【英文摘要】Phaeodactylum tricornutum is a potential source of biodiesel for its abundance in fatty acids.Moreover as its fatty acid composition contains much eicosapentaenoic acid(EPA,20:5D5,8,11,14,17),P.tricornutum represents an interesting alternative source for the industrial production.The absence of an adapted transformation system has been a serious limitation for its genetic manipulation.A novel transformation method was firstly established using micro-particle bombardment in P.tricornutum.The results showed that the GUS gene,a reporter gene,was successfully expressed.Transgenetic cells presented blue color under the microscope after stained.In addition,different factors which influenced transformation were optimized.The experiment indicated that the best parameters for P.tricornutu transformation:60 μg plasmid DNA was coated onto the tungsten particles,1500psi rupture-disc pressures was applied at a bombardment distances of 6cm.This new method overcame the obstacle of P.tricornutum rigid cell walls.The adoption of endogenetic fcp promoter facilitated the expression of foreign gene.The P.tricornutum was tested for sensitivity to 5 antibiotics:kananycin(Km),ampicillin(Amp),streptomycin(Str),neomycin(Nm)and chloramphenicol(Cm).The result of sensitivity test showed that P.tricornutum were not sensitive to Km,Amp,Str and Nm.Otherwise,P.tricornutum is highly sensitive to Cm,the half lethal concentration of Cm in liquid culture was 60 μg/ml.It suggests that Cm can be suitable to select regent for P.tricornutum genetic engineering.This method can be used as a potential tool in the research of P.tricornutu gene engineering and modification of its fatty acids synthesis pathway.

【题目】Growth characteristics of the cyanobacterium Nostoc flagelliforme in photoautotrophic, mixotrophic and heterotrophic cultivation
【中文关键词】无
【英文关键词】Nostoc flagelliforme Growth characteristics Mixotrophic culture Heterotrophic culture
【中文摘要】无

【英文摘要】Nostoc flagelliforme is a terrestrial cyanobacterium with high economic value. Dissociated cells separated from a natural colony of N. flagelliforme were cultivated for 7 days under either phototrophic, mixotrophic or heterotrophic culture conditions. The highest biomass, 1.67 g L − 1 cell concentration, was obtained under mixotrophic culture, representing 4.98 and 2.28 times the biomass obtained in phototrophic and heterotrophic cultures, respectively. The biomass in mixotrophic culture was not the sum as that in photoautotrophic and heterotrophic cultures. During the first 4 days of culture, the cell concentration in mixotrophic culture was lower than the sum of those in photoautotrophic and heterotrophic cultures. However, from the 5th day, the cell concentration in mixotrophic culture surpassed the sum of those obtained from the other two trophic modes. Although the inhibitor of photosynthetic electron transport DCMU [3-(3,4-dichlorophenyl)-1,1-dimethylurea] efficiently inhibited autotrophic growth of N. flagelliforme cells, under mixotrophic culture they could grow by using glucose. The addition of glucose changed the response of N.flagelliforme cells to light. The maximal photosynthetic rate, dark respiration rate and light compensation point in mixotrophic culture were higher than those in photoautotrophic cultures. These results suggest that photoautotrophic(photosynthesis) and heterotrophic (oxidative metabolism of glucose) growth interact in mixotrophic growth of N.flagelliforme cells.

【题目】Recombinant expression of rt-PA gene (encoding Reteplase) in gametophytes of the seaweed Laminaria japonica (Laminariales, Phaeophyta)
【中文关键词】海带 遗传转化 生物反应器
【英文关键词】Laminaria japonica; gametophyte; genetic engineering; Reteplase; rt-PA; bioreactor
【中文摘要】rt-PA 基因在海带配子体中的重组表达
【英文摘要】The life cycle of seaweed Laminaria japonica involves a generation alternation between diploid sporophyte and haploid gametophte. The expression of foreign genes in sporophte has been proved. In this research, the recombinant expression in gametophyte was investigated by particle bombardment with the rt-PA gene encoding the recombinant human tissue-type plasminogen activator (Reteplase), which is a thrombolytic agent for acute myocardial infarction (AMI). Transgenic gametophytes were selected by their resistance to herbicide phosphiothricin (PPT), and proliferated in an established bubble column photo-bioreactor. According to the results from quantitative ELISA, Southern blotting, and fibrin agarose plate assay (FAPA) for bioactivity, it was showed that the rt-PA gene had been inte-grated into the genome of gametophytes of L. japonica, and the expression product showed the ex-pected bioactivity, implying the proper post-transcript modification in haploid gametophyte

【题目】Accumulation of Exopolysaccharides in 35 Liquid Susp-ension Culture of Nostoc flagelliforme Cells
【中文关键词】无
【英文关键词】Nostoc flagelliforme cells;Liquid suspension culture;Exopolysaccharides;Culture conditions
【中文摘要】无
【英文摘要】The liquid suspension culture of dissociated Nostoc flagelliforme cells was investigated. It was found that the growth rate of N. flagelliforme cells and the accumulation of exopolysaccharides (EPS) increased prominently when NaNO3 and KH2PO4 were added in the liquid BG-11culture medium though phosphate had little effect on EPS yield for specific mass of cells. N. flagelliforme cells

grew well at 25 ° C and neutral pH, however, a lower or higher temperature and weak alkaline can promote EPS accumulation. With the increase of the light intensity, the growth rate of N. flagelliforme cells and the EPS accumulation increase accordingly. When N. flagelliforme cells was cultured in BG-11 medium added with 2.5 g L − 1 of NaNO3 and 0.956 g L − 1 of KH2PO4 at 25 ° C with 60 μ mol photonm − 2 s − 1 of light intensity, 1.05 g L − 1 cell density and 89.9 mg L − 1 EPS yield were achieved respectively. Adopting the optimal conditions established in flask culture, the liquid culture of N. flagelliforme cells in 20-L photobioreactor for 16 days was conducted and a maximum biomass of 1.32 g L − 1 was achieved, which was about 17.6-fold of that in the initial inoculation. The yield of EPS was 228.56 mg L − 1and about 2.23-fold of that in flask culture. Moreover, the polysaccharides ' material was released into the culture medium during cell growth. These released polysaccharides (RPSs), which can be easily recovered from the medium, are favorable for industrial applications.

【题目】Molecular cloning and characterization of three crustins from the Chinese white shrimp, Fenneropenaeus chinensis
【中文关键词】中国明对虾 甲壳肽 抗菌肽
【英文关键词】Chinese white shrimp; Fenneropenaeus chinensis; Crustin; Antibacterial activity; Innate immunity
【中文摘要】中国明对虾甲壳肽的基因克隆和特征
【英文摘要】Antibacterial peptides crustins are the effector molecules of innate immunity in decapods. In this study, three crustin cDNA sequences (Fc-crus 1, Fc-crus 2, and Fc-crus 3) were cloned from the Chinese white shrimp Fenneropenaeus chinensis. The full-length cDNAs of Fc-crus 2 and 3 are 473 bp and 574 bp, respectively. The deduced peptides of Fc-crus 2 and 3 contain a signal peptide and a crustin domain at the C-terminal formed by twelve conserved cysteine residues. The partial sequence of Fc-cru 1 is 575 bp long and the deduced amino acids also contain a crustin domain. The expression profiles of these three crustins were studied with RT-PCR. Fc-crus 1 and Fc-crus 2 constitutively expressed in hemocytes with high levels, and the expression level is increased in the heart, stomach, intestine and ovaries when shrimp was challenged with Vibrio anguillarum, The expression of Fc-crus 1 and Fc-crus 2 was detected in each developmental stage. Fc-crus 3 was constitutively expressed in the ovaries and induced as an expression in the stomach. Unlike Fc-crus 1 and Fc-crus 2, the mRNA of Fc-crus 3 was not detected in the developmental stages extending from nauplii and mysis

to post-larvae. The recombinant proteins containing mature Fc-crus 2 and Fc-crus 3 were recombinantly expressed in Escherichia coli and respectively purified. The antibacterial assays revealed that the recombinant mFc-crus could inhibit the growth of Gram-positive bacteria in vitro

【题目】Desalination of the Nostoc flagelliforme polysaccharide with radial flow chromatography
【中文关键词】无
【英文关键词】Nostoc flagelliforme polysaccharide;radial flow chromatography
【中文摘要】无
【英文摘要】In recent years, the extracellular polysaccharides of Nostoc flagelliforme were found to have a remarkable anti-virus effect on many kinds of enveloped viruses (1). Their separation and purification are also attracted much attention. In this study, the coarse extracellular polysaccharides acquired from the mixed culture of N.flagelliforme free cells were first purified with ion exchange chromatography using NaCl gradient elution in a radial flow chromatography column (7.7 cm of bed length and 229.6 cm3 of bed volume) and three components were obtained. The isolated second polysaccharide component (containing NaCl eluent) was then selected as the sample to be desalinated with the same radial chromatography column filled with Sephadex G-100 gel resin to examine the desalination efficiency of the gel radial flow chromatography. The effects of sampling concentration, eluting rate on the desalination efficiency were examined and the optimized condition for the desalination with gel radial chromatography were 0.3 mg/mL of sampling concentration (8 mL of sampling volume) and 0.3 mL/min of eluting velocity. Under this condition, the NaCl content in the polysaccharide decreased to 2.36%.

【题目】Comparison of photobioreactors and optimal light regime for rapid vegetative propagation of transgenic Undaria pinnatifida gametophytes
【中文关键词】海带 转基因 增殖
【英文关键词】bubble-column bioreactor; airlift bioreactor; vegetative propagation; Undaria pinnatifida gametophytes; light; transgenic
【中文摘要】转基因海带配子体的制备与高效增殖
【英文摘要】BACKGROUND: Previously, tachyplesin gene (tac) has been successfully transferred into Undaria pinnatifida gametophytes using the method of microprojectile bombardment transformation. The objectives of this study were to compare and evaluate the performance of bubble-column and airlift bioreactors to determine a preferred configuration of bioreactor for vegetative propagation of transgenic U. pinnatifida gametophytes, and to then investigate the influence of light on vegetative propagation of these gametophytes, including incident light intensity, photoperiod and light quality to resolve the problems of rapid vegetative propagation within the selected bioreactor. RESULTS: Experimental results showed that final dry cell density in the airlift bioreactor was 12.7% higher than that in the bubble-column bioreactor under the optimal aeration rate of 1.2 L air min(-1) L(-1) culture. And a maximum final dry cell density of 2830 mg L(-1) was obtained within the airlift bioreactor using blue light at 40 mu mol m(-2) s(-1) with a light/dark cycle of 14/10 (h). Polymerase chain reaction (PCR) analysis indicated that genes (bar and tac) were not lost during rapid

vegetative propagation within the airlift bioreactor. CONCLUSION: The airlift bioreactor was shown to be much more suitable for rapid vegetative propagation of transgenic U. pinnatifida gametophytes than the bubble-column bioreactor in the laboratory. The use of blue light allows improvement of vegetative propagation of transgenic U. pinnatifida gametophytes.

【题目】不同DEAE离子交换树脂纯化发菜多糖的比较研究
【中文关键词】发菜 多糖 离子交换树脂 纯化
【英文关键词】Nostoc flagelliforme; polysaccharide; ion-exchange resins; purify
【中文摘要】用DEAE01 、DEAE52 、DEAE-Cellulose 、DEAE-SephroseCL-6B离子交换树脂对发菜粗多糖进行纯化,多糖含量采用苯酚-硫酸法测定,并用考马斯亮蓝染色法测定多糖中的蛋白含量。4种树脂纯化后多糖的含量分别为64.7% 、62.4% 、80.0%和60.8%,而蛋白分别为1.911g/mL、2.397g/mL、1.938g/mL和2.959μg/mL。实验结果表明:DEAE-Cellulose纯化后发菜多糖不仅蛋白含量较低,且多糖含量最高。因此4种树脂中DEAE-Cellulose纯化发菜多糖的效果最好。
【英文摘要】Effect of the four different DEAE ion-exchange resins, DEAE01, DEAE52, DEAE-cellulose and DEAE-SephroseCL-6B on the purification of extracellular polysaccharide from Noscoc flagelliforme were compared. The polysaccharide was determined with the phenol- sulfuric acid method and the content of protein was determined with coomassie brilliant blue method. The results showed that the purities of polysaccharides were 64.7%, 62.4%, 80.0% and 60.8%, respectively. The proten contents are 1.911, 2.397, 1.938, 2.959 μg/ml, respectively. It can be concluded that DEAE-Cellulose is the best ion-exchange resin for purifying polysaccharide fromNoscoc flagelliforme.

【题目】Polymorphism of the superoxide dismutase gene family in the bay scallop (Argopecten irradians) and its association with resistance/susceptibility to Vibrio anguillarum
【中文关键词】SOD; SNP; Promoter; Argopectenirradians; Resistance; Susceptibility; Vibrio Anguillarum
【英文关键词】SOD; SNP; Promoter; Argopectenirradians; Resistance; Susceptibility; Vibrio Anguillarum
【中文摘要】The superoxide dismutases (SODs) are a family of enzymes that function as the first line of antioxidant defense against highly reactive superoxide radicals. The bayscallopArgopectenirradians contains three unique superoxide dismutases: Ai-icCuZnSOD, Ai-MnSOD and Ai-ecCuZnSOD, which were characterized in our previous studies. qRT-PCR was also performed to characterize the temporal expression of SODs in the hemocytes of bayscallops injected with the bacterium Vibrio anguillarum. To characterize the SOD family in A. irradians completely, we evaluated the polymorphism in the SOD genes and investigated the association of this polymorphism with resistance/susceptibility to V. anguillarum. Fifty-nine SNPs were identified in the promoter, exon and partial intron sequences of the three SOD genes. AiECSOD contained the most SNPs, as compared to AiCuZnSOD and AiMnSOD, and the majority of these were located in the promoter. Among them, the genotypes of −1739 T – C SNP in the AiCuZnSOD promoter and

alleles of the − 498 A – T and − 267 G – A SNPs in the AiECSOD promoter showed a significant association with resistance/susceptibility to V. angullarum (P < 0.05). The only non-synonymous SNP that was identified, E1-38 C – A in Ai-ecCuZnSOD, was a dimorphism caused by a C to A transition that resulted in a Thr to Lys substitution at position 13 in the signal peptide. The Thr allele was associated with increased susceptibility to V. anguillarum (P < 0.05). To confirm the presumption, another independent challenge experiment was performed, in which the cumulative mortality of Ai-icCuZnSOD Q − 1739 genotype TT was significantly lower than TC (P < 0.05). Ai-ecCuZnSOD Q − 498 genotype AA and AT were significantly lower than TT (P < 0.05), Ai-ecCuZnSOD E1-3 genotype AA was significantly higher than CA and CC (P < 0.05). The results suggested that these three polymorphic loci could be potential gene markers for the future molecular selection of strains that are resistant to diseases caused by V. anguillarum.

【英文摘要】The Yessoscallop (Patinopecten yessoensis) is one of the most important aquacultural scallops in the north of China. We identified a rare colour variant that occurs in about 0.2% of the natural population. Orange variants have not been reported before in shellfish, including scallops. Identification of the molecular basis of this colour variation will provide guidance when developing a breeding plan for these scallops. The mainpigment was isolated from the muscle tissues of the variant Yessoscallop by silica gel column chromatography, and was characterised by mass spectrometry and 1H and 13C nuclear magnetic resonance methods. Its structure was identified as that of pectenolone (3,3′-dihydroxy-β,β-caroten-4–one). This is the first report of pectenolone, a type of carotenoid, in the muscle of the Yessoscallop.

【题目】Molecular Characterization of Myostatin Gene from Zhikong scallop Chlamys farreri (Jones et Preston 1904)
【中文关键词】Chlamys farreri, cloning, mapping, myostatin, quantitative expression
【英文关键词】Chlamys farreri, cloning, mapping, myostatin, quantitative expression
【中文摘要】The scallop is an economically important sea food prized for its large and delicious adductor muscle. Studying the molecular basis of scallop muscle growth is important for both scallop breeding and our understanding of muscle mass regulation in bivalve. Myostatin (MSTN) is a conserved negative regulator of muscle growth and development. Here we report the MSTN gene from Zhikong scallop (Chlamys farreri Jones et Preston 1904). The C. farreri MSTN consists of 11651 nucleotides encoding 457 amino acids. The gene has a 3-exon/2-intron structure that is conserved with vertebrate homologs. The exons are 586, 380 and 408 bp in length, respectively, and separated by introns of 5086 and 1518 bp. The protein sequence contains characteristic conserved residues including a cleavage motif of proteolysis (RXXR) and nine cysteines. Three transcription initiation sites were found at 62, 146, and 296 bp upstream of the translation start codon ATG. In silico analysis of the promoter region identified a TATA-box and several muscle-specific regulatory elements including COMP, MEF2s, MTBFs and E-boxes. Minisatellite DNA was found in intron 1. By fluorescence in situ hybridization (FISH), the gene was mapped to the long arm of a pair of middle subtelocentric chromosome. Quantitative analysis of MSTN transcripts in embryos/larvae indicated high expression level in gastrulae and limited expression at other stages. In adult scallops, MSTN is predominantly expressed in striated muscle, with different expression levels in other tissues. Our data provide valuable genomic and expression information which will aid the further study on scallop MSTN function and MSTN evolution.
【英文摘要】The scallop is an economically important sea food prized for its large and delicious adductor muscle. Studying the molecular basis of scallop muscle growth is important for both scallop breeding and our understanding of muscle mass regulation in bivalve. Myostatin (MSTN) is a conserved negative regulator of muscle growth and development. Here we report the MSTN gene from Zhikong scallop (Chlamys farreri Jones et Preston 1904). The C. farreri MSTN consists of 11651 nucleotides encoding 457 amino acids. The gene has a 3-exon/2-intron structure that is conserved with vertebrate homologs. The exons are 586, 380 and 408 bp in length, respectively, and separated by introns of 5086 and 1518 bp. 【题目】Intracellular copper/zinc superoxide dismutase from bay scallop Argopecten irradians: its gene structure, mRNA expression and recombinant protein
【中文关键词】Copper/zincsuperoxidedismutase; Gene organization; Promoter; qRT-PCR; Immune response; Enzyme assay
【英文关键词】Copper/zincsuperoxidedismutase; Gene organization; Promoter; qRT-PCR; Immune response; Enzyme assay
【中文摘要】Superoxide dismutases are an ubiquitous family of enzymes that function to efficiently catalyze the dismutation of superoxide anions. Two unique and highly compartmentalized bayscallopArgopecten irradianssuperoxide dismutases: MnSOD and ecCuZnSOD, have been molecularly characterized in our previous study. To complete characterize the SOD family in A. irradians, a novel intracellularcopper/zinc SOD from the A. irradians (Ai-icCuZnSOD) was obtained and characterized. The full-length cDNA of Ai-icCuZnSOD was 1047 bp with a 459 bp open reading frame encoding 152 amino acids. The genomic length of the Ai-icCuZnSOD gene was about 4279 bp containing 4 exons and 3 introns. The promoter region containing many putative transcription factor binding sites were analyzed. Furthermore, quantitative reverse transcriptase real-time PCR (qRT-PCR) analysis indicated that the highest expression of the Ai-icCuZnSOD was detected in gill and the expression profiles in hemocytes of bayscallops challenged with bacteria Vibrio anguillarum and lipopolysaccharide (LPS) were different. The result presented an increased expression after injection with LPS whereas no significant changes were observed after V. anguillarum injection. A fusion protein containing Ai-icCuZnSOD was produced in vitro. The rAi-icCuZnSOD is a stable enzyme, retaining more than 80% of its activity between 10 and 60 ° C and keeping above 88% of its activity at pH values between 5.8 and 9. Ai-icCuZnSOD is more stable under alkaline than acidic conditions.

【英文摘要】Extracellular superoxidedismutase (ECSOD) is a major extracellular antioxidant enzyme that protects organs from damage by reactive oxygen species (ROS). We cloned a novel ECSOD from the bayscallopArgopectenirradians (AiECSOD) by 3 ′ and 5 ′ RACE. The full-length cDNA of AiECSOD was 893 bp with a 657 bp open reading frame encoding 218 amino acids. The

deduced amino acid sequence contained a putative signal peptide of 20 amino acids, and sequence comparison showed that AiECSOD had low degree of homology to ECSODs of other organisms. The genomic length of the AiECSOD gene was about 5276 bp containing five exons and six introns. The promoter region contained many putative transcription factor binding sites such as c-Myb, Oct-1, Sp1, Kruppel-like, c-ETS, NF κ B, GATA-1, AP-1, and Ubx binding sites. Furthermore, tissue-specific expressions of AiECSOD and temporal expressions of AiECSOD in haemocytes of bayscallops challenged with bacteria Vibrio anguillarum were quantified using qRT-PCR. High levels of expression were detected in haemocytes, but not in gonad and mantle. The expression of AiECSOD reached the highest level at 12 h post-injection with V. anguillarum and then returned to normal between 24 h and 48 h post-injection. These results indicated that AiECSOD was an inducible protein and that it may play an important role in the immune responses against V. anguillarum.

【题目】Fine-Scale Population Genetic Structure of Zhikong Scallop (Chlamys farreri): Do Local Marine Currents Drive Geographical Differentiation?

【中文关键词】Zhikong scallop Chlamys farreri . Geographical differentiation .Microsatellite DNA . Population structure . Marine gyre . Landscape genetics

【英文关键词】Zhikong scallop Chlamys farreri . Geographical differentiation .Microsatellite DNA . Population structure . Marine gyre . Landscape genetics

【中文摘要】Marine scallops, with extended planktonic larval stages which can potentially disperse over large distances when advected by marine currents, are expected to possess low geographical differentiation. However, the sessile lifestyle as adult tends to form discrete “ sea beds ” with unique population dynamics and structure. The narrow distribution of Zhikong scallop (Chlamys farreri), its long planktonic larval stage, and the extremely hydrographic complexity in its distribution range provide an interesting case to elucidate the impact of marine currents on geographical differentiation for marine bivalves at a fine geographical scale. In this study, we analyzed genetic variation at nine microsatellite DNA loci in six locations throughout the distribution of Zhikong scallop in the Northern China. Very high genetic diversity was present in all six populations. Two populations sampled from the same marine gyre had no detectable genetic differentiation (FST=0.0013); however, the remaining four populations collected from different marine gyres or separated by strong marine currents showed low but significant genetic differentiation (FST range 0.0184 – 0.0602). Genetic differentiation was further analyzed using the Monmonier algorithm to identify genetic barriers and using the assignment test conducted by software GeneClass2 to ascertain population membership of individuals. The genetic barriers fitting the orientation of marine gyres/currents were clearly identified, and the individual assignment analysis indicated that 95.6% of specimens were correctly allocated to one of the six populations sampled. The results support the hypothesis that significant population structure is present in Zhikong scallop at a fine geographical scale, and marine currents can be responsible for the genetic differentiation.

【英文摘要】We constructed the microsatellite-based linkage maps using 318 markers typed in two F1 outbred families of Zhikong scallop (Chlamys farreri). The results showed an extremely high proportion (56.2%) of non-amplifying null alleles and a high ratio (30%) of segregation distortion. By aligning different individual-based linkage maps, 19 linkage groups were identified, which are consistent with the haploid chromosome number of Zhikong scallop. The integrated linkage map contains 154 markers covering 1561.8 cM with an average intermarker spacing of 12.3 cM and 77.0% of genome coverage. We found that the heterogeneity in recombination rate was not determined by sexes but by different individuals on 18 linkage regions. The phenotypic marker of general shell colour was placed on LG4, which was flanked by microsatellite markers CFLD064 and CFBD055. Four size-related traits including shell length (SL), shell width (SW), shell height (SH) and gross weight (GW) were analysed to identify the putative quantitative trait loci (QTL). Under the half-sib model, using dam as common parent, three, two, two and one QTL affecting SL, SW, SH and GW exceeded the genome-wide thresholds respectively. While using sir as common parent, a larger number of QTL were detected for these four traits: four, five, three and two for SL, SW, SH and GW respectively. The single QTL explained 3.7 – 19.2% of the phenotypic variation. The linkage map and the QTL associated with economic traits will provide useful information for marker-assisted selection of Zhikong scallop.

【题目】Isolation and characterization of new microsatellite markers from the Japanese scallop, Patinopecten yessoensis
【中文关键词】Japanese scallop,Microsatellite, Population structure, Twice hybridizations
【英文关键词】Japanese scallop,Microsatellite, Population structure, Twice hybridizations
【中文摘要】Twenty polymorphic microsatellite loci were isolated from the Japanese scallop (Patinopecten yessoensis) using a method of hybridizing twice. The genetic diversity was analyzed by these microsatellite markers in Þeld specimens from Zhangzidao Island in Liaoning Province, China. Observed heterozygosity (Ho), expected heterozygosity (He), number of effective alleles (Ne), and polymorphism information contents (PIC) were calculated. The heterozygote deÞciency or excess was detected by the Þxation index (Fis). The HardyÐWeinberg equilibrium was tested by possibilities (PHWE) using chi-square test. Results indicate that the average of allele numbers was 6.0. The mean values of the parametersHo, He, Ne, and PIC were 0.7921, 0.7076, 4.4347, and 0.6684, respectively. Only 4 of 20 microsatellite markers showed heterozygote deÞciency including loci FJ262370, FJ262381, FJ262384, and FJ262400. ThePHWE value indicates the wild population deviated somewhat from the HardyÐWeinberg equilibrium. These newly

isolated markers increase the available molecular resources of the Japanese scallop.

【英文摘要】A novel manganesesuperoxidedismutase (MnSOD) was cloned from bayscallopArgopecten irradians by 3′ and 5′ rapid amplification of cDNA ends (RACE) PCR. The full-length cDNA of MnSOD was of 1207 bp with a 678 bp open reading frame encoding 226 amino acids. The deduced amino acid sequence contained a putative signal peptide of 26 amino acids. Sequence comparison showed that the MnSOD of A. irradians shared high identity with MnSOD in invertebrates and vertebrates, such as MnSOD from abalone Haliotis discus discus (ABG88843) and frog Xenopus laevis (AAQ63483). Furthermore, the 3D structure of bayscallop MnSOD was predicted by SWISS-MODEL Protein Modelling Server and compared with those of other MnSODs. The overall structure of bayscallop MnSOD was similar to those of zebrafish Danio rerio, fruit fly Drosophila melanogaster, Chinese shrimp Fenneropenaeus chinensis, human Homo sapiens, and had the highest similarity to scallopMizuhopecten yessoensis and abalone H. discus discus. A quantitative real-time PCR (qRT-PCR) assay was developed to detect the mRNAexpression of MnSOD in different tissues and the temporal expression in haemocytes following challenge with the bacterium Vibrio anguillarum. A higher-level of mRNAexpression of MnSOD was detected in gill and mantle. The expression of MnSOD reached the highest level at 3 h post-injection with V. anguillarum and then slightly recovered from 6 to 48 h. The results indicated that bayscallop MnSOD was a constitutive and inducible protein and thus could play an important role in the immune responses against V. anguillarum infection.

【英文摘要】Two novel elements (CFG1 and PYG1) of Mag lineage of Ty3/Gypsy retrotransposons were cloned from Zhikong scallop (Chlamys farreri) and Japanese scallop (Patinopecten yessoensis). The total length of the CFG1 element is 4826 bp, including 5 0 -LTR (192 bp), the entire ORF (4047 bp) and 3 0 -LTR (189 bp). The entire ORFs of both CFG1 and PYG1 elements are composed of 1348 aa and do not have any frameshifts. Their closest relative is Jule element from the poeciliid fi sh (Xiphophorus maculatus). On average, the diploid genome of C. farreri contains approximately 84 copies of CFG1 elements. We summarize the major features of CFG1, PYG1 and other elements of Mag lineage of the Ty3/Gypsy group. mRNA expression of CFG1 element in larvae increases gradually before the gastrulae stage and decreases gradually afterward, whereas in adductor such expression in adductor muscle and digestive gland are lower than those in other tissues. Overall, mRNA expression of CFG1 element in the early larvae is signi fi cantly higher than that in adult tissues. In muscle tissue, while the promoter and partial GAG domain of CFG1 element are unmethylated, the partial RT domain is highly methylated. These results suggest that CFG1 expression may be controlled by a post-transcriptional gene silencing mechanism that is associated with coding-region (RT domain) methylation.

【题目】Fast identification of scallop adductor muscles using species-specific microsatellite markers
【中文关键词】Scallop, Adductor muscle, Microsatellite, Species-speci Wc marker, Species identi Wcation, Food labeling
【英文关键词】Scallop, Adductor muscle, Microsatellite, Species-speci Wc marker, Species identi Wcation, Food labeling
【中文摘要】Scallop adductor muscles are very popular delicious seafood distributed in the international markets. IdentiWcation of commercial adductor muscles to the species level is an important issue to assure the correct labeling for their distribution. In the present study, we established the species-speci Wc microsatellite markers for four main economic scallop species to identify commercial adductor muscles. A total of 140 adductors derived from three di Verent food processes, the fro zen, the dried and the canned, were collected from markets and analyzed using the species-speciWc microsatellite markers. Although the DNA extracted from the commercial samples was highly degraded, all samples were well identi Wed using the method established in the present study. This method well demonstrated high precision and high sensitivity, and more competence in the identi Wcation of mixed commercial samples. Moreover, the results in this study gave the experimental evidences for the potential use of species-speci Wc microsatellite markers for species identi Wcation in the market management.

【题目】Accurate methods of DNA extraction and PCR-based genotyping for single scallop embryos/larvae long preserved in ethanol
【中文关键词】conservation genetics;embryo;larva;microsatellite genotype;plankton;scallop
【英文关键词】conservation genetics;embryo;larva;microsatellite genotype;plankton;scallop
【中文摘要】Marine scallops are sessile as adult but have a long planktonic larval phase showing great possibility to migrate in marine realm lacking of obvious barriers. Genetic analysis of scallop embryos/larvae based on molecular markers is very essential to clarify the spatial and temporal gene flow and the unique population and community structure. However, the technical challenges, such as single embryos/larvae isolation and low quantity and poor quality of DNA extracted, make genotyping for a single embryo/larva long preserved in ethanol to be a really difficult task. In this study, we analysed the factors that might affect the DNA quantity and quality for simple sequence repeat-based genotyping for single embryos/larvae. Based on the factors analysed, we developed a LoTEPA buffer-based method, of which the accuracy, stability and reproducibility were evaluated by controlled inter- and intraspecies and self-fertilized scallop families. The genotyping results showed the high success rate of more than 90% in total for embryos/larvae preserved in ethanol for 1 – 5 years. Furthermore, the successful genotyping for the larvae sampled from a natural habitat well demonstrated the potential use of this method in practical ecological analysis.

In this study, we analysed the factors that might affect the DNA quantity and quality for simple sequence repeat-based genotyping for single embryos/larvae. Based on the factors analysed, we developed a LoTEPA buffer-based method, of which the accuracy, stability and reproducibility were evaluated by controlled inter- and intraspecies and self-fertilized scallop families. The genotyping results showed the high success rate of more than 90% in total for embryos/larvae preserved in ethanol for 1 – 5 years. Furthermore, the successful genotyping for the larvae sampled from a natural habitat well demonstrated the potential use of this method in practical ecological analysis.

【题目】Initial analysis of tandemly repetitive sequences in the genome of Zhikong scallop (Chlamys farreri Jones et Preston)
【中文关键词】Tandemly repetitive sequences, Zhikong scallop, Chlamys farreri, tandem repeats finder (TRF)
【英文关键词】Tandemly repetitive sequences, Zhikong scallop, Chlamys farreri, tandem repeats finder (TRF)
【中文摘要】Tandemly repetitive sequences are widespread in all eukaryotic genomes, but data on tandem repeats are limited in Zhikong scallop (Chlamys farreri). In the present study, paired-end sequencing of 2016 individual fosmid clones resulted in 3646 sequences. A total of 2,286,986 bp of genomic sequences were generated, representing approximately 1.84‰ of the Zhikong scallop genome. Using tandem repeats finder (TRF) software, a total of 2500 tandem repeats were found, including 313 satellites, 1816 minisatellites and 371 microsatellites. The cumulative length of tandem repeats was 552,558 bp, accounting for 24.16% of total length. Specifically, the length of microsatellites, minisatellites and satellites was 9425, 336,001 and 207,132 bp, accounting for 1.71, 60.81 and 37.49% of the length of tandem repeats, and 0.41, 14.69 and 9.06% of total length, respectively. The detailed information on the characteristic of all repeat units was also represented, which will provide a useful resource for physical mapping and better utilization of the existing genomic information in Zhikong scallop.

【题目】Characterization of 95 novel microsatellite markers for Zhikong scallop Chlamys farreri using FIASCO-colony hybridization and EST database mining
【中文关键词】colony hybridization;EST;FIASCO;microsatellite;polymorphism;Zhikong scallop;Chlamys farreri
【英文关键词】colony hybridization;EST;FIASCO;microsatellite;polymorphism;Zhikong scallop;Chlamys farreri
【中文摘要】In order to construct a simple sequence repeat (SSR)-based genetic linkage map and to promote molecular marker-assisted selection (MAS) in scallop breeding, the methods of Fast Isolation by AFLP of Sequences COntaining repeats (FIASCO)-colony hybridization and expressed sequence tag (EST) database mining were modified and used to develop 95 novel microsatellite markers for Zhikong scallop. The SSR-enriched library constructed by the FIASCO method consisted of 830 clones, and 295 (35.5%) positive clones were identified after colony hybridization. One hundred and fifty clones were randomly sequenced and the results showed all clones contained at least one microsatellite. Of 91 primer pairs designed, 72 were amplified scorable polymerase chain reaction (PCR) products and 70 were polymorphic with the allele number range of 3 – 16 alleles/locus (average 7.0 alleles/locus). When EST database mining was performed, 66 microsatellites containing ESTs were identified from 3467 sequences deposited in GenBank. Based on cluster analysis of length and GC content of the flanking regions, 47 primer pairs were designed and 23 scorable EST SSRs were obtained. Compared with genomic SSRs developed in this study, EST SSRs showed lower genetic variability with an average of 4.2 alleles/locus. The results in the present study demonstrate that modified FIASCO-colony hybridization is an efficient and low-cost method for the isolation of large numbers of microsatellite markers for scallop species.

【英文摘要】Zhikong scallop (Chlamys farreri Jones et Preston, 1904) is one of the most commercially important bivalves in China, but research on its genome is underdeveloped. In this study, we constructed the fi rst Zhikong scallop fosmid library, and analyzed the fosmid end sequences to provide a preliminary assessment of the genome. The library consists of 133,851 clones with an average insert size of about 40 kb, amounting to 4.3 genome equivalents. Fosmid stability assays indicate that Zhikong scallop DNA was stable during propagation in the fosmid system. Library screening with two genes and seven microsatellite markers yielded between two and eight positive clones, and none of those tested was absent from the library. End-sequencing of 480 individual clones generated 828 sequences after trimming, with an average sequence length of 624 bp. BLASTN searches of the nr and EST databases of GenBank and BLASTX searches of the nr database resulted in 213 (25.72%) and 44 (5.31%) signi fi cant hits (E G e5), respectively. Repetitive sequences

analysis resulted in 375 repeats, accounting for 15.84% of total length, which were composed of interspersed repetitive sequences, tandem repeats, and low-complexity sequences. The fosmid library, in conjunction with the fosmid end sequences, will serve as a useful resource for physical mapping and positional cloning, and provide a better understanding of the Zhikong scallop genome.

【英文摘要】We isolated and characterized 150 novel microsatellite markers of Zhikong scallop (Chlamys farreri) from three simple sequence repeat-enriched libraries constructed with (GA)15 and (CA)15. The polymorphism was assessed with 48 individuals, and the result showed the number of allele ranged from two to 30, with an average of 8.4 alleles/locus. The values of observed and expected heterozygosities ranged from 0.0791 to 0.9878 and from 0 to 1.0000, respectively. Sixty-five loci showed significant departure from Hardy – Weinberg equilibrium, and 14 locus pairs displayed linkage disequilibrium. These markers are therefore potentially useful for conservation studies, population structure assessment, ecological analyses and linkage map construction.

【英文摘要】Using denaturing high-performance liquid chromatography (DHPLC), we screened the insertion/deletion (indel) polymorphism in the internal transcribed spacer (ITS) sequences of 40 individuals from a natural population of Zhikong scallop (Chlamys farreri). Surprisingly, only 7.5% of individuals were homogeneous in ITS constitution, while the others (92.5%) were heterozygous. Based on different peak types in DHPLC analysis, seven individuals were randomly chosen to investigate indel polymorphism in the ITS sequences within individuals. Furthermore, indel polymorphism in the ITS sequences of single sperms was also investigated in more individuals belonging to different peak types. Based on these results, we concluded that rapid intrachromosomal recombination drove homogenization of rDNA arrays and interchromosomal recombination might contribute to form new variants, and that it may be less rare than previously thought although it was much less frequent than intrachromosomal recombination in the homogenization process. Further, we proposed an expanded model for concerted evolution of the rDNA family

in a natural population of C. farreri. A pathway in the new model which homogenizes a variant unit, beginning with two-peak type individuals and ends with two-peak type individuals, is a larruping pathway in the natural population of C. farreri. As the highest proportion in natural populations, two-peak individuals with equal peak areas can be viewed as being in a steady and balanced state which is maintained by rapid intrachromosomal recombination.

【中文摘要】The ribosomal DNA internal transcribed spacer (ITS) region is a useful genomic region for understanding evolutionary and genetic relationships. In the current study, the molecular phylogenetic analysis of Pectinidae (Mollusca: Bivalvia) was performed using the nucleotide sequences of the nuclear ITS region in nine species of this family. The sequences were obtained from the scallop species Argopecten irradians, Mizuhopecten yessoensis, Amusium pleuronectes and Mimachlamys nobilis, and compared with the published sequences of Aequipecten opercularis, Chlamys farreri, C. distorta, M. varia, Pecten maximus, and an outgroup species Perna viridis. The molecular phylogenetic tree was constructed by the neighbor-joining and maximum parsimony methods. Phylogenetic analysis based on ITS1, ITS2, or their combination always yielded trees of similar topology. The results support the morphological classifications of bivalve and are nearly consistent with classification of two subfamilies (Chlamydinae and Pectininae) formulated by Waller. However, A. irradians, together with A. opercularis made up of genera Amusium, evidences that they may belong to the subfamily Pectinidae. The data are incompatible with the conclusion of Waller who placed them in Chlamydinae by morphological characteristics. These results provide new insights into the evolutionary relationships among scallop species and contribute to the improvement of existing classification systems.

【英文摘要】Cytogenetic analysis was performed for the bay scallop(Argopecten irradians Lamarck 1819) and the Japanese scallop(Patinopecten yessoensis Jay 1857) by primed in situ labeling (PRINS) and propidium iodide (PI) banding techniques. The PRINS analysis revealed that major rRNA genes were clustered in two loci on the telomeric regions of the short arms on two acrocentric chromosome pairs in A. irradians and on two submetacentric pairs in P. yessoensis. The histone H3 gene sites differed in number and location between these two species. The C-band-like patterns revealed by PI staining varied considerably between these two species. A. irradians displayed terminal bands at long arms on all chromosomes, centromeric bands on some pairs and interstitial bands on five pairs. P. yessoensis exhibited only centromeric bands on all chromosomes. These results would contribute to the better understanding of karyotype evolution in A. irradians and P. yessoensis.

【题目】异源精子诱导栉孔扇贝雌核发育后代的微卫星分析
【中文关键词】栉孔扇贝,异源精子,雌核发育,微卫星
【英文关键词】Chlamys farreri, heterologous sperm, gynogenesis, microsatellite
【中文摘要】采用紫外线遗传灭活的长牡蛎精子激活栉孔扇贝卵子,6-DMAP诱导染色体加倍的方法,获得第二极体抑制型雌核发育二倍体早期胚胎。通过优化PCR反应条件,在11对栉孔扇贝和10对长牡蛎微卫星引物中共筛选出3对引物,可以同时在长牡蛎和栉孔扇贝基因组中获得稳定性,多态性较好的特异性扩增条带,其中2对引物为栉孔扇贝引物。利用筛选出的3对通用微卫星引物对雌核发育后代进行检验及遗传分析。结果表明,雌核发育个体基因完全来自于母本,后代中没有父本基因的表达;部分雌核发育后代在4个座位上发生了纯合,部分个体发生了不同程度的基因
&1 &1 &1
【英文摘要】The Zhikong scallop Chlamys farreri plays an important role in the shellfish breeding in the north of China and the gynogenesis in this scallop has developed rapidly in recent years. In this study, the meiotic division of the eggs of C. farreri was activated by ultraviolet (UV)-irradiated heterogenous sperms of Pacific oyster Crassostrea gigas and the gynogenetic diploids were induced by blocking extrusion of the second polar body from fertilized eggs with 6-dimethylaminopurine (6-DMAP). To assess homogeneity and isogenedity between the progeny and their parents, microsatellite technique were used. Then 3 pairs of common microsatellite primers to be used for genetic analysis of offspring were screened from 21 pairs of microsatellite primers among which 11 pairs were indentified in C. farreri and 10 pairs in C. gigas by optimizing the condition of polymerase chain reaction(PCR). Under the optimal condition, PCR was performed for analyzing the genetic character of the gynogenetic offspring. It was found that the 3 loci could amplify clear fragments in these offspring. The results of genetic analys is showed that the gene of offspring without gene contamination of male parent C. gigas was completely inherited from fem ale pa rent C. farreri. Microsatellite locus and centromere recombined at the 3 polymorphic loci and the recombination rates were 40% , 55% , and 35% , respectively. This study confirmed that it was feasible to achieve diploid gynogenetic progeny of C. farreri by heterologous sperm ’ s inducement while it w as difficult to get an absolute homozygotic population once in manner of suppression of the meiosis2 II , because there was high heterozygosity in the first meiogynogenetic generation owing to crossover between the homologous chromosome during the meiosis-I.

【英文摘要】Scallops, comprise more than 300 species identified in worldwide oceans, occupy an economically important position in many coastal countries. Until now, more than 15 scallop species have been considered as valuable fishery or aquaculture resources. Scallop adductor muscles are being considered as one of the most flavorful sea foods in markets at home and abroad, mainly due to their delicious taste and abundant nutrition. Because of the potential values, the scallop aquaculture has made great progress during the past three decades in many countries, especially in China. For examples, the farmed tideland for scallop aquaculture has exceeded 1 million hectares (ha.) and the annual production is more than 11 million tons in 2007, which makes China the first rank not only in farmed acreage but also in annual production. However, with the blooming expansion of scallop aquaculture, some problems such as poor growth of some wild strains and large scale breakout of diseases have been arising during the past years. Further investigation and solution to these problems mainly depend on the availability of primary molecular genetic tools and the combination of efficient breeding programs with these molecular tools (i.e. molecular marker assisted selection, MAS). Microsatellite analysis based on polymerase chain reaction (PCR) offers the finest resolution for studying such genetic questions in aquacultural species. Based on the studies to date, microsatellite DNA marker has been one of the leading molecular markers for genetic analysis. Four scallops including Zhikong scallop Chlamys farreri, Noble scallop C. nobilis, Yesso scallop Patinopecten yessoensis and Bay scallop Argopecten irradians are the main species maricultured in China. In this study, we reviewed the progress in development of microsatellite DNA markers for these four scallops. We also summarized the applications of this robust molecular marker system in genetic analysis, such as genetic diversity analysis, pedigree reconstruction, genetic linkage map construction and species identification.

【题目】虾夷扇贝体形性状对软体重和闭壳肌重的影响效果分析
【中文关键词】虾夷扇贝;体形性状;解剖性状;相关分析
【英文关键词】Patinopecten yessoensis; body shape traits; anatomical traits; correlation analysis
【中文摘要】利用虾夷扇贝表型性状资料,分析性状间的相关关系及其相关程度,建立相应的回归方程,为扇贝的选择育种奠定基础。试验随机抽取126只体形规则的3龄大连獐子岛海区底播增殖的虾夷扇贝,其中雌雄各63只,测定其壳长(X1)、壳高(X2)、壳宽(X3)、活体重(Y)、软体重(Z)和闭壳肌重(W),分别计算相关系数,采用通径分析方法计算了以体形性状为自变量对软体重和闭壳肌重作依变量的通径系数、决定系数及相关指数,定量的分析了体形性状对虾夷扇贝解剖性状的影响。结果表明虾夷扇贝壳长、壳宽、壳高与活体重、软体重和闭壳肌重的相关系数均达到极显著水平(P < 0.01);壳高、壳宽是影响雌性软体重的主要因素,壳长、壳宽是影响雄性软体重的主要因素,而混合组受3个壳尺性状的共同影响;影响虾夷扇贝闭壳肌重的主要因素是壳宽,壳长、壳高的作用不显著;决定系数分析结果与通径分析结果有一致的变化趋势;多元回归分析,剔除不显著因子,建立了壳长、壳高、壳宽对软体重、闭壳肌重的回归方程:(1)雌性Z = - 128.573 + 1.355X2 + 1.407 X3;W = - 8.216 + 0.869X3;(2)雄性Z =138.493 + 1.082 X1 + 2.524 X3;W = - 11.855 + 0.955 X3;(3)混合Z = - 133.939 + 0.606X1 + 0.679X2 + 1.709X3;W = - 9.525 + 0.896 X3。通过性状间的相关分析对两性状间的关系进行明确的定量,有利于制定合理的多性状选择方案,为虾夷扇贝选育提供理想的测度指标。
【英文摘要】This study is based on the material of Japanese scallop (Patinopecten yessoensis Jay) phenotypic characters, and the objective is to analyse correlation relationship, define degree of correlation among characters, establish the regression equation, and to lay a foundation of selective breeding. Data for this study were collected from 126 Japanese scallops at three years old in Zhangzidao Island of Dalian City. The shell length (X1) , shell height (X2) , shell width (X3) , live body weight (Y) , soft-tissue weight (Z) and adductor weight (W) of 63 m ale scallops and 63 female scallops were measured individually. The correlation coeff icient matrix was calculated respectively. Three body shape traits were used as independent variables, the soft-tissue weight and adductor weight were used as dependent variable for path analysis, and path coeff ic ients (Pi) , determination coefficients (di) and correlation index (R2) were calculated. The results show that correlation coefficients between each body shape trait and the live body weight (Y) , sof t-tissue

weight (Z) and adductor weight (W) are all significantly different (P < 0. 01) . Shell length (X1) and shell height (X2) give predominant direct effect and determinacy on the sof t-tissue weight of female scallops; it is the key effective factor. Shell length (X1) and shell width (X3) give predominant direct effect and determinacy on the soft-tissue weight of male scallops; it is the key effective factor. But the key effective factors of mixed scallops are shell length (X1) , shell height (X2) and shell width (X3) . The key effective factor on adductor weight (W) is only shell width (X3) , shell length (X1) and shell height (X2) give slightly direct effect and significant indirect effect through shellwidth (X3) , is the secondary factor. It was clear from the result of high correlation index that the path coefficient analysis could reveal the truthful relationship between the independent variables and the dependent variable. Eliminate inconspicuousness factor, the multiple regress ion equation obtained to estimate two anatomical traits as: 1) For fem a le Z = -128. 573 + 1. 355 X2 + 1. 407 X3 ; W = - 8. 216 + 0. 869 X3 ; 2) For m ale Z = - 138. 493 + 1. 082 X1 + 2. 524 X3 ; W = - 11. 855 + 0. 955 X3 ; 3) Form ixed Z = - 133. 939 + 0. 606 X1 + 0. 679 X2 + 1. 709 X3 ; W = - 9. 525 + 0. 896 X3. Efficient scheme of multiple trait selection will be made if we obtain definite quantitative relationship between each two characters. This s tudy provides theoretical evidence and perfect measure target for breeding of Japanese scallop.

【中文摘要】栉孔扇贝和虾夷扇贝是我国北方两种重要的经济贝类, 两者的生态习性与外部形态差异明显] 。虾夷扇贝个体大, 经济价值高, 但适温低,只能在我国北方局部海域进行养殖。与栉孔扇贝相比,两者在性状方面具有一定的互补性,且两者染色体数目相同,都是38条。本实验室利用栉孔扇贝与虾夷扇贝进行杂交, 成功获得了可成活的杂交个体,且子代在生长和抗逆性方面已经初步显示出一定杂种优势。以上特点使诱导异源四倍体成为可能。本文通过62二甲氨基嘌呤(6-dimethylamino-purine, 6-DMA P)抑制栉孔扇贝♀×虾夷扇贝♂异源受精卵第一极体的释放诱导扇贝异源四倍体,对诱导的适宜条件进行了筛选,旨在为扇贝四倍体的诱导研究提供技术参考。
【英文摘要】The allotetraploid in cross-fertilized eggs of Chlamys farreri♀ × Patinopecten yessoensis ♂was induced in this paper. In order to find out the appropriate duration time of 6-DMAP treatment, ploidy status of induction offspring was analyzed by flow cytometry. The results showed that the optimal duration time of 6-DMAP treatment was to treat the fertilized eggs with 50 mg /L 6-DMAP for 15 min based on the integrated evaluation of the results of fertilization rate, survival rate of D-larvae, development status of larvae, and percentage of tetraploid. The results of flow cytometry showed that 17. 3% tetraploid was obtained which showed that allotetraploid could be gotten with this method. The causes of the problem sin the work were also discussed in this paper.

【题目】扇贝异源三倍体诱导
【中文关键词】无
【英文关键词】scallop, allotriploid, GISH, chromosome conversion
【中文摘要】荧光显微观察表明,20 ℃水温下,栉孔扇贝(Chlamys farreri)的卵与海湾扇贝(Argopecten irradians)的精子可以正常受精和发育,具备人工诱导三倍体的可行性。亲贝充分促熟后,分开催产,以20 :1的精卵比授精;在50%的受精卵排出第1极

体时,以60 mg/L 6-二甲基氨基嘌呤(6-DMAP)处理受精卵10 — 25 min,可诱导75.23% — 92.14%的三倍体;6-DMAP处理15 min综合诱导效果最好,三倍体诱导率可达88.56%,孵化率可达53.52%。得到的三倍体幼虫经基因组原位杂交(Genomicin situ hybridization,GISH)验证,为含有2套栉孔扇贝染色体组和1套海湾扇贝染色体组的异源三倍体。孵化后诱导组与杂交对照组(未经6-DMAP处理)幼虫生长越来越缓慢,受精后14 d其幼虫存活率分别下降到0.000 67%和0.002 24%,没有幼虫度过附着变态期。GISH分析显示,栉孔扇贝与海湾扇贝不同倍性的杂种后代早在担轮幼虫阶段就出现母本偏向性染色体转变。

【英文摘要】Induction of triploidy is of great importance in mollusk breeding,and can be modified further with interspecific hybridization techniques to create allotriploids which may benefit both from triploidization and hybridization. Prior to the allotriploid induction,the feasibility of fertilization between Zhikong scallop Chlamys farreri eggs and Bay scallop Argopecten irradians sperm was verified by epifluorescence microscopy. Parental scallops were fully induced mature separately and induced spawning. Insemination was carried out with the ratio of sperms and eggs being 20 :1. Triploidy rates of D-stage larvae ranging from 75.23% to 92.14%,were obtained by inhibiting the second polar body with 60 mg/L 6-deimethylaminopurine(6-DMAP) for 10,15,20 and 25 min durations when 50% zygotes released the first polar body in 20 °C seawater. An optimum effect with triploidy rate of 88.56% and incubation rate of 53.52% was gained under 15 min duration. With genomic in situ hybridization(GISH)method,the consequent larvae were validated to be real interspecies hybrids from C. farreri × A. irradians cross with two C. farreri genome and one A. irradiams genome. Overall,allotriploid scallop can be readily produced,but no statistical advantages of growth or survival was found in triploid induction groups compared with controls during larvae development. Larva survival rate of triploid and diploid hybrids were 0.000 67% and 0.002 24%,at the 14 th day after insemination. All larvae died before metamorphism without forming eyespot or foot. Furthermore,maternal biased chromosome conversion was revealed by GISH in both triploid and diploid hybrids,as early as at trophore-larvae stage.

【题目】虾夷扇贝微卫星标记的分离及其养殖群体遗传结构的分析

【中文关键词】虾夷扇贝;微卫星;养殖群体;遗传结构

【英文关键词】Patinopecten yessoensis;microsatellites;cultured populations;genetic structure

【中文摘要】采用新型生物素-磁珠吸附微卫星与同位素杂交相结合的方法筛选出15对微卫星引物,并对大连地区3个虾夷扇贝(Patinopecten yessoensis)养殖群体(黑石礁海区、小长山岛海区、广鹿岛海区)的遗传结构进行分析。获得175个阳性克隆并测序,得到160个含微卫星的序列,其中完美型,非完美型和混合型分别占42.69% (73)、46.20% (79)和11.11%(19) ,经筛选得到15个微卫星标记。虾夷扇贝3个群体的有效等位基因数在1.000 0 ~ 8.857 3之间;期望杂合度在0.021 1 ~ 0.911 1之间;观测杂合度在0.000 0 ~ 0.877 8 之间。表明这几个群体遗传多样性水平较高。群体间遗传相似系数在0.929 1 ~ 0.962 4,相似性较高。聚类分析显示,黑石礁群体与小长山岛群体遗传距离最小,亲缘关系最近。基于Hardy-Weinberg平衡的卡方检验表明3个群体均在一定程度上偏离了平衡。本研究所获得的微卫星位点可以为虾夷扇贝的群体遗传多样性分析和遗传图谱的构建等研究提供参考,群体的遗传结构分析对虾夷扇贝的养殖和遗传育种具有一定的指导意义。

【英文摘要】Patinopecten yessoensis is one of the most important cultured scallops in the world. Samples of cultured Japanese scallops were collected from Heishijiao sea area,Xiaochangshan island and Guanglu island area. Each population has about 90 individuals. Microsatellite DNAs were isolated from the Japanese scallop genome with magnetic beads in the present work. One hundred and seventy-one microsatellites were obtainded from the 160 positive clones (from 175 clones),among which 42.39% were found to be perfect,46.24% imperfect,and the rest compound type (11.11%). 56 pairs of SSR-primers were synthesized,and 15 polymorphic microsatellite markers were screened out,which were applied to analyze the population diversity of the three populations. Amplification was performed in PCR reactor with the 15 microsatellite loci,tested by 8% polypropylene gel eletrophoresis and analyzed by gel analysis software. The observed(Ho) and expected(He) heterozygosity values,the polymorphic information content(PIC) and the number of effective alleles(Ne) were all calculated.We found the genetic diversity level was relatively high in all three populations. Seventy-five alleles were obtained,and the number of alleles of each locus was 1 to 12,ranging from 134 to 520 bp. The average Ne of HSJ population,XCS population and GL population was 3.454 8,3.788 7 and 3.5241,respectively. The average Ho was 0.5623,0.5761 and 0.6060,respectively. The average He was 0.6102,0.6198 and 0.6354,respectively. The data above indicated that genetic potential level

of GL population was higher than that of other the rest populations. The genetic similarity coefficient and Nei‘ S standard genetic distance were computed based on the allele frequencies. According to the data,HSJ population and XCS population were shortest in genetic distance among the three populations,followed by GL population. A dendrogram was constructed based on NJ methods using MEGA3.0 software package. The three populations were divided into two clusters,the HSJ population and XCS population were in one cluster,and GL population was another cluster. The Hardy-Weinberg equilibrium was checked by χ2 test. The P value test of Hardy-Weinberg equilibrium showed that each population departed from Hardy-Weinberg equilibrium to some certain extent. These microsatellite markers are useful for genetic structure analysis and genetic linkage mapping construction of Patinopecten yessoensis. The population structure results obtained in this work should be helpful to the breeding and culture of Japanese scallops.

【题目】利用ISSR技术研究虾夷扇贝不同地理种群的遗传多样性及其分化

【中文关键词】ISSR,虾夷扇贝,遗传多样性

【英文关键词】ISSR, Patinopecten yessoensi, genetic diversity

【中文摘要】利用10个ISSR引物对虾夷扇贝天然群体、人工养殖群体、象牙白群体、俄罗斯群体和日本群体进行遗传多样性分析,共获得134个多态位点,其比例分别为78136%、73188%、76187%、89155%、89155%; Shannon指数为015159,遗传多样性指数为013378.结果显示5个群体特异性位点16个, 占被检测位点总数的11194% ,这些特异位点可为种群的判别提供依据. 群体聚类结果显示:天然群体、人工养殖群体、象牙白群体首先聚为一类,尔后与日本群体聚在一起,俄罗斯群体单独聚为一类. 本研究还进行了个体聚类分析,个体聚类分析对虾夷扇贝育苗过程中的选种具有一定的指导意义.

【英文摘要】Natural population、Cultured population、White population、Russia population and Japanese population of Patinopecten yessoensi are analyzed using ISSR with 10 p rimers. 134 polymorphic loci are obtained, and the mean percentages of which are 78136% (Natural) , 73188% (Cultured) , 76187% (White) , 89155% (Russian) and 89155% (Japanese) , respectively. The Shannon’s information index and Nei’s gene diversities are 015159 and 013378, respectively. Sixteen specific loci accounting for 11194% in all loci are found in 5 populations, these specific loci can p rovide evidence of populations identification. It is shown that the Natural, the Cultured and theWhite assemble in one group, then assemble with Japanese population, and the Russian population does alone. Individuals phylogenetic analysis is also done, which may be helpful to breeding of Patinopecten yessoensi.

【题目】虾夷扇贝群体的遗传结构及微卫星标记与体尺、体重的相关性分析

【中文关键词】虾夷扇贝; 遗传结构; 相关分析; 微卫星

【英文关键词】Patinopecten yessoensis; genetic structure; correlation analysis;microsatellite

【中文摘要】选用39个虾夷扇贝Patinopecten yessoensis多态性微卫星分子标记对大连獐子岛海域虾夷扇贝一个家系群体(以獐子岛海域底播虾夷扇贝和日本产野生虾夷扇贝为父母本交配产生的F1代) 的有效等位基因数(Ne) 、观测杂合度(Ho) 、期望杂合度(He) 、多态信息含量(PIC) 等进行了检测, 以卡方检验估计群体Hardy - Weinberg平衡。结果表明: 在39个基因座位中共检测到105个等位基因, 每个座位检测到的等位基因数为2~4个不等, 等位基因片段大小为95~440 bp, 平均等位基因数为2170个, 平均有效等位基因数为2140个, 观测杂合度平均值016280, 期望杂合度平均值为015240, 平均多态信息含量为014556, 经卡方检验(P < 0101) 值显示多于半数的位点都发生了偏离。采用SAS 812 软件中的一般线性模型(GLM)对

39个微卫星标记与虾夷扇贝群体的生长性状进行连锁显著性检验。结果表明: 在39个微卫星座位中,HLJX202位点与体重、壳长、壳高、壳宽都显著相关, HLJX109、HLJX196位点与体重、壳长、壳高显著相关, HLJX183位点与壳长、壳高显著相关, 而HLJX128和HLJX236位点分别只与壳宽和体重显著连锁。

【英文摘要】The genetic structure of one breeding population of Japanese scallop (Patinopecten yessoensis) was analyzed using thirty - nine polymorphic microsatellite markers. The effective number of alleles (Ne) , observed heterozygosity (Ho) , expected heterozygosity (He) and polymorphism information content (PIC) were all determined.The Hardy - Weinberg equilibrium was checked by chi - square test. For each locus, 2 - 4 alleles were detected,with a total of 105 alleles for 39 loci. The average effective number of alleles and the mean polymorphism information content were 2. 40 and 0. 4556, respectively. Observed heterozygosity and expected heterozygositywere 0. 6280 and 0. 5240, respectively. The p robability value of chi - square test showed thatmore than half of the thirty – nine loci had significantly deviated from Hardy - Weinberg equilibrium (P < 0. 01). The SAS 8. 2 was used to analyze the effect of these 39 microsatellites on body weight, shell length,width and height. Results indicated that HLJX109, and HLJX196 had a significant impact on bodyweight and shell length ; HLJX128 and HLJX236 had a significant impact on shell width and body weight, respectively; HLJX183 had a significant on shell length and body weight. Several significantl diversity lociwere also analyzed by the multiple comparisons of Duncan.

【题目】两种壳色虾夷扇贝的RAPD分析

【中文关键词】虾夷扇贝,壳色,RAPD,遗传多样性,遗传距离

【英文关键词】Patinopecten yessoensis, Shell colors, RAPD, Genetic diversity, Genetic distance

【中文摘要】采用RAPD 技术对两种壳色虾夷扇贝Pat i nopecten yessoensis 的遗传多样性和遗传结构及其分化进行研究。用筛选出的22 个随机引物对白色贝和褐色贝各40 个个体进行RAPD 扩增,进行群体内及群体间的遗传学分析。白色贝共检测出128 个多态位点,多态位点的比例为79.5 % ,Shannon 遗传多样性指数为0.424 ;褐色贝共检测出127 个多态位点,多态位点的比例为78.9 % ,Shannon 遗传多样性指数为0.423 。白色贝和褐色贝之间的遗传相似性指数和遗传距离为0.961 和0.039 ,二者之间的遗传分化指数Gst 为0.052 ,遗传分化的程度较低。结果表明,白色贝和褐色贝之间的等位基因频率、多态位点的比例和遗传多样性等的差别不明显,遗传变异主要来自于群体内。S285-1 在褐色贝大部分个体中都能获得扩增片段,但在白色贝所有个体中均未见这个位点的扩增片段,推断S285-1 为白色贝的特异阴性片段。

【英文摘要】The genetic diver sity ,heredity st ructure and differentiation of two Patinopecten yessoensis populations of different shell colours (white and brown) were compared using RAPD method (Random Amplified Polymorphic DNA) . A total of 161 interpretable bands ranging f rom 100-3000 bp in each population were obtained by 22 arbitrary primer s. The numbers of polymorphic loci were 128 and 127 for white scallop s and brown scallops ,respectively wit h t he percentages of polymorphism 79.5 % and 78.9 % and Shannon information indices 0.424 and 0.423 ,respectively. The high similarity rate (0.961) and low genetic differentiation (Gst = 0.052) indicated t hat t here was no significant difference in genetic differentiation and genetic st ructure between t he two populations. According to t he Shannon information index ,the genetic diver sity was mainly due to individual differences in each population. The band at locus S285-1 appeared in 30 of 40 individual s of brown scallop s ,but it disappeared completely wit h no amplification in white scallops ; it is suggested t hat t his band is t he negative genetic marker in white scallop s.

【题目】6-DMAP诱导栉孔扇贝异源雌核发育二倍体
【中文关键词】6-DMAP,栉孔扇贝,雌核发育二倍体,异源精子
【英文关键词】6-DMAP, Chlamys farreri, Gynogentic diploids, Heterogenous sperm
【中文摘要】采用紫外线遗传灭活的长牡蛎精子激活栉孔扇贝卵子,运用L9 (34) 设计不同6-DMAP 的处理条件来诱导染色体加倍,获得第二极体抑制型栉孔扇贝雌核发育二倍体早期胚胎。以雌核发育担轮幼虫为材料,滴片法制备染色体并采用计数法统计倍性,分析不同6-DMAP 浓度、诱导时机和诱导持续时间对雌核发育二倍体诱导率的影响,并统计早期胚胎畸形率。结果表明,不同6-DMAP 浓度、诱导时机和诱导持续时间对异源精子诱导栉孔扇贝雌核发育二倍体的诱导率均有显著影响;早期胚胎畸形率与二倍体的诱导率呈负相关, y = 46.632 － 0.891 x (r = - 0.813 , P < 0.01) 。6-DMAP 诱导栉孔扇贝雌核发育二倍体的最佳处理条件为:20 %~25 %受精卵排放出第1 极体时,60 μg/ ml 的6-DMAP 持续处理25 min 可得到最高的诱导率为29.5 ±5.36 %。研究结果为6-DMAP 诱导栉孔扇贝雌核发育染色体加倍提供了一定的细胞学依据和技术参数
。
【英文摘要】The eggs of Chlamys farreri were activated by ultraviolet-irradiated heterogenous sperms of Pacific oyster Crassostrea gigas and t he pro-embryos were induced by inhibiting extrusion of t he second polar body from fertilized eggs with 6-DMAP. Those eggs were t reated with different parameters of 6-DMAP which were designed in the met hod of orthogonal experiment design L9 (34) . It was found that the occasion of starting time , t he length of the treatment time and t he concent ration of 6-DMAP were important factor s to affect the derivational rate of diploids. The statistic data of t he t rochop hores ’ chromosomes in t he nine groups was analysed with the software SPSS11.5. Results showed that all the three factors had prominent effect on the derivational rate of diploids ; the relationship between the rate of malformed embryos and the rate of diploids was negative correlation and t he equation was y = 461 632 - 01 891 x (r = -0.813 , P < 0.01) . Based on the relationship between derivational rate of diploids and t he rate of malformed embryos , in t he stated range , it was confirmed that the optimal inducing condition of 6-DMAP for gynogenesis in the C. farreri was that t he eggs were to be t reated with 6-DMAP at the concent ration of 60 μg per ml for 25 minutes when of the fertilized eggs expelling first polar body 20 % to 25 %. In this way , 29.5 ±5.36 % diploidinduction could be got . In this study , the states of poly ploidy yield in the treatment groups were also discussed.

【题目】两种壳色虾夷扇贝的同工酶分析
【中文关键词】虾夷扇贝,同工酶,多态性,遗传变异,壳色
【英文关键词】Patinopecten yessoensis, Isozyme, Polymorphism, Genetic variability, Shell colors
【中文摘要】采用不连续聚丙烯酰胺凝胶垂直电泳技术对两种壳色虾夷扇贝的闭壳肌进行了同工酶检测分析与比较。8 种同工酶(MDH、ADH、ME、SOD、EST、GDH、SDH 和α-AMY) 共检测出17 个位点,其中白色贝有7 个多态位点,褐色贝有6 个多态位点,多态位点(P0199) 的比例分别为41.18 %和35.29 %,白色贝和褐色贝平均每个位点的等位基因有效数目(Ae) 分别为1.142 1 和1.104 0 ,预期杂合度分别(He) 为0.091 9 和0.067 4 ,实际杂合度(Ho) 分别为0.1275 和0.090 7 ,多态位点的遗传偏离指数表明,白色贝具有更高的遗传变异水平和多样性水平。位点Est-3 可以作为鉴定白色贝和褐色贝的特异性蛋白质分子标记。
【英文摘要】The electrophoretograms of isozymes from adductor muscle of Patinopecten yessoensis were analyzed by vertical polyactylamide gel elect rop horesis. Results showed that there were 17 loci by detecting 8 isozymes (MDH ,ADH ,ME ,SOD ,EST ,GDH ,SDH , α2AMY) in white scallops and brown scallops. Among t he recorded loci ,7 loci (S od-2 , s-M dh-1 , Est-2 ,Est-3 , Sdh-1 , α-A my-2 , α-A my-5) and 6 loci (Sod-2 , s-Mdh-1 , Est-2 , Sdh-1 , α-A my-2 , α-A my-5) were polymorphic in white and brown scallops , and the mean proportion of polymorphic loci (P) was 41.18 % and 35.29 %. The mean effective number of alleles per locus (Ae) was 1. 1421 and 1.1040 , the mean expected heterozygosity per locus (He) was 0.0919 and 0.0674 , and the mean observed heterozygosity (Ho) was 0.1275 and 0.0907. In the mean time , the deviation indexes from Hardy-Weinberg equilibrium (d) of the polymorphic loci were calculated ,both of them showed the absence of heterozygosity. The genetic variability of white scallops was

higher than those of brown scallops , which had a better growth potential during the further selection. We conclude that white scallops have batter potential a for further selection and breeding. At the same time , we found the dissimilarity of activity and polymorphism in Est-3 between white scallops and brown scallops , and it can be used as the genetic marker of variation.

【中文关键词】栉孔扇贝; Chlamys farreri ; fosmid 文库构建; 序列分析
【英文关键词】Zhikong scallop ; Chlamys farreri ; fosmid library contruction ; sequence analysis
【中文摘要】研究构建第一个栉孔扇贝的fosmid 基因组文库,该文库包含133 851 个克隆,插入片断平均长度为40 kb ,覆盖栉孔扇贝基因组的4. 3 倍。栉孔扇贝DNA 在fosmid 传代中表现得较为稳定,没有发现插入片段的丢失或重排。所有的克隆进行了超级池和二级池的构建,并筛选了2 个基因和7 个微卫星,结果阳性克隆数介于2 到8 之间。由此可见,该文库可以很好的用于目的基因或标记的筛选,将有利于物理作图和基因的图位克隆研究。2 016 个克隆进行双末端测序,获得3 646 条序列。序列总长2 286 986 bp ,大约占栉孔扇贝基因组的1. 84 ‰。共得到2 500 条串连重复序列,其中微卫星序列371 条,小卫星序列1 816 条,卫星序列313 条。共得到317 条散布重复序列,总长97 412 bp ,占测序总长的4. 26 %。查找到的散布重复序列共有4 种类型:DNA 转座子、L TR 反转座子、L INE 反转座子和滚环转座子,其中L INE 反转座子的数目最多。BLAST比对共有1 383 条序列与数据库现有的序列有明显的相似性(E < e - 5) ,占测序总数的37. 93 %。BLASTN 比对有明显相似性的1 036 条序列中,与nr 数据库序列相似的有113 条,与EST 数据库序列相似的有923 条。BLASTX 比对有明显相似性的序列有347 条,占序列总数的9. 52 %。

【英文摘要】Zhikong scallop (Chlamys farreri) is one of the most commercially important bivalves in China ,but study on its genome is underdeveloped. The first Zhikong scallop fosmid library was const ructed in this study. It consist s of 133 851 clones with an average insert size of about 40 kb , amounting to 4.3 genome equivalent s. Fosmid stability assays indicate that Zhikong scallop DNA was stable during propagation in the fosmid system. Library screening with two genes and seven microsatellite markers yielded between 2 and 8 positive clones , and none of those tested was absent f rom the library. The fosmid library will serve as a useful resource for physical mapping and positional cloning , and provide a better understanding of Zhikong scallop genome. In the present study , 2 016 individual clones were sequenced , resulting in 3 646 sequences. A total of 2 286 986 bp of genomic sequences was generated , representing approximately 1. 84 ‰of the Zhikong scallop genome. Using Tandem Repeat s Finder (TRF) software to analyze the sequences , a total of 2 500 tandem repeat s were found , including 371 microsatellites , 1 ,816 minisatellites and 313 satellites , RepeatMasker analysis showed that a total of 317 interspersed repetitive sequences were found , which account for 4. 26 % of the total length. There are 4 types in these sequences : DNA t ransposons , L TR ret rot ransposons , L INE ret rot ransposons and rolling circles. Among them , L INE ret rot ransposons is the most f requent , followed by L TR ret rotransposons , DNA t ransposons and rolling circles. A total of 1 383 sequences were found to significantly hit to sequences in GenBank database using BLASTN and BLASTX(E < e - 5) . BLASTN searches on the nr and EST databases of GenBank and BLASTX searches on the nr database resulted 113 , 923 and 347 significant hit s , respectively.

【题目】海湾扇贝壳色与数量性状之间的关系

【中文关键词】海湾扇贝, 壳色, 多态性, 数量性状, 相关性

【英文关键词】Bay scallop, Argopecten irradians irradians, Shell color, Polymorphism, Quantitative trait, Correlativity

【中文摘要】海湾扇贝北部亚种Argopecten irradians irradians 的左右两枚贝壳均具有丰富多彩的颜色,它们不仅能够稳定地遗传, 而且还与生长、存活等数量性状有关。为了查清海湾扇贝壳色与数量性状之间的关系, 2005 年11 月中下旬, 作者对河北、山东、辽宁三省的海湾扇贝养殖群体的壳色种类、分布频率及其数量性状进行了统计、测量和分析。这些养殖群体来自于相同的基础群体, 均是1998—1999 年引种繁殖的后代。三个养殖区都有橙、棕、黑、紫、白等壳色的个体, 表明海湾扇贝的壳色具有多态性, 且不受环境的影响, 橙、棕、黑、紫、白等壳色的分布频率分别为17.8%、48.8%、32.5%、3.8%、1.1%。总重、闭壳肌重、出柱率、壳长、壳高、壳宽等数量性状间存在显著相关性, 相关系数最大值出现在壳长与壳高之间, 其次在全湿重与闭壳肌重之间, 最小值在出柱率与壳高之间;壳长、壳高和壳宽都能显著地影响总重和闭壳肌重。海湾扇贝的壳色与数量性状之间有密切关系, 棕色个体总重最大、紫色个体总是最轻最小。方差分析表明, 壳色(遗传因素)和养殖区(环境因素)均能够单独地对数量性状产生显著的影响, 而且它们的交互作用也是显著的。本研究结果对海湾扇贝遗传育种有重要意义。

【英文摘要】Argopecten irradians irradians ， subspecies of bay scallop, was studied on shell color on both sides. Many varieties in colors are shown, which are not only genetic but also relative to quantitative traits such as growth, and survival, in November 2005 for different hatchery populations cultured at three provinces of Hebei, Shandong, and Liaoning in China. Relationships between shell colors and quantitative traits in the bay scallop, types of shell color and their distribution frequency therefore were quantified in traits including total weight (Wt), abductor muscle weight (Wm), rate of muscle (Rm), shell length (SL), shell height (SH), and shell width (SW). These hatchery populations were originated from the same base population introduced from USA in 1998—1999. Shell colors including orange, brown, black, purple, and white were seen in all hatchery populations at 17.8%, 44.8%, 32.5%, 3.8%, and 1.1% in frequency, respectively, indicating that the shell color is of polymorphism and is not affected by environmental factors. The correlativity was significant for all six traits. The largest coefficient was found between SL and SH, then Wt and Wm, and between Rm and SH. Relationship between shell colors and quantitative traits in the bay scallop are close. For the same quantitative trait, brown scallop was always the largest, whereas purple scallop was always the smallest. Analyses in variance showed that both shell color (genetic factor) and aquaculture location (environmental factor) made significant impacts independently on quantitative traits, and their interaction was also significant. The present results are important for genetic breeding of the bay scallop in author ’ s view.

【题目】海湾扇贝“中科红”品种与普通品种在不同温度下早期性状的比较
【中文关键词】“中科红”品种; 幼虫; 交配方式; 早期性状; 温度
【英文关键词】Argopecten irradians; “Zhong kehong” strain; larvae; mating type; larval traits ; temperature
【中文摘要】采用自交、杂交和混交等不同的交配方式分别获得海湾扇贝“中科红”品种和普通养殖群体(对照组) 的受精卵和幼虫, 在20℃、23℃和26℃三个温度条件下培养, 比较了两个群体在不同温度下的孵化率、10日龄幼虫存活率、1日龄和10日龄幼虫壳长。实验结果表明:“中科红”海湾扇贝自交系、杂交系和混交系的孵化率均大于对照组。自交系10日龄幼虫存活率显著高于对照组(P< 0. 05) , 而杂交系和混交系的10 日龄幼虫存活率小于对照组, 但差异不显著(P > 0. 05) 。“中科红”海湾扇贝自交系(P< 0. 05)和混交系幼虫的1日龄壳长大于对照组, 杂交系的显著小于对照组(P< 0. 05)。幼虫生长10日后,“中科红”海湾扇贝自交系、杂交系(P < 0. 05)和混交系幼虫壳长均比对照组大, 表现了较强的生长优势。温度对4个性状均有显著影响(P< 0. 05) 。“中科红”海湾扇贝对低温(20℃)和高温(26℃)的耐受性均高于对照组。
【英文摘要】Fertilized eggs and larvae of strain “Zhongkehong bay scallop (Argopecten irradians) and common cultured population (control) were separately produced by self-fertilization, hybridization,and mixed mating. The three types of off spring were hatched and cultured at 20℃, 23℃ and 26℃ respectively. Hatching r ate, ten-day larval survival, larval shell length on day 1 and day 10 were separately compared between two populations. Results showed that the hatching rate of fertilized eggs from “Zhong kehong” was higher than that from the common cultured population. Ten-day survival of self-fertilized larvae from “Zhongkehong” was significantly higher than that of the control (P < 0. 05) , while off spring from hybridization and mixed mating were insignificantly lower (P > 0. 05) . Shell length of self-fertilized larvae (P < 0. 05) and larvae of mixed mating from “Zhong kehong” were greater than their co unterpart s on day 1, but that of the hybrid larvae was significantly smaller than the common cultured population (P < 0. 05) . At age of 10 days, shell length of larvae produced by self-fertilization, hybridizat ion (P < 0. 05) and mixed mating from “Zhong kehong” exceeded that of the controls, indicating the growth advantage of “Zhongkehong” population. Temperature influenced the four larval traits significantly (P< 0. 05) and “Zhongkehong” population was more tolerant to 20℃ and 26℃ than the control.

【题目】1龄虾夷扇贝形态性状对重量性状的影响效果分析
【中文关键词】虾夷扇贝;形态性状;重量性状;多元回归分析;通径分析
【英文关键词】Patinopecten yessoensis;body shape trait;weight trait;muhiple regression analysis;path analysis
【中文摘要】随机抽取浮筏养殖的97个体形规则的1龄虾夷扇贝Patinopecten yessoensis,测定其壳长(X1)、壳高(X2)、壳宽(X3)、活体重(Y)、软体重(z)和闭壳肌重(W),计算其相关系数,采用通径分析方法计算以贝壳形态性状为自变量对各重量性状作依变量的通径系数、决定系数及相关指数。结果表明:虾夷扇贝壳长、壳宽、壳高与活体总重、软体重和闭壳肌重的相关系数均达到极显著水平(P<0.01);壳长对各重量性状的直接影响最大,是影响重量性状的主要因素;壳高和壳宽与活体重的相关程度较大,但对活体重的直接影响较小,主要通过壳长间接影响,是影响活体重的次要因素,但二者对软体重和闭壳肌重直接影响都很小;决定系数分析结果与通径分析结果有一致的变化趋势。用多元回归分析法建立了壳长、壳宽、壳高对各重量性状的回归方程:Y=-16.4103+3.9683Xl+1.5254X2+2.7990 ,Z=-5.5523+2.0535X ,W=-1.5683+0.5480X 。该回归方程可以为虾夷扇贝遗传育种提供一定的理论依据。

【英文摘要】The shell length(X1),shell height(X2),shell width(X3),and live body weight(Y),body-tissue weight(Z)and adductor muscle weight(W)of 97 one-year old yessoseanop (Patinopecten yessoensis)were measured.and their correlation coeficients was calculated.The first 3 morphometrical traits were used as independent variables,and live body weight,body—tissue weight and adductor muscle weight were used as a dependent variable for path analysis,path coeficients(Pi),determination coeficients(di)and correlation index(Ri2) were calculated. The results showed that 3 correlation coeficients between morphometrical trait and live body weight。body—tissue weight and adductor muscle weight were all very significant difference(P<0.01).Shell length(X1)as a key efective factor had predominant direct effect and determinacy on weight traits.Shell height (X2)and shell width(X3)had slightly direct effect and significant indirect effect through shell height on weight traits,which is the secondary factor.But shell height(X2)and shell width(X3)showed very slightly direct effect on body-tissue weight and adductor muscle weight.It was inferred from the results of high corelation index that the path coeficient analysis revealed the truthful relationship between the independent variables and the dependent variable.Except the insignificant factor,the multiple regression equation obtained to estimate live body weight,body-tissue weight,and adductor muscle weight as one-year old:Y= -16.4103+3.9683X1+1.5254X2+2.7990X3,Z = -5.5523+2.0535 X1,W = -1.5683+0.5480X1.

【题目】虾夷扇贝面盘幼虫细菌性疾病的病原研究
【中文关键词】虾夷扇贝;病原; 16S rRNA;药敏试验
【英文关键词】Patinopecten yessoensis; pathogen; 16S rRNA; drug sensitivity test
【中文摘要】从发生下沉死亡的虾夷扇贝面盘幼虫中分离到3株细菌X1, X2, X3,经过人工感染试验证实,3株细菌均对虾夷扇贝面盘幼虫具有致病性。应用PCR技术扩增16S rRNA基因的部分序列,并对其序列进行测定,同源性分析结果表明,这3株细菌分别与交替单胞菌属、冰居壶属和假交替单胞菌属的菌株具有较高的相似性,相似性均超过98%。10种抗生素的药敏试验结果表明, 3株细菌对菌必治均敏感。
【英文摘要】This paper reported the study of bacterial pathogeny in D-larva stage of scallop Patinopecten yessoensis Jay. Bacterial strains X1, X2 and X3 isolated from the diseased scallop D-larva stage in an aquarium were proved to be a pathogenic organism by artificial infection experiments. In order to investigate the phylogenetic position of the there pathogens, their 16S rRNA gene sequences were compared with those relatted strains. Molecular phylogenetic dendrogram was constructed based on the genetic distance analysis,which revealed that strains X1, X2 and X3 exhibitted the highest levels of 98% similarity with A lterom onas sp. , Glaciecola sp. , and Pseudoalterom onas sp. . Drugs sensitivity tests showed that the three pathogentic bacteria were sensitive to rocephin.

【题目】栉孔扇贝♀和长牡蛎♂杂交受精及早期胚胎的细胞学研究
【中文关键词】栉孔扇贝,长牡蛎,远缘杂交,雌核发育
【英文关键词】Chlamys farreri,Crassostrea gigas,Distant hybridization,Gynogenesis
【中文摘要】以栉孔扇贝Chl amys f arreri为母本、长牡蛎Crassostrea gigas为父本进行人工杂交。采用Bouin氏液固定、石蜡切片和苏木精-伊红染色在光镜下对其受精和第1次卵裂过程中核相变化进行观察;运用压片法和热滴片法分别对4~8细胞期和担轮幼虫期胚胎进行染色体制片。结果表明,长牡蛎精子可以进入栉孔扇贝卵子,并激活卵子减数分裂使其释放第1极体(PB1) 和第2极体(PB2) ,能够形成雌、雄原核并融合为合子核,接着受精卵开始第1次卵裂;杂交胚胎发育过程中,囊胚期

很长、胚胎畸形严重,只能发育到担轮幼虫期;杂种胚胎染色体数目变化范围较大,在20~85之间,染色体不能平均分配到两个子细胞中是杂种胚胎死亡的主要原因。杂交胚胎不能存活保证了异源精子诱导栉孔扇贝雌核发育的可靠性。

【英文摘要】Fertilized eggs of hybrid Chlamys farreri (♀) ×Crassost rea gi gas (♂) were fixed in Bouin ' s fixative during fertilization and the first cleavage , before paraffin sections were made and stained by hematoxylineosin. Nuclear changes of these eggs were observed under an optical microscope. Squash met hod and air-dry method were al so used to observe the chromosomes of 4-8 cell stage and t rochop hore stage, respectively. The results showed that sperms of C. gigas could at tach to C. farreri eggs rapidly and be incorporated into it after insemination. The sperm activated the meiosis of C. farreri eggs , induced the fertilized eggs to release PB1 and PB2 , before the male and female pronuclei were formed. At last, the male and female pronuclei fused into zygotonuceus and the first cleavage then began. During the whole development process , the blastula stage was relatively long and the embryo was obviuouly abnormal , which could only reach trochophore stage and died before D-shaped larva stage. The number of chromosomes in the hybrid embryos varied greatly , which was between 20 and 85. The chromosome separated abnormally and could not distribute equally. It s unequal distribution into two daughter cell s was the main reason for the death of the embryo. Mass mortality of the hybrid embryos proved the reliability of gynogenesis of C. farreri induced by heterologous sperm.

【题目】异源精子诱导栉孔扇贝雌核发育二倍体的微管动态变化

【中文关键词】栉孔扇贝;异源精子;雌核发育;免疫荧光染色;微管;动态变化
【英文关键词】Chlamys farreri;gynogenesis;heterologous sperm;immunofluorescence staining;microtubule;dynamic status

【中文摘要】采用紫外线遗传灭活的长牡蛎(Crassostrea gigas) 精子激活栉孔扇贝(Chlamys farreri) 卵子,并用6-DMAP诱导染色体加倍的方法,获得第二极体抑制型雌核发育二倍体早期胚胎。多聚甲醛固定、免疫荧光染色后,运用荧光显微镜观察栉孔扇贝正常发育卵子和异源精子诱导的雌核发育卵子,对其受精过程中微管的动态变化过程进行观察和分析。结果表明:(1) 正常发育组受精卵内以微管为基础的纺锤体能够顺利地组装并引导卵细胞进行减数分裂和第一、第二极体的排放,以及雌、雄原核融合和第一次卵裂;(2) 异源精子诱导雌核发育的卵子经6-DMAP处理后,部分微管变得模糊或消失,纺锤体受到破坏导致染色体的分离无法进行,第二极体的形成受到抑制并使雌核染色体二倍化;去除6-DMAP作用后,微管重新组装,雌核分裂重新启动继而进行卵裂;精核保持固浓缩状态或轻微膨胀形成雄性原核,但卵裂后期则以致密的染色质体(DCB)形式存在于分裂沟上或进入一个卵裂球中。结果证实,长牡蛎精子经紫外线遗传灭活后可顺利进入并激活栉孔扇贝成熟卵子但不参与合子核的形成,6-DMAP也可有效抑制第二极体的排放而获得雌核发育二倍体胚胎。本实验结果为研究异源精子诱导栉孔扇贝雌核发育的可行性提供了细胞学依据。

【英文摘要】Artificial diploid gynogenesis techniques in shellfish have developed rapidly in recent years,however,few studies on the dynamic status of microtubule in this field were reported. This study depicted the microtubule status in early developmental stages of normal fertilized diploids and gynogenetic diploids of scallop Chlamys farreri,and,provided cytological bases for cytoengineering breeding and related researches. The meiotic division of the eggs of Chlamys farreri was activated by ultraviolet (UV)-irradiated heterogenous sperm of Pacific oyster Crassostrea gigas and the gynogenetic diploids were induced by blocking extrusion of the second polar body from fertilized eggs with 6-dimethylaminopurine (6-DMAP). The dynamic status of microtubule was studied by direct immunofluorescence with FITC-anti- α -tubulin. The results showed that the spindle assembled periodically towed the chromosomes to accomplish the extrusion of the first and second polar bodies,and the female and male pronuclei fused into zygotonucleus in normal fertilized eggs. However,the behavior of microtubule in eggs of gynogenetic diploids was considerably complicated. The microtubule in 6-DMAP treated eggs was destroyed badly and the spindle became anomalistic shape or disappeared,the microtubule became shorter and unconspicuous. The chromosomes arranged irregularly and couldn ' t move to form the second polar bodies. After relieving the treatment of 6-DMAP,the microtubule reassembled and conduced the diploid female pronuclei ' s movement to activate the first cleavage. In this process,the sperm nucleus of gynogenesis kept dense or expanded again to become a dense chromatin body (DCB) which didn ' t join into the karyokinesis. The results of this study suggested that the ultraviolet (UV)-irradiated sperms of Crassostrea gigas could enter into the eggs of Chlamys farreri and activate the eggs while they did not form the zygocyte. And the 6-DMAP could prohibit the excursion of the second polar body to produce diploids. The feasibility of gynogenesis in Chlamys farreri induced by

heterologous sperm was demonstrated.

【题目】海湾扇贝正反交两个家系形态学指标比较分析
【中文关键词】海湾扇贝(Argopecten irradians irradians),正反交,形态学指标
【英文关键词】无
【中文摘要】以海湾扇贝(Argopecten irradians irradians)正反交两个F1代家系为材料,研究了壳长、壳宽、壳高、全湿质量、软体部质量和壳质量6个生长指标的分布特点。结果表明,各指标两两之间均显著相关,3个质量指标均完全符合正态分布(P0.05),3个长度指标略偏离正态分布(0.01P0.05)。相对于标准正态分布来讲,各形态学指标较小的个体略多。6个性状指标均呈连续分布状态,符合数量遗传学特点。6个指标在正反交后代中差异显著,但均显著高于自交群体。且在反交群体中各指标离散程度较高,初步说明同一扇贝产生雌雄配子时亲本效应不同。

【题目】虾夷扇贝5个群体的遗传多样性
【中文关键词】虾夷扇贝,微卫星,遗传多样性
【英文关键词】Patinopecten yessoensis,microsatellites, genetic diversity
【中文摘要】:虾夷扇贝为20世纪80年代初从日本引入我国并逐渐开展养殖的双壳贝类,目前已在我国北方地区大面积养殖。实验采用微卫星分子遗传标记技术对大连獐子岛底播增殖放流群体(CC)、黄海北部海区采集的野生群体(HQ)、日本青森养殖群体(JX)、俄罗斯远东日本海沿岸养殖群体(RX)及大连大长山岛养殖上壳白化群体(ZB)等5个虾夷扇贝群体的遗传多样性进行研究。其中HQ群体为本课题组2005年在黄海北部采集的野生群体,本研究筛选出一个该群体的特异性遗传标记。用8个微卫星位点进行扩增,共获得45个等位基因,每个位点的等位基因数处于3~9之间,大小为100~340bp,平均有效等位基因数为3.1535,基因型数为3~21个,PIC(Polymorphism Information Content)值处于0.0322~0.5944之间。5个群体的平均观测杂合度分别为0.3292、0.3048、0.3167、0.2708、0.3042,平均期望杂合度分别为0.4595、0.4002、0.3838、0.3620、0.3885,群体间的多态性差异不显著。根据群体间遗传相似性系数、遗传距离及UPGMA聚类分析发现,CC和HQ群体亲缘关系最近,JX和RX群体的亲缘关系较近,ZB群体与JX和RX群体的亲缘关系较近。通过Hardy2Weinberg平衡及F2检验发现,5个群体都不同程度的偏离平衡,表明各群体基因频率和基因型频率的稳定性较低,且5个群体均处于不同程度的杂合子缺失状态,群体间的遗传分化程度较高,但遗传变异主要来自群体内的个体间。
【英文摘要】The Japanese scallop (Patinopecten yesoensis) was introduced from Japan to Dalian in the 1980ps. It has been cultured on large scale in this area. In this study genetic diversity of 5 cultured and natural populations of Japanese scallop were investigated by microsatellites. The 5 populations were the population in Zhangzidao island (CC), the natural population in north area of the Yellow Sea (HQ), Japanese cultured population (JX), Russian population (RX) and albino population collected in Dachangshan island (ZB). HQ is a natural population which has been collected in north area of Yellow Sea in 2005. A specific genetic markerwas found in this population. Thirty individuals from each population were analyzed. Amp lificationswere performed in a PCR reactorwith 8 microsatellite loci, tested by agarose gel eletrophoresis and analyzed by gel analysis software. In this study 45 alleleswere obtained. The number of alleles of each locus ranged from 3 to 9, and allele size ranged from 100 to 340bp. The mean number of effective alleles (ae)

was 3. 1535 and the number of genotypes ranged from 3 to 21 in each locus. PIC (Polymorphism Information Content) per locus ranged from 0. 0322 to 015944. The average observed heterozygosity (Ho) for the five populations was 0. 3292, 0. 3048, 0. 3167, 0. 2708 and 013042, respectively. The average expected heterozygosity (He) for the 5 populations was 0. 4595, 0. 4002, 0. 3838, 013620 and 0. 3885, respectively. The difference in genetic diversity among the 5 populations is not significant. According to their genetic similarity (I) and genetic distance (D) , we found that the genetic distance between CC and HQ was the least, followed by that of JX and RX. The distance between ZB to JX and RX were both closer than those of CC and HQ. The P value test of Hardy2Weinberg equilibrium showed that the populations departed from Hardy2Weinberg equilibrium in some loci. All 5 populations showed the absence of heterozygosity. The results of the F2test suggested high genetic differentiations among the 5 populations, and mainly due to individual difference.

【中文关键词】虾夷扇贝,繁殖期,幼虫分布,采苗技术
【英文关键词】Patinopecten yessoensis, Spawning period, Larvae distribution, Spat collection
【中文摘要】在调查了2005、2006年黄海北部大连海域虾夷扇贝的繁殖期、浮游幼虫的时空分布的基础上, 对虾夷扇贝海区天然采苗进行了研究。结果表2005、2006年该区域的樟子岛海域、大长山岛海域、广鹿岛海域养殖的虾夷扇贝的繁殖期在4月初至5月上旬, 盛期在4月15-25日。4月上旬至6月中旬, 在此区域均可发现大量的虾夷扇贝浮游面盘幼虫, 不同区域浮游幼虫密度变化很大。5月底至6月初是面盘幼虫集中的附着变态时期, 在海区投放附着袋可进行虾夷扇贝天然苗的采集。从各海区虾夷扇贝浮游幼虫的施网调查和采苗结果看, 在虾夷扇贝主要养殖区璋子岛、大长山岛海域和广鹿岛海域, 浮游幼虫在浮游的初始阶段能够形成较高的密度, 但在附着阶段密度极低, 不能采集到大量苗种, 但在远离灯夷扇贝养殖区的大李家湾和凌水湾, 浮游幼虫的出现比养殖区晚, 在幼虫附着期能达到较高密度, 能够采集到大量天然苗种。2005年在凌水湾的采苗数量达526±131个/袋(壳长0.6-1mm), 2006年在大李家湾的采苗数量达673±200个/袋(壳长0.6-1mm)。
【英文摘要】The technique for natural spat collection of introduced scallop Patinopecten yessoensis in the field was reported, based on assessments of spawning period and temporal-spatial distributions of larvae in Northern Yellow Sea in 2005 and 2006. Spawning period of the scallops started in early April and ended in early May around Zhangzi Island, Da Changshan Island and Guanglu Island, and peaked during April 15-25. From early April to mid June, pelagic larvae were found in these areas. Larvae densities varied greatly with locations. Late May and early June were the primary periods for settlement of scallops, when settlement mesh bags should be put out to sea for spat collection. Survey by dragnet sampling and seed collection showed that higher densities of early stage larvae appeared around the three islands, although the biomass of eyespot larvae was too low to support a viable spat collection. Far from the scallop cultivation areas, the pelagic larvae appeared later in the Bays of Lingshui and Da Lijia, where the peak density of eyespot larvae and spat settlement also occurred. In 2005, the highest density of spat collection was 526±131 ind./bag(shell length 0.6-1mm), found in Lingshui Bay; while in 2006, the highest density was 673±200 ind. /bag(shell length 0.6-1mm), found in Da Lijia Bay.

【题目】
Crosses between bay scallop Argopecten irradians subspecies and heterosis for yield traits at harvest

【中文关键词】bay scallop,heterosis,hybrid gain,subspecies,Argopecten irradians,shell colour,bay scallop,heterosis,hybrid gain,subspecies,Argopecten irradians,shell colour

【英文关键词】bay scallop,heterosis,hybrid gain,subspecies,Argopecten irradians,shell colour,bay scallop,heterosis,hybrid gain,subspecies,Argopecten irradians,shell colour

【中文摘要】In order to improve the yield of bay scallop Argopecten irradians by exploiting geographic subspecies heterosis, crosses between and within two subspecies, the northern A. i. irradians (Lamarck) and the southern A. i. concentricus (Say), were created and the offspring were cultured under the same environmental conditions. The two parental populations were collected from Bohai Bay in northern China and Beibu Bay in southern China, which were distinct in particular shell colours. The results indicated that the shell colour of bay scallop was inheritable and could be used as a morphological mark to distinguish hybrid and purebred individuals. At harvest, hybrid offspring always produced a significantly higher yield than purebred offspring. Positive heterosis was achieved for shell length, shell height, shell width, total weight and adductor weight, which was 5.02, 5.22, 3.88, 7.53 and 9.47 respectively. Hybrid gain was 10.86% for shell length, 10.48% for shell height, 9.77% for shell width, 34.90% for total weight and 41.69% for adductor weight, respectively, and all were significantly >5%. The present study reveals that it is effective for improving yield by hybridization between different geographic subspecies in the bay scallop.

【题目】扇贝精子与卵子的生物学特性

【中文关键词】扇贝,精子,卵子,卵水,顶体反应,皮层反应

【英文关键词】scallop, sperm, egg, egg water, acrosome reaction, cortical reaction

【中文摘要】采用扫描电子显微镜和普通光学显微镜观察方法,结合全光谱扫描分析方法,对栉孔扇贝和虾夷扇贝的精子及卵子的受精生物学特性进行了详细的观察,包括精卵产出后形态学变化、卵水的特性、精子顶体反应、卵子皮层反应以及精子分级分离组分对卵子的作用5个方面。结果表明,这两种扇贝精卵生物学特性没有本质的区别,扇贝精子排入海水中10min以内,外形没有太大的变化,但30min以后约有1/4的精子出现头部膨大变成圆球形的现象,受精能力明显下降;扇贝卵子产入海水中1h以内受精能力没有变化,但2h以后,约1/3的卵子出现卵裂现象,未见极体的排放,且卵裂多停止在2细胞期,少数达到4细胞期,基本属于均等卵裂,并失去受精能力;滴入卵水中的精子极易发生自溶解体,未解体的精子发生凝集,10min之后卵水中基本检测不到完整的精子,卵水和钙离子载体A23187均能诱导精子发生顶体反应;精子分级分离组分分别为精浆、精子头部和精子尾部,这三部分除了少数精子头部能够附着在卵子表面外,其他都不具备激活卵子的作用。对扇贝精子和卵子的生物学特性的研究将为解释不同种扇贝的精卵相互识别并受精的现象提供基础资料。

【英文摘要】The fertilization biology characteristics of eggs and sperms in two scallop species,Patinopecten yessoensis and Chlamys farreri,including m0rphological changes of gametes after release,egg water characteristics,sperm acrosome reaction,egg cortical reaction,and the effect of the sperm fractional separation components on the eggs,were observed using electronic microscopy,optical microscopy,and spectrum scanning analysis and insemination.The results showed that there were no significant difference in biological characteristics between P. yessoensis and C.farreri.No obvious appearance changes in the scallop sperms within 10min after release in the seawater.However,30 minutes later,25% of the sperms became head-enlarged to near spherical and the fertilization ability was

weakened.While the fertilization ability of the scallop eggs did not change within 1 hour after release in the seawater,and about 33% of the eggs became cleaved but without appearance of polar body in two hours. Most egg cleavage were equal cleavage terminated at the 2-cell stage and some at the 4-cell stage, and the fertilization ability of the eggs at this phase were lost.Most sperms dropped into the egg water were autolyzed,and other sperm agglutinated.No intact sperm individual was seen after being transferred into the egg water for 10 minutes.The sperm acrosome reaction was induced by the egg water or calcium ionophone A23187.Although a few sperm heads attached to the surface of the eggs,the components of sperm including seminal plasma,sperm head,and sperm tail,couldnot activate the eggs. This research on biological characteristics of eggs and sperms in scallop are expected to provide basic data for understanding why sperm and eggs from different species of scallops could recognize each other and fertilize.

【题目】不同壳色虾夷扇贝家系F1代幼虫生长及遗传结构的比较分析

【中文关键词】虾夷扇贝;F1幼虫;生长性状;壳色;遗传结构;家系;遗传距离;成活率;孵化率;遗传差异

【英文关键词】Patinopecten yessoensis;F1 larva;growth;shell color;genetic diversity

【中文摘要】虾夷扇贝(Patinopecten yessoensis)群体存在2种壳色个体,简称白贝和褐贝。本研究通过近交和杂交方法建立了褐贝(♀)×褐贝(♂)、白贝(♀)×褐贝(♂)、褐贝(♀)×白贝(♂)和白贝(♀)×白贝(♂)4个家系,分别用1F、2F、3F和4F代表,每家系设3个平行,共12个家系。对各家系的卵径、幼虫的孵化率、成活率和生长性状等生物学参数进行了比较,建立了各个家系幼虫壳长、壳高的生长方程,并利用微卫星标记比较4个家系的遗传差异。结果表明,不同壳色家系间卵径大小、幼虫的孵化率、成活率差异不显著(P>0.05),家系4F幼虫期壳长和壳高日生长速率均高于1F、2F和3F,且差异显著(P<0.05),家系2F、3F和4F间幼虫期壳长和壳高日增长速率差异不显著(P>0.05)。家系1F的遗传多样性最低;遗传相似性系数(0.6351~0.9772)和遗传距离(0.0231~0.4540)分析表明,1F和4F之间遗传相似性(0.6351)最低,遗传距离(0.4540)最远;不同家系间存在着遗传差异,1F和4F差异最大。本研究结果初步说明虾夷扇贝群体内白贝个体和褐贝个体之间产生了遗传分化,这种遗传结构的差异造成了不同壳色家系在幼虫阶段生长性状上的不同。

【英文摘要】Fourdiferent colorlines ofPatinopectenyessoensisincluding 1F(brown*brown),2F(white*brown),3F(brown*white)and 4F(white*white)were established by inbreeding and crossing.Each line had three parallel groups.Biology parameters of egg size,hatching rate,juvenile ’s growth rate and survival rate were compared among different shell color lines.The four lines ’genetic diversity was mutually compared with microsatellite markers.Linear regression equations between shell length and culture time,and between shell height and culture time for all lines were obtained.Comparation of egg diameter,hatching rate of larvae and larval survival rate among1F, 2F, 3F and 4F lines showed no significant differences(P>0.05).But daily growth rates of shell length for 1F, 2F, 3F and 4F were significantly different(P<0.05),which were 4.349 um/d, 4.495 um/d,4.623 um/d and 6.365 um/d, respectively.Shell height daily growth rates for 1 F, 2F, 3F and 4F were also significantly different from each other(P<0.05), which were 4.464 um/d,4.644 um/d, 4.691 um/d and 6.365 um/d, respectively. The growth rates of larva ’s shell length and shell height of 4F were significantly higher than those of I F, 2F, 3F(P<0.05). The important genetic parameters of all lines such as allele number,expected heterozygosity and observed heterozygosity were analyzed by SSR.The results showed that 1 F had the lowest genetic diversity.In addition,Nei ’s genetic identity(0.6351-0.9772)and genetic distance(0.0231-0.4540) indicated that genetic identity between 1 F and 4F (0.6351)was the lowest and genetic distance between them was the farthest(0.454 0). The present results indicated genetic diferentiation exists between white and brown individuals within Patinopecten yessoensis populations, which caused different larval growth rates among four kinds of shell color lines of Patinopecten yessoensis.The present studyprovides basic data for selective breeding of different shell color Japanese scallop.

【题目】Study on the potential of suspended longline mariculture of scallop Chlamys farreri in offshore area
【中文关键词】scallop Chlamys farreri,suspended longline mariculture,offshore,Sungo Bay
【英文关键词】scallop Chlamys farreri,suspended longline mariculture,offshore,Sungo Bay
【中文摘要】The growth and survival of the scallop Chlamys farreri exposed to different initial densities were evaluated in culture systems from inshore and offshore areas of Sungo Bay, China, from May 2007 to March 2009. Water quality data (e.g. temperature, salinity, current speed, chlorophyll a and total particulate material) were measured concurrently. The C. farreri reached the market size after 10 months of cultivation. Average survival rates for the same initial densities were lower in the inshore area than those in the offshore area. Survival rates also were inversely proportional to the initial densities. Scallops in offshore area with initial densities of 20 and 30 individuals per disc resulted in significantly greater shell heights, soft tissue weights and muscle weight compared with the other experimental groups. Tissue weight increased rapidly from May to September. However, scallops in offshore area had a second growth peak during October to November. Scallops in the offshore area had higher growth and survival rates, which may be attributed to high water current speed resulting in increased food supplies. Results indicate that the scallop C. farreri has an aquaculture potential in offshore cultivation systems.

【题目】Molecular characterization and expression analysis of chitinase (Fcchi-3) from Chinese shrimp, Fenneropenaeus chinensi
【中文关键词】中国明对虾 几丁质酶 重组表达
【英文关键词】Fenneropenaeus chinensis; Chitinase; Recombinant expression; LC-ESI-MS
【中文摘要】中国明对虾几丁质酶基因克隆、重组表达
【英文摘要】Complementary DNA (cDNA) and genomic DNA, including flanking regions of the chitinase gene (Fcchi-3) of Fenneropenaeus chinensis, were cloned and sequenced. Fcchi-3 was found to have 92.0 and 91.4% identity at the cDNA level to that of Litopenaeus vannamei and Marsupenaeus japonicus, respectively. The predicted amino acid sequence had an overall similarity with a comparable region of L. vannamei (96.8%) and M. japonicus (93.4%). Based on the cDNA sequence, the genomic structure of the gene was characterized. Sequence analysis revealed that the Fcchi-3 gene was composed of seven exons with 411, 252, 186, 132, 171, 117 and 135 bp and six introns with 232, 196, 121, 90, 159 and 157 bp. Analysis by RT-PCR revealed that Fcchi-3 was a hepatopancreas specific gene. Semi-quantitative RT-PCR analysis revealed that Fcchi-3 transcript was down-regulated significantly in response to the challenge of WSSV at 5 h post-injection and then came back to normal level at 37 h. A fusion protein containing Fcchi-3 was produced and the purified recombinant protein exhibited similar biological function. The result of identification through LC-ESI-MS showed that three peptide fragments (-MAADPVLR-, -ATIDPAYNVPELSK- and -AILAVGGWNEGSPK-) of the recombinant protein were identical

to the corresponding sequence of L. vannamei chitinase-3. The recombinant Fcchi-3 could degrade the colloid chitin confirming that the recombinant protein is actually the chitinase.

【题目】Molecular characterization and effect of RNA interference of retinoid X receptor (RXR)
【中文关键词】中国明对虾 蜕皮 Retinoid X receptor
【英文关键词】Retinoid X receptor; Molting; Fenneropenaeus chinensis
【中文摘要】中国明对虾Retinoid X receptor的分子特征以及与几丁质合成的关系
【英文摘要】Retinoid X receptor (RXR)/ultraspiracle (USP) is the heterodimeric partner of ecdysteroid receptor and is required for the molting process of arthropods. To better understand the molecular aspects governing the process of molting in shrimp, the full-length cDNA of two RXRs, named as FcRXR-1 and FcRXR-2 were obtained from Chinese shrimp Fenneropenaeus chinensis which were of 1715 and 1700 bp long, revealed a 1315 and 1300 bp open reading frame (ORF) respectively. Quantitative Real time PCR analysis showed a marked tissue-specific difference in the expression of FcRXR transcript, which revealed that the expression of FcRXR Could be regulated in a tissue-specific manner. Moreover, high expression of FcRXR mRNAs was observed in late pre-molt period (D3) and post molt stages (A-B) of shrimp. Among the two isoforms, FcRXR-2 appeared in a considerably high level in all the stages compared to the FcRXR-1. In addition, we examined the temporal expression of two chitinase genes: FcChitinase (FcChi) and FcChitinase-1 (FcChi-1) during the molt cycle of F chinensis. Both the FcChi and FcChi-1 transcripts were detected in all stages of molting, although considerable fluctuations observed through the molt cycle. Injection of double stranded RXR (dsRXR) into juvenile shrimp resulted in a maximum silencing effect at 48 h post injection. We analyzed the expression levels of FcChi, FcChi-1 and the ecdysone inducible gene E75 (FcE75) in samples of dsRXR injected shrimp. Significant reduction in levels of both FcE75, FcChi and FcChi-1 transcripts Occurred in the silenced shrimp. This correlation suggested that RXR might involve in the downstream regulation of E75 and chitinase gene transcription in the ecdysone signaling pathway of decapod crustaceans.

【题目】Molecular characterization of an ecdysone inducible gene E75 of Chinese shrimp Fenneropenaeus chinensis and elucidation of its role in molting by RNA interference
【中文关键词】E75; 蜕皮 中国明对虾 RNAi
【英文关键词】E75; Molting; Fenneropenaeus chinensis; RNAi
【中文摘要】中国明对虾 E75 与蜕皮的关系
【英文摘要】Ecdysone inducible gene. E75 is a primary target of ecdysone receptor (EcR). and is found to play a critical role in the molting process of arthropods In this study, a cDNA encoding the E75 of Chinese shrimp Fenneropenaeus chinensis (FcE75) was cloned using RT-PCR and RACE techniques FcE75 cDNA was 3611 bp in length with an ORF of 2394 bp. The deduced amino acid sequence of FcE75 had the highest sequence identity to E75 from a land crab Gecarcinus lateral's and E75 of the shrimp Metapenaeus crisis Quantitative real-time PCR revealed a prominently high expression of FcE75 mRNA in the whole body RNA extract of late premolt period (D3) juvenile shrimp. The role of E75 in the process of shrimp molting was investigated using the RNA interference technique Long double-stranded RNA corresponding to the FcE75 (dsE75) efficiently silenced the FcE75 transcript levels in juvenile F.

chinensis. Further, injection with dsE75 completely arrested the molting process in experimental shrimp which eventually caused death Setogenic analysis of the uropods from molt-arrested shrimp, showed defective epidermal retraction, poor development of setae and new cuticle. These results indicate that E75 might be related to the molting process and is essential for proper molting and survival of shrimp This is the first report demonstrating the use of double stranded RNA to elucidate the possible role of E75 in the molting of decapod crustaceans

【题目】Identification of the immediate-early genes of white spot syndrome virus
【中文关键词】WSSV; IE genes; 对虾
【英文关键词】WSSV; IE genes; Cycloheximide; Crayfish; Primary Culture
【中文摘要】对虾白斑病毒早期反应基因的鉴定
【英文摘要】During viral infection, viral immediate-early (IE) genes encode regulatory proteins critical for the viral life cycle. Here we screened white spot syndrome virus (WSSV) IE genes with cycloheximide (CHX)-treated primary culture of crayfish hemocyte and a WSSV genome tiling microarray. Sixteen ORFs, including a known WSSV IE gene (ie1/wsv069), were identified and confirmed by RT-PCR and time course studies. The 16 identified IE proteins contain four proteins (WSV051. WSV069, WSV100, WSV079) with transcription activity, one (WSV083) with Ser/Thr kinase domain and one (WSV249) previously described to function as an ubiquitin E3 ligase. Furthermore, most of the identified WSSV IE genes cluster in a 14 kb genomic region (WSSV China isolate: 36,052 to 50,300 bp). This type of arrangement may facilitate the coordinate control and rapid expression of IE genes.

【题目】黑鲷CXC趋化性因子的体外表达及生物学活性
【中文关键词】黑鲷(Acanthopagrus schlegeli); ELR+CXC 趋化因子; 重组表达; 生物活性
【英文关键词】black bream(Acanthopagrus schlegeli); ELR~+CXC chemokines; recombination expression; biological activity
【中文摘要】采用 DNA 体外重组技术,将一个黑鲷 CXC 趋化因子基因亚克隆到 pQE30表达载体并转化到大肠杆菌(M15)中诱导表达后,利用 pn 递降的缓冲液从金属亲和柱洗脱含6xHis 标签蛋白的方法得以纯化,纯化产物的分子量约为8kDa,表达量约占蛋白总量的25%,以6xHis 单抗为一抗,采用 Western-blotting 方法鉴定获得的蛋白为目的蛋白。对表达产物进行生物活性鉴定表明,该蛋白具有显著的嗜中性粒细胞和巨噬细胞的趋化活性(P<0.01,P<0.05),它对嗜中性粒细胞和头肾巨噬细胞的趋化能力呈剂量依赖性,且对嗜中性粒细胞的趋化能力大于对头肾巨噬细胞的作用,还能诱导改变嗜中性粒细胞和巨噬细胞对细菌的吞噬活性,但对嗜中性粒细胞吞噬能力的改变小于巨噬细胞。该趋化性因子在结构和功能上属不完全 ELR+CXC 型趋化因子,兼具 ELR~+CXC 和 ELR~-CXC 趋化因子的活性,是一种不成熟 ELR+CXC 型趋化因子。
【英文摘要】With the method of DNA recombination in vitro,a black sea bream CXC (BSCXC) chemokine mature peptide coding sequence was sub cloned into expression vector pQE30 and expressed in E.Coli M15.About 8kDa expressed protein was purified by Ni-NTA chromatographic technology and identified by Western blotting using 6xHis tag antibodies.The bioactivity assay showed that the expressed protein had significantly chemotactic activities towards both leucocytes and macrophages in a dose dependent manner (P<0.01,P<0.05),and the BSCXC had stronger chemotaxis effects to leucocytes than that to macrophages.Furthermore,the BSCXC can significantly enhance the phagocytic activity of macrophages.The results indicate that the BSCXC is an incomplete ELR~+ CXC chemokine for it is structurally and func- tionally incomplete,and possesses ELR~+ CXC and ELR~- CXC chemokine activities.

【题目】Functional characterization of the ELR motif in piscine ELR+CXC like chemokine
【中文关键词】ELR+CXC 趋化因子; 重组表达; 生物活性
【英文关键词】ELR+CXC-like chemokine; Recombinant; Mutant; ELR motif; Chemotaxis
【中文摘要】ELR+CXC 趋化因子的重组表达和生物活性
【英文摘要】To elucidate the functional role of piscine incomplete ELR motif, the recombinant CXC and its mutants (mELR and mLoop) were produced in Escherichia coli M15 based on the predicted mature peptide coding sequence of the black sea bream CXC (BS CXC) chemokine. Assays showed that the BS rCXC proteins displayed strong ability to induce fish blood neutrophils and head kidney (HK) macrophage migration in a dose-independent manner (10 to 200 ng), both in black sea bream and common carp. Although the ELR motif and the N-terminal loop of ELR+CXC chemokines are essential for chemotactic activity and receptor binding in mammals, the mELR and mLoop mutants showed no significant difference in their induction of chemotaxis of fish blood neutrophils compared with the full-length rCXC at the same dose. Human recombinant IL-8 (hrIL-8) can clearly induce piscine blood neutrophil migration and has no effect on macrophages, whereas the BS rCXC cannot induce chemotaxis in higher vertebrates, such as rat blood neutrophils or macrophages, even if the incomplete ELR motif in rCXC was mutated to ELR. The BS CXC and its mutants can promote the phagocytosis ability of piscine blood neutrophils and HK macrophages both in black sea bream and common carp, but have no effect on rat neutrophils or macrophages. Results showed that the piscine ELR+CXC-like chemokine represents an ancient version of a CXC chemokine; the ELR motif still does not show the higher specific polarization of function as found in mammalian.

【题目】Preparation and PEGylation of exendin-4 peptide secreted from yeast Pichia pastoris
【中文关键词】Exendin-4; Pichia pastoris; PEGylation; Bioactivity; Histological
【英文关键词】Exendin-4; Pichia pastoris; PEGylation; Bioactivity; Histological
【中文摘要】Exendin-4; Pichia pastoris; PEGylation; Bioactivity; Histological
【英文摘要】Exendin-4, a peptide analogue of glucagon-like peptide (GLP-1), has been developed for treatment of type 2 diabetes. Herein, the secretive exendin-4 peptide, expressed by methanol induction in Pichia pastoris, was purified to near homogeneity by Ni-NTA agarose chromatography. 103.6 mg of protein was obtained from 1 L of the supernatant and its purity was 96.1%. Subsequently, the PEGylated exendin-4 was prepared. The bioactivity of exendin-4 was determined by examining the glucose-lowering and insulin-releasing ability in plasma. Then, a safety evaluation was performed by histological examination of the main organs (liver, kidney and pancreas). PEGylated exendin-4 displayed glucose-lowering and insulin-stimulating action in vivo without obvious damage to the above organs. The results suggest that the P. pastoris expression could be used to produce large quantities of exendin-4, and PEGylation is a useful tool to maintain and enhance bioactivity of the peptide.

【题目】Purification and characterization of a natural lectin from the plasma of the shrimp Fenneropenaeus chinensis
【中文关键词】中国明对虾 凝集素 模式识别蛋白
【英文关键词】affinity chromatography; shrimp; lectin; invertebrate; pattern recognition protein
【中文摘要】中国明对虾凝集素的分离纯化和特征
【英文摘要】A natural lectin from the plasma of the shrimp Fenneropenaeus chinensis was purified by singlestep affinity chromatography using fetuin-coupled agarose. The purified plasma lectin showed a strong affinity for human A/B/O erythrocytes (RBC), mouse RBC and chicken RBC. The hemagglutinating (HA) activity of the lectin was dependent on Ca2+ and reversibly sensitive to EDTA. This lectin was named FC-L and its inactive form had a molecular mass estimate of 168 kDa. Fifteen N-terminal amino acid sequences of this protein were determined. We performed HA-inhibition assays with several carbohydrates and glycoproteins. FC-L showed a distinct and unique specificity to N-acetylated sugars, particularly sialic acid and sialoproteins. The FC-L also has binding activity to some Gram-negative bacteria which caused disease in shrimp and fish. The activity of FC-L was inhibited at temperatures greater than 75 degrees C and at a pH less than 7 or greater than 11. These results suggest that FC-L may play a role as pattern recognition proteins in the reorganization and clearance of invaders in shrimp F. chinensis.

【题目】有机碳源对发状念珠藻单体细胞生长和光合作用的影响
【中文关键词】发状念珠藻单体细胞;有机碳源;生长;光合作用
【英文关键词】Nostoc flagelliforme cells; organic carbon sources; growth; photosynthesis
【中文摘要】采用液体悬浮培养方法研究了有机碳源对发状念珠藻(Nostoc flagelliforme)单体细胞生长及光合作用的影响。结果表明发状念珠藻单体细胞具有利用有机碳源进行混合营养生长的能力,葡萄糖和蔗糖对其生长具有明显的促进作用,乳糖、木糖、乙酸钠和甘油也能促进其生长。在BG-11 培养基中添加浓度为3.98 g L－1 葡萄糖,培养7 d,细胞生物量(干重)达到1.77 g L－1,是同等培养条件下光合自养所得干重的4.81 倍。通过测定添加有机碳源初时和生长2 d 后发状念珠藻单体细胞的光合放氧速率的变化情况,发现在培养初时,低光照强度(低于50 μmol m－2s－1)有机碳源不能促进藻细胞的光合作用;在光饱和点(100 μmol m－2s－1)混合营养藻细胞的净光合放氧速率达到192.31 μmolO2 (mgChl) －1 h－1,是光合自养细胞的1.57 倍。进入对数期后,混合营养藻细胞的净光合作用降低,但是呼吸速率达到703.43 μmolO2 (mgChl) －1 h－1,是光合自养细胞的14.27 倍;真正光合作用(净光合作用和呼吸作用之和)提高。
【英文摘要】The effects of organic sources on the growth and photosynthesis of Nostoc flagelliforme cells in liquid suspension culture were studied. The results show that the glucose and sucrose in the medium can promote the growth of N. flagelliforme cells efficiently; in addition, lactose, xylose, acetate and glycerol can also promote the growth of N. flagelliforme cells. It indicates that the N. flagelliforme cells have the ability of utilizing the organic carbon sources to grow mixotrophically. In the BG-11 medium with glucose concentration of 3.98 g L－1 and after 7 d of cultivation, the cell density of N. flagelliforme can reach 1.77 g L－1, which is 4.81 folds of that obtained under autophototrophic condition. Through the determination of the photosynthetic rate variation of N. flagelliforme cells at its beginning and after 2 d cultivation of mixotrophic growth, it was found that, at the initial time after addition of organic carbon sources, the maximum net photosynthetic rate of N.flagelliforme cells is low when the light intensity of illumination is low (lower than 50 μmol m－2 s－1). However, the net photosynthetic rate of N.flagelliforme cells in mixotrophic culture reaches 192.31 μmolO2 (mgChl) －1 h－1 at light saturation point, which is 1.57 folds of that obtained under autophototrophic culture. After 2 d of cultivation, the net photosynthetic rate of N. flagelliforme cells in mixotrophic culture decreases, while their respiration rate increases to 703.43 μmolO2 (mgChl) －1 h－1, which is 14.27 folds of that in autophototrophic culture. Thus, the gross photosynthesis rate (net photosynthetic rate plus respiration rate) of N. flagelliforme cells increases.

【题目】PCR-DGGE analysis of intestinal bacteria and effect of Bacillus spp. on intestinal microbial diversity in kuruma
【中文关键词】对虾 肠道微生物 PCR-DGGE
【英文关键词】intestinal microbial diversity; PCR-DGGE; Kuruma shrimp
【中文摘要】对虾肠道微生物的PCR-DGGE分析以及芽孢杆菌对其产生的影响
【英文摘要】In this study, the intestinal microbiota of kuruma shrimp (Marsupenaeus japonicus) was examined by molecular analysis of the 16S rDNA to identify the dominant intestinal bacteria and to investigate the effects of Bacillus spp. on intestinal microbial diversity. Samples of the intestines of kuruma shrimp fed normal feed and Bacillus spp. amended feed. PCR and denaturing gradient gel electrophoresis (DGGE) analyses were then performed on DNA extracted directly from the guts. Population fingerprints of the predominant organisms were generated by DGGE analysis of the universal V3 16S rDNA amplicons, and distinct bands in the gels were sequenced. The results suggested that the gut of kuruma shrimp was dominated by Vibrio sp. and uncultured gamma proteobacterium. Overall, the results of this study suggest that PCR-DGGE is a possible method of studying the intestinal microbial diversity of shrimp.

【题目】中国对虾血蓝蛋白基因cDNA的克隆与序列分析
【中文关键词】中国对虾; 血蓝蛋白; 基因克隆; 序列分析
【英文关键词】Fenneropenaeus chinensis Hemocyanin Gene cloningSequence analysis
【中文摘要】利用3’和5’RACE技术从中国对虾Fenneropenaeus chinensis肝胰腺中克隆了1个血蓝蛋白基因FCHc,FCHc基因cDNA全长为2161bp。其中,开放阅读2 034bp,编码678个氨基酸,预测分子量为77.59 kDa。FCHc序列与凡纳滨对虾Litopenaeus vannamei血蓝蛋白同源性为82%,与日本囊虾Marsupenaeus japonicas同源性为85%。Real-timePCR实验结果表明,FCHc在肝胰腺中的相对表达量最高,在心脏和表皮中几乎不表达。该基因在鳗弧菌和对虾白斑综合征病毒(WSSV)感染后的对虾肝胰腺中的表达量显著增加,并具有不同的时空表达趋势,提示中国对虾FCHc基因在免疫反应中具有重要作用。
【英文摘要】A hemocyanin gene(FCHc) was cloned from hepatopancreas of Chinese shrimp Fenneropenaeus chinensis by Rapid Amplification Complementary DNA Ends(RACE) method.The full length cDNA of FCHc consists of 2 161bp with a 2 034 bp Open Reading Frame(ORF),which encoded 678 amino acids,and the predicted molecular mass was 77.59kDa.It showed 82% and 85% homology with those of Litopenaeus vannamei and Marsupenaeus japonicas.The real-time PCR results showed that the expression level of FCHc in hepatopancreas was the highest among seven studied tissues.Real-time PCR analysis showed that the expression of FCHc was up-regulated distinctly in the hepatopanereas of shrimp when they were challenged by Vibrio anguillarum and white spot syndrome virus(WSSV).FCHc showed different expression profiles in the hepatopancreas during V.anguillarum or WSSV virus infection.The results implied that FCHc might play an important role in shrimp immune system

【题目】发状念珠藻不同细胞破碎方法的研究
【中文关键词】藻蓝蛋白;细胞破碎;发状念珠藻
【英文关键词】C-phycocyanin; cell disruption; Nostoc flagelliforme
【中文摘要】为了获得野生发状念珠藻和液态培养发状念珠藻细胞破碎和提取藻蓝蛋白的最佳方法,进行了发状念珠藻细胞破碎方法的研究。采用液氮研磨、反复冻融,超声破碎,高压均质和玻璃珠破碎这几种方法对野生和液态培养发状念珠藻进行破碎研究。通过测定破碎率、藻蓝蛋白提取得率和纯度,对几种细胞破碎效果和藻蓝蛋白提取方法进行比较。结果表明,采用高压均质方法能获得最佳的破碎效果,当野生发状念珠藻和液态培养发状念珠藻细胞密度为10 mg/mL 时,破碎率分别达到96.45%97.06%。反复冻融法为提取液态培养发状念珠藻藻蓝蛋白最理想的方法,其藻蓝蛋白的纯度和提取得率分别为0.468 和1.28%;高压均质为提取藻蓝蛋白的最理想方法,其藻蓝蛋白纯度和提取得率分别为0.153 和1.43%。
【英文摘要】In order to get the best method for extraction of C-phycocyanin from Nostoc flagelliforme, the cell disruption of N.flagelliforme were investigated using five methods, including liquid nitrogen grounding, repeated freezing and melting, ultrasonic disruption, high-pressure homogenization, and glass beads-breaking treatment. And the five methods were compared by determination the breakage rate, extraction rate and purity of C-phycocyanin. Results showed that high-pressure homogenization was the most efficient method for cell disruption, with which the breakage rates of wild and liquid-cultured Nostoc flagelliforme reached 96.45% and 97.06%, respectively, when their cell density was 10 mg/mL. And repeated freezing and melting method was the most suitable method for extraction of C-phycocyanin from liquid-cultured Nostoc flagelliforme, with which the extraction rate and purity of C-phycocyanin were 1.28% and 0.468, respectively. For extraction of C-phycocyanin from wild Nostoc flagelliforme, high-pressure homogenization showed to be the best one. Using this method, the extraction rate and purity of C-phycocyanin were 1.43% and 0.153, respectively.

【题目】中国明对虾组织蛋白酶L的原核重组表达及其组织分布
【中文关键词】中国明对虾; 组织蛋白酶L; 原核重组表达; 组织分布
【英文关键词】Fenneropenaeus chinensis; cathepsin L; recombinant expression; tissue distribution
【中文摘要】组织蛋白酶L属于半胱氨酸蛋白酶中的木瓜蛋白酶超家族,在哺乳动物中它与抗原提呈、肿瘤入侵和转移、骨质吸收、细胞凋亡等许多生命活动有关。但对其在无脊椎动物中的功能了解的不多。从中国明对虾(Fenneropenaeus chinensis)中克隆得到了组织蛋白酶L基因,为了进一步研究组织蛋白酶L的组织分布及其功能,对该基因进行了重组表达。将中国明对虾组织蛋白酶L基因的酶原片段亚克隆进原核表达载体pET30a中,转化大肠杆菌BL21(DE3),再进行诱导表达,表达产物经SDS-PAGE电泳检测,其分子量在40kD左右,与期望的中国明对虾组织蛋白酶L的分子量一致。表达产物形成包涵体,经过对包涵体变性和复性,并进行His-tag柱亲和纯化,得到了纯化的蛋白。利用重组蛋白制备了的兔抗血清。Western实验表明,组织蛋白酶L在中国明对虾的肝、胃、肠中有表达,而在卵巢中没有表达。
【英文摘要】Cathepsin L,a member of the papain superfamily of cysteine proteases,has been linked to tumor invasion and metastasis,antigen presentation,osteoclastic bone resorption and apoptosis in mammals,but the knowledge of cathepsin L from invertebrates remains underdeveloped.A cDNA of cathepsin L has been cloned from Fenneropenaeus chinensis (FCL).In order to analyze the function of FCL,it was recombinantly expressed in Escherichia coli.The fragment of FCL cDNA was subcloned into pET30a expression vector, and the recombinant plasmid was transformed into E.coli BL21 (DE3) and then induced by isopropylthio-b-D-galactoside(IPTG).SDS-PAGE analysis conf irmed the expression of FCL and the molecular mass was about 40 kDa,which was in accord with the expected.However,the expressed product formed complete inclusion bodies in the cells.After denature with 8 mol/L urea and refolding by dialysis in Tris-HCl buffer, the soluble target protein was obtained,which could be purifi ed by His Bind resin chromatography.The purif ied FCL was used as an antigen to immunize rabbits.After several injections,the polyclonal antiserum against FCL was obtained and used in immunoblotting experiments.Western blot analysis revealed that FCL was distributed in hepatopancreas, stomach and gut, but not in ovary.

【题目】不同型式和洗脱剂对离子交换树脂纯化发菜多糖的影响
【中文关键词】洗脱剂,离子交换,纯化,发菜,多糖
【英文关键词】elution regents;elution method;purification;Nostoc flagelliforme;polysaccharide
【中文摘要】采用离子交换色谱对发菜多糖进行分离纯化,对OH- 型和Cl- 型交换色谱对发菜多糖分离纯化效果进行初步的比较。离子交换色谱柱(Φ216 ×30) ,采用DEAE- Cellulose离子交换树脂和NaCl梯度洗脱对发菜多糖进行纯化。使用PeakFit 4112对色谱峰的峰高、峰宽、保留体积、对称因子各参数进行比较。选择一种分离纯化效果较好的离子交换色谱类型,使用上样浓度为1mg/mL (上样体积50mL) ,分别采用0~1mol/L NaCl、CH3 COONa、NH4 Cl溶液为洗脱剂,洗脱流速为110mL /min,比较三者洗脱效果,进而确定其最佳洗脱剂和洗脱浓度。结果表明,OH- 型离子交换色谱对发菜多糖有更好的分离纯化效果,NaCl的洗脱效果更好,最佳洗脱浓度为012mol/L。
【英文摘要】The isolation and purification of polysaccharide from Nostoc flagelliforme by ion-exchange chromatography with DEAE cellulose were studied. The column of ion-exchange chromatography (Φ2.6×30) was packed with DEAE-Cellulose anion ion-exchange resin and gradient eluted with NaCl solutions. The content of the polysaccharide was determined with the phenol - sulfuric acid method. The effects of different types of DEAE cellulose resin on the separation efficiency were examined with 0.0-1.00 mol/L of gradient elution. PeakFit 4.12 software was employed to collect the chromatographic peak data such as the height, width, retention volume and symmetry factor of the peaks. The elution velocity is 1.0 mL/min. The sampling rent elution regents such as NaCl,

CH3COONa and NH4Cl on separation efficiency were examined. It was found that the best separation efficiency can be obtained using OH- type of DEAE cellulose resin with NaCl as the elution regent. With this regent, the comparison of gradient elution with equivalent elution was conducted and the results showed that the separation efficiency of the equivalent elution is better than that of the gradient elution. The optimal elution concentration is 0.2 mol/L NaCl. The polysaccharide was further purified with gel chromatography.

【题目】Statistical optimization of medium composition and culture condition for the production of recombinant anti-lipopolysaccharide factor of Eriocheir sinensis in Escherichia coli
【中文关键词】抗脂多糖因子 大肠杆菌 条件优化
【英文关键词】anti-lipopolysaccharide factor; optimization; medium composition; culture conditions; statistical methodology
【中文摘要】以响应面实验设计和分析方法优化了大肠杆菌表达抗脂多糖因子的表达条件
【英文摘要】Anti-lipopolysaccharide factors (ALFs) are important antimicrobial peptides that are isolated from some aquatic species. In a previous study, we isolated ALF genes from Chinese mitten crab, Eriocheir sinensis. In this study, we optimized the production of a recombinant ALF by expressing E. sinensis ALF genes in Escherichia coli maintained in shake-flasks. In particular, we focused on optimization of both the medium composition and the culture condition. Various medium components were analyzed by the Plackett-Burman design, and two significant screened factors, (NH(4))(2)SO(4) and KH(2)PO(4), were further optimized via the central composite design (CCD). Based on the CCD analysis, we investigated the induction start-up time, the isopropylthio-D-galactoside (IPTG) concentration, the post-induction time, and the temperature by response surface methodology. We found that the highest level of ALF fusion protein was achieved in the medium containing 1.89 g/L (NH(4))(2)SO(4) and 3.18 g/L KH(2)PO(4), with a cell optical density of 0.8 at 600 nm before induction, an IPTG concentration of 0.5 mmol/L, a post-induction temperature of 32.7 degrees C, and a post-induction time of 4 h. Applying the whole optimization strategy using all optimal factors improved the target protein content from 6.1% (without optimization) to 13.2%. We further applied the optimized medium and conditions in high cell density cultivation, and determined that the soluble target protein constituted 10.5% of the total protein. Our identification of the economic medium composition, optimal culture conditions, and details of the fermentation process should facilitate the potential application of ALF for further research.

【题目】饲料中添加重组抗菌肽对吉富罗非鱼生长性能及免疫力的影响
【中文关键词】重组抗菌肽; 吉富罗非鱼; 生长; 免疫; 攻毒实验
【英文关键词】recombinant antimicrobial peptide; tilapia; growth performance; index of immunity; protest test
【中文摘要】以吉富罗非鱼(genetically improved farmed tilapia,GIFT)幼鱼(体质量10.68 g±0.53 g)为研究对象,在实验饲料中分别添加0、5、10、20、50 mg/kg重组中国明对虾抗菌肽以及100 mg/kg氟苯尼考,并于实验结束时进行注射攻毒(嗜水气单胞菌)。通过8周的养殖实验,研究了饲料中添加抗菌肽对吉富罗非鱼幼鱼的生长性能、免疫指标以及攻毒实验的影响。结果显示,饲料中添加5~10 mg/kg抗菌肽可以显著提高罗非鱼的增重率、红细胞总数以及过氧化氢酶的活性,当添加量为5 mg/kg时,特定生长率最高;当添加量为50 mg/kg时,肝脏的超氧化物歧化酶与血清中溶菌酶活性较对照组显著降低

(P<0.05);添加100 mg/kg氟苯尼考组较对照组能显著提高红细胞总数;当添加量为5~20 mg/kg时,嗜水气单胞菌攻毒后的死亡率显著降低(P<0.05),以5 mg/kg组存活率最高,氟苯尼考组差异不显著。结论认为,饲料中添加适量重组抗菌肽对幼鱼有一定的促生长作用,并能提高部分免疫指标以及攻毒后的存活率,但过高剂量的抗菌肽对幼鱼的生长与部分酶指标有一定的负面影响,因此建议抗菌肽的添加量不超过20 mg/kg。本研究旨为对虾抗菌肽在罗非鱼饲料中的合理应用提供实验依据。

【英文摘要】Antimicrobial peptides have attracted considerable attention because of their potential use for therapy and prophylaxis.We evaluated the effects of dietary supplementation with recombinant antimicrobial peptide on growth,immunity,and performance in the protest test in tilapia(genetically improved farmed tilapia,GIFT)(ini-tial body weight 10.68 g±0.53 g).The fish were divided into six treatment groups and fed experimental diets con-taining 0,5,10,20,or 50 mg/kg recombinant antimicrobial peptide(RAP) derived from Fenneropenaeus chinensis or 100 mg/kg florfenicol for 56 d.Weight gain,red blood cell numbers,and catalase activity were significantly higher in the groups supplemented with 5 and 10 mg/kg compared with the control.The specific growth rate was highest in the group given 5 mg/kg RAP.Liver superoxide dismutase activity and serum lysozyme activity were significantly lower in the group given 50 mg/kg RAP than in the control.Supplementation with 100 mg/kg flor-fenicol increased the number of red blood cells,but had no effect on the other indexes.Following infection with Aeromonas hydrophila,the death rate was significantly lower in groups fed between 5 – 20 mg/kg RAP than in the control.The survival was highest in the group fed 5 mg/kg.Our results suggest that dietary supplementation with appropriate levels of antimicrobial peptide improves growth,immunity,and performance in the protest test in tila-pia.However,increasing the dose can lead to negative effects on growth and enzyme activity.Therefore,we rec-ommend that supplementation should not exceed 20 mg/kg.Our results provide insight into the proper application of recombinant antimicrobial peptides to tilapia.

【题目】生物条形码:一种新的痕量蛋白检测技术
【中文关键词】条形码; 检测技术; 检测灵敏度; 蛋白质; 探针
【英文关键词】bio-barcodes assay;detective technique;detective sensivity;protein;probe
【中文摘要】目前,蛋白质的痕量检测仍存在一定的困难,一个最主要的原因是缺乏像检测核酸的 PCR 那样高灵敏度的、可对目标蛋白进行扩增的技术[1-2]。2003 年,美国科学家 Mirkin领导的课题组首次报道了生物条形码检测技术(bio-barcodes assay,BCA)[3],可以对痕量蛋白进行检测。与临床上常规的 ELISA 法检测相比,其检测灵敏度可达它的106 倍。本文针对 BCA 检测系统的技术要点和发展前景进行了简要综述。

【题目】群特异性蓝舌病病毒单克隆抗体的制备和鉴定
【中文关键词】蓝舌病病毒;单克隆抗体;细胞融合
【英文关键词】bluetongue virus; monoclonal antibody; cell fusion
【中文摘要】目的:制备群特异性抗蓝舌病病毒(BTV)单克隆抗体,并对其特性进行鉴定,为建立检测BTV 抗原及抗体的ELISA 方法奠定基础。方法:用纯化的BTV 颗粒为免疫抗原免疫BALB / c 鼠,以大肠杆菌表达的VP7 蛋白作为筛选抗原,用间接ELISA 法筛选杂交瘤细胞株;选取抗体效价最高的一株制备BTV 单克隆抗体,以抗体为捕获抗体与8 种不同血清型BTV 进行ELISA 反应,结果与细胞病变反应进行比对;以该抗体为竞争抗体,与12 种不同血清型绵羊BTV 抗血清进行竞争ELISA 反应,并将结果与参比c-ELISA 试剂盒结果进行比对。结果:筛选出5 株稳定分泌BTV 单克隆抗体的杂交瘤细胞株,并选其中一株(3E2)制备了高纯度的单克隆抗体;该单抗用于检测不同血清型BTV,与细胞病变反应结果完全相符;用于检测不同血清型绵羊BTV 抗血清,其结果与参比c-ELISA 试剂盒符合率为100%,与鹿流行性出血热病毒抗原和抗体均无交叉反应。结论:制备的BTV 单克隆抗体具有良好的群特异性,可用于检测不同血清型BTV 抗原及BTV 抗体。
【英文摘要】Objective: To prepare and characterize group specific monoclonal antibody (McAb) against bluetongue virus(BTV) for establishing ELISA detecting BTV antigen and antibodyMethodPurified BTV visions were used to immunizeBALB / c mice. The hybridoma culture supernatants were screened by indirect ELISA with bacterial expressed VP7 protein as coating antigen. The hybridoma clones with the highest antibody titer were selected and employed for preparation ofMcAb. Antigen capture ELISA was performed with this McAb to detect BTV of eight different groups. Competition ELISA was performed with this McAb to detect BTV antiserum of twelve different groups. Results: Five hybridoma clones that constitutively secrete McAb against BTV were screened. High purified McAb was prepared with 3E2 hybridoma clone. Theresult of antigen capture ELISA was consistent with cell pathological effect. The level of agreement between the McAb and the reference c-ELISA test was 100%. There is no cross-reaction with antibody to EHDV in sera. Conclusion: Group specific McAb against BTV has been prepared successfully. The McAb represents a convenienttool for detecting BTV antigen as well as antibody of different groups.

【题目】蓝舌病毒核酸检测技术研究进展
【中文关键词】蓝舌病毒; RT- PCR; 实时荧光定量PCR; 基因芯片
【英文关键词】bluetongue virus; RT- PCR;real- time fluorescent PCR ;gene chip
【中文摘要】蓝舌病毒(BTV) 血清型较多, 其核酸检测主要涉及通用型检测和分型检测, 寻求相应的适宜检测靶基因尤为重要。BTV 核酸检测技术是蓝舌病诊断的重要手段, 其发展过程主要经历了基因杂交探针技术、RT- PCR 检测技术、实时荧光定量PCR 检测技术及基因芯片检测技术等; 同时, 建立和完善高通量BTV 筛查技术成为迫切要求。
【英文摘要】There are 24 serotypes of bluetongue virus(BTV). The nucleic acid detecting techniques for BTV are involvedin universal detection for the BTV group and special detection for each serotype. Gene detection is important for BTV,and includes hybridization probe method, reverse transcription- polymerase chain reaction(RT- PCR) method, real- time fluorescent PCR technique, as well as gene chip. It is urgent to develop the reliable method for rapid and high throughputdetecting methods for BTV.

【题目】广布野豌豆裂荚影响因素与裂荚日动态研究
【中文关键词】广布野豌豆;裂荚因素;裂荚时间
【英文关键词】Vicia cracca;factors of pod dehiscence;time of pod dehiscence
【中文摘要】为探明豆科牧草裂荚与环境条件的关系,以及每天的裂荚时间,以广布野豌豆为对象分别进行了晴天和阴天裂荚影响因素与裂荚日动态研究。研究结果表明,晴天时,相对裂荚率与气温、空气相对湿度、荚皮温度和荚皮含水量均呈极显著的相关关系(P%O.01),阴天时,除裂荚率与荚皮含水量相关关系未达到显著外,其余也均达到极显著或显著的相关水平(P<o.ol或P(O.05),相对裂荚率与风速无关(P>0.05);晴天的裂荚率明显大于阴天,每天裂荚高峰期发生在12:()[]一14:。0,而8:OO前和18:0O后不裂荚。上述结果得出,外界环境中的温度和湿度与裂荚率密切相关,选择8:。0前的清晨和18:OO后的傍晚,是避免种子损失,收获种子的最佳时间。
【英文摘要】Abstract:Factors influencing the daily dynamics of pod dehiscence in Vicia crncc& were investigated on both sunny and cloudy days to find when the pods dehiscence and the relationships between pod dehiscence and environmental conditions.The results showed that the pod dehiscence rate had a significant positive correlation with air temperature,humidity,pod wall temperature,and moisture content on SHDDy days (P < 0. O1). Oncloudy days,such factors,but not pod moisture content or wind speed,had a significant correlation (P< O. 05)with pod dehiscence.Peak pod dehiscence occurred at 1 2:O0 to 1 4:O0 and there was little dehiscence before8:O0 or after 18:00. More pods dehisced on sunny days than'on cloudy days. These resuIts indicate that D0ddehiscence rate is closely correlated with air temperature and hum idity. To reduce seed 1oss,the oDtimum har~vest tim e is in the morning before 8:00 or at dusk after l8:00.

【题目】蓝舌病毒血清5 型毒株S7 基因编码区的分子克隆与序列分析
【中文关键词】蓝舌病毒; S7 基因; 分子克隆; 序列分析
【英文关键词】bluetongue virus; S7 gene; molecular cloning;sequence analysis
【中文摘要】目的: 对蓝舌病毒(BTV) 血清5 型毒株(BTV- 5) 的S7 基因编码区(ORF) 进行克隆和序列分析。方法: 用TRIzol LS试剂提取病毒总RNA, 经反转录- 聚合酶链反应(RT- PCR) 扩增BTV- 5 型毒株S7 基因的编码区, 将扩增片段克隆到pGEM- T Easy 载体上, 对阳性克隆进行核苷酸序列测定; 采用DNAStar 和DNASIS v2.5 软件对环状病毒属不同种群的S7基因ORF 序列及其推导的氨基酸序列进行同源性及系统进化树分析。结果: 克隆的基因片段长1 050 bp, 为S7 基因开放性读码框的全长序列, 编码349 个氨基酸残基; 与环状病毒属不同血清型毒株比较, 核酸序列同源性范围为42.2%~96.6%,推导的氨基酸序列同源性范围为40.4%~99.7%。结论: 蓝舌病毒与非洲马瘟病毒、鹿流行性出血热病毒分属于不同种群, 群内不同血清型的S7 基因ORF 序列及其推导的氨基酸序列显示出很高的同源性, 而不同种群之间的同源性很低。
【英文摘要】Objective: To clone and sequence the S7- ORF of bluetongue virus serotype 5(BTV- 5). Methods: The RNA of BTV- 5 was isolated by treatment of the virus with TRIzol LS Reagent. The cDNA of the S7- ORF of BTV- 5 was amplified by reverse transcription- polymerase chain reaction(RT- PCR), cloned into pGEM- T Easy vector and sequenced. Phylogenetic trees based on homologies of the S7 - ORF and deduced amino acid of different orbivirus were performed by DNAStar and DNASIS v2.5 softs. Results: The complete length of the S7- ORF was 1 050 bp, which encoded 349 amino acids. Comparing to the different sequences of orbivirus serotypes, the homogeneity of cDNA sequence was 42.2%~96.6%,and the homogeneity of predicted amino acid sequence was 40.4%~99.7%. Conclusion: BTV, epizootic hemorrhagic disease virus(EHDV) and african horse sickness virus(AHSV) belong to different groups. The S7- ORF nucleotide sequences and predicted amino acid sequences of the orbivirus in one group exhibit high identity, while lowidentity exist in differentgroups.

【题目】利用生物条形码技术对蓝舌病毒VP7 蛋白进行微量检测
【中文关键词】蓝舌病毒; 生物条形码检测; VP7 蛋白
【英文关键词】bluetongue virus;bio- bar codes assay; VP7 protein
【中文摘要】目的: 建立高灵敏检测蓝舌病毒VP7 蛋白的生物条形码检测方法。方法: 制备VP7 蛋白的多抗及特异DNA 链标记的金纳米颗粒探针(NP) 和VP7 蛋白单抗标记的磁性微球探针(MMP) , 形成MMP- VP7 蛋白- NP 三明治复合物后, 再利用去杂交将NP 探针上标记的DNA 链释放出来, 通过PCR 或芯片检测方法鉴定释放的DNA 链, 确定VP7 蛋白的存在。结果: 建立了蓝舌病毒VP7 蛋白的生物条形码检测体系, 检测灵敏度可达10 fg/mL, 为常规ELISA 检测的106 倍。结论: 为发展高灵敏度的蓝舌病毒生物条形码检测试剂盒鉴定了基础。

【英文摘要】Objective: To establish a high sensitive bio- bar codes assay method for detecting bluetongue virus(BTV) VP7 protein. Methods: Nanoparticle(NP) probes encoded with DNA that wass unique to VP7 protein, polyclonal antibodies agaist VP7 protein and magnetic microparticle (MMP) probes with monoclonal antibodies that bind VP7 protein specifically were prepared. After forming MMP- VP7- NP sandwich complex, dehybridization of the oligonucleotides on the NP surface allows the determination of the presence of VP7 protein by identifying the oligonucleotide sequence released from the NP through PCR or chip- based detection. Results: The bio- bar codes assay system for detecting VP7 protein was established,and the sensitivity limit was about 10 fg/mL, comparable clinically accepted conventional ELISA assays for detecting the same targe, six orders of magnitude less sensitive than what was observed with this method. Conclusion: This study lays a foundation for establishing high sensitive BTV bio- bar codes assay kit.

【题目】羊草种群各类地下芽的发生、输出与地上植株的形成、维持动态
【中文关键词】羊草;芽类型;母株和子株类型;密度和比例;季节动态;种群维持
【英文关键词】Leymus chinensis;bud types;parent and daughter shoot types;density and proportion;seasonal variations;maintenance of population

【中文摘要】羊草地下芽库中各类型芽及所形成子株和母株的季节动态变化研究结果表明,当年返青母株是由上一年母株形成的8O 的分蘖芽与分蘖芽子株,15%的根茎顶芽与根茎顶芽子株,以及5 根茎节芽和根茎节芽子株组成的,分蘖芽与分蘖芽子株是返青母株的主体。随着返青母株的生长,根茎顶芽是在5月20日早于分蘖芽和根茎节芽1个月发生,并首先呈水平生长方式远离母株,占据生态位;在6月2O日水平根茎顶芽开始向地面弯曲,输出子株的同时,分蘖芽和根茎节芽开始形成,并输出子株。羊草母株以产生低比例根茎芽和高比例分蘖芽的扩展和丛生联合生长方式,以年内和年间的芽、子株、母株之间的不断循环,年复一年地维持着种群的无性繁殖机制。高降水年份可显著地增加地下芽库各类型芽数量,从而使地上子株和母株密度增加。

【英文摘要】Seasonal variations of densities of all types of buds,parent and daughter shoots of Leymus chinensis were investigated.The origin of current year parent shoots was 80% from shoot buds and daughter axillaryshoots,1 5 from apical rhizome buds and daughter apical rhizome shoots,and 5 from axillary rhizome buds and daughter axillary rhizome shoots,from total buds and shoots formed during previous years.When parent shoots were growing,apical rhizome buds began to generate and spread horizontally to occupy niches during 20May,one month earlier than axillary shoot buds and axillary rhizome buds.By 20 June,the horizontal apicalrhizome buds started growing into vertical apical rhizome buds and finally into daughter rhizome shoots.Similarly,by 20 June,shoot buds and axillary rhizome buds occurred and finally developed into daughter shoots.Parent shoots of L.chinensis produced both a lower proportion of spreading shoots(i.e.apical rhizome buds and shoots,or axillary rhizome buds and shoots)and a higher proportion of clumping shoot(i.e.shoot budsand axillary shoots),resulting in a combined growth form.This enables L.chinensis to maintain an asexualpropagation mechanism through continuous growth of buds,daughter shoots and parent shoots between and within years.Higher precipitation can promote the density of all types of buds,leading to an increase in density of daughter and parent shoots

【题目】A Pair of Novel Primers for Universal Detection of the NS 1 Gene from Various
【中文关键词】RT—PCR;蓝舌病毒(BTV);NS 1;通用检测
【英文关键词】RT—PCR;Bluetongue virus(BTV);NS 1;Universal detection
【中文摘要】通过生物信息学对BTV进行基因序列分析,设计通用引物,对BTV进行RT-PCR检测,获得对不同血清型BTV的通用检测方法。

【英文摘要】Twenty five serotypes of Bluetongue virus(BTV)have been identified worldwide.Rapid and reliable methods of virus universal detection are essential for fighting against bluetongue(BT).We have therefore developed and evaluated a pair of primers which can detect various serotypes of BTV by RT-PCR.Analysis of the viral protein 7(VP7)and the non—structural protein(NS 1)gene from different serotypes of BTV by DNAstar showed that the 5 ’end of the NS 1 gene is the most conserved region.The primer pairs(P1 and P2)were designed based on the highly conserved region of NS 1.The novel primers were evaluated by detecting BTV serotypes 1,3,5,8,10,1 1,2 1 and 22.The specificity of the primers was estimated by comparing to gene sequences of viruses published in GenBank.and further assessed by detecting BTV serotype 1—1 2 and Epizootic hemorrhagic disease virus(EHDV)serotype 1—4.The sensitivity and repeatability of PCR with the novel primers were evaluated by successfully detecting the recombinant plasmid pGEM—T1 2 1 containing the diagnosed nucleotide sequence.Our results suggest that these unique primers can be used in high throughout and universal detection of the NS 1 gene from various BTV serotypes

【题目】8 个 紫花苜蓿品种比较试验
【中文关键词】紫花苜蓿;品种;生长特性;养分
【英文关键词】alfalfa;variety;growth feature;nutrient
【中文摘要】在吉林省农业科学院牧草试验地内对来自欧洲的8个苜蓿M c口g0 们品种进行了田间比较试验,对于不同紫花苜蓿品种的生长速率、自然高度、分枝数、干草生物量和其他生长发育特性进行了比较。分析结果表明:8个紫花苜蓿品种在生长发育特性上存在显著的差异,其中表现好的是蒂坦、罗佐马、伊鲁瑰斯、凯恩4个品种,他们的优势是返青早.生长速度快。蒂坦、罗佐马产草量高;蒂坦、凯恩粗蛋白含量高,营养价值较高。蒂坦、罗佐马、伊鲁瑰斯和凯恩适宜在吉林地区大面积推广和种植。
【英文摘要】A field com paratiVe test of l O al{a " a varieties introduced frOm Europe and domestic was carried out in Jilin Forage Experimental Station of Academy of Agricultural Sciences of Jilin Provience.The characteristics inc1uding grOwth rate,natural height,t订ler number,fresh yield were tested. The resuhs showed that there were significant differences in characteristics of growth and deveIopment among 8 varieties. The foreign varieties,including Titan, Luozuoma,Roquois and Kane had better performances and their yields were high. Meanwhile, they showed early regreenning and faster growth. In which,the yields of Titan and Luozuoma were higher. The crude protein content of Titan in the squaring stage was the highest and the second was Kane. It could be concluded that these 4 varieties were suitable for extension in Jilin Province.

【题目】小麦新品种郑麦9694配粉特性的研究
【中文关键词】小麦;馒头;加工品质;配粉
【英文关键词】Wheat; Streamed bread; Processing quality; Flour blending
【中文摘要】用小麦新品种郑麦9694与优质强筋小麦郑麦9023进行配粉,测定粉质仪参数和馒头加工品质,结果表明,郑麦9694的馒头加工品质较好,随着郑麦9023添加比例的增加,可使馒头的比容、宽高比、内部结构、弹性、韧性、黏性和食味得分显著提高,总分有了一定的提高;但郑麦9023 的添加超过一定的比例后,馒头比容、内部结构和弹性得分则又下降了,表面色泽虽然没有变化,但表面结构得分则随着郑麦9023比例的增加呈下降趋势。最适宜的配粉比例为70∶30,即在郑麦9694中搭配30%的郑麦9023,其湿面筋含量、粉质仪参数等达到优质馒头粉标准,可显著改善馒头的加工和制作品质。
【英文摘要】Flour blending effects of Zhengmai 9694 on farinograph parameters and streamed bread-makingquality was analyzed by mixed with high-gluten wheat cultivar Zhengmai 9023. The results indicated that Zhengmai 9694 had preferable steamed bread-making quality. With the continuous increasement of Zhengmai 9023 , t he specific volumes , aspect ratios , internal st ructures , flexibilities , toughness , stickiness and taste scores of steamed bread made of the blends increased significantly while total scores just improved slightly. However, when the content of Zhengmai 9023 in the blends exceeded a certain proportion , not only t he bread specific volumes , internal structures and flexibility scores of steamed bread would dropped, but also the surface color kept unchangeable and the surface structures were declining. The most appropriate blending ratio of Zhengmai 9694 vs Zhengmai 9023 was 70∶30 , with main quality properties such as wet-gluten content and farinograph parameters achieved the national high-quality steam bread standards.

【题目】Effects of saline and alkaline stresses on the germination, growth, photosynthesis, ionic balanceand anti-oxidant system in an alkali-tolerant leguminous forage Lathyrus quinquenervius

【中文关键词】无
【英文关键词】alkaline stress, ionic balance, Lathyrus quinquenervius, oxidative stress, saline stress.
【中文摘要】无
【英文摘要】We compared the effects of saline stress (9:1 molar ratio of NaCl : Na2SO4, pH 6.44 – 6.65) and alkaline stress(9:1 molar ratio of NaHCO3 : Na2CO3, pH 8.71 – 8.89) on the germination, growth, photosynthesis, ionic balance and activity of anti-oxidant enzymes of Lathyrus quinquenervius to elucidate the physiological adaptivemechanism of plants to alkaline stress (high pH). The results showed that, at a low stress intensity, the effects of saline stress and alkaline stress on L. quinquenervius were similar. Compared with saline stress, high alkaline stress intensity clearly inhibited germination, growth, photosynthesis and root system activity, and led to a sharpincrease in Na+ and an ion imbalance in the shoots, as well as enhanced H2O2 and malondialdehyde content,resulting in severe intracellular oxidative stress. The results indicated that the accumulation of organic acid wasa central adaptive mechanism by which L. quinquenervius maintained intracellular ionic balance under alkalinestress. Lathyrus quinquenervius may enhance organic acid synthesis to remedy the shortage of negative chargeresulting from the massive influx of Na+ and decreased inorganic anions. In addition, saline stress and low alkaline stress slightly enhanced the activities of superoxide dismutase (SOD) and ascorbate peroxidase (APX), but did not affect catalase (CAT) activity. However, strong alkaline stress significantly enhanced the activities ofSOD and APX, and reduced CAT activity. We propose that enhancing the activities of SOD and APX may be a vital mechanism by which L. quinquenervius resists oxidative stress caused by alkaline stress.

【题目】Physiological responses and adaptive strategies of wheat seedlings to salt and alkali stresses
【中文关键词】无
【英文关键词】alkali stress, salt stress, physiological mechanisms, wheat seedling.
【中文摘要】无
【英文摘要】Effects of salt (NaCl : Na2SO4) and alkali (NaHCO3 : Na2CO3) stresses on the contents of inorganic ions andorganic solutes in wheat shoots were compared to explore the physiological responses and adaptive strategies ofwheat to these stresses. Wheat significantly accumulated Na+ and simultaneously accumulated Cl), soluble sugars and proline to maintain osmotic and ionic balance under salt stress. Compared with salt stress, the high pHfrom alkali stress enhanced Na+ accumulation and affected the absorption of

inorganic anions. To maintainionic and osmotic balance, wheat accumulated organic acids, soluble sugars and proline. The accumulation ofCl) and organic acids was the main difference in the physiological responses and adaptive mechanisms to saltand alkali stresses, respectively.

【题目】Study on flower traits' genetic effect of cultivated, semi-wild and wild soybean
【中文关键词】大豆,花器,野生豆
【英文关键词】soybean, flower trait, wild soybean
【中文摘要】利用两年实验数据对166个河南大豆栽培品种的7个花器性状和3个产量性状进行典型相关性和逐步回归分析,旨在揭示花器性状对产量性状的影响,为大豆育种产量水平突破提供深层理论依据。结果显示:花器性状间相关性显著,部分花器性状与产量性状相关性显著。其中,萼片、沟槽、花瓣外露对百粒重和单株总粒重的影响较大。逐步回归表明,萼片长度、花瓣外露和花柱长度对柱头的影响很大。
【英文摘要】This article is to discuss the relationship and genetic mechanism between soybean seed characters and its yield, and to locate QTLs that control its characters. The researchers grew 474 recombinant inbred lines (RIL) derived from Jinbean 23 as the female parent and semi-wild black bean Huibuzhi as the male parent. Based on the results of two repeated experiments in three years, the researchers used multi-year multi-locus joint analysis method to conduct heredity analysis and quantity character mapping of nine characters such as seed and yield. Related analysis results showed that: yield is significantly or highly significantly correlated to seed weight, seed length, seed weight per plant, two seeds per pod and three seeds per pod.

【题目】Oral administration of myostatin-specific whole recombinant yeast Saccharomyces cerevisiae vaccine increases body weight and muscle composition in mice
【中文关键词】酵母;酿酒酵母;疫苗;肌肉生成抑制素;胴体重
【英文关键词】Yeast;Saccharomyces cerevisiae;Vaccine;Myostatin;Body weight
【中文摘要】肌肉生成抑制素负向调节骨骼肌增长。这说明通过在小鼠体内接种肌肉生成抑制素的特异性疫苗,能产生疫苗抑制肌肉生成抑制素的功能,从而使小鼠体重增加和肌肉组成改变。然而,传统疫苗及其给药方式是昂贵和烦琐的。在本研究中,我们使用热灭活的特异性重组酵母载体疫苗来调节小鼠肌肉生长抑制素功能。从猪的基因组中通过PCR获得肌肉生长抑制素的CDS区序列并构建由硫酸铜诱导的酵母表达载体。肌肉生成抑制素的表达通过免疫印迹法检测。通过对口服免疫和皮下注射方式进行比较,我们发现,二者获得类似的免疫反应,都可以在小鼠体内检测到特异性抗体血清,这两种方式都可以增加小鼠体重。整个实验中小鼠都健康成长,说明,重组酵母疫苗是安全可靠的免疫载体。基于酵母天然的免疫特性,热灭活的重组肌肉生成抑制素特异性重组酵母为治疗人类肌肉萎缩症提供了研究思路。
【英文摘要】Myostatin negatively regulates skeletal muscle growth. It was found that active immunization with myostatin-specific vaccine blocked myostatin function in vivo, which resulted in increase of body weight and muscle composition in mice. However, traditional vaccine and its administration method are expensive and laborious. In this study, we investigated the possibility of using heat-killed whole recombinant yeast Saccharomyces cerevisiae vaccine to modulate myostatin function in mice. The CDS of myostatin was obtained from a pig genome by PCR and subcloned into a yeast expression vector, which was driven by a copper-inducible promoter. Expression of recombinant myostatin was induced by CuSO4 and confirmed by western blot. We vaccinated mice by oral feeding and subcutaneous injection as comparison.We found that oral feeding resulted in the similar effective immune response than injection, which was measured by the presence of myostatin-specific antibodies in mouse serum. Interestingly, animals vaccinated by both methods demonstrated enhanced growth performance compared to control. All animals were healthy looking throughout the course of experiment, suggesting that whole recombinant yeast vaccine is nontoxic and therefore safe to use. Given the simplicity of its nature, heat-killed myostatinspecific whole recombinant yeast vaccine holds a promise to treat human muscle-wasting diseases in the future.

【题目】苜蓿种子生物学研究概况
【中文关键词】苜蓿种子;生物学;研究概况
【英文关键词】alfalfa seed;biology;research survey
【中文摘要】综述了苜蓿种子的形态特点,营养组成,影响其生理变化的因素及种子产量与其他性状的关系。苜蓿为优良牧草,其种子营养价值丰富、均衡,具有很高的食用价值。苜蓿种子在贮藏中的活力与贮藏温度、种子含水量及种子携带真菌的严重程度呈负相关。产量与每株花序数、每花序小花数,每生殖枝荚果数、每荚种子数和千粒质量呈正相关。浓度分别为0.03% 的稀土、0.05 %的多效唑处理能有效提高种子产量。Cd2+,Zn2+,Cu2+,La3+ ,AI3+等重金属离子在较低浓度下能促进种子萌发,浓度较大时就产生严重的胁迫,离子间的交互作用明显。苜蓿种子的耐盐半致死浓度为0.6% ~1.0 %,阿魏

酸等化感物质对种子萌发有显著的抑制效应。
【英文摘要】The characters of seed shape,nutrition component,factors affecting the physiological variations of alfalfa seeds and the relationship between the yield of seeds and other characters of alfalfa are discussed in this paper.Alfalfa(Medicago sativa)is a forage grass of high quality.It's nutrition components in seeds are rich and in balance.The seed vigor of alfalfa is correlated negatively to temperature,seed moisture content and infectionof seed—borne fungi.However,the yield of seeds is correlated positively to the inflorescences per plant,flowers per inflorescence,pods per plant,seeds per pod and thousand—grain weight.Lanthanon solution of 0.03% and paclobutrazol solution of 0.05 applied to alfalfa through spraying on leaf surfaces for improving the effects onseed yield significantly.Heavy metal ions(Cd2+,Zn2+,Cu2+,La3+,A13 +,etc)have serious effects on the seed vigor,and there are obviously interactions among the ions.The germination of seed is deferred as the salt concentration level goes up,with the semicritical salt concentration being 0.6 %~1.0 %,allelochemicals could havesignificant allelopathic effects on seed germination.

【题目】低温对白三叶膜质过氧化及保护酶活性的影响
【中文关键词】白三叶;低温胁迫;抗寒性;膜质过氧化;保护酶
【英文关键词】white clover;low temperature stress;cold resistance;peroxidization of cytomembrane;protective enzyme
【中文摘要】对白三叶的3个品种海发(Haifa),黑龙江白三叶(Mini—BL)和瑞文德(Rivende1)进行低温胁迫,测定叶片中丙二醛(MDA)含量,超氧化物歧化酶(SOD)活性和过氧化物酶(POD)活性,结果表明:低温胁迫下,3个品种SOD和POD活性均表现出先降低再上升再下降的趋势,MDA含量呈上升趋势,且3个品种在5,0和一5℃处理时差异极显著(P<0.01),Mini-BL的MDA含量明显低于其他两个品种,Haifa最高,Rivendel居中。分析3个品种的MDA含量,SOD和POD的活性变化特点,Mini-BL抗寒性强于其他两个引进品种。
【英文摘要】Abstract:In view of the cold resistance problem of introduced white clover using in north China,we cornpared the performance of 3 cultivars Haifa,Rivendel and Mini—BL under lOW temperature stress.The malondiadehyde(MDA)content,superoxide dismatase(SOD),and peroxidases(POD)activity in Jeaves were measured.The results showed that the activities of protective enzymes(SOD,POD)decreased at the earlier treatment stage and increased then and decreased

finally.The content of M DA showed significance difference in the cultivars,Mini—BL was lower than other tWO,and Haifa is the highest.The cold resistance of Mini—BL is better thanthe introduced after analyzing the changing characteristics of these indexes in 3 cultivars.

【题目】The critical role of myostatin in differentiation of sheep myoblasts
【中文关键词】肌肉生成抑制素;成肌细胞;shRNA;分化;绵羊
【英文关键词】Myostatin;Myoblast;shRNA;Differentiation;Sheep
【中文摘要】肌肉生长抑制素(MSTN),也称为生长分化因子8(GDF8),能抑制剂骨骼肌的生长。已有报道称阻断MSTN的抑制作用会导致小鼠肌肉的增加。然而,它在家畜成肌细胞分化中的作用尚未确定。在目前的研究中,我们试图确定MSTN在绵羊成肌细胞分化中的作用。我们发现过表达MSTN导致绵羊成肌细胞融合度降低,这表明它降低了成肌细胞的分化。使用shRNA沉默MSTN表达的细胞会发生表型变化。相比之下,使用shRNA沉默的内源性MSTN会导致肌原性的分化。更多的研究表明,通过沉默内源性或异位的MSTN,会导致MyoD和myogenin的上调,以及Smad3的下调。我们的结果表明,MSTN在绵羊成肌细胞分化中扮演关键的角色,类似于在老鼠体内的作用。这项研究还表明,shRNA沉默的MSTN可能是一个潜在实用的方法来促进绵羊肌肉的生长,提高羊肉生产量。
【英文摘要】Myostatin [MSTN, also known as growth differentiation factor 8 (GDF8)], is an inhibitor of skeletal muscle growth. Blockade of MSTN function has been reported to result in increased muscle mass in mice. However,its role in myoblast differentiation in farm animals has not been determined. In the present study,we sought to determine the role of MSTN in the differentiation of primary sheep myoblasts. We found that ectopic overexpression of MSTN resulted in lower fusion index in sheep myoblasts, which indicated the repression of myoblast differentiation. This phenotypic change was reversed by shRNA knockdown of the ectopically

expressed MSTN in the cells. In contrast, shRNA knockdown of the endogenous MSTNresulted in induction of myogenic differentiation. Additional studies revealed that the induction of differentiation by knocking down the ectopically or endogenously expressed MSTN was accompanied by up-regulation of MyoD and myogenin, and down-regulation of Smad3. Our results demonstrate that MSTN plays critical role in myoblast differentiation in sheep, analogous to that in mice. This study also suggests that shRNA knockdown of MSTN could be a potentially promising approach to improve sheep muscle growth, so as to increase meat productivity.

【题目】Safety assessment of sFat-1 transgenic pigs by detecting their co-habitant microbe in intestinal tract
【中文关键词】sFat-1;转基因猪;微生物菌群;遗传漂变;生物安全
【英文关键词】sFat-1; Transgenic pig ;Microbial fl ora ; Gene drift; Biosafety
【中文摘要】本课题组制备出肌肉中富含ω-3不饱和脂肪酸的sFat-1转基因猪,对改善人类的饮食健康具有重要的意义。虽然sFat-1转基因猪具有广泛的应用前景,但其生物安全性正日益成为人们关注的焦点。转基因动物体内微生物安全评价,本部分研究的目的主要是从转基因猪肠道内微生物菌群数量变化的角度去评估sFat-1基因的表达对转基因猪本身健康和生态环境安全的影响。为了监测sFat-1转基因猪不同段肠道和粪便中微生物菌群数量的改变,选取总需氧菌、总厌氧菌、特异有益菌和有害菌进行培养分析。结果表明,与对照组相比,sFat-1转基因猪不同段肠道和粪便中微生物菌群没有发生明显改变。此部分研究表明,外源基因sFat-1基因的表达对转基因猪肠道和粪便中的微生物菌群数量未产生明显影响。
【英文摘要】Transgenic pigs containing sFat-1 (synthesized fatty acid desaturase-1) gene were produced by DNA microinjection. The meat of these pigs contain x-3 unsaturated fatty acid which is bene fi cial to the health of human being. The aim of this study is to assess the effects of expression of sFat-1 in pig on the health of animal themselves and on the safety of environment from the angle of the changes in microbe population of pig intestinal tract. Four F1 male semisibling of sFat-1 transgenic pigs and four F1 female semi-sibling of sFat-1 transgenic pigs were used as experimental animals, together with their none transgenic siblings as control animals. For inspection of any change in populations of microbial fl ora in various parts of intestinal tract and feces of sFat-1 transgenic pigs

total aerobe, total anaerobe, main beneficial bacteria and main harmful bacteria were cultured and analyzed. At the same time foreign gene drift was assessed by PCR amplifying foreign fragment in samples of total aerobe and total anaerobe. Results indicated that in comparison with control pig microbe population of various species in different parts of intestinal tract and feces of sFat-1 transgenic pig remained unchanged and foreign gene sequence could not be detected in DNA of total aerobe and total anaerobe. In conclusion, the data of this study suggest that microbe population in intestinal tract and feces of transgenic pig was not influenced by the expression of transferred foreign gene sFat-1 and also foreign gene drifting from animal genome to microbial genome must be a rare incident.

【题目】猪MSTN基因双筛选标记打靶载体的构建及其功能鉴定

【中文关键词】同源重组;基因打靶;肌肉生长抑素基因;双筛选标记

【英文关键词】homologous recombination; gene targeting; MSTN gene; double-selection

【中文摘要】【目的】利用正负筛选策略,构建猪肌肉生长抑素(Myostatin,MSTN)基因的双筛选标记打靶载体。【方法】以猪胎儿成纤维细胞DNA为模板,PCR扩增MSTN基因同源长、短臂;采用PCR和Overlap PCR扩增打靶载体正筛选标记嘌呤霉素和绿色荧光蛋白基因和负筛选标记单纯疱疹病毒胸苷激酶基因。以pUC57载体为骨架载体,在其多克隆位点连接一段包括Frt序列在内的酶切位点的多克隆位点序列,在2个Frt序列之间连接正筛选标记嘌呤霉素基因和绿色荧光蛋白基因,在Frt序列两侧分别连接5.7 kb和1.9 kb的MSTN基因同源长、短臂;在同源短臂后连接负筛选标记基因单纯疱疹病毒胸苷激酶基因,将目的片段与载体定向连接克隆。用脂质体法将打靶载体转染猪肾细胞,用嘌呤霉素和丙氧鸟苷进行正负筛选,验证正负筛选标记基因功能。【结果】成功克隆了猪MSTN基因同源长、短臂及正筛选嘌呤霉素和绿色荧光蛋白基因和负筛选单纯疱疹病毒胸苷激酶基因,构建了猪MSTN基因双筛选标记打靶载体,打靶载体长度为14 kb。在PK15细胞正负筛选标记基因均有生物学活性。【结论】成功构建了猪MSTN基因双筛选标记打靶载体,为进一步开展猪MSTN基因打靶提供了平台。

【英文摘要】【Objective】A pig myostatin (MSTN) gene targeting vector containing double-selection markers was constructed based on the positive-negative selection strategy. 【Method】The MSTN gene homologous long arm and short arm were cloned in the genome of pig fetus fibroblasts cells by PCR method. The posistive selection cassette puromycin(Puro) and enhanced green fluorescent protein(EGFP) genes and the negative selection cassette thymidine kinase(TK) gene were cloned by PCR and overlap PCR. A set of cassettes and plasmids were used for creating the targeting vector. A positive selection marker cassette (PGK-Puro-EGFP) including the eukaryotic promoter to permit consecutive selection for recombination and allow positive selection of puromycin resistant transfectants in mammalian cells was flanked by two Frt sequences. EF1 α - herpes simplex virus thymidine kinase (TK) minigene was used as the negative selection marker. The homologous long arm with a length of 5.7 kb amplified from pig embryonic fibroblast cell genomic DNA was placed before the first Frt sequence. The homologous short arm with a length of 1.9 kb was cloned between the positive and negative selection cassettes. The plasmid was transfected into PK15 cells with X-tremeGene HP DNA transfection reagent to evaluate the positive and negative selection markers function. 【Result】 The homologous long arm and short arm together with the Puro and EGFP and TK gene were successfully cloned. The presence of the correct inserts in the targeting vector with the full length of 14 kb was verified by DNA sequencing. Meanwhile, the PK15 cells conferred resistance to puromycin(Puro) and ganciclovir(GAC), which suggested the positive and negative selection markers could expressed in the cells. 【Conclusion】 The gene targeting vector containing double-selection markers could be used for future pig MSTN gene targeting.

【题目】A touchdown multiplex PCR for porcine circovirus type 2 and pseudorabies virus
【中文关键词】猪圆环病毒2型;伪狂犬病毒;常规复合PCR;多重降落PCR
【英文关键词】porcine circovirus type 2; pseudorabies virus; conventional multiplex PCR; touchdown multiplex PCR
【中文摘要】多重聚合酶链反应(mPCR)是一个变化 - 的PCR,在相同的反应中通过多对引物多个目标序列可以被放大。相比单个PCR(sPCR),它使用更少的DNA模板,降低了成本,缩短了时间,可以用于快速鉴定。根据扩增产物大小的不同在同一样品中检测是否有多种病毒或细菌。
【英文摘要】Multiplex polymerase chain reaction (mPCR) is a variant of PCR in which more than one target sequence can be amplified by including more than one pair of primers in the same reaction (8, 12). In comparison with single PCR (sPCR), it uses less DNA template, reduces the extensive costs, time requirements, and allows for rapid identification. It is practically a reasonable choice for simultaneous identification and differentiation of multiple viruses or bacteria in a single sample on the basis of amplicon size (4, 7, 11).

【题目】Efficient production of transgenic chickens based on piggyBac
【中文关键词】PiggyBac;转基因鸡;电穿孔;显微注射
【英文关键词】PiggyBac;Transgenic chicken;Electroporation;Microinjection
【中文摘要】转基因技术在鸡由于鸡独特的繁殖机制,致使转基因技术在鸡中的发展慢于其在其他哺乳动物中的研究程度。逆转录病毒的方法是在鸡中最成功的转基因技术。PiggyBac转座子有13bp的末端反向重复序列,能在动物在基因组中的TTAA位点进行插入和切离。因此,我们选择PB建立新的转基因鸡生产方法。我们构建了三个供体载体(ZGL-neo,ZGM-neo和ZGS-neo)表达绿色荧光蛋白标记基因和新霉素抗性基因。将供体载体与辅助载体(CAG-Pbase)共转染,发现ZGL-neo是最有效的PB供体载体。它能插入到DF1细胞的TTAA位点。将PB载体在鸡胚的空腔显微注射,电穿孔,然后进行5个循环的50毫秒和100毫秒与20-V脉冲。 GFP能在包括性腺的不同组织中表达。将22只转基因鸡胚孵化,我们筛选血液中73%(16/22)阳性率。13只发育到性成熟的鸡中,11只为雄性,40%的鸡胚精液成阳性,拷贝数从0.05到0.21不等。在G1代中没有整合型的PiggyBac转座子个体。我们推断PB转座子系统是在转基因鸡生产中高效的转基因工具。
【英文摘要】Transgenic techniques in chickens have been developed much more slowly than in mammals due to chickens ’ unique reproduction mechanism. Retroviral methods have been the most successful. piggyBac(PB) is a transposon that has a 13 bp perfect terminal invert repeat sequence. PB can be inserted into TTAA sites and can also be precisely excised in mammals. Therefore, we have selected PB as a candidate to establish a new method to produce transgenic chickens. We constructed three donor vectors (ZGl-neo, ZGm-neo and ZGs-neo) expressing a GFP marker-gene and a neomycin resistant gene based on PB. We co-transfected each donor vector with a helper vector (CAG-PBase). We found that ZGl-neo was the most efficient PB vector. This vector could insert into TTAA sites in DF-1 cells. PB vectors were microinjected into sub-germinal cavity of newly laid eggs, and electroporation was then performed with a 20-V pulse for 5 cycles of 50 ms on and 100 ms off. GFP was expressed in different tissues of the embryos, including the gonads. Twenty-two chickens hatched after microinjection with compounds ZGl-neo and CAG-PBase (3:1). When we screened the blood DNA, 73 % (16/22) of the individuals were positive. Thirteen of the chickens grew to adulthood, 11 of which were males. 40 % (4/10) of the individuals were semen positive, and their copy numbers ranged from 0.05 to 0.21 (0.11, 0.21, 0.05, 0.06). No G1 offspring containing the integrated transposon were produced. We conclude that the PB transposon system is a novel useful tool for the efficient production of transgenic chickens.Electronic supplementary material

【题目】绵羊Follistatin 基因表达及其结构域的功能分析
【中文关键词】绵羊Follistatin 基因,原核表达,慢病毒,细胞生长曲线
【英文关键词】ovine Follistatin gene; prokaryotes expression; lentivirus; cell growth curve
【中文摘要】为研究羊Follistatin 基因的功能,提取了绵羊卵巢总RNA,通过RT-PCR 方法获得羊Follistatin cDNA 的完整开放阅读框 (1 038 bp)。去除信号肽序列后与原核表达载体pET41a 连接,构建重组表达质粒pFSsig －,经大肠杆菌诱导表达获得FS sig － 蛋白 (66 kDa)。通过RT-PCR 克隆了包含N 端和结构域1 的Follistatin 突变体 (FS N+D1),将FS N+D1片段插入慢病毒载体 (pLEX-MCS) 构建了pFS-N+D1 慢病毒重组表达质粒。在293T 细胞中进行慢病毒的包装,再感染绵羊肌肉原代细胞,得到稳定表达FS N+D1 的肌肉细胞系,通过细胞生长曲线结果显示稳定表达FS N+D1 的肌肉细胞明显比正常肌肉细胞增殖快,且差异极显著 (P<0.01),表明绵羊FS N+D1 结构域有促进肌肉细胞生长的功能。
【英文摘要】In order to study ovine follistatin function, we amplified the total of 1 038 base pair of ovine complete follistatin cDNA and cloned into pGEM-T vector by RT-PCR from ovine ovary RNA. After removal of the signal peptide it was subcloned into the pET41a to construct the prokaryotic expression vector, named pFSsig － . SDS-PAGE and Western blotting identified the 66 kDa product of the expression of follistatin cDNA. Based on the complete CDS sequence, we cloned follistatin N-terminal domain anddomain 1 with PCR and inserted into pLEX-MCS lentiviral vector, named pFS-N+D1. After package and passage of lentivirus in293T cells, and then infected sheep primary muscle cells (SPMC). The expression of FS N+D1 in SPMC was assayed by Westernblotting. The cell growth curve of the infected SPMC and noninfected control cells displayed that FS N+D1 stablly transfected SPMC proliferated significantly faster than the control cells (P<0.01). Our data inferred that ovine FS N+D1 domain had the function to stimulate sheep muscle cell growth.

【题目】绵羊MSTN 基因启动子区SNPs分析
【中文关键词】绵羊; MSTN; 启动子; PCR-RFLP; 多态性
【英文关键词】MSTN; Promoter; PCR-RFLP; Polymorphsim
【中文摘要】采用测序和PCR-RFLP 的方法,分析了MSTN 基因启动子区在7 个品种绵羊中的单核苷酸多态性,结果表明: 存在2 个SNP 位点(- 959T/C,- 784G/A) ,表现为6 种基因型(TT、TC、CC、GG、GA、AA) ,在- 959T/C 位点中,国外肉用绵羊品种陶赛特、德国肉用美利奴及我区的巴士拜羊,TT 为优势基因型,地方品种绵羊巴音布鲁克羊、多浪羊和阿勒泰羊在该位点中CC 为优势基因型,经χ2 检验,其群体的基因频率和基因型频率均处于Hardy-Weinberg 平衡状态,群体遗传多态性分析表明,这6 个绵羊品种中群体的多态信息含量(PIC) 均处于0. 25 ~ 0. 50 之间,为中度多态,特克赛尔羊在该位点未发生突变。在- 784G/A 位点中,除陶赛特与特克赛尔羊在该位点未发生突变,其他5个品种绵羊优势等位基因均为G 等位基因。经χ2 检验后,其群体的基因频率和基因型频率均处于Hardy-Weinberg 平衡状态,群体遗传多态性分析表明,多浪羊、巴士拜羊和巴音布鲁克羊的群体多态信息含量(PIC) 均处于0. 25 ~ 0. 50 之间,为中度多态,而阿勒泰羊和德国肉用美利奴的群体多态信息含量(PIC) 小于0. 25,为低度多态。
【英文摘要】Sequencing along with PCR-RFLP was applied to analyze the polymorphism of MSTN gene promoterin seven sheep breeds. Two SNPs at - 959(T /C) and - 784(G/A) including six genotype (TT,TC,CC,GG,GA,AA) respectively were detected in the promoter region,At - 959(T /C) , the predominant genotype of TT was identified in Dorset,German Merino and Bashibai sheep, the

CC in Bayinbuluke,Duolang and Aletai sheep. A chi-square analysis suggested that the allele frequencies and genotype frequencies of two polymorphisms were in Hardy-Weinbergequilibrium. Statistical analysis also revealed the variation of intermediate polymorphism information content (PIC) in six breeds (0. 25 < PIC < 0. 50) . At - 784(G/A) ,The G was predominant allele in all breeds,whereas the low polymorphism information content (PIC) was observed in German Meilin and Aletai populations (PIC <0. 25) and intermediate PIC in the Bayinbuluke,Duolang and Bashibai populations (0. 25 < PIC < 0. 50) .

【题目】PiggyBac 转座子介导的诱导细胞永生化转基因载体的构建及其整合效率的检测
【中文关键词】小鼠; SV40 T; 转录激活域rtTA; PiggyBac转座子; 正负向筛选
【英文关键词】mice; SV40 T; transcription activation rtTA; PiggyBac transposon; positive and negative selection
【中文摘要】【目的】构建在小鼠水平上实现多个目的基因的表达以及标记基因安全删除的转基因载体。【方法】以载体为模板,分别扩增SV40P neo、IRES、tk-PloyA,通过overlap PCR连接,并在两端添加方向相同的LoxP序列,构建转基因基本载体PB-NIT;然后通过overlap PCR扩增获得Tet-CMV-SV40 T-T2A-p 53-PolyA基因表达盒,将其插入PB-NIT中,构建载体PB-NIT-STP;最后将转录因子激活域 rtTA 通过同尾酶连接插入PB-NIT-STP,构建载体PB-rtTA-NIT-STP。【结果】经酶切和测序等鉴定,以上载体均正确;经转座活性鉴定,共转染转座子载体PB-rtTA-NIT-STP和转座酶载体比只转染转座子载体获得的阳性克隆数提高了20倍。【结论】得到了基于PiggyBac转座子的可用于正负向筛选和诱导目的基因表达的转基因载体。
【英文摘要】【Objective】 The objective of the study is to construct a Piggybac transposon-based transgenic vector for multiple gene expression and selection of removable marker gene.【Method】 To construct positive and negative selection marker gene cassette based on pXL-BacII, the two marker genes, neo (with SV40 promoter) and tk, were PCR amplified from the corresponding vectors and connected with IRES sequence by an overlap PCR approach. Then LoxP sequence was added into the expression cassette ends and resulted in PB-NIT. The transgenes, SV40 large T and mouse p 53 linked with T2A sequence, were firstly cloned into an expression vector with an inducible promoters Tet-CMVP and SV40 Poly A. The transgene expression cassette was then inserted into the PB-NIT vector and resulted in PB-NIT (LoxP-SV40P neo-IRES-tk-PloyA-LoxP)-STP (Tet-CMV-SV40 T-T2A-p 53-PloyA). Finally, the rtTA gene expression cassette was cloned into the PB-NIT-STP vector and a final transgene vector, PB-rtTA-NIT-STP, was obtained. 【Result】 The final transgene vector was verified by both enzyme digestion and sequencing. The transgene vector transposon activity was examined by co-transfecting the transgene vector and PiggyBac transposase expression vector PB-transposase into mouse ES cells. The results demonstrated that the number of the positive colonies in ES cell transfected with PB-rtTA-NIT-STP and PB-transposase was 20 times more than that transfected with PB-rtTA-NIT-STP alone. 【Conclusion】 The PiggyBac transposon-based transgene vector constructed in this study could be used for inducible multiple gene expression and for selection of marker free transgene generation.

【题目】Suitability of two seaweeds, Gracilaria lemaneiformis and Sargassum pallidum, as feed for the abalone Haliotis discus hannai Ino
【中文关键词】略

【英文关键词】Abalone;Haliotis discus hannai Ino;Seaweeds;Aquaculture;Feed and nutrition
【中文摘要】略
【英文摘要】The suitability of two algae species, Gracilaria lemaneiformis and Sargassum pallidum, for use as food sources for the abalone Haliotis discus hannai Ino was evaluated. Abalones were fed one of five experimental diets: 1)kelp Laminari japonica; 2) G. lemaneiformis; 3) S. pallidum; 4) a mixed diet of L. japonica and G. lemaneiformis (1:1); and 5) a mixed diet of L. japonica and S. pallidum (1:1) for a period of 4 months. The survival, growth (shell length and body weight), condition index (body weight/shell length), and feed utilization were measured. Survival was excellent (100%) in all groups. Growth rate (body weight) was highest in the abalone fed kelp exclusively, followed by the mixed diet of kelp and G. lemaneiformis. The abalone fed S. pallidum had the lowest increase in body weight and the lowest feed intake. The mixed diet of kelp and G. lemaneiformis yielded the biggest increase in shell length. There were no significant differences in the condition index among all the treatment groups. The mean daily feed intake of L. japonica was highest, followed by the mixed diets of kelp and G. lemaneiformis, and was lowest for S. pallidum. Abalone exhibited a preference for L. japonica. The feed conversion efficiency was highest for G. lemaneiformis. Results suggest that G. lemaneiformis can be used as a partial substitute for kelp in the diet of cultured abalone.

【题目】贝壳上污损生物的重量对栉孔扇贝生长和存活的影响
【中文关键词】栉孔扇贝;污损生物;桑沟湾;特定增长率;存活率
【英文关键词】Scallop Chlamys farreri; Fouling; Sanggou Bay; Specific growth rate(SGR); Survival
【中文摘要】对网笼养殖的栉孔扇贝壳上污损生物的数量进行了研究, 发现9~11月贝壳上污损生物的湿重分别为1.47、0.49 和2.09g, 与上壳重的比值分别为28.16%、10.24%和31.29% 。通过在栉孔扇贝上壳添加上壳干重0.5、1、2和3倍重的水泥, 用以模拟附着在扇贝壳上的污损生物, 设不添加水泥的对照组, 对贝壳上污损生物的重量对栉孔扇贝生长和存活的影响进行了研究。结果表明, 实验组扇贝壳长、闭壳肌和剩余软体组织的特定增长率及存活率与对照组均没有显著差异(P> 0.05) , 说明贝壳上的污损生物的重量没有影响扇贝的生长和存活。
【英文摘要】The quantity of fouling organism on scallop shell and the effects of the mass of artificial fouling on growt h and survival of C.farreri was studied. Sixty scallops were randomly sampled from Sept ember to November, 2007, at monthly intervals. Ar tificial fouling (cement) weighing 0. 5, 1, 2 and 3 times the mass of t he upper valve were fix ed to the upper valve of C.farreri Scallops with no art ificial fouling served as the controls. Survival and specific growth rate (SGR) of shell length, dry mass of muscle and remaining soft t issue were ex amined after 60d longline cult ivation in Sanggou Bay. From September to November , the amount of shell fouling decreased from 1.47 g to 0.49 g, and again increased to 2.09 g in November. T here were no significant differences in growth parameters and survival between the t reatment and control groups, indicating that ar tificial fouling did not detr imentally af fects the growth and survival of C.farreri. In Sanggou Bay, even in summer season when t he natural fouling was heaviest, the mass that developed on scallop shells was much lower t han the exper imental levels. T hus, it is unlikely that the mass of nat ural occur red fouling organisms on t he shell would negat ively affect the growth and survival of C.farreri.

【题目】不同处理方法对浒苔粉贮藏性状的影响
【中文关键词】浒苔; 热风干燥; 低温真空干燥; 叶绿素; TBA值
【英文关键词】Enteromorpha prolifera; Hot-air Drying; Low-temperature vacuum drying; Chlorophyl;TBA
【中文摘要】[目的]研究不同处理方法对水浒苔贮藏性状的影响。[方法]采用热风干燥、低温真空干燥、真空包装、普通包装等方法研究浒苔叶绿素含量和TBA值的变化情况。[结果]在贮藏的开始阶段, 热风干燥的样品叶绿素含量低于低温真空干燥的样品。在贮藏过程中经热烫的样品比未烫的样品叶绿素损失率高, TBA值高。真空包装贮藏的样品与密封贮藏的样品相比损失率低, TBA值较小, 且变化较缓慢。低温真空干燥的样品与热风干燥的样品相比, TBA值较小, 且TBA值变化缓慢。[结论]真空低温干燥是一种比较理想的方式。
【英文摘要】[Objective] The study amis to research the effects of different treatments on the storage properties of enteromorpha prolifera. [Method] The different treatm ents of hot-air drying, low-temperature vacuum drying, vacuum packaging, general packaging were used to study the content of chlorophyll and TBA of enterom orpha prolifera. [Result] The results showed that the chlorophy ll content of the sample under low-temperature vacuum dryingwas lower than hot-air drying. The loss rate of chlorophy ll and TBA of samplewhichw as blanchedw ere higher than un-blanched. The loss rate of chlorophy ll and the TBA of vacuum packaging samplew ere lower than sea led storage. The chlorophyll content decreased and TBA increased by the storage tmi e. The TBA o f the samplew as lower under low-temperature vacuum dry ing than hot-air dry ing and the change of TBA was slow. [Conclusion] The vacuum low-tempera ture dry ing was an ideal way for stor ing enteromorpha prolifera.

【题目】不同温度和接种密度下亚心形扁藻增殖的初步研究
【中文关键词】温度;接种密度;比生长速率;增殖模型
【英文关键词】Temperature;Inoculation density; Relative growth rate;Multiplication model
【中文摘要】在自然变温和水浴恒温的条件下,用3种接种密度培养亚心形扁藻Platyrnonas subcordiformis,以研究其增殖形式。结果表明,较高接种密度时,扁藻密度始终较高且较早进入平稳期;接种密度相同,恒温下较早进入平稳期。但就所能达到的最大密度而言,变温培养时更高;低密度接种的比生长速率最大,而中等接种密度下的比生长速率最稳定;培养时的比生长速率较高,且比较稳定;增殖模型所反映的和观测结果一致。随着接种密度增加,依赖于初始种群密度的参数a减少,环境容量增加而瞬时增殖速度下降。模型也反映出在相同接种密度条件下,变温培养的环境容量大于恒温培养;恒温时的微藻瞬时增长速度要大于变温时。就Nt/No而言,在变温下培养扁藻,各处理间的差异不具有统计学意义,而在恒温培养时各处理间的差异显著;低密度接种时,变温和恒温条件下的就Nt/No具有显著差异,而在中密度接种和高密度接种时,两种温度条件下的就Nt/No差异不显著。
【英文摘要】At a natural fluctuant temperature and a constant temperature,and starting from three inoculation densities,the multiflication 0f Platyrnonas subcordiformis was studied.Higher inoculation densities always resulted in higher subsequent concentrations of the microalgae,and an earlier setting in of the steady growth phase.When the initial density was the same,the microalgae reached steady growth phase earlier at a constant temperature than it did at a fluctuant temperature,although the latter treatment reached a much higher maximum density.At the same temperature,lower inoculation density resulted in the fastest relative growth rate,and medium inoculation density correlated with the most stable relative growth rate.And the microalgae cultivated at a fluctuant temperature showed higher and more stable relative growth rate.The multiplication models developed correlated well with the observations.As the inoculation density increased,the initial—density dependent parameter a also decreased,along with the increase of environmental capacity and the decrease of instantaneous multiplication speed.These models also reflected that,when the initial density was the same,the microalgae cultivated at a fluctuant temperature had higher environmental capacity than that cultured at a constant temperature.Furthermore,the microalgae showed higher instantaneous growth rate at a constant temperature.The ratios of Nt/No were not statistically different among treatments at the fluctuant temperature,while there was significant difference between treatments at the constant temperature.When the initial density was low, the ratio of Nt/No was significantly different between the constant and fluctuant temperature treatments,while medium and higher initial densities did not result in significant differences between the treatments of the different temperature regimes.

【题目】长牡蛎夏季死亡与养殖环境及自身体质关系的初步研究
【中文关键词】长牡蛎;夏季死亡;桑沟湾;养殖环境;SOD
【英文关键词】Pacif ic oyster;Summer mor tality;Sanggou Bay;Culture environment;SOD
【中文摘要】选取桑沟湾和爱连湾两个典型牡蛎养殖区为研究对象, 调查了两个海区高温季节牡蛎的死亡情况, 监测了不同养殖区的水温、盐度、pH 和DO 等环境指标, 并测定了牡蛎体内超氧化物歧化酶(SOD) 活性和生长指标的差异, 初步探讨了桑沟湾养殖长牡蛎夏季高温死亡的原因。结果表明, 实验期间(5~ 10月) 桑沟湾崖头养殖海区 (E122.498, N37.151) 长牡蛎夏季累积死亡率为37%, 最高死亡率出现在8 月17 日, 高达51% , 而爱连湾养殖海区(E122.582, N37.179) 的累积死亡率仅为2.5%, 最高死亡率出现在9 月28 日, 为4.5%。单因子方差分析(ANOVA) 表明死亡率与水温具有很强的正相关(R= 0.804, P<0.01) , 与溶氧呈明显负相关(R=-0.377, P<0.01) ; 死亡率与体重、软体湿重、性腺湿重等生长状况指标呈明显的负相关(R 分别为-0.690, -0.498, -0.358) , 与SOD活性呈正相关(R=0.21, P<0.05)。
【英文摘要】Pacific oyster Crassostrea gigas summer mortality frequently occurs in Sanggou Bay recent years, but the oyster appears low mortality rate in its neighboring region-Ailian bay. In this study, two typical Pacific oyster culture areas of these bays have been selected as exper imental sites. The environmental factors including water temperature, salinity, pH and DO, superoxide dismutase (SOD) activity and growth situation of oysters have been monitored, and the oyster summer mortalities of two sites have been researched. The reason of Pacific oyster summer mor tality in Sanggou bay has been analyzed. T he results show that: in experiment per iod (from May to October) , the total mortality rate was 37% in Yatou marine culture region of Sanggou bay (E122.498, N37.151) , the highest mortality rate that appeared on August 17 was 51%. The total mor tality rate was 2.5% in Ailian bay (E122.582, N37.179) , the highest mortality rate that appeared on September 28 was 4.5%. One-way ANOVA results show that: the mortality rate has significant positive correlation with water temperature (R= 0.804, P<0.01) , negative correlation with the dissolved oxygen (R=-0.377, P<0.01) , negative correlation with body weight, soft weight and gonad weight and so on (R=-0.690, -0.498, -0.358, respectively), positive correlation with superoxide dismutase activity (R=0.21, P<0.05).

【题目】充气在几种饵料单细胞藻二级培养中的应用
【中文关键词】单胞藻; 充气培养; 生长率
【英文关键词】microalgae; air-charging incubation; growth rate
【中文摘要】采用实验与生产结合的方法, 研究了充气条件下几种饵料单胞藻的生长特性。结果表明, 充气能大幅度提高4种饵料单胞藻的生长速度。在充气条件下, 新月菱形藻、金藻3011、3012 和扁藻的最大培养密度分别为2. 957×107,1.7×107, 2. 355×107和3. 5 ×106细胞/mL, 分别是对照组最大培养密度的3. 2倍, 6. 5倍, 4. 1倍和5倍; 实验组(充气)与对照组(不充气)在细胞数目、特定生长率(SGR) 、相对生长率(RGR)和绝对生长率(AGR) 等方面均有显著差异。二级充气培养的藻液可以直接扩种到大池进行生产培养, 能有效延长生长时间, 显著提高生产培养效率。
【英文摘要】Growth characteristics of 4 microalgae in bubble condition were studied using experiment combined with production method. The results showed that bubble incubation could improve the growth rate of 4 m icroalgae dram atically. Under bubble condition, the maximum cell density of N. closterium, I. galbana Parke 3011,I. galbana Parke 3012 and P.subcordiform is we re 2.957×107, 1.7×107, 2.355×107 and 3.5 ×106 cell per milliliter, and which was 3. 2, 6. 5, 4. 1 and 5 tim es of the control group under the same conditions respectively. The experiment group showed significant differencew ith the control one in cell number, special growth rate (SGR), re lative grow thrate (RGR) and absolute grow thrate (AGR). The a ir- charg ing incubation seed can be d irectly used for amplified culture. Air- charging incubation can effectively prolong the growth period of the algae ce l,l and remarkably enhance the production efficiency.

【题目】海水鱼类网箱养殖的环境效应及多营养层次的综合养殖
【中文关键词】海水网箱养殖; 富营养化; 有机污染; IMTA
【英文关键词】Marine fish cage aquaculture; Eutrophication; Organic waste; IMTA
【中文摘要】海水鱼类网箱养殖是世界主要渔业国家(如挪威、日本等) 广泛开展的一种高密度、集约化的养鱼方式,这种养殖方式在给广大从业者带来巨大经济、社会效益的同时,对环境也造成了不可忽视的负面影响。开展多营养层次的综合养殖(IMTA) 是缓解这一环境压力的有效途径,鱼类养殖过程中释放出的二氧化碳、氮、磷等物质,由无机提取单元(大型藻类) 来吸收,粪便和残饵等微小颗粒则成为有机提取单元(滤食性贝类) 的饵料,较大的颗粒物质沉到海底后,可以为腐食性单元(海参等) 提供食物,通过这种养殖模式,最大限度地实现系统内营养物质的高效利用,在减轻养殖对环境压力的同时,使系统具有较高的容纳量和食物产出能力。
【英文摘要】The cage aquaculture subsector has grown very rapidly during the past two decades and is presently undergoing rapid changes in response to pressures from globalization and a growing global demand for aquatic products. Following its rapid development,the nutrients of cage culture,mainly uneaten food,and faecal and urinary products,are released directly into the environment and result in many environmental problems. Integrating the fed aquaculture of finfish with the inorganic extractive components of seaweeds,the organic extractive components of shellfish and sea cucumber,has been advocated as an effective strategy to alleviate waste loadings and environmental impacts,the wastes of one resource user become a resource (fertilizer or food) for the others. Through Integrated Multi-Trophic Aquaculture (IMTA) ,some of the food and energy considered lost in finfish monoculture are recaptured and converted into crops of commercial value.

【题目】海洋酵母培育仿刺参Apostichopus japonicus浮游幼体研究
【中文关键词】海洋酵母; 仿刺参Ap ostichop us jap onicus; 幼体; 生长; 变态
【英文关键词】marine yeast; Apostichopus japonicus;auricularia; growth; metam orphosis
【中文摘要】采用海洋酵母(Rhodotorula sp.)作为单细胞藻类的替代饵料培育仿刺参(Apostichopus japonicus)浮游幼体。从生长速度(G) 、浮游期成活率(SRP)、变态成活率(SRM)、特定生长率(SGR)和40% 樽形幼体出现时间(T)等5个指标比较了海洋酵母组(Z9)与不同种类和比例单胞藻混合饵料组(8个组合, Z1~ Z8)的投喂效果; 并确定了不同发育阶段海洋酵母的最佳投喂组合。结果表明: 海洋酵母能够促进刺参幼体的正常发育和变态。ANOVA 分析表明, 不同饵料组间的生长和变态率等指标差异显著, Z2 和Z9两组间差异不显著, 但显著优于其他单胞藻混合组。投喂不同数量的海洋酵母对浮游幼体也有显著影响。
【英文摘要】Marine yeast (Rhodotorula sp.) was used as an alternative bait of sing le-cell microalgae to culture Apostichopus japonicus auricularia. By five indicators of grow thrate (G), the survival rate of plank ton ic period (SRP),surviva l rate o fm etamo rphosis (SRM), specific growth rate (SGR) and 40% bottle-shaped larvae time (T), the effect of feeding with marine yeast group (Z9) was compared with that of by different types and proportion of single cell microalgae mixed feed groups (altogether 8 combinations, from Z1 to Z8), and confirmed the optimum feeding combination in different grow th phases with marine yeast. The results show ed that ma rine yeast could promo te the normal development and metamorphos is of larvae ANOVA analysis indicated that there were significant differences in the targets for grow th and survival rate among different diet groups. There were no significant differences between groups Z2 and Z9, but the effect of these 2 groups were no tably better than the other single-cell microalgae mixed groups. Besides, different feeding quantities also had significant influences on auricularia.

【题目】Molecular cloning and immune responsive expression of a novel C-type lectin gene from bay scallop Argopecten irradians
【中文关键词】略
【英文关键词】C-type lectin;CRD;Argopecten irradians;Tissue distribution;mRNA expression;Injury healing;Immune response
【中文摘要】略
【英文摘要】Abstract C-type lectins are Ca2+-dependent carbohydrate-recognition proteins that playcrucial roles in innate immunity. The cDNA of C-type lectin (AiCTL1) in the bay scallop Argopecten irradians was cloned by expressed sequence tag (EST) and RACE techniques. The full-length cDNA of AiCTL1 was 660 bp, consisting of a 50-terminal untranslated region (UTR) of 30 bp and a 30 UTR of 132 bp with a polyadenylation signal sequence AATAAA and a poly(A) tail. The AiCTL1 cDNA encoded a polypeptide of 166 amino acids with a putative signal peptide of 20 amino acid residues and a mature protein of 146 amino acids. The deduced amino acid sequence of AiCTL1 was highly similar to those of the C-type lectins from other animals and contained a typical carbohydrate-recognition domain (CRD) of 121 residues, which has four conserved disulfide-bonded cysteine residues that define the CRD and two additional cysteine residues at the amino terminus. AiCTL1 mRNA was dominantly expressed in the hemocytes of the bay scallop. The temporl expression of AiCTL1 mRNA in hemocytes was increased by 5.7- and 4.9-fold at 6 h after injury and 8 h after injection of bacteria, respectively. The structural features, high similarity and expression pattern of AiCTL1 indicate that the gene may be involved in injury healing and the immune response in A. irradians.

【题目】人端粒酶逆转录酶(hTERT)基因的腺病毒载体构建及包装
【中文关键词】人端粒酶逆转录酶(hTERT)基因;重组腺病毒;细胞永生化
【英文关键词】human telomerase reverse trancriptase(hTERT)gene;recombinant adenoviruses;immortalization
【中文摘要】[摘 要]【目的】获得含有人端粒酶逆转录酶(hTERT)基因的腺病毒。【方法】通过对PCI-neo-hTERT质粒进行改造,依次构建出JMB293-hTERT、pAdTrack-hTERT,将构建好的pAdTrack-hTERT经Pme I 线性化后与pAdEasy-1载体共转化到 BJ5183 细胞中在重组酶的作用下经氨苄青霉素抗性筛选获得重组腺病毒载体pAdEasy-hTERT载体。将pAdEasy-hTERT经Pac I 酶切线性化并回收后,转染 HEK293细胞,培养7 d 后,收集细胞并反复冻融,收集细胞裂解液;反复扩增3次后,获得高滴度的重组腺病毒,测定其病毒滴度。【结果】○1利用酶切连接的方法得到了穿梭载体pAdTrack-hTERT;○2通过同源重组将外源目的基因整合到腺病毒骨架载体中,得到重组质粒pAdEasy-hTERT;○3成功获得了滴度为6.73×1010 GFU/mL的高滴度腺病毒颗粒。【结论】含有hTERT基因的重组腺病毒颗粒包装成功,为后续获得永生化的家畜细胞系等相关研究做好准备工作。
【英文摘要】Abstract:【Objective】The study was to construct the recombination adenovirus vector containing human telomerase reverse trancriptase (hTERT) gene.【Method】We designed JMB293-hTERT/pAdTrack-hTERT/pAdEasy-hTERT vectors in turn through modified the PCI-neo-hTERT vector. The linear pAdEasy-hTERT vector was transfected into HEK 293 cells, and the recombination adenovirus was collected after 7 days. The linear pAdTrack-hTERT vector after linearization with PmeI enzyme was cotransformed into BJ5183 cells with pAdEasy-1, and the recombination adenovirus vector was obtained under the action of recombinat enzyme and ampicillin resistence screening. Then transfected the recombinant adenovirus vector into HEK 293 cell after linearization with PacI enzyme. The cells were frozen and thawed about 7 days after transfection, and the lysates were harvested. Transfection-culture-harvest was repeated three times to obtain high titer of the recombinant adenovirus and detected the titer of the recombinant adenovirus.【Result】① pAdTrack-hTERT vector was designed .② pAdEasy-hTERT vector was designed by recombinant the foreign hTERT gene into the adenovirus backbone vector.③ The titer of recombinant adenovirus was 6.73×1010 GFU/mL .【Conclusion】Successfully obtained the recombinant adenovirus which may has implications on the further research on immortalized cell lines of livestock.

【英文关键词】PiggyBac transposon;transgenic mice

【中文摘要】嵌合体、基因串联表达以及安全性问题是目前动物转基因技术面临的重大问题。PiggyBac转座子属于II型转座子,最新研究结果显示PiggyBac介导的转基因效率在细胞水平上可以达到10%,转入的基因不形成串联多聚体,而且基因插入的位点多、特异性强,作为转基因的载体能够容纳高达14kb的外源基因。可以在转基因研究中的应用克服传统转基因技术引起的嵌合体、基因串联表达等问题。Cre-LoxP系统是安全删除标记基因及非靶基因序列的有效方法。本研究应用上述两种技术,以小鼠胚胎干细胞(ESC)为研究材料,制备转基因小鼠,研究在转基因过程中多基因表达及标记基因删除的可行性。

【英文摘要】Chimera, gene series expression and safety problem were the big problems for the animal transgenic . The latest research results show that ,PiggyBac transposons ,which belongs to type II transposons, could mediate transgenic efficiency reach to 10% at cell level.It has the propority of no forming series and mulity insert site and specificity and accommodated up to 14 KB exogenous genes. Cre - LoxP system is an effective methods for marker gene and the target gene safe deletion . This study applies the above two kinds of technology to mouse embryonic stem cells (ESC) to prepare the transgenic mice and investigate the possibility of mulity gene expression and maker gene deletion in transgenic process many .

【题目】Alterations in mitochondrial function and spermatozoal motility in goat spermatozoa following incubation with a human lysozyme plasmid

【中文关键词】无

【英文关键词】Transgenic animal; Spermatozoa mediated gene transfer; Human lysozyme plasmid; Mitochondrial function; Spermatozoa motility

【中文摘要】无
【英文摘要】Spermatozoa mediated gene transfer has become a promising technology to generate transgenic animals with disease resistance. However, exogenous DNA invasion may cause changes in spermatozoon natural defense system which result in spermatozoon dysfunction. The objective of this study was to investigate the changes of mitochondrial function and motility in goat spermatozoa after pre-incubation and incubation with and without the human lysozyme plasmid pFLAG-hLY. The results demonstrated that human lysozme plasmid pFLAG-hLY could bind to the surface of the spermatozoon membrane at 186,000 copies/spermatozoa and incorporate to spermatozoon nucleus at 78 copies/spermatozoa after incubation. However, the treated spermatozoon samples showed a significant lower motility (29.7 +/- 2.2% vs. pre-incubation control 48.0 +/- 1.4% and incubation control 54.5 +/- 1.5%, P < 0.05). and percentage of rapid progressive motile spermatozoa (16.4 +/- 2.4% vs. pre-incubation control 31.4 +/- 0.6% and incubation control 37.0 +/- 0.5%, P < 0.01). Meanwhile, the incubation with plasmids caused significant reduction of mitochondrial membrane potential (31.44 +/- 2.17% vs. pre-incubation control 51.79 +/- 2.08% and incubation control 58.81 +/- 1.76%, P < 0.05). In addition, dichlorofluorescin relative fluorescence intensity (32.81 +/- 2.41%) and malondialdehyde levels (2.18 +/- 0.21 nM/10(8) spermatozoa), which represents mitochondrial function, showed a significant increase after incubation (P < 0.05). The cytochrome c release from the mitochondrial inner membrane space, and enzymatic activities of caspase-3 (0.086 +/- 0.024) and caspase-9 (0.083 +/- 0.019) (P < 0.05) also increased, in which resulted in spermatozoon dysfunction. In conclusion, this study confirmed that goat spermatozoa could capture human lysozyme plasmid pFLAG-hLY, but the incubation with the plasmids resulted in a decrease of spermatozoa motility and partial rupture of mitochondrial membrane, and further prompted the expression of cytochrome c, and generation of oxidative stress in vitro and finally led to spermatozoon dysfunction. 【题目】大豆异黄酮与脂肪蛋白质含量基因定位分析
【中文关键词】大豆,SSR,QTL,品质,异黄酮
【英文关键词】soybean, SSR, QTL, quality, isoflavone
【中文摘要】【目的】研究大豆异黄酮与脂肪、蛋白质含量基因定位及相关性,为大豆品质改良、分子育种及基因克隆等应用提供理论依据。【方法】利用SSR 技术,对晋豆23 号和灰布支杂交构建的F13 代大豆重组自交系群体的474 个家系进行了连锁图谱的构建。在此基础上,利用 WinQTLCart2.0 软件分析了影响大豆异黄酮含量、脂肪含量和蛋白质含量3 个重要品质性状的QTL,通过复合区间作图分析,检测QTL;同时,对异黄酮与脂肪、蛋白质的含量相关性分析。【结果】检测到23 个QTL,其中控制异黄酮含量QTL 有6 个,分别定位在J、N、D2 和G 染色体的连锁群上;控制脂肪含量的QTL 有11 个,分别定位在第A1、A2、B2、C2 和D2 染色体的连锁群上;控制蛋白质含量的QTL 有6 个,分别定位在B2、C2、G 和H1 染色体的连锁群上。相关性分析结果表明:异黄酮与蛋白质含量呈极显著负相关;蛋白质和脂肪含量呈极显著负相关;蛋白质和蛋白质脂肪总量呈极显著正相关。【结论】3 个重要品质性状的部分基因定位结果与其相关性分析是一致的,其结果对大豆品质育种应用有重要利用价值。
【英文摘要】【Objective】 Dietary intake of isoflavones has been shown to reduce the risk of several major diseases in humans. Therefore, breeding soybean [Glycine max (L.) Merrill] seeds with desirable isoflavone content would be beneficial to the food and healthy industries, but the environmental sensitivity of the trait complicates phenotypic selection. The objective of this study was to identify quantitative trait loci (QTL) and epistatic interactions associated with isoflavone contents, protein contents, oil contents in soybean seeds. 【Method】 An F13 recombinant inbred line(RIL) comprising 474 lines was derived from a cross between Jindou23 and Huibuzhi. SSR technique was employed for mapping the QTLs. 【Result】 The QTLs for isoflavone content, protein content, oil content were analyzed and 23 QTLs were detected based on the constructed linkage map. Six QTLs for isoflavone content were localized in linkage groups J, N, D2, and G; Eleven QTLs for oil content were localized in the linkage groups A1, A2, B2, C2 and D2. Six QTLs for protein content were localized in linkage groups B2, C2, G and H1. The correlation analysis demonstrated that the content of isoflavone was in significant correlation with protein content. Significantly negative correlations were existed between oil content and protein content, and significantly positive correlations were existed between protein content and the content of total

protein and oil. 【Conclusion】 All these have laid an important basis for the marker assisted breeding of the soybean. According to analysis of this investigation, the phenotype correlations of quantitative traits may result from the correlations of QTL controlling those traits.

【题目】Coupled Effects of Soil Water and Nutrients on Growth and Yields of Maize Plants in a Semi-arid Region
【中文关键词】作物;灌溉;氮素;磷素
【英文关键词】crop irrigation nitrogen phosphorus
【中文摘要】土壤水分和养分之间的耦合作用在半干旱区可持续作物管理中扮演一个重要角色。该项研究分析了东北半干旱区灌溉和施肥条件下对玉米生长和产量的耦合效应。对作物产量而言,氮素有最显著的影响,其次是水和磷素的含量。通过水分和养分的耦合效应对玉米生长发育和产量的影响建立回归模拟方程。回归分析表明,除了合理灌溉,高水平的氮和磷素,可以大大提高效率的粮食生产。同样,优化的土壤养分条件可大大提高水的利用效率。研究结果表明灌溉和养分管理应该基于定量分析水和营养物质的相互作用,对可持续提高作物产量具有重要意义、特别是在干旱地区和半干旱地区。
【英文摘要】Interaction between soil water and nutrients plays an important role in sustainable crop management in semi-arid environments.The coupled effects of irrigation and fertilizers on maize growth and yield in a semi-arid region of northeastern China.In terms of plant productivity,nitrogen fertilizer had the most significant effect followed by irrigation and phosphate levels.The combined application of nutrients and irrigation exerted a synergistic effect on the grain yield of maize plants.Regression analysis indicated that optimal levels of nitrogen and phosphate,in addition to adequate irrigation,could greatly improve the efficiency of grain production.Similarly,optimization of soil nutrient availability substantially increased water use efficiency.These suggested that for the most efficient and sustainable crop production,irrigation and nutrient management should be based on a quantitative understanding of water/nutrients interaction,particularly in semi-arid and arid regions.

【题目】不同区域与品种的海带中砷富集特征差异
【中文关键词】海带 总砷 无机砷 富集规律
【英文关键词】kelp total arsenic inorganic arsenic accumulation regularity
【中文摘要】通过分析不同养殖海域、不同品种海带中无机砷和总砷含量在养殖期间的变化,研究海带中总砷及无机砷的富集规律。结果显示,在生长期内海带对总砷的富集呈增长趋势,而无机砷含量则逐渐降低,其占总砷的比例由3月份1.36%~1.47%下降到7月份的0.41%~0.57%;同一海域、不同品种的海带对总砷和无机砷的富集具有差异性;同时期在不同养殖海域采收的同品种海带总砷和无机砷含量差异显著。基于监测数据对海带中的无机砷进行分析,所有海带样品中无机砷含量远低于现行食品卫生标准中的限量要求,不对食用安全性造成影响。
【英文摘要】The experiments aim to study the enrichment regularity of inorganic arsenic and total arsenic in kelp by analyzing the variation of inorganic and total arsenic in kelps which are from different maritime regions and different species during their growth.The content of inorganic arsenic is detected by HPLC-AFS,while the content of the total arsenic is examined by hydride atomic fluorescence

spectrophotometry in GB/T 5009.11-2003.The results show that the enrichment in kelps of total arsenic displays an increase trend in growing season,whereas the content of inorganic arsenic is decreasing.The percentage of inorganic arsenic in total arsenic decreased from 1.36%-1.47%(March)to 0.41%-0.57%(July).The enrichment of inorganic and total arsenic varies from kelp to kelp even they are cultivated in the same maritime region,meanwhile,the same types of kelps have dramatically different contents of inorganic and total arsenic,which depends on the variety of maritime regions.Judging from the data,the contents of inorganic arsenic in all examined kelps are far below the MRL and will have no negative effects on food safety.The study provides relevant theory foundation for food safety and processing.

【题目】高效液相色谱氢化物发生原子荧光(HPLC-HG-AFS)联用技术检测海藻食品中无机砷

【中文关键词】高效液相色谱; 氢化物发生原子荧光; 海藻; 无机砷;

【英文关键词】high performance liquid chromatography(HPLC); HG-AFS; hydride generation atomic fluore-scence spectrometry; seaweed; inorganic arsenic

【中文摘要】海藻食品中无机砷的含量是水产品质量检验中主要的安全卫生指标。实验采用高效液相色谱氢化物发生原子荧光联用技术(HPLC-HG-AFS)对海藻食品中无机砷的检测进行了研究。通过实验优化了提取剂、提取时间及其仪器条件,建立了HPLC-HG-AFS联用技术检测海藻食品中无机砷含量的方法。用1.2mol/LHCl在70℃水浴下提取1h,用过氧化氢(H2O2)氧化;pH6.0的15mmol/L(NH4)2HPO4溶液为流动相,HPLC-HG-AFS上机分析。样品加标量在0.10mg/kg和1.00mg/kg时的平均回收率均在92%以上,相对标准偏差均低于4%,方法精密度较高。研究结果表明,该方法测定海藻中的无机砷较为准确、可靠,为制定农业行业标准海藻食品中无机砷的测定,提供技术支持。

【英文摘要】The inorganic arsenic(iAs) in seaweed food is an important safety index in seafood quality detection. High performance liquid chromatography-hydride generation-atomic fluorescence spectrometry(HPLC-HG-AFS) was used to determine the iAs in seaweed food. The concentration of extraction reagents,the extraction time and instrument conditions were optimized. A new method to determine the content of inorganic arsenic in seaweed food using HPLC-HG-AFS was obtained:firstly the seaweeds were extracted with 1.2 mol/L.

【题目】茶悬浮培养细胞玻璃化超低温保存研究
【中文关键词】茶; 悬浮培养细胞; 玻璃化法; 超低温保存;
【英文关键词】tea(Camellia sinensis); suspension culture cell; vitrification; cryoproservation;
【中文摘要】为保存具有稳定代谢能力的优良茶细胞系,本文对茶叶悬浮培养细胞玻璃化法超低温保存进行了初步研究。结果表明:预培养以4d最佳,60%PVS2冰浴装载以20min最好,100%PVS2冰浴脱水处理60min最优,40℃复温解冻细胞存活率最高,采用这些参数进行完整试验的细胞存活率达到76%,初步建立了茶悬浮培养细胞玻璃化超低温保存的冷冻程序。 更多还原
【英文摘要】To preserve eminent cell lines with stable metabolism,the cryopreservation of suspension culture cells by vitrification in Camellia sinensis has been preliminarily investigated in this article. It showed that the preculture for four days was best,loading with 60% PVS2 in freezing bath for 20 minutes was optimal. Treating with 100% PVS2 dehydration in freezing bath for 60 minutes was suggested. The cryopreservation of suspension culture cells warmed in 40°Cwater bath had the highest survival rate. The cells ’ survival rate was as high as 76% when these parameters were adopted through the whole trial. The procedure of cryopreservation of suspension culture cells by vitrification in Camellia sinensis was preliminarily established.

【题目】茶树新梢中非酯型儿茶素及其合成酶的变化规律
【中文关键词】茶树; 非酯型儿茶素; 不同季节; 生物合成;
【英文关键词】tea plant [Camellia sinensis (L.) O. Kuntze]; non-galloylated catechins; different seasons; biosynthesis;
【中文摘要】对不同季节茶树新梢不同部位鲜叶中儿茶素组分和非酯型儿茶素合成酶的变化规律进行了研究。结果表明,在茶树新梢上,从芽到第四叶,四种非酯型儿茶素中除了GC外,C、EC和EGC含量均逐步增加;两种非酯型儿茶素合成酶中,DFR/LAR活性呈下降趋势,而ANR在第三叶中达到最高。相关分析进一步表明,不同部位鲜叶中儿茶素的总量变化与DFR/LAR活性变化呈显著正相关,而与ANR变化相关性不大。
【英文摘要】The changes of non-galloylated catechins and relative enzymes as well as the composition of catechins in different parts of tea shoots and in different seasons were investigated in this paper. The results showed that the contents of non-galloylated catechins except GC increased gradually from bud to the fourth leaf. Both of two synthetical enzymes related to non-galloylated cahechins, the activity of DFR/LAR declined gradually, but the activity of ANR was the highest in the third leaf. The result of correlation analysis showed that the contents of total catechins in different tea leaves presented a prominent positive correlation with the activity of DFR/LAR,but not with the activity of ANR.

【题目】Exploring polymorphisms and their effects on reproductive traits of the INHA and INHbA genes in three goat breed
【中文关键词】英文文章,详见英文关键词
【英文关键词】goat, INHA, INHbA, litter size, polymorphisms
【中文摘要】英文文章,详见英文摘要
【英文摘要】In this study, we report the analysis of INHA and INHbA gene polymorphisms in 786 goats of three breeds: Xinong Saanen (SN), Guanzhong (GZ) and Boer (BG). We identi fi ed three new allelic variants: P1 – C80G and/126G (GenBank accession no. HQ202573) in the three goat breeds and P2 – C936T (GenBank accession no. HQ202572) in SN and GZ goat breeds. At P1 locus, AA, AB and BB genotypes were found in the three goat breeds. At P2 locus, CC and CT genotypes were found in SN and GZ goat breeds. After comparing genotype distribution within the three goat breeds, BG had conspicuous differences from SN and GZ ($P < 0.001$) at P2 locus. The SNP locus was in Hardy – Weinberg disequilibrium at P1 locus in the three goat breeds ($P < 0.05$). At P2 locus, the SNP locus was in Hardy – Weinberg disequilibrium in SN and GZ goat breeds ($P < 0.05$). Association of polymorphisms with litter size was done at P1 locus in the three goat breeds. The result showed that AA genotype had remarkable litter size at P1 locus in the three goat breeds ($P < 0.05$). Therefore, these results suggest that INHA gene is a strong candidate gene that affects litter size in goats.

【题目】Study on polymerization effect of polyembryony genes by SSCP marker and family trees in Chinese goats
【中文关键词】英文文章,详见英文关键词
【英文关键词】SSCP; Family trees; Goat; Polymerization effect
【中文摘要】英文文章,详见英文摘要
【英文摘要】The aim of experiment was to analyze the polymerization effect of genotypes and genotype combinations of PRLR and LHb gene loci in Xinong Saanen goat by SSCP marker and family trees. The relationships of genotype combinations and litter size were compared in Xinong Saanen goat. The results indicate that there are genetic polymorphisms at the PRLR and LHb gene loci, and there are 4 positive genotypes (GG, CC, PP and LL) and 4 negative genotypes (HH, DD, QQ and MM) effects on litter size, respectively in Xinong Saanen goat. Compared with the other genotype combinations, the polymerization effect of GGCCPPLL markedly improved (P\0.05). The polymerization effect value of CC genotype was higher than that of CD genotype by 14.12%, and MM genotype was higher than that of LM genotype by 3.80%, and PP genotype was higher than that of QQ genotype by 15.67%, and LL genotype was higher than that of LM genotype by 11.48%, and PQ genotype was higher than that of QQ genotype by 11.02%, and CD genotype was higher than that of DD genotype by 10.69%, and PQ genotype was higher than that of PP genotype by 6.09%. There was significantly polymerization effect in the course of reproduction from parental generation (F0) to F1 generation. However, there was significantly gene isolation effect in the course of reproduction from F1 generation to F2 generation. This result can be used to guide the goat breeding in polyembryony trait.

【中文摘要】无
【英文摘要】Histochemical staining using vanillin-HCl is a potential tool to identify the site-specific accumulation of catechins in the tea plant (Camellia sinensis (L.) O. Kuntze). Using this technique revealed that catechins existed ubiquitously in all inspected tissues in young tea leaf, but the distribution was concentrated in the vascular bundle and palisade tissue, whereas the large parenchyma cells of the main vein contained lower amounts of catechins. At the subcellular level, catechins were located mainly in the chloroplasts of mesophyll cells and in the vessel wall. In young stems, catechins could be detected in most cells except the parenchyma cells of the pith and the cortex, whereas, in roots, catechins could be detected only in those cells surrounding the pericycle. Moreover, differing distributions of catechins were found in calluses cultivated in darkness and light. On the basis of HPLC analyses, six main types of catechins were present in tea leaves, stems, calluses, and chloroplasts; however, roots contained only epicatechin.

【题目】Characterisation of anthocyanidin reductase from Shuchazao green tea
【中文关键词】无
【英文关键词】tea plant (Camellia sinensis (L.) O. Kuntze); tea flavan-3-ols; anthocyanidin reductase; enzyme assay
【中文摘要】无
【英文摘要】BACKGROUND: Flavan-3-ols, which account for approximately 700-800 g kg(-1) of tea polyphenols, exert many health-promoting effects. Anthocyanidin reductase (ANR) is an important enzyme involved in the biosynthesis of flavan-3-ols in the tea plant. The purpose of this study was to establish a suitable method for the determination of ANR activity. RESULTS: Thin layer chromatography (TLC), high-performance liquid chromatography (HPLC) and mass spectrometry (MS) analyses showed that cyanidin and delphinidin were converted into epicatechin and epigallocatechin respectively via ANR by using reduced nicotinamide adenine dinucleotide phosphate (NADPH) as a coenzyme in the tea plant. In order to measure ANR activity via NADPH concentration changes at 340 nm, several interference factors were studied. The interferences from the high background absorbance of substrate and coenzyme and the oxidation reaction of substrate and product were excluded by devising control experiments, decreasing substrate and coenzyme concentrations or adding antioxidants. The optimal pH and concentrations of substrate and NADPH were chosen such that the ANR assays were carried out at 45 degrees C for 25 min in a total volume of 1.5 mL of reaction mixture containing 0.1 mol L(-1) phosphate buffer (pH 6.5), 0.0667 mmol L(-1) cyanidin, 1 mmol L(-1) NADPH, 0.53 mmol L(-1) ascorbic acid and 150 microg total protein. Quantitative reverse transcriptase polymerase chain reaction (qRT-PCR) analysis showed that the trends in ANR gene expression corresponded with the enzyme activity in leaves at different development stages. CONCLUSION: The proposed method is simple, rapid, sensitive and suitable for the determination of ANR activity in the tea plant.

【题目】Differential gene expression in tea (Camellia sinensis L.) calli with different morphologies and catechin contents
【中文关键词】无
【英文关键词】Camellia sinensis
Catechin biosynthesis
Differential gene expression
Gene cloning
Tea calli
【中文摘要】无
【英文摘要】Tea (Camellia sinensis) is a commercially important crop that contains valuable secondary metabolites. To understand the molecular regulation of secondary metabolism in tea, we selected and analyzed two cell lines of tea callus (Yunjing63Y and Yunjing63X) that showed different morphological characteristics and catechin contents. Yunjing63Y callus was yellow and tight, while yunjing63X callus was white and loose. HPLC analyses showed that Yunjing63Y contained 3.71 times higher levels of catechins than Yunjing63X. Using cDNA amplified fragment-length polymorphism (cDNA-AFLP) we identified 68 genes that were differentially expressed between the two lines. Of the 68 differentially expressed ESTs, 40 showed higher expressions in Yunjing63Y and 28 showed higher expressions in Yunjing63X. BLASTX comparisons classified these ESTs into seven functional groups; phenylpropanoid metabolism (2.9%), UDPG-dependent glucosyl transferase (8.8%), transcription factors (11.8%), transporters (13.2%), signal transduction (19.1%), other metabolism (26.5%), and unknown (17.7%). We used qRT-PCR to validate the expression of genes and ESTs, and found that genes associated with flavan-3-ols biosynthesis and metabolism were expressed at higher levels in Yunjing63Y than in Yunjing63X. In addition, the expression of ESTs associated with flavonoid biosynthesis, regulation and transport were higher in Yunjing63Y than in Yunjing63X. The full-length cDNA of a EST coding for a putative MYB transcription factor was amplified using rapid amplification of cDNA ends (RACE). The resulting 1270bp long cDNA, named CsMYB1, contained a 933-bp ORF encoding a 310-amino acid protein with a predicted molecular weight of 105.27kDa and a predicted isoelectric point of 4.85 and showed highest homology to plant MYBs likely involved in stress signaling.

【题目】茶树不同器官组织总RNA提取方法的研究
【中文关键词】茶树; 总RNA; 器官; 提取方法; 简易CTAB-LiCl法;
【英文关键词】tea plant(Camellia sinensis(L.) O.Kuntze); total RNA; organs; extracting method; CTAB-LiCl method;
【中文摘要】从茶树组织中提取高质量的总RNA,是开展茶树基因组学、功能基因组学研究的重要前提,而RNase、多酚类物质严重干扰茶树总RNA的分离提取。鉴于茶树组织总RNA提取过程难易不一、总RNA提取质量良莠不齐的现状,现对材料用量、提取液、DNA和蛋白质抽提液、RNA沉淀试剂、多酚氧化抑制剂等进行了比较研究,建立了一种适合茶树各器官组织总RNA提取的简单高效的方法(简易CTAB-LiCl法),并与实验室常用的改良Tri-Reagent法、改良CTAB法进行了比较。核酸定量和琼脂糖凝胶电泳检测结果显示,简易CTAB-LiCl法从茶树各器官组织中提取到的总RNA质量高、得率高。

总RNA的得率是改良CTAB法的1.6-5倍。因此,简易CTAB-LiCl法具有效率高、适用范围广,且操作简单、实验成本低的特点。RT-PCR和cDNA-AFLP实验表明,提取的总RNA能够用于后续的分子生物学研究。

【英文摘要】Obtaining high quality total RNA is an important prerequisite for studying genomics and functional genomics of tea plant.It is hard to extract high quality total RNA from tea due to the interference of RNase,and polyphenols.Aiming at the drawbacks in extracting method for total RNA of tea plant,a comparative study was carried out to determine material dosage,extracting buffer,protein extracting solution,precipitating reagent for extracting total RNA,in this paper. The simple CTAB-LiCl method was established,which was a simple and effective method for extracting total RNA from different organs of tea plant.The differences among the improved Tri-Reagent method,the improved CTAB method and the simple CTAB-LiCl method were comparably investigated.The results of spectrophotometry testing and agarose gel electrophoresis showed that the simple CTAB-LiCl method was suitable for extracting high yield and high quality total RNA from tea organs.The intensity ratio of 28 S and 18 S rRNA bands was 2:1,the absorbanee ratios of A260 to A280 were about 2.0,the absorbanee ratios of A260 to A230 were up to 2.0,and the yield of total RNA ranged from 290.61 μg/g to 532.44 μg/g fresh weight.This method is good for extracting total RNA from different tea organs with its simple,efficient,high extracting rate and low cost.The results of RT-PCR and cDNA-AFLP analysis also revealed that the simple CTAB-LiCl method could obtain high quality total RNA from different tea organs.

【题目】茶树实时荧光定量PCR分析中内参基因的选择

【中文关键词】茶树, 实时荧光定量PCR, 内参基因

【英文关键词】Camellia sinensis, real-time fluorescence quantitative PCR, reference genes

【中文摘要】选择合适的内参基因是提高实时荧光定量PCR分析(qRT-PCR)准确性的先决条件。该文以茶树(Camellia sinensis)芽、叶、幼根、嫩茎、花瓣、种子和愈伤组织为材料, 应用实时荧光定量PCR技术, 分析了18S rRNA、GAPDH、β-actin和α-tubulin 4个常用内参基因在茶树不同器官组织中的表达情况。经GeNorm和NormFinder软件分析发现, 当利用荧光定量PCR分析比较茶树不同器官组织中的基因表达差异时, 可选择β-actin作为校正内参基因; 而比较不同成熟度的叶片和愈伤组织时, 可以选择GAPDH作为校正内参基因

【英文摘要】The selection of a suitable reference gene is an important prerequisite for successful gene expression analysisby real-time fluorescence quantitative PCR (qPCR). We investigated the expression stability of 4 endogenous candidategenes (18S rRNA, GAPDH, β-actin and α-tubulin) in qPCR experiments in different organs and tissues, including buds,leaves, young roots, stem, petals, seeds, and callus, of the tea plant Camellia sinensis (L.) O. Kuntze. The analysis withGeNorm and NormFinder algorithms revealed that β-actin could be used as a reference gene for organs and tissues andGAPDH for mature leaves and callus.

【题目】A preferable approach to clone hLIF cDNA from the genomic DNA

【中文关键词】英文文章,详见英文关键词

【英文关键词】cDNA cloning, hLIF, oral mucous membrane, overlap PCR

【中文摘要】英文文章,详见英文摘要

【英文摘要】Complementary DNA (cDNA) is valuable for investigating protein structure and function in the research of life science, but it is difficult to obtain by traditional reverse transcription. In this study, we employed a novel strategy to clone the human leukemia inhibitory factor (hLIF) gene cDNA from genomic DNA directly isolated from the mucous membrane of mouth. The hLIF sequence can be acquired within a few hours by means of amplification of each exon and splicing using overlap-PCR. Thus, the new approach developed in this study is simple, time- and cost-effective, and it is not limited to particular gene expression levels of each tissue.

【题目】Analysis of Differentially Expressed Genes in Ovaries of Polytocous versus Monotocous Dairy Goats Using Suppressive Subtractive Hybridization
【中文关键词】英文文章,详见英文关键词
【英文关键词】SSH, EST, goat
【中文摘要】英文文章,详见英文摘要
【英文摘要】In this study, suppressive subtractive hybridization (SSH) was performed to screen differentially expressed genes in ovarian tissues between polytocous and monotocous goats. From the SSH cDNA library, we obtained 29 differentially expressed sequence tags (ESTs) that have high similarity with known genes in the public database, which were involved in signal transduction, transcriptional regulation, cellular molecular dynamics, cytoskeleton, metabolism and oxidation – reduction. In addition, one novel EST that has no similarity with known genes in the public database was obtained. Eight ESTs, TIMP1, NUCB1, OAZ1, CXXC5, CAPNS2, ATP5A1, Z and RPL5, were further examined for the reproducibility of the SSH data by the real-time quantitative PCR. The results con fi rmed an increased expression of respective mRNA in ovarian tissues of polytocous goats compared with those of monotocous goats. The study has identi fi ed several genes (known or unknown) that may have effect on follicular development, ovulation and egg activation in goats.

【题目】Polymorphism identification in goat GNRH1 and GDF9 genes and their association analysis with litter size
【中文关键词】英文文章,详见英文关键词
【英文关键词】goat, linkage disequilibrium, litter size, SNP
【中文摘要】英文文章,详见英文摘要
【英文摘要】This study investigated the polymorphisms of GNRH1 and GDF9 genes in 641 goats of three breeds: Xinong Saanen, Guanzhong, and Boer. Two allelic variants were identified in the GNRH1 gene (JN645280:g.3548A>G and JN645281:g.3699G>A) and one allelic variant was found in the GDF9 gene (JN655693:g.4093G>A). Furthermore, g.4093G>A was a missense mutation (p.Val397Ile of GDF9). Results of an association analysis indicated that SNPs g.3548A>G and g.4093G>A had significant effects on litter size ($P < 0.05$). The combination genotypes of SNPs g.3548A>G, g.3699G>A, and g.4093G>A also affected litter size with C5 genotype having the highest litter size in the fi rst, third, fourth, and average parity. Hence, the biochemical and physiological functions, together with the results obtained in our investigation, suggest that the GNRH1 and GDF9 genes could serve as genetic markers for litter size in goat breeding.

【题目】GnRHR gene polymorphisms and their effects on reproductive performance in Chinese goats
【中文关键词】英文文章,详见英文关键词
【英文关键词】GnRHR, Polymorphisms, Litter size, Goat
【中文摘要】英文文章,详见英文摘要
【英文摘要】In this study, polymorphisms in the goat GnRHR gene exon 1 were detected by PCR-SSCP and DNA sequencing methods in 786 individuals from two different goat breeds. Two haplotypes (A and B), two observed genotypes (AA and AB), and two single nucleotide polymorphisms (SNPs) were detected, which resulted in five amino acid substitutions. The frequencies of haplotypes A and B in the two goat breeds were 0.78 – 0.83 and 0.17 – 0.22, respectively. The SNP locus was in Hardy – Weinberg disequilibrium in the two goat breeds ($P < 0.05$). Polymorphisms of the GnRHR gene were shown to be associated with litter size in the two goat breeds. The SNPs in the goat GnRHR gene had significant effects on litter size ($P < 0.05$). Therefore, these results suggest that the GnRHR gene is a strong candidate gene that affects litter size in goat.

【题目】New genetic polymorphisms of KiSS-1 gene and their association with litter size in goats
【中文关键词】英文文章,详见英文关键词
【英文关键词】PCR-SSCP,Base deletions,SNP,Candidate gene
【中文摘要】英文文章,详见英文摘要
【英文摘要】In the present study, the polymorphisms of kisspeptin (KiSS-1) gene were analyzed in 652 individuals from three goat breeds: Xinong Saanen goats (SG), Guanzhong goats (GZ) and Boer goats (BG). Three alleles (T, C and G) and four genotypes (TT, TC, CC and TG) were detected in the intron 2 of KiSS-1 gene by PCR-SSCP analysis. In addition, two single nucleotide polymorphisms (SNPs) – T2643C and 8bp base deletions (2677AGTTCCCC) were identified by DNA sequencing. The SNPs loci were in Hardy – Weinberg disequilibrium in three goat breeds ($P < 0.05$). After comparing genotypic distribution within three goat breeds, BG had conspicuous differences from SG and GZ ($P < 0.001$). Association of polymorphism with litter size was done in SG and GZ breeds, which showed to be associated with litter size in both goat breeds. The SNP in goat KiSS-1 gene had significant effects on litter size ($P < 0.05$). Therefore, these results suggest that KiSS-1 gene is a strong candidate gene that affects litter size in goats.

【题目】Novel polymorphisms of goat growth hormone and growth hormone receptor genes and their effects on growth traits
【中文关键词】英文文章,详见英文关键词
【英文关键词】GH gene　GHR gene　Polymorphisms
【中文摘要】英文文章,详见英文摘要
【英文摘要】In this study, the polymorphisms of growth hormone (GH) gene 50 promoter region and intron 8, exons 4 and 10 of growth hormone receptor (GHR) gene were analyzed in Xinong Saanen goats (SG) and Boer goats (BG). Two alleles (A and B) and three genotypes (AA, AB and BB) were detected at P1 locus of GH gene, and two alleles (G and T) and two genotypes (GG and GT) were detected at P4 locus of GHR gene by PCR-SSCP analysis. In addition, two single nucleotide polymorphisms (SNPs)- A73C (P1 locus) and G114T (P4 locus), were identified by DNA sequencing. The frequencies of alleles A and B in the two goat breeds were 0.61 – 0.62, and 0.39 – 0.38, respectively, and the frequencies of alleles G and T in the two goat breeds were 0.82 – 0.86, and 0.18 – 0.14, respectively. The SNP loci were in Hardy – Weinberg disequilibrium in both goat breeds (P\0.05). Polymorphisms of GH and GHR genes were shown to be associated with growth traits in BG breed. AA and GG genotypes were associated with superior growth traits in 1-, 2- and 3-month old individuals. Hence, AA and GG genotypes are suggested to be a molecular marker for superior growth traits in BG breed.

【题目】Polymorphism identification in goat DGAT2 gene and association analysis with milk yield and fat percentage
【中文关键词】英文文章,详见英文关键词
【英文关键词】Allelic variants, Linkage disequilibrium, SNP, PCR-SSCP
【中文摘要】英文文章,详见英文摘要

【英文摘要】In this study, we reported the analysis of DGAT2 gene polymorphisms in 468 goats of two breeds: Xinong Saanen (SN) and Guanzhong (GZ). We identified three new allelic variants: P2 (C234A), P4 (C182T) and P5 (G301T) in SN and GZ breeds. Furthermore, P2 locus was a missense mutation (Leu > Met) in both breeds. Three genotypes were found at P2 (CC, CDand DD) and P4 (AA, AB and BB) loci in SN and GZ breeds, respectively. At P5 locus, EE and EF genotypes were found in both breeds. The SNP loci were in Hardy – Weinberg disequilibrium at P2 and P5 loci in SN and GZ breeds ($P < 0.01$). The P4 locus was in Hardy – Weinberg equilibrium in both breeds ($P > 0.05$). Association of polymorphisms with milk yield and fat percentage was done in both breeds, which showed that genotypes CC, CD (P2 locus) and EE (P5 locus) had higher milk yield and fat percentage. Some of those with better performance could be used for the breeding of improved genotypes of goat. Therefore, these results suggest that DGAT2 gene is a strong candidate gene that affects milk yield and fat percentage in goat.

【题目】Polymorphism identification in the goat KITLG gene and association analysis with litter size
【中文关键词】英文文章,详见英文关键词
【英文关键词】goat, haplotype, linkage disequilibrium, polymorphisms.
【中文摘要】英文文章,详见英文摘要
【英文摘要】This study reported the analysis of KIT ligand (KITLG) gene polymorphisms in 681 goats of three breeds: Xinong Saanen (SN), Guanzhong (GZ), and Boer (BG). In addition, the study identified three allelic variants: g.769T>C and g.817G>T in SN and GZ breeds, and g.9760G>C in the three goat breeds. The g.769T>C and g.817G>T loci were closely linked ($r2 > 0.33$). All the single nucleotide polymorphism loci were in Hardy – Weinberg disequilibrium ($P < 0.05$). Significant associations were found for litter size with all three loci. Therefore, these results suggest that the KITLG gene is a strong candidate gene affecting litter size in goats.

【题目】Polymorphism of Exon 2 of FSH β Gene and Its Relationship with Reproduction Performance in Two Goat Breeds
【中文关键词】英文文章,详见英文关键词
【英文关键词】goat, FSH β, polymorphism, litter size
【中文摘要】英文文章,详见英文摘要
【英文摘要】The objectives of the present study were to detect the polymorphism in follicle stimulating hormone beta (FSH â) gene and investigate the relationship between FSH â gene and high prolificacy in goats. According to the sequence of ovine FSH â gene, two pairs of primers were designed to detect single nucleotide polymorphism of exon 2 of FSH â gene in two goat breeds, Xinong Saanen dairy goat and Boer goat, by PCR-SSCP. The least square mean and genetic variance of different genotypes at polymorphic locus were analyzed, and the selection reaction was forecasted by genetic correlation between marker locus and genetic variance of litter size traits. There was one polymorphic locus occurring in exon 2 (P2) with three genotypes (EE, EF and FF). In Xinong Saanen dairy goat, EE genotype had significantly higher ($P < 0.05$) litter size than EF and FF genotype in the first to fourth parity and average parity; EF genotype had significantly higher ($P < 0.05$) litter size than FF genotype in the second and average parity. In Boer goat, EE genotype had significantly higher ($P < 0.01$) litter size than EF and FF genotype in the second to fourth parity and average parity; EF genotype had significantly higher ($P < 0.05$) litter size than FF genotype in average parity. In Xinong Saanen dairy and Boer goat, the heredity of

litter size was mainly influenced by genetic additive effect and the EE genotype is a favorable marker genotype for litter size in these two breeds.

【题目】Polymorphism of PRLR and LH β genes by SSCP marker and theirassociation with litter size in Boer goats
【中文关键词】英文文章,详见英文关键词
【英文关键词】SSCP; Pedigrees; Boer goats; Polymerization effect
【中文摘要】英文文章,详见英文摘要
【英文摘要】In the study, the polymerization effect of genotypes and genotype combinations of prolactin receptor (PRLR) and luteinizing hormone beta (LH β) gene was analyzed in Boer goats by SSCP marker, DNA sequencing and pedigrees. The relationships of genotypes and genotype combinations with litter size were compared in Boer goats. The result indicated that there were genetic polymorphisms in PRLR and LH β genes. There were 4 positive genotypes (HH, CC, PQ and LL) and 4 negative genotypes (GG, DD, PP and MM) effects on litter size, respectively in Boer goats. Compared with the other genotype combinations, the polymerization effect of HHCCPQLL was markedly improved (Pb0.05). The polymerization effect value of CC genotype was higher than that of CD genotype by 6.55%, and HH genotype was higher than that of GH genotype by 9.47%, and HH genotype was higher than that of GG genotype by 10.55%, and PQ genotype was higher than that of PP genotype by 7.73% – 11.68%, and PQ genotype was higher than that of QQ genotype by 14.06%, and LL genotype was higher than that of LM genotype by 2.76%. This result can be used to guide goat breeding in polyembryony trait.

【题目】马铃薯淀粉磷酸寡糖的全酶法制备及其分离
【中文关键词】马铃薯淀粉,全酶法,磷酸寡糖,柱层析,分离,制备
【英文关键词】potato starch, enzymatic, phosphoryl oligosaccharides, column chromatography, separation, preparation
【中文摘要】研究了制备低葡萄糖当量值(dextrose equivalent value,DE)麦芽低聚糖的工艺,以及从中分离制备磷酸寡糖(phosphoryl oligosaccharides, POs)的工艺条件。以马铃薯淀粉为原料,采用全酶法结合喷射液化工艺制备低DE值麦芽低聚糖,采用高效液相色谱法(high performance liquid chromatography, HPLC)测定样品糖分组成,柱层析法从中分离制备磷酸寡糖,并利用红外光谱进行定性分析。结果表明,麦芽低聚糖液化DE值为15%,糖化DE值36%,其中含有葡萄糖及麦芽二至七糖,以麦芽二至五糖居多,符合分离制备磷酸寡糖的要求。弱碱性阴离子交换树脂HJ-30分离磷酸寡糖的工艺条件:洗脱液NaCl浓度0·5 moL/L,洗脱速度1·2 mL/min。红外光谱分析结果显示,样品为结合有磷酸基团的糖类物质。
【英文摘要】The paper studied on the crafts to prepare maltooligosaccharides with low dextrose equivalent(DE) values and phosphoryl oligosaccharides (POs). Firstly, the low DE maltooligosaccharides was prepared from potato starch by enzymatic-jet liquefaction methodologies and was analyzed by high performance liquid chromatography (HPLC). Then, POs was separated from maltooligosaccharides by column chromatography and analyzed by infrared chromatography. The results showed that the DE values of liquefied and saccharified maltooligosaccharides were 15% and 36%, respectively. HPLC analysis showed that it mainly contained maltoolgosaccharide with DP 2 to 5. The optimal conditions to separate POs by HJ-30 column are as follows: the column was eluted with 0.5 mol/L NaCl at 1.2 mL/min. IR analysis of POs showed that it was sugar with phosphate groups.

【题目】辽西地区土壤耕层及养分状况调查分析
【中文关键词】辽西地区;土壤耕层;犁底层;养分状况
【英文关键词】Western Liaoning, Soil plough layer, Plough pan, Soil nutrients
【中文摘要】目前,东北地区农田土壤耕层中明显存在的“浅、实、少”问题,已成为制约区域农业发展的主要限制因素。本文对辽西地区主要作物农田土壤耕层和养分状况进行了调查分析,结果表明:辽西地区的平均耕层为15.17 cm,比我国土壤平均耕层(16.5cm)低1.33cm。阜新、铁岭、朝阳、赤峰的有效耕层土壤量分别为2.27×106、1.97×106、1.95×106、1.79×106kg/hm2,均低于正常有效耕层土壤量(2.72×106kg/hm2),分别低16.5%、27.6%、28.3%、34.2%。但阜新、铁岭、朝阳、赤峰的土壤体积质量平均值分别为1.32、1.38、1.33、1.33 g/cm3,均高于作物生长适宜的土壤体积质量范围(1.1~1.3 g/cm3)。同时,辽西地区土壤养分状况也较为低下,其中速效P总变异趋势最大,pH值总变异趋势最小。
【英文摘要】At present soil plough layers of the farmland are obviously shallow, solid and little in the Northeast region of China, which have become into the main limiting factors for the development of regional agriculture. This paper studied soil plough layers and soil nutrients in western Liaoning. The results showed that the thickness of the mean plough layer in western Liaoning was 15.17 cm, which was 1.33 cm shallower than that of nationwide plough layer. Soil bulks of the effective plough layers in Fuxin, Tieling, Chaoyang and Chifeng were 2.27×106, 1.97×106, 1.95×106 and 1.79×106kg/hm2 respectively, which were 16.5%, 27.6%, 28.3% and 34.2% lower than that of the normal effective plough layer (2.72×106kg/hm2)respectively. The mean soil bulk densities in Fuxin, Tieling, Chaoyang and Chifeng were 1.32, 1.38, 1.33 and 1.33 g/cm3 respectively, all were higher than the suitable range (1.1 - 1.3 g/cm3) for crops normal growth. Meanwhile, soil nutrients in western Liaoning were low too. The general variation available phosphorus was maximum while that of pH was minimum.

【题目】秸秆与氮肥配施对玉米生长及水分利用效率的影响
【中文关键词】秸秆还田;氮肥;玉米;生长发育;水分利用效率
【英文关键词】returning straw to soil; nitrogen fertilizer; maize; growth and development;water use efficiency
【中文摘要】针对辽西风沙半干旱区降水少、干旱频发、土壤瘠薄,玉米秸秆资源丰富的现状,重点研究了秸秆与氮肥配施对玉米生长发育及水分利用效率的影响。试验设4个秸秆还田量水平,2个施氮量水平。结果表明,秸秆还田配施氮肥对玉米生长前期和中后期的影响差别较大,对玉米早期生长有一定的负面作用,中后期秸秆还田正效应逐渐得到体现,玉米生长及水分利用效率以秸秆量9 000 kg·hm-2配施纯N 420 kg·hm-2和秸秆量6 000 kg·hm-2配施纯N 420 kg·hm-2效果较佳。
【英文摘要】In view of the current situation of rainless, poor soil and a large amount of maize strawin semi-arid area of western Liaoning Province, 4 levels of straw application rate plus 2 levels of nitrogen fertilizer were designed to study the effect of straw and nitrogen fertilizer on the growth,development and water use efficiency of maize. The results showed that the effect differenceof corn straw plus nitrogen fertilizer on the growth of maize between early stage and middle-and-late stages were great. At the early stage, it had some negative effects on the growth of maize, while at middle-and-later stages,some positive effects began to appear. To achieve the best effect of growth and water use efficiency ofmaize, maize-residue application treatment of 9 000 kg·hm-2 plus nitrogen (N) fertilizer of 420 kg·hm-2 and maize-residue application treatment of 6 000 kg·hm-2 plus nitrogen fertilizer (N) of 420 kg·hm-2 would be appropriate.

【题目】施氮量对玉米产量、氮素利用效率和土壤硝态氮累积的影响
【中文关键词】玉米;施氮量;产量;土壤硝态氮;氮素利用率
【英文关键词】Maize;N application;Yield;Soil nitrate;Nitrogen utilization efficiency
【中文摘要】采用田间试验研究不同施氮量对两个玉米品种子粒产量、土壤硝态氮累积量及氮素利用率的影响。结果表明,玉米产量随施氮量增加显著提高,当施氮量高于200kg/hm2时玉米产量不再增加,高氮处理地上部分秸秆生物量出现下降趋势。0~100cm土层硝态氮累积量随氮素输入量的增加显著增加。不同玉米品种对氮素的吸收利用影响硝态氮在土壤中的累积,植株氮积累量存在差异。密植型玉米先玉335总吸氮量高于平展型玉米辽单28,土壤硝态氮的累积量也显著低于后者。不同氮肥水平的氮肥利用率为28.38%~35.33%,高氮处理氮肥利用率最低。本试验条件下,中氮处理水平基本能够满足作物生长的需求。综合产量、氮肥利用效率和土壤硝态氮累积情况,确定合理施氮量应控制在200kg/hm2左右。
【英文摘要】Field experiment was carried out to investigate N application on yield,soil nitrate accumula-tion,plant N uptake and utilization of two kinds of maize.The results showed that maize yield increased significantly with the increment of nitrate application rate,but the biomass of maize decreased and the yield of grain of maize didn ’ t increase when the nitrogen application rate was higher than 200kg/ha.Nitrogen application significantly increased nitrate content in all layers of soil profile and hyper-accumulation of ni-trate was found in 0-100cm soil layer in the treatment of 200kg/ha nitrogen application.There weredifferences in the yield and plant total amount of N absorption among 2types of maize.Total amount of N absorption and the content of soil nitrate in the high dose treatment which planted density-tolerance maize Xianyu 335were higher than density no-tolerance maize Liaodan 28.High nitrogen using efficiency was found in the treatment whose nitrogen fertilizer rate was 200kg/ha.Under the experimental conditions,with the consideration of yield,nitrogen utilization and soil nitrate accumulation,a reasonable amount of nitrogen application should be controlled at about N 200kg/ha.

【题目】不同耕作方式对土壤水分及玉米生长发育的影响
【中文关键词】玉米;耕作方式;土壤水分
【英文关键词】Maize; Tillage management; Soil water content
【中文摘要】针对辽宁省中北部地区土壤耕层变浅、犁地层变硬等问题,以当地传统的耕作方式秋季旋耕为对照,设置秋季旋耕后翻耕25 cm、秋季旋耕后深松 30 cm、秋季旋耕后隔年深松 30 cm 3 种耕作方式,探讨不同耕作方式对土壤水分和玉米生长发育的影响。结果表明,翻耕或深松处理均有利于土壤含水量的提高,其中以秋季旋耕后深松30 cm 和秋季旋耕后翻耕 25 cm 的保墒效果最佳;翻耕或深松处理均增加了根冠比和产量,提高了玉米叶片酶活性,延缓了玉米生育后期叶片的衰老,其中以秋季旋耕后翻耕25 cm 效果最佳。秋季旋耕后翻耕 25 cm 的耕作方式较好。
【英文摘要】According to the characters of soil layer shoal and plow pan was hard in the middle and northern areas of Liaoning province, used plowing 25 cm, sub- soiling 30 cm and sub- soiling 30 cm in alternate years in autumn to study effects of different tillage managements on soil moisture and development of maize. The results showed that soil water contents of different tillage managements were all higher than CK. Among of which the sub- soiling 30 cm and the plowing 25 cm were the most significant. All the tillage managements increased the root/shoot ratio and yield. Increased the enzyme activity in leaves of maize, defer decrepitude effectively of leaves at latter growing stage, the plowing 25 cm in the fall was the best. The plowing 25 cm was the best, and obviously superior to that of other tillage managements.

【题目】半干旱区中耕深松对土壤水分和作物产量的影响
【中文关键词】半干旱区;深松;土壤水分;玉米;大豆;产量
【英文关键词】Semi- arid area; Subsoiling; Soil water; Maize; Soybean; Yield
【中文摘要】为了提高半干旱区旱作农田对天然降雨的利用率,打破犁底层,增加雨水入渗,达到蓄水保墒、提高作物产量的目的,2008 ~ 2009 年在朝阳半干旱区对旱地玉米和大豆进行中耕深松试验。研究表明,深松能打破犁底层,降低表层土壤容重和根系穿透阻力,提高土壤孔隙度。与对照相比,深松可以增加土壤含水量并可以提高水分入渗深度,深松区土壤水分入渗深度可达 80 cm左右,未深松区土壤水分入渗深度只有 40 cm左右。深松使玉米根干重增加幅度为 3.6% ~ 6.1%,使大豆根干重增加15.1%,并使大豆主根系入土深度增加 3 cm,玉米增产幅度 1.9% ~ 11.3%,在干旱年份增产效果明显,大豆增产 19.47%。
【英文摘要】In order to improve the utilization of natural rainfall in the dry farmland in the semi- arid area, break up plough pan, increase rainfall infiltration, achieve the purpose of water conservation and enhance the crop production,the subsoiling experiment on dryland corn and soybean made in the semi- arid area in Chaoyang in 2008 - 2009. The study shows that subsoiling can break up plough pan, decrease soil bulk density of surface layer and penetration resistence of the root system, increase soil porosity. Subsoiling can increase soil water content and enhance water infiltration depth to 80 cm compared with the control whose depth is only 40 cm. The root dry weight of maize is increased by 3.6% - 6.1%, and the root dry weight of soybean is increased by 15.1%, and the length of taproot is increased by 3.0 cm through subsoiling. Maize yield is increased by 1.9% - 11.3%, and stimulation effect is obvious in a dry year, and soybean yield is increased by 19.47%.

【题目】马铃薯淀粉制备磷酸寡糖的研究
【中文关键词】马铃薯淀粉 磷酸寡糖 分离 定性分析
【英文关键词】potato starch,phosphoryl oligosaccharides,separation,analysis
【中文摘要】以马铃薯淀粉为原料,采用全酶法并借以喷射液化工艺制备低 DE 值的麦芽低聚糖浆,采用高效阴离子交换色谱法测定所制备样品的糖分组成,离子树脂交换法从中分离制备磷酸寡糖,最后,采用薄层层析法和红外光谱法对其进行定性分析。结果表明: 制备液化 DE 值 16%,糖化 DE 值 35% 的糖液,其中,主要成分为麦芽二糖至麦芽七糖,以二糖至五糖居多。201 ×4 强碱性苯乙烯系阴离子交换树脂分离效果好,分离条件为: 洗脱液为 0. 4 mol/L NaCl,洗脱速度为 1. 4 mL/min。经红外光谱定性分析,结果显示样品为结合有磷酸基团的糖类物质。
【英文摘要】Malt - oligosaccharides with low dextrose equivalent (DE) was prepared from potato starch by using the fully enzymatic method and steam ejection liquefaction. Sample composition was detected using high performance anion - exchange chromatography,and phosphoryl oligosaccharides (POs) were separated from malt - oligosaccharides with the ion - exchange method. Finally,the POs were analyzed by thin - layer chromatography and infrared spectrum. Results: The DE values of the prepared liquefied and saccharified malt - oligosaccharides are 16% and 35% ,respectively,and a majority of the product is malt - oligosaccharides of disaccharide to pentose. The optimal conditions to separate POs are using 201 × 4 ion - exchange resin for separation,and eluting the column with 0. 4 mol / L NaCl at a speed of 1. 4 mL / min. IR analysis indicates the product is phosphate groups bound saccharides.

【题目】发情期家兔输卵管上皮细胞和基质细胞的分离培养与鉴定
【中文关键词】输卵管;上皮细胞; 基质细胞;共培养; 免疫组化和免疫荧光;家兔
【英文关键词】oviduct; epithelial cells; stromal cells; coculture; immunocytochemistry andimmunofluores cence; rabbit
【中文摘要】目的 探讨输卵管上皮细胞和基质细胞的体外分离培养方法及在激素刺激下基质细胞对上皮细胞的作用。[1]方法 通过差速贴壁法体外分离纯化兔输卵管上皮细胞和基质细胞; 免疫组织化学染色和免疫荧光染色方法鉴定上皮细胞和基质细胞的类型和纯度;并在无胎牛血清DMEM/ F12培养液和含体积分数15%胎牛血清的DMEM/F12培养液中,分别添加不同浓度的雌激素(17E2)和孕激素(P4), 比较上皮细胞和基质细胞的增殖情况及其对上皮细胞/基质细胞共培养的影响。[1]结果 体外成功地分离到兔输卵管上皮细胞和基质细胞; 兔输卵管上皮细胞经鼠抗人细胞角蛋白单克隆抗体(antiCK18)免疫组织化学染色后呈阳性, 细胞质呈棕色,免疫荧光染色检测其纯度在98%以上;兔输卵管基质细胞经鼠抗人波形蛋白单克隆抗体(antiVimentin) 免疫组织化学染色后呈阳性, 细胞质呈棕色,免疫荧光染色检测其纯度在95%以上。17E2 和P4 均能促进兔输卵管上皮细胞和基质细胞的增殖, 使其数量明显增加。基质细胞与上皮细胞共培养,上皮细胞增殖较快。[1]结论 差速贴壁法能够获得纯度较高的输卵管上皮细胞和基质细胞,在17E2 和P4 共同作用下,少量基质细胞能促进上皮细胞生长。
【英文摘要】The research is to study methods for isolation and culture of epithelial cells and stromal cells fromr abbit oviduct, and stromal contributionto epithelial functions inthe stimulation of estrogen. Method Invitro rabbit oviductal epithelial cells andstromal cells were isolated and purified through differential attachment technique. Immunocytochemical staining and immunofluorescence staining were usedto identify typesof epithelial cellsandstromal cells and the purification. Different concentration of 17estrogen(17E2) andprogesterone (P4) were added respectively to the fetal bovine serum-free DMEM/ F12mediumandDMEM/ F12 mediun including the volume fraction 15% fetal bovineserum, compared with proliferation of epithelial cells and stromal cells, and whose effected on the cocultured epithelial cells stromal cessl. Result Rabbit oviduct epithelial cells and stromal cells, immunocytochemistry of rabbit

oviductal epithelial cells, thecytoplast showbrown(+) toanticytokeratin 18, the purification of epithelial cells reach over 98% through immunofluorescence staining; immunocytochemistry of rabbit oviductal stromal cells, thecytoplast show brown(+) to antivimentin, the purificationof stromal cells reachover 95% through immunofluorescence staining. 17E2 andP4 could accelerate the proliferation of rabbit oviductal epithelial cells and stromal cells, whose quantity distinctly increased. Epithelial cells were cocultured instromal cells, epithelial cellsproliferate quickly. Conclusion This study demonstrates that differential attachment technique can receive more highpurity of oviductal epithelial cellsandstromal cells. Uncler the combinedaction of 17E2 and P4, a small quantityof stromal cells could accelerate the growth of epithelial cells

【题目】枸杞锁阳山羊奶饮料加工工艺的研究

【中文关键词】山羊奶;枸杞;锁阳;加工工艺;配方

【英文关键词】Goat milk;Medlar;Cynomorium;ProcessinglFormulation

【中文摘要】采用山羊奶、枸杞、锁阳为主要原料,应用对比和正交试验方法,研制功能性山羊奶饮料。结果表明:①工艺流程为:枸杞、锁阳原料一浸提一过滤一添加羊奶调配一均质一灌装一灭菌一成品;②最佳配方为:50%纯净水、30%羊奶、6%白砂糖、7%枸杞汁、5%锁阳,l%酸味剂;③复合稳定剂的添加量为:0.12%蔗糖脂,O.08%CMC,0.08%黄原胶。工的饮料稳定性佳,口感细腻,酸甜适宜,具有羊奶的芳香和特殊口味。

【英文摘要】Use goat milk,medlar,and cynomorium aa the main material.Following the contrasting testing and orthogonal experiment,developing a kind offunctionaldairydrinks.The processing techincs was.①medlar.eynomorium.Extraction 4 filter add goat milk.homogenizationfilling+sterilization produetion.②the bestformula was.50%pure water.30%goat milk.6%sugar.7%medlarjuice.5%cynomoriumjuiee.l%acids.③the stabilizer compoundinclude 0.12% sucrose fatty acid esters.0.08%CMC.0.08%xanthangum.

【题目】猕猴桃奶豆腐加工工艺及配方研究
【中文关键词】山羊奶;猕猴桃;奶豆腐;配方
【英文关键词】Goat;kiwi;milk curd;formula
【中文摘要】发一种新型的适合大众口味的高营养奶制品。以山羊奶为主要原料,以适量的猕猴桃汁和白砂糖等作为辅料,通过工艺改进和配方优化,加工一种新型山羊奶制品。得出猕猴桃奶豆腐的加工工艺为:原料乳(制作奶皮子后的脱脂乳)+杀茵_+添加发酵剂+自然凝乳+切割+排清+升温搅拌+保温搅拌_静置_排乳清-+切碎_压榨_成形_冷藏。配方为:鲜羊奶75%,猕猴桃汁17%,白砂糖8%,再加入少量的甜味剂和调味荆。研制的猕猴桃奶豆腐既有羊奶的乳香、猕猴桃的酸甜,同时更富于其更全面的营养物质。

【题目】由马铃薯淀粉制得磷酸寡糖的定性定量测定
【中文关键词】磷酸寡糖;薄层层析法;高效阴离子交换色谱 - 脉冲安培检测;红外吸收光谱
【英文关键词】phosphorylated oligosaccharides;thin layer chromatography (TLC);high-performance anionic exchange chromatography-air pulsing ampere detectors (HPAEC-PAD);infrared spectroscopy (IR)
【中文摘要】对以马铃薯淀粉为原料、全酶法制得的磷酸寡糖进行定性定量分析。通过采用薄层层析法(thin layerchromatography,TLC)和高效阴离子交换色谱-脉冲安培检测(high-performance anionic exchange chromatography-air pulsing ampere detectors,HPAEC-PAD)对磷酸寡糖组分进行检测分析,同时利用红外吸收光谱(infrared spectroscopy,IR)对其进行结构分析。结果表明:磷酸寡糖是结合有磷酸基团的并且聚合度在 3~7 之间的麦芽低聚糖混合物,以麦芽三糖至麦芽

六糖组分居多。
【英文摘要】The current study was carried out to quantitatively and qualitatively analyze phosphorylated sligosaccharides prepared from potato starch by totally enzymatic method. The phosphorylated sligosaccharide composition was determined by thin layer chromatography (TLC) and high performance anionic exchange chromatography with pulsed amperometric detection (HPAEC-PAD). Infrared spectroscopy (IR) was used for structure elucidation. The analytes were identified as a mixture of maltooligosaccharides containing phosphate groups and having a degree of polymerization between 3 and 7, in which maltotriose,maltotetraose, maltopentaose and maltohexaose were the dominant components.

【题目】基于磷酸寡糖生产的淀粉磷酸酯中结合磷含量的分析研究
【中文关键词】磷酸寡糖;淀粉磷酸酯;结合磷含量
【英文关键词】phosphoryl oligosaccharides; phosphates starch; binding-phosphorus content
【中文摘要】研究中分别通过分光光度法和感应耦合等离子体原子发射光谱(ICP-AES)法对不同淀粉磷酸酯中的结合磷含量进行了分析。结果表明,分光光度法较 ICP-AES 法更适于淀粉磷酸酯中磷含量的分析,测定波长为 825 nm;市售淀粉磷酸酯的结合磷含量均较低,不适于磷酸寡糖的制备研究,为高产率磷酸寡糖的生产奠定重要理论基础。
【英文摘要】The research herein provides valuable data with respect to the binding -phosphorus content ofdifferent phosphate starches using spectrophotometry and inductively coupled plasma emission spectrometry (ICP-AES). The result shows that, Spectrophotometry is more suitable for the analysis of phosphorus content in phosphate starch than ICP-AES, and the wavelength is 825 nm. Furthermore, commercial phosphate starches was not suitable for the preparation of phosphoryl oligosaccharides which have a low binding -phosphorus content. It has laid an important theoretical foundation for the high yield of phosphoryl oligosaccharides.

【题目】离子色谱法测定超高麦芽糖浆中的麦芽糖
【中文关键词】超高麦芽糖浆;高效阴离子色谱;脉冲安培检测器
【英文关键词】extreme highmaltose syrup; high performance anion-exchange chromatography; pulsed amperometr
【中文摘要】该研究旨在建立一种采用高效阴离子色谱测定超高麦芽糖浆中的麦芽糖含量的方法。在CarboPacT-MPA200 3mm×250 mm(带CarboPacTMPA200 3 mm×50 mm保护柱)离子色谱柱上,用200 mmol·L-1氢氧化钠和100 mmol·L-1乙酸钠梯度洗脱,在Au工作电极和Ag/AgCl参比电极的脉冲安培检测器上测定超高麦芽糖浆中麦芽糖的含量。结果表明,标准溶液测定的保留时间和峰面积相对标准偏差为0·52%和0·13%。该方法用于测定超高麦芽糖浆中的麦芽糖含量,取得了满意的结果,加标回收率为85·4%~115·2%。
【英文摘要】In order to develop amethod for analysis ofmaltose in extreme highmaltose syrup using high performance anion-exchange chromatography,we used sodium hydroxide solution and sodium acetate solution as the mobile phase on CarboPacTMPA200 3 mm×250 mm column (with guard column CarboPacTMPA200 3mm×50mm) with anAuworking electrode and anAg/AgCl reference electrode to determine themaltose in extreme high maltose syrup.The results show that the relative standard deriation for retain time and peak area ofstandard solution were 0·52% and 0·13% respectively.A satisfied resultwasobtained foranalysisofmaltose in extreme highmaltose syrupwith the proposedmethod. The recoverieswere 85·4% -115·2%.

【题目】2个山羊品种多胎性状的微卫星标记研究
【中文关键词】微卫星标记;山羊;遗传多样性;产羔数
【英文关键词】microsatellite markers;goat;genetic polymorphism;litter size
【中文摘要】根据比较基因组学原理,选择与绵羊高繁殖力紧密关联的4个微卫星标记OarAEl01、OarHH55、BMl329、BMS2508,分析其在波尔山羊和西农莎能奶山羊中的多态性分布情况。结果表明,4个微卫星标记在波尔山羊中的多态信息含量(PIC)分别为0.834 0、0.722 2、0.802 1、0.685 5,有效等位基因数(Ne)分别为6.719、4.098、5.610、3.542;在莎能奶山羊中的PIC分别为0.765 5、0.738 7、0.670 1、0.682 0,Ne分别为4.849、4.360、3.520、3.609。4个微卫星基因座对波尔山羊和莎能奶山羊的产羔数效应分析表明,在波尔山羊群体中,OarAEl01基因座126 bp等位基因对产羔数具有正效应,而134 bp则呈负效应;OarHH55基因座120和124 bp等位基因对产羔数具有正效应,而130 bp/140 bp基因型则呈负效应;BMl329基因座185 bp等位基因对产羔数具有正效应,而176 bp等位基因和215 bp/240 bp基因型均呈负效应;BMS2508基因座118 bp等位基因对产羔数具有正效应,而122 bp/141 bp基因型和148bp等位基因均呈负效应。在西农莎能奶山羊群体中,OarAEl01基因座108 bp等位基因和114 bp/126 bp基因型对产羔数均呈正效应,而124 bp等位基因则呈负效应;OarHH55基因座120 bp等位基因对产羔数呈正效应,而150 bp/165 bp基因型呈负效应;BMl329基因座185 bp等位基因对产羔数呈正效应,而176 bp等位基因和215 bp/240 bp基因型则均呈负效应;BMS2508基因座118 bp等位基因对产羔数呈正效应,而141 bp等位基因和153 bp/160 bp基因型均呈负效应。
【英文摘要】According to comparative genomics,four microsatellite loci including OarAEl01,OarHH55.BMl329 and BM$2508 that linked to the fecundity gene FecB in the sheep chromosome 6 were analyzed for polymorphisms in Boer goat and Xinong Shaanen goat.The results indicate that there are genetic polymorphisms at these 4 microsatellite loci.The polymorphism information content(PIC)and number of effective alleles(NP)are 0.834 0,0.722 2,0.820 1,0.685 5 and 6.719,4.098,5.610,3.542 respectively in Boer goats;the PIC and Ne are 0.765 5,0.738 7,0.670 1,0.682 0 and 4.849,4.360,3.520,3.609,respectively in Xinong Shaanen goats.The resuit of the effect of the 4 microsatellite loci on the litter size of 2 goat breeds showed that the allele 126 bp at OarAEl01 has positive effects on the litter size in Boer goat but 1 34 bp has negative Effects on the allele 120 bp and 124 bp at OarHH55 have positive effects on the litter size in Boer goat,but 130 bp/140 bp has negative effects;the allele 185 bp at BMl329 has positive effects on the litter size in Boer goat but 176 bp,215 bp/240 bp have negative effects;the allele 118 bp at BMS2508 has positive effects on the litter size in Boer goat and 122 bp/141 bp,148 bp has negative effects;the allele 108 bp,1 14 bp/126 bp at OarAEl01 have positive effects on the litter size in Xinong Shaanen goat and 124 bp has negative effects;the allele 120 bp at OarHH55 has positive effects on the litter size in Xinong Shaanen goat and 150 bp/165 bp has negative effects;the allele 185 bp at BMl329 has positive effects on the litter size in Xinong Shaanen goat and 176 bp,215 bp/140 bp have negative effects;the allele 118 bp at BMS2508 has positive effects on the litter size in Xinong Shaanen goat and 141 bp,153 bp/160 bp have negative effects.

【题目】FMDV2A介导的乳腺上皮细胞双基因表达载体构建及表达
【中文关键词】人白细胞介素2;EGFP,FMDV2A;双顺反子

【英文关键词】hlL-2;EGFP;FMDV 2A;bicistronic expression vector
【中文摘要】构建FMDV 2A介导的人白细胞介素2基因(hlL一2)和增强型绿色荧光蛋白(EGFP)基因双顺反子乳腺特异性表达载体,并验证其在乳腺上皮细胞中的表达。克隆奶山羊p酪蛋白启动子序列,将hlL一2基因序列置于启动子之后,然后利用口蹄疫病毒2A(FMDV 2A)自剪切序列连接EGFP基因,构建出乳腺特异性的双顺反子表达载体pFIENp,并利用脂质体转染山羊乳腺上皮细胞,然后用RT-PCR技术和Western blot检测hlL一2基因与EGFP基因的表达。重组质粒pFIENp经酶切鉴定后表明构建成功,转染质粒PFIEN|3和pEGFP-C1的细胞均观察到绿色荧光;从转染pFIENp的乳腺上皮细胞中扩增出hlL一2基因和EGFP基因,而转染pEGFP—C1的细胞中只扩增出EGFP基因;经Western blot检测,转染pFIEN|3的细胞中均表达了hlL-2和EGFP蛋白。结果表明山羊p酪蛋白启动子能同时启动hlL-2基因和EGFP基因在山羊乳腺上皮细胞中的表达,并且利用FMDV 2A元件实现了hlL-2基因和腼FP基因的非融合型表达。
【英文摘要】The aim of this study was to construct mammary gland specific bicistronic expression vector based on FMDV2A.and verify the expression of sequences of EGFP and human IL-2 in mammary epithelial cells.We utilized self-cleaving peptide 2A from foot-and-mouth disease virus(FMDV 2A)connecting hIL-2 and EGFP sequence,and cloned into goat pcasein regulatory sequence,then we got mammary gland specific bicistronic expression vector pFIENp,after transient transfection into goat mammary epithelial cells by LipofectamineTM 2000,we used RT_.PCR and Western blot to detect the expression of hILr2 and EGFP.Restriction analysis suggested that the recombinant plasmid pFIENp is correct.Then we found that the cells which were transfected with pFIEN|3 and pEGFP二C1 expressed EGFP bv observing with fluorescent microscope,and there is no green flourescence in which were untransfected,and we amplificating hll,2 and EGFP sequence in the cells transfected with pFIEN[3,and amplifieating EGFP sequence only in the cells transfected with pEGFP-C1;After detection by Western blot,the cells transfected with pFIEN|3 expressed both hIL,2 and DGFP.The results showed that goat p-casein regulatory sequence can trigger hIL.2 and EGFP expression in mammary epithelial cells.And FMDV2A facilitate expresson of hiL-2 and EGFP independently.

【题目】FSH β 基因外显子2 的多态性及其与两个山羊品种繁殖性能的相关性研究
【中文关键词】山羊;卵泡刺激素 β 亚基;多态性;产羔数
【英文关键词】goat; FSH β ; polymorphism; litter size
【中文摘要】【目的】寻找与产羔数相关的遗传标记,为山羊高繁殖力标记辅助选择提供依据.【方法】根据绵羊FSH β 基因序列设计2 对引物,采用 PCR-SSCP 技术检测山羊FSH β 基因外显子2 的多态性,利用最小二乘均数法对其与产羔数的关系进行分析,同时对多态位点的遗传方差进行分析,通过标记位点与产羔性状的遗传相关预测选择反应.【结果】在引物(P2)扩增片段中检测到1个多态位点,出现3 种基因型(EE、EF 和FF).对于西农萨能奶山羊,在1~4 胎和平均产羔数中,EE 型个体产羔数显著高于EF 和FF 型个体(P<0.05),EF 型个体的第2胎和平均产羔数显著高于FF 型个体(P<0.05);对于波尔山羊,在2~3 胎和平均产羔数中,EE 型个体产羔数极显著高于EF 和FF 型个体(P<0.01),EF 型个体平均产羔数显著高于FF 型个体(P<0.05).在西农萨能奶山羊和波尔山羊两个群体中,产羔性状的遗传主要受基因加性效应的影响.【结论】对于西农萨能奶山羊和波尔山羊,多态位点EE 基因型可作为产羔性状上的标记基因型.
【英文摘要】【Objective】The objectives of the present study were to detect the polymorphism in follicle stimulating hormone beta (FSH β) and investigate the relationship between FSH β gene and high prolificacy in goats.【Method】According to the sequence of ovine FSH β gene,two pairs of primers were designed to detect single nucleotide polymorphism of exon 2 of FSH β gene in two goat breeds by PCR-SSCP. The least square mean and genetic variance of different genotypes at polymorphic loci were analyzed, and the selection reaction was forecasted by genetic correlation between marker locus and genetic variance of litter size traits. 【Result】There was one polymorphic locus occurring in exon2 (P2) with three genotypes (EE, EF and FF). In Xinong Saanen dairy goat, EE genotype had significantly higher (P<0.05) litter size than EF and FF genotype in the first to fourth parity and average parity; EF genotype had significantly higher (P<0.05) litter size than FF genotype in the second and average parity. In Boer goat, EE genotype had significantly higher (P<0.01) litter size than EF and FF genotype in the second to fourth parity and average parity; EF genotype had significantly higher (P<0.05) litter size than FF genotype in average parity. In Xinong Saanen dairy and Boer goat, the heredity of litter size was mainly influenced by genetic additive effect. 【Conclusion】 In Xinong Saanen dairy and Boer goat, the EE genotype is a favorable

marker genotype for litter size.

【题目】PRLR基因外显子10多态性与西农萨能奶山羊产奶性能的相关分析
【中文关键词】西农萨能奶山羊;PCR-SSCP;催乳素受体基因;产奶性能
【英文关键词】Xinong Saanen dairy goat;PCR-SSCP;PRLR gene;milk performance
【中文摘要】设计4对引物,采用PCR-SSCP技术检测催乳素受体(PRLR)基因外显子10在西农萨能奶山羊群上的单核苷酸多态性,同时研究该基因对其产奶性能的影响.结果表明:引物Pz、P.与P.扩增片段具有多态性,Pt的扩增片段不存在多态性.应用Pz扩增片段,在西农萨能奶山羊中仅检测到AA和AB基因型,纯化测序表明AA与AB基因型相比有2处突变,C27T的突变没有导致氨基酸变化,第189处的碱基缺失导致氨基酸由组氨酸变为酪氨酸和苏氨酸.AA和AB基因型之间产奶量的最dx--乘均值差异显著(P<0.05),AA基因型在各胎次产奶量和平均产奶量等指标上均高于AB基因型,其中第3胎的产奶量达到显著水平(P<0.05);应用P.扩增片段,在西农萨能奶山羊中检测到3种基因型(CC、CD、DD),纯化测序表明CC与DD基因型相比有2处突变(C103A和T106C),分别导致氨基酸由赖氨酸变为苏氨酸、苏氨酸变为异亮氨酸;3种基因型之间产奶量的最/b--乘均值差异不显著(P>0.05).应用P.扩增片段,在西农萨能奶山羊中也只检测到EE和EF基因型,纯化测序表明EE与EF基因型相比有1处突变(A114G),该突变导致氨基酸由蛋氨酸变为缬氨酸;EE和EF基因型之间产奶量差异显著(P<0.05).EE基因型的个体各胎次产奶量均比EF型高,其中在第3、4胎产奶量和前4胎平均产奶量3项指标上都达到显著水平(P<0.05).研究结果提示:PRLR基因对奶山羊产奶量有显著影响,因此认为PRLR基因外显子10位点可作为奶山羊高产奶量的标记辅助选择的有效分子标记.
【英文摘要】Prolactin receptor(PRLR)gene was studied as a candidate gene for the milk performance of in Xinong Saanen dairy goat.Four pairs of primers were designed to detect single nucleotide polymorphisms of exon 10 of PRLR gene by PCR-SSCP.The results showed that only the products amplified by primer P1 didn ’ t display polymorphisms.For primer P2,two genotypes(AA and AB)were detected in Saanen dairy goat.Sequencing revealed two mutations of PRLR gene in the genotype AA in comparison to the genotype AB,The mutation C27T did not cause any amino acid change,The deletion of 189th result in two amino acid changes of His · Tyr and Thr.The difference of the least squares means(LSM)for milk yield between AA and AB was significant(P<O.05)in Saanen dairy goat,the third lactation milk yield of individuals with gen一otype AA was higher than that with genotype AB(P<0.05).For primer P3,three genotypes (CC,CD,DD)was detected in Saanen dairy goat.Sequencing revealed tWO mutations(C103A and T106C)of PRLR gene in the genotype CC in comparison tO the genotype DD.The former mutation resulted in an amino acid change of Lys÷Thr,and the later mutation resulted in an anino acid change Thr-}Ile.The difference of LSM for milk yield among CC,CD and DD was non—significant (P>0.05).For primer P4,tWO genotypes(EE and EF)were detected in Saanen dairy goat.Sequencing revealed one mutation(A1 14G)of PRLR gene in the EE in comparison tO the genotype EF,and this mutation resulted in an amino acid change of Met-- ’ Val.The difference of the LSM for milk yield between EE and EF was significant(P<O.05)in Saanen dairy goat,The milk yield of individuals with genotype EE was higher than that with genotype EF in third,fourth lactation milk yield and average milk yield(P<O.05).Based on these results.it was indicated that PRLR gene had significant positive effects on milk performance of dairy goats.Additionally,The exon 10 of PRLR gene can be regarded as effective molecular markers on MAS program for milk performance of dairy goat.

【题目】西农莎能奶山羊和波尔山羊GDF9 基因多态性与产羔数的相关分析
【中文关键词】GDF9; PCR-SSCP; 遗传多态性; 西农萨能奶山羊; 波尔山羊
【英文关键词】GDF9; PCR-SSCP; g enetic polymo rphism; x inong shaaneng dairy goat; boer goat
【中文摘要】为了研究西农萨能奶山羊和波尔山羊生长分化因子9(GDF9) 基因遗传多态性及其与产羔数和生长体重的相关性.根据绵羊GDF9 基因序列设计4 对引物,采用PCR-SSCP 技术检测GDF9 基因的多态性,同时用最小二乘法研究了其多态性与产羔数和生长体重的关系.所研究的西农萨能奶山羊群体和波尔山羊群体P1 扩增片段存在多态性,分别定义为AA、AG 和GG 3 种基因型; P2、P3 和P4 扩增片段均不存在多态性,只出现一种带型.通过测序发现:GG 型与AA 型相比在外显子2 的792 bp 处有1 个G! A 的单碱基突变,结果导致第396 位氨基酸由缬氨酸变为异亮氨酸.在西农莎能奶山羊群体中,AA 基因型产羔数最小二乘均值均极显著高于AG 基因型和GG基因型; AG 基因型显著高于GG 基因型.此外,在西农莎能奶山羊中还发现AA 基因型的个体各个生长阶段的体重和GG 型和AG 型的相比差异均不显著.在波尔山羊群体中,AA 基因型产羔数最小二乘均值均极显著高于AG基因型和GG 基因型,AG 基因型的高于GG 型,但没达到显著水平.结果表明,GDF9 基因对西农莎能奶山羊和波尔山羊的产羔数均有显著影响,因此认为GDF9 基因外显子2 第792 bp 处G! A 的突变可作为西农莎能奶山羊和波尔山羊多胎性状的有效分子标记.
【英文摘要】In this st udy,we detected the relatio n betw een the g enet ic polymo rphisms of g row th differ ent iatio n factor 9(GDF9) and the litter size and g row th weight in x inong shaaneng dairy go at and in bo er g oat. 4 pairs primer s wer e desig ned to detect sing le nucleotide polymo rphism o f GDF9 g ene in both x ino ng shaaneng dair y go at breed and boer goat br eed by PCR-SSCP and,sequencing was applied to ana lyze t he genetic var iatio n,and meanwhile least squar e was applied to analy ze the r elation betw een different g eno types and the lit ter size and g row th w eig ht. The results show ed that o nly t he pr oducts amplified by pr imer 1 (P1) displayed polymo rphism,and three genoty pes (AA,AG and GG) wer e detected in bo th tw o go at breeds. w ith pr imer P2,P3 and P4,ther e w as no po lymor phism. T he sequencing results revealed there was only o ne sing le nucleot ide mutatio n (G792! A792) at ex on 2 of GDF9 g ene in g oats,and this mutat ion resulted in an am ino acid change:valine ! iso leucine. In xino ng shaaneng dair y g oat breed,the aver age litt le size with g eno type AA w as significantly higher than that of genoty pe AG(P < 0. 01) and that o f g eno type GG(P< 0. 01) as w ell as that the av erag e little size wit h g enot ype AG w as sig nificant ly hig her t han that o f g eno type GG(P< 0. 01) . In additio n,the gr ow th weig ht of each st ag e w ith genoty pe GG w ere not sig nificantly different compared whith that o f genoty pe AA and g eno type AG. In bo er go at br eed,t he aver age little size w ith genoty pe AA w as significantly hig her than that o f genoty pe AG(P< 0. 01) and that of g enot ype GG(P < 0. 01) ,and the aver age little size w ith g enot ype AG w as hig her than that of g enot ype GG. T he r esult s show ed that the differ ent g eno types o f GDF9 g ene can significantly affect the litter size in x inong shaaneng dairy go at breed and bo er go at breed. So GDF9 gene can be co nsidered as a candidat e g ene o f litter size for selecting x inong shaaneng dairy goat .

【中文关键词】GnRH;PRC-SSCP;遗传多态性;西农萨能奶山羊;布尔山羊
【英文关键词】GnRH, PCR-SSCP, genetic polymorphism, Xinong shaaneng dairy goat, Boer goat

【中文摘要】根据牛GnRH 基因序列设计4对引物,采用PCR-SSCP技术检测GnRH 基因的多态性,同时用最小二乘法研究了其多态性与产羔数和生长体质量的关系.所研究的西农莎能奶山羊和布尔山羊群体在P4扩增片段存在多态性,分别定义为CC、CT和TT 3种基因型;P1、P2和P3扩增片段均不存在多态性,只表现一种带型.通过测序发现CC型与GG型相比扩增片段的第185、336bp处同时有C→T的单碱基突变.在西农莎能奶山羊和布尔山羊群体中,CC和CT基因型产羔数最小二乘均值均极显著或显著高于TT基因型(P<0.05).研究结果表明,GnRH基因对西农莎能奶山羊和布尔山羊的产羔数均有显著影响,因此认为GnRH 基因P4扩增位点的突变可作为西农莎能奶山羊和布尔山羊多胎性状的有效分子标记.

【英文摘要】4 pairs primers were designed to detect single nucleotide polymorphism of GnRH gene in both Xinong shaaneng dairy goat breed and boer goat breed by PCR-SSCP and, sequencing was applied to analyze the genetic variation, and meanwhile least square was applied to analyze the relation between different genotypes and the little size and growth weight. The results showed that only the product amplified by primer 4(P4) displayed polymorphism, and three genotypes (CC, CT and TT) were detected in both two goat breeds. For primer P1, P2 and P3, there was no polymorphism. The sequencing results revealed there were two mutation (185bpC>A and 336bpC>A) at the product amplified by primer 4 in genotype CC compared with genotype TT in goat. The first, second, third birth litter size and the average litter size of individuals with genotype CC and CT were significant or extremely significant higher than those of genotype TT (P<0.05) in both breeds. The results showed that the different genotype of GnRH gene can significantly affect the litter size in the two breeds.

【题目】组织块再移法分离培养奶山羊乳腺上皮细胞

【中文关键词】山羊;乳腺上皮细胞;组织块再移法;生长曲线;群体倍增时间

【英文关键词】Goat, mammary epithelial cells, tissue re-shift method, growth curve, cell population doubling time

【中文摘要】通过比较组织块贴壁培养法、组织块再移法、胰蛋白酶消化法、胶原酶Ⅱ消化法和胶原酶消化配合组织块贴壁法分离、培养、纯化山羊乳腺上皮细胞,绘制细胞生长曲线并计算细胞群体倍增时间,研究乳腺上皮细胞培养效果.结果显示,利用胶原酶消化配合组织块贴壁法不能获得正常生长的乳腺上皮细胞;利用组织块贴壁培养法、组织块再移法和胶原酶Ⅱ消化法获得大量的乳腺上皮细胞,所得到的上皮细胞生长曲线呈典型的“S”型,符合细胞生长的一般规律.组织块再移法不仅可快速获得大量纯化的乳腺上皮细胞,而且所得到的细胞经传代后,细胞群体倍增时间最短、增殖能力最强,表明,该法是获得山羊乳腺上皮细胞最适宜的方法.

【英文摘要】In this study, in order to obtain a method to culture mammary epithelial cells with high purity in vitro efficiently,5 methods which include adherent tissue culture,tissue reshift method, trypsin digestion, collagenase Ⅱ digestion and the combination of collagenase digestion with tissue adherence were applied and compared. Goat mammary epithelial cells were isolated,cultured and purified in 5 methods and finally the cell growth curves were made and the cell population doubling time was calculated. The results indicated that the last method was barely efficient whereas adherent tissue culture, tissue re-shift method and collagenase Ⅱ digestion showed high efficiency to get large amount of mammary epithelial cells and the cell growth curve showed a typical "S" type. It was notable that tissue re-shift method showed high efficiency to get a large number of purified mammary epithelial cells, short cell population doubling time, strong proliferation after cells were obtained after passage, thus suggesting it is an appropriate method to obtain goat mammary epithelial cells.

【题目】6个微卫星基因座与西农萨能奶山羊产羔数相关性的研究
【中文关键词】微卫星基因座;西农萨能奶山羊;遗传多样性;产羔数;分子育种
【英文关键词】microsateffite markers;Xinong Saanen dairy goat;genetic polymm]hism,titter size;molecular breedng
【中文摘要】选择与羊高繁殖力紧密关联的微卫星基因座OarAl7,101、BMl329、OarHH55、BMl43、BMS2508和LSCV043,分析其在西农萨能奶山羊群体中的遗传多态性及与西农萨能奶山羊产羔数的关系.结果表明:6个微卫星基因座在西农萨能奶山羊中的有效等位基因数在6.571 3~8.992 5,多态信息含量在0.830 1~0.878 1,属于高度多态基因座.6个微卫星基因座对西农萨能奶山羊产羔数的效应分析表明:OarAEl01基因座的109 bp等位基因、OarHH55基因座的165和140 bp等位基因、BMS2508基因座的140 bp等位基因,BMl43基因座的124 bp等位基因、BMl329基因座的219 bp/185 bp基因型以及LSCV043基因座的140 bp/120 bp基因型,均对西农萨能奶山羊产羔数具有正效应.以上6个微卫星基因座可作为西农萨能奶山羊产羔性状候选基因的遗传标记.
【英文摘要】The study aimed at finding out the locus related to fecundity and providing some assistance for creating goat fecundity lines,early selection of parents.increasing selection accuracy and acceleration breeding.Six microsatellite markers OarAEl01,BMl329,OarHH55,BMl43,BMS2508 and LSCV043 closely associated with high reproduction in sheep and goats were analysed for polymorphisms in Xinong Saanen dairy goat.The results showed high genetic polymorphisms at the six microsatellite loci.The number Of effective alleles(Ne)at 6.571 3~8.992 5,pclymorphism information content(PIC)at 0.830 1~0.878 1 in Xinong Saanen dairy goat.The analysis of litter size effect of the six microsatellite loci in Xinong Saanen dairy goat indicated that the allele,109 bp at OarAEl01,165 and 140 bp at Oar- HH55,140 bp at BMS2508.124 bp at BMl43 as well as the genotype,219 bp/185 bp at BMl329 and 140 bp/120 bD at LSCV043,have positive effects 013 litter size.Microsatellite analysis showed that the 6 selected microsatellite lOCi can be used for marker assisted selection.

【题目】GHR基因exon 9和exon 10多态性与西农萨能奶山羊产奶性能的相关分析
【中文关键词】西农萨能奶山羊;PCR-SSCP;GHR基因;产奶性能;exon
【英文关键词】Saanen dairy goat;PCR-SSCP;G;milk performance;exon
【中文摘要】针对GHR基因exon 9和exon 10设计了2对引物,采用PCR-SSCP技术检测该基因这2个位点在西农萨能羊群上的单核苷酸多态性,同时研究其对产奶性能的影响.结果表明:exon 9具有多态,exon 10不存在多态性.Exon 9住点在西农萨能山羊中检测到NN型和NT型,纯化测序发现有1个SNP位点,NN型与NT型相比在该片段第241 bp处有1个G-T的突变;NN和

NT基因型之间产奶量的最小二乘均值差异显著(P<0.05):NN基因型在各胎次产奶量和平均产奶量等指标上均好于NT基因型,其中在第3胎的产奶量和第4胎产奶量2项指标上都达到显著水平(P<0.05).研究结果提示:GHR基因exon 9对奶山羊产奶量有显著影响,因此认为GHR基因exon 9位点可作为奶山羊高产奶量的标记辅助选择的有效分子标记.

【英文摘要】The GHR gene was studied as a candidate gene for milk performance in Xinong Saanen dairy goats.Two pairs of primers were designed to detect single nucleotide polymorphisms of exon 9 and 10 of GF佣gene by PCR-SSCP.The results showed that products amplified by exon 10 did not exhibit polymorphisms.For exon 9,two genotypes(NNand NT)were detected in Saanen dairy goats.Sequencing revealed one mutations of the Ggene in the genotype NN in comparison to the genotype NT;the difference in the least squares means(LSM)for milk yield between NN and NT was significant(P<0.05).The milk yield of individuals with genotype NN was higher than those with genotype NT in the third and fourth lactation periods(P<0.05).Based on these results,the GHR gene had significant positive effects On milk performance of dairy goats and the exon 9 of the Ggene may be regarded as an effective molecular markeron the MAS program for the milk performance Of dai ry goats.

【英文关键词】growth hormone gene;PCR-SSCP;genetic p01ymorphism;goat
【中文摘要】【目的】研究波尔山羊级进杂交后代GH基因第4、5外显子的遗传多态性及其与体重性状的相关性.【方法】采集波尔山羊及其与关中奶山羊级进杂交Fz、Fz和F3代羊的血样,利用PcR-SSCP技术分析其GH基因第4、5外显子的多态性,并用最小二乘法研究了第5外显子多态性与体重性状的关系.【结果】第4外显子在山羊群体中不存在多态性,而第5外显子在该群体存在多态性(有AA,AB,AC,AD 4种基因型);第5外显子发生了2处突变,AB基因型在237 bp位发生了C-T突变,AD基因型在第289 bp位发生了C-A突变,但突变均没有导致氨基酸的变化.波尔山羊及其Fl代群体中AD型个体的初生重极显著高于AC型(P<0.01);在F:代群体中,AB型个体的初生重和1月龄体重显著高于AA型(P<0.05);不同基因型个体的3月龄体重均差异不显著(P>0.05).【结论】第4外显子在山羊群体中不存在多态性,而第5外显子在该群体存在多态性.GH基因第5外显子可能对波尔山羊级进杂交后代体重性状有影响.
【英文摘要】【0bjective】The experiment studied the relation between the genetic polymorphisms and the weight traits of the fourth and fifth exon of GH gene of Boer and their progeny.【Method】Blood samples were collected from boar goat and their Fl,Fz and F3 generation.PCR—SSCP and sequencing were applied to analyze the effect of the genetic variation,and least square was applied to analyze the correlation of different genotypes and body weight in fifth exon of GH gene.【Result】There were no polymorphisms in the fourth exon and four genotypes of AA,AB,AC,AD in the fifth exon.Two polymorphisms were detected in the fifth exon AB genotype at 237 site(C-T)and AD genotype at 289 site(C-A),and two mutations occurred in the fifth exon.The association of the variation in the fifth exon of GH gene with the birth weight trait in the population were analyzed.The results showed that the birth weight of the individuals with a genotype AD was sjgnjficantly higher(P<0.01)than that with a genotype AC in the Boer and their Fj generation.But in the F2 generation the individuals with a genotype AB had a higher birth weight and one month weight than that with a genotype AA(P<0.05).【Conclusion】The result showed that there were no polymorphisms in the fourth exon and the p01ymorphism in the fifth exon of gGH gene had significant effect on weight traits.

【题目】Effects of molecular characteristics of on konjac glucomannan glass transitions of potato amylose, amylopection and their mixtures

【中文关键词】魔芋葡甘聚糖,直链淀粉,支链淀粉,玻璃化相变,分子特性

【英文关键词】konjac glucomannan (KGM); amylose; amylopectin; glass transition; molecular characteristics

【中文摘要】这项研究的目的是进一步探索魔芋葡甘聚糖(KGM)在淀粉基食品中所起的功能作用。实验研究的模型为直链淀粉/支链淀粉/KGM的混合体系。利用高速示差扫描量热仪(hyper-DSC),并辅以配备有多角度激光扫描(MALLS)和示差折光检测器(RI)的高效分子排阻色谱仪(HPSEC),X射线衍射仪(XRD)以及粘度仪等进行测试KGM在不同混合体系中的玻璃化相变温度(Tgs)。Hyper-DSC的检测结果显示,直链淀粉,支链淀粉以及混合体系的Tgs随着KGM浓度的增加而降低。基于KGM的分子特性,HPSEC-MALLS-RI,粘度仪以及XRD检测结果显示,KGM的摩尔质量为1023000-1329000g;均方根半径为110.5-129.6nm,且Mw/Mn为1.017。KGM在溶液中呈无定形状态的线性分子,无结晶相。以上研究结果表明KGM的添加可以起到塑化直链和支链淀粉结构的效果,从而增加直链和支链淀粉链的自由体积和分子流动性,并最终引起其Tgs的降低。

【英文摘要】BACKGROUND: The purpose of this study was to explore further the functions of konjac glucomannan (KGM) in starch-based foods. Experiments were carried out using the mixed amylose/amylopectin/KGM system as a model. High-speed differential scanning calorimetry (hyper-DSC) with the support of high-performance size exclusion chromatography (HPSEC) equipped with multi-angle laser light scattering (MALLS) and differential refractive index (RI), X-ray diffractometry (XRD) and viscosimetry was used to investigate the effects of KGM on glass transition temperatures (T(g)s) of mixtures with different amylose/amylopectin ratios. RESULTS: Hyper-DSC results showed that the T(g)s of amylase, amylopection and their mixtures decreased with increasing concentration of KGM. Based on the molecular characteristics of KGM, HPSEC-MALLS-RI, viscosimetry and XRD results showed that the molar masses of KGM ranged from 1.023 x 10(6) to 1.329 x 10(6) g mol(-1); the root mean square (RMS) radii were distributed from 110.5 to 129.6 nm, and M(w)/M(n) was 1.017. KGM was a linear molecule with random-coil conformation in solution and the crystallinity was 0.00%. CONCLUSION: It is suggested that the addition of KGM has plasticizing effects on the structures of amylase and amylopectin, which can increase free volume and molecular movement of amylase and amylopectin chains, resulting in a decrease in their T(g)s.

【题目】不同微集水方式对玉米田耗水规律的影响
【中文关键词】土壤耗水量;作物需水量;作物系数;水分利用效率
【英文关键词】micro-catchment; soil water consumption; water requirement; crop coefficient; water use efficiency
【中文摘要】针对辽西地区水资源严重缺乏的突出问题,以传统种植模式为对照,研究了垄覆膜沟种植(T1)、垄覆膜沟覆膜种植(T2)和垄覆膜沟覆秸秆种植(T3)3种一元或二元覆盖微集水模式的效果。本试验条件下T2的保水效果最好,其次为T3,再次为T1,玉米生育期内分别比对照少耗水49.87,43.06,29.39 mm。同时,微集水模式可以降低作物的需水量,T2、T3和T1分别较对照生育期内需水量减少81.66,69.20,48.45 mm,生育期平均作物系数分别较传统模式降低0.12,0.16,0.09。集水种植各种栽培模式与传统种植相比都不同程度地增加玉米产量和水分利用效率,尤以T3和T2提高幅度最大。
【英文摘要】The experiment was conduced to study the effect of unary or binary coverage of three micro-catch-ment patterns in comparison with the traditional cropping pattern. The results indicated that T2(ridge and ditch mulched film) water conserved best, T3(ridge mulched film and ditch mulched straw) was the next-best pattern, and T1(ridge mulched film and ditch no-mulched) was the third. In compared with the control,the volume of soil water consumption of T2, T3and T1decreased by 49.87 mm, 43.06 mm and 29.39 mm.and the volume of water requirement of T2, T3and T1decreased by 81.66 mm, 69.20 mm and 48.45 mm,the average of crop coefficient decreased by 0.12, 0.16 and 0.09. Micro-catchment patterns can increase maize production and water use efficiency in varying degrees, especially T3and T2.

【题目】辽西地区微集水不同覆盖方式对玉米生长发育的影响
【中文关键词】微集水;玉米;生长发育;半干旱区
【英文关键词】micro-catchment; coverage; growth; maize
【中文摘要】以传统种植模式为对照,研究了垄覆膜沟种植、垄覆膜沟覆膜种植和垄覆膜沟覆秸秆种植三种一元或二元微集水覆盖方式对玉米生长发育的影响。结果表明,农田微集水技术能够提高玉米出苗率2.7~3.1个百分点,垄覆膜沟覆膜种植和垄覆膜沟种植能够缩短玉米的出苗时间1~3 d,垄覆膜沟覆秸秆种植会延长玉米出苗时间2 d。相对于传统种植模式,生育前期垄覆膜沟覆膜种植和垄覆膜沟种植能够促进玉米株高和叶面积增长,促进干物质积累,而垄覆膜沟覆秸秆种植生育前期生长缓慢,株高、叶面积和干物质积累量一直处于最低值,生育中后期生长速度加快。垄覆膜沟覆膜种植由于提前生育进程和高温等原因,出现了早熟或早衰迹象,叶面积和叶绿素含量下降迅速,而垄覆膜沟覆秸秆种植则能降低叶面积和叶绿素下降速度,延缓叶片衰老。微集水各种覆盖方式均不同程度的增加玉米产量,尤以垄覆膜沟覆膜种植和垄覆膜沟覆秸秆种植增产幅度最大,分别较对照提高35.38%和30.41%。
【英文摘要】With traditional cropping pattern as CK, the effects of unaryor binarymulchingof three micro-catchment patterns on maize growth were studied, and these patterns were ridge film mulching + furrow seeding, ridge film mulching + furrowfilmmulching, and ridge filmmulching + furrowstrawmulching. The results showthatthese micro-catchment patterns can enhance maize emergence rate by 2.7~3.1 percentage points, and the first two patterns reduce emergence time by 1~3 d, while the last one extends maize emergence time by 2 d. Compared to CK, ridge film mulching + furrowfilmmulching and ridge filmmulching + furrowseeding promote significantly the maize plant height and leaf area growth, increasing drymatter accumulation. And, atthe initial stages, ridge filmmulching + furrowstraw mulching slows down maize growth, and plant height, leaf area and dry matter accumulation are at low level, but the maize growth accelerates in the middle and late stages. Ridge film mulching + furrow film mulching makes the growth stages become earlier at higher temperature, there appear signs of premature and earlier aging, and leaf area and the chlorophyll content decrease significantly, but ridge filmmulching + furrowstrawmulching is just contrary to it. Micro-catchment patterns can increase maize production in varying degrees, especially ridge film mulching + furrow seeding and ridge filmmulching + furrowstrawmulching, whichmay increase the production by 35.38% and 30.41% respec-tively caompared with CK.

【题目】风沙半干旱区果粮立体复合模式下土壤水分与微生物量碳变化特征及产量效益评价
【中文关键词】立体复合模式;土壤水分;微生物量碳;产量效益
【英文关键词】compound cultivation mode; soil moiture; microbial biomass carbon; output benefit
【中文摘要】选择科尔沁沙地南缘7种果粮立体复合模式(模式A1:大扁杏//花生/玉米/花生//大扁杏;模式A2:大扁杏//谷子/玉米/谷子//大扁杏;模式A3:大扁杏//大豆/玉米/大豆//大扁杏;模式B1:大扁杏//玉米//大扁杏;模式B2:大扁杏//花生//大扁杏;模式B3:大扁杏//谷子//大扁杏;模式B4:大扁杏//大豆//大扁杏),分析比较7种果粮立体复合模式土壤水分含量与微生物量碳的变化,评价不同模式区的经济效益。结果表明:果粮立体复合模式区玉米地在整个生长季(0~60 cm)平均含水量为:模式A1>模式A2>模式A3>模式B1,模式A1、A2、A3对矮棵作物0~20 cm土壤含水量影响不显著。不同立体复合模式区玉米地(0~20 cm)土壤微生物量碳的含量顺序为,模式A3>模式A1>模式B1>模式A2;矮棵作物(0~20 cm)土壤微生物量碳的含量状况为:模式A1、A3中的花生与大豆高于模式B2、B4,说明玉米与豆科作物带状间作模式可增加其微生物量碳的含量。不同立体复合模式玉米单位面积产量顺序为:模式A1>模式A3>模式A2>模式B1。模式A1、A2、A3的矮棵作物(花生、谷子、大豆)产量比模式B2、B3、B4略有减产,减产幅度均小于5%,差异不显著。从不同果粮立体复合模式的经济效益分析,模式A1与模式B2经济效益较高。因此,模式A1与模式B2在风沙半干旱区表现较好。
【英文摘要】Seven compound cultivation modes in south ofHorqin sandy land are chosen (A1: prunus armeniaca //peanut / corn / peanut // prunus armeniaca; A2: prunus armeniaca // grain / corn / grain // prunus armeniaca; A3:prunus armeniaca // bean / corn / bean // prunus armeniaca; B1: prunus armeniaca // corn // prunus armeniac; B2:prunus armeniaca // peanut // prunus armeniac; B3: prunus armeniaca // grain // prunus armeniac; B4: prunus ar-meniaca // bean // prunus armeniac) to study the variation of soil moiture and soil microbial biomass carbon in the sev-en modes and to evaluate the economic benefit in each mode. The results showed that the average water cotent of cornfield throughout the growing season (0~40 cm) in fruit and grain compound cultivationwas mode A1>mode A2>modeA3>mode B1, while the effect on dwarf plants (0~20 cm) on intercropping mode is insignificant. Soil microbial biomass carbonwasmodeA3>modeA1>mode B1>modeA2 on corn field; Soil microbial biomass carbon of intercrop-ping code is larger than that of the inteva-l cropping for peanuts and beans on dwarf plant field, so is the intercropping code of corn and bean. Yield per unit area of corns in different compound cultivation modes: mode A1>mode A3>mode A2>mode B1, production in

intercropping corns and dwarf plants (peanut, grain and bean) decreased by less than 5%, and the difference is insignificant. In terms of the economic benefits, both A1 and B2 exceed others. The conclusion is that A1 and B2 prove to be more productive modes on semiarid sandy and windy areas.

【题目】不同微集水方式在不同降水年型对玉米产量的影响
【中文关键词】微集水;玉米产量;降水年型;水分利用效率
【英文关键词】micro-catchment; maize yield; different precipitation years; water use efficiency
【中文摘要】针对辽西半干旱地区玉米产量低而不稳的问题,以传统种植模式为对照,研究了垄覆膜沟种植(T1)、垄覆膜沟覆膜种植(T2)和垄覆膜沟覆秸秆种植(T3)3 种一元或二元覆盖微集水模式在不同降水年型对玉米产量的影响。试验条件下,T2和T1均能缩短玉米出苗时间,提高玉米出苗率,T3能够延长玉米出苗时间,平水或干旱年型能够提高玉米出苗率,但丰水年型降低玉米出苗率。行粒数在不同降水年型几种微集水种植方式均要优于传统种植方式,而穗长和穗行数在不同降水年型几种种植方式间的差异均不显著,玉米穗粗仅在2009 年(干旱年型)要优于传统种植方式,百粒重在 2007 年(平水年型)和 2009 年(干旱年型)微集水种植要高于传统模式。集水种植各种栽培方式与传统种植相比都不同程度的增加玉米产量,并达到显著水平,尤以 T2和T3增产幅度大。在不同降水年型,微集水种植水分利用效率提高幅度不同,在丰水年型水分利用效率提高幅度要小些,在干旱或平水年型,水分利用效率提高幅度较大。
【英文摘要】This study focuses on the outstanding issues of the low and unsteadiness maize yield insemi-arid area of western Liaoning Province. Traditional cropping patterns as contrast, studied on the effectof unary or binary coverage of three micro-catchment patterns, which were ridge film mulching and furrowseeding (T1), groove ridgemulch film (T2), ridge ditch straw mulching cultivation (T3). T2 and T1could reducemaize emergence time and increase maize emergence, T3 extend the maize emergence time, increasing maize emergence in normal or dry years, reducing maize emergence in the wet year. The maize grain number of row in micro-catchment patterns was superior to the traditional pattern. However, the ear length and row number of ear in different treatments showed no significant difference. Maize ear diameter only in 2009 (dry year), maize row and 100-grain weight in 2007 (normal year) and 2009 (dry year) were significantly different level. Micro-catchment patterns could increase maize production in varying degrees,and significant levels, especially T2 and T3. Micro-catchment patterns could increase the rate of water use efficiency, margin in the wet year was smaller, in dry or normal year was big margin.

【题目】不同有机无机配比对玉米产量及土壤物理性质的影响
【中文关键词】有机无机肥;土壤培肥;玉米;物理性状;产量
【英文关键词】organic manure and chemical fertilizer; improving soil fertility; maize; physical property; yield
【中文摘要】土壤肥力下降、耕层变浅,是东北平原粮食高产的主要限制因子。因此,研究不同有机物与化肥配合施用对土壤物理性质及玉米产量的影响具有现实意义。在辽北棕壤土上,采用田间微区定位的方法研究,结果表明:有机无机配施不仅能够改善土壤的物理性质,还能够增加玉米产量;施用有机物料的各处理较无肥对照处理土壤容重下降了3.05%~9.92%,差异达到显著水平;与单施化肥处理相比,有机物料和化肥配合施用可增产1.64%~8.91%,同时能够增加田间持水量、毛管孔隙度和改善土壤微团聚体结构。在等碳量条件下,玉米秸秆对改善土壤理化性质的效果好于猪粪,化肥配施

高量猪粪增产效果最为明显。
【英文摘要】Decline of soil fertility and shoaling of topsoil are dominant limiting factors for high yield of cropproduction in northeast plain. So it has practical significance to study the effect of different ratios of organic manure and chemical fertilizer on soil physic properties and maize yield. Micro-plot positioning method was used on long-term located brown soil. The results showed that combined application of organic manure and chemical fertilizer improved soil physic properties and increased maize yield. Compared to CK treatment without fertilizer application, applying organic fertilizers could decrease bulk density by 3.05%-9.92% , and there was a significant difference between two treatments. Organic manure plus chemical fertilizer increased yield by 1.64%-8.91% than CK treatment that applied only chemical fertilizer, and increased field-moisture capacity and capillary porosity, decreased soil bulk density, and improved soil micro-aggregate structure. Provided the carbon contents were the same, maize straw was better than pig manure, and the treatment with chemical fertilizers plus high ratio of pig manure had significant effect on improving the yield of maize.

【题目】风沙半干旱区秸秆还田对间作花生土壤酶活性与产量的影响
【中文关键词】straw returning; soil enzyme activity; peanut yield
【英文关键词】秸秆还田;土壤酶活性;花生产量
【中文摘要】在风沙半干旱区间作(大扁杏)花生)大扁杏)条件下,以花生品种“ 阜花10号 ”为材料,研究了不同秸秆还田量对花生土壤酶活性和产量的影响。结果表明:秸秆覆盖还田能显著提高土壤脲酶、过氧化氢酶、蛋白酶的活性,处理III的土壤脲酶与蛋白酶活性较强,处理II过氧化氢酶活性略高于处理I与处理III。秸秆覆盖还田对花生产量和WUE的影响达到

显著水平。产量与WUE的高低顺序均为:处理Ⅱ>处理Ⅲ>处理Ⅰ>处理Ⅳ(CK)。因此,处理Ⅱ较适宜本地区。
【英文摘要】We studied the effect of straw returning amount on the yield of peanut variety Fuhua10and soil enzyme activity under intercropping system (prunus armeniaca-peanut-prunus armeniaca) in the sandy and windy sem-i drought area. The results showed: The activity of urease, catalase and pro-tease were increased significantly through straw returning. The urease and protease of treatmentIII were stronger than other treatments, and the catalase activity of II was higher than that of I and III. The effect of straw returning on peanut yield and WUE was at significant difference level. The peanut yield and WUE of different treat were II>III>I>IV(CK). So treat II was more suitable to the local area.

【题目】基于灰色关联度分析的辽宁阜新地区玉米品种评价
【中文关键词】灰色关联度分析;阜新地区;玉米品种;评价
【英文关键词】grey relational analysis; Fuxin; maize variety; evaluation
【中文摘要】品种是影响玉米高产的主要因素之一,不同区域选择适宜的品种对玉米高产有着重要意义。针对辽宁阜新地区品种混杂多样的特点,在2年试验数据的基础上,采用灰色关联度分析方法对该区域12个主栽玉米品种进行了评价。结果表明:辽单565、郑单958、沈玉21、金玉228、良玉11、世宾28、辽单632、沈农T19、东亚56、铁丰88、东单90、登海3686的关联度分别为0.8999,0.8520,0.8271,0.8257,0.7863,0.7761,0.7592,0.7584,0.7505,0.7490,0.7371,0.7136,说明适宜阜新地区的玉米品种为辽单565、良玉11、金玉228和郑单958。
【英文摘要】The variety is one of the main factors affecting maize yield, so choosing suitable variety is significant to the high yield in different areas. In view of the various characteristics of maize varieties in Fuxin, based on the two years' experiment data, this article evaluated twelve maize varieties using the grey relational analysis method. The results showed that the variety grey relational degrees of Liaodan565, Zhengdan958, Shenyu21, Jinyu228, Liangyu11, Shibin28, Liaodan632, ShennongT19, Dongya56, Tiefeng88, Dongdan90, Denghai3686 were 0.8999, 0.8520, 0.8271, 0.8257, 0.7863, 0.7761, 0.7592, 0.7584, 0.7505, 0.7490, 0.7371, 0.7136, respectively. The suitable maize varieties were Liaodan565, Liangyu21 and Jinyu228, Zhengdan958 in Fuxin.

【题目】基于灰色关联度分析的辽西地区典型种植模式评价
【中文关键词】灰色关联度分析;辽西地区;种植模式;模式评价
【英文关键词】grey relational analysis; western Liaoning Province; plantingmode; model evaluation.
【中文摘要】不同种植模式评价是当今种植制度研究中的热点之一,针对辽西地区自然特点和种植模式混杂多样的现状,在多年试验研究和专家问卷调查的基础上,采用灰色关联度分析方法对辽西地区6种典型种植模式进行了评价。结果表明:无论是在等权关联度下还是在侧重生态环境指标或经济指标的变权重下,南果梨+南瓜种植模式与参考模式的关联度均为最大,分别为01867、01920和01841,南果梨+花生种植模式次之,说明南果梨+南瓜+花生的林粮间作模式的生态和经济效益最好,是辽西地区发展种植业的最佳模式,玉米/大豆间作模式的关联度最小,分别为01848、01901和01821,这种模式的生态和经济效益最差。该研究结果对保护辽西地区生态环境,发展多熟立体农业,推动该区域的社会经济与环境的协调发展提供了理论依据。

【英文摘要】Evaluation ofdifferentplantingmodes is one of the hotspots in today.s cropping sys-tem research. In termsofwesternLiaoningProvince.snaturalcharacteristics and diverse planting modes, this paper evaluated six typical plantingmodes adopted in this region, based on experimental studies and expert questionnaire surveys and by the method of gray relational analysis. The results showed thatwhetherunderaverage orvariable correlation ofecological indices oreconomic indices, the plantingmode ofNanguo pearwith pumpkin wasmost closely related to reference pattern, with the correlation being 01867, 01920, and 01841, followed by the planting mode ofNanguo pearwith peanu,t the correlation being 01848, 01901, and 01821, indicating that the plantingmodes ofNanguo pearwith pumpkin orpeanuthad the bestecological and economic benefits, being the optimal planting modes in western Liaoning Province. The planting mode ofcorn intercroppedwith soybeanwas less related to referentialpattern, with the ecological and economic benefits being comparativelyworse. This studywould provide a theoretical support in protecting the ecological environmen,t developing the mult-i dimensional agriculture, and enhancing the sustainable development of regional society and economy in western Liaoning Province.

【题目】辽西不同玉米_沙打旺间作模式的土壤水分和产量效应研究
【中文关键词】玉米;沙打旺;间作;土壤水分;产量
【英文关键词】maize; erect milkvetch; interplanting; soil moisture; yield
【中文摘要】以玉米清种、沙打旺清种、玉米/沙打旺间作(2B1)、玉米/沙打旺间作(4B2)、玉米/沙打旺间作(2B2)为例研究不同间作模式的土壤水分和产量效应。结果表明:玉米/沙打旺间作对土壤水分时空变化有一定的影响,土壤水分季节性变化趋势明显,从上到下,随土层深度增加,土壤含水量均表现出/先增大,后减小0的趋势。玉米/沙打旺间作对玉米株高的影响不显著,而对沙打旺的株高影响显著,同时株高的差异改变了玉米的通风透光状况。玉米、沙打旺间作(4B2)可以影响玉米干物质积累速率并延长峰值出现的时间,使其保持较长的快速增长期。玉米产量性状中,穗长、穗粗、行粒数、行数和轴粗各处理间差异不显著,而百粒重达到了显著性差异,产量也达到了极显著差异,以玉米清种最大,为15 567.50 kg/hm2,以玉米/沙打旺(2B1)的产量最低,为11 238.33 kg/hm2。综合来看,玉米/沙打旺间作(4B2)模式可以在辽西地区推广种植。
【英文摘要】An experimentwas conducted to study the effect of maize and erectmilkvetch interplanting on soil moisture and yield throuth pure maize planting, pure erect milkvetch planting, maize/erect milkvetch interplanting(2B1),maize/erect milkvetch interplanting(4B2), and maize/erect milkvetch interplanting(2B2). The results indicate: The maize/erect milkvetch interplanting has certain influence on spatial and temporal changes of soil moisture, and the seasonal change tendency of soil moisture is obvious, fromtop to bottom, increasing alongwith the soil layer depth, and the soil moisture content displays a tendencyof/increasing first and then decreasing0. The maize/erectmilkvetch interplanting dose not have remarkable influence on maize height, but has remarkable influence on the height of erect milkvetch, while the difference of plant height changes the maize.s aeration and photopenetration conditions. The maize/erect milkvetch interplanting(4B2) may affectthe drymatter accumulation speed ofmaize and prolongthe peaktime thusmaintain a longer period of fastgrowth. Forthe maize yield characters, the length and diameterof ears, grain number per row and row number are not much different under various treatments, but 100-grain weight is significantly different, and the yield achieves extremely remarkable difference, of which the greatest is pure maize planting, as much as 15 567.50kg/hm2, while that of maize/erect milkvetch interplanting(2B1) is the lowest, as low as 11 238.33 kg/hm2. As a whole, the pattern of the maize/erect milkvetch interplanting(4B2) may be extended in west Liaoning area.

【题目】辽西半干旱区玉米_大豆单间作田间耗水规律研究
【中文关键词】单作;间作;玉米;大豆;耗水规律
【英文关键词】monocropping; intercropping; corn; soybean; laws of water consumption
【中文摘要】采用FAO Penman-Monteith公式和水量平衡法对辽西半干旱区玉米、大豆单作和间作模式的耗水规律进行了研究。结果表明,全生育期玉米/大豆间作的农田实际蒸散量比玉米、大豆单作分别低15.37 mm和29mm,水分亏缺量分别比大豆、玉米单作低45.54 mm和5.68 mm,间作群体作物系数为0.82,介于单作玉米(0.81)和单作大豆(0.83)之间。此外间作模式作物需水量与降水量的吻合程度好于单作。
【英文摘要】The laws of water consumption of corn and soybean were studied through the FAO Penman-Monteith method and the water balance method on the semiarid region of western Liaoning Province. Compared with that in corn monocropping and soybeanmonocroppiing, the actual evapotranspiration in intercropping system is 15.37 mmand 29 mm lower respectively in the whole growth period, while the quantity of water deficit is 45.54 mm and 5.68 mm less. The crop coefficient of intercropping system lies between corn monocropping and soybean monocropping, in addition, its degree of agreement between water demand and level of precipitation is better.

【题目】Study on Water Consumption and Use Efficiency of Major Crops in Southern Kerqin Sandy Land
【中文关键词】耗水规律;水分利用;主要作物
【英文关键词】Water consumption;Wateruse efficiency;Main crops
【中文摘要】采用FAO-PenmanMonteith公式法和水量平衡法对科尔沁沙地南缘地区玉米、花生和谷子等主要作物的耗水规律进行了研究。结果表明,玉米的日需水量、全生育期需水量和土壤水分亏缺量均最大,需水量与降水的吻合程度最差

,作物系数平均值较大;谷子的日需水量、土壤水分亏缺量和作物系数平均值较大,由于生育期相对较短,全生育期需水量最少,需水量与降水吻合程度较好;花生的日需水量和土壤水分亏缺量均最小,全生育期需水量较少,需水量与降水吻合程度最好,作物系数平均值较小,作物系数变化较为平稳,生育中前期需水量相对较小。从水分利用效率的角度,区域优先种植的作物应为玉米、谷子、花生。从水分经济效益的角度,区域优先种植的作物顺序为花生、玉米、谷子;优先灌溉的作物顺序为花生、谷子、玉米。

【英文摘要】The pattern of water consumption in corn, peanut and millet plots were studied using the FAO-Penman Monteith and the water balance methods. Among the three corps, the amount of day water demand, water demand for the whole growth period and soil water deficit were highest in the corn plot. However, the degree of agreement between water demand and level of precipitation in corn plot was the poorest. The amount of day water demand, soil water deficit and average crop coefficient were highest in the millet plot. Because of its short growth period, the water demand was the lowest, resulting in better degree of agreement between the water demand and level of precipitation in the millet plot. For peanuts, the water demand for the whole growth period was low but the degree of agreement between water demand and level of precipitation was reasonable. Also, the change in crop coefficient was relatively steady, and water demand during the early and middle period of crop growth was low. Based on water use efficiency, the crop order of regional priorities should be corn, millet, and peanuts but based on economic benefits of water use, the order should be peanuts, corn, and millet; the order of priority for irrigation should be peanuts, millet, and corn.

【题目】花期调亏灌溉对大豆生长发育及产量的影响
【中文关键词】大豆;调亏灌溉;水分利用效率;产量
【英文关键词】Soybean; RDI; WUE; Yield
【中文摘要】在盆栽条件下,研究了花期调亏灌溉对大豆生长发育和产量的影响。结果表明花期不同强度、不同时间调亏处理对株高、叶面积、根重、产量、根冠比等均有影响,且不同品种性状表现差异各异。耗水量随着控水强度加大、控水时间延长而降低,水分利用效率也变化明显,其中7 d 中度控水处理 WUE 最高。随着控水强度和控水时间的延长,经济系数有逐渐增大的趋势。综合上述研究,辽 51064 和辽 51095 均以 7 d 中度调亏处理(土壤含水量为 19% ~ 21%)为适宜。品种抗旱方面,辽 51095 的抗旱性优于辽 51064。
【英文摘要】The influence of regulated Deficit Irrigation (RDI) on the growth and yield was studied at the soybean flowering under the pot condition. The results indicated that the plant height, leaf area, ground and root weight, yield were effected under the different RDI treatments in flowering stage. Also the differences in performance of different varieties had different characters. The water consumption reduced with the water intensity and watering times, and WUE also changed obviously, the highest in the moderate control water treatment after 7 days. Along with the intensity and time of controlled water, the economical coefficients had the increased gradually tendency.

【中文关键词】玉米;土壤水分;耗水规律;灌溉田
【英文关键词】Corn; Soil moisture; Law of water consumption; Irrigated farmland
【中文摘要】以辽宁省主要旱地作物玉米为研究对象,研究了其灌溉田土壤水分变化及其耗水规律。在试验条件下,0~20 cm 土层水分含量最低,整个玉米生育期内水分变化幅度最大;30~50 cm 土层由于受长期耕作习惯等因素的影响土壤的黏滞度较高,保持较明显的水分梯度,并使 50~90 cm 土层水分变化与 0~20 cm 土层相比滞后 1~3d;90~120 cm 土层土壤水分受根系影响较小,变化不大。玉米生育前期农田实际蒸散量和参考蒸散量均趋于不断增大,生育中期个别时段内由于受阴雨气候影响蒸散量有所减弱;参考蒸散量最大值出现在玉米播种后第46 天左右,农田实际蒸散量最大值出现在玉米出苗后第96

天左右,玉米生育后期两者逐渐减弱。玉米生育前期表层土壤棵间蒸发量占实际蒸散量的比重较大,生育中期棵间蒸发量受降雨和灌溉等因素影响,变化幅度较大,生育后期相对较小。随着玉米叶面积增加,作物系数不断增加,在播种后第 81 天左右作物系数达最大值,之后作物系数逐渐下降。

【英文摘要】We had studied law changes of soil moisture and evapo- transpiration in irrigated farmland of corn which was the principal crop of dry farmland in Liaoning province. The results indicated that the minimum moisture content of soil was in the soil layer 0 - 20 cm where moisture fluctuation ranged the most widely in the whole crop growth and development period. In contrast, the change of moisture was modest in the soil layer 30 - 50 cm where the water content of the soil keeped a gradient clearly. The change of the moisture in the soil layer 50 - 90 cm lagged the layer 0 - 20 cm, though the change in the two soil layers were parallel. The actual measured evaporation and the reference evapotranspiration increased greatly in the earlier stage of crop growth and development period. The evaporation was weak sometimes in the intermediate stage of crop growth and development period for various reasons, especially for the overcast sky. The maximum of reference evapotranspiration at the 46th day after sowing and the maximum of actual measured evaporation at the 96th day after sowing. Both decreased gradually in the later stage of crop growth and development period. The proportion of plant interspace evaporation to actual measurement evaporation was higher in the earlier stage of crop growth and development period. The proportion was changed in evidence in the intermediate stage, because of the rainfall and irrigation. And the proportion was smaller in the later stage. The crop coefficient increase with leaves area. The maximum crop coefficient at the 81st day after sowing, and then it became weak gradually.

【题目】不同覆盖方式对春玉米土壤水分及生长发育的影响

【中文关键词】旱地农业;春玉米;土壤水分;生长发育

【英文关键词】Agriculture in dryland; Springmaize; Soilmoisture; Growth and developmen

【中文摘要】采用渗水地膜覆盖、地膜覆盖、地膜和渗水地膜交替覆盖、秸秆覆盖、裸地五种种植方式探讨了对辽西风沙半干旱地区春玉米土壤水分及生长发育的影响,结果表明:不同覆盖处理可以不同程度的增加耕层土壤含水量,其中渗水地膜覆盖和秸秆覆盖效果最为明显;可以有效地促进了玉米的生长发育,使其生育进程合理,植株生长稳健,有效提高玉米产量,其中以渗水地膜覆盖效果最显著。

【英文摘要】Five kinds ofmulching methods have been used to study soilmoisture and maize growth on the sem-i arid region of western Liaoning province, results showed that soilmoisture ofwater-permeability plastic membranemulching and straw mulching increased obviously, maize yield ofwater-permeability plastic membrane mulching was the highest. Growth and yield of maize could be effectively promoted by some mulchingmethods, ofwhich water-permeability plastic membrane mulching effect was themost significant.

【题目】Effect of bamboo (Phyllostachys pubescens) extract

【中文关键词】无

【英文关键词】Huainan partridge chicken, powdered bamboo extract, weight gain, serum enzymatic activity

【中文摘要】无
【英文摘要】The objective of the study was to establish whether powdered bamboo extract (BFRE) as a feedadditive for chickens was effective in maintaining body weight gain and serum enzymatic activity when birds are exposed to cold stress. Broiler Huainan partridge chickens (4 weeks old), fed a diet containing powdered BFRE (0.3 g/kg) for one week, showed significant weight gains compared to the control.Subsequently, the chickens were exposed to low temperatures (15 or 10 ° C) for one week with or without BFRE addition. After one week of exposure to 15 or 10 ° C, serum enzymatic activities were recorded.Chickens not receiving BFRE and exposed to 10 ° C showed a significant decrease in the body weight gain and in serum creatine kinase, lactic dehydrogenase L and alanine aminotransferase activities, whereas the activity of these enzymes changed to a lesser extent in chickens receiving BFRE. However, body weightgains were maintained within the normal range when the ambient temperature was 10 ° C. In conclusion,BFRE was an effective additive in preventing chickens from losing body weight during cold stress, and in fluctuations in serum enzymatic activity when exposed to cold stress. The results suggest that powdered BFRE is an effective additive in minimizing the negative effects of cold stress in broiler chickens.

【题目】我国农业用水结构演变态势分析
【中文关键词】农业用水结构 农业用水效率 农业用水水平 农业结构型节水 农业经济用水量
【英文关键词】Agricultural water construction,Agriculture water efi ciency,Agricultural water level,Structural water-saving of agriculture,Economic agricultu ral water consumption

【中文摘要】农业用水结构对农业用水效率及效益有较大影响。采用1949-2006年农业用水资料分析了我国农业用水结构的演变历程,并根据农业用水结构的发展变化及灌溉农业的发展历史和未来发展方向,将1949一2050年我国农业用水水平分为初级利用、低效利用、合理利用及高效利用4个阶段。研究表明:我国农业用水结构日趋合理,农业用水比重持续减少,农、林、牧、渔用水及粮、经、饲作物用水比例协调程度不断提高。据此,提出了注重农业用水结构优化的农业经济用水量概念。华北地区的实例分析表明,在同时提高农业用水综合效益的情形下,依靠优化农业用水结构可年节水199.94亿m ;而有无用水结构优化的综合节水措施节水效果相差29.97亿m 。

【英文摘要】Agricultural water structure(AWS)influences the eficiency and potential benefits of water use.The evolution history of AWS in China was analyzed in this study using agricultural water consumption data in China for 1949-2006.Agricultural water use level for 1949-2050 was divided into four periods of primary use,low eficiency use.,reasonable use and high eficiency use in accordance with the evolution history and tendency of future AWS.The analysis shows that AWS in China is improving as the proportion of agricultural water consum ption to total water use is steadily decreasing.The level of water use is increasingly harmonized among agriculture,forestry,herding and fishing as well as water consum ption by grain crops,cash crops and grazing grass.The concept of economic agricultural water consumption is advanced,emphasizing water-saving via optimized AWS.A case study of North China illustrates that AW S optimization increases water use benefits an d saves 199.94x10 m3 water per year. Integrative water-saving measures along with optimized AW S saves an additional 29.97x 10 m3 water per year over water-saving measures alone.

【题目】西北内陆县域气候变化及其对河川径流的影响
【中文关键词】县域;气候变化;河川径流;预测
【英文关键词】intra—county;climate change;rive runoff;prediction
【中文摘要】根据民乐县及祁连县气象站点1958—2008年气温、降水资料,结合民乐县历年水文数据,利用Mann—Ken—dall秩相关分析法等方法分析了民乐、祁连县1958-2008年气温、降水和民乐地表径流量的变化,在建立定量化关系的基础上研究了气候变化对民乐县地表径流的影响并对未来径流量做出预测。研究表明,气温的变化可分为基准期(1958—1986年)和增温期(1987—2008年),后者增温速率达0.62℃/lO a,且全年各季度整体增加;降水量总体上呈上升趋势,增幅为19.5 mm/10 a,突变年(1978年)后降水量的波动性增大;历年降水量有减少趋势,受气候变化影响,径流量的年际变化增大,气温与降水对径流变化的贡献相反。未来径流量还有减小的趋势,对此,提出了调整产业和种植结构、节水灌溉、综合利用水资源等措施以应对。
【英文摘要】Using the Mann-Kendall rank correlation analysis method to analyze the changes of temperature,rainfall and the runoff in Minle county,first,we established the quantitative relationships of the climate changing and the changes in surface runoff,and based on which we predict the runoff of the river in future.The results showed that:the climate changing time can be divided into two stages-the base period(1958—1986)and the warming period(1987-2008).The warming speeds of the latter periods is 0.62~C/10 a,and increased all over the year-round.The general trend of upward,the rate of increase is 19.5 mm/10 a,the volatility of the precipitation is increasing since the muration year(1978),there is a decrease trends in precipitation over the years,the annual changes in precipitation is increased,just owing to the climate changing.On the contrary,the contribution of the rainfall to the runoff was different.The trends of the runoff in future wilI be reduced.Moreover,we proposed severaI measures as the response to this matter,including make adj ustment to the industries and cropping pattern,use water saving irrigation,make full use of the water resources and so on.

【题目】黑河流域农业用水健康性及其评价方法研究
【中文关键词】黑河流域;农业用水;健康性评价
【英文关键词】the Heihe River basin; agricultural water consumption; health assessment
【中文摘要】定性评价了黑河流域农业用水健康性,并对其定量评价方法进行了初步探讨。在提出农业用水健康性科学内涵的基础上,分析探讨了农业用水健康性的评价标准、理论与技术基础。以协调性与效率性为标准,定性判断了黑河流域目前农业用水仍不健康。为进行定量评价,以资源利用效率、用水结构、用水效率和用水综合效益4个方面为准则,初步选择了20项指标作为农业用水健康评价的指标体系。
【英文摘要】This paper evaluates qualitatively the health for agriculture water use and discusses preliminarily the quantitative evaluation methods in the Heihe River basin. Rational agriculture water use is the key to solve the growing tension ofwater resources and continued deterioration of the ecological environment, and the health assessmentof agriculture water use is the basewhether reasonable for agriculturewater use. The paper analyses the conceptof the health of agriculture water use, explains the evaluation criteria and theoretical and technological base of health assessment for agriculture wateruse. Accordingto coordination and efficiencystandard, it can evaluate qualitativelythatthewateruse is not healthy. To the purpose of quantitative evaluation, the study takes resources use efficiency, water use structure, water use efficiency and benefit as regulation, selects initially twenty indexes as index system of health assessment for agriculture water use.

【题目】塔里木河流域农业节水潜力综合评价体系研究
【中文关键词】农业节水潜力;指标体系;综合评价;塔里木河流域
【英文关键词】agricultural water-saving potential; indicator system ;comprehensive evaluation;analytic hierarchical process;Tarim River Basin
【中文摘要】以地处西北内陆干旱地区的塔里木河流域为研究单元,以流域系列统计资料和野外实际调研为研究基础,利用层次分析法原理,考虑到流域社会经济、水文水资源、农业水资源开发利用、农业节水水平及其生态环境对农业节水潜力的影响,构建了塔里木河流域农业节水潜力评价指标体系和相应评价模型,并利用评价模型对塔里木河流域的农业节水潜力实现水平进行了评价,其评价结果表明塔里木河流域农业节水潜力实现水平2003年比1996提高了49%,比2000年提高了17%,说明该流域随着农业节水措施的实施及节水水平的不断提高,农业节水取得了一定的成效且农业节水潜力实现水平将越来越高,目前尚存在较大节水潜力待进一步挖掘。

【英文摘要】Abstract:Based on statistical information and fieldwork investigation,applying analytic hierarchical process theory and taking the Tarim River Basin as a research unit,this paper established the mathematical model and indicator system for integrated evaluation of agricultural water-saving potentia1 .The indictor system includes five aspects such as socio-economic,hydrology and water resources,agricultural water use eficiency,and the extent of agricultural water-saving development and the ecological environment.The evaluating model an d the indicator system are applied to evaluate synthetically the agricultural water saving po tential in Tarim River Basin.Th e evaluation results showed that level of agricultural water-saving potential in 2003 increased by 49% compared to that in 1996.and by 17% compared to that of 2000 in the basin,indicating that with the implementation of the agricultural water-saving measures and continuous improvement of the level of water-saving,the efectiveness of agricultural water conservation has been obtained and the implementation level of agricultural water-saving measures is getting higher an d higher,and greater po tential leaves for further exploitation in the basin.

【题目】黄土丘陵区退耕还林工程对县域粮食安全的影响-以陕西省清涧、米脂、子洲、吴堡县为例

【中文关键词】退耕还林工程;耕地压力指数;粮食安全

【英文关键词】Grain for Green Project;land use pressure index:food security

【中文摘要】为了评估黄土丘陵区实施退耕还林工程对县域粮食安全的影响,选取研究区典型四县——米脂、清涧、子洲和吴堡,假设实施退耕还林工程粮食补贴全部以粮食实物兑现和不实施退耕还林工程退耕的坡耕地提供粮食生产为前提,运用修订的耕地压力指数模型来对比评估退耕还林丁程对县域粮食安全的影响。研究结果表明:退耕还林工程对米脂县和子洲县粮食安全影响较明显,对清涧县和吴堡县影响甚微。不同退耕规模对不同人口密度县域粮食安全的影响程度不同。研究结果对国家建立长期、稳定、有效的粮食补偿机制有一定参考意义。

【英文摘要】Since 1999,the government of China has carried out an awfully ambitious consmwationprogram for “ win—win ” objective of environment refinement and poverty reduction becoming self—sustainable.The program was famous Grain for Green Project,for which the government of China spent more than 4300 billion yuan and 27 million hm of slope cultivated land was converred to forest and more than 100 million farmers took part in the program from 1999 to 2008. So we adopted the revised

model of land use pressure index to the assessment of Grain for Green Proiect on the county—level food security from 1999 to 2008 based on case study in Mizhi, Qingjian,Zizhou and Wupu counties. Supposed food subsidies to compensation loss of farmers conversed of cropland to forest land in the form of grain for framers conversed of forest land to cropland, the results indicates that the effects of Grain for Green Project on Mizhi and Zizhou counties,whichhave a population density of 1 50—1 80 people per km and implementation conversion of 1. 44 —1.58 ten thousand hm of cropland to forest land,are obvious;but that of Qingjian County with a population density of l 1 0 —1 20 people per km and implementation conversion of 0.4 ten thou.sand hm of cropland to forest land and Wupu County with a population density of 170 —190 people per km2 and implementation conversion of 0.4 ten thousand hm of cropland to forest land, are little influenced. In a word,the effects on food safety for counties with different popu1ation densitv and different conversion scale are different in the Loess Plateau hilly region. The government will choose the results to establish long-term ,stable and effective food compensation mechanism, in order to consolidate gains of Grain for Green Project in the future.

【题目】坡面生物调控措施对土壤水分入渗的影响
【中文关键词】生物调控措施、土壤水分入渗、降雨强度、坡度、植被覆盖度
【英文关键词】biological regulated measures, soil water filtration, rainfall intensity, slope, vegetation coverage
【中文摘要】为了研究不同生物调控措施的植被覆盖度、降雨强度和坡度以及各因素间交互作用对土壤水分入渗的影响,本文通过室外人工模拟降雨试验,对不同生物调控措施坡面的土壤水分入渗规律进行了探索。结果表明:1、有生物调控措施坡面的土壤稳定入渗率较裸坡偏大,且差异极显著,但生物调控措施坡面之间的差异并不明显。2、降雨强度、坡度与土壤稳定入渗率间不是线性单值函数,均存在使土壤稳定入渗率最大的临界雨强与临界坡度。稳定入渗率随植被覆盖度增加的速率是非恒定的,存在着增速变化的临界植被覆盖度。临界植被覆盖度前,稳定入渗率的增加速率很快,之后,迅速降低并趋于稳定。3、坡面径流调控度随雨强增大而减小;相同雨强下不同措施坡面径流调控度排序为:黑麦草>春小麦>苜蓿>裸坡。4、采用SPSS软件通过逐步回归分析法提取了影响土壤稳定入渗率最显著的单因子交互作用项,建立了包含降雨强度、坡度和植被覆盖度在内的多因素非线性入渗模型,通过实测数据对其进行验证发现该模型精度较高。
【英文摘要】In order to research the impact of rainfall intensity, slope, vegetation coverage and the interaction between multiple factors on the soil infiltration, we in-depth systematically researched the soil infiltration law under different biological regulated measures thought the artificial simulated rainfall in the paper. The results indicated that, 1, The stable infiltration rate of Hillslope with biological regulated measures were big than those Hillslope without biological regulated measures. And the difference was extremely

significant; however, the difference was not obviously between those Hillslope with biological regulated measures. 2,It wasn’t a simple linear single-valued function between rainfall intensity, slope and the soil stable infiltration rate; there were critical rainfall intensity and critical slope to make the soil stable infiltration rate of the largest. The increasing speed of the stable infiltration rate with the increasing of vegetable coverage was not constantly, there was a critical vegetable coverage. Before the critical vegetation coverage, the increasing speed of the stable infiltration rate was very fast, after that, the increasing speed of the stable infiltration rate reduced quickly and tended to stabilization.3, Runoff regulating degree decreased with the increasing of rainfall intensity. The sequencing of runoff regulating degree under different control measures in same rainfall intensity as follow: ryegrass> wheat> alfalfa> Bare3, On that basis, by the stepwise regression analysis, we analysised the impact of each factor and the interaction between the various factors on the stable infiltration, used the t test to eliminate the item of independent variable insignificant, and established a multiple non-linear model including rainfall intensity, slope and vegetation coverage. Finally, we used the measured data to prove this model’s fitness and feasibility.

【题目】高油玉米花粉直感效应对普通玉米品质的影响
【中文关键词】高油玉米; 花粉直感效应; 产量; 品质; 经济效益
【英文关键词】High- oil maize; Pollination effect; Yield; Quality; Economic effect
【中文摘要】通过两个高油玉米品种与 5 个普通玉米品种混种, 利用高油玉米品种为普通玉米品种授粉, 研究高油玉米对普通玉米的花粉直感效应。两年的研究结果表明: 通过花粉直感效应, 增加了普通玉米的含油量和粗蛋白含量, 改变了淀粉含量。与通油 1 号玉米杂交的 5 个普通玉米产量均增加, 增加幅度最高的是吉单 180, 其经济效益也最大。与四油 199 玉米杂交的 5 个普通玉米, 除吉单 180 外, 产量均降低, 经济效益最高的是吉单 180。由此可见, 高油玉米通油 1 号比四油 199 更适合与普通玉米进行花粉直感效应, 而吉单 180 是与高油玉米进行花粉直感效应最为合适的普通玉米品种。
【英文摘要】Through the interbreeding between the high- oil maize and the five normal maize varieties, we made some research on the pollination effect of normal maize by high- oil maize. On the basis of the two years experiments,we drewthe conclusion that high-oil maize had a obvious pollination effect to normal maize which increased the crude fat and protein content, changed the starch content. Pollinated byTongyou No.1, the yield ofthe five normal maize va-rieties was all increased, and Jidan180 had the biggest yield and the largest benefit. Pollinated by Siyou199, except Jidan180, the yield of the other four maize varieties was all decreased, and Jidan180 had the largest benefit. From the above, we can tell that high oil maize of Tongyou No.1 is a better variety that interbreeds with normal maize variety than Siyou1

【题目】多参数非线性降雨产流阈值模型试验研究
【中文关键词】Rainfall-Runoff Threshold is the minimum rainfall producing surface runoff; and is an important parameter for the runoff and sediment yield law researches. In this paper, the field artificial rainfall simulated experiments were carried out, and using the
【英文关键词】rainfall-runoff threshold, vegetation cover, linear regression, runoff amount, rainfall amount
【中文摘要】降雨产流阈值是受雨下垫面能够产流的最小降雨量值,是产流产沙规律研究的重要参数。本文采用室外人工模拟降雨试验,用传统直线回归法推求了几种植被覆盖下坡面的降雨产流阈值,并综合其他因素对降雨产流阈值的影响,建立了一种多参数非线性降雨产流阈值模型。结果表明:传统直线回归法得到的四种不同调控措施下坡面的降雨产流阈值分

别为:裸坡9.4 mm、黑麦草23.6 mm、苜蓿15.8 mm和春小麦19.5 mm。结合直线回归法并充分考虑降雨强度、植被覆盖度和前期土壤含水量三个因素对降雨产流阈值的影响,通过多元回归分析建立了一种多参数非线性降雨产流阈值模型,由该模型得到的四种不同调控措施下坡面的降雨产流阈值分别为:裸坡13.4 mm、黑麦草23.7 mm、苜蓿18.8 mm和春小麦19.7 mm。用实测数据对模型进行检验,计算值与实测值吻合程度较高,证实了该多参数非线性模型的适合性与可行性。

【题目】吉林省不同类型土壤玉米施肥效应研究
【中文关键词】土壤类型; 施肥模式; 施用效益; 吉林省
【英文关键词】Soil types; Fertilization mode; Application effect; Jilin province
【中文摘要】吉林省东、中、西不同类型土壤田间试验结果表明: 不同类型土壤的氮、磷、钾肥施用模式符合二次曲线Y=ax2+bx+c。利用该模式, 结合肥料和玉米价格进行综合分析, 明确了不同类型土壤上的氮、磷、钾施用效益, 即东部冲积土玉米最佳施肥量为 N192 kg/hm2、P2O556 kg/hm2、K2O33 kg/hm2; 中部黑土玉米最佳施肥量为 N 133 kg/hm2、P2O538 kg/hm2、K2O47 kg/hm2; 西部淡黑钙土玉米最佳施肥量为 N59 kg/hm2、P2O565 kg/hm2、K2O51 kg/hm2。
【英文摘要】Field experiment conducted on the different types of soil in the east, middle and west parts of Jilin province showed that the N, P and K application mode could be expessed by the quadratic equation Y=ax2+bx+c, andthrough this mode by the maize and fertilizer price, we made sure that the optimum fertilizer rates on the alluvium soil of the east part of Jilin province was N 192 kg/ha, P2O556 kg/ha and K2O 33 kg/ha respectively, and the optimum fertilizer rates on the black soil of the middle part of Jilin province was N 133 kg/ha, P2O538 kg/ha and K2O 47 kg/ha respectively, the optimum fertilizer rates on the light chemozem soil of the west part of Jilin province was N 59 kg/ha,P2O565 kg/ha and K2O51 kg/ha respectively.

【题目】保水剂对冬小麦不同生育阶段土壤水分及利用的影响
【中文关键词】作物,土壤水分,产量,冬小麦,保水剂,水分利用效率
【英文关键词】crops,soil moisture,production,winter wheat,WUE
【中文摘要】为探明保水剂施用后对冬小麦不同生育阶段水分利用的作用机理,在豫西丘陵旱作区,通过大田试验,研究了保水剂对冬小麦不同生育阶段的保水、作物的耗水特征、水分利用效率等的影响。结果表明:保水剂提高了冬小麦不同生育阶段0~100 cm土层的土壤含水量、促进了生物量的积累、降低了小麦耗水量、提高了小麦产量和水分利用效率。各处理中,60和90kg/hm 处理的土壤含水量及储水量均较其他处理高,而耗水量最低。播种一拔节期,保水剂用量越高干物质积累越显著;拔节一孕穗期及灌浆.收获期,60 kg/hm 处理较对照增加的干物质量最高;而孕穗.灌浆期,30 kg/hm干物质量增加最为显著。各生育阶段,除孕穗.灌浆期外,60 kg/hm2处理的水分利用效率均较高。最终,60 kg/hm2处理的产量和水分利用效率均最高,较对照增产47.4%,水分利用效率增加10.6 kg/(mm · hm)。
【英文摘要】In order to ascertain the mechanism of water—retaining agent on soil moisture and water use in diferent growth stage of winter wheat,a field experiment in hilly and drought fanning region of western Henan province was conducted to investigate the effects of water—retaining agent on holding moisture, characteristics of water consumption of crop,and water use eficiency(WUE)in different reproductive stage.The results indicated that soil moisture in 0—100 cm soil layer was increased,biomass accumulation Was

raised,water consum ption of winter wheat was decreased yield and WUE were all increased after applying water—retaining agent.While the soil moisture and storage capacity of treatment with 60 kg/hm2 and 90 kg/hm2 of water-retaining agent at each growth were higher than that with other treatments,but water consuption was lower.What's more,from sowing to jointing stage,the biomass of winter wheat increased with the increase of water—retaining agent.Jointing—booting and fillingharvest,the biomass of treatment 60 kg/hm2 of water-retaining agent had the most increasing compared with other treatments. But from booting to filling stage,the biomass of treatment 30 kg/hm~of water-retaining agent increased evidently compared with other treatments.At diferent growth stages,WUE of treatment with 60 kg/hm2 of water-retaining agent was me highest among diferent treatments except for booting-filling stage.It was concluded that yield and W UE of treatm ent with 60 kg/hm2 of water-retaining agent were the highest among diferent treatments,and compared to control,increased by 47.4% and 10.6 kg/(mm · hrn2)respectively.

【题目】施氮对高淀粉玉米子粒产量形成的影响
【中文关键词】高淀粉玉米,氮肥,产量
【英文关键词】High starch maize; Nitrogen fertilizer; Yield
【中文摘要】采用田间试验、植株生理生化分析方法,研究了不同施氮量对高淀粉玉米吉单 535 和普通玉米军单 8号子粒产量形成的影响。结果表明,高淀粉玉米粒重的增长符合 Logistic 方程;营养体干重随时间的变化符合回归方程 Y=axebx;生物产量依子粒产量和营养体干重变化符合回归方程 Y=exp(a+b1x1+b2x2)。与普通玉米军单 8 号比较,高淀粉玉米吉单 535 营养体干重增长期较长,干重下降速率低,即由营养体干物质向子粒转运量较低。适宜的施氮量可有效地促进高淀粉玉米植株生育前期总生物量的积累以及生育后期干物质从营养体向子粒的转移,从而获得较高产量。高淀粉玉米吉单 535 的适宜施氮量为 200 kg/hm2。
【英文摘要】Field experiment and plant physi- biochemical analysis observation were used to investigate the effects of nitrogen application on yield and its formation of high starch maize of Jidan 535, as compared with the ordinary maize of Jundan 8. The results indicated that for two maize cultivars, the dynamic changes of total biomass and grain weight in maize could be described by Logistic equation, and that of vegetative mass by exponential equation asY=axebx. Biomass yield(Y) was a function of grain yield(x1) and vegetative mass(x2), as described by regression equation of Y=exp(a+b1x1+b2x2). As compared with Jundan 8, dry weight of vegetative in high starch maize of Jidan 535 in-creased with a longer duration, and then decreased with a lower rate, thus the translocation amount of dry matter from vegetative mass to grain is found to be lower. The appropriate N application rate is beneficial to biomass accumulation in vegetative growth stage and dry matter translocation from the vegetative to the grain, therefore higher grain yield was obtained in high starch maize. The proper application rate of nitrogen fertilizer is 200 kg/ha for high starch maize of Ji-dan 535.

【题目】吉林省不同肥力黑土玉米平衡施肥研究
【中文关键词】玉米;黑土;平衡施肥;吉林省
【英文关键词】Maize; Black soil; Balanced fertilization; Jilin province
【中文摘要】在吉林省黑土区 3 种不同肥力土壤上研究平衡施肥效果。结果表明,平衡施肥对玉米具有较好的增产增收效果,其增产顺序为低肥力黑土>中肥力黑土>高肥力黑土。高肥力黑土施肥适宜用量分别为 N 145 kg/hm2、P2O546 kg/hm2、K2O 90 kg/hm2;中肥力黑土施肥适宜用量分别为 N 90 kg/hm2、P2O569 kg/hm2、K2O 60 kg/hm2;低肥力黑土施肥适宜用量分别为 N200 kg/hm2、P2O592 kg/hm2、K2O 30 kg/hm2。氮肥对玉米的增产增收效果最好,是玉米高产的主要限制因子。玉米子粒吸收的养分随施肥量的增加而增加,肥料利用率随施肥量的增加而降低。
【英文摘要】By the study on balanced fertilization for maize on the black soil of different fertility, the results showed that balanced fertilization had a good yield and income increasing effect whose yield and income increasing order was low fertility black soil > middle fertility black soil > high fertility black soil. The optimum application rate for N, P2O5and K2O was 145, 46, 90 kg/ha, respectively on the high fertility black soil. The optimum application rates for N, P2O5and K2O was 90, 69, 60 kg/ha, respectively on the middle fertility black soil. The optimum application rates for N, P2O5and K2O was 200, 92, 30 kg/ha, respectively on the low fertility black soil. N was the main high- yielding limiting factor due to its high yield and income increasing effect to maize. With the increment of fertilizer application, the nutrients requirement for producing 100 kg grain was increased, whereas fertilizer utilization rate was decreased.

【题目】基于GIS和PCA的冬小麦需水量影响因子分析
【中文关键词】需水量; 空间分布;主导因子;主成分;冬小麦
【英文关键词】crop water requirements;spatial distribution;dominant factors;principal component anaIysis;winter wheat
【中文摘要】影响作物需水量的各因子之间由于存在相关性,不仅难以满足传统的回归分析方法对独立变量的要求, 而且会影响大尺度数据处理的运行效率.采用主成分分析方法和GIS技术,对影响作物需水的主导因子进行识别分析.结果表明:热力因子和水分因子相互作用共同构成影响作物需水量的第1主成分,其空间分布呈西北到东南逐渐升高趋势;第2主成分主要为动力因子,基本上是从西向东逐渐增高;热力因子的生育期平均最高温度为第3主成分,在石家庄、邢台等地出现一相对低值区区;而第4主成分坡向的空间分布没有明显规律,低值区与高值区相互交错,但都是在地形变化较大的地区,表明微地形也具有一定影响,但其贡献率仅为总信息量的6.64 ,不考虑其影响也能反映华北地区冬小麦需水量空间分布大的趋势.
【英文摘要】It is difficult to estimate winter wheat water requirem ents with classical regression analysis method because there is obvious correlation among the influencing factors of crop water req uirements. The principal components analysis method and the GIS technology are adopted to analyze the dominant factors influencing crop water requirement. The results indicate that the thermal factor and water factor ;oint1v form ed the first principal com ponent of affecting crop water requirement;the spatial distriI)ution of which

Increases gradually from northwest to southeast. As the second principal component,the dynamic factorincreases gradually from west to east.The third principal component(thermal factor), the m ean maxim umemperature during wheat growth period appears a relative low value area in Shijiazhuang,Xingtai,etc.The spatial distribution of slope direction,as being the fourth principal component, has n。obviously regularity;and the high value and low value of it staggers in the region with a great change of terrain. It is shown that he microtopography has some influences but its contribution rate occupies 6.64% of tota1 information amount. Winter wheat water requirements in North China represent a great spatia1 distribution even if the effect of terrain is not considered.

【题目】基于基尼系数的内陆河流域用水公平性评价
【中文关键词】用水公平性;水资源配置;石羊河流域;基尼系数
【英文关键词】fairness of warter use;water allocation;Shiyang river basin;Gini coefficient
【中文摘要】【目的】对水资源紧缺地区的用水公平性进行研究,为了解当地用水现状进而合理配置水资源提供参考。【方法】借鉴收入公平性评价指标基尼系数的基本概念,构建内陆河流域用水公平性的评价方法,即通过影响用水量的人口、国内生产总值、参考作物蒸发蒸腾量、降水量等主要指标,计算单项指标与用水量的基尼系数,并计算综合基尼系数,进而以石羊河流域为例,对其用水公平性进行了评价。【结果】利用本研究建立的评价方法,对石羊河流域用水公平性的评价表明,石羊河流域在现状超采地下水的情况下,代内用水较为公平,但代际用水并不公平。【结论】可以利用基尼系数客观地评价区域间社会经济用水的公平性。
【英文摘要】Study on the fairness of water use in water deficient areas can provide reference for identifying the status of water use and allocating water resources reasonably.According to the concept of Gini coeficient, an index for estimating equity of incom, a method for evaluating the fairness of water use in inland river basins was established. Through the key indicators of water use, such as the population,GDP,precipitation,reference crop evapotransporation(ET0),the Gini coefficient for each indicator and comprehensive Gini coefficient were calculated, then the method was applied to Shiyang river basin. The result showed that in the case of the status of over-extraction of groundwater, the water use in shiyang river basin was intra-generational fair, but the intergenerational use of water was not.The Gini coefficient can objectively evaluate the fairness of socio-economic water use in different regions.

【题目】干旱区两种微气象学法测定农田蒸散发的比较研究
【中文关键词】波文比法;涡度相关法;蒸散发;大气稳定度
【英文关键词】Bowen ratio-energy balance method;Eddy covariance method;evapotranspiration;atmospheric

【中文摘要】利用涡度相关系统(EC)和波文比系统(BREB)监测干旱区农田蒸散发变化,从时间步长、天气条件、生育期以及灌溉的影响四方面入手,对比研究了两种方法在测定农田蒸散发方面的差异,并从仪器测量精度以及大气湍流稳定状况两个方面着重分析了引起这两种观测方法产生差异的原因。结果表明: R-G测定的不确定性及温湿度探头精度是引起两种方法测定差异的主要原因。受BREB传感器精度的限制,灌水后该法测定农田蒸散发偏低。受大气湍流稳定度的影响,晴天条件下两种方法测定蒸散发差异较小,阴天条件下差异较大。相对于EC而言,全生育期BREB高估总蒸散发约6.1%;在生育前期BREB测定蒸散发偏高,生育后期测定蒸散发偏低。

【英文摘要】Measuring field evapotranspiration (ET)accurately is of great importance in investigating the hydrologic process,developing hydrological models and improving the water use efficiency.Bowen ratio-energy balance method (BREB) and Eddy covariance method (EC)were used to monitor the process of field evapotranspiration in the oasis of Northwest China.Probably there is discrepancy between ET value evaluated by these two methods when time scale.weather condition and growth stages are different.This paper examined the effects of equipment resolution and atmospheric stability on the discrepancy.The results show that the uncertainty of R -G and the resolution of sensors have a strong effect on the discrepancy.Due to the limited resolution, BREB underestimated ET after irrigation. The discrepancy is higher during the cloudy days under stable atmospheric conditions than that during the sunny days under unstable atmospheric conditions.Compared with EC.the total ET estimated by BREB was 6.1% higher.BREB overestimated daily ET during the early growth stage,while underestimated it during the late growth stage.

【题目】灌区农业灌溉节水潜力估算理论与方法

【中文关键词】灌溉,指标,估算,节水潜力

【英文关键词】irrigation,indicators,estimation,water—saving potentia

【中文摘要】为了估算农业灌溉的节水潜力,提出了基于灌区尺度的农业节水潜力估算理论和方法,将不同节水措施实现的灌溉节水量分为“毛节水量”和“净节水量”,用于区分目前关于“工程节水量”和“真实节水量”的争论。毛节水量指由于提高灌溉效率,降低渗漏损失和田间蒸发等而少引的灌溉水量。净节水量指采取节水措施后减少的无效消耗水量和无效流失水量之和。案例分析在徒骇马颊河流域现有节水灌溉工程措施基础上分别估算了节水灌溉率提高20%和40%两种场景的节水量。估算结果表明,节水灌溉工程措施的节水潜力很大,但主要是毛节水量,即减少了从水源取用的水量,而净

节水量的节水潜力不大。这是由于大多数工程措施的主要作用是提高灌溉水的利用系数,减少渗漏损失,而减少的耗水量相对比较小。

【英文摘要】In order to estimate irrigation water—saving potential,this paper proposed a new theory and method based on irrigation district scale.According to this theory.the conception of “ gross water—saving ” and “ 'net water-Saving ” were introduced to avoid the argument of opinions between engineering—type water-saving and real water。 saving.Furthermore,the assessment indicators of irrigation water.saving was conducted and the calculating model of water—saving potential was proposed.To verify this theory and method,a case study on Tuhaimajiahe river basin was made to estimate water saving of irrigation engineering measures with tw o scenarios at 20% and 40% water-saving rate seperately.The estimate result showed that the water.saving irrigation projects had good effect on gross water—saving water than on net water—saving.

【题目】气候变化对中国农业用水和粮食生产的影响
【中文关键词】气候变化,农业,水,粮食产量
【英文关键词】climate change,agriculture,water,grain production
【中文摘要】全球气候变暖作为一个不争的客观事实,不可避免地会对中国农业用水和粮食生产产生影响。该文分别采用Palmer干旱指数(PDSI)、单位灌溉面积用水量(GIO)、单位面积粮食产量(PHGO)作为气候变化、农业用水和粮食生产具体度量指标,分析了中国1949-2005年PDSI、GIQ、PHGO年际变化特征及其相关关系,发现在1949—1983年PHGO和1949—1990年GIQ均与PDSI具有较好线性相关关系,表明气候变化在上述时间段对农业用水和粮食生产影响显著,人为因素(技术进步、政策机制、生产投入等)影响相对较小。依据相关关系对1949-2005年G[Q和PHGO进行预测发现,1991-2005年GIQ和1984-2005年PHGO预测值与实际值拟合程度较差,表明人为因素(技术进步、政策机制、生产投入等)在农业用水和粮食生产中已逐渐占据主导地位,对农业节水平均影响率达27%以上,对粮食增产平均影响率达40%以上。通过技术创新、政策机制保障和生产投入增加等人为因素控制,可在一定程度上缓解气候变化对中国农业用水和粮食生产带来的负面影响。
【英文摘要】Global climate warming is an indisputable objective fact.and it inevitably impacts agricultural water use and grain security production in China.In this paper,the Palmer drought severity index(PDSI),the gross irrigation quota(GIQ)and the per-hectare grain output(PHGO)were used as specific indexes of climate change.agricultural water use and grain producfion to analyze inter-annual variation characteristics and correlation between PDSI,GIQ,PHGO in China from l949 to 2005.and a good linear correlation between PHGO during 1949.、983 and PDsI as well as GIQ during 1949-1990 was found which indicated that climate change significantly affected agricultural water use and grain production.while human factors (technological progress,policies mechanisms,production inputs,etc.) afected relatively small at above.mentioned stage.According to the correlation.the GIQ and PHGO during 1949—2005 were predicted.It was found that predicted values and actual ones ofthe GIQ during 1949—1990 and the PHGO during 1949 1983 had poor relationships.which indicated that human factors(technological progress,policies mechanisms,production inputs,etc.)gradually became the leading position,and their average impact rate on agricultural water-saving and grain yield reached over 27% and 40% ,respectively.The negative impact of climate chan ge on agricultural water use and gr ain production can be mitigated to some extent by controlling the human factors as techn ologicalinnovation.policy mechanisms protection as well as production inputs increment.

【题目】中国“农业北水南调虚拟工程”现状及思考
【中文关键词】粮食,生产,农业,水足迹,北水南调虚拟工程,虚拟水贸易
【英文关键词】grain,production,agriculture,water footprint,North-to-South water diversion virtual engineering,virtual watertrade
【中文摘要】基于中国南北方粮食调动的变化分析,结合农业水足迹与虚拟水理论,提出中国在实施南水北调实体工程建设的同时,自1990年已经形成并运行着一个“农业北水南调虚拟工程”。计算结果表明,该工程在1990-2008年期间年均调

运虚拟水量已超过200亿m ,远大于南水北调实体工程目前的调水规模;北水南调虚拟工程调水量总体上呈增加趋势,依靠现有南水北调实体工程难以支撑中国北方粮食生产,解决这一问题的唯一出路只能是依靠科学技术,大力发展现代节水农业,提高粮食生产的综合用水效率。考虑到中国南北方经济状况的现实差距,以及“ 农业北水南调虚拟工程 ”的长期运行,建议国家实施区域虚拟水贸易战略,同时,加强区域农业水足迹演变与控制研究,制定区域农业水足迹相关技术标准,为实施区域虚拟水贸易战略提供科学依据与政策支持。

【英文摘要】Based on the variable analysis of Chinese north and south grain transfer and combined agricultural water footprint theory,this paper puts forward that at the same time of implementing South.to-North water diversion entity engineering construction,the “ agricultural North—to—South water diversion virtual engineering ” has been formed and carried out since 1990.The calculating results showed that:this engineering has transferred over 20 billion cubic meters virtual water from 1990 to 2008.which was much more than transfer scale of South—to-North water diversion entity engineering.The water transfer amount of North.to—South water diversion virtual engineering showed an overall increasing tendency,it was hard to support food production in northem China only by South—to-North water diversion entity engineering,so it became a only solution for this problem to vigorously develop modem water-saving agriculture and improve the comprehensive water efi ciency of food production by using technology.Considering the realistic gap of economic condition between south and north China and the extended service of South.to-North agriculture water diversion,researchers suggested that,implementing regional virtual water trade strategy, at the same time,reinforcing the research of the evolution and management of regional agricultural water footprint,making relevant technical standards of regional agricultural water footprint.It will provide scientific basis and policy support for implementation of the regional virtual water trade.

【中文关键词】黄土高原;雨水资源化潜力;GIS;评价模型

【英文关键词】Loess Plateau; rainwater harvesting potential; GIS; assess

【中文摘要】区域雨水资源化潜力的定量评价对于雨水资源开发利用的宏观决策、规划设计具有十分重要的意义。该文以黄土高原地区为例,系统分析了影响区域雨水资源化潜力的各个因子,确定定量评价区域雨水资源化潜力的各项指标,并运用GIS技术,集成多种来源、多种比例尺和多种类型的数据,建立区域雨水资源化潜力定量评价模型。评价模型对于黄土高原地区雨水资源可持续利用及生态与环境保护具有重要作用。

【英文摘要】Quantitative assessment for regional rainwater harvesting potential is very significant for macro decision-making and comprehensive planning of regional rainwater harvesting. Taking the Loess Plateau as a sample region and rainwater resources as research object, the influence factors of regional rainwater harvesting potential were analyzed systematically. Quantitative assessment indices of regional rainwater harvesting potential were defined. And the data with different origins, different scale and different types were integrated using GIS technique. Quantitative assessment model for rainwater harvesting potential was established. The assessment model plays an important role for sustainable utilization of rainwater resources and eco-environmental protection in the Loess Plateau.

【题目】不同耕作方式对玉米产量及叶片某些生理机制的影响
【中文关键词】保护性耕作;玉米;生理特性;产量
【英文关键词】Conservation tillage;Maize; Physiological Traits; Yield
【中文摘要】以玉米品种郑单958为试验材料,分析不同耕作措施对玉米生产的影响,探讨不同耕作方式间玉米产量及叶片某些生理特性的差异。研究结果表明:宽窄行种植玉米的产量显著高于免耕、翻耕和常规耕法,免耕、翻耕和常规耕法间产量差异不显著,百粒重在耕法间也没有显著差异;宽窄行种植玉米冠层的光合特性好于免耕、翻耕和常规耕法,叶片的净光合速率提高,水分利用效率也显著提高;叶片中叶绿素含量、比叶重、可溶性糖和可溶性蛋白含量都明显高于免耕、翻耕和常规耕法;免耕条件下玉米叶片丙二醛的含量较高。不同的耕作措施影响产量与叶片某些生理指标的相关性。
【英文摘要】Cultivar of maize zhengdan958 was chose to work as experimental materials in this study. The results show that yield of maize under width lines(WL) were more about 15.87%, 16.54% and 9.87% than no tillage(NT),plough tillage(PT) and conventional tillage(CT), moreover, there was no significance about 100 seeds weight among different tillage methods). Photosynthetic traits of maize leaves under WL were more than other tillage methods, and net photosynthetic rate under WL was improved by 30.73%, 14.79% and 10.71% compared to NT, PT and CT. Meanwhile,water use efficiency of leaves was improved well under width lines. Chlorophyll content, specific weight, solublesugar and soluble of maize leaves were higher than other tillage methods significantly, MDA content of maize leaves under no tillage was most among different tillage methods ,meanwhile, relationship between yield and some physiological traits were effected by different tillage methods.

【题目】不同耕作措施下土壤孔隙的多重分形特征
【中文关键词】土壤耕作; 多重分形; 土壤孔隙结构; 土壤切片
【英文关键词】Soil tillage; Multifracta;l Soil pore structure; Soil th in sect ion
【中文摘要】首先利用数字图像处理技术提取了东北黑土区长期免耕(no tillage, NT)和翻耕(m oldboardtillage, MT)制度下土壤切片中的孔隙信息, 然后应用矩方法研究了两种耕作制度下土壤孔隙结构的多重分形特征。结果表明, 免耕降低了表层(0~5 cm)大孔隙度(> 500 Lm), 但是提高了10~ 15 cm 和20~25 cm 深度的孔隙度和大孔隙度。土壤孔隙结构在64~1024像素尺度上具有多重分形特征。广义维(Dq) 和多重分形谱(f (A))及相关参数能够反映切片中孔隙结构的特征。表层

土壤孔隙多重分形谱明显右偏, 随深度增加趋于对称。在同一深度下, 免耕处理的$A(A- 10 - A10) 和$D (D - 10 - D10)均大于翻耕处理, 免耕处理增加了孔隙结构的复杂程度, 尤其是10~ 15 cm 和20~25 cm 深度下的孔隙结构。

【英文摘要】Soil pore system s under no tillage (NT) and moldboard tillage (MT) in the black soil zone of Northeast China were extracted from so il th in sections with digital mi age process techniques and the multifractal characteristics of soil pore structure were studied w ith m ethod of moment Results indicate tha NT decreased them acroporosity (> 500 m) in the surface layer (0~ 5 cm), but increased the total poros- ity and macroporosity at 10~ 15 and 20~ 25 cm depth1 Multifractal characteristics were observed at 64~ 1 024 pixel scales and generalized dmiensions (Dq), multifractal spectra (f (A)) and other related parameters reflected characteristics of the pore structure in the soil sect ions under NT and MT.The multifractal spectra of the pores in the surface layer apparently leaned toward the right side but approached tosymmetry with increasing depth1Compared to MT, NT increased the $A(A- 10 - A10) and $D (D- 10 - D10) of soil pore structure, and complexity of soil pore system, especially at 10~ 15 cm and 20~ 25 cm in depth.

【题目】保护性耕作模式对黑土有机碳含量和密度的影响

【中文关键词】土壤,有机碳,土壤测试,保护性耕作,活性碳,缓性碳,惰性碳,土壤有机碳密度

【英文关键词】soils, organic carbon, soil testing, conservation tillage, active organic carbon, slow organic carbon, passive organic carbon, soil organic carbon density

【中文摘要】以公主岭市长期(10 a)保护性耕作定位试验为研究对象,分析与传统耕作模式相比的几种保护性耕作模式对黑土固碳效应的影响。共设4 种耕作模式,即秋翻秋耙匀垄、秋灭茬匀垄、全面旋耕深松和宽窄行交替休闲(又叫松带、苗带交替休闲)(后3 种视为保护性耕作)。结果表明,经过10 a 的耕作试验,不同的耕作模式对土壤有机碳有显著的影响。表层0~20 cm 秋翻秋耙匀垄和秋灭茬匀垄模式的土壤有机碳含量最低,深层30~50 cm 全面旋耕深松模式的土壤有机碳质量分数显著低于其他耕作模式13.49%~25.14%;0~50 cm 耕层中宽窄行交替休闲的土壤有机碳质量分数高于其他耕作处理0~33.58%。宽窄行交替休闲模式下的宽窄行松带活性有机碳质量分数及缓性有机碳质量分数分别高于其他模式8.06%~48.87%和0~33.83%。全面旋耕深松模式与宽窄行交替休闲模式下的宽窄行苗带土壤有机碳密度分别低于和高于秋翻秋耙10.95%、17.13%;>20~50 cm 宽窄行苗带的活性有机碳密度及缓性有机碳密度分别高于其他耕作模式2.20%~18.85%和17.00%~29.19%,不同耕作模式的土壤惰性有机碳密度没有显著性差异。相对秋翻秋耙的传统模式,不同的保护性耕作模式能够增加土壤有机碳密度也能够降低土壤有机碳密度,宽窄行交替休闲主要通过增加土壤活性有机碳及缓性有机碳密度来增加其土壤有机碳密度,是东北地区固定土壤有机碳、提高土壤有机碳质量的有效耕作方式。

【英文摘要】Based on the long-term (10 years) conservational tillage experiment in Gongzhuling city, the effects of minimal tillage patterns (MTs) and conventional tillage pattern (CT) on soil sequestrated carbon were analyzed. Four tillage patterns were designed as follows: fall moldboard plowing and harrowing ridge (called as CT); fall stubbing ridge(called as MT1); deep loosing tillage (called as MT2); wide-narrow row alternation fallow (called as MT3), the last three minimal tillage patterns were regarded as conservation tillage patterns. Results showed that different tillage patterns had a significant effect on the soil organic carbon for a 10 years tillage experiment. CT and MT1 had the lowest soil organic carbon content in the surface layer (0 – 20 cm); organic carbon content of MT2 pattern was significantly 13.49% – 25.14%lower than that of other tillage patterns in deeper layer (30 – 50 cm); organic carbon content of MT3 was 0 – 33.58%higher than that of other tillage patterns. Active and slow organic carbon content of loosing belt of MT3 was8.06% – 48.87% and 0 – 33.83% higher than that of other patterns, respectively. Soil organic carbon density of MT2 pattern and seeding belt of MT3 pattern was 10.95% lower and 17.13% higher than that of CT; active and slow organic carbon density of seeding belt of MT3 in 20 – 50 cm was 2.20% – 18.85% and 17.00% – 29.19% higher than that of other tillage patterns; passive organic carbon density of different tillage patterns had no significant variance. In contrast to CT,different conservation tillage patterns could increase soil organic carbon density or reduce soil organic carbon density.MT3 pattern increases soil organic carbon density through the increasing of soil active and slow organic carbon density,which is the most beneficial tillage pattern for soil organic carbon sequestration and quality improvement of soil organic carbon in northeast region.

【题目】关于改进东北春玉米现行耕法的思考
【中文关键词】玉米;耕作;改进
【英文关键词】Maize; Tillage; Improvement
【中文摘要】分析以传统垄作为主的现行耕法在生产应用上存在的秸秆还田量不足、作业环节多、保水保土性能差、土壤结构恶化等问题,提出了改垄作为平作、改中耕为深松、改灭茬为留茬的技术思路,并建立了玉米宽窄行平作留高茬及均匀垄平作留高茬两种新耕作方式。
【英文摘要】There were lots of problems in traditional tillage method, such as less maize stubble returned into soil, more times of tillage needed, poor capacity of water storing and soil keeping, and destroy of soil structure, etc. For these reasons, ideas of converting tillage with pillage into no tillage and stubble crashed into stubble kept were suggested, and two new tillage methods were put forward in this study, one was wide narrow row with high stubble kept, another was even row with high stubble kept.

【题目】伽师瓜贮藏温度试验小结
【中文关键词】伽师瓜;温度;呼吸强度;冷害
【英文关键词】Jiashi Muskmelon; temperature; respiration rate; chilling injury
【中文摘要】【目的】试验以伽师瓜为研究对象,筛选其适宜的贮藏保鲜温度。【方法】温度设置为:1、2和3℃,从贮藏温度与伽师瓜采后呼吸强度、乙烯释放量、可溶性固形物含量、总糖含量、总酸含量、硬度、果肉细胞膜透性等关系方面,研究了伽师瓜采后生理活性和适宜贮藏温度。【结果】在贮藏过程中可溶性固形物和总糖均略有下降,中后期总酸含量下降明显;在1℃条件下能较好的保持伽师瓜的硬度、延缓呼吸高峰出现的时间、降低呼吸强度、维持较低的电导率、延缓细胞衰老和减少腐烂。【结论】在较低温度下伽师瓜表面凹陷能否作为伽师瓜冷害的重要指标,值得商榷。
【英文摘要】【Objective and Method】The present experimentwas carried out to screen the suitable temperature for Jiashi Muskmelon 1℃,2℃and 3℃to study the post-harvesting respiration tate ethylene production,soluble solids content,total sugar content,total acid content, hardness, pulp cell membrane permeability, etc.【Result】The result showed that in the storage process, soluble solids content and total sugar content of Jiashi Muskmelon had dropped slightly, total acid contenthad dropped obviously in the middle and late storage process; Under1℃,it can maintain hardness of Jiashi Muskmelon,delay the time of respiration peak,reduce respiration rate,last out the lower electrical conductivity,inhibit cell senescence and reduce decay.【Conclusion】Under lower temperature, it is of great importance to devote every effort to maintain the surface of Jiashi Melon.

【题目】1998~2007年吉林省种植玉米经济效益的变化
【中文关键词】吉林省;玉米;经济效益;变化
【英文关键词】Jilin province;maize;economic profit,;change
【中文摘要】将2007年吉林省中部玉米种植成本与10 a前进行了比较。结果表明:投入方面,物质投入和用工投入较10 a前成倍增加;产出方面,产量略有增加,玉米价格增加幅度较大;取消农业税及提留款,增加了良种补贴等,大大降低了生产成本,因此收益较10 年前增加。
【英文摘要】The value costs of maize planting in central Jilin Province from 1998 to 2007 were compared.The results showed that the input of materials and labour force increased several times in 2007,the output increased slightly,and the maize price increased significantly.After abolishing agricultural tax and fees paid by farmers for village reserve,the production cost of maize planting decreased,and the income increased in 2007 than that in the past ten years.

【题目】高密度栽培条件下玉米剪叶处理对产量构成的影响
【中文关键词】玉米;高密度种植;剪叶
【英文关键词】Maize; High plantting populaiton; Leaf cutting
【中文摘要】在抽雄期将密度为100 000株/hm2的玉米植株剪去部分穗位叶及穗位下部分叶片,将叶面积系数控制在4.5~7.0,研究剪叶处理对玉米产量的影响。结果表明:剪叶处理的产量都高于不剪叶处理(CK),剪叶后叶面积系数为5.5的处理产量最高,为14 211 kg/hm2。以叶面积系数5.5为中间值,叶面积系数距5.5越远,产量越低。收获穗数随叶面积减少而增加,穗粒数以叶面积系数5.5处理最多,百粒重变化不显著。
【英文摘要】Cutting central and lower parts of maize leaives to make the leaf area index(LAI) range among 4.5 to 7.0,to study the effects of leaf cutting treatment to maize yield under the high plant population cultivation condition.The results showed that all the yields of treatments were higher than CK,the highest yield was LAI 5.5 treatment.Put the LAI 5.5 as the model,the more the number of the LAI to the model,the lower the yield.The harvest ears was more along as the LAI was less.

【题目】Combined stalk-stubble breaking and mulching machine
【中文关键词】无
【英文关键词】Maize Residue Soil Conservation tillage Implement
【中文摘要】无
【英文摘要】The stalk – stubble breaking and mulching process is a core technique for some conservation tillage system. Over the past 10 years, this technique has been widely adopted in the dry farming area of northern China. On the basis of analyzing the existing problems in stalk-breaking and stubble-breaking machines, we have developed a combined stalk – stubble breaking and mulching machine with two frames fixed together, the stalk and stubble-breaking blade rotors were mounted respectively on the frames. The machine can be used to break the maize (Zea maysL.) stalk and stubble and bury about one-third of the broken stalk and stubble in the soil, preventing them being blown away by wind. This paper describes the structural features of the machine, the design of main working parts, determination of the parameters of the central position of the two blade rotors, and presents the performance test results. Thetests showed that the machine had a stalk-breaking rate of 89% and the vegetation coverage rate reached 67.9%, which meets the agro-technical requirements in the dry farming area of northern China.

【题目】PMPD模型预测中国土壤有效磷变化
【中文关键词】PMPD模型;中国土壤;有效磷
【英文关键词】无
【中文摘要】本研究采用北京昌平区潮褐土试验站的长期定位试验数据对土壤磷肥力预测(PMPD)模型的主要参数进行调整,并用河南郑州潮土试验站的数据对其进行模拟和验证。结果表明经参数调整后的模型对河南潮土土壤有效磷的预测值与实测值之间呈极显著相关关系,相关系数达到0.848,表明校正后的模型较适用于潮土及潮褐土区田块尺度土壤有效磷的模拟预测。
【英文摘要】This study was aimed at providing a model for the long-term changes in soil available P. Data from Eutric Cambisols of Beijing long-term experiments were used to adjustment parameters of PMPD model which have been developed to calculate the long-term change in soil P. The model calibrated in this way gave good fits to the data from Henan long-term experiment, and gave predictions of soil available P were in good agreement with measurements in calcaric fluvisols, the correlation coefficient is 0.848.

【题目】应用肥料量级试验建立吉林省春玉米磷肥施用指标体系
【中文关键词】相对产量;磷肥力分级指标;磷肥推荐
【英文关键词】relative yield,phosphorus classification index,phosphorus recommendation
【中文摘要】应用“肥料量级”试验结果建立吉林省适宜春玉米生产体系的磷肥施肥技术指标体系。以相对产量75%,90%和95%为标准,=将吉林省土壤有效磷划分为低、中、高和极高4级;并用一元二次加平台模型对不同土壤养分分级范围内施肥量与产量关系进行模拟,计算最佳磷肥用量。结果表明:当吉林省土壤有效磷含量处于低等级(Olsen-P<5 mg/kg)时,磷肥(P2O5)用量应为83 kg/hm2;中等级(Olsen-P 5~21 mg/kg)时,磷肥用量为60 kg/hm2;高等级(Olsen-P 21~34 mg/kg)时,磷肥用量为45 kg/hm2;当土壤有效磷高于34 mg/kg时,短期内无需磷肥施用。
【英文摘要】Taking the spring maize "fertilizer rate" experiments in Jilin Province as an example, the process of establishing fertilization recommendation index was investigated. Soil Olsen-P were classified as low (<75% relative yield), medium (75%-90% relative yield), high (90%-95% relative yield) and very high (>95% relative yield) based on the relative yields. P fertilizer recommended rates were simulated by the models of one-factor for each "fertilizer rate" field experiment. The results indicated that phosphorus fertilizer rates (P2O5) were 83 kg/hm2, 60 kg/hm2, 45 kg/hm2 and 0 kg/hm2. When soil fertility were classified as low, medium, high and very high (Olsen-P<5 mg/kg, 5-21 mg/kg, 21-34 mg/kg,>34mg/kg), respectively.

【题目】超高产玉米籽粒的灌浆特性
【中文关键词】超高产玉米;灌浆速率;胚乳细胞;粒重
【英文关键词】Super high-yield maize; The rate of grain filling ; Endosperm cells; Grain weight

【中文摘要】以2个超高产玉米品种和2 个普通玉米品种为试材, 采用Richard 生长分析法和细胞计数法, 研究籽粒灌浆过程中籽粒增重与胚乳细胞增殖的关系以及灌浆持续期和灌浆速率与粒重的关系。结果表明:籽粒平均灌浆速率和最大灌浆速率是影响同一品种粒重的2个主要因素;其次,灌浆持续期长短是影响不同品种粒重的1个主要因素,而且胚乳细胞数与灌浆速率和灌浆持续期均呈极显著相关(r12 =0.9717**,r13 =0.9897**)。4个品种的胚乳细胞数目由高到低的总趋势为超高产先玉335 > 郑单958 > 普通品种长城799 > 通吉100,这表明胚乳细胞数的不同是引起粒重不同的主要因素。

【英文摘要】In this experiment, two super high-yield maizes and two common maizes were used. The relationships of the grain weig ht increase and endosperm cells proliferation, the duration of grain-filling,the rate of g rain-f illing and the grain weight were studied by the means of richard grow the quation and taking count of endosperm cells in the process of grain-filling. The result showed that the averagegrain-f illing rate and the max grain-filling rate were two main factors to affect the g rain weight of one cultivar,meanwhile the length of duration of grain-filling was one main factor to af fect the grain weight of different cultivars. And the number of endosperm cells had a high positive cor relation w ith the rate of g rain-filling and duration of grain-filling (r12 =0.9717**,r13 =0.9897**) . The rank about the number of endosperm cells in four cultivars was super high-yield maizes Xianyu335 > Zhengdan958 > common cultivars Chang cheng799 > Tong ji100 from higher to low er. It indicated that the difference of number of endosperm cells was the main reason for the difference of grain w eight .

【题目】超高产玉米品种干物质积累与分配特点的研究
【中文关键词】玉米; 干物质积累与分配; 产量
【英文关键词】Maize; Drymatter accumulation and distribution; Yield
【中文摘要】以4个玉米品种为试验材料, 比较研究了超高产玉米干物质积累和分配的特点。结果表明: 高的生物产量是获得高产的物质基础; 高产和超高产品种的物质生产优势表现在生育中期和后期, 玉米植株个体干物质积累呈S形曲线变化; 玉米干物质在各器官的分配随生长中心的转移而发生变化, 小喇叭口以前干物质主要分配在叶片, 之后转为茎、叶; 散粉后, 各器官干物质开始向子粒转移, 高产品种子粒产量主要来源于生育后期叶片制造的光合产物即成为光合产物的分配中心,并与抽雄后具有较高的叶面积指数且持续时间较长密切相关。
【英文摘要】The properties of dry matter product of four different varieties were studied. The results indicated that more total dry matter accumulation was the basis of higher yield. The production superiority of high- yield and superhigh- yield maize was exhibited during the middle and the late growth stage. The CGR of high- yield and super high- yield varieties was obviously higher than that of low- yield variety during the middle and the late growth stage.The photosynthetic products made by leaves during the late growth stage was main sources of grain yield of high-yield varieties. This result was closely connected with higher LAI and longer duration after the full-heading stage.

【题目】不同抗旱性玉米苗期叶片活性氧代谢对水分胁迫的响应
【中文关键词】玉米; 抗旱性; 水分胁迫; 活性氧代谢
【英文关键词】Corn; Drought-resistance; Water stress; Activated oxygen metabolism
【中文摘要】[目的]抗旱性玉米栽培和育种提供理论依据。[方法]以耐旱品种掖单13和不耐旱品种丹玉13为试材,通过盆栽试验研究了水分胁迫对玉米苗期叶片活性氧代谢水平的影响。[结果]与正常供水处理相比,水分胁迫下掖单13和丹玉13苗期叶片O2产生速率分别升高了28.9%、36.1%(WS 50%)和31.3%、41.9%(WS 35%),叶片H2O2含量分别升高了16.1%、25.4%(W S 50%)和23.7%、29.8%(W S 35%)。中度水分胁迫下掖单13和丹玉13的叶片SOD和POD活性分别比对照提高了22.8%、29.9%和22%、21.7%。与正常供水处理相比,丹玉13和掖单13的叶片MDA含量分别比对照增加了22.7%、14.5%(中度胁迫)和40.2%、15.6%(重度胁迫)。重度水分胁迫下掖单13和丹玉13的AsA和GSH含量分别比对照降低了12.6%、

14.2%和33.3%、44.1%。[结论]耐旱性较强的玉米品种在水分胁迫下维持活性氧代谢平衡的能力较强。
【英文摘要】Abstract and breeding of drough-resistant corn.[Method] With drought-resistant variety Yedan 13 and drought-susceptible variety Danyu 13 as tested materials,the influences of water stress on the activated oxygen metabolism level in corn leaves in seedling stage were studied through potting experiment. [Result]Compared with the treatment with normal water supp ly,under water stress,the p roduction rate of O2 in the leaves of Yedan 13 and Danyu 13 were enhanced by 28.9%,36.1% (WS50%)and 31.3%,41.9%(WS35%)resp. and their contents of H2O2 were enhanced by 16.1%,25.4%(WS50%)and 23.7%,29.8%(WS35%)resp.in seedling stage.Under moderate water stress,the activities of SOD and POD in the leaves of Yedan 13 and Danyu13 were enhanced by 22.8%,29.9%and 22%,21.7%resp.in comparison with CK.Compared with the treatment with normal water supply,the contents of MDA in the leaves of Danyu 13 and Yedan 13 were increased by 22.7%,14.5%(under moderate stress)and 40.2%,15.6%(under serious stress)resp.in comparison with CK.Under serious water stress,the contents of A sA and GSH in Yedan 13 and Danyu13 were decreased by 12.6%, 14.2% and 33.3%,44.1%resp.in comparison with CK. [Conclusion]The corn variety with stronger drought-resistance had stronger ability on maintaining activated oxygen metabolism balance under water stress.

【题目】基于决策树算法的土壤养分管理分区的研究
【中文关键词】ID3;土壤养分;管理分区;变量施肥
【英文关键词】ID3; soil nutrients; management partition; variable rate fertilization
【中文摘要】为了便于精细施肥的实际操作和管理。以吉林省德惠市的图斑数据中的有机质、全氮、速效磷和速效钾含量为对象,采用决策树ID3 算法进行农田土壤养分管理分区的研究。结果表明:得到的分区数目为6 个,分区内土壤养分含量相近或差异较小,分区间差异显著。说明基于ID3 算法的土壤养分管理分区方法可用于指导精细农业中的变量施肥,为土壤养分管理区提供了一种有效的划分方法。
【英文摘要】For more efficiently applying fertilization and management of precision agriculture, the decision trees arithmetic was used to establish model for management partition of soil nutrients, based upon the test data from Dehui in Jilin Province. Four evaluation indices, organic material, nitrogen, phosphorus and K were analysed. Six partitions were determined. Soil nutrient content was similar within partitions. The management partition of soil nutrients based on decision trees arithmetic could be used to guide variable fertilization in precision agriculture, and provided an effective classification method for management partition of soil nutrients.

【题目】组合预测方法在玉米施肥预测中的应用
【中文关键词】组合预测;玉米施肥;预测模型;拉格朗日乘数法
【英文关键词】combination forecasting; corn fertilization; forecasting model; Lagrange multiplier method
【中文摘要】为提高玉米施肥量预测的精度,利用拉格朗日乘数法,基于预测误差平方和最小这一目标,对肥料效应函数、神经网络施肥预测方法这2种单一施肥量预测模型进行加权组合,建立了玉米施肥组合预测模型。预测结果显示:肥料效应函数、神经网络施肥预测方法和组合预测模型的预测误差平方和分别为2 789·40,653·79,421·72,说明玉米施肥组合预测模型优于单一施肥预测模型;采用组合预测方法对玉米施肥量进行预测,能够显著提高预测精度。
【英文摘要】A combination forecasting model was applied to forecast fertilizing amount for corn to improve the precision of the prediction. In order to achieve the least sum of square error, the weight of fertilizer effect function method and neural network forecasting model in combination forecasting model was objectively calculated withLagrange multipliermethod, and a combination

forecastingmodel for corn fertilizing amount was constructed. The results show that the error sum of squares of fertilizer effect function method, neural network forecasting model and combination forecasting model is 2 789 • 40, 653 • 79 and 421 • 72 , respectively. The result accounts for the fact that combination forecasting model is superior to single forecasting methods, and adopting combination forecasting model in corn fertilization can obviously improve forecasting accuracy.

【题目】Molecular structure of starch from Pueraria lobata (Willd.) Ohwi relative to Kuzu starch
【中文关键词】野葛根淀粉,分子结构,直链淀粉,支链淀粉
【英文关键词】Pueraria lobata (Willd.) Ohwi starches; Molecular structure; Amylose;Amylopectin
【中文摘要】该文对野葛根(Pueraria lobata (Willd.) Ohwi)淀粉的分子结构进行了测定,并与其它块茎(根)类淀粉进行了比较。应用凝胶渗透色谱法对中国三个野葛根主产区新鲜采集的葛根块茎进行了测定,结果显示其支链淀粉的链分布状况与其它淀粉类似。对三种支链淀粉的研究发现,其相应的β-淀粉分解限值分别为55%,56%和58%,与葛粉(Kuzu)支链淀粉接近;支链淀粉的平均聚合度(DPn)为8700-9700,比甘薯(DPn =9900)和马铃薯(DPn =11200)支链淀粉低;每个直链淀粉分子的支链数量为5.0。葛根直链淀粉的平均链长与葛根(Kuzu,310),甘薯(310)以及木薯(340)淀粉接近,但比百合(475)和马铃薯(670)淀粉低。
【英文摘要】The molecular structures of starches from Pueraria lobata (Willd.) Ohwi were examined and compared with those of other tuberous and root starches. The fresh tubers were collected from three Chinese main Pueraria lobata (Willd.) Ohwi growing regions. The chain distributions of the amylopectins as determined by gel permeation chromatography were similar to those of the amylopectins of other starches. Among the three amylopectins studied, the respective beta-amylolysis limits were 55%, 56% and 58% which were similar to that of kuzu amylopectin. The number average degree of polymerization ((DP(n)) over bar) values of the amylopectins were 8.7-9.7 x 10(3), lower than those of sweet potato and potato amylopectins (9.9 X 10(3) and 11.2 X 10(3), respectively). The number of branch chains per amylose molecule was 5.0. The average chain length ((CL) over bar) of the Pueraria lobata (Willd.) Ohwi amyloses was similar to those of kuzu (310), sweet potato (310) and tapioca amyloses (340), but lower than those of lily (475) and potato (670).

【题目】垄膜沟种技术对辽西旱地春玉米土壤水分及产量的影响
【中文关键词】春玉米;垄膜沟种;土壤水分;旱地农业
【英文关键词】Spring corn; Ridge film mulching and furrow seeding; Soil water; Dry land Agriculture
【中文摘要】在辽西风沙半干旱雨养农业区采用垄膜沟种技术,可有效提高自然降水利用率,达到保水增墒、减少无效蒸发,提高玉米产量的作用。试验结果表明,垄膜沟种技术种植的春玉米全生育期内在同等降雨条件下土壤含水量比常规地膜覆盖增加0.75 个百分点,比裸地增加 3.32 个百分点。春玉米单株总叶面积比常规地膜覆盖和裸地种植分别增加了881.70 cm2和714.39 cm2,为春玉米增产提供了物质保障。垄膜沟种技术可提高玉米经济性状指标,增加产量,试验单产达11 847.39 kg/hm2,较裸地种植增加了2 681.62 kg/hm2,增产29.14%;比常规地膜覆盖种植增加了484.37 kg/hm2,增产4.25%。
【英文摘要】Using the technique of ridge film mulching and furrow seeding in western Liaoning can improve the utilization ratio of natural precipitation to prohibit soil water evaporation, conserver soil water and increase yield of corn. Experiment showed that the total leaf area per plant increased by 881.70 cm2and 714.39 cm2, and soil water content of spring corn increased by 0.75 and 3.32 percentage points using technique of ridge film mulching and furrow seeding, which provided material guarantee for the yield increase of spring corn, than plastic film mulching and bare land. Technique of ridge film mulching and furrow seeding could improve the

indexes of economic character, yield up to 11 847.39 kg/ha, 2 681.62 kg/ha more than a bare land increased by 29.14% and 484.37 kg/ha more than conventional plastic film mulching cultivation increased by 4.25%.

【题目】风沙半干旱区旱地玉米提高降水生产效率的栽培技术研究
【中文关键词】玉米;风沙半干旱区;降水生产效率;产量
【英文关键词】Corn; Sand semi- arid zones; Rainfall productivity; Yield
【中文摘要】研究垄膜沟种微集雨和全地面平铺覆膜栽培技术对提高旱地玉米天然降水利用率的影响。结果表明,田间沟垄微集雨结合覆盖有效地利用了垄膜的集雨和沟覆盖的蓄水保墒功能,改变了降雨的时空分布,使降雨集中在沟内,明显提高了降雨的利用率,特别是 5 mm左右微小降雨的利用率。全地面平铺覆盖栽培最大限度降低了土壤水分的无效蒸发,达到保墒的目的。田间沟垄微集雨技术和全地面平铺覆盖栽培技术能增加玉米产量,提高降水利用率。
【英文摘要】For improving of the rainfall use efficiency of dryland corn and achieving the goal of increasing the yield of corn further, a set of technology of ridge film mulching and furrow seeding and whole flat covering of dryland corn is designed. The on- field ridge and furrow rainwater harvesting and mulching combination system is built by shaping the soil surface with alternate ridges and furrows along the contour. The plastic- covered ridges serve as a rainfall harvesting zone and furrows as a planting zone. This system can significantly improve rainwater use efficiency by concentrate rainwater into the furrows through the plastic- covered ridge and particularly can make better utilization of 5㎜ small rain, and change the rainfall space and time distribution. Some materials are used to mulch the furrows to reduce soil evaporation. The whole flat covering cultivation can minimize the soil moisture invalid evaporation, achieving purpose of preserving soil moisture. The results indicate that the technology of ridge film mulching and furrow seeding and the whole flat covering can increase grain yields,and enhance the rainfall productivity.

【题目】辽西北半干旱区土壤深松对玉米生长发育及产量的影响
【中文关键词】半干旱地区;深松;玉米;生长发育;产量
【英文关键词】semi-arid region; deep tillage; maize; growth status; yield
【中文摘要】针对辽宁西北半干旱区耕层浅、犁底层厚,影响雨水下渗和玉米生长的实际,玉米苗期进行深松,并测定了深松部位土壤含水量、土壤容重及玉米生长发育状况和产量。 结果表明,深松与对照相比,耕层土壤含水量增加、土壤容重降低,玉米株高提高了6.3%,茎粗增加了 7.0%,穗长增加了 19.4%,穗径增加了:3.9%,产量提高了 10.5%。
【英文摘要】In the conditions of shallow topsoil layer and thick plow pan, influencing the rainfall infiltration and maize growth in the semi-arid region of northwest Liaoning, the deep tillage was carried out during the period of maize seedlings, and the soil moisture, soil bulk density, maize growth and yields were investigated. The results showed that the soil moisture increased, however, the soil bulk density decreased compared with the control. The maize height and stem diameter increased by 6.3% and 7.0%, respectively, compared with the control. The length, diameter and yield of maize increased by 19.4%, 3.9% and 10.5%, respectively.

【题目】辽西地区节水农业发展现状及对策
【中文关键词】辽西;节水农业;现状调查
【英文关键词】liaoxi; water-saving agriculture; current situation; investigation
【中文摘要】为保障粮食安全,保障农业的可持续发展,必须大力发展节水农业。通过调查辽西地区的节水农业发展现状,得出目前节水农业在农村发展中存在的问题,并提出今后节水农业的工作重点和对策。对节水农业的更好更快发展具有一定的指导意义。
【英文摘要】In order to ensure food-security and the sustainable development of agriculture, water-saving agriculture must be developed. Through investigation of current development situation of water-saving agriculture in western region of Liaoning province, existing problems at present are found, and countermeasures and future work emphasis are put forward. This has certain significance in guiding the development of water-saving agriculture in the future.

【题目】玉米茬不同处理方式对土壤耕层水分的影响
【中文关键词】土壤水分;留茬;翻耕;留茬覆盖秸秆;翻耕覆盖秸秆;翻耕覆膜
【英文关键词】soil moisture; stubble remaining; tillage; stubble covered with straw; tillage plus straw covering; tillage plus film covering
【中文摘要】针对朝阳半干旱区春季十年九旱的实际情况,在秋后玉米地设置了玉米地留茬、留茬覆盖玉米秸秆、翻耕、翻耕后覆盖玉米秸秆和翻耕后覆盖地膜5种不同处理方式,探讨不同处理方式对春播前表层土壤水分的影响。测定结果表明,各处理春播前表层土壤水分含量大小顺序为翻耕后覆膜>翻耕后覆盖秸秆>留茬覆盖秸秆>翻耕无覆盖>留茬无覆盖,其中翻耕覆膜处理土壤含水率为17.03%,比留茬无覆盖处理高4.51%,比翻耕无覆盖处理高2.57%,比留茬覆盖秸秆处理高1.27%,比翻耕覆盖秸秆处理高0.66%。
【英文摘要】In viewof the characteristic of spring drought occurring in nine years in a decade in Chaoyang sem-i arid region, five differenttreatments on corn stubble after autumn, including stubble remainingwithout covering, stubble covered with straw, tillage without covering, tillage plus straw covering and tillage plus film covering, are designed to study the effect of each treatment on surface soil moisture before spring sowing. The results indicate that before spring sowing, the amount of soil moisture of surface layer in different treatments is in the order of tillage plus film covering > tillage plus straw covering > stubble covered with straw> tillage without covering> stubble remaining without covering, and the soilwater contentoftillage plus filmcovering is 17.03%, being4.51,2.57,1.27 and 0.66 percentage points higher than stubble remaining, tillagewithout covering, stubble plus strawcovering and tillage plus strawcovering respectively.

【题目】花期水分胁迫对大豆器官平衡和产量的影响
【中文关键词】水分胁迫;大豆;器官平衡;产量
【英文关键词】water stress; soybean; organ equilibrium; yield
【中文摘要】水分亏缺是限制作物生长的最主要因素之一,研究水分胁迫下大豆生长发育规律,对于提高大豆产量具有重要意义。试验在盆栽条件下,研究了花期水分胁迫对大豆器官平衡和产量的影响。结果表明:花期在不同时间、不同强度水分胁迫下,不同时期大豆各器官的物质分配比例不同,且不同品种表现出各异差异。水分胁迫是通过影响各器官物质分配比例来影响大豆产量的。不同时间、不同强度的水分胁迫经济系数不同,不同品种间的经济系数也有差异。大豆花期水分胁迫影响产量形成, 14 d中度 、重度水分胁迫对产量影响显著;而7 d水分胁迫处理影响不显著。辽51064和辽51095均以7 d中度水分胁迫(土壤含水量为19% ~21%)为适宜,单株产量分别达到了18. 36 g、17. 53 g。
【英文摘要】The water deficithas been themain factor that limits the crops grow, it is important to improve the yield to research the growing law of soybean under the condition ofwater stress. Under the condition of pot, this article studies the influence on the organ equilibrium and yield ofsoybean by thewater stress at flowering. The result indicates tha:t the different time and different strength ofwater stress on the flowering leads to the differentdistribution proportion ofsoybean organ' material in differentperiod, and differentvarietieshad different characters. Thewaterstresswas through affected various organs material assignment proportion to affectthe soybean yield. The the different time and different strength water stress economical coefficientwas differen,tand differentvariety economical coefficientalso had the difference. the study indicated thatLiao51064 and Liao51095 took the 7 dmoderate accentprocessing (soilmoisture content as 19% ~21%) being suitable. The single yield has respectively achieved 18. 36 g, 17. 53 g.

【题目】半干旱区南果梨秸秆覆盖蓄水保墒技术研究
【中文关键词】秸秆覆盖;蓄水保墒;南果梨;半干旱区
【英文关键词】Covering straw; Water conservation; Nanguo fruitpear; Sem-i arid area
【中文摘要】在辽西半干旱区,南果梨树盘覆盖秸秆能够提高土壤含水量和果树产量。随着秸秆覆盖厚度的增加土壤蓄水保墒能力逐渐增强,产量不断提高,但是厚度超过25 cm后,作用效果不再明显增强。在5个水平中,覆盖厚度为30 cm和25 cm与其它三个处理相比,增产显著,但二者之间的差异不显著。因此,南果梨覆盖栽培中适宜的秸秆覆盖厚度为25 cm左右。
【英文摘要】In sem-i arid area ofwestern Liaoning Province, theNanguo pear fruit can improve production and soilmoisture by covering straw. The retention capacity of soilwas gathering strength and the fruit production increased, with increase the thicknessofstrawmulch. Butthe rate of increase to become less, when the thickness to exceed 25 cm. In the five levels of coverage for the thickness of30 cm and 25 cm compared with the other treatmen,t significantly increase production, but the differencewas notsignificantbetween them. Therefore, the appropriate coverage thickness of strawmulch is around 25 cm inNanguo pear fruit cultivation.

【题目】苗期水分胁迫对大豆器官平衡和产量的影响
【中文关键词】水分胁迫;大豆;器官平衡;产量
【英文关键词】Water stress; Soybean;Organ equilibrium;Yield
【中文摘要】在盆栽条件下,研究了苗期水分胁迫对大豆器官平衡和产量的影响。结果表明:在苗期不同强度水分胁迫下,不同时期大豆各器官的物质分配比例不同。中度水分胁迫下收获期的器官平衡为:籽粒>根>荚皮>叶片>茎秆>叶柄,两个品系辽51064和辽51095的叶片分别占16. 31%、15. 28%,籽粒分别占25. 83%、28. 92%,叶柄分别占6. 27%、4. 85%,说明大豆苗期适度水分胁迫可以改变大豆的/源-库0关系。中度水分胁迫下,辽51095生物产量和经济产量的相关系数最大(0. 9956)。就产量而言,正常供水与中度水分胁迫的差异并不显著,与重度水分胁迫则差异显著。
【英文摘要】The shortage ofwater has been themain factor that limits the yield of soybean.Understanding the growing law of soybean under the condition ofwater stress is of great importance to improve soybean yield. The effect ofwater stress at seedling on organ equilibrium and yield of soybean was studied under pot experimentwith two soybean sister lines Liao 51064 and Liao 51095. The proportion of dry matter distributed to each organ in different growth period varied with the strength ofwater stress.Undermedium water stress, the organ equilibrium in the harvesting timewas: seed>root>pod shell >leaf>stem>petiole, and the lea,f grain and petiole for the two sister lines ofLiao 51064 and Liao 51095 accounted for 16131% and 15. 28%, 25. 83% and 28. 92%, 6. 27% and 4. 85% of totalbiomass,which showed that itwas helpful to improve the balance between/the source and sink0.Undermedium water stress, the correlation coefficient of biological yield and economic yield was highest(0. 9956)forLiao 51059.The soybean yield under normalwater supply and medium water stress also significantly higher than that ofheavywater stress.

【题目】半干旱区坐水播种条件下玉米高产栽培措施研究
【中文关键词】玉米;坐水播种;高产栽培;半干旱区
【英文关键词】maize; bed-irrigating sowing; high-yielding cultivation; semiarid area
【中文摘要】采用五因素(1/2)二次回归旋转组合设计,研究了坐水播种条件下,坐水量、氮肥、磷肥、钾肥和密度对玉米产量的影响,建立了产量模型。结果表明,各因素对产量的作用大小顺序为氮肥>坐水量U磷肥>钾肥>密度;在各因素编码水平为最低时,磷肥的起始增产速率最大,其次为氮肥,坐水量、钾肥和密度分列第三、四、五位;随着因素水平的提高,各因素的增产速率均下降,下降的快慢顺序为磷肥>密度U氮肥>坐水量>钾肥;当坐水量为46.25 t/hm2、氮肥(N)为327.68 kg/hm2、磷肥(P2O5)为149.10 kg/hm2、钾肥(K2O)为189.24 kg/hm2、密度为71 172.00株/hm2,产量可达14 059.62 kg/hm2;玉米产量大于10 560 kg/hm2的主要农艺措施为:坐水量为41~54 t/hm2,氮肥(N)用量为276~348 kg/hm2,磷肥(P2O5)用量为145~165 kg/hm2,钾肥(K2O)用量为166~217kg/hm2,种植密度为64 728~72 726株/hm2。

【英文摘要】The effects of water amount, nitrogenous fertilizer, phosphate fertilizer, potasium fertilizer anddensity in maize bed-irrigating sowing were studied through the design of 5-factor(1/2) orthogonal regression rotational combination. The weighing on effect of yield in different factors was nitrogenous fertilizer>water amountUphosphate fertilizer>potasium fertilizer>density. When all factors at low-level, the yield-increasing rate at beginning was phosphate fertilizer>nitrogenous fertilizer>water amount>potasium fertilizer>density. Along with the level of factors heightened, the yield-increasing rate was inching down, the velocity sequence was phosphate fertilizer>densityUnitrogenous fertilizer>water amount>potasium fertilizer. When the water amount was 46.25 t/hm2, the nitrogenous fertilizer(N) was 327.68 kg/hm2, the phosphate fertilizer(P2O5) was 149. 10 kg/hm2, the potasium fertilizer (K2O) was 189. 24 kg/hm2, the density was 71 172. 00 plants/hm2, the tiptop yield was 14 059.62 kg/hm2. The optimal cultivation measures for yield above 10 560 kg/hm2were as follows: the water amount of 41~54 t/hm2, the nitrogenous fertilizer(N) of 276~348 kg/hm2,the phosphate fertilizer(P2O5) of 145~165 kg/hm2, the potasium fertilizer(K2O) of 166~217 kg/hm2, the density of 64 728~72 726 plants/hm2.

【题目】风沙半干旱区秸秆覆盖微集水技术对玉米产量及土壤水分的影响
【中文关键词】风沙地;秸秆覆盖;玉米产量;土壤水分
【英文关键词】wind sandy land;Straw mulching;corn yield;soil moisture
【中文摘要】风沙半干旱区生态环境脆弱,耕作方式滞后,平均年降水量少且变率大。秸秆覆盖微集水技术是解决风沙半干旱区粮食产量不稳和土壤易干易旱的有效途径。试验结果表明,7.50t/hm2秸秆覆盖量的玉米穗粗和百粒重最高;覆盖玉米秸秆的玉米产量均高于不覆盖玉米秸秆,7.50t/hm2秸秆覆盖量的玉米产量最高。0~40cm 土层含水量呈递减趋势,10~20cm 中层不覆盖玉米秸秆蓄水能力较好;30~40cm深层土层含水量覆盖玉米秸秆高于不覆盖玉米秸秆 0.3~1.9 个百分点。

【题目】地下水硝态氮污染现状及研究进展
【中文关键词】硝态氮;地下水;化肥;污染;农田类型;评价标准
【英文关键词】Nitrate;Groundwater; Chemical fertilizer; Contamination; Type of farmland; Evaluation criteria
【中文摘要】地下水是重要的饮用水资源,与人民身体健康及生活质量密切相关。近年来,地下水硝态氮污染问题日益严重,逐渐引起全世界各国的关注,硝态氮成为进入地下水最频繁的污染物质,对此我国和欧美等国均进行了大量的监测调查。结果表明,化学氮肥的施用是造成地下水硝态氮污染的最主要原因。我国不同类型农田氮肥施用对种植区地下水硝态氮污染影响情况有所不同,蔬菜田氮肥施用量很大,其种植区地下水硝态氮污染情况最严重,超标率要明显高于粮田种植区和水稻田种植区。而近年由于氮肥施用过量及施肥方式不当等原因,粮田和稻田的地下水污染情况也不容忽视,即使现在没有发生污染,耕地土层中因降雨、灌溉水淋溶而积累的硝态氮仍是地下水体的潜在威胁。目前,我国对地下水硝态氮污染制定了明确的评价监测标准和检验方法标准,但仍缺乏完善的系统研究和行政管理,广大科学工作者仍需努力。
【英文摘要】Groundwater resource is limited, as an important resourcewhich is closely related to people.s health and the quality of life.Recently, the problem on groundwater nitrate contamination that is increasingly serious gradually arouses the concern of the

peoples of theworld, and NO3--N becomes themost frequently contamination into groundwater.Therefore, China, Europe, the United States and other countries allhave done a greatdeal survey andmonitoring on this. The results show that the application of chemical nitrogen fertilizer is themain reason that causes the nitrate pollution of groundwater. In China, application of chemical nitrogen fertilizer in different types of farmland reflectdifferent impact to the goundwaterofcrop-growing aeras.The vegetable field usesmore amount ofnitrogen fertilizer,which is usually several times and evenmore several times than the grain and rice fields. Hence, the groundwater polluted situation of shallow root vegetable crop-growing areas is themost serious, and the rate of exceeding nitrate content standard in groundwater is stillhigher than the other two types of farmland. Moreover, in recentyears, due to excessive application ofnitrogen fertilizer and improper fertilizationmethods, and so on, the groundwater pollution shuold not be ignored both in the grain-growing areas and the paddy cultivation areas.Even if there is no any pollution at themoment, the potential threat is stillexisting in the soilofarable land that the accumulation ofNO3--Nwould eluviate into groundwaterby theway of rainfall and irragation. At the present time,we have developed a serie ofunambiguous evaluation criteria and standards of test menthod on the governance ofnitrate contamination ofgroundwater.Although there are stillmany deficiencies, scientists areworking hard to improve the problem of drinkingwater nitrate polluted in rural areas.

【题目】辽宁省三种类型作物产区饮用水硝态氮污染状况研究

【中文关键词】饮用水;地下水;硝态氮;污染;氮肥;农田类型;辽宁省
【英文关键词】drinking water; groundwater; nitrate; contamination; nitrogenous fertilizer; type of farmland; Liaoning province

【中文摘要】对辽宁省水稻、玉米、蔬菜3类作物产区189个地下水饮用水井的硝态氮含量进行调查分析。结果表明,辽宁省平原农区饮用水硝态氮含量平均为4.63 mg/L,其中10.6%的饮用水井硝态氮含量超标(硝态氮含量\10 mg/L),2.1%的饮用水井硝态氮含量严重超标(硝态氮含量\20 mg/L),超过国家Ó类饮用水质量标准。3种类型作物产区中,玉米产区饮用水硝态氮污染情况最轻,硝态氮平均含量为2.49 mg/L,超标率为4.2%,无严重超标率,87.5%采样点井水水质良好;蔬菜产区饮用水质量相对较差,硝态氮平均含量为4.48 mg/L,超标率和严重超标率分别为7.1%和1.8%,71.4%采样点井水水质良好;水稻产区饮用水硝态氮污染情况最为严重,20.8%采样水井硝态氮含量超标,3.8%水样严重超标。化学氮肥的施用对辽宁省不同作物产区饮用水中硝态氮含量有着直接且重要的影响,呈明显的正相关关系。由于氮肥施用量的增加,辽宁省水稻产区饮用水硝态氮污染呈恶化趋势,而蔬菜产区饮用水硝态氮含量在田间氮肥用量减少之后呈明显降低趋势,玉米产区饮用水硝态氮含量变化略有波动,但随着氮肥的增施已然出现了超标现象。

【英文摘要】Nitrate content of 189 groundwater samples in drinking water wells on rice, corn, vegetables, three types of crop-producing areas of Liaoning province were taken investigation and analysis. The results showed that the mean value of NO-3-N content in drinking water was 4.63 mg/L in plain area of Liaoning, 10.6 % of NO-3-N content in wells exceeded the MAC standard(nitrate content\10 mg/L), and 2.1% of NO-3-N content seriously exceeded the drinking water quality standards that the National Class Ó drinking water quality standards(nitrate content\20 mg/L). Of the three types of crop-producing areas, the pollution status in corn-producing areas was the lightest, the average nitrate content was of 2.49 mg/L, the rate over MAC standard was 4.2%, and there is none of the wells in which nitrate content was above 20 mg/L, 87.5% of the sampling of well water reflected good water quality; the quality of drinking water in vegetable-producing areas was relatively poor, the mean value of NO-3-N content was 4.48 mg/L, the rate over the standard of MAC and National Class Ó drinking water quality were 7.1% and 1.8%, the good rate of sampling points was 71.4%; the nitrate polluted situation in drinking water of rice-producing areas was the most serious, for which 20.8% sampling wells nitrate content was over the MAC standard and 3.8% seriously exceeded the drinking water quality standards. The application of chemical nitrogen fertilizer had a direct and significant impact on the nitrate content in drinking water of different crop-producing areas in Liaoning province, between the two there were a significant positive correlation. Due to the increased use of nitrogen fertilizer, nitrate contamination of drinking water in Liaoning rice-producing areas showed a trend of deteriorating, at the same time, the nitrate content of drinking water in vegetable-producing areas reflected a decreasing trend after reducing the amount of nitrogen fertilizer in field. The nitrate content of corn-producing areas performed a slight fluctuations change, but with the increased use of nitrogen fertilizer, the pollution in drinking water had already occurred.

【题目】东北风沙半干旱区雨水资源跨时调控对玉米生长发育及产量的影响
【中文关键词】半干旱地区; 雨水资源跨时调控; 玉米
【英文关键词】Semiarid region; Seasonal control of rainwater resource; Maize
【中文摘要】针对东北风沙半干旱地区春旱严重、降雨资源年内分布不均的气候特点, 在秋收后、霜冻之前进行灭茬覆膜处理, 对旱地雨水资源跨时调节; 通过对翌年春季土壤含水量、玉米生长状况及产量的调查结果表明, 秋覆膜处理的耕层土壤含水量比未覆膜处理高出 65%, 播种 14 天后玉米出苗率达到 88%, 抽穗期玉米株高比未覆膜处理高 35cm、径粗增加0.43cm, 秋收时玉米穗重比未覆膜处理提高了 50.6%。
【英文摘要】A field experiment was conducted to re- distribute moisture from rainfall against Spring drought in semiarid region of western Liaoning Province. The treatments of stubbling and plastic film mulching after the Autumn harvest could keep rainwater to be used in next growth periods. By investigating the soil water content, the growth and yield of maize, the results showed that the soil water content in plastic film mulching treatment was more 65% than that of uncovered treatment. The seedling emergence ratio reached 88% averagely after seeding 14 days. In the maize heading stage, the plant height in plastic film mulching treatment wast more 33cm than that uncovered treatment, and stem diameter was increased by 0.42cm. After the Autumn harvest, the yield of maize in plastic film mulching treatment increased by 50.6%.

【题目】不同泌乳期奶山羊乳腺OPN 基因表达及其对MCF-7细胞生长的影响
【中文关键词】奶山羊,乳腺组织,骨桥蛋白基,因荧光定量PCR,细胞生长
【英文关键词】dairy goat; mammary gland; OPN gene; real-time PCR; cell proliferation
【中文摘要】为了研究骨桥蛋白基因(OPN)在奶山羊(Capra hircus)乳腺组织不同泌乳期的变化规律及其功能,采用SYBR Green染料建立该基因的实时荧光定量PCR(QPCR)分析方法,以β-actin基因为内参,对该基因在乳腺组织泌乳28d、60d、100d、190d、270d和330d的mRNA表达水平进行检测;同时将该基因片段克隆到真核表达载体pcDNA3.1,构建重组质粒pcDNA3.1-OPN,所获重组质粒经过酶切和测序鉴定后,转染MCF-7细胞,采用MTT(四唑盐,3-(4,5)-dimethylthiahiazo(-z-y1)-3,5-di-phenytetrazoliumromid)法检测OPN对MCF-7细胞的增殖差异,结果表明:OPN基因在泌乳初期(28d)和泌乳后期(190d)表达水平较高,干奶期最低,其表达水平总体呈现高-低-高-低的变化模式。MTT实验表明转染OPN基因的MCF-7细胞较未转染基因组细胞的生长具有显著差异(P0.05),说明OPN的表达具有促进MCF-7细胞生长的作用。
【英文摘要】To investigate the expression pattern and preliminary function of OPN gene in mammary gland of dairy goat dur-ing different lactation stages, using β-actin gene as the internal control, the SYBR Green quantitative real-time PCR (QPCR) analysis was conducted to determine the mRNA expression of OPN gene in mammary gland at the 28th, 60th, 100th, 190th, 270th and 330th day after kidding. Recombinant plasmid of pcDNA3.1-OPN was constructed by inserting the fragment of OPN gene into eukaryotic expression vector pcDNA3.1 and used to transfect the MCF-7 cell line following the restrictive en-donuclease cleavage and sequence identification of the target gene segment, the effect of OPN gene on MCF-7 cell prolifera-tion was assessed by MTT analysis. The results indicated that OPN gene exhibited the higher expression level in early (28 d) and late (190 d) lactation stages and the lowest level at dry stage (330 d), which demonstrated a high-low-high-low pattern. There was a significant difference ($P < 0.05$) in the proliferation between OPN gene transfected and non-transfected MCF-7 cells, which suggested that the expression of OPN gene could stimulate the proliferation of MCF-7 cells.

【题目】西农萨能奶山羊泌乳中期和后期乳腺组织差异基因的筛选
【中文关键词】西农萨能羊;乳腺组织;抑制性削减杂交;差异表达基因;实时定量PCR
【英文关键词】Xinong Saanen Dairy goat; mammary gland; suppression subtractive hybridization; differentially expressed gene; real-time quantitative PCR
【中文摘要】旨在利用抑制性削减杂交(SSH)技术筛选西农萨能奶山羊泌乳中期和后期的差异表达基因,并用实时定量PCR(Q2PCR)分析差异基因的表达丰度,探讨奶山羊不同泌乳阶段乳腺组织的基因表达规律。本研究以西农萨能奶山羊泌

乳中期和后期乳腺组织的mRNA互为检测子(Tester)和驱动子(Driver)构建cDNA消减文库(M2L和L2M) ,随机挑选克隆测序,进行序列比对分析,并检测部分差异基因在乳腺组织中的表达丰度。结果,成功构建了泌乳中期和后期的cDNA文库,随机挑选30个克隆测序,得到M2L和L2M文库中与细胞凋亡、抗氧化、脂类代谢、能量代谢等生理过程相关的差异基因,对其中的6个基因进行实时定量分析,发现5个均为阳性克隆,表达水平增加了1.3~5.5倍不等。结果表明,利用SSH技术成功构建了泌乳中期和后期乳腺组织正反向消减cDNA文库,筛选出24个差异基因,为进一步研究奶山羊乳腺组织基因调控机理奠定了基础。

【英文摘要】The objective of this study was to use suppression subtractive hybridization (SSH) to screen the differentially expressed genes in mammary gland of Xinong Saanen Dairy goats at the middle and late lactation stages, and the expression abundance of several genes were analyzed by real-time quantitative PCR (Q-PCR) to explore the gene expression mechanism of mammary gland in the different lactation stages of dairy goats. The subtracted cDNA libraries (M-L and L-M) were constructed by using mRNA of mammary gland of Xinong Saanen Dairy goat at the mid-dle and late lactation stages as the Tester and/or Driver, clones were randomly selected and se-quenced for sequence alignment, the expression abundance of several genes in mammary gland was analyzed. 30 randomly selected clones from the constructed cDNA subtraction libraries of mammary gland at middle and late lactation stages were sequenced, and the differentially ex-pressed genes related with physiological process including cell apoptosis, anti-oxidation, lipid and energy metabolism etc. were obtained. Five positive clones were observed from 6 genes assayed by quantitative PCR, the expression levels of which were 1.3-5.5 folds higher in mammary gland of either middle or late lactation stage. The results showed that the forward and reverse subtrae-ted cDNA libraries of mammary gland at middle and late lactation stages were constructed using SSH, the screening of 24 differentially expressed genes laid the foundation for the further studies on gene regulation in the mammary gland of dairy goats.

【英文关键词】loop-mediated isothermal amplification; Roundup Ready (RR) soybean; genetically modified organism (GMO) detection

【中文摘要】利用Loop-Mediated Isothermal Amplification技术检测转基因大豆

【英文摘要】Using the LAMP method, a highly specific and sensitive detection system for genetically modified soybean (Roundup Ready) was designed. In this detection system, a set of four primers was designed by targeting the exogenous 35S epsps gene. Target DNA was amplified and visualized on agarose gel within 45 min under isothermal conditions at 65 degrees C. Without gel electrophoresis, the LAMP amplicon was visualized directly in the reaction tube by the addition of SYBR Green I for naked-eye inspection. The detection sensitivity of LAMP was 10-fold higher than the nested PCR established in our laboratory. Moreover, the LAMP method was much quicker, taking only 70 min, as compared with 300 min for nested PCR to complete the analysis of the GM soybean. Compared with traditional PCR approaches, the LAMP procedure is faster and more sensitive, and there is no need for a special PCR machine or electrophoresis equipment. Hence, this method can be a very useful tool for GMO detection and is particularly convenient for fast screening.

【题目】Detection of transgenic DNA in tilapias (Oreochromis niloticus, GIFT strain) fed genetically modified soybeans (Roundup Ready)
【中文关键词】罗非鱼 转基因大豆 检测
【英文关键词】aquatic feed; GM soybean; nested-PCR; Oreochromis niloticus; tissues; transfer
【中文摘要】利用PCR技术检测了食用转基因豆粕的罗非鱼体内转基因片段的残留
【英文摘要】We used nested-polymerase chain reaction (PCR) to detect Roundup Ready soybean in aquatic feeds and feeding tilapias. A template concentration of 10(-10) g mu L(-1) DNA solution could be detected with a dilute degree of 0.01%. Most (90.6%) of the aquatic feeds containing soybean byproduct included exogenous DNA segments. We also compared genetically modified (GM) soybean with non-GM soybean diets in feeding tilapias (Oreochromis niloticus, GIFT strain) and examined the residual fragments (254 bp) of GM soybeans. Tilapias receiving GM soybean diets had DNA fragments in different tissues and organs, indicating that exogenous GM genes were absorbed systemically and not completely degraded by the tilapia's alimentary canal.

【题目】PCR-DGGE analysis of intestinal bacteria and effect of Bacillus spp. on intestinal microbial diversity in kuruma shrimp (Marsupenaeus japonicus)
【中文关键词】日本对虾 肠道微生物 多样性
【英文关键词】intestinal microbial diversity; PCR-DGGE; Kuruma shrimp
【中文摘要】利用PCR-DGGE技术分析了日本对虾肠道微生物多样性
【英文摘要】In this study, the intestinal microbiota of kuruma shrimp (Marsupenaeus japonicus) was examined by molecular analysis of the 16S rDNA to identify the dominant intestinal bacteria and to investigate the effects of Bacillus spp. on intestinal microbial diversity. Samples of the intestines of kuruma shrimp fed normal feed and Bacillus spp. amended feed. PCR and denaturing gradient gel electrophoresis (DGGE) analyses were then performed on DNA extracted directly from the guts. Population fingerprints of the predominant organisms were generated by DGGE analysis of the universal V3 16S rDNA amplicons, and distinct bands in the gels were sequenced. The results suggested that the gut of kuruma shrimp was dominated by Vibrio sp. and uncultured gamma proteobacterium. Overall, the results of this study suggest that PCR-DGGE is a possible method of studying the intestinal microbial diversity of shrimp.

【题目】秸秆全量还田对冬小麦不同小穗位和粒位结实粒数和粒重的影响
【中文关键词】秸秆还田;冬小麦;结实粒数;粒重;小穗位;粒位
【英文关键词】straw returned to the field; winter wheat; fertile spikel et number; grain weight; spik elet position; grain position
【中文摘要】【目的】研究小麦玉米秸秆连续全量还田对小麦穗部不同小穗位和粒位结实粒数及粒重变化的影响。【方法】通过设置 3 年定位试验研究小麦玉米秸秆全量还田对小麦不同小穗位结实粒数、粒重的小穗位和粒位的影响效应。【结果】小麦玉米秸秆连续全量还田提高了小麦的公顷穗数、穗粒数、千粒重和产量。各处理小麦不同小穗位结实粒数、小穗重、小穗平均单粒重均呈现二次曲线变化趋势,不同粒位的粒重也随小穗位的变化呈二次曲线形式。结实小穗越多、各小穗结实粒数或单粒重差异越小,空间分布模拟曲线的弧度越平缓。秸秆还田提高了小麦主茎穗和分蘖穗的结实小穗数与小穗结实粒数,降低了不孕小穗数,且下部小穗的结实粒数增加幅度较大;秸秆还田还提高了小麦不同粒位的单粒重,以第 3、4 粒位提高幅度较大。【结论】小麦玉米秸秆连续全量还田提高了小麦不同小穗位的结实粒数和粒重,进而提高了籽粒产量。
【英文摘要】【Objective 】 The objectives of this study were to research th e change of gain number and grain weight of wheat with spikelet and grain position in main stem and tiller spike under the condition of straw returned to the field. 【Method】 A location field experiment was conducted from 2008 to 2010, single maize straw returned to the field, single wheat straw returned to the field, wheat and maize straw returned to the field were conducted to study the effects of straw returned to the field on grain number and grain weight at different spikelets and grain positions in winter wheat. 【Result】 Results showed that, the spike per hectare, grain number per spike, 1 000-grain weight and yiel d were increased in treatment of straw re turned to the field. The distribution of grain number, spikelet weight, and grai n weight with the spikelets posi tions showed parabolic changes, so as the grain weight at 1st, 2nd, 3rd in each treatment and 4th in treatment of straw returned to the field. The more fertile spikelet number and less difference in spikelet grain

number and single grain weig ht, the smoother the parabola was. The fertile spikelet number and spikelet grain nu mber in main stem and tiller spike were increased in treatment of straw returned to the field, the increase range of fertile spikele t number in the bottom spikelet were bigger. There were different increasing effects of straw returned to th e field on single grain weight at different grain positions, especially for at of 3rd and 4th grain position. 【Conclusion】 Therefore, under the condition of wheat and maize straw returned to the field, grain yield and yield components, spikelet grain number and grain weight at different spikel ets of wheat were enbanced.

【题目】砂姜黑土区小麦玉米秸秆全量还田对玉米抗倒性能的影响
【中文关键词】夏玉米;砂姜黑土;秸秆还田;抗倒性能
【英文关键词】summer maize; lime concretion black soil; straw returned to the field; lodging-resistance
【中文摘要】【目的】探讨砂姜黑土区小麦玉米秸秆全量还田对夏玉米抗倒性能的影响。【方法】以夏玉米品种郑单958为材料,通过定位试验研究小麦玉米秸秆全量还田对玉米抗倒性能的影响。【结果】小麦或玉米秸秆全量还田均能提高玉米气生根条数、0—30 cm 土层根条数及根系干重,同时,玉米株高和单株鲜重均有所增加。秸秆还田后,在吐丝期和灌浆中期,玉米茎秆基部3—7节间的长度、直径、干重和单位茎长干物质重有增加的趋势,尤其是基部节间的茎秆压碎强度和穿刺强度显著提高。另外,玉米的根倒伏系数显著降低,而植株抗倒指数则显著升高。相关分析表明,根倒伏系数与根倒率显著正相关,而与单株鲜重、根系干重和基3节压碎强度显著负相关。玉米总倒折率与节间长度极显著正相关,而与节间干重、充实度、压碎强度和穿刺强度显著负相关。【结论】小麦玉米秸秆连续全量还田可以显著降低夏玉米的根倒率和茎折率,提高籽粒产量。
【英文摘要】【Objective 】 The objective of the experiment is to study the effects of straw returned to the field on lodging resistance of maize in lime concretion black soil region. 【Method】 Maize cultivar Zhengdan 958 was grown in this plot experiment to investigate the effects of straw returned to the field on lodging resistance of maize. 【Result】 The results showed that wheat or maize straw returned to the field could increase aerial root number, root number in 0- 30 cm soil layer and root weight, so as the plant height and fresh weight of maize. After straw returning, the length, diameter, dry weight and ratio of dry weight to length of internodes from bottom 3rd to 7th were increased especially the stalk crash strength and stalk rind penetrain strength of botto m internodes were significantly increased at silking and filling stage. In addition, the root lodging coefficients were a significantly decreased while the lodging resistance indexes were significantly increased. The correlation coefficient showed that there was significant positive correlation between root lodging coefficien t and root lodging percentage while there was a negative signif icant correlation among root lodging coefficient, fresh weight, root weight and stalk crash strength of bottom 3rd internode. The rel ation between total lodging percentage and internode length was a very significant post ive correlation while that among total lodging percentage and the dry weight, plumpness, crash strength and rind penetrain strength of internodes were a si gnificant negative correlation. 【Conclusion】Therefore, under the condition of wheat and maize straw returned to the field, the root lodging percentage and stalk breaking percentage of maize would be decreased while the grain yield would be increased.

【题目】氮肥运筹方式对孕穗期受渍冬小麦穗部结实特性与产量的影响
【中文关键词】渍害; 氮肥运筹方式; 冬小麦; 结实特性; 产量
【英文关键词】Waterlogging; Nitrogen fertilization; Winter wh eat; Seed-setting characteristics; Grain yield
【中文摘要】以小麦品种皖麦54为试验材料, 连续两个生长季进行了氮肥运筹方式对孕穗期渍水冬小麦不同小穗位、粒位的结实粒数和粒重影响的观测。结果表明, 不同氮肥运筹方式显著影响穗部结实特性, 主茎穗结实特性优于分蘖穗。全部基施的氮肥运筹方式较基肥50%+拔节肥50% 和基肥30%+拔节肥50%+孕穗肥20% 的运筹方式显著增加了不孕小穗数, 降低结实小穗数和结实粒数, 2008 —2010 两年度全部基肥运筹方式较基肥 30%+拔节肥50%+孕穗肥20% 氮肥运筹方式处理不孕小穗数分别增加25.5% 和29.8%, 结实小穗数均降低5.7%。孕穗期渍水逆境对分蘖穗结实特性影响大于主茎穗, 渍水逆境显著增加不孕小穗数, 较对照处理, 2008 —2010两年度, 不孕小穗数分别增加10.6%和4.6%; 结实小穗数分别降低2.8%和1.4%。孕穗期渍水降低主茎穗结实4 粒的小穗数比例和分蘖穗结实3 、4 粒小穗数的比例及第3 、第 4 粒位籽粒粒重和第3 、第 4 粒位粒重对单穗粒重的贡献率。氮肥后移运筹方式显著提高孕穗期受渍小麦主茎、分蘖穗结实小穗数和粒重, 增加主茎和分蘖穗结实3 、4 粒小穗的比例和结实小穗第3 、4 粒位的粒重, 提高第3 、4 粒位粒重对单穗粒重的贡献率, 减少不孕小穗数, 进而较氮肥前移处理显著提高经济产量。氮肥后移运筹方式有利于减轻孕穗期渍害对小麦穗部结实特性的影响。
【英文摘要】Waterlogging has great influence on yield reduction in wint er wheat production in some areas of China. Nitrogen (N) application is believed to be able to improve dry matter translocation in wheat, as a result to increase final yield. In a fiel d experi-ment across two growing seasons, we used winter wheat cultivar “ Wanmai 54 ” to investigate the effect of waterlogging at booting stage and N fertilizing strategy on number and weight of grain at different spikelet positions and grain positions. Under both wa-terlogging and control (normal watering) cond itions, we implemented four N application treatments with different N application ratios (total N amount of 240 kg ha 1 in all treatments) at land preparation, jointi ng, and booting stages (10:0:0 for N1, 7:3:0 for N2, 5:5:0 for N3, and 3:5:2 for N4). The results showed that seed-setting characteristics of main stem were superior to tiller spike. In the N1 treatment, the sterile spikelet per spike was significantly increased, and the grain number per spike was significant ly decreased. Compared with N4 treatment, sterile spikelet per spike of N1 treatment increased by 25.5% and 29.8% in 2008 – 2009 and 2009 – 2010 growing seasons, respectively. The grain number per sp ike of N1 treatment decreased by 5.7%. Waterlogging had greater effect on the tiller spike than the main stem spike. Waterlogging at booting stage sign ificantly increased sterile spikelet per spike by 10.6% and 4.5%, and the grain number per spike decreased by 2.8% and 1.4% in the two growing seasons, especially for spike with four grains on main stem and three grains per spike of tiller spike, the grain weight in the third and the fourth gr ain positions, the contribution rate of the third and the fourth grain weights to the grain weight per spike. With the delay of N f ertiliza-tion, spikelet per spike, single weight per spike increased significantly, the sterile spikelet per spike decreased compared to the prior N fertilization treatments. Postponed N fertilization could compensate the decrease of spike with three and four grains a nd increase the grain weight in third and the fourth grain positi ons under waterlogged environment at booting stage, increase the contribution rate of the third and the fourth grains weight to th e grain weight per spike. Therefore, with the postponed N fertili zation, grain yield and spikelet grain number and grain weight at different spikelet of wheat were enhanced. Results indicate that post-poned N fertilization alleviates the effect of waterlogging at booting stage on the seed-setting characterisitics of spike and single grain weight.

【题目】中国明对虾(Fenneropenaeus chinensis)肠道微生物区系组成的分子分析
【中文关键词】Fenneropenaeus chinensis, microbial flora , gut
【英文关键词】中国明对虾; 肠道微生物区系; 区系组成; 养殖对虾; 微生态制剂; 水产动物; 微生物基因组; 水产养殖; 基因克隆; 阳性克隆
【中文摘要】中国明对虾主要分布在我国黄渤海和朝鲜西部沿海,南海部分海域也有少量存在,是我国重要的海水养殖对虾之一。中国明对虾是中国的特产,也是重要的出口水产品,无论是品质还是市场价格都远远高于其他养殖对虾品种,其最高养殖年产量曾达到近20万吨。而随其养殖规模的扩大,对虾疾病的发生越来越频繁,1993年爆发的病毒性流行病,使中国明对虾的养殖遭受毁灭性打击,此后始终未能全面恢复。

【题目】TOR信号转导通路介导的翻译控制
【中文关键词】TOR; 4E-BP; S6K; eEF2; Sit4; 信号转导; 翻译控制
【英文关键词】TOR; 4E-BP; S6K; eEF2; Sit4; Signaling transduction; Translation control
【中文摘要】TOR(target of rapamycin)是真核生物中高度保守的一种大分子的Ser/Thr激酶,是免疫抑制剂雷帕霉素的在体内的靶物质。TOR能够对营养状况和生长因子等因素的变化做出应答反应,通过介导磷酸化反应调节蛋白激酶4E-BP1,S6K,eEF2和磷酸酶等的活性,控制下游翻译因子的磷酸化水平,调节核糖体发生,蛋白质合成等生理过程,在细胞的生长,增殖的综合调控中起到中枢作用。
【英文摘要】Target of rapamycin(TOR) is a high conserved large Ser/Thr protein kinase in Eukaryotic.TOR is able to respond to change of such factors as nutrition and growth factors.Through mediating phosphorylation of protein kinase,such as 4E-BP1,S6K,eEF2,and the phosphates,TOR signaling pathway controls the phosphorylation of downstream translation factor,regulates ribosome biogenesis and protein translation,and plays a central role in regulating and integrating signals controlling cell growth,proliferation

【题目】热力烟雾机在玉米病虫害防治上的应用研究
【中文关键词】热力烟雾机;热雾粒; 玉米病虫害; 防治效果

【英文关键词】thermal fogger; depositiondensity; diseasesandpestsofmaize; control effect
【中文摘要】玉米病虫害的药剂防治主要在玉米生长的中后期进行,但由于株高叶茂,田间喷药困难。热力烟雾机采用一些油剂作为农药的载体,经输导管在高温点(350~400e) 时瞬间气化,形成热雾且分布均匀,可沿田埂施药。试验以机动弥雾机喷雾防治为对照,在玉米田进行了热力烟雾机热雾粒田间不同水平距离和垂直高度的药剂雾滴分布规律和对玉米南方锈病、纹枯病、蚜虫的防效试验。结果表明,使用热力烟雾机防治效果高于机动弥雾机喷雾防治效果,热力烟雾机防治有效距离为25m以上,热雾粒数量在田间不同水平距离(0~25m)、垂直高度(0~2m)范围内比较均匀,正面热雾粒附着量为150~300粒#cm- 2,背面热雾粒附着量为50~ 140 cm2粒。

【题目】摄食转基因大豆罗非鱼各组织中转基因成份的检测研究
【中文关键词】转基因大豆; 罗非鱼; 组织; 检测;
【英文关键词】Transgenic soybean; Tilapias; Tissues; Detection
【中文摘要】利用转基因豆粕制作的饲料,喂养吉富罗非鱼,分别于投喂1h、4h和8h以后取罗非鱼胃内容物、肠道内容物和粪便,并分别于4周、7周和继续饥饿2周后,取罗非鱼不同组织,提取DNA,检测转基因大豆中的外源基因在各种组织中的分布,结果显示在胃内容物、肠内容物、粪便、心脏、肝脏、肠、胃、卵巢、精巢、脑、鳃丝、脾脏、胆囊、肌肉等不同部位的DNA中都能检测到外源基因的存在,说明转基因大豆中的外源DNA并不能被罗非鱼的消化道完全降解,其DNA片段可能通过消化吸收进入鱼体的各种组织。
【英文摘要】Tilapias(Oreochromis niloticus)were fed using transgenic soybean diets and non-transgenic soybean diets.Gastric contents,intestinal contents and faeces were sampled respectively from tilapias at 1h,4h and 8h after feeding and different tissues of tilapias were collected at 4-,7-week and continued hunger 2-week.DNA was extracted from these samples and the distribution of exogenous gene in different tissues was detected by nested PCR.Exogenous gene fragments were detected in DNA samples extracted from gastric contents,intestinal contents,faeces,heart,liver,stomach,intestines,ovary,spermary,brain,branchia,spleen,cholecyst,muscle of tilapias receiving transgenic soybean diets.The results demonstrated that exogenous gene of transgenic soybean couldn’t be degraded by alimentary canal of tilapia totally,and the transgene DNA can transfer to different tissues of tilapias by digestive absorption.

【题目】沉降剂控制热雾机热雾滴扩散范围及防效的研究

【中文关键词】热雾机; 沉降剂; 雾滴; 分布; 农作物病害; 防治效果
【英文关键词】thermal fogger; sedimentationagent; droplet; distribution; cropdiseases; control efficiency
【中文摘要】热雾机一般以柴油为热雾剂承载农药, 形成的热雾喷出后随着喷口产生的动力和热雾的自身密度压差向前方自行推进,该施药技术由于效率高而广泛用于林业病虫害的防治。但由于热雾易飘移、难控制,造成农药污染的缺陷,在农作物生产中难以推广应用。本试验通过加入热雾沉降剂的方法, 加大了热雾机热雾滴的比重和沉降速度,在此基础上, 选择难以进入田间施药的玉米、油菜,进行了中、后期病害的防治试验, 结果表明: 加入热雾沉降剂后热雾滴的主体分布于田间水平距离(0~ 25m) 和垂直高度(0~ 2m) 范围内,分布密度为148.5~ 265.4粒/ cm2,同柴油对照相比,加入热雾沉降剂后,同等直径的热雾滴飘移的距离和高度明显降低。田间防治试验结果也表明,热雾机施药对油菜菌核病和玉米南方锈病的防治效果普遍高于机动弥雾机喷雾的防治效果, 加入热雾沉降剂后可提高有效防治范围内的防效。
【英文摘要】Thermal fogger formedheat fog by meansof diesel oil for dispersing pesticides. The fog movedforwardalong withthe power inthe spout andthe difference of density pressure, andsprayedaroundthe field. Since theefficiency of the spraying technique washigh, it waswidely usedto control the forest diseasesandpests. Howev-er, it wasdifficult to be usedincropsbecause of the drift potential of the fog droplet. Inthisstudy, throughin-creasing specific gravity and improving sedimentationrate by adding the sedimentation agents, the control eff-iciency of the technique for oilseedrape sclerotiumblight andmaize southernrust were tested. The resultsshowedthat the most droplet depositionwaswell distributedat the level distance from0to 25m, or vertical height from0to 2mafter adding the sedimentationagents, and the dropletswere about 148. 5- 265. 4per cm2. Under thesame diameter, the drift distance andheight of the thermal fog dropletsdroppedsignificantly by using sedimenta-tionagent. The control effect of chemicalsoncropdiseasesby thermal fogger washigher thanthat of electricmistsprayer. At the range of effective distance, sedimentationagentscouldimprove the control efficiency.

【中文关键词】蓝舌病毒;血清型;实时定量RT-PCR;TaqMan 荧光探针
【英文关键词】Bluetongue virus;Serotypes;Real-time RT-PCR;TaqMan fluorescent probe
【中文摘要】分析蓝舌病24种血清型的核酸序列,设计TaqMan荧光探针,利用该探针和一对特异性引物通过荧光定量PCR技术对蓝舌病进行检测。对其特异性、灵敏度和交叉反应进行了测定分析。提出了蓝舌病通用检测的特异性方法。
【英文摘要】Twenty-four serotypes of bluetongue virus (BTV) have been recognized world wide. Reliable and quantitative assays of virus universal detection are essential for fighting against BT. A real-time reverse transcription-polymerase chain reaction (RT-PCR) with a TaqMan fluorescence probe has been developed for detection of the NS1 gene of different BTV serotypes. In BHK-21 cells, in the assay detectedBTV1-22 specifically, and had no cross-reactivity with the closely related epizootic hemorrhagic disease virus (EHDV) serotypes 1 – 5. The limit of sensitivity of the assay was 0.1 TCID50/ml for BTV-1 and 102 copies for the control R121/pGEM. Accurate quantitation can be achieved with samples containing between 102 and 106 copies. The coefficient of variation (CV) of intra-assay and inter-assay ranged from 2.17% to 5.60%. The developed real-time RT-PCR assay showed good coincident rate (99.2%) with duplex RT-PCR in 122 whole blood clinical samples from sheep. Therefore, the real-time RT-PCR can be a reliable method for detection of various serotypes of BTV.

【题目】基于镜头检测的成熟期水稻图像处理算法研究
【中文关键词】水稻密度;镜头检测;喂入量;联合收割机
【英文关键词】density of rice; shot detection; feeding volume; combine harvester
【中文摘要】快速处理视频信息,实时获取水稻生长密度,是实现水稻联合收割机喂入量实时控制的关键。采用模板算法,引入基于镜头检测的视频挖掘技术,提取视频信息中的关键帧作为水稻密度突变检测依据。结果表明,镜头检测技术的平均每帧检测时间是0.05 s ,比传统静态图像算法提取作物的密度特征速度快16倍;模板算法可有效消除田间作物品种、生长态势、光照等自然因素的影响,算法具有通用性。
【英文摘要】In order to realize real-time controlling of feed quantity, fast access is th e key to get large quanti-ties of image video information and rice growth density in real time. This paper adopted template algorithm and video mining technology based on shot detection. We extracted the key frames from video information as the basis of rice in density detection. The results indicated that real-time detection of rice crop growth density by using shot detection was realizable and the average detection time is 0.05s. The running time of the template algorithm was 16 times faster than that of the traditional algorithms of image. The template algorithm reduce or eliminate effect of natural factors such as the crop strains, growth situa tion and illumination,so the algorithm could be universality.

【题目】核桃外果皮棕色素的提取纯化及其稳定性研究
【中文关键词】核桃外果皮;棕色素;稳定性
【英文关键词】walnut outer peel, brown pigment, stability
【中文摘要】提取、纯化核桃外果皮棕色素,并研究其稳定性。采用溶剂提取法提取得到棕色素粗品,利用盐酸沉淀法和乙醇沉淀法纯化棕色素粗品,并且研究了pH、氧化剂、还原剂、温度、金属离子、食品添加剂对纯化色素稳定性的影响。结果表明,核桃外果皮棕色素的最佳提取溶剂为水,不溶于非极性溶剂,通过盐酸沉淀法和乙醇沉淀法纯化后分别制得色素Ⅰ和色素Ⅱ,色素Ⅰ提取率为6.2%;色素Ⅱ提取率为5.3%。色素Ⅰ和色素Ⅱ性质相近,最大吸收波长均为570 nm和670 nm,两种色素在酸性条件下均有沉淀产生,碱性条件下颜色加深。双氧水使其褪色,而亚硫酸钠不影响其稳定性;色素Ⅰ耐高温,色素Ⅱ在80℃下较稳定;金属离子Na+、Ca2+、Cu2+、Zn2+、Mg2+对色素色泽无明显影响,而Fe3+、Al3+、Pb2+对其稳定性影响较大;食品添加剂柠檬酸、维生素C、山梨酸钾、氯化钠、苯甲酸钠对色素无不良影响,而蔗糖会影响两种色素的稳定性。首次提取纯化制得核桃外果皮棕色素,并确定其最大吸收波长,因原料易得,生产工艺简单,并可用于工业化生产,所以核桃外果皮棕色素是一种很有推广价值的天然色素。
【英文摘要】To extract, purify and study the stability of the brown pigment in walnut outer peel. The brown pigment could be extracted by solvent extraction, and its purified pigment could be obtained with the method ofethanol-precipitation and hydrochloric acid- precipitation, and the influence to stability of the purified pigment by pH, oxidizing agent, reducing agent, temperature, metal ion, and food additive was studied. The resultsshowed that the pigment dissolved easily in water, but undissolved in noapolar solvent. Pigment Ⅰ and pigment Ⅱ could be obtained with the method of ethanol-precipitation and acid precipitation, the extracting rate of them was 6.2% and 5.3 respectively. The biggest absorption wave length was 570 nm and 670 nm. There were sediment when pH<6.0, and under alkaline conditions they became darker in color. Hydrogen peroxide bleached it, and the sodium didn't affect its stability. Pigment Ⅰ was also at a high temperature stability, pigment Ⅱ in a more stable below 80℃. Metalions Na+, Ca2+, Cu2+, Zn2+, Mg2+had no significant impact on the pigment color, and Fe3+, Al3+, Pb2+had a greater impact on its stability. Citric acid, vitamin C, potassium sorbate, sodium chloride, sodium benzoate had no adverse impact on the pigment, and the sugar will affect the stability of the two pigment. The author extracted and purified the brown pigment in walnut outer peel first time, and definited its maximum absorption wavelength. Owing to easy to get the raw materials, production technology is simple, can be used for industrial production, so the brown pigment of walnut epicarp is a great generalization val ue in the natural pigment.

【题目】Mutations of MC4R gene and its association with economic traits in Qinchuan cattle
【中文关键词】MC4R基因,多态性,肉质,屠宰性状,秦川牛
【英文关键词】MC4R gene; Polymorphism; Meat quality; Carcass traits; Qinchuan cattle
【中文摘要】MC4R基因属于一个七次跨膜G-蛋白偶联受体,可以调节人体的组成和胰岛素的作用。许多在MC4R基因的突变与肥胖,能量消耗,在人类和动物的血清甘油三酯水平。在我们的研究中确定了六在MC4R基因的突变(293C> G,-193A> T,-192T> G,-129A> G-84T> C和1069 C> G)。显着相关的活重(LW)(P <0.05),AG和GG基因型有较高的LW比AA基因型牛与-129A> G。 1069 C> G的显着与LW(CW),胴体重,背膘厚和大理石纹评分(MS)。牛的GG基因型有较高的LW,CW和MS比CC基因型GG和CG有较高的MS比CC基因型的黄牛。结果表明-129A> G和1069C> G SNP的MC4R基因可能是有用的作为秦川牛胴体和肉质性状的遗传标记。
【英文摘要】MC4R belongs to a seven-transmembrane G-protein-coupled receptor which may regulate body composition and insulin action. Many mutations in the MC4R gene are associated with obesity, energy expenditure and serum triglyceride levels in human and animals. Six mutations in the MC4R gene were identified in our study (-293C > G, -193A > T, -192T > G, -129A > G, -84T > C and 1,069C > G). The -129A > G was significantly associated with live weight (LW) (P < 0.05), Cattle with the genotypes AG and GG had higher LW than genotype AA. The 1,069C > G was significantly associated with LW, carcass weight (CW), backfat thickness and marbling score (MS). Cattle with the genotype GG had higher LW, CW and MS than genotype CC; Cattle with the genotypes GG and CG had higher MS than CC. The results suggested that -129A > G and 1,069C > G SNP of the MC4R gene may be useful as a genetic marker for carcass and meat quality traits in Qinchuan cattle.

【题目】Surface IgM on DT40 cells may be a component of the putative receptor
【中文关键词】cDNA 文库; 细胞结合; 噬菌体展示
【英文关键词】cDNA library; cell binding; phage display
【中文摘要】构建病毒核酸cDNA文库,利用噬菌体展示技术呈现病毒基因,通过亲和筛选和细胞结合试验,鉴定病毒与细胞结合的特异性受体。
【英文摘要】To investigate the host　pathogen interactions between infectious bursal disease virus (IBDV) and target Blymphocytic cells, a cDNAT7 phage display library from the chicken bursa of Fabricius was constructed and screened for virus binding. Surface immunoglobulin M (sIgM) was isolated as a putativecandidate binding site and its interactions with IBDV were further investigated using a chicken bursal lymphoma-derived cell line DT40. The results showed that the l light chain of sIgM specifically interacted with IBDV in a virulenceindependent manner in vitro, and most of the binding of IBDV to DT40 cells was inhibited by sIgM-specificmonoclonal antibodies. Further, the infectivity of IBDV in vitro was reduced by sIgM-specific monoclonal antibodies. Our data provided evidence that sIgM may participate as one of the putative membrane binding

【题目】1-MCP处理对香梨采后生理效应的影响
【中文关键词】香梨;1-MCP;生理效应
【英文关键词】fragrant pear; 1-Methycyclopropene; physiological function
【中文摘要】以新疆库尔勒香梨为试材,研究了果实采后1-甲基环丙烯(1-MCP)对叶绿素含量变化、呼吸强度、乙烯产生、果胶酶的影响。结果表明:1-MCP对叶绿素的降解有一定的抑制作用。降低果实的呼吸强度,推迟呼吸高峰的出现,250 nL/L和500 nL/L 1-MCP处理使呼吸跃变延后24 d。1-MCP处理推迟或抑制了果实乙烯高峰的产生。250 nL/L和1 000 nL/L的1-MCP处理明显抑制了果胶酶的活性。
【英文摘要】Fragrant pear(PyrussinkiangensisYu) was used to investigate the effects of 1-MCP(1-methylcyclopropene) postharvest treatment on chlorophyll, respiration, ethylene production and pecticase. The results indicated that the degradation of chlorophyll was controlled with 1-MCP treatment. The respiration rate was decreased. The climacteric peak of respiration was postponed for 24 d by 1-MCP at concentration of 250 nL/L and 500 nL/L.The ethylene production of fruit was inhibited with 1-MCP at three concentrations. The pecticase of fruit treated with 1-MCP at concentration of 250 nL/L and 500 nL/L was inhibited.

【题目】HPLC-APCI(+)MS/MS内标法测定水产品中的三种硝基咪唑类药物残留量

【中文关键词】高效液相色谱-串联质谱; 大气压化学源(APCI); 内标法; 甲硝唑; 二甲硝唑; 洛硝哒唑; 残留; 水产品

【英文关键词】High performance liquid chromatography-tandem mass spectrometry Atmospheric pressure chemical ionisation(APCI) Internal standard methodMetronidazole Dimetridazole Ronidazole ResiduesAquatic products

【中文摘要】建立了水产品中3种硝基咪唑类残留量的HPLC-APCI(+)MS/MS测定方法。以氘代二甲硝唑(DMZ-D3)作为内标,以乙酸乙酯提取水产品中残留的硝基咪唑类药物,采用HPLC-MS/MS多反应监测(MRM)正离子模式测定,可一次对水产品中的MTZ、DMZ和RNZ进行定性和定量。该法简便快捷,适合大批量样品处理。方法简化了样品前处理过程,省去固相萃取步骤,具有操作简便和有机试剂消耗量少等优点。DMZ、MTZ和RNZ的检出低限均为0.5μg/kg,DMZ、MTZ和

RNZ的定量下限均为1.0μg/kg。

【英文摘要】The method for the determination of three nitroimidazole residues in aquatic products was developed by high performance liquid chromatography-tandem mass spectrometry(HPLC-MS/MS). Deuterated dimetridazole (DMZ-D3) was added to the sample as internal standard before extraction. The sample was extracted with ethyl acetate. The mass spectrometer was operated in the positive ion mode using multiple reaction monitoring for qualitative and quantitative analysis of MTZ,DMZ and RNZ at the same time. The preliminary treatment included predigestion,and no solid phase extraction(SPE) procedure was adopted. The advantage of the method was simple operation,less organic chemicals consumed,and shorter operation time. The limits of detection for DMZ,MTZ and RNZ were 0.5 μg/kg. The limits of quantitation for DMZ、 MTZ and RNZ were 1.0 μg/kg

【题目】An in silico strategy identified the target gene candidates regulated by dehydration responsive element binding proteins (DREBs) in Arabidopsis genome.

【中文关键词】无

【英文关键词】Target genes prediction / Transcription factor binding site /DREBs /SVM /Arabidopsis

【中文摘要】无

【英文摘要】Identification of downstream target genes of stress-relating transcription factors (TFs) is desirable in understanding cellular responses to various environmental stimuli. However, this has long been a difficult work for both experimental and computational practices. In thisresearch, we presented a novel computational strategy which combined the analysis of the transcription factor binding site (TFBS) contexts and machine learning approach. Using this strategy, we conducted a genomewide investigation into novel direct target genes of dehydration responsive element binding proteins (DREBs), the members of AP2-EREBPs transcription factor super family which is reported to be responsive to various abioticstresses in Arabidopsis. The genome-wide searching yielded in total 474 target gene candidates. With reference to the microarray data for abiotic stresses-inducible geneexpression profile, 268 target gene candidates out of the total 474 genes predicted, were induced during the 24-h exposure to abiotic stresses. This takes about 57% of totalpredicted targets. Furthermore, GO annotations revealed that these target genes are likely involved in protein amino acid phosphorylation, protein binding and Endomembrane sorting system. The results suggested that the predicted target gene candidates were adequate to meet the essential biological principle of stress-resistance in plants.

【题目】Polymorphism identification in the goat MSTN gene and association analysis with growth traits
【中文关键词】英文文章,详见英文关键词
【英文关键词】MSTN gene; polymorphisms; growth traits; linkage disequilibrium
【中文摘要】英文文章,详见英文摘要
【英文摘要】The myostatin (MSTN) gene was studied as a candidate genetic marker for growth traits. We investigated polymorphisms of the MSTN gene in 664 individuals from four goat populations and applied PCR-SSCP and DNA sequencing analysis to reveal two single nucleotide polymorphisms (DQ167575: g.368A>C (p.Lys49Thr) and g.4911C>T. At g.368A>C locus, the frequencies of g.368A allele were 0.75 – 0.81, and the frequencies of g.368C allele were 0.19 – 0.25. At g.4911C>T locus, the frequencies of g.4911C allele were 0.76 – 0.82, and frequencies of g.4911T allele were 0.18 – 0.24. Compared to the female goats with AC genotype, those with AA genotype had superior body weight in Boer goats (15.69 ± 0.28 vs. 14.51 ± 0.31, P < 0.05) and F1 generation of Boer × Guanzhong dairy goats (19.39 ± 0.34 vs. 18.27 ± 0.33, P < 0.05). In addition, the female goats with AA genotype (45.80 ± 0.33 cm) had greater withers height than those with AC genotype (44.78 ± 0.36 cm) in F2 generation of Boer × Guanzhong dairy goats (P < 0.05). Hence, the biochemical and physiological functions along with the results obtained in our investigation suggest that the MSTN gene might play an important role in affecting the growth traits in goats.

【题目】Polymorphism identification in the goat THRSP gene and association analysis with growth traits
【中文关键词】英文文章,详见英文关键词
【英文关键词】variant, Boer goat, THRSP, growth traits
【中文摘要】英文文章,详见英文摘要
【英文摘要】In this study, we reported the analysis of THRSP gene polymorphisms in 610 goats of three breeds: Xinong Saanen (SN), Guanzhong (GZ) and Boer (BG). We identified new allelic variant: P2-G39294A (GenBank acc. no. JN618075) in the three goat breeds. At P2 locus, GG, GA and AA genotypes were found in the three goat breeds. The frequencies of G allele were 0.54-0.55 and frequencies of A allele were 0.46-0.45, and the PIC was 0.37. The SNP locus was in Hardy Weinberg disequilibrium in Boer goat breed (P<0.05). Association of polymorphisms with growth traits was done at P2 locus in Boer goat breed. The result showed that AA genotype had remarkable growth traits at P2 locus (P<0.05). Therefore, these results suggest that THRSP gene is a strong candidate gene that affects growth traits in goat.

【题目】Screening of seven microsatellite markers for litter size in Xinong Saanen dairy goat
【中文关键词】英文文章,详见英文关键词
【英文关键词】Microsatellite markers, Xinong Saanen dairy goat, genetic polymorphism, litter size.
【中文摘要】英文文章,详见英文摘要
【英文摘要】Seven microsatellite markers OarAE101, BM1329, OarHH55, BM143, BMS2508, OarAE129 and OarFCB11 closely associated with high reproduction trait in sheep were analyzed for polymorphisms in Xinong Saanen dairy goat. The results indicated that there were high genetic polymorphisms at six microsatellite loci. The number of effective alleles (Ne), polymorphism information content (PIC) and average heterozygosity (He) were the highest at OarFCB11 and the lowest at OarAE129 in Xinong Saanen dairy goat. The analysis of the effect of the six polymorphisms microsatellite loci on the litter size of Xinong Saanen dairy goat indicated that these polymorphisms microsatellite loci had positive effect on the litter size.

【中文摘要】以库尔勒香梨果实为试材,分三个不同的采收期,在室温(20~25°C)下贮藏,研究其生理和品质的变化。结果表明,三种不同采收期的香梨在贮藏过程中都出现呼吸高峰,呈现跃变型果实的特征,晚采收(9月17日)香梨果实的呼吸峰较低。随着采收期的延迟,果实硬度下降较大,果实硬度在采后贮藏过程中变化较小。果实叶绿素含量随采收期的推迟而下降,在室温下贮藏叶绿素分解很快。三个采收期的香梨果实可溶性固形物含量相近,在贮藏过程中呈下降趋势。
【英文摘要】The present studywas performed to investigate the postharvest changes in respiration rate, firmness, chlorophyll content, and soluble solids content of fragrant pear fruit with three different maturities at harvest.The research indicated that the fragrant pear harvested at three different date showed the climacteric peak of respiration during the storage process.Fruit firmness declined rapidly due to postponing harvest date. The declines of firmness were slow after harvest. Chlorophyll content of fragrant fruit reduced along with later pick date, and broke down swiftly during storage period at room temperature.There was little difference between soluble solids contents of fruit from three different harvest date.They decreased during storage.

【题目】1-MCP对库尔勒香梨采后活性氧相关代谢的影响
【中文关键词】香梨;1-甲基环丙烯;活性氧相关酶;丙二醛;超氧阴离子
【英文关键词】Fragrant pear;1-methylcyclopropene;active oxygen related enzymes; MDA;O2・-
【中文摘要】研究1-甲基环丙烯(1-Methylcyclopropene,1-MCP)处理延缓库尔勒香梨采后衰老的机理,为香梨保鲜提供理论依据。【方法】以库尔勒香梨(Pyrus sinkiangensisYu)为试材,研究1-甲基环丙烯处理对香梨果实贮藏期间活性氧代谢相关酶活性、超氧阴离子(O2.-)、丙二醛(MDA)、果皮色调角(h°)的影响。【结果】贮藏前期,1-MCP处理抑制了香梨果实超氧化物歧化酶(SOD)、过氧化物酶(POD)的活性,后期提高了POD的活性。整个贮藏期过氧化氢酶(CAT)活性低于对照;1-MCP处理果实丙二醛(MDA)含量低于对照果实;1-MCP处理在贮藏前期抑制超氧阴离子的产生,保持了较高的果实色调角。【结论】1-甲基环丙烯处理能够有效降低香梨活性氧产生速率,延缓果实衰老。
【英文摘要】【Objective】The mechanism of 1-methylcyclopropent treatment for delaying postharvest senescence of fragrant pear fruitwas studied in orderto supplythe basis for fresh storage of pear fruit.【Method】Kuerle fragrant pears(Pyrus sinkiangensisYu) were used to investigate the effect of 1-methylcyclopropene treatment on enzymes activity of active oxygen related metabolismof postharvest fragrant pear fruit. Fruitwere treatedwith 1μl/L1-MCP and stored in cold room. The enzymes related to active oxygen metabolism superoxide dismutase(SOD), peroxidase(POD),and catalase(CAT), superoxide radical(O2・-),malonaldehyde(MDA) and hue-angle in pulp were determined.【Result】Results showed that 1-MCP inhibited the raising of SOD and POD activity at prophase of storage, increased enzyme activity of POD at the end of the storage. 1-MCP treated fruit had lowerMDA content than that of the control. 1-MCP inhibited significantly the production rate of O2・-and maintained a higher hueangle of fruit pericarp atthe prophase of storage.【Conclusion】1-MCPtreatmentwas able to decline the productionrate of active oxygen and delayed the senescence of fruit during storage.

【题目】库尔勒香梨采后特征品质的研究
【中文关键词】库尔勒香梨;采后贮藏;特征品质
【英文关键词】fragrant pear; postharvest storage; characteristic quality
【中文摘要】库尔勒香梨贮藏在0、5、10、15、20℃,在相对湿度:90%~95%的环境中,测定香梨在贮藏过程中果实硬度、可溶性固形物含量及果皮色泽的变化,采用数值的极差及变异系数,研究采后库尔勒香梨的特征品质。结果表明:香梨采后贮藏于不同温度下,其硬度随着果实的成熟均呈现下降趋势,低温贮藏对硬度的下降有明显的抑制作用;可溶性固形物在不同贮藏温度下降不明显,特别是低温贮藏;果品色泽在各贮藏温度下,随着贮藏时间的延长,成熟度增加,有显著的变化。比较香梨果实硬度、可溶性固形物、色差在整个贮藏期间的变化差异,色差的数值变化最为明显,对香梨采后品质及衰老具有明显的指示作用,可作为评价香梨果实采后品质变化的特征指标及采后衰老的重要指标。
【英文摘要】Fragrant pear (Pyrus sinkiangensis Yu) was stored at refrigerator room with 0、5、10、15、20℃, relative humidity 90%-95% to determine the changes in firmness, soluble solid content(SSC) and hue of fragrant pear fruit during storage. The characteristic quality of postharvest fruit was studied from the range and coefficient of variation of firmness, SSC and hue. The results indicated that fruit firmness decreased at ageing of postharvest fruit during storage period. Lower temperature (0℃) inhibited significantly the decline of firmness of fruit. Fruit SSC had a little decrease during storage especial at low storage temperature. Hue of pericarp had a bigger change with ripening of fruit. The hue was regarded as characteristic quality of postharvest pear fruit because the hue ranges were visible compared with that of firmness and SSC during storage.

【题目】A novel polymorphism of GDF5 gene and its association with body measurement traits in Bos taurus and Bos indicus breeds
【中文关键词】牛,GDF5基因,多态性,PCR-RFLP,体尺性状
【英文关键词】Cattle; GDF5 gene; SNP polymorphism; PCR-RFLP; Body measurement
【中文摘要】由基因和环境因素影响的体尺性状在生产率和经济性的价值评估中发挥了许多重要作用。参与骨和软骨生长和发育的增长分化因子5(GDF5),是利用分子标记辅助选择(MAS)体尺性状的一个重要的候选基因。在这项研究中,PCR-RFLP技术的基础上,我们发现和评估GDF5基因的单核苷酸多态性(SNP)与985牛,42头瘤牛和76头瘤牛杂交牛(BMY牛)体尺性状潜在的关联T586C外显子1)。普通牛与BMY牛的SNP标记与体长(BL)有显著差异(P <0.05)。普通牛群体,TT基因型的个体比TC和CC基因型个体有较低的与坐骨端宽(HW)平均价值(P <0.01)。以BMY群体中,TC基因型的个体比CC基因型有较低的体长(BL)平均值(P <0.05)。这些结果表明,GDF5基因的单核苷酸多态性可能是一个在牛的繁殖与育种中非常有用的体尺性状遗传标记。
【英文摘要】Body measurement traits, influenced by genes and environmental factors, play numerous important roles in the value assessment of productivity and economy. Growth differentiate factor 5 (GDF5), involved in the development and maintenance of bone and cartilage, is an important candidate gene for body measurement traits selection through marker-assisted selection (MAS). In this study, based on the PCR-RFLP technology, we discovered and evaluated the potential association of the single nucleotide polymorphism (SNP) (T586C in exon 1) of the bovine GDF5 gene with body measurement traits in 985 Bos taurus breed, 42 Bos indicus breed and 76 Bos indicus x Bos taurus individuals. As the SNP marker, there were the significant effects on the Body length (BL) in the Bos taurus (BT) and Bos indicus x Bos taurus (BMY) populations (P < 0.05). In BT population, animals with the genotype TT had lower mean values for BL and Hip width (HW) than these with the TC and CC genotype (P < 0.01). In BMY population, animals with the genotype TC had lower mean values for BL than these with the genotype CC (P < 0.05). These results suggest that the SNP of the GDF5 gene could be a very useful genetic marker for body measurement traits in the bovine reproduction and breeding.

【题目】Four divergent Arabidopsis ERF domains bind to a target DNA motif with a universal CG step core recognition and different flanking bases preference.
【中文关键词】无
【英文关键词】CG step; DRE motif; ERF domain; homology; universal binding characteristic
【中文摘要】无
【英文摘要】The Arabidopsis ethylene-responsive element-binding factor (AtERF) family of transcription factors has 120 members, all of which possess a highly conserved ERF domain. AtERF1, AtERF4, AtEBP and CBF1 are members from different phylogenetic subgroups within the family.Electrophoretic mobility shift assay analyses revealed that the ERF domains of these four proteins were capable of binding specifically to either GCC or dehydration-responsive element (DRE) motifs. In vitro and in vivo binding assays of the four AtERFs with the DRE motif showed that the recognition of the CG step was indispensable in all four of the specific binding reactions, implying that there may be a universal binding characteristic of various ERF domains binding to a given consensus (e.g. the DRE motif). In addition, the core DNA-binding motifs preferred by the four AtERFs were identified, and all of

these motifscontained a conserved CG step core. Thus, conserved recognition of the CG step may be the foundation of the formation of the stable complex by the ERF domain with the DRE motif, which is probably determined by the highly conserved residues presented in the DNA contact surfaceamong the whole AtERF family members. The different preferences at flanking bases of individual ERF domains, which appear to be attributed to the subfamily- or subgroup-specific residues, may be essential discrimination of the target binding motif from various similar sequences by divergent AtERF domains.

【题目】Genetic variation of calsarcin-1 gene and association with carcass traits in 3 Chinese indigenous cattle
【中文关键词】Calsarcin-1基因,屠宰性状,牛,snp
【英文关键词】Calsarcin-1 gene; carcass traits; cattle; SNP
【中文摘要】本研究旨在研究Calsarcin-1基因的多态性,并评估其对3个中国黄牛品种,(鲁西(LX),南阳(NY)和郏县红牛(JXR)品种429个样本的屠体性状的影响,,与320 bp的片段跨越Calsarcin-1基因的内含子2的一部分的,完整的外显子3和4的内含子的一部分的PCR产物进行扩增和测序。利用PCR-SSCP方法检测到calsarcin-1基因的外显子3区的突变(NW_001495138:g.16718C> A)。结果表明,A / C在LX,NY和IXR品种的等位基因频率分别为0.1116/0.8884,0.1591/0.8409和0.0947/0.9053,。最小二乘分析,揭示了AC和AA基因型相比CC基因型个体在背膘厚和嫩度有显著差异(P<0.05)。
【英文摘要】This study aimed to investigate polymorphisms of Calsarcin-1 gene and evaluate its effect on carcass traits in 429 samples of 3 Chinese indigenous cattle breeds, namely, Luxi (LX), Nanyang (NY) and Jiaxianred (JXR) breeds, PCR products with a 320 bp fragment of the Calsarcin-1 gene spanning over a part of intron 2, complete exon 3 and a part of intron 4 were amplified and sequenced. A synonymous alteration (NW_001495138: g. 16718C>A) in the exon 3 region of the calsarcin-1 gene was detected and PCR-SSCP method was then developed to genotype all of the individuals. The results showed that the allele frequencies of A/C in LX, NY and IXR breeds were 0.1116/0.8884, 0.1591/0.8409 and 0.0947/0.9053, respectively. Least squares analysis revealed a significant effect (P<0.05) of genotypes on backfat thickness and tenderness of the animals, with the AC and AA genotype being favourable compared to the CC genotype.

【题目】超高产春玉米氮磷钾的吸收与分配
【中文关键词】超高产;春玉米;氮;磷;钾
【英文关键词】super-high yield;spring maize;nitrogen;phosphorus;potassium
【中文摘要】采用田间试验的方法,在供试玉米亩(667m2)产1029公斤的超高产水平下,对春玉米氮、磷、钾吸收、分配与转移规律进行了系统研究。结果表明:在灌浆期前,超高产春玉米对氮、磷、钾养分吸收规律变化较为相似,即阶段吸收量和日均吸收量随生育时期的推进逐渐增大;而灌浆期后,植株对氮、磷、钾养分吸收趋势出现显著差异,即氮、磷吸收持续增高,钾吸收迅速下降。养分在各器官体内的分配特点体现在氮、磷分配随生长中心的转移而发生变化,而钾向生长中心的转移变化不明显。
【英文摘要】This experiment systematically studied the regularity of absorption distribution and translocation of N、P、K in spring maize under 1029kg yield per mu level. The results showed that the rules of super-high yield spring maize absorbing kinds of nutrient were similar. Before the grain filling period, the absorption quantity of stage and the absorption quantity of day gradually increased with

the progress of the growth stage .After the grain filling period, there were some difference in the trend of absorbing nutrient. The absorption quantity of super-high yield spring maize absorbing N and P gradually increased, while the absorption quantity of K gradually decreased. The characteristics of different kinds of organs absorbing every nutrient showed that with the center of growth changing the absorption quantity of organs absorbing N and P were changed. but the change of the absorption quantity of K was not significant different .

【题目】Association of MC4R gene variants with carcass and meat quality traits in Qinchuan cattle
【中文关键词】MC4R 基因,多态性,肉质,屠宰性状,秦川牛
【英文关键词】MC4R gene; polymorphism; meat quality; carcass traits; qinchuan cattle
【中文摘要】MC4R属于一个七次跨膜G-蛋白偶联受体,可以调节人体的组成和胰岛素的作用。许多在MC4R基因的突变与肥胖,能量消耗,在人类和动物的血清甘油三酯水平。在我们的研究中确定了六在MC4R基因的突变(-293 C> G,-193 A> T,-192 T> G,-129A> G-84T> C和1069C> G)。 -129A> G,明显与活重(LW)(P <0.05);牛与AG和GG基因型有较高的LW比AA基因型。 1069 C> G显着相关的活重(LW),胴体重(CW),背膘厚(BFT),大理石纹评分(MS)。有较高的LW,CW和MS比CC基因型GG和CG有较高的MS比CC基因型牛与牛的基因型GG。结果表明,-129 A> G和1069 C> G SNP的MC4R基因可能是有用的作为秦川牛胴体和肉质性状的遗传标记。
【英文摘要】MC4R belongs to a seven-transmembrane G-protein-coupled receptor which may regulate body composition and insulin action. Many mutations in the MC4R gene are associated with obesity, energy expenditure and serum triglyceride levels in human and animals. Six mutations in the MC4R gene were identified in our study (-293 C>G, -193 A>T, -192 T>G, -129A>G, -84T>C and 1069C>G). The -129A> G was significantly associated with live weight (LW) (P<0.05); cattle with the genotypes AG and GG had higher LW than genotype AA. The 1069 C>G was significantly associated with live weight (LW), carcass weight (CW), back fat thickness (BFT) and marbling score (MS). Cattle with the genotype GG had higher LW, CW and MS than genotype CC; cattle with the genotypes GG and CG had higher MS than CC. The results suggested that -129 A>G and 1069 C>G SNP of the MC4R gene may be useful as a genetic marker for carcass and meat quality traits in Qinchuan cattle.

【题目】氮、钾不同营养水平对春玉米氮代谢的影响
【中文关键词】春玉米;氮钾营养;氮代谢
【英文关键词】Spring maize; N and K nutrition; Nitrogen metabolism
【中文摘要】采用田间小区试验方法研究了氮、钾不同营养水平对春玉米氮代谢的影响。结果表明:氮代谢指标(可溶性蛋白、硝酸还原酶、谷氨酸脱氢酶)在整个生育时期内呈单峰曲线变化,即从苗期开始逐渐增加,达到高峰后又呈下降趋势,成熟期最低。可溶性蛋白含量在抽雄吐丝期达到最高峰,硝酸还原酶和谷氨酸脱氢酶活性在大喇叭口时期达到最高。各生育时期,氮代谢关键酶活性及可溶性蛋白含量均表现为随氮、钾营养水平的提高先增加后减少的趋势。表明适宜氮、钾肥用量可以增加叶片可溶性蛋白含量及提高硝酸还原酶和谷氨酸脱氢酶活性,过量施用氮、钾肥反而会使其含量或活性下降。
【英文摘要】Study on the effects of different N and K level on nitrogen metabolism of spring maize was carried out By field experiment. The result showed that the main indexes of N metabolism in maize leaves(content of soluble protein, NR and GDH) showed a single curve at the whole growth stage, and the peak value period of soluble protein was Present in the heading stage, the peak value period of NR and GDH was present in the large bell stage. The main indexes of N metabolism was increasing and then decreasing following the increasing apply of N and K. it was concluded that the moderate N%and K nutrition levels could keep relative higher content of soluble protein, NR, and GDH, but Overabundance could get the contrary result.

【题目】耕作方式对黑土有机碳及有机无机复合状况的影响
【中文关键词】耕作方式;黑土;腐殖酸;有机无机复合度;腐殖质结合形态
【英文关键词】Cultivation pattern; Black soil; Humic acid;Degree of organo-mineral complexation;Forms of combined humus
【中文摘要】[目的]研究耕作方式对黑土有机碳数量的变化、有机无机复合度及腐殖质结合形态的影响。[方法]采用设置休闲、玉米连作和玉米—大豆轮作3种耕作方式进行长期定位试验。[结果]不同耕作方式对黑土有机无机复合状况有明显的影响。休闲、连作及轮作均能增加土壤有机碳及其各组分、重组有机碳含量以及原土复合量,提高土壤活性有机碳含量,降低土壤有机碳的氧化稳定性及原土复合度。连作和轮作增加黑土土壤追加复合量和追加复合度,以轮作效果最好。不同耕作方式中各种结合形态的腐殖质在绝对含量上均有明显提高,以松结合态腐殖质增加较多。[结论]轮作更有利于提高土壤HA/FA比值、HA的E4/E6比值、土壤松结合态腐殖质含量及土壤重组腐殖质碳的松/稳和松/紧比值。
【英文摘要】[Objective]The aimwastostudythe effectof cultivationpatternsonthe changeoforganic carbonamount, the degreeoforgano-mineral com-plexation and forms of combinedhumus inblacksoil. [Method]The long-termlocated experimentswere carriedoutbyusing3 kindsof cultivationpatternsincluding fallow, continuous cropping of maize and maize-soybean rotation cropping. [Result] The different cultivation patterns had obvious effects on organo-mineral complexation inblacksoil.The fallow, continuous croppingandrotation croppingall could increasetheorganic carbon contentand its com-ponents in soil, therecombinationorganic carbon contentandsoil complexamount, enhancethe activeorganic carbon content insoil andreducetheoxida-tion stability of soil organic carbonandsoil complexdegree.The continuous croppingandrotation croppingcould increasethe additional quantityandadditional degree of organo-mineral complexation, with the effect of rotation cropping being best. The absolute contents of various combined humus forms in different cultivation patternswere increased greatly and the increasing contents of loosely combined humus were more than the others.[Conclusion] The corn-soybean rotation were propitious to increase soilHA/FAratioandE4/E6ratioofHA,the contents of loosely combined humus and that of loosely to tightly combined humus in soil.

【题目】Insulin Inhibits the Expression of Adiponectin and AdipoR2 mRNA in Cultured Bovine Adipocytes
【中文关键词】胰岛素,脂联素,牛前脂肪细胞
【英文关键词】Insulin; Adiponectin; Adiponectin Receptors; PI3-Kinase; Bovine Adipocyte

【中文摘要】利用和AdipoR1和AdipoR2介导的脂质代谢。胰岛素如何影响脂联素基因的表达和分泌仍存在争议。该研究旨在确定胰岛素对牛脂肪细胞中脂联素,AdipRs和脂肪细胞分化过程中的PPAR-γ记忆的表达效果。牛前脂肪细胞开始积累脂肪三天后,增加脂联素,AdipoR2和PPAR-γ基因的表达诱导分化。胰岛素的表达降低的脂连蛋白mRNA表达的剂量和时间依赖的方式,和抑制检测到在胰岛素浓度低至10 nM的早2小时后加入100 nM胰岛素。胰岛素也抑制AdipoR2 mRNA的浓度从I至1,000 nM或24小时后,加入100 nM胰岛素的表达,但丝毫没有影响AdipoR1在牛脂肪细胞表达。与LY294002抑制PI3K逆转胰岛素抑制脂联素和AdipoR2 mRNA表达的。这些结果表明,胰岛素通过PI3K信号通路的至少部分地抑制脂联素与AdipoR2表达。

【英文摘要】utilization and lipid metabolism are mediated by AdipoR1 and AdipoR2. How insulin affects adiponectin gene expression and secretion is still controversial. This study was conducted to determine the expression of adiponectin, AdipRs; and PPAR-gamma during the differentiation of bovine preadipocytes and the effect of insulin on expression of these genes in bovine adipocytes. The bovine preadipocytes started to accumulate lipids three days after differentiation was induced, with increased expression of adiponectin, AdipoR2 and PPAR-gamma mRNAs. Insulin decreased the expression of adiponectin mRNA in a dose- and time-dependent fashion, and the inhibition was detectable at insulin concentrations as low as 10 nM and as early as 2 h after addition of 100 nM insulin. Insulin also inhibited the expression of AdipoR2 mRNA at concentrations from I to 1,000 nM or 24 h after addition of 100 nM insulin, but did not affect the expression of AdipoR1 in bovine adipocytes. Inhibition of PI3K with LY294002 reversed the inhibition of adiponectin and AdipoR2 mRNA expression by insulin. These results suggest that insulin suppresses the expression of adiponectin and AdipoR2 at least partially via the PI3K signal pathway.

【题目】不同产量水平玉米干物质积累态势研究
【中文关键词】玉米;干物质积累;Logistic方程
【英文关键词】Corn; The dryweigh;t Logistic equation
【中文摘要】[目的]以玉米为研究对象,对不同产量水平玉米干物质积累规律进行全面、系统的研究。[方法]设计对照、平产处理和高产处理,其产量水平分别为7 051、9 681和11 803 kg/hm2。分别于8个生育期(苗期、拔节期、大喇叭口期、吐丝期、灌浆期、乳熟期、蜡熟期和成熟期)采样,用烘箱干燥法测定干物质积累量。[结果]不同产量水平玉米平均单株干物质积累量(Y)依出苗后各采样期的天数(X)的增长为不对称的S型曲线,可用Logistic方程Y=K/1+e(a-bX)加以描述,可根据该方程求得其最大增长速率及其出现日期。在玉米各器官干物质积累方面,不同产量水平玉米叶片、茎秆干物质积累速度均呈现出前期慢、中期快、后期慢的积累规律;而籽粒干物质积累速度呈现不断增加的趋势。不同处理玉米的叶片、茎秆和籽粒干物质积累量均是高产处理>平产处理>不施肥处理。[结论]该研究为指导吉林省玉米的高产生产奠定理论基础和提供实践经验。
【英文摘要】[Objective]The research systematically studied dryweight change law of corn in differentyield treatments. [Method]Three yield level treatments of7 051, 9 681 and 11 803 kg/hm2were designed, including contro,l normalyield treatmentand high yield treatmen.t Thesampleswere collected at8 growing stages, and theirorganism yieldwere determined by drying in oven. [Result]The results showed that thedryweightquantity(Y) ofaverage every plant corn in differentyield treatments on the basis of the days (X)ofeach sampling stage accordedto the equation ofLogisticY=K/1+e(a-bX), and the highestrate of increase and the day ofemerge could be calculate from the equation. On the dryweightof corn each componentaspec,t the dryweightaccumulative speed of leafand stalkin differentyield treatmentsallshowed the regular of earlier stage fas,t midterm slow and later stage fas,t but the dry weight accumulative speed of grain continuously raise. The dry weightquantity of lea,f stalk and grain in differentyield treatments allshowed high yield treatment>midterm yield treatment> non-fertilizer treatmen.t [Conclusion]The study can establish the theory basis of understanding themechanism of Jilin Province corn high yield and offer some practice experience.

【题目】不同施钾水平春玉米对钾的吸收·积累与分配
【中文关键词】高产;春玉米;钾
【英文关键词】High production; Springmaize; Potassium
【中文摘要】[目的]研究春玉米对钾素的吸收、积累与分配规律,为有效施用钾肥,促进产量增长提供理论依据。[方法]以先玉335为材料,设置K0(不施用钾肥)、K1(施用K2O 100 kg/hm2)、K2(施用K2O 200 kg/hm2)、K3(施用K2O 300 kg/hm2)4个处理,进行田间小区试验,研究钾素在春玉米不同生育时期的动态变化。[结果]不同施钾处理钾素吸收、积累与分配规律基本一致,春玉米生育前期钾素积累量为K3>K2>K1>K0,生育后期则为K2>K3>K1>K0。[结论]春玉米对钾素的吸收不随施钾量的增加而提高,过量施用钾肥不是提高玉米产量的有效途径。
【英文摘要】[Objective] The expermi ent ami ed to study the regularity of absorption, accumulation and distribution of potassium in spring maize underdifferent treatments ofK-fertilizerand provide theoretical foundation for effective application ofK-fertilizer to mi prove the produc-tion ofmaize. [Method]UsingXianyu335 asmateria,l four treatmentswere setup for field plottes,t includingK0(noK fertilizer),K1(apply-ing100kg/m2K2O, K2(applying200 kg/m2K2O), K3(applying300 kg/m2K2O). The dynamic changesofpotassium in springmaize under differentgrowth stageswere studied. [Result] Different treatments ofpotassium were almost the same in absorption, accumulation and distri-bution. The accumulation ofpotassium in springmaizewasK3>K2>K1>K0at early growth stage, whileK2>K3>K1>K0at late growth stage. [Conclusion] The absorption ofpotassium in springmaize didn’t grow with theincrease of K-fertilizer. ExcessiveK-fertilizerwasn’t the effectiveway to mi prove the production ofmaize.

【题目】新疆杏制干品种的筛选及制干工艺的初步研究
【中文关键词】制干工艺;杏;品种筛选
【英文关键词】dried technology; apricot; screen
【中文摘要】【目的】筛选适宜的杏制干品种并对其制干工艺进行研究。【方法】对大胡安娜、佳娜丽、库买提、赛买提等46个杏品种的鲜杏自然晾晒制干,通过对46个品种的杏干果肉的总糖、总酸、制干比等指标测定及感官评价,筛选出适宜的杏制干品种。以库买提为原料,通过采用促干剂、蒸汽漂烫、NaHSO3溶液浸泡、漂烫结合NaHSO3溶液浸泡等处理方法,经过自然晾晒得到杏干,并对杏干的总糖、总酸、制干比、水分、残留SO2量进行测定以确定最佳制干工艺。【结果】适宜的制干品种为大胡安娜、黑叶杏、库买提、佳娜丽等。最佳制干工艺条件为整果经90℃热水漂烫3 min,再浸泡于浓度为3.75 g/L的NaHSO3溶液中1 h后晾晒。【结论】采用该工艺提高了制干速率,制干时间缩短2 d,且杏干感官品质好。
【英文摘要】【Objective】Proper varieties of apricot for dring were selected and the drying technology was studed.【Method】46 cultivars such as Dahuanna, Jianali, Kumaiti were dried naturally,the proper dried variety of apricotwas selected by the total sugar, total acid and the ratio of dried apricot to fresh apricot. The optimal dried technologywas determined from a wide range of treatment such as apricot-specific drier, steam, blanching, NaHSO3treatment, infusion method then were naturally dried. After that, the total sugar, total acid ,the ratio of dried apricot to fresh apricot,water content ,residual sulfur content were also determined.【Result】The results showed that the optimal dried technologywas as follows: the whole fruit was blanched for 3 minutes in 90°C,then treated by NaHSO3solution (3.75 g/L)for 1 hour.【Conclusion】On this condition, the products have good color while the dried time is short.

【题目】Molecular characterization, polymorphism of bovine ZBTB38 gene and association with body measurement traits in native Chinese cattle breeds
【中文关键词】牛,ZBTB38基因,多态性,关联性,体尺性状
【英文关键词】Cattle; ZBTB38 gene; SNP polymorphism; Association analysis; Body measurement
【中文摘要】锌指含有BTB域38(ZBTB38),结合和抑制甲基化的DNA,是一个重要的候选基因,通过分子标记辅助选择(MAS)的体尺性状的选择。 ZBTB38基因在人类和动物的高度表达。8基因组结构分析表明,牛ZBTB38与人类ZBTB3十分相似。我们发现和评估722个牛个体ZBTB38基因的单核苷酸多态性与体尺性状之间的关系。最新的研究结果表明,外显子1 A841G SNP明显与体长(BL),腰高(HH)和胸围(HG)显著相关。此外,A841G SNP标记分析表明,在722个个体中与BL(P =0.0389)显著相关,在秦川改良的阉牛(QI)群体中显着影响HH(P =0.0173),HG(P =0.0147),以及显着影响在雪龙号(XL)WH(P= 0.0094)。这些结果清楚地表明,ZBTB38基因在牛繁殖与育种中可以作为的体尺性状的靶基因,从而为建立动物模型研究大动物体型提供数据。
【英文摘要】Zinc finger and BTB domain containing 38 (ZBTB38), binding to and repressing methylated DNA, is an important candidate gene for selection of body measurement traits through marker-assisted selection (MAS). The expression of ZBTB38 is regulated in human and animal height as well as other stature indexes. Genomic structural analysis shows that bovine ZBTB38 shares much similarity with human ZBTB38. We discovered and evaluated the potential association of the single nucleotide polymorphism

(SNP) of the bovine ZBTB38 gene with body measurement traits in 722 individuals. The latest findings demonstrate that the A841G SNP in exon 1 is significantly associated with Body Length (BL), Hip Height (HH) and Heart Girth (HG). Furthermore, the analysis of A841G SNP marker shows that there are significant effects on the BL (P = 0.0389) in 722 individuals, significant effects on the HH (P = 0.0173) and HG (P = 0.0147) in Qinchuan improvement steers (QI) population, as well as significant effects on the WH (P = 0.0094) in Xuelong (XL) population. These results clearly suggest that the ZBTB38 gene is among of target genes for body measurement traits in bovine reproduction and breeding, and thus provide data for establishment of an animal model using cattle to study big animal body type.

【题目】Inhibition on hepatitis B virus in vitro of lectin from Musca domestica pupa via the activation of NF-κB
【中文关键词】凝集素、家蝇、HBV、抗病毒蛋白、细胞因子、NF-κB
【英文关键词】Lectin, Musca domestica, HBV, Antiviral proteins, Cytokines,NF-κB
【中文摘要】据目前研究报道用家蝇凝集素(MPL)处理HepG2.2.15细胞后,HepG2.2.15细胞分泌的HBsAg和HBeAg会有很大程度的降低,而且细胞中HBV的DNA、cccDNA的复制以及胞外HBV的DNA的复制都受到抑制。MPL处理后IL-2、INF-γ和MxA的mRNA表达量都体现为上调作用,但是当NF-κB的通路被PDTC阻断时体现为下调作用。进一步的研究表明胞浆中的NF-κB抑制因子受到抑制且NF-κB转移到细胞核内。结果表明MPL处理激活NF-κB途径可以指导IL-2、INF-γ和MxA的表达,从而抑制HBV的复制。

【英文摘要】The present study reported that the secretions of HBsAg and HBeAg in HepG2.2.15 cells were significantly decreased under the treatment of lectin from Musca domestica pupa (MPL). Both the replication of hepatitis B virus (HBV) DNA and HBV cccDNA in cells, and the copies of extracellular HBV DNA were inhibited by MPL. The mRNA expressions of interleukin-2 (IL-2), gamma interferon (INF-) and MxA were up-regulated by MPL treatments, but down-regulated when nuclear factor- B (NF- B) signal pathway was blocked by pyrrolidine dithiocarbamate (PDTC). Subsequent investigation revealed that nuclear factor- B inhibitory B (I B) in endochylema was inhibited and NF- B was translocated into the nucleus. These findings indicate that MPL could inhibit HBV replication via the induction of the expression of IL-2, INF- and MxA through the activation of NF- B.

【题目】不同施钾水平对春玉米产量及钾素吸收积累的影响
【中文关键词】产量 不同施钾量 钾素积累量
【英文关键词】yield ,different amount of potassium,accumulation of potassium
【中文摘要】[目的]研究了不同施钾量对春玉米产量及植株和不同器官钾素吸收积累量的影响。[方法]通过田间试验,布置K0(不施钾肥)K1(K2O 75kg/hm2)K2(K2O 150kg/hm2)K3(K2O 225kg/hm2)K4(K2O 300kg/hm2)5个处理。[结果与结论]适量施用钾肥能明显提高春玉米的产量,当施钾(K2O)225kg/hm2时玉米产量最高,为15531.0 kg/hm2,与对照处理相比增产24.73%,产量差异达极显著水平;随生育时期的进展春玉米钾素积累量前期缓慢增长在灌浆期达到最大值,而后钾素积累量下降;春玉米各器官钾素积累量变化有所不同,叶片、叶鞘和穗部均呈单峰曲线,而茎秆钾素吸收规律呈“N”形曲线。不同施钾量各处理间产量、植株钾素积累量和不同器官钾素积累量均表现为K3>K4>K2>K1>K0。
【英文摘要】[Objective] This paper studied the different amount of potassium in the yield of spring maize,plants and accumulation in different organs of the impact of potassium absorption.[Method] The author arranged K0 (no potassium),K1 (K2O 75kg/hm2),K2 (K2O 150kg/hm2),K3 (K2O 225kg/hm2) and K4 (K2O 300kg/hm2) 5 treatments through the field experiment. [Results and Conclusion] The application of potassium fertilizer can significantly improved the yield of spring maize, when applying (K2O) 225kg/hm2 potassium,the yield of spring maize reach the highest level,which was 15531.0 kg/hm2, compared to the control treatment, increased by 24.73% and the yield differences were highly significant; with the stages of spring maize growth, the potassium accumulation increased slowly in the early period, then reached the maximum at the filling stage, after that began to decrease;different organs of spring maize had different potassium accumulation curve, the leaf, the leaf sheath and the panicle showed a single peak curve,however,the stems potassium absorption law was "N"-shaped curve. Different amount of potassium among the treatments, the yield,the plant potassium accumulation and potassium accumulation in different organs all appeared as K3> K4> K2> K1> K0.

【题目】Purification and characterization of a new D-galactoses-pecific lectin from the housefly, Musca domestica, and its antiproliferative effect on human K562 and MCF-7 tumor cells
【中文关键词】原子力显微镜,糖蛋白
【英文关键词】atomic force microscopy, glycoprotein
【中文摘要】通过目前的研究工作,纯化出家蝇蛹内一种拥有新型N端序列的D-半乳糖凝集素。通过亲和层析、超滤、以及高效液相色谱分析进行纯化。通过D-半乳糖作用可以有效的抑制家蝇凝集素的血细胞凝集作用。当温度在65°C以上、

pH在4-8之间时这种凝集素的血细胞凝集作用是稳定的。盐类包括FeCl3和MnCl2对这一凝血过程是起到抑制作用的,而NaCl, KCl, CaCl2, MgCl2, ZnCl2和 AlCl3则不会有抑制作用。有或者没有β-疏基乙醇都能通过聚丙烯酰胺凝胶电泳纯化家蝇蛹凝集素能够得到分子质量为40kDa的条带,并且能被阿尔新蓝8GX染色。通过原子力显微镜观察纯化后的家蝇凝集素的形态:直径 8.27nm的球形糖蛋白有长1.41nm链状多聚糖。另外,家蝇凝集素对肿瘤细胞K562和MCF-7的抗细胞恶性增生作用通过用3-(4,5-二甲基噻唑-2-yl)-2,5-二苯基四唑溴化物进行比色测定,结果显示在IC505.7、6.7,24h;IC505.5、6.4,36h;IC505.2、6.5,48h条件下抗肿瘤作用是呈现时间剂量依赖性的。

【英文摘要】In the present work, a D-galactose-specific lectin with novel N-terminal sequence was purified from Musca domestica L. (Diptera: Muscidae) pupae. The purification was performed using affinity chromatography, ultra-filtration, and HPLC. The haemagglutinating activity of M.domestica lectin was specifically inhibited by D-galactose. The haemagglutinating activity of this lectin was stable at temperatures up to 65 ° C and in pH ranging from 4 to 8. Salts including FeCl3and MnCl2 inhibited the haemagglutinating process, whereas NaCl, KCl, CaCl2, MgCl2, ZnCl2, and AlCl3 did not. By SDS-PAGE, purified M. domestica pupae lectin yielded a single band with a molecular weight of 40 kDa, with or without reduction of β-mercaptoethanol, and it could be stained with Alcian Blue 8 GX. The morphology of purified lectin was observed by atomic force microscopy, which indicated that M. domestica lectin was an 8.27 nm high, globular shapedglycoprotein with a 1.41 nm high polysaccharide chain. In addition, antiproliferative activity of this lectin against tumor cells K562 and MCF-7 was determined with a colorimetric assay using 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide, which showed that the antiproliferative process was time- and dose-dependent with an IC50 of 5.7 and 6.7 at 24 h, 5.5 and 6.4 at 36 h, 5.2 and 6.5 μM at 48 h, respectively.

【中文关键词】冬小麦; 施氮模式; 冻害; 茎秆抗倒伏性能;
【英文关键词】winter wheat; nitrogenous fertilizer application pattern; freeze injury; culm resistance to lodging;
【中文摘要】以中筋高产小麦品种新麦18为试验材料,采用大田试验的方法,从土壤-小麦植株系统出发研究了3个梯度氮肥用量(180 kg/hm2、240 kg/hm2和300 kg/hm2)和3种基追比例(基肥∶拔节肥∶孕穗肥为3∶5∶2、基肥:拔节肥为5∶5和基肥∶拔节肥为7∶3)对冬小麦越冬期麦苗冻害和茎秆抗倒伏性能的影响。结果表明,施氮模式显著影响小麦抗冻能力和茎秆抗倒伏能力。基部第一、第二节间的节间长度和基部第二节间的含氮量均随施氮水平和基肥比例的增加而增加,基部第一、第二节间的节间粗度、秆壁厚度和节间充实度以及基部第二节间机械强度则表现相反。基部第二节间机械强度与其节间粗度、秆壁厚度、充实度呈极显著正相关,而与其氮含量呈极显著负相关。

【英文摘要】Xinmai 18(a high-yield and mid-gluten wheat cultivar)was used as material in the field experiment,to study the effects of nitrogenous fertilizer application pattern on freeze injury and culm lodging resistance of winter wheat.Nitrogen application rate treatment was set as 180 kg/hm2,240 kg/hm2 and 300 kg/hm2,ratios of base to topdressing as 3∶5∶2(base∶jointing∶booting),5∶5(base∶jointing),7∶3(base∶jointing).The results showed that nitrogenous fertilizer application pattern significantly influenced resistance to freeze and lodging of winter wheat.The length of the first and second internode as well as total nitrogen content of the second internode increased with increment of nitrogen fertilizer amount and ratios of base to topdressing,while the outside diameter,thickness and filling of the first and second internode as well as the culm mechanical strength of the second internode showed inverse effects.The culm mechanical strength of the second internode had a significantly positive correlation with the outside diameter,thickness and filling,but was significantly negative with total nitrogen content.

【题目】Immunomodulation activity of lectin isolated from usca domestica (housefly) pupae
【中文关键词】家蝇、凝集素、免疫调剂作用、细胞因子
【英文关键词】Musca domestica; Lectin; Immunomodulation; activity; Cytokine
【中文摘要】作为中药中重要成分之一,从明清时期起家蝇幼虫就常用来治疗脓疮、骨髓炎、褥疮、营养不良症、淋巴疖肿等疾病。本文的目的是鉴定家蝇蛹凝集素的对巨噬细胞和脾细胞的免疫调节作用。通过半乳糖凝胶色谱法和超滤对小分子的IBS凝集素进行纯化,此凝集素对兔血细胞的凝集剂量为10μg/mL,家蝇凝集素的免疫调节作用通过NO、IL-6、IL-12以剂量依赖方式进行研究。当家蝇凝集素的剂量为5μg/mL时IL-6的分泌减少;当家蝇凝集素的剂量为15μg/mL时IL-12有明显的降低。体外淋巴细胞转化实验显示MPL可能是潜在的免疫调节因子。与对照组相比在家蝇凝集素剂量为10μg/mL时,增值指数显著增加。我们的实验表明家蝇凝集素有一部分的有效治疗作用,同时家蝇凝集素的不同使用浓度有不同的免疫调节能力。
【英文摘要】As one of important components in traditional Chinese medicines, Musca domestica larvae has been used to cure ecthyma, osteomyelitis, decubital necrosis, malnutritional stagnation and lip boil since the Ming/Qing Danysty. The objective of this study was to evaluate the immunomodulatory effects of the Musca domestica pupae lectin (MPL) on the activity of macrophages and splenocyte. The fraction of buffer insect solution (BIS) lectin was purified by affinity chromatography on galactose-Sepharose-4B and ultrafiltration. This lectin agglutinatin rabbit blood cells (RBC) at 10 μg/ml. The immunomodulatory of the MPL was studied by the production of nitric oxide (NO), IL-6 and IL-12 in a dose-dependent manner. The production of IL-6 was induced by MPL at 5 μg/ml; IL-12 was significantly induced at 15 μg/ml. Lymphocyte transformation test in vitro shown MPL potential as immunomodulator, splenoctye proliferation index was significant increased at 10 μg/ml comparing with the control . Our results suggested a portion of the beneficial therapeutic properties of lectin from Musca domestica, our results also supported the concept of using MPL as an immunostimulation adjuvant.

【题目】Three novel SNPs in the coding region of PPARγ gene and their associations with meat quality traits in cattle
【中文关键词】PPARγ基因,SNP多态性,肉质,PCR-SSCP
【英文关键词】PPAR gamma gene; SNP polymorphism; Meat traits; PCR-SSCP
【中文摘要】过氧化物酶体增殖物激活受体γ(PPARγ)是一种核激素受体,调节脂肪细胞和其他许多生物过程。在本研究中,我们进行了PCR-SSCP和DNA测序分析,研究PPARγ基因的编码区单核苷酸多态性。对5个中国黄牛品种共660个体进行了基因分型。我们确定了三个SNP位点,它们与肉品质性状进行了分析,108秦川牛。两个错义突变和一个同义突变的研究发现:200 A> G(基因型AA,AB,BB)的导致在D7G变化,沉默的替代42895 C> T(基因型JJ和JI)和72472 G> T(基因型CC,DC DD)Q448H的变化。秦川牛,南阳牛,郏县红牛,鲁西牛,夏南牛群体PPARγ-A等位基因的频率分别为0.86,0.83,0.80,0.72和0.87。在5个群体中PPARγ-J等位基因的频率变化范围从0.87到0.96。 PPARγ-C等位基因的频率在72472 G> T位点,高于PPARγ-D等位基因,从0.58到0.82不等。最小二乘分析结果显示,在42895 C> T位点,有一个显着的影响18-20个月秦川牛嫩度(P <0.01),与DC的72472 G> T位点的基因型个体有较低的平均价值与CC基因型(P <0.01),背膘厚在18-20个月,基因型DD基因型CC和DC(P <0.01)有较低的平均价值比这些系水力在21至24个月龄(P<0.01)。我们已经确定的单核苷酸多态性可能建立一个更有效的选择方案改良中国黄牛的遗传特征。
【英文摘要】The peroxisome proliferator-activated receptor gamma (PPAR gamma) is a nuclear hormone receptor that regulates adipogenesis and many other biological processes. In the present study, we carried out PCR-SSCP and DNA sequencing analyses to examine SNPs in coding region of the PPAR gamma gene. A total of 660 individuals from five Chinese cattle breeds were genotyped. We identified three SNPs and their associations with meat quality traits were analyzed in 108 Qinchuan cattle. Two missense mutations and one synonymous mutation were found: 200 A > G (genotypes AA, AB and BB) resulting in D7G change, the silent substitution

42895 C > T (genotypes JJ and JI) and 72472 G > T (genotypes CC, DC and DD) producing Q448H change, respectively. The frequencies of PPAR gamma-A allele were 0.86, 0.83, 0.80, 0.72 and 0.87 for Qinchuan, Nanyang, Jiaxian, Luxi and Xianan populations, respectively. The frequencies of PPAR gamma-J allele varied from 0.87 to 0.96 in the five populations. In the 72472 G > T locus, the frequencies of PPAR gamma-C allele were higher than PPAR gamma-D allele in the five populations, and ranged from 0.58 to 0.82. Least squares analysis revealed that in 42895 C > T locus, there was a significant effect on tenderness in 18-20 months Qinchuan cattle ($P < 0.01$), and in the 72472 G > T locus, animals with the genotype DC had lower mean values than these with genotype CC ($P < 0.01$) for back fat thickness in 18-20 months, and animals with the genotype DD had lower mean values than these with genotypes CC and DC ($P < 0.01$) for water holding capacity in 21-24 months ($P < 0.01$). The SNPs we have identified may contribute to establishing a more efficient selection program for improving of genetic characteristics in indigenous Chinese cattle.

【题目】保护性耕作条件下玉米田土壤微生物区系变化与影响因素分析

【中文关键词】保护性耕作;土壤微生物区系;土壤环境

【英文关键词】Conservation tillage; Soil microflora; Soil environmental factors

【中文摘要】通过田间试验研究了吉林省中部地区黑土保护性耕作条件下,玉米不同生育期土壤微生物区系的空间变化规律,初步明确不同耕作方式细菌、真菌和放线菌的活动主要集中在0-30cm范围内,30cm以下数量很少;土壤微生物数量与土壤有机质、土壤全氮和全磷呈显著或极显著正相关,与速效养分相关性不明显;磷酸酶(酸性、碱性和中性)在播种前与土壤微生物数量均达到极显著相关,但在玉米生长后期没有表现有规律的相关性;保护性耕作对培育细菌型土壤、优化土壤环境有一定的积极作用。

【英文摘要】A long-term field experiment was carried out to study spatial distribution rule of soil microflora in maize different growth duration in the central regions of Jilin province under black soil planting technology of conservation tillage. The results showed that the activity of bacterium, Fungi, and Actinomycete mainly concentrate in the 0-30cm scope with different conservation Tillage modes, the quantity of soil microorganisms under 30cm are very few. But correlativity analysis indicates that the quantity of soil microorganisms has significant correlation or highly significant correlation with the organic matter of soil, the total phosphorus and nitrogen of soil, the correlation is not obvious with available nutrient; The phosphoric acid enzyme (acidity, alkalescence and neuter) before sowing has highly significant correlation with the quantity of soil microorganisms, but changes of the rule in the later growth duration of maize is not significant correlation, the conservation tillage has the certain positive role to cultivating bacterium type of soil and developing soil environment. The result of change of quantity of soil microorganisms in growth duration with different conservation tillage modes showed that the conservation tillage play active role to cultivating bacterium type of soil.

【题目】东北黑土区不同耕作方式土壤养分与酶活性的时空变化

【中文关键词】黑土;耕作方式;土壤养分;土壤酶活性

【英文关键词】black soil, tillage form, soil nutrient, soil enzyme activity

【中文摘要】通过田间试验研究了东北黑土区玉米不同耕作方式的土壤养分与酶活性的时空变化规律。结果表明,整个生育期不同处理在各个土层均有较高的碱解氮含量,而在播种前常规耕作高于宽窄行,玉米生长中期则是宽窄行高于常规耕

作,收获后各处理含量水平基本一致。有效磷不同处理均表现出养分表聚现象,且宽窄行在各个生育期的不同土层内均高于常规耕作。速效钾含量随着土层的加深降低不十分明显,处理间没有表现出明显的差异,体现了钾素养分移动性大的特点。玉米生长关键期的全量氮、磷、钾变化幅度不大,处理间含量水平一致;有机质含量在2%~3%之间;PH值不同处理均有随着土层的加深逐渐升高的趋势,说明不同的耕作措施都有促进土壤表层酸化的现象。不同耕作方式土壤酶活性在整个生育期变化趋势相同,无明显差异。

【英文摘要】Field experiment was carried out in this study to investigate the effect of tillage form on the soil nutrient and enzyme activities of in the maize rhizosphere at black soil area of Northeast china. A factorial complete randomized microplot (40m2) was designed. The factors were two applications [Normal rows and wide-narrow rows] and replicated three times. In the normal rows, higher and lower NH4+-N was measured at before sowing and middle of cultivation, respectively. While, there was no significant differences after harvest. Throughout the study, assembled available phosphorus was found at both treatment and relatively higher available phosphorus was measured in the wide-narrows row at each soil layers compared to normal rows. For potassium content, a minor change was found at each layer in both applications and no significant differences were found between the two applications. As well as, there was minor changes were investigated in the total nitrogen, phosphorous and potassium during the main growth period at each application. Organic matter content of rhizosphere was maintained at 2~3% at each applications. However, pH value was positively correlated with the soil depth which demonstrates that both applications may contribute to soil acidification. Same trend was found in both applications and no significant differences were found between the applications. The results indicate the potential wide-narrow rows application in maize cultivation..

【题目】Lectin purified from Musca domestica pupa up-regulates NO and iNOS production via TLR4/NF-κB signaling pathway in macrophages

【中文关键词】凝集素、家蝇蛹、NO、iNOS、NF-κB

【英文关键词】Lectin,Musca domestica pupa,NOiNOS,NF-κB

【中文摘要】目前研究报道称家蝇蛹中的凝集素反应对巨噬细胞中的NO有正调节作用并且没有细胞毒性。mRNA的表达和蛋白iNOS的分泌在使用MPL处理后急剧减小,进一步研究发现在使用MPL处理后胞浆中的NF-κB抑制因子受到抑制且NF-κB转移到核内,同时,IKKβ急剧减少,TLR4的产量被显著正调。此外,MPL能通过激活NF-κB通路减少iNOS 的表达增加NO的产量,而这也表明MPL可能在NF-κB通路的激活中起激活剂的作用。

【英文摘要】The present study reported that nitric oxide (NO) was up-regulated by the induction of lectin purified from Musca domestica pupa (MPL) in macrophages without cytotoxicity. The mRNA expression and protein secretion of inducible nitric oxide synthase (iNOS) were strongly induced by MPL treatments. Subsequent investigation revealed that the nuclear factor-κB (NF-κB) inhibitory κB (IκB) in endochylema was inhibited and NF-κB translocated into the nucleus after MPL treatment. Meanwhile, the IKKβ was strongly induced and the production of the toll-like receptor 4 (TLR4) was significantly up-regulated. Moreover, MPL increased NO production via inducing the expression of iNOS through the activation of NF-κB, which suggested that MPL probably acted as an activating agent of the NF-κB activation.

【题目】保护性耕作玉米不同生育期土壤生物肥力与化学肥力的相关性
【中文关键词】黑土;耕作方式;生物肥力;化学肥力
【英文关键词】black soil,tillage forms, biological fertility, chemical fertility.
【中文摘要】通过田间试验研究了吉林省中部黑土区玉米不同生育期土壤酶活与土壤养分以及微生物区系的相关性。结果表明,土壤脲酶在玉米收获后与土壤全氮、全磷极显著相关;在灌浆期以后与土壤PH极显著相关;在播种前、拔节期和收获后与土壤碱解氮含量显著相关;与土壤有效磷和速效钾没有表现出明显的相关性;在本试验条件下与土壤微生物数量没有表现出相关性。土壤磷酸酶(酸性、碱性和中性)在玉米关键生育期与土壤全氮和全磷显著或极显著相关;与有效磷、速效钾和PH值(负相关)除灌浆期以外均表现了较为明显的相关性,说明土壤磷酸酶活性受土壤养分状况及PH值的影响十分显著;磷酸酶在播种前与土壤微生物数量均达到极显著相关,但在玉米生长后期没有表现有规律的相关性。土壤酶活性与土壤有机质含量均表现了较好的相关性,与土壤全钾含量没有表现出明显的相关性。
【英文摘要】The correlations among soil enzyme activities, soil nutrient and variations of microflora was investigated at black soil are of central Jilin during different developmental stages of maize. Soil urease activity was significantly correlated with soil total N and total P contents ($p \leqq 0.01$) at post-harvest stage and pH ($p \leqq 0.01$) after filling stage. As well as, soil urease was significantly correlated with alkali-hydrolyzable N ($p \leqq 0.05$) at pre-planting, jointing and post-harvest stages. However, soil urease showed no significant correlations with available P, K contents and no correlations with the amount of soil microflora, respectively. Soil phosphatase (acid, alkaline and neutral) activities were significantly correlated with soil total N ($p \leqq 0.05$) and total P ($p \leqq 0.01$) during the main development stages of maize. As well as, soil phosphatase (acid, alkaline and neutral) activities showed relatively significant correlations with available P, K contents and pH (negative) except filling stage. It means that, activities of soil phosphatase were mostly infected by the distribution of soil nutrient and pH values. Soil phosphatase activities were significantly correlated with soil microflora ($p \leqq 0.01$) at pre-planting stages and no continuous regularity correlations were investigated at the end of maize growth. Soil enzyme activities showed relative significant correlation with soil organic matters. While no significant correlation was investigated with soil total K content.

【题目】Surfactin induces apoptosis in human breast cancer MCF-7 cells through a ROS/JNK-mediated mitochondrial/caspase pathway
【中文关键词】surfactin,细胞凋亡,ROS,MAPK,线粒体
【英文关键词】Surfactin,Apoptosis, ROS, MAPK,Mitochondria
【中文摘要】Surfactin通过ROS/JNK介导的线粒体/caspase途径诱导人乳腺癌细胞MCF-7的凋亡众所周知,surfactin能够抑制肿瘤细胞增殖和诱导肿瘤细胞凋亡。但是,在诱导肿瘤凋亡的分子机制方面现在还是知之甚少。本论文主要阐述了surfactin诱导肿瘤细胞MCF-7凋亡当中所出现的信号通路。在本研究中,surfactin能够提高细胞内ROS的水平,并且surfactin诱导细胞凋亡能够被NAC和过氧化氢酶所抑制,这就表明ROS参与了surfactin诱导肿瘤细胞凋亡。Surfactin能够持续性的诱导细胞出现ERK1/2和JNK的磷酸化,但是不能够出现p38的磷酸化。Surfactin诱导细胞凋亡能够被PD98059(ERK1/2抑制剂)和SP600125(JNK抑制剂)所抑制,但是不能被SB203580所抑制。JNK的磷酸化能够被NAC/catalase所抑制,但是ERK1/2的磷酸化不能够被抑制。结果显示,surfactin诱导MCF-7凋亡通过了ERK1/2和JNK通路,但是不通过p38,且ERK1/2和JNK的活化是通过两个独立的信号通路机制。Surfactin触发了线粒体/caspase凋亡通路加强了Bax和Bcl-2,细胞色素C的释放和caspase的级联反应。NAC和SP600125能够抑制上述的通路。此外,caspase的抑制剂z-VAD-FMK能够抑制caspase-6的活性,抑制surfactin诱导MCF-7的凋亡。结果表明,Surfactin通过ROS/JNK介导的线粒体/caspase途径诱导人乳腺癌细胞MCF-7的凋亡。
【英文摘要】Surfactin has been known to inhibit proliferation and induce apoptosis in cancer cells. However, the molecular mechanisms involved in surfactin-induced apoptosis remain poorly understood. The present study was undertaken to elucidate the underlying network of signaling events in surfactin-induced apoptosis of human breast cancer MCF-7 cells. In this study, surfactin caused reactive oxygen species (ROS) generation and the surfactin-induced cell death was prevented by antioxidants N-acetylcysteine (NAC) and catalase, suggesting involvement of ROS generation in surfactin-induced cell death. Surfactin induced a sustained activation of the phosphorylation of ERK1/2 and JNK, but not p38. Moreover, surfactin-induced cell death was reversed by PD98059 (an inhibitor of ERK1/2) and SP600125 (an inhibitor of JNK), but not by SB203580 (an inhibitor of p38). However, the phosphorylation of

JNK rather than ERK1/2 activation by surfactin was blocked by NAC/catalase. These results suggest that the action of surfactin on MCF-7 cells was via ERK1/2 and JNK, but not via p38, and the ERK1/2 and JNK activation induce apoptosis through two independent signaling mechanisms. Surfactin triggered the mitochondrial/caspase apoptotic pathway indicated by enhanced Bax-to-Bcl-2 expression ratio, loss of mitochondrial membrane potential, cytochrome c release, and caspase cascade reaction. The NAC and SP600125 blocked these events induced by surfactin. Moreover, the general caspase inhibitor z-VAD-FMK inhibited the caspase-6 activity and exerted the protective effect against the surfactin-induced cell death. Taken together, these findings suggest that the surfactin induces apoptosis through a ROS/JNK-mediated mitochondrial/caspase pathway.

【题目】Surfactin Induces Apoptosis and G2/M Arrest in Human Breast Cancer MCF-7 Cells Through Cell Cycle Factor Regulation

【中文关键词】surfactin,Bacillus subtilis natto TK-1,抗肿瘤,细胞凋亡,AO/EB染色,TUNEL,Ca2+,细胞周期

【英文关键词】Surfactin Bacillus subtilis natto TK-1Anti-tumor Apoptosis AO/EB staining TUNEL [Ca2?]i Cell cycle

【中文摘要】Surfactin,提取纯化于Bacillus subtilis natto TK-1,抑制MCF-7的增殖,并且呈现剂量和时间效应,24、48、72 h的IC50分别是82.6、27.3和14.8 μM。通过典型的凋亡形态学研究,AO/EB染色和dUTP标记,显示了surfactin诱导肿瘤细胞的凋亡。Surfactin能够诱导胞内产生大量的钙离子释放。流式细胞术显示surfactin诱导MCF-7细胞凋亡主要出现在G2/M期。Western blot显示surfactin诱导肿瘤抑制蛋白p53和细胞周期调节蛋白p21的堆积,并且抑制G2酶和B1/p34。研究表明,surfactin通过诱导MCF-7的凋亡来抑制其增殖,且Ca2+在其中扮演者重要的角色。Surfactin导致G2/M期阻滞通过细胞周期因素。

【英文摘要】Surfactin, purified from Bacillus subtilis natto TK-1, inhibited proliferation of human breast cancer MCF-7 cells in a dose- and time-dependent manner, with IC50 at 24, 48, and 72 h of 82.6, 27.3, and 14.8 lM, respectively. Surfactin-induced cell death was considered to be apoptotic by observing the typical apoptotic morphological change by acridine orange/ethidium bromide staining and Transferase-mediated dUTP Nick End-labeling assay. [Ca]Imeasurement revealed that surfactin induced a sustained increase in concentration of intracellular [Ca]i. Flow cytometric analysis also demonstrated that surfactin caused time-dependent apoptosis of MCF-7 cells through cell arrest at G2/M phase. Western blot revealed that surfactin inducedaccumulation of the tumor suppressor p53 and cyclin kinase inhibitor p21waf1/cip1, and inhibited the activity of the G2-specific kinase, cyclin B1/p34cdc2. Based on our findings, surfactin inhibited proliferation in MCF-7 cells by inducing apoptosis and the elevation of [Ca]i may play an important role in the apoptosis. The mechanism which surfactin caused G2/M arrest seems to be through cell cycle factorregulation.

【英文关键词】Seed coating agents; Maize head smut; Control effect

【中文摘要】以高感玉米丝黑穗病品种吉单 209 为试验接菌寄主,从市售种衣剂中筛选出 17 个种衣剂,播种前对玉米子粒进行包衣,筛选出 6 个高效种衣剂,对玉米丝黑穗病防治效果达 90%以上,保苗效果达 95%以上

【英文摘要】Maize hybrids Jidan 209 was chosen as high susceptible to head smut and 17 seed coating agents were tested in this experiment. Maize seeds were packed by different seed coating agents before seeding. The results showed that 6 seed coating agents were selected which head smut controlling effects exceed 90% and seedling protect effects exceed 95%.

【题目】家蝇蛹血淋巴及其提取物的免疫调节作用
【中文关键词】家蝇蛹;血淋巴;提取物;免疫调节;胞外信号调节激酶
【英文关键词】Musca domestica pupae;Hemolymph;Extract;Immtmomodulation;Extracellular signal—regulated kinase(ERK)
【中文摘要】目的:观察家蝇蛹血淋巴及其提取物对小鼠脾淋巴细胞增殖的影响。方法:以不同浓度血淋巴及其提取物与脾淋巴细胞、T细胞和B细胞共孵育72小时,采用MTI"法测定淋巴细胞的吸光度值,观察它们对淋巴细胞增殖的促进作用,采用免疫印迹法研究提取物对B淋巴细胞增殖的信号转导通路。结果:与对照组相比,血淋巴冻干粉、分子量在50 kD以上的冻于粉及其提取物对混合淋巴细胞和B细胞增殖有显著促进作用,然而对于T细胞的增殖却没有明显的促进作用。^,rrI ’实验和免疫印迹结果表明血淋巴提取物激活了B淋巴细胞的ERK通路,促进了B淋巴细胞的增殖。结论:家蝇蛹血淋巴及其提取物具有免疫调节作用,为天然免疫增强剂的开发提供了一定的参考依据。

【题目】东北地区玉米弯孢菌的致病性分化与RAPD分析
【中文关键词】玉米弯孢菌;致病性分化; RAPDg
【英文关键词】curvularia lunata ;Pathogenicity differentiation; RAPD
【中文摘要】在东北三省 15 个地区采集分离 26 个玉米弯孢菌菌株,通过鉴别寄主技术与 RAPD分子标记技术进行致病性与遗传分化的研究 结果表明,东北地区玉米弯孢菌在致病性与遗传上都存在明显的变异,二者有一定的相关性,未发现变异程度与菌株地理来源有明显的直接关系 26个菌株的致病性分为 5 种类型,其中中等致病类型分布遍及东北三省,为优势致病类群;强致病类型分布在吉林省的白城市;弱致病类型主要分布在吉林省的白山和梨树 用 8 个引物对供试菌株进行RAPD扩增,共获得 77 个 RAPD标记,其中多态性标记 71 个,多态性比例92.2% 供试菌株在相似系数约0.71处共聚为4 组,大多数致病性较强的菌株聚在一起,而弱致病株在相似系数相对较低时和其他菌株聚在一起
【英文摘要】26 isolates of curvularia lunata, mainly isolated from corn curvularia leaf spot in 15 different geographic regions in Jilin, Liaoning and Heilongjiang province, which were characterized by differential host and randomamplified polymorphic DNA(RAPD). The results indicated that there was abundant genetic diversity and pathogenicitydifferentiation in these isolates. Two kinds of variation may have a certain correlation. No close correlation was found between genetic diversity and geographic orgins of isolates. The strains for test were identified as five pathogenic types by differential host which higher pathogenic types was distributed widely in Northeast, therefore that could be considered as the dominant pathogenic group. However highest pathogenic types was distributed in Baicheng in Jilin Province, weakly pathogenic types was mainly distributed in Baishan and Lishu in Jilin Province. Eight primers were employed for RAPD analyses of 26 isolates. Out of the 77 RAPD markers, 71 polymorphic markers (=92.2%) were obtain. All isolates were clustered into four distinct groups at similar level of 0.71. Most strains with highest and higher pathogenicity was clustered together, however strain with weak pathogenicity was clustered at lower similar level.

【题目】,Surfactin对人乳腺癌MCF-7细胞增殖、凋亡及细胞骨架的影响
【中文关键词】surfactin, 增殖, 凋亡, 细胞骨架
【英文关键词】surfactin, proliferation, apoptosis, cytoskeleton
【中文摘要】以体外培养的人乳腺癌细胞株MCF-7 为研究对象, 探讨surfactin 对肿瘤细胞增殖、凋亡及细胞骨架的影响。MTT 实验表明, surfactin 能抑制MCF-7 的增殖, 并且呈现出浓度和时间的依赖关系, 作用48 h 时的IC50 是27.3 mol/L。AO/EB 荧光染色法及流式细胞术检测发现, surfactin 可诱导MCF-7 发生典型的凋亡形态学改变和G2/M 期阻滞。免疫荧光和免疫印迹结果表明, surfactin 显著抑制了细胞内vimentin 的表达, 诱导了 -tubulin 的解聚和重排, 使细胞的骨架系统发生了剧烈的变化。可见, surfactin 具有抑制MCF-7 细胞增殖, 诱导细胞凋亡的作用, 其机制可能与细胞骨架蛋白的表达水平有关。

【题目】家蝇蛹凝集素对免疫低下小鼠免疫功能的影响
【中文关键词】家蝇蛹;凝集素;免疫低下
【英文关键词】Musca domestica pupae;lectin;immunomodulation activi
【中文摘要】将家蝇蛹凝集素(MPL)分别按400 lag/(kg·d)、800 lag/(kg·d)、1 200 lag/(kg·d)连续给小鼠灌胃10d,于第8d和第9d给阴性对照组和3个剂量组小鼠腹腔注射环磷酰胺,造成小鼠免疫功能低下.观察家蝇蛹凝集素对免疫低下小鼠免疫器官指数、巨噬细胞的吞噬能力、脾脏淋巴细胞增殖和血清溶血值HC n的影响.结果表明,家蝇蛹凝集素能显著拮抗环磷酰胺所致免疫功能低下小鼠的免疫器官指数下降,提高巨噬细胞的吞噬能力,明显促进脾脏淋巴细胞增殖,且能使血清溶血素含量显著增加.说明家蝇蛹凝集素对环磷酰胺所致小鼠免疫功能低下有较好的预防作用.

【题目】氮肥运筹模式对冬小麦氮素吸收利用的影响
【中文关键词】冬小麦; 施氮量; 追肥比例; 土壤氮素累积; 氮素吸收;
【英文关键词】Winter wheat; Nitrogen application amount; Ratio of base/topdressing fertilizer; Nitrogen absorption and utilization;
【中文摘要】为给小麦高产、高效、无污染及可持续生产提供合理的氮肥运筹技术和理论依据,以烟农19为材料,在大田条件下,研究了不同施氮量和基追比例对土壤-小麦系统氮素积累及分配的影响。结果表明,施氮可提高0~100 cm土体内的全氮含量。在小麦越冬前,0~40 cm土层中NO3--N含量随氮肥用量和基肥比例的增加显著增加;起身期到拔节期,施氮量为180和240 kg.hm-2且基肥∶拔节肥∶孕穗肥为3∶5∶2处理的0~40 cm土层内NO3--N含量下降,而施氮量为240 kg.hm-2且基肥∶拔节肥为7∶3和5∶5的处理及施氮量为300 kg.hm-2且基肥∶拔节肥为7∶3的处理则显著增加;拔节期到成熟期,随施氮量的增加,0~60 cm土层速效氮增加幅度有所提高。孕穗肥可明显提高灌浆期的植株全氮含量。因此,在240 kg.hm-2施氮水平、基肥∶拔节肥∶孕穗肥为3∶5∶2条件下,施氮既能减少土壤硝态氮累积量,又能有效降低土壤硝态氮污染地下水的可能性。
【英文摘要】The experiments were conducted from 2006 to 2008 at the farm of Anhui Agricultural University.Yannong 19 was used in this study.The effects of three nitrogen application amounts ranged from 180 to 300 kg · hm-2 and three ratios of base and topdressing on nitrogen assimilation and distribution in soil-plant system were investigoued.The main results were as follows: application of nitrogen fertilizer could increase total nitrogen content in 0~100 cm soil profile.The NO3——N content in 0~40 cm soil layer increased significantly with the increment of nitrogen fertilizer dosage and ratio of basal nitrogen fertilizer at the wheat over-winter stage.The NO3——N content in 0~40cm soil layer lowered for treatments L1,M1,while that of treatments M3,H2,H3 increased in 0~40 cm soil layer at middle growth stage.The NO3——N content of depth layer increased obviously in 0~60 cm soil layer for three ratios of base and topdressing at the same nitrogen fertilizer dosage during middle and latter growth stage,especially under the high nitrogen fertilizer level.The total nitrogen content of wheat plant before anthesis could be increased with the mount of basal nitrogen fertilizer increasing.In general,M1(basal N fertilizer: jointing N fertilizer: booting N fertilizer=3∶5∶2) was the optimum nitrogen application model for 240 kg N · hm-2,which only could decrease the possibility of nitrogen pollution to groundwater but also gained the best economy benefit.

【题目】Genome-scale identification of cell-wall related genes in Arabidopsis based on co-expression network analysis
【中文关键词】无
【英文关键词】Plant cell wall, Arabidopsis, Co-expression network analyses, Bi-clustering, Cis regulatory motifs
【中文摘要】无
【英文摘要】Here we present a computational study focused on identification of the novel PCW genes inArabidopsis based on the co-expression analyses of transcriptomic data collected under 351conditions, using a bi-clustering technique. Our analysis identified 217 highly co-expressedgene clusters (modules) under some experimental conditions, each containing at least onegene annotated as PCW related according to the Purdue Cell Wall Gene Families database.These co-expression modules cover 349 known/annotated PCW genes and 2,438 newcandidates. For each candidate gene, we annotated the specific PCW synthesis stages inwhich it is involved and predicted the detailed function. In addition, for the co-expressedgenes in each module, we predicted and analyzed their cis regulatory motifs in the promotersusing our motif discovery pipeline, providing strong evidence that the genes in each coexpression module are transcriptionally co-regulated. From the all co-expression modules, weinfer that 108 modules are related to four major PCW synthesis components, using three complementary methods.

【题目】欧洲葡萄品种‘无核白’不同营养系果实的酚类物质
【中文关键词】葡萄;无核白;酚类物质;多酚氧化酶;白藜芦醇
【英文关键词】grapevine; Thompson Seedless; phenolic compounds; polyphenol ox idase; resveratrol
【中文摘要】摘要:【目的】更有效地发挥欧洲葡萄品种‘无核白’不同营养系鲜食或制干的用途,筛选‘无核白’系列大粒与白藜芦醇含量较高的鲜食品系,酚类物质浓度与多酚氧化酶活性较低而适宜绿色葡萄干制备的制干品系。【方法】以‘无核白’葡萄为对照,以其性状上有变异的 10 个营养系成熟果实为材料,取样测定其果粒重,用折光仪测定可溶性固形物含量,HPLC 法测定果皮与全果白藜芦醇含量、酚类物质,比色法测定多酚氧化酶活性。【结果】大粒无核白和 W3 等营养系浆果单粒重为对照的 1.3286—1.4682 倍;W2、W8、长穗无核白和 W7 等营养系果实白藜芦醇含量为对照的 110.65%—128.41%;‘无核白’葡萄营养系果实中总酚含量具有明显差异,含量较低的有长粒无核白、W8、W3 和大粒无核

白等;不同营养系果皮中多酚氧化酶活性是全果的 1.06—13.19 倍。【结论】与对照相比,供试 10 个‘无核白’葡萄营养系中,单粒重、可溶性固形物含量、果皮与全果的白藜芦醇含量较高的有 W3、大粒无核白、长粒无核白和 W5 等;酚类物质总量较低的营养系有大粒无核白、长粒无核白、W3 等;多酚氧化酶活性较低的营养系有 W7、长穗无核白、W3、W8。本研究结果为‘无核白’系列无核葡萄品种选育提供了部分依据。

【英文摘要】Abstract: 【Objective】 This research was aimed to evaluate the clonal lines of V. v i n e f e r a cv. Thompson Seedless for breeding of new table grape varieties of higher resv eratrol concentration, or ne w raisin grape varieties of lower total phenolic compound (TPC) concentration and polyphenol oxidase (PPO) activity relatively. 【Method】 Using V. v i n e f e r a cv. Thompson Seedle ss and ten diverse lines of this variety as materials, fresh berry mass and soluble solid content (TSS), resveratrol ,TPCs and PPO activity were evaluated. 【Result】 The results indicated that the berry mass of Big-berry Thompson Seedless and W3 were 1.3286-1.4682 times of that of the control (Thompson Seedless). Resveratrol contents of W2 , W8, Long-bunch Thompson Seedless and W7 were 110.65%-128.41% of that of the control. TPC contents of each lines were significantly different, in which Long-berry Thompson Seedless, W8, W3, and Big-berry Thompson Seedless were with small amount TPCs. PPO activity of berry skin was 1.06-13.19 times of that of the whole berry.【Conclusion】Compared to the control, W3, Big-berry Thompson Seedless, Long-berry Thompson Seedless and W5 were superior for fresh table grape breeding based on berry mass, T SS, resveratrol content. TPCs of Big-berry Thompson Seedless,Long-berry Thompson Seedless and W3 were relatively lower th an other lines, and PPO activity of W7, Long-bunch Thompson Seedless, W3, W8 were relatively low among the materials tested. These results could pr ovide some indications for the prospecti ve breeding of new lines of Thompson Seedless variety.

【题目】利用胚挽救技术创制葡萄多倍体种质的研究
【中文关键词】葡萄多倍体胚挽救流式细胞术 染色体计数 育种
【英文关键词】Grape ; Polyploid ; Embryo rescue ; Flow Cytometry ; Chromosome identification ; Breeding
【中文摘要】为培育三倍体无核葡萄新品种以二倍体欧洲葡萄无核品种红宝石无核 爱 莫 无 核黎明无核和欧山杂种北醇及四倍体欧美杂种藤稔 黑奥林为亲本进行了红宝石无核 藤稔黎 明 无 核藤 稔爱 莫 无 核黑 奥 林藤 稔北 醇黑奥林北醇 个组合的杂交通过胚挽救技术获得杂种幼苗 株 在此基础上利用流式细胞术 染色体计数的方法对所获得的杂种幼苗进行了早期倍性鉴定 结 果 表 明 有 株杂种为三倍体 株 为 四 倍 体 株 为 非 整 倍 体 其 余株为二倍体 这将为进一步选育出三倍体无核葡萄新品种和提供新的育种材料奠定基础
【英文摘要】For the purpose of breeding triploid grape , five cross combinations including Ruby Seedless (Vitis vinifera) × Fujiminori (V. vinifera × V. labrusca) , Dawn Seedless (V. vinifera) × Fujiminor (V. vinifera × V. labrusca) , Emerald Seedless (V. vinifera) × Black Olimpia (V. vinifera × V. labrusca) , Fujiminori × Beichun V. vinifera × V. amurensis and Black Olimpia × Beichun were performed and embryo rescue techniques were employed. As a result , 41 ybrid seedlings were obtained. Furthermore , the chromosome ploidy of these ybrids was measured by flow cytometry and chromosome identification. The results showed that the hybrids were made up of 10 triploid plants , 6 tetraploid plants , 4 aneuploid plants and 21 diploid plants. This study will provide a foundation for further breeding triploid varieties and new breeding materials in grape.

【题目】不同秸秆还田方式对夏玉米性状及水分利用效率的影响
【中文关键词】麦秸; 玉米; 出苗率; 抗倒性能; 水分利用效率;
【英文关键词】wheat straw; maize; emergence rate; lodging-resistance; water use efficiency;
【中文摘要】为探求适合淮北平原机播夏玉米的最佳麦秸还田方式,在大田条件下,研究了麦秸全量还田方式(粉碎抛撒、灭茬覆盖、直接覆盖)对机播夏玉米出苗率、抗倒性能和水分利用效率的影响。结果表明,粉碎抛撒处理的出苗率最高;灭茬覆盖处理的总倒伏率最低,而单株气生根数目,总根条数和根系干重最高,且其植株基部第3~7节间的直径、单位茎长干重和茎秆压碎强度、穿刺强度、抗倒指数、土壤含水率、产量及水分利用效率也高于粉碎抛撒和直接覆盖处理。灭茬覆盖和粉碎抛撒处理的产量和经济效益之间差异不显著,但均高于直接覆盖处理。因此,无论是从直接经济效益,还是长期的生态效益考虑,麦秸灭茬覆盖和粉碎抛撒覆盖都值得在生产中推广。
【英文摘要】The objective of this study was to investigate effects of different treatments of wheat straw such as grinding cover(GC),stubbing cover(SC) and direct cover(DC) on emergence rate,lodging-resistance and water use efficiency of summer maize sowed mechanically in Huaibei district.The results showed that GC-treated maize had the highest emergence number and rate,SC-treated one had the lowest total lodging percentage whereas the brace root number,total root number and root dry weight per plant were the highest.Among the three treatments,GC had the higher basal 3 to 7 internode diameter,the ratio of dry weight to length of internode,culm crashing strength and rind penetration strength,lodging-resistance index,soil water content,grain yield and water use efficiency.There is no significant difference of grain yield and economic benefit between GC and SC treatments,but all of them were higher than these of DC.Therefore,when taking both economic and long-term ecological benefits into consideration,treatment of mechanically-sowed summer maize with GC and SC will become a favorite practice for summer maize production in Huaibei district.

【题目】超高产玉米品种不同密度光合特性的比较研究
【中文关键词】超高产玉米;穗部性状整齐度;产量;密度
【英文关键词】Super high-yieding corn; Ear characteristics uniformity;Yiled;Plant population

【中文摘要】对两个超高产玉米品种先玉335和郑单958在5个密度种植条件下的穗部性状整齐度及其与产量的关系研究表明,穗部各性状整齐度与产量均呈正相关,并且行粒数整齐度、穗粒数整齐度、穗位高整齐度均在7.5万株/公顷和9.0万株/公顷两个密度条件下最高;先玉335产量在9.0万株/公顷条件下最高,7.5万株/公顷时次之;郑单958产量在7.5万株/公顷密度下最为突出;两个品种的穗位高整齐度和行粒数整齐度均与产量的关系最为密切,因此,把行粒数整齐度和穗位高整齐度作为选择高产品种和采取适宜栽培措施的一项指标具有一定的可行性。
【英文摘要】The correlation between the ear uniformity and yield of two super high-yielding corn, Xianyu335 and Zhengdan958,was studied,the results showed that there were positively correlated between the ear characteristics uniformity and yield, and the value of seeds per row uniformity,seeds per ear uniformity and ear height uniformity was the highest by planting in plant populations of 75000 plants/hm2 and 90000 plants/hm2.Yield of Xianyu335 was the best by planting in 90000 plants/hm2 and the better in 75000 plants/hm2,yield of Zhengdan958 was the best by planting in 75000 plants/hm2.There was closed relationship between ear height uniformity,seeds per row uniformity and yield. So, the ear height uniformity and seed per row uniformity couled be used as a selection index for high-yielding corn cultivars and taking feasible cultural measure.

【题目】秸秆全量还田对冬小麦不同小穗位和粒位结实粒数和粒重的影响*
【中文关键词】秸秆还田; 冬小麦; 结实粒数; 粒重; 小穗位; 粒位;
【英文关键词】straw returned to the field; winter wheat; fertile spikelet number; grain weight; spikelet position; grain position;
【中文摘要】【目的】研究小麦玉米秸秆连续全量还田对小麦穗部不同小穗位和粒位结实粒数及粒重变化的影响。【方法】通过设置3年定位试验研究小麦玉米秸秆全量还田对小麦不同小穗位结实粒数、粒重的小穗位和粒位的影响效应。【结果】小麦玉米秸秆连续全量还田提高了小麦的公顷穗数、穗粒数、千粒重和产量。各处理小麦不同小穗位结实粒数、小穗重、小穗平均单粒重均呈现二次曲线变化趋势,不同粒位的粒重也随小穗位的变化呈二次曲线形式。结实小穗越多、各小穗结实粒数或单粒重差异越小,空间分布模拟曲线的弧度越平缓。秸秆还田提高了小麦主茎穗和分蘖穗的结实小穗数与小穗结实粒数,降低了不孕小穗数,且下部小穗的结实粒数增加幅度较大;秸秆还田还提高了小麦不同粒位的单粒重,以第3、4粒位提高幅度较大。【结论】小麦玉米秸秆连续全量还田提高了小麦不同小穗位的结实粒数和粒重,进而提高了籽粒产量。

【英文摘要】【Objective】 The objectives of this study were to research the change of gain number and grain weight of wheat with spikelet and grain position in main stem and tiller spike under the condition of straw returned to the field.【Method】 A location field experiment was conducted from 2008 to 2010,single maize straw returned to the field,single wheat straw returned to the field,wheat and maize straw returned to the field were conducted to study the effects of straw returned to the field on grain number and grain weight at different spikelets and grain positions in winter wheat.【Result】Results showed that,the spike per hectare,grain number per spike,1 000-grain weight and yield were increased in treatment of straw returned to the field.The distribution of grain number,spikelet weight,and grain weight with the spikelets positions showed parabolic changes,so as the grain weight at 1st,2nd,3rd in each treatment and 4th in treatment of straw returned to the field.The more fertile spikelet number and less difference in spikelet grain number and single grain weight,the smoother the parabola was.The fertile spikelet number and spikelet grain number in main stem and tiller spike were increased in treatment of straw returned to the field,the increase range of fertile spikelet number in the bottom spikelet were bigger.There were different increasing effects of straw returned to the field on single grain weight at different grain positions,especially for at of 3rd and 4th grain position.【Conclusion】 Therefore,under the condition of wheat and maize straw returned to the field,grain yield and yield components,spikelet grain number and grain weight at different spikelets of wheat were enbanced.

【题目】温宿红葡萄生物学特性及果实性状多样性研究
【中文关键词】葡萄;温宿红;多样性;物候期;新疆
【英文关键词】Wensuhong;grapevine;biodiversity;phenophase;Xinjiang
【中文摘要】摘要:【研究目的】温宿红是新疆温宿县地方优异葡萄品种,当地长期栽培中形成了丰富的葡萄种质资源多样性,该文通过对温宿红葡萄果实与形态性状多样性的研究,以期为筛选出适合当地条件的温宿红葡萄系列新品种(系)提供材料基础。【方法】通过田间观察,以果实特性为主要指标,植株形态特征为辅,研究温宿红葡萄品种多样性。【结果】温宿红葡萄植株生长势强,晚熟、丰产,果穗松紧适中、穗梗粗壮,果粒圆、大小一致,果肉硬脆,味甜,果皮红色鲜丽,符合人们的消费习惯,有一定的耐贮运性,是较为理想的鲜食品种。温宿红自然群体中存在诸多变异类型,初步筛选出的7 个形态与果实性状多样性植株在果穗、果粒形态,果实耐压力、耐拉力、可溶性固形物含量和种子数等方面均存在显著性差异。【结论】温宿红葡萄自然群体中存在变异类型,对该品种的深入研究及初选的多样性植株具有一定育种及利用价值。
【英文摘要】Abstract:【OBJECTIVE】Grapevine ‘ Wensuhong ’ is an elite grapevine variety native to Wensu County,Xinjiang. Some vegetative mutations might exist in the garden. The objective of this study is to evaluate thebiologicalcharacteristicsandbiodiversityofthefruitcharacteristicsofthevariety, 【METHOD】Thestudywasperformed on the variety through field investigation and vegetative mutant selection. 【RESULTS】The resultsindicated that the plants of this variety were vigorous growth, late maturation, productive. The grape bunchesweremoderateindegreeoftightness,strongonbunchstalk.Theberrywascircular,identical,sweet,somewhatfirm,crispyandwithlonger shelflife.Thegrapepeelwasattractivelyred.Soitisasuperiorcultivatedvarietyof table grape. There are many variations in the natural grapevine population. Seven diversity plants of thevariety based on the fruit characteristics were selected. They were significantly different in bunches, berrymorphology, press and pull resistance, soluble solid content and number of seeds in each grape.【CONCLUSION 】We could conclude that it

【题目】砂姜黑土区小麦玉米秸秆全量还田对玉米抗倒性能的影响*
【中文关键词】夏玉米; 砂姜黑土; 秸秆还田; 抗倒性能;
【英文关键词】summer maize; lime concretion black soil; straw returned to the field; lodging-resistance;
【中文摘要】【目的】探讨砂姜黑土区小麦玉米秸秆全量还田对夏玉米抗倒性能的影响。【方法】以夏玉米品种郑单958为材料,通过定位试验研究小麦玉米秸秆全量还田对玉米抗倒性能的影响。【结果】小麦或玉米秸秆全量还田均能提高玉米气生根条数、0—30 cm土层根条数及根系干重,同时,玉米株高和单株鲜重均有所增加。秸秆还田后,在吐丝期和灌浆中期,玉米茎秆基部3—7节间的长度、直径、干重和单位茎长干物质重有增加的趋势,尤其是基部节间的茎秆压碎强度和穿刺强度显著提高。另外,玉米的根倒伏系数显著降低,而植株抗倒指数则显著升高。相关分析表明,根倒伏系数与根倒率显著正相关,而与单株鲜重、根系干重和基3节压碎强度显著负相关。玉米总倒折率与节间长度极显著正相关,而与节间干重、充实度、压碎强度和穿刺强度显著负相关。【结论】小麦玉米秸秆连续全量还田可以显著降低夏玉米的根倒率和茎折率,提高籽粒产量。
【英文摘要】【Objective】 The objective of the experiment is to study the effects of straw returned to the field on lodging resistance of maize in lime concretion black soil region.【Method】 Maize cultivar Zhengdan 958 was grown in this plot experiment to investigate the effects of straw returned to the field on lodging resistance of maize.【Result】 The results showed that wheat or maize straw returned to the field could increase aerial root number,root number in 0-30 cm soil layer and root weight,so as the plant height and fresh weight of maize.After straw returning,the length,diameter,dry weight and ratio of dry weight to length of internodes from bottom 3rd to 7th were increased especially the stalk crash strength and stalk rind penetrain strength of bottom internodes were significantly increased at silking and filling stage.In addition,the root lodging coefficients were a significantly decreased while the lodging resistance indexes were significantly increased.The correlation coefficient showed that there was significant positive correlation between root lodging coefficient and root lodging percentage while there was a negative significant correlation among root lodging coefficient,fresh weight,root weight and stalk crash strength of bottom 3rd internode.The relation between total lodging percentage and internode length was a very significant post ive correlation while that among total lodging percentage and the dry weight,plumpness,crash strength and rind penetrain strength of internodes were a significant negative correlation.【Conclusion】 Therefore,under the condition of wheat and maize straw returned to the field,the root lodging percentage and stalk breaking percentage of maize would be decreased while the grain yield would be increased.

【题目】氮肥运筹方式对孕穗期受渍冬小麦穗部结实特性与产量的影响*
【中文关键词】渍害; 氮肥运筹方式; 冬小麦; 结实特性; 产量;
【英文关键词】Waterlogging; Nitrogen fertilization; Winter wheat; Seed-setting characteristics; Grain yield;
【中文摘要】以小麦品种皖麦54为试验材料,连续两个生长季进行了氮肥运筹方式对孕穗期渍水冬小麦不同小穗位、粒位的结实粒数和粒重影响的观测。结果表明,不同氮肥运筹方式显著影响穗部结实特性,主茎穗结实特性优于分蘖穗。全部基施的氮肥运筹方式较基肥50%+拔节肥50%和基肥30%+拔节肥50%+孕穗肥20%的运筹方式显著增加了不孕小穗数,降低结实小穗数和结实粒数,2008—2010两年度全部基肥运筹方式较基肥30%+拔节肥50%+孕穗肥20%氮肥运筹方式处理不孕小穗数分别增加25.5%和29.8%,结实小穗数均降低5.7%。孕穗期渍水逆境对分蘖穗结实特性影响大于主茎穗,渍水逆境显著增加不孕小穗数,较对照处理,2008—2010两年度,不孕小穗数分别增加10.6%和4.6%;结实小穗数分别降低2.8%和1.4%。孕穗期渍水降低主茎穗结实4粒的小穗数比例和分蘖穗结实3、4粒小穗数的比例及第3、第4粒位籽粒粒重和第3、第4粒位粒重对单穗粒重的贡献率。氮肥后移运筹方式显著提高孕穗期受渍小麦主茎、分蘖穗结实小穗数和粒重,增加主茎和分蘖穗结实3、4粒小穗的比例和结实小穗第3、4粒位的粒重,提高第3、4粒位粒重对单穗粒重的贡献率,减少不孕小穗数,进而较氮肥前移处理显著提高经济产量。氮肥后移运筹方式有利于减轻孕穗期渍害对小麦穗部结实特性的影响。
【英文摘要】Waterlogging has great influence on yield reduction in winter wheat production in some areas of China. Nitrogen (N) application is believed to be able to improve dry matter translocation in wheat, as a result to increase final yield. In a field experiment

across two growing seasons, we used winter wheat cultivar "Wanmai 54" to investigate the effect of waterlogging at booting stage and N fertilizing strategy on number and weight of grain at different spikelet positions and grain positions. Under both waterlogging and control (normal watering) conditions, we implemented four N application treatments with different N application ratios (total N amount of 240 kg ha 1 in all treatments) at land preparation, jointing, and booting stages (10:0:0 for N1, 7:3:0 for N2, 5:5:0 for N3, and 3:5:2 for N4). The results showed that seed-setting characteristics of main stem were superior to tiller spike. In the N1 treatment, the sterile spikelet per spike was significantly increased, and the grain number per spike was significantly decreased. Compared with N4 treatment, sterile spikelet per spike of N1 treatment increased by 25.5% and 29.8% in 2008-2009 and 2009-2010 growing seasons, respectively. The grain number per spike of N1 treatment decreased by 5.7%. Waterlogging had greater effect on the tiller spike than the main stem spike. Waterlogging at booting stage significantly increased sterile spikelet per spike by 10.6% and 4.5%, and the grain number per spike decreased by 2.8% and 1.4% in the two growing seasons, especially for spike with four grains on main stem and three grains per spike of tiller spike, the grain weight in the third and the fourth grain positions, the contribution rate of the third and the fourth grain weights to the grain weight per spike. With the delay of N fertilization, spikelet per spike, single weight per spike increased significantly, the sterile spikelet per spike decreased compared to the prior N fertilization treatments. Postponed N fertilization could compensate the decrease of spike with three and four grains and increase the grain weight in third and the fourth grain positions under waterlogged environment at booting stage, increase the contribution rate of the third and the fourth grains weight to the grain weight per spike. Therefore, with the postponed N fertilization, grain yield and spikelet grain number and grain weight at different spikelet of wheat were enhanced. Results indicate that postponed N fertilization alleviates the effect of waterlogging at booting stage on the seed-setting characterisitics of spike and single grain weight.

【题目】新疆阿克苏地区木纳格葡萄果实性状多样性研究
【中文关键词】木纳格;果实性状;多样性;新疆阿克苏
【英文关键词】fruit characteristics; Munage; diversity; Akesu of Xinjiang
【中文摘要】摘　要:以新疆地方葡萄品种木纳格栽培资源为对象,以品种选育为目标,研究了果实性状多样性。初步结果表明,果穗性状(果穗长、穗宽、果穗梗长、果穗重),果粒性状(单粒重、果粒纵横径、果梗长),果实商品性状(果实耐压力、果梗耐拉力、可溶性固形物含量), 种子性状(种子数、种子鲜重)等指标,均获得了丰富的多样性,大部分多样性植株具有比对照木纳格更优良的特性,其中28、8、13和27号等株系综合性状较好,为进一步研究木纳格葡萄果实性状多样性植株的遗传稳定性及变异植株的生理、分子机理等奠定了材料基础。
【英文摘要】Abstract : The diversity of the fruit characteristics of Vitis vinifera cv. Munage, a traditional grapevine cultivar cultivated in southern Xinjiang Uygur Autonomous Region, was studied for breeding elite variety. A plenty of individual plants were evaluated, and they showed different the grape bunch characteristics, including bunch length and width, bunch stalk length, bunch weight; different grape berry characteristics, including single berry weight, berry length and width, length of berry stalk; different grape commodity characteristics, including pressure and pulling force of berry, and its soluble solid content; and different characteristics of seeds, including seed number per berry and seed weight. Most of the clones have one or more phenotypic traits superior to that of Munage used as the control, among which clone 8, 13, 27, and 28 were those with comprehensively advanced variants. The results suggested these plants could be used as materials for further studies on the hereditary stability, physiological, and some molecular mechanism of some important phenomena.

【题目】砂姜黑土区秸秆还田对玉米生育及水分利用效率的影响
【中文关键词】砂姜黑土; 秸秆还田; 玉米; 出苗; 水分利用效率;
【英文关键词】lime concretion black soil; straw returned to the field; maize; emergence; water use efficiency;
【中文摘要】为了在淮北砂姜黑土区推广小麦玉米秸秆全量还田技术,采用大田定位试验,设置小麦玉米秸秆不还田、小麦玉米秸秆单季还田和小麦玉米秸秆两季还田4种秸秆还田方式,研究了小麦、玉米秸秆全量粉碎还田对机播夏玉米出苗、生育、产量和水分利用效率的影响。结果表明:小麦玉米秸秆两季还田处理2008和2009年玉米出苗数分别比对照高3.25%和11.98%;出苗均匀度、株高整齐度、幼苗素质和耕层土壤含水率均高于对照,最终2008和2009年玉米产量分别较对照提高了7.92%、9.51%,土壤水分利用效率分别提高了8.15%、9.48%。可见,砂姜黑土区小麦玉米秸秆两季全量还田有利于玉米生长发育,提高籽粒产量。
【英文摘要】The effects of straw returned to the field which including no straw returning(CK),wheat straw returning(T1),maize straw returning(T2) and wheat and maize straw returning(T3) on emergence,growth,yield and water use efficiency of maize under field location condition to generalize the techniques of total straw of wheat and maize returned to the filed in lime concretion black soil region of Huaibei plain.The results showed that to compared with CK,the maize emergence number of T3 were increased by 3.25% and 11.98% in 2008 and 2009,respectively.The emergence rate,emergence uniformity,evenness of plant height,seedling quality and soil water content of T3 were higher than that of CK,which created a good population growth condition for maize,thus the population leaf area index and dry matter accumulation of that were improved.Finally,be compared with CK,the yield of T3 were increased by 7.92% and 9.51% while water use efficiency of that were increased by 8.15% and 9.48% in 2008 and 2009,respectively.Therefore,under the condition of wheat/maize straw returned in two seasons,the growth and grain yield of maize could be improved.

【题目】新疆喀什地区四个葡萄品种的引种分析
【中文关键词】新疆;喀什; 葡萄;果实性状
【英文关键词】Xinjiang; Kashi; Grapevine; Fruit introduction
【中文摘要】摘　要: 对新疆喀什引进栽培的红地球、黑大粒、巨峰及美人指葡萄的果实性状进行了测定分析。结果表明:4个供试品种在喀什地区都具有较强的适应性,果穗、果粒形态表现出了该品种应有的特性, 丰富了当地葡萄栽培品种。但供试各品种可溶性固形物含量偏低, 果粒偏小, 分析主要原因是当地有关葡萄生产、科研与技术推广相对薄弱的现状, 影响了品种的果实特性, 当地栽培管理技术水平亟待提高。
【英文摘要】Abstract:Fruit characteristicsof 4grapevinevarietiesof RedGlobe, Exotic, Kyoho,ManicureFinger, cultivatedinKashi,Xinjiangwereanalysized. Theresultsindicatedthat all the4varietiescouldbeculturedhere, but thefruitswerenot sogoodunder cultivationtechnologynowadays. Thesedemonstratedthat trainingthefarmersof theircultivationtechnologyfor grapeproductionwaspractically important.

【题目】播种密度对冬小麦不同穗位与粒位结实粒数和粒重的影响
【中文关键词】冬小麦; 播种密度; 穗型; 小穗位; 粒位;
【英文关键词】Winter wheat; Plant density; Spike type; Spikelet position; Grain position;
【中文摘要】利用重穗型小麦品种兰考矮早八和中间型品种周麦18,研究了不同播种密度对结实粒数与粒重的小穗位和粒位效应的影响。结果表明,不同穗型冬小麦品种小穗位结实粒数、小穗重及不同粒位粒重均随着小穗位自基部至顶部呈先增后降的二次曲线变化;不同穗型冬小麦品种穗部籽粒的分布差异显著,主茎穗的结实特性及粒重均优于分蘖穗;随着播种密度的下降,穗部结实特性和粒重有优化的趋势,重穗型品种兰考矮早八对密度的反应更为敏感,中间型品种周麦18小穗位和粒位对播种密度的调节效应较强;不同部位小穗粒重因结实粒数的差异表现出不同的粒位效应,下部和中部小穗位的第2粒位粒重较大,而位于上部和顶部小穗位第1粒位粒重较大,第3粒位粒重次于第1和第2粒位,第4粒位粒重最小。在小麦栽培中,应在保证主茎穗的基础上适当增加分蘖穗的比例。并在保证结实粒数的基础上提高粒重,尤其是下部小穗的结实粒数和粒重。同时,在保证第1、2粒位粒重的前提下最大限度地发挥第3、4粒位的粒重潜力,可以使小麦实现高产稳产。
【英文摘要】Seed-setting traits and grain weight are influenced by either genetic factor or cultivation environment in wheat (Triticum aestivum L.), such as plant density. Due to the unbalanced development of a spike, grain number and grain weight at different spikelets and grain positions are largely different. Although their distributions have been described in earlier reports, the effect of plant density is not clear. This study focused on the effect of plant density on the grain number and grain weight of two wheat cultivars (Lankao Aizao 8 of large-spike type and Zhoumai 18 of medium-spike type) at different spikelets and grain positions. The grain number, spikelet weight, and grain weight with the spikelets positions from the bottom to the top increased first and then decreased. The differences of seed-setting traits between two cultivars were significant. Meanwhile, seed-setting traits of main sipke were superior than that of tillering spike. Under low sowing density, the seed setting characteristics and grain weight in Lankao Aizao 8 were more superior than those in Zhoumai 18, and those of main stem spike were more superior than those of tillering spike. The effects of spikelet and grain positions on the weight of individual grain varied with the grain number of spikelet. For the basal and middle spikelets, the grain weight was higher at second grain position than at the first one, whereas it was inverse for the upper and top spikelets. The grain weight was lower in the third grain position than in the first and second grain position, and the least in the fourth grain position. In conclusion, appropriate plant density is important for high yield of different spike-type cultivars, and in wheat production we should properly increase the proportion of tillering spike on the basis of ensuring main stem spike number; increase grain weight on the basis of ensuring fertile grain number especially for basal spikelet; and develop the potential of grain weight in the third and fourth grain positions on the basis of ensuring that in the first and second grain positions of spikelet.

【题目】环塔里木地区葡萄科研推广现状
【中文关键词】新疆;塔里木盆地;葡萄
【英文关键词】Xinjiang; Tarim Basin; grapevine
【中文摘要】摘要:通过对新疆环塔里木盆地各主要葡萄产区实地考察与查阅相关研究文献资料,对该地区的葡萄科研与技术示范推广现状予以综述。主要内容包括当地葡萄基础与育种研究、引种试验、栽培技术研究、采后技术、加工、农机、科技推广和发展战略研究等;重点从10个方面(葡萄标准化生产技术、建园技术、水分管理、套袋技术、修剪技术、施肥、激素处理、套种与病虫草害及其防治)总结了栽培技术研究进展;分析该地区葡萄产业发展存在问题,提出了相应的对策与建议。以期对当地葡萄行业决策、产业发展、科研与技术推广及当地群众技术全面提升提供依据。
【英文摘要】Advances and current situation of grapevine R&D in the area around Tarim Basin in recent years were reviewed based on our field survey and literature related reading. The paper focused on researches of fundamental and breeding, introduction, cultivation, post-harvest and processing, agricultural machinery, and development strategy, and status of science and technology extension. The cultivation techniques of grapevines were summarized especially on some different technology aspects of standardization cultivation, water and fertilizer management, bagging, pruning, plant growth regulator application, inter-planting, plant diseases, insect pests, weed prevention and control. The countermeasures for dealing with existing problems of grapevine industry developments in this area were raised. The results could be references for the grapevine industry development, research and technology extension and training.

【题目】BMY牛冷冻精液质量控制及影响因素研究
【中文关键词】BMY牛; 冷冻精液; 人工授精; 冷冻; 解冻
【英文关键词】BMY cattle; Frozen semen; Artificial insemination; Chill; T haw
【中文摘要】[目的] 为了加大BMY 牛的推广应用力度和提高人工授精受胎率, 开展了BMY 牛冷冻精液质量控制研究, 优选出冷冻稀释液及得出冷冻精液质量控制技术程序。[方法] 采用不同的初始冷冻温度、不同种类的稀释、不同的冷冻方法对BMY牛精液冷冻及解冻效果进行试验。[结果] 不同的初始冷冻温度、不同种类的稀释液、不同的冷冻方法, BMY 牛精液冷冻解冻效果各异。初始冷冻温度为-121~-140℃时, TRIS 液为基础稀释液添加糖类和氨基酸一步法稀释BMY 牛精液冷冻6~10 min BMY 牛冷冻精液解冻效果较好, 用程控冷冻仪冷冻BMY 牛精液, 同样获得良好的解冻效果, 解冻活力达到0.372±0.026。BMY 牛冷冻精液平均解冻活力可达0.357±0.029 以上, 精子解冻复苏率达50% 以上。精子畸形率平均为16.8% ±4.26%, BMY牛采精成功率为75.3%。[结论] 全放牧条件下BMY 牛电刺激采精法获得很好效果, 精液质量好, 更有利于种质资源的保存和利用。
【英文摘要】【Objective】The purpose was to enhance the extension and apply of BMY cattle, to select the good quality semen and get the quality control technical procedure.【Method【The frozen semen and thaw effect of BMY were tested by different initial frozen temper atures, different types of dilution liquid and different frozen methods. During the initial chill temperature was between -121 and-140°C, the thaw effect was the best by using adding and amino acid in TRIS dilution liquid and chilling 6 to 10 min. The frozen semen had the same effect with the above by using program mable freezing instrument, and the thaw activity was 0.372±0.026. The mean thaw activity of BMY frozen semen was more than 0.357±0.029, and the thaw recovery rate was above 50%. The mean rate of sperm deformity was 16.8±4.26% , and the success rate of semen was 75. 3% .【Conclusion】The sperm collection method by electrical stimulation had good effect under season long grazing , and the semen quality was high, which was better preserve and utlize the germplasm resources.

【题目】不同贮藏温度对红提葡萄贮期品质及生理指标变化的影响
【中文关键词】红提葡萄;不同温度;品质指标;生理指标
【英文关键词】Red Globe grape;different temperature;quality;physiology
【中文摘要】【目的】研究和筛选红提葡萄采后适宜的贮藏温度。【方法】将红提葡萄分别贮藏于1、0、-1、-2和-3℃下,测定其贮期呼吸强度、乙烯释放量、硬度、可溶性固形物、相对电导率、丙二醛(MDA)含量等品质生理指标的变化。【结果】-1℃为红提葡萄较为适宜的贮藏温度,该温度下,果实的呼吸与乙烯变化趋势较为平缓,果实硬度保持较好,略高于其它温度处理,且能够较好的保持果实在贮藏期间果肉细胞的完整性,果实内丙二醛等有害物质的含量略低于其它处理,可溶性固形物含量略高于其它处理。【结论】-1℃能够较好的保持红提葡萄果实在贮藏期间果肉细胞的完整性。
【英文摘要】【Objective and Method】The study was conducted to determine the five different temperatures for Red Globe grape storage experiment and reveal the quality and physiological index of postharvest Red Globe grape, such as the changes of respiration、the production rate of C2H2,firmness,soluble solids content,cell membrane permeability,MDAcontentunderthe temperature of 1℃,0℃,-1℃,-2℃,-3℃.【Result and Conclusion】The result showed that -1℃is the best storage temperature for the Red Globe grape,in this temperature,the change tendency of respiration and the production rate of C2H2is gentle,the fruit was kept in suitable firmness.It was slightlybetterthan thatofothertemperature,MDAcontentwas lower and soluble solids contentwas higherthan other processing.

【题目】BMY牛杂交利用的初步研究
【中文关键词】BMY牛; 杂交改良; 杂种优势率; 生长性能
【英文关键词】BMY cattle; Crossbreeding ; Heterosis Rate; Growth Performance
【中文摘要】[目的] 以BMY 牛为父本, 云南黄牛、西本杂、短本杂等为母本的多元肉牛杂交, 以期为云南省肉牛改良及其肉牛生产模式提供发展基础。[方法] 通过应用BMY 公牛及冻精与云南黄牛及其杂交母牛进行杂交改良中试。[结果] 截止2009 年底累计完成杂交改良14 734头, 产犊12 738 头, 产犊率86. 45%。进行了1 485 头次体重体尺测定, BMY 牛对云南黄牛及云南现有杂交组合的杂交后代初生体重为12.40 kg, 较云南黄牛(YY) 高1. 64 kg, 提高幅度较小(P > 0. 05) , 但6月龄体重为108. 96 kg , 较YY 高74. 99 kg , 有明显的改良效果(P >0. 01) , 估计的BMY 牛对云南黄牛改良后代的初生重与6 月龄体重杂种优势率分别是-8. 02% 和2. 91% 。[结论] 以BMY 牛为父本的杂交组合后代各生长性能都表现出较好的杂交优势, 初生重、6 月龄体重体尺有较大提高, 为云南省、南方肉牛改良及其肉牛生产模式的探索提供了坚实基础。
【英文摘要】Objective:The aim of the study was to explore some models for beef improvement, beef industry in Yunnan province and South China by BMY cattle as paternal crossing Yunnan Yellow cattle andthe crossing combinations including Simmental Yunnan Yellow, Shorthorn Yunnan Yellow and others.Method: The crossbreeding trial was carried by using BMY bull and frozen semen, BMY bull or f rozen semen crossed Yunnan Yellow cattle and its hybrids from different crossing combinations. Result: By the end of 2009, 14 734 cows were mated with BMY bull or frozen emen, 12 738 calves were born and the birth rate was 86. 45% . Body weight and body measurements were done to 1 485 times, of which the birth weight of BMY crossing Yunnan Yellow cattle and other hybrids from different crossing combinations was 12. 40 kg , that increased by 1. 64 kg, which was not significant compared to that of Yunnan Yellow cattle (P> 0. 05) . The body weight at the age of 6 months was 108. 96 kg, it was above 74. 99 kg, significantly higher than that of Yunnan Yellow cattle. The averag eheterosis rates were 8.02% and 2. 91% estimated from which BMY cattle crossed Yunnan Yellow cattle at the birth weight and 6 month, respectively.Conclusion: As BMY cattle paternal, the different growth performances show ed better hybridvigor of which body weight and body measurement could improve at the birth and 6 month to provide st rong foundations for beef improvement models and beef industrial models to Yunnan province and South China.

【题目】不同温度对阿克苏灰枣采后生理活性及贮藏效果的影响
【中文关键词】阿克苏灰枣;不同温度;生理活性;贮藏效果
【英文关键词】Aksu Jujube;different temperature;physiological activity;storage quality
【中文摘要】【目的】筛选适宜的阿克苏灰枣贮藏温度。【方法】设置0、-1和-2℃3个温度,从贮藏温度与阿克苏灰枣采后呼吸强度、乙烯释放量、硬度、可溶性固形物含量、VC含量及果肉细胞膜透性等关系进行试验。【结果】-2℃条件下贮藏阿克苏灰枣的果实硬度、可溶性固形物含量和VC含量均高于其它2个温度条件下的;且该温度条件下贮藏的灰枣果实相对电导率在整个贮期一直处于较低的水平,表明其细胞膜还未受到破坏;从贮藏效果看,-2℃条件下贮藏的灰枣果实在整个贮期失水率和转红率较低,好果率和脆果率较高。【结论】为了进一步探究阿克苏灰枣贮藏的临界温度,将继续降低温度对其进行观察和研究。
【英文摘要】【Objective and Method】This experiment was designed to select the appropriate temperature for storage of Aksu jujube.The three temperatures were set including 0,-1 and -2°Cto study the relations between storage temperature and the post-harvestAksu Jujube respiration rate,ethylene production,hardness ,soluble solids content,vitamin C content and pulp cell membrane permeability, etc.【Result】Under -2°Cthe hardness,soluble solids content and vitamin C content ofAksu Jujub fruit are higher than those under other two storage temperatures; and relative electrical conductivity has been kept lower level, cell membrane has not been destroyed; From quality during storage, under -2°C,water loss rate and turn red rate of Akesu Jujube fruit has been kept,fine fruit rate and crisp fruit rate has been kept greater during storage.【Conclusion】In order to study the critical temperature of Aksu Jujub the storage temperature should be reduced.

【题目】CAPN1 基因遗传变异及其对牛肉质性状的效应分析
【中文关键词】钙蛋白酶1基因;群体遗传分析;肉质性状;SNP
【英文关键词】CAPN1 gene; analysis of population genetic variations; carcass traits; SNP
【中文摘要】【目的】探索钙蛋白酶1(CAPN1)基因在中国黄牛不同群体中的变异,以及CAPN1 基因作为影响牛肉质性状候选基因的可能性,寻找与牛肉质性状相关的分子标记。【方法】采用PCR-SSCP 技术对雷琼牛、云南高峰牛、BMY 牛与中国西门塔尔牛共367 个个体CAPN1 基因Exon11-Exon16 与Intron21 遗传变异检测,运用SPSS17.0软件中的GLM 模型分析检测到的遗传变异与中国西门塔尔牛部分肉质性状的关联性。【结果】发现了CAPN1 基因DNA 序列中的两个突变位点A4558G 和C4684T,分别检测到AA/AG/GG 和CC/CT/TT 3 种基因型。相关分析表明,A4558G位点GG 基因型个体剪切力和大理石花纹评分显著低于AG 和AA 型个体(P<0.05);C4684T 位点TT 基因型个体剪切力显著低于CT 型个体(P<0.05)。组合基因型分析表明,GGTT 组合剪切力显著低于CCAA、CTAG 和CTAA(P<0.05),大理石花纹评分显著低于其它基因型组合(P<0.05),脂肪颜色评分显著高于AGTT(P<0.05),其余指标间无显著差异(P<0.05)。【结论】初步推测CAPN1基因A4558G 和C4684T 的位点,可以作为牛肉嫩度和大理石花纹评分的遗传标记。
【英文摘要】【Objective】To explore the distribution of Calpain 1 gene (CAPN1) in Chinese south yellow cattle populations and north beef cattle populations, and to evaluate it as a candidate molecular marker associated with beef quality. 【Method】PCR-SSCP method was used to detect the polymorphism of CAPN1 in 367 heads from four cattle populations, including Leiqiong, Yunnan highpump, BMY and Chinese Simmental. The association between SNP locus and some meat straits were analyzed by general linear model (GLM) in SPSS program. 【Result】 Three enotypes, AA, AG, GG and CC, CT, TT, were detected at site A4558G and C4684T, respectively, with G as an advantageous gene at site A4558G, and A as an advantageous gene at site C4684T. Genotypic variance had significant association with shearing force strait and marbling score strait. The cattle with GG in site A4558G had lower

shearing force and marbling score than others (P<0.05), while the cattle with TT in site C4684T had lower shearing force than thatof CT (P<0.05) and individuals with TT had lower former PH after rowing of acid than that of CC (P<0.05). Combined-genotype analysis indicated that the cattle with GGTT had lower hearing force than that of AACC, AGCT and AACT (P<0.05) and lower score of marbling than that of the rest (P<0.05), while the score of fat color of these cattle were higher than others. But there were no significant associations between two sites and other straits. 【Conclusion】 Site C4684T and A4558G of CAPN1 gene could be used as genetic marks for beef tenderness and marbling score traits.

【题目】气调指标对库尔勒香梨果实贮藏质量的影响
【中文关键词】库尔勒香梨;气调指标;贮藏质量
【英文关键词】Pyrus bretschneiderirehd; Controlled atmosphere index; Quality during storage
【中文摘要】[目的]探讨保持库尔勒香梨贮藏质量的气调贮藏条件。[方法]挑选大小一致、无病虫害、无机械伤的库尔勒香梨为试材,设置9个具有不同气体体积分数的气调处理(4%O2+2%CO2、5%O2+2%CO2、6%O2+2%CO2、4%O2+3%CO2、5%O2+3%CO2、6%O2+3%CO2、4%O2+4%CO2、5%O2+4%CO2、6%O2+4%CO2)和1个对照处理(21%O2+0%CO2),研究-1℃条件下,各处理对库尔勒香梨果实硬度、可滴定酸、呼吸强度、果皮叶绿素含量、果实维生素C含量及果肉组织中相对电导率的影响。[结果]适当降低O2浓度可以减缓库尔勒香梨果实硬度和可滴定酸含量的下降、降低果实的呼吸强度、延缓果皮叶绿素和果实维生素C的降解、抑制果肉组织中相对电导率的上升。适宜的贮藏参数是:气体成分为5%O2+4%CO2和4%O2+3%CO2,贮藏温度为-1℃;相对湿度为90%~95%。[结论]适当降低O2浓度对保持库尔勒香梨的贮藏质量比较有利。
【英文摘要】[Objective] The study ami ed to discuss the controlled atmosphere storage condition that could keep the fruit quality of Pyrus bretschneiderirehd during storage. [Method]P. bretschneideriwith consistentsize andwithoutdisease-insectandmachine harm were selected as the testedmaterials. 9 controlled atmosphere treatmentswith differentgas composition concn. (4%O2+2%CO2, 5%O2+2%CO2, 6%O2+2%CO2, 4%O2+3%CO2, 5%O2+3% CO2, 6%O2+3% CO2, 4%O2+4% CO2, 5%O2+4% CO2, 6%O2+4% CO2) and one CK(21%O2+0%CO2) were setup to study theireffectson the fruitfirmness, titratable acid, respiration intensity, chlorophyllcontent in peeland Vc content in frui,t relative electricalconductivity in the flesh ofP. bretschneiderifruitunder the condition of low temperature of-1℃. [Result] The suitable low-concn. ofO2could alleviate the reduction of firmness and titratable acid, decrease the respiratory intensity of frui,t stay the degradation ofchlorophyll content in peelandVc content in fruitand restrain the rising of the relative electrical conductivity in the flesh of P. bretschneiderifrui.t The appropriate storage parameterswere follows: gas compositions of5%O2+4% CO2and 4%O2+3% CO, storage temperature of-1℃and relative humidity of90% -95%. [Conclusion] Appropriately decreasingO2concn. wasmore favorable forkeeping the fruitquality ofP. bretschneideriduring storage.

【题目】CAPN3 基因在草原红牛不同组织中的表达差异
【中文关键词】草原红牛; CAPN 3; 实时荧光定量PCR; 表达水平
【英文关键词】Chinese Red Steppe; CAPN 3; real time PCR; expression level

【中文摘要】钙激活中性蛋白酶(CAPN3) 参与哺乳动物体内多种重要的生理生化过程, 但是有关它的确切生理功能和作用机制研究较少。本研究采用实时荧光定量PCR 技术检测CAPN3 基因在草原红牛多种组织中的表达水平差异情况。试验结果表明, CAPN3 基因在所检测草原红牛的心脏、肝脏、脾脏、肺脏、肾脏、十二指肠、瘤胃和背最长肌8 种组织中均有表达, 且在不同组织中的表达水平有所不同。草原红牛脾脏中的CAPN3 基因表达量显著高于其他组织, 十二指肠和瘤胃中的CAPN3 基因表达量显著高于心脏、肝脏、肺脏、肾脏和背最长肌。本试验为肉牛肉质性状的改良提供了分子遗传学依据, 并为深入研究草原红牛体内CAP N3 基因的生物学作用及作用机制奠定了基础。

【英文摘要】The present study was designed to detect the differences of the calpain 3 (CAPN3) gene expression level in varieties tissues of Chinese Red Steppe by real time RT PCR. The results show ed that CAPN3 mRNA was expressed in all of the eight tissues: heart, liver, spleen, lung , kidney , intestine, stomach and skelet al muscle; we also found that CAPN3 gene expression level was higher in spleen than in other tissues of Chinese Red Steppe (P<0.05) . The research provides the basis for the future studies of the biological function and the molecular mechanisms of CAPN3 gene.

【题目】不同能量与蛋白比对BMY公牛血液生化指标的影响

【中文关键词】能量; 蛋白; 血液; 生化指标

【英文关键词】Energy ; Protein; Blood; Biochemical Marker

【中文摘要】[目的] 为了测定血液葡萄糖、蛋白、脂肪含量变化。[方法] 利用三种不同能量蛋白比配合日粮对BMY公牛进行饲喂, 测定12月龄BMY公牛的血液生化指标。[结果] 表明, 低能量蛋白比日粮组的血清总脂比有所降低, 各试验组的其它指标, 如血清总蛋白、血清葡萄糖以及血清尿素氮的浓度都比采食试验日粮前有不同程度的升高, 但试验测定值均在文献报道的正常生理范围内。[结论] 说明不同能量蛋白比日粮对BMY 公牛生化指标有一定的影响。

【英文摘要】Objective:The purpose was to detect the change of the glucose, protein and fat contents in blood. Method:The BMY bulls were fed by the diets with 3 different ratio of energy and rotein, and the blood chemical markers at the age of 12 months were detected. Result:The results showed that the ratio of serum total lipid in low energy protein diet decreased than that of in basal dietary. Other markers, such as the concent rations of serum total protein, serum glucose and blood urea nitrogen, increased differently than that of before feeding experimental dietary, but the measured values were between the normal physiological range reported in the literature. Conclusion:The dietary with different ratio of energy and proteinhad a certain effect on the biochemical markers of BMY bulls.

【题目】桃及油桃贮藏保鲜技术

【中文关键词】油桃;贮藏;保鲜

【英文关键词】Nectarine; storage; storage environment

【中文摘要】桃和油桃两者均属核果类,由于它们成熟期都在高温季节,采后果肉变质快,因此贮藏性远不及仁果类的苹果及浆果类的葡萄。桃和油桃二者性质相近,每年成熟期集中上市,产后损失高达30%左右,它们在贮藏上的问题也类似,所以在贮藏保鲜方面更为果农所重视。

【题目】不同牛群体间钙蛋白酶1基因第14内含子4685bp位点的多态性分析
【中文关键词】草原红牛; 延边黄牛; 杂交牛; CAPN1; PCR-SSCP
【英文关键词】Chinese Red cattle; Yanbian Yellow cattle; cross cattle; CAPN1; PCR-SSCP
【中文摘要】本研究采用PCR-RFLP 技术分析了钙蛋白酶1(CAPN1) 基因第14 内含子4685 bp 位点在东北地区特色养殖品种草原红牛、延边黄牛及不同二元杂交品种红安格斯牛×西门塔尔、利木赞×西门塔尔、德国黄牛×西门塔尔和夏洛莱×西门塔尔等群体间的多态性。结果表明, 4685 bp 位点无论是基因型频率还是等位基因频率, 在以上牛群体间均存在较大差异。延边黄牛中CT基因型作为优势基因型其频率达到0. 53, CC 及TT 基因型频率差异不大, 分别为0. 27 和0. 20; 德国黄牛×西门塔尔二元杂交牛中TT 、CT 基因型具有非常高的基因型频率, 分别达到0. 50 和0. 40, 而CC 基因型则只有0. 10, T 等位基因频率高达0. 70, C 等位基因频率仅为0. 30。其他二元杂交品种无论是基因型频率还是等位基因频率上均与延边黄牛相类似。本研究中最值得关注的是草原红牛中4685 bp 位点仅存在1 种基因型, 即为TT型, 未发现C 等位基因的存在。3 种牛群体间4685 bp 位点基因型频率的比较, 为进一步分析该位点与肉质嫩度的相关性奠定了基础。
【英文摘要】CAPN1 gene as the major gene which controls beef tenderization was concerned by researchers. In this study , we reported the 4685 bp loci genotype frequency and allele frequency in Chinese Red Steppe, Yanbian Yellow cattle, Red Angus×Simmental, Limo usin×Simmental,Germany Yellow cattle×Simmental and Charolais × Simmental cross. The results showed that genotype requency and allele frequency were significant different in these population. As the predominant genotype in

Yanbian Yellow cattle, the frequency of CT genotype was 0. 53, the frequency of CC and TT genotype just were 0. 27 and 0. 20 respectively . The TT and CT genotype had very high frequency in Germany Yellow cattle × Simment alcross, reached 0. 50 and0. 40 respectively , the CC genotype frequency only was 0.10, the T allele frequency reached 0. 70, and the Callele f requency only was 0. 30. The others cross cattle had similar genotype and allele frequency to Yanbian Yellow cattle. The most interesting result in this study was the genotype distribution in Chinese Red cattle, we only found one genotype TT which suggested C allele was not exist in Chinese Red cattle. The complement of genotype frequency test of 4685 bp loci in CAPN 1 gene in triple cattle laid a foundation to research the relationship of 4685 bp loci to meat tenderness.

【题目】草原红牛IGFBP3 基因多态性及与部分屠宰性状的相关性分析
【中文关键词】草原红牛; 胰岛素样生长因子结合蛋白3; PCR- SSCP; 屠体性状
【英文关键词】red steppe; insulin- like growth factor binding protein 3 (IGFBP3) ; PCR-SSCP; carcass trait
【中文摘要】以草原红牛为研究对象, 采用PCR-SSCP 方法检测IGFBP3 基因的多态性, 并将不同基因型与部分屠宰性状进行相关分析。结果表明在第2 内含子发现多态性位点, 有AA、AB 和BB 3 种基因型; 测序结果显示在8 069 bp处存在C/T 的碱基突变; 该位点的多态性对草原红牛的眼肌面积有显著影响(P< 0. 05) , AA 型显著高于BB 型(P< 0. 05) , 但与AB 型之间差异不显著(P> 0. 05) ; 其他屠宰性状在不同基因型间差异不显著。由此可以初步推断IGFBP3 基因可能是影响草原红牛肉质性状的一个主效基因或是一个与影响肉质性状的QTL 连锁的基因。
【英文摘要】This study was designed to investigate the single nucleotide polymorphism (SNP) of insulin- like growth facto r binding pro tein 3(IGFBP3) gene in red steppe by PCR-SSCP, and at the same time a correlation between the polymorphisms and several carcass traits. The results of cloning and sequencing indicated that polymorphism of intron 2 was dued to base mutation of C/T in position 8 069, and there were three geno types (AA, AB and BB) . The correlation analysis revealed that polymorphisms had asignificant effect on marbling, the AA genotype had higher marbling than the BB genoty pe in red steppe (P< 0. 05) , but there were

nosignificant differences between AA genotype and AB genotype(P> 0. 05) . Other carcass traits of red steppe was not significant in different genotypes (P >0. 05) . It could be preliminarily concluded that IGFBP3 gene was probably a major gene or a QTL linked gene whichassociated with meat quality traits in red steppe.

【题目】含胆酸高分子化合物的制备和特性
【中文关键词】胆酸;高分子材料;制备;特性
【英文关键词】cholic acid; polymer material; preparation; characterization
【中文摘要】胆酸是哺乳动物体内合成的一种天然化合物,具有特殊的分子结构和优良的生物适应性。由胆酸合成的高分子化合物保持了胆酸的部分性质,如双亲性、手性、侧基反应活性和自组装性能等。在化学和药学领域,含胆酸高分子材料具有重要的应用价值。本文从自由基聚合形成的含胆酸高分子化合物、胆酸修饰的高分子化合物和胆酸缩聚物等几个方面综述了含胆酸高分子化合物的制备和特性,并对胆酸在高分子材料方面的新用途作了展望。
【英文摘要】Cholic acid is a natural compound that is synthesized in the animal body, which has special chemical structure and good biocompatibility. Polymers prepared from cholic acid can preserve some properties of cholic acid, such as facial amphiphilicity, chirality, reactivity of the side groups and capacity of self-assembiling. In chemical and pharmaceutical fields, polymeric materials containing cholic acid can be used widely. This paper reviews the preparation and characterization of polymers containing cholic acid obtained by free radical polymerization, polymers modified with cholic acid and polycondensation of cholic acid, etc. The development of polymers containing cholic acid in the future is also forecasted.

【题目】草原红牛IGFBP-5 基因外显子多态性及对胴体性状的影响
【中文关键词】中国草原红牛; IGFBP-5; PCR- SSCP; PCR-RFLP; 胴体性状
【英文关键词】Chinese red steppes; IGFBP- 5; PCR- SSCP; PCR-RFLP; carcass weight
【中文摘要】为揭示草原红牛IGFBP- 5 基因外显子多态性与胴体性状的相关性, 采用PCR- SSCP 及PCR-RFLP 两种方法分别对58 头草原红牛群体该基因外显子多态性进行了检测, 并对检测到的突变位点用SPSS 软件分析其与胴体性状的相关性。结果表明: IGFBP- 5 基因第3 外显子在191 bp 处存在G(A) 突变, 该基因多态性与宰前活重、胴体重呈显著相关, BB 型显著高于AA 型(P> 0. 05) ; 对其他性状的影响差异不显著。通过研究IGFBP- 5 基因外显子的多态性, 为草原红牛的选种选育提供实验依据。
【英文摘要】This ex per iment was conducted to detecte SNP of IGFBP- 5 gene exons and the relationship with carcass weight in red steppes. The polymorphism of IGFBP- 5 exons in red steppes was detected by PCR-SSCP and PCRRFLP.And then the genetic correlations between genotypes and performances was obtained by SPSS. The results indicated that there was one single nucleotide mutation G(A) in the 191 bp of exon 3 of IGFBP- 5 gene; And the genetic polymorphisms ignificantly correlated with living weight. And living weight of BB genotype was higher than AA genotype(P< 0.05) . Other traits were not significantly affected. The research laid a foundation for the future studies of the biological function of IGFBP- 5 gene genetic in red steppes and a theoretical basis for breeding of red steppes.

【题目】酶法制备多肽铁及产物分析
【中文关键词】血红蛋白;酶解产物;多肽铁
【英文关键词】hemoglobin; enzymatic hydrolysate; polypeptide-Fe
【中文摘要】本文利用胰蛋白酶对猪血血红蛋白进行酶解,综合考虑酶添加量和酶解时间,选取酶添加量为1%,V(血红细胞):V(蒸馏水)=1:4,pH=8,温度为50 ℃,酶解5 h 血红蛋白可完全酶解。对酶解产物分级沉淀,收集沉淀产物,采用紫外光谱、葡聚糖凝胶层析、液相色谱法对酶解产物进行分析,证明沉淀产物的主要成分为多肽铁。
【英文摘要】Porcine hemoglobin was completely hydrolyzed by trypsinase under the following the optimum conditions: trypsinase dosage 1%, red blood cells-distilled water ratio 1:4(V:V), temperature 50 ℃, pH value 8.0, and hydrolysis time 5 h. The hydrolysate was precipitated and the precipitate was analyzed by UV spectrophotography, Sephadex-G25 chromatograph and HPLC. The results showed that the main component of the precipitate was polypeptide-Fe.

【题目】牛骨酶解制备牛肉香精及气质联用分析
【中文关键词】牛骨;酶解;美拉德反应;气质联用
【英文关键词】beef bone; enzymatic hydrolysis; Maillard reaction; GC-MS
【中文摘要】以牛骨为原料,采用正交实验对复合蛋白酶和风味蛋白酶同步水解牛骨蛋白的工艺进行优化。再以水解动物蛋白(HAP)为基料,通过美拉德反应制备牛肉香精。结果表明,牛骨的最适酶解条件是用酶量5000 U/g,料液比1:3,酶解温度50 ℃,酶解时间6 h。美拉德反应的最佳时间为3 h,在不添加香料的条件下最好。采用固相微萃取技术(SPME)并结合气质联用(GC-MS)检测技术对牛骨美拉德反应液进行分析,共鉴定出68 种挥发性风味物质。
【英文摘要】The enzymatic hydrolysis of beef bone protein by protamex and flavorzyme were optimized by orthogonal experiment. Then the hydrolyzed animal protein (HAP) was used to prepare the beef flavors through Maillard reaction. The results showed that the best hydrolysis parameters were enzyme dosage 5000 U/g, substrate-liquid ratio 1:3, temperature 50 ℃, and time 6 h. The time of Maillard reaction without spice was 3 h. The products of Maillard reaction of bone were extracted by SPME and then analyzed by GC-MS. Sixty-eight kinds of volatile compounds were identified.

【题目】草原红牛m-calpain基因的多态性及其与肉质性状的关系
【中文关键词】草原红牛; 遗传多态性; calpain基因; 肉质性状
【英文关键词】China red cattle; genetic polymorphisms; calpain gene; meat quality trait
【中文摘要】对草原红牛m-calpain的30 ku调节亚基的DNA序列通过PCR扩增得到1830 bp大小的产物, 这个产物序列包括从外显子4到外显子7的全部序列(包括它们之间的内含子序列)。利用限制性内切酶HhaI对PCR产物进行酶切, 并利用最小二乘线性模型初步探索了不同基因型与肉质性状间的关系。结果表明: 在31头草原红牛群体中检测到2个等位基因A 和B, 2个等位基因的频率分别为0. 355和0. 645; 检测到3 种基因型AA、BB 和AB, 3种基因型的频率分别为0.161, 0.452和0.387。草原红牛m-calpain基因中BB基因型对牛肉嫩度剪切力值有较大的影响(P<0.05) ; AA基因型对大理石花纹评分值有较大的影响(P<0.05)。
【英文摘要】The 1 830 bp fragment encoding for the regulatory subunit (30 ku) of China red cattle m-calpain gene, putatively including the sequences of exon 4 through exon 7, was amplified by PCR. Two alleles(A and B) of the China red cattle m-calpain regulatory submit gene were identified with PCR- RFLP analys is using endonu clease HhaI, which the frequency of alleles found was 0.355 for A and 0.645 for B. Three genotypes AA, BB and AB were identified among the 31 China red cattle breeds. The frequency of genotypes found was 0.161 for AA, 0. 452 for BB and 0. 387 for AB. The association between genotype markers and meattraits were analyzed by general linear model at the level of DNA. The result was the BB genotype of China red cattle m - calpa in gene showed a highly significant negative effect on shear force ofbeef tenderness traits (P < 0. 05) . The result was the AA genotype of China red cattle m - calpa in gene showed a highly significant positive effect on marbling score of beef enderness traits (P < 0. 05) .

【题目】牛喉管软骨多糖的提取及其化学组成分析
【中文关键词】软骨多糖;提取;硫酸软骨素;化学组成
【英文关键词】Cartilage polysaccharide; extraction; chondroitin sulfate; chemical component
【中文摘要】采用双酶法从牛喉管软骨中提取软骨多糖,以35%、55%、80%乙醇浓度作为分级沉淀的终浓度,所得粗多糖分别命名为CS-35、CS-55、CS-80。分析比较三种粗多糖的含糖量、纯度及分子量变化,结果显示含糖量分别为24.1%,27.5%,38.9%,分子量呈逐渐降低。三种粗多糖经降解后进行薄层层析分析,结果表明,CS-80 单糖组成区别于CS-35 和

CS-55。通过酶解-高效液相色谱法,进一步证明CS-80 不是典型的硫酸软骨素结构。
【英文摘要】Cartilage polysaccharide was extracted from the bovine pipes bone by two enzymes. Three crud polysaccharides, were fractional precipitates by 35%, 55% and 80% ethanol. The sugar contents, purities and molecular weights of the three polysaccharides were compared. Results showed that their polysaccharide contents were 24.1%,27.5% and 38.9%, respectively. The molecular weights of the three polysaccharides were gradually reduced as following sequence: CS-35>CS-55 > CS-80. Thin layer chromatography analysis showed that the composition of CS-80 was different from those of CS-35 and CS-55. In addition, HPLC analysis of the enzyme-hydrolyzed CS-80 showed that CS-80 did not possessed the typical chondroitin sulfate structure.

【题目】α-亚麻酸钙对高脂小鼠脂质代谢的调节作用
【中文关键词】α-亚麻酸钙;高血脂症;脂质代谢
【英文关键词】calcium α-linolenic acid; hyperlipidemia; lipid metabolism
【中文摘要】研究α-亚麻酸钙(Ca-ALA)的降血脂作用。将健康昆明种小鼠随机分为空白组、模型组、低级量组、中剂量组和高剂量组,模型组和剂量组饲喂高脂饲料造小鼠高脂模型;低、中、高剂量组的小鼠在建模7 d 后,向其高脂饲料中分别添加0.095%、0.190%、0.380%的α-亚麻酸钙粉剂。每周称体重,6 周后测定小鼠肝指数和血清中总胆固醇(TC)、甘油三酯(TG)、高密度脂蛋白胆固醇(HDL-C)和低密度脂蛋白胆固醇(LDL-C)的含量。结果表明,α-亚麻酸钙能明显降低高血脂小鼠的体重和肝指数,并显著降低高血脂症小鼠血清TC、TG 和LDL-C 水平。α-亚麻酸钙具有显著的调节小鼠脂质代谢的作用。
【英文摘要】The effect of calcium α-linolenic acid (Ca-ALA) on lipid metabolism of mice with hyperlipidemia was studied. The KunMing-strain male mice were divided into normal, model, low-dose, middle-dose and high-dose groups. The hyperlipidemia model was established by feeding mice with high fat feed. 7 Days later, the mice of the low-dose, middle-dose and high-dose groups were feed with high fat feeds containing 0.095%,0.190% and 0.380% of Ca-ALA, respectively. 6 Weeks later, the effects of Ca-ALA on weight, liver index and serum lipid were observed. The results showed that Ca-ALA could significantly reduce weight and liver index of the mice, significantly reduce serum TC, TG and LDL-C lever also. All these results indicated that Ca-ALA had significantly effect on regulation of lipid metabolism.

【题目】草原红牛不同组织雄激素受体基因表达量检测及比较研究
【中文关键词】雄激素受体; 草原红牛; 实时荧光定量RT-PCR; 表达量
【英文关键词】androgen receptor(AR) ; red steppes; real time RT PCR; expression
【中文摘要】采用实时荧光定量RT-PCR 技术检测雄激素受体基因(Androgen receptor gene, AR) 在草原红牛公牛和母牛多种组织中的表达情况, 探讨该基因在草原红牛公牛和母牛不同组织中的表达差异。结果表明, AR 基因在所检测的公牛和母牛的心、肝、脾、肺、肾、肠、胃及睾丸(卵巢) 等8 种组织中均有表达, 且肝脏中的表达量高于其他组织;草原红牛公牛和母牛相同组织间比较结果显示: AR 基因在草原红牛公牛肝脏中表达量与母牛相比较差异不显著,其他不同组织间表达量均有显著差异(P < 0. 05) , 且公牛各组织中的表达量均高于母牛。本试验为深入研究AR基因的生物学功能及了解该基因对不同性别个体肉质性状的形成的作用机制奠定了基础。

【英文摘要】The present study was designed to detect the differences of androgen receptor (AR) gene expression level in varieties tissues of male and female Chinese red steppes by Real-time RT PCR. The results showed that AR mRNA was expressed in all of the eight tissues: heart,liver , spleen, lung, kidney, intestine, stomach and testis(ovary) ;We also found that AR gene expression level was higher in liver than in other tissues of male and female Chinese red steppes; The expression level of AR mRNA had significant differ ence in heart, liver, spleen, lung , kidney , intestine, stomach and testis(ovary) between the male and the female Chinese red steppes except liver (P< 0. 05) , and it was higher in male than that of in female. The research provides the basis for the future studies on the biological function and the molecular mechanisms of AR gene.

【题目】草原红牛胰岛素样生长因子Ⅰ受体基因3’UTR 序列多态性分析
【中文关键词】草原红牛; IGF-ⅠR 基因; 3’UTR; 多态性分析
【英文关键词】red steppes; insulin- like growth factor recepto r(IGF-ⅠR) ; 3'UTR; single nucleotide polymorphism
【中文摘要】以58 头草原红牛为试验材料, 采用PCR- SSCP 技术对胰岛素样生长因子Ⅰ受体(IGF-ⅠR) 基因3‘UTR序列多态性进行了检测。结果表明, 在IGF-ⅠR 基因3’UTR中发现PCR-SSCP的多态位点, 有2种等位基因和3 种基因型。对所得基因型与生长和胴体性状的相关性分析结果发现, 在3‘UTR 中AB 型的胴体产肉率、肉骨比显著高于AA、BB 型(P < 0. 05) ;AA 型的脂肪覆盖率显著高于BB 型(P< 0. 05) , 与AB 型差异不显著(P > 0. 05) 。
【英文摘要】The 3'UTR polymorphism of IGF-ⅠR gene was detected by PCR- SSCP in 58 red steppes. The results showed that two allelomorphic gene, three genotype of IGF-ⅠR gene were detected. The associativity was analyzed between the polymorphism of slaughter and carcass traits. The results indicated that procured meat percentage and the ratio of meat in bone for AB genotype was higher than AA and BB geno types(P< 0. 05) , the rate of fatcover age for AA genotype was higher than BB genotype(P< 0. 05) , and was no significant difference with AB genotype(P> 0. 05) .

【题目】猪肉半干香肠发酵成熟过程中脂肪酸变化研究
【中文关键词】半干香肠;脂肪酸;成熟;气相色谱
【英文关键词】semi-dry sausage; fatty acid; fermentation; GC analysis
【中文摘要】采用混合型发酵剂生产猪肉半干香肠,实验分为A 组(发酵剂添加量0.1%)和B 组(发酵剂添加量0.01%),分别于0、2、4、6、8、10 d 取样,采用KOH-乙醇皂化、HCl-甲醇酯化的方法进行样品处理,利用气相色谱技术分析不同发酵成

熟时期脂肪酸组成及含量变化。结果表明,从发酵初期到成熟末期,A 组、B 组样品中,含量最高的脂肪酸均为油酸(C18:1),占脂肪酸总量的35%~61%,其次为棕榈酸(C16:0)16%~24%和亚油酸(C18:2)8%~17%。A 组脂肪酸种类及相对含量的变化均高于B 组,尤其是8~10 d 期间,A 组多不饱和脂肪酸的含量明显提高,以亚油酸(C18:2)、亚麻酸(C18:3)及花生四烯酸(C20:4)为最多。实验证明,猪肉半干香肠中微生物直接影响了产品中脂肪酸的组成及含量,另外成熟工艺(烟熏)对于脂肪酸的变化也具有一定影响。

【英文摘要】Mixed starter culture was used to produce semi-dry sausage in this research which was divided into two groups according to the addition of starter. The samples of 0 d, 2 d, 4 d, 6 d, 8 d and 10 d were saponified by using KOH -ethanol and esterified by HCl -methanol. The fatty acid composition and their changes were analyzed by means of GC. The results showed that the content of oleic acid (35%~61%) was the highest of fatty acid, the second one was palmitic acid(16%~24%) and the third one was linoleic acid(8%~17%). The changes of fatty acids of the group A were more than group B, especially in terms of fermentation and ripening. In that term, the content of unsaturated fatty acids especially the oleic acid, linolenic acid and arachidonic acid were increased significantly. The experiment showed that microorganism had effect on the constituents and contents of fatty acid and the mature technology had certain influence on the changes of fatty acid.

【题目】软骨多糖对荷瘤小鼠免疫功能影响的初步研究

【中文关键词】软骨多糖; 小鼠肉瘤S180; 脾细胞增殖; NK 细胞活性; E 花环

【英文关键词】Cartilage Polysaccharide; Sarcoma 180; Mouse; Lymphocyte proliferation assay ; Activity, NK cell; Erythrocyte rosette formation test

【中文摘要】研究软骨多糖对荷瘤小鼠的作用, 并探讨其对免疫功能的影响。方法:采用小鼠肉瘤S180细胞建立动物腹水瘤模型, 然后随机将小鼠分为生理盐水对照组和软骨多糖给药组, 连续腹腔注射生理盐水或软骨多糖, 分别测量ConA和LPS 刺激下小鼠脾细胞淋巴增殖情况、外周血NK细胞的活性, 及外周血单个核细胞E花环形成率。结果: 软骨多糖能刺激淋巴细胞增殖, 明显提高NK细胞的活性, 提高E 花环形成率。结论:软骨多糖能通过增强S180荷瘤小鼠的免疫功能而抑制肿瘤的生长。

【英文摘要】To investigate the influence of cartilage polysaccharide on immunel function in S180 sarcoma-bearing mice. Methods-S180 cells were used to generate the mouse tumor model. The mice were randomly divided into 3 groups: control, model and treated groups, which received either saline or cartilage polysaccharide i. p. injection, respectively. Lymphocyte proliferation stimulated by ConA and LPS, the activity of NK cells in peripheral blood from tumor-bearing mice and erythrocyte rosette formation test (ERFC) were assayed after treatment to detect the changes of immunological function. Results-The cartilage polysaccharide could significantly stimulate lymphocyte proliferation, promote the activity of NK cells in tumor-bearing mice, and enhance the rate of erythrocyte rose formation. Conclusion-The date suggested that cartilage polysaccharide can improve immunological function in tumor bearing mice.

【中文关键词】硒酸多糖;二乙基亚硝胺;肝肿瘤
【英文关键词】selenium-polysaccharide; diethylnitrosamine; hepatocarcinoma
【中文摘要】本论文研究硒酸多糖对二乙基亚硝胺(diethylnitrosamine,DEN) 致小鼠肝癌的预防作用。采用50 μL/kg DEN诱发小鼠肝癌,每周皮下注射1 次,连续8 周,同时对照组饮用灭菌水,低硒含量组和高硒含量组分别饮用含不同硒量的硒酸多糖(150 mg/kg)。实验结束后,处死小鼠,测定生化指标等,用比色分析法检测肝匀浆SOD、GSH-Px 的活性及MDA 含量的变化。病理学检查发现,对照组肝脏损坏严重,补硒组则较轻;2 个补硒组能显著提高SOD、GSH-Px 的活性,降低MDA 含量。硒酸多糖对DEN 致小鼠肝脏癌变有抑制作用。
【英文摘要】The inhibitory effect of selenium-polysaccharide on diethylnitrosamine (DEN) induced hepatocarcinoma in mice was investigated. Mice hepatocarcinoma was induced by subcutaneously injecting 50 μL/kg diethylnitrosamine (DEN) once a week for 8 weeks. Mice were fed with distilled water for control group and different dosages of selenium-polysaccharide for low selenium supplementation group and high selenium supplementation group. Then the biochemical indexes of the killed mice were measured. The activities of superoxide dismutase (SOD), glutathione peroxidase (GSH-Px) and the concentrations of malondialdehyde (MDA) were investigated by colorimetric method. It was found that selenium-polysaccharide significantly increased the activities of SOD,GSH-Px and decreased MDA content in liver cell homogenate. Pathology analysis also showed that damage of mice liver in control group was more serious than those in the selenium supplementation groups. Selenium-polysaccharide had inhibitory effect on DEN-induced hepatocarcinoma in mice.

【题目】胶原蛋白多肽铬对四氧嘧啶损伤肝细胞的保护作用
【中文关键词】胶原蛋白多肽铬;HL-7702 人肝细胞;四氧嘧啶;抗氧化
【英文关键词】collagen polypeptide-chromium chelate; HL 7702 hepatocytes; alloxan; antioxidative effect
【中文摘要】研究了胶原蛋白多肽铬(CPCC)对四氧嘧啶损伤肝细胞HL-7702 的保护作用,并探讨其作用机理。方法是将肝细胞HL-7702分为正常对照组、四氧嘧啶组、胶原蛋白多肽铬组及四氧嘧啶+胶原蛋白多肽铬组,分别检测细胞存活率、细胞胞内活性氧(ROS)、胞外超氧阴离子(O2.-)含量及超氧化物歧化酶(SOD)、谷胱甘肽过氧化物酶(GSH-Px)活力、脂质过氧化物丙二醛(MDA)含量,并检测胶原蛋白多肽铬在过氧化氢(H2O2)模型组中的作用。结果表明胶原蛋白多肽铬处理使四氧嘧啶损伤肝细胞存活率增加,胞内ROS 生成减少,O2.-含量、SOD 与GSH-Px 低偿性升高及MDA 含量降低。结论是胶原蛋白多肽铬处理对四氧嘧啶损伤肝细胞具有一定的保护作用,其作用机制可能与三价铬抗氧化性能有关。
【英文摘要】To study the protective effect of collagen polypeptide-chromium chelate (CPCC) in HL 7702 hepatocytes treated by alloxan and the possible mechanism. Cells were divided into control group, alloxan-treated group, CPCC group and alloxan+CPCC group. Cell viability, contents of reactive oxygen species (ROS) and superoxide radical (O2.-) , activities of SOD and GSH-Px and MDA content were analyzed. The protective effect of CPCC in H2O2-treated hepatices was also determined. Results shows that Cell viability was significantly increased by CPCC, while the contents of ROS, O2.- and MDA and the activities of SOD and GSH-Px in alloxan-treated hepatocyte were decreased. CPCC had a protective effect in alloxan-treated HL 7702 hepatocytes, acting as an antioxidant.

【题目】古尼虫草多糖对衰老模型小鼠的影响
【中文关键词】D-半乳糖;古尼虫草多糖;抗衰老作用
【英文关键词】D-galactose; Cordyceps gunnii(Berk.)Berk. polysaccharide; anti-aging effect
【中文摘要】研究古尼虫草多糖的抗衰老作用。将健康小鼠随机分为空白组、模型组、低剂量组、中剂量组和高剂量组,将模型组、低剂量组、中剂量组和高剂量组用D-半乳糖造亚急性衰老小鼠模型;低剂量组、中剂量组和高剂量组的小鼠建模11 d 后每天灌胃50%古尼虫草多糖溶液,剂量分别为100 mg/kg、200 mg/kg 和400 mg/kg;45 d 后观察脑组织中以及血清中超氧化物歧化酶(SOD)和谷胱甘肽过氧化物酶(GSH-Px)活力,丙二醛(MDA)含量。结果表明,古尼虫草多糖可提高小鼠脑组织和血清中SOD(P<0.01)和GSH-Px(P<0.01)活力,明显抑制小鼠脑组织和血清中MDA(P<0.01)的形成。因此,古尼虫草多糖有很好的抗衰老作用。
【英文摘要】The anti-aging effect of Cordyceps gunnii(Berk.)Berk. polysaccharide(G-50) on the senescent mice was studied. D-galactose-induced senescent mice were divided into model, low-dose, middle-dose and high-dose groups. 11 Days later, the mice of the low-dose, middle-dose and high-dose groups were gastricly lavaged with 50 % polysaccharide with its dose being of 100, 200,and 400mg/kg, respectively. After 45 days, the activities of superoxide dismutase (SOD) and glutathione peroxidase (GSH-Px), and the MDA contents in serum and brains were observed. Results showed that Cordyceps gunnii(Berk.)Berk. polysaccharide improved SOD and GSH-Px activities and obviously inhibited the formation of MDA in serum and brains, indicating that the Cordyceps gunnii(Berk.)Berk. polysaccharide had good anti-aging effect.

【题目】High-Level Expression of the Antimicrobial Peptide Plectasin in Escherichia coli
【中文关键词】THIOREDOXIN REDUCTASE; RESISTANCE; PROTEINS; AGENTS
【英文关键词】THIOREDOXIN REDUCTASE; RESISTANCE; PROTEINS; AGENTS
【中文摘要】Plectasin is a defensin-like antimicrobial peptide isolated from a fungus, the saprophytic ascomycete Pseudoplectania nigrella. Plectasin showed marked antibacterial activity in vitro against Gram-positive bacteria, especially Streptococcus pneumoniae, including strains resistant to conventional antibiotics. Plectasin could kill the sensitive strain as efficaciously as vancomycin and penicillin and without cytotoxic effects on mammalian cell viability. In order to establish a bacterium-based plectasin production system, in the present study, the coding sequence of plectasin was optimized, and then cloned into pET32a (+) vector and expressed as a thioredoxin (Trx) fusion protein in Escherichia coli. The soluble fusion protein collected from the supernatant of the cell lysate was separated by Ni(2+)-chelating affinity chromatography. The purified protein was then cleaved by Factor Xa protease to release mature plectasin. Final purification was achieved by Ni(2+)-chelating chromatography again. The recombinant plectasin exhibited the same antimicrobial activity as reported previously. This is the first study to describe the expression of plectasin in E. coli expression system, and these works might provide a significant foundation for the following production or study of plectasin, and contribute to the development and evolution of novel antimicrobial drugs in clinical applications.

【题目】The Role of Lactic Acid Adsorption by Ion Exchange Chromatography
【中文关键词】FERMENTATION; BIOREACTOR; RECOVERY; SORPTION; WASTE
【英文关键词】FERMENTATION; BIOREACTOR; RECOVERY; SORPTION; WASTE
【中文摘要】Background: The polyacrylic resin Amberlite IRA-67 is a promising adsorbent for lactic acid extraction from aqueous solution, but little systematic research has been devoted to the separation efficiency of lactic acid under different operating conditions. Methodology/Principal Findings: In this paper, we investigated the effects of temperature, resin dose and lactic acid loading concentration on the adsorption of lactic acid by Amberlite IRA-67 in batch kinetic experiments. The obtained kinetic data followed the pseudo-second order model well and both the equilibrium and ultimate adsorption slightly decreased with the increase of the temperature at 293-323K and 42.5 g/liter lactic acid loading concentration. The adsorption was a chemically heterogeneous process with a mean free energy value of 12.18 kJ/mol. According to the Boyd plot, the lactic acid uptake process was primarily found to be an intraparticle diffusion at a lower concentration (<50 g/liter) but a film diffusion at a higher concentration (>70 g/liter). The values of effective diffusion coefficient D-i increased with temperature. By using our Equation (21), the negative values of Delta G degrees and Delta H degrees revealed that the adsorption process was spontaneous and exothermic. Moreover, the negative value of Delta S degrees reflected the decrease of solid-liquid interface randomness at the solid-liquid interface when adsorbing lactic acid on IRA-67. Conclusions/Significance: With the weakly basic resin IRA-67, in situ product removal of lactic acid can be accomplished especially from an open and thermophilic fermentation system without sterilization.

【题目】Soluble Expression of Active Recombinant Human Tissue Plasminogen Activator Derivative (K2S) in Escherichia coli
【中文关键词】Thrombolytic drug; disulfide isomerase; affinity chromatography
【英文关键词】Thrombolytic drug; disulfide isomerase; affinity chromatography
【中文摘要】Context: The kringle 2 plus serine protease domains (K2S) of human tissue plasminogen activator (tPA) is an efficacious thrombolytic drug, which has been used to treat heart attacks and strokes by breaking up the clots that cause them. It has nine disulfide bridges, which are needed for proper folding and be the bottleneck in improving the production in the Escherichia coli system. So far, few reports have described the production of soluble active K2S from E. coli. Objective: To achieve high-level expression of active K2S in the E. coli system. Materials and methods: The DNA fragment coding for K2S was fused with the E. coli disulfide isomerase DsbC. The constructed fusion protein was expressed in E. coli, and then purified with the Ni<SU2++</SU-chelating affinity chromatography. K2S was released by cleavage with Factor Xa protease, and the thrombolytic activity was determined using the fibrin plate assay. Results: The fusion protein DsbC-K2S was found in the culture supernatant of recombinant E. coli as a soluble form of similar to 40%. The result of fibrinolysis fibrin plate assay showed that the purified recombinant K2S exhibited significant fibrinolysis activity in vitro. Discussion and conclusion: These works provided a novel approach for the production of active K2S in E. coli without the requirements of in vitro refolding process, and might establish a significant foundation for the following production of K2S.

【题目】Cloning, characterization and application of the promoter region of the alkaline protease gene in Bacillus alcalophillus PB92
【中文关键词】promoter;alkaline protease;Bacillus alcalophillus
【英文关键词】promoter;alkaline protease;Bacillus alcalophillus
【中文摘要】Promoter fragment of alkaline protease gene was cloned from Bacillus alcalophillus PB92 genome by TAIL-PCR. The fragment was sequenced and analyzed, then submitted to GenBank (EU130686). The results showed that it contained several typical promoter charactered regions and two reverse translation frames located in - 538 to - 370 bp and - 275 to -128 bp region. Deletion analysis of the sequence indicated that 414 bp upstream of the TSS exhibited predominant promoter activity, while an 105bp length could serve as this function. Additionally, our data demonstrated that a representative Sectype signal peptide structure presented in PB92 alkaline protease signal peptide. The efficiency of PaprE- AprE signal peptide gene cassette was validated by its driving a plant sweet protein monellin gene highly expression in Bacillus subtilis 1A751.

【题目】Separation of Angiotensin-Converting Enzyme Inhibitors from Fermented Milk Prepared with Lactobacillus casei HZ1
【中文关键词】ACEI; Lactobacillus Casei
【英文关键词】ACEI; Lactobacillus Casei
【中文摘要】In this paper, a strain HZ1 which was isolated in our former works was classified as Lactobacillus Casei (L. Casei) by 16S rDNA sequence analysis. The results of angiotensin-converting enzyme (ACE) inhibitory assay showed that this novel stain was able to produce ACE inhibitory components when it was used to fermented milk. Applying the methods of membrane filtration and anion-exchange chromatography with fast protein liquid chromatography (FPLC) system, nine fractions with remarkable ACE inhibitory activity were obtained, and two bioactive fractions, recorded as ACEI-2 and ACEI-5, exhibited the highest ACE inhibitory rate of 60.55% and 71.71%, respectively. Furthermore, seven fractions proteins/polypeptides, which exhibited ACE inhibitory rate higher than 50% were separated from ACEI-2 and ACEI-5 by using sephadex gel filtration chromatography. These works might provide a foundation for the following study of L. Casei HZ1 and its probiotics functions, and contribute to the development of functional foods or drugs that provide health benefits to patients suffering from hypertension.

【题目】Identification and Characterization of Lactobacillus plantarum TH1
【中文关键词】Identification;Characterization;
Lactobacillus plantarum TH1
【英文关键词】Identification;Characterization;
Lactobacillus plantarum TH1
【中文摘要】Lactobacillus plantarum (L. plantarum) is a flexible and versatile microorganism that inhabits a variety of environmental niches, and some strains are marketed as probiotics. In this study, a strainTH1 which was isolated from silage in our former works was

classified asL. plantarum by 16S rDNA sequence analysis and phylogenetic tree. Then its potential abilities of bile tolerance, nitrate reduction and anti-hypertension were investigated. The results showed that L. plantarum TH1 had capacity to resistance to bile salt, directly deoxygenate nitrate to nitrogen or ammonia rather then nitrite, and produce ACE inhibitory components in fermented milk. These works indicated that this novel lactobacillus strain might be considered as candidates for probiotics strains using in the food or drug system to improve the health of patients suffering from hypertension or other chronic disease.

【题目】Indipendent and Tandem Expression of a novel antimicrobial peptides plectasin in Escherichia coli

【中文关键词】Expression;antimicrobial peptides plectasin

【英文关键词】Expression;antimicrobial peptides plectasin

【中文摘要】Plectasin, a novel antimicrobial peptide, is isolated from a saprophytic fungus Pseudoplectania nigrella. Plectasin showed potent antibacterial activity in vitro against Gram-positive, especially the Streptococcus pneumoniae and Streptococcus pneumoniae, including strains resistant to conventional antibiotics. In our previous study, plectasin had been expressed at a high yield as a thioredoxin (Trx) - fused protein in Escherichia coli. However, it couldn't exhibit the antimicrobial activity unless the Trx-tag had been cleaved, which made the producing process be complicated. Concerning that plectasin has no complex post-translational modification and toxicity on E. coli, on the basis of the former works, we further establish the independent and tandem expression system of plectasin in E. coli. In the present study, the coding sequence of plectasin was obtained from pET32a-PLEC with four primers to amplify the independent and tandem plectasin fragments by overlapping PCR-based gene synthesis, and then cloned into pET22b (+) vector. The recombinant protein was expressed successfully in E. coli with IPTG induction. These works might throw light on the production or study of plectasin, and contribute to the development of novel anti-infectious drugs in the future. © (2012) Trans Tech Publications, Switzerland.

【题目】Functions of Bacillus Subtilis BS7.29 in Wasterwater Treatment
【中文关键词】Functions;Bacillus Subtilis BS7.29;Treatment
【英文关键词】Functions;Bacillus Subtilis BS7.29;Treatment
【中文摘要】Bacillus subtilis (B. subtilis) is a kind of Gram positive bacteria possessing multiple enzyme systems, which might be useful in wastewater treatment. In this paper, in order to confirm whether Bacillus subtilis BS7.29, a novel strain isolated from soil in our previous work, could be applied in the wastewater treatment, its effects on assimilation of ammonium, transformation of nitrite, and degradation of pectin were investigated. The results showed that the content of NH3-N and NO2-N in aquaculture water decreased with time increasing after being treated with B. subtilis BS7.29. Furthermore, when the secretion enzyme extracted from this bacterium was used to treat the paper-making white water, it could reduce CD and turbid it, decrease the size of colloidal substances and promote the deposition. These findings suggested that B. subtilis BS7.29 might be valuable in the wastewater treatment, and contribute to the development of biological purification of industrial effluents.

【题目】硒酸赖氨酸对四氧嘧啶诱发的小鼠肝损伤的防护作用
【中文关键词】硒酸赖氨酸,四氧嘧啶,肝损伤
【英文关键词】Seleno-lysine;Alloxan;Hepatic injury
【中文摘要】研究硒酸赖氨酸对四氧嘧啶诱发的小鼠肝损伤的防护作用。方法:选取昆明小鼠50只,雌雄各半,随机分成五组,即对照组、模型组、低剂量组、中剂量组、高剂量组。采用四氧嘧啶致急性肝损伤模型,检测各组小鼠血清中谷丙转氨酶(ALT)、谷草转氨酶(AST)、碱性磷酸酶(AKP)活性,并对各组小鼠肝脏进行组织病理学观察。结果:硒酸赖氨酸能降低小鼠血清中ALT、AST、AKP活性(P<0.05或P<0.01),,明显减轻四氧嘧啶致肝损伤小鼠肝细胞的病变及炎症反应。结论:硒酸赖氨酸具有对四氧嘧啶诱发小鼠肝损伤的保护作用。
【英文摘要】Objective: To investigate the protective effect of seleno-lysine on hepatic injury in mice induced by alloxan. Methods: 50 healthy Kunming mice were randomly divided into 5 groups-control group, model group, low dose group, middle dose group and high dose group. Hepatic injury mouse model was set up by alloxan. The levels of ALT,AST and AKP in serum were measured and com- pared, and the pathological changes of hepatic tissues were observed under the microscope. Results: Seleno-lysine could significantly lower the levels of AST, ALT and ALP in serum in hepatic injury mice, and reduce the pathological changes of hepatic tissues. Conclusion: Seleno-lysine can prevent hepatic injury in mice induced by alloxan.

【题目】多肽-Fe对小鼠急性肝损伤保护作用的研究
【中文关键词】多肽-Fe;四氯化碳;急性肝脏损伤;抗氧化
【英文关键词】polypeptide-Fe; carbon tetrachloride; acute hepatic injury; antioxidant ability
【中文摘要】目的:研究多肽-Fe 对四氯化碳(CCl4)引起的小鼠肝脏氧化损伤的保护作用。方法:用CCl4(50 mg/kg.d)灌胃造成小鼠急性肝脏损伤模型,将多肽-Fe 分为低、中、高剂量预防组,分别为67.5 mg/kg·d、675 mg/kg·d、2 025 mg/kg·d 喂饲小鼠30 d,观察其对血清ALT、AST 和ALP 及肝脏TG、TC、GSH、MDA 和SOD 的影响。结果:与模型组相比,多肽-Fe 可显著降低血清中ALT、AST、ALP 活性和肝脏中TG、TC、MDA 含量(P <0.01),提高肝脏中GSH 含量(P <0.05),以中剂量组最为有效。结论:多肽-Fe 对CCl4 引起的小鼠肝脏氧化损伤具有保护作用
【英文摘要】Objective: To study the protective effects of polypeptide-Fe on acute hepatic injury induced by CCl4 in mice. Method:Mice model of acute hepatic injury was set up by CCl4 ig (50mg/kg·d). and fed with polypeptide-Fe 67.5 mg/kg·d, 675 mg/kg·d and 2 025 mg/kg·d for 30 d respectively. The effects on serum ALT, AST, and ALP and liver TG, TC, GSH, MDA, and SOD avtivities were observed. Results: Polypeptide-Fe decreased the activities of ALT, AST, and ALP in serum and the levels of TG, TC, and MDA in liver, and increased the level of GSH in liver. Middle dosage group of polypeptide-Fe was the most effective one. Conclusion:Polypeptide-Fe showed significant antioxidant ability in protecting acute hepatic injury induced by CCl4 in mice.

【题目】Pollinator Effects on Genotypically Distinct Soybean Cytoplasmic Male Sterile Lines
【中文关键词】多样性分析,细胞质雄性不育
【英文关键词】ANOVA, analysis of variance; CMS, cytoplasmic male sterile
【中文摘要】本研究以网室作为隔离条件,以稳定的细胞质雄性不育系JLCMS9A、JLCMS82A、JLCMS89A为基本试材,通过五个处理设置,即①罩网后打杀虫剂,开花时放苜蓿切叶蜂;②罩网后打杀虫剂,开花时不放苜蓿切叶蜂;③罩网,不打杀虫剂,开花时放苜蓿切叶蜂;④罩网,不打杀虫剂,开花时不放苜蓿切叶蜂;⑤自然开放,不打农药,研究了切叶蜂的传粉效果、蓟马和天然昆虫群体在大豆传粉中的作用及不同基因型不育系在异交结实上存在的差异。研究结果表明,苜蓿切叶蜂是网室内为大豆传粉的最理想昆虫;不同基因型不育系的异交结荚率存在很大的差异,以JLCMS82A最高,JLCMS89A最低,JLCMS9A居中;蓟马等小昆虫的传粉作用可使上述三个不育系的结荚率分别达到1.33%、5.32%和0.48%,说明蓟马虽然在大豆传粉中有一定的作用,但并不是理想的传粉昆虫;在自然开放条件下,不育系JLCMS9A、JLCMS82A和JLCMS89A的平均结荚率分别为11.27%、25.2%和4.55%,说明天然昆虫群体在大豆异交结实中起着非常重要的作用。
【英文摘要】Poor seed-set limits potential for soybeanhybrid seed production. The objective of thisstudy was to evaluate effects of different pollinatorson the rate of seed set in three soybeancytoplasmic male sterile (CMS) lines, JLCMS9A,JLCMS82A, and JLCMS89A. The followingfi ve treatments were applied under net roomisolation-conditions: (i) insecticide applicationand release of alfalfa leafcutter bees (Megachilerotundata) during fl owering; (ii) insecticideapplication in the absence of leafcutter bees;(iii) release of alfalfa leafcutter bees during fl oweringwithout insecticide application; (iv) theabsence of insecticide or alfalfa leafcutter beesduring fl owering; (v) plants without a net coverand pesticide application. Results indicated thatthe rate of pod production and seed set differsignifi cantly between CMS lines and betweentreatments. Alfalfa leafcutter bees were aneffective pollinator as evidenced by increasesin pod-bearing rate and seed-set rate respectivelyfrom 21.35 to 53.22% and from 19.91 to58.77% in the three CMS lines. The

three CMSlines also showed signifi cant differences in seedset, with JLCMS82A exhibiting the highest ratein all fi ve treatments, followed by JLCMS9A andthen JLCMS89A. These results suggested thatthrips (Sericothrips variabilis) might have someeffect on soybean pollination, but did not elicita major infl uence based on the low increasesin seed production. The natural insect populationserved an important role in outcrossing andseed set in soybean.

【题目】DNA methylation polymorphism in annual wild soybean (Glysine soja Sieb. et Zucc.) and cultivated soybean (G. max L. Merr.)
【中文关键词】野生大豆,栽培大豆,DNA甲基化
【英文关键词】Annual wild soybean (Glycine soja), cultivated soybean (G. max), DNA methylation polymorphism
【中文摘要】本文采用20份一年生野生大豆和27份栽培大豆研究了DNA甲基化多样性和遗传多样性,这些材料来源于吉林省农科院。MSAP(Methylation Sensitive Amplified Polymorphism)分析用了27对引物,共产生了984条带。进一步将MSAP数据分为甲基化敏感多态性(Methylation-Sensitive Polymorphism,MSP)和甲基化不敏感多态性(Methylation-Insensitive Polymorphism,MISP)。一年生野生大豆和栽培大豆的MSP和MISP分别为34.65% vs. 47.05% 和34.76% vs. 47.15%。这些数据表明,无论是MSP还是MISP都是栽培大豆高于野生大豆,这一结果与AFLP的结果不相一致(AFLP表现为野生大豆的多样性高于栽培大豆的多样性)。这说明发生瓶颈效应的基因型可以产生多种多样的表观基因型。根据这三类分子标记做的聚类图都可以将这些材料分为两个明显的群体,而且每个群体都主要分别由野生大豆和栽培大豆组成。此外,MSAP聚类分析暗示存在物种特异的表观遗传多态性,并可稳定的遗传下去。但是由于野生大豆和栽培大豆之间的渐渗现象,使得聚类分析中有个别栽培大豆与野生大豆聚为一类。 将测序的MSP多样性条带进行了BLAST分析,结果显示12/24与已知功能基因或者推测蛋白质基因高度同源。相关性分析结果表明MSP和MISP以及MSP和AFLP之间没有相关性,暗示表观遗传多态与遗传多态形成和/或维持的机制是不相同的。本研究的结果暗示,大豆DNA甲基化多样性受自然选择和人工选择影响,也暗示表观遗传机制在大豆的起源进化与驯化过程中发挥了作用。
【英文摘要】To studyDNA methylation polymorphism in soybean, 20 and 27 lines of annual wild and cultivated soybeans, respectively, wereselected from previously established "Soybean Core Collections in China", and subjected to methylation-sensitive amplifiedpolymorphism (MSAP) analysis. Twenty-seven primer pairs generated 984 CG/CNG methylation sites across the 47 lines,and the data were dissected into methylation-sensitive (MS) and methylation-insensitive(MIS) polymorphisms. Thecalculated MSP vs. MISP for wild soybeans were 34.65 vs. 34.76%, while corresponding results for the cultivated soybeanswere 47.05 vs. 47.15%, indicating higher levels of MSP and MISP in cultivated than in wild soybeans. These results wereincongruent with the amplified fragment length polymorphism (AFLP) analysis of the same soybean lines, and suggestedenhanced DNA methylation polymorphism due to human selection. All three markers, MSP, MISP and AFLP, enabledclustering of the soybean lines into two distinct groups each predominantly containing wild or cultivated ones. Homologysearch indicated that 12 out of 24 sequenced MSPs had significant similarities to known-function or predicated genes,suggesting possible functional relevance of the methylation polymorphism. No significant association between MSP andMISP or MSP and AFLP was detected. Our results suggest thatDNAmethylation polymorphism in soybean has been underboth natural and human selections, implicating possible roles of this epigenetic modification in genome evolution anddomestication

【题目】大豆细胞质雄性不育恢复基因的SSR标记
【中文关键词】大豆,细胞质雄性不育系,恢复基因,分子标记
【英文关键词】Soybean ;Cytoplasmic male sterile (CMS) ;Restorer gene ;Molecular marker
【中文摘要】大豆细胞质雄性不育系的获得,为大豆杂种优势利用奠定了基础。在确认RN 型大豆细胞质雄性不育系属单基因配子体不育,恢复性是由显性单基因控制的遗传模式的基础上,开展恢复基因的分子标记研究,旨在找到与恢复基因紧密连锁的分子标记,为进一步克隆恢复基因及恢复系的分子标记辅助育种奠定基础。研究选用412 对SSR 引物,利用RN 型不育系YA 与恢复系167 杂交的F2 分离群体,获得了与恢复基因连锁的两个标记Sat t414 和Sat t596 ,遗传距离分别为16. 4 和14. 6 cM。为了找到更近的分子标记,分析了Sat t414 和Sat t596 附近的所有SSR 引物,并利用两个遗传差异较大的亲本重新构建了分离群体, 从而获得了与恢复基因连锁比较紧密的标记Sat t547 ,遗传距离为7. 56 cM。根据Cregan 等构建的大豆分子遗传连锁图,将恢复基因定位于J连锁群上。
【英文摘要】The development of cytoplasmic male sterile (CMS) line has facilitated the utilization ofsoybean heterosis. It was confirmed that t he fertility restoration of t he RN type soybean CMS linewas cont rolled by a single dominant nuclear gene. Two SSR maker s ,Sat t414 and Sat t596 ,whichwere genetically linked to t he nuclear restorer gene ,were selected by screening of SSR markerswit h F2 segregation pop ulation f rom t he cross between sterile line YA and restorer line 167. Thegenetic distance between t he markers and t he restorer gene were 16. 4 and 14. 6 cM ,respectively.A segregating pop ulation developed f rom a cross between more diver sified parent s was used forscreening the closer SSR markers. SSR marker Sat t547 with genetic distance of 7. 56 cM to t herestorer gene was identified. The nuclear restorer gene was located in J linkage group accordingto Cregan ’s soybean genetic map

【题目】大豆骨干恢复系花和花粉数量的研究
【中文关键词】大豆;恢复系;授粉;花粉数量
【英文关键词】Soybean; Restorer line; Pollination;Number ofmicrospores
【中文摘要】制种产量低已成为制约杂交大豆产业化的瓶颈,父本恢复系花粉数量直接影响母本不育系的结实率,选育花粉数量多的恢复系对提高杂交大豆制种产量至关重要,花粉数量也是衡量一个恢复系授粉能力的一个指标。采用田间调查和显微镜镜检对已育成的12个骨干恢复系的开花持续时间、开花数量和花粉数量进行调查和统计。结果表明:不同基因型恢复系单株花的数量存在明显差异, 12个恢复系的单株花数量为74. 8~408. 9个,单株花数量最多的是恢复系JLR104,最少的是恢复系JLR75,而大多数的恢复系单株花数量为120~160个;大豆每朵花的花粉数量没有明显差异,为3400~4900个。单株花的数量决定了花粉的数量
【英文摘要】The low yield of soybean hybrid seed p roduction is the bottleneck of commercialization on hybrid soybean. The re2storer lineswithmore flowers andmicrospores possess better pollination ability, and it is one of important affecting factors forimp rovement of seed p roduction. In order to study the pollination ability of main fertility restorer lines with different geno2types, the duration of flowering stage, number of flowers and number of microspores of 12 restorer lines were investigated.The results indicated

that flower numbers per p lant of the restorer lineswith different genotypeswere statistically significantdifferent. Flower numbers per p lant of the 12 restorer lines ranged from 74. 8 to 408. 9, highest were from restorer lineJLR104 and lowestwere from JLR75,whereas, flower numbers per p lant of most restorer lines ranged from 120 to 160. Nosignificant difference was found in microspores per flower ranging from 3400 to 4900. It is inferred that flower number perp lant is a decisive affecting factor for totalmicrospores

【题目】野生大豆Δ′2吡咯琳252羧酸合成酶(P5CS)基因的克隆与序列分析
【中文关键词】野生大豆;Δ′2吡咯琳252羧酸合成酶;耐盐
【英文关键词】Wild soybean;Δ′2 pyrroline252carboxylate synthetase; Salt resistance
【中文摘要】根据栽培大豆(Glycine m ax)Δ′2吡咯琳252羧酸合成酶基因的全长序列设计引物,通过RT2PCR直接扩增的方法从野生大豆中克隆到了野生大豆(Glycine soja)的同源基因,命名为GsP5CS。GsP5CS 最大开放阅读框为2148bp,编码含有716个氨基酸残基、分子量为77. 9 kDa的蛋白,预测等电点6. 21。亲疏水性分析显示, GsP5CS含有连续的亲水片断。序列分析显示, GsP5CS与栽培大豆(Glycine m ax) 、飞蛾豆(V igna aconitifolia) 、蒺藜苜蓿(M edicagotruncatula) 、紫花苜蓿(M edicago sativa) 、甘蓝型油菜(B rassica napus) 、拟南芥(A rabidopsis thaliana) 、水稻(O ryza sati2va) 、普通小麦(Triticum aestivum)等植物的Δ′2吡咯琳252羧酸合成酶基因高度同源,序列相似性分别为94%、87%、87%、86%; 75%、74%、72%。根据野生大豆与这8种植物的P5CS基因序列相似性所建立的进化树,显示与传统的分类地位基本一致
【英文摘要】GsP5CS , homologous with the Gm P5CS gene encoding aΔ′2 pyrroline 252carboxylate synthetase was cloned fromwild soybean (Glycine soja) by RT2PCR,with p rimers designed according to the sequence of Gm P5CS. The largest open read2ing frame of GsP5CS gene has 2148bp in length and encoded a p rotein of 716 amino acid residues. The estimated molecularweight and isoelectric points of the putative p rotein was 77. 9 kDa and 6. 21, respectively. Hydropathy p lot analysis indicatedthat the GsP5CS was hydrophilic. Blast result analysis showed that GsP5CS, Gm P5CS,M sP5CS,M tP5CS, A tP5CS, B nP5CS,OsP5CS, TaP5CS shared a cluster. The phylogenetic tree shows that the relationship based on the homology is consistentwith

the morphological and taxonomic results

【题目】大豆线粒体细胞色素 b 基因的克隆及系统分析
【中文关键词】大豆;线粒体;细胞色素 b
【英文关键词】Soybean;Mitochondrial;Cytochromeb
【中文摘要】根据实验室测序的大豆线粒体基因组片段设计线粒体细胞色素 b(Cytochrome,cob)基因特异引物,PCR 扩增获得 1 173 bp 大豆(JLGM-1B)线粒体 cob 基因保守区序列。经序列分析,该基因编码 391 个氨基酸,A + T 含量58. 1%,G + C 含量 41. 9% 。Southern 杂交表明 cob 基因在栽培大豆线粒体基因组中至少有 2 个拷贝。氨基酸序列及系统进化树分析表明,大豆与其它植物的 cob 基因具有较高的同源性,与双子叶作物同源性高达 98%,其分类地位与传统系统分类地位相吻合,说明 cob 基因具有较高的保守性,可以作为分子系统分类学潜在的遗传分化标记
【英文摘要】In this study,mitochondrial DNA uncompleted sequence was used to design special prime of mitochondrial cyto-chrome b gene(cob)and obtained conservation domain of soybean cob gene by PCR amplification. The results showed that cobgene was consisted by 1 173 bp which encoded 391 amino acids,with 58. 1% A + T and 41. 9% G + C content. Southern blotanalysis revealed that more than 2 cob gene copies were found in G. max mitochondrial genome. Amino acid sequence and phy-logenetic analysis showed that cob was most similar to the dicotyledon,with 98% identity at the nucleotide level. In conclusion,cob gene is a potential hereditary marker for phyletic classification basing on its highly conservative property

【题目】八种植物线粒体基因组结构特征分析与比较
【中文关键词】单子叶植物 双子叶植物 线粒体 基因组
【英文关键词】Monocotyledon, Dicotyledon ,Mitochondria, Genome
【中文摘要】比较来源于 GenBank 中发表的 8 种植物(烟草、拟南芥、甜菜、油菜、高粱、水稻、小麦和玉米) 线粒体基因组(mtDNA) 。结果显示,它们共同的特点是编码 30 -40 个蛋白,3 个核糖体 RNA,15 -30 个 tRNA,G + C 含量在 40% -45% 之间; 各植物线粒体基因组的编码区约占 mtDNA 的 10% -20%。比较发现,虽然 8 种作物线粒体基因组大小存在较大差异,基因排列顺序不同,但它们都编码几乎相同的基因产物
【英文摘要】Mitochondrial genomes of eight plants,including tobacco,Arabidopsis,sugar beet,rape,sorghum,rice,wheat and cornpublished in GenBank (mtDNA) were analyzed comparatively. Result showed that they all encode 30 - 40 proteins,3 ribosomal RNAs,15 - 30 tRNAs,with G + C content 40% - 45% . The percent of coding region of mtDNA to whole genome is 10% - 20% . Comparisonrevealed that although the difference in size and gene order of mitochondrial genome between eight crops,they code almost the samegene product.

【题目】栽培大豆染色体改构复合体基因SNP5的克隆及序列分析
【中文关键词】栽培大豆 染色质改构复合体 SNP5基因 克隆
【英文关键词】Glycinemax,Chromatin remodeling complexe SNP5 gene, Cloning
【中文摘要】根据大豆耐盐基因表达芯片上提供的表达量下调的EST序列信息,借助了电子克隆方法,根据获得的假定序列设计引物,通过RT PCR,从栽培大豆克隆了染色体改构复合体SNP5类同源基因。其片段长度为812 bp,编码240个氨基酸的多肽,分子重量为27·4 kD,等电点pI为5·37。NCBI保守结构域分析表明,其属于SNF5超家族,因此我们将其命名为Gm SNP5 (GenBank登录号:HM068595)。Southern杂交表明,GmSNF5基因在栽培大豆基因中至少有一个拷贝。氨基酸序列及系统进化树分析表明,GmSNF5与其同科的豌豆PsSNF5有较高的同源性,氨基酸序列一致性高达92%。由于其部分EST序列在大豆耐盐芯片中表达量下调,因此推测此基因在功能上与栽培大豆的耐盐性相关
【英文摘要】Based on the down regulated EST sequence information in the salt tolerantgene expression chip, a SNF5 type Chroma tin remodeling complex genewas cloned fromGlycinemaxbyRT PCR, using primers designed according to the sequence in silico clo ning. It is 812 bp in length encoded anORF of240 amino acidswith a theoreticalmolecularweightof27·4 kD and isoelectric pointof5·37.The conserved domain analysis inNCBI showed that itbelongs to SNF5 superfamily, and named asGmSNP5(GenBankAccessionnumber:HM068595). Southern blotanalysis revealed that ithas at leastone copy inG.maxgenome.Amino acid sequence and phyloge netic analysis showed thatGmSNF5 ismost similar to thePisum sativumSNF5 protein with 92% identity at the amino acid leve.l Aspart of its EST sequenceswas down regulated in the tolerantsoybean chips, itsuggests that this gene is functionally related to salt toler ance inG.max

【题目】大豆细胞质雄性不育系配套保持系线粒体基因组 BAC 文库的构建
【中文关键词】大豆; 细胞质雄性不育系; 保持系; 线粒体基因组; BAC 文库
【英文关键词】Soybean; Cytoplasmic Male Sterility; Maintainer; Mitochondrial Genome; BAC library
【中文摘要】以大豆细胞质雄性不育系配套保持系材料(JLCMS1) 的黄化苗为材料,纯化得到线粒体。低熔点琼脂糖包埋线粒体成胶块,消化裂解后用 HindⅢ部分酶切,通过脉冲场电泳回收 40 ~60 kb 酶切片段。将回收产物连接到载体 pIndigo-BAC 5,通过电击转化大肠杆菌 DH10B 感受态细胞,获得的 BAC 文库包含 2 000 个单克隆,平均插入片段大小约为 50 kb,约覆盖大豆线粒体基因组 250 倍以上。
【英文摘要】A soybean maintainer of the coytoplasmic male sterility soybean (JLCMS1) was used for mitochondria isolation withhigh purity. Purified mitochondria was embedded into plugs by low melt point agarose,then the plugs was lysed and partiallydigested by HindIII. The DNA fragments between 40 and 60 kb size were selected by pulsed field gel electrophoresis. Thesize-selection product was ligated to BAC vector pIndigo-BAC5 and then transformed into competent cell of DH10B by electro-peration. The constructed BAC library consist of 2 000 clones with an average 50 kb inserts and covered more than 250 timesof the soybean mitochondrial genome used in this research

【题目】植物体细胞无性系变异研究进展
【中文关键词】遗传学基础, 鉴定方法, 品种改良, 体细胞无性系变异
【英文关键词】genetic bases, identification method, improvement of varieties, somaclonal variation
【中文摘要】植物体细胞无性系变异是植物组织培养中的普遍现象,泛指在植物细胞、组织和器官培养过程中, 培养细胞和再生植株中产生的遗传变异或表观遗传学变异。植物体细胞无性系变异的发生有其遗传学基础, 可从形态学、细胞学、生物化学和分子生物学等多个方面对其进行综合检测和鉴定。植物体细胞无性系变异是植物育种的有利资源, 但同时也是植物微繁和遗传转化工作中需要克服的一大难题,一直被众多研究者所关注。本文分别从细胞学和分子生物学两个层次综述了植物体细胞无性系变异的遗传学基础及其鉴定方法的研究进展,并就其在植物品质改良中的应用现状、存在的问题和应用前景进行了讨论
【英文摘要】The phenomenon‘ somaclonal variation ’ refers to genetic and/or epigenetic changes in cells or regeneration that arisethrough the culture of plant cells, tissues and organs. Some genetic bases underlye the plant somaclonal variation, which can beintegratively determined and identified at morphological, cytological, biochemical andmolecular biological levels. Plant somaclonalvariation is one of available resources in plant breeding, but it is an unwelcome puzzle to be won through in plant micropropagationin vitro and genetic transformation. This paper reviews the progress in study of the genesis and identification of plant somaclonalvariation at both cytological level andmolecular biological level, and discusses the problems and prospects of applying somaclonalvariation in breeding and improving plant varieties.

【题目】大额牛溶菌酶(LYZ) 基因序列测定和进化分析
【中文关键词】大额牛, 溶菌酶基因, 分子系统进化
【英文关键词】Mithum; Lysozyme gene; Molecular phylogenetic; evolution
【中文摘要】[目的] 为了对大额牛与其他物种间分子系统进化研究以及为大额牛群体遗传资源评价、保护与开发利用提供理论依据。[方法] 本研究依据普通牛溶菌酶(lysozyme, LYZ) 基因已知序列设计引物, 用PCR 的方法扩增并测定了大额牛LYZ 基因的编码区核苷酸序列(444bp) , 并与GenBank 上8 个物种相应基因编码区核苷酸序列进行比对分析。[结果] 大额牛与普通牛、人、猪、家鼠、沟鼠、猩猴、鸡、斑马鱼各物种在LYZ 基因编码区核苷酸序列上同源性大小分别为99. 3%、7 6. 6% 、79. 4%、81. 8%、71. 3%、68. 2%、5 8. 9%、50. 5%, 并分别采用邻接法(NJ) 和最大简约法(MP) 构建了大额牛与其他物种间分子进化树, 并得到了基本一致的拓扑结构。系统发育分析发现大额牛与普通牛首先聚为一类, 再与其他物种聚为一类。该系统聚类结果与动物学分类一致, 表明LYZ 基因适合于构建不同物种间系统进化树。[结论] 本研究为进一步探索大额牛与近缘物种间分子进化, 阐明大额牛的真正起源奠定一定实验基础。
【英文摘要】Objective:Inorder to study the molecular evolut ion betw een Mithum and o ther spieces, toprovide theoretical basis of evaluating, protecting and exploiting the Mithum population genetic resource.Method: Primers designed according to the sequences of Lysozyme gene were used to amplify the nucleotide sequence of coding region (444 bp) of Lysozyme gene in Mithum, and the corresponding nucleotide sequences of coding region of eight species retrieved from the GenBank were compared. Result:The Lysozyme gene homologies of the coding region between Mithum and cattle, pig, human, monkey , house,mouse, Norway rat, chicken and zebrafish were 99. 3% , 76. 6% , 79. 4% , 81. 8% , 71. 3% , 68. 2%, 58. 9%, 50. 5%respectively. The phylogenetic trees wer econst ructed by NJ and MP methods, respectively, and got almost the same topology . The phylogeny analysis showed that Mithum and cattle clustered first, then gathered with other species. The phylogenetic clustering result was identical to the zoological classificat ion system, indicating that the Lysozyme gene were also fit to construct molecular phylogenetic tree among different species. Conclusion:The study provided an experimental fo undation for further studying molecular evolution between Mithum and close relationship species and

interpreting really origin of Mithum.

【题目】Molecularly imprinted solid phase extraction coupled to high-performance
【中文关键词】敌敌畏
分子印迹
固相萃取
高效液相色谱
【英文关键词】Dichlorvos
Molecular imprinting
Solid phase extraction
High-performance liquid chromatography
【中文摘要】在本文中,我们使用室温离子液体介导的本体聚合技术制备一种具有高度选择性的分子印迹聚合物。选择敌敌畏为模板,甲基丙烯酸为功能单体,三羟甲基丙烷三甲基丙烯酸酯作为交联剂。利用傅里叶红外表征,静态和动态吸附试验的结果表明,该分子印迹吸附剂具有良好的识别和选择的能力,并提供快速敌敌畏的吸附和解吸的动力学。使用所制备的材料作为固相萃取的吸附剂,建立了一种新型的样品前处理技术和高校液相色谱联用测定食品中残留的微量敌敌畏。在最优条件下,敌敌畏的检出限(S / N = 3)为94.8ng/L,五次试验的精密度是4.41%。黄瓜和生菜中加入敌敌畏标品为0.005和0.02ug/g时,回收率的范围是82.1%-94.0%。
【英文摘要】In this paper, we prepared a highly selective imprinted polymer by a room temperature ionic liquid-med-iated bulk polymerization technique, using dichlorvos as the template, methacrylic acid as the functional monomers, and trimethylolpropane trimethacrylate as the cross-linker. This functionalized material was characterized by FT-IR, static and kinetic adsorption experiments, and the results showed that this imprinted sorbent exhibited good recognition and selective ability, and offered fast kinetics for the adsorption and desorption of dichlorvos. Using the prepared material as a solid phase extraction sorbent,a novel sample pre-treatment technique that can be coupled to high-performance liquid chromatography (HPLC) had been developed for determination of trace dichlorvos residues in foods. Under the selected experimental condition, the detection limit (S /N = 3) of dichlorvos was 94.8 ng/L , and the peak area pre-cision (RSD) for five replicate detections of 10l ng/Ldichlorvos was 4.41%. The blank samples of cucum-ber and lettuce spiked with dichlorvos at 0.005 and 0.02lug/g levels were determined with recoveries ranging from 82.1% to 94.0%.

【题目】N-Methylimidazolium ionic liquid-functionalized silica as a sorbent for selective
【中文关键词】N咪唑离子液体,液体功能化,磺酰脲类除草剂,固相萃取,高效液相色谱
【英文关键词】N-Methylimidazolium ionic
liquid-functionalized silica
Sulfonylurea herbicides
Solid-phase extraction
High-performance liquid chromatography
【中文摘要】本文通过固载化法将N-甲基咪唑离子液体固定在硅胶上合成了一种新型的固相萃取填料。应用这种新型填料的固相萃取小柱成功的对水样和土壤样品中痕量的噻吩磺隆、甲磺隆、氯磺隆、甲嘧磺隆、玉嘧磺隆、胺苯磺隆、苯磺隆、苄嘧磺隆、氟磺隆、吡嘧磺隆、氯嘧磺隆与氟嘧磺隆进行了前处理。用高效液相色谱法能够在50分钟内对12种磺酰脲类除草剂进行很好的分离。本文考查了两个添加水平的三个水样和土壤样品的回收率,结果表明12种磺酰脲类除草剂的平均回收率在60.9-121.3%之间,RSD值均低于11.3%。与商业化的C18固相萃取小柱相比,这种新型的固相萃取填料对磺酰脲类除草剂有更好的选择性。
【英文摘要】A novel material for solid-phase extraction (SPE) was synthesized by chemical immobilization of a functionalized N-methylimidazolium ionic liquid on silica gel. Cartridges packed with the syn-thetic material were successfully applied to the pre-concentration of trace-level thifensulfuron-methyl,metsulfuron-methyl, chlorsulfuron, sulfometuron-methyl, rimsulfuron, ethametsulfuron, tribenuron-methyl, bensulfuron-methyl, prosulfuron, pyrazosulfuron, chlorimuron-ethyl and primisulfuron from environmental water and soil samples. The 12 sulfonylurea herbicides (SUs) obtained a good resolution in less than 50 min using HPLC with a UV detector. The recovery studies using the ionic liquid-functionalized silica as a sorbent were performed by three consecutive extractions of water and soil samples at two spiked levels. The average recovery for each analyte was in the range of 53.8 – 118.2% for the water samples and 60.9 – 121.3% for the soil sample, with RSDs lower than 11.3% in all cases. The ionic liquid-functionalized silica cartridges showed higher selectivity for the SUs than commercially available C18 cartridges did.

【题目】鲁西黄牛群体遗传多样性的微卫星标记研究
【中文关键词】鲁西黄牛; 微卫星标记; 遗传多样性; 遗传变异
【英文关键词】Luxi cattle; microsatellitemarkers; genetic diversity; genetic variation
【中文摘要】本研究采用微卫星标记技术, 检测了鲁西黄牛群体的遗传多样性现状。从联合国粮农组织(FAO) 和国际动物遗传学会(ISAG) 推荐的30对微卫星引物中, 筛选出6对多态性丰富的微卫星位点, 对112个个体的DNA多样性进行了检测, 结果共检测到101个基因座, 每个座位的等位基因数范围为4 - 6 个。所有座位的平均等位基因数为4. 67,0. 82, 平均有效等位基因数为2. 54, 0. 64, 平均杂合度(H) 为0. 59, 0.09, 平均期望杂合度为0. 41,0. 09, 平均多态性信息含量(PIC) 为0. 53, 0.

09, 符合评价遗传多样性的要求。检测结果发现, 鲁西黄牛群体的遗传多样性较高。研究结果为鲁西黄牛的保种和合理开发利用提供了科学依据。

【英文摘要】Genetic diversity of Luxi cattle was evaluated by them icrosatellites markers. 6 pairs of primers out of 30 microsatellite loci were tested which were recommended by the UN Food and Agriculture (FAO) and the International Animal Genetics (ISAG) in 112 individualm icrosate llites, a total of 101 alleles were detected. The number of alleles per locus was from 4 to 6, the average allele number, effective allele number, observed heterozygosity, expected heterozygosity and polymorphism in formation content for the population sampled were 4.67 0. 82, 2. 54 0. 64, 0. 59 0. 09, 0. 41 0. 09 and 0. 53 0. 09, respectively. All Parameters had almost reached the rich standard of geneticd iversity. The results may provide a scientific basis for the study of characteristics of Luxi cattle breeds so as to preserve and utilize them.

【题目】Preparation and application of a molecularly imprinted polymer for the determination of trace metolcarb in food matrices by high performance liquid chromatography

【中文关键词】食品基质,速灭威,分子印迹,固相萃取

【英文关键词】Food matrices / Metolcarb / Molecularly imprinted polymer / SPE

【中文摘要】本论文第一次以本体聚合的方法合成了检测速灭威的分子印迹聚合物,其中以速灭威为模版分子,甲基丙烯酸作为功能单体,三乙烯乙二醇作为交联剂。经傅里叶红外光谱、静态及动态吸附试验验证,该聚合物被成功合成并对速灭威具有良好的选择吸附能力。该聚合物作为固相萃取的吸附剂与高效液相色谱联用分离和检测三种食品样品中三个添加浓度的速灭威的痕量残留。在最优的条件下,甘蓝、黄瓜和梨三种样品的最低检出限(S/N=3)分别为7.622, 6.455 和13.52 mg/kg,回收率在68.80 – 101.31%之间,相对标准偏差都低于3.78%。为了进一步证明该聚合物的选择性,将其与商品化C18固相萃取柱对比,结果表明该聚合物对速灭威具有更好的选择性及较高的回收率。

【英文摘要】In this article, for the first time, a molecularly imprinted polymer (MIP) for the metolcarbwas prepared by bulk polymerization using metolcarb as the template, methacrylic acid asthe functional monomer and ethylene glycol dimethacrylate as the cross-linker. Theprepared polymer was characterized by FT-IR, static and kinetic adsorption experiments,and the results showed that it has been successfully synthesized and had good selectiveability for metolcarb. The MIP was applied as a sorbent in molecularly imprinted SPEcoupled with HPLC-UV for separation and determination of trace metolcarb in threekinds of food matrices at three concentration levels. Under the optimal conditions, theLODs (S/N 5 3) of cabbage, cucumber and pear were 7.622, 6.455 and 13.52 mg/kg,respectively, and recoveries were in the range of 68.80 – 101.31% with RSD (n 5 3) below3.78% in all cases. To demonstrate further the selectivity of the MIP obtained, acomparison with commercially available C18 SPE was performed. The results indicated that molecularly imprinted SPE showed better chromatography, better selectivity and higher recoveries for metolcarb than commercially available C18 SPE.

【题目】Isolation and characterization of a novel glycogen synthasekinase-3 gene, GmGSK, in Glycine max L. that enhancesabiotic stress tolerance in Saccharomyces cerevisiae

【中文关键词】非生物胁迫,耐旱,糖原合成酶激酶-3 耐盐,亚细胞定位
【英文关键词】Abiotic stress Drought tolerance
Glycogen synthase kinase-3 Salt tolerance
Subcellular localization
【中文摘要】通过电子克隆得到一条类似糖原合成酶激酶的cDNA序列,并通过RT-PCR的方法从栽培大豆中将其克隆,序列分析表明,此cDNA包含一条1230bp的完整开放阅读框,编码410个氨基酸,估计分子量为46.5kD,等电点PI为8.64。蛋白序列分析表明,其编码一个与GSK-3同源的蛋白,含有丝氨酸/苏氨酸蛋白激酶活性位点,命名为GmGSK(Genbank登录号:FJ460228)。 Southern杂交表明,GmGSK基因在栽培大豆基因组中至少有两个拷贝。Northern杂交表明,在栽培大豆的根、茎、叶和叶柄中均能表达GmGSK,但不同的组织器官中GmGSK基因的表达量不同,在根中分布较多。半定量RT-PCR分析结果显示, GmGSK基因的表达可以被NaCl、NaHCO3、干旱、ABA和低温所诱导,这表明GmGSK可能参与了大豆非生物胁迫的信号传导过程或对非生物胁迫的耐受。
【英文摘要】A novel glycogen synthase kinase-3 gene,GmGSK, was isolated from Glycine max. It is1,596 bp in length with one ORF of 410 amino acids.Southern blot analysis revealed that it has at leasttwo copies in the G. max genome. GmGSK, whentransiently expressed in Nicotiana tabacum leaves,was localized in both cell membrane and cytoplasm.Northern blot analysis indicated that GmGSK isexpressed in all tissues, with highest expression inthe root. GmGSK can be induced by various abioticstresses. When transformed with GmGSK, Saccharomycescerevisiae exhibited enhanced resistance to saltand drought stress.

【题目】Multiwalled Carbon Nanotubes as SPE Adsorbents for Simultaneous Determination of Seven Sulfonylurea Herbicides in Environmental Water by LC – MS – MS
【中文关键词】环境水,固相萃取,多壁残纳米管,磺酰脲类除草剂,液相色谱串联质谱法
【英文关键词】Environmental water
Solid-phase extraction
Multiwalled carbon nanotubes
Sulfonylurea herbicides
Column liquid chromatography – tandem mass spectrometry
【中文摘要】本文利用多壁碳纳米管作为固相萃取材料和高效液相色谱串联质谱成功的建立了一个高效快速的测定环境水样中七种磺酰脲类除草剂的方法,并对影响固相萃取效率的重要因素,例如上样pH、上样流速、洗脱溶剂种类和洗脱体积进行了优化。七种磺酰脲类除草剂在0.05-5000 ng/l浓度范围内有良好的线性关系(r2>0.99),九次测定200ng/l浓度标品的的RSD值为1.9-7.3%。检测限和定量限分别为0.02-0.20和0.05-1.00 ng/l。这个方法成功的用于自来水、泉水、地下水和井水四种样品中磺酰脲类除草剂的测定,这七种除草剂在三个加标浓度水平下的加标回收率为81.5-110.5%,RSD值为0.3-7.0%。结果表明该方法能够广泛应用于水样中磺酰脲类除草剂的痕量分析。
【英文摘要】An effective and rapid method was developed for simultaneous determination of sevensulfonylurea herbicides in environmental water using multiwalled carbon nanotubes as solid-phase extraction sorbent coupled with liquid chromatography – tandem mass spectrometry.Important parameters influencing the extraction efficiency such as pH of the sample solution,flow rate of sample loading, the eluent and its volume were optimized. Under optimumconditions, good linearity was obtained for all herbicides (r2>0.99) over the range of 0.05 – 5,000 ng L-1, and precisions (RSD) for nine replicate measurements of a standard mixture of 200 ng L- 1 were 1.9 – 7.4%. The limits of detection and quantification were 0.01 – 0.20 and 0.05 – 1.00 ng L-1, respectively. The proposed method was successfully applied to the analysis of tap water, spring water, ground water and well water, and mean recoveries for seven analytes at three spiked concentration levels were from 81.5 to 110.5% with RSDs between 0.3 and 7.0%. The results showed that the established method has wide application to analyze sulfonylurea herbicides at trace level in water.

【题目】Preparation and characterization of molecularly imprinted silica monolith for screening sulfamethazine
【中文关键词】毛细管整体柱,离子液体,分子印迹,磺胺甲嘧啶
【英文关键词】Capillary monolith / Ionic liquid / Molecularly imprinted polymer / Sulfamethazine
【中文摘要】本文提供了一种两步法制备分子印迹膜-衍生硅胶整体柱材料的方法。首先以四甲氧基硅烷为前躯体,采用溶胶-凝胶法制备了硅胶整体柱。并采用三甲氧硅丙基甲基丙烯酸对硅胶整体柱进行接枝,连接上乙烯基。再次,以甲基丙烯酸为功能单体,二甲基丙烯酸乙二醇酯为交联剂,磺胺二甲基嘧啶为模板分子,离子液体为致孔剂制备分子印迹前聚合液,并将制备好的分子印迹前聚合液注入到乙烯基功能化的硅胶整体柱中反应一定时间使之在硅胶基质表面形成分子印迹膜。采用扫描电镜,红外光谱和固体反射紫外扫描对制备的硅胶整体柱进行表征。同时采用高效毛细管电色谱和高效液相色谱对制备的印迹材料进行评价。结果显示,制备的分子印迹膜-衍生硅胶整体柱材料表面有足够的识别位点将磺胺二甲基嘧啶从磺胺类药物混合物种选择性的分离。致孔剂离子液体能够改善分子印迹功能化硅胶整体柱的通透性和选择性。
【英文摘要】In this work, a novel approach of preparing molecularly imprinted film- derivatized silicamonolith materials was developed by a two-stepprocedure. The silica monolithic support wasfirst prepared by the sol – gel method with tetram ethoxysilane as the precursor. Subsequently,vinyl groups were introduced onto the surface of silica monolith by immobilization ofg-methacryloxypropyltrimethoxysilane. The prepolymerization mixt ures, consisting ofmethacrylic acid as a functional monomer, ethylene dimethacrylate as a crosslinker, sulfa-methazine as a template molecule and an ionic liquid as porogen, were injected into the silicamonolith immobilized vinyl groups to form the molecularly imprinted films on the surface ofthe vinyl functionalized silica monolith. The mo nolithic materials were characterized by SEM,Fourier transform IR and solid-state reflection UV spectra. The resulted imprinted materialswere evaluated under CEC and HPLC mode. The results indicated that there were enoughrecognition sites on the surface of the imprinted film-derivatized monolithic materials forselectively recognizing sulfamethazine from the sulfonamide mixture. Ionic liquids, whichwas utilized as the porogens, could improve the flow-through property and the imprintingeffect of the molecularly imprinted film-functionalized silica monolithic materials.

【题目】Joint Multifractal Analysis of Scaling Relationships Between SoilWater-Retention Parameters and Soil Texture
【中文关键词】无
【英文关键词】clay content, multiple-scale analysis, sand content, silt content, van Genuchten parameters
【中文摘要】Wang, Z., Y., Shu, Q. S., Xie, L. Y., Liu, Z. X. and Si, B. C. 2011. Joint multifractal analysis of scalingrelationships between soil water-retention parameters and soil texture. Pedosphere. 21(3): 373{379.
【英文摘要】Soil water-retention characteristics at measurement scales are generally di ® erent from those at application scales, andthere is scale disparity between them and soil physical properties. The relationships between two water-retention parameters,the scaling parameter related to the inverse of the air-entry pressure (® vG, cm ¡ 1) and the curve shape factor related to soilpore-size distribution (n) of the van Genuchten water-retention equation, and soil texture (sand, silt, and clay contents)were examined at multiple scales. One hundred twenty-eight undisturbed soil samples were collected from a 640-m transectlocated in Fuxin, China. Soil water-retention curves were measured and the van Genuchten parameters were obtained bycurve ¯ tting. The relationships between the two parameters and soil texture at the observed scale and at multiple scaleswere evaluated using Pearson correlation and joint multifractal analyses, respectively. The results of Pearson correlationanalysis showed that the parameter ® vG was signi ¯ cantly correlated with sand, silt, and clay contents at the observedscale. Joint multifractal analyses, however, indicated that the parameter ® vG was not correlated with silt and sand contentsat multiple scales. The parameter n was positively correlated with clay content at multiple scales. Sand content wassigni ¯ cantly correlated with the parameter n at the observed scale but not at multiple scales. Clay contents were stronglycorrelated to both water-retention parameters because clay content was relatively low in the soil studied, indicating thatwater retention was dominated by clay content in the ¯ eld of this study at all scales. These suggested that multiple-scaleanalyses were necessary to fully grasp the spatial variability of soil water-retention characteristics.

【题目】寒地水稻应用生物增温剂抗低温育苗研究
【中文关键词】水稻;生物增温;育苗
【英文关键词】Rice; Biochemical Calefacient; Culture of Seedling
【中文摘要】为探讨生物增温技术在水稻抗低温育苗中的应用效果,以‘空育131’为供试水稻品种,通过田间小区实验(苗床和水田2 个部分),研究了酿热物基础上施用不同剂量生物增温剂(一种微生物发酵复合菌群)对水稻苗床温度、秧苗素质以及栽后水稻的生育期和产量性状的影响。结果表明,较酿热物育苗相比,增施生物增温剂后可显著提高苗床温度,改善秧苗素质,促进水稻早熟,达到增产、增收的目的,其中以中等剂量(2.5 kg/100 m2)生物增温剂处理效果最好:可提高苗床温度3.0℃,增产8.8%,增收2110元/hm2。
【英文摘要】In cold regions such as Heilongjiang Province, low temperature is generally a limit factor to thegrowth of rice seedling. The effects of biochemical calefacien (a kind of microbial community) applicationcombined with rice straw were investigated on rice seedbed temperature, seedling quality, rice growing seasonsand yield characteristics after transplanting in such a region. The conducted field experiments includedseedbed and paddy field. Four treatments with the biochemical calefacien at the rates of 0, 1.25, 2.5 and 5.0kg/100 m2, were designed with three replicates. The application of biochemical calefacient could significantlyelevate the temperature of the rice seedbed, improve the seedling quality, promote the rice maturity andincrease the rice yield and profits. The best application rate was 2.5 kg/100 m2, with the highest temperatureincrease of rice seedbed of 3.0℃, the highest yield increase of 8.8%, and the highest economic benefitsincrease of 2110 yuan/hm2.

【题目】不同P、K、Sill~对玉米苗期抗寒效果的研究
【中文关键词】玉米;硅肥;磷肥;钾肥;抗寒性
【英文关键词】corn;Silicon fertilizer;P fertilizer;K fertilizer;cold——resistant
【中文摘要】此文突破常规只重施N、P、K肥的情况,通过施用不同水平的P、K、Si肥在玉米苗期低温环境下进行盆栽试验,再通过室内分析方法进行初步研究,确定不同的肥料水平对玉米苗期各项抗寒指标的影响。结果表明,低温胁迫下并且氮肥含量固定时,施用P肥,使超氧化物歧化酶(S0D)的活性逐渐增强,可以减少细胞膜透性,增加干物重;施用K肥可以降低电解质的平均渗出率,提高可溶性糖含量;而Si肥能提高叶绿素含量,降低绝对电解质渗出量。从而得出不同用量的磷肥、钾肥和硅肥对玉米可以起到抗寒作用。
【英文摘要】This breakthrough was conventional only heavy use N,P,K fertilizer,through the effects of differentlevels of P,K,Si fertilizer in the corn seedling cryogenic environment pot experiment,again through thelaboratory analysis method was preliminarily studied,identified the different fertilizer levels on the coinseedling various cold—tolerance index effects.The results showed that low temperature stress and nitrogencontent,application of P fertilizer fixed,superoxide dismutase(SOD)activity gradually strengthened,whichcould reduce the membrane permeability,increased dry matter weight.Application of K fertilizer could reducethe average rate of electrolyte,improved oozy and content of soluble sugar.And Si fertilizer could improve thechlorophyll content and reduce absolute electrolyte leakage quantity.Thus at the different content of P and Kand Si fertilizer could play a role of corn cold-resistant.

【题目】尿素配施添加剂NAM 对三江平原白浆土氮素转化和玉米产量的影响
【中文关键词】肥料添加剂; 脲酶抑制剂; 硝化抑制剂; 土壤氮素转化; 氮肥利用率; 玉米产量
【英文关键词】fertilizer additive; urease inhibitor; nitrification inhibitor; soil N transformation; urea N recovery rate; corn yield
【中文摘要】通过田间小区试验,研究了尿素配施肥料添加剂NAM (由脲酶抑制剂和硝化抑制剂等成分组成) 对三江平原白浆土氮素转化、玉米产量以及氮肥利用率的影响,以期为肥料添加剂NAM 的进一步推广应用提供理论依据。研究结果表明,与常规施氮处理相比,等氮量配施NAM 处理使土壤NH+4 - N 在较长时间内维持较高的水平,并显著提高了作物后期的土壤总有效氮供应水平,从而使作物吸氮量增加了6. 8%,增产3. 1%; 减氮20%配施NAM 处理维持了土壤NH+4 - N 总体供应水平和作物后期的土壤总有效氮供应,从而使作物吸氮量及产量与常规施氮处理保持相当; 减氮40%配施NAM 处理由于过多降低了施氮水平,致使在作物生长前期土壤供氮量明显不足,进而降低了作物吸氮量及产量。尿素配施NAM 较单施尿素提高氮肥利用率4. 9 ~ 8. 0 个百分点。在等氮和适当减氮条件下,肥料添加剂NAM 适用于三江平原白浆土- 玉米体系,有利于农业可持续发展。
【英文摘要】NAM is a kind of fertilizer additive made of the urease inhibitor,nitrification inhibitor and other components.This paper reported the effects of urea combined with NAM on soil nitrogen (N) transformation and corn yield and fertilizerN use efficiency in Sanjiang Plain of China. Compared with the N1 treatment,the N1 + NAM treatment significantly increasedsoil NH+4 -N content across the corn growing season and total available N content at the corn later season,and thuselevated corn N uptake (6. 8%) and grain yield (3. 1%) ; the 80% N1 + NAM treatment remained constant soil NH+4 -Ncontent across the season and total available N content at the later season,and therefore resulted in unchanged corn N uptakeand grain yield; The 60%N1 + NAM treatment caused the

significant decline of soil N supply especially at the earlier seasondue to the over reduction of urea rate,and in turn decreased N uptake by corn and grain yield. Urea N recovery rate wassignificantly enhanced by 4. 9 to 8. 0 percentage point under the combination of urea and NAM than the urea alone. Ourfindings indicated that NAM application was an effective option for promoting agricultural sustainability in corn systems ofSanjiang Plain of China.

【题目】NAM添加剂对水稻减氮施肥的影响效果研究
【中文关键词】NAM添加剂;水稻;NH4
+- N;NO3
- - N;产量;氮肥利用率
【英文关键词】Additive NAM; Rice; NH4
+- N; NO3
-- N; Yield; Fertilizer- nitrogen use efficiency (FNUE)
【中文摘要】通过田间小区试验,研究NAM添加剂在水稻减氮施肥的情况下,对土壤NH4+- N、NO3- - N 含量、水稻产量以及氮肥利用率的影响,旨在验证利用NAM添加剂减少当地水稻施氮量的可行性。结果表明,施用NAM添加剂,在一定的时间内,使土壤NH4+- N 保持较高的水平,延缓土壤NH4+- N向NO3- - N 的转化,减少氮素损失,从而保证总有效氮能够满足作物后期的生长需要。NAM添加剂能够有效地增加水稻产量,常规施肥不添加NAM处理的产量为9676.93 kg hm- 2,与常规施肥添加NAM的处理差异显著,而与减氮20%添加NAM处理差异不显著。与常规施肥氮肥利用率33.94%相比,NAM添加剂能够将氮肥的利用率提高到40.58%,并且氮肥的利用率随着施氮量的减少而增加。研究试验表明,在欲节氮减肥的水稻生产中,NAM不失为一种理想的添加剂。
【英文摘要】A field experiment was carried out to study the effect of additive NAM on the soil NH4+- N and NO3-- Ncontent, rice yield, and fertilizer- nitrogen use efficiency (FNUE). The objective of this experiment was to find whetherthe additive NAMcould reduce the fertilizer nitrogen application rates while not the yield at the same time. The resultsshowed that the additive NAM could keep

the NH4+- N at a high level over a period of time and slow down itstransformation into NO3-- N. It could reduce the loss of nitrogen and make the total available nitrogen to meet thedemands of rice growth at the later stage. The additive NAM could increase rice yield greatly. The yield of thetreatment of traditional fertilizer without NAM reached 9676.93 kg hm- 2, while the yield of the treatment of traditionalfertilizer with NAM reached 9977.91 kg hm- 2. The treatment of traditional fertilizer without NAM and the treatmentwith 20% reduction of fertilizer- nitrogen plus NAMreached the same level of rice production. Compared to 33.94% ofFNUE in conventional treatment, FNUE in NAM treatments reached 40.58% and increased with the reduction offertilizer N application. The above results showed that NAMwas one of effective additives for the extension of reducingnitrogen fertilizer application in rice production.

【题目】不同施肥处理对大豆根际土壤微生物及土壤肥力影响
【中文关键词】大豆; 肥料; 土壤微生物; 土壤肥力
【英文关键词】Soybean; Fertilizer; Soil microoganisms; Soil fertility
【中文摘要】为研究不同施肥方式对大豆根际土壤微生物数量及土壤肥力影响,采用无肥、常规肥、有机肥、常规施肥+生物肥 4 种肥料处理,分别于大豆播种前、苗期、花期、鼓粒期和成熟期对大豆根际土壤的细菌、真菌、放线菌进行测定。结果表明: 肥料的施用可提高土壤微生物的数目及土壤肥力,其中有机肥处理与常规肥 + 生物肥处理在大豆各生育时期可明显增加土壤中细菌、真菌及放线菌数目; 与无肥处理相比,常规肥、有机肥及常规肥 + 生物肥处理提高了土壤肥力。
【英文摘要】The objective of current study was to investigate the effects of different fertilizer treatments on rhizosphere soil mi-crooganisms and fertility of soybean. Four fertilizer treatments including no fertilizer,conventional fertilizer,organic fertilizerand conventional fertilizer + bio-fertilizer were adopted. The numbers of bacteria,fungi,actinomycetes of rhizosphere soil atdifferent growth stages were determined through colony counting method. The results showed that application of fertilizer couldincrease microoganisms and improve fertility of soil,both organic fertilizer and conventional fertilizer + bio-fertilizer could sig-nificantly increase the number of bacteria,fungi and actinomycetes in each growth stage of soybean,meanwhile,the treat-ments of conventional fertilizer,organic fertilizer and conventional fertilizer + bio-fertilizer improved the fertility of soil com-pared with no fertilizer.

【题目】控释肥对大豆根际土壤微生物数目、肥力及大豆农艺性状的影响
【中文关键词】大豆;土壤微生物;土壤肥力;控释肥
【英文关键词】Soybean;Soil microoganisms;Soil fertility;Controlled-release fertilizer
【中文摘要】采用无肥、常规肥、控释尿素和控释复合肥4种肥料处理,于大豆播种前和成熟期对大豆根际土壤的细菌、真菌、放线菌采用平板计数法进行测定;并对大豆成熟期根际土壤微生物数量变化、土壤养分含量变化及大豆农艺性状及产量相关因素进行分析。结果表明:与无肥和常规肥比较,控释尿素和控释复合肥可明显增加土壤中细菌、真菌及放线菌数目,并且控释复合肥处理的细菌数目、土壤养分含量等项目优于控释尿素处理;在大豆农艺性状及产量相关因素方面,控释尿素及控释复合肥未表现出显著优势。与常规肥相比,施用控释肥可以增加土壤中微生物数量、提高供肥能力,从而提高肥料利用率,减少化肥对环境的污染。
【英文摘要】The objective of current study was to investigate the effects of controlled-release fertilizer treatments on rhizospheresoil microorganisms,soil fertility and agronomic characters of soybean. Four fertilizer treatments,including no fertilizer(CK),conventional fertilizer(CF),controlled-release urea(CRU) and controlled-release compound fertilizer(CRF)were adopted. Thenumbers of bacteria,fungi,actinomycetes of rhizosphere soil at pre-sowing and maturity were determined through colony countingmethod;the change of rhizosphere soil microorganisms,soil nutrient content,soybean agronomic characters as well as yieldcomponents were investigated. Compared with CK and CF,the numbers of bacteria,fungi,actinomycetes as well as soil fertilitywere obviously increased under CRU and CRF. The effect of CRF was better than CRU in terms of soil bacteria number andsoil fertility. CRU and CRF didn't show significant advantage for agronomic characters and yield components of soybean. Comparedwith conventional fertilizer,controlled-release fertilizer could increase the numbers of soil microoganisms,improve soilfertility and fertilizer efficiency,hence reduce fertilizer pollution on the environment.

【题目】氮磷钾配施对三江平原玉米产量的影响
【中文关键词】3414;玉米;肥料效应;数学模拟
【英文关键词】无
【中文摘要】为研究适合黑龙江八五三农场地区玉米最佳施肥量,采用“3414”试验方案进行了肥效试验,拟合了肥料效应一元二次方程和三元二次方程。通过一元二次方程拟合分析得出,在该土壤条件下的最大的施氮量、施磷量和施钾量分别为147.96、85.635和44.205kg·hm-2,最佳的施氮量、施磷量和施钾量分别为76.245、52.98和32.4kg·hm-2。氮、磷、钾三者必须配合施用才能达到高产,任何一种营养元素受到胁迫都不利于高产。通过三元二次方程得出,在该土壤条件下,氮、磷、钾最高施肥量为N-P2O5-K2O=131.7-85.3-36.1(kg·hm-2),对应的最高产量为9 522.81kg·hm-2。最佳施肥量N-P2O5-K2O=82.7-54.1-33.6(kg·hm-2),其对应的产量为9 288.54kg·hm-2。

【题目】活化剂对黑土有效磷含量及玉米产量影响的研究
【中文关键词】磷素活化剂;有效磷;玉米产量;千粒重;抽穗期
【英文关键词】Phosphorus activator; Olsen-P; Corn yield; 1000-seed weight; Heading stage
【中文摘要】本试验研究了活化剂对玉米各生育时期土壤有效磷含量和玉米产量的影响,得出以下结果:施用活化剂能有效减缓土壤有效磷下降的趋势,提高玉米产量,其中以活化剂H2(450 kg/hm2)效果最好,其次为柠檬酸铵(15 kg/hm2)和腐植酸(150 kg/hm2),分别比对照(处理3)增产9.32%、5.99%和4.99%。活化剂主要通过增大千粒重和穗粒数来增加玉米产量。相关分析得出,玉米产量与抽穗期土壤有效磷含量的相关性最大,应掌握好抽穗期合理施肥。
【英文摘要】Effects of phosphorus activator (PA) on amount of Olsen- P and corn yield in black soilwere studied in order to conduct fertilizing rationally. The results showed that PA could slow the trend ofdecreasing of Olsen- P in black soil and enhance corn yield. H2 (450 kg/hm2) was the best PA which enhancedcorn yield 9.32% more than CK. Following was citrate (15 kg/hm2) and HA

(150 kg/hm2), whichenhanced corn yield 5.99% and 4.99% more than CK, separately. PA could enhance corn yield mainlythrough increasing 1000- seed weight and grain number per spike. Correlated analysis showed that correlationbetween corn yield and amount of Olsen- P at heading stage was best. It should be cautious to fertilizephosphates at heading stage.

【题目】基于GIS 的典型白浆土区八五三农场耕地地力的定量评价
【中文关键词】耕地地力;GIS;八五三农场
【英文关键词】cultivated land productivity; Geographic information system; 853 farm
【中文摘要】以黑龙江省典型白浆土区的853 农场为例,采集农田耕层(0~20cm)样品1695 个,以土地利用现状图的耕地图斑为评价单元,选取10 个指标,利用特尔菲法和层次分析法,结合GIS 技术,对853 农场耕地地力进行了定量化的分析和评价。评价结果表明八五三农场耕地地力整体水平为:三级地占总耕地面积的35.47%,其次为二级和四级,分别占27.53%和20.86%,比例最小的是一级和五级地,分别占6.83%和9.30%。分级结果较好的体现了地区特点,同时明确了不同等级耕地的面积、空间分布格局, 为探讨制定科学的培肥政策、提高作物产量和土壤基础地力, 保护生态环境提供了定量化的分析依据。
【英文摘要】The quantitative analysis and evaluation was conducted based on GIS,combined with Delphi model and AHP(Analytical HierarchyProgress) for typical Albic bleached soil region in the 853 farm in Heilongjiang Province.In the study,1295 soil samples with0 ~20cm layer were collected from the field,evaluation unit was extracted from land use actuality map,and ten essential factors wereselected as evaluation indices.The results showed that the percentage of the third grade reached maximum,was 35.47%,then the secondand fourth grade which were 27.53% and 20.86%,the minimum were the first and fifth with 6.83% and 9.30%,respectively.The researchresults could reflect regional characteristic,and has verified the area of cultivated land of different level and the space distributing pattern.So this research can provide scientific and quantification foundation for making scientific fertilizer policy,improving crop production andthe soil fundamental fertility,and protecting ecological environment.

【题目】Multiwalled Carbon Nanotubes as Matrix Solid-Phase Dispersion Extraction Absorbents To Determine 31 Pesticides in Agriculture Samples by Gas Chromatography#Mass Spectrometry
【中文关键词】残留,农药,多壁残纳米管,基质固相分离,气质联用,农业样品
【英文关键词】Multiresidue; pesticides; multiwalled carbon nanotubes; matrix solid-phase dispersion extraction; gas chromatography-mass spectrometry; agriculture sample
【中文摘要】本文以多壁碳纳米管(MWCNTs)为吸附材料,以基质固相分散萃取(MSPDE)为前处理方法,建立了农产品中31种农药多残留的气质联用(GC/MS)分析方法。在所建立MSPD方法的基础上,比较了MWCNTs、C18和硅藻土三种吸附材料的吸附效果。结果显示,通过MWCNTs得到的提取物比通过C18和硅藻土得到的更加干净。以苹果和土豆为样品验证所建立方法的可行性,苹果样品中的回收率为74.2-104.2%,RSD为3.1-8.8%,检出限为0.1-3.1 μg kg-1 (S/N=3);土豆样品中的回收率为71.5-113.3%,RSD为3.2-9.7%,检出限为0.1-4.0 μg kg-1(S/N=3)。将建立的方法用于从当地市场获得的实际样品的检测,得到的结果与采用加速溶剂萃取(ASE)得到的结果相同,扑草净、水胺硫磷和杀扑磷的检测水平低于中国政府所允许的最大残留限量(MRLs)。

【英文摘要】A matrix solid-phase dispersion extraction (MSPDE) method was developed to extract 31 pesticides from agriculture samples using multiwalled carbon nanotubes (MWCNTs) as adsorbent prior to gas chromatography-mass spectrometry (GC-MS) determination. The comparisons of MWCNTs with C18 and diatomite were studied in the MSPD procedure. The results showed that the extracts obtained by using MWCNTs were cleaner than those obtained by using C18 and diatomite. Using the developed method, recoveries ranged from 74.2 to 104.2% with relative standard deviations (RSD) ranging from 3.1 to 8.8% for the apple matrix, and 71.5-113.3% with RSD ranging from 3.2 to 9.7% for the potato matrix. The limits of detection (LODs), calculated as 3 times the background noise, ranged from 0.1 to 3.1 μgkg-1 for the apple matrix and 0.1 to 4.0 μgkg-1 for the potato matrix. The proposed MSPDE method was used to analyze real samples obtained in a local market, the results were approximation to those obtained using accelerated solvent extraction (ASE) method, and prometryn, isocarbophos and methidathion were detected at levels below the maximum residue limits (MRLs) allowed by the Chinese Government.

【题目】Study on an on-line molecularly imprinted solid-phase extraction coupled to high-performance liquid chromatography for separation and determination of trace estrone in environment
【中文关键词】高效液相色谱;分子印迹技术;莱克多巴胺;溶胶-凝胶;在线固相萃取
【英文关键词】HPLC / Molecular imprinting / Ractopamine / Sol – gel / SPE
【中文摘要】在这项研究中,分子印迹功能聚合物用于选择性分离莱克多巴胺,是通过表面分子印迹和溶胶凝胶技术制备。用静态和动力学吸附和选择性吸附试验来评价聚合物。结果显示分子印迹聚合物有较高的吸附能力,较强的选择性和较快的传质速率。聚合物应用于在线固相萃取与液相色谱联用的痕量检测。样品富集速度2ml/min,增强因子在516.26,最低检出限(信噪比为3)达到4.6ng/l,标准曲线的线性范围在0.04~18mg/l,r2>0.99。在三个不同添加浓度(0.5 ng kg-1、1.0 ng kg-1和2.0 ng kg-1)下猪肉样品中莱克多巴胺的回收率为55.86%-67.28%之间。
【英文摘要】In this study, a molecularly imprinted functionalized polymer for the selective sep-aration of ractopamine (RAC) was prepared by combining a surface molecularimprinting technique with a sol – gel method process. The polymer was evaluated bystatic, kinetic adsorption, and selective experiments. Results indicated that themolecularly imprinted polymer had high adsorption capacity, selective ability, andfast mass transfer rate. The polymer was applied for the determination of trace RACthrough online SPE-HPLC. With a sample loading flow rate of 2 mL/min, theenhancement factor of 516.26 and the LOD (S/N = 3) of 4.6 ng/L were achieved,respectively, and the linear range of the calibration curve was 0.04 – 18 lg/L withr2>0.99. The RAC in pork was determined at three spiked levels (0.5, 1, and 2 ng/g)with recoveries ranging from 55.86 to 67.28%.

【题目】Study on an on-line molecula rly imprinted solid-phase extraction couple d to high-performance liquid chromatography for separation and determination of trace estrone in environment
【中文关键词】雌酮,分子印迹,溶胶凝胶,在线固相萃取,高效液相色谱
【英文关键词】Estrone
Molecular imprinting.
Sol – gel
On-lin e soli d-phase extractio n
High-per form ance liquid chromatogr aphy
【中文摘要】雌酮是一种重要的潜在干扰内分泌机能的物质,因此需要建立一种灵敏、可靠的检测雌酮的分析方法来保障人类健康。本文以以雌酮作为模板分子,氨丙基三乙氧基硅烷为功能单体,四乙氧基硅烷为交联剂,以表面分子印迹与溶胶凝胶相结合的方法合成了一种高选择性分子印迹硅球。经傅里叶红外光谱和静态吸附试验表明该印迹聚合物对雌酮具有良好的识别和选择能力。本实验建立了一种新颖的结合固相萃取与高效液相色谱联用的的方法来分离和检测环境样品中雌酮的方法。在线固相萃取上样流速为2.6 mL min − 1,进样时间为9.6min, 富集倍数以进样量为10 μ L的标准溶液对比为1045. 最低检出限 (S/N=3) 为5.7 ng L − 1, 5.0 μ g L − 1浓度的九次重复进样的相对标准偏差低于10.0%。该方法应用于泉水和湖水样品中雌酮的检测来验证方法实用性,结果表明在添加量为0.5 and 1.0 μ gL − 1时回收率在86%到95%之间。
【英文摘要】Estrone is one of the important potential endocrine-disrupting compounds, and the sensitive and reliable analyt-ical methods for the determination of estrone are required forthe assurance of human health. In this paper, using estrone as template molecule, 3-aminopropyltriethoxysilane as function monomer, and tetraethoxysilicane as cross-linker, a highly selective molecularly imprinted microsphere was synthesized by surface molecular imprinting technique combined with a sol – gel process. The imprinted material was characterized by the Fourier transform infrared and static adsorption experi-ments, and the results showed that it exhibited good recognition and selective ability for estrone. A novel method for separation and determination of trace estrone in environ-mental sample was developed using on-line molecularly imprinted solid-phase extraction coupled to high-performance liquid chromatography. With a sample loading flow rate of 2.6 mL min − 1 for a 9.6-min extraction, the enrichment factor obtained by the slopes of the linear portion in comparison with the direct injection of 10 μ Lstandardsamplesolution was 1,045. The detection limit (S/N =3) was 5.7 ng L − 1,and the relative standard deviations for nine replicate extractionsf 5.0 μ gL − 1 estrone was less than 10.0%. This method was evaluated for quantitative determination of estrone in well and lake water samples spiked at two levels (0.5 and 1.0 μ gL − 1) with recoveries ranging from 86% to 95%.

【题目】中国草原红牛CAPN I基因的遗传多样性分析
【中文关键词】草原红牛; 钙蛋白酶基因; PCR-SSCP
【英文关键词】Red steppe cattle; CAPN; PCR-SSCP
【中文摘要】[目的]利用PCRSSCP技术研究中国草原红牛CAPN I 基因的多态性。[方法]以90头草原红牛的全血为试材,用酚/氯仿/异戊醇法提取基因组DNA, 采用PCRSSCP技术分析了钙蛋白酶I 基因(CAPN I)在草原红牛群体中的多态性。[结果]试验所设计的18对引物用于PCR扩增均获得良好的结果。经PCR SSCP分析, E7-1引物扩增的群体出现了AA、BB、AB和AC 4种基因型; E14-1引物扩增的群体出现了AA和BB 2种基因型, E14-5、E14-6和E20-2引物扩增的群体出现了AA、BB和AB 3种基因型。对不同基因型的测序表明, 在第14内含子4 685 bp处发生了C-T 的碱基突变,在第17内含子6 545 bp处发生了C-T 的碱基突变, 在第21内含子上8 462 bp处发生了G-A、8 561 bp处A-G、8 696 bp处A-T 的碱基突变。[结论]该研究为改善牛肉质性状的分子育种提供新的分子生物学基础数据。
【英文摘要】[Objective] The ami was to research the polymorphism of polymorphism of calpain I(CAPN I) gene in ChinaRed Steppe by using PCR-SSCP technique. [Method] With thewhole blood of 90 head ChinaRed Steppe as the testedmateria,l the genome DNA was extracted by using phenol/chlorofo rm / isoamyl alcoho lmethod and the CAPN I gene in the ChinaRed Steppe group by using PCR SSCP technique. [Result] The designed 18 pairs of prmiers used to PCR amplification all got the better results. Through PCR-SSCP analysis, the group of E7-1 prmier amplification appeared 4 kinds of genotypes of AA, BB, AB andAC; the group of E14-1 prmier amplification appeared 2 kinds of genotypes of AA and BB, the group of E14-5, E14-6, E20-2 prmier amplification appeared 2 kinds of genotypes of AA, BB andAB. The sequencing on different genotypes showed that the basem utation of C-T was happened at the 14th intron 4 685 bp, the basemutation of C-T was happened at the 17th intron 6 545 bp, the basemutation of G-A, A-G, A-T were happened at the 21th intron 8 462, 8 561 and 8 696 bp resp.[Conclusion] This research provided the basic data of molecular biology for the molecular breeding of miproving the beef quality characteristics.

【题目】Agrobacterium rhizogenes-mediated transformation of a high oil-producing filamentous fungus Umbelopsis isabellina.
【中文关键词】发根农杆菌介导的转化,分生孢子,深黄伞形霉,接合菌
【英文关键词】Agrobacterium rhizogenes-mediated transformation, conidia, Umbelopsis isabellina, zygomycetes.
【中文摘要】将深黄伞形霉中的高油基因转入发根农杆菌中,通过southern检测,最佳条件下可得到71%的整合率。我们随机选择115个阳性转化的潮霉素抗性分析的总脂肪酸量的γ-亚麻酸(GLA)。6个转化体,产生较高量的总脂肪酸的比野生型菌株,和一个转化也比野生型菌株在气相色谱分析中产生了较高水平的GLA。
【英文摘要】The Agrobacterium rhizogenes-mediated transformation procedure was developed by using thehygromycin B phosphotransferase gene (hph) as a selective marker for the oil-producing fungus Umbelopsisisabellina. Different conditions were combined to increase the transformation efficiency. The highest efficiencywas obtained by using A. rhizogenes strain R105 and a vector with zygomycete promoter. Southern blot analysisdemonstrated that 71% of transformants contained random integrations of T-DNA sequences under optimal con-ditions. We randomly selected 115 positive transformants resistant to hygromycin to analyze the amount of totalfatty acid and gamma-linolenic acid (GLA). Six transformants produced a higher amount of total fatty acids thanthe wild strain, and one transformant also produced a higher level of GLA than the wild strain in gas chromatogra-phy analysis. This is the first report about using A. rhizogenes strain R105 and germinated conidia to transformsuccessfully the recalcitrant zygomycetes and to obtain transformants with a stable phenotype.

【题目】三角褐指藻Δ5-脂肪酸脱氢酶基因的克隆及在酿酒酵母中的表达
【中文关键词】花生四烯酸　酿酒酵母　功能验证
【英文关键词】arachidonic acid　Saccharomyces cerevisiae　functional identification
【中文摘要】 D5-脂肪酸脱氢酶是合成花生四烯酸的关键酶。根据已报道的D 5-脂肪酸脱氢酶基因设计引物, 分别从三角褐指藻基因组DNA和总cDNA中扩增得到1520 bp和1410 bp的特异片段, 序列分析结果显示, 结构基因中含有一个大小为110 bp的内含子, 这是国内外首次报道。将D5-脂肪酸脱氢酶基因亚克隆到大肠杆菌和酿酒酵母的穿梭表达载体pYES2.0中, 在大肠杆菌中筛选到含有目的片段的重组质粒pYPTD5, 用电击转化的方法将重组质粒pYPTD5转化到营养缺陷型酿酒酵母菌株INVSc1中, 在缺省培养基中筛选得到酿酒酵母转化菌株YPTD5。在合适的培养条件下, 添加外源底物双高g-亚麻酸和诱导物半乳糖, 培养并收集菌体。通过脂肪酸甲酯气相色谱分析, 表明三角褐指藻D5-脂肪酸脱氢酶基因在酿酒酵母中获得了高效的表达, 将双高g-亚麻酸转化为花生四烯酸, 其底物转化率达到了45.9%。
【英文摘要】 Δ5-fatty acid desaturase is the key enzyme in synthesis of arachidonic acid. Two specific fragment was cloned from genomic DNA and total cDNA of Phaeodactylum tricornutum through PCR with primer designed according to the reported sequences, respectively 1520 bp and 1410 bp. Comparison of the genomic and cDNA sequences revealed that the Δ5-fatty Acid Desaturase gene from genomic DNA had an 110 bp intron. The 1.4 kb was subcloned into the yeast-E. coli shuttle vector pYES2.0, then an expression recombinant plasmid pYPTD5 contatining target gene was constructed. The plasmid pYPTD5 was transformed into defective mutant INCSc1 of Saccharomyces cerevisiae for expression by electrotransformation method. Dihomo-g-linolenic acid was provided as an exogenous substrate to the yeast cultures, with galactose as inducer. By GC detecting, the recombinant S. cerecisiae had arachidonic acid. The results indicated that high level expression of Δ5-fatty acid desaturase, and the substrate conversion reached 45.9%.

【题目】小眼虫藻△8-脂肪酸脱氢酶基因的克隆及其在酿酒酵母中的表达
【中文关键词】△8-脂肪酸脱氢酶　　小眼虫藻　　多不饱和脂肪酸
【英文关键词】Δ8-fatty acid desaturase, Euglena gracilis, polyunsaturated fatty acids
【中文摘要】△8途径是合成多不饱和脂肪酸的替代途径,△8-脂肪酸脱氢酶是该途径的关键酶之一.根据已报道的△8-脂肪酸脱氢酶基因设计引物,分别从小眼虫藻基因组DNA和cDNA中扩增得到该基因片段,序列分析表明:结构基因长1 266 bp,编码421个氨基酸;该基因没有内含子,比已经报道的△8-脂肪酸脱氢酶基因长6bp,并且N末端序列也有所不同.利用酿酒酵母的载体pYES2.0构建△8-脂肪酸脱氢酶表达载体pYEFD,并转化到营养缺陷型酿酒酵母菌株INVSc1中,在选择培养基中筛选得到酿酒酵母转化菌株YD8.YD8在合适的培养条件下,添加外源底物二十碳二烯酸和二十碳三烯酸并诱导基因表达.脂肪酸甲酯气相色谱分析表明小眼虫藻△8-脂肪酸脱氢酶基因在酿酒酵母中获得了高效表达,将二十碳二烯酸和二十碳三烯酸分别转化成二高-γ-亚麻酸和二十碳四烯酸,其底物转化率分别达到了31.2%和46.3%
【英文摘要】Δ8 desaturase pathway, different from common Δ6 desaturase pathway, is an alternate pathway of polyunsaturated fatty sequence. Comparison of the genomic and cDNA sequences revealed that there wasn't intron in this Δ8-fatty acid desaturase gene.This gene has an open reading frame of 1 266 bp that encodes 421 amino acids. It is 6 bp longer than the reported gene sequence, andalso showed certain difference from the reported sequence in the N-terminal. The recombinant expression plasmid pYEFD bysubcloning Δ8-fatty acid desaturase gene into the yeast-E. coli shuttle vector pYES2.0 was constructed and was transformed into thedefective mutant INVSc1 of Saccharomyces cerevisiae by electrotransformation. The resulting strain YD8 harboring plasmid pYEFDwas selected and was cultured in the induction medium with exogenous substrates ω6-eicosadienoic acid and ω3-eicosatrienoic acidfor the expression of Δ8-fatty acid desaturase gene. The results indicated that high level expressed Δ8-fatty acid desaturase couldconvert ω6-eicosadienoic acid and ω3-eicosatrienoic acid to dihomo-γ-linolenic acid and eicosatetraenoic acid with substrateconversion ratio 31.2% and 46.3%, respectively.acids biosynthesis. Δ8-fatty acid desaturase is one of the key enzymes in Δ8 desaturase pathway. Two specific fragments were separately cloned from genomic DNA and cDNA of Euglena gracilis by PCR with the primers designed according to the reported。

【题目】毕赤酵母Δ9-脂肪酸脱氢酶基因的克隆和表达
【中文关键词】毕赤酵母　Δ9-脂肪酸脱氢酶　cDNA末端扩增　酿酒酵母　表达
【英文关键词】Pichia pastoris　△A^9-desaurase　RACE　Saccharomyce scerevisiae　expression
【中文摘要】根据真菌Δ9-脂肪酸脱氢酶保守的氨基酸序列设计简并引物进行PCR,获得一个741 bp的毕赤酵母cDNA片段,再根据获得的部分序列设计基因特异性引物,通过cDNA末端扩增技术(RACE)获得该cDNA的3′和5′序列,从而得到全长为1 689 bp的cDNA序列.序列分析结果表明,该序列具有一个长度为1 194 b p、编码397个氨基酸的开放阅读框(PPD9).与报道的Δ9-脂肪酸脱氢酶一样,推测的氨基酸序列具有膜整合脂肪酸脱氢酶特异性的3个组氨酸保守区和疏水结构,在其氨基酸序列的C-末端具有类似于细胞色素b5的血红素结合区.该序列为一个新的编码Δ9-脂肪酸脱氢酶的基因,为了验证其功能,把开放阅读框序列PPD9亚克隆到表达载体pYES 2.0,构建重组表达载体pYPPD9,并转化到酿酒酵母的Δ9-脂肪酸脱氢酶缺陷型菌株DTY-11A中进行表达。通过平板互补实验结果表明,该序列在酿酒酵母中获得表达。所编码的蛋白具有Δ9-脂肪酸脱氢酶活性,能弥补DTY-11A中由于Δ9-脂肪酸脱氢酶的缺失而引起的致死性突变。

【英文摘要】A 741 bp DNA fragment was amplified from Pichia pastoris strain Gs115 with degenerate oligonucleotide primers designed based on the sequences information from fungal△^9 fatty acid desaturase genes by PCR and sequenced.Gene specific primers derived from this partial sequence were used for the amplification of the 3' and 5' ends of this cDNA by RACE(rapid amplification of cDNA ends) method,and this lead to a full length cDNA sequence with 1 689 bp.Sequence analysis showed this cDNA sequence had an open reading frame(ORF) of 1 194 bp coding 397 amino acids.The deduced amino acid sequence of the ORF showed similarity to those of the above△^9-fatty acid desaturaes which comprised the characteristics of membrane bound desaturases,including three conserved histidine rich boxes and hydropathy profile.A cytochrome b5 like domain was observed at the C-terminus.The full length cDNA sequence is a putative novel△^9-fatty acid desaturase gene.To elucidate the function of the protein,open reading frame of the gene was subcloned into the expression vector pYES2.0 to generate a recombinant plasmid pYPPD9,which was subsequently transformed into Saccharomyces cerevisiae△^9-fatty acid desaturase mutation strain DTY-11A for heterologous expression.The transforments can grow on the synthetic minimal medium plate with out oleic acid supplement,the pYPPD9 complement the mutation of DTY-11A and succesfully expressed.

【题目】Resistance of the Binary insect-resistant transgenic soybean to Heliothis viriplaca
【中文关键词】大豆食心虫;苜蓿夜蛾;抗虫;大豆
【英文关键词】Soybean pod borer, Heliothis viriplaca, Insect-resistance, Soybean
【中文摘要】大豆食心虫和苜蓿夜蛾是影响我国大豆产量和品质的重要害虫。抗虫品种的培育是害虫防治措施中最为经济、有效的途径。本研究利用农杆菌转化法将CpTI和人工合成GFMCryIA基因导入大豆栽培品种吉林27中。T1代转基因大豆抗大豆食心虫分析表明,转基因大豆株系R-150和R-190的虫食率比对照低~30%,抗虫能力显著提高。T2~T4连续三代田间接虫测定结果表明,转基因材料虫食率均显著低于对照非转基因材料,抗虫性状已获得稳定遗传;转基因大豆抗苜蓿夜蛾分析表明,转基因株系R-150和R-190的叶片损害程度明显减轻;同时,苜蓿夜蛾幼虫食叶量显著下降、存活天数缩短,发育变慢,蛹化数也显著降低,表明转基因大豆抗苜蓿夜蛾能力显著提高。本研究为抗食心虫和苜蓿夜蛾的大豆新品种的培育提供了依据。
【英文摘要】Soybean pod borer [Leguminivora glycinivorella(Mats)] and Heliothis viriplaca are two major insect pests affecting yields and qualities of soybean in China. Breeding insect-resistant soybean cultivars is considered as an economic and efficient strategy for control of the pests. In this paper, a binary vector harboring CpTI and modified GFMCryIA genes was transformed into a soybean cultivar Jilin 27 by the Agrobaterium-mediated transformation. The bioassay results showed that the pest infestation ratio of the T1 transgenic lines R-150 and R-195 were 30% lower than that of the non-transgenic ones under field conditions. Consecutive insect-resistant analysis on T2, T3, T4 transgenic lines also showed a lower pest infestation ratio and higher resistance to soybean pod borer than the non-transgenics; As for the resistance to H. viriplaca, the transgenic lines R-150 and R-195 showed a lower defoliation percentage than the non-transgenic ones. H.viriplaca larvae feeding on the leaves of those two transgenic lines exhibited less leaf consumption, greater larvae mortalities, slower development, and less pupation ratios, compared to those feeding on nontrangenic leaves. Taken together, our results indicated that the overexpression of CpTI and GFMCryIA in soybean can confer an effective resistance to both soybean pod borer and H.viriplaca.

【题目】Inhibition of PEPCase by antisense RNA increases oil in soybean seeds
【中文关键词】大豆;PEPCase;反义RNA; 高油
【英文关键词】Soybean (Glycine Max L.), PEPCase, Antisense RNA, high-oil
【中文摘要】大豆是世界上食用蛋白和油脂的重要来源, 高含油量是大豆育种的重要目标之一。磷酸烯醇式丙酮酸羧化酶(PEPCase)是CAM和C4植物光合碳代谢的关键酶,不仅参与空气中CO2的固定,同时具有调控种子蛋白质/油脂含量比例的作用。为研究PEPCase表达水平的降低对大豆籽粒油分积累的影响,我们从大豆中分离了PEP基因,并利用反义RNA技术,通过农杆菌介导法将反义PEP片段导入栽培大豆品种。T1代转基因植株籽粒含油量分析表明,转基因大豆种子含油量比对照非转基因材料提高15%,含油量达到25.42%;连续多代(T2 ,T3, T4)籽粒含油量测定结果表明,转基因株系高含油量性状表现为稳定遗传。本研究表明利用反义RNA技术降低植物内源PEP水平可以有效促进大豆籽粒中油脂的合成和积累,并为高油大豆品种的培育提供了一条新的技术途径。
【英文摘要】As one of the most important sources of plant oil and proteins for the human, soybean with high-content oil is a major objective in many soybean breeding efforts. Phosphoenolpyruvate carboxylase (PEPCase) is a pivotal enzyme in the photosynthesis pathway of the CAM and C4 plants, involved in not only assimilation of CO2 in the air, but also regulation of oil/protein content ratios in oilseeds. To investigate the effects of the decreased PEPCase level on oil accumulation in soybean seeds, we isolated a PEP cDNA from soybean leaves and transformed a partial fragment of the cDNA in reverse direction driven the 35S promoter into a soybean

cultivar Jilin35 by the Agrobacterium-mediated transformation. Oil content analysis showed that the seed oil increased by 15% in the T1 transgenic plants compared to that of the non-transgenics, accounting for 25.52% of seed dry weight (22.1% for the non-transgenics). Consecutive analysis on seed oil content of T2 ,T3, T4 transgenic lines indicated that the high-oil trait of the transgenic lines can be transmitted stably through offspring generations. Taken together, our results demonstrate that the inhibition of PEPCase by antisense RNA can greatly increase oil in soybean seeds, therefore providing a new effective way for breeding high-oil soybean cultivars.

【题目】植物叶绿体遗传转化及研究进展
【中文关键词】叶绿体;遗传转化;进展
【英文关键词】Chloroplast; Chloroplast transformation; Advances
【中文摘要】叶绿体遗传转化与传统的细胞核遗传转化相比具有许多独特的优点:包括外源基因表达效率高,可同时转化及表达多个基因,由于通过母性遗传,因此没有基因沉默现象及位置效应,也不会造成外源DNA的扩散。目前已经有超过40多个外源基因整合到烟草等作物的叶绿体基因组中,表现出理想的农艺性状或作为生物反应器表达高水平的生物疫苗。本文对植物叶绿体基因组转化技术的原理和优点,外源基因导入叶绿体基因组的方法,以及目前叶绿体转化研究的最新进展进行了综述,并对其应用进行了展望。
【英文摘要】Chloroplast genetic engineering offers a number of unique advantages, including high-level transgene expression, multigene engineering in a single transformation event, transgene containment via maternal inheritance, lack of gene silencing, position and pleiotropic effects and undesirable foreign DNA. More than 40 transgenes have been stably integrated and expressed via the tobacco chloroplast genome to confer desired agronomic traits or express high levels of vaccine antigens and biopharmaceuticals. In this paper, the principles and advantages of the chloroplast genetic engineering, the methods used for chloroplast transformation, and the recent advances in the field were illustrated and the application of the technology in future was also discussed.

【题目】大豆体细胞胚胎发生系统组织学研究
【中文关键词】大豆; 体细胞胚胎发生; 组织学
【英文关键词】somatic embryogenesis, histology, soybean
【中文摘要】大豆体细胞可以诱导发生在形态和结构上类似胚结构的胚状体。利用大豆体细胞胚发生系统进行大豆遗传转化, 具有转化频率高、同步性好、转基因植株嵌合体少等诸多优点。对经根癌农杆菌侵染后, 在含卡那霉素筛选培养基上生长的大豆未成熟子叶胚性细胞的发生、分化及发育进行了组织学研究。结果表明, 体细胞胚以非芽体方式发生。胚性细胞可以从外植体表层或表层下1~2 层细胞开始发生,随着胚性细胞的分裂, 周围细胞开始退化解体, 并形成具有类似胚柄结构的胚状体。之后, 呈球形的胚状体突出于表皮之外, 并依次发育成心形胚、鱼雷形胚和子叶形胚。以期为利用大豆未成熟子叶诱导体细胞胚发生系统高效转化体系的建立提供理论依据。
【英文摘要】Embryoids with embryo- like structure can be induced from soybean somatic cells. Transformation of soybean through somatic embryogenesis possesses many advantages, such as higher efficiency, better synchronism, and lower chimerism, over other recipient systems. In this paper, we conducted histological investigations on initiation, differentiation and development of soybean embryogenic cells of the immature cotyledons cultured on the selection medium containing kanamycin after infection with Agrobacterium tumefaciens. The results showed that the somatic embryloids were generated through the non- shooting way. The embryogenic cells initiated at first from the cells of epidermis and 1~2 layers of subepidermis of the immature cotyledons. With division of these embryogenic cells, the cells around degraded and suspensor - like cells mass appeared. The globular embryoids eventually extruded out of the epidermis of the explants, and developed into heart - shaped, torpedo- shaped and cotyledon - shaped embryoids consequently. Our study might provide some insight into the mechanism for high- efficiency transformation through somatic embryogenesis of the immature cotyledons of soybean.

【题目】奶牛体外成熟卵母细胞与X分离冻精体外受精及其胚胎发育
【中文关键词】X 分离冻精,体外受精,共培养,胚胎,奶牛
【英文关键词】X-sorted frozen-thawed sperm, In vitro fertilization, Co-culture, Embryo, Cattle
【中文摘要】比较了X 分离冻精和未分离冻精与牛卵母细胞进行体外受精后,受精卵的卵裂率和胚胎发育率。X分离冻精组受精卵的卵裂率(51.4%)和囊胚发育率(19.7%)显著低于未分离冻精组(67.9%, 29.9%, P< 0.05);微量上浮非离心法处理X 分离冻精和未分离冻精后,其受精卵的卵裂率(50.7%,65.5%)高于上浮离心法处理组(48.3%,63.8%),但两种处理方法之间无统计学差异(P>0.05);同一种精子采用微量上浮非离心法或上浮离心法处理后,其卵裂胚的桑葚胚发育率和囊胚发育率无统计学差异(P>0.05);X 分离冻精的受精卵与颗粒细胞和睾丸支持细胞共培养后,其卵裂率(50.0%,51.4%)与非共培养组(50.3%)无显著差异P> 0.05);两个共培养组的桑葚胚发育率(53.3%,54.6%)和囊胚发育率(21.1%,21.5%)均高于对照组52.2%,20.4%),但无统计学差异(P>0.05).
【英文摘要】The embryo developmental capacity after in vitro fertilization with the X-sorted frozen and unsorted frozen sperm were studied. The cleavage and blastocyst rate of embryos fertilized with X-sorted frozen sperm, were significantly lower than that of control group fertilized with unsorted frozen sperm (51.4% vs. 67.9%, P<0.05; 19.7% vs 29.9 %, P<0.05). After the two kinds of frozen sperm were treated with the micro epi-floating noncentrifugation and the epi-floating , the cleavage rate of the former was better than that of the latter, but there were not statistically significant difference (50.7% and 65.5% vs. 48.3% and 63.8%, P>0.05). Additionally, no

statistical differences were observed in morula rate and blastocyst rate of the cleavaged zygotes fertilized with the X-sorted frozen sperm and unsorted frozen sperm. After co-culturing with sertoli cells and granular cells respectively, the cleavage rate (50.0% and 51.4%) of sexed zygotes co-cultured with feeder cells were not statistically ignificant difference with that of control group (50.3%, P>0.05). And the morular rate(53.3% and 54.6%) and blastular rate (21.1% and 21.5%) of sexed embryo co-cultured with feeder cells were higher than that of control group (52.2% and 20.4%), but there were no statistically difference (P>0.05).

【题目】牛AMPK 家族基因的研究进展
【中文关键词】牛; AMPK 家族基因; 研究进展
【英文关键词】Bovine; AMPK family genes; Study progress
【中文摘要】AMP 激活的蛋白激酶(AMP activated prorein kinase, AMPK) 是一种能被腺苷一磷酸(AMP) 激活的蛋白激酶。在动物应激(生理、营养、环境和疾病等) 过程中起着重要作用。近年研究表明, AMPK 在细胞和全身组织器官能量代谢平衡中起着举足轻重的作用, 并且在调节物质代谢中起重要作用, 其调节代谢过程主要包括葡萄糖转换, 糖酵解和脂类代谢等。近年来在牛上已经进行了很多研究, 其中包括其染色体定位及结构的确定等。本文将简要介绍AMPK 的分子结构及功能, 并对AMPK 基因在牛上的研究进展进行综述。
【英文摘要】AMP activated protein kinase (AMPK) is a protein kinase that can be activated by AMP. Itplays a critical role in animal stress (physiology、nutrition、environment and disease, etc.) . The recent study indicated that AMPK functions as energy metabolism at both cell and whole body levels, play an important role in substance metabolism, it regulated many metabolic processes including glucose transport, glycolysis, and lipid metabolism, etc. AMPK had been recently widely studied in bovine, including chromosomal localization and the definition of its structure. The main purpose of this paper was to briefly introduce the molecular structure and function of AMPK gene, and to review the study progress of this genein bovine.

【题目】牛AR 基因5‘ UTR SNP分析及与精液品质关系
【中文关键词】牛; 雄激素受体基因; 5 ’非翻译区; SNP分析; 精液品质
【英文关键词】bull; androgen receptor gene; 5'UTR; single nucleotide polymorphism; semen quality
【中文摘要】采用PCR- SSCP 方法对种公牛群体雄激素受体(AR) 基因5 ’非翻译区(5‘ UTR) 多态性进行检测。结果表明: AR 基因5 ’UTR 含有多态性位点; 测序结果显示5‘ UTR 的- 1575 处存在T/G 碱基突变; 用最小二乘方法对该基因型与生产性状相关分析显示遗传多态性与精子密度性状呈显著相关, AA 型显著高于AB 型(P = 0.025) , 对其他性状的影响差异不显著。试验为研究种公牛体内AR 基因的生物学作用奠定了基础, 为肉用种公牛的早期选种选育提供了候选基因和分子标记。
【英文摘要】The polymorphism of AR gene 5'UTR in bulls was detected by PCR- SSCP. The sequencing results indicated that there was one single nucleotide mutat ion (T to G) in the 5'UTR- 1575 of the ARgene; The genetic correlations were between genotypes and performances were obtained by the least square analysis, and the results showed that genetic polymorphisms significantly correlated with sperm count performance. And AA genotype was higher than AB genotype (P= 0.025) . Other traits were not significantly affected. The research laid the foundation for the future studies of the biological function of AR gene in bulls and theoretical basis for

breeding of meat bulls.

【题目】牛POMC 基因多态性及其与南阳牛生长性状的相关分析
【中文关键词】牛; POMC 基因; 单核苷酸多态性; 生长性状; 体重
【英文关键词】cattle; POMC gene; SNP; growth trait; body weight
【中文摘要】为研究阿片黑皮质素前体(POMC)在动物采食和能量平衡调控中发挥重要作用, 文章采用PCR-SSCP 结合DNA 测序方法, 对秦川牛、南阳牛、郏县红牛、晋南牛、鲁西牛、安格斯牛和荷斯坦奶牛共计480 头个体POMC 基因的多态性进行研究, 并分析了多态位点与南阳牛生长性状的相关性。结果表明, 牛POMC 基因3 个位点中, 在3′侧翼区P3 位点新发现3 个连锁存在的SNP(811845 C>T、811821 T>C 和811797 A>G, 与NW_928357 对照)。POMC 基因3′侧翼区多态位点与南阳牛6 月龄体重和0~6 月龄平均日增重显著相关, BB 型个体显著大于AA 型(P<0.05)。
【英文摘要】Pro-opiomelanocortin (POMC) plays an important role on animal ingestive behavior and energy homeostasis.Genetic variation of POMC was detected by PCR-SSCP and DNA sequencing techniques in 480 individuals from seven cattle breeds (i.e., Qinchuan, Nanyang, Jiaxian Red cattle, Jinnan, Luxi, Angus, and Chinese Holstein), and association analyses were carried out to evaluate the effects of genotypes of the candidate genes on growth traits in Nanyang cattle.Three SNPs (811845 C>T, 811821 T>C and 811797 A>G, ref. NW_928357) in linkage were detected in P3 locus, which were located at the 3 ’ flanking region of bovine POMC gene. The body weight at 6-month-old and the average daily gain of 0~6-month-old were higher in Nanyang cattle with the genotype BB than with the genotype AA (P<0.05).

【题目】牛催乳素受体基因遗传多态性及其与部分精液品质性状的关联分析
【中文关键词】种公牛; 催乳素受体; 生产性状
【英文关键词】bull; prolactin receptor; performance
【中文摘要】采用PCR- SSCP 方法对种公牛群体的催乳素受体基因(PRLR) 所有外显子及5'UTR 多态性进行检测。结果表明: 外显子1 及外显子8 分别检测到了2 种等位基因A、B 和C、D, 其中A、C 为群体中优势基因, 其他外显子及5'UTR 没有遗传多态性; 相关性分析表明, 第1 外显子位点AA 型鲜精顶体完整率显著高于AB 型(P = 0.012) , 第8 外显子位点CD 型冻精活力显著高于CC 型和DD 型(P = 0.004) 。初步推断PRLR 为影响种公牛繁殖性状的一个候选基因。
【英文摘要】The exons and 5'UTR polymorphisms of PRLR gene in bulls were detected in this reserch by PCR- SSCP. The result showed that alleles A, B in exon 1 and C, D in exon 8 were detected in this population, among which A and C dominated, and there was no polymorphism in other exons and 5'UTR; The relationship between genetypes and performances was analyzed, and the results ndicated that fresh acintegrity rate of genotype AA was higher than genotype AB in exon 1 and frozen semen energy of genotype CD was much higher than genotypes CC and CD in exon 8. It was initially concluded that PRLR is one of the candidate genes for breeding traits.

【题目】牛孕激素受体SNP分析及其与精液品质的关系
【中文关键词】种公牛; 孕激素受体; 精液品质
【英文关键词】bull; progesterone receptor; semen quality
【中文摘要】孕激素受体(PR) 对于正常雌性动物生殖功能的实现具有重要调节作用, 该基因在雄性动物中生物学作用尚不十分清楚。本研究通过PCR-SSCP方法对种公牛群体的PR基因所有外显子及5'UTR多态性进行检测。结果表明: PR基因外显子4、外显子8 及5'UTR均检测到了多态性位点, 其他外显子没有发现遗传多态性; 测序表明外显子4 发生了A20G 突变, 没有导致氨基酸的改变, 外显子8 发生G86T 和A207T 突变,其中G86T 突变导致所编码的G (甘氨酸) 变成V (缬氨酸) , A207T 突变导致所编码的Q (谷氨酰胺) 变成H (组氨酸) , 5'UTR 处存在G-1809A和C-1808G碱基突变。最后用最小二乘分析方法对其基因型和生产性状进行了相关性分析, 第4 及第8外显子的遗传多态性与部分精液品质性状呈显著相关。
【英文摘要】Progesterone receptor (PR) plays critical roles in the female, however, the biological effect of PR in the male is not clear. The exons and 5'UTR polymorphisms of PR gene in bulls were detected in the current project by PCR-SSCP. The result indicated that polymorphisms in exon 4, exon 8 and 5'UTR were detected in this population, there was nopolymorphism in other exons; sequencing result indicated that there was an A20G mutation in exon 4, no amino acid alteration by this mutation. There were two mutations in exon 8, G86T and A207T, and they led to Gly- to-Val and Gln- to-H is substitutions respectively. G-1809A and C-1808G mutations occurred in 5'UTR. The relationship between genetypes and performances was analyzed, the results indicated that genetic polymorphisms of exon 4 and exon 8 significantly correlated with partial sperm quality performances.

【题目】秦川牛CEBPA 基因遗传变异对体尺和胴体性状的影响
【中文关键词】CEBPA 基因;PCR-RFLP;体尺性状;胴体性状;秦川牛
【英文关键词】CEBPA gene; PCR-RFLP; body measurement traits; carcass traits; Qinchuan cattle
【中文摘要】试验以CCAAT 增强子结合蛋白A(CEBPA)为候选基因,采用直接测序的方法寻找秦川牛CEBPA 基因SNP,筛查到一个新的多态位点T963G,该突变位于基因的编码区。运用PCR- RFLP 方法验证并分析该位点在215 头秦川牛群体中的多态性。结果表明:在秦川牛群体中分布A、B 2 个等位基因,处于中度多态。经过χ2 适合性检验,秦川牛群体在该位点达到Hardy- Weinberg 平衡状态(P > 0.05)。将该T963G 位点的基因型与体尺、胴体性状进行关联分析,表明该位点与胴体重显著相关(P < 0.05),BB 为有利基因型,B 等位基因为有利等位基因,提示该位点有可能作为秦川牛胴体性状标记辅助选择的标记之一。
【英文摘要】CCAAT enhancer binding protein A (CEBPA) gene was studied as a candidate gene for the body measurement and carcass traits of bovine. A new SNP T963G was detected by sequencing at CDS region. Different genotypes were determined in Qinchuan cattle by restriction fragment length polymorphism (RFLP) . The value of polymorphism information content indicated that it was a moderate polymorphism in Qinchuan cattle. The $\chi 2$ test indicated that the polymorphic locus in Qinchuan cattle did fit Hardy-Weinberg equilibrium (P > 0.05). T963G polymorphism ignificantly associated with carcass weight (P < 0.05),genotype BB was a predominant genotype and B was a predominant allele. It is suggested that T963G locus may be one of the marker-assisted selection used as carcass traits in Qinchuan cattle.

【题目】Purification of lectin from larvae of the fly, Musca domestica, and in vitro anti- tumor activity in MCF- 7 cells
【中文关键词】家蝇蛹,凝集素,细胞凋亡,抗肿瘤活性
【英文关键词】Musca domestica larvae, Lectin, Apoptosis, Anti-tumor activity
【中文摘要】一种新的家蝇凝集素从家蝇的蛹中提取出来,使用亲和层析和HPLC,38kDa,命名为MLL-2。对MLL-2的抑制MCF-7的增殖进行了研究,发现MLL-2对MCF-7的抑制增殖效果具有时间和剂量效应。AO染色显示MLL-2诱导了MCF-7的凋亡。使用TUNEL测定了MCF-7的DNA碎片。流式细胞术显示MLL-2对MCF-7的抑制有剂量效应,并且出现G2/M阻滞。MLL-2的刺激下,细胞中的游离钙离子有持续性的升高。Western显示,MLL-2诱导细胞凋亡出现许多相关蛋白的变化,通过线粒体途径。与正常细胞相比,MLL-2刺激细胞48h之后,caspase-3的活性明显增高。MLL2-诱导MCF-7细胞凋亡可能主要的通过线粒体通路。
【英文摘要】A new lectin was purified from larvae of the fly, Musca domestica L. (Diptera: Muscidae) (MLL-2, 38 kDa) using affinity chromatography and HPLC. Anti-tumor activity of MLL-2 was demonstrated by its inhibition of proliferation of human breast cancer (MCF-7) cells in a timeand dose-dependent manner. The results of acridine orange staining indicated that MLL-2 caused apoptosis in MCF-7 cells. DNA fragmentation in MCF-7 cells has been detected by TUNEL . Flow cytometric analysis also demonstrated that MLL-2 caused dose-dependent apoptosis of MCF-7 cells through cell arrest at G2/M phase. The MLL-2 induced a sustained increase in concentration of intracellular free calcium. Western blot revealed that MLL-2 induced apoptosis in MCF-7 cells was associated with typical apoptosis proteins in the mitochondrial pathway. In addition, the caspase-3 activity in MCF-7 cells treated with MLL-2 for 48 hours was significantly increased compared to controls (407.4 ± 3.0 vs. 1749.2 ± 6.0, P <0.01). Since MLL-2 induced apoptosis in MCF-7cells the mitochondrial pathway may be the main pathway of antitumor activity.

【题目】去乙酰化酶1基因对牛前体脂肪细胞凋亡影响的研究
【中文关键词】去乙酰化酶1(SIRT1),烟酰胺,牛,前体脂肪细胞,凋亡
【英文关键词】SIRT1, nicotinamide, bovine, preadipocytes, apoptosis
【中文摘要】去乙酰化酶1 (sirtuin type 1,SIRTl) 是一个新的脂肪细胞调控因子,通过与其靶基因叉头转录因子1 (the forkhead box O family 1,FoxO1) 相互作用,参与细胞增殖、分化、衰老、凋亡和代谢过程.利用吖啶橙(acridine orange,AO)染色、流式细胞仪、荧光定量PCR (quantitative real-time PCR,qPCR) 等技术方法,研究SIRT1 的抑制剂—— 烟酸胺(nicotinamide,NAM) 处理后对鲁西黄牛皮下前体脂肪细胞(bovine subcutaneous preadipocytes,BSP) 和肌内前体脂肪细胞(bovine intramuscular preadipocytes,BIP) 凋亡的影响.观察了BSP 和BIP 的凋亡形态;比较了SIRT1 基因抑制后,相关基因如FoxO1 等在两种细胞之间的表达差异.结果表明,NAM 对BSP 和BIP 细胞表现出相同的生长抑制作用,处理组的BSP 和BIP细胞的凋亡率均显著高于对照组,其作用可能通过抑制SIRT1,激活FoxO1 凋亡通路实现.SIRT1 及其相关基因对BSP和BIP 的调控存在不同途径.
【英文摘要】Sirtuin type 1 (SIRTl), a novel regulatory factor of adipocyte and myocyte, interacts with target the forkhead box O family 1 (FoxOl) to modulate cell proliferation and differentiation, aging, apotosis and metabolism. The effect of nicotinamide (NAM, inhibitor of SIRT1) on the apoptosis of bovine preadipocytes was investigated with Acridine Orange (AO) staining, the flow cytometry detection and quantitative real-time PCR (qPCR). The results showed that NAM inhibited the differentiation of bovine subcutaneous

preadipocytes (BSP) and bovine intramuscular preadipocytes (BIP), and their apoptosis rates were higher than control. SIRT1 influenced the apoptosis of bovine preadipocytes by regulating FoxO1 and adipocyte marker genes. The different mechanisms of SIRT1 and its related genes exist in BSP and BIP.

【题目】Musca domesticapupae lectin induces apoptosis in HepG2 cells through a NF-B/p65-mediated caspase pathway
【中文关键词】家蝇凝集素,NF-kB/p65,HepG2,FLIP,细胞凋亡,caspase
【英文关键词】Musca domestica pupae lectin, NF- B/p65,HepG2, FLIP, apoptosis, caspase
【中文摘要】一个新的家蝇凝集素(42kDa)抑制肿瘤细胞的增殖。本文中,流式细胞术显示MPL能够明显的抑制HepG2细胞的凋亡并且出现了S期阻滞。MPL抑制了IkB-α的降解和NF-kB/p65的入核。同时,FLIP,NF-kB的基因靶点出现下调,然后caspase-8和caspase-3出现活化,来诱导细胞凋亡。结果显示,MPL诱导caspase依赖的细胞凋亡通过NF-kB/p65途径在HepG2细

胞中。
【英文摘要】A new lectin (42 kDa) from Musca domestica pupae (MPL) has been known to inhibit proliferation in tumor cells. In this study, flow cytometry analysis showed that MPL induced HepG2 cells apoptosis significantly and the cells were arrested at S phase. MPL inhibited I_B-_ degradation and NF- _B/p65 translocation from cytoplasm into nucleus. Simultaneously, the expressions of FLIP, which is a target gene of NF-_B/p65 were down-regulated and the caspase-8 and caspase-3 were then activated to induce apoptosis. Taken together, these results showed that MPL induced a caspase-dependent apoptosis via NF- _B/p65 pathway in HepG2 cells.

【题目】基因枪法建立紫菜丝状体遗传转化模式
【中文关键词】张喆 姜鹏 杨锐 费修绠 唐学玺 秦松
【英文关键词】Porphyra concocelis particle delivery system lacZ reporter gene SV40 promoter
【中文摘要】以坛紫菜和条斑紫菜的自由丝状体为材料,利用基因枪法分别转化CaMV35S、SV40、FCP、Amt、Ubi5种启动子与报告基因组合,转化后48h进行原位组织化学染色检测,首次针对重要经济红藻紫菜的自由丝状体建立并优化遗传转化技术,为紫菜研究提供了新工具。结果显示,SV40启动子可以驱动laeZ报告基因(编码B一半乳糖苷酶)在紫菜丝状体中的瞬间表达,空白与阴性对照未检测到本底;其它4种启动子未检测到基因表达。进一步优化实验发现,在可裂膜650psi、轰击距离6cm下获得最高转化效率为8.0×10^-5,经定量检测与双因子方差分析,是最佳转化参数,提示基因枪参数对外源基因转化效率具显著影响。
【英文摘要】Using a biolistic PDS 1000/He system, free-living conchocelis of Porphyra haitanensis (Rhodophyta) and P. yezoensis are bombarded respectively to test five heterologous promoter-reporter gene cassettes under different biolistic parameters. According to the results of in situ histochemical staining 48 hours after transformation, this is the first report on optimization of Porphyra concocelis-mediated transformation. The established transient expression technique could serve as a new tool for Porphyra research in the concocelis stage, and be ready to set up a stable expression system. It is showed that only the SV40 promoter could drive the transient expression of lacZ reporter gene without background in either blank control or negative control, whereas CaMV35S, FCP, Amt and Ubi promoters all failed to be recognized effectively by Porphyra concocelis. The highest transformation efficiency of SV40-lacZ is obtained as 8.0×10^-5, suggesting that 650 psi rupture-disc pressure and 6cm of bombardment distance are optimal biolistic parameters for Porphyra concocelis, and it is also proved by quantitative determination to lacZ expression.[

【题目】除草剂草丁膦抗性基因bar作为三角褐指藻基因工程选择标记的研究.
【中文关键词】卞曙光 姜鹏 崔玉琳 刘兆普 秦松
【英文关键词】Phaeodactylum tricornutum; phosphinothricin; bar gene; selective marker;
【中文摘要】研究了三角褐指藻(Phaeodactylum tricornutum)对氯霉素、卡那霉素、青霉素、链霉素、潮霉素5种抗生素和一种除草剂草丁膦的敏感性,发现三角褐指藻对草丁膦非常敏感,用统计学分析法得出了其72h半致死质量浓度为22mg/L。通过基因枪法将携带草丁膦抗性基因bar的载体pSVB导入三角褐指藻细胞中,通过草丁膦筛选成功获得了抗性藻细胞,PCR检测获得阳性结果,提示草丁膦更适合用于构建安全、高效、廉价的三角褐指藻表达系统。 更多还原
【英文摘要】Zeocin, a routine selective reagent in diatom genetic engineering, is not suitable for the construction of expression system of diatoms, due to its photosensitivity and mutagenicity. In order to find a suitable selective reagent for photobioreactor-based culture of transformed Phaeodactylum tricornutum. The sensitivity of P. tricornutum to five antibiotics (Chloramphenicol, Kanamycin, Penicillin, Streptomycin, and Hygromycin) and phosphi-nothricin (PPT) was tested. The results showed that P. tricornutum was sensitive to PPT, with a 72-h half death concentration of 22 mg/L. The expression vector pSVB, which contained PPT-resistant gene bar, was transformed into P. tricornutum cells by particle bombardment; and the resistant P. tricornutum was selected by PPT screening. It was perimentally confirmed that the transformed P. tricornutum was resistent to PPT. This research indicates that

phosphinothrin is suitable for constructing a safe, efficient, low cost expression system of P. tricornutum

【题目】PCR-suppression effect: Kinetics analysis and application to representative or long-molecule biased PCR-based amplification of complex samples.
【中文关键词】Dai Zhong-Min,Zhu Xiao-Jing,Yang Wei-Jun
【英文关键词】PCR-suppression effect; annealing temperature; complex PCR; representation; full-length cDNA
【中文摘要】In the present study, we analyzed the kinetics of the PCR-suppression effect (PS-effect) and firstly demonstrate that lower annealing temperature enhances PS-effect. Furthermore, we controlled the average size of complex PCR products over a wide range, and simultaneously amplified targets from 0.25 to 10 kb by regulating the degree of suppression in a single-primer PCR. In addition, we describe an improved template-switching full-length cDNA synthesis method that greatly reduces truncated cDNA. This study provides a general guide for the design of PS-effect related PCR and is useful for representative or long-transcript enriched cDNA library construction, especially when only a small amount of total RNA is available. (c) 2006 Published by Elsevier B.V.

【题目】A male reproduction-related kazal-type peptidase inhibitor gene in the prawn, Macrobrachium rosenbergii: molecular characteriza- tion and expression patterns.
【中文关键词】Cao Jun-Xia,Dai Jie-Qiong,Dai Zhong-Min,Yin Guo-Li,Yang Wei-Jun
【英文关键词】Crustacean; male development; male reproductive tract; male-specific
【中文摘要】Peptidase inhibitors in the male reproductive tract are well known in mammals, in which they play roles in protecting the tract epithelium against proteolytic damage or in regulating the fertilization process. By screening the subtracted cDNA clones enriched for male reproductive tract-specific transcripts, one clone encoding a putative protein that showed significant similarity to Kazal-type peptidase inhibitor (KPI) was obtained. This is the first report of an invertebrate in which a male reproductive tract-specific KPI gene has been identified and characterized. The gene contains a 405-bp open reading frame (ORF), a 72 bp 5' untranslated region (UTR), and a 259 bp 3' UTR. The conceptually translated protein consisted of a 21-amino-acid signal peptide and a 113-amino-acid mature polypeptide with two Kazal-type domains (named after the discoverer). Significant levels of the mRNA were observed only in the male reproductive tract, while mRNA expression was not detected in any other tissues tested. The transcription of the gene remained constant during maturation, although not in the postlarval stage. In situ hybridization demonstrated the presence of the mRNA in the secretory epithelial cells of vas deferens and terminal ampullae.

【题目】DNA methyltransferase 2 gene in the prawn Macrobrachium rosenbergii: characteristics and expression patterns during ovary and embryo development.
【中文关键词】Feng Chen-Zhuo, Ding Xia, Li Ye, Chen S, Yang Fan, Yang Wei-Jun
【英文关键词】Dnmt2; DNA methylation; ovary; development; Macrobrachium rosenbergii
【中文摘要】DNA methylation plays important roles in eukaryotic development. However, studies of DNA methylation in Crustacea are very limited. In the present study, we isolated and identified a DNA methyltransferase 2 (Mar-Dnmt2) gene from the prawn Macrobrachium rosenbergii. The cDNA of Mar-Dnmt2 contained an 1,191-bp open reading frame that encoded a putative Dnmt2 protein of 396 amino acids with the ten motifs characteristic of DNA methyltransferases and exhibiting high identities with other known Dnmt2 homologs (30%-42%). By real-time PCR, an especially high level of Mar-Dnmt2 mRNA was found in the ovary, approximately 5-16 times higher than in other tissues. Moreover, Mar-Dnmt2 mRNA obviously decreased during embryonic development. On the other hand, DNA methylation was detected in this study; about 0.05% of cytosine residues were found to be methylated in the DNA of M. rosenbergii.

【题目】二维亲和电泳技术在玉米淀粉结合蛋白复合物分离中的应用

【中文关键词】二维亲和电泳技术 淀粉结合蛋白复合物 淀粉代谢没
【英文关键词】无
【中文摘要】最近的研究表明玉米淀粉代谢过程中,多个淀粉代谢酶类与其他蛋白能够在玉米胚乳发育中形成蛋白复合物继而发挥相应功能。本研究中我们将二维亲和电泳技术、酶谱分析技术以及液相色谱-质谱串联技术有效结合,建立了一套新的分离与鉴定淀粉结合蛋白(蛋白复合物)的研究体系,并利用该套研究体系对发育中的玉米胚乳进行了调查性研究。2-DAE研究中首先提取了总玉米胚乳蛋白粗提物,进行一维的非失活电泳分离。然后,将一维凝胶胶条水平转移到含有支链淀粉亲和底物的非失活的二维亲和电泳凝胶上呈现出明显的偏离对角线涌动迁移。而其他不与淀粉结合的蛋白质由于与淀粉代谢酶类相结合,在凝胶中叶城县涌动滞后的现象,并且与淀粉代谢酶一起存在相同的滞后点或条带中。我们的研究共发现8个明显电泳迁移滞后的蛋白点和一个蛋白条带。LC-MS/ms质谱鉴定结果表明其中6个蛋白点和仅有的一个蛋白条带为含有淀粉代谢酶的淀粉结合蛋白复合物。文献检索发现其中部分蛋白复合物为已报道蛋白复合物,表明二维亲和电泳分离技术结合LC-MS/MS的研究体系能够有效的分离并鉴定淀粉结合蛋白复合物。此外一些新的蛋白呗发现包含在可能的新淀粉结合蛋白复合物中,包括蔗糖代谢糖酵解、木质素合成、萜类合成、氨基酸合成等多种代谢关键调控酶类,预示着这些蛋白复合物在玉米胚乳发育过程中很可能发挥非常重要的作用。

【题目】控失肥在沿江棉区施用的肥效和经济效益
【中文关键词】棉花;控失肥; 试验;示范
【英文关键词】Cotton; loss control fertilizer; test; demonstration
【中文摘要】摘 要: 在棉花上开展新型控失肥的肥效研究及经济效益分析, 结果表明: 分次施肥较一次施肥棉花产量有所增加,其中控失化肥(352kg/667平方米)较等养分的普通复合肥(338kg/667平方米)和习惯施肥(316kg/667平方米)分别增产4.11%和11.14%;控失化肥一次性基施(336kg/667平方米)产量较等养分的普通复合肥相当, 较习惯施肥增产6.13%。大田示范的趋势基本一致; 用肥、用工和产值综合经济效益分析显示, 使用控失化肥较普通化肥经济效益有所增加。本试验为控

失肥在沿江棉区棉花的应用和推广提供重要依据。
【英文摘要】Abstract: in cotton launched a new type of controlled-release fertilizer on growth and yield and economic benefit analysis, the results show that: fertilization is a fertilizing cotton yield increased, the controlled-release fertilizer (352kg/667 m2) more nutrient compound fertilizer (338kg/667 m2) and conventional fertilization (316kg/667 m2) respectively the yield increased by 4.11% and 11.14%; loss control fertilizer once base fertilizer (336kg/667 square meters) to yield a more nutrient compound fertilizer is a habit, yield increase of 6.13%. Field demonstration, the tendency is consistent; fertilizer use, labor and value analysis of comprehensive economic benefit show, the use of controlled-release fertilizer than ordinary fertilizer economic increase. The test for loss control fertilizer on the cotton in the application and promotion to provide important basis.

【题目】杨木CTMP及其碱性H2O2漂白浆中溶出的DCS的特性分析
【中文关键词】杨木;CTMP;溶解与胶体物质
【英文关键词】poplar; CTMP; dissolved and colloidal substances; characteristic
【中文摘要】采用多种分析手段对杨木CTMP及其碱性H2O2漂白后浆水体系中的溶解与胶体物质的特性进行了分析。结果表明,两种浆中的DS分别占各自DCS的80%和95.7%。DS的阳离子需求量分别占各自DCS阳离子需求量的84%和87%,而且BCTMP的DCS阳离子需求量约为CTMP的4.4倍。CTMP经碱性H202漂白后,有更多的木素溶出,BCTMP的DS中木素含量占其DCS中木素的87%。杨木CTMP的DCS中碳水化合物主要含有木糖、葡萄糖和半乳糖醛酸;碱性H2O2漂白导致较多的葡萄糖醛酸和甘露糖的溶出。DCS的MTBE抽出物中主要含有各种脂肪酸。[
【英文摘要】The characteristics of dissolved and colloidal substances released from Poplar CTMP and BCTMP were analyzed using different methods. The results showed that the contents of DS(dissolved substances) from CTMP and BCTMP account for about 80% and 95.7% of their DCS respectively. The cationic demands of DS account for about 84% and 87% of DCS respectively, and the cationic demand of BCT- MP DCS is 4.4 times higher than that of CTMP. The alkaline hydrogen peroxide bleaching leads to the

release of more dissolved lignin, glu- curonic acids and mannans. The extractives of DCS with methyl tert butyl ester (MTBE) mainly consist of different fatty acids.[

【题目】Partially Substituting MgO for NaOH as the Alkali Source in the Second-stage Impregnation of Triploid Poplar P-RC APMP
【中文关键词】氢氧化镁,过氧化氢,机械浆,阔叶木
【英文关键词】MAGNESIUM-HYDROXIDE MG(OH)(2); HYDROGEN-PEROXIDE; MECHANICAL PULPS; HARDWOODS
【中文摘要】在传统的温和的化学预处理加盘磨化学处理的碱性过氧化氢机械制浆(P-RC APMP)中,NaOH被用作为漂白碱源。本文中MgO部分替代NaOH(替代率至50%)作为杨木P-RC APMP二段预浸渍的碱源,研究了预处理后漂白残液的pH、木片的得率及其化学组成、相应的成浆物理性能等的变化。研究结果表明:MgO部分替代NaOH后,导致漂白残液的pH降低,木片得率提高。此外,苯醇抽出物、木素、戊聚糖以及碳水化合物的溶出量均降低,所得的P-RC APMP具有较高的松厚度、不透明度和光散射系数,但是浆张强度和白度有所下降。
【英文摘要】In the conventional preconditioning followed by refiner chemical treatment, alkaline peroxide mechanicalpulping (P-RC APMP) process, sodium hydroxide (NaOH) is used as the alkali source. In this study, magnesiumoxide (MgO) was used to partially substitute for NaOH as the alkali source (substitution ratio of up to 50%)in the second-stage impregnation of the triploid poplar P-RC APMP process. The changes in pH values ofthe residual bleaching liquor, yields, and chemical components of the treated wood chips in the second-stageimpregnation and also the physical properties of the resultant P-RC APMP pulps with and without MgOsubstitution were investigated to explore the potential advantages of the process. The results showed that thepartial MgO substitution for NaOH resulted in a lower pH of residual bleaching liquor and a higher treatedwood chips yield than those of the NaOH-based process. In addition, the dissolution of benzene alcoholextractives, lignin, pentosans, and carbohydrates were all decreased. The resultantly yielded P-RC APMPpulp has a higher bulk, opacity, and light-scattering coefficient, but lower strength properties and a slightlylower brightness.

【题目】杨木APMP制浆废液的污染特性
【中文关键词】杨木;APMP;制浆废液;超滤;GC—MS
【英文关键词】polar; APMP; pulping effluent; ultrafiltration; GC-MS
【中文摘要】高得率制浆废液具有组成比较复杂,色度高,化学需氧量高等特点.采用超滤分级方法初步考察杨木APMP制浆废液中污染物质的相对分子质量分布,并且采用GC—MS联用仪研究了废液中小分子有机污染物的组成.结果表明:相对分子质量较大的污染物是废液色度的主要来源,实际应用中,超滤技术可以有效地去除这些大分子发色物质:GC—MS检测到废液中的小分子有机污染物主要是脂肪酸类物质,约占检测物质的57.13%,树脂酸的含量很少.
【英文摘要】The high yield pulping effluent is composed of more complex, high color, high chemical oxygen demand. The molecular weight distribution of contamination of APMP pulping effluent was discussed through using ultrafiltration classification,and the composition of small-sized organic pollutants was also studied by using GC-MS. The results showed that larger molecular weight of pollutants in the effluent were the main source of color, in practical application, ultrafiltration can be an effectively method to remove

these colored pollutants. The small-sized organic pollutants which detected by GC-MS were mainly contained fatty acids, accounting for about 57.13 %, but only few resin acid.

【题目】Adsorbent & Treatment for High Yield Pulp Effluents of Cotton Staff by Coke
【中文关键词】吸附处理;高得率浆;制浆废液;焦渣
【英文关键词】Adsorption; High Yield Pulp; Effluent ; Coke
【中文摘要】文章研究了双螺旋高得率制浆高浓废水的处理一种新的工艺,采用焦渣对废水进行吸附和絮凝处理,通过焦渣吸附絮凝处理后,再经过板框过滤,废液的COD和SS去除率可分别达到74.1%和98.9%,并且处理后的污泥脱水效率大大提高,固含量可达到32.68%,可直接用于锅炉进行燃烧处理。
【英文摘要】Twin-screw extruder(TSE) was used to produce high yield pulp by using cotton stalk as the raw material. The pollution loading of CODcr of the High Yield Pulp(HYP) effluents was 128450 mg/L, SS was 21670 mg/L, and the liquor was sticky. Treatment of the effluent by flocculation and precipitation process was very difficult, because the floc was too much to apart from the liquor. Clastic coke was used as filter aids & adsorbent to treat the liquor, while organic flocculant PAM and inorganic flocculant PFAS were used in flocculation treatment. Plate and frame filter was applied in separation of sludge from the treated liquor. Under the optimum experimental conditions, the reduction rate of COD is 74.1%, and the reduction rate of SS was 98.9%, the solid content of sludge increase to 32.68%. The improving flocculation effect of coke is remarkable. The treated Supernatant was recycled and reused in pulping preimpregnation, and the sludge which comprise of coke, fine fiber and SS was incineration treated in boiler. The treatment process will promote the popularization and application of high yield pulp of the cotton staff.

【题目】Adsorption and Coagulation Tertiary Treatment of Pulp & Paper Mills wastewater
【中文关键词】PASiC; 吸附絮凝; 制浆造纸废水
【英文关键词】PASiC; Adsorption and coagulation; Wastewater; pulp and paper
【中文摘要】文章采用膨润土和聚硅氯化铝对制浆造纸废水进行吸附絮凝处理,在膨润土和聚硅氯化铝用量分别为400 mg/l and 450 mg/l,吸附温度30度、吸附时间30分钟,搅拌转速300rpm条件下,吸附絮凝处理COD和色度去除率分别为60.87%和41.33%,处理效果显著。
【英文摘要】The pulp & paper industry generates a considerable amount of wastewater in its manufacturing processes. Currently, the pulp and paper industry is facing more stringent standards for discharges of wastewater and associated permits. Biological processes such as activated sludge and aerated lagoons are conventionally used to treat pulp mill effluents. However, these processes have limited ability to provide effluents of high-quality conforming to stringent regulations, since large amounts of lignin and lignin-derived compounds remain in the wastewater. These compounds cannot be metabolized biologically because of their size and complex structure. The objective of this work was to improve the treatment performance of pulp & paper mill effluents, and hence the quality of treated wastewater. For this purpose, a combination of adsorption and coagulation treatment has been proposed. In this study, bentonite was used as adsorbent while PASiC (Polyaluminum Silicate Chloride) was used as coagulant. Respectively, 60.87% of COD removal and 41.38% of color removal can be obtained at the optimum conditions for coagulant dosage and adsorbent are 400 mg/L and 450 mg/L, and adsorption reaction temperature is 30 ° C, while stirring at the speed of 300rpm for 30min, and the pH value is nature.

【题目】Combining Coagulation Process with Biological Pretreatment for APMP Effluents Treatment
【中文关键词】生物预处理,APMP废水,絮凝处理,黑曲霉
【英文关键词】Biological Pretreatment, APMP, Effluents, Coagulation, Flocculation, Aspergillus niger.
【中文摘要】一种新的APMP废水处理工艺在文章被研究和开发,工艺首先采用黑曲霉对模拟制浆废水进行生物预处理,然后采用絮凝处理的模式对废水进行处理,生物处阶段COD、木素和色度去除率达到了60.22%、60%和42.57%,并得到了7.12g/l的生物菌体。再经聚合铝和PAM处理絮凝处理后,废水色度去除率可达到83.80%。
【英文摘要】The moderate pollution load of APMP effluents provides a chance for a new treatment process--combination of biological pre-treatment and coagulation treatment. Biological pre-treatment can reduce the pollution load and produce biomass at the same time. The removal of COD was 60.22% and the yield of biomass was 7.12g/L at the optimized conditions treated by Aspergillus niger. And the removal of acid-soluble lignin and color were up to 60% and 42.57%. The coagulation treatment was applied after bio-treatment by using alum and PAM as coagulation agent. The conditions of coagulation were optimized in this article. The optimized conditions were: Dosages of alum and PAM were 1000-1200mg/L and 2mg/L, pH is 5, stirring time is 30S at 300rpm, the temperature is 50°C. The coagulation removals of COD, color and turbidity were 83.80%, 86.38% and 98.33%. The removals of color were characterized by absorbance of 465nm, 325nm, 275nm and 254nm.

【题目】制浆造纸低浓废水的吸附絮凝法深度处理
【中文关键词】造纸废水;膨润土;聚硅氯化铝;吸附絮凝
【英文关键词】waste water of pulp & paper mill ; bentonite ; PASC ; flocculation and adsorption
【中文摘要】采用膨润土为吸附剂对制浆造纸企业低浓外排废水进行吸附絮凝处理。处理条件:絮凝剂聚硅氯化铝(PASC)用量为400mg/L,膨润土用量为500mg/L,反应温度30°C,搅拌速度300r/min,吸附20min。处理后废水CODCr从230mg/L下降到了90mg/L,CODCr去除率为60.9%,色度去除率达到了41.4%,在投入和运行成本都较低的情况下,废水排放达到了国家标准。
【英文摘要】In this paper, bentonite was used in treatment of low concentration waste water from pulp & paper mills. The bentonite was used as adsorption agent while the PASC was used as flocculation agent. At the optimum conditions: dosage of PASC 400 mg/L, dosage of bentonite 500 mg/L, reaction temperature 30°C, 300 rpm stirring and Absorption 20 min, CODCr decreases from 230 mg/L to 90 mg/L, the removal rate is 60.9%, the removal rate of chroma is 41.4%. Indicating that it meets the new discharge standards at a relatively low cost of investment and operation.

【题目】聚合硫酸铝铁处理双螺旋挤压浆制浆废液的研究
【中文关键词】双螺旋制浆; 制浆废液; 混凝; 聚硫酸铝铁

【英文关键词】twin screw extrusion pulping; pulping effluent; coagulation; polymeric aluminum ferric sulphate (PAFS)

【中文摘要】研究了用聚硫酸铝铁(PAFS)和阳离子聚丙烯酰胺(PAM)为絮(助)凝剂,处理木材下脚料双螺旋制浆废液,在pH=10.5条件下,PAFS用量为200ppm、搅拌转速为300rpm、搅拌时间为6min、PAM用量为10ppm时废液中CODCr的去除率为60.8%,SS的去除率达95%以上,处理后的废液用于原料的预浸处理,经过运行证明,通过PAFS和PAM处理,可实现制浆废液的循环回用。

【英文摘要】The treatment of effluent from wood twin screw extrusion pulping with polyacrylamide (PAM) and polymeric aluminum ferric sulphate (PAFS) as coagulant aids was studied. The results showed that at pH value 10.5, with a PAFS amount of 200 ppm, stirring speed to 300 rpm, stirring time for 6 min, and PAM amount of 10 ppm, CODCr removal rate was 60.8%, and ss removal rate was more than 95% of waste water. The treated effluent was used to the presoaking treatment of raw materials.The operation result showed that with the treatment of PAFS and PAM, it can be realized of the recycled of pulping effluent.

【题目】造纸废水色度与CODCr关系初探
【中文关键词】造纸废水;色度;CODCr;浊度
【英文关键词】paper mill effluent; chroma; CODCr; turbidity
【中文摘要】利用大量CODCr、色度、浊度的监测数据,初步探讨了造纸废水中色度与CODCr的关系。结果表明,浊度较低(≤2NTU)时,具有发色基团的有机溶解性分子对COD贡献率较高,色度—CODCr公式可以较准确的估计CODCr值;随浊度升高(>2NTU),公式估计值的相对标准偏差呈现近似直线的上升态势,必须考虑色度和浊度两个影响因素。
【英文摘要】With a great deal of measuring data of CODCr, chroma and turbidity, the relationship between chroma and CODCr of paper mill effluent was preliminarily investigated. The results showed that when the turbidity was low (≤2NTU), the contribution rate of organic solu- bility molecular with chromophoric groups to COD was relatively high, and CODCr was positively correlated with chroma; when the turbidity was high (>2NTU), the rela- tive standard deviation of formula estimated value was in an increasing tendency approximate to straight-line, so chroma and turbidity influencing factors must be consid- ered simultaneously.

【题目】Biocontrol Function of Bacillus Strain Transformation Using Poplar APMP Pulp Wastewater as Substrate
【中文关键词】生物防治;半化学机械浆废液,生物转化,拮抗作用
【英文关键词】biocontrol function; alkaline peroxide mechanical pulping (APMP) pulp wastewater; biotransformation; antagonism tests.
【中文摘要】制浆废水由于高色度和高化学需氧量(COD)而很难处理。但是,制浆造纸浓废液含有的营养元素适合于作为具有拮抗作用的枯草芽孢杆菌的培养基。本文研究了将废液进行生物转化的可行性和一些真菌病害的拮抗作用。种子发芽和作物实验结果表明:转化物安全无毒。同时,有利于植物的生长。这种方法是造纸废液处理的新途径。
【英文摘要】Pulp wastewater is hard to treat due to its high chrominance and high chemical oxygen demand (COD). However, pulp wastewater can be adopted as nutrient elements to produce Bacillus strain, which has a biocontrol function. In this paper, the feasibility of biotransformation using pulp wastewater is studied and antagonism tests for some fungal diseases are carried out. The seed germination and plant tests ’ results showed that the transformation is safe and nontoxic. Furthermore, the results showed a positive effect to promote plant growth. This novel approach of treating pulp wastewater could be a potential way for the wastewater treatment.

【题目】杨木APMP废液的生物转化及应用
【中文关键词】APMP制浆废液; 枯草芽孢杆菌; 培养条件; 抑菌作用
【英文关键词】APMP pulping wastewater; Bacillus subtilis; Culture conditions; Bacteriostatic action
【中文摘要】[目的]研究杨木APMP废液培养枯草芽孢杆菌SY1菌株(Bacillus subtilis)的适宜条件和转化液对番茄病原菌的拮抗作用。[方法]通过单因素实验对培养条件进行了初步优化;利用平板扩散法测定转化液对番茄病原菌的抑制作用。[结果]杨木APMP废液培养SY1菌株较适宜的条件为:pH值8.0,装液量75/250 m l,接种量5%,温度35℃;在此培养条件下SY1菌株的活芽孢数达3.96×108CFU/m l,废液COD转化率达59.52%。同时发酵液对供试的4种病原菌均有较强的抑菌作用。[结论]该研究为利用杨木APMP废液培养枯草芽孢杆菌的工业深层发酵提供了依据。
【英文摘要】[Objective] The aim of the research was to study the suitable conditions of culturing SY-1 strain of Bacillus subtilis in poplar APMP wastewater and the antagonistic effect of transformation liquid on tomato pathogen.[Method] The culture conditions were preliminarily optimized through single factor test.The inhibition of transformation liquid to tomato pathogen was determined by using plate diffusion method.[Result] The optimum conditions for culturing SY1 strain in poplar APMP wastewater were as follow: pH 8.0,liquid volume was 75 ml in 250 ml flask,the inoculation amount was 5%,temperature was 35 ℃.Under these culture conditions,the viable spore number of SY1 strain reached 3.96×108 CFU/ ml.COD conversion rate reached 59.52%.At the same time,the fermentation liquid all had stronger bacteriostatic action on 4 kinds of test pathogens.[Conclusion] The research provided the basis for the industrial submerged fermentation of culturing Bacillus subtilis by poplar APMP wastewater.

【题目】杨木APMP废液及转化液对白菜种子萌发和幼苗生长的影响

【中文关键词】杨木APMP废液; 枯草芽孢杆菌; 转化液; 种子发芽; 幼苗生长
【英文关键词】poplar APMP wastewater; bacillus subtilis; fermented liquor; seed germination; seedling growth
【中文摘要】以不同稀释倍数的杨木APMP废液和转化液(经枯草芽孢杆菌SY-1菌株发酵后的废液)分别对白菜种子进行浸种处理,通过种子发芽实验和生长实验,研究原废液和转化液对白菜种子活力、幼苗早期发育、幼苗中叶绿素含量和保护酶活性的影响。结果表明,在适宜的稀释倍数下,原液和转化液可改善白菜种子发芽和幼苗生长;在相同的稀释倍数下,转化液的促进作用要明显优于原液组。综合比较,当转化液稀释25倍浓度时,较适合白菜种子的发芽和生长发育。
【英文摘要】The seeds of Chinese Cabbages were soaked with serially diluted raw APMP wastewater and its fermented liquor (after fermentation by bacterial strain SY-1). The effects of the raw APMP wastewater and its fermented liquor on seed development, early seedling development, content of chlorophyll and activity of protective enzyme of Chinese Cabbages were studied by seed germination test and growth test. The results showed that raw APMP wastewater and the fermented liquor, with suitable concentration, could improve seed germination and growth; with the same concentration, the effect of fermented liquor was obviously better than the raw wastewater; besides, the fermented liquor (25 times dilution) was superior to the others on seed germination and growth. The research offered the foundation for further study of the application of poplar APMP wastewater to crops growth.

【题目】Effect of Bacillus Subtilis SY1 on antifungal activity and plant growth
【中文关键词】真菌病害;拮抗作用;生长促进;保护酶
【英文关键词】fungal pathogen, antagonism, growth promotion, protective enzymes
【中文摘要】由于常年不合理耕作使农田遭到严重破坏,土传病害是土壤污染的主要原因,直接影响了土壤和农产品的品质。对污染土壤进行生物修复是解决这些问题的有效方法。本文研究了使用枯草芽孢杆菌SY1 作为拮抗剂用于抑制茄子的几种常见病害。接种枯草芽孢杆菌SY1后,寄主植物的长势和病害的耐受力都有明显改善。在种子发芽试验中,发芽势、累计发芽率、发芽指数和活力指数分别增加24%、24%、35%和64%。接种枯草芽孢杆菌SY1后,还显著提高了种苗的茁壮程度和植株的株高、株重等参数。寄主植物被激发产生系统抗性后,植株叶片中抗氧化保护酶活性明显增强,有助于提高植株的抗病性。
【英文摘要】Agriculture soil in some areas of China is seriously damaged due to years of irrational farming practices. Soil-borne disease is a major problem of soil pollution, which affects yield and quality of agricultural products. Ecological remediation of soil is an effective way to solve this problem. In this study, Bacillus subtilis SY1 was successfully used to antagonist several normal fungal pathogens in eggplant. The growth and pathogenic tolerance of the host plant were improved after inoculation. In the seedling test, sprout tendency, accumulative germination percentage, sprout index, and vigour index of seeds increased 24%, 24%, 35%, and 64%, respectively. Inoculation also made the seedlings stronger and improved their plant-morphologic characters significantly. When infected by fungal pathogen, the activity of protective enzymes in inoculated seedlings improved, which helped lessening membrane damage by superoxideanion.

【题目】杨木P-RC APMP废水的厌氧处理
【中文关键词】杨木P-RC APMP废水; 厌氧处理; 毒性
【英文关键词】P-RC APMP wastewater; anaerobic treatment; toxicity
【中文摘要】对杨木P-RC APMP废水性质进行了研究,同时应用生物鉴定技术对杨木P-RC APMP废水进行生物产甲烷势(BMP)及厌氧毒性鉴定(ATA)实验,并在35°C的中温条件下采用上流式厌氧污泥床反应器对杨木P-RC APMP废水进行连续厌氧处理实验。结果表明,杨木P-RC APMP废水中含有抑制产甲烷微生物活性的物质,且这种抑制是可逆的,通过一定时间的培养,产甲烷微生物活性可以得到恢复;杨木P-RC APMP废水具有较好的厌氧生物可处理性,在35°C下,CODCr和BOD5去除率分别可达64.2%和93.0%以上。
【英文摘要】Aspen P-RC APMP wastewater characteristic was studied in this paper,and its anaerobic biotreatability and methanogenic toxicity were evaluated by the means of biological methane potential (BMP) test and anaerobic toxicity assay (ATA) test. Continuous anaerobic treatment of the wastewater was carried out in a UASB reactor. The results showed that aspen P-RC APMP wastewater contains substances which inhibit methanogenic microorganism,but this harmful effect can be released after a period time of cultivation. Aspen P-RC APMP wastewater is fairly anaerobic biotreatable,and the CODCr and BOD5 removal reaches 64.2% and 93.0% respectively.

【中文关键词】微生物生态学,细菌,原生生物,生态基因组学,分子分类学
【英文关键词】Microbial ecology, bacteria , protists, ecogenomics, moleculartaxonomy
【中文摘要】过去几十年中,遗传学和免疫学方法的进步改变了医学和生物制药学的研究。人类和几种模式生物的基因组已全部完成测序,这一遗传学信息财富的初步开发已经开始引起对这几种生物的研究及由此产生的应用的革命。得益于生物医学领域的技术进步带来的巨大便利,对微生物(包括海洋微生物)生态学的理解也紧随其后。通过这些新方法、新技术的应用,海洋微生物生态学已经从二十世纪五、六十年代海洋生物学和生物海洋学的小脚注变成了我们对海洋的兴趣焦点。在过去的半个世纪中,关于海洋中微生物的丰度、分布和活性,我们学到了大量知识。由于认识到海洋微生物异常丰富的多样性、他们在全球生物地球化学过程中所起的主导作用以及天然和工程微生物产品给人类带来益处的潜力,它们已成为科研和公众关注的中心,而且人们对这些海洋中微小生物的迷恋也不会迅速消退。最新的研究表明我们对海洋生态系中微生物多样性广度的了解相当有限,而且,自然界中许多、或者说大多数海洋微生物的优势种还没有被引入实验室培养。因此,我们对这些物种的生化、生理和行为能力的认识还是懵懂的,并且,在可预见的未来,海洋微生物研究还将是海洋科学研究的主要焦点。随着很多领域的研究者转向这项工作,我们可以期待海洋微生物群落组成和功能方面将会有更多新的发现和更多的范例出现。
【英文摘要】Advances in genetic and immunological approaches during the last few decades have transformed medicine and biomedical research.The human genome and the genomes of numerous model organisms are now fully sequenced.Initial exploitation of this wealth of genetic information has begun tO revolutionize research on these species,and the applications derivedfrom it.Progress in understanding the ecology of microorganisms(including marine taxa)hasfollowed closely on the heels of these advances,owing tO the tremendous benefit afibrded bymajor technological advances in biomedicine.Through the application of these novel approachesand new technologies,marine microbial ecology has moved from a minor footnote within marinebiology and biological oceanography during the 1950s and ‘ 60s tO the focus of much of our present interest in the ocean.During the intervening half-century,we have learned a great deal regarding the overall abundances,distributions and activities of microorganisms in the sea.Recognition of the extraordinary diversity of marine microbes,the predominant role that they play in global biogeochemical processes,and the potential for natural or engineered microbial products to benefit humankind,has placed marine microbes in the spotlight of both scientific and popular attention.Our fascination with these minute denizens of the ocean is not likely to wane anytime soon.Recent studies have indicated that we still know relatively little about the breadth of microbial diversity in marine ecosystems.In addition,many(most)of the predominant marine microbial forms in nature have not yet been brought into laboratory culture.Thus,our knowledge is still rudimentary with respect tO the spectra of biochemical,physiological and behavioral abilities of these species,and the study of marine microbes will remain a major focus of investigations in marine science well into the foreseeable future.As a large cadre of researchers moves headlong into this work,we can expect many new discoveries and more paradigm shifts regarding tile composition and marine microbial communities.

【题目】The Optimization for Crop Planning and Some Advances for water-ssving crop planning in the semiarid Loess Plateau of China
【中文关键词】中国;作物规划优化;干旱;研究进展;半干旱黄土高原节水;
【英文关键词】China; crop planning optimization; drought; research progress; semiarid Loess Plateau; water-saving
【中文摘要】建立节水型农业种植结构是中国黄土高原以及世界干旱半干旱地区节水农业发展的重要选择。节节水型农业种植结构是指种植结构,中心调整作物适应水,优化的时间和空间布局的庄稼,当地自然资源,营销资源,人力资源和资金投入,使区域或流域水资源有限的实现最大的经济,社会和生态效益种植业在一定技术经济。分析了节水型农业种植结构优化理论、目标机方法,以及宏观调控措施的研究进展后,指出目前缺少研究节水型农业种植结构的强有力理论依据,以及不够成熟的优化技术。未来的重要研究方向将集中在五个方面,如特殊优化理论体系的划分方法,通过研究流域单元和使用技术,优化模型的基础上多目标进化算法,基于公众参与的评价的合理性和宏观调控措施。
【英文摘要】The establishment of water-saving crop planning is an inevitable choice of the water-saving agriculture for the water-deficiency region in the arid and semiarid Loess Plateau of China and the world. The water-saving crop planning refers to the planting structure that centres the adjustment of the crop's adaptation to water, the optimization of temporal and spatial layout for crops, the local natural resources, marketing resources, human resources and financial input to enable region or basin with limited water resources to achieve the maximum economic, social and ecological benefits of planting industry under certain technology and economy. After the analysis on the research progress of optimization theory, optimization goals, optimization methods of water-saving cultivation structure and macro-control measures, it is pointed out that the main deficiencies of the current research of water-saving cultivation pattern optimization are lacking of a strong theoretical basis, and the immaturity of optimization technologies. The future crucial research direction will focus on five aspects such as the special optimization theory system, the division methods by studying the watershed unit and using 3S technology, optimization model based on multi-objective evolutionary algorithm, evaluation of rationality and macro-control measures on the basis of the public participation.

【题目】Immunomodulatory effect of lectin from Musca domestic pupa on immunosuppressive mice Effect of lectin on immunosuppressive mice
【中文关键词】家蝇凝集素,免疫低下小鼠,脾脏,免疫调节
【英文关键词】lectin from Musca domestic pupa;
immunosuppressive mice; spleen; immunomodulation
【中文摘要】本文主要阐明家蝇凝集素体内的免疫调节作用。MPL(200,400,800μg/kg体重)对免疫器官的质量,脾淋巴细胞,巨噬细胞的吞噬活性,NK细胞活性,和炎性因子mRNA的表达在环磷酰胺刺激的小鼠。与免疫低下的小鼠相比,脾脏和胸腺的质量明显的升高,脾脏淋巴细胞的增殖明显,NK细胞的活性和巨噬细胞的吞噬活性也出现明显的升高。脾脏细胞中的IL-6,IL12和IFN-γ的mRNA表达量出现升高其呈现剂量效应。结果研究表明,MPL对免疫低下小鼠具有明显的提高免疫的作用,可以更深的研究MPL提高免疫的活性。
【英文摘要】The present study was conducted to elucidate the immunomodulatory effect of a lectin from Musca domestic pupa (MPL) in vivo. The effects of MPL (200, 400 and 800 μg/kg body wt.) on immune organ weight, mitogen-induced proliferation of spleen lymphocyte, phagocytosis activity of macrophages, NK cell activity, and the mRNA expression of immune factor in spleen like interleukin (IL) and interferon (IFN) were investigated in cyclophosphamide (CP) immunosuppressive mice. In comparison with that of immunosuppressive mice, the weight index of spleen and thymus were significantly increased ($p<0.05$), the proliferation of spleen lymphocyte was enhanced, NK cell activity and phagocytosis activity of macrophages had been improved ($p<0.01$) and the mRNA expression of IL-6, IL-12 and INF- in spleen were potentialized in a dose-dependent manner by MPL administration. These results demonstrated that MPL has a remarkable immunomodulatory effect on immunosuppressive mice, which suggested that MPL could be useful for further study as an immunomodulating agent.

【题目】Towards Development of Eco-Agriculture of Rainwater-Harvesting for Supplemental Irrigation in the Semi-Arid Loess Plateau of China
【中文关键词】中国;农业保护;生态农业;集水补灌;半干旱黄土高原径流农业;
【英文关键词】China; conservation agriculture; eco-agriculture; rainwater harvesting for supplemental irrigation; runoff agriculture; semi-arid Loess Plateau
【中文摘要】半干旱黄土高原是中国雨养农业的中心地带。干旱和土壤侵蚀是限制该区发展的两大瓶颈因素。传统的水保农业和径流农业经过几十年发展,不同程度的将少了该区水土流失、提高了雨水资源利用效率。然而,他们对雨水资源的调控能力仍然十分有限,并引起了诸多农业生产问题,比如严重的季节性干旱、较低的农业产量、脆弱的生态环境以及较低的投入产出比,并且这些仍在持续恶化。收集雨水进行集雨补灌是基于水保农业、径流农业理论的雨水资源调控利用的重要手段,不仅促进了不同空间位置雨水资源的收集利用,如水保农业、径流农业对雨水资源的调控,同时也是的雨水资源得到合理叠加利用并减少土壤无效蒸发。农业产量通过对雨水资源的收集补灌而得到极大提升。它不仅带来了一体化的生态重建与经济发展,而且还提供了一种新的方法对农业可持续发展和克服两家最大的障碍(干旱和水土流失),这一技术将成为一个战略措施综合模式和半干旱黄土高原中国。
【英文摘要】The semi-arid Loess Plateau is a central zone of Chinese rain-fed farming. Drought and soil erosion are the two major obstacles to restrict economic development in this semi-arid Loess Plateau. The traditional conservation agriculture and runoff agriculture have been developed for several decades, which have reduced water and soil loss and improved rainwater utilization efficiency to a certain extent. However, its regulative role in rainwater is very much limited, and problems of agriculture production, such as severe seasonal drought and water shortage, low agriculture productivity, fragile ecological environment, and low yield-invest ratio, are still going on. Supplemental irrigation of harvested rainwater is an important form of rainfall regulation and utilization on the basis of sophisticated technologies and theories of conservation agriculture and runoff agriculture, which not only promotes fulfilling rainfall harvesting in spatial location like the conservation agriculture and runoff agriculture measure but also gets at true rainfall harvesting in time distribution by principle of superposition and also decreases invalid evaporation for rainfall runoff. Agriculture productivity will be highly increased by using rainwater harvesting for supplemental irrigation. It not only brings about the integration of ecological reconstruction with economic development, but also provides a new approach to the agriculture sustainable development and overcomes two of the biggest obstacles (drought and soil erosion). It is suggested that this technology will become a strategic measure and comprehensive development model in semi-arid Loess Plateau of China.

【题目】Impact of climate change and irrigation technology advancement on agricultural water use in China
【中文关键词】null
【英文关键词】null
【中文摘要】本文分析了1949-1990年气候变化和灌溉技术发展中国对农业用水的影响。反映气候变化的Palmer干旱指数(PDSI)和毛灌溉定额(GIQ)用来建立中国农业用水与气候变化之间的关系。结果表明,1949-2005年间GIQ和PDSI之间有着良好的相关关系,并建立了他们之间的定量回归统计模型,通过该模型生成了系列GIQ数据。生成的GIQ数据与气象数据之

前关系遵循1949-1990年间实际GIQ变化规律。但1991年之后,实际的GIQ变得越来越小于生成的GIQ,这表明灌溉技术的发展成为影响中国农业用水强度的主要因素。

【英文摘要】The impact of climate change and irrigation technology advancement on agricultural water use in China is analyzed for the period of 1949-2005. The Palmer Drought Severity Index (PDSI) is adopted to characterize climate change, and the Gross Irrigation Quota (GIQ) is used to examine the relationship between agricultural water use and climate change in China. The results show that the GIQ correlates well with the PDSI in Chinese irrigated areas for the period of 1949-1990. A quantitative relationship between the GIQ and PDSI is statistically regressed; a new GIQ dataset is generated with the PDSI based on this relationship over the period 1949-2005. The generated GIQ data with climate-only information follow the pattern of the actual GIQ for the period 1949-1990. Since 1991, the actual GIQ becomes much smaller than the generated GIQ, indicating that irrigation technology advancement exerts a dominant impact on reducing agricultural water use intensity in China.

【题目】An antitumor peptide from Musca domestica pupae (MATP) induces apoptosis in HepG2 cells through a JNK-mediated and Akt-mediated NF- j B pathway

【中文关键词】Akt,抗肿瘤肽,细胞凋亡,JNK,NF-kB

【英文关键词】Akt, antitumor peptide, apoptosis, c-Jun N-terminal kinase,
nuclear factor-jB

【中文摘要】An antitumor peptide from Musca domestica pupae (MATP) was seen to inhibit proliferation and induce apoptosis in cancer cells in our previous investigation. However, the molecular mechanisms involved in MATP-induced apoptosis are still uncharacterized in the human liver cancer cell line HepG2. The present study was undertaken to elucidate the signaling events in MATP-induced apoptosis of HepG2 cells. In this study, the sustained activation of phosphorylated c-Jun N-terminal kinase (JNK) and the obvious inactivation of phosphorylated AktSer473, which prevented IjBa from degeneration, were induced by MATP. Simultaneously, the apoptosis induced by MATP was reversed by SP600125 (a JNK inhibitor) whereas it was aggravated by LY294002 (an Akt inhibitor). These results proved that JNK and Akt independently participated in the apoptosis of HepG2 cells, which were treated with MATP. Moreover, the activation of phosphorylated JNK together with the inactivation of phosphorylated AktSer473 restrained nuclear factor-jB (NF-jB p65) from entering the nucleus. The apoptosis induced by MATP was increased by pyrrolidine dithiocarbamate (NF-jB p65 inhibitor) and the restriction of NF-jB p65 from entering the nucleus induced the decrease of Bcl-2. Simultaneously, MATP induced the increase of Bax, but this mechanism did not depend on the decrease of NF-jB p65 in the nucleus. The release of cytochrome c from the mitochondria, which intensified the expression of caspase-9 and caspase-3, was enhanced by the increase in Bax-to-Bcl-2 expression ratio. The apoptosis of HepG2 cells was induced ultimately by the increase in caspase-3. Taken together, these findings suggest that MATP-induced apoptosis through a JNK-mediated and Akt-mediated NF-jB pathway.

【英文摘要】我们研究发现,家蝇凝集素MATP能够抑制肿瘤细胞的增殖和诱导肿瘤细胞凋亡。但是对诱导HepG2细胞凋亡的机制目前还是不明了。本文章阐明MATP诱导HepG2肿瘤细胞凋亡的分子机制。本文中MATP诱导肿瘤细胞凋亡,出现了JNK和Akt的磷酸化。并且JNK的抑制剂SP600125和Akt的抑制剂LY294002能够抑制MATP诱导的肿瘤细胞凋亡。结果显示JNK和Akt是单独调节肿瘤细胞凋亡的。但是这两个蛋白的磷酸化都受制于NF-kB。加入PDTC之后,能够增加MATP对肿瘤细胞的诱导凋亡作用,限制NF-kB入核降低了Bcl-2的表达量。同时MATP诱导了Bax的增加,Bax与NF-kB不相关。Bax到Bcl-2的增加出现了细胞色素C的释放,然后出现了caspase-9和caspase-3的表达。结果显示,MATP诱导细胞凋亡通过JNK,Akt和NF-kB通路。

【题目】Effect of dietary betaine supplementation on LPL gene mRNA expression and promoter CpG methylation in laying hens
【中文关键词】甜菜碱,CpG甲基化,蛋鸡,脂蛋白酯酶基因,mRNA表达
【英文关键词】betaine, CpG methylation, laying hen, lipoprotein lipase gene, mRNA expression
【中文摘要】本研究开展了甜菜碱对蛋鸡脂肪沉积及相关基因表达的影响,探讨了甲基化影响其表达的机制。结果表明,180日龄蛋鸡LPL(lipoprotein lipase,脂蛋白脂酶) mRNA的表达量在添加0.08%的甜菜碱时显著低于对照组(P<0.01)。180日龄蛋鸡添加0、0.04%、0.06%和0.08%的甜菜碱时LPL启动子CpG甲基化比率分别为3.20%、4.31%、1.83%和3.65%,各组之间差异不显著(P>0.05),但随着添加的增加,出现CpG的甲基化由1到14位的迁移。
【英文摘要】In laying hens, dietary betaine supplementation is reported to reduce abdominal fat, however, the mechanism of which remains largely unknown. The present study investigated the e ect of dietary betaine supplementation on mRNA expression and the promoter CpG dinucleotide methylation profiles of chicken lipoprotein lipase (LPL) gene. The experiments were carried out with laying hens which were randomly allocated to four diets supplemented with ,0,0.04,0.06, and 0.08% betaine. The mRNA levels of LPL gene was investigated by using real-time RT-PCR. The CpG methylation profiles at LPL promoter region were analyzed by using bisulfite sequencing method. The results indicated that betaine supplementation at levels of 0.06 and 0.08% tend to decrease LPL mRNA expression in both 165-day-old and 180-day-old hens. In 180-day-old hens, two distinct CpG methylation profiles at the promoter region of chicken LPL gene were revealed: in control and 0.04% betaine groups, in which LPL mRNA expressions in abdominal adipose tissue were higher, CpG methylation occurs mainly 1st to 8th sites, the remaining sites were less methylated; whereas in 0.06 and 0.08% betaine groups, in which LPL mRNA expressions in abdominal adipose tissue were lower, methylation levels of 1st to 8th CpG sites were decreased, while those of the remaining sites increased.

【题目】Optimization of fermentation and product collection process of the functional bacteria for bioremediation of shrimp culture environment
【中文关键词】无
【英文关键词】Aquaculture environment, Bioremediation, Functional bacteria, Fermentation
【中文摘要】无
【英文摘要】In order to implement industrial production of selected functional bacteria for ioremediation of shrimp culture environment, the fermentation conditions of the threefunctional bacteria,which have high ability in degrading organic pollutants at the bottom ofshrimp ponds,were studied. The results showed that the favorable fermentation medium (per L)was 25 g of peptone, 5 g of yeast extract, and 0.2 g of ferric phosphate, and the initial pH value of the medium was 8.0. The optimum fermentation time was 20 h. The optimum stirring waywas stirring one hour after one hour. Iso-electric point sedimentation collecting method was the most efficient and economic method to collect the bacteria cells after fermentation, with the optimum sediment pH of 3.67, 4.02, and 3.40 for the strains Lt7222, Gy7018 and Lt7511,respectively. It was also indicated that the survival and reproducing ability of the acterial cells were not affected by the sedimentation process.

【题目】A novel approach for the improvement of ethanol fermentation by Saccharomyces cerevisiae
【中文关键词】非整倍体,酒精,啤酒酵母菌株,高重力
【英文关键词】aneuploid, ethanol, Saccharomyces cerevisiae, very high gravity.
【中文摘要】酿酒酵母中,通过基因的控制发酵,来改变传统的发酵是比较困难的。这里,开发了一种新的基因工程方法,来改善300g/L葡萄糖做碳源高重力下提高酒精的发酵量。这个需要构建4倍体的菌株。构建这个菌株需要使用质粒YCplac33-GHK,这个质粒上包含HO基因编码,位点转移的内切核酸酶。非整倍体菌株WT4-M,被挑选了出来,当四倍体菌株被methyl benzimidazole-2-yl-carbamate作用之后,诱导了有丝分裂染色体的缺失。研究发现,非整倍体菌株WT4-M不仅能够提高酒精的产量,发酵的热量,并且能够提高糖乙醇的转化效率。与正常菌株相比,WT4-M提高了9.8%的酒精产量。结果显示,非整倍体菌株对发酵有很好的价值。
【英文摘要】Fermentation properties under the control of multiple genes are difficult to alter with traditional methods in Saccharomyces cerevisiae. Here, a novel genome engineering approach is developed to improve ethanol production in very high gravity fermentation with 300 g/L glucose as the carbon source. This strategy involved constructing aneuploid strains on the base of tetraploid cells. The tetraploid strain was constructed by using the plasmid YCplac33-GHK, which harbored the HO gene encoding the site-specific Ho endonucleases. The aneuploid strain, WT4-M, was selected and screened after the tetraploid cells were treated with methyl benzimidazole-2-yl-carbamate to induce loss of mitotic chromosomes. It was found that aneuploid strain WT4-M not only exhibited an increase in ethanol production and osmotic and thermal tolerance, but also an improvement in the sugar – ethanol conversion rate. Notably, WT4-M provided up to 9.8% improvement in ethanol production compared with the control strain. The results demonstrated that the strategy of aneuploidy was valuable for creating yeast strains with better fermentation characteristics.

【题目】Isolation and functional analysis of the Catharanthus roseus deacetylvindoline-4-O-acetyltransferase gene promoter.
【中文关键词】脱乙酰文多灵-4-O-乙酰转移酶,萜类吲哚生物碱,葡萄糖醛酸酶,甲基茉莉酸,4-丁酸-β-D-葡糖苷酸,4-丁酸
【英文关键词】Catharanthus roseus; Deacetylvindoline-4-O-acetyltransferase; GUS activity; Metyljasmonate; Promoter
【中文摘要】长春花含有多种有药用价值的萜类吲哚生物碱,如文多灵、长春质碱、长春碱和长春新碱。DAT是文多灵合成通路上下游关键酶。在这项研究中,DAT基因的启动子被克隆并分析,DAT基因的启动子含有近1773 bp。序列分析表明,DAT启动子包含了一些潜在调控元件,这些元件参与基因表达调控。为了研究它的功能,5’缺失和增益功能缺失的启动子片段与GUS报告基因融合,在长春花细胞悬浮液中瞬时表达并分析。荧光定量检测用来分析DAT启动子的启动活性。研究发现,DAT启动子中在808bp和1086bp之间的三个TGACG序列和一个倒置的CGTCA序列参与茉莉酸信号转导过程。
【英文摘要】Madagascar periwinkle (Catharanthus roseus) produces many therapeutically valuable terpenoid indole alkaloids (TIAs), such as vinblastine and vincristine derived from the monomers vindoline and catharanthine. Deacetylvindoline-4-O-acetyltransferase (DAT) is a key enzyme for the terminal step of vindoline biosynthesis. In this research, the DAT gene promoter was cloned, sequenced, and analyzed. An approximately 1,773 bp genomic DNA fragment of DAT promoter was obtained. Sequence analysis revealed that DAT promoter contained several potential regulatory elements which were involved in the regulation of gene expression. To investigate its function, the promoter fragments with 5' deletions and gain-of-function deletions were fused to GUS reporter gene, and their expressions were analyzed by transient expression in C. roseus cell suspensions. The regulatory activity of DAT promoter was identified with fluorescence quantitative assays. Three TGACG motifs and one inverted motif (CGTCA) between -808 and -1,086 bp in the DAT promoter were found to be involved in methyljasmonate signal transduction pathway.

【题目】Effect of Plant Growth Regulators on the Biosynthesis of Vinblastine, Vindoline and Catharanthine in Catharanthus roseus.
【中文关键词】长春花,植物生长调节剂,文多灵,长春质碱,长春碱,开花期
【英文关键词】Catharanthus roseus ;Plant growth regulators;Vinblastine ;Vindoline ;Catharanthine ;Blooming ;period
【中文摘要】长春花是一种重要的药用植物,它包含两种抗癌化合物:萜类吲哚生物碱长春碱和长春新碱。有大量的研究是对于次生代谢途径调节生物碱生物合成的机制。在本文中,不同的植物生长调节剂用来短期处理开花时期的长春花,从而研究它们在长春碱、文多灵和长春质碱的合成过程中的作用。水杨酸和乙烯(乙烯利)能够显著提高长春碱、文多灵和长春质碱的含量,而脱落酸和赤霉素降低这三种生物碱的含量。甲基茉莉酸对三种生物碱含量的变化没有显著影响。矮壮素提高了长春碱的含量,但降低了文多灵和长春质碱的含量。
【英文摘要】Catharanthuse roseus is a wellknown medicinal plant for its two valuable anticancer compounds: vinblastine and vincristine, which belongs to terpenoid indole alkaloids. Great efforts have been made to study the principles of its secondary metabolic pathways to regulate the alkaloids biosynthesis. In this article, different plant growthregulators were shortly applied to Catharanthus roseus plants during the blooming period to study their effects on the biosynthesis of vinblastine, vindoline and catharanthine. Salicylic acid and ethylene (ethephon) treatments resulted in a significant increase of vinblastine, vindoline and catharanthine while abscisic acid and gibberellic acid had a strongly negative influence on the accumulation of the three important alkaloids. Methyl jasmonate showed no great effect on the production of these valuable alkaloids. Chlormequat chloride highly enhanced the accumulation ofvinblastine but greatly decreased the contents of vindoline and catharanthine.

【英文关键词】Catharanthuse roseus is a wellknown medicinal plant for its two valuable anticancer compounds: vinblastine and vincristine, which belongs to terpenoid indole alkaloids. Great efforts have been made to study the principles of its secondary metabolic pathwa
【中文摘要】用长春花太平洋樱桃红、热浪系列和地中海玫瑰红这三种品种,研究出一种高效且快速的长春花下胚轴再生植株的方法。经过10天的培养,下胚轴愈伤组织(HPC)在诱导基质(MSCP1)上形成。在诱导基质(MSCP2)上诱导两周,长出胚性愈伤组织(EC)。然后,EC在植株诱导基质(MSCP3)上被筛选,每两周继代一次。六周后, EC发芽并长成幼嫩植株。水解酪蛋白和L-脯氨酸在长春花植株再生中最为氮源是有必要的,它们不仅缩短了培养时间,同时也增加了很多体细胞和派生苗。下胚轴转化为EC进而发育为再生苗的百分比远高于先前的报道。
【英文摘要】An efficient and rapid somatic embryogenesis based plant regeneration from hypocotyls of three Catharanthus roseus cultivars, Pacifica cherry red (PCR), Heatwave mix color (HWMC), and Mediterranean Rose Red (MRR) was standardized. Hypocotyl-derived primary calluses (HPC) were formed on callus induction medium (MSCP1) after 10 days of culture. Embryogenic calluses (EC) withsomatic embryos were induced from HPC on proliferation medium (MSCP2) within 2 weeks of culture.Later, EC were selected and maintained on plantlet formation medium (MSCP3) with periodic subculturing at an interval of 2 weeks. Somatic embryos were germinated well into plantlets on MSCP3 within 6 weeks of culture. As sources of nitrogen, casein hydrolysate (CH; acid free) and L-proline were necessary as standard addenda in the plant regeneration protocol of C. roseus. The promotive effects of CH and L-proline not only decreased the culturing time but also increased the number of somatic embryos and their derived plantlets. The percentage of EC and regenerated plant initiated from hypocotyls were higher than those previously reported.

【题目】根癌农杆菌介导的g10h基因遗传转化长春花初步研究
【中文关键词】长春花,根癌农杆菌EHA105,g10h基因,遗传转化
【英文关键词】Catharanthus roseus; Agrobacterium tumefaciens EHA105;g10h gene;genetic transformation
【中文摘要】以长春花下胚轴为基因转化的受体材料,利用根癌农杆菌EHA105介导,将g10h基因转化到3种品系的长春花中。结果表明,附加100 μ mol/L乙酰丁香酮的根癌农杆菌悬液在OD600=0.5~0.6时侵染效果较好;PCR分子检测转基因植株部分呈现阳性,证明g10h基因已整合到长春花基因组中,3种不同品系的长春花的再生率和阳性率存在差异;采用Real time PCR技术进一步检测g10h基因表达情况,结果表明转基因长春花植株中g10h mRNA表达量比非转基因对照高1.62~3.79倍。
【英文摘要】By using the hypocotyls of C.roseus as the gene transformation acceptor. The g10h gene was transferred into varieties of C.roseus mediated by Agrobacterium tumefaciens EHA105. The results that the best infected effect was determined when the suspension liquid medium of Agrobacterium tumefaciens contained 100 μ mol/L acetosyringone, and OD600=0.5~0.6. The PCR screening showed that some transgenic plants were positive, which indicated the g10h gene was seemed to integrate into genome of C.roseus. And the rate of regeneration and transformation of C.roseus were different in three genotypes. Following analysis of Real time RT-PCR results showed that the expression level of g10h mRNA in the transgenic C.roseus plants was 1.62~3.79 fold higher than that of control(non-transgenic C.roseus plants).

【题目】西农萨能羊FAS基因shRNA序列筛选及其腺病毒载体的构建
【中文关键词】西农萨能羊;乳腺脂肪酸合酶基因;shRNA;腺病毒载体
【英文关键词】Xinong Saanen goat;Mammary gland;Fatty acid synthasegene;shRNA;Adenovirus vector
【中文摘要】山羊脂肪酸合酶(Fatty acid synthase,FAS)是脂肪酸合成的关键酶,对乳腺短、中链脂肪酸合成起重要调控作用。设计了shRNA-5544、shRNA-5936s、hRNA-6132 3条针对FAS基因不同区域的小发夹RNA(Short hairpin RNA,shRNA)及一条阴性对照序列shRNA-NC,并构建表达这4条shRNA序列的入门载体及其靶基因与红色荧光蛋白基因的融合表达载体,二者共转染HEK 293细胞进行有效序列筛选,结果显示shRNA-5544和shRNA-5936序列具有明显的干扰效果。在LR Clonase-Ⅱ重组酶作用下,分别将pENTR/CMV-GFP/U6-shRNA-5544、pENTR/CMV-GFP/U6-shRNA-5936及pENTR/CMV-GFP/U6-shRNA-NC入门载体与腺病毒骨架载体pAd/PL-DEST进行LR重组,经氨苄青霉素及氯霉素抗性筛选后成功获得3个重组腺病毒载体,Sca Ⅰ酶切鉴定及测序分析证实所构建的重组腺病毒载体中插入序列与设计序列一致。重组腺病毒载体经Pac Ⅰ酶切线性化后,利用Lipofectamine 2000转染HEK 293细胞,10~12 d后收集病毒,在HEK 293细胞中反复扩增3次后,获得高滴度的重组腺病毒,利用TCID50法测定重组腺病毒滴度分别为6×108PFU/mL(表达shRNA-5544序列)、5×108PFU/mL(表达shRNA-5936序列)及6×108PFU/mL(表达shRNA-NC序列),为进一步在原代培养的山羊乳腺上皮细胞中进行FAS基因的RNA干扰研究奠定基础。
【英文摘要】Goat fatty acid synthase(FAS),a central multifunctional enzyme in charge of fatty acid synthesis in mammary gland,plays a significant role in regulation of short-and medium-chain fatty acid.This study designed three short hairpin RNA(shRNA) sequences shRNA-5544,shRNA-5936,and shRNA-6132 targeting different area of FAS gene and one negative control sequence,then constructed four entry vectors containing shRNA expression cassette as well as pDsRed1-C1 vector expressing target gene by cotransfecting HEK 293 cell.The result showed that entry vector expressing shRNA-5544 and shRNA-5936 sequences caused an obvious interference effect.Then ampicillin and chloramphenicol were successfully applied to identify three recombinant adenovirus vectors generated by LR recombination between entry vector(pENTR/CMV-GFP/U6-shRNA-5544,pENTR/CMV-GFP/U6-shRNA-5936,pENTR/CMV-GFP/U6-shRNA-NC) and backbone vector(pAd/PL-DEST).Sca Ⅰ digestion identification and sequencing analysis indicated that the sequence inserted into pAd/PL-DEST vector was the same with designed shRNA template.Recombinant adenovirus vector was transfected into HEK 293 Cell by Lipofectamine 2000 reagent after linearization by Pac Ⅰ digestion.The cell lysates harvested during 10 to 12 days post transfection were employed to perform virus amplification in HEK 293 cells for three times to generate high-titer virus.The titer of the adenoviral stock was determined by TCID50 method and respectively reaches 6×108 PFU/mL(Expressing shRNA-5544 sequence),5×108 PFU/mL(Expressing shRNA-5936 sequence),and 6×108 PFU/mL(Expressing shRNA-NC sequence),respectively.The attaining of recombinant virus lays a foundation for RNA interference research of FAS gene in primary goat mammary epithelial cells.

【题目】Molecular characterization and chromosomal mapping of porcine brain and muscle arnt-like protein-1 gene
【中文关键词】猪,BMAL1,序列,表达,辐射杂交作图
【英文关键词】Pig, Brain and muscle Arnt-like protein-1 gene, Sequence, Expression,Radiation hybrid mapping
【中文摘要】BMAL1(brain and muscle Arnt-like protein-1)是调节生物钟的一种重要转录因子,其表达受乙酰化的调控,与CLOCK基因形成二聚体对包括脂肪沉积在内的多个性状进行表观遗传调控。本研究克隆了猪BMAL1基因1878bp的cDNA序列,与人、小鼠和大鼠对应序列的同源性分别为94.36%、89.85%和89.79%,氨基酸序列的同源性分别为99.20%,98.24% 和 97.92%。猪BMAL1在背膘、脾脏和小肠等大多数组织中表达。在长白猪的5种脂肪组织中均有表达,在肠系膜脂肪表达量最高,在花油表达量最低,但差异不显著(P>0.05)。在长白猪和莱芜猪背膘中发现了两个剪接变异体。pBMAL1 mRNA在成年莱芜猪14种组织均有表达,在背膘中表达最高,在眼肌中表达最低。用辐射杂种板把pBMAL1基因定位在SSC

2p11-q21。
【英文摘要】Abstract As a transcription factor regulating circadian rhythm, brain and muscle Arnt-like protein-1 (BMAL1)plays an important role in lipid homeostasis. The Chinese indigenous and western pig breeds show marked difference in fat deposition, the structure and function of porcine BMAL1 (pBMAL1) between them might be different. In present study, the molecular characteristics and chromo-somal location of pBMAL1 were analyzed. The results indicated that pBMAL1 cDNA had a coding region of 1,878 bp and shared 94.36, 89.85 and 89.79% identity with human, mouse and rat BMAL1, respectively, and the pBMAL1 protein had 99.20, 98.24 and 97.92% identity to those of human BMAL1b, mouse BMAL1b and rat BMAL1b, respectively. Compared with other mammals, pBMAL1 was more closely related to humanBMAL1. The expression of pBMAL1 was detected in kidney, stomach, spleen, bladder, gallbladder, lumbar spinal cord, meduoblongata, heart, longissimus dorsi muscle, liver, small intestine, large intestine, lung and backfat tissues. In adipose tissues, it was detected in mesentery fat, leaf fat, caul fat, backfat and cardiac fat, however, the expression level was not significantly different. Alternative usage of exon 2 was revealed to result in two pBMAL1 transcripts. Finally, by using a whole genome porcine radiation hybrid (RH) panel (IMpRH), the pBMAL1 gene was mapped to SSC 2p11-q21.

【题目】西农萨能奶山羊脂肪酸合酶基因启动子的克隆及活性测定
【中文关键词】西农萨能奶山羊;FAS启动子;基因克隆;活性测定
【英文关键词】Xinong Saanen dairy goat; FAS promoter; gene cloning; activity determination
【中文摘要】克隆测定西农萨能奶山羊脂肪酸合酶基因(fatty acid synthase,FAS)启动子的全长序列,进行活性区域分析,为奶山羊FAS基因功能和表达调控机理研究提供依据。【方法】根据牛和人脂肪酸合酶基因启动子的同源序列以及西农萨能奶山羊脂肪酸合酶基因5′UTR区域,分别设计上、下游引物,以西农萨能奶山羊全血DNA为模板克隆启动子序列。依据生物信息学分析结果重设引物,将FAS启动子基因分段克隆并连接到荧光素酶表达载体PGL-3,与Psv-β-半乳糖苷酶对照载体共转染293、MCF-7细胞,进行荧光素酶活性检测和β-半乳糖苷酶的活性检测。【结果】FAS基因启动子序列全长2640bp,与牛、人FAS启动子序列同源性90%以上,包括数个潜在SP1、Ets、LSF等转录因子结合位点和CCAAT框、GC框。-1040—-340bp处可能包含启动子活性中心,通过启动子缺失片段试验将活性中心范围缩小至-721—-540bp之间。【结论】通过克隆FAS基因启动子区域,分析表明启动子前端存在负调控元件,找出了启动子最小活性中心。
【英文摘要】The fatty acid synthase (FAS) gene promoter of Xinong Saanen dairy goat was cloned and sequenced to analyze the active region, thus providing an evidence for function determination and expression regulation of FAS gene. [Method] According to the homologous sequences of bovine and homo, and to 5'UTR of Xinong Saanen dairy goat FAS gene, upstream and downstream primers were designed, respectively. Using genome DNA as the template, the FAS gene promoter was cloned. Primers were redesigned according to the results of bioinformatics analysis, the FAS gene promoter was cloned by segmenting and linking up with the PGL-3 expression vector, co-transfecting 293 and MCF-7 cells with the β-galactosidase control vector, and luciferase and β-galactosidase expression were detected. [Result] There are 2 640 bp in FAS gene promoter totally, the homology with bovine and homo is over 90%. The promoter contains several potential transcription factor bind sites such as SP1, Ets, LSF bind sites, several CCAAT boxes and a GC box. The core promoter sequences potentially locate in -1 040-340 bp, and reduced the range to -721--540 bp by promoter deletion experiment. [Conclusion] The full length of Xinong Saanen Dairy Goat FAS gene promoter was cloned, the potential negative control element was analyzed, and the core promoter sequences were found.

【题目】Protective Effect of Selenoarginine against Oxidative Stress in D-Galactose-Induced Aging Mice
【中文关键词】硒酸精氨酸,D-半乳糖;氧化应激;保护作用
【英文关键词】selenoarginine; D-galactose; oxidative stress; protective effect
【中文摘要】硒酸精氨酸对耐氧化性的保护作用,研究了在D-半乳糖(D-半乳糖苷)诱导的衰老小鼠。小鼠随机分为四组(n=15):正常对照组,模型组,低剂量硒酸精氨酸组(8.35微克的硒/公斤体重/天),高剂量硒酸精氨酸组(硒16.78微克/千克体重/天)。诱导衰老模型南卡罗来纳注射D-半乳糖溶解在0.9%生理盐水的剂量为150毫克/公斤/天,共6周。正常对照组的小鼠接受皮下注射相同的剂量和频率在无菌生理盐水中的注射。结果表明,氧化应激在肝,肾和脑组织和D-半乳糖诱导的小鼠血清,但硒酸精氨酸对D-半乳糖致衰老模型小鼠有明显的保护作用。低剂量硒酸精氨酸表现优于高剂量硒酸精氨酸。硒酸精氨酸对D-半乳糖致衰老模型小鼠的保护作用,可以归因于海拔抗氧化酶的活性,增强抗氧化防御系统。
【英文摘要】The protective effect of selenoarginine against oxidation resistance was investigated in D-galactose (D-gal)-induced aging mice. The mice were divided into four groups (n=15): a normal group, a model group, a lowdose selenoarginine group (8.35 microg of Se/kg b.w./d), and a high dose selenoarginine group (16.78 microg of Se/kg b.w./d). The aging model was induced by s.c. injection D-galactose dissolved in 0.9% normal saline of a dose of 150 mg/kg/d for 6 weeks. The mice in the normal group received s.c. injection of sterile normal saline at the same dose and frequency. The results showed that oxidative stress in the liver, kidney, and brain tissues and the serum of the mice was induced by D-galactose, but selenoarginine had an obviously protective effect against D-galactose-induced aging mice. Lowdose selenoarginine performed better than high dose selenoarginine. The protective effect of selenoarginine on D-galactose-induced aging mice can be attributed to elevation of the activity of antioxidase and enhanced antioxidant defenses.

【题目】奶山羊POU1F1基因CDs区的克隆、分析及原核表达
【中文关键词】关中奶山羊;POU1F1;克隆;生物信息学分析;原核表达
【英文关键词】Guanzhong dairy goat;POU1F1;cloning; biological information analysis; prokaryotic expression
【中文摘要】克隆奶山羊垂体特异性转录因子POU1F1基因CDs区,并对其进行生物信息学分析和原核表达。【方法】采集关中奶山羊垂体组织,提取其总RNA,根据绵羊POU1F1基因序列,利用反转录RT-PCR克隆POU1F1基因CDs区,对其进行生物信息学分析,并构建原核表达载体pET-32a-POU1F1,在大肠杆菌BL21(DE3)pLysS中进行表达。【结果】关中奶山羊POU1F1基因(GenBank登陆号:FJ547813)开放读码框由876个碱基组成,编码291个氨基酸,基中包含1个POU-specific结构域(从第124~198个氨基酸)和1个Homeobox结构域(从第214~276个氨基酸);奶山羊POU1F1基因CDs区核苷酸序列与绵羊(NM_001009350)、牛(NM_174579)、人(NM_000306)和小鼠(NM_008849)的同源性分别为98%,97%,91%和86%,其氨基酸序列与绵羊、牛、人和小鼠的同源性分别为98%,98%,96%和92%;成功构建了重组质粒pET-32a-POU1F1的原核表达系统,并在体外条件下诱导表达出融合蛋白His-POU1F1。【结论】POU1F1基因编码的共跟你过氨基酸在奶山羊、绵羊、牛、人和小鼠上高度保守,推测奶山羊POU1F1基因与其他物种的POU1F1基因具有相似的功能。
【英文摘要】The study cloned prokaryotic expression of the CDs of dairy goat pituitary-specific transcription factor POU1F1 gene and analyzed the biological information.【Method】 The CDs of goat pituitary-specific transcription factor POU1F1 gene was amplified and cloned from total RNA of goat pituitary by RT-PCR according to the corresponding sequence in sheep.The biological information analysis was performed with it.The prokaryotic expression vector pET-32a-POU1F1 was constructed and expressed in E.coli BL21(DE3)pLysS.【Result】 The gene POU1F1 CDs is cloned and registered in GenBank(GenBank accession No.FJ547813).The ORF of POU1F1 gene consisted of 876 nucleotides encoding 291 amino acids with a POU-specific(POUs) domain from 124-198 amino acids and a Homeobox domain from 214-276 amino acids.The nucleotide sequence homology of POU1F1 CDs of Guanzhong dairy goat was found to be 98%,97%,91% and 86% compared with that of sheep(NM_001009350),bovine(NM_174579),human(NM_000306) and mouse(NM_008849),while the amino acid sequence

homology was 98%,98%,96% and 92% respectively.The prokaryotic expression system of recombined vector pET-32a-POU1F1 was constructed successfully.The fusion protein His-POU1F1 was expressed by inducing in vitro.【Conclusion】 The functional amino acids coded by the gene POU1F1 are highly conserved in goat,sheep,cattle,human and mouse.It is implied that the gene POU1F1 in dairy goat shows the same function as it does in other species.

【题目】添加营养物质提高商品水质净化菌剂净化能力的研究

【中文关键词】微生物制剂, 营养物, 养殖废水净化

【英文关键词】microorganism products, nutrients, aquaculture wastewater purification

【中文摘要】利用室内试验,研究了添加营养物质提高商品水质净化菌剂SYMCORE BZTTM的净化能力的方法。研究分两部分,第1 部分设1个对照组和2个试验组,研究了添加营养物质对水质净化菌剂的净化能力的影响;第2部分设1个对照组和15个试验组,研究了营养物质添加量配比与净化效果的关系。通过计算葡萄糖和磷酸盐的添加量对COD、NH3-N和NO2-N 去除率的影响,建立了相关模型。实验结果表明,添加葡萄糖和磷酸二氢钾能显著提高水质净化菌剂对养殖废水的净化能力。添加葡萄糖使COD、NH3-N和NO2-N 的去除率分别提高了21.92%、34.43%和57.41%; 添加磷酸盐使COD、NH3-N和NO2-N 的去除率分别提高了30.02%、53.45%和15.08%。当C∶N∶P = 62.5∶4.85∶1 时,水质净化菌剂对养殖废水中COD的净化效果最佳; 当C∶N∶P = 37.5∶4.51∶1 时,对氨氮的去除效果最好;当C∶N∶P = 25∶2.97∶1时,对亚硝酸氮的净化能力最高。葡萄糖与磷酸盐的添加量与3 种污染物去除率的关系可以用二项式曲线拟合。实验结果与拟合结果相符。为养殖废水的生物修复和微生物制剂的推广应用提供了理论和技术依据。

【英文摘要】The promoting effect of nutrient addition on aquacultural wastewater purification of microorganism products,SYMCORE BZTTM was investigated,and furthermore,the relationship between removal rates of chemical oxygen demand (COD),ammonia nitrogen (NH3-N) and nitrite nitrogen (NO2-N) and the ratio of C∶N∶P was studied. The experiments were composed of two parts. Part I consisted of one control group and two trial groups,promoting effect of nutrient addition on removal rate of microorganism was proved. Part II was made up of one control group and 15 trial groups to analyze the relationship between the mount of addednutrients and the removal rates of pollutants. Moreover,the relationship between the ratio of carbon,nitrogen and phosphorus and the removal rates of COD,NH3-N and NO2-N was calculated,and the mathematics models were set up. The results showed that the purification ability of microorganism products was significantly improved by adding suitable nutrients. The removal rates of COD,NH3-N and NO2-N of the treatment group increased 21.92%,34.43%,57.41% by adding glucose and 30.02%,53.45%,15.08% by adding phosphate compared with the control,respectively. At the same time,the amount of phosphate was found insufficient in control group. The removal rates for COD,NH3-N and NO2-N were the highest,97.07%,96.88% and 93.41%,when the ratio of C∶N∶P was 62.5∶4. 85∶1,37.5∶4.51∶1 and 25∶ 2.97∶1,respectively. The relationship of glucose and phosphate concentration with COD,NH3-N and NO2-N removal rates could be described by quadratic equations,V = aX2 + bX + c. The individual COD,NH3-N and NO2-N removal rates of the microorganism products are positively correlated with the concentration of glucose and phosphate in range of 0- 40 mg/L and 0-1600 mg/L,respectively. The process of microbial remediation could be featured as three sequential stages: Firstly,dissolved organic matter (DOM) was degraded; secondly ammonia was oxidized; and at last,nitrite was oxidized. From day 1 to day 7,DOM was directly utilized as the carbon and nitrogen sources of the heterotrophic bacteria. The removal rates of COD at this stage were significantly higher than those of the control. From day 7 to day 13,bacteria mainly utilized ammonium as nitrogen sources and produced nitrite. So the concentration of NH3-N reduced sharply,while NO2-N concentration increased suddenly. From day 13 to 19,NO2-N concentration decreased rapidly,because the nitrite was oxidized to nitrate. This paper supplied theoretical and technical foundation for the biopurification of aquaculture wastewater and the extending application of microbial products.

【题目】Effects of Genistein on oxidative injury in Endothelial cells
【中文关键词】染料木黄酮,血管内皮细胞,细胞凋亡,抗氧化作用,体外
【英文关键词】genistein, vascular endothelial cell, apoptosis, antioxidation, in vitro
【中文摘要】本文的主要目的是研究染料木黄酮对血管内皮细胞动脉粥样硬化氧化脂蛋白的影响,通过诱导抗氧化酶的产生和阻止细胞凋亡。使用染料木黄铜(10-100μmol/L)作用人的脐带衍生细胞ECV304,清楚抗氧化剂VE(50μmol/L)或者是作用24h,然后使用ox-LDL额外的孵育24h。然后,测定细胞的抗氧化剂酶的活性,脂质过氧化反应,单核细胞的粘附能力,细胞的形态,生存和凋亡的指数。Ox-LDL降低了超氧化物歧化酶和谷胱甘肽过氧化物酶的活性,出现了脂质的过氧化反应,出现了单核细胞的粘附性增强和细胞形态学方面的损伤和凋亡。维生素E和染料木黄酮能够组着这样的作用,并且染料木黄酮呈现出剂量效应。除此之外,染料木黄酮能够保护抗氧化酶的活性,抑制脂质过氧化反应。
【英文摘要】The aim of this study was to test the hypothesis that genistein protects vascular endothelial cells against the pro-atherosclerotic stressor, oxidized low-density lipoprotein, by inducing antioxidant enzymes and preventing apoptosis. Human umbilical cor-derived endothelial cells were incubated with genistein, the radical scavenging antioxidant vitamin E,or vehicle for 24h and then were incubated with ox-LDL for an additional 24h.Subsequently, antioxidant apoptotic index were assessed. Further, this effect of genistein is associated with maintenance of antioxidant enzyme activities and inhibition of lipid peroxidation.

【题目】对虾养殖中后期虾塘沉积物的硝化与反硝化作用
【中文关键词】虾塘, 沉积物, 硝化, 反硝化, 氧化亚氮
【英文关键词】Shrimp pond, Sediment, Nitrification, Denitrification, Nitrous oxide
【中文摘要】2009年7~8月,通过使用乙炔抑制技术对对虾养殖池塘的投饵区和非投饵区沉积物硝化与反硝化速率进行了测定,并同时用气相色谱法测定了虾塘表层N2O浓度。结果表明,虾塘沉积物硝化、反硝化和硝酸盐还原速率分别为10.70~337.47 μmol/m·h、1.10~17.92 μmol/m·h、0.090~7.48 mmol/m2·h,虾塘表层N2O浓度为5.98~10.90 nmol/l ,海一气交换通量为1.76~3.89 μmol/m2·d。虾塘硝化与反硝化作用较为复杂,不仅存在着显著的区域性差异,而且呈现出明显的养殖季节变化特征,其中8月中旬硝化与反硝化速率达到最高值,而在整个养殖季节,投饵区硝化速率约为非投饵区的2~10倍,反硝化速率约为非投饵区的1~4倍。反硝化作用在虾塘生态系统的氮循环中扮演着重要角色,其日无机氮去除量为2.8Og/d,占虾塘无机氮总输入的2.34 ,占总输出的2.56 。
【英文摘要】The nitrification and denitrification non-feeding areas of the shrimp culture pond wererates in the sedim ents of the feeding and measured by applying acetylene inhibition technique,and the N2O concentration in the surface water was determined by GC-ECD duringJuly-August,2009.The results showed that the rates of nitrification,denitrification,and ni-trate reduction ranged between 10.70-337.47 μmol/m·h,1.10-17.92 μmol/m·h,0.09-7.48 mmol/m·h respectively.Concentrations of N2O in the surface water was 5.98-10.9nmol/L and the air water flux of N2O ranged between 1.76-3.89 μmol/m·d.Nitrification and denitrification process in the sediments of the shrimp pond showed both significant regionaldifferences and significant seasonal variations.In mid-August,nitrification and denitrification rates reached the highest values,and in the whole culture period,nitrification rates in the feed-ing area were 2-10 folds of the non feeding area and denitrification rates in the feeding area were 1-4 folds of the non-feeding area.Denitrification played an important role in the nitrogen cycle of the shrimp pond ecosystem,removing inorganic nitrogen at 2.80g/d,accounting for 2.34 of the total input of inorganic nitrogen and 2.5 6 of the total output in the shrimp pond.

【题目】西农萨能奶山羊激素敏感脂酶基因CDS区的克隆与生物信息学分析
【中文关键词】西农萨能奶山羊;激素敏感脂酶;RT-PCR;序列分析
【英文关键词】Xinong Saanen dairy goat;Hormone-sensitive lipase;RT-PCR Sequence; analysis
【中文摘要】根据GenBank已收录的牛(Bos taurus)、人(Homo sapiens)和小鼠(Mus musculus)等物种激素敏感脂酶(HSL)基因序列的同源保守区域,设计特异性引物,利用RT-PCR技术,从西农萨能羊乳腺组织中克隆得到了山羊(Caprar hircus)HSL基因的CDS,并对其核苷酸序列和推导的氨基酸序列以及蛋白质结构进行了生物信息学分析。结果表明,山羊HSL基因CDS全长2271bp,编码756个氨基酸残基(GenBank登录号为:EU273879),与牛、人和小鼠的核苷酸序列同源性分别为96%、86%和79%;氨基酸序列的同源性分别为96%、85%和83%;其蛋白质的分子量为82583.7D,等电点为6.23,其氨基酸序列中存在较强的疏水区域,三级结构存在一个α/β水解酶折叠区域,该特征与牛、人及小鼠的HSL基本一致。
【英文摘要】According to the highly conservative region of Hormone-sensitive Lipase (HSL) gene sequences from bovine (Bos taurus), human (Homo sapiens) and mouse (Mus musculus) in the GenBank, the specific primers were designed to clone the CDS region of HSL gene in mammary gland of Xinong Saanen dairy goats using the RT-PCR method, the bioinformatic analyses of nucleotide sequence, the deduced amino acid sequence, and the prediction of protein structures of HSL gene were conducted. The results showed that the full length of CDS region of HSL gene was 2 271 bp encoding 756 amino acids (GenBank accession No. EU273879), homogeneities of CDS nucleotide sequence between goat and bovine, human and mouse were 96%, 86%, and 79%; that of amino acid sequence were 96%, 85%, and 83%, respectively, the predicted molecular weight and isoelectric point of HSL gene were 82 583.7 D and 6.23, there were a strong hydrophobic region in amino acid sequence and a α/β hydrolase fold region in the tertiary structure, which were similar with the structure of CDS region of HSL gene in bovine, human and mouse.

【题目】Protective Effect of Cartilage-selenium Polysaccharide on Diethylnitrosamine-Induced Liver Injury in Mice and Its Possible Mechanisms
【中文关键词】软骨硒多糖,肝损伤;二乙基亚硝胺(DEN);自由基,抗氧化能力; RT-PCR
【英文关键词】cartilage-selenium polysaccharide; Liver injury; diethylnitrosamine (DEN); free radical; antioxidant ability; RT-PCR
【中文摘要】为研究软骨硒多糖对肝损伤的保护作用及机制所造成的二乙基亚硝胺DEN在小鼠。在整个实验期间,肝脏的肝损伤指标进行分析,大大受伤DEN诱导和完全防止低和高的软骨硒多糖。 GSH-Px和SOD和GSH-Px和SOD的表达量分别为显着降低MDA含量和中心点OH和O(2)(-)中心点清除。软骨硒多糖型胶原量I和的α-SMA和HSP47的mRNA,通过RT-PCR检测到模型组相比明显降低。 ,软骨硒多糖DEN在诱导小鼠肝损伤的保护作用,其机制与清除自由基,提高SOD和GSH-Px活性,提高GSH-Px和SOD的mRNA的数量,型胶原的减少量我和mRNA表达的α-SMA和HSP47和抑制炎症介质的生产。
【英文摘要】To study the protective effects and mechanisms of cartilage-selenium polysaccharide on liver injury caused by diethylnitrosamine DEN in mice. During the entire experimental period, to analyze liver injury indexes, the liver was greatly injured by DEN induced and completely prevented by low and high cartilage-selenium polysaccharide. GSH-Px and SOD activities and quantity of mRNA of GSH-Px and SOD were significantly higher to decrease MDA content and center dot OH and O(2)(-)center dot scavenging. Cartilage-selenium polysaccharide was evidently reduced quantity of collagen type I and mRNA of alpha-SMA and HSP47 compared to model group by RT-PCT detecting. Cartilage-selenium polysaccharide had protective effect on liver injury induced by DEN in mice, and its mechanisms were related to free radical scavenging, increasing SOD and GSH-px activities, enhancing quantity of mRNA of GSH-Px and SOD, decreasing quantity of collagen type I and mRNA of alpha-SMA and HSP47 and inhibiting the production of proinflammatory mediators.

【题目】Phylogenetic analysis of bacterial communities in the shrimp and sea cucumber aquaculture environment in northern China by culturing and PCR – DGGE
【中文关键词】无
【英文关键词】Bacteria, Biodiversity, Aquaculture, Shrimp, Sea cucumber,Environment, DGGE
【中文摘要】无
【英文摘要】In this study, we investigated the bacterial communities in the shrimp and sea cucumber culture environment, including shrimp ponds (SP), sea cucumber ponds (SCP),mixed-culture ponds (MCP) and the effluent channel (EC) in Qingdao, China. Bacteria cultivation showed that the counts of heterotrophic, nitrate-reducing and sulfate-reducing bacteria in the sediment of SP were higher than that in the sediment of SCP and MCP, varying between 8.7 9 104 and 1.86 9 106, 2.1 9 104 and 1.1 9 105, and 9.3 9 101 and 1.1 9 104 CFU g-1,respectively. In contrast, the counts of ammonium-oxidizing and nitrifying bacteria in the sediment of SP was lower than that in the sediment of SCP and MCP. Denaturing gradient gel electrophoresis (DGGE) of 16S rDNA gene and dendrogram analyses showed that bacterial diversity in the mixed-culture environment was higher than that in the monocultures. The similarity of bacterial community between EC and SCP or MCP was higher than that between EC and SP. These results indicated that sea cucumber culture played a significant role in influencing the environmental bacterial communities that were composed mainly of Flavobacteriaceae (64.3%), Bacteriodetes (21%) and delta proteobacteria (14.7%), including the genera of Croceimarina, Lutibacter, Psychroserpens and so on. The results explained the benefit of sea cucumber culture in shrimp ponds at the level of microbial ecology.

【题目】Effects of soybean Isoflavone on the Notch signal pathway of the brain in rats with cerebral Ischemia
【中文关键词】大豆异黄酮 Notch 脑缺血 小鼠
【英文关键词】soybean isoflavone, Notch, cerebral ischemia, rat
【中文摘要】本文旨在测试灌胃大豆异黄酮在模拟中风实验过程中激活Notch 信号通路并阻止大脑皮层凋亡的假设。将SD鼠按每组十只随机分配成四组,分别是假手术加溶剂组(Sham),中间脑动脉闭塞加溶剂组(MCAO),Sham中小鼠加低剂量(10mg/(kg·d)大豆异黄酮组,MCAO中小鼠加高剂量(50mg/(kg·d)大豆异黄酮组。盐溶液(浓度,10ml/(kg·d))和大豆异黄酮在进行假手术和MCAO之前通过灌胃给予,先灌胃28天,随后再灌胃7天。尽管通常细胞凋零是通过TUNEL检测来进行,Notch信号系统(notch1和Hes5)混合物的信使RNA和蛋白表达程度通过原位杂交与分子印迹分别进行检测。实验结果表明MCAO组刺激Notch1和Hes5在信使RNA和蛋白层面的表达,并且促进细胞凋零。大豆异黄酮剂量依赖性地增强MCAO组在Notch1和Hes5表达程度上的刺激作用,但是降低了细胞凋零作用。这些结果表明可能存在一种机制关于大豆异黄酮对中风者神经保护的作用。
【英文摘要】The aim of this study was to test the hypothesis that gastric lavage with soybean isoflavone activates the Notch signaling pathway and prevents apoptosis in the cerebral cortex during experimental strokes. Sprague-dawley rats were randomly assigned to four groups of 10 rats each.The results identify a possible mechanism by which soybean isoflavone confers neuroprotection in strokes.

【题目】西农萨能奶山羊甘油三酯水解酶(ATGL)基因的克隆与组织表达分析
【中文关键词】西农萨能奶山羊;甘油三酯水解酶;基因克隆;组织表达
【英文关键词】Xinong Saanen dairy goat; Adipose triglyceride lipase(ATGL); Gene cloning; Tissue expression
【中文摘要】甘油三酯水解酶(adipos etriglyceride lipase,ATGL)是水解甘油三酯的关键酶。本研究采用RT-PCR和RACE技术,分离并克隆了西农萨能奶山羊(Capra hircus)ATGL基因的cDNA序列,其全长2074bp(GenBank收录号为:GQ918145),包括5'UTR141bp,CDS1461bp,和3'UTR472bp,该基因编码486个氨基酸(GenBank收录号为:ADD25174)。经氨基酸序列分析发现,山羊与GenBank中牛(Bos taurus)、大鼠(Rattus norvegicus)、小鼠(Mus musculus)、猪(Sus scrofa)和人(Homo sapiens)的ATGL的相似性较高,均在85%以上。经蛋白质结构分析表明,其蛋白质的分子量为53243.4D,等电点为7.4,具有GXSXG(氨基乙酸-X-丝氨酸-X-氨基乙酸)脂肪酶活性特征结构和Patatin结构域及α/β水解酶折叠域,在N端存在跨膜螺旋结构,并且整个序列中不含信号肽。此外,本研究还通过实时荧光定量PCR(RT-qPCR)技术对ATGL基因进行了组织表达分析。结果表明,在所检测的12个组织或器官中均有ATGLmRNA存在,其中皮下脂肪组织中表达最丰富,并且远远高于其它组织或器官,肺、乳腺次之,心脏相对最少。ATGL基因在奶山羊的乳腺组织中具有较高的表达水平,为该基因的功能研究提供了实验依据。
【英文摘要】Adipose triglyceride lipase (ATGL) is a key enzyme in lipid lipolysis. In this experiment, the whole cDNA length ATGL gene with 2 074 bp (GenBank accession No. GQ918145) was isolated and cloned by RT-PCR and RACE (rapid amplification cDNA ends) from Xinong Saanen dairy goats (Capra hircus). ATGL gene contains 141 bp 5'UTR, 472 bp 3'UTR, and 1 461 bp coding sequences (CDS) which encode a protein of 486 amino acid residues (GenBank accession No. ADD25174). AA sequence alignment showed that the AA of goat ATGL had high score similarity, more than 85%, when compared with bovine (Bos taurus), rat (Rattus norvegicus), mouse (Mus musculus), pig (Sus scrofa), and human (Homo sapiens) in GenBank. The protein structure had a Patatin domain, α/β hydrolase folds and GXSXG (Gly-X-Ser-X-Gly) structure. A transmembrane helix was speculated in the N-terminal and no signal peptide found in the entire sequence. The protein molecular weight was 53 243.4 D and the isoelectric point was 7.4. Furthermore, the ATGL gene expressions in various organs and tissues were analyzed by real-time fluorescence quantitative-PCR. The results showed that the ATGL mRNA existed in all of the 12 detected organs and tissues. The most abundant expression was detected in subcutaneous adipose tissue, which was significantly higher than that of the other tissues, and the minimal expression was observed in heart tissue. The higher expression level of ATGL gene in the mammary gland of dairy goats provided the experimental evidence for its function analysis.

【题目】Partial characterization and anti-tumor activity of an acidic polysaccharide from Gracilaria lemaneiformis
【中文关键词】龙须菜;多糖;抗肿瘤;免疫调节
【英文关键词】Gracilaria lemaneiformis; Polysaccharide; Anti-tumor; Immunomodulation
【中文摘要】龙须菜的酸性多糖(GLSPs)的分离与碳水化合物的含量为72.06%和6.13%的硫酸盐含量。 FTIR的GLSPs分析表明,两种典型的吸收出现在1259和804厘米-1被分配到SO和COS债券拉伸。高效凝胶渗透色谱表明分子量GLSPs主要分布在1.37×106沓。 GC分析表明GLSPs被主要由半乳糖,并含有少量的鼠李糖,阿拉伯糖,木糖和甘露糖。此外,ICR小鼠移植H22肝癌细胞中的抗肿瘤和免疫调节作用评价GLSPs的。它表明,GLSPs显着抑制肿瘤的生长,促进脾细胞增殖和巨噬细胞的吞噬能力,并增加了水平的IL-2和CD8 + T细胞的荷瘤小鼠血液中。结果表明,GLSPs显示的显着的抗肿瘤和免疫调节作用,并且它可以提供一个潜在的材料,健康食品和临床药物。
【英文摘要】An acidicpolysaccharide (GLSPs) with carbohydrate content of 72.06% and sulfate content of 6.13% was isolated from Gracilarialemaneiformis. FTIR analysis of GLSPs showed that two typical absorptions appeared at 1259 and 804 cm − 1 were assigned to

SO and COS bonds stretching respectively. HPGPC showed the molecular weight of GLSPs was mainly distributed at 1.37 × 106 Da. GC analysis showed GLSPs was chiefly composed of galactose, and contained a small amount of rhamnose, arabinose, xylose and mannose. Moreover, the anti-tumor and immunomodulatory effects of GLSPs were evaluated in ICR mice transplanted H22 hepatoma cells. It was shown that GLSPs significantly inhibited the growth of tumor, promoted splenocytes proliferation and macrophage phagocytosis, and increased the level of IL-2 and CD8+ T cells in blood of tumor-bearing mice. The results suggested that GLSPs displayed remarkable anti-tumor and immunomodulatory activities, and it may provide a potential material of healthy food and clinical medicines.

【题目】HRM技术在高直链淀粉基因ae筛选中的应用
【中文关键词】淀粉分支酶SBEIIb HRM技术 SNP基因发掘
【英文关键词】无
【中文摘要】操作简单并且成本较低的新型的单核苷酸多态性检测方法的不断创新和应用对于植物功能基因发掘非常重要。基于PCR反应和饱和荧光染料LC-Green发展起来的HRM技术是一种最新的遗传学分析手段。该项技术从2003年发明以来,主要应用于临床疾病的分子诊断和病人基因分型等研究中。本研究在国内率先将HRM技术引入到玉米SNP 筛查研究中。研究中针对高直链淀粉玉米关键基因sebIIb的22个外显子设计17个特异性筛选引物,利用LightScanner分析系统对已建立的Mo17玉米品种的EMS诱变的点突变种子资源库进行高通量筛选,研究从512份试验样本中共筛选获得69个点突变。进一步的生物信息学分析表明这些点突变大多数发生在外显子与内含子交界区域。只有7个点突变存在于外显子上。其中sebIIb第11个外显子的一个点突变导致淀粉分支酶SEBIIb第358位由谷氨酸变化为天冬氨酸。体外酶活实验和籽粒淀粉含量分析表明该突变能够导致淀粉分支酶SBEIIb活性发生变化,进而引起突变体重直链淀粉含量的明显变化。我们的研究结果表明HRM 技术作为一项新型的snp检测方法能够有效的在玉米SNP基因发掘中应用,所获得的ae基因突变体为高直链淀粉玉米的分子育种提供很好的材料来源。

【题目】奶山羊乳腺上皮细胞的分离、培养及鉴定
【中文关键词】奶山羊;乳腺上皮细胞;原代培养
【英文关键词】dairy goat; mammary gland epithelial cell; primary culture
【中文摘要】应用组织块培养法和高密度培养、连续传代法建立西农萨能奶山羊乳腺上皮细胞体外培养体系,通过生长曲线绘制、核型分析、免疫荧光染色(角蛋白、上皮膜抗原、波形蛋白、β-酪蛋白)、油红染色及β-酪蛋白基因的RT-PCR分析进行培养细胞鉴定。实验结果表明细胞生长曲线为典型的S型,染色体数目众数为60,细胞角蛋白、上皮膜抗原、波形蛋白、β-酪蛋白表达均呈阳性,油红染色后可见细胞质内的脂滴,且细胞表达酪蛋白mRNA。说明运用本方法培养的细胞为正常的乳腺上皮细胞,并具有一定的泌乳功能。
【英文摘要】Based on the in vitro culturing system developed for epithelial cells in mammary gland of Xinong Saanen dairy goats using tissue explant culture, high density cultivation, and continuous passaging, the cultured epithelial cells were evaluated by growth curve fitting, karyotype analysis, immunofluorescence staining (keratin, epithelial membrane antigen (EMA), vimentin, β-casein), oil

red staining and RT-PCR of β-casein gene. The results showed that the growth of epithelial cells with the model number of chromosome of 60 demonstrated a typical ‘S’ shape curve, the positive gene expression of keratin, EMA, vimentin and β-casein was detected, the cytoplasmic lipid droplets were observed following the oil red staining, the cultured cells expressed the mRNA of β-casein. In conclusion, the current in vitro culturing system can obtain the normal mammary gland epithelial cells with the function of secretion.

【题目】Identification and characterization of a novel L-arabinose isomerase from Anoxybacillus flavithermus useful in D-tagatose production
【中文关键词】D-塔格糖;L-阿拉伯糖异构酶; Anoxybacillus flavithermus;嗜热;嗜碱酶
【英文关键词】D-tagatose; L-arabinose isomerase; Anoxybacillus flavithermus; Thermophilic; Alkaliphilic enzyme
【中文摘要】D-塔格糖是一个功能很强的罕见的己酮糖,并且已作出了许多尝试,以D-半乳糖转换成D-塔格糖的宝贵使用L-阿拉伯糖异构酶(L-AI)。在这项研究中,高温型品种,拥有L-AI基因分离从温泉污泥,确定为Anoxybacillus flavithermus根据其生理生化特性及系统发育分析其16S rRNA基因。此外,该基因编码L-人工智能从A. flavithermus(AFAI)中克隆和表达在大肠杆菌BL21(DE3),在较高的水平。 L-AI的分子量为55,876沓,最适pH为10.5,温度为95℃。结果表明,转移到由D-半乳糖D-塔格糖的转化平衡,通过提高反应温度和添加硼酸。 A 60%的转化率,D-半乳糖,D-塔格糖的异构化温度为95℃下与硼酸观察。对于D-半乳糖与硼酸盐的催化效率(k(下猫)/ K(米))为9.47 mM的(-1)的分钟(-1)的两倍之多,无硼酸盐。我们的研究结果表明,AFAI是一种新型的超嗜热和嗜碱具有较高的催化效率为D-半乳糖异构酶,表明其用于生产D-塔格糖的巨大潜力。
【英文摘要】D-Tagatose is a highly functional rare ketohexose and many attempts have been made to convert D-galactose into the valuable D-tagatose using L-arabinose isomerase (L-AI). In this study, a thermophilic strain possessing L-AI gene was isolated from hot spring sludge and identified as Anoxybacillus flavithermus based on its physio-biochemical characterization and phylogenetic analysis of its 16s rRNA gene. Furthermore, the gene encoding L-AI from A. flavithermus (AFAI) was cloned and expressed at a high level in E. coli BL21(DE3). L-AI had a molecular weight of 55,876 Da, an optimum pH of 10.5 and temperature of 95 ° C. The results showed that the conversion equilibrium shifted to more D-tagatose from D-galactose by raising the reaction temperatures and adding borate. A 60% conversion of D-galactose to D-tagatose was observed at an isomerization temperature of 95 ° C with borate. The catalytic efficiency (k (cat) /K (m)) for D-galactose with borate was 9.47 mM(-1) min(-1), twice as much as that without borate. Our results indicate that AFAI is a novel hyperthermophilic and alkaliphilic isomerase with a higher catalytic efficiency for D-galactose, suggesting its great potential for producing D-tagatose.

【题目】西农萨能奶山羊LXRα基因的克隆、序列分析及组织表达
【中文关键词】西农萨能奶山羊;LXRα;序列分析;组织表达
【英文关键词】Xinong Saanen Dairy Goat;LXRα;Sequence analysis;Tissue expression
【中文摘要】采集西农萨能奶山羊乳腺组织,利用RT-PCR和RACE技术分离并克隆LXRα基因的cDNA序列。其全长1 654 bp(GenBank收录号为GU332719),包括5′UTR150 bp,CDS1 344 bp和3′UTR160 bp,该基因编码447个氨基酸。经氨基酸序列

分析发现,山羊LXRα与GenBank中牛(Bos taurus)、小鼠(Mus muscu-lus)、褐鼠(Rattus norvegicus)、猪(Sus scrofa)和人(Homosapiens)的LXRα相似性较高,均在90%以上。蛋白质结构分析表明,其蛋白质分子量为50.35 ku,等电点为6.3。具有受体特征结构域:配体结合区域(Lig-and-binding Domain,LBD)、DNA结合区域(DNA-binding Domain,DBD)和锌指蛋白C4型区域(Zinc fingerC4 type,zf-C4)。整个序列具有较强的亲水性且不含信号肽与跨膜结构,该基因定位于细胞核。此外,还通过实时荧光定量PCR(RT-qPCR)技术对LXRα基因进行组织表达分析。在所检测的西农萨能奶山羊11个组织中均有LXRα基因的mRNA存在,其中小肠组织中表达最丰富,乳腺、肝脏、脾脏、皮脂次之,心脏相对最低。

【英文摘要】LXRα(Liver x receptor α)is a key sensor of lipid homeostasis.This experiment was conducted to clone LXRα gene cDNA sequence,to analyze the sequence by biology information analyzing software,and to study the gene expression in differences tissues.In this experiment,RT-PCR and RACE methods were used for the isolation and cloning of the whole cDNA in mammary gland.The length with 1 654 bp(GenBank accession No.GU332719) which contain 150 bp 5′ UTR,1 344 bp CDS and 160 bp 3′ UTR,encoding a protein of 477 amino acid residues.The amino acid of Capra hircus LXRα with high score similarity,more than 90%,compared to Bos taurus,Mus musculus,Rattus norvegicus,Sus scrofa and Homo sapiens in GenBank which was indicated by amino acid sequence alignment.The protein structure analysis showed that the protein molecular weight is 50.35 ku and the isoelectric point is 6.3.It has the characteristic of receptor domain: Ligand-binding Domain(LBD),DNA-binding Domain(DBD) and Zinc finger C4 type(zf-C4).The whole sequence has strong hydrophilic,does not have signal peptide and transmembrane structure,localized in the nucleus.In addition,we also analyzed the tissue expression of LXRα gene through the approach of real-time fluorescence quantitative-PCR(RT-qPCR).The results showed that the mRNA of LXRα gene existed in all the 11 detected organizations with the most abundant expression in small intestine tissue,followed by the mammary gland,liver,spleen and sebum,the minimal expression in heart was observed.

【题目】A novel C-type lectin (Cflec-3) from Chlamys farreri with three carbohydrate-recognition domains
【中文关键词】Wang, Lingling;Song, Linsheng;Zhao, Jianmin;Qiu, Limei;Zhang, Huan;Xu, Wei;Li, Honglei;Li, Chenhua;Wu, Longtao
【英文关键词】Chlamys farreri; C-type lectin; Innate immunity; Bacterial agglutination; Recombinant expression; Real-time RT-PCR
【中文摘要】 C-type lectins are a superfamily of carbohydrate-recognition proteins which play crucial roles in the innate immunity. In this study, the gene of a C-type lectin with multiple carbohydrate-recognition domains (CRDs) from scallop Chlamys farreri (designated as Cflec-3) was cloned by rapid amplification of cDNA ends (RACE) approach based on expression sequence tag (EST) analysis. The full-length cDNA of Cflec-3 was of 2256 bp. The open reading frame encoded a polypeptide of 516 amino acids, including a signal sequence and three CRDs. The deduced amino acid sequence of Cflec-3 showed high similarity to members of C-type lectin superfamily. By fluorescent quantitative real-time PCR, the Cflec-3 mRNA was mainly detected in hepatopancreas, adductor, mantle, and marginally in gill, gonad and hemocytes of healthy scallops. After scallops were challenged by Listonella anguillarum, the mRNA level of Cflec-3 in hemocytes was up-regulated and was significantly higher than that of blank at 8 h and 12 h post-challenge. The function of Cflec-3 was investigated by recombination and expression of the cDNA fragment encoding its mature peptide in Escherichia coli BL21 (DE3)-pLysS. The recombined Cflec-3 (rCflec-3) agglutinated Gram-negative bacteria Pseudomonas stutzeri. The agglutinating activity was calcium-dependent and could be inhibited by D-mannose. These results collectively suggested that Cflec-3 was involved in the immune response against microbe infection and contributed to nonself-recognition and clearance of bacterial pathogens in scallop. 【英文摘要】A high-quality cDNA library was constructed from whole body tissues of the zhikong scallop, Chlamys farreri, challenged by Listonella anguillarum. A total of 5720 clones were sequenced, yielding 5123 expressed sequence tags (ESTs). Among the 3326 unique genes identified, 2289 (69%) genes had no significant (E-value < 1e-5) matches to known sequences in public databases and 194 (6%) matched proteins of unknown functions. The remaining 843 (25%) genes that exhibited homology with genes of known functions, showed broad involvement in metabolic processes (31%), cell structure and motility (20%), gene and protein expression (12%), cell signaling and cell communication (8%), cell division (4%), and notably, 25% of those genes were related to immune function. They included stress response genes, complement-like genes, proteinase and proteinase inhibitors, immune recognition receptors and immune effectors. The EST collection obtained in this study provides a useful resource for gene discovery and especially for the identification of host-defense genes and systems in scallops and other molluscs. 【题目】Polysaccharides from Lycium barbarum leaves Isolation, characterization and splenocyte proliferation activity
【中文关键词】枸杞叶; 多糖; 结构表征; 脾细胞增殖
【英文关键词】Lycium barbarum leaves; Polysaccharide; Structure characterization; Splenocyte proliferation
【中文摘要】在以前的出版物,枸杞多糖的成果已得到相当的重视,但多糖的叶子鲜有报道。在目前的工作中,水溶性多糖成分分离枸杞叶,枸杞多糖,枸杞多糖LBP-I-II-III和LBP-IV通过DEAE-葡聚糖凝胶A-25纯化。 LBP-II和LBP-IV分别显示一个对称峰HPGPC与均分子量为9.39×104 Da和4.18×105沓。两个组分的UV和IR分析表明结合的多肽或蛋白质的酸性多糖的特性。 GC分析表明,LBP-IV主要由鼠李糖,阿拉伯糖,木糖,半乳糖和葡萄糖的摩尔比为1.61:3.82:3.44:7.54:1.00,和糖醛酸的含量为47.68%(w / w的)由硫酸确定-咔方法。 1 H和13 C NMR谱的LBP-IV也表明,存在的羰基上的碳原子和5个异头碳原子的,并建议有可能是该馏分中的α-和β-端基异构体的配置。此外,脾细胞增殖活性检测表明,LBP-IV显着增强了ConA或LPS刺激的小鼠脾淋巴细胞的增殖,说明部分的有益的免疫刺激活性的影响。
【英文摘要】The polysaccharides from the fruits of Lycium barbarum have received considerable attention in previous publication, but the polysaccharides from the leaves were rarely reported. In the present work, four water-soluble polysaccharide fractions: LBP-I, LBP-II, LBP-III and LBP-IV isolated from L. barbarum leaves were purified through DEAE-Sephadex A-25. LBP-II and LBP-IV respectively showed one symmetrical peak on HPGPC with average molecular weight of 9.39×10^4 Da and 4.18×10^5 Da. UV and IR analysis of the two fractions showed the characteristics of acidic polysaccharides combined with polypeptides or proteins. GC analysis showed LBP-IV was mainly composed of rhamnose, arabinose, xylose, glucose and galactose with molar ratio of 1.61:3.82:3.44:7.54:1.00, and the uronic acid content was 47.68% (w/w) determined by sulfuric acid-carbazole method. ^{1}H and ^{13}C NMR spectra of LBP-IV also showed the presence of carboxyl carbon and five anomeric carbons, and suggested there may be both α- and β-anomeric configurations in this fraction. Moreover, splenocyte proliferation activity assay showed that LBP-IV significantly enhanced the proliferation of splenocyte stimulated by ConA or LPS, indicating the fraction has the beneficial effect on immunostimulating activity.

【题目】Up regulation of annexin A2 on murine H22 hepatocarcinoma cells induced by cartilage polysaccharide
【中文关键词】软骨多糖,H22肝癌细胞,肿瘤免疫,膜联蛋白A2
【英文关键词】Cartilage polysaccharide; H22 hepatocarcinoma cells; Tumor immunity; Annexin A2
【中文摘要】在这项研究中,我们研究了H22肝癌细胞诱导软骨多糖制备肿瘤疫苗的抗肿瘤作用。我们发现有从免疫小鼠血清中的抗原特异性抗体的结合的特异性抗原。免疫印迹分析结果显示,约36 kDa的特异性抗体的免疫小鼠的抗血清特异性抗体的出现,在诱导时间为48小时,而最佳的免疫效果变得清晰可见。二维电泳分析识别特定的抗原,这是一个糖基化蛋白,含有一个糖基化位点的发生,癌症的发展,侵袭和转移密切相关,膜联蛋白A2。蛋白质组学研究表明,无论是数量和构象改变软骨多糖诱导后,膜联蛋白A2。最后,我们发现,H22细胞诱导软骨多糖膜联蛋白A2基因有大幅增加。总之,我们的数据表明,膜联蛋白A2,一个特定的抗原发挥了关键作用,在抗肿瘤免疫反应,激活免疫系统。这将是一个潜在的类型的肿瘤疫苗,肿瘤免疫预防提供了新的思路。
【英文摘要】In this study, we investigated the antitumor effect of a tumor vaccine prepared from H22 hepatocarcinoma cells induced by cartilage polysaccharide. We found out there were specific antigens which combined with antigen-specific antibodies from immune murine serum. Results of western blot analysis showed that about 36 kDa make specific antibodies appeared specific antibodies in antiserum of immune mice, whereas the best immune effects became visible at the induction time of 48 h. Analyses of 2-dimensional electrophoresis identified the specific antigen was annexin A2, which was a glycosylated protein that contained a glycosylation site, closely related to oncogenesis, cancer development, invasion and metastasis. Proteomics indicated that both quantity and conformation of annexin A2 were changed after induced by cartilage polysaccharide. Lastly, we found there was a major increase of annexin A2 mRNA on H22 cells induced by cartilage polysaccharide. In summary, our data suggested that annexin A2, a specific antigen played a key role in antitumor immune response and activating the immune system. It would be a potential type of tumor vaccine which provided new ideas for tumor immunoprophylaxis.

【题目】A D-galactose-Binding Lectin with Mitogenic Activity from Musca domestica Pupae
【中文关键词】糖蛋白,凝集素,纯化,促有丝分裂,家蝇蛹
【英文关键词】glycoprotein, lectin, purification, mitogenic, Musca domestica pupae
【中文摘要】从家蝇中分离出一种具有促有丝分裂活性的凝集素,此凝集素分子质量为55kDa,纯化过程主要采用半乳糖凝胶-4B色谱层析法。家蝇凝集素使接受胰岛素治疗的兔血细胞发生凝集,实验发现D-半乳糖能够抑制凝集素的红血球凝集作用,此家蝇凝集素具有金属依赖性和温度依赖性,通过糖原染液检测得到此家蝇凝集素为一种糖含量为2.1%的糖蛋白。使用原子力显微镜观察得到:此凝集素是一个75nm大小的球型蛋白,表面具有几个糖链。它能引起小鼠的脾细胞的体外有丝分裂反应,当凝集素的浓度为20μg/mL时脾细胞的有丝分裂达到最大值。目前还没有相关此类家蝇蛹凝集素的报道,我们发现的这一凝集素在昆虫免疫以及免疫低下疾病方面将会有很重大的意义。
【英文摘要】A lectin with potent mitogenic activity was isolated from Musca domestica pupae. The lectin was a monomer with a molecular weight of 55 kDa. The purification procedure mainly involved affinity chromatography on galactose-Sepharose-4B. The lectin agglutinated trypsin-treated rabbit blood cells. D-galactose was detected to inhibit the lectin ’s hemagglutination activity. The lectin was metal independent and temperature dependent and was detected by the periodic acid-Shiff reaction to be a glycoprotein with a carbohydrate content of 2.1%. Observations with an atomic force microscope indicated that the lectin was a globular protein about 75 nm in size, with several carbohydrate chains linked to it. It elicited a mitogenic response from mouse splenocytes in vitro, with the maximal response at a concentration of 20 g/ml. No lectin has been reported before from Musca domestica pupae, and the lectin we discovered could be of great importance in insect immunity and hypoimmune diseases.

【题目】Administration of Vitamin E prevents thymocyte apoptosis in murine sarcoma S180 tumor bearing mice
【中文关键词】维生素E,活性氧,S180荷瘤小鼠,胸腺退化,细胞凋亡
【英文关键词】Vitamin E, reactive oxygen species, S180 tumor bearing mice, thymic involution, apoptosis
【中文摘要】许多报道称,胸腺退化发生在肿瘤的宿主,而导致减少T细胞的增殖和免疫系统受损。在这项研究中,小鼠肉瘤(S180)的肿瘤细胞被用来建立肿瘤模型。 3周后肿瘤接种的S180荷瘤宿主胸腺细胞凋亡的不同。高水平活性氧的产生,检测在S180肿瘤承载胸腺。一种强力抗氧化剂,维生素E,S180荷瘤小鼠口服给药,以消除多余的ROS在主机和评估对胸腺细胞凋亡的影响。完整的胸腺结构和胸腺细胞凋亡的证明,VE治疗3周后在S180荷瘤小鼠的胸腺部分恢复。此外,VE治疗规范化的ROS水平,丙二醛(MDA)水平和超氧化物歧化酶(SOD)水平的S180肿瘤承载。因此,可以得出结论,VE治疗S180荷瘤小鼠的胸腺退化防止,主要是由于胸腺细胞凋亡的抑制和消除活性氧生产中的主机。
【英文摘要】Many reports claimed that thymic involution occurred in tumor bearing host, which led to a reduction of proliferation in T cells and an impaired immune system. In this study, murine sarcoma S180 tumor cells were used to establish tumor model. There was distinct apoptosis in thymus of the S180 tumor bearing host after 3-week tumor inoculation. High level reactive oxygen species generation was detected in thymocytes of S180 tumor bearers. Vitamin E, a potent antioxidant, was oral administrated to S180 tumor bearing mice in order to eliminate redundant ROS in the host and evaluate the effect against thymic apoptosis. Intact thymic structure and less apoptosis of thymocytes demonstrated that partial restoration of thymuses in S180 tumor bearing mice after 3-week VE treatment. Besides, VE treatment normalized ROS level, MDA level and SOD level of S180 tumor bearers. Thus, it could be concluded that thymic involution prevented by VE treatment in S180 tumor bearing mice was mainly due to inhibition of apoptosis in thymus and elimination of ROS over-production in the host.

【题目】Superoxide Dismutase Induced G1-Phase Cell Cycle Arrest in Murine Sarcoma S180 Tumor Cells
【中文关键词】超氧化物歧化酶;超氧阴离子;S180肿瘤细胞;细胞周期阻滞;抗肿瘤
【英文关键词】superoxide dismutase; superoxide anion; S180 tumor cells; cell cycle arrest; antitumor
【中文摘要】作为一个高效率的活性氧物种的清除酶,超氧化物歧化酶(SOD)已经显示出抑制肿瘤的生长和癌细胞的运动和侵袭干扰。在这项研究中,细胞周期阻滞的分子机制时,S180肿瘤细胞暴露于高浓度的超氧化物歧化酶的影响。在这里,两种小鼠肉瘤S180肿瘤细胞和NIH-3T3小鼠成纤维细胞,分别用不同浓度的Cu / Zn-SOD为24,48和72 h,以确定最佳浓度为800 U / ml的SOD超氧化物歧化酶(SOD)的剂量,这是48小时。它的发现,超氧化物歧化酶诱导S180细胞周期停滞在G1期超生产水平下降,而SOD NIH-3T3细胞增殖的影响较小。此外,在S180肿瘤细胞的增殖细胞核抗原(PCNA)的表达率抑制超氧化物歧化酶治疗后,这表明抑制S180细胞的DNA合成。此外,有显着下降,法规的cyclin-E和CDK-2 S180细胞超氧化物歧化酶治疗后,造成的堵塞S180细胞周期G1/ S过渡。总之,我们的数据证实,SOD能显着抑制S180肿瘤细胞的增殖和诱导细胞周期停滞在G1相通过下调细胞周期蛋白E和CDK-2的表达。
【英文摘要】As an efficient reactive oxygen species-scavenging enzyme, superoxide dismutase (SOD) has been shown to inhibit tumor growth and interfere with motility and invasiveness of cancer cells. In this study, the molecular mechanisms of cell cycle arrest when S180 tumor cells were exposed to high levels of SOD were investigated. Here, both murine sarcoma S180 tumor cells and NIH-

3T3 mouse fibroblasts were respectively treated with varying concentrations of Cu/Zn-SOD for 24, 48 and 72 h to determine optimal dose of SOD, which was a concentration of 800 U/ml SOD for 48 h. It is found that SOD induced S180 cell cycle arrest at G1-phase with decreasing level of superoxide production, whereas SOD had less effect on proliferation of NIH-3T3 cells. Moreover, the expression rate of Proliferating Cell Nuclear Antigen (PCNA) in S180 tumor cells was suppressed after SOD treatment, which indicated the inhibition of DNA synthesis in S180 cells. Besides, there were significant down-regulations of cyclin-E and Cdk-2 in S180 cells after SOD treatment, which contributed to the blockage of G1/S transition in S180 cell cycle. Together, our data confirmed that SOD could notably inhibit proliferation of S180 tumor cell and induce cell cycle arrest at G1-phase by down-regulating expressions of cyclin-E and Cdk-2.

【题目】猪软骨多糖与H22鼠肝癌细胞共培养物对小鼠体液免疫保护作用的研究

【中文关键词】猪软骨多糖;免疫佐剂;体液免疫

【英文关键词】cartilage polysaccharide;immuno-adjuvant;humoral immunity

【中文摘要】本试验以猪软骨多糖与H22 鼠肝癌细胞的共同培养物(PS&H22)为研究对象,探讨其对小鼠体液免疫的影响。结果表明:PS&H22 组小鼠的生命延长率和存活率极显著高于模型组($P < 0.01$); 免疫荧光检测结果显示PS&H22 免疫小鼠血清可与H22 细胞发生特异性结合,说明免疫小鼠体内存在抗H22 细胞特异性抗体;ELISA 检测表明PS&H22 免疫小鼠抗体效价大于12800,进一步证明免疫小鼠血清中抗体含量高,且其抗肿瘤体液免疫得到增强。

【英文摘要】This experiment was conducted to study the effects of co-culture of cartilage polysaccharide and H22 cells by murine liver cancer immunoprophylaxis (PS&H22) on mice humoral immunity. The results showed that:the life span rate and survival rate of PS&H22 immunized group was significantly higher than the others($P < 0.01$);the specific binding of antiserum and antigen was found by immunofluorescent staining,which confirmed that the anti-H22 cell antibody existed in the immunized mice;the antibody titer of immunized mice serum was over 12800 detected by ELESA assay. The high antibody titer suggested that the humoral immunity on anticancer was strengthened.

【题目】猪软骨多糖作为免疫佐剂的肝癌疫苗激发抗肿瘤细胞免疫
【中文关键词】猪软骨多糖;免疫佐剂;肝癌疫苗;细胞免疫
【英文关键词】cartilage polysaccharide; immunoadjuvant; hepatocarcinoma vaccine; cell immunity
【中文摘要】探讨以猪软骨多糖作为免疫佐剂的肝癌疫苗对小鼠细胞免疫抗肿瘤的影响。以猪软骨多糖作为免疫佐剂,采用共同培养的方法制备小鼠肝癌H22 细胞全细胞肝癌疫苗,免疫小鼠后,分别以脾淋巴细胞、巨噬细胞为对象检测肝癌疫苗对小鼠机体细胞免疫的影响。结果表明,以猪软骨多糖为免疫佐剂的全细胞肝癌疫苗能明显刺激脾淋巴细胞活化、增强巨噬细胞的吞噬能力。以猪软骨多糖为免疫佐剂的肝癌疫苗能增强机体的细胞免疫,为软骨多糖用于肿瘤的免疫治疗和免疫预防提供了试验依据,为进一步的临床免疫治疗肿瘤奠定了基础。
【英文摘要】The anti-tumor cell-depended immunity response to hepatocarcinoma vaccine treated with cartilage polysaccharide as immunoadjuvant was investigated in this paper. H22 cells treated with cartilage polysaccharide were used as hepatocarcinoma vaccine to immunize KM mice. Lymphocyte and phagocytosis of macrophage were proliferated to test the cell immunity induced by the vaccine. Results showed that vaccine treated with cartilage polysaccharide can enhance lymphocyte and macrophage mediated immunity. The vaccine with cartilage polysaccharide as immunoadjuvant may play an important role in inducing anti-tumor cell immunity response, which provided a foundation for immuotherapy or immunoprophylaxis of tumor in clinic.

【题目】Molecular Characterization of multi-functional Acetyl Coenzyme A Carboxylase, Biotin Carboxylase and β-Carboxyltransferase from Arachis hypogaea L.
【中文关键词】无
【英文关键词】Arachis hypogaea; Acetyl-CoA carboxylase;
sequence analysis; phylogenetic analysis
【中文摘要】无
【英文摘要】Acetyl-CoA carboxylase (ACCase; EC6.4.1.2) catalyzes the synthesis of malonyl-CoA, thefirst intermediate in fatty acid synthesis. Genes formulti-functional acetyl-CoA carboxylase and twosubunits of multi-subunit acetyl-CoA carboxylase,biotin carboxylase and β-Carboxyltransferase,have been cloned from peanut. The ORF of thethree proteins are 6783bp, 1623bp, 1479 bp inlength, encoding 2260, 540, 492 amino acids,respectively. The predicted amino acid sequencesof the multi-functional AhACCase and AhBC frompeanut shared high sequence identity, 90.9% and88%, to the corresponding Glycine max proteins,respectively, while the amino acid sequence ofAhβCT gene showed 71.6% identity with that fromNothofagus gunnii. Phylogenetic analysis showedthat all of these three genes from peanut weregrouped into the big branch of proteins fromhigher plant. Moreover, observation of the treerevealed that multi-functional ACCase genes mayarise by independent gene duplication events ingreen algae and higher plants branches, and thebiotin carboxylase and β-Carboxyltransferasegenes from cyanobacteria may be the origin ofgenes from higher plants, mosses and eukaryoticalgae.

【题目】Isolation, characterization and expression analysis of stearoyl-ACP desaturase gene from Kosteletzkya virginica
【中文关键词】无
【英文关键词】Stearoyl-ACP desaturase, gene isolation, sequence
analysis, expression analysis, Kosteletzkya virginica
【中文摘要】无
【英文摘要】Kosteletzkya virginica is a halophyte species which could be used for production of industrial raw material such as biodiesel and for developing ecologically sound saline agriculture as well as for tideland soil improving. Using Rapid Amplification of cDNA Ends (RACE) method, a 1610 bp cDNA of stearoyl-ACP desaturase (SAD) gene containing a 1188 bp complete open reading fragment (ORF) was firstly isolated from seeds of K. virginica. Sequence analysis revealed that the nucleotide sequence of K. virginica SAD had a high level of homology to SAD from Gossypium hirsutum, but had relative low identity to SAD from other pants. However, K. virginica SAD had a high level of amino acid sequence homology to SAD from other plants. Characteristics of the deduced protein were predicted and analyzed using bioinformatic methods. Expression analysis via real-time PCR indicated that expression levels of the SAD gene were markedly distinct in different K. virginica tissues and different development stage seeds. The results of the expression analysis in this study, combined with existing research, suggest that SAD may be involved in the regulation of plant seed growth and development. These results serve as a foundation for further studies of the mechanisms regulating SAD gene expression and could eventually lead to the development of higher quality K. virginica varieties.

【题目】Molecular cloning, characterization and expression analysis of b-ketoacyl-ACP synthetase II gene from peanut
【中文关键词】无
【英文关键词】β-ketoacyl-ACP synthetase II, RACE, sequence
analysis, expression analysis, peanut (Arachis hypogaea L.)
【中文摘要】无
【英文摘要】β-ketoacyl-ACP synthetase II (KAS II) which catalyzesthe elongation of 16:0-ACP to 18:0-ACP,determines theratio of palmitic acid (16:0) to stearic acid (18:0). UsingRapid Amplification of cDNA Ends (RACE) and a peanutcDNA library we had previously constructed, we isolated a1867bp cDNA of the KAS II gene containing a 1212bpcomplete open reading fragment (ORF). Sequence analysisrevealed that peanut KAS II had a high level of nucleotideand amino acid sequence homology to KAS II from otherplants. Phylogenetic analysis showed that KAS II fromplants, bacteria and virus were grouped into different cladesrespectively suggesting the independent evolution of KAS IIfrom different sources. Characteristics of the deducedprotein were predicted and analyzed using bioinformaticmethods. The protein was predicted as stable andhydrophobic with molecular weight of 43181.4 andtheoretical PI of 5.69. Expression analysis by real-time PCRindicated that expression levels of KAS II gene weremarkedly distinct in different peanut tissues and varieties.The expression analysis in this study combined with existingresearches suggested KAS II may be involved in theregulation of plant growth and development.

【题目】AhZFP1, a cDNA encoding C2H2-type zinc finger protein, induced by salt stress in peanut (Arachis hypogaea L.)
【中文关键词】无
【英文关键词】Peanut; C2H2-type zinc finger
protein; Gene cloning and expression; Salt stress
【中文摘要】无
【英文摘要】The plant C2H2-type zinc finger proteinsplay important roles in plant tolerance to abioticstresses. In this study, we isolated the full-lengthcDNA of a C2H2-type zinc finger protein geneAhZFP1 from peanut (Arachis hypogaea L.). AhZFP1encodes a 24.75kDa protein with two C2H2-type zincfinger domains. Phylogenetic analysis showed that theAhZFP1 was close to Arabidopsis zinc finger proteinAZF2. The semi-quantitative RT-PCR assay revealedthat the expression of AhZFP1 was induced by saltstress in peanut roots, stems and leaves. AhZFP1 wasthe first C2H2-type zinc finger protein gene reported inpeanut.

【题目】Cloning, characterization and expression analysis of a stearoyl-ACP desaturase gene from Arachis hypogaea
【中文关键词】无
【英文关键词】Stearoyl-ACP desaturase, gene cloning, sequence
analysis, expression analysis,peanut (Arachis hypogaea L.)
【中文摘要】无
【英文摘要】Stearoyl-ACP desaturase (SAD), which catalyzes the first desaturation reaction of the most common pathway of unsaturated fatty acid synthesis in plants, plays a key role in determining the ratio of saturated to unsaturated fatty acids. Using rapid amplification of cDNA ends (RACE) and a peanut cDNA library we had previously constructed, we isolated a 1499 bp cDNA of the SAD gene containing a 1218 bp complete open reading fragment (ORF). Sequence analysis revealed that peanut SAD had a high level of nucleotide and amino acid sequence homology to SAD from other plants. Characteristics of the deduced protein were predicted and analyzed using bioinformatic methods. Phylogenetic analysis showed that three different types of delta-9 fatty acid desaturases form separate clades, indicating that the three isozymes may have evolved independently. Expression analysis via real-time PCR indicated that expression levels of the SAD gene were markedly distinct in different peanut tissues and varieties. The results of the expression analysis in this study, combined with existing research, suggest that SAD may be involved in the regulation of plant seed growth and development.

【题目】Identification of AhAQ1 encoding a putative aquaporin whose expression is regulated by salt stress in peanut (Arachis hypogaea

【中文关键词】无
【英文关键词】Peanut; Aquaporin; Gene cloning; Expression analysis; Salt stress
【中文摘要】无
【英文摘要】The primary role of aquaporins is to control water transport in plants, which might function in plant response against salt stress. In this research, we obtained the full-length cDNA of an aquaporin gene AhAQ1 by RT-PCR approach from salt-stressed peanut leaves. AhAQ1 encodes a protein consisting of 287 amino acids with the calculated molecular mass of 30.57 KD and the isoelectric point of 9.04. Sequence analysis indicated that AhAQ1 contained six transmembrane domains and two NPA-boxes and phylogenetic analysis showed that the AhAQ1 clusters were the same with the PIP1 family. The expression pattern of AhAQ1 in peanut tissues under high-salt treatment was examined by semi-quantitative RT-PCR, The results showed that the accumulation of AhAQ1 transcripts was induced by salt stress . The combination of these results illustrate that AhAQ1 may play a role in peanut in response to salt stress.

【题目】Comparison of the Δ12 fatty acid desaturase gene between high-oleic and normal-oleic peanut genotypes
【中文关键词】无
【英文关键词】peanut; 12 fatty acid desaturase; oleic acid; yeast expression; function identification
【中文摘要】无
【英文摘要】12 fatty acid desaturase gene has been targeted as a logical candidate controlling the high oleate trait in peanut seeds. By RT-PCRmethod, the full-length cDNAs of 12 fatty acid desaturase gene were isolated from peanut (Arachis hypogaea L.) genotypes with normaland high ratio of oleic to linoleic acid, which were designated AhFAD2B and AhFAD2B', respectively. Sequence alignment of their codingregions revealed that an extra A was inserted at the position +442 bp of AhFAD2B' sequence of high oleic acid genotypes, which resultedin the shift of open reading frame and a truncated protein AhFAD2B', with the loss of one histidine box involved in metal ion complexrequired for the reduction of oxygen. Analysis of transcript level showed that the expression of 12 fatty acid desaturase gene in high oleicacid genotype was slightly lower than that in normal genotype. The enzyme activity experiment of yeast (Saccharomyces cerevisiae) celltransformed with AhFAD2B or AhFAD2B' proved that only AhFAD2B gene product showed significant 12 fatty acid desaturase activity,but AhFAD2B' gene product did not. These results suggested that the change of AhFAD2B' gene sequence resulted in lower activity ordeactivation of 12 fatty acid desaturase in high oleic acid genotype.

【题目】花生EST-SSR分子标记的开发
【中文关键词】花生 EST SSR 频率 特点
【英文关键词】Peanut EST SSR Frequency Characteristics
【中文摘要】利用NCBI的Genbank数据库中公布的花生53177条EST序列以及本实验室创造的花生栽培品种E12(Arachis hypogaea L.)所构建的Unigene文库中的4074条EST序列,对这些序列进行前期处理(去除冗余序列,对含有重叠区域的EST序列进行拼接),总共获得非冗余且拼接较长的序列11260条。通过软件分析发现两个EST库中共包含有1323个SSR位点,主要是2个和3个核苷酸重复,除此之外也有少量的4核苷酸重复以及复合重复。这些EST—SSR平均长度为18.88bp,平均每8.5条EST序列就包含有一个SSR位点。其中AG/TC、CTr/GAA重复出现的频率最大,分别占到2个核苷酸重复和3个核苷酸重复的39.3%和22.6%。
【英文摘要】53 177 ESTs from Genbank database in NCBI and 4 074 ESTs from Unigene library of El2 (Arachis hy- pogaea L.) in our laboratory are analysed. Totally 11 260 non-redundant ESTs contigs are detected. 1 323 SSR loci are searched by software analysis in NCBI database and Unigene library, mainly di-and tri-nucleotide repeat motif except of few tetra-nucleotide repeat motif and compound repeat. In these EST-SSR loci, average length is 18.88 bp and average 8.5 ESTs contain one SSR loci. The AG/TC and CTF/GAA motif are most frequent types, accounting for 39.3 % and 22.6% in dinucleotide and trinucletide repeats, respectively.

【题目】花生△12-脂肪酸脱氢酶基因的克隆及序列分析
【中文关键词】花生,脂肪酸脱氢酶,基因克隆,序列测序
【英文关键词】peanut, fatty acid desaturase, gene cloning, sequence analysis
【中文摘要】花生是重要的油料作物,富含优质蛋白和脂肪,是人们健身增寿的食疗保健佳品。花生仁中含脂肪50%左右,其中大约80%由油酸和亚油酸组成。油酸在人体的脂类代谢中发挥着特殊的作用,它可以降低有害胆固醇(低密度脂蛋白,LDL),但保持有益胆固醇(高密度脂蛋白,HDL)的水平,从而减缓动脉粥样硬化,有效预防冠心病等心血管疾病的发生[1,2]。而亚油酸为多不饱和脂肪酸,虽能降低有害胆固醇但也能降低有益胆固醇的含量,因而对健康不利[3,4]。而且油酸与亚油酸比值的高低决定了花生的品质性状。油酸与亚油酸的比值高,抗氧化能力就强,在夏季高温的情况下不易氧化酸败,货架周期较长,耐储能力也较强[8]。因此,油酸含量高的花生品种具有更好的商品性。提高油酸的相对含量,增加油酸/亚油酸(O/L)的比值,已成为目前油料作物品质改良育种的研究重点。脂肪酸脱氢酶在生物体内对脂肪酸代谢、维持膜结构和生物学功能方面起着重要作用[5]。植物在质体和内质网上都含有脂肪酸脱氢酶,这些脱氢酶具有位置特异性和底物特异性[6,7]。△12-脂肪酸脱氢酶是油酸脱氢形成亚油酸的关键酶,在油酸的△12位上加上一个双键形成亚油酸。
【英文摘要】To study the function of peanut△12-fatty acid dc}}tut"ase,the fatty一fenRh cC3 IA of AhF"AD was amplified 6y RAC1:: from peanut seed. Sequence analysis found that the open reading frame encodes a proteia with 379 amiac3 acids and the ntalecutar weight of deduced [trotein of AhFAf) wap 43 kI)a. C)ne highly conserved feature of ail snens6ranrbound de'aturxses was the prcsenee pf three histidine boxes, with the general sequence HXXXH. Z'he hydrophobicity analysis showed shat the sequrace of the encoded amino acids had two hydraphof,ic structures sharinq the characteristics of membranranchured protein, which totally crossed the membrane four times. These analyses revealed the obtained ser}vance was x712-fatty acid dc"saturase.

【题目】Cr3+对盐藻生长的影响及其在细胞中的富集和分布
【中文关键词】盐藻;Cr3+;细胞形态;富集;分布
【英文关键词】Dunaliella salina, Cr3+; cell morphology; accumulation; distribution
【中文摘要】本文研究了Cr3+对盐藻生长和细胞形态的影响,并对其在盐藻中的富集和在盐藻主要大分子化合物中的分布进行了探索和分析。结果表明,低浓度的Cr3+促进盐藻的生长,而高浓度的Cr3+对其生长产生抑制作用,并对盐藻细胞形态产生不良影响。CrCl3·6H2O 浓度为2 mg/L 时,Cr3+对盐藻生长和Cr3+富集均产生促进作用,其富集量达到779.64 μg/g,富集率达到85.27%。实验结果还表明,铬跟盐藻中主要大分子化合物都有结合作用,而且主要与多糖结合。
【英文摘要】In this research, the effects of Cr3+ on the growth and morphology of Dunaliella salina was studied and the accumulation and distribution of Cr3+ in the macromolecular compounds within D. salina were also investigated. The results showed that low concentration of Cr3+ could promote the growth of D. salina. In contrast, the high concentration of Cr3+ not only inhibited the D. salina growth, but also had detrimental impacts on cell morphology. When the concentration of Cr3+ was 2 mg/L, both the D. salina growth and accumulation of Cr3+ were promoted, where the accumulation quantity and accumulation rate of Cr3+ reached 779.64 μg/g and 85.27%, respectively. It was also demonstrated that Cr3+ mainly combined with macromolecular compounds within D. salina, in particular polysaccharides.

【题目】ROS-Ca2+ is associated with mitochondria permeability transition pore involved in surfactin-induced MCF-7 cells apoptosis
【中文关键词】surfactin,MPTP,Ca2+,ROS
【英文关键词】Surfactin,MPTP,Ca2+,ROS
【中文摘要】Surfacin能够抑制肿瘤细胞增殖和诱导细胞凋亡。Surfactin能够通过线粒体途径诱导MCF-7的凋亡。但是这方面的分子机制需要探明。本文中,ROS和Ca2+在MTPT上的功能,还有surfactin诱导MCF-7凋亡的功能被研究了。Surfactin能够提高线粒体内的ROS水平,且ROS的抑制剂NAC能够抑制肿瘤细胞的凋亡。Surfactin诱导肿瘤细胞凋亡,胞内的钙离子水平出现了明显的升高,并且钙离子的抑制剂BAPTA-AM能够抑制肿瘤细胞的凋亡。然后我们研究了ROS和Ca2+之间的关系。结果显示,surfactin能够诱导了ROS水平,出现PT孔开放,出现线粒体膜电位的崩塌。线粒体的变化导致了钙离子的外流,这样的钙离子外流能够被BAPTA-MA所抑制。细胞色素C从线粒体中释放出来,激活caspase-9,诱导细胞凋亡。结果表明,surfactin能够抑制肿瘤细胞的凋亡,但是对正常细胞并没有毒性作用
【英文摘要】The surfactin can inhibit proliferation and induce apoptosis in cancer cells. Moreover, surfactin can induce cell death in human breast cancer MCF-7 cells through mitochondrial pathway. However, the molecular mechanism involved in this pathway remains to be elucidated. Here, the reactive oxygen species (ROS) and Ca2+ on mitochondria permeability transition pore (MPTP) activity, and MCF-7 cell apoptosis which induced by surfactin were investigated. It is found that surfactin evoked mitochondrial ROS generation, and the surfactin-induced cell death was prevented by N-acetylcysteine (NAC, an inhibitor of ROS). An increasing cytoplasmic Ca2+ concentration was detected in surfactin-induced MCF-7 apoptosis, which was inhibited by 1,2-bis (2-aminophenoxy) ethane-N,N,N_,N_-tetraacetic acid (BAPTA-AM, a chelator of calcium). In addition, the relationship between ROS generation and the increase of cytoplasm Ca2+ was determined. The results showed that surfactin initially induced the ROS formation, leading to the MPTP opening accompanied with the collapse of mitochondrial membrane potential (__m). Then the cytoplasmic Ca2+ concentration increased in virtue of the changes of mitochondrial permeability, which was prevented by BAPTA-AM. Besides, cytochrome c (cyt c) was released from mitochondria to cytoplasm through the MPTP and activated caspase-9, eventually induced apoptosis. In summary, surfactin has notable anti-tumor effect on MCF-7 cells, however, there was no obvious cytotoxicity on normal cells.

【题目】A lectin from Musca domesticapupae stimulates B cell proliferation and enhances IL-12 production via ERK1/2-NF-jB signaling pathways
【中文关键词】B细胞,IL-12,凝集素,家蝇蛹
【英文关键词】B cell, Interleukin-12, Lectin, Musca domestica pupa
【中文摘要】从家蝇中提取的D-半乳糖凝集素,大小40kDa,命名为MPL。MPL能够明显的提高B细胞的增殖,并且增强了IL-12的分泌,并且呈现剂量效应。MPL能够刺激IkB-α的降解,NF-kB的入核和ERK的磷酸化,ERK在NF-kB的上游在MPL刺激的B细胞中。此外,MPL能够通过ERK1/2-NF-kB信号通路来调节细胞增殖和诱导IL-12分泌。
【英文摘要】A D-galactose-specific lectin, MW = 40 kDa, had been purified from pupae of Musca domestica (MPL). MPL significantly promoted the proliferation of B cells and enhanced the production of IL-12 in a dose-dependent manner. MPL stimulated IjB-a degradation, NF-jB translocation and ERK1/2 phosphorylation which played an upstream role for NF-rB in MPL-induced B cells. Moreover, MPL regulated cell proliferation and induced IL-12 production through ERK1/2-NF-jB signaling pathway.

【题目】古尼虫草多糖提取分离及初步分析
【中文关键词】古尼虫草;多糖;提取;纯化
【英文关键词】Cordyceps gunnii (Berk.) Berk.; Polysaccharide; extraction; purification
【中文摘要】本文用30%乙醇溶液作提取剂,从古尼虫草菌丝体中提取多糖,提取液经去脂、去蛋白、醇析后得两种粗多糖CPS-50,CPS-70。利用DEAE-Sephadex A-25柱色谱对两种粗多糖进行分离纯化,得纯多糖CPS-1,CPS-2。苯酚-硫酸法测定糖含量,紫外光谱分析证明其纯度,红外光谱显示其具有多糖类的特征吸收峰。多糖降解后经薄层分析表明,降解的虫草多糖由葡萄糖或(和)甘露糖组成。
【英文摘要】Two crude polysaccharides, CPS-50 and CPS-70, were extracted from the mycelium of Cordyceps gunnii (Berk.) Berk.using 30% ethanol. After remove of lipids (by ethyl acetate) and proteins (using sevage method), and precipitation (with 50% and 70% alcohol),the crude polysaccharides were further purified by DEAE-Sephadex A-25 column. The contents and purities of the obtained polysaccharides, named as CPS-1 and CPS-2, were determined using phenol-sulfuric acid method and UV spectrophotometric method, respectively.Their structures were analyzed by infrared spectrum (IR).In addition, thin layer chromatography analysis showed that the hydrolysis of the pure polysaccharides yielded two kinds of monosaccharides, glucose and/or mannose.

【题目】古尼虫草菌丝体维生素E的初步分析
【中文关键词】虫草;维生素E;分离提取;紫外分光光度法
【英文关键词】Cordyceps gunnii; vitamin E; extraction; UV-VIS spectrophotometry
【中文摘要】古尼虫草与传统名贵中药冬虫夏草类似,具有多种活性物质及广泛的药理作用,是一种重要的虫草属真菌。分别用30 %、50 %、80 %乙醇溶液和乙酸乙酯作为提取液,从古尼虫草菌丝体中提取维生素E,并用乙酸乙酯萃取的方法进行初步分离,硅胶薄层层析和紫外分光光度法分析粗产物中的维生素E。结果表明,提取物质的总量与提取液的乙醇含量有关,提取液的有机溶剂比例越高,提取到维生素E 量越高,但提取的维生素E 的纯度越低。初步确定乙酸乙酯为提取虫草维生素E 的最适溶剂。
【英文摘要】Cordyceps gunnii (Berk.) Berk. is one of the important species of Cordyceps spp, which has similar constituents and pharmacological activities to the traditional Chinese medicine Cordyceps sinensis. In the paper, the extraction and separation of vitamin E from Cordyceps gunnii (Berk.) Berk. were studied using 30%, 50%,80% ethanol solution and ethyl acetate. The content of the crude vitamin E was analyzed with thin layer chromatography (TLC) and UV spectrophotometer methods. The results showed that the higher the organic solvent content in the extracting solution, the higher the content of vitamin E and the lower the purity of the vitamin E. Besides, ethyl acetate was shown to be the best organic solvent for the extraction of vitamin E from Cordyceps gunnii.

【题目】褐藻酸的提取、降解及理化性质研究
【中文关键词】海带;褐藻酸;提取;降解;纯化;性质
【英文关键词】Laminaria japonica; alginic acid; extraction; degradation; purification; properties
【中文摘要】本文以市售海带为原料,通过单因素试验选取了试验的因素与水平,在单因素试验基础上,通过正交试验确定了褐藻酸提取的最佳工艺条件。并采用酸法降解褐藻酸得到降解多糖D-AGS。D-AGS经过DEAE-Sephadex A-25凝胶柱和Sephadex G-75凝胶柱分离纯化后,得到两个单一组分D-AGS-1A和D-AGS-2A,并对D-AGS-2A进行了理化性质研究。通过紫外光谱表明其不含有核酸和蛋白质,碘与碘化钾反应、斐林反应、塞式、考马斯亮蓝反应均呈阴性,咔唑-硫酸反应呈阳性。
【英文摘要】Taking Laminaria japonica as raw material, extraction of alginic acid was studied and optimized by L9 (34) orthogonal test. And D-AGS was obtained by the degradation of alginic acid, which was further purified by chromatography on DEAE-Sephadex A-25 and Sephadex G-75 columns, giving two pure polysaccharides (D-AGS-1A and D-AGS-2A). The result of UV spectrophotometric illustrated that D-AGS-2A does not contain protein and nucleic acid. And D-AGS-2A was assayed by means of iodine- potassium iodide , Fehling, Seliwanoff, coomassie brilliant blue G-250 and carbazole sulfuric acid reaction.

【题目】鱿鱼肝脏鱼油成分及其体外抗氧化性的研究
【中文关键词】鱿鱼肝脏;鱼油;抗氧化;脂肪酸
【英文关键词】squid liver; oil; antioxidant; fatty acids
【中文摘要】以鱿鱼肝脏为原料提取鱼油,确定了直接水提法提取鱿鱼肝脏鱼油的加水量。用气相色谱-质谱法分析了鱿鱼肝脏鱼油中脂肪酸的组成,并对鱼油的体外抗氧化能力分别进行了DPPH自由基清除能力、超氧阴离子自由基清除作用、过氧化氢清除能力以及脂质过氧化抑制作用的测定。另外对鱿鱼肝脏鱼油进行了薄层分析及全波长扫描,确定了其中含有虾青素。为鱿鱼肝脏在食品、药品和饲料方面的应用提供了理论依据。
【英文摘要】In this study, squid liver oil was extracted by water and amount of water in the extraction was determined. The fatty acids of the oil were analyzed by gas chromatography-mass spectrometry. And its antioxidation effect in vitro was also determined, including DPPH free radical scavenging, superoxide anion radical scavenging, hydrogen peroxide scavenging capabilities and inhibition effect on lipid peroxidation. Besides, thin-layer analysis and full wavelength scanning analysis showed that the extracted crud squid liver oil contained astaxanthin. It provided a theoretical basis for the application of squid liver in food, medicines and feed.

【题目】牛关节软骨复合物对佐剂性关节炎的治疗作用
【中文关键词】牛关节软骨复合物;软骨多糖;佐剂性关节炎;超氧化物歧化酶;丙二醛;一氧化氮;白细胞介素IL-1β
【英文关键词】bovine articular cartilage; cartilage polysaccharide; adjuvant-induced arthritis; superoxide dismutase; malondialdehyde; nitric oxide; interleukin-1β

【中文摘要】本文系统考察了牛关节软骨复合物对类风湿性关节炎的治疗作用。采用弗氏完全佐剂皮下注射左后足跖建立小鼠佐剂性关节炎模型,主要考察了牛关节软骨复合物、牛关节软骨多糖及牛喉管骨软骨多糖对模型小鼠关节指数、肝指数、脾指数和胸腺指数的影响,并检测了小鼠血清中超氧化物歧化酶(SOD)、丙二醛(MDA)、一氧化氮(NO)和白细胞介素(IL-1β)含量的变化。实验结果表明,牛关节软骨复合物可有效缓解小鼠关节肿胀现象,显著降低小鼠肝指数,胸腺指数,MDA,NO(P<0.05)及IL-1β(P<0.01)的含量,对佐剂性关节炎具有明显的治疗作用,且治疗效果优于软骨多糖组。关节软骨复合物为治疗类风湿性关节炎提供了一种新的药物选择。

【英文摘要】The therapeutic effects of bovine articular cartilage on adjuvant-induced arthritis in Kunming mice were investigated in the present study. Animals were divided into control group, model group and treatment groups (bovine articular cartilage, polysaccharide from bovine articular cartilage, polysaccharide from bovine laryngeal cartilage; administered orally by gastric intubations, 180 mg/kg/d, for 20 days after induction). The arthritis model was induced by injection of Freund ' s complete adjuvant (FCA) into the left hind footpad. Arthritis index as well as the index of liver, spleen and thymus was analyzed. Corresponding kits were used in determining superoxide dismutase (SOD), malondialdehyde (MDA), nitric oxide (NO) and interleukin-1β (IL-1β) levels in serum. The results indicated that bovine articular cartilage could obviously attenuate the paw swelling response. Liver and thymus index, MDA and NO levels were significantly (P<0.05) lowered by bovine articular cartilage-treatment. The serum level of IL-1β was significantly (P<0.01) decreased by the treatment. Our results indicated that bovine articular cartilage had a therapeutic effect on adjuvant-induced arthritis and its efficacy was higher than those of polysaccharide groups. Bovine articular cartilage may be a viable therapeutic candidate for the treatment of rheumatoid arthritis.

【题目】自然降雨条件下秸秆还田对巢湖流域旱地氮磷流失的影响
【中文关键词】农业面源污染 秸秆覆盖 氮磷流失 径流 巢湖流域
【英文关键词】Agriculture non-point source pollution, Straw mulch, Nitrogen and phosphorus loss, Surface runoff, Chaohu Lake Region
【中文摘要】本文通过野外径流小区观测试验, 开展了自然降雨条件下秸秆覆盖对巢湖流域旱地地表径流、泥沙和氮磷流失影响的研究。试验结果表明, 秸秆覆盖能有效减少地表径流量、侵蚀产沙量以及因地表径流引起的土壤氮磷流失。在整个玉米生长期间, 秸秆覆盖小区的总产流量与产沙量比传统耕作小区分别减少30.47%和22.88%, 表现出显著的水土保持作用。与传统耕作小区相比, 秸秆覆盖小区随地表径流迁移的氮、磷流失总量分别降低27.42%和32.29%, 但秸秆覆盖对径流中氮磷浓度的影响却不明显。溶解态氮是氮素流失的主要形态, 颗粒态磷是磷素流失的主要形态。秸秆覆盖可以作为源头控制农业面源污染的较好措施之一加以推广。
【英文摘要】A field experiment was conducted in the Chaohu Lake Region to analyze the characteristics of nitrogen and phosphorus loss via runoff from farmlands under natural rainfall conditions. Tw o treatments of conventional tillage (CK) and straw mulch (TS) were set up in 3 replications. The results show that straw mulc h effectively reduces surface runoff, and sediment and nutrient loss from farmlands under natural rainfa ll conditions. During maize growth period, the amounts of runoff and sediments in TS decrease by 30.47% and 22.88%, respectively compared with CK. This imp lies that straw mulch has a signi ficant effect on soil and water conservation. Straw mulch respectively reduces total nitrogen (TN) and total phosphorus (TP) loss via surface runoff by 27.42% and 32.29%. However, straw mulch has an insignificant influence on TN and TP concentration of runoff. While dissolved nitrogen (DN) is predominant form of nitrogen loss, particle phosphorous (PP) is the main form of phosphorus loss. In order to control agricu lture non-point source pollution, straw mulch should be strongly promoted in the study area.

【题目】Analysis on cDNA sequence, mRNA expression and imprinting status of Dlk1 gene in goats
【中文关键词】山羊,Dlk1,序列,表达,印记
【英文关键词】Goat, Dlk1, Sequence, Expression,Imprinting
【中文摘要】本研究克隆了山羊Dlk1的cDNA,分析了其表达特征,确定了存在两种转录本。在该基因的编码区找到一处多态性位点,通过对杂合子中表达的等位基因的分析,证明该基因为母系印记。
【英文摘要】Dlk1 (Delta-like homolog 1) is a cell surface transmembrane glycoprotein belonging to the epidermal growth factor like family of homeotic proteins and plays an important role in regulating fetal and postnatal develop-ment. Increased expression ofDlk1 is the primary cause of muscle hypertrophy in the callipyge sheep exhibiting overgrowth of fast-twitch muscles and reduced adiposity. However, the function of Dlk1 in goats remains unknown. In this study, a fragment of 864 bp of goat Dlk1 cDNA, encoding 287 amino acids, was amplified, which has a high homology both in nucleotide sequence and amino acid sequence with the corresponding region of pig, cattle and sheep Dlk1. The Dlk1 was found to be expressed in most tissues of goat fetuses, and in the adrenal gland, pancreas and thymus of adult goats. Two alternative transcripts of Dlk1 - C and Dlk1 - C2were expressed in both fetuses and adult goats. One C/T transition in the coding region of goat Dlk1 was identified and by genotyping one segregating goat family and the expressed allele in the tissues of the offspring, Dlk1 was found to be paternally expressed.

【题目】SSR标记分析国家北方花生区试品种的遗传多样性
【中文关键词】花生 遗传多样性 SSR标记 聚类分析
【英文关键词】Peanut Genetic diversity SSR marker Cluster analysis
【中文摘要】利用10对SSR引物对参加我国北方区域试验的27份花生品种进行PCR扩增分析,共扩增出57条带,其中45条呈现多态,多态性比率为78.95%。引物的多态性信息含量(PIC)变幅为0.417-0.857,平均值为0.688。27个品种间的遗传相似系数在0.311-0.962之间,平均为0.651。聚类分析结果表明,27个参试花生品种在遗传相似系数0.61处分为3个类群,同一类型的参试品种优先聚为一类,同一地区或同一育种单位提供的品种往往首先聚为一类。系谱分析表明亲本来源相近的品种优先聚在一起,利用农家品种和辐照诱变材料对于拓宽花生遗传基础发挥作用较明显。SSR分析结果基本上与系谱相吻合
【英文摘要】Peanut is an important oil and economic crop in China. Many peanut breeders have been paying attention and efforts to solve the problem of narrow genetic diversity in peanut. In order to broaden the genetic basis in peanut breeding, it is necessary to know the genetic diversity in the current peanuts. In this study, the genetic diversity of 27 peanut varieties under the Region Tests of North China were analyzed with SSR markers. Total 57 bands were generated with 10 SSR primers, of which 45 (78.95%) were polymorphic. The polymorphism information content (PIC) was varied from 0. 417 -0. 857, with an average of 0. 688. The genetic similarity (GS) among 27 peanut varieties were calculated based on the data from these SSR markers. The value of GS ranged from 0.311 to 0. 962, with an average of 0. 651. UPGMA cluster analysis showed that the 27 peanut varieties could be divided into three groups at similarities coefficient of 0.61. Most of the similar varieties were bred by the same breeders or belonged to the same type, which was in accordance with the pedigree information. It is no doubt that microsaterllites are very useful DNA markers to analyze genetic diversity in peanut varieties.

【题目】Isolation of a novel C18-D9 polyunsaturated fatty acid specific elongase gene from DHA-producing Isochrysis galbana H29 and its use for the reconstitution of the alternative D8 pathway in Saccharomyces cerevisiae
【中文关键词】无
【英文关键词】D8 desaturase, D9 elongase, Isochrysis galbana, Polyunsaturated fatty acids, The alternative D8 pathway
【中文摘要】无
【英文摘要】A novel gene (IgASE2) encoding a C18-D9 polyunsaturated fatty acids specific (C18-D9-PUFAs-specific) elongase was isolated and characterized from DHA-rich microalga, Isochrysis galbana H29. The IgASE2 gene was 1,653 bp in length, contained a 786 bp ORF encoding a protein of 261 amino acids that shared 87% identity with D9 elongase, IgASE1, and possessed a 44 bp 50-untranslated region (50-UTR) and a 823 bp 30-untranslated region (30-UTR). IgASE2, by its heterologous expressionin Saccharomyces cerevisiae, elongated linoleic acid (LA, 18:2n-6) and a-linolenic (ALA, 18:3n-3) to eicosadienoic acid (EDA, 20:2n-6) and eicosatrienoic acid (ETrA, 20:3n-3), respectively. The conversions of LA to EDA and ALA to ETrA were 57.6 and 56.1%, respectively. Co-expression of this elongase with D8 desaturase required for the synthesis of C20-polyunsaturated fatty acids resulted in the accumulation of dihomo-c-linolenic acid (20:3n-6) from LA and eicosatetraenoic acid (20:4n-6) from ALA. These results demonstrated that IgASE2 exhibited C18-D9-PUFAs-specific elongase activity and the alternative D8 pathway was reconstituted.

【题目】Cloning and Identification of a Novel C18-Δ9 Polyunsaturated Fatty Acid Specific Elongase Gene from DHA-producing Isochrysis galbana H29
【中文关键词】无
【英文关键词】Δ9-elongase, polyunsaturated fatty acids, Isochrysisgalbana, arachidonic acid, eicosapentaenoic acid
【中文摘要】无
【英文摘要】Isochrysis galbana, a marine prymnesiophyte microalga, is able to produce a high level of long chain polyunsaturated fatty acids such as docosahexaenoic acid (DHA, C22:6n-3). In this article, a novel gene (IgASE2) that encoded a C18-Δ9 polyunsaturase fatty acids specific (C18-Δ9-PUFAs-specific) elongase was isolated and characterized from DHA-rich microalga, I. galbana H29. A full-length cDNA of 1653 bp was cloned by rapidamplification of cDNA ends (RACE) PCR techniques. The IgASE2 contained a 786 bp ORF encoding a protein of 261 amino acids that shared 87% identity with the reported Δ9-elongase IgASE1, a 44 bp 5' untranslated region and an 823 bp 3' untranslated region. The function of IgASE2 was demonstrated by its heterologous expression in Saccharomyces cerevisiae. In S. cerevisiae, IgASE2 elongated linoleic acid (LA, C18:2n-6), α-linolenic (ALA, C18:3n-3) to eicosadienoic acid (EDA, C20:2n-6) and eicosatrienoic acid (ETrA, C20:3n-3). The conversion ratios of LA to EDA and ALA to ETrA were 60.47 and 58.36%, respectively. However, IgASE2 could not catalyze the elongation reactions of oleic acid (OA, C18:1n-9) and other fatty acids. These results confirmed that IgASE2 had C18-Δ9-PUFAs-specific elongase activity.

【题目】大豆杂种产量和品质性状早世代优势和亲本配合力分析
【中文关键词】大豆;杂种优势;自交衰退;配合力×世代互作
【英文关键词】soybean; heterosis; inbreeding depression; combining ability×generation interaction
【中文摘要】【目的】研究黄淮地区一组优良大豆亲本早世代(F1~F3)产量与品质性状的杂种优势和自交衰退表现,分析杂种早世代亲本产量与品质性状配合力的变化特点,为大豆杂种品种和家系品种选育的亲本选配和后代选择提供依据。【方法】以来自黄淮地区及美国的8个大豆重要亲本及其组配的28个双列杂交组合为材料,以中亲优势率、超亲优势率作为杂种优势的指标,以自交衰退率作为自交衰退的指标,采用DIALLEL-SAS05软件进行多世代数据的联合方差分析和配合力分析。【结果】(1)黄淮地区大豆亲本间产量性状普遍存在杂种优势和自交衰退现象,产量优势最大,单株荚数和单株粒数次之,百粒重无优势。F1杂种优势大的性状,其F2、F3自交衰退率一般也较大。生育期及品质性状(蛋白质和脂肪含量)杂种优势不明显,自交衰退也不明显。(2)大豆产量存在显著的一般配合力×世代和特殊配合力×世代的互作,杂种F1表现配合力高的亲本不一定在后代表现出高配合力。亲本品质性状的一般配合力×世代和特殊配合力×世代的互作效应不显著,由杂种一代的配合力预测杂种后代的可靠性较高。(3)亲本本身产量性状的的高低不能估计其一般配合力效应。但亲本本身蛋白质、脂肪含量的高低是估计其一般配合力效应的重要指标。【结论】黄淮地区大豆亲本间各性状中以产量的杂种优势最大,自交衰退率也较大,不宜直接利用杂种二代。杂种优势利用和杂种后代家系选育可能有不同的最佳亲本和组合。杂种早世代开始对籽粒蛋白质与脂肪含量进行定向选择,有利于及早提高后代的含量。
【英文摘要】【Objective】 The present study was aimed at evaluating the hybrid heterosis, inbreeding depression and combining ability performed in F1-F3 generations of 14 yield and quality traits among parental materials of soybean in Huang-Huai velleys so as to provide guidelines of parental selection and early generation selection in breeding of hybrid cultivars and inbred line cultivars.【Method】 A set of eight parental cultivars chosen from Huang-Huai valleys and the US along with their 28 diallel crosses were tested in 2005. The mid-parent heterosis and high-parent heterosis as well as inbreeding depression were evaluated for each of the 14 traits. DIALLEL-SAS05 was used to carry out the combined analysis of variance of combining ability of eight traits in F1, F2 and F3

generations. 【Result】 The obtained results were as follows: (1) There appeared hybrid heterosis and inbreeding depression foryield-related traits, among them, yield heterosis was the largest, that of number of pods per plant and seeds per plant the next, while no obvious heterosis for 100-seed-weight was observed. The traits with high F1 heterosis performed high inbreeding depression in F2 and F3, therefore, were not appropriate for utilization of heterosis in F1-derived generations. But there showed no obvious hybrid heterosis in maturity and quality (protein and oil contents) traits. (2) There existed significant GCA×Generation and SCA×Generation interaction in yield, therefore, the parental cultivars with high combining ability performed in F1 were not necessary with high combining ability in derived inbred generations, while no significant GCA×Generation and SCA×Generation interaction of quality traits were observed, therefore, the combining ability performed in F1 could predict that in derived inbredgenerations. (3) The yield of the parental materials per se could not be used as an indicator of its GCA, but the protein and oil contents of them per se could be used as an indicator of its GCA. 【Conclusion】 The heterosis of yield was the largest among the traits studied, but that in F1-derived generations declined and, therefore, not useful in production. There might be different superior parental materials and crosses in F1 hybrid cultivars and derived inbred line cultivars. In breeding for line cultivars, selection pressure can be put on early hybrid generations for the effective improvement of the quality traits.

【题目】黄淮地区大豆重要亲本间产量的杂种优势、配合力及其遗传基础
【中文关键词】大豆; 产量; 杂种优势; 一般配合力; 特殊配合力; 亲本系数; SSR标记
【英文关键词】Soybean; Yield; Heterosis; General combining ability; Specific combining ability; Coefficient of parentage; SSR marker
【中文摘要】2003—2005年以选自黄淮地区及美国的8个大豆重要亲本品种(系)及其组配的28个双列杂交组合为材料, 分析大豆亲本间的产量杂种优势及其配合力, 探讨高优势组合的遗传基础, 包括杂种优势与亲本系数、SSR标记遗传距离的相关。结果表明: (1) 黄淮地区大豆亲本间存在产量超亲优势, 平均20.39%, 组合间差异甚大, 变幅为－5.34%~76.88%, 优选出豫豆22×晋豆27、淮豆4号×晋豆27、诱变30×蒙90-24, 超亲优势分别为76.88%、29.90%和34.42%, 超标率均在25.00%以上, 晋豆27和诱变30为优秀亲本材料。单株荚数及单株粒数的优势和产量优势相对一致。(2) 大豆亲本间产量杂种优势既与双亲一般配合力之和及特殊配合力有关, 又不完全相关。高优势高产组合的亲本产量配合力特点为亲本之一具有较高的一般配合力, 或双亲具有较高的一般配合力之和, 兼有较高的特殊配合力。单株荚数和单株粒数的情况和产量一致。(3) 按亲本系数聚类和按SSR标记遗传相似系数聚类揭示的8个亲本间的遗传关系相对一致, 均分为两组, 一组包含6个黄淮中、南部品种(系), 另一组包含1个山西和1个美国品种。要获得高优势高产组合, 亲本间必须具有一定的遗传距离, 但遗传距离大并不一定都高产高优势, 还有其他因素决定杂种优势。

【英文摘要】In recent years, breeding for hybrid cultivars of soybean [Glycine max (L.) Merr.] for utiliazation of heterosis has been paid great attention, but there are few reports on the fundamental aspects regarding the heterosis in soybeans.. In fact, for a real utilization of hybrid soybean, the important prerequisite is high heterosis. Therefore, a fundamental effort in hybrid breeding is the choice of parents and identification of superior hybrid combinations. In this paper, heterosis and combining ability were determined using eight key parental materials, including seven from Huang-Huai region and one from US as well as their 28 F1 diallel crosses in Huai ’an, Jiangsu, China from 2003 to 2005, and relationships between F1 performance and its pedigree-based and SSR-based genetic distances were investigated. The results showed that there were heterobeltiosis in yield among parents in Huang-Huai region with the average heterobeltiosis of 20.39%, and a large difference among hybridized combinations with a range from －5.34% to 76.88%. We screened combinations, among them, Yudou 22 × Jindou 27, Huaidou 4 × Jindou 27, and Youbian 30 × Meng 9024 had the heterobeltiosis in yield of 76.88%, 29.90%, and 34.42%, respectively. Among these parents used above, Youbian 30 and Jindou 27 were the elite. Heterosis of pods per plant and seeds per plant were relatively in accord with yield heterosis. Yield heterosis in parents was related to general combining ability (GCA) and specific combining ability(SCA). One of parents has high GCA or both have high GCA and high SCA in high-yield combinations. Parents-based cluster and SSR-based cluster analysis revealed that genetic relationships for eight parents were basically consistent, and eight parents were classified into two groups, one including six varieties from middle and south of Huang-Huai region, the other consisting of one from Shanxi and one from America. Therefore, certain genetic distance is

require for a cross with high heterosis and high yield, but genetic distance is not an only determinant factor for high-yield heterosis.

【题目】杂交大豆制种技术体系的建立
【中文关键词】大豆; 杂交种; 制种技术
【英文关键词】Soybean; H yb rid o f soybean; Seed production techn ique
【中文摘要】阐述杂交大豆制种技术体系建立的依据, 介绍了该技术体系的核心内容和关键技术及环境、昆虫、作物3个因素在杂交大豆制种中的作用和相互关系, 并介绍了吉林省农科院在杂交大豆制种技术研究上的最新进展。实践表明: 通过综合调控这3个因素, 在开放大田不进行人工放蜂的情况下, 仅利用天然传粉昆虫, 不育系的结荚率可达到90%以上。
【英文摘要】In this paper, the basis fo restablishment of hybrid soybean seed production technology system were elucidated and the key techniques were described. The roles of environment, insec ts and crops in the hybrid soybean seed production and the relationships among the three factors were illustrated in detail. The recent progress in hybrid soybean seed productiontechnology system of Jilin Academy of Agricultural Sciences were introduced. Our results show ed that the pod set rate of sterile lines could reach up to 90%, without releasing leafcutter bees in the field, through natural pollinators and integrated control of the three factors.

【题目】大豆RN不育胞质不育与恢复类型的研究.
【中文关键词】大豆; RN不育细胞质; 恢保类型
【英文关键词】Soybean; RN ste rile cytoplasm; Types of CM S A- lines and R- lines
【中文摘要】阐述了以RN不育细胞质为基础选育的细胞质雄性不育系和恢复系的类型。在大量测交以及预备试验的基础上, 选择具有代表性的9对不育系和相应的保持系以及10个恢复系, 进行不育系与所有保持系之间, 以及不育系与所有恢复系之间所有可能的杂交。对不育系与恢复系杂交的F1, 依据花粉败育率分为3类以表示恢复度, A类: 败育率0~ 10%, B类: 败育率11% ~ 60%, C类: 败育率61%以上。再依据这3类的分布情况和恢复谱, 对不育系和恢复系进行分类。结果表明: 任何一个保持系均可保持所有不育系, 保持不育性的遗传机制较为简单, 受隐性单基因控制。不育系分为极易被恢复, 易被恢复和不易被恢复3类。依据恢复谱和恢复度将恢复系分为: 强恢复,恢复和弱恢复3类。极易被恢复的不育系和强恢复系是大豆杂交种选育中的珍贵育种材料。由于育性的恢复比较复杂, 测交中最好同时用上述3类不同类型的不育系做测交母本。
【英文摘要】The classification of male-sterile lines with RN sterile cytoplasm and their restorers was described in this paper.Representative genetic stocks including 9 pairs of male-sterile lines and their maintainers and 10 restorers were selected as experimentalmaterials based on comprehensive test crosses and a preliminary experiment. All possible crosses were made between male-sterile lines and their maintainers, as well as the ir restorers. The F1s from crosses betw een ma le-sterile lines and the ir resto rers cou ld be div ided into three ca tegor ies of A (0~ 10%) , B (11% ~ 60%) and C (61%) to indicate the degree o f resto ra tion according to the percen tage o f ster ile pollen grains. Taking the d istr ibu tion of A, B and C and the restoration spectrum as basic cons idera tion them ale ste rile lines and the restorers were further class ified. The result showed that any maintainer could maintain the sterility of all male sterile lines. The genetics of ster ility m aintenance seems sim ple: single recessive gene control. Three types o fm a le ste rile lines of very easy to be restored, easy to be resto red and d ifficu lt to be restored were identified. The restorers could also be

divided into three types-strong restorers, normal restorers and weak restorers.The male sterile lines that are very easy to be restored and the strong restorers are very valuable in the use of heterosis breeding. It is suggested that all three types of male sterile lines should be included as female testers in test crosses since the sterility restoration is quite complicated.

【题目】大豆杂交种杂交豆3号选育报告
【中文关键词】大豆杂交种;杂交豆3 号;细胞质雄性不育系
【英文关键词】Hybrid soybean; HybSoy 3; CMS
【中文摘要】杂交豆3 号是利用“三系”法选育的大豆杂交种,不育系为JLCMS8A,恢复系为JLR9 。杂交豆3号的主要特点是高产、稳产,品质较好,抗病性强。预备试验平均公顷产3 691.9 kg,比对照增产20.2%;两年区试平均比对照增产6.4%。人工接种鉴定高抗大豆灰斑病,中感大豆花叶病毒病,田间自然诱发鉴定,高抗大豆花叶病毒病、大豆灰斑病、大豆霜霉病和大豆细菌性斑点病。籽粒脂肪含量20.84%,蛋白质含量40.54%,蛋脂合计61.38%。该品种适于吉林省和黑龙江省中早熟区种植。
【英文摘要】‘HybSoy 3’, developed from cross of JLCMS8A (CMS A line) × JLR9 (CMS R line), has the characteristics of high yield, good quality and high resistance to disease. The yield of ‘HybSoy 3’ was 3691.9 kg per hectare in the preparation experiment, increased 20.2% compared with the control. It significantly increased yield by 6.4% in regional test compared with the control cultivar. ‘HybSoy 3’ was middle resistant to soybean Mosaic Virus and to Cercospora sojina Hara by artificial inoculating test. The seed oil content and protein content of ‘HybSoy 3’ were 20.54% and 40.75% , respectively. The variety was suitable to be cultivated in Jilin province and early to middle mature zone in Heilongjiang province.

【题目】大豆细胞质雄性不育系MADS-bos基因的分离分析
【中文关键词】大豆; 细胞质雄性不育; cDNA-AFLP; MADS-box 转录因子
【英文关键词】Soybean; Cytoplasmic male sterility; cDNA-AFLP; MADS-box transcription factor
【中文摘要】采用cDNA-AFLP 差异显示技术对大豆细胞质雄性不育系NJCMS2A 与其保持系NJCMS2B 间基因差异表达进行研究, 结果从NJCMS2A 花蕾中分离到一个差异表达片段, 对该差异片段进行克隆、测序和序列比对分析, Blast检索结果显示它与大豆基因组中Gm13 上g29510.1 cDNA 片段的同源性达98.7%, 与大豆中一个MADS-box 基因的同源性达98%, 氨基酸序列比对结果表明它与大豆中一个MADS-box 蛋白有96%的同源性, 与豌豆中MADS-box M7蛋白有83%的同源性, 与苦瓜中MADS-box2 蛋白有88%的同源性, 与海岛棉典型的MADS-box 基因编码的AGAMOUS 蛋白保守区有83%的同源性, 进一步对其氨基酸序列进行结构和功能预测显示该差异片段具有MADS-box 转录因子的典型结构域K-box, 证明其编码蛋白为一MADS-box 转录因子, 半定量RT-PCR 分析结果显示其在NJCMS2A 花蕾中表达量很高, 而在NJCMS2B 花蕾中表达量很低, 推测该差异片段可能与大豆细胞质雄性不育有关。
【英文摘要】CMS (cytoplasmic male sterility) plays an important role in the utilization of crop heterosis. It is of important significance on theory and practice to study the genetic base and mechanism of CMS. To reveal the molecular mechanism of soybean cytoplasmic male sterility, we analyzed the gene differential expression between the soybean cytoplasmic male sterile line NJCMS2A and its maintainer line NJCMS2B by the cDNA-AFLP differential display method. A differentially expressed fragment from the flower buds of NJCMS2A was cloned and sequenced. The Blast results showed that the differentially expressed fragment shared 98.7% homology with g29510.1 cDNA fragment on Gm13 of soybean genome, and 98% homology with a MADS-box gene of soybean. The Blast results of the amino acid sequences indicated that the differentially expressed fragment shared 96% homology with a MADS-box protein of Glycine max, 83% homology with the MADS-box M7 protein of Pisum sativum, 88% homology with the MADS-box 2 protein of Momordica charantia, and 83% homology with AGAMOUS protein of Gossypium barbadense. The structure and function prediction of the amino acid sequence showed that the protein encoded by the differentially expressed fragment was the transcription factor of the MADS-box gene which contained a typical K-box domain. The results of semi-quantitative RT-PCR showed that the expression quantity of the differentially expressed fragment in the flower buds of NJCMS2A was much higher than that of NJCMS2B. According to the above results, it was inferred that the differentially expressed fragment was probably related to the soybean cytoplasmic male sterility.

【题目】大豆细胞质雄性不育系与保持系atp6基因的RNA编辑比较研究
【中文关键词】大豆; 细胞质雄性不育; atp6 基因; RNA 编辑
【英文关键词】Soybean; Cytoplasmic male sterility(CMS) ; Atp6 gene; RNA editing
【中文摘要】对大豆细胞质雄性不育系NJCMS1A 与其保持系NJCMS1B 的atp6 基因的RNA 编辑进行比较研究。结果在不育系NJCMS1A 与保持系NJCMS1B 的atp6-3 基因保守区中均发现2 个编辑位点,但互不相同,并且导致了氨基酸的不同变化; mtDNA 序列分析显示,atp6-3 基因转录本保守区在不育系NJCMS1A 与保持系NJCMS1B间存在1 个碱基的差异; 另外还发现atp6-1、atp6-2 和atp6-3 的表达在不育系NJCMS1A 与保持系NJCMS1B 间存在明显差异。

【英文摘要】The atp6 gene is an important mitochondrial functional gene. The studies on some plant species showed that RNA editing of atp6 gene was related to the cytoplasmic male sterility. In this paper,the comparative studies of RNA editing of atp6 gene between the cytoplasmic male sterile line NJCMS1A and its maintainer line NJCMS1B in soybean (Glycine max L.Merr.) were conducted. The results showed that two editing sites were found on the conservative region of the atp6 gene of NJCMS1A and NJCMS1B,but the two editing sites of the atp6 gene of NJCMS1A were different from those of NJCMS1B,and led to the different changes of amino acid. The results of the mtDNA sequence comparision showed that one base difference was found in the conservative region of atp6-3 gene between NJCMS1A and NJCMS1B. In addition,the obvious difference was found on the expression of atp6-1,atp6-2 and atp6-3 between NJCMS1A and NJCMS1B.

【中文关键词】大豆; 产量; 杂种优势; 主-微位点组; 加性效应; 显性效应
【英文关键词】Soybean; Yield; Heterosis; Major-minor locus groups; Additive effects; Dominance effects
【中文摘要】选用来源于中国黄淮和美国的熟期组II~IV 的8 个大豆品种, 按Griffing 方法II 设计, 配成36 个双列杂交组合(28 个杂种组合+8 个亲本)于2003—2005 年进行田间试验。应用基于数量性状主基因+多基因遗传模型的主-微位点组分析法, 解析8 个大豆亲本产量的主、微位点组遗传构成及其效应, 估计主、微位点组对产量杂种优势的贡献。结果表明, 8 个大豆亲本间产量由6 个主位点组加微位点组控制, 主位点组、微位点组分别解释表型变异的75.98%和10.81%。6 个主位点组加性效应(aJ)分别为140.10、259.65、1.95、151.35、 − 32.70 和45.00 kg hm − 2, 显性效应(dJ)分别为177.15、314.25、105.75、75.90、242.85 和171.00 kg hm − 2。杂种遗传构成包括主位点组杂合显性效应、主位点组纯合加性效应、微位点组杂合显性效应和微位点组纯合加性效应4 部分, 相对重要性依次递减, 以显性效应为主,加性效应为辅。亲本间主、微位点组及其遗传效应的解析阐释了各杂种组合的遗传特点, 还提供了进一步挖掘遗传潜力进行优势改良的基础。
【英文摘要】The analysis of major-minor locus groups of diallel crosses based on major gene plus polygene mixed inheritancemodel provides a way to explore the genetic structure of hybrids among a group of materials. Eight soybean parental materials,seven from Huang-Huai region in China and one from the US with maturity group II – IV were used to develop a set of 36 diallel crosses (including 28 F1 crosses and eight parents) according to the Griffing II pattern. The materials were tested in 2003 − 2005. From the analysis of major-minor locus groups of the 36 materials, the results showed that six major locus groups plus minor locus groups were detected to explain 75.98% and 10.81% of the phenotypic yield variation, respectively. This indicated that major locus groups were the major source of genetic variation among the materials with their additive effects (aJ) of 140.10, 259.65, 1.95, 151.35, − 32.70, and 45.00 kg ha − 1 and dominance effects (dJ) of 177.15, 314.25, 105.75, 75.90, 242.85, and 171.00 kg ha – 1, respectively, while the minor locus groups were a supplement source in the genetic system. The genetic constitutions of the hybrids were composed of heterozygous dominance effects of major locus groups, homozygous additive effects of major locus groups,heterozygous dominance effects of minor locus groups and homozygous additive effects of minor locus groups, with their relative importance in a descending order. The dissection of the relative importance of the genetic effects of major-minor locus groups helps to explain the genetic characteristics of the hybrids among the parents and provides the genetic basis for further mining the genetic potential of parental materials in the improvement of hybrids.

【题目】大豆质核互作雄性不育系NJCMS3A双亲雄性育性基因的SSR标记
【中文关键词】大豆; 质核互作雄性不育; 雄性育性遗传; 基因定位
【英文关键词】Soybean; Cytoplasmic-nuclear male sterility; Fertility inheritance; Gene mapping
【中文摘要】利用大豆质核互作雄性不育系NJMCS3A 的质、核供体亲本N21566 和N21249 构建F2 和BC1F1 育性分离群体进行雄性育性的遗传分析与基因定位。结果表明, F1 正反交可育, F2 和BC1F1 的可育株与不育株分离比例经χ2 测分别符合3∶1 和1∶1, 表明NJCMS3A 供体亲本雄性育性由一对基因控制, 可育等位基因为显性。该基因可能是NJCMS3A的一个恢复基因。选用793 对SSR 引物对F2 和BC1F1 群体分别进行育性基因定位, 发现该育性基因位于O 连锁群上, 在Satt331 和Satt477 标记之间, 与Satt331、CSSR133 和Satt477 标记距离的次序一致, 分别为8.1~10.4、11.4~16.4 和13.3~19.2 cM。
【英文摘要】Utilization of the three lines [cytoplasmic-nuclear male-sterile (CMS) line, maintainer line, and restorer line] in producing hybrids with heterosis has been very successful in a number of crops including soybean. The soybean CMS line NJCMS3Awas developed through six consecutive backcross generations with N21566 as cytoplasm source and N21249 as nuclear donor. The objective of our study was to reveal the genetic mechanism and mapping the male fertility gene in the two parents of the CMS line NJCMS3A, i.e. N21566 and N21249. The male fertility of (N21566×N21249) F2 and BC1F1 showed that the segregation ratio of fertile to sterile plants fitted the expected ratios of 3:1 and 1:1, respectively, indicating one pair of gene conferring male fertility in the parents of NJCMS3A with dominance allele in N21249 being male fertile. This gene might be one of the restorer genes for the male sterility of NJCMS3A. The mapping results on BC1F1 and F2 showed that out of the 793 randomly selected SSR markers,Satt331, CSSR133 and Satt477 on linkage group O were linked to the male fertility gene Rf with their genetic distances of 8.1 − 10.4, 11.4 − 16.4, and 13.3 − 19.2 cM, respectively, in a same order and its location between Satt331 and Satt477.

【题目】不同统计遗传模型QTL定位方法应用效果的模拟比较
【中文关键词】QTL 定位; 遗传模型; 定位程序; 定位方法与数据模型的适配性
【英文关键词】QTL mapping; Genetic model; Mapping procedure; Pertinence between mapping method and data model
【中文摘要】分子遗传和数量遗传的结合, 发展了QTL 定位研究。随着定位方法与软件的建立和完善, QTL 定位的研究越来越多。准确定位的QTL 可用于分子标记辅助选择和图位克隆, 而假阳性QTL 将误导定位信息的应用。本文分析了迄今主要定位方法(软件)对于各种遗传模型数据的适用性。应用计算机模拟4 类遗传模型不同的重组自交系群体(RIL), 第一类只包含加性QTL; 第二类包含加性和上位性互作QTL; 第三类包含加性QTL 和QTL 与环境互作效应; 第四类包含加性、上位性互作QTL 和QTL 与环境互作效应。每类按模拟QTL 个数不同设两种情况, 共分为8种数据模型(下称M-1~M-8)。选用WinQTLCart 2.5 的复合区间作图(下称CIM)、多区间作图前进搜索(MIMF)、多区间作图回归前进选择(MIMR)、IciMapping 2.0 的完备复合区间作图(ICIM)、MapQTL 5.0 的多QTL 模型(MQM)以及QTLnetwork 2.0 的区间作图(MCIM) 6 种程序对8 种不同遗传模型的RIL 进行QTL 检测。结果表明, 不同程序适用的遗传模型范围不同。CIM 和MQM 只适于检测第一类模型; MIMR、MIMF 和ICIM 只适于检测第一类和第二类模型; 只有MCIM 适于检测所有4 类遗传模型; 因而不同遗传模型数据的最适合检测程序不同。由于未知实际数据的遗传模型, 应采用在复杂模型程序, 如QTLnetwork 2.0, 扫描基础上的多模型QTL 定位策略, 对所获模型用相应模型软件进行验证。
【英文摘要】QTL mapping has emerged based on the development and integration of molecular genetics and quantitative genetics.Along with the establishment and improvement of QTL mapping procedures, a great number of studies of QTL mapping in various crop species have been carried out. QTLs detected with high accuracy can be used for marker-assisted selection and map-based cloning, while the false-positive QTLs are meaningless, even mislead their usefulness. In the present study, the recombinant inbred line (RIL) populations were simulated based on four kinds of genetic models, including Model I, additive QTL; Model II, additive and epistatic QTLs; Model III, additive QTL and QTL×environment interaction, and Model IV, additive, epistatic QTLs and QTL×environment interaction. Two sets of RIL data for each of the four models were obtained, in a total of eight sets of RIL data designated as M-1 to M-8. Six QTL mapping procedures, i.e. CIM (Composite interval mapping), MIMF (forward search of multiple

interval mapping) and MIMR (regression forward selection of multiple interval mapping) of WinQTLCartographer Version 2.5, ICIM (Inclusive composite interval mapping) of IciMapping Version 2.0, MQM (multiple-QTL model) of MapQTL Version 5.0, and MCIM (mixed model based CIM) of QTLnetwork Version 2.0 were used for detecting QTLs of the eight sets of RIL data. The results showed: (1) Different mapping procedures fit different genetic models. CIM and MQM were only suitable for Model I data. MIMR, MIMF, and ICIM were only suitable for Model I and Model II data. Only MCIM was suitable for all four models ’ data. Therefore, the data from different genetic models corresponded to different optimal QTL mapping procedures. (2) Since the genetic model of the practical experimental data was unknown, a multiple model mapping strategy should be taken, i.e., a full model scanning with complex model procedure, such as QTLnetwork 2.0, followed by verification with another procedure corresponding to the scanning results

【题目】大豆不育系的恢复系筛选及其杂种优势利用研究
【中文关键词】大豆; 雄性不育系; 恢复系; 杂种优势
【英文关键词】Soybean; M ale sterile line; Restorer line; H eterosis
【中文摘要】以大豆质核互作雄性不育系S0105为母本, 与分别来自国内外不同纬度、不同生态区的280个品种测交, 根据测交一代的花粉育性和植株育性, 筛选出恢复株率达97% 以上的恢复系9个; 用这9个恢复系与不育系配制杂交组合, 对其F1籽粒产量进行测定。结果表明: 所有杂交组合的F1都有超亲和超标优势, 其中超亲和超标优势都达到25%以上的组合有4个。

【英文摘要】S0105, a soybean cytoplasmic nuclear male sterile line, was used as female parent to test cross with 280 cultivars from home and abroad in different latitudes and ecological zones. The results showed that when the fertilities rate of pollens were over 90 percent, the plant was fe rtile. Accord ing to both fertilities of pollens and plants of F1, 9 restorer lines (resto ring rate 97%) were selected. Crossed with the sterile line, superparen ts and superstandard heterosis appeared in all the 9 crosses by the seed yields of their F1. Furthermore, 4 crosses showed over 25% of both heterosis

【题目】大豆杂交种杂种优势分析
【中文关键词】大豆;杂交种;杂种优势;分析
【英文关键词】soybean; hybrid strains; heterosis; analysis
【中文摘要】:分析了大豆杂交种杂种优势大小及其来源,为今后大豆杂交种亲本选配及后代选育提供理论依据。采用经过初次测产、一次测产表现优良的20 份杂交大豆品种作为试验材料,通过农艺性状调查及测产分析,研究大豆杂交种杂种优势及来源。结果表明,参试的20 份杂交大豆组合中比高产对照黑农38 号增产的组合19 个,增产幅度为2.39%~61.33%,其中增产15%以上的组合11 个,占参试组合的55%;增产2.39%~14.76%的组合8 个,占参试组合的40%;减产组合1 个(-11.4%),占参试组合的5%。不同产量性状变异程度不同。大豆杂交种在三粒荚数、四粒荚数、单株荚数、单株粒数、单株产量、分枝数等产量性状上明显优于对照品种。分析表明,大豆杂交种具有明显的杂种优势,可显著提高大豆的产量,杂种优势主要来源于三粒荚数、四粒荚数、单株荚数、单株粒数、分枝数等产量性状。

【英文摘要】To analyze the soybean hybrid heterosis and the source of soybean hybrids, provided the theoreticalb basis of the parents and the future generations selection for the future. This study used 20 hybrid soybean varieties which through the initial and first

yield testing as the test material, through agronomic traits investigation and yield analysis, to research the soybean hybrid heterosis and the sources. The results showed that the hybrid soybean variety had significant advantages in yield, the yield of 19 combinations increased than the high-yield control Heinong 38, the range of 2.39%-61.33%. Yield-related traits analysis showed thatdifferent traits have the different variation degrees. Soybean hybrid yield advantage mainly came from three pods, four pods, pods number, seed number per plant, yield per plant, number of branches and other production traits. The soybean hybrids had obvious heterosis, can significantly increased soybean yield, the heterosis mainly from the three pods, four pods, pods number, seed number per plant, and other production traits.

【题目】光对红肉桃果肉红色形成的影响
【中文关键词】红肉桃;色素;果实套袋;红色形成;花青苷
【英文关键词】red-fleshed peach; pigments; bagging fruit; red color formation; anthocyanins
【中文摘要】为探讨光照是否影响红肉桃果实果肉着色,以青岛市地方红肉桃品种“大把撸”为材料,研究了不同套袋处理对红肉桃果肉糖酸和色素尤其是花青苷含量变化的影响。结果表明:套袋明显抑制了果肉红色的形成,套袋果果实成熟时a*值为10.32,仅为不套袋果的19.4%;但如果套袋果实在采收前15天摘袋,则见光后的果实果肉花青苷合成能力迅速恢复,采收时花青苷含量达到248.85 nmol/g,比不套袋果还高27.88 %。套袋也降低了红肉桃果肉可滴定酸、可溶性糖、叶绿素和类胡萝卜素含量。认为红肉桃果实果肉红色形成需要光照。
【英文摘要】Qingdao local red-fleshed peach variety“ Dabalu ”(Prunus persica cv Dabalu L.) was used to explore if the red color formation in the flesh of red-fleshed peach fruit needs sunlight directly. Anthocyanin content in red flesh and other fruit quality attributes were measured with bagged and exposed fruits. The results showed that the red color formation was inhibited greatly by bagging. At harvest the red color index a* of bagging fruit was 10.32 which just took 19.4% of that in the fruit without bagging. The ability of anthocyanins synthesis could restore rapidly after bag-moving 15 days before harvest, and the content of anthocyanin reached to 248.85nmol/g at harvest, which was 24.88% higher than that in exposed fruits. Bagging also reduced the content of acid, sugar, carotenoid and chlorophyll. It is proposed that red color formation in the flesh of red-fleshed peach requires sunlight in some ways.

【题目】Effect of dietary betaine supplementation on lipogenesis gene expression and CpG methylation of lipoprotein lipase gene in broilers
【中文关键词】甜菜碱,肉鸡,脂蛋白酯酶,FAS,A-FABP,CpG甲基化
【英文关键词】Betaine, Broiler, Lipoprotein lipase gene,Fatty acid synthase gene, Adipocyte-type fatty acid binding protein gene, CpG methylation
【中文摘要】本研究开展了甜菜碱对肉鸡脂肪沉积及相关基因表达的影响,探讨了甲基化影响其表达的机制。添加甜菜碱提高了56和66日龄肉鸡的平均日增重并降低了腹脂。添加0.1%的甜菜碱使56日龄肉鸡腹脂中FAS(fatty acid synthase) 和A-FABP(adipose fatty acid binding protein,脂肪型脂肪酸结合蛋白) 的表达量显著降低(P<0.05),使66日龄肉鸡腹脂中LPL和FAS(fatty acid synthase) 的表达量显著降低(P<0.01))。 0.1%的甜菜碱使66日龄肉鸡腹脂中LPL基因启动子区CpG的甲基化分布型发生改变:第1、 6、 7、 8及第10~50的CpG的甲基化程度较低,但第2、5 和 9 位置的CpG甲基化较高。甜菜碱未使肉

鸡脂肪PPAR γ (peroxisome proliferator activated receptor,过氧化物酶体增殖物激活受体)基因启动子区CpG的甲基化程度发生明显改变(P>0.05)。

【英文摘要】Experiments were conducted to investigate the effect of betaine supplementation on mRNA expressionlevels of lipogenesis genes and CpG methylation of lipoprotein lipase gene (LPL) in broilers. From 22 days of age, 78 broilers were feed basal diet without betaine and basal diet supplemented with 0.1% betaine, respectively, and at 56 and 66 days of age, the traits of 15 chickens (7 males and 8 females) of each group were recorded and abdominal fat pads were collected. The mRNA expression levels ofseveral lipogenesis gene were analyzed by semi-quantitative RT-PCR and real-time quantitative RT-PCR (qPCR), respectively. The CpG methylation profile at the promoter region of LPL gene in 66-day-old broilers was determined by bisulfite sequencing. The average daily gain and percentabdominal fat traits were slightly improved in 56-day-old and 66-day-old broilers after dietary supplementation of betaine to diet. After adding 0.1% betaine to diet, the mRNA levels of fatty acid synthase (FAS) and adipocytetype fatty acid-binding protein genes in abdominal adipose were significantly decreased in 56-day-old broilers, and those of LPL and FAS genes in abdominal adipose were significantly decreased in 66-day-old broilers comparing with the control group (P\0.05 and P\0.001). Moreover, in 66-day-old broilers fed 0.1% betaine diet, a different CpG methylation pattern was observed: the CpG dinucleotides of 1st, 6th, 7th, 8th and from 10th to 50th were less methylated; however, those of 2nd, 5th and 9th were more heavily methylated. The results suggest that transcription of some lipogenesis genes was decreased by betaine supplementation and betaine may decrease LPL mRNA expression by altering CpG methylation pattern on LPL promoter region.

【题目】Molecular characterization of porcine NECD, SNRPN and UBE3A genes and imprinting status in the skeletal muscle of neonate pigs

【中文关键词】猪,印记,NECD, SNRPN, UBE3A,基因

【英文关键词】Pig, Imprinting, NECD, SNRPN, UBE3A,Gene

【中文摘要】本研究克隆了猪NECD, SNRPN, UBE3A基因的cDNA序列,对其在物种间的保守性,组织表达谱进行了分析。分别在其编码区找到一处SNP。通过在杂合子中表达的等位基因的分析,证明,在初生仔猪骨骼肌中NECD, SNRPN呈母系印记, UBE3A未印记。

【英文摘要】Imprinted genes are expressed monoallelically depending on their parental origin, and play important roles in embryo survival and postnatal growth regulation. In this study, we characterized the porcine NECD (necdin), SNRPN (small nuclear ribonucleoprotein polypeptide N) and UBE3A (UBE3A ubiquitin protein ligase E3A) genes, analyzed their expression in nine tissues including liver, lung, small intestine, skeletal muscle, heart, kidney, spleen, inguinal lymph nodes and fat, and also examined their imprinting status in the skeletal muscle of neonate pigs. Results indicated that these three genes were highly homologous between pigs and cattle, being 95.02 % in nucleotide and 99.17 % in amino acid with the cattle SNRPN gene, and 96.46 % in nucleotide and 98.63 % in amino acid with the cattle UBE3A gene, respectively. The three genes were expressed in all the tissues investigated. Three single nucleotide polymorphisms (SNPs) in the coding region of these genes, i.e. g.263G[C, g.402T[C and g.340A[G for porcine NECD, SNRPN and UBE3A genes, respectively, were revealed; and imprinting analysis with which indicated that, in the skeletal muscle of neonate pigs, both NECD and SNRPN were maternally imprinted, while UBE3A was not imprinted.

【题目】Effect of dietary betaine supplementation on mRNA level of lipogenesis genes and on promoter CpG methylation of fatty acid synthase (FAS) gene in laying hens

【中文关键词】甜菜碱,CpG甲基化,基因表达,蛋鸡,脂生成基因

【英文关键词】Betaine, CpG methylation, gene expression, laying hen, lipogenesis genes

【中文摘要】本研究对甜菜碱对蛋鸡脂生成相关基因表达的影响进行了分析,结果显示,腹脂中FAS基因的mRNA水平受到甜菜碱添加的影响,其启动子区部分位点的CpG也有变化。

【英文摘要】Our aims are to determine the effects of dietary betaine supplementation on growth performance,percentage of abdominal fat, ratio of liver to body weight, mRNA expression levels of acetyl-CoA carboxylase (ACC), fat acid synthase (FAS) and adipose differentiation-related protein (ADRP) genes in the abdominal fat of hens. In addition, promoter DNA methylation patterns of FAS gene were also analyzed by bisulfite sequencing. A total 120 of Hy-Line White laying hens were randomly divided into four diet groups with supplemented betaine of 0, 0.04, 0.06 and 0.08%, respectively. At 180 old days of age, the significant difference in egg production was observed between the control and 0.08% betaine diet group ($P < 0.05$). The FAS mRNA abundance was increased in the abdominal adipose of hens receiving 0.08% betaine compared to the hens receiving control diet with no betaine ($P < 0.05$).However, supplementation of betaine had no significant effect on FAS expression level in 165-day-old hens. The ACC and ADRP gene expression levels were not significantly affected by betaine at either 165 or 180-day-old hens ($P>0.05$). Furthermore, the overall GpG methylation patterns at the FAS gene promoter region ranging from −961 to −749 were not significantly different among all groups in 180-day-old hens ($P > 0.05$), CpG methylation mainly occur from 1st to 5th sites. This study suggests that betaine could regulate lipogenesis of laying chickens by affecting the transcription of FAS genes, and that DNA methylation at some CpG dinucleotides may play a role in regulating FAS gene expression.

【题目】菲律宾蛤仔摄食率与温度、壳长和饵料浓度的关系

【中文关键词】菲律宾蛤仔, 摄食率, 温度, 壳长, 饵料浓度

【英文关键词】Ruditapes philippinarum, Ingestion rate, Temperature, Shell length, Algae concentration

【中文摘要】以等边金藻3011为饵料,采用室内流水法,在12、2O和24°C3个温度和不同的壳长、饵料浓度下,测定并计算了温度、壳长和饵料浓度与菲律宾蛤仔摄食率的关系,并建立了相关数学模型。结果显示,在实验条件范围内,摄食率随着饵料浓度的增大而增大,且符合幂函数方程。摄食率可以用温度、壳长和饵料浓度的自然对数方程表示,其模型为:IR = 21.2LnT + 20.06LnL + 7.10LnC - 97.95,经协方差分析结果表明,其相关系数呈非常显著水平。

【英文摘要】The ingestion rates of Ruditapes philippinarum fed with Isochrysis galbana 3011 under simulated conditions were studied.M oreover,investigation of the relationship between feed ingestion and temperature(1 2°C 、 2o°C and 24°C),shell length and algae concentration was carried out,and some mathematic models about the factors were set up. It was found that the ingestion rate was positively correlated with the algae concentration,and the ingestionrate of Ruditapes philippinarum correlated with them by the allometric equations.The impact of temperature,shell length and algae concentration on ingestion rate could be describedby the following model:IR = 21.2LnT + 20.06LnL + 7.1OLnC - 97.95,and analysis of covariance showed that the coefficient of correlation of the model was significant($P< O.0 1$).

【题目】栉孔扇贝的氮、磷排泄及其与温度、壳长之间的关系
【中文关键词】栉孔扇贝, 氮, 磷, 排泄
【英文关键词】Chlamys farreri, nitrogen, phosphorus, excretion
【中文摘要】通过天然饵料条件下的室内流水法, 测定并计算了栉孔扇贝氮、磷排泄物的排泄量及温度和壳长对其的影响, 建立了相关的数学模型, 并对栉孔扇贝排泄物中各种形态的N、P含量与组成进行了分析。结果显示: 在实验条件范围内, 扇贝排泄物中VDTN、VPTN的分布范围分别为14.94-248.28ug/h · ind、1.47-84.08 ug/h · ind, VD TP、VPTP的分布范围分别为0.007-42.54ug/h · ind、0.916-17.78ug/h · ind。DTN、PTN 占总氮排泄量的百分比分别为77.2% 、22.8%, 其中氨氮占50.8%; DTP、PTP占总磷排泄量的百分比分别为75.6%、24.4%。各形态N、P排泄速率均随着温度的升高而增加, 溶解、颗粒态N、P与温度之间的关系可以用二项式曲线描述, 而与壳长的关系可以用幂函数关系描述。溶解、颗粒态N、P均随温度和壳长的增加呈加速增大的趋势, 它们与温度和壳长之间的关系均可用对数曲线加以定量描述, 其交互作用模型分别为: VDTN = 131.13Lnt + 217.95LnL - 617.65, VPTN =67.41Lnt + 54.07LnL - 242.37, VDTP = 8.67Lnt + 65.82 LnL - 112.15 和 VPTP = 11.73Lnt + 1.14LnL - 43.74, 经协方差分析结果表明, 其相关系数均呈非常显著水平。
【英文摘要】The excretion features of farrer' scallop (Chlamy farreri) under simulated natural cond- itions were studied with the aim of learning the moda lity of nitrogen and phosphorus excretion, and their excretion rates. Moreover, the investigation of the relationship among water temperature, shell length and alga concentration was also carried out and some mathematics models about several factors were made. The results showed the excretion rates of DTN and PTN were 14.94ug/h · ind to 248.28 ug/h · ind and 1.47ug/h · ind to 84.08ug/h · ind and the excretion rates of DTP and PTP were 0.007ug/h · ind to 42.54 ug/h · ind and 0.916 ug/h · ind to 17. 78 ug/h · ind. The content of DTN and PTN were 77.2% and 22.8%, thereinto, the content of ammonia was 50.8%,

while the contents of DTP and PTP were 75.6% and 24.4% . The individual total nitrogen and phosphorus excretion rates of the scallop are positively correlated with the shell length and temperature in range of 9.2- 27.3 °C. After considering dissolution and particle excretion of nitrogen and phosphorus, the excretion rates of C. farreri were related to temperature by quadratic equations, and to shell length by the allometric equations. The interaction of temperature and shell length with DTN, PTN, DTP and PTP couldbe described by the models VDTN = 131.13Lnt + 217.95LnL - 617.65, VPTN = 67.41Lnt+ 54.07LnL -242.37, VDTP = 8.67Lnt+ 65.82LnL - 112.15 and VPTP = 11.73Lnt+ 11.14LnL - 43.74, furthermore, the results of analysis covariance of thosemodels were P < 0. 01.

【题目】A coding SNP of LHX4 gene is associated with body weight and body length in bovine

【中文关键词】无

【英文关键词】PCR – RFLP; LHX4 gene; Polymorphism;Growth traits

【中文摘要】无

【英文摘要】Heterozygous mutations in LHX4 are associated with combined pituitary hormone deficiency. In this study, the polymorphism of LHX4-HaeIII locus was revealed in 822 individuals from four Chinese cattle breeds. The PCR-RFLP analysis showed that there were three genotypes: GG, GA, AA. The frequencies of genotype GG ranged from 0.6620 to 0.9789 in analyzed populations. The genotypic frequencies of LHX4 locus in the four populations all agreed with Hardy-Weinberg equilibrium (P > 0.05). Distributions of genotypic frequencies of different breeds (QC, NY, JX, CH) at this locus were found to be significantly different based on a chi (2) test (P < 0.001). The genetic diversity analysis revealed the JX cattle possessed intermediate genetic diversity, and the other three Chinese cattle breeds belonged to poor genetic diversity. Correlation analysis with growth traits in the NY breed indicated that: the animals with genotype GA had greater body weight than those with genotype GG (P < 0.05); the animals with GA genotype owned significantly longer body length than the ones with GG genotype (P < 0.05) at 18 and 24 months.

【题目】Two novel SNPs in the coding region of the bovine PRDM16 gene and its associations with growth traits

【中文关键词】无

【英文关键词】Bovine;PRDM16 gene;Forced PCR – RFLP;SNPs;Growth trait

【中文摘要】无

【英文摘要】As a zinc-finger protein, PR domain containing 16 (PRDM16) controls brown fat determination by stimulating brown fat-selective genes expression while suppressing the expression of genes selective for white fat cells, whose mutations were associated with myelodysplastic syndrome (MDS) and leukemogenesis in human and murine model of leukemia. To date, no polymorphisms of PRDM16 gene in bovine had been reported. Herein, PCR-SSCP and DNA sequencing methods were employed to screen the genetic variation within PRDM16 gene in 1031 Chinese indigenous bovine. The results revealed two novel silent mutations: XM_001788152: m.1641T > C (547aa), 1881G > A (627aa). Hence, we described the PvuII and HaeIII forced PCR-RFLP methods for detecting these mutations, respectively. In the forced PCR-RFLP analysis with PvuII, the frequencies of bovine PRDM16-C allele varied from 0.044 to 0.506 in four Chinese native breeds. In the forced PCR-RFLP analysis with HaeIII, the frequencies of bovine PRDM16-G allele were 0.474, 0.494, 0.576 and 0.906 for Jiaxian (JX), Nanyang (NY), Qinchuan (QC) and Chinese Holstein (CH) population. Significant

statistical differences between genotypic frequencies implied that both of the polymorphic loci were significantly associated with cattle breeds by the chi square test (chi(2) = 190.058, P < 0.001 and chi(2) = 118.239, P < 0.001 for PvuII; chi(2) = 209.842, P < 0.001 and chi(2) = 108.711, P < 0.001 for HaeIII). The associations of the PvuII and HaeIII forced PCR-RFLPs of bovine PRDM16 loci with growth traits were analyzed in Nanyang breed. The two SNPs were associated with body weight and average daily gain in Nanyang aged 12 months, individuals with genotype TT and AA showed significantly better body weight (P < 0.05) and average daily gain (P < 0.01) at 12 months, respectively.

【题目】An efficient and rapid method for gene cloning from eukaryotic genomic DNA using overlap-PCR: With an example of cattle Ghrelin gene.

【中文关键词】无

【英文关键词】Megeprimer;Gene cloning;Genomic DNA;Gene splicing;Cattle Ghrelin gene

【中文摘要】无

【英文摘要】In this study, overlap-PCR, an efficient and rapid method, was used to clone cattle Ghrelin gene CDS (coding sequence) from genomic DNA. The procedure included seven primers and three-step PCRs. Cattle Ghrelin gene consists of four exons and the CDS contains 351 bps. In the first step three PCRs were performed to generate extended exon1, exon2, and exon3 that contained overlapped nucleotides and were used as the templates for second ligation PCR. Secondly, exon1 and exon2 were spliced together. And it was same with exon3 and exon4. Lastly, the four exons were linked together with outermost primers and the templates from the second step. Comparison analysis on the obtained CDS of Ghrelin gene and cDNA by RT-PCR showed that the two sequences were same. As an efficient and rapid method, overlap-PCR is feasible and acceptable for gene cloning from genomic DNA. (c) 2009 Elsevier Inc. All rights reserved.

【题目】Novel 12-bp deletion in the coding region of the bovine NPM1 gene affects growth traits

【中文关键词】无

【英文关键词】cattle, growth traits, deletion mutation, NPM1 gene.

【中文摘要】无

【英文摘要】The nucleophosmin 1 gene (NPM1) encodes a multifunctional nucleolar phosphoprotein that plays a crucial role in the control of various aspects of cell growth and homeostasis. In this study, the coding region of the NPM1 gene was screened in 1035 individuals of 4 Chinese cattle breeds by DNA sequencing and polyacrylamide gel electrophoresis. A novel 12-bp deletion mutation was identified in the coding region of the NPM1 gene. The PCR products of primer NPM1-P2 exhibited 3 genotypes and 2 alleles: 178 bp (denoted as W) and 166 bp (denoted as D). Genotype DD and allele D were predominant in the studied populations. Association analysis with growth traits in the Nanyang breed (N = 265) showed that the animals with genotype DD had significantly greater birth weight, body weight, body length, and heart girth than those with genotype WD (P < 0.01 or P < 0.05) at birth and after 6 months and 12 months, but not at 18 and 24 months of age. Results of this study suggest that the NPM1 gene is a candidate gene for growth traits in cattle.

【题目】MEF2A Gene Polymoephisms are Associations with growth traits in Chinese Indigenus Cattle Breeds
【中文关键词】无
【英文关键词】MEF2A gene; cattle; Single Nucleotide Polymorphisms (SNPs); growth traits; association; mutation
【中文摘要】无
【英文摘要】Myocyte enhancer factor 2A (MEF2A) gene encodes a member of the myocyte enhancer factor 2 (MEF2) protein family, which involves in vertebrate skeletal muscle development and differentiation. The important function of MEF2A implies this gene is a potential candidate gene for considering association analysis between polymorphism and growth trait. Sequencing and forced-PCR-RFLP were used to analyze the polymorphisms of the MEF2A gene in 1009 cattle from three Chinese indigenous breeds. Three SNPs (C1598T, G1641A and C1734T) were detected in the cattle MEF2A gene, leading to a missense (P420L) and two silent mutations (E434 E, P465P). The frequencies of 1598CC genotype and the frequencies of allele 1598C varied from 0.884-1.000 in the analyzed population (NY, QC and JX). The genotypic and allelic frequencies of G1641A and C1734T in. three populations were 0.034-1.000. The C1598T was associated with body length at 6 and 12 months of cattle. The G1641A was associated with average daily gain at 12 months of cattle. And the C1734T affected the average daily gain and body weight at 6 months of cattle. Those three mutations affected the early growth and development of cattle, which could be potential molecular makers in assistant selection of cattle breeding.

【题目】Analysis of the codon use frequency of AMPK family genes from different species.
【中文关键词】无
【英文关键词】AMP-activated protein kinase,Synonymous codon use,Correspondence analysis,Hierarchical cluster method,Gene function
【中文摘要】无
【英文摘要】In mammals, AMP-activated protein kinase (AMPK) is involved in the regulation of cellular energy homeostasis and, on the whole animal level, in regulating energy balance and food intake. In this paper, the relative synonymous codon use frequency of 40 AMPK family genes from seven mammal species (Bos taurus, Homo sapiens, Macaca mulatta, Mus musculus, Pan troglodytes, Rattus norvegicus, Sus scrofa) were analyzed using correspondence analysis and hierarchical cluster method. The result suggests that gene function is the dominant factor that determines codon usage bias in AMPK family genes, while species is a minor factor that determines further difference in codon usage bias for genes with similar functions.

【题目】The novel 5bp deletion polymorphism in the promoter region of bovine ACRP30 gene
【中文关键词】无
【英文关键词】Cattle,ACRP30 (adiponectin) gene,Promoter Deletion mutation,Growth trait
【中文摘要】无
【英文摘要】ACRP30 gene was located nearby the QTL affecting the marbling, ribeye muscle area and fat thickness on the BAT1 in Angus. In this study, a 5bp deletion mutation within the bovine ACRP30 gene was firstly detected and confirmed in 991 cattle by PCR-SSCP, DNA sequencing and direct PCR amplification. The deletion mutation was appeared in Qinchuan, Nanyang, Jiaxian and Hasake, but was not found in Jinnan, Chinese Holsteins and Angus. The association of the deletion polymorphism with growth traits (including birth weight, body weight, average daily gain and body sizes in different growth periods (6/12/18/24 month-old)) was analyzed in 224 Nanyang cattle. No signification association of the deletion polymorphism with growth traits were observed (P > 0.05). The deletion was located in the promoter region and it resulted in a new putative CCAAT/enhancer binding protein-beta response element (C/EBP-RE).

【题目】Novel 35-bp insertion in visfatin gene in Chinese cattle.
【中文关键词】无
【英文关键词】Visfatin, insertion, mutation, cattle
【中文摘要】无
【英文摘要】Visfatin is a protein that is preferentially produced in visceral adipose tissue. Both its tissue expression and secreted plasma levels increase in parallel with obesity. Therefore, the present study is focused on detecting insertion in bovine visfatin gene and analyzing its effect on growth traits in four Chinese cattle breeds (Nangyang, Qinchuan, Jiaxian, and Chinese Holstein) using PCR-SSCP, DNA sequencing and agarose electrophoresis methods. For the first time, a 35-bp insertion was described in the gene and two alleles were revealed: W and I. The x (2)-test analysis demonstrated that all breeds were in agreement with Hardy-Weinberg equilibrium (P > 0.05). The associations of the novel 35 bp-insertion of visfatin gene with growth traits of Nanyang cattle at 6, 12, 18, and 24 months old were analyzed: 6 month-old cows with genotype WW had greater birth weight than cows with genotype II and WI (P < 0.01 or P < 0.05). These results suggest that the presence of 35 bpinsertion in visfatin gene may influence the birth weight and bodyweight in 6 month-old cows.

【题目】Associations of a HinfI PCR-RFLP of POU1F1 Gene with Growth Traits in Qinchuan Cattle
【中文关键词】无
【英文关键词】Growth traits; PCR-RFLP; Polymorphism; POU1F1 gene; Qinchuan cattle

【中文摘要】无
【英文摘要】The objectives of the present study were to estimate the allele and genotype frequencies of the POU1F1/HinfI polymorphisms in beef cattle belonging to four different genetic groups and to determine the effects of these polymorphisms on growth traits in cattle. The 451-bp PCR products of POU1F1 gene digested with HinfI exhibited three genotypes and two alleles, which were at Hardy-Weinberg equilibrium (P0.05). Genotype BB was the predominant genotype and B the predominant allele in the studied populations. There was significant difference between LimousinQinchuan and Qinchuan in the distribution of genotypes (P0.0001). The association of the polymorphism of the POU1F1 gene with growth traits among Qinchuan, LimousinQinchuan, AngusQinchuan and Germany YellowQinchuan crosses was analyzed. Body weight and wither height of individuals with genotypes AB were higher (P0.05)than that of individuals with genotype BB in the Germany YellowQinchua cross, but were not in the other three populations (P0.05).

【题目】A novel SNP of the Hesx1 gene in bovine and its associations with growth traits.
【中文关键词】无
【英文关键词】Cattle,Hesx1 gene,SNP,Average daily gain
【中文摘要】无
【英文摘要】As an essential repressor, the homeobox gene Hesx1/HESX1 is required within the anterior neural plate for normal forebrain development. Mutations within the Hesx1 gene have been associated with GH deficiency or combined pituitary hormone deficiency. We detected the polymorphism of Hesx1 gene by PCR-SSCP and DNA sequencing methods in 702 individuals from four Chinese cattle breeds. A novel single nucleotide polymorphism (SNP) (IVS1 + 382T > C) was detected. The frequencies of genotype TC in four breeds were 0.000-0.222. Polymorphism of the Hesx1 gene was shown to be associated with growth in the Nanyang breed. Individuals with genotype TC was significantly lower average daily gain than TT at 18 months ($P < 0.05$).

【题目】Association between variants in the 50-untranslated region of the bovine MC4R gene and two growth traits in Nanyang cattle.
【中文关键词】无
【英文关键词】MC4R,Polymorphisms,Bovine,Growth traits
【中文摘要】无
【英文摘要】Melanocortin-4 receptor (MC4R) is one of five G-protein-coupled receptors binding melanocortins that is implicated in the control of feeding behavior and energy homeostasis. Six cattle populations (n = 594), including four Chinese indigenous breeds, Chinese Holstein, and a meat type breed (Angus), were used to detect single nucleotide polymorphisms in 5'-untranslated region of MC4R gene by means of PCR-SSCP and DNA sequencing. Four linked SNPs (g.[-293C > G; -193A > T; -192T > G; -129A > G]) were identified. The g.-293C > G and g.-129A > G could be genotyped with a PCR-RFLP using TaiI in three combined genotypes (AA, AB and BB). The two linked SNPs were associated with body weight and daily gain in Nanyang aged 6 months ($P < 0.05$), but they had no significant effect on body weight and daily gain in Nanyang aged 24 months ($P > 0.05$).

【题目】Associations of polymorphism within the GHSR gene with growth traits in Nanyang cattle
【中文关键词】无
【英文关键词】Cattle, GHSR gene, Polymorphism,SNP (single nucleotide polymorphism),Growth traits
【中文摘要】无
【英文摘要】GH secretagogue receptor (ghrelin receptor, GHSR) is known to be involved in the control of GH release by mediating the strong stimulatory effect of the endogenous ligand, ghrelin, on GH secretion. Associations between the GHSR gene polymorphism and the growth traits were revealed in Nanyang cattle. The mutations at nt456(G > A) and nt667(C > T) were complete linkage and located in exon 1 of the coding region of the GHSR gene. Least squares analysis revealed a significant statistical effect ($P < 0.05$) of the GHSR gene different genotypes on body weight and average daily gain at 6 months of age in Nanyang cattle. Individuals with GHSR-MM genotype showed higher body weight and average daily gain than individuals with GHSR-MN genotype.

【题目】Detecting a deletion in coding region of bovine bone morphogenetic protein 15 gene.
【中文关键词】无
【英文关键词】bovine, bone morphogenetic protein 15 (BMP15) gene, detection,mutation
【中文摘要】无
【英文摘要】The aim of this study was to detect polymorphism in the bovine bone morphogenetic protein 15 (BMP15) gene. On the basis of PCR-SSCP and DNA sequencing, a 4-bp deletion was identified in the coding region of the gene. Sequence analysis revealed that the deletion altered the reading frame and introduced a stop codon at position 264. Eight breeds (Luxi, Qinchuan, Nanyang, Jinnan, Bohai Black, Menggolian, Holstein, and Simmental) were genotyped by PCR-SSCP. No cows homozygous for this Mutation were observed in these breeds. Heterozygous cows were detected in Luxi, Qinchuan, Nanyang, Jinnan and Bohai Black cattle. Fecundity was not increased in heterozygous individuals.

【题目】Novel SNPs of the mtDNA ND5 Gene and their Associations with Several Growth Traits in Nanyang Cattle Breeds
【中文关键词】无

【英文关键词】Cattle, mtDNA, ND5 gene, Polymorphism, Single nucleotide polymorphism (SNP), Growth traits
【中文摘要】无
【英文摘要】Polymorphism of the mtDNA ND5 gene was detected by PCR-SSCP and DNA sequencing methods in 714 individuals from six Chinese cattle breeds. The results showed that at the P2 locus, two kinds of haplotypes, named A and B, with three SNPs (T12900C, A12923T, C12924T) were detected. The frequencies of haplotype A in six breeds were 0.041-0.167. Polymorphism of the ND5 gene was shown to be associated with growth in the Nanyang breed. Individuals with haplotype B had greater hucklebone width than those with haplotype A when 6 months old ($P < 0.01$), as well as better body height, body length, body weight, and average daily gain at 6 months ($P < 0.05$). Therefore, haplotype B of the ND5 gene was likely to have a positive effect on growth traits at 6 months in the Nanyang breed.

【题目】A TaqI PCR-RFLP detecting a novel nucleotide sequence polymorphism in exon 2 of bovine POU1F1 gene
【中文关键词】无
【英文关键词】Growth traits, PCR-RFLP, Polymorphism, POU1F1 gene, Qinchuan cattle
【中文摘要】无
【英文摘要】PCR-SSCP and DNA sequencing methods were applied to reveal three novel single nucleotide polymorphisms (SNPs) in exon 2 of the POU1F1 gene in 963 Chinese cattle belonging to eight breeds. Among them, a silent SNP (NM_174579:c.545G > A) detected by TaqI endonuclease is described. Frequencies of the POU1F1-G allele varied from 0.685 to 1.000. The association of TaqI polymorphism with growth traits was analyzed in 251 Nanyang cattle. No significant associations of the TaqI polymorphism with body weight and average daily gain for different growth periods (6, 12, 18, and 24 months old) were observed ($P > 0.05$), as well as for body sizes ($P > 0.05$).

【题目】A DdeI PCR-RFLP detecting a novel missense mutation of POU1F1 gene showed no effects on growth traits in cattle
【中文关键词】无
【英文关键词】bovine; POU1F1 gene; PCR-RFLP; growth traits
【中文摘要】无
【英文摘要】In this study, a novel missense (NM_174579:c.1201C>T) mutation in exon 6 at the bovine POU1F1 locus is reported, which results in p.S284F, namely, Ser (TCT) > Phe (TTT) at position 284 of the mature protein. A DdeI PCR-RFLP was used to determine the genotypes. The polymorphism was studied in eight Chinese cattle breeds (Nanyang, n = 251; Qinchuan, 149; Jiaxian Red, 144; Chinese Holstein, 61; Luxi, 57; Angus, 49; Jinnan, 60; Guyuan, 192). The frequencies of the POLU1F1 T allele in the analyzed populations ranged from 0.010 to 0.053. The relationships between the DdeI polymorphism and growth traits and body sizes were analyzed by adjusted linear model in 251 Nanyang cattle. Fixed effects of marker genotype, birth year, season of birth (spring vs. fall), age of dam, sire, farm and sex, and random effects of an animal were included. Statistical evaluation revealed no significant relationships between this polymorphism and birth weight, body weight and average daily gain for different growth periods (6-month old, 12-month old, 18-month old and 24-month old) body height, body length, heart girth and height at the hip cross for different growth periods ($P >$

0.05).

【题目】The polymorphisms of bovine cocaine- and amphetamine-regulated transcripts and their associations with cattle (Bos taurus) growth traits
【中文关键词】无
【英文关键词】CART; cattle; growth traits; SNPs
【中文摘要】无
【英文摘要】We investigated the polymorphisms of bovine cocaine- and amphetamine-regulated transcripts (CART). The coding and regulating regions of CART were screened in 7 cattle breeds by the single-stranded conformation polymorphism (SSCP) technique. The four loci (C1, C2, C3 and C4) studied were all polymorphic. Polymerase chain reaction (PCR) products representing different SSCP variants were sequenced and a total of 9 single-nucleotide polymorphisms (SNPs) were found. The associations between polymorphic loci and the growth traits of Nanyang cattle were analysed. The results indicated that genotype A(1)A(1) of the C1 locus was associated with a higher body weight ($P < 0.05$) than heterozygous A(1)B(1) Genotype A(2)A(2) of the C2 locus was associated with lower body weight and average daily weight gain ($P <= 0.001$) than heterozygous A(2)B(2). C3 and C4 loci had no significant effect on Nanyang cattle growth traits ($P > 0.05$).

【题目】Three novel single-nucleotide polymorphisms of the bovine LHX3 gene
【中文关键词】无
【英文关键词】Bovine; genetic variation; LHX3 gene; PCR-SSCP; single-nucleotide polymorphisms (SNPs)
【中文摘要】无
【英文摘要】The LHX3 gene encodes LIM homeodomain class transcription factors that have important roles to play in pituitary and nervous system development. On the one hand, mutations of LHX3 are associated with deficiencies of growth hormone (GH), prolactin (PRL), luteotrophic hormone (LH), follicle-stimulating hormone (FSH) and thyroid-stimulating hormone (TSH); on the other hand, mutations of LHX3 are also associated with combined pituitary hormone deficiency (CPHD) diseases in human and animal models. To date, few polymorphisms of the bovine LHX3 gene have been reported. In this study, polymerase chain reaction-single strand conformation polymorphism (PCR-SSCP) and DNA sequencing methods were employed to screen the genetic variations within the bovine LHX3 gene in 802 Chinese indigenous cattle. The results revealed three novel single-nucleotide polymorphisms (SNPs): AY923832: g.7553G > A, 7631C > T and 7668C > G. Among them, a synonymous mutation of exon II was identified: GAG (Glu) > GAA (Glu) at position 72 aa (AY923832:g.7553G > A) of LHX3 (403aa) in the four Chinese bovine breeds. Significant statistical differences in genotypic frequencies for exon 11 and its flanking region of the LHX3 gene implied that the polymorphic locus was significantly associated with cattle breeds by the chi(2)-test ($chi(2) = 68.975$, $df = 6$, $P < 0.001$). Hence, the three novel SNPs not only extend the spectrum of genetic variations of the bovine LHX3 gene, but could also possibly contribute to conducting association analysis and evaluating these as genetic markers in bovine breeding and genetics, and CPHD detection.

【题目】Novel SNPs of the bovine LEPR gene and their associations with growth traits
【中文关键词】无
【英文关键词】Bovine; LEPR gene; PCR-SSCP; Growth trait
【中文摘要】无
【英文摘要】In this study, polymorphism in the bovine LEPR gene exon 4 was detected by PCR-SSCP and DNA sequencing methods in 653 individuals from five Chinese cattle breeds. Two haplotypes (M and N), three observed genotypes (MM, MN, and NN), and five single nucleotide polymorphisms (SNPs) (NC_007301:g.26767T > C, NC_007301:g.26805C > T, NC_007301:g.27050A > G, NC_007301:g.27063G > A, NC_007301:g.27079G > A) were detected. The frequencies of haplotypes M and N in the five breeds were 0.661-0.747 and 0.253-0.339, respectively. The SNP locus was in Hardy-Weinberg equilibrium in Nanyang, Jiaxian red, Angus, and Jinnan cattle (P > 0.05) and was in Hardy-Weinberg disequilibrium in Qinchuan cattle (P < 0.05). Polymorphism of the LEPR gene was shown to be associated with growth traits in the Nanyang breed. The SNP in the bovine LEPR gene had significant effects on body height, body length, body weight, heart girth, and average daily gain at 6 and 12 months old (P < 0.01 or P < 0.05). Therefore, these results suggest that the LEPR gene is a strong candidate gene that affects growth traits in cattle.

【题目】Five novel single nucleotide polymorphisms (SNPs) of the prophet of PIT1 (PROP1) gene in bovine
【中文关键词】无
【英文关键词】MILK-PRODUCTION TRAITS; BLACK-AND-WHITE; SHORT COMMUNICATION; ASSOCIATIONS; CATTLE
【中文摘要】无
【英文摘要】The prophet of Pit1 (PROP1) gene encodes a paired class homeodomain transcription factor of 226 amino acids and is organized of 3 exons. PROP1 is necessary for the specification, differentiation and proliferation of cells. Its function is essential for anterior pituitary organogenesis, and heritable mutations in this gene are associated with combined pituitary hormone deficiency (CPHD) in human patients and animals (SAVAGE et al., 2003; CARVALHO et al., 2006). To date, no polymorphisms of the bovine PROP1 gene were described. In the present experiment, the 5' flanking region, the coding region and partial introns of bovine PROP1 were scanned for single nucleotide polymorphism (SNPs) in Five cattle breeds of China.

【题目】Association between polymorphisms of MSTN and MYF5 genes and growth traits in three Chinese cattle breeds
【中文关键词】无
【英文关键词】cattle; MSTN; MYF5; growth traits
【中文摘要】无
【英文摘要】The objective of this study was to assess the association of polymorphisms in MSTN and MYF5 genes with growth traits in three Chinese cattle breeds. Only one homozygous animal with BB genotype at MSTN locus was observed in Jiaxian population which was at Hardy-Weinberg disequilibrium ($p < 0.05$). The frequencies of allele A at MSTN locus and allele B at MYF5 locus in the three Chinese breeds were 0.9550/0.9730/0.9720 and 0.8275/0.7581/0.7523, respectively. Allele A at MSTN locus and allele B at MYF5 locus were dominant in these three populations. No statistically significant differences in growth traits were observed between the genotypes of the Jiaxian breed at MSTN and MYF5 loci and the Nanyang breed at MYF5 locus. However, there were statistically significant differences between the genotypes at MSTN locus of the Nanyang breed for WH, HQ HGI and HGBLR ($p < 0.05$), and of the Qinchuan breed for BLI ($p < 0.05$). The SNP in MYF5 had significant effects on WH and HHC of Qinchuan animals ($p < 0.05$). These results suggest that MSTN and MYF5 are strong candidate genes that influence growth traits in cattle. Other SNPs of MSTN and MYF5 or other linked genes should also be studied, which could lead to the development of selection plans to improve the performance of Chinese cattle and also promote the breeding of genuine beef cattle in China.

【题目】Single Nucleotide Conformation Polymorphisms of Leptin Gene in Chinese Cattle
【中文关键词】无
【英文关键词】Chinese indigenous cattle; leptin gene; PCR-SSCP; polymorphism; growth traits
【中文摘要】无
【英文摘要】PCR-SSCP was used to analyze the polymorphism of leptin gene in 539 samples of six cattle breeds, namely Nanyang (NY), Qinchuan (QC), Jiaxianred (JXR), Xizhen (XZ), Luxi (LX), and Holstein cow (HOL) breeds. PCR products with a 330 bp were amplified and sequenced. The results showed that the frequencies of alleles A/B of NY, QC, JXR, XZ, LX, and HOL breeds were 0.558/0.442, 0.492/0.508, 0.571/0.429, 0.658/0.342, 0.591/0.409, and 0.615/0.385, respectively. The association of variations of leptin gene with growth traits in NY, QC, JXR breeds was analyzed. Some indexes of the individuals with genotype BB were higher than that with genotype AA and AB in NY breed, such as the indexes of body length, heart length, body weight, hucklebone width, body height, and average day gain. The height at hip cross of the individuals with genotype BB was higher than that of those with genotype AA and AB in QC breed ($P < 0.05$). So leptin gene may be one of the candidate genes for growth traits with height at hip cross, but not for body weight, heart length, and body length trait. However, the height at hip cross and hucklebone width of the individuals with genotype AB and BB were higher than that of those with genotype AA in JXR breed ($P < 0.05$), but the difference was not statistically significant in body weight and body sizes (body height, body length, and heart length). And the polymorphisms in leptin gene were caused by G→T transversion at the 66th bp position, A→C transversion at the 67th bp position and G→T transversion at the 299th bp position. These results may be applied to marker-assisted selection of Chinese cattle breeds.

【题目】The polymorphisms of bovine VEGF gene and their associations with growth traits in Chinese cattle
【中文关键词】无
【英文关键词】Vascular endothelial growth factor (VEGF) gene; Single nucleotide polymorphism (SNP); Chinese cattle
【中文摘要】无
【英文摘要】PCR-SSCP and DNA sequencing methods were employed to screen the genetic variation of VEGF gene in 671 individuals belonging to three Chinese indigenous cattle breeds including Nanyang, Jiaxian Red and Qinchuan. Three haplotypes (A, B and C), four observed genotypes (AA, AB, BB and AC) and three new SNPs (6765T > C ss130456744, 6860A > G ss130456745, 6893T > C ss130456746) were detected. The analysis suggested that one SNP (ss130456744) in the bovine VEGF gene had significant effects on birth weight, body weight and heart girth at 6 months old in the Nanyang breed ($P < 0.05$). The results showed that the SNP (ss130456744) in intron 2 of the VEGF gene is associated with early development and growth of Chinese cattle. These findings raise hope that this polymorphism can be a molecular breeding marker in breeding strategies through marker assisted selection (MAS) in Chinese domestic cattle.

【题目】Polymorphism of DLK1 and CLPG gene and their association with phenotypic traits in Chinese cattle
【中文关键词】无
【英文关键词】Bovidae; DLK1 and CLPG; Phylogenetic; Polymorphism
【中文摘要】无
【英文摘要】DLK1 and CLPG were located in DLK1-GTL2 imprinted cluster. They all affected muscle growth and meat tenderness. The functional importance of DLK1 and CLPG imply that the variation of the genes could affect the growth traits of animal. PCR-SSCP and sequencing were used to analyze the four loci of DLK1 gene and CLPG gene in 1109 individuals, which belong to eight breeds/species of bovidae, including cattle, buffalo and yak. A synonymous mutation (C451T) was detected in exon 5 of DLK1 in Qinchuan cattle, but didn't change significantly with phenotypic traits. Three genotypes AA, AB and AC of CLPG were identified in Jiaxian cattle. The associations analyst of different genotypes showed that the individuals with genotypes AA and AC had a greater body weight and longer body length than those with genotype AB ($P < 0.05$ and $P < 0.01$, respectively); the AA individuals were different from those AB ($P < 0.05$) in the circumference of cannon bone. No polymorphism was observed in the other populations at other loci. These results were in agreement with the homology analysis: DLK1 and CLPG genes were in a highly conserved.

【题目】Polymorphisms of MRF4 and H-FABP genes association with growth traits in Qinchuan cattle and related hybrids

【中文关键词】无
【英文关键词】Qinchuan cattle; PCR-RFLP; MRF4 gene; H-FABP gene; Polymorphism; Growth traits
【中文摘要】无
【英文摘要】PCR-RFLP was applied to analyse polymorphisms within the MRF4 and heart fatty acid-binding protein (H-FABP) gene for correlation studies with growth traits in three-month-old Qinchuan (QQ), Qinchuan x Limousin (LQ) and Qinchuan x Red Angus (AQ) cattle. The results showed that 874 bp PCR products of MRF4 digested with XbaI and 2,075 bp PCR products of H-FABP digested with HaeIII were polymorphic in the three populations. Moreover, the frequencies of allele A at MRF4 locus and allele B at H-FABP locus in the QQ, AQ, and LQ populations were 0.8358/0.8888/0.8273 and 0.8358/0.7500/0.8195 respectively. Allele A at MRF4 locus and allele B at H-FABP locus were dominant in the three populations. No statistically significant differences in growth traits were observed among the genotypes of the all three populations at H-FABP locus. However, the association of MRF4 polymorphism with growth traits was then determined in all three populations. The body weight, withers height, heart girth and height at hip cross of individuals with genotype AA were higher than those with genotype AB or BB ($P < 0.05$). Therefore, we suggest that the MRF4 gene may function in the control or expression of growth traits, particularly body weight, withers height, heart girth and height at hip cross.

【题目】The polymorphisms of bovine melanocortin-3 receptor pseudogene
【中文关键词】无
【英文关键词】Melanocortin-3 receptor; Polymorphisms; Cattle
【中文摘要】无
【英文摘要】Mammalian melanocortin-3 receptor (MC3R) plays an important role in the central control of energy homeostasis, and several functional polymorphisms of mc3r have been detected. Interestingly, the bovine mc3r was a pseudogene, and its polymorphisms and function remain to be investigated. Single-strand conformation polymorphism (SSCP) showed 5, 2 and 3 genotypes in fragment F1, F2 and F3 of mc3r in seven cattle breeds, respectively. All genotypes revealed novel sequences. Three SNPs 657G > T, 756C > T, 822T > C were detected in fragment Fl, five SNPs 1091T > C, 1133T > C, 1144C > T, 1259T > C and 1319G > A were detected in fragment F2, and two SNPs 1687G > A. 1860C > T were detected in F3. The SNPs in fragment Fl and F2 were located at exon 2. The five SNPs in fragment F2 demonstrated a tight linkage disequilibrium status. Variation detected here might have an impact on the function of bovine mc3r pseudogene. (C) 2010 Published by Elsevier Ltd.

【题目】Association analysis of thyroglobulin gene variants with carcass and meat quality traits in beef cattle
【中文关键词】无
【英文关键词】association analysis; beef cattle; SNP polymorphism; thyroglobulin gene
【中文摘要】无
【英文摘要】Thyroid hormones play an important role in regulating the metabolism and can affect the homeostasis of fat deposition. The gene encoding thyroglobulin (TG), producing the precursor for thyroid hormones, has been proposed as a positional and functional candidate gene for a QTL with an effect on fat deposition. In the present study, we identified 6 novel SNPs at the 3' flanking

region of the TG gene. The SNP marker association analysis indicated that the SNP markers G133C, G156A, C220T and A506C were significantly associated with marbling score ($P < 0.05$, N=271). Animals with the new homozygote genotype had higher marbling scores than those with the other genotypes. Besides, the linkage disequilibrium analysis indicated that these 4 SNPs were completely linked ($r(2) = 1$). Results of this study suggest that the TG-gene-specific SNP may be a useful marker for meat quality traits in future marker-assisted selection programmes in beef cattle.

【题目】Association of LXRA gene variants with carcass and meat quality traits in beef cattle
【中文关键词】无
【英文关键词】Cattle; LXRA gene; polymorphism; carcass; meat
【中文摘要】无
【英文摘要】LXRA is an important regulator of genes involved in lipid, fatty acid and glucose metabolism in liver, and adipose tissue as well as in skeletal muscle. In this study, we discovered and evaluated the association of two SNPs (T1891C in intron 2, and A2377G in exon 3) in the bovine LXRA gene with carcass and meat quality traits in beef cattle. The T1891C SNP was significantly associated with carcass weight (CW), dressing percentage (DP), meat percent (MP) and loin muscle area (LMA) ($P < 0.05$). Animals with the genotype TT had higher CW, DP, MP and LMA than the CT genotype. No significant associations were observed between the A2377G SNP and any traits analyzed in this study ($P > 0.05$). These results suggested that T1891C SNP of the LXRA gene may be useful as a genetic marker for carcass and meat quality traits in beef cattle.

【题目】Novel SNPs of the bovine GAD1/gad67 gene and their association with growth traits in three native Chinese cattle breeds
【中文关键词】无
【英文关键词】Bovine; GAD1 gene; PCR-SSCP; Growth trait
【中文摘要】无
【英文摘要】In this study, polymorphismin the exon 1, 2, 3, 4 and 5 of bovineGAD1 genewas detected by PCR – SSCP and DNA sequencing methods in 726 individuals from three Chinese cattle breeds. Two haplotypes (T and C) and three observed genotypes (TT, TC, and CC) were detected. The result of DNA sequence showed one mutations (T12345C) by comparisons with NC_007300: g.12345T[C. The mutation was at the exon 3, and was identi fi ed a missense mutation Phe (TTT)[Leu (CTT) at position 51 (p.F51L). Polymorphism of the GAD1 gene was shown to be associated with growth traits in the Nanyang breed. The SNP in the bovine GAD1 gene had signi fi cant effects on body length, bodyweight, heart girth, and average daily gain at 24 months (P\0.05). Therefore, these results suggest that the GAD1 gene is a strong candidate gene that affects growth traits in cattle.

【题目】Novel SNPs of the bovine NUCB2 gene and their association with growth traits in three native Chinese cattle breeds
【中文关键词】无
【英文关键词】Bovine; NUCB2 gene; PCR-SSCP; Growth trait
【中文摘要】无
【英文摘要】In this study, polymorphism in the exon 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 and 11 of bovine NUCB2 gene was detected by PCR-SSCP and DNA sequencing methods in 686 individuals from three Chinese cattle breeds. Two haplotypes (M and N), three observed genotypes (MM, MN and NN) and two SNPs (NC_007313: g. 27451G > A, NC_007313: g. 27472T > C) were detected. The frequencies of haplotypes M and N in inland Chinese three breeds were 0.531-0.721 and 0.279-0.469 respectively. The studied showed that Nanyang, Jiaxian Red and Qinchuan cattle populations were in Hardy-Weinberg equilibrium at SNPs locus of NUCB2 gene ($P > 0.05$). Polymorphism of the NUCB2 gene was shown to be associated with growth traits in Qingchuan and Nanyang cattle breed. The linkage of two mutant sites in the bovine NUCB2 gene had significant effects on body length, body weight, heart girth, and average daily gain at 24 months ($P < 0.05$). Results of this study suggested that the NUCB2-gene-specific SNP may be a useful marker for growth traits in future marker-assisted selection programmes in inland Chinese cattle.

【题目】Polymorphisms in the promoter region of bovine PRKAB1 gene
【中文关键词】无
【英文关键词】AMP-activated protein kinase beta 1 subunit gene; Promoter region; Single nucleotide polymorphism; Cattle
【中文摘要】无
【英文摘要】The AMP-activated protein kinase (AMPK) is an evolutionarily conserved sensor of cellular and systemic energy balance. PRKAB1, the gene that encodes the beta 1 regulatory subunit of AMPK, has been shown to be highly involved in the glycogen metabolism. To date, several mutations affecting function of human PRKAB1 have been identified, but few studies have shown a complete description of variability of the promoter region of PRKAB1. Therefore, the extent of genetic polymorphisms in the promoter region of PRKAB1 gene was investigated in a sample of 811 Chinese indigenous bovine individuals using a PCR-SSCP (single strand conformation polymorphism) strategy. Sequence analysis revealed 12 single nucleotide polymorphisms and one 10 bp insertion and one 4 bp deletion variations, which are within some important transcription factor binding sites: GC-Box factors SP1/GC, PAX-3 binding sites, zinc binding protein factors, nuclear respiratory factor 1, and serum response element binding factor. It is expected that these polymorphisms regulate PRKAB1 gene transcription and might have consequences at a regulatory level.

【题目】A new insight into cattle ’ s maternal origin in six Asian countries
【中文关键词】无
【英文关键词】cattle; D-loop; Asia; maternal origin; mtDNA
【中文摘要】无
【英文摘要】The domestication of cattle fuelled the development of agricultural society in the history of human being. The evolution and genetic relationship of cattle can be elucidated by investigating the variation of mitochondrial DNA (mtDNA) D-loop sequence. In this study, we built a cattle phylogeny with a pool of 856 individual D-loop sequences, of which 264 Chinese cattle D-loop sequences were obtained in this study (141 ones were first analyzed, and 123 were first submitted) and the rest sequences of cattle from six Asian countries (Japan, Korea, Mongolia, Nepal, India and China) were retrieved from GenBank. Our results indicated that cattle from six Asian countries fell into three clades, Bos taurus (taurine), Bos indicus (zebu) and yak. Four main haplogroups T1A, T2, T3 (including T3A and T3B) and T5 were found in taurine, and two haplogroups I1 and I2 in zebu. Furthermore, we found that I1 and I2 haplogroups were separated by four variable sites rather than five ones and four haplogroups or sub-haplogroups of T1A, T3A, T3B and T5 were found for the first time in these Asian cattle. These data brought us a new insight into cattle's genetic structure in these six Asian countries. The geographical distribution of haplogroups was also outlined to provide systematic information on cattle genetic resources.

【题目】TWO NOVEL CODING SNPs OF SREBP1c GENE ARE ASSOCIATED WITH BODY WEIGHT AND AVERAGE DAILY GAIN IN BOVINE
【中文关键词】无
【英文关键词】Cattle; Forced PCR-RFLP; Growth traits; SNP; SREBP1c gene
【中文摘要】无
【英文摘要】It is known that the SREBP1c gene is an important gene responsible for adipogenesis and regulation of the expression of genes controlling fatty acid biosynthesis. Its expression levels increase in parallel with obesity. Therefore, the present study focused on screening the genetic variation within bovine SREBP1c gene and analyzing its effect on growth traits in 1035 individuals belonging to four Chinese cattle breeds (QC, NY, JX, CH) using PCR-SSCP, DNA sequencing, and forced PCR-RFLP methods. The results revealed two novel mutations: NC_007317: g. 10781 CA (457aa), 10914 GA (502aa). Association analysis with growth traits in the Nangyang breed indicated that: The SNPs in the bovine SREBP1c gene had significant effects on body weight and average daily gain at birth, 6 and 12 months old (P0.05 or P0.01). Therefore, these results suggest that the SREBP1c gene is a strong candidate gene that affects growth traits in cattle.

【题目】SNP discovery and haplotype analysis in the bovine PRKAA2 gene
【中文关键词】无
【英文关键词】Cattle; PRKAA2; Haplotype; SNP; Phylogenetic tree

【中文摘要】无
【英文摘要】The evolutionarily conserved serine/threonine kinase, AMP-activated protein kinase (AMPK), functions as a cellular fuel gauge that regulates metabolic pathways in glucose and fatty acid metabolism and protein synthesis, and recent data demonstrate that it also plays a critical role in systemic energy balance. PRKAA2, the gene that encodes the alpha 2 catalytic subunit of AMPK, showed be involved in the glucose and lipid metabolism. To date, genetic variants in human PRKAA2 have been shown associations with type 2 diabetes (T2D) in several populations, but few studies show a complete description of the variability of bovine PRKAA2. In the present study, we reported the investigation of PRKAA2 genetic polymorphisms in three Chinese indigenous bovine breeds [Qinchuan (n = 328), Nanyang (n = 278), Jiaxian (n = 148)] and yak (n = 57). The screening of all exons including adjacent splice sites of the gene was performed using a PCR-SSCP strategy, and following sequence analysis revealed fifteen single nucleotide polymorphisms (SNPs). Five SNPs were identified in exons, which all generate synonymous mutations, and other identified variations were located in introns. Linkage disequilibrium (LD) coefficients and haplotype frequencies for some SNPs were investigated. In total, six haplotypes were found in the cattle breeds. Two LD blocks were found in Qinchuan cattle and three common haplotypes were identified based on four SNPs, with the most common haplotype (TGCT) occurring at a frequency of 53.7%; three of the four possible haplotypes were found in Nanyang cattle, with the most common haplotype (CT) occurring at a frequency of 56.3%; whereas, no suitable haplotypes were found in Jiaxian cattle and yak. Phylogenetic analysis showed that Qinchuan and Jiaxian were firstly clustered together, and then Nanyang was added to the branch. The yak (Poephagus grunniens) diverged strongly from the branch of the Bos Taurus. These data will provide a background for more extensive characterization of the bovine PRKAA2 gene, its diversity in different cattle breeds, and evolutionary information of Chinese cattle breeds.

【题目】Novel Mutation in TGA Stop[1]Codon of Bovine SIX6 Gene
【中文关键词】无
【英文关键词】SIX6 gene; stop-codon; mutation; ACRS-PCR; growth traits; cattle
【中文摘要】无
【英文摘要】As a transcriptional regulatory gene of the SIX family, SIX6 (also known as OPTX2, SIX9), probably affects pituitary development and secretion of hormones, suggesting that this gene is a potential candidate gene for studying association with growth trait in animals. Therefore, this study is first of all focused on detecting sequence variations in a bovine SIX6 gene and on its effects on growth traits in 1087 cattle from five Chinese cattle breeds using DNA sequencing and HhaI-ACRS-PCR methods. Herein, a novel mutation (NC_007308: g 2015T > C) in the TGA stop-codon of a bovine SIX6 gene was found, which leads to an ORF shift and extension of the encoded protein for four amino acids (Arg(223)-Gln(224)-Arg(225)-Val(226)). The frequency of allele "C" varied from 0.255 (Chinese Holsteins) to 0.614 (Hasake). They all were in the Hardy-Weinberg equilibrium except Jiaxian Red and Hasake cattle. Using amino acid sequence alignment and online prediction software, a new helix in the C-terminal domain of the mutated bovine SIX6 protein was revealed, which possibly affects pituitary development and hormone secretion. So, relationship analysis between this polymorphism and growth traits in the Nanyang breed was carried out based on a proper linear model. Although no statistically significant associations were observed (P > 0.05), the presented work preliminarily demonstrated a novel mutation in the TGA stop-codon which extends the spectrum of genetic variations of the bovine SIX6 gene and might be of interest in terms of its association with other biophysical and biochemical indexes.

【题目】牛pAcGFP-FADD融合蛋白真核表达载体构建及在CHO-K1细胞中的表达
【中文关键词】FADD; pAcGFP-Nl; 重组质粒; CHO-K1细胞;
【英文关键词】FADD; pAcGFP-Nl; recombinant plasmid; CHO-K1 cell;
【中文摘要】FADD是Fas/FasL系统的一个信号连接蛋白,通过传递凋亡信号,介导细胞凋亡。为了揭示FADD在牛卵泡发育过程中的调控作用,采用RT-PCR从牛卵巢组织中扩增FADD基因,将其cDNA终止密码子删除,采用定向克隆技术连接到带有水母绿色荧光蛋白(AcGFP)报告基因的真核表达载体pAcGFP-Nl中,构建融合蛋白重组质粒,经BglⅡ/EcoRⅠ酶切、测序鉴定后,用脂质体介导质粒转染CHO-K1细胞,观察有无荧光的表达及用RT-PCR和Western blotting方法检测基因转录、表达情况。结果表明,成功克隆牛FADD基因,通过PCR方法在FADD阅读框两端引入了BglⅡ和EcoRⅠ克隆位点,并于起始位点前加入Kozak序列,成功构建pAcGFP-bFADD融合蛋白真核表达载体,重组质粒转染CHO-K1 24 h后在荧光显微镜下观察到绿色荧光,转染效率可达65%,通过RT-PCR扩增出654 bp的转录产物,并用Western blotting检测到51.4 kD目的蛋白的表达。
【英文摘要】Fas-associated death domain(FADD) is a signal connection protein in Fas/FasL apoptotic path which might play a key role on apoptosis by transferring apoptotic signal.To reveal the intracellular signal transduction molecules involved in the procedure of follicular development in bovine ovary,we cloned FADD gene in bovine ovary tissue with RT-PCR,deleted the termination codon in its cDNA and directionally cloned the amplified FADD gene into eukaryotic expression vector pAcGFP-Nl including AcGFP,successfully c...

【题目】3个黄牛品种的myostatin 5′调控区多态与生长性状的相关分析
【中文关键词】myostatin 5′调控区; 突变; 生长性状; 黄牛;
【英文关键词】myostatin 5′regulatory region; mutations; growth traits; cattle;
【中文摘要】用PCR-RFLPs方法对南阳牛、秦川牛、郏县红牛3个品种共411个个体的myostatin5′调控区的单核苷酸多态性(SNPs)进行分析。结果表明,3个品种在myostatin5′调控区T→A突变以等位基因T为主,仅在郏县红牛中发现1个AA型纯合体,郏县红牛品种显著偏离Hardy-Weinberg平衡状态(P<0.05),其它品种处于Hardy-Weinberg平衡状态(P>0.05)。对黄牛myostatin5′调控区T→A突变与南阳牛、秦川牛和郏县红牛生长性状进行相关分析,结果显示,TT型南阳牛6月龄的胸围和胸围指数显著低于TA型个体,TT型南阳牛18月龄的体高显著高于TA型个体(P<0.05),但基因型对秦川牛和郏县红牛生长性状的效应不显著(P>0.05)。提示在南阳牛的育种实践中应该综合考虑南阳牛生长阶段和所要选择的性状。
【英文摘要】Single nucleotide polymorphisms(SNPs) of myostatin 5′regulatory region in Nanyang,Qinchuan and Jiaxian Red cattle breeds were analyzed by PCR-RFLPs.The results showed that the allele T was dominant in the three breeds for the T→A mutation,and only one homozygous AA individual was detected in Jiaxian Red cattle which was at Hardy-Weinberg disequilibrium(P<0.05).The Nanyang and Qinchuan populations were at Hardy-Weinberg equilibrium(P>0.05).The effects of the T→A mutation on growth traits of the three b...

【中文关键词】郏县红牛; PCR-RFLP; DGAT2; 生长性能;
【英文关键词】Jiaxian red cattle; PCR-RFLP; DGAT2; growth traits;
【中文摘要】利用PCR-RFLP技术对随机抽取的92头郏县红牛的DGAT2基因进行多态性分析。结果表明,DGAT2基因第6内含子的PCR扩增产物被限制性酶Taq Ⅰ酶切消化后表现多态性。经电泳检测后,显出AA、AB两种不同基因型。该基因座处于Hardy-Weinberg平衡状态,通过对郏县红牛DGAT2基因多态性与体重及体尺指标的方差分析显示:郏县红牛DGAT2基因不同基因型对郏县红牛体重和体长有显著影响(P<0.05),而对其他体尺指标在统计学上无显著影响(P>0.05),且初步认为AB基因型对选择有正向效应。
【英文摘要】The polymorphisms of DGAT2 gene in 92 Jiaxian red cattle were analyzed using PCR-RFLP method. Results showed that the PCR products digested with TaqI demonstrated polymorphisms, and showed two kinds of genotype: AA and AB. This polymorphic locus of DGAT2 gene was at Hardy-Weinberg equilibrium (P>0.05). The results of general linear model analysis showed that polymorphisms of DGAT2 gene had significant association (P<0.05) with body weight and body length, while had no significant association with othe...

【题目】郏县红牛ZAG基因多态性与生长性状的相关性
【中文关键词】郏县红牛; ZAG基因; PCR-SSCP; 生长发育性状;
【英文关键词】Jiaxian red cattle; ZAG gene; PCR-SSCP; growth and development traits;
【中文摘要】ZAG基因的功能主要是促进脂肪分解,减少脂肪含量。文章利用PCR-SSCP和DNA测序技术研究了145头郏县红牛ZAG基因编码区4个位点(Z1、Z2、Z3、Z4)的多态性,发现Z1、Z3、Z4位点存在SSCP多态。对不同SSCP带型的对应片段进行了测序分析,共发现6个新的SNP多态位点(C115T、A3257G、A4013G、T4027C、C4032T、T4120C)。Z3位点处于Hardy-Weinberg平衡状态,Z1、Z4位点处于非平衡状态。不同基因型与生长发育性状的相关性分析显示,Z4位点上,AC基因型个体的体斜长、胸围、管围、体重指标显著(P<0.05)或极显著(P<0.01),大于AA、AB基因型个体,暗示该位点有可能作为郏县红牛生长性状标记辅助选择的标记之一。
【英文摘要】The main function of ZAG gene is to enable the decomposition of fat,and reduced fat content.In this study, polymorphisms of four loci(Z1,Z2,Z3,Z4)at the coding region of the bovine ZAG gene were detected in 145 Jiaxian red cattle,and polymorphisms were found on Z1,Z3,Z4 loci.The fragments showing different SSCP patterns were sequenced, nd a total of six SNPs(C115T,A3257G,A4013G,T4027C,C4032T,and T4120C)were found.The Z3 locus of ZAG gene was at Hardy-Weinberg

equilibrium,while Z1 and Z4 loci of ZAG gene wer...

【题目】中国地方牛CCK基因第1外显子的多态性及其与生产性状的相关性
【中文关键词】牛; SNPs; 胆囊收缩素基因; PCR-RFLP; 生产性状;
【英文关键词】cattle; SNPs; CCK; PCR-RFLP; growth traits;
【中文摘要】【目的】研究中国本地牛胆囊收缩素(Cholecystokinin,CCK)基因第1外显子的多态性及其与南阳牛生产性状的关系,为中国地方牛品种的选育提供参考。【方法】利用PCR-RFLP和DNA测序技术,研究了6个中国本地牛品种(南阳牛、秦川牛、郏县红牛、鲁西牛、草原红牛和荷斯坦奶牛)1390头个体CCK基因的多态性,并分析其多态性与南阳牛生产性状的相关性。【结果】DNA池测序结果发现,CCK基因第1外显子有2个新的SNP多态位点(1 224 T→C,1 275 G→C),其中1 275 G→C是一个错义突变,该突变导致1个内切酶PVUⅡ切割位点的消失,表现为GG、GC、CC 3种基因型。3种基因型在南阳牛、秦川牛、郏县红牛、鲁西牛、草原红牛和荷斯坦奶牛CCK基因第1外显子G等位基因的频率分别为0.744 0,0.947 0,0.888 5,0.956 3,0.756 3,0.957 0;C等位基因频率分别为0.256 0,0.053 0,0.111 5,0.043 7,0.243 7,0.043 0。不同基因型与南阳牛生产性状的相关分析表明,GC和CC基因型个体除了与初生质量和6月龄性状指标不相关外,与12,...
【英文摘要】【Objective】 The study was to study the polymorphism of the missense mutation in exon 1 of CCK gene and the association with the production traits in Nanyang cattle,in order to provide reference for the breeding of Chinese local cattle.【Method】 DNA sequencing and PCR-RFLP were applied to analyze the polymorphism of CCK gene in 1390 individuals that comprised six Chinese native cattle(Nanyang cattle,Qinchuan cattle,Jiaxian Red cattle,Luxi cattle,Caoyuan Red cattle and Holstien cow),and associated with the gro...

【题目】固原本地黄牛及其利杂群体Pit-1基因多态性与育肥性状的关系
【中文关键词】固原本地黄牛; 利木赞牛杂交群体; Pit-1基因; PCR-RFLP; 育肥性状;
【英文关键词】Guyuan local cattle; crossbreed of Limousin×local cattle; Pit-1 gene; PCR-RFLP; fattening trait;
【中文摘要】为了分析固原本地黄牛及其利木赞牛杂交群体(简称利杂群体)Pit-1基因的多态性与育肥性状的关系,为固原本地黄牛下一步的杂交改良提供理论基础,利用PCR-RFLP技术研究了固原本地黄牛及其利杂群体共178个个体的Pit-1基因多态性,并分析了其与育肥个体育肥性状的相关性。结果表明,451 bp的PCR产物被限制性内切酶HinfⅠ消化后表现出多态性,固原本地黄牛及其利杂群体在该位点均处于Hardy-Weinberg平衡状态,等位基因A/B的频率分别为0.3039/0.6961和0.1614/0.8386。与部分育肥性状的相关分析表明,在育肥的初期阶段,BB型和AB型个体的精料料肉比均显著低于AA型个体(P<0.05);7月龄育肥牛BB型个体的胸深显著低于AA型,而胸宽显著高于AA型(P<0.05);育肥牛6~12月龄体长增长量也表现出BB型个体优于AB型的趋势(P<0.05)。初步认为,BB基因型与优良的育肥性能显著相关,对B等位基因的选择有利于优良性状的改良。
【英文摘要】PCR-RFLP was applied to analyze the polymorphisms of Pit-1 gene in 178 Guyuan local cattle and crossbreed of Limosin×local cattle,and then the association with fattening traits had been analyzed.The results showed that 451 bp PCR products digested with HinfⅠ demonstrated polymorphisms in Guyuan local cattle and crossbreed of Limosin×local cattle which were all at Hardy-Weinberg equilibrium,and the frequencies of allele A/B were 0.303 9/0.696 1 and 0.161 4/0.838 6,respectively.The association of polymorphism...

【题目】牛FADD基因的克隆分析及其真核表达载体的构建
【中文关键词】FADD基因; pAcGFP-Nl载体; 融合蛋白; 重组质粒;
【英文关键词】FADD gene; pAcGFP-Nl vector; fusion protein; recombinant plasmid;
【中文摘要】【目的】克隆牛FADD基因并构建真核表达载体,以探讨其在牛卵泡发育过程中的调控作用。【方法】采用RT-PCR技术,从牛卵巢组织总RNA中反转录FADD cDNA,对编码区核苷酸序列分析后,将其全长cDNA删除终止密码子,采用定向克隆技术连接克隆到含有水母绿色荧光蛋白(AcGFP)报告基因的真核表达载体pAcGFP-Nl中,用BglⅡ、EcoRⅠ双酶切、测序进行鉴定,并进行了牛FADD mRNA的组织表达谱分析。【结果】克隆的牛FADD基因编码区全长序列与NCBI公布的序列完全一致,核苷酸和氨基酸序列与猪的同源性最高,与鸡的同源性最低,仅为42.5%和44%;通过PCR方法在FADD阅读框两端引入了BglⅡ和EcoRⅠ克隆位点,并于起始位点前加入Kozak序列,成功构建pAcGFP-N1-bFADD融合蛋白表达载体。组织表达谱分析表明,牛FADD mRNA高表达于肝脏、淋巴组织及睾丸、卵巢组织,在小肠、心、胰腺、肺、肾及肌肉中则弱表达或无表达。【结论】成功克隆了牛FADD基因,并构建pAcGFP-N1-bFADD融合蛋白表达载体,为FADD基因在牛卵母细胞发育调控中的基础研究提供了一种简便可靠的方法。
【英文摘要】【Objective】Cattle FADD gene was cloned and its eukaryotic expression vector was constructed to exploit the gene s regulation role in the procedure of follicular development in bovine ovary.【Method】The FADD gene was amplified in cattle ovary tissue by RT-PCR,the nucleotide sequence in the coding region was analyzed and the termination codon in its cDNA was deleted.The amplified FADD gene was directionally cloned into eukaryotic expression vector pAcGFP-Nl including AcGFP,then identifed by restrictive enzyme ...

【题目】牛MyoD1基因遗传变异及其对胴体性状的影响
【中文关键词】牛; MyoD1基因; 多态性; 基因效应;
【英文关键词】cattle; MyoD1 gene; polymorphism; genetic effect;
【中文摘要】运用DNA池快速测序法寻找牛MyoD1基因SNPs,筛查到1个新的多态位点C1867T,该位点C-T突变引起甘氨酸/丝氨酸的转变。运用PCR-RFLP法验证并分析该位点在不同群体间的多态性,并与相应牛群体的胴体性状进行关联分析。结果显示,中国西门塔尔牛、鲁西牛群体的C1867T位点的突变达到了Hardy-Weinberg平衡状态,而秦川牛未达到平衡状态。不同基因型对肉牛的背膘厚、大腿肉厚的影响差异极显著或显著($P<0.01$或$P<0.05$),对日增重、屠宰率、肌间脂肪、大理石花纹、嫩度的影响差异不显著。

【英文摘要】Based on gene pooling and sequencing,a new SNPs was found on the bovine MyoD1 gene,its transition C-T leads to a reaplacement of glicine with serine.Polymorphism and relationship with the carcass traits was analysised by PCR-RFLP in different populations.The transition of this locus fit in with Hardy-Weinberg equilibrium in Chinese-simmental cattle and Luxi cattle,but not in Qinchuan cattle.Statistical analysis revealed higher value in back fat and thickness of thigh(P<0.05),not in average daily growth,y...

【题目】牛Fas基因的组织表达分析及其功能预测
【中文关键词】Fas/APO-1/CD95; 基因克隆; 序列分析; 牛;
【英文关键词】Fas/APO-1/CD95; gene cloning; sequence analysis; cattle;
【中文摘要】采用RT-PCR技术从中国西门塔尔牛睾丸组织总RNA中反转录FascDNA,将其克隆于pMD19-Tvector后进行测序分析,并对其表达的蛋白结构功能进行预测、分析。结果表明:牛的FascDNA序列为1109bp,编码323个氨基酸残基,在氨基酸序列上与羊、猪、人、小鼠的相似性分别为90.5%、65.3%、56.7%和48.6%。Fas蛋白的胞外区有2个糖基化位点和3个富含半胱氨酸残基的结构亚域,对Fas蛋白的定位及凋亡信号识别有重要作用。牛与羊、猪、人、小鼠Fas的死亡结构域(Death domain,DD)氨基酸序列的相似性分别为94.3%、68.5%、59.6%和70.8%,体现了该结构在各物种间较强的保守性及接受凋亡信号诱导靶细胞凋亡的重要性。组织表达谱发现,Fas不仅表达于牛的淋巴、脾等淋巴系统,而且高表达于牛生殖系统的睾丸中,这对于进一步阐明Fas在公牛精子发生过程中的调控作用奠定基础。
【英文摘要】The Fas cDNA gene was amplified from the RNA of simmental cattle testis by polymerase chain reaction(PCR), the PCR products were cloned into PMD19-T vector and sequenced.The results showed that bovine Fas cDNA consisted of 1 109 bp and encoded 323 amino acid residues.The identities of the deduced amino acid sequence of the cattle Fas to sheep, pig, human and mouse were 90.5%,65.3%,56.7% and 48.6%, respectively.There were two N-linked glycosylation sites and three cysteine-rich domains(CRD)in the extracellul...

【题目】Mapping of Quantitative Trait Loci for Hematological Traits on Pig Chromosome 10
【中文关键词】无
【英文关键词】Pig; microsatellite; QTL mapping; chromosome; hematological traits; likelihood ratio
【中文摘要】无
【英文摘要】This study was aimed to identify Quantitative Trait Loci (QTL) for haematological traits in pig chromosome 10 and facilitate the cloning of candidate genes underlying the QTLs. Hematological traits are essential parameters for evaluating the health status of animals and play a extremely important role in disease resistance. In this study, three main components, leukocyte traits, erythrocyte traits and platelet traits were measured in a composite pig population consisting of 445 pigs of three breeds (Landrace, Large White and Songliao Black Pig) distributed in 16 boar families, before and after vaccination with modified live CSF (classical swine fever) vaccine. A partial genome scan for mapping Quantitative Trait Loci (QTL) for these traits was performed by genotyping 13 microsatellite markers on chromosome 10. Through a linear mixed model and the permutation for empirical threshold values, 4 significant QTLs on chromosome 10 were identified affecting hematocrit (HCT), hemoglobin (HGB), Mean Corpuscular Volume (MCV) and blood platelet counts (PLT) (p<0.05), respectively. Our results confirms that haematological traits variation differs between

the three pig breeds and variations of HCT, HGB, MCV, PLT are associated with the 81 similar to 133 cM region in chromosomal 10.

【题目】当归对冷应激断奶仔猪生理机能的影响
【中文关键词】当归;断奶仔猪;冷应激
【英文关键词】Angelica;weaning piglets;cold stress
【中文摘要】选取 25 日龄断奶的大约克仔猪 96 头,胎次相似,体重一致,随机分为 4 组,C 组为对照组,饲喂基础日粮,L、M、N 组在基础日粮基础上分别添加 0.5 %、1 %、1.5 %的中草药当归,对猪进行冷应激。 试验结果表明,各试验组猪只体重及平均日增重均高于对照组,NO 含量显著降低,GSH-Px 活性及白细胞和红细胞的数量明显升高,表明中草药当归对断奶仔猪有明显的抗冷应激及促生长作用。
【英文摘要】96 Yorkshire piglets with similar parity and body weight weaned at 25-day-old were selected and divided into 4 groups. Group C was control group and fed with basal diet,Group L,M,N were fed with basal diet supplemented with 0.5 %,1 %,1.5 % Angelica respectively.Piglets were suffered cold stress (12±1 ℃) for 14 d.The results showed that NO contents in the groups of Angelica significantly decreased compared with the control group,the body weight, average daily gain, GSH-Px activities, RBC and WBC amounts in the groups of Angelica increased.These results indicated that Angelica had significantly effects on growth-promotion and anti-cold stress in weaning piglets.

【题目】副猪嗜血杆菌安徽分离株的致病性与RELP基因型的相关性研究
【中文关键词】HPS;致病性;tbpA;RFLP基因型
【英文关键词】HPS;Pathogenicity;tbpA;RFLP genotypes
【中文摘要】为了研究PCR限制性酶切电泳长度多态性试验(PcR.RELP)-b副猪嗜血杆菌(HPS)对豚鼠的致病性,本研究采用PCR-RELP分析12株HPS安徽分离株的tbpA基因,并将12株HPS分为5种不同的RELP基因型 (AAA、BBB、BAB、BAC、CAB);12株HPS对豚鼠的致病性试验表明,致病性最强的RELP基因型为BAC,其次是AAA和CAB,无致病性的为BBB和BAB型。进一步分析12株HPS的tbpA基因序列系统进化关系发现,PIPS的RFLP基因型的不同,其致病性存在差异,表明tbpA是影响HPS致病性的重要因素。
【英文摘要】To investigate the relationship of PCR—restriction fragment length polymorphism (PCR—RELP)with the pathogenesis of Haemophilus parasuis(HPS)to guinea pig,the 12 HPS isolates from Anhui Province were classified into 5 diferent RELP genotypes(AAA、BBB、BAB、BAC、CAB)based on the nucleotide sequences of the tbpA gene.Phylogenetic analysis of tbpA gene was consistent with RFLP assay with closer evolution elationship.Guinea pigs regression test and RFLP demonstrated that tbpA gene of HPS isolates is closely related with the virulence of HPS.

【题目】安徽PRSS发病猪副猪嗜血杆菌的分离鉴定及其耐药性分析
【中文关键词】副猪嗜血杆菌; 猪繁殖与呼吸综合征;继发感染;分离鉴定;耐药性
【英文关键词】Haemophilus parasuis; PRRS; Secondary infection; Isolation and identification; Antimicrobial-resistance
【中文摘要】目的 了解猪繁殖与呼吸综合征 (PRRS)发病猪继发感染副猪嗜血杆菌 (HPS)的情况及分离菌株的药物感受性。方法 应用细菌分离培养、 形态学检查、 生化试验和 PCR技术 ,对 2007年 1月至 2008年 12月从安徽不同地区采集的 146头份 PRRS发病猪的病料进行 HPS检测 ,并采用标准 K2 B纸片法对分离菌株进行 14种抗菌药物敏感试验。结果 分离鉴定出 12株 HPS ,检出率为 8 . 22% (12 /146) ; 12株 HPS对氯霉素 100%敏感 ,环丙沙星为 91 . 7% ,阿莫西林和新霉素为 83 . 3% ,对罗红霉素 100%耐药 ,阿米卡星为 83 . 3%。结论 安徽省不同地区PRRS感染猪群中均存在程度不同的 HPS感染 ,各地区 HPS分离株表现出形态上的变化特征和一致的生化特性 ,且有对临床常用抗菌药物耐药性增强的趋势。
【英文摘要】Objective To analyze the secondary infection and drug-susceptibility of HPS isolates from the pigs infected with PRRS . Method Based on the bacteria morphology, Gram ′ s staining results, bacteria growth requirements, colonial morphology, biochemical properties and PCR, 146 samples from the pigs infected with PRRS were examined for HPS during January 2007 and Decemeber 2008 in Anhui Province . Antibiotic sensitivity of the isolated strains were detected with fourteen kinds of antibiotics by K2 B method . Result Twelve strains of HPS were isolated from the pigs infected with PRRS .The total detection rate of HPS was 8 . 22% (12 /146) . The HPS isolates were resistant t o Roxithromycin (100%) and Amikacin (83 .3%) ,while they were still sensitive t o Chloramphenicol (100%) , Cip-rofloxacin and Amoxicillin (83 . 3%) . Conclusion The pigs infected with PRRS in Anhui Province was secondarily infected by HPS to some degrees . These HPS isolates had non-identicalmorphology and identical biochemical characteristics, and their antimicrobial-resistance tended to increase .

【题目】安徽省猪圆环病毒2型毒株的分离与鉴定
【中文关键词】猪圆环病毒2型; 安徽株; 分离; 鉴定
【英文关键词】Porcine circovirus type 2; Anhui strains; Isolation; Identification
【中文摘要】目的 从病原学角度了解安徽省猪群中PCV2的感染情况。方法 PCR检测临床疑似PCV2感染的病料, 阳性病料接种于PK15细胞中进行PCV2的分离和增殖, 再经PCR 检测、间接免疫荧光试验、电镜观察, 以及ORF2基因序列分析等鉴定。结果 9份临床病料中均扩增出630 bp 的PCV2特异性DNA片段, 分离鉴定获得5株PCV2, 分离毒株之间及其与27株国内外参考毒株之间的ORF2基因序列同源性在87. 3% ~ 99. 8%。结论 首次从病原学角度证实安徽省猪群中PCV2感染的普遍存在, 分离毒株与国内外参考毒株的同源性均较高。
【英文摘要】Objective To understand the infection of procine circovirus type 2 (PCV2) in Anhui province from etiological point of view. Method The clinical samples with suspected infection of PCV2 w ere detected by PCR. Positive samples were inoculated into PK15 cells to isolate and replica tePCV2. The isolated viruses were identified by PCR, indirect immunofluo rescence test(IFA), electron microscopy, sequence analysis of ORF2 gene and so on. Result The 630 bp specific DNA fragment of PCV2 w as amplified from 9 clinical samples, 5 PCV2 starins were isolated, and the sequence of ORF2 genes of the 5 PCV2 isolates w as com pa red with 27 reference strains registered in GenBank, and the homology were from 87. 3% to 99. 8%. Conclusion The infection of PCV2 exists widespreadly in pig s in Anhui province, and these strains are of high homology.

【题目】安徽省猪圆环病毒2型感染的流行病学调查
【中文关键词】猪圆环病毒2型;流行病学;ELISA;PCR
【英文关键词】Porcine circovirus type 2;Epidemiology;ELISA;PCR
【中文摘要】目的 了解安徽地区猪群中猪圆环病毒2 型(PCV2) 的感染状况。方法 应用酶联免疫吸附试验(EL ISA) 对采自安徽省14个地(市)的468份血清样品进行PCV2抗体检测, 并运用PCR技术同步进行PCV2核酸检测。结果 PCV2抗体检测的平均阳性率为74. 36%, 且阳性率随猪的日龄增长而升高, 皖南地区的阳性检出率明显高于淮北和江淮两个地区, PCR与ELISA 检测结果的符合率为99. 37%。结论 安徽省猪群中普遍存在PCV2的感染, 病毒血症与抗体共存现象显著。
【英文摘要】Epidemiologic investigation on porcine circovirus type 2 in AnhuiObjective To understand the infection of porcine circovirus type 2 (PCV2) in Anhui province. Method 468 serum samples from 14 areas in Anhui were detected for antibodies against PCV2 by EL ISA and for PCV2 by PCR. Result Average positive ratio of antibodies against PCV2 in 468 serum samples were 74. 36%. The positive ratio of antibodies against PCV2 increased as pig grew in days. The positive ratio of antibodies against PCV2 in southern Anhui wassignificantly higher than that in areas north of the Huai River and in areas between Yangtze River and Huai River. There are 99. 37% conformity between PCR and ELISA. Conclusion The infection o f PCV2 exist widespreadly in pigs in Anhui There is the phenomenon o f co-existence between viremia and antibody against PCV2.

【题目】PRRSV感染猪体内多杀性巴氏杆菌的分离与血清型鉴定
【中文关键词】猪繁殖与呼吸综合征; 多杀性巴氏杆菌; 分离; 血清型

【英文关键词】porcine reproductive and respiratory syndrome; Pasteurella multocida; is-olation; serotype
【中文摘要】应用常规方法和 PCR技术, 对来自安徽肥西、庐江、肥东、定远、桐城 5个地区猪场检测为猪繁殖与呼吸综合征病毒 (PRRSV) 阳性的肺脏进行多杀性巴氏杆菌 (Pm) 的分离及其血清型鉴定。结果显示, 49份病料中分离鉴定出 7株 Pm , 且均属于 A型, 分离率为 14.3%, 高于其他细菌 (副猪嗜血杆菌、猪链球菌) 的检出率。表明猪繁殖与呼吸综合征 (PRRS) 患猪继发或混合感染 Pm的比率较高, 而且 A型 Pm是安徽省感染猪群中的主要血清型。
【英文摘要】A total of 49 lung samp les were collected from the infected pigs with porcine reproductive and respirat ory syndrome virus(PRRS V) in the five districts of Anhui, including Feixi, Lujiang, Feidong, Dingyuan, Tongcheng . Seven strains of Pasteurella multocida were is olated from the samples and all identified t o be serotype A using conventional method and polymerase chain reaction . The detection rate was 1413% and higher than those of other bacteria (Haemophilus parasuis, Streptococcus suis) . The results indicated that there was a high infection of Pm ultocida in the pigs suffered from porcine reproductive and respiratory syndrome and serotype A was dominant in Anhui .

【题目】中草药对断奶仔猪抗冷应激机能的影响
【中文关键词】中草药;断奶仔猪;冷应激;抗氧化功能;生理机能
【英文关键词】Chinese herbal medicine; weanling piglets; cold stress; antioxidant ability; physiological functions
【中文摘要】选用黄芪、 红景天、 当归3味中草药,对33日龄断奶仔猪在(14±1) ℃条件下进行了慢性冷应激(5 d)试验,通过测试仔猪的血清中NO含量、 谷胱甘肽过氧化物酶(GSH-PX)活性、 红细胞和白细胞数量等指标来探索中草药对冷应激断奶仔猪抗氧化功能和生理机能的作用。 结果表明,与对照组相比, 1%当归组和1%红景天组断奶仔猪血清中NO含量、 GSH-Px 活性、 红细胞及白细胞数量变化差异不显著(p>0.05); 1%黄芪组断奶仔猪血清中 NO 含量极显著下降(p<0.01),而 GSH-Px 活性、 红细胞及白细胞数量极显著升高(p<0.01),说明黄芪可使冷应激引起的 NO 含量、 GSH-PX 活性明显发生变化,具有抗氧化功能和生理机能促进作用。
【英文摘要】To explore the effects of traditional Chinese medicines (Astragalus, Angelica and rhodiola) against cold stressof weanling piglets, the experiment of chronic (for 5 d) cold stress (14 ±1℃) was conducted to 33 day-old weanling piglets, and then, the NO content, the glutathione peroxidase (GSH-Px) activities, the red blood cell (RBC) amount and the white blood cell (WBC)

amount in serum of the weanling piglets were examined. The results showed that in comparison with control group, the changes of GSH -Px activities, RBC amount and WBC amount in serum of the weanling piglets in 1% of Angelica group and 1% of rhodiola group were not significant ($p>0.05$); the NO content in serum of the weanling piglets in 1% of Astragalus group decreased extremely significant ($p<0.01$), but the GSH-Px activities, RBC amount and WBC amount increased extremely significant ($p<0.01$), which means Astragalus can change the NO content and GSH-Px activities that caused by cold stress significantly. Therefore, Astragalus has antioxidant ability and promotion of physiological function.

【题目】Molecular characterization and expression analysis of MHC class II α and ß genes in large yellow croaker (Pseudoaena crocea)

【中文关键词】Suhong Yu, Jingqun Ao, Xinhua Chen

【英文关键词】Large yellow croaker (Pseudosciaena crocea) – MHC class II α gene – MHC class II β gene – Inactivated trivalent bacterial vaccine – Polyinosinic polycytidylic acid – Expression modulation

【中文摘要】MHC class II molecules play an important role in the activation of CD4(+) T cells, which are the central orchestrating cells of an immune response. Here, we report the cloning of MHC class II alpha and beta cDNAs from large yellow croaker (Pscr-DAAs and Pscr-DAB) by expressed sequence tags analysis and RACE-PCR techniques. Three different class II alpha and two class II beta sequences were obtained from spleens of two individual fish. Each of the three class II alpha sequences encodes a polypeptide of 239 amino acids while the two class II beta cDNA sequences encode for a protein of 249 aa. All the characteristic features of MHC class II chain structure could be identified in the deduced proteins of three class II alpha and two class II beta sequences, including the leader peptide, alpha1/beta1 and alpha2/beta2 domains, connecting peptide and transmembrane and cytoplasmic regions, as well as conserved cysteines and N-glycosylation site. RT-PCR analysis showed that MHC class II alpha and beta mRNAs were broadly expressed in various tissues examined, although at different levels. Upon stimulation with inactivated trivalent bacterial vaccine or polyinosinic polycytidylic acid (poly(I:C)), the expression levels of both alpha and beta genes were obviously up-regulated in intestine, kidney and spleen. Real-time PCR analysis demonstrated that the expression levels of class II alpha and beta were quickly up-regulated in spleen, kidney, and intestine at 12 h after induction with poly(I:C), while their expression levels significantly increased at 48 h upon immunization with bacterial vaccine, indicating that the up-regulation of both class II alpha and beta expression was induced by bacterial vaccine or poly(I:C) at the early phase of induction, and that class II alpha and beta transcripts were quicker up-regulated by poly I:C than by bacterial vaccine.

【题目】The up-regulation of large yellow croaker secretory IgM heavy chain at early phase of immune response
【中文关键词】Chen Tian, Jingqun Ao, Xinhua Chen
【英文关键词】Large yellow croaker - Pseudosciaena crocea - Immunoglobulin M heavy chain - Poly (I: C) - Inactivated trivalent bacterial vaccine - Expression modulation
【中文摘要】An immunoglobulin M (IgM) heavy-chain gene homologue was isolated from the spleen cDNA library of the large yellow croaker Pseudosciaena crocea (LycIgH). The complete cDNA of LycIgH is 1,987 nucleotides long, encoding a protein of 585 amino acids with a putative molecular weight of 64.5 kDa. The deduced LycIgH possesses a typical secretory IgM heavy chain organization with a variable region (V(H)) connected to four constant regions (C(H1-4)) by a diversity segment (D(H)) and a joining segment (J(H)). Tissue expression profile analysis showed that LycIgH was constitutively expressed in gills, intestine, liver, kidney, heart, spleen, muscle, and blood, while at a higher level in spleen, kidney and intestine. Upon stimulation with poly (I: C), the LycIgH transcripts were quickly increased in spleen and kidney at 12 h post induction (with 5.87- and 5.48-fold mRNA increases, respectively), followed by a recovery to normal level at 24 h. The LycIgH transcripts in spleen and kidney induced by inactivated bacterial vaccine reached their peak levels at 48 h (14.53-fold) and 12 h (3.70-fold), respectively. These results indicated the up-regulation of LycIgH expression in spleen and kidney by poly (I: C) or bacterial vaccine occurred at the early phase of induction and was differentially modulated in the two tissues by different stimulations.

【题目】春玉米穗位叶叶绿体超微结构对农田管理措施的响应
【中文关键词】春玉米;叶绿体;超微结构;管理措施
【英文关键词】Spring maize;Chloroplast;Ultrastructure;Managements
【中文摘要】以春玉米为研究对象,利用透射电镜(TEM)对灌水、有机培肥和氮肥施用作用下的穗位叶叶绿体超微结构进行了表征。结果显示,随着灌水量、有机培肥量及施氮量增加,叶绿体的超微结构逐渐完整,被膜逐渐清晰,基质片层增加且排列规则,基粒垛叠变丰富,且片层清晰,淀粉粒数量增加,嗜锇颗粒减少。与其他处理相比,灌水量每盆每天1 200mL、有机

培肥量每亩4 000kg和施氮量每亩23kgN处理的叶绿体超微结构显示出较大的优势。与一次追肥相比,二次追肥和控释一次深施的施氮方法更能使叶绿体呈现一个完整的膜系统结构。分析结果表明,叶绿体超微结构的正常与否可以作为判断植株细胞活性的一个重要指标;合理的农田管理措施能够使春玉米叶片叶绿体的超微结构更加稳定,有利于春玉米的高效生产。

【英文摘要】Spring maize was selected as research object,and the characteristics of chloroplast ultrastructure of ear leaves wereevaluated with scanning electron microscopy(SEM)as affected by irrigation,organic manure fertilization and nitrogen application.The results showed that with increasing irrigation amount,organic manure fertilization amount and nitrogen application amount,the chloroplast ultrastructure gradually became integrated,the membrane envelope of chloroplast became clear,the stroma lamellae increased and arranged regularly,the grana were clear and stacked increasingly,the starch particles increased andthe osmiophilic grains decreased.Compared with other treatments,irrigation,organic manure fertilization and nitrogen application at a rate of 1 200milliliter per pot and per day,4 000kilogram per mu and 23kilogram N per mu could make the chloroplastultrastructure show greater predominance.Compared with one topdressing,two topdressing and one deep application with control fertilizer made chloroplast become a more integrated membrane system.It was indicated that whether the chloroplast ultrastructure was normal was considered as an important index judging activities of plant cells,and reasonable field managementscould make chloroplast ultrastructure of spring maize more stable,which was advantaged for high-efficiency production of springmaize.

【题目】5种生物农药对水稻褐飞虱的防治效果
【中文关键词】关键词:生物农药;褐飞虱;防治效果
【英文关键词】biological insecticides;Nilaparvata lugens ; control effect

【中文摘要】为了明确5 种生物农药对水稻褐飞虱的控制效果,以喷雾施药法进行了防治五(3)代褐飞虱低龄若虫的田间试验,结果表明:单用7 天后,以0.5%藜芦碱WP 3000 mL/hm2和4.0×1010孢子/g 球孢白僵菌WP 1800 g/hm2制剂用量的杀虫效果较好,分别为78.6%和79.0%,与对照药剂2.5%噻嗪酮WP 600 mL/hm2的防效接近,但单用的速效性较差。而以单用的剂量减半两两混合使用,以球孢白僵菌+ 噻嗪酮防效最高,药后1 天达到65.0%,药后7 天达到87.6%。因此,球孢白僵菌和藜芦碱可以部分替代高毒、高残留的化学农药,用于防治褐飞虱低龄若虫。

【英文摘要】Abstract: To understand the control effects of 5 biological insecticides against the younger nymphae of Nilaparvata lugens , the field trials were made in rice through field spray. The results showed that, 7 days after single spray respectively at a dosage of 3000 mL/hm2 and 1800 g/hm2, the control effects of veratridine 0.5% WP andBeauveria bassiana 4.0×1010 spores/g WP were better, i.e. 78.6% and 79.0% respectively, and the efficacy of the two biological insecticides was similar to that of buprofezin 25% WP at a dosage of 600 g/hm2,but these biological insecticides took effect more slower than chemical insecticides. When the two pesticides were mixed at a half dosage of the recommended dosage for spraying alone, the control efficacy ofB. bassiana +buprofezin was the best, i.e. 65.0% in 1 day and 87.6% in 7 days after treatment. ThereforeB. bassiana and veratridine can substitute partly for chemical insecticides to control younger nymahae ofN. lugens.

【题目】4种生物农药及其与2种化学农药混配对稻飞虱混合种群的防治效果
【中文关键词】生物农药,褐飞虱,白背飞虱,防治效果
【英文关键词】biological insecticides,Nilaparvata lugens,Sogatella furcifera,control effect
【中文摘要】试验以喷雾法研究4 种生物农药及其与2 种化学农药组合混用对水稻褐飞虱Nilaparvatalugens (St l) 和白背飞虱Sogatella furcifera (Horvath) 混合种群的防治效果。结果表明:0. 36% 苦参碱AS、0. 5% 藜芦碱WP、1. 8% 阿维菌素EC、400 亿孢子/ 克白僵菌WP,分别以1 500 mL / hm2、3 000 g / hm2、900 mL / hm2、1 800 g / hm2 的制剂用量单独使用,只有阿维菌素效果较好,药后7、14 d 的防效分别达到了73. 3% 和82. 3% ,但与对照药剂48% 毒死蜱EC 1 500 mL / hm2 和25% 噻嗪酮WP 750 g /hm2 的防效差异极显著。而4 种生物农药与2 种化学农药分别以单用剂量减半混合使用的8 个处理中,① 苦参碱+ 毒死蜱、② 藜芦碱+ 毒死蜱、③ 阿维菌素+ 毒死蜱、④ 球孢白僵菌+ 毒死蜱、⑤ 苦参碱+噻嗪酮、⑥ 藜芦碱+ 噻嗪酮6 种组配,药后1 d 的校正防效为81. 8% ~ 89. 2% ,3 d 为88. 2% ~ 96. 5% ,7d 为95. 6% ~ 98. 1% ,14 d 为86. 0% ~ 97. 8% 。因此,以上生物农药与化学农药的6 种组合混用可以有效防治稻飞虱低龄若虫。
【英文摘要】Abstract The effectiveness of four biological and two man-made pesticides,and mixtures of these compounds,in controlling sympatric populations of Nilaparvata lugens (St l) and Sogatella furcifera (Horvath) ,was tested in rice fields. The results show that,of four biological pesticides tested; matrine (0. 36% AS 1 500 mL /hm2) ,veratridine (0. 5% WP 3 000 g / hm2) ,abamectin (1. 8% EC 900 mL / hm2) and Beauveria bassiana(4. 0 × 1010 spores / g WP 1 800 g / hm2) ,abamectin was the most effective with control efficiencies 7 and 14days after spraying of 73. 3% and 82. 3% respectively. These results were significantly higher than those achieved by the man-made pesticides; chlorpyrifos (48% EC at 1 500 mL / hm2) and buprofezin (25% WP at750 g / hm2) . The control efficiencies of six combinations of the above biological and chemical pesticides; ①matrine + chlorpyrifos,② veratridine + chlorpyrifos,③ avermectin + chlorpyrifos,④ Beauveria bassiana+ chlorpyrifos,⑤ matrine + buprofezin,⑥ veratridine + buprofezin,were 81. 8% - 89. 2% ,88. 2% -96. 5% ,95. 6% - 98. 1% ,and 86. 0% - 97. 8% ,respectively,1,3,7 and 14 days after application. Weconclude that these combinations of biological and man-made pesticides and dosages are more effective theirconstituents for controlling younger nymphs of N. lugens and S. furcifera.

【题目】Cflec-4, a multidomain C-type lectin involved in immune defense of Zhikong scallop Chlamys farreri
【中文关键词】Zhang, Huan;Wang, Hao;Wang, Lingling;Song, Linsheng;Song, Xiaoyan;Zhao, Jianmin;Li, Ling;Qiu, Limei
【英文关键词】Chlamys farreri; C-type lectin; Innate immunity; Gene cloning; Real-time PCR
【中文摘要】无
【英文摘要】C-type lectins are a superfamily of carbohydrate-recognition proteins which play crucial roles in the innate immunity. In this study, a novel multidomain C-type lectin gene from scallop Chlamys farreri (designated as Cflec-4) was cloned by RACE approach based on EST analysis. The full-length cDNA of Cflec-4 was of 2086 bp. The open reading frame was of 1830 bp and encoded a polypeptide of 609 amino acids, including a signal sequence and four dissimilar carbohydrate-recognition domains (CRDs). The deduced amino acid sequence of CflecA shared high similarities to other C-type lectin family members. The phylogenetic analysis revealed the divergence between the three N-terminal CRDs and the C-terminal one, suggesting that the four CRDs in Cflec-4 originated by repeated duplication of different primordial CRD. The potential tertiary structure of each CRD in Cflec-4 was typical double-loop structure with Ca(2+)-binding site 2 in the long loop region and two conserved disulfide bridges at the bases of the loops. The tissue distribution of Cflec-4 mRNA was examined by fluorescent quantitative real-time PCR. In the healthy scallops, the Cflec-4 transcripts could be only detected in gonad and hepatopancreas, whereas in the Listonella anguillarum challenged scallops, it could be also detected in hemocytes. These results collectively suggested that CflecA was involved in the immune defense of scallop against pathogen infection and provided new insight into the evolution of C-type lectin superfamily. 【题目】The polymorphism of lysozyme gene in Zhikong scallop (Chlamys farreri) and its association with susceptibility/resistance to Listonella anguillarum
【中文关键词】Li, Ling;Zhao, Jianmin;Wang, Lingling;Qiu, Limei;Zhang, Huan;Dong, Chaohua;Cong, Ming;Song, Linsheng
【英文关键词】 Goose type lysozyme; Chlamys farreri; Polymorphism; Disease resistance; Disease susceptibility; PCR-RFLP
【中文摘要】无
【英文摘要】 Lysozyme functions as a crucial biodefence effector against the infection of bacterial pathogens in innate immunity. The nucleotide sequence polymorphisms in promoter region of a nuclear goose type lysozyme gene from Zhikong scallop Chlamys farreri (designated as CFLysG) were investigated to explore their association with susceptibility/resistance to Listonella anguillarum infection. Eight sites of single nucleotide polymorphisms (SNPs) and two sites of insert-deletion (ins-del) polymorphisms were identified in the promoter region of CFLysG. Two of them, -753 TATCTCGATCAGG ins-del polymorphism and -391 A-G SNP were selected to analyze their distribution in the susceptible and resistant stocks, which were identified according to the survival time after L. anguillarum challenge. Using polymerase chain reaction-restriction fragment length polymorphism (PCR-RFLP), two genotypes were found at each site, which were ins/del and ins/ins at locus -753, and A/A and A/G at locus -391, respectively. The -753 ins/del genotype was more prevalent in the resistant stock than that in the susceptible stock, 30% vs 16.67% in frequency, but there was no significant difference in the frequency distribution between these two stocks (P=0.15). In contrast, the frequency of -391A/G genotype in the

resistant stock was significantly higher (30%) than that in the susceptible stock (7.14%) (P=0.007), indicating a significant association with the resistance of Zhikong scallop to L anguillarum. To confirm the presumption, another independent challenge experiment was performed, in which the cumulative mortality of scallops with -391 A/A genotype (96.8%) was significantly higher than those with -391 A/G genotype (64.5%) (P=0.001), which further validate the association between -391 A/G genotype and the resistance of Zhikong scallop to L anguillarum. These results suggested that the -391 A/G could be a potential marker applied in future selection of Zhikong scallop with enhanced resistance to L anguillarum. (C) 2008 Elsevier Ltd. 【题目】The expression of peptidoglycan recognition protein-S1 gene in the scallop Chlamys farreri was enhanced after a second challenge by Listonella anguillarum

【中文关键词】Cong, Ming;Song, Linsheng;Qiu, Lime;Li, Chenghua;Wang, Bo;Zhang, Huan;Zhang, Lei

【英文关键词】: Listonella anguillarum; Zhikong scallop Chlamys farreri; Chlamys farreri peptidoglycan recognition protein-S1 (CfPGRP-S1); Immune priming; Immunological memory

【中文摘要】无

【英文摘要】A more rapid and powerful response against repeated exposure of same pathogen in vertebrates is usually considered as the reflection of immunological memory, but it is not well understood in invertebrates. In the present Study, the temporal expression profiles of Chlamys farreri peptidoglycan recognition protein-S1 (CfPGRP-S1) gene after two challenges of Listonella anguillarum were examined to evaluate priming response in scallops. The up-regulation of CFPGRP-S1 mRNA occurred 3 h earlier, and the expression level was significant higher ($P < 0.05$), after the second challenge than that after the first challenge. The preliminary results Provided new insights into invertebrate immunological memory, and they also would be helpful to develop strategies for disease control. (C) 2008 Elsevier Inc. 【题目】A fibrinogen-related protein from bay scallop Argopecten irradians involved in innate immunity as pattern recognition receptor

【中文关键词】Zhang, Huan;Wang, Lingling;Song, Linsheng;Song, Xiaoyan;Wang, Bo;Mu, Changkao;Zhang, Ying

【英文关键词】Argopecten irradiant; Fibrinogen-related protein; Innate immunity; Pattern recognition receptor; Hemagglutinating activity; Bacterial agglutinating activity

【中文摘要】无

【英文摘要】The family of fibrinogen-related proteins (FREPs) is a group of proteins with fibrinogen-like domains. Many members of this family play important roles as pattern recognition receptors in innate immune responses. The cDNA of bay scallop Argopecten irradians FREP (designated as AiFREP) was cloned by rapid amplification of cDNA ends (RACE) method based on the expressed sequence tag (EST). The full-length cDNA of AiFREP was of 990 bp. The open reading frame encoded a polypeptide of 251 amino acids, including a signal sequence and a 213 amino acids fibrinogen-like domain. The fibrinogen-like domain of AiFREP was highly similar to those of mammalian ficolins and other FREPs. The temporal expression of AiFREP mRNA in hemolymph was examined by fluorescent quantitative real-time PCR. The mRNA level of scallops challenged by Listonella anguillarum was significantly up-regulated,

peaked to 9.39-fold at 9 h after stimulation, then dropped back to 4.37-fold at 12 h, while there was no significant change in the Micrococcus luteus challenged group in all periods of treatment. The function of AiFREP was investigated by recombination and expression of the cDNA fragment encoding its mature peptide in Escherichia coli Rosetta gami (DE3). The recombinant AiFREP (rAiFREP) agglutinated chicken erythrocytes and human A, B, O-type erythrocytes. The agglutinating activities were calcium-dependent and could be inhibited by acetyl group-containing carbohydrates. rAiFREP also agglutinated Gram-negative bacteria E. coli JM109, L anguillarum and Gram-positive bacteria M. luteus in the presence of calcium ions. These results collectively suggested that AiFREP functions as a pattern recognition receptor in the immune response of bay scallop and contributed to nonself recognition in invertebrates, which would also provide clues for elucidating the evolution of the lectin pathway of the complement system. 【题目】Identification and expression of TRAF6 (TNF receptor-associated factor 6) gene in Zhikong scallop Chlamys farreri

【中文关键词】Qiu, Lime;Song, Linsheng;Yu, Yundong;Zhao, Jianmin;Wang, Lingling;Zhang, Qingchun

【英文关键词】Chlamys farreri; TPAF6; Signal transduction; Immune response; Gene cloning; mRNA expression; Innate immunity

【中文摘要】无

【英文摘要】 Tumor necrosis factor receptor-associated factor 6 (TRAF6), a key signaling adaptor molecule common to the TNFR superfamily and IL-IR/TLR family, is important not only for a diverse array of physiological processes functions of the TNFR superfamily, but also is involved in adaptive immunity and innate immunity. In this report, the first bivalve TRAF6 (named as CfTRAF6) gene is identified and characterized from Zhikong scallop Chlamys farreri. The full-length cDNA of CfTRAF6 is of 2510 bp, consisting of a 5'-terminal untranslated region (UTR) of 337 bp, a 3'-terminal UTR of 208 bp with a canonical polyadenylation signal sequence AATAAA and a poly (A) tail, and an open reading frame (ORF) encoding a polypeptide of 655 amino acids. The predicted amino acid sequence of CfTRAF6 comprises characteristic motifs of the TRAF proteins, including a Zinc finger of RING-type, two Zinc fingers of TRAF-type, a coiled-coil region, and a MATH (the meprin and TRAF homology) domain. The overall amino acid sequence identity between CfTRAF6 and other TRAF6s is 28-68%. Phylogenetic analyses of CfTRAF6 sequence with TRAF sequences from other organisms indicate that CfTRAF6 is a true TRAF6 orthologue. The mRNA expression of CfTRAF6 in various tissues is measured by Real-time RT-PCR. The mRNA transcripts are constitutively expressed in tissues of haemocyte, muscle, mantle, heart, gonad and gill, but the highest expression is observed in the gonad. The temporal expressions of CfTRAF6 mRNA in the mixed primary cultured haemocytes are recorded after treatment with 20 mu g mL(-1) and 0.5 mu g mL(-1) peptido-glycan (PGN). The expression level of CfTRAF mRNA is down-regulated from 1.5 h to 3 h after the treatment with 0.5 mu g mL(-1) PGN, and then recovers to the original level. While the expression of CfTRAF6 is obviously decreased after treatment with 20 mu g mL(-1) PGN, and reach the lowest point (only about 1/9 times to control) at 3 h. The result Suggests that CfTRAF6 can be greatly regulated by PGN and it may be involved in signal transduction and immune response of scallop. (C) 2008 Published by Elsevier Ltd.

【中文摘要】无
【英文摘要】Cyclophilin A (CypA), a receptor for the immunosuppressive agent cyclosporin A (CsA), is a cis-trans peptidyl-prolyl isomerase (PPIase) which accelerates the cis-trans isomerization of prolyl-peptide bonds, interacts with a variety of proteins and therefore regulates their activities. One CypA (designated CfCypA) cDNA was cloned from Chlamys farreri by expressed sequence tag (EST) and rapid amplification of cDNA ends (RACE) techniques. The full-length cDNA of CfCypA consisted of 1,248 nucleotides with a canonical polyadenylation signal sequence AATAAA, a poly (A) tail, and an open reading frame (ORF) of 495 nucleotides encoding a polypeptide of 164 amino acids. The deduced amino acid sequence shared high similarity with CypA from the other species, indicating that CfCypA should be a new member of the CypA family. Quantitative real-time (RT) PCR was employed to assess the mRNA expression of CfCypA in various tissues and its temporal expression in haemocytes and gonad of scallops challenged with Vibrio anguillarum. The mRNA transcripts of CfCypA could be detected in all the examined tissues with highest expression level in gonad. After bacterial challenge, the expression level of CfCypA was almost unchanged in haemocytes, but up-regulated in gonad and increased to the peak (22.59-fold; $P < 0.05$) at 4 h post-injection, and then dropped to the original level at 8 h post-injection. These results indicated that CfCypA was constitutive expressed in haemocytes, but could be induced in gonad, and perhaps played a critical role in response to the bacterial challenge in gonad.

【题目】Molecular cloning, characterization and mRNA expression of peroxiredoxin in Zhikong scallop Chlamys farreri
【中文关键词】Cong, Ming;Ni, Duojiao;Song, Linsheng;Wang, Lingling;Zhao, Jianmin;Qiu, Limei;Li, Ling
【英文关键词】Chlamys farreri; Fluorescent real-time quantitative PCR; Immune response; Listonella anguillarum; Peroxiredoxin
【中文摘要】无
【英文摘要】Peroxiredoxin V (PRX V) is known as an atypical 2-cysteine peroxiredoxin that protects the organisms against various oxidative stresses and functions in signal transduction. The cDNA of a PRX V gene (designated as CfPRX) was cloned from scallop Chlamys farreri. The full-length sequence of CfPRX cDNA was of 2,179 bp with a 564 bp open reading frame encoding a peptide of 187 amino acids. Sequence comparison showed that CfPRX shared higher identities with PRX Vs than that with other isoforms of PRX, indicating CfPRX was a member of the PRX V family. Fluorescent real-time quantitative PCR analysis revealed the presence of CfPRX transcripts in gill filaments, adductor muscle, heart, gonad, kidney and hemocytes, and the stimulation of Listonella anguillarum significantly ($P < 0.01$) enhanced the mRNA expression of CfPRX in hemocyte. These results indicated that CfPRX was a constitutive and inducible acute-phase protein which was involved in the immune resistance to L. anguillarum stimulation.

【题目】Alteration of metallothionein mRNA in bay scallop Argopecten irradians under cadmium exposure and bacteria challenge.
【中文关键词】Wang, Lingling;Song, Linsheng;Ni, Duojiao;Zhang, Huan;Liu, Weiqing

【英文关键词】Argopecten irradians; Metallothionein; mRNA expression; Cadmium exposure; Bacteria challenge
【中文摘要】无
【英文摘要】Metallothionein (MT) is a superfamily of cysteine-rich proteins contributing to metal metabolism, detoxification of heavy metals, and immune response such as protecting against ionizing radiation and antioxidant defense. A metallothionein (designated AiMT2) gene was identified and cloned from bay scallop, Argopecten irradians. The full length cDNA of AiMT2 consisted of an open reading frame (ORF) of 333 bp encoding a protein of 110 amino acids. with nine characteristic Cys-X-Cys, five Cys-X-X-Cys, five Cys-X-X-X-Cys and two Cys-Cys motif arrangements and a conserved structural pattern Cys-x-Cys-x(3)-Cys-Tyr-x(3)Cys-x-Cys-x(3)-Cys-x-Cys-Arg at the C-terminus. The cloned ANT showed about 50% identity in the deduced amino acid sequence with previously published MT sequences of mussels and oysters. The conserved structural pattern and the close phylogenetic relationship of AiMT2 shared with MTs from other mollusc especially bivalves indicated that AiMT2 was a new member of molluscan MT family. The mRNA transcripts in hemolymph of AiMT2 under cadmium (Cd) exposure and bacteria challenge were examined by real-time RT-PCR. The mRNA expression of AiMT2 was up-regulated to 3.99-fold at 2 h after Listonella anguillarum challenge, and increased drastically to 66.12-fold and 126.96-fold at 16 and 32 h post-challenge respectively. Cadmium ion exposure could induce the expression of AiMT2, and the expression level increased 2.56-fold and 6.91-fold in hemolymph respectively after a 10-day exposure of 100 mu g L(-1) and 200 mu g L(-1) CdCl(2). The sensitivity of AiMT2 to bacteria challenge and cadmium stress indicated it was a new Cd-dependent MT in bay scallop and also regulated by an immune challenge. The changes in the expression of AiMT2 could be used as an indicator of exposure to metals in pollution monitoring programs and oxidative stress, and bay scallop as a potential sentinel organism for the cadmium contamination in aquatic environment. 【题目】Genetic Analysis of Porphyra yezoensis Using Microsatellite
【中文关键词】Kong, Fanna;Mao, Yunxiang;Yang, Hui; Qu, Haijun; Yan, Xinghong; Wang, Li
【英文关键词】Genetic analysis; Microsatellite markers; Microsatellite-enriched library; Porphyra yezoensis Ueda; Simple sequence repeats
【中文摘要】无
【英文摘要】Microsatellites are repetitive genomic elements that show high levels of variation and therefore are useful tools for studying genetic polymorphism and constructing genetic linkage maps of eukaryotic organisms. Porphyra yezoensis Ueda is an economically important seaweed that is being targeted for genetic improvement using marker-assisted breeding. Hence, in an attempt to develop microsatellite markers for P. yezoensis, a microsatellite (or simple sequence repeat)-enriched library was constructed to identify (GA)n and (CA)n motifs. A total of 71 perfect microsatellite clones were identified, of which 30 simple sequence repeat primer pairs were developed. Of these, 24 (80%) amplified polymerase chain reaction products of expected sizes. Twelve primer pairs amplified two to four bands, whereas another 12 primer pairs produced monomorphic banding patterns. Data for 12 loci were analyzed using POPGENE software version 1.32. A total of 29 alleles were produced at 12 loci, with an average of 2.42 alleles (Na) and 1.81 effective alleles (Ne) per locus. These markers were used to analyze the genetic diversity within 11 geographically different lines of P. yezoensis. Overall, these lines were clustered into two divisions with those from close geographic locations clustering together. Further cloning and sequencing of size variant alleles at two microsatellite loci revealed that the variable numbers of motif repeats in different alleles were major sources of polymorphisms.

【题目】Cloning and Analysis of Calmodulin Gene from Porphyra yezoensis Ueda (Bangiales, Rhodophyta)
【中文关键词】Wang Mengqiang; Mao Yunxiang; Zhuang Yunyun; Kong Fanna; Sui Zhenghong
【英文关键词】Computer Applications (Computational Biology); Molecular Genetics (Biochemistry and Molecular Biophysics)
【中文摘要】无
【英文摘要】 In order to understand the mechanisms of signal transduction and anti-desiccation mechanisms of Porphyra yezoensis, cDNA and its genomic sequence of Calmodulin gene (CaM) was cloned by the technique of polymerase chain reaction (PCR) based on the analysis of P. yezoensis ESTs from dbEST database. The result shows that the full-length cDNA of CaM consists of 603 bps including an ORF encoding for 151 amino acids and a terminate codon UGA, while the length of genomic sequence is 1231 bps including 2 exons and 1 intron. The average GC content of the coding region is 58.77%, while the GC content of the third position of this gene is as high as 82.23%. Four Ca2+ binding sites (EF-hand) are found in this gene. The predicted molecular mass of the deduced peptide is 16688.72 Da and the pI is 4.222. By aligning with known CaM genes, the similarity of CaM gene sequence with homologous genes in Chlamydomonas incerta and Chlamydomonas reinhardtii is 72.7% and 72.2% respectively, and the similarity of the deduced amino acid sequence of CaM gene with homologous genes in C. incerta and C. reinhardtii are both 71.5%. This is the first report on CaM from a species of Rhodophyta.

【题目】坛紫菜 EST-SSR 筛选及其在遗传多样性分析中的实用性
【中文关键词】杨惠; 茅云翔; 孔凡娜; 王莉; 严兴洪
【英文关键词】Porphyra haitanensis; microsatellite sequence; EST-SSRs; polymorphism analysis;
【中文摘要】微卫星标记作为1种重要的分子标记,在分子标记辅助育种及遗传图谱构建中都起到重要的作用。EST文库搜索法是获得微卫星标记的途径之一,本研究对坛紫菜EST数据库中6035条序列进行搜索,发现340条EST包含SSR序列,其中三碱基重复最多,占总数45.95%;其次是两碱基重复,占总数的45.38%;再次是六碱基和五碱基,分别占总数的5.78%和2.02%;四碱基最少,仅占总数的0.87%。在两碱基中AG,GA,TC,CT类型数量最多,占所有两碱基SSR的82.8%;在三碱基中CCG,CGC,GCC,GGC,GCG,CGG类型数量最多,占所有三碱基SSR的52.83%;其它重复次数中,各种类型所占比例相差不大。进一步比较坛紫菜与条斑紫菜EST-SSR序列,发现2种紫菜SSR类型及比例存在明显差异。根据EST-SSR序列设计合成了10对引物,其中4个位点在8个不同来源坛紫菜叶状体间存在多态性,说明从坛紫菜EST中筛选的SSR标记可以用于进行坛紫菜遗传多样性分析。 更多还原
【英文摘要】Simple sequence repeats(SSRs) or microsatellites are important molecular markers, which have been applied to marker-assisted selection and construction of genetic mapping. Microsatellite markers can be developed from expressed sequence tag(EST) in public databases directly. In this paper we analyzed 6 035 EST sequences of the Porphyra haitanensis dbEST from NCBI database, in which 340 EST were found to contain SSRs. The length of repeat motifs ranged from 2 bp to 6 bp, among which trinucleotide and dinucleotide repeat motifs were most common with abundance of 45.95% and 45.38%, respectively; followed by hexanucleotide and pentanucleotide(respectively 5.81% and 2.03%) and tetranucleotide(0.87%). AG, GA, TC, CT units were found to be the most abundant in dinucleotide(82.8%), so did CCG, CGC, GCC, GGC, GCG, CGG units in trinucleotide(52.83%), however there were no significant differences among other types. Furthermore, EST-SSRs from P. yezoensis were compared to that of P. haitanensis and the difference existed not only in SSR types but also in quantity of repeat motifs. Ten EST-SSR primers were designed to analyze the genetic polymorphisms of eight different sources thallus and four loci showed polymorphisms, which indicated that SSRs from P. haitanensis dbEST are feasible in polymorphism analysis

【题目】Comparison of photobioreactors and optimal light regime for rapid vegetative propagation of transgenic Undaria pinnatifida gametophytes.
【中文关键词】Deng, Xiang-Yuan, Qin Song, Zhang Yi-Chen, Jiang Peng
【英文关键词】bubble-column bioreactor airlift bioreactor vegetative propagation Undaria pinnatifida gametophytes light transgenic
【中文摘要】无
【英文摘要】BACKGROUND: Previously, tachyplesin gene (tac) has been successfully transferred into Undaria pinnatifida gametophytes using the method of microprojectile bombardment transformation. The objectives of this study were to compare and evaluate the performance of bubble-column and airlift bioreactors to determine a preferred configuration of bioreactor for vegetative propagation of transgenic U. pinnatifida gametophytes, and to then investigate the influence of light on vegetative propagation of these gametophytes, including incident light intensity, photoperiod and light quality to resolve the problems of rapid vegetative propagation within the selected bioreactor.RESULTS: Experimental results showed that final dry cell density in the airlift bioreactor was 12.7% higher than that in the bubble-column bioreactor under the optimal aeration rate of 1.2 L air min(-1) L(-1) culture. And a maximum final dry cell density of 2830 mg L(-1) was obtained within the airlift bioreactor using blue light at 40 mu mol m(-2) s(-1) with a light/dark cycle of 14/10 (h). Polymerase chain reaction (PCR) analysis indicated that genes (bar and tac) were not lost during rapid vegetative propagation within the airlift bioreactor.CONCLUSION: The airlift bioreactor was shown to be much more suitable for rapid vegetative propagation of transgenic U. pinnatifida gametophytes than the bubble-column bioreactor in the laboratory. The use of blue light allows improvement of vegetative propagation of transgenic U. pinnatifida gametophytes.

【题目】Microprojectile bombardment of Laminaria japonica gametophytes and rapid propagation of transgenic lines within a bubble-column bioreactor.
【中文关键词】Deng, Xiang-Yuan, Qin Song, Zhang Yi-Chen, Jiang Peng,Cui Yulin, Li Xiaokun
【英文关键词】Microprojectile bombardment; Bubble-column bioreactor; Laminaria japonica gametophytes; Human acidic fibroblast growth factor
【中文摘要】无
【英文摘要】A human acidic fibroblast growth factor gene, hafgf, was successfully transferred into Laminaria japonica (kelp) gametophytes via microprojectile bombardment using the biolistic PDS-1000/He gene gun. Following phosphinothricin screening, PCR detection and Southern blot analysis, transgenic L. japonica gametophytes were cultivated in an illuminated bubble-column bioreactor to optimize growth conditions. A maximal final dry cell density of 1,695 mg l(-1) was obtained in a batch culture having an initial dry cell density of 129.75 mg l(-1). This was achieved using an aeration rate of 1.08 l air min(-1) l(-1) culture in a medium containing 1.5 mM inorganic nitrate and 0.15 mM phosphate. In addition, the relationship between different nitrogen sources and growth of transgenic gametophytes indicated that both urea and sodium nitrate were effective nitrogen sources for cell growth, while ammonium ions inhibited growth of these gametophytes

【题目】Genetic transformation in Kappaphycus alvarezii using micro-particle bombardment: a potential strategy for germplasm improvement
【中文关键词】Wang Jin-Feng, Jiang Peng, Cui Yu-Lin, Deng, Xiang-Yuan, Li Fu-Chao, Liu Jianguo, Qin Song
【英文关键词】Genetic transformation; LacZ; Micro-particle bombardment; SV40 promoter; Kappaphycus alvarezii; Transgenic breeding
【中文摘要】无
【英文摘要】This study investigated the delivery of a SV40 promoter driving lacZ gene into cells of Kappaphycus alvarezii using particle bombardment. Thallus pieces 0.5-0.8 mm in diameter and 1 cm in length were prepared as gene recipients. Bombardment parameters of 450 psi (rupture pressures) x 6 cm (particle travel distances), 650 psi x 6 cm, 1,100 psi x 6 cm and 1,100 psi x 9 cm were used. A significant increase in transformation efficiency from about 33% under the rupture pressure of 450 psi to 87% at 650 psi was observed in transformed thalli. Most of the positive cells appeared in epidermal cells bombarded at 450 psi, whereas positive signals were seen in both epidermal and medullary cells at 650 psi. No positive transient expression was detected at a bombardment of 1,100 psi, or in negative or blank controls. For the conditions tested, the best parameter was obtained at 650 psi at a distance of 6 cm. Thus, the strategy of taking vegetative thalli as recipients, using particle bombardment, and combining this with micro-propagation, together with developing an in vivo selectable marker, is a viable way to produce stable transformants, to eliminate chimeric expression, and to achieve transgenic breeding in K. alvarezii.

【题目】Gene transfer into conchospores of Porphyra haitanensis (Bangiales, Rhodophyta) by glass bead agitation
【中文关键词】Wang Jin-Feng, Jiang Peng, Cui Yu-Lin, Guan, Xiang-Yu, Qin Song
【英文关键词】egfp; Genetic transformation; lacZ; Porphyra haitanensis; SV40 promoter
【中文摘要】无
【英文摘要】Genetic transformation by electroporation of protoplasts is a standard procedure for many plants. However, for the genus Porphyra, the method is not effective because of low viability of protoplasts and is a time-consuming and expensive procedure. Based on the life history of Porphyra, a spore-targeted strategy of genetic transformation was developed, that is, using fresh conchospores of Porphyra haitanensis Chang & Zheng transformed by agitation with glass beads. A SV40 promoter-driven lacZ reporter gene was expressed in conchospores 48 h after the agitation. More transformants were obtained by increasing the agitation time from 10 to 25 s. The maximum number of transformants was more than six out of 1 million agitated conchospores. Transfer of a SV40 promoter-driven egfp gene into conchospores resulted in significant green GFP fluorescence. The expression of lacZ and egfp revealed that this strategy of spore-targeted transformation using glass bead agitation is feasible in P. haitanensis and that the SV40 promoter is effective for monitoring expression of foreign genes in this red algal species.

【题目】The integrative expression of GUS gene driven by using FCP promoter in the seaweed Laminaria japonica (Phaeophyta).
【中文关键词】Li, Fu-Chao, Qin Song,Jiang Peng, Wu Yun, Zhang Wei
【英文关键词】FCP; GUS; Integrative expression; Laminaria japonica; Promoter
【中文摘要】无
【英文摘要】In this study, the background activity of beta-glucuronidase (GUS) was analyzed histochemically and fluorometrically in the negative control of Laminaria japonica (Phaeophyta) thalli, showing low level of activity. GUS gene transformation without selectable gene in L. japonica was performed using four different promoters, i.e., Cauliflower mosaic virus 35S promoter (CaMV35S) from cauliflower mosaic virus, ubiquitin promoter (UBI) from maize, adenine-methyl transfer enzyme gene promoter (AMT) from virus in green alga Chlorella, and fucoxanthin chlorophyll a/c-binding protein gene promoter (FCP) from diatom Phaeodactylum tricornutum. The GUS transient activity was determined fluorometrically after bombarding sliced parthenogenetic sporophytes explants, and it was found that the activity resulting from CaMV35S and FCP promoters (in 114.3 and 80.6 pmol MU min(-1) (mg protein)(-1), respectively) was higher than for the other two promoters. The female gametophytes were bombarded and regenerated parthenogenetic sporophytes. FCP was the only promoter that resulted in detectable GUS chimeric expression activity during histochemical staining and polymerase chain reaction. Results of Southern blot showed that GUS gene was integrated with the L. japonica genome.

【题目】Naturally occurring antisense RNA of allatostatin gene in the prawn, Macrobrachium rosenbergii.
【中文关键词】Guo-Li Yin, Qi Chen, Wei-Jun Yang
【英文关键词】Allatostatin; Antisense transcript; RNA – RNA base pairing; Gene expression; Macrobrachium rosenbergii
【中文摘要】无
【英文摘要】Allatostatins are important regulatory neuropeptides which are widely distributed in invertebrates and execute their functions through either neural or Immoral routes. However, the regulatory mechanism of the gene expression is unclear. In this paper, we report a naturally occurring amisense transcript, named as asMacro-AST A, of the crustacean FGLamide allatostatin gene (Macro-AST A) from the prawn, Macrobrachium rosenbergii. The asMacro-ASTA contains an 843-bp sequence fully complementary to the 3'end of the Macro-ASTA. To our knowledge, this is the first report of a natural antisense transcript in crustacean and the first endogenous antisense transcript of all identified allatostatin genes. Northern blotting analysis demonstrated that the gene was expressed in the thoracic ganglia where the sense gene was also expressed. Furthermore, we have detected a RNA-RNA duplex between the sense-antisense complementary region by using RNasc protection analysis and RT-PCR. These results suggest that the antisense gene may play a role in the regulation of Macro-AST A gene expression. (c) 2006 Elsevier Inc. All rights reserved.

【题目】Prawn lipocalin: characteristics and expressional pattern in subepidermal adipose tissue during reproductive molting cycle.
【中文关键词】Wang Mo-Ran, Zhu Xiao-Jing, Yang, Jin-Shu, Da Zhong-Min, Mahmood Khalid, YangFan, Yang Wei-Jun
【英文关键词】lipocalin; prawn; cDNA; maturation; molting cycle
【中文摘要】无
【英文摘要】In crustaceans, the fascinating processes of maturation, reproductive molting and carapace coloration are regulated by hydrophobic molecules. Interestingly, most of the molecules are ligands of lipocalin. To understand the role of lipocalin in the aforementioned processes at molecular level, we isolated a cDNA that belongs to the lipocalin family, from a central nervous system cDNA library of Macrobrachium rosenbergii. We monitored the spatial and temporal distributions of the mRNA by using Northern Blotting analysis. Our results demonstrated that this gene expresses abundantly in the subepidermal adipose tissue, while faintly in the hepatopancreas and central nervous system. However, no signal was detected in other tissues including muscle, gill and ovary. Its expression levels in subepidermal adipose tissue during various stages of maturation as well as through the whole molting cycle showed that prawn lipocalin is involved in sexual maturation, as the maximal level was observed just after molt. 【题目】Inhibition of a novel sperm gelatinase in prawn sperm by the male reproduction-related kazal-type peptidase inhibitor.
【中文关键词】Li Ye, Ma Wen-Ming, Dai Jie-Qiong, Feng Chen-Zhuo, Yang, Fan, Ohir Tsuyoshi, Nagasaw Hiromich,Yang Wei-Jun
【英文关键词】kazal-type peptidase inhibitor; gelatinase; inhibition; sperm; vitelline coat
【中文摘要】无
【英文摘要】Previously, we have identified and characterized a male reproduction-related kazal-type peptidase inhibitor (MRPINK) gene from the prawn, Macrobrachium rosenbergii. In the present study, MRPINK was discovered to have an inhibitory effect on the gelatinolytic activity of M. rosenbergii sperm and immunofluorescence analysis revealed it bound specifically onto the base of sperm. The proteolytic activity of sperm extracts to vitelline coat components was also detected to be interfered by MRPINK. Furthermore, a novel gelatinase on sperm was found to be specifically inhibited by MRPINK and was named M. rosenbergii sperm gelatinase (MSG). MSG was then isolated and purified by reversed-phase high performance liquid chromatography combining with gelatinolytic assay. By amino-terminal amino acid sequence analysis and molecular cloning, the primary structure of MSG was determined. The data presented in this study provided evidence that MRPINK has an inhibitory effect on the gelatinolytic activity as well as proteolytic activity of prawn sperm and specifically blocks the activity of MSG.

【中文摘要】无
【英文摘要】Metallothioneins, metal-inducible proteins, are being characterized from different organisms and shown as potential biomarkers of exposure to pollution by certain heavy metals. Here we report the identification of a new metallothionein cDNA (433 bp) from the shrimp Macrobrachium rosenbergii, putatively encoding a 61 residue polypeptide. Tissue specific analysis indicated that Mar-MT-I (M. rosenbergii Metallothionein Gene-1) is expressed with the highest levels in the hepatopancreas and lowest in the thoracic ganglia, and none in the gills or muscles. In addition, our data showed that Mar-MT-I is differentially regulated in the hepatopancreas by certain heavy metals and thermal stress: Cd and Cu produce somewhat similar expression profile patterns, Zn has a reductional effect and thermal stress alone entirely stops its expression. These results show that Mar-MT-I mRNA levels can potentially be used as biomarkers for Cd. Cu or Zn pollution individually. However, in the case of combined metal treatment, different combinations of these metals have quite different effect on Mar-MT-I expression. Therefore, factors of such differential behaviors should be kept as a priority for further biomonitring studies. (C) 2009 Elsevier B.V. All rights reserved.

【题目】CHH family peptides from an 'eyeless' deep-sea hydrothermal vent shrimp, Rimicaris kairei: characterization and sequence analysis.

【中文关键词】Qian, Ye-Qing, Dai Li, Yang Jin-Shu, Yang Fan, Chen Dian-Fu, Fujiwara Yoshihiro, Tsuchida Shinji, Nagasawa Hiromichi, Yang Wei-Jun
【英文关键词】Crustacean hyperglycemic hormone; Extreme environment; Isoform; Molecular cloning; Rimicaris kairei; Vitellogenesis-inhibiting hormone
【中文摘要】无
【英文摘要】The crustacean eyestalk synthesizes and secretes several structurally-related peptides belonging to the crustacean hyperglycemic hormone (CHH) family, which are considered major physiological regulators during the crustacean life cycle. However, it is intriguing that eyestalks of many hydrothermal vent crustaceans prove to have varying degrees of reduction. In the present study, we characterized full-length cDNAs encoding two important eyestalk hormones of the CHH family, CHH and VIH (vitellogenesis-inhibiting hormone), from the 'eyeless' hydrothermal vent shrimp Rimicaris kairei. The two isoforms of Chh cDNA were 1027 and 1877 bp in length, respectively, and the deduced preprohormones contained 137 and 138 aa, respectively. The Vih cDNA was 907 bp in length, encoding a putative preprohormone of 113 aa. When compared with other known protein sequences of CHHs and VIHs, these polypeptides from hydrothermal vents show high similarity with their non-vent counterparts. These results may provide evidence for the mechanisms of eyestalk reduction and vent-adapting evolution of crustaceans. The hydrothermal vent shrimp with reduced eyestalks may take a different evolutionary pathway than eyestalk-holding crustaceans, and the reduced eyestalks can be considered a good example for the investigation of the diversity of crustacean evolution in different environments. 【题目】cDNA cloning, characterization and expression analysis of the antioxidant enzyme gene, catalase of Chinese shrimp Fenneropenaeus chinensis
【中文关键词】Zhang, Qingli; Li, Fuhua;Zhang, Xiaojun; Dong, Bo; Zhang, Jiquan;Xie, Yusu;Xiang, Jianhai
【英文关键词】catalase; cloning; WSSV; immune response; expression; Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】Catalase is an important antioxidant protein that protects organisms against various oxidative stresses by eliminating hydrogen peroxide. The full-length catalase cDNA of Chinese shrimp Fenneropenaeus chinensis was cloned from the hepatopancreas using degenerate primers by the method of 3' and 5' rapid amplification of cDNA ends PCR. The cDNA sequence consists of 1892 bp with a 1560 bp open reading frame, encoding 520 amino acids with high identity to invertebrate, vertebrate and even bacterial catalases. The sequence includes the catalytic residues His71, Asn144, and Tyr354. The molecular mass of the predicted protein is 58824.04 Da with an estimated pl of 6.63. Sequence comparison showed that the deduced amino acid sequence of F. chinensis catalase shares 96%, 73%, 71% and 70% identity with that of Pacific white shrimp Litopenaeus vannamei, Abalone Haliotis discus hannai, Zhikong scallop Chlamys farreri and Human Homo sapiens, respectively. Catalase transcripts were detected in hepatopancreas, hemocytes, lymphoid organ, intestine, ovary, muscle and gill. by real-time PCR. The variation of catalase mRNA transcripts in hemocytes and hepatopancreas was also quantified by real-time PCR and the result indicated that the catalase showed up-regulated expression trends in hemocytes at 14 h and in hepatopancreas at 37 h after injection with white spot syndrome virus (WSSV). 【英文关键词】WSSV; Vibrio; cDNA microarray; Fenneropenaeus chinensis ;
【中文摘要】无
【英文摘要】Microarray technique was used to analyze the gene expression profiles of shrimp when they were challenged by WSSV and heat-inactivated Vibrio anguillarum, respectively. At 6 h post challenge (HPC), a total of 806 clones showed differential expression profile in WSSV-challenged samples, but not in Vibrio-challenged samples. The genes coding energy metabolism enzyme and structure protein were the most downregulated elements in 6 h post WSSV-challenged (HPC-WSSV) tissues. However, a total of 155 clones showed differential expression in the Vibrio-challenged samples, but not in WSSV-challenged samples. Serine-type endopeptidase and lysosome-related genes were the most upregulated elements in tissues 6 h post Vibrio challenge (HPC-Vibrio). Totally, 188 clones showed differential expression in both 6 and 12 HPC-WSSV and HPC-Vibrio samples. Most of the differentially expressed genes (185/188) were downregulated in the samples of 12 HPC-WSSV, whereas upregulated in the samples at 6 and 12 HPC-Vibrio and 6 HPC-WSSV. The expression profiles of three differentially expressed genes identified in microarray hybridization were analyzed in hemocytes, lymphoid organ, and hepatopancreas of shrimp challenged by WSSV or Vibrio through real-time PCR. The results further confirmed the microarray hybridization results. The data will provide great help for us in understanding the immune mechanism of shrimp responding to WSSV or Vibrio.

【题目】Inhibition mechanism and the effects of structure on activity of male reproduction-related peptidase inhibitor Kazal-type (MRPINK) of Macrobrachium rosenbergii
【中文关键词】Li, Ye; Qian, Ye-Qing; Ma, Wen-Ming; Yang, Wei-Jun
【英文关键词】Kazal-type peptidase inhibitor; Recombinant; Mutant; Domain; P(1) position
【中文摘要】无
【英文摘要】In our previous reports, a Kazal family serine protease inhibitor, male reproduction-related peptidase inhibitor Kazal-type (MRPINK) has been identified from the prawn, Macrobrachium rosenbergii, and discovered having an inhibitory effect on the sperm gelatinolytic activity. MRPINK was predicated to inhibit chymotrypsin since it contains leucine and proline at P(1) positions of the two domains, respectively. In this report, recombinant MRPINK was as expected found to specifically inhibit chymotrypsin, but no inhibition was detected against trypsin or thrombin. By the analysis of kinetic tests, the inhibition mechanism of MRPINK was determined to be typical competitive model with K(i) of 354 nM. To elucidate the effects of structure on activity of MRPINK, the mutants (domain-1 only, domain-2 only, MRPINK(P88I), MRPINK(L37K), MRPINK(L37A), and MRPINK(L37G)) were prepared and their inhibitory activities assayed. The results showed that domain-2 was the key contributor to the inhibition of chymotrypsin (K(i) of 416 nM) and P(1) Pro was crucial for the activity. Nevertheless, whether the P(1) amino acid residue was Leu, or even if it was replaced by Lys, Ala, or Gly, domain-1 was ineffective to the activity.

【题目】条斑紫菜光系统Ⅱ反应中心蛋白编码psbA和psbD的表达分析
【中文关键词】陈张帆,王广策
【英文关键词】条斑紫菜(Porphyrayezoensis Ueda) 不同发育阶段 psbA psbD 基因表达
【中文摘要】从条斑紫菜(Porphyra yezoensisUeda)的3个不同的生长阶段:壳孢子、孢子体和配子体中提取总RNA,并用相应基因的引物扩增序列,用荧光定量PCR技术检测条斑紫菜3个生长阶段中psbA和psbD的转录水平变化。结果表明,psbA和psbD的变化趋势不一致,并且,在壳孢子内基因表达量相对较高。这说明在细胞内,D1蛋白和D2蛋白并非同比例合成。壳孢子成熟发育成叶状体的过程要求光合作用提供更多的能量。
【英文摘要】Proteins D1 and D2, respectively encoded by psbA and psbD genes, comprise the PSⅡreaction center. The are correlative with PSⅡ activity, which is affected by light intensity and temperature. In this study, transcription changes of psbA and psbD genes in three different growth phases of Porphyrayezoen-sis-conchospores, sporophytes and gametophytes were determined with real-time PCR. The results showed that psbA expression changes were different from psbD expression changes, indicating the variation of D1 protein and D2 protein synthesis. Both of the gene expressions were relatively high inconchospores, which may be due to the higher requirement of energy provided by photosynthesis inconchospores than in gameto-phytes.

【题目】Molecular cloning, tissue distribution and expression profiles of thyroid hormone receptors during embryogenesis in orange-spotted grouper (Epinephelus coioides).
【中文关键词】Tang, Xiaochen; Liu, Xiaochun;Zhang, Yong; Zhu, Pei;Lin, Haoran
【英文关键词】Thyroid hormone receptors; cDNA cloning; Tissue distribution; Embryogenesis; Orange-spotted grouper
【中文摘要】无
【英文摘要】Three distinct thyroid hormone receptor (TR) cDNAs (gTR alpha A, gTR alpha B and gTR beta) were cloned and sequenced in orange-spotted grouper (Epinephelus coioides). The cDNA of gTR alpha A consisted of 1555-bp and encoded a putative protein of 416 amino acids, while the cDNA of gTR alpha B consisted of 1459-bp and encoded 398 amino acids. The cDNA of gTR beta is 1470-bp in length and encoded 395 amino acids. The cDNAs of gTR alpha A and gTR alpha B had 68.7% identity in nucleotide sequence and 83.9% identity in deduced amino acid sequence, and shared 57.8%, 57.9% identity in nucleotide sequence and 76.5%, 76.6% in deduced amino acid sequence with gTRp, respectively. mRNA expression of gTR was determined by using real-time RT-PCR. The zygotic mRNA expression of gTR alpha A, gTR alpha B and gTRP was already presented at the blastula stage, and decreased by gastrulation and body segment appearance. Both gTR alpha A and gTR beta mRNAs dramatically increased by brain vesicle appearance and lens formation stages, whereas the magnitude of the increase of gTR beta was higher than that of gTR alpha A. However, gTR alpha B remained relatively constant. All three gTR mRNAs were detected in various tissues of adult fish, with considerable levels found in the pituitary and brain. The expression of gTR alpha A and gTR alpha B was ubiquitous, while the gTRP transcription in the pituitary was higher than other tissues. The results suggest that gTRs may be important in adult grouper brain function and that gTR alpha A and gTR alpha B may be important factors in metabolic regulation. In addition, gTRp may be the major TR isoform in the regulation of TSH activity by TH feedback in grouper

【中文摘要】无
【英文摘要】Two GPR39 transcripts, designated as sbGPR39-1a and sbGPR39-1b, were identified in black seabream (Acanthopagrus schlegeli). The deduced amino acid (aa) sequence of sbGPR39-1a contains 423 residues with seven putative transmembrane (TM) domains. On the other hand, sbGPR39-1b contains 284 aa residues with only five putative TM domains. Northern blot analysis confirmed the presence of two GPR39 transcripts in the seabream intestine, stomach, and liver. Apart from seabream, the presence of two GPR39 transcripts was also found to exist in a number of teleosts (zebrafish and pufferfish) and mammals (human and mouse). Analysis of the CPR39 gene structure in different species suggests that the two GPR39 transcripts are generated by alternative splicing. When the seabream receptors were expressed in cultured HEK293 cells, Zn(2+) could trigger sbGPR39-1a signaling through the serum response element pathway, but no such functionality could be detected for the sbGPR39-1b receptor. The two receptors were found to be differentially expressed in seabream tissues. sbGPR39-1a is predominantly expressed in the gastrointestinal tract. On the other hand, sbGPR39-1b is widely expressed in most central and peripheral tissues except muscle and ovary. The expression of sbGPk39-1a in the intestine and the expression of sbGPR39-1b in the hypothalamus were decreased significantly during food deprivation in seabream. On the contrary, the expression of the GH secretagogue receptors (sbGHSR-1a and sbGHSR-1b) was significantly increased in the hypothalamus of the food-deprived seabream. The reciprocal regulatory patterns of expression of these two genes suggest that both of them are involved in controlling the physiological response of the organism during starvation

【题目】用显微注射方法分析牙鲆肌肉发育调节基因MyoD,Myf5的启动子序列
【中文关键词】张玉青, 谭训刚, 张培军, 孙威, 徐芃, 徐永立
【英文关键词】肌肉发育;启动子;牙鲆(Paralichthysolivaceus)
【中文摘要】克隆了牙鲆(Paralichthysolivaceus)肌肉发育调节基因MyoD和Myf5的启动子序列,分别为608bp和1073bp。对序列进行分析发现MyoD和Myf5的启动子含有参与肌肉发育调控的基因的结合位点。将MyoD和Myf5的启动子连接到GFP载体上,构建了重组质粒MyoDP2GFP和Myf5P2GFP,并注射到一细胞或两细胞的斑马鱼胚胎中,对这两个基因的启动子进行了瞬时表达研究。结果表明,牙鲆MyoD和Myf5的启动子可以驱动绿色荧光蛋白特异地在斑马鱼肌肉纤维中表达,因此牙鲆608bpMyoD和1073bpMyf5的启动子包含着可以驱动MyoD和Myf5正常表达的必需元件,它们是肌肉特异的,并且可以跨物种行使其功能
【英文摘要】The promoter sequences of flounder muscle regulatory gene, MyoD and My f5, are cloned as 608 bp and 1 073 bp respectively. Many muscle regulatory gene binding sites are found in the promoters of MyoD and Myf g. The promoter sequences were ligated to GFP vector and constructed as MyoDP-GFP and Myf5 P-GFP. The result constructs were microinjected into one-cell or two-cell stage zebrafish embryos to make a transient expression analysis. The results showed that the 608 bp MyoD promoter and the 1 073 bp My f5 promoter can drive GFP specifically expressed in muscle fibers in zebrafish. It can be seen that the two promoters contain muscle specific regulatory elements, and they can function across species.

【题目】Molecular cloning, characterization and distribution of two types of growth hormone receptor in orange-spotted grouper (Epinephelus coioides)
【中文关键词】Li, Yun;Liu, Xiaochun; Zhang, Yong; Zhu, Pei; Lin, Haoran
【英文关键词】growth hormone receptor; tissues expression; orange-spotted grouper
【中文摘要】无
【英文摘要】The cDNAs encoding two distinct growth hormone receptors (GHRs) were firstly cloned and sequenced from the liver of orange-spotted grouper (Epinephelus coioides). The cDNA of grouper GHR1 consisted of 2673-bp and encoded 658 amino acids, while the cDNA of grouper GHR2 consisted of 2989-bp and encoded 577 amino acids. The two cDNAs shared 78.6% identity in nucleotide sequence and 37.8% identity in deduced amino acid sequence. Northern blot analysis demonstrated a single GHR1 transcript of approximately 4.3 kb in liver and a single GHR2 transcript of approximately 3.9 kb in the liver and muscle. In the Real-time PCR assay, grouper GHR1 and GHR2 were expressed in all tissues tested. The expression of GHR2 was significantly higher than that of GHR1 in telencephalon, cerebellum, pituitary, heart and white muscle, whereas the expression of GHR1 was significantly higher in liver. These results indicated that there were two types of GHRs existing in orange-spotted grouper, and they had different structural features and tissues expression patterns. However, the functional differences between GHR1 and GHR2 in orange-spotted grouper remained further research

【题目】Fosmid Library Construction and Initial Analysis of End Sequences in Zhikong Scallop (Chlamys farreri)
【中文关键词】Zhang, Lingling; Bao, Zhenmin;Cheng, Jie; Li, Hui; Huang, Xiaoting; Wang, Shi; Zhang, Can; Hu, Jingjie
【英文关键词】Chlamys farreri; fosmid end sequences; fosmid library; zhikong scallop
【中文摘要】无
【英文摘要】Zhikong scallop (Chlamys farreri Jones et Preston, 1904) is one of the most commercially important bivalves in China, but research on its genome is underdeveloped. In this study, we constructed the first Zhikong scallop fosmid library, and analyzed the fosmid end sequences to provide a preliminary assessment of the genome. The library consists of 133,851 clones with an average insert size of about 40 kb, amounting to 4.3 genome equivalents. Fosmid stability assays indicate that Zhikong scallop DNA was stable during propagation in the fosmid system. Library screening with two genes and seven microsatellite markers yielded between two and eight positive clones, and none of those tested was absent from the library. End-sequencing of 480 individual clones generated 828 sequences after trimming, with an average sequence length of 624 bp. BLASTN searches of the nr and EST databases of GenBank and BLASTX searches of the nr database resulted in 213 (25.72%) and 44 (5.31%) significant hits (E < e(-5)), respectively. Repetitive sequences analysis resulted in 375 repeats, accounting for 15.84% of total length, which were composed of interspersed repetitive sequences, tandem repeats, and low-complexity sequences. The fosmid library, in conjunction with the fosmid end sequences, will serve as a useful resource for physical mapping and positional cloning, and provide a better understanding of the Zhikong scallop genome.

【题目】FISH Mapping and Identification of Zhikong Scallop (Chlamys farreri) Chromosomes
【中文关键词】Zhang, Lingling; Bao, Zhenmin; Wang, Shi; Hu, Xiaoli; Hu, Jingjie
【英文关键词】Chlamys farreri; chromosome identification; FISH; fosmid; Zhikong scallop
【中文摘要】无
【英文摘要】Chromosome identification is the first step in genomic research of a species, but it remains a challenge in scallops. In the present study, fluorescence in situ hybridization (FISH) mapping of 19 fosmid clones was attempted and used for chromosome identification in Zhikong scallop (Chlamys farreri Jones et Preston, 1904). Data showed that 10 clones were successfully mapped, including 7 without and 3 with C(0)t-1 DNA. Among them, 2 represented multiple signals and made no contribution to chromosome identification. Karyotypic analysis and cohybridization indicated that the remaining 8 clones realized the identification of 8 chromosomes. All 10 clones were sequenced at both ends, which could be developed as sequence-tagged sites and used for the unification of the cytological and genetic linkage maps. This study shows that fosmid clones can benefit chromosome identification and will undoubtedly be useful for cytogenetic research in Zhikong scallop.

【题目】AMPK alpha subunit gene characterization in Artemia and expression during development and in response to stress.
【中文关键词】Zhu, Xiao-Jing; Feng, Chen-Zhuo; Dai, Zhong-Min;Zhang, Ruo-Chao; Yang, Wei-Jun
【英文关键词】AMPK alpha subunit; Artemia; brine shrimp; crustacean; development; diapause
【中文摘要】无
【英文摘要】AMP-activated protein kinase (AMPK) plays a central role in maintaining the energy balance of organisms under physiological and environmental stresses. Here two AMPK alpha subunit gene transcripts (named Afr-AMPKalpha1 and Afr-AMPKalpha2) from Artemia franciscana were isolated and gene expression was characterized by semiquantitive reverse transcription-polymerase chain reaction (RT-PCR). Afr-AMPKalpha1 was differentially expressed during Artemia developmental stages as well as in response to stresses, such as heat-shock, starvation and a hyperosmotic environment. Afr-AMPKalpha1 mRNA expression in adult Artemia decreased under heat shock, but not in a time- and temperature-dependent manner. By contrast, the transcript sharply decreased in heat-shocked cysts in a time-dependent manner. Under hyperosmotic stress, however, the mRNA level in adults first declined and then increased with prolonged exposure. In the case of starvation, the gene expression in adults decreased and was undetectable after day 9. In addition, Afr-AMPKalpha2 mRNA expression was too low to be detected without nested PCR. Southern blot analysis, moreover, indicated AMPK alpha subunit was present in multiple copies in the Artemia genome. Furthermore, our results demonstrate that the Afr-AMPKalpha1 mRNA level sharply decreases in Artemia carrying diapause-destined embryos and this indicates the possibility that Afr-AMPKalpha1 is involved in determining the reproductive mode in Artemia.

【题目】cDNA cloning and mRNA expression of heat shock protein 90 gene in the haemocytes of Zhikong scallop Chlamys farreri
【中文关键词】Gao, Qiang; Song, Linsheng; Ni, Duojiao; Wu, Longtao; Zhang, Huan; Chang, Yaqing
【英文关键词】biomarker; cDNA cloning; expressed sequence tag; heat shock protein 90; heavy metal stress; mRNA expression; Zhikong scallop Chlamys farreri
【中文摘要】无
【英文摘要】Heat shock protein 90 (HSP90) is a highly conserved molecular chaperone contributing to the folding, maintenance of structural integrity and proper regulation of a subset of cytosolic proteins. The full-length cDNA of Zhikong scallop Chlamysfarreri HSP90 (designated CfHSP90) was cloned by EST and rapid RACE techniques. It was of 2710 bp, including an open reading frame (ORF) of 2181 bp encoding a polypeptide of 726 amino acids with all the five HSP90 family signatures. BLAST analysis revealed that the CfHSP90 gene shared high similarity with other known HSP90 genes. Fluorescent real-time quantitative RT-PCR was used to examine the expression pattern of CfHSP90 mRNA in haemocytes of scallops exposed to Cd2+, Pb2+ and Cu2+ for 10 and 20 days, respectively. All the three heavy metals could induce CfHSP90 expression. There was a clear dose-dependent expression pattern of CfHSP90 after heavy metals exposure for 10 days or 20 days. Different concentrations of the same metal resulted in different effects on CfHSP90 expression. The results indicated that CfHSP90 responded to various heavy metal stresses with a dose-dependent expression pattern as well as exposure time effect, and could be used as a molecular biomarker in a heavy metal polluted environment.

【英文关键词】Largeyellow croaker (Pseudosciaena crocea); Cystatin; Immunomodulatory function; Tumor necrosis factor- α ; Interleukin-10; Poly(I:C); Inactivated trivalent bacterial vaccine
【中文摘要】无
【英文摘要】The cDNA of a cystatinanalogue was isolated from the spleen Smart cDNA library of largeyellow croaker Pseudosciaena crocea (Lyccys). The open reading frame (ORF) of 354 nucleotides (nt) of Lyccys encodes a protein of 118 amino acids (aa), containing a 21-aa signal peptide and a 97-aa mature polypeptide. The deduced Lyccys possessed structural features of the Family II cystatins, including three evolutionally conserved motifs known to interact with the active sites of cysteine peptidases: Gly at the N-terminus (Gly25), Gln-X-Val-X-Gly motif (Q69LVAG73) and Pro-Try pair at the C-terminus (P106W107). Genomic analysis revealed that Lyccys gene, spanning 2297 nt, consisted of three exons and two introns. The Lyccys gene was constitutively expressed in all eight tissues examined although at different levels. Real-time PCR analysis revealed that Lyccys transcript in spleen and kidney was obviously up-regulated by poly(I:C) or inactivated trivalent bacterial vaccine, while in blood its expression was down-regulated. Immuno-electron microscopy showed that Lyccys was mainly localized to the rough endoplasmic reticulum (rER) or in the vesicular structures in spleen and kidney cells. Recombinant Lyccys protein fused with glutathione S-transferase (rLyccys) was shown to have remarkable protease-inhibitory activity and well affinity binding to papain (with a Ki of 1.3 × 10 − 13 M). An in vivo administration of rLyccys could significantly up-regulate the expression levels of largeyellow croaker tumor necrosis factor- α 2 (TNF- α 2) and interleukin-10 in spleen and kidney, but to a lesser extent increase TNF- α 1 expression. These results suggest that the Lyccys is a secreted inhibitor of cysteine proteinases, which may have an immunomodulatory function in inflammation response.

【题目】牙鲆肌肉生长抑素(MSTN)基因克隆
【中文关键词】牙鲆 肌肉生长抑素基因 MSTN GDF8
【英文关键词】Japanese flounder myostatin MSTN GDF8
【中文摘要】采用同源克隆及基因组步移的方法,分离克隆了牙鲆肌肉生长抑制素(MSTN)基因。经过序列分析及cDNA验证,牙鲆MSTN基因具有3个外显子和2个内含子,编码377个氨基酸。5′侧翼区含有8个TATA框,一个CAAT框,6个E框;3′侧翼区含有加尾信号。通过同源分析,牙鲆MSTN C末端含有9个保守半胱氨酸残基和一个RVRR蛋白酶酶切位点;通过进化树分析,牙鲆MSTN与鱼类MSTN基因聚为一支。RT-PCR分析表明,牙鲆MSTN在胚胎发育中不表达或表达量较低,说明MSTN在牙鲆胚胎发育中并不起重要作用;其在各组织中的表达,随个体和环境的不同而有差异,暗示MSTN的表达受外界因素调控。
【英文摘要】Myostatin (MSTN) gene was isolated from Japanese flounder(Paralichthys olivaceus) by homology cloning strategy and genome walking .By sequence analysis and verified in cDNA level, Japanese flounder MSTN gene included three exons and two introns, encoding a 374-amino-acid protein. Eight TATA box, one CAAT box and six E box located in 5` flanking region. A polyA signal existed in 3` flanking region. Nine conserved cysteine residues and an RXXR proteolytic cleavage domain were detected in the C terminal of protein. MSTN in Japanese flounder was high homologous with MSTN genes in fish via phylogeny analysis. The RT-PCR analysis demonstrated that MSTN was undetectable during embryo development and its transcription was influenced by environment factors in adult.

【题目】日本牙鲆主要组织相容性复合体DAB等位基因的多态性
【中文关键词】牙鲆,主要组织相容性复合体,等位基因,多态性
【英文关键词】Japanese flounder,Paralichthys olivaceus,Major histocompatibility complex,Allele,Polymophism
【中文摘要】根据牙鲆(Paralichthys olivaceus)主要组织相容性复合体(MHC)DAB基因序列设计特异性引物,在日本牙鲆基因组中扩增了包括DAB基因完整外显子2和内含子1在内的长度为408bp的DNA片段。对该片段克隆测序后,发现了37个MHC-DAB等位基因,各等位基因的频次以及各主型中亚型数目分布都不平衡。在第二外显子273bp核苷酸序列中有50个位点发生变异,核苷酸多样性PI值为0.0618,在编码的氨基酸序列中存在多态变异位点30个,其中简约信息位点29个,单变异位点1个。非同义替代与同义替代的比率在抗原结合区(PBR)和非PBR编码区分别为10.0和1.62,分析表明正向选择机制可能是产生牙鲆MHC-DAB多态性的主要因素。估计的核苷酸的转换和颠换数随着遗传距离的增加而增加。各等位基因间的系统发生关系表明,19个主型分为两个群。对氨基酸组分和密码子的偏倚性以及分布频率的分析表明各同义密码子的使用频率不均衡。本研究为牙鲆MHC-DAB基因的遗传进化和分子标记辅助育种的研究提供了理论基础。
【英文摘要】Polymorphism of the major histocompatibility complex(MHC)DAB gene in Japanese flounder Paralichthys olivaceus was investigated using sequences analysis.In this study,24 individuals were selected to amplify partial exon1 and intron2,complete intron1 and exon2 of DAB gene.131 sequences were subsequently used to analyze genetic variation and revealed 31 different sequences,which presented 31 novel alleles belonging to 19 allele major types according to accepted nomenclature rules.Frequency of alleles and numbers of subtype were not distributed equally.There were 50 variable sites in exon2,the average number of nucleotide

diversity PI value of the whole sequences was 0.0618.The nucleotide sequence was corresponded with putative 91 amino acids peptide,32.97%(30 out of 91)of the amino acid were variable,of which 29 parsimony informative sites were observed.The rates of non-synonymous substitution(d_N)were 10.00 times and 1.62 times higher than the rate of synonymous substitution(d_S)in the peptide-binding regions(PBR)and non-PBR,respectively.The rate of d_N occurred at a significantly higher frequency than that of d_S in PBR,d_N in PBR was higher than that in non-PBR,but d_S in PBR was significantly lower than in non-PBR.In this study,the high ratio of d_N/d_S value and high allelic diversity observed in flounder suggested a balancing selection in the MHC-DAB gene,which explained the high polymorphism of MHC-DAB gene in Japanese flounder.The number of transitions and tranversions gradually increased with genetic distances,indicating that the MHC-DAB gene might discuss the genetic evolution.Phylogenetic tree was based using NJ method revealed a preliminary phylogeny among 19 MHC-DAB major type of alleles.Frequency of synonym codons were not distributed equally.These results provide molecular date for the study on genetic variation and marker-assisted selective breeding in Japanese flounder.

【题目】牙鲆MHC-DAA 结构及其等位基因多态性

【中文关键词】牙鲆; DAA 基因结构; 等位基因; 多态性

【英文关键词】Japanese flounder (Paralichthys olivaceus); DAA genomic structure; allele; polymophism

【中文摘要】为了探讨牙鲆MHC-DAA 等位基因的多态性, 根据牙鲆 (Paralichthys olivaceus) MHC-DAA 的cDNA 序列设计特异引物, 扩增内含子序列。牙鲆DAA 基因由4 个外显子和3 个内含子组成, 与大西洋鲑 (Salmo salar)DAA 基因结构相同, 在内含子2 中存在一个高度多态的微卫星位点(GT)n。根据获得的MHC-DAA 基因组序列设计特异性引物, 在45 尾牙鲆中扩增了包括完整外显子2 和内含子2 的长度约670 bp 的DNA 片段, 克隆测序后共发现30 个MHC-DAA 等位基因, 各等位基因的频次及其各主型中亚型的数目都不均衡。在249 bp 的外显子2 序列中共有55 个位点发生变异, 核苷酸多样性指数为0.0887, 编码的氨基酸序列中多态变异位点31 个,其中简约信息位点30 个, 单变异位点1 个。非同义替代与同义替代的比率在PBR(Peptide binding region)和非PBR 结合区分别为3.30 和2.43, 分析证明平衡选择是牙鲆存在众多DAA 等位基因的发生机制。

【英文摘要】To investigate the allele polymorphism of MHC-DAA in Japanese flounder (Paralichthys olivaceus), specificprimers were designed based on the published DAA-cDNA sequence of P. olivaceus to amplify the entire introns fromflounder. Gene DAA consisted of four exons and three introns. The exon-intron structure was similar as that of Atlanticsalmon. A polymorphic microsatellite was detected in intron 2. Subsequently, specific primer was designed based on theDAA genomic sequences. The genetic polymorphism within exon 2 of MHC-DAA was investigated by means of sequenceanalysis. Forty-five individuals were selected to amplify exon 2 and intron 2. One hundred and twenty-nine fragments revealed30 novel alleles belonging to 18 allele major type. The frequency of alleles and the numbers of subtypes were notdistributed equally. There were 55 variable sites in exon 2. The diversity of nucleotide within the sequence of exon 2 was0.0887. The nucleotide sequence was corresponded with a putative peptide. Among the 83 amino acids in this peptide,37.80% were variable, and 30 parsimony informative sites were observed. The rates of non-synonymous substitution (dN)were 3.30 and 2.43 times higher than the rate of synonymous substitution (dS) in the peptide-binding regions (PBR) and non-PBR, respectively. In this study, the high ratio of dN/dS value and high allelic diversity observed in flounder suggested a balancing selection in the exon2 of the MHC class IIA gene, which explained the high polymorphism of MHC-DAA gene in Paralichthys olivaceus.

【题目】大菱鲆脾脏cDNA文库构建、EST序列分析与免疫抗病相关基因的筛选
【中文关键词】大菱鲆 cDNA文库 表达序列标签 免疫相关基因
【英文关键词】turbot(Scophthalmus maximus) cDNA library expressed sequence tag (EST) immune related genes
【中文摘要】以大菱鲆脾脏为材料,构建cDNA文库,通过对文库克隆的序列测定和初步生物信息学分析,共获得3 656个大菱鲆脾脏表达序列标签(EST)。经与GenBank数据库的序列比对后发现,1 891个EST代表了149个已知基因,其余1 765个EST为未知序列。这149个基因大致可分为6类:9个为细胞结构类(6.0%);26个为代谢类(17.5%);45个为细胞防御/免疫类(30.2%);43个为基因/蛋白质表达类(28.9%);16个为细胞信号转导/细胞交流类(10.7%);10个无法明确分类(6.7%)。鉴定的与免疫抗病相关重要基因主要有:CC/CXC趋化因子;主要组织相容性复合体(MHC)class Ⅰα;C3补体;天然杀伤细胞增强因子(NKEF);胸腺素β-4/β-12;干扰素诱导蛋白Gig1;白介素8受体;STAT 4;热激蛋白70/90等。
【英文摘要】A cDNA library was constructed from turbot, Scophthalmus maximus, spleen by unidirectional cloning. A total of 3 656 ESTs from the library were sequenced and compared with sequences in the GenBank database. 1 765 clones (48.3%) appeared to be completely unknown and are likely to represent newly described genes, whereas 1 891 clones (51.7%) were identified based on matches to sequences in the database. These identified clones were derived from at least 149 genes which were categorized into six categories: 9 in cell structure/motility (6.0%), 26 in metabolism (17.5%), 45 in cell defense/immunity (30.2%), 43 in gene/protein expression (28.9%), 16 in cell signal transduction/communication (10.7%), and 10 genes lacking enough information to be classified (6.7%). Immune related cDNAs identified from the spleen were: CC/CXC chemokine, MHC class Iα, complement component C 1/C3, natural killer cell enhancing factor (NKEF), thymosin beta 4/ beta 12, interferon inducible protein Gig1, IL B4 receptor, STAT4, and hot shock protein 70/90.

【题目】Cloning, characterization, and expression analysis of a CC chemokine gene from turbot (Scophthalmus maximus)
【中文关键词】Turbot - Scophthalmus maximus - cDNA - CC chemokine - Infection - RT-PCR - RACE
【英文关键词】Turbot - Scophthalmus maximus - cDNA - CC chemokine - Infection - RT-PCR - RACE
【中文摘要】无
【英文摘要】The chemokines are a superfamily of chemotactic cytokines playing an important role in leukocyte chemotaxis. Here, a turbot head kidney cDNA library was constructed in which KC70 was identified as a CC chemokine. Unknown 5′ and 3′ parts of the cDNA were amplified by 5′ and 3′ rapid amplification of cDNA ends (RACE). The complete cDNA of KC70 contains a 59-bp 5′ UTR, a 336-bp ORF, and a 152-bp 3′ UTR. Four exons and three introns were identified in KC70. Phylogenetic analysis showed that KC70 was similar to CCL19. In normal turbot KC70 was expressed in all tissues except brain and skin. Infection of turbot with pathogenic bacteria significantly increased expression of KC70 in the liver. Expression of KC70 in head kidney first increased and then decreased after bacterial challenge. No significant change was observed in the spleen after bacterial challenge. During embryonic development, KC70 was highly expressed after the gastrula stage. These results indicated KC70 plays important and multiple roles in turbot immune response.

【题目】Patterns of Concerted Evolution of the rDNA Family in a Natural Population of Zhikong Scallop, Chlamys farreri
【中文关键词】Concerted evolution - Internal transcribed spacer (ITS) - Denaturing high-performance liquid chromatography (DHPLC) - Chlamys farreri
【英文关键词】Concerted evolution - Internal transcribed spacer (ITS) - Denaturing high-performance liquid chromatography (DHPLC) - Chlamys farreri
【中文摘要】无
【英文摘要】Using denaturing high-performance liquid chromatography (DHPLC), we screened the insertion/deletion (indel) polymorphism in the internal transcribed spacer (ITS) sequences of 40 individuals from a natural population of Zhikong scallop (Chlamys farreri). Surprisingly, only 7.5% of individuals were homogeneous in ITS constitution, while the others (92.5%) were heterozygous. Based on different peak types in DHPLC analysis, seven individuals were randomly chosen to investigate indel polymorphism in the ITS sequences within individuals. Furthermore, indel polymorphism in the ITS sequences of single sperms was also investigated in more individuals belonging to different peak types. Based on these results, we concluded that rapid intrachromosomal recombination drove homogenization of rDNA arrays and interchromosomal recombination might contribute to form new variants, and that it may be less rare than previously thought although it was much less frequent than intrachromosomal recombination in the homogenization process. Further, we proposed an expanded model for concerted evolution of the rDNA family in a natural population of C. farreri. A pathway in the new model which homogenizes a variant unit, beginning with two-peak type individuals and ends with two-peak type individuals, is a larruping pathway in the natural population of C. farreri. As the highest proportion in natural populations, two-peak individuals with equal peak areas can be viewed as being in a steady and balanced state which is maintained by rapid intrachromosomal recombination.

【题目】Cytogenetic characterization of the bay scallop, Argopecten irradians irradians, by multiple staining techniques and fluorescence in situ hybridization.
【中文关键词】Argopecten irradians irradians, banding, FISH, rDNA, telomeric
【英文关键词】Argopecten irradians irradians, banding, FISH, rDNA, telomeric
【中文摘要】无
【英文摘要】The chromosomes of Argopecten irradians irradians were studied by various cytogenetic approaches. Conventional chromosome characterization built on C-banding, DAPI-staining, and silver staining was complemented by the physical mapping of ribosomal DNA and telomeric sequence (TTAGGG)n by FISH. Results showed that the constitutive heterochromatin revealed by C-banding was mainly distributed at telomeric and centromeric regions. However, interstitial C-bands were also observed. The pattern of DAPI banding was almost consistent with that of C-banding. Silver staining revealed that NORs were located on the short arms of chromosome 3 and 10, and this was further confirmed by FISH using 18S-28S rDNA. 5S rDNA was mapped as two distinguishable loci on the long arm of chromosome 11. 18S-28S and 5S rDNA were located on different chromosomes by sequential FISH. FISH also showed that the vertebrate telomeric sequence (TTAGGG)n was located on both ends of each chromosome and no interstitial signals were detected. Sequential 18S-28S rDNA and (TTAGGG)n FISH demonstrated that repeated units of the two multicopy families were closely associated on the same chromosome pair.

【题目】Two novel elements (CFG1 and PYG1) of Mag lineage of Ty3/Gypsy retrotransposons from Zhikong scallop (Chlamys farreri) and Japanese scallop (Patinopecten yessoensis)
【中文关键词】CFG1 - Chlamys farreri - Methylation - Patinopecten yessoensis - PYG1 - Retrotransposon - Scallop
【英文关键词】CFG1 - Chlamys farreri - Methylation - Patinopecten yessoensis - PYG1 - Retrotransposon - Scallop
【中文摘要】无
【英文摘要】Two novel elements (CFG1 and PYG1) of Mag lineage of Ty3/Gypsy retrotransposons were cloned from Zhikong scallop (Chlamys farreri) and Japanese scallop (Patinopecten yessoensis). The total length of the CFG1 element is 4826 bp, including 5′-LTR (192 bp), the entire ORF (4047 bp) and 3′-LTR (189 bp). The entire ORFs of both CFG1 and PYG1 elements are composed of 1348 aa and do not have any frameshifts. Their closest relative is Jule element from the poeciliid fish (Xiphophorus maculatus). On average, the diploid genome of C. farreri contains approximately 84 copies of CFG1 elements. We summarize the major features of CFG1, PYG1 and other elements of Mag lineage of the Ty3/Gypsy group. mRNA expression of CFG1 element in larvae increases gradually before the gastrulae stage and decreases gradually afterward, whereas in adductor such expression in adductor muscle and digestive gland are lower than those in other tissues. Overall, mRNA expression of CFG1 element in the early larvae is significantly higher than that in adult tissues. In muscle tissue, while the promoter and partial GAG domain of CFG1 element are unmethylated, the partial RT domain is highly methylated. These results suggest that CFG1 expression may be controlled by a post-transcriptional gene silencing mechanism that is associated with coding-region (RT domain) methylation.

【题目】Two specific causes of cell mortality in freeze-thaw cycle of young thalli of Porphyra yezoensis (Bangiales, Rhodophyta)
【中文关键词】absolute water content;cold-preservation time;frozen nets;imaging PAM;Porphyra yezoensis;thawing temperature
【英文关键词】absolute water content;cold-preservation time;frozen nets;imaging PAM;Porphyra yezoensis;thawing temperature
【中文摘要】无
【英文摘要】Porphyra yezoensis Ueda is an important marine aquaculture crop with single-layered gametophytic thalli. In this work, the influences of thallus dehydration level, cold-preservation (freezing) time, and thawing temperature on the photosynthetic recovery of young P. yezoensis thalli were investigated employing an imaging pulse-amplitude-modulation (PAM) fluorometer. The results showed that after 40 d of frozen storage when performing thallus thawing under 10 ° C, the water content of the thalli showed obvious effects on the photosynthetic recovery of the frozen thalli. The thalli with absolute water content (AWC) of 10% – 40% manifested obvious superiority compared to the thalli with other AWCs, while the thalli thawed at 20 ° C showed very high survival rate (93.10%) and no obvious correlation between thallus AWCs and thallus viabilities. These results indicated that inappropriate thallus water content contributed to the cell damage during the freeze-thaw cycle and that proper thawing temperature is very crucial. Therefore, AWC between 10% and 40% is the suitable thallus water content range for frozen storage, and the thawing process should be as short as possible. However, it is also shown that for short-term cold storage the Porphyra thallus water content also showed no obvious effect on the photosynthetic recovery of the thalli, and the survival rate was extremely high (100%). These results indicated that freezing time is also a paramount contributor of the cell damage during the freeze-thaw cycle. Therefore, the frozen nets should be used as soon as time permits

【题目】Photosynthetic parameters of sexually different parts of Porphyra katadai var. hemiphylla (Bangiales, Rhodophyta) during dehydration and re-hydration.
【中文关键词】Chlorophyll fluorescence - Desiccation-tolerant - Effective quantum yield - Electron transport rate - P700+ absorbance - Porphyra
【英文关键词】Chlorophyll fluorescence - Desiccation-tolerant - Effective quantum yield - Electron transport rate - P700+ absorbance - Porphyra
【中文摘要】无
【英文摘要】Physiological data from extreme habitat organisms during stresses are vital information for comprehending their survival. The intertidal seaweeds are exposed to a combination of environmental stresses, the most influential one being regular dehydration and re-hydration. Porphyra katadai var. hemiphylla is a unique intertidal macroalga species with two longitudinally separated, color distinct, sexually different parts. In this study, the photosynthetic performance of both PSI and PSII of the two sexually different parts of P. katadai thalli during dehydration and re-hydration was investigated. Under low-grade dehydration the variation of photosystems of male and female parts of P. katadai were similar. However, after the absolute water content reached 42%, the PSI of the female parts was nearly shut down while that of the male parts still coordinated well and worked properly with PSII. Furthermore, after re-hydration with a better conditioned PSI, the dehydrated male parts were able to restore photosynthesis within 1 h, while the female parts did not. It is concluded that in P. katadai the susceptibility of photosynthesis to dehydration depends on the accommodative ability of PSI. The relatively lower content of phycobiliprotein in male parts may be the cause for a stronger PSI after severe dehydration

【题目】Full-length normalization subtractive hybridization: a novel method for generating differentially expressed cDNAs
【中文关键词】Zhong-Min Dai, Xiao-Jing Zhu and Wei-Jun Yang
【英文关键词】Differentially expressed gene, Subtractive hybridization, Full-lenth cDNA, Normalization
【中文摘要】无
【英文摘要】Here we present a novel method termed full-length normalization subtractive hybridization (FNSH) for efficiently generating subtracted cDNA libraries with a high degree of productivity. This method has the ability to isolate full-length differentially expressed genes from target samples. Normalization and subtraction of FNSH are performed simultaneously with efficiency equal to or even higher than that of suppression subtractive hybridization. Using FNSH, we have isolated at least 40 unique cDNAs that are expressed in terminal ampullae but not in the ovaries of the prawn Macrobrachium rosenbergii from 120 randomly picked subtracted clones. Sequence analysis shows that 37 of the 40 cDNAs are full length.

【题目】A novel terminal ampullae peptide is involved in the proteolytic activity of sperm in the prawn, Macrobrachium rosenbergii
【中文关键词】Wen-Ming Ma, Ye-Qing Qian, Mo-Ran Wang, Fan Yang and Wei-Jun Yang
【英文关键词】terminal ampullae peptide, proteolytic activity, Macrobrachium rosenbergii
【中文摘要】无
【英文摘要】As the distal part of the crustacean male reproductive tract, terminal ampullae play important roles in sperm development and storage of mature spermatophores. In the present study, the novel gene terminal ampullae peptide (TAP) was cloned from terminal ampullae of the prawn, Macrobrachium rosenbergii. The cDNA sequence consists of 768 nucleotides, with an open-reading frame of 264 nucleotides which encodes a putative 88-amino acid precursor protein with a 17-amino acid residue signal peptide. Western blotting and immunohistochemical analysis revealed that TAP was distributed on terminal ampullae and sperm, and its expression was related to gonad development. To elucidate the functional role of TAP in vivo, we disrupted the TAP gene by RNA interference (RNAi) and evaluated the effect on fertility and several sperm parameters. Although there was no difference in fertility between RNAi-induced prawns and controls, RNAi treatment decreased the sperm gelatinolytic activity and blocked proteolytic activity on the vitelline coat. These data provide evidence that TAP participates in regulating sperm proteolytic activity, and performs a crucial role in sperm maturation and degradation of the vitelline coat during fertilization.

【题目】The complete mitogenome of the hydrothermal vent crab Gandalfus yunohana (Crustacea: Decapoda: Brachyura): a link between the Bythograeoidea and Xanthoidea
【中文关键词】Jin-Shu Yang, Hiromichi Nagasawa, Yoshihiro Fujiwara, Shinji Tsuchida, Wei-Jun Yang
【英文关键词】mitogenome, Gandalfus yunohana
【中文摘要】无
【英文摘要】Metazoan mitochondrial genomes (mitogenomes) are often used for all-level phylogenetic analyses and evolution modelling. Although mitochondrial fragments facilitate studying the occurrence and dispersal of hydrothermal-vent species, few complete mitogenomes have been determined for comprehensive analyses. We determined the complete nucleotide sequence of the bythograeid crab Gandalfus yunohana. The G. yunohana mitogenome is 15 567 bp in length and with an AT content of 69.9%. A putative control region of 625 bp was identified due to its position (between rrnS and trnI) and AT richness (72.8%), which exhibits high similarity with that of the Australian giant crab Pseudocarcinus gigas. The mitochondrial gene order is identical to the typical brachyuran mode. Codon usage, nucleotide composition and bias are well conserved as the Brachyura. Phylogenetic analyses from protein-coding genes indicated its closest relationship with P. gigas. All the results support the close evolution distance between the Bythograeoidea and Xanthoidea, which might imply the possible origin that the only superfamily of vent crabs underwent. The G. yunohana mitogenome exhibits highly conserved characteristics with those of other decapods, especially its close relative brachyurans. A recent origin rather than the relic fauna was suggested. The present study will supply considerable data of use for both genomics and evolutionary research on hydrothermal vent ecosystems.

【题目】Development and characterization of monoclonal antibodies to spring viraemia of carp virus. Veterinary
【中文关键词】Zhong-Yuan Chen, Hong Liu, Zheng-Qiu Li, Qi-Ya Zhang
【英文关键词】Monoclonal antibodies; Fish rhabdovirus; Spring viraemia of carp virus (SVCV0504); Flow cytometry
【中文摘要】无
【英文摘要】Five monoclonal antibodies (mAbs) against spring viraemia of carp (SVCV0504, isolated from common carp in China) were produced from mice immunized with purified virus preparations. The virion of SVCV contains five structural proteins, representing the nucleoprotein (N), phosphoprotein (P), matrix protein (M), glycoprotein (G) and RNA-dependent RNA polymerase (L). Western blotting analysis revealed that three mAbs (1H5, 1E10, and 1H7) recognized specifically to a single protein of 47kDa (N), the mAb 3G4 reacted with two SVCV0504 proteins of 69kDa (G) and 47kDa (N), while the mAb 1A9 reacted with three SVCV0504 proteins of 69kDa (G), 50kDa (P), and 47kDa (N). By indirect ELISA, two mAbs (1H5 and 1H7) showed cross-reactivity with pike fry rhabdovirus (PFRV), but no cross-reactions with the Siniperca chuatsi rhabdovirus (SCRV), Scophthalmus maximus rhabdovirus (SMRV), Paralichthys olivaceus rhabdovirus (PoRV) were demonstrated with the five mAbs. Indirect immunofluorescence showed intense fluorescence in the cytoplasm of the SVCV0504-infected epithelioma papulosum cyprini (EPC) cells in areas corresponding to the location of granular structures. The sucrose gradient-purified SVCV0504 particles could be detected successfully by these mAbs using immunodot blotting. mAb 1A9 could completely neutralize 100 TCID(50) (50% tissue culture infective dose) of SVCV0504 at a dilution of 1:8. This is the first report of development of the neutralizing mAbs against SVCV. The mAb 1A9 was analyzed further and could be used to successfully detect viral antigens in the infected-EPC cell cultures or in cryosections from experimentally infected crucian carp (Carassius auratus) by immunohistochemistry assay. Furthermore, a flow cytometry procedure for the detection and quantification of cytoplasmic SVCV0504 in cell cultures was developed with mAb 1A9. At 28h after inoculation with the virus (0.01PFU/cell), 10.12% of infected cells could be distinguished from the uninfected cells. These mAbs will be useful in diagnostic test development and pathogenesis studies for fish rhabdovirus.

【题目】Rana grylio virus thymidine kinase gene: an early gene of iridovirus encoding for a cytoplasmic protein
【中文关键词】Zhe Zhao, Fei Ke, Yan Shi, Guang-Zhou Zhou, Jian-Fang Gui and Qi-Ya Zhang
【英文关键词】Rana grylio virus (RGV) - Iridovirus - Thymidine kinase - Early viral gene - Cytoplasmic protein
【中文摘要】无
【英文摘要】The presence of thymidine kinase (TK) is a feature of many large DNA viruses. Here, a TK gene homologue was cloned and characterized from Rana grylio virus (RGV), a member of family Iridoviridae. RGV TK encodes a protein of 195 aa with a predicted molecular mass of 22.1 kDa. Homologues of the protein were present in all the currently sequenced iridoviruses, and phylogenetic analysis showed that it was much close to cellular TK type 2 (TK2), deoxycytidine kinase (dCK) and deoxyguanosine kinase (dGK). Subsequently, Western blotting revealed TK expression increased with time from 6 h post-infection in RGV-infected cells. Using drug inhibition analysis by protein synthesis inhibitor (cycloheximide) and DNA replication inhibitor (cytosine arabinofuranoside), RGV TK was classified as the early expression gene during in vitro infection. Subcellular localization by TK-GFP fusion protein expression and immunofluorescence staining showed RGV TK was an exclusively cytoplasmic protein in fish cells. Collectively, current data indicate that RGV TK was an early gene of iridovirus which encoded a cytoplasmic protein in fish cells.

【题目】Expression, Purification of Recombinant Flounder MRF4 protein in Escherichia coli and analysis of its polyclonal antibodies
【中文关键词】XU Peng, TAN Xun-Gang, ZHANG Pei-Jun, ZHANG Yu-Qing, WANG Bo
【英文关键词】flournder, expression, purification, MRF4 antibody
【中文摘要】无
【英文摘要】MRF4 is one of muscle regulatory factors and plays critical roles during skeletal muscle development. The muscle development is important for the fish growth which is an important economic factor for the fish culture. To analyze the function of MRF4 in fish, the founder MRF4 antibody was prepared. The flounder MRF4 was cloned, ligated into prokaryotic expression vector pET-30b and expressed in strain E. coli BL21 (DE3). The recombinant flounder MRF4 fusion protein was soluble and purified with cobalt IMAC resins. To prepare MRF4 polyclonal antibodies, rabbits were immunized with the soluble protein and the increasing level of antibodies was determined by Western blot. Also, the endogenous flounder MRF4 was recognized by the anti-serum. The result further proved the existence of the anti-MRF4 antibody in the anti-serum, which will be useful for studies on the function of flounder MRF4.

【题目】Quantitative comparison of the expression of myogenic regulatory factors in flounder (Paralichthys olivaceus) embryos and adult tissues
【中文关键词】ZHANG Yuqing , TAN Xungang ,XU Peng , SUN Wei , XU Yongli ,ZHANG Peijun
【英文关键词】Paralichthys olivaceus; myogenic regulatory factors; myogenesis; muscle; quantitative RT-PCR

【中文摘要】无
【英文摘要】MyoD, Myf5, and myogenin are myogenic regulatory factors that play important roles during myogenesis. It is thought that MyoD and Myf5 are required for myogenic determination, while myogenin is important for terminal differentiation and lineage maintenance. To better understand the function of myogenic regulatory factors in muscle development of flounder, an important economic fish in Asia, real-time quantitative RT-PCR was used to characterize the expression patterns of MyoD, Myf5, and myogenin at early stages of embryo development, and in different tissues of the adult flounder. The results show that, Myf5 is the first gene to be expressed during the early stages of flounder development, followed by MyoD and myogenin. The expressions of Myf5, MyoD, and myogenin at the early stages have a common characteristic: expression gradually increased to a peak level, and then gradually decreased to an extremely low level. In the adult flounder, the expression of the three genes in muscle is much higher than that in other tissues, indicating that they are important for muscle growth and maintenance of grown fish. During embryonic stages, the expression level of MyoD might serve an important role in the balance between muscle cell differentiation and proliferation. When the MyoD expression is over 30% of its highest level, the muscle cells enter the differentiation stage.

【题目】Peroxiredoxin IV Regulates Pro-Inflammatory Responses in Large Yellow Croaker (Pseudoaena crocea) and Protects against Bacterial Challenge
【中文关键词】Suhong Yu, Yinnan Mu, Jingqun Ao, Xinhua Chen
【英文关键词】large yellow croaker (Pseudosciaena crocea) • proteomics • peroxiredoxin IV • NF-κB activation • pro-inflammatory response • antibacterilal immunity • siRNA
【中文摘要】无
【英文摘要】In this study, we applied a comparative proteomic approach to the analysis of differentially expressed proteins in the spleens of large yellow croaker following treatment with an inactivated trivalent bacterial vaccine. Twenty-four altered proteins were identified by MALDI-TOF or MALDI-TOF-TOF, including immune-related proteins, antioxidant proteins, signal transducers, protein biosynthesis and catabolism modulators, and carbonic anhydrases. Three Prx family members, namely, Prx I, Prx II, and Prx IV, were upregulated after treatment with the vaccine, indicating potentially important roles for these antioxidant proteins in the antibacterial immune response. Large yellow croaker Prx IV (LycPrxIV), which has thiol-dependent peroxidase activity, was constitutively expressed in all tissues examined. Immunoelectron microscopy showed that LycPrxIV was primarily localized to the rER or peroxisome in spleen cells of healthy fish, and its synthesis on the rER increased following treatment with bacterial vaccine. Suppression of LycPrxIV by siRNA resulted in an increase in NF-kappaB activity in spleen tissues, while in vivo administration of recombinant LycPrxIV (rLycPrxIV) caused a decrease in NF-kappaB activity, indicating that LycPrxIV negatively regulates NF-kappaB activation. Likewise, siRNA-mediated knockdown of LycPrxIV increased the expression of TNF-alpha and CC chemokine, and downregulated the expression of IL-10. However, injection of fish with rLycPrxIV induced the opposite expression pattern of these cytokines, suggesting a role for LycPrxIV in regulating pro-inflammatory responses. Bacterial challenge experiments showed that suppression of LycPrxIV expression by siRNA significantly increased fish mortality as compared to controls, whereas rLycPrxIV provided a protective effect. Together, our data suggest that LycPrxIV may regulate pro-inflammatory responses to protect large yellow croaker from bacterial challenge, revealing a novel antibacterial mechanism in fish.

【题目】温室内地温变化规律及与气温的相关性
【中文关键词】温室;地温;气温;相关性
【英文关键词】greenhouse; soil temperature; air temperature; relativity
【中文摘要】摘要:为了找出温室内地温变化特点及其与气温变化的相关性,为温室内作物栽培管理及温室结构优化设计提供理论依据。对不同类型温室大棚内地下5、10、15、20 cm 4 种不同深度浅层土壤温度及温室中地上20、50、150 cm 3 种不同高度空气温度进行多点同步观测分析研究。结果表明:随着土壤深度的增加,其温度最高或最低出现的时间逐渐延迟;同时,表层土壤温度变幅远大于深层,即随着土壤深度的增加,土温的变幅将迅速变小;地温与气温变化规律基本一致,但存在一定的滞后现象。
【英文摘要】Abstract: In order to find out the characteristics that the soil temperature changes in the greenhouse and therelativity with atmosphere temperature changes. For the farm crop cultivation and management and theglasshouse structure of excellent turn and design provide a theory basis. Following to carry on more orderingand synchronously prognosticate an analysis research in greenhouse. Observed the four kinds of different depthsoil temperatures at 5, 10, 15 and 20 cm in shallow layer and the three kinds of different high air temperaturesabove the ground 20, 50, 150 cm in different kinds of glasshouses. The results showed that the tallest soiltemperature or lowest soil temperature appear delayed gradually along with the increment of the soil depth. Atthe same time, the changes range of surface layer soil temperature was larger than deep soil temperature,namely the variety range of soil temperature will quickly diminish along with the increment of the soil depth.The change regulation of soil temperature and air temperature was unanimously basic. Butthe soiltemperaturevariety compared with air temperature variety to have to definitely delay a phenomenon.

【题目】山羊美臀突变基因(CLPG)的多态性鉴定及其与生产性能的关系
【中文关键词】山羊;CLPG ;多态性;生产性状
【英文关键词】goat; CLPG; polymorphism; productiontraits
【中文摘要】Callipyge绵羊的臀部肌肉明显肥大,呈极性超显性遗传。研究克隆了山羊美臀突变基因250bp的序列(GenBank登录号:EU753362),对其多态性及其与山羊生产性能的关系进行了分析。结果表明,所扩增片段与绵羊和猪相应片段的同源性分别为96.04%和88.65%。PCR-SSCP分析表明,在该DNA区段存在多态性。测序结果显示,在对应于绵羊的基因没有发现A→G的突变,但在该位点下游147bp处检测到一个A→C的颠换,记为SNP216。对波尔山羊(=63)、莱芜黑山羊(=70)、鲁波杂交山羊(=40)、鲁北白山羊(=29)和内蒙古阿拉善白绒山羊(=115)共5个群体的多态性进行了检测,结果表明:除鲁北白山羊以外,A等位基因均为优势等位基因;波尔山羊、莱芜黑山羊、鲁北白山羊和鲁波杂交山羊群体均处于Hardy-Weinberg平衡状态(p>0.05),而内蒙古阿拉善白绒山羊群体显著偏离Hardy-Weinberg平衡状态(p<0.01);不同基因型的

内蒙古阿拉善白绒山羊的初生重、从出生到断奶时的增重及产绒量的最小二乘均值差异不显著(p>0.5)。
【英文摘要】The Dorset ram with Callipy gephenotype shows muscular hypertrophy at buttock,and its inheritance is polar overdominance. A partial DNA fragment of 250bp in goat Callipyge mutation gene (GenBank Accession No.EU753362) was obtained, and had a 96.04% and 88.65%identity with the corresponding region of ovine and porcine , respectively. And apolymorphism in the DNA fragment was detected by PCR-SSCP. Sequencing results indicated that no A→Cmutation was corresponding to ovine ,whereas a A→C transversion located 147bp downstream from the site was identified. The polymorphism was named after its position as SNP216 was investigated in Boer(n =63), LaiwuBlack(n=70), Lubei White *Boer Hybrid(n=40), Lubei White(n =29) and Inner Mongolia Alashan white cashmere(=115) goat populations. The results indicated that allele A was predominant in the four goat populations of Boer, LaiwuBlack, Lubei White *Boer Hybrid and Inner Mongolia Alashan white cashmere, and except for the Inner Mongolia Alashan White cashmere goat, the other four populations were in the state of Hardy-Weinberg equilibrium(p>0.05). In Inner Mongolia Alashan white cashmere goats, least square means of birthweight, production of cashmere and body weight gain from birth to weaning between AA and AC were not significantly different(p >0.5).

【英文关键词】 Paralichthys olivaceus; major histocompatibility complex; Vibrio anguillarum; disease resistance

【中文摘要】无
【英文摘要】Genetic variation in the major histocompatibility complex (MHC) class IIB was tested in Japanese flounder (Paralichthys olivaceus) for survival after challenge with bacterial infection. The material consisted of 6000 Japanese flounder from 60 families challenged with Vibrio anguillarum, which causes significantly different mortality in flounder families. Five individuals from each of six high-resistance (HR) and six low-resistance (LR) families were screened for their MHC class IIB genotypes using sequence analysis. High polymorphism of MHC IIB gene and at least three loci were discovered in Japanese flounder and the rate of d(N) occurred at a significantly higher frequency than that of d(S) in PBR. Among 60 individuals, 76 alleles were discovered and 15 alleles were used to study associations between alleles and resistance to disease. We found highly significant associations between resistance towards infectious disease caused by V. anguillarum and MHC class IIB polymorphism in Japanese flounder. Some alleles appeared in both HR and LR families, while some alleles were only discovered in HR or LR families. One allele, Paol-DAB*4301, was significantly more prevalent in HR families than in LR families (P = 0.023). Paol-DAB*0601, Paol-DAB*0801, Paol-DAB*2001, Paol-DAB*3803 were discovered in two HR families with high frequency. One allele, Paol-DAB*1601, was discovered in three LR families. The steady heredity of MHC class IIB alleles was observed, and the family having Paol-DAB*4301 alleles was confirmed with higher resistance to V. anguillarum. This study confirmed the association between alleles of MHC class IIB gene and disease resistance, and also detected some alleles which might be correlated with high bacterial infection resistance. The disease resistance-related MHC markers could be used for molecular marker-assisted selective breeding in the flounder.

【题目】A lectin (CfLec-2) aggregating Staphylococcus haemolyticus from scallop Chlamys farreri.
【中文关键词】Zheng, Peilin;Wang, Hao;Zhao, Jianmin;Song, Linsheng;Qiu, Limei;Dong, Chaohua
【英文关键词】Chlamys farreri; lectin; Ca2+ independent; Staphylococcus haemolyticus
【中文摘要】无
【英文摘要】Lectins are a family of carbohydrate-recognition proteins which play crucial roles in innate immunity. In this study, a new lectin (CfLec-2) gene was cloned from Chlamys farreri by EST and RACE approaches. The full-length cDNA of CfLec-2 was composed of 708 bp, encoding a typical Long form carbohydrate-recognition domain of 130 residues. The deduced amino acid sequence showed high similarity to Brevican in Homo sapiens, C-type lectin-1 and lectin-2 in Anguilla japonica. The cDNA fragment encoding the mature peptide of CfLec-2 was recombined into plasmid pET-32a (+) and expressed in Escherichia coli Rosseta-Gami (DE3). The recombinant CfLec-2 (rCfLec-2) protein exhibited aggregative activity toward Staphylococcus haemolyticus, and the agglutination could be inhibited by D-mannose but not EDTA or D-galactose, indicating that CfLec-2 was a Ca2+ independent lectin. Moreover, rCfLec-2 could suppress the growth of E. coli TOP10F'. These results suggested that CfLec-2 was perhaps involved in the recognition and clearance of bacterial. pathogens in scallop.

【题目】A novel C1q-domain-containing protein from Zhikong scallop Chlamys farreri with lipopolysaccharide binding activity
【中文关键词】Zhang, Huan;Song, Linsheng

【英文关键词】Chlamys farreri; C1qDC protein; C1q; complement system; gene cloning; real-time PCR; recombinant protein; LPS-binding activity
【中文摘要】无
【英文摘要】 The C1q-domain-containing (C1qDC) proteins are a family of proteins characterized by a globular C1q (gC1q) domain in their C-terminus. They are involved in various processes of vertebrates and supposed to be an important pattern recognition receptor in innate immunity of invertebrates. In this study, a novel member of C1q-domain-containing protein family was identified from Zhikong scallop Chlamys farreri (designated as CfC1qDC) by expressed sequence tag (EST) and rapid amplification of cDNA ends (RACE) approaches. The full-length cDNA of CfC1qDC was of 777 bp, consisting of a T-terminal untranslated region (UTR) of 62 bp and a 3' UTR of 178 bp with a polyadenylation signal sequence AATAAA and a poly (A) tail. The CfC1qDC cDNA encoded a polypeptide of 178 amino acids, including a signal peptide and a C1q-domain of 158 amino acids with the theoretical isoelectric point of 5.19 and the predicted molecular weight of 17.2 kDa. The C1q-domain in CfC1qDC exhibited homology with those in sialic acid binding lectin from mollusks and C1qDC proteins from higher vertebrates. The typical 10 beta-strand jelly-roll folding topology structure of C1q-domain and the residues essential for effective packing of the hydrophobic core were well conserved in CfC1qDC. By fluorescent quantitative real-time PCR, mRNA transcripts of CfC1qDC were mainly detected in kidney, mantle, adductor muscle and gill, and also marginally detectable in hemocytes. In the bacterial challenge experiment, after the scallops were challenged by Listonella anguillarum, there was a significant up-regulation in the relative expression level of CfC1qDC and at 6 h post-injection, the mRNA expression reached the maximum level and was 4.55-fold higher than that of control scallops. Similarly, the expression of CfC1qDC mRNA in mixed primary cultures of hemocytes stimulated by lipopolysaccharides (LPS) was up-regulated and reached the maximum level at 6 h post-stimulation, and then dropped back to the original level gradually. In order to investigate its function, the cDNA fragment encoding the mature peptide of CfC1qDC was recombined and expressed in Escherichia coli BL21 (DE3). The recombinant CfC1qDC protein displayed a significantly strong activity to bind LIDS from E. coli, although no obvious antibacterial or agglutinating activity toward Gram-negative bacteria E. coli JM109, L. anguillarum and Gram-positive bacteria Micrococcus luteus was observed. These results suggested that CfC1qDC was absolutely a novel member of the C1qDC protein family and was involved in the recognition of invading microorganisms probably as a pattern recognition molecule in mollusk

【题目】cDNA cloning, characterization and mRNA expression of a pacifastin light chain gene from Eriocheir sinensis
【中文关键词】Gai, Yunchao;Wang, Lingling;Song, Linsheng
【英文关键词】 Pacifastin; Serine protease inhibitors (SPIs); Pacifastin light chain domain (PLD); Eriocheir sinensis; mRNA expression
【中文摘要】无
【英文摘要】The pacifastin family, characterized by several conserved arrays of six cysteine residues, is a newly identified serine protease inhibitor (SPI) family discovered uniquely in arthropods and plays important roles in multiple biological processes. In the present study, the full-length cDNA of a pacifastin light chain (designated ESPLC) was cloned from the Chinese mitten crab Eriocheir sinensis by expressed sequence tags (ESTs) and PCR techniques. The 1036 bp ESPLC cDNA contained an 831 bp open reading frame (ORF) encoding a putative pacifastin-related peptide of 276 amino acids, a 5'-untranslated region (UTR) of 67 bp, and a 3'-UTR of 138 bp. Six putative conserved domains sharing a characteristic cysteine array (Cys-Xaa(9-12)-Cys-Asn-Xaa-Cys-Xaa-Cys-Xaa(2-3)-Gly-Xaa(3-4)-Cys-Thr-Xaa(3)-Cys) were identified in the deduced amino acid sequence of ESPLC. The conservation of these PLDs (pacifastin light chain domains) and the relative higher similarity of ESPLC to other pacifastin-related precursors suggested that ESPLC was a member of pacifastin family. The mRNA transcripts of ESPLC were found to be higher expressed in hepatopancreas, gill and haemolymph than in gonad, muscle and heart, with the highest expression level in hepatopancreas. The ESPLC mRNA expression in haemolymph of Chinese mitten crab was up-regulated at 2 h and 12 h after challenged with Listonella anguillarum. The tissue distribution and temporal characteristics of ESPLC mRNA expression, similar to that of prophenoloxidase gene in E. sinensis, suggested that ESPLC was potentially involved in the response against invading bacteria, with the possibility that it functioned in the

prophenoloxidase system in E sinensis.

【题目】A prophenoloxidase from the Chinese mitten crab Eriocheir sinensis: Gene cloning, expression and activity analysis.
【中文关键词】Gai, Yunchao;Zhao, Jianmi;Song, Linshen
【英文关键词】prophenoloxidase; Eriocheir sinensis; quantitative real-time PCR; innate immunity; enzyme specific activity; mRNA expression profile
【中文摘要】无
【英文摘要】 Prophenoloxidase (proPO) is a conserved copper-containing enzyme that plays important roles in immune response of crustaceans and insects. In the present study, the full-length cDNA of a prophenoloxidase (designated EsproPO) was cloned from haemocytes of Chinese mitten crab Eriocheir sinensis by expressed sequence tag (EST) and PCR techniques. The isolated 3549 bp full-length cDNA of EsproPO contained a 2040 bp open reading frame (ORF) encoding a putative proPO protein of 679 amino acids, a 5'-untranslated region (UTR) of 68 bp, and a long 3'-UTR of 1441 bp. Two putative copper-binding sites, a proteolytic activation site, and a complement-like motif (GCGWPQHM) were identified in the deduced amino acid sequence of EsproPO. Homology analysis revealed that EsproPO was highly similar to other proPOs from crustaceans with identities from 52% to 68%. The conserved domains and motifs, and higher similarity with other proPOs suggested that EsproPO was a member of the proPO family. The mRNA expression of EsproPO and PO specific activities in the tissues of hepatopancreas, gill, gonad, muscle, heart, eye and haemocytes were measured by quantitative real-time PCR and colorimetric assay, respectively. The mRNA transcripts of EsproPO and PO specific activities could be detected in all the examined tissues with the highest level both in hepatopancreas. Three peaks of EsproPO mRNA expression were recorded at 2 h, 12 h and 48 h in haemocytes of Chinese mitten crab post Vibrio anguillarum challenge, which was consistent with the temporal profile of PO specific activity. The mRNA expression pattern and the activity fluctuation of EsproPO post V. anguillarum stimulation indicated that it was potentially involved in the acute response against invading bacteria in Chinese mitten crab.

【题目】Cloning and characterization of a novel C-type lectin gene from shrimp Litopenaeus vannamei
【中文关键词】Zhang, Ying;Qiu, Limei;Song, Linsheng
【英文关键词】 C-type lectin; Gene cloning; Recombinant expression; Bacteria agglutination; Litopenaeus vannamei
【中文摘要】无
【英文摘要】In invertebrates, C-type lectins play crucial roles in innate immunity responses by mediating the recognition of host cells to pathogens and clearing microinvaders, which interact with carbohydrates and function as pattern recognition receptors (PRRs). A novel C-type lectin gene (LvLec) cDNA was cloned from hemocytes of Litopenaeus vannamei by expressed sequence tag (EST) and rapid amplification of cDNA ends (RACE) PCR. The full-length cDNA of LvLec was of 618 bp, consisting of a 5'-terminal untranslated region (UTR) of 60 bp and a 3'-UTR of 87 bp with a poly (A) tail. The deduced amino acid sequence of LvLec possessed all conserved features critical for the fundamental structure, such as the four cysteine residues (Cys(53), Cys(128), Cys(144), Cys(152)) involved in the formation of disulfides bridges and the potential Ca(2+)/carbohydrate-binding sites. The high similarity and the close phylogenetic

relationship of LvLec shared with C-type lectins from vertebrates and invertebrates. The structural features of LvLec indicated that it was an invertebrate counterpart of the C-type lectin family. The cDNA fragment encoding the mature peptide of LvLec was recombined and expressed in Escherichia coli BL21(DE3)-pLysS. The recombinant protein (rLvLec) could agglutinate bacteria E. coli JM109 depending on Ca(2+), and the agglutination could be inhibited by mannose and EDTA. These results indicated that LvLec was a new member of C-type lectin family and involved in the immune defence response to Gram negative bacteria in Litopenaeus vannamei.

【题目】Molecular cloning and expression of a novel Kazal-type serine proteinase inhibitor gene from Zhikong scallop Chlamys farreri, and the inhibitory activity of its recombinant domain
【中文关键词】Wang, Bo;Zhao, Jianmin;Song, Linsheng
【英文关键词】Chlamys farreri; Kazal-type serine proteinase inhibitor; realtime RT-PCR; recombinant expression; inhibitory activity; inhibition constant (K-i)
【中文摘要】无
【英文摘要】Serine proteinase inhibitors (SPIs) play important roles in host physiological and immunological processes in all multicellular organisms. A novel Kazal-type SPI gene was cloned from the Zhikong scallop Chlamys farreri (designated as CfKZSPI) by expressed sequence tag (EST) and rapid amplification of cDNA ends (RACE) approaches. The full-length cDNA of CfKZSPI was of 1788 nucleotides with a canonical polyadenylation signal sequence AATAAA and a polyA tail, and an open reading frame (ORF) encoding a polypeptide of 509 amino acids with a putative signal peptide of 22 amino acids. The deduced amino acid sequence of CfKZSPI contained 12 tandem Kazal domains with high similarity to other Kazal-type SPIs. The temporal expression of CfKZSPI in hemocytes after Vibrio anguillorum challenge was recorded by quantitative real-time RT-PCR. The relative mRNA expression level of CfKZSPI was up-regulated and reached 43.6-fold at 3 h post-challenge. After a decrease at 6 h, the expression Level increased again and reached 207.8-fold at 12 h post-challenge. The 12th Kazal domain of CfKZSPI was recombined into pET-32a(+) and expressed in Escherichia coli Rosetta-gami (DE3) to investigate its inhibitory activity. The purified recombinant protein (rCf KZSPI-1 2) showed significant inhibitory activity against trypsin but no activity against thrombin. When the molar ratio of inhibitor to trypsin reached 1:1, almost 90% of the enzyme activity could be inhibited, which suggested that one molecule of rCfKZSPI-12 was able to inhibit one molecule of trypsin. Kinetics analysis with Dixon plot showed that the inhibition constant (K-i) of rCfKZSPI-12 to trypsin was 173 nmol L-1. These results indicated that CfKZSPI was a novel Kazal-type SPI with significant inhibitory activity against trypsin, and was suspected to be involved in scallop immune response.

【题目】Molecular cloning and characterization of a catalase gene from Zhikong scallop Chlamys farreri
【中文关键词】Li, Chenghua;Ni, Duojiao;Song, Linsheng
【英文关键词】Chlamys farreri; catalase; gene cloning; quantitative real-time PCR
【中文摘要】无
【英文摘要】: Catalase is one of the central enzymes involved in scavenging the high level of reactive oxygen species (ROS) by degradation of hydrogen peroxide to oxygen and water. The full-length catalase cDNA of Zhikong scallop Chlamys farreri (denoted as

CfCAT) was identified from hemocytes by expressed sequence tag (EST) and rapid amplification of cDNA ends (RACE) approaches. The nucleotide sequence of CfCAT cDNA consisted of 3146 bp with a 5' UTR of 103 bp, an unusually long 31 UTR of 1519 bp with a canonical polyadenylation signal sequence AATAAA and a potyA tail, and an open reading frame (ORF) of 1521 bp encoding a polypeptide of 507 amino acids with predicted molecular weight of 57.5 kDa. The deduced amino acid sequence of CfCAT has significant homology to catalases from animals, plants and bacteria. Several highly conserved motifs including the proximal heme-ligand signature sequence RLFSYNDTH, the proximal active site signature FNRERIPERVVHAKGGGA, and the three catalytic amino acid residues of His(72), Asn(145) and Tyr(355) were identified in the deduced amino acid sequence of CfCAT. The CfCAT was demonstrated to be a peroxisomal glycoprotein with two potential glycosylation sites and a peroxisome targeting signal of ANL that was consistent with human, mouse and rat catalases. The time-course expression of CfCAT in hemocytes was measured by quantitative real-time PCR. The expression of CfCAT increased gradually and reached the highest point at 12 h post-Vibrio infection, then recovered to the original level at 24 h. All these results indicate that CfCAT, a constitutive and inducible protein, is a member of the catalase family and is involved in the process against ROS in scallop

【题目】Molecular cloning and responsive expression to injury stimulus of a defender against cell death 1 (DAD1) gene from bay scallops Argopecten irradians

【中文关键词】Zhu, Ling;Song, Linsheng

【英文关键词】Argopecten irradians; cDNA cloning; defender against apoptotic cell death (DAD1); phylogeny; tissue distribution; injury

【中文摘要】无

【英文摘要】Apoptosis is an active process of cell death, which is an integral part of growth and development in multicellular organisms. The defender against cell death 1 (DAD1), the regulatory protein to inhibit the apoptosis process, was first cloned from the bay scallop Argopecten irradians by randomly sequencing a whole tissue cDNA library and rapid amplification of cDNA end (RACE). The full-length cDNA of the A. irradians DAD1 was 607 bp, consist of a 5'-terminal untranslated region (UTR) of 63 bp, a 3'-terminal UTR of 205 bp with a canonical polyadenylation signal sequence AATAAA and a poly (A) tail, and an open reading frame of 339 bp. The deduced amino acid sequence of the A. irradians DAD1 showed 75.5% identity to Araneus ventricosus, 74.5% to Drosophila melanogaster, and 73.6% to Homo sapiens, Sus scrofa, Mesocricetus auratus, Rattus norvegicus and Mus musculus. Excluding the Saccharomyces cerevisiae DAD1 homologue, all animal DAD1 including A. irradians DAD1 homologue formed a subgroup and all plant DAD1 proteins formed another subgroup in the phylogenetic analysis. The A. irradians DAD1 was expressed in all examined tissues including adductor muscle, mantle, gills, digestive gland, gonad and hemolymph, suggesting that A. irradians DAD1 is expressed in most body tissues. Furthermore, the mRNA expression levels of A. irradians DAD1 gene of hemolymph were particularly high after injury, suggesting that the gene is responsive to injury stimuli.

【题目】Molecular cloning, characterization and expression of heat shock protein 90 gene in the haemocytes of bay scallop Argopecten irradians

【中文关键词】Gao, Qiang ;Zhao, Jianmin;Song, Linsheng
【英文关键词】heat shock protein 90; gene cloning; bacterial challenge; mRNA expression; Argopecten irradians
【中文摘要】无
【英文摘要】 Heat shock protein 90 (HSP90) is a highly conserved molecular chaperone that plays key roles in the folding, maintenance of structural integrity and regulation of a subset of cytosolic proteins. In the present study, the cDNA of Argopecten irradians HSP90 (designated AiHSP90) was cloned by the combination of homology cloning and rapid amplification of cDNA ends (RACE) approaches. The full-length cDNA of AiHSP90 was of 2669 bp, including an open reading frame (ORF) of 2175 bp encoding a polypeptide of 724 amino acids with predicted molecular weight of 83.08 kDa and theoretical isoelectric point of 4.81. BLAST analysis revealed that AiHSP90 shared high similarity with other known HSP90s, and the five conserved amino acid blocks defined as HSP90 protein family signatures were also identified in AiHSP90, which indicated that AiHSP90 should be a cytosolic member of the HSP90 family. Fluorescent real-time quantitative PCR was employed to examine the expression pattern of AiHSP90 mRNA in haemocytes of scallops challenged by Gram-negative bacteria Vibrio anguillarum and Gram-positive bacteria Micrococcus luteus. In both bacterial challenged groups, the relative expression level of AiHSP90 transcript was up-regulated and reached maximal. level at 9 h after injection, and then dropped progressively to the original level at about 48 h post challenge. The results indicated that AiHSP90 was potentially involved in the immune responses against bacteria challenge in scallop A. irradian.

【题目】The enhanced immune protection of Zhikong scallop Chlamys farreri on the secondary encounter with Listonella anguillarum
【中文关键词】Cong, Ming;Song, Linsheng;Wang, Lingling
【英文关键词】cumulative mortality; enhanced immune protection; immune parameters; immune priming; Zhikong scallop Chlamys farreri
【中文摘要】无
【英文摘要】 It is well known that invertebrates are devoid of adaptive immune components and rely primarily on innate immunity to defend against pathogens, but recent studies have demonstrated the existence of enhanced secondary immune protection in some invertebrates. in the present study, the cumulative mortality of scallops received two successive Listonella anguillarum stimulations was recorded, and variations of immune parameters including phagocytosis (phagocytic rate and phagocytic index), phenoloxidase-like enzyme, acid phosphatase and superoxide dismutase activities were also examined. The scallops received a previous short-term L anguillarum stimulation were protected against a long-term stimulation of L. anguillarum. Significantly higher level of phagocytic activities and acid phosphatase activity were observed in the scallops received twice stimulations compared with those only received the secondary stimulation. These results indicated that a short-term immersion with L. anguillarum modulated the scallops' immune system and endowed the scallops with enhanced resistance to the secondary bacterial stimulation: phagocytosis and acid phosphatase were suspected to be involved in the protection.

【题目】Molecular cloning and characterization of peroxiredoxin 6 from Chinese mitten crab Eriocheir sinensis
【中文关键词】Mu, Changkao;Zhao, Jianmin;Wang, Lingling;Song, Linsheng
【英文关键词】Eriocheir sinensis; Peroxiredoxin 6 (Prx6); Innate immunity; Gene cloning; mRNA expression; Bacteria challenge
【中文摘要】无
【英文摘要】Peroxiredoxin is a superfamily of antioxidative proteins that play important roles in protecting organisms against the toxicity of reactive oxygen species (ROS). In this study, the full-length cDNA encoding peroxiredoxin 6 (designated EsPrx6) was cloned from Chinese mitten crab Eriocheir sinensis by using rapid amplification of cDNA ends (RACE) approaches. The full-length cDNA of EsPrx6 was of 1076 bp, containing a 5' untranslated region (UTR) of 69 bp, a 3' UTR of 347 bp with a poly (A) tail, and an open reading frame (ORF) of 660 bp encoding a polypeptide of 219 amino acids with the predicted molecular weight of 24 kDa. The conserved Prx domain, AhpC domain and the signature of peroxidase catalytic center identified in EsPrx6 strongly suggested that EsPrx6 belonged to the 1-Cys Prx subgroup. Quantitative real-time RT-PCR was employed to assess the mRNA expression of EsPrx6 in various tissues and its temporal expression in haemocytes of crabs challenged with Listonella anguillarum. The mRNA transcript of EsPrx6 could be detected in all the examined tissues with highest expression level in hepatopancreas. The expression level of EsPrx6 in haemocytes was down-regulated after bacterial challenge and significantly decreased compared to the control group at 12 h. As time progressed, the expression level began to increase but did not recover to the original level during the experiment. The results suggested the involvement of EsPrx6 in responses against bacterial infection and further highlighted its functional importance in the immune system of E sinensis.

【题目】Interleukin-1β gene in orange-spotted grouper, Epinephelus coioides: Molecular cloning, expression, biological activities and signal transduction.
【中文关键词】Dan-Qi Lu, Jin-Xin Bei, Li-Na Feng, Yong Zhang, Xiao-Chun Liu
【英文关键词】IL-1 ; Orange-spotted grouper; Gene organization; Tissue distribution; Mitogen; Recombinant protein; Signal transduction
【中文摘要】无
【英文摘要】IL-1beta, a key mediator of inflammation, orchestrates a variety of immune responses by initiating gene expression. Herein, we have cloned and sequenced the IL-1beta in orange-spotted grouper (Epinephelus coioides), produced soluble mature recombinant IL-1beta in Escherichia coli, and characterized its biological properties and downstreamsignal transduction. The grouper IL-1beta cDNA was 1364bp in length, containing an open reading frame of 765bp. The predicted protein of 254 amino acids revealed the presence of the IL-1 family signature motif and the absence of a conventional ICE cut site. Phylogenetically, the grouper IL-1beta clustered closely with those of teleost belonging to Perciformes and apart from those of mammals. The grouper IL-1beta was constitutively expressed in almost all tissues examined, and was augmented in PBL after the addition of LPS or Poly I:C in vitro. The prokaryotically produced rIL-1beta significantly stimulated the proliferation of grouper head kidney cells, and activated gene expression of IL-1beta and COX-2. Moreover, the rIL-1beta-induced IL-1beta and COX-2 expression were reduced by p38 MAPK inhibitor (SB203580) and JNK inhibitor (SP600125), respectively. Taken together, the present study indicated that grouper IL-1beta may have an important role in grouper immune system and activate similar downstream cascades as its mammalian counterparts.

【中文摘要】无
【英文摘要】GRP78 (78 kDa glucose-regulated protein), also known as BiP (immunoglobulin heavy-chain-binding protein), is an essential regulator of endoplasmic reticulum (ER) homeostasis because of its multiple functions in protein folding, ER calcium binding, and controlling of the activation of transmembrane ER stress sensors. In this report, we cloned the full length cDNA of GRP78 (FcGRP78) from Chinese shrimp Fenneropenaeus chinensis. This cDNA revealed a 2,325 bp with 1,968 bp open reading frame encoding 655 amino acids. This is the first reported GRP78 gene in Crustacea. The deduced amino acid sequence of FcGRP78 shared high identity with previously reported insect GRP78s: 86, 87 and 85% identity with GRP78s of Drosophila melanogaster, Aedes aegypti and Bombyx mori, respectively. Northern blot analysis shows that FcGRP78 is ubiquitously expressed in tissues of shrimp. Heat shock at 35A degrees C significantly enhanced the expression of FcGRP78 at the first hour, reached the maximum at 4 h post heat shock, dropped after that and resumed to the normal level until 48 h of post recovery at 25A degrees C. Additionally, differential expression of FcGRP78 was detected in haemocytes, hepatopancreas and lymphoid organ when shrimp were challenged by white spot syndrome virus (WSSV). We inferred that FcGRP78 may play important roles in chaperoning, protein folding and immune function of shrimp.

【题目】Identification and characterization of a myeloid differentiation factor 88 (MyD88) cDNA from Zhikong scallop Chlamys farreri
【中文关键词】Qiu, LM ; Song, LS ; Yu, YD ; Xu, W; Ni, DJ ; Zhang, QC
【英文关键词】Chlamys farreri; innate immunity; Myd88; real-time RT-PCR
【中文摘要】无
【英文摘要】Myeloid differentiation factor 88 (MyD88) is a universal and essential adapter for the TLR/IL-1R family. In this report, the first mollusk Myd88 ortholog (named as CfMyd88) was cloned from Zhikong scallop (Chlamys farreri). The full-length cDNA of CfMyd88 was of 1554 bp, including a 5 '-terminal untranslated region (UTR) of 427 bp, a polyA tail, and an open reading frame (ORF) of 1104 bp encoding a polypeptide of 367 amino acids containing the typical TLR and IL-1R-related (TIR) domain and death domain (DD). Homology analysis revealed that the predicted amino acid sequence of CfMyd88 was homologous to a variety of previously identified Myd88s with more than 30% identity. The temporal expressions of CfMyd88 mRNA in the mixed primary cultured haemocytes stimulated by lipopolysaccharide (LPS) and peptidoglycans (PGN) were measured by real-time RT-PCR system. The mRNA expression of CfMyd88 decreased after stimulation with both LPS and PGN, and the lowest level was about 1/3 times (at 6 h) and 1/10 times (at 9 h) to that in the control group, respectively. The expression then recovered and was upregulated to two-fold at 9 h after LPS stimulation or to the original level at 12 It after PGN stimulation. The results suggest that the MyD88-dependent signaling pathway exists in scallop and was involved in the defense system.

【题目】Loss of allele diversity in introduced populations of the hermaphroditic bay scallop Argopecten irradians
【中文关键词】Wang, LL; Zhang, H; Song, LS; Guo, XM
【英文关键词】Argopecten irradians; non-native species; hermaphrodite; microsatellite; genetic variation; founder population
【中文摘要】无
【英文摘要】The bay scallop Argopecten irradians is a hermaphroditic bivalve native to the Atlantic coast of the United States that was introduced to China for aquaculture production in 1982. It now supports a major aquaculture industry in China. Introduced species often start with limited genetic variability, which is problematic for the further selective breeding. Bay scallop aquaculture is exclusively hatchery based and as the initial introduction consisted of only 26 scallops, there have been concerns about inbreeding and inbreeding depression in cultured populations in China. In this study, eleven simple sequence repeat (SSR) markers were used to compare genetic variation in cultured populations from China with that in a natural population from the east coast of America. Although the difference in heterozygosity was small, the Chinese populations lost 9 of the 45 alleles (20%) found in the wild population. The reduced allele diversity suggests that the Chinese bay scallop populations experienced a bottleneck in genetic diversity that remains significant despite several recent introductions of new stocks aimed at expanding the gene pool. The loss of allele diversity may affect future efforts in selective breeding and domestication, and results of this study highlight the need for additional introductions, advanced breeding programs that minimize inbreeding and continued genetic monitoring.

【题目】Molecular cloning and characterization of a short type peptidoglycan recognition protein (CfPGRP-S1) cDNA from Zhikong scallop Chlamys farreri
【中文关键词】Su, JG; Ni, DJ; Song, LS; Zhao, HM; Qiu, LM
【英文关键词】Chlamys farreri; peptidoglyean recognition protem-S1 (PGRP-S1); pattern recognition receptors (PRRs); gene cloning; mRNA expression
【中文摘要】无
【英文摘要】Peptidoglycan recognition protein (PGRP) specifically binds to peptidoglycan and plays a crucial role in the innate immune responses as a pattern recognition receptor (PRR). The cDNA of a short type PGRP was cloned from scallop Chlamys farreri (named CfPGRP-SI) by homology cloning with degenerate primers, and confirmed by virtual Northern blots. The full length of CfPGRP-SI cDNA was 1073 bp in length, including a 5 ' untranslated region (UTR) of 59 bp, a 3 ' UTR of 255 bp, and an open reading frame (ORF) of 759 bp encoding a polypeptide of 252 amino acids with an estimated molecular mass of 27.88 kDa and a predicted isoelectric point of 8.69. BLAST analysis revealed that CfPGRP-S1 shared high identities with other known PGRPs. A conserved PGRP domain and three zinc-binding sites were present at its C-terminus. The temporal expression of QPGRP-S1 gene in healthy, Vibrio anguillarum-challenged and Micrococcus lysodeikticus-challenged scallops was measured by RT-PCR analysis. The expression of CfPGRP-S1 was upregulated initially in the first 12 h or 24 h either by M. lysodeikticus or V. anguillarum challenge and reached the maximum level at 24 h or 36 h, then dropped progressively, and recovered to the original level as the stimulation decreased at 72 h. There was no significant difference between V. anguillarum and M. lysodeikticus challenge. The results indicated that the CfPGRP-S1 was a constitutive and inducible acute-phase protein which was involved in the immune response against bacterial infection.

【题目】Molecular cloning and characterization of a thioester-containing protein from Zhikong scallop Chlamys farreri
【中文关键词】Zhang, H ; Song, LS ; Li, CH; Zhao, JM; Wang, H; Gao, Q; Xu, W
【英文关键词】Chlamys farreri; thioester-containing protein; gene cloning; complement evolution; RT-PCR
【中文摘要】无
【英文摘要】Thioester-containing proteins are a family of proteins characterized by the unique intrachain beta-cysteinyl-gamma-glutamyl thioester, which play important roles in innate immune responses. The cDNA of Zhikong scallop Chlamys farreri thioester-containing protein (designated as CfTEP) was cloned by expressed sequence tag (EST) and rapid amplification of cDNA ends (RACE) approaches. The full-length cDNA of CfTEP was of 4616 bp, consisting of a 5 '-terminal untranslated region (UTR) of 30 bp and a 3 ' UTR of 140 bp with a polyadenylation signal sequence AATAAA and a poly(A) tail. The CfTEP cDNA encoded a polypeptide of 1481 amino acids with the theoretical isoelectric point of 5.98 and the predicted molecular weight of 161.4 kDa. The deduced amino acid sequence of CfTEP contained the canonical thioester motif GCGEQ, nine potential N-glycosylation sites and a C-terminal distinctive cysteine signature. It also contained a presumed catalytic histidine and proteolytic cleavage sites that were similar to C3 molecules. The high similarity of CfTEP with the thioester-containing proteins in other organisms, such as the TEPs from insects, the complement component C3, C4, C5 and the protease inhibitor alpha(2)-macroglobulin indicated that CfTEP should be a member of TEP family. The phylogenetic analysis revealed that CfTEP was closely related to TEPs from mollusc, nematodes and insects, and they formed a separate branch apart from the branches of complements factors and alpha(2)-macroglobulins. The spatial expression of CfTEP transcripts in healthy and bacterial challenged scallops was examined by semi-quantitative RT-PCR. The CfTEP transcripts were mainly detected in the tissues of hepatopancreas and gonad, and remarkably up-regulated by Microbial challenge, which suggested that CfTEP was a constitutive and inducible acute-phase protein involved in immune defense. These results provided new insights into the role of CfTEP in scallop immune responses, as well as the evolutionary origin of this important, widespread and functionally diversified family of proteins.

【题目】Molecular cloning and characterization of a putative lipopolysaccharide-induced TNF-a factor (LITAF) gene homologue from Zhikong scallop Chlamys farreri
【中文关键词】Yu, YD; Qiu, LM; Song, LS; Zhao, JM; Ni, DJ; Zhang, Y; Xu, W
【英文关键词】Chlamys farreri; lipopolysaccharide-induced TNF-alpha factor (LITAF); lipopolysaccharide (LPS); real-time RT-PCR; innate immunity
【中文摘要】无
【英文摘要】LPS-induced TNF-alpha factor (LITAF) is a novel transcriptional factor that was first discovered in LPS-stimulated human macrophage cell line THP-1. LITAF can bind to TNF-a promoter to regulate its expression. The first scallop LITAF (named as CfLITAF) was cloned from Zhikong scallop Chlamys farreri by Expressed Sequence Tag (EST) and Polymerase Chain Reaction (PCR) techniques. The cDNA of CfLITAF was of 1240 bp and consisted of a 5' untranslated region (UTR) of 112 bp, a 3' UTR of 678 bp and an open reading frame (ORF) of 450 bp encoding a polypeptide of 149 amino acids with an estimated molecular mass of 16.08 kDa and theoretical isoelectric point of 6.77. A typical conserved LITAF-domain was identified in CfLITAF by SMART analysis. Homology analysis of the deduced amino acid sequence of CfLITAF with other known sequences by using the BLAST program revealed that

CfLITAF was homologous to the LITAF from human and rat (Identity = 46%), cattle, horse, mouse and chicken (Identity = 48%), western clawed frog (Identity = 42%), and zebrafish (Identity = 50%). The mRNA expression of CfLITAF in different tissues including haemocytes, muscle, mantle, heart, gill and gonad, and the temporal expression in haemocytes challenged by LPS or peptidoglycan (PGN) were measured by Real-time RT-PCR. CfLITAF mRNA transcripts could be detected in all tissues examined and be up-regulated in haemocytes after LPS challenge. No significant changes were observed after PGN stimulation. All these data indicated the existence of LITAF in scallop and also provided clue on the presence of TNF-alpha-like molecules in invertebrates.

【题目】The cDNA cloning and mRNA expression of cytoplasmic Cu, Zn superoxide dismutase (SOD) gene in scallop Chlamys farreri
【中文关键词】Ni, DJ ; Song, LS; Gao, Q; Wu, LT; Yu, YD; Zhao, JM; Qiu, LM; Zhang, H; Shi, FF
【英文关键词】scallop; Chlamys farreri; reactive oxygen species (ROS); superoxide dismutase (SOD); innate immunity; mRNA expression
【中文摘要】无
【英文摘要】Cu, Zn superoxide dismutases (SODs) are rnetalloenzymes that represent one important line of defence against reactive oxygen species (ROS). A cytoplasmic Cu. Zn SOD cDNA sequence was cloned from scallop Chlamys farreri by the homology-based cloning technique. The full-length cDNA of scallop cytoplasmic Cu, Zn SOD (designated CfSOD) was 1022 bp with a 459 bp open reading frame encoding a polypeptide of 153 amino acids. The predicted amino acid sequence of CfSOD shared high identity with cytoplasmic Cu. Zn SOD in molluscs, insects, mammals and other animals, such as cytoplasmic Cu, Zn SOD in oyster Crassostrea sostrea gigas (CAD42722), mosquito Aedes aegypti (ABF18094), and cow Bos taurus (XP_584414). A quantitative reverse transcriptase real-time PCR (qRT-PCR) assay was developed to assess the mRNA expression of CfSOD in different tissues and the temporal expression of CfSOD in scallop challenged with Listonella anguillarum, Micrococcus luteus and Candida lipolytica respectively. Higher-level mRNA expression of CfSOD was detected in the tissues of haemocytes, gill filaments and kidney. The expression of CfSOD dropped in the first 8-16 h and then recovered after challenge with L. anguillarum and M. litteus, but no change was induced by the C. lipolytica challenge. The results indicated that CfSOD was a constitutive and inducible acute-phase protein, and could play an important role in the immune responses against L. anguillarum and M. luteus infection.

【题目】In Silico Screening for Microsatellite Markers from Expressed Sequence Tags of Porphyra yezoensis
【中文关键词】Wang MQ; Hu JJ; Zhuang YY; Zhang L; Liu W; Mao YX
【英文关键词】bioinformatics data mining; EST; microsatellites; Porphyra yezoensis
【中文摘要】无
【英文摘要】The genomic resources of Porphyra yezoensis expressed sequence tags (ESTs) were utilized to identify simple sequence repeats (SSRs), or microsatellites. This method took the advantag e of using ESTs and microsatel lites either for the establishme nt of gene identities or for the acquisition of hi gh polymorphism. The microsatel lites can be used as gene markers when microsatellites are tagged to genes. Revealed by bioinformatics analysis, 1 162 out of 21 954 ESTs contained microsatellites and cluster analysis indi-

cated that 984 of these ESTs fell into 112 contigs, while the other 178 ESTs were singletons. A total of 290 unique SSR-containing genes were identified. The AAC SSRs were the most populous type of microsatellites. GC-rich microsatellites were predominant among all the microsatellites.

【题目】Two novel secreted ferritins involved in immune defense of Chinese mitten crab Eriocheir sinensis
【中文关键词】Kong, PF; Wang, LL; Zhang, H; Zhou, Z; Qiu, LM; Gai, YC; Song, LS
【英文关键词】Secreted ferritin; Iron-withholding strategy; Innate immunity; Metal binding site; Pathogen infection; Eriocheir sinensis
【中文摘要】无
【英文摘要】As a principal extracellular iron storage molecule, secreted ferritin plays an important role in the iron-withholding strategy of innate immunity. In this study, two novel secreted ferritins were identified from Chinese mitten crab Eriocheir sinensis (designated as EsFer-1 and EsFer-2) by rapid amplification of cDNA ends (RACE) approaches and expressed sequence tag (EST) analysis. The full-length cDNAs of EsFer-1 and EsFer-2 were of 1278 and 1595 bp, respectively, both containing a putative iron response element (IRE) in their 5' UTRs and multiple A + U-destabilizing elements (TATT or ATTTA) in their 3' UTRs. The ORFs of these two crab ferritin cDNAs were of 639 and 663 bp, respectively, encoding two peptides of 212 and 220 amino acid residues each with a signal peptide and typical structures of ferritins such as four long alpha-helices, one short alpha-helix and an L-loop. EsFer-2 exhibited higher similarity with the H-ferritins from both invertebrates and vertebrates, while EsFer-1 was closer matched to L-ferritins. The eight amino acid residues identified as metal binding sites in vertebrate H-ferritins were conserved in EsFer-2 (Glu53, Tyr60, Glu87, Glu88, His91, Glu146, Glu177 and Gln178), but none of them was observed in EsFer-1. By fluorescent quantitative real-time PCR, mRNA transcripts of EsFer-1 and EsFer-2 were mainly detected in muscle, hepatopancreas and gill, and also marginally detectable in gonad, heart and hemocytes. After the crabs were challenged by bacteria Listonella anguillarum, the transcriptional levels of both EsFer-1 and EsFer-2 in hemocytes were up-regulated twice. In the first up-regulation, the mRNA relative expression levels of both EsFer-1 and EsFer-2 reached peak at 3 h post-challenge, while in the second up-regulation, they did not reach the highest point within the experiment duration. After the fungi Pichia pastoris GS115 challenge, there was only one transcriptional level peak of both the two ferritins, appearing at 6 h post-challenge. These results suggest that secreted EsFer-1 and EsFer-2 are crucial proteins in the iron-withholding defense system, and play important roles in the innate immune responses in crabs.

【题目】Protective immunity induced by CpG ODNs against white spot syndrome virus (WSSV) via intermediation of virus replication indirectly in Litopenaeus vannamei.
【中文关键词】Zhang, Y; Song, LS; Zhao, JM; Wang, LL; Kong, PF; Liu, L; Wang, MQ; Qiu, LM
【英文关键词】CpG; White spot syndrome virus; Dicer; Argonaute; Reactive oxygen species; STAT; Virus replication; Litopenaeus vannamei
【中文摘要】无

【英文摘要】The worldwide shrimp culture is beset with diseases mainly caused by white spot syndrome virus (WSSV) and suffered huge economic losses, which bring out an urgent need to develop the novel strategies to better protect shrimps against WSSV. In the present study, CpG-rich plasmid pUC57-CpG, plasmid pUC57 and PBS were employed to pretreat shrimps comparatively to evaluate the protective effects of CpG ODNs on shrimps against WSSV. The survival rates, WSSV copy numbers, and antiviral associated factors (Dicer, Argonaute, STAT and ROS) were detected in Litopenaeus vannamei. There were higher survival proportion, lower WSSV copy numbers, and higher mRNA expression of Dicer and STAT in pUC57-CpG-pretreatment shrimps than those in pUC57- and PBS-pretreatment shrimps after WSSV infection. The Argonaute mRNA expression in pUC57-CpG-, pUC57- and PBS-pretreatment shrimps after WSSV infection was significantly higher than that of shrimps post PBS stimulation on the first day. The ROS levels in pUC57-CpG-pretreatment shrimps post secondary stimulation of PBS were significantly higher than those post WSSV infection on the first day. These results together demonstrated that pUC57-CpG induced partial protective immunity in shrimps against WSSV via intermediation of virus replication indirectly and could be used as a potential candidate in the development of therapeutic agents for disease control of WSSV in L. vannamei.

【中文摘要】无
【英文摘要】Galectins are a family of β-galactoside-binding lectins which play crucial roles in innate immunity of vertebrates and invertebrates. In the present study, the cDNA of a galectin with multiple carbohydrate-recognition domains (CRDs) was cloned from bay scallop Argopectens irradians (designated AiGal1) by expressed sequence tag (EST) and rapid amplification of cDNA ends (RACE) techniques. The full-length cDNA of AiGal1 was of 2235 nucleotides, encoding a polypeptide of 549 amino acids. SMART program analysis revealed that AiGal1 contained four galectin CRDs, and all the CRDs contained the two consensus motifs essential for ligand-binding. Quantitative real-time PCR was employed to investigate the tissue distribution of AiGal1 mRNA and temporal expression in haemocytes of scallops challenged with Vibrio anguillarum, Micrococcus luteus and Pichia pastoris. The AiGal1 mRNA could be detected in all tested tissues with the highest expression level in hepatopancreas. After challenged by V. anguillarum and M. luteus, the expression level of AiGal1 mRNA was both up-regulated and reached the maximum level at 9 h (1.52 fold, $P < 0.05$) and 18 h (2.89 fold, $P < 0.01$) post challenge, respectively. However, there was no significant difference in the mRNA expression of AiGal1 in haemocytes after P. pastoris challenge ($P > 0.05$). These results collectively indicated that AiGal1 was a new member of the galectin family and involved in the immune responses against bacterial infection.

【题目】The involvement of suppressors of cytokine signaling 2 (SOCS2) in immune defense responses of Chinese mitten crab Eriocheir sinensis

【中文关键词】Zhang, Y; Zhao, JM; Zhang, H; Gai, YC; Wang, LL; Li, FM; Yang, JL; Qiu, LM; Song, LS

【英文关键词】 Eriocheir sinensis; SOCS3; Listonella anguillarum; Micrococcus luteus; Immune defense responses

【中文摘要】无

【英文摘要】The suppressors of cytokine signaling 2 (SOCS2) has been identified as negative feedback inhibitors for various cytokines signaling via the JAK/STAT pathway.In the present studies, the cDNA of Eriocheir sinensis SOCS2 (designated as EsSOCS2) was cloned by expressed sequence tag (EST) and rapid amplification ofcDNA ends (RACE) approaches. The full-length cDNA of EsSOCS2 was of 2535 bp, consisting of an open reading frame (a ORF) of 1071 bp encoding a polypeptideof 357 amino acids. The deduced amino acid sequence of EsSOCS2 shared 55-62% similarity with other SOCS2 family members. There were three typical conserved SOCS family domains in EsSOCS2, including an N-terminal ESS formed from a single amphipathic helix, a central SH2 domain with a classic phosphotyrosine (pY) site and a C-terminal SOCS box. The sequence and structural similarity of EsSOCS2 with SOCS2 proteins from other organisms indicated that EsSOCS2 should be a new member of the SOCS2 family. Phylogenetic analysis revealed that EsSOCS2 was clustered with SOCS2 from the other invertebrates, and fell into the group of type 11 SOCS subfamily as a sister branch to CIS and SOCS2 from vertebrate, suggesting the great divergence of SOCS2 of vertebrate from invertebrate and complex evolution of SOCS2 family members. The mRNA transcript of EsSOCS2 could be detected by semi-quantitative RT-PCR in all examined tissues of healthy crabs, including haemocytes, hepatopancreas, gill, muscle, heart and gonad. The mRNA expression of EsSOCS2 in haemocytes was up-regulated to 3.5-fold at 8 h after Listonella anguillarum challenge, 3-fold and 3.5-fold at 4 and 6 h, respectively, after Micrococcus luteus challenge. These results collectively suggested that EsSOCS2 could be induced by bacteria challenge, and it was involved in the immune defense responses in E. sinensis.

【题目】A putative endocrine factor SIBD (single insulin binding domain protein) involved in immune response of Chinese mitten crab Eriocheir sinensis.

【中文关键词】Gai, YC; Wang, LL; Song, LS; Zhao, JM; Qiu, LM; Xing, KZ

【英文关键词】IGFBP; Insulin binding domain; Eriocheir sinensis; Arthropod endocrine; Innate immunity; mRNA expression profile

【中文摘要】无

【英文摘要】Insulin growth factor binding proteins (IGFBPs), characterized by the conserved insulin binding (IB) domains, are important components of endocrine system and play key roles in metabolism and growth. In the present study, the full-length cDNA of a single IB domain protein (designated EsSIBD) was identified from Chinese mitten crab Erlocheir sinensis based on expressed sequence tag (EST) sequence. The 1187 bp EsSIBD cDNA contained a 321 bp open reading frame (ORF) encoding a putative protein of 106 amino acids, a T-untranslated region (UTR) of 189 bp, and a 3'-UTR of 677 bp. Multiple sequence alignment presented ten conserved cysteine residues critical for the fundamental structure and function of IB domain. BLAST analysis revealed that EsSIBD shared high similarity with previously known IB domains of IGFBPs; with the identities ranging from 40% to 46%. The sequence similarity and domain conservation indicated that EsSIBD was a potential member of the IGFBP family. Phylogenic analysis presented that EsSIBD was closer to IGFBP7 than to the other 113 domain containing proteins, suggesting its functional similarity with the endocrine factor IFGBP7. The mRNA expression of EsSIBD in different tissues including hepatopancreas, gill, gonad, muscle, heart and haemocytes, and the temporal expression in haemocytes challenged by Listonella anguillarum were measured by real-time RT-1 CR. EsSIBD mRNA transcripts could be detected in all examined tissues with the highest expression level in gill. The EsSIBD mRNA

expression in haemocytes was sensitive to L anguillarum stimulation and it was up-regulated from 3 to 24 h after challenge. The structure conservation and functional similarity to IFGBPs, and its sensitivity to L anguillarum stimulation collectively implied that EsSIBD was probably involved in endocrine and immune systems of Chinese mitten crab, and provided insight into the cross-talk between the invertebrate endocrine and immune system.

【英文摘要】Crustin is a cysteine-rich antibacterial peptide which widely distributes within decapod crustaceans. In the present study, the cDNA encoding crustin-like peptide (designated CrusEs) was cloned from Chinese mitten crab Eriocheir sinensis by using rapid amplification of cDNA ends (RACE) approaches and expressed sequence tag analysis. The full-length cDNA of CrusEs was of 796 bp, containing a 5' untranslated region (UTR) of 214 bp, a 3' UTR of 267 bp with a poly(A) tail, and an open reading frame (ORF) of 315 bp encoding a polypeptide of 104 amino acids including a putative signal peptide of 21 amino acids. A WAP domain and the consensus framework existing in class I crustins were both identified in CrusEs, suggesting that CrusEs is a new member of type I crustins. Quantitative real-time RT-PCR was employed to examine the expression of CrusEs, and its mRNA transcript was mainly detected in haemocytes and gill. The CrusEs mRNA transcript in haemocytes was down-regulated after the challenge with Gram-positive bacteria Micrococcus luteus, while Gram-negative bacteria Listonella anguillarum did not induce significant variation of CrusEs mRNA. The mature peptide of CrusEs was cloned into pET-21a(+) with a C-terminal hexa-histidine tag fused in-frame, and expressed in Escherichia coil, and the recombinant CrusEs inhibited the growth of Gram-positive bacteria with low MIC. The results indicate that CrusEs is a potent antibacterial protein against Gram-positive bacteria infection, and it may play an important role in innate immune response of E. sinensis.

【题目】A Dicer-1 gene from white shrimp Litopenaeus vannamei: expression pattern in the processes of immune response and larval development.
【中文关键词】Yao, XM; Wang, LL; Song, LS; Zhang, HA; Dong, CH; Zhang, Y; Qiu, LM; Shi, YH; Jianmin, ZM ; Bi, YK
【英文关键词】Litopenaeus vannamei; Dicer-2; mRNA expression; Immune response; Laval development
【中文摘要】无
【英文摘要】Dicer is a member of the RNAase III family which catalyzes the cleavage of double-stranded RNA to small interfering RNAs and micro RNAs, and then directs sequence-specific gene silencing. In this paper, the full-length cDNA of Dicer-1 was cloned from white shrimp Litopenaeus vannamei (designated as LvDcr1). It was of 7636 bp, including a poly A tail, a 5' UTR of 136 bp, a 3' UTR of 78 bp, and an open reading frame (ORF) of 7422 bp encoding a putative protein of 2473 amino acids. The predicted amino acid sequence comprised all recognized functional domains found in other Dicer-1 homologues and showed the highest (97.7%)

similarity to the Dicer-1 from tiger shrimp Penaeus mondon. Quantitative real-time PCR was employed to investigate the tissue distribution of LvDcr1 mRNA, and its expression in shrimps under virus challenge and larvae at different developmental stages. The LvDcr1 mRNA could be detected in all examined tissues with the highest expression level in hemocyte, and was up-regulated in hemocytes and gills after virus injection. These results indicated that LvDcr1 was involved in antiviral defense in adult shrimp. During the developmental stages from fertilized egg to postlarva VII, LvDcr1 was constitutively expressed at all examined development stages, but the expression level varied significantly. The highest expression level was observed in fertilized eggs and followed a decrease from fertilized egg to nauplius I stage. Then, the higher levels of expression were detected at nauplius V and postlarva stages. LvDcr1 expression regularly increased at the upper phase of nauplius, zoea and mysis stages than their prophase. The different expression of LvDcr1 in the larval stages could provide clues for understanding the early innate immunity in the process of shrimp larval development.

【题目】The involvement of HSP22 from bay scallop Argopecten irradians in response to heavy metal stress
【中文关键词】Zhang, L; Wang, LL; Song, LS; Zhao, JM; Qiu, LM; Dong, CH; Li, FM; Zhang, H; Yang, GP
【英文关键词】HSP23; Argopecten irradians; Gene cloning; Biomarker; Heavy metals
【中文摘要】无
【英文摘要】Heat shock protein 22 (HSP22) is an important member of small heat shock protein (sHSP) subfamily which plays a key role in the process of protecting cells, facilitating the folding of nascent peptides, and responding to stress. In the present study, the cDNA of HSP22 was cloned from Argopecten irradians (designated as AiHSP22) by rapid amplification cDNA end (RACE) based on the expressed sequence tags (ESTs). The full-length cDNA of AiHSP22 was of 1,112 bp, with an open reading frame of 588 bp encoding a polypeptide of 195 amino acids. The deduced amino acid sequence of AiHSP22 showed high similarity to previously identified HSP22s. The expression patterns of AiHSP22 mRNA in different tissues and in haemocytes of scallops exposed to Cd(2+), Pb(2+) or Cu(2+) were investigated by real-time quantitative RT-PCR. The mRNA of AiHSP22 was constitutively expressed in all examined tissues, including haemocyte, muscle, kidney, gonad, gill and heart. The expression level in heart and muscle was higher than that in other tissues. The mRNA level of AiHSP22 in haemocytes was up-regulated after a 10 days exposure of scallops to Cu(2+), Pb(2+) and Cd(2+). However, the expression of AiHSP22 did not increase linearly along with the rise of heavy metal concentration. Different concentrations of the same metal resulted in different effects on AiHSP22 expression. The sensitive response of AiHSP22 to Cu(2+), Pb(2+) and Cd(2+) stress indicated that it could be developed as an indicator of exposure to heavy metals for the pollution monitoring programs in aquatic environment.

【题目】Cloning and expression analysis of myogenin from flounder (Paralichthys olivaceus) and promoter analysis of muscle-specific expression
【中文关键词】Xu, P; Tan, XG; Zhang, YQ; Zhang, PJ; Xu, YL
【英文关键词】flounder; myogenin; myogenesis; somites; myogenin promoter; zebrafish

【中文摘要】无
【英文摘要】Myogenin is a bHLH transcription factor of the MyoD family. It plays a crucial role in myoblast differentiation and maturation. We report here the isolation of flounder myogenin gene and the characterization of its expression patterns. Sequence analysis indicated that flounder myogenin shared a similar structure and the conserved bHLH domain with other vertebrate myogenin genes. Flounder myogenin gene contains 3 exons and 2 introns. Sequence alignment and phylogenetic showed that flounder myogenin was more homologous with halibut (Hippoglossus hippoglossus) myogenin and striped bass (Morone saxatilis) myogenin. Whole-mount embryo in situ hybridization revealed that flounder myogenin was first detected in the medial region of somites that give rise to slow muscles, and expanded later to the lateral region of the somite that become fast muscles. The levels of myogenin transcripts dropped significantly in matured somites at the trunk region. Its expression could only be detected in the caudal somites, which was consistent with the timing of somite maturation. Transient expression analysis showed that the 546 bp flounder myogenin promoter was sufficient to direct muscle-specific GFP expression in zebrafish embryos.

【题目】Transcriptome and expression profiling analysis revealed changes of multiple signaling pathways involved in immunity in the large yellow croaker during Aeromonas hydrophila infection.
【中文关键词】Mu, YN; Ding, F; Cui, P; Ao, JQ; Hu, SN; Chen, XH
【英文关键词】无
【中文摘要】无
【英文摘要】Background: The large yellow croaker (Pseudosciaena crocea) is an economically important marine fish in China suffering from severe outbreaks of infectious disease caused by marine bacteria such as Aeromonas hydrophila (A. hydrophila), resulting in great economic losses. However, the mechanisms involved in the immune response of this fish to bacterial infection are not fully understood. To understand the molecular mechanisms underlying the immune response to such pathogenic bacteria, we used high-throughput deep sequencing technology to investigate the transcriptome and comparative expression profiles of the large yellow croaker infected with A. hydrophila. Results: A total of 13,611,340 reads were obtained and assembled into 26,313 scaffolds in transcriptional responses of the A. hydrophila-infected large yellow croaker. Via annotation to the NCBI database, we obtained 8216 identified unigenes. In total, 5590 (68%) unigenes were classified into Gene Ontology, and 3094 unigenes were found in 20 KEGG categories. These genes included representatives from almost all functional categories. By using Solexa/Illumina's DeepSAGE, 1996 differentially expressed genes (P value < 0.05) were detected in comparative analysis of the expression profiles between A. hydrophila-infected fish and control fish, including 727 remarkably upregulated genes and 489 remarkably downregulated genes. Dramatic differences were observed in genes involved in the inflammatory response. Bacterial infection affected the gene expression of many components of signaling cascades, including the Toll-like receptor, JAK-STAT, and MAPK pathways. Genes encoding factors involved in T cell receptor (TCR) signaling were also revealed to be regulated by infection in these fish. Conclusion: Based on our results, we conclude that the inflammatory response may play an important role in the early stages of infection. The signaling cascades such as the Toll-like receptor, JAK-STAT, and MAPK pathways are regulated by A. hydrophila infection. Interestingly, genes encoding factors involved in TCR signaling were revealed to be downregulated by infection, indicating that TCR signaling was suppressed at this early period. These results revealed changes of multiple signaling pathways involved in immunity during A. hydrophila infection, which will facilitate our comprehensive understanding of the mechanisms involved in the immune response to bacterial infection in the large yellow croaker.

【题目】解淀粉芽孢杆菌BI2 的鉴定及其对黄曲霉的抑制作用
【中文关键词】解淀粉芽孢杆菌;菌株鉴定;黄曲霉;抑菌活性
【英文关键词】Bacillus amyloliquefaciens ;strain identification; Aspergillus flavus ;antagonistic activity
【中文摘要】菌株BI2是从青贮玉米秸秆饲料中分离得到的一株革兰氏阳性芽孢杆菌。经16S rDNA 序列分析,发现该菌株与解淀粉芽孢杆菌 Bacillus amyloliquefaciens(NC_009725)的相似性达到 99.6%;进一步结合 Biolog 及生理生化分析,将该菌株鉴定为解淀粉芽孢杆菌。以番茄叶霉病菌、黄瓜枯萎病菌等12种植物病原菌及部分霉菌、酵母、食品乳酸菌和人类致病细菌为指示菌进行抑菌实验。结果表明:BI2 主要抑制丝状真菌,而对细菌无拮抗作用;BI2 菌株生长36 h的上清液能明显抑制黄曲霉孢子萌发及其菌丝生长,抑制率分别达到67.4%和74.8%;而且该上清液经120 ℃高温处理20 min 后对黄曲霉的抑制效果基本没有影响。
【英文摘要】The strain BI2 isolated from corn stalk of silage was G+ bacillus. By means of 16S rDNA sequence analysis,morphological observation, physiological examinatio and Biolog assay, BI2 was identified as Bacillus amyloliquefaciens . Its 16S rDNA sequence was 99.6% to B. amyloliquefaciens in similarity. Its antagonistic experiments were conducted with 12 plant pathogens including Fulvia fulva ,Fusarium oxysporum, yeasts, mold fungi, food lactobacilla and pathogenic bacteria.The results show that BI2 possessed evident inhibitory activity to filamentous fungi, but had no evident effect on bacteria. It was further found that the supernatant of its broth after 36 h fermentation significantly inhibited the conidial germination and hyphal growth of Aspergillus flavus with the inhibition ratios of 67.4% and 74.8% respectively. It was also found that its an-tagonistic activity of the supernatant was not decreased although it was treated even at 120 ℃ for 20 min.

【题目】Characterization of a novel bacteriocin produced by Lactobacillus sakei LSJ618
【中文关键词】细菌素
乳杆菌 sakei

西卡菌素
生物防腐剂
【英文关键词】Bacteriocin
Lactobacillus sakei
Biopreservative
【中文摘要】sakacin LSJ618是一种由中国传统萝卜发酵中分离出的乳杆菌菌株产生的被研究的新细菌。L. sakei LSJ618的两个表型和生理测试结合16SrD NA序列分析都已经被确定。sakacin lsj618敏感水解酶包括脂肪酶,在PH2-8之间稳定、耐热(30分钟,121 °C)。sakacin lsj618表现出对使食物变质的细菌和食物传染的病原体的抑制活性,包括革兰氏阳性单增李斯特菌,金黄色葡萄球菌,藤黄微球菌属,和革兰氏阴性菌大肠杆菌及变形杆菌。但大多数乳酸细菌检验呈阴性。细菌的大量表达是在后期固定相,抑制活性会在在26小时之内下降。sakacin lsj618被确定为杀菌,并证明其对四联球菌的杀菌作用。部分纯化后经硫酸铵沉淀和Se phadex G - 25层析, sakacinlsj618的分子量通过SDS-PAGE确定为5.2 k D。sakacin lsj618性质的确定表明它是一种新型有潜在的应用作为一种在食品工业中的生物防腐剂的细菌。
【英文摘要】A novel bacteriocin, sakacin LSJ618, produced by the strain Lactobacillus sakei LSJ618 isolated fromtraditional Chinese fermented radish, was studied. L. sakei LSJ618 was identified by both phenotypicaland physiological tests combined with 16S rDNA sequence analysis. Sakacin LSJ618 is sensitive tohydrolytic enzymes including lipase, is stable between pH 2e8, and is heat resistant (30 min at 121 C).Sakacin LSJ618 exhibits inhibitory activity against food-spoiling bacteria and food-borne pathogens,including the Gram-positive Listeria monocytogenes, Staphylococcus aureus, Sarcina sp., Micrococcusluteus, and the Gram-negative Proteus sp. and Escherichia coli, but not against most of the lactic acidbacteria tested. Maximal production of bacteriocin was reached in the late stationary phase, andinhibitory activity declined within 26 h. The mode of action of sakacin LSJ618 was determined to bebactericidal, as evidenced by its action upon Micrococcus tetragenus. After partial purification byammonium sulfate precipitation and Sephadex G-25 chromatography, the molecular weight of sakacinLSJ618 was determined to be 5.2 kDa by Tricine-SDS-PAGE. The identified properties of sakacin LSJ618indicate that it is a novel bacteriocin with potential application as a biopreservative in the food industry.

【题目】Major forest types and the evolution of sustainable forestry in China.
【中文关键词】China ’ s forestry , China ’ s forest types,Sustainable forest management, China ’ s forest resource,Six key forestry programs Eco-construction
【英文关键词】China ’ s forestry , China ’ s forest types,Sustainable forest management, China ’ s forest resource,Six key forestry programs Eco-construction
【中文摘要】In this article, we introduce China ’ s majorforest types and discuss the historical development offorest management in China, including actions taken overthe last decade toward achieving SMF. Major challengesare identi fi ed, and a strategy for SFM implementation inChina is presented. China ’ s forests consist of a wide varietyof types with distinctive distributional patterns shaped bycomplex topography and multiple climate regimes. How tomanage this wide array of forest resources has challengedforest managers and policy-makers since the founding ofthe country. Excessive exploitation of China ’ s forestresources from the 1950s to the late 1990s contributed toenvironmental problems and calamities, such as fl oods, soilerosion, and deserti fi cation. At the start of the new millennium, the Chinese government decided to shift itsemphasis from timber production towards the achievementof sustainable forest management (SFM). With a series ofendeavors such as the implementation of the ‘ ‘ Six KeyForestry Projects ’ ’ and the reform of forest tenure policies,and the adoption of a classi fi cation system for China ’ sforests, a beginning has been made at reversing the trend ofenvironmental degradation that occurred throughout thelatter half of the last century. At the same time, hugechallenges remain to be tackled for the development offorestry in China.

【题目】Evaluating land-use suitability of an industrial city in northeast China
【中文关键词】Land-use suitability, sustainable land use, multi-criteria evaluation, Nanfen
【英文关键词】Land-use suitability, sustainable land use, multi-criteria evaluation, Nanfen
【中文摘要】Distribution of industrial land use has a crucial influence on the regional environment.Nanfen is a developing industrial city affiliated with Benxi City, northeastern China. Thesuitability of industrial land use in Nanfen was evaluated to provide a scientific basis forindustrial land-use planning and to minimise negative impacts on the local environment.Multi-criteria evaluation (MCE) within GIS was employed to derive a suitability map. Thesuitability map was compared with current industrial land use to identify areas

for reloca-tion of current industries. A total of 25.7% of the urban area in Nanfen was rated as suit-able, 28.1% as somewhat suitable, 37.9% as unsuitable and 8.2% as most unsuitable. About20.6% of the current industrial land was in suitable areas, 46.5% in somewhat suitableareas and 32.9% in unsuitable areas. We further verified the influence of selected factorson the suitability of industrial land use using a field survey. The results confirmed thatindustrial land-use relocation in Nanfen is required. This study uses ecological suitabilityevaluation as a basis for land-use planning and has implications for other industrial citiesin northeast China that have similar environmental and ecological problems.

【题目】Current situation and development of Chinese urban forestry

【中文关键词】ECOSYSTEM SERVICES, PLANNING AND CONSTRUCTION, LANDSCAPE SPATIAL PATTERNS, GREEN GDP

【英文关键词】ECOSYSTEM SERVICES, PLANNING AND CONSTRUCTION, LANDSCAPE SPATIAL PATTERNS, GREEN GDP

【中文摘要】This paper introduces Chinese urban forestry research in terms of the concept, forest types, ecosystem services, spatial structure, planning and construction, assessment and management. Modern Chinese urban forest had a close relationship with traditional landscape architecture. Urban forest services had been quantified in some case cities, and determined by urban forest spatial patterns and internal structures. Based on landscape ecology and urban planning, urban forest spatial patterns have been analysed and planned rationally in some cities. However, studies on urban forestry generally lack long-term, continuous and systemic observations, as well as in-depth research on ecological processes and mechanisms. The development trends in urban forestry in China might include extensive application of '3S' technology, research on the relationship between urban forest landscape spatial patterns and their ecological effects, economic assessment, ecological and economic benefits and studies on the negative effects of pollutants.

【题目】Forest ecosystem services and eco-compensation mechanisms in China.
【中文关键词】Ecosystem services Eco-compensation Compensation fund system for forest ecological benefits Noncommercial forests China forestry
【英文关键词】Ecosystem services Eco-compensation Compensation fund system for forest ecological benefits Noncommercial forests China forestry
【中文摘要】Forests are a major terrestrial ecosystem providing multiple ecosystem services. However, the importance of forests is frequently underestimated from an economic perspective because of the externalities and public good properties of these services. Forest eco-compensation is a transfer mechanism that serves to internalize the externalities of forest ecosystem services by compensating individuals or companies for the losses or costs resulting from the provision of these services. China's current forest eco-compensation system is centered mainly on noncommercial forest. The primary measures associated with ecosystem services are (1) a charge on destructive activities, such as indiscriminate logging, and (2) compensation for individual or local activities and investments in forest conservation. The Compensation Fund System for Forest Ecological Benefits was first listed in the Forest Law of the People's Republic of China in 1998. In 2004, the Central Government Financial Compensation Fund, an important source for the Compensation Fund for Forest Ecological Benefits, was formally established. To improve the forest eco-compensation system, it is crucial to design and establish compensation criteria for noncommercial forests. These criteria should take both theoretical and practical concerns into account, and they should be based on the quantitative valuation of ecosystem services. Although some initial headway has been made on this task, the implementation of an effective forest eco-compensation system in China still has deficiencies and still faces problems. Implementing classification-based and dynamic management for key noncommercial forests and establishing an eco-compensation mechanism with multiple funding sources in the market economy are the key measures needed to conquer these problems and improve the forest eco-compensation system and China's forestry development in sequence.

【题目】Short Communication Differences in the structure, species composition and diversity of primary and harvested forests on Changbai Mountain, Northeast China.
【中文关键词】broadleaved-Korean pine mixed forest; forest structure; species composition; species diversity
【英文关键词】broadleaved-Korean pine mixed forest; forest structure; species composition; species diversity
【中文摘要】Broadleaved-Korean pine (Pinus koraiensis) mixed forest is a typical vegetation type in the eastern Eurasian continent. We compared the structure, composition and diversity of a primary forest and a logged forest for effective management and regeneration of a mixed forest ecosystem on Changbai Mountain, Northeast China. The logged for-est was subjected to selective harvesting twenty years ago. The mean diameter and basal area for overall trees (≥ 2 cm dbh) were higher in the primary forest than in the logged forest, whereas overall tree density was significantly lower in the former (994 ± 34 trees · ha $^{-1}$) than in the logged forest (1921 ± 79 trees · ha $^{-1}$). The values of species richness and both Simpson ’ s and Shannon ’ s diversity indices for seedlings (< 2 cm dbh, ≥ 50 cm tall), saplings (2 − 9.9 cm dbh) and overall trees were greater in the primary forest. These results indicate that the selective logging had a lasting impact on the structural characteristics of the forest. There were major differences in species composition between the two forest sites, with the logged forest having more pioneer and mid-tolerant species than the primary forest. Diversity was more extensive in the logged forest due to the invasion of pioneer species. Twenty years is clearly an insufficient time for the logged forest to regain “ primary ” forest composition and structure. These two characteristics of the primary forest may serve as a reference for developing management plans for forest regeneration.

【题目】Effects of Clear cutting on the Tree Species Composition, Structure, and Diversity of a Mixed Broadleaf-Korean Pine(Pinus koraiensis) Forest on Changbai mountain:Implications for Ecosystem Restoration.

【中文关键词】clearcutting, forest structure, tree species composition, species diversity, ecosystem restoration

【英文关键词】clearcutting, forest structure, tree species composition, species diversity, ecosystem restoration

【中文摘要】Large areas of primary mixed broadleaf-Korean pine forests on Changbai Mt., on the border between China and North Korean have been replaced by secondary forests through clearcuting since the 1950s. How clearcutting impacts the mixed forest ecosystem still remains unclear. We compared the tree species composition, structure, and diversity of a primary and a secondary forest that had suffered clearcutting, 30 yr. previously. Results showed that the mean basal area of trees (≥ 10 cm diameter at breast height (DBH)) was markedly lower in the secondary forest than in the primary forest, whereas the density of seedlings (< 2 cm DBH, ≥ 50 cm tall), saplings (2~9.9 cm DBH), and trees were all significantly higher in the former. Values for the species richness and both Simpson ' s and Shannon ' s diversity indices for seedlings and saplings were greater in the secondary forest than in the primary forest, but the values of these 3 indices for trees were significantly lower in the former. These results indicate that clearcutting altered the forest structure by significantly de -creasing the basal area of trees and increasing the numbers of seedlings and saplings. It also altered the species composition with the secondary forest having more pioneer species than the primary forest. The secondary forest has higher species diversity and abundant climax species of seedlings and saplings, and this potentially favorable situation offers an opportunity to develop restoration plans.

【题目】Structural and compositional responses to timber harvesting for an old-growth forest on Changbai Mountain, China - Short Communication
【中文关键词】forest harvesting; stand structure; species composition; northeast China; forest conservation; Pinus ko-raiensis
【英文关键词】forest harvesting; stand structure; species composition; northeast China; forest conservation; Pinus ko-raiensis
【中文摘要】Broadleaved-Korean pine (Pinus koraiensis) mixed forest is a dominant native vegetation type in the eastern Eurasian Continent. We intended to examine the implications of high-intensity timber harvesting (ca 70% of stand volume) for the sustainable management of a mixed forest ecosystem. We measured trees at three sites: control without cutting, older-cut site cut in 1987 and newer-cut site (cutting in 1997). There were significant differences in structure and composition between these three sites in 2003. There were 4,441 trees of 14 species with basal area 56 m 2 at control plot, 6,314 trees of 16 species with basal area 9 m 2 at newer-cut site and 8,438 trees of 21 species with basal area 31 m 2 at older-cut site (all on the area of 1 ha). The high-intensity timber harvesting system helped promote natural regeneration and the growth of small trees but it also allowed light-demanding tree species to invade into the forest. Dominant position and suitable diameter distribution of economically important species (Pinus koraiensis and Tilia amurensis) were maintained across the three sites. The existing timber harvesting appears to consider short-term economic values to a larger extent than long-term ecological values. To manage the broadleaved-Korean pine mixed forest for both timber production and biodiversity conservation, timber-harvesting intensity must be lowered.

【题目】State-led ecotourism development and nature conservation: a case study of the Changbai Mountain biosphere reserve, China
【中文关键词】Changbai Mountain Biosphere Reserve; conservation; ecotourism; local support
【英文关键词】Changbai Mountain Biosphere Reserve; conservation; ecotourism; local support
【中文摘要】Faced with fiscal constraints and enormous population pressures, 80% of Chinese naturereserves have employed ecotourism as a support and development strategy. Assessing the actual effects ofecotourism at a nature reserve that has a relatively long history of ecotourism development experience maybe instructive for other reserves. Therefore, we take Changbai Mountain Biosphere Reserve (CMBR) innortheastern China as a case study, for it is one of the pioneers in embracing ecotourism in China. Personalinterviews and informal group discussions were employed to understand local residents ’ attitudes towardconservation. Factors affecting their attitudes were then analyzed using logistic regression. Results indicatethat attitudes held by most farmers are not favorable toward the conservation of the CMBR. It is notecotourism but rather income from collection of forest products, household

crop lands, and migrant laborthat actually influences their attitudes. We found that the 1-day-sightseeing tour style, the limited tourismperiod, and the low level of education and extreme poverty of the local residents, together with existinginstitutions and lagging regulations make it very difficult for ecotourism to engender local residents ’ support.We concluded that institutional measures to guarantee local people ’s sharing in the revenue generated bythe reserve, as well as regulations to ensure involvement of the local community in the decision-makingprocess are preconditions for ecotourism to engender local support in China. Providing educationalopportunities for children and vocational training for young local residents can also contribute indirectlyto enhanced conservation.

【题目】Density dependence on tree survival in an old-growth temperate forest in northeastern China

【中文关键词】competition density-dependent mortality neighborhood effects spatial pattern analysis temperate forest
【英文关键词】competition density-dependent mortality neighborhood effects spatial pattern analysis temperate forest

【中文摘要】Density dependence is a major mechanism for shaping plant communities. However, its role inregulating diverse, mixed natural tree communities is less certain. • In this study we investigated density-dependent e ff ects in a large-scale (25 ha) old-growth temperateforest in northeastern China. Spatial patterns of neighborhood distribution in the plot were analyzedusing various methods for inferring competition, including (1) pair correlation function to determinespatial patterns of pre-mortality and post-mortality and (2) neighborhood analysis of individuals toexamine the extent to which tree survival is correlated with other covariates. • Results showed that, for common species, 3 of 5 canopy species and 3 of 8 midstory and understoryspecies were random in mortality. Negative density-dependent mortality was not found when treesreach 1 cm in DBH. There was no signi fi cant correlation for canopy species between tree survivaland conspeci fi c abundance, but largely positive correlations for midstory and understory species. Incontrast, tree survival was found to negatively correlate with conspeci fi c basal area for most species,indicating strong intraspeci fi c competition. No strong interspeci fi c density dependence was found inthe forest.

【英文摘要】Density dependence is a major mechanism for shaping plant communities. However, its role inregulating diverse, mixed natural tree communities is less certain. • In this study we investigated density-dependent e ff ects in a large-scale (25 ha) old-growth temperateforest in northeastern China. Spatial patterns of neighborhood distribution in the plot were analyzedusing various methods for inferring competition, including (1) pair correlation function to determinespatial patterns of pre-mortality and post-mortality and (2) neighborhood analysis of individuals toexamine the extent to which tree survival is correlated with other covariates. • Results showed that, for common species, 3 of 5 canopy species and 3 of 8 midstory and understoryspecies were random in mortality. Negative density-dependent mortality was not found when treesreach 1 cm in DBH. There was no signi fi cant correlation for canopy species between tree survivaland conspeci fi c abundance, but largely positive correlations for midstory and understory species. Incontrast, tree

survival was found to negatively correlate with conspeci fi c basal area for most species,indicating strong intraspeci fi c competition. No strong interspeci fi c density dependence was found inthe forest.

【题目】Feasibility of implementing thinning in pure even-aged Larix olgensis plantations to establish uneven aged larch-broadleaved mixed forests.

【中文关键词】Broad leaved tree species Larix olgensis plantation Natural regeneration Thinning Uneven aged forest
【英文关键词】Broad leaved tree species Larix olgensis plantation Natural regeneration Thinning Uneven aged forest
【中文摘要】Thinning experiments were conducted in larch(Larix olgensis) plantations to assess the feasibility ofconverting even-aged plantation stands to uneven-agedforests with more complex stand structures. Stands estab-lished in 1965 and 1960 were thinned in 2004 (Regime A,for determining the effect of recent thinning on emergenceof seedlings) and 1994 (Regime B, for examining theeffects of the past thinning on establishments of recruit-ments), respectively, at two intensities each. Naturalregeneration, together with litter depth, canopy opennessand vegetation cover, was surveyed in the thinned plots.Results indicated that larch seedlings started to emerge inMay, reached a peak in June, decreased from June throughSeptember, and then disappeared in October. No larchseedlings exceeded 1 year old in the thinned plots becauseof the low levels of light and dense litter and vegetationcover. However, there were many naturally regeneratedseedlings (5 – 50 cm in height) and saplings (50 – 500 cm inheight) of broadleaved tree species such as Acer spp.,Fraxinus spp., Cornus controversa, Quercus mongolica,and even the climax tree species, Pinus koraiensis, in thethinned plots. The mean density of regenerated seedlingsreached 6.7 and 4.5 stems m-2in Regimes A and B,respectively, whilst the mean density of regenerated sap-lings reached 4,595 stems ha-1in Regime B. These resultssuggest that it is impractical to turn even-aged larchplantations to uneven-aged larch forests, but it may befeasible to develop uneven-aged larch-broadleaved forestsfrom even-aged larch plantations through thinning.

【题目】The role of environmental, root, and microbial biomass characteristics in soil respiration in temperate secondary forests of Northeast China.
【中文关键词】Microbial biomass carbon Microbial biomass nitrogen Phenology Soil temperature Soil water content
【英文关键词】Microbial biomass carbon Microbial biomass nitrogen Phenology Soil temperature Soil water content
【中文摘要】For secondary forests, the major forest resour-ces in China (accounting for more than 50% of the nationaltotal), soil respiration (R S) and the relationship between R Sand various biotic/abiotic factors are poorly understood.The objectives of the present study were to examine sea-sonal variations in soil respiration during the growingseason, and to explore the factors affecting the variation insoil respiration rates for three forest types (Mongolian oak,Manchurian walnut and mixed forests) of temperate sec-ondary forest in Northeast China. The results showed that(1) the maximum total R S rate occurred in July, following abell-shaped curve with season, (2) for all forest types, thetotal R S was signi fi cantly in fl uenced by soil temperature(P \ 0.01), and did not signi fi cantly correlate with soilmoisture, (3) compared with fi ne root biomass, coarse rootbiomass was more closely related with the root respirationin mixed forest (R2= 0.711, P = 0.017) and in Manchu-rian walnut forest (R2= 0.768, P = 0.010), and (4)microbial biomass carbon (MBC) and nitrogen were sig-ni fi cantly correlated with heterotrophic R S in Mongolianoak forest (R2= 0.664, P = 0.026; R2= 0.784, P = 0.008,respectively) and in mixed forest (R2= 0.918, P = 0.001;R2= 0.967, P = 0.001, respectively). We can concludethat in temperate secondary forests: (1) the R S rate and therelationships between R S and abiotic/biotic factors changegreatly with forest types, and (2) R S is strongly in fl uencedby soil temperature, MBC, microbial biomass nitrogen andcoarse root biomass in temperate secondary forests.

【题目】Predicting the distributions of suitable habitat for three larch species under climate warming in Northeastern China.
【中文关键词】Dahurian larch; Korean larch; Prince Rupprecht larch; Random Forest; Potential distribution; CGCM3 climate change scenario; Northeastern China
【英文关键词】Dahurian larch; Korean larch; Prince Rupprecht larch; Random Forest; Potential distribution; CGCM3 climate change scenario; Northeastern China
【中文摘要】The larch (Larix) genus is the most important species group in the forest ecosystems in Northeastern China, occupying about 25% of the forestareas. The high tolerance to coldness and relatively fast growth rate make this genus the main species group for forestation. According to thepredictions of the global circulation model CGCM3, temperature could rise by 2 – 4 8C over the next 100 years. Few studies have been conducted onthe response of larch species to climate warming in Northeastern China. Such studies are becoming increasingly needed due to the economic andecological signi fi cance of this genus. This paper studies the potential distribution ranges of three larch species under the current and the warmingclimate conditions. A new classi fi cation and regression tree technique, Random Forest, was used to investigate the potential distributions of threelarch species, based on 18 environmental variables

which reflect the climate, topography and soil conditions of Northeastern China. The resultsshowed that the biological coldness index (BCI) is the most important factor for Dahurian larch, annual precipitation (AP) is the most importantfactor for Korean larch and elevation (DEM) is the most important factor for Prince Rupprecht larch.Under the current climate regime, in general, the prediction accuracy for the training dataset is much higher than that of testing dataset. Theprediction accuracy for Dahurian larch is much higher than that of other two larch species. Under three climate warming scenarios, the southeastboundary of suitable habitat of Dahurian Larch was modeled to retreat northwestward by 90 km (CGCM3-B1) via 105 km (CGCM3-A1B) to140 km (CGCM3-A2) scenario. The potential area would thus decrease from 25.5 million ha currently to 13, 9.5 and 7.2 million ha,correspondingly. The northwest boundary of suitable habitat for Korean larch was modeled move northwestward by 100 km (CGCM3-B1)via 125 km (CGCM3-A1B) to 340 km (CGCM3-A2), while the southern boundary may move northeastward 125 km via 170 – 200 km,respectively. The modeled potential area thus decreased from 14.6 million ha to 14.5, 12.6 and 9.7 million ha, correspondingly. The suitablehabitat of Prince Rupprecht Larch was modeled to disappear under each of the three scenarios.

【题目】China’s Classification-Based Forest Management: Procedures, Problems, and Prospects.

【中文关键词】China forestry Forest classification system Subsidies for ecological services Forest policy Ecological welfare forest
【英文关键词】China forestry Forest classification system Subsidies for ecological services Forest policy Ecological welfare forest

【中文摘要】China’s new Classification-Based Forest Man-agement (CFM) is a two-class system, includingCommodity Forest (CoF) and Ecological Welfare Forest(EWF) lands, so named according to differences in theirdistinct functions and services. The purposes of CFM are toimprove forestry economic systems, strengthen resourcemanagement in a market economy, ease the conflictsbetween wood demands and public welfare, and meet thediversified needs for forest services in China. The forma-tive process of China’s CFM has involved a series of trialsand revisions. China’s central government accelerated thereform of CFM in the year 2000 and completed the final version in 2003. CFM was implemented at the provinciallevel with the aid of subsidies from the central government.About a quarter of the forestland in China was approved asNational EWF lands by the State Forestry Administrationin 2006 and 2007. Logging is prohibited on National EWFlands, and their landowners or managers receive subsidiesof

about 70 RMB (US$10) per hectare from the centralgovernment. CFM represents a new forestry strategy inChina and its implementation inevitably faces challenges inpromoting the understanding of forest ecological services,generalizing nationwide criteria for identifying EWF andCoF lands, setting up forest-speci fi c compensation mech-anisms for ecological bene fi ts, enhancing the knowledge ofadministrators and the general public about CFM, andsustaining EWF lands under China ' s current forestlandtenure system. CFM does, however, offer a viable pathwaytoward sustainable forest management in China.

【题目】Valuing eco-assets: A note on valuation methods.

【中文关键词】Valuation method, social development stage coefficient, Engel ' s coefficient
【英文关键词】Valuation method, social development stage coefficient, Engel ' s coefficient

【中文摘要】The valuation of eco-assets should take into account the perceptions and judgments of thepublic. However, the value of eco-assets based on conventional calculations has oftenbeen unreliable as a result of differing situations and individuals involved. Therefore, areasonable and efficient method for valuing eco-assets is needed. In this paper, a briefsummary of the history of valuing eco-assets is provided, followed by a summary of con-ventional methods of valuation. This summary of the currently used methods revealedthat they do not take into account the effect of the stage and development of the popula-tion determining the value of the eco-assets. Therefore, we have developed a socialdevelopment stage coefficient (l), based on Engel ' s coefficient. A new valuation methodwas then created by integrating the development stage coefficient (l) with a conventionalmodel. Finally, possible future strategies for valuing eco-assets are discussed.

【题目】Spatial distribution pattern of soil seed bank in canopy gaps of various sizes in temperate secondary forests, Northeast China.
【中文关键词】Early formation stage . Gap size . Seed invasion . Succession . Temperate secondary forests Vegetation restoration
【英文关键词】Early formation stage . Gap size . Seed invasion . Succession . Temperate secondary forests Vegetation restoration
【中文摘要】To promote the natural regeneration ofsecondary forests under gap disturbance is one ofimportant approaches for realizing their restorationand sustainable management. However, soil seedbank, one of regeneration strategies, is poorlyunderstood in gaps of secondary forests. Objectivesof the study were to evaluate the effects of sizes ofexperimentally created gaps on seed distribution insoil, and of seed banks on vegetation recovery at earlyformation stage of gaps in temperate secondaryforests, Northeast China. It was found that withincreasing gap size, species richness in the seed banksignificantly increased (r=0.691, P<0.05, n=10), butcorrespondence in species-composition of seed reser-voir between gaps and canopies adjacent to gapsdecreased (r= − 0.83, P<0.01, n=10). Gap size andsoil depth and their two-way interactions had signif-icant differences on the distribution of seed bankdensity (F=4.101, P<0.05; F=34.483, P<0.01; F=5.232, P<0.01, respectively). The Sokal and Sneathsimilarity indices in species-composition betweenextant and potential (seed bank) vegetation weregenerally low, ranging from 0.06 (interior of largegaps) to 0.24 (canopies adjacent to large gaps). Fromthe view of seed bank to restore temperate secondaryforests, establishment of medium-sized artificialgaps (i.e., gap size with 500 − 150 m2) could bemore feasible for seed invasion. To conclude, theregeneration potential out of soil seed banks islimited, and the restoration of gaps at early formationstage may be mostly dependent on other reproductivestrategies (e.g., vegetative propagation of species).

【题目】Spatial pattern of diversity in an old-growth temperate forest in Northeastern China.
【中文关键词】Changbai Mountain Temperate forest Species diversity Spatial pattern
【英文关键词】Changbai Mountain Temperate forest Species diversity Spatial pattern
【中文摘要】Species diversity has attracted particular attention because of its signi fi cance for helpingdetermine present species performance and likely future community composition. Thespatial pattern of species diversity (species richness, abundance and Shannon diversity)in Changbai temperate forest in Northeastern China was studied to investigate the presentand likely causes for the formation of spatial patterns. To ful fi ll this goal, three aspects ofdiversity were addressed: 1) changes in the relationships of the diversity

variables, speciesrichness, abundance and Shannon diversity, to sampling area and sampling design. Thethree diversity variables were found to respond to sampling area in a dissimilar way.Sampling design had no signi fi cant effect on the diversity variable-area curves. The powerfunction, which was derived under the assumption that the forest was in equilibrium, didnot fi t the observed species-area curves, indicating that the Changbai temperate forest wasprobably not in equilibrium. 2) Variograms, used to examine the spatial structure of speciesdiversity, showed that the spatial structure of species diversity in the Changbai temperateforest was weakly anisotropic. 3) Partitioning the variation of species diversity into spatialand environmental factors indicated that the spatial pattern of the Changbai forestcommunity was unpredictable, probably because there were many undetermined pro-cesses controlling its development.

【题目】Spatial variation of species diversity across scales in an old-growth temperate forest of China.

【中文关键词】Changbai Mountains Temperate forest Spatial scale Species diversity

【英文关键词】Changbai Mountains Temperate forest Spatial scale Species diversity

【中文摘要】Species richness and abundance are the twomost important diversity variables. Species abundance isadditive when aggregated across spatial scale, whereasspecies richness is non-additive. This study analyzes thee ff ect of spatial scale and site on species abundance andrichness in a 25-ha temperate forest plot in the ChangbaiMountains, northeastern China. The result shows thatspecies abundance and richness are not only dependenton spatial scales, but also dependent on site. Speciesabundance responds linearly to changes of spatial scalewith no intersection in di ff erent sites of the study area.However, although species richness also increases withthe increase of spatial scale, there are some intersectionsfor the di ff erent sites, suggesting that a species-rich sitedoes not always have a high value if the spatial scale ischanged. In all, with respect to additive variables, it isrelatively easy to extrapolate them from one spatial scaleto another spatial scale, as they and the spatial scaleusually form a linear relationship. In contrast, non-additive variables are difficult to extrapolate acrossspatial scales, because they often respond nonlinearly tospatial scale changes. In order to extrapolate these non-additive variables across spatial scales, it is necessary toestimate the relationships between them and spatialscales. As a result, extrapolation of information amongspatial scales may be possible, but very difficult, espe-cially for non-additive variables. Because the 25-haChangbai plot is very small compared to the extent ofthe world temperate forests, and the vegetation is arelatively uniform type, more such studies in other eco-systems are needed before theories and generalizationabout scaling e ff ects can be formulated.

【题目】Tree size distributions in an old-growth temperate forest.

【中文关键词】Changbai Mountains Temperate forest Spatial scale Species diversity

【英文关键词】Changbai Mountains Temperate forest Spatial scale Species diversity

【中文摘要】Despite the wide variation in the structural characteristics in natural forests, tree size distribution show fundamentalsimilarities that suggest general underlying principles. The metabolic ecology theory predicts the number of individualscales as the 2 power of tree diameter. The demographic equilibrium theory predicts tree size distribution starting fromthe relationship of size distributions with growth and mortality at demographic equilibrium. Several analytic predictionsfor tree size distributions are derived from the demographic equilibrium theory, based on different growth and mortalityfunctions. In addition, some purely phenomenological functions, such as polynomial function, have been used to describethe tree size distributions. In this paper, we use the metabolic ecology theory, the demographic equilibrium theory andthe polynomial function to predict the tree size distribution for both the whole community and each species in an old-growth temperate forest in northeastern China. The results show that metabolic ecology theory predictions for the scalingof tree abundance with diameter were unequivocally rejected in the studied forest. Although these predictions ofdemographic theory are the best models for most of the species in the temperate forest, the best models for some species(Tilia amurensis, Quercus mongolica and Fraxinus mandshurica) are compound curves (i.e. rotated sigmoid curves), bestpredicted by the polynomial function. Hence, the size distributions of natural forests were unlikely to be invariant and thepredictive ability of general models was limited. As a result, developing a more sophisticated theory to predict tree sizedistributions remains a complex, yet tantalizing, challenge.

【英文摘要】Despite the wide variation in the structural characteristics in natural forests, tree size distribution show fundamentalsimilarities that suggest general underlying principles. The metabolic ecology theory predicts the number of individualscales as the 2 power of tree diameter. The demographic equilibrium theory predicts tree size distribution starting fromthe relationship of size distributions with growth and mortality at demographic equilibrium. Several analytic predictionsfor tree size distributions are derived from the demographic equilibrium theory, based on different growth and mortalityfunctions. In addition, some purely phenomenological functions, such as polynomial function, have been used to describethe tree size distributions. In this paper, we use the metabolic ecology theory, the demographic equilibrium theory andthe polynomial function to predict the tree size distribution for both the whole community and each species in an old-growth temperate forest in northeastern China. The results show that metabolic ecology theory predictions for the scalingof tree abundance with diameter were unequivocally rejected in the studied forest. Although these predictions ofdemographic theory are the best models for most of the species in the temperate forest, the best models for some species(Tilia amurensis, Quercus mongolica and Fraxinus mandshurica) are compound curves (i.e. rotated sigmoid curves), bestpredicted by the polynomial function. Hence, the size distributions of natural forests were unlikely to be invariant and thepredictive ability of general models was limited. As a result, developing a more sophisticated theory to predict tree sizedistributions remains a complex, yet tantalizing, challenge.

【题目】Climatic controls in radial growth of major tree species on Changbai Mountain
【中文关键词】Climate response, Tree ring,Dendrochronology. Changbai Mountain, Northeast China
【英文关键词】Climate response, Tree ring,Dendrochronology. Changbai Mountain, Northeast China
【中文摘要】Introduction Information on spatial variability in treeradial growth is essential for improving predictions of forestecosystem responses to climate change. To date, researchershave designed models to simulate the potential distributionarea of major forest types under different climate changescenarios in Northeast China, but little is known about thespatial variability of tree growth in response to climate.& Materials and methods We used a dendroecologicaltechnique to examine the climate – growth relationship ofsix dominant tree species on seven sites varying in altitudeon Changbai Mountain in Northeast China, to explorewhether the spatial variability of tree growth is an indicatorof regional climatic forces, and whether simulation resultsgenerated by models can accurately reflect this in tree radialgrowth.& Results Fifteen site-specific species can be distinguishedspecies at or near their upper limit distribution from those atthe lower distributions. Species differences were moreimportant than altitude differences in influencing species ’ site-specific radial growth. Precipitation, temperature, andsoil moisture together constitute the major factors limitingtree radial growth.

【题目】Forest Management in Northeast China: History, Problems and Prospects.
【中文关键词】Regional forest management Forest
【英文关键词】Regional forest management Forest
【中文摘要】Studies of the history and current status offorest resources in Northeast China have become importantin discussions of sustainable forest management in theregion. Prior to 1998, excessive logging and neglectedcultivation led to a series of problems that left exploitableforest reserves in the region almost exhausted. A sub-stantial decrease in the area of natural forests was accom-panied by severe disruption of stand structure and seriousdegradation of overall forest quality and function. In 1998,China shifted the primary focus of forest management inthe country from wood production to ecological sustain-ability, adopting ecological restoration and protection askey foci of management. In the process, China launchedthe Natural Forest Conversion Program and implemented anew system of Classi fi cation-based Forest Management.Since then, timber harvesting levels in Northeast Chinahave decreased, and forest area and stocking levels haveslowly increased. At present, the large area of low qualitysecondary forest lands, along with high levels of timberproduction, present researchers and government agenciesin China with major challenges in deciding on managementmodels and

strategies that will best protect, restore andmanage so large an area of secondary forest lands. Thispaper synthesizes information from a number of sources onforest area, stand characteristics and stocking levels, andforest policy changes in Northeastern China. Following abrief historical overview of forest harvesting and ecologi-cal research in Northeast China, the paper discusses thecurrent state of forest resources and related problems inforest management in the region, concluding with keychallenges in need of attention in order to meet thedemands for multi-purpose forest sustainability and man-agement in the future.

【题目】Composition and seasonal dynamics of seed rain in broadleaved Korean pine (Pinus koraiensis) mixed forest in Changbai Mountain, China.

【中文关键词】seed rain; seed dispersal; broad-leaved Korean pine (Pinus koraiensis) mixed forest; Changbai Mountain

【英文关键词】seed rain; seed dispersal; broad-leaved Korean pine (Pinus koraiensis) mixed forest; Changbai Mountain

【中文摘要】To explore the composition and spatio-temporal dynamics of seed rain in broad-leaved Korean pine (Pinus koraiensis)mixed forest, 150 seed traps were set up in a 25 hm 2 plot in Changbai Mountain. Seeds, fruits, anthotaxy and others in seed traps were collected, identified and divided into 4 types. From 2005 to 2006, we collected 47 different types. Total number of seeds andfruits was 121291, including 23147 mature seeds and fruits (19.1% of the total). Tilia amurensis and Fraxinus mandshurica, with the most seeds and fruits, accounted for 90% of the total. The analysis on seasonal dynamics of seed rain showed that there were thelargest number of seeds and fruits between July and October, which were composed of immature seeds and fruits. In mid-October, mature seeds and fruits reached their peak, but immature seeds and fruits still accounted for high proportion. There were 91 traps that contained 100 – 200 mature seeds and fruits, and one trap without any mature seed or fruit. The largest number of species found in a trap was 7, and usually 3 or 4 species were found in most of the traps. There were obvious relationships between spatial patterns of mature seeds and fruits and their parent trees, indicating that their mature seeds and fruits were not dispersed far from their parent trees.

【题目】Vertical structure and spatial associations of dominant tree species in an old-growth temperate forest.
【中文关键词】Spatial pattern; Point pattern analysis; Stand dynamics; Scale; Changbai Mountain
【英文关键词】Spatial pattern; Point pattern analysis; Stand dynamics; Scale; Changbai Mountain
【中文摘要】A 25-ha broad-leaved Korean pine (Pinus koraiensis) mixed forest plot was established on Changbai Mountain, PR China, in 2004 in order togain insights into the processes driving regeneration and succession of the forest. All trees at least 1 cm in diameter at breast height were mappedand identi fi ed to species. In this study, the spatial distribution patterns and spatial associations of four dominant tree species among different treeheight classes were analyzed by a point pattern analysis method, which was the O-ring statistic. We found that: (1) P. koraiensis was adiscontinuously regenerating population, while Tilia amurensis and Quercus mongolica were continuously regenerating populations, and Fraxinusmandshurica might be a declining population. (2) Intra- and interspecies spatial associations of varied with species, tree height, and scales. P.koraiensis and T. amurensis at the lower height classes showed positive association to most species at the upper height class at almost all scales,suggesting that they have broad niches and grow well under the canopy of other species. Q. mongolica at the lower height classes showed spatialindependence at smaller scales and negative association at larger scales to non-conspeci fi c adults, suggesting that spatial heterogeneity may beimportant to generate patterns. (3) Scale is an important factor for pattern formation, and different species showed different distribution patternsand spatial associations at different scales.

【题目】Tourism-induced deforestation outside Changbai Mountain Biosphere Reserve, northeast China
【中文关键词】Land use change.Deforestation.Urbanization .Spatial variation . Temporal change
【英文关键词】Land use change.Deforestation.Urbanization .Spatial variation . Temporal change

【中文摘要】Introduction Old-growth forests on Changbai Mountain are economically and ecologically important but have been fragmented outside Changbaimountain Biosphere Reserve.The trend of forest landscape degradation on ChangbaiMountain threatens forest sustainability and sityconservation in the region. Previous studies have focused mainly on the structure and function of protected forests but have oored managed forests outside the reserve border. • Objectives In this paper, deforestation processes are studied for two forestry enterprises, namely Baihe and Lushuihe Forestry Bureaus, with different tocioeconomic structure due to their differences in proximity to Changbai Mountain Biosphere Reserve, which attracts hundreds of thousands of tourists each year. Baihe ’ s income comes from both forestryand tourism whereas Lushuihe ’ s revenue is primarily from forest products. Land-use change was mapped using a time series of satellite images acquired in 1977, 1991, 1999 and 2007 for both forestry bureaus.

【题目】Current status and problems in certification of sustainable forest management in China.

【中文关键词】Forest management Forest certification Forest products Certification cost China forestry
【英文关键词】Forest management Forest certification Forest products Certification cost China forestry

【中文摘要】Forest certification is a mechanism involvingthe regulation of trade of forest products in order to protect forest resources and improve forest anagement. Although China had a late start in adopting this process, the country has made good progress in recent years. As of July 31, 2009,17 forest management enterprises and more than one million hectares of forests in China have been certified by the Forest Stewardship Council (FSC). Several major factors affect forest certification in China. The first set is institutional in nature. Forest management in China is based on centralized national plans and therefore lacks flexibility. A second factor is public awareness. The importance and value of forest certification are not widely nderstood and thus consumers do not make informed choices regarding certified forest products. The third major factor is the cost of certification. Together these factors have constrained the development of China ’ s forest certification efforts. However,the process does have great potential. According topreliminary calculations, if 50% of China ’ s commercialforests were certified, the economic cost of forest certification would range from US$0.66 – 86.63 million while the economic benefits for the forestry business sector could exceed US$150 million. With continuing progress in forest management practices and the development of international trade in forest products, it becomes important to improve the

【题目】中国长白山植物区系的垂直分布格局
【中文关键词】长白山;植物区系;垂直分布
【英文关键词】Changbai Mountain;flora;vertical distribution
【中文摘要】:为了探讨长白山植物区系的垂直分化特征及其与周边地区植物区系的联系,通过对以往在该地区采集的标本进行分类学鉴定,统计得出长白山共有维管束植物134科517属1 323种。对这些植物从属、种两级进行统计分析,结果表明:长白山4个植被垂直带的植物区系具有明显的垂直分布格局;在整体上具有温带性质,包含有少量的热带成分,主要体现在阔叶红松林带;随海拔的升高,温带性质逐渐减弱,寒带亚寒带逐渐增强。植物区系的垂直变化反映了长白山低海拔植物区系与热带植物区系的联系,以及高海拔地段与北极成分之间的联系。
【英文摘要】To explore the vertical differentiation of flora from Changbai M ountain and its relationship with those of surrounding areas,by the taxonomic identification for the plant samples in this area,about 1 323 species,517 genera, 134 families of the vascular bundle plants in Changbai Mountain were acquired and analyzed at the level of genus and species.Major results are as follows:the flora

of the four vertical vegetational belts is obvious in vertical pattem .The flora in this area, especially in broad-leaved/Korean pine mixed forest zone is temperate nature and is composed of few tropical elements.rI1he temperate nature decreases and the frigid and subfrigid elements increase as altitude increasing.The vertical change of flora from Changbai Mountain reflects the relationship between the flora of low elevation and tropical flora, and the connection between Changbai Mountain and arctic components at the alpine zone.

【英文摘要】Quantitative classification and ordination aiming to realize muhifactor ecological land classification was developed for the mountainous region in eastern Liaoning Province.Data for ground flora and canopy trees species from selected stands were

summarized and subjecied to TWINSPAN classification and PCA,CCA ordination.CCA indicated that slope and aspect were hi.ghly correlated with the ground flora and canopy tree species.Pairwise MRPP tests indicated many significant differences(P < 0.05)among the vegetation groups and environmental factors.6 types of plant community,which can be used to indicate the vegetation type in ecological classification system , were based on cluster analysis of the six most environment factors . The vegetation of the mountainous region in eastern Liaoning Province was believed to be related a moisture and nutrient gradient which was mainly influenced by slope and aspe ct,which can be used as criterion in ecological land clas sification.

【题目】东北地区花楸种子质量的种源变异研究.
【中文关键词】花楸 ;种子质量;种源变异
【英文关键词】Sorbus pohuashanensis;seed quality;provenan ce variation
【中文摘要】为 了探讨花楸种子质量 的变异规律 ,对我 国东北 自然分布 区7个种源地 的花楸种 子的种子千粒重、饱满度、含水量和生活力进行 了研究.结果表 明:花楸种子千粒重远远小于乔 木树种的平均水平 ,其 中白河种源的种子千粒重最大 ,带岭种源的最小.新采 收的未 经贮藏直 接播 种 的种 子生 活力最 高 ,其次 是低 温 干藏 ,而经 室温干 藏和低 温湿 藏的种 子 生 活力只 能达 到 20%左右 ;长 白种源 的种子无论哪种贮藏处理方式 ,其生活力都要 明显高于其他种源.花楸种 子从西南到东北有变轻、变小的趋势 ;饱满度与经纬度有关,海拔和年降水量也有一定影响;含 水量则主要与年均气温和无霜期有关 ;生活力 的变化主要受年均气温的影响.长 白种源的花楸 种子质量最佳 ,而汪清和带岭的种源则最差.
【英文摘要】To explore variation of seed quality,weight of one thousand seed,plumpress,water content and vi— talky of~orbus pohuashanensis seed which collected from 7 provenan ces were studied in the paper.The re— suit showed:the weight of one thousand seeds is smaller than that of average of the arbor seed,which that of Baihe provenan ce was the heaviest an d Dailing provenance was the lightest.Viability of fresh seed were most high than other treatment,dry storage in low-temperature for 5 months were secondly,but dry storage in house-temperature and wet storage of dry—temperature only have 20% or so,it WfS effected by mean an — nual temperature,an d seed viability of Changbai provenan ce was highest than other provenance every treat— ment.From northeast to southwest,it is a trend that seed weight of S .pohuashanensis is heavier an d hea v— ier.Plumpness of seeds was related with longitude an d latitude,and also Was influenced by altitude and rain— faU per year.Contain water capacity of seeds Was effected by mean an nual tempe rature an d frost—free period. Seed quality of Changbai provenance Was the best,and then W angqing an d Dailing provenances ’ Was the most bad.

【题目】长白山西坡风灾区森林恢复情况.
【中文关键词】风灾干扰 摇 恢复状况 摇 多样性指数 摇 阔叶红松林 摇 云冷杉林 摇 岳桦林
【英文关键词】wind disturbance; recovery state; diversity index; broad-leaved Korean pine forest;spruce-fir forest; Erman's birch forest.
【中文摘要】以长白山西坡风灾迹地(阔叶红松林、云冷杉林、岳桦林)的样地调查资料为基础,研究了各林型森林群落遇灾 23 年后的恢复特征 . 结果显示: 3 种林型的恢复速度为阔叶红松林 > 云冷杉林 > 岳桦林,并且它们与各自对照的群落共有度指数分别为 0郾 49 、 0郾 44 、 0郾 33. 风灾对各林型的乔木组成和多样性的影响不同:阔叶红松林中,风灾显著增加了

乔木总数量,但对乔木种数和琢多样性指数没有显著影响(P >0郾05);云冷杉林中,风灾仅显著降低了 Shannon多样性指数和 Simpson 优势度指数;岳桦林中,除 Pielou 均匀度指数,其余多样性指数都因风灾而显著降低 . 各林型优势树种组成变化及更新情况对风灾的响应也与林型相关:阔叶红松林与对照区的优势树种组成显著不同,而云冷杉林及岳桦林受灾前后的优势树种组成差异均不大;阔叶红松林的幼树更新情况较好,云冷杉林有少量更新,岳桦林带几乎没有林木更新 . 表明风灾对森林群落的影响在 23 年后仍未消除,森林在风灾干扰后的恢复需要一个漫长的过程 .

【英文摘要】Based on the field investigation in windfall areas of Changbai Mountains, this paper stud鄄ied the community recovery characteristics of broad鄄leaved Korean pine forest (BKPF), spruce firforest (SFF), and Erman爷s birch forest (EBF) that were disturbed by wind disaster 23 years ago.The recovery rate of these three forest types was in the order of BKPF>SFF>EBF, and their totalcommunity index was 0郾49, 0郾44, and 0郾33, respectively. The effects of the wind disaster on theforest tree species composition and diversity were different. In BKPF, the total number of trees in鄄creased significantly, but the tree species number and 琢 diversity index had no significant change;in SFF, only the Shannon diversity index and Simpson dominance index decreased significantly;while in EBF, all diversity indices except Pielou evenness index had significant decrease. The re鄄sponses of dominance tree composition and regeneration to the wind disaster depended on foresttypes. Comparing with the plots not suffered from wind disaster, the BKPF under wind disaster dis鄄turbance had greatly different dominance tree compositions, but the difference in both SFF and EBFwas not significant. The BKPF爷s sapling regeneration was fairly good, while the SFF爷s was small,and EBF almost had no sapling regeneration. All the results suggested that the effects of wind disas鄄ter disturbance on the test forest ecosystems in study areas was not removed even after 23 years, andthe recovery of forest after wind disaster disturbance needs a relatively long time.

【题目】长白山次生杨桦林样地(CBS): 群落组成与结构

【中文关键词】群落结构 生物多样性 天然次生林 森林动态监测样地 长白山

【英文关键词】无

【中文摘要】长白山次生杨桦林是该地区阔叶红松林经皆伐和火烧等破坏后恢复形成的主要次生林类型之一,是阔叶红松林次生演替系列中的重要阶段。参照巴拿马巴洛科罗拉多岛(Barro Colorado Island,BCI)50hm2热带雨林样地的技术规范,于2005年在长白山北坡的自然保护区内建立了一块5hm2的次生杨桦林长期监测样地,对样地内所有胸径≥1cm的木本植物进行了详细的定位调查。对样地的物种组成与群落结构的分析表明:次生杨桦林样地物种组成丰富,共包括16科28属44种;区系特征明显,北温带成分占主要部分;样地内被监测的树木个体数为20101,不包括分枝的独立个体数为16565;优势树种明显,从个体数、平均胸径、胸高断面积和重要值等分析来看,演替先锋树种白桦(Betula platyphylla)和山杨(Populus davidiana)在群落中占有绝对优势地位,但从径级结构来看,它们的更新却非常差,随着演替的进展,这些先锋树种将逐渐走向衰亡;阔叶红松林中的主要树种如红松(Pinusko-raiensis)和紫椴(Tilia amurensis)等已经在次生杨桦林中占有了一定的比例,林下更新良好,逐渐进入林冠层并最终取代杨桦等成为该森林的优势种;从物种的空间分布格局来看,演替先锋树种和阔叶红松林中的主要树种并没有表现出明显的聚集性分布格局,而其它的小乔木和灌木树种则表现出明显的聚集性分布格局,但与地形并没有表现出明显的相关性,相关结论还需要进一步分析。

【英文摘要】Aims Natural secondary poplar-birch forest is one of main secondary forests in Changbai Mountain,which is formed by the restoration after clear-cutting or fire.And it is an important stage in the secondary succession of broad-leaved Korean pine(Pinus koraiensis)mixed forest.A 5 hm2 natural secondary poplar-birch forest plot was established in Changbai Mountain Natural Reserve in 2005 in order to gain insights into the processes driving regeneration and succession of the forest and its climax community—broad-leaved Korean pine mixed forest.This paper aims to give some basic information on the forest,including species composition and community structure.Methods In the plot,all free-standing trees at least 1 cm in diameter at breast height(DBH,1.3 m above ground)were mapped,tagged,and identified to species,and their geographic coordinates were recorded following a standard field protocol.A total survey station was used to determine the elevations of edge points.Important findings There are 16 565 genotype individuals(20 101 individuals with branch),belonging to 44 species,28 genera,and 16 families.Floristic characteristics of the community are very prominent.At the generic levels,North temperate areal-type is the main part of genus areal-types.The statistics of species abundance,basal area,mean DBH,and important value showed that pioneer species Betula platyphylla and Populus davidiana are obviously dominant species.However,the regeneration of the two species is very poor by the analysis of size-class distributions,which indicated that they will quit the stage along with the succession of the community.Some tree species,such as Korean pine and Tilia amurensis,which are main species in broad-leaved Korean pine mixed forest,account for a large proportion in the understory layer.Therefore,they will replace the pioneer species and dominate the overstory layer.Spatial distribution patterns of species were analyzed.For pioneer species and those species that are main species in broad-leaved Korean pine mixed forest,there is no obviously clumped pattern captured.For the midstory and understory species,there are obviously clumped patterns of many species by the observation.There is no obvious correlation between the clumped patterns and the topography.

【题目】三维可视化软件在辽东山区森林生态系统管理中的应用
【中文关键词】三维可视化软件森林生态系统管理 封育 小面积皆伐择伐 二次渐伐
【英文关键词】三维可视化软件森林生态系统管理 封育 小面积皆伐择伐 二次渐伐
【中文摘要】利用三维可视化软件WCS6.O,结合林相图信息,构建了辽东山区普乐堡乡的虚拟森林景观,并模拟了4种经营管理方案(封育未成林幼抚、小面积皆伐、择伐和二次渐伐)下研究区林相的动态变化.结果表明:对幼龄林采取保育措施后,10—30龄长白落叶松的生长速度较快,大约以o-6m · a_1的速度生长,蒙古栎的生长速度稍慢,约为0.4m · a~;小面积皆伐对林分的影响较大,二次渐伐其次,低强度的择伐对林分的影响最小.wCS能够直观地显示各种森林经营管理方案的后果,可以为森林经营决策提供科学依据.
【英文摘要】By using 3D visualization software WCS 6.0,the virtual forest landscape of Pulepu Town in eastern Liaoning mountainous region was constructed,and the dynamic changes of forests under four different management scenarios,i.e.,enclosing undeveloped forest,small area clear-cutting,selective-logging,and two-step progressive logging,were modeled.The results showed that under enclosure,10-30 years old Larix olgensis var.changpaiensis grew faster(ca.0.6 m · a-1),while 10-30 years old Quercus mongolica grew slower(ca.0.4 m · a-1).Small area clear-cutting had the greatest effects on the forests,followed by two-step progressive logging,and low intensity selective-logging.The WCS software could visually display the outcomes of different scenarios,which would benefit the decision-making in forest management.

【题目】长白山阔叶红松林草本植物多样性、季节动态及其空间分布格局.

【中文关键词】草本植物 物种多样性 季节动态 空间格局 阔叶红松林 长白山
【英文关键词】herbs;species diversity;seasonal dynamics;spatial pattern;broad.1eaved Korean
【中文摘要】基于长白山阔叶红松林25 hm 样地(CBS)一年内草本植物的4次调查数据,对样地 内草本植物多样性的季节动态及其空间分布格局进行了初步分析.结果表明:样地内草本植 物物种组成丰富,共有102种,隶属于4O科84属.Shannon多样性指数、Simpson多样性指数 和Pielou均匀度指数分别为3.52、0.96和0.75;物种组成的季节变化比较明显,以初夏物种 数最多;各季节的Shannon多样性指数、Simpson多样性指数和Pielou均匀度指数的变化较大,个体数量从早春到秋季逐渐减少;物种丰富度和多度的空间分布连续性较差,主要表现为斑 块性分布,说明草本植物对微环境有较强的依赖性;坡向是影响物种丰富度和多度的主要因素,在早春、夏末和秋季,不同坡向的物种丰富度和多度差异极显著(P<0.01),且早春阶段北坡和东坡的丰富度高于南坡和西坡,夏末和秋季则相反.
【英文摘要】In this paper,the species composition,seasonal dynamics,and spatial distribution patterns of herbs were examined in a 25 hm broadleaved Korean pine(Pinus koraiensis)mixed forest plot in Changbai Mountains.The results ’showed that the plot had a relatively high herbaceous richness,with 102 species belonging to 40 families and 84 genera,and the Shannon index,Simpson index.and Pielou index was 3.52.0.96 and 0.75,respectively.The three indices varied dramatically with growth season,whereas the species abundance decreased linearly from early spring to autumn.The species richness and abundance showed irregular distribution,indicating that herbaceous species were microenvironment-dependent.Slope aspect had significant effects on herbaceous species richness and abundance.Northern and eastern slopes had higher species richness and abundance in early spring than southern and western slopes,whereas it was in adverse in late summer and autumn.

【题目】采伐对长白山阔叶红松林乔木群落的影响.
【中文关键词】采伐;长白山;重要值;生物多样性;群落结构
【英文关键词】harvest cutting;Changbai mountain;importance value;biodiversity;community structure
【中文摘要】选取了4种受不同强度采伐后的次生阔叶红松林乔木群落作为研究对象,利用重要值、多样性指数等指标定量的分析 其群落的外貌以及结构的变化,定量研究不同采伐强度对阔叶红松林乔木群落的影响。研究结果表明:采伐改变了群落中物种的优势地位,红松(Pinus koraiensis)的重要值排名随采伐强度的增加而降低,白(Betulaplatyphylla)的重要值排名随采伐强度 的增加而上升;采伐改变了阔叶红松林中主要树种的年龄结构。采伐30 a后,红松幼树(胸径<10 am)占种群数量的比例随采伐强度的增加而增加,白桦幼树在种群中的比例随采伐强度增加而减少。由于主要树种年龄结构的改变,群落的演替也受到一定的影响;采伐可以促进阔叶红松林中主要树种的更新。
【英文摘要】In order to quantitative study the influence of diferent cut intensities on arbor community of broad—leaved Korean pine forest,four secondary arbor communities of broad-leaved Korean pine forest,which were cut by diferent cutting intensities,were selected as study objects,and the changes of appearance and structure of community were quantitative analyzed by importance value,diversity index and other indexes.The results indicated that harvest cutting had changed the advantage positions of species in community:the ranking of importance value of Pinus koraiensis reduced with increased intensity of cut;the ranking of importance value of Betula platyphylla rose with increased intensity of cut.Harvest cutting also had changed the age structure of main species in broad-leaved Korean pine forest:after 30 years of harvest cutting,the proportion of Pinus koraiensis saplings(DBH<10 cm)account for population quantity increased with increased intensity of cut;the proportion of Betula platyphylla saplings account for population quantity decreased with increased intensity of cut.The succession of community was afected by the changes in the age structure of main tree species.Whereas the harvest cutting could accelerate natural regeneration of main tree species in broad-leaved korean pine forest.

【题目】采伐对长白山阔叶红松林乔木竞争关系的影响.
【中文关键词】采伐;竞争强度;阔叶红松林;种间竞争;种内竞争
【英文关键词】Cutting; Competitionintensity; Broad2leavedKoreanpine forest; Interspecific competition; Intraspecific competition
【中文摘要】[目的]研究不同采伐方式与强度对阔叶红松林群落结构和功能的影响。[方法]通过调查乔木的胸径、树高以及在样方中的位置等指标,采用Hegyi单木竞争指数模型,对长白山地区受不同采伐方式以及强度干扰的阔叶红松林群落中乔木竞争强度进行定量分析。[结果]不同采伐方式和强度对阔叶红松林中乔木竞争强度有不同影响,低强度择伐后变化最小,皆伐后变化最大。不同林层间乔木竞争强度有明显差异,主林层<次林层<林下层。无论采伐方式与强度如何,红松的胸径与其竞争指数都严格服从CI=A(DBH)B的幂函数关系。采伐对红松种内竞争强度有重要影响,随着采伐强度的加大,红松种内竞争压力减小,红松幼树更新得到促进。[结论]采伐经营应保持17%以下的小强度择伐,而择伐时应选择那些胸径大且在竞争中占绝对优势的针、阔叶树种。
【英文摘要】[Objective] The purpose was to study the effect of different cutting modes and intensity on community structure and function of broad-leaved Korean pine forest.[Method] By investigating the indexes of DBH,tree height of trees and their position in quadrat etc.and using Hegyi ’s single tree competition index model,the quantitative analysis was conducted on competition intensity of trees in the community of broad-leaved Korean pine forest,which were under different cutting modes and intensity interference.[Result] The varied cutting modes and intensity had different influence on competition intensity of trees in the broad-leaved Korean pine forest;the change was the least after low intensity selective cutting,while the clear cutting had the most variation.The tree competition intensity among different forest layers had significant differences with the order of: overstory < sub-story < understory.No matter what the cutting modes and intensity were,the DBH of Korean pine and its competition index were strictly obeyed by power function relationship of CI=A(DBH)B.The cutting had important affection on intraspecific competition of Korean pine,the pressure of intraspecific competition of Korean pine was minished with the increase of cutting intensity,and the renewal of Korean pine saplings was advanced.[Conclusion] The cutting management should be kept in selective cutting of little intensity lower than 17%,and the coniferous and broad-leaved tree species with big DBH and absolute superiority in competition should be chosen in selective cutting.

【题目】不同种源花楸幼苗气体交换特性.
【中文关键词】花楸幼苗;种源;气体交换
【英文关键词】Sorbus pohuashanensis;Provenances;Gas exchanges
【中文摘要】以吉林通化、长白、白河、汪清和黑龙江带岭、海林、牡丹江7种源的花楸幼苗为材料,对其叶片净光 合速率、蒸腾速率、气孔导度和胞间CO,体积分数进行了测定。结果表明:各种源花楸净光合速率和蒸腾速率日变化均为单峰曲线,净光合速率峰值在12:oo一14:oo,蒸腾速率峰值则出现在12:00,气孔导度为“ 一峰一谷 ”曲 线,而胞间CO,体积分数为“ 双谷 ”曲线;种源能够显著地影响花楸的气体交换参数。牡丹江和汪清种源光合作用 比较强,气孔导度和胞间CO:体积分数较低;各气体交换特性与环境因子都有一定相关性,其中,净光合速率主要 受光合有效辐射影响,蒸腾速率主要与气温和叶温有关,气孔导度与空气湿度相关性最高,胞间CO 体积分数则 对空气CO,体积分数的变化最为敏感。
【英文摘要】Net photosynthetic rate,transpiration rate,stomatal conductance,and intercellular CO2 concentration of Sorbus pohuashanensis seedlings from Tonghua,Changbai,Baihe,Wangqing,Dailing,Hailin and Mudanjiang were investigated. Results showed that the diurnal variation of net photosynthetic rate and transpiration rate could be described by a unimodal curve,and the peak value of net photosynthetic rates was between 12:00 and 14:00 and that of transpiration rates was at 12:00. The diurnal variation of stomatal conductance exhibited a curve with one peak and one dip,and that of intercellular CO2 concentration could be described by a two-

valley model. A significant difference in gas exchange parameters was found between different provenances of S. pohuashanensis. The photosynthesis of the seedlings from Mudanjiang and Wangqing was stronger,but their stomatal conductance and intercellular CO2 concentration were lower. The characteristics of gas exchange had certain correlation with environmental factors. The net photosynthetic rates was primarily affected by the photosynthetic active radiation,the transpiration rate was related with air and leaf temperature,the correlation was the highest between stomatal conductance and air humidity,and the intercellular CO2 concentration was the most sensitive to air CO2 concentration.

【题目】关于建立和完善中国生态补偿机制的思考
【中文关键词】生态补偿;生态系统;中国实践;实践路径
【英文关键词】eco-compensation;ecosystem;China ’S practice;practice path.
【中文摘要】生态补偿是近年来学界及社会较为关心的重要议题,如何构建较完善的理论体系 和运行机制已成为当前迫切之需。本文从揭示“ 外部成本内部化 ”和“ 明晰产权界限 ”的生 态补偿本质切入,简要回顾了生态补偿的中国实践,在详细阐释补偿依据、补偿客体、补偿 主体、补偿标准和补偿方式5大核心要素的基础上,构建了生态补偿实践路径,提出了完善 生态补偿机制方面需要注意的关键问题是确定合理的实施方案、权衡适当的利益关系和准 确定位管理者角色。
【英文摘要】Eco-compensation is a hot topic in academic and social fields in recent years, and to construct a more complete theoretic system and an operating mechanism is a matter of great urgency. Beginning with the nature of eco-compensation, i.e., to internalize the externalities and to clarity the limits of property rights, the eco-compensation practice in China was briefly reviewed, and, based on the elaborate analyses on five core elements including account of compensation, compensation receivers, compensation payers, eco-compensation criteria, and forms of compensation, a practice path on eco-compensation was constructed. Finally, some critical issues on improving eco-compensation mechanism, i.e., determination of reasonable implementation program, appropriate balance between interests relations, and accurate positioning of managers roles, were put forward.

【题目】长白山次生白桦林数量特征.
【中文关键词】长白山;次生白桦林;数量特征;径级结构;空间分布格局
【英文关键词】ChangbaiMountains; Secondarybirchforests; Quantitativecharacteristics; Sizeclassstructures; Spatial distributionpatterns
【中文摘要】对长白山1hm2次生白桦林样地的研究结果表明:样地内共有活立木2550株,分属于14科23种;从株密度、平均胸径及胸高断面积等分析看,白桦和落叶松在林分中占有绝对优势;样地内所有林木的径级分布为“S”型,白桦、落叶松和红松的径级分布近似于正态分布,水曲柳和春榆的径级分布近似于倒“J”型;从径级结构分析看,白桦和落叶松等先锋树种的小径级林木在林下分布很少,更新很差,而红松、水曲柳等寿命较长的树种在林下已经占有很大的比例,更新良好,随着演替的进展,它们将逐渐进入主林层;从主要树种的空间分布格局分析看,落叶松在样地中表现出了明显的聚集性分布格局,而白桦、水曲柳、红松和春榆没有表现出明显的聚集性分布格局。
【英文摘要】A plot with an area of 1 hectare was set up in a secondary birch forest in Changbai Mountains in 2007. All free-standing trees at least 1 cm in diameter at breast height (DBH) were measured,tagged,mapped and identified to species in the plot. Tree density,mean DBH,basal area at DBH,size class structure,and spatial distribution patterns of five tree species were analysed. Results show that there are 2550 living trees,belonging to 23 species and 14 families. The statistical results of tree density,mean DBH,and basal area at DBH show that Betula platyphylla and Larix olgensis are obviously dominant tree species. The curves of size class distribution of all the tree species are sigmoid. The size classes of B. platyphylla,L. olgensis and Pinus koraiensis exhibit approximately normal distribution,while Fraxinus mandshurica and Ulmus japonica exhibit approximately inverse J-shaped distribution. By the analysis of size class structure,the regeneration of B. platyphylla and L. olgensis is very poor,whereas some tree species such as F. mandshurica and P. koraiensis account for a large proportion in the understory layer,which will replace B. platyphylla and become the dominant ones. Among the five tree species,only L. olgensis shows obviously clumped distribution pattern.

【题目】不同光环境对红松幼苗光合生理特征的影响.
【中文关键词】红松;光强;净光合速率;光合参数;暗呼吸速率
【英文关键词】Pinus koraiensis; light intensity; net photosynthetic rate; photosynthetic parameter; dark respiration rate.
【中文摘要】应用 便携式光合测定系统于生长季(8月)测定了 4种模拟光环境(100%、60% 、30% 和15% 自然光强,分别记为F1、I1、L1 和W1)下3个实际光环境(林窗、林下和林缘,分别记为G、U和E)下 3个苗龄红松针叶气体交换参数和净光合速率(p)的日变化,以及单位叶面积叶绿素(Chl)含量和比叶质量(LMA)的变化。结果表明:3年和 5年生红松在 I1和 L1处理间的p 基本一致,且均高于F1 的 ;7年生红松在F1处理下的 p高于其他处理的p ,各处理的p 峰值均出现在 13:00。3年和 5年生红松在 L1处理下的最大光合速率(Amax)和暗呼吸速率(Rd)均高于全光 F1处理。随光强降低,呈下降趋势,说明红松通过改变 的方式适应光环境的变化。年和 年生红松处理与 处理间的光合生理指标差异不显著(P>0.05),L1和 W1处理与 E处理间同样如此,说明光环境模拟很好地反映了实际的光环境。通过对红松针叶生理生态指标的可塑性分析,得出 3种不同苗龄红松可塑性的大小顺序为 3年 >5年>7 年。表明随树龄增大,红松的需光性增加;3年和 5年生红松在全光 条件下生长较好,7年生红松则是在全光下生长最好。

【英文摘要】Pinus koraiensis is an ecologically important tree species in Northeast China. To explore its light adaptation characteristics and related eco-physiological mechanisms, the 3-, 5-, and 7-year old P. koraiensis seedlings were transplanted under the conditions of 100%, 60%, 30%, and 15% of full sunlight (marked as FI, II, LI, and WI, respectively), and sampled from forest gap, understory, and edge (marked as G, U and E, respectively) under actual light. The study on the changes of net photosynthetic rate (Pn), chlorophyll (Chl) content per unit leaf area, and specific leaf mass (LMA) showed that the Pn of 3- and 5-year old P. koraiensis in treatments II and LI was similar, and higher than that in treatment FI. 7 years old P. koraiensis had the highest Pn in treatment FI. In all treatments, P. koraiensis had a mono-peak change of Pn, with the peak at 13:00. The dark respiration rate (Rd) and maximum photosynthetic rates (Amax) of 3- and 5-year old P. koraiensis were higher in treatment LI than in treatment FI. The LMA decreased with decreasing light intensity, suggesting that P. koraiensis could effectively adapt to the changes of light condition in this way. No significant differences were observed in the photosynthetic characteristics of 3- and 5-year old P. koraiensis between treatments II and U, and between treatments LI, WI, and E, which suggested that the simulated light conditions matched well with the actual one. The plasticity index of eco-physiological parameters of 3 years old P. koraiensis was the highest. It was concluded that 1) the light requirement of P. koraiensis increased with its increasing age, 2) the optimal light condition for 3- and 5-year old P. koraiensis was 30%-60% of full sunlight, and that for 7 years old P. koraiensis was full sunlight, and 3) the favorable age of P. koraiensis seedlings for transplanting was 3 years old.

【题目】不同光强下胡桃楸、水曲柳和黄波罗的光合生理特征.

【中文关键词】光强;净光合速率;光合参数;暗呼吸速率

【英文关键词】light intensity;net photosynthetic rate;photosynthetic parameters;dark respiration

【中文摘要】研究辽东山区次生林3种树种幼苗(核桃楸、水曲柳和黄菠萝)对生长光环境的适应性,在生长季测定4 种光强下(全光、60%透光、30%透光、15%透光,分别记为F1,II,u和WI)树种幼苗叶片气体交换参数、净光合速率、 单位叶面积叶绿素含量和比叶重(LMA)。结果表明:随着光强的减弱,3个树种的光补偿点(LCP)、光饱和点(LSP)、 最大光合速率(P)、暗呼吸速率(R)、类胡萝卜素(Car)、LMA、单位叶鲜质量(LFA)均呈下降趋势;全光下单位叶 面积的叶绿素Chl含量均低于弱光处理。本研究结果支持水曲柳在幼苗时期具有一定耐荫性的观点。树种生理生 态指标的可塑性分析表明:黄菠萝能适应更宽的光强幅度,且黄菠萝的需光性大于核桃楸。不同光环境下3个树 种的生理生态变化特征对解释森林生态系统内树种的共生和演替具有重要意义。

【英文摘要】The acclimation of seedlings of three secondary—forest tree species to light regimes was investigated during the growth season in 2007 in the Northeast of China.The seedlings of Juglans mandshurica.Fraxinus mandshurica and只heff0dendron amurense were cultivated under four light intensity regimes(100%,60%,30%and 15%of full light,which were termed as FI,II,LI and WI respectively).The photosynthetic characteristics,leaf mass per unit area,and chlorophyll content were determined during the growth season.The resuhs showed that light compensation point(LCP),light saturation point(LSP),dark respiration rate(Rd),maximum photosynthetic rate(P).The content of carotenoid,leaf dry mass per unit leaf avea (LMA)of al the three tree species decreased along with decreasing light intensities.And the contents of chlorophyll(Ch1)of full light treatment were lower than that of the others for all the tree species.The results suggested that Fraxinus mandshurica was moderately shade tolerant at the seedling stage.Analysis of the plasticity index of eco-physiological parameters,suggested that P.amurense had the ability of adapting to wider light intensity range;and the ability of shade-intolerance for P.amurense was greater than that of Juglans mandshurica.The different adapting characters of eco—physiology to light regimes played an important role in explaining the mechanism of co—existing and succession of diferent species in secondary forest ecosystem.

【题目】试论生态分类系统在我国数字林业建设中的应用.
【中文关键词】生态分类系统 数字林业 森林生态系统管理 森林资源调查方法
【英文关键词】ecological classificationsystem; digital forestry; forest ecosystemmanagement; forest inventorymethods
【中文摘要】我国传统森林区划中,二类小班和三类小班两类小班体系同时存在,二者在空间上不一致;即使是同一小班体系,先后两次调查结果也不相同,不利于应用数字技术制定长期的森林管理计划.本文以辽宁东部山区为例,建立生态分类系统(ecological classificationsystem,ECS),共得到5类生态土地类型(ecological landtype, ELT), 34类生态土地类型相(ecologicallandtypephase, ELTP). 以ELTP作为固定小班,设计了一致性森林资源调查方法,解决了我国数字林业建设中的基础技术问题.以生态分类系统和空间信息技术为依托的生态系统管理方法,加上计算机模型和辅助决策界面的支持,构成了数字林业的基本框架.
【英文摘要】In China ’s conventional forest management system,there are two types of sub-compartment,i.e.,the 2nd-and 3rd-level sub-compartments,which are concurrent but inconsistent in size and boundary locations.Even in the same type of sub-compartments,the inconsistency still existed at different time,which is unbeneficial to the long-term forest management planning by using digital technologies.With the mountainous region in eastern Liaoning Province as a case,this paper established an ecological classification system(ECS),which contained 5 ecological land types(ELTs) and 34 ecological land type phases(ELTPs).Based on the basic technical needs of China ’s digital forestry,the ELTPs could be used as a fixed sub-compartment system.A compatible forest inventory system was designed then.It was concluded that ecosystem management based on ECS and geospatial information technologies combined with computer models and decision-support systems would be the important component of digital forestry.

【题目】辽宁东部山区林地生态分类系统.
【中文关键词】生态分类系统 生态土地类型 生态土地类型相 森林区划 辽宁东部山区
【英文关键词】Ecological Classification System(ECS);Ecological Land Type(ELT);Ecological Land Type Phase(ELTP);forest inventory unit;eastern mountainous region of Liaoning Province.
【中文摘要】以数字高程模型和SPOT一5遥感数据为数据源,通过地理信息系统的空间分析,在辽 宁东部山区有代表性实验区域内,完成了生态土地类型(ELT)和生态土地类型相(ELTP)两 个等级的分类和绘图,构成了生态分类系统(ECS)等级结构中最低的两个层次.实验区域内 共得到5种ELT和34种ELTP.ELT的划分以环境特征为基础,表征了植被分布的潜在状况 和森林生态系统潜在的生产力.ELTP是对ELT的再划分,是生态分类系统的最小单元,相当 于我国林业区划中的小班.ELTP既包含ELT中的环境信息又包含现存植被构成的信息,具有 空间精准、生态学含义明确的优点.在森林管理活动中,采用ELTP代替小班可以从景观尺度 科学地指导森林经营计划编制,调整森林管理方式,实现对森林生态系统的有效管理.
【英文摘要】Based on Digital Elevation Models(DEM)and satellite SPOT-5 data,and by using the spatial analysis function in Geographic Information System,a hierachical Ecological Classification System of forest landscape was developed for the eastern mountainous region of Liaoning Province,and the two lowest layers in the hierachical framework,Ecological Land Types(ELTs)and Ecological Land Type Phases(ELTPs),were mapped.The results indicated that there were 5 ELTs and 34 ELTPs.The boundaries of ELTs,which presented the potential vegetation distribution and potential forestry ecosystem productivity,were determined by environmental conditions quantified by DEM.ELTPs were classified by overlaying ELTs with forest vegetation data layers which were obtained from remotely sensed data,forest inventory data,and ground data.The ELTPs represented the divisions of land in terms of both natural and human-induced forest conditions,and therefore,were reliable units for forest inventories and management.ELTPs could

function as conventional forest inventory sub-compartments.By this means,forestry departments could adjust forest management planning and forest management measures from the viewpoint of forest landscape scale to realize forest ecosystem management.

【题目】遮阴对黄波罗幼苗的光合特性及光能利用效率的影响.
【中文关键词】黄波罗　耐阴性　次生林　光合作用
【英文关键词】Phellodendron amurense, shade tolerance, secondary forest, photosynthesis
【中文摘要】一直以来黄波罗(Phellodendron amurense) 被认为是不耐阴树种, 然而引入美国纽约后, 发现它具有一定的耐阴性, 在全光和林下均能更新, 在纽约已经成为生物入侵种。为了探讨黄波罗的耐阴性问题, 通过设置自然光与遮阴(15%自然光) 两种光环境, 观测了三年生黄波罗幼苗(遮阴1 a后)光合生理参数、光能利用效率、叶绿素和比叶重的变化。结果表明, 与自然光处理相比, 遮阴处理的黄波罗幼苗最大光合速率、表观量子效率和暗呼吸速率略有下降, 但差异不显著(p >0.05), 光补偿点下降显著(p <0.05); 同时, 单位面积叶绿素含量无显著差异(p>0.05), 而单位干重叶绿素含量显著升高, 比叶重显著下降, 叶面积显著增大(p<0.05) 。上述结果说明: 遮阴的黄波罗幼苗通过降低光补偿点和暗呼吸速率利用环境中的弱光, 同时通过减小比叶重、增大叶面积和提高叶绿素b 相对含量来增强对光的捕获 , 使其在弱光时的光能利用效率提高。由此推断 , 黄波罗幼苗能适应一定程度的遮阴。
【英文摘要】Aims Although Phellodendron amurense is generally recognized as a shade-intolerant tree species, it has been reported to have some shade tolerance and be able to regenerate in both full sun-shine and shade in New York, USA, where it is invasive. Our objective was to investigate shade toler-ance of P. amurense . Methods We planted 2-year-old P. amurense seedlings in two plantation plots, one with full natural light and the other with 15% of full natural light. After one year we observed the parameters of gas ex-chang, including maximum net photosynthetic rate (P max), apparent quantum yield (AQY), dark respira-tion rate (Rd), light compensation point (LCP) and light use efficiency (LUE), using a Li-6400 (Li-Cor,USA). We also determined chlorophyll (Chl) contents per unit leaf area and per unit mass and specific leaf weight (SLW). Important findings There were no significant differences (p>0.05) between sun and shade treatments for P max, AQY and R d. However, plants in the shade treatment had significantly lower LCP and SLW , but higher Chl content per unit mass and leaf area. These results indicated that P. amurense seedlings effec-tively used weak light by decreasing LCP and R d, and enhanced the ability of capturing light by de-creasing SLW and increasing leaf area and relative content of chlorophyll b, which made LUE increase in weak light condition. Therefore, P. amurense seedlings are shade tolerant.

【题目】光环境对胡桃楸幼苗生长与光合作用的影响.
【中文关键词】胡桃楸; 光适应; 季节动态; 可塑性; 次生林;
【英文关键词】Juglans mandshurica; light adaptation; seasonal dynamics; plasticity; secondary forest.;
【中文摘要】为了解胡桃楸幼苗对光的需求及适应规律,采用Li-6400便携式光合测定系统研究了不同光环境处理(100%、60%、30%和15%自然光)条件下3年生胡桃楸幼苗(适应1年后)叶片光合能力的季节变化及其对光强的响应.结果表明:在春季,胡桃楸幼苗对光反应不敏感,夏季和秋季随着光强的增加,叶片的最大光合速率、最大羧化速率和最大电子传递速率均显著增加(P<0.05).光饱和点随光强的下降而降低(P<0.05),表观量子效率、暗呼吸速率和光补偿点在不同光环境下未发现显著差异.100%和60%自然光处理的幼苗相对生长率差异不显著,但是随着光强下降,相对生长率显著下降(P<0.05),为

60%>30%>15%自然光处理.胡桃楸幼苗对不同的光环境表现出较强的适应性和可塑性;同时,通过降低光饱和点和减少碳积累,也能适应15%~30%自然光环境.

【英文摘要】In order to understand the light requirement and adaptability of Juglans mandshurica seedlings,two-year-old J.mandshurica seedlings were grown under four light regimes(100%,60%,30%,and 15% of natural irradiance).After 1-year adaptation,the seasonal variations of the seedlings photosynthetic variables were measured by a Li-6400 portable photosynthesis system.The J.mandshurica seedlings were insensitive to the changes of light environment in spring,but their maximum net photosynthetic rate,maximum carboxylation rate,and maximum electron transport rate increased significantly with increasing light intensity in summer and autumn(P<0.05).The light saturation point declined with decreasing light intensity(P<0.05),but the apparent quantum yield,dark respiration rate,and light compensation point under different light environments had no significant changes.The relative growth rate under 100% and 60% of natural irradiance had no significant difference(P>0.05),but declined significantly in the order of 60%>30%>15% of natural irradiance(P<0.05).These results indicated that J.mandshurica seedlings had the maximum relative growth rate under 100% and 60% of natural irradiances,and could tolerate 15%-30% of natural irradiance by reducing light saturation point and carbon accumulation,exhibiting strong adaptability and plasticity to light environment.

【题目】长白山阔叶红松林物种多度和空间分布格局的关系

【中文关键词】长白山; 阔叶红松林; 多度; 随机分布; 聚集分布;

【英文关键词】Changbai Mountains; broad-leaved Korean pine mixed forest; abundance; random distribution; aggregated distribution;

【中文摘要】应用随机分布多度模型和聚集分布多度模型,探讨不同研究尺度下物种多度和空间分布格局的关系。结果表明,预测的物种多度不仅受物种分布面积大小的影响,还受其聚集程度的影响。物种多度和空间分布格局的关系存在着明显的尺度效应,即随着研究尺度的增加,无论是随机分布多度模型还是聚集分布多度模型,通过物种空间分布格局来预测物种多度的准确度都在下降。聚集分布多度模型预测物种多度的结果要好于随机分布多度模型,这表明该区大多数物种是聚集分布的。由于物种的空间分布格局不同,不同物种多度的预测值和真实值之间的差异也不同。因此,为了进一步提高模型预测的准确性,进一步考虑不同物种的生活史特性是必要的。

【英文摘要】By using random and aggregated distribution-abundance models,this paper studied the relationships between species abundance and distribution patterns of broad-leaved Korean pine(Pinus koraiensis)mixed forest in Changbai Mountains of China under different spatial scales.The results showed that both species distribution area and species aggregation degree affected the estimated species abundance.Spatial scale had profound effects on the distribution-abundance relationships.With the increase of spatial scale,the accuracy of species abundance estimation by the two models all declined.Aggregated distribution-abundance model could better estimate the species abundance than random distribution-abundance model,suggesting that most species were aggregately distributed.However,due to the different species distribution patterns under different spatial scales,the differences between estimated and observed data of species abundance varied greatly.Therefore,in order to further improve the estimation accuracy of the models,the life history of different species as well as the spatial scale and species aggregation should be considered.

【题目】辽宁冰砬山两种类型林地土壤入渗特性比较研究.
【中文关键词】辽宁冰砬山;长白落叶松人工林;蒙古栎天然次生林;土壤入渗
【英文关键词】辽宁冰砬山;长白落叶松人工林;蒙古栎天然次生林;土壤入渗
【中文摘要】通过对辽宁冰砬山两种类型林地(长白落叶松人工林和蒙古栎天然次生林)土壤入渗特性 的研究得到,前者林地的3种入渗指标(初始入渗速率7.1lmm/min,平均入渗速率4.09ram/rain,稳定入渗速率3.48ram/rain)均显著低于后者(初始入渗速率为19.79ram/rain,平均入渗速率为 14.23ram/rain,稳定入渗速率为l1.74ram/rain),后者林地的入渗能力要强于前者。KostiakOV方程和 Horton方程能较好的模拟这两种森林林地土壤的水分入渗规律。长白落叶松人工林地的土壤入渗 速率减小快于蒙古栎天然次生林地。土壤孔隙度特征是影响入渗规律的一个重要因素,土壤质地、紧实度、石砾含量与砾径大小和植被的根系生长等与入渗规律有密切的关系。

【题目】长白山原始阔叶红松林径级结构研究.
【中文关键词】阔叶红松林; 径级结构; q值法则; Weibull分布; 负指数分布;
【英文关键词】broadleaf-Korean pine mixed forest; diameter distribution; constant ratio q; Weibull distribution; negative exponential distribution;
【中文摘要】以原始阔叶红松林为研究对象,设置了2块1hm2样地,利用Weibull分布函数、负指数函数和q值理论对其林分径级结构进行模拟。结果表明:2块样地林分的径级分布均呈倒"J"形,森林更新良好;Weibull分布函数和负指数函数都取得了较好的模拟效果,但Weibull分布函数更好地预测了大径阶株数,因此,Weibull分布函数比负指数函数更适合原始阔叶红松林径级结构的模拟;2块样地的q值偏小(分别为1.74和1.45),说明径级结构曲线较平缓,大径材数量多。q值法则对于阔叶红松林径阶株数密度的表达效果较好,可以被用于描述阔叶红松林的胸径分布。
【英文摘要】Two 1-ha plots were set up in an old-growth broadleaf-Korean pine mixed forest in Changbai Mountains, Northeast China, and the Weibull function, negative exponential function, and constant ratio q were used to model the diameter distribution. In the two plots, the diameter distribution of the trees all exhibited inverse J-shape, which meant that understory regeneration was relatively good. Both Weibull and negative exponential functions were suitable for modeling the diameter distribution in primary broadleaf-Korean pine mixed forest, but Weibull function could better predict the number of big trees, compared with negative exponential function. The diameter q values of the two plots were small, being 1.74 and 1.45, respectively, which meant that the slope of diameter distribution was quite mild and there were many big trees in the plots. The constant ratio q was better for expressing the diameter-density of broadleaf-Korean pine mixed forest, being possible to be used to describe the diameter distribution of broadleaf-Korean pine mixed forest.

【题目】辽宁冰砬山长白落叶松林能量平衡和蒸散的研究.
【中文关键词】冰砬山; 长白落叶松林; 能量平衡; 森林蒸散量;
【英文关键词】Bingla Mountain; Larix olgensis forest; energy balance; evapotranspiration;
【中文摘要】利用辽宁冰砬山长白落叶松林内小气候梯度观测塔观测数据,采用波文比-能量平衡法(BREB),计算出冰砬山长白落叶松林的热量平衡各分量和蒸散量,研究生长季和非生长季能量平衡特征和蒸散量的差异。分析了冰砬山落叶松林的净辐射、潜热通量和湍流热交换通量日变化趋势及其形成原因。结果表明:生长季森林生态系统主要能量支出项为潜热通量(LE),平均占能量平衡的65.44%,非生长季主要能量支出项为感热通量(H),平均占能量平衡的64.94%;生长季森林蒸散量明显大于非生长季森林蒸散量,生长季平均日蒸散量(2.6mm)是非生长季平均日蒸散量(0.3mm)的8倍。冰砬山长白落叶松林全年蒸散量531.4mm,占同期降水量(707.9mm)的75.1%。
【英文摘要】Based on the observation data in the Larix olgensis forest in Bingla mountain,the authors calculated all the items of energy balance and the evapotranspiration utilizing the BREB,researched characteristics of energy balance and difference of evapotranspiration in growth season and non-growth season.The net radiation,latent heat flux and sensible heat flux changing in one day and its cause were analysed.The seasonal variation of energy balance components were also analysed.In growth season,the energy components were dominated by upward latent heat flux(LE),about 65.44% of Rn.This contrasted dramatically with non-growth season,when it was dominated by upward sensible heat flux(H),and nearly 64.94% of Rn.Evapotranspiration was obviously higher in the growth season than that in the non-growth season.The daily evapotranspiration was eight times in growing season(2.6mm) as that in non-growth season(0.3mm).The annual evapotranspiration amounted to 531.4mm accounting for 75.1% of the annual rainfall(707.9 mm).

【题目】阔叶林下人工更新红松幼树光合作用研究.
【中文关键词】红松; 光合速率; 光能利用率; 水分利用率;
【英文关键词】Pinus koraiensis; photosynthesis rate; light utility efficiency; water utility efficiency;
【中文摘要】利用LI-6400便携式光合测定系统,对天然次生林下、林缘、林窗环境中红松幼树的净光合速率进行测定,同时记录光合生理因子和环境因子。分析了林下、林缘、林窗不同条件下红松幼树的净光合速率、蒸腾速率、光能利用率、水分利用率日进程及其差异。结果表明:日平均气温林下<林缘<林窗;空气相对湿度林下>林缘>林窗;林窗阳面叶光合有效辐射呈单峰型曲线,阳面叶光合有效辐射最大值林窗>林缘>林下;红松幼树净光合速率阳面叶大于阴面叶,林窗处阳面叶净光合速率日变化呈单峰型曲线,林缘呈双峰型曲线,林下呈多峰型曲线,净光合速率最大值林窗>林缘>林下;红松阳面叶的光能利用率林下>林缘>林窗;红松阳面叶蒸腾速率日变化呈单峰型曲线,且蒸腾速率林窗 > 林缘 > 林下,阳面叶 > 阴面叶;红松阳面叶水分利用率林下 > 林窗 > 林缘,阳面叶水分利用率 > 阴面叶水分利用率。
【英文摘要】Net photosynthesis rates(NPR) for young plants of Pinus koraiensis in natural secondary forests in such surroundings as in the forests,at the edge and canopy gaps of forests were determined by means of LI-6400 portable photosynthesis system,and physiological and environmental factors were recorded,the diurnal process and differences regarding NPR,transpiration rates(TR),light utility efficiency(LUE) and water utility efficiency(WUE) of young plants of Pinus koraiensis in above-mentioned conditions were analyzed.The results indicated that: daily average temperature was in the forest<at the edge<at canopy gaps,and air relative humidity

was in the forest>at the edge>at canopy gaps.The photosynthesis active radiation(PAR) of sunshine-side leaves at canopy gaps showed a single peak curve,and maximum PAR was at canopy gaps>at the edge>in the forest.NPR for sunshine-side leaf of young plants of Pinus koraiensis was greater than that of shade-side leaf,and NPR diurnal variation of NPR for sunshine-side leaf at canopy gaps,at the edges and in the forest showed a single peak curve,a double-peak curve and a multi-peak curve respectively,the maximum NPR was at canopy gaps>at the edge>in the forest.LUE for sunshine-side leaf of Pinus koraiensis was in the forest>at the edge>at canopy gaps.TR diurnal variation for sunshine-side leaf of Pinus koraiensis showed a single peak curve,and TR was at canopy gaps>at the edge>in the forest and sunshine-side leaf>shade-side leaf.WUE for sunshine-side leaf of Pinus koraiensis was in the forest>at canopy gaps>at the edge and sunshine-side leaf>shade-side leaf.

【题目】外源腐殖酸对三种土壤磷吸附与解吸特性的影响.
【中文关键词】外源腐殖酸;无机磷组分;活化作用
【英文关键词】外源腐殖酸;无机磷组分;活化作用
【中文摘要】磷是植物生长所需的大量元素之一,然而磷肥的当季利用率一般只有10%~25%,75%~90%的磷肥以不同形态的磷酸盐积累在土壤中。因此,磷在土壤中的存在形态,以及施肥对磷素形态的影响一直受到人们的广泛关注。植物直接吸收利用的磷大部分为无机磷,已有研究表明,有机酸能明显提高土壤有效磷含量,而有效磷含量的增加与土壤中无机磷形态的变化密切相关。面对当前土壤中累积的大量磷元素,而植物可利用的磷却十分低的现象,
【英文摘要】An investigation from 2006 to 2007 was made on the Pinus koraiensis seed consumption by rodents and birds in the broad-leaved P.koraiensis mixed forest and birch forest at the same altitude in Changbai Mountains.The results showed that in broad-leaved P.koraiensis mixed forest,rodents consumed more pinecone seeds than birds;while in birch forest,birds did more than rodents.In the two forests,the total number of pinecone seeds consumed by rodents was significantly higher than that consumed by birds(P<0.01).In addition,rodents consumed more embedded seeds in broad-leaved P.koraiensis mixed forest than in birch forest,and the consumption amount in the two forests decreased with increasing embedded depth.

【题目】长白山阔叶红松林中红松与紫椴的空间分布格局及其关联性.
【中文关键词】点格局分析 空间关联性 空间格局 阔叶红松林 长白山
【英文关键词】point pattern analysis; spatial association; spatial pattern; broad-leaved Korean pine (Pinus koraiensis) forest; Changbai Mountains;
【中文摘要】以长白山阔叶红松林25hm2样地调查数据为基础,采用点格局分析方法O-ring统计,分析了红松与紫椴两个优势树种在主林层、次林层和林下层的空间分布格局,以及各林层之间的种内和种间关联性.结果表明:在小尺度上,红松和紫椴总体上呈聚集性分布,但不同林层的分布格局各异.物种在较低的林层呈明显的聚集分布,而在较高的林层则呈随机或规则分布,聚集度随林层的增高而降低.主林层与次林层红松在<11m的尺度内呈明显的正相关.主林层与次林层、林下层紫椴之间呈负相关.红松和紫椴在整体上表现为正相关,但不同林层间的关联性各异.主林层红松与3个林层紫椴之间没有明显的关联性;次林层红松与次林层紫椴在>4m的尺度上呈负相关,而与林下层紫椴没有明显的关联性;主林层紫椴与次林层红松在0~100m尺度内都表现为显著正相关.
【英文摘要】Based on the investigation data from a 25 hm2 broadleaved Korean pine (Pinus koraiensis) mixed forest plot in Changbai Mountains of China, the dominant species Korean pine and Tilia amurensis were chosen as research objects. One point pattern analysis method, O-ring statistics, was used to analyze the spatial patterns of the species in three vertical layers, i.e., overstory, midstory and understory layers, and the spatial associations of intra- and inter-species between different vertical layers were studied. The

results showed that P. koraiensis and T. amurensis were clumped at smaller scales. Higher layers tended to be randomly or regularly distributed, while lower layers tended to be aggregated at smaller scales. The aggregation degree decreased with canopy height. P. koraiensis stems in overstory layer were significantly positively associated to the stems in midstory layer at scales <11 m, and T. amurensis in overstory layer showed negatively correlation with that in midstory and understory layers. There was generally a positive correlation between the two species, but the association varied among different layers. No significant correlation was observed between P. koraiensis stems in overstory layer and T. amurensis in three layers. P. koraiensis stems in midstory layer showed slightly negative correlation with T. amurensis in the same layer at scales >4 m, but no significant association to T. amurensis in understroy layer. T. amurensis in overstory layer was significantly positively associated to P. koraiensis in midstory layer at scales <100 m.

【题目】辽东山区长白落叶松人工林天然更新障碍分析.
【中文关键词】辽东山区; 长白落叶松; 人工林; 天然更新; 间伐;
【英文关键词】montane regions of eastern Liaoning Province; Larix olgensis; plantation; natural regeneration; thinning.;
【中文摘要】通过对辽东山区不同间伐强度下长白落叶松林内种子库,种子萌发,幼苗出现、成活与生长的观测,分析了长白落叶松天然更新的主要影响因素.结果表明:40年生落叶松人工林的种子雨中,有30%的种子有活力,可以满足天然更新的需要;土壤种子库的种子主要分布在枯枝落叶层,4月下旬林内种子开始萌发,6月幼苗数量达到最大,幼苗累计出现率与间伐强度(光照)之间无显著相关,只受到地被物的影响;随间伐强度的增加,幼苗平均存活率提高,但林下幼苗生长缓慢,苗高均不超过6 cm;林内当年幼苗9月全部消失,没有超过1年生的幼苗,但皆伐迹地的更新幼苗存活较多、生长良好.初步确定地被物和光照是辽东山区长白落叶松天然更新的主要障碍因子.

【英文摘要】Based on the field investigations about the seed bank,seed germination,seedling emergence,and seedling survival and growth in the Larix olgensis plantations with different thinning intensities and various ground preparations in the montane regions of eastern Liaoning Province,the main factors affecting the natural regeneration of L.olgensis were analyzed in this paper.The results showed that in the seed rain of 40 years old L.olgensis plantation,30% of the seeds had viability,which could meet the needs of natural regeneration.The seeds in soil seed bank mainly distributed in litter layer,and the seedlings younger than one-year old emerged in April

and reached the peak in June.The accumulative emergence rate of the seedlings had no significant correlation with thinning intensities,but was affected by ground preparations.The average survival rate of appeared seedlings increased with increasing thinning intensities,but the seedling growth was generally slow in the plantation stands,e.g.,the seedling height was less than 6 cm,and most of the seedlings disappeared in September.In the plantation stands,it was difficult to find the L.olgensis seedlings elder than one-year;but in the clear-cut area with enough light and less ground cover,more seedlings could survive and grew well.Based on the above mentioned results,it was concluded that the main obstacles for the natural regeneration of L.olgensis plantations in montane regions of eastern Liaoning Province could be light intensity and ground cover.

【题目】Development of primary shrimp hemocyte cultures of Penaeus chinensis to study white spot syndrome virus (WSSV) infection

【中文关键词】Jiang YS, Zhan WB,Wang SB,Xing J

【英文关键词】hemocytes; WSSV; infection; immunocytochemical tests

【中文摘要】Hemocytes were withdrawn from hearts of Penaeus chinensis, cultured with seven kinds of culture media, the hemocytes remained viable for about 20 days using Leibovitz's 2 x L-15 medium consisting of 20% fetal bovine serum, 20% GIT, and 2% glucose, adjusting osmolarity with sodium chloride, pH 7.2-7.4, and incubated at a temperature of 25 degrees C. Different concentrations of virus inoculum were inoculated into the primary cultured hemocytes, and diverse cytopathic effects were observed with an inverted phase-contrast microscope. WSSV infection was confirmed by immunocytochemical tests with monoclonal antibodies against the virus. These revealed that WSSV could infect hemocytes of P chinensis and propagate in the nuclei of infected cells. (C) 2005 Elsevier B.V. All rights reserved.

【题目】Development of an immuno- chromatographic test to detect White Spot Syndrome Virus of shrimp

【中文关键词】Wang XJ, Zhan WB

【英文关键词】shrimp; WSSV; MAbs; ICT

【中文摘要】A rapid, single step, sensitive and specific immunochromatographic test (ICT) is described for detecting white spot syndrome virus (WSSV) using anti-WSSV monoclonal antibodies (MAbs), 2E6 and 2A3, labeled with colloidal gold as a detection reagent and anti-WSSV MAb 1135 as a capture antibody immobilized on nitrocellulose membrane (NCM). The test process was completed within 10min without incubation or any other equipment. A reddish color at the site of immune reaction on NCM indicated

a positive result and 1 mu g/ml of WSSV could be detected. The assay sensitivity could be increased to 0.01 mu g/ml by silver enhancement. The sensitivity of ICT was similar to that of dot-blot nitrocellulose enzyme immunoassay (DB-NC-EIA). However, ICT is a method that is more convenient and can be quickly performed pond side without false positive results.

【题目】Development of dot-immunogold filtration assay to detect white spot syndrome virus of shrimp

【中文关键词】Wang XJ, Zhan WB,Xing J

【英文关键词】shrimp; WSSV; MAbs; DIGFA

【中文摘要】The dot-immunogold filtration assay (DIGFA) detects white spot syndrome virus (WSSV) by using a nitrocellulose membrane (NCM) as a support of WSSV and anti-WSSV monoclonal antibodies (MAbs) 1D5 and 6A4 labelled with red color colloidal gold. The principle of filtration for the rapid reaction of antigen and antibody is adopted in order for the test process to be completed within 3 min without incubation or any equipment. A reddish dot indicative of a positive result is present visibly. In comparison with dot-blot nitrocellulose enzyme immunoassay (DB-NC-EIA), the sensitivity of DIGFA is similar. However, DIGFA is a method that can be per-formed conveniently pond side providing a faster result without the production of false positive results.

【英文摘要】The dot-immunogold filtration assay (DIGFA) detects white spot syndrome virus (WSSV) by using a nitrocellulose membrane (NCM) as a support of WSSV and anti-WSSV monoclonal antibodies (MAbs) 1D5 and 6A4 labelled with red color colloidal gold. The principle of filtration for the rapid reaction of antigen and antibody is adopted in order for the test process to be completed within 3 min without incubation or any equipment. A reddish dot indicative of a positive result is present visibly. In comparison with dot-blot nitrocellulose enzyme immunoassay (DB-NC-EIA), the sensitivity of DIGFA is similar. However, DIGFA is a method that can be per-formed conveniently pond side providing a faster result without the production of false positive results.

【题目】Molecular cloning and characterization of a putative lipopolysaccharide-induced TNF-a factor (LITAF) gene homologue from Zhikong scallop

【中文关键词】Yu, Yundong;Qiu, Limei;Song, Linsheng;Zhao, Jianmin;Ni, Duojiao;Zhang, Yin;Xu, Wei

【英文关键词】Chlamys farreri; lipopolysaccharide-induced TNF-alpha factor (LITAF); lipopolysaccharide (LPS); real-time RT-PCR; innate immunity

【中文摘要】LPS-induced TNF-alpha factor (LITAF) is a novel transcriptional factor that was first discovered in LPS-stimulated human macrophage cell line THP-1. LITAF can bind to TNF-a promoter to regulate its expression. The first scallop LITAF (named as

CfLITAF) was cloned from Zhikong scallop Chlamys farreri by Expressed Sequence Tag (EST) and Polymerase Chain Reaction (PCR) techniques. The cDNA of CfLITAF was of 1240 bp and consisted of a 5' untranslated region (UTR) of 112 bp, a 3' UTR of 678 bp and an open reading frame (ORF) of 450 bp encoding a polypeptide of 149 amino acids with an estimated molecular mass of 16.08 kDa and theoretical isoelectric point of 6.77. A typical conserved LITAF-domain was identified in CfLITAF by SMART analysis. Homology analysis of the deduced amino acid sequence of CfLITAF with other known sequences by using the BLAST program revealed that CfLITAF was homologous to the LITAF from human and rat (Identity = 46%), cattle, horse, mouse and chicken (Identity = 48%), western clawed frog (Identity = 42%), and zebrafish (Identity = 50%). The mRNA expression of CfLITAF in different tissues including haemocytes, muscle, mantle, heart, gill and gonad, and the temporal expression in haemocytes challenged by LPS or peptidoglycan (PGN) were measured by Real-time RT-PCR. CfLITAF mRNA transcripts could be detected in all tissues examined and be up-regulated in haemocytes after LPS challenge. No significant changes were observed after PGN stimulation. All these data indicated the existence of LITAF in scallop and also provided clue on the presence of TNF-alpha-like molecules in invertebrates.

【题目】Molecular cloning and mRNA expression of peptidoglycan recognition protein (PGRP) gene in bay scallop (Argopecten irradians, Lamarck 1819)

【中文关键词】Ni, Duojiao; Song, Linsheng; Wu, Longtao, Chang, YQ (Chang, Yaqing); Yu, YD (Yu, Yundong); Qiu, LM (Qiu, Limei); Wang, LL (Wang, Lingling)
【英文关键词】Argopecten irradians; peptidoglycan recognition protein; expressed sequence tag; cDNA cloning; mRNA expression
【中文摘要】无

【英文摘要】 Peptidoglycan recognition proteins (PGRPs) are a type of pattern recognition molecules (PRM) that recognize the unique cell wall componentpeptidoglycan (PGN) of bacteria and are involved in innate immunity. The first bivalve PGRP cDNA sequence was cloned from bay scallop Argopectenirradians by expressed sequence tag (EST) and PCR technique. The full-length cDNA of bay scallop PGRP (designated AiPGRP) gene contained 10 18 bp with a 615-bp open reading frame that encoded a polypeptide of 205 amino acids. The predicted amino acid sequence of AiPGRP shared high identity with PGRP in other organisms, such as PGRP precursor in Trichoplusia ni and PGRP SC2 in Drosophila melanogaster. A quantitative reverse transcriptase Real-Time PCR (qRT-PCR) assay was developed to assess the mRNA expression of AiPGRP in different tissues and the temporalexpression of AiPGRP in the mixed primary cultured hemocytes challenged by microbial components lipopolyssacharide (LPS) from Escherichia coli and PGN from Micrococcus luteus. Higher-level mRNA expression of AiPGRP was detected in the tissues of hemocytes, gonad and kidney.

The expression ofAiPGRP in the mixed primary cultured hemocytes was up regulated after stimulated by PGN, while LPS from E. coli did not induce AiPGRP expression. The results indicated that AiPGRP was a constitutive and inducible expressed protein that was mainly induced by PGN and could be involved in scallopimmune response against Gram-positive bacteria infection. 【题目】Molecular cloning, characterization and expression of a serine protease with clip-domain homologue from scallop
【中文关键词】Zhu L, Song LS, Zhao JM, Xu W, Chang YQ
【英文关键词】serine protease; clip domain; Chlamys farreri; tissue distribution; mRNAexpression; injury healing; immune response
【中文摘要】无
【英文摘要】Serine proteases play critical roles in a variety of invertebrate immune defense responses, including hemolymph coagulation, antimicrobial peptide synthesis, and melanization. The first mollusk serine protease with clip-domain (designated CFSP1) cDNA was obtained from the scallop Chlamys farreri challenged with Vibrio anguillarum by randomly sequencing a whole tissue cDNA library and rapid amplification of cDNA ends (RACE). The full-length cDNA of the C. farreri serine protease was 1211 bp, consisting of a 5-terminal untranslated region (UTR) of 72 bp, a 3'-terminal UTR of 77 bp with a canonical polyadenylation signal sequence AATAAA and a poly (A) tail, and an open reading frame of 1062 bp. The CFSP1 cDNA encoded a polypeptide of 354 amino acids with a putative signal peptide of 19 amino acids and a mature protein of 335 amino acids. The deduced amino acid sequence of CFSP1 contained an amino-terminal clip domain, a low complexity region, and a carboxyl-terminal serine protease domain. CFSP1 mRNA was mainly expressed constitutively in the hemocytes and was up-regulated and increased 2.9- and 1.9-fold at 16 h after injury and injection of bacteria. (c) 2006 Elsevier Ltd. 【题目】Molecular cloning and characterization of a lipopolysaccharide and beta-1,3-glucan binding protein from fleshy prawn (Fenneropenaeus chinensis)
【中文关键词】Du XJ, Zhao XF, Wang JX
【英文关键词】LGBP; fleshy prawn; Fenneropenaeus chinensis; pattern recognitionprotein; innate immunity
【中文摘要】无
【英文摘要】Pattern recognition proteins (PRPs), such as lipopolysaccharide and beta-1,3-glucan binding protein (LGBP), have been identified in many animals and play a crucial role in invertebrate defense systems. In the current study, an LGBP gene was cloned from fleshy prawn (Fenneropenaeus chinensis, Fc-LGBP) utilizing homology cloning and RACE methods. The full cDNA of the Fc-LGBP gene in fleshy prawn was 1253 bp in size with a deduced 366 amino acid protein that includes a glycosyl hydrolase domain. Northern blot and RT-PCR data suggested that Fc-LGBP mRNA was mostly synthesized in haemocytes and that the expression was down-regulated 24 It post-injection of bacteria. In situ hybridization demonstrated that Fc-LGBP mRNA was only detected in haemocyte cytoplasm, with no detection in other tissues. The molecular weight of the purified recombinantly expressed Fc-LGBP was approximately 46 kDa. Immunohistochemistry of haemocytes revealed that Fc-LGBP protein was localized on the membrane of most cells. Data from bacterial binding assays utilizing purified protein suggested that rFc-LGBP had strong binding activity to Gram-

negative bacteria. (c) 2006 Elsevier Ltd. All rights reserved.

【题目】cDNA cloning and mRNA expression of heat shock protein 90 gene in the haemocytes of Zhikong scallop
【中文关键词】Gao Q, Song LS, Ni DJ, Wu LT, Zhang H, Chang YQ
【英文关键词】biomarker; cDNA cloning; expressed sequence tag; heat shock protein 90;heavy metal stress; mRNA expression; Zhikong scallop Chlamys farreri
【中文摘要】无
【英文摘要】Heat shock protein 90 (HSP90) is a highly conserved molecular chaperone contributing to the folding, maintenance of structural integrity and proper regulation of a subset of cytosolic proteins. The full-length cDNA of Zhikong scallop Chlamysfarreri HSP90 (designated CfHSP90) was cloned by EST and rapid RACE techniques. It was of 2710 bp, including an open reading frame (ORF) of 2181 bp encoding a polypeptide of 726 amino acids with all the five HSP90 family signatures. BLAST analysis revealed that the CfHSP90 gene shared high similarity with other known HSP90 genes. Fluorescent real-time quantitative RT-PCR was used to examine the expression pattern of CfHSP90 mRNA in haemocytes of scallops exposed to Cd2+, Pb2+ and Cu2+ for 10 and 20 days, respectively. All the three heavy metals could induce CfHSP90 expression. There was a clear dose-dependent expression pattern of CfHSP90 after heavy metals exposure for 10 days or 20 days. Different concentrations of the same metal resulted in different effects on CfHSP90 expression. The results indicated that CfHSP90 responded to various heavy metal stresses with a dose-dependent expression pattern as well as exposure time effect, and could be used as a molecular biomarker in a heavy metal polluted environment. 【题目】Neutralizing assay of monoclonal antibodies against white spot syndrome virus (WSSV)
【中文关键词】Jiang YS, Zhan WB, Sheng XZ
【英文关键词】white spot syndrome virus; monoclonal antibody; neutralization;haemocyte membranes
【中文摘要】无
【英文摘要】Monoclonal antibodies (Mabs) against white spot syndrome virus (WSSV) were tested for their ability to neutralize WSSV infectivity by immunodot-blot assay and enzyme-linked immunosorbent assay. It was proved that WSSV could bind to haemocyte membranes of Penaeus chinensis, moreover, the result showed that the Mab 2132 could reduce the binding of WSSV with haemocyte membranes of P. chinensis. The neutralization assay was further conducted in vitro with primary cultured haemocytes of P chinensis, and the cell culture assay showed that the two monoclonal antibodies, 2132 and 6134 could partially neutralize WSSV infection. 【题目】Characterization and expression of a new subfamily member of penaeidin antimicrobial peptides (penaeidin 5) from Fenneropenaeus chinensis
【中文关键词】Kang CJ, Xue JF, Liu N, Zhao XF, Wang JX
【英文关键词】fleshy prawn; Fenneropenaeus chinensis; antimicrobial peptide;penaeidins; gene expression; Pichia pastoris
【中文摘要】无
【英文摘要】Penaeidins are members of a special family of antimicrobial peptides existing in penaeid shrimp and play an important role in the immunological defence of shrimp. Here, we report one penaeidin with a putative isotype newly cloned from fleshy prawn Fenneropenaeus chinensis. The penaeidin open reading frame encodes a 79 amino acid peptide while two exons and an intron were identified within the 1126 bp genomic sequence of Fenchi-penaeidin 5. Phylogenetic analysis and sequence comparison with other known penaeidins suggest the new gene belongs to a novel subfamily of penaeidins and the two isoforms were named Fenchi-penacidin 5-1 and 5-2, respectively. Fenchi-penaeidin 5 mRNA was examined in normal and microbial challenged shrimp and was found to be constitutively expressed in heamocytes, heart, gill, intestine and ovary. Bacterial challenge resulted in mRNA up-regulation, inducing expression in hepatopancreas and stomach. Fenchi-penaeidin 5-1 was also expressed in Pichia pastoris, and recombinant Fenchi-penaeidin 5-1 exhibited activities against Gram-positive and -negative bacteria and fungi. (c) 2006 Elsevier Ltd. 【英文摘要】Immunoglobulin (Ig) of Japanese flounder (Paralichthys olivaceus) was purified by a combination of salting-out and DEAE Sepharose Column chromatography. The purified immunoglobulin had an apparent molecular weight of 74 kDa (heavy chain) and 24 kDa (light chain) in SDS-PAGE. Eighteen hybridomas secreting monoclonal antibodies (MAbs) against Japanese flounder 12 were obtained by immunisation of Balb/C mice with purified Ig preparations, which were selected on the basis of the double indirect enzyme-linked immunosorbent assay (D-ELISA). Two of them designated as 2D8 and 2H1 were cloned by limiting dilution and characterised with western blotting, indirect immunofluorescence assay test (IIFAT) and fluorescence-activated cell sorter (FACS) analysis. Under reducing conditions in western blotting, both MAb 2D8 and MAb 2H1 were specific for the heavy chain of Japanese flounder Ig MAb 2D8 was used to identify surface Ig-positive lymphocytes in the peripheral blood, spleen and pronephros of healthy Japanese flounder by flow cytornetry. FACS analysis revealed that 40.48% of lymphocytes in the peripheral blood, 17.32% in the spleen and 9.67% in the pronephros were reactive to 2D8. (C) 2007 Elsevier Ltd. All rights reserved.

【题目】Ontogenesis of haemocytes in shrimp (Fenneropenaeus chinensis) studied with probes of monoclonal antibody
【中文关键词】Lin YB, Zhan WB, Li Q, Zhang ZD, Wei XM, Sheng XZ
【英文关键词】shrimp; haemocyte; ontogenesis; monoclonal antibody
【中文摘要】无
【英文摘要】Monoclonal antibodies (Mabs) specifically against haemocytes of shrimp (Fenneropenaeus chinensis) were employed to study the ontogenesis of haemocytes by immunofluorescence assay technique (IFAT) with the aids of avidin-biotin complex method. Different developmental stages were identified by means of histochemical staining. Stages including blastula, gastrula, limb bud stage, embryonic-nauplius and nauplius were examined. With Mab 2A3 against both hyline, semi-granular and granular haemocytes, the first positive cells were detected at the limb bud stage of the embryos. Distinguishable positive haemocytes with a diameter of about 7 mu m appeared in ernbryonic-nauplius. Whereas, with Mab 1H11 specific to cytoplasmic granulars in haemocytes, the first positive granular haemocytes were observed at the stage of embryonic-nauplius. Increased number of both total and granular haemocytes at the stage of nauplius impressed a possible enhancement of the immune system as the embryogenesis progressed. (C) 2007 Elsevier Ltd. 【题目】A prophenoloxidase from the Chinese mitten crab Eriocheir sinensis: gene cloning, expression and activity analysis
【中文关键词】Gai YC, Zhao JM, Song LS, Li CH, Zheng PL, Qiu LM, Ni DJ
【英文关键词】prophenoloxidase; Eriocheir sinensis; quantitative real-time PCR; innateimmunity; enzyme specific activity; mRNA expression profile
【中文摘要】无
【英文摘要】Prophenoloxidase (proPO) is a conserved copper-containing enzyme that plays important roles in immune response of crustaceans and insects. In the present study, the full-length cDNA of a prophenoloxidase (designated EsproPO) was cloned from haemocytes of Chinese mitten crab Eriocheir sinensis by expressed sequence tag (EST) and PCR techniques. The isolated 3549 bp full-length cDNA of EsproPO contained a 2040 bp open reading frame (ORF) encoding a putative proPO protein of 679 amino acids, a 5'-untranslated region (UTR) of 68 bp, and a long 3'-UTR of 1441 bp. Two putative copper-binding sites, a proteolytic activation site, and a complement-like motif (GCGWPQHM) were identified in the deduced amino acid sequence of EsproPO. Homology analysis revealed that EsproPO was highly similar to other proPOs from crustaceans with identities from 52% to 68%. The conserved domains and motifs, and higher similarity with other proPOs suggested that EsproPO was a member of the proPO family. The mRNA expression of EsproPO and PO specific activities in the tissues of hepatopancreas, gill, gonad, muscle, heart, eye and haemocytes were measured by quantitative real-time PCR and colorimetric assay, respectively. The mRNA transcripts of EsproPO and PO specific activities could be detected in all the examined tissues with the highest level both in hepatopancreas. Three peaks of EsproPO mRNA expression were recorded at 2 h, 12 h and 48 h in haemocytes of Chinese mitten crab post Vibrio anguillarum challenge, which was consistent with the temporal profile of PO specific activity. The mRNA expression pattern and the activity fluctuation of EsproPO post V. anguillarum stimulation indicated that it was potentially involved in the acute response against invading bacteria in Chinese mitten crab. 【题目】Identification and characterization of a myeloid differentiation factor 88 (MyD88) cDNA from Zhikong scallop
【中文关键词】Qiu LM, Song LS, Yu YD, Xu W, Ni DJ, Zhang QC
【英文关键词】Chlamys farreri; innate immunity; Myd88; real-time RT-PCR
【中文摘要】无
【英文摘要】Myeloid differentiation factor 88 (MyD88) is a universal and essential adapter for the TLR/IL-1R family. In this report, the first mollusk Myd88 ortholog (named as CfMyd88) was cloned from Zhikong scallop (Chlamys farreri). The full-length cDNA of CfMyd88 was of 1554 bp, including a 5 '-terminal untranslated region (UTR) of 427 bp, a polyA tail, and an open reading frame (ORF) of 1104 bp encoding a polypeptide of 367 amino acids containing the typical TLR and IL-1R-related (TIR) domain and death domain (DD). Homology analysis revealed that the predicted amino acid sequence of CfMyd88 was homologous to a variety of previously identified Myd88s with more than 30% identity. The temporal expressions of CfMyd88 mRNA in the mixed primary cultured haemocytes stimulated by lipopolysaccharide (LPS) and peptidoglycans (PGN) were measured by real-time RT-PCR system. The mRNA expression of CfMyd88 decreased after stimulation with both LPS and PGN, and the lowest level was about 1/3 times (at 6 h) and 1/10 times (at 9 h) to that in the control group, respectively. The expression then recovered and was upregulated to two-fold at 9 h after LPS stimulation or to the original level at 12 It after PGN stimulation. The results suggest that the MyD88-dependent signaling pathway exists in scallop and was involved in the defense system. (c) 2007 Elsevier Ltd. All rights reserved.

【英文关键词】Chlamys farreri; clip domain; immune response; mRNA expression; serineprotease; tissue distribution
【中文摘要】无
【英文摘要】Peroxiredoxin is a superfamily of antioxidative proteins that play important roles in protecting organisms against the toxicity of reactive oxygen species (ROS). In this study, the full-length cDNA encoding peroxiredoxin 6 (designated EsPrx6) was cloned from Chinese mitten crab Eriocheir sinensis by using rapid amplification of cDNA ends (RACE) approaches. The full-length cDNA of EsPrx6 was of 1076 bp, containing a 5' untranslated region (UTR) of 69 bp, a 3' UTR of 347 bp with a poly (A) tail, and an open reading frame (ORF) of 660 bp encoding a polypeptide of 219 amino acids with the predicted molecular weight of 24 kDa. The conserved Prx domain, AhpC domain and the signature of peroxidase catalytic center identified in EsPrx6 strongly suggested that EsPrx6 belonged to the 1-Cys Prx subgroup. Quantitative real-time RT-PCR was employed to assess the mRNA expression of EsPrx6 in various tissues and its temporal expression in haemocytes of crabs challenged with Listonella anguillarum. The mRNA transcript of EsPrx6 could be detected in all the examined tissues with highest expression level in hepatopancreas. The expression level of EsPrx6 in haemocytes was down-regulated after bacterial challenge and significantly decreased compared to the control group at 12 h. As time progressed, the expression level began to increase but did not recover to the original level during the experiment. The results suggested the involvement of EsPrx6 in responses against bacterial infection and further highlighted its functional importance in the immune system of E sinensis. (C) 2009 Elsevier Ltd. 【题目】Optimization of medium composition for production of lacticin LLC518 by Lactococcus lactis subsp lactis LLC518 using response of surface methodology
【中文关键词】优化,细菌、球菌lacticin、效应面方法
【英文关键词】Optimization, bacteriocin, Lactococcus lactis, lacticin, response surface methodology.
【中文摘要】LLC518生产乳酸链球菌素lacticin LLC518的产量。胰蛋白胨、磷酸氢二钾和硫酸镁在正交实验中对lacticin LLC518有一个显著的影响。通过最速上升法概率水平上显著因素的中心组合设计,得到最佳培养基成分(g/l):蔗糖20,酵母粉5,胰蛋白8.18,牛肉膏10,七水硫酸镁0.82,磷酸氢二钾2.8,草酸铵5.0,无水乙酸钠5.0,硫酸锰0.25和吐温-80 5ml。优化过培养基的细菌素产量(180.13 IU/ml)与未优化培养基细菌素产量(96.72 IU/ml)提高了86.3%。在优化条件下,在培养4小时开始产生乳酸链球菌LLC518,在14小时达到最大值。
【英文摘要】Response surface methodology (RSM) was applied for the optimization of lacticin LLC518 production, which was produced by Lactococcus lactis subsp. lactis LLC518. Tryptone, KH2PO4 and MgSO4 had signicant effects on lacticin LLC518 biosynthesis by a Plackett-Burman design (PBD). After steepest ascent design (SAD) and central composite design (CCD), the optimum medium compositions were obtained as follows (g/l): sucrose 20, yeast extract 5, tryptone 8.18, beef extract 10, MgSO4 · 7H2O 0.82, K2HPO4 2.8, (NH4)2HC6H5O7 5.0, CH3COONa 5.0, MnSO4 0.25 and Tween 80 5 ml. An 86.3% increase in bacteriocin production (180.13 IU/ml) was achieved under this condition compared within unoptimized medium (96.72 IU/ml). Under these optimized conditions, the production of Lacticin LLC518 began at 4 h, peaked at 14 h.

【中文摘要】在这项研究中,从巢湖麻鸭中分离出一种新型的禽β-防御素(AVBD)。该基因的全基因组序列包含一个204 bp的开放阅读框,编码67个氨基酸(AA),其中包括20个氨基酸的信号肽,5个氨基酸的前体蛋白的,42个氨基酸的成熟肽。AVBD与其它禽类基因的同源性和特征进行比较证实,鸭AvBD6与鸡,鹅,鸭的前体蛋白的AvBD6s 是高度保守的,氨基酸同源性为100%。在所研究的健康的5月龄鸭子组织中,除了皮肤,肾脏,和法氏囊外,AvBD6 mRNA在其他组织中广泛表达,在脾,肺,胃,舌头,和蛋黄中高表达,在骨髓和肝脏中适度表达,在气管,心脏,肠,肌肉,食道和睾丸中低表达。我们在大肠杆菌中表达和纯化重组AvBD6蛋白。将诱导温度从37°C降至30°C,包涵体可溶性GST-AvBD6的产量增加显着。正如预期的那样,GST-AvBD6的对嗜水气单胞菌表现出很强的杀菌性能。
【英文摘要】In this study, a novel avian β-defensin (AvBD) was isolated from Chaohu duck. The complete nucleotide sequence of the gene contained a 204 bp open reading frame encoding 67 amino acids (aa), which included a signal peptide of 20 aa,a propiece of 5 aa, and a mature peptide of 42 aa. Homology, characterization and comparison of the gene with AvBD from other avian species confirmed that it was duck AvBD6, and the preproprotein of AvBD6s from chicken, goose and duck are highly conserved with 100% amino acids homology. AvBD6 mRNA was widely expressed in the investigated healthy five-months-old duck tissues except the skin, kidney, and bursa; and highly expressed in the spleen, lung, stomach, tongue, and egg yolk successively; and moderately expressed in the bone marrow and liver; and lowly expressed in the trachea, heart, intestine, muscle, esophagus and testis. We produced and

purified recombinant AvBD6 by expressing the gene in Escherichia coli. The yield of soluble glutathione S-transferees (GST)-AvBD6 in the inclusion bodies increased significantly with incubation temperature decreased from 22 37°C to 30°C. As expected, the GST-AvBD6 exhibited strong bactericidal properties against Aeromonas veronii biovar sobria strain BJCP-5, E.coli, and Enterococcus faecalis (ATCC 29212)(MIC = 0.5~2 μM); and medium bactericidal properties against Staphylococcus aureus, Salmonella enteritidis, Pseudomonas aeruginosa (ATCC 27853) and Bacillus subtilis (CMCC 63501) (MIC = 4~8 μM), but less effective against Candida albicans (ATCC 10231) (MIC = 16 μM). Additionally, the antimicroble activity of GST-AvBD6 is same as synthetic AvBD6. The A. veronii biovar sobria strain BJCP-5cells treated with GST-AvBD6 showed pore-forming, shrinkage, and lysis underscanning electron microscopy, the mechanism in GST-AvBD6 mediated killing of A. veronii biovar sobria involved in cell lysis and no-lysis. Our results indicate an important role of AvBD6 in Chaohu duck innate immunity.

【题目】Cloning and expression of chicken AvBD8 mature peptide gene in Lactococcus lactis

【中文关键词】AvBD8 成熟肽基因克隆、 表达、 球菌

【英文关键词】AvBD8 mature peptide, Cloning, Expression, Lactococcus lactis

【中文摘要】鸡β防御素8(AvBD8)是一种抗菌肽,其在鸡体的先天性免疫中起重要作用。本研究目的是研究鸡AvBD8成熟肽基因在乳酸乳球菌的表达。从安徽三黄鸡肝脏组织中反转录出AvBD8成熟肽基因,然后将其克隆到表达载体pNZ8048中,通过PCR,双酶切鉴定及测序结果表明,重组体pNZ8048-AvBD8 构建成功且成功电转化到乳酸乳球菌NZ9000中。重组蛋白AvBD8的表达用Tricine-SDS-PAGE分析。研究表明,乳酸乳球菌可以作为β防御素的宿主菌,为进一步研究奠定基础。

【英文摘要】Chicken beta-defensin-8 (AvBD8) is an antibacterial peptide that plays significant roles in innate immunity. The aim of this study was to investigate the expression of Chicken avian AvBD8 mature peptide gene in Lactococcus lactis (L. lactis) system. In this study, the AvBD8 gene was cloned and sequenced from chicken liver by reverse transcriptase-polymerase chain reaction (RT-PCR). Then the AvBD8 mature peptide gene was amplified and cloned into the expression vector pNZ8048. The result showed that the recombinant vector pNZ8048-AvBD8 that verified by colony PCR, double digestion and DNA sequencing was transformed into the competent cell L. lactis NZ9000 by electroporation. The expression of the recombinant protein AvBD8 was confirmed by tricine-SDS-PAGE analysis. Our present findings suggest that L. lactis could act as a host for the production of avian beta-defensins for further study.

【题目】Protective immune responses in ducklings induced by a suicidal DNA

【中文关键词】“ 自杀性 ”DNA疫苗 ,鸭肝炎病毒 ,VP1基因,雏鸭

【英文关键词】Suicidal DNA vaccine

Duck hepatitis virus

VP1 gene

Ducklings

【中文摘要】SFV复制子真在被用来研制一种防治1型鸭病毒性肝炎的“ 自杀性 ”DNA疫苗。“ 自杀性 ”DNA疫苗的基础上森林脑炎病毒(SFV)复制评估疫苗对鸭肝炎病毒1型(DHV-1)的发展。 DHV-1的VP1基因的克隆和插入SFV pSCA1,基于DNA的复制子载体得到的质粒,pSCA/VP1,转染BHK-21细胞,用间接免疫荧光法和免疫印迹法检测证实表达的蛋白的抗

原性。雏鸭免疫原性研究。雏鸭肌肉注射与pSCA/VP1两次,在14天的时间间隔。反DHV-1抗体,通过ELISA法检测的淋巴细胞的增殖反应也测试了由3 - (4,5 - 二甲基-2 - 噻唑基)-2,5 - 二苯基-2H-四唑鎓溴化物的方法,中和抗体的测定由微量的测试。我们的研究结果表明,DHV-1特异性抗体,中和抗体和淋巴细胞增殖,诱导雏鸭。此外,所有的小鸭保护,以防止与野生DHV-1的挑战。总之,我们的自杀性DNA疫苗是一种很有前途的候选疫苗的预防鸭肝炎所造成的DHV-1提供便利。

【英文摘要】A suicidal DNA vaccine based on a Semliki Forest virus (SFV) replicon was evaluated for thedevelopment of a vaccine against duck hepatitis virus type 1 (DHV-1). The VP1 gene ofDHV-1 was cloned and inserted into pSCA1, an SFV DNA-based replicon vector. Theresultant plasmid, pSCA/VP1, was transfected into BHK-21 cells and the antigenicity of theexpressed protein was confirmed using an indirect immunofluorescence and western blotassay. Immunogenicity was studied in ducklings. Ducklings were injected intramuscularlytwo times with pSCA/VP1 at 14 days intervals. Anti-DHV-1 antibodies were detected byELISA, the lymphocyte proliferation response was also tested by the 3-(4,5-dimethyl-2-thiazolyl)-2,5-diphenyl-2H-tetrazolium bromide method and neutralizing antibodieswere measured by microneutralization tests. Our results showed that DHV-1-specificantibodies, neutralizing antibodies and lymphocyte proliferation were well induced inducklings. Furthermore, all the ducklings were protected against challenge with wildDHV-1. In conclusion, we demonstrate that the suicidal DNA vaccine is a promisingvaccine candidate facilitating the prevention of duck hepatitis caused by DHV-1.

【题目】不同施肥措施对休宁土壤Cd形态的影响与蔬菜富集特性的研究

【中文关键词】关键词:施肥措施;土壤Cd形态;蔬菜;富集特性

【英文关键词】Keywords:Fertilization measurement;Cd fraction in soil;Vegetable;Enrichment capacity

【中文摘要】摘 要:[目的]研究不同施肥措施对休宁土壤Cd形态的影响与蔬菜富集特性.[方法]通过盆栽试验,研究了鸡粪、改良剂和外源Cd对休宁菜园土中重金属Cd形态的影响与蔬菜富集特性.[结果]结果表明,施入鸡粪可降低土壤中可交换态Cd和铁锰氧化态Cd的含量,增加了土壤中的碳酸盐态Cd和有机物结合态Cd含量.改良剂可提高土壤中可交换态Cd和碳酸盐态Cd的含量.外源Cd进入到土壤中主要以可交换态、碳酸盐态和铁锰氧化物结合态存在.萝卜、白菜和辣椒的可食用部分对土壤Cd的富集能力为:白菜>萝卜≈辣椒,转移系数为白菜>萝卜>辣椒.[结论]在农业生产上,可在土壤中添加有机肥和无机改良剂减少蔬菜对重金属Cd的吸收积累.在重金属Cd含量高的土壤中应避免种植富集能力极强的蔬菜品种.

【英文摘要】Abstract:[Objective]The effect of the different fertilization measure on the Cd fraction in soil in Xiuning County and its accumulation in vegetable were studied. [Method]The potted experiment in the effect of the chicken manure, additives and Cd addtion on the Cd fraction in soil and its accumulation in vegetable was carried out. [Results]The results showed that the application of chicken manure could decrease the content of exchangeable Cd and Fe-Mn oxide Cd;and increase the content of the carbonate Cd and organic Cd. The content of soil exchangeable Cd and Carbonate Cd could be increased under the condition of additives application. The Cd addition in soil could be mainly transformed into the exchangeable, carbonate and iron-manganese oxide. The order of Cd accumulation in the edible part of different vegetable species was cabbage > radish and pepper, and the transferring coefficient was cabbage > radish > pepper. [Conclusion]The application of organic manure and inorganic soil additives could decrease Cd accumulation by vegelables in farming practices. The vegetables with high enrich ment capacity of Cd should be avoided in soil with high content of Cd.

【题目】Cloning of a gene encoding thermostable cellobiohydrolase from the thermophilic fungus Chaetomium thermophilum and its expression in Pichia pastoris
【中文关键词】纤维素酶;嗜热毛壳菌;克隆;表达;毕赤酵母
【英文关键词】cDNA cloning;cellobiohydrolase;Chaetomium thermophilum;expression;Pichia pastoris
【中文摘要】无
【英文摘要】AIMS:A new cellobiohydrolase (CBH) gene (cbh3) from Chaetomium thermophilum was cloned, sequenced and expressed in Pichia pastoris.METHODS AND RESULTS:Using RACE-PCR, a new thermostable CBH gene (cbh3) was cloned from C. thermophilum. The cDNA of the CBH was 1607 bp and contained a 1356 bp open reading frame encoding a protein CBH precursor of 451 amino acid residues. The mature protein structure of C. thermophilum CBH3 only comprises a catalytic domain and lacks cellulose-binding domain and a hinge region. The gene was expressed in P.pastoris. The recombinant CBH purified was a glycoprotein with a size of about 48.0 kDa, and exhibited optimum catalytic activity at pH 5.0 and 60 degrees C. The enzyme was more resistant to high temperature. The CBH could hydrolyse microcrystalline cellulose and filter paper.CONCLUSIONS:A new thermostable CBH gene of C. thermophilum was cloned, sequenced and overexpressed in P. pastoris.SIGNIFICANCE AND IMPACT OF THE STUDY:This CBH offers an interesting potential in saccharification steps in both cellulose enzymatic conversion and alcohol production.

【题目】Cloning, expression and characterization of the serine protease Gene from Chaetomium thermophilum
【中文关键词】嗜热毛壳菌;蛋白酶;克隆;表达;毕赤酵母
【英文关键词】Chaetomium thermophilum, expression, gene cloning, Pichia pastoris, protease.
【中文摘要】无
【英文摘要】AIMS:Microbial proteases play an essential role in scientific research and commercial applications. This study is to clone, sequence, and express a thermostable protease gene from the thermophilic fungi Chaetomium thermophilum and to generate yeast strains expressing C. thermophilum protease suitable for industrial applications.METHODS AND RESULTS:Degenerate primers were designed based on the conserved domain of other identified serine proteases and cDNA fragment of C. thermophilum gene pro was obtained through reverse transcriptase-polymerase chain reaction (RT-PCR). The full-length cDNA of 2007 bp was generated using RACE amplification. The cDNA contains an open reading frame of 1596 bp encoding 532 amino acids. Sequence analysis of the deduced amino acid sequence revealed high homology with the catalytic domains of the subtilisin serine proteases. The C. thermophilum gene pro was expressed in Escherichia coli BL21 (DE3) and Pichia pastoris, respectively and soluble protein was obtained in P. pastoris. The expressed protease was secreted into the culture medium by the yeast in a functional active form and the purified recombinant protease exhibits optimum catalytic activity at pH 8.0 and 60 degrees C. The enzyme is stable at 60 degrees C. The integration of gene pro into P. pastoris genome is stable after 10 generations and the yeast transformants showed a consistent protease expression.CONCLUSIONS:Gene pro encoding a serine protease from C. thermophilum was cloned, sequenced, and overexpressed successfully in P. pastoris. The expressed protease was purified and the properties of the recombinant protease are characterized.SIGNIFICANCE AND IMPACT OF THE STUDY:Chaetomium thermophilum is a soil-borne thermophilic fungus and the protease cloned from it is stable in a high temperature and a wide rage of pH. The overexpression of the enzyme in a mesophilic micro-organism offers a potential value for scientific research and commercial applications.

【题目】Cloning, expression, and characterization of thermostable manganese superoxide dismutase from Thermoascus aurantiacus var. levisporus
【中文关键词】热稳定MnSOD; 克隆;表达;嗜热子囊菌
【英文关键词】thermostable MnSOD;cloning; expression; Thermoascus aurantiacus
【中文摘要】无
【英文摘要】A superoxide dismutase (SOD) gene of Thermoascus aurantiacus var. levisporus, a thermophilic fungus, was cloned, sequenced, and expressed in Pichia pastoris and its gene product was characterized. The coding sequence predicted a 231 residues protein with a unique 35 amino acids extension at the N-terminus indicating a mitochondrial-targeting sequence. The content of Mn was 2.46 μg/mg of protein and Fe was not detected in the purified enzyme. The enzyme was found to be inhibited by NaN3, but not by KCN or H2O2. These results suggested that the SOD in Thermoascus aurantiacus var. levisporus was the manganese superoxide dismutase type. In comparison with other MnSODs, all manganese-binding sites were also conserved in the sequence (H88, H136, D222, H226). The molecular mass of a single band of the enzyme was estimated to be 21.7 kDa. The protein was expressed in tetramer form with molecular weight of 68.0 kDa. The activity of purified protein was 2,324 U/mg. The optimum temperature of the enzyme was 55 ° C and it exhibited maximal activity at pH 7.5. The enzyme was thermostable at 50 and 60 ° C and the half-life at 80 ° C was approximately 40 min.

【题目】Two novel thermostable chitinase genes from thermophilic fungi: cloning, expression and characterization
【中文关键词】几丁质酶;热稳定;克隆;表达;嗜热真菌
【英文关键词】Chitinase; Thermophilic fungi; Cloning; Expression; Thermostability
【中文摘要】无
【英文摘要】Two chitinase genes, Tachit1 from Thermoascus aurantiacus var. levisporus and Ctchit1 from Chaetomium thermophilum were isolated. Tachit1 and Ctchit1 encode putative single-domain proteins (TaCHIT1 and CtCHIT1) of 399 and 402 amino acid residues, respectively. The catalytic domains of TaCHIT1 and CtCHIT1 are similar to those of other fungal chitinases in family 18 of glycosyl hydrolases. TaCHIT1 and CtCHIT1 have a molecular weight of about 48.4 and 47.3kDa, respectively when produced in recombinant Pichia pastoris. The enzymes exhibited optimum catalytic activity at pH 8.0 and 50 degrees C for TaCHIT1 and at pH 5.5 and 60 degrees C for CtCHIT1. TaCHIT1 retained 95.3% of its activity after 60 min at 50 degrees C. CtCHIT1 was stable at 50 degrees C and retained 96.7% of its activity after 60 min incubation at 60 degrees C. The TaCHIT1 and CtCHIT1 produced GlcNAc2 as the major product, when colloidal chitin was used as the substrate. The enzyme could not hydrolyze pNp-(GlcNAc), but hydrolyzed colloidal chitin, powdery chitin and chitosan. These features make these proteins potentially useful for applications requiring chitin hydrolysis at elevated temperatures.

【题目】嗜热子囊菌光孢变种内切葡聚糖酶I基因在毕赤酵母中的表达及部分酶学性质
【中文关键词】纤维素酶; 内切葡聚糖酶; 嗜热子囊菌光孢变种; 嗜热真菌; 毕赤酵母
【英文关键词】cellulase; endo-1; 4-β-glucanase; Thermoascus aurantiacus var. levisporus; thermophilic fungus; Pichia pastoris
【中文摘要】嗜热子囊菌是一种嗜热真菌,可以产生具有很高工业价值的内切葡聚糖酶. 本研究成功表达了嗜热子囊菌内切葡聚糖酶Ⅰ基因,并获得热稳定的重组内切葡聚糖酶. 提取嗜热子囊菌光孢变种(Thermoascus aurantiacus var. levisporus)总RNA,通过RT-PCR方法克隆出内切-β-葡聚糖酶eg1基因的成熟肽编码序列. 采用基因重组的方法构建该基因的巴斯德毕赤酵母Pichia pastoris分泌型表达载体pPIC9K-eg1,经线性化后采用电穿孔法将其导入毕赤酵母GS115中,大量筛选后获得高效表达内切葡聚糖酶Ⅰ的毕赤酵母工程菌株GpN24. 该菌株采用甲醇诱导120 h后,内切葡聚糖酶Ⅰ的活力可达570.7 U/mL,最适温度为55 ℃,在90 ℃的条件下保温30 min后仍具有60%的酶活力;最适pH为5.0,在pH 3.0~5.0的条件下酶活力保持稳定.
【英文摘要】The thermophilic fungus Thermoascus aurantiacus var. levisporus was studied and it was found able to produce thermostable endo-1,4-β-glucanase with high industrial value. The thermostable endo-1,4-β-glucanase was obtained through Pichia pastoris expression. The eg1 gene was isolated from T. aurantiacus var. levisporus by RT-PCR. A DNA fragment coding for eg1 without signal sequence was cloned into P. pastoris expression vector pPIC9K for extracellular expression in P. pastoris. The resulted recombinant plasmid pPIC9K-eg1 was then linearized and transformed into P. pastoris GS115 by electroporation. The eg1 gene was integrated into the genome of P. pastoris through homologous recombination and a multi-copy expression strain, named GpN24, was obtained through high throughput screening with G418. The endo-1,4-β-glucanase secreted by GpN24 reached a final yield of 570.7 U/mL after methanol induction for 120 h. The optimum pH and temperature of the recombinant enzyme activity were 5.0 and 55 ℃, respectively. The recombinant enzyme remained 90% of its original activity after 30 min at 90 ℃.

【题目】嗜热子囊菌光孢变种Thermoascus aurantiacus var.levisporus内切β-葡聚糖酶的分离纯化及特性
【中文关键词】嗜热子囊菌光孢变种 Thermoascusaurantiacusvar.levisporus 内切β-葡聚糖酶 纯化 特性
【英文关键词】thermophilic fungi Thermoascus aurantiacus var. levisporus endoglucanase purification characterization
【中文摘要】采用培养分离、室内测定等方法,对嗜热子囊菌光孢变种Thermoascus aurantiacus var. levisporus产生的内切β-葡聚糖酶进行了分离纯化及特性研究.粗酶液经硫酸铵沉淀、DEAE-Sepharose Fast Flow阴离子层析、Phenyl-Sepharose疏水层析等步骤获得了凝胶电泳均一的内切β-葡聚糖酶.结果表明,经12% SDS-PAGE测得酶的单亚基分子量约为31.5 kD,凝胶过滤层析测得酶的分子量约为34.5kD.该酶反应的最适温度为55℃,最适pH为2.5~3.0该酶在pH3.0条件下60℃较为稳定;80℃保温30 min有20%原酶活性.金属离子对内切β-葡聚糖酶活性影响较大, 其中K+、Ca2+、Mn2+对酶有激活作用;Ag+、Cu2+、Al3+ 对酶有显著抑制作用.该酶对羧甲基纤维素具有很强的底物特异性.
【英文摘要】Endoglucanase was purified from culture supernatant of Thermoascus aurantiacus var.levisporus to homogeneity, using ammonium sulfate fractionation, DEAE-Sepharose, Pheny1-Sepharos, and Sephacry1 S-100 fast-flow chromatography. The obtained endoglucanase ia a single subunit molecule about 31.5 kD or 34.5 kD as determined by 12% SDS-PAGE and gel filtration, respectively. The maximum endoglucanase activity was observed at pH 2.5~3.0 and 55 ℃. The endoglucanase appeared to be thermostable at 60 ℃, and exposure in 80 ℃ for 30 min resulted in 80% of activity loss. Metal ions like K+, Ca2+ and Mn2+ enhanced the endoglucanase activity, whereas Ag+,Cu2+ and Al3+ inhibited the activity significantly. The endoglucanase possessed a strong specificity to carboxymethyl cellulose.

【题目】嗜热子囊菌光孢变种β-葡萄糖苷酶的基因克隆、表达及酶学性质分析
【中文关键词】嗜热子囊菌光孢变种;表达;纯化;毕赤酵母;β-葡萄糖苷酶
【英文关键词】Thermoascus aurantiacus var. levisporus; expression; purification; Pichia pastoris; β-glucosidase
【中文摘要】从嗜热子囊菌光孢变种(Thermoascus aurantiacus var. levisporus) RNA中通过RT-PCR克隆出β-葡萄糖苷酶基因bglⅡ的全长序列,cDNA序列为2 672 bp,Genbank登录号为EU269025,将该片段插入巴斯德毕赤酵母Pichiapastoris分泌型表达载体pPIC9K中,获得重组质粒pPIC9K/bgl,经线性化后用电穿孔法导入毕赤酵母GS115中,在醇氧化酶AOX1基因启动子作用下,获得高效表达β-葡萄糖苷酶的毕赤酵母工程菌株. 经DEAE-Sepharose Fast Flow阴离子层析纯化了该重组表达蛋白. SDS-PAGE测得该重组蛋白相对分子质量(M)约为120×103. 经甲醇诱导,培养基中β-葡 r萄糖苷酶的活力可达1.2 U/mg,小规模发酵量达0.45 mg/mL. 该酶的最适反应温度为60 ° C,最适反应pH为5.0. 于70 ° C保温30 min仍保持80%的酶活力,具有较高的热稳定性,在pH 3.0~9.0的条件下酸碱耐受性强.
【英文摘要】 β-glucosidase bglIgene was isolated from thermophilic fungus Thermoascus aurantiacus var. levisporus RNA through RT-PCR. The length of the gene was 2 672 bp, which was registered in GenBank with accession number EU269025, and the gene was ligated with the Pichia pastoris expression vector pPIC9K, resulting in recombinant plasmid pPIC9K/bg1. pPIC9K/bg1 was then linearized and transformed into P. pastoris GS115 by electroporation, and highly efficient recombinant strains were obtained under control of the AOX1 promotor. The recombinant β-glucosidase was purified using DEAE- Sepharose Fast Flow chromatography. The molecular mass of the purified enzyme was 120×103 determined by SDS-PAGE. With methanol induction, the recombinant strain expressed and secreted β-glucosidase into the culture with activity of 1.2 U/mg, and the expression level was 0.45 mg/mL by small-scale culturing. The expression of β-glucosidase exhibited the optimum catalytic activity at 60 ° C and pH 5.0, remained 80% of its original activity after 30 min at 70 ° C, possessed high thermostability, and had high acid and alkali tolerance under the condition of pH 3.0~9.0.

【中文摘要】本研究以疏绵状嗜热丝孢菌(Thermomyces lanuginosus) cDNA 为模板,克隆了糖化酶基因(gla),序列 分析表明 gla 的开放阅读框由 1 854 个核苷酸组成,编码 617 个氨基酸。根据氨基酸序列推算该酶的分子量 为 64 kD,属于糖苷水解酶第 15 家族,具有该家族催化保守区的典型特征。PCR 扩增 gla 的成熟蛋白编码基 因,构建表达载体,经线性化后电击转化导入巴斯德毕赤酵母(Pichia pastoris GS115),并成功进行了表达。重 组酶经摇瓶发酵后酶活可达 11.6 U/mL,经硫酸铵沉淀、DEAE-Sepharose Fast Flow 阴离子交换等步骤纯化 了该重组蛋白,SDS-PAGE 显示该重组蛋白大小约为 67 kD,比推测的蛋白分子量稍大,可能与该蛋白的糖 基化有关。该重组酶的最适反应温度和最适 pH 值分别为 60 ° C和 5.0,该酶具有较高的热稳定性,70 ° C保温 20 min 后剩余酶活为 54%。
【英文摘要】The glucoamylase gene gla was cloned by PCR from thermophilic fungus Thermomyces lanuginosus. Se- quence analysis revealed that gla had an open reading frame of 1 854 bp, which encodes a putative polypeptide of 617 amino acids and the theoretical molecular mass was 64 kD. The glucoamylase fall into glycoside hydrolase fam- ily 15. The fragment encoding mature glucoamylase was inserted into Pichia pastoris vector pPIC9K to construct re- combinant plasmid pPIC9K/gla. The pPIC9K/gla was then introduced into Pichia pastoris GS115, and the glu- coamylase was secreted into the culture medium by the yeast in a functionally active form and the activity reached 11.6 U/mL after fermatation by Erlenmeyer flask. The recombinant glucoamylase purified was a glycoprotein with a size of about 67 kD, and a little bigger than the deduced molecular mass, possibly related to the glycosylation site. The recombinant glucoamylase exhibited optimum catalytic activity at pH 5.0 and 60 ° C respectively. It was ther- mostable at 60 ° C and remained 54% of its original activity after 20 min at 70 ° C.

【英文摘要】A more rapid and powerful response against repeated exposure of same pathogen in vertebrates is usually considered as the reflection of immunological memory, but it is not well understood in invertebrates. In the present Study, the temporal expression profiles of Chlamys farreri peptidoglycan recognition protein-S1 (CfPGRP-S1) gene after two challenges of Listonella anguillarum were examined to evaluate priming response in scallops. The up-regulation of CFPGRP-S1 mRNA occurred 3 h earlier, and the expression level was significant higher ($P < 0.05$), after the second challenge than that after the first challenge. The preliminary results Provided new insights into invertebrate immunological memory, and they also would be helpful to develop strategies for disease control. (C) 2008 Elsevier Inc. 【英文摘要】Five monoclonal antibodies (MAbs) (1A7, 1C6, 1E4, 1G8, 2C3) against haemocytes of Feneropenaeus chinensis (Osbeck, 1765) were produced by immunizing Balb/c mice, followed by indirect immunofluorescence assay tests (IIFAT). These showed specificity for more than one haemocyte type and for various haemocyte components of F.chinensis. Using Wright's staining and IIFAT with haemocyte monolayers prepared by sucrose gradient centrifugation, MAb 1A7, 1C6 reacted with membranes of hyalinocytes and the cytoplasm of semi-granulocytes, respectively; MAb 1E4 reacted with membranes and the cytoplasm of hyalinocytes, and with membranes of semi-granulocytes; MAb 1G8 reacted with haemocyte granules; and MAb 2C3 reacted with surface membranes of all haemocyte types. Western-blotting of haemocytes and haemocyte membrane analysis demonstrated that MAb 1G8 recognized an antigen of 96 kDa in haemocyte; that MAb 1E4 reacted with antigens of 88 kDa and 79 kDa in the haemocyte membrane; and that MAb 2C3 reacted specifically to a single membrane protein band with an approximate molecular weight of 153 kDa; however, there was no protein band detected by either MAbs 1A7, or 1C6.

【英文摘要】Monoclonal antibodies (Mabs) specifically against haemocytes of shrimp (Fenneropenaeus chinensis) were employed to study the ontogenesis of haemocytes by immunofluorescence assay technique (IFAT) with the aids of avidin-biotin complex method. Different developmental stages were identified by means of histochemical staining. Stages including blastula, gastrula, limb bud stage, embryonic-nauplius and nauplius were examined. With Mab 2A3 against both hyline, semi-granular and granular haemocytes, the first positive cells were detected at the limb bud stage of the embryos. Distinguishable positive haemocytes with a diameter of about 7 mu m appeared in ernbryonic-nauplius. Whereas, with Mab 1H11 specific to cytoplasmic granulars in haemocytes, the first positive granular haemocytes were observed at the stage of embryonic-nauplius. Increased number of both total and granular haemocytes at the stage of nauplius impressed a possible enhancement of the immune system as the embryogenesis progressed. (C) 2007 Elsevier Ltd. 【题目】The antimicrobial peptides of the immune response of shrimp
【中文关键词】XF Zhao, JX Wang
【英文关键词】antimicrobial peptides; innate defense effectors; innate immunity; penaeid shrimp
【中文摘要】无
【英文摘要】The cultivation of penaeid shrimp is a worldwide economic activity which has the potential to contribute to increasing shrimp production. However, penaeid shrimps are susceptible to bacterial and viral diseases, and may thus cause significant losses to the aquaculture industry. In view of this, it is imperative to understand the immune response of shrimp against pathogens as this could help in devising efficient strategies to control, and eventually eradicate, shrimp diseases. At present, a considerable number of research studies on the identification and characterization of antimicrobial peptides/proteins (AMPs) in penaeid shrimps. Such research activities will contribute to finding solutions to shrimp diseases. AMPs are widespread in animals and plants, involved in their innate immunity, and considered as the front liners of host defense against pathogens. In penaeid shrimps, eight kinds of AMPs have been found. These are the penaeidins, whey acidic protein (WAP) domain containing proteins [crustins and single WAP domain containing peptides (SWD)], antilipopolysaccharide factors (ALFs), lysozymes, a C-type lectin, histones, anionic hemocyanins, and peritrophins. In this study, the structures, distributions, expression profiles, phylogenetic evolution, and functions of some AMPs are discussed, focusing on the WAP-domain containing peptides and ALF in penaeid shrimp.

【题目】Hematological Changes in White Spot Syndrome Virus—Infected Shrimp, Fenneropenaeus chinensis (Osbeck)
【中文关键词】Feng, Shouming; Zhan, Wenbin; Xing, Jing; Li, Jun; Yang, Kai; Wang, Jing
【英文关键词】hemocyte - pathological changes - WSSV - Fenneropenaeus chinensis (Osbeck)
【中文摘要】无
【英文摘要】The pathological changes of hemocytes in the haemolymph and hepatopancreas were examined in experimentally and naturally WSSV (white spot syndrome virus) infected Fenneropenaeus chinensis. The results showed that the pathological manifestations of hemocytes were similar among moribund shrimps infected via injection, feeding and by nature. Firstly, the total hemocyte counts (THCs) in WSSV-infected shrimp were significantly lower than those in healthy shrimp. Secondly, necrotic, broken

and disintegrated cells were often observed, and a typical hematolysis was present in the haemolymph smear of WSSV-infected shrimp. Thirdly, necrosis and typical apoptosis of hemocytes were detected with TEM in the peripheral haemolymph of WSSV-infected shrimp. Hyalinocytes and semi-granulocytes with masses of WSSVs in their nuclei often appeared, whereas no granular hemocytes with WSSV were found in the hepatopancreas of moribund infected shrimps. All our results supported that hemocytes were the main target cells of WSSV, and hyalinocytes and semigranular hemocytes seemed to be more favorable for WSSV infection in F. chinensis.

【题目】白斑综合征病毒卵黄抗体对凡纳滨对虾免疫相关酶活力和抗病毒能力的影响
【中文关键词】韦嵩 宋晓玲 李海兵 李赟
【英文关键词】无
【中文摘要】免疫活性物质可以调动或激活虾类自身的免疫系统,提高动物的免疫机能,增强动物的抗病毒能力.实验通过连续投喂的方法,用3个水平(1%、0.5%、0.1%)的Ig-Guard(shrimp)制成的试验饲料,同时以基础饲料为空白对照饲喂凡纳滨对虾(Litopenaeus vannamei) 20 d,分别测定了第5,10,15,20 天血淋巴的酚氧化酶(PO)、溶菌酶(UL)、酸性磷酸酶(ACP)及肌肉匀浆液的超氧化物歧化酶(SOD)等非特异性免疫因子活性,并对血清及肌肉匀浆液中蛋白进行定量.结果表明,免疫组的PO、UL、ACP、SOD活力均显著高于对照组(P<0.05).免疫20 d后,用白斑综合征病毒(WSSV)投喂感染.攻毒后第7 天各免疫组的相对免疫保护率分别为17.95%、23.08%、35.90%.实验结果说明,Ig-Guard(shrimp)能有效提高对虾免疫因子的活性,对于提高抗WSSV感染能力也有一定作用.将对虾免疫因子活性和累计死亡率协同分析,摄食低浓度Ig-Guard(shrimp)组较之高浓度组的酶活力高,其累计死亡率低,建议适当地投喂低浓度Ig-Guard(shrimp)更为合理.
【英文摘要】Immunoreactive substances can stimulate the immune system of shrimps, and enhance the immunocompetence of animal. The influence of egg yolk immunoglobulin on the immunity-related enzyme activities and WSSV resistance of shrimps has not been reported. In this research, we fed basic diets containing three levels (1% , 0. 5% , 0. 1%) (M/M) of Ig-Guard (shrimp) to Litopenaeus vannamei continuously for 20 days, and the basic diets as blank control. Then phenoloxidase(PO), acid phosphatase (ACP) and lysozyme(U_L) activities of the serum and superoxide dismutase(SOD) activity of the muscle, and protein concentration of the serum and the muscle were detected on days 5, 10, 15 and 20. All the immune parameters of the test groups measured were higher (P < 0. 05) than the control group. After 20 days, we fed white spot syndrome virus (WSSV) to shrimps, and recorded the mortalities of challenging test in seven days. The relative percent survival(RPS) value of the test groups was 17.95% , 23.08% , 35.90%. This experiment indicates that Ig-Guard (shrimp) can effectively enhance the shrimps' immunity-related enzyme activities, and it can also promote shrimps' WSSV resistance. Based on the results of immunity-related enzyme activities and cumulative mortality, the enzyme activities of the lower concentration group was higher than those of the higher concentration group, and its cumulative mortality was lower, so this paper suggests that to feed the lower concentration Ig-Guard (shrimp) properly is reasonable.

【题目】对虾白斑综合征病毒囊膜蛋白VP19的单克隆抗体制备及其定位.
【中文关键词】 姜有声; 战文斌; 程顺峰; 王世表
【英文关键词】 white spot syndrome virus; VP19; monoclonal antibody; location

【中文摘要】为了更好地研究对虾白斑综合征病毒(WSSV)蛋白VP19在WSSV感染过程中的作用,利用VP19的单克隆抗体直接对VP19进行了定位。从患白斑综合征的中国明对虾(Fenneropenaeus chinensis)鳃丝中提取WSSV,将提纯的WSSV经十二烷基磺酸钠-聚丙烯酰胺凝胶电泳(SDS-PAGE)分离,然后洗脱提纯其病毒蛋白VP19并免疫Balb/c小鼠,取免疫小鼠脾细胞和骨髓瘤细胞融合,用间接免疫荧光技术(IFAT)和Western-Blot技术筛选出1株阳性杂交瘤细胞,将检测出的阳性杂交瘤细胞经有限稀释法克隆,研制出抗VP19的单抗,再利用免疫胶体金技术对病毒蛋白VP19进行定位,结果显示,胶体金粒子位于WSSV病毒的囊膜上,说明病毒蛋白VP19位于WSSV囊膜上。

【英文摘要】White spot syndrome virus(WSSV)which emerged in 1993 has been a severe threaten to shrimp culture industry up to now.Therefore,WSSV has been extensively studied in the aspects of epidemiologt, gene and protein characteristics,etc.And some exciting research progresses have been abtained.For example, it is proved that virus envelop proteins(VPs)play important roles in virus infection.In order to investigate the infection mechanism of one of the WSSV envelop proteins-VP19,this study tried to locate VP19 on WSSV using the Mab of VP19.WSSV was isolated from tissues of WSSV-infected Fenneropenaeus chinensis and electroeluted by SDS-PAGE.A prominent 19KD protein(VP19)was electroeluted from the SDS-PAGE gels,dialyzed in PBS and concentrated by a vacuum evaporator.Then monoclonal antibodys(McAb)were produced against VP19.The 4-week-old Balb\c mice were immunized by WSSV and VP19.Spleen cells of the immunized mice were fused with P3-X63-Ag8U1 myeloma cell,and hybridoma were detected by Immunofluoresence assays(IFAs)and western blotting analysis,and then subcloned.One clone was eventually chosen that reacted in IFAs with WSSV and in western blotting analysis with the denatured viral protein VP19 of WSSV.The result suggests that this Mab against VP19 target linear epitopes.The location of VP19 was tested by Immuno-electron microscopy with gold- labelled antibody and Mabs against VP19,the result revealed that the gold particles were distributed in the outer envelope of WSSV virions and showed that VP 19 is a virus envelope protein.

【题目】一种改进的对虾白斑综合征病毒提纯方法

【中文关键词】 姜有声; 战文斌; 程顺峰; 王世表

【英文关键词】 white spot syndrome virus; virus purification; intact virus

【中文摘要】对虾白斑综合征病毒(WSSV)的囊膜蛋白在提纯的过程中易脱落,用传统的密度梯度离心方法不易获得完整的病毒粒子,对传统的蔗糖密度梯度离心方法加以改进后,可以获得大量完整的病毒粒子。用患白斑综合征病毒病的中国对虾鳃制备WSSV粗提液,感染螯虾(Cambarus proclarkii),选取25%的蔗糖溶液用作病虾鳃的匀浆液,然后经蔗糖密度梯度离心,分取各带负染后电镜观察,大量完整的病毒位于46%~52%蔗糖梯度之间,病毒粒子末端带有很长的尾;而病毒裸露的核衣壳位于40%~46%蔗糖梯度之间;在57%~62%之间观察到较多完整病毒粒子和少量细菌。实验结果表明改进的病毒提纯方法较好,可得到大量完整的带囊膜的病毒颗

【英文摘要】The envelope proteins of white spot syndrome virus(WSSV) are easy to be destroyed during purification.It was difficult to obtain intact virions by routine sucrose gradient centrifugation.After modifying the sucrose gradient,we can obtain a large quantity of intact virions.WSSV inoculums were prepared from gills of heavily infected Fenneropenaeus chinensis,and infected crayfish(Cambarus proclarkii),WSSV was purified from the gills of infected crayfish,25% sucrose was selected as homogenate medium.After being centrifuged in sucrose gradient,each band was collected and examined by transmission electron microscope.Enveloped virus was located between 46%-52% sucrose gradient,and most viral particles had a long tail-like envelope extension at one extremity.The nucleocapsids were between 40%-46% sucrose gradient.Between 57%-62% sucrose gradient,there were some bacteria and intact virus.The result showed this modified technique is very efficient for virus purification.

【题目】双歧杆菌肽聚糖结构及分子量的分析
【中文关键词】张悦　宋晓玲　黄倢
【英文关键词】Bifidobacterium thermophilum　Peptidoglycan　Structure　Molecular weight
【中文摘要】从双歧杆菌细胞壁中分离纯化肽聚糖,研究其化学成分、结构和分子量分析。经氨基酸、多糖和蛋白质含量分析和肽聚糖的溶解实验鉴定,所提取物质的主要成分为肽聚糖;经核磁共振和红外光谱分析,所提取肽聚糖的结构与已知的肽聚糖的结构相吻合,其糖链结构为由D型吡喃糖N-乙酰葡糖胺和N-乙酰胞壁酸以β-1,4-糖苷键连接而组成;经SDS-PAGE和多种染色方法结合,分析经溶菌酶水解后的肽聚糖,其分子量的分布呈弥散状,范围在97.6kD到14.4kD之间。
【英文摘要】PG derived from Bifidobacterium thermophilum was separated and purified from the cell wall, and involved in research and analysis of its chemical compositions, structure and molecular weight. The major component of the preparation was validated to be peptidoglycan by animo acid analysis, polysaccharides and protein determination, dissolution by lysozyme. NMR and Infrared spectrum substantiated the glycan chain of peptidoglycan was connected by D-pyranose N-acetylglucosamine and N-acetylmuramic acid through β - 1,4 glycosidic bond. SDS-PAGE and multistain suggested that the molecular weight of soluble peptidoglycan showed certain diffusibility, and its ranged from lower than 97.6 kD to higher than 14.4 kD.

【题目】Molecular cloning, genomic organization and functional analysis of an anti—lipopolysaccharide factor from Chinese mitten crab Eriocheir sinensis
【中文关键词】　Li CH
【英文关键词】　Eriocheir sinensis; anti-lipopoly-saccharide factor; Northern blot; quantitative real-time PCR; recombinant protein; bactericidal activity
【中文摘要】无
【英文摘要】Anti-lipopolysaccharide factor (ALF) represents one kind of basic proteins, which binds and neutralizes LPS and exhibits strong antibacterial activity against Gram-negative R-type bacteria. The ALF gene of Chinese mitten crab Eriocheir sinensis (Milne Edwards, 1853) (denoted as EsALF) was identified from haemocytes by expressed sequence tag (EST) and PCR approaches. The full-length cDNA of EsALF consisted of 700 nucleotides with a canonical polyadenylation signal-sequence AATAAA, a polyA tail, and an open-reading frame of 363 bp encoding 120 amino acids. The high similarity of EsALF-deduced amino acid sequence shared with the ALFs from other species indicated that EsALF should be a member of ALF family. The mRNA expression of EsALF in the tissues of heart, gonad, gill, haemocytes, eyestalk and muscle was examined by Northern blot analysis and mRNA transcripts of EsALF were mainly detected in haemocytes, heart and gonad. The temporal expression of EsALF in haemocytes after Vibrio anguillarum challenge was recorded by quantitative real-time RT-PCR. The relative expression level of EsALF was up-regulated rapidly at 2 h post-injection and reached 3-fold to that in blank group. After a drastic decrease to the original level from 4 to 8h, the expression level increased again and reached 4-fold to that in the blank group at 12 h post-injection. The genomic DNA sequence of EsALF gene consists of 1174bp containing three exons and two introns. The coding sequence of the EsALF mature peptide was cloned and expressed in Escherichia coli BL21(DE3)-pLysS to further elucidate its biological functions. The purified recombinant product showed bactericidal activity against both Gram-positive (G(+)) and Gram-negative (G(-)) bacteria, which demonstrated that the rEsALF was a broad-spectrum antibacterial peptide. All these results indicated that EsALF was an acute-phase protein involved in the immune responses of Chinese mitten crab, and provided a potential therapeutic agent for disease control in aquaculture. 【题目】Preliminary study on a potential antibacterial peptide derived from histone H2A in hemocytes of scallop
【中文关键词】 Li CH
【英文关键词】Chlamys farreri; antibacterial peptide; histone H2A; recombinant product; antibacterial activity
【中文摘要】无
【英文摘要】 Histone H2A is reported to participate in host defense response through producing novel antimicrobial peptides (AMPs) from its N-terminus in vertebrates and invertebrates, while the AMPs derived from H2A have not to our knowledge been reported in mollusca. In the present study, gene cloning, mRNA expression of H2A from scallop Chlamys farreri, and the recombinant expression of its N-terminus were conducted to investigate whether a similar mechanism exists in mollusca. The full-length DNA of H2A was identified by the techniques of homology cloning and genomic DNA walking, The full-length DNA of the scallop H2A was 696 bp long, including a 5'-terminal untranslated region (UTR) of 90 bp, a 3'-terminal UTR of 228 bp with a stem-loop structure and a canonical polyadenylation signal sequence AATAAA, and an open reading frame of 375 bp encoding a polypeptide of 125 amino acids. The mRNA expression of H2A in the hemocytes of scallop challenged by microbe was measured by semi-quantitative RT-PCR. The expression of H2A was not upregulated after stimulation, suggesting that H2A did not participate in immunity response directly. The DNA fragment of 117 bp encoding 39 amino acids corresponding to the N-terminus of scallop H2A, which was homologous to buforin I in vertebrates, was cloned into Pichia pastoris GS115. The transformants (His(+) Mut(+)) containing multi-copy gene insertion were selected with increasing concentration of antibiotic G418. The peptide of 39 amino acids was expressed by induction of 0.5% methanol. The recombinant product exerted antibacterial activity against both Gram-positive (G(+)) and Gram-negative (G(-)) bacteria. The antibacterial activity toward G(+) bacteria was 2.5 times more than that against G(-) bacteria. The results elucidated that N-terminus of H2A was a potential AMP and provided a promising candidate for a new antibiotic screening. However, whether H2A is really involved in scallop immune response mechanisms needs to be further investigated. (C) 2006 Elsevier Ltd. All rights reserved.

【题目】The cDNA cloning and mRNA expression of cytoplasmic Cu, Zn superoxide dismutase (SOD) gene in scallop
【中文关键词】 Ni, DJ
【英文关键词】scallop; Chlamys farreri; reactive oxygen species (ROS); superoxide dismutase (SOD); innate immunity; mRNA expression
【中文摘要】无
【英文摘要】 Cu, Zn superoxide dismutases (SODs) are rnetalloenzymes that represent one important line of defence against reactive oxygen species (ROS). A cytoplasmic Cu. Zn SOD cDNA sequence was cloned from scallop Chlamys farreri by the homology-based cloning technique. The full-length cDNA of scallop cytoplasmic Cu, Zn SOD (designated CfSOD) was 1022 bp with a 459 bp open reading frame encoding a polypeptide of 153 amino acids. The predicted amino acid sequence of CfSOD shared high identity with cytoplasmic Cu. Zn SOD in molluscs, insects, mammals and other animals, such as cytoplasmic Cu, Zn SOD in oyster Crassostrea sostrea gigas (CAD42722), mosquito Aedes aegypti (ABF18094), and cow Bos taurus (XP_584414). A quantitative reverse transcriptase real-time PCR (qRT-PCR) assay was developed to assess the mRNA expression of CfSOD in different tissues and the

temporal expression of CfSOD in scallop challenged with Listonella anguillarum, Micrococcus luteus and Candida lipolytica respectively. Higher-level mRNA expression of CfSOD was detected in the tissues of haemocytes, gill filaments and kidney. The expression of CfSOD dropped in the first 8-16 h and then recovered after challenge with L. anguillarum and M. litteus, but no change was induced by the C. lipolytica challenge. The results indicated that CfSOD was a constitutive and inducible acute-phase protein, and could play an important role in the immune responses against L. anguillarum and M. luteus infection. 【题目】4株对虾肠道益生菌的筛选及鉴定

【中文关键词】李海兵

【英文关键词】Probiotic bacteria,Screening,Identification,Inhibitory activity,Safety test

【中文摘要】采用体外拮抗试验的方法,先从不同生长阶段的对虾肠道中分离的96株细菌中筛选出4株对病原菌(鳗弧菌、副溶血弧菌、哈维氏弧菌)有拮抗作用的细菌;进一步通过固体扩散法和液体混合法确定LV060806、LV060808的产物对鳗弧菌有明显抑制作用,Lv060806、LV060815的产物对副溶血弧菌有明显抑制作用,LV060810、LV060815的产物对哈维氏弧菌有明显抑制作用。溶血试验证实这些菌株不产生溶血素,不具有潜在的致病性;动物安全性实验证实菌株浓度在10^6 cfu/ml以下对实验对虾无明显的毒害作用。随后测定了其16S rRNA基因序列,分析了相关细菌相应序列的同源性,构建了系统发生树,结合菌株表型特征和生理生化特性最终鉴定结果为:LV060806、LV060808为Vibrio natriegens;LV060810、LV060815为V.alginolyticus。

【题目】免疫增强剂在对虾生产中的研究与应用现状

【中文关键词】兰萍 宋晓玲 张辉

【英文关键词】immunostimulant ; shrimp ; immune mechanism ; disease resistance

【中文摘要】免疫增强剂是指能够通过提高机体的非特异性免疫功能来增强其抗应激和对病原体的抵抗能力的物质。研究表明,对虾的酚氧化酶原激活系统可被免疫增强剂激活,在激活过程中产生一系列活性物质,通过多种形式参与宿主防御反应,在对虾的免疫识别、防卫及细胞信息传递中发挥着重要作用。免疫增强剂具有作用广泛、特性稳定、安全高效、适宜于作为饲料添加剂来替代抗生素等特点,目前在对虾广泛应用的免疫增强剂主要有免疫多糖类、益生菌、草药提取物、营养因子类物质和生物活性物质等五大种类,文章对它们的作用机理及其应用发展趋势进行了阐述

【英文摘要】Immunostimulants are valuable for the prevention and control of shrimp diseases and may be useful in shrimp culture, Immunostimulants can enhance the immunocompetence of shrimps,which can contribute to health of shrimps,making them more immune to many kinds of bacterial pathogens and to parasitic infections. These immunostimulants mainly facilitate the function of phagocytic cells and increase their bactericidal activities. Recent progress shows that the prophenoloxidase activating system can be activated by immunostimulants. Several components are produced during the activation and involved in host defence. The prophenoloxidase system plays an important role in the host recongnition,defence and cell-tocell communication. Therefore, immunostimulants can reduce the losses caused by disease in aquaculture. Immunostimulants,with characteristics of stability, security,

efficiency and other features,can be used as feed additives to replace antibiotics. Immune polysaccharides,probiotic bacteria, Chinese herb extracts,vitamins,bioactive microbial products were reported as primary immunostimulants in aquaculture . Several immunostimulants and their effective mechanisms were reviewed, and the future research tendency in immunostimulant application were described

【题目】施用沼肥对茄子田节肢动物群落结构与茄子产量的影响

【中文关键词】茄子田 沼肥 节肢动物群落 群落结构 群落多样性 群落稳定性 茄子产量

【英文关键词】Eggplant field, Biogas manure, Arthropod community, Co mmunity structure, Community diversity, Community stability, Eggplant yield

【中文摘要】摘 要 在等氮、等磷、等钾施肥条件下, 对茄子田分别施用化肥、沼肥加化肥减半、沼肥加饼肥, 研究施用沼肥对茄田节肢动物群落结构及茄子产量的影响。结果表明: 在节肢动物种类与数量上, 沼肥加饼肥处理茄子田的害虫种类为3.67±0.88 种・4m－ 2, 显著低于化肥处理和沼肥加化肥减半处理, 且沼肥加化肥减半处理显著低于化肥处理; 害虫个体数量为64.67±4.06 头・4m－ 2, 目标害虫桃蚜的数量为31.67±0.56 头・4m－ 2、二十八星瓢虫个体数量为8.00±0.15 头・4m－ 2, 显著低于化肥处理, 且与沼肥加化肥减半处理差异不显著; 蜘蛛类的个体数量为12.67±1.76 头・4m－ 2, 优势种天敌大腹园蛛的个体数量为7.67±0.67头・4m－ 2, 显著高于化肥处理, 且与沼肥加化肥减半处理差异不显著。在节肢动物群落多样性上, 沼肥加饼肥处理茄子田的节肢动物群落多样性指数为1.68±0.04, 均匀度指数为0.53±0.003, 显著高于化肥处理和沼肥加化肥减半处理; 优势集中性指数为0.33±0.02, 显著低于化肥处理, 且与沼肥加化肥减半处理差异不显著。在节肢动物群落稳定性上, 沼肥加饼肥处理Ss / Si 指数为0.112 5±0.001 1, 显著高于化肥处理, 且与沼肥加化肥减半处理差异不显著; Sn/ Sp指数为1.650 0±0.005 5, 显著高于化肥处理和沼肥加化肥减半处理。沼肥加化肥减半、沼肥加饼肥处理的茄子产量与化肥处理相比无显著差异。

【英文摘要】Abstract Three fertilizer application treatments (chemical fertilizer, half chemical fertilizer and biogas manure, and biogas plus cake manure) were adopted under equal N, P (P2O5) and K (K2O) rates to study the effects of biogas manure on yield of eggplant and structure of arthropod community in eggplant fields. The results showed that the number of pest sp ecies under combined application of biogas and cake manure was 3.67±0.88 in 4 m2 in eggplant field, significantly less than that under application of chemical fertilizer or half chemical fertilizer and biogas manure. Pest species number under application of half chemical fertilizer and biogas manure was also significantly less than that under chemical fertilizer application. The individual number of pests and target pests Myzus per-sicae (Sulzer) and Henosepilachna vigintioctopunctata (Fabricius) under combined applic ation of biogas and cake manure was 64.67±4.06, 31.67±0.56 and 8.00±0.15 in 4 m2, respectively. This was significantly less than that under chemical fertilizer application, but not significantly different from that under half chemical fertilizer and biogas manure application. The individual number of spi-ders and dominant nature enemy Aranea ventricocus (Koch) under combined application of biogas and cake manure was 12.67±1.76 and 7.67±0.67 in 4 m2, respectively, significantly gr eater than that under chemical ferti lizer application, but no t significantly different from that under half chemical fertilizer and biogas manure application. Under combined application of biogas and cake manure, ar-thropod community diversity index was 1.68±0. 04 and evenness index was 0.53±0.003. This was significantly higher than those un-der applications of chemical fe rtilizer, and half chemical and biogas manure. The dominant concentration of arthropod community under combined application of biogas and cake manure was 0.33±0.02, also significantly less than that under chemi cal fertilizer ap-plication, but not significantly different fo rm that under half chemical fertilizer and biogas manure application. In terms of arthropod community stability, Ss/Si index was 0.112 5±0.001 1 under combined applicatio n of biogas and cake manure, significantly higher than that under chemical fertilizer application, but not significantly different from that under half chemical fertilizer and biogas ma-nure application. Sn/Sp index under combined application of biogas and cake manure was 1.650 0±0.005 5, which significantly ex-ceeded that under applications of chemical fertilizer, and half chemical fertilizer and biogas manure. Eggplant yield under the three fertilizer application treatments was not significantly different.

【题目】巢湖流域麦稻轮作农田径流氮磷流失特征研究

【中文关键词】巢湖　农田 氮磷流失
【英文关键词】Eggplant field, Biogas manure, Arthropod community, Co mmunity structure, Community diversity, Community stability, Eggplant yield
【中文摘要】摘　要　在等氮、等磷、等钾施肥条件下，对茄子田分别施用化肥、沼肥加化肥减半、沼肥加饼肥，研究施用沼肥对茄田节肢动物群落结构及茄子产量的影响。结果表明：在节肢动物种类与数量上，沼肥加饼肥处理茄子田的害虫种类为3.67±0.88 种・4m－ 2，显著低于化肥处理和沼肥加化肥减半处理，且沼肥加化肥减半处理显著低于化肥处理；害虫个体数量为64.67±4.06 头・4m－ 2，目标害虫桃蚜的数量为31.67±0.56 头・4m－ 2、二十八星瓢虫个体数量为8.00±0.15 头・4m－ 2，显著低于化肥处理，且与沼肥加化肥减半处理差异不显著；蜘蛛类的个体数量为12.67±1.76 头・4m－ 2，优势种天敌大腹园蛛的个体数量为7.67±0.67头・4m－ 2，显著高于化肥处理，且与沼肥加化肥减半处理差异不显著。在节肢动物群落多样性上，沼肥加饼肥处理茄子田的节肢动物群落多样性指数为1.68±0.04，均匀度指数为0.53±0.003，显著高于化肥处理和沼肥加化肥减半处理；优势集中性指数为0.33±0.02，显著低于化肥处理，且与沼肥加化肥减半处理差异不显著。在节肢动物群落稳定性上，沼肥加饼肥处理Ss / Si 指数为0.112 5±0.001 1，显著高于化肥处理，且与沼肥加化肥减半处理差异不显著；Sn/ Sp指数为1.650 0±0.005 5，显著高于化肥处理和沼肥加化肥减半处理。沼肥加化肥减半、沼肥加饼肥处理的茄子产量与化肥处理相比无显著差异。
【英文摘要】Abstract　Three fertilizer application treatments (chemical fertilizer, half chemical fertilizer and biogas manure, and biogas plus cake manure) were adopted under equal N, P (P2O5) and K (K2O) rates to study the effects of biogas manure on yield of eggplant and structure of arthropod community in eggplant fields. The results showed that the number of pest sp ecies under combined application of biogas and cake manure was 3.67±0.88 in 4 m2 in eggplant field, significantly less than that under application of chemical fertilizer or half chemical fertilizer and biogas manure. Pest species number under application of half chemical fertilizer and biogas manure was also significantly less than that under chemical fertilizer application. The individual number of pests and target pests Myzus per-sicae (Sulzer) and Henosepilachna vigintioctopunctata (Fabricius) under combined applic ation of biogas and cake manure was 64.67±4.06, 31.67±0.56 and 8.00±0.15 in 4 m2, respectively. This was significantly less than that under chemical fertilizer application, but not significantly different from that under half chemical fertilizer and biogas manure application. The individual number of spi-ders and dominant nature enemy Aranea ventricocus (Koch) under combined application of biogas and cake manure was 12.67±1.76 and 7.67±0.67 in 4 m2, respectively, significantly gr eater than that under chemical ferti lizer application, but no t significantly different from that under half chemical fertilizer and biogas manure application. Under combined application of biogas and cake manure, ar-thropod community diversity index was 1.68±0. 04 and evenness index was 0.53±0.003. This was significantly higher than those un-der applications of chemical fe rtilizer, and half chemical and biogas manure. The dominant concentration of arthropod community under combined application of biogas and cake manure was 0.33±0.02, also significantly less than that under chemi cal fertilizer ap-plication, but not significantly different fo rm that under half chemical fertilizer and biogas manure application. In terms of arthropod community stability, Ss/Si index was 0.112 5±0.001 1 under combined applicatio n of biogas and cake manure, significantly higher than that under chemical fertilizer application, but not significantly different from that under half chemical fertilizer and biogas ma-nure application. Sn/Sp index under combined application of biogas and cake manure was 1.650 0±0.005 5, which significantly ex-ceeded that under applications of chemical fertilizer, and half chemical fertilizer and biogas manure. Eggplant yield under the three fertilizer application treatments was not significantly different.

【中文关键词】茄子田 沼肥 节肢动物群落 群落结构 群落多样性 群落稳定性 茄子产量
【英文关键词】Eggplant field, Biogas manure, Arthropod community, Co mmunity structure, Community diversity, Community stability, Eggplant yield

【中文摘要】摘 要 在等氮、等磷、等钾施肥条件下, 对茄子田分别施用化肥、沼肥加化肥减半、沼肥加饼肥, 研究施用沼肥对茄田节肢动物群落结构及茄子产量的影响。结果表明: 在节肢动物种类与数量上, 沼肥加饼肥处理茄子田的害虫种类为3.67±0.88 种・4m－ 2, 显著低于化肥处理和沼肥加化肥减半处理, 且沼肥加化肥减半处理显著低于化肥处理; 害虫个体数量为64.67±4.06 头・4m－ 2, 目标害虫桃蚜的数量为31.67±0.56 头・4m－ 2、二十八星瓢虫个体数量为8.00±0.15 头・4m－ 2, 显著低于化肥处理, 且与沼肥加化肥减半处理差异不显著; 蜘蛛类的个体数量为12.67±1.76 头・4m－ 2, 优势种天敌大腹园蛛的个体数量为7.67±0.67头・4m－ 2, 显著高于化肥处理, 且与沼肥加化肥减半处理差异不显著。在节肢动物群落多样性上, 沼肥加饼肥处理茄子田的节肢动物群落多样性指数为1.68±0.04, 均匀度指数为0.53±0.003, 显著高于化肥处理和沼肥加化肥减半处理; 优势集中性指数为0.33±0.02, 显著低于化肥处理, 且与沼肥加化肥减半处理差异不显著。在节肢动物群落稳定性上, 沼肥加饼肥处理Ss / Si 指数为0.112 5±0.001 1, 显著高于化肥处理, 且与沼肥加化肥减半处理差异不显著; Sn/ Sp指数为1.650 0±0.005 5, 显著高于化肥处理和沼肥加化肥减半处理。沼肥加化肥减半、沼肥加饼肥处理的茄子产量与化肥处理相比无显著差异。

【英文摘要】Abstract Three fertilizer application treatments (chemical fertilizer, half chemical fertilizer and biogas manure, and biogas plus cake manure) were adopted under equal N, P (P2O5) and K (K2O) rates to study the effects of biogas manure on yield of eggplant and structure of arthropod community in eggplant fields. The results showed that the number of pest sp ecies under combined application of biogas and cake manure was 3.67±0.88 in 4 m2 in eggplant field, significantly less than that under application of chemical fertilizer or half chemical fertilizer and biogas manure. Pest species number under application of half chemical fertilizer and biogas manure was also significantly less than that under chemical fertilizer application. The individual number of pests and target pests Myzus per-sicae (Sulzer) and Henosepilachna vigintioctopunctata (Fabricius) under combined applic ation of biogas and cake manure was 64.67±4.06, 31.67±0.56 and 8.00±0.15 in 4 m2, respectively. This was significantly less than that under chemical fertilizer application, but not significantly different from that under half chemical fertilizer and biogas manure application. The individual number of spi-ders and dominant nature enemy Aranea ventricocus (Koch) under combined application of biogas and cake manure was 12.67±1.76 and 7.67±0.67 in 4 m2, respectively, significantly gr eater than that under chemical ferti lizer application, but no t significantly different from that under half chemical fertilizer and biogas manure application. Under combined application of biogas and cake manure, ar-thropod community diversity index was 1.68±0. 04 and evenness index was 0.53±0.003. This was significantly higher than those un-der applications of chemical fe rtilizer, and half chemical and biogas manure. The dominant concentration of arthropod community under combined application of biogas and cake manure was 0.33±0.02, also significantly less than that under chemi cal fertilizer ap-plication, but not significantly different fo rm that under half chemical fertilizer and biogas manure application.
In terms of arthropod community stability, Ss/Si index was 0.112 5±0.001 1 under combined applicatio n of biogas and cake manure, significantly higher than that under chemical fertilizer application, but not significantly different from that under half chemical fertilizer and biogas ma-nure application. Sn/Sp index under combined application of biogas and cake manure was 1.650 0±0.005 5, which significantly ex-ceeded that under applications of chemical fertilizer, and half chemical fertilizer and biogas manure. Eggplant yield under the three fertilizer application treatments was not significantly different.

【题目】虾塘养殖中后期微型浮游动物的摄食压力
【中文关键词】微型浮游动物, 浮游植物, 摄食压力, 养殖中后期, 虾塘
【英文关键词】Microzooplankton, Phytoplankton, Grazing pressure, The middle and late shrimp culture period, Shrimp pond
【中文摘要】2008年8月底到10月初,用现场稀释法对虾塘中≤200、≤100 μm 和≤20 μm 3个粒级的微型浮游动物对浮游植物的摄食压力进行了研究。共进行了3次培养实验,结果表明:浮游植物的生长率为0.0834-0.4498/d,微型浮游动物的摄食率为0.1212-0.2998/d,微型浮游动物摄食率对浮游植物生长率比值(g:k)为0.4271-3.4901,占浮游植物现存量的11.41%-25.90%,对初级生产力的摄食压力为48.20%-314.69%。≤20 μm 微型浮游动物的摄食率、对浮游植物现存量和初级生产力的摄食压力,占微型浮游动物(≤200 μm) 的相关比例范围为73.85%-97.69%、76.67%-97.91%、78.87%-98.59%。这表明≤20 μm 微型浮游动物比≥20 μm的微型浮游动物在对虾养殖中后期虾塘能量流动和物质循环方面起到更重要的作用。
【英文摘要】Phytoplankton growth and microzooplankton herbivory studies in three size fractions (≤20 μm,≤100 μm,≤200 μm) were studied using the in situ dilution technique from the end of August to the beginning of October in 2008 in a shrimp pond in Tianjin, China. Waters used in the dilution incubations were mixed waters sampled from four points in the pond: the inlet, outlet and middle points of both sides of the square-shaped pond. The waters were filtered through meshes with aperture sizes of 20 μm,100 μm and 200 μm to make sized fractionated waters as ≤20 μm,≤100 μm and ≤200 μm. PFW (particle-free water) was used to dilute the size fractionated waters to four dilution series of 0%, 25%, 50%, 75%. The microzooplankton grazing rate and phytoplankton growth rate were estimated by the linear regression of AGR (apparent growth rate) versus d (dilution factor). Microzooplankton grazing impact on phytoplankton was estimated by calculating phytoplankton net growth rate, percentage of phytoplankton standing stock ingested, percentage of primary production ingested. The coupling between microzooplankton grazing rate (g) and phytoplankton growth rate (k) was demonstrated with the ratio g:k. Chlorophyll a concentrations varied widely (32.41-50.83 μg/L) in 31 August,19 September and 3 October. Smaller phytoplankton (≤20 μm) consistently dominated the phytoplankton communities in the whole culture time, contributing over 90% of chlorophyll a biomass of ≤200 μm. Phytoplankton growth rates of 3 dilution incubations were 0.0834 to 0.4498/d. Microzooplankton grazing rates changed from 0.1212 to 0.2998 /d. The ratio of g： k was 0.4271 to 3.4901.Microzooplankton grazing pressure on the phytoplankton initial stock and primary production varied from 11.41% to 25.90% and 48.20% to 314.69%,respectively. In the September, microzooplankton grazing rates reached the maximum value, followed by 19 microzooplankton grazing pressure on the phytoplankton initial stock and primary production. But microzooplankton grazing pressure on phytoplankton primary production was too high,and the ratio of g： k varied widely. This was because that phytoplankton may not adapt to the environment to grow slowly and even die, while the microzooplankton grazing rate showed the relatively higher value, with rainfall increasing but temperature decreasing in coming autumn. Compared with the other regions around the world, the microzooplankton grazing pressure in shrimp pond was in the middle of the ange of measurements elsewhere. The coupling between microzooplankton grazing and phytoplankton growth was good. In the same group, microzooplankton grazing rates and pressure on the phytoplankton initial stock and primary production changed slightly. ≤20 μm microzooplankton grazing rates and pressure on the phytoplankton initial stocks and primary production contributed 73.85%-97.69%,76.67%-97.91%,78.87%-98.59% of microzooplankton (≤200 μm), respectively. These results showed that small-celled microzooplankton (≤20 μm) was ubiquitous and played more important role in energy transmission and nutrients regeneration in the middle and late shrimp culture period of shrimp pond.

【题目】流式细胞术检测对虾白斑症病毒(WSSV)对克氏原螯虾血细胞的感染

【中文关键词】王轶南　战文斌　邢婧
【英文关键词】无
【中文摘要】用WSSV粗提液人工感染克氏原螯虾,感染后分别在6,12,18,24h采血分离血细胞,通过WSSV的混合单抗和FITC标记的羊抗鼠二抗的间接免疫荧光染色,应用流式细胞仪检测病毒对克氏原螯虾血细胞的感染并分析感染强度。结果表明:分离获得的血细胞形态完好,感染后血细胞内的病毒被标记上了绿色荧光;流式检测发现,随感染时间延长,被感染细胞的百分率及平均荧光强度均逐渐升高,反映血细胞的病毒感染程度逐渐加深;PCR检测同时证实人工感染后各采样点血细胞样品均为WSSV阳性。
【英文摘要】Crayfish(Cambarus proclarkii) were artificially infected with WSSV solution and the haemocytes were collected at 6 h, 12 h, 18 h and 24 h post-infection and stained with WSSV specific Mabs and secondary antibody conjugated with FITC, a flow cytometer was used to detect WSSV and analyse the infection degree of crayfish haemocytes. The results showed that the collected cells were intact in shape, the virus within the cells were stained with green fluorescence and could be detected by FCM. Furthermore, the percent and mean fluorescence intensity of infected cells increased from 6 h to 24 h post-infection, which indicated the deepening of virus infection in crayfish haemocytes. PCR confirmed the haemocytes samples after virus infection were WSSV positive.[

【题目】白斑综合征病毒与中国对虾血细胞膜体外结合实验研究
【中文关键词】林颖博,战文斌,邢婧,唐小千,刘宝良.
【英文关键词】white spot syndrome virus　haemocyte plasma membrane　receptor　inhibitor
【中文摘要】　筛选小分子受体配基或抗受体蛋白的单克隆抗体作为阻断剂,是阻断病毒感染的有效途径。通过差速离心法提取海捕中国对虾血细胞膜,分别利用Dot-Blot和ELISA技术,将血细胞膜包被于硝酸纤维素(NC)膜或酶标板,使地高辛(Digoxigenin, DIG)标记的对虾白斑综合征病毒(WSSV-DIG)与之4 ℃结合4 h,并以碱性磷酸酶标记抗DIG抗体作为探针检测,实验结果皆为阳性,证明体外环境下WSSV能稳定地与血细胞膜结合。通过血细胞膜免疫Balb/c小鼠生产抗中国对虾血细胞多克隆抗体,以该多抗37℃孵育血细胞膜1 h,然后使WSSV-DIG与血细胞膜结合并检测。在Dot-Blot实验中,阻断组发色明显浅于未阻断组;在ELISA实验中,阻断组OD值比未阻断组降低69%。可以推断,多抗中抗血细胞受体的抗体与血细胞膜上的受体蛋白结合,占据了WSSV黏附蛋白的结合位点,从而显著得抑制了WSSV与血细胞膜的体外结合。实验所建立的WSSV与对虾血细胞膜体外结合技术可以应用于WSSV与血细胞受体蛋白的黏附特性的研究以及WSSV阻断剂的筛选,多抗阻断实验证明了本方法的可行性。
【英文摘要】Selecting small molecular ligands or monoclonal antibodies to cellular receptors as inhibitors is an effective approach to inhibit virus infection. In this research, haemocyte plasma membranes (HPM) of Chinese shrimp (Fenneropenaeus chinensis) were isolated employing differential centrifugation. Utilizing the techniques of Dot-Blot and ELISA, HPMs immobilized in microtiter plats or nitrocellulose (NC) membranes were incubated with Digoxingenin labeled white spot syndrome virus (WSSV-DIG) at 4°C for 4 h. Then alkaline phosphatase labeled antibodies against DIG was used as a sensitive probe to detect the　in vitro　combination of WSSV-DIG to HPM. Both ELISA and Dot-Blot combination showed positive reactions. In blocking experiment, polyclonal antibody against haemocytes of Chinese shrimp was allowed to bind to the HPM at 37°C for 1 h before the incubation with WSSV-DIG. In Dot-Blot assay, the blocked group showed a significantly lighter color compared with the unblocked group. In ELISA assay, OD value of the blocked group was 69% lower than the unblocked group. It can be deduced that some receptor antibodies, which were specifically against the WSSV receptors, existed in the polyclonal antibody. During incubation, these antibodies adhered to the receptors on the HPM and significantly blocked the combination of WSSV-DIG. The　in vitrocombining technology between WSSV and HPM developed in this research provide a strategy to characterization of WSSV receptors and selection inhibitor to WSSV. The blocking experiments carried out with polyclonal antibody have proved the feasibility.

【题目】A lectin (CfLec—2) aggregating Staphylococcus haemolyticus from scallop Chlamys farreri
【中文关键词】 Zheng, Peilin; Wang, Hao; Zhao, Jianmin; 等.
【英文关键词】Chlamys farreri; lectin; Ca2+ independent; Staphylococcus haemolyticus
【中文摘要】无
【英文摘要】Lectins are a family of carbohydrate-recognition proteins which play crucial roles in innate immunity. In this study, a new lectin (CfLec-2) gene was cloned from Chlamys farreri by EST and RACE approaches. The full-length cDNA of CfLec-2 was composed of 708 bp, encoding a typical Long form carbohydrate-recognition domain of 130 residues. The deduced amino acid sequence showed high similarity to Brevican in Homo sapiens, C-type lectin-1 and lectin-2 in Anguilla japonica. The cDNA fragment encoding the mature peptide of CfLec-2 was recombined into plasmid pET-32a (+) and expressed in Escherichia coli Rosseta-Gami (DE3). The recombinant CfLec-2 (rCfLec-2) protein exhibited aggregative activity toward Staphylococcus haemolyticus, and the agglutination could be inhibited by D-mannose but not EDTA or D-galactose, indicating that CfLec-2 was a Ca2+ independent lectin. Moreover, rCfLec-2 could suppress the growth of E. coli TOP10F'. These results suggested that CfLec-2 was perhaps involved in the recognition and clearance of bacterial. pathogens in scallop.

【题目】A novel C1q—domain—containing protein from Zhikong scallop Chlamys farreri with lipopolysaccharide binding activity
【中文关键词】Zhang, Huan; Song, Linsheng; Li, Chenghua; 等.
【英文关键词】Chlamys farreri; C1qDC protein; C1q; complement system; gene cloning; real-time PCR; recombinant protein; LPS-binding activity
【中文摘要】无
【英文摘要】The C1q-domain-containing (C1qDC) proteins are a family of proteins characterized by a globular C1q (gC1q) domain in their C-terminus. They are involved in various processes of vertebrates and supposed to be an important pattern recognition receptor in innate immunity of invertebrates. In this study, a novel member of C1q-domain-containing protein family was identified from Zhikong scallop Chlamys farreri (designated as CfC1qDC) by expressed sequence tag (EST) and rapid amplification of cDNA ends (RACE) approaches. The full-length cDNA of CfC1qDC was of 777 bp, consisting of a T-terminal untranslated region (UTR) of 62 bp and a 3' UTR of 178 bp with a polyadenylation signal sequence AATAAA and a poly (A) tail. The CfC1qDC cDNA encoded a polypeptide of 178 amino acids, including a signal peptide and a C1q-domain of 158 amino acids with the theoretical isoelectric point of 5.19 and the predicted molecular weight of 17.2 kDa. The C1q-domain in CfC1qDC exhibited homology with those in sialic acid binding lectin from mollusks and C1qDC proteins from higher vertebrates. The typical 10 beta-strand jelly-roll folding topology structure of C1q-domain and the residues essential for effective packing of the hydrophobic core were well conserved in CfC1qDC. By fluorescent quantitative real-time PCR, mRNA transcripts of CfC1qDC were mainly detected in kidney, mantle, adductor muscle and gill, and also marginally detectable in hemocytes. In the bacterial challenge experiment, after the scallops were challenged by Listonella anguillarum, there was a significant up-regulation in the relative expression level of CfC1qDC and at 6 h post-injection, the mRNA expression reached the maximum level and was 4.55-fold higher than that of control scallops. Similarly, the expression of CfC1qDC mRNA in mixed primary cultures of hemocytes stimulated by lipopolysaccharides (LPS) was up-regulated and reached the maximum level at 6 h post-stimulation, and then dropped back to the original level gradually. In order to investigate its function, the cDNA fragment encoding the mature peptide of CfC1qDC was recombined and expressed in Escherichia coli BL21 (DE3). The recombinant

CfC1qDC protein displayed a significantly strong activity to bind LIDS from E. coli, although no obvious antibacterial or agglutinating activity toward Gram-negative bacteria E. coli JM109, L. anguillarum and Gram-positive bacteria Micrococcus luteus was observed. These results suggested that CfC1qDC was absolutely a novel member of the C1qDC protein family and was involved in the recognition of invading microorganisms probably as a pattern recognition molecule in mollusk.

【题目】cDNA cloning, characterization and mRNA expression of a pacifastin light chain gene from the Chinese mitten crab
【中文关键词】Gai, Yunchao; Wang, Lingling; Song, Linsheng; 等.
【英文关键词】Pacifastin; Serine protease inhibitors (SPIs); Pacifastin light chain domain (PLD); Eriocheir sinensis; mRNA expression
【中文摘要】无
【英文摘要】The pacifastin family, characterized by several conserved arrays of six cysteine residues, is a newly identified serine protease inhibitor (SPI) family discovered uniquely in arthropods and plays important roles in multiple biological processes. In the present study, the full-length cDNA of a pacifastin light chain (designated ESPLC) was cloned from the Chinese mitten crab Eriocheir sinensis by expressed sequence tags (ESTs) and PCR techniques. The 1036 bp ESPLC cDNAcontained an 831 bp open reading frame (ORF) encoding a putative pacifastin-related peptide of 276 amino acids, a 5'-untranslated region (UTR) of 67 bp, and a 3'-UTR of 138 bp. Six putative conserved domains sharing a characteristic cysteine array (Cys-Xaa(9-12)-Cys-Asn-Xaa-Cys-Xaa-Cys-Xaa(2-3)-Gly-Xaa(3-4)-Cys-Thr-Xaa(3)-Cys) were identified in the deduced amino acid sequence of ESPLC. The conservation of these PLDs (pacifastin light chain domains) and the relative higher similarity of ESPLC to other pacifastin-related precursors suggested that ESPLC was a member of pacifastin family. The mRNA transcripts of ESPLC were found to be higher expressed in hepatopancreas, gill and haemolymph than in gonad, muscle and heart, with the highest expression level in hepatopancreas. The ESPLCmRNA expression in haemolymph of Chinese mitten crab was up-regulated at 2 h and 12 h after challenged with Listonella anguillarum. The tissue distribution and temporal characteristics of ESPLC mRNA expression, similar to that of prophenoloxidase gene in E. sinensis, suggested that ESPLC was potentially involved in theresponse against invading bacteria, with the possibility that it functioned in the prophenoloxidase system in E sinensis

【题目】A novel C-type lectin (Cflec-3) from Chlamys farreri with three carbohydrate-recognition domains.
【中文关键词】Zhang, Huan; Wang, Hao; Wang, Lingling;Song, Xiaoyan; Zhao, Jianmin; Qiu, Limei; Li, Ling;Cong, Ming; Song, Linsheng
【英文关键词】Chlamys farreri; C-type lectin; Innate immunity; Bacterial agglutination; Recombinant expression; Real-time RT-PCR
【中文摘要】无

【英文摘要】C-type lectins are a superfamily of carbohydrate-recognition proteins which play crucial roles in the innate immunity. In this study, the gene of a C-type lectin with multiple carbohydrate-recognition domains (CRDs) from scallop Chlamys farreri (designated as Cflec-3) was cloned by rapid amplification of cDNA ends (RACE) approach based on expression sequence tag (EST) analysis. The full-length cDNA of Cflec-3 was of 2256 bp. The open reading frame encoded a polypeptide of 516 amino acids, including a signal sequence and three CRDs. The deduced amino acid sequence of Cflec-3 showed high similarity to members of C-type lectin superfamily. By fluorescent quantitative real-time PCR, the Cflec-3 mRNA was mainly detected in hepatopancreas, adductor, mantle, and marginally in gill, gonad and hemocytes of healthy scallops. After scallops were challenged by Listonella anguillarum, the mRNA level of Cflec-3 in hemocytes was up-regulated and was significantly higher than that of blank at 8 h and 12 h post-challenge. The function of Cflec-3 was investigated by recombination and expression of the cDNA fragment encoding its mature peptide in Escherichia coli BL21 (DE3)-pLysS. The recombined Cflec-3 (rCflec-3) agglutinated Gram-negative bacteria Pseudomonas stutzeri. The agglutinating activity was calcium-dependent and could be inhibited by D-mannose. These results collectively suggested that Cflec-3 was involved in the immune response against microbe infection and contributed to nonself-recognition and clearance of bacterial pathogens in scallop. 【题目】A putative endocrine factor SIBD (single insulin binding domain protein)
【中文关键词】Gai, Yunchao;Wang, Lingling;Song, Linsheng; Zhao, Jianmin;Qiu, Limei;Xing, Kezhi
【英文关键词】IGFBP; Insulin binding domain; Eriocheir sinensis; Arthropod endocrine; Innate immunity; mRNA expression profile
【中文摘要】无
【英文摘要】Insulin growth factor binding proteins (IGFBPs), characterized by the conserved insulin binding (IB) domains, are important components of endocrine system and play key roles in metabolism and growth. In the present study, the full-length cDNA of a single IB domain protein (designated EsSIBD) was identified from Chinese mitten crab Erlocheir sinensis based on expressed sequence tag (EST) sequence. The 1187 bp EsSIBD cDNA contained a 321 bp open reading frame (ORF) encoding a putative protein of 106 amino acids, a T-untranslated region (UTR) of 189 bp, and a 3'-UTR of 677 bp. Multiple sequence alignment presented ten conserved cysteine residues critical for the fundamental structure and function of IB domain. BLAST analysis revealed that EsSIBD shared high similarity with previously known IB domains of IGFBPs; with the identities ranging from 40% to 46%. The sequence similarity and domain conservation indicated that EsSIBD was a potential member of the IGFBP family. Phylogenic analysis presented that EsSIBD was closer to IGFBP7 than to the other 113 domain containing proteins, suggesting its functional similarity with the endocrine factor IFGBP7. The mRNA expression of EsSIBD in different tissues including hepatopancreas, gill, gonad, muscle, heart and haemocytes, and the temporal expression in haemocytes challenged by Listonella anguillarum were measured by real-time RT-1 CR. EsSIBD mRNA transcripts could be detected in all examined tissues with the highest expression level in gill. The EsSIBD mRNA expression in haemocytes was sensitive to L anguillarum stimulation and it was up-regulated from 3 to 24 h after challenge. The structure conservation and functional similarity to IFGBPs, and its sensitivity to L anguillarum stimulation collectively implied that EsSIBD was probably involved in endocrine and immune systems of Chinese mitten crab, and provided insight into the cross-talk between the invertebrate endocrine and immune system. 【题目】A review of advances in research on marine molluscan antimicrobial peptides and their potential application in aquaculture
【中文关键词】Li Cheng-Hua; Zhao Jian-Min; Song Lin-Sheng
【英文关键词】Innate immunity; immunostimulation; oysters; scallops; mussels; abalone
【中文摘要】无
【英文摘要】Antimicrobial peptides (AMPs) are important components of the host innate immune response against microbial invasion. They are usually characterized by their small-size, heat-stability and broad range of antimicrobial activity. This review covers research advances on marine mollusc AMPs, specifically those isolated from mussels, scallops, oysters, venerid clams and abalone, which mainly include MGD, mytilin, myticin, mytimycin, big defensin, and RPD-1. Their structural characteristics, antibacterial activity, and expression pattern as well as peptide distribution and their release following microbial challenge are also discussed. In addition, the prospect of the application of AMPs as food additives or their use in immunostimulation to prevent diseases of aquatic animals, as well as their potential hazards, are also discussed.

【题目】Protective immunity induced by CpG ODNs against white spot syndrome virus
【中文关键词】Zhang, Ying;Song, Linsheng;Zhao, Jianmin;Wang, Lingling;Kong, Pengfei;Liu, Lin;Wang, Mengqiang;Qiu, Limei
【英文关键词】CpG; White spot syndrome virus; Dicer; Argonaute; Reactive oxygen species; STAT; Virus replication; Litopenaeus vannamei
【中文摘要】无
【英文摘要】The worldwide shrimp culture is beset with diseases mainly caused by white spot syndrome virus (WSSV) and suffered huge economic losses, which bring out an urgent need to develop the novel strategies to better protect shrimps against WSSV. In the present study, CpG-rich plasmid pUC57-CpG, plasmid pUC57 and PBS were employed to pretreat shrimps comparatively to evaluate the protective effects of CpG ODNs on shrimps against WSSV. The survival rates, WSSV copy numbers, and antiviral associated factors (Dicer, Argonaute, STAT and ROS) were detected in Litopenaeus vannamei. There were higher survival proportion, lower WSSV copy numbers, and higher mRNA expression of Dicer and STAT in pUC57-CpG-pretreatment shrimps than those in pUC57- and PBS-pretreatment shrimps after WSSV infection. The Argonaute mRNA expression in pUC57-CpG-, pUC57- and PBS-pretreatment shrimps after WSSV infection was significantly higher than that of shrimps post PBS stimulation on the first day. The ROS levels in pUC57-CpG-pretreatment shrimps post secondary stimulation of PBS were significantly higher than those post WSSV infection on the first day. These results together demonstrated that pUC57-CpG induced partial protective immunity in shrimps against WSSV via intermediation of virus replication indirectly and could be used as a potential candidate in the development of therapeutic agents for disease control of WSSV in L. vannamei. 【题目】The construction of a cDNA library enriched for immune genes and the analysis

【中文关键词】Gai, Yunchao;Wang, Lingling;Zha, Jianmin;Qiu, Limei;Song, Linsheng;Li, Ling;Mu, Changkao;Wang, Wan;Wang, Mengqiang;Zhang, Ying;Yao, Xuemei;Yang, Jialong
【英文关键词】cDNA library; ESTs analysis; Eriocheir sinensis; Bacteria challenge; Innate immunity
【中文摘要】无
【英文摘要】Chinese mitten crab Eriocheir sinensis is one of the most important aquaculture crustacean species in China. A cDNA library was constructed from hemocytes of E. sinensis challenged with the mixture of Listonella anguillarum and Staphylococcus aureus, and randomly sequenced to collect genomic information and identify genes involved in immune defense response. Single-pass 5' sequencing of 10368 clones yielded 7535 high quality ESTs (Expressed Sequence Tags) and these ESTs were assembled into 2943 unigenes. BLAST analysis revealed that 1706 unigenes (58.0% of the total) or 4593 ESTs (61.0% of the total) were novel genes that had no significant matches to any protein sequences in the public databases. The rest 1237 unigenes; (42.0% of the total) were closely matched to the known genes or sequences deposited in public databases, which could be classed into 20 or 23 classifications according to "molecular function" or "biological process" respectively based on the Gene Ontology (GO). And 221 unigenes (7.5% of all 2943 unigenes, 17.9% of matched unigenes) or 969 ESTs (12.9% of all 7535 ESTs, 32.9% of matched ESTs) were identified to be immune genes. The relative higher proportion of immune-related genes in the present cDNA library than that in the normal library of E. sinensis and other crustaceans libraries, and the differences and changes in percentage and quantity of some key immune-related genes especially the immune inducible genes between two E. sinensis cDNA libraries may derive from the bacteria challenge to the Chinese mitten crab. The results provided a well-characterized EST resource for the genomics community, gene discovery especially for the identification of host-defense genes and pathways in crabs as well as other crustaceans. 【题目】The immune responses in Chinese mitten crab Eriocheir sinensis challenged with double-stranded RNA
【中文关键词】Dong, Chaohua;Zhao, Jianmin;Song, Linsheng;Wang, Lingling;Qiu, Limei;Zheng, Peilin;Li, Ling;Gai, Yuncao;Yang, Guanpin
【英文关键词】Eriocheir sinensis; Double-stranded RNA; Immune response; EsALF; Superoxide dismutase; Malondialdehyde; Phenoloxidase; Acid phosphatase
【中文摘要】无
【英文摘要】Double-stranded RNA (dsRNA) is a virus-associated molecular pattern which induces antiviral innate immune responses and RNA interference (RNAi) in mammals. In invertebrates, RNAi phenomenon has been widely studied, but dsRNA-induced innate immune response is seldom reported. In the present study, two different dsRNAs specific for green fluorescent protein (GFP) and the putative D1 protein of photosystem II (NoPSD) from Nannochloropsis oculata, were employed to challenge Chinese mitten crab Eriocheir sinensis. The temporal changes of phenoloxidase (PO), acid phosphatase (ACP), superoxide dismutase (SOD) and malondialdehyde (MDA) content, as well as the mRNA expression of some immune-related genes were examined in order to estimate the effect of dsRNAs on the innate immunity of E. sinensis. The activities of PO, ACP and SOD significantly increased after dsRNA treatment, whereas malondialdehyde (MDA) content did not change significantly. Among the examined genes, only the mRNA expression of EsALF, an antibacterial peptide in E. sinensis, was significantly up-regulated (about 5 fold, $P < 0.05$) at 12 h after dsRNA treatment, while no significant expression changes were observed among the other immune genes. The increase of PO, ACP and SOD activities, and mRNA expression level of EsALF after dsRNA stimulation indicate that phenoloxidase, hydrolytic enzyme, antioxidation and EsALF were involved in dsRNA-induced innate immunity, suggesting that broad-spectrum immune responses could be induced by dsRNA in E. sinensis. 【题目】Two thymosin-repeated molecules with structural and functional diversity coexist in Chinese mitten crab Eriocheir sinensis
【中文关键词】Gai, Yunchao;Zhao, Jianmin;Song, Linsheng;Wang, Lingling;Qiu, Limei;Ning, Xuanxuan;Zheng, Xiangdong;Zhang, Yi;Mu, Changkao;Zhang, Ying;Li, Ling
【英文关键词】Eriocheir sinensis; Thymosin-repeated protein (TRP); Tumor growth; Wound healing; MTT assay; mRNA temporal expression profile
【中文摘要】无
【英文摘要】Recently, beta-thymosin-like proteins with multiple thymosin domains (defined as thymosin-repeated proteins) have been identified from invertebrate. In the present study, the cDNAs of two thymosin-repeated proteins (designated EsTRP1 and EsTRP2) were cloned from Chinese mitten crab by expressed sequence tags (EST) techniques. BLAST analysis presented three and two thymosin domains in EsTRP1 and EsTRP2, respectively, with the identities amongst the five domains varying from 47% to 100%. Both EsTRP1 and EsTRP2 shared high similarities with previously identified vertebrate beta-thynnosins and invertebrate thymosin-repeated proteins (TRPs) with the identities ranging from 43% to 78%, indicating that EsTRPs were new members of the beta-thymosin family. Real-time RT-PCR assay was adopted to determine the tissue distribution of EsTRPs and their temporal expression profile in hemocytes after pathogen stimulation and injury challenge. The expression of EsTRP1 transcript was predominantly detectable in the tissues of hemocytes, hepatopancreas and gonad with the highest expression in hemocytes, while the highest expression level of EsTRP2 was found in heart. EsTRP1 mRNA expression in hemocytes significantly increased at 3 and 48 h after Listonella anguillarum challenge, but there was no significant variation in EsTRP2 temporal expression profile. The injury challenge reduced the mRNA expression of EsTRPs, with the down-regulation of EsTRP2 expression occurred earlier than that of EsTRP1. The cDNA fragments encoding their mature peptides of EsTRP1 and EsTRP2 were recombined and expressed in Escherichia coli. The activities of recombinant proteins (rEsTRP1 and rEsTRP2) were examined by MTT (3-(4,5-dimethylthiazol-2-yl)-2, 5-diphenyltetrazoliumbromide) and lysoplate assay. rEsTRP2 could significantly accelerate the growth of human hepatocellular carcinoma cell line, but there was no significant effect of rEsTRP1 on the tumor cell proliferation. Both rEsTRP1 and rEsTRP2 did not possess the ability of killing Micrococcus luteus and L. anguillarum. The differences in the tissue distribution of mRNA transcripts, the response to pathogen stimulation and injury challenge, and the effect of recombinant proteins on human cell proliferation, indicated that there were functional diversity between the two structurally different molecules, EsTRP1 and EsTRP2. 【题目】A double WAP domain (DWD)-containing protein with proteinase inhibitory activity in Chinese white shrimp, Fenneropenaeus chinensis.
【中文关键词】Du, Zhi-Qiang;Ren, Qian;Zhao, Xiao-Fan;Wang, Jin-Xing
【英文关键词】Whey acidic protein; Chinese white shrimp; Fenneropenaeus chinensis; Proteinase inhibitory activity; Innate immunity
【中文摘要】无
【英文摘要】The whey major component, whey acidic protein (WAP), has one or more WAP domains characterized by a four-disulfide core (4-DSC) structure. These kinds of proteins are involved in multiple functions, including proteinase inhibitor activity, antimicrobial activity, ATPase inhibitor activity, and regulatory function in cell proliferation. Recent research indicates that WAP domain-containing proteins play an important role in the innate immunity of crustaceans. In this study, a novel double WAP domain (DWD)-containing protein named Fc-DWD was found for the first time in Chinese white shrimp, Fenneropenaeus chinensis. The

open reading frame of Fc-DWD encodes a protein of 117 amino acids, including a signal peptide of 16 amino acids and two WAP domains. The predicted molecular mass of the mature protein is 12.78 kDa with an estimated pI of 8.49. The first WAP domain, named WAP 1, composed of 49 amino acids locates in the amino-terminal of Fc-DWD, and the second WAP domain, named WAP 2, composed of 45 amino acids locates in the carboxy-terminal. Fc-DWD mRNA was upregulated in hemocytes, hepatopancreas, gills, and stomach of bacteria- and virus-challenged shrimp. Results of the binding assay showed that rFc-DWD could bind to both Gram-negative bacteria and Gram-positive bacteria. rWAP 1 could only bind to Gram-positive bacteria, but rWAP 2 could bind to both Gram-negative and positive bacteria. Moreover, rFc-DWD exhibited proteinase inhibitory activity against the secretory proteinase(s) from Bacillus subtilis and Pseudomonas aeruginosa. All of these findings suggest that Fc-DWD may play an important role in enabling the host defense to execute its proteinase inhibitory activity against pathogens. (C) 2009 Elsevier Inc. 【题目】Characterization, kinetics, and possible function of Kazal-type proteinase inhibitors of Chinese white shrimp, Fenneropenaeus chinensis.
【中文关键词】Wang, Zong-Heng;Zhao, Xiao-Fan;Wang, Jin-Xing
【英文关键词】Kazal serine proteinase inhibitor; Fenneropenaeus chinensis; Mixed-type inhibitor; Fast tight binding inhibitor; Innate immunity
【中文摘要】无
【英文摘要】Serine proteinase inhibitor plays an essential role in arthropods by restraining the activities of endogenic or exogenic serine proteinases. Four Kazal-type serine proteinase inhibitors, Fcspi-1-4, from the hepatopancreas of Chinese white shrimp, Fenneropenaeus chinensis, were cloned and identified. The open reading frames (ORFs) of Fcspis are 1389, 1236, 1080, and 939 base pairs, encode the pre-proteins of 462, 411, 359, and 312 amino acids and form the 9, 8, 7, and 6 typical Kazal domains, respectively. When analyzing the amino acid sequences of the four inhibitors, it was found that they might have been derived from the same transcript, which was subjected to alternative splicing, and none of the Kazal domains were identical within each inhibitor. Multiple alignments showed that the Kazal inhibitors were homologous with a conserved Motif of Cx(3)Cx(6)VCGSDGxTYx(3)CxLx(5)Cx(5)ITx(6)GC. The results from RT-PCR indicated that the expression of Fcspis as a whole was upregulated by bacterial challenge, no obvious change was noticed after viral challenge, and Fcspi-1 had a similar expression pattern with that of Fcspis. Recombinant FcSPIs were successfully expressed in bacteria and purified for further study. Recombinant FcSPI-1 was sensitive to DTT and had thermal stability. The inhibitory kinetics assay suggested that rFcSPI-1 was a mixed-type fast tight binding inhibitor with inhibitory activities against subtilisin A at a molar ratio of 1:1, 1:2 against proteinase K, and 2:1 against elastase. It can firmly bound to two Gram-positive and one Gram-negative bacteria but without anti-bacterial ability. In addition, it inhibited the activities of both bacteria I-secreted proteinases and natural chymotrypsin of Chinese white shrimp, suggesting that FcSPI-1 may participate in the immune defence response by inhibition of bacterial pathogen proteinases and possibly be involved in the regulation of shrimp proteinase activity. 【题目】Generation of the first BAC-based physical map of the common carp genome
【中文关键词】鲤鱼基因组;物理图谱;BAC
【英文关键词】common carp genome;physical map;BAC
【中文摘要】背景:鲤鱼属鲤亚科,是世界上第三大水产养殖物种,年产量约为340万吨,占世界淡水养殖产量的14%。显然,这一物种的基因资源用以研究其产量性状的研究。但是鲤鱼物理图谱还没有完成,本研究是使用荧光限制指纹构建BAC物理图谱结果:第一代鲤鱼物理图谱构建使用四色高信息含量指纹。总共分析了72158 BAC克隆产生67493个有效指纹。这些BAC克隆被组装成3696个平均长度为476 kb和688 kbN50长度的片段,代表大约1.76 Gb的鲤鱼基因组。有761个片段超过了N50,这些片段是有用的资源对于基因组全序列组装和连锁图的构建。可用的鲤鱼物理图谱在http://genomics.cafs.ac.cn/fpc/WebAGCoL/Carp/WebFPC/。结论:报告的鲤鱼物理图谱是鲤鱼基因组的第一个物理图谱,对于全基因组的装配和水产养殖的基因定位有促进作用。
【英文摘要】Background: Common carp (Cyprinus carpio), a member of Cyprinidae, is the third most important aquaculture species in the world with an annual global production of 3.4 million metric tons, accounting for nearly 14% of the all freshwater aquaculture production in the world. Apparently genomic resources are needed for this species in order to study its performance and production traits. In spite of much progress, no physical maps have beenavailable for common carp. The objective of this project was to generate a BAC-based physical map using fluorescent restriction fingerprinting.Result: The first generation of common carp physical map was constructed using four- color High Information Content Fingerprinting (HICF). A total of 72,158 BAC clones were analyzed that generated 67,493 valid fingerprints (5.5 × genome coverage). These BAC clones were assembled into 3,696 contigs with the average length of 476 kb and a N50 length of 688 kb, representing approximately 1.76 Gb of the common carp genome. The largest contig contained 171 BAC clones with the physical length of 3.12 Mb. There are 761 contigs longer than the N50, and these contigs should be the most useful resource for future integrations with linkage map and whole genome sequence assembly. The common carp physical map is available at http://genomics.cafs.ac.cn/fpc/WebAGCoL/Carp/WebFPC/.Conclusion: The reported common carp physical map is the first physical map of the common carp genome. It should be a valuable genome resource facilitating whole genome sequence assembly and characterization of position-based genes important for aquaculture traits.

【题目】Cultivation of the brown alga Hizikia fusiformis(Harvey) Okamura:controlled fertilization and early development of seedlings in raceway tanks in ambient light and temperature
【中文关键词】-
【英文关键词】Hizikia fusiformis, seaweed cultivation, fertilization, egg release
【中文摘要】-
【英文摘要】Commercial cultivation of the dioecious brown macroalgaHizikia fusiformis(Harvey) Okamura in East Asia depends on the supply of young seedlings from regenerated holdfasts or from wild population. Recent development of synchronized release of male and female gametes in tumble culture provides a possibility of mass production of young seedlings via sexual reproduction. In this paper, we demonstrate that controlled fertilization can be efficiently realized in ambient light and temperature in a specially designed raceway tank in which the sperm-containing water has been recirculated. The effective fertilization time of eggs by sperm was found to be within six hours. Fast growth and development of the young seedlings relied on the presence of water currents. Velocity tests demonstrated that young seedlings of 2 – 3 mm in length could withstand a water current of 190 cm s − 1 without detachment. Culture experiments at 24 h postfertilization showed that elongation of both the seedlings and their rhizoids were not hampered by high irradiance up to 600 μ mol photons m − 2 s − 1. However, growth was slightly retarded if culturedat a temperature of 16 ◦ C compared to other culture temperatures of 22, 25 and 29 ◦ C. No seedling detachment was observed after transfer of the young seedlings to raft cultivation in the sea after one and 1.5 months post-fertilization,indicating the feasibility of obtaining large quantity of seedlings in such a system.

【题目】The novel missense mutation of goat LHX4 gene
【中文关键词】山羊,错义突变,LHX4基因
【英文关键词】missense mutation;goat; LHX4
【中文摘要】新发现山羊LHX4基因的一个错义突变
【英文摘要】As a member of the LIM homeobox gene family, LHX4 gene plays a critical role in pituitary gland and nervous system development. Mutations in the LHX4 gene are associated with CPHD diseases in human and animal models. To date, no polymorphisms of LHX4 gene in goats have been reported. Herein, PCR-SSCP and DNA sequencing methods were employed to screen the genetic variation within goat LHX4 gene in 1275 Chinese indigenous goats. The results revealed a novel mutation: XM_613195.3:m.1053G>A, which identified a missense mutation at LHX4 locus: GTT (Val)>ATT (Ile) at position 280 aa of the LHX4 (390 aa). Moreover, frequencies of LHX4-A allele in the analyzed populations were 0.662, 0.553, 0.912, 0.957, 0.846, 0.693, 0.950 and 0.757 for Inner Mongolia white cashmere, Shaanbei white cashmere, Laoshan, Xinong Sarmen, Guanzhong, Boer, Haimen and Xuhuai populations, respectively. Gene homozygosity varied from 0.506 to 0.917. Significant statistical differences of genotypic frequencies for exon 6 of LHX4 locus implied that the V280I locus significantly associated with goat breeds by chi(2)-test (P < 0.001). 【题目】Molecular characterization of CART, AgRP, and MC4R genes and their expression with fasting and re-feeding in common carp (Cyprinus carpio)
【中文关键词】鲤鱼;CART;AgRP;MC4R;硬骨鱼;基因表达
【英文关键词】Common carp;CART;AgRP;MC4R;Teleost;Gene expression
【中文摘要】CART,AgRP和MC4R基因可控制食欲,这些基因已经得到了克隆和表征,并且用鲤鱼做了研究。CARTI和CARTII分别包含117和120个残基。AgRP-1和AgRP-2基因分别包含128和136个残基。CARTI基因主要在脑,眼和卵巢中表达,而CARTII在脑中有较高的表达。AgRP-1在脑,肠,睾丸和眼中大量表达,而AgRP-2基因在鳃和眼中高量表达。MC4R基因包含326个氨基酸残基,主要在脑,精巢,垂体和眼中表达。系统分析表明CARTI/CARTII和AgRP-1/AgRP-2可能源自鲤鱼基因组进化中基因的重复。与正常进食的鲤鱼相比,CART,AgRP和MC4R基因在禁食后表达亮降低,在重新进食后又急剧增加。因此CART,AgRP和MC4R在调节鲤鱼食欲方面起作用。
【英文摘要】Cocaine and amphetamine-regulated transcript (CART), agouti-related proteins (AgRP) and Melanocortin 4 Receptor (MC4R) involves in the control of appetite. The genes were cloned and characterized, and their regulation was studied in common carp. The CARTI and CARTII genes encode 117- and 120-amino acids, respectively. The AgRP-1 and AgRP-2 genes encode 128- and 136-amino acids, respectively. CARTI was principally expressed in the brain, eye and ovary, while CARTII was highly expressed in the brain. AgRP-1 was strongly expressed in the brain, intestine, testis and eye, while AgRP-2 was highly expressed only in the gill and eye. The MC4R gene, encoding 326-amino acids, was mainly expressed in the brain testis, pituitary and eye. Phylogenetic analysis had been conducted which implied that both CARTI/CARTII and AgRP-1/AgRP-2 might derived from gene duplication events during genome evolution of common carp. CART, AgRP and MC4R gene expression in brain were decreased after fasting treatment and increased

sharply after refeeding comparing with normal fed controls, which suggested that CART, AgRP and MC4R are involved in appetite regulation in common carp.

【题目】The polymorphism of a novel 30 bp-deletion mutation at KAP9.2 locus in the cashmere goat
【中文关键词】绒山羊,KAP9.2基因,缺失突变
【英文关键词】Cashmere goat; KAP9.2 gene; Deletion mutation
【中文摘要】在绒山羊KAP9.2位点发现一种新的30bp的缺失突变
【英文摘要】The keratins and keratin-associated proteins (KAPs) are a large heterogeneous group of proteins that make up about 90% of the cashmere fiber. Keratin-associated proteins 9.2 gene (KAP9.2) is one of the ultra high Sulfur KAPs. which might play an important role in the bundling of intermediate filaments. In this study, the deletion/insertion mutation of KAP9.2 gene in 997 cashmere goat samples was firstly detected, at the same time, parts of these samples were sequenced. The results showed that two alleles were detected at this KAP9.2P1 locus, named allele W and D. The frequencies of the KAP9.2-W allele in Inner Mongolia White cashmere (n = 785) and Shaanbei White cashmere goat breeds (n = 212) were 0.878 and 0.790, respectively. The chi(2)-test showed that the genotype distributions in these two cashmere goat breeds were not in agreement with Hardy-Weinberg equilibrium. According to the classification of polymorphism information content (PIC), Shaanbei White cashmere goat was more polymorphic at this locus. Moreover a 30bp-deletion mutation was described at KAP9.2P2 locus for the first time and no deletion/insertion was described at KAP9.2P1 locus. The results possibly revealed that the size polymorphism existed in the two Chinese cashmere goat and the 30 bp-deletion mutation was possibly Caused by variations in the number of the decapeptide repeat structures. 【题目】Cultivation of the intertidal brown alga Hizikiafusiformis (Harvey) Okamura: mass production of zygote-derived seedlings under commercial cultivation conditions, a case study experience
【中文关键词】-
【英文关键词】Seaweed cultivation; Hizikia fusiformis; seedling production; fertilization; mariculture
【中文摘要】-
【英文摘要】Mariculture of the brown alga Hizikia fusiformis (Harvey) Okamura as an export-oriented human food has been more than 20 years in China. It is now one of the five major farmed algal species along the Chinese coast. Stable and sufficient supply of young seedlings for scaling up the cultivation has been a problem throughout the farming history of this species due to the unique dioecious life cycle and relatively short time window of sexual reproduction. A key solution to this problem is to control the synchronization of the receptacle development and to realize simultaneous discharge of male and female gametes, such that fertilization rate could be greatly enhanced. Focusing on one of the farmed populations in this report, we present our results on mass production of seedlings by use of synchronization technique on large scale performed in 2007. Totally 5.5 hundred million embryos were obtained from 100 kg female sporophytes. The seedlings were raised up to 3.5 mm in length in greenhouse tanks over a month and were further grown up in open sea over 3 months at two experimental sites. The success of mass production of seedlings in this alga helped to lay the basis for

future trials in other species in the genus of Sargassum that have identical life cycle.

【题目】TRBP homologue interacts with Eukaryotic Initiation Factor 6 (eIF6) in Fenneropenaeus chinensis.
【中文关键词】Wang, Shuai;Liu, Ning;Chen, An-Jing;Zhao, Xiao-Fan;Wang, Jin-Xing
【英文关键词】RNA-BINDING-PROTEIN; DOUBLE-STRANDED-RNA; KINASE PKR; ANTIVIRAL IMMUNITY; MOLECULAR-CLONING; PENAEUS-MONODON; MARINE SHRIMP; HIV-1 TAR; IN-VITRO; VIRUS
【中文摘要】无
【英文摘要】The HIV transactivating response RNA-binding protein (TRBP) plays an important role in many biological processes. We have cloned three cDNAs from newly identified genes in the TRBP family from Fenneropenaeus chinensis. These genes have been designated Fc-TRBPI-3. Recombinant Fc-TRBP1, which was produced in Escherichia coli, was used for panning of a T7 phage display library of the Chinese shrimp hemocytes. From this panning, Fc-eukaryotic initiation factor 6 (Fc-eIF6) was isolated and sequenced. Fc-eIF6 was then cloned, recombinantly expressed, and shown to interact with Fc-TRBP by the performance of pull-down assays and Far Western blot analysis. Expression of Fc-TRBP was detected in many tissues, with elevated expression in the heart, gill, and intestine in the early stages of infection by the white spot syndrome virus (WSSV), and enhanced expression in most tissues following challenge with Vibrio anguillarum. Western blot studies confirmed the increased expression of Fc-TRBP in the gill after WSSV infection. The expression pattern of eIF6 was also analyzed and its expression was also up-regulated in intestine of WSSV-challenged shrimp. The replication of WSSV was reduced after injection of Fc-TRBP. These results indicate that Fc-TRBP and Fc-eIF6 may be components of the RNA-induced silencing complex (RISC), and thereby play a crucial role in the antiviral defense response of shrimp. 【题目】CHH family peptides from an ‘ eyeless ‘ deep-sea hydrothermal vent shrimp, Rimicaris kairei: characterization and sequence analysis
【中文关键词】Qian, Ye-Qing;Dai, Li;Yang, Jin-Shu;Yang, Fan;Chen, Dian-Fu;Fujiwara, Yoshihiro;Tsuchida, Shinji;Nagasawa, Hiromichi;Yang, Wei-Jun
【英文关键词】Crustacean hyperglycemic hormone; Extreme environment; Isoform; Molecular cloning; Rimicaris kairei; Vitellogenesis-inhibiting hormone
【中文摘要】无
【英文摘要】The crustacean eyestalk synthesizes and secretes several structurally-related peptides belonging to the crustacean hyperglycemic hormone (CHH) family, which are considered major physiological regulators during the crustacean life cycle. However, it is intriguing that eyestalks of many hydrothermal vent crustaceans prove to have varying degrees of reduction. In the present study, we characterized full-length cDNAs encoding two important eyestalk hormones of the CHH family, CHH and VIH (vitellogenesis-inhibiting hormone), from the 'eyeless' hydrothermal vent shrimp Rimicaris kairei. The two isoforms of Chh cDNA were 1027 and 1877 bp in length, respectively, and the deduced preprohormones contained 137 and 138 aa, respectively. The Vih cDNA was 907 bp in length, encoding a putative preprohormone of 113 aa. When compared with other known protein sequences of CHHs and VIHs, these polypeptides from hydrothermal vents show high similarity with their non-vent counterparts. These results may provide evidence for the mechanisms of eyestalk reduction and vent-adapting evolution of crustaceans. The hydrothermal vent shrimp with reduced eyestalks may take a different evolutionary pathway than eyestalk-holding crustaceans, and the reduced eyestalks can be considered a good example for the investigation of the diversity of crustacean evolution in different environments. 【题目】Response of metallothionein gene-1 to laboratory exposure to heavy metals and thermal stress in the freshwater prawn Macrobrachium rosenbergii
【中文关键词】Mahmood K, Yang JS, Chen DF, Wang MR, Yang F, Yang WJ
【英文关键词】Metallothioneins; Biomarkers; Heavy metals; Environment; Biomonitring
【中文摘要】无
【英文摘要】Metallothioneins, metal-inducible proteins, are being characterized from different organisms and shown as potential biomarkers of exposure to pollution by certain heavy metals. Here we report the identification of a new metallothionein cDNA (433 bp) from the shrimp Macrobrachium rosenbergii, putatively encoding a 61 residue polypeptide. Tissue specific analysis indicated that Mar-MT-I (M. rosenbergii Metallothionein Gene-1) is expressed with the highest levels in the hepatopancreas and lowest in the thoracic ganglia, and none in the gills or muscles. In addition, our data showed that Mar-MT-I is differentially regulated in the hepatopancreas by certain heavy metals and thermal stress: Cd and Cu produce somewhat similar expression profile patterns, Zn has a reductional effect and thermal stress alone entirely stops its expression. These results show that Mar-MT-I mRNA levels can potentially be used as biomarkers for Cd. Cu or Zn pollution individually. However, in the case of combined metal treatment, different combinations of these metals have quite different effect on Mar-MT-I expression. Therefore, factors of such differential behaviors should be kept as a priority for further biomonitring studies.

【题目】兔抗对虾白斑症病毒(WSSV)独特型抗体的制备及其特性分析
【中文关键词】韦秀梅, 绳秀珍, 唐小千, 邢婧, 战文斌
【英文关键词】Idiotypic antibody; WSSV; ELISA; Dot-blot; IIFA; Western-blot;
【中文摘要】以前期已制备的抗WSSV囊膜蛋白单克隆抗体4G9(Ab1)杂交瘤细胞生产小鼠腹水,腹水经辛酸-硫酸铵法、ProteinG亲和层析法纯化后,用以制备兔抗血清,所得血清经纯化得到粗提的兔抗WSSV独特型抗体(Ab2)。采用竞争酶联免疫吸附实验、间接免疫荧光法、斑点免疫印迹和蛋白免疫印迹等实验方法分析了Ab2特性,结果表明:Ab2能识别Ab1并与WSSV竞争Ab1的抗原结合位点,是具有模拟WSSV特性的抗独特型抗体;Ab2能与中国对虾血细胞结合,并能部分阻断WSSV与血细胞膜的结合;其与中国对虾血细胞膜上结合的蛋白分子量分别为94.5、51.5和27.0kDa,由此推断,这三个蛋白为WSSV在中国对虾血细胞膜上的结合蛋白。本研究结果可为进一步研究WSSV侵染机理提供资料。
【英文摘要】During the past more than ten years since a white spot syndrome virus (WSSV) disease outbreak in 1993, many research papers have been published on the pathogen, pathology, detection and diagnostic methods of the disease. Recent works focused mainly on the infection mechanism and searching the strategies of prophylaxis and control of WSSV infection. The purpose of this work was to produce rabbit anti-idiotypic antibody of WSSV (Ab2), analyze its characteriza-tion, and find a new way to study WSSV infection

mechanism. Anti-WSSV envelope protein monoclonal antibody (Ab1), which was produced previously, was purified from ascitic fluid using caprylic acid-ammonium sulfate (CA-AS) and Pro-tein G agrose, then used to immunize rabbit, and finally Ab2 was purified from rabbit antiserum using CA-AS. The Ab2 was characterized by enzyme-linked immunosorbent assay (ELISA), indirect immunofluorescence assay (IIFA), Dot-blot and Western-blot. Results of competitive ELISA indicate that Ab2 could recognize Ab1 specifically and inhibit competi-tively the binding of WSSV with Ab1, implying that Ab2 could compete against the same paratope on Ab1 with WSSV, and represent an internal image of WSSV. In the meantime, IIFA proved that Ab2 could bind to the haemocyte membrane of Chinese shrimp (Fenneropenaeus chinensis). The results of both Dot-blot and ELISA blocking experiments show that Ab2 could block the binding of WSSV to haemocyte membrane. By Western-blot, three protein bands of 94.5, 51.5 and 27.0kDa were recognized specifically by Ab2, and they were considered to be WSSV binding protein on Chinese shrimp haemocyte membrane.

【题目】A Dicer-1 gene from white shrimp Litopenaeus vannamei: Expression pattern
【中文关键词】Yao XM, Wang LL, Song LS, Zhang H, Dong CH, Zhang, Y, Qiu LM, Shi YH,Zhao JM, Bi YK
【英文关键词】Litopenaeus vannamei; Dicer-1; mRNA expression; Immune response; Laval development
【中文摘要】无
【英文摘要】Dicer is a member of the RNAase III family which catalyzes the cleavage of double-stranded RNA to small interfering RNAs and micro RNAs, and then directs sequence-specific gene silencing. In this paper, the full-length cDNA of Dicer-1 was cloned from white shrimp Litopenaeus vannamei (designated as LvDcr1). It was of 7636 bp, including a poly A tail, a 5' UTR of 136 bp, a 3' UTR of 78 bp, and an open reading frame (ORF) of 7422 bp encoding a putative protein of 2473 amino acids. The predicted amino acid sequence comprised all recognized functional domains found in other Dicer-1 homologues and showed the highest (97.7%) similarity to the Dicer-1 from tiger shrimp Penaeus mondon. Quantitative real-time PCR was employed to investigate the tissue distribution of LvDcr1 mRNA, and its expression in shrimps under virus challenge and larvae at different developmental stages. The LvDcr1 mRNA could be detected in all examined tissues with the highest expression level in hemocyte, and was up-regulated in hemocytes and gills after virus injection. These results indicated that LvDcr1 was involved in antiviral defense in adult shrimp. During the developmental stages from fertilized egg to postlarva VII, LvDcr1 was constitutively expressed at all examined development stages, but the expression level varied significantly. The highest expression level was observed in fertilized eggs and followed a decrease from fertilized egg to nauplius I stage. Then, the higher levels of expression were detected at nauplius V and postlarva stages. LvDcr1 expression regularly increased at the upper phase of nauplius, zoea and mysis stages than their prophase. The different expression of LvDcr1 in the larval stages could provide clues for understanding the early innate immunity in the process of shrimp larval development

【题目】cDNA cloning and mRNA expression of a selenium-dependent glutathione from Eriocheir sinensis
【中文关键词】Changkao Mu, Duojiao Ni, Jianmin Zhao, Lingling Wang, Linsheng Song , Ling Li, Huan Zhang,
【英文关键词】Chlamys farreri,Selenium-dependent glutathione peroxidase,Gene cloning,Expression profile
【中文摘要】无

【英文摘要】The glutathione peroxidases are essential enzymes of the cellular antioxidant defence system. In the presentstudy, the full-length cDNA sequence encoding an extracellular glutathione peroxidase (designated CfGPx3)was isolated from Zhikong scallop Chlamys farreri. The complete cDNA was of 1194 bp, containing a 5′ untranslated region (UTR) of 50 bp, a 3′ UTR of 490 bp and an open reading frame (ORF) of 654 bp encodinga polypeptide of 217 amino acids. CfGPx3 possessed all the conserved features critical for the fundamentalstructure and function of glutathione peroxidase, such as the selenocysteine encoded by stop codon UGA, theGPx signature motif (96LGVPCNQF103) and the active site motif (179WNFEKF184). The high similarity ofCfGPx3 with GPx from other organisms indicated that CfGPx3 should be a new member of the glutathioneperoxidase family. By fluorescent quantitative real-time PCR, the CfGPx3 mRNA was universally detected inthe tissues of haemocytes, gill, gonad, muscle and hepatopancreas with the highest expression inhepatopancreas. After scallops were challenged by Listonella anguillarum, the expression level of CfGPx3transcript in haemocytes was significantly up-regulated (Pb0.05) at 8 h post challenge. These resultssuggested that CfGPx3 was potentially involved in the immune response of scallops and perhaps contributedto the protective effects against oxidative stress.

【题目】Identification and characterization of a Cystatin gene from Eriocheir sinensis
【中文关键词】Limei Qiu a, Ming Cong
【英文关键词】Cystatin; Eriocheir sinensis; mRNA expression; Immune response; Papain; Inhibitory activity
【中文摘要】无
【英文摘要】Cystatins are a superfamily of proteins as reversible inhibitor of cysteine proteinases which play essential roles in a spectrum of physiological and immunological processes In this study, a novel member of Cystatin superfamily was identified from Chinese mitten crab Enocheir sinensis (designated EsCystain) by expressed sequence tag (EST) analysis and rapid amplification of cDNA ends (RACE) approaches The full-length cDNA of EsCystatin was of 1486 bp, consisting of a 5'-terminal untranslated region (UTR) of 92 bp, a 3' UTR of 1034 bp with a polyadenylation signal sequence AATAAA and a polyA tail, and an open reading frame (ORF) of 360 bp encoded a polypeptide of 120 amino acids with the theoretical isoelectric point of 548 and the predicted molecular weight of 13 39 kDa. A signal Cystatin-like domain (Gly(25) to Lys(112)) was found in the putative amino acid sequences of EsCystatin Similar to other Cystatins, the conserved central Q(70)VVSG(74) motif was located in the Cystatin-like domain of EsCystatin But EsCystatin lacked of signal peptide and disulphide bond. The EsCystatin exhibited homology with the other known Cystatins from invertebrates and higher vertebrates, and it was clustered into Cystatin family 1 in the phylogenetic tree. The mRNA transcripts of EsCystain were mainly expressed in hemolymph, gill, hepatopancreas, gonad and muscle, and also marginally detectable in heart After Listonella anguillarum challenge, the relative expression level of EsCystatin in hemolymph was down-regulated to 0 6-fold ($P < 0.05$) at 3 h post-challenge. Subsequently, it was up-regulated to 3.0-fold ($P < 0.01$)at 24 h Afterwards. EsCystatin mRNA transcripts suddenly decreased to original level. After Pichia pastoris GS115 challenge, its mRNA expression level in hemolymph was up-regulated to the peak at 3 h (2 8-fold of that in blank ($P < 0$ 01)) The cDNA fragment encoding the mature peptide of EsCystatin was recombined and expressed in Escherichia coli Rosetta-gami (DE3). The recombinant EsCystatin displayed a promoter inhibitory activity against papain When the concentration of EsCystatin protein was of 300 mu g mL(-1), almost 89% of papain activity could be inhibited. These results collectively suggested that EsCystatin was a novel member of protein in Cystatin family, was a potent inhibitor of papain and involved in immune response versus invading microorganisms.

【题目】Molecular characterization and expression of a crustin-like gene from Chinese mitten crab Eriocheir sinensis
【中文关键词】Mu CK, Zheng PL, Zhao JM, Wang LL, Zhang H, Qiu LM, Gai YC, Song LS
【英文关键词】Eriocheir sinensis; Crustin; WAP domain; Recombinant expression; Antibacterial activity; Minimal inhibitory concentration (MIC)
【中文摘要】无
【英文摘要】Crustin is a cysteine-rich antibacterial peptide which widely distributes within decapod crustaceans. In the present study, the cDNA encoding crustin-like peptide (designated CrusEs) was cloned from Chinese mitten crab Eriocheir sinensis by using rapid amplification of cDNA ends (RACE) approaches and expressed sequence tag analysis. The full-length cDNA of CrusEs was of 796 bp, containing a 5' untranslated region (UTR) of 214 bp, a 3' UTR of 267 bp with a poly(A) tail, and an open reading frame (ORF) of 315 bp encoding a polypeptide of 104 amino acids including a putative signal peptide of 21 amino acids. A WAP domain and the consensus framework existing in class I crustins were both identified in CrusEs, suggesting that CrusEs is a new member of type I crustins. Quantitative real-time RT-PCR was employed to examine the expression of CrusEs, and its mRNA transcript was mainly detected in haemocytes and gill. The CrusEs mRNA transcript in haemocytes was down-regulated after the challenge with Gram-positive bacteria Micrococcus luteus, while Gram-negative bacteria Listonella anguillarum did not induce significant variation of CrusEs mRNA. The mature peptide of CrusEs was cloned into pET-21a(+) with a C-terminal hexa-histidine tag fused in-frame, and expressed in Escherichia coil, and the recombinant CrusEs inhibited the growth of Gram-positive bacteria with low MIC. The results indicate that CrusEs is a potent antibacterial protein against Gram-positive bacteria infection, and it may play an important role in innate immune response of E. sinensis.

【题目】The second anti-lipopolysaccharide factor (EsALF-2) with antimicrobial activity in Eriocheir sinensis
【中文关键词】Zhang Y, Wang LL, Wang LL, Yang JL, Gai YC, Qiu LM, Song LS
【英文关键词】Eriocheir sinensis; Anti-lipopolysaccharide factor; Listonella anguillarum; Pichia pastoris; Antimicrobial activity
【中文摘要】无
【英文摘要】The anti-lipopolysaccharide factor CALF) is a small basic protein that can bind and neutralize lipopolysaccharide (LPS), mediating degranulation and activation of an intracellular coagulation cascade. In the present study, cDNA of the second Eriocheir sinensis ALF (designated as EsALF-2) was cloned and the full-length cDNA of EsALF-2 was of 724 bp, consisting of an open reading frame (ORF) of 363 bp encoding a polypeptide of 120 amino acids. The deduced amino acid of EsALF-2 shared 82% similarity with EsALF-1 from E. sinensis and about 53-65% similarity with ALFs from other crustaceans. The potential tertiary structures of EsALF-1 and EsALF-2 contained two highly conserved-cysteine residues to define the LPS binding site, but the N-terminal of EsALF-1 formed a single additional alpha-helix compared to EsALF-2, implying that EsALF-1 and EsALF-2 might represent different biological functions in E. sinensis. The mRNA transcript of EsALF-2 was detected in all examined tissues of healthy crabs, including haemocytes, hepatopancreas, gill, muscle, heart and gonad, which suggested that EsALF-2 could be a multifunctional molecule for the host immune defense responses and thereby provided systemic protection against pathogens. The mRNA expression of EsALF-2 was up-regulated after Listonelln anguillarum and Pichia pastoris challenge and the recombinant protein of EsALF-2 showed antimicrobial activity against L. anguillarum and P. pastoris. indicating that EsALF-2 was involved in the immune defense responses in Chinese mitten crab against L. anguillarum and P. pastoris. These results together indicated that there were abundant and diverse ALFs in E. sinensis with various biological functions and these ALFs would provide candidate promising therapeutic or prophylactic agents in health management and diseases control of crab aquaculture.

【题目】Two novel secreted ferritins involved in immune defense of Eriocheir sinensis
【中文关键词】Kong PF, Wang LL, Zhang H, Zhou Z, Qiu LM, Gai YC, Song LS
【英文关键词】Secreted ferritin; Iron-withholding strategy; Innate immunity; Metal binding site; Pathogen infection; Eriocheir sinensis
【中文摘要】无
【英文摘要】As a principal extracellular iron storage molecule, secreted ferritin plays an important role in the iron-withholding strategy of innate immunity. In this study, two novel secreted ferritins were identified from Chinese mitten crab Eriocheir sinensis (designated as EsFer-1 and EsFer-2) by rapid amplification of cDNA ends (RACE) approaches and expressed sequence tag (EST) analysis. The full-length cDNAs of EsFer-1 and EsFer-2 were of 1278 and 1595 bp, respectively, both containing a putative iron response element (IRE) in their 5' UTRs and multiple A + U-destabilizing elements (TATT or ATTTA) in their 3' UTRs. The ORFs of these two crab ferritin cDNAs were of 639 and 663 bp, respectively, encoding two peptides of 212 and 220 amino acid residues each with a signal peptide and typical structures of ferritins such as four long alpha-helices, one short alpha-helix and an L-loop. EsFer-2 exhibited higher similarity with the H-ferritins from both invertebrates and vertebrates, while EsFer-1 was closer matched to L-ferritins. The eight amino acid residues identified as metal binding sites in vertebrate H-ferritins were conserved in EsFer-2 (Glu53, Tyr60, Glu87, Glu88, His91, Glu146, Glu177 and Gln178), but none of them was observed in EsFer-1. By fluorescent quantitative real-time PCR, mRNA transcripts of EsFer-1 and EsFer-2 were mainly detected in muscle, hepatopancreas and gill, and also marginally detectable in gonad, heart and hemocytes. After the crabs were challenged by bacteria Listonella anguillarum, the transcriptional levels of both EsFer-1 and EsFer-2 in hemocytes were up-regulated twice. In the first up-regulation, the mRNA relative expression levels of both EsFer-1 and EsFer-2 reached peak at 3 h post-challenge, while in the second up-regulation, they did not reach the highest point within the experiment duration. After the fungi Pichia pastoris GS115 challenge, there was only one transcriptional level peak of both the two ferritins, appearing at 6 h post-challenge. These results suggest that secreted EsFer-1 and EsFer-2 are crucial proteins in the iron-withholding defense system, and play important roles in the innate immune responses in crabs.

【题目】Cultivation of the brown alga Sargassum horneri : sexual reproduction and seedling production in tank culture under reduced solar irradiance in ambient temperature
【中文关键词】-
【英文关键词】Sargassum horneri; Fertilization;Brown alga; Seaweed cultivation; Seedling production
【中文摘要】-
【英文摘要】As a larg e conspicuous intertidal brown alga,individuals of Sargassum horneri can reach a length of more than 7 m with a fresh weight of 3 kg along the coasts of the Eastern China Sea. The biomass of this alga as a vital component in coast al water eco logy has been well documented. In recent years, a stead y disappearance o f the algal biomass along the once densely populated coastal areas of the Eastern Chin a Sea has drawn attention in China. Efforts have been made to reconstruct the subtidal algal flora or even to grow the alga by use of long-lines. As part of the efforts to establish an efficient technique for producing seedlings of S. horneri, in this investigation a series of culture experiments were carried out in indoor raceway and rectangular tanks under reduced solar irradiance at ambient temperature in 2007 – 2008. The investigation demonstrated that : (1) sexual reproduction of S.horneri could be accelerated in elevated temperature and light climates, at least 3 months earlier than in the wild; (2)eggs of S. horneri had the potential to be fertilized up to 48 h, much longer than that of know n related species; (3)suspen sion and fixed cult ure met hods were both effective in growing the seedlings to the long-lin e cu ltivation stage; and (4) the life cycle of S. horneriin culture could b e short ened to 4.5 months, thus establis hing this alga as an appropr iate model for inves tigatin g sexual reprod ucti on in dieocious speci es of this genus.

【题目】Novel SNP of the goat prolactin gene (PRL) associated with cashmere traits
【中文关键词】PRL基因,单核苷酸多态性
【英文关键词】PRL;SNP
【中文摘要】在PRL基因中发现了新的与产绒性状相关的SNP
【英文摘要】Concentrations of the single-chain polypeptide hormone prolactin (PRL) are associated with wool or cashmere traits, and its seasonal changes may determine patterns of enzymatic activity and may affect cashmere fibre growth and moult. So, the PRL gene is a potential candidate gene for cashmere traits in marker-assisted selection (MAS). In this paper, we report a novel missense single-nucleotide polymorphism (SNP) within the goat PRL gene in 1367 individuals by PCR-SSCP (polymerase chain reaction with single-strand conformation polymorphism) analysis and DNA sequencing. The novel X76049:g.576C>A mutation is confirmed by Eco24I PCR-RFLP (restriction fragment length polymorphism) analysis and causes a missense codon (Pro176Thr). The frequencies of allele C varied from 0.79 to 0.93 in 9 analysed goat populations. C allele was correlated with higher fibre length ($P = 0.014$).

【题目】浙江洞头不同羊栖菜品系的形态特征及1 个代表性养殖群体的AFLP 分析
【中文关键词】羊栖菜;形态特征;AFLP;遗传多态性
【英文关键词】Hizikia fusiformis ;morphological characteristics;AFLP;genetic polymorphism
【中文摘要】2007 年对中国羊栖菜(Hizikia fusiformis) 主产区浙江省洞头县12 个羊栖菜养殖品系的重要形态特征和经济性状进行了比较研究,并利用AFLP 技术对1 个典型养殖群体的遗传多态性进行了分析。结果显示,这12 个品系在全长、全湿质量、侧枝长、侧枝湿质量、侧枝密度等方面存在显著或极显著差异(P<0.05 或P<0.01)。8 对AFLP 引物组合在这个典型羊栖菜养殖群体的27 个随机挑选的个体中扩增出198 个片段,其中多态性片段为166 个,多态位点比率为83.8%。平均每对引物扩增的片段为24.8 条。根据个体间的Nei 遗传距离,以UPGMA 法构建了个体间的系统树图,27 个羊栖菜个体聚为一枝,作为对照的铜藻为另一枝。本研究从形态与DNA 分子水平说明了浙江洞头羊栖菜养殖群体具有高度遗传多态性。
【英文摘要】The brown seaweed Hizikia fusiformis has been one of the five major farmed algae species along the Chinese coast. In recent years,mass production of zygote-derived seedlings by use of synchronization technique has been well established and successfully applied under commercial cultivation conditions. This techniqueadvance makes cultivation of this alga more sustainable and lays the foundation for future breeding work. Theprincipal cultivation ground of H. fusiformis in China is at Dongtou county,Zhejiang province. The farmedpopulation in that region is a mixture of different geographical populations collected along the Chinese coast. Up to now,there has been no report on fundamental biological information of this farmed population. Theprincipal goal of this investigation is to analyze morphological variations among different strains and assessgenetic polymorphism of a representative population. Totally 12 strains were collected and six characteristicswere measured including total length,total wet weight,branchlet length,branchlet wet weight,branchletdensity and the number of receptacles per branchlet. Meanwhile,twenty-seven individuals were randomlysampled from a representative population for genomic DNA isolation and AFLP analyses to assess geneticpolymorphism. Morphological analyses revealed significant differences among these 12 strains in terms of totallength,total wet weight,branchlet length,branchlet wet weight and branchlet density (P<0.05 or P<0.01). InAFLP analyses,by using eight pairs of primer combinations in the representative population including EcoRI-AAC/MseI-CAA,EcoRI-AAC/MseI-CAC,EcoRI-AAC/MseI-CCA,EcoRI-AAC/MseI-CCT,EcoRI-AAG/MseI-CAA,EcoRI-AAG/MseI-CAC,EcoRI-AAG/MseI-CAG,EcoRI-ACC/MseI-CAA,a total of 198 DNA fragmentswere amplified,of which 166 were polymorphic. The percentage of polymorphic fragments was 83.8% and the number of amplified fragments ranged from 15 to 38 with an average of 24.8 for each primer combination. Based on Nei ' s genetic distance individual-wise dendrogram was constructed by use of UPGMA cluster analysis,from which it was presented that 27 H. fusiformis individuals clustered into one clade and the individual of Sargassum horneri clustered into another one. The morphological characteristics selected in this study were closely related to commercial production and could be used as reference for future studies. The most important result of this study is the high polymorphism detected in the farmed population. High polymorphic parental resources provide valuable basic materials for breeding of new varieties.

【题目】Analysis of caprine pituitary specific transcription factor-1 gene polymorphism in indigenous Chinese goats

【中文关键词】山羊,多态性,垂体特异性转录因子1,

【英文关键词】Caprine Adiponectin Gene, Polymorphism

【中文摘要】山羊垂体特异性转录因子1在中国本土山羊中的多态性分析

【英文摘要】Since mutations on POU1F1 gene possibly resulted in deficiency of GH, PRL, TSH and POU1F1, this study revealed the polymorphism of goat POU1F1-AluI locus and analyzed the distribution of alleles on 13 indigenous Chinese goat breeds. The PCR-RFLP analysis showed the predominance of TT genotype and the frequencies of allele T varied from 0.757 to 0.976 in the analyzed populations (SBWC, Bo, XH and HM). Further study, distributions of genotypic and allelic frequencies at this locus were found to be significantly different among populations based on a chi(2)-test ($P < 0.001$), suggesting that the breed factor significantly affected the molecular genetic character of POU1F1 gene. The genetic diversity analysis revealed that Chinese indigenous populations had a wide spectrum of genetic diversity in goat POU1F1-AluI locus. However, the ANOVA analysis revealed no significant differences for gene

homozygosty, gene heterozygosty, effective allele numbers and PIC (polymorphism information content) among meat, dairy and cashmere utility types (P > 0.05), suggesting that goat utility types had no significant effect on the spectrum of genetic diversity.

【题目】Novel Polymorphism at the 3 ′ UTR of the Caprine Adiponectin Gene
【中文关键词】脂联素,多态性
【英文关键词】Polymorphism; Caprine Adiponectin Gene
【中文摘要】发现脂联素基因3 ′ UTR新的多态性
【英文摘要】As an adipose-derived plasma protein, adiponectin (also called ADIPON, ACRP30),is an adipose tissue-speci fi c secretory protein that plays an important role in thedevelopment of metabolic and atherosclerotic disorders, such as obesity,

hypertension, type 2 diabetes, and cardiovascular disease, which can stimulate fatty acidoxidation, suppress hepatic gluconeogenesis, and inhibit in fl ammatory responses(D ı ´ ez and Iglesias 2003; Yang et al. 2004). It is signi fi cantly associated with obesityand weight loss. Moreover, it improves insulin sensitivity by stimulating glucoseutilization and fatty acid oxidation through the phosphorylation and activation ofAMPK in both skeletal muscle and liver (Yang et al. 2004). Numerous humangenetic studies on adiponectin and the metabolic syndrome strongly suggest thatadiponectin is one of the causative factors in its pathogenesis, providing signi fi cantinsights into the genetic makeup of the metabolic syndrome (Yang and Chuang2006).

【题目】基于有性繁殖的鼠尾藻规模化繁育试验
【中文关键词】鼠尾藻　人工育苗　幼苗发育　附着基
【英文关键词】-
【中文摘要】2007~2009年间, 先后在威海小石岛开展了两次鼠尾藻的规模化人工育苗试验, 在威海周边和青岛开发区海域进行了3次保苗实验。两年育苗的试验规模均为10个育苗池(规格一致, 均为2m　5m) 和部分备用池。所用种菜主要在威海附近的多个海域采集, 其中以小石岛采集的种菜最为理想。通过6种常见附着基的对比试验, 附着基以竹帘附苗密度最高, 操作方便和附苗量结合理想的附着基是织带帘。平面基质上的附苗密度最大, 达到30株/ cm2。2007年出幼苗750　7万株, 平均苗长3　5mm; 2008年出幼苗3015　42万株, 平均苗长3　2mm。本试验发现, 鼠尾藻幼苗早期发育中, 幼苗附苗较均匀, 但生长到4mm后, 幼苗有大面积脱落的现象, 随着日后的生长, 苗种密度也逐渐下降, 到10mm时密度降低到0　2~ 10株/ cm2。

【题目】A PCR-SSCP and DNA sequencing detecting two silent SNPs at KAP8.1 gene in the cashmere goat
【中文关键词】KAP8.1基因,多态性
【英文关键词】KAP8.1,Polymorphism
【中文摘要】使用PCR-SSCP和DNA测序发现绒山羊KAP8.1基因的2个沉默SNP
【英文摘要】Keratin-associated proteins 8.1 gene (KAP8.1) is a structural gene responsible for the cashmere. KAP8.1 protein contains high glycine and tyrosine, which concerns regulation and function of the matrix structure fiber. In this study, the polymorphism of KAP8.1 gene was detected by methods of aPCR-SSCP (asymmetric polymerase chain reaction single-strand conformation polymorphism) and DNA sequencing in 791 individuals from two breeds. The results showed that there were two mutations in this gene. The mutations were described as c.63 T > G and c.66 C > G, which would result in two synonymous mutations in KAP8.1 protein. The findings go against previous research, in which there was not polymorphism at KAP8.1 gene. The reasons might be that different cashmere breeds were detected in two studies. Further analysis of results leads us to believe that the polymorphism of KAP8.1 gene might be relevant to fiber diameter.

【题目】A PstI polymorphism at 3′UTR of goat POU1F1 gene and its effect on cashmere production
【中文关键词】PstI内切酶,多态性,3′端非翻译区,产绒量
【英文关键词】PstI,polymorphism,3′UTR,cashmere production
【中文摘要】山羊POU1F1基因3′UTR的一个新的PstI酶切多态性以及对产绒形状的影响
【英文摘要】POU1F1 is a positive regulator for prolactin (PRL) whose metabolites may directly or indirectly affect some aspects of the hair growth cycle, therefore, POU1F1 gene is an important candidate gene for cashmere traits selection through marker-assisted selection (MAS). Hence, in this study, the PCR-RFLP method was applied to detect a T > C transition determining a PstI polymorphism at the 3'UTR of POU1F1 locus and evaluate its associations with cashmere traits in 847 Inner Mongolia White Cashmere goats. In the analyzed population, the allelic frequencies for the T and C alleles are 0.959 and 0.041, respectively and the genotypic frequencies are in Hardy-Weinberg equilibrium (P > 0.05). Moreover, significant statistical relationships between the PstI polymorphism of POU1F1 gene and goat cashmere yields were found (*P < 0.05). When compared with TC genotype, TT genotype was associated with superior cashmere yields in 2, 4, and 5 years old individuals, as well as with average cashmere yield. Hence, TT genotype is suggested to be a molecular marker for senior cashmere yield.

【英文摘要】Hizikia fusiformis thalli experience dynamic incide nt ligh t condition s during the pe riod of grow th. The presen t study was designed to examine how changi ng photon irra diance affects the photos ynthes is both in the short and long terms by culturing H. fusifor misunder three different light levels: 35 μ mol photon s m-2s-1(low light,LL), 85 μ mol photons m-2s-1(interm ediate light, IL), and165 μ mol photon s m-2s-1(high light, HL). A sim ilarrelative grow th rate was o bserved be tween IL- and HL-grown algae, but the grow th rate was signi ficantly reducedin LL-grow n algae. The p hotosynthe tic rates (Pn) meas uredat thei r respec tive growth ligh t levels wer e found to belowest in the thal li grown at LL and highest at HL.However, LL-grow n algae exhibi ted much higherPn in compa rison with IL- and the HL-gr own thalli at the samemeas uring photosynth etic photon flux densi ty, indic atingth e p ho to syn th etic a cc lim a tion to lo w gr owt h lig ht in H. fusifor mis. The photoynth esis – ligh t curves showed thatLL-g rown algae had a highes t light-s aturating maxi mum Pn(Pmax) in compa riso n with IL- or HL-gr own algae when thephotos ynthetic rates wer e e xpressed on the biomass b asis.However, PMax was highes t in HL-gr own algae compa red to IL- or LL-grow n algae when the rates were norm alized to chlor ophyll a . The ph otosynthes is – inorganic carbon (Ci) respon se curves wer e also signifi cantly affected by the growth ligh t condition s. The highest value of apparen t photos ynthetic conduct ance occurr ed in LL-g rown algae while the lowest value in HL-grown algae. Additionall y, the activity of exter nal carbonic anh ydrase (CA) tended to incre ase whi le the tota l CA activity incl ined to decreas e in H. fusiformi sthalli when the grow th ligh t level alte red from 35 to 165 μ mol photon s per square meter per second. The e xt er na l CA in hi bi to rs sh ow ed a h igher inhibit ion i n HL-gr own algae compa red with LL-g rown algae. It was prop os ed that photosyn thetic acclimation to low light condit ion in H. fusifor miswas achiev ed throu gh an incre ase in the number of react ion centers and incre ased capaci ties of electron transport and of Ci trans port withi n cells. The ability of photos ynthetic accli mation to low light confer s H. fusiformi sthalli to overcom e the environmen tal low light condit ion as a result o f the attenuati on o f seaw ater or self-shadi ng throu gh enhanci ng its photos ynthet ic p erformance and carbon assi milation necess ary for growth.

【题目】Twelve novel SNPs of the goat POU1F1 gene and their associations with cashmere traits
【中文关键词】单核苷酸多态性,POU1F1基因
【英文关键词】SNPs,POU1F1
【中文摘要】山羊POU1F1基因12个SNP以及它们与产绒形状的关系
【英文摘要】As a member of the POU-domain family, pituitary-specific transcription factor 1 (POU1F1) is responsible for a phenotype of combined pituitary hormone deficiency (CPHD) involving growth hormone (GH), prolactin (PRL) and thyrotropin β subunit (TSH β). Owing to PRL concentrations associated with wool growth and wool traits, the POU1F1gene is a potential candidate gene for cashmeretraits selection and breeding through marker-assisted selection (MAS). We used PCR – SSCP and DNA sequencing to screen for genetic variations of the unreported exons 1 – 5 and 5 ′ -UTR within POU1F1gene in 452 Inner Mongolian white cashmeregoats. We report twelvenovelSNPs within the goatPOU1F1gene, namely, IVS + 10G > T, EX3_113G > T resulting in Glu109His, EX3_114G > T resulting in Glu110ter, IVS3 + 8C > T, IVS3 + 41T > G, IVS3 + 41_42insT, IVS3 + 175T > A, EX4_53delA causing a frame shift in 164 aa, IVS4 + 710T > A, EX5_14G > A resulting in Glu206Glu, EX5_34G > A resulting in Arg213Lys, EX5_59G > A resulting in Arg218Lys. We establish the relationship between four polymorphic fragments within POU1F1gene and two cashmeretraits (greasy fleece weight, fiber length). Association analysis shows that two genotypes of P4 fragment are significantly associated with fiber length in the analyzed population (P = 0.031). Moreover, significant statistical associations of two genotypes of P6

fragment with greasy fleece weight (P = 0.048) are also found. Therefore, the goatPOU1F1gene has significant effects on greasy fleece weight and fiber length, suggesting that this gene is an important candidate gene for these traits and will contribute to cashmeregoat breeding and genetics through MAS.

【题目】A novel missense (A79V) mutation of goat PROP1 gene and its association with production traits
【中文关键词】错义突变,PROP1基因
【英文关键词】missense mutation,PROP1
【中文摘要】一个山羊PROP1基因新的错义突变(A79V)及其与生产性状的关系
【英文摘要】As a paired class homeodomain transcription factor, mutations of PROP1 (Prophet of POU1F1) are responsible for deficiencies of GH, PRL, TSH, LH and FSH. Regarding mutations of GH, PRL, and POU1F1 genes significantly associating with different production traits, PROP1 gene is a novel important candidate gene for detecting genetic variation and association analysis in marked-assist selection (MAS) program. Therefore, the objective of this study is to detect goat PROP1 gene mutation and its association with production traits. Herein, a novel mutation (AF453512:g.1795C > T) within PROP1 gene is revealed by PCR-SSCP and DNA sequencing methods, and genotyped by Hin6I PCR-RFLP method in 1,344 individuals belonging to eight goat breeds. Only two genotypes (CC and CT) are revealed and the frequencies of allele C go from 0.9014 to 1.000 in analyzed populations. The genetic diversity analysis reveals that all PIC values are less than 0.1619, implying that the Hin6I locus within PROP1 gene possesses low genetic diversity in goat. Furthermore, nucleotide sequence analysis shows that AF453512:g.1795C > T results in a missense amino acid (A79V). But, association analysis demonstrates no significant differences between different genotypes and production traits (such as body weight, cashmere yield, fiber length and wool thickness) of Inner Mongolia White Cashmere goat (P > 0.05), as well as no significant relationship between different genotypes and average milk yield (P > 0.05). Although Hin6I polymorphism can not be used as a molecular marker for production traits in MAS, the present work presents preliminary novel missense mutation which extends the spectrum of genetic variations of goat PROP1 gene and may benefit for considering its association with other biophysical and biochemical indexes.

【题目】Relationships Between Polymorphisms of IGFBP-3 Gene and Cashmere Traits in Cashmere Goats
【中文关键词】绒山羊,IGFBP-3基因,多态性
【英文关键词】Cashmere Goats,IGFBP-3,Polymorphisms
【中文摘要】绒山羊IGFBP-3基因多态性和产绒性状之间的关系
【英文摘要】To analyze associations of polymorphisms of IGFBP-3 gene with cashmere traits in Inner Mongolia white Cashmere (IMWC) goat, significant statistical results are found in cashmere yields between individuals with H(1)H(1) and H(2)H(2) genotypes (P<0.05). The individuals with genotype H(1)H(1) had higher cashmere yield than that of genotype H(2)H(2) in three-year-old (P<0.05), but trend was reversed in five-year-old (P<0.05). Therefore, this study provided possible support for influence of IGFBP-3 gene on cashmere yield which might be at least partially dependent on age and circulating levels of PRL in Inner Mongolia white Cashmere goats.

【题目】Effects of genetic variability of the carpine homeobox transcription factor HESX1 gene on performance traits
【中文关键词】山羊,同源盒转录因子,HESX1基因,单核苷酸多态性,生产性能
【英文关键词】Caprine; Homeobox transcription factor; HESX1 gene; Single nucleotide polymorphism (SNP); Performance traits
【中文摘要】山羊同源盒转录因子HESX1的遗传变异对生产性能的影响
【英文摘要】HESX1 plays a key role in the development of the forebrain and pituitary gland and produces potential effects on performance traits. The objective of this study was to detect and assess the associations of the possible polymorphisms of six loci within HESX1 gene with performance traits in Chinese 1,119 goats. Only one novel SNP (NM_001494116:g.307049A > G) locating on IVS1 + 348A > G was identified and detected by HaeIII forced-RFLP-PCR. The frequencies of allele "G" varied from 0.025 to 0.245 in analyzed populations with the Hardy-Weinberg equilibrium (P > 0.05). Genotypic and allelic frequencies were found to be significantly different in four breeds (chi(2) = 147.674, df = 6, P < 0.001; chi(2) = 157.250, df = 3, P < 0.001, respectively), implying that the distribution of genotypic and allelic frequencies of goat HESX1 gene was significantly associated with different goat utilities (cashmere, meat and dairy). Association analysis results revealed no significant effects of caprine HESX1 gene on body sizes in XNSN population (P > 0.05) and cashmere traits in IMWC population (P > 0.05). Significant statistical of HESX1 gene with body weight was found (*P < 0.05). The genotype AA showed significantly higher body weight than those of AG in 2-year-old age (*P < 0.05), while the AA genotype was senior to AG genotype in 4-year-old body weight trait (*P < 0.05). These suggestions indicated that the HESX1 gene has significant effect on goat body weight depending on ages, which is accordance with the function repressor of the HESX1.

【题目】Two novel cSNPs of weaver gene in Chinese indigenous goat and their associations with milk yield
【中文关键词】山羊,Weaver基因,产奶量,遗传变异
【英文关键词】Goat; Weaver gene; Milk yield; Genetic variation; Forced PCR-RFLP
【中文摘要】中国本土山羊weaver基因两个新的cSNPs及其与产奶量的关系
【英文摘要】Weaver gene plays an essential physiological role in the function of many organs, including brain, heart, kidney and endocrine cells, and also in the regulation of insulin secretion by glucose and/or neurotransmitters. Thus, weaver gene is an important potential candidate gene effecting on performance traits. The objective of this study was to detect the genetic variation of five loci within weaver gene by PCR-SSCP, DNA sequencing and forced PCR-RFLP methods in 1,019 Chinese indigenous goats. Two novel coding SNPs (XM_598993:m.864G > A; XM_598993:m.1224T > A) locating on P3 and P4 loci were identified and detected by MluI and AsuII forced PCR-RFLP, respectively. In the MluI analysis, the frequencies of goat MluI-A allele in the analyzed populations were 0.226, 0.248, 0.096 and 0.088 for XNSN, GZ, SBWC and XJWC, respectively. Genotypic frequencies were found to be significantly different in four breeds (chi(2) = 75.842, df = 6, P < 0.001); In the AsuII analysis, the frequencies of goat AsuII-A allele in the analyzed populations were 0.584, 0.441, 0.073 and 0.063 for XNSN, GZ, SBWC and XJWC, respectively. Genotypic frequencies were found to be significantly different among four breeds (chi(2) = 399.464, df = 6, P < 0.001). The frequencies of allele MluI-A and AsuII-A in XNSN and GZ populations were significantly higher than those of SBWC and XJWC goats. Association analysis with adjusted milk yield in the XNSN breed indicated that the animals with AsuII-AA genotype owned significantly higher adjusted milk yield than the ones with AsuII-TT genotype in the second lactation (P < 0.05). The observation suggested that the allele "AsuII-A" had the positive effects on adjusted milk yield in the second lactation.

【题目】Association of IGF-I gene polymorphisms with milk yield and body size in Chinese dairy goats
【中文关键词】IGF-I基因;奶山羊;产奶量;PCR-单链构象多态性
【英文关键词】IGF-I gene; dairy goat; milk yield; PCR- SSCP
【中文摘要】中国奶山羊IGF-I基因多态性与产奶量和体尺性状的关联
【英文摘要】The association of IGF-I gene polymorphisms with certain traits in 708 individuals of two Chinese dairy-goat breeds (Guanzhong and Xinong Saanen) was investigated. Polymerase chain reaction-single strand conformation polymorphism (PCR-SSCP) and DNA sequencing methods were employed in screening for genetic variation. Two novel mutations were detected in the 5'-flanking region and in intron 4 of IGF-I gene, viz., g.1617 G > A and g.5752 G > C (accession D26119.2), respectively. The associations of the g.1617 G > A mutation with milk yield and the body size were not significant (p > 0.05). However, in the case of g.5752 G > C, Xinong Saanen dairy goats with the CG genotype presented longer bodies (p < 0.05). Chest circumference (p < 0.05) was larger in Guanzhong goats with the GG genotype. In Xinong Saanen dairy goats with the CC genotype, milk yields were significantly higher during the first and second lactations (p < 0.05). Hence, the g.5752 G > C mutation could facilitate association analysis and serve as a genetic marker for Chinese dairy-goat breeding and genetics.

【题目】A Novel SNP of α_Lactalbumin Gene in Chinese Dairy Goats
【中文关键词】奶山羊,α-乳糖蛋白基因,PCR-单链构象多态性,体尺性状,产奶性状
【英文关键词】dairy goat, α-lactalbumin gene,PCR-SSCP,SNP,body size traits,milk trait
【中文摘要】在中国奶山羊α_乳糖蛋白中发现了一个新的SNP
【英文摘要】The α-lactalbumin (α-LA) plays a key role in lactose synthesis in mammary glands of domestic animals. Mutations in the α-LA gene are associated with the milk traits in dairy cattle. In our study, a novel SNP: NO_X06366: g.875 C > T was detected in 708 dairy goat individuals—268 of the Xinong Saanen breed and 440 of Guanzhong breed, which revealed a synonymous mutation in the exon 1 of α-LA gene. The Polymerase Chain Reaction-Single Strand Conformation Polymorphism (PCR-SSCP) and sequencing techniques showed that there were three genotypes: CC, CT and TT. Moreover, the χ2-test showed that the genotype frequencies of the two breeds were in good agreement with the Hardy-Weinberg equilibrium (P > 0.05). The relationship of the polymorphism of dairy goat α-LA gene with the milk trait and the body size trait was revealed. Individuals with the CC genotype were significantly smaller at chest circumference than those with CT (P < 0.05) in both breeds. But the milk trait and other body size traits of the two dairy goat breeds had no significant association with genotypes studied.

【题目】The Prophet of PIT1 Gene Variation and its Effect on Growth Traits in Chinese Indigeous Goat
【中文关键词】山羊,PROP1基因;单核苷酸多态性,PCR-单链构象多态性,标记辅助选择,基因型
【英文关键词】Goat; Prophet of PIT1 (PROP1) gene; Single Nucleotide Polymorphism (SNP); PCR-RFLP; Marker Assisted Selection (MAS); genotype
【中文摘要】中国本土山羊PROP1基因的变异及其对生长性状的作用
【英文摘要】Due to the significant influence of GH, PRL and PIT1 mutations on production traits, Prophet of PIT1 (PROP1) regulating them is considered as an important and potential candidate gene for goat growth traits by Marker Assisted Selection (MAS). Using Hin6I PCR-RFLP, this study verified the AF453512: g.1795C >T resulting in GCG (79Ala)>GTA (79Val) within PROP1 gene in Hainan Black Goat (HNBG). Three genotypes (CC, CT and TT) were observed and their frequencies were 0.310, 0.493 and 0.197, respectively. The allelic frequencies of allele C and T were 0.556 and 0.444, respectively in analyzed population with Hardy-weinberg equilibrium (p>0.05). Combining with the reported genotypic frequencies at Hin6I locus in cashmere goat breeds (IMWC and SBWC), dairy goat breeds (Sa, LS and GZ), genotypic frequency of HNBG population showed significant differences when compared with other goat breeds (p<0.001) as well as significant differences of allelic frequencies between HNBG and other breeds were revealed (p<0.001), implying that the allele T possibly was associated with the meat traits and growth traits. Association analysis showed significant relationships between Hin6I polymorphisms and Body Length (BL), Chest Circumferene (ChC), Chest Width (ChW) and Cannon Circumference Index (CaCI) ((p<0.05), suggesting that the PROP1 gene produced significant influences on growth trait. The individuals with genotype CT demonstrated better Body Length (BL), Chest Circumferene (ChC) and Cannon Circumference Index (CaCI) (p<0.05) when compared with those of individuals with genotype CC.

【题目】阳光紫外辐射对羊栖菜人工幼苗生长和光合电子传递速率的影响
【中文关键词】羊栖菜;阳光紫外辐射;生长; 光合作用
【英文关键词】Hizikia fusiformis; solar ultraviolet radiation; growth; photosynthesis
【中文摘要】为探讨经济褐藻羊栖菜人工幼苗对阳光紫外辐射变化的响应,在全波段阳光辐射省(PAB, 280 ~ 700 nm) 、去除UV-B辐射 (PA, 320 ~ 700 nm) 和光合有效辐射PAR (P, 400 ~ 700 nm) 三种辐射处理及不同辐射水平下培养羊栖菜幼苗,并测定了其生长与光合作用的变化。结果表明,无论在紫外辐射 (UVR) 存在情况下 (PA,PAB) 还是滤除UVR (PAR) 时,高辐射水平条件下 (55%),羊栖菜幼苗都具有较高的生长速率,而低辐射水平下羊栖菜的生长速率较低。在不同辐射处理之间,随着辐射水平的增高,UVR的抑制效应逐渐突显。UVR降低羊栖菜幼苗的光合电子传递速率。
【英文摘要】Effects of solar ultraviolet radiation (UVR) on the growth and photosynthesis of artificially raised young seedlings of Hizikia fusiformis were investigated while exposed to full spectrum solar radiation (PAB, 280-700 nm), solar radiation depleted of UV-B (PA, 320-700 nm) and solar radiation deprived of total UVR (P, 400-700 nm) in order to understand its responses to changes in solar UVR. It was found that the young seedlings showed higher relative growth rate at 55% of solar irradiance level, regardless of the treatments with UVR (PA, PAB) or without UVR (PAR). Lower solar irradiance level resulted in low relative growth rate. Among the different treatments, the inhibitory effects on growth were increased with the enhancement of solar irradiance level. In addition, photosynthetic electron transfer rate of young seedlings was significantly suppressed by UVR.

【题目】Polymorphisms of Bone Morphogenetic Protein 4 (BMP4) Gene in Goats
【中文关键词】山羊,BMP4基因,多态性,单核苷酸多态性,微卫星,中国
【英文关键词】Goat; BMP4 gene; polymorphism; Single Nucleotide Polymorphism (SNP); microsatellite; China

【中文摘要】山羊BMP4基因多态性

【英文摘要】Bone Morphogenetic Protein 4 (BMP4) plays a crucial role in development and productivity of mammalian. The aim of the present study was to identify and characterize polymorphisms within the coding region, the intron region and the 3'flanking region of the goat BMP4 gene in three different breeds. Three DNA fragments were amplified by Polymerase Chain Reaction (PCR) and then used for polymorphism identification by Single Stranded Conformation Polymorphism (SSCP). The fragments showing different SSCP patterns were sequenced. Clonal sequencing analysis indicated that it was a microsatellite of dinucleotide-repeated sequence. The lengths of repeated sequence dinucleotide CA were 24, 17, 14, respectively. The PIC (Polymorphism Information Content) values in three populations were 0.3656, 0.5792, 0.3103 for Xuhuai White goat, Boer goat and Haimen goat, respectively, which indicated this goat microsatellite locus had rich polymorphism.

【题目】Polymorphism of the VEGF gene and its association with growth traits in four goat breeds

【中文关键词】VEGF基因;山羊;单核苷酸多态性;遗传变异; PCR-单链构象多态性

【英文关键词】VEGF gene; caprine; single nucleotide polymorphism (SNP); genetic variation; PCR-SSCP

【中文摘要】血管内皮生长因子基因多态性及其与4个山羊品种的生长性状的关系

【英文摘要】The vascular endothelial growth factor (VEGF) is a regulator of angiogenesis which is an important physiological adaptation to increased metabolic demand. Thus, mutations of this gene may exert a significant influence on animal growth. We screened the exons of the caprine VEGF gene using PCR-SSCP and DNA sequencing methods in 459 individuals from four goat breeds to identify sequence variations that may have an effect on protein structure and function, and might be related to different phenotypes of growth traits. Two single nucleotide polymorphisms (SNPs) (GU014696:g.49 G>C and GU014696:g.270G>A) were identified in the P3 locus of the caprine VEGF gene. Significant associations were observed between the genotypes of the P3 locus and body length, body height and chest circumference. Individuals with genotype P3-B had a significantly longer body length and higher body height than individuals containing genotype P3-AB. Thus, animals of genotype P3-AB should be culled in a selection programme for fast growth. It is suggested that P3-B could be used as a molecular marker in marker-assisted selection (MAS).

【题目】A novel SNP of the GHRL gene in goat and its association with growth traits

【中文关键词】GHRL基因;单核苷酸多态性; PCR-单链构象多态性;山羊

【英文关键词】GHRLgene; Single nucleotide polymorphism (SNP); PCR – SSCP; Goat

【中文摘要】山羊GHRL基因中发现的一个新的单核苷酸多态与生长性状的关联

【英文摘要】Ghrelin, an endogenous gland for growth hormone secretagogue receptor, has been shown to stimulate food intake and control energy homeostasis and lipid metabolism. So, ghrelin precursor (GHRL) gene is a potential candidate gene for caprine growthtraits. In this study, we detected the polymorphism of the caprine GHRLgene by PCR – SSCP and DNA sequencing methods in 459 individuals from four goat breeds. Anovel single nucleotide polymorphism (SNP) (IVS2 + 147G > A) was detected. Frequencies of IVS2 + 147G allele varied from 0.842 to 1.000. The association of IVS2 + 147G > A with growthtraits was analyzed and IVS2 + 147G > A was shown to be associated with growthtraits. Individuals with genotype AG were significantly higher than those of individuals with

genotype GG in circumference of chest and cannon and trunk index (P < 0.05 or P < 0.01). Moreover, there was a tendency that genotype AG individuals had better performance in other aspects such as body height and body length than genotype GG individuals although no significant differences appeared (P > 0.05). We suggested that IVS2 + 147G > A could be a perfect molecular marker in marker-assisted selection (MAS).

【题目】Stearoyl-CoA Desaturase (SCD) Gene Polymorphism in Goat Breeds
【中文关键词】硬脂酰CoA;脂质代谢;单核苷酸多态性;肉质;单链构象多态性
【英文关键词】Stearoyl CoA desaturase gene; Lipid metabolism; SNPs; Meat quality; SSCP
【中文摘要】硬脂酰CoA去饱和酶(SCD)基因在山羊中的多态性
【英文摘要】There is evidence that stearoyl-CoA desaturase (SCD) is a key enzyme for lipid metabolism. Changes in enzyme activity that depends on SCD gene polymorphism and regulation could cause variations of fatty acid composition of meat and milk. We investigated genetic variability in caprine SCD, analyzing 335 animals belonging to three goat breeds by single-strand conformation polymorphism and DNA sequencing. Six single nucleotide polymorphism were identified, in intron 3 (585T -> A and 601A -> G; Ref. AF422168), intron 4 (719T -> A; AF422169), and exon 6 (690 A -> G, 718 C -> G, and 802 A -> C; AF422171). The less polymorphic SNP 601A -> G displayed variability only in Xuhuai and Boer breeds. Across breeds, the average frequency for the least frequent alleles ranged from 0.1158 to 0.2532. The three SNPs in exon 6 resulted in variations of amino acids 313 tyr -> cys, 322 phe -> leu, and 350 arg -> ser. The allelic distribution in exon 6 of Xuhuai was significantly different from Boer and Haimen.

【题目】Novel single nucleotide polymorphisms of the caprine PC1 gene and association with growth traits
【中文关键词】生长性状;山羊; PC1基因; PCR-单链构象多态性;单核苷酸多态性
【英文关键词】Growth traits; Goat; PC1; PCR-SSCP; SNP
【中文摘要】山羊PC1基因中新发现的单核苷酸多态性及其与生长性状的关联
【英文摘要】Proprotein convertase 1 (PC1) is an endopeptidase involved in proteolytic processing of peptide hormone precursors in granules of the regulated secretory pathway in endocrine cells. Mutations in the PC1 gene are thought to cause obesity, and multiple alternatively spliced transcript variants have been described for this gene. In this study, based on PCR-SSCP and DNA sequencing methods, polymorphisms of the PC1 gene were detected in 447 individuals from three breeds. Only the P(1), P(2), P(3), P(9), and P(10) loci showed polymorphisms, and 12 SNPs in the PC1 gene were identified. Additionally, an association analysis between mutations in the 5'-UTR and four growth traits indicated that the polymorphisms were significantly associated with caprine body height (P < 0.05) and chest circumference (P < 0.01).

【题目】Analysis of the polymorphisms in the caprine PRDM16, SHH and SF-1 genes and their association with production traits in goats
【中文关键词】PR结构域包含16个基因;单核苷酸多态性;PCR-单链构象多态性;山羊
【英文关键词】PR domain containing 16 gene; SNP; PCR-SSCP; Caprine
【中文摘要】山羊PRDM16,SHH和SF-1基因的多态性以及与山羊生产性状的关系分析
【英文摘要】Genes that regulate metabolism, development and energy partitioning have the potential to influence economically important traits in farm animals, as do polymorphisms within these genes. In the present study, polymorphisms of the caprine PRDM16. SHH and SF-1 genes were detected by PCR-SSCP and DNA sequencing methods in 560 individuals from three goat breeds. The results revealed two novel silent mutations (GU363953:1305 G > A and GU363953 :1641 A > G) in the caprine PRDM16 gene. The associations of the two SNPs with growth traits were analyzed in 313 Xuhuai goats. The results indicated that GU363953 :1641 A > G has remarkable effects on growth traits. Individuals with genotype GG and GA were significantly higher than individuals with genotype AA in body length, chest circumference and body weight ($P < 0.05$). Moreover, there was a tendency that GG and GA genotype individuals to have higher body height and thicker cannon circumference than AA genotype although no statistic differences presented ($P > 0.05$). So, we suggested that G1i363953:1641 A > G could be a molecular marker in marker-assisted section (MAS). As no mutations was detected in the exons of the caprine SHH and SF-1 genes, we can preliminary eliminate the significant role of the caprine SHH and SF-1 genes in the differences of caprine growth traits. 【题目】Effects of genetic variability of the dairy goat growth hormone releasing hormone receptor (GHRHR) gene on growth traits
【中文关键词】奶山羊;GHRHR基因;单核苷酸多态性;生长性状
【英文关键词】Dairy goat; GHRHR gene; SNP; Growth traits
【中文摘要】奶山羊生长激素释放激素受体(GHRHR)基因的遗传变异对生长性状的影响
【英文摘要】Growth hormone-releasing hormone receptor (GHRHR) plays a critical role in growth hormone (GH) synthesis, release and regulation of pituitary somatotroph expansion in vertebrates. The objective of this study was to investigate variations in goat GHRHR gene and their associations with growth traits in 668 dairy goats. The results showed four novel single nucleotide polymorphisms (SNPs): NC_007302:g.5203C > T, 7307C > G, 9583G > A and 9668A > C. In detail, the novel SNP C > T in the 5203rd nucleotide identified a missense mutation: CCC (Pro)> TCC (Phe) at position 116aa of the goat GHRHR (423aa). Besides, 9583G > A and 9668A > C polymorphism were in complete linkage disequilibrium. The genetic diversity analysis revealed that the Guanzhong dairy goat possessed intermediate genetic diversity in P3 and P7 loci, and the Xinong Sannen dairy goat belonged to poor genetic diversity in P4 locus. Significant associations between the genotypes of P3 locus and body length, body height and chest circumference was observed in Guanzhong goat ($P < 0.05$). However, in Xinong saanen population, significant statistical difference was only found in body height and body length ($P < 0.05$). In P4 and P7 loci, no significant associations were detected between any variant sites and body length, body height and chest circumference, as well as for the milk traits ($P > 0.05$). These results strongly suggested that the goat GHRHR gene is a candidate gene that influences growth traits in dairy goat.

【题目】Novel SNPs of butyrophilin (BTN1A1) and milk fat globule epidermal growth factor (EGF) 8 (MFG-E8) are associated with milk traits in dairy goat
【中文关键词】奶山羊t; BTN1A1基因; MFG-E8基因; 单核苷酸多态性;产奶性状
【英文关键词】Dairy goat; BTN1A1 gene; MFG-E8 gene; SNP; Milk traits
【中文摘要】BTN1A1与MFG-E8基因中新发现的SNP与奶山羊的产奶性状相关
【英文摘要】Butyrophilin (BTN1A1) and milk fat globule epidermal growth factor (EGF) 8 (MFG-E8) genes are both milk fat globule membrane proteins. BTN1A1 plays a key role in the secretion of milk lipid and production which has effects on performance traits, while the MFG-E8 is vital for the development of the mammary gland and phagocytic clearance of apoptotic cells. Therefore, BTN1A1 and MFG-E8 gene are candidate genes for quantitative traits in mammalian animals with respect to milk performance traits. The objective of this study is to investigate variations in goat BTN1A1 and MFG-E8 gene and analyze their associations with growth trait and milk performance. In this study, the goat BTN1A1 gene showed a novel single-nucleotide polymorphism (SNP): XM_001494179:g.8659C > T, resulting in a missense mutation: CTT (Leu)> TTT (Phe) at position 377 aa of the BTN1A1 (526 aa); the goat MFG-E8 gene showed four novel SNPs: NC_007319: g.843delA, 6417delC, 14892T > C and 14996A > C, only the 14892T > C result in a synonymous mutation. The associations between genotypes and production traits were analyzed. Significant statistical results implied that HinfI locus of BTN1A1 gene is associated with milk fat yield (P = 0.004), total solid (P = 0.002), solid-non fat (P = 0.018) and first milk yield (P = 0.030). The DA and EcoRV loci of MFG-E8 gene are associated with milk fat yield (DA locus: P = 0.000; EcoRV locus: P = 0.033) and total solid (DA locus: P = 0.002; EcoRV locus: P = 0.015) in the Xinong Saanen dairy goat.

【题目】Novel SNPs in the caprine stearoyl-CoA desaturase (SCD) and decorin (DCN) genes that are associated with growth traits in Chinese goat breeds
【中文关键词】核心蛋白聚糖(DCN); 山羊;生长性状;硬脂酰辅酶A去饱和酶(SCD);单核苷酸多态性
【英文关键词】DCN; Goat; Growth trait; SCD; SNP
【中文摘要】硬脂酰辅酶A去饱和酶(SCD)和核心蛋白聚糖(DCN)基因中发现的新单核苷酸多态性与中国山羊品种的生长性状相关联
【英文摘要】Stearoyl-CoA desaturase (SCD) is an iron-containing enzyme involving in the biosynthesis of monounsaturated fatty acids (MUFA) in mammary gland and adipose tissue, while decorin (DCN) consists of a protein core and a single dermatan or chondroitin sulfate glycosaminoglycan chain, contributing multifunctionally to matrix assembly, modulation of the activity of growth factors and cell migration and proliferation. However, few studies have focused on the genetic variability of them in goat. Herein, five Chinese goat breeds (1229 animals) were analyzed. Based on DNA pooling and PCR-RFLP, three nucleotide substitutions, one of which caused a amino acid substitution, were detected in SCD gene and three haploids (A, B, C) were constructed. According to SSCP analysis and DNA sequencing methods, a 2-bp deletion and two other SNPs were found existing in another analyzed gene DCN, and three haploids (X, Y, Z) were built. Associations between the genotypes and the growth traits (body length, body height, chest circumference, cannon circumference) were also analyzed. For SCD gene, genotype CC individuals had significant greater body height in Guanzhong and body length in both Guanzhong and Xinong saanen than genotype BC individuals (P < 0.05). For DCN gene, individuals with genotype XX was obviously higher than that with genotype XY (P < 0.05). These results indicated that genotype CC of SCD gene and genotype XX of DCN gene could be used for the breeding of new breeds of goat in China.

【题目】The CSN1S1 N and F alleles identified by PCR-SSCP and their associations with milk yield and composition in Chinese dairy goats
【中文关键词】CSN1S1基因;奶山羊;多态性;产奶量;乳成分
【英文关键词】CSN1S1; Dairy goat; Polymorphism; Milk yield; Milk composition
【中文摘要】通过PCR-SSCP的方法鉴定CSN1S1 N 和 F 两个等位基因,两个等位基因与中国奶山羊产奶量和乳成分的关系
【英文摘要】A method was depicted to identify null allele CSN1S1 N and low allele CSN1S1 F of the CSN1S1 gene of goat using PCR-SSCP (polymerase chain reaction-single strand conformation polymorphism). First, primer A was designed to amplify the exon 9 of CSN1S1 gene which produced three genotypes AA, AB, and BB. Among these three genotypes, only AA and AB individuals had a cytosine deletion at exon 9 after DNA sequencing, which cannot be used to identify the N and F alleles. Therefore, primer B was used to amplify intron 14 of CSN1S1 of described AA and AB individuals. Genotypes FF, FN and NN were detected within AA individuals and genotypes FO and NO were detected in the above AB individuals. The frequencies of F and N alleles in 708 samples from Xinong Saanen (XS) and Guanzhong (GZ) dairy goat breeds were 0.1139, 0.0927, and 0.2376, 0.1193, respectively. In 268 XS samples, the individuals with NN genotype contained a significant lower protein content than that of other genotypes ($P < 0.01$). Individuals of FF genotype had significant higher milk yield than that of NO genotype in the first milk lactation of 202 XS individuals ($P < 0.05$). Therefore, the variability at CSN1S1 locus contains enough genetic diversity to be potentially useful in improving the quality and production of milk in Chinese dairy goat breeds.

【题目】AGPAT6 polymorphism and its association with milk traits of dairy goats

【中文关键词】奶山羊; AGPAT6基因;多态性; PCR-限制性片段长度多态性;乳用性状
【英文关键词】Dairy goat; AGPAT6 gene; Polymorphism; PCR-RFLP; Milk traits
【中文摘要】奶山羊AGPAT6基因多态性及其与奶山羊的乳用性状的关系
【英文摘要】As one of the eight members in the 1-acylglycerol-3-phosphate-O-acyltransferase (AGPATs) family, AGPAT6 is a crucial enzyme for the biosynthesis of glycerolipids and triacylglycerol in eukaryotes, as well as catalyzing the conversion from lysophosphatidic acid to phosphatidic acid. AGPAT6 can be considered as a candidate gene for regulating milk composition. DNA sequencing and PCR-RFLP methods were applied to detect genetic variation in the AGPAT6 gene in 549 Chinese dairy goats. Four polymorphisms (NC_007328.3: g. 152G>C, 8124G>A, 9263C>G, 16436G>A) were detected in 5'UTR, intron 2, exon 4, and 3'UTR, respectively. For the KpnI locus, the frequencies of the AGPAT6-G allele were 0.955 and 0.936 for SN (Xinong Sannen) and GZ (Guanzhong) dairy goat breeds, respectively. In the PCR-RFLP analysis for Kpn., EcoRII, NcoI, and BglI, the frequencies of the G allele of AGPAT6 were 0.955 and 0.936, 0.694 and 0.819, 0.206 and 0.254, 0.729 and 0.623 for SN and GZ dairy goat breeds, respectively. The 9263C>G mutation revealed a synonymous genetic code of Thr (threonine). Associations between the four mutations and milk traits were analyzed in two dairy goat breeds. At the 9263C>G locus, genotype GG and CG individuals showed significantly better milk performance than genotype CC individuals ($P < 0.05$). Therefore, the G allele is suggested to be a molecular marker for milk production in dairy goats.

【题目】A novel polymorphism of the lactoferrin gene and its association with milk composition and body traits in dairy goats
【中文关键词】山羊; 乳铁蛋白基因;单核苷酸多态性; PCR-SSCP(聚合酶链式反应-单链构象多态性); 乳成分;体尺性状
【英文关键词】Goat; LF gene; SNP; PCR-SSCP; Milk composition; Body measurement traits
【中文摘要】发现奶山羊乳铁蛋白基因的多态性及其与乳成分和体尺性状的关系
【英文摘要】Milk composition and body measurement traits, influenced by genes and environmental factors, play important roles in value assessments of efficiency and productivity in dairy goats. Lactoferrin (LF), involved in the efficient expression of protein in milk, is also an anabolic factor in skeletal tissue and a potent osteoblast survival factor. Therefore, it is an important candidate gene for milk composition and body measurement trait selection in marker-assisted selection. We employed PCR-SSCP and DNA sequencing to screen the genetic variations of the LF gene in 549 Chinese dairy goats. A novel single-nucleotide polymorphism (SNP) (G198A in exon II) of the LF gene was detected. The frequencies of the AA genotype were 0.0285 and 0.0261 in GZ and SN populations, respectively. Both populations were found to have low levels of polymorphism and were in Hardy-Weinberg disequilibrium ($P < 0.05$). We found significant ($P < 0.05$) associations of the SNP marker with milk protein and acidity in the total population; animals with the AA genotype had higher mean values for milk protein than those with the GA genotype. Animals with genotype AA had higher mean values for withers height than those with genotype GG ($P < 0.05$). We concluded that this SNP of the LF gene has potential as a genetic marker for milk composition and body traits in dairy goat breeding.

【题目】Molecular characterization and polymorphisms of the caprine Somatostatin (SST) and SST Receptor 1 (SSTR1) genes that are linked with growth traits

【中文关键词】山羊;山羊生长抑素基因;山羊生长抑素受体1基因;单链构象多态性; 单核苷酸多态性;关联分析
【英文关键词】Goat; SST gene; SSTR1 gene; SSCP; SNP; Association analysis
【中文摘要】山羊生长抑素SST及其受体SSTR1的分子特征和多态性,它们与生长性状相关
【英文摘要】Somatostatin (SST) and its receptors (SSTR1-5) appear to be important in central regulation of many metabolic systems that affect growth, adiposity and nutrient absorption. In this study, we investigated polymorphisms within the caprine SST and SSTR1 genes and determined their relationship with growth traits. As there were no sequence information of the caprine SST and SSTR1 genes, we explored their DNA sequence and genomic organizations. The caprine SST gene is organized in two exons and is transcribed into an mRNA containing 351 bp of sequence coding for a protein of 116 amino acids. Its protein sequences showed substantial similarity (97-99%) to its respective orthologs from cattle, human and mouse. We also cloned and sequenced a 1.2 kb DNA fragment which contained the major part of the coding region and 3' UTR of the caprine SSTR1 gene. We then detected the polymorphisms in these determined sequences by PCR-SSCP and DNA sequencing methods in 459 goats from four breeds. Four SNPs (GU014693:g.647T > C, GU014693:g.844A > C, GU014693:g.970T > C, GU014693:g.1039T > A), segregating as two haplotypes (T-A-T-T and C-C-C-A), were identified in intron 1 of the caprine SST gene and showed the associations to body length and body height ($P < 0.05$). Two SNPs (GU014695:g.801 C > T, GU014695:g.948 C > T) were identified in the caprine SSTR1 gene. Significant associations between the three genotypes of GU014695:801 C > T and body length, body height, and chest circumference was observed ($P < 0.05$). These results suggest that the caprine SST and SSTR1 genes are strong candidate genes that influence growth traits in goat.

【题目】Polymorphisms in BMP-2 gene and their associations with growth traits in goats
【中文关键词】BMP-2基因;山羊;生长性状
【英文关键词】BMP-2 gene; Goat; Growth traits
【中文摘要】山羊BMP-2基因的多态性及与生长性状的关联
【英文摘要】BMPs plays an important role in skeletal development. In this study, PCR-SSCP and DNA sequencing methods were employed to screen the genetic variation of caprine BMP-2 gene in 299 goats from three breeds (Boer goat, Chinese Xuhuai white goat and Chinese Haimen goat). Three fragments of BMP-2 gene were investigated, only 3' flanking region of BMP-2 gene showed polymorphism. The alignment between nucleotide sequences of AY714781.1 in GenBank and the sequencing results of three PCR products with different patterns revealed that there was one mutation (AY714781.1: g.A172G) in 3' flanking region of BMP-2 gene, which constructed three genotypes (AA, AB, BB). The frequencies of allele A and genotype AA were dominant in all three breeds. Frequency of allele B in Haimen goat breed was significantly lower than that of the other two breeds. The genotype distributions were in

good agreement with Hardy-Weinberg equilibrium (P > 0.05) in each breed. The PIC (Polymorphism Information Content) values in three populations were 0.3261, 0.2558, 0.1663 for Boer goat, Xuhuai White goat and Haimen goat respectively. It was indicated that individuals of Boer goats with genotype BB were significantly higher than those of individuals with genotype AA in body trunk index (P < 0.01). No polymorphism was detected in the exon3.

【中文摘要】建立了药物盐酸阿苯达唑亚砜的化学结构确证方法。通过高效液相色谱(HPLC) 测定盐酸阿苯达唑亚砜纯度,采用紫外光谱(UV) 、红外光谱(IR) 、核磁共振(NMR) 以及质谱(MS)等分析方法对盐酸阿苯达唑亚砜样品进行了结构测定。结果确证盐酸阿苯达唑亚砜的结构为[5 -(丙亚砜基) -1H-苯并咪唑-2-基]氨基甲酸甲酯盐酸。本方法测定结果准确全面,为盐酸阿苯达唑亚砜的生产和鉴定提供了较为全面的参考数据。
【英文摘要】A method for determination of the chemical structure of albendazole sulfoxide hydrochloride was established. High-performance liquid chromatography (HPLC), ultraviolet spectroscopy(UV), infrared fourier transform spectroscopy (FT-IR), nuclearmagnetic resonance (NMR), mass spectroscopy(MS) were adopted to analyze the chemical structure of albendazole sulfoxide hydrochloride. The results showed that the chemical structure was methyl 5-(propylsulfinyl)-2 -benzimidazole carbamate hydrochloric acid.The results of the method was accurate, general and can provide a comprehensive reference for production and identification of albendazole sulfoxide hydrochloride.

【题目】An improved PCR method for direct identification of Porphyra (Bangiales, Rhodophyta) using conchocelis based on a RUBISCO intergenic spacer
【中文关键词】Wang Chao; Dong Dong;Wang Guangce; Zhang Baoyu;Peng Guang;Xu Pu;Tang Xiaorong
【英文关键词】Rhodophyta; Porphyra; RUBISCO intergenic spacer; DNA sequence; PCR
【中文摘要】无
【英文摘要】An improved method of PCR in which the small segment of conchocelis is amplified directly without DNA extraction was used to amplify a RUBISCO intergenic spacer DNA fragment from nine species of red algal genus Porphyra (Bangiales, Rhodophyta), including Porphyra yezoensis (Jiangsu, China), P. haitanensis (Fujian, China), P. oligospermatangia (Qingdao, China), P. katadai (Qingdao, China), P. tenera (Qingdao, China), P. suborboculata (Fujian, China), P. pseudolinearis (Kogendo, Korea), P. linearis (Devon, England), and P. fallax (Seattle, USA). Standard PCR and the method developed here were both conducted using primers specific for the RUBISCO spacer region, after which the two PCR products were sequenced. The sequencing data of the amplicons obtained using both methods were identical, suggesting that the improved PCR method was functional. These findings indicate that the method developed here may be useful for the rapid identification of species of Porphyra in a germplasm bank. In addition, a phylogenetic tree was constructed using the RUBISCO spacer and partial rbcS sequence, and the results were in concordant with possible alternative phylogenies based on traditional morphological taxonomic characteristics, indicating that the RUBISCO spacer is a useful region for phylogenetic studies.

【题目】Cloning and quantitative analysis of the carbonic anhydrase gene from Porphyra yezoensis UEDA.
【中文关键词】Zhang, Bao Yu;Yang, Fang;Wang, Guang Ce;Peng, Guang

【英文关键词】carbonic anhydrase gene; mRNA expression level; Porphyra yezoensis; qPCR; RACE
【中文摘要】无
【英文摘要】Carbonic anhydrase (CA), an enzyme that catalyzes the interconversion of CO(2) and HCO(3)-, has a critical role in inorganic carbon acquisition in many kingdoms, including animals, plants, and bacteria. In this study, the full-length cDNA of the CA gene from Porphyra yezoensis Ueda (denoted as PyCA) was cloned by using an expressed sequence tag (EST) and rapid amplification of cDNA ends (RACE). The nucleotide sequence of PyCA consists of 1,153 bp, including a 5' untranslated region (UTR) of 177 bp, a 3' UTR of 151 bp, and an open reading frame (ORF) of 825 bp that can be translated into a 274-amino-acid putative peptide with a molecular mass (M) of 29.8 kDa and putative isoelectric point (pI) of 8.51. The predicted polypeptide has significant homology to the beta-CA from bacteria and unicellular algae, such as Porphyridium purpureum. The mRNA in filamentous thalli, leafy thalli, and conchospores was examined, respectively, by real-time fluorescent quantitative PCR (qPCR), and the levels of PyCA are different at different stages of the life cycle. The lowest level of mRNA was observed in leafy thalli, and the level in filamentous thalli and in the conchospores was 4-fold higher and 10-fold higher, respectively.

【题目】Induction and characterization of Green pigmentation mutant in Porphyra yezoensis Ueda
【中文关键词】Li, Ying Xia;Wang, Guang Ce;Xu, Pu;Fan, Xiao Lei;Niu, Jian Feng;Zhou, Bai Cheng
【英文关键词】Porphyra yezoensis Ueda; The green pigmentation mutant; Wild type; Conchocelis; Gametophytic blade
【中文摘要】无
【英文摘要】The free living conchocelis of Porphyra yezoensis Ueda was treated with N-methyl-N-nitro-N-nitrosoguanidine to induce pigmentation mutants. The artificial green pigmentation mutant of P. yezoensis conchocelis, which was composed entirely of green cells, was isolated through visualization with the unaided eye. The acquired green conchocelis was further developed into a green gametophytic blade. This mutant was relatively stable in color in both gametophytic blade and conchocelis phases. The gametophytic blade mutant was successively cultivated for commerce at some Porphyra farms in Rudong, China, and few wild type or sectorially variegated gametophytic blade occurred, indicating that the green mutant has commercial value. The green mutant was characterized as having lower phycoerythrin and higher phycocyanin content, and SDS-PAGE suggested that phycoerythrin was missing the gamma-subunit in comparison to the wild type. The wild type and the green mutant showed a clear difference in 02 evolution rates in white, green, yellow, and red light, which might be due to the qualitative and quantitative changes of phycoerythrin, and the quantitative difference of phycocyanin. 【中文摘要】无
【英文摘要】To ascertain the neuroendocrine function of the kisspeptin/GPR54 system in non-mammalian species, full-length cDNAs encoding for Kiss1 and Kiss2 as well as their putative cognate receptors GPR54a and GFR54b, were isolated from goldfish (Carassius auratus). The deduced protein sequences between Kiss1 and Kiss2 in goldfish share very low similarity, but their putative mature peptides (kisspeptin-10) are relatively conserved. RT-PCR analysis demonstrated that the goldfish kiss1 gene (gfkiss1) is highly expressed in the optic tectum-thalamus, intestine, kidney, and testis, while the goldfish kiss2 gene (gfkiss2) is mainly detected in the hypothalamus, telencephalon optic tectum thalamus, adipose tissue, kidney, heart, and gonads. The two receptor gene, (gfgpr54a and gfgpr54b) are highly expressed in the brain regions including telencephalon, optic tectum, thalamus, and hypothalamus. Both mature goldfish kisspeptin-10 peptides (gfKiss1-10 and gfKiss2-10),ire biologically active as they could functionally interact with the two goldfish receptors expressed in cultured eukaryotic cells to trigger the downstream signaling pathways with different potencies. The actions of gfKiss1-10 and gfKiss2-10 oil LH secretion were further investigated in vitro and fit vivo. Intraperitoneal administration of gfKiss1-10 to Sexually mature female goldfish could increase the serum LH levels. However, this peptide does not significantly influence LH release from goldfish pituitary cells in primary culture, indicating that the peptide does not exert its actions at the pituitary level. Oil the other hand, gfKiss2-10 appears to be a much less potent peptide is it exhibits no significant in vivo bioactivity and is also inactive oil the primary pituitary cells. journal of Endocrinology (2009) 201, 407-418

【英文关键词】RECOMBINANT GOLDFISH PROLACTIN; GROWTH-HORMONE; HOMEOBOX GENE; FISH; GENOME; IDENTIFICATION; DUPLICATION; EXPRESSION; SEQUENCES; BIPOLAR
【中文摘要】无
【英文摘要】Background: The three pituitary hormones, viz. prolactin (PRL), growth hormone (GH) and somatolactin (SL), together with the mammalian placental lactogen (PL), constitute a gene family of hormones with similar gene structure and encoded protein sequences. These hormones are believed to have evolved from a common ancestral gene through several rounds of gene duplication and subsequent divergence.Principal Findings: In this study, we have identified a new PRL-like gene in non-mammalian vertebrates through bioinformatics and molecular cloning means. Phylogenetic analyses showed that this novel protein is homologous to the previously identified PRL. A receptor transactivation assay further showed that this novel protein could bind to PRL receptor to trigger the downstream post-receptor event, indicating that it is biologically active. In view of its close phylogenetic relationship with PRL and also its ability to activate PRL receptor, we name it as PRL2 and the previously identified PRL as PRL1. All the newly discovered PRL2 sequences possess three conserved disulfide linkages with the exception of the shark PRL2 which has only two. In sharp contrast to the classical PRL1 which is predominantly expressed in the pituitary, PRL2 was found to be mainly expressed in the eye and brain of the zebrafish but not in the pituitary. A largely reduced inner nuclear layer of the retina was observed after morpholino knockdown of zebrafish PRL2, indicating its role on retina development in teleost.Significance: The discovery of this novel PRL has revitalized our understanding on the evolution of the GH/PRL/SL/PL gene family. Its unique expression and functions in the zebrafish eye also provide a new avenue of research on the neuroendocrine control of retina development in vertebrates.

【题目】雄尼罗罗非鱼肝脏2 种生长激素受体基因表达的发育性变化
【中文关键词】马细兰,张勇,刘晓春,林浩然
【英文关键词】尼罗罗非鱼;生长激素受体;基因表达;实时定量PCR;发育性变化
【中文摘要】选取同一批30 日龄的尼罗罗非鱼(Oreochromis niloticus) 鱼苗置于水泥池中自然饲养,分别于30、60、80、110、140 日龄取样测定不同发育阶段雄鱼的特定生长率。用实时荧光定量PCR方法检测雄鱼肝脏中两种生长激素受体(GHR1和GHR2) 的mRNA丰度。结果表明,30 ~ 110 日龄,雄鱼特定生长率呈不断上升趋势,至80 ~ 110 日龄达到最高,之后开始下降;雄鱼肝脏中2 种GHR基因表达的发育性变化趋势不相同,30 ~ 110 日龄,GHR1 mRNA表达逐渐上升,110 日龄达到最高,随后开始下降,其发育性变化与特定生长率显著正相关(R=0.96,P<0.01);GHR2 mRNA表达在60 日龄达到最高,80 日龄急剧下降,之后又缓慢上升,其发育性变化与特定生长率无相关性。提示尼罗罗非鱼生长激素可能主要通过与肝脏中GHR1受体的结合启动其促生长机制,肝脏中GHR1 mRNA表达具有显著的年龄依赖性,其表达对尼罗罗非鱼的生长有重要影响。
【英文摘要】Growth hormone (GH) plays a central role as a pluripotent endocrine regulator of physiologicalfunctions in fish and higher vertebrates,working through specific growth hormone receptors (GHR) that triggera phosphorylation cascade for signaling and gene expression events. Two genomic contigs of putative growthhormone receptors (GHRs) were identified in fugu and zebrafish genomes by in silico analysis,suggesting thepresence of two GHR subtypes in a single teleost species. We have tested this hypothesis by cloning The full-lengthcDNA sequences of both GHR subtypes from Nile tilapia,Oreochromis niloticus,were cloned in present study.Phylogenetic analysis of known GHR sequences from various vertebrates revealed that fish GHRs cluster into twodistinct clades,viz. GHR1 and GHR2. One clade (GHR1),containing 6 to 7 extracellular cysteine residues,wasstructurally more akin to non-teleost GHRs. The other clade (GHR2),containing only 4 to 5 extracellular cysteineresidues,was unique to teleosts and was structurally more divergent from the non-teleost GHRs. To accuratelyanalyze the roles of two growth hormone receptors of GHR1 and GHR2 during development of Nile tilapiaOreochromis niloticus,methods of real-time quantitative PCR were established to examine GHR gene expression.Total RNA was extracted from male Nile tilapia liver tissue and the fragments of target gene were amplified by RTPCRwith special primers. PCR product was cloned via pGEM-T Easy vector and extracted plasmid. The success ofrecombinant plasmid was identified by PCR amplified and restriction enzyme analysis. Variation of mRNA levelsof GHR1 and GHR2 during development of male Nile tilapia was studied with real-time quantitative PCR. MaleNile tilapias from 30-day to 140-day old were used in the study to investigate the developmental changes of twoGHRs mRNA expressions in liver. Male Nile tilapias were sampled at days 30,60,80,110 and140 respectively. Thebody lengths and body weights were recorded to calculate specific growth rates (SGR) and the liver total RNA wasextracted to determine the abundance of GHR mRNA by real-time quantitative PCR. The SGR of male Nile tilapiaincreased from day 30 to day 110,and to the top at day 80-110 then decreased. Different expression of GHR1 andGHR2 was observed in male Nile tilapia liver. The GHR2 mRNA expressions was higher than that of GHR1 at day30 and day 60 (P<0.05),while from day 80 onward,the GHR1 mRNA expression was evidently higher than thatof GHR2 (P<0.05).The developmental tendency of two GHR mRNA expressions in liver of male Nile tilapia wasalso different. From day 30 to day 110 the GHR1 mRNA abundance increased with age,but from day 110 onward,the expression of GHR1 mRNA decreased. The ohange of GHR1 mRNA abundance was evidently correlatedwith SGR(R=0.96,P<0.01) of male Nile tilapia. GHR2 mRNA abundance increased from 30 to 60 day and with asharp decrease at 80 day,following a slow increase from 80 to 110 day,without correlation with SGR. The resultssuggest that actions of GH may be mostly mediated by GHR1 but not GHR2,and the liver GHR1 gene expressionis affected by age,playing an important role in male Nile tilapias development,while the biologic function of liverGHR2,as a new gene,is different from GHR1 and needs further study. The developmental changes of hepaticGHR1 mRNA expression in male Nile tilapia may be the key reason why male tilapia have different SGRs indifferent developmental stages

【题目】The second prolactin receptor in Nile tilapia (Oreochromis niloticus): molecular characterization, tissue distribution and gene expression
【中文关键词】Zhang, Yong;Long, Zijie;Li, Yangyuan;Yi, Shibai;Shi, Yu;Ma, Xilan;Huang, Weiren;Lu, Danqi;Zhu, Pei;Liu, Xiaochun;Meng, Zining;Huang, Xigui;Cheng, Christopher H. K.;Lin, Haoran
【英文关键词】Gene expression; Molecular characterization; Nile tilapia (Oreochromis niloticus); Prolactin receptor; Tissue distribution
【中文摘要】无
【英文摘要】Prolactin (PRL) is one of the most versatile hormones found in the pituitary of vertebrates and exerts its actions through binding to a specific PRL receptor (PRLR). Here we describe the cloning and characterization of a second prolactin receptor (ntPRLR2), isolated from the ovary of Nile tilapia (Oreochromis niloticus). The newly identified PRLR cDNA was 2011 bp in length and encoded 529 amino acids. It shared 31.6% identity in nucleotide sequence and 29.2% in deduced amino acid sequence with the first PRLR identified in Nile tilapia (ntPRLR1). Both of these ntPRLRs resemble the long form mammalian PRLRs. The nominated ntPRLR2 was further confirmed as a real prolactin receptor based on its competence to transactivate the beta-casein and c-fos promoters in the transiently ntPRLR2-transfected HEK293 cells. The ntPRLR2 gene also found to encode a 864-bp short form transcript in the ovary, which was confirmed by Northern blot analysis. A tissue distribution study by real-time PCR revealed that the mRNA of both receptors (ntPRLR1 and ntPRLR2) was widely expressed in different tissues, with an extremely high abundance in the osmoregulatory organs, including the gills, intestine and kidney. ntPRLR1 mRNA was more abundant than ntPRLR2 in the testis, while the reverse expression pattern was found in the ovary. In the ovary, ntPRLR2 mRNA demonstrated a distinct gonadal development-dependent expression profile, with significantly higher levels at a sexual mature stage than at sexual recrudescent and sexual regressed stages. When challenged with estradiol, ntPRLR2 mRNA expression was up-regulated by E(2), whereas E(2) had no significant effect on ntPRLR1.

【题目】Cloning, characterization and expression analysis of extracellular copper/zinc superoxide dismutase gene from bay scallop Argopecten irradians

【中文关键词】Bao, Yongbo;Li, Li;Wu, Qi;Zhang, Guofan
【英文关键词】ECSOD; Gene organization; Promoter; qRT-PCR; mRNA expression; Immune response
【中文摘要】无
【英文摘要】Extracellular superoxide dismutase (ECSOD) is a major extracellular antioxidant enzyme that protects organs from damage by reactive oxygen species (ROS). We cloned a novel ECSOD from the bay scallop Argopecten irradians (AiECSOD) by 3' and 5' RACE. The full-length cDNA of AiECSOD was 893 bp with a 657 bp open reading frame encoding 218 amino acids. The deduced amino acid sequence contained a putative signal peptide of 20 amino acids, and sequence comparison showed that AiECSOD had low degree of homology to ECSODs of other organisms. The genomic length of the AiECSOD gene was about 5276 bp containing five exons and six introns. The promoter region contained many putative transcription factor binding sites such as c-Myb, Oct-1, Sp1, Kruppel-like, c-ETS, NF kappa B, GATA-1, AP-1, and Ubx binding sites. Furthermore, tissue-specific expressions of AiECSOD and temporal expressions of AiECSOD in haemocytes of bay scallops challenged with bacteria Vibrio anguillarum were quantified using qRT-PCR. High levels of expression were detected in haemocytes, but not in gonad and mantle. The expression of AiECSOD reached the highest level at 12 h post-injection with V. anguillarum and then returned to normal between 24 h and 48 h post-injection. These results indicated that AiECSOD was an inducible protein and that it may play an important role in the immune responses against V anguillarum. Crown Copyright (C) 2008 Published by Elsevier Ltd. 【题目】A Dorsal homolog (FcDorsal) in the Chinese shrimp Fenneropenaeus chinensis is responsive to both bacteria and WSSV challenge
【中文关键词】Li, Fuhua;Wang, Dongdong;Li, Shihao;Yan, Hui;Zhang, Jinkang;Wang, Bing;Zhang, Jiquan;Xiang, Jianhai
【英文关键词】Dorsal; Relish; Immunity; WSSV; Bacteria; Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】Rel/NF kappa B is a family of transcription factors. In the present study, a Rel/NF kappa B family member, Dorsal homolog (FcDorsal) was cloned from the Chinese shrimp Fenneropenaeus chinensis. The full length cDNA of FcDorsal consists of 1627 bp, revealed a 1071 bp open reading frame encoding 357 aa. The predicted molecular weight (MW)of the deduced amino acid sequence of FcDorsal was 39.78 kDa, and its theoretical pl was 8.85. Amino acid sequence analysis showed that FcDorsal contains a Rel homolog domain (RHD) and an IPT/TIG (Ig-like, plexins and transcriptions factors) domain. The signature sequence of dorsal protein existed in the deduced amino acid sequence. Spatial expression profiles showed that FcDorsal had the highest expression level in the hemocytes and lymphoid organ (Oka). The expression profiles in the hemocytes and lymphoid organ were apparently modulated when shrimp were stimulated by bacteria or WSSV. Both Gram-positive (G(+)) bacteria (Micrococcus lysodeikticus) and Gram-negative (G(-)) bacteria (Vibrio anguillarium) injection to shrimp caused the up-regulation of FcDorsal at the transcription level. DsRNA approach was used to study the function of FcDorsal and the data showed that FcDorsal was related to the transcription of Penaeidin 5 in shrimp. The present data provide clues that FcDorsal might play potential important roles in the innate immunity of shrimp. Through comparison of the expression profiles between FcDorsal and another identified Rel/NF kappa B member (FcRelish) in shrimp responsive to WSSV challenge, we speculate that FcDorsal and FcRelish might play different roles in shrimp immunity. 【题目】Cloning of cytoplasmic heat shock protein 90 (FcHSP90) from Fenneropenaeus chinensis and its expression response to heat shock and hypoxia
【中文关键词】Li, Fuhua;Luan, Wei;Zhang, Chengsong;Zhang, Jiquan;Wang, Bing;Xie, Yusu;Li, Shihao;Xiang, Jianhai
【英文关键词】Heat shock protein 90; Fenneropenaeus chinensis; Heat shock; Hypoxia
【中文摘要】无
【英文摘要】Heat shock protein 90 (HSP90) works as a multi-functional chaperone and is involved in the regulation of many essential cellular pathways. In this study, we have identified a full-length complementary DNA (cDNA) of HSP90 (FcHSP90) from Chinese shrimp Fenneropenaeus chinensis. FcHSP90 full-length cDNA comprised 2,552 bp, including a 2,181-bp open reading frame encoding 726 amino acids. Both homology analyses using alignment with previously identified HSP90 and a phylogeny tree indicated that FcHSP90 was a cytoplasmic HSP90. Real-time reverse transcription polymerase chain reaction analysis revealed that FcHSP90 was ubiquitously expressed in all the examined tissues but with highest levels in ovary of F. chinensis. FcHSP90 mRNA levels were sensitively induced by heat shock (from 25A degrees C to 35A degrees C) and reached the maximum at 6 h during heat shock treatment. Under hypoxia conditions, FcHSP90 mRNA levels, in both hemocytes and gill, were induced at 2 h and depressed at 8 h during hypoxia stress. The assessment of FcHSP90 mRNA levels under heat shock and hypoxia stresses indicated that the transcription of FcHSP90 was very sensitive to heat shock and hypoxia, so we deduced that FcHSP90 might play very important roles for shrimp to cope with environmental stress.

【题目】A serpin from Chinese shrimp Fenneropenaeus chinensis is responsive to bacteria and WSSV challenge
【中文关键词】Liu, Yichen;Li, Fuhua;Wang, Bing;Dong, Bo;Zhang, Xiaojun;Xiang, Jianhai
【英文关键词】Serpin; Cloning; Expression profile; Challenge; Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】Arthropod defence responses (e.g. prophenoloxidase (proPO) activation and Toll pathway initiation) are mediated by serine proteinase cascades and regulated by serpins in haemolymph. A serpin (Fc-serpin) cDNA was cloned from the haemocytes of Fenneropenaeus chinensis by rapid amplification of cDNA ends (RACE) PCR and haemocyte cDNA library screening. The full-length cDNA consists of 1734 bp, encoding 411 amino acids with a calculated molecular mass of 46.55 kDa and a theoretical isoelectric point of 7.70. Fc-serpin contains a typical serpin-like homologue (serine proteinase inhibitors domain). The deduced protein contains a putative signal peptide of 19 amino acids and the serpin's signature sequence ((379)FHCNRPFLFLI(389)). Fc-serpin showed some identity with Pacifastacus leniusculus serpin (42%) and Manduca sexta serpin-6 (34%). The reactive centre loop (RCL) sequences of Fc-serpin, P leniusculus serpin, M. sexta serpin-6 and Bombyx mori serpin-2 are highly similar. An Arg at the PI position of the reactive site indicates that Fc-serpin may have inhibitory activity against prophenoloxidase activating proteinase (PAP) and clotting enzyme. Transcripts of Fc-serpin mRNA were mainly detected in haemocytes and the lymphoid organ by RT-PCR. The variation of the mRNA transcription level in haemocytes followed by artificial infection with bacteria OF white spot syndrome virus (WSSV) was quantified by SYBR Green real-time PCR analysis. Expression profiles of Fc-serpin greatly fluctuated after challenge. This work represents the first report Of a serpin in penaeid shrimp. The data provide clues that Fc-serpin might play potential roles in the innate immunity of shrimp. (C) 2008 Elsevier Ltd. All rights reserved

【题目】Molecular characterization and effect of RNA interference of retinoid X receptor (RXR) on E75 and chitinase gene expression in Chinese shrimp Fenneropenaeus chinensis,
【中文关键词】Priya, T. A. Jose;Li, Fuhua;Zhang, Jiquan;Wang, Bing;Zhao, Cui;Xiang, Jianhai
【英文关键词】Retinoid X receptor; Molting; Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】Retinoid X receptor (RXR)/ultraspiracle (USP) is the heterodimeric partner of ecdysteroid receptor and is required for the molting process of arthropods. To better understand the molecular aspects governing the process of molting in shrimp, the full-length cDNA of two RXRs, named as FcRXR-1 and FcRXR-2 were obtained from Chinese shrimp Fenneropenaeus chinensis which were of 1715 and 1700 bp long, revealed a 1315 and 1300 bp open reading frame (ORF) respectively. Quantitative Real time PCR analysis showed a marked tissue-specific difference in the expression of FcRXR transcript, which revealed that the expression of FcRXR Could be regulated in a tissue-specific manner. Moreover, high expression of FcRXR mRNAs was observed in late pre-molt period (D3) and post molt stages (A-B) of shrimp. Among the two isoforms, FcRXR-2 appeared in a considerably high level in all the stages compared to the FcRXR-1. In addition, we examined the temporal expression of two chitinase genes: FcChitinase (FcChi) and FcChitinase-1 (FcChi-1) during the molt cycle of F chinensis. Both the FcChi and FcChi-1 transcripts were detected in all stages of molting, although considerable fluctuations observed through the molt cycle. Injection of double stranded RXR (dsRXR) into juvenile shrimp resulted in a maximum silencing effect at 48 h post injection. We analyzed the expression levels of FcChi, FcChi-1 and the ecdysone inducible gene E75 (FcE75) in samples of dsRXR injected shrimp. Significant reduction in levels of both FcE75, FcChi and FcChi-1 transcripts Occurred in the silenced shrimp. This correlation suggested that RXR might involve in the downstream regulation of E75 and chitinase gene transcription in the ecdysone signaling pathway of decapod crustaceans. 【题目】Identification of a novel inducible cytosolic Hsp70 gene in Chinese shrimp Fenneropenaeus chinensis and comparison of its expression with the cognate Hsc70 under different stresses.
【中文关键词】Luan, Wei;Li, Fuhua;Zhang, Jiquan;Wen, Rong;Li, Yutao;Xiang, Jianhai
【英文关键词】Heat shock proteins . Hsp70 . Heat shock . Heavy metal . Stress . Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】The heat shock protein 70 (Hsp70) family is widely expressed in eukaryotic cells as the major chaperone protein. In this study, the full-length complementary DNA (cDNA) of a novel inducible cytosolic Hsp70 family member (FcHsp70) was cloned from Fenneropenaeus chinensis. FcHsp70 full-length cDNA consists of 2,511 bp with a 1,890-bp open reading frame encoding 629 amino acids. Three Hsp70 protein family signatures, IDLGTTYS, IIDLGGGTFDVSIL, and IVLVGGSTRIPKVQK, were found in the predicted FcHsp70 amino acid sequence. Phylogenetic analysis showed that FcHsp70 was categorized together with the inducible HSP70s reported in other crustaceans. Compared to the previously identified cognate Hsp70 (FcHsc70) in F. chinensis, the expression of FcHsp70 showed quite different expression profiles when the shrimp were subjected to different stresses including heat shock and heavy metal treatments. Under heat shock treatment, the expression of FcHsp70 showed much higher up-regulation than FcHsc70. Copper treatment also induced higher up-regulation of FcHsp70 than FcHsc70. Cadmium treatment did not induce the expression of FcHsp70, but caused down-regulation of FcHsc70. The different expression profiles of FcHsp70 and FcHsc70 in shrimp may indicate their different reactions to different stresses. Therefore, Hsp70 or Hsc70 could be developed as a biomarker to indicate different stresses

in shrimp.

【题目】First molluscan TNFR homologue in Zhikong scallop: Molecular characterization and expression analysis
【中文关键词】Li, Ling;Qiu, Limei;Song, Linsheng;Song, Xiaoyan;Zhao, Jianmin;Wang, Lingling;Mu, Changkao;Zhang, Huan
【英文关键词】Chlamys farreri,TNFR,mRNA expression,Innate immunity
【中文摘要】无
【英文摘要】Tumor necrosis factor receptors (TNFRs) are a superfamily of proteins characterized by the unique cysteine-rich domain (CRD) and their important roles in diverse physiological and pathological events such as inflammation, apoptosis, autoimmunity and organogenesis. The first member of the molluscan TNFR family, designated as CfTNFR, was identified from Zhikong scallop Chlamys farreri by expressed sequence tag (EST) and rapid amplification of cDNA ends (RACE) approaches. The full-length cDNA of CfTNFR was of 1334 bp, consisting of a 5' UTR of 17 bp, a 3'UTR of 69 by with a poly (A) tail, and an open reading frame (ORE) of 1248 by encoding a polypeptide of 415 amino acids with a theoretical isoelectric point of 8.33 and predicted molecular weight of 47.07 kDa. There were a signal peptide, a CRD, a transmembrane region and a death domain in the deduced amino acid sequence of CfTNFR, suggesting that it was a typical type 1 membrane protein. The high identities (22-40%) of CfTNFR with other TNFR superfamily members indicated that CfTNFR should be a member of TNFR superfamily, and moreover, it should be the first death domain-containing TNFR found in invertebrates. Phylogenetic analysis revealed that CfTNFR was closely related to TNFR-like proteins from Strongylocentrotus purpuratus, Drosophila melanogaster and Ciona intestinalis, and they formed a separate branch apart from vertebrate TNFRs. The spatial expression of CfTNFR transcripts in healthy and bacteria challenged scallops was examined by quantitative real-time PCR. CfTNFR transcripts could be detected in all tested tissues, including haemocytes, gonad, gill, mantle and hepatopancreas, and significantly up-regulated in the tissues of gonad, gill, mantle and hepatopancreas after Listonella anguillarum challenge, indicating that CfTNFR was constitutive and inducible acute-phase protein involved in immune defence. The present results suggested the existence of the TNFR-like molecules and TNF-TNFR system in low invertebrates, and provided new insights into the role of CfTNFR in scallop innate immune responses to invading microorganisms. 【题目】The genomic structure, alternative splicing and immune response of Chlamys farreri thioester-containing protein
【中文关键词】Zhang, Huan;Wang, Lingling;Song, Linsheng;Zhao, Jianmin;Qiu, Limei;Gao, Yang;Song, Xiaoyan;Li, Ling;Zhang, Ying;Zhang, Lei
【英文关键词】Chlamis farreri; Thioester-containing protein (TEP); Gene structure; Alternative splicing; Nonsense mediated decay (NMD); Immune response
【中文摘要】无
【英文摘要】MEP is a member of thioester-containing protein (TEP) family found in Zhikong scallop Chlamys farreri and is involved in innate immunity against invading microbes. In the present study, the genomic DNA of CfTEP was cloned and characterized. The genomic DNA sequence of CfTEP consisted of 40 exons and 39 introns spanning 35 kb with all exon-intron junction sequences agreeing with the GT/AG consensus. The genomic organization of CfTEP was similar to human and mouse 0 rather

than ciona C3-1 and Drosophila dTEP2. By RT-PCR technique, seven different cDNA variants of CfTEP (designated as CfTEP-A-CfTEP-G) were cloned from scallop gonad. CfTEP-A-CfTEP-F were produced by alternative splicing of six mutually exclusive exons (exons 19-24), respectively, which encoded the highly variable central region. While in CfTEP-G, the deletion of all the six exons introduced a new translation stop site and might trigger nonsense mediated decay (NMD). The mRNA expression and the proportion of the seven CfTEP variant transcripts were examined in the gonad of scallops after bacterial challenge. The fragments containing the highly variable central region of UTEP were amplified by RT-PCR and a 100 positive clones were sequenced randomly. The expression profiles of the seven MEP variants were different and displayed the sex and bacteria dependent manner. In the blank, sea water and Listonella anguillarum challenged subgroups of male scallops, all the transcripts detected were CfTEP-G isoform. In the Micrococcus luteus challenged subgroup, the isoforms expressed and their proportions were CfTEP-F (54%), CfTEP-B (23%), CfTEP-A (10%), CfTEP-C (7%) and CfTEP-E (6%). However, in the gonad of female scallops, only CfTEP-A were found in blank and sea water challenged subgroups. After L anguillarum or M. luteus challenge, four and five isoforms were detected, respectively, with CfTEP-F isoform being the most one in the both subgroups. These results suggested that the evolution of TEP genes was very complex, and that the diverse CfTEP transcripts generated by alternative splicing played an important role as pattern recognition receptors in the innate immune defense of scallops. 【题目】小麦遗传转化中优良受体基因型和L-PPT适宜浓度的筛选
【中文关键词】小麦; 遗传转化; 幼胚; 基因型; L-PPT
【英文关键词】Wheat ; Genetic transformation; Immature embryos; Genotypes; L-phosphinthricine
【中文摘要】为了筛选小麦遗传转化中的优良受体基因型和L-PPT适宜浓度,以16 份具有较大应用潜力的小麦品种(系) 幼胚为外植体, 研究了不同基因型间幼胚愈伤组织诱导、增殖、分化成苗的差异, 并对获得的转基因受体基因型进行L-PPT敏感性试验。结果表明, 16 份材料组织培养特性差异较大, 其中周19 和2000H1012-2-1-5 组织培养特性较好, 其诱导率、增殖率和绿苗分化率均较高, 可作为组织培养和转基因受体材料的良好基因型; 筛选剂L-PPT 为6 mg / L 时大部分愈伤组织分化受到抑制, L-PPT 为6 mg/ L 是周19 和2000H 1012-2-1-5 幼胚愈伤组织比较理想的分化筛选浓度。
【英文摘要】A mature genetic transformation system of w heat relies on high efficiency transformation system and high frequency regeneration system. In order to screen the optimal acceptor genotype and concentration of L-PPT in wheat transformation, immature embryo s o f 16 wheat genotypes w ere cultured to evaluate the culture efficiency by comparing the callus induct ion r ate, propagation rate, regeneration rate. Then the sensitivity to L-PPT of the optimal genotypes were studied on. The results indicated that Zhoumai 19 and 2000H1012-2-1-5 were optimal for t issue culture and genetic transformation because the indexes of the two genotypes were higher than others. When the concentration of L-PPT reached 6 mg/ L, most calluses w ere rest rained in the process of regeneration. Therefore, the concentration of L-PPT 6mg/ L was optimal for zhou19 and 2000H1012-2-1-5.

【题目】玉米磷酸烯醇式丙酮酸羧化酶基因高效表达载体构建及其导入小麦的研究
【中文关键词】小麦; 玉米磷酸烯醇式丙酮酸羧化酶(PEPC); 高效表达载体; 转基因; 拷贝数

【英文关键词】Wheat; Zea mays phosphoenolpyruvate carboxylase(PEPCase); High-efficient expression vector; Transgenic lines; Copy number
【中文摘要】为获得具有C4光合特征的高光效转基因小麦材料,利用从玉米中克隆的磷酸烯醇式丙酮酸羧化酶(PEPC)基因(pepc,GenBank接受号为FJ415327)构建高效双元表达载体,通过基因枪介导法将其导入小麦品种(系)中,利用Real-time PCR方法分析外源基因在转基因植株中的拷贝数。PCR和双酶切鉴定表明,玉米PEPCcDNA序列已插入双元表达载体pCAMBIA3301中,命名为p3301-pepc;对获得的抗性再生植株进行PCR扩增,其中有342株扩增出目的条带;在选取的15株转基因植株中7株拷贝数为1,3株拷贝数为2,2株拷贝数为3,拷贝数为5、8和17的分别为1株。初步证明玉米pepc基因已整合到小麦基因组中,且外源基因在转基因植株中既有单拷贝插入,也有多拷贝插入,这为进一步研究该基因在小麦基因组中的功能表达提供了试验材料。
【英文摘要】Transferring of key enzymes gene of C4 photosynthetic character is an important pathway to improve the photosynthesis efficiency and seed yield of C3 crop wheat.Phosphoenolpyruvate carboxylase(PEPC) plays an important role in C4 photosynthetic pathways.In order to obtain high photosynthetic efficiency transgenic wheat germplasm with C4 photosynthetic characteristics,a full-length cDNA sequence coding for maize PEPCase gene was cloned into the high-efficiency binary expression vector pCAMBIA3301,and was introduced into wheat by particle bombardment mediated transformation.The copy number of different transgenic lines were analyzed by real-time fluorescence quantitative PCR.PCR and double enzymes digestion determined that maize C4-specific PEPLase gene was cloned into the high-efficiency binary expression vector pCAMBIA3301,named as p3301-pepc;the expected 164 bp fragment was present in 342 of the 400 resistant plants;Among the fifteen positive transgenic lines,seven had one copy three had two copies,two had three copies,one had five copies,one had eight copies and one had seventeen copies.The results preliminary proofed that maize C4-specific PEPLase gene was integrated into wheat genome,and the copy number was different in transgenic lines,which would provide experimental materials for further function study of pepc gene in wheat genome.

【题目】田间条件下转玉米C4型PEPC基因小麦的光合生理特性
【中文关键词】磷酸烯醇式丙酮酸羧化酶 转基因小麦 光合特性
【英文关键词】Phosphoenolpyruvate carboxylase; Transgenic wheat; Photosynthetic characteristics
【中文摘要】为了检验转PEPC基因小麦是否具有C4光合生理特性,以转PEPC基因小麦和对照周麦19为试验材料,分别于抽穗期、开花期、花后第7天和花后第15天测定其单株旗叶的气体交换参数日变化,对净光合速率日变化进行单位日光合总量分析,并且对净光合速率日变化与单株气孔导度、胞间CO2浓度、蒸腾速率日变化的相关性进行了分析;在花后第15天测定其单株叶绿素荧光参数,并在成熟期调查了单株产量性状。与对照相比,转基因株系在4个测定时期的旗叶净光合速率明显提高,尤其在花后第15天,单位日光合总量较对照提高29.1%和23.3%,气孔导度和蒸腾速率均明显增加,胞间CO2浓度降低;花后第15天12:00与8:00相比,转PEPC基因小麦的Fv/Fm、qP、NPQ、ΦPSII的变幅均小于对照;单茎重、千粒重、单穗重和收获指数较对照显著增加。以上结果表明,转PEPC基因小麦材料在田间条件下光合特性明显优于对照,且具有提高小麦产量水平的潜力。
【英文摘要】Transformation and high efficiency expression of key enzymes gene of C4 photosynthetic characteristics are the important approach to improve photosynthetic efficiency and seed yield for C3 crop wheat. Phosphoenolpyruvate carboxylase (PEPC) plays an important role in C4 pathway. The authors have obtained several transgenic wheat lines with maize C4 type PEPC gene. To explore the expression and functional characteristics of PEPC gene in transgenic wheat plants, PCR test, PEPC activity, gas exchange parameters, chlorophyll fluorescence parameters and yield related characteristics of transgenic wheat lines were determined, using untransformed wheat as the control, and the value of diurnal photosynthesis cumulative (VDPC) at the four stages and the correlations between net photosynthesis rate and stomata conductance, intercellular CO2 concentration and transpiration rate were analyzed. The results showed that in the four determination stages, net photosynthetic rate of transgenic wheat obviously increased. For instance VDPC was increased by 29.1% and 23.3% on the 15th day after anthesis. Stomatal conductance and transpiration rate in flag leaves of transgenic wheat obviously increased compared to the control, and intercellular CO2 concentration decreased. Net photosynthetic rate of transgenic wheat enhanced by 23.2%, and variation scope of Fv/Fm, qP, NPQ, and ΦPSII of transgenic wheat was smaller than that of the control from 8:00 to 12:00 on the 15th day after anthesis; the major yield characteristics, such as weight per stem, thousand grain weight, single spike weight and harvest index of transgenic wheat, were significantly higher than those of the control. The results described above indicated that the transgenic wheat expressing maize PEPC gene showed better photosynthetic characteristics than untransformed plant and has the potential to increase wheat yield.

【英文关键词】Escape strategy, Interplant root competition, Maize (Zea mays L.), Root discrimination
【中文摘要】11
【英文摘要】We conducted an experiment with two maize hybrids (Zea mays L.) to examine the effect of interplant root competition on root growth and evaluate the impact to total plant performance. Two maize hybrids (Jinhai 5 and Denghai 3719) were grown either with no root competition in their own plot (owners) or as individuals sharing twice the space and nutrients (sharers). Plants were sampled every other week after pollination to track changes in root and shoot biomass. The carbohydrate allocation was smaller in the roots of sharers compared to owners at the pro-phase of grain filling and shoot accumulation was slightly accelerated during this period. However, at the lag phase, the accumulation rate in the shoots of individual plants was distinctly lower than in owners, as a result of earlier root senescence. Overall, shoot mass was reduced by 8% in sharers of both hybrids while they showed a similar root to shoot ratio compared with the owners. Although the ‘ sharing ’ treatment was confounded by larger soil space, the effects of larger soil volume and interplant root competition were different and demonstrated that interplant root competition had an inhibitory effect on roots. Maize plants displayed an escape strategy by allocating more carbohydrate to the shoots at the expense of the roots when faced with interplant root competition.

【题目】海洋侧孢短芽孢杆菌Lh-1抗菌活性物质的分离及特性研究
【中文关键词】海洋侧孢短芽孢杆菌Lh一1;抗菌活性物质;分离纯化;性质
【英文关键词】Brevibacillus laterosporus Lh一1;antimicrobial substance;purification;properties
【中文摘要】采用超滤、DEAE—Sephadex A25和CM—Sepharose FF离子交换层析及HPLC反相层析等步骤得到了海洋侧孢短芽孢杆菌(Brevibacillus laterosporus)Lh一1的抗菌活性物质,命名为R一1。HPLC纯化出的抗菌物质经质谱测定其分子量为1608.023 Da,BIO—RAD等电聚焦测得其pI为8.55,氨基酸分析表明该物质由Leu、Tyr、val、Ile、Lys、Gly、Met、Ser、Ala 9种氨基酸组成。该抗菌物质具有极强的耐热、耐酸碱特性,在pH 11.0~12.0条件下,121℃ 处理1h,其活力保持在75%以上。经3种蛋白酶(碱性蛋白酶、胰酶、胃蛋白酶)处理后,活性保持在80% 以上。茚三酮反应阳性。推测R一1可能是低分子量的脂肽。抑菌试验表明对食品腐败菌、致病性革兰氏阴性、阳性菌及少数真菌均有抑菌活性。
【英文摘要】An antimicrobial substance produced by Brevibacillus laterosporus isolated from the sea sediment was purifiedand characterized.The antimicrobial substance was purified by uhrafihration,DEAE-Sepharose Fast flow chromatography,CM-Sepharose Fast flow chromatography and HPLC reversed phase column chromatography,and after the final purification step,one active fraction was obtained,designated R-1.The molecular weight(MW)was accurately determined by MALDI-TOF-MS as 1608.023 Da. And its p1

was determ ined with Rotofor Cell BIO-RAD to be 8.55. Amino acid analysis of the purified R-1 showed that it was composed of Leu,Tyr,Val ,Ile,Lys,Gly,Met,Ser and Ala.Most of them were hydrophobic and neutral amino acid except Lys which was a basic amino acid.And this accorded with pI of R-1.R-1 remained active over a wide temperature range and it also was active over a broad pH rang.R-1 was insusceptible to pancreatin,pepsin and alkaline proteinase.Agar radial diffusion assay showed that R-1 had low minimun bactericidal concentration against Gram-Positive Bacteria such as Streptococcus mutans,Staphylococcus aureaus ,Clostridium and Gram—Negative Bacteria such as Escherichia coli,Pseudomonas putrefaciens.And R-1 had antibacterial activities against Candida albicans.

【题目】Hormonal change caused by the xenia effect during grain filling of normal corn and high corn crosses
【中文关键词】11
【英文关键词】Hormonal,Grain Filling,Normal Corn,High-Oil Corn,Crosses
【中文摘要】11
【英文摘要】The xenia effect results from the cross-fertiliza-tion of nonrelated lines of crops, which causes a grain to produce a germ or embryo that is much larger than average. It is a signii cant genetic component in TopCross grain production systems, which can affect grain yield and quality. This study measured hormone variations during grain i lling of normal corn (Zea mays L.) hybrids, and normal corn crossed with a high-oil corn. Two normal corn hybrids, Nongda 108 (ND108) and Liaoyu 20 (LY20), were used as the females. A high-oil corn hybrid, HOC115, was used as the male. Compared with self-fertilization, the cross between ND108 and HOC115 resulted in higher yield, while the cross of LY20 with HOC115 had lower yield. The changes in grain yield were mainly due to grain weight. Both hormone levels and endosperm cell division rates increased rapidly during the early stage of grain development, and then declined gradually until maturity. The levels of indole-3-acetic acid, gibberellin (GA3), zeatin riboside, and abscisic acid at an early developmental stage were closely related to the grain weight at maturity. Higher endosperm cell division rates and cell numbers were associated with lower levels of GA3, and higher i lling rates were associated with higher GA3. The xenia effect was mainly mediated through changes of hormone contents, which affected endosperm cell division, grain sink strength, and, therefore, changed grain weight and grain yield.

【题目】海洋微生物溶菌酶的发酵优化与中试生产
【中文关键词】:菌株s-12—86;海洋微生物溶菌酶;发酵优化
【英文关键词】strain S-12-86;marine microorganism lysozyme;ferm entation optimization
【中文摘要】以海洋细菌s-12-86为试验菌株,采用摇瓶发酵优化的方式,研究培养基组分(碳源、氮源、碳源与氮源的比例、金属离子)与发酵条件(培养温度、接种体积分数、装液体积分数、起始pH值、产酶周期)对海洋微生物溶菌酶产量的影响,并进行中试放大试验。结果表明:该菌产酶最佳培养基组分为:葡萄糖10g/L,蛋白胨5g/L,MgSO5 g/L,CaCI:2 g/L;最适发酵培养温度为30℃ ,接种体积分数为4.0% ,装液体积分数为10.0% ,起始pH值为8.0,发酵周期24 h。海洋细菌s-12.86发酵优化后的产酶量(25 636.8 U/mL)较优化前的产酶量(14 454.4 U/mL)提高了75.4% 。海洋微生物溶菌酶中试发酵的产酶量达26 697.87 U/mL。说明摇瓶发酵优化条件可以应用于海洋微生物溶菌酶中试生产上。

【英文摘要】The fermentation optimization of Marine strain S一12—86 was studied by shake flask.The effects of carbon source,nitrogen source, the ratio between carbon source and nitrogen source and metallic ion on marine microorganism lysozyme yield were investigated. The ferm entation conditions including incubation temperature,inoculum volume fraction,culture medium volume fraction,initial pH value and enzyme producing period of strain S-l2-86 were also analyzed. The pilot ferm entation experiment was carried out. The results indicate that the optimum culture medium is consisted of glucose 10 g/L,tryptone 5 g/L,MgSO4 5 g/L,CaC12 2 g/L.The optimum ferm entation conditions for S一12—86 strain include incubation temperature 30~C,inoculum volume fraction 4% ,culture medium volume fraction 10% ,initial pH value 8.0 and incubation period 24 h.The optimized enzyme yield(25 636.8U/mL)was increased by 75.4% compared with that of the original conditions(14 454.4 U/mL).The enzyme activity reached 26 697.87 U/mL after pilot ferm entation.It shows that the parameters screened by shake flask can be applied to marine microorganism lysozyme production in pilot scale directly.

【题目】灌浆期干旱胁迫对夏玉米叶片光系统活性的影响
【中文关键词】玉米; 干旱胁迫; 叶绿素荧光快速诱导动力学曲线; PSI最大氧化还原活性; 820nm光吸收
【英文关键词】Maize; Drought stress; Chlorophyll a fluorescence transient; Maximal oxidation-reduction activity of PS I; 820 nm light absorbance
【中文摘要】以高淀粉玉米品种郑单21为材料,借助叶绿素荧光快速诱导动力学曲线和820nm光吸收曲线,研究了灌浆期土壤干旱胁迫对玉米籽粒产量和叶片光系统I(PSI)及光系统II(PSII)活性的影响。两年的研究结果均表明,干旱胁迫显著降低叶片光合速率(P<0.05)和籽粒产量(P<0.05)。JIP-test分析发现干旱胁迫导致叶绿素荧光快速诱导动力学曲线中的K点和J点上升,表明PSII放氧复合体(OEC)和QA之后的电子传递链受到抑制,且PSII受体侧受抑制的程度大于供体侧。此外,干旱胁迫也显著地抑制PSI的最大氧化还原活性(ΔI/Io),阻碍光合电子从PSII向PSI的传递,破坏了PSI和PSII的协调性。我们认为干旱胁迫抑制PSI和PSII活性并破坏二者的协调性,是导致Pn和籽粒产量下降的重要原因之一。
【英文摘要】At grain filling stage, the effects of drought stress on photosynthetic acivities of photosystem I (PS I) and photosystem II (PS II) in leaves of maize (Zhengdan 21, a cultivar with high starch content) were studied by simultaneously analyzing chloro-phyll a fluorescence transient and light absorbance at 820 nm. The results, obtained from two years experiments, demonstrated that the drought stress significantly reduced photosynthesis (P<0.05) and grain yield (P<0.05) of the maize. The K and J steps at fluorescence transient were increased by drought stress, which indicated the inhibition of oxygen-evolving complex (OEC) and electron transport chain after QA in PS II. The acceptor side of PS II was damaged more severely than the donor side of PS II. Furthermore, the maximal oxidation-reduction activity of PS I (ΔI/Io) was also significantly decreased by the drought stress, which inhibited the photosynthetic electron tranport from the PS II to PS I, destructing the coordination between PS I and PS II. We suggest that the inhibition of PS I and PS II and the destruction of the coordination between PS I and PS II by the drought stress is one of the main reasons to cause the decrease in photosyntheis and grain yield of maize.

【题目】供氮水平对雄性不育玉米物质生产和氮代谢的影响
【中文关键词】玉米 细胞质雄性不育 氮素水平 物质生产 氮代谢
【英文关键词】11
【中文摘要】在池栽条件下,比较了不同供氮水平下玉米细胞质雄性不育系 及其同型可育系碳氮代谢的差异。结果表明,两种供氮水平下,玉米子粒产量和收获指数均高于其同型可育系,生物产量差异不显著,根量较多,根冠比高于其可育系。玉米保绿性好,净同化率高,果穗叶光合速率生育后期优势明显。果穗叶硝酸还原酶、谷氨酸胺合成酶 和谷氨酸脱氢酶 活性均具有较高活性,两种供氮水平下都表现出相对优势其叶片、茎秆和根中氮百分含量和氮积累量都表现出花后一较高,生育后期较低的特点。玉米的氮素转运多,贡献率和氮利用效率高,且不施氮水平下优势更为明显。说明雄性不育植株光合

碳生产和果穗叶氮代谢能力强,促进了植株对氮素的转运和利用,有利于子粒灌浆充实和产量提高。

【题目】Improvement of the photosynthetic characteristics of transgenic wheat plants by transformation with the maize C4 phosphoenolpyruvate carboxylase gene
【中文关键词】无
【英文关键词】Gene cloning; Photosynthesis; Transgenic wheat; Zea mays Phosphoenolpyruvate carboxylase
【中文摘要】无
【英文摘要】Attempts have been made to transform C3 crops with C4 genes to improve the photosynthetic rate of C3 plants. In our study, a full-length cDNA for phosphoenolpyruvate carboxylase gene (pepc) was isolated from Zea mays by PCR. The pepc gene was introduced into wheat plants (Triticum aestivum) by particle bombardment transformation. The integration, transcription and expression of the pepc gene were confirmed by, Southern blot, RT-PCR and Western blot analysis. Physiological studies showed that PEPCase activity in the transgenic plants was 140% higher than that of the untransformed plants. The highest rate of photosynthesis in the transgenic plants was 31.95 μmolCO2m-2s-1, which was 26% greater than the rate in untransformed plants. The light saturation point and carboxylation efficiency of pepc transgenic wheat were 20% and 22.57% higher, respectively, than those of untransformed wheat. As a result, the weight of seed per spike and thousand-grain weight were 0.23 g and 1.21 g higher than those of untransformed wheat. Our research will facilitate the further study of the function of the pepc gene in wheat plants.

【题目】Purification and properties of lysozyme from a marine strain
【中文关键词】海洋微生物,纯化,溶菌酶
【英文关键词】marine strain, purification, lysozyme
【中文摘要】从海泥中筛选到一株能分泌胞外溶菌酶的菌株。通过超滤、硫酸铵盐析、透析、Sephadex G-100分子筛、CM-Sephadex-50 离子交换色谱方法对该溶菌酶进行了纯化,纯化倍数达到65.28倍,得率为17.68%。该溶菌酶的分子量为16.0 kDa,最适温度为35°C,最适pH为8.0。锌离子和铜离子对该酶有激活作用,而锰离子则有抑制作用,EDTA对该酶酶活没有影响。该溶菌酶在几种增稠剂中稳定性良好,一些表面活性剂能增强酶活,对革兰氏阴性、阳性、真菌的抑菌效果明显,表明该溶菌酶具有广泛的应用前景。
【英文摘要】An extracellular lysozyme from a new strain which was screened from a sea mud sample was purified to homogeneity by ultrafiltration, followed by ammonium sulphate precipitation, dialysis, Sephadex G-100 chromatography and CM-Sephadex-50 ionexchange chromatography. This purification protocol resulted in a 65.28 fold purification of lysozyme with 17.68% final yield and the relative molecular weight of the enzyme was determined to be 16.0 kDa by SDS-PAGE. The kinetic characterisation of the purified enzyme exhibited maximum activity at 35 ° C and pH 8.0. The enzyme activity was promoted in the presence of Zn2+ and Cu2+, and inhibited by Mn2+. EDTA did not affect the enzyme activity. The enzyme was highly stable in the presence of several thickening agents. Some surfactants increased its activity. It had a broad antimicrobial spectrum against several Gram positive bacteria, Gram negative bacteria and fungi. The enzyme has broad potential application.

【题目】种植密度对夏玉米产量和源库特性的影响
【中文关键词】夏玉米 高产 种植密度 源库特性
【英文关键词】summer maize; high-yield; plant density; source-sink characteristics
【中文摘要】以耐密高产玉米品种郑单958(ZD 958)和登海661(DH 661)为试验材料,在4个不同生态区域(山东农业大学、汶口、兖州、莱州),设置22500株·hm-2、45000株·hm-2、67500株·hm-2、90000株·hm-2和112500株·hm-2 5个种植密度,研究了高产条件下种植密度对夏玉米产量及源库特性的影响。结果表明,两品种在112500株× hm-2密度条件下玉米籽粒产量和生物产量最高,分别为19132 kg×hm-2和36965 kg×hm-2,与密度22500株×hm-2和67500株×hm-2处理相比,籽粒产量分别增加了72%和48%,生物产量增加了152%和112%。叶面积指数随密度增大显著提高,两品种单株叶面积、最大花丝数、穗粒数和千粒重随密度增大而减少,但叶面积指数随密度增大而显著提高。收获指数与粒叶比变化趋势一致,随密度增大先显著减小,而当密度超过67500株×hm-2时差异不显著,表明当密度小于67500株×hm-2时,密度增加主要增加了源,而当密度大于67500株×hm-2时库相对增加,即高密度条件下通过增加群体库提高产量。
【英文摘要】It was studied that the effects of planting density on the yield and source-sink characteristics of summer maize under the of high-yield condition in four ecological regions: Shandong Agricultural University, Wenkou, Yanzhou and Laizhou. ZhengDan958 (ZD958) and DengHai661 (DH661) were used for experimental materials, and planted by five different densities which were 22500, 45000, 67500, 90000 and 112500 plant×ha-1. Results showed that the maximum yield and biomass were 19132 kg×ha-1 and 36965 kg×ha-1 under the condition of 112500 plant×ha-1, respectively. Compared with 22500 and 67500 plant×ha-1, the yield was

increased by 72% and 48%, and the biomass was increased by 152% and 112%, respectively. With the increment of plant density, leaf area index (LAI) was significantly increased, while the leaf area per plant (LA), the maximum number of filaments, the grains per spike and 1000-grain weight were all decreased. At the same time the harvest index was decreased with the increment of density, and the grain-leaf ratio was significantly decreased, while there was not significant difference when density was above 67500 plant×ha-1. The yield increased with the increasing of plant population. It showed that the higher plant density distinctly increased ear grain number per area, through improving the sink-capability of population, and obtained higher yield of summer maize.

【题目】Expression analysis of maize gene encoding C4-pyruvate orthophosphate dikinase (PPDK) and C4-phosphoenolpyruvate Carboxylase (PEPC) in transgenic Arabidopsis
【中文关键词】无
【英文关键词】Expression PPDK PEPC Transgenic Arabidopsis
【中文摘要】无
【英文摘要】To improve the efficiency of CO2 fixation in C3 photosynthesis, C4-cycle genes were overexpressed in Arabidopsis plants. In this study, a full-length cDNA for pyruvate orthophosphate dikinase (PPDK) with 971 amino acids was isolated from Zea mays using LA-PCR. The PPDK gene (GenBank accession number GU363532) and the phosphoenolpyruvate carboxylase (PEPC) gene (GenBank accession number: FJ415327) derived from a previous study were introduced into wild-type Arabidopsis both individually and in combination. The vector pCAMBIA3301 (p3301) was introduced into Arabidopsis as a control using an Agrobacterium-mediated system. The integration, transcription, and translation of the PPDK and the PEPC genes were confirmed by Southern blot, quantitative real-time PCR, and Western blot analysis. The average enzyme activity of C4-PPDK and C4-PEPC peaked at 4.63- and 5.81-fold compared to that of controls, respectively. The insertion of PPDK was found to increase the activity of PEPCase and vice versa. The photosynthetic rates of C4-PPDK, C4-PEPC, and C4-PKC(PPDK+PEPC) transgenic lines increased to 123.3, 136.4, and 146.6 % compared to that of controls, respectively.

【题目】Marine lysozyme from a marine bacterium that inhibits
【中文关键词】海洋溶菌酶,抑制血管生成,抑制肿瘤
【英文关键词】Lysozyme . Antiangiogenesis . Endothelial cells .CAMassay . Antitumor . Marine lysozyme
【中文摘要】最新研究资料表明,鸡蛋中富含的溶菌酶具有抗癌作用。在本实验中,我们研究了一种新型海洋溶菌酶体内和体外的抗癌和抗血管生成作用。首先,我们发现,这种来自海洋的溶菌酶对内皮细胞(ECV304)的增殖有特异的抑制作用,无细胞毒性(IC50=3.64 μM)。其次,我们通过鸡胚绒毛尿囊膜实验发现,这种海洋溶菌酶能够直接抑制鸡胚的血管新生,第三,我们的研究证明,这种海洋溶菌酶能够显著抑制小鼠肉瘤180细胞和肝癌22细胞的生长。此外,相同剂量的蛋清溶菌酶对体外内皮细胞的增殖没有作用,也不能抑制鸡胚的血管新生及裸鼠体内肿瘤细胞的生长。综上所述,我们的研究清楚的表明,这种新发现的海洋溶菌酶是强有力的抗癌因子,它能抑制肿瘤细胞的生长和血管增生。我们相信,这种海洋溶菌酶在抗肿瘤药物的开发中具有重要意义。

【英文摘要】Recent studies suggest that lysozyme, rich in hen egg, has an antitumor function. In the present study, we investigated the antitumor and antiangiogenesis effects of a newly isolated marine lysozyme both in vitro and in vivo. First, we showed that this marine-derived lysozyme specifically inhibits the proliferation of endothelial cells (ECV304) in a dose-dependent manner with no cytotoxicity (IC50=3.64 μM). Second, we showed that this marine lysozyme directly suppresses neovascularization in chickenembryos using chorioallantoic membrane assay. Third, we demonstrated that this marine lysozyme markedly inhibits tumor growth in mice bearing either sarcoma 180 or hepatoma 22. Unexpectedly, hen egg lysozyme has no effects on the proliferation of endothelial cells in vitro or neovascularization in chicken embryos or tumor growth in nude mice at the same dosage range. Taken together, our studies clearly show that the newly identified marine lysozyme is a potent antitumor molecule, which may inhibit tumor growth and inhibit angiogenesis. We believe that this marine lysozyme may have a therapeutic value in antitumor drug development.

【题目】阳光紫外辐射对褐藻羊栖菜生长和光合作用的影响
【中文关键词】阳光紫外辐射;羊栖菜; 生长;光合作用
【英文关键词】Solarultraviolet radiation; Hizikiafusiformis; Growth; Photosynthesis
【中文摘要】为探讨经济褐藻羊栖菜对阳光紫外辐射变化的响应, 我们在全波段阳光辐射(280) 700nm), 去除UV-B辐射(320) 700nm)以及光合有效辐射PAR(400) 700nm) 3种辐射条件下对其进行培养, 测定了其光合作用与生长的变化。羊栖菜的生长是通过每两天测量一次藻体的湿重来测定的,光合放氧是用Clark型氧电极测定的, 为了测定藻体叶绿素a和紫外吸收物质的含量, 从250nm到750nm对羊栖菜的甲醇提取液进行扫描, 叶绿素a的浓度用Porra的公式计算, 紫外吸收物质的计算是根据Dunlap的方法先计算紫外吸收物质和叶绿素a的比率, 然后乘以每单位藻体叶绿素a的含量。结果表明,当藻体接收较多的日辐射量时有较高的相对生长速率, 当滤除UVR后,较高的太阳辐射也导致了较高的光合放氧。然而太阳紫外辐射能够抑制藻体的光合放氧和生长速率, 降低叶绿素a的浓度, 并且这种抑制作用随着辐射水平的升高而增强。此外, 阳光紫外辐射也诱导产生了一定量的紫外吸收物质, 但并不足以抵抗紫外辐射对藻体的伤害作用

【英文摘要】Effectsof solarultraviolet radiation(UVR) onthegrowthandphotosynthesis of theeconomicbrownalgaHizikia fusiformiswere investigatedwhileexposedtofull spectrumsolarradiation(280) 700nm), solar radiationdepletedofUV-B(320) 700nm) andsolarradiationdeprivedof totalUVR(400) 700nm) inordertounderstanditsresponses tochan-ges insolarUVR. 【题目】吉林省高寒山区玉米平衡施肥效果分析
【中文关键词】高山地区;玉米;平衡施肥;效果;
【英文关键词】Alpine areas;Corn; Balanced fertilization; Effect
【中文摘要】通过吉林省高寒山区玉米平衡施肥试验,结果表明处理13施用N、P2O、K2O的肥用量分别为100kg/hm2、80kg/hm2和50kg/hm2,其产量和纯收入最高,分别为7189.5Kg/hm2和8037.4元/hm2,所产生的经济效益最高。因此,得出处理13的施肥用量是该区域玉米最佳施肥用量,为吉林省高寒山区玉米高产高效栽培,提供技术支撑。
【英文摘要】The experiment of balanced fertilization on corn was done in alpine areas of Jilin province, the results as followed,the yield and net income of treatment 13 is optimal and its fertilizer quantity of N, P2O5,K2O is 100kg/hm2,80 kg/hm2,50 kg/hm2 repectively, the yield is 7189.5 kg/hm2 and the net income is 8037.4 yuan/hm2,the economic benefits is the highest among all the treatments. Accordingly, the fertilizer quantity of treatment 13 is the optimal in the areas, and it could be used as a technology support

for corn high yield cultivation in alpine areas of Jilin province.

【题目】不同 N 水平条件下羊栖菜对阳光辐射的响应
【中文关键词】羊栖菜;紫外辐射;N;有效光化学效率;相对电子传递速率
【英文关键词】Hizikia fusiformis; UV radiation; N; the effective photosynthetic quantum yield; rETR
【中文摘要】探讨了太阳紫外辐射对两种 N 水平条件下羊栖菜藻体光化学特性的影响及其恢复。结果显示,在高的光辐射下羊栖菜藻体的有效光化学效率和相对电子传递速率急剧下降,两种 N 水平条件下藻体的光化学活性下降趋势一致;在全波长太阳辐射条件 (即高的光辐射和紫外辐射同时存在) 下它们的下降幅度更大,而 N 加富条件下羊栖菜藻体的相对电子传递速率要高于对照 N 水平下生长的藻体,表明 N 加富的生长条件使得藻体具有更高抵御紫外辐射的能力,这可能是与 N 加富生长条件下的藻体中含有较高含量的紫外吸收物质和类胡萝卜素有关。在低光恢复过程中,全波长辐射处理藻体的有效光化学效率比可见光辐射处理藻体的恢复要慢 (分别为 6 h 和 3 h 可恢复到起始水平) ;而相对电子传递速率的恢复能力则比有效光化学效率的恢复能力更弱,需要 24 h 或者更长的时间。
【英文摘要】Physiological properties of photosynthesis were investigated under solar radiation in the marine brown macroalga, Hizikia fusiformis, grown at two different N availabilities. The significant decrease of the effective photosynthetic quantum yield and rETR was found in the thalli when exposed to solar radiation, with the decrease fluctuation being more greater in the thalli treated with full solar radiation (PAB, i.e. PAR plus UV radiation) than those treated with solar photosynthetically active radiation (PAR). The decrease trend of the effective photosynthetic quantum yield was the same between the algae grown under normal N level and high N level when the thalli were exposed to PAR or PAB. However, when exposed to PAB, rETR of the thalli grown under high N level was higher than those grown under normal N level, indicating that the algae cultured in high N level exhibited higher capacity of defending UV radiation, whic h might be related with the high contents of UVAC and carotenoids. During the recover period, the effective photosynthetic quantum yields in the thalli treated with PAB recovered a little slowly compared with the thalli treated wi th PAR (they reached the initial levels after 6h and 3h, respectively). The rETR of the th alli recovered much more slowly (at least 24 h) than the effective photosynthetic quantum yields did.

【中文摘要】用副溶血弧菌悬液和生理盐水(对照) 注射感染日本蟳, 研究其血清超氧化物歧化酶(SOD) 、酸性磷酸酶(ACP) 、碱性磷酸酶(AKP) 、过氧化氢酶(CAT) 活性的变化, 并进行统计学分析。试验结果表明, 注射副溶血性弧菌悬液组12、2 4、48 h 后SOD 活性均高于对照组, 48 h 达到最高; 12、24 h CAT活性增加明显, 24 h 达最高; AKP 活性5、1 2、24 h 均有增加, 高于对照组, 24 h 最高; ACP 活性12 h 开始上升, 24 h 达最高。在人工感染副溶血性弧菌48 h 内, 日本蟳体内的免疫因子发生明显的变化, 血清中SOD、ACP 、AKP 、CAT 活性在不同时间段均有显著升高趋势, 高于对照组。

【题目】科尔沁沙地乌兰敖都地区荒漠化动态监测
【中文关键词】荒漠化 动态监测 气温 植被 土壤侵蚀 科尔沁沙地
【英文关键词】无
【中文摘要】摘 要:利用科尔沁沙地乌兰敖都荒漠化试验站的监测资料,从植被、土壤、水分、气象和沙尘暴等方面分析了乌兰敖都地区的荒漠化发展动态。结果表明:近10年内气温有暖温化趋势,但灾害天气没有明显增加;流动沙丘侵蚀最严重,沙丘平均移动速率为2.2 m/a;人工植被发展良好,但原生草场的可持续发展能力有所下降;地下水位没有明显下降趋势。目前,科尔沁沙地乌兰敖都地区土地荒漠化呈逆转趋势,整体环境有所改善

【题目】鲶爱德华氏菌间接酶联免疫快速检测法的建立
【中文关键词】鲶爱德华氏菌;酶联免疫吸附实验(ELISA);黄颡鱼;“ 红头病 ”;多克隆抗体
【英文关键词】无
【中文摘要】用鲶爱德华氏菌兔抗血清作为一抗,碱性磷酸酶(AP)标记的羊抗兔IgG 作为酶标二抗,建立黄颡鱼“ 红头病 ”病原菌—鲶爱德华氏菌的间接酶联免疫(ELISA)快速检测法,并优化检测条件。抗原最佳包被浓度为107 /mL,一抗工作的最佳稀释度为1∶211,病原菌的检测灵敏度为105 /mL,交叉反应实验证明该方法特异性强,与迟钝爱德华氏菌、弧菌等13 种标准菌株无交叉。应用上述技术对人工感染发病鱼中分离的优势菌进行检测,结果表明阳性检出率为80%;对自然发病黄颡鱼体内分离获得的20 株优势菌检测结果表明,12 株菌为鲶爱德华氏菌。

【题目】抗鲶爱德华氏菌多克隆抗体的制备及特性分析
【中文关键词】黄颡鱼; 红头病; 鲶爱德华氏菌; 多克隆抗体
【英文关键词】无
【中文摘要】利用2 株黄颡鱼 红头病 病原菌!!!鲶爱德华氏菌的灭活疫苗作为免疫原, 免疫新西兰大白兔, 制备了高效价的多克隆抗体。通过间接酶联免疫、间接免疫荧光和免疫印迹等技术对多克隆抗体特性进行了分析。测定获得多抗效价分别为1∀ 215 和1 ∀ 214 , 2 株病原菌之间存在很强的交叉反应, 且2 种多抗均与鲶爱德华氏菌、迟钝爱德华氏菌、副溶血弧菌、鳗弧菌、溶藻弧菌、火神弧菌、河流弧菌、创伤弧菌标准菌株存在交叉反应, 与粪肠球菌、大肠杆菌、酿脓链球菌、海豚链球菌、杀鲑气单胞菌、嗜水气单胞菌、类产碱假单胞菌标准菌株均无交叉反应。免疫印迹实验结果表明, 2 株病原菌的主要抗原决定簇相同, 分子量分别为61. 1, 46. 6, 41. 3, 28. 8 和19 kDa。本实验得到了黄颡鱼 红头病 致病菌高效价的多克隆抗体, 可以作为初步筛选 红头病 病原菌的工具, 为建立快速有效的疾病监测方法和进一步的免疫学

防病研究提供了依据, 奠定了基础。

【题目】三疣梭子蟹病原副溶血弧菌的分离与鉴定
【中文关键词】三疣梭子蟹;副溶血弧菌;16S rRNA 基因;gyrB 基因
【英文关键词】Portunus trituberculatus L.; Vibrio parahaemolyticus; 16S rRNA gene; gyrB gene
【中文摘要】从养殖病死三疣梭子蟹肝胰脏及心脏血淋巴液中分离到大量优势生长的细菌,人工感染试验证明分离菌对三疣梭子蟹有较强的致病性;对分离菌进行了形态特征、理化特性、胞外酶及溶血素活性等表型生物学性状及16S rRNA 和gyrB 两种基因的分子鉴定。菌株(JGX080708-1)所扩增的16S rRNA 基因序列长度为1 453bp(GenBank 登录号:FJ824663),所扩增的gyrB 基因序列长度为1 191bp(GenBank 登录号:GQ372985);两种基因序列在NCBI 通过blast 检索,结果均与弧菌属细菌的基因序列自然聚类;根据分离菌的表型及分子特征,判定分离菌为弧菌属(Vibrio Pacini 1954)的副溶血弧菌[Vibrio parahaemolyticus(Fujino et al 1951)Sakazaki Nakamura and Takizawa 1963]。分离菌的药敏试验结果显示,对供试49 种抗菌药物中的安曲南等42 种药物高度敏感,对林可霉素敏感,对青霉素G 等6 种药物耐药。
【英文摘要】Dominant bacteria were isolated from diseased Portunus trituberculatus L., and have strong pathogenicity toPortunus trituberculatus L. by artificial challenge. The phenotypic biological characters were examined, includingmorphological characteristics, physiological and biochemical characteristics; and the activity of extracellulase andhemolysin. The molecular identification were also

conducted, and the 16S rRNA and gyrB genes were partiallysequenced and compared with sequences deposited in databases, moreover molecular phylogenetic trees wereconstructed. The sequenced 16S rRNA gene of strain JGX080708-1 (GenBank accession No. FJ824663) is 1,453bp inlength, and the sequenced gyrB gene of strain JGX080708-1 (GenBank accession No. GQ372985) is 1,191bp in length.Blasting of 16S rRNA and gyrB genes in NCBI showed high homogeneity between the isolates and Vibrio sp. fromGenBank database. The results showed that the identified strains belonged to Vibrio parahaemolyticus [(Fujino et al1951) Sakazaki Nakamura and Takizawa 1963] of Vibrio (Pacini 1954) based on their phenotypic and molecularcharacteristics. Drug resistance of isolates to 49 antimicrobial agents was detected, and the results showed that isolateswere high sensitive to 42 agents including aztreonam, and also sensitive to lincomycin, furthermore they were resistantto 6 agents including penicillin G.

【题目】科尔沁沙地人工固沙群落草本植物种群生态位特征
【中文关键词】科尔沁沙地 固沙群落 生态位宽度 生态位重叠
【英文关键词】无
【中文摘要】摘 要:运用Levins生态位宽度和Pianka生态位重叠公式,计测分析了科尔沁沙地流动沙丘以及山竹子Hedysarum fruticosum、柠条锦鸡儿Caragana korshinskii、黄柳Salix gordejevii和小叶锦鸡儿C.microphylla人工固沙群落内草本植物种群的生态位宽度和生态位重叠。研究结果表明:在不同的生境条件下物种的生态位宽度存在差异.沙蓬Agriophyllum squavrosum在流动沙丘上的生态位宽度最大.狗尾草Setaria viridis、毛马唐Digitaria ciliaris分别在山竹子群落和黄柳群落中的生态位宽度最大.烛台虫实Corispermum candelabrum在柠条锦鸡儿群落和小叶锦鸡儿群落中占据着最宽的生态位。各群落中生态位宽的物种对生态位重叠值较大,但有些较窄的生态位物种对之间也出现较大的生态位重叠,这种现象从另外的角度表明各群落内环境资源存在一定的空间异质性。不同固沙群落中相同物种的生态位宽度和生态位重叠的差异在一定程度上反映了各群落内不同的区域环境特征。

【题目】科尔沁沙地沙漠化过程中植被与土壤退化特征的研究
【中文关键词】科尔沁沙地 沙漠化 植被退化 土壤理化性质 土壤酶
【英文关键词】无
【中文摘要】摘 要:选择科尔沁沙地沙漠化严重地区相邻地段的固定沙丘、半固定沙丘、半流动沙丘和流动沙丘为对象,对土地沙漠化过程中植物种类消长、物种多样性、生活型结构及土壤理化性质和生物活性的变化特征进行了分析。结果表明:沙漠化过程是一个物种多样性衰减的过程,沙漠化导致大多数原生眭物种消失。从生活型来看,地面芽植物受沙漠化影响最大。沙漠化过程中土壤养分严重丧失,土壤微生物量C、N、P,以及土壤脲酶、蛋白酶、蔗糖酶、磷酸单酯酶、脱氢酶和硝酸还原酶的活性均随沙漠化程度的加剧而大幅度下降。土壤生物活性对土壤沙漠化比较敏感,在固定沙丘到半固定沙丘的转化过程中土壤生物活性和物种多样性下降最快。

【题目】塑料增塑剂对凡纳滨对虾存活、生长和免疫的影响
【中文关键词】凡纳滨对虾;塑料增塑剂;存活;生长;免疫
【英文关键词】Litopenaeus vannamei;plastic plasticizer; survival;growth;immune factors
【中文摘要】研究了塑料增塑剂邻苯二甲酸二甲酯(DMP)、邻苯二甲酸二乙酯(DEP)、邻苯二甲酸二丁酯(DBP)和邻苯二甲酸二辛酯(DOP)对凡纳滨对虾(Litopenaeus vannamei)存活、生长和免疫的影响. 96h 急性毒性实验表明,在助溶剂Tween 20 的安全浓度范围内,随着DMP、DEP、DBP 和DOP 水平的升高,凡纳滨对虾存活率呈下降趋势,24h、48h、72h 和96h 的LC50分别为40.33、35.29、25.48、19.14mg・L -1,30.52、23.45、16.96、15.38mg・L -1,7.51、6.97、6.57、6.06mg・L-1 和6.85、5.87、5.01、4.47mg・L-1;DMP、DEP、DBP 和DOP 对凡纳滨对虾的安全浓度随塑料增塑剂碳链的增加呈下降趋势,分别为8.11、4.15、1.80 和1.29mg・L-1. 90d 慢性毒性实验表明,凡纳滨对虾存活率、特定生长率、血清蛋白含量、血清酚氧化酶和超氧化物歧化酶活性均以对照组和0.0400mg・L-1 助溶剂Tween 20 处理组最高,而且显著高于1/100 倍DMP、DEP、DBP 和DOP 安全浓度处理组(p<0.05).
【英文摘要】The experiments were designed to determine the effects of plastic plasticizers on survival, growth and immunefactors of Litopenaeus vannamei. The four commonly used plasticizers were dimethyl phthalate (DMP), diethyl phthalate(DEP), di-n-butyl phthalate(DBP)and dioctyl phthalate(DOP). The result of acute toxicity test for 96h indicated that thesurvival rate of Litopenaeus vannamei exhibited decreased trend with increasing DMP, DEP, DBP and DOP levels withinthe safety concentration of co -solvent Tween 20, and LC50 at 24h, 48h, 72h and 96h were 40.33, 35.29, 25.48 and19.14mg・L-1; 30.52, 23.45, 16.96 and 15.38mg・L-1; 7.51, 6.97, 6.57 and 6.06mg・L-1; 6.85、5.87, 5.01 and 4.47mg・L-1, respectively. The safety concentration of DMP, DEP, DBP and DOP decreased with increasing carbon chain, and were8.11, 4.15, 1.80 and 1.29mg・L-1, respectively. The result of chronic toxicity test for 90d indicated that the survival rate,specific growth rate, serum protein content, polyphenol oxidase activity and superoxide dismutase activity were high in thecontrol and 0.0400mg・L -1 co -solvent Tween 20 treatment, which were significantly higher than the

treatments of 1/100safety concentration of DMP, DEP, DBP and DOP.

【题目】科尔沁沙地生物与工程结合的固沙措施与效果
【中文关键词】科尔沁沙地 固沙 草方格 土壤养分 植被
【英文关键词】Key words:Horqin sandy land;sand-stabilizing;straw check boards;soil nutrients;vegetation
【中文摘要】摘 要:应用生物与工程措施对科尔沁沙地西部流动沙丘进行植被恢复,并通过沙丘监测和植被调查来评价流沙固定和恢复效果。1.0×1.0m的草方格结合适宜的固沙植物,能达到最佳的防风固沙效果。流动沙丘经人工措施固定后,随固定年限的增加,土壤水源涵养能力逐步提高,土壤中的有效养分如全C、有效K、碱解N和有效P等指标显著提高,土壤化学性质得到明显改善。植被盖度明显提高,植物生态系统趋于相对稳定的状态。
【英文摘要】Abstract:Applying biology and engineering measures to restoring the vegetation of shifting sand in western region of Horqin sandy land, and sand-stabilizing and restore effect were assessed through sand monitoring and vegetation investigation. 1.0×1.0m size straw check boards with suited sand-stabilizing plants could achieve the best wind break and sand-stabilizing effect. As the time goes by after shifting sands were stabilized, soil water conservation capacity, and the available nutrients, total C, available K, N, and P were increased, soil chemical property was improved obviously. Vegetation coverage was increased and plant ecology system was inclined to reach stabilization condition relatively.

【题目】基于叶面积指数(LAI)的小麦变量施氮模型研究
【中文关键词】小麦;模型;变量施氮;精确农业
【英文关键词】wheat;model;variable fertilization;precise agriculture
【中文摘要】摘 要:为探讨基于叶面积指数变化的小麦变量施氮技术,依据养分平衡原理和“ 作物-土壤-环境-技术 ”整体原则,采用土壤空间信息数据与小麦需氮量和各生育阶段叶面积指数相结合的方法,设计了小麦播前施氮总量和播后精确追氮的数量模型。根据拔节期和抽穗期小麦的长势,对施氮量的初值进行订正,确定小麦的最适追氮量。在河南郑州市和鹤壁市两地的试验验证结果表明:小麦产量模拟值与实测值间的相关系数分别为0.7799和0.7169,达显著水平。与传统施肥

技术相比,在相同产量下,使用模型后每公顷施氮量减少43.5 kg。该研究提出的基于模型的变量施氮技术,可以兼顾天气、地力和作物长势三方面因素,最终实现小麦的精确施氮,对促进精确农业的发展具有重要意义。

【英文摘要】Abstract:In order to study the variable nitrogen fertilization techniques based on LAI , the model on total amount of N fertilization before sowing and precise N amount after sowing was designed following the theory of nutrient balance and the principle of “ crop-soil-environment-technology ”, taking spatial variability of soil nutrition, wheat N requirement and LAI in different development phrase into account. According to the growth status of elongation period and heading period of wheat, initial rate of N application was corrected, and optimum additional amount of N fertilizer was ensured. Field experiments of wheat with variable nitrogen fertilization model were respectively carried out at Henan Agricultural University Research Station and Agricultural Research Institute of Hebifrom 2004 to 2005. The results showed that the simulated value of yield was significant correlated with that of field survey, and the correlation coefficient was 0.7799 and 0.7169 respectively. Compared with traditional N fertilization system, the variable nitrogen fertilization model can save 43.5 kg N per hm 2 with the same yield. Variable nitrogen fertilization model based on this model can take weather, soil fertility and the growth status intoaccount, and realize precise nitrogen fertilization in small size field at last, which means a lot to develop precise agriculture.

【题目】Individual Variation in Growth in Sea Cucumber Apostichopus
【中文关键词】无
【英文关键词】sea cucumber; Apostichopus japonicus; growth; coefficient of variation; individual
【中文摘要】无
【英文摘要】The exceptionally large individual growth variation has been previously recognized in several sea cucumber cohorts.However, there is a lack of information regarding the mechanism of such individual differences. In this study, the sea cucumberApostichopus japonicus (Selenka) was reared individually in order to eliminate possible effects of social interaction, stocking density,etc. The results showed that there were substantial differences in growth among the sea cucumber individuals during the 100-dayexperiment. The special growth rate of the sea cucumber individuals differed by up to three folds (from 0.40% to 1.01%), and thecoefficient of variation in body weight increased from 12.04% to 40.51%. The final wet body weight, food intake and food conversionefficiency for each sea cucumber were generally positively correlated with their initial wet body weight ($P<0.05$). Energy budgetof the animals showed that the food energy spent on respiration was much greater (about four folds) but energy deposited for growthwas much less for (initially) smaller than for larger A. japonicus. The present result implies that there are obvious genetic differencesamong the sea cucumber individuals, largely accounting for the individual growth variation of the cohort sea cucumber. These resultswill provide some basic data for promoting selective breeding and farming of the sea cucumber.

【题目】有机无机肥配施对小麦冠层结构、产量和蛋白质含量的影响
【中文关键词】有机肥;豫麦34;冠层结构;产量;蛋白质含量
【英文关键词】Organic manure; Yumai34;Canopy archit ecture; Grain yield; Protein content
【中文摘要】摘要:【目的】揭示有机无机肥配施对豫麦 34 冠层光分布特征、产量和蛋白质含量的影响。【方法】采用大田切片法,研究了尿素、鸡粪及鸡粪和尿素配施方式下,强筋小麦品种豫麦34的冠层结构、产量构成及籽粒蛋白质含量的变化。【结果】施用鸡粪有利于提高豫麦34旗叶的叶绿素含量(SPAD值),促进群体光合有效辐射(PAR)的提高,增大小麦群体的平均叶倾角(MLA),降低群体的冠层开度(DIFN),提高光能利用效率和小麦群体的叶 面积指数(LAI),有利于经济系数和籽粒蛋白质含量的改善。【结论】综合考虑小麦产量、经济系数和籽粒蛋白质含量等因素,3 种肥料处理以鸡粪与尿素配施为最佳,配施处理的小麦冠层结构适宜、株型最佳、群体光分布合理。
【英文摘要】Abstract: 【Objective】 The study was conducted to reveal the effect s of organic manure and urea mixture on canopy architecture, grain yield and protein content of Yumai34. 【Method】 Field experiments with the conventional “ Layer upon layer cut method ” were carried out to study the dynamics of canopy architecture characters and changes of grain yield and protein content of strong gluten wheat Yumai34 after application of urea, urea and chicken manure mixture, and chicken manure alone. 【Result】 The results showed that chlorophyll content (SPAD value) in flag leaves, photo synthetically active radiation (PAR), mean leaf angle (MLA), and leaf area index (LAI) increased under chicken ma retreatment, while canopy openness (DIFN) behaved oppositely, and these were all helpful to improve the light utilized efficiency. The fact that kernel weight per spike and kernel protein content of Yumai34 increased at chicken manure and urea mixture treatment remarkably, has meliorated the grain yield and kernel quality

significantly. 【Conclusion】The mixed fertilizer treatment had a reasonable canopy architecture than others, which accounted for they had intercepted more solar radiation. The grain yield, eco no my coefficient and kernel protein content of mixed fertilizer treatment were higher than those of other treatments significantly or extremely significantly.

【题目】中国海五种群三疣梭子蟹的形态差异分析
【中文关键词】中国海;三疣梭子蟹;形态差异;多元分析
【英文关键词】China Sea; Portunus trituberculatus; morphological variation; multi-variation analysis
【中文摘要】运用三种多元分析方法,即聚类分析、主成分分析和判别分析,通过测量三疣梭子蟹23 个形态学性状参数,对中国海大连海区、东营海区、连云港海区、舟山海区和湛江海区5 个种群三疣梭子蟹的形态差异进行了比较研究。聚类分析结果表明,连云港种群和东营种群形态最为相似(形态距离0.07),大连种群与东营种群、大连种群(dl)与舟山种群(zs)的趋异程度逐渐增加,形态距离分别为0.08和0.09,而湛江种群的趋异程度最大,与其余4 种群的形态距离达0.15 以上。主成分分析构建了3 个主成分,其贡献率:主成分1 为27.39%,主成分2 为15.23%,主成分3 为10.27%,累积贡献率为52.89%。在第1 主成分中,比例性状ICM/CL、BCW/CL、PWC/CL 和SW/CL的影响比较大。判别分析结果表明,5 个海区种群之间的形态差异极显著(P<0.01),通过建立5 个地理种群的判别函数,结果判别准确率P1 为63.64%~94.44%, P2 为67.74%~92.86%,综合判别率为82.24%,因此,该判别方程具有较高的判别效果。
【英文摘要】Based on 23 morphological characters of Portunus trituberculatus, three multivariation analysis methods(cluster analysis, principal component analysis and discriminant analysis) were used to comparably reveal themorphological variation among the five geographical populations from China Sea areas (Dalian, Dongying, Lianyungang, Zhoushan and Zhanjiang). The results of cluster analysis and principal component analysis indicated thatthe morphological characters were similar between Dongying and Lianyungang, but quite different from that ofZhanjiang. In the principal component analysis, three principal components were constructed, and the contributoryratio of the first principal component was 27.39%, the second was15.23%, and the third was 10.27%.The cumulativecontributory ratio was 52.89%.The results of discriminant analysis indicated that there were significant differencesamong the five populations (P<0.01). The identification accuracy was 63.64%~94.44%(P1) and 67.74%~92.86%(P2), and the total discriminant accuracy was 82.24%.

【题目】科尔沁沙地植被恢复及其对土壤的改良效应
【中文关键词】流动沙丘;草方格;小叶锦鸡儿;围封;人工固沙群落;植被恢复;土壤改良;科尔沁沙地
【英文关键词】mobile sand dune; straw checkboard; caragana microphylla; enclosure; artificial sand-fixed community; vegetation restoration; soil improvement; Horqin sandy land
【中文摘要】摘要:探讨了对科尔沁沙地乌兰敖都地区流动沙丘采取生物和工程措施建立起人工固沙植被的相关配套技术,并就植被恢复程度对土壤改良效应进行了对比研究。结果表明:在流动沙丘进行人工固沙时采用1.0 m×1.0 m草方格内播种小叶锦鸡儿(Caragana microphylla)种子的措施具有较好的固沙效果,一般经过2年可使沙丘表面得到固定。在围栏封育条件下实施适宜的植被恢复措施,一般可在2~3年获得明显的固沙效果。小叶锦鸡儿人工固沙群落内土壤养分随着群落的生长发育而发生变化,在0~30 cm土层中,有机质、速效钾、全氮、水解性氮、全磷、有效磷含量都表现为:11年生群落>6年生

群落>流动沙丘;小叶锦鸡儿人工群落的建立可大幅度提高土壤微生物生物量,并随着年龄的增加,微生物生物量C、N、P的含量均呈现增加趋势。

【英文摘要】Horqin sandy land, located in the transition zone of North-east plain and Inner Mongolian plateau, is the typical ecotone of farming and grazing in northeastern China. In this region, arid climate and unreasonable human activities leads to severe desertification, which is an important ecological problem in east region of Inner Mongolia. Here, we discussed the biological and engineering technologies that fixed the mobile and semi-mobile sand dunes. The responses of soil improvement to vegetation restoration in Horqin sandy land were also analysed. The results showed that: (1) Planting seeds of Caragana microphylla in 1.0 m×1.0 m size straw checkboards could achieve the better sand-stablizing effect and the mobile sand dune could be fixed in 2 years. (2) The restoration effects of artificial sand-fixed community after enclosure would be showed in 2 or 3 years. (3) The soil nutrients of artifical sand-fixed community increased with the development of Caragana microphylla community, the organic matter, available K, N, P and total N, P in soil depth (0~30 cm) showed the same tendency: fixed sand dune have been fixed for 11 years> fixed sand dune have been fixed for 6 years>mobile sand dune; the building of artificial community could improve the soil microbe biomass, and the content of microbe C, N, P increased with the development of caragana microphylla shrubs.

【题目】盐度和温度对半滑舌鳎生长、渗透生理及能量收支的影响

【中文关键词】半滑舌鳎; 盐度; 温度; 生长性能; 渗透生理; 能量收支

【英文关键词】无

【中文摘要】研究了盐度和温度对半滑舌鳎(Cynoglossus semilaevis)幼鱼的生长、生化组成、渗透生理及能量收支的影响。实验鱼体质量(18.06±3.65) g,全长(15.45±2.77) cm。实验设置了3个盐度水平(22、26和30)和4个温度水平(18 ℃、21 ℃、24 ℃和27 ℃),每个处理设置4个重复。8周的生长实验结果表明,各处理半滑舌鳎特定生长率总体变动在1.00% ~ 1.34%。在本研究条件下,盐度对半滑舌鳎生长影响不显著(P > 0.05),而温度对其生长影响显著(P < 0.05)。在盐度22、26和30下,其最大生长率分别出现在21℃、24 ℃和18℃下,而在27℃下生长率最低。饲料转化率和消化率变化趋势与生长率相似。随温度的升高鱼体蛋白质含量有升高趋势,脂肪含量和能值降低,但受盐度影响不显著。渗透生理研究结果表明,盐度和温度对半滑舌鳎血浆渗透压和鳃丝Na+/K+-ATP酶活性影响均显著(P < 0.05)。随盐度的升高,血浆渗透压和鳃丝Na+/K+-ATP酶活性均有所升高。温度对不同盐度下半滑舌鳎血浆渗透压影响有所差异,但随温度的升高半滑舌鳎鳃丝Na+/K+-ATP酶活性显著降低。能量收支研究表明,生长能和呼吸能的变化主导着半滑舌鳎的能量收支模式,在本研究设置

的温度和盐度范围内,生长能占摄食能的比例以盐度18和温度21°C最高,而呼吸能的比例则总体随温度升高而逐渐升高。

【题目】对羟基苯甲酸对2种赤潮微藻生长的影响
【中文关键词】赤潮微藻; 酚酸; 抑制作用
【英文关键词】red tide microalgae;phenolic acid;growth inhibition
【中文摘要】:通过测定藻细胞密度和细胞体积,观察藻细胞形态,分析藻细胞内硝酸还原酶(NR)、过氧化物酶(POD)和超氧化物歧化酶(SOD)活性以及丙二醛(MDA)含量等生理指标的变化,研究了对羟基苯甲酸对2 种赤潮微藻-米氏凯伦藻和塔玛亚历山大藻生长的影响。结果表明,浓度>1.6 mmol/L 时,对羟基苯甲酸能明显地抑制这两种微藻的生长。同时发现,添加对羟基苯甲酸的藻细胞运动能力降低,藻细胞体积减小,并出现空洞、破碎以及部分抱团现象。进一步研究发现,对羟基苯甲酸明显降低了塔玛亚历山大藻NR 和SOD 活性,但对POD 活性无明显影响;其低浓度时能增大米氏凯伦藻NR、POD 和SOD 活性,高浓度时则明显降低此三种酶的活性;它显著提高了两种微藻细胞内的MDA 含量。
【英文摘要】Abstract:Effects of p-hydroxybenzoic acid on the growth of Karenia mikimitoi and Alexandrium tamarense were investigated.Based on the observation of algal morphology and measurement of algal density,cell size and contents of physiological indicatorsincluding NR,POD,SOD andMDA,results showed that when the concentrations ofp-hyroxybenzoic acid was over 1.6mmol · L-1,ithad obvious inhibitory effect on the two species of microalgae. And p-hydroxybenzoic acid decreased the athletic ability of the cellsand decreased the cell size of Karenia mikimitoi and Alexandrium tamarense,and caused cells into cavities and pieces and gofers oncells. The further investigation found that p-hydroxybenoic acid significant inhibited the activities of NR and SOD in the cells ofAlexandrium tamarense,while had no significant effect on POD activities. Activities of NR,POD and SOD in the cells of Kareniamikimitoi increased with increasing of p-hydroxybenzoic acid concentration when it was less than 0.4mmol · L-1,while these threeenzymes activities decreased significantly at higher concentration of p-hydroxybenzoic acid. p-hydroxybenzoic acid increasedsignificantly the contents ofMDA in the cells of all tested microalgae.

【题目】不同肥料处理对豫麦34冠层结构特征及产量的影响
【中文关键词】冬小麦;肥料类型;冠层结构;产量
【英文关键词】Winter wheat ;Fertilizer Types; Canopyarchitecture;Grainyield
【中文摘要】摘 要:为给小麦合理施肥提供依据,在等氮条件下,研究了尿素、鸡粪和尿素与鸡粪配施三种肥料处理对豫麦34冠层结构特性和产量的影响。结果表明,在小麦拔节期,尿素与鸡粪配施处理小麦平均叶倾角最小,为53.89°;叶面积指数

、群体透光率、消光系数依次为4.63、0.055和0.63,均处在鸡粪处理和尿素处理之间。在孕穗期到灌浆期,尿素与鸡粪配施使小麦平均叶倾角介于鸡粪和尿素处理之间,为51. 96°;叶面积指数、群体消光系数均最大,分别为5.80和0.66;群体透光率最小,为0. 028。尿素与鸡粪配施的小麦穗粒数、穗粒重、生物产量、经济产量均高于鸡粪处理和尿素处理。综合来看,配施处理的小麦冠层结构适宜,株型最佳,群体光分布合理。

【英文摘要】Abstract: At the same amount of nitrogen application, the effects of treatments of urea, chicken mature and mixed fertilizer on canopy architecture and grain yield of Yumai 34was studied, and the results showed as follows: during Jointing stage, average leaf angle of mixed fertilizer treatment was 53. 89°, this number was less than that of urea and chicken manure treatment, and its leaf area index, light trans mission rate and extinction coefficient was 4.63, 0.055 and 0.63, respectively, and in the middle of the three treatments. From booting stage to grain filling stage, the average leaf angle of mixed fertilizer treatment was 51. 96°, and in the middle of the three treatments; Leaf area index and extinction coefficient numbers was 5.80 and 0.66, respectively, and were the biggest among the three treatments. Light transmission rate was 0. 028, which was the least among the three treatments. Grains of per spike, spike weight, biomass yield, grain yield of the mixed fertilizer treatment were all higher than that of the other two treatments. In general, canopy architecture of Yumai34was the best , and sunlight distribution was reasonable in mixed fertilizer treatment.

【题目】硝唑尼特体外抑杀阴道毛滴虫效果观察

【中文关键词】硝唑尼特; 阴道毛滴虫; 阴道毛滴虫携病毒株; 甲硝唑

【英文关键词】Nitazoxanide; Trichomonas vaginalis ; TVV; metronidazole

【中文摘要】目的观察硝唑尼特体外抑杀阴道毛滴虫效果。方法分别以2、1、0.5、0.25、0.125、0.062 5和0.031 25mg/ml,硝唑尼特作用于阴道毛滴虫携病毒株与无病毒株12和24 h,观察体外抑杀效果。实验以甲硝唑作为药物对照。结果随着药物浓度的增加和作用时间的延长,硝唑尼特对两种虫株的抑制率均增高,显微镜下可见滋养体活力下降,培养基底部有死亡虫体沉淀,染色后可见滋养体细胞质内有空泡,鞭毛脱落,虫体变形,细胞核变形,细胞膜破裂,细胞溶解。经统计学分析,硝唑尼特对阴道毛滴虫两种虫株的抑制率差异无统计学意义($\chi 2=0.12$,$P>0.05$)。在24 h时,甲硝唑对阴道毛滴虫无病毒株抑制率为81.06%,硝唑尼特(1 mg/ml)对阴道毛滴虫两种虫株的抑制率可达100%,硝唑尼特对阴道毛滴虫无病毒虫株的抑制率显著高于甲硝唑($\chi 2=4.43$,$P<0.01$)。结论硝唑尼特对阴道毛滴虫两种虫株均有较好的抑杀作用,其中对无毒株阴道毛滴虫的抑杀效果硝唑尼特优于甲硝唑。

【英文摘要】Objective To observed the inhibiting and killing effect of the Nitazoxanide on Trichomonas vaginalis in vitro.Methods Different concentrations at 2,1,0.5,0.25,0.125,0.062 5 and 0.031 25 mg/ml)and different times at 12 h and 24 h were selected to act on the two kinds of trophozoites(T.vaginalis infected with T.vaginalis virus(TVV) and T.vaginalis without TVV).Meanwhile Metronidazole as the drug control.Results With the concentrations and action time increased,the inhibition rates of Nitazoxanide on T.vaginalis were raised.Using microscope we observed the activity of the trophozoites has decreased and some precipitation of death trophozoites at the bottom of medium.The trophozoites looked disintegration with appearance of vacuoles in cytoplasm,exfoliation of flagella,distorted with nucleus and membrance rupture.The statistical analysis revealed that the inhibition rate of Nitazoxanide on the two kinds of trophozoites had no distinction($\chi 2=0.12$,$P>0.05$).However,there was a significant difference between Metronidazole and Nitazoxanide acted on T.vaginalis without TVV($\chi 2=4.43$,$P<0.01$).The inhibition rate of the Metronidazole and Nitazoxanide(1 mg/ml)was 81.06% and 100% at 24 h,respectively. Conclusion It was concluded that the Nitazoxanide has a good inhibiting and killing effect on T.vaginalis.In addition,the effectiveness of inhibition of Nitazoxanide on T.vaginalis without TVV may be superiorer than Metronidazole in vitro test.

【题目】硝唑尼特治疗犬贾第虫病的研究
【中文关键词】犬;贾第虫病;硝唑尼特;治疗
【英文关键词】Dogs;Giardia canis;Nitazoxanide
【中文摘要】选择试验犬8只,将其随机分为4个小组,每组2只。连续6 d对8只试验犬分剐进行粪检,确定无贾第虫感染后,用体外纯培养的犬贾第虫滋养体接种试验犬,然后每天采集试验犬新鲜粪便40 g,用硫酸锌漂浮法进行粪检,当检测犬贾第虫感染呈阳性时,分别用1、2、4 mg/kg体质量剂量的硝唑尼特对1、2、3组试验犬进行灌服治疗,第4组试验犬不用药作为对照。用药后,每天以同样的方法检测贾第虫包囊,并计数。结果表明,以2、4 mg/kg体质量给药的试验犬1 d后粪检结果转为阴性,以1 mg/kg体质量给药的试验犬4 d后粪检结果转为阴性。结果表明以2、4 mg/kg体质量剂量的硝唑尼特对犬贾第虫痛有很好的疗效
【英文摘要】To observe the therapeutic effect of Nitazoxanide(NTZ)on dogs infected with Giardia canis trophozoites. Eight dogs were infected with Giardia canis trophozoites and divided into four groups rondomly,G1:2 dogs treated with Nitazoxanide at a single dose of 1 mg/kg body weight;G2:2 dogs treated with NTZ at asingle dose of 2 mg/kg;G3:2 dogs treated with NTZ at a single dose of 41 mg/kg;G4:2 dogs treated without drugs as control. All groups were examined for Giardia canis cysts by Zinc Sulfate Flotation.Each group was subjected to collect stool per day and counted cysts.The results of G2 and G3 were negative after 1th day.G1 were negative after 4th days.The results indicated that NTZ at adose of 2 mg/kg and 4 mg/kg in dogs had afaourable effect on the dogs infected with Giardia canis.

【题目】超级小麦品种穗部性状间相关性分析及穗粒数改良途径的研究
【中文关键词】超级小麦;穗部性状;穗粒数;相关
【英文关键词】Super-Wheats,Ear trait,Kernel Number Per Spike,Relevance

【中文摘要】以10个超级小麦品种(系)为材料,对株高与穗部性状间进行了相关分析及穗粒数的改良途径分析,结果表明,穗粒数与株高呈负相关,而与穗长、分化小穗、结实小穗均呈显著或极显著的正相关;穗长和结实小穗数对小麦穗粒数的影响最大,均为极显著正相关;我国超级小麦的育种目标应是在一定群体的基础上通过增加穗粒数来提高小麦的单穗重。在穗粒数的改良过程中,应选育矮秆、大穗、结实小穗数多的品种。

【题目】高产多抗强筋小麦新品种新麦19号的优良特性和产量结构分析
【中文关键词】新麦19
【英文关键词】Xinmai19
【中文摘要】新麦19号是河南省新乡市农业科学院以(C5/新乡3577)F3d1为母本,新麦9号为父本杂交选育而成的优质强筋、高产稳产、早熟抗寒、抗病广适优质强筋小麦新品种。2006年9月通过河南省品种审定,2007年1月通过国家品种审定(审定证号分别为:豫审麦2006001、国审麦2006015)。新麦19 号遗传基础丰富,是法国V.P.M/moission品种的后代,有偏凸山羊草、波斯小麦、黑麦的多重抗病基因,能抗多种病害。亲本(C5/新乡3577)F3d1含有5+10优质麦谷蛋白亚基,品质指标好、稳定;亲本豫麦69号属半冬性大穗型中熟丰产品种,高抗条锈病,中抗纹枯和赤霉病。新麦19号具有双亲的优良特性。

【题目】3 种酚酸对4 种水华微藻生长的影响
【中文关键词】酚酸;抑制作用;水华微藻
【英文关键词】p henolic acid ; inhibitory effect ; bloom microalgae
【中文摘要】通过测定藻细胞密度,分析邻苯二酚、没食子酸和焦性没食子酸的自氧化时间,研究了此3种酚酸对水华束丝藻、颤藻、实球藻和衣藻等4 种水华微藻生长的影响。结果表明,当酚酸质量浓度超过312 mg/ L 时,3 种酚酸对此4 种微藻的生长均有明显的抑制作用。其中,没食子酸和焦性没食子酸对4 种微藻的抑制作用比邻苯二酚更为显著。3 种酚酸的自氧化测定结果表明,没食子酸和焦性没食子酸在2 h 时完全消失;邻苯二酚的自氧化时间较长,约为8 d 。根据上述结果,推测此3 种酚酸对4 种水华微藻的抑制作用很可能与其自氧化能力有关。
【英文摘要】Based on the measurement of algae density , t he inhibitory activity of t hree kinds ofp henolic acids (o2dihydroxybenzene , gallic acid monohydrate , and pyrogallic acid) against fourspecies of bloom microalgae , i. e. A p hani z omenon f los2aquae , Osci l l atori a sp . , Pandori na mo2rum and Chl amy domonas sp . was tested. The autoxidation of t hree kinds of p henolic acids wasal so determined by high performance liquid chromatograp hy (HPLC) . The result s showed t hatt he growt h of t he four species of bloom microalgae was significantly inhibited by t he acids at t heconcent ration of 3. 2 mg/ L , and t he inhibitions of gallic acid monohydrate and pyrogallic acid weremore obvious t han t hat of o2dihydroxybenzene. HPLC showed t hat t he presence of a kind of p he2nolic acid was found to vanish over time (gallic acid monohydrate and pyrogallic acid , 2 h ; o2di2hydroxybenzene , 8 days) . Our researches showed t hat t he inhibiting of t hree kinds of p henolicacids over the growt h of t he four species of bloom microalgae might be related wit h autoxidation.

【题目】基于高斯概率模型的水稻重叠病斑分割算法
【中文关键词】水稻病斑重叠; 病斑分割; 像素概率模型;
【英文关键词】Rice lesion overlap; Rice lesion segmentation; Probabilistic model based on pixel;
【中文摘要】研究水稻病斑中的重叠病斑识别问题,针对诊断水稻图像信息和及早防治,传统的水稻病斑分割算法都是对病斑的像素进行直接的操作,容易造成像素信息的丢失,存在着识别准确性差问题,造成后期的识别率不高。为解决上述问题,提出了基于像素概率模型的水稻病斑分割方法。通过自适应病斑分割算法,用高斯混合模型描述每一像素的色彩分布情况,再以具有最大适应度值的子模型作为当前分布模型来描述每一病斑像素的特征,避免了对像素的直接操作。仿真结果表明,方法能够有效的分割大部分重叠水稻病斑特征,提高了识别准确性,取得了比较好的效果。

【英文摘要】Research the overlap of rice lesion segmentation.The traditional rice lesion segmentation algorithm directly processes the lesion pixels,which easily leads to the loss of pixel information,a bad segmentation,and low recognition rate.For this problem,we propose a probabilistic model based on pixel rice lesion segmentation.By adaptive lesions segmentation algorithm,Gaussian mixture model is used to describe the color distribution of each pixel,and the maximum fitness value is as the current distribution model to describe the characteristics of each lesion pixel, avoiding the pixel direct operation. Experiments show that this method can effectively separate most of the characteristics of overlapping lesion of rice and chieved better results

【题目】蓖麻毒素A 链基因的克隆表达、纯化及其活性
【中文关键词】蓖麻毒素;RTA ;RTB ; 融合表达;细胞杀伤
【英文关键词】ricin ,RTA ,RTB , f usion expression , cell killing
【中文摘要】为了实现蓖麻毒素A 链基因(rt a) 的克隆表达,制备有高生物活性的重组蓖麻毒素A 链蛋白(RTA) ,借助重组腺病毒介导表达的RTB 进入细胞,发挥RTA 的细胞毒作用,检测其活性。重组质粒p ET32a2His2RTA 能正确表达RTA 融合蛋白,相对分子质量约47 000 ,每升细菌培养物回收约50 mg 的纯化蛋白质, 在有RTB 表达的系列中,细胞死亡率明显上升,最高可达50 %~60 %。说明利用p ET32a 表达系统可以快速获得大量有高生物活性的可溶性RTA 融合蛋白质。以腺病毒为载体表达RTB 可以帮助RTA 进入细胞,对细胞发挥毒性作用。
【英文摘要】The target of t his st udy is to achieve t he cloning and expression of ricin A chain geneand produce the recombined ricin A chain protein (RTA) with high activity ane t hen assay itactivity by RTB mediated by recombined adenovirus t he RTA could enter cell s and exertcytotoxicity. For this , t he ricin A chain gene was amplified by PCR and cloned it into t he f usionexpression vector p ET32a to const ruct plasmid (p ET32a2His2RTA) , the plasmid was t ransferredinto E. col i BL21 and induced wit h low concent ration of IPTG (1 mmol/ L) at low temperature(20 ℃) . Purified RTA by Ni2N TA column and the p urified protein was identified by SDS2PA GEelect rop horesis and Western2blot . It was found that t he const ructed recombinant plasmid(p ET32a2His2RTA) was efficient expressed RTA f usion protein and about 50mg p urified protein(Mr 47 000) was obtained f rom 1 liter cult ure brot h. The cell deat h rate significantly increasedand t he highest being about 50260 percentage point in t he system containing RTB.

【题目】河南省地方小麦品种醇溶蛋白的遗传多样性分析
【中文关键词】小麦,地方品种,醇溶蛋白,遗传多样性
【英文关键词】Wheat,Landrace,Same name,Gliadin,Genetic diversity
【中文摘要】为给河南省小麦地方品种资源的利用提供科学依据,采用A-PAGE方法,对小麦地方品种白和尚头、白麦、白芒糙、出山豹等15种243份地方小麦品种进行了同质检验,对同质地方品种进行了同名品种间和非同名品种间醇溶蛋白构成分析,并将聚类结果与农艺性状相结合进行分析。结果表明,243份材料中有156 份同质,占总样品的64.2 %。这156份地方品种共产生72条谱带,其中α区21 条、 β区22 条、 γ区16 条、ω区13 条,共147 种构型;谱带分布频率范围为0. 6 %~100 % ,平均为25. 6 %;多样性指数为0. 957 ,其中α区0.801、 β区0.836、 γ区0.897、 ω区0.870。15 种同名品种产生谱带的范围为27~41条;品种间遗传距离最小为0,最大为2.033,平均遗传距离分布在0.330~0.574之间;遗传多样性指数分布在0.940~0.958 之间。将聚类结果与农艺性状进行比较,农艺性状相近的材料大都能在遗传距离为1.0 时被聚为一类。相同的带型在同名品

种间和非同名品种间都有出现,表明小麦地方品种间存在同名异种、同种异名的现象。
【英文摘要】In order to investigate special relationship and genetic diversity, the homogeneity of 243 wheat (Triticum aestivum L .) landraces of 15 species were tested by A-PAGE. Simultaneously, the gliadin composition of the homogeneous landraces were analyzed, and associated with their agronomiccharacters. The results were as follows: 156 (64.2%) were homogeneous in 243 wheat landraces. In total, 72 gliadin bands, which formed 147 gliadin patterns, were observed in all accessions. Among α 、 β 、 γ and ω zones, there were 21, 22, 16and 13 band combinations, respectively. And their frequencies appeared high variation ranging within 0.6 %~100% , with an average of 25.6%. The analysis of gliadin genetic diversity indexes showed that β region (0.836) contained t he most diverse gliadins , followed as α (0.801) , γ (0.897) and ω (0.870). In 15 homonymy landraces, the gliadin bands ranged from 27 to 41, and polymorphic information contents (PIC) fluctuate between 0.940 and 0.958. The genetic distance (GD) ranged from 0-2.033, had an average distribution between 0.330 and 0.574. Camparing the clustering analysis with agronomic traits showed that the landraces with similar agronomic traits could be classified into the same groups in GD1. 0, and the same pattern bands appeared in both homonymy and non-homonymy landraces. This indicated that gliadin A-PAGE can be used to reveal the relationships and genetic diver sity of Henan homonymy landraces, and some of them were not a specie and some landraces with different name were t he same species.

【题目】强光高温同时作用下不同小麦品种的光合特性
【中文关键词】小麦,高光强高温,光合作用,叶绿素荧光
【英文关键词】Wheat,High temperature and high light intensity,Ph0tosynthesis,Chlorophyll fluorescence
【中文摘要】以小麦品种藁城8901、豫麦49、郑麦9405、周18为试材,用强光(1900μmol·m-2·s-1)、高温(35°C)同时处理材料3h,研究了高光强和高温共同合胁迫对小麦旗叶光合作用和叶绿素荧光特性的影响。结果表明,正常生长条件下,郑麦9405和周18的光饱和速率、饱和光强均高于藁城8901和豫麦49,郑麦9405的表观量子效率也最高。强光高温处理使藁城8901、豫麦49和周18的光合速率(Pn)、蒸腾速率(Tr)、气孔导度(Gs)、胞间CO2浓度(Ci)较对照大幅下降;郑麦9405的Pn、Gs也出现了下降,但降幅最小,Pn仍保持11.6μmol CO2 ·m-2·s-1,Tr较对照略有上升;4种基因型小麦的Ci未较对照明显变化;与对照相比,4个材料的最大光量子效率(Fv/Fm)、开放的光系统Ⅱ反应中心的激发能捕获效率(Fv’/Fm’)、作用光下光系统Ⅱ的实际量子效率(ΦPSII)、光化学猝灭系数(qP)均下降,而非光化学猝灭系数(NPQ)大幅上升:其中郑麦9405的各

项荧光参数均较高。研究表明,小麦旗叶对强光高温的适应性存在品种间差异,郑麦9405的耐强光高温特性优于其他3个品种;强光高温下较高的蒸腾速率和较大的NPQ可能是郑麦9405维持光合机构功能的重要原因。

【英文摘要】High light associated with high temperature has strong efects on photosynthesis in wheat(Triticum aestivum L.) and results in grain yield loss at maturity.To explore the photosynthetic responses of diferent wheat cultivars to high light and high temperature(HLHT).we measured the photosynthetic and chlorophyll fluorescence characteristics of flag leaves of four cultivars under the high light intensity of 1900 μmol·m-2·s-1 and high temperature of 35°C.Under natural growth condition(contro1), both photosynthetic rate under saturated light and saturated light intensity for photosynthesis in Zhengmai 9405 and Zhou 18 were higher than those in Gaocheng 8901 and Yumai 49, and the apparent quantum yield of Zhengmai 9405 was the maximal among the four cultivars.Compared with the control, after the HLHT treatment, the net photosynthetic rate(Pn), transpiration rate(Tr), stomatal conductance(Gs)in Gaocheng 8901, Yumai 49, and Zhou 18 were significantly reduced, whereas these parameters changed slightly in Zhengmai 9405 with a rather steady Pn value of 11.6 μmol CO2·m-2·s-1 in flag leaves.In the four cultivars, the intercellular CO2, concentration(Ci)showed no significant changes compared with the control,the maximum photochemical eficiency (Fv/Fm), the eficiency of open centers of photosystem II (Fv'/Fm'), the actual photochemical eficiency of photosystem II (ΦPSII), and the photochemical quenching(qP)decreased while nonphotochemical quenching(NPQ) increased significantly,and each of the five chlorophyll fluorescence parameters in Zhengmai 9405 was the highest.The results mentioned above indicated that diferent cultivars had notable differences in the adaptability to high light intensity and high temperature,Zhengmai 9405 was more adaptable than Gaocheng 8901, Yumai 49, and Zhou 18.The higher and NPQ of Zhengmai 9405 may be one of the reasons for its higher photosynthesis rate.

【题目】荣成靖海湾海参养殖池塘初级生产力季节变化特征
【中文关键词】海参池塘; 浮游植物; 种类组成; 多样性; 粒级结构; 叶绿素; 脱镁叶绿素
【英文关键词】无
【中文摘要】2007年5月~2007年11月调查了山东荣成靖海湾海参养殖池塘水体中浮游植物种类组成、生物量、叶绿素含量变化以及底泥沉积物中叶绿素和脱镁叶绿素含量的变化。结果表明,海参养殖池塘水体中浮游植物共有7门,44属,62种,主要以硅藻为主。水体中浮游植物平均生物量1号池塘为17.52×104/L;2号池塘为18.30×104/L。水体叶绿素含量变化范围:1号池塘为1.38~5.00μg/L;2号池塘为0.98~5.45μg/L。池塘沉积物中叶绿素含量变化范围:1号池塘为0.66~1.67μg/g,2号池塘为0.56~1.34μg/g。池塘沉积物中脱镁叶绿素含量变化范围:1号池塘为2.97~5.63μg/g;2号池塘为2.90~6.36μg/g。1号池塘和2号池塘的浮游植物群落结构及叶绿素含量没有显著性差异(P>0.05)。叶绿素,脱镁叶绿素变化趋势较为一致。海参夏眠期间,沉积物中叶绿素及脱镁叶绿素含量最高,为海参结束夏眠进入摄食提供食物储备。研究结果表明,靖海湾海参养殖池塘浮游植物以硅藻为主,养殖池塘水体浮游植物生物量较低,多样性指数较高,增加浮游植物沉降速率,增加养殖系统初级生产力可为海参提供更多食物。

【中文关键词】鼠尾藻(S argassum thunbergi i) ; 重金属; 富集; 排放; 指示生物; 生物修复
【英文关键词】无
【中文摘要】将鼠尾藻(S argassum thunbergi i) 暴露在不同质量浓度锌和镉溶液里40 d ,以及暴露20 d 后,移入自然海水恢复20 d ,分析了藻体内金属离子含量的变化。富集实验结果表明,鼠尾藻积累金属离子的量和暴露溶液金属质量浓度正相关、与暴露时间具有线性关系;暴露3 d ,藻体的金属离子含量(除了暴露在Cd2 + 质量浓度为0. 1 mg/ L 处理组) 均显著增加;在Zn2 + 处理组,溶液里Zn2 + 质量浓度越大,线性关系越显著,而在Cd2 +处理组,Cd2 + 质量浓度5. 0 mg/ L 处理组藻体内Cd2 + 含量与暴露时间的线性关系则最低。排放试验结果表明,排放20 d 后与排放0 d 比较,藻体内的金属离子质量浓度均显著降低,但是均显著高于暴露前水平;在Zn2 + 溶液里,鼠尾藻暴露Zn2 + 质量浓度0. 1 mg/ L 和Zn2 + 质量浓度5. 0 mg/ L 20 d 后移入自然海水5 d 后,藻体内的Zn2 + 含量与排放0 d 相比显著降低,而在Cd2 + 溶液里,藻体排放5 d 后,藻体内的Cd2 + 含量与排放0 d 相比均显著降低。最终结果表明,鼠尾藻潜在地可作为一种指示生物,用于监测海洋环境重金属污染状况。同时,鼠尾藻对Zn2 + 和Cd2 + 具有较强的富集能力,可以利用鼠尾藻修复受重金属污染的海洋水体,尤其是锌的污染

【题目】温度对半滑舌鳎的生长、生化组成和能量收支的影响
【中文关键词】半滑舌鳎; 温度; 生长; 体成分组成; 能量收支
【英文关键词】无
【中文摘要】研究了不同温度(16 ,19 ,22 ,25 ,28 和31 ℃) 对半滑舌鳎(Cy noglossus semi laevis G ü nther) 幼鱼的生长、体成分组成和能量收支的影响。结果表明,随温度的升高,半滑舌鳎幼鱼生长率总体呈现先升高后降低的趋势。其中,在19~25 ℃温度范围内,半滑舌鳎幼鱼的特定生长率相对较高,在16 和28 ℃下则有所降低,而在31 ℃下,半滑舌鳎幼鱼特定生长率则显著降低。本研究表明半滑舌鳎幼鱼特定生长率与温度符合二次曲线模型。半滑舌鳎摄食量随温度升高而逐渐增大,但在31 ℃时显著减小,饵料转化率则随温度的升高而降低。鱼体脂肪与能值均随温度升高而降低,蛋白质含量受温度影响不显著。温度对半滑舌鳎的能量收支影响显著,其中,生长能和代谢能主导半滑舌鳎的能量分配,生长能占摄食能比例则随温度的升高而降低,呼吸能占摄食能比例则随温度的升高而升高。本研究表明,半滑舌鳎幼鱼(13~37 g) 适宜生长温度范围为18~25 ℃,而不同温度导致的半滑舌鳎摄食量和能量收支的差异可能是温度影响其生长的主要生理生态学机制。

【题目】中国刺参与日本红刺参杂交子一代的早期生长比较
【中文关键词】刺参; 杂交; 生长; 杂种优势
【英文关键词】无
【中文摘要】研究以中国刺参和日本红刺参为材料,进行了4 个组合的杂交和自交实验,分析了各实验组受精率、孵化率、幼虫和稚参阶段的生长以及杂交子代的杂种优势。结果表明,杂交组的受精率、孵化率均低于自交组,但是经单因素方差分析表明没有显著性差异(P > 0. 05) ;日本红刺参♀×中国刺参♂杂交组(JC) 在幼虫期和稚参期的各生长性状平均值均大于其它3 组,并表现出显著性差异;日本红刺参♀×中国刺参♂组(JC) 的体长和体重的杂种优势率均较为明显,其幼虫体长和稚参体长、体重的杂种优势率分别在4. 60 %~6. 90 % ,8. 39 %~18. 85 %和23. 21 %~63. 74 %之间;中国刺参♀×日本红刺参♂组(CJ) 的杂种优势率在160 日龄后表现为正值。杂交子一代中存在正交和反交结果不同的现象可能与母性效应、性别连锁和细胞质遗传有关。

【题目】投饵与不投饵海参养殖池塘水质变化的初步研究
【中文关键词】海参池塘; 水质; 投饵与不投饵; 换水
【英文关键词】无
【中文摘要】初步调查了投饵和不投饵2 口海参养殖池塘水质的变化以及换水对池塘水质的影响。实验结果表明:在2 种养殖模式下,池塘水体的pH 呈逐渐增大的趋势,盐度则缓慢降低,两者皆在降雨期间波动剧烈;池塘的水温、NH+42N、NO-32N、NO-22N、NH32N 和SRP 在夏季偏高,春季和秋季较低,季节变化明显;池塘水体的TN 和TP 表现为春季> 夏季> 秋季;投饵池塘NO-22N 含量显著高于不投饵池塘(P < 0. 05) ,其它指标差异不显著(P < 0. 05) ;2 池塘水体皆属于磷限制中度营养化水。换水后,2 池塘水体的pH 和盐度波动趋于平稳; TN 含量差异不明显, TP 含量明显降低,差异显著(P < 0. 05) ;NH+42N、COD、NO-32N 含量明显升高,差异显著(P < 0. 05) ;NO-32N、NO-22N 含量换水后不投饵池塘降低,投饵池塘升高,两者差异显著(P < 0. 05) 。换水对池塘水质的影响可能与投饵和池塘的底质有关。

【题目】不同饵料对三疣梭子蟹生长和能量收支的影响
【中文关键词】虎鱼; 鹰爪虾; 杂色蛤; 三疣梭子蟹; 生长; 能量收支
【英文关键词】无
【中文摘要】研究虎鱼肉、鹰爪虾肌肉、杂色蛤肉3 种不同饵料投喂体重为(31. 01 1. 06) g 三疣梭子蟹(Por tunus trituber culatus) 的生长和能量收支。实验结果表明, 饵料种类对三疣梭子蟹的生长以及能量收支都有显著影响。投喂杂色蛤组获得最大特定生长率, 其湿重特定生长率、干重特定生长率、蛋白质特定生长率和能量特定生长率分别为2. 56%、2. 26%、3. 48%、0. 49%, 显著高于虎鱼组(P< 0. 05) , 摄食虎鱼、鹰爪虾和杂色蛤时的湿重、干重、蛋白质、能量转化效率均以摄食杂色蛤组为最高, 分别为39. 82% 2. 09%、30. 18% 1. 86%、33. 44% 2. 81%、3 3. 88% 3. 09%, 其中, 蛋白质和能量转化效率显著高于其它两组(P< 0. 05) 。方差分析表明饵料种类对三疣梭子蟹能量收支各个组分占摄食能的比例有显著影响(P < 0. 05) 。投喂杂色蛤组生长能占摄食能的比例为29. 8% 0. 9%, 显著高于投喂虎鱼组17. 93% 3. 5%、鹰爪虾组18. 21% 0. 5%(P < 0. 05) , 投喂杂色蛤组排泄能占摄食能比例为7. 32% 0. 33%, 显著低于投喂虎鱼组12. 17% 0. 63%、鹰爪虾组13. 6% 0. 18%(P < 0. 05) 。实验结果表明投喂杂色蛤比虎鱼、鹰爪虾更有利于三疣梭子蟹的生长。

【题目】岩牡蛎和长牡蛎杂交的受精细胞学观察
【中文关键词】长牡蛎; 岩牡蛎; 杂交; 细胞学观察
【英文关键词】无
【中文摘要】实验利用DAPI 染色观察了岩牡蛎和长牡蛎正反杂交的受精卵在受精过程,减数分裂和早期卵裂的核相变化。结果表明,长牡蛎精子进入岩牡蛎成熟卵子后,激活卵子完成2 次成熟分裂,同时,精核出现了2 次明显的体积膨大扩散过程。第一次为精子刚入卵时,精核由固缩状态略微膨大去浓缩成为圆球形;另一次为第2 次减数分裂之后,精核迅速扩散形成

雄性原核,几乎与雌性原核同时形成。在长牡蛎♀×岩牡蛎♂反交组中,受精卵内核行为的变化与正交组相同。正反交组的胚胎发育过程都具有明显的不同步现象,正交组的发育进程比反交组滞后。

【题目】刺参养殖池塘颗粒悬浮物结构及其沉积作用
【中文关键词】刺参养殖池塘;悬浮物结构;沉积物;沉积量;沉积速度
【英文关键词】Apostichopus japonicus; cultured pond; suspended particles; sedimentary flux; sediment; sinking velocity
【中文摘要】对不投饵刺参养殖池塘的颗粒悬浮物结构及其沉积量和沉积速度进行了研究。结果表明: (1)各池塘总颗粒悬浮物重量(TS)为(73. 1 ±20. 5)mg/L,变动于46. 0~132. 0mg/L之间;颗粒无机物(IS)含量为(50. 6 ±12. 6)mg/L,变动于28. 5~7615mg/L之间,占总颗粒悬浮物的69. 13%;浮游生物干重(PZ)为(0. 675 ±0. 706)mg/L,变动于0. 064~2. 814mg/L之间,其中浮游植物干重(DWP)为(0. 541 ±0. 622)mg/L,变动于0. 062~2. 582mg/L之间,浮游动物干重(DWZ) 为(0. 135 ±0. 200)mg/L,变动于0. 002~1. 160mg/L 之间;颗粒腐质为(21. 91 ±19. 59) mg/L,变动于4. 18 ~83. 86mg/L 之间,占总颗粒悬浮物的比例为29195%。(2)总颗粒物沉积量为(19. 44 ±16. 34) g · m- 2 · d- 1 ,变动于6. 33~91. 98g · m- 2 · d- 1之间,沉降速度为(0. 30 ±0. 30)m · d- 1 ,变动于0. 08~1. 63m · d- 1之间,新生态颗粒有机物沉积量为(5. 09 ±7. 30) g · m - 2 · d- 1 ,变化于0. 14~31. 27g · m - 2 · d- 1之间,总颗粒物沉积量和新生态颗粒物沉积量均是底层高于表层。
【英文摘要】The structure of suspended particles and the sedimentary flux and sinking velocity in sea cucumber, Apostichopusjaponicus Selenka ponds were studied. The results showed as follows: (1) The concentration of total suspended particularmatter (TS) varied from 43. 5 to 132. 0mg/L with an average of (73. 4 ±20. 4) mg/L; The concentration of inorganicparticular matter (IS) varied from 29. 5 to 76. 5mg/L with an average of (50. 8 ±12. 3)mg/L was 71. 74% in TS; The dryweight of p lankton (PZ) varied from 0. 07 to 3. 74mg/L with an average of 0. 68 ±0. 79mg/L was 0. 90% in TS. Ofwhich,the dry weight of phytop lankton (DWP) ranged from 0. 06 to 2. 58mg/L with an average of (0. 54 ±0. 62) mg/L was0171% in TS, and the dry weight of zoop lankton (DWZ) ranged from 0. 01 to 1. 16mg/L with an average of (0. 13 ±0120)mg/L was 0. 19% in TS. Particular debris and bacteria ranged from 4. 24 to 84. 15mg/L with an average of (21. 91±19. 58)mg/L accounted for 27. 36% of TS. (2) The sedimentary flux of total suspended particularmatterwas (19. 69 ±16. 66) g · m- 2 · d - 1 which varied from 6. 33 to 91. 98g · m- 2 · d - 1 ; Sinking velocity was 7. 56 11. 07m d- 1 which ranged from0. 19 to 23. 39g · m- 2 · d- 1. The sedimentary flux of nascent suspended particulate matter in the Apostichopus japonicusSelenka ponds was (2. 75 ±8. 21) g · m- 2 · d - 1 , which ranged from 0. 19 to 23. 39g · m- 2 · d- 1. Both the sedimentary flux oftotal and nascent suspended particulate matter in the bottom of ponds were higher than those in surface water.

【题目】水生生物的性选择
【中文关键词】水生生物;性选择;进化;性角色反转
【英文关键词】无
【中文摘要】性选择作为生物进化的原动力,在物种形成和进化过程中具有重要作用,也是动物行为学的研究热点之一。目前,水生生物中性选择相关的研究逐渐增多。水生生物复杂的性选择行为,不仅体现在交配前选择,还体现在配子水平上的选择,同时,鱼类还有性角色反转等现象。性选择依据一定的内在生理生化机制发生,相关研究显示,性选择行为与基因决定的遗传因素和环境等非遗传因素有关。这些非遗传因素包括了雌雄个体所处的时间和空间因素、人类活动和其它诸如捕食者和“偷情者”等生物因素等等。水生生物的性选择研究侧重点集中在鱼类上,还有待更多的研究发现来揭示水生生物复杂的性选择行为及其机制。

【题目】球等鞭金藻生长抑制物对自身藻细胞的抑制效应
【中文关键词】球等鞭金藻;生长抑制物;抑制效应;分析
【英文关键词】无
【中文摘要】研究了生长抑制物1 - 羟基,丙二酸二乙酯- 十二烯酸异丙酯(HDMA)对自身藻细胞生长、叶绿素和丙二醛(MDA)含量、胞外可溶性蛋白质和多糖含量、硝酸还原酶(NR) 、超氧化物歧化酶(SOD)和过氧化物酶(POD)活性等生理指标的影响,分析HDMA 对球等鞭金藻的抑制效应。结果表明, HDMA 显著降低了细胞密度、叶绿素含量以及NR、SOD 和POD 活性,显著增大胞外可溶性蛋白质和多糖的比值, 并且还明显提高MDA 含量。因此, 认为HDMA能够影响微藻细胞的某些生理生化过程。其中包括降低叶绿素含量,影响光合作用;改变胞外可溶性蛋白质和多糖的比值,增强细胞的疏水性,促使细胞絮凝; 降低微藻硝酸还原酶和抗氧化体系酶的活性,影响细胞内营养平衡,并加速细胞体内活性氧的积累,导致细胞发生过氧化反应,从而影响微藻生长。

【题目】The Study of Farmland Information Management System based on Wireless Sensor Networks
【中文关键词】无线传感器网络; 体系结构; 能量控制; 系统安全;
【英文关键词】Wireless Sensor Network; System structure; Energy control; System safety;
【中文摘要】为满足农产品优质高产的需求,提出了基于无线传感器网络的农田信息管理系统,着重分析了该系统的基本功能,建立应用系统体系结构和网络系统体系结构,实现系统的能量控制和安全性设计。该系统能够在实际生产过程中减少人力操作和人工测量的误差,降低农业生产成本,并可以最大程度地实现农业生产的自动化操作,为实现农产品的优质高产提供了一种有效的方法和手段,具有重要的现实意义。
【英文摘要】To satisfy the need of good quality and high yield primary production,the farmland information management system based on wireless Sensor Network has been proposed.We give priority to analyzing the basic function of the system,building the systematic structure of applied system and network system,and implementing the energy control and safety design of system.The system can reduce manpower operation and the error of manual measuration in the course of practical production,reduce the cost of agricultural

【题目】投饵与不投饵池塘刺参肠道异养菌区系比较
【中文关键词】异养菌; 肠道; 刺参
【英文关键词】Key words
H eterotroph ic bacter ial flora; Intestine; Apostichopus japonicus
【中文摘要】从2007年6月到2008年5月, 对威海市荣成不投饵刺参养殖池塘和青岛市胶南投饵刺参养殖池塘内的刺参肠道内的异养细菌总活菌数的周年变化进行了调查, 并分析了刺参肠道内异养细菌的区系组成。结果表明, 投饵与不投饵池塘中刺参肠道内活菌的数量随季节总体变化趋势相似, 均为春夏季较低, 秋冬季较高, 但不投饵池塘刺参肠道内活菌数量在0.01水平显著高于投饵池塘。通过对分离得到的菌株鉴定, 发现308株细菌分别属于20个属。在投饵和不投饵池塘中, 刺参肠

道内的优势菌均为弧菌、假单胞菌和芽孢杆菌, 但在投饵池塘中, 刺参肠道内的弧菌和芽孢杆菌的比例明显高于不投饵池塘, 假单胞菌和其他细菌的比例则明显低于不投饵池塘。不投饵池塘刺参肠道细菌Shannon W iener多样性指数在夏季明显高于投饵池塘, 其他季节差异不明显。从异养细菌的种类组成看, 色杆菌属、Endozoicimonas、瑰杆菌属、副球菌属、短杆菌属、Jeotgalicoccus、Glaciecola仅出现在不投饵池塘刺参肠道内, 而屈扰杆菌属、希瓦氏菌、八叠球菌属则仅出现在投饵池塘刺参肠道内。

【英文摘要】Seasona l variation o f heterotrophic bacteria l flora associated w ith the intestine o f sea cucumber (Apostichopus jap onicus) was inves tigated in the feed ing ponds in Jiaonan, Q ingdao and unfeeding ponds in Rongcheng, We iha.i Results showed that the to ta l v iab le counts(TVC) of bacteria in the intestine of sea cucumber in two types o f ponds exhibited smi ilar tendencyw ith seasons, wh ich was h igh in spring andsummer but low in autumn and w inter. However, TVC of bacteria in the intestine o f sea cucumber in the unfeeding ponds w as significantlyh igher than that in feeding ponds (P < 0. 05). Altogether, 20 generawere identified from the intestine o f sea cucumber. V ibrio, Pseudonom asand Bacillus were themost abundant species in both feeding and unfeeding ponds. However, the percentages o f both V ibrio and Bacillus to to tal heterotroph ic bacter ial species isolated from the intestine o f sea cucumber in the feeding ponds w ere significantly higher than those in theunfeed ing ponds (P < 0. 05). According to the calculation o f Shannon W iener diversity index, the diversity of heterotrophic bacterial flora inthe intestine o f sea cucumber in the unfeeding pondswas h igher than that in the feeding ponds. Additionally, the spec ies o fChrom obacterium,Endozoicimonas, Roseobacter, Paracoccus, Brachybacterium, Jeotgalicoccus, G laciecola w ere only found in the intestine o f sea cucumber in theunfeed ing ponds, and F lex ibacrer, Shewanella, Sporosarcina were only isolated from the intestine of sea cucumber in the feeding ponds.

【题目】In vitro and in vivo antileishmanial efficacy of nitazoxanide
【中文关键词】无
【英文关键词】无
【中文摘要】无

【英文摘要】Control of Leishmania infection relies primarily on chemotherapy, and the current drug available for treating leishmaniasis is limited. Nitazoxanide (NTZ) is a broad spectrum antiparasitic agent with activity against protozoa, nematodes, cestodes, and trematodes. In the present study, the in vitro antileishmanial efficacy of NTZ was evaluated by incubation of Leishmania donovani promastigotes with NTZ, indicating that NTZ can affect the ultrastructure of parasite promastigote and efficiently inhibit the parasite growth. Moreover, 200 μg/ml NTZ inhibited >90% of promastigotes growth, showing similar activity of the reference drug amphotericin B (P>0.05). Therapeutic efficacy of NTZ against L. donovani-infected BALB/c mice demonstrated that oral NTZ produced a significant reduction of parasite burden in spleen and liver from L. donovani-infected mice, compared with the untreated mice (P<0.05). These results indicated NTZ may be a novel therapeutic drug for leishmaniasis.

【题目】Optimization of Stocking Density for the Sea Cucumber,
【中文关键词】无

【英文关键词】sea cucumber; Apostichopus japonicus; stocking density; feed-supplement; non-feed-supplement; yield
【中文摘要】无
【英文摘要】Optimal stocking densities were investigated for the sea cucumber Apostichopus japonicus Selenka under feed-supplementand non-feed-supplement regimes in net enclosures for 333 d. Substantial weight loss occurred during the aestivation phase (AE).Decreased growth rates were also observed during the winter phase (WT). In contrast, sea cucumbers showed rapid growth duringthe spring (SP) and autumn (AU) phases. Feeding regimes considerably influenced the growth performance, i.e., sea cucumbers grewfaster under feed-supplement regime than under non-feed-supplement regime ($P < 0.05$). The average survival rates of sea cucumbersunder feed-supplement regime were higher than those under non-feed-supplement regime for both the autumn phase and spring phase,but the differences were only significant for the latter phase ($P < 0.05$). The fitted B-N curves showed that the optimal stocking densities,in terms of net production, were 22.3 ind. m-2 for feed-supplement regime and 14.1 ind. m-2 for non-feed-supplement regime.

【题目】萱藻生活史中盘状体阶段生长特性
【中文关键词】萱藻;生活史;盘状体;丝状体;叶状体
【英文关键词】无
【中文摘要】:于2006年3- 5月在大连沿海萱藻[Scytosiphon lomentaria(Lyngbye) Link]的繁殖期内,采集具有多室配子囊的成熟萱藻,采用阴干刺激方法获得配子并在室内培育形成盘状体。观察结果显示,在20 ℃和15 ℃下,盘状体表面细胞生长出丝状体和叶状体。叶状体经生长后沿藻体纵轴裂开又形成了丝状体。丝状体上与基质接触的细胞进行放射状分裂形成盘状体,未与基质接触的细胞在继续分裂增加藻体长度的同时,在丝状体上形成了许多节状细胞团,节状细胞团与基质接触后向周边分裂又形成了盘状体。由丝状体形成的盘状体在15 ℃和10 ℃下培养2个月后形成了单室孢子囊。单室孢子囊成熟后经阴干刺激可放出游孢子,游孢子附着后萌发为直立管状萱藻幼苗。实验结果表明,在萱藻生活史中的盘状体阶段还存在盘状体→丝状体→盘状体与盘状体→叶状体→丝状体→盘状体2个循环。盘状体阶段这2个循环的存在,改变了从配子或合子获得盘状体的单一途径。利用丝状体游离培养生长速度快以及节状细胞团切碎后能在短时间内形成盘状体的特性,在室内进行人工增殖丝状体,当节状细胞团出现后将丝状体切碎,可以获得大量盘状体,通过室内培养使盘状体形成孢子囊并放出孢子,经孢子采苗后在室内培育出萱藻幼苗。本研究旨在为萱藻人工育苗探索一条新路。

【题目】仿刺参多种杂交方式下杂交效果的初步研究
【中文关键词】仿刺参; 杂交; 杂种优势
【英文关键词】无
【中文摘要】对仿刺参Ap ostichop us jap onicus 中国群体(C) 与俄罗斯群体(R) 杂交子一代F1 (C R) 亲参的发育情况及其与中国仿刺参群体多种杂交后代的早期生长情况进行了研究。结果表明: 杂交仿刺参子一代F1 (C R) 在渤海北部池塘可自然发育成熟, 或经人工促熟后发育成熟。3龄成熟子一代个体体重为(246 5 65 1) g, 体重为140~400 g, 性腺指数为(15 7 1 6)%, 卵径为130~ 160 m。通过人工催产获得成熟精卵, F1 (C R) 与C 回交,

在温度为(20 0 0 5) 、盐度为31、pH 为8 0、溶氧为7 4mg /L的条件下进行幼体培育, 并对其生长指标进行测量。结果表明: 各组杂交后代在体长、体重方面表现出一定的杂种优势。其中, 耳状幼体阶段各组仿刺参生长速度由高到低依次为F1 (C R) ! C∀ > C! F1 (C R) ∀ > F1 (C R) ! F1 (C R) ∀ > C! C∀ ; 4月龄时各组稚参、幼参体长日增长由高到低依次为F1 (C R) ! F1 (C R) ∀ > C! F1 (C R) ∀ > C! C∀ > F1 (C R) ! C∀ , 体重日增长由高到低依次为F1 (C R) ! F1 (C R) ∀ > F1 (C R) ! C∀ > C! F1 (C R) ∀ > C! C∀ 。

【题目】仿刺参体腔细胞吞噬与凝集功能及其与温度的关系
【中文关键词】仿刺参; 体腔细胞; 吞噬; 凝集; 温度
【英文关键词】无
【中文摘要】采用光镜和电镜技术研究了仿刺参Apostichopus japonicus体腔细胞的吞噬和凝集功能及其与温度的关系。结果表明: 仿刺参体腔细胞中球形细胞和变形细胞具有较强的吞噬功能, 当异物的大小、性质不同时, 其吞噬过程和吞噬能力存在一定差异。当体腔细胞吞噬洋红颗粒时, 试验进行6 h其吞噬率最高(48101%) , 108 h时吞噬过程结束; 当体腔细胞吞噬酵母时, 试验进行4 h其吞噬率最高(35117%) , 且体腔细胞的凝集现象较多, 到96 h时吞噬过程结束。仿刺参体腔细胞的吞噬能力与温度关系密切, 18 ℃下吞噬百分率和吞噬指数最高, 12 ℃下次之, 4 ℃和25 ℃下最低。仿刺参离体的体腔细胞很快发生凝集反应, 且温度和异物刺激都会影响体腔细胞的凝集作用时间和强度。

【题目】不同类型附着基对刺参生长和存活的影响
【中文关键词】刺参;附着基;成活率;生长
【英文关键词】无
【中文摘要】附着基是刺参(Apostichopusjaponicus,Selenka)池塘或围堰养殖水体中设置的专用养殖设施,其功能主要是为刺参提供避光场所和培养刺参的天然饵料。本实验比较研究了石头、瓦片、塑料管、空心砖和水泥管5种不同附着基处理对刺参(规格为5.0 g±2.0 g)生长和存活的影响。结果表明,不同附着基上异养菌含量差异显著,5月附着基上异养菌含量显著的低于11月;石头附着基刺参的成活率最高,但其生长速度较慢;空心砖刺参的生长速度最快,成活率略低于石头;空心砖和石头附着基处理刺参产量显著高于其他附着基,瓦片、塑料管和水泥管上海参产量之间差异不显著。仅从养殖效果上看,目前较为流行的5种刺参附着基以空心砖较好。

【题目】三疣梭子蟹对饵料鱼和蛤摄食参数的研究
【中文关键词】三疣梭子蟹;摄食节率;饵料;底质;摄食量比值
【英文关键词】无
【中文摘要】研究体重为(9.2O±1.5O)g的三疣梭子蟹在分别投喂饵料鱼和兰蛤及有无沙底质条件下的昼夜摄食节律、摄食率和昼夜摄食量的差异。结果表明:投喂兰蛤组的三疣梭子蟹摄食高峰在2O:OO左右,投喂饵料鱼组三疣梭子蟹的摄食高峰在O2:OO左右;沙底质条件下三疣梭子蟹的夜晚摄食量占全天摄食量的94.34% ,而无底质组为75%,表明在潜底环境条件下三疣梭子蟹具有更明显的昼夜摄食节律;投喂兰蛤组三疣梭子蟹黑夜摄食量比值显著高于白天,分别为75 和25% ,而投喂鱼组黑夜摄食量比值仅略高于白天,分别为59.2l 和4O.79 。此外,投喂鱼组白昼摄食率可迭8O ,显著高于投喂兰蛤组的lO ,表明投喂鱼饵料有利于三疣梭子蟹的白昼进食。根据昼夜摄食量对比分析,建议采用白昼投喂占总投喂量2O% ~30 的鱼肉以降低蜕皮残食,夜晚投喂7O ~8O 的兰蛤的投喂策略促其生长,并减少梭子蟹的残食。

【题目】Inheritance Pattern of Microsatellite Loci and Their Use for
【中文关键词】无
【英文关键词】Patinopecten yessoensis; larvae; allelic transmission; kinship; microsatellites
【中文摘要】无
【英文摘要】The inheritance mode of seven microsatellite markers was investigated in Patinopecten yessoensis larvae from four controlledcrosses, and the feasibility of using these markers for kinship estimation was also examined. All the seven microsatellite lociwere compatible with Mendelian inheritance. Neither sex-linked barriers to transmission nor major barriers to fertilization betweengametes from the parents were evident. Two of the seven loci showed the presence of null alleles in two families, suggesting the needto conduct comprehensive species-specific inheritance studies for microsatellite loci used in population genetic studies. However,even if the null allele heterozygotes were considered as homozygotes in the calculation of genetic distance, offspring from four familieswere all unambiguously discriminated in the neighbor-joining dendrogram. This result indicates that the microsatellite markersused may be capable of discriminating between related and unrelated scallop larvae in the absence of pedigree information, and ofinvestigating the effective number of parents contributing to the hatchery population of the Japanese scallop.

【题目】刺参不同养殖模式实验围隔内沉积物———水界面营养盐通量研究

【中文关键词】N、P 通量; 沉积物———水界面; 刺参; 底泥呼吸; 不同养殖模式
【英文关键词】无
【中文摘要】研究刺参(A postichopus japonicus) 养殖模式对池塘底质的影响,于2007 年5~11 月间从不同养殖模式实验围隔内采得底泥样并通过实验室培养的方法测定了底泥耗氧率(SOD) 及沉积物—水界面的N、P 等。结果表明,投饵对SOD影响不显著(P > 0. 05) ,说明本实验条件下投饵没有造成实验围隔底泥中的有机物积累;7 月份的SOD 与其它月份间存在显著差异(P < 0. 05) ;大部分模式中沉积物释放溶解性无机磷酸盐(DIP) 且不同月份之间的通量存在显著差异(P <0. 05) ,不同模式之间的变化较复杂;在硝酸盐(NO -3 + NO-2) 通量结果中,投饵模式下的平均通量为非投饵模式下通量值的2~3 倍,夏季的交换通量为冬季交换通量的2 倍;当养殖密度较大时,非投饵模式中沉积物吸收氨氮的通量大于投饵模式中的通量,其它密度下投饵模式中沉积物释放氨氮的通量大于非投饵模式中的通量,并且随着养殖密度的增加通量值降低。

【题目】仿刺参体腔细胞和血细胞类型及体腔细胞数量研究
【中文关键词】仿刺参; 体腔细胞; 血细胞; 类型; 数量
【英文关键词】无
【中文摘要】本文应用光镜、电镜技术研究了仿刺参(Apos tichopus jap onicus)体腔细胞和血窦中血细胞的形态、结构、周年体腔细胞总数及主要类型的细胞数量。研究结果表明, 仿刺参体腔细胞和血细胞形态结构相同, 作者将体腔细胞分为淋巴样细胞、球形细胞、变形细胞、透明细胞、纺锤细胞和结晶细胞, 其中球形细胞又分为 型、! 型、∀ 型。血窦中血细胞除未见结晶细胞外, 其余与体腔细胞相同。体腔细胞和血细胞均以淋巴样细胞、变形细胞、球形细胞为主, 透明细胞、纺锤细胞次之, 结晶细胞数量最少。从形态和结构分析, 作者认为仿刺参体腔细胞和血细胞来源可能相同。周年平均的体腔细胞总数为(3 85 # 0 21) ∃ 106 个/mL, 淋巴样细胞为(1 58 # 0 11) ∃ 106 个/mL, 占细胞总数的(41 # 1 47)%; 球形细胞为(1 16 # 0 13) ∃ 106 个/mL, 占细胞总数的(30 # 0 89)%; 变形细胞为(0 99 #0 07) ∃ 106 个/mL, 占总细胞数的(25 # 0 98)%, 三种主要类型细胞占细胞总数的(96 # 1 53)%。

【题目】三疣梭子蟹与不同虾类混养技术研究
【中文关键词】三疣梭子蟹 虾类 混养
【英文关键词】无
【中文摘要】分别利用中国明对虾、凡纳滨对虾、日本囊对虾和脊尾白虾等虾类与三疣梭子蟹进行混养。结果表明:日本囊对虾与三疣梭子蟹混养组三疣梭子蟹养殖单产最高,平均产量1 678. 5 kg/ hm2 ,其次为凡纳滨对虾与三疣梭子蟹混养组,平均产量1 659 kg/ hm2 。对虾养殖单产以凡纳滨对虾与三疣梭子蟹混养组最高,平均产量990 kg/ hm2 ,其次为中国明对虾与三疣梭子蟹混养组,平均产量952. 5 kg/ hm2 。但考虑到日本囊对虾市场售价为其他混养虾类的两倍,因而日本囊对虾与三疣梭子蟹混养组养殖效益最高。

【题目】仿刺参耳状幼体和稚参阶段的体长遗传力估计
【中文关键词】仿刺参; 遗传力; 生长性状
【英文关键词】无
【中文摘要】采用不平衡巢式设计方法和人工授精技术, 为每个雄性仿刺参配3个雌性仿刺参, 每个雌性个体产生若干幼体, 建立了仿刺参Apostichopus japonicus 9个半同胞家系和27个全同胞家系。对仿刺参中耳幼体的27个全同胞和稚参阶段的23个全同胞幼仿刺参的体长分别进行了测量, 中耳幼体阶段共测量810个个体,稚参阶段共测量640个个体, 并用MTDFREML软件中的混合动物模型对其进行分析, 估计仿刺参早期生长发育的遗传力。结果表明, 仿刺参中耳幼体阶段的体长生长性状遗传力为0129, 稚参阶段的体长遗传力为0149。在仿刺参的不同发育阶段其体长生长性状的遗传力属于中度遗传力范围, 说明仿刺参的体长生长性状是在加性效应控制下, 对仿刺参进行选择育种具有较大的遗传改良潜力, 可以获得较好的选择效果。
