图像处理, 获取了蛋壳表面颜色信息和表示鸡蛋新鲜的参数哈夫单位值(HU), 得到了利用计算机视觉预测鸡蛋新鲜度的有关的H, I, S, a, b, a*, b*, a-a*, b-b*共9个参数, 然后通过分析哈夫单位HU与9个参数之间的相关性, 并建立多元线性回归方程, 确立了与鸡蛋新鲜度密切相关的三个参数H, I, b。并以H, I, b作为输入变量, 创建了基于Matlab的结构为3-15-4的3层BP神经网络模型, 对鸡蛋的新鲜度进行分级, 模型具有较好的泛化功能和鲁棒性, 对各个等级鸡蛋的新鲜度分级准确率达90%, 对整体鸡蛋新鲜度分级的准确率达到93.3%。
【英文摘要】In order to acheieve non-destructive detection and gading of egg freshness, an experimental system was set up based on computer vision. Then egg internal substance transmission images were acquired. After pre-processing, H, S, I, a, b values were extracted. The egg shell color information (a*, b*) was also measured. And the weight of egg was measured using electronic balance and the height of egg albumen was measured using height vernier calliper. Egg freshness was calculated according to its weight and albumen height. The linear regression model for egg Hough unit and egg information (H, I, S, a, b, a*, b*, a-a*, b-b*) was established by SAS. Afterwards the 3 parameters (H, I, b) which is greatly correlated with egg freshness (HU, Egg Hough unit) was reserved. With 3 parameters (H, I, b) of input, the best BP neural network model (3 input nodes, 15 hidden nodes, 4 output nodes) was established by using Matlab. On the BP neural network model of detecting the egg freshness, the automatic detection system was designed, which can immediately show the results according to the egg ′ s color data after the network initialization. The results showed that the grading accuracy by using computer vision and BP neural network for egg freshness exceeds 90%.

【英文关键词】psychrophilic;raw milk;rapid detection method
【中文摘要】嗜冷菌作为冷藏原料奶中生长的优势菌群,在原料奶贮存过程中会大量繁殖,并产生及其耐热的脂肪酶和蛋白酶,这些酶类在高温处理后仍会有残留,并在奶制品储藏过程中继续分解其中的脂肪和蛋白质,导致产品的风味和质地产

生变化。因此,研发出一种即快速又实用的嗜冷菌计数技术成为乳品行业关注的焦点。本文主要介绍了国内外对原料奶中嗜冷菌快速检测的一些方法,并将各个方法在工业应用上的优缺点进行了比较。

【英文摘要】Being the preponderant microorganism in refrigerated raw milk,psychrophilic bacteria increase very swiftly and produce some cellular enzymes with high thermal stability such as lipases and proteases.After treated at high temperature,these enzymes are still active and continue to decompose the fat and protein in raw milk so that the quality of dairy products decrease.Therefore,recently more and more researchers focus the attention on the rapid and exact detection of psychrophilic bacteria in raw milk .This paper discussed many detection methods and compared their advantages and disadvantage.

【题目】国内外乳品真蛋白检测方法的进展

【中文关键词】乳品真蛋白;酪蛋白;凯氏定氮法;检测方法

【英文关键词】true protein, casein, Kjeldahl method, determination methods

【中文摘要】介绍了乳品真蛋白的定义,比较了国内外牛乳蛋白质检测的标准方法,简述了乳品真蛋白的快速检测方法,提出了我国国家标准需要改进的方向,即在样品处理前先用150g/L的三氯乙酸溶液使乳中的蛋白质沉淀,用滤纸分离,再用凯氏定氮法分别测定沉淀和滤液中的蛋白态氮含量和非蛋白态氮含量,计算蛋白质含量。如果改用pH4.6来沉淀酪蛋白,同样的方法还可以用于测定乳品中酪蛋白。

【英文摘要】Definition of true protein in milk was introduced; the standardized methods of protein determination were compared domestically and abroad; fast determination methods were also described. Our National standard methods of protein determination need to be improved. The suggestions were: Samples should be pre-treated with 15% (w/ v) trichloroacetic acid solution and precipitate protein was separated by filtration. Nitrogen contents of protein precipitate and the triehloroacetie acid solution were determined by Kjeldahl methods. The same principal and method could be used for determination of casein in dairy products by isoeleetrie precipitation at pH 4.6.

【题目】基于乙醇氧化酶型酶膜的生物传感器的研制和应用

【中文关键词】乙醇检测,生物传感器,核膜微孔,酶的固定化,乙醇氧化酶

【英文关键词】ethanol, biosensors, enzyme electrode, enzyme immobilizatio, alcohol oxidase

【中文摘要】以可溶性淀粉和海藻酸钠混合胶为固定化载体,戊二醛为交联剂,通过固定化乙醇氧化酶(AOX)制成核微孔酶膜,构建出过氧化氢电极系统。同时研究了该酶电极的特性,以及温度、海藻酸钠浓度、pH等相关参数对酶膜检测能力的影响。实验结果表明,在pH8,35°C时酶膜活性最佳,当乙醇体积分数为0.01%~1%时响应值有良好的线性关系,最低乙醇检测浓度在0.001%以下,响应时间为20s。通过对酶膜活性半衰期的检测,建立了乙醇氧化酶型酶膜优化工艺条件,其性能良好,具有较好的应用前景,特别适用于乙醇的在线监测。

【英文摘要】The research constructed an ethanol sensors by building nuclear pore film, which is made by AOX immobilization. The system contained the immobilized carrier via mixing Soluble Starch and Sodium Alginate, and chose Glutaraldehyde to be the cross-linking agent. The research also tested the specialty of enzyme electrode,temperature, coneentration of sodium alginate, pH and concerning parameter which influence the detecting ability of memb'rane. The results showed that the membrane have the

best.detection ability in the atmosphere of pH8 and 35°C. When the alcohol concentration ranges from 0.01%to 1% the response value has a good linear relationship. The lowest detectable concentration is less than 0. 001%, and the responding time is 20s. Finally, we found the optimum production technology of alcohol oxidase enzyme membrane, by means of testing the half time of membrane. It must be a wonderful application prospect because of the high performance and being suitable for online detecting.

【题目】棉花生长期的气候变化对棉花生产的影响——以新疆昌吉回族自治州为例
【中文关键词】棉花生长季; 气候变化; 初、终霜; ≥10 ℃积温; 棉花生产; 昌吉回族自治州; 新疆
【英文关键词】cotton growing season; climate change; beginning and ending datesof frost; accumulated temperature≥10 ℃; cotton production.
【中文摘要】利用新疆昌吉回族自治州主要棉区 4个代表站 1961 - 2005年 4~10月的气象资料及昌吉市近 10年棉花发育期观测资料 ,分析气候变化对当地棉花生产的影响。主要表现在:气候变化导致 45年来终霜期提早、初霜期推迟;而近 10年平均初、终霜出现日期均较稳定 ,对棉苗生长影响不大 ,对部分年份的棉花品质可能造成一些影响。其次,10 ℃界限温度初日自 20世纪 90年代以后逐渐提早; 10℃终日自 20世纪 70年代以来变化不大。45年来10 ℃界限温度持续天数呈逐年延长的趋势,约 2d/10a,尤其近10年最长。≥10℃积温也呈增高趋势 ,为 57.4℃ · d/10 a,且近10年为热量条件最好的时期,不仅对当地棉花的生长发育有利 ,而且使昌吉州棉花种植界限发生了明显变化 ,棉花种植区域向东扩展了 100 km,适宜种植海拔高度也提高了 200 m左右。但是近 10年降水分布极不均匀以及日照时数减少的事实对棉花生产有不利影响。
【英文摘要】In this study, climate change in the primary cotton growing region of ChangjiHuiAutonomous Prefecture, Xinjiang during the cotton growing season in different decadeswas analyzed using themeteorological data observed at 4 representative meteorological stations from 1961 to2005, with a focuson the last decade. The effectof climate change on cotton production in the prefecturewas then evaluated. The results revealed that both temperatureand precipitation in the prefecture have increased during the growing season in the last 45 years, and that this increase has been especially notable during the last 10 years. Specifically, the rate of increase in temperature and precipitation has been 0. 25 ℃/decade and 6. 66 mm /decade respectively, although this value varied for different decades. Moreover, the sunshine duration has been decreasing over the last 45 years, and this trend has become especially pronounced during the last10 years. The resultsof this study also revealed that the beginning and ending datesof frostwere relatively stable, and that their effecton cotton production in the prefecture is not veryobvious,although they did impact the qualityof cotton in some years. Furthermore, the beginning date of an air temperatureof10 ℃ hasoccurred earlier since the 1990 ’ s, but the ending date has not changed significantly. Moreover, the accumulated temperature ≥10 ℃ has increased by 57. 4℃/decade, which has resulted in the cotton2growing area being extended by 100 km eastward and the cotton2growing elevation be increased by 200 m. However, the decrease of sunshine duration is disadvantageous for cotton growth.

【题目】一种实时方法研究阪崎肠杆菌的生长情况
【中文关键词】阪崎肠杆菌 生长 快速、实时方法
【英文关键词】Enterobacter sakazakii Growth Real - time method

【中文摘要】目的:建立一种实时方法研究阪崎肠杆菌生长情况。方法:采用96孔板培养阪崎肠杆菌,然后由扫描仪实时监测阪崎肠杆菌的生长。结果:采用传统的平板方法和微孔板光谱分析仪测定阪崎肠杆菌数量之间具有非常好的相关性(r2=0.92)。采用这种新的快速方法测定阪崎肠杆菌的生长,从而缩短测定时间(由至少24 h缩短为小于10 h),比传统方法更方便、快速,并可实现实时监测阪崎肠杆菌的生长情况。
【英文摘要】Objective:To establish a fast and real - time method of detecting the growth of Enterobacter sakazakii. Methods: The correction between E. sakazakii counts by conventional plating and microplate luminometer was highly agreeable (r^2 = 0. 92). Results:The new method can quickly monitor E. sakazakii in brain heart infusion broth and requires much shorter incubation times (no more than 10 h) than the conventional plating method (at least 24 h).

【题目】使用微孔板光谱分析仪和平板计数测定阪崎肠杆菌的生长
【中文关键词】阪崎肠杆菌;微孔板光谱分析仪;平板计数
【英文关键词】Enterobacter sakazakii miroplate luminometer plate counting method
【中文摘要】本实验采用96孔板培养阪崎肠杆菌,然后由微孔板实时监测阪崎肠杆菌的生长。采用微孔板光谱分析仪和传统的平板方法测定阪崎肠杆菌数量之间具有非常好的相关性(R2=0.92),且可缩短测定时间(由至少24h,缩短为小于10h)。阪崎肠杆菌菌株36℃培养末期数量相近,但生长曲线不同。进一步研究17株阪崎肠杆菌菌株42℃生长情况,发现微孔板光谱分析仪方法不仅能快速简便测定生长,且可以一种实时的方式知道阪崎肠杆菌在整个培养过程中的生长情况。研究结果表明,采用该方法可将阪崎肠杆菌菌株根据生长曲线的差异进行表型分类,该表型与阪崎肠杆菌菌株生化反应表型结果一致。
【英文摘要】Experiments were undertaken to determine the growth of E. sakazakii under different temperatures by microplate luminometer. 16 Strains of 17 E. sakazakii strains (including ATCC 29544) used in this study were isolated from dried infant milk formula powder on China retail market. The results showed that the E. sakazakii counts determined by microplate luminometer are perfectly correlated with those determined by conventional plate counting method (r=0.92). E. sakazakii in brain heart infusion broth can be quickly monitored with much shorter time (no more than 10 h) than that of conventional plating method (at least 24 h). Although at the end of incubation the amounts of E. sakazakii strains are close under 36 ℃, but the growth curves are different. And the further research results of 17 E. sakazakii strains being incubated at 42 ℃ indicated that the microplate luminometer method provides a convenient, rapid and real-time way to monitor the growth of E. sakazakii. The results suggested that this microorganism can be divided into different phenotypes according to their different growth characters, which are consistent with phenotypes divided into according to their different biochemistry reactions.

【题目】阪崎肠杆菌生长特性及耐热耐酸碱性分析
【中文关键词】阪崎肠杆菌;耐热;耐酸碱
【英文关键词】Enterobacter sakazakii anti-thermal anti-acid anti-alkaline
【中文摘要】目的研究不同阪崎肠杆菌菌株的生长特性和耐热耐酸碱性。方法采用光谱扫描仪培养22株阪崎肠杆菌,由扫描仪实时监测不同阪崎肠杆菌菌株生长特性;采用显色平板涂布方法观察高温和酸碱条件下阪崎肠杆菌存活情况。结果传统平板计数法和微孔板光谱扫描仪建立的阪崎肠杆菌生长曲线具有良好相关性(R2=0.92);22株阪崎肠杆菌经75℃处理

2min后,尚有1株存活;经碱处理后(pH12.55)立即检测,所有菌株均已死亡;用酸处理1min后(pH1.18)检测,尚有2株存活。结论采用光谱扫描仪方法测定阪崎肠杆菌生长曲线方便快捷,不需要培养计数;不同的阪崎肠杆菌菌株具有不同的耐热、耐酸特性。

【英文摘要】Objective To study the characters of growth, anti-thermo, anti-acid and anti-alkaline of different Enterobacter sakazakii strains. Methods The growth character of 22 E. sakazakii strains were monitored by mieroplate luminometer. And the survival of the strains under high temperature, acid or alkaline environment was detected by plating method. Results The correlation between E. sakazakii counts by conventional plating and by microplate luminometer was very good(R^2 = 0.92). 22 strains were treated at 75 ℃ for 2 min, and only 1 strain was survival. 22 strains were all died immediately after treated on alkaline condition. Conclusion The microplate luminometer method in growth curves analysis of E. sakazakii strains was rapid and convenient. The differences of anti-thermal, anti-acid and anti-alkaline characters of different strains were observed by the method.

【题目】新疆草原蝗虫发生面积与大气环流特征量指数模型的研究
【中文关键词】大气环流指数; 蝗虫发生面积;预测模型; 新疆
【英文关键词】atmospheric circulation; area of grasshopper occurrence; prediction model; Xinjiang
【中文摘要】通过对1986- 2003 年新疆草原蝗虫发生面积与大气环流指数74项特征值的相关分析, 筛选出与新疆蝗虫发生有显著关系的大气环流指数因子, 采用逐步回归方法建立4 个新疆蝗虫发生面积预测预报模型, 并对模型进行了检验。利用模型对2004- 2006年新疆蝗虫发生面积进行延伸预测,并与实际蝗虫发生面积进行比对,最终挑选出预报准确率在85% 以上、对新疆草原蝗虫发生面积趋势具有一定预报能力和应用价值的模型,并初步分析了大气环流特征量与蝗虫发生面积的关系。
【英文摘要】By analyzing thecorrelation between the area of grasshopper occurrenceand74 characteristic indexesof atmospheric circulation in Xinjiang from 1986 to 2003, the factors of atmospheric circulation whichwere significant relatedwithgrasshopper occurrence wereselected. And then, 4 models for predicting the area of grasshopper occurrence were established by using the successive regression and tested. The area of grasshopper occurrence in Xinjiang from 2004 to 2006 were predicted with these models, thenthe predicted and actual results were compared and a model, its accuracy rate for prediction was more than 85%, was selected. Meanwhile, the relationship between the factors of atmospheric circulation and the area of grasshopper occurrence were analyzed.

【题目】原料乳中嗜冷菌的分离鉴定及其生长特性分析
【中文关键词】嗜冷菌;荧光假单胞菌;生长特性分析
【英文关键词】psychrophilic bacteria Pseudomonasfluorescens raw milk growth

【中文摘要】从来自河北保定一牛场的原料乳中筛选出12株嗜冷菌,基于形态学、生理生化特征及分子生物学数据,其中8株嗜冷菌被确定为荧光假单胞杆菌,1株嗜冷菌被鉴定为食醇鞘氨醇杆菌,3株嗜冷菌被鉴定为短黄杆菌。对不同季节的原料乳采样表明,按数量统计,荧光假单胞菌在嗜冷菌中占的比重大于40%。生长性状研究表明,荧光假单胞菌菌株PF5的最适生长温度为30°C;初始pH值为7时能促进其生长;随着培养时间延长,培养介质的pH值逐渐上升到8.3,并长时间保持稳定和产生蛋白酶。

【英文摘要】12 strains of psychrophile were isolated fi'om a local cattle-farm of Baoding, Hebei Province of China over one year. Among the 12 swains of psychrophile, 8 strains were identified as pseudomonas fluorescens, 1 strain as Sphingobacterium spiritiuvorum, and 3 strains as Havobacterium. breve based on the properties of cell morphological, physic-biochemical characteristics and homology in 16S rDNA sequence. It was found that Pseudomonas fluorescens took up a larger proportion of whole microflora in raw milk sampled from the cattle-farm. Moreover, the growth characteristics of Pseudomonas fluorescens was further chosen to investigate. The optimum growth temperature of Pseudomonas fluorescens was 30°C, and an initial pH of 7 favored the growth of Pseudomoans strains, pH in media rose slowly from 7.0 to 8.3 in the presence of Pseudomonas fluoreseens grown at 30 °C for 24 h, and tended to stabilize as its growth continued.

【题目】近49年新疆棉区≥10°C终日和初霜期变化及对棉花生长的影响

【中文关键词】新疆棉区;初霜期;≥10°C终日;变化特征;影响

【英文关键词】Xinjiang cotton-growing area; ≥10°Cterminal day; the first frost date; change characteristics; effect

【中文摘要】利用新疆棉区22 个站1961—2009 年日平均气温和日最低气温资料,分析棉区≥10°C终日和初霜 期的变化特征及对棉花生长的影响。结果表明,≥10°C终日和初霜期均以吐鲁番棉区最晚,南疆棉区次之,并由盆地东部向西部推迟,北疆棉区和哈密棉区最早。49 年来,≥10°C终日在伊犁河谷和石河子地区变化趋势明显,呈显著性向后推迟,北疆其余棉区、东疆棉区、南疆棉区长期变化趋势不明显。初霜期北疆棉区大部变化趋势明显,呈显著性的推迟趋势,东疆棉区、南疆棉区长期变化趋势不明显。≥10°C终日变化吐鲁番棉区最为稳定,南疆棉区次之,北疆棉区波动幅度最大。初霜期变化东疆棉区幅度小于北疆棉区和南疆棉区。北疆棉区、东疆棉区、南疆棉区初霜变幅均大于≥10°C终日,尤以塔里木盆地东部棉

区最为明显。全疆大部棉区20 世纪90年代及2001—2009 年≥10℃终日除少部分站点早于常年外,全疆大部棉区均晚于常年,尤其是北疆棉区、吐鲁番棉区、塔里木盆地西部棉区偏晚较多。初霜期全疆大部分棉区延迟趋势明显,且大部棉区2001—2009 年平均初霜在各年代中是最晚的。这些对于棉花后期生长都是有利的,主要有利条件为热量多,棉花后期生长遭遇霜冻的风险减小,霜前花产量高,品质好。而且≥10℃终日和初霜日变化在很大程度上影响着棉花的种植界限,近年来新疆棉区向北向西扩展。因此生产上,各棉区可以根据该地的≥10℃积温和初霜变化状况选择合适的棉花品种,便于做到棉花生产的高产高效。

【英文摘要】The article was based on data about the mean daily and minimum temperatures of Xinjiang cotton-growing area of 22 stations from 1961 to 2009. The article analyzed not only the change characteristic of ≥10°Cterminal day and the first frost date, but also the effect of cotton growth. The results showed that the latest ≥10°Cterminal day and the first frost date were Turpan regions, followed by cotton-growing areas in southern Xinjiang, delayed from west to east in the Tarim Basin, and cotton-growing areas in northern Xinjiang and Hami was the first. During the 49 years, the change in trend of ≥10°Cterminal day was later in Yili and Shihezi cotton-growing areas, but there was not a clear trend in the rest of the cotton-growing areas in Xinjiang. The change in trend of first frost was later in northern Xinjiang, there was not a clear trend in the rest of the cotton-growing areas in Xinjiang. There was significant linear correlation between ≥10°Cterminal day and the first frost in the most of cotton-growing areas. The most stable ≥10°Cterminal day was Turpan regions, followed by cotton-growing areas in southern Xinjiang. Motion the range cotton-growing areas in northern Xinjiang were biggest. The change in trend of first frost period in eastern regions was smaller than in northern regions and southern Xinjiang cotton-growing areas. The change in trend of first frost period in eastern regions, in northern regions and southern Xinjiang cotton-growing areas were bigger than ≥10°C terminal day. Particularly, Tarim Basin south-eastern cotton-growing regions were the most obvious. most of the cotton-growing areas in Xinjiang 90 years and from 2001 to 2009,the change in trend of ≥10°Cterminal day, only a small part of the site as early as year-round, the rest were later than the year-round. Especially the northern cotton region, Turpan cotton region and western Tarim Basin cotton region late more. Most of Xinjiang early frost delay trend was clearly cotton, and most of the cotton area from 2001 to 2009 the average first frost was last of the era. These were beneficial for the later growth of cotton, mainly as heat and more favorable conditions for cotton growth later reduced the risk of frost encountered before frost high yield, good quality. And ≥10°Cterminal day and the first frost date change to a large extent affected the cultivation of cotton boundaries extend north and west Xinjiang cotton area in recent years. Therefore, the production and the cotton could the local accumulated temperature ≥10°Cand select the appropriate state change first frost of cotton varieties, easy to achieve high yield and efficiency of cotton production.

【中文关键词】牛乳α_s-酪蛋白;酶联免疫吸附试验;多克隆抗体
【英文关键词】bovine αs-casein ELISA polyclonal antibody

【中文摘要】用牛sα-酪蛋白纯品免疫新西兰白兔,制得兔抗牛sα-酪蛋白的多克隆抗体。以牛sα-酪蛋白包被抗原,自制抗体为一抗,辣根过氧化物酶标记的羊抗兔IgG为二抗,邻苯二胺(OPD)为底物,建立了牛乳中sα-酪蛋白的间接ELISA检测方法。检测的线性范围是25 1200ng/mL,相关系数是0.9825,回收率在91.97% 115.61%之间,证明可以用酶联免疫法简单快速地测定牛乳中的sα-酪蛋白,因为该蛋白在酪蛋白中质量浓度稳定,所以可以计算出牛乳中酪蛋白的质量浓度。显然该方法可以用于牛乳掺杂使假的鉴别和原料奶酪蛋白质量浓度是否合格的快速检测。

【英文摘要】The polyclonal antibody was prepared by immunizing New Zealand rabbits with bovine αs-casein. Enzyme-Linked Immunosorbent Assays (ELISA) was developed for bovine αs-casein .The standard curve was linear between 25 and 1 200 ng/mL with regression coefficients 0.9825.The recovery rates were between 91.97%~115.61%. It is proved that using ELISA can determinate the content of bovine αs-casein easily and effectively. Because the content of αs-casein is so steady that its content can be calculated easily. Obviously, this method can be determined the adulteration of raw milk and quantified the content of bovine αs-casein.

【题目】津沪地区原料奶中金黄色葡萄球菌的污染情况研究
【中文关键词】原料奶 金黄色葡萄球菌 单克隆抗体检测试板
【英文关键词】raw milk Staphylococcus aureus monoclonal antibody test plate
【中文摘要】金黄色葡萄球菌是影响原料奶质量的微生物之一,它能产生高温灭菌被破坏的肠毒素。近年来,由金黄色葡萄球菌肠毒素引发的食物中毒事件屡见不鲜,严重影响到消费者的身体健康。本研究是利用黄色葡萄球菌金标特异性单克隆检测试板和金黄色葡萄球菌快速检验测试片对天津周边地区及上海共84个原料奶样品进行检测和调查。结果表明,原料奶市场的微生物污染状况不容乐观。通过本研究确定金黄色葡萄球菌金标特异性单克隆抗体快速检测试板是一种快速、简便、准确的检测产品,值得在原料奶市场大力推广。
【英文摘要】Staphylococcus aureus is one of the microbe which affect the quality of the raw milk.It can produce enterotoxin which can not be destroyed by the high temperature sterilization. Enterotoxin is harmful to the human body.The Staphylococcus aureus golden marked specificity single-clone test plate and the petrifilm staph express count plate were used in the research to verify altogether 84 raw milk samples collected from Tianjin and Shanghai.The results indicated that the microbial contamination condition in raw milk is unopfimisfic.It proved the Staphylococcus aureus golden marked specificity monoclonal antibody test plate is a kind of fast,convenient and veracious examination product through the research.It is worth to popularize in raw milk market.

【题目】核微孔膜为基础的乳糖-葡萄糖双功能酶电极的研制
【中文关键词】乳糖传感器 葡萄糖传感器 核微孔膜 酵母破碎液
【英文关键词】lactose biosensor glucose biosensor nuclear pore membrane fragmentized liquid of the yeast
【中文摘要】利用酵母破碎液改性后的核微孔膜作为固定载体,戊二醛为交联剂,通过固定葡萄糖氧化酶(GOD)和β-半乳糖苷酶(GAL)构建出过氧化氢双电极系统。研究了该酶电极的性质,以及不同来源GAL抗干扰性的差异。乳糖电极在0.2%~2%和4%~10%内有良好的线性关系,响应时间40s,半衰期15~20d。葡萄糖电极的线性范围0~1%,分辨率达到0.001%,响应时间20s,半衰期大于60d。该系统可同时测定样品中乳糖和葡萄糖的含量,乳糖电极的葡萄糖干扰用差分法消除。
【英文摘要】Hybrid biosensor for the detecting of lactose and glucose simultaneously was developed. This biosensor consisting of two electrodes was based on the nuclear pore films modified by the yeast broken liquid and 1-1202 electrodes. Glucose oxidase (GOD) and β - galactosidase(GAL) were immobilized on the membranes by using the glutaric dialdehyde as crosslinking agent. Having studied the response characteristics of the two electrodes, the biosensor shows good linearity among the ranges of 0.2- 2 g/100ml and 4-10 g/100ml of lactose and 0- 100mg/100ml glucose respectively. The response time is less than 40s for lactose and less than 20s for glucose. The self(half-life)-life of the galactosidase-electrode is between 15 and 20 days while the glucose oxidase-electrode is more than 60 days. The interference of glucose in lactose detecting can be removed through the subtractive operation between the response datas of the two electrodes.

【题目】免疫传感器测定食品中黄曲霉毒素的研究进展
【中文关键词】免疫传感器 黄曲霉毒素 检测 丝网印刷微电极 纳米材料
【英文关键词】immunosensors aflatoxin detection screen printed electrodes (SPEs) nano-materials
【中文摘要】黄曲霉毒素是一类毒性极强的剧毒物质,及时检测和控制食品中黄曲霉毒素,对于保障人们生命安全和提高我国农副产品国际竞争力是相当重要的。本文综述了近十年来各种免疫传感器测定食品中黄曲霉毒素的研究及应用情况。着重介绍了电化学免疫传感器的制作原理、检测性能及其应用于牛奶、小麦、玉米等基质中测定黄曲霉毒素的研究现状。简要评述了免疫传感器结合丝网印刷微电极、流动注射分析系统和以纳米材料作为固相基底或信号扩增标签等方面的研究。
【英文摘要】Aflatoxins (AFTs) are a group of virulent substances having similar chemical structure. It is important for protecting human health and increasing international competitiveness of agricultural products to detect and control AFrs in foods in time. The development and application of aflatoxin detection in foods by means of various immunosensors are reviewed in this paper, especially the manufacture principle and the detection performance of electrochemical immunosensor as well as its application to detect AFTs in milk, wheat and corn. Recently, an intensive research effort has been performed on the application of immunosensors combined with screen printed electrodes, flow-injection immunoassays (FI-IA) and nano-materials which are used as a solid support or signal-amplification label. The application of immunosensors in food safety which has an extensive application prospect has become the focus of attention.

【题目】不同载体固定化GOD-GAL双酶乳糖生物传感器核微孔膜的研究
【中文关键词】固定化酶 酵母细胞壁微粒 醛基化环糊精微粒 醛基化淀粉胶 乳糖酶膜
【英文关键词】immobilization carrier yeast cell wall particulates: β-cyclodextrin glutaraldehyde particulates (β--CDP) starch glutaraldehyde adhesive lactose membrane

【中文摘要】分别以酵母细胞壁微粒、醛基化环糊精微粒(β-CDP)和醛基化淀粉胶材料为载体固定葡萄糖氧化酶(GOD)和β-半乳糖苷酶(β-GAL)双酶,制作三种乳糖酶膜,并用生物传感分析仪测试它们的性能。实验结果表明,用这三种材料制成的酶膜均表现出优良的性能,在乳糖溶液浓度为0.02%~2%的范围内具有良好的线性关系,R2都在0.995以上,乳糖最低检出浓度可达0.001g/L,具有良好的响应性能,响应时间为20~40s。在这三种酶膜中,酵母壁微粒酶膜的线性范围最宽,达0%~10%,这种传感器可广泛应用于原料乳和乳制品中乳糖的检测;β-CDP酶膜具有较强的吸附酶分子的能力,响应值高达2500;醛基化淀粉胶制成的酶膜材质具有良好的均一性,且制作工艺简单。

【英文摘要】Glucose oxidase (GOD), together with β-galactosidase (β-GAL), was immobilized onto yeast cell wall particulates, [~-cyclodextrin glutaraldehyde particulates (β-CDP) and starch glutaraldehyde adhesive respectively to construct bi-enzyme membranes, whose lactose detection performances were tested using an SBA-40C biosensor. All hi-enzyme membranes performed a good detection capability, with a linear calibration range of 0.02%--2% lactose (R2 above 0.995) and a detection limit of 0.001 g/L and had a fast response, with response lime within 20--40s. Among them, bi-enzyme membranes made with yeast cell wall particulates as a carrier had the widest linear calibration range of 0 -- 10% and therefore could be widely used for the detection of lactose in raw milk and dairy products; β-CDP bi-enzyme membranes had a strong adsorption capacity to enzyme molecules and the response values were as high as 2500; hi-enzyme membranes made with starch glntaraldehyde adhesive as a carrier had a good homogeneity and were easy to prepare and could be used to detect lactose in milk.

【题目】我国东北部分地区原料奶中蜡样芽孢杆菌污染情况调查

【中文关键词】原料奶 蜡样芽孢杆菌 菌落总数 大肠菌群数 污染

【英文关键词】The raw milk Bacillus cereus The total bacterial count Coliform groups Pollution

【中文摘要】对中国东北3个地区的原料奶中微生物污染情况进行调查与鉴定,主要检测原料奶中蜡样芽孢杆菌数,以及菌落总数和大肠菌群数,确定原料奶中微生物的污染状况与蜡样芽孢杆菌污染的关系。结果表明,3个地区的蜡样芽孢杆菌数平均值均≤105CFU/mL。而细菌总数平均值则为106~107CFU/mL,都属于超标奶。大肠菌群平均值,地区1为1 349 MPN/100mL。地区2为2 574 MPN/100 mL,地区3为2 032 MPN/100 mL。综合分析得出,蜡样芽孢杆菌数与原料奶的微生物污染状况无相关性。

【英文摘要】The microbiology pollution of the raw milk was investigated and identified in three areas of northeast China. Bacillus cereus count in raw milk was detected, mainly, as the same time, aerobic bacterial count, coliform groups count were detected. Especially the relationship between Bacillus cereus count and microbiological contamination was determined. The results indicated that the microbial contamination condition in raw milk is unoptimistic. The Bacillus cereus count average values were bellow or equal to l0^5 CFU/mL in three areas. But all the total bacterial count average values exceeded the criterion, between 10^6 and 10^7 CFU/mL. In terms of the coliform groups average values, the first area were 1 349 MPN/100 mL, the second area were 2 574 MPN/100 mL , the third is 2 032 MPN/100 mL. So there were no relevance between Bacillus cereus count and microbiological contamination of the raw milk.

【题目】中南和东北地区原料奶中金黄色葡萄球菌的调查
【中文关键词】原料奶 金黄色葡萄球菌 金标特异性单克隆抗体检测试板
【英文关键词】raw milk Staphylococcus aureus colloidal gold marked specific monoclonal antibody test plate
【中文摘要】利用金黄色葡萄球菌金标特异性单克隆抗体检测试板对中南和东北地区个体养牛户的240个原料奶样品进行快速检测。结果表明:湖南、湖北和河南省原料奶样品中均未检出金黄色葡萄球菌;而辽宁、吉林和黑龙江省原料奶样品金黄色葡萄球菌阳性率分别为10%、30%和100%,原料奶的微生物污染状况不容乐观。本研究结果说明金黄色葡萄球菌金标特异性单克隆抗体快速检测试板是一种快速、简便、准确的金黄色葡萄球菌检测产品,值得在原料奶市场推广。
【英文摘要】The Staphylococcus aureus colloidal gold marked specific monoclonal antibody test plates co-developed by Tianjin University of Commerce and Lanzhou Institute of Biological Products were used in the investigation of positive rate of Staphylococcus aureus in 240 samples of raw milk collected from individual raising households in central south and northeast China. Staphylococcus aureus was not detected in the raw milk samples collected from central south China including Huan, Hubei and Henan provinces, but the microbial pollution status in raw milk was not optimistic because the positive rates of Staphylococcus aureus were 10%, 30% and 100% respectively in the samples collected from Liaoning, Jilin and Heilongjiang provinces. The investigation prove that the Staphylococcus aureus colloidal gold marked specific monoclonal antibody test plates are fast, convenient and accurate examination products. Therefore, it is worth popularizing in raw milk market.

【题目】食品作用于肠黏膜免疫系统可能的信号途径
【中文关键词】功能性食品 肠黏膜免疫系统 树突状细胞 信号传递途径 细胞因子网络
【英文关键词】functional food gastrointestinal mucosa immunity system dendritic cells signaling pathway cytokine network
【中文摘要】树突状细胞是体内最强的抗原呈递细胞,也是介导机体先天免疫和获得性免疫的桥梁。当食品中的不同生理活性成分作用于肠黏膜免疫系统时,会被肠黏膜中的树突状细胞吞噬加工呈递,也可以直接结合到DC细胞表面的模式识别受体上,如TLRs、CLRs以及NLRs等,然后启动相应的信号传递途径,从而调节肠黏膜免疫系统中细胞因子网络的变化。本文

主要目的是在现有的研究结果的基础上,尽量详尽地判断和揭示食品中的生理活性成分如何与DC相互作用,激发DC可能的信号传导途径,而后如何影响肠黏膜系统中细胞因子的变化。理解这一因果关系,对食品如何发挥其生物功能具有十分重要的指导意义。

【英文摘要】Dendritic cells (DCs) are considered to be the most potent antigen presenting cells of the immune system. They also are critical in the initiation of innate immune responses and the regulation of adaptive immune responses. When different physiologically active compounds in foods act towards the gaslrointestinal mucosa immunity system, these compounds can be captured and processed by DCs in this system, or can directly be binded to the pattern recognition receptors (PRRs) on DCs, such as TLRs, CLRs and NLRs, and then the corresponding signaling pathways are incluced. These signaling pathways maybe influence the cytokine network in this system. This review aimed to estimate and unveil exhaustively how physiologically active compounds interact with DCs, which possible signaling pathway would be induced, and how the cytokine network could be modulated finally, on the basis of current researches. Adequate understanding of this cause and effect is of directive significance for performance of the biological functions of foods.

【题目】食品-家兔体温-免疫调节的因果关系研究

【中文关键词】发炎细胞因子 抗炎细胞因子 体温 细胞因子网络 功能食品
【英文关键词】inflammatory cytokine anti-inflammatory cytokine body temperature cytokine network functional food

【中文摘要】通过用滋补类食品山药和清热类食品苦瓜、苦荞麦和酸奶饲喂家兔,研究其体温和主要抗炎与发炎细胞因子的变化规律,分析食品与细胞因子网络和体温的因果关系,揭示食品对机体的免疫调节作用。结果表明:对喂食山药后的家兔24h的跟踪结果为体温升高;细胞因子浓度降低的有:IL-1ra、IL-4、TGF-β、TNF-α、INF-γ、IL-12。升高的有:IL-6、IL-10、IL-1β。对喂食酸奶后家兔24h的跟踪结果为体温降低;细胞因子浓度降低的有:IL-1ra、IL-4、TGF-β、IL-1β、TNF-α、INF-γ;升高的有:IL-6、IL-10、IL-12。喂食苦瓜后家兔对24h跟踪结果为体温降低;细胞因子浓度降低的有:IL-1ra、TGF-β、IL-1β、TNF-α、INF-γ,升高的有:IL-4、IL-6、IL-10、IL-12。对喂食苦荞麦后家兔24h跟踪结果为体温降低;细胞因子浓度降低的有:IL-1ra、IL-4、TGF-β、IL-1β、TNF-α、INF-γ,升高的有:IL-6、IL-10、IL-12。说明食品可以通过肠黏膜信号途径调节细胞因子网络,从而调节免疫细胞网络和活性。但其作用规律非常复杂,往往既可以刺激发炎细胞因子的升高(或降低),也可以刺激抗炎细胞因子的升高(或降低)。不同食品对体温的作用则比较有规律,其中滋补类食品使动物的体温升高,而清热类食品则可以刺激动物体温降低,其变化都在正常体温范围内。实验证明饲喂不同的食品可以调节细胞因子网络,从而调节机体的免疫网络,进而表现出体温的变化。它们存在一定的因果关系。

【英文摘要】Rabbits were fed with nourishing food (yam) and heat-cleating foods (balsam pear, buckwheat and yoghourt). The change regularities of pro- and anti-inflammatory cytokine in the rabbit serum and rabbit body temperature were investigated, and the causal relationship of the foods with rabbit body temperature and cytokine network was expolred to reveal the immunoregulation of the foods. After 24 h of being fed with yam, the body temperatures of the rabbits rise. The concentrations of the cytokines such as IL-1ra, IL-4, TGF- β, TNF- α, INF- γ and IL-12 decline, but those of IL-6, IL-10 and IL-1 β are reverse. After 24 h of being fed with yoghourt,the body temperatures of the rabbits decilne, the concentrations of the cytokines such as IL-1ra, IL-4, TGF- β, IL-1 β, TNF- α and INF- γ decline, but those of IL-6, IL-10 and IL-12 rise. After 24 h of being fed with balsam pear,the body temperatures of the rabbits decline the concentrations of the cytokines such as IL-1ra, TGF- β, IL-1 β, TNF-α and INF- γ decline, but those of IL-4, IL-6, IL-10 and IL-12 rise. After 24 h of being fed with buckwheat, the concentrations of the cytokines such as IL- 1ra, IL-4, TGF- B, IL- β, TNF- α and INF- γ decline, butthose of IL-6, IL- 10 and IL-12 rise. It is clearly that the functional foods can regulate the complicated cytokine network to control the immunosystem and the body temperature of animal. The results revealed that the animal body temperature can be changed by feeding different functional foods, which follow the traditional Chinese experience laws about negative ("Yin') or positive ("Yang") of foods. Therefore the causal relationship of food-animal body temperature - immunoregulation maybe really exist by the interaction between food and mucosal immunosystem.

【题目】预处理方法对可食性植物样品中微量元素测定结果的影响
【中文关键词】微波消解法 原子吸收分光光度法 野菜 绿叶蔬菜 微量元素
【英文关键词】microwave digestion FAAS wild vegetables green leaf vegetables trace elements
【中文摘要】采用干法、湿法和微波消解法处理紫苏样品,以原子吸收分光光度法检测钙、镁、铜、铁、锌和锰6种微量元素的精密度和加标回收率,证实三种预处理方法会显著影响紫苏中微量元素含量的测定结果。与其它两种方法相比,用混酸HNO3-H2O2(6∶2)处理紫苏并采用微波消解样品后,各微量元素测定结果的加标回收率较高,加标回收率在99.00%~102.00%之间,相对标准偏差(RSD)低于5%。采用微波消解法对水白菜和山莴苣2种野菜样品以及油麦菜、油菜、韭菜和生菜4种绿叶蔬菜样品进行预处理表明,各微量元素的加标回收率在96.51%~99.87%之间,相对标准偏差(RSD)低于5%,这意味着对可食性植物中的微量元素检测而言,微波消解法预处理样品能够提高测定结果的准确性和重复性。
【英文摘要】Three pretreatments of vegetable samples, i.e.dry ashing, wet ashing and microwave digestion procedures,were investigated to evaluate their effects on the concentrations of trace elements including Ca, Mg, Cu,Zn, Fe and Mn by flame atomic absorption spectrometry(FAAS).Perilla frutescens, a vegetable consumed in Tianjin of China,was chosen as a case to deal with the differences occurring in the detected contents of the trace elements due to different pretreatments of samples.A higher recovery ranging from 99.00% to 102% and relative standard deviations below 5% in the detection of these trace elements were obtained when Perilla frutescens samples were pretreated with microwave digestion procedure instead of dry-ashing or wet-ashing method. Moreover, more vegetable samples including Brassica juncea var. multisecta, Lactuca indica, Lactuca sativa, Brassica napus, Allium tuberosum and Lactuca sativa var. capitata were chosen to confirm the accuracy and repeatability of microwave digestion treatment in the detection of these trace elements.It was seen that RSDs were below 5% and the ranges of the recoveries related to the assay of these trace elements varied from 96.51% to 99.87%.Obviously, using microwave digestion to pretreat edible vegetable samples can improve the determination accuracy of trace elements in food nutrition assay.

【题目】原料乳中嗜冷菌的危害分析及控制研究
【中文关键词】原料乳 嗜冷菌 控制
【英文关键词】raw milk psychrophile control
【中文摘要】采用分离培养基从牧场的原料乳样品中分离得到嗜冷菌,经鉴定为荧光假单胞菌。进一步研究了不同杀菌方式下嗜冷菌对贮存过程中乳品品质的影响,结果表明,原料乳经115°C高温灭菌,然后进行55°C保温1h灭酶处理,有助于控制嗜冷菌的生长,与25°C贮存相比,在4°C贮存8d后,其蛋白质和脂肪含量相对较高。
【英文摘要】A psychrophile strain, identified as Pseudomonas fluorescens, was isolated by isolation medium from raw milk samples collected from pastures. Furthermore, the effects ofpsychrophile on the quality of stored milk treated by different sterilization methods were investigated. It was found that the growth ofpsychrophile would be controlled after the raw milk was sterilized at 115°C and heat-treated at 55°C for 1 h to destroy enzyme activity. The contents of protein and fat in the milk stored at 4°C for 8 d were higher than those in the milk stored at 25°C.

【题目】检测温度对阻抗法快速检测微生物的影响
【中文关键词】阻抗微生物;检测温度;检出时间
【英文关键词】impedance micro-organisms detection temperature detection time
【中文摘要】检测温度对阻抗参数值及微生物生长代谢影响重大,基于此,本文研究检测温度对阻抗检测的影响。比较无菌利乐培养基及5g/L氯化钠溶液在20、22、24、26、28、30、32、34、36、38、40℃温度下对应的G、θ、Cs、Cp、Z值的变化情况。结果表明这些阻抗参数随温度的改变而呈线性变化,同样的温度波动值,导电性好的培养介质的阻抗参数变化值大;将装有8.4×104CFU/mL藤黄微球菌、3.3×103CFU/mL微生物菌群的测试管分别在20、30、40℃培养,结果在20℃条件下阻抗变化率未能达到检出阈,而当检测温度从30℃升高至40℃,藤黄微球菌的检出时间从11.8h缩短至6.8h,微生物菌群则从16.5h缩短至12.5h,说明检测温度对于阻抗微生物快速检测方法意义重大。
【英文摘要】The detection temperature has significant impact on impedance parameters value and the growth of micro-bial,based on this,in this paper the effect of temperature on impedance detection was studied.G, θ ,Cs,Cp and Z values of aseptic Tetra medium and 5 g/L NaCl solution at 20 ℃,22 ℃,24 ℃,26 ℃,28 ℃,30 ℃,32 ℃,34 ℃,36 ℃,38 ℃,40 ℃ were compared,get linear relationship between these impedance parameters and temperature and the same temperature fluctuations have greater impact on the culture medium of high conductivity.At the same time,we compare the detection time of Micrococcus luteus(8.4×104 CFU/mL),microbial flora(3.3×103 CFU/mL) grow at 20 ℃,30 ℃,40 ℃ respectively were also compared,and get that when grow at 20 ℃,the change rate of impedance failed to reach the detection threshold,meanwhile when the incubation temperature rise from 30 ℃ to 40 ℃,the detection time of Micrococcus luteus reduced from 11.8 h to 6.8 h,the microbial flora from 16.5 h to 12.5 h,showed that the temperature have significant impact on the impedance rapid method.

【题目】Completion of the sequence of rice gall dwarf virus from Guangxi, China
【中文关键词】水稻瘤矮病毒;基因组片段;倒转重复序列
【英文关键词】Rice gall dwarf virus;Genome segments;Inverted repeats
【中文摘要】本研究测定水稻瘤矮病毒中国广西分离物(RGDV-GX)基因组片段S2/S3/S5/S8-11的全序列,由此获得了该分离物的基因组完整序列信息。该分离物全基因组由25567nt组成,在基因组结构于最近新报道的泰国分离物(RGDV-T)相似。序列分析发现S3/S5/S8的近3’-端存在未报道的第二个7-8nt长度的基因组特异性的重复序列;分析发现RGDV-GX基因组片段S4比RGDV-T的S4短139nt,在RGDV-T S4中该插入片段上存在34nt长度的倒转重复序列,而且该插入片段的破坏了预期存在于3’-端的茎环结构,这对病毒基因表达的影响有待进一步分析。
【英文摘要】The complete nucleotide sequences of segments S2, S3, S5, and S8 – S11 of a Rice gall dwarf virus isolate from Guangxi Province, China, (RGDV-GX) were determined, completing the sequence of this isolate. The total genome (25,567nt) was similar in organization to a recently reported Thailand isolate (RGDV-T). A previously unreported second segment-specific repeat of 7 or 8nt was detected close to the 3’-end of segments S3, S5, and S8. The 3’-UTR of RGDV-GX S4 was 139nt shorter than that of RGDV-T; the insertion in RGDV-T contains a 34-nt inverted repeat, with the 3’-terminus probably abolishing the expected stem loop structure.

【题目】Studies on the epidemiology and yield losses from rice black-streaked dwarf disease in a recent epidemic in Zhejiang province, China

【中文关键词】品种感病性,病害监控,灰飞虱,水稻黑条矮缩病毒,播期

【英文关键词】cultivar susceptibility, disease survey, Laodelphax striatellus, Rice black-streaked dwarf virus, sowing date

【中文摘要】根据1995-2007年间的记载水稻黑条矮缩病的迅速蔓延已成为浙江省中、南部冬小麦、双季水稻种植区的一个重要病害,其中晚稻危害最为严重,每年受害面积达64640 ha,损失稻米约120 000 t。调查分析表明其灰飞虱介体的成虫数量高峰与水稻幼苗期重叠;而且灰飞虱带毒率在1998-2005年间也有所增高;研究表明水稻在3-4页最为感病,而在分蘖后期接毒稍有病状,甚至无症状;病株率和带毒虫量呈正相关性;播种期早的病株率和损失率最高,当播种期推迟25天后,几乎无损失;对于籼稻品种,病株率每增加1%,损失增加0.8%;对于粳稻品种损失则为0.92%;不同品种之间,感病差异很大,表明种植抗病品种有助于该病害的控制。耕作措施和近年冬季气候等方面的变化可能促进了该病害的发生。

【英文摘要】The spread of rice black-streaked dwarf disease, which has emerged as a major problem on winter wheat and the two summer rice crops (early indica and late japonica) grown in central and southern Zhejiang province, China, is documented from 1995 to 2007. The late japonica crop suffered the most: up to 64 640 ha were affected with estimated losses of c. 120 000 t grain per year. Peak adult numbers of the small brown planthopper vector, Laodelphax striatellus, coincided with the seedling stages of both rice crops and the proportion of the insect population carrying virus increased during 1998 – 2005. Seedlings with three to four leaves were the most susceptible, whereas plants inoculated after the end of tillering developed few or no symptoms. Disease levels were strongly correlated with numbers of viruliferous vectors. In sowing-date experiments with both rice crops, the earliest sowings had the most disease and suffered the greatest yield losses. With the last sowing date (25 days after the first), there were almost no losses. There were yield losses of 0.80% for every 1% increase in disease incidence in early indica rice and rather more (0.92%) in the late japonica crop. There were large differences in susceptibility between cultivars, indicating the possibility, within currently available germplasm, of using more resistant cultivars to help contain the disease. Changes in cropping practice and in recent winter weather conditions have probably contributed to the emergence of the virus as a major pathogen in eastern China.

【题目】土壤逐渐干旱对4种荒漠植物光合作用和海藻糖含量的影响

【中文关键词】干旱;光合作用;叶绿素荧光;海藻糖;荒漠植物

【英文关键词】drought stress;photosynthesis;chlorophyII fluorescence;trehalose;desert plant

【中文摘要】以腾格里沙漠东南缘4种优势植物红砂(Reaumuria soongorica Maxim)、珍珠(Salsola passerine Bge)、柠条锦鸡儿(Caragana korshinskii Kom)和油蒿(Artemisia ordosica Krasch)为对象,研究土壤逐渐干旱对叶片相对含水量、净光合速率(Pn)、叶绿素荧光参数及海藻糖含量的影响。结果表明:土壤逐渐干旱过程中,4种植物的叶片相对含水量、净光合速率(Pn)、光系统II(PSⅡ)最大光化学量子产量(Fv/Fm)、光系统II表观电子传递速率(ETR)、光化学淬灭(qP)都随干旱程度的加剧而下降;非光化学淬灭(qN)和海藻糖含量随干旱程度的增加而升高。4种植物对干旱过程的响应差异明显,随着土壤干旱的加剧,相对于其他三种植物,柠条具有更高的抗逆保护能力。相关分析表明,土壤含水量显著影响着4种植物的光合作用和海藻糖累积,海藻糖含量与光合作用存在相关性。

【英文摘要】The responses of net photosynthetic rate(Pn), chlorophyII fluorescence parameters and trehalose content of Reaumuria soongorica Maxim, Salsola passerine Bge, Caragana korshinskii Kom and Artemisia ordosica Krasch, to drought stress were studied. The results were as follows: Relative water content of leaves, net photosynthetic rate, maximal photochemical efficiency of PS II in the dark(Fv/Fm), apparent quantum transport rate(ETR), photochemical quenching(qP) decreased, trehalose content and non photochemical quenching(qN) increased under drought stress. The effects of drought stress on those variables among the four desert plants were obviously different, and Caragana korshinskii Kom was the highest tolerance and resistant to drought stress among the four plants studied. Correlation between soil water content, trehalose content, net photosynthetic rate and chlorophyII fluorescence parameters was analyzed. The results indicated that soil water content remarkably affected photosynthesis and trehalose content of four

desert plants.

【题目】两种固沙蒿属植物在原产地和引种地适应机制的比较研究
【中文关键词】固沙林;油蒿;差不嘎蒿;引种;适应机制
【英文关键词】sand fixation forest;Artemisia ordosica;Artemisia halodendron;introduced plant;adaptive mechanism
【中文摘要】油蒿(Artemisia ordosica)和差不嘎蒿(Artemisia halodendron)在原产地和引种地的生理特性及其与环境因子关系的比较研究显示:油蒿在不同的自然分布区,生理生态学特性有明显不同;在自然条件较好的沙地,会表现出旺盛的生命活动,但不利于植物对水分的有效利用;严酷的环境条件利于植物内部调节机制的启动,利用有限的环境资源,保证其自身的生存。差不嘎蒿引种后光合速率和蒸腾速率明显降低,一方面是由于引种地环境条件的严酷,另一方面是因为引种后植物内部生理因子之间的相互关系及调节程度都发生了变化;引种后的差不嘎蒿尽管可以通过一定的适应性调节使水分利用效率维持在较高水平并维持了生存,但如果遇到连续的干旱年份,则可能会因体内生理过程的紊乱而导致死亡。
【英文摘要】In order to understand the differences in physiological characteristics as well as their relationship with environmental factors, a comparative study was conducted on Artemisia ordosica and A. halodendron in their native habitats and introduced area. The results showed that A.ordosica in different natural distribution regions had significant differences in ecophysiological characteristics. It grew better in advantaged habitat of sand land but the efficiency of water use was low. Adverse environmental conditions were conducive to the activation of modulation mechanisms, resulting the effective using of limited environmental resources for plant survival. A. halodendron showed a decrease in photosynthetic rate and transpiration rate in the introduced area, which was not only related to the adverse environmental conditions, but also the changes of interaction of physiological factors and degree of regulation of introduced plants. A. halodendron could survive by maintain a higher level of water utilization efficiency by means of adaptability regulations, while, if subjected to a consecutive years of drought, A. halodendron would die because of in vivo physiological disorder.

【中文关键词】压砂田;土壤贮水量;土壤肥力
【英文关键词】gravel-mulched land;soil water storage;soil fertility
【中文摘要】以宁夏环香山地区农田压砂地为研究对象,对压砂不同种植年限(CK,1 a,3 a,5 a,15 a,25 a)下的土壤肥力及其相关因子进行了研究。结果表明:农田压砂后能显著提高土壤贮水量,压砂不同种植年限下的土壤贮水量分别比农田CK提高了68.5%,50.12%,40.42%,60.03%,44.39%。受季节降雨的影响,压砂不同种植年限土壤贮水量的季节变化趋势相一致。农田压砂种植初期(1~5 a)显著降低了pH值,随着种植年限的增加PH值含量基本呈增加趋势。农田压砂后明显降低了土壤全氮、全磷、有机质、碱解氮、速磷、速钾的含量,且随着种植年限的增加呈逐年下降的趋势。随着种植年限的增加西瓜产量呈明显下降趋势,农田压砂种植5~8 a,10 a,15 a,20 a分别比压砂种植1~3 a产量下降了33.33%,38.89%,55.56%,71.11%。
【英文摘要】This paper was studied on the soil fertility and correlation factor of gravel-mulched land with different years (CK, 1 a, 3 a, 5 a, 10 a, 15 a, 25 a) around Xiangshan mountain. The results showed that graveled on the farmland can significantly increase the soil water storage. The soil water storage of gravel-mulched land with different years were superior to the control increased by 68.5%,

50.12%, 40.42%, 60.03%, 44.39%, respectively. By the effect of rainfall, the seasonal variations of soil water storage were almost same in grave-mulched lands with different years. Soil pH value was decreased in gravel-mulched land with initial stage (1~5 a), but showed a rising trend with the increasing of graveled period. The contents of total nitrogen, total phosphorus, organic matter, available nitrogen, available phosphorus and available potassium were all decreased significantly with the increasing of graveled period. The watermelon production showed a decreasing trend, and decreased by 33.33%, 38.89%, 55.56%, 71.11% in different years (5~8a, 10 a, 15 a and 20 a) contrast with that in 1~3 a gravel-mulched land.

【题目】荒地不同压砂年限对土壤微生物区系、酶活性与土壤理化性状的影响
【中文关键词】压砂地;微生物区系;酶活性;土壤理化性质
【英文关键词】gravel mulched field;microbial population;enzyme activity;soil physiochemical property
【中文摘要】以宁夏中卫市香山地区荒地压砂3,8,15,25 a和邻近未压砂(对照)的土壤为研究对象,研究了压砂对土壤微生物区系、酶活性和土壤理化性状的影响。结果表明,与对照相比,压砂后微生物总数减少;土壤脲酶活性随着压砂年限的延长呈下降趋势;前15 a压砂地土壤有机碳、全氮、碱解氮和速效钾随着压砂年限的延长呈下降趋势;压砂地土壤含水量高于对照;压砂地全盐含量远远低于对照;说明荒地压砂种植能蓄水保墒,防止土壤次生盐碱化,但连续种植肥力下降,微生物量减少。
【英文摘要】The effects of gravel mulch on soil microbial population, enzyme activity, and physicochemical properties were evaluated on the wasteland in Xiangshan area, Zhongwei City, Ningxia Hui Autonomous Region. Four typical sites were selected as a chronological sequence (3, 8, 15, and 25 years) and an adjacent non-mulched gravel land was taken as the control. Results indicated that compared with the control, the number of microbes in the gravel mulched field was decreased. With the increased year of gravel mulched field, soil urinary enzyme activity presented a declined trend. The contents of soil organic carbon, total nitrogen, available nitrogen, and potassium declined for the sites of 3, 8, and 15 years. The soil water content in gravel mulched field was higher than the control, but the total salt content was much lower than the control. It is suggested that gravel mulch on wasteland can restore vegetation through preserving water, but soil fertility and microbial biomass are low.

【题目】不同土壤类型下AM真菌分布多样性及与土壤因子的关系
【中文关键词】丛枝菌根真菌(AM 真菌);多样性;土壤环境因子;土壤类型;根际土壤
【英文关键词】Arbuscular mycorrhizal fungi (AMF);Diversity;Soil environmental factor;Soil type;Rhizospheric soil
【中文摘要】以禾本科植物群落为研究对象, 研究了宁夏六盘山林地、银川农耕地、暖泉农耕地、固原农耕地、盐池沙地、灵武沙地6个采样地点5种土壤类型(黑垆土、灌淤土、黄绵土、灰钙土、风沙土)下AM 真菌物种多样性及其与土壤因子的关系。结果表明:5种土壤类型采样点的植被根际土壤中共鉴定出5属48种AM真菌, 其中, 无梗囊霉属(Acaulospora)1种, 巨孢囊霉属(Gigaspora)3种, 球囊霉属(Glomus)37种, 类球囊霉属(Paraglomus)1种, 盾巨孢囊霉属(Scutellospora)6 种, 各采样点土壤均以球囊霉属为优势属。地球囊霉(G.geosporum)和木薯球囊霉(G.manihotis)是6个采样地点中的优势种。不同土壤类型各采样点AM真菌各属的频度存在明显差异, 球囊霉属在各点均有出现, 频度值最高。具有较高植被多样性的暖泉样点, AM 真菌的种属数量较多。土壤环境因子对 AM 真菌孢子密度的影响因所处土壤、植被类型

不同而异。pH、全盐、速效钾、速效磷等土壤肥力因子, 在PCA轴上能最大程度地解释AM真菌孢子密度与土壤环境因子之间相互关系的大部分信息。宁夏不同土壤类型区域中AM真菌种类及分布一定程度上与该采样点的植被类型、植物多样性和土壤肥力特征相对应。

【英文摘要】Rhizospheric soil samples were collected from 5 soil types (dark loessial soil, cumulated irrigated soil, cultivated loessial soil, sierozems and aeolian soil) in 6 sampling sites (Liupanshan Mountain forest land, Yinchuan farmland, Nuanquan farmland, Guyuan farmland, Yanchi desert and Lingwu desert) with gramineae vegetation communities. Then the relationship between Arbuscular mycorrhizal Fungi (AMF) diversity and soil environmental factors was investigated. Based on spore morphological characteristics, a total of 5 genera and 48 species of AMF were found in five soil types. Specifically, there were 1 Acaulospora, 3 Gigaspora, 37 Glomus, 1 Paraglomus and 6 Scutellospora species. From the 6 sampling sites, Glomus was the most dominant genera and G. geosporum and G. manihotis were the most dominant species. Obviously differences were noted in AMF genus frquencies at each sampling site. Glomus was found at every site, its frequency was the highest. Nuanquan farmlands with high plant diversities had relatively high AMF species abundance and diversity. The effects of soil environmental factors on AMF spore density changed with soil and vegetation type. Based on axial principal analysis, total salt, pH, available potassium and available phosphorus mostly explained the relationship between AMF spore density and soil fertility. To a certain degree, the species and distribution of AMF corresponded with vegetation type, plant diversity and soil fertility at the various sampling sites.

【题目】宁夏压砂地土壤水分动态及消耗规律分析

【中文关键词】压砂农田;压砂西瓜;灌水试验;土壤水分

【英文关键词】Gravel-covered mulched field;Watermelon;Irrigation Experiment;Soil water

【中文摘要】通过田间试验分析不同灌水条件下压砂农田土壤耗水及全生育期土壤水分变化规律,结果表明:压砂农田一次性灌水15mm左右能够有效提高土壤水分,可满足压砂瓜近10d的水分需求;压砂瓜全生育期内存在4个较明显的需水关键期,其中以变瓤期和成熟前期对土壤水分需求最大;不同年限的压砂农田其土壤水分存在一定差异,通常老砂地(压砂10年以上)水分含量高于新砂地。

【英文摘要】The field experiments are carried out to analyse the soil water deprivation and water requirement of crops during the whole growth stages under different irrigations in gravel-covered mulched fields. The result showed that 15mm one-time irrigation can improve the soil moisture around and it can be to meet the water needs for nearly 10d. The water requirement has 4-sensitive period during the watermelon growth, in which the greatest demand for moisture occurred during the early stage of flesh and maturity. There are some differences between soil moisture in the gravel-covered mulched field in various years. Normally water content is higher in aged fields (above 10 years old) than that in the new fields.

【题目】红砂和珍珠对极端环境的生理响应与调节机制

【中文关键词】红砂;珍珠;气体交换;水势;渗透调节

【英文关键词】Reaumuria soongorica;Salsola passerine;gas exchange;water potential;osmosis regulating

【中文摘要】红砂和珍珠的生理生态特性随其生长的环境条件而变化;长期生长在一起的红砂和珍珠其生理生态特性具明显的差异,两者适应逆境的机制亦不相同。红砂和珍珠作为超旱生植物,其生理生态学特性明显区别于其他沙生植物;生长在山前地带的红砂和珍珠,可以在极低的水势条件下保证其生命活动,低的水势可能与渗透调节物质(如大量的脯氨酸)的存在有关,这类物质增加了植物的吸水能力;红砂和珍珠的光抑制程度较其他沙生植物要高得多,且光抑制的产生已对两种灌木光合色素产生了破坏,然而在条件稍好的早晚光抑制可得到恢复。

【英文摘要】Reaumuria soongorica and Salsola passerine have significant differences in ecophysiological characteristics and which change with the change of environmental conditions, although they with a long-term growth in together, their adaptive mechanisms to environmental stresses are also different. As two extreme xerophytes, Reaumuria soongorica and Salsola passerina differ significantly from other Psammophytes in ecophysiological characteristics; they can survive in lower water potential, even growth in the Piedmont area. Low water potential may be related to the existence of osmosis-regulating substance, such as praline, which can strengthen the capacity of water absorption. Compared to other Psammophytes, Reaumuria soongorica and Salsola passerina have a higher degree of photoinhibition under the same condition, and the appearance of photoinhibition has been leading to the destruction to photosynthetic pigment contents of the two pants, nevertheless, this photoinhibition can be repaired under suitable conditions in the morning and evening.

【题目】几种荒漠植物干旱休眠机理的初步研究

【中文关键词】干旱休眠机理;脱落酸;海藻糖;脯氨酸;甜菜碱

【英文关键词】drought dormancy mechanism;abscisic acid;trehalose;proline;betaine

【中文摘要】研究了阿拉善荒漠区天然生长的荒漠植物梭梭(Haloxylon ammodendron)、骆驼蓬(Peganum harmala)、白刺(Nitraria tangutorum)、霸王(Zygophyllum xanthoxylon)、红砂(Reaumuria soongorica)、珍珠(Salsolapasserina)、油蒿(Artemisia ordosica)叶片的相对含水量、脯氨酸、甜菜碱、海藻糖以及脱落酸(Abscisic Acid,ABA)含量在不同生长季节的变化特征。结果表明,ABA可促进脯氨酸、甜菜碱的积累;脯氨酸在9月累积较多,甜菜碱在7月大量累积,海藻糖在5月和9月积累较多,脱落酸在9月累积较多。脱落酸和脯氨酸对植物休眠可能存在着促进作用。

【英文摘要】Changes in contents of water, proline, betaine, trehalose, and ABA (abscisic acid) in leaves of Haloxylon ammodendron, Peganum harmala, Nitraria tangutorum, Zygophyllumant hoxylon, Reaumuria soongorica, Salsol apasserina, and Artemisia ordosicain Alxa desert in different growing seasons are investigated. The result shows that the content of proline is the highest in September; the content of betaine is the highest in July; the content of trehalose is the highest in May and Sep; while ABA is the highest in September. It suggests that plant dormancy may be promoted by ABA and proline.

【题目】Identification, Characterization, and Distribution of Southern rice black-streaked dwarf virus in Vietnam

【中文关键词】南方水稻黑条矮缩病毒,斐济病毒,进化分析

【英文关键词】Southern rice black-streaked dwarf virus (SRBSDV) ,feijivirus,phylogenetic analysis

【中文摘要】近年来,一种新的水稻矮缩病在越南发生并迅速扩展至越南中部和北部的19个省,病株表现矮缩,叶色浓绿,叶尖扭曲,叶片边缘出现缺刻,后期产生腊白色或黑色突起,该病害在水稻收获后,也感染玉米。经鉴定,该病害的病原与最近在

中国南部稻区报道的南方水稻黑条矮缩病毒(SRBSDV)属于同一种病毒,电镜观察表明在病株体内存在典型的斐济病毒的细胞病理学特征,包括晶体状排列整齐的直径约70-75nm球状病毒粒子;生物学实验表明该病毒可由白背飞虱传播给水稻和玉米;应用一步RT-PCR技术从越南中部、北部的5个农业生态区29个省采集的477个水稻和玉米病样中的检测结果证实了SRBSDV的存在,当没有检测稻RBSDV,序列分析显示越南和中国的SRBSDV之间的变异率较低,暗示了二者之间共同的起源,也支持SRBSDV作为一个病毒新种的结论。

【英文摘要】A novel dwarf and twisting syndrome first observed on rice in Nghe AnProvince, Vietnam, in 2009 has spread rapidly to the other 19 provinces of North and Central Vietnam. Infected rice plants showed stunting, darkening of leaves, twisting of leaf tips, and splitting of leaf margins. At a later stage, white waxy enations that eventually turned black were observed on the underside of leaf blades, leaf sheaths, and culms. The disease also infected maize after rice was harvested. Infected maize plants were stunted and dark green with small enations along the minor veins on the back of leaves. The disease agent has now been identified as Southern rice black-streaked dwarf virus (SRBSDV) recently reported from Southern China. Typical fijivirus viroplasms containing crystalline arrayed spherical virions approximately 70 to 75 nm in diameter were observed under the electron microscope in ultrathin sections of infected rice leaves. The virus was transmitted to rice and maize seedlings by the white-backed planthopper (Sogatella furcimera). A one-step reverse transcription-polymerase chain reaction (RTPCR) protocol was used to confirm the presence of SRBSDV in 477 samples of rice or maize from 29 provinces among 5 agroecological regions in North and Central Vietnam. Rice black-streaked dwarf virus was not detected in these samples. Partial sequences of RNA segments 4 and 10 from several isolates showed very low genetic divergences between isolates from Vietnam and China, suggesting a common origin, and phylogenetic analysis confirmed the placement of SRBSDV as a distinct virus within subgroup 2 of the genus Fijivirus.

【题目】家蚕性连锁平衡致死系致死基因的SSR定位

【中文关键词】家蚕; 性连锁平衡致死系; 致死基因; SSR; 基因定位
【英文关键词】Bombyx mrori; sex-linkaged balanced lethal strain; lethal gene; SSR; gene location

【中文摘要】家蚕性连锁平衡致死系(S-14)雄蚕的两条Z染色体分别携带有一个非等位、紧密连锁的隐性胚胎期致死基因l1(lethal gene 1)和l2(lethal gene 2)。两个致死基因的致死时期分别是转青期和G2期。将S-14品系的雄蚕和家蚕P50品系的野生型雌蚕杂交, F1代雄蚕和P50品系雌蚕回交, 即P50×(P50×S14)。回交后代雌蛾根据父本(F1代雄蚕)携带l1 或l2 基因分成两类BC1-l1 和BC1-l2, 分别用来做l1 和l2 基因定位。利用公布的家蚕全基因组序列筛选l1 基因和l2 基因所在Z染色体与P50品系Z染色体间的差异SSR标记, 分别获得16个和18个差异性SSR标记, 用差异性标记检测BC1-l1 和BC1-l2, 最终将l1 基因定位在Z染色体物理图谱中的19.79 Mb位点到染色体末端约2.60 Mb范围内, 将l2 基因定位在Z染色体物理图谱的17.86 Mb位点到18.55 Mb位点约 0.69 Mb范围内。

【英文摘要】The males of sex-linkaged balanced lethal silkworm strain (S-14) has two non-allelic recessive genes (lethal gene 1, l1 and lethal gene 2, l2). The two genes are located on two different Z chromosomes and cause death of embryos at body pigmentation stage and end reversal embryo stage, respectively. We firstly hybridized the males of S-14 strain with the females having wild-type genes of P50 strain and then backcrossed the males of F1 with females of P50 strain. A total of 1660 female moths of BC1 generation were divided into two groups, 1 100 in BC1-l1 and 560 in BC1-l2 according to the lethal gene carried by these female moths ′ fathers-fame moths of F1, respectively. Based on the nucleotide sequence infor-mation from the published physical map of Bombyx mori, we developed 16 polymorphic SSR markers in l1 gene region and 18 polymorphic SSR makers in l2 gene region compared to the allelic region of P50 strain and used these SSR markers and groups of BC1-l1 and BC1-l2 to map the two lethal genes, respectively. Gene l1 was mapped on the region of Z chromosome, covering a physical distance of 2.60 Mb. Gene l2 was fine mapped on the region of Z chromosome, covering a physical distance of 0.69 Mb.

【题目】基于虚拟仪器和神经网络的禽蛋检测系统设计
【中文关键词】Lab Windows/CVI,神经网络,禽蛋,检测系统
【英文关键词】Lab Windows/CVI, neural network, egg, detection-system
【中文摘要】该文针对现有禽蛋无损检测方法系统集成度不高,操作界面易用性差,测量误差大、试验效率低等不足,研制了基于 Lab Windows/CVI的多传感器融合的禽蛋无损检测虚拟仪器品质分级系统。该系统以 Lab Windows/CVI 软件为设计操作平台,以 MATLAB 神经网络的分析算法为分析模块核心,充分结合计算机视觉检测和声学检测方法的优点,在无损检测的信息采集和处理层面实现了多传感器融合。系统通过系统静态分级测试,系统动态分级测试和系统连续动态测试等 3 种测试,测试结果表明该系统界面易用性好,在快速运行(27 个样品/min)的情况下具有较好的准确度 (系统连续动态测试准确率大于 90%),和漏检率(最高速情况下小于 3%)。
【英文摘要】The system-integration degree, system working efficiency and user interface of egg non-destructive detection system cannot meet the requirement of fast and accurate detection. A non-destructive detection system for eggs based on virtual instrument and artificial neural network was designed and evaluated. This system used Lab Windows/CVI as the system design platform and the neural network as the core-analysis module. This approach fully uses the advantages of both computer vision and acoustics non-destructive detection. This system realizes the amalgamation of multi-sensors in data collecting and processing.. Three kinds of tests were conducted--the system static grading test, the system dynamic grading test and the system continuous dynamic test. The test results indicate this system was easy to use and provided a good graphical user interface. The system has good veracity (system continuous dynamic test result above 90%) and low un-detecting rate at high speed of the gearing machine (27 samples/min).

【题目】电子鼻检测鸡蛋货架期新鲜度变化
【中文关键词】无损检测,主成分分析,载荷,电子鼻,鸡蛋,新鲜度,线性判别分析
【英文关键词】nondestructive examination, principal component analysis (PCA), loading, electronic nose, egg, freshness, linear discrimination analysis (LDA)
【中文摘要】该文旨在通过气味检测鸡蛋的新鲜度。利用德国 AIRSENSE 公司 PEN3 型电子鼻对鸡蛋在 20°C,70%相对湿度条件下罗曼鸡蛋货架期的气味进行了无损检测。通过测定哈夫单位,建立了不同货架期气味与鸡蛋哈夫单位等级的对应关系。首先,分析并对比了第 0 天与第 36 天的完整鸡蛋与蛋液所产生气体的变化情况,确定氨氧化物、烷烃和醇类等是鸡蛋贮藏中产生的恶化气体。其次,结合电子鼻,利用主成分分析、线性判别等多元统计方法进行数据分析,对不同货架期、不同等级的鸡蛋进行归类区分,发现线性判别(LDA)效果优于主成分分析法(PCA)。结合载荷分析,确认了检测鸡蛋新鲜度的主要传感器 S1、S2、S3、S5、S6、S8。初步证明了气体传感器和模式识别方法在电子鼻区分鸡蛋货架期新鲜度的可行性,为建立利用气体传感器监控鸡蛋新鲜度的方法提供实验基础和理论依据。
【英文摘要】In order to explore the feasibility of determining egg freshness by their generated deteriorate volatile, a PEN3 electronic nose (E-nose) was used to detect the quality of ‘ Roma ’hen eggs through their shelf-life at 20°C , 70% RH in this study. The corresponding relationship between the shelf-life and grade of eggs was determined by Haugh unit. Firstly, the values of sensor response of the 0 and 36 days of egg liquid and whole egg were compared. The alkanes, ammonium, alcohol were the main deteriorate volatile which changed during the storage. Then the sample response signals were analyzed by principal components analysis (PCA) and linear discrimination analysis (LDA) to discriminate the different freshness during shelf-life, and the latter method proved better results than the former one. A further study of loading analysis and multiple linear regression selected the S1, S2, S3, S5, S6, S8 sensors of the E-nose

in the research. The results indicated that it was possible to discrimination of different shelf-life and quality of eggs by E-nose, and provided theoretical and experimental basis for monitoring the freshness of eggs.

【题目】The Complete Genome Sequence of Two Isolates of Southern rice black-streaked dwarf virus, a New Member of the Genus Fijivirus
【中文关键词】进化树分析,水稻黑条矮缩病毒,南方水稻黑条矮缩病毒
【英文关键词】phylogenetic analysis, Rice black-streaked dwarf virus, Southern rice black-streaked dwarf virus
【中文摘要】本研究测定了海南和广东2个侵染水稻的斐济病毒分离物基因组片段S1-S8和S1-S6的序列,由此获得这些分离物的全序列,序列分析显示这2个分离物与水稻黑条矮缩病毒(RBSDV)的关系最近,其中S1/S2/S10最为保守,与RBSDV对应基因组片段的核苷酸同源性为78.5 – 79.2%,氨基酸同源性为83.4 – 89.0%;而基因组S5/S6最不保守,核苷酸同源性70.6 – 71.6%,氨基酸同源性为63.1 – 69.9%。全基因组比较和进化树分析支持之前的观点,即该病毒为斐济病毒属的一个新种的结论,之前的2个名称中,建议称为南方水稻黑条矮缩病毒。
【英文摘要】The nucleotide sequences of genomic segments S1 – S8 and S1 – S6, respectively, of the Hainan (HN) and Guangdong (GD) isolates of a rice-infecting fijivirus were determined, completing the genome sequences of these isolates. The isolates were most closely related to Rice black-streaked dwarf virus (RBSDV): S1, S2 and S10 were most conserved with identities of 78.5 – 79.2% nt (83.4 – 89.0% aa) while S5 and S6 were the least conserved with 70.6 – 71.6% nt (63.1 – 69.9% aa) identity. Whole genome comparisons and phylogenetic analyses supported suggestions that the isolates represent a new species within the genus Fijivirus, family Reoviridae. Of the two names previously suggested for this virus, Southern rice black-streaked dwarf virus is preferred.

【题目】基于计算机视觉和声学响应信息融合的鸡蛋裂纹检测
【中文关键词】裂纹,计算机视觉,神经网络,鸡蛋,声学响应,检测
【英文关键词】cracks, computer vision, artificial neural networks, eggshell, acoustic response, detection
【中文摘要】为了提高对鸡蛋裂纹识别的准确性,建立利用计算机视觉和声学响应信息融合技术检测鸡蛋裂纹的系统,首先采集和分析鸡蛋被敲击后的声音信号,提取了 4 个特征频率、偏斜度平均值和峭度平均值共 6 个特征参数,作为人工神经网络的输入量,创建了结构为 6-15-1 的 3 层 BP 神经网络模型判别鸡蛋裂纹。其次,利用计算机视觉系统获取鸡蛋表面图像,提取了区域面积、圆形度、区域长径、短径和长短径之比共 5 个特征参数,作为 BP 人工神经网络的输入量,创建了结构为 5-10-1 的 3 层 BP 神经网络模型识别鸡蛋裂纹。最后,根据计算机视觉与声学响应技术检测鸡蛋裂纹结果的差异,融合二者的信息进行最终判断。结果表明:单独利用声学响应技术对裂纹鸡蛋判别准确率达 92%,计算机视觉对裂纹鸡蛋的判别准确率只有 68%。而将 2 种技术进行信息融合,对裂纹鸡蛋判别准确率可达 98%,优于单一技术,能够发挥计算机视觉技术和声学技术检测的优势,充分保证鸡蛋的质量和安全。
【英文摘要】In order to increase the detection accuracy of eggshell crack, information fusion technology of computer vision and acoustic response was introduced for eggshell crack detection. An experimental system including computer vision system and acoustic response system was built up. Firstly, the acoustic response signals were captured and analyzed, then six variables including the dominant response frequency (f1, f2, f3, f4), the mean value of coefficient of skewness (CS), and the mean value of coefficient of excess

(CE) were extracted after eggs was impacted four times oneggshell equator. With the six variables as inputs, 6-15-1 BP neural network was built to detect eggshell cracks. Secondly, the eggshell images were captured and processed through computer vision system, and five geometrical characteristic parameters of crack and noise regions of eggshell images were extracted. With the five variables including area (A), roundness (R), major axis (Max), minor axis (Min) and the quotient of long path and short path (LS) as inputs, 5-10-1 BP neural network was developed to detect cracks and classify eggs. Finally, the eggshell cracks were evaluated based on the difference of detecting results between computer vision technique and acoustic response technique. The results showed that the detection accuracy of cracked eggs were 92% and 68% respectively by computer vision technique and acoustic response technique. However, the accuracy equaled to 98% by the information infusion of two techniques. The information fusion technology was better than single technique, and the method based on the information fusion of computer vision and acoustic response was applicable for detecting egg cracks.

【题目】西瓜果实中番茄红素的研究进展
【中文关键词】西瓜;番茄红素;功能;含量;研究进展
【英文关键词】watermelon; lycopene; function; content; research progress
【中文摘要】开展西瓜果实中番茄红素的研究,对人体保健和疾病的预防有着重要的意义。文章综述了西瓜果实中番茄红素的理化性质、生理功能、提取方法和测定方法和生物合成,分析了番茄红素在自然界中的分布情况和影响西瓜果实中番茄红素含量的因素,讨论了西瓜中番茄红素的应用前景。
【英文摘要】Carrying out the study of Lycopene in watermelon is of great significance to human health and disease prevention. This Article summaries physicochemical property, physiological function, extraction methods, testing methods and biosynthesis of Lycopene in watermelon. This paper analyzes the distribution situation in nature, factors affecting lycopene content in watermelon. The application prospect of Lycopene in watermelon are dicussed.

【题目】核桃树的养分积累、分布及叶绿素含量的变化
【中文关键词】核桃;营养;叶绿素
【英文关键词】核桃;营养;叶绿素
【中文摘要】基于合理实施果园养分管理的前提,以核桃为研究对象,对核桃树体各部位营养元素的累积、分布以及叶片叶绿素含量动态变化进行研究。 结果表明:核桃树当年新生生物量主要由叶片和果实构成。 成龄核桃树当年氮素吸收量主要在叶片和果仁中积累,分别占年吸收氮量的 41%和 49%;磷素主要分布在果仁中,占年吸收磷量的 56%,其次为叶片;钾素主要在核桃果皮中积累,占钾素总吸收量的 66%。 核桃年纯养分吸收量为 907g,氮磷钾比例为 1∶0.2∶1。 叶片叶绿素含量在核桃开花后随叶片生长逐渐增加,二者呈显著正相关。

【题目】基于激光图像分析的苹果表面损伤和内部腐烂检测

【中文关键词】苹果 损伤 内部腐烂 计算机视觉 半导体激光
【英文关键词】Apple, Surface damage, Inner decay, Computer vision, Semiconductor laser
【中文摘要】利用波长650 nm、功率25 mW的半导体激光及计算机视觉技术,初步探讨了利用激光图像分析检测苹果(嘎拉)采后表面损伤和内部腐烂检测的可行性。利用钢球砸伤,模拟苹果在采收和运输过程中受到的损伤;利用微量注射器从苹果底部将15 μL(105/mL孢子浓度)的青霉菌液注入果心部位使其腐坏,模拟苹果内部的腐烂。进行激光图像检测试验,结果表明,受损伤后苹果图像像素数S3在36 h达到最高值(3 964),且在1~84 h内与对照差异显著(P≤0. 05);接种后的苹果随着内部的腐烂,在第4 d时像素数S3达到最高值(3 682),而后开始下降,第7 d与对照差异显著(P≤0. 05)。初步验证本方法检测苹果表面的损伤和内部腐烂是可行的。
【英文摘要】The semiconductor laser beam and computer vision technology were used to monitor the surfacedamageand inner decay of apples (c.v.gala). In the experiments, the damage was produced by falling of a spherical steel ball (diameter: 16 mm, weight: 96 g) on the apples from a height of 20 cm, to simulate the damage caused during the picking and transportation. In order to simulate the inner decay, 15 μL suspensions at 105/mL conidia ofPenicillium expansumwas injected into the inner of the apples by a micro-injection. The laser scattering image analysis indicates that the number of the pixels of the images (S3) reached the maximum (3 964) after 36 hours after damaged, and had significant differences with the control group during 84 hours after damaged (P≤0. 05). After injecting the suspensions, the number of the pixels ofS3reached the maximum (3 682) on the 4th day, and showed significant differences with the control group on the 7th day (P≤0. 05). This trial laid a theoretical basis for applying low power laser beam to monitor the surface damage and inner decay of apples.

【题目】西藏牦犊牛早期生长发育潜力的研究
【中文关键词】西藏牦犊牛;发育受阻;生长发育;全哺乳;生长潜力
【英文关键词】yak calves; retarded; growth and development; full lactating; potential growth
【中文摘要】发育受阻在牦牛中普遍存在。本文就牦犊牛暖季全哺乳,暖季适当哺乳+补饲和冷季少量哺乳+半舍饲饲养三种模式对犊牛生长发育的进行了研究。全哺乳和适量哺乳+补饲条件下犊牛的生长发育显著快于牧户母牛挤乳的犊牛(P<0.01);冷季适量哺乳+半舍饲饲养不仅可以防止犊牛冷季掉膘,而且可以继续使牦犊牛生长发育。研究提出了挖掘犊牛早期生长潜力的具体技术措施. 通过挖掘早期生长发育潜力,可以提高犊牛的生长发育, 并降低冷季掉膘和死亡率。
【英文摘要】Growth retarded are very conmen in yak. The following paper study on the growth rate of yakcalves raised under three different conditions: unrestricted lactating, restricted lactating + supplement ,restricted lactating with no supplement. The results show that the growth rate of yak calves improved under condition where calves either had full access to their mother's milk or where limited access to the milk was carried out in conjunction with additional sources of nutrients to calves (p<0.01). In comparison, growth rates were reduced under the traditional condition of raising yak calves where access to mike is restricted but no other sources of nutrients are provided to compensate for this reduction in feed intake. The current study provide some techniques and approaches for improving potential growth rate of yak calves. By improving the potential growth rate at an early stage , yak calves may be given a nutritional advantage necessary for improving productivity and reducing calf mortality over the cold and dormant conditions presented in the winter.

【题目】Grain Yield Prediction for Irrigation District Based on LS—SVM
【中文关键词】Yield; Prediction; LS-SVM; Model
【英文关键词】Yield; Prediction; LS-SVM; Model
【中文摘要】Commonly used grain yield forecasting models were briefly reviewed, and a yield prediction model of irrigation district was establishedbased on least squares support vector machines(LS-SVM).The grain yield in irrigation district was analog calculated. And the test sampleswere used to compare with gray prediction, and neural network model. The maximum predicted error of least squares SVM was 7.12%,with anaverage error of 4.81%.The results showed that LS-SVM model has high prediction accuracy and strong generalization ability. So it could beused as a new method for irrigation district yield prediction.

【题目】莫索湾地区农业气候资源的变化特征分析
【中文关键词】莫索湾;气候变化;初终霜日;无霜期;积温
【英文关键词】Mosuowan;Climatic change; First frost date and latest frost date; Frostless season;Accumulated temperature
【中文摘要】对1959 - 2007年莫索湾地区平均气温和降水资料的变化特征进行统计分析。结果表明:1 莫索湾地区48a来气温呈明显上升趋势,尤以近10a的升温最为明显。四季平均气温总体呈上升趋势,秋季增温最为明显.其次是冬季。 2 年降水量呈上升趋势,特别是20世纪90年代 - 21世纪初降水量增加更为明显,近10a平均降水量比48a均值偏多24. 98%。四季以夏季降水最多,春季次之,冬季最少。进一步分析了影响农业生产的布局和结构的无霜期、0°C、10°C、15°C、20°C积温的变化规律等。为合理利用农业气候资源,科学制定农业发展规划、指导地区农业生产提供依据。
【英文摘要】By analyzing the change ofmean air temperature and precipitation from 1959 to 2007 inMosuowan district.The results showed that the air temperature increased obviously in past 48 years, especially in recent 10 years. Themean air temperature in 4 seasons increased, especially in autumn and winter. The annual precipitation also increased obviously from 1990s to the beginning of this century. The mean precipitation of last decade was 24. 98% more than thatof last 30 years 1971 - 2000 . In 4 seasons, summer had the mostprecipitation, following spring and winter. Further analysis showed the change frost2free duration, accumulated temperature of 0°C,10°C,15°C and 20°C. The resultscould provide evidences formaking use of agricultural climatic resources reasonably,making scientific agricultural development plan and guiding the agricultural production in the district.

【题目】北疆北部地区春季地表湿润状况特征分析
【中文关键词】地表湿润指数;变化特征;极端干湿事件频率;北疆北部
【英文关键词】Surface humid index; Variation characteristics; Frequencyof the extreme dry/wet events; North Xinjiang
【中文摘要】利用北疆北部地区12个气象站1961-2008年3-5月月平均气温、降水量及相对湿度资料,计算得到春季地表湿润指数,对北疆北部地区48a来春季地表湿润指数年际及年代际变化特征及分布规律进行了较为深入的研究。结果表明:2O世纪6O年代以来,北疆北部地区春季地表有变干趋势;从空间分布上看,呈经向分布,偏西地区春季地表湿润指数大于偏东地区,表明偏东地区春旱重于偏西地区。同时探讨了北疆北部地区春季地表湿润指数与降水量、气温和空气相对湿度的关系以及春季极端干湿事件频率的空间分布。
【英文摘要】Abstract: The surface humid index in Springwere calculatedwith themonthlyprecipitation andmean temperature and relative humidity data in spring from 1961 to 2008 of12meteorological stations in north Xinjiang. According to index,the inter2annual and interdecadal change characteristics of the surface humid index in spring and its distribution rule were analyzed. The results showed that the surface humid index in spring declines slowly since 1960s, its spatial distribution were meridional. The surface humid index in spring in the west area were greater than that of the east area in north Xinjiang, it showed that the spring drought in the east areaweremore serious than thatof thewest area in north Xinjiang. Meantime, the relationship between the surface humid index in spring and precipitation and temperature and air relative humiditywere discussed and the spatial distribution of the frequencyof the extreme dry/wet events in springwere analyzed in thispaper.

【题目】运用土壤水盐运移模型优化棉花微咸水膜下滴灌制度
【中文关键词】灌溉; 土壤; 模型; 膜下滴灌; 微咸水; 棉花; HYDRUS;
【英文关键词】irrigation; soils; models; mulched drip-irrigation; brackish water; cotton; HYDRUS;
【中文摘要】为优化设计棉花微咸水膜下滴灌灌溉制度,利用HYDRUS建立含根系吸水项的土壤水盐运移数值模拟模型,并用田间试验资料进行参数识别和模型验证。用验证认可的数值模型优化设计棉花微咸水膜下滴灌和非生育期洗盐灌溉制度,并预测棉花生育期水盐运移规律和长期效应。结果表明:模型仿真度较高、运行速度较快;T检验说明土壤含水率和电导率模拟值与实测值均无显著差异;模型参数中形状系数α、n对含水率影响较大,纵向弥散度DL对电导率影响较大;当地膜下滴灌适合生育期一膜双管、低额高频灌溉,并结合非生育期1年1次或2年1次大水漫灌洗盐,20a的模拟结果显示此灌溉制度下不会引起土壤次生盐渍化。
【英文摘要】n order to optimize the program of mulched drip-irrigation with brackish water for cotton,a soil water and salt numerical model with the root water uptake item was built by using HYDRUS.The parameters were identified and model was verified using the data of field experiments.The verified model was used to set up proper irrigation program of mulched drip-irrigation at cotton growth season and the flood irrigation at non-growth season for leaching soil salt,and to predict soil water and salt migration characteristics and its long-term effect.The results showed that the simulation matched observation well and the calculation rate was fast.The simulated and observed soil water and salt had no significant difference by T test.The parameters α and n had more notable influences on soil water than other parameters,while the longitudinal dispersivity D L had notable influence on soil salt.The proper program of mulched drip-irrigation in the study area is that two pipes are set up for one tarp with low irrigation water quantity and high irrigation interval combined with once flood irrigation during non-growth season for one or two years.Twenty-year simulation showed that the irrigation program would not result in soil secondary salinization.

【题目】基于染色示踪的膜下滴灌棉田水盐运移规律
【中文关键词】膜下滴灌; 土壤水分; 染色示踪; 亮蓝FCF; 水文地质学; 环境工程;
【英文关键词】mulched drip-irrigation; soil moisture; dye tracer; brilliant blue FCF; hydrogeology; environmental engineering.;
【中文摘要】采用亮蓝FCF染色示踪剂,研究膜下滴灌条件的水盐运移规律;分别在灌溉前、灌溉中和灌溉后等不同时间段共开挖13个时刻的剖面,观察膜下滴灌湿润面的运移情况;以10cm间隔的网格,用MP406土壤水分探测器原位测定3120个点的土壤体积含水率,同时取1430份土样,利用1:5土水比浸提法测定土壤盐分;并利用WATCHDOG气象站监测研究区气象要素.结果表明:染色示踪能直观表征土壤水盐运动轨迹;膜下滴灌条件下,垂直滴灌带方向土壤水流呈点源入渗特征、沿滴灌带方向近似呈线源入渗特征;现行灌溉模式下,壤质砂土湿润锋横向运移速率约为8cm/h;滴灌对滴头附近土体有一定洗盐效果,未覆膜区域地表土体出现盐分积累;灌水时间越长,湿润锋越深,横向扩展速率接近无作物小区(8cm/h);从土壤水合理利用角度考虑,满足研究区一膜一带四行的种植模式和土质的单次合理灌水量应为29.4~69.8mm.
【英文摘要】Brilliant Blue FCF was used to trace water flow in cotton field of mulched drip-irrigation using brackish water.13 cross sections were dug before irrigation,during irrigation and after irrigation,respectively,for observation of the movement of wetting front.The soil moistures were in-situ measured at 3 120 points by using MP406 moisture probe and 1 430 soil samples were sampled to analyze soil salinity by extracting soil water with 1:5 of soil to water,while cross sections were divided as each grid 10 cm×10 cm.The meteorology data were measured by WATCHDOG.The results show that the dye tracer can trace soil water flow and salinity transport obviously.There are two infiltrating states for soil water and salinity transport characters in field under film mulched drip-irrigation:point source infiltrating in the direction vertical to drip irrigation pipe and approximate line source infiltrating along with drip irrigation pipe.The velocity of soil wetting front movement was 8cm/h under the present irrigation.The soil salinity near the dripper was leached by irrigation water;however,the salt accumulated in the surface soil without film mulch.The wetting front extended with the irrigation time,and the spreading distance was similar to that with no plants.For efficient use of soil water,the reasonable irrigation quota for the present planting pattern of one film,one irrigation pipe and four row cottons was 29.4-69.8 mm in the study area

【中文关键词】砂; 土壤; 毛细水; 水分; 干旱区; 矿化度;
【英文关键词】sand; soils; capillarity; moisture; arid regions; total dissolved solids;
【中文摘要】为明晰极端干旱区高盐度潜水蒸发机理,指导盐荒地开发与水盐调控,开展了砂性土条件下,不同粒径及潜水矿化度(1、30、100、250g/L)组合的毛细水上升试验。结果表明,试验后期毛细水上升规律稳定时段:粗砂土柱,潜水矿化度越大,毛细水上升高度越小;细砂土柱,1g/L处理毛细水上升高度明显大于其他3组;粉土土柱,不同处理毛细水上升高度由大到小为:30、100、250、1g/L。试验初始阶段,除粗砂外并不表现为矿化度越大,毛细水上升速度越小的趋势。相比高矿化度,粒径是控制毛细水上升的主要因素。研究表明,土体颗粒较细时(细砂、粉土),高矿化度不仅改变毛细水重力,也使得土体孔隙结构发生不同程度变化,二者综合作用于毛细水上升过程。
【英文摘要】Capillary rise is a significant contributor of soil salinity in extremely arid areas and is highly dependent on soil grains and total dissolved solids (TDS) in phreatic water. In this paper, experiments about effects of different grains of sand soil and TDS of phreatic water (1, 30, 100, 250 g/L) on capillary rise were conduced. The results showed that the height of capillary rise was steadily increasing in later stage of experiments and TDS had significant effects on capillary rise. For coarse sand, the higher TDS made the lower height of capillary rise. But for fine sand, the height of capillary rise of 1g/L was obviously larger than others. The sequence of height

from lower to larger of capillary rise in silt was 30, 100, 250 and 1g/L. At the beginning of experiments about coarse sand, the higher TDS made the lower velocity of capillary rise, but other soil groups were not. Compared to high-TDS condition, the grain of sand soil was a more primary controlling factor of capillary rise. The research indicates that high-TDS not only changes the gravity of capillary water but also the pore size of soil during the period of capillary rise in fine sand.

【题目】新疆主要城市地下水水质现状分析
【中文关键词】地下水; 水质评价; 灰色关联度分析法; 新疆城市;
【英文关键词】groundwater; water quality evaluation; method of Grey Relational Analysis; cities in Xinjiang;
【中文摘要】将2003年4至6月份新疆7个城市地下水42个水样监测结果,以各城市为评价单元,以《地下水环境质量标准》(GB/T 14848-93)为评价标准,选择总硬度、矿化度、氨氮、挥发酚、高锰酸钾指数、硫酸盐和氯化物这7个项目作为评价因子,运用灰色关联度分析方法对新疆7个城市的地下水水质进行分析。评价结果表明,矿化度和总硬度较大,总体水质较好。应加强地下水保护及地下水资源质量管理,实现地下水资源可持续利用,并对地下水污染防治提出建议。
【英文摘要】The article investigates the tested results of 42 samples from groundwater in 7 cities of Xinjiang from April to July 2003 regarding city as the basic evaluation unit,choosing the 7 items as the evaluation factors including total hardness,mineralization,NH4-N,C6H5OH,CODMn,SO2-4and Cl-,the《GB/T14848-93 Groundwater Quality Standard》 were taken as the evaluation standard,the method of Grey Relational Analysis was adopted to classify groundwater quality of the 7 cities.The evaluation results indicate that quality of groundwater in the 7 cities of Xinjiang is relatively good,but the total hardness and mineralization are quite high.The priority was given to strengthening the protection of ground water and quality management of ground water resources,to realize the sustainable utilization of ground water resources and some advices were put forward about groundwater pollution prevention.

【题目】干旱区膜下滴灌条件下膜孔蒸发特征研究
【中文关键词】覆膜开孔率; 湿润锋; 累积蒸发量; 返盐量;
【英文关键词】hole opening ratio; wetness van; cumulative evaporation; increased salt content accumulated;
【中文摘要】模拟不同覆膜开孔率下的蒸发试验,研究了蒸发过程中不同覆膜开孔率下土体湿润锋及水盐运移情况的动态分布特征。结果表明:随蒸发历时的延长垂直湿润距离增大,在蒸发1 d后垂直湿润距离的增加量最大,蒸发结束时随覆膜开孔率的增大垂直湿润距离减小;随蒸发历时的延长土体剖面内的含水量在减小,表层减小最快,剖面底部边侧含水量有所增加;盐分则呈现向表层和底部范围增加,剖面中部的含盐量相对减小的动态变化;蒸发结束时土体剖面上同一位置处含水量随开孔率的增大在减小,盐分则表现随开孔率增加表层返盐明显,土体剖面中下部的盐分向远离滴头的斜下方运移,在湿润锋处聚集。而各覆膜开孔率下累积蒸发量与蒸发时间的开平方呈线性关系,累积蒸发量的增量与开孔率呈幂函数关系。
【英文摘要】Plastic film mulching has been widely used in crop planting in arid areas, but due to the seeding holes and other factors, entire mulching can not be performed in the field,and this must affect the distribution of soil water and salt content. Evaporation was simulated with different holes opening ratio to study the dynamic distribution characteristics of wetness van and soil water and salt transfer with different holes opening ratio in evaporation process. The results indicated that vertical wetness distances were increasing with the elongation of evaporation time, and the increment was the biggest after a day of evaporation;The vertical wetness distances were depressed with holes opening ratio increasing at the end of evaporation. The soil water content was inducing with the extension of evaporation time, it was the most rapid in the top layer, but it increased in the bottom of soil profile; The soil salt content was increasing in top and bottom layers. At the end of evaporation the soil water content was reducing with hole opening ratio increasing at the same profile position, but the increased salt content accumulated at top layer was getting higher with hole opening ratio increasing, and the soil salt content of lower profile was moving along inclined below direction, and assembled in the wetness van. There was fine linear relationship between cumulative evaporation and evaporation time, and there was also powerful function relationship between cumulative evaporation increment and open holes ratio.

【题目】Simulated and measured soil wetting patterns foroverlap zone under double points sources of drip irrigation
【中文关键词】Drip irrigation, HYDRUS, intersection, soil wetting pattern
【英文关键词】Drip irrigation, HYDRUS, intersection, soil wetting pattern
【中文摘要】Water resource scarcity is a serious problem hampering agricultural development in the arid and semiaridregion. Drip irrigation is one of the most useful methods that is widely used in the arid and semiaridregion. Intersection is a however, common event under drip irrigation and the crops are alwaysplanted in the overlap zone, hence a suitable design and operation of the system is very important forcrop yield. In this study, experimental and simulated soil wetting pattern of overlap were investigatedfor drip irrigation at different emitter discharge, irrigation volume and emitter spacing, respectively.Simulations of the water content and wetting front were close to the observed data. To evaluate theeffects of various parameters on wetting, additional simulations were carried out with HYDRUS. Afterthe simulation under the HYDRUS environment, we therefore recommended a larger irrigation volume,larger wetting pattern; and when the emitter spacing is shorter, then the wetting patterns should belarger. Due to the heterogeneity of soil texture, the horizontal and vertical distance are almost uniformlyin the loam and silt, inversely in loamy sand.

【题目】地表滴灌条件下土壤湿润体运移经验方程
【中文关键词】地表滴灌; 土壤湿润体; 数值模拟; SWMS_ 2D模型
【英文关键词】surface drip irrigation ; soil wetted volume ; mathematical simulation ; SWMS_2D model
【中文摘要】为给滴灌制度提供设计依据,研究了地表滴灌下土壤湿润体的运移规律。设置33 种情景,采用SWMS_2D 模型进行数值模拟实验,建立了描述土壤饱和导水率、初始含水率和滴头流量等影响湿润体运移规律的经验关系式。结果表明: 湿润体体积与灌水量成正比,比例系数与土壤饱和含水率和初始含水率正相关,与滴头流量负相关; 湿润锋比和灌水量之间呈幂函数关系,主要受地表积水入渗半径的影响,地表积水半径由滴头流量与土壤饱和导水率的比例决定。与其他试验数据对比表明,本经验关系式具有较高的模拟精度。
【英文摘要】The movement of soil wetted bodies during surface drip irrigation was studied to improve the drip irrigation system design. The SWMS_2D model was used to numerically analyze 33 situations of 22D soil water movement. Two empirical equations were then formulated to describe the effects of the saturated hydraulic conductivity , Ks , initial soil moisture content , θ 0 , and trickle discharge rate , qV , on the development of soil wetted bodies. The results show a linear relationship between the volume of the wetted soil body and the total volume of irrigated water . The volume increases with Ks and θ 0 and decreases with qV . The ratio of the radial to vertical wetting fronts was found to be related exponentially to the irrigated water volume , which depends on the ratio of qV to Ks . These formulas agree well with experimental data from other literatures.

【题目】基于CVODE求解器的饱和-非饱和土壤水分运动数值模型
【中文关键词】地表滴灌; 积水动边界; CVODE; Richards方程;
【英文关键词】无
【中文摘要】为研究地表滴灌条件下的土壤水分分布特征和运动规律,构建了基于二维Richards方程的土壤水分运动数值模型TIVS(Tsinghua Integrated Variably Saturated soil water movement model)。将Richards方程空间半离散后利用CVODE常微分方程求解器进行求解,改进了地表滴灌积水动边界的处理方法,提高了数值求解稳定性和计算效率,模拟结果能保持良好的水量平衡.数值模拟检验和试验验证结果表明,模型具有较高的模拟精度,可用于地表滴灌复杂边界条件下的土壤水分运动长期模拟。
【英文摘要】A numerical model of two-dimensional soil water movement under surface drip irrigation condition was developed. The physical process of soil water movement is described by 2D Richards equation, and the upper boundary condition is depicted by the improved moving ponded area boundary. The partial differential equation (PDE) is transformed into ordinary differential equations (ODEs) through spatial semi-discretization and numerically solved by an ordinary differential equation solver (CVODE). The numerical and field experiments indicate the good performance of the model in terms of accuracy and efficiency. The model provides a useful tool for long-term simulation of soil water movement under surface drip irrigation. Also, the model can serve as a general 2D Richards equation solver for variably saturated soil water movement, which is named as TIVS model (Tsinghua Integrated Variably Saturated soil water movement model).

【题目】膜下滴灌棉田土壤水盐分布特征及灌溉制度试验研究
【中文关键词】 干旱区; 膜下滴灌; 棉花; 水盐分布; 灌溉制度;
【英文关键词】 arid area; mulched drip irrigation; cotton; soil water and salt movement; irrigation scheduling;
【中文摘要】在新疆库尔勒市西尼尔镇开展了膜下滴灌棉田土壤水盐分布特征及灌溉制度的试验研究,根据不同灌溉定额(375、525和675mm)及灌水间隔(3.5、7和10.5d)组合设置7个试验处理,通过对比分析研究了膜下滴灌条件下的土壤水、盐分布规律及其对棉花生长性状及最终产量的影响。试验结果表明:(1)主根区土壤含水率自靠近滴灌带的宽行往外至膜间逐渐降低,土壤含盐率则呈相反的规律分布,灌溉期靠近滴灌带的主根区土壤处于脱盐状态,远离滴灌带的土壤处于积盐状态;(2)相同灌水间隔下,灌溉定额越大,主根区含水率越高,主根区以下渗漏水分越多,棉花产量提高但灌溉水生产效率降低;相同灌水定额下,灌水间隔过大或过小均不利于棉花的生长;(3)在试验区的砂性土壤条件下,675mm灌溉定额和7d灌水间隔的灌溉制度可获得最大籽棉产量为6816kg/hm2,375mm灌溉定额和7d灌水间隔的灌溉制度可获得最高的灌溉水生产效率为1.33kg/m3。
【英文摘要】Field experiments were conducted to investigate the dynamic regimes of soil moisture and salt as well as irrigation scheduling for cotton under mulched dripirrigation condition. Seven irrigation treatments with different total irrigation amounts (TIA) and irrigation intervals were designed. The results show that soilmoisture decreases and soil salt increases as the distance from drip tape increases in horizontal direction. In irrigation periods, areas close to drip tape are in desalting process and areas away from drip tape are in salt cumulating process. The higher TIA leads to higher soil moisture while the irrigation water use efficiency will be lower. Either longer or shorter irrigation interval result in unfavor conditions for growth and yield of cotton. Under sandy soil condition, the maximum yield of cotton occurs when TIA is 675 mm and irrigation interval is 7d, the maximum irrigation water used efficiency occurs when TIA is 375 mm andirrigation interval is 7d.

【题目】滴灌施钙时间对盐碱土水盐运移特征研究
【中文关键词】盐碱土; 滴灌; 施钙时间; 水盐运移;
【英文关键词】saline-alkali soil; drip irrigation; calcium-using time; water movement and salt transport;
【中文摘要】通过室内试验测定新疆昌吉地区盐碱土在不同滴灌施钙时间的入渗运动过程,研究不同施钙时间(前期施用Ca-W、后期施用W-Ca、中间施用W-Ca-W、前后期施用Ca-W-Ca)的盐碱土土壤盐分运移和水分运动。结果表明不同施钙方式对滴灌盐碱土土壤水分分布具有影响,对盐碱土盐分运移影响明显,随着湿润锋水平、垂直运移距离的增加,不同滴灌施钙方式的土壤含盐量、钠离子含量和钠吸附比均在不断增加,Ca-W-Ca方式的达标脱盐区评价系数和脱钠区深度系数均大于其他方式,钠吸附比均小于其他方式,脱盐效果均优于其他方式,说明Ca-W-Ca方式更有利于作物根系生长,改良盐碱土效果最明显。 更多还原
【英文摘要】Based on indoor experiments, the movement of soil water in drip irrigation was measured in saline-alkali soil of Changji region in Xinjiang province for different drip irrigation calcium-using time. Soil water movement and salt transport in saline-alkali soil for different drip irrigation calcium-using time (in the beginning of the irrigation cycle (Ca-W), at the end (W-Ca), in the middle (W-Ca-W), and in the beginning and end of the irrigation cycle (Ca-W-Ca)) were studied. The results show that distributions of water in soil is influenced for different calcium-using modes. The salt transport of saline-alkali soil is significantly influenced for different calcium modes. With the increase of the horizontal and vertical advance distance of soil wetted front increasing, soil salinity and sodium content and sodium absorption ratio increase for different calcium treatments in drip irrigation. Coefficients of controlled desalinization zone and the depth of the sodium desalinization zone coefficients of Ca-W-Ca mode are higher than that of other modes, but the sodium absorption ratio of Ca-W-Ca mode is less than that of other modes, and the desalinization effect of Ca-W-Ca is also superior to that of other modes. It can be concluded that the crop root grow better in the Ca-W-Ca mode and improvement effect of saline-alkali soil of this mode superior to that of other modes.

【题目】滴灌条件下石膏配比对盐碱土水盐运移特征影响
【中文关键词】盐碱土;滴灌;石膏配比;水盐运移;
【英文关键词】saline-alkali soil;drip irrigation;gypsum proportion;water movement and salt transport;
【中文摘要】 针对西北等干旱地区土地次生盐渍化的问题,以室内实验为基础,研究了不同石膏配比对盐碱土土壤盐分运移和水分运动的影响。结果表明,不同石膏配比对滴灌盐碱土土壤水分分布具有影响,对盐碱土盐分运移影响明显。随着湿润锋水平、垂直运移距离的增加,不同石膏配比的土壤含盐量增加,在相同入渗距离内,随着石膏配比的增加,钠离子含量减小,脱钠区深度系数增大,脱钠效果明显,石膏配比为0.1的脱钠区深度系数增加比率最大。因此,施加石膏有利于滴灌淋洗土壤盐分。
【英文摘要】 In order to solve the secondary saline-alkalization problems in the northwest arid areas of China,based on the laboratory experiment,soil water movement and salt transport in saline-alkali soil under different gypsum proportions were investigated.The results showed that the gypsum proportion had a great impact on the distribution of water in soil and the salt transport of saline-alkali soil was significantly influenced by it.With the increase of the horizontal and vertical advance distances of soil wetted front,the soil salinity also increased under different gypsum proportions.In the same infiltration distance,with the increase of gypsum proportion,the sodium content decreased while the sodium desalinization zone depth coefficient increased,which showed that the desalinization effect was distinct.When the gypsum proportion was 0.1,the increment of the sodium desalinization zone depth coefficient was greater than that of any other treatments.So the gypsum was propitious to wash soil surface salt under drip irrigation.

【题目】滴灌施钙土壤水盐运移特征的田间试验研究
【中文关键词】滴灌;连续施钙;间歇施钙;淋洗效果
【英文关键词】无
【中文摘要】盐碱地的改良措施主要有水利改良、化学改良、生物改良。随着农业灌溉水的日益缺乏,水利改良盐碱地已受到一定程度的限制,化学改良和生物改良引起大家的重视。在化学改良中主要是通过添加钙离子含量降低钠离子含量,从而改善土壤结构性能,增加土壤的渗透性和通气性[1]。在盐碱地上,钠离子过多会严重影响土壤的结构,使其通气透水性能大为减小,形成土壤板结现象,严重的影响作物对水分和营养的吸收以致无法正常生长。通过在盐碱地上施加钙离子置换吸附在土壤胶体的钠离子,降低在作物根区范围的钠离子含量。同时近年来在新疆等地大面积推广的膜下滴灌开发利用盐碱地和防治次生盐碱化方法已经取得了显著成效。国内许多就膜下滴灌水盐运移特征 更多还原

【题目】土石混合介质水分运动规律研究
【中文关键词】 碎石; 累积入渗量; 湿润锋; Philip入渗模型
【英文关键词】rock fragment; accumulative infiltration; wetting front; Philip infiltration model
【中文摘要】通过一维垂直积水入渗试验,研究碎石含量与碎石粒径对土壤累积入渗量与湿润峰的影响,结果表明碎石的存在明显的促进水分的运动,在碎石含量为30%时,累积入渗量与湿润峰均达到最大,碎石粒径在5~10 mm时,累积入渗量与湿润峰均达到最大,碎石含量对水分运动的影响程度要大于碎石粒径的影响程度;累积入渗量随入渗历时的变化过程与湿润峰随入渗历时的推进过程均可以利用Philip入渗模型进行描述。
【英文摘要】One-dimensional vertical ponding infiltration experiment was performed in order to study the effect of rock fragment content and particle size on soil accumulative infiltration and wetting front,the results turn out to be that rock fragment could promote water movement significantly,the maximum of accumulative infiltration and wetting front appear when rock fragment content reach 30% or particle size is 5~10 mm,the results also present that rock fragment content has a more obvious effect on water movement than rock fragment particle size;in addition,changing process of accumulative infiltration with infiltration duration and advancing process of wetting front with infiltration duration could be described by Philip infiltration model.

【题目】水平入渗法确定土石混合介质的水力参数分析
【中文关键词】土石混合介质; 累积入渗量; Hydrus-1D; 水平入渗法
【英文关键词】 stony-soil media; cumulative infiltration; Hydrus-1D; horizontal infiltration;
【中文摘要】我国大量分布着土石混合山区,研究该区的土壤水分运动特征对于我国山区水文研究具有重要的现实意义,其中土石混合介质水力参数的确定是一个重要研究内容。利用一维水平入渗法间接的来推求土石混合介质的水力参数,将其求得的参数作为数学模拟软件hydrus-1D的输入参数来模拟水分入渗过程,将实测的累积入渗量与模拟累积入渗量进行对比,其相对误差介于0.04%~0.48%,说明利用一维水平入渗法来确定土石混合介质的水力参数具有较高的精度,满足实际需要。
【英文摘要】Stony-soil mountain areas largely exist in China.The study on the characteristics of soil water movement of this area has a great realistic significance to the research on mountain zone hydrology of our country.Among which,determination of hydraulic parameters of stony-soil media is an important research content.In this paper,hydraulic parameters of stony-soil media were indirectly obtained through one dimensional horizontal infiltration.Parameters obtained from this method were used as the input parameters of mathematical modeling software called hydrus-1D in order to simulate the process of water infiltration.The relative error between measured and simulated cumulative infiltration lies between 0.04%~0.48%,which indicates that the determination of hydraulic parameters of stony-soil media through one dimensional horizontal infiltration have higher precision and could meet the practical needs.

【题目】滴灌施钾肥土壤水盐分布特征的田间试验
【中文关键词】脱盐,灌溉,离子,土壤含水率,盐碱地,钾素,滴灌

【英文关键词】Calcium - Concentration (process) - Desalination - Fertilizers - Ions - Moisture determination - Physical chemistry - Soil moisture - Underwater soils - Water filtration
【中文摘要】:化学改良是一种有效改善土壤物理化学特征的土壤盐碱地改良方法,为将化学改良与膜下滴灌和增加土壤肥力相结合,该文通过滴灌施加硝酸钾并对土壤水盐分布特征进行分析,研究了0~30 cm耕作层内3种施K质量浓度400、800、1 000 mg/L及5种(连续、滴水.滴施硝酸钾溶液、滴施硝酸钾溶液.滴水、滴施硝酸钾溶液.滴水一滴施硝酸钾溶液、滴水一滴施硝酸钾溶液.滴水)施K方式下土壤盐分及离子的分布特征。结果表明,随着外源钾素的滴入土壤,改变了土壤耕作层内离子的组成,Ca 、Mg 浓度相对增加、Na 浓度降低;阴离子s0 ‘ 浓度增加,C1 浓度降低;高施K浓度下耕作层内的总盐、钠吸附比(SAR)、C1 ‘ /SO42-减小,滴水.滴施硝酸钾溶液施K方式下的SAR、C1一/$042-最小,说明滴施硝酸钾在土壤耕作层内有明显的土壤改良效果,其施K质量浓度为1 000 mgm 及滴水一滴施硝酸钾溶液施K方式下脱盐效果最好。
【英文摘要】The chemical ameliorant using in salt field is a kind of efficient method, which can meliorate the physical chemistry characteristics of soil. But a problem is always concerned, that is how to combine chemical ameliorant and the under-mulch drip irrigation and the soil fertility. Through analyzing characteristics of soil water and salt distribution in drip fertigation of kalium-using fertilizers, the characteristics of soil water and ion distribution were studied under three kinds of kalium-using concentrations as 400, 800 and 1000 mg/L and five kinds of kalium-using modes (continuous drip irrigation, drip irrigation of water (W)-drip fertigation of KNO3 (K), K-W, K-W-K, and W-K-W) as concatenation, in 0-30 cm cultivation layer. Results indicated that the soil ion forms were changed through drip fertigation of kalium-using fertilizers, Ca2+ and Mg2+ concentrations relatively increased, Na+ concentration reduced, anion SO42- concentration increased and Cl- concentration falled, the total salt content, sodium absorption ratio (SAR) and Cl-/SO42- reduced by high kalium-using concentration in cultivation layer, SAR and Cl-/SO42- in W-K kalium-using mode were least in five kinds of kalium-using modes, which showed drip fertigation of niter-using had visible meliorated effect in cultivation layer, and the effect of pulling salts with 1000 mg/L kalium-using fertilizer and W-K mode were best in three kinds of kalium-using concentrations and five kinds of kalium-using modes.(18 refs)

【题目】DRAV模型及其在干旱区地下水脆弱性评价中的应用
【中文关键词】地下水;脆弱性;DRAV模型;新疆焉耆县
【英文关键词】无
【中文摘要】结合内陆干旱区地下水的特点,在地下水脆弱性评价的GOD法和DRASTIC 模型的基础上,提出了DRAV模型,其中D为地下水埋深(groundwater depth)、R为含水层净补给量(net recharge of aquifer)、A为含水层特征(aquifer characteristics)、V为包气带岩性(lithology of vadose zone)。以新疆焉耆县平原区为例,在GIS平台上,利用DRAV模型评价该地区孔隙地下水的脆弱性。结果表明:开都河南岸沿岸地区(包括库尔勒市城市地下水水源地)和焉耆镇一带是地下水脆弱性高的地段。为解决城市供水与地下水脆弱性这一对明显的矛盾,应加强该地区地下水污染防治工作,在开展工作时应坚持“ 以预防为主,防、治结合 ”的原则。

【题目】新疆塔里木盆地平原区中盐度地下水分布及其质量评价
【中文关键词】中盐度地下水;　补给资源量;　灌溉水质评价;　塔里木盆地;
【英文关键词】　medium salinity groundwater;　recharge resources quantity;　evaluation of agricultural irrigation water quality;　Tarim Basin;
【中文摘要】依据2002-2004年完成的"新疆平原区地下水资源调查与评价"成果,采用地下水资源模数法和GIS技术,确定了塔里木盆地平原区中盐度地下水(矿化度为2~3、3~5和5~7 g/L)的分布状况,分布面积为92 141.32 km2,占塔里木盆地平原区总面积的30.6%;计算了各流域、各地(州)中盐度地下水的补给资源量,总补给资源量为11.16亿m3/a。分别采用单指标法(盐度S、可溶性钠含量SSP、镁系数KMg、残余碳酸钠RSC和钠吸附比SAR)、综合危害系数K和灌溉系数Ka法对中盐度地下水的水质进行了全面的评价,得出了各流域、各地(州)中盐度地下水的灌溉适应性评价结果。
【英文摘要】In this paper,based on the results of Groundwater Resources Survey and Evaluation in Xinjiang Plain Areas(2002-2004),by using groundwater resources module method and GIS technology,the distribution of medium salinity groundwater(2 to 3,3 to 5 and 5 to 7 g/L) in plain area of Tarim Basin,Xinjiang is determined.The total area is 92 141.32 km2,accounting for 30.6% of total plain area of Tarim Basin.Recharge resources quantity of each basin and each prefecture were calculated,the total recharge is 11.16×108 m3/a.An evaluation of irrigation adaptability medium salinity groundwater is conducted by using the single index method,the synthetic harmful coefficient method and the irrigation coefficient method.

【题目】内陆干旱平原区水土资源开发与盐分再分布的关系
【中文关键词】水平排水; 水土资源开发; 盐分再分布; 内陆干旱平原区
【英文关键词】horizontal drainage; exploitation of soil and water resources; redistribution of salt; inland arid plain area;
【中文摘要】以新疆阜康市和哈密市典型水土开发区为例,利用典型剖面分层土壤含盐量及地下水水质的测试结果,分析开垦初期有水平排水和无水平排水条件下土壤及地下水中盐分再分布特征。结果表明:开垦初期的水平排水排盐过程,可以将垦区土壤历史时期积累的大量盐分排出农田,作物耕作层下部和地下水含盐量较低;而开垦初期未经历水平排水排盐过程,直接采用竖井灌排的垦区,历史时期积累在表层的盐分随地下水位下降而积累于作物耕作层以下和地下水中。
【英文摘要】By investigating the soil salt content and groundwater quality of typical profiles of soil and water development regions in Fukang City and Hami City of Xinjiang Uygur Autonomous Region, this study analyzed the redistribution characteristics of salt content in soil and groundwater under the conditions with or without horizontal drainage in the initial stage of reclamation. The results showed that many soil salts accumulated in the reclamation area could be discharged from the farmland under horizontal drainage conditions in the initial stages of reclamation, so the salt contents of soil and groundwater below the cultivated horizon were low; but in reclamation areas with shaft well drainage instead of horizontal drainage in the initial stages of reclamation, the salt in the surface stratum leached into the soil and groundwater below the cultivated horizon due to the descent of the groundwater level. © (2012) Trans Tech Publications, Switzerland.

【题目】我国咸水灌溉对作物生长及产量影响研究进展与展望

【中文关键词】咸水灌溉;生态环境;膜下滴灌
【英文关键词】saline water irrigation;ecological environment;drip irrigation under mulch
【中文摘要】 灌溉水资源的短缺已成为我国干旱半干旱地区农业持续发展的一个重要限制因素,微咸水资源的开发利用可有效地缓解灌溉水源短缺的问题。总结了国内咸水灌溉对作物生长与产量影响的研究进展,为合理利用咸水资源进行灌溉提供指导。从咸水资源灌溉利用现状来看,膜下滴灌为干旱半干旱地区有效利用微咸水资源以及盐碱地的开发利用提供了有效的手段。但利用膜下滴灌方式进行微咸水灌溉,目前仍存在一些问题,需要进一步研究。此外,如何从流域或区域尺度上评价微咸水灌溉对生态环境的影响,并从更大尺度维持盐分平衡及环境的可持续发展值得深入研究。
【英文摘要】The shortage of water resources in irrigation has become an important restraint factor in arid and semi-arid areas in China.The utilization of saline water is an effective way of easing up the shortage of water resources.Drip irrigation under mulch film is an effective way for utilization of saline water and salinized land in arid and semiarid areas.But researches on irrigation with saline water by way of drip irrigation under mulch film are less frequent.It is necessary to go on with the researches.In addition,for sustainable agricultural production,just like water balance,a salinity balance has also to be maintained at the irrigation system basin.

【题目】基于DRAV模型的塔里木盆地地下水脆弱性评价
【中文关键词】地下水; 脆弱性; DRAV模型; 塔里木盆地
【英文关键词】vulnerability ,DRAV model, Tarim Basin
【中文摘要】结合内陆干旱区地下水的特点, 在地下水脆弱性评价的GOD法和DRASTIC 模型的基础上提出DRAV模型, 对新疆塔里木盆地孔隙潜水的脆弱性进行了评价。结果表明: 塔里木盆地平原区地下水脆弱性指数在2~ 4、4~ 6、6 ~ 8和> 8的区域面积分别占塔里木盆地平原区总面积的10. 1%、80. 4%、9. 2%和0. 2%; 地下水脆弱性相对较高区域主要位于薄土层(包气带地表土壤层厚度为20~ 30 cm, 其下部主要为砂砾石)和粉细砂层灌区, 包气带中多缺失亚砂土和亚黏土, 灌溉水入渗补给量较大; 地下水脆弱性相对较低区域主要位于亚砂土和亚黏土层的非灌区, 基本不存在灌溉水的入渗补给, 大气降水补给也极其有限。
【英文摘要】According to the characteristics of groundwater in arid area, this paper proposes DRAV model for groundwater vulnerability assessment, where D is groundwater depth, R is the net recharge of aquifer, A is the aquifer characteristics, and V is the lithology of vadose zone. As a case study, the paper assesses the vulnerability of pore phreatic water in Tarim Basin of Xinjiang, China by using the DRAV model. The results indicate that the areas of phreatic water with vulnerability index ranges of 2-4, 4-6, 6-8 and >8 accounting for 10.1, 80.4, 9.2 and 0.2% of the total plain area of the Tarim Basin respectively, and the areas with the latter two vulnerability ranges (6-8 and >8) are mainly located in the irrigation districts with thin soil layer (20-30 cm thick surface soil of vadose zone, mainly with underlying sandy gravel) and with silty and fine sand layer. Such vadose zone generally lacks sandy loam and clayey soil and has larger recharge by infiltration of irrigation water. © 2009 Springer-Verlag.(32 refs)

【中文关键词】无
【英文关键词】groundwater quality, evaluation, one veto
【中文摘要】无
【英文摘要】The paper is based on the testing results of 386 groundwater samples acquired during period of April to August,2003. With Grade-III water resource area as the basic evaluating units, value of pH, total dissolved solids, total hardness, NH3-N、C6H5OH、CODMn and intestinal germ group – 7 factors were selected as evaluating criteria by following the “ GB/T14848-93 Groundwater Quality Standard ”. The classification of groundwater quality of these basic evaluating units are evaluated with One Veto Method. The formation causes of the water quality are concisely analyzed.

【题目】微咸水膜下滴灌灌溉制度试验研究
【中文关键词】微咸水; 膜下滴灌; 灌溉制度; 棉花; 水分生产率;
【英文关键词】saline water; drip irrigation under plastic film; irrigation system; cotton; water productivity;
【中文摘要】为了探讨科学合理的微咸水膜下滴灌灌溉制度,在新疆巴音郭楞蒙古自治州水利管理处国家重点灌溉试验站进行了不同灌溉定额、灌水频次的微咸水膜下滴灌大田试验。研究结果表明:①灌溉定额4500m3/hm2、灌水频次10次,灌溉定额3000m3/hm2、灌水频次7次,均有利于保持土壤水分。②当灌溉定额≤4500m3/hm2时,灌溉定额越大,土壤积盐越严重;在灌溉定额一定时,灌溉次数越多,土壤积盐越严重。③当灌溉定额≤4500m3/hm2时,灌溉定额越大,棉花产量越高,微咸水灌溉影响棉花产量的灌溉定额上限在4500m3/hm2左右;灌溉定额多时,灌水次数多棉花产量高,灌溉定额少时,灌水次数少棉花产量高。④灌溉水分生产率随着灌溉定额的增大而减小,在灌溉定额大时,采用少量多次灌溉,在灌溉定额小时,采用多量少次灌溉,均可提高灌溉水分生产率。⑤以节水、控盐和高产为优选标准,当地较为理想的微咸水膜下滴灌模式为灌溉定额3750m3/hm2、灌水次数20次、灌水间隔为7d。

【英文摘要】To establish a scientific irrigation system of drip irrigation under the plastic film with saline water,field experiments of different irrigation quota and irrigation frequency at key irrigation experiment station of water resources management division were carried out in Bayingolin,Mongol Autonomous Prefecture,Xinjiang.The results show that:(1)When the irrigation quota reaches 4 500m3/hm2,the irrigation frequency accounts for as much as 10times,while the smaller irrigation quota(3 000m3/hm2)amounts to the irrigation frequency of 7times,both of which are conducive to maintaining the soil moisture.(2) When the irrigation quota is≤4 500m3/hm2,the larger irrigation quota causes more serious soil salt accumulation.While with a constant the irrigation quota,the increasing number of irrigation frequency also leads to more serious soil salt accumulation.(3)When the irrigation quota was smaller than 4 500m3/ hm2,the larger irrigation quota gets the higher yield with brackish water irrigation quota limit around 4 500 m3/hm2,for it has a bigger impact of cotton production.Normally the bigger irrigation quota with greater irrigation frequency leads to higher yields,and vice versa.(4)The irrigation water productivity increases with the decrease of irrigation quota,and so a small amount of many times in large irrigation quota and a big amount of less times in small irrigation quota can both increase irrigation water productivity.(5)With water,salt and high yield as the optimal control standards,the ideal irrigation system of drip irrigation un-der the plastic film with saline water should be 3 750m3/hm2 of irrigation quota,20times of irrigation frequency and 7days of irrigation.

【题目】农田秸秆覆盖的土壤水分效应
【中文关键词】秸秆覆盖;腾发量;入渗补给;土壤水分通量法;水均衡
【英文关键词】straw mulch ;evapot ranspiration ;infilt ration recharge ; soil water flux met hod ;water balance
【中文摘要】以大水位埋深的栾城试验站为例,开展玉米秸秆覆盖及对照条件下冬小麦田间试验,运用土壤水分通量法和包气带水均衡的原理,分析了秸秆覆盖农田的土壤水分效应。结果表明在大水位埋深条件下,覆盖秸秆麦田的入渗补给量(165. 02 mm)小于不盖秸秆(192. 91 mm) ,作物腾发量和土壤水消耗量大于不覆盖处理,说明秸秆覆盖不利于降水、灌溉水的入渗补给,但可以抑制土壤水分棵间无效蒸发,增加作物蒸腾量,充分利用土壤水,从而提高土壤水分的利用效率,揭示了秸秆覆盖对农田土壤水分调控的机理,为干旱区推广秸秆覆盖技术提供了理论依据。同时,对大水位埋深条件下土壤水分通量法的适用性进行了探讨。
【英文摘要】In this paper,field experiments of winter wheat with or without cornst raw mulching are carried out at Luancheng Stationunder deep - water table depth. The soil water flux met hod and water balance met hod for unsaturated zone are used to analyze strawmulch ’ s effect on soil water in cropland. The result shows that when water table depth is deep ,the recharge amount with straw mulch(165. 02 mm) is smaller than that without straw mulch (192. 91 mm) ,but crop evapot ranspiration and the change of soil moisture during the growth of winter wheat were bigger. It indicates that straw mulch makes against the infiltration of precipitation and irrigation ,rest rains evaporation lo ss of soil water ,adds crop transpiration ,makes f ull use of soil water ,and use soil water effectively ,whichreveals t he mechanism of straw mulch for soil water control management . The study provides a theoretical foundation for applyingst raw mulch technique in arid regions. Meanwhile ,the application of the soil water flux met hod is discussed under deep water tabledepth.

【中文关键词】重金属元素;释放特征;盐酸浓度;振荡时间
【英文关键词】heavy metal;release characteristic; HCl concentration; shaking time
【中文摘要】采用河南省黄淮海平原典型农田土壤样品,开展了不同浓度盐酸(1,0.1,0.001,0.000 01 mol/L)和振荡时间(2,24,48,96 h)的土壤重金属元素提取实验,分析了盐酸浓度和振荡时间等对土壤重金属元素释放的影响,探讨了不同提取条件下土壤重金属元素的释放效果及其影响因素。研究表明:土壤Cr、Cu、Ni、Zn和Pb采用1 mol/L盐酸振荡48 h时萃取率显著高于其他处理,其中Pb的萃取率最高,土壤As采用1 mol/L盐酸振荡2 h时萃取率最高,碱性土壤Cd采用0.1 mol/L盐酸振荡2 h时萃取率最高。在此基础上,根据1 mol/L盐酸振荡2 h的提取结果,采用统计分析方法分析了土壤重金属元素全量、理化性质以及土壤类型对土壤重金属元素释放的影响,结果表明:土壤Cr全量越高,Cr萃取率越高;土壤干密度越大,Pb萃取率越高;土壤pH值越低,土壤Ni萃取率越高,而土壤Pb正好相反;土壤有机质对重金属元素萃取率无统计上的显著影响;Cu、As、Pb在碱性土壤(黄河流域)萃取率相对较高,而Cr、Ni、Zn在酸性土壤(淮河流域)萃取率相对较高;土壤类型对重金属元素释放的影响表现为砂姜黑土Cr,水稻土Cu、Ni、Zn,潮土As、Pb的萃取率相对较高。
【英文摘要】The samples were obtained from the typical cropland in Huanghuaihai Plain,Henan Province.Extraction experiments of soil heavy metals under different HCl concentration(1,0.1,0.001 and 0.00001 mol/L)and shaking time(2,24,48 and 96 h)were carried out to figure out the effects of HCl concentration and shaking time on the release of heavy metals.The extraction effect of the soil heavy metals and its factors were also analyzed.The results show that the extraction ratios of Cr,Cu,Ni,Zn and Pb by 1 mol/L HCl extraction for 48 h shaking were much higher than those in other treatments,and the extraction ratio of Pb was the highest among the heavy metals.The extraction ratio of As by 1 mol/L HCl extraction for 2 h shaking,of Cd from basic soil by 0.1 mol/L HCl extraction for 2h shaking were the highest.Based on the results above,statistical analysis was used to analyze the effects of total metal content,physical and chemical properties,soil types on the extraction ratios according to the extraction ratios by 1 mol/L HCl extraction for 2 h shaking.The results indicate that extraction ratio of Cr is higher when the total Cr content of the soil is higher,and extraction ratio of Pb is higher when the dry density of the soil is bigger.While the extraction ratio of Ni is higher when the soil pH is lower,but Pb is just on the opposite.The organic matter content of the soil has no statistically significant effect on the extraction ratio of the soil heavy metals;while extraction ratios of Cu,As and Pb are higher in basic soil(Yellow River basin),but extraction ratios of Cr、Ni and Zn are higher in acid soil and the extraction ratio of Cr in indicotic black soil,Cu,Ni and Zn in paddy soil,As and Pb in meadow soil are the highest.

【题目】膜下滴灌棉花根系发育特征及其与土壤水盐分布的关系
【中文关键词】膜下滴灌; 根系分布; 土壤水盐动态;
【英文关键词】mulch drip irrigation; root distribution; soil water-salt dynamics;
【中文摘要】为探讨膜下滴灌条件下水分和盐分对棉花根系空间发育的影响,在花铃期选择相同灌溉制度、咸淡水灌溉的两个膜下滴灌处理田块采集距滴灌带不同距离、不同深度上的根系样品144件。用1mm土筛和手拣将棉花根系从土壤中筛分出来,去除死根,冲洗干净后用扫描仪扫描成tif格式图像,再用DT-SCAN软件计算根长密度。对比分析发现膜下滴灌及盐胁迫条件下,咸水灌溉的根系分布范围较大,其总根长密度比淡水大31.69mm/cm3,根系生长深度也远大于淡水灌溉。咸水灌溉根系分布主要受盐分胁迫,淡水灌溉根系分布主要受水分胁迫。水平方向上距滴头40cm以远,水分胁迫对根系发育起主导作用。土壤体积含水率在20%以上、电导率在2000μs/cm以下时可以满足根系的正常生长发育。
【英文摘要】In order to understand the impact of water-salt on spatial development of cotton roots under mulch drip irrigation, 144 root samples were collected in the flower and boll stage for two different treatments irrigated with saline groundwater and fresh surface water using same irrigation system. Screening out cotton roots from the soil with 1 mm soil sieve and hand-picking, removing dead roots, scanning into a tif format images after washing, then the root length density was obtained through DT-SCAN software calculation. The results show that the distribution area of roots under mulch drip irrigation with saline water is larger and total root length density (31.69 mm/cm3) is bigger than that with fresh water. The depth of root for saline water irrigation is much greater than that with fresh water because of salt stress. Root distribution is mainly affected by salt stress under saline water irrigation; however, it is affected by water stress under fresh water irrigation. Water stress plays a leading role in root development 40 cm away from the emitter

at the horizontal direction. When the volumetric water content of soil is greater than 20 % and the electric conductivity is smaller than 2000 μs/cm, the root can grow and develop normally.

【题目】棉花微咸水膜下滴灌灌溉制度的研究
【中文关键词】微咸水,棉花,灌溉,膜下滴灌,灌溉制度
【英文关键词】saline water; cotton; irrigation; mulch drip irrigation; irrigation scheduling;
【中文摘要】为寻求微咸水膜下滴灌的最优灌溉制度,利用2008 和2009 年田间试验结果,从棉花生长和产量的角度出发,分析11 种灌溉处理各生育期的变化情况。测定了叶面积、干物质质量、棉花产量、土壤盐分等指标。结果表明:灌溉水量越大,棉花营养生长部分生长越快,生长时间越长;灌水盐分越高,盐分胁迫使生殖生长部分所占比例越大,越易衰老;试验区内灌溉定额3 750 m^3/hm^2(微咸水80%,淡水20%)的轮灌处理,2008 年棉花产量达到5 190 kg/hm^2,接近仅灌淡水5 250 m^3/hm^2 处理(5 205 kg/hm^2),该轮灌处理2008 年总盐为负增长(-0.95 g/kg),2009 年试验结果有力验证了该灌溉制度的节水增产、保护土壤环境的优越性。
【英文摘要】In order to obtain the optimal irrigation program of mulch drip irrigation with brackish groundwater,the growth and yield of cotton under 11 different irrigation treatments in 2008 and 2009 were analyzed in different reproductive periods.In this paper,the leaf area,dry matter,cotton yield and salt of soil were measured by WDY-500A micro-electron leaf area,oven drying method,artificial method,atomic absorption spectrometer and titration,respectively.These results showed the cotton vegetative growth became faster with increase of irrigation water;the proportion of reproductive growth was greater and easier to become old when the salinity of irrigation was higher.These results also indicated that rotation irrigation system(3 750 m3/hm2,80% brackish water and 20% fresh water) was the optimal one,whose yield reached 5 190 kg/hm2.Meanwhile,in 2008 the rotation irrigation system attained a negative growth(-0.95 g/kg) of total salt.And results of 2009 strongly demonstrated the superiority of the irrigation system.This rotation irrigation system will realize water conservation,increasing yield effectively and protection of soil environment.

【题目】新疆膜下滴灌土壤粒径分布及与水盐含量的关系
【中文关键词】土壤粒径分布; 水盐含量; 膜下滴灌; 分形分析; 多重分形; 质地三角;
【英文关键词】soil particle size distribution – soil water and salt – mulched drip irrigation – fractal analysis – multifractal analysis – textural triangle
【中文摘要】土壤粒径分布及空间变化是土壤重要的物理特性之一,对土壤水分和溶质运移、土壤侵蚀等有重要意义.研究选用新疆膜下滴灌试验田的563个土壤样品,利用激光衍射粒径分析仪分析土壤粒径分布,采用质地三角分类、分形和多重分形对土壤粒径分布进行研究,探讨土壤粒径特征及与水盐含量的关系.研究区土壤颗粒中粘粒含量偏低,平均值为1.52%,砂粒含量最大,粒径分布呈现复杂的单、双峰分布特征;土壤粒径分布的分形和多重分形与土壤颗粒含量的标准差及最大值有良好的相关性,可以较好地反映土壤粒径分布曲线.膜下滴灌对表层土壤盐分空间分布有较大影响,随着深度增加影响减弱;土壤质地与稳定状态下土壤水盐含量关系密切,特别是对土壤表层盐分聚集和深层土壤水分分布有显著影响.
【英文摘要】Soil particle size distribution (PSD), one of the most important soil physical attributes, is of great importance to soil water movement, soil erosion and soil solute migration. In this study, the soil PSD of 563 soil samples from the mulched drip irrigated

cotton fields in Xinjiang of China were measured by laser diffraction particle size analyzer. The soil PSD characteristics and its relations with soil water and salt were studied by using the combined methods of textural triangle, fractal and multifractal analysis. The results showed very low clay content (about 1.52%) while really high sand content of the studied soil, and a complex shape of bimodal or unimodal of soil PSD. The results also showed that the two indices, i.e., standard deviation and the peak value of soil particle relative volumes, were good indicators of soil PSD and thus had good relations with fractal and multifractal characteristics. The correlative analysis further indicated that the mulched drip irrigation had a significant impact on the distribution of the soil salt, while this impact withered for the deeper soil layer. The soil texture feature was found to dominate soil water and salt distribution, especially the surface soil salt content and the deep soil water content.

【题目】葡萄糖酸-δ-内酯诱导乳清蛋白冷凝胶对双歧杆菌的保护
【中文关键词】乳清分离蛋白; 冷凝胶; 葡萄糖酸-δ-内酯; 双歧杆菌; 保护;
【英文关键词】whey protein; cold-set gel; glucono- δ-lactone; bifidobacteria; protection;
【中文摘要】目的:探讨葡萄糖酸-δ-内酯(glucono-δ-lactone,GDL)诱导乳清分离蛋白(whey protein isolate,WPI)所形成的包含双歧杆菌的乳清蛋白冷凝胶(cold-set gels of whey protein containing bifidobacteria,CGWPCB)对双歧杆菌的保护作用。方法:通过酸耐受性实验评价CGWPCB对菌体的保护作用,借助扫描电子显微镜、物性仪和激光粒度仪观察凝胶结构,并考察CGWPCB在液态制品中的储藏稳定性。结果:0.30%GDL诱导5%WPI和6%WPI形成的颗粒状冷凝胶,在pH1.5的酸环境下对双歧杆菌的保护性最好,作用120min后菌落数下降两个数量级,菌体存活率分别达到1.7%和2.1%;而其在果汁中同样对菌体有很好的保护作用,在4℃条件下储藏56d后菌体存活率可达到43.9%。结论:制备出对双歧杆菌具有良好保护性且适用于液态产品的CGWPCB。 更多还原
【英文摘要】The cold-set gels of whey protein containing bifidobacteria (CGWPCB) were prepared in the presence of glucono- δ-lactone (GDL). Their protection effect on bifidobacteria was investigated by means of acid tolerance test, and the gel structure was observed using scanning electron microscope (SEM), texture analyzer and laser particle size analyzer. The results showed that the cold-set gel particles of 5% and 6% WPI solution induced by 0.30% GDL present the best protection effect, the numbers of bifidobacteria decrease by two order of magnitude, and the survival rates of bifidobacteria are 1.7% and 2.1%, respectively 120 minutes later in the acid condition of pH 1.5; both the survival rates of bifidobacteria are 43.9% after 56 days in fruit juice stored at 4 ℃. In conclusion, cold-set gels of WPI, which have protection effect on bifodobacteria, can be applied in liquid products

【题目】酸适应对一株乳酸乳球菌膜脂肪酸组成和膜蛋白表达的影响
【中文关键词】酸适应; 乳酸乳球菌; 脂肪酸; 应激蛋白; 存活率;
【英文关键词】acid adaptation; Lactococcus lactis; fatty acids; shock protein; survival rate;
【中文摘要】【目的】筛选具有较强酸适应能力的菌株,研究酸适应对其膜脂肪酸组成和膜蛋白表达的影响。【方法】从20株菌中筛选出一株具有较强酸适应能力的乳酸乳球菌KLDS4.0312,以GC-MS法测定该菌酸适应前后膜脂肪酸组成变化;对酸适应前后该菌膜蛋白的差异表达进行双向电泳分析。【结果】酸适应后,该菌膜不饱和脂肪酸含量从30.77%上升到42.93%,饱和脂肪酸含量从69.23%下降到57.07%,且有一种新的长链单不饱和脂肪酸C19:1-n6被诱导产生。酸适应过程中至少有65个蛋白质点表达出现显著差异,其中上调的蛋白质点有43个,减弱表达的蛋白质点有22个。而添加氯霉素后,菌株的

酸适应能力消除,可能与氯霉素抑制新蛋白的合成有关。【结论】说明细胞膜脂肪酸组成的适应性改变和应激蛋白的诱导产生是该菌主要的酸适应机制。 更多还原

【英文摘要】Objective Lactococcus lactis with high acid adaptive capacity was screened, and the influence of acid adaptation on membrane fatty acid profile and expression of membrane proteins were studied. Methods Lactococcus lactis KLDS4.0312 with high acid adaptive capacity was screened from 12 lactic acid bacteria and 8 Bifidobacterium. The change of the fatty acid profile in cell membrane of this strain was analyzed by gas chromatography-mass spectrometry, and two dimensional polyacrylamide gel electrophoresis method was used to analyze the differential expression of membrane proteins during the acid adaptation. Results After acid adaptation, Lactococcus lactis KLDS4.0312 increased the proportion of unsaturated fatty acids from 30.77% to 42.93% in its membrane lipids with a concomitant decrease in saturated fatty acids from 69.23% to 57.07%, and a new long-chained, mono-unsaturated fatty acid C19:1-n6 was induced. Compared with the non-adapted sample, there were at least 65 distinct protein points in the adapted sample, where 43 proteins were up-regulated and 22 proteins were down-regulated. But the acid adaptive capacity of Lactococcus lactis KLDS4.0312 was eliminated by adding chloramphenicol which can restrain the synthesis of new proteins. Conclusion These results showed that change in the membrane fatty acid profile by acid adaptation in Lactococcus lactis KLDS4.0312

【中文关键词】乳清蛋白; 冷凝胶; 盐诱导; 双歧杆菌; 保护作用;

【英文关键词】whey protein; cold-set gels; salt-induction; Bifidobacterium sp.; protection;

【中文摘要】探讨盐诱导乳清分离蛋白(whey protein isolates,WPI)形成的包含双歧杆菌的乳清蛋白冷凝胶(cold-set gels ofwhey protein containing bifidobacteria,CGWPCB)对双歧杆菌的保护作用。借助扫描电子显微镜和物性仪观察凝胶结构,评价以氯化钙为凝胶剂,形成的CGWPCB对双歧杆菌的保护作用。结果表明,7.5 mmol/L CaCl2诱导8%WPI形成的网络状冷凝胶,在pH 1.5的酸环境下对双歧杆菌的保护性最好,作用120 min后菌落数下降3个数量级,菌体存活率达到0.42%。说明制备的乳清蛋白冷凝胶对双歧杆菌有良好的保护性,为益生菌产品的开发和应用提供了参考。 更多还原

【英文摘要】The protection of salt-induced whey protein isolates(WPI) on Bifidobacterium was investigated.The protection on Bifidobacterium was determined by experiments of acid tolerance,and the gel structure was observed by scanning electron microscope and texture analyser.The results show that the network cold-set gels of 8% WPI solution induced by 7.5 mmol/L CaCl2 can give the best protection on bifidobactetrial cells with an acid condition of pH 1.5.The number of bifidobacterial cells decreases by three order of magnitude,and the survival rate of bifidobacteria is 0.42% by treatment in the acid condition of pH 1.5 for 120 minutes,which suggests better protection on bifodobacterial cells by cold-set gels of WPI can be achieved,and can provide a strategy in the development and application of probiotics

【题目】一株布氏乳杆菌所产类细菌素的初步纯化与部分特性

【中文关键词】布氏乳杆菌; 类细菌素; 纯化; 特性;

【英文关键词】Lactobacillus buchneri; Bacteriocin-like substance; Purification; Characteristics;

【中文摘要】从分离自内蒙古传统乳制品的67株乳酸菌中筛选得到一株产生类细菌素的布氏乳杆菌KLDS1.0364,对其所产类细菌素进行初步分离纯化,同时研究其所产类细菌素的生物学特性。KLDS1.0364无细胞发酵上清液经阳离子交换树脂纯化后,采用tricine-SDS-PAGE测定类细菌素分子量,并测定了类细菌素的部分特性。KLDS1.0364产生的类细菌素分子量约为21.6kD,对热和pH值稳定,可被多种蛋白酶失活,不能被过氧化氢酶和α-淀粉酶失活。KLDS1.0364产生的类细菌素的作用方式是杀菌,且抑菌谱广,可抑制多种革兰氏阳性菌、革兰氏阴性菌和真菌。 更多还原

【英文摘要】The purpose of this study is to obtain effective and stable bacteriocin-like substance from lactic acid bacteria. Lactobacillus buchneri KLDS1.0364,which was isolated from fermented cream,a traditional dairy product in Inner Mongolia,could produce bacteriocin-like substance. The bacteriocin-like substance produced by KLDS1.0364 was partially purified and the characteristics were studied. The bacteriocin-like substance was purified by SP-Sepharose fast flow cation exchange chromatography. The molecular weight of the bacteriocin-like substance was 21.6kD,as determined by tricine-SDS-PAGE. The bacteriocin-like substance remained stable after 30 min at 121°C and after 2 h of incubation during pH 2~10. Complete inactivation of antimicrobial activity was observed after treatment of the bacteriocin-like substance with several proteinases. Treatment with catalase and α-amylase did not result in any changes of antimicrobial activity. The mode of action of the bacteriocin-like substance is bactericidal. It exhibited a broad spectrum of antagonistic activity against various species of Gram-positive bacteria,Gram-negative bacteria and fungi.

【题目】Paenibacillus sp.K1 β-半乳糖苷酶基因的克隆及在大肠杆菌中的表达

【中文关键词】类芽孢杆菌; β-半乳糖苷酶;DNA文库

【英文关键词】Paenibacillus; β-galactosidase; DNA librar
【中文摘要】从鲜牛奶中分离到1株产-β galactosidase的细菌,经16S rDNA序列比对鉴定为类芽孢菌Paenibacillussp.K1。提取该菌株的染色体DNA,以pUC18(lac-)为载体,构建其DNA文库;在含有X-gal的LB平板上筛选该文库,得到6个蓝色菌落;对阳性克隆中插入的DNA片段序列测定,鉴定出1个编码全长为2 028 bp并携带有组成型启动子的β-半乳糖苷酶基因。将该基因导入大肠杆菌BL21(DE3)中,实现了β-半乳糖苷酶高效表达,其酶活为25.06 U/mL,高于原始菌株的4.55 U/mL,并进一步用亲和层析将该酶进行了纯化。
【英文摘要】A bacteria strain with β-galactosidase activity was isolated from fresh milk on LB plates containing X-gel.It was identified as Paenibacillus sp.K1 by 16S rDNA analysis.The genomic DNA library of Paenibacillus sp.K1 was constructed in Escherichia coli DH5α with the vector pUC18(lac-).A gene of β-galactosidase was obtained by sequencing a positive clone with potential β-galactosidase activity from the DNA library.The full length of the gene is 2028 bp.A constructive promoter was found upstream of the ORF(open reading frame).The overproduction of the β-galactosidase was carried out in E.coli BL21(DE3),and the β-galactosidase activity in E.coli was 25.06 U/mL,which was more than 4.55 U/mL in the wild strain of Paenibacillus sp.K1.This enzyme was purified using affinity chromatography.

【题目】产广谱细菌素乳酸菌的筛选
【中文关键词】乳酸菌;细菌素;抑菌试验
【英文关键词】Lactic acid bacteria; bacteriocin; antibacterial experimen
【中文摘要】利用牛津杯双层平板法从70株乳酸菌中筛选得到2株具有较高抑菌活性的乳酸菌LAB30、LAB211。研究这2株乳酸菌的抑菌物质发现:排除酸性产物乳酸、乙酸以及过氧化氢的干扰,LAB211和LAB30仍具有较高的抑菌活性;对其发酵液进行蛋白酶处理,LAB30的发酵液经胰蛋白酶和蛋白酶K处理后抑菌活性均有降低;而LAB211的发酵液经蛋白酶K处理后有所降低,胰蛋白酶处理没有变化,因此可以判定这两株乳酸菌产生的抑菌物质为细菌素。利用特异性引物PCR分析可知,LAB211和LAB30产生的细菌素并非nisin。抑菌谱实验表明,LAB30和LAB211的发酵液不仅抑制革兰氏阳性菌,而且对部分革兰氏阴性菌也有抑制作用。因此LAB211和LAB30产生的是一类广谱细菌素。
【英文摘要】LAB211 and LAB30 strains,which showed obvious micro-biostatic effects, were selected from 70 Lactic acid bacteria isolated from fresh milk using the agar diffusion method.The supernatants of LAB211 and LAB30 cultures eliminated the effects of organic acid and hydrogen peroxide,and still exhibited inhibitor activity against the gram-positive bacteria.However,the inhibitory activity of LAB30 stain decreased after treatment with protease K and trypsin,while the inhibitory activity of LAB211 strain decreased by treatment with protease K, which showed that this inhibitory material had the feature of protein.Thus,the inhibitory material produced by LAB211 and LAB30 could be classed as bacteriocin.PCR analysis showed that the inhibitory materials were not nisin.The inhibitory spectrum proved that the supernatants of LAB211 and LAB30 could inhibit not only gram-positive bacteria but also partial gram-negative bacteria.Therefore,these two wide inhibitory spectrum bacteriocin-producing Lactic acid bacteria strains were isolated.

【题目】利用PCR-DGGE技术分析微生态制剂在传代过程中的菌群变化
【中文关键词】微生态制剂; 变性梯度凝胶电泳; 传代培养; 菌群组成;
【英文关键词】microecological preparation; DGGE; subculture; microbial community;

【中文摘要】利用变性梯度凝胶电泳(denaturing gradient gel electrophoresis,DGGE)技术,结合传统平板培养法对实验室研制的1种由乳酸菌和芽孢杆菌组成的微生态菌剂WS-401及其在连续转接培养过程中细菌种群组成的动态变化进行分析。WS-401原液的活菌数为2×107cfu/mL,且细胞个体形态多样。将分离自原液的3株细菌进行DGGE分析,出现2种指纹谱带,对照标准的DGGE指纹图谱库和序列分析,分别被鉴定为蜡状芽孢杆菌(Bacillus cereus)和嗜热链球菌(Streptococcus thermophilus)。将该菌剂分别在LB和MRS两种培养基中30°C或37°C连续转接5次,DGGE分析每次转接后培养物的菌群组成,结果发现,随着转接次数的增加,微生物菌群的种类减少,在LB培养基中转接5次后优势菌群只有蜡状芽胞杆菌,而在MRS培养基中转接后优势菌群为植物乳杆菌(Lactobacillus plantarum)和类干酪乳杆菌(Lactobacillus paracasei)。由此说明,微生物的营养基质和培养条件对微生态制剂在传代过程中的菌群组成和动态变化有重要影响。

【英文摘要】Denaturing gradient gel electrophoresis(DGGE) technique combined with classical plate culture and sequencing of partial 16S ribosomal RNA(rRNA) genes were applied to examine microbial community changes of microecological preparation,which was coded as WS-401,composed of lactic acid bacteria and Bacillus sp.,and subjected to successive sub-cultured processes.The population of bacteria with a diverse morphology in WS-401 preparation was 2×107cfu/mL.Two types of band patterns appeared on DGGE gel for three strains of isolates,implying two different species.These isolates were identified as Bacillus cereus and Streptococcus thermophillus by comparison with identification ladder and sequence analysis.When the microecological preparation WS-401 was continuously sub-culturing for five times in medium LB and MRS medium and at 37 °C or 30 °C,respectively,microbial communities largely changed.The results show that Bacillus cereus is dominant in LB medium,while L.plantarum and L.paracasei are dominant in MRS medium.It was concluded that medium components and culture conditions have significant influences on microbial communities and species dynamic changes of microecological preparation.

【题目】Lactobacillus helveticus 9制备酪蛋白源活性肽工艺的研究

【中文关键词】酪蛋白; L. helveticus 9; 水解度; 肽产量

【英文关键词】casein; L. helveticus 9; degree of hydrolysis; peptides production

【中文摘要】基于酪蛋白水解度和多肽质量浓度数据,研究了接种量、培养时间、培养温度及底物浓度对瑞士乳杆菌菌株L.helveticus 9水解酪蛋白的影响。结果表明,L.helveticus 9对酪蛋白的水解作用的最佳条件为接种量为1×108 mL-1,底物质量浓度为50g/L,培养时间为48 h,培养温度为37°C;在此优化条件下,酪蛋白的水解度可达17.3%,多肽质量浓度达到0.62 g/L。显然,具有较高蛋白水解活力的菌株L.helveticus 9可以用于从酪蛋白中来制备潜在的生物活性肽。

【英文摘要】The present study examined the effects of Lactobacillus helveticus 9 with good proteolytic activity on peptides formation from casein degradation according to degree of hydrolysis and peptide concentration produced.It was seen that such factors as inoculums size,cultivation time and temperature,and substrate concentration were important in affecting the formation of casein-derived peptides.The optimum conditions for this strain to hydrolyze casein to peptides were inoculum level with 1×108 cfu/mL,5% of casein,and incubation at 37 °C for 48 h.The degree of hydrolysis reached 17.3%,and the concentration of peptides formed was 0.62 mg/mL after 48h due to the presence of this strain.It was clear that application of L.helveticus strain 9 with good proteolytic activity would provide a promising technology for the potential production of bio-activity peptides from casein.

【题目】类食品乳杆菌412对酸面团发酵的影响
【中文关键词】类食品乳杆菌412; 安琪酵母; 酸面团; 发酵;
【英文关键词】Lactobacillus paralimentarius 412; Anqi ’ s yeast; sourdough; fermentation;
【中文摘要】从酸面团中分离得到1株类食品乳杆菌(Lactobacillus parali mentarius)412,添加该菌株的面团在28°C发酵4h后的pH为5.2,发酵24h后pH为3.5;而添加商业化安琪酵母发酵的面团在28°C发酵4h后的pH为5.9,发酵24h后pH为5.2。类食品乳杆菌412与安琪酵母(接种量为107CFU/g)联合发酵测定表明,若菌株412起始接种量为109CFU/g,则面团在28(C发酵24h后的滴定酸度为0.76%(滴定酸度以乳酸计,%为质量分数);若菌株412的起始接种量是108CFU/g或107CFU/g时,则面团在28°C发酵24h后的滴定酸度为0.57%。当向面团添加6.75g/kg的葡萄糖或蔗糖可以促进类食品乳杆菌412的生长。面团在28°C发酵12h后,添加葡萄糖可以使菌株412的细胞数量从起始的2×108CFU/g提高到2.5×1010CFU/g,添加蔗糖则可以使其细胞数量提高到2.6×1010CFU/g;而添加果糖的面团在28°C发酵12h,菌株412的细胞生物量仅3.8×108CFU/g。与25(C或32°C发酵条件相比,28°C下发酵的酸面团中类食品乳杆菌412和安琪酵母菌的活菌数都比较高,且面团酸化速率高于单独采用安琪酵母菌发酵的面团。结果证明,类食品乳杆菌412能够单独或与商业化的安琪酵母联合应用到酸面团发酵中,并对面团的酸化起到积极促进作用。
【英文摘要】Lactobacillus paralimentarius 412 as a food-grade microorganism was isolated from a traditional sourdough collected from Handan Area,Hebei Province,China.With Lactobacillus paralimentarius 412 added to sourdough,the pH was 5.2 when fermented for 4h at 28°C and 3.5 after 24h incubation.However,pH in dough inoculated with Anqi ’ s yeast was only 5.9 after 4h and 5.2 after 24h incubation at 28°C.Moreover,the combined fermentation of L.paralimentarius 412 with Anqi ’ s yeast(containing 10 7 CFU/g)indicated,if the initial cell concentration of strain 412 was 10 9 CFU/g,the titratable acidity of sourdough fermented for 24h was 0.76%,while the titratable acidity of sourdough was 0.57% if the initial cell counts of 10 7 CFU/g or 10 8 CFU/g were inoculated into the dough.Adding 6.75g/kg saccharose or glucose to dough increased the cells of strain 412 from 2×10 8 CFU/g to 2.5×10 10 CFU/g or 2.6×10 10 CFU/g after 12h incubation,respectively.When the sourdough was fermented for 12h at 28°C,addition of glucose increased the cells of strain 412 from 2×10 8 CFU/g to 2.5×10 10 CFU/g.Addition of saccharose can increase the cells of strain 412 to 2.6×10 10 CFU/g and addition of fructose to dough leads to lower viable cells of strain 412 with 3.8×10 8 CFU/g after 12h incubation.Compared to 25°C or 32°C,fermentation temperature of 28°C not only improved the viable cells of strain 412 and Anqi ’ s yeast,but also favored the acidification of sourdough quickly.It was clear that L.paralimentariu 412 would be promising in improving sourdough fermentation alone or in combine with the commercial Anqi ’ s yeast.

【题目】Molecular cloning and analysis of the tryptophan oxygenase
【中文关键词】无
【英文关键词】eye pigmentation, Lepidoptera, vermilion gene
【中文摘要】无
【英文摘要】A Bombyx mori L. (Lepidoptera: Bombycidae) gene encoding tryptophan oxygenase has been molecularly cloned andanalyzed. The tryptophan oxygenase cDNA had 1374 nucleotides that encoded a 401 amino acid protein with anestimated molecular mass of 46.47 kDa and a PI of 5.88. RT-PCR analysis showed that the B. mori tryptophan oxygenasegene was transcribed in all examined stages. Tryptophan oxygenase proteins are relatively well conserved amongdifferent orders of arthropods.

【题目】辽宁绒山羊毛囊群结构的研究
【中文关键词】:Liaoning cashmere goat ;follicle group st ructure ;follicle density
【英文关键词】辽宁绒山羊;毛囊群结构;毛囊密度
【中文摘要】辽宁绒山羊的产绒性能与其皮肤毛囊结构是密切相关的。通过组织切片技术观察辽宁绒山羊皮肤毛囊结构,并对获得的数据进行最小二乘均数分析,研究了辽宁绒山羊羔羊不同月龄,不同季节毛囊密度和S/ P 值的变化及出生类型,母羊年龄对毛囊性状影响。结果表明,辽宁绒山羊的毛囊群主要是由3 个初级毛囊和若干个次级毛囊组成的三毛群,三毛群占毛囊群总数的75 %左右。次级毛囊呈楔形群排列在中心初级毛囊和外周初级毛囊中间,随着羔羊月龄的增长,毛囊密度逐渐下降,S/ P 值逐渐上升,S/ P 在6 月龄达到最大值。成年羊初级毛囊密度季节间变化不大,次级毛囊密度和S/ P 值表现出明显的季节变化,4 月份次级毛囊密度和S/ P 值最小,9 月份次级毛囊密度和S/ P 值最大。
【英文摘要】Differences of follicle density and S/ P among different months of age in young goat s and among seasons of yearin adult goat and effect s of age ,birth type and mother ’ s age on follicle t rait s were studied in this paper. Follicle group was con2sisted of three primaries and a varying number of secondaries with a wedge2shaped group among cent ral and lateral primaries ,Rate of t ri2group was about 75 %. With increase of age ,S/ P increased with a maximum at 6 months of age and follicle densitydecreased. There was no obvious changes among seasons in primary density of adult goat s. But there were significant differencesamong seasons in secondary density and S/ P of adult goat with a maximum at September and a minimum at April.

【题目】家蚕基因组DNA甲基化分析
【中文关键词】家蚕; DNA甲基化; 甲基化敏感扩增多态性
【英文关键词】B om b yx m o ri; DNA m e thyla tion; M e thyla tion2s e ns itive amp lific a tion p o lym o rp h ism
【中文摘要】DNA甲基化在生物的基因表达调控与发育调节过程中具有重要作用。应用甲基化敏感扩增多态性(MSAP)技术对7个家蚕保存品种的胞嘧啶甲基化模式和程度进行评估。在所能检测的CCGG序列中,至少有816%~1019%的胞嘧啶发生了甲基化; 12对引物共获得1 156条扩增带,其中376条在品种间呈多态性,多态性比例为3215%。结果显示:家蚕基因组可检测到DNA甲基化,各品种间的甲基化模式存在差异, CCGG序列中胞嘧啶外部甲基化(1019%)高于内部甲基化(816%) 。

【题目】膳食纤维微胶囊化包埋益生菌的研究
【中文关键词】膳食纤维; 嗜酸乳杆菌; 微胶囊; 益生菌;
【英文关键词】dietary fiber; Lactobacillus acidophilus; microencapsulation; probiotics;
【中文摘要】酸碱-酶结合法从麦麸中提取出膳食纤维,得出最佳提取工艺:淀粉酶0.5%,60℃,1%NaOH,碱解100min。以活化的嗜酸乳杆菌(Lactobacillus acidophilus)与可溶性膳食纤维作为芯材,不溶性膳食纤维与海藻酸钠、明胶作为壁材制成微胶囊,进行崩解耐受性试验。结果表明,壁材(不溶性膳食纤维0.5g+3%明胶：2%海藻酸钠=1：1):芯材(50%可溶性膳食纤维：嗜酸乳杆菌菌液=1：1)按1：1的比例制成的微胶囊可明显提高益生菌(嗜酸乳杆菌)的存活能力和活性。
【英文摘要】An optimal process was established to extract dietary fiber from wheat bran. Following the pre-treatment of 0.5% amylase, dietary fiber reached 61.4% of total wheat bran treated with 1% of NaOH solution at 60 °C for 100 min. Then the soluble dietary fiber plus Lactobacillus acidophilus NCFM cells (50% of soluble dietary fiber: Lactobacillus acidophilus = 1:1) were used as a core material, and insoluble dietary fiber in combination with sodium alginate and gelatin(0.5 g insoluble dietary fiber plus 3% gelatin: 2% sodium alginate=1:1) as wall material. The core material was blended with wall material in the ration of 1:1 to form the dietary fiber-based microencapsulated cells.

【题目】弱化H~+-ATPase的德氏乳杆菌乳酸亚种的生理特性研究
【中文关键词】德氏乳杆菌乳酸亚种L5; 弱化H+-ATPase; 生理特性
【英文关键词】Lactobacillus delbrueckii subsp.lactis L5; reduced H+-ATPase activity; physiology characteristic;
【中文摘要】以德氏乳杆菌乳酸亚种(L5)为出发菌株,以新霉素为选择"压力",获得了弱化H+-ATPase变异菌株5M1、5M6和5B1。与出发菌株L5(对照)相比,各变异株的H+-ATPase活力分别下降51.3%、27.7%和34.3%。对变异株5M1、5M6和5B1的形态及其生理特性研究表明,变异株的细胞较菌株L5细长。L5的ATP含量为0.63×10-18mol/个,明显低于变异菌株;变异株5M6和5B1的ATP含量分别为1.18×10-18mol/个和1.38×10-18mol/个;变异株5M1的ATP含量最高,约为1.60×10-18mol/个。当各菌株在MRS培养基中37°C培养12 h后,变异株表现出较高的谷氨酸到γ-氨基丁酸的转化率,其中变异株5M6最高,为16.73%,变异株5M1和5B1谷氨酸转化率居中,分别为15.6%和15.4%,出发菌株L5的谷氨酸转化率最低,为13.91%。与出发菌株L5相比,变异株5M6、5M1和5B1的H+-ATPase活性下降导致其耐酸性和耐盐性降低。
【英文摘要】Three mutant strains(5M6,5M1 and 5B1) obtained from Lactobacillus delbrueckii subsp.lactis L5 and grown in MRS medium,which contained a lethal concentration of neomycin sulfate,showed reduced H+-ATPase activity.The membrane-bound H+-ATPase activities of 3 mutant strains were reduced by 51.3% for 5M6,27.7% for 5M1 and 34.3% for 5B1 respectively.Cell shapes of the mutant strains 5M6,5M1and 5B1 were slenderer than that of the parental strain L5.Physiological performance indicated that the ATP level of the parental strain(0.63×10-18mol/cell) was lower than that of the mutant strains.The conversion rate of glutamic acid(GA) to γ-aminobutyric acid(GABA) by parental strain L5 cultured in MRS at 37 °C for 12 h was 13.91%.The conversion rates of GA to GABA were 16.73% in mutant strain 5M6,15.6% in mutant strain 5M1 and 15.4% in mutant strain 5B1.The parental strain L5 transformed 13.91% GA to GABA. It was proved that the parental strain showed more acid and salt resistance than its mutant strains in an extended growth period.

【题目】辽宁绒山羊皮肤毛囊细胞凋亡特点的研究
【中文关键词】:辽宁绒山羊;毛囊;细胞凋亡
【英文关键词】Liaoning Cashmere goats;hair follicle;apoptosis
【中文摘要】:采用TUNEL法在一个生物年的周期内每隔两月对绒山羊体侧部的皮肤毛囊进行检测,观察毛囊细胞凋亡的周期性变化特点。结果表明,控制毛囊生长变化的凋亡细胞是成簇分布的,毛乳头的成纤维细胞很少有凋亡现象,细胞凋亡与毛囊周期性生长具有相关性,兴盛期毛囊凋亡细胞减少,退行期凋亡细胞显著增多。常年长绒型与季节长绒型品系在一年内的凋亡细胞变化情况基本一致,只是常年长绒型品系在兴盛前期的细胞凋亡明显低于季节长绒型品系。
【英文摘要】TUNEL method was adopted for vertical and longitudinal slip section of hair follicles,which were from lateralpart of Liaoning Cashmere goats during ayear in different months,two months as an internal.The results indicated that thedead cells which controlling growth of hair follicle were clustering disposed,the phenomenon of apoptosis on mechanocyte ofhair papilla was hardly found.The correlation between cycling of growth and apoptosis of hair follicle was found.The cells ofapoptosis decreased during anagen,the cells of apoptosis increased prominently.The trend of changing on apoptosis of hair follicle,from the two types of Liaoning Cashemere goats,was coincidence fundamentally,compared with seasonal type,only thequantity of apoptosis cells were fewer before anagen.

【题目】应用交叉拮抗法筛选产细菌素菌株的试验研究
【中文关键词】细菌素; 明串珠菌; 乳酸片球菌;
【英文关键词】bacteriocin; Leuconostoc; Pediococcus acidilactici;
【中文摘要】应用交叉拮抗法从明串珠菌和片球菌菌株中筛选产细菌素菌株,获得了4株具有明显抑菌效果并对蛋白酶敏感的菌株,分别为乳酸明串珠菌9、乳酸片球菌、肠膜明串珠菌WZ30-2和肠膜明串珠菌WZ-9-2菌株。
【英文摘要】Bacteriocins produced by lactic acid bacteria as biological preservation have received more attention in recent years. As food-graded microorganisms, Leuconostoc and Pediococcus strains play an important role in modern food production. The ability of some strains from these two LAB to produce bacteriocins to be used potentially as biological agent according to recommended methods was investigated. It was proved that 4 strains from Leuconostoc (Leuconostoc lactis 9, Leuconostoc pseudomesenteroides WZ-9-2 and Leuconostoc mesenteroides subsp. dextranicum WZ30-2) and Pediococcus acidilactici produced bacteriocin-like compounds which were sensitive to proteinase K in MRS medium incubated at 37 °C for 12 h.

【题目】两种抽提家蚕基因组DNA 方法的比较
【中文关键词】家蚕; 基因组; DNA 抽提
【英文关键词】Silkworm; Genomic; DNA isolation
【中文摘要】基因组DNA 是开展分子生物学研究的基础工作,而抽提方法繁多。为此,本研究主要对蛋白酶K、CTAB 法进行了系统的分析比较,结果发现两种方法抽提的DNA 均能满足一般的PCR 分析, CTAB 法抽提耗时较短,但的蛋白酶K 抽提法DNA 得率更高,且不同的缓冲液对抽提效果有一定影响。这为今后广泛开展家蚕分子生物学研究有一定的参考作用。
【英文摘要】Extracting genomic DNA is considered to be the basic work for molecular biology research.Methods involved of Proteinase K or CTAB for extraction genomic DNA from Bombyx mori werecompared systemically in present paper. Results showed that both can be used as template for PCRanalysis. Time was saved by CTAB method while more DNA was acquired by Proteinase K. Moreover,quality of extraction DNA by buffer Ⅱ was better than the else when using Proteinase K method. Thismay provide help for the later molecular research on silkworm.

【题目】保加利亚乳杆菌胞外多糖合成条件优化及其在发酵乳中的应用研究
【中文关键词】保加利亚乳杆菌; 胞外多糖; 合成条件;
【英文关键词】Lactobacillus delbrueckii subsp.bulgaricus; exopolysaccharide(EPS); synthesis condition;
【中文摘要】研究了不同碳源、氮源、碳氮比及发酵条件等因素对保加利亚乳杆菌Y5菌株产胞外多糖的影响。结果表明,以果糖为碳源时,胞外多糖的产量是55.46 mg/L,显著高于用半乳糖作为碳源时的产量(29.59 mg/L);以鱼蛋白胨作为氮源为时,胞外多糖产量可达到46.89 mg/L,明显高于用胰蛋白胨作为氮源时的产量(P<0.01);当碳氮比为2∶1时,Y5菌株产生的胞外多糖最多,可达50.10 g/L,显著高于碳氮比为1∶2时的产量(P<0.01)。培养温度为40°C,发酵时间为16h,初始pH值为6.0,葡萄糖添加量为2%的发酵条件是Y-5菌株产胞外多糖的最佳工艺条件,其胞外多糖水平可达105.36 g/L。与采用ST和LB菌株的发酵乳相比,应用Y5菌株生产的发酵乳,其乳清析出量仅为7 mL(P<0.01);冷藏30 d后,Y5菌株制备的发酵乳仍能维持107 mL-1以上的活菌数,明显高于对照菌株的存活数量(P<0.01)。
【英文摘要】The factors,including carbon and nitrogen sources,the ratio of C to N,temperature,incubation time and initial pH in medium affecting the level of exopolysaccharides(EPS) produced by Lactobacillus delbrueckii subsp.bulgaricus Y5 were studied.Strain Y5 preferred fructose to galactose as carbon source in producing EPS(P<0.01).In the presence of fructose,EPS formed by strain Y5 reached 55.46mg/L;whereas in the presence of galactose,EPS was 29.59 mg/L.EPS production by strain Y5 was higher in the presence of fish peptone than in the presence of tryptone,and reached 46.89 mg/L.Clearly,a 2:1 of C to N was better than a 1:2 of C to N in improving strain Y5 to produce EPS with 50.10 mg/mL.The combinations of temperature at 40 °C,16h of fermentation time,initial pH in 6.0 and supplemented glucose of 2% significantly improved EPS production,up to 105.36 g/L.Use of strain Y5 to manufacture fermented milk produced significantly lower whey separation than strains ST and LB did(their fermented milks used as the control),and the amount of whey separated was only 7 mL.The live cell counts of strain Y5 decreased slowly during a 30 d refrigerated storage at 4 °C,but were higher than 107 mL-1 and were significantly improved compared to those of the controlled samples.

【题目】辽宁绒山羊胎儿发育的初步研究
【中文关键词】辽宁绒山羊,胎儿,生长发育
【英文关键词】Liaoning cashmere goats, fetus, growth and development
【中文摘要】了解辽宁绒山羊胎儿期的发育过程对于指导其妊娠期和生后饲养管理及培育具有重要的一样。因此,分别对妊娠后45、60、75、90、105、135天的辽宁绒山羊胎儿外形、体尺体重及部分器官发育速度进行了测定,获得了如下研究结果:辽宁绒山羊的胎儿在45日龄时已经具备其固有体型;135日龄时其形态、机体的所有器官均已发育完全; 135日龄的胎儿体重、体尺已经接近出生羔羊;胎儿在90胎龄前,绝对增重不大,但相对体重增长快速;90胎龄后绝对增重加快,尤其是120胎龄后,日增重可达40-80g,说明辽宁绒山羊与其他羊一样胎儿发育主要以后3个月为主;胎儿器官的发育速度与相应器官的生理机能是密切相关的,凡是代谢旺盛的器官得以优先发育;胎儿的粗毛在105天时,已经开始全部生长于皮肤之外,而山羊绒则是在120天开始出现,在135天时能够覆盖全身。
【英文摘要】It was great significance that understanding the fetal development of Liaoning cashmere goats for guiding the management and cultivate during pregnancy and after birth. Therefore, the fetus shape, body size, body weight and some organs in the

growth rate were measured on 45,60,75,90,105,135 day of gestation. We had obtained the following results: the fetus at 45 days of age had own inherent size; its shape and all the organs of the body have been developed completely in 135 days of age. The 135-day-old fetal weight and body size are close to a born lamb. The absolute growth was not evident before 90 day of gestational age, but the relative growing weight had a rapid development. The absolute growth was picking up after 90 day of gestational age. The average daily gain would get to 40-80g especially 120 day of gestational age. It said that the fetus growing of Liaoning cashmere goats was the same of other goat. The fetal development is concentrated in the past three months. The speed of and physiological functions of fetal organ was closely relation. Organs of metabolism had priority development. The coarse hair of the fetus on 105 days, the whole had grown up. The cashmere began to appear on 120 days. The whole body was covered on 135 days.

【题目】β-catenin在辽宁绒山羊皮肤毛囊中表达的研究
【中文关键词】β-catenin;毛囊;发育;辽宁绒山羊
【英文关键词】β-catenin; Liaoning cashmere goats skin; Gene expression
【中文摘要】β-catenin是Wnt信号途径中的重要调控因子,对毛囊细胞的生长、分化、运动、凋亡的调节都具有重要的作用。采用荧光定量PCR方法检测45日龄、365日龄、730日龄的辽宁绒山羊皮肤中β-catenin mRNA表达量,分析其在不同日龄辽宁绒山羊皮肤上的表达差异。研究结果表明:β-连环蛋白在不同年龄辽宁绒山羊皮肤中均有表达。45日龄的β-catenin基因mRNA表达量极显著(P<0.01)地高于365日龄(周岁)和730日龄(2周岁)的表达量,而365日龄(周岁)与730日龄(2周岁)间β-catenin基因mRNA表达量则差异不显著(P>0.05)。说明β-catenin在绒山羊皮肤毛囊的发育和成熟过程中发挥重要作用。
【英文摘要】β-catenin is an important catenin, it plays an important role in growth and development, organizational function of organisms. In order to study the expression of β-catenin in the different ages Liaoning cashmere goat skin, in this experiment, 45 days old, 1 year old, 2 years old Liaoning cashmere goat skin used as experimental materials, to extract of their total RNA,obtaining cDNA by reverse transcription,the obtained cDNA as the template, using PCR technology to amplify the β-catenin,finally,using the fluorescence quantitative PCR reaction for quantitative analysis of target gene expression. The experimental results show that: β-catenin expression in the Liaoning cashmere goats skin in different age groups.Expression levels in the 45 days of age and 1 years old difference is highly significant(P<0.01),1 year old and 2 years old difference was not significant(P>0.05), 45 days and 2 years old difference is highly significant(P<0.01).

【题目】基于AFLP的家蚕性连锁平衡致死系Z染色体连锁分子标记筛选
【中文关键词】家蚕;性平衡致死系;AFLP;分子标记
【英文关键词】silkworm, balanced sex-linked lethal strain, AFLP, molecular marker
【中文摘要】平48(以下简称P48)是通过转育方法将性连锁平衡致死系的群体性比控制基因转移到白云品系培育而成的。本研究以P48与白云(BY)这对近等位基因系为分析材料,利用AFLP筛选并分析差显标记,经PAGE电泳、片段回收、克隆、测序及与家蚕(P50)基因组数据库序列比对发现家蚕性连锁平衡致死系Z染色体特异性连锁标记C094,该标记与P50的对应序列间存在明显差异。进一步设计差异引物对P48与P50及其杂交F1代进行PCR验证,确定C094标记与家蚕性连锁平衡致死系P48 致死基因l1连锁,这为进一步鉴定及克隆致死相关基因奠定了基础。
【英文摘要】Silkworm Ping48 strain (short for P48), which is obtained by transforming of group sex ratio-controlled letal genes into normal strain Baiyun, is a near isogenic line with Baiyun strain. P48 and Baiyun strains were analyzed by amplification fragment length polymorphism (AFLP) in present paper for screening the Z chromosome markers in silkworm sex-linked balanced lethal strain. C094,

one Z linked marker, was found by DNA retrieving, cloning, sequencing, and blasting silkworm (P50) whole genome database on NCBI. PCR primers were designed to perform the difference identification among P48, P50, and their F1 hybridization. Results showed that C094 marker was genetically linked with l1 lethal gene in silkworm balanced sex-linked lethal strain. This benefits the characterizing and cloning of lethal related genes in silkworm sex-linked balanced lethal strain.

【题目】不同药物处理对辽宁绒山羊血液生理生化指标的影响
【中文关键词】辽宁绒山羊;褪黑素;环磷酰胺;血液生理生化指标
【英文关键词】Liaoning Cashmere goat; melatonin; Cyclophosphamide; blood physiological and biochemical indexe
【中文摘要】探讨不同药物处理对辽宁绒山羊血液生理生化指标的影响。选用健康的4 岁辽宁绒山羊母羊12 只,随机分为4 组。第1 组为对照组,第2,3 组皮下埋植褪黑素(60mg · 只-1),第3,4 组肌肉注射环磷酰胺(26mg · kg-1)[1]。分别于试验开始后0,30,50d 采集血液样本进行检测。血常规指标测定结果表明:试验2,3 组白细胞数量下降且差异显著(p<0.05),各组平均血红蛋白含量降低,组间差异不显著。对照组和试验3 组血清总胆固醇呈降低趋势,50d 与0d 相比分别降低21%和45%,试验1 组1 与试验2 组呈升高趋势,50d 与0d 相比分别升高10%和47%。各试验组甘油三酯和血清总蛋白含量降低,钙、磷含量升高。结果表明,埋植褪黑素可导致绒山羊白细胞数和红细胞数升高,环磷酰胺具有提高白细胞数量的作用,两种药物单独或共同作用对其他血常规指标的影响没有表现出规律性;褪黑素、褪黑素+环磷酰胺可提高血清中总胆固醇、钙和磷含量水平;褪黑素、环磷酰胺、褪黑素+环磷酰胺可降低血清中甘油三酯、总蛋白的含量水平。
【英文摘要】The aim of this study is to investigate the effect of different drugs on blood physiological and biochemical indiees inLiaoning Cashmere goats. Twelve healthy four-year old female Liaoning Cashmere goats were divided into four groups randomly.The first one was the normal control group, the second and third groups were subcutaneously implanted by melatonin (60mg/each),and the third and fourth groups were administered with cyclophosphamide (26mg · kg-1) by muscle injection. Blood sampleswere collected at three time points: 0d, 30d and 50d after administration, and blood physiological and biochemical indices weredetermined. According to the blood biochemical indicator, the leukocyte number of group Ⅱ and Ⅲ got lower and hadsignificant difference(p<0.05), the average level of hemoglobin was reduced in every group but the differences were not significantbetween them.Compared to the 50 day and 0 day, the total cholesterol of serum seemed to decrease in the control group and thegroup Ⅲ, decreased 21% and 45% separately, but the group Ⅰ and group Ⅱ seem to increase, about 10%, 47% each. The levelof triglyceride and total serum protein was decreased in the test groups, but the level of calcium and phosphor was increased.Results showed that leukocyte number and erythrocyte number increased after subcutaneous administration of melatonin,cyclophosphamide increased the leukocyte number, but other indices of routine blood had no regularly change when the twokinds of medication played a part alone or at the same time. Melatonin, melatonin combining with cyclophosphamide couldincrease the level of total cholesterol, calcium and phosphorus in serum. Melatonin, cyclophosphamide, melatonin combining withcyclophosphamide could reduce the level of triglyceride and total protein in serum.

【题目】药物脱绒对辽宁绒山羊血清激素及酶水平的影响

【中文关键词】辽宁绒山羊;褪黑素;环磷酰胺;激素;酶
【英文关键词】Liaoning Cashmere goat;melatonin;cyclophosphamide
【中文摘要】将12只4岁雌性健康辽宁绒山羊,随机分为4组,分别为对照组、埋植褪黑素(每只60mg)组、埋植褪黑素(每只60mg)+注射环磷酰胺(26mg·kg-1)组及注射环磷酰胺(26mg·kg-1)组,分别于试验开始后0、30和50d采样,检测血清激素及酶水平,以分析药物脱绒对辽宁绒山羊血清激素及酶水平的影响。结果表明,褪黑素可提升辽宁绒山羊血清α-淀粉酶(A-AMY)、碱性磷酸酶(ALP)的水平,降低肾上腺皮质激素(ACTH)、皮质醇(Cor)、表皮生长因子(EGF)、血清肌酸磷酸激酶(CPK)的含量;环磷酰胺可提升CPK、A-AMY、Cor的水平,降低碱性磷酸酶(ALP)、褪黑素(MT)的含量。说明,埋植褪黑素可以在一定程度上降低环磷酰胺脱毛引起的应激反应。
【英文摘要】Abstract:This study was to examine effects of depilation by drugs on blood hormone and enzyme levels ofLiaoning Cashmere goat.Twelve four-year-old female Liaoning Cashmere goats were divided into fourgroups randomly,in which control group was without any treatment,group Ⅰ was treated with subcutaneous implantation of melatonin(60mg·goat-1),groupⅡ was subcutaneous implantation of melatonin plusinjected muscularly with cyclophosphamide(26mg·kg-1),and groupⅢ was only injected with cyclophosphamide(26mg·kg-1).To determine the levels of several serum hormones and enzymes,blood samplesof goats were collected and tested at 0,30and 50dafter treatments.Results obtained from the studyshowed that subcutaneous implantation of melatonin increased the levels of alpha amylase(A-AMY)andalkaline phosphatase(ALP),but reduced the levels of adrenocorticotrophic hormone(ACTH),cortisol(Cor),epidermal growth factor(EGF)and creatine phosphokinase(CPK).Injection of the cyclophosphamide increased the levels of creatine phosphokinase,alpha amylase and cortisol,and reduced the levels ofalkaline phosphatase and melatonin(MT).

【题目】Lead Application for the Stimulation of Fusaricidin Type Compounds by Paenibacillus polymxa SQR-21
【中文关键词】无
【英文关键词】Fusaricidin,Paenibacillus polymyxa SQR-21
【中文摘要】无
【英文摘要】Paenibacillus polymyxa strains produce fusaricidin type compounds that are activeagainst a wide variety of Gram-positive bacteria and fungi. Growth and production of fusaricidin type antifungal compounds by P. polymyxa SQR-21 were compared in tryptone broth supplemented with three concentrations (200, 400 and 600 μM) of lead. The data revealed that the growth of P. polymyxa increased by 7-34 % and fusaricidin type compounds production increased by 15-70 % with the increase in concentration of lead ion (Pb2+). The increase in Pb2+ concentration, decreased the intracellular carbohydrate contents but increased the intracellular protein and lipid contents, however, higher levels of Pb2+ inhibited the intracellular protein and lipid contents. On the other hand, extracellular protein contents were decreased and extracellular polysaccharide contents were increased with the increase in Pb2+ contents in liquid culture. In addition, the regulatory effects of lead were also reflected by decrease of total RNA and increase of relative expression of the six module-containing nonribosomal peptide synthetase (FusA) when the lead treated experimental samples were compared with the untreated controls. The Pb2+ seems to be directly or indirectly correlated with the production of fusaricidin type antifungal compounds. This information will aid in developing fermentation technology for maximum antibiotic production.

【题目】中国绒山羊的毛囊结构特性与发育机制
【中文关键词】绒山羊;毛囊性状;毛囊群结构;发育;调控机制
【英文关键词】cashmere goat; follicle traits; follicle group structure; development; regulating mechanism
【中文摘要】绒山羊业是中国畜牧业的重要组成部分,其皮肤次级毛囊所产的山羊绒是毛纺工业中最优质的天然纤维原料,也是中国国际贸易份额比重最大的畜产品。绒山羊皮肤次级毛囊是山羊绒纤维的“发源地”,因而绒山羊皮肤毛囊的结构特点、遗传特性、发生发育与周期性变化及调控因素,是了解绒山羊种质特性的基础,也是绒山羊选育研究基础。笔者在查阅国内外对绒山羊皮肤毛囊研究文献的基础上,结合多年的研究结果,综述了中国绒山羊毛囊性状与发育调控研究的现状与进展,以期为指导绒山羊育种提供理论基础。
【英文摘要】Cashmere goat industry is an important constituent of Chinese animal husbandry. The cashmere produced by the secondary follicle in the skin of cashmere goat is the best natural material of fiber in the wollen spinning industry, and it takes the highest percentage among the livestock products in the international trade. Because of the secondary follicle in the skin of cashmere goat is the “place of origin” of the cashmere fiber, the follicle structure, genetic characterization, the development, the cyclical change and the regulating facters are the basics for the idioplasm and the selection of cashmere goat. Thus, based of the large amount of paper reading and our own findings in these years, the article overviewed the current situation and the progress of the hair follicle structure characterizations and its developmental mechanisms of Chinese cashmere goat to provide the theoretical basis for the selection of the cashere goat.

【题目】Bcl-2/Bax在不同月份辽宁绒山羊皮肤毛囊表达的研究
【中文关键词】辽宁绒山羊,毛囊,Bax,Bcl-2
【英文关键词】Liaoning Cashmere Goats, hair follicle, Bax, Bcl-2
【中文摘要】探讨细胞凋亡相关基因Bcl-2/Bax在辽宁绒山羊成年母羊1年12个月份皮肤毛囊上表达情况。【方法】本研究通过免疫组化,检测Bax和Bcl-2的表达量和表达部位的年周期变化情况。研究结果表明:不同月份辽宁绒山羊成年母羊皮肤的Bax和Bcl-2主要在初级毛囊和次级毛囊的毛球、内根鞘、外根鞘上,以及汗腺、皮脂腺以及表皮上表达。初级毛囊上的Bax表达量6月份最低,7月份最高,而Bcl-2各月之间变化不显著,因此其Bax/Bcl-2比值6月份是全年的最低点,而7月份为最高点;次级毛囊Bax表达量变化呈双峰型,5月和9月为两个高峰值,其他月份表达水平较低,而Bcl-2表达量在5月份为最高峰,其他月份处于低表达水平;Bax/Bcl-2比值4月份是全年的最高点,7月份是另一个高峰,10月达到全年的最低点。
【英文摘要】In this research, the expression of VEGF and the distribution of microvessel was detected by using immunohistochemisty. The results showed as follow, by studying the Liaoning Cashmere Goat’s adult female monthly in a whole year, Bax and Bcl-2-positive was detected in PF and SF’s hair bulb, inner root sheath, outer root sheath, and aebaceous gland, sweat gland, pidermis, similar to VEGF. Expression of Bax in PF minimized at June and maximized at July, while Bcl-2’s changed unremarkable among months, thus the ratio of Bax/Bcl-2 in PF minimized at June and maximized at July. Expression of Bax in SF was bimodal pattern with two peaks at May and September, while Bcl-2’s only peak shown at May, thus the ratio of Bax/Bcl-2 in SF minimized at October and maximized at April, but with another high level at July.

【题目】Expression of the Arabidopsis thaliana Histone Gene AtHTA1 Enhances Rice Transformation Efficiency
【中文关键词】无
【英文关键词】Arabidopsis; histone H2A; Agrobacterium; rice; transformation
【中文摘要】无
【英文摘要】We expressed the Arabidopsis thaliana histone AtHTA1 in rice under the control of the maize ubiquitin promoter.Transformation efficiencies of rice plants that constitutively expressed AtHTA1 were 28 – 44% higher than calli containing an empty vector control. Furthermore, co-infection of rice calli with a vector containing AtHTA1 and another vectorwith the target gene increased transformation by 27 – 50%. Thus, expression of AtHTA1 either transiently or in stably transformed cells improved rice transformation efficiency.

【题目】基于分形理论的参考作物蒸发蒸腾量估算
【中文关键词】温度; 辐射; 趋势分析; 分形维数;
【英文关键词】temperature; radiation; trend analysis; fractal dimension;
【中文摘要】根据成都、雅安和乐山等站点实测的1954~2000年的气象资料和地理参数,建立了温度推算辐射的模型,从分形理论的角度,进一步揭示了温度和辐射的关系特征,并结合Penman-Monteith模型对参考作物蒸发蒸腾量(ET0)进行了估算。研究表明,温度(T)、净辐射(Rn)和净短波辐射(Qns)无标度区拐点的界限时间和分形维数非常接近,具有相似的分形特征,可利用T估算Rn和Qns;通过T估算的Rn计算的ET0的平均绝对偏差和平均相对偏差,均小于通过T估算的Qns计算的ET0的平均绝对偏差和平均相对偏差,而且偏差较小。因此,在实际应用中可通过T估算Rn来计算ET0,简化ET0的计算过程。
【英文摘要】According to the meteorological data and geographical parameters in 1954~2000,establishing a model of the radiation and temperature calculation based on fractal theory from the angle of further reveals that the relationship between temperature and radiation characteristics,combining Penman-Monteith model for reference crop the evapotranspiration(ET0) estimated.Temperature(T)、 net radiation(Rn) and net shortwave radiation(Qns) no-scaling regions and the boundary point of fractal dimension is close,with simila...

【题目】Effect of fusaric acid on biomass and photosynthesis of watermelon seedlings leaves
【中文关键词】无
【英文关键词】biomass; Fusarium oxysporum f. sp. niveum (FON); fusaric Acid (FA); photosynthesis; stress; watermelon (Citrullus lanatus (Thunb.) Matsum. & Nakai cv. Zaojia 84-24).
【中文摘要】无
【英文摘要】Wilt disease of watermelon caused by Fusarium oxysporum f. sp. niveum in long-term monoculture system has been much often found particularly in protected land cultivation system worldwide. Fusaric acid (FA), a fungal phytotoxin, was extracted from F. oxysporum f. sp. niveum isolated from diseased watermelon plant. The influence of FA on the biomass and leaves

photosynthesis of watermelon seedlings was investigated in a laboratory study. Results obtained are listed as follows. Plant height, fresh weight, main root length and lateral roots of watermelon seedling exposed to FA (400 mg · L-1) for 12 hours and then grown in ordinary condition for nine days were decreased by 23.0%, 23.1%, 23.6% and 33.6% compared with control respectively. Cotyledons were wilted to death completely and necroses occurred on the first true leaf and the upper leaves had become crinkled and chlorosis, which was a typical symptom of wilting disease of watermelon. And thus physiological functions were inhibited and damaged strongly. Net photosynthesis rate, stomatal conductance, intercellular CO2 concentration, and chlorophyll (SPAD reading) of the seedlings decreased with the increasing of concentrations of FA and duration of exposure to FA. Compared with control, stomatal conductances of leaves treated with FA were declined by 87.4-98.4% and net photosynthesis rates of leaves were decreased by 51.8-92.1%. Intercellular CO2 concentration of the seedlings treated with FA was reduced by 66.6 -94.8%. Chlorophyll content in the leaves of the seedlings was decreased by 42.7-72.3%. Transpiration rate fell down to 86.8-96.3%. It was concluded that FA strongly reduced the chlorophyll content of watermelon seedlings leaves resulting to heavy suppression of leaf photosynthesis, which therefore affected seedlings growth finally leading to leaf wilting and necrosis.

【题目】Identification and expression analysis of OsHsfs in rice
【中文关键词】无
【英文关键词】Heat shock, Transcription factors, Rice, Protein structure, Expression analysis
【中文摘要】无
【英文摘要】Heat stress transcription factors (Hsfs) are the central regulators of defense response to heat stress. We identified a total of 25 rice Hsf genes by genome-wide analysis of rice (Oryza sativa L.) genome, including the subspecies of O. japonica and O. indica. Proteins encoded by OsHsfs were divided into three classes according to their structures. Digital Northern analysis showed that OsHsfs were expressed constitutively. The expressions of these OsHsfs in response to heat stress and oxidative stress differed among the members of the gene family. Promoter analysis identified a number of stress-related cis-elements in thepromoter regions of these OsHsfs. No significant correlation, however, was found between the heat-shock responses of genes and their cis-elements. Overall, our results provide a foundation for future research of OsHsfs function

【题目】Molecular and functional comparisons of the vacuolar Na+/H+ exchangers originated from glycophytic and halophytic species
【中文关键词】无
【英文关键词】NHX gene, Rice transformation, Salt stress, Tolerance
【中文摘要】无
【英文摘要】A novel vacuolar Na+/H+ exchanger, CgNHX1, was cloned from a halophytic species Chenopodium glaucum by usingreverse transcriptase-polymerase chain reaction (RT-PCR) and rapid amplification of cDNA ends (RACE) technique. Sequencealignment and phylogenetic analysis of 22 NHX genes from GenBank as well as the new CgNHX1 gene indicate that NHX genesshared a great degree of similarity, regardless of their glycophytic or halophytic origin. Expression of the CgNHX1 gene wasinduced by NaCl and peaked at 400 mmol/L NaCl. Overexpression of NHX1 genes in rice enhanced their tolerance to salt stress.However, there is no significant difference in salt tolerance among the transgenic rice plants overexpressing the NHX1 genes fromeither glycophytic or halophytic species. The Na+ content of both the wild type (WT) and transgenic plants increased when exposedto 50 and 100 mmol/L NaCl, and the Na+ concentration in transgenic plants was marginally higher than that of WT. Our datademonstrate that the overexpression of the NHX1 gene from either glycophytic or halophytic species resulted in the enhancedtolerance to salt stress at a similar level, suggesting that NHX gene per se might not be the reason accounting for the difference insalt tolerance between glycophytes and halophytes.

【题目】Adventitious root formation in rice requires OsGNOM1
【中文关键词】无
【英文关键词】Oryza sativa L., adventitious root, OsGNOM1, polar auxin transport
【中文摘要】无
【英文摘要】The fibrous root system in cereals comprises primarily adventitious roots (ARs), which play important roles in nutrient and water uptake. Current knowledge regarding the molecular mechanism underlying AR development is still limited. We report here the isolation of four rice (Oryza sativa L.) mutants, from different genetic backgrounds, all of which were defective in AR formation. These mutants exhibited reduced numbers of lateral roots (LRs) and partial loss of gravitropism. The mutants also displayed enhanced sensitivity to N-1-naphthylphthalamic acid, an inhibitor of polar auxin transport (PAT), indicating that the mutations affected auxin transport. Positional cloning using one of the four mutants revealed that it was caused by loss-of-function of a guanine nucleotide exchange factor for ADP ribosylation factor (OsGNOM1). RT-PCR and analysis of promoter::GUS transgenic plants showed that OsGNOM1 is expressed in AR primordia, vascular tissues, LRs, root tips, leaves, anthers and lemma veins, with a distribution pattern similar to that of auxin. In addition, the expressions of OsPIN2, OsPIN5b and OsPIN9 were altered in the mutants. Taken together, these findings indicate that OsGNOM1 affects the formation of ARs through regulating PAT.

【题目】Application of Bio-Organic Fertilizer Significantly Affected Fungal Diversity of Soils
【中文关键词】无
【英文关键词】BOF, bio-organic fertilizer; CFU, colony-forming units; DGGE, denaturing gradient gel electrophoresis; NCBI, National Center for Biotechnology Information; NMDS, nonmetric multidimensional scaling; OF, organic fertilizer; PCR, polymerase chain reaction.
【中文摘要】无
【英文摘要】Cotton verticillium wilt (Verticillium dahliae Kleb.) is a very destructive disease. In this study, we evaluated a Bacillus subtilis enhanced bio-organic fertilizer (BOF) for control of the disease and for its eff ect on rhizosphere microbiota. Greenhouse pot experiments were conducted during three cotton (Gossypium hirsutum L.) growing seasons with serial treatments of BOF or unenhanced organic fertilizer (OF). Consistent control of cotton verticilliumwilt was obtained in the three trials. Th e complete BOF treatment, in which both nursery cups with healthy soils and transplanted pots with diseased soils were amended with BOF, was the most eff ective in reducing the counts of pathogenic V. dahliae and of total fungi in the cotton rhizosphere. Th e complete BOF treatment was also the most eff ective in reducing disease incidence. Rhizosphere soil DNA was extracted at harvest and the 5 ´ end (370 base pairs) of the fungal 18S rRNA gene was amplifi ed by using the primer pair NS1 and GCFung (fungus specifi c). Seventy-one bands were recognized in denaturing gradient gel electrophoresis (DGGE) gels and excised for sequencing, but only 35 bands were successfully sequenced during the study. Nonmetric multidimensional scaling analysis of DGGE patterns showed that the complete BOF treatments were not close to any other treatment. Ribotypes related to four Ascomycota and two Basidiomycota fungi were detected in the untreated but not in the BOF-amended soil. Th e results suggest that the complete BOF treatment could eff ectively control cotton verticillium wilt by signifi cantly improving fungal structure in rhizosphere soils.

【题目】Identification of a novel iron regulated basic helix-loop-helix protein involved in Fe homeostasis in Oryza sativa
【中文关键词】无
【英文关键词】Fe,helix-loop-helix,protein
【中文摘要】无
【英文摘要】Background: Iron (Fe) is the most limiting micronutrient element for crop production in alkaline soils. A numberof transcription factors involved in regulating Fe uptake from soil and transport in plants have been identified.Analysis of transcriptome data from Oryza sativa grown under limiting Fe conditions reveals that transcriptabundances of several genes encoding transcription factors are altered by Fe availability. These transcription factorsare putative regulators of Fe deficiency responses.Results: Transcript abundance of one nuclear located basic helix-loop-helix family transcription factor, OsIRO3, isup-regulated from 25- to 90-fold under Fe deficiency in both root and shoot respectively. The expression of OsIRO3is specifically induced by Fe deficiency, and not by other micronutrient deficiencies. Transgenic rice plants overexpressingOsIRO3 were hypersensitive to Fe deficiency, indicating that the Fe deficiency response wascompromised. Furthermore, the Fe concentration in shoots of transgenic rice plants over-expressing OsIRO3 wasless than that in wild-type plants. Analysis of the transcript abundances of genes normally induced by Fedeficiency in OsIRO3 over-expressing plants indicated their induction was markedly suppressed.Conclusion: A novel Fe regulated bHLH transcription factor (OsIRO3) that plays an important role for Fehomeostasis in rice was identified. The inhibitory effect of OsIRO3 over-expression on Fe deficiency response geneexpression combined with hypersensitivity of OsIRO3 over-expression lines to low Fe suggest that OsIRO3 is anegative regulator of the Fe deficiency response in rice.

【题目】温室茄子不同生育期茎直径变化特征及其与气象因子的关系
【中文关键词】茄子; 茎直径变化; 生育期; 气象因子; 土壤含水量;
【英文关键词】eggplant; variation of stem diameter; growth stage; meteorological factor; soil water content;
【中文摘要】为了寻找诊断温室作物水分状况的可靠的茎变化指标,对春季温室条件下茄子不同生育期、不同土壤含水量茎变化关键指标进行了研究。结果表明,各生育期低水分处理的茎直径(MDS)日最大收缩量基本上大于高水分处理的MDS,但它们的变化趋势基本一致,这种一致性是由气象因子所致;苗期的日生长量(DI)从未出现过负值,高水分处理的累积DI要大于低水分处理的累积DI,且MDS和DI之间呈现出一定程度的负相关,而其余时期的DI基本上在DI=0附近波动;通过对MDS、DI和相关气象因子进行回归分析发现,MDS和气象因子有更好的相关性,基本上各时期MDS和相对湿度呈负相关关系,与温度、辐射、空气饱和差呈正相关关系;且气象因子对低水分处理的茎变化影响大于对高水分处理茎变化影响,由此提出建立合理土壤水分条件下的气象因子对MDS的预测模型作为诊断温室作物水分状况、实现自动灌溉的方法。
【英文摘要】In order to find a reliable index of stem variation to diagnose water content of crops in greenhouse,an analysis was made of some key indexes of stem variation under high and low soil water content in greenhouse in spring.The result indicated that,the maximum daily shrinkage(MDS) of low soil water content was mostly bigger than that of high soil water content during three growth stages,but they both shared the same variation trend which was caused by meteorological factors.Furthermore,there was no negative ...

【题目】刺参的趋光性以及对附着基颜色的感应行为
【中文关键词】刺参;趋光特性;附着基;平均聚集率;行为生态学
【英文关键词】Apostichopus japonicus;phototactic characteristics;settlement substratum;mean attractive rate;behavioral ecology.
【中文摘要】为了探讨刺参的趋光特性和附着基颜色对其行为反应的影响,分别用平均趋光率 (mean phototactic rate,MPR)和平均聚集率(mean attractive rate,MAR)统计分析了刺参在 100、50、10、5和1 lx共5档强度的光照和7种颜色的附着基(红色、灰色、黄色、蓝色、白色、黑色和绿色)下的行为反应差异。结果表明:在水平光场内,光源照度为100、50和lO lx时,光照度较强区与光照度较低区之间的MPR均存在显著差异(P<O.05),而光源照度为5 和1 lx时,各区域之间的MPR无显著差异;不同颜色附着基实验时,刺参在黑暗和自然光照条件下,同种颜色附着基的MAR无显著差异(P>0.05);在相同光照条件下,黑色和灰色附着基的MAR明显优于其他颜色的附着基,与蓝色、黄色及不放置附着基的MAR差异极显著(P<0.01),不同颜色附着基的MAR由大到小排列为黑色>灰色>红色>绿色>白色>蓝色>黄色。表明刺参的趋光性随着光照强度的增加而减小,呈负趋光性;平均聚集率较高的3种颜色的附着基是黑色、灰色和红色。
【英文摘要】The behavioral responses of sea cucumber(Apostichopus japonicus)to different light intensity(100,50,10,5,and 1 Ix)and settlement substratum color(red,gray,yellow,blue, white,black,and green)were examined by mean phototactic rate f MPR)and mean attractive rate(MAR)methods.The results showed that the MPR was significantly different(P<0.O5) among strong light regions(100,50,and 10 Ix)(P<0.05),but was not between weak ones (5 and l lx).Under natural light and darkness.the MAR of same color settlement substrata had no significant difference;while under the same light intensity.the MAR of black and grey settle— ment snbstrata was superior to that of the others.being significantly different with that of blue and yellow settlement substrata and of the control(P<0.O 1).The attractive effect of different color settlement substrata was in the order of black>gray>red>green>white>blue>yellow.The above results suggested that the MPR of A.japonicus decreased with increasing light intensity, representing the photonegative response of the organism.Among the seven colors settlement sub— strata,the black.gray.and red ones had the higher MAR.

【英文关键词】Ziziphus jujuba Mill; cold resistance; relative electric conductivity; relative K+-leakage;
【中文摘要】【目的】测定环塔里木盆地绿洲的主栽品种灰枣、骏枣、砧木种酸枣及伊犁河谷抗寒品种-霍城大枣的抗寒性。【方法】以枣树一年生休眠枝条为试验材料。测定其相对电导率和K+相对渗出率,建立不同品种(或砧木)的Logistic方程。【结果】(1)参试品种的相对电导率和K+相对渗出率均随着温度的降低而增加;(2)同一低温胁迫下,不同品种间相对电导率和K+相对渗出率存在明显差异。【结论】综合分析得出不同品种间抗寒性为:霍城大枣>酸枣>骏枣>灰枣。
【英文摘要】【Objective and Method】The major cultivation clones of one year dormant seedling of Ziziphus jujube in the oasis around Tarim Basin were used as materials to observe their one year dormant woods of relative electric conductivity and relative leakage of K+ under different low temperature treatments,and various clones Logistic equation were established.【Result】The results show that:(1) The relative electric conductivity and relative leakage of K+ of the clones increased with the decreased of temperature;(2) Under the same low temperature stress,the relative electric conductivity and relative leakage of K+ were different in difference clones.【Conclusion】The comprehensive analysis was given that the difference of the cold resistance abilities of the clones were as follows:Huochengzao jujube > wild jujube> Junzao jujube> Huizao jujube.

【题目】DS1844与M430在差分放大电路中的应用
【中文关键词】作物参数; 差分放大; DS1844; M430;
【英文关键词】crop parameter; differential magnify; DS1844; M430;
【中文摘要】针对农业生产中一些作物参数的微小变化无法用传统的数据采集设备检测的现状,研究了DS1844数字电位器功能及特性。采用M430单片机自带AD转换器将检测到的数字量转换为模拟量,再将该采集值锁存在DS1844寄存器中,DS1844的锁存值与下一时刻M430单片机AD转换值之差进行差分放大,对差分信号进行分析处理后获得所需参数值。实例结果表明,该方法检测精度高,测量成本低,更适合于实际农业生产的应用。
【英文摘要】The function and characteristic of DS1844 Quad digital potentiometer are studied in this paper in order to measure the tiny change of crop growth parameters. The potentiometer transfers the DS1844 record to the simulation result with the M430 AD adapter. After analyzing the differential amplifier between DS1844 latch data and AD data at next time,the crop parameters can be obtained. The result shows that this method can be widely used in the agricultural production because of the high precision and low cost...

【题目】枣树的结实特性影响因素
【中文关键词】枣; 自然授粉; 自花授粉; 结实特性; 育性; 影响因素;
【英文关键词】Chinese jujube (Ziziphus jujuba); natural-pollination; self-pollination; fruiting ability; fertility; influncing factors;
【中文摘要】以河北沧县枣种质资源圃的124个枣品种和山西太谷国家枣种质资源圃的156个枣品种为试材,研究枣树的结实特性及其影响因素。结果表明:枣树种质可分为自花可育、自花可实不育、自花不实3类,其中自花可实不育是基本类型,它与自花不实和自花可育类之间可相互转化,而自花可育和自花不实之间相互转化极少;在自然(异花)授粉条件下供试品种均可结实,但育性有不育和可育2类,其中可育的占42.31%。枣树的结实性和育性因基因型(品种和品系)、年份、地区、树冠方位不同而有显著差异,其中影响最大的是基因型;供试品种间自花结实率(吊果率)和可育率的变幅分别为0~61.54%和0~100%,自然授粉结实率和可育率的变幅分别为4.17%~136.84%和0~100%;36个金丝小枣品系自花结实率和可育率的变幅分别为0.89%~163.64%和0~6.98%,自然授粉结实率和可育率的变幅分别为10.71%~138.89%和0~90.00%;5个无核小枣品系的分别为1.10%~81.72%,0~100%和8.06%~137.04%,0~2.70%;3个冬枣品系的分别为25.00%~62.93%,0~1.37%和11.32%~89.23%;不同年份和地区间结实性变化大而育性相对稳定,年份间自花和异花结实率均表现稳定的仅有4.17%、可育率稳定的则高达64.58%,地区间表现稳定的分别为15.38%和73.08%;西南-西北方向自花结实率高。初步筛选出一批自花不实或自花不育而异花高度可育、适宜作为杂交母本的优异种质。
【英文摘要】The factors influencing fruiting ability and fertility of Chinese jujube (Ziziphus jujuba) were analyzed based on an investigation of 124 cultivars in the Cangxian County Jujube Repository,Hebei and 156 cultivars in the National Jujube Repository,Pomology Institute of Shanxi. The results showed that Chinese jujube germplasm resources could be classified into 3 groups,i. e. self-fruitless,self-sterile (but self-fruitful) and self-fertile. Among them,self-sterile was the basic type,and it could convert with self-fruitless and self-fertile. However,the transform between self-fertile and self-fruitless was very scarce. Under natural pollination,all the cultivars and strains tested were able to bear fruits,but they were not all fertile,accounting for 42. 31% ,the rest sterile. The fruiting ability and fertility changed with genotypes (cultivars or strains),years,regional conditions and orientation of the canopy,of which genotype was the most dominant factor. The percentage of fruit to bearing shoot (PFTBS) and the percentage of fruit with seed (PFWS) were respectively in a range of 0 -61. 54% and 0 -100% under self-pollination,and 4. 17% -136. 84% and 0 -100% under natural pollination. PFTBS and PFWS in 36 strains of cultivar ’Jinsixiaozao’were respectively in a range of 0. 89% -163. 64% ,0 -6. 98% under self-pollination,and 10. 71% -138. 89% and 0 -90. 00% under natural pollination. For 5 strains of cultivar ’Wuhexiaozao’,the two parameters were 1. 10% -81. 72% ,0 -100% under self-pollination,and 8. 06% -137. 04% and 0 -2. 70% under natural pollination;For the 3 strains of cultivar ’Dongzao’the two parameters were 25. 00% -62. 93% ,0 -1. 37% under self-pollination,and 11. 32% -89. 23% and 0% under natural pollination,respectively. The variation of fruiting ability was much bigger than that of fertility. Only 4. 17% and 15. 38% of the cultivars had stable PFTBS respectively between years and between regional conditions,while the corresponding ratio of the cultivars with stable PFWS was respectively 64. 58% and 73. 08%. The PFTBS under self-pollination was much higher in the south-west and north-west aspects of the canopy than in other orientations. Some excellent germplasms (with self-fruitless or self-sterile under self-pollination but fertile under cross-pollination),which were fit to be used as female parent in cross breeding,were preliminarily screened out.

【题目】田间喷施生长调节剂对冬枣胚发育及坐果的影响
【中文关键词】喷施生长调节剂; 冬枣; 胚发育; 坐果;
【英文关键词】growth regulators spraying; Ziziphus jujuba‘ Dongzao ’; embryo development; fruit set;
【中文摘要】以轻度败育枣品种冬枣为试材,在盛花期进行不同种类、不同浓度生长调节剂(GA3、IAA、6-BA)的喷施试验,旨在明确外源生长调节剂对枣胚发育和坐果的影响。结果表明,盛花期喷施不同浓度6-BA(50~150mg/L)可有效提高冬枣小果含仁率至100%(对照91.1%),同时坐果率可达18.3%(对照7.3%);而喷施GA3、IAA却不同程度上降低了冬枣含仁率,但果实坐果率明显提高分别为69.3%(对照17.0%)、45.8%(对照14.6%)。
【英文摘要】Spraying different variety and concentrations growth regulators by treating‘ Dongzao ’which is slightly Abortion with experiment material. The optimum condition about hormone regulating embryo development was studied at the stage of flowering. The results indicated that Spraying 6-BA(50 -150 mg/L) can increased the seed rate of small fruit from 91.1 % to 100 %, and fruit set reached 18.3%(contrast 7.3%); while spraying GA and IAA cause embryo abortion more or less, at the same time, fruit set raised up to 69.3% (contrast 17%), 45.8% (contrast 14.6%).

【题目】棘皮动物免疫学研究进展
【中文关键词】棘皮动物,后口动物,先天性免疫,比较免疫学
【英文关键词】echinoderm, deuterostome, innate immunity, comparative immunology
【中文摘要】棘皮动物属原始后口动物、无脊椎动物的最高等类群,它处于由无脊椎动物向脊椎动物开始分支进化的阶段.研究棘皮动物的免疫功能和作用机理,对从比较免疫学角度探讨动物免疫系统进化过程有承前启后的重要意义.因此,有必要对棘皮动物的免疫学研究进展作一个较全面的综述,并理清未来的研究热点和方向.棘皮动物与其他无脊椎动物一样具有先天性免疫系统,但未发现脊椎动物所具有的获得性免疫.其免疫应答是由参与免疫反应的效应细胞———体腔细胞和多种体液免疫因子共同介导的.比较免疫学分析表明,棘皮动物存在脊椎动物补体系统的替代途径和凝集素途径,但未发现经典途径和明确的终端途径.棘皮动物先天性免疫系统存在数量庞大的基因家族.今后应加强对未知免疫相关基因、蛋白质、信号传导途径及效应分子的研究,回答免疫系统的起源、功能和进化等问题.
【英文摘要】Echinoderms are deuterostome, and occupy the top taxonomic position of invertebrates, where is the evolutionary linkage between invertebrates and vertebrates. This is a critical phylogenetic vantage point to infer both the early evolution of bilaterian immunity and the underpinnings of the vertebrate adaptive immune system.The available published literatures on echinoderm immunological mechanisms are compiled and discussed here to understand its evolution process and the hot spots or directions in future investigations. Echinoderms have an innate immune system like vertebrates but their adaptive attributes have not been observed. Its immune responses are based on coelomocytes activity working in parallel with a variety of humoral factors that react directly with invading pathogens. Comparative studies of immune functions in echinoderms have demonstrated that there is a complement system in echinoderms that appears to have alternative pathway and lectin pathway but lack classicalpathway and terminal pathway. The sea urchin innate immune system has a number of large gene families. Further investigations are needed to understand the unknown immune-associated genes, proteins, immune signaling pathways and effector molecules, and to know the origin, the underlying mechanisms and evolution of innate immune system.

【题目】枣(Ziziphus jujube Mill.)品种结实特性研究
【中文关键词】枣; 自然授粉; 自花授粉; 结实性; 可育性;
【英文关键词】Chinese jujube (Ziziphus jujuba Mill.); Natural-pollination; Self-pollination; Fruiting ability; Fertility;
【中文摘要】对河北省沧县枣种质资源圃124个和山西果树研究所国家枣种质资源圃156个枣品种(品系)在自花授粉和自然授粉条件下的结实及种仁发育情况进行了调查。结果表明,供试品种自然授粉和自花授粉条件下的平均结实率(结果数/100枣吊)分别为37.06%、20.63%,变幅分别为4.17%~175.00%、0%~163.64%,平均可育率(含仁果实/果实总数×100%)分别为12.10%、3.07%,变幅均为0%~100%;自花结实率和自然结实率极显著正相关,相关系数0.597;供试枣品种可分成自花不实异花可实不育、自花不实异花可育、自花异花均可实不育、自花可实不育异花可育、自花异花都可育等5种结实类型,分别占总品种数的10.27%、16.06%、45.19%、17.15%、11.33%;筛选出稳定表现自花不实或自花可实不育而异花授粉可育率高且种仁饱满的品种2个(小枣4、小墩墩枣),种仁较饱满的5个(洪赵十月红、广东白枣、大荔圆枣、小枣25、圆铃枣),利用这些品种做母本进行杂交育种时可省略去雄程序,有效解决因枣花小去雄难的问题;蛤蟆枣、团枣、无核小枣、马牙枣、核桃纹等自花不实而异花可实的品种,在栽植时应配置授粉树。
【英文摘要】The fruit and seed development of 124 Chinese jujube cultivars in Cangxian County Jujube Repository and 156 Chinese jujube cultivars in National Jujube Repository,Shanxi were investigated. The results showed that average percentage of fruits to bearing shoots (PFTBS) under natural pollination and self-pollination were 37.06% and 20.63%,with the range of 4.17%-175.00% and 0%-163.64%,respectively,while average percentage of fruit with seed (PFWS) under natural pollination and self-pollination were 12.10% and 3.07%,both ranged from 0% to 100%. PFTBS under self-pollination showed significant positive correlation with PFTBS under natural-pollination,(r= 0.597). All the tested cultivars could be devided into five types according to their fruiting charactoristics,i.e. self-(self-pollination) fruitless and natural-(natural-pollination) sterility,self-fruitless and natural-fertility,sterility under both self-and natural-pollination,self-sterility and natural-fertility,fertility under both self-and natural-pollination. The five types counted for 10.27%,16.06%,45.19%,17.15% and 11.33%,respectively. Two cultivars with plump seeds and five cultivars with relative-plump seeds

under natural polllination together with stable characteristics of self-fruitless or natural-sterility were selected to be further used in jujube cross breeding for their advantages of omitting stamen removing. Pollinating cultivars are necessary for cultivar Hamazao,Tuanzao,Wuhexiaozao,Mayazao and Hetaowen because of their characteristic of self-fruitless and fruitfulness after natural or cross pollination.

【题目】秋、冬季节刺参养殖池塘浮游细菌数量变化规律的研究
【中文关键词】刺参 浮游细菌 AODC DVC HPC
【英文关键词】Apostichopus aponicus Planktobacteria AODC DVC HPC
【中文摘要】应用平板稀释涂布培养计数法和荧光显微镜计数法,对秋、冬季(2008年9月~2009年2月)刺参养殖池塘水体中的浮游细菌数量变化规律进行了分析。结果表明,吖啶橙染色直接计数法(AODC)测得细菌总数的变化范围是 1.0 x 10 ~2.1×1O 个/ml,活菌直接计数法(DVC)测得活菌总数的变化范围是4.0×10 ~5.7×1O 个/ml。异养细菌平板计数法(HPC)测得异养细菌数量为 0.6×10。~1.7×10 CFU/m1。TCBS平板培养的弧菌数量在6.6x10。CFU/ml以下。从时间分布看,刺参养殖池塘水体中浮游细菌数量最高值出现在 1O月份,最低值出现在1月份,秋季细菌数量显著高于冬季(P<0.01)。从空间分布看,水体底层细菌数量显著高于表层(P<0.05)。利用SPSS13.0软件对所得到的数据进行统计分析表明,同一样品不同计数方法获得的细菌总数数值之间存在显著的相关性(P<0.01)。
【英文摘要】The spatial and temporal variations of p1anktobacteria quantity in Apostichopus japonicus culture ponds during autumn and winter(from September,2008 to Februray,2009) were investigated by plate culture and fluorescence microscope techniques.The total number of planktobacteria estimated by acridine orange direct count(AODC)and Direct Viable Count (DVC)ranged in 1.0×10 ~2.1×10 cell/ml and 4.0×10 ~5.7×10 cell/ml,respectively. The amount of heterotrophic bacteria detected by heterotrophic plate count(HPC)ranged from 0.6×10 0 to 1.66×l0 CFU/m1.The amount of V/brio was below 6.6×lO。CFU/ml using TCBS selective medium cultivation.The number of D1anktobacteria varied in different season,which reached the maximum in 0ctober and the minimum in January.The number of bacteria in the ponds was significantly higher in autumn than in winter(P~0.01).The total number of bacteria in different water layers was determined.The results showed that the total number of bacteria in the bottom water was significantly higher than that in the surface water(P<0.05).There was significant correlation(Pd0.01)between data deduced by using different bacterial count methods.

【题目】幼龄灰枣适宜负载量研究
【中文关键词】灰枣; 负载量; 枝组; 枣吊;
【英文关键词】Huizao(Zizyphus jujuba); fruit load; branch group; bearing branch;
【中文摘要】【目的】通过对幼龄灰枣适宜负载量的研究,以期为实现枣高产、优质和高效栽培提供基础。【方法】以34、龄灰枣嫁接苗为试材,通过连续2年的研究,探讨负载量与枝组粗度、产量及单果重的关系。【结果】枝组粗度(X)与产量(Y)成显著相关性,其回归方程为Y=219.6X-102.7,枝组负载量(Y)与枝组粗度(X1)和平均单果重(X2)的回归方程为Y=[219.6X1-102.7]/X2;单株负载量与产量成正相关,与单果重及枣果均匀度成反相关;枣吊1~7节保果数约占总保果数的89.7%;枣吊负载量越大,落果率越高、单果重越小。【结论】3龄灰枣单株负载量以150个果左右为宜;生产中枣吊摘心宜在第8个节点后;单个枣吊负载量以保留2个枣果为宜。
【英文摘要】【Objective】Study on suitable furit load of young Ziziphus jujuba cv.Huizao,expecting to provide planting technology of high yield,fine quality and efficiency.【Method】3-4 years of Huizao were used as study material.The relation between fruit load and branch group diameter,yield and single fruit weight were studied for two years in succession.【Result】The branch group diameter(X) was positively correlated with yield(Y) and the regression equation was Y=219.6X-102.7,the regression equation of group load with branch group diameter and average single furuit weight(X2) was Y=[219.6X1-102.7]/X2;the single plant load was positively correlated with yield,and negatively correlated with fruit single weight and fruit evenness;The fruiting percent of 1-7 bearing branch was 89.7% within fruit number.The higher the bearing branch ,the higher the fruit drop rate and the smaller the single fruit weight.【Conclusion】The suitable fruit load of three ages Huizao tree was 150;The suitable bearing branch should be pruned after the eight node;The suitable single bearing branch fruit load was 2 fruit per branch.

【题目】幼龄直播密植枣园的拉枝效应研究
【中文关键词】枣; 拉枝; 光环境; 产量; 品质;
【英文关键词】jujube; branch drawing; light environment; yield; fruit quality;
【中文摘要】【目的】拉枝对直播密植枣园树体生长、光环境以及枣果产量和品质的影响。【方法】对参试株干径和基径进行调查,分析拉枝处理与对照的生长量差异;采用LAI-2000冠层仪和照度计进行行间叶面积指数、株间透光率及树冠中部光照强度日变化进行测定;果实成熟期用蒽酮法、氢氧化钠滴定法和钼蓝比色法分别测定其总糖、总酸和VC的含量。【结果】(1)拉枝处理的干径生长量小于对照,基径生长量则高于对照,差异达显著水平;(2)拉枝处理后行间叶面积指数较对照提高119.0%,株间透光率较对照提高1倍;(3)拉枝后树冠中部光照强度日均值为334.70 lx,对照仅为101.01 lx,光环境明显改善;(4)拉枝后单果重和单株产量与对照差异达极显著水平,品质差异不显著。【结论】在不减少密植枣园有效株数的前提下,株间拉枝方式改善树体光照环境和枣果品质,提高枣果产量和经济效益。
【英文摘要】【Objective】Study the effects of branch drawing on the tree growth,light environment,fruit quality and yield of jujube in direct seeding close planting jujube field.【Method】The stem diameter and branch diameter of the test trees are investigated to analyse the difference between branch drawing treatment and CK.Interplanting leaf area index,the daily changes of light transmittance and light intensity in the middle part of the canopy are observed with the LAI-2000 type and photometer. The content of total sugar,total acids and Vc was detected by anthrone method, sodium hydroxide titration method and molybdenum blue colorimetric method.【Result】(1)The growth of stem diameter was smaller than the contrast, the growth of branch diameter was higher than contrast,and the difference between them was quite significant;(2)The interplanting leaf area index after branch drawing was increased 119.0% more than the contrast,interplanting light transmittance was twice more than the contrast;(3)After branch drawing,the light environment of the middle part of the canopy was obviously improved,the average daily light intensity was 334.70 lx,and the contrast was only 101.01 lx;(4)Single fruit weight and fruit yield of a branch of direct seeding jujube and the contrast achieved significant difference after branch drawing,but fruit quality was not obviously different.【Conclusion】Under the presupposition of not decreasing the effective number of trees in the jujube field,branch drawing helps to improve the light environment and fruit quality,increase fruit yield and economic benefit.

【题目】新疆塔里木盆地骏枣果营养与土壤养分相关性分析
【中文关键词】骏枣; 土壤养分; 果实营养; 多元逐步回归; 聚类分析;
【英文关键词】Ziziphus Jujuba cv. Junzao; Soil property; Fruit quality; Multiple linear stepwise regression; Cluster analysis;
【中文摘要】测定了新疆塔里木盆地8个县市骏枣种植园土壤养分含量,及相应果园骏枣的果实营养,应用SPSS软件进行多元逐步回归分析,结果显示,骏枣果实营养与土壤养分含量间存在明显的相关关系,其中枣果中总糖和土壤中N含量呈极显著性负相关,枣果中总酸和土壤中的Ca呈显著性正相关;枣果中Vc和土壤中P呈极显著性正相关,和土壤中Fe呈显著性正相关;枣果中Zn和土壤中P呈极显著性负相关,和土壤中Fe呈典型性正相关。对不同采样地土壤和枣果营养的聚类分析显示,采样地间土壤相似性较高,但枣果营养相似性较低,说明除了土壤营养物质外还有其他多种因素共同对枣果实营养起着综合影响。 更多还原
【英文摘要】The soil nutrients of four Junzao orchards were determined, the fruit qualities were analyzed, and the multiple linear stepwise regression analysis was done with SPSS software. Results showed that there was evident relationship between soil property and fruit quality. The content of total sugar in fruit had critically significantly negative correlation with the content of N in soil. The content of total acidity had significantly positive correlation with the content of Ca in soil. The content of Vc had critically significantly positive correlation with the content of P in soil and significantly positive correlation with the content of Fe in soil. The content of Zn had critically significantly negative correlation with the content of P in soil and significantly positive correlation with the content of Fe (?)in soil. The cluster analysis showed that there had high soil similarity and low jujube fruit quality similarity among sampling places. That means that besides soil property, many other factors such as environment also had significant influence on fruit quality.

【题目】Effects of circadian rhythms of fluctuating temperature on growth and biochemical composition of Ulva pertusa
【中文关键词】无
【英文关键词】macroalga Ulva pertusa fluctuating temperature growth biochemical composition
【中文摘要】无
【英文摘要】The marcoalga Ulva pertusa was cultured under (20 +/- 2)degrees C, (20 +/- 4)degrees C, (20 +/- 6)degrees C, (20 +/- 8)degrees C and (20 +/- 10)degrees C circadian rhythms of fluctuating temperature conditions, and constant temperature of 20 degrees C was used as the control. The growth rate of macroalga at (20 +/- 2)degrees C, (20 +/- 4)degrees C and (20 +/- 6)degrees C were significantly higher than that at constant temperature of 20 degrees C, while growth rate at (20 +/- 8)degrees C and (20 +/- 10)degrees C were significantly lower than that at constant temperature of 20 degrees C. The growth rate of macroalga was a quadratic function of the thermal amplitude. Such a growth model can be described by G = beta(0) + beta(1)(TA) + beta(2)(TA)(2), where G represents the relative growth rate, TA is thermal amplitude in degree Celsius, beta(0) is the intercept on the G axis, and beta(1) and beta(2) are the regression coefficients. The optimal thermal amplitude for the growth of thallus at mean temperature of 20 degrees C was estimated to be +/- 3.69 degrees C. Analysis of biochemical composition at the final stages of thaulls growth revealed that diel fluctuating temperature caused various influences ($P < 0.05$). The content of chlorophyll, protein and total solute carbohydrate at (20 +/- 2)degrees C and (20 +/- 4)degrees C were slightly higher than those at constant temperature of 20 degrees C, however no statistically

significant differences were found among them (P > 0.05). While osmolytes (total solute carbohydrate and free proline) at (20 +/- 10)degrees C were significantly higher than that at 20 degrees C (P < 0.05). Therefore, more chlorophyll and carbohydrate production might account for the enhancement in the growth of macroalga at the diel fluctuating temperatures in the present study.

【题目】新疆不同种植区赞皇大枣品质的差异分析
【中文关键词】赞皇大枣; 果实品质; 差异分析; 新疆;
【英文关键词】Zizyphus jujuba cv.Zanhuang; fruit quality; difference analysis; Xinjiang;
【中文摘要】为给新疆不同种植区赞皇大枣的栽培提供理论依据,选择位于新疆塔克拉玛干沙漠北部和南部2个种植区的赞皇大枣作为研究材料,分析2个产地赞皇大枣营养成分含量的差异。分析结果显示:(1)沙雅县赞皇大枣总糖含量和糖酸比相对较高,口感偏甜;224团枣果口感更偏向酸甜口味。综合分析各品质测定结果显示,224团赞皇大枣主要营养成分含量较高,枣品质较沙雅县好。(2)224团土壤养分含量总体较沙雅县偏低,但224团赞皇大枣Vc、Ca、Fe的含量都较沙雅县高且差异明显。测定结果进一步证明气候和土壤营养物质等诸多因子共同影响着枣果品质,在对不同产地枣营养成分进行深加工时,一定要注意枣果的来源和产地的生境差异。
【英文摘要】In order to provided theoretical basis for cultivation of Zizyphus jujubacv.Zanhuang at different planting areas of Xinjiang,taking Zanhuang Jujube from two planting areas of Taklimakan Desert of Xinjiang as materials,the contents of nutritional components in fruit were determined.The results showed that:(1)the total sugar content and ratio of sugar to acid in fruit at Shaya County were higher than those at Farm 224.The fruit tasted sweeter at Shaya County,and it tasted more sour-sweet at Farm 224.The results of comprehensive analysis indicated that the fruit quality at Farm 224was better than Shaya County,in which the contents of main nutrient components were higher. (2)The contents of main nutrient components in soil at Farm 224was lower,but the contents of Vc,Ca and Fe in fruit were significantly higher than those at Shaya County.Those all proved that climate,soil property,and some other factors had common effects on jujube fruit quality.So the source and planting area must be considered when fruit was deep processing.

【题目】冬季刺参养殖环境与肠道内细菌菌群的研究
【中文关键词】刺参(Apostichopus japonicus Liao); 肠道菌群; ARDRA; 分子鉴定; 16S rDNA
【英文关键词】Sea Cucumber; Intestinal bacteria; ARDRA; Molecular identification; 16S rDNA
【中文摘要】运用传统细菌分离培养与分子生物学技术相结合的方法, 对 2008 年 11 月至 2009 年 1 月冬季刺参(Apostichopus japonicus Liao)养殖池塘环境(养殖水、底泥、附着基)及刺参肠道内的细菌菌群进行了分析。应用平板稀释涂布培养计数法测得刺参养殖池塘水体、底泥、附着基和肠道细菌数量分别为0.75×10 2 ~1.4×10 4 cfu/mL、8.7×10 4 ~8.1×10 5 cfu/g、3.8×10 5 ~2.8×10 6 cfu/g、7.1×10 5 ~ 1.5×10 7 cfu/g; 根据形态学差异从培养所得的细菌中筛选得到 22 株菌, 用限制性内切酶 Rsa I 和 Msp I 对所分离菌株进行ARDRA (Amplified rDNA Restriction Analysis)分析, 这 22 株菌被分为 8 种不同的分类单元(Operational Taxonomic Unit, OTU), 其中 OTU2 与 OTU3 所包含的菌株分别占分离菌株种数的 30%和 20%; 此外, 作者对不同环境培养所得的优势度最高的细菌进行分子鉴定分析。结果表明: 水环境中优势菌为施氏假单胞菌(Pseudomonas stutzeri)、门多萨假单胞菌(Pseudomonas mendocina)及巨大芽孢杆菌(Bacillus megaterium), 沉积物中优势菌为巨大芽孢杆菌(B.megaterium)、施氏假单胞菌(P.stutzeri)、苏云金芽孢杆 菌 (Bacillus thuringiensis), 附 着 基 中 优 势 菌 为 巨 大 芽 孢 杆 菌 (B. megaterium) 、 苏 云 金 芽 孢 杆 菌(B.thuringiensis), 灿烂弧菌(Vibrio splendidus), 肠道中优势菌为巨大芽孢杆菌(B. megaterium)、苏云金芽孢杆菌(B.thuringiensis), 灿烂弧菌(V.splendidus)、施氏假单胞菌(P.stutzeri)。通过对冬季刺参池塘细菌菌群多样性分析和优势菌鉴定, 为筛选低温益生菌和防治刺参疾病提供了有益参考。
【英文摘要】Studies on the bacteria community in the intestine and culture environment of Apostichopus japonicus in winter were conducted using tranditional bacterial cultivation method combined with molecular biology techniques during the period between November 2008 to January 2009. The total numbers of bacteria in the pond water, the sediment, the cultch and A. japonicus intestine, estimated by the tranditional bacterial cultivation method, ranged from 0.75×10 2 to 1.4×10 4 cfu/mL, 8.7×10 4 to 8.1×10 5 cfu/g, 3.8×10 5 to 2.8×10 6 cfu/g and 7.1×10 5 to 1.5×10 7 cfu/g, respectively. Twenty-two strains were isolated judged by the morphological characteristics of bacteria cultured on the plates. ARADA analysis with restriction enzymes Rsa I and Msp I revealed that the 22 strains were divided into 8 Operational Taxonomic Units (OTUs), which were dominated by OTU2 and OTU3 that accounted for 30% and 20% of the total isolated strains, respectively. Molecular identification was employed to identify the dominant bac-teria in different environments. It was shown that the dominant bacteria were Pseudomonas stutzeri, P. mendocina, and Bacillus megaterium in the pond water; B. megaterium, P. stutzeri, and Bacillus thuringiensis in the sediment; B. megaterium, B. thuringiensis, and Vibrio splendidus on the cultch; B. megaterium, B. thuringiensis, V. splendidus, and P. stutzeri in the sea cucumber intestine. The result of this experiment may be helpful for hypothermia probiot-ics isolation and disease prevention in sea cucumber culture.

【题目】微型无人飞机遥感影像后期处理技术方法研究
【中文关键词】微型无人飞机;几何纠正;二级校正
【英文关键词】The Miniature Unmanned Aircraft; geometry corrects; dual geography check
【中文摘要】微型无人飞机遥感对于影像的采集具有低成本、高精度、快速度的特点,但是获取的数码图像畸变很大不能直接使用。以吐鲁番市葡萄沟景区、和布克赛尔县景区和克拉玛依市化学工业园区的航拍影像为研究对象,对造成误差的

各种因素进行分析,归纳总结出引起影像几何变形的因素主要可以分为有规律的系统性因素和无规律的非系统性因素,并针对这些因素提出畸变纠正和“二级校正”的思路和方法。通过实际应用,表明这种影像的后期处理方法和流程是有效可行的,可为资源调查和灾害应急调查提供有力的技术方法和数据支撑。

【英文摘要】The miniature unmanned aircraft remote sensing has the characteristics of low cost, high accuracy and quick speed for image gathering. But the images cannot be used directly because the geometry distortion. Based on image analyze on Tulufan Vineyard, the Scenic Region of Hebukesaier County and Kelamayi Chemical Industry Park as the investigated objects, we have summarized the factors which cause geometry distorts mainly to be possible to divide into the orderly systematic factor and the disorder non-systematic factor, and proposed the distortion correction method and the “dual geography check” method. The practical application indicated that these kinds of processing method are effective and feasible, and may provide the powerful data support for the resources investigation and disaster emergency investigation.

【题目】Effects of materials, incubation time and colors of artificial shelters on behavior of juvenile sea cucumber Apostichopus japonicus

【中文关键词】无

【英文关键词】Sea cucumber Apostichopus japonicas Artificial shelter Material Incubation time Color

【中文摘要】无

【英文摘要】In the present studies, the effects of various artificial shelters on behavior of juvenile sea cucumber, Apostichopus japonicus, were evaluated. The preferences of animals in the experiments with eight different artificial material shelters were compared, and showed that shelters of stone, cement pipe, polywoven fabric (a synthetic woven material mainly composed of polypropylene), ceramic tile and PVC (polyvinylchloride) pipe attracted significantly more animals than low-pressure polyethylene pipe, wood block and corrugated PVC board ($P < 0.05$). The influences of shelters pre-incubation for 0.5 M (month), 1 M, 1.5 M and 2 M to grow biofilm on the shelter selection of the animals were compared with non-incubation shelters (0 M), and showed that the numbers of the animals attracted by incubated shelters were significantly greater than that without incubation, and the 1.5 M shelters attracted significantly more sea cucumbers than other treatments ($P < 0.05$) except 2 M ($P > 0.05$). Among six color shelters white shelter attracted less juvenile A. japonicus than green, red and blue ones, and there were no significant differences among white, yellow and black shelters ($P > 0.05$). 【题目】Sedimentation and sediment characteristics in sea cucumber Apostichopus japonicus (Selenka) culture ponds
【中文关键词】无
【英文关键词】sea cucumber ponds sedimentation sediment chlorophyll pheophytin POC PON TP
【中文摘要】无
【英文摘要】Annual sedimentation, re-suspension rates and contents of particulate organic carbon (POC), particulate organic nitrogen (PON) and total phosphorus (TP) in the sediment were investigated in two sea cucumber culture ponds at Rongcheng, Shandong Province, China. The results showed that the average flux of total particulate matter in the ponds was 22.1 g m2 d-1. The average re-suspension rate of the sediment in the ponds was 81.7%. The re-suspension rates in spring and autumn were higher than those in summer and winter. The mean contents of POC, PON and TP in the sediment of the ponds were 4.4, 0.5 and 0.6 (mg g-1), respectively, and the mean contents of Chlorophyll a (Chl a) and pheophytin in the sediment were 8.1 and 12.1 mu g g-1 respectively. The POC, PON and TP contents in the sediment of the ponds increased during the period of sea cucumber aestivation (summer) and hibernation (winter), while they decreased during the feeding periods. The organic matter accumulation rate and the contents of POC, PON, TP, Chl a and pheophytin in the sediment were even lower than those in the pond without sea cucumber ($P < 0.05$). The results demonstrated that sea cucumber culture can effectively stop nutrient accumulation at the bottom of the cucumber culture ponds.

【题目】双歧杆菌肽聚糖结构及分子量的分析*
【中文关键词】双歧杆菌,肽聚糖,结构,分子量
【英文关键词】Bifidobacterium thermophilum , Peptidoglycan , Structure , Molecular weight
【中文摘要】从双歧杆菌细胞壁中分离纯化肽聚糖,研究其化学成分、结构和分子量分析。经氨基酸、多糖和蛋白质含量分析和肽聚糖的溶解实验鉴定,所提取物质的主要成分为肽聚糖;经核磁共振和红外光谱分析,所提取肽聚糖的结构与已知的肽聚糖的结构相吻合,其糖链结构为由 D 型吡喃糖 N2乙酰葡糖胺和 N2乙酰胞壁酸以β21,42糖苷键连接而组成;经 SDS2PAGE 和多种染色方法结合,分析经溶菌酶水解后的肽聚糖,其分子量的分布呈弥散状,范围在 9716kD 到 1414 kD 之间。
【英文摘要】PG derived from Bifidobacterium thermophilum was separated and purified from the cell wall , and involved in research and analysis of its chemical compositions , structure and molecular weight. The major component of the preparation was validated to be peptidoglycan by animo acid analysis, polysaccharides and protein determination , dissolution by lysozyme. NMR and Infrared spectrum substantiated the glycan chain of peptidoglycan was connected by D-pyranose Nacetylglucosamine and N-acetylmuramic acid through β-1,4 glycosidic bond. SDS-PAGE and multistain suggested that the molecular weight of soluble peptidoglycan showed certain diffusibility , and its ranged from lower than 97.6 kD to higher than14.4 kD.

【题目】Sediment-water Fluxes of Nutrient and Dissolved Organic Carbon in Extensive Sea Cucumber Culture Ponds
【中文关键词】无
【英文关键词】Nutrient fluxes Pond sediment Sea cucumber Polyculture
【中文摘要】无
【英文摘要】Sediment samples were collected from three seawater aquaculture ponds, and soil characteristics, sediment oxygen consumption (SOC), dissolved organic carbon (DOC) and nutrient fluxes were measured using chamber incubations at laboratory. The three ponds were each representing a specific monoculture or polyculture model of sea cucumber. Total organic carbon (TOC) and total nitrogen (TN) contents in the dry sediment ranged from 0.14 to 0.26% and 0.022 to 0.037%, respectively. Total phosphorus (TP) contents in the sediment were more spatially and temporally variable. SOC ranged from 15.29 to 45.86 mmol m(-2) d(-1) and showed significant differences among the three ponds ($p < 0.05$). TOC, total carbon (TC) contents, and SOC of the sediment in the pond polycultured with jellyfish increased with culture time, indicating that jellyfish farming enhanced the accumulation of organic matter in the sediments to some extent. Sediment showed net nitrate and ammonium uptake in most ponds and months, and significant differences were found among months ($P < 0.05$). Dissolved inorganic phosphate (DIP) was released from the sediments in all ponds with low flux rates. DOC was released from the sediment in all ponds and ranged from 0.67 to 1.74 g DOC m(-2) d(-1). The results suggested that non-artificial-feeding sea cucumber culture ponds could not only yield valuable seafood products, but also effectively remove nutrients from the aquaculture systems and consequently alleviate nutrient loadings of the nearby coast.

【题目】Drawback of loop-mediated isothermal amplification
【中文关键词】无
【英文关键词】Loop-mediated Isothermal Amplification, LAMP, Foodborn Salmonella, raw milk, sensitivity
【中文摘要】无
【英文摘要】Loop-mediated isothermal amplification (LAMP) was a novel nucleic acid amplification method that amplified DNA with high specificity, efficiency and rapidity under isothermal conditions using a set of four specially designed primers and a DNA polymerase with strand displacement activity. In our research,LAMP was developed to detect foodborn Salmonella in raw milk, a set of six primers, two outer, two inner and two loop primers, were designed from Salmonella genomic DNA targeting invA. Temperature condition for detection of Salmonella was optimized to be 61 ° C. At the same time, LAMP was found to be effective when the template was pure; however, the usefulness of LAMP methods can be limited by the presence of inhibitors in the analysis of raw milk, unlike all the reports about LAMP, the sensitivity of LAMP was lower than that of PCR methods.

【题目】北方海区鼠尾藻大规格苗种提前育成的技术
【中文关键词】鼠尾藻 大规格苗种 提前采苗 种菜 促熟 规模化繁育
【英文关键词】Sargassum thunbergii Large-size seedling Early seed collection Broodstock thallus Maturation acceleration Large-scale seedling production
【中文摘要】通过连续3年的鼠尾藻生产性育苗试验,证明在北方海区提前育苗技术可行。该技术克服了鼠尾藻种苗繁育过程中难以培育出大苗的难题,通过提前50d采苗,缩短室内培育周期,采用种菜人工促熟方法,结合室内及海上培育、管理的各种技术措施,得到的种苗健壮、均匀,整齐。共培育出鼠尾藻大规格苗种3373.7万株,经海上中间培育3个多月后,幼苗直立枝数量3~4根、长度可达4~6cm。
【英文摘要】A method for early production of large-size Sargassum thunbergii seedling in north China was developed, which consisted of procedures such as 50 d advancement of seed collection, timesaving of indoor cultivation and accelerated artificial maturation of broodstock thalli. This method should be used in combination with a set of off-shore mariculture and management techniqes. It is applicable in north China as proved by trials for three consecutive years. About 33.737 million healthy seedlings with uniform size were bred with this method, which grew into vertical young thalli (4~6 cm in length) with 3~4 branches after being cultured off-shore for over three months. This method overcomes the difficulty of breeding large-size seedlings met in previous S. thunbergii seedling production practice, and will certainly facilitate the large scale seedling production and cultivation of S. thunbergii.

【题目】不同类型附着基对刺参生长和存活影响
【中文关键词】刺参 附着基 成活率 生长
【英文关键词】sea cucumber(Apostichopus japonicus) Selenka shelter survival rate growth
【中文摘要】附着基是刺参(Apostichopus japonicus,Selenka)池塘或围堰养殖水体中设置的专用养殖设施,其功能主要是为刺参提供避光场所和培养刺参的天然饵料。本实验比较研究了石头、瓦片、塑料管、空心砖和水泥管5种不同附着基处理对刺参(规格为5.0 g±2.0 g)生长和存活的影响。结果表明,不同附着基上异养菌含量差异显著,5月附着基上异养菌含量显著的低于11月;石头附着基刺参的成活率最高,但其生长速度较慢;空心砖刺参的生长速度最快,成活率略低于石头;空心砖和石头附着基处理刺参产量显著高于其他附着基,瓦片、塑料管和水泥管上海参产量之间差异不显著。仅从养殖效果上看,目前较为流行的5种刺参附着基以空心砖较好。
【英文摘要】Shelters are a type of farming equipment especially used in sea cucumber pond and sea ranching.They can provide shelter and culture natural food for sea cucumber.The study was conducted in twenty 8 m(L)×8 m(W)×2 m(H) net enclosures to investigate the optimal shelter through measuring the growth,survivalship and yields of sea cucumber(Apostichopus japonicus Selenka) with an initial size of(5.0±2.0) g for different shelter types of stone(ST),cement pipe(CP),earthenware(EA),brick(BR),and plastic pipe(PL) from 20th May 2007 to 20th April 2008.The results showed: the numbers of bacteria on the shelters were different significantly among shelter types and higher in Nov.2007 than in May 2008.The highest survival rate of sea cucumber was gained in ST where sea cucumber growth rate was slow.Sea cucumber grow fastest in BR where,however,the survival rate was lower than in ST.The yields of sea cucumber in BR and ST were significantly higher than in the other shelters where there was no significantly difference in yield.Based on the results obtained in the present study,it could be concluded that BR shelter was the best one for sea cucumber culture among the popular 5 shelter types.

【题目】不同营养盐因子对鼠尾藻氮、磷吸收速率影响
【中文关键词】鼠尾藻 氮 磷 吸收速率
【英文关键词】Sargassum thunbergii nitrogen phosphorus uptake rate
【中文摘要】评估鼠尾藻作为净化海水水质的可行性,在实验室条件下,研究营养盐因子对鼠尾藻(Sargassum thunbergii)氮、磷吸收速率的影响。结果表明:(1)氮、磷浓度对鼠尾藻氮、磷吸收速率影响极显著(P<0.01)。鼠尾藻对氮、磷吸收速率随着溶液中的氮、磷浓度的升高而升高,在本研究条件下,未出现吸收饱和现象。在氮浓度为200 μmol·L-1时,氮吸收速率最大.为2.48 μmol·g-1·h-1;在磷浓度为13.33 μmol·L-1时,磷吸收速率最大,为0.11 μmol·g-1·h-1。(2)不同氮磷比、氮浓度对鼠尾藻氮、磷吸收均具有极显著的影响(P<0.01),且二者对氮、磷吸收速率的交互作用极显著(P<0.01)。氮最大吸收速率发生在氮浓度为200 μmol·L-1、氮磷比为5:1时,而磷的最大吸收速率发生在氮浓度为80 μmol·L-1、氮磷比为5:1时。(3)鼠尾藻对氨氮和硝酸氮两种化合态氮的吸收速率与其在培养液中所占总氮的比例成正相关,总氮吸收速率在氨氮:硝酸氮为10:1时较低,其它处理的吸收速率无显著差异(P>0.05);鼠尾藻对总磷的最大吸收速率出现在氨氮:硝酸氮为3:1时,之后磷吸收速率随着氨氮比率下降而下降。

【英文摘要】The effects of nutrient factors on the uptake of N and P by Sargassum thunbergii were studied un- der laboratory conditions.The uptake rates of N and P by seaweed increased with the increase of concentrations of N and P in the solution,and no saturation in the uptake of N and P occurred.Concentrations of N and P have significant influences on N and P uptake by seaweed(P<0.01).The highest N uptake rate was 2.48 μ mol · g-1 · h-1,which occurred at 200 μ mol · L-1N in the solution,while the greatest P uptake rate was 0.11 μ mol · g-1 · h-1,which occurred at 13.33 μ mol · L-1p in the solution.The ratio of N to P and concentration of N in the solution have significant effects on the N and P uptake rates by seaweed(P<0.01),and significant in- teractive effects were found between them(P<0.01).The highest N uptake rate occurred at 200 μ mol · L-1N in the solution and 5:1 of N to P,while the highest P uptake rate occurred at 80 μ mol · L-1N and 5:1 of N to P.The inhibition between NH4+-N and NO3--N did not occur in this study.The uptake rates of two chemical forms of N were proportional to their amounts in the solution.The lowest uptake rate of total N occurred at 10:1 of NH4+-N to NO3--N,and there was no significant difference among other treatments.The uptake rate of total P was the highest at 10:1 of NH4+-N to NO3--N,then decreased with the decrease of the ratio of NH4+- N to NO3--N in the solution.

【题目】刺参不同养殖模式实验围隔内沉积物——水界面营养盐通量研究

【中文关键词】N、P通量 沉积物——水界面 刺参 底泥呼吸 不同养殖模式

【英文关键词】fluxes of nutrients sediment-water interface Apostichopus japonicus sediment respiration different culture model

【中文摘要】研究刺参(Apostichopus japonicus)养殖模式对池塘底质的影响,于2007年5~11月间从不同养殖模式实验围隔内采得底泥样并通过实验室培养的方法测定了底泥耗氧率(SOD)及沉积物—水界面的N、P等。结果表明,投饵对SOD影响不显著(P>0.05),说明本实验条件下投饵没有造成实验围隔底泥中的有机物积累;7月份的SOD与其它月份间存在显著差异(P<0.05);大部分模式中沉积物释放溶解性无机磷酸盐(DIP)且不同月份之间的通量存在显著差异(P<0.05),不同模式之间的变化较复杂;在硝酸盐(NO3-+NO2-)通量结果中,投饵模式下的平均通量为非投饵模式下通量值的2~3倍,夏季的交换通量为冬季交换通量的2倍;当养殖密度较大时,非投饵模式中沉积物吸收氨氮的通量大于投饵模式中的通量,其它密度下投饵模式中沉积物释放氨氮的通量大于非投饵模式中的通量,并且随着养殖密度的增加通量值降低。

【英文摘要】Sediment samples were collected from different sea cucumber (Apostichopus japonicus) experimental enclosures from May to November in 2007, and sediment-water fluxes of oxygen, nitrogen and phosphorus were investigated using laboratory chamber incubations. Sediment oxygen demand (SOD) in July was significantly different from those in the other months(P<0.05), and SOD values in enclosures were not significantly different between feed model and unfed model(P>0.05), indicating that feeding did not lead to enriched sediments. Dissolved inorganic phosphate (DIP) was released from the sediments in most enclosures. The fluxes of DIP of different months were significantly different(P<0.05) and the variations of the fluxes in different feeding models were more complex. Fluxes of nitrate + nitrite (NO-3+NO-2) in the enclosures with feeding models were two to three times higher than those with non-feed models, and in summer they were higher than in winter. Fluxes of ammonium uptaken by sediments in the enclosures with feeding models were greater than those with non-feed models when sea cucumber density was high. Fluxes of ammonium released from sediments were increased with increasing cultural density with enclosures of non-feed models greater than those of feeding models.

【题目】刺参池塘低温有机污染物降解细菌的分离筛选及其降解特性
【中文关键词】刺参 池塘 低温有机污染物降解菌 筛选 细菌鉴定 降解特性
【英文关键词】Apostichopus japonica rearing ponds low-temperature organic-pollutant-degrading bacteria screen-ing and selection bacterial identification degrading characteristics
【中文摘要】利用刺参(Apostichopus japonicus)饵料培养基,在低温(16±1)℃下,从刺参养殖池塘环境中富集驯化分离有机污染物低温降解细菌;根据菌株生长情况、好氧性和生物安全性进行了初步筛选,然后在菌体接种密度1×106 CFU/mL、(16±1)℃、pH 8.0、160 r/min条件下,通过检测菌株对饵料中有机物(COD)和氨态氮(NH4+-N)成分的去除率来最终筛选获得优良低温有机污染物降解细菌,并对其降解特性进行研究。菌株筛选结果表明,从分离的17株低温细菌中共获得3株菌株DR7、DR8和DR11,它们能同时高效降低和去除饵料浸出物中COD和NH4+-N,5 d COD去除率分别为37.7%、50.0%和21.0%,NH4+-N去除率分别为95.0%、98.0%和99.8%。根据菌株的形态特征、生理生化特性以及16S rRNA序列分析,初步鉴定DR7和DR11属于假单胞菌属细菌(Pseudomonas sp.),DR8属于副球菌属细菌(Paracoccus sp.)。菌株降解特性研究结果表明,菌株培养时间对饵料降解有显著影响(P<0.05),在0~6 d内3菌株对饵料中有机物和氨态氮的去除过程明显,其中DR8降解力最强;各组合菌株的饵料降解效果差异显著(P<0.05),但并不完全优于对照单菌株,其中最佳组合为DR8-DR11。研究认为,筛选的3株低温有机污染物降解细菌为良好的菌种资源,在刺参养殖池塘污染环境调控及刺参微生态制剂的研制方面具有较好的潜在应用前景。
【英文摘要】Low-temperature organic-pollutant-degrading bacteria were isolated from sea cucumber(Apostichopus japonicus) outdoor rearing ponds after enriching the liquid sea cucumber feed-medium and acclimating at(16±1)°C.All of the bacterial strains were preliminarily selected by evaluating their aerobic growth on sea cucumber feed-medium and verifying their specificity for the sea cucumber.The bacteria were finally selected by evaluating their ability to degrade organic pollutants(COD) and ammonia nitrogen(NH4+-N) in the feed-medium,with an inoculation of 1.0×106 cfu/mL.Culture conditions were(16±1)°C,pH 8.0 and a shaking rate of 160 r/min.After screening of 17 bacterial isolates,three bacterial strains(DR7,DR8 and DR11) were selected.These strains were able to degrade the feed over 5 d with COD removal rates of 37.7%,50.0% and 21.0%,and NH4+-N removal rates of 95.0%,98.0% and 99.8%,respectively.From morphological and physio-biochemical analyses,and 16S rRNA sequence similarity analysis,strains DR7 and DR11 were identified as Pseudomonas sp.,and strain DR8 as Para-coccus sp.The time course of degradation of the feed was observed by examination of the concentrations of the organic pollutants and ammonia-nitrogen in the liquid sea cucumber-feed-medium between 0 d and 6 d.Bacterial cultivation time had a significant effect on the feed-degrading activities of the three strains(P<0.05).Based on the dynamics of feed degradation,strain DR8 was considered to be the most effective of the three strains.Significant differences(P<0.05) were also observed in the combined feed-degrading capacities of mixtures of the strains.The optimal combination was considered to be DR8 + DR11.However,the overall feed-degrading abilities of the combined strains were not much better than that of the single strain.We conclude that the 3 low-temperature or-ganic-pollutant-degrading bacteria screened in this study are useful bacterial resources,which could show good potential for pollution control in sea cucumber culture ponds and the development of probiotics for sea cucumber culture.

【题目】在仿刺参体腔液中发现新的调理素样分子
【中文关键词】仿刺参;吞噬细胞;体腔液;调理素样分子
【英文关键词】Apostichopus japonicus;phagocyte;coelomic fluid;opsonin—like molecule
【中文摘要】通过研究发现,仿刺参体腔液中存在一种新的调理素样分子。通过SDS—PAGE,凝胶过滤层析,质谱分析等方法进行蛋白质的纯化和分析,采用荧光显微镜观察吞噬细胞对酵母细胞的吞噬作用,发现一种分子量约为18 kDa的分子可以结合到酵母细胞表面,并可以增强吞噬细胞的吞噬作用。推测这种分子是无脊椎动物调理素样分子中的新成员。同时也发现,虽然调理素样分子能够增强吞噬细胞的吞噬作用,但是,它不是单独起作用的,仍然必须依赖体腔液中其他未知成分,而对未知成分的鉴定需要进一步研究。

【英文摘要】In order to determine if opsonin—like molecules exist in the coelomic fluid of sea cucumber Apostichopus japonicus and identify their properties,immunochemical methods including phagocytosis assay,SDS- PAGE,gel filtration and mass spectrometric analysis were performed.The phagocytosis of sea cucumber phagocytes was quantified in vitro using heat—killed yeast cells as target cells.Phagocytes of the sea cucumber were capable of phagocytosis in isotonic buffer,cell—free coelomic fluid(CFCF)and yeast cell-adsorbed CFCF.but the phagocytosis was significantly enhanced when the incubation medium was CFCF.This phagocytosis promoting activity of CFCF was eliminated by pre—adsorption of CFCF with yeast cells.SDS-PAGE analysis showed that a protein with 1 8 kDa was able to bind to yeast cells.By using gel filtration,the protein was isolated from coelomic fluid of the sea cucumber.Functional test of this molecule demonstrated that it was a phagocytosis—enhancing opsonin-like mole. cule.However,the phagocytosis-enhancing function of the opsonin-like molecule was dependent on some unknown factor(S)in the CFCF,which needs further investigations.Mass spectrometric analysis indicated that this opsonin— like molecule is a new protein.

【题目】刺参养殖池塘环境有机物降解菌固定化的初步研究
【中文关键词】马氏副球菌 固定化 沸石粉 COD 氨氮 亚硝氮
【英文关键词】Paracoccus marcusii immobilization zeolite Chemical Qxygen demand ammonia nitrogen nitrite nitrogen
【中文摘要】本文以沸石粉作为固定化载体,对一株刺参(Apostichopus japonicus)养殖池塘环境低温有机物降解菌(马氏副球菌Paracoccus marcusii,菌株编号DB11)的固定化技术进行了初步研究,并比较了固定化后有机物降解菌对主要水质参数的降解效果。结果表明,固定化时间、温度、pH和摇床转速均显著影响沸石粉对菌体的吸附率(P<0.05)。在本研究条件下,固定化时间90min、温度16℃、pH值5.8和摇床转速180rpm/min为沸石粉对DB11菌株的最佳固定化条件。菌体固定化以后可以显著提高其对水体中COD、NH4+-N和NO2--N的降解效果,与游离菌体相比,固定化后菌体对COD、NH4+-N和NO2--N的降解率分别达到了56.2%、51.0%、78.3%,降解率则分别提高了11.2%、10.4%和5.29%。鉴于此,以沸石粉作为载体对马氏副球菌进行固定化的技术在刺参池塘养殖的水质和底质环境修复实践中可能具有较大的应用价值。
【英文摘要】Using zolite as carrier, the preliminary study of immobilization of the low-temperature bacteria(Paracoccus marcusii,strain NO. DB11) isolated from sea cucumber culturing ponds was carried out. Their degradation effects on artificial aquaculture sewage water were compared.In this paper, the factors influencing the immobilization and the degradation of waste water in aquaculture by the stain DB11 were studied. The results show that, the adsorption time, pH, temperature and rotations can significantly influenced the effect of immobilization(P<0.05). In this study, the optimum immobilization conditions for the immobilization were adsorption time 90min, temperature 16℃, pH value 5.8 and shaker rotations 180rpm/min. The purification efficiency by immobilized bacteria is much higher than that by free bacteria. The removal rate of COD, NH4+-N and NO2--N reached 56.2%, 51.0%, 78.3% and the degradation rate were increased by 11.2%, 10.4% and 5.29% respectively. In view of this, the zeolite powder as a carrier for immobilized Paracoccus marcusii technology may have greater value in sea cucumber culture pond water quality and sediment environmental restoration practice.

【中文关键词】能值 刺参 能值产生率 环境负载率 能值可持续发展指标
【英文关键词】emergy sea cucumber(Apostichopus japonicus) mergy yield ratio(EYR) emergy loading ratio(ELR) emergy sustainable index(ESI)
【中文摘要】利用能值(emergy)理论对我国北方刺参(Apostichopus japonicus)养殖池塘的经济收益和环境可持续性进行分析.利用能量系统模型符号构建了刺参池塘的能值图,并对刺参池塘能值的各部分分布进行了分析.通过比较刺参养殖池塘和几种集约化鱼类养殖池塘的能值产生率(emergy yield ratio,EYR)、环境负载率(emergy load-ing ratio,ELR)和能值可持续发展指标(emergy sustainable index,ESI),表明刺参养殖池塘单位能值投入的收益明显高于鱼类的集约化养殖模式,其可持续性和环境容纳量均较高。
【英文摘要】The economic income and environmental sustainability of sea cucumber(Apostichopus japonicus) culture in northern China was analyzed using the emergy approach.Schematic diagram of sea cucumber ponds with emergy symbols was built to analyze the emergy of different parts in sea cucumber earthen ponds.Emergy yield ratio(EYR),emergy loading ratio(ELR) and emergy sustainable index(ESI) were selected to evaluate the sustainability and carrying capacity of sea cucumber ponds and several integrated fish and shrimp culture model.The results showed that the EYR in sea cucumber culture was higher than that in integrated fish and shrimp culture,and sea cucumber culture gained higher sustainability and carrying capacity.

【题目】鼠尾藻生长、藻体成分及其生境初步研究
【中文关键词】鼠尾藻 生长 藻体成分 氮 磷
【英文关键词】鼠尾藻 生长 藻体成分 氮 磷
【中文摘要】对威海小石岛附近海区鼠尾藻(Sargassum thunbergii)的生长、藻体成分和水体中氮、磷等营养元素的月份变动情况进行了初步研究。结果表明,研究海区水体中硝酸氮的含量具有明显的月份变化,5~10月含量较低,11~4月含量较高;相对于硝酸态氮,氨氮的含量较低,随月份变动也较小;总无机氮的含量变化与硝酸氮含量变化趋于一致;总无机磷含量随月份的变动也较大,在2~6月含量较低,11~1月含量较高。鼠尾藻生长有着明显的月份变化,4~5月生长最快,6~7月藻体达到最大长度;侧枝一般在4月开始出现,7月达到最长。对鼠尾藻体内的碳、氮、磷、碳水化合物以及色素进行测定的结果表明,鼠尾藻体内的碳含量变化较小,一般在25.6%~33.0%之间;氮的含量变化较大,12~5月含量较高,超过3%,7~11月含量较低,低于3%;磷的含量也具有很大的波动,在11~4月含量较高,5~10月含量较低。色素含量具有明显的月份变化,12~3月含量较高,7~10月含量较低。碳水化合物含量在4~7月时较高,最低出现在8~9月。
【英文摘要】A preliminary anniversary investigation was conducted on Sargassum thunbergii at Xiaoshidao,Weihai.The growth and chemical compositions(C,N,P,pigment and carbohydrate)of S.thunbergii were investigated and the fluctuations of environment factors(temperature,salinity,and pH)and nutritional content(N,and P)around S.thunbergii were measured monthly at the same time.The results showed that the content of NO3-in the water was changed significantly monthly,which was lower from May to October,and higher from November to April.Compare wih NO3-,the content of NH4+ was low and small changed with month.The content of total inorganic N showed the same trends as NO3-in the water.The content of total inorganic P fluctuated sharply with month,which was lower from February to July,while higher from November to January.The growth of Sargassum thunbergii was changed significantly with month.Their growth rate was higher at April and May,and the greatest length at Yune and july.Lateral branches appeared at April,and the greatest length at July,however,disappeared at August.Receptacles appeared at May and matured at later July.Carbohydrate content of S.thunbergii was from 25.6% to 33.0%,which had small change with month.N concentration in S.thunbergii fluctuated significantly with month,which showed the same trend as NO3-concentration in the water.P concentration in the algae also showed significant change with month,which was higher from November to April,and lower from May to October.The pigment content was significantly changed with month,and its content was higher from December to March,while lower from July to October.The content of carbohydrate was higher from April to July,while lower at August and September.

【题目】投饵与不投饵池塘刺参肠道异养菌区系的比较
【中文关键词】异养菌 肠道 刺参
【英文关键词】Heterotrophic bacterial flora Intestine Apostichopus japonicus
【中文摘要】从2007年6月到2008年5月,对威海市荣成不投饵刺参养殖池塘和青岛市胶南投饵刺参养殖池塘内的刺参肠道内的异养细菌总活菌数的周年变化进行了调查,并分析了刺参肠道内异养细菌的区系组成。结果表明,投饵与不投饵池塘中刺参肠道内活菌的数量随季节总体变化趋势相似,均为春夏季较低,秋冬季较高,但不投饵池塘刺参肠道内活菌数量在0.01水平显著高于投饵池塘。通过对分离得到的菌株鉴定,发现308株细菌分别属于20个属。在投饵和不投饵池塘中,刺参肠道内的优势菌均为弧菌、假单胞菌和芽孢杆菌,但在投饵池塘中,刺参肠道内的弧菌和芽孢杆菌的比例明显高于不投饵池塘,假单胞菌和其他细菌的比例则明显低于不投饵池塘。不投饵池塘刺参肠道细菌Shannon-Wiener多样性指数在夏季明显高于投饵池塘,其他季节差异不明显。从异养细菌的种类组成看,色杆菌属、Endozoicimonas、瑰杆菌属、副球菌属、短杆菌属、Jeotgalicoccus、Glaciecola仅出现在不投饵池塘刺参肠道内,而屈扰杆菌属、希瓦氏菌、八叠球菌属则仅出现在投饵池塘刺参肠道内。
【英文摘要】Seasonal variation of heterotrophic bacterial flora associated with the intestine of sea cucumber(Apostichopus japonicus) was investigated in the feeding ponds in Jiaonan,Qingdao and unfeeding ponds in Rongcheng,Weihai.Results showed that the total viable counts(TVC) of bacteria in the intestine of sea cucumber in two types of ponds exhibited similar tendency with seasons,which was high in spring and summer but low in autumn and winter.However,TVC of bacteria in the intestine of sea cucumber in the unfeeding ponds was significantly higher than that in feeding ponds($P<0.05$).Altogether,20 genera were identified from the intestine of sea cucumber.Vibrio,Pseudonomas and Bacillus were the most abundant species in both feeding and unfeeding ponds.However,the percentages of both Vibrio and Bacillus to total heterotrophic bacterial species isolated from the intestine of sea cucumber in the feeding ponds were significantly higher than those in the unfeeding ponds($P<0.05$).According to the calculation of Shannon-Wiener diversity index,the diversity of heterotrophic bacterial flora in the intestine of sea cucumber in the unfeeding ponds was higher than that in the feeding ponds.Additionally,the species of Chromobacterium,Endozoicimonas,Roseobacter,Paracoccus,Brachybacterium,Jeotgalicoccus,Glaciecola were only found in the intestine of sea cucumber in the unfeeding ponds,and Flexibacrer,Shewanella,Sporosarcina were only isolated from the intestine of sea cucumber in the feeding ponds.

【题目】温度、盐度和光照强度对鼠尾藻氮、磷吸收影响
【中文关键词】鼠尾藻 温度 盐度 光照强度 氮 磷 吸收速率
【英文关键词】Sargassum thunbergii temperature salinity light intensity nitrogen phosphorus uptake rate
【中文摘要】在实验室条件下,研究了不同的温度和盐度组合,温度和光照强度组合对鼠尾藻(Sargassum thunbergii)氮、磷吸收速率的影响。结果表明,上述3个环境因子对鼠尾藻氮、磷吸收速率均有显著影响。其中,温度和盐度对鼠尾藻氮、磷吸收速率有极显著影响(P<0.01),二者交互作用也极显著(P<0.01)。在盐度20、温度25°C条件下和盐度30、温度30°C条件下,鼠尾藻对氮有较高吸收速率,分别为11.26 μmol/[g(dw)?h]和11.01 μmol/[g(dw)?h];在盐度40、温度15~30°C范围内对磷的吸收速率较大,达到1.5 μmol/[g(dw)?h]以上。温度和光照对鼠尾藻氮、磷吸收速率均有极显著影响(P<0.01),二者交互作用极显著(P<0.01)。在温度15°C和光照强度140~180 μE/(m2?s)以及温度20~25°C和光照强度60~100 μE/(m2?s)条件下,鼠尾藻对氮有较高吸收速率,均在9.60 μmol/[g(dw)?h]以上;在温度25°C和光照强度60 μE/(m2?s)条件下,鼠尾藻对磷的吸收速率达到最大,为1.30 μmol/[g(dw)?h]。本研究结果表明,鼠尾藻总体上对水体中的氮、磷均具有较高的吸收速率,且能较好地同时吸收NH4+-N和NO3--N,显示了它对海水环境中营养盐具有较强的吸收能力。
【英文摘要】There was a close relationship between ambient nutritional concentrations and nutritional content in macroalgae. Previous studies revealed that it was a feasible way to apply seaweeds to assimilate nutrient, i.e., nitrogen, phosphorus, etc., in eutrophic water environment. Sargassum thunbergii,as a kind of macroalgae, has great importance in feed, nutrition, medicine and industry. So most studies focused on the growth and reproduction of S. thunbergii, however,while few studies were reported about their nutritional uptake until now. In this study,the effect of temperature,salinity and light intensity on the uptake of nitrogen and phosphorus by Sargassum thunbergii were investigated under laboratory conditions. Two two-factor experiments were designed. Part one:S. thunbergii were exposed to the combinations of temperature (10°C,15°C,20°C,25°C,30°C) and salinity (10,20,30,40). Part two:S. thunbergii were exposed to combinations of temperatures(10 °C,15 °C, 20°C,25°C)and light intensity (20,60,100,140,180 μE/(m2 ? s). There were three replicates and one control without seaweed for each treatment. S. thunbergii were cultured in beakers with seawater containing total nitrogen of 100 μmol/L (NH4+-N： NO3--N=1：1)and phosphorus of 8 μmol/L (PO43--P) for 12 h,then nitrogen and phosphorus concentrations in the solution were measured. The results showed that all of the three environmental factors had significant effects on the uptake rates of nitrogen and phosphorus. Significant differences in the uptake rates of nitrogen and phosphorus among different temperatures or salinities were observed,and there was significant interaction between temperature and salinity as well (P<0.01). The uptake rates of nitrogen reached as high as 11.26 μmol/[g(dw)?h] and 11.01 μmol/[g(dw)?h] under moderate combinations of salinity 20 and temperature 25 °C,salinity 30 and temperature 30 °C,respectively. While in the temperature of 15-30 °C,the uptake rate of phosphorus was higher at salinity of 40 than at any other salinities,which reached up to 1.50 μmol/ g(dw)?h. There were significant differences in nitrogen and phosphorus uptake rates among different temperatures or light intensities (P<0.01). The temperatures and light intensities had significantly interactive effects on nitrogen or phosphorus uptake (P<0.01). The nitrogen uptake rates were higher at temperatare of 15 °C and light intensiy of 140-180 μE/(m2?s),20-25 °C and 60-100 μE/(m2?s),which all reached up to 9.60 μmol/[g(dw)? h]. The uptake rate of phosphorus reached 1.30 μmol/[g(dw)?h] at temperature of 25°C and light intensity of 60 μE/(m2?s),whick was the highest among all the combinations of temperatur and light intensity. Therefore, Sargassum thunbergii has high ability of uptaking nutrient from water environment,and could uptake ammonium and nitrate simultaneity.

【题目】注射一株灭活气单胞菌苗对刺参部分免疫因子的影响
【中文关键词】刺参;腐皮综合征;气单胞菌;灭活菌苗;免疫指标
【英文关键词】Ap0stichopus japonic ;skin ulcer syndrome;Aeromonas;inactivated bacterium;immunity index
【中文摘要】从患有“腐皮综合征”的刺参(Apostichopus japonicas Liao)病灶处分离出1株优势菌株,经形态学、生理生化分析以及16S rDNA分子生物学方法鉴定其为气单胞菌属(Aeromo~as)的1个种;人工感染试验证明,该菌株对刺参有一定毒力。将其制备成甲醛灭活菌苗后对健康刺参进行体腔注射,测定灭活气单胞菌苗对刺参部分免疫指标的影响,同时将生理盐水注射组作为对照。结果表明,注射菌苗浓度3.9×10 CFU/mL组刺参血清中溶菌酶活力在注射后6 h达到峰值,而4.7 x 10 CFU/mL注射组的活力在注射后24 h达到最高值;实验组的溶菌酶活力显著高于对照组(P<0.05)。在3.9×10。 CFU/mL组中,碱性磷酸酶活力于48 h达到最高值;而4.7×10 CFU/mL组在96 h达到最高值,实验组的碱性磷酸酶活力显著高于对照组(P<0.05)。相比之下,注射菌苗对血清的超氧化物歧化酶活力影响却不显著。总体上,该菌苗在一定程度上可以刺激刺参机体产生强的免疫应激反应。注射高浓度菌苗时,溶菌酶、碱性磷酸酶活力达峰所用时间较短而且显著,但其酶活力升高持续时间较短。
【英文摘要】The cultured sea cucumber(Apostichopus japonicus Liao)recently suffered from serious disease‘ skin ulcer syndrome ’which has caused massive losses.One bacterial strain was isolated from these naturally infected sea cucumber,which was the most dominant among the isolates.The bacterium was identified as Aeromonas sp · bv morph0logical,physiological and biochemical tests and 1 6S rDNA sequence analysis.Challenge test proved that it was the causative pathogen associated with the disease.The bacterium were killed by formaldehyde and used as an inactivated vaccine to inject normal sea cucumber.The immune effects were shown as follows:me highest lysozyme activities were observed at 6 h post.injection in 3.9×10 CFU/mL group,and at 24 h post—injection in 4.7×10 CFU/mL group.The alkaline phosphatase(AKP)activities reached maximum at 48 h post—injection in 3.9×10 CFU/mL group,and at 96 h post—injection in 4.7×10 CFU/mL group.However,there was no significant difference in superoxide dismutase(SOD)between the experimental groups and the control group · In enera1.the inactivated bacterium could increase the immune effects on sea cucumber.In addition,as the concentration of the inactivated bacterium was higher,lysozyme and AKP activities could reach the maximum rapidlv and significantly.But the increased activities could not last long.

【题目】温度和光照强度对鼠尾藻生长和生化组成影响
【中文关键词】鼠尾藻 温度 光照强度 生长 生化组成
【英文关键词】Sargassum thunbergii temperature light intensity growth biochemical composition
【中文摘要】在实验室条件下,研究了温度(10、15、20、25℃)和光照强度(20、60、100、140、180 μE.m-2.s-1)对鼠尾藻生长和生化组成的影响.结果表明,温度、光照强度及两者的交互作用对鼠尾藻生长均具有极显著影响.鼠尾藻在15℃和20℃下生长速率较高,随着温度的升高,达到最大生长速率所需要的光照强度有上升趋势.在10℃和15℃下,较高的光照强度对鼠尾藻生长产生了一定抑制作用,而在20℃和25℃下,其生长速率总体随光照强度的增加而增加.温度和光照强度对鼠尾藻叶绿素a、墨角藻黄素的含量影响极显著,其中光照强度的影响大于温度.总体上,叶绿素a和墨角藻黄素的含量均随着光照强度的升高而显著下降,随着温度的升高而升高.鼠尾藻碳水化合物含量随着光照强度的升高而显著升高,而温度对碳水化合物含量影响不显著.鼠尾藻蛋白质含量随着光照强度的增加而显著下降,在10℃和15℃下含量较高,随着温度的继续升高,蛋白质含量呈下降趋势.光照强度和温度的变化可改变鼠尾藻的藻体成分含量,这种改变可能是鼠尾藻为了适应环境因子改变而做出的积极的生理调节,对其生长和生存具有重要的生态意义。
【英文摘要】A two-factorial experiment was designed to study the effects of temperature (10,15,20,and 25 ℃) and light intensity (20,60,100,140,and 180 μE · m-2 · s-1) on the growth and biochemical composition of Sargassum thunbergii. The results showed that temperature,light intensity,and their interactions had significant effects on the growth of S. thunbergii. A higher growth rate of S. thunbergii was observed at 15 ℃-20 ℃,and,with the increase of temperature,the light intensity for the maximum growth rate of S. thunbergii had an increasing trend. At 10 ℃ and 15 ℃,higher light intensity had definite inhibition effect on the growth of S. thunbergii;

while at 20 °C and 25 °C,the growth rate was generally increased with increasing light intensity. Both temperature and light intensity had significant effects on the chlorophyll a and fucoxanthin contents of S. thunbergii,and the effects of light intensity was greater than those of temperature. In general,the chlorophyll a and fucoxanthin contents of S. thunbergii decreased significantly with increasing light intensity but increased with increasing temperature. The carbohydrate content of S. thunbergii increased with increasing light intensity,while no significant difference was observed at different temperature. The protein content of S. thunbergii decreased with increasing light intensity,and was higher at 10 °C and 15 °C but tented to decrease with increasing temperature. The variation of light intensity and temperature induced the changes in the biochemical composition of S. thunbergii,and these changes could be an active physiological adjustment for the adaptation to the variation of environmental factors,which was of ecological significance to the growth and survival of S. thunbergii.

【题目】盐度日节律性连续变化对孔石莼生长和生化组成影响

【中文关键词】盐度变化 孔石莼 生长 生化组成

【英文关键词】diel fluctuating salinity Ulva pertusa growth biochemical composition

【中文摘要】利用实验生态学的方法,探讨盐度日节律性连续变化对孔石莼(Ulva pertusa)生长和生化组成的影响,旨在查明潮间带大型海藻对盐度日节律性连续变化的适应性。实验共设5个盐度日节律变化处理(30±3,30±6,30±9,30±12和30±15)和1个恒盐(30±0)对照处理。实验结果表明:孔石莼能够耐受较大范围的盐度日节律性连续变化,这种变化虽然对孔石莼的生长不利,但是仍然能够使孔石莼的相对生长率保持在12%以上;盐度变化幅度±3~±15与恒盐对照相比明显不利于孔石莼的生长,盐度变化幅度越大,孔石莼生长越缓慢。同恒盐处理相比,盐度日节律连续变化对孔石莼叶绿素含量的影响不明显,但叶绿素a和叶绿素b含量都有随着盐度变化幅度的增大而逐渐减少的趋势。盐度日节律性连续变化使孔石莼蛋白质和可溶性糖的相对含量显著增加(P<0.05),随着盐度变化幅度的增大,蛋白质和可溶性糖增加的趋势越明显,并且在盐度日节律性连续变化下,蛋白质增加的速度比可溶性糖增加的速度要快。同时,游离脯氨酸的相对含量随着盐度变化幅度的增加而增加,但是在缓和的盐度日节律性连续变化下(30±3)孔石莼游离脯氨酸的含量却显著小于恒盐对照组(P<0.05)。盐度日节律性连续变化同恒定盐度相比,虽不利于孔石莼的生长,却促进了孔石莼生化产物的合成,是海藻干露时品质得以提高的原因之一。

【英文摘要】The marcoalga Ulva pertusa was cultured under 30±3,30±6,30±9,30±12 and 30±15 circadian rhythms of fluctuating salinity conditions,and a constant salinity of 30 was used as the control.The growth rates of macroalga under fluctuating salinity conditions were significantly lower than that at the constant salinity of 30,while the RGR of U.pertusa under different fluctuating salinity conditions were all kept at least 12%.Analysis of biochemical composition at the final stages of thaulls growth revealed that diel fluctuating salinity caused various influences(P<0.05).The contents of chlorophyll a and chlorophyll b under fluctuating salinity conditions were slightly lower than those at constant salinity of 30,however no statistically significant differences were found among them(P>0.05).The contents of protein and total solute carbohydrate under fluctuating salinity conditions were significantly higher than those at constant salinity of 30(P<0.05),and there was a trend that the content of proline increased with the increase of amplitude of fluctuating salinity,while the content of proline during mild salinity of changes(30±3) was significantly lower than that at constant salinity(P<0.05). Therefore,more protein and carbohydrate production might account for the enhancement in the quality of macroalga at the diel flunctuating salinity in the present study.

【题目】一株低温降解菌的分离鉴定及其降解特性研究
【中文关键词】低温菌 有机物 氨氮 分离鉴定 降解特性
【英文关键词】low-temperature bacterium organic-pollutants ammonia-nitrogen isolation and identification degrading characteristics
【中文摘要】从刺参(Apostichopus japonicus)养殖池塘环境中驯化分离筛选到1株低温有机物和氨氮降解菌株DB11。根据其形态特征、生理生化特性以及16S rDNA序列分析,将该菌株鉴定为马氏副球菌(Paracoccus marcusii)。经驯化,该菌株以刺参饵料为唯一营养源,低温(15℃)、低接种量(<5×10-3)条件下能同时高效降解饵料中的有机物和氨态氮,5 d时间内对富集培养基中COD和NH4+-N的降解率分别达50%和98%。进一步研究其降解特性表明,菌株生长适温15~30℃,生长适宜pH值为7~10,降解刺参饵料中COD和NH4+-N的最适温度条件为15~20℃、最适pH条件为8.0~8.5;在最适降解条件下、接种量为5×10-3时,对10~20 g/L高质量浓度的刺参饵料液中COD降解效果显著,3 d时间去除率达56.9%~65.7%,对1~20 g/L质量浓度的刺参饵料液中NH4+-N 3 d时间的去除率达91.7%~99.9%。
【英文摘要】A low-temperature bacterium named DB11 was isolated from sea cucumber outdoor culturing ponds with high degradation of organic-pollutants and ammonia-nitrogen.Physiological and biochemical tests and the 16S rDNA sequence similarity analysis indicated that strain DB11 was similar to Paracoccus marcusii.When inoculated into the sea cucumber-feed-enrichment-medium by less than 5×10-3,strain DB11 was able to utilize 50% of COD and 98% of NH+4-N within five days at 15 ℃.Further degradation studies showed that the appropriate range of temperature and pH value for growth of strain DB11 was 15~30 ℃ and pH 7~10,respectively,while the optimal temperature and pH value conditions for degradation of sea cucumber feed was 15~20 ℃ and pH 8.0~8.5,respectively.Strain DB11 could decompose sea cucumber feed concentration of 10~20 g/L with 56.9%~65.7% of COD degradation rate,and feed concentration of 1~20 g/L with 91.7%~99.9% of NH+4-N degradation rate,respectively,within 3 days after inoculated by 5×10-3.

【题目】一株芽孢杆菌对刺参生长以及消化和非特异性免疫相关酶活性的影响
【中文关键词】芽孢杆菌 生长 免疫 消化酶 刺参
【英文关键词】Bacillus cereus growth immune capacity digestive enzyme Apostichopus japonicus
【中文摘要】研究了一株蜡样芽孢杆菌(Bacillus cereus)对刺参(Apostichopus japonicus)生长、消化和免疫相关酶活性的影响。芽孢杆菌的添加量分别为107、109和1011cfu/kg饲料(以活菌量计),以投喂基础饲料组作为对照,实验时间为56d。实验过程中分别于实验中期和结束时测量刺参生长情况,并于实验结束时测定刺参肠道消化酶和体腔液非特异性免疫相关酶类的活性。结果表明:添加107和109cfu/kg芽孢杆菌可以显著提高刺参的生长速度,降低刺参体重变异系数(p<0.05)。刺参肠道蛋白酶活性与投喂的菌浓度呈明显的正相关,而淀粉酶活性则呈明显的负相关,但添加该芽孢杆菌对脂肪酶活性影响不大(p>0.05)。添加芽孢杆菌对刺参非特异性免疫相关酶类影响有所不同。在本研究的添加量范围内,刺参体腔液超氧化物歧化酶(SOD)活性显著提高(p<0.05);适量添加该芽孢杆菌可以显著提高刺参体腔液中酸性磷酸酶(ACP)、碱性磷酸酶(AKP)和溶菌酶(LSZ)活性(p<0.05)。综合比较表明,芽孢杆菌BC-2的适宜添加量109cfu/ kg,可以显著提高刺参的生长速度、消化功能和非特异性免疫能力。
【英文摘要】Effects of Bacillus cereus on the growth, activities of digestive and non-specific immune enzymes in Apostichopus japonicus were studied over 56 days. The additive doses of living bacillus cells in feed were 0, 107, 109 and 1011cfu/kg, respectively. Results showed that the growth of A. japonicus enhanced significantly (p<0.05), while the coefficient of variation in body weight decreased significantly (p<0.05) when B. cereus was added in feed at the dose of 107 and 109 cfu/kg. Intestinal protease activity exhibited a positive correlation with Bacillus concentration in feed while amylase activity showed a negative correlation (p<0.05). The activities of non-specific immune enzymes were affected by various addtive doses of Bacillus in feed. With the increase of Bacillus concentration in feed, superoxide dismutase (SOD) activity in coelomic fluid of A japonicus enhanced significantly (p<0.05). And the

activities of acid phosphatase (ACP), alkaline phosphatase (AKP) and lysozyme (LSZ) in A japonicus when Bacillus was added in feed at the dose of 109cfu/kg significantly enhance (p<0.05). According to the results in the present study, it could be concluded that the optimal additive concentration of B. cereus BC-2 in feed was 109cfu/ kg, at which the growth rate, activities of digestive enzyme and the capacity of non-specific immunity in A. japonicus could be significantly improved.

【题目】应用PCR-DGGE技术分析复合芽孢杆菌制剂水体泼洒对刺参体内外微生物群落结构的影响

【中文关键词】芽孢杆菌制剂 微生物群落结构 PCR-DGGE 刺参
【英文关键词】composite Bacillus microbial community structure PCR-DGGE Apostichopus japonicus

【中文摘要】通过传统培养与PCR-DGGE相结合,研究了泼洒复合芽孢杆菌制剂对刺参(Apostichopus japonicus)生长以及养殖水体和肠道中菌群结构的影响。复合芽孢杆菌制剂由枯草芽孢杆菌(Bacillus subtilis)、蜡样芽孢杆菌(Bacillus cereus)和地衣芽孢杆菌(Bacillus licheniformis)按一定比例复配制作而成,其泼洒浓度分别为106、108、1010cfu/m3(分别命名为WSR6、WSR8和WSR10),每7d全量换水1次,以未泼洒芽孢杆菌制剂处理为对照组2(CT2)。另外设置每隔3d全量换水1次的不泼洒芽孢杆菌制剂的处理作为对照组1(CT1)。8周的养殖实验表明,WSR6和WSR10处理组刺参特定生长率显著高于WSR8处理组和两个对照组,刺参个体差异则显著低于两个对照组(P<0.05)。经传统2216E培养基涂布培养分离,从水体和刺参肠道分别中分离出22和14株细菌,分属于弧菌属(Vibrio)、假交替单胞菌属(Pseudoalteromonas)、海杆菌属(Marinobacter)、交替单胞菌属(Alteromonas)、Phaeobacter、Idiomarina、假单胞菌属(Pseudomonas)、希万氏菌属(Shewanella)、Agarivorans、芽孢杆菌属(Bacillus)和不动杆菌属(Acinetobacter)。PCR-DGGE技术分析表明,刺参养殖水体中的优势菌群归属于α-变形菌纲(α-Proteobacteria)、γ-变形菌纲(γ-Proteobacteria)、δ-变形菌纲(δ-Proteobacteria)、黄杆菌纲(Flavobacteria)、拟杆菌纲(Bacteroidetes)和疣微菌纲(Verrucomicrobiae),而芽孢杆菌纲(Bacilli)细菌在水体中未能形成优势菌群。刺参肠道内的优势菌群归属于α-变形菌纲、γ-变形菌纲、ε-变形菌纲(ε-Proteobacteria)、黄杆菌纲、拟杆菌纲和芽孢杆菌纲。施用芽孢杆菌制剂显著改变了刺参肠道的微生物群落结构,以对照组CT2为参照,刺参肠道内除γ-变形菌纲的相对含量有所增加外,其它类群的细菌都有不同程度的降低,而芽孢杆菌纲细菌则在刺参肠道中形成了明显的优势菌群,其相对含量最高达35.5%。本研究表明,水体中泼洒该芽孢杆菌制剂对水体和刺参肠道内菌群结构和丰度均具有显著影响,在适宜的泼洒浓度下可以有效提高刺参的生长速度、降低刺参生长的个体差异。

【英文摘要】An 8-week trial was conducted to study effects of a composite Bacillus on the growth of sea cucumber (Apostichopus japonicus) and microbial community structure in the water and sea cucumber ’s gut by combination of traditional method and PCR-DGGE. Sea cucumbers were cultured in 25 aquaria and divided into five groups including three treatments and two controls. The composite Bacillus,which contains Bacillus subtilis, B. cereus and B. licheniformis, was applied into the water with the doses of 106, 108 and 1010 cfu/m3 every 7 days after water exchange (WSR6, WSR8 and WSR10, respectively). Those with no composite Bacillus application were as the controls, in which water was exchanged every 3 days (CT1) or 7 days (CT2), respectively. The results showed that the specific growth rates of sea cucumber in WSR6 and WSR10 were significantly higher than those in WSR8 and the controls (P<0.05), and the weight coefficients of sea cucumber were significantly lower than those in the controls (P<0.05). With the traditional 2216E medium coated method, 22 and 14 bacteria were isolated from the water and sea cucumber ’s gut, which were classify into Vibrio, Pseudoalteromonas, Pseudomonas, Shewanella, Agarivorans, Idiomarina, Pseudomonas, Shewanella, Agarivorans, Idiomarina and Bacillus. The results from the analysis of PCR-DGGE showed that Bacilli, α-Proteobacteria, γ-Proteobacteria, δ-Proteobacteria, Flavobacteria, Bacteroidetes and Verrucomicrobiae were dominant in the water, while α-Proteobacteria, γ-Proteobacteria, δ-Proteobacteria, Flavobacteria, Bacteroidetes and Bacilli were dominant in the gut of sea cucumber. Bacilli were the most dominant microflora in the gut of sea cucumber and increased up to 35.5% in relative abundance after the application of the composite Bacillus. Compared to CT2, the relative abundance of γ-Proteobacteria increased to some extent as well, while those of the other bacteria decreased. The results in present study demonstrated that the composite Bacillus applied into water had significant influences on microbial community structure in both the water and sea cucumber ’s gut. The composite Bacillus in moderate application dose could effectively enhance the growth rate of sea cucumber and reduce the individual differences between sea cucumbers.

【题目】Rough Set based Decision Tree Ensemble Algorithm for Text Classification
【中文关键词】文本分类;粗糙集;决策树;系统算法
【英文关键词】Text Classification; Rough Set; Decision Tree; Ensemble Algorithm
【中文摘要】决策树集成方法可以极大地提高分类的泛化能力,它已经成为文本分类领域中的一个热点话题。然后这种技术通常使用所有训练好的决策树进行集成,因此要花费大量的计算时间。为了改进决策树集成的性能,本文提出了一种称为RSDTE的基于粗糙集的决策树集成算法来进行文本分类。实验结果表明RSDTE算法减少了集成的规模,并且性能优于其它方法。
【英文摘要】Abstract. Decision tree ensemble can significantly improve the generalization ability of classification and has become a hot topic in the field of text classification. However, this kind of techniques usually employs all the trained decision trees for constructing ensembles, which can cost a lot of computational time. For improving the performance of decision tree ensemble, a rough set based decision tree ensemble algorithm for text classification, called RSDTE (Rough Set based Decision Tree Ensemble), is proposed in this paper. Experiment results show that RSDTE decreases the size of ensemble and outperforms existing methods.

【题目】仿刺参体腔细胞原代培养以及灿烂弧菌胞外产物对其毒性的研究
【中文关键词】刺参;体腔细胞;体外细胞培养;灿烂弧菌;胞外产物
【英文关键词】Hemifusus tuba Gmelin;population;morphological variation;discriminant analysis
【中文摘要】采用CCM、HSM和L 15N 3种培养液对刺参(Apostichopusjaponicas)的体腔细胞进行了体外原代培养,并用MTT还原法对细胞的体外存活力进行测定,结果显示:CCM和 HSM培养的体腔细胞,在体外分别存活至3 d和6 d大量 死亡;L-15N培养液可使细胞在 1周内保持存活。用刺参病原菌灿烂弧菌的胞外产物与刺参体外培养细胞共培育,发现对 体腔细胞有毒性作用,半致死蛋白质浓度(IQo)为27.6/ag/mI 。
【英文摘要】By applying multi—variant morphological measurement data,we used 7 morphological proportional charaeters to analyze the morphological variations from four different natural populations of Hemifus s tuba Gmelin,which were respectively located in Beihai,Wenzhou,Zhanjiang and Lianyungang.From cluster and principal component analyses,morphological characters were rather similar between Beihai and Zhanj iang populations,whereas high variance was found between Wenzhou and Lianyungang populations.Four principal components were constructed,the contributory ratio,from high to low,was 42.74 ,18.23 ,15.83%and 11.83 ,respectively,with 88.63 as the cumulative contributory ratio.The discriminant functions of the four populations were established,the discriminant accuracy being 81.3%--95.6 for P1 and 75.0 ~93.3 for P2,the average discriminant accuracy being 87.3 .The resuIts of multivariation analysis indicated that there were some morphological differences in the four different geographical populations.which were related to geographical distribution,environment,climate, food.and SO on.But the morphological variation of them was characterized under~subspecies.

【题目】Cinnamic Acid Inhibits Growth but Stimulates Production of Pathogenesis Factors by in Vitro Cultures of Fusarium oxysporum f.sp.niveum
【中文关键词】无
【英文关键词】Biomass; cinnamic acid; Fusarium oxysporum f.sp. niveum (FON); mycotoxin production; pathogenic enzymes
【中文摘要】无
【英文摘要】Long-term monoculture of watermelon leads to frequent occurrence of watermelon fusarium wilt caused by Fusarium oxysporum f.sp. niveum (FON). Some allelochemicals contained in watermelon root exudates and decaying residues are possibly responsible for promoting the wilt disease. The purpose of this study was to evaluate the allelopathic effect of artificially applied cinnamic acid on FON. Results demonstrated that hyphal growth of FON was strongly inhibited by cinnamic acid. At the highest concentration of cinnamic acid, the biomass in liquid culture was decreased by 63.3%, while colony diameter, conidial germination on plates, and conidial production in liquid culture were completely inhibited. However, mycotoxin production and activity of phytopathogenic enzymes were greatly stimulated. Mycotoxin yield, pectinase activity, proteinase activity, cellulase activity, and amylase activity were increased by 490, 590, 760, 2006, and 27.0%, respectively. It was concluded that cinnamic acid dramatically stimulated mycotoxin production and activities of hydrolytic enzymes byFON but inhibited growth and germination of FON. The findings presented here indicate that cinnamic acid is involved in promoting watermelon fusarium wilt.

【题目】Involvement of OsSPX1 in phosphate homeostasis in rice
【中文关键词】无
【英文关键词】rice, SPX domain, phosphate, homeostasis, suppressor
【中文摘要】无
【英文摘要】Arabidopsis thaliana SPX (SYG/PHO81/XPR1) domain genes have recently been shown to be involved in the phosphate (Pi) signaling pathway. We show here that a rice (Oryza sativa) SPX gene, OsSPX1, is specifically induced by Pi starvation in roots. Suppression of OsSPX1 by RNA interference resulted in severe signs of toxicity caused by the over-accumulation of Pi, similar to that found in OsPHR2 (phosphate starvation response transcription factor 2) overexpressors and pho2 (phosphate-responsive mutant Quantitative RT-PCR showed that expression of OsSPX1 was strongly induced in OsPHR2 overexpression and pho2 mutant plants,indicating that OsSPX1 occurs downstream of OsPHR2 and PHO2. The expression of 10 genes associated with the phosphate-starvation signal pathways was analyzed. Expression of OsPT2 (phosphate transporter and OsPT8 was significantly induced in OsSPX1-RNAi (OsSPX1-Ri) plants, suggesting that over-accumulation of Pi in OsSPX1-Ri plants results from an increase in Pi transport. In contrast, overexpression of OsSPX1 suppressed the induction of expression by Pi starvation of all 10 phosphate starvation-induced genes tested: IPS1 (inducedby phosphate starvation 1), IPS2, OsPAP10 (purple acid phosphatase 10), OsSQD2 (sulfoquinovosyldiacylglycerol ,miR399d and miR399j (microRNA 399), OsPT2, OsPT3, OsPT6 and OsPT8. This suggests that OsSPX1 acts via a negative feedback loop to optimize growth under phosphate-limited conditions.

【题目】Responses of Fusarium oxysporum f. sp. niveum to exogenously added sinapic acid in vitro
【中文关键词】无
【英文关键词】Fusarium oxysporum f. sp. niveum .Plant – microbe interaction . Sinapic acid .Virulence factors
【中文摘要】无
【英文摘要】To assess the influence of phenolic acids from plant root exudates on soil pathogens, we studied the effect of sinapic acid added to chemically defined media on the growth and virulence factors of Fusarium oxysporum f. sp.niveum. Sinapic acid inhibited the growth and conidial formation and germination of F. oxysporum f. sp. niveum by 6.7 – 8.8% and 11.2 – 37.3%, respectively. Mycotoxin production by F. oxysporum f. sp. niveum was stimulated by81.6 – 230.7%. Pectinase, proteinase, cellulase, and amylase activities were stimulated at a lower concentration of sinapic acid, while they were inhibited at a higher concentration.It is concluded that sinapic acid inhibited the growth and conidial germination of F. oxysporum f. sp. niveum and decreased the pathogenic enzymes ’ activity at higher doses.

【题目】Identification of rice purple acid phosphatases related to
【中文关键词】无
【英文关键词】Expression analysis; phylogenetic analysis;
Pi starvation; purple acid phosphatase; rice.
【中文摘要】无
【英文摘要】Purple acid phosphatases (PAPs) are a family of metallo-phosphoesterases involvedin a variety of physiological functions, especially phosphate deficiency adaptations inplants. We identified 26 putative PAP genes by a genome-wide analysis of rice (Oryzasativa), 24 of which have isolated EST sequences in the dbEST database. Amino acidsequence analysis revealed that 25 of these genes possess sets of metal-ligatingresidues typical of known PAPs. Phylogenetic analysis classified the 26 rice and 29Arabidopsis PAPs

into three main groups and seven subgroups. We detected transcriptsof 21 PAP genes in roots or leaves of rice seedlings. The expression levels often PAP genes were up-regulated by both phosphate deprivation and over-expressionof the transcription factor OsPHR2. These PAP genes all contained one or twoOsPHR2 binding elements in their promoter regions, implying that they are directlyregulated by OsPHR2. Both acid phosphatase (AP) and surface secretory acidphosphatase (SAP) activity assays showed that the up-regulation of PAPs by Pi starvation,OsPHR2 over-expression, PHO2 knockout or OsSPX1 RNA interference ledto an increase in AP and SAP activity in rice roots. This study reveals the potentialfor developing technologies for crop improvement in phosphorus use efficiency.

【题目】宁夏中南部地区马铃薯双垄全膜覆盖沟播栽培密度试验
【中文关键词】关键词:宁夏;马铃薯;双垄全膜覆盖;密度
【英文关键词】Key Words: Ningxia Province, Potato, Double-ridge covered the whole film, Density
【中文摘要】摘要:宁夏中南部地区是宁夏主要的马铃薯种植基地,近年来该区由于马铃薯产业的不断发展和环境气候的逐渐改变,马铃薯双垄全膜覆盖沟播栽培已开始较大面积推广。因此,针对宁夏中南部地区不同土壤肥力及气候条件,不同地区选用当地的主栽品种(南部山区为‘陇薯3号’,中部干旱带为‘虎头’),布置了马铃薯不同种植密度试验。结果表明,宁夏中南部地区马铃薯双垄全膜覆盖模种植密度的高低与其生育期、商品薯率及产量间均存在较大的关系。从马铃薯生育期、商品薯率和产量综合因素来看,宁夏南部山区和中部干旱带马铃薯适宜栽培的密度分别为3500~4000株/667m2和2000~2500株/667m2,通过函数拟合发现,宁夏南部山区马铃薯种植高产的密度为3612株/667m2,中部干旱带为2564株/667m2。
【英文摘要】Abstract: South-central area of Ningxia province is the main planting base of potatoes. Due to the continuous development of potato industry and environmental and climatic changes, the potato planting technology of double ridges mulching was widely extended in this area. According to the differences of soil fertility, climatic conditions in south-central area, the experiment with different planting densities of potato was conducted in different testing sites, and local main cultivars were adopted (‘Longshu 3’ was used in southern mountainous area, and ‘Hutou’ in central arid area). The results indicted that, under the planting mode of double ridges mulching, the planting density of potato had close relationship with its growth period, commodity potato rate and yield. Comprehensively considered these indexes, the suitable planting density of potato was 3500-4000 hill/667m2 and 2000-2500 hill/667m2, respectively, in southern mountainous area and central arid area. By function fitting, the highest yield of potato was demonstrated for southern mountainous area and central arid area of Ningxia province, which was 3612 hill/667m2 and 2564 hill/667m2, respectively.

【题目】Influence of fertilizers on nitrogen mineralization and utilization in the rhizosphere of wheat
【中文关键词】无
【英文关键词】Rhizosphere .N mineralization .Microorganism . Enzyme
【中文摘要】无
【英文摘要】Plant roots and microorganisms play an important role in the soil N cycle and plant N nutrition through the release of extracellular enzymes. In the present greenhouse pot experiment, wheat (Triticum aestivum) seedlings were grown in a fluvo-aquic soil (Udifluvent) to investigate N mineralization and utilization in the rhizosphere of wheat. The soil received chemical fertilizer (15N-

labeled urea), chemical fertilizer plus manure (common urea + 15N-labeled swine manure) or no N. Plant roots were separated from the soil with a nylon cloth, and 1-mm increments of soil moving laterally away from roots were analyzed for N, microbial C, and the activities of invertase, urease and protease. Chemical fertilizer plus manure promoted wheat growth and N absorption significantly compared with chemical fertilizer. 15N from both chemical fertilizer and swine manure accumulated significantly in the rhizosphere soil within 5 mm of the roots. Fertilized N could thus move easily laterallytowards roots and there was no indication that movement through the soil limited plant N supply. A large proportion of fertilizer N was lost from the soil during the wheat growing period, and N utilization efficiency was 24% for chemical fertilizer and 30% for swine manure. In addition, faster rates of N mineralization, larger amounts of microbial C, and increased activities of invertase, urease and protease occurred in the rhizosphere compared with other parts of the soil. There was a significant correlation between microbialC and N mineralization rate ($r=0.968$, $P<0.01$) in the whole soil. Microbial C also showed significant positive correlations with activities of invertase ($r=0.892$, $P<0.01$) and protease ($r=0.933$, $P<0.01$).Further study showed that adding manure into soil increased microbial C and the activities of invertase and protease; adding urea stimulated urease activity in the same soil. Changes in soil enzyme activities in response to N fertilizers could be considered indicators for different fertilizer managements.

【题目】A PIN1 Family Gene, OsPIN1, involved in Auxin-dependent Adventitious Root Emergence and Tillering in Rice
【中文关键词】无
【英文关键词】Adventitious root — Auxin transporter —
Emergence — Oryza sativa L. — PIN-FORMED1 family —
Tillering.
【中文摘要】无
【英文摘要】Auxin transport affects a variety of important growthand developmental processes in plants, including the regulationof shoot and root branching. The asymmetrical localizationof auxin influx and efflux carriers within the plasmamembrane establishes the auxin gradient and facilitates itstransport. REH1, a rice EIR1 (Arabidopsis ethylene insensitiveroot 1)-like gene, is a putative auxin efflux carrier.Phylogenetic analysis of 32 members of the PIN family,taken from across different species, showed that in terms ofevolutionary relationship, OsPIN1 is closer to the PIN1family than to the PIN2 family. It is, therefore, renamed asOsPIN1 in this study. OsPIN1 was expressed in the vasculartissues and root primordial in a manner similar toAtPIN1. Adventitious root emergence and developmentwere significantly inhibited in the OsPIN1 RNA interference(RNAi) transgenic plants, which was similar to thephenotype of NPA (N-1-naphthylphalamic acid, an auxintransportinhibitor)-treated wild-type plants. α-naphthylaceticacid (α-NAA) treatment was able to rescue themutated phenotypes occurring in the RNAi plants. Overexpressionor suppression of the OsPIN1 expressionthrough a transgenic approach resulted in changes of tillernumbers and shoot/root ratio. Taken together, these datasuggest that OsPIN1 plays an important role in auxindependentadventitious root emergence and tillering.

【题目】Control of Fusarium wilt disease of cucumber plants with the application of a bioorganic fertilizer

【中文关键词】无
【英文关键词】Antagonistic substance . Bacillus subtilis .Bioorganic fertilizer . Cucumber plant . Fusarium wilt .Paenibacillus polymyxa
【中文摘要】无
【英文摘要】Two field experiments were conducted to evaluate the effect of organic fertilizer application either with or without antagonistic bacteria (Bacillus subtilis SQR-5 and Paenibacillus polymyxa SQR-21) on the control of Fusarium oxysporum f. sp. Cucumerinum J. H. Owen wilt disease in cucumber. The incidence of Fusarium wilt disease was 5.3 – 13.5% for cucumber plants treated with bioorganic fertilizer,while it was 30.3 – 51% in controls (only with organic fertilizer). Higher yields and lower disease incidences were observed in the dry season when compared with the wet season for both types of organic fertilizer treatments. Biolog analysis showed a significant change in soil bacterial composition and activity after bioorganic fertilizer application.The numbers of colony-forming units of F. oxysporumf. sp. Cucumerinum J. H. Owen for bioorganic-fertilizertreated soils were significantly decreased compared with control. Scanning electron micrographs of cucumber basal stems showed a presence of mycelia-like mini strands accompanied by an amorphous substance within the xylemvessels. This amorphous substance and mini strands were richer in calcium and phosphorus but had low carbon and oxygen than the living mycelia. Reverse-phase high-pressure liquid chromatography and mass spectroscopic analysis showed that the antagonistic bacteria produced the antifungal compounds fusaricidin A, B, C, and D with molecular weights of 883.5, 897.5, 947.5, and 961.5 Da, respectively.The application of bioorganic fertilizer has a great potential for the control of F. oxysporum wilt disease in cucumber plants.

【题目】Development of a mode of application of bioorganic fertilizer for improving the biocontrol efficacy to Fusarium wilt
【中文关键词】无
【英文关键词】Bioorganic fertilizer (BIO) , Nursery application , Fusarium wilt , Watermelon , Paenibacillus polymyxa
【中文摘要】无
【英文摘要】More effective ways of applying biocontrol products should be developed based both on thecharacteristics of the biocontrol agents and the normal practices of the agricultural producer.Anewsystemwas developed to improve the biocontrol efficacy of Fusarium wilt forwatermelon production, and this systemwas tested in pot and field experiments. Biocontrol was achieved by applying a novel bioorganic fertilizer product (BIO) to Fusarium-infested soil. The best biocontrol was obtained by application of a bioorganic fertilizer, BIO, into soil during the nursery phase of watermelon seedling followed by a second applicationto Fusarium-infested soil when watermelon seedlings were transplanted. In comparison with the controls, the incidence of the diseasewas reduced by 60 – 100%in the pot experiment and by 59 – 73% in the field experiment when the BIO was applied during the nursery stage.After application of BIO during the nursery stage, the number of colony-forming units of Fusarium oxysporum in rhizospheric soil was significantly (P\0.05) inhibited compared to the controls. An in vitro experiment showed that the antagonist Paenibacillus polymyxa in the BIO could effectively colonize the rhizosphere of watermelon and proliferate along the extending plant roots. This inhibited growth of Fusarium oxysporum in the rhizosphere of watermelon andprotected the watermelon roots from attack by the pathogens. The method used for biocontrol Fusarium wilt disease inwatermelon should be a useful strategy to improve field efficacy of other biocontrol agents.

【题目】Nicotianamine, a Novel Enhancer of Rice Iron Bioavailability to Humans
【中文关键词】无
【英文关键词】iron,OsNAS1
【中文摘要】无
【英文摘要】Background: Polished rice is a staple food for over 50% of the world ’s population, but contains little bioavailable iron (Fe) tomeet human needs. Thus, biofortifying the rice grain with novel promoters or enhancers of Fe utilization would be one ofthe most effective strategies to prevent the high prevalence of Fe deficiency and iron deficiency anemia in the developingworld.Methodology/Principal Findings: We transformed an elite rice line cultivated in Southern China with the rice nicotianaminesynthase gene (OsNAS1) fused to a rice glutelin promoter. Endosperm overexpression of OsNAS1 resulted in a significantincrease in nicotianamine (NA) concentrations in both unpolished and polished grain. Bioavailability of Fe from the high NAgrain, as measured by ferritin synthesis in an in vitro Caco-2 cell model that simulates the human digestive system, wastwice as much as that of the control line. When added at 1:1 molar ratio to ferrous Fe in the cell system, NA was twice aseffective when compared to ascorbic acid (one of the most potent known enhancers of Fe bioavailability) in promotingmore ferritin synthesis.Conclusions: Our data demonstrated that NA is a novel and effective promoter of iron utilization. Biofortifying polished ricewith this compound has great potential in combating global human iron deficiency in people dependent on rice for theirsustenance.

【题目】Mutation in Nicotianamine Aminotransferase Stimulated the Fe(II) Acquisition System and Led to Iron Accumulation in Rice
【中文关键词】无
【英文关键词】Iron,Rice,NAAT1
【中文摘要】无
【英文摘要】Higher plants acquire iron (Fe) from the rhizosphere through two strategies. Strategy II, employed by graminaceous plants,involves secretion of phytosiderophores (e.g. deoxymugineic acid in rice [Oryza sativa]) by roots to solubilize Fe(III) in soil. Inaddition to taking up Fe in the form of Fe(III)-phytosiderophore, rice also possesses the strategy I-like system that may absorbFe(II) directly. Through mutant screening, we isolated a rice mutant that could not grow with Fe(III)-citrate as the sole Fesource, but was able to grow when Fe(II)-EDTA was supplied. Surprisingly, the mutant accumulated more Fe and otherdivalent metals in roots and shoots than the wild type when both were supplied with EDTA-Fe(II) or grown under waterloggedfield conditions. Furthermore, the mutant had a significantly higher concentration of Fe in both unpolished andpolished grains than the wild type. Using the map-based cloning method, we identified a point mutation in a gene encodingnicotianamine aminotransferase (NAAT1), which was responsible for the mutant phenotype. Because of the loss of function ofNAAT1, the mutant failed to produce deoxymugineic acid and could not absorb Fe(III) efficiently. In contrast, nicotianamine,the substrate for NAAT1, accumulated markedly in roots and shoots of the mutant. Microarray analysis showed that theexpression of a number of the genes involved in Fe(II) acquisition was greatly stimulated in the naat1 mutant. Our resultsdemonstrate that disruption of deoxymugineic acid biosynthesis can stimulate Fe(II) acquisition and increase iron accumulationin rice.

【题目】Physiological and Transcriptome Analysis of Iron and Phosphorus Interaction in Rice Seedlings
【中文关键词】无
【英文关键词】Iron,rice Seedling,Phosphorus,
【中文摘要】无
【英文摘要】The antagonistic interaction between iron (Fe) and phosphorus (P) has been noted in the area of plant nutrition. To understandthe physiology and molecular mechanisms of this interaction, we studied the growth performance, nutrient concentration, andgene expression profiles of root and shoot segments derived from 10-d-old rice (Oryza sativa) seedlings under four differentnutrient conditions: (1) full strength of Fe and P (+Fe+P); (2) full strength of P and no Fe (2Fe+P); (3) full strength of Fe and noP (+Fe2P); and (4) without both Fe and P (2Fe2P). While removal of Fe in the growth medium resulted in very low shoot androot Fe concentrations, the chlorotic symptoms and retarded seedling growth were only observed on seedlings grown in thepresence of P. Microarray data showed that in roots, 7,628 transcripts were significantly changed in abundance in the absenceof Fe alone. Interestingly, many of these changes were reversed if P was also absent (2Fe2P), with only approximately 15%overlapping with – Fe alone (– Fe+P). Analysis of the soluble Fe concentration in rice seedling shoots showed that P deficiencyresulted in significantly increased Fe availability within the

plants. The soluble Fe concentration under – Fe – P conditions wassimilar to that under +Fe+P conditions. These results provide evidence that the presence of P can affect Fe availability and inturn can influence the regulation of Fe-responsive genes.

【题目】Cytokinin represses phosphate-starvation response through increasing of intracellular phosphate level
【中文关键词】无
【英文关键词】Oryza sativa
L.; transcript profile
【中文摘要】无
【英文摘要】The involvement of cytokinins (CTKs) in the repression ofphosphate (Pi)-starvation signalling has been widely documented.However, the full physiological and molecularrelevance of this role remains unclear. To gain furtherinsights into the regulation system of CTK repression ofPi-starvation signalling, a global analysis of gene expressionevents in rice seedlings under Pi starvation, and theexogenous CTK treatment under Pi-sufficient (+P) andPi-deficient (-P) conditions, was conducted using oligonucleotidearray analysis. Physiological and biochemicaladaptation was observed after 10 d Pi starvation in riceseedlings. A global reduction of the Pi-starvation signallingwas detected after 3 d treatment of exogenous CTK. Expressionprofiling data indicate that, together with a significantincrease of intracellular Pi content, many expressionchanges responsive to Pi starvation were reversed by exogenousCTK treatment while CTK-responsive genes behavednormally under-P condition. These results suggest that theinterplay of CTK signal and Pi-starvation response can bepartially explained by the rise of Pi concentration afterexogenous CTK treatment. Microarray data also revealedthat a small number of genes have different CTK responsepatterns under different Pi levels, suggesting a subtle interactionbetween CTK and Pi-starvation signalling pathway.

【题目】Bacillus subtilis SQR 9 can control Fusarium wilt in cucumber by colonizing plant roots
【中文关键词】无
【英文关键词】Colonization . Bio-organic fertilizer . Fusarium wilt . Rhizosphere . Bacillus subtilis
【中文摘要】无
【英文摘要】Fusarium wilt is one of the major constraints on cucumber production worldwide. Several strategies have been used to control the causative pathogen, Fusarium oxysporum f. sp. cucumerinum J. H. Owen, including soil solarization, fungicide seed treatment and biological control.In this study, F. oxysporum f. sp. cucumerinum was successfully controlled by a newly isolated strain, Bacillus subtilis SQR 9, in vitro and in vivo. Greenhouse experimentswere carried out to evaluate the effect of inoculation and solid fermentation of organic fertilizer with B. subtilis SQR 9, hereby defined as bio-organic fertilizer (BIO), onthe control of Fusarium wilt. In comparison with the control, the wilt incidence was significantly reduced (49 – 61% reduction) by application of BIO. The rhizospherepopulation of F. oxysporum f. sp. cucumerinum, as detected both by selective plating and realtime PCR, was significantly lower in BIO-treated plants than the control. The localization of bacterial cells, pattern of colonization and survival of B. subtilis SQR 9 in the rhizsosphere of cucumber, was examined by fluorescent microscopy and explored following recovery of the green fluorescent protein (gfp)-labeled SQR 9 with the new gfp-markedshuttle vector pHAPII through selective plating. The preferential sites of the labeled strain were the differentiation and elongation zone, root hair and the lateral root junctions. The population of the strain was 106 cfu/g root in rhizoplane. These results indicate that the strain was able to survive well in the rhizosphere of cucumber, suppressed growth of F. oxysporum in the rhizosphere of cucumber and protected the host from the pathogen.

【题目】盐胁迫对棉田土壤微生物量和土壤养分的影响
【中文关键词】盐胁迫; 棉花; 土壤微生物量; 土壤养分
【英文关键词】soil salinity stress;cotton; soil microbial biomass;soil nutrient
【中文摘要】以耐盐品种中棉所44为材料,模拟滨海混合盐土成分,研究了正常灌水(土壤相对含水量保持在75±5%)和轻度干旱(55±5%)下,不同程度盐胁迫(0,0.35%,0.60%,0.85%,1.00%)对棉田土壤微生物量和土壤养分的影响。结果表明,棉花产量及产量构成(铃数和铃重)、生物量、根重均随着盐浓度的升高而显著递减。棉田土壤微生物量C和N在棉花各个生育期内均随着盐浓度的升高而显著降低,花铃期达到最大,土壤有机质、全氮、速效N、有效P、速效K等养分含量的变化趋势与土壤微生物量C和N基本一致,但降幅较小。土壤微生物量碳与土壤有机碳的比值、土壤微生物量氮与全氮的比值均随着盐浓度的升高而呈现逐渐下降的趋势,表明了土壤微生物量碳氮受盐胁迫的影响大于土壤有机碳和全氮,也表明了土壤微生物对土壤有机碳和全氮转化效率的显著减低。正常灌水条件下各盐分处理的棉花生物量、铃数、铃重、根重、土壤微生物量和土壤养分含量均显著高于相应干旱处理,干旱加重了盐分对土壤微生物量和土壤养分的抑制效应。土壤微生物量C和N与土壤pH值之间存在显著负相关,与土壤有机质、全氮、速效N、有效P、速效K之间均存在显著正相关。
【英文摘要】The experiment was completed in pot with CCRI-44(salinity-tolerance) at Pailou experimental station in Nanjing Agricultural University.By simulating the salinity component of seashore saline soil,setting five soil salinity rates(0%,0.35%,0.60%,0.85%,1.00%),two soil water treatments including well-watering(soil relative water content is 75±5%) and water stress(soil relative water content is 55±5%),this study aims to assess the effects of soil salinity stress on soil microbial biomass C and N,and soil nutrient in cotton field.The results showed that seed cotton yield,boll number,boll weight,biomass and root weight significantly declined with increasing soil salinity.At the same time,the soil microbial biomass C and N significantly declined with increasing soil salinity at different growth stages of cotton.For each salinity rate treatment,the microbial biomass C and N at the flowering and boll-forming stage were the highest in all four stages.Compared with CK(soil salinity rate is 0%),the microbial biomass C in different salinity rates decreased by 14.69%~64.32%,and the microbial biomass N decreased by 7.59%~56.81% at flowering and boll-forming stage under the well-irrigated.Soil organic matter,total N,available P,rapidly available N,and rapidly available K were all reduced with increasing soil salinity at different growth stages of cotton.At the same time,soil water stress aggravated the effects of salinity stress on seed cotton yield,boll,boll weight,biomass and root weight,soil microbial biomass and soil nutrients.Correlation analysis demonstrated that soil microbial biomass C and N were significantly positively correlated with soil organic matter,total N,available P,rapidly available N,rapidly available K,seed cotton yield,biomass,and root weight,but significantly negatively correlated with soil pH.

【题目】不同灌木柳的扦插成活率和光合特性比较
【中文关键词】灌木柳; 无性系; 扦插成活率; 光合参数
【英文关键词】shrub willow; clones; cutting survival ratio; photosynthesis parameter
【中文摘要】编织柳品种单一,柳条产量和质量低下是沿淮地区柳编产业发展的瓶颈。引进11 个灌木柳新无性系,在沿淮低湿地上进行栽培试验,并对其成活率和光合性状进行调查比较。结果表明,引进的无性系P716、2344、2372的扦插成活率均在90%以上,可以作为淮河低湿地杞柳栽培的后备资源或育种材料加以选择。在光合特性方面,无性系1050、51-3、9-6

和P716 的净光合速率均达到45 μmol / (m2 · s) 以上,明显高于本地种,具有较高的生长潜力。通过初步的综合判断,无性系P716 和51-3 在沿淮低湿地具有极好的适应性和生长表现。

【英文摘要】Because of the uniform variety cropping of the shrub-willow,the lack and degradation of the wicker products has become a crucial restriction to the development of the pillar wickerwork industry along Huaihe river basin. In this study,eleven new shrub-willow clones were introduced to plant in the low land along Huaihe riverside,and their cutting survival ratio and photosynthesis parameters were compared. The results showed that the survival ratios of introduced clones P716,2344 and 2372 were higher than 90%,which indicated that these clones could be chosen as reserve resources or breeding materials for shrub-willow cropping. Considering the photosynthesis parameters,clones 1050,51-3,9-6 and P716 represented net photosynthesis rates of over 45 μmol /(m2 · s) and obviously higher than the local species. According to the pre-evaluation integrating the cutting survival ratio and the photosynthesis aspects,clone P716 and 51 -3 have superior adaptability and growth performance in the low land along Huaihe river basin.

【题目】种薯药剂处理防治大田马铃薯晚疫病试验

【中文关键词】马铃薯晚疫病; 致病疫霉菌; 浸种处理; 化学防治

【英文关键词】Potato late blight; Phytophthora infestans; Seed tuber treatment; Chemical control

【中文摘要】对利用药剂处理马铃薯种薯的方法进行研究,比较3种杀菌剂在2种含量水平上防治马铃薯晚疫病的效果,以期确立种薯处理防治马铃薯晚疫病应用技术,评估其生产推广价值。用商业化广泛使用的克露、安克以及银法利3种药剂和2个含量分别处理种薯,从马铃薯生长后期植株的发病率、发病部位以及发病程度等方面,系统分析不同药剂浸种处理对马铃薯晚疫病的防控效果。结果表明,50%安克WP 350倍液的种薯处理,植株发病率最低,叶片发病数最少,发病级数最低,防治效果最好。可见,种薯处理作为马铃薯晚疫病防控环节中的一个重要措施,通过有效防控来自带菌种薯的初侵染及其初始菌源来控制病害的发生。

【英文摘要】The late blight of potato,caused by Phytophthora infestans,has been the most devastating disease of potato in the world.Its current control strategies highly depend on spraying application of fungicides.In this study,soaking treatment of potato seed tubers was employed to assess the field efficacy of three different,commonly used fungicides,including cymoxanil-mancozeb,dimethomorph,and propamocarb,at two different concentrations on the control of potato late blight,according to the percentage of diseased plants,position and severity of diseased tissues in the late potato growing season.The results showed that the soaking treatment of seed tubers with the 50% dimethomorph WP of 350 times dilution achieved the best efficiency against late blight in terms of lower percentage of diseased plants,fewer and light diseased leaf tissues.Seed tuber-soaking is a potentially important method in the development of integrated approaches to control potato late blight,by effectively controlling primary infections resulted from P.infestans infected and contaminated seed tubers.

【题目】Trichoderma harzianum strain SQR-T37 and its bio-organic fertilizer could control Rhizoctonia solani damping-off disease in cucumber seedlings mainly by the mycoparasitism
【中文关键词】无
【英文关键词】Trichoderma harzianum SQR-T37 . Rhizoctonia solani . Mycoparasitism . Bio-organic fertilizer (BIO) .Quantification real-time PCR . DGGE
【中文摘要】无
【英文摘要】Damping-off disease is caused by Rhizoctonia solani and leads to serious loss in many crops. Biological control is an efficient and environmentally friendly way to prevent damping-off disease. Optical micrographs, scanning electron micrographs, and the determination of hydrolytic enzymes were used to investigate the antagonism of Trichoderma harzianum SQR-T37 (SQR-T37) against R. solani. Experiments were performed in pots to assess the in vivo disease-control efficiency of SQR-T37 and bio-organic fertilizer. The results indicate that themycoparasitism was the main mechanism accounting for the antagonistic activity of SQR-T37. In one experiment,the population of R. solani was decreased from 106 internal transcribed spacer (ITS) copies per gram soil to 104 ITS copies per gram soil by the presence of the antagonist. In this experiment, 45% of the control efficiency was obtained when 8 g of SQR-T37 hyphae per gram soil was applied. In a second experiment, as much as 81.82% of the control efficiency was obtained when bio-organic fertilizer (SQR-T37 fermented organic fertilizer, BIO) was applied compared to only 27.27% of the control efficiency when only 4 g of SQRT37 hyphae per gram soil was applied. Twenty days after incubation, the population of T. harzianum was 4.12×107 ITS copies per gram soil in the BIO treatment, which was much higher than that in the previous treatment (8.77×105 ITS copies per gram soil), where only SQR-T37 was applied.The results indicated that SQR-T37 was a potent antagonist against R. solani in a mycoparasitic way that decreased the population of the pathogen. Applying BIO was more efficient than SQR-T37 application alone because it stabilized the population of the antagonist.

【题目】Physiological and molecular responses of nitrogen-starved rice plants to re-supply of different nitrogen sources
【中文关键词】无
【英文关键词】Ammonium assimilation Æ
Ammonium transporters Æ Glutamine synthetase Æ
Nitrate reductase Æ Nitrate transporters Æ Nitrogen
starvation
【中文摘要】无
【英文摘要】Rice grown under anaerobic waterloggedsoil condition takes up ammonium as amajor source of nitrogen (N). A substantialquantity of nitrate is taken up by rice when aerationconditions prevail. This work compared thephysiological and molecular responses of N-depletedrice (Oryza sativa L. japonica ssp. cv.Wuyunjing) to re-supply of different N sources ina hydroponic system. Expression of six genesknown to be related to N uptake and assimilationin roots was analyzed by semi-quantitativereverse transcription polymerase chain reaction(RT-PCR). N starvation increased root growthbut decreased shoot biomass and nitrate reductase(NR) activity. In comparison to nitrate as Nsource, ammonium tended to inhibit root growthbut significantly improved shoot growth, total Nuptake, and, particularly, the translocation of N tothe above ground parts. Replacing half of theammonium by nitrate in the single ammoniumsolution increased glutamine synthetase (GS)activity and total N uptake. This replacementenhanced expression of OsAMT1;3 but decreasedthe expression of OsAMT1;2 in the roots. Likewise,replacing half of the nitrate by ammoniumin the single nitrate solution, increased NRactivity and expression of an NR gene (OsNR1)but suppressed expression of OsNRT2 in theroots. Expression of both OsAMT1;1 and a GSgene (OsGS1;1) was relatively constant and notaffected by the N form or starvation in the riceroots. Predominant beneficial effects of dualsupply of the two forms of N in comparison with asingle form of N either as ammonium or as nitratemight be due to improvement of ammonium uptakedue to nitrate presence near the roots andenhanced reduction of nitrate in leaves byammonium.

【题目】Meat quality is associated with muscle metabolic status but not contractile myofiber type composition in premature pigs
【中文关键词】猪肉质;能量代谢; MyHC;AMPK;PGC-1α;糖皮质激素受体
【英文关键词】Pork quality; Energy metabolism; MyHC; AMPK; PGC-1α; Glucocorticoid receptor
【中文摘要】本文是李晓博士撰写,早产猪的肉质与肌肉代谢状态有关,与收缩肌纤维类型无关。
【英文摘要】Longissimus muscles were sampled from Erhualian (EHL) and Pietrain (PIE) pigs at 20 kg of body weight. No breed differences were detected in either the proportions or the mRNA/protein expression of respective MyHC isoforms, or the mRNA expression of PGC-1α (all $P > 0.10$). However, meat quality traits were already divergent between breeds, and were associated with distinct energy metabolic status, as reflected by dramatically lower AMPK activity yet higher CK and LDH activities (all $P < 0.01$) in longissimus muscle of EHL pigs. Moreover, mRNA expression of glucocorticoid receptor (GR) was found to be higher ($P < 0.05$) in longissimus muscle of EHL pigs. These results indicate that the differences in meat quality traits occur early in premature pigs, and these are attributed to skeletal muscle energy metabolism and not contractile myofiber type composition. Breed-specific GR expression in muscle may be related to the pattern of energy metabolism and meat quality, yet the mechanism awaits further investigation.

【题目】Effects of vegetation cover on phosphorus loss from a hillslope cropland of purple soil under simulated rainfall: a case study in China
【中文关键词】无
【英文关键词】Overland flow , Subsurface flow Phosphorus transport , Purple soil
【中文摘要】无
【英文摘要】Nutrients and sediment lost through runoff to surface and ground water represents a risk tohuman and environmental health. In order to understand the mechanisms of nutrient and sediment loss under different levels of vegetation cover, we conducted a simulated rainfall experiment on hillslope cropland in the Sichuan Basin of China. The experiment was performed on a 4.5 m long 9 1.5 m wide 9 0.6 m deep plot to analyze the mechanisms of overland flow, subsurface flow, sediment yield, and P loss for bare soil, and soil with 25, 50, 75, and90% vegetation coverage. The results showed that total sediment loss and total bioavailable P (BAP) loss by overland flow decreased with increasing coverage; the rate of P release from fertilizer decreased with increasing time during a rain event and increasing coverage; and the growth in vegetation shoots and roots improved soil physical properties around roots, thus increasing P absorbance and the infiltration rate. Hence, we suggest increasing vegetation coverage to conserve soil and reduce BAP loss by sediments, and paying more attention to groundwater affected by pollutant transport through subsurface flows.

【题目】Investigation of factors influencing spore germination of Paenibacillus polymyxa ACCC10252 and SQR-21
【中文关键词】无
【英文关键词】Paenibacillus polymyxa . AGFK . Fructose plus L-alanine . Germination temperature . Germination buffer .pH
【中文摘要】无
【英文摘要】Bioorganic fertilizer containing Paenibacillus polymyxa SQR-21 showed very good antagonistic activity against Fusarium oxysporum. To optimize the role of P.polymyxa SQR-21 in bioorganic fertilizer, we conducted a study of spore germination under various conditions. In thisstudy, L-asparagine, glucose, fructose and K+ (AGFK), and sugars (glucose, fructose, sucrose, and lactose) plus Lalanine were evaluated to determine their ability to induce spore germination of two strains; P. polymyxa ACCC10252 and SQR-21. Spore germination was measured as a decrease in optical density at 600 nm. The effect of heat activation and germination temperature were important for germination of spores of both strains on AGFK in Tris – HCl. L-Alanine alone showed a slight increase in spore germination; however, fructose plus L-alanine significantly induced spore germination, and the maximum spore germination rate was observed with 10 mmol l − 1 L-alanine in the presence of 1 mmol l − 1 fructose in phosphatebuffered saline (PBS). In contrast, fructose plus L-alanine hardly induced spore germination in Tris – HCl; however, in addition of 10 mmol l − 1 NaCl into Tris – HCl, the percentages of OD600 fall were increased by 19.6% and 24.3% for ACCC10252 and SQR-21, respectively. AGFK-induced spore germination was much more strict to germinationtemperature than that induced by fructose plus L-alanine.For both strains, fructose plus L-alanine-induced spore germination was not sensitive to pH. The results in this study can help to predict the effect of environmental factors and nutrients on spore germination diversity, which will be beneficial for bioorganic fertilizer storage and transportation to improve the P. polymyxa efficacy as biological control agent.

【题目】饲料中添加硒酵母和维生素E对刺参生长、免疫力及抗病力的影响
【中文关键词】刺参;硒酵母;维生素E;免疫力;抗病力
【英文关键词】sea cucumbers(Apostichopus japonicas Selenka);selenoyeast;vitamin E;immunity;disease resistance
【中文摘要】本文旨在研究饲料中添加硒酵母和维生素E对刺参生长、免疫力及抗病力的影响。采 用2 X4双因子试验设计,即在基础饲料中分别添加0和250 mg/kg的维生素E,每一维生素E 水平下分别添加0、100、300和600 mg/kg的硒酵母,共制成8种试验饲料,饲喂平均初始体重 为(3.52±0.08)g的刺参8周。每组设3个重复,每个重复25头刺参,其中饲喂未添加硒酵母和维生素E的基础饲料的组为对照组。饲养试验结果表明,硒酵母和维生素E对刺参的特定生 长率(SGR)均有显著影响(P<0.05),高剂量硒酵母(600 mg/kg)和维生素E(250 mg/kg)添加 组刺参的SGR最高。当饲料中不添加维生素E时,刺参的吞噬活性、呼吸爆发(RB)活性、酚氧 化酶(PO)活性和酸性磷酸酶(ACP)活性随硒酵母添加量的增加而升高,且600 mg/kg硒酵母添加组上述指标均显著高于对照组(P<0.05)。当饲料中250 mg/kg的维生素 E时,添加 600 mg/ 硒酵母组刺参的吞噬活性、RB活性和PO活性均高于其他硒酵母添加组,并显著高 于对照组(P<0.05)。攻毒试验结果表明饲料中添加硒酵母和维生素E均可显著影响刺参感 染灿烂弧菌后的14 d内的累积死亡率(P<0.05)。当饲料中不添加维生素E时,刺参的累积死 亡率随着硒酵母添加量的增加有下降的趋势(P>0.05)。当饲料中添加250 mg/kg的维生素E 时,各硒酵母添加组刺参的累积死亡率显著低于对照组(P<0.05)。在本试验条件下,饲料中添 加硒酵母和维生素E均可提高刺参的特定生长率、免疫力和抗病力,同时添加600 mg/kg硒酵 母和250 mg/kg的维生素E是本研究最优的组合。
【英文摘要】This trial was conducted to investigate the effects of dietary selenoyeast and vitamin E on growth, immunity and disease resistance of sea cucumbers(Apostichopus japonicus Selenka).A total of 600 sea cu-cumbers with an average initial body weight of(3.52±0.08)g were fed with 8 practical diets according to a 2×4 factorial design. The feeding trial results showed that dietary selenoyeast and vitamin E had significant influence on specific growth rate(SGR)(P<0.05),and the highest SGR of sea cucumbers was found in the group with the diet containing 600 mg/kg selenoyeast and 250 mg/kg vitamin E. It can be concluded that the supplementation of selenoyeast and vitamin E in diets can enhance the SGR,immunity and disease resistance of sea cucumbers.Accordingly,the supplementation of 600 mg/kg selenoyeast and 250 mg/kg vitamin E in the diet is the optimal combination in the present study

【题目】植物磷转运蛋白基因及其表达调控的研究进展
【中文关键词】基因; 表达调控; 磷转运蛋白; 植物
【英文关键词】gene ; regulated expression ; phosphate transporter ; plants
【中文摘要】土壤有效磷的缺乏是限制植物生长发育的主要因素之一,植物对于磷素营养的吸收及转运主要是通过不同家族的磷转运蛋白来进行的。在外部介质严重缺磷的环境中,植物体自身会通过诱导或增强磷素转运蛋白基因的表达量提高其对根际和共生菌根菌丝磷素的吸收和利用,同时外界环境中的其他一些因素也会影响磷转运蛋白基因的表达调控。近年来,随着分子生物学技术和植物基因组学的快速发展,国内外有关磷素转运蛋白的分子研究也在不断深入,并取得了一系列令人振奋的成果。本文简述了近年来高等植物磷素转运蛋白基因的克隆、表达、调控及其可能存在的相互作用,并对进一步的研究作了展望。
【英文摘要】Phosphorus (P) is considered to be one of the least available plant nutrients in the soil . The deficit of available P in soil is one of the major factors restraining the growth and development of crop. Inorganic phosphate (Pi) transport through plant membranes

is mediated by a number of Pi transporter proteins. Plants regulate the expression of Pi transporter genes to adapt low available P environment by enhancing their ability to acquire and transfer Pi . Over the past years , a significant advance has been obtained on the gene cloning , expression regulation and functional characterization of Pi transporters in plants. In this article , the research progresses on molecular level of known plant Pi transporters in last decade were reviewed.

【题目】In Vitro Physiological Responses of Fusarium oxysporum f. sp. niveum to Exogenously Applied Syringic Acid
【中文关键词】无
【英文关键词】Phenolic acid, plant – microbe interaction.
【中文摘要】无
【英文摘要】Plant – microbe interactions are often accompanied by allelochemicals, such as syringic acid, released from the host plant.To explore the role of phenolic acids released from crop host plants in response to pathogen invasion, we examined the allelopathic effect of an artificially applied syringic acid on Fusarium oxysporum f. sp. niveum. We demonstrated that the growth and the conidial germination rate of F. oxysporum f. sp. niveum were stimulated at lower concentrations of syringic acid, though inhibited by higher dosage compared with control. The yield of fungus mycotoxin was increased from 60.9% to 561.5%. We conclude that syringic acid can be considered as a allelochemical inducer, stimulating the relative virulence factors of invading pathogens.

【题目】Conservation and divergence of both phosphate -and mycorrhiza-regulated physiological responses and expression patterns of phosphate transporters in solanaceous species
【中文关键词】无
【英文关键词】divergence, evolution, genetic conservation, mycorrhiza, phosphate transporter, phosphorus (P) nutrition, plant gene expression, Solanaceae.
【中文摘要】无
【英文摘要】 • Here, orthologous genes of six phosphate transporter (PiT) genes, which aremembers of thePht1andPht2families in tomato and potato, have been clonedfrom the solanaceous species pepper, eggplant and tobacco. • Overall, expressions of these genes in pepper, eggplant and tobacco showed similarpatterns to those in tomato and potato: P-starvation enhancement in both leaves androots forPht1;1, P-depletion induction exclusively in roots forPht1;2, mycorrhizalenhancement forPht1;3, and mycorrhizal induction for bothPht1;4andPht1;5. • In the roots of nonmycorrhizal eggplant,SmPht1;3,SmPht1;4andSmPht1;5werealso expressed under extreme P starvation. Mycorrhizal symbiosis under high-Psupply conditions reduced plant growth, with concurrent enhancement ofPht1;2expression in the roots of pepper as well as eggplant. In addition, the mycorrhizalsymbiosis down-regulated the expression ofPht2;1genes greatly in the leaves ofpepper and tobacco. • The discrepancies between the evolutionary distances of the PiT genes and theirexpression patterns among the five species suggest greater complexity in functionof PiT in plants than previously expected.

【题目】氮饥饿水稻利用不同形态氮素的差异及其生理机制
【中文关键词】水稻;铵态氮;硝态氮;硝酸还原酶;谷氨酰胺合成酶;叶绿素
【英文关键词】无
【中文摘要】通过水培试验,研究了氮饥饿7d 后,恢复供应不同形态氮源对水稻氮吸收和积累及氮同化中关键酶活性和光合色素的影响。结果表明,缺氮促进根系生长,增加根冠比。恢复供氮4d 显著增加地上部生物量。铵硝混合营养促进了水稻对氮的吸收和转运,叶片和根系中全氮及叶片中铵态氮的含量以硝酸铵处理最高。与单一铵或硝营养相比,铵硝混合营养增强了根系的谷氨酰胺合成酶和叶片中硝酸还原酶的活性,提高了水稻同化和利用氮的能力。另外,与纯硝营养相比,供应铵态氮显著增加了叶片中总叶绿素,尤其是叶绿素a 的含量。因此,改善水肥管理、平衡对水稻供氮的铵硝配比将提高水稻氮素的吸收和利用效率。

【题目】Amplification of rainbow trout microsatellites in Brachymystax lenor
【中文关键词】细鳞鱼,微卫星,多态性,种群遗传
【英文关键词】Brachymystax lenok, microsatellite, polymorphism, population genetics
【中文摘要】细鳞鱼是冷水性鱼,栖息于含氧量高的山溪上游。我们用来自虹鳟13对多态性微卫星引物扩增32B,细鳞鱼采自乌苏里江。每个位点等位基因2-7个平均3.9个。发现杂合率0.0625-0.9677。一个位点显著偏离Hardy-Weinberg平衡。13个位点为细鳞种群结构及遗传多样性研究提供了基础。
【英文摘要】Brachymystax lenok is a cold freshwater fish accustomed to inhabit relatively high concentration of dissolved oxygen and clean upper streams. Here we present 13 polymorphic microsatellite primer pairs from rainbow trout to amplify in 32 B. lenok individuals from Ussuri River of China. The number of alleles ranged from two to seven with an average of3.9 per locus. Observed heterozygosity ranged from 0.0625 to 0.9677. One locus showed significant deviation from Hardy – Weinberg equilibrium. These 13 loci will provide a good basis for investigation of B. lenok population structure and genetic diversity in different distribution region..

【题目】池养大鲵的人工催产研究
【中文关键词】关键词:大鲵;人工养殖;人工繁殖
【英文关键词】Key wor ds : Chinese giant salamander ; Tank2culture ; Artificial propagation
【中文摘要】摘要:本文报道了人工培育大鲵亲本的繁殖结果。在养殖条件下,大鲵的性腺可正常发育,大鲵的性成熟年龄为5龄,性周期为一年一次,群体的繁殖高峰期出现在每年的6 —8 月。使用LRH2A 或HCG均可诱导大鲵产卵和排精。群体的性腺发育进程存在明显的个体差异,雄性比雌性的发育时间长10 —20d 。在繁殖盛期进行人工催产,获产率为60 %左右。人工繁育的子代,在培育为亲本时,其性腺发育的个体差异仍然存在。养殖的性成熟个体,在没有受到外源激素作用时,将不会发生自然排卵现象,雄鲵不能挤出精液。在20 —23 ℃下,雌性大鲵的效应时间约为96 —120h ,雄性可在80h 后挤到精液。大鲵的产卵量为400 —500 粒,平均为430 粒。多次产卵个体的产卵量多于初次产卵个体。低剂量的药物催熟,未发现对性腺发育进程和产卵结果有明显的促进作用。
【英文摘要】Abstract : Chinese giant salamander[Andrias davidianus (Blanchard)] ,Which is the largest species i n amphibian , is found in17 provinces of Chi na. The resources of salamander are declined remarkably because of inordinate catching by men . Therefore the artificial domestication and propagation of salamander are widely developed in the present time. In this paper , the results ofpropagation for artificial domesticated brood in Chinese giant salamander are reported.he salamande rs or the test we re c aught rom Hubei and an i Provinces . he area o each tank or domestication was 1 m2and the dept h o water wa s 0 20m. n e ach tank 12 40 salamande rs are cultured in static water which came rom tap water .he water was changed onc e in 1 2 da s. he temperature o water changed rom to 2 in all ea r . he eed was resh fish.In the condition of artificial domestication , it takes 5 years for the Chinese giant salamander to attain gonad maturity and thegonads can be normally developed . Its reproductive cycle is once a year and fastigiumis 6 —8 mont h in each year. Its ovulationand spermiation can be induced byLHRH2Aor HCGinjection . Individual differences were observed in gonad development withinthe population . During the reproductive fastigium , only about 60 % brood salamanders can lay eggs after hormonal injection. It takes 10 —20 days more for male than female to attain gonad maturity. The phenomenon is often observed that the gonad of someindividuals in the population attaining progenitive age cannot attain maturity. When the filial generations coming from artificialpropagation attain maturity , their individual differences of gonad development are also observed.If they were not induced by exterior hormone , the mature individual under the condition of artificial domesticationwould nottake ovulation and spermiation. Furthermore , their gonads will degenerate and absorb naturally. After induced by hormone , female salamanders can lay eggs naturally in tank , but copulatory action is not observed .The reactive time for salamander spawning is related with different hormone and water temperature. The reactive time ofLHRH2A was longer than that of HCG. The lower the water temperature was ; the longer time needed. If the water temperature declines 1 ℃, the reactive time will delay 10 hours. Induced by the extender of LHRH2A and HCG, the reactive time of female was about 96 —120h and sperm could be extruded in male after 80h.The quantity of eggs laid by each brood salamander was about 400 —500 , with an average of 430. The ovulated quantity ofrepetitious spawni ng brood was more than that of first spawning brood. The method of inducing ovulation was that exterior hormone was directly injected into t he celomof salamander. The effect of once injection was better than that of more than one injection. No significant effects were found upon the gonad development and spawning rate by using low doses of hormones for inducing maturation . On the contrary , low doses of hormones could lead to the abortion of some brood salamander.

【题目】大鲵遗传多样性分析
【中文关键词】关键词:大鲵(Andrias davidianus);线粒体DNA;遗传多样性
【英文关键词】Key words:Andrias davidianus;mtDNA;genetic diversity
【中文摘要】摘要:以线粒体DNA控制区为分子标记,对汉水流域大鲵(Anddas davidianus)的遗传多态性进行了研究。在获得的757bp的碱基序列中,有18个多态性核苷酸变异位点,占全部碱基数的2.38%;基因突变以转换为主,有一处插入或缺失;A、T、C、G四种碱基的平均含量分别为31.8%、33.0%、20.9%、14.3%,且A+T的含量(64.8%)明显高于G+c的含量(35.2%)。28个样本检测到8种单倍型,单倍型间的核苷酸变异在0.13%一1.74%之间,单倍型多样性(Haplotype diversity)指数和核苷酸多样性(Nucleotide diversity)指数分别为h=0.8230±0.0440和7r=0.00446±0.00122,显示了大鲵驯养群体的的遗传多样性水平较低。
【英文摘要】Abstract:A research on polymorphism of giant salamander,was conducted by taking their mtDNA control region as no1ecular marker.A sequence of 757 bp obtmned contained 18 polymorphic nucleotide variable loci,accounting for 2.38%of the total number of bases Transition was the predominating gene mutation. There was only one insertion or deletion. Theaverage contents of the four bases A,T,G and C were 31.8% ,33.0% 20.9% and 14.3% ,respectively. And A+Tcontents(64.8%)were significantly higher than those of G+C (35.2%).Eight haplotypes were detected in 28 samplesThe nucleotide divergence among the haplotypes was between 0.13% and 1.74% . The haplotype diversity index and thenucleotide diversity index were h=0.8230±0.0440 and 7r=0.00446±0.00122.which suggested that the genetic diversityof the giant salamander population was at a rather low leve1.

【题目】底质和遮蔽物在锯缘青蟹Scylla serrata(Forslca9l)种苗中间培育中的作用
【中文关键词】关键词:锯缘青蟹幼蟹 底质 遮蔽物 存活率
【英文关键词】Key words:abbreviation
【中文摘要】【提要】 在日换水量30%基础上比较了粗沙、海细泥沙底质及有无遮蔽物对锯缘青蟹幼蟹生长存活的影响。实验结果表明:蟹苗潜沙比例与沙粒径大小及蟹苗规格相关。表现为沙粒径越小或蟹苗规格越大,蟹苗完全潜沙的比例越高;C1、C2 阶段蟹苗,具较强的攀附习性,以网片为附着物的蟹苗数量约占30%以上,进入C3 后,网片上蟹苗数量呈明显下降趋势。变态速度方面,海沙底较其余各组要提前1 天,而其余各组无明显差异;最终成活率方面,网片(77%)>海泥沙(70%)>粗沙(65%)>空白(60%);规格方面,同一期的幼蟹壳宽无明显差异(P> 0.05)

【题目】点篮子鱼肌肉的营养成分分析与评价
【中文关键词】关键词: 点篮子鱼; 肌肉; 生化成分; 氨基酸; 营养评价; A /E 值
【英文关键词】Key words: Siganus guttatus; muscle; biochem ical components; am ino acid; nutritive evaluat ion; A /E ra tio
【中文摘要】摘要: 利用常规肌肉营养测试方法测定分析了10尾野生点篮子鱼(S iganus guttatus) 的一般生化成分与氨基酸含量。结果表明, 点篮子鱼肌肉(鲜样)中水分、粗灰分、粗蛋白和粗脂肪的质量分数分别为74. 27%、1. 60%、21. 20%和2. 79%。点篮子鱼肌肉中检测出18 种氨基酸(包括牛磺酸, 胱氨酸未检测), 总量为74. 57% (质量分数, 干样), 必需氨基酸总量为31. 72%, 占氨基酸总量的42. 54%, 点篮子鱼必需氨基酸的构成比例符合联合国粮农组织/世界卫生组织(FAO /WHO)的标准。点篮子鱼的限制性氨基酸为色氨酸和(蛋氨酸+ 胱氨酸), 其必需氨基酸指数(IEAA)为69. 77。点篮子鱼肌肉中4种鲜味氨基酸(DAA) 总量为25. 41%(质量分数, 干样) , 占总氨基酸含量的34. 01%。对点篮子鱼肌肉10种必需氨基酸的A /E 值进行了计算与分析, 从A /E 值的大小次序来看, 点篮子鱼与银大麻哈鱼基本类似, 比值最高的前三位必需氨基酸依次为赖氨酸、亮氨酸和精氨酸, 最小的为色氨酸。A /E 值为点篮子鱼必需氨基酸需求研究和配合饲料的开发提供了基础素材。
【英文摘要】Abstract: B iochem ica l components and am ino acids composit ion in themusc le o fS iganus guttatus w ere tested and ana lyzed w ith routine methods. Samp les of 10 w ild indiv iduals, w ith (20. 04 0. 53) cm body length and (305. 86 34. 00) g body w eigh,t were collected from the South Ch ina Sea, near Sanya C ity o fH ainan Prov ince in September of 2007. The results show ed that contents of mo isture, crude ash, crude pro te in andcrude fat o f freshmuscles w ere 74. 27%, 1. 60% , 21. 20% and 2. 79% , respectively. The composition o fam ino acids ofmuscle w as 18 common am ino ac ids, inc lud ing Tau, and 8 essential am ino ac ids for human needs (no ana lysis w as made for Cys) . In dry samp le the tota l content of am ino acids w as 74. 57% ; thecontent o f essentia l am ino acids w as 31. 72%; the percentage of essentia l am ino ac ids in tota l am ino ac idsw as42. 54% . Itw as apparent that the content of the different am ino acidsw as stable and the const itutional rate o fthe essen tial am ino ac ids accorded w ith the FAO /WHO Standard, fundamenta lly. A ccord ing to nutritioneva luation in am ino acids score (SAA) and chem ica l score (SC) , the first lim ited am ino ac id w asT rp, and thesecond lim ited am ino ac ids was Phe + Tyr; the essentia l am ino acids index (IEAA) w as 69. 77; in dry samplethe conten t o f four k inds delicious am ino ac ids w as 25. 41%, and the percentage o f de lic ious am ino acids intota l am ino ac ids w ere 34. 01%. W e calcu lated the A /E ratios o f 10 essent ial am ino acids for S. guttatus.Based on the descent order ofA /E rat ios, the first three essent ia l am ino ac ids w ere G lu, Leu and Arg. Thevalue ofA /E ratio for Trp was the sma llest in 10 essen tial am ino acids. This descent order w as a lso found inchum salmon. 【题目】豆油代替鱼油对哲罗鱼稚鱼生长和体成分的影响
【中文关键词】豆油; 哲罗鱼; 生长; 体成分
【英文关键词】soybean oil; H ucho taimen ; growth performance; body composit ion
【中文摘要】研究不同比例豆油取代粗制鱼油对哲罗鱼(H ucho taimen) 稚鱼生长和体成分的影响。实验分4 个组, 每组设3 个重复, 每个重复100 尾稚鱼(体质量7~ 8 g) 。第1 组(G1) 为对照组, 添加15%鱼油, 第2 组(G2) 、第3 组(G3) 和第4 组(G4) 分别用5%、10%和15%豆油取代鱼油。实验进行8 周。结果表明, 不同处理成活率和平均日增重差异不显著(P> 0 05) , 但随着豆油比例的增加, 特定生长率和肥满度都得到提高, G3 和G4 组特定生长率显著高于G1 组(P > 0 05);G4 组肥满度显著高于G1 组(P > 0 05) 。G3、G4 组饵料系数显著降低(P < 0 05) 。不同处理体成分中水分、粗蛋白质和粗脂肪含量均差异不显著(P > 0 05) 。实验表明, 豆油作为脂肪源可以完全代替鱼油用于哲罗鱼稚鱼饵料生产。
【英文摘要】Dietary lipids are major source of energy and also prov ide essential PUFA for fish. But the resource of fish oil, w hich w as the major source of dietary lipid, w as scarce. So it s important to find a replacement for f ish oil in aqua feed. In this study, four t reatments w ere designed and three replicates w ere set in each t reatment, each w ith 100 juvenile fish(body weight 7- 8 g) in each replicate. G1 w as set up as the control group, w ith 15% f ish oil added in, and treatments G2, G3 and G4 used 5%, 10% and 15% soybean oil respectively as the replacement of f ish oil. T he experiment w as conducted for eight w eeks. T he results show ed that there w ere no dif ferences in survival rate(SR) and daily w eight gain(P > 0 05) among different treatments, but specif ic grow th rates(SGR) and condit ion factors were signif icantly improved w hen the soybean oil level was increased, and feed conversion rat io(FCR) decreased in G3(P > 0 05) and G4(P < 0 05) ; SGRincreased in G4 and G3 signif icantly (P < 0 05) and condit ionfactors increased signif icant ly in G4. The moisture, crude protein and crude fat content of f ish body were not dif ferent among dif ferent t reatments(P> 0.05) . The conclusion is that soybean oil can replace fish oil completely and can improve the product ion of juvenile H uchotaimen, which is verysignificant in feed producing of H . taimen.

【题目】呼玛河哲罗鱼遗传多样性的AFLP 分析
【中文关键词】关键词: 哲罗鱼; AFLP; 遗传多样性
【英文关键词】Key words:H ucho taimen Pallas; AFLP; genetic diversity
【中文摘要】摘要: 2002 年4 月在黑龙江水系呼玛河塔河河段100 km 范围内, 用三刺网捕获索饵洄游哲罗鱼(H ucho taimen Pallas) 个体20 尾, 用12 对引物对其进行AFLP 分析, 每对引物组合扩增的位点在39~ 53 之间, 共扩增出了565 个位点, 多态性位点为477 个, 多态性比例为841 43%, 平均Nei 氏基因多样性指数H 为01386 7, 平均Shannon 氏指数I 为01 510 2, 个体间平均遗传距离为01455 2, UPGMA 聚类结果显示呼玛河水系哲罗鱼群体内有严重的近亲交配现象。研究结果表明呼玛河水系哲罗鱼具有适度的遗传多样性, 这对呼玛河水系哲罗鱼资源量的恢复有着至关重要的作用。
【英文摘要】H ucho taimen is the biggest salmonid species and endemic to cold w ater systems around China,especially w idely distributed in Amur Basin and w ater systems in Xinjiang Autonomous Region in 1960s. Inthe recent decades, the census size of the w hole populat ions has dramat ically decreased and its habitat hasbecome narrow, resulting from habitat damage, overfishing and climate change as w ell as its propagat ingcharacterist ics of later maturity and weak fecundity. In order to protect this precious species, H ucho tainmenhas been listed in Red Book as endangered fish species in China since 1998. Additionally, some researchersnot only evaluated the current status of it s habitats but made some prog resses on evolut ion, genet icdiversity and populat ion st ructure using biological methods. Huma River, a branch of Amur River, w as authorizedto nature protect ion region for H ucho taimen. How ever, document s about populat ion st ructure andgenet ic diversity of H . taimen in Huma River are very limited. Amplif ied fragment length

polymorphism ofDNA (AFLP) is a kind of molecular markers famous for its higher sensit iv ity and capability. In our study ,w e use 12 primer pairs to amplify genomic DNA samples f rom 20 w ild individuals captured in Huma Riverw ith AFLP method. As a result , a total number of loci detected are 565 w ith 39- 53 loci per primer pair. Ofthe 565 loci, 477 loci are polymorphic and the percentage of polymorphisms is 84. 43%. The mean Nei. sgenic diversity index (H) is 01386 7, the mean Shannon. s information index (I) is 01510 2, show ing a relative higher genetic polymorphism. The mean genetic distance among individuals is 01455 2. UPGMA dendrogram shows that 20 individuals are divided into tw o groups. It is notew orthy that the phylegenet ic tree also demonst rates that there is serious inbreeding w ithin taimen populat ion, which is a disadvantageous factorfor stock enhancement .Although the genet ic diversity of taimen inHuma River is moderate based on ourresult s, the inbreeding degenerat ion cannot be ig nored. And further more it is necessary to invest ig ate thehabitat and spaw ning sites of H . taiman in detail. In this case, the chances of propagation for indiv idualsfrom dif ferent genetic backgrounds will be increased by human. s intervent ion, w hich w ill play a vital rolefor populat ion recovering.

【题目】黄斑篮子鱼肌肉营养成分与品质的评价
【中文关键词】关键词: 黄斑篮子鱼; 肌肉; 营养成分; 品质评价
【英文关键词】Key words: Siganus oramins; muscle; nutrient components; evaluation of nutritive quality
【中文摘要】摘要: 测定分析了10 尾黄斑篮子鱼的肌肉营养成分。结果表明, 黄斑篮子鱼肌肉(鲜样) 中水分、粗灰分、粗蛋白和粗脂肪的质量分数分别为74. 52%、1. 09%、19. 64% 和4. 71%。肌肉中含有18 种氨基酸, 总量为68. 33% (质量分数, 干样) , 其中8 种人体必需氨基酸(EAA) 总量是30. 40% , 占氨基酸总量的44. 48% ; 其必需氨基酸的构成比例符合联合国粮农组织/ 世界卫生组织(FAO/WHO) 的标准。黄斑篮子鱼的限制性氨基酸为(蛋氨酸+ 胱氨酸) 和色氨酸, 必需氨基酸指数(EAAI) 为61. 07, 4 种鲜味氨基酸(DAA) 总量为24. 36% (质量分数, 干样) 。脂肪酸中EPA 与DHA 质量分数分别为3. 13%和18. 03% , 明显的高于其它几种经济鱼类; 矿物元素比例合理, 微量元素中锌和硒含量较丰富, 表明黄斑篮子鱼具有较高的食用价值与保健作用。
【英文摘要】Abstract: Nutrient components in the muscle of Siganus oramin were investigated in this paper. Sample fish(n= 10) were collected from the South China Sea, near Qionghai city of Hainan Province in May of 2006. Theexamination results showed that the content of moisture, crude ash, crude protein and crude fat in fresh muscle ofS . oramin were 74. 52%, 1. 09%, 19. 64 % and 4. 71% , respectively. Eighteen common amino acids were found in the muscle of S . oramin, including 8 essential amino acids (EAA) 2 half-essential amino acids (HEAA) and 8 nonessential amino acids (NEAA) . In dry sample, the total content of amino acids(TAA) was 68. 33% ; the content of EAA, HEAA and NEAA were 30. 40 %, 6. 40% and 31. 55% respectively. Four kinds of delicious amino acids(

DAA) accounted for 24. 37% in dry sample; the rat io of total delicious amino acids to total amino acids (WDAA / WTAA) was 35. 66% . The essential amino acids index(EAAI) was 61. 07, the ratio of total essential amino acids to total amino acids (WEAA/ WTAA) was 44. 48% , and the rat io of total essential amino acids to total nonessential amino acids(WEAA/ WNEAA) was 96. 35% . It was clear that the content of thedifferent amino acids was stable and the constitutional rate of the essential amino acids met the Food andAgriculture Organization of the United Nations/World Health Organization (FAO/WHO) Standard. According tonutrition evaluation in amino acids score (AAS) and chemical score (CS) , the first limited amino acid wasMet+ Cys and the second limited amino acid was Trp. 10 saturated fatty acids (SFA) , 6 mono-unsaturated fatty acids (MUFA) and 9 poly unsaturated fatty acids (PUFA) were found in the muscle of S. oramin . The contents of EPA and DHA in fatty acids were 3. 13% and 18. 03%, respectively, which were much higher than those ofmost f ish species. The composition of mineral elements in the muscle of S. oramin was reasonable and the traceelements such as Zn and Se were rich. In conclusion, this investigation indicated that S. oramin is a nutritiveand delicious food f ish, and it could be a potential aquaculture species.

【题目】Nitrogen metabolism disorder in watermelon leaf caused by fusaric acid
【中文关键词】无
【英文关键词】Enzymes in relation to nitrogen metabolism; Fusaric acid (FA); Fusarium oxysporum f.sp. niveum; Programmed cell death; Stress; Watermelon fusarium wilt
【中文摘要】无
【英文摘要】The effect of fusaric acid (FA) on the activity of leaf nitrogen (N) metabolism enzymes in watermelon seedlings supplied with different N forms was studied. The results showed that FA inhibited nitrogen uptake and caused decreased leaf amide and protein but increasedthe content of ammonium and amino acids. When treated with FA the activities of enzymes in the pathway for the synthesis of amino acid in leaves (GS, GOGAT, and GDH) were decreased by 15 – 23%, 13 – 40%, and 71 – 86%, respectively. The activity of asparagine synthetase was decreased by 34 – 57%. The proteinase activity was initially increased by 37 – 125% at 12 h after treatment of FA but then subsequently decreased. The activity of glutamate-pyruvate aminotransferase was increased by 280 – 400%, though the activity of glutamate-oxaloacetate aminotransferase was decreased by 30 – 63%. It was suggested that FA inhibited the uptake of ammonium in seedlings and suppressed the activities of amino acid and amide synthases, while stimulating proteinase activity.A new pathogenic mechanism of watermelon infection by Fusarium spp. was found as FA caused the complete disorder and collapse of the host plant ’s nitrogen metabolism. This work provides a new insight into the progression of watermelon wilting caused by Fusariumoxysporum f.sp. niveum.

【题目】三种鲟科鱼类和两种鲑科鱼类卵黄免疫球蛋白性质的比较
【中文关键词】施氏鲟　小体鲟　西伯利亚鲟　哲罗鲑　金鳟　卵　Ig
【英文关键词】Amur sturgeon, A . schrencki, Sterlet, A . ruthenus , Siberian sturgeon, A . baeri, Taimen, Hucho taimen,Golden rainbow trout, Oncorhynchus mykiss, Egg yolk, Immunoglobulin
【中文摘要】从施氏鲟(Acip enser schrencki) 、小体鲟(Acipenser ruthenus) 、西伯利亚鲟(Acipenser baeri) 、哲罗鲑(Hucho taimen) 和金鳟(Oncorhynchus mykiss) 五种鱼类卵黄中分离、纯化Ig , 并对其分子结构进行了初步研究。结果表明: 五种鱼类卵中Ig 的分子量分别为施氏鲟524 kD、小体鲟468 kD、西伯利亚鲟475 kD、哲罗鲑为490kD, 金鳟498 kD, 其Ig 重链的相对分子量相同, 约为97 kD。轻链的相对分子量各不相同, 施氏鲟为27 kD, 小体鲟28 . 5 kD, 西伯利亚鲟30 kD, 哲罗鲑28 . 5 kD 和金鳟16 kD。其中西伯利亚鲟、施氏鲟和小体鲟Ig 等电点约为5 . 85, 哲罗鲑和金鳟的Ig 等电点约为6 . 55, 其蛋白质结构上具有一定的相似性, 且均为糖蛋白
【英文摘要】In this paper, immunoglobulins (Igs) were purified respectively from egg yolk of Amur sturgeon Acipenser schrencki,sterlet A . ruthenus , Siberian sturgeon A . baeri, taimen Hucho taimen and golden rainbow trout Oncorhynchus mykiss . Theirchemical, physical, and antigenc characteristics were studied by high speed centrifugation and gel filtration chromatography.Molecular weights of immunoglobulin from Amur sturgeon,Sterlet, Siberian sturgeon, Taimen and golden rainbow trout were 524,468, 475, 490 and 498 kD respectively. After SDS- PAGE, immunoglobulin of the five species of fishes appeared as two bands,representing heavy chains and light chains respectively . The molecular weight of the heavy chains of five fishes was about 97 kD,and the molecular weight of the light chains was 27 kD for Amur sturgeon, 28 . 5 kD for Sterlet, 30 kD for Siberian sturgeon, 28. 5

kD for Taimen and 16 kD for golden rainbow trout. Immunoglobulins of these five species were confirmed to be glycoproteins bystaining with Molecular Proes Pro-QR Emerald 300 Glycoprotein Gel stain. The pI of immunoglobulin of fishes were 5 . 85 forAmur sturgeon, Sterlet and Siberian sturgeon, and 6 . 55 for Taimen and gold rainbow trout. Immunoglobulin from egg yolk andserum of the Amur sturgeon showed identical antigencity. Antiserum against Ig in egg yolk of the Amur sturgeon also cross-reactedwith Igs in egg yolk of other sturgeons and cross- reacted weakly with Igs from the salmonid fishes suggesting that Igs in egg yolk offish may not be species specific

【题目】三种鲟鱼血清及组织中磷酸酶和补体活性的比较
【中文关键词】关键词: 鲟鱼; 磷酸酶; 补体
【英文关键词】Key word: Sturgeon; Phosphate; A lex in
【中文摘要】摘要: 对施氏鲟、小体鲟和西伯利亚鲟的血清、肝脏、鳃及肠中碱性磷酸酶(AKP)、酸性磷酸酶(ACP)、补体C3及补体C4活性进行了测定和比较。AKP活性在小体鲟鳃和肠中显著高于施氏鲟和西比伯利亚鲟(P < 0. 05), 而其在三种鲟鱼的肝脏和血清中差异不显著(P > 0. 05); ACP活性在小体鲟肠中显著高于施氏鲟和西比伯利亚鲟(P < 0. 05), 而其在三种鲟鱼的肝脏、鳃和血清中差异不显著(P > 0. 05); 补体C3 活性在小体鲟肝脏和肠中显著高于施氏鲟和西比伯利亚鲟(P < 0. 05) , 而其在三种鲟鱼的鳃和血清中差异不显著(P > 0. 05); 小体鲟血清中补体C4 活性显著高于施氏鲟和西伯利亚鲟(P < 0. 05) , 而补体C4活性在三种鲟鱼的肝脏、鳃及肠中差异不显著(P > 0. 05) 。由此可见, 虽然三种同为鲟科鲟属鱼类, 但它们之间的AKP、ACP、补体C3及补体C4活性存在着种间差异。
【英文摘要】Abstract: The activities of AKP, ACP , A lex in C3 and A lex in C4 in serum, liver, gill and intest ine ofAmur sturgeon (Acip enser schrencki Brandt), Sterlet (Acip enser ru thenus Linnaeus) and S iberian sturgeon (A cipenser baer ii) from Engeer ing and Technology Center o f S turgeon B reeding and Cultivation, B eijing, Fangshan w ere studied in the experimen.t The re su lts show ed that act iv ity o fAKP in gill and intestine o f Sterletw as sign ificantly h igher than that ofAmur sturgeon and Siberian sturgeon (P < 0. 05) , not sign if icantly in liver and serum(P >0. 05). act iv ity of ACP in intest ine o f S terlet w as sign ificantly higher than that o fAmur sturgeon and S iberian sturgeon (P < 0. 05) , not sign if icantly in liver, g ill and serum (P > 0. 05).activ ity of A lex in C3 in liver and intestine o f Sterletw as sign ificantly higher than that of Amursturgeon and S iber ian sturgeon (P < 0. 05), no t sign ificantly in g ill and serum (P > 0. 05).activ ity of A lex in C4 in serum of Sterlet was sign ificantly higher than that o fAmur sturgeon and S iberian sturgeon (P < 0. 05), no t sign ificantly in liver, g ill and intestine (P > 0. 05) . A lthough three kinds o f sturgeons w ere in the sam e genus and fam ily, AKP, ACP , A lex in C3 and A lex in C4 acy ivities of the three k inds fishw ere signifi can tly different

【题目】施氏鲟不同组织来源细胞离体培养的初步研究
【中文关键词】关键词 施氏鲟; 细胞系; 离体培养
【英文关键词】Key words Amur sturgeon (Acipenser schrencki Brandt); cell lines; cultivation in vitro
【中文摘要】摘要:采用组织块移植培养技术, 对来源于施氏鲟(Amur sturgeon, Acipenser schrencki Brandt)肝脏、脾脏、肾脏、鳍条和心脏组织的细胞进行了原代培养, 2~3天左右可见组织块周围有成纤维样细胞迁出, 10 天左右组织块周围形成单层细胞。对原代培养的单层细胞用胰蛋白酶-EDTA消化后传代培养, 建立了可连续传代的施氏鲟肝脏、脾脏、肾脏、

心脏组织细胞系。初步确立施氏鲟细胞培养的条件, 培养基为MEME, 培养温度为25 °C, 血清浓度为20%。对传代培养细胞以二甲基亚砜为保护剂在液氮冷冻保存, 细胞复苏后可连续传代培养。施氏鲟细胞离体培养为开展鲟鱼病毒病和遗传资源保存研究提供了重要试验材料。

【英文摘要】Abstract By using the tissue explantation technique, primary culture of cells derived from the liver, spleen,kidney, fin and heart tissue of Amur sturgeon, Acipenser schrencki Brandt, were conducted. In 2 – 3 days cellsmigrate out around tissues and in 10 days post culture cells outgrow to monolayer. Continuous cell lines from liver,spleen, kidney and heart tissues were established after subculture of primary cells with trypsin-EDTA digestionmethod. The optimized conditions for these cells are: minimum essential medium eagle ’ s (MEME), 25 °C 20% fetal bovine serum. Cells were cryopreserved with preservative DMSO in liquid nitrogen and grew well afterrecovery.The establishment of cell lines derived from Amur sturgeon has provided important experimental materials for theresearch on sturgeon virosis and genetic resources conservation

【题目】施氏鲟出血性败血症病原菌的分离和鉴定

【中文关键词】关键词 施氏鲟; 出血性败血症; 病原; 分离鉴定; 嗜水气单胞菌

【英文关键词】Key words amur sturg eo n(A cip enser schr encki i Brandt) ; hemorrhage disease; pathog en; isolat ionand identif icat io n; A eromonas hy dr op hila

【中文摘要】摘要 从患典型出血性败血症死亡的施氏鲟(Acip enser schrenckii Brandt) 脾脏组织分离到1 株致病性病原菌。依Koch 法则建立室内感染模型, 一次感染试验和回归感染试验的试验组均可复制出与自然发病情况下相同的症状, 根据Reed Muench 法计算病原菌半数致死浓度为1. 17 107 cfu/ mL。对从自然发病和一次感染试验的病鱼体内分离的致病菌进行形态和VITEK 全自动细菌生理生化表型鉴定以及16S rRNA 基因部分序列进化树分析, 结果表明导致施氏鲟出血性败血症的病原菌为嗜水气单胞菌(Aer omonas hy dr op hila) 。药物敏感试验结果显示, 该病原菌对庆大霉素、环丙沙星、阿米卡星等药物敏感, 对氨卞青霉素、舒巴坦、头孢唑啉等药物具有抗性。

【英文摘要】Abstract A st rain o f causat ive pathogen w as iso lated from the spleen tissue of freshly died amursturgeon (A cip enser schr encki i Brandt) suf fered from hemorrhagic sept icemia. Ex perimental infect io nmodel w as established based o n the Koch rule. In init ial infect io n test and regr essive infect ion test, thety pical diseased symptoms as naturally occurred w ere ex perimentally repro duced by intr aperito neal inject ion w ith iso lated bacterium suspension. T he result o f infect ion test show ed the LD50 w as 1. 17 ×107cfu/ mL, calculated by the Reed Muench method. Co nsidering the r esult s of the Gram ’ s staining , VITEKbacterial automat ic ident ificat ion system, sequencing of 16S rRNA gene and phy logenet ic analysis, the isolated pathog en w as identif ied as A eromonas hy dr op hila. The suscept ibility test to ant ibiot ics rev ealed the isolated pathog en was resistant to ampicillin, sulbactam, cefazolin, piper acillin and sensit ive to ciprof lox acin, gentamicin, etc.Key words amur sturg eo n(A cip enser schr encki i Brandt) ; hemorrhage disease; pathog en; isolat ionand identif icat io n; A eromonas hy dr op hila

【题目】细鳞鱼卵巢滤泡细胞的发育及功能
【中文关键词】关键词:细鳞鱼;卵巢;滤泡细胞;闭锁细胞
【英文关键词】Key words:Brachymystax lenok;ovary;follicular cell;atretic cells
【中文摘要】摘要:通过光镜和透射电镜对细鳞鱼(Brachymystax lenok) 的卵巢滤泡细胞进行了研究。结果表明,滤泡细胞起源于非生殖细胞,并且其整个发育过程可分为4 个时期:零散细胞期、单层扁平细胞期、多层扁平细胞期和颗粒细胞分泌期。滤泡细胞在初级卵母细胞早期并不具备任何功能,到卵母细胞卵黄积累初期,滤泡细胞上皮协同其合成部分卵膜;卵黄积累旺盛时期,滤泡细胞在此过程中起到信号介导、物质转运和储存的作用;在卵巢退化阶段,滤泡细胞与未发育的卵母细胞形成闭锁卵泡,对卵细胞残体和碎片还具有吞噬、消化等作用
【英文摘要】Abstract:The ovarian follicular cells of Brachymystax lenok were studied by light and transmission electronmicroscopies. The results show that follicular cells originate from non-germ cells,and its whole developmentprocess can be divided into four stages:scattered cell stage,unilayer flat cell stage,multilayer flat cell stage andgranule cell secretion stage. At early primary oocyte stages follicular cells don ’ t have any function;at early yolkaccumulating stages follicular cells and follicular cell endepidermis synthesize part egg envelope coordinately;at yolk-quickly-accumulating stages ,follicular cells play a role in signal media,as well as material conveyingand storing;at ovaries degenerating stages follicular cells and undeveloped oocytes become corpora atretica,andhave the function of phagocytosing and digesting ovotid fragment.

【题目】小体鲟卵黄雌性蛋白分离纯化及抗血清的研制

【中文关键词】小体鲟; 卵; 卵黄蛋白; 卵黄雌性特异蛋白
【英文关键词】Acip enser ruthenus; egg; yolk protein; yolk female specif ic protein
【中文摘要】采用凝胶柱层析法, 对小体鲟(Acip enser r uthenus Linnaeus) 卵黄蛋白粗提液进行分离纯化。小体鲟卵黄蛋白粗提液的质量浓度为25 04 mg/ mL, 经Sephadex G- 200 层析后出现3 个蛋白峰。用聚丙烯凝胶电泳、免疫印迹(Westernblo tting) 和免疫扩散等方法研究表明, 小体鲟卵黄蛋白由分子量分别为132 1 kD、97 4 kD、85 9 kD、67 0 kD、59 2 kD、47 6 kD、3 0 kD、1 4 3 kD 和12 8 kD 的9 个亚基组成; 层析后峰B 蛋白为卵黄雌性特异蛋白(yolk female specific protein,YFSP) , 是一种糖脂磷蛋白, 具有雌性特异性和组织特异性, 抗体具有种属特异性。Western blotting 结果表明, 卵黄雌性特异蛋白(YFSP) 与血清雌性蛋白(FSSP) 免疫印迹图谱上都显示分子量为97 4 kD 和30 kD 的2 条杂交带, 可见两种蛋白在免疫原性上具有相似性, 可以用卵黄雌性蛋白抗血清代替卵黄蛋白原抗血清对卵黄蛋白原进行检测。
【英文摘要】Yolk is the primary nutrit ion material during the development of embryo of w hich itellin is primary constitude element . At present only the yolk protein of H uso huso Acip enser ruthenus and Acip enser tr ansmontanus had been studied in all of Acip enser . It had not been reported that yolk female specific protein (YFSP) of A cipenser ruthenus Linnaeus w as studied. So in order to know the characters ofyolk female rotein f rom Acipenseriformes, the yolk protein w as abstracted and purified and it s ropert ies w ere analysed. The crude ex tract ion of yolk protein from Acip enser ruthenus Linnaeus serum w as concen trated and its concent rat ion was 25 04 mg/ mL. The crude ext ract w as purif ied by g el chromatography ofSephaden G200. The results showed there were three protein peaks A, B and C by g el chromatography at4 0 2 mmol/ L PMSF and three protein peaks w ere relatively symmet ric. Then rotein peak B w as purified by more than one t ime Sephadex G 200 eluting . T he propert ies of yolk protein w ere analyzed by themethods of polyacrylamide gel electrophoresis, w estern blott ing and immuno diffusion. Based on the 12%SDS PAGE staining data, nine brands w ere detected w ith molecular w eights of 132 1 kD, 97 4 kD,85 9 kD,67 0 kD, 59 2 kD, 47 6 kD, 30 kD, 14 3 kD and 12 8 kD, respect ively . And protein peak B was composed of tw o subunits with molecular w eights of 30 kD and 97 4 kD, respect ively. T wo ext ra brandsw ith molecular w eights of 30 kD and 97 4 kD also w ere found in serum of latter reproductive period of female adult s of Acip enser r uthenus Linnaeus by 12% SDS PAGE. The special dying analyses of hosphorus, lipid and carbohydrate show ed protein B w as a kind of carbohydrate phosphorus lipid rotein. The result ofpolyacrylamide gel elect rophoresis, western blot t ing andimmuno diffusion showed protein B w as a kind ofYFSP. YFSP is a kind of hospholipins glycoprotein and it had female specificity and t issue specif icity andits antibody is species specif ic. Immunity experiment show ed that the vitellin only xisted in reproduct ive lat ter period of female adult s of A cip enser ruthenus Linnaeus. The result of Western blot t ing show ed IgGcould ident ify protein B and two hybridizat ion bands w ere detected w ith molecular mass 97 4 kD and 30kD, respect ively. These how ed the immunogenicity of both YFSP and female serum specific protein(FSSP) was similar and its ant ibody w as species specific. So the ant i serum of Lipov itell (Lv)can replacethe ant i serum of Vitelline to detect vitelline.

【题目】Responses of Rice Cultivars with Different Nitrogen Use Efficiency to Partial Nitrate Nutrition
【中文关键词】无
【英文关键词】Ammonium transporter, partial NO3 nutrition, NH4 uptake, nitrogen use efficiency, rice, Oryza sativa.
【中文摘要】无
【英文摘要】† Background and Aims There is increased evidence that partial nitrate (NO32) nutrition (PNN) improves growth ofrice (Oryza sativa), although the crop prefers ammonium (NH4þ) to NO32 nutrition. It is not known whether theresponse to NO32 supply is related to nitrogen (N) use efficiency (NUE) in rice cultivars. † Methods Solution culture experiments were carried out to study the response of two rice cultivars, Nanguang(High-NUE) and Elio (Low-NUE), to partial NO32 supply in terms of dry weight, N accumulation, grain yield,NH4þ uptake and ammonium transporter expression [real-time polymerase chain reaction (PCR)]. † Key Results A ratio of 75/25 NH4þ-N/NO32-N increased dry weight, N accumulation and grain yield of ‘ Nanguang ’ by 30, 36 and 21 %, respectively, but no effect was found in ‘ Elio ’ when compared with those of 100/0 NH4þ-

N/NO32-N. Uptake experiments with 15N-NH4þ showed that NO32 increased NH4þ uptake efficiency in ‘ Nanguang ’ by increasing Vmax (14 %), but there was no effect on Km. This indicated that partial replacement of NH4þ byNO32 could increase the number of the ammonium transporters but did not affect the affinity of the transportersfor NH4þ. Real-time PCR showed that expression of OsAMT1s in ‘ Nanguang ’ was improved by PNN, while thatin ‘ Elio ’ did not change, which is in accordance with the differing responses of these two cultivars to PNN. † Conclusions Increased NUE by PNN can be attributed to improved N uptake. The rice cultivar with a higher NUEhas a more positive response to PNN than that with a low NUE, suggesting that there might be a relationshipbetween PNN and NUE.

【题目】小体鲟卵黄蛋白生化特性及合成途径的研究
【中文关键词】小体鲟; 卵黄蛋白; 生化特性; 免疫组织化学; 合成途径
【英文关键词】A cip enser ruthenus; Yo lk protein; B iochem ical character; Immunohistochem istry; Synthesis pathw ay
【中文摘要】使用葡聚糖凝胶(Sephadex G-200)从小体鲟鱼卵粗提液中, 提纯卵黄脂磷蛋白(Lipov itellin, Lv)和卵黄高磷蛋白(Phosv itin, Pv) 。卵黄脂磷蛋白(含糖、磷和脂, 等电点7150) 具有雌性特异性, 分子量为144kD, 由9714kD和30kD的大小2个亚基组成。卵黄高磷蛋白(含糖、磷, 等电点8130)其分子量为66kD, 其具有两个亚基, 分子量分别为716kD、161 8kD。制备卵黄脂磷蛋白兔抗血清, 采用免疫组化方法对不同年龄小体鲟的肝脏、肠、卵(Ò) Õ期卵巢) 及血涂片, 进行免疫组织化学定位研究。小体鲟卵巢发育到Ô期前, 卵黄蛋白主要靠卵母细胞自身合成这个时期内源性合成卵黄蛋白; 当卵巢发育到Ô期, 卵母细胞自身不合成卵黄蛋白, 主要是通过肝脏合成卵黄蛋白原, 通过血液循环运送到卵巢, 被卵母细胞吸收后, 裂解为卵黄蛋白, 这个时期外源性合成卵黄蛋白。

【题目】星突江鲽的形态特征及内部结构研究
【中文关键词】关键词:星突江鲽;外部形态;可量可比性状;可数性状;内部结构
【英文关键词】Key words:Platichthys stellatus Pallas; morphometic characters; meistic characters; internal structure
【中文摘要】摘要: 通过观察、测量、解剖、数据的整理和分析,对120 尾全长11~43 cm, 体质量0.02~2.49 kg 的养殖星突江鲽(Platichthys stellatus Pallas) 外部形态、可量可比性状、可数性状和内部结构进行了研究。外部形态包括口、鼻、眼、鳍条、侧线和鳞片的特征;可量可比性状包括全长/ 体长(Tl/Sl)、体长/ 体高(Sl/Bd)、体长/ 头长(Sl/Hl)、头长/ 吻长(Hl/Pl)、尾柄长/ 尾柄高(Cl/Cd)、体长/ 尾柄长(Sl/Cl)、头长/ 眼间距(Hl/Ei)、头长/ 眼径(Hl/Ed) 比值及其相关方程;可数性状包括背鳍鳍条、尾鳍鳍条、臀鳍鳍条、腹鳍鳍条、胸鳍鳍条、侧线鳞、侧线上鳞、侧线下鳞、牙齿、幽门盲囊、上鳃耙、脊椎骨;内部结构主要包括消化系统的组成和解剖位置。结果表明:(1) 外部形态的明显特征在于:背鳍、臀鳍、尾鳍有黑色和黄色相间的条纹;多角星状鳞片,有刺状突起。(2) 全长/ 体长变动范围最小,雌雄差异最小,其线性相关性最好,全长与体长相关方程为Sl= 0.877 1Tl-0.158 9(R2=0.982 2);头长/ 吻长、头长/ 眼径不仅变动最大,而且其线性相关性最差,雌雄的差异也最大;星突江鲽体长与体质量关系为:W=0.016 8Sl3。199 ,R2= 0.979 7;雄性:W=0.027 4Sl2。972 1,R2= 0.993;雌性:W=0.013 4Sl3。300 8,R2= 0.982 2(W 代表体质量,kg;Sl 代表体长,cm)。(3) 星突江鲽腹鳍鳍条与幽门盲囊最稳定;侧线鳞和牙齿变动最大。(4) 牙尖锐,圆锥形;胃大,呈“I”型,肠粗短;1~2 枚幽门盲囊。通过比较发现:星突江鲽的外部形态、可量可比性状和内部结构特征均与石鲽相近;星突江鲽与6 种比目鱼相比,可数性状指标的数目多较少。
【英文摘要】Abstract: By observing,measuring and anatomizing 120 individuals of the raised Platichthys stellatus Pallas(total length ranged from 11 to 43 cm, body weight ranged from 0.02 to 2.49 kg), the fish external shape,morphometic characters, meistic characters and internal structure were observed and described. The external shapeincludes the description for mouth, noses, eyes, pterygiophores, lateral lines and scales; the morphometric characters include total length/standard length(Tl/Sl), standard length/body depth(Sl /Bd), standard length /headlength(Sl /Hl), head length /proboscis length(Hl /Pl), caudal length/caudal depth(Cl/Cd), standard length /caudal length (Sl / Cl), head length /eye interal(Hl /Ei), head length /eye diameter(Hl/Ed) and their correlationequations; the meistic characters includes dorsal fin rays, caudal fin rays, anal fin rays, ventral fin rays pectoral fin rays, lateral line scales, the upper scales of lateral line, the lower scales of lateral line, teeth, pyloric caeca,the upper gill rakers, vertebrae; the internal structure mainly includes the constitution and anatomic positionof digestive system. The results indicate that the visible characteristic of external shape lies in the black-yellow stripes on dorsal fin, anal fin and caudal fin as well as the multiangular stellate scales with spinulose gibbosity.Besides, the variation magnitude of total length/standard length is small with little difference between female andmale. The correlation equation of total length and standard length [Sl = 0.8771 Tl -0.1589(R2=0.982 2)] presentsthe best in linear correlation. The values of both head length/proboscis length and head length /eye diameter not only vary largely but present the worst in linear correlation with great difference between female and male. The general correlation equations of standard length (Sl) and body weight (W) is W=0.016 8Sl3。199 (R2= 0.979 7),for male, W=0.027 4Sl2。9721 (R2= 0.993);for female, W=0.013 4Sl3。3008,R2= 0.982 2. Moreover, the numbersof ventral fin rays and pyloric caeca are relatively steady. The deviation of lateral line scales and teeth is thelargest. The teeth are sharp and conical; the stomach with “I” shape is big;the intestine is wide and short andthere are one to two pyloric caeca. By comparison, it is discovered that the characteristics of external shape,morphometic characters and internal structure of Platichthys stellatus Pallas are always similar with Kareiusbicoloratus(Basilewsky), and most of the meistic character indexes of Platichthys stellatus Pallas are less thansix flatfishes in numerical value.

【题目】星突江鲽胚胎发育的研究

【中文关键词】关键词 星突江鲽 受精卵 胚胎发育

【英文关键词】KEY WORDS Starry flounder, Fertilized egg

【中文摘要】对人工干法授精、微量充气孵化条件下星突江鲽的胚胎发育进行了研究。星突江鲽受精卵为分离的球形浮性卵,无油球、卵膜薄、光滑且透明,具弹性。吸水前卵径为O.66~0.7Omm,吸水后为0.91~1.06mm。根据胚胎发育的外部形态及典型特征将星突江鲽胚胎发育过程划分为卵裂期、囊胚期、原肠期、神经胚期、胚孔关闭、眼泡和肌节形成、尾芽形成、晶体出现、听囊出现、出膜前期和出膜期11个连续的典型时期。在11±O.5℃ 水温下,受精卵经过101h仔鱼脱膜孵出。初孵仔鱼全长2.3~2.5mm,卵黄囊长径1.O75~1.25mm,短径O.6O~O.675mm。

【英文摘要】ABSTRACT This paper presents the result of research on embryonic development of starry flounder P n f s PZ nf “ by means of artificial propagation and incubation in lightly aerated seawater. Fertilized eggs of starry flounder were isolated and spherical, contained no oil glob—ules,and were buoyant in sea water.The egg membrane was thin,smooth,transparent and elastic. The mean size of eggs was O.66~ O.7O mm in diameter before absorbing water and O.9l~ 1.06 mm after fertilization and water absorption. According to the appearance and character—istics of the embryo,embryonic development was divided into 1 1 consecutive periods: cleavagestage,blastula stage,gastru1ae stage,neurula stage,blastopore closed,formation of optic vesi—cle and somite, tail ud forming, formati0n of crystal, formation of otocyst, pre—hatchingstage,hatching stage. In 1 l± 0.5℃ sea water,larvae hatched at about 1 O 1 h after fertilizati0n The total length of the post—hatch larvae was 2.3~ 2.5 mm. The long diameter of yolk sac was1.O75~ 1.25mm and short diameter was O.60~ 0.675 mm.

【题目】野生和养殖大鲵群体遗传多样性的微卫星分析
【中文关键词】Andrias davidianus,微卫星标记,等位基因,多态信息含量
【英文关键词】Andrias davidianus,microsatellite DNA markers,allele,PIC
【中文摘要】中国大鲵是世界上最大的两栖动物并且为我国特有,现在该物种野生种群急剧下降,而人工养殖种群逐渐增多。为了对大鲵 ndrias davidianus)群体进行遗传多样性的本底调查,本文用10对微卫星引物对28尾野生大鲵和16尾人工养殖的大鲵样本进行了遗传多样性分析。结果表明,在10对引物中有7对检测到多态位点,野生群体和养殖群体的观察等位基因数分别为5—8和4—6,期望杂合度分别为o.81~I]0.75,说明本实验中研究的大鲵的遗传多样性水平较高。通过人工养殖群体和野生群体的比较发现,人工养殖群体存在较大的等位基因丢失现象,并且遗传多样性水平低于野生群体。以上结果将为大鲵的人工繁育和遗传多样性的保护、利用提供一定的理论依据。
【英文摘要】The Chinese giant salamander ndrias davidianus)is world ’ S largest amphibian and is endemic to China.W ild populations of the species have declined drastically,while domesticated populations have increased in recent years.To estimate genetic variation in the Chinese giant salamander,we analyzed ten microsatellite loci of 44 individuals from two wild and one domesticated populations.A total of 52 alleles were fotmd from seven loci shown to be polymorphic.The number of alleles ranged from 6 to 9(mean 7.41.The polymorphism information content(PIC)of all populations at all loci exceeded 0.54 except the YQY atGS 1 34(0.3750),suggesting high polymorphism at microsatellite markers.Compared with the wild populations,some alleles in the domesticated population were drifted and the PIC was lower.Our results may providea theoretical basis for conservation and exploitation of giant salamanders in China

【英文关键词】Key words:Hucho taimen Pallas;digestive system ;digestive enzymes
【中文摘要】采用组织学方法对野生与养殖哲罗鱼(Hucho taimen Pallas)消化系统的形态及组织结构进行比较研究,采用聚丙烯酰胺凝胶电泳方法比较了两个群体哲罗鱼3种消化酶的相对含量。结果表明,野生与养殖哲罗鱼的消化系统在形态上存在一定差异,在组织结构上无明显差异。两个群体哲罗鱼在食道与胃酯酶相对含量上差异不显著(0.05),在肝脏与幽门盲囊酯酶相对含量上差异显著(JPl<0.05),在肠道酯酶的相对含量上差异极为显著(JPl<0.01)。两个群体哲罗鱼在食道与胃淀粉酶的相对含量上差异不显著(0.05),在肝脏与肠道淀粉酶的相对含量上差异显著(P<0.05),在幽门盲囊淀粉酶的相对含量上差异极为显著(JPl<0.01)。哲罗鱼的蛋白酶表达存在一定的pH依赖性,在体外酸性条件下(pH3),两个群体哲罗鱼只有食道与胃有蛋白酶表达;在体外碱性条件下(pH 9),两个群体哲罗鱼只有幽门盲囊与肠道有蛋白酶表达;两种pH条件下,两个群体哲罗鱼各组织中蛋白酶的相对含量差异均不显著(0.05)。两个群体哲罗鱼的消化系统结构及消化酶含量所表现出的差异与其生活环境及食物有关。
【英文摘要】The morphology and histology of the digestive system of wild and cultivated Hucho taimen has beenstudied using histological method.The results showed that there were some diferences between the wild an dcultivated types in the shape of digestive system,but the diferences in histology of esophagus,stomach,liverpyloric caecum and intestine were not clear.The digestive enzymes of the tw o populations were studied bymeans of polyacrylamide gel electrophoresis.The results showed that diferences of relative esterase content inesophagus and stomach between the two populations were not significant(P>0.05),while in liver and pyloriccaecum the diferences were significant(P<0.05).In intestine,the relative enzyme content were extremely significant(P<0.0 1).The diference of relative amylase content in esophagus and stomach between the opopulatioas is not significant(P>0.05),in liver and intestine,the diference was significant(P<0.05),in pyloriccaecurn,the diference was extremely significant(P<0.0 1).The expression of proteases relied on pH value.Only in esophagus and stomach there was protease ’s expression of the two populations in acidic condition(pH 3).In alkaline condition(pH=9),pyloric caecum and intestine had the expression of proteases.In both conditions,the Tence relative protease content of each tissue between the two populations was not prominent(p>0.05).It could bc concluded that diference of digestive system an d digestive enzymes betw een the tw o populations reliedon their living condition and food

【题目】哲罗鱼AFLP技术体系建立的研究
【中文关键词】哲罗鱼,AFLP,反应体系
【英文关键词】Key words:Hucho taimen(pallas);AFLP;reaction system
【中文摘要】以哲罗鱼为材料提取DNA,采用两组限制性内切酶组合酶切基因组,并对酶量、酶切时间、扩增时稀释倍数及镁离子的浓度进行优化,结果表明200 ngDNA用4 U的EcoR I和PstI在37℃酶切4 h后,再分别用4 U的Tru9I和z-伽I在65℃酶切4 h后用3 U的T4连接酶连接3 h,进行预扩增,预扩增产物稀释100倍后选择扩增效果最佳,得到了清晰稳定的扩增图谱;并对两组酶切组合的扩增结果进行了比较,结果显示EcoRI、Tru9I酶切组合扩增的条带数要多于PstI、raqI酶切组合扩增的条带数,但后者的多态性要高于前者。本研究为采用该技术对哲罗鱼基因组的研究提供了参考。
【英文摘要】Abstract:Nowadays,amplified fragment length polymorphism(AFLP)is one of the most regularly usedmolecular markers.In this study,the aim DNA was extracted from Hucho taimen(pallas).The genomic DNAwas digested with two groups of restriction enzymes.Th e quantity of the restricting enzymes,the time of the digested reaction,times of pre—amplification product dilution and concentration of Mg2 were optimized. 200 nggenomic DNA was digested for 4 h at 37 oC with 4 U EcoRI.PstI an d then

65 ℃ for 4 h with 4 U Tru9I an dTaqI,respectively;the product was ligated for 3 h with 3 U ligase and was pre—amplificated;the products ofpre—am pification was diluted 100 times for selective amp lification;the amplification patterns were obtainedclearly and stably.Comparison the obtained results with two pairs of restriction enzymes showed that the groupof EcoRI an d Tru9I obtained more amplification bands than the group of PstI and TaqI,but the polymorphicbands of the later exceed the former.An useful tool was provided to check the Hucho taimen(pallas)geneticvariations and was helpful for molecular assisted selection of breeding.

【题目】哲罗鱼基因组微卫星富集文库的构建与分析

【中文关键词】哲罗鱼; 微卫星; 磁珠富集

【英文关键词】Hucho taimen Pallas; microsatellite; enrichment w ith mag net ic beads

【中文摘要】采用磁珠富集法构建哲罗鱼(Hucho taimen Pallas) 基因组微卫星文库。哲罗鱼基因组DNA 经Mbo I 限制性内切酶 消化后, 选取400~ 900 bp 的片段, 用生物素标记的简单重复序列(ACA) 15作探针与其杂交, 杂交复合物结合到包被有链霉亲和素的磁珠上, 获得目的片段, 连接T 载体克隆, 构建基因组微卫星富集文库。再用同位素标记的(ACA) 15探针进行二次筛选, 筛选出686 个阳性克隆, 阳性克隆率为351 94%。对其中140 个阳性克隆进行测序, 共获得149 个微卫星序列, 4 个小卫星序列, 其GenBank Accession Number 为DQ110955~ DQ121108。其中per fect(完美型) 62 个, 占41161%;imperfect(非完美型) 92 个, 占611 74%; compound(混合型) 5 个, 占31 36%, 重复次数主要分布于6~ 45(81121%) , 平均重复次数为321 5, 这表明(ACA/ TGT) n 在哲罗鱼基因组DNA 中含量非常丰富。本研究旨为从DNA 水平上研究哲罗鱼种群结构、遗传多样性及目前群体现状等方面提供有效工具

【英文摘要】Enrichment of microsatellite DNA w ith magnet ic beads is a simple and efficient DNA isolat ing method, w hich was used to const ruct microsatellite DNAs library f rom H ucho taimen Pallas genome in this study. This project w as designed to isolate microsatellite markers from H ucho taimen Pallas genome using the biot in capture method, w hich had been developed as a convenient and eff icient method in recent years. Firstly, genomic DNA w as ext racted and digested w ith Mbo Ñ . And 400- 900 bp f ragment s w ere recovered and ligated to a short linker (23 bp) . Secondly , the lig ated DNAs were hybridized w ith biot in-labeled simple sequence repeat s(SSR) probes (ACA) 15 and the mix ture w as incubated w ith reptavidin-coated magnetic beads. T he selected sing le-st rand microsatellite DNA w as obtained by removing the SSR-uncombined fragments Af ter the amplificat ion of the selected microsatellite DNA, the PCR product s w ere ligated to Tvector and transformed to E . col i competent cells. inally, a library containing 2 100 colonies w as constructed.Six hundred and eig hty six positive colonies w ere obtained af ter the screening of the library by radioact ive labeling hybridizat ion. Sequencing of 140 posit ive colonies confirmed 149 microsatellite loci. Of these sequences, only 4 ontained compound repeat mot ifs (2161%) , and the others included 60 perfect (39122%) and 89 imperfect (58117%) repeat motifs. In addition, relat ively short arrays (6- 45 repeats) w ere most abundant (7117%) and the larg est array contained 131 repeats in the microsatellite repeat s. According to unique sequences flanking each motif, 117 primers were designed using the sof tw are Primer Premier 5. The results indicated that microsatellite sequences w ere characterized by (ACA) n abundant in genomic DNA of H ucho taimen pallas. T he (ACA) 15-enriched library onstructed in this study w ill be a useful resource for screening addit ional microsatellite markers from H ucho taimen Pallas for further study .

【题目】哲罗鱼精子的超微结构
【中文关键词】哲罗鱼; 精子; 超微结构
【英文关键词】Hucho taimen; spermatozoon; ultrastructure
【中文摘要】应用透射电镜观察了乌苏里江哲罗鱼(Hucho taimen) 精子的超微结构。哲罗鱼的精子由头部、中段和尾部组成。头部呈卵圆形, 主要结构是细胞核。核前端无顶体, 后端有植入窝, 核中染色质致密, 存在着不规则的网络状间隙。中段包括中心粒复合体和袖套。近端中心粒为9 组三联微管结构, 与远端中心粒相互垂直。袖套与细胞核后端相连, 含有丰富的线粒体和泡, 部分线粒体彼此融合, 形成复合线粒体。尾部细长, 主要结构是轴丝, 为典型的/ 9+ 20管结构。尾部的近核段有许多囊泡包围着轴丝, 远核段则无此结构。尾部有对称排列的波纹状侧鳍
【英文摘要】Ultrastructure of spermatozoon of Hucho taimen in Wusuli River was observed by transmission electron microscopy. The spermatozoon of Hucho taimen consisted of a head, a midpiece and a tail. The head was ovoid in shape, of which the main structure was nucleus. It had no acrosome and at its caudal end the nucleus had an implantation fossa. The nucleus consisted of electron dense chromatin materials and contained irregularly netlike gap. The midpiece consisted of the centriolar complex and the sleeve. The proximal centriole, which is made up of nine triplets of peripheral microtubules, and the distal centriole were arranged at a right angle to each other.The sleeve, which contained a high number of mitochondria and vesicles, was connected to the osterior end of the nucleus. Some of the single mitochondria were fused with each other and formed a complex chondriosome.The main structure of the tail was axoneme, which was slim and long. The structure of the tail was of the typical / 9+ 20 model. At the proximal end of the tail there were many vesicles outside the axoneme. The distal end of the tail, however, did not contain any esicles. The tail had lateral fins, which were undulating and arranged symmetrically.

【题目】哲罗鱼全人工繁育的初步研究
【中文关键词】哲罗鱼; 人工养殖; 生长; 性腺发育; 繁殖
【英文关键词】H ucho taimen; art if icial rearing; grow th; gonad development ; propag at ion
【中文摘要】从乌苏里江捕获体质量0 5~ 2 kg 的野生哲罗鱼(Hucho taimen) 幼鱼, 经人工培育至性腺成熟后催产获得鱼苗, 分别饲养于北京房山鲟鱼基地(水温8~ 22) 和黑龙江渤海冷水鱼实验站 水温3~ 18) , 观察和测定在人工养殖条件下哲罗鱼的生长和性腺发育, 并进行全人工繁殖实验。结果表明, 在流水池塘驯养条件下, 投喂人工配合颗粒饵料可以保证哲罗鱼的生长能量需求, 性腺能够发育成熟。北京房山基地的养殖池, 生长适温期较长, 5 龄鱼体质量可达(5 560 1 353) g, 体长(76 85 6 56) cm。黑龙江渤海站的养殖池, 生长适温期较短, 5 龄鱼体质量可达(3 626 1 282) g, 体长(67 32 6 13) cm。在黑龙江渤海站饲养的实验鱼, 原始生殖细胞出现明显性别分化的时间在出苗后60 d 左右, 期卵巢的出现期在3~ 14 个月, 期卵巢出现期在15~ 34 个月, 期卵巢出现期在35~ 47 个月, 期卵巢出现期在48~ 59个月。所得鱼苗经5 年多的人工池塘驯养, 2006 年分别在北京房山基地和黑龙江渤海站成功进行了哲罗鱼的全人工繁殖, 为该鱼的规模化养殖提供了实验依据。
【英文摘要】H ucho taimen w ith body w eight ranging from 0 5 kg to 1 5 kg w ere captured f rom Wushuli River, China, and the f ries were reproduced af ter t ificial rearing T he fries w ere reared separately in Beijing Fangshan base at w ater temperature of 8- 22 and Heilong jiang Bohai stat ion at w ater temperature at 3- 18 . During the period of rearing, w e observed the growth and gonad development of H ucho taimen , and made a pilot f art ificial propag at ion. The result s showed that feeding part icle foods can meet the energy demands for grow th and gonad maturity of H ucho taimen reared in ponds w ith flow ing w ater. Unlike Bohai Stat ion in Heilongjiang, Fangshan Base has a longer period of opt imum emperature,thus, the body weight and body leng th of 5-year-old fish can reach (5 560 1 353) g and (76 85 6 56) cm, respect ively. In cont rast , the body w ght and body leng th of the same-year-old fish reared in BohaiStation only reach(3 626 1 282) g and (67 32 6 13) cm. For those fishrearedinohai Stat ion, the primary germ cell tends to present obvious sex different iat ion at 60 days of ag e, phase ovary shape at 3-14 months, phase ovary hape at 15- 34 months, phase ovary shape at 35- 47 months, and phase ovary shape at 48-59 months.After 5 years rearing in ponds, artif icial propagat ion w ith sex-matured H ucho taimen w as conducted. The results show ed that in Beijing Fangshan base, the mean values of spaw ning ate, fert ilization rate, eyed-egg rate, incubat ion rate and larva float ing rate were 21 7, 56 3, 88 3, 88 9 and75 0, respect ively.

【中文关键词】哲罗鱼; 消化系统; 器官; 发生发育; 组织学

【英文关键词】Hucho taimen; Digestive system; Organ; Development; Histology

【中文摘要】The development of digestive system in Hucho taimen during embryonic period and pos-t embryonic period was studied by continuous tissue sectioning technique.The results howed that, an original digestive vessel was formed 11 days after fertilization. Liver primodium appeared and U stomach was formed by 18 days. The egg membrane was broken, and the scrod could open its mouth freely by 30 days. The teeth and anus were formed, and the digestive tract composed of cavum oropharyngeum, esophagus, U stomach, intestine and anus was observed 8 days after the rupture of egg membrane. The pancreas and cystigenic valve were found, and the digest system of the baby fish became capable of ingestion and igestion of extraneous foods by 16 days after hatching . After 24 days, the fish floated to water surface for searching foods and changed from endogenous nutrition to mixed utrition. By 30 days after hatching, the yolk sac was completely absorbed; the structure and function of the digestive organs were developed; and the fish switched from mixed nutrition to exogenous nutrition. As the fish further grew, its digest organs matured slowly; its hyoid tooth together with lower pharyngeal teeth became arranged in double lines; its powerful stric glands changed into net structure; plenty of pyloric caecum was formed; the intestine became straight; and the liver and pancreas were separated into independent organs.。

【英文关键词】H ucho t aimen; protein; lipid; requirement
【中文摘要】采用4 @ 3 两因素完全随机设计, 研究了哲罗鱼(H ucho taimen) 稚鱼蛋白质和脂肪的需要量。初始体质量为7~ 8 g的哲罗鱼饲养于玻璃钢水簇箱中(直径90 cm, 水深45 cm) 。实验共设4 个蛋白质水平(50%、46%、42%、3 8%) , 每个蛋白质水平设3 个脂肪水平(10%、15%和20%) , 共12 种饲料, 每种饲料投喂组设3 个重复, 每个重复100 尾鱼。实验期间水温111 5~ 171 5 e , 溶解氧71 8~ 10 mg/ L, 每天饲喂3 次, 实验共进行8 周。结果表明, 不同处理对成活率未产生显著影响; 脂肪水平对蛋白质需要量影响较大, 在10% 脂肪水平, 与其他蛋白质水平相比, 50% 蛋白质水平显著提高了终末体质量、终末体长和平均日增重(P < 01 01) , 特定生长率和饵料系数也得到改善(P < 0105) ; 在15%脂肪水平下, 与38%蛋白质水平相比, 42%、46%和50%蛋白质水平各组终末体质量、平均日增重、特定生长率和饵料系数都显著改善(P< 01 05) ; 在20%脂肪水平下, 38%与50%蛋白质水平相比, 终末体质量、平均日增重和饵料系数差异显著(P < 0105),但其他各组差异不显著; 与10%和15%脂肪水平相比, 20%脂肪水平显著提高了蛋白质效率(P < 01 05) ; 鱼体脂肪含量随饲料中脂肪含量增加而显著提高(P < 0101) ; 50% 蛋白质水平显著降低了鱼体水分和脂肪含量, 提高了体蛋白含量(P <01 05) ; 鱼体总能随着蛋白质和脂肪水平的提高也极显著提高(P < 0101) 。本实验结论为: 在10%脂肪水平, 哲罗鱼稚鱼最适蛋白质水平为50%, 在15%和20%脂肪水平下, 最适蛋白质水平为42%。
【英文摘要】A 4×3 factorial feeding trail w as conducted to determine the optimal dietary protein and lipid requirementof juvenile H ucho taimen. Juvenile f ish w ith init ial average weig ht of 7- 8 g were raised in tanksof 90 cm × 45 cm. T welve practical diets were

formulated to contain four protein levels(50%, 46% , 42% ,38%) , each protein levels w ith three lipid levels(10% , 15% , 20%) , each diets was randomly assigned tot riplicate groups of 100 fish. Water temperature f luctuated at 1115- 1715 e ; dissolved ox ygen content wasapproximately 718- 10 mg/ L during the experiment period. Fish w ere fed 3 t imes daily to apparent sat iation for 8 weeks. The results show ed that different t reatment s did not influence the survival rate. Protein requirement w as influenced by lipid level. At 10% lipid level, finial body weight , finial body length and average daily w eight g ain all increased at 50% protein level(P < 0101) compared w ith other protein levels, and SGR and FCR w ere improved(P < 0105) too. At 15% lipid level, compared w ith 38% protein, finial body w eight , daily w eight gain, SGR and FCR were improved(P < 0105) by 42% , 46% and 50% protein. At20% lipid level, f inial body w eight, daily w eight g ain and FCR were improved by 50% protein compared w ith 38% protein, but there w ere no dif ferences among other groups. Compared w ith 10% and 15% lipid levels, PER increased at 20% lipid level(P < 0105) . Body fat content increased w hen feed lipid increased(P< 0101) ; body moisture and fat content decreased and protein increased on 50% protein level(P < 0101) ;body energy content increased w hen protein and fat levels increased(P < 0101) . Viscerosomat ic index increased when proteinincreased(P < 0101) . These results sugg ested that at 10% fat level, the protein requirement w as 50% , and at 15% and 20% fat levels, the protein requirement was 42% for juvenile Hucho taimen .

【题目】Functional characterization of LePT4: a phosphate Functional characterization of LePT4: a phosphate
【中文关键词】无
【英文关键词】Glomus intraradices, Lycopersicon esculentum,
Micro-Tom, phosphorus acquisition, root/shoot.
【中文摘要】无
【英文摘要】Many plant roots acquire inorganic phosphate (Pi)from soils directly through the root – soil interface viahigh-affinity Pi transporters and/or through symbioticassociations between the cortical cells and arbuscularmycorrhizal fungi. In tomato, three phosphate transporters(LePT3, LePT4, and LePT5) are up-regulatedupon colonization by arbuscular mycorrhizal fungi. Inthis study, the role of LePT4 in tomato is elucidated bymolecular and physiological characterizations ofa loss-of-function mutant lept4. In the absence ofmycorrhizal infection and under solution-Pi concentrations(Cp) of 0.05 mM and 0.5 mM, the mutant exhibitedsevere Pi-deficiency symptoms which were associatedwith significantly lower Pi uptake as compared withthat of the wild type. However, at a Cp of 5 mM, lept4grew better than the wild type. Mycorrhizal infection ata Cp of 0.05 mM resulted in a significant increase inthe transcripts of LePT4 in the wild type and a concomitant2-fold increase in Pi uptake. Although uponmycorrhizal infection, lept4 also exhibited an increasedPi uptake, it was significantly lower than thatof the wild type. Under a Cp of 1 mM and in theabsence of mycorrhizal infection, LePT4 expressionwas suppressed in the wild type and a mutation in thisgene resulted in a slight reduction in total Pi uptake.These data highlight the pivotal role of LePT4 inmycorrhizal-mediated Pi uptake in tomato, and showthat this function may not be fully compensated byother members of the family. Characterization of themycorrhiza-associated Pi transporter lept4 mutant,along with expression analysis of LePT3, providesevidence for the different routes of mycorrhizamediatedPi uptake in plants.

【题目】Effect of fungal fusaric acid on the root and leaf physiology of watermelon (Citrullus lanatus) seedlings
【中文关键词】无
【英文关键词】Cell transmembrane potential . Fusaric acid phytotoxin . Pathogenesis-related proteins . Phenylalanine ammonia-lyase . Lipid peroxidation .Reactive oxygen species . Stress
【中文摘要】无
【英文摘要】The impact of fusaric acid (FA) phytotoxin on the physiology of root leaf cells in watermelonseedlings was evaluated. Results revealed that the cell membrane potential treated with FA in 12 h was decreased by 61.9 – 81.8% compared with untreated controls. FA markedly accelerated the lipid peroxidase activity of watermelon leaves. Malondiadehyde in leaves treated with different concentrations of FA in 24 h was 5.2 – 11.0 fold as much as control. Phenylalanineammonia-lyase activity (PAL) in leaves treated with FA was first increased and then decreased. The highest PAL activity was obtained after 6 – 12 h,which was 7.2 – 10.5 fold as much as control.Activities of catalase (CAT), superoxide dismutase (SOD), and peroxidase (POD) were first increased and then decreased when the seedlings were treatedwith FA. The highest SOD and POD activities were observed after 12 h and then both declined. The β-1,3-glucanase and chitinase activities in leaves treated with FA were first quickly increased and then declined, the highest activities were found after 12 and 3 h. We concluded that FA strongly inhibited root and leaf cells functions physiologically responsible for fusarium wilt of watermelon.

【题目】Comparing nitrate storage and remobilization in two rice cultivars that differ in their nitrogen use efficiency
【中文关键词】无
【英文关键词】Cellular nitrate activities, nitrate reductase, nitrogen use efficiency, rice, vacuolar remobilization.
【中文摘要】无
【英文摘要】Soil nitrogen (N) is available to rice crops as eithernitrate or ammonium, but only nitrate can be accruedin cells and so factors that influence its storage andremobilization are important for N use efficiency(NUE). The hypothesis that the ability of rice crops toremobilize N storage pools is an indicator of NUE wastested. When two commonly grown Chinese ricecultivars, Nong Ken (NK) and Yang Dao (YD), werecompared in soil and hydroponics, YD had significantlygreater NUE for biomass production. The abilityof each cultivar to remobilize nitrate storage pools 24 hafter N supply withdrawal was compared. Althoughmicroelectrode measurements of the epidermal subcellularnitrate pools in leaves and roots showedsimilar patterns of vacuolar remobilization in bothcultivars, whole-tissue analysis showed very littledepletion of storage pools after 24 h. However, leafepidermal cell cytosolic nitrate activities were significantlyhigher in YD when compared with NK. Before Nstarvation and growing in 10 mM nitrate, the xylemnitrate activity in YD was lower than that of NK. After24 h of N starvation the xylem nitrate had decreasedmore in YD than in NK. Tissue analysis of stemsshowed that YD had accumulated significantly morenitrate than NK, and the remobilization pattern suggestedthat this store is important for both cultivars.Changes in nitrate reductase activity (NRA) and expressionwere measured. Growing in 10 mM nitrate,NRA was undetectable in roots of both cultivars, andthe leaf total NRA of equivalent leaves was similar inNK and YD. When the N supply was withdrawn, after24 h NRA in NK was reduced to 80% but no decreasewas found in YD. The proportion of NRA in an activeform in YD was significantly higher than that in NKunder both nitrate supply and deprivation conditions.Checking NR gene expression showed that leaf expressionof OsNia1 was faster to respond to nitratedeprivation than OsNia2 in both cultivars. Thesemeasurements are discussed in relation to cultivardifferences and physiological markers for NUE in rice.

【题目】Roles of the spiA gene from Salmonella enteritidis in biofilm formation and virulence
【中文关键词】无
【英文关键词】spiA,Salmonella enteritidis,biofilm,virulence
【中文摘要】无
【英文摘要】Salmonella enteritidis has emerged as one of the most important food-borne pathogens forhumans, and the formation of biofilms by this species may improve its resistance todisadvantageous conditions. The spiA gene of Salmonella typhimurium is essential for itsvirulence in host cells. However, the roles of the spiA gene in biofilm formation and virulence of S.enteritidis remain unclear. In this study we constructed a spiA gene mutant with a suicide plasmid.Phenotypic and biological analysis revealed that the mutant was similar to the wild-type strain ingrowth rate, morphology, and adherence to and invasion of epithelial cells. However, the mutantshowed reduced biofilm formation in a quantitative microtitre assay and by scanning electronmicroscopy, and significantly decreased curli production and intracellular proliferation ofmacrophages during the biofilm phase. In addition, the spiA mutant was attenuated in a mousemodel in both the exponential growth and biofilm phases. These data indicate that the spiA gene is involved in both biofilm formation and virulence of S. enteritidis.

【题目】Bio-available phosphorus transport from a hillslope cropland of purple soil under natural and simulated rainfall
【中文关键词】无
【英文关键词】Overland flow , Subsurface flow ,Phosphorus transport , Natural rainfall
【中文摘要】无
【英文摘要】To further understand the mechanism of bioavailable total P (BAP) and bioavailable dissolved P (BDP) transport by overland and subsurface flow, we exposed a runoff plot 4.5 m long × 1.5 m wide × 0.6 m deep to simulated and natural rainfall in order to study the effects of rainfall type, rainfall intensity, and vegetation cover on BAP and BDP transport. The resultsshowed that vegetation cover could alleviate the discharge of overland flow and sediment ransport and enhance subsurface flow. BAP transport significantly increased with elevated rainfall intensity.Vegetation cover reduced the BAP transport by overland flow and increased t by subsurface flow. BDP transport showed no significant relationship with vegetation cover and rainfall type.The bioavailable particulate P (BPP) transport by overland flow contributed to no less than 90% by weight of total BAP, and the BPP transport by subsurface flow ntributed to no less than 60% by weight of total BAP. Short-time heavy rainfall caused more BAP transport and accelerated nonpoint source pollution.

【题目】Interaction of dietary Bacillus subtilis and fructooligosaccharide on the growth performance, non-specific immunity of sea cucumber, Apostichopus japonicus

【中文关键词】仿刺参,益生菌,益菌素,生长,免疫,灿烂弧菌
【英文关键词】Apostichopus japonicus;Probiotic;Prebiotic Growth;Immunity;Vibrio splendidus
【中文摘要】本养殖试验是为了研究益生菌枯草芽孢杆菌和益菌素低聚果糖对海参生长性能,免疫,肠道微生物和疾病抵抗方面的作用。实验表明,饲料的中芽孢杆菌明显提高了海参的特定生长率,总体腔细胞数和吞噬作用,也提高了活菌数和对弧菌的抗病性,然而弧菌的数量减少。但是芽孢杆菌饲料并没有对酚氧化酶活性和体腔细胞裂解物上清液产生明显的影响。低聚果糖饲料对特定生长率,酚氧化酶活性,总活菌数和弧菌数都产生了明显的影响。实验条件下,饲料中的芽孢杆菌和低聚果糖协同提高了海参的免疫性和抗病能力。
【英文摘要】A feeding experiment was conducted to investigate the interaction of probiotic Bacillus subtilis and prebioticfructooligosaccharide (FOS) on the growth performance, immunity, intestinal micro fl ora and disease resistance of sea cucumber (Apostichopus japonicus). Five hundred and forty individuals (initial body weight:5.06 0.10 g, mean S.E) were fed nine practical diets according to a 3 3 factorial design: the basal diet as the control diet supplemented with three levels of B. subtilis (0, 1.82 107 or 4.95 107 CFU g 1 diet),crossed with 0, 0.25% or 0.50% FOS. After 8 weeks, three sea cucumbers per tank were sampled for bacterial quanti fi cation and immunity determination. Then all the sea cucumbers left were challenged by Vibrio splendidus. The results showed that dietary B. subtilis signi fi cantly increased the speci fi c growth rate (SGR),total coelomocytes counts (TCC), phagocytosis of sea cucumbers, the counts of total viable bacteria and disease resistance to V. splendidus ($P < 0.05$), whereas the counts of Vibrio decreased. However, dietary B. subtilis had no signi fi cant effect on phenoloxidase (PO) activity in coelomocyte lysate supernatant (CLS)($P > 0.05$). The SGR, PO activity, total viable bacterial counts (TBC) and Vibrio counts (VBC) were signi fi cantly affected by dietary FOS. In the group with 0.50% FOS, TCC, phagocytosis and PO activity signi fi cantly increased compared to the group fed without FOS in diet ($P < 0.05$). In the groups with 1.82 107 CFU B. subtilis/g diet, FOS supplementation remarkably decreased VBC. And higher level of FOS (0.50%) resulted in signi fi cantly higher TCC and PO activity compared with 0.25% FOS ($P < 0.05$). Moreover, the animals fed with diets supplemented with 0.25% and 0.50% FOS at each B. subtilis level had notably lower cumulative mortality after 14 days following V. splendidus exposure ($P < 0.05$). Under the experimental conditions,dietary B. subtilis and FOS had a synergistic effect on enhancing immunity and disease resistance of sea cucumber ($P < 0.05$).

【题目】水稻中的磷转运蛋白基因在异源表达系统中的功能分析
【中文关键词】水稻; 磷转运蛋白; 酵母; 人胚胎肾细胞; 功能分析
【英文关键词】rice ; phosphate t ransporter ; yeast ; human embryonic kidney cell ; functional analysis
【中文摘要】为了更好地研究植物在磷素吸收过程中的分子机制以及生物化学过程的变化,将水稻中分离得到的一个磷转运蛋白基因(Os P T6) 用于互补实验。互补实验结果表明,Os P T6 能够与缺失磷转运功能的酵母突变体实现互补,并在低磷条件下促进酵母突变体对磷的吸收。进一步分析表明Os P T6 属于水稻Pht1 家族运输蛋白基因,所编码的蛋白对磷酸盐(Pi) 的吸收Km值为96 μ mol/ L ,属于高亲和的磷转运蛋白。不同的酵母转化子对不同p H 环境的响应实验显示,OsPT6 是一个与质子相偶联的磷运输蛋白,其吸收磷素的最佳p H 为6. 0 。对Os P T6 在人的胚胎肾细胞(HEK293) 中的表达分析表明,该基因能够编码蛋白并定位于细胞膜,证明OsPT6 的功能与酵母磷转运子PHO84 相似,是一个定位于细胞膜上的具有吸收转运磷素作用的运输蛋白。
【英文摘要】For a better understanding of the molecular and biochemical processes involved in orthophosphate (Pi) uptake ,a phosphate t ransporter cDNA (Os P T6) f rom rice was expressed in yeast and HEK293 cell expression systems. The geneOsPT6 codes a protein that belongs to Pht1 family of phosphate t ransporters with 12 putative t ransmembrane domains. The yeast mutant complementation analysis suggested that the t ransporter (OsPT6) was functional Pi t ransporter in yeast cells mediating Pi uptake at micromolar concent rations. When expressed in a Pi2uptake deficient yeast mutant , the phosphatet ransporter (OsPT6) protein exhibited an apparent Km of 96 μ mol/ L and mediated the highest Pi uptake at p H 6. 0. The p H experiment suggested that the activity of OsPT6 was dependent on the elect rochemical membrane potential mediated by the yeast P2type H+ 2ATPase. When expressed in HEK293 cells by either Os P T6 ：Y FP or Os P T6 ：CFP proteins , both the Y FP and CFP fluorescence were observed at the plasma

membrane. This work demonst rated that OsPT6 had a similar function as PHO84 which is a phosphate t ransporter in yeast S accharomyces cerevisiae and OsPT6 played an important role in Pi acquisition.

【题目】Root Physiological and M orphological Characteristics of Two Rice Cultivars with Different Nitrogen-Use Efficiency
【中文关键词】无
【英文关键词】N accumulation,root bleeding rate,root dry weight,root surface area,total root length
【中文摘要】无
【英文摘要】The variation in nitrogen(N)uptake by rice has been widely studied but difierences in rice root morphology that may contribute to this variation are not completely understood.Field and greenhouse experiments were carried out to study N accumulation,root dry weights,total root lengths,root surface areas,and root bleeding rates of two rice cultivars,Elio with low N—use eficiency and Nanguang with high N—use eficiency.Low (1 mmol N L)and high(5 mmol N L-1)N applications were established in the greenhouse experiment,and the N rates were 0,120,and 240 kg ha- in the field experiments at Jiangning and Jiangpu farms,Nanjing,China.The results showed that the N accumulation.root dry weight,total root length,and root surface area increased with an increase in N application.At the heading stage,Naccumulation in the shoots and roots of Nanguang was greater than that of Elio in the field experiments and that of Elio at 5 mmol N L一 in the greenhouse experiment.After the heading stage.N accumulation was higher for Nanguang at both 1 and 5 mmol N L一 in the greenhouse experiment.The total root length and root surface area were significantly different between the two cultivars.Over the range of the fertilizer application rates.the root lengths of Nanguang at Jiangning Farm were 49%一61% greater at booting and 26%—39% greater at heading than those of Elio.and at Jiangpu Farm they were 22%一42% and 26%一38% greater,respectively Nanguang had a greater root bleeding rate than Elio.It was concluded that the N—use eficiency of the two rice cultivars studied depended to a great extent on the root n1orDh0logical parameters and root physiological characteristics at different growth stages.

【题目】盐胁迫对棉田土壤微生物数量与酶活性的影响
【中文关键词】盐胁迫; 棉花; 土壤微生物; 土壤酶活性
【英文关键词】salinity stress; cotton; soil microbe; soil enzyme activity
【中文摘要】在盆栽条件下模拟滨海盐土组成,研究土壤盐胁迫对不同耐盐性棉花品种"中棉所44"和"苏棉12号"土壤微生物数量和土壤酶活性的影响。结果表明:从苗期到吐絮期,两个品种的土壤细菌、真菌和放线菌数量,以及土壤脲酶、蔗糖酶、碱性磷酸酶和纤维素酶活性均随土壤盐分的增加呈现逐渐下降的一致趋势,处理间差异均达显著水平。土壤水分亏缺加重盐胁迫影响,相同盐分水平下,正常灌水处理的土壤微生物数量和酶活性显著高于相应干旱处理。棉株的生长发育亦受到土壤盐分的显著抑制,根系活力、根重、生物量和籽棉产量均随土壤盐分水平升高而一致降低,根冠比则相反。耐盐性品种中棉所44各项测定指标的下降幅度均小于苏棉12号。相关性分析表明,各菌类数量和酶活性与籽棉产量之间存在显著的正相关关系,同时各菌类数量和酶活性之间密切相关,其中碱性磷酸酶和纤维素酶活性与各菌类数量之间的相关系数均达到极显著水平。说明土壤微生物与土壤酶活性对盐胁迫反应极为敏感,并与棉花产量密切相关,是盐胁迫下棉花显著减产的一个重要原因,可作为土壤盐胁迫过程中的重要指标。

【英文摘要】The two-year experiment was conducted in pot with Sumian 12 (salinity-sensitivity) and CCRI-44 (salinity-tolerance) at Pailou experimental station in Nanjing agricultural university.Simulating the salinity component of seashore saline soil,setting five soil salinity rates (0%,0.35%,0.60%,0.85%,1.00%)and two soil water treatments including well-watering ((75±5)%)and water stress((55±5)%),the objective of this study was to evaluate the effects of soil salinity on soil microbes and enzyme activities at different growth stages of cotton.The results showed that under the same soil water treatment,with increasing of soil salinity,the number of bacteria,fungi and actinomyces,and the activity of urease,invertase,phosphatase,celluloytic enzyme decreased.At the same time,the growth of cotton was inhabited by soil salinity stress.Root vigor,root dry weight,biomass,and seed cotton yield all declined with the increase of soil salinity,but R/S-ratio improved.Under the same soil salinity,the number of soil microbe and activity of soil enzyme were much higher in well-watering treatment than in water stress treatment.Soil water stress aggravated the effects of soil salinity stress.Compared to Sumian 12,CCRI-44 was less affected by soil salinity at different growth stages of cotton.Correlation analysis showed that the seed cotton yield had a significant positive correlation with soil microbe and soil enzyme,and the number of soil microbe was closely related with activity of soil enzyme,especially in phosphatase and celluloytic enzyme.Soil microbe and soil enzyme,which are sensitive to soil salinity stress and closely related with cotton yield,are the important reasons of cotton yield decreasing and important indices to extent of soil salinity stress.

【题目】Isolation and characterisation of fusaricidin-type compound-producing strain of paenibacillus polymyxa SQR-21 active against Fusarium oxysporum f.sp. nevium

【中文关键词】无

【英文关键词】Antifungal compound . Biocontrol potential . Disease incidence . Enzyme activity

【中文摘要】无

【英文摘要】A bacterial strain was isolated from the rhizosphere of healthy watermelon plants in a heavilywilt-diseased field. This isolate was tentatively identified as Paenibacillus polymyxa (SQR-21) based on biochemical tests and partial 16S rRNA sequence similarity. The purified antifungal compounds were members of the fusaricidin group of cyclic depsipeptides having molecular masses of 883, 897, 947, and 961 Da with an unusual 15-guanidino-3-hydroxypentadecanoic acid moiety, bound to a free amino group.The strain SQR-21 was not able to produce antifungal volatile compounds but was able to produce cellulase, mannase, pectinase, protease, β-1,3-glucanase and lipase enzymes. However, the strain did not show anychitinase activity. Biocontrol potential of this strain was evaluated against Fusarium oxysporum cause of Fusarium wilt disease of watermelon in a greenhouse experiment. This strain combined with organic fertiliser decreased the disease incidence by 70% and increasedthe dry plant weight by 113% over the control.

【题目】土壤盐分对棉花功能叶气体交换参数和叶绿素荧光参数日变化的影响

【中文关键词】棉花; 土壤盐分; 功能叶; 气体交换参数; 叶绿素荧光参数; 日变化

【英文关键词】cotton(Gossypium hirsutum); soil salinity; functional leaf; gas exchange parameter; chlorophyll fluorescence parameter; diurnal variation

【中文摘要】2007—2008年在南京农业大学牌楼试验站进行盆栽试验,选择耐盐品种中棉所44和盐敏感品种苏棉12号为材料,试验设置5个土壤盐分水平(0、0.35%、0.60%、0.85%和1.00%),研究土壤盐分对棉花功能叶气体交换参数和叶绿素荧光参数日变化的影响.结果表明:随土壤盐分水平的升高,棉花功能叶中Na+、Cl-和Mg2+含量升高,K+和Ca2+含量降低.低于0.35%盐分处理对叶片气体交换参数和叶绿素荧光参数的影响较小,高于0.35%的盐分处理显著降低了棉花功能叶的净光合速率(Pn),提高了棉花功能叶对日间光辐射强度和温度的敏感程度,导致光温抑制现象加重,并改变了Pn和气孔导度(Gs)的日变化趋势,使其由单峰曲线逐渐变为持续下降趋势.随日间光辐射强度和温度的变化,棉花叶片最大光化学效率(Fv/Fm)、光系统Ⅱ(PSⅡ)量子产量(ΦPSⅡ)和光化学猝灭系数(qP)的日变化趋势呈"V"型曲线,最低值出现在12:00—13:00,非光化学猝灭系数(qN)的日变化趋势呈单峰曲线;盐分处理降低了棉花功能叶Fv/Fm、ΦPSⅡ和qP,提高了qN,且增大了其变化幅度.耐盐品种中棉所44功能叶片中较低的Na+、Cl-含量及相对较高的K+、Ca2+含量保证了PSⅡ的相对稳定性,相对较高的热耗散能力是其在盐胁迫下保持相对较高Pn的重要原因之一

【英文摘要】A two-year(2007-2008) pot experiment with cotton varieties Sumian 12(salinity-sensitive) and Zhongmiansuo 44(salinity-tolerance) was conducted at the Pailou experimental station of Nanjing Agricultural University to study the diurnal variation of the gas exchange and chlorophyll fluorescence parameters of cotton functional leaves under five levels(0,0.35%,0.60%,0.85%,and 1.00%) of soil salinity.With the increase of soil salinity,the concentrations of Na+,Cl-,and Mg2+ in functional leaves increased,whereas the concentrations of K+ and Ca2+ decreased.The salinity level <0.35% had little effects on the gas exchange and chlorophyll fluorescence parameters,but that >0.35% depressed the net photosynthetic rate(Pn) dramatically.At the salinity level >0.35%,the sensitivity of functional leaves to daytime photon flux density(PFD) and air temperature(Ta) enhanced,which in turn resulted in more severe photo-and temperature inhibition,and changed the diurnal variation patterns of Pn and stomatal conductance(Gs) from a one-peak curve to a constantly decreasing one.Along with the variations of daytime PED and Ta, the diurnal variation patterns of the maximum photochemical efficiency(Fv/Fm),quantum yield of electron transport(ΦPSⅡ),and photochemical quenching coefficient(qP) of functional leaves presented a V-shaped curve,with the minimum value appeared at 12:00-13:00,while the non-photochemical quenching coefficient(qN) showed a single-peak curve.Soil salinity decreased the Fv/Fm,ΦPSⅡ,and qP significantly,but increased the qN and enlarged its change trend.The comparatively low concentrations of Na+ and Cl-and the relatively high concentrations of K+ and Ca2+ in salt-tolerant Zhongmiansuo 44 functional leaves benefited the relative stability of PSⅡ,and the maintenance of a relatively high thermal dissipation capacity could be one of the reasons for a high level of Pn at high salinity level.

【题目】氮素供应形态对水稻根系形态和磷吸收的影响
【中文关键词】铵态氮; 硝态氮; 磷素; 根系形态; 水稻
【英文关键词】无
【中文摘要】采用水培方法,研究了缺磷条件下不同形态氮(NH4+ 、NO3- 和NH4 NO3) 下的水稻根系形态性状,以及它们产生的后效应对磷吸收的影响。结果表明,在氮素供应充足但磷饥饿胁迫的状况下,氮素形态对根系的影响仍然十分显著。与单一的铵营养相比,铵硝混合营养增加了根长和根系的表面积、根系的密度以及磷的总吸收量;与单一的铵或硝营养相比,铵硝混合营养可增加吸收的磷从根系向地上部的运输。因此,铵硝混合营养改善低磷胁迫下水稻对磷的吸收和转运,其部分原因与氮素形态与根系形态发生有关。

【题目】水稻根系细胞膜H+2ATPase 对缺磷的反应
【中文关键词】水稻; 细胞膜H+2ATPase ; 缺磷
【英文关键词】无
【中文摘要】用两相法分离了供磷(+ P) 和缺磷(- P) 营养下水稻苗期根系的细胞膜,并测定了细胞膜上H+2ATPase 的水解活性,以期阐明水稻根系细胞质膜上H+2ATPase 对不同缺磷的反应机制。结果表明,缺磷的水稻根系细胞膜H+2ATPase 的水解活性和H+2ATPase 的Vmax , Km 均低于正常供磷的植物; 缺磷的水稻根系细胞膜H+2ATPase 最佳pH 值为610 ,而正常供磷植物的为pH 614 左右; Western Blot 结果说明,缺磷水稻根系细胞膜H+2ATPase 酶浓度与正常供磷植物相似。本试验结果还说明,缺磷水稻根系细胞膜H+2ATPase 活性低的原因并不是因为其单位细胞膜上的H+2ATPase 酶分子数量小于正常供磷的植物,而是缺磷水稻根系细胞膜上H+2ATPase 的同工酶的组成与供磷植物相比发生了变化。这很可能是缺磷胁迫下水稻根系细胞膜H+2ATPase 的一种适应机制。

【题目】棉花萌发期和苗期耐盐性评价及耐盐指标筛选
【中文关键词】棉花; 萌发期; 苗期; 耐盐性; 耐盐指标; 隶属函数值
【英文关键词】cotton (Gossypium hirsutum); germinating stage; seedling stage; salt tolerance; salt tolerance index; subjection value.
【中文摘要】于2010年在江苏南京农业大学人工气候室内进行砂培试验,采用不同浓度的NaCl水溶液模拟盐胁迫,以多项指标盐害系数隶属函数值和总隶属函数值为依据,比较了13个棉花品种萌发期和苗期的耐盐性,并进行聚类分析.结果表明:150mmol · L-1NaCl是进行棉花耐盐性鉴定的适宜盐浓度.棉花的耐盐性在生育期和品种间表现不同:中棉所44和中棉所177是在萌发期和苗期均表现稳定的耐盐品种,表现稳定但不耐盐品种有中棉所102、苏棉12号和泗棉3号,表现稳定且中等耐盐品种有中棉所103、德夏棉1号和美棉33B;发芽率、发芽势、发芽指数、活力指数和鲜质量的盐害系数可以作为棉花萌发期耐盐鉴定指标,株高、叶片伸展速率、地上部干质量、根系干质量、根系活力和净光合速率的盐害系数可以作为棉花苗期耐盐鉴定指标.
【英文摘要】A sand culture experiment was conducted to study the salt tolerance of 13 cotton cultivars at their germinating and seedling stages under the stress of different concentration NaCl, and a cluster analysis was made on the salt tolerance, according to the subjection values of salt toxicity coefficients of multi-indices and the sum subjection value. It was observed that the appropriate concentration of NaCl for the evaluation of salt tolerance was 150 mmol · L-1. The salt tolerance differed with cultivar and growth stage. Among the 13 cultivars, the CCRI-44 and CCRI-177 were steadily salt-tolerant at both germinating and seedling stages, the CCRI-103, Dexiamian 1, and NuCOTN 33B were steadily and moderately salt-tolerant, while the CCRI-102, Sumian 12, and Simian 3 were steadily salt-sensitive. Germination rate, germination potential, germination index, vigor index, and fresh mass could be served as the indicators to evaluate the salt tolerance of the cultivars at germinating stage, while plant height, leaf expansion rate, shoot dry mass, root dry mass, root vigor, and net photosynthetic rate could be applied to assess the salt tolerance at seedling stage.

【题目】Effects of discontinuous administration of β-glucan and glycyrrhizin on the growth and immunity of white shrimp Litopenaeus vannamei
【中文关键词】南美白对虾,β-葡聚糖,甘草酸,免疫疲劳
【英文关键词】Litopenaeus vannamei; β-glucan;Glycyrryhizin;Immunity fatigue
【中文摘要】本实验持续六周,比较添加了不同免疫增强剂的饲料对南美白对虾生长和免疫的影响。实验设置六个不同饲料的小组,分别为不添加免疫增强剂的对照组,只添加β葡聚糖或者甘草酸的连续喂养的实验组,添加β葡聚糖的间断喂养的实验组和添加β葡聚糖和添加甘草酸交替喂养的实验组。结果表明,β葡聚糖更能使对虾维持较高的免疫水平。但是β葡聚糖和甘草酸的持续喂养会导致南美白对虾的免疫疲劳。在第27天,β葡聚糖连续投喂组对虾的总血细胞数,超氧化物阴离子和超氧化物歧化酶活性不再明显高于对照组;35天,酚氧化酶活性不再高于对照组。在第25,37,29天,甘草酸连续投喂组的总血细胞数,酚氧化酶活性和超氧化物歧化酶活性分别低于对照组。间断喂养可以消除免疫疲劳。β葡聚糖喂养2天后,接着用基本饲料喂养5天,对虾的特定生长率最高,这是最适合的投喂方式。
【英文摘要】A 6-week growth trial was conducted to compare the effects of different feeding strategies of dietary immunostimulants on the growth and immunity of white shrimp Litopenaeus vannamei (4.70 ±0.20 g). Six feeding strategies were set, including feeding immunostimulants-free diet continuously (control), feeding dietary β-glucan or glycyrrhizin continuously, feeding dietary β-glucan discontinuously, feeding dietary β-glucan and glycyrrhizin alternately. The results showed that compared with glycyrrhizin, β-glucan couldmaintain the immunity of shrimps at a higher level during the experimental period. However, continuously applying β-glucan or glycyrrhizin into the diet caused immunity fatigue in L. vannamei. On the 27th day, the total haemocyte count (THC), superoxide anion and superoxide dismutase (SOD) activity of the shrimps fed with β-glucan continuously were no longer signi fi cantly higher than those in the control group. Meanwhile,phenoloxidase (PO) activity was no longer signi fi cantly higher on the 35th day. THC, PO activity and SOD activity of the shrimps fed with glycyrrhizin were no longer signi fi cantly higher than those in the controlgroup on the 25th, 37th, 29th day, respectively. Discontinuous administration of β-glucan or glycyrrhizin could eliminate the immunity fatigue. Shrimps fed with dietary β-glucan 2 days followed by the basal diet for 5 days showed the highest speci fi c growth rate (SGR). It was concluded that this feeding strategy is most suitable for L. vannamei.

【题目】紫色丘陵区典型小流域暴雨径流迁移过程与通量
【中文关键词】迁移过程;小流域;暴雨径流;氮磷;初期冲刷效应;壤中流;流域
【英文关键词】无
【中文摘要】对紫色丘陵区盐亭截流小流域2007 年3 次暴雨径流的全过程进行了连续监测,测定了径流量及降雨—径流过程中氮、磷的形态、浓度与通量变化。结果表明,N、P 各形态浓度变化曲线与流量曲线趋势大致相同,总氮(TN)浓度迅速达到峰值后缓慢下降,而后期又略呈上升趋势,硝态氮(NN) 浓度变化总体呈上升趋势,颗粒态氮(PN) 与颗粒态磷(PP) 浓度在径流过程中迅速达到峰值后陡然下降,氨态氮(AN) 及磷酸盐(PO43 - 2P) 含量较低且波动较小。暴雨径流前期氮素迁移以PN 为主,主要来源于地表径流,受降雨强度控制。后期以NN 为主,来源于土壤硝酸盐随壤中流淋失。磷素主要以地表径流迁移的PP 为主。暴雨径流导致的N、P 流失负荷巨大,说明初期冲刷效应明显。

【题目】Tomato sugar transporter genes associated with mycorrhiza and phosphate
【中文关键词】无
【英文关键词】Arbuscular mycorrhiza AM fungi Phosphate Sugar transporter genes
【中文摘要】无
【英文摘要】In arbuscular mycorrhizal (AM) symbiosis,there is a reciprocal nutrient exchange betweensymbiotic partners. AM fungi assist the plants withuptake of mineral nutrients from the soil, especiallyphosphate (Pi). The host plants, in return, provide thefungi with sugar. In contrast to the studies on thesymbiotic transport of Pi in arbuscular mycorrhiza,there have been few investigations devoted specificallyto sugar transport in AM symbiosis. Usingreverse transcriptase PCR (RT-PCR), we analyzedthe effects of mycorrhiza and Pi on the expression ofseven putative sugar transporter genes in tomatoplants. The expression of LeSUT1 and LeHT2,classified, respectively, as putative sucrose andhexose transporter genes, were down-regulated inthe roots inoculated with AM fungi Glomus caledoniumor Glomus intraradices. Unexpectedly, theexpression of LeST3, a putative monosaccharidetransporter gene, was decreased by inoculation ofGlomus caledonium, but was enhanced by inoculationof Glomus intraradices in both the roots and leaves.High-Pi in the tomato decreased the expression ofLeHT2 and LeST3 in the roots, and enhanced thatof LeHT2 in the leaves. The contradictory regulationof the expression of LeST3 in the AM symbiosisindicates that different interaction may take placeduring mycorrhizal colonization, and a quite complicatedregulation of expression of the sugar transportergenes exist in mycorrhizal tomato.

【题目】Use of response surface methodology to evaluate the effect of metal ions (Ca2+, Ni2+, Mn2+, Cu2+) on production of antifungal compounds by Paenibacillus polyxa
【中文关键词】无
【英文关键词】Antifungal compounds,Metal ions,Paenibacillus polymyxa,Quadratic model
【中文摘要】无
【英文摘要】The effects of four metal ions (Ca2+, Ni2+, Mn2+ and Cu2+) were evaluated on growth and production of antifungal compounds by Paenibacillus polymyxa SQR-21 and a quadratic predictive model was developed using response surface methodology (RSM). The results revealed, Mn2+ and Ni2+ showed most positive synergistic interactive affect on production of antifungal compounds followed by the positive interactive synergistic affect of Cu2+ and Ni2+ and then Mn2+ and Cu2+. While the interactive effect of Ca2+ with all other three metals inhibited the production of antifungal compounds. The Mn2+ (P = 0.0384), Ni2+ (P = 0.0004) and Cu2+ (P = 0.0117) significantly affected the production of antifungal compounds whilethe effect of Ca2+ (P = 0.1851) was less significant. The maximum growth (OD600 = 1.55) was obtained at 500 (0), 125 (0), 100 (2) and 37.5 (0) lM levels and the maximum size of inhibition zone (31 mm) was measured at 400 (1), 150 (1), 400 (1) and 25 lM (1) levels of Ca2+, Mn2+, Ni2+ and Cu2+, respectively.The RSM model provided an easy and effective way to determine the interactive effect of metal ions on production of antifungal compounds by P. polymyxa SQR-21 so that optimum media recipes can be developed to produce maximum amounts of antifungal compounds under laboratory and commercial fermentation conditions.

【题目】土层厚度对紫色土坡地生产力的影响
【中文关键词】紫色土;土层厚度;生产力;临界土层
【英文关键词】无
【中文摘要】通过紫色土坡地土层厚度的调查与不同土层厚度的小区对比试验,研究紫色土薄层坡地的生产力特性。结果表明,约73%的紫色土坡耕地土层厚度为20~60 cm。土层厚度是紫色土生产力的基本限制条件。土层越薄,作物株高、生物量和产量愈低,生产力愈低;土层越厚,生物量、产量愈高,生产力愈高,土层厚度的影响在玉米季尤为突出, 20 cm、40 cm小区夏玉米产量仅为60 cm小区的50%、74% ,为80 cm小区的28%、40% , 100 cm小区的23%、34%。当土壤厚度超过60 cm,小麦、玉米的株高、生物量及根重差异不显著,而土壤蓄水可抵御紫色丘陵区连续20 d的夏旱,因此,可初步判定60 cm土层为紫色土生产力临界土层。60 cm以上厚度的紫色土可维持基本稳定的生产力水平。

【题目】Antibiotic effect of exogenously applied salicylic acid on in vitro soilborne pathogen, Fusarium oxysporum f.sp.niveum
【中文关键词】无
【英文关键词】Antibiotic action,Biomass,Fusarium oxysporum f.sp. niveum (FON),Virulence factors,Salicylic acid
【中文摘要】无
【英文摘要】Salicylic acid, which is biosynthesized inside plant and is often found and accumulated in soil due to plant debris decaying, is considered as a signaling substance during plant – microbe interactions. It is involved in the cycling of biogeochemistry and

related to plant resistance to biotic and abiotic stress. The antibiotic effect of salicylic acid on Fusarium oxysporum f.sp.niveum (FON) was studied to investigate the relationships between the salicylic acid and the fungus in the ecological interaction of plant – microbe. Resultsshowed that the biomass, colony diameter, number of conidium germination and conidium production of FON were decreased by 52.0%, 25.7%, 100% and 100% at concentrations of 800 mg L 1. However, mycotoxin yield was increased by 233%, pectinase activity raised by 168.0% and cellulase activity increased by 1325% compared to control at higher concentrations. It was concluded that salicylic acid as an allelochemical greatly inhibited FON growth and conidia formation and germination, though stimulated mycotoxin production and activities of hydrolytic enzymes by FON.

【题目】Proton pump OsA8 is linked to phosphorus uptake and translocation in rice
【中文关键词】无
【英文关键词】Knockout mutant, plasma membrane H+-ATPase, Oryza sativa, phosphorus, Tos17 retrotransposon, phosphate Knockout mutant, plasma membrane H+-ATPase, Oryza sativa, phosphorus, Tos17 retrotransposon, phosphate
【中文摘要】无
【英文摘要】The plasma membrane (PM) proton pump ATPases (H+-ATPases) are involved in almost all aspects of biology. Theyare plant specific and several members of this family are supposed to play a key role in nutrient acquisition. Atpresent, only some members of this gene family in plants have been characterized. However, no nutrient uptakeassociated H+-ATPase gene in rice has been functionally analysed. It is reported here that OsA8, a typical PMH+-ATPases gene that was predominantly expressed in roots of rice, is down-regulated by nutrient deficiency. TheOsa8 mutant had a relatively smaller size and root to shoot biomass ratio, but higher ATPase activity than its wild-typecounterparts under phosphorus (P) starvation conditions. Knockout of OsA8 affected the expression of several OsAgenes and the high affinity phosphate transporter, OsPT6, and resulted in a higher P concentration in the roots anda

lower amount of P in the shoots. These analyses demonstrate that OsA8 not only influences the uptake of P by roots,but also the translocation of P from the roots to the shoots in rice.

【题目】Suppression of Fusarium wilt of watermelon by a bio-organic fertilizer containing combinations of antagonistic microorganisms
【中文关键词】无
【英文关键词】Antioxidase activity ,Bio-organic fertilizer Fusarium oxysporum f.sp.niveum , Lipid peroxidation Malondialdehyde ,Pathogenesis-related proteins
【中文摘要】无
【英文摘要】Fusarium wilt of watermelon commonly occurs in locations where the crop has been grown formany seasons. Its occurrence results in a severely decreased watermelon crop. The goal of this study was to assess the capability of a new product (bio-organic fertilizer) to control the wilt in Fusarium-infested soil.Pot experiments were conducted under growth chamberand greenhouse conditions. The results showed that the fertilizer controlled the wilt disease. Compared with control pots, the incidence rates of Fusarium wilt at 27 and 63 days following treatment of the plants with the bio-organic fertilizer at a rate of 0.5% (organic fertilizer + antagonistic microorganisms, including 3 9 109 CFU g-1 Paenibacillus polymyxa and 5 9107 CFU g-1 Trichoderma harzianum) were reduced by 84.9 and 75.0%, respectively, in both the growth chamber and greenhouse settings. The activities of antioxidases (catalase, superoxide dismutase and peroxidase) in watermelon leaves increased by 38.9, 150 and 250%, respectively. In the roots, stems and leaves,the activity of b-1,3-glucanase (pathogenesis-related proteins) increased by 80, 1140 and 100% and that of chitinase increased by 240, 80, and 20%, respectively,while the contents of malondialdehyde fell by 56.8, 42.1 and 45.9%, respectively. These results indicate that this new fertilizer formula is capable of protecting watermelon from Fusarium oxysporum f.sp. niveum. The elevated levels of defense-related enzymes are consistent with the induction and enhancement of systemic acquired resistance of plant.

【中文摘要】本实验研究β葡聚糖,甘露寡糖,CPG寡聚脱氧核苷酸,乳铁蛋白和维生素c在体外对日本刺身免疫反应的影响。在含有不同增强剂的培养基中培养,并在不同时间孵化。实验结果表明,β葡聚糖,甘露糖,寡聚脱氧核苷酸乳铁蛋白和维生素c可以在体外可以提高刺身的非特异性免疫反应。
【英文摘要】The in vitro effects of β-glucan, mannan oligosaccharides (MOS), CpG oligodeoxynucleotide (CpG ODN),lactoferrin and vitamin C on the non-speci fi c immune response of sea cucumber Apostichopus japonicus coelomocytes were studied. Coelomocytes were cultured in L-15 medium containing different concentrations of β-glucan (0, 5, 25 and 100 μg ml − 1), CpG ODN (0, 0.5, 2.5 and 5 μM), MOS (0, 40, 80 and 120 μg ml − 1), lactoferrin(0, 5, 25 and 100 μg ml − 1) and vitamin C (0, 25, 100 and 250 μg ml − 1). Coelomocytes were incubated with the above immunostimulants for 1 h, 3 h, 6 h, 12 h or 24 h except vitamin C for 3 h, 6 h, 12 h, 24 h or 48 h.Coelomocytes incubated in medium without immunostimulants were taken as

controls at each incubation time.After exposure to these substances, coelomocytes were sampled and immune parameters viz., phagocytosis,superoxide anion production, superoxide dismutase (SOD) activity and total nitric oxide synthase (T-NOS)activity were determined. All immune parameters were signi fi cantly (Pb0.05) enhanced by β-glucan, MOS and CpG ODN. Lactoferrin induced signi fi cant (Pb0.05) increase in superoxide anion production and SOD activity of coelomocytes but did not affect phagocytosis and T-NOS activity. Vitamin C signi fi cantly (Pb0.05) enhanced the SOD and T-NOS activities of coelomocytes while no signi fi cant effects were observed in phagocytosis and superoxide anion production. The results suggest that β-glucan, MOS, CpG ODN, lactoferrin and vitamin C canenhance the non-speci fi c immune response of sea cucumber in vitro.

【题目】Effects of dietary b-glucan and glycyrrhizin on nonspecific immunity and disease resistance of white shrimp, Litopenaeus vannamei (Boone) challenged with Vibrio alginolyticus
【中文关键词】β-葡聚糖,甘草酸,南美白对虾,免疫,溶藻弧菌
【英文关键词】b-glucan, glycyrrhizin, Litopenaeus vannamei, immunity,Vibrio alginolyticus
【中文摘要】分别用无免疫增强剂的,含0.2%β葡聚糖的,含0.06%甘草酸的饲料喂养18天,用每只虾6.4×104CFU浓度的的溶藻弧菌侵染。持续120h检测对虾的总血细胞数,酚氧化酶活性,呼吸爆发和超氧化物歧化酶的活性的改变,记录死亡率。结果显示,含两种免疫增强剂饲料喂养的对虾的酚氧化酶活性,呼吸爆发和超氧化物歧化酶活性都明显高于对照组。在感染后0到24h,总血细胞数和超氧化物歧化酶活性明显降低,然后在96h和72h时,两者分别恢复到正常水平。感染后0到48h,酚氧化酶活性和呼吸爆发的值增加。与对照组相比,在感染后120h,用免疫增强剂喂养的对虾的酚氧化酶活性和呼吸爆发值都明显升高。死亡率在免疫增强剂组也明显降低。总之,饲料中添加β葡聚糖和甘草酸提高了对虾的免疫能力。而且在弧菌侵染后β葡聚糖能够比甘草酸早12小时引起某些免疫因子增加。
【英文摘要】The white shrimp Litopenaeus vannamei, fed immunostimulant-free 0.2% b-glucan and 0.06% glycyrrhizin diets for 18 days, respectively, were challenged with Vibrio alginolyticus at 6.4 10 4 CFU shrimp 1 .The total haemocyte count (THC), phenoloxidase(PO) activity, respiratory burst (RB) and superoxide dismutase (SOD) activity changes for a 120-h periodwere investigated, and shrimp mortality was also recorded. The results showed that PO activity, RB and SOD activity were signi ¢ cantly higher in shrimp fed the two immunostimulant diets after 18 days than those in shrimp fed immunostimulant-free diets. The THC and SOD activity decreased signi ¢ cantly from 0 to 24 h post challenge, and then reverted to normallevels at 96 and 72 h respectively. The values for PO activity and RB increased from 0 to 48 h post challenge. Compared with those fed the control diets,shrimp fed immunostimulants had signi ¢ cantly higher PO activity and RB values at 120 h post challenge. Mortalities after challenge withV. alginolyticus were signi ¢ cantly lower in shrimp fed with b-glucan or glycyrrhizin than in those fed with a diet without immunostimulants. It was concluded that dietaryb-glucan and glycyrrhizin Q2 increased the shrimp immune ability. Furthermore, b-glucan caused an increase in some immune parameters12 h earlier than glycyrrhizin afterV. alginolyticus challenge.

【题目】4种杀虫剂对杞柳瘿蚊幼虫的室内毒力测定和田间药效试验
【中文关键词】杞柳瘿蚊;毒力测定;药效试验
【英文关键词】Rhabdophaga salics Schrank; indoor toxicity; field efficacy
【中文摘要】为了明确4 种杀虫剂对杞柳瘿蚊幼虫的防治效果,分别用浸渍法和喷雾法进行了室内毒力测定和田间药效试验。结果表明,20%啶虫脒可溶性粉剂毒杀效果最好,其毒力指数为1 995.43,为当地常规药剂毒死蜱的19.95倍。20%啶虫脒可溶性粉剂、70%吡虫啉水分散粒剂和48%毒死蜱乳油田间防效较好,药后3 d 校正防效分别为60.27%、54.80%和40.83%,药后7 d 校正防效分别为79.50%、70.71%和58.07%,药后30 d 保苗效果分别为59.74%、50.65%和46.75%。在生产上防治杞柳瘿蚊幼虫时,选择药剂可首选20%啶虫脒可溶性粉剂,其次为70%吡虫啉水分散粒剂和48%毒死蜱乳油,可分别按照300 g · hm-2、150 g · hm-2 和1 500 mL · hm-2 的用量进行田间喷雾。3 种药剂交替使用,以延缓害虫抗药性的产生。

【英文摘要】Indoor toxicity and field efficacy were tested with dipping and spraying methods to determine the efficacies of four kinds of insecticides in controlling the larva of Rhabdophaga salics Schrank. The results indicated that 20% Acetamiprid SP had the most significant toxic effect on the larva. Its toxicity index was 1 995.43 and 19.95 times of that of 48% Chlorpyrifos EC, which was used as a regular pharmacy in the local. 20% Acetamiprid SP, 70% Imidacloprid WDG and 48% Chlorpyrifos EC exhibited better control in the field. Three days after spraying, the corrected efficacies were 60.27%, 54.80% and 40.83%, respectively. Seven days after spraying, the corrected efficacies were 79.50%, 70.71% and 58.07%. Thirty days after spraying, the seedling protecting effects were 59.74%, 50.65% and 46.75% respectively. In actual use, 20% Acetamiprid SP, 70% Imidacloprid WDG and 48% Chlorpyrifos EC should be selected to spray at 300 g · hm-2, 150 g · hm-2 and 1 500 mL · hm-2, respectively. The three insecticides must be used alternately to postpone the appearance of insecticide resistance of R. salics.

【题目】Pathogenicity and Immunogenicity of a Mutant Strain of Listeria monocytogenes in the Chicken Infection Model
【中文关键词】无
【英文关键词】Pathogenicity and Immunogenicity,Listeria monocytogenes, Chicken
【中文摘要】无
【英文摘要】Listeria monocytogenes has been exploited as a vaccine carrier based upon its ability to induce a strongcell-mediated immune response. At present, the safety of live, attenuated L. monocytogenes vaccines in patientsis being studied in clinical trials. L. monocytogenes is also an attractive vaccine vector for use in poultry;however, the pathogenicity and immunogenicity of this organism in poultry remain to be fully elucidated. Inthis study, we investigated the pathogenicity and immunogenicity of an actA- and plcB-deficient L. monocytogenesstrain, yzuLM4 actA/plcB, and its wild-type parent strain, yzuLM4, in an avian infection model. Theresults showed that the wild-type strain could infect ISA brown chickens, causing serious tissue disruptions,including various degrees of degeneration, necrotic lesions, and inflammatory cell infiltration in the liver,spleen, heart, and kidney. However, the mutant strain showed reduced virulence in embryonated eggs comparedwith that of the parent strain (the 50% lethal dose [LD50] was 3 logs higher). The mutant strain alsoshowed low virulence in chickens and was rapidly eliminated by the host. There were no obvious pathologicalchanges in tissue sections, but the mutant strain still retained the ability to stimulate high levels of antibodyagainst the protein listeriolysin O (LLO). Booster immunization with the mutant strain led to rapid bacterialclearance from the livers and spleens of chickens challenged by the intramuscular route or the oral route.Collectively, our data suggest that the wild-type serotype 1/2a L. monocytogenes strain can cause serious diseasein chickens but the mutant strain with a deletion of the actA and plcB genes is less virulent but induces a strongimmune response. This mutant strain of L. monocytogenes is therefore a promising candidate as a safe andeffective vector for the delivery of heterologous antigens to prevent zoonosis and infectious disease in poultry.

【题目】安徽阜南杞柳林生长及其土壤特性
【中文关键词】生物量; 相关性; 杞柳; 土壤养分; 林分结构
【英文关键词】Biomass; Correlation; Salix integra; Soil nutrients; Stand structures

【中文摘要】对阜南黄岗地区杞柳纯林及杨树-杞柳混交林两种栽培模式下的林分结构、生物量及土壤特性进行了研究。结果表明: 不同栽培模式下杞柳的平均地径为0. 46 ~ 0. 99 cm,平均条高为130. 44 ~ 187. 61 cm,在相同林龄下纯林的平均地径和条高大于混交林; 杞柳纯林及混交林的平均总生物量分别为17. 55、17. 03 t · hm-2 ,纯林的杞柳叶平均生物量高于混交林,而根系生物量则低于混交林,杞柳各部位的生物量大小依次为根(7. 51) >去皮茎杆(6. 32) >茎皮(2. 42) >叶(1. 16) 。不同林分下,各样地土壤有机质、全N 及全K 质量分数随土层深度的加深而降低,同一土层中养分质量分数差异不显著。相关分析显示: 平均地径与平均条高呈极显著正相关; 杞柳林平均总生物量与土壤速效磷及10 ~ 30 cm 土层有机质质量分数都呈极显著正相关; 在各土层内土壤有机质、全N、全P、速效P、全Ca 和全Mg 质量分数间均存在不同程度的正相关。

【英文摘要】An investigation was conducted to study the structure,biomass and soil characteristics of Salix integra pure and mixed stands under two cultivation patterns. Results indicated that the mean base diameter and mean height for the two cultivation patterns were 0. 46-0. 99 cm and 130. 44-187. 61 cm respectively. The pure stands had higher mean base diameter andmean height compared with the mixed stands with poplar I-69 of the same forest age. The average total biomass of the pure and mixed stands were 17. 55 t · hm-2 and 17. 03 t · hm-2 ,respectively. The foliar biomass was higher in the pure stands than in the mixed stands. However,the root biomass was adverse. The biomass of root (7. 51 t · hm-2) was the highest, followed by peeled stem (6. 32) ,peel (2. 42) ,and leaf (1. 16) . The contents of organic matter,total nitrogen and total potassium in different stands decreased with increasing depth of soil. There was no significant difference in nutrient content in the same soil layer between the pure and mixed stands. Correlation analysis demonstrated that the mean base diameter was significantly and positively correlated with mean height. The total biomass of S. integra stands had a significant positive correlation with available phosphorus in all soil layers,and organic matter in 10-30 cm soil layer. There were different degrees of correlations between organic matter,total nitrogen,total phosphorus,available phosphorus,total calcium and total magnesium.

【题目】基于概念邻近度的本体映射重用
【中文关键词】本体; 映射重用; 二分图; 概念邻近度
【英文关键词】ontology; mapping reuse; bipartite graph; neighboring concepts similarity
【中文摘要】为减少映射查找时相似度的冗余计算,改善映射查找效果,提出了一种通过考察待查概念与已有映射概念之间的邻近度,来推断待查概念映射关系的映射重用算法。构建概念描述概要间的语义二分图联系,从最佳匹配的角度,计算已有映射中概念与待查概念间的邻近程度,以已有映射中概念的邻近概念具有相似映射关系为前提,根据概念间相似度传递性决定待查概念间的映射关系。实验结果表明,该映射重用算法明显改善了映射查找的效果。

【英文摘要】To reduce the redundant similarity calculations and improve the mapping discovery,by considering the neighboring similarity among the concepts to be investigated and the concepts in the existing mapping which could infer the new mappings,an ontology mapping reuse algorithm was proposed.Firstly,a semantic bipartite graph be-tween the concepts ’ profile was established.Then,the neighboring concepts similarity from the best match of the bi-partite graph was obtained.Finally,inspired by the similarity transmission among neighboring concepts,the new mapping among the concepts was decided by their neighboring similar concepts ’ existing mapping.Experimental re-sults showed that the proposed algorithm could improve the mapping discovery.

【题目】基于棉花功能叶高光谱参数的土壤电导率监测模拟
【中文关键词】棉花功能叶; 高光谱参数; 土壤电导率; 监测模拟
【英文关键词】cotton functional leaf; hyperspectral parameter; soil electrical conductivity; monitoring and simulation
【中文摘要】通过2008—2009年在江苏南京农业大学牌楼试验站的盆栽试验,选择耐盐棉花品种中棉所44和盐敏感性品种苏棉12号为材料,模拟5种不同含盐水平的滨海盐土(0、0.35%、0.60%、0.85%和1.00%),分析了棉花生育期棉田土壤电导率与棉花功能叶光谱反射率和高光谱参数的关系,并建立了棉田土壤电导率(EC)的定量监测模型.结果表明:棉花功能叶光谱反射率在近红外和中红外区域均随土壤盐分水平的升高而升高;以敏感波段1350nm和2307 nm构建的归一化光谱指数NDSI(R1350,R2307)与土壤电导率的决定系数最高,基于此构建了基于NDSI(R1350,R2307)的棉田土壤EC监测模型:EC=-42.899NDSI(R1350,R2307)+27.338;在光谱微分参数中,以TM影像第5个波段的光谱反射率(TM5-SWIR)与棉田土壤EC的决定系数最高,构建了基于TM5-SWIR的棉田土壤EC监测模型:EC=0.0574TM5-SWIR2-2.5928TM5-SWIR+30.021.以NDSI(R1350,R2307)和TM5-SWIR为自变量的监测模型的预测精度均较高,分别为0.887和0.814,根均方差均较小,分别为1.09和1.29 dS.m-1.利用棉花功能叶NDSI(R1350,R2307)和TM5-SWIR均能较好地监测棉田土壤电导率.
【英文摘要】Taking the salt-tolerant cotton variety CCRI-44 and salt-sensitive cotton variety Sumian 12 as test materials,a two-year pot experiment was conducted at the Pailou experimental station of Nanjing Agricultural University in 2008 and 2009 to study the relationships of soil electrical conductivity(EC) with the spectral reflectance and hyperspectral indices of cotton functional leaves at different growth stages under five simulated salinity levels(0,0.35%,0.60%,0.85%,and 1.00%) of coastal saline soils,and the quantitative monitoring models on the cotton soil EC were established.With increasing salinity level,the cotton functional leaves had an increased spectral reflectance in near-infrared and middle-infrared regions,and the spectral parameter normalized difference spectrum index(NDSI) based on 1350 nm and 2307 nm,i.e.,NDSI(R1350,R2307),correlated well to the soil EC.With the NDSI(R1350,R2307) as independent variable,the soil EC monitoring model was constructed as EC=-42.899NDSI(R1350,R2307) +27.338.Among the derivative spectral parameters,TM5-SWIR was most correlated to soil EC,and thus,the soil EC monitoring model was constructed as EC=0.0574TM5-SWIR2-2.5928TM5-SWIR+30.021.The two models with NDSI(R1350,R2307) and TM5-SWIR as the independent variables respectively all had higher prediction precision,with the determination coefficient being 0.887 and 0.814 and the root mean square error being 1.09 and 1.29 dS · m-1,respectively,suggesting that using the hyperspectral parameters NDSI(R1350,R2307) and TM5-SWIR of cotton functional leaves could effectively monitor the soil EC of saline cotton fields.

【题目】Fate of 15N after combined application of rabbit manure and inorganic N fertilizers in a rice – wheat rotation system
【中文关键词】无
【英文关键词】Fate .N pool . IOF. 15N-labeled fertilizers .Rice – wheat rotations
【中文摘要】无
【英文摘要】The present study was carried out on pot experiments with rice (Oryza sativa L. cv. Wuyujing 7) and winter wheat (Triticum aestivum L. cv. Yangmai 6) rotation in a sandy and a clayey soil fertilized with 15N-labeled ammonium sulfate (AS) and 15N-labeled rabbit feces so asto study the mechanisms of reduction of fertilizer N loss by organic fertilizers. The treatments included: (1) control without any N fertilizer application; (2) fertilization with15N-labeled AS (IF); (3) fertilization with labeled rabbit feces (OF); (4) fertilization with either 40% 15N-labeled rabbit feces and 60% unlabeled AS (IOF1) or (5) 40% unlabeled rabbit feces and 60% 15N-labeled AS (IOF2). In the rice season, the IOF treatments compared to the IFtreatment decreased the percentage of lost fertilizer N from the sandy and clayey soils, whereas it increased the percentage of fertilizer N, present as mineral N and microbial biomass N (MBN). During the second season,when soils were cropped to winter wheat, the IOFtreatments in comparison with the IF or OF treatment increased mineral N and MBN contents of soils sampled at tillering, jointing, and heading stages, and such increases were derived from the organic N fertilizer in the sandy soil and from the inorganic N fertilizer in the clayey soil. The increased MBN in the IOF treatments was derived from inorganic fertilizers applied both soils. Therefore, in the IOF treatment, during the rice season, the organic Nincreased the immobilization of inorganic N in MBN,while the inorganic N fertilizer applied to both soils stimulated the uptake of organic N and the organic N fertilizer increased the uptake of inorganic N by winter wheat; the inorganic N increased the recovery of organic Nin the plant-soil system after harvesting the winter wheat.

【中文关键词】土地利用; 土壤有机碳; 土壤呼吸; 地表气温
【英文关键词】land use; soil organic carbon; soil respiration; ground surface air temperature
【中文摘要】为了探讨土地利用方式对土壤碳储及土壤呼吸的影响,对安徽沿淮洼地杞柳纯林、杞柳-杨树混交林及杨树纯林3 种不同土地利用方式下土壤有机碳储量及土壤呼吸特点进行了比较。结果表明: 杞柳纯林、杞柳-杨树混交林、杨树纯林0~30 cm土壤有机碳含量分别为6.80、8.50 和7.71 g · kg-1,土壤有机碳密度分别为2.88、3.26和2.95 kg · m-2,土壤有机碳含量和土壤碳密度随土层深度的增加而降低。不同土地利用类型土壤呼吸年平均值分别为1.68 μmol · m-2 · s-1(杞柳纯林) 、2.33 μmol · m-2 · s-1(杞柳-杨树混交林) 、1.61 μmol · m-2 · s-1(杨树纯林),土壤呼吸日均值最高出现在夏季(6.64 μmol · m-2 · s-1),最低为冬季(0.13 μmol · m-2 · s-1) 。相关分析表明,土壤呼吸速率与地表气温之间呈显著的指数关系,杞柳纯林、杞柳-杨树混交林、杨树纯林的相关系数R2 分别为0.71、0.62、0.54。杞柳-杨树混交林较杞柳纯林有利于土壤有机碳的固定,杞柳纯林土壤有机碳储量偏低,与其粗放经营有关。在今后的栽植管理中,应采取合理的耕作施肥措施,在提高土壤肥力的同时增强土壤的碳固定。
【英文摘要】To understand the effects of land use type on soil carbon storage and soil respiration,a comparative study was made to study the characteristics of soil carbon storage and soil respiration under three different land use types,i.e.,pure willow plantation (WP) ,willow-poplar mixed plantation (WPP) ,and pure poplar plantation (PP) on the lowlands along the Huaihe River in Funan of Anhui Province,East China. The organic carbon storage in 0 - 30 cm soil layer in WP,WPP,and PP was 6. 80,8. 50 and 7. 71 g · kg - 1,and the corresponding organic carbon density was 2. 88,3. 26,and 2. 95 kg · m - 2, respectively. Under the same land use types, both the soil organic carbon storage and density decreased with soil depth. The mean annual soil respiration rate in WP,WPP,and PP was 1. 61,2. 33 and 1. 61 μmol · m - 2 · s - 1,respectively, and the mean daily soil respiration rate was the maximum (6. 64 μmol · m - 2 · s - 1) in summer and the minimum (0. 13 μmol · m - 2 · s - 1) in winter. There was an exponential relationship between soil respiration rate and ground surface air temperature,with the R2 value being 0.71 for WP,0. 62 for WPP,and 0. 54 for PP. The WPP was beneficial to the sequestration of soil organic carbon,as compared to WP,and the lower soil organic carbon storage in WP was relatedto its extensive management. It was suggested that in the future forest management, reasonable tillage and fertilization should be taken to improve soil fertility and enhance soil carbon sequestration.

【题目】Maternal low-protein diet programs offspring growth in association with alterations in yolk leptin deposition and gene expression in yolk sac membrane, hypothalamus and muscle of developing Langshan chicken embryos
【中文关键词】低蛋白日粮;蛋;卵黄尿囊膜;下丘脑;肌肉;皮质酮;瘦素;甲状腺激素
【英文关键词】Maternal low-protein diet: Eggs: Yolk-sac membrane: Hypothalamus: Muscle: Corticosterone: Leptin: Thyroid hormone: Gene expression: Chickens
【中文摘要】本文由饶开晴博士所写,描述低蛋白日粮对崑山肉鸡胚胎卵黄囊和蛋黄中瘦素基因表达的改变。
【英文摘要】The present study was aimed to investigate the mechanism underlying the influence of maternal low-protein (LP) diet on offspring growth in the chicken. One hundred and twenty Chinese inbred Langshan breeder hens were allocated randomly into two groups fed diets containing low (10 %,LP) or normal (15 %) crude protein levels. Low dietary protein did not affect the body weight of hens, but significantly decreased the laying rate and egg weight. The yolk leptin content was significantly lower in eggs laid by LP hens, while no differences were detected for yolk contents of corticosterone, tri-iodothyronine (T3) or thyroxine. Despite significantly lower

hatch weight, the LP offspring demonstrated obviously higher serumT3 concentration, which is in accordance with the faster post-hatch growth rate achieving significantly heavier body weight and pectoralis major muscle weight 4 weeks post-hatching. Expression of 20-hydroxysteroid dehydrogenase (20-HSD) mRNA in the yolk-sac membrane was signifi-cantly down-regulated at embryonic day 14, whereas that of transthyretin and leptin receptor (LepR) was not altered. Moreover, hypothalamic expression of 20-HSD, glucocorticoid receptors, thyrotropin-releasing hormone and LepR mRNA was significantly up-regulated in the LP group compared with their control counterparts. In the pectoralis major muscle, significantly higher expression of insulin-like growth factor (IGF)-I and IGF-I receptor mRNA was observed in LP embryos. The present study provides evidence that maternal LP diet programmes post-hatch growth of the offspring. The associated alterations in yolk leptin deposition as well as in yolk-sac membrane, fetal hypothalamus and muscle geneexpression may be involved in mediating such programming effect in the chicken.

【题目】Effect of exogenously added ferulic acid on in vitro Fusarium oxysporum f.sp. niveum

【中文关键词】无

【英文关键词】Allelopathy,Ferulic acid,Fusarium wilt of watermelon,Fusarium oxysporum f. sp. niveum (FON) Interaction of plant – microbe,Mycotoxin,Hydrolytic enzymes related to,pathogenicity

【中文摘要】无

【英文摘要】Allelochemicals from root exudates or decaying residues of watermelon plant may be related towatermelon fusarium wilt. The aim of this work was to study the effect of an artificially applied allelochemical, ferulic acid, on in vitro Fusariumoxysporum f. sp. niveum (FON), a causal pathogen of plant wilting in the laboratory setting.The results showed that ferulic acid inhibited growth at high concentrations. The biomass wasreduced by 71.6% and the conidial germinate rate was decreased by 100%, while mycotoxin production by FON was increased by 227.7% at the highest concentration (1600 mg L 1). Activities of hydrolytic enzymes related to pathogenicity were also affected.It is concluded that ferulic acid at commonly found concentrations inside plants suppressed the growth of pathogen F. oxysporum f. sp. niveum.

【题目】慈姑球茎膨大过程中主要碳水化合物变化的初步研究

【中文关键词】慈姑;球茎;碳水化合物

【英文关键词】Sagittaria trifolia var. sinensis; corm; carbohydrate

【中文摘要】通过对慈姑球茎膨大过程中的主要碳水化合物含量的变化进行了初步研究,以期为慈姑的田间生产提供丰产的理论依据。在武汉地区的气候条件下,‘刮老乌’品种从9 月上旬球茎开始膨大。结果表明,在膨大过程中,蔗糖含量呈上升趋势,在球茎膨大约90 天时含量最高达28.05 mg/g。果糖含量遵循“上升-下降-上升”的变化规律;葡萄糖含量先上升,之后降低。总淀粉、直链淀粉和支链淀粉含量都呈上升的变化规律,支链淀粉/直链淀粉的比值总是小于1。

【英文摘要】Based on the Arrowhead bulbs in the process of enlargement of the main changes in carbohydratecontent of a preliminary study, Sagittaria to the field for the production of high yield of the theoretical basis, the results indicated that climatic conditions in Wuhan, scraping the old varieties of ‘ Ukraine ’ in early September bulbs from the start swelling. In the enlargement process, the sugar content went up, about 90 days in the content of bulb enlargement up to 28.05 mg/g. Fructose follow the “ up-down-

up ” variation; glucose increasedfirst and then decreased. Total starch, amylose and amylopectin content increased for changes of amylopectin/amylose ratio were always less than 1.

【题目】Development of a single base extension-tag microarray for the detection of pathogenic Vibrio species in seafood
【中文关键词】无
【英文关键词】Vibrio species, Single base extension-tag on glass slides (SBE-TAGS), Microarray . Multiplex PCR
【中文摘要】无
【英文摘要】In this study, a single base extension-tag array onglass slides (SBE-TAGS) microarray was established todetect the seven leading seafood-borne pathogens, includingVibrio parahaemolyticus, Vibrio cholerae, Vibriovulnificus, Vibrio mimicus, Vibrio alginolyticus, Vibrioanguillarum, and Vibrio harveyi. Three multiplex PCRassays were developed to specifically target the followingspecies with individual gene markers, which are aadS, tdh,and trh for V. parahaemolyticus; col, toxR, and vvh for V.alginolyticus, V. mimicus, and V. vulnificus; and empA,vhh1, and tcpA for V. anguillarum, V. harveyi, and V.cholerae, respectively. The purified PCR products wereused as template DNA for single base extension-tagreactions, labeled with Cy3 fluorescent dye and hybridizedto DNA microarrays. The detection specificity of thismicroarray method was 100%, with the sensitivity for puregenomic DNA at 200 fg to 2 pg per reaction. Application ofthe DNA microarray methodology to 55 naturally contaminatedseafood samples (shrimp, fish, and oysters) revealedthe presence of V. parahaemolyticus at 50.9% and V.alginolyticus at 32.7%. This corresponds with traditionalassays (microbiological and biochemical tests) except onesample which was identified as negative in V. parahaemolyticusby the microarray assay but as positive bythe conventional method. Therefore, a combination ofmultiplex PCR with DNA microarray hybridization basedon SBE-TAGS ensures rapid and accurate detection ofpathogenic Vibrio species in seafood, thereby providingsafer seafood products for consumers at a low financialburden to the aquaculture industry.

【题目】慈姑球茎形成与膨大进程的初步研究
【中文关键词】慈姑;球茎;根状茎
【英文关键词】Sagittaria trifolia Linn. var. Sinensis; Corm; Rhizome
【中文摘要】对慈姑球茎的形成与膨大进程进行了初步研究。研究结果表明,在武汉地区的气候条件下,慈姑的根状茎从7月上旬开始陆续形成,其后数目不断增加,大约到10 月上旬根状茎的数目基本不再变化,根状茎的生长主要是以伸长生长为主,其横径基本不发生变化。9 月上旬球茎开始形成,9 月中下旬球茎数目迅速增加,到10 月中下旬基本无新的球茎形成。单个球茎从形成到成熟大约80 d。在球茎形成的30~60 d 膨大最为迅速。其单个球茎质量的增加遵循“ 慢-快-慢 ”的变化规律。球茎的淀粉、可溶性总糖含量在40 d 以前呈缓慢上升,之后快速增加;还原糖呈“ 上升-降低-上升 ”的变化趋势。
【英文摘要】The corm formation and enlargement process of the arrowhead were studied. The results showed that the rhizome of the arrowhead started to form from early July in Wuhan climatic conditions, then increasing number of rhizomes, in early October about to not the number of basic changes. The growth of rhizome elongation mainly dominated its diameter did not change basically. Began to form in early September bulbs, bulbs form late September the number increased rapidly to 10 months, almost no new bulbs in late formation. The formation of a single bulb to mature form about 80 d. Time is growing fastest in the bulb formation of the first 30-60

d. The single bulb weight increase follows a "slow-fastslow" variation. Bulbs of starch, total soluble sugar content increased slowly before the 40 d, after a rapid increase. Reducing sugar had "up-lower-up" trend.

【题目】Fluorescence excitation – emission spectroscopy with regional integration analysis for assessment of compost maturity
【中文关键词】无
【英文关键词】Compost,Excitation-emission matrix (EEM),Maturity,Fluorescence spectroscopy,Water extract organic matter
【中文摘要】无
【英文摘要】Composting of animal manures is believed as an alternative way for directly recycling them in farms, andtherefore assessment of compost maturity is crucial for achieving high quality compost. Fluorescenceexcitation – emission matrices (EEMs) combined with regional integration analysis is presented to assesscompost maturity. The results showed that the EEM contours of water-extract organic matter (WEOM)from immature composts exhibited four peaks at excitation/emission (Ex/Em) of 220/340 nm, 280/340 nm, 220/410 nm, and 330/410 nm, whereas EEM contour of WEOM from mature composts had onlytwo peaks at Ex/Em of 230/420 nm and 330/420 nm. Pearson correlation demonstrated that peaks intensityrather than their ratios had a significantly correlation with the common indices assessing compostmaturity, whereas the normalized excitation – emission area volumes (Ui,ns) from regional integrationanalysis had a stronger correlation with the common indices assessing compost maturity than peaksintensity. It is concluded that the Ui,ns from regional integration analysis are more suitable to assessthe maturity of compost than the intensities of peaks. Therefore, the fluorescence spectroscopy combinedwith regional integration analysis can be used as a valuable industrial and research tool for assessingcompost maturity, given its high sensitivity and selectivity.

【题目】An weighted ontology-based semantic similarity algorithm for web service
【中文关键词】无
【英文关键词】Semantic web services;Semantic similarity;Degree of matching;Rank
【中文摘要】无
【英文摘要】A critical step in the process of reusing existing WSDL-specified services for building web-based applications is the discovery of potentially relevant services. However, the category-based service discovery, such as UDDI, is clearly insufficient. Semantic web services, augmenting web service descriptions using semantic web technology, were introduced to facilitate the publication, discovery, and execution of web services at the semantic level. Semantic matchmaker enhances the capability of UDDI service registries in the semantic web services architecture by applying some matching algorithms between advertisements and requests described in OWL-S to recognize various degrees of matching for web services. Based on semantic web service framework, semantic matchmaker and probabilistic matching approach, this paper proposes a weighted ontology-based semantic similarity algorithm for web service to support a more automated and veracious service discovery and rank process in the semantic web service framework.

【题目】氮磷钾肥对莲藕产量和品质的影响
【中文关键词】莲藕;产量;品质
【英文关键词】Lotus root; Yield; Quality
【中文摘要】通过分别施用不同水平的氮磷钾肥,研究其对莲藕(Nelumbo nucifera Gaertn.)产量和品质的影响。研究结果表明,施用氮磷钾肥对莲藕的产量和品质有明显的影响,施肥的增产效应为氮肥略高于钾肥,氮肥和钾肥远高于磷肥;不同水平的氮磷钾用量中,中等施肥量的处理N450、P180 和K450 的莲藕产量最高;合理施用氮磷钾肥不仅能增加莲藕中蛋白质、维生素C、还原糖含量,而且还能降低莲藕中粗纤维和硝酸盐含量,从而使莲藕品质得到改善。氮肥对增加莲藕蛋白质、维生素C 和还原糖含量的作用明显,钾肥对降低莲藕粗纤维和硝酸盐含量的作用明显,磷肥对莲藕品质的影响没有氮肥和钾肥显著,所以生产中应注意氮钾肥的合理施用。
【英文摘要】The effects of different levels of NPK fertilizer on yield and quality of lotus root (Nelumbo nucifera Gaertn.) were studied. The results showed that application of NPK on yield and quality of lotus root had a significant impact, effects of nitrogen fertilization yield slightly increased potash, nitrogen and potassium much higher than the phosphate fertilizer,amount of different levels of NPK, the medium amount of fertilizer N450, P180 and K450 handle lotus yield were the highest; rational application of NPK not only increased the lotus root protein, vitamin C, reducing sugar content but also reduced the lotus root crude fiber and nitrate, improve the quality of lotus root, nitrogen for protein increased, vitamin C and sugar content reduced obviously, and potassium, lotus root nitrate content of crude fiber reduced obviously, and phosphate on the quality of lotus root had no significant difference, so the lotus root production should be noted the rational application of nitrogen fertilizer.

【题目】Antibacterial Activity, Mechanism of Action, Zinc Oxide Nanoparticles,Campylobacter jejuni
【中文关键词】无
【英文关键词】Antibacterial Activity and Mechanism of Action of Zinc Oxide,
Nanoparticles against, Campylobacter jejuni
【中文摘要】无
【英文摘要】The antibacterial effect of zinc oxide (ZnO) nanoparticles on Campylobacter jejuni was investigated forinhibition and inactivation of cell growth. The results showed that C. jejuni was extremely sensitive totreatment with ZnO nanoparticles. The MIC of ZnO nanoparticles for C. jejuni was determined to be 0.05to 0.025 mg/ml, which is 8- to 16-fold lower than that for Salmonella enterica serovar Enteritidis andEscherichia coli O157:H7 (0.4 mg/ml). The action of ZnO nanoparticles against C. jejuni was determinedto be bactericidal, not bacteriostatic. Scanning electron microscopy examination revealed that the majorityof the cells transformed from spiral shapes into coccoid forms after exposure to 0.5 mg/ml of ZnOnanoparticles for 16 h, which is consistent with the morphological changes of C. jejuni under other stressconditions. These coccoid cells were found by ethidium monoazide-quantitative PCR (EMA-qPCR) to havea certain level of membrane leakage. To address the molecular basis of ZnO nanoparticle action, a largeset of genes involved in cell stress response, motility, pathogenesis, and toxin production were selected fora gene expression study. Reverse transcription-quantitative PCR (RT-qPCR) showed that in response totreatment with ZnO nanoparticles, the expression levels of two oxidative stress genes (katA and ahpC) anda general stress response gene (dnaK) were increased 52-, 7-, and 17-fold, respectively. These resultssuggest that the antibacterial mechanism of ZnO nanoparticles is most likely due to disruption of the cellmembrane and

oxidative stress in Campylobacter.

【题目】Allelopathic impact of artificially applied coumarin on Fusarium oxysporum f.sp. niveum
【中文关键词】无
【英文关键词】Allelopathy , Biomass , Coumarin,Fusarium oxysporum f.sp. niveum (FON) ,Mycotoxin (MT)
【中文摘要】无
【英文摘要】Watermelon production is threatened by fusarium wilt caused by Fusarium oxysporum f.sp. niveum(FON) in continuous cultivation system. Some elements,mainly allelochemicals, released from living roots or decayed plants might be associated with the disease. The purpose of this work was to evaluate the possible impact of coumarin, one kind of watermelon allelochemical, on FON.Furthermore, possible new mechanisms might be investigated during the ecological interactions of plant-microbe.Results showed that coumarin strongly inhibited growth ofFON leading to a decrease in its biomass, dry weight of mycelia of FON in a liquid culture. The dry weight was decreased by 62.9% compared with control. The hyphal growth of FON on plates was stopped at high ([400 mg l-1) concentrations of coumarin. At 320 mg l-1,sporulationand enzyme activities of FON were also severely suppressed by coumarin. The yield of conidia, and the activities of proteinase, cellulase, and amylase were reduced by 98.9%, 79.7%, 29.8% and 15.9% respectively.However, conidial germination and mycotoxin (MT) production of FON were greatly stimulated, being increased by 55.7% and 14.9 fold at 320 mg l-1 respectively. Weconclude that coumarin acted as an allelochemical substance to inhibit growth and pathogenic enzyme activities of FON but to stimulate mycotoxin production and conidial germination. It was suggested that coumarin acted as a signal transduction element bridging plant and pathogen in the process of plant-microbe interactions.

【题目】Intercropping with aerobic rice suppressed Fusarium wilt in watermelon
【中文关键词】无
【英文关键词】Watermelon; Aerobically growing rice; Intercropping; Fusarium oxysporum f. sp. niveum; Microbial community; Rice root exudates
【中文摘要】无
【英文摘要】Watermelon is susceptible to Fusarium wilt in successively mono-cropped soil. Pot experiments were carried out to investigate theeffect of intercropping with aerobic rice on Fusarium wilt in watermelon. The tested soil was classified as a loam soil, previously plantedwith watermelon and collected from Hexian county, Anhui province, China. The results obtained are listed as follows: (1) 66.7% ofwatermelon plants were infected with wilt disease and 44.4% died on 40 days after transplanting in mono-cropped soil, but plants weremuch less susceptible to infection when intercropped with rice; (2) the density of Fusarium oxysporum f. sp. niveum decreased by 91% insoil from the intercropped watermelon rhizosphere when compared with that from the mono-crop 40 days after transplanting; (3)densities of bacteria and actinomycetes increased, but fungal density decreased in rhizosphere soil from the intercrops in comparison withthe mono-crop control; (4) compared to the control, the germinated Fusarium spores were decreased by 41.0% in the treatment withaddition of 1.5 ml rice root exudates. Adding 20 ml of root exudates decreased Fusarium spore production by 76.4%; and (5) the activitiesof defense enzymes in the leaves and roots of watermelons in the intercropped system were significantly lower than those in the monocroppedsystem. It is suggested that intercropping with aerobic rice alleviated Fusarium wilt in watermelon, by restraining the sporeproduction of Fusarium and by changing the microbial communities in rhizosphere soil through the production of rice root exudates.r 2007 Elsevier Ltd. 【题目】Influence of Root Exudates of Watermelon on Growth and Virulence Factors of in vitro Fusarium oxysporum f.sp.niveum
【中文关键词】无
【英文关键词】FON, Fusarium oxysporum f. sp. nivea; HPLC, high-performance liquid chromatography.
【中文摘要】无
【英文摘要】Watermelon [Citrullus lanatus (Thunb.) Matsum. & Nakai var. lanatus] production in the same fi eld without rotation of crops leads to disease buildup and poor yields. The purpose ofthis research was to evaluate the infl uences of root exudates produced by watermelon cultivars susceptible or resistant to the pathogen Fusarium oxysporum f. sp. niveum (FON). At low concentrations of root exudates (<50 mg L − 1), the susceptible cultivar stimulated the growth of FON but the resistant cultivars inhibited FON at high concentration (200 mg L − 1).Mycotoxin production was increased more in the presence of exudates from susceptible thanresistant cultivars and after fl owering than before fl owering. Activities of enzymes (protease,pectinase, cellulose, and amylase) were stimulated more in resistant than susceptible cultivars by FON. Also, there were higher ratios of antifungal phenolic acids (p-hydroxybenzoic,phthalic, gallic, coumaric, cinnamic, ferulic, salicylic, and sinamic acids) to fungus-stimulating phenolic acids (vanillic and syringic acids) in resistant cultivars than in susceptible ones both before and after fl owering. Breeding of resistant cultivars containing more antifungal agents is a strategy that, if pursued, could lead to a reduction in the occurrence of watermelon wilt disease, especially when rotation of crops is not possible.

【题目】Biocontrol of Fusarium wilt disease for Cucumis melo melon using bio-organic fertilizer
【中文关键词】无
【英文关键词】Antagonistic microbes,Fusarium oxysporum f. sp. melonis,Melon,Soil-borne disease
【中文摘要】无
【英文摘要】Fusarium wilt disease in melon (Cucumis melo L.) is widespread, responsible for serious economic losses.Pot and field experiments were performed to investigate the effects of different bio-organic fertilizers (BIOs) made from organic fertilizer and different antagonistic microbes. BIOs decreased the incidence of fusarium wilt disease and increased melon yield. The disease incidence

of treatments with double application (BIOs applied both in the nursery and in the pot soil) was 20%, much lower than control (80%).Moreover, double application of a mix termed BIOII resulted in a 17.4-fold increase in plant fresh weightcompared to control. Application of BIOs strongly reduced the number of pathogen colony-forming units (cfu) in stems and roots of melon. Pathogen populations were 2.27×103 and 6.67×103 cfu g − 1 FW (fresh weight) on BIOII-treated stems and roots, respectively, and 8.17×104 and 3.67×104 cfu g − 1 FW on control stems and roots, respectively; i.e., cfus were reduced by 97% and 82%, respectively. Microbial community structure was ameliorated by all BIOs. The number of bacteria and actinomycota in rhizosphere soil increased markedly under all BIO applications compared to control. In contrast, pathogen and fungal density was dramatically higher in the rhizosphere of control plants. The activities of defenseenzymes in the leaves of melons receiving double application of BIOII were lower than those of control plants. The highest melon yield was achieved by plants that received a double application of BIOII in field experiments (7225 kg ha − 1 vs. 4447 kg ha − 1 for control plants). In conclusion, the most effective treatment was double application of BIOII, which minimized the incidence of wilt disease, maximized biomass production, and altered microbial community structure.

【题目】Influence of dietary probiotic Bacillus TC22 and prebiotic fructooligosaccharide on growth, immune responses and disease resistance against Vibrio splendidus infection in sea cucumber Apostichopus japonicus.

【中文关键词】仿刺参,益生菌,益菌素,免疫,灿烂弧菌

【英文关键词】Apostichopusjaponicus;probiotics;prebiotics;immunity;Vibrio splendidus

【中文摘要】本实验研究益生菌TC22芽孢杆菌(从感染的刺身肠道中分离)和益菌素黄金双歧因子对仿刺参生长,免疫和抗病力的影响。实验设置六个实验组,三个浓度水平的芽孢杆菌和两个浓度水平的黄金双歧因子组合。在养殖试验最后八周,给刺参注射灿烂弧菌。结果显示刺身的特定生长率没有受TC22和黄金双歧因子或两者之间的相互作用影响。但是,刺身的免疫反应和抗病能力受两者相互作用明显。在饲料中TC22的含量为109CFUg-1和黄金双歧因子的含量为0.5%,两者单独存在或组合存在时,刺身体腔细胞吞噬作用,呼吸爆发和酚氧化酶活性均显著提高;对灿烂弧菌感染的抗病力也显著增强。但是,饲料中同时添加上述含量的两种物质所产生的作用效果没有明显高于单独添加其中一种时所得到的作用效果。因此,其他水平的TC22和黄金双歧因子组合对刺身免疫和抗病力影响仍需进一步研究。

【英文摘要】The effects of probiotic Bacillus TC22 risolated from intestine of infected sea cucumber)and prebiotic fi'uctooligosaccharide fFOS、on growth,immunity and disease resistance in sea cucumber Apostichopus japonicus were studied.Six experimental diets were formulated with combinations of three levels of TC22(0,1 0 and 1 0 CFU g diet)and two levels of FOS(0 and 0.5%)in a 3×2 factorial experiment.At the end of the 8-week feeding trial animals were challenged by injecting Vibrio splendidus.The resuits revealed that the specific growth rates(SGR)of sea cucumbers were not affected by TC22 and FOS,or the interaction between TC22 and FOS r尸>0.05).However,there were significant interactions between TC22 and FOS fur immune response and disease resistance in sea cucumbers(P<0.05).When sea cucumbers were fed with TC22 at 10 CFUg- feed and O.5%FOS alone or in combination,the phagocytosis,respiratory burst and phenoloxidase activity of sea cucumber coelomocytes were significantly en—hanced;the disease resistance against splendidus infection was also increased significantly(JD<0.05).However,dietary combination of TC22 at 10 CFUg diet and 0.5% FOS did not yield significantly higher efficiency than either TC22 at l0 CFUg diet or 0.5%FOS used alone >0.05).Therefore,further studies should examine the effects of combinations of other levels of FOS f>0.5%or<0.5%)and TC22 on the immunity and disease resistance of sea cucumbers.

【题目】Formulations can affect rhizosphere colonization and biocontrol efficiency of Trichoderma harzianum SQR-T037 against Fusarium wilt of cucumbers

【中文关键词】无

【英文关键词】Biocontrol formulation . Bioorganic fertilizer .Trichoderma harzianum . Fusarium oxysporum f. sp.cucumerinum . Cucumis sativus

【中文摘要】无

【英文摘要】Pot experiments were carried out over two growing periods to assay the biocontrol efficacy andrhizosphere colonization of Trichoderma harzianum SQRT037 (SQR-T037) applied as SQR-T037 conidia suspension (TCS), SQR-T037 conidia suspension blended with organic fertilizer (TBF), or SQR-T037 fermented organic fertilizer (TFF). Each formulation had three T. harzianumnumbers. In two experiments, Percent Disease Indexes (PDIs) decreased with the increase of SQR-T037 number added to soils. The TFF treatment consistently exhibited the lowest PDIs at same amendment rate of SQR-T037 and 0 – 8.9%, 25.6 – 78.9%, and 4.4 – 50.0% of PDIs were found inTFF, TCS, and TBF treatment, respectively. Soils treated with TFF showed the highest SQR-T037 population in rhizosphere and bulk soil. Decrease of Fusarium oxysporum population in both bulk and rhizosphere soils occurred in the treatment SQR-T037 at 105 and 106 cfug − 1 soil rate. The TFF treatment at the SQR-T037 rate of 103 cfug − 1 soil significantly ($p<0.05$) increased SQR-T037 population within the rhizoplane but had no effect on F.oxysporum population when compared to TCS and TBF.Generally, TFF treatments were superior to TCS and TBFtreatments on disease control by sustaining colonization of SQR-T037 and decreasing F. oxysporum abundance in the rhizosphere soil. We propose that TFF treatment at SQRT037rate of 107 cfug − 1 (i.e., 105 cfug − 1 soil after applied to soil) was the best formulation for controlling Fusarium wilt of cucumber.

【题目】Effects of continuous and alternate administration of β-glucan and mannan-oligosaccharide on the growth, immunity and resistance against Vibrio splendidus of sea cucumber Apostichopusjaponicus (Selenka)

【中文关键词】仿刺参,β葡聚糖,甘露聚糖,免疫,灿烂弧菌

【英文关键词】Apostichopus japonicus, b-glucan,mannan-oligosaccharide, immunity, Vibrio splendidus

【中文摘要】本养殖试验持续四周,研究添加了免疫增强剂的饲料采用不同的投喂方式对仿刺参生长,免疫和对灿烂弧菌抗病力的影响。设置六种投喂方式,包括无添加的对照组,添加β葡聚糖(1.25 g kg-1)饲料连续投喂,添加甘露寡糖(MOS;2.00 g kg-1)饲料连续投喂,添加β葡聚糖饲料投喂5天再用添加MOS饲料投喂2天,添加β葡聚糖饲料投喂2天再用MOS投喂5天,投喂β葡聚糖7天再用MOS投喂7天。添加免疫增强剂的饲料组表现出较高的特定生长率,和较低的累积死亡率。连续投喂β葡聚糖,在第四天,总体腔细胞数和超氧化物阴离子明显高于对照组。但是在18天后,这两种免疫指标并没有明显高于对照组。MOS连续喂养,在15天内,这两种免疫指标没有显著高于对照组。β葡聚糖和MOS间隔喂养,所有的免疫指标显著高于对照组。七天间隔的投喂方式表现出最高的特定生长率和第二低的累积死亡率。这表明这种投喂方式为刺身的最适投喂方式。

【英文摘要】A 4-week growth trial was conducted to comparethe effects of different feeding strategies of dietary immunostimulants on the growth, immunity and resistance against Vibrio splendidus of sea cucumbers Apostichopus japonicus (Selenka). Six feeding strategies were set, including feeding immunostimulants-free diet continuously (control), feedingdietary b-glucan (1.25 g kg 1diet) continuously,feeding dietary mannan-oligosaccharides (MOS;2.00 g kg 1diet) continuously, feeding b-glucan2 days followed by MOS 5 days alternately, feeding b-glucan 5 days followed by MOS 2 days alternately and feeding b-glucan 7 days followed by MOS 7 days alternately. The sea cucumbers fed immunostimulants showed higher speci fi c growth rate (SGR) and lower cumulative mortality than control ($P < 0.05$). When sea cucumbers were fed with b-glucan continuously, total coelomocytes counts and superoxide anion were signi fi cantlyhigher than control on the 4th day ($P < 0.05$). However, these two immune parameters were not signi fi cantly higher than those in control after the 18th day ($P > 0.05$). While sea cucumbers continuously fed

MOS, these two immune parameters were not signi fi cantly higher than control untilthe 15th day. All immune parameters of the sea cucumbers fed with b-glucan and MOS alternately were signi fi cantly higher than those in controlduring the experiment ($P < 0.05$). The sea cucumbers fed with b-glucan 7 days followed MOS 7 days alternately showed the highest SGR and second lowest cumulative mortality. It was suggested that this feeding strategy is most suit-able for sea cucumbers.

【题目】Diversity analysis of antagonists from rice-associated bacteria and their application in biocontrol of rice diseases
【中文关键词】扩增核糖体DNA限制性分析,拮抗菌,生物防治,BOX-PCR,鉴定,生理特征,水稻细菌,水稻真菌病原物
【英文关键词】amplified ribosomal DNA restriction analysis, antagonists, biocontrol, BOX-PCR, identification, physiological characteristics, rice-associated bacteria, rice fungal pathogen
【中文摘要】目的:为了了解水稻相关细菌的多样性、类别和抗性潜力,为了发现新的防治水稻叶部病原物的生防细菌。方法和结果:利用rDNA扩增性片段酶谱分析(ARDRA)、BOX-PCR和16S rRNA基因序列分析方法来分析203种水稻相关抗性细菌的多样性。通过大田试验检测11种有生防潜力的细菌对稻瘟病的生防效果。11个不同属来自于5个纲,包括芽孢杆菌纲、α-变形菌纲、β-变形菌纲、γ-变形菌纲、恐球菌纲。微环境中最突出的属是芽孢杆菌属(68.5%)。菌株1Pe2、2R37和1Re14对水稻叶瘟的生防效果分别为64.35%、57.86%和56.44%。讨论:大田试验的生防数据显示抗性、生理特性和生防效果之间没有显著的关联。从不同微环境中分离的水稻相关细菌之间存在显著性差异。所有微环境中最突出的是芽孢杆菌属。短短芽孢杆菌属菌株1Pe2和异常球菌属菌株1Re14有很好的大田应用和商业运用潜力。研究的意义和影响:这是首次尝试对不同微环境中的水稻相关抗性细菌进行多样性研究和鉴别,植物内生细菌异常球菌属菌株1Re14、假单胞菌属菌株3Re21和短短芽孢杆菌属菌株1Pe2是首次作为水稻相关细菌被报道。
【英文摘要】Aims: To understand the diversity, taxonomy and antagonistic potential of rice-associated bacteria, and to discover new bacteria for biocontrol of rice foliar pathogens. Methods and Results: Amplified ribosomal DNA restriction analysis (ARDRA), BOX-PCR and 16S rRNA gene sequence analysis were used to identify the diversity of 203 rice-associated antagonistic bacteria. Eleven potential biocontrol bacteria were used to test their biological control of rice blast in a natural field experiment. Eleven different genera were encountered in five divisions, including Bacilli, Alphaproteobacteria, Betaproteobacteria, Gammaproteobacteria and Deinococci.

The most prominent genus in all microenvironments was Bacillus (68.5%). The efficacy of rice leaf blast biocontrol was 64.35% for strain 1Pe2, 57.86% for strain 2R37 and 56.44% for strain 1Re14. Conclusions: Biocontrol data from the field experiments demonstrated no positive correlation between antagonism, physiological characteristics and biocontrol efficacy. There was significant diversity among the rice-associated bacteria isolated from different microenvironments. The most prominent genus of all microenvironments was Bacillus. Brevibacillus brevis strain 1Pe2 and Deinococcus aquaticus strain 1Re14 have good potential for field application and commercial use. Significance and Impact of the Study: This is the first attempt to study the diversity and identification of rice-associated antagonistic bacteria from different microenvironments, and endophytic bacteria Deinococcus aquaticus strain 1Re14, Acidovorax sp. isolate 3Re21 and Brevibacillus brevis strain 1Pe2 are first reported as rice-associated bacteria.

【题目】Analysis of defence enzymes induced by antagonistic bacterium Bacillus subtilis strain AR12 towards Ralstonia solanacearum in tomato

【中文关键词】枯草芽孢杆菌,青枯劳尔氏菌,抗氧化酶,解毒酶,诱导系统抗性

【英文关键词】Bacillus subtilis, Ralstonia solanacearum, antioxidant enzyme, detoxifying enzyme, induced systemic resistance

【中文摘要】在中国很多的省份中,由青枯雷尔氏菌(Smith ,Yabuuchi et al.)引起的番茄细菌性枯萎病是一种重要的经济病害。在温室中用枯草芽孢杆菌属的抗性菌株AR12防治番茄(Lycopersicon esculentum Miller)细菌性枯萎病。生防效果高达90.18%。研究了番茄植株中的超氧自由基和过氧化氢的产生率以及苯丙氨酸解氨酶(PAL)、多酚氧化酶(PPO)、过氧化物酶(POD)、过氧化物歧化酶(SOD)、抗坏血酸过氧化物酶(APX)和过氧化氢酶(CAT)的活性变化。菌剂显著的增加和增强PAL、 PPO、POD和 SOD 的活性。相比之下,这四个酶的活性在仅用青枯雷尔氏菌株TM15处理的番茄上增强的较少且较慢(处理2),在用灭菌水处理的番茄上没有改变呈现最低的水平(处理1)。四种酶在番茄中的最大活性出现在AR12处理后的不同阶段:PAL、 PPO、POD和 SOD 的活性分别在接种病原菌后的48、48、12和12h达到最高水平并保持一段时间。H2O2与系统获得抗病性的过敏反应(HR)有关。番茄中的H2O2含量在AR12处理后显著增加,但是过敏反应(HR)并未出现。CAT和APX是降解H2O2的关键酶。在AR12处理过的番茄中,CAT的活性在接种病原菌80h后降低,此时APX的活性显著增强。这一现象表明番茄根际促生菌株对病原菌感染下的番茄生长性能存在有益效果与抗氧化酶活性有关。

【英文摘要】Bacterial wilt, caused by Ralstonia solanacearum (Smith) Yabuuchi et al., is an economically important disease on tomato in many provinces of China. Antagonistic bacterium Bacillus subtilis strain AR12 was used to control bacteria wilt of tomato (Lycopersicon esculentum Miller) in the greenhouse. The biocontrol efficiency was as high as 90.18%. Superoxide anion and hydrogen peroxide generation rates and changes in phenylalanine ammonia lyase (PAL), polyphenoloxidase (PPO), peroxidase (POD), superoxide dismutase (SOD), ascorbate peroxidase (APX), and catalase (CAT) activities were studied in tomato plants. Antagonist AR12 advanced and increased significantly activities of PAL, PPO, POD, and SOD. As comparison, the activities of these four enzymes increased less and later in tomato only treated with R. solanacearum TM15 (control 2), and kept lowest level with few change in tomato with sterilised water (control 1). The maximum activities of these four enzymes in tomato treated with AR12 occurred in different stages: activity of PAL, PPO, POD, and SOD increased to the top level at 48, 48, 12 and 12 h, respectively, after pathogen inoculation and kept high level for some time. H2O2 is associated with hypersensitive response (HR) during systemic acquired resistance. H2O2 content increased significantly in tomato treated with AR12, but HR response was not seen. CAT and APX are the key H2O2 detoxifying enzymes. Activities of APX in tomato treated with AR12 were increased significantly, while CAT was degraded until 80 h after pathogen inoculation. This work support the view that increased antioxidant enzyme activities could be involved, at least in part, in the beneficial effects of plant growth-promoting rhizobacteria strains on the performance of vegetable grown under the pathogen infection conditions.

【题目】Evaluation of the strains of Acinetobacter and Enterobacter as potential biocontrol agents against Ralstonia wilt of tomato
【中文关键词】拮抗菌,青枯劳尔氏菌,生物防治,不动杆菌属,蘸根,浸润,肠杆菌属
【英文关键词】Antagonist, Ralstonia solanacearum, Biological control, Acinetobacter sp., Root-dipping, Drenching, Enterobacter sp.
【中文摘要】在中国南方番茄细菌性枯萎病(Ralstonia solanacearum)造成番茄大量减产。生物防治是降低这一病害造成的发病率和产量损失的有效途径。通过对青枯雷尔氏菌和3个土传真菌病原物的抗性试验和温室防效试验,从14株潜在生防菌株中筛选出Xa6 (不动杆菌属Acinetobacter sp.) 和Xy3 (肠杆菌属Enterobacter sp.)两个菌株。为了找出抗性菌株合适的接种方式,我们从根围定植能力、生防效果和促生效果方面对蘸根和灌根两种方法进行比较。灌根处理表现出更好的生防效果和增产,且这一方法在田间大规模施用时更易操作。通过田间试验对两个拮抗菌株进一步评估。在温室和大田试验中,菌株Xy3的防效比菌株Xa6的高,而Xa6则引发更高的生物量或产量。两次田间试验中处理后第75天的记录表明,两次田间试验中Xy3的生防效果都约为65%,Xa6分别增加了32.4%和40.7%的产量。这是首次将不动杆菌属菌株作为防治番茄青枯病生防因子的报道。
【英文摘要】Bacterial wilt (Ralstonia solanacearum) of tomato, Lycopersicon esculentum, causes a considerable amount of damage to tomato in Southern China. Biological control is one of the more promising approaches to reduce the disease incidence and yield losses caused by this disease. Based on antagonistic activity against R. solanacearum and three soil-borne fungal pathogens as well as biocontrol efficacy in the greenhouse, two bacterial strains Xa6 (Acinetobacter sp.) and Xy3 (Enterobacter sp.) were selected out of fourteen candidates as potential biocontrol agents. In order to find a suitable antagonist inoculation method, we compared the methods of root-dipping with soil-drenching in the aspects including rhizocompetence, biocontrol efficacy, and effect of promoting plant growth under greenhouse conditions. The drenching treatment resulted in a higher biocontrol efficacy and plant-yield increase, and this method was also easier to operate in the field on a large scale. Field trials were conducted for further evaluation of these two antagonistic strains. In both greenhouse and field experiments, the strain Xy3 had a better control effect against bacterial wilt than Xa6 did, while Xa6 caused higher biomass or yield increases. As recorded on the 75th day after treatment in two field experiments, biocontrol efficacy of Xy3 was about 65% in both field trials, and the yield increases caused by Xa6 were 32.4 and 40.7%, respectively, in the two trials. This is the first report of an Acinetobacter sp. strain used as a BCA against Ralstonia wilt of tomato.

【题目】Effects of potential probiotic Bacillussubtilis T13 on growth, immunity and disease resistance against Vibrio splendidusinfection in juvenile sea cucumber Apostichopusjaponicus
【中文关键词】仿刺参,益生菌,生长,免疫,芽孢杆菌。
【英文关键词】Apostichopus japonicus;Probiotics;Growth;Immunity;Bacillus
【中文摘要】本养殖试验为了研究潜在益生菌枯草芽孢杆菌T13(从健康刺身肠道中分离)对仿刺参幼参生长,免疫和对灿烂弧菌感染抗病力的影响。幼参用芽孢杆菌含量为0,,105,107,和109CFU/g的饲料分别喂养30天。最后取每桶15头幼参测定免疫指标。然后剩余的二十头刺身用灿烂弧菌侵染。结果显示,添加T13会对刺参的特定生长率产生明显的影响。109CFU/gT13组的刺参体腔细胞吞噬作用,呼吸爆发和总一氧化氮合成酶活性明显的提高。该组还表现出最高的总体腔细胞数和超氧化物歧化酶活性。弧菌侵染后该组的累积死亡率明显的降低。目前的研究证实,饲料中添加益生菌枯草芽孢杆菌T13会对仿刺参产生潜在的有益影响。
【英文摘要】A feeding experiment was conducted to determine in fl uences of potential probiotic Bacillus subtilis T13(isolated from intestine of healthy sea cucumbers) on growth, immunity and disease resistance against Vibrio splendidus infection in juvenile sea

cucumbers Apostichopus japonicus. Animals were fed with diets containing B. subtilis T13 at 0, 105, 107 and 109 CFU/g for 30 days, respectively. At the end of the growth trial, fi fteen sea cucumbers from each aquarium were sampled for immune indices measurement. Then twenty sea cucumbers from each replicate were challenged with V. splendidus. Results showed that administration of B. subtilis T13 had signi fi cant effect on the speci fi c growth rates (SGR) of sea cucumbers($P < 0.05$). Phagocytosis, respiratory burst activity and total nitric oxide synthase (T-NOS) activity were signi fi cantly improved in coelomocytes of sea cucumbers fed with T13 at 109 CFU/g diet ($P < 0.05$). The highest values of the total coelomocytes counts (TCC) and superoxide dismutase (SOD) activity were found in sea cucumbers fed diet containing T13 at 109 CFU/g. The cumulative mortality after V. splendidus challenge decreased signi fi cantly in sea cucumbers fed with T13 at dose of 109 CFU/g ($P < 0.05$). The present study con fi rmed the potential bene fi cial effects of B. subtilis T13 as dietary probiotic in juvenile A.japonicus.

【中文关键词】生长,免疫,免疫增强剂,南美白对虾,大豆异黄酮,溶藻弧菌
【英文关键词】growth, immunity, immunostimulant, Litopenaeus vannamei, soybean iso fl avones, Vibrio alginolyticus
【中文摘要】饲料中分别添加0,5,10,20,40mg kg-1的大豆异黄酮,喂养8周,检测南美白对虾的生长回应,总血细胞数,呼吸爆发,一氧化氮合成酶活性和对溶藻弧菌抗病力。异黄酮对对虾的存活率没有产生显著地影响。10,20和40mg kg-1的异黄酮使对虾的特定生长率显著高于对照组。20mg kg-1异黄酮喂养的对虾的总血细胞数,酚氧化酶活性,呼吸爆发值,超氧化物歧化酶活性和一氧化氮合成酶活性都显著增加。10或40mg kg-1异黄酮组的总血细胞数,呼吸爆发值,超氧化物歧化酶活性和一氧化氮合成酶活性也有明显变化。添加异黄酮的组在弧菌感染后的累积死亡率显著低于对照组。因此,持续口服添20mg kg-1的异黄酮可以提高对虾的免疫力,提高对虾养殖的产量。
【英文摘要】The growth response, total hemocyte count (THC), respiratory burst (release of superoxide anion), phenoloxidase (PO)activity, superoxide dismutase (SOD) activity, nitric oxidesynthase (NOS) activity and resistance to the pathogen Vibrio alginolyticus were measured in white shrimp (Litopenaeus vannamei) which had been fed diets supplemented with soy-bean iso fl avones (SI) at 0, 5, 10, 20, 40 mg kg)1feed for 8 weeks. Dietary SI had no signi fi cant in fl uence on survival rate of the shrimp. Signi fi cantly greater SGR was observed intreatments with 10, 20 and 40 mg kg)1SI supplement than that in control ($P < 0.05$). Shrimp fed a diet with 20 mg kg)1SI showed signi fi cant increase in THC, PO activity, respiratory burst activity, SOD activity as well as NOS activity ($P < 0.05$).Increased THC, respiratory burst activity, SOD activity and NOS activity were also noticed in shrimp fed SI at 10 or40 mg kg)1($P < 0.05$). Signi fi cant lower cumulative mortality after challenge was observed in shrimp fed diets with SI supplement (10.0 – 13.3%) than that in control group (36.7%)($P < 0.05$). It is therefore concluded that oral administration of SI at 20 mg kg)1for 8 weeks could enhance the immune ability of shrimp and improve production in shrimp farming.

【题目】Effects of Dietary Glycyrrhizin on Growth and Nonspecific Immunity of White Shrimp, Litopenaeusvannamei
【中文关键词】生长,免疫,免疫增强剂,南美白对虾,大豆异黄酮,溶藻弧菌

【英文关键词】growth, immunity, immunostimulant, Litopenaeus vannamei, soybean iso fl avones, Vibrio alginolyticus
【中文摘要】饲料中分别添加0,50,100,150和200mg/kg的甘草酸,喂养八周,测定南美白对虾的生长回应,总血细胞数,呼吸爆发,酚氧化酶活性,超氧化物歧化酶活性,一氧化氮合成酶活性和对溶藻弧菌抗病力。饲养试验中,存活率没有显著不同。添加甘草酸的实验组的特定生长率显著高于对照组。200mg/kg浓度的甘草酸实验组对虾的总血细胞数,酚氧化酶活性,呼吸爆发活性和超氧化物歧化酶活性显著高于对照组。100和150mg/kg甘草酸添加组的总血细胞数,呼吸爆发活性和一氧化氮合成酶活性也明显的增加。弧菌感染后,甘草酸添加组的累积死亡率显著低于对照组。以上结果表明,甘草酸可以增强南美白对虾的非特异性免疫系统,增强对虾的抗病力,同时提高对虾养殖的产量。
【英文摘要】The growth response, total hemocyte count (THC), respiratory burst (release of superoxide anion),phenoloxidase (PO) activity, superoxide dismutase (SOD) activity, nitric oxide synthase (NOS) activity as well as resistance to the pathogen Vibrio alginolyticus were measured in Litopenaeus vannamei,which had been fed diets supplemented with glycyrrhizin (the aqueous extract of licorice, Glycyrrhiza glabra, roots) at 0, 50, 100, 150, and 200 mg/kg of feed for 8 wk. In the feeding trial, there was no signi fi cant difference in survival rate (P > 0.05). Signi fi cant higher speci fi c growth rate was observed in treatments with dietary glycyrrhizin than that in the control group (P < 0.05). Shrimp fed a diet with 200 mg/kg of glycyrrhizin had signi fi cant higher THC, PO activity, respiratory burst activity and SOD activity than that in the control group (P < 0.05). Increased THC, respiratory burst activityand NOS activity were also noticed in shrimp fed glycyrrhizin at 100 or 150 mg/kg (P < 0.05). There were signi fi cantly lower cumulative mortalities after the disease challenge in shrimp fed glycyrrhizin diets (8.33 – 16.67%) than that in the control group (36.67%) (P < 0.05). These results indicated that glycyrrhizin may enhance the nonspeci fi c immune system, increase the resistance of L. vannamei as well as improve production in shrimp farming.

【题目】Effects of dietary β-glucan on the growth, immune responses and resistance of sea cucumber,Apostichopusjaponicus against Vibrio splendidus infection
【中文关键词】仿刺参,β葡聚糖,生长,免疫反应,疾病挑战,灿烂弧菌
【英文关键词】Apostichopus japonicus; β-glucan;Growth;Immunity response;Disease challenge;Vibrio splendidus
【中文摘要】本养殖实验进行8周,研究饲料中添加β葡聚糖对刺参生长,免疫和对弧菌侵染抗病力的影响。基础饲料含有20.6%的粗蛋白和4.8%的粗脂肪。两个水平(1.25和2.50g/kg)的β葡聚糖代替小麦粉添加到基础饲料中。养殖结束后,给刺参注射灿烂弧菌,检测β葡聚糖对对虾抗病力的影响。添加了1.25g/kgβ葡聚糖的饲料组生长加快,但是在2.50g/kg组没有表现。添加β葡聚糖饲料的实验组对虾的体腔细胞吞噬作用明显高于基础饲料的对照组。此外,实验组的酚氧化酶活性也显著增强。与2.50g/kgβ葡聚糖相比,投喂1.25g/kgβ葡聚糖的对虾体腔细胞的呼吸爆发显著提高;然而,前者与基础饲料组的呼吸爆发无显著差异。1.25g/kgβ葡聚糖组对虾具有明显的对灿烂弧菌感染的抗病力。但是2.50g/kg水平的β葡聚糖对对虾的保护作用不明显。总之,β葡聚糖可以作为刺参饲料原料用来抵抗灿烂弧菌的不利影响,但是在使用时剂量是一个非常重要的考虑因素。
【英文摘要】An eight-week feeding trial was conducted to determine the effects of dietary supplementation of β-glucan on the growth, immunity and resistance of sea cucumber against Vibrio splendidus infection. A basal diet was formulated to contain 20.6% crude protein and 4.8% crude lipid. Two levels (1.25 and 2.50 g/kg) of β-glucan were added to the basal diet to replace wheat. After the feeding trial, a V. splendidus injection challenge was executed to test the effects of β-glucan on disease resistance. Enhanced growth was observed in sea cucumber fed diet supplemented with 1.25 g glucan/kg, but not in sea cucumber fed diet supplemented with 2.50 gglucan/kg. The coelomocyte phagocytosis activity of sea cucumber fed β-glucan-supplemented diets was signi fi cantly (Pb0.05) higher than those of sea cucumbers fed the basal diet. In addition, phenoloxidase activity of coelomocytes was signi fi cantly (Pb 0.05) enhanced by dietary supplementation of β-glucan. Sea cucumbers fed 1.25 g/kg glucan had a signi fi cant (Pb0.05) increase in respiratory burst of coelomocytes, compared to sea cucumber fed diet containing 2.50 g β-glucan/kg; however, coelomocyte respiratory burst of sea cucumber fed 2.50 g β-glucan/kg diet was not signi fi cantly different from those of sea cucumber fed thebasal diet. The challenge test showed that dietary supplementation of β-glucan at inclusion level of 1.25 g/kg conferred signi fi cant protection to sea cucumber against V. splendidus infection. However, protective effect of β-glucan supplementation at 2.50 g/kg was

marginal. It is concluded that dietary β-glucan has potential for use in diet formulations of sea cucumber to limit the adverse effects of V. splendidus, however, dosage should be an important consideration in administration.

【题目】4 株对虾肠道益生菌的筛选及鉴定
【中文关键词】益生菌, 筛选, 鉴定, 抑制作用, 安全性实验
【英文关键词】Probiotic bacteria, Screening, Identification, Inhibitory activity, Safety test
【中文摘要】采用体外拮抗试验的方法, 先从不同生长阶段的对虾肠道中分离的96 株细菌中筛选出4 株对病原菌(鳗弧菌、副溶血弧菌、哈维氏弧菌)有拮抗作用的细菌; 进一步通过固体扩散法和液体混合法确定LV060806、LV060808 的产物对鳗弧菌有明显抑制作用, LV060806、LV060815 的产物对副溶血弧菌有明显抑制作用, LV060810、LV060815 的产物对哈维氏弧菌有明显抑制作用。溶血试验证实这些菌株不产生溶血素, 不具有潜在的致病性; 动物安全性实验证实菌株浓度在106 cfu/ml 以下对实验对虾无明显的毒害作用。随后测定了其16S rRNA 基因序列, 分析了相关细菌相应序列的同源性, 构建了系统发生树, 结合菌株表型特征和生理生化特性最终鉴定结果为:LV060806、LV060808 为Vibrio natriegens; LV060810、LV060815 为V. alginolyticus。
【英文摘要】96 bacteria strains were isolated from the intestine of different-aged shrimps. Four stains showingantagonism against three pathogenic indicator vibrios, Vibrio anguillarum, V. harveyi, and V. parahaemolyticus wereselected, and their inhibitory activities were tested. The inhibitory of the stains was tested in solid diffusion assay andliquid blend assay; and showed no pathogenicity to artificially infected shrimp. The 16S rRNA of strains were sequencedand compared with those of relative strains. Strains LV060806, LV060808 were identified as V. natriegens, and LV060810,LV060815 as V. alginolyticus in physiology and biochemistry shown molecular phylogenetic dendrogram.

【题目】大黄对凡纳滨对虾生长和非特异性免疫指标的影响
【中文关键词】凡纳滨对虾;生长;非特异性免疫指标;大黄
【英文关键词】Litopenaeus vannamei; rhubarb; growth; non-specific immune response
【中文摘要】在凡纳滨对虾饲料中分别添加大黄 0、0.5、1.0、5.0、10.0 和 20.0 g/kg,研究大黄对凡纳滨对虾(初始体重为 0.34±0.004 g)生长及非特异性免疫指标的影响。结果表明,大黄对凡纳滨对虾成活率、增重率、特定生长率、饲料系数、蛋白质效率和蛋白质累积率的影响不显著(P > 0.05),对全虾和尾肌肉的灰分、脂肪和粗蛋白含量影响显著,全虾的粗蛋白和粗脂肪含量以 1.0 g/kg 组最高(P < 0.05),对凡纳滨对虾血清碱性磷酸酶、酸性磷酸酶、酚氧化酶、超氧化物歧化酶、溶菌酶以及血清总蛋白量等的影响显著,溶菌酶活性以 1.0 g/kg 组最高(P < 0.05);细菌感染实验中以 1.0 g/kg 组存活率最高(P < 0.05)。以非特异性免疫反应指标及感染实验存活率为指标,凡纳滨对虾饲料中大黄的适宜添加量为 1.0 g/kg。
【英文摘要】An 8-week feeding experiment was conducted to evaluate the effect of rhubarb levels on growth and non-specific immunity in Litopenaeus vannamei (initial body weight 0.34±0.004 g). Six experimental diets containing different rhubarb levels (0, 0.5, 1, 5, 10 and 20 g/kg) were formulated and fed to triplicate groups of juvenile white shrimp. The result indicated that there were no significant difference in the survival, weight gain, specific growth rate, feed conversion ratio, protein efficiency ratio and productive protein value (P > 0.05). Ash, lipid and protein content were significantly affected by the dietary rhubarb levels. AKP, ACP, PO, SOD, LSZ and Serum total protein were different among all the groups (P <0.05). The challenge experiment with Vibro alginolyticus showed that the highest cumulative survival was found in group that fed the diets with 0.1% rhubarb supplementation. These results suggested that the rhubarb significantly influenced the immune response and disease resistance of white shrimp. Based on the data of non-specific immune response and survival rate of infection experiment, the dietary rhubarb supplemented level was recommended to be 0.1% for white shrimp.

【题目】美人鱼发光杆菌对凡纳滨对虾非特异性
【中文关键词】凡纳滨对虾 美人鱼发光杆菌 非特异性免疫 抗病力 WSSV
【英文关键词】Litopenaeus vanname;P hotobacterium damselae ; Non-specific immunity ;Resistance to disease ; White Spot Syndrome Virus (WSSV)
【中文摘要】在基础饲料中分别添加 01 1% 和 1%美人鱼发光杆菌灭活菌、01 1% 美人鱼发光杆菌活菌配制成 3 种免疫实验饲料, 以基础饲料为空白对照组饲料, 每组设 3 个平行样。对个体质量为(41 83? 01 36) g 的凡纳滨对虾进行为期 20 d 的饲养实验, 分别在 0、5、10、15 和 20d 进行取样, 以血清中的酚氧化酶(PO) 、酸性磷酸酶(ACP) 、碱性磷酸酶(AKP) 、超氧化物歧化酶(SOD) 和溶菌酶(U L) 活性为免疫指标, 探讨了美人鱼发光杆菌作为免疫制剂对凡纳滨对虾非特异性免疫效应的影响; 在投喂免疫饲料后的第 22 天, 按 01 004 2 kg/ kg 体重的剂量, 直接投喂对虾白斑综合征病毒(WSSV) 病料, 并记录累积死亡率。结果表明, 美人鱼发光杆菌免疫实验组对凡纳滨对虾血清中 PO、ACP、AKP、UL和 SOD 活性影响明显高 于对照组, 并且在 饲料中添 加美人 鱼发光杆 菌后, 明显 提高了 对虾抵 御WSSV 感染的能力。其中 01 1%美人鱼发光杆菌活菌实验组的抗病毒感染能力最强, WSSV 感染 14d 内累计死亡率为 631 3% ? 51 8% ; 而对照组为 961 7% ? 31 3%。研究表明, 美人鱼发光杆菌添加在对虾饲料中能提高凡纳滨对虾非特异性免疫水平, 增强抵抗疾病的能力, 将其作为对虾免疫增强剂具有良好的应用前景。
【英文摘要】Litop enaeus vannamei at (41 83 ? 01 36) g body w eight w ere fed w ith 01 1%heat-killed, 1% heat-killed and 01 1% living P hotobacterium damselae for 21 days respectively.The serum w as collected at 0, 5, 10, 15 and 20 days post-immunization and Phenoloxidase (PO) , acid phosphat ase (ACP) , alkaline phosphat ase (A KP) , superoxide dismutase (SOD)and lysozyme activity (U L) in the serum of L . vannamei w ere determined to evaluat e t he nonspecific immune effect of P . damselae A fter 21

days, the shrimps w ere challeng ed by w hite spot syndrome virus (WSSV) and the mortalities of challenging test w ere recorded. The results showed that most PO, ACP, AKP, UL and SOD in the serum of L. vannamei of the test groups were significantly different (P < 01 05 or P< 01 01) , and the resistance ability of shrimps to WSSV w as also significantly enhanced by the diet supplemented with P. damselae T he group fed w ith 10g hea-t killed P.damselae per 1 kg shrimps exhibited the strongest resistance to WSSV in 14 days and its final cumulative mortality was 631 3% ? 51 8% , while the control w as 961 7% ? 71 3% . The results indicated that P. damselae improved shrimp non-specific immunity and its resistance to WSSV, suggesting that it might be a promising diet supplement in shrimp farming.

【题目】Phenotypic, Proteomic, Genomic, ABC-Transporter Permease, Biofilm Formation
【中文关键词】无
【英文关键词】Phenotypic, Proteomic, and Genomic Characterization,
of a Putative ABC-Transporter Permease Involved,
in Listeria monocytogenes Biofilm Formation
【中文摘要】无
【英文摘要】The foodborne pathogen Listeria monocytogenes is able to form biofilms in food processing environments. Previously,we have reported that an lm.G_1771 gene (encoding a putative ABC-transporter permease) was involvedin negative regulation of L. monocytogenes biofilm formation using LM-49, a biofilm-enhanced mutant isolated onTn917 mutagenesis (AEM 2008 p.7675 – 7683). Here, the possible action of this ABC-transporter permease inL. monocytogenes biofilm formation was characterized by phenotypic, proteomic, and genomic analyses usingan lm.G_1771 gene deletant (D1771). The D1771mutant exhibited the same enhanced ability for biofilm formationas the LM-49 strain using a crystal violet staining assay. DNA microarrays and two-dimensional gel electrophoresisrevealed 49 and 11 differentially expressed (twofold or more) genes or proteins in D1771, respectively.The transcriptomics study indicated that lm.G_1771 could play a vital role in regulating candidate genes involvedin biofilm formation such as genes encoding cell surface proteins (Dlt), cell surface anchor proteins (SrtA), andtranscriptional regulators (GntR) contributing to negative reglution of biofilm formation by L. monocytogenes. Themutant D1771 was more sensitive to Triton X-100 and less resistant to cationic antibiotics, which might beexplained by the down-regulation of dlt operon in this deletant and the fact that dlt involves the incorporation ofD-alanine residues into lipoteichoic acids, resulting in a positive net charge on the teichoic acids. Therefore,lm.G_1771 is considered to be involved in negative regulation of biofilm formation, and the results from this workprovide a possible molecular mechanism of biofilm formation regulated by lm.G_1771 in L. monocytogenes.

【题目】Characterization of biofilm formation by Salmonella enterica Serovar Pullorum strains
【中文关键词】无
【英文关键词】Salmonella enterica Serovar Pullorum, biofilm, curli, virulence
【中文摘要】无

【英文摘要】Salmonella enterica Serovar Pullorum causes acute or persistent infection in chickens, resulting insignificant economic losses. The objective of this study was to evaluate the biofilm-forming ability of S.enterica Serovar Pullorum strains and association with the pathogenicity. A total of 62 S. entericaSerovar Pullorum isolates were measured for biofilm formation by crystal violet staining. Thirty-nine outof 62 strains were found to produce biofilm which were further confirmed by observation under lightmicroscopy, field emission scanning electron microscopy. Analysis of the major components forbiofilm formation showed that bacterial colonies were smooth phenotype and the architecture of biofilmwas composed of exopolysaccharides and curli other than cellulose. In addition, animal experimentswere performed to determine the 50% lethal doses (LD50) of four S. enterica Serovar Pullorum isolateswith or without biofilm-producing ability. Although the virulence of S. enterica Serovar Pullorum strainswas independent of the ability of biofilm formation, prior growth as a biofilm for a biofilm producer of S.enterica Serovar Pullorum lead to enhanced virulence in chickens. The results suggested that biofilmmay be one of the important virulence factors for S. enterica Serovar Pullorum infection.

【题目】基于多传感器融合的鸡蛋裂纹系统性识别
【中文关键词】鸡蛋 裂纹 支持向量机 判别模型 多传感器融合
【英文关键词】Egg Crack, Support vector machine, Discriminate model, Multi-sensor fusion
【中文摘要】通过图像分析、敲击振动和电子鼻3种传感器分别输出与鸡蛋外部常规裂纹、外部细小裂纹和内部裂纹有关的无损检测参数并进行实验,设计一组针对鸡蛋裂纹程度的支持向量机判据。用该判据并结合实验数据构建一对多的支持向量数为4的鸡蛋裂纹判别模型。模型性能参数(模型拟合度为0.9735,收敛误差在0.0001以内)和验证性实验(对确定的5种裂纹状态判别准确率均可达90%)表明该模型具有可信的结构和较好的判别能力。
【英文摘要】The egg crack detection is one of the most important parts in the non-destructive detection of egg.The non-destructive testing parameters related the eggs external conventional cracks, the externalminimal cracks and internal cracks were extracted through image analysis, impact excitation frequency analysis and electronic nose pattern recognition respectively. A non-destructive testing criterion was designed according to the eggs cracks based on experimental research. The criterion was used to build the-one-to-many support vector discriminated model in eggs crack combined with experiment data. Performance parameters of the model (the model fitting degree was 0.9735, the convergence error was less than 0.0001) and the confirmatory test (the discriminated accuracy in the five cracks status was more than 90%) indicates that the model has credible structure and good discriminated ability.

【题目】农用轮式机器人间接型专家控制系统研究
【中文关键词】农用机器人;自动导航;路径跟踪;间接型专家控制;
【英文关键词】Agricultural robot; Automatic guidance; Path tracking; Indirect expert control
【中文摘要】为了适应农用机器人的工作环境复杂多变,研究了一种用于自动导航路径跟踪控制的间接型专家控制算法,根据不同的控制策略、转向方式建立了专家控制的控制算法库,对农用机器人路径跟踪和转向进行控制。针对农用机器人沿作物行行走建立了精确的数学模型,同时采用相适应的转向方式并依最优控制律对农用机器人进行控制;针对田间地头转向时转角较大、对转向灵活性要求较高,采用四轮转向方式设计了模糊控制算法。专家控制器根据具体的路径状况,调用不同的控制算法。通过仿真验证,该专家控制算法能满足农用机器人导航时的路径跟踪控制的精度要求。
【英文摘要】According to the different working environment,an indirect expert control algorithm for the path tracking control of the automatic guidance was designed.Based on the control strategy and steering model,the control algorithm library was designed to track the path and control the steering of the agricultural robot.The exact mathematical model was set up with the path along which the agricultural robot worked in the field,and the agricultural robot was controlled by the corresponding steering model and the optimal control laws.The fuzzy control algorithm was designed due to the larger shift angle at the end of the field and the higher requirement for the agility.The expert controller adopted different control algorithms according to the actual working path.Through the simulation,it was verified that the expert control system could satisfy the precision of the path tracking control when the agricultural robot was guided.

【题目】基于自主导航和全方位转向的农用机器人设计
【中文关键词】农业机器人; 全方位转向; CAN总线; 路径跟踪控制;
【英文关键词】agricultural mobile robot; omni-directional steering; CAN-BUS; path tracking control;
【中文摘要】为了提高农业作业的自动化程度,在对传感器技术、信息技术、自动导航技术等进行研究的基础上,设计了一种自动导航农用轮式移动机器人。针对目前农业机器人存在的操纵、路径跟踪等技术问题,机器人采用四轮全方位转向,操纵灵活;利用CAN总线使导航、控制等模块的通讯效率得以改善;选用模糊控制模仿人在路径跟踪控制时的控制策略,提高了移动机器人的智能化程度。仿真和试验表明机器人有较好的转向性能且在速度为1m/s时跟踪路径的偏差为0.1m左右。
【英文摘要】For raising automation level of farm operation, an agricultural wheeled-mobile robot was designed on the basis of the research on the intelligent sensor, information and automatic navigation. Aiming at some of the current problems on handle and path tracking, the omni-directional steering was adopted, which made the robot agility on steering. The efficiency of communication on modules such as navigation and control has been improved highly by the application of CAN-BUS. The intelligence of the mobile robot has been improved through the use of the fuzzy controller which was designed by imitating the human ’s control strategy. The simulation and experiment indicate that the robot ’s steering performance is property and the path tracking error is 0.1 m when the velocity is 1 m/s.

【题目】Large-scale conditional random field for natural outdoor scene labeling
【中文关键词】null
【英文关键词】image understanding; conditional random fields; computer vision; image labeling; Markov random fields.
【中文摘要】null
【英文摘要】We propose a novel large-scale conditional random field model with respect to the problem of natural outdoor scene labeling. The novelty of the proposed method lies in three aspects: 1. features from two neighboring regions are concatenated to form the input of the pairwise classifier to compensate for the simultaneous feature deviation of neighboring regions; 2. the definition of a generalized neighboring system and the incorporation of direction-specific patterns in conditional random field models based on the

generalized neighboring system to better simulate the visual cognition of human being; and 3. the definition of a similarity criterion based on the bags-of-words expression to facilitate the incorporation of semantic patterns. The proposed model is first evaluated over the Corel dataset. Both qualitative and quantitative results show that our model is capable of modeling large-scale spatial relationships between objects in natural outdoor scenes, and achieves better results than other existing conditional random field models. Furthermore, our model is also evaluated over several other natural datasets, which are taken from logged field tests, to further demonstrate the adaptability of our model to different lighting conditions.

【题目】Learning long-range terrain perception for autonomous mobile robots
【中文关键词】null
【英文关键词】autonomous navigation, stereo vision, machine learning, conditional random fields
【中文摘要】null
【英文摘要】Long-range terrain perception has a high value in performing efficient autonomous navigation and risky intervention tasks for field robots, such as earlier recognition of hazards, better path planning, and higher speeds. However, Stereo-based navigation systems can only perceive near-field terrain due to the nearsightedness of stereo vision. Many near-to-far learning methods, based on regions' appearance features, are proposed to predict the far-field terrain. We proposed a statistical prediction framework to enhance long-range terrain perception for autonomous mobile robots. The main difference between our solution and other existing methods is that our framework not only includes appearance features as its prediction basis, but also incorporates spatial relationships between terrain regions in a principled way. The experiment results show that our framework outperforms other existing approaches in terms of accuracy, robustness and adaptability to dynamic unstructured outdoor environments.

【题目】农业机械导航中的GPS定位误差分析与建模
【中文关键词】农业机械; 全球定位系统; 导航; 定位误差; AR模型;
【英文关键词】Agricultural machinery; GPS; Navigation; Positioning error; AR model;
【中文摘要】为实现高精度的农业机械导航,分析了GPS定位误差及其相关性,运用时间序列分析方法建立GPS静态和动态定位误差的AR模型,给出了导航过程中的定位误差处理方法,并在自制的农田智能移动平台上进行了实验。结果表明,处理后的GPS定位误差信号的相关性明显下降,接近于白噪声,定位误差均值从0.1951 m下降为-0.0022 m。
【英文摘要】The GPS positioning error and its correlation were analyzed,and then corresponding static and dynamic error were described as AR model by using time series methods.Finally,the process for dealing with the positioning error in navigation was presented,and the experiment was carried out with self-made agricultural robot.The experimental results showed that the proposed approach improves the positioning precision of GPS,and the correlation within the positioning error is decreased,similar to white noise. The average value of positioning error is reduced to-0.002 2 m from 0.195 1 m.So it can be applied to achieve high precision navigation of agricultural machinery.

【题目】基于立体视觉的水果采摘机器人系统设计
【中文关键词】采摘机器人; 立体视觉; 手眼标定; 识别;
【英文关键词】Fruit harvesting robot; Stereo vision; Hand-eye calibration; Recognition;
【中文摘要】基于立体视觉建立了水果采摘机器人系统。在图像空间利用Hough变换检测出果实目标,并利用随机采样目标上均匀分布多个点的三维坐标信息重建果实球模型,进而获得目标质心的空间位置坐标;通过最小二乘法研究了采摘机器人手眼标定;分析了采摘机器人的轨迹规划。实验结果表明,设计的自动采摘系统可以有效地消除遮挡以及立体视觉匹配失效等因素的影响,目标定位误差小于8 mm,显著地提高了抓取的精度和可靠性。
【英文摘要】The automatic picking system of fruit harvesting robot was designed based on stereo vision.Firstly,the fruit objects were recognized in image space by using the Hough transform.Some pixels of each object obeying the uniform distribution in the image space were sampled randomly.Then the sphere model of fruit was constructed in 3-D space with these pixels,and the coordinates of the center of each fruit object were obtained directly.Secondly,hand-eye calibration was carried out through the least square method.Finally,the path planning of the harvesting robot was analyzed simply.Experimental results showed that the effects of the partial occlusion and invalidation of stereo matching in the presence of complex scene on the automatic picking system was weakened,and the positioning accuracy of the fruit object was less than 8mm.Therefore the reliability and precision of fruit gripping were improved significantly.

【题目】基于力矩外环的软物体抓取控制
【中文关键词】抓取; 控制; 灰色力矩预测; 机械手; 软物体;
【英文关键词】grasping; control; grey torque prediction; manipulator; soft objects;
【中文摘要】为减少机械手抓取软物体造成的损害,提出基于关节力矩预测的力矩外环在线抓取控制方案。该方案通过建立灰色预测模型直接预测关节力矩的变化代替预测软物体刚度的变化;并能同时控制机械手抓取过程中关节力矩偏差和角速度关系。在实际关节力矩和灰色预测力矩之间采用线性插值,按采样周期将预测力矩逐渐加到力矩回路中。仿真表明,当抓取具有刚度变化的软物体时,基于关节力矩预测的力矩外环软物体抓取控制系统对机械手和软物体之间的动态接触过程具有一定的自适应性,可以快速跟踪设定值,而且无大的超调和振荡出现,使控制性能和动态品质得到较大改善,具有较强的鲁棒性,是适合软物体抓取的一种控制方法。
【英文摘要】To decrease the damage of grasping soft objects,an online joint torque predictive grasping control scheme is proposed based on external torque control loops.Grey prediction model is established to predict joint torque variation instead of stiffness of soft objects directly.The relations between joint torque deviation and angular velocity of manipulator are controlled.The predicted joint torque is gradually added to torque loops according to sampling period based on linear interpolation between the current torque and predictive one.Simulation results show that,when the stiffness of soft objects is variable,it makes grasping control system adaptive to the dynamic contact process between manipulator and soft objects,and can fast track fixed value without overshoots and oscillations.The control property and dynamic performance are greatly improved,so it is a good control method in grasping soft objects with strong robustness.

【题目】基于灰色预测控制的果蔬抓取系统设计与试验
【中文关键词】机器人; 力控制; 算法; 抓持; 灰色预测;
【英文关键词】robots; force control; algorithms; grasping; grey prediction;
【中文摘要】为使末端执行器和变形果蔬间的抓持力快速低超调地跟踪设定力,提出基于灰色预测的增量式比例积分(PI)力控制算法。该算法通过采集果蔬受到的抓持力建立灰色预测模型,当预测模型精度较高或较低时,相应地加大或减小预测力偏差在综合力偏差中的权值,使力控制器可以利用过去、当前和未来的果蔬抓持力信息来计算合适的控制校正量对抓持力偏差进行预补偿,可以使控制器获得超调量小和响应快速的特点,对末端执行器和果蔬之间的动态抓持过程具有适应性。果蔬抓持试验证明了灰色预测PI力控制算法的有效性,可减小果蔬抓持损伤。 更多还原
【英文摘要】Incremental PI(proportional integral) force control algorithm was proposed based on grey prediction for making grasp force track set value quickly with small overshoot between end-effector and deformable fruit and vegetable. Grey prediction model was built by the signal of grasp force acquired from the sensor,the weights of predictive force error were increased or decreased in integrated error accordingly to the precision of predictive model. Force controller could employ the past,present and future grasp force information to calculate an appropriate control correction to pre-compensate the force error,and could yield small overshot,fast response simultaneously,so make the controller adaptive to the dynamic grasp process between fruit and end-effector. Experimental results demonstrated the efficacy of grey predictive incremental PI algorithm,which the damage of grasping fruit and vegetable could be decreased.

【中文关键词】相位编组; 改进的Sobel算子; 梯度相位直方图; 平方梯度; 两点Hough变换;
【英文关键词】Phase grouping; Improved sobel operator; Histogram of gradient ’s phrases; Squared gradient; Two points hough transform;
【中文摘要】为了能够快速准确地计算出果树枝干的空间位置,提出了一种基于梯度相位编组的Hough变换树枝检测新算法。利用改进的平方梯度法计算边缘点的梯度相位角,找出梯度相位直方图中多个阈值大于T的峰值。然后将具有相近梯度相位角的边缘点归为一组。最后对每组中的边缘点采用改进的两点表决Hough变换算法找出对应的直线参数。利用梯度相位角进一步验证参数的正确性。研究结果表明,提出的梯度相位编组直线检测方法具有速度快、检测误差小和鲁棒性强的特点,能够快速准确地实现果树树枝的定位和检测,对部分被遮挡的树枝的识别效果也较好。
【英文摘要】A new method of Hough transform based on gradients phase grouping for branches detection was proposed to locate the position of branches of fruit trees accurately and rapidly.After the gradient phase of edge points was calculated by using the squared gradient method,the histogram of gradients ’s direction was calculated.From the histogram,several peak values were found by threshold T.Then edge points were grouped according to their gradent phases,and points in each group almost had the same gradient ’s direction.At last,an improved two-points Hough transform was applied to edge points in each group to calculate the parameters of lines,and the gradent ’s direction of every group was used to affirm the correctness of the parameters.The research results show that the proposed method has the merits of high speed,low error and strong robustness,can locate the branches of fruit trees accurately and fastly,and also can detect part-covered branches satisfactorily. 更多

【题目】基于光谱分析技术的黄瓜与茎叶识别研究
【中文关键词】光谱分析; 黄瓜识别; 主成分分析; 偏最小二乘法; 马氏距离法;
【英文关键词】Spectral analysis; Cucumber recognition; Principal component analysis; Partial least squares; Mahalanobis distance;
【中文摘要】为了能够快速实时地识别温室中的黄瓜,研究了黄瓜和其茎叶的近红外反射光谱特性。利用近红外光谱仪在室内共采集138个样本(黄瓜46个,茎46个,叶46个)的反射光谱,进行Savitzky-Golay平滑后,抽取光谱中的108个样本作为校正集,采用偏差权重法选择信息量较大的光谱波段690~950 nm进行研究。在主成分分析(PCA)的基础上,结合马氏距离建立识别模型,剔除了7个异常样本。用剩余的101个样本进行偏最小二乘法建模,对校正集之外的30个样本进行预测。结果显示预测值和实际值的相关性达0.994 1,正确识别率达100%。说明黄瓜、茎和叶的近红外反射光谱特性之间有一定差异,可以用近红外光谱技术进行鉴别,为黄瓜识别提供了一种新的方法和思路。
【英文摘要】To be able to quickly identify the cucumber real time,the present paper studied the near infrared reflectance characteristics of cucumber,stem and leaf.Spectral reflectance of 138 samples(46 cucumbers,46 stems and 46 leaves) was collected using near infrared spectroscopy in the band range of 600~1 099 nm indoor.After Savitzky-Golay smoothing preprocessing,random 108 spectral samples were put forward as calibration set.The weighted deviation method was used for choosing the spectral bands 690~950 nm that include much more information.The samples were analyzed by PCA method to extract the principal component scores,combining the Mahalanobis distance method the recognition model was established,and seven abnormal samples were excluded.The partial least squares(PLS) model was established by remaining 101 samples spectra of calibration set,which was used for predicting the validation set(30 samples except of the calibration set).The result shows that the correlation of the predicted value and the actual value reaches up to 0.994 1,and the correct recognition rate is 100%.This significantly illustrates that the near infrared spectral reflectance characteristics are different among the cucumbers,stems and leaves,which can be successfully applied to recognition of cucumber by the method.The developed technique can provide a new method for cucumber identification.

【题目】黑背景下收获前棉花图像色特征生成及其品级聚类分析
【中文关键词】图像特征; 颜色空间; 棉花品级; 聚类; 有效性;
【英文关键词】image features; color space; cotton grade; clustering; validity;
【中文摘要】为了客观地评价田间收获前棉花品级,依据我国子棉收购文字标准,运用机器视觉技术,对棉花的尺寸和色泽特征进行了研究,其色泽特征包括6个常用颜色空间下棉花和带壳棉花的黄色区域、黄色深度、白度、色差等8个色泽特征。结果表明,RGB、NTSC、亨特、HSI颜色空间下的特征参数区分度较好;棉花尺寸与色泽特征的相关性表明棉花白度为无效特征。在各颜色空间下,基于有效图像特征对7个品级的棉花样本进行了K均值聚类分析。分析结果说明,棉花品级的聚类结果独立于颜色空间;铃壳色泽对品级的贡献显著;由于其聚类品级与图像特征的相关性普遍较高、较均衡,且算法运行时间较短,HSI颜色空间可能是棉花品级聚类的最优颜色空间。与人工分级相比,机器视觉的区分度更好,因此机器视觉技术可用于提高收获前棉花分级精度。
【英文摘要】In order to assess the grades of preharvest cottons objectively,boll size and fiber color features,including yellow region,yellow degree, white degree and brightness contrast of cottons with/without bracteoles in six typical color spaces,were investigated based on Chinese government grading standards and machine vision technologies.The results show that better discriminations of feature parameters can be obtained in RGB,NTSC,Hunter and HSI color spaces,white degree is unvalued according to the correlation analysis between boll size and fiber color features.K-means clustering were performed based on valid image features to grade cotton samples into seven categories in each color.The results indicate that clustering results are independent of color spaces,bracteoles color contributes to their grades obviously and HSI color space maybe the best color spaces for grade clustering because of higher and more uniform correlations between grades and features as well as shorter runtime can be obtained in this space.Machine vision can be used to improve sorting accuracy of preharvest cottons since its more exact discriminability comparing with that of human eyes.

【题目】基于机器视觉技术的田间籽棉品级抽样分级模型研究
【中文关键词】田间; 籽棉; 品级; 机器视觉技术; 图像特征; 分级模型; 泛化;
【英文关键词】Field; Seed cotton; Grade of quality; Machine vision technology; Image feature; Grading model; Generalization;
【中文摘要】【目的】客观评价田间籽棉质量。【方法】依据中国籽棉品级分级标准,基于机器视觉技术选取棉花尺寸、色泽特征建立田间籽棉品级抽样分级模型。【结果】相关分析表明:亮度修正后,图像特征与籽棉品级之间相关显著。贝叶斯判别分析结果表明:基于10折交叉验证建立的籽棉品级判别模型的识别率在75.00%~92.86%之间,模型的平均识别率达83.20%。基于“1个标准误差”规则选取较好的贝叶斯判别模型,它在独立数据集上的泛化精度达89.11%,其中,前3级籽棉的识别率均达到100%。【结论】基于机器视觉技术识别籽棉品级是可行的,有利于提高籽棉品级抽样分级模型精度。
【英文摘要】【Objective】The quality of field seed cottons is assessed objectively.【Method】According to Chinese government grading standards of field seed cotton,grading models of field sampling cottons were developed based on their image features,including size and colors. 【Result】 Correlation analysis showed that the correlations among image features as well as grades of seed cotton quality were significant after image intensity correction. Based on 10-fold cross-validation,Bayes-criterion discrimination results showed that grading models of field sampling cottons were developed with accuracy of 75.00% to 92.86%,with average of 83.20%. Based on a rule of “ one-standard error ”,a better grading model of field sampling cottons was investigated with a generalization accuracy of 89.11% on an independent-model data,and 1-3 grade of seed cotton quality were recognised with an accuracy of 100%【 .Conclusion】 It is feasible to recognise grades of seed cotton quality by using machine vision technologies,which helps to improve the accuracy of grading models of field sampling cottons.

【题目】基于图像特征的收获前籽棉品级聚类融合分析
【中文关键词】籽棉品级; 机器视觉; 图像特征; 聚类融合; 识别率;
【英文关键词】Cotton grade; Machine vision; Image features; Cluster fusion; Accuracy;
【中文摘要】为客观评价收获前籽棉品级,依据籽棉品级国家标准,基于机器视觉在3个颜色空间中选取棉瓣大小、色泽特征用K-均值、竞争学习网络方法对7个品级的样本进行聚类融合分析。结果表明,亮度修正后特征之间极显著相关,Hunter颜色空间较好。肉眼对第1、2、7品级的识别率为73%~100%,3~6品级为26%~46%,总计47.7%;聚类融合对各品级的识别率为65%~100%,总计78.6%。聚类融合方法基于人类的先验知识,在更宽的视觉范围内更均衡所有特征,可克服个体聚类器的过度训练,能够客观地识别收获前籽棉品级,提高其采摘、收购质量。
【英文摘要】In order to assess preharvest cotton grades, according to Chinese government grading standard, clustering fusion was performed based on machine vision technologies by using K-means and competitive learning network to grade cotton quality with 7 categories renewedly based on their size, white, impurity and yellow in Ohta, HSI, and Hunter Color Spaces. Correlation analysis showed that the Peason ’s correlations among image features were significant at the 0.01 probability level by adjusting image intensity and Hunter Color Space to an approximate optimum; clustering by human eyes did not consider all image features uniformly with fitting coefficients of quadratic polynomial of 0.55-0.98 (0.88, 0.94, 0.98, 0.55) between cluster center of image features and grade value of cotton quality; individual clustering by K-means and competitive learning network also did not consider all image features uniformly with fitting coefficients of 0.32-0.74 (0.74, 0.63, 0.70, 0.32) and 0.39-0.94 (0.85, 0.39, 0.94, 0.84), respectively; and their clustering fusion considered all image features uniformly with fitting coefficients of 0.71-0.99(0.89, 0.71, 0.99, 0.83). Bayes quadratic discriminants analysis for cotton graded showed that clustering by human eyes recognized the 1st, 2nd, 7th grades with accuracies of 73%-100%, the grades 3-6 with accuracies of 26%-46%, and total accuracy of 47.7%; accordingly, clustering by K-means recognized each grade with accuracies of 93%-100%, and total accuracy of 96%; clustering by competitive learning network recognized each grade with accuracies of 79%-95%, and total accuracy of 86%; clustering fusion recognized each grade with accuracies of 65%-100%, and total accuracy of 78.6%. On the whole, the average quality grade of clusering fusion was 4.33 while that of clustering by human eyes was 4.57, and the specimens with large recognization difference between the two methods were less than 1/3 of the total. Compared with by human eyes, clustering fusion can use each image feature more adequately and uniformly with the wider range of vision based on human ’s previous knowledge, and overcome the over-training of individual clustering, further, grade preharvest cottons objectively to improve high-quality cottons to be purchased, and this method can be generalized effectively to meet different environments.

【题目】基于竞争学习网络的田间籽棉图像分割
【中文关键词】田间籽棉; 图像分割; 颜色空间选取; 竞争学习网络; 形态学滤波;
【英文关键词】field cotton; image segmentation; color space selection; competitive learning network; morphological filtering;
【中文摘要】为了正确识别田间籽棉,将籽棉和铃壳、绿叶、根茎、土地等自然背景视为二个类别,基于竞争学习网络进行了图像分割。从多幅典型的籽棉图像中选取10000个像素作为训练样本,并为它们贴上类别标签,在HSI、Lab、Ohta、RGB颜色空间下对训练样本的颜色特征及其组合进行K-均值聚类,选取了误分率普遍较低的RGB颜色空间,其B值的误分率尤其低。在RGB颜色空间下,用训练样本的R、G、B组合或B值一次性地训练了竞争学习网络,将图像的全部像素输入网络进行测试,同时与K-均值聚类比较,形态学滤波去噪后的结果表明,基于B值的竞争学习网络较优,用907幅籽棉图像对其进行

仿真的精度达92.94%。该方法结合了有监督的学习算法,避免了传统K-均值聚类的反复迭代和过拟合现象,提高了图像分割的效率和精度。

【英文摘要】In order to distinguish field cotton image exactly,cotton and its nature background,including bracteole,leaf,rhizome and land,were classified into two categories and segmented based on competitive learning network.10000 pixels with two categories extracted from some typical cotton images were regarded as training data,their color components and mixing of components were classified into two categories based on K-means clustering in HSI,Lab,Ohta,RGB color space,and error rates of color components and their mixtures are lower in RGB color space,particularly blue component.Competitive learning networks were trained only onec with one input value of blue component or three inputs of red,green and blue components of training data in RGB color space and all pixels of an image as test data were input into them,comparing the results of competitive learning networks with K-means clustering after morphological filtering show that competitive learning network with one input value of blue component was optimized,907 cotton images were segmented with an accuracy of 92.94%.Combining supervisory learning arithmetic,avoiding iterative and over-fitting of K-means clustering,competitive learning network has good performance and high efficiency in image segmentation.

【题目】基于颜色阈值的田间籽棉图像分割技术

【中文关键词】田间棉花; 图像分割; 颜色阈值; 去噪;

【英文关键词】Field cotton; Image segmentation; Color threshold; Removing noise;

【中文摘要】为正确分割田间籽棉图像,将棉花与背景视为两个类别,在典型的未成熟籽棉图像和不同质量等级的成熟/过熟籽棉图像中,用肉眼选取20000个白棉、黄染棉和污染棉等棉花像素以及20000个棉株、土壤等背景像素,在RGB、HSI、La*b*和Hunter颜色空间下获取两类像素之间的颜色阈值,基于阈值进行图像分割,选取噪声较少的HSI和La*b*颜色空间,进一步基于形态学滤波器去噪,实验结果表明,907幅籽棉图像分割的准确率为87.21%和86.33%。HSI颜色空间更适合分割成熟籽棉图像,La*b*颜色空间则适合未成熟籽棉;颜色阈值覆盖范围广,基于速度的阈值分割法能够适应田间籽棉环境。

【英文摘要】The goal of cotton production in China is to improve corresponding rate of cotton quality grade, foreign fibers, adulteration, and cotton baling inconsistent phenomenon to decrease continuously. With the background, machine vision and pattern recognition technologies are introduced into traditional picking task to discriminate maturity degree and grade of quality of field cotton, which will solve the problem of picking cotton by the way from source, so that various cotton varieties can be adapted, pollution caused by agriculture chemicals can be avoided, labor cost can be reduced and agriculture cost can be decreased. In order to segment field cotton images exactly, we regarded cotton and its background as two classes and segmented them based on their color threshold. A total of 20 000 white, yellow, and stain cotton pixels and 20 000 background pixels of soil and cotton plant, including cotton bracteole, leaf, and branch, were extracted from typical under-ripe cotton images and ripe/over-ripe cotton images with various quality grades from 1 to 7. Color threshold of two classes of cotton and its background pixels were obtained in RGB, HSI, La*b*, and Hunter color space respectively; on the basis of which cotton regions were segmented from images; and HSI and La*b* color spaces were selected respectively by using S below 28, I over 108, L over 118, a* from 123 to 134, b* below 136 with less segmentation noise which would be removed based on morphological filter. The experiment results showed that 907 cotton images were segmented with an accuracy of 87.21% and 86.33% in HSI and La*b* color space respectively. The front images were segmented with an accuracy of 90.83% and 89.98% and the side images with an accuracy of 83.33% and 82.42%. Ripe cotton images were segmented perfectly in HSI color space while under-ripe cotton images in La*b* color space, and the speed-based segmentation method with threshold covering a wide area was preferable for field cotton surroundings.

【中文摘要】在苹果品质检测中,淤伤是影响检测效率的一个重要原因,针对苹果淤伤检测这一难题,提出应用红外图像处理技术解决。根据红外热图像成像原理及其特点,采用风扇加热与冷却两种实验方法。在实验过程中,红外摄像机拍摄获

得苹果红外图像,选用优越的混合图像增强算法等红外图像处理方法识别早期淤伤。实验结果表明,应用红外图像技术可以检测苹果早期淤伤,且效率达96%以上。
【英文摘要】Bruise is one of the most important causes for rejecting apples at quality inspection.Infrared image processing can implement bruise detection in apple.Infrared image processing is applied to solve this problem.Because of the theory and features of infrared thermal images forming,the images are gained by using two ways of fan heating and cooling,and then the good mixed image enhancement algorithm and other infrared image processing technology are used to detect.Experiments show that infrared image processing implement bruise detection in apple,up to above 96% of apple bruises are detected using infrared image.

【题目】成熟番茄的图像识别及其位姿的获取研究
【中文关键词】成熟番茄; 图像识别; 位姿; 质心; 惯性主轴;
【英文关键词】Ripe tomato; Recognition of image; Pose; Center of mass; Principal inertia axis;
【中文摘要】针对自然生长状态下成熟番茄图像的识别问题,提出选用YIQ颜色空间,采用Otsu最大类间方差法分割图像,然后用面积阈值的方法消除噪声,来获取成熟番茄图像的目标区域;然后用矩法来求目标区域的质心位置和惯性主轴,用惯性主轴的角度来标识果实果轴的方向,进而获取果实的生长姿态。实验结果表明,用这种方法可以取得较好的效果。
【英文摘要】Aiming at the recognition of the ripe tomato images in natural growth conditions,YIQ color space was selected,Otsu method was used to segment images,and the area threshold method was applied to eliminate noise and obtain the target area of the ripe tomato images;and then the moment method was used to obtain the center of mass of the target region and inertia axis,and the angle of the principal inertia axis was used to identify the direction of fruit fruit-axis and obtain the pose of the fruits.The experimental results showed that this method could obtain good effects.

【题目】基于二维熵的农业图像目标分割
【中文关键词】机器视觉; 图像分割; 二维熵;
【英文关键词】computer vision; image segmentation; two-dimensional entropy;
【中文摘要】农业图像的目标分割是在农业领域应用机器视觉技术的基础,采用阈值法进行图像的目标分割,能够克服一些图像缺陷。首先将彩色数字图像转换成像素灰度级分布与其邻域平均像素灰度级分布所构成的二维灰度图,再根据图像分割后的最大熵计算分割阈值,然后由计算出的阈值分割农业田间图像,分割的结果显示,二维熵法分割农业田间图像的效果很好,分割质量的优秀率达到了98%。
【英文摘要】Agricultural image segmentation is the basic work of computer vision technology in agriculture.Some faults can be overcome by using threshold method.First two-dimensional gray-level histogram of pixel gray and neighborhood average gray distribution was converted from color digital image,then the threshold value was calculated based on maximum entropy.The agricultural image was seg-mented by the threshold.The image after segmentation was very good and the excellence rate reached 98%.

【题目】苹果采摘机械手对果实损伤的影响
【中文关键词】苹果; 采摘机械手; 机械损伤; 硬度; 可溶性固形物;
【英文关键词】apple; picking manipulator; mechanical damage; hardness; soluble solids content;
【中文摘要】我国是苹果种植大国,机械采摘的快速发展与大面积推广应用为我国苹果产业的后续发展提供了强大的动力。但同时由于机械采摘带来的果实机械损伤每年都在增加。以此为依据,设计了一种采摘机械手,对果实进行模拟采摘,并使用仪器检测采摘后苹果硬度和可溶性固形物含量的变化,确定是否造成损伤。结论表明,该机械手在满足工作要求的同时,对果实几乎没有损伤。
【英文摘要】China is a big country planting apples. Apple industry developed very fast with widely using of mechanical harvesting. The loss of fruits mechanical damage has increased every year because of the rapid development. In order to solve this problem,a kind of robot hand was designed to pick apples. Instruments were used to discover the change of the apple hardness and soluble solids content. The results indicted that the robot hand could meet the requirements of use and there was little damage on fruits.

【题目】Freeways in the plant: transporters for N, P and S and their regulation
【中文关键词】无
【英文关键词】phosphorus,sulfur,nitrogen,regulation,Freeways
【中文摘要】无
【英文摘要】This review focuses on plant acquisition and transport of theinorganic forms of nitrogen, phosphorus and sulfur. Families ofmembrane transporters have been identified and severalmembers are well characterised. Although some families arelarge, specific members may be expressed in a particularmembrane or cell type, or at certain times during development.Therefore, each transporter can have specific activities and theconcept of functional redundancy is questionable. Structurallyrelated proteins can mediate all transport steps within the plant,including uptake from the soil. Although transport mechanismsand membrane locations may be different, a picture isemerging that suggests sequence homology can be areasonable indicator of the nutrient that is transported by eachprotein.

【题目】Adaptation of plasma membrane H+-ATPase of rice roots to low pH as related to ammonium nutritionpce_2009
【中文关键词】无
【英文关键词】NH4+; NO3-; pH; plasma membrane H+-ATPase;rice (Oryza sativa L.).
【中文摘要】无
【英文摘要】The preference of paddy rice for NH4+ rather than NO3- isassociated with its tolerance to low pH since a rhizosphereacidification occurs during NH4+ absorption. However, theadaptation of rice root to low pH has not been fully elucidated.This study investigated the acclimation of plasmamembrane H+-ATPase of rice root to low pH. Rice seedlingswere grown either with NH4+ or NO3-. For both nitrogenforms, the pH value of nutrient solutions was graduallyadjusted to pH 6.5 or 3.0. After 4 d cultivation, hydrolyticH+-ATPase activity, Vmax, Km, H+-pumping activity, H+ permeabilityand pH gradient across the plasma membranewere significantly higher in rice roots grown at pH 3.0 thanat 6.5, irrespective of the nitrogen forms supplied. Thehigher activity of plasma membrane H+-ATPase of adaptedrice roots was attributed to the increase in expression ofOSA1, OSA3, OSA7, OSA8 and OSA9 genes, whichresulted in an increase ofH+-ATPase protein concentration.In conclusion, a high regulation of various plasma membraneH+-ATPase genes is responsible for the adaptation ofrice roots to low pH. This mechanism may be partly responsiblefor the preference of rice plants to NH4+ nutrition.
