【题目】An approach to improve ACE inhibitory activity of casein hydrolysates with plastein reaction catalyzed by Alcalase
【中文关键词】无
【英文关键词】Casein　Hydrolysis; ACE-inhibitory activity; Plastein reaction;　Alcalase
【中文摘要】无
【英文摘要】The preparation method of casein hydrolysates with high ACE-inhibitory activity was studied by Alcalase catalyzed hydrolysis coupled with plastein reaction. Casein hydrolysates with an IC50 value of about 47 lg mL-1 were first prepared by hydrolysis of casein with Alcalase andthen modified with plastein reaction catalyzed by the same enzyme. The impacts of four reaction conditions on plastein reaction of casein hydrolysates were studied, and thenoptimal conditions were determined using response surface methodology with the decrease of free amino groups in the reaction mixture as response. When the concentration ofcasein hydrolysates was fixed at 35% by weight, the maximum decrease of free amino groups in the reaction mixture of 181.8 lmol g-1 proteins was obtained. The optimum conditions for the above decrease were found to be an E/S ratio of 7.7 kU g-1 proteins, reaction temperatureof 42.7　C and reaction time of 6 h. Analysis results showed that ACE-inhibitory activity of casein hydrolysates prepared could be improved significantly by plastein reaction. When casein hydrolysates were modified by plastein reaction, with a decrease of free amino groups in the mixture of about 154.7 lmol g-1 proteins and 181.8 lmol g-1 proteins, their IC50 values could be decreased to 0.6 and 0.5 lg mL-1.

【题目】不同地理群体菲律宾蛤仔的选择反应及现实遗传力
【中文关键词】菲律宾蛤仔; 地理群体; 选择反应; 现实遗传力
【英文关键词】Ruditapes philippinarum; geographical population; response to selection; realized heritability
【中文摘要】对不同地理群体的3龄菲律宾蛤仔(Pp莆田群体、Dp大连群体、Tp东京群体)进行了混合选择。测量了各实验组的壳长,计算了不同地理群体菲律宾蛤仔的选择反应和现实遗传力。结果表明,3个地群体菲律宾蛤仔子代的上选组壳长显著大于对照组(P<0.05)。在不同生长发育阶段,菲律宾蛤仔的选择反应(R)和现实遗传力(hR2)随着日龄的增大而减小,即R幼虫培育期0.804±0.084>稚贝期0.705±0.039>养成期0.671±0.024;hR2幼虫期0.458±0.051>稚贝期0.402±0.025>养成期0.382±0.013。从总体水平上分析,菲律宾蛤仔R为0.726±0.1074,莆田群体、大连群体、东京群体的R分别为0.758±0.101、0.690±0.049、0.732±0.059;hR2为0.414±0.044,莆田群体、大连群体、东京群体的hR2分别为0.432±0.058、0.393±0.028、0.417±0.033。地理群体间的R和hR2次序为莆田群体>东京群体>大连群体,且彼此间无显著差异。　更多还原
【英文摘要】Three geographical populations (Pp: Putain population; Dp: Dalian population; Tp: Tokyo population) of Manila clam Ruditapes philippinarum of 3-years old were used to test mass selection on growth in July 2006. Shell length of individual was measured by microscope and vernier caliper,moreover,responses to selection and realized heritability were calculated by the methods of Zheng,et al. (2004,2006) among three geographical populations of Manila clam. The results showed that the shell length of selection groups were all significantly higher than that of the control group (P < 0. 05). R and hR2 of Manila clam decreased with increasing days of age during different development stages,that is SR: Larval rearing stage 0. 804 ± 0. 084 > Juvenile nursing stage 0. 705 ± 0. 039 > Youth culture stage 0. 671 ± 0. 024;hR2: Larval rearing stage 0. 458 ± 0. 051 > Juvenile nursing stage 0. 402 ± 0. 025 > Youth culture stage 0. 382 ± 0. 013. R of Manila clam was 0. 726 ± 0. 1074,and Pp,Dp,Tp of that was 0. 758 ± 0. 101,0. 690 ± 0. 049,0. 732 ± 0.

059, respectively. Accordingly,hR2 of Manila clam was 0. 414 ± 0. 044,and Pp,Dp,Tp of that was 0. 432 ± 0. 058,0. 393 ± 0. 028,0. 417 ± 0. 033,respectively. The order of R and hR2 of Manila clam among geographical populations was as follow: Pp > Dp > Tp. Differences in response to selection and realized heritability among the three geographical populations are presumably due to differences in genetic variability.

【题目】黑龙江省水稻冷害Ⅰ冷害发生的时间规律
【中文关键词】水稻;冷害;发生规律
【英文关键词】cooling injury; regularity
【中文摘要】摘要:通过对50余年黑龙江省部分市、县气象资料和产量数据的分析,阐述了黑龙江省水稻低温冷害发生的时间规律。自20世纪80年代以来,全球气候变暖,水稻生育期内的气温也呈明显增加趋势。而在最近的几年间,6~8月份的日平均温度却呈现下降的态势,这正是导致2002年、2003年和2006年部分水稻产区障碍型冷害发生的原因。
【英文摘要】Abstract:By dealing with meteorological data and yield of Heilongjiang province, the time regularity of rice cooling injury was discussed. From 1980,with the global warming, the temperature in rice growth and development stage is increasing. However in recent years,the average temperature between June and August is decreasing. This is the major reason of sterile cooling injury occurred at partial rice production regions in 2002,2003 and 2006.

【题目】Oxidative cross-linking of casein by horseradish peroxidase and its impacts on emulsifying properties and the microstructure of acidified gel
【中文关键词】无
【英文关键词】Casein, horseradish peroxidase, cross-linking, emulsifying property, response surface methodology.
【中文摘要】无
【英文摘要】The cross-linking of food proteins is an interesting topic of food science in recent years and served successfully as an approach to modify protein functional properties. In the presented work, horseradish peroxidase (HRP, EC 1.11.1.7) was used to oxidative cross-link casein in presence of H2O2. The cross-linking of casein was demonstrated by capillary zone electrophoresis analysis. The central composite design using response surface methodology was used to optimize cross-linking conditions of casein. The optimal cross-linking conditions of casein were as follows: the addition level of HRP was 4.73 mkat · g-1 proteins, temperature was 37 ° C and reaction time was 2.9 h when casein concentration and pH of reaction medium were fixed at 5% (w/w) and 9.5, respectively. Cross-linked casein was prepared with these optimal conditions and used to analyze its emulsifying activity index, emulsifying stability index and microstructure of acidified gel. The emulsifying activity index and emulsifying stability index of the cross-linked casein were enhanced about 10 and 6% compared to that of casein.The microstructure of acid-induced gel of the cross-linked casein observed by scanning electron microscopy was more compact and uniform than that of casein without cross-linking. Cross-linking of food proteins induced by horseradish peroxidase might serve as an alternative approach to modify functional property of the proteins.

【题目】黑龙江省水稻冷害II品种间耐障碍型冷害的差异
【中文关键词】水稻;障碍型冷害;不育率;冷积温
【英文关键词】rice; sterile style cooling injury; sterile rate; accumulated cooling temperature
【中文摘要】摘要:利用人工气候室对黑龙江省主栽水稻品种进行耐小孢子阶段低温试验,结果表明:不同水稻品种耐低温的能力有较大的差异。15°C低温处理7 d,不育率降低幅度由3%增至70%。冷积温每增加1°C,不育率由0.002%增至1·898%。由此鉴定出来的耐小孢子阶段低温的水稻品种有:空育131、龙稻3号以及龙稻6号。而对此期低温较敏感的品种是龙粳11、龙粳13、松粳7号、龙稻7号和垦稻12等。
【英文摘要】Abstract: Cooling temperature tolerant experiment on major rice cultivars at microspore stage in Heilongjiang province was conducted in phtotran. The experimental results showed that cooling temperature tolerant ability among cultivars was greatly different. Under cooling temperature(15°C)for 7 days,the spikelets sterile rate ranged from 3% to 70%.When accumulated cooling temperature increased for 1°C,the spikelets sterile rate ranged from 0.002% to 1.989%.Therefore,it could be referred that cooling temperature tolerant cultivars were Kongyu 131,Longdao No.3 and Longdao No.6.While the cooling temperature sensitive cultivars were Long jing 11,Longjing 13,Songjing No.7,Longdao No.7 and Kendao 12.

【题目】Hydrogen peroxide and ferulic acid-mediated oxidative cross-linking of casein catalyzed by horseradish peroxidase and the impacts on emulsifying property and microstructure of acidified gel
【中文关键词】无
【英文关键词】Casein, horseradish peroxidase, cross-linking, emulsifying property, ferulic acid, acidified gel, microstructure.
【中文摘要】无
【英文摘要】Horseradish peroxidase (HRP, EC 1.11.1.7) was used in this study to catalyze oxidative cross-linking of casein in the presence of hydrogen peroxide and cross-linker ferulic acid. Cross-linking of casein was demonstrated by sodium dodecylsulfate-polyacrylamide gel electrophoresis (SDS-PAGE) and ultraviolet absorbance analysis. Oxidative cross-linked casein mediated by hydrogen peroxide and ferulic acid was prepared at casein concentration of 5% (w/ w), HRP addition of 3 mkat · g-1 proteins, ferulic acid addition of 6 mmol · l-1, 3% (w/w) H2O2 addition of 1 ml, reaction temperature 37 ° C and reaction time 3 h. Analysis results showed that the emulsifying activity index and emulsifying stability index of cross-linked casein prepared were enhanced compared to that of untreated casein totally. Microstructure of chemical acid-induced gel of cross-linked casein was observed under scanning electron microscopy and appeared to be more compact and uniform than that of casein. Hydrogen peroxide and ferulic acid-mediated oxidative cross-linking of casein catalyzed by horseradish peroxidase might have a beneficial to the emulsifying property or gelation of casein.

【题目】Preparation of Alcalase-catalyzed casein plasteins in the presence of proline addition and the ACE- inhibitory activity of the plasteins in vitro
【中文关键词】无
【英文关键词】Casein,Casein plasteins,Plastein reaction, ACE-inhibitory activity,Alcalase,Proline
【中文摘要】无
【英文摘要】Casein hydrolysates were prepared by hydrolysis of casein with alkaline protease Alcalase for 6 h and showed the highest ACE-inhibitory activity in vitro with an IC50 value of 47.1 lg mL-1. Casein hydrolysates prepared were subjected to Alcalase-catalyzed plastein reaction in the presence or absence of proline addition to prepare casein plasteins. Some optimal reaction conditions of plastein reaction in the presence of proline addition were studied using response surface methodology with the decrease in free amino groups in the casein plasteins asresponse. When the concentration of casein hydrolysates was fixed at 35% (w w-1) and reaction time at 6 h, the optimal conditions were reaction temperature 48 C, addition level of proline 0.54 mol/mol free amino groups of casein hydrolysates and addition level of Alcalase 9.5 kU g-1 proteins. With these conditions, the maximal decrease in free amino groups in casein plasteins was 195.7 lmol g-1 proteins. The ACE-inhibitory activities of twelve casein plasteins in vitro, prepared in the presence or absence of proline addition with different reaction extents, were evaluated and compared. The results showed that the ACE-inhibitory activity of the casein plasteins prepared in the presence of proline addition changed irregularly, different to that of the casein plasteins prepared in the absence of proline addition, and might relate to the different linking of proline to the peptides in casein hydrolysates during plastein reaction. When the casein plasteins prepared in the presence of proline addition had a decrease in free amino groups 195.7 lmol g-1 proteins, the IC50 value of the casein plasteins was lowered to 0.2 lg mL-1.

【题目】机插杂交粳稻基本苗数对分蘖发生与成穗的影响
【中文关键词】杂交粳稻 机插秧 分蘖发生率 分蘖成穗率 产量 基本苗 每穗粒数 分孽 单茎重 常规品种
【英文关键词】hybrid japonica rice;machine-transplanted rice;tiller emerging rate;tiller earbearing rate;yeild
【中文摘要】以杂交粳稻常优1号为材料,设置25.05、50.10和75.15万株·hm~(-2) 3个基本苗数,进行机插秧新生分蘖跟踪挂牌,研究各级分蘖的发生率及成穗率特征。结果表明:机插杂交粳稻栽插50.10万株·hm~(-2)基本苗时群体有效穗数最多,产量最高;机插杂交粳稻分蘖发生和成穗主要集中在2/0、3/0、4/0、5/0和6/0的一级分蘖及1/2、1/3和1/4的二级分蘖;随着基本苗数增加,分蘖发生数减少,最终成穗数也减少,同时高位分蘖对产量的贡献也减少,单茎重、各蘖位的每穗粒数和占最终穗数的比例均减小。机插杂交粳稻移栽时以50.10万株·hm~(-2)基本苗为宜,过多或过少都影响机插杂交粳稻分蘖发生、蘖位利用和成穗数。
【英文摘要】Hybird japonica rice Changyou 1 was machine-transplanted in three basic seedlings density,250 500,501 000 and 751 500 seedling per hm2. The tiller emerging rate and tiller earbearing rate were investigated. Rwsults showed that colony of 501 000 seedlings per hm2 had the highest effective panicle number and produced the highest grain yield. With the increasing of basic seedling density, the number of tiller emerging and tiller earbearing decreased. And the upper position tillers had lower dry weight per stem, spikelet number per panicle and tiller earbearing rate, thus having less contribution to grain yeild. This research indicated that seedling density has substantial influence on the tiller emerging and earbearing, and suggested that 501 000 seedling per hm2 was the optimal planting number for machine-transplanted hybird japonica rice.

【题目】文蛤山东种群与江苏种群杂交及自繁子代的遗传差异分析
【中文关键词】文蛤; 杂交; 遗传差异; 地理种群
【英文关键词】Meretrix meretrix; hybridization; genetic variation; geographical population
【中文摘要】利用fAFLP技术研究了文蛤山东种群与江苏种群的杂交子代(SJ,JS)和自繁子代(SS,JJ)群体的遗传差异。3对荧光引物组合在4个F1群体96个个体中共扩增出255个位点,多态位点比例高达97.65%。Nei’s基因多样性和Shannon信息指数显示,4个群体的遗传多样性大小依次为SJ>SS>JS>JJ,而且两杂交组的变异度都大于自繁组,说明杂交增加了文蛤种群的遗传多样性和变异程度。fAFLP扩增位点分析表明,SJ和JS的显性基因频率有所增加,并且正、反杂交群体在遗传结构上均表现出明显的偏母性特征。从群体间遗传相似性指数来看,JS与JJ间的遗传相似性系数最大(0.976 1),而与SS间的遗传相似性为0.945 0;SJ与SS间的遗传相似性系数为0.950 2,与JJ群体间为0.925 4;SJ群体与JS群体间的遗传相似性系数最小(0.907 5)。在依据群体间相对遗传距离构建的系统树上,JS与JJ间的亲缘关系最近,首先聚在一起,SJ与SS间亲缘关系较近,也能聚为一支,但明显可以看出正交组合SJ与其它3个群体间的亲缘关系较远。综合分析表明,文蛤地理种群杂交增加了遗传多样性和变异度,正、反交群体在遗传结构上都明显地偏向母本,正交组合SJ群体的遗传多样性最高、变异度最大,这与其在生长速度上表现出的杂种优势可能有直接关系。
【英文摘要】The fluorescent amplified fragment length polymorphism(fAFLP) technique was applied to analyze the genetic variation of 4 F1 groups(SS,JJ,SJ,JS) produced from matings and crosses of Shandong stock and Jiangsu stock in Meretrix meretrix.A total of 255 AFLP loci amplified with three pairs of primers were obtained from 96 individuals.The percentage of polymorphic loci ranged from 91.98% to 96.02% of 4 groups and the overall polymorphic loci percentage reached 97.65%.The results of Nei’s gene diversity and Shannon’s information index showed that the level of genetic diversity from high to low was SJ> SS> JS>JJ and the degree of variation of two hybrid groups was greater than that of two mating groups.The analysis of fAFLP loci indicated the frequency of dominant gene of SJ and JS increased and the genetic structure of two hybrid groups was similar to their maternal parent’s.By analyzing genetic similarity between groups,it was found that the genetic similarity was 0.976 1 between JS and JJ,0.945 0 between JS and SS.And the genetic similarity was 0.950 2 between SJ and SS,and 0.925 4 between SJ and JJ.It is obvious that the genetic similarity(0.907 5) between SJ and JS was the lowest.Phylogenetic tree based on the genetic distance of 4 groups with NJ method and UPGMA method showed that JS and JJ were clustered together firstly because of the nearest genetic relationship,and SJ and SS were also clustered together.But it is evident that the phylogenetic relationship between SJ and other groups was more distant.In conclusion,hybridization between different geographical populations in Meretrix meretrix is a dominant approach to increasing genetic diversity and variation degree;two hybrid groups in genetic structure were similar to their maternal parent;high level of genetic diversity and variation degree of SJ group perhaps have a direct relationship with its heterosis in growth.

【题目】Preparation and radical scavenging activity of papain-catalyzed casein plasteins
【中文关键词】无
【英文关键词】casein ,plastein reaction , papain ,scavenging activity ,antioxidant
【中文摘要】无
【英文摘要】The aim of this study was to prepare papain-catalyzed casein plasteins and to demonstrate the influence of the plastein reaction on the radical scavenging activity. Casein was initially hydrolyzed with papain under selected conditions to give a degree of hydrolysis of 9.6%. The casein hydrolysates were then subjected to papain-catalyzed plastein reaction to prepare casein plasteins. The formation of plasteins in the prepared casein plasteins was confirmed by size exclusion chromatography. The optimal conditions for the plastein reaction, determined by response surface methodology using the decrease of free amino groups in the casein plasteins as the response variable, were as follows: papain addition level was fixed at 500 U · g − 1 proteins, reaction temperature 30 ° C, concentration of casein hydrolysates 50% and reaction time 5.6 h. Six different casein plasteins were prepared and the radical scavenging

activity on two radicals, 2,2-diphenyl- 1-picrylhydrazyl (DPPH) and 2,2′-azino-bis(3-ethyl-benzothiazoline-6-sulfonic acid) (ABTS), was evaluated by the Trolox equivalent antioxidant capacity (TEAC). Analysis showed that all casein plasteins had improved radical scavenging activities. Compared to casein hydrolysates, the scavenging activity of the casein plasteins on DPPH radical had a seven- or ninefold increase, as TEAC increased from 10.45 to 73.41 or 90.31 mmol · g − 1 proteins, while a onefold increase was detected on ABTS+ (TEAC increased from 8.33 μmol · g − 1 to 15.09 or 16.45 μmol · g − 1 proteins). The results of this study clearly showed that the papain-catalyzed plastein reaction could be applied to prepare casein antioxidant peptides with higher activity, and that the plastein reaction may have a new application in dairy science.

【题目】Optimization of liquid culture conditions of protease from Mucor by Box-Behnken design
【中文关键词】无
【英文关键词】Mucor spp.; protease; response surface methodology
【中文摘要】无
【英文摘要】the nutritional parameters of protease, which is isolated from mao-tofu and identified as Mucor spp, were studied by response surface methodology (RSM). Glucose, soybean protein and KH2PO4 were analyzed by Box-Behnken design for optimizing their concentrations in the medium and the effect of their mutual interaction on protease activity. Glucose and soybean protein were found in influencing the protease activity highly significant. Glucose and soybean protein also showed an effect on the protease activity in interaction with other variables.The optima values of the parameters obtained through RSM, 0.72% glucose, 2.58% soybean protein and 0.1% KH2PO4 were applied. Actual value of verifiable experimentation was that theprotease activity was 184.42±0.54 U/L at the optima conditions.

【中文关键词】菲律宾蛤仔; 壳色; 双列杂交; 杂种优势
【英文关键词】Ruditapes philippinarum; shell color; diallel cross; heterosis
【中文摘要】于2006年秋,以"海洋红"(R)、白蛤(W)、斑马蛤(Z)为材料,开展了不同壳色菲律宾蛤仔品系间3×3的双列杂交。实验由3个自交组R×R、W×W、Z×Z和3个杂交组R×Z、W×Z、W×R,即6个正反交RZ、ZR、WZ、ZW、WR、RW组成,研究了子一代在不同阶段生长、变态、存活的杂种优势及壳色遗传机制。结果表明,在不同阶段,不同杂交组合的杂种优势表现程度不同。浮游期间,各杂交组幼虫生长优势(Hg)随着日龄而增大,存活优势(Hs)与日龄几乎无相关性,其值分别为Hg=6.20±2.43,Hs=14.83±0.28。W×Z杂交组合表现出明显的杂种优势,其值分别为Hg w×z=8.50±2.79,Hs w×z=20.59±0.98,与R×Z、W×R杂交组差异显著(P<0.05)。杂交有效地提高了变态率,缩短了变态时间;变态率的杂种优势为Hm=15.84,平均缩短变态时间2d。室内培育期间,刚刚完成变态的稚贝很快表现出生长优势,而后一段时间才表现出存活优势,其值分别为Hg=8.98±2.91,Hs=8.11±8.18;W×Z杂交组合的杂种优势为Hg w×z=15.93±6.47、Hs w×z=8.78±8.76,Hg w×z与R×Z、W×R杂交组差异显著(P<0.05),Hs w×z与W×R杂交组差异显著(P<0.05)。养成期间,幼贝的杂种优势分别为Hg=12.77±1.20,Hs=49.85±1.93;W×Z杂交组合的杂种优势分别为Hg w×z=20.92±1.98,Hs w×z=61.60±1.38,与其它杂交组的显著性差异程度与稚贝期相同。从总体水平上分析,幼虫、稚贝、幼贝生长速度的杂种优势分别为15.06、17.40、15.77,彼此间无显著性差异(P>0.05);综合各阶段的杂种优势,3个杂交组的杂种优势大小顺次为:W×Z>R×Z>W×R。R×Z、W×Z、W×R的子一代的壳色分别表现为:红斑马、白斑马(左壳背部有一条深色条带)、中红(左壳背部有一条深色条带),且正反交的壳色表现一致,说明壳色表现形式与性别无关,为非伴性遗传。
【英文摘要】The 3×3 diallel crosses of different shell color strains were conducted using "Ocean Red"(R),"White"(W)and "Zebra"(Z) in autumn 2006.The experiments consisted of three self-fertilized groups(R R,W W, Z Z) and three hybrid groups(R Z,W Z,W R),in total six reciprocal crosses(RZ,ZR,WZ,ZW,WR,RW).The heterosis of growth,metamorphosis,survival and shell color determinism for offspring were investigated.The results showed that heterosis varied at different phases for each hybrid groups.At pelagic stage,the growth heterosis(Hg=6.20±2.43) increased with post-days and correlativity between the survival heterosis(Hs=14.83±0.28) and post-days was not observed.The hybridized group(W×Z) presented obvious heterosis(Hg w×z=8.50±2.79,Hs w×z=20.59±0.98) which was significantly different from those of other group(R Z,W R)(P < 0.05).At metamorphic stage,the metamorphosis rates of hybrid groups were higher than those of self-fertilized groups and the metamorphic time was shortened by two days.The metamorphic heterosis was 15.84.At indoor rearing stage,the growth heterosis(Hg=8.98±2.91) was found prior to the survival heterosis(Hs=8.11±8.18).The growth heterosis of hybrid group(W×Z)(Hg w×z=15.93±6.47) was significantly different from that of hybrid group(R×Z,W×R) and the survival heterosis of hybrid group(W×Z) (Hs w×z=8.78±8.76) was remarkably different from(W×R)(P< 0.05).At outdoor rearing stage,the heterosis was Hg=12.77±1.20,Hs=49.8±5 1.93,respectively.The heterosis of hybrid group(W×Z)were Hg w×z=20.92±1.98,Hs w×z=61.60±1.38,the differences of which among hybrid groups were the same as those at the juvenile stage.Generally,the heterosis of growth rate were 15.06,17.40,15.77,respectively at larvae stage,juvenile stage and youth stage and no significant difference at each stages was observed.As a whole,the order of heterosis was W×Z>R×Z>W×R.The shell colors of offspring for R×Z,W×Z,W×R were red zebra,white zebra(a posterior band on the left valve) and middle red(a posterior band on the left valve),respectively.The results of both direct cross and reciprocal cross were the same.Results indicated that coloring was not linked to sex and was not of sex-linked inheritance. 更多

【题目】过氧化物酶催化酪蛋白的交联反应优化与乳化性改善
【中文关键词】酪蛋白,辣根过氧化物酶,交联,乳化性质
【英文关键词】Casein , Horseradish peroxidase , Cross2linking , Emulsifying property
【中文摘要】采用辣根过氧化物酶对酪蛋白进行酶促交联,并经SDS2聚丙烯酰胺凝胶电泳、光谱分析和毛细管电泳验证。利用毛细管电泳、面积归一化方法对交联酪蛋白进行分析并计算交联度;以交联度为指标、应用响应面分 析法对交联条件优化,得出适宜的条件为:温度37 ℃、反应时间219 h、酶添加量为每克蛋白质4173 μkat ,此条件下 酪蛋白交联度达到619 %。与酪蛋白相比,交联酪蛋白的乳化活性在蛋白质质量分数为0101 %时提高了817 % ,而 其乳化稳定性在蛋白质质量分数为0103 %时提高了2111 %。
【英文摘要】Cross-linking of casein catalyzed by horseradish peroxidase was studied , which was demonst rated by SDS-PAGE analysis , spect roscopic analysis and capillary elect rophoresis analysis. The cross2linking degree of casein was measured by capillary elect rophoresis with an area normalization method. Response surface method was applied to optimize the reaction conditions for cross2linked casein. The optimal cross-linking conditions obtained were that enzyme addition level was 4173 μkat per gram protein ,

temperature was 37 °C and reaction time was 219 h. Under these optimal conditions , the cross-linking degree of casein prepared was about 619 %. Evaluation result s show that emulsifying activity index of cross2linked casein at concent ration of 0101 % has an increase of 817 % , while emulsifying stability index of cross-linked casein at concent ration of 0103 % has an increase of 2111 % comparing to that of native casein , which indicates the improvement in emulsifying properties of cross-linked casein.

【题目】菲律宾蛤仔2个壳色品系群体杂交的研究
【中文关键词】菲律宾蛤仔; 群体杂交; 壳色品系; 杂种优势
【英文关键词】Ruditapes philippinarum; population hybridization; shell color strain; heterosis
【中文摘要】于2007年10月,以F1代海洋红(R)和斑马蛤(Z)为材料,开展了2个壳色菲律宾蛤仔(Ruditapes philippinarum)品系的群体杂交。试验由RR(R♀×R♂)、ZZ(Z♀×Z♂)、RZ(R♀×Z♂)和ZR(Z♀×R♂)组成。结果表明,2个壳色品系亲贝壳长、重量和产卵量差异显著(P<0.05)。各试验组卵径、受精率和D形幼虫大小无显著差异(P>0.05),但杂交组孵化率显著高于相应对照组(P<0.05)。浮游期间幼虫未表现出明显的生长优势,但表现出一定的存活优势。RZ和ZR的生长优势平均值分别为(1.63±0.81)%和(2.58±0.67)%;生长速度分别为(8.64±0.32)和(8.67±0.31) μm · d-1,显著高于相应对照组(P<0.05);存活优势分别为(10.30±1.92)%和(16.30±1.04)%。室内培育期间稚贝表现出明显的生长、存活优势。RZ、ZR的生长优势平均值分别为(11.25±2.98)%和(20.31±2.10)%;生长速度分别为(9.88±1.45)和(10.79±1.32) μm · d-1,显著高于相应对照组(P<0.05),存活优势分别为(40.85±9.90)%和(57.08±11.98)%。
【英文摘要】The population hybridization was conducted by using clams of two shell color strains "ocean red"(R),"zebra"(Z) strains in October of 2007. The experiments was consisted of RR (R♀×R♂), ZZ (Z♀×Z♂),RZ(R♀×Z♂), ZR (Z♀×R♂) groups. The results showed that difference of shell length, weight and fecundity of parents were significant between two shell color strains

(P<0.05). There were no difference on egg-diameter, fertilized rate and size of D larvae among each experimental groups (P>0.05).The hatching rates in hybrid groups were higher than in control groups (P<0.05).At the planktonic stage,survival heterosis was obvious instead of growth heterosis for larvae tested. Survival heterosis were(10.30±1.92)%and(16.30±1.04)%,respectively for RZ and ZR, and growth heterosis for RZ, ZR were(1.63±0.81)%and(2.58±0.67)%.Growth rates for RZ, ZR were (8.64±0.32) and (8.67±0.31) μm·d-1, respectively (P<0.05).At indoor rearing stage, obvious growth and survival heterosis were found. The growth heterosis of RZ, ZR were(11.25±2.98)%and(20.31±2.10)%, the growth rates were (9.88±1.45) and (10.79±1.32) μm·d-1, and the survival heterosis were(40.85±9.90)%and(57.08±11.98)%, respectively. There was no significant difference of survival heterosis between RR and ZZ (P<0.05).

【题目】酪蛋白水解物的酶法修饰优化与抗氧化活性改善

【中文关键词】酪蛋白水解物,抗氧化活性,类蛋白反应,响应面分析

【英文关键词】casein hydrolysates;antioxidant activity;plastein reaction;reaction condition;response surface analysis

【中文摘要】利用木瓜蛋白酶对酪蛋白水解,并对所得到的水解物进行类蛋白反应修饰,制备高活性抗氧化肽。以水解物的游离氨基含量变化为响应值,利用响应面分析法对类蛋白反应条件进行优化,得到适宜条件为:酶添加量为500U/g,温度30°C,底物质量分数50%,反应时间5　6h。毛细管电泳分析确认,水解物经类蛋白反应修饰后肽分子组成发生变化。抗氧化活性分析结果表明,所制备的3个修饰产物对3种自由基的清除能力显著提高。

【英文摘要】Casein hydrolysates were prepared by hydrolysis of casein with papain, and then modified by plastein reaction to prepare antioxidant peptides with higher activity. Response surface analysis was applied to optimize the conditions of plastein reaction with the variations of free amino groups as index. The optimal conditions obtained were that enzyme addition level was 500 U·g-1 hydrolysates, temperature was 30 °C, concentration of hydrolysates was 50% and reaction time was 5.6 h. The analysis results from capillary electrophoresis confirmed that the peptide compositions of modified products were different from that of casein hydrolysates. The antioxidant activity of three modified products were also analyzed, which indicated that their scavenging activities for three free radicals were enhanced obviously.

【题目】蛋白酶微胶囊制备工艺及在干酪成熟中的应用
【中文关键词】蛋白酶,微胶囊,制备,干酪,降解,质地
【英文关键词】Protease, Microcapsule, Cheese, Protein, Degradation, Texture
【中文摘要】以明胶和阿拉伯胶为壁材,通过Box-Behnken设计响应面优化试验,采用冷冻干燥工艺制备蛋白酶微胶囊。将微胶囊添加到干酪中,测定pH4.6可溶性氮总氮比、水溶性氮总氮比以及12%TCA可溶性氮总氮比,同时进行质构、SDS PAGE、SEM分析。结果表明:明胶质量分数为38%、阿拉伯胶质量分数为37%、芯材添加量为64mg/(100mL)时蛋白酶微胶囊化效率达到93.4%;干酪中应用该微胶囊后使pH4.6可溶性氮总氮比、水溶性氮总氮比以及12%TCA可溶性氮总氮比增加,酪蛋白逐渐被降解为小肽且质地改善,干酪成熟60d后蛋白质微观结构破坏。
【英文摘要】The microencapsulated protease prepared was added to cheese to accelerated maturate. Gelatin and arabic gum were used as wall material to prepare protease microcapsule with freeze drying technique through Box-Behnken design and response surface methodology. The microencapsulated protease were added to cheese to study its influence on the ratio of pH 4.6 soluble nitrogen to total nitrogen, water soluble nitrogen to total nitrogen or 12% TCA soluble nitrogen to total nitrogen in ripened cheese. SDS-PAGE analysis, texture analysis and scanning electron microscope examination were also applied to analyze the ripened cheese. It was shown from the analysis results that the optimum conditions for the preparation of protease microcapsule were that the concentration of gelatin and arabic gum was 3.8% and 3.7%, core material (protease) was 6.4 mg/100 mL and microencapsulation efficiency was 93.4%. The ratio of pH 4.6 soluble nitrogen to total nitrogen, water soluble nitrogen to total nitrogen or 12% TCA soluble nitrogen to total nitrogen in the ripened cheese was increased when protease microcapsule was incorporated into cheese, which indicated that degradation of casein into small peptides was occurred and lead to the improvement in texture. The microstructure of proteins in cheese was destroyed after 60 days of ripening.

【题目】缢蛏六群体线粒体DNA-COI基因序列变异及群体遗传结构分析
【中文关键词】缢蛏; 线粒体DNA; COI; 遗传多样性
【英文关键词】Sinonovacula constricta; mtDNA; COI; genetic diversity
【中文摘要】利用线粒体DNA细胞色素氧化酶亚基(COI)基因序列片段对江浙闵沿海地区缢蛏三个野生群体(江苏射阳-WS、浙江象山-WX,福建霞浦-WP)和三个养殖群体(江苏射阳—CS、浙江象山-CX、福建焦城-CJ)的遗传结构进行初步分析。以特异引物进行PCR扩增,经纯化、测序、同源序列比对获得长度为556 bp的核苷酸序列,其中A+T含量为66.2%,显著高于G+C含量。在缢蛏六群体98个个体中共检测到了56个单倍型和66个核苷酸多态位点,多态位点比例为11.7%。野生群体的平均核苷酸差异数和核苷酸多样性指数略高于养殖群体,但是野生群体和养殖群体的单倍型多态性指数均大于0.9,其单倍型较为丰富。此外,六群体均有各自特有的单倍型,但只有射阳野生群体与其他群体无共享单倍型,具有鉴定该群体的特异碱基序列。遗传距离和聚类结果显示,养殖群体与象山野生群体和霞浦野生群体间亲缘关系较近。 更多还原
【英文摘要】The Razor Clam,Sinonovacula constricta,is distributed alo ng the coastal waters of West pacific ocean which is one of the four most valuable and popular shellfish resources in China.To examine the genetic diversity in three wild and three cultured S.constricta populations from Jiangsu,Zhejiang and Fujian Provinces,mitochondrial cytochrome oxidase subunit I gene(COI) was

determined.A 556bp long partial gene segment was acquired and sequences were moderately A+T rich(A+T = 66.2 %),which was higher than G+C content.The results showed that 56 haplotypes and 66 variation sites were found in the sequences of the 98 samples.The nucleotide diversity and average number of differences of wild populations were a few higher than that of cultured populations,but the values of haplotype diversity of six populations were 0.9.Moreover,there were special haplotypes in wild Jiangsu population,which were not shared with others ’.The genetic distance and cluster analysis suggested that the phylogenetic relationship of three cultured populations was closed to the Zhejiang and Fujian wild populations in Zhejiang and Fujian Provinces

【题目】Cheddar干酪理化性质变化对其质构及微观结构的影响
【中文关键词】干酪; 蛋白质水解; 脂肪水解; 质构; 微观结构
【英文关键词】Cheese,Proteolysis,Lipolysis,Texture,Microstructure
【中文摘要】在贮藏过程中干酪的理化变化对其质构起到重要作用, 由于蛋白质的降解破坏了其网络结构, 脂肪水解和氧化使脂肪球发生聚集融合, 形成脂肪槽, 这些变化促进了干酪质构的变化, 使其质地变软。本文系统研究Cheddar干酪在贮藏期的蛋白质水解程度、脂肪水解和氧化程度、质构及微观结构的变化, 分析蛋白质水解、脂肪水解对质构和微观结构的影响。
【英文摘要】The change of physicochemical properties play important on texture of cheese during storage. Protein degradation damages its network.With the increase in free fatty acid content and degree of oxidation intensified, fat globule aggregated and formed fat groove shape.These changes make it soft. We studied proteolysis, lipolysis, texture and microstructure of Cheddar cheese during storage, analyzed effect of proteolysis on texture and microstructure .

【题目】大蒜对菲律宾蛤仔早期生长发育的影响
【中文关键词】大蒜; 菲律宾蛤仔; 生长; 存活; 变态;
【英文关键词】garlic extract; Ruditapes philippinarum; growth; survival; metamorphosis;
【中文摘要】实验了不同大蒜汁浓度(0、2、4、8、16、32 mg/L)对菲律宾蛤仔受精卵孵化率,幼虫生长、存活、变态及稚贝生长与存活的影响,总结了室内大规模人工育苗过程中大蒜防病效果。结果表明:随着大蒜汁浓度的增加,孵化率降低;大蒜汁浓度达到16mg/L,胚胎发育延迟;达到32mg/L,受精卵不能孵化为正常幼虫。浮游期间,幼虫的生长受大蒜汁抑制,幼虫的存活率则随着大蒜汁浓度增加先升高后降低;幼虫的变态率随着大蒜汁浓度的增加先升高后降低,以16mg/L为最适浓度;变态规格随着大蒜汁浓度增加而减小。室内培育期间,稚贝生长与存活随着大蒜汁浓度的增加先升高后降低,以8mg/L为最适浓度;室内大规模人工育苗过程中,使用浓度为8-10mg/L大蒜汁可以起到较好的防病效果。 更多还原

【英文摘要】This study investigated effects of various concentrations of garlic extract(0,2,4,8,16,and 32 mg/L) on hatching rate,growth and survival of larvae and juveniles,metamorphosis,and disease prevention for Manila clam Ruditapes philippinarum.The results showed that the hatching rate decreased with increasing concentrations of garlic extract.A garlic extract concentration of 16 mg/L resulted in delayed embryo development,and 32 mg/L resulted in hatching failure of the embryos.During the planktonic stage,larval growth was depressed by garlic extract;larval survival and metamorphosis increased and then decreased as garlic extract concentrations increased.A garlic extract concentration of 16 mg/L appeared to be optimal for larval metamorphosis and survival.The metamorphosis size decreased with increasing garlic extract concentrations.During the indoor rearing period,the growth and survival of juveniles also increased and then decreased as garlic extract concentrations increased,with 8 mg/L being the optimum concentration.Results from the present study demonstrated that garlic extract concentrations of 8-10 mg/L could prevent diseases in the hatchery.

【题目】单宁酸交联处理对明胶性质的影响
【中文关键词】明胶,单宁酸,交联,性质
【英文关键词】Gelatin,Tannic acid,Cross-linking,Property
【中文摘要】采用单宁酸作交联剂对明胶进行交联改性处理, 对其凝胶性、降解性进行分析, 制备, 微胶囊并确定芯材的释放性能。结果表明, 与原料明胶相比, 交联明胶形成凝胶的最低浓度基本未发生改变, 仍为左右,但是在相同浓度下交联明胶的凝胶强度明显降低。体外降解实验表明, 原料明胶和交联明胶在模拟胃液中几乎不发生降解, 但在模拟肠液中都发生降解, 且交联明胶的降解速度更慢。交联明胶为壁材制备的微胶囊, 其芯材在模拟胃液和模拟肠液中有一定的缓释效果。
【英文摘要】Gelatin was crosslinked by tannic acid as cross-linking agent. Gel property, degradation character of cross-linked gelatin was evaluated. A microcapsule was prepared with cross-linked gelatin as wall material and vitamin B1 as core material. Release characters of core material in microcapsules were analyzed. The results showed that minimum concentration of cross-linked gelatin to form gel was same to raw gelatin about 0.6%. However, the gel strengh of cross-linked gelatin was lower than that of raw gelatin at the same concentration. Degradation study in vitro showed that raw gelatin and cross-linked gelatin were nearly not degraded in simulated gastric fluid, but both were degraded in simulated intestinal fluid. Data showed that cross-linked gelatin was degraded slowly than raw gelatin. Microcapsules with cross-linked gelatin as wall material showed that they had a slow-release property in the simulated gastric and intestinal fluid at some extent。

【题目】酪蛋白水解物的酶法修饰与ACE抑制活性变化
【中文关键词】酪蛋白,水解物,类蛋白反应,ACE 抑制
【英文关键词】casein , hydrolysates , plastein , ACE inhibition
【中文摘要】利用枯草杆菌碱性蛋白酶水解酪蛋白制备酪蛋白水解物,其水解度为1112 % , IC50为4711 μg/ mL 。再应用相同的酶对酪蛋白水解物进行类蛋白反应修饰,考察底物浓度、温度和酶添加量对类蛋白反应的影响,并制备5 个不同的修饰产物测定其ACE 抑制活性和IC50值。结果表明,修饰产物的ACE 抑制活性随修饰程度(游离氨基减少量) 的增加而提高,并且都高于未经修饰的酪蛋白水解物。当游离氨基减少量为154165 μmol/ g (蛋白) 时,修饰产物的IC50值可降至016 μg/ mL

。毛细管电泳分析结果显示类蛋白修饰后水解物的多肽组成情况发生明显变化。研究结果证明酪蛋白水解物的ACE 抑制活性可以通过类蛋白反应的修饰作用而提高。

【英文摘要】Casein hydrolysates t hat had t he degree of hydrolysis of 11.2 % and value of IC50 about 38. 6 μg/ mL were prepared f rom casein with B cillus subtilis alkaline p rotease. Casein hysrolysates t hen were modified by plastein reaction wit h t he same protease. The effect s of t he concent ration of casein hydrolysates ,temperature and addition level of p rotease on the plastein reaction were st udied. Five modified casein hydrolysates wit h different modification extent s were prepared and t heir ACE inhibitory activity and value of IC50 were determined. The result s indicated t hat all five modified casein hydrolysates had higher ACE inhibitory activity t han t hat of casein hydrolysates. When modified casein hydrolysates had a decrease in f ree amino groups of 154. 65 μmol/ g protein , their ACE inhibitory activity was decrease to 0. 6 μg/ mL . Analysis result from capillary elect rop horesis indicated t hat the peptide profiles between casein hydrolysates and modified casein hydrolysates were different obviously. The st udy result s showed t hat the ACE inhibitory activity of casein hydrolysates could be effectively improved by plastein reaction.

【题目】文蛤副溶血弧菌间接ELISA检测技术的研究

【中文关键词】文蛤; 副溶血弧菌; 弧菌病; 间接ELISA; 快速检测

【英文关键词】Meretrix meretrix linnaeus; Vibrio parahaemolyticus; vibriosis; Indirect ELISA; Rapid detection

【中文摘要】从患病文蛤组织内分离出一株细菌,回归感染试验证明是文蛤的致病菌,经鉴定为副溶血弧菌,灭活后(56°C,1h)制成菌苗,用该菌苗制备兔抗血清,以辣根过氧化酶标记的羊抗兔血清(HRP-IgG)为酶标二抗,对副溶血弧菌进行间接ELISA快速检测。结果表明:应用间接ELISA技术检测副溶血弧菌具有较高的灵敏度,其最低检测极限为1×105cfu/mL。患病文蛤内脏团中副溶血弧菌的检出率为80%,无病症带菌文蛤中的检出率为15%,海水中副溶血弧菌的浓度低于最低检测极限。表明间接ELISA检测法不仅可以用于发病文蛤的快速检测,而且能够检测出无病症的带菌的文蛤,为有效预防副溶血弧菌病的暴发提供了检测手段。

【英文摘要】Pathogenic bacterium was isolated form diseased hard clam Meretrix meretrix Linnaeu,and it was identified to be Vibrio parahaemolyticus (Vp),and was confirmed to be the pathogens of the epidemic by artificial infection experiment. This pathogen was inactivated (56°C,1h),to be as vaccine,the antiserum specific for Vp was obtained from rabbits by injecting vaccine; and the anti-rabbit IgG goat was marked by horseradish peroxidase (HRP)and used in an indirect ELISA detection. The results showed the lowest VP suspension detection limit in laboratory was 1×105cfu/ml on worksite. Vp were detected by ELISA form samples of diseased and healthy clam with 80% and 15% respectively,but none for the seawater. This indicated that ELISA could be used not only to diagnose the clinically diseased clam Meretrix meretrix,but also to recognize pathogen—carrier clam Meretrix meretrix Linnaeus,and it can provide basis to preclude the explosion of the vibriosis.

【题目】植物单宁酸交联明胶的条件优化及性质分析

【中文关键词】明胶,交联,单宁酸,性质

【英文关键词】gelatin, cross-linking, tannic acid, property

【中文摘要】该文用单宁酸作交联剂对明胶进行交联改性,通过响应面法优化反应条件并建立回归模型,并对交联前后的明胶进行十二烷基磺酸钠-聚丙烯酰胺凝胶电泳(SDS-PAGE)、紫外光谱和黏度等3 方面的分析测定,确认单宁酸交联对明胶所产生的交联作用,开发新食品配料交联明胶。结果显示:适宜的交联反应条件为反应温度47.5℃,时间50 h,单宁酸添加量80 mg/g 明胶。性质分析表明,与原料明胶相比交联明胶一些性质发生变化,紫外光谱分析发现交联明胶在276 nm 出现新吸收峰,表明交联明胶分子中存在苯环;电泳后交联明胶的蛋白质条带色泽明显变浅,且交联度越大条带色泽越浅,此外,交联明胶溶液的黏度明显增大,说明单宁酸交联处理使交联明胶中有更多的大分子物质生成。

【英文摘要】Gelatin was modified with tannic acid as a cross-linker in this study. Cross-linking conditions of gelatin were optimized by response surface methodology and corresponding regression model was thus established. Sodium dodecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE) analysis, ultraviolet absorption spectrum analysis and viscosity determination were conducted to confirm the cross-linking of gelation by tannic acid. The results showed that the optimal cross-linking conditions were as follow: reaction temperature was 47.5℃, reaction time was 50 h and addition level of cross-linker was 80mg · g-1 on gelatin basis. Compared to those of gelatin, some properties of cross-linked gelatin were changed. Ultraviolet absorption spectrum analysis showed that cross-linked gelatin had an additional absorption peak at 276 nm, which indicates the existence of benzene rings in cross-linked gelatin. It was also found that the color of protein bands of cross-linked gelatin in SDS-PAGE analysis became lighter when cross-linking degree of gelatin increased, and relative viscosity of cross-linked gelatin solution increased clearly. All results indicate the formation ofhigher molecules in cross-linked gelatin as the result of treatment of gelatin with tannic acid.

【题目】高活性酪蛋白抗氧化肽的制备方法研究

【中文关键词】酪蛋白水解物;木瓜蛋白酶;抗氧化活性;毛细管电泳

【英文关键词】casein hydrolysates;papain;antioxidant activity;capillary electrophoresis

【中文摘要】采用木瓜蛋白酶对酪蛋白进行水解,得到抗氧化活性较好的酪蛋白水解物,并且水解物在木瓜蛋白酶作用下进行类蛋白反应制备出高活性酪蛋白抗氧化肽。第一步制备酪蛋白水解肽时酶添加量为500U/g 酪蛋白、温度45℃、底物浓度5%、反应时间2h。第二步类蛋白反应的最优条件为:酶添加量为500U/g 水解物、温度30℃,底物浓度50%、作用时间5.5h。毛细管电泳结果确认,类蛋白反应修饰后抗氧化肽的组成情况发生变化。抗氧化活性分析结果表明,类蛋白反应修饰后的酪蛋白抗氧化肽对DPPH 自由基和ABTS+ · 的清除能力显著提高。

【英文摘要】Peptides with high antioxidant activity were prepared from casein by a two-step method, i.e., first preparation of casein hydrolysates by papain-catalyzed, and then modification of these hydrolysates by plastein reaction with papain. The antioxidant activities of casein hydrolysates and their modification products were evaluated by DPPH assay and ABTS assay.The optimum conditions for casein hydrolysis were casein concentration 5%, papain concentration 500 U/g casein, pH 4.5,temperature 45 ℃ for a hydrolysis duration of 2 h, and the optimal plastein reaction conditions were substrate concentration 50%, papain concentration 500U/g substrate, and temperature 30 ℃ for 5.5 h reaction. Capillary electrophoresis analysis confirmed that the compositions of antioxidant peptides were changed as a result of plastein reaction. The DPPH and ABTS scavenging activity of casein peptides were remarkably enhanced after enzymatic modification.

【题目】酪氨酸存在下酪蛋白水解物的Plastein反应修饰与抗氧化活性影响
【中文关键词】酪蛋白水解物; Plastein反应;酪氨酸;抗氧化活性
【英文关键词】casein hydrolysates, Plastein reaction, tyrosine, antioxidant activity
【中文摘要】利用木瓜蛋白酶水解酪蛋白,然后添加酪氨酸于酪蛋白水解物并进行Plastein反应修饰。利用响应面分析法对Plastein反应条件进行优化,以反应体系的游离氨基含量减少量为响应值,得到适宜的Plastein反应条件为:酪蛋白水解物浓度50% ,木瓜蛋白酶添加量500 U /g蛋白质,酪氨酸添加量2125 mol/mol水解物游离氨基,反应温度35℃,反应时间415 h。对制备出的3个不同修饰程度的产物的抗氧化活性进行分析,结果表明修饰产物对DPPH游离基和ABTS·+的清除能力有显著提高。排阻色谱分析结果显示,修饰产物中肽分子组成发生了显著变化。
【英文摘要】Casein was hydrolyzed by papain, and the hydrolysates p repared were modified by Plastein reaction inthe presence of tyrosine. Some conditions of Plastein reaction were op timized with response surface methodology, and the decrease of free amino group s in reaction mixture was used as response. The op timal conditions for Plastein reaction were as follows: concentration of casein hydrolysateswas 50% , addition level of papain or tyrosine was 500 U /g proteins or 2125 mol/mol free amino group s in casein hydrolysates, and reaction temperature or time was 35 ℃ or 4.5 h. Three modified casein hydrolysateswere thus p repared with different reaction extents. Analysis results showed that these modified casein hydrolysates had better free radical scavenging activity on DPPH radical orABTS·+ than casein hydrolysates clearly. The p rofiles from size2exclusion chromatography indicated that the compositions of the pep tides in modified casein hydrolysates were obviously different from that of the pep tides in casein hydrolysates.

【题目】蛋白交联中多酚氧化酶的酶源筛选及酶学性质研究
【中文关键词】交联;多酚氧化酶;双孢蘑菇;茄子
【英文关键词】cross-linking;polyphenol oxidase(PPO);Agaricus bisporus;eggplant
【中文摘要】从多种植物和真菌中筛选出多酚氧化酶(PPO)活力高的原料,并对其酶学性质进行研究,以利于其在蛋白交联中的应用。双孢蘑菇和茄子中PPO 酶活相对较高,达到11004U/g 和9376U/g。双孢蘑菇PPO 和茄子PPO 的最适温度和pH 值均分别为20℃和7.0;在温度较高时,茄子PPO 比双孢蘑菇PPO 稳定性更好。Zn2+、Mn2+、Ag+对双孢蘑菇PPO 和茄子PPO 活力表现明显的抑制作用,Cu2+ 对双孢蘑菇PPO 活力表现明显的促进作用,而对茄子PPO 却有很强的抑制作用。双孢蘑菇PPO 和茄子PPO 的Km 和Vmax 分别为5.5mmol/L、1666.7U 和8.75mmol/L、2500U。
【英文摘要】The plants and fungus with high polyphenol oxidase (PPO) activity were selected to apply to protein cross-linking,and biochemical nature of this enzyme was characterized. PPOs from Agaricus bisporus and eggplant were observed to be the highest, 11004 U/g and 9376 U/g. The optimum temperature and pH for these two kinds of PPO were found to be 20 ℃ and 7.0, while PPO from A. bisporus showed lower heat stability than that from eggplant at high temperature. Metal ions like Zn2+,Mn2+ and Ag+ showed obvious inhibition on PPOs while Cu2+was able to promote the PPO activity from A. bisporus (140.9%)and inhibit PPO activity from23.4%. The Km and Vmax values of PPOs from A. bisporus and eggplantwere 5.5mmol/L and 1666.7 U,8.75 mmol/L and 2500 U, respectively.

【题目】阿魏酸存在下酪蛋白的酶促氧化交联与一些性质变化
【中文关键词】酪蛋白;辣根过氧化物酶;阿魏酸;交联;乳化性质
【英文关键词】casein; horseradish peroxidase; ferulic acid; cross-linking; emulsifying property
【中文摘要】在pH值为9.5,阿魏酸存在和37 °C的条件下,利用辣根过氧化物酶(EC 1.11.1.7)和过氧化氢对酪蛋白进行氧化交联,并用十二烷基磺酸钠-聚丙烯酰胺凝胶电泳和紫外吸收分析确认交联作用。在蛋白质质量分数为0.04%时,交联酪蛋白的乳化活性指数、乳化稳定性分别比酪蛋白提高25.2%和7.0%。利用葡萄糖酸 – δ – 内酯制备酪蛋白和交联酪蛋白的酸化凝胶,扫描电子显微镜观察可以看出交联酪蛋白凝胶的微观结构中空穴减少,形成了更为致密的结构。
【英文摘要】Horseradish peroxidase (EC 1.11.1.7) and peroxide hydrogen was used to oxidative cross-link casein in presence of H2O2 and ferulic acid at 37 °C and pH =9.5. Cross-linking of casein occurred was first demonstrated by SDS-PAGE and spectroscopic analysis. Crosslinked casein was then prepared and used to analyze its emulsifying activity index, emulsifying stability index and microstructure of acidified gel. The emulsifying activity index and emulsifying stability index of cross-linked casein at concentration of proteins of 0.04% (w/w) were enhanced about 25.2% and 7% compared to that of casein at same concentration of proteins, respectively. The gel microstructure of cross-linked casein prepared by acidification of glucono- δ -lactone was observed by scanning electron microscopy as more compact and uniform structure.

【题目】TLR2基因多态性与奶牛体细胞评分的相关性研究
【中文关键词】新疆褐牛;TLR2基冈;隐性乳房炎;体细胞评分
【英文关键词】Xinjiang Brown cattle;TLR2 gene;sub-mastitis;SCC
【中文摘要】旨在分析Toll-样受体2在奶牛隐性乳房炎中的作用。本研究以同一牛场内的中国荷斯坦奶牛和新疆褐牛为研究对象,选取奶牛体细胞数小于20万和大于100万的个体各15头,对TLR2基因进行测序,然后对发现的多态位点进行PCR-RFLP检测,分析这些位点与体细胞评分(SCS)的相关性。结果发现了TLR2基因E+189、E+631和E+22603个SNP位点,其中E+631和E+2260位点为本试验首次发现。E+189、E+631和E+22603个SNP位点在2个品种内均处于Hardy-Weinberg平衡状态(P>O.05);3个位点在2个品种间的基因型分布差异都极显著(P<O.01)。分析每个SNP位点与SCS的相关性,最示TLR2E+189位

点AA比BB和AB基因型个体的SCS高(P<0.05),AB与BB基因型个体的SCS差异不显著(P>0.05);说明BB基因型个体的乳房炎发病率低。而TLR2E+631的SCS和TLR2E+189位点表现相似,但各个基因型个体间的SCS差异不足著(P>0.05)。E+2260位点AA基因型个体比AB的SCS低(P>0.05)。新疆褐牛的SCS低于荷斯坦牛(P<O.01),说明新疆褐牛乳房炎发病率比衙斯坦牛低。在发现的3个SNP位点中,E+189位点对奶牛的SCS有显著影响(P<0.05),TLR2基因SNP位点在2个品种内的分布差异町能足新疆褐牛比荷斯坦牛乳房炎发病率低的原因之一。

【英文摘要】This study aims to identify single nucleotide polymorphisms (SNPs) and haplotypes in the TLR2 gene, and analyze the association of SNPs or haplotypes and somatic cell scores in 151 Xinjiang Brown cattle and 138 Holsteins to evaluate the role of TLR2 during intramammary infections. TLR2 coding region was amplified by PCR and screened for SNP sequencing.Genotypes and frequencies of SNPs were identified. Finally, the associations of genotypes or haplotypes and somatic cell scores (SCS) were analyzed. The results showed that: (i) 15 SNPs (E +653, E +945, E +978, E +1010, E+1250, E+1688, E+1707, E+1779, E+1782, E+1891, E+1995, E+2025, E+2055, E+2214 and E +2295) were observed and detected from 289 cows; (ii) distribution of the 14 SNPs were significantly different from Xinjiang Brown cattle and Holstein (P < 0.001) except for the E +945 (P > 0.05); (iii) in 11 SNPs (E+945, E +978, E +1010, E+1688, E+1707, E+1779, E+1782, E+1995, E+2025,E+2055 and E +2214), the SCS of AB genotype was lower than AA (P < 0.05) in Xinjiang Brown cattle; and (iv) haplotypes composed of the above-mentioned 11 SNPs were constructed. The SCS of cattle with Hap5 was lower than that of Hap3(P < 0.05). This suggests that Hap5 might play an important role in sub-mastitis resistance in Xinjiang Brown cattle.

【题目】脯氨酸存在下酪蛋白ACE抑制肽的Plastein反应修饰
【中文关键词】酪蛋白;类蛋白反应;AC E 抑制肽;碱性蛋白酶;修饰
【英文关键词】casein;plastein reaction;ACE inhibitory peptide;alkaline protease;modification
【中文摘要】利用枯草杆菌碱性蛋白酶水解酪蛋白制备ACE 抑制肽,其IC50 为47.1 μg/mL;采用相同酶催化ACE 抑制肽和脯氨酸进行Plastein 反应,对ACE 抑制肽进一步修饰,并用响应面分析法优化反应条件。在ACE 抑制肽质量分数为35%,反应时间为6h,以反应体系游离氨基减少量为指标,得到适宜的反应条件为:温度为47.8℃、脯氨酸比例为0.54、酶添加量为9.5kU/g pro,此条件下体系游离氨基减少量约195.7 μmol/g pro。在适宜条件下改变反应时间对酪蛋白ACE 抑制肽进行不同程度的Plastein 反应修饰,制备出6 个修饰程度不同的多肽混合物并测定它们的ACE 抑制活性、计算其IC50 值。结果表明:修饰产物的ACE 抑制活性随修饰程度的增加不规则变化,当反应体系的游离氨基减少量为195.7 μmol/g pro 时,修饰产物的

IC50 降低至0.2 μg/mL。
【英文摘要】ACE inhibitory peptides with IC50 value of 47.1 μg/mL were prepared by hydrolyzing casein with alkaline protease from Bacillus subtilis and further modified by plastein reaction under the catalysis of the same protease in the presence of proline. The optimal conditions for plastein reaction were determined using response surface methodology at the fixed concentration of 35% (m/m) peptides and the reaction time of 6 h as follows: reaction temperature 47.8 °C,molar ratio of proline to total free amino groups in ACE inhibitory peptides derived from casein 0.54, and addition level of alkaline protease 9.5 kU/g proteins. Under these optimal reaction conditions, a maximal decrease of free amino groups in reaction mixture of 195.7 μ mol/g proteins was obtained. Six modified products with different modification degrees were prepared by adjusting reaction time. ACE inhibitory activities and IC50 values of these modified peptides were also analyzed. Results indicated that ACE inhibitory activity of modified products revealed irregular change with increasing modification degree.When the reaction mixture had a decrease of free amino groups of 195.7 μ mol/g proteins, there was a decline of IC50 value of modified products to 0.2 μ g/mL.

【题目】酪蛋白水解物的中性蛋白酶修饰及其ACE抑制活性
【中文关键词】酪蛋白水解物, 类蛋白反应, ACE抑制活性, 中性蛋白酶
【英文关键词】casein hydrolysates, Plastein reaction, ACE inhibitory activity, Neutrase
【中文摘要】采用碱性蛋白酶水解酪蛋白,制备水解度为1315%、IC50为45123 μg/mL的酪蛋白水解物,然后利用中性蛋白酶对水解物进行类蛋白反应修饰,并研究酶添加量、底物浓度、反应温度和时间对修饰反应的影响。结果表明,修饰反应体系中水解反应占优势,表现为游离氨基含量增加;酶添加量、底物浓度、反应时间对修饰反应的影响显著,而反应温度的影响不大;在低酶添加量、高底物浓度和短反应时间下,修饰反应体系的游离氨基的增加幅度减少,水解反应相对降低。制备6个不同反应程度的修饰产物,ACE抑制活性分析结果显示,修饰产物的IC50降至15156~19198 μg/mL,表明中性蛋白酶催化的类蛋白反应修饰可以提高酪蛋白水解物的ACE抑制活性。
【英文摘要】Casein hydrolysates that have the degree of hydrolysis of 13. 5 % and IC50 value of 45. 23 μg/mL were prepared from casein with a p rotease Alcalase, and then modified by plastein reaction with another protease Neutrase.The effects of the addition level of Neutrase, the concentration of casein hydrolysates, temperature and time on the plastein reaction of casein hydrolysateswere studied. The results indicated that hydrolysis reaction was the dominantone in the Plastein reaction system as the content of free amino group s in reaction system increased in all conditions. The addition level ofNeutrase, the concentration of casein hydrolysates and reaction time all had significant impact on the plastein reaction of casein hydrolysates, while reaction temperature gave some influence. Under lower addition level of Neutrase, higher concentration of casein hydrolysates and shorter reaction time, the extent of increase in free amino groups in Plastein reaction system tended to decrease which implied that hydrolysis reaction were weakened relatively. Six modified casein hydrolysateswith different reaction extentswere p repared and their ACE inhibitory activities were determined. The results showed that the values of IC50 of the modified products were in range of 15. 56 to19. 98 μg/mL, indicating that the ACE inhibitory activity of casein hydrolysates could be imp roved significantly by plastein reaction catalyzed by Neutrase.

【题目】Medium optimization and structural characterization of exopolysaccharides from endophytic bacterium Paenibacillus polymyxa EJS-3
【中文关键词】Paenibacillus polymyxa; Endophyticbacterium; Exopolysacchrides; Response surface methodology; Structural characterization
【英文关键词】Paenibacillus polymyxa; Endophyticbacterium; Exopolysacchrides; Response surface methodology; Structural characterization
【中文摘要】In this study, response surface methodology was employed to optimize the medium compositions for the production of exopolysaccharides (EPS) from endophyticbacteriumPaenibacilluspolymyxaEJS-3. Firstly, fractional factorial design was applied to evaluate the effects of different components in the medium. It was found that sucrose, yeast extract and CaCl2 influenced significantly the production of EPS. Then, steepest ascent method and central composite design were used to optimize the concentrations of the three variables. As results, the optimal medium compositions were determined as following (g/L): sucrose 188.2, yeast extract 25.8, K2HPO4 5 and CaCl2 0.34, with a corresponding yield of 35.26 g/L. In addition, both polysaccharide fractions (EPS-1 and EPS-2) from crude EPS were mainly composed of (2 → 6)-linked β -d-fructofuranosyl residues backbone with (2 → 1)-linked branches based

on their structural characterization by FT-IR spectroscopy, methylation analysis and 13C NMR spectroscopy.

【题目】两步法制备高活性酪蛋白ACE抑制肽的工艺参数研究
【中文关键词】酪蛋白;ACE 抑制肽;制备工艺;Plastein 反应
【英文关键词】casein;ACE inhibitory peptides;preparation method;plastein reaction
【中文摘要】为了制备高活性ACE 抑制肽,研究两步法高活性酪蛋白ACE 抑制肽的制备工艺条件参数。利用枯草杆菌碱性蛋白酶55℃水解酪蛋白6h 制备酪蛋白ACE 抑制肽,IC50 为38.6 μg/mL;采用相同的酶进行Plastein 反应来修饰酪蛋白ACE 抑制肽,并应用响应面分析法优化修饰反应条件。固定酪蛋白ACE 抑制肽质量分数为35%,以ACE 抑制肽的游离氨基减少量为指标,优化的修饰反应条件为酶添加量7.7kU/g 蛋白质、温度42.7℃、反应时间6h,在此条件下,酪蛋白ACE 抑制肽的游离氨基减少量达到179.72 μmol/g 蛋白质。ACE 抑制活性分析结果表明,修饰后ACE 抑制肽的抑制活性显著提高且与修饰反应程度相关,IC50 可降至0.5 μg/mL。
【英文摘要】The ACE inhibitory peptides derived fromcasein hydrolyzed with alkaline protease from Bacillus subtilis at 55 ℃ for 6 h exhibited an IC50 of 38.6 μg/mL. To enhance their activity, they weremodified via the plastein reaction catalyzed by the enzyme.Moreover, response surfacemethodology was employed to investigate the optimal values of plastein reaction parameters including enzyme dosage and reaction temperature and time. Results showed that after the optimal reaction for 6 h at 42.7 ℃ and an enzyme dosage of 7.7 kU/g protein, the content of free amino groups in the peptides were decreased by up to 179.72 μmol/g protein. The optimized plastein reaction resulted in an obvious enhancement of casein-derived ACE inhibitory peptides, which was related to the reaction degree and the IC50 of the modified ACE inhibitory peptides was reduced to 0.5 μg/mL.

【题目】农田无线传感器网络移动终端数据收集方案
【中文关键词】无线传感器网络,计算机仿真,拓扑,移动终端,数据收集
【英文关键词】wireless sensor networks, computor simulation, topology mobile terminal, data collection
【中文摘要】农田无线传感器网络部具有署面积大、汇聚节点位置不固定的特点,为了解决移动汇聚节点高效、低能耗地收集网络数据的问题,提出了一种基于层次型拓扑结构的移动终端数据收集方案—DCSMT_H。方案综合考虑节点位置及当前剩余能量选举簇头并形成层次型拓扑结构,根据移动终端当前位置灵活构建簇间数据汇聚路由。仿真实验结果表明,DCSMT_H 方案的网络能耗低,该方案与LEACH 相比能有效延长网络生存期约15%,能够较高效地应用于移动终端收集大规模农田生产信息。该研究为提高无线传感器网络在精准农业中的应用水平做出了有益探索。
【英文摘要】Farmland wireless sensor network is characterised by its large deployment area and the unfixed location of sinknode. In order to work out a more efficient and less energy-consuming way for the mobile sink node to collect the data of thenetwork, the paper proposed a data collection scheme for mobile terminal based on hierarchical topology—DCSMT_H.Taking the location of nodes and residual energy into account, a clustering topology was built by selecting the clusterheads in the scheme, and finally a inter-cluster data routing was constructed flexibly according to the current location ofthe mobile terminal. Simulation experiments showed that DCSMT_H possessed low energy-comsumption network andextend the lifetime of the network by about 15% compared with LEACH. So DCSMT_H being appliod to the mobileterminal can well fit for collecting the environmental information of large-scale farmlands. This research can providereferences for improving the application of wireless sensor networks in precision agriculture.

【题目】Production, characterization and antioxidant activities in vitro of exopolysaccharides from endophytic bacterium Paenibacillus polymyxa EJS-3
【中文关键词】Paenibacillus polymyxa; Endophytic bacterium; Exopolysaccharides; Culture conditions; Antioxidant activity
【英文关键词】Paenibacillus polymyxa; Endophytic bacterium; Exopolysaccharides; Culture conditions; Antioxidant activity
【中文摘要】The production, characterization and antioxidantactivitiesin vitro of exopolysaccharides (EPS) from endophyticbacteriumPaenibacilluspolymyxaEJS-3 were investigated. For EPS production, the preferable culture conditions were 24 ° C and pH 8 for 60 h with sucrose and yeast extract as the carbon and nitrogen sources, respectively. Notably, sucrose concentration was the prominent factor, and the maximum yield of EPS (22.82 g/L) was obtained at a sucrose concentration of 160 g/L. The crude EPS was purified by chromatography of DEAE-52 and Sephadex G-100, affording EPS-1 and EPS-2 with molecular weights of 1.22 × 106 and 8.69 × 105 Da, respectively. They were composed of mannose, fructose and glucose in a molar ratio of 2.59:29.83:1 and 4.23:36.59:1, respectively. In addition, both crude and purified EPS showed strong scavenging activities on superoxide and hydroxyl radicals, and their antioxidantactivities decreased in the order of crude EPS > EPS-2 > EPS-1.

【题目】用小球藻进行缢蛏人工繁育技术试验
【中文关键词】小球藻; 缢蛏; 人工繁育
【英文关键词】Chlorella sp.; Sinonovacula constricta; artificial propagation
【中文摘要】利用轮虫培养设施,以小球藻作为缢蛏浮游幼虫的开口饵料,采取贝类育苗的一般工艺进行缢蛏的室内人工育苗,试验结果表明,缢蛏一般于晚上产卵,一直持续至凌晨;2.5 kg亲蛏共获受精卵3.0×107个,缢蛏受精卵在平均水温约15°C时,经25 h发育成2.5×107个D形幼虫,孵化率为83.3%。投喂小球藻后经12 d培育幼虫能够正常变态附着,共获1.0×107个眼点幼虫,幼虫成活率40%,刚附着稚蛏于室内经40 d的培育获得平均壳长为3 mm稚蛏3.0×106粒,平均成活率30%。
【英文摘要】In this study,razor clam(Sinonovacula constricta)seeding was conducted in rotifer cultivation devices,by ordinary process of seed breeding for bivalve and alga Chlorella sp.as live food of the razor clam.The results showed that the razor clam usually spawned at evening and stopped spawning in the early morning.About 3.0×107 zygotes were obtained from 2.5 kg of brood stock.The zygote developed into D-larva in 25 h and the amount of D-larva was about 2.5×107,with the hatching rate of 83.3%.When fed with Chlorella sp.,the larvae was attached in 12 d,the amount of eyespot larva was about 1.0×107 and the survival rate was 40%.After 50 d cultivation,3.0×106 juveniles were obtained,with shell length of up to 3 mm and the average survival rate of about 30%.

【题目】双孢蘑菇多酚氧化酶交联作用对酪蛋白乳化性及其稳定性的影响
【中文关键词】双孢蘑菇多酚氧化酶; 酪蛋白; 交联; 乳化性; 稳定性
【英文关键词】Agaricus bisporus polyphenol oxidase; casein; cross-linking; emulsifying capacity; emulsion stability
【中文摘要】利用双孢蘑菇多酚氧化酶(PPO)对酪蛋白进行交联,考察交联后酪蛋白乳化性和乳化稳定性,并采用SDS-PAGE电泳检测交联物的形成情况。结果表明:当PPO酶比活力为400U/mL,25°C反应4h时,交联后的酪蛋白乳化性和乳化稳定性分别为18.3m2/g和19.8min,较未交联的酪蛋白乳化性和乳化稳定性分别提高了17.3%和37.5%。交联后酪蛋白的乳化性和乳化稳定性得到显著提高,并且与形成的聚合物含量有着密切的关系。
【英文摘要】Cross-linking of food proteins can modify their functional properties.Casein was cross-linked by polyphenol oxidase from Agaricus bisporus.The emulsifying capacity and emulsion stability of cross-linked casein were analyzed and SDS-PAGE was used to detect the amount of polymer formation.The emulsifying capacity and emulsion stability of cross-linked casein obtained after polyphenol oxidase treatment at 25 °C and an enzyme concentration of 400 U/mL for 4 h were 18.3 m2/g and 19.8 min,17.3% and 37.5% higher than those of non-cross-linked casein,respectively.Such significant increments in both emulsifying properties might be tightly related to the amount of formed cross-linked casein.

【题目】四种微藻对缢蛏稚贝暂养效果研究
【中文关键词】单胞藻; 缢蛏稚贝; 成活率; 日增长率
【英文关键词】无
【中文摘要】采用实验生态学方法研究了小球藻、牟氏角毛藻、绿色巴夫藻和亚心形扁藻对缢蛏稚贝的暂养效果。结果表明:在20d的实验时间内,4种单胞藻对缢蛏稚贝的暂养成活率为小球藻(0.91±0.05)>亚心形扁藻(0.80±0.06)>牟氏角毛藻(0.79±0.05)>绿色巴夫藻(0.76±0.09),方差分析表明终末成活率并无显著性差异(P>0.05)。4组稚贝的初始壳长无显著性差异(P>0.05),但最终壳长差异显著(P<0.05),就日生长率而言,绿色巴夫藻明显高于小球藻和亚心形扁藻(P<0.05)。牟氏角毛藻和小球藻之间差异显著(P<0.05),其他各组间差异不显著(P>0.05)。因此,绿色巴夫藻和牟氏角毛藻对缢蛏稚贝的暂养效果优于小球藻和亚心形扁藻。

【题目】Cloning, characterization and expression of two new polyphenol oxidase cDNAs from Agaricus bisporus
【中文关键词】无
【英文关键词】Agaricus bisporus,Cloning,Expression, Polyphenol oxidase
【中文摘要】无
【英文摘要】Two new polyphenol oxidase (PPO) cDNAs (PPO3 and PPO4 cDNAs, accession numbers GQ354801 and GQ354802, respectively) were obtained by RACE-PCR from Agaricus bisporus. PPO3 cDNA was 1844 bp in length with an open reading frame of 1731 bp, while PPO4 cDNA was 2042 bp with an open reading frame of 1836 bp. PPO3 and PPO4 cDNAs, with 52% identity at the nucleic acid level, encoded a 576-amino acid protein of 66.3 kDa and 611-amino acid protein of 68.3 kDa, respectively. Mature forms of PPO3 and PPO4 were characterized after removing the specific C-terminal region and expressed in Escherichia coli BL21 (DE3) RIPL using pGEX-4T-1 vector. The expressed proteins were probed by the anti-A. bisporus PPO antibody but without PPO activity. This indicated that the recombinant mature PPO3 and mature PPO4 could not form an active center in prokaryotic expression system.

【题目】不同芯材的海藻酸-壳聚糖微球的体外模拟释放
【中文关键词】海藻酸钠; 壳聚糖; 包埋; 酪氨酸; 维生素B1; 牛血清白蛋白; 释放
【英文关键词】alginate; chitosan; encapsulation; tyrosine; vitamin B1; bovine serum albumin; release
【中文摘要】以酪氨酸、维生素B1或牛血清白蛋白为芯材,在芯材/壁材比为1∶10、pH5·0的条件下,采用锐孔法制备Ca2+单一交联和双重交联海藻酸-壳聚糖凝胶微球,测定芯材的包埋率,并考察芯材在模拟胃肠液中的释放。结果表明,牛血

清白蛋白包埋率最大,超过83%;模拟胃液中芯材的释放速率低于其在模拟肠液中的释放速率,释放速度与分子质量有关;模拟胃液中双重交联微球比Ca2+单一交联微球的芯材释放速率更慢,释放速度也与分子质量有关,30min时芯材释放率低于50%。结果表明,双重交联海藻酸-壳聚糖微球在酸性条件下可限制性释放芯材,在中性条件下较快地释放芯材。

【英文摘要】Alginate-chitosan microcapsules were prepared in this study by piercing method basing on Ca2+ single or dual crosslinking treatment,with tyrosine,vitamin B1 and bovine serum albumin as core materials and the selected conditions of the ratio of core material to wall material of 1：10 and pH5.0. The encapsulation efficiency of core materials in the microcapsules prepared was evaluated,and the releasing behaviors of core materials in the simulated gastrointestinal conditions were also determined. The results showed that the encapsulation efficiency of bovine serum albumin was the highest and up to 83%. It was found that core materials in the microcapsules released slowly in simulated gastric fluid than in simulated intestinal fluid,and the releasing rate was related to the molecular weights of core materials. Meanwhile,it was also shown that core materials in dual crosslinked microcapsules released more slowly than that in Ca2+ single crosslinked microcapsules in simulated gastric fluid,for the amount of core materials released from dual crosslinked microcapsules was less than 50% in 30min duration. The results indicated that dual crosslinked microcapsules could release core materials in a limited behavior in acidic medium,but in a rapidly behavior in mild alkali medium.

【题目】Screening of bifidobacteria with acquired tolerance to human gastrointestinal tract

【中文关键词】无

【英文关键词】bifidobacteria; tolerance; adhesion; screening

【中文摘要】无

【英文摘要】Tolerance capabilities of 38 Bifidobacterium strains were achieved by Simulating the micro-environment of human gastrointestinal tract using modified MRSC broth (pH 3.0). Fourteen strains of them with high Viability were obtained in MRSC with 0.3% bile salts. Sequently, six strains of bifidobacteria with higher survivability were picked in MRSC broth (pH 3.0) supplemented with 1-20mg/ml bile salt. Finally, strain A04 with the optimal ability was chosen for further studies. It had been seen that Bifidobacterium? breve A04 had better Survival capability to 0.5% pepsin (w/v) or 1% pancreatin (w/v) than other bifidobacteria, and viable bacteria were above 8.00logcfu/ml after incubation for 24h. Meanwhile, it had higher adhesive capability to HT-29 cells in vitro and average adhesive bacteria numbers reached 12.8 +/- 0.9 for each HT-29 cell. The results indicated that the ability to tolerate gastroenteric environment and the adhesive capacity to HT-29 cells among Bifidobacterium strains was different. B. breve A04 has several aspects of advantages and may be regarded as potential probiotics. (c) 2007 Elsevier Ltd. All rights reserved.

【题目】Studies on time-related changes of dipeptidyl peptidase during processing of Jinhua ham using response surface methodology

【中文关键词】无

【英文关键词】jinhua ham; dipeptidyl peptidase; dipeptidyl peptidase 1; dipeptidyl peptidase IV; Response Surface Methodology

【中文摘要】无

【英文摘要】Sixty experimental Jinhua hams were processed by traditional methods using green hams from local cross-bred pigs of Lanxi, Zhejiang province, PR China. Biceps femoris was sampled from five hams randomly taken after each processing stage. Potential activities of DPP I and IV in addition to the changes of some enzyme influencing factors were determined. The effects of temperature, sodium chloride content, sodium nitrate content and pH value on the activities of muscle DPP I and IV were evaluated using Response Surface Methodology (RSM) and the actual activities of muscle DPP I and IV during Jinhua ham processing were estimated. The results showed that potential activity of muscle DPP I decreased gradually from 8608.23 to 1842.06 U g(-1) before loft-aging and then increased gradually from 1842.06 to 12196.60 U g(-1) at the end, while that of muscle DPP IV decreased continuously and about 11% of the initial potential activity was left at the end of processing. Most of the chemical components analyzed in Biceps femoris as well as physical parameters changed greatly during processing. Temperature, sodium chloride concentration and pH value influenced DPP I and IV activities significantly. However, nitrate concentration from 0 to 50 mg kg(-1) showed little effect. By regression analysis, two quadratic regression equation models were built. The models showed that DPP I could have strong activity during Jinhua ham processing, whereas the activity of DPP IV was always very weak despite its strong potential for activity. In conclusion, muscle DPP I may be a key enzyme responsible for the generation of dipeptides in Jinhua ham processing while the effect of DPP IV was possibly very limited. (C) 2004 Elsevier Ltd. 【题目】两种蛋白水解物的Fenton反应修饰与抗氧化活性变化
【中文关键词】大豆分离蛋白; 酪蛋白; 水解物; Fenton反应; 抗氧化活性
【英文关键词】soy protein isolate; casein; hydrolysates; Fenton reaction; antioxidant activity
【中文摘要】利用碱性蛋白酶分别水解大豆分离蛋白、酪蛋白,对两种水解物进行Fenton反应修饰。用紫外吸收及Lowry法评价修饰反应对两种水解物的影响,结果表明,修饰后产物与原水解物显著不同,表明修饰反应对水解物组成产生影响。抗氧化活性分析发现,大豆分离蛋白水解物的修饰产物的IC50从2.92mg/mL降低至1.36~2.28mg/mL,酪蛋白水解物的修饰产物的IC50从2.80mg/mL降低至0.89~2.12mg/mL,表明Fenton反应可提高修饰产物对DPPH自由基的清除能力。
【英文摘要】Soy protein isolate hydrolysates or casein hydrolysates were prepared by hydrolysis of soy protein isolate or casein with alcalase 2. 4L FG respectively,and then modified by Fenton reaction. Ultraviolet absorption and Lowry assay were applied to estimate the effects of Fenton reaction on the two hydrolysates. The results indicated that the modified hydrolysates were different from the original ones and showed the impacts of Fenton reaction on the compositions of two protein hydrolysates. The antioxidant activities of the modified protein hydrolysates were analyzed for DPPH radical scavenging activity. The analysis results showed that the IC50 values of the modified soy protein isolate hydrolysates or casein hydrolysates on DPPH radical were decreased from 2. 92 or 2. 80mg/mL to 1. 36 ~ 2. 28 or 0. 89 ~ 2. 12mg/mL,which clearly indicated that modification of two protein hydrolysates by Fenton reaction improved their free radical scavenging activities.

【题目】酪蛋白水解物的Plastein反应修饰及ACE抑制活性变化
【中文关键词】酪蛋白水解物; 中性蛋白酶; plastein反应; ACE抑制活性
【英文关键词】casein hydrolysates; Neutrase; plastein reaction; ACE inhibitory activity
【中文摘要】采用中性蛋白酶水解酪蛋白,一定条件下制备水解度为13.0%、IC50质量浓度为40.4 mg/L的酪蛋白水解物。利用中性蛋白酶对所制备出的水解物进行plastein反应修饰,以反应体系的游离氨基量的变化为评价指标,通过单一因素试验研究酶添加量、底物质量分数、反应时间和反应温度对修饰反应的影响。结果表明,适宜的反应条件为中性蛋白酶添加量3 kU/g蛋白质、底物质量分数60%、反应时间6 h、反应温度20℃。制备5个不同反应程度的修饰产物,ACE抑制活性分析结果显示,修饰产物的IC50降至14.7~31.1 mg/L,表明中性蛋白酶催化的plastein反应修饰提高酪蛋白水解物的ACE抑制活性,且ACE抑制活性的提高程度与plastein反应程度有关。
【英文摘要】Casein was hydrolyzed by Neutrase under the fixed conditions to prepare casein hydrolysates that had the degree of hydrolysis of 13.0 % and value of IC50 about 40.4 μg/mL.The obtained hydrolysates then were modified by plastein reaction catalyzed by Neutrase.The effects of the addition level of Neutrase,the concentration of casein hydrolysates,reaction time and temperature on the plastein reaction of casein hydrolysates were studied by single factor experiments,with the decreased amount of free amino groups of the hydrolysates as the evaluation index.The results indicated that the suitable reaction conditions were addition level of Neutrase of 3 ku/g proteins,substrate concentration of 60%,reaction time of 6 h and reaction temperature of 20 ℃.Five modified casein hydrolysates were prepared with the selected reaction conditions but different reaction times.The analysis results showed that the modified hydrolysates had an improved ACE-inhibitory activity because their values of IC50 ranged from 14.7 to 31.1 μg/mL.Our results indicated that Neutrase-catalyzed plastein reaction could be applied to enhance the ACE-inhibitory activity of casein hydrolysates,and reaction extent of plastein reaction showed impact on the ACE-inhibitory activity of the modified product.

【题目】我国沿海缢蛏群体遗传结构的mtDNA-CO Ⅰ分析
【中文关键词】缢蛏; 线粒体DNA; 群体遗传; 遗传结构
【英文关键词】Sinonovacula constricta; mtDNA; Population genetics; Genetic structure
【中文摘要】采集了我国沿海共计9个缢蛏(Sinonovacula constricta)地理群体的197个样本,分别是北部组群的3个群体:辽宁省庄河群体(ZH),天津市汉沽群体(HG),山东省海阳群体(HY);中部组群的3个群体:江苏省盐城群体(YC),上海市崇明县东滩

群体(DT)和堡镇群体(BZ);以及南部组群的3个群体:浙江省宁波群体(NB),浙江省台州群体(TZ)以及福建省宁德群体(ND)。利用线粒体CO Ⅰ标记分析了9个群体的遗传多样性和遗传分化。结果表明,在共计197个个体中检测到125个单倍型和96个变异位点,核苷酸多样性指数位于2.1764~7.4970之间,其中中部组群的群体遗传多样性指数最高。AMOVA分析结果显示,组间遗传变异量占总变异的80.27%,18.74%来自于群体内,只有0.99%来自于组内群体间。群体间遗传分化系数位于0.0219~0.8706之间,不同群体间具有一定的遗传分化,尤其是中部群体与其他群体间遗传分化值达到了0.8以上,为极高度分化。遗传距离和聚类结果显示,北部3群体和南部3群体首先聚在一起,之后与中部3群体聚类。

【英文摘要】The Razor Clam (Sinonovacula constricta)is an important shellfish in China,Japan and Korea. We sequenced mitochondrial cytochrome oxidase Ⅰ (CO Ⅰ) genes of 197 individuals from nine populations to investigate population genetic structure of the northern (ZH,HG,HY),the mid-regional(YC,DT,BZ) and the southern(NB,TZ,ND)groups of S. constricta along the coast of China. We identified 125 haplotypes and 96 variable sites from 556 bp of CO Ⅰ. Nucleotide diversity ranged from 2. 176 4 to 7. 497 0. Analysis of molecular variance (AMOVA) showed that interpopulation variance accounted for 80. 27% (P < 0. 05), whereas the remaining 18. 74% and 0. 99% were detected within population and among populations of same groups respectively,indicating significant genetic differentiation among populations. Phylogenetic tree analysis and genetic distance analysis showed that the nine populations were clustered into three distinct groups,with the northern group clustering first with the southern group and then with the mid-regional group.

【题目】Limited deamidation of soybean protein isolates by glutaminase and its impacts on the selected properties

【中文关键词】无

【英文关键词】Glutaminase, Soybean protein isolates, Emulsify property, Rheological property, Iron (II)-chelating activity.

【中文摘要】无

【英文摘要】Glutaminase (EC 3.2.1.5) was applied in the present work to deamidate soybean proteinisolates with limited extent, and some reaction conditions were selected. Three deamidatedsoybean protein isolates products with degree of deamidation of 3.5, 5.6, and 6.6% werepreprared with reaction conditions as follows: soybean protein isolates concentration of 5%(w/v), glutaminase addition level of 400 U/kg soybean protein isolates, reaction temperatureof 37 ◦ C, and reaction times of 12, 24, and 36 h, respectively. SDS-PAGE and size exclusionchromatography analysis showed that glutaminase exhibited weak ability to catalyzethe hydrolysis of the peptide bonds in soybean protein isolates. The results indicated that thedeamidated soybean protein isolates prepared showed improved solubility in a pH range of3 to 10, and had higher emulsion stability on the oil-in-water dispersions when compared tothe original soybean protein isolates, but had poor emulsifying activity. Rheological assayrevealed that the suspensions prepared by the deamidated soybean protein isolates productsshowed higher apparent viscosity, and the values of apparent viscosity depended on thedegree of deamidation of the deamidated soybean protein isolates product and the additionlevel of Ca2+ in the suspensions. The storage modulus G and viscous modulus G of theprepared suspensions gave similar behaviors as apparent viscosity. Three deamidated soybeanprotein isolates products prepared contained better iron (II)-chelating activity than theoriginal soybean protein isolates as the evaluated index showed an increase of 19 to 30%.Limited deamidation of soybean protein isolates by glutaminase showed beneficial impactson the selected properties of deamidated soybean protein isolates totally, and might be servedas a practical approach to prepare multifunctional ingredients for the food industry.

【题目】Applicability of bacteriocinogenic Lactobacillus pentosus 31-1 as a novel functional starter culture or co-culture for fermented sausage manufacture
【中文关键词】无
【英文关键词】Meat product; Pork product; Lactic acid bacteria; Bacteria; Lactobacillaceae; Microorganism interrelationships; Sausage; Fermented product; Lactobacillus; Bacteriocin;
【中文摘要】无
【英文摘要】The technological feasibility of producing fermented sausages using the bacteriocin-producing Lactobacillus pentosus 31-1,isolated from a traditional Chinese fermented meat product (Xuanwei ham), was evaluated. Strain 31-1 was used both as a single starter and in coculture for manufacture of fermented sausages. The microbiological and physicochemical properties (color,texture, and sensory quality) and the production of bacteriocin during ripening of these products were compared with those characteristics of sausages produced with a commercial meat starter. Challenge tests were performed using Listeria innocua or Staphylococcus aureus as target strains. The addition of L. pentosus 31-1 can significantly reduce L. innocua and S. Aureus populations during all ripening phases. Free amino acid and free fatty acid analysis suggested that strain 31-1 might have proteolytic and lipolytic activity. The use of this strain resulted in a final product with a brighter surface and better texture and sensory profiles. A maximum bacteriocin (pentocin 31-1) concentration of 640 AU/g was detected in homogenized sausages with added L. pentosus 31-1. The bacteriocin-producing strain L. pentosus 31-1 could be used as a novel functional starter culture or coculture for sausage fermentation.

【题目】Characterization of the dominant microflora in naturally fermented camel milk shubat
【中文关键词】无
【英文关键词】shubat,Camel milk,Lactic acid bacteria,Yeasts,Characterization
【中文摘要】无
【英文摘要】This study aimed to characterize the dominant microflora in shubat, a special fermented product prepared from unheated two-humped camel milk. In the seven investigated samples of shubat, lactic acid bacteria and yeasts were the dominant microorganisms with the number ranging from log 6.8 to 7.6 cfu/ml and from log 4.3 to 4.7 cfu/ml, respectively. Using phenotypic and molecular methods, a total of 48 LAB isolates were identified as Lactobacillus sakei, Enterococcus faecium, Lactobacillus helveticus, Leuconstoc lactis, Enterococcus feacalis, Lactobacillus brevis and Weissella hellenica, whereas 15 yeast isolates were identified as Kluyveromyces marxianus, Kazahstan uiosporus, and Candida ethanolica. Results showed also that Lactobacillus and Enterococcus as well as Kluyveromyces were the predominant genera, with the most frequently isolated species being Lactobacillus sakei and Enterococcus faecium as well as Kluyveromyces maxius, respectively. This is the first report on the characterization of dominant microflora of shubat in China.

【题目】A survey of biogenic amines in Chinese rice wines
【中文关键词】无
【英文关键词】biogenic amines; Chinese rice wines; histamine; tyramine; HPLC
【中文摘要】无
【英文摘要】Fourteen Chinese rice wines from four rice wine-making regions of China were analyzed for the first time, using HPLC with diode array detection after pre-column derivatization with dansyl chloride. The results showed that Chinese rice wines contained the five biogenic amines histamine, tyramine, cadaverine, spermine and spermidine. Histamine was detected in all samples (100%), followed by spermine (93%), cadaverine (87%), tyramine (79%) and spermidine (79%). The mean total level of biogenic amines in samples was 107 mg/l with a range from 39.30 to 241 mg/l. These levels are below the level that may elicit direct adverse reactions for most consumers. However, patients being treated with monoamine oxidase inhibitors should be aware of the presence of amines in rice wines and limit their consumption. (c) 2005 Elsevier Ltd. All rights reserved.

【题目】Purification and partial amino acid sequence of pentocin 31-1, an anti-Listeria bacteriocin produced by Lactobacillus pentosus 31-1
【中文关键词】无
【英文关键词】PEDIOCOCCUS-ACIDILACTICI; ENTEROCOCCUS-FAECIUM; FOOD PRESERVATION; STARTER CULTURES; IIA BACTERIOCINS; SDS-PAGE; MODE; CHEESE; STRAIN; BOZA
【中文摘要】无
【英文摘要】Pentocin 31-1, an anti-Listeria bacteriocin produced by Lactobacillus pentosus 31-1 from the traditional Chinese fermented Xuan-Wei ham, was Successfully purified by the pH-mediated cell adsorption-desorption method and then purified by gel chromatography with Sephadex G-10. The purification resulted in a 1,381.9-fold increase in specific activity with a yield of 76.8% of the original activity. Using Tricine-sodium dodecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE), the molecular mass of the purified peptide was found to be between 3,500 and 6,400 Da, and bacteriocin activity was confirmed by overlayer techniques. When subjected to mass spectrometry analysis, the protein was highly pure and its molecular mass was 5,592.225 Da. The partial N-terminal sequence of pentocin 31-1 was the following: NH2-VIADYGNGVRXATLL. Compared with the sequence of other bacteriocins, pentocin 31-1 has the consensus sequence YGNGV in its N-terminal region, and therefore it belongs to the class IIa of bacteriocins.

【题目】Accumulation and species distribution of selenium in Se-enriched bacterial cell of the Bifidobacterium animals
【中文关键词】无
【英文关键词】Bifidobacteria; Selenium; Accumulation; Species distribution; Selenomethionine; LC-MS
【中文摘要】无
【英文摘要】Bifidobacterium animalis 01 (B. animalis 01) could absorb 16.7-39.6% of inorganic selenium in the medium and transform most of it into organic selenium. Most of the organic selenium (50.7-63.0%) was found in the protein fraction, 9.62-18.7% in

the polysaccharide fraction, 0.273-0.754% in the nucleic acid fraction, and 20.8-30.9% in other components. Furthermore, the selenium content of different protein extractions was in the following order: Alkaline-soluble protein-bound Se (46.5-53.4%) > Water-soluble protein-bound Se (27.4-30.8%) > Salt-soluble protein-bound Se (7.79-11.9%) > Alcohol-soluble protein-bound Se (not detected). Additionally, the molecular mass of most proteins or protein subunits containing selenium was about 10-20 kDa. Analysis by LC-MS showed that selenomethionine (SeMet) is the major selenocompound in protein. (C) 2008 Elsevier Ltd. All rights reserved.

【题目】屎肠球菌M-2产细菌素的纯化与特性研究
【中文关键词】屎肠球菌;细菌素;纯化;特性
【英文关键词】Enterococcus faecium;bacteriocin ； purification ； characterization
【中文摘要】从内蒙古传统干酪中分离到的 1 株产细菌素屎肠球菌(Enterococcus faecium)M-2为试材,对 其所产细菌素进行提取、纯 化和理化特性分析。经80%硫酸铵盐析及SP Sepharose Fast Flow 阳离子交换树脂层析得到纯化的细菌素,其比活力可达411.204 AU/mg;T ricine SDSPAGE电泳结果显示其分子量约为 3400 D;特性分析发现该细菌素有很好耐热和酸碱性,经121 ℃处理 20 min 后仍有活性残留,且在 pH 2~10 的范围内活性稳定;吐温 20 和吐温 80 对其活性无影响,而 SDS、司本 80和尿素可导致活性损失 40%~50%;蛋白酶 K 和胰蛋白酶处理可使其完全失活,而木瓜蛋白酶和中性蛋白酶仅可导致部分失活;8 71 AU/mL肠球菌素 M2对单增李斯特氏菌(Listeria monocytogenes)的作用方式为杀菌;该细菌素抑菌谱较广,不仅对李斯特氏菌(Listeria spp.),葡萄球菌(Staphylococcus spp.),芽胞杆菌(Bacillus spp.)等革兰氏阳性菌有明显抑制作用,同时对大肠杆菌(Escherichia coil)及假单胞菌(Pseudomonas spp.)等阴性菌也表现出抑菌活性,有作为食品防腐剂的良好应用前景。
【英文摘要】Purification and characterization of an antilisteria bacteriocin produced by Enterococcus faecium M-2,isolated from Inner Mongolia traditional cheese, were studied. Enterocin M2 was purified by 80% ammonium sulphate precipitation, followed by SPSepharose FF cation exchange chromatography. And the specific activity of purified bacteriocin was 411.204 AU/mg. The inhibitory activity was heatstable and still remained after 20 min at 121 °C . The activity remained stable at pH values from 2 to 10.Tween 20 and tween 80 did not decrease the activity. However, SDS, span 80 and urea induced 40%~50% activity loss. Enterocin M-2 could be inactivated by proteinase K and trypsin, and partially inactivated by papain and neutral proteinase. Mode of action of enterocin M-2 against Listeria monocytogenes is bactericidal at 871 AU/mL. In addition, the bacteriocin had a broad inhibitory spectrum.It not only had a strong effect on grampositive,such as Escherichia spp., Staphylococcus spp.,Bacillus spp. and etc, but also could inhibited several gramnegative bacteria, such as ,Listeria spp. and Staphylococcus etc. These results show that the bacteriocin has a potential application as food additives and biopreservatives in food industry.

【题目】长寿老人源产细菌素乳酸菌的筛选与分子生物学鉴定
【中文关键词】长寿老人;细菌素;乳酸菌;筛选;鉴定
【英文关键词】Centenarians; Bacteriocin; LAB; Screening; Identification
【中文摘要】本研究以124株我国广西巴马百岁以上长寿老人源乳酸菌菌株为试材,采用双层琼脂平板扩散法筛选产细菌素的优良菌株。在排除有机酸、H2O2 等的干扰后,菌株B02、B03、B04、B07、B11、B25、B24和B78的发酵上清液对受试的大肠埃希菌、金黄色葡萄球菌等5株指示菌都表现出很强的抑制作用;进一步硫酸铵沉淀、透析及浓缩处理后,其抑菌活

性显著增强,同时蛋白酶敏感性试验显示其具有蛋白质性质,这些结果共同确定其为乳酸菌细菌素。最后,通过16S rRNA序列分析鉴定后确定B02为副干酪乳杆菌; B03为植物乳杆菌; B04为动物双歧杆菌; B07为干酪乳杆菌; B11为德氏乳杆菌保加利亚亚种; B24为鼠李糖乳杆菌; B25为粪肠球菌; B78为植物乳杆菌。

【英文摘要】124 strains of lactic acid bacteria (LAB) isolated from centenarians ′ intestine were examined for production of bacteriocin by agar diffusion method. After eliminating the effects of organic acid and H2O2 , cell2free supernatants from strains(B02,B03,B04,B07,B11,B25,B24 and B78) exhibited inhibitory activity against Escherichia coli, Staphylococcus aureus, Bacillus coagulans, B. cereus and Clostridium buty ricum tested. The activity was enhanced after ammonium sulphate p recipitation, dialysis and concentration, and these substances were sensitive to p roteinase. The protein properties and antimicrobial activity indicated they belong to bacteriocins. With 16S rRNA sequence analysis, the above 8 bacteriocinp roducing strains were identified as Lactobacillus paracasei(B02) , L. plantarum (B03, B78) , B if idobacterium anim als(B04) , L. casei (B07) , L. delbrueckii subsp. bulgaricus (B11) , L. rham nosus (B24) and Enterococcus faecail (B25).

【题目】pH吸附法纯化戊糖乳杆菌素31-1的研究

【中文关键词】细菌素;吸附- 解吸;纯化;Tricine-SDS-PAGE

【英文关键词】bacteriocin;adsorption-desorption;purification;Tricine-SDS-PAGE

【中文摘要】戊糖乳杆菌素31-1,由分离自宣威火腿的戊糖乳杆菌31-1 产生,随pH 的改变可以选择性的吸附于产生菌细胞表面,pH5.0 时吸附率达75%,而在pH3.0 以下,7.0 以上吸附率为0。基于以上规律,通过调整pH 值,戊糖乳杆菌素31-1 在pH5.0 吸附、pH7.0 释放于产生菌细胞,达到了较好的分离纯化效果,戊糖乳杆菌素31-1 回收率为45%,纯化倍数为33。经Tricine-SDS-PAGE 进行分子量的估测及纯度鉴定,证实戊糖乳杆菌素31-1 的分子量在6400~14000D 之间。该纯化方法简便、高效,具有工业生产的潜力。

【英文摘要】Pentocin 31-1, produced by Lactobacilluspentosus 31-1 isolated from the traditional China fermented Xuan-Wei Ham, coud be adsorbed selectively on its producer at different pH conditions. At pH5.0, the adsorption rate was 75%, while below pH 3.0 or above pH7.0, Pentocin 31-1 wasn't adsorbed at all. On the basis of this property, by changing pH, Pentocin 31-1 was adsorbedatpH5.0andreleasedatpH7.0. The efficiency of isolation and purification was high. The specific activity of Pentocin 31-1was increased 33 fold with a yield of 45%. The active extract was further subjected to Tricine-SDS-PAGE. The result showed that two bands appeared, where most of the activity corresponded to the band with molecular weight between 6400~14000 D. It is simple and effective, could be used as commercial preparations for food industry.

【题目】全子叶生物活性豆腐凝胶特性的研究
【中文关键词】全子叶;豆腐;凝胶;MTG;乳酸茵;响应曲面;数学模型
【英文关键词】who1e cowedon;Tofu;Gel;MTG;LactobaciUus;Response Surface M~hoddogy (RSM);Mathematics mode
【中文摘要】通过因子筛选实验,确定了接种量、微生物转谷氨酰胺酶(MTG)用量和水豆比是影响全子叶生物活性豆腐凝胶特性的关键因子。在此基础上,采用响应曲面法(Response Surface Mehodology,RSM)分别建立了豆腐硬度和持水率的二次

多项数学模型,验证了模型的有效性并探讨了上述3个因子的交互作用。从产品成本和凝胶特性综合考虑,选择出最佳配比,即乳酸菌接种量为10 cfu/mL,MTG用量为347 u/L,水豆比为8.5,其硬度和持水率实测值分别为44.8g和89.2% ,可生产出富含乳酸菌和几乎全部大豆营养的健康豆腐。

【英文摘要】The results of factorial experiment showed that the significant external factors affecting the gel characteristic of LAB-contained tofu made in whole cotyledon were the amount of inoculation,microbial transglutaminase (MTG)concentration and the ratio of water to bean.Based on the results,Response Surface Methodology (RSM)was employed and a quadratic polynomial equation for the hardness and water holding capacity of tofu Was built in the present work.The applicability of the model equation for predicting the optimum response values Was verified efectively by the validation data an d the interaction of the 3 factors was also discussed .Consid-eringthe costof the productan dthetofu gd properties,the best solution was found,namely theam ountof inoculationWas 10 ofu/mL,MTG concentration was 347U/L,the ratio of water to bean Was 8.5,and the corresponding hardness and water holding capacity of tofu was 44.8g and 89.2% respectively.Hygienical tofu,which was rich in LA B and almost the whole nutrition of beans,could be produced.

【题目】响应曲面法优化鼠李糖乳杆菌Ls- 8菌株产抑真菌活性物质的条件

【中文关键词】乳酸菌;拮抗活性;响应曲面法;优化

【英文关键词】LAB;antagonic activity;response surface methodology;optimization

【中文摘要】在使用Plackett-Burman设计试验的基础上,筛选出发酵时间、乳清粉、蔗糖和乙酸钠为鼠李糖乳杆菌Ls-8菌株发酵产抑真菌活性物质的4个关键影响因子。采用响应曲面法对这4个关键因子进行了优化,根据二次多项式回归方程求解得出,在发酵时间为82h、乳清粉添加量为29 L、蔗糖添加量为25.5g/L、乙酸钠添加量为10.7g/L时、Ls-8发酵液的抑菌活性可达0.66AU/mL。

【英文摘要】Based on the results of the previous Plackett-Burman design,four key factors was chosen,namely fermentation time,whey powder,saccharose and sodium acetate.Response surface methodology was used to optimize the optimal levels of the four impo~ant factors.Response surface model computed by guadraic re-gression methodology show the optimal condition for obtaining 0,66AU antifungal activity per milliliter were: fermentation time 82h,whey powder 29g/L,saccharose 25.5g/L,sodium acetate 10.7g/L.

【题目】液芯包囊制备条件的研究

【中文关键词】液芯包囊;挤压法;制备条件

【英文关键词】liquid-core microcapsules:extrusion technique;preparation conditions

【中文摘要】采用挤压法,结合正交试验设计,优化了液芯包囊的制备条件。其中重点考察了一些制囊参数如海藻酸钠浓度、氯化钙浓度以及氯化钙浸泡时间、壳聚糖浓度、包覆时间等对液芯包囊的直径、膜厚和机械强度的影响,从而得到了制备液芯包囊的基本操作条件。

【英文摘要】In this paper. based on the extrusion technique and combined with orthogonal test method,the conditions for preparing the liquid-core microcapsules were optimized. And this paper mainly focused GR the efects of operation conditions (concentrations of sodium alginate or CaCl2, CaCl2 incubating time, chitosan concentration and coating time) on the diameter, membrane thickness and

compression intensity of the microcapsules.The Optimal operation conditions for microcapsules preparation were determined.

【题目】开菲尔粒和西藏灵菇中细菌和酵母群落结构的比较
【中文关键词】开菲尔;西藏灵菇;细菌;酵母菌;群落结构;PCR—DGGE
【英文关键词】kefir;Tibetan kefir;bacterium;yeast;community structure;PCR—DGGE
【中文摘要】用PCR—DGGE指纹图谱比较了开菲尔粒和西藏灵菇中微生物的群落结构。图谱相似性分析,来自不同家庭西藏灵菇中细菌群落的相似性为78%-84% ,酵母群落的相似性为80%-2% ;不同地区开菲尔粒中细菌群落的相似性为50%-70% ,酵母群落的相似性为50%-75% 。序列比对显示,开菲尔粒和西藏灵菇中细菌的16S rDNA的V3区序列与乳酸菌16S rDNA序列十分接近,其中最亮条带的序列与乳酸乳球菌的相似性为100%,其它共性条带所对应的为开菲尔囊乳杆菌、肠膜明串珠菌、嗜酸乳杆菌、干酪乳杆菌。酵母的26S rDNA的D1区序列分析表明,开菲尔粒和西藏灵菇中存在单孢酵母和假丝酵母。
【英文摘要】Microbial community structures of Tibetan kefir and Kefir were compared by using PCR—DGGE.Through clustering analysis of microbe DGGE,bacteria community showed a 78%-84% similarity among different Tibetan kefir,and 50%-70% among kefir from different regions.DGGE profiles of yeast indicated 80%-92% similarity of yeast conmunity among 3 Tibetan kefirs,and a 50%-75% similarity among kefir from different regions.The comparison analysis showed that Tibetan kefir is likely to be one of the Kefir series.The results of sequence alignment exhibited that V3 region in 16SrDNA was highly similar between bacteria from Tibetan kefir and lactic acid bacteria,and the sequence data of the strongest band showed a 100% homology to Lactococcus lactis,others to Lactobacillus kefiranofaciens,Leuconostoc mesenteroides,Lactobacillus acidophilus,LactobaciUus casei.The sequence analysis of yeast showed that there existed Saccharomyces unisporus and Candida humi in Tibetan kefir.

【题目】Chemical composition and rheological properties of set yoghurt prepared from skimmed milk treated with horseradish peroxidase
【中文关键词】无
【英文关键词】skimmed milk, set yoghurt, horseradish peroxidase, ferulic acid, rheological properties
【中文摘要】无
【英文摘要】The aim of this work is to determine the impact of an enzymatic treatment on the fermentation and rheological properties of set yoghurt prepared from skimmed milk. Skimmed bovine milk was treated with horseradish peroxidase added at the level of 645 U/g proteins in the presence or absence of cross-linker ferulic acid (addition level of 7.8 mmol/L milk) as a cross-linking agent, and used to prepare set yoghurt with commercial direct vat set starter culture. The evaluation showed that the treatment of skimmed milk with horseradish peroxidase enhanced its apparent viscosity and storage and loss modulus. The prepared yoghurt contained protein, fat and total solids at 3.49-3.59, 0.46-0.52 and 15.23-15.43 %, respectively, had titratable acidity of 0.83-0.88 %, and no significant difference in the composition was found among the yoghurt samples ($p>0.05$). Compared to the control yoghurt, the yoghurt prepared from the milk treated with horseradish peroxidase had a higher apparent viscosity, storage and loss modulus and flow behavior indices, especially when ferulic acid was added. Yoghurt samples from the skimmed milk treated either with horseradish peroxidase only or with the additional ferulic acid treatment had better structural reversibility, because their hysteresis loop area during rheological analysis was larger ($p<0.05$).

【题目】两种缢蛏线粒体基因全序列扩增方法的比较
【中文关键词】长PCR; 缢蛏; 线粒体全序列
【英文关键词】LA-PCR Sinonovacula constricta Complete mitochondrial genome
【中文摘要】介绍了应用长PCR技术扩增缢蛏线粒体全序列的两种方法,并进行了比较。一种方法是使用通用引物扩增COI基因和16S基因并测序后,在两基因的两端分别设计两对引物扩增两基因中间的大片段,分别得到了9.7 kb和7.3 kb的扩增产物。另一种方法是在COI基因序列两端设计一对引物,扩增整个线粒体全序列,得到了17.1 kb的扩增产物。两种方法在缢蛏的研究中进行比较后发现,前一种方法在操作实用性和后期测序方面都比后者好。
【英文摘要】The Razor Clam(Sinonovacula constricta) is one of the most widely cultured and valuable shellfishes.Two methods were introduced and compared to amplify the complete mitochondrial genomes of the Razor Clam using LA-PCR.One method was to amplify and sequence the genes of 16S and COI with universal primers.The two products of amplification were obtained,the length of which were 9.7 kb and 7.3 kb respectively.The other method was to design one pair of primers which amplified the whole mitochondrial genomes.The length of the amplification product was 17.1 kb.The first method was better in the practical operation and the sequence work than the other one.

【题目】Dynamical partition of photosynthates in tillers of rice (Oryza sativa L.) during late growth period and its correlation with feeding value of rice straw at harvest

【中文关键词】非结构碳水化合物;波动;半纤维素;粗蛋白;稻草;相关性

【英文关键词】Nonstructural carbohydrates;Rebounding rate;Hemicellulose;Acid detergent fiber;Crude protein; Freehand section;Rice straw;Correlation

【中文摘要】本研究旨在探讨摘除穗的水稻在生长后期的光合产物的动态分布及其与稻草饲用价值的相关性本实验有四个水稻品种(两优108,淮稻6,南京43,南京44),分别在江苏南京地区同一管理条件下种植,从开花后的第1周至第5周取样,并分别在2008年,2009年和2010年收割。然后,测定每株的非结构碳水化合物(NSC),半纤维素,和酸性洗涤纤维(排除残留的灰分,ADFom)。粗蛋白(CP)含量在2009年和2010年测定。在2010年开花期的1、3、5周通过徒手画的第四茎节的薄壁细胞来测定的淀粉颗粒。结果表明,非结构碳水化合物的含量从第1周到第3周急剧下降,然后开始增加;半纤维素的含量第5周和第1周近似;酸性洗涤纤维从第1周到第3周稍微增加,到第5周保持不变;茎的薄壁细胞的淀粉颗粒从第1周到第3周减少,一直到第5周又稍微增加。非结构碳水化合物的波动和非结构碳水化合物的含量和粗蛋白的含量呈正相关,而和半纤维素和酸性洗涤纤维含量负相关。

【英文摘要】This study was to investigate the dynamical partition of photosynthates in panicle-removed tillers of rice (Oryza sativa L.) during late growth period and its correlation with the feeding value of rice straw at harvest. Four rice cultivars (Liangyou 108,Huaidao6,Nanjing 43, Nanjing 44) were cultivated in Nanjing under the same management of Jiangsu area,and were sampled from weeks 1 to 5 after anthesis and at harvest in 2008, 2009 and 2010. Then, the content of nonstructural carbohydrates NSC),hemicellulose,and acid detergent fiber(exclusive of residual ash, ADFom) in tillers were determined. The crude protein(CP)content in tillers at harvest was assayed in 2009and2010. Freehand sections of the fourth internodeof main culm were made to visualize the starch particles in parenchyma cells in week 1,3 and 5 after anthesis in 2010. The results showed that the content of NSC decreased sharply from week 1to3and then increased to week 5 after anthesis; hemicellulose in week 5 remained at an approximate level with that of week 1; ADFom increased slightly from week 1 to 3,and then stayed constant till week 5 after anthesis. The starch particles in parenchyma cells of stems decreased from week 1 to 3and increased slightly till week 5 after anthesis again. The rebounding rate of NSC (NSCRR) was positively correlated with the content of NSC and CP at harvest while negatively correlated with the content of hemicellulose and ADFomat harvest.

【题目】不同微藻对缢蛏稚贝摄食和生长的影响

【中文关键词】缢蛏稚贝; 微藻; 清滤率; 存活率; 壳长增长率; 日生长率

【英文关键词】juvenile Sinonovacula constricta; microalgae; clearance rate; survival rate; daily growth rate; shell growth rate

【中文摘要】用实验生态学方法研究了小球藻(Chlorella sp.)、绿色巴夫藻(Pavlova viridis)、小新月菱形藻(Nitzschia closterium f.minutissima)、亚心形扁藻(Platymonas subcordiformis)、微绿球藻(Nannochloropsis oculata)和湛江等鞭金藻(Isochrysis zhanjiangensis)对缢蛏稚贝摄食和生长的影响。结果表明:缢蛏稚贝对6种微藻的清滤率随浓度的增加而增大,当达到一定浓度时清滤率反而下降;在相同浓度下,稚贝对中规格的绿色巴夫藻、小新月菱形藻和湛江等鞭金藻的清滤率显著高于小规格的小球藻、微绿球藻和大规格的亚心形扁藻(P<0.05)。不同微藻对缢蛏稚贝的存活率顺序为微绿球藻<小球藻+亚心形扁藻+微绿球藻<小球藻<湛江等鞭金藻<亚心形扁藻<小新月菱形藻<绿色巴夫藻+小新月菱形藻+湛江等边金藻<绿色巴夫藻。初始壳长无显著性差异的稚贝经30 d的生长试验,8个饵料组稚贝的壳长出现明显差异(P<0.05);亚心形扁藻组的日生长率均明显高于其他组(P<0.05),壳长增长率和绿色巴夫藻组无显著性差异(P<0.05)。从本试验可知,小球藻、绿色巴夫藻、小新月菱形藻、亚心形扁藻、微绿球藻和湛江等鞭金藻的适宜投喂浓度为30×104、15×104、10×104、6×104、40×104和10×104cell/mL,绿色巴夫藻和亚心形扁藻对缢蛏稚贝的生长效果要好于其他微藻。

【英文摘要】Using the method of experimental ecology,the effects of Chlorella sp.,Pavlova viridis,Nitzschia closterium f.minutissima,Platymonas subcordiformis,Nannochloropsis oculata and Isochrysi zhanjiangensis on ingestion and growth rate of

juvenile Sinonovacula constricta were studied.The results showed that: the clearance rate of juvenile S.constricta increased with the concentration of the six species of microalgae.But when it reached a certain concentration,the filtration rate decreased.At the same concentration,the filtration rate of P.viridis,N.closterium f.minutissima and I.zhanjiangensis which had the medium size was much higher than P.subcordiformis which had the big size,Chlorella sp.and N.oculata which had the small size.The order of the microalgae for their feeding effects on the juvenile S.constricta with the increasing survival rate was N.oculata< Chlorella sp.+P.subcordiformis+N.oculata<Chlorella sp.<I.zhanjiangensis<P.subcordiformis<N.closterium f.minutissima<P.viridis+N.closterium f.minutissima+I.zhanjiangensis<P.viridis.The initial shell length of juvenile S.constricta had no significant difference(P>0.05),but through growth experiment of 30 d,the difference of final shell length for the eight groups was significant(P<0.05).Fed with P.subcordiformis,the daily growth rate of juvenile S.constricta was much higher than other groups(P<0.05),but the shell growth rate had no significant difference with the groups which was fed with P.viridis(P>0.05).From this experiment,we can see that the best feeding concentration of Chlorella sp.,P.viridis,N.closterium f. minutissima,P.subcordiformis,N.oculata and I.zhanjiangensis were 30×104cell/mL,15×104cell/mL,10×104cell/mL,6×104cell/mL,40×104cell/mL and 10×104cell/mL.By feeding with P.viridis and P.subcordiformis,the growth effect was better than other microalgae.

【题目】不同群体缢蛏营养成分的多元性分析
【中文关键词】缢蛏; 脂肪酸; 氨基酸; 多元分析
【英文关键词】Sinonovaculla constricta; fatty acids; amino acids; multivariation analysis
【中文摘要】本实验研究不同地区缢蛏的总蛋白、脂肪、氨基酸、脂肪酸、灰分、呈味核苷酸、甜菜碱、游离总糖、肌球蛋白等与品质密切相关的各类指标。其中,脂肪酸、游离总糖、外套膜中呈味核苷酸及肌球蛋白含量均呈现出春季含量明显高于秋季的规律(p<0.05),氨基酸总量、必需氨基酸、呈味氨基酸、总蛋白、脂肪、灰分含量则呈现出相反的规律(p<0.05),甜菜碱含量无显著差异。春季的长街种群优势主要体现在甜菜碱、氨基酸总量、必需氨基酸、呈味氨基酸、呈味核苷酸的含量;秋季的长街种群缢蛏优势主要体现在游离总糖、脂肪、肌球蛋白明显高于当季的其他种群(p<0.05)。由于养殖方式的不同造成了缢蛏营养的多样性,从总体上可以看出,不管是春季还是秋季养殖缢蛏,滩涂养殖方式的缢蛏品质上明显优于围塘养殖缢蛏,聚类分析结果也可以看出,各样品最终可以聚为两类,即滩涂养殖和围塘养殖。
【英文摘要】This study aimed to analyze several indexes of Sinonovaculla constricta Lamarck in different populations concerning to nutrition and flavour,including total protein,fat,amino acid,fatty acid,ash,flavour nucleotide,lycine,sugar and myosin and so on.Compared with Sinonovaculla constricta cultivated in autumn,the S.constricta cultivated in spring has more fatty acid,sugar,flavour nucleotide in mantle and myosin.However,total amino acid,essential amino acid,flavour amino acid,total protein,fat and ash come to the inverse disciplinarian.But lycine has no significant differences among these samples.Changjie population cultivated in spring has significant advantage in lycine,total amino acid,essential amino acid,flavour amino acid and flavour nucleotide in foot.The population cultivated in autumn has significant advantage in sugar,fat and myosin.The quality of S.constricta varies due to different cultivations.Regardless of different cultivating seasons,tidal-flat aquaculture is significantly better than pond aquaculture.It was concluded that all the samples can be clustered into the above-mentioned two aquacultures according to clustering analysis. 更多

【题目】基于cDNA微阵列数据对乳酸菌生长及应激代谢转录组特征的研究
【中文关键词】乳酸菌;cDNA 微阵列;应激代谢;转录组特征
【英文关键词】lactic acid bacteria;cDNA microarray;stress response;transcriptome property
【中文摘要】应用本实验室编写的perl 程序包将GEO 数据库中乳酸菌生长、应激代谢相关实验数据和相应的基因组数据整合,构建易于本地查询和访问的MySQL 数据库,利用该数据库研究乳酸菌在生长、衰亡及应对不利环境(如胆盐、过氧化氢、碳氮源饥饿)时的转录组特征,并利用MEME 软件寻找到了各种情况下部分协同表达基因前导序列的共有motif,即潜在的调控蛋白作用位点。结果表明:除了胆汁和草酸铵对嗜酸乳杆菌细胞代谢特征的影响具有较高的一致性外,面对其他压力环境乳酸菌细胞的应激模式具有较大的差异,有着各自受到特异性诱导表达或抑制的基因群,但在各种情况下翻译(J)、脂类运输和代谢(I)、细胞内运输和分泌(U)相关因的转录水平变化都比较显著,特别是蛋白质翻译相关基因变化最为明显,说明细胞主要通过调控蛋白质翻译相关基因的种类和表达量来对细胞的状态进行调整。
【英文摘要】A local MySQL database of lactic acid bacteria (LAB) was built through integrating genome data and chip data from gene expression profile used perl program written by our laboratory. The local database was used to investigate transcriptome properties of LAB in different growth phases or stress environments such as the presence of bile salts, hydrogen peroxide and starvation. Meanwhile, MEME software was also used for searching the common motif located in upstream of transcription starting point in co-expression genes under certain stress environments. Results indicated that no obvious difference was observed in transcriptome properties of LAB under the stress from bile and ammonium oxalate. However, a significant difference was observed in transcriptome properties of LAB under the stress from other factors. These responses to stress exhibited specific induced or inhibition gene expression. In addition, gene expression associated with translation (J), lipid transport and metabolism (I), intracellular transport and secretion (U) revealed a high level, especially for translation-related genes, which indicating that modulation of cell metabolism was mainly achieved through regulating the expression of translation-related genes.

【题目】一种检测革兰氏阴性菌群体感应抑制剂的简便方法
【中文关键词】群体感应;群体感应抑制剂;N- 酰基- 高丝氨酸内酯;检测
【英文关键词】quorum sensing;quorum sensing inhibitor;n-acyl-homoserine lactones;detection
【中文摘要】许多革兰氏阴性菌通过产生N- 酰基- 高丝氨酸内酯类(AHLs)化合物介导的群体感应(QS)现象来调控特定生理性状的表达。而AHL 类似物作为群体感应抑制剂(QSI)可使由QS 所调控的生理特性不表达或表达水平下降。本研究的目的是建立检测AHL 类似物方法。基于QS 抑制原理,建立了平板法及TLC 方法从微生物中筛选AHL 类似物。该方法简便有效,费用低廉,为筛选群体感应抑制剂提供了一种新方法。
【英文摘要】Many Gram-negative bacteria regulate the expression of some physiological traits in quorum sensing (QS) mediated by N-acyl-homoserine lactones (AHLs). Quorum sensing inhibitor (QSI)of AHL antagonists can block or attenuate the expression of characteristic associated with QS. Based on the above inhibitory principle, this study developed an agar plate and TLC assay to detect the antagonists for N-acyl-homoserine in microorganism. This new method is simple, inexpensive and easy to application.

【题目】Effects of gibberellic acid application after anthesis on the feeding value of double-purpose rice (Oryza sativa L.) straw at harvest

【中文关键词】非结构碳水化合物;粗蛋白;发酵品质;稻草;穗重;赤霉素

【英文关键词】Nonstructural carbohydrat;Crude protein;Fermentation quality;Rice straw;Panicle weight;Gibberellic acid

【中文摘要】本研究旨在探讨开花后喷洒赤霉素对两用水稻(人类食物和动物粗饲料)饲用价值的影响。本实验在江苏南京地区同一管理条件分别于2009年种植淮稻6,南京43,南京46三个水稻品种和2010年种植淮稻6,南京43,杨福静8三个水稻品种。并在2009年水稻开花后的第15天和2010年水稻开花后的第1天、第7天、第15天分别喷洒45g hm-2 的赤霉素。收获后,测定两年水稻的秸秆的饲用特征、单株穗重、1000粒稻米重。2010年测定青贮稻草的发酵品质。开花后喷洒赤霉素,稻草中的非结构碳水化合物和粗蛋白的含量明显增加,特别是在开花后的第15天喷洒赤霉素,其含量更高。 随着非结构碳水化合物和粗蛋白含量的增加,青贮稻草的发酵品质也得到了改善。单株穗重也在开花后喷洒赤霉素后明显增加。结果表明开花后喷洒赤霉素能够显著的改善稻草的饲用价值和水稻的穗重。

【英文摘要】This study was to investigate the effects of gibberellic acid (GA) application after anthesis on the feeding value of double-purpose (grains as human food and straw as animal roughage) rice (Oryza sativa L.) straw at harvest. Three japonica rice cultivars Huaidao 6, Nanjing 43 and Nanjing 46 in 2009 and Huaidao 6,Nanjing 43 and Yangfujing 8 in 2010 were cultivated in Nanjing under the same management of Jiangsu area. They were sprayed GA with 45ghm − 2 on the 15thd after anthesis in 2009 and on the 1st, 7th and 15thd after anthesis in 2010. At harvest, the feeding value related traits of rice straw,single panicle weight (PW) and 1000-grain weight were determined in 2 years. The fermentation quality related trait of fresh rice straw silage were determined in 2010. Nonstructural carbohydrates (NSC) and crude protein(CP)contents in rice straw were significantly increased by spraying GA,especially on the 15thd after anthesis,and the fermentation quality of rice straw silage was improved with the increase of NSC and CPcontents.PW was also significantly increased by spraying GA after anthesis. The results indicated that spraying GA after anthesis could significantly improve the feeding value of straw and the panicle weightfor double-purpose rice.

【题目】侗族酸肉中硝酸盐还原菌的分离筛选及其特性研究

【中文关键词】侗族酸肉;肉葡萄球菌;硝酸还原酶;肉品发酵剂

【英文关键词】Nanx wudl;Staphylococcus carnosus;nitrate reductase;meat starter

【中文摘要】从传统侗族酸肉中分离到216 个菌株,通过快速半定量平板法结合液体培养基产酶实验筛选出具有硝酸盐还原能力的菌株9 株,其中1708 和1709 两个菌株活性最高。该菌株硝酸盐还原能力强、耐盐、不溶血、不产生异味,有开发为肉品发酵剂的潜力。进而对筛选的两个高活性菌株进行生理生化与分子生物学鉴定,结果表明两株菌均为肉葡萄球菌(Staphylococcus carnosus)。

【英文摘要】Total 216 bacterial strains were isolated from the traditional fermented meat products “ Nanx wudl ”, and 9 nitrate reducing strains were screened by the liquid media method combined with fast semi-quantitative plate method according to the conversion ability of nitrate to nitrite. Among them, the strains No. 1708 and No. 1709 had the highest reducing activity.Furthermore, these two strains were salt-tolerant and non-hemolytic and did not cause the generation of peculiar smell.Therefore they might be developed as a potential meat starter. According to the physiological-biochemical and molecular biological identification, both of them were Staphylococcus carnosus.

【题目】Quantitative trait loci analysis for the developmental behavior of Soybean(Glycine max L. Merr.)
【中文关键词】大豆,株高,发育动态QTL
【英文关键词】soybean, Plant height, developmental QTL
【中文摘要】数量性状位点(QTL)可以确定了大豆发育最终时期的遗传效应,但这并不表示在一个特定的发展阶段的遗传效应段。因此,本研究的目的是确定条件QTL与产量相关性状在特定发育时期的遗传效应。143个重组自交系父母本大豆品种‘ Charlesdon ’和‘ 东农594 ”被用于发展的QTL分析群体,主要通过区间作图法结合的混合遗传模型来分析荚数和株高。结果表明:数量和QTL类型的定位及其遗传效应在不同的测定阶段并不相同,共有10个条件QTL连锁群6和5个条件QTL在3个连锁群被确定与荚数相关,而13个条件QTL7个连锁群和12个条件QTL在6个连锁群被确定为与株高相关。许多数量性状位点被发现的早期阶段,而不在稍后阶段。一些数量性状位点只存在在一个时期和其他存在于两年或三时期。5标记区间(satt509-satt251,sat_099-sat_113,sat_113-opaw19_4,satt457-opc10_85,sat_095-opba08_5)被证明在2个发育时期与主茎荚数和株高相关。本研究表明,大豆豆荚和植株高度发育受基因的时空表达影响。
【英文摘要】Quantitative trait loci (QTLs) identified so far in soybean were mainly derived in the final stage of plant development, which did not apply to the exploitation of genetic effects that were expressed during a specific developmental stage. Thus, the aim of this study was to identify conditional QTLs associated with yield traits at a specific developmental interval of soybean plant. The 143 recombinant inbred lines developed from the cross of soybean cultivars ‘ Charleston ’ and ‘ Dongnong 594 ’ were used for the developmental QTLs analysis of pod number in the main stem and plant height by compositeinterval mapping method combined with mixed genetic model. The results indicated that the number and type of QTLs and their genetic effects for the two agronomic traits were different in a series of measuring stages. A total of 10 unconditional QTLs in 6 linkage groups and 5 conditional QTLs in 3 linkage groups were identified for the pod number of the main stem, while 13 unconditional QTLs in 7 linkage groups and 12 conditional QTLs in 6 linkage groups were identified for plant height. Many QTLs that were detected in the early stages were different from those detected at the later stages. Some QTLs existed only at one stage and others existed across two or three stages. Five marker intervals (satt509-satt251, sat_099-sat_113, sat_113-OPAW19_4, satt457-OPC10_85, sat_095-OPBA08_5) were proven to be associated both with the development of pod number in the main stem and the development of plant height. The present study suggested that the development of pods and plant height in soybean were governed by time-dependent gene expression.

【题目】发酵过程对橙皮渣中农药残留的影响
【中文关键词】发酵,甜橙,皮渣饲料,农药残留
【英文关键词】fermentation,sweet orange,peel feed,pesticide residues
【中文摘要】热带假丝酵母(Candida tropicalis)1254和宇佐美曲霉(Aspergillususamii)对甜橙皮渣进行发酵处理,研究发酵过程对皮渣中16种农药残留含量的影响。结果显示:酵母和曲霉发酵处理对甜橙皮渣中百菌清和敌敌畏残留的降解最显著,降解率达到了72.87%~100%;除氧化乐果外,其他有机磷农药残留的降解率为27.95%~62.28%,显著高于对照,也高于相应处理中的三氯杀螨醇、腐霉利和菊酯类农药残留的降解率。此外,酵母发酵处理对皮渣中农药残留降解的总体效果要好于曲霉处理。
【英文摘要】The effects of Candida tropicalis and Aspergillus usamii fermentation on pesticide residues in sweet orange peel were investigated in this paper.Among the 1 6 pesticide residues,the reduction rates of chlorothalonil and dichlorvos residues in these peels were the highest by two fermentation courses,and their values ranged from 72.87%to 100%;on the other hand,the reduction rates(27.95%~62.28%)of organophosphorus pesticide residues without omethoate in the two fermenting courses were generally higher than those of pyrethroid,dicofol and procymidone pesticides,as well as significantly higher than CK;furthermore,the effects of Candida tropicalis on reducing pesticide residues in the fermented peels were generally superior to the Aspergillus usamii treatment.

【题目】单孔PVC微喷灌管喷水量的分布特性
【中文关键词】PVC;喷水特性;微喷灌
【英文关键词】PVC(polyvinyl chloride);spray characteristic;micro-spraying irrigation
【中文摘要】在5种不同的工作压力下,采用直径为40mm,壁厚为2.4mm,孔径分别为0.9、1.1、1.3、1.5mm的PVC微喷灌管,进行单孔流量及近似射程试验,根据试验结果选择近似射程最远的孔径为1.3mm的微喷灌管进行研究试验。结果表明:PVC微喷灌管单孔喷水量分布的基本特征与旋转式喷灌有本质区别,但与微喷带相似。为此,采用微喷带的评价指标来描述PVC微喷灌管的喷水量分布特性。
【英文摘要】The single hole flow and spraying range of the PVC pipes with 40 mm diameters and 2.4 mm wall thickness and different hole diameters such as 0.9, 1.1, 1.3, 1.5 mm under different work pressures,were studied,and the hole diameter of 1.3 mm with the furthest approximate spraying range was choosed as experiment object. The result showed the basic characteristics of spraying water distribution of PVC micro-spray pipe with single hole Was different from rotary spray,and was similar to the thin-soft spray tape,and the distribution characteristics of spraying water of PVC micro.spray pipe was described by using evaluation index of thin-soft spray tape.

【题目】Quantitative trait loci underlying the development of seed composition in soybean
【中文关键词】条件QTL,大豆品质性状,SSR标记,RAPD标记,基因与环境互作
【英文关键词】conditional QTL, soybean seed-quality traits, SSR, RAPD, G E interaction
【中文摘要】143个F2:7重组自交系(重组自交系)从父母本'charleston ’和‘ 东农594在6个不同发育阶段地进行与蛋白质和油含量相关QTL的分析。基因型与环境相互作用的QTL也在评价。19(2004)和33(2005)非条件QTL在8和9个连锁群与种子蛋白或油含量相关。这些QTL能够解释6.26%-30.52%和5.38%- 28.47%的表现型变异。14(2004)和21(2005)条件QTL在5和8个连锁群与种子蛋白或油含量相关。这些QTL能够解释2.97%-29.68%和5.42%-31.96%的表现型变异。QTL数量和类型及遗传效应在不同的发育阶段与这2个性状相关。然而,一些QTL同时控制发展的2个性状进行检测。satt335 – ssatt334同时影响蛋白质含量和脂肪含量,其反映了蛋白质含量和脂肪含量的负相关。
【英文摘要】One hundred and forty-three F2:7 recombinant inbred lines (RILs) developed from the cross of soybean cultivars ‘ Charleston ’ and ‘ Dongnong 594 ’ were analyzed for the quantitative trait loci (QTLs) underlying protein or oil content at 6 different developmental stages by composite interval mapping with a mixed genetic model. The genotype _ environment (G _ E) interactions of the QTLs were also evaluated. Nineteen (2004) and 33 (2005) unconditional QTLs underlying seed protein or oil content at the different developmental stages were mapped onto 8 and 9 linkage groups, respectively. The proportion of phenotypic variation explained by these QTLs ranged from 6.26% to 30.52% and from 5.38% to 28.47%, respectively. Fourteen (2004) and 21 (2005) conditional QTLs underlying seed protein or oil content were mapped onto 5 and 8 linkage groups, respectively. The proportion of phenotypic variation explained by these QTLs ranged from 2.97% to 29.68% and from 5.42% to 31.96%, respectively. The numbers and types of QTLs and the genetic effect for the two traits were different at each developmental stage. However, several genomic regions that simultaneously control the development of both traits were detected. The genetic effect on protein content and oil content was opposite for loci in the marker interval Satt335 – SSatt334, reflecting a negative correlation of protein content and oil content. A G _ E interaction effect of some QTLs underlying protein or oil content at different growth periods was observed.

【题目】留蔓数和留果数对厚皮甜瓜植株根系活力及抗氧化
【中文关键词】留蔓数; 留果数; 甜瓜; 根系活力; 抗氧化特性
【英文关键词】vine num ber ; fruit num ber ; muskmelon ; root vigor ; antioxidant characteristic
【中文摘要】探讨留蔓和留果数对厚皮甜瓜根系衰老的影响, 确定能延缓根系衰老的适宜留蔓数和留果数。本研究以厚皮甜瓜品种中甜 1号和众天翠玉为试材, 设计了留 1蔓 2果 (V1F2)、 留 2蔓 2果 (V2F2)、 留 3蔓 2果(V3F2)、 留 1蔓 3果 (V1F3)、 留 2蔓 3果 (V2F3)和留 3蔓 3果 (V3F3)共 6个处理, 以不留侧蔓、 留 1果为对照(CK), 分析不同留蔓数和留果数对厚皮甜瓜植株根系活力及抗氧化特性的影响。结果显示: 适宜的留蔓数和留果数能显著减缓厚皮甜瓜植株根系活力和可溶性蛋白质含量的下降;降低根系超氧阴离子自由基 (O2 -)产生速率和丙二醛 (MDA)含量;提高超氧化物歧化酶 (SOD)、过氧化氢酶 (CAT)活性和抗坏血酸 (AsA)含量; 降低过氧化物酶(POD)活性。表明留蔓数和留果数与厚皮甜瓜植株的根系活力及抗氧化特性密切相关, 每株留 2条果同时保留 2条或 3条侧蔓能提高厚皮甜瓜植株根系的抗衰老能力。中甜 1号每株留 2蔓 2果、 众天翠玉每株留 3蔓 2果,植株根系生长状况最好。
【英文摘要】To investigate the desirable numbers of vine and fruit beneficialtode lay root senescence , two muskmelon varieties , Zhong tian No . 1 and Zhongtiancui yu, were used as the materials to study the root vigor and antioxidant characteristics of muskmelon. The two muskmelon varieties were applied with six treatments , . i e . , 1 vine and 2 fruits , 2 vines and 2 fruits , 3 vines and 2 fruits , 1 vine and 3fruits , 2 vi nes and 3 fruits , and 3 v i nes and 3 fru its , and 1 fruitw i thout any v i new as set as CK. The results revealed that proper numbers of v i ne and fruit could significantly slow down decline of root vigor and the soluble prote incontent reduce the production rate of O2-and the content of malondial dehyde (MDA), improve the activities of superoxide dismutase (SOD), catalase (CAT) and the content of ascorbicacid (AsA) , decrease the activity of peroxidase(POD). The results indicated that the numbers of vineand fruit had a closed relati on with root vigor and anti oxidant characteristics of muskmelon plants . Two or three vines w ith two fruits remained could enhance senescence resistant ability of muskmelon roots . Two vines with 2 fruits remained for Zhong tian No . 1 and 3 vines and 2 fruits for Zhongtiancui yu could achieve the best growth of muskmelon root.

【题目】Comparison of Muscle Fiber Growth from F1 Generations of Large Yorkshire Pig and Erhualian Pig by Reciprocal Cross
【中文关键词】大约克猪; 二花脸猪,正反交,肌纤维
【英文关键词】Large Yorkshire pig; Erhualian pig; Reciprocal combination; Muscle fiber growth
【中文摘要】[目的]为了比较大白猪和二花脸猪正反交的F1代之间的肌肉纤维的生长,为养殖的合理利用,杂交组合肉质性状和生长性能提供了理论依据。 [方法]在相同的条件下,大白猪和二花脸猪的杂交猪的饲养和管理。正反交为二花脸猪♀×约克夏猪♂和大约克夏猪♀×二花脸猪♂,。在20,70,120和180天的年龄,背最长肌和大腿肌肉,收集,制成冷冻切片的苏木精和曙红(HE)染色,然后测定肌纤维区域。 [结果]随着年龄的增加,肌纤维逐渐增厚,以及“ S ”形曲线的肌纤维面积的绝对增长。的直径,周长和面积的背最长肌和大腿肌肉纤维的相互结合约克夏猪♀×二花脸猪♂均高于那些在相互结合的二花脸猪♀×约克夏猪♂(P <0.01)。大腿肌肉增长的速度比背最长肌的年龄为20-120 ð,但在年龄为120-180 D,背最长肌的增长速度高于大腿肌肉;在180天的年龄之间的背最长肌和大腿肌肉,肌纤维面积没有显着性差异。肌纤维区域之间的相互组合,在20天的年龄有非常显著的差异,但无显着差异,在180天的年龄。 [结论]相互组合的杂交猪,约克夏猪和二花脸猪,可以影响肌肉纤维的生长年龄的增加,但影响程度降低。
【英文摘要】Abstract [Objective]To compare the muscle fiber growth between F1 generations of large Yorkshire pig and Erhualian pig by reciprocal cross, and provide a theoretical basis for the integrated breeding of meat quality traits and growth performances by rational utilization of hybrid combination. [Method]The hybrid pigs of large Yorkshire pig and Erhualian pig were fed and managed in the same conditions. The reciprocal combinations wereErhualian pig ♀ × Yorkshire pig ♂ and Yorkshire pig ♀ × Erhualian pig ♂,respectively. At the age of 20,70,120 and 180 d,the longissimus dorsi muscle and thigh muscle were collected and made into frozen sections for hematoxylin and eosin (HE) staining,and then the muscle fiber area was determined. [Result]The muscle fiber was thickened gradually with increasing age; and the absolute growth curve of muscle fiber area was presented as “ S ” shape. The diameter,perimeter and area of longissimus dorsi muscle and thigh muscle fibers in the reciprocal combination of Yorkshire pig ♀ × Erhualian pig ♂ were higher than those in the reciprocal combination of Erhualian pig ♀ × Yorkshire pig ♂(P < 0.01) . The thigh muscle grew faster than longissimus dorsi muscle at the age of 20 -120 d; but at the age of 120 -180 d,the growth rate of longissimus dorsi muscle was higher than that of thigh muscle; and at the age of 180 d,the muscle fiber area had no significant difference between the longissimus dorsi muscle and the thigh muscle. The muscle fiber area had extremely significant difference between the reciprocal combinations at the age of 20 d; but no significant difference was found at the age of 180 d. [Conclusion]The reciprocal combinations can affect the muscle fiber growth of hybrid pigs of Yorkshire pig and Erhualian pig,but the affect degree reduces with the increasing age.

【题目】Mapping QTL tolerance to Phytophthora root rot in soybean using microsatellite and RAPD/SCAR derived markers.
【中文关键词】数量遗传位点,SSR分子标记,SCAR分子标记,分子辅助育种,疫霉根腐病,大豆
【英文关键词】Quantitative trait loci, SSR marker,SCAR marker, Marker-assistant selection,Phytophthora root rot, Soybean
【中文摘要】广泛的耐大豆疫霉根腐病的生理小种(PRR)引起的大豆疫霉菌已成为一个重要的大豆育种目标。本研究的目的是确定在“Conrad”耐病QTL的位置,Conrad(能耐多个生理小种)和ox760-6-1(感病品种)。通过单粒传法112个F2:7家系被选出,共有39多态性PAPD和89个SSR标记被用来构建遗传连锁图谱。在温室中,重组自交系被接种四株大豆疫霉菌株。3个(qgp1,qgp2,qgp3)QTL被winqtlcart 2.1软件检测出来。qgp1(satt509附近)位于连锁群F和能够解释鸡西和双鸭山的13.2%,5.9%表现型变异,qgp2(satt334附近)位于不同的连锁群和解释5.1%和2.4%能够鸡西和双鸭山分离株的表型变异。qgp3位于连锁群入D1b + W(Wopl18800 /scl18659附件)和解释10.2%的表型变异woodslee的变异。qgp1和qgp2似乎能够抗不同的菌株,但qgp3抗性只针对woodslee的菌株。该研究检测得到的 QTL,对标记辅助选择耐病品种有很大的益处。
【英文摘要】Broad tolerance to phytophthora root rot (PRR) caused by Phytophthora sojae has become an important goal for the improvement of soybean (Glycine max) because of the rapid spread of races that defeat the available resistance genes. The aim of this research was to identify the location of quantitative trait loci (QTL) in ‘ Conrad ’, a soybean cultivar with broad tolerance to many races of P. sojae. A PRR susceptible breeding line ‘ OX760-6-1 ’ was crossed with Conrad. Through single-seed-descent,112, F2 derived, F7 recombinant inbred lines (RILs) were advanced. A total of 39 random ampliWed polymorphic DNA bands (RAPDs) and 89 type 1 microsatellite (simple sequence repeat; SSR) markers were used to construct a genetic linkage map. In the greenhouse, RILs were inoculated with four P. sojae isolates (three from China and one from Canada). Disease was measured as the percent of dead plants 20 days after germination in P. sojae inoculated vermiculite in the greenhouse. Three QTLs (QGP1, QGP2, QGP3) for PRR tolerance in the greenhouse were detected using WinQTLCart 2.0 with a log-likelihood (LOD) score 27.14 acquired through permutations (1,000 at P • 0.05). QGP1 (near Satt509) was located at linkage group F and explained 13.2%, 5.9%, and 6.7% of the phenotypic variance for tolerance to the JiXi, JianSanJiang and ShuangYaShan isolates, respectively. QGP2 (near Satt334) was located in a different interval on linkage group F and explained 5.1% and 2.4% of the phenotypic variance for JiXi and ShuangYaShan isolates, respectively. QGP3 was located on linkage group D1b + W (near OPL18800/SCL18659) and explained 10.2% of the phenotypic variance for Woodslee isolate. QGP1 and QGP2 appeared to be associated with PRR tolerance across a range of isolates but QGP3 was active only against the Woodslee isolate. At Woodslee and Weaver (in Ontario) in 2000, the interval associated with QGP3 explained

21.6% and 16.7% of phenotypic variance in resistance to PRR, respectively and was referred as QFP1. The identiWed QTLs would be beneWcial for marker assistant selection of PRR tolerance varieties against both China and North America P. sojae races

【题目】Analysis of the microflora in Tibetan kefir grains using denaturing gradient gel electrophoresis
【中文关键词】无
【英文关键词】16S rDNA 26S rDNA Denaturing gradient gel electrophoresis Tibetan kefir grains Microflora
【中文摘要】无
【英文摘要】The microflora of Tibetan kefir grains was investigated by culture-independent methods. Denaturing gradient gel electrophoresis (DGGE) of partially amplified 16S rRNA for bacteria and 26S rRNA for yeasts,followed by sequencing of the most intense bands, showed that the dominant microorganisms werePseudomonas sp., Leuconostoc mesenteroides, Lactobacillus helveticus , Lactobacillus kefiranofaciens, Lactococcus lactis , Lactobacillus kefiri, Lactobacillus casei, Kazachstania unispora , Kluyveromyces marxianus, Saccharomyces cerevisiae, and Kazachstania exigua. The bacterial communities between three kinds of Tibetan kefir grains showed 78 – 84% similarity, and yeasts 80 – 92%. The microflora is held together in the matrix of fibrillar material composed largely of a water-insoluble polysaccharide.

【中文摘要】无
【英文摘要】
The objective of this study was to evaluate the antioxidant activity of cultivated fruiting bodies of an endophytic Xylariasp. (strain number YX-28), from Ginkgo biloba . The results indicated that the methanol extract exhibited strong antioxidant capacity in both 2,2-diphenyl-1-picrylhydrazyl (DPPH) analysis and b -carotene – linoleic acid model system. Total phenolic and flavonoid contents extracted by different solvents were determined using Folin – Ciocalteu procedure and the flavonoid – aluminium method. The results showed that total phenolic and flavonoid contents were the highest in methanol extract (54.51 ± 1.05 mg gallic acid equivalent/g dry weight and

【题目】Biogenic amines in Chinese soy sauce
【中文关键词】无
【英文关键词】Biogenic amine Chinese soy sauce Amino nitrogen
【中文摘要】无
【英文摘要】The biogenic amine contents in 40 samples of Chinese soy sauce from different manufactures were deter-mined using HPLC after pre-column derivatization with dansyl chloride. Also, the amino nitrogen levels and pH values of these samples were analyzed. Of the five biogenic amines under study, tyramine was the most prevailing amine and was detected in 97.5% of the samples, followed by spermidine (95%), hista-mine (92.5%), cadaverine (82.5%) and spermine (80%). The total content for the five biogenic amines in these samples was 497 mg/l with a range from 41.7 to 1357 mg/l. The pH and amino nitrogen levels in soy sauce samples were between 3.86 and 4.98 and between 0.25 and 1.26 mg/100 g, respectively. In general, total content for the five biogenic amines was high in samples that had high amino nitrogen levels

【题目】Pentocin 31-1, a novel meat-borne bacteriocin and its application as biopreservative in chill-stored tray-packaged pork meat
【中文关键词】无
【英文关键词】Cordyceps militaris CMase
Entomogenous fungus Fibrinolytic activity
Medicinal mushroom
【中文摘要】无
【英文摘要】A novel fibrinolytic enzyme from Cordyceps militaris was purified and partially characterized for the first time, which was designated C. militaris fibrinolytic enzyme (CMase). This extracellular enzyme from C. mil-itaris was isolated by ammonium sulphate fraction, and purified to electrophoretic homogeneity using gel filtration chromatography. The apparent molecular mass of the purified enzyme was estimated to be 27.3 kDa by SDS-PAGE. The optimum pH and temperature for the enzyme activity were pH 6.0 and 25 C, respectively. In the pres-ence of metal ions such as Mg 2+ and Fe 2+ ions the activity of the enzyme increased, whereas EDTA and Cu2+ ion inhibited the enzyme activity. Interestingly the N-terminal amino acid sequences of the enzyme is extremely similar to those of the trypsin proteinases from insects, and has no significant homology with those of the fibrinolytic enzyme from other medicinal mushroom. In conclusion, C. mili-taris produces a strong fibrinolytic enzyme CMase and may be considered as a new source for thrombolytic agents.

【题目】Effects of low-voltage electrical stimulation and rapid chilling on meat quality characteristics of Chinese Yellow crossbred bulls
【中文关键词】无
【英文关键词】low-voltage electrical stimulation; rapid chilling; beef quality; Chinese yellow cattle
【中文摘要】无
【英文摘要】In this study, the effects of low-voltage electrical stimulation (LVES) and rapid chilling (RC) treatments on the quality characteristics of beef carcasses were evaluated, including the rate of pH and temperature decline, evaporative loss of carcasses, purge loss, cooking loss, and shear force values of m. longissimus steaks. Each carcass of 28 Chinese Yellow crossbred (Simmental x Yanbian) bulls was subjected to one of the four treatments, i.e., electrical stimulation and conventional chilling (ES/NR), electrical stimulation and rapid chilling (ES/RC), no electrical stimulation and rapid chilling (NE/RC), or no electrical stimulation and conventional chilling (NE/NR). Carcass pH and temperature were measured at 1, 3, 5, 7, 9, 11, and 24 h post-mortem. After that, a 2.5-cm-thick m. longissimus steak was taken from the right side of each carcass and used for analyses of purge loss, cooking loss and Warner-Bratzler shear force (WBSF). The results showed that LVES accelerated the rate of carcass pH decline ($P < 0.05$) and rapid chilling increased the rate of carcass temperature decline ($P < 0.05$). There was no significant difference found for the mean carcass evaporative losses from all treatments ($P > 0.05$). Mean purge losses for m. longissinius steaks from rapidly chilled carcasses were lower ($P < 0.05$) than those from conventionally chilled carcasses. Electrical stimulation had no impact on m. longissimus steak purge losses ($P > 0.05$). Rapid chilling significantly decreased ($P < 0.05$) the cooking loss of in. longissitnus steaks from electrically stimulated carcasses whilst it increased the cooking loss of m. longissimus steaks from carcasses without stimulation ($P < 0.05$). LVES increased ($P < 0.05$) cooking loss of m. longissimus steaks from conventionally chilled carcasses, but had no effect under the procedure of pre-rigor rapid chilling ($P > 0.05$). The lowest mean shear force value was found for the ES/NR-treated m. longissimus steaks, whilst the highest one for the NE/RC-treated carcasses ($P < 0.05$). Regression analyses indicated that carcass pH at 1 h post-mortem was the most useful predictor for beef shear force. Abattoirs processing Chinese Yellow bulls could optimize meat quality by using low-voltage stimulation together with pre-rigor rapid chilling. (c) 2005 Published by Elsevier Ltd.

【题目】Study of the Lactobacillus sakei protective effect towards spoilage bacteria in vacuum packed cooked ham analyzed by PCR-DGGE
【中文关键词】无
【英文关键词】Lactobacillus sakei; protective effect; cooked ham; PCR-DGGE
【中文摘要】无
【英文摘要】The effectiveness of Lactobacillus sakei B-2 inoculated as a protective culture on the inhibition of spoilage bacteria on sliced vacuum packed cooked ham was investigated by using culture-dependent and -independent approaches. Total microbial DNA was directly extracted from both control and treatment samples, and subjected to a nested PCR protocol, PCR-DGGE analysis was used to identify and monitor the dynamic changes in the microbial population, followed by partial 16S rDNA sequencing. The DGGE profile demonstrated that the protective culture effectively suppressed growth of predominant spoilage bacteria L. sakei, Lactobacillus

curvatus and Leuconostoc mesenteroides in cooked ham during storage at 4 degrees C, however, growth of uncultured Leuconostoc was not inhibited. The shelf-life of this product inoculated with L. sakei B-2, at levels of 5.91 +/- 0.04 log(10) CFU g(-1) was 35 days, compared to 15 days of control samples, when the ham was stored at 4 degrees C. 【题目】Optimizing palm oil and palm stearin utilization for sensory and textural properties of chicken frankfurters.
【中文关键词】无
【英文关键词】Frankfurter; palm oils; palm stearin; emulsion; texture; sensory
【中文摘要】无
【英文摘要】This study was designed to explore the potential of refined, bleached and deodorized (RBD) palm oil (PO) and palm stearin (POs) utilization in chicken frankfurters. A 10 points augmented simplex-centroid design was used to Study the effect of chicken fat (CF), PO and POs as well as the interaction of these fats on the emulsion, textural and sensory properties of chicken frankfurters. All frankfurters were formulated to contain approx 25% fat, 52% Moisture and 10% protein. No significant difference was found in end chopping temperatures of all meat batters even though the temperature of PO and POs upon incorporation into meat batters was 50 degrees C higher than CF. Strong emulsions were formed as no fluid losses were observed in all the meat batters tested after heating. Texture profiles of the frankfurters containing PO and/or CF were quite similar, but increment of POs raised hardness, chewiness, and shear hardness of the frankfurters. Acceptability of the frankfurters was evaluated using hedonic test. Panelists found no difference in hardness preference between frankfurters made from totally CF and PO, while frankfurters made from POs were rated as hard and brittle. CF was important in determining acceptability of the frankfurters, as reduction of CF in formulation resulted in lower scores in chicken flavor, juiciness, oiliness and overall acceptance of the frankfurters. Frankfurters with sensory acceptability comparable to a commercial one were found to comprise of more than 17%, CF, and less than 67% PO and 17% POs of the fat blend. (c) 2005 Elsevier Ltd. 【题目】植物乳杆菌耐酸耐胆盐的体外试验及其降胆固醇作用
【中文关键词】植物乳杆菌 胆盐水解酶 降胆固醇 共沉淀
【英文关键词】lactobacillus plantarum ; bile salt hydrolase ; cholesterol-reducing ; coprecipitation ;
【中文摘要】目的:研究产胆盐水解酶植物乳杆菌H13的耐酸、耐胆盐特性,在此基础上对其可能的降胆固醇作用机理进行体外试验研究。方法:采用MRS培养基,模拟人体胃酸环境(pH=3)和胆盐环境(0.3%),测定H13菌株在酸性及高胆盐环境作用后的存活菌数,并在此胆盐浓度下测定植物乳杆菌H13的胆盐水解酶活力、降解胆盐能力和胆固醇沉淀量。结果:菌体能够耐受pH3的环境和0.3%的胆盐环境;该菌产生的胆盐水解酶在降低胆固醇方面具有重要作用,酶活性与游离胆酸量、胆固醇沉淀量呈正相关,而且胆盐水解酶对反应底物的特异性不同,以甘氨胆酸钠为佳。结论:植物乳杆菌H13体外降胆固醇作用的机理主要是其产生的胆盐水解酶使胆盐失去共轭作用,在酸性(pH〈6.0)条件下,解共轭胆盐与胆固醇形成复合物共同沉淀下来。
【英文摘要】Objective : In this study, the acid and bile salt resistant ability of L. plantarum H13 producing bile salt hydrolase and its possible cholesterol-reducing mechanism in vitro were investigated. Methods: By stimulating human gastric acid and intestinal bile salt

condition, the viability of H13 strain during exposure to acid MRS broth (pH=3) and bile salt MRS broth (0.3%) were determined respectively. Then the bile salt hydrolase activity of H13 strain, degradation of bile salt and cholesterol precipitation were measured in this bile salt concentration. Results: H13 strain had tolerance capability to the pH=3 environment and 0.3% concentration of bile salt. Bile salt hydrelase produced by H13 strain had an significant impact on reducing cholesterol. It showed that there was positive correlation with enzymic activity, free bile acid and cholesterol precipitation. This bile salt hydrolase showed substrate specificity and sodium glycocholate was better. Conclusion: The main mechanism for the in vitro reducing cholesterol by LactobaciUus plantarum H13 was related to the bile salt hydrolase activity of the cells, and releasing unconjugated bile acids induced cholesterol coprecipitation at low pH values.

【中文关键词】乳酸菌 存活性 培养基 保护剂 饥饿处理

【英文关键词】lactic acid bacteria ; survival ; growth medium ; cryoprotector ; starvation

【中文摘要】研究了培养基、冻干保护剂、饥饿处理对冻干乳酸菌存活性的交互影响.结果表明,培养液中加入NaCl、干燥介质中添加冻干保护剂蔗糖、冻干前对L.bulgaricus S-1细胞饥饿,这三种处理都可以提高冻干菌体在贮藏期的存活性;然而当培养液中含有NaCl时,保护剂蔗糖以及对细胞饥饿处理并不能进一步提高该培养液中生长的细胞在贮藏期的存活性.

【英文摘要】Interactive effects of growth medium, cryoprotector and starvation treatment on bacterial survival during the storage of freeze-dried lactic acid bacteria have been studied. Three factors, including addition of NaCl to the growth medium, addition of sucrose to the drying medium and starvation of S-1 in the stationary phase, could help survive during storage in the dried state. However, in the case of NaCl in the growth medium, not only sucrose in the drying medium seemed to be largely ineffective in further increasing the survival rate of dried cells throughout storage, but also starvation was rather inadequate in protecting dried cells survival during storage.

【中文关键词】植物乳杆菌; 人体肠道; 益生特性; 活疫苗; 分子研究

【英文关键词】Lactobacillus plantarum; human intestinal tract; probiotic property; living vaccine; molecular study

【中文摘要】植物乳杆菌能够通过胃, 并定植于肠道, 对人体安全。服用植物乳杆菌后, 对健康人群和病患者具有特定的医疗保健作用。同时, 植物乳杆菌分泌生物活性分子, 激发免疫反应, 可作为活疫苗在医学上广泛应用。另外, 随着L. plantarum WCFS1 全基因组序列的测出, 可用分子手段(如启动子筛选、R - IVET 、DNA微矩阵) 研究肠道微生态系统的机制和探索植物乳杆菌更深层次的益生特性。

【英文摘要】L. plantarum has a proven ability to survive gastric transit and colonize the gut, with an apparent safety to the consumer. Many studies describe health promoting effects of consumption of L. plantarum on healthy volunteers and patients. L. plantarum can secrete bioactive molecules that evoke an immune response, therefore as a living vaccine offers a large range of therapeutic possibilities. The availability of the complete genome sequence of L. plantarum WCFS1 makes it a suitable model to study with molecular approaches such as promoter screens, R - IVET, and DNA micro- arrays. This is expected to contribute to unraveling more mechanisms behind the targeted intestinal microbial e-cosystem and possible further probiotic properties of L. plantarum.

【题目】利用16S rRNA序列鉴定分离自开菲尔粒的一株乳杆菌
【中文关键词】开菲尔粒; 16SrRNA; 植物乳杆菌; 系统发育树
【英文关键词】Kefir grains; 16SrRNA; Lactobacillus plantarum; phylogenetic tree
【中文摘要】对菌株H13的16SrRNA序列进行克隆和测序,并以此为基础构建菌株H13的系统发育树,对菌株H13进行鉴定。应用PCR技术,扩增H13菌株的16SrRNA基因,将其与pEASY2T载体相连接,用Sanger双脱氧链终止法测定序列并将16SrRNA序列与GenBank所选择的同属及非同属的菌进行同源性比较。结果表明:H13菌株16SrRNA基因序列同源性与乳杆菌属10株菌均在89%以上,与所选的植物乳杆菌和类植物乳杆菌的同源性高达99.5%和9912%,与其他8株乳杆菌属菌株的同源性都小于97%,可进一步确定其为植物乳杆菌或类植物乳杆菌。系统发育进化树结果表明,H13与植物乳杆菌的同源性最为接近。H13最终鉴定为植物乳杆菌,该菌株现在已被中国微生物菌种保藏管理委员会普通微生物中心收录保存,编号为CGMCC1357。
【英文摘要】The strain H13isolated fromKefir , which can reduce cholesterol in blood, was primarily identified as Lactococcus byphysiological2biochemical characteristics. 16S rRNAgene of H13was amplifiedin vitro using PCR technology and was sequenced. Comparedwithother tenstrains of LactococcusfromGenBank, the homologyof 16S rRNA gene of H13was above89%. EspeciallycomparedwithLactobacillus plantarum, Lactobacillus paraplantarum, the homologywas evenhigher to9915%, 9912%respectively, andlower than97%comparedwithother eight strains of Lactococcus. Thus we couldfurther identifythat it was Lactobacillus plantarumor Lactobacillus paraplantarum. Accordingtothe phylogenetic tree of H1316S rRNAgene, the homology of strain H13was closer to Lactobacillus plantarum. In conclusion, the strain H13 belongs to Lactobacillus plantarum, and has been preserved and designated as CGMCC1357byChina General MicrobiologyCulture CollectionCenter

【题目】藏灵菇微生物种群结构的分子特性研究
【中文关键词】藏灵菇,PCR—DGGE,微生物多样性,16S rDNA,26S rDNA
【英文关键词】Tibetan kefir grains,PCR—DGGE,Microbial diversity,16S rDNA,26S rDNA
【中文摘要】用PCR—DGGE指纹技术,研究了藏灵菇中微生物多样性及藏灵菇发酵奶发酵过程微生物种群动力学。结果表明,藏灵菇中细菌的种群结构较酵母菌的复杂,不同来源的藏灵菇中细菌种群结构的相似性为78%一84%,酵母菌种群结构的相似性为80%一92%。发酵过程中细菌种群结构变化图谱中的条带B和条带E,以及酵母菌种群结构变化图谱中的条带N贯穿于整个发酵过程,是发酵过程的优势菌。序列分析表明,细菌种群结构的DGGE图谱中的绝大多数条带与乳酸菌相对应,其中最亮条带(条带E)的序列与乳酸乳球菌的相似性为100%
【英文摘要】The diversity in Tibetan kefir and grains and dynamics of the microbial community during the fermentation of Tibetan kefir by PCR—DGGE fingerprinting technique were studied.The results showed that bacterial community of Tibetan kefir grains was more complex than that of yeast.The bacteria communities between different Tibetan kefir and grains showed 78%~84%similarity,and yeast80%-92%.Bands B,EandNofDGGE profiles of the microbial COlllnullity during fermentation of Tibetan kefir were present throughout the fermentation.Analysis of sequence date showed them majority of the DGGE bands of bacteria comunity correspondedto LAB,and the most intense band(band E)was completely homology to Lactococcus lactis.

【题目】真空浸渍法制备固定化乳酸菌苹果粒的研究
【中文关键词】乳酸菌;苹果;真空浸渍;条件优化
【英文关键词】lactic acid bacteria apple:vacuum impregnation:optimization
【中文摘要】真空浸渍可将保加利亚乳杆菌和嗜热链球菌富集到苹果组织间隙,从而获得富集乳酸菌的苹果粒制品。本实验采用响应曲面法结合单因素实验对抽真空温度、抽真空时间和浸渍时间等因素进行了优化。结果表明,温 度35℃,抽真空时间10min,浸渍时间80min时,苹果粒对乳酸菌吸附率最高,达到80%以上。同时实验表明冷冻干燥的效果明显优于热风干燥。冷冻干燥的苹果粒色泽鲜亮,外形饱满,口感松脆,具有苹果的芳香,乳酸菌活菌达≥10 ’ CFU/g。
【英文摘要】
Vacuumimpregnationisanewtechnologyofimmobilization Itcalincorporatelacticacidbacteriaintoappletissueswithoutdestroyingtheinitialfoodmatrix.Inthispaper,threefactors aleoptimizedusingresponse surfacemethod.Whenthe vacuumtemperaturewaskept 35"C,airpumpworked fortenminutes andthetimeofexposureinnormalatmosphericpressureis80minutes,thetotalcountsofLactobacillus delbrueckiisubsp.Bulgaricus and Streptococcusthermophilusinapplepieceswere around109CFU/g.It can also be found that frozen drying is better than hot-air drying methods.It can keep the sensing qualities ingoodcondition.

【题目】微囊化纯培养发酵剂发酵奶与藏灵菇奶的比较研究
【中文关键词】藏灵菇 发酵剂 风味成分
【英文关键词】Tibetan kefir grains, culture starter, flavour and aroma

【中文摘要】利用从藏灵菇中分离出的优势菌,进行混合发酵,比较了这种纯培养菌种发酵的酸奶与藏灵菇发酵奶在感官、主要风味成分以及优势菌株数量的差异。HPLC检测结果表明,这2种发酵奶的乳酸产量分别为7.62g/L和7.85g/L,无显著差异;GC检测结果表明,微囊化纯培养发酵剂发酵奶中丁二酮的含量明显高于传统藏灵菇奶;GC-MS检测结果表明,2种发酵奶中挥发性风味成分有90%相同;感官评定表明微囊化纯培养发酵剂发酵奶的可接受程度显著高于藏灵菇奶。表明,微囊化纯培养发酵剂发酵奶既保持了藏灵菇奶原有的特征,又在风味上得到了进一步的提高,表明微囊化纯培养发酵剂可以替代藏灵菇进行这类发酵奶的规模化生产。

【英文摘要】Fermented milk using mixed microcapsule pure cultures compared with traditional Tibetan Kefir on sensory elaluation, flavour and preponderant microbial counts. According to the results of HPLC, the content of lactic acid of the two was close 7.62 g/L and 7.85 g/L respectively. The results of GC showed that the content of diacetyl in the fermented milk using mixed microcapsule starter was clearly higher than that in traditional fermented milk. The results of GC-MS showed that volatile flavor substances of the two had a 90% similarity. The results of sensory elaluation showed the fermented milk using mixed microcapsule pure cultures was more acceptant than the traditional fermented milk. In conclusion, mixed microcapsule cultures makes fermented milk retaining the flavor of traditional Tibetan kefir and will be a novel and valuable pure cultures

【题目】纳豆激酶第36位氨基酸突变对其活性及热稳定性的影响
【中文关键词】纳豆激酶 nk基因 序列分析 毕赤酵母 热稳定性
【英文关键词】nattokinase ; nk gene ; sequence analysis ; Pichia pastoris ; thermostability
【中文摘要】为了解纳豆激酶分子结构与其功能的关系,研究了纳豆菌诱变株DU115的纳豆激酶基因突变对其酶活性和热稳定性的影响。从原生质体紫外诱变纳豆菌DU115和野生纳豆菌BN10基因组DNA中扩增纳豆激酶成熟肽基因nkD和nkB,构建重组表达载体pPICZα-A—nkD和pPICZα-A—nkB,在毕赤酵母X33中实现了表达,并对表达产物进行分离纯化、酶活性测定及热稳定性检测。结果表明,与nkB基因序列相比,nkD基因有两处的核苷酸发生了突变(A107G和C396T),A107G碱基突变导致氨基酸的替代D36G(Asp→Gly);诱变菌株纳豆激酶DNK与野生菌的BNK在65℃处理15min后,前者的热稳定性提高20%,比活力提高16.6%。由此可推断,第36位氨基酸残基的突变可能与其酶热稳定性及活性提高密切相关。
【英文摘要】The effect of mutational nattokinase (NK) gene on the activity and thermostability in Bacillus natto mutant induced mutagenesis by UV on protoplasts was researched to reveal the relation between their molecular structure and function. The mature peptide gene of NK was obtained by PCR amplification from Bacillus natto mutant strain DU115 which was protoplast mutagenesis with UV and wild-type strain BN10 genomic DNA, and sub-cloned into pPICZα-A. The recombinants pPICZα-A-nkD and pPICZα-A- nkB were expressed in Pichia pastoris X-33. The results showed that sequencing of the amplified fragment revealed a synonymous mutation C396T and a nonsynonymous mutation A107G leading to amino-acid substitution D36G (Asp→Gly). The comparison experiments of purified mutant enzymes DNK with natural BNK showed that the thermostability of the former increased by 20% , when it was exposed for 15 min at 65 ℃ and specific activity increased by 16. 6%. The mutation of the 36th amino acid of nattokinase was positive for the thermostability and activity.

【题目】响应面法优化植物乳杆菌冷冻干燥保护剂配方的研究
【中文关键词】响应面法 植物乳杆菌 冷冻干燥保护剂 直投式发酵剂
【英文关键词】response surface methodology (RSM) ; Lactobacillus plantarum ; cryprotectants: direct-to-vat starter (DVS)
【中文摘要】本实验应用二水平部分因子设计和响应面中心组合设计联用的方法筛选并优化了植物乳杆菌冷冻干燥的保护剂配方。实验结果表明,众多保护剂当中脱脂乳、海藻糖、硫酸锰的作用最为突出,能够显著提高细胞对冷冻和干燥的环境的耐受能力。以冻干后的细胞存活率为响应目标,响应面法优化的结果为:脱脂乳3.34%、海藻糖1.85%、硫酸锰0.25%。用此配方保护剂冻干样品时,能使细胞存活率达到96.8%±1.3%,与理论预测值较为接近
【英文摘要】The formula of cryprotectants for Lactobacillus plantarum was optimized by 2-Level factorial design and central composite design (CCD). The resuks indicated that the skim milk, trehalose, and MnSO4 are three key factors, which contribute to the survival of the cells after cryodesiccation. By CCD design and response surface analysis, the quadratic model for the three significant factors was established with cell survival rate as the target response. The optLrnal formula obtained is skim milk 3.34%, trehalose 1.85% and MnSO4 0.25%, and the cell survival rate reaches 96.8% ± 1.3%.

【题目】含水量对植物乳杆菌冻干粉细胞活性的影响及其贮藏稳定性的研究
【中文关键词】真空冷冻干燥技术 植物乳杆菌发酵剂 含水量 存活率 复苏活力
【英文关键词】vacuum freeze-drying ; Lactobacillus plantarum ; water capacity ; cell survival rate ; viability
【中文摘要】应用真空冷冻干燥技术,研究不同含水量对冻干产品中植物乳杆菌细胞活性的影响和不同保藏温度条件下样品中细胞存活率与复苏活力随时间变化的规律,并建立适用于判定菌体细胞冷冻干燥工艺终点的有效方法。结果表明:具有不同含水量的样品中,植物乳杆菌细胞的存活率间无显著性差异,但随着样品中含水量的降低,植物乳杆菌细胞进入对数生长期的时间逐渐延长,复苏活力也呈下降趋势。贮藏稳定性实验结果表明,-20℃条件下,植物乳杆菌细胞的存活率一直呈现上升趋势,到第515天可达91.46%;4℃条件下,28d内植物乳杆菌细胞的存活率呈上升趋势,到第515天其存活率又下降到53.16%。综上所述,解析干燥初期是植物乳杆菌菌体冻干工艺理想的终点,比较适于植物乳杆菌发酵剂短期和长期保藏的温度条件分别是4℃和-20℃。
【英文摘要】Lactobacillus plantarum starter cultures were freeze-dried under vacuum, and the effect of water capacity on cell survival rate and viability of Lactobacillus plantarum during storage were studied. Results showed that there was no significant difference among the cell survival rates of Lactobacillus plantarum of different water capacity, but with the decrease of water capacity of Lactobacillus plantarum, the time of Lactobacillus plantarum logarithmic growth phase was postponed and the cell viability declined. The cell survival rate of Lactobacillus plantarum increased during storage under -20℃ and up to 91.46% on day of 515th, while the cell survival increased under 4℃ before 28d, and drop to 53.16% on day of 515th. In conclusion, the early stage of secondary drying phase was the ideal terminal point of freeze-drying. 4℃ was good for short time storage for Lactobacillus plantarum, while -20℃ was a better choice for longer time storage.

【题目】A RAV-like transcription factor controls photosynthesis and senescence in soybean.
【中文关键词】大豆,短光照,RAV
【英文关键词】soybean, SD, RAV
【中文摘要】基因文库富集了大量在短期内从光敏感大豆叶组织的编码EST。Gmrav全长基因编码同源转录因子被从大豆中分离,含有一个1056的开放阅读框。Gmrav家族的蛋白质包括AP2/ERF域和B3域. 在短光照或BR处理下Gmrav表达丰度增加。转基因烟草Gmrav过表达显示形态和生理改变植物的生长速度缓慢,减少根伸长,开花延迟时间和减少光合速率,减少叶片叶绿素含量。因此Gmrav可能是负调节作用在光合作用和生长。转基因烟草也显示加速衰老。分析了大豆叶,根和茎器官表明,Gmrav表达丰度较高。因此,增强表达Gmrav可抑制大豆叶,根和茎的生长。
【英文摘要】A cDNA library enriched for mRNAs encoding ESTs that increased in abundance during short days was constructed by SSH from leaf tissues of a photoperiod sensitive soybean. The proteins predicted to be encoded by the mRNAs were inferred to be involved in diverse functions. A full-length mRNA that encoded a soybean ortholog of the transcription factor RAV was isolated by RACE, containing an open reading frame of 1,056 bp. The GmRAV protein included an AP2/ERF domain and a B3 domain.GmRAV mRNA abundance was increased in SDs following leaf treatments with ABA and decreased following BR treatment. Transgenic tobacco overexpressing GmRAV showed morphological and physiological alterations such as slower plant growth rate (dwarWng), reduced root elongation, delayed Xowering time and reduced photosynthetic rate, reduced chlorophyll contents in leaves. Therefore GmRAV may be a negative regulator acting on both photosynthesis and growth. Transgenic tobacco also showed accelerated senescence with both dark and ABA treatments versus the longer longevity compared to the wild type in LDs. The analyses of soybean leaf, root and stem organs showed that GmRAV mRNA abundances were higher in SDs than in LDs. Therefore, the enhanced expression of GmRAV in SDs compared to LDs may have caused the inhibited growth of soybean leaf, root and stem.

【题目】2001~ 2010 年福建水稻品种现状分析
【中文关键词】水稻; 品种; 分析
【英文关键词】Rice; var iety; analysis
【中文摘要】分析比较2001~ 2010 年福建省审定152 个水稻品种的育种途径、主要不育系以及审定品种的产量、抗性、品质等主要性状。结果表明: 三系法杂交稻组合133 个, 占871 5%; 二系法杂交稻组合13 个, 占81 6%;常规稻品种6 个, 占31 9%。三系法仍然是当前福建省水稻育种主要方法。146 个杂交稻组合使用了55 个不育系, 其中三系法不育系47 个, 占851 5%, 二系法不育系8 个, 占141 5%; 有Ò-32A、龙特甫A、冈46A、D62A、谷丰A、天丰A、金23A、和SE21S 等8 个不育系配组5 个杂交稻组合以上, 是目前福建省杂交稻育种的主要不育系。稻谷单产比对照增产6%以上(含6%) 、中感稻瘟病以上(含中感) 、米质达三等部颁食用籼米标准以上(含三等) 和直链淀粉含量在15%~ 20%之间等4 项品种性状, 其中3 项品种性状达标的有: Ò 优沈98, 乐优94, e Ò 优315, Ò 优039, 闽丰优3301, 秋优125、玉优一号, 江优明62、两优航2 号和金农2 优3 号等10 个品种; 4 项品种性状达标的有金农2 优3 号。
【英文摘要】Breeding o f the 152 r ice v arieties that w ere ex amined and approv ed dur ing 2001 and 2010 in Fujian mainlyinvolved with sterile lines and var ieties wit h g ood compr ehensiv e tr aits. Our analysis indicated that : There wer e 133three- line- hybr id combinations (i. e. , 871 5% of t otal) , 13 t wo- line- hybrid combinatio ns (i. e. , 81 6%) , 6co nv entional new v arieties (i. e. , 31 9%) , and the three- line method remained to be the major br eeding method forrice; Of 146 hy br id rice combinatio ns, 55 ster ile lines wer e used, among w hich three- line- ster ile lines w ere 47 (i.e. , 851 5%) , tw o- line- st erile lines wer e 8 (i. e. , 141 5%) , and each o f the 8 sterile lines, such as II- 32 A, LongTefu A, Gang 46A, D62A, GufengA, TianfengA, Jin23A, SE21S, etc. , w as applied to make o ver 5 hybrid r icecombinat ions, w hich wer e t he majo r sterile lines in the pr ov ince; and According to t he established criteria, t he y ieldof a new ly bred var iety should at least incr ease by 6%, its resistance to rice blast be abo ve moderate lev el, the r icequalit y be equal or better t han the third- class eating I ndica r ice standar d issued by the Department o f Agr iculture,and its amy lose content be 15% - 20%; by compar ing to CK, there w ere 10 var ieties, i. e. , IIy oushen98, Ley ou94, eIIy ou 315, I Iyou 039, Minfeng yo u 3301, Qiuy ou 125, Yuy ou No . 1, Jiang youming 62, Liang yo uhang No1 2,Jinnon 2 y ou 3, etc. , that met three of t he cr iteria, and o nly Jinnon 2 y ou 3 met all four cr iter ia. 【题目】柑橘栽培品种(系)DNA指纹图谱库的构建
【中文关键词】柑橘;品种鉴定;SSR;ISSR;指纹图谱库
【英文关键词】citrus; cultivar identification; SSR; ISSR; fingerprinting database
【中文摘要】【目的】构建柑橘栽培品种(系)的DNA指纹图谱数据库,为建立柑橘种苗纯度及真实性鉴定技术体系和技术规范奠定基础。【方法】利用SSR标记和ISSR标记对102个柑橘栽培品种(系)进行DNA指纹分析,筛选适合的特征引物,构建柑橘栽培品种(系)的指纹图谱数据库。【结果】从200对SSR引物中筛选到重复性好、多态性丰富的12对引物作为柑橘品种(系)鉴定的特征引物,12对SSR特征引物组合可鉴别42个品种(系);在此基础上,对未出现SSR特征指纹的60个品种(系)进行ISSR指纹分析,从40个ISSR引物中筛选到2个可用于品种鉴定的特征引物,结合SSR标记,可快速、准确地鉴别70个柑橘的品种(系)。并利用这12对SSR特征引物和2个ISSR特征引物构建了70个柑橘栽培品种(系)的DNA特征指纹图谱数据库。【结论】SSR和ISSR标记适于构建柑橘栽培品种DNA指纹图谱库;指纹图谱库的建立为柑橘种苗纯度及真实性鉴定奠定了基础。
【英文摘要】【Objective】 The aims of this study were to construct a DNA fingerprinting database of major citrus cultivars, which could provide a possibility of establishment of a technical standard system for purity and authenticity identification of citrus nursery trees. 【Method】 Simple sequence repeat (SSR) and inter-simple sequence repeat (ISSR) markers were used to analyze the DNA fingerprinting of 102 citrus cultivars(lines) and then to choose suitable primers for the construction of DNA fingerprinting database of

citrus cultivars (lines). 【Result】 12 SSR primer pairs, with high polymorphisms and good repeatability, regarded as specific primers, which could identify 42 cultivars (lines), were selected from 200 SSR primer pairs. Meanwhile, 40 ISSR primers were used to analyze the DNA fingerprinting of 60 cultivars (lines) that can not be distinguished by SSR markers and 2 ISSR specific primers were chosen. As a result, a total of 70 citrus cultivars (lines) could be identified by the 12 SSR primers and 2 ISSR primers. Finally, a DNA fingerprinting database containing 70 major citrus cultivars (lines) was constructed by using those 12 SSR and 2 ISSR primers.【Conclusion】 The results indicated that SSR and ISSR markers are suitable for the construction of DNA fingerprinting database of citrus cultivars (lines). Moreover, the fingerprinting database will provide a basis for genetic purity and authenticity fast evaluation of citrus nursery trees.

【中文关键词】多甲氧基黄酮;结构;生物活性;分类;掺假
【英文关键词】polymethoxyflavonoids (PMFs);structure;biological activity; taxonomy;adulteration
【中文摘要】芸香科柑橘属中的多甲氧基黄酮(PMFs),由于具有抗炎、抗氧化、抗诱变、抗癌等生物活性而备受青睐。而且PMFs的提取使得柑橘果汁加工中的果皮得到充分利用,对其深入研究具有重大的经济效益和社会效益。本文对PMFs的结构及其生物活性,在柑橘分类学研究、柑橘果汁掺假和保健食品中的应用进行了综述。
【英文摘要】Recently polymethoxyflavonoids (PMFs) from citrus of rutaceae genus have been given extra attention because of their broad biological activities, including anti-oxidant, anti-inflammatory, anti-mutagenesis, anti-cancer (gastric cancer, liver cancer, and lung cancer and so on) properties. The extraction of PMFs makes full use of citrus peel from the process of orange juice and has huge economic and social benefits. This paper mainly reviewed their molecular structure, biological activities and applications in taxonomic study of citrus, adulteration identification of orange juice and production of health food.

【题目】OsCRY2 基因抑制表达对水稻主要农艺性状的影响
【中文关键词】水稻; OsCRY2 基因; ihpRNA 表达载体; 转化
【英文关键词】rice; OsCRY2 gene; ihpRNA expression vector; transformation
【中文摘要】利用已公布的水稻OsCRY2 基因序列设计引物,扩增部分基因片段,成功构建了ihpRNA 植物表达载体pSC1301-347-OsCRY2,并通过农杆菌介导法将OsCRY2 干扰片段导入水稻获得了转基因植株。根据转基因植株主要农艺性状的表现,分析了该基因的功能。结果表明,抑制OsCRY2 基因表达会强烈延迟水稻开花与成熟; 转基因植株穗与剑叶变短,结实率下降,粒增长,其他农艺性状未见明显变化。
【英文摘要】According to the published rice OsCRY2 gene sequence,we designed the related primers to obtain part of thegene by PCR and constructed an ihpRNA plant expression vector named pSC1301-347-OsCRY2. The OsCRY2 geneinterference fragment was then introduced into rice by Agrobacterium-mediated transformation. The functions of the genewas preliminarily analyzed by the performance of the transformants. The results indicated that the transgenic plants inwhich the expression of OsCRY2 gene was suppressed give rise to both retarded flowering and maturing. Moreover ,thetransgenic plants have short panicles and flag leaves,lower seed-set percent with the grain becoming longer while theother agronomic traits do not change apparently.

【题目】乡村建设中的村民认知与意愿表达分析
【中文关键词】新农村建设 康居示范村 村民认知 意愿表达
【英文关键词】New countryside construction, Livable model village, The recognition of peasants, The willingness expression
【中文摘要】以江苏省宿迁市为例,通过问卷调研和深入访谈走入村组,针对“康居示范村”规划建设的现状和内在问题进行调研、分析,主要内容包括:规划实施的现状;农村居民对现有农村生活环境改善的意愿;农村居民的利益变化以及对宅基地置换的意愿表达;农村居民对公共政策及政府作为的认知。最后从规划管理、多渠道筹资、农村宅基地补偿标准、公众参与保障农民的权利等方面提出了政策建议。
【英文摘要】Taking Suqian city of Jiangsu province as an example, Tools of the questionnaire investigation and in-depth interviews with villages have be used in order to understand the actual condition of the country planning of modern villages and its existing problems. Several problems have been explored, including the condition of enforcement of the country planning, the willingness of peasants to improve the current residential environment, the willingness of peasants to replacement of rural housing land with changing peasant ’s advantages, and peasant ’s recognition to public policy and government. It reached a conclusion that some policies should be brought out for the management of the country planning, raising finance through various channels, making out the standard of compensation for rural housing land and peasants participation to safeguard the legal rights and security of peasants.

【题目】果蔬总抗氧化能力间接测定法及其影响因素
【中文关键词】间接测定法;ABTS;DPPH;抗氧化能力
【英文关键词】indirect method;ABTS;DPPH;antioxidant activity
【中文摘要】果蔬抗氧化能力是衡量果蔬抗氧化成分作用强弱的主要参数,评价总抗氧化能力的方法有直接法和间接法,其中,间接法是最为快捷、简便的分析方法。ABTS法和DPPH法是目前应用最为普遍的间接测定方法;间接测定的影响因素有底物及其相互之间的作用、体系中的干扰物质、pH值、反应时间、自由基产生体系等。研究人员试图用HPLC等方法与间接法联用以减少外界因素对检测结果的影响。
【英文摘要】The total activity is the main parameter to value the antioxidant ability of objects. Methods to measure total antioxidant activity can be divided into indirect and direct methods according to priciple, and indirect methods were fast and simple ways to determine the total antioxidant activity. At present, ABTS and DPPH were applied widely. The results of indirect methods were influenced by factors such as antioxidants and interactions, interference materials, pH, action time, producing system for free radicals and so on. Researchers tried to use the other advanced methods such as HPLC to decrease the environmental influence on the indirect method.

【题目】水稻新质源(CMS-FA)雄性不育恢复基因的遗传
【中文关键词】杂交稻; 新质源CMS-FA; 雄性不育; 育性恢复基因; 遗传
【英文关键词】Hybrid rice; New cytoplasmic resource CMS-FA; Male sterility; Restorer gene; Inheritance
【中文摘要】发掘水稻新型雄性不育细胞质源CMS-FA, 育成系列优质米不育系和系列新质源恢复系, 在组配成强优势杂交稻组合的基础上, 研究新质源雄性不育恢复系的恢复基因遗传。采用新质源(CMS-FA)不育系金农1A 与恢复系金恢3 号杂交获得杂交F1 和F2 代种子。用F1 分别与不育系或保持系回交, 获得(不育系//不育系/恢复系和不育系/恢复系//保持系)2 个测交群体。同时种植P1、P2、P3、F1、F2、B1F1 和B2F1 等群体, 考察花粉染色率、套袋结实率和自然结实率, 卡平方测验遗传分离适合度。结果表明, 不育系与恢复系杂交F1 代正常可育, 育性恢复(可育)基因为显性遗传。F2代分离出可育∶不育适合 3∶1, 育性恢复(可育)基因为 1 对显性基因控制。B1F1和 B2F1代 2 个测交群体的可育∶不育都适合 1∶1 分离规律, 验证了 F2代育性恢复(可育)单基因的遗传模式。暂时确定新质源(CMS-FA)核质互作三系的基因型为不育系S(SS)、保持系F(SS)和恢复系S(FF)。
【英文摘要】Based on identification of new male sterile cytoplasm (CMS-FA) from wild rice, a series of CMS-FA male sterile linesand restorer lines as well as their hybrid combinations with good quality and strong heterosis were developed. The cross ofJinnong 1A (A line) × Jinhui 3 (R line) was made to study the fertility inheritance of CMA-FA hybrid rice. The F1 generation wasbackcrossed with the A line and maintainer line (B line) to get two test cross populations (A line//A line/R line and A line/R line//Bline). Totally six populations, namely, P1, P2, P3, F1, F2, B1F1, and B2F2, were planted at the same time to evaluate fertility usingindexes of stained pollen rate, bagged seed-setting percent, and natural seed-setting percent. The F1 generation showed a normalcondition in fertility, and the F2 generation had a segregation ratio of 3 (fertile):1 (sterile) according to Chi-square test. Moreover,the two test-cross populations both had a segregation ratio of 1 (fertile):1 (sterile). The results indicated there was only one dominantgene controlling the fertility in the restorer line. Therefore, the genotypes of the three lines of CMS-FA hybrid rice could betentatively determined as S(SS) for the male sterile line, F(SS) for the maintainer line, and S(FF) for the restorer line.

【题目】Identification of QTL underlying the resistance of soybean to pod borer, Leguminivora glycinivorella (Mats.) obraztsov, and correlations with plant, pod and seed traits.
【中文关键词】大豆,食心虫,SSR标记,QTL
【英文关键词】soybean, pod boer, SSR marker, QTL
【中文摘要】大豆食心虫在世界某些地区导致大豆的产量和质量的严重损失,特别是北部中国,日本和俄罗斯。本文的目的是利用东农1068 ’9 “ 东农8004衍生的129个F5:6重组自交系并且利用131个SSR标记。相关分析表明食心虫抗性与植株高度,熟期,荚色,茸毛密度,百粒重和蛋白质含量,即矮茎,浅色的豆荚,小种子,密度较低的短柔毛,成熟早、低蛋白质含量似乎有更高的抗性。3个QTLqrspb-1(satt541 – satt253)和qrspb-2(satt253 – satt314)在2个连锁群(LG)和qrspb-3(satt288 – satt199)能够解释10.96,9.73和11.59%。这些能够检测到的QTL共同提供潜在的标记辅助选择改良品种抗性。
【英文摘要】Soybean (Glycine max L. Merr.) pod borer (Leguminivora glycinivorella (Mats.) Obraztsov)(SPB) results in severe loss in soybean yield and quality in certain regions of the world, especially inNortheastern China, Japan and Russia. The aim here was to evaluate the inheritance of pod borer resistance and to identify quantitative trait loci (QTL) underlying SPB resistance for the acceleration of the control of this pest. Used were the 129 recombinant inbred lines (RILs) of the F5:6 derived population from ‘ Dong Nong 1068 ’ 9 ‘ Dong Nong 8004 ’ and 131 SSR markers. Correlations between the percentage of damaged seeds (PDS) by pod borer and plant, pod and seed traits that were potentially related to SPB resistance were analyzed. The results showed highly significant correlations between PDS by pod borer and plant height (PH), maturity date (MA), pod color (PC), pubescence density (PB), 100-seed weight (SW) and protein content existed. Soybeans with dwarf stem, light color of pod coat, small seeds, lower density of pubescence, early maturity and low content of protein seemed to have higher resistance to SPB. The correlated traits had potential to inhibit egg deposition and thereby to decrease the damage by SPB. Three QTL directly associated with the resistance to SPB judged by PDS at harvest were identified. qRspb-1 (Satt541 – Satt253) and qRspb-2 (Satt253 – Satt314) were both on linkage group (LG) H and qRspb-3 (Satt288 – Satt199) on LG G. The three QTL explained 10.96, 9.73 and 11.59% of the phenotypic variation for PDS, respectively. In addition,12 QTL that underlay 10 of 13 traits potentially related with SPB resistance were found. These QTL detected jointly provide potential for marker assisted selection to improve cultivar resistance to SPB

【题目】两株橙汁酵母菌落发育的动态特征及鉴定意义
【中文关键词】橙汁; 酵母; 菌落; 动态发育特征; 鉴定意义;
【英文关键词】orange juice; yeast; colony; dynamic development features; significance of identification;
【中文摘要】利用体式镜对分离自橙汁的两株酵母菌YA2和Y17-2菌落形态发育的动态特征进行了细致观察,结果表明:不同菌株的菌落具有各自稳定且特定的发育特征.同一菌株不同培养时期的菌落,其形态结构有差异,早期的菌落呈半球形,随着培养时间的延长,菌落中央部分生长速度由快到趋于稳定或下降,由半球形隆起逐渐平缓至塌陷成凹坑;同时,菌落的大小、色泽和质地都将发生较大的变化,具有多样性;同一菌株在不同培养基上的菌落形态特征也有较大的差异.用菌落的发育动态特征来描述菌株,对菌株鉴定具有更为直观和重要的意义.结合菌落特征与细胞形态、子囊孢子、假菌丝等特征的分析,将分离自橙汁的酵母菌株YA2和Y17-2分别鉴定为Hansenias-pora和Pichia.
【英文摘要】Two yeast strains isolated from orange juice,YA2 and Y17-2,were examined with a stereoscopic microscope.The results showed that the colonies of different strains had their respective stable and specific development features.The morphological structures of colonies for the same strain were different in different culture periods.Young colonies were hemispheroid in shape,and over the time of culture the growth the central part of the colony changed from fast to stable or slow,and the hemispherical colonies gradually flattened and,finally,caved in.At the same time,the size,texture,color and gloss of the colonies changed extensively,resulting in great diversity in appearance.The morphological features of the same strain growing in different media were also different.It is of intuitional and important significance to identify the yeast strains by the dynamic characteristics of the growing colonies.Based on an analysis of the colony features and the characteristics of cell shape,ascospores and pseudo-hyphae,YA2 and Y17-2 were identified as Hanseniaspora and Pichia.

【题目】水稻隐花色素基因Cry1a/Cry2/Cry1b RNAi表达载体构建及遗传转化研究
【中文关键词】水稻; 隐花色素基因; RNAi; 载体构建; 遗传转化
【英文关键词】Rice; Cryptochrome gene; RNAi; Vector conrtruction; Genetic transformation
【中文摘要】构建一个包含3 个水稻隐花色素基因片段的RNAi 表达载体pSC1301-347-Cry1aCry2Cry1b 并转化水稻,以期导致Cry1a、Cry1b 与Cry2 集体沉默, 观察它们对水稻重要农艺性状的影响。结果表明, 转基因水稻开花期显著延迟, 结实率骤降, 株高增加, 剑叶变短, 谷粒变长、变宽; 而剑叶宽、穗长与对照无显著差异。
【英文摘要】A RNAi expression vector with three rice cryptochrome genes (Cry1a/Cry2/Cry1b)fragments wasconstructed and transformed into rice so as to cause all of the three genes to be silent collectively, based onwhich the effects of these genes on rice important agronomic traits were analysed. The results showed thattransgenic plants significantly delayed flowering time with a drastically declined seed-set percent, increased plantheight, shortened flag leaves, elongated and widened grain, but the flag leaf width and the panicle length were notsignificantly different from the control variety.

【题目】农村居民点整理区域联动机制的原则与实现途径-以江苏省为例
【中文关键词】区域联动机制;农村居民点整理指标;江苏省;补偿;信息共享;利益协调
【英文关键词】regional concatenation mechanism; rural residential consolidation index; Jiangsu province; compensation; sharing information; benefits coordination
【中文摘要】农村居民点用地整理是优化农村居民点布局和实现耕地占补平衡的有效途径,也是建设现代乡村社区的必然选择 本文以江苏省为例,简要分析其区域不平衡现状及建立农村居民点整理区域联动机制的迫切性和可行性,提出从四个方面实现农村居民点整理的区域联动机制的新思路:建立区域间农村居民点整理指标流动补偿机制 建立区域间农村居民点整理的信息共享体系 建立区域间农村居民点整理的联动预警机制 建立区域间的联动利益分配机制
【英文摘要】The rural residential areas consolidation has become one of the effective means of readjusting rural land use structure and of keeping the dynamic balance of cultivated land. At the same time, it is also an inevitable choice for developing modern rural community. Taking Jiangsu province as an example, the author analyzes briefly itsdisequilibrium situation and tries to justify it is feasible to construct regional concatenation mechanism of the rural residential areas consolidation. Then the author put forwards some new ideals. Such as setting up a regional flow compensation mechanism of the consolidation index, a regional sharing information system, a regional concatenationearly warning system, a regional distribution economic benefit of interconnected parts.

【题目】Genetic diversity in soybean genotypes from north-eastern China and identification of candidate markers associated with maturity rating.
【中文关键词】大豆,熟期,SSR标记,RAPD标记
【英文关键词】soybean, HU, SSR ,RAPD
【中文摘要】RAPD和SSR标记被用来估计在中国东北101个大豆品种遗传之间的关系,。在101个大豆品种多态性的53个PAPD片段和35个多态性SSR标记,些大豆品种相似性系数在45.2%-100%之间,和 36.1%-100%之间。相似矩阵分析表明这些品种中度相关 (r = 0.31, P < 0.05)。聚类分析表明,相同育成单位育成的品种大多聚在一起。在主成分分析的基础上,结合分子分子和表现型的数据,HU< 2200和HU> 2200的品种分离较为明显。
【英文摘要】Random amplified polymorphic DNA (RAPD) and simple sequence repeat (SSR) markers were used to estimate the genetic relationships among 101 soybean cultivars developed in north-eastern China. Fifty-three fragments of the 100 RAPD markers and 35 SSR markers tested were polymorphic across the 101 soybean cultivars. Similarity values among these soybean cultivars ranged from 45.2% to 100% for RAPD data, and ranged from 36.1% to 100% for SSR data. The similarity matrices for SSR data and RAPD data were moderately correlated (r = 0.31, P < 0.05). Cluster analyses indicated that the cultivars released from the same seed company weremostly grouped together. A principal component analysis, based on the combined RAPD and SSR data, yielded a good separation of soybean varieties with different maturity ratings [represented by soybean Heat Unit (HU)]. The varieties with HU < 2200 were well separated from those with HU > 2200. Four RAPD markers and eight SSR markers were significantly associated with the maturity ratings of soybean.

【题目】新疆褐牛与荷斯坦牛隐性乳房炎与体细胞数、病原菌种类的比较
【中文关键词】隐性乳房炎;体细胞数;菌落形成单位
【英文关键词】subclinical mastitis;SCC;CFU
【中文摘要】本试验以新疆乌鲁木齐市地区一大中型奶牛场的新疆褐牛、荷斯坦牛奶样为研究对象,对奶样进行了病原菌分离培养,同时对不同品种牛体细胞数与菌落形成单位(colony-forming unit,CFU)、体细胞数与不同年龄进行了统计分析。结果表明,2个品种牛感染病原菌种类稍有差别且新疆褐牛感染葡萄球菌的机率明显高于荷斯坦牛;荷斯坦牛比新疆褐牛更容易患乳房炎;新疆褐牛、荷斯坦牛体细胞在小于20万/mL时均与体细胞大于50万/mL时的CFU值呈显著差异(P<0.05),而这2个品种牛的体细胞在20~50万/mL时分别与体细胞小于20万/mL、大于50万/m1 时的CFU值均无显著差异(P> 0.05),初步推测体细胞数和细菌总数之间没有必然联系,还受其它因素影响;此外,随着年龄增长,褐牛和荷斯坦牛的体细胞评分(somatic cell score,SCS)都呈上升趋势,且不同品种间的SCS差异显著。
【英文摘要】Milk samples of Xinjiang Brown cattle and Chinese Holstein cattle from Urumqi breeding cattle farm were collected and isolated culture.The effects of subclinical mastitis on different varieties were compared,information of somatic cell counts(SCC)and colony forming units(CFU),SCC and different ages from different varieties were analyzed.The results showed that there was difference on category of pathogenic bacteria and Xinjiang Brown cattle was prior to Chinese Holstein cattle on the infected rate of Staphylococci;the former has a stronger resistance to disease than the latter;there was a extremely significant association two varieties between CFU of SCC<200 thousand/mL and CFU of SCC >500 thousand/mL (P<0.05),while there was no significant correlation between CFU of 200 thousand/mL<SCC<500 thousand/mL and CFU of SCC<200 thousand/mL,SCC>500 thousand/mL(P>0.05),statistical analysis on complete SCC and cuhure data showed no association between SCC and bacterial isolation and there was other factors:there was the trend of escalation on SCS of Xinjiang Brown cattle and Chinese Holstein cattle and there was significant correlation on SCS of different varieties.

【题目】新质源(CMS-FA)杂交稻产量相关性状的相关性分析
【中文关键词】杂交稻;新质源(CMS-FA);加性相关;显性相关;产量相关性状
【英文关键词】hybrid rice;new cytoplasmic resource(CMS-FA);additive correlation;dominance correlation;yieldrelated trait
【中文摘要】以新质源(CMS-FA)杂交稻遗传系统的5个不育系和5个恢复系进行不完全双列杂交,采用加性-显性遗传模型和MINQUE (1)法,对新质源(CMS-FA)杂交稻产量相关性状进行多种相关分析。结果表明,新质源(CMS-FA)杂交稻产量相关性状间的相关性为:株高与结实率,剑叶长与生育期、结实率,生育期与每穗实粒数,结实率与千粒重,千粒重与单株产量等性状之间的遗传相关以基因的加性正相关为主;单株穗数与株高、剑叶长、每穗总粒数、每穗实粒数、结实率,千粒重与每穗总粒数等性状之间的遗传相关以基因的加性负相关为主。株高与穗长、剑叶长、每穗总粒数、千粒重,穗长与每穗总粒数、每穗实粒数、单株产量等性状之间具有显著或极显著的显性相关。利用加性相关为主的性状进行间接选择可取得较好的育种效果。
【英文摘要】Using 5CMS-FA sterile lines as female parents and 5corresponding restorers as male parents,25crosseswere bred with the incomplete diallel cross design for the experiment.Their parents and F1generations were plantedto generate data on the yield-related traits.By the additive-dominant model and MINQUE(1)method,the geneticcorrelations among 10yield-related traits of CMS-FA

hybrid rice were analyzed.The results showed significantcorrelations among the traits.The genetic correlations between the plant height(PH)and seed-set percent(SSP),between the flag-leaf length(FLL)and growth duration(GD)or SSP,between GD and filled grain number perpanicle(FGNPP),between SSP and 1000-grain-weight(TGW),and between TGW and yield per plant(YPP)werebasically positive and additive.Those between the panicle number per plant(PNPP)and PH,between FLL,totalgrain number per plant(TGNPP),FGNPP,SSP,and between TGW and TGNPP were mainly negative andadditive.There were also significant or very significant positive dominance correlations between traits of PH andpanicle length(PL),between FLL,TGNPP,TGW,PL and TGNPP,FGNPP,YPP.Consequently,in breeding,it would be advisable to choose the traits that showed high additive correlations.

【英文关键词】agricultural product;geographical origin traceability;spectroscopy;mass spectrometry

【中文摘要】农产品产地溯源是建立农产品质量安全追溯制度的重要组成部分,也是保障农产品质量安全的有效手段。通过物理学、化学和生物学方法,分析农产品的有机组成、挥发性成分、同位素含量与比率、DNA 图谱等特征成分或指标,结合化学计量学研究,建立起能区分农产品产地来源的特征指纹图谱。本文综述了近年来几种常用农产品产地溯源技术在不同种类农产品中的应用研究进展,并展望了今后农产品产地溯源技术研究的发展趋势。

【英文摘要】The geographical origin traceability of agricultural products, an important part of traceability system, is effective in protecting the quality and safety of agricultural products. Using physical, chemical and biological methods, geographical origin of agricultural products can be analyzed according to specific indexes such as organic constituents, volatile compounds, isotope content and ratio, and DNA mapping. Combined with chemometrics, fingerprint profiles of agricultural products can be established by analyzing component data related to geographical origin of samples. Current analytical techniques used for determining geographical origin of agricultural products are reviewed in this paper. Furthermore, the future development trends are also discussed.

【题目】Impact of epistasis and QTLrenvironment interaction on the accumulation of seed mass of soybean(Glycine max L. Merr.)
【中文关键词】大豆,籽粒重,发育动态QTL
【英文关键词】soybean, seed weight, developmental QTL
【中文摘要】大豆种子的积累受基因型与环境互作的影响。本研究的目的是分析上位性和QTL与环境互作对大豆籽粒重积累的影响。143个父母本大豆品种‘Charles东’和‘东农594”衍生的重组自交系。百粒重的广义遗传力从30天到80天为0.58,0.52,0.62,0.60,0.66和0.57。共有17个非条件QTL和/或条件QTL的加性效应与环境互作效应在10个连锁群上发现。其中,只有4个在不同阶段有显着影响大豆种子发育的条件QTL。一共有35对QTL在不同的发育阶段影响大豆籽粒重。5对QTL检测到加性与加性互作效应,16个QTL具有AAE效应。总之,大豆百粒重下发育受遗传和环境控制。
【英文摘要】The accumulation of seed mass in soybean is affected by both genotype and environment. The aim of the present study was to measure additive, epistatic and quantitative trait locus (QTL)renvironment (QE) interaction effects of QTLs on the development of 100-seed weight in a population of 143 F5 derived recombinant inbred lines (RILs) developed from the cross between the soybean cultivars‘Charleston’and‘Dong Nong 594’. Broad-sense heritability of 100-seedweight from 30 days (30D) to 80D stages was 0.58, 0.52, 0.62, 0.60, 0.66 and 0.57, respectively. A total of 17 QTLs with conditional additive (a) effect and/or conditional additiverenvironment interaction (ae) effect at specific stages were identified in ten linkage groups by conditional mapping. Of them, only 4 QTLs had significant a effect or ae effect at different stages of seed development. Among QTLs with significant a effect, five acted positively and six acted negatively on seed development. A total of 35 epistatic pairwise QTLs of 100-seed weight were identified by conditional mapping at different developmental stages. Five pairs of QTL showed the additiveradditive epistatic (aa) effect and 16 QTLs showed the aarenvironment interaction (aae) effect at the different developmental stages. QTLs with aa effect as well with their environmental interaction effect appeared to vary at different developmental stages. Overall, the results indicated that 100-seed weight in soybean is under developmental, genetic and environmental control.

【题目】杀菌剂抑霉唑人工抗原的合成和鉴定
【中文关键词】抑霉唑;半抗原;人工抗原;合成;鉴定
【英文关键词】imazalil;hapten;antigen;synthesis;identification
【中文摘要】以咪唑乙醇为原料,与6- 溴己酸乙酯发生取代反应后再经水解反应合成抑霉唑半抗原(6-[1-(2,4- 二氯苯基)-2-(1- 咪唑基)乙氧基]己酸)。产物经薄层层析和1H-NMR 鉴定后,采用活化酯法分别与牛血清蛋白(BSA)和卵清白蛋白(OVA)偶联得到免疫原(HIA-BSA)和包被原(HIA-OVA),紫外光谱分析法计算得其偶联比分别为13:1 和7:1,初步说明人工抗原合成成功。通过免疫动物获得效价为1:64000 的抗体,采用间接竞争ELISA 法测定抗体的IC50 值为1.76 μg/mL,从而进一步证明人工抗原合成成功,所得的抗体可用于ELISA 检测试剂盒的研制。
【英文摘要】Abstract:In this study, imazalil (6-[1-(2,4-dichloro-phenyl)-2-(1-imidazolyl) ethoxy] hexanoic acid) was synthesized via substitution reaction between imidazole ethanol and 6-bromo-ethyl followed by hydrolysis reaction to provide a hapten. The synthesized product was identified by thin-layer chromatography (TLC) and 1H-NMR. The hapten was conjugated with bovine serum albumin (BSA) and ovalbumin (OVA) to obtain artificial immune antigen and artificial coating antigen, respectively. The coupling molar ratios were calculated to be 13:1 and 7:1 according to UV spectroscopy analysis, which suggests that artificialantigens are both synthesized successfully. The titer of the antibodies secreted by immunized animals was 1:64000 and the IC50 value was 1.76 μg/L determined by indirect ELISA, which further confirms successful synthesis of artificial antigens. The obtained antibodies can be used for the development of ELISA test kit.

【中文摘要】采用手工碾钵磨制和不锈钢质粉碎机制备柑桔叶片样品!用火焰原子吸收分光光度法测试钾、钙、镁、铁、锰、铜、锌等7种金属元素含量.结果表明,柑桔叶样中上述7种元素含量测试数据经t测验分析,各自t值均小于t0.10,14值,同种元素的测试值之间不存在显著性差异,即柑桔叶片中7种金属元素测试,机械粉碎与手工磨碎两种方式制样,其测试结果具有一致性。

【题目】Size effect of Se-enriched green tea particles on in vitro antioxidant and antitumor activities
【中文关键词】Superfine Se-enriched green tea; particle size; antioxidant; antitumor
【英文关键词】Superfine Se-enriched green tea; particle size; antioxidant; antitumor
【中文摘要】The antioxidant and antitumor activities (in vitro) of superfine regular and Se-enriched green tea particles with different sizes (3.52 μm and 220 nm) were investigated in this paper. The vitamin C and tea polyphenol contents of green tea in different sizes were significantly different, and amino acid and chlorophyll just changed a little. The antioxidant activity of green tea particles was evaluated by DPPH radical scavenging and linoleic acid peroxidation inhibition methods, and the antitumor activity was evaluated by antiproliferation assay on HepG2, A549, and MGC803 cells. The results indicated that enrichment of selenium endowed green tea with higher antioxidant activity and antitumor activity on HepG2 and A549 cells but not on MGC803 cells. The DPPH radical scavenging rates of regular and Se-enriched green tea of 220 nm (67.87% and 69.49%, respectively) were significantly greater than that of 3.52 μm, but the inhibition of linoleic acid peroxidation for green tea of 220 nm was lower. The inhibitory rates of green tea of 220 nm on HepG2, A549, and MGC803 cells achieved 77.35%, 80.76%, and 87.54% for regular green tea, and 82.51%, 88.09%, and 74.48% for Se-enriched green tea at the dose of 100 μgmL-1, values that were all significantly higher compared to that of 3.52 μm.

【题目】Optimization of Fabrication Parameters To Produce Chitosan-Tripolyphosphate Nanoparticles for Delivery of Tea Catechins
【中文关键词】Chitosan; chitosan-tripolyphosphate nanoparticles; controlled release; encapsulation;nanoparticle surface charge; nanoparticle size; tea catechins
【英文关键词】Chitosan; chitosan-tripolyphosphate nanoparticles; controlled release; encapsulation;nanoparticle surface charge; nanoparticle size; tea catechins
【中文摘要】This work investigated the polyanion-initiated gelation process in fabricating chitosan-tripolyphosphate (CS-TPP) nanoparticles intended to be used as carriers for delivering tea catechins. The results demonstrated that the particle size and surface charge of CS-TPP nanoparticles could be controlled by fabrication conditions. For preparation of CS-TPP nanoparticles loaded with tea catechins, the effects of modulating conditions including contact time between CS and tea catechins, CS molecular mass, CS concentration, CS-TPP mass ratio, initial pH value of CS solution, and concentration of tea catechins on encapsulation efficiency and the release profile of tea catechins in vitro were examined systematically. The study found that the encapsulation efficiency of tea catechins in CSTPP nanoparticles ranged from 24 to 53%. In addition, FT-IR analysis showed that the covalent bonding and hydrogen bonding between tea catechins and CS occurred during the formation of CSTPP nanoparticles loaded with tea catechins. Furthermore, studies on the release profile of tea catechins in vitro demonstrated that the controlled release of tea catechins using CS-TPP nanoparticles was achievable.

【题目】液相色谱法测定柑橘果实中类黄酮的方法研究
【中文关键词】高效液相色谱;柑桔;类黄酮
【英文关键词】high performance liquid chromatography;citrus;flavonoids
【中文摘要】文中以柑橘中常见的、含量丰富的柚皮素-7-β-芸香糖苷等10种类黄酮为研究对象,建立了同时测定柑橘中黄烷酮和多甲氧基黄酮含量的高效液相色谱分析方法。采用Waters Symmetry C_(18)色谱柱(250 mm×4.6 mm,5 μm),流动相为0.2%乙酸水溶液和乙腈,梯度洗脱,二极管阵列检测器,检测波长为287 nm和330 nm,柱温25°C,流速1.0 mL/min。外标法定量,柚皮素-7-β-芸香糖苷、柚皮苷、橙皮苷、新橙皮苷、香风草苷、柚皮素、橙皮素、甜橙黄酮、川皮苷和桔黄酮等

10种类黄酮的线性范围为0.01~27.00 mg/L(r≥0.99),检出限为0.01~0.02 mg/L。果汁的平均加标回收率为在94.20%~106.58%之间,相对标准偏差为1.15%~5.41%;果皮的平均加标回收率为95.15%~101.19%,相对标准偏差为1.47%~3.78%。

【英文摘要】Flavonoids,which are rich in citrus fruits,are good to health.Therefore,studies on how todetermine the amount of flavonoids had become fl hot research field.A method was established for the identification and quantification of flavonoids including flavanones and polymethoxyflavones in citrus fruits by reverse—phase HPLC coupled with photodiode array detection using Waters Symmetry C18 column.The mobile phase used was 0.2%acetic acid solvent and acetonitrile,in a concentration gradient,and the column temperature was 25°C.the UV detection wavelengths were 287 nm and 330 nm.The flavonoids were quantifled by external standard method.The linear ranges of 10 flavonoids were 0.01~27.00 mg/L(r≥O.99),and the detection 1imits were 0.0 1~O.02 mg/L.The average recoveries of flavonoids in juice and dry peeI powder were 94.20%~106.58%and 95.15%~101.19%,RSD were 1.15%~5.41%and 1.47%~3.78% respectively.The analytic parameters showed that the method was sensitive,reliable,accurate and reproducible.

【题目】奶牛乳房炎与核转录因子KB基因的表达调控

【中文关键词】NF-ｋB;奶牛乳房炎;奶牛

【英文关键词】nuclear factor ｋB;mastitis;dairy cow

【中文摘要】核转录因子(nuclear{actor-ｋB,NF-ｋB)是一个广泛存在于哺乳动物细胞中的转录因子,参与机体的免疫反应、细胞黏附、细胞分化、细胞增殖与凋亡及应激反应等。在奶牛感染乳房炎时,大部分涉及中性白细胞移行和激活的炎性蛋白质的编码基因在他们的启动子区都包含一个可结合NF-ｋB的ｋ B位点,因此在一定程度上依赖NF-ｋB调控这些基因的表达。笔者 详细的阐述NF-ｋB基因在奶牛乳房炎发病过程中的特点、作用和表达机制,为从分子水平认识和治疗奶牛乳房炎提供一定的文献支持。

【英文摘要】Nuclear factor-ｋB(NF-ｋB)is widespread in mammal which is responsible for immune response,cell adhesion, differentiation,proliferation and apoptosis.Most of the genes encoding inflammatory proteins involved in neutrophil migration and activation have been shown to contain KB sites for the NF-ｋB within their promoter region and therefore partly depend on NF-ｋB for their expression,suggesting that this transcription factor might play a critical roles in the pathophysioIogy of mastitis.This paper summarized NF-ｋB characteristic,function and expression mechanism,for the purpose to give some fundamental messages to understand the mechanisms of dairy mastitis.

【题目】Effect of nano-packing on preservation quality of Chinese jujube

【中文关键词】Chinese jujube (Ziziphus jujuba Mill. var.inermis (Bunge) Rehd);Nano-packing;Preservation

【英文关键词】Chinese jujube (Ziziphus jujuba Mill. var.inermis (Bunge) Rehd);Nano-packing;Preservation

【中文摘要】The effect of a novel nano-packing material on preservation quality of Chinese jujube (Ziziphus jujuba Mill.var. inermis (Bunge) Rehd) during room temperature storage was investigated. The nano-packing material with lower relative humidity, oxygen transmission rate and high longitudinal strength (2.05 g/m2 24 h,12.56 cm3/m2 24 h 0.1 MPa and 40.16 MPa, respectively) was

synthesized by blending polyethylene with nano-powder (nano-Ag, kaolin, anatase TiO2, rutile TiO2). The results showed that the nano-packing material had a quite beneficial effect on physicochemical and sensory quality compared with normal packing material. After 12-day storage, fruit softening, weight loss, browning and climatic evolution of nano-packing were significantly inhibited. Meanwhile, the contents of titrable acid and ascorbic acid were decreased to 0.21%, 251 mg/100 g, for nano-packing and 0.15%, 198 mg/100 g, for normal packing;The contents of total soluble sugar, reducing sugar, total soluble solids and malondialdehyde were increased to 28.4%, 5.2%, 19.5% and 98.9 lmol/g for nano-packing and 30.0%, 6.3%, 23.1% and 149 lmol/g for normal packing. Therefore, the nano-packing could be applied for preservation of Chinese jujube to expand its shelf life and improve preservation quality.

【题目】Inhibition of mitomycin C-induced chromosomal aberrations by micrometer powder of selenium-enriched green tea in mice spermatocytes

【中文关键词】Micrometer powder of Se-enriched greentea;Chromosomal aberration assay;Anticlastogenicity;Mitomycin C;Antioxidant enzymes
【英文关键词】Micrometer powder of Se-enriched greentea;Chromosomal aberration assay;Anticlastogenicity;Mitomycin C;Antioxidant enzymes

【中文摘要】The anticlastogenic effect of micrometer powder of selenium-enriched green tea (MSTP) was evaluated by using a chromosomal aberration assay in mouse testicular cells. Animals fed with a Se-deficient diet were treated with MSTP, micrometer powder of regular green tea (MRTP), selenite, and MRTP+ selenite for 30 days by an intragastric route, followed by treatment of mitomycin C (MMC) on day 19 through intraperitoneal injection (ip). Selenium status and antioxidant enzymes were measured. Results indicated that MSTP showed a significant capability to reduce the incidence of MMC-induced chromosomal aberrations in spermatocytes from 22.7% to 6.7%. This inhibitory was highest, for MSTP, at 73.1%, whileit was only 38.4% for MRTP. After 30 days of a Se-deficient diet, mice, either with or without the MMC treatment, showed a lower selenium concentration in blood and liver as well as lower enzyme activity of the antioxidants, GPx and SOD. Supplementation with MSTP, selenite, or selenite +MRTP enhanced the activities of these antioxidant enzymes. This enhancement was accompanied with a concomitant elevation of selenium levels, which favored the synthesis of the seleno-enzyme GPx and protected the cells from the MMC-induced oxidative stress. Our results indicate that MSTP is both able to prevent the chromosomal aberrations induced byMMCin mouse spermatocytes and to enhance GPx and SOD activityin blood serum and liver.

【题目】Determination of polyphenolic content and antioxidant activity of kudingcha made from Ilex kudingcha C.J.Tseng

【中文关键词】Antioxidant activity; DPPH;FRAP;HPLC;Ilex kudingcha C.J. Tseng;Kudingcha;Polyphenol content;TEAC

【英文关键词】Antioxidant activity; DPPH;FRAP;HPLC;Ilex kudingcha C.J. Tseng;Kudingcha;Polyphenol content;TEAC

【中文摘要】The total polyphenol content and the antioxidant activity of kudingcha made from Ilex kudingcha C.J. Tseng were determined by Folin – Ciocalteu reagent, and DPPH, FRAP, and TEAC methods, respectively. The crude extract (CE) of kudingcha and its four fractions of chloroform (CfF), ethyl acetate (EaF), n-butanol (nBF), and water (WtF) were prepared and subjected to antioxidant evaluation and analysis by high performance liquid chromatography. The extracts of kudingcha contained large amounts of caffeoylquinic acid (CQA) derivatives, including 3-CQA, 5-CQA, 3,4-diCQA, 3,5-diCQA, and 4,5-diCQA, and showed potent antioxidant activity. The antioxidant activities of CE and its fractions decreased in the order of EaF > nBF > CE > WtF > CfF, according to the DPPH assay and FRAP assay, which were the same, with the exception of the rank order of CfF and WtF, as the TEAC assay. Furthermore, a satisfactory correlation between total polyphenol content and antioxidant activity was observed.

【题目】Effect of superfine grinding on properties of ginger powder

【中文关键词】Ginger;Superfine grinding;Particle size;Physical and chemical properties

【英文关键词】Ginger;Superfine grinding;Particle size;Physical and chemical properties

【中文摘要】The superfine grinding could produce a narrow and uniform particle size distribution in dry ginger. The physical – chemical properties of five types of ginger powders with particles size of 300, 149, 74, 37 and 8.34 lm were investigated. The size was smaller for ginger powders, greater for the surface area (from 0.331 to 1.320 m2/g) and bulk density (from 0.3069 to 0.3426

g/ml) and smaller for the angle of repose (from 51.50_ to 46.33_) and slide (from 45.80_ to 39.50_). The values of water absorption index (WAI), water solubility index (WSI) and protein content significantly increased with decreasing the size of ginger particles ($p < 0.05$). Interestingly, the values of WAI, WSI and protein content of ginger powder with a particle size of 8.34 lm during soaking reached 0.52 g/g, 33.70% and 84.93% for 60 min, respectively. SEM observations revealed the shape and surface morphology of five types of ginger powders.

【题目】Characterization and High-Pressure Microfluidization-induced Activation of Polyphenoloxidase from Chinese Pear (Pyrus pyrifolia Nakai)

【中文关键词】Polyphenoloxidase; Pyrus pyrifolia Nakai; catechol; characterization; high-pressure microfluidization; activation

【英文关键词】Polyphenoloxidase; Pyrus pyrifolia Nakai; catechol; characterization; high-pressure microfluidization; activation

【中文摘要】Polyphenoloxidase (PPO) from Chinese pear (Pyrus pyrifolia Nakai) was characterized using catechol as a substrate. PPO had a Vmax of 289.2 units/min and a Km of 3.8 mmol/L, which indicates that P. pyrifolia Nakai PPO has a great affinity for catechol. The catalyzing reaction velocity was proportional to the PPO concentration. The optimum pH and temperature for PPO activity were 4.5 and 45 C, respectively. In addition, an investigation was made on the effect of high-pressure microfluidization of

treatment pressure, treatment pass, and enzyme solution temperature on P. pyrifolia Nakai PPO. As the treatment pressure increased, the PPO relative activity was elevated from 100% untreated to 182.57% treated at 180 MPa. PPO relative activity was enhanced as the treatment pass increased. PPO solution temperature (25, 35, and 45 C) had a significant effect on PPO relative activity when treated at 120 and 140 MPa.
【英文摘要】Polyphenoloxidase (PPO) from Chinese pear (Pyrus pyrifolia Nakai) was characterized using catechol as a substrate. PPO had a Vmax of 289.2 units/min and a Km of 3.8 mmol/L, which indicates that P. pyrifolia Nakai PPO has a great affinity for catechol. The catalyzing reaction velocity was proportional to the PPO concentration. The optimum pH and temperature for PPO activity were 4.5 and 45 C, respectively. In addition, an investigation was made on the effect of high-pressure microfluidization of treatment pressure, treatment pass, and enzyme solution temperature on P. pyrifolia Nakai PPO. As the treatment pressure increased, the PPO relative activity was elevated from 100% untreated to 182.57% treated at 180 MPa. PPO relative activity was enhanced as the treatment pass increased. PPO solution temperature (25, 35, and 45 C) had a significant effect on PPO relative activity when treated at 120 and 140 MPa.

【题目】Activation and Conformational Changes of Mushroom Polyphenoloxidase by High Pressure Microfluidization Treatment
【中文关键词】High pressure microfluidization;Activation;Mushroom PPO;Conformation
【英文关键词】High pressure microfluidization;Activation;Mushroom PPO;Conformation
【中文摘要】Activation and conformational changes of mushroom polyphenoloxidase (PPO) after high pressure microfluidization treatment were observed by means of UV spectrophotometer, far-UV circular dichroism,fluorescence emission spectra, UV absorption spectra and sulphydryl groups detection. The results indicated that, treated under pressures of 90 MPa, 110 MPa, 130 MPa and 150 MPa one pass, and 150 MPa 1, 2 and 3 passes, respectively, mushroom PPO exhibited an increase in activity. The circular dichroism (CD) analysis demonstrated that some of secondary structures such as α-helix were destroyed. There were some indices that the increase of relative activity was accompanied by a decrease in α-helix content. The fluorescence emission spectra analysis indicated that Trp and Tyr residues in mushroom PPO were more or less exposed tosolvent, and the result was in good agreement with that of UV absorption spectra analysis. The sulphydryl groups detection showed that the sulphydryl groups content on the surface of mushroom PPO was increased. Industrial relevance: Results of the present study show that high pressure microfluidization can not be used to inactivate mushroom PPO. However, it provides a new way for enzyme preparation, such as enzymemodification, with higher activity. High pressure microfluidization can be easily operated, with shorter treatment time and higher food safety compared with chemical methods.

【题目】Efficient procedure for isolating methylated catechins from green tea and effective simultaneous analysis of ten catechins, three purine alkaloids, and gallic acid in tea by high-performance liquid chromatography with diode array detection
【中文关键词】HPLC-DAD;Methylated catechin;Purine alkaloid;Tea;Toyopearl HW-40S column chromatography
【英文关键词】HPLC-DAD;Methylated catechin;Purine alkaloid;Tea;Toyopearl HW-40S column chromatography
【中文摘要】Monomers of (−)-epigallocatechin (EGC), (−)-epigallocatechin gallate (EGCG), (−)-epicatechin (EC), (−)-epicatechin gallate (ECG), (−)-epigallocatechin 3-O-(3-O-methyl) gallate (EGCG3__Me) and (−)-3-Omethyl epicatechin gallate (ECG3_Me) (purity, >97%) were successfully prepared from extract of green tea by two-time separation with Toyopearl HW-40S column chromatography eluted by 80% ethanol. In addition, monomers of (−)-catechin (C), (−)-gallocatechin (GC), (−)-gallocatechin gallate (GCG), and (−)catechin gallate (CG) (purity, >98%) were prepared from EC, EGC, EGCG, and ECG by heat-epimerization and semi-preparative HPLC chromatography. With the prepared catechin standards, an effective and simultaneous HPLC method for the analysis of gallic acid, tea catechins, and purine alkaloids in tea was developed in the present study. Using an ODS-100Z C18 reversed-phase column, fourteen compounds were rapidly separated within 15 min by a linear gradient elution of formic acid solution (pH 2.5) and methanol. A 2.5 – 7-fold reduction in HPLC analysis time was obtained from existing analytical methods (40 – 105 min) for gallic acid, tea catechins including O-methylated catechins and epimers of epicatechins, aswell as purine alkaloids. Detection limitswere generally on the order of 0.1 – 1.0 ng for most components at the appliedwavelength of 280 nm. Method replication generally resulted in intraday and interday peak area variation of <6% for most tested components in green, Oolong, black, and pu-erh teas. Recovery rates were generally within the range of 92 – 106% with RSDs less than 4.39%. Therefore, advancement has been readily achievable with commonly used chromatography equipments in the present study, which will facilitate the analytical, clinical, and other studies of tea catechins.

【题目】Preparation and pH stability of ferrous glycinate liposomes
【中文关键词】Ferrous glycinate; liposomes; encapsulation efficiency; stability; gastrointestinal juice
【英文关键词】Ferrous glycinate; liposomes; encapsulation efficiency; stability; gastrointestinal juice
【中文摘要】Ferrous glycinate liposomes were prepared by reverse phase evaporation method. The effects of cholesterol, Tween 80, ferrous glycinate concentration, hydrating medium, pH of hydrating medium, and sonication strength on the encapsulation efficiency of liposomes were investigated. Encapsulation efficiency was significantly influenced by the different technique parameters. Ferrous glycinate liposomes might be obtained with high encapsulation efficiency of 84.80% under the conditions of optimized technique parameters. The zeta potential and average particle size of liposomes in the hydrating medium of pH 7.0 were 9.6 mV and 559.2 nm, respectively. The release property of ferrous glycinate liposomes in vitro was investigated in simulated gastrointestinal juice. A small amount of ferrous glycinate was released from liposomes in the first 4 h in simulated gastrointestinal juice. The mean diameters of liposomes increased from 559.2 to 692.9, 677.8, and 599.3 nm after incubation in simulated gastrointestinal juice of pH 1.3, 7.5, and 7.5 in the presence of bile salts, respectively. Results showed that the stability of ferrous glycinate in strong acid environment was greatly improved by encapsulation in liposomes, which protected ferrous glycinate from disrupting the extracapsular environment by lipid bilayer. The bioavailability of ferrous glycinate, as the iron source for biological activity including hemoglobin formation, may be increased. The ferrous glycinate liposomes may be a kind of promising iron fortifier.

【题目】Novel and efficient method for immobilization and stabilization of β-D-galactosidase by covalent attachment onto magnetic Fe3O4 – Chitosan nanoparticles
【中文关键词】Magnetic Fe3O4 nanoparticle;Chitosan;_-d-Galactosidase;Immobilization;Galactooligosaccharide
【英文关键词】Magnetic Fe3O4 nanoparticle;Chitosan;_-d-Galactosidase;Immobilization;Galactooligosaccharide
【中文摘要】A novel and efficient immobilization of -d-galactosidase from Aspergillus oryzae has been developed by using magnetic Fe3O4 – chitosan (Fe3O4 – CS) nanoparticles as support. The magnetic Fe3O4 – CS nanoparticles were prepared by electrostatic adsorption of chitosan onto the surface of Fe3O4 nanoparticles made through co-precipitation of Fe2+ and Fe3+. The resultant material was characterized by transmission electron microscopy, X-ray diffraction, Fourier transform infrared spectroscopy, vibrating sample magnetometry and thermogravimetric analysis. -d-Galactosidase was covalently immobilized onto the nanocomposites using glutaraldehyde as activating agent. The immobilization process was optimized by examining immobilized time, cross-linking time, enzyme concentration, glutaraldehyde concentration,the initial pH values of glutaraldehyde and the enzyme solution. As a result, the immobilized enzyme presented a higher storage, pH and thermal stability than the soluble enzyme. Galactooligosaccharide was formed with lactose as substrate by using the immobilized enzyme as biocatalyst, and amaximumyield of 15.5% (w/v) was achieved when about

50% lactose was hydrolyzed. Hence, the magnetic Fe3O4 – chitosan nanoparticles are proved to be an effective support for the immobilization of -d-galactosidase.

【题目】Antioxidative activity and properties of gelatin films incorporated with tea polyphenol-loaded chitosan nanoparticles

【中文关键词】gelatin; tea polyphenols; chitosan nanoparticles; film; antioxidant activity

【英文关键词】gelatin; tea polyphenols; chitosan nanoparticles; film; antioxidant activity

【中文摘要】BACKGROUND: Gelatin film is widely used for the protection of food quality. In order to improve its antioxidant activity,natural antioxidant tea polyphenol-loaded chitosan nanoparticles (TPCN) were prepared and incorporated into gelatin film.The antioxidant effect of TPCN against the oxidation of fish oil was investigated, as well as the release of TP from nanoparticles in the film.RESULTS: The incorporation of TPCN greatly decreased the tensile strength and oxygen permeability but increased the water vapour permeability and affected the transparency of gelatin film. Scanning electron microscopy images indicated that extensive interference was embedded with TPCN in the film microstructure. The peroxide value of fish oil packaged with films incorporated with TPCN was lower than that of fish oil packaged with control films during the incubation period. The radicalscavenging activity of films incorporated with TPCN was higher than that of control films, and increasing radical-scavenging activity of the former was observed during the storage period.CONCLUSION: The antioxidant activity and properties of gelatin film were affectedy TPCN incorporation and storage time.Also, the oxidation of fish oil was retarded. The addition of TPCN could improve the antioxidant activity of gelatin film, and the release of TP from nanoparticles in the film was achieved during the storage period.

【题目】Nanoliposomes mediate coenzyme Q10 transport and accumulation across human intestinal Caco-2 cell monolayer
【中文关键词】Coenzyme Q10; nanoliposomes; transport; accumulation; Caco-2 cells
【英文关键词】Coenzyme Q10; nanoliposomes; transport; accumulation; Caco-2 cells
【中文摘要】The feasibility of using nanoliposomes as an oral delivery system to improve the intestinal absorption of coenzyme Q10 (CoQ10, ubiquinone-10) was examined using Caco-2 cell monolayers as the model of human intestinal epithelium. The apparent permeability coefficient of CoQ10 with nanoliposomes as vehicles was increased to be 4.19(0.76 10-6 cm/s, which was higher than the favorable intestinal absorption value (1 10-6 cm/s). The kinetic data demonstrated that nanoliposomal CoQ10 transport occurred via passive diffusion and carrier mediation routes. anoliposomes might suppress the modulation activity of the peptide transporter, organic anion transporter, and P-glycoprotein through fluidizing cell membrane. The transported CoQ10 was still in the original oxidative form as ubiquinone-10. However, 70-80% of coenzyme Q10 accumulated by the cells was in the reduced form (ubiquinol-10, CoQ10H2), suggesting that the conversion of CoQ10 to CoQ10H2 takes place in the enterocytes during its absorption. These results indicated that the absorption behavior of CoQ10 was modified through nanoliposomes. The bioavailability of CoQ10 following its oral administration might be improved with nanoliposomes as the delivery system.

【题目】Formation and characterization of mint oil/S and CS/water microemulsions
【中文关键词】Mint oil;Microemulsion;Phase diagram;Encapsulation efficiency
【英文关键词】Mint oil;Microemulsion;Phase diagram;Encapsulation efficiency
【中文摘要】Preparation and characterisation of microemulsions (ME) with mint oil (MO) as the oil phase were conducted to find a system which could provide a controlled, sustained, and prolonged delivery of MO. The influence of surfactant type and processing parameters on the formation of MO-ME ’ s was studied by comparing the areas of the monophase ME regions in pseudoternary phase diagrams. A 1:1 mixture of the surfactants, AOT and CrEL, was found to be the most effective, and it produced a ME monophase area of about 70%. The monophase regions were analysed by conductivity measurements; the results suggested that O/W regions within the ME phases were formed when the water content was higher than 60 – 65%. As tested with dynamic light scattering (DLS) and head space (HS) GC analysis, the particle size of O/W ME, with 60% water and AOT/CrEL = 1:1 as surfactants, was 20.0 nm and the encapsulation efficiency was 78.4%. The results indicated that a ME of MO/AOT and CrEL/ethanol/water, may be a promising dispersion for the protection of MO in food products.

【题目】The effect of dynamic high-pressure microfluidization on the activity, stability and conformation of trypsin
【中文关键词】Trypsin;Dynamic high-pressure microfluidization;(DHPM);Activity;pH and thermal stability;Conformation
【英文关键词】Trypsin;Dynamic high-pressure microfluidization;(DHPM);Activity;pH and thermal stability;Conformation
【中文摘要】Dynamic high-pressure microfluidization (DHPM) treatment of trypsin showed no significant effects with relative activities of 98.5% (80 MPa), 98.3% (100 MPa), 97.8% (120 MPa) and 97% (160 MPa). However,DHPM treatment enhanced the pH and thermal stability of trypsin. After 100 min of incubation at 45 C, the residual activity of trypsin treated at 80 MPa was still as high as 96% while the untreated trypsin retained only 86% of its original activity. The optimum pH of trypsin maintained surprising consistency (pH = 7.6); nevertheless, the relative activities were about 97%, 102% and 103% at 80, 100 and 120 MPa, respectively. In addition, DHPM-induced conformational changes of trypsin were observed.The unfolding of trypsin, induced by DHPM treatment, was reflected in the increase in maximum emission fluorescence intensity and exposed SH ontents, as well as the decrease in total SH contents, UV absorbance and a-helix intensity.

【题目】Effect of ultrafine grinding on hydration and antioxidant properties of wheat bran dietary fiber
【中文关键词】Ultrafine grinding;Submicron;Hydration properties;Antioxidant properties;Dietary fiber
【英文关键词】Ultrafine grinding;Submicron;Hydration properties;Antioxidant properties;Dietary fiber

【中文摘要】Wheat bran dietary fiber (DF) powders was prepared by ultrafine grinding, whose effects were investigated on the composition, hydration and antioxidant properties of the wheat bran DF products. The results showed that ultrafine grinding could effectively pulverize the fiber particles to submicron scale.As particle size decrease, the hydration properties (water holding capacity, water retention capacity and swelling capacity) of wheat bran DF were significantly ($p < 0.05$) decreased and a redistribution of fiber components from insoluble to soluble fractions was observed. The antioxidant activities of wheat bran and DF before and after grinding were in terms of 1,1-diphenyl-2-picrylhydrazyl (DPPH) radical scavenging activity, ferrous ion-chelating activity, reducing power and total phenolic content (TPC). Compared with DF before and after grinding, micronized insoluble DF showed increased chelating activity,reducing power and TPC yet decreased DPPH_ radical scavenging activity. Positive correlations were detected between chelating activity, reducing power and TPC.

【题目】Effect of Nano-Packing on Preservation Quality of Fresh Strawberry (Fragaria ananassa Duch. cv Fengxiang) during Storage at 4°C

【中文关键词】nano-packaging, preservation quality, shelf life, storage, strawberry
【英文关键词】nano-packaging, preservation quality, shelf life, storage, strawberry

【中文摘要】A novel nano-packing material with lower relative humidity, oxygen transmission rate and high longitudinal strength was synthesized by blending polyethylene with nano-powder (nano-Ag, kaolin, anatase TiO2, rutile TiO2), and its effect on preservation quality of strawberry fruits (Fragaria ananassa Duch. cv Fengxiang) was investigated during storage at 4 ◦ C. Results showed that nano-packaging was able to maintain the sensory, physicochemical, and physiological quality of strawberry fruits at a higher level compared with the normal packing (polyethylene bags). After a 12-d storage, decreases in the contents of total soluble solids, titratable acidity, and ascorbic acid of nano-packing were significantly inhibited. Meanwhile, decay rate, anthocyanin, and malondialdehyde contents were decreased to 16.7%, 26.3 mg/100g, 66.3 μ mol/g for nano-packing and 26.8%, 31.9 mg/100g, 75.4 μ mol/g for normal packing; polyphenoloxidase (PPO) and pyrogallol peroxidase (POD) activities were significantly lower in nano-packing than the control. These data indicated that the nano-packaging might provide an attractive alternative to improve preservation quality of the strawberry fruits during extended storage.

【题目】Response surface methodology in the optimization of tea polyphenols-loaded chitosan nanoclusters formulations
【中文关键词】Tea polyphenols;Carboxymethyl chitosan;Chitosan hydrochloride;Nanoclusters;Box – Behnken design
【英文关键词】Tea polyphenols;Carboxymethyl chitosan;Chitosan hydrochloride;Nanoclusters;Box – Behnken design
【中文摘要】Response surface methodology was used to optimize tea polyphenols-loaded chitosan nanoclusters preparation conditions, including carboxymethyl chitosan concentration, chitosan hydrochloride concentration and amount of tea polyphenols. The responses particle size and entrapment efficiency of nanoclusters were studied. The optimum conditions of carboxymethyl chitosan concentration,chitosan hydrochloride concentration and amount of tea polyphenols were found to be 3.63, 1.19 and 10.94 mg/mL, respectively. The optimized particle size was 301 nm, and entrapment efficacy of nanoclusters was added up to 83.7%. The results demonstrated that Box – Behnken design methodology was an effective way to obtain the optimal formulation of tea polyphenols-loaded chitosan nanoclusters, and the nanoclusters complexation synthesizing through ionic gelation between carboxymethyl chitosan and chitosan hydrochloride was good biomaterials, which could be successfully used to encapsulate tea olyphenols.

【题目】Preparation and characterization of Medium-Chain Fatty Acid Liposomes by Lyophilization
【中文关键词】edium chain fatty acid, liposomes, entrapment efficiency, lyophilization
【英文关键词】edium chain fatty acid, liposomes, entrapment efficiency, lyophilization
【中文摘要】In this study, medium-chain fatty acid (MCFA) liposomes were prepared by the film ultrasonic dispersion, modified ethanol injection, and everse-phase evaporate methods. The results indicated that the liposomes prepared by the thin-film ultrasonic dispersion method had a high ntrapment efficiency of 82.7% and a good distribution in size diameters. The MCFA liposomes were freeze-dried and the optimal preparation onditions of freeze-drying were as follows: The cryoprotectants were mannitol and sucrose (1:1 w/w), the hydrated medium was distilled ater,and the freeze-drying time was 48 hours. Under these conditions, the freeze-dried MCFA liposomes had a perfect appearance, a small particle size, nd high encapsulation efficiency. The mean diameters were 251.1 and 265.3 nm, and the encapsulation efficiencies were 80.5 and 79.2% for reshly prepared and reconstituted liposomes, respectively.

【题目】Medium-chain Fatty Acid Nanoliposomes for Easy Energy Supply
【中文关键词】Medium-chain fatty acids, Nanoliposomes, High-pressure microfluidization, Easy energy supply, Stability
【英文关键词】Medium-chain fatty acids, Nanoliposomes, High-pressure microfluidization, Easy energy supply, Stability
【中文摘要】Objective Developing a nanoliposome delivery system for an easy energy supply of medium-chain fatty acids (MCFAs) to improve oral doses and bioavailability. Methods Bangham ’ s method and high-pressure microfluidization were used to prepare MCFA liposomes. The easy energy-supply property of MCFA anoliposomes was estimated by the anti-fatigue experiments of mice including a weight-loaded swimming test and its corresponding parameters serum urea nitrogen, blood lactic acid, and hepatic glycogen). For comparison, nanoliposomes without MCFAs and MCFAs not entrapped in anoliposomes were used throughout. Results Compared with crude MCFA liposomes according to Bangham ’ s method, the MCFA nanoliposomes made by high-pressure microfluidization xhibited great advantages in their characteristics, with a small average diameter (76.2 ± 34.7 nm), narrow size distribution (polydispersity ndex 0.207), high ζ -potential (− 50.51 mV), great entrapment efficiency (70.5%) and drug loading (9.4%), and good stability. The high-dose roup and the MCFA group (680 mg/kg) showed a longer weight-loaded swimming time (104 ± 29 min, P = 0.087, and 108 ± 11 min, P = 0.047, espectively) and significantly higher hepatic glycogen (16.40 ± 1.45 mg/g, P < 0.001 and 17.27 ± 2.13 mg/g, P < 0.001, respectively) than the ontrol group (59 ± 11 min and 8.79 ± 2.76 mg/g, respectively). Moreover, serum urea nitrogen (891.5 ± 113.4 mg/L, P = 0.024, and 876.6 ± 0.8 mg/L, P = 0.015, respectively) and blood lactic acid (6.05 ± 1.40 mmol/L, P = 0.001, and 5.95 ± 1.27 mmol/L, P < 0.001, respectively) in he high-dose group and the group with an equivalent MCFA dose were significantly lower than those in the control group (1153.6 ± 102.5 mg/L nd 12.53 ± 1.86 mmol/L, respectively).Conclusion Similar to MCFAs, MCFA nanoliposomes prepared by high-pressure microfluidization showed a strong easy energy-supply property, which suggested that MCFA nanoliposomes could be a potential drug candidate for an easy energy supply.

【题目】The Effect of Dynamic High Pressure Microfluidization on the Activity of Papain
【中文关键词】dynamic high pressure microfluidization (DHPM), fluorescence spectra, papain, molecular conformation
【英文关键词】dynamic high pressure microfluidization (DHPM), fluorescence spectra, papain, molecular conformation
【中文摘要】The effect of dynamic high pressure microfluidization (DHPM) on the activity of papain had been investigated, and the molecular conformation hanges of papain had been detected by fluorescence spectra. The results showed that after DHPM (120~180 MPa) treatment, the enzyme activity ecreased in different degrees. The papain activity reduced to 90.04% after 180 MPa treatment. With the increasing of treatment pressure, the luorescence emission peaks of papain, Tyr and Trp residues gradually red shifted from 334, 285 and 277.5 nm for untreated sample to 335.5, 85.5 and 278.5 nm for 140 MPa treated sample, and then returned to 334, 285 and 278 nm for 180 MPa treated sample, respectively. After 24 h placing t 0~4 °C, papain activity further decreased and the fluorescence intensity of papain and Tyr residue showed oscillate (down, up and down), hich indicated that DHPM treatment (120~180 MPa) changed the molecular conformation of papain visibly with low stability of the new formed onformation.

【题目】动态瞬时高压作用对膳食纤维酶解速度的影响
【中文关键词】膳食纤维,瞬时高压作用,粒度分布,密度,酶解速度
【英文关键词】dietary fiber,instantaneous high pressure (IHP),size distribution,density,enzymolysis rates
【中文摘要】对纤维素酶在动态瞬时高压处理后膳食纤维的酶解速度进行了研究.豆渣膳食纤维(Dietary Fiber,DF)经微射流均质机的瞬时高压作用(Instantaneous High Pressure,IHP),在不同的压力以及同一压力的不同作用次数下产生不同粒径和密度,它们对应的酶解速度是不同的.纤维素酶水解膳食纤维产生纤维二糖和葡萄糖等还原糖,通过测定水解后还原糖的含量判断不同粒径和密度的膳食纤维的酶解速度.结果表明,在40~90 MPa的压力范围内,物料粒径随压力的增大呈显著下降,物料密度随之增大,酶解速度增大,在90 MPa的均质压力下物料粒径达到最小,为202.4 nm;当压力继续增大时,物料因膨化作用,物料粒径呈增大趋势,但其密度开始减小,酶解速度继续增大,在140 MPa的均质压力下物料密度达到最小,为1.027 g/mL,此时酶解后还原糖含量最高,酶解速度最快.压力超过140 MPa 后,由于超微颗粒间的团聚,物料的密度和粒径均增大,酶解速度减小.在90 MPa和140 MPa下分别对物料进行多次的瞬时高压处理,发现随处理次数的增多,物料粒径增大,体系密度先减小

后增大,酶解速度减小.
【英文摘要】The enzymolysis rates of cellulase on dietary fiber under dynamic Instantaneous High Pressure (IHP) were studied in the paper. Utilizing the Microfluidizer machinery as the carrier of Instantaneous High Pressure treatment to deal with dietary fiber from bean dregs, we got dietary fiber of different granularities and densities under different pressures and different times with the same pressure. The corresponding enzymolysis rates of cellulase on dietary fiber were different. The hydrolysates of cellulase on dietary fiber were some reducing sugars, such as cellobiose and glucose. The enzymolysis rates could be judged by measuring the contents of the reducing sugars in the dietary fiber of different granularities and densities. The results indicated that with the increase of the pressure in the range of 40~90 MPa, the granularities of the materials reduced greatly, the densities of the materials and the enzymolysis rates increased. And the granularity of the materials was in minimum at 202.4 nm; when the pressure went on increasing, the granularities of the materials tended to increase because of the occurrence of expanding in the system, but the densities started to decreased and the enzymolysis rates kept increasing. The density of the materials was in minimum at 1.027 g/mL, the contents of the reducing sugars after enzyme hydrolysis was maximal at this time. When the pressure higher than 140 MPa, the granularities and density of the materials increased, the enzymolysis rates decreased. It could be due to the reuniting of particles in the system. When the materials were treated separately with instantaneous high pressure between 90 MPa and 140 MPa for several times, the granularities of the materials increased as the increase of dealing times, the density decreased at the start and then increased, and the enzymolysis rates decreased.

【题目】壳聚糖添加纳米碳酸钙助剂对鲜切山药品质的影响
【中文关键词】山药,保鲜,纳米碳酸钙,壳聚糖,试验
【英文关键词】Yam;Preservation;Nano2CaCO3;Chitosan;Experiment
【中文摘要】为了探索纳米碳酸钙助剂对鲜切山药保鲜效果的影响,研究了壳聚糖添加纳米碳酸钙助剂对鲜切山药在10 ℃下品质的影响。结果表明,壳聚糖添加纳米碳酸钙助剂处理后鲜切山药的总酸度、Vc 含量和L 值分别比单独使用壳聚糖高1015 %、814 %和619 %;失重率和总酚含量分别比单独使用壳聚糖低912 %和813 %。壳聚糖添加纳米碳酸钙助剂可显著抑制多酚氧化酶和过氧化物酶活性,延缓果实褐变,延长货架期。添加纳米碳酸钙助剂可显著提高壳聚糖对鲜切山药的保鲜效果。
【英文摘要】In order to determine the effectiveness of nano2CaCO3 appendix on chitosan , f resh cut yam were t reated by chitosan coating with nano2CaCO3 appendix before stored at 10 ℃. The result s indicate the tit ratable acidity (TA) , Vitamin C content and L value of t reated f ruit by chitosan coating with nano2 CaCO3 appendix was 1015 % , 814 % and 619 % higher than that of chitosan coating f ruit , while the weigh loss and total phenolic content were 912 % and 813 % less than that of chitosan coating f ruit . It also inhibited the activities of polyphenol oxidase (PPO) and peroxidase (POD) maintained lower level of BI and prolonged shelf2life. Therefore , chitosan modified with nano2CaCO3 have potential use in f resh cut yam storage.

【题目】动态高压微射流对茎菠萝蛋白酶性质和构象的影响
【中文关键词】动态高压微射流技术;茎菠萝蛋白酶;最适pH 值;最适反应温度;pH 值稳定性;热稳定性;构象

【英文关键词】dynamic high-pressure microfluidization (DHPM);bromelain;optimal pH;optimal reaction temperature;pH stability;thermal stability;conformation

【中文摘要】以茎菠萝蛋白酶为原料,研究动态高压微射流(DHPM)对其活性、稳定性和构象的影响。结果显示:DHPM对茎菠萝蛋白酶具有钝化作用,但活力并不随着压力的升高而降低。压力为60、80、100、120MPa时,茎菠萝蛋白酶的相对酶活力分别是94%、93%、98%及92%。DHPM不同压力对茎菠萝蛋白酶的最适反应温度的影响不同,但对最适pH值几乎没有影响。然而经DHPM 60、120MPa处理后,茎菠萝蛋白酶在pH8.0的稳定性显著增强。在pH8.0保温40min后,60、120MPa处理的茎菠萝蛋白酶相对酶活力分别为85%和82%,分别比未经处理的高14%和11%。可见,DHPM 60、120MPa处理极大地提高了茎菠萝蛋白酶在pH8.0时的稳定性。此外,紫外光谱和荧光光谱的结果表明:DHPM导致茎菠萝蛋白酶部分去折叠,分子中赖氨酸和色氨酸残基所处的微环境发生了变化;红外光谱结果显示:DHPM处理后茎菠萝蛋白酶二级或三级结构发生了变化。

【英文摘要】The effect of dynamic high-pressure microfluidization (DHPM) treatment on activity, stability, and conformation of stem bromelain was studied. Results indicated that bromelain activity was inhibited by DHPM treatment although the residual activity did not decrease with increasing pressure. Under the pressures of 60, 80, 100 MPa and 120 MPa, 94%, 93%, 98% and 92% of bromelain activity were remained, respectively. The optimal temperature of bromelain treated under different pressures exhibited a significant difference, whereas, the optimal pHwas not affected. However,DHPMtreatments under 60 MPa and 120 MPa resulted in an obvious increase of pH stability. After incubation at pH 8.0 for 40 min, the residual rates of bromelain activity treated under 60MPa and 120 MPa were 85% and 82%, respectively, which exhibited increases of 14% and 11% compared with untreated bromelain. In addition, conformational change of bromelain induced by DHPM treatment was observed in the change of spectra. Ultraviolet and fluorescence spectra indicated that DHPM treatment induced the unfolding of bromelain and microenvironment changes of tryptophan and tyrosine residues. FTIR spectral analysis indicated that the secondary or tertiary structure of bromelain also disturbed by DHPM.

【题目】纳米碳酸钙改性壳聚糖涂膜对鲜切茄子生理生化指标的影响

【中文关键词】壳聚糖;纳米碳酸钙;茄子

【英文关键词】chitosan;nano-CaCO3;eggplant fruit

【中文摘要】以茄子作为材料,研究了纳米碳酸钙改性壳聚糖对鲜切茄子在10℃下品质和生理的影响。结果表明,纳米碳酸改性壳聚糖涂膜鲜切茄子的硬度和总可溶性固形物分别比未改性壳聚糖的高5%和7%,而细菌总数和水分损失比未改性壳聚糖的少32%和10%,纳米碳酸钙改性壳聚糖涂膜比未改性壳聚糖更能有效抑制鲜切茄子多酚氧化酶和过氧化物酶活性,从而维持果实的L值,抑制褐变。这表明纳米碳酸钙改性壳聚糖具有用于鲜切茄子保鲜的潜在价值。

【英文摘要】After stored at 10 °C for 5 days, the firmness and total soluble solid (TSS) content of eggplant fruits treated with modified chitosan are higher than those of fruits treated with unmodified chitosan by 5% and 7% respectively, while the total bacteria and weigh loss of fruits treated with modified chitosan are less than those of fruits treated with unmodified chitosan by 32% and 10% respectively. Also, modified chitosan more effectively inhibits activities of polyphenol oxidase and peroxidase, and maintain the higher level of L and the lower level of BI. Therefore, chitosan modified with nano-CaCO3 has potential value in fresh cut eggplant fruit storage.

【题目】奶牛乳房炎金黄色葡萄球菌毒力因子检测与基因分型
【中文关键词】乳房炎;金黄色葡萄球菌;毒力基因;ERIC-PCR
【英文关键词】Mastifs;Staphylococcus aureus;Virulence determinants;ERIC-PCR
【中文摘要】用PCR方法对新疆乌鲁木齐周边3个奶牛场奶牛乳汁中分离到的49株金黄色葡萄球菌的entA、 tsst-1、nuc、clfA、fnbA、fnbB、hla、hlb 8种毒力基因进行分子流行病学调查,并用肠道细菌基因间重复序列-PCR(ERIC-PCR)法对这49株金黄色葡萄球菌进行基因分型。结果:tsst-1、nuc、clfA、fnbA、fnbB、hla、hlb、entA毒力基因的检出率分别为4%、59.2%、63.3%、69.4%、22.5%、46.9%、53.1%、0,且以clfA、fnbA为主要检出毒力基因。ERIC-PCR分型结果显示:49株金黄色葡萄球菌可扩增出3~7条带,共分为4个聚类群,在同一牛场中的分离株存在不同基因型;而不同牛场中的分离株也可属于同一基因型。这种结果提示,在不同环境下同一种病原菌的基因型存在一定差异,可能存在多个金黄色葡萄球菌的流行株。
【英文摘要】Molecular investigations on the genes encoding virulence determinants entA,tsst-1,nuc,clfA,fnbA,fnbB、hla,hlb were conducted within 49 strains of Staphylococcus aureus isolated from subclinical mastitis by means of PCR and typed by Enterobacterial Repetitive Intergenic Consens-PCR (ERIC-PCR).The results revealed that the positive rate of tsst-1,nuc,clfA,fnbA,fnbB,hla,hlb,entA were 4%,59.2%,63.3%,69.4%,22.5%,46.9%,53.1%,0.ClfA and fnbA are predominant virulence determinants.ERIC-PCR could be amplified out 3~7 straps,revealing 4 genotype.Isolates from the same cow farm belonged to the different gene type,and isolates from different farms belonged to the same gene type.This suggested that the different genotypes of pathogenic bacteria can exist in different environments.

【题目】QTL analyses of seed weight during the development of soybean
【中文关键词】大豆,籽粒重,QTL
【英文关键词】soybean, seed weight, QTL
【中文摘要】象大豆籽粒重这样的收获性状通常都是受整个发育阶段的综合遗传效应的影响的,特别是生殖生长阶段。本研究的目的是检测从发育早期到发育终止期的大豆籽粒发育动态变化。本研究主要通过143个父母本大豆品种‘Charles东’和‘东农594”衍生的重组自交系来研究。结果表明68个非条件QTL与大豆籽粒发育相关,94个条件QTL受环境影响很大。在C2连锁群上,swC2-1, swC2-2 and swC2-3在6个发育时期影响大豆的籽粒重。QTL数量、位置和类型的基因和环境在不同发育是影响大豆籽粒重。
【英文摘要】At harvest traits such as seed weight are the sum of development and responses to stresses over the growing season and particularly during the reproductive phase of growth. The aim here was to measure quantitative trait loci (QTL) underlying the seed weight from early development to drying post harvest. One hundred forty-three F5 derived recombinant inbred lines (RILs) developed from the cross of soybean cultivars ‘Charleston’ and ‘Dongnong 594’ were used for the analysis of QTL underlying mean 100-seed weight at six different developmental stages. QTL_Environment interactions (QE) were analyzed by a mixed genetic mode based on 3 years’ data. At an experiment-wise threshold of a¼0.05 and by single-point analysis 94 QTL unaffected by QE underlay the mean seed weight at different developmental stages. Sixty-eight QTL affected by QE that also underlay mean seed weight were identified. From the 162 QTL 42 could be located on 12 linkage groups by composite interval mapping (LOD42.0). The numbers, locations and types of the QTL and the genetic effects were different at each developmental stage. On linkage group C2 the distantly linked QTL swC2-1, swC2-2 and swC2-3 eachaffected mean seed weight throughout the different developmental stages. The DNA markers linked to the QTL possessed potential for use in marker-assisted selection for soybean seed size. The identification of QTL with genetic main effects and QE interaction effects suggested that such interactions might significantly alter seed weight during seed development.

【题目】新质源(CMS-FA)杂交稻产量相关性状的遗传效应与杂种优势分析
【中文关键词】杂交稻;新质源(CMS-FA);杂种优势;遗传效应;产量相关性状
【英文关键词】hybrid rice; new cytoplasmic resource(CMS-FA); heterosis; genetic effects; yield-related traits
【中文摘要】:【目的】研究水稻新质源(CMS-FA)不育系和恢复系的产量相关性状遗传效应和杂种优势水平,评价新型细胞质源杂交稻亲本的育种潜力。【方法】采用不完全双列杂交设计,以新质源(CMS-FA)杂交稻系统的5 个不育系为母本,5 个恢复系为父本配制25 个杂交组合,种植亲本和F1获得产量相关性状的试验数据。利用加性-显性遗传模型和MINQUE(1)法对10 个产量相关性状遗传方差分量比率、遗传率、亲本加性效应和组合显性效应以及杂种优势进行剖析。【结果】新质源杂交稻产量相关性状同时受加性效应和显性效应的控制,单株穗数、每穗总粒数、每穗实粒数、结实率、千粒重、剑叶长和生育期等性状以加性效应占主导,单株产量、株高和穗长等性状则以显性效应控制为主;狭义遗传率以千粒重表现最高,生育期次之,单株产量最低;加性效应最好的不育系是金农2A,恢复系是金恢3 号和金恢1 号;显性效应最强的4 个组合为金农2A×金恢5 号、金农2A×金恢2 号、金农4A×金恢5 号和金农5A×金恢5 号;单株产量、株高、穗长3 个产量相关性状F1 具有很强的群体平均优势(7.351%—16.330%)和群体超亲优势(4.233%—10.507%),强优势组合杂种优势可达10.307%—49.462%。【结论】供试不育系以金农2A 较好,恢复系以金恢3 号和金恢1 号最好,金恢5 号在配制生育期较短的杂交稻高产组合中是一个很好的亲本。
【英文摘要】【Objective】 This study aimed at detecting the genetic effects and heterosis level of yield-related traits of CMS-FAsterile lines and restorers as well as the breeding potential of CMS-FA hybrid rice parents. 【Method】 By incomplete diallel crossdesign, using five CMS-FA sterile lines as female parents and five corresponding restorers as male parents, twenty-five crosses weremade. The parents and F1 generations were planted to obtain the data of yield-related traits. By using the additive-dominant modeland MINQUE(1) method, the genetic variance, heritability, parent additional effects and combination dominant effects, and heterosisof ten yield-related traits were analyzed. 【Result】 Yield-related traits of CMA-FA hybrid rice were controlled by both additive anddominant effects, among which panicle number per plant, total grain number per panicle, filled grains per panicle, seed-set percent,1000-grain-weight, flag-leaf length and growth duration and so on were mainly controlled by additive effects. The dominant effectsprevailed in the traits of yield per plant, plant height, and panicle length and so on. As for narrow heritabilities, the dominant effectsof 1000-grain-weight were the highest, the growth duration was the next, and the yield per plant was the lowest. Sterile line Jinnong2A and restorers Jinhui 3 and Jinhui 5 had the best additive effects. The four combinations with the strongest dominant effects wereJinnong 2A×Jinhui 5, Jinnong 2A×Jinhui 2, Jinnong 4A×Jinhui 5 and Jinnong 5A×Jinhui 5. Three yield-related trais yield per plant,plant height and panicle length had stronger population mean heterosis of 7.351%-16.330% and population over-parent heterosis of4.233%-10.507% in F1 with the highest heterosis reaching 10.307-49.462%. 【Conclusion】 Jinnong 2A was the best one of all thesterile lines tested, Jinhui 3 and Jinhui 1 were the best ones of restorers tested, and Jinhui 5 was a good parent for the development ofhigh-yielding hybrid rice combination with short growth duration.

【题目】基于Web与模拟模型的水稻栽培数字化设计
【中文关键词】WEB;模拟模型;水稻栽培;决策支持系统;数字化设计

【英文关键词】WEB; Simulation model; Rice cultivation; Decision-making support system; Digital design
【中文摘要】【目的】集成作物生长模拟、决策支持系统与WEB技术,实现作物栽培数字决策技术的网络化。【方法】以武运粳7号、扬稻6号、粤优948及南粳41为供试材料,2005年在江苏省农科院试验区进行了不同基肥田间试验,采集和更新了品种参数;采用SQLServer2000建立水稻品种、土壤及气象资料数据库;采用VS.NET进行了水稻生长模拟、决策支持系统与WEB的集成和页面设计,包括登录、系统主界面、品种参数管理、地点气象数据管理、参数调整以及水稻栽培决策等功能。【结果和结论】基于WEB与模拟模型的水稻栽培数字化设计符合TCP/IP协议,可在服务器上(IIS5.0)安装、运行和在任何Internet浏览器上调用,它继承了RCSODS的机理性、普适性和实用性,将水稻生长模型与WEB技术相结合,形成了水稻模拟优化决策的网络平台,使水稻主产区农业技术人员通过INTERNET因地、因种、因时制定具有动态、目标和数字化特征、可下载的播前优化方案,提供当年调控建议,对作物生长模型的网络化具有重要意义。
【英文摘要】In order to integrate WEB with crop growth simulation and decision-making support system, the field experiment of different basal levels was carried out in experiment area of Jiangsu Academy of Agricultural Sciences in 2005 adopting 4 cultivars such as “ Wuyungeng 7 ”, “ Yangdao 6 ”, “ Yueyou 948 ” and “ Nanggeng 41 ”, which mainly was used in collecting cultivar parameters and updating database of them. The database of rice cultivars, soil and weather data were developed using SQL Server 2000. The pages of digital design of rice cultivation based on web and simulation model (DDRCBWSM) were designed using Visual Studio.Net, which included register, the main page, cultivar parameter management, site data management, parameter adjustment, decision making for rice cultivation, and so on. The DDRCBWSM accorded with TCP/IP agreements, which could be installed and run in server (IIS5.0), and be browsed on internet, it inherited mechanism, universal adaptability and utility of rice cultivation simulation-optimization-decision making system(RCSODS), combined web techniques with research of rice growth models, set up web system of rice simulation-optimization-decision making, made agricultural technicians of main rice production area of china gain pre-sowing optimization cases and rice management suggestion of the current year with dynamic, goal and digital characteristic in accordance with soil, cultivar and weather conditions online, and to fulfill technical direction through many kind manner such as paper, internet, email, television, wall newspaper, and so on, eventually.

【题目】新疆褐牛Toll样受体基因(TLR4)外显子III 2021位点突变与奶牛体细胞评分的相关性研究
【中文关键词】新疆褐牛,Toll样受体4(TLR4)基因,基因型,定量PCR,奶牛乳房炎,体细胞评分
【英文关键词】XinJiang brown cattle,TLR4 gene,Genotype,Quantitative RT-PCR, Mastiffs,SCS
【中文摘要】Toll-样受体(toll like receptors,TLRs)可以通过识别病原微生物启动天然免疫并激活适应性免疫。以中国荷斯坦奶牛和新疆褐牛为研究对象,对TLR4基因外显子3进行了序列分析,并对发现的多态性位点进行PCR-RFLP分析,共发现TLR4 E3+1656、TLR4 E3+2021和TLR4 E3+2414三个多态位点。对TLR4 E3+1656和TLR4 E3+2021位点x2检验表明:2个品种的突变均处于Hardy-Weinberg平衡状态(P>0.05)。运用最小二乘法分析表明,TLR4 E3+1656位点的各基因型个体间的体细胞评分(SCS)差异不显著(P>0.05);而TLR4 E3+2021位点中AA与AB基因型SCS水平差异显著(P<0.05),AA与BB基因型SCS水平差异极显著(p<0.01),但AB与BB基因型SCS水平差异不显著(P>0.05)。研究结果提示,TLR4 E3+2021位点的AA基因型可能与抗乳房炎的抗性有关,A等位基因是乳房炎抗性的有利基因。采用RT-PCR技术检测了不同基因型的新疆褐牛个体中TLRs信号通路下游的部分基因mRNA的表达水平,结果显示,NF-κB1、NF-κB2和IL-1β基因mRNA表达水平与TLR4 E3+2021位点AB和BB两种基因型差异显著(P<0.05),TLR4、IL-10和IL-8基因mRNA表达水平与TLR4 E3+2021位点AB和BB两种基因型差异不显著(P>0.05)。
【英文摘要】Toll like receptors(TLRs) recognize pathogen ligands and mediates signaling to initiate innate and adaptive immune responses.In this experiment.Chinese holstei and Xinjiang brown cattle were used as experimental example.Their genetic polymorphisms of TLR4 gene exon IIIwere detected by sequencing first and by PCR-RFLP in the second.Results showed that threePoiymorphism loci,TLR4 E3+l656,TLR4 E3+2021 and TLR4 E3+2414,were discovered.Statistical results of X2 test indicated that two polymorphism sites(TLR4 E3+1656 and TLR4 E3+2021)in the three populations fixed with Hardy-Weinberg equilibrium(P>0.05).The associations were observed between genotypes and SCS by the least square analysis.The results showed that SCS was not significantly affected by different genotypes in TLR4 E3+1656(P>0.05);the significantdifferent effect between genotype AA

and AB was found(P<0.05),the difference was significantbetween genotype AA and BB was found(P<0.01) and no significant difference were detectedbetween genotype AB and BB(P>0.05) in TLR4 E3+2021 site.In conclusion,the AA genotypeinTLR4 E3+2021 site may be the best genotype to resist mastitis,the allele A may play an important role in mastiffs resistance in bovine.To research the effect of different genotypesof TLR4 E3+2021 site on SCS,part of the mRNA of the gene expression wherein TLRs signalingpathway downstream of Xinjiang brown cattle were detected by Real-Time PCR.The level of Nuclear Factor-kappa b1(NF-KB1),Nuclear Factor-kappa b2(NF-KB2)and Interleukin-1β (IL-1β)transcripts was significantly correlated with genotype of AA and BB in TLR4 E3+2021(P<0.05),but the level of TLR4,IL-10 and IL-8 transcripts was no significantly correlated with genotype of AA and BB in TLR4 E3+2021(P>0.05).

【题目】新质源(CMS-FA)杂交稻谷粒性状的遗传效应分析

【中文关键词】杂交稻;新质源(CMS-FA);谷粒性状;遗传效应

【英文关键词】无

【中文摘要】:采用加性- 显性遗传模型(AD),对新质源杂交稻(CMS-FA)遗传系统的10 个亲本和25 个杂种一代的谷粒性状进行遗传分析。结果表明,新质源杂交稻的千粒重和粒长的遗传主要受加性效应控制,它们的狭义遗传率较大且均达极显著水平,在早代对这2 性状进行选择可达到较好的效果,而粒宽、长宽比各项遗传方差分量均不显著。亲本加性遗传效应预测值表明,金恢3 号是改良水稻谷粒性状的优良亲本,其能显著的提高千粒重、增加粒长和长宽比。杂交组合显性效应在千粒重性状上有较大的差异,而在粒长、粒宽和长宽比性状上差异较小。

【题目】新质源CMS-FA 杂交稻系统的亲本资源筛选
【中文关键词】CMS-FA; 保持系; 杂交稻亲本资源利用率; 花粉染色率; 套袋结实率; 自然结实率
【英文关键词】CMS-FA; Maintainer line; Utilization rate of parental resources of hybrid rice; Pollen dyeability percentage; Bagged seed-setting percentage; Self-setting percentage
【中文摘要】用新质源雄性不育系金农1A(CMS-FA)作母本, 分别与来自10 个国家和国内13 个省份的220 个水稻品种组配成杂交种, 考察F1 代的花粉染色率、套袋结实率和自然结实率。在F1 代中, 当这3 项育性指标均≤10%时, 显示父本品种具有雄性不育保持能力, 因而将其划分为保持系资源; 当3 项育性指标均≥80%时, 显示父本品种具有雄性不育恢复能力, 将其划分为恢复系资源; 此外的其他父本品种, 即3 项育性指标中任何一项指标>10%或<80%, 既不能作为保持系, 也不能作为恢复系, 被划分为非杂交稻亲本资源。在220 个水稻品种中, 可作为金农1A 保持系的有122 个, 占55.5%; 未发现恢复系亲本; 非杂交稻亲本品种有98 个, 占44.5%。CMS-FA 型的杂交稻亲本资源利用率为55.5%。对照野败型不育系珍汕97A(CMS-WA)的保持系亲本品种有44 个, 占20.0%; 恢复系亲本品种42 个, 占19.1%; 非杂交稻亲本品种134 个, 占60.9%。CMS-WA 型的杂交稻亲本资源利用率为39.1%。CMS-FA 系统比CMS-WA 系统的亲本稻种资源利用率高16.4 个百分点, 尤其是保持系资源利用率高35.5 个百分点(近1.8 倍)。国外品种的育性普遍低于国内品种。
【英文摘要】Jinnong 1A is a new type of cytoplasm male sterile (CMS) line in three-line hybrid rice (Oryza sativa L.). It is completelydifferent from the sterile line of CMS-WA and CMS-HL types, and designated as CMS-FA type. In this study, Jinnong 1A,as the female parent, was crossed with 220 rice varieties originated from 10 countries and 13 provinces of China. The fertility ofthe F1 generation was evaluated with F1 pollen dye ability rate, bagged seed-setting rate, and natural seed-setting rate. The maleparent was classified into maintainer or restorer lines when all the three fertility indices were ≤10% or ≥80% in the F1 generation.Otherwise, it was regarded as non-parental variety for CMS-FA hybrid rice. In the total 220 varieties, 122 were identified asmaintainer lines of Jinnong 1A, which accounted for 55.5%, but no varieties could be used as restorer lines. The other 98 varieties(accounting for 45.5%) were non-parent for CMS-FA hybrid rice. With regard to CMS-WA sterile line, Zhenshan 97A taken as thecontrol in the study, the maintainer and restorer lines were 44 (20.0%) and 42 (19.1%), respectively. Compared with CMS-WAhybrid system, the CMS-FA system had a higher parent utilization rate by 16.4 percentile, especially the maintainer line utilizationwas higher by 35.5 percentile (up to 1.8 folds). Generally, the fertility abilities of domestic varieties were higher that those of introducedvarieties in the F1 generation.

【题目】IdentiWcation of QTL underlying isoXavone contents in soybean seeds among multiple environments
【中文关键词】大豆,异黄酮,QTL
【英文关键词】Soybean, isoflavone, QTL
【中文摘要】大豆异黄酮在某些药品,化妆品,食品和饲料的价值。选择高异黄酮含量与农艺性状的种子是许多大豆育种目标。该研究的目的是在中国的7个环境与种子异黄酮含量相关的QTL。一个高异黄酮中豆27和低异黄酮九农20的130个F5重组自交系。 共有99个SSR标记构建了开一个遗传连锁图谱。种子异黄酮含量分析采用高效液相色谱法的多个年份和地点(哈尔滨2005,2006和2007,呼兰2006,2007,和绥化的2006和2007)。3个QTL与DZ,3个QTL与GC,4个QTL与GT,5个QTL与Ti。1个在F连锁群上的QTL与DZ、GT、TI能够在7个环境与异黄酮相关。这些QTL具有巨大的分子育种潜在的价值。
【英文摘要】Soybean isoXavones are valued in certain medicines, cosmetics, foods and feeds. Selection for high-isoflavone content in seeds along with agronomic traits is a goal of many soybean breeders. The aim of the study was to identify the quantitative trait loci (QTL) underlying seed isoflavone content in soybean among seven environments in China. A cross was made between ‘ Zhongdou 27 ’, a soybean cultivar with higher mean isoXavone content in the seven environments (daidzein, DZ, 1,865 _g g ¡ 1; genistein, GT, 1,614 _g g ¡ 1; glycitein, GC, 311 _g g ¡ 1 and total isoflavone, TI, 3,791 _g g ¡ 1) and ‘ Jiunong 20 ’, a soybean cultivar with lower

isoXavone content (DZ, 844 _g g ¡ 1; GT, 1,046 _g g ¡ 1; GC, 193 _g g ¡ 1 and TI, 2,061 _g g ¡ 1). Through single-seed-descent, 130 F5-derived F6 recombinant inbred lines were advanced. A total of 99 simple sequence repeat markers were used to construct a genetic linkage map. Seed isoflavone contents were analyzed using high-performance liquid chromatography for multiple years and locations (Harbin in 2005, 2006 and 2007, Hulan in 2006 and 2007, and Suihua in 2006 and 2007). Three QTL were associated with DZ content, four with GT content, three with GC content, and Wve with TI content. For a QTL detected the beneWcial allele was from Zhongdou 27. QTL were located on three (DZ), three (GC), four (GT) and five (TI) molecular linkage groups (LG). A novel QTL was detected with marker Satt144 on LG F that was associated with DZ (0.0014 > P > 0.0001, 5% < R2 < 11%; 254 <DZ < 552 _g g ¡ 1), GT (0.0027 > P > 0.0001; 4% < R2< 9%; 262 < GT < 391 _g g ¡ 1), and TI (0.0011 > P > 0.0001;4% < R2 < 15%; 195 < TI < 871 _g g ¡ 1) across the various environments. A previously reported QTL on LG M detected by Satt540 was associated with TI across four environments and TI mean (0.0022 > P > 0.0001; 3% < R2 < 8%; 182 < TI < 334 _g g ¡ 1) in China. Because both beneficial alleles were from Zhongdou 27, it was concluded that these two QTL would have the greatest potential value for marker-assisted selection for high-isoflavone content in soybean seed in China.

【中文关键词】水稻;低温;分蘖;黑龙江
【英文关键词】rice; low temperature; tiller; Heilongjiang
【中文摘要】摘要:通过对水稻低温处理条件下的分蘖情况调查,结果表明低温处理对分蘖的发生具有明显的抑制作用,不同品种对低温的敏感度不同,3~6 d的低温处理严重影响水稻分蘖的发生,而低温处理时间低于3 d对水稻的最大分蘖数影响不大。
【英文摘要】Abstract: Under the low temperature, the rice tillering was surveyed. The results showed that:the low temperature lead to a low tiller occurring. The effect of low temperature was different among the different rice varieties. The number of tillers of the rice treated in low temperature for 3 to 6 days was significantly lower than the ck. The maximum number of rice tiller was not significantly affected by low temperature within 3 days.

【题目】Identi fi cation of QTL underlying soluble pigment content in soybean stems related to resistance to soybean white mold(Sclerotinia sclerotiorum)
【中文关键词】大豆,菌核病,QTL
【英文关键词】soybean, SWM, QTL
【中文摘要】自从1978年大豆菌核病爆发以后,这个病害已经在全世界爆发了。在这个研究中我们利用一个茎中色素含量作为QTL判定的标准。我们利用感病品种和丰25和抗病品种Maple Arrow杂交衍生的149个F5:6重组自交系,和109个SSR标记构建了一个遗传连锁图谱,一共3个QTL Qsp-1 (Satt502-Sat_159), Qsp-2 (Sat_156-Satt251), and Qsp-3 (Satt525-Satt233), 被定位在D1a+q, B1 和 A2连锁群上。其分别能够解释6.29-15.37%的表现型变异。这3个QTL对于分子育种是十分重要的。.
【英文摘要】The frequency of soybean white mold(Sclerotinia sclerotiorum, SWM) outbreaks hasincreased since 1978, and this disease is currently considered to be the second most important cause of soybean yield loss worldwide. We have studied SWM in stems of soybean cultivar Maple Arrow, which shows partial resistance to SWM, in an attempt to identify the quantitative trait loci (QTLs) underlying soluble pigment(s) content, which is associated with SWM resistance. A SWM-susceptible cultivar, Hefeng25, was crossed with Maple Arrow, and 149 F5:6 recombinant inbred lines were subsequently advanced through single-seed-descent. A total of 109 simple sequence repeat (SSR) markers were used to construct a genetic linkage map. Three QTLs for soluble pigment content in soybean stems associated with the resistance to SWM, namely, Qsp-1 (Satt502-Sat_159), Qsp-2 (Sat_156-Satt251), and Qsp-3 (Satt525-Satt233), were identified in 2007 and 2008 and located onto linkage groups D1a+q, B1 and A2, respectively. The phenotypic variation (R2) explained by these QTLs ranged from 6.29 to 15.37%. These three QTLs were not significantly related to known QTLs associated with escape resistant mechanisms. The use of these QTLs in marker-assisted selection may contribute to improved soybean resistance to SWM.

【题目】水稻苗期耐冷QTL的图谱整合
【中文关键词】水稻;苗期耐冷;QTL映射;元分析
【英文关键词】Rice; Cold tolerance at seedling stage; QTL projection; Meta analysis
【中文摘要】摘 要:提高水稻苗期耐冷性是寒地水稻育种的主要目标之一。本研究利用生物信息学手段,收集整理了来自11个作图群体共96个与水稻苗期耐冷性相关的QTL信息。通过Biomercator2·1和共有标记映射,将QTLs 整合到参考图谱cornell2001上,并通过元分析的方法计算真实QTLs。建立了水稻苗期耐冷QTLs的一致性图谱,共发现18个“真实QTLs”及其连锁标记。为水稻苗期耐冷基因的精细定位、图位克隆以及分子辅助育种奠定基础。
【英文摘要】Abstract:Cold tolerance at seedling stage is a critical trait for rice growth.A total of 96 QTLs related to seedling cold tolerance of rice from 11 mapping populations were collected and arranged by bioinformatics tools. These QTLs and their common markers were integrated with the reference map cornell2001 by Biomercator2.1,The real QTLs were calculated by the method of meta analysis. Moreover, a consensus map of rice QTLs conferring seedlings cold tolerance was constructed. Totally, 18 real QTLs and their linked markers were found. This research offers a basis for fine mapping, map based cloning and marker assisted breeding of rice seedling cold tolerance genes.

【题目】叶面喷施调节肥对寒地水稻生长及产量形成的影响
【中文关键词】水稻;调节肥;生长;产量
【英文关键词】Rice; Regulating fertilizer; Growth; Yield
【中文摘要】摘要:以水稻空育131(主茎11叶)为材料,通过叶面喷施调节肥,比较了不同处理之间水稻生长及产量形成的差异,确定了适宜的调节肥施用量及喷叶期。结果表明:调节肥叶喷施用量为整个生育期氮肥用量的10%和15%更有利于提高水稻成穗率和增加平方米茎数,其中15%施用量对各节间长度的配比效果最佳;3个处理均显著提高了抽穗后15~20 d干物质积累量,其中6.1 ~6.5叶期喷干物质积累为最多,8.1~8.5叶期喷次之。
【英文摘要】Abstract: In the experiment, we used a rice cultivar 'Kongyul3l ’ by spraying in a field experiment. The aim of this experiment was to discover difference of growth and the formation of production in rice plant by spraying regulating fertilizer, determine the appropriate application and period of regulate fertilizer. The results showed that the application of 10 percent and 15 percent of N significantly enhanced effective panicle rate and increased stems per square meter, in which the 15 percent of N was a best selection in the ratio between the inter node lengths. On the other hand, three treatments were significantly increased dry matter accumulation 15 to 20 days after heading, of which 6.1 to 6.5 leaves of the spraying period was a maximum of dry matter accumulation, next was 8.1 to 8.5 leaves of the spraying period. However, variance analysis showed that the application and period of regulating fertilizer on rice yield components and rice quality did not reach significant levels. The above results indicated that the appropriate application of regulate fertilizer was 15 percent of the total N throughout the season, and the period of regulating fertilizer was 6.1 to 6.5 leaves.

【题目】QTL in mega-environments: II. Agronomic trait QTL co-localized with seed yield QTL detected in a population derived from a cross of high-yielding adapted high-yielding exotic soybean lines.
【中文关键词】大豆, QTL, 普适QTL
【英文关键词】soybean, QTL, universal QTL
【中文摘要】多环境普遍适用的与种子产量相关的QTL(qtlu),其分别与satt100,satt130,satt162,satt194,satt259 satt277和sat_126相关。这些QTL主要通过加拿大与中国主栽大豆品种。因此,本研究的目的是确定性状与产量的相关性和确定产量qtlu。4个标记satt100,satt277,satt162和sat_126,共本地化与性状与农艺性状,表现为qtlu或qtlsp的农艺性状。例如,产量qtlu与satt100有关,也与百粒重,单株荚,荚节,株高,R 1,R 5,R 8,含油率和蛋白质含量,但只有与单株荚,荚节,株高,R 1,R 5,但其与一个或多个中国环境。
【英文摘要】Seed yield mega-environment-universal and specific QTL (QTLU and QTLSP, respectively) linked to Satt100, Satt130, Satt162, Satt194, Satt259 Satt277 and Sat_126, have been identiWed in a population derived from a cross between a Chinese and a Canadian soybeanelite line. The variation observed in yield could be the consequence of the variation of agronomic traits. Yield-component traits have been reported in the literature, but a better understanding of their impact at the molecular level is still lacking. Therefore, the objectives of this study were to identify traits correlated with yield and to determine if the yield QTLU and QTLSP were co-localized with QTLU and QTLSP associated with an agronomic trait. A recombinant inbred line (RIL) population was developed from a cross between a high-yielding adapted Canadian and a high-yielding exotic Chinese soybean elite line. The RIL were evaluated in multiple environments in China and Canada during the period from 2004 to 2006. Four yield QTLU, tagged by markers Satt100, Satt277, Satt162 and Sat_126, were co-localized with a QTL associated with an agronomic trait, behaving as either QTLU or QTLSP for the agronomic trait. For example, the yield QTLU, tagged by marker Satt100 was associated also with 100 seed weight, pods per plant, pods per node, plant height, R1, R5, R8, oil content and protein content in all Canadian environments, but only with pods per plant, pods per node, plant height, R1, R5, R8 and oil content in two or more Chinese environments. No agronomic traits QTL were co-localized with the yield QTLU tagged by the marker Satt139 or the yield QTLSP tagged by Satt259, suggesting a physiological basis of the yield in these QTL. The results suggest that a successful introgression of crop productivity alleles from plant introductions into an adapted germplasm could be facilitated by the use of both the QTLU and QTLSP because each type of QTL contributed either directly or indirectly through yield-component traits to seed yield of RILs.

【题目】优质超级稻松粳9号籽粒灌浆动态研究
【中文关键词】超级稻;松粳9号;灌浆动态
【英文关键词】super rice; Song jing No. 9; dynamic of seed filling
【中文摘要】摘要:通过对不同水稻品种籽粒灌浆动态的研究,结果表明:与两个对照品种相比,优质超级稻松粳9号籽粒灌浆具有启动早、灌浆速率高而且平稳的特点。上部籽粒和下部籽粒灌浆速率平稳,抽穗后25 d灌浆速率达到最大值,与两个对照品种一致;中部籽粒在抽穗后30 d灌浆速率达到最大,晚于两个对照品种。不同部位的籽粒灌浆差异明显,灌浆速率和粒重由大到小依次是上部籽粒、中部籽粒、下部籽粒。

【英文摘要】Abstract: Dynamic study of seed filling on Song jing No. 9 was conducted. The results showed that: The seed filling character of Song jing No. 9 was earlier, faster and more stable than the two contract varieties. It was the same as CKs that the seeds filling velocity on top and low were stable, and reached the maximum after 25 days of heading, but the middle seeds were 5 days later than the top and low. The difference was evident that the filling velocity of seeds on different part, the sequence of fill2ing velocity and seed weight from strong to weak was top, middle and low.

【题目】增施氮肥对寒地水稻产量性状的影响
【中文关键词】氮肥;移栽密度;产量
【英文关键词】N fertilizer; Planting density; Yield
【中文摘要】摘要:[目的]研究氮肥用量对寒地水稻产量性状的影响。[方法]以龙粳14、龙粳18、龙粳20为材料,研究不同种植密度(18、20穴/m2)下氮肥用量(150、165、180、195 kg/hm2)对水稻产量性状的影响。[结果]增加N肥用量可提高3个水稻品种的有效穗数;2种密度下,龙粳20的有效穗数最多,龙粳14和龙粳18的有效穗数差异不大;20穴/m2种植密度下,各施肥处理水稻产量均高于18穴/m2密度下相应施肥处理;氮肥用量为165 kg/hm2时龙粳14和龙粳18的产量最高,氮肥用量为180 kg/hm2时龙粳20的产量最高;龙粳14和龙粳18的出米率与施肥量无明显关系,而龙粳20的出米率随施氮量的增加略有升高。[结论]施氮量为165~180 kg/hm2时,3个品种的最佳移栽密度为20穴/m2
【英文摘要】Abstract:[Objective] The aim was to study the effects of N application amount on yield traits of rice in cold area. [Method]With Longjing14, Long jing 18, Long jing 20 as the materials, the effects of N application amount(150, 165, 180 and 195 kg/hm2) on their yield traits under 2 planting densities(18, 20 points/m2) were studied. [Result] Increasing N application amount could mi prove the effective panicle number of 3 varieties. Under2 planting densities, the effective panicle number of Longjing20 was the most and those of Longjing14 and 18 had little difference. Rice yield in all N treatments under 20 points /m2 were all higher than those under 18 points /m2. When N application amount was 165 kg/hm2, the yields of Longjing14 and 18 were the highest and that of Longjing 20 was the highest when N application amount was180 kg/hm2. The white rice yield of Longjing14 and Longjing18 had no obvious relationship with fertilization amount But the white rice yield of Long jing 20 was slightly increased with the increment of N application amount [Conclusion]When N application amountwas165-180 kg/hm2, the optimum planting densities of 3 varieties were 20 points/m2

【英文关键词】Continuous cropping; Protected soil; Soil nutrients
【中文摘要】摘 要: 通过连3年定位对水稻施肥, 明确了不同肥料处理的应用效果及最佳使用方法。试验结果表明: 在不同处理中, 以Bokashi+化肥处理水稻生长发育及产量构成与常规水稻生产相比差异不明显。对减少化肥使用量, 提高化肥利用率, 发展绿色水稻生产有重大意义。
【英文摘要】Abstract: Thirty- six soil samples of different years of continuous cropping of protected cultivation and controls in the near open ground were collected and their nutrients determined in this study. The results showed that the contents of organic matter, total N, total P, total K and alkali- hydrolysable N, available P and available K in the soil of continuous cropping of protected cultivation of tomato were obviously higher.

【题目】氮肥基追不同分施比例对寒地粳稻产量及氮肥利用率的影响
【中文关键词】寒地粳稻;氮肥利用率;产量;施氮比例
【英文关键词】cold rice; nitrogen use efficiency; yield; nitrogen proportion
【中文摘要】摘 要:在基础地力和施氮总量相同的条件下,氮肥基追不同分施比例对寒地粳稻产量及氮肥利用率的影响。以11叶品种空育131和12叶品种垦鉴稻6号为材料,设基肥、蘖肥、调节肥和穗肥9种施肥比例。表明:氮肥基追不同分施比例对各时期植株体内氮素积累量差异显著,其中成熟期氮素积累量与产量呈显著正相关,相关系数r=0.67-0.75*。氮肥基追不同分施比例对氮肥利用率和产量差异显著正相关,相关系数为r=0.63-0.68*。在基础地力和施氮总量相同的条件下,基肥、蘖肥、调节肥和穗肥的最佳分施比例为4:2:2:2和4:3:1:2,这种施肥比例下氮肥利用率和产量高。
【英文摘要】Abstract:The aim of this experiment was to discount fertilizing nitrogen in different proportion between base fertilizer and top dressing fertilizer affects yield and efficiency of nitrogen fertilizer utilization of Japonica rice in cold region at the same level of soil fertilizer content and the same amount of nitrogen fertilizer application. In this paper, we used two rice cultivars ‘ Kongyu 131 ’ and ‘ Kenjiandao 6 ’. The results were as followed, at every stage of rice plant growing, there is significantly different among the amount of nitrogen accumulation of plant. In the maturity, the amount of nitrogen accumulation with yield was positive correlation (r=0.67-0.75*).Fertilizing nitrogen in different proportion between base fertilizer and top dressing fertilizer was positive correlation with

yield (r=0.63-0.68*). When the nitrogen was fertilizer in the base fertilizer, tillering fertilizer, regulation fertilizer, panicle fertilize of 4:2:2:2, and 4:3:1:2, the efficiency of nitrogen fertilizer utilization and the yield were respectively the highest.

【题目】氮素用量对寒地水稻氮代谢关键酶活性的影响
【中文关键词】寒地水稻;氮素用量;硝酸还原酶;谷氨酰胺合成酶;核酮糖 - 1,5- 二磷酸羧化酶
【英文关键词】rice in cold region; nitrogen level; NR; GS; RuBP carboxylase
【中文摘要】摘 要:本试验以寒地水稻松粳 6 号和松粳 9 号为材料,研究了氮素用量对寒地水稻功能叶片氮代谢关键酶活性的影响。研究结果表明:寒地水稻功能叶片 NR、GS 活性在整个生育期均呈单峰曲线变化,峰值均出现在抽穗期,氮素用量对功能叶片 NR、GS 活性的影响因品种和时期而异;寒地水稻功能叶片RuBP羧化酶活性从齐穗后呈下降趋势,并且随施氮量的增加而提高;不同生育时期 NR、GS、RuBP羧化酶活性与产量及产量构成因子相关关系和相关程度不一致;在一定范围内,水稻产量随着氮量增加而增加,氮素用量与产量间呈一元二次曲线关系。
【英文摘要】Effects of Nitrogen Level on Key Enzyme to Nitrogen Metabolism of Rice in Cold Region GANG Shuang, WANG Jing-guo, YANG Liang, GAO Yang, ZANG Jia-xiang, ZHAO Hong-wei(Agricultural College, Northeast Agricultural University, Harbin, Heilongjiang 150030, China)Abstract:This experiment with two varieties of rice (Song jing 6 and Song jing 9) in cold region for test materials to study the effect of nitrogen application on nitrogen metabolism key enzyme activity of rice functional leaves. The results show that NR, GS activity of rice function leaves appeared with single peak curve in the whole growth period, the peak value occurred in the heading stage. The effect of nitrogen application on NR and GS activity in functional leaves of rice in cold region were different on different varieties and growth stages, RuBP carboxylase activity of rice functional leaves emerged downtrend from heading stage, moreover the activity improved with the nitrogen application rate increased. The NR, GS and RuBP carboxylase activity with yield and yield components and associated factors related to the degree of inconsistency in different growth stages. In certain extent, the rice yield increased with nitrogen application improved, the relationship between nitrogen consumption and yield was monadic quadratic curve.

【题目】氮素用量对水稻籽粒谷氨酰胺合成酶活性及产量的影响
【中文关键词】氮素;水稻;籽粒;谷氨酰胺合成酶活性;产量
【英文关键词】nitrogen; rice; grain; glutamine synthetase; yield
【中文摘要】摘 要:以东农 423、东农 425、松粳 6 号和松粳 9 号 4 个水稻品种为试验材料,研究了不同氮素处理对水稻籽粒谷氨酰胺合成酶活性及产量的影响。结果表明,籽粒谷氨酰胺合成酶活性在抽穗后呈下降趋势,适量施氮对谷氨酰胺合成酶活性有明显的促进作用;对 4 个品种来说,东农 425 和松粳 9 号以 N150 处理下有较高的酶活性,东农 423 和松粳 6 号则以 N100 处理为最佳;在一定范围内,籽粒产量随施氮量的增加而增加,对东农 423、东农 425 和松粳 6 号而言,N150 是保证高产最佳施肥量;松粳 9 号以 N200 处理为最佳。籽粒谷氨酰胺合成酶活性与籽粒产量呈正相关关系,其中抽穗后 7,35 d 酶活性与产量呈极显著正相关
【英文摘要】Abstract: This experiment utilized Dongnong423, Dongnong425, Songjing6 and Songjing9 as the tested varieties , the effect of different nitrogen levels on the glutamine synthetase (GS) activity in grains and the yield of rice was studied. The results showed that dynamics of GS activities gradually declined since the heading, the effect nitrogen application could increase the GS activities ,

when the best GS activity apply nitrogen was 150 kg · hm-2for Dongnong425 and Songjing9, but the treatment of 100 kg · hm-2was the best for Dongnong423 and Songjing6. To a certain extent, the yield of rice increased with the increasing of nitrogenous fertilizer. N150 treatment was the best for Dongnong423, Dongnong425 and Songjing6 ton sure a high yield, while N200 was a prime treatment for Songjing9. The GS activities in grains were positively related to the yield. The GS activities at 7, 35 d after heading showed significantly positive correlation with the yield.

【题目】寒地粳稻生育后期剑叶光合特性变化的研究
【中文关键词】寒地粳稻; 剑叶; 叶绿素含量; 净光合速率; 硝酸还原酶活性
【英文关键词】Japonica rice in cold region; chlorophyll content; net photosynthetic rate; nitrate reductase ac-Tivity
【中文摘要】摘 要: 文章研究了黑龙江省第一积温带 5 个主栽品种生育后期剑叶叶绿素含量、净光合速率和硝酸还原酶(Nitrate Reductase, NR) 活性的变化规律。结果表明, 产量高的品种其生育后期剑叶叶绿素含量、光合速率和 NR活性均高于产量低的品种, 品种间差异显著。因此, 将剑叶生育后期叶绿素含量、净光合速率和 NR 活性作为寒地粳稻高光效育种和超高产育种中的一项生理选育指标是可行的。
【英文摘要】Abstract: The change rules of chlorophyll content, net photosynthetic rate and nitrate reductase activity in flag leaf after full heading stage of five varieties with different yield levels in the First Accumulated Temperature Zone of Heilongjiang Province were studied in this experiment. The results showed that the chlorophyll content, net photosynthetic rate and nitrate reductase activity in flag leaf of varieties of high yield were higher than those of the varieties of low yield and had great difference in these varieties. So chlorophyll content, net photosynthetic rate and nitrate reductase activity in flag leaf after full heading stage of different varieties as indicators in breeding of high photosynthetic efficiency and super high yield of Japonica rice were useful in cold region.

【题目】寒地水稻氮磷钾营养诊断技术的研究
【中文关键词】水稻;营养;诊断技术
【英文关键词】rice, nutrition, technique of diagnosis
【中文摘要】摘 要:采用多点田间生物试验法,在2006—2007年对寒地水稻进行了两年营养诊断技术研究,形成了寒地水稻氮、磷、钾的土壤和植株营养诊断技术与方法。氮素诊断在分蘖期和孕穗期均以叶片叶绿素相对含量作为诊断指标最好;磷素营养诊断在分蘖期土壤全磷和植株全磷均可作为诊断指标,在孕穗期以植株全磷为诊断指标最好;钾素诊断在分蘖期土壤速效钾和植株全钾均可作为这个时期的诊断指标,在孕穗期以土壤速效钾进行钾营养诊断最能反映生产实际。
【英文摘要】Abstract: Two years studies on the technique of rice nutritional diagnosis were conducted during 2006-2007by the method of field multi-sited experiments in cold region of northeast China. The N, P, K diagnostic technique and methods were formed in both plant and soil. For the nutrient of nitrogen, the chlorophyll content of blade was the best indicator to the nutritional state in both tillering and spike formation stage. To the nutrient of phosphorus, both plant and soil total P could be used for P nutritional diagnosis in tillering stage, but plant total P was the best one to indicate the rice phosphorus status in spike formation stage. Concerning the potassium, either soil available K or plant total K could be used in the diagnosis of tillering stage, and in spike formation stage, only the soil available K was the most suitable characteristic in the practice of K diagnosis.

【题目】寒地早粳稻稻种资源品质状况评价
【中文关键词】寒地; 早粳稻; 稻种资源; 品质
【英文关键词】cold region; early japonica rice; rice germplasm resuource; quality of mid rice
【中文摘要】摘 要: 以黑龙江八一农垦大学水稻中心保存的 180 份寒地早粳稻品种(系) 为试材, 对其品质性状进行分析, 并做出评价。研究结果表明, 寒地早粳稻的营养品质和蒸煮品质普遍较优, 但仅有 1.7 %的品种综合品质性状达到了国家一级米标准; 垩白粒率和垩白度的品种间差异较大, 在参试材料中仅有 6.1 %和 1.2 %的品种达到了国家一级优质米标准, 是今后水稻品质育种改良的重点, 在今后寒地水稻品质改良和育种中, 应注意改善稻米的外观品质; 特别在育种中应首先注意粒形和碾米品质的选择, 以提高品质育种效率。
【英文摘要】Abstract: 180 early japonica rice varieties (lines) from Heilongjiang August First Land Reclamation University were analyzed and evaluation. The results showed that most of them had better nutritional and cooking quality, but only 1.7 % varieties reached First class's standard of grain quality. The differences of CR and CD among varieties were significant. According to high quality rough rice qualitative index, 6.1 % and 1.2 % varieties reached First class's standard of grain quality score. CR and CD would be the emphases of rice quality breeding in future. It was suggested that appearance quality, especially grain shape and milling quality should be particularly considered in rice grain quality breeding.

【题目】Validation of mega-environment universal and specific QTL
【中文关键词】大豆,产量,QTL
【英文关键词】soybean, yield, QTL
【中文摘要】有价值的QTL是依赖于标记与性状联系程度,等位基因多样性的QTL影响遗传背景中的表达数量性状位点表达。最近的一些研究已经确定的基因与性状的关系,似乎是独立于环境而依赖于遗传背景。因此,本研究的目的是验证普遍和/或多环境的产量性状,此前已在一个独立的中国与加拿大的优良品种进行创造重组自交系。在2005和2006的中国和加拿大在5个环境,这7个分子标记与种子产量性状, qtlu satt162与几个农艺性状相关。因此,PI已被确认为来源的有利等位基因可能增加遗传变异的大豆种子资源,导致进一步改良产量等农艺性状。
【英文摘要】The value of quantitative trait loci (QTL) is dependant on the strength of association with the traits of interest, allelic diversity at the QTL and the effect of the genetic background on the expression of the QTL. A number of recent studies have identified QTL associated with traits of interest that appear to be independent of the environment but dependant on the genetic background in which they are found. Therefore, the objective of this study was to validate universal and/or mega-environment-specific seed yield QTL that have been previously reported in an independent recombinant inbred line (RIL) population derived from the cross between an elite Chinese and Canadian parent. The population was evaluated at two field environments in China and in five environments in Canada in 2005 and 2006. Of the seven markers linked to seed yield QTL reported by our group in a previous study, four were polymorphic between the two parents. No association between seed yield and QTL was observed. The result could imply that seed yield QTL were either not stable in this particular genetic background or harboured different alleles than the ones in the original mapping population. QTLU Satt162 was associated with several agronomic traitsof which lodging was validated. Both the non-adapted and adapted parent contributed favourable alleles to the progeny. Therefore, plant introductions have been validated as a source of favourable alleles that could increase the genetic variability of the soybean germplasm pool and lead to further improvements in seed yield and other agronomic traits.

【题目】寒地早粳稻叶部性状与产量关系的研究
【中文关键词】早粳稻; 叶部性状; 产量
【英文关键词】early japonica rice; leaf characters; output
【中文摘要】摘 要: 针对寒地特殊的生态环境, 以 180 份不同基因型早粳稻为材料, 探讨了叶部性状与产量的关系。研究表明, 随着产量水平的提高, 各叶位叶片的长、宽均表现为减小的趋势; 在一定范围之内减小剑叶、倒 2 叶叶基角, 适当增加倒 3 叶叶基角有利于光能利用, 提高群体生物量, 从而提高产量, 在育种选择时, 选择剑叶叶基角、倒 2 叶叶基角的角度更为有效; 在一定范围之内增加倒 1、倒 2 叶鞘的长度, 减小倒 3 叶鞘长度有利于产量的提高; 保持足够的上三叶面积是获得高产、超高产的主要途径, 对剑叶和倒 2 叶叶面积的选择也十分重要。在进行叶部性状综合评价时, 倒二叶面积、单株上三叶面积、倒三叶叶基角和剑叶叶基角 4 个因子就足以代表 17 个叶部性状的全部信息量。
【英文摘要】Abstract: 180 early japonica rice varieties (or lines) were studied in special ecological environment of cold region. The relations of the leaf characters and output were discussed systematically. The main results were as follows: With the increasing of yield, the length and width of leaf showed a down tendency. In a restricted range, reducing angle between stem and flag leaf (ABSFL) and angle between stem and 2nd leaf from the top (ABS2LFT), appropriately increasing angle between stem and 3rd leaf from the top (ABS3LFT) were favourable to use light energy, improving biomass of population and raising out put. Moreover, choosing ABSFL and ABS2LFTwas most effective. In-creasing vaginal length off lag leaf and 2nd leaf from the top, reducing vaginal length of 3rd leaf from the top were in favor of raising out-put. Keeping enough top 3 leaf area (T3LA) was an important mean for high- yielding or super- high yielding. Especially, choosing flag leaf area and area of 2nd leaf from the top (A2LFT) was very important. A2LFT, T3LA per plant, ABS3LFT and ABSFL were enough tost and for the whole amount of information about seventeen leaf characters when making overall evaluation on leaf characters.

【题目】水稻倒伏研究及其影响因素分析
【中文关键词】水稻;倒伏;影响因素
【英文关键词】Rice; Lodging; Affecting factors
【中文摘要】摘 要:倒伏是水稻生产中普遍存在的问题,已成为高产稳产的重要限制因素之一。 倒伏所造成的损失与水稻生长环境和倒伏的发生时期有关。倒伏是一个综合的、复杂的现象,它受到外界环境、栽培技术以及本身特性等多重影响。适宜的生长环境可以促进水稻生长和产量的提高,但会引发倒伏或使倒伏程度加重。 鉴于倒伏对产量、品质的严重影响。 本文综述了近年来国内外关于水稻倒伏的类型、水稻倒伏构成因素以及提高水稻抗倒伏能力的各种措施,展望了水稻抗倒性研究的方向。
【英文摘要】Abstract:As a prevalent problem in rice production, lodging has become one of important limiting factors for stable and high yield of rice. The yield loss due to lodging is correlated to rice growing environment and growth period. Lodging of rice is very complicated and affected by many factors, such as environment, variety character and cultivation skills. The reason and types of rice lodging and lodging resistance measures are reviewed in this article and the prospects for rice lodging resistance research are discussed.

【英文关键词】Rice;Lodging resistance;Fertilization techniques
【中文摘要】摘要:倒伏是水稻生产中的一个严重问题,水稻茎秆倒伏严重影响水稻产量和稻谷品质,倒伏发生越早,损失越大。从施肥方法和肥料组成等方面,综述了防止水稻倒伏施肥技术研究进展,提出了有待拓宽和深化研究的内容。
【英文摘要】Abstract:The lodging is one of the serious problems in rice production and it affects yield and quality seriously. The earlier the lodging appears,the more the yield loss is.The research progress in the lodging resistance of rice was reviewed from the aspects such as the method of fertilization and the composition of fertilization.The research issues to be widened and deepened in lodging resistance of rice were also put forward.

【题目】植物激素及其对水稻植株发育调控的研究进展
【中文关键词】植物激素;水稻;调控
【英文关键词】Plant hormones; Rice; Regulation
【中文摘要】摘 要:随着我国科技力量的飞速发展,科学家们在激素受体基因分离鉴定、激素控制株型以及激素间的相互作用等方面取得了突破性进展,其中生长素(IAA)在协调体内外调节机制中起着不可或缺的作用;细胞分裂素(CTK)可以通过对细胞分裂与分化的调节而参与对水稻生长发育的调控;赤霉素作为植物生长的必需激素之一,调控植物生长发育的各个方面,如:种子萌发,下胚轴的伸长,叶片的生长和水稻开花时间等;脱落酸(ABA)同样也是一种重要的植物激素,受到生物胁迫和非生物胁迫的调控,在水稻对胁迫耐受性和抗性中发挥着重要作用;乙烯(ETH)则是一种多功能的植物激素,它在水稻生长发育和应对生物及非生物胁迫过程中起着重要作用。 本文着重阐述了近几年植物激素在生理学研究方面的研究进展,提出了我国在植物激素研究领域的未来发展方向与趋势,同时也展望了植物激素研究对水稻重要农业性状改良的意义。
【英文摘要】Abstract: With rapid development of Chinese science and technology, scientists has been able to make significant progress in identification of hormone receptors, the hormone-regulated plant architecture formation as well as interactions among different hormone signaling pathways. Auxin (IAA) plays essential roles in coordination of these two regulation mechanisms. The plant phytohormone cytokinin (CTK) regulates numerous growth and developmental processes of rice by regulating cell division and cell differentiation. The phytohormone gibberellins (GA) play an important role in controlling and modulating diverse developmental processes, such as seed germination, hypocotyls elongation, leaf expansion and flowering time of rice. Abscisic acid (ABA), an important phytohormone induced by biotic stress and abiotic stress, plays great roles in rice tolerance to stresses. The gaseous plant hormone ethylene (ETH) is a versatile phytohormone, and it regulates a variety of developmental process andbiotic and abiotic stress response in rice. In this review, we summarize the recent advances in the study of plant hormones in China mainly focusing on physiological studies and offer a prospective view on the future studies on plant hormones in china. Prospects are also made on possible improvement of important agricultural traits in rice by manipulating the hormones.

【题目】植物生长调节剂在水稻倒伏上的研究进展
【中文关键词】植物生长调节剂;水稻;倒伏;研究进展
【英文关键词】Plant growth regulators; Rice; Lodging; Research progress
【中文摘要】摘 要:针对水稻倒伏问题,从化控角度出发,介绍了几种植物生长调节剂在水稻倒伏上的应用情况。 其中着重从水稻株高、茎粗、节间长等形态指标上诠释了植物生长调节剂的调控作用及机制,简要的分析了植物生长调节剂对水稻形态解剖微结构的影响,展望了化控技术的先进性,同时也提出了应用植物生长调节剂的不足之处。
【英文摘要】Abstract:In this paper, rice lodging problem in recent years and an overview of several plant growth regulators on lodging of rice from the chemical control perspective were introduced. The mechanisms of plant growth regulators were introduced through the analysis of rice morphology standard, such as plant height, stem diameter, inter node length, and so on. The effects of plant

growth regulators micro-structure of morphology anatomy in rice were briefly analyzed, advance of control technology was prospected, the inadequacies in the application of plant growth regulators were raised, and finally a theoretical basis on lodging resistance of rice for the future study of chemical regulation was provided.

【题目】河套灌区套种粮油作物耗水规律的试验研究
【中文关键词】套种; 蒸发蒸腾量; ET 0 ; 产量; 水分利用效率
【英文关键词】intercropping; water requirement ; ET 0 ; yield; water use efficiency
【中文摘要】2009—2010年河套灌区磴口项目区试验结果表明,小麦套种玉米与小麦套种油葵2种立体种植模式下,生育期内作物日平均蒸发蒸腾量分别为:小麦4.31 mm、覆膜玉米4.43 mm、不覆膜玉米4.39 mm、油葵3.42 mm。根据田间波文比系统监测数据,通过多种方法确定项目区ET0比较,FAO-56推荐Penman-Monteith方法与Ir-mark-Allen拟合法计算的结果较符合当地实际。研究表明,3种套种模式中,套种不覆膜玉米小麦的生物学产量略占优势,与不覆膜玉米的产量有此消彼长的关系;并且3种套种模式下,灌水模式为52 mm、97 mm交替灌溉模式的经济系数相比其他灌溉模式的经济系数均表现较大,套种作物经历一定程度的水分亏缺,后期及时补偿可提高经济系数。
【英文摘要】The results o f the experiment in Hetao irrigated regions of Dengkou in 2009、 2010 show that in the pat tern of stereo planting of Wheat Corn relay intercropping and Wheat Sunflower relay intercropping, the daily average water requirement in growth period of wheat, plastic film Corn , none plastic film Corn and sunflower are respectively 4. 31 mm, 4. 43 mm, 4. 39 mm, 3. 42 mm. Through analyzing monitoring data by Bowen Ratio System and E T0 determined by various methods, the Penman Monteith method recommended by FA O56 and the Irmark Allen f it ting method accord with local reality. T he research shows that the pat tern the o f Wheat and none plastic film Corn relay intercropping predominate in biological yield in above three stereo planting pat tern and w hen the yield of Wheat is rising , one of plastic film Corn is falling . T he economic coefficient of the alternative irrigation mode of 52 mm and 97 mm is superior. It is visible that tmely water compensation for oil crop undergoing water deficit can improve economic coefficient.

【题目】复合土工膨润土垫用于寒旱区渠道衬砌的实验研究
【中文关键词】复合土工膨润土垫; 流变性; 滤矢量; 力学性能
【英文关键词】GCL; flow characteristic; filter vector ; mechanical performance
【中文摘要】通过室内外试验, 分析了膨润土自由膨胀体积、滤矢量、粘度与盐溶液浓度及阳离子化合价的关系, 得出盐溶液浓度、化合价与膨润土自由膨胀体积呈负相关, 与滤矢量、渗透系数呈正相关。0. 01 mol/ L AlCl3 使3 试样滤矢量分别增加了291. 9%、404. 8%、367. 3%; NaCl 溶液对GCL 渗透系数的影响最小, 溶液浓度由0. 01 mo l/ L 升高到0. 25 mol/ L 时, 1 号、2 号、3 号3 种GCL 的渗透系数分别增加了193. 4 倍、205. 1 倍、3 1. 3 倍。而CaCl2 浓度由0. 01mol/ L 增加到0. 25 mo l/ L 时, 3 种GCL 试样的渗透系数分别增加了3 289. 7 倍、1 8461. 6 倍、3 57. 9 倍; GCL 力学性能主要影响因素为紫外线照射及空气中氧化, 其老化主要发生在第1 年, 1 年后3 试样第一峰值分别下降了2. 10%、18. 35%、2 4. 13%; 第二峰值下降了12. 13%、- 179. 10%、24. 04%。黄河水中阳离子使其自由膨胀体积减小, 滤矢量增大, 塑性粘度减小, 3 试样滤矢量分别增加了26. 4%、1 6. 7%、26. 8%。对GCL 的防渗性能也有一定影响, 但影响较小, GCL 在寒旱盐渍化地区仍能满足渠道防渗要求, 在类似地区可用于渠道防渗。
【英文摘要】In this paper, the relat ionship o f free swelling vo lume of bentonite, filter v ecto r, visco sity and salt concentrat ion and valence of cation wer e analyzed thro ug h indoor and outdoor ex periment. The r esult indicated that the co ncentrat ion o f salts, valence were neg atively cor related w ith the free swelling vo lume of bento nite. While they were positive co rr elated with the filter v ecto r and permeabilit y. T he so lution of 0. 01 mo l/ L AlCl3 made t he v ecto r filter of 3 samples increased by 291. 9%, 404. 8%, 367. 3%. Theeffect o f NaCl solution o n the permeabilit y of GCL was the minimum. When the so lutio n concentr atio n w as increased fr

om 0. 01mol/ L to 0. 25 mo l/ L, t he permeability coefficients o f 1 # , 2 # , 3 # w ere incr eased by 193. 4 t imes, 205. 1 times, and 31. 3times, respectiv ely . When the CaCl2 solution concentr atio n w as increased from 0. 01 mol/ L to 0. 25 mo l/ L, the permeabilit y of thee GCL samples w as incr eased by 3 289. 7 times. The main influencing factor s of GCL mechanical pr operties w ere ult rav iolet radiationand air ox idat ion. T he ag ing occur ed mainly in the first year . After one year, the fir st peak of sample 3 decr eased by 2. 10%,18. 35%, 24. 13%, and t he second peak decreased by 12. 13%, - 179. 10%, 24. 04%. T he cat ion in Yellow River water made the free swelling volume reduced, filter vector increased, the plast ic visco sity decreased, v ecto r filter o f three sample increased by26. 4%, 16. 7%, 26. 8%. It also had effect on the perfo rmance o f GCL, but the effect w as little. GCL could meet t he demands of seepage in cold, arid, salty distr ict and could be used for channel seepag e in similar region.

【题目】GCL用于内蒙古河套灌区渠道防渗的适用性研究
【中文关键词】GCL; 渗透系数; 渠道; 防渗
【英文关键词】GCL; Infiltration coefficient; canal Seepage control
【中文摘要】内蒙古河套灌区是我国3 个特大型灌区之一, 该地区共有渠道8 365条, 渠系水利用系数仅为0. 42, 渠道防渗节水有较大潜力。该地区干旱寒冷、盐渍化严重, 普通防渗材料有一定局限性, GCL为防渗新材料, 有防渗效果好、施工简单、抗冻胀性能好等优点, 研究GCL在该地区的适用性有重要的意义。本文针对GCL在内蒙古河套灌区渠道防渗的适用性进行了研究; 研究表明, 离子、浓度、初始水化液水质对GCL渗透系数有一定的影响, 溶液矿化度由0. 5g /L增大到10g /L时, 钙、镁、钾、钠离子溶液对应渗透系数约增大1 000倍、100倍、30倍、100倍。用自来水进行预先充分水化, 则渗透系数减小100倍。GCL在该地区用于渠道防渗, 离子及冻融作用会对防渗效果有一定影响,但影响较小, 可满足渠道防渗要求, 提高渠道水利用系数。
【英文摘要】H etao Irrig ation D istrict is one of the three largest districts in Ch ina. The district w ith the to tal of cana ls is 8, 365; the coefficient of watere fficiency in canal system only is 0. 42; the seepag e contro l of cana l is o f g rea t potentia l forw ater sav ing. The general mater ia l of seepage contro l is of som e lim itation in the distr ict due to the distr ict located in ar id co ld area and w ith sa linization hazard.The GCL is a new material for seepage con tro ,l and it is of the charac teristics o f better effic iency o f seepage con tro ,lsimp le bu ilding,and better perform ance o f freezing resistance and so on. So research the applicab ility of the GCL is a great sign ificance in the district.This research was carried out on the applicab ility of GCL for seepage con tro l of canal in Hetao Irr iga tion D istrict. The results obta ined from th is study indicated that the ions, concentration, and wa ter qua lity of in itia l liquefactions impacted obv iously on the in filtration coefficien t, these influences w ere tha t the in filtration coefficient increasing w ith the m ine ra liza tion deg ree from 0. 5g / l to 10g / l was about 1000 tim es for the calc ium ion so lution, 100 tim es for m agnesium ion, 30 times fo r potass ium ion so lution, and 100 times for sodiumion so lution, respective ly. H ow ev er, if the initial liquefaction was tap w ater, the infiltration coeffic ient dec reased to 100 tim es. The -ions and freeze thaw ing may im pact on the effic iency o f seepage contro l in the d istrict under apply ing the GCL conditions, but the influence was little and then could se ttle to the requ irem ent of seepage contro l o f cana l and improved the coeffic ient o fw ater effic iency in canal system.

【题目】Microarray analysis of gene expression profiles in the bovine mammary gland during lactation
【中文关键词】乳腺;微阵列;泌乳;基因组;基因表达谱
【英文关键词】mammary gland, microarray, lactation, genomics, gene expression profile
【中文摘要】从青春期到泌乳期以至干乳期, 奶牛乳腺经历复杂的生物学功能和代谢水平的变化.通过基因芯片分析奶牛乳腺的基因表达谱, 通过泌乳旺盛的泌乳期与不泌乳的青春期和干乳期相比较, 共筛选出122 个差异表达的基因, 其中包括79 个泌乳期上调基因和43 个泌乳期下调基因. GO 分析表明, 在泌乳期奶牛乳腺中上调的基因主要与物质转运、生物合成、信号转导、催化活性、免疫防御、细胞凋亡以及促进发育相关. 这些数据提示了奶牛乳腺泌乳期所发生的分子事件.
【英文摘要】Mammary glands undergo functional and metabolic changes during virgin, lactation and dry periods. A total of 122 genes were identified as differentially expressed, including 79 up-regulated and 43 down-regulated genes during lactation compared with virgin and dry periods. Gene ontology analysis showed the functional classification of the up-regulated genes in lactation, including transport, biosynthetic process, signal transduction, catalytic activity, immune system process, cell death, and positive regulation of the developmental process. Microarray data clarified molecular events in bovine mammary gland lactation.

【题目】不同灌水参数组合时田面坡度对灌水质量的影响研究
【中文关键词】畦灌; 灌水质量; 田面坡度; 单宽流量; 田面糙率
【英文关键词】border irrigation; irrigation efficiency; field surface slope; flux per width; land roughness
【中文摘要】田面坡度是影响畦灌灌水质量的重要因素, 研究田面坡度对灌水性能的影响时, 要结合灌水定额、平整精度、田面糙率和单宽流量等参数进行分析。通过对常规平地技术条件下多组合灌溉参数模拟分析得出: 不同灌水定额、平整精度、田面糙率和单宽流量组合对应不同的最佳田面坡度, 当灌水定额为60. 00 mm, 平整精度为4. 25 cm, 田面糙率为0. 12, 单宽流量分别为4、3 L/ (s　　m) 和2 L/ (s　　m) 时, 反向模拟出最佳的田面坡度分别为1. 6、1.8和2.2; 并通过研究田面坡度对水流推进和消退过程的影响得出: 田面坡度为2.0的水流推进和消退过程曲线明显比1.6和1.2的曲线平滑, 说明在较小的单宽流量条件下, 相对较大的田面坡度可使田面水流运动更加稳定, 有利于改善灌水质量。
【英文摘要】As field surface slope is an important factor which influences irrigation efficiency in border irrigation, it is necessary to study its influence on irrigation capability in combinat ion with irrigation quota, land leveling precision,land roughness and flux per

width. Irrigation simulation in different irrigation factors by general technical level off border indicates: different irrigation quota, land leveling precision, land roughness and flux per width are corresponding to different optimum field surface slop, optimization slopes are 1.6 ,1.8and 2.2by reverse simulation when irrigation quota is 60mm, land leveling precision is 4. 25 cm, land roughness is 0. 12 and flux per width are respectively 4L/ (s m) , 3 L/ (s m) and 2 L/ (s m) . The study of water flux advance and gression process in different field surface slopes concludes that the curve of water flux advance and regression of process field surface slopes in 2. 0 is more smooth than in 1. 6 and 1. 2 , indicating that water flux advance in relatively larger field surface slope is stable and and is favorable for the improvement of irrigation quality in smaller flux per width.

【题目】河套灌区节水抗旱玉米品种田间鉴选
【中文关键词】玉米; 节水; 抗旱; 河套灌区
【英文关键词】Corn; Water - saving; Drought - resistance; Hetao irrigation district
【中文摘要】在节水灌溉和常规充分灌溉条件下,对20 个北方玉米主产区品种的形态及生理指标、产量形成、水分利用等进行了系统测定,并比较了相关抗旱节水性能评价指标。结果表明,节水灌溉条件下,多数品种的产量和水分利用效率(WUE) 表现一般,通过隶属函数法筛选出5 个经济产量和WUE 都表现较好的玉米品种并进行田间验证。以WUE 和抗旱指数综合评价证明,郑单958、内单314 和科河10 号3 个品种的节水抗旱性能均优于对照品种益丰29号和潞玉13 号,适宜在内蒙古河套灌区引进推广。抗旱指数及其修订式与2 水处理下的产量和水分利用效率均呈极显著正相关,是筛选节水抗旱玉米品种的有效指标。节水、抗旱、高产玉米品种的共同特征是株高中等、茎秆粗壮、穗位较低、单株叶面积较大; 叶片叶绿素含量较高,光合速率和水分利用效率均较高; 穗型中等、粒重较大,且单位面积穗数多等。

【英文摘要】The morphological and physiological characters,yield formation,water use efficiency (WUE) of 20 corn varieties planted in northern corn region were studied systematically under water - saving irrigation and conventional sufficient irrigation conditions. The different drought - resistance and water - saving indices were compared at the same time. The results showed that both the yield formation and WUE in most varieties were ordinary under water saving irrigation condition,five corn varieties were selected through the dependence function analysis for their better economic yield and WUE. Through the drought - resistant index (DRI) and WUE evaluation,the drought - resistant performance of Zhengdan958,Neidan314 and Kehe10 were better than that of Yifeng29 and Luyu13. Three of these were drought - resistance,water - saving and high - yielding corn varieties,which could be introduced to plant in Hetao irrigation region,Inner Mongolia. The drought - resistant index of corn varieties are correlated positively with economic yield and WUE,therefore DRI is an effective way to select the drought - resistance and water - saving corn variety. The main characteristic of drought -resistance,water - saving and high yield corn variety are 1) the medium plant height,thicker stalk and bigger leaves area of single plant; 2) higher SPAD value,photosynthetic efficiency and WUE of leaf blade; 3) the medium corn ear,high grains weight and major number of ears per unit area etc.

【题目】河套灌区套种模式下田间灌水有效性评价
【中文关键词】套种模式; SPAC 系统; 双作物系数法; 田间灌溉; 河套灌区
【英文关键词】interplanting mode; SPAC system; dual crop coefficient method; field irrigation; Hetao Irrigation Area
【中文摘要】针对河套灌区典型的套种模式以及地下水位较浅的情况,基于SPAC 系统应用土壤水动力学理论定量分析了作物生育期内大气水、灌溉水、作物水、土壤水和地下水的相互转化关系。应用FAO 推荐的Penman-Monteith 法及双作物系数法,对小麦套种玉米、小麦套种向日葵模式的实际腾发量进行了计算。从动态观点出发,在时间尺度上考虑深层渗漏量和根系层储水量对作物的有效性,对灌区田间灌溉水的有效性进行了评价。结果表明: 小麦套种玉米的实际腾发量为635. 8 mm,小麦套种向日葵的实际腾发量为428. 2 mm; 小麦套种玉米灌溉水利用率为91. 9%,小麦套种向日葵的灌水利用效率为88. 4%。
【英文摘要】For the typical intercropping mode and the unique situation of shallow groundwater level in Hetao Irrigation Area,by using the theory of soil water dynamics at the base of SPAC system,this paper quantitatively analyzed interchangeable relations of atmospheric water,irrigation water,crop water,soil water and groundwater during crop growth period,then calculate the actual evapotranspiration of wheat intercropping maize and wheat intercropping sunflower mode by using the Penman-Monteith method recommend by FAO and dual crop coefficient method. From the dynamicpoint of view,the availability of field irrigation water in Hetao Irrigation Area were estimated in the scale of time to consider the availability of deeppercolation and the soil water storage of root zone to crops. The results show that the actual evapotranspiration of wheat intercropping maize and wheat intercropping sunflower is 635. 8 mm and 428. 2 mm respectively; irrigation water use efficiency of wheat intercropping maize and wheat intercropping sunflower is 91. 9% and 88. 4% respectively.

【题目】小麦间作向日葵耗水量与优化灌溉制度研究

【中文关键词】作物耗水量;WIN ISAREG模型;灌溉制度;小麦间作向日葵
【英文关键词】crop water requirement;WIN ISAREG model;irrigation schedule;wheat intercropping sunflower
【中文摘要】小麦间作向日葵是一种典型的河套灌区种植模式,研究运用WIN ISAREG模型确定了参考作物蒸发蒸腾量,结合立体种植特征,采用综合作物系数法确定小麦间作向日葵全生育期作物耗水量。同时通过实际处理结果对模型参数进行率定与验证,最终对小麦间作向日葵实际灌溉制度进行准确的评价并进行不同方案的优化,得到试验区如配有井灌等条件,优选灌溉方案为土壤含水率下降至适宜含水率70%时实施灌溉,灌水量为补充根系层水量至田间持水量85%所需水量;若灌水水源仅为黄河水,则优选灌溉方案为整个生育期灌5水,灌水量为达到根系层中总有效水量的80%。
【英文摘要】Wheat interplanting sunflower is a typical planting mode in Hetao Irrigation Area.By using WIN ISAREG model,this study calculates the reference crop evapotranspiration on the basis of the characteristics of intercropping planting,using the integrated crop coefficient method to determine the wheat intercropping sunflower crop water consumption in whole growth stages.And at the same time through practical results of verified model parameters,finally,actual irrigation system and optimized different scheme of wheat intercropping sunflower evaluated accurately.Optimization irrigation scheme is implementing irrigation when the soil watercontent down to 70%of the appropriate moisture content,the water of the root layer reaches 85%of field capacity then stop the irrigation.If only the Yellow River water for irrigation water,the optimization scheme is irrigation five times in the whole growth period,then irrigation stops when water reaches 80%of the total effective water in the root layer.

【题目】基于水热耦合模型的干旱寒冷地区冻融土壤水热盐运移规律研究
【中文关键词】河套灌区; 冻融土壤; 水热盐运移; 秋浇; SHAW 模型
【英文关键词】Hetao Irrigation District ; freezing-thawing of soil; water-hea-t salt transfer; Simultaneous Heat and Water (SHAW) model; autumn irrigation
【中文摘要】运用水热耦合模型(SHAW) 对内蒙古河套灌区3 种盐渍化土壤冻融期水热盐的动态变化进行了模拟研究。研究结果表明: 重度盐渍化土壤累积蒸发量最大, 主要是由于土壤中盐分含量较大, 降低了土壤的冰点, 延长了土壤的冻结时间, 从而增大了土壤的蒸发量, 导致翌年土壤水分大量损失, 影响作物播种出苗和发芽。而且重度盐渍化土壤在冻结和融解过程中表层盐分聚积严重, 而中度和轻度盐化土壤在冻结期和融解期盐分增加幅度略小一些; 当秋浇定额大于150mm 时, 其中30%~ 50%水量储存于0~ 1m 土层中, 具有明显的储水保墒作用。秋浇定额和秋浇时间对于土壤蒸发量以及1m 土层的储水量和含盐量的影响只是在冻结前影响较大。
【英文摘要】The Simultaneous Heat and Water model (SHAW) was used to simulate the dynamic variationof water-hea-t salt in the process of soil freezing-thawing for three kinds of salinized soil, with different degrees of saline, in the Inner Mongolia Hetao Irrigation District. The results show that the accumulated evaporation of serious saline soil is the largest among the three kinds of soils. It is caused by the high content of salt which can depress the ice point and prolong the period of soil freezing. Consequently, it results in the loss of soil moisture in next year and affects the germination of crop. The 30% ~ 50% of quota irrigation water in autumn will be deposited in soil layer within the depth of 110m when it excesses150mm. The effect of autumn irrigation quota and schedule affecting the soil evaporation and water stored in soil layer happen to the period before freezing of soil only.

【题目】冻融作用对膨润土防渗毯防渗特性的影响
【中文关键词】膨润土,剪切应力,试验,冻融循环,滤失量,渗透系数
【英文关键词】bentonite, shear stress, expiment, freeze-thaw cycle, filtrate loss, permeability coefficient
【中文摘要】为研究膨润土防渗毯(Geosynthetic Clay Liner)在寒旱区渠道衬砌应用中的防渗性能,该文采用室内模拟方法对3 种膨润土防渗毯(分别为韩国、中国生产,编号为1#、2#、3#)的抗冻特性进行了研究,结果表明:采用黄河水水化31 次冻融后,1#、2#、3#膨润土防渗毯自由膨胀体积增加了16.7%、4.5%、8.0%,滤失量降低了31.1%、28.9%、27.0%,屈服值增加了200.0%、23.3%、90.6%。31 次冻融循环后滤出液EC 值分别降低27.3%、27.0%、31.0%,渗透系数均增加了1 个数量级,但渗透系数仍较小,仅为渠床土壤渗透系数的0.35%~0.72%;研究表明,膨润土防渗毯可用于西北干旱盐渍化地区渠道衬砌。
【英文摘要】In order to study the seepage control performance of Geosynthetic Clay Liner (GCL) in lining channel in thecold and arid regions, the antifreeze characteristics of three different GCL (produced in Korea and China, 1#、2#、3#)were studied with indoor simulation method. The results showed that by hydrating with the Yellow River water and after 31 times of freeze-thaws , the free swelling volume of 1#、2#、3# GCL increased by 16.7%、4.5% and 8.0%respectively;The filtration loss reduced by 31.1%、28.9% and 27.0% respectively; The yield value increased by 200.0%, 23.3% and 90.6% respectively, and the EC values of the filtrate reduced by 27.3%、27.0% and 31.0% respectively. The permeability coefficient increased by one order of magnitude, but was still small, which was 0.35-0.72% in canal bed. These indicatedthe GCL can be used in canal lining in the northwest arid and saline regions.

【题目】膨润土防渗毯用于渠道衬砌及其老化因素对力学性能的影响
【中文关键词】渠道衬砌,压力测试,力学性能,GCL,老化因素
【英文关键词】canal linings, stress measurements, mechanical properties, geosynthentic clay liners, aging factors
【中文摘要】膨润土防水毯(GCL)在渠道衬砌工程有较大的应用价值。为了测试膨润土防渗毯用于渠道衬砌其老化因素对力学性能的影响,以内蒙古河套灌区为研究区域,采用室内模拟及工程现场试验相结合,对5 种老化因素的3 种GCL 力学性能影响进行了测试。结果表明:温度、湿度、紫外线照射都会对GCL 的力学性能造成影响。高温对GCL 力学性能影响大于低温,高低温循环对GCL 力学性能影响小于高温或低温单独的影响。60℃高温老化72 h,3 种试样力学性能值(最大荷载)降低了34.27%、35.77%、45.02%;-40℃低温老化72 h,降低了19.51%、31.49%、18.40%;高低温循环10 次(低温-40℃下保持12 h,高温60℃下保持12 h),降低19.32%、32.62%与38.28%。紫外线照射1 200 h,降低了29.08%、18.31%与36.17%。GCL 含水率从50%增加到100%在60℃下老化24 h,2#与3#的力学性能值下降12.41%、13.08%,1#没有变化。野外GCL 第1 年老化速度较快,3 试样力学性能值下降12.1%、18.5%和17.8%,1 年后力学性能变化减缓。该研究可为GCL 在渠道衬砌中大面积推广应用提供依据。
【英文摘要】Geosynthentic clay liners (GCL) have great application value in canal lining projects. In order to estimate the effects of aging factors on the mechanical properties of GCL as canal lining materials, a series of laboratory simulation and field experiments in Inner Mongolian Hetao irrigation district were conducted to test effects of the five aging factorson the mechanical indexes of three kinds of GCL. The results indicated that temperature, humidity and ultraviolet radiation had some effects on the mechanical properties of GCL. The effects of high temperature on mechanical properties of GCL were more significant than those of low temperature, and the effects of high-low temperature cycling were weaker than effects of high or low temperature separately. Three kinds of mechanical properties of GCL sampleswas decreased by 34.27%, 35.77%, 45.02% after high temperature (60°C) aging 72 h and 19.51%, 31.49%, 18.40% after low temperature(-40°C) aging 72 h, 19.32%, 32.62% and 38.28% after high-low temperature cycling(-40°C for 12h and 60°C for 12h) 10 times and 29.08%, 18.31% and 36.17% after Ultraviolet radiation 1200 h, respectively. The mechanical properties of 2 # and 3 # decreased by 12.41%, 13.08%, but 1# has no change with GCL moisture content from 50% to 100% after high temperature (60°C) aging 24 h. GCL in field aged faster in the first year, and the mechanical properties of the three samples decreased by 12.1%, 18.5% and 17.8% respectively while mechanical properties varied mitigatively after one year. This research can provide references for the application of GCL as canal lining materials.

【题目】基于SHAW 模型的内蒙古河套灌区秋浇节水灌溉制度
【中文关键词】灌溉,冻结,融化,节水灌溉,SHAW 模型
【英文关键词】irrigation, freezing, thawing, water saving irrigation, simultaneous heat and water model
【中文摘要】根据内蒙古河套灌区秋浇节水与土壤盐渍化防治的需要,利用SHAW 模型模拟确定了不同盐渍化土壤合理的秋浇节水灌溉制度。结果表明:对于轻度盐渍化土壤,秋浇定额一般为142~183 mm,秋浇时间为9 月28 日-10 月23 日;对于中度盐渍化土壤,定额应该为180~200 mm,时间在10 月14 日-18 日;对于重度盐渍化土壤,一般不种小麦,而种葵花等耐盐作物,定额为200~225 mm。因此,对于该灌区应该根据不同的土壤盐渍化程度,合理地安排秋浇。
【英文摘要】In accordance with the prevention of soil salination and water-saving irrigation in autumn in Inner Mongolia Hetao irrigation district, the reasonable water-saving irrigation scheme in autumn was quantificationally established by using SHAW model in theory, which aimed at the different salinized soils. For slight salinized soils,autumn irrigation quota was from 142 to183 mm between September 28 and October 23. For moderate salinized soils,autumn irrigation quota was from 180 to 200 mm between October 14 and 18. For serious salinized soils, plantingsunflower instead of wheat, autumn irrigation quota was from 200 to 225 mm. In the studied irrigation district, autumn irrigation is supposed to be reasonably arranged according to the different salinized soils.

【题目】内蒙古河套灌区荒地水盐运移规律模拟
【中文关键词】灌溉,土壤含水率,盐,运移,HYDRUS-1D 模型,荒地
【英文关键词】irrigation, soil moisture, salts, transport, HYDRUS-1D model, uncultivated land
【中文摘要】:该文以内蒙古河套灌区为背景展开荒地水盐运移规律研究。在田间试验基础上,分析荒地土壤水盐的运移机理,利用HYDRUS-1D 模型对荒地土壤水盐的迁移规律进行了模拟。荒地做为灌区盐分的贮存地,成为灌区水盐平衡的重要调节因素,荒地水盐动态研究对于干旱灌区具有重要意义。结果表明,强蒸发是荒地水盐运移的原动力,5 cm 土层EC值上升了66.10%,20 cm 土层EC 值上升了63.89%。荒地在作物生育期是积盐的过程,在秋浇期是流失盐分的过程。经检验,HYDRUS-1D 模型对盐渍化地区荒地水盐在垂直方向运移的模拟具有较高的精度,为区域水盐管理和灌区的可持续发展提供科学依据。
【英文摘要】Water and salt transport was studied in the uncultivated land of Hetao Irrigation District in Inner Mongolia.Based on field experiment, mechanism of water and salt transport of the uncultivated land in the irrigation district was analyzed, and its water and salt transport dynamics were simulated with HYDRUS-1D model. The uncultivated land in the irrigation district had become salt storage area and the important regulator for water and salt balance in the irrigation district, and study on water and salt dynamic in uncultivated land was of significance for uncultivated irrigation district. The results showed that strong evaporation was the driving force for water and salt transport, EC values in soil layers of 5 cm had increased by 66.10%, and EC values in soil layers of 20 cm had increased by 63.89%. The uncultivated land underwent salt accumulating process in crop growing period but salt losing process in autumn irrigation period. Verification using the experiment data indicated thatHYDRUS-1D model had a high precision for the simulation of water and salt transport of the uncultivated land in vertical direction. The results can serve as a scientific basis for regional water and salt management and sustainable development of the irrigation districts.

【题目】环丙沙星残留量对嗜热链球菌grx02发酵乳品质的影响
【中文关键词】环丙沙星; 发酵乳; 嗜热链球菌
【英文关键词】ciprofloxacin; fermented milk; S.thermophilus
【中文摘要】研究不同环丙沙星残留量对S.thermophilus grx02发酵乳的感官性状、酸度、组织状态和挥发性风味物质的影响。结果显示:当环丙沙星的残留量高于0.4μg/mL时,会对发酵乳的感官质量产生显著的不利影响。当发酵乳中环丙沙星残留量高于0.2μg/mL时会显著降低发酵乳的黏度,增大其脱水收缩性;且环丙沙星残留量为0.1μg/mL时就会降低发酵乳挥发性风味物质的总含量。可见,用于发酵乳制品生产的原料乳中环丙沙星的残留限量应该控制在0.1μg/mL以下。
【英文摘要】The effect of ciprofloxacin residue on sensory properties, acidity, texture and volatile flavor substances in S.thermophilus fermented milk was studied. The results showed that the sensory quality of the fermented milk was significantly affected by ciprofloxacin at concentrations higher than 0.4 μg/mL. The viscosity of the fermented milk revealed a reduction and more severe dehydration and shrinkage was found at ciprofloxacin concentrations higher than 0.2 μg/mL. The content of volatile components in the fermented milk obviously decreased when the ciprofloxacin concentration was 0.1 μg/mL. These findings show that ciprofloxacin residue in raw milk used for preparing fermented dairy products should be less than 0.1 μg/mL.

【题目】内蒙古河套灌区解放闸灌域
【中文关键词】土壤含水率; EC; 空间变异性; 半方差函数; 克立格法
【英文关键词】soil water content; soil salt; spatial variability; semi variance function; Krigin method
【中文摘要】以河套灌区解放闸灌域的节水改造项目区作为研究对象, 从统计特征值、半方差函数和克立格法绘制的分布图几个方面对比分析了节水改造前后的土壤水分和盐分的空间变异性。结果表明: 2007 年与2008 年土壤水分和盐分可分别用球状模型和指数模型进行拟合, 空间自相关距离表明二者具有中等强度的空间自相关性, 且2008 年土壤水分和盐分的相关性都大于2007 年, 2008 年较2007 年土壤水盐的空间变化趋于连续。对克里格插值结果分析可知: 土壤水分和盐分在空间上的分布都具有明显的逐渐变化趋势, 表现为相近值的局部聚集; 而且2008 年的土壤水分和盐分分布与2007 年相比在较大的范围内颜色变化幅度小且较连续。通过对灌区节水改造前后大尺度采样分析,了解区域土壤水盐分布状况和空间变异情况, 为灌区今后的节水灌溉、盐碱地分区治理、区域化水资源管理提供一定得理论依据。
【英文摘要】Dates of soil water salt used in this study were collected from the water saving renovation project in Jiefangzha irrigation field of the Hetao irrigation district. Statistical and geost atistical analy sis w ere conducted to analyze and compare the spatial variability o f soil water salt before and after water saving renovation project. The dates o f soil water salt in 2007 and 2008 could be individu ally analyzed by spherical model and ex ponential function. The spatial auto correlation distances indicated that the auto correlations of soil water salt were belonged to medium intensity, and the correlations , as w ell as the space variation continuous trend , of soil water salt in 2008 were greater than that in 2007. The end value of Kriging showed the graded t rend of space variation of soil water - salt was obvious and could be considered as local focusing of approximant, and what's more, in major range, the color vary o f space distribution of soil water salt in 2008 within narrower and more continuous limits when compared with that in 2007. Based on the larg escale sampling before and after water saving renovation project, the distribution and spatial variation of soil water salt were comprehended. All the

achievements of this study are important for the water saving irrigation, zone management of salt lick and management of water resources.

【题目】7个紫花苜蓿品种开花习性与结荚关系的动态研究
【中文关键词】紫花苜蓿;开花动态;结荚动态
【英文关键词】Medicago sativaL.;flowering dynamics;podding dynamic
【中文摘要】【目的】探讨紫花苜蓿品种开花习性与结荚性的关系,为进行科学杂交和提高种子品质及产量提供依据。【方法】采用田间调查的方法,分别对7个紫花苜蓿品种的单个花絮小花数、开花与结荚动态、单个花序结荚数、单个荚内种子数及其相关性进行了观察研究。【结果】晴天时,7个紫花苜蓿品种开花均始于7:00左右,终于19:00左右;龙骨瓣一般9:00以后开放,10:00~15:00是龙骨瓣开放高峰期,也是昆虫活动的高峰时期; 7个紫花苜蓿品种结荚过程呈现类似规律,即开始时结荚数不断增加,达到一定水平后保持稳定,而后基本不再变化。关中苜蓿、固原紫花的单个花序小花数、单个花序结荚数和单个荚内种子数较国外引进的5个紫花苜蓿品种低,单个花序小花数与单个花序结荚数呈显著正相关,与单个荚内种子数呈极显著正相关;单个花序结荚数与单个荚内种子数相关不显著。【结论】10:00-15:00是苜蓿授粉的高峰时期,也是进行苜蓿杂交的最佳时期。
【英文摘要】【Objective】The study was to provide a basis for scientific hybrid and improve seed qualityand yield ofMedicago sativaL..【Method】A field survey method is used in this paper to conduct a studyon the relationship between the flowering and pod ding in 7Medicago sativaL.varieties.【Result】Theflowers ofMedicagosativaL.bloomed from 7:00 to 19:00 in daytime only.The time of keel ’ s blooming isgenerally after 9:00,while the flowering peak ofMedicago sativaL.which is insect activity peak falls on10:00-15:00.There is a similar law in the podding process of 7Medicago sativaL.varieties,namely thenumber of pods of 7Medicago sativaL.keeps in creasing until reaching maximum,and then keep stable.7varieties ofMedicagosativaL.have obvious flowering peaks.7MedicagosativaL.varieties'single inflores-cence florets is remarkably correlated with a single inflorescence pods number,and was significantly posi-tive correlation with the number of single pod seeds.But the correlated is not significant between the num-ber of single inflorescence pods with a single pod seed.【Conclusion】The peak period ofMedicago sativaL.pollination is 10:00-15:00,which is the best time for cross-breeding.

【题目】22个紫花苜蓿品种遗传关系的RAPD分析
【中文关键词】紫花苜蓿; RAPD;遗传距离;聚类分析;杂种优势
【英文关键词】alfalfa;RAPD;genetic distance;cluster analysis;higher heterosis
【中文摘要】【目的】为不同品种苜蓿亲缘关系的判断和最大限度地利用杂种优势提供理论依据。【方法】采用RAPD(Random amplified polymorphic DNA)标记方法,利用NTSYS软件,对22个紫花苜蓿(MedicagosativaL.)品种的遗传距离进行聚类,并对其亲缘关系进行分析。【结果】供试苜蓿品种之间的遗传基础较广,22个随机引物共检出289条扩增片段,其中多态性条带占88.93%;平均每个引物扩增的DNA条带数为4~18条,其中多态性谱带为2~17条;品种间遗传距离的变异为0.135 6~0.361 1,平均遗传距离为0.209 5,其中变异最大的是WL252HQ和“ 阿尔冈金 ”,最小的是“ 德福 ”和“ 赛特 ”,22个紫花苜蓿品种中以“ 德福 ”和“ 赛特 ”间的亲缘关系最近。【结论】“ 阿尔冈金 ”与“ 三得利 ”之间及二者与其他品种之间亲

缘关系较远,二者之间杂交或分别与其他品种之间杂交,可能会产生较大的杂种优势;引自加拿大的“放牧者”与其他21个苜蓿品种的遗传距离较远,其与这21种苜蓿品种杂交,亦可能会产生较大的杂种优势。

【英文摘要】【Objective】The study was done to judge genetic relationship of different varieties of alfalfa,making the most of heterosis and gaining good hybrid offspring.【Method】With RAPD markers,NTSYSsoftware was used for cluster analysis of 22 alfalfa varieties genetic distance and kinship analysis betweenthem.【Result】The 22 alfalfa varieties of genomic DNA were amplified with 22 random primers,and therewere 257 polymorphism fragments in the 289 amplified fragment found,accounting for 88.93%.The rangeof DNA bands amplified of each primer was 4 to 18,an average of 13.1,polymorphism bands 2 to 17,an av-erage of 11.7.The variation range of genetic distance of 22 alfalfa varieties was 0.135 6-0.361 1,and theaverage value was 0.209 5.Evidently,a larger genetic variation happened between varieties,and the largestwas“WL252HQ”and“Algonquin”,the Smallest“Derby”and“Sitel”.【Conclusion】“Algonquin”and“Sandity”and the other 21 varieties show more distant relationship,the crossing between them and theother 21 varieties crossing can gain higher heterosis.“Haygrazer”crossing with the other 21 varieties canalso gain higher heterosis.

【题目】基于SIRMOD模型的畦灌入渗参数估算及灌溉模拟

【中文关键词】入渗,参数估算,模型,灌溉,效率,灌水均匀度

【英文关键词】infiltration, parameter estimation, models, irrigation, efficiency, irrigation distribution uniformity

【中文摘要】土壤入渗参数是地面灌溉中制定灌溉制度、评价灌水质量的重要指标。针对现有估算方法存在计算工作量较大、精度不高的现状,根据田间实测资料,利用SIRMOD模型,对小麦畦灌条件下田间土壤入渗参数进行了估算。与用Maheshwari法计算结果较为接近,差异均在2.0%以内。根据估算的土壤入渗参数,应用SIRMOD模型进行了多组合灌溉模拟,在保证灌水质量较高的条件下,得出了在不同亏缺水量时的适宜灌水量和灌水流量,通过田间实例验证表明模拟效果较好。

【英文摘要】Infiltration parameter is one of the most important indexes in both irrigation schedule design and irrigation efficiency evaluation for surface irrigation. Most methods used currently to estimate the parameters have the disadvantages in low efficiency and precision. SIRMOD method was employed to estimate the infiltration parameters for border irrigation under the condition of wheat planting. The results showed that the errors of the infiltration rates were less than 2.0% calculated by Maheshwari and SIRMOD methods, respectively. Multi-irrigation alternatives were modeled by SIRMOD and the optimum irrigation quota and irrigation flow with high irrigation efficiency different water deficient conditions. The field experiments were carried out using the modeled results. The observed data from the field experiments verified the agreement with the modeled results.

【题目】多年生黑麦草叶片长度数量性状位点(QTLs)研究

【中文关键词】多年生黑麦草;叶片长度;数量性状位点(QTLs);遗传图;分子标记

【英文关键词】Lolium perenne; Lamina length; Quantitative trait loci; Genetic mapping; Molecular markers

【中文摘要】选择固定有益等位基因,研究多年生黑麦草叶片长度数量性状位点,结果表明:与叶长最为相关的3个标记所表达的变异占表型总变异的50.9%(r2);在选择中如能将这3个标记最优化地组合在一起,其综合共同作用有望使叶片长度延长和缩短26 mm;鉴于供试材料在最初3个世代的群体选择中所估测到叶片长度的遗传力为0.32,这样在今后的选择工作中,即

使只使用现有的两个标记,其效果亦优于传统的表型选择法。
【英文摘要】Quantitative trait loci (QTLs) of the lamina length ofLolium perennehave been studied to betterunderstand the genetic control of growth in grasses and to help the fixation of favorable alleles. Thus, amapping population was built by crossing a ‘ long-leave' genotype and a ‘ short-leaf' one. Genetic maps wereconstructed at LOD=5.5 by the mean of 178 molecular markers, including 167 AFLP, 6 RAPD and 5 iso-enzyme loci. Lamina length was measured first in the greenhouse at the early germination stage, and later inthe field at the late germination stage. Over all, 10 markers significantly associated with lamina length werefound, its mean single genetic effect ranging from 6 mm to 19.1 mm. Only 3 markers appeared to be QTLs oflamina length at the early stage , the other 7 were related to the lamina length measured in the field. To avoidredundancy of QTLs found in each parent, a multiple regression analysis with all significant markers(ANOVA,P<0.005) from both parents was then carried out on the average lamina length in the field. Threemarkers closely related to the lamina length explained 50.9% (r2) of the total phenotypic variance of which amarker is expected to respond. The interaction of the most favorable combination of these markers could extendor shorten the lamina length by 26 mm. As the realized heritability over the 3 cycles of mass selection forlamina length was estimated to be 0.32, it is suggested that selection of even only 2 markers could be moreefficient than phenotypic selection.

【题目】微咸水灌溉对土壤环境效应的预测研究
【中文关键词】微咸水灌溉;淋洗灌溉定额;SWAP 模型;预测
【英文关键词】light saline water irrigation; leaching quota; SWAP model; Prediction
【中文摘要】利用识别后的SWAP 模型,探讨了微咸水灌溉条件下土壤水盐及其均衡要素的转化关系和土壤的积盐趋势预测。结果显示,两种灌溉定额下土壤盐分都有所增加,但淋洗灌溉定额下比正常灌溉定额下小麦、葵花和玉米模型土壤盐分分别降低了6.5%、0.7%、4%;小麦、葵花和玉米的相对减产率分别比正常灌溉定额下降低了1%、2%、6%。微咸水灌溉后在灌溉定额和灌溉水浓度不变的前提下,土壤盐分的积累随着时间的推移而呈递减趋势,大约在10 a 后盐分达到进出平衡状态,此时土壤的含盐量达到0.185 2 mg · cm-3,比微咸水灌溉前增加0.082 2 mg · cm-3。但仍属于轻度盐渍土(土壤含盐量0.126%),不会对土壤水土环境产生较大的影响。
【英文摘要】There are many researches on salt water irrigation technology, salt water utilization pattern, impact on crop yield and quality using salt water irrigation, adaptability of salt water irrigation, and salt water irrigation amelioration of soils, etc.Inrecent,environmental effect caused by light salt water irrigation at the regional scale is concerned. Based on the field experiment in the Inner Mongolia Hongwei testing station, this paper introduced the SWAP model and discussed the conversion relation of soil water salt balance elements and soil salt accumulation trends on the conditions of light salt water irrigation. The prediction results indicated that both in the leaching quota and in the normal irrigation could lead to the increase of soil salt. But, in the leaching quota, the soil salt in the wheat model decreased 6.5%, 0.7% in the sunflower model, and 4% in the maize model comparing with the corresponding values in the normal irrigation quota. The decreasing rate of yield in the wheat, sunflower and maize decreased 1%, 2%, and 6%, respectively. On the condition of the saline water irrigation, unchanging the irrigation quota and the irrigation water concentration, the soil salt accumulation decreased as trend goes. After about 10 years, soil salt could reach the recharging and discharging balance. At that time, the soil salt content was 0.185 2 mg • cm-3, and increased amount was 0.082 2 mg • cm-3. But the soil still was belongs to the light salinity, and the light saline water irrigation couldn ′ t affect the soil water environment significantly. Through analyzing the simulation results, this paper indicated that light salt water irrigation was feasible in arid or semi-arid regions.

【中文关键词】小麦; 氮肥; 株高; 产量; 水分利用效率
【英文关键词】Wheat; Nitrogen fertilizer : Plant height : Y ie ld ; W a te r u s e e fi e ie n ey
【中文摘要】针对河套灌区盐渍化的特点, 研究五种水平下的氮肥对小麦株高、干物质量、产量和水分利用效率的影响。结果表明各处理的株高、干物质积累量、产量都随施氮量的增加而增加。氮肥增施增加了小麦耗水量, 但水分利用效率依然增加, 说明施用氮肥对小麦的同化作用和生长的促进作用要大于耗水的促进作用, 合理的分期施肥和控制好追肥量可以提高小麦生长的各项指标。本试验初步确定N 3 处理(播前5 kg N爪时, 拔节10 kg N小澎, 开花7 0 k g N /h m Z , 总施肥量2 2 5 kg N/h m ,) 的施肥量和施肥时期最为适宜。
【英文摘要】According to the characteristies of salinization of he tao irigation area .influencing the Plant height, dry matte r , yield and water use efficiency of wheat in five kind of diferent nitrogen fertilizer evel was conducted.The results showed that the processing of Plant height, dry matter accumulation, yield increase with the increase of nitrogen .The water consumption of wheat increased along with the nitrogenous fertilizer increases but water use efficiency still increased ,The result showed that applying nitrogenous fertilizer influenced on assimilation of w heat and Promoting wheat geowth much more import ant than promotion of water consumption .Reasonable fertilization stages and the control of fertilization quantity can increase the growth index of wheat. The experiment initially determined that fertilization quantity and fertilization time of N 3 treatment(pre 一sowing 55 kg N/h m Z ,join ting stage l0() kg N/h m Z flowering stage 7 0 k g N /hm Z, total nitro g e n 2 2 5 k g N/h m Z)was appropriate .

【题目】Expression of bovine trypsin in Lactococcus lactis
【中文关键词】Bovine trypsin,Lactococcus lactis,expression of trypsin
【英文关键词】Bovine trypsin,Lactococcus lactis,expression of trypsin
【中文摘要】Bovine trypsin is widely used in the production of bioactive peptides from milk proteins. The objective of this study was to express bovine trypsin in Lactococcus lactis to produce peptides by fermentation. The bovine trypsin with bias codon of L. lactis was synthesized, cloned into a secretory expressive vector pSEC-E7, and then introduced to L. lactis strain NZ9000 by electroporation. The

expression of trypsin induced by nisin was identified by Western blot. Western blot analysis revealed a band in the protoplast fraction corresponding to SPUsp45 (signal peptide of usp45)-trypsin. Biological activity of expressed trypsin was confirmed by the single substrate overlay assay. These results suggest that the expression ofbiologically active bovine trypsin has been detected in the protoplast fraction of L. lactis strain NZ9000(pSEC:trypsin).

【题目】Expression of Bovine Prochymosin Gene in Lactococcus Lactis

【中文关键词】Bovine prochymosin , NICE ,lactococcus lactis

【英文关键词】Bovine prochymosin , NICE ,lactococcus lactis

【中文摘要】Bovine prochymosin (bPC) could act to initiate milk clotting. NICE (Nisin Controlled gene Expression system) in lactococcus lactis was one of the most successful and widely using Grampositive gene expression systems. It was composed by six experiments in this study. They are cloning of bovine preprochymosin gene, electrotransformation in lactococcus lactis, construction of expression vector of bPC gene, detection of mRNA after recombinant bPC transcription, identification of recombinant bPC by SDS-PAGE and Western blot. Through the above method, we successfully constructed expression vector of recombinant bPC in lactococcus lactis by using NICE successfully, as well as achieved its expression and identified to immunocompetence of recombinant bPC.

【题目】抗旱节水春小麦品种鉴选指标比较研究

【中文关键词】春小麦; 抗旱; 节水; 评价指标

【英文关键词】Spring w heat ; Dro ug ht-resistance; Water-saving ; Selection index

【中文摘要】为给抗旱节水春小麦新品种的选育提供参考依据, 在节水灌溉和常规充分灌溉条件下, 对20 个北方春麦区主栽品种的形态及生理指标、产量形成、水分利用效率(WU E) 进行了系统测定和分析, 并比较了相关抗旱节水性能评价指标。结果表明, 节水灌溉条件下, 多数品种的产量和WUE 都表现一般, 通过系统聚类筛选出5 个经济产量和WU E 都表现较好的小麦品种。以抗旱指数评价, 宁春41 号、龙麦32 号和农鉴7号抗旱性优于对照永良4 号, 而巴优2 号和农鉴1 号表现不及永良4 号; 以产量- 水分高效利用指数评价, 5 个品种的节水性能均优于永良4 号。产量- 水分高效利用指数与经济产量、WUE 均呈显著正相关, 而抗旱指数及其修订式与产量、WUE 的相关不显著, 产量- 水分高效利用指数结合抗旱指数是筛选抗旱节水春小麦品种的有效方法。抗旱、节水、高产春小麦品种的共同特征是株高较高、上部节间长且株高构成指数

较大; 叶型中等, 叶片高光效; 根系发达, 分布合理; 贮藏物质高转运等。宁春41 号是兼具抗旱、节水、高产潜力的春小麦品种, 适宜在内蒙古河套灌区引进推广。

【英文摘要】The morpho logical and physiolog ical characters, yield component s, w ater use ef f iciency(WUE) of 20 spr ing w heat variet ies planted in no rthern spr ing w heat region were studied systemat-i cally under w ater-sav ing ir rigatio n and convent ional suff icient irrigat ion condit ions. Different dro ug htresistance and w ater-sav ing indices w ere compared. The result s show ed that both the y ield and WUE of most variet ies w ere ordinary under water saving irrigat ion, f ive w heat variet ies were selected thro ug h systematic cluster analysis for their better economic yield and WU E. Based on drought-r esistant index (DRI) ev aluat io n, the drought resistance of Ningchun 41, Longmai 32 and Nong jian 7 w ere bet ter than that of Yongliang 4, the drought-r esistance o f Bay ou 2 and N ong jian 1 w ere w o rse than that of Yo ng liang 4. By the yield-hig h w ater use ef ficiency index (YHWUEI) evaluat io n, the w ater use eff iciency of all five variet ies w as better than that of Yongliang 4. The YHWUEI of spring w heat variet ies w as correlated posit iv ely with economic yield and WUE, but bo th the drought-resistant index(DRI) and the r ev ised drought-r esistant index (DI) w ere not r emarkable co rrelated w ith economic yield and WUE, YHWU EI w ith DRI w as an ef fect ive way to select spr ing w heat variety w ith dro ug htresistantand w ater-saving. T he main characterist ic of drought-r esistance, w ater-saving and hig h y ield spring w heat v ar iety w ere: 1) hig her plant height , longer upper internodes length and bigger index of plant heig ht composition; 2) medium f lag leaf and high photosy nthetic eff iciency; 3) w el-l developmed and feasible dist ribut ion of ro ot s; 4) hig h t ranspor tat ion rat io of the reserves in vegetative o rgans before the anthesis stag e etc. Ningchun41 is a dro ug ht- resistant , w ater-saving and hig h-yielding spring wheat variety , w hich could be int roduced to plant in Hetao irrig at ion reg io n, Inner Mongo lia.

【题目】Comparison of Volatile Compounds in Multi- strains Douchi Fermented in Different Salinity and Strains

【中文关键词】Volatile compounds,multi-strains,salinity

【英文关键词】Volatile compounds,multi-strains,salinity

【中文摘要】Volatile compounds were extracted with a simultaneous steam distillation and extraction (SDE) from multi-strains douchi fermented in different conditions, and analyzed by continued investigations of gas chromatography-mass spectrometry (GC-MS). A combined total of 150 volatile compounds were identified from 11 samples. Arranged according to the sequence of salinity and strains inoculated, the numbers of components were 42, 51, 45, 36, 39, 34, 35, 36, 39, 38, and 44 respectively, which were divided into 13 compound classes. These 13 classes of compounds include alcohols (23), acids (7), esters (30), aldehydes (5), ketones (10), phenols (8), pyrazines (11), furans (4), sulphur-containing compounds (3), furan ketones (3), acid amides (10) and other compounds (36). The six common flavor compounds that played an important role in soybean fermented condiment flavor, which was reported, were all detected from these 20 samples. Different fermentation conditions led to a great changes in kind and concentration of total volatile compounds. Based on initial research, it was supposed that salinity had a direct or indirect effect to furans and pyrazines, and strains to furans.

【题目】地表覆盖对河套灌区土壤水热和番茄生长的影响
【中文关键词】河套灌区;地面覆盖;番茄;土壤水分;土壤温度
【英文关键词】Hetao irrigation area;soil surface mulching;tomato;soil moisture;soil temperature
【中文摘要】在河套灌区以不覆盖为对照,测定了地膜覆盖、秸秆覆盖、地膜+秸秆覆盖对土壤水热和番茄生长的影响。结果表明,地膜覆盖提高了土壤温度,而秸秆覆盖、地膜+秸秆覆盖降低了土壤温度,其中秸秆覆盖降低的幅度较大。在番茄生育前期不同覆盖可提高0—50cm土层的土壤水分含量,其中地膜覆盖效果最好。地膜覆盖使番茄产量提高了222.61%,地膜+秸秆覆盖使产量提高了17.04%,而秸秆覆盖则使产量降低了3.06%。地膜覆盖使水分利用效率提高了93.83%,地膜+秸秆覆盖使之提高了5.90%,秸秆覆盖则使水分利用效率降低了19.29%。河套灌区番茄播种时以地膜覆盖为宜,不宜采用秸秆覆盖。
【英文摘要】Compared with the control of bare surface,the effects of plastic-film mulching,corn-straw-only mulching,and film-plus-straw mulching on the soil temperature,soil moisture and the growth of tomato were monitored in Hetao irrigation area.The results showed that the plastic-film mulching increased the soil temperature,and cornstraw mulching and film-plus-straw mulching reduced the soil temperature.In comparison,corn-straw-only mulching exerted stronger effects than film-plus-straw mulching.All the mulching treatments resulted in increases of soil moisture within 0—50cm in the early stage of tomato growth,while the plastic-film mulching was the best.The yields of tomato with plastic-film mulching and film-plus-straw mulching were 222.61%and 17.04%higher than the control,respectively.However,the yield with corn-straw mulching was 3.06%lower than the control.The water use efficiency under plastic-film mulching and film-plus-straw mulching were 93.83% and 5.90%higher than the ,respectively.Similarly,water use efficiency of corn-straw-only mulching was 19.29%lower than the control.The results indicated that the plastic-film mulching was suitable,and thecorn-straw mulching was undesirable in sowing time for tomato production in Hetao irrigation area.

【题目】河套灌区春小麦高产栽培水氮高效利用研究
【中文关键词】水分利用效率(WUE); 氮素利用效率(NUE); 高产; 春小麦; 河套灌区
【英文关键词】Water use efficiency; nitrogen use efficiency; high yield; spring wheat; Hetao Irrigation Region
【中文摘要】在内蒙古河套灌区解放闸灌域沙壕渠实验站,通过田间试验,对节水灌溉模式(拔节+ 抽穗2 水)和常规充分灌溉模式(分蘖+ 拔节+ 抽穗+ 灌浆4 水) 下,不同施氮量对春小麦产量形成、水分利用和氮素利用等方面进行了研究。结果表明:2 水与4 水处理间小麦产量及其构成因素均无显著差异,而水分利用效率(WUE)比4 水处理提高7. 8%。在较低施氮量范围内,随着施氮量的增加,小麦产量、耗水量和WUE 同步提高,当施氮量超过一定值后,产量和WUE 开始下降。两种灌溉模式下,增施氮肥均能促进植株对氮素的吸收,但氮素利用效率明显降低。与4 水处理相比,2 水处理下小麦氮素利用效率显著提高。小麦的经济产量、水分利用效率及氮素农学利用效率与总施氮量均呈一元二次曲线关系,河套平原春小麦实现节水、省肥、高产相统一的适宜施氮量(纯N)为8 ~ 10 kg /667m2。
【英文摘要】The effect of nitrogen - application amount on yield formation,water use and nitrogen use were studied under water - saving irrigation model and conventional sufficient irrigation model in Shahaoqu experimental station of Hetao irrigation region,Inner Mongolia. Of water - saving irrigation model,wheat was irrigated at jointing and heading stage; while of conventional sufficient irrigation,wheat was irrigated at tillering,jointing,heading and grain - filling stage. The results showed that there were no significant difference of wheat yield and yield component between water - saving irrigation model and conventional sufficient irrigation model. But of water use efficiency (WUE) the former was higher than the latter by 7. 8%. In the range of lower nitrogen - application amount,wheat yield,water consumption amount and WUE increased with the increasing of nitrogen - application amount. However,wheat yield and WUE would decrease when the nitrogen - application amount reached some level. Nitrogen - application could promote the nitrogen absorbing of plant and decrease nitrogen use efficiency (NUE) obviously under both two model. Comparing with conventional sufficient irrigation model,wheat WUE of water - saving model was increased significantly. It was conic section between Wheat economic yield, WUE and NUE and total nitrogen - application amount. The suitable nitrogen - application amount of spring wheat for water - saving,fertilizer - saving and high yield was about 8 - 10 kg N/667m2 in Hetao irrigation region.

【题目】牛凝乳酶原基因在乳酸乳球菌中的表达
【中文关键词】牛凝乳酶原;乳酸乳球菌;蛋白印迹;凝乳活性
【英文关键词】Bovine prochymosin; Lactococcus lactis; Western blot; milk-clotting activity
【中文摘要】【目的】利用乳酸乳球菌nisin 诱导基因表达系统(the NIsin Controlled gene Expression system,NICE) 表达牛凝乳酶原。【方法】从克隆载体pS19-PPC 中获得牛凝乳酶原基因,将该基因与表达载体pNZ8148 连接并电转化乳酸乳球菌NZ9000,转化子经酶切、PCR 和测序鉴定后,用nisin 进行诱导表达,表达产物利用SDSPAGE和Western blot 鉴定,表达产物纯化后检测凝乳活性。【结果】重组牛凝乳酶原与天然牛凝乳酶原比较,其分子量大小、免疫性质、生物活性和抑制剂敏感性没有发现显著差异,其凝乳活性可达2 × 103 IMCU/mL。【结论】在乳酸乳球菌中表达了具有凝乳活性的牛凝乳酶原,同时乳酸乳球菌作为发酵剂和凝乳酶产生菌双重角色的实现,为奶酪加工提供了新思路和新方法。

【英文摘要】[Objective]Bovine prochymosin was expressed by the nisin controlled gene expression system in Lactococcus lactis. [Methods]We amplified bovine prochymosin gene from pS19-PPC vector by PCR,and ligated the gene with expression vector pNZ8148. Ligated products were electrotransformated into Lactococcus lactis NZ9000. Then we identified transformants by restriction,PCR and sequencing,and molecular weight and immune characteristics of expression product by SDS-PAGE and Western blot after inducting using nisin. We tested milk-clotting activity after purification. [Results]Recombinant bovine prochymosin was not significantly different in molecular weight,immune characteristics,bioactivity and sensitivity of inhibitors comparison from nature bovine prochymosin. The milk-clotting activity of recombinant bovine prochymosin was 2 × 103 international milk-clotting unit per milliliter. [Conclusion]We expressed recombinant bovine prochymosin of milk-clotting activity in Lactococcus lactis. This study suggested potential application in cheese manufacture as a new method,which could regard Lactococcus lactis as starter of milk and host of expression bovine prochymosin.

【题目】河套灌区农业节水技术集成研究
【中文关键词】河套灌区;农田灌溉;节水技术;集成模式
【英文关键词】Hetao irrigation district;field irrigation;water-saving technology;intergration model
【中文摘要】河套灌区是中国乃至亚洲最大的一首制自流灌区。目前河套灌区农田灌溉中存在的主要问题是灌溉水源不足,水利工程老化,田间工程标准低,节水灌溉推广缓慢,灌溉水浪费严重等。为了解决这些问题,河套灌区应从工程节水、农业节水、化学节水、管理节水等综合技术方面考虑。工程节水主要从渠道衬砌、激光平地、小畦灌溉等方面着手,同时积极开展节水灌溉,合理利用地下水。农业节水主要是做好种植区划,加强农艺节水,深耕蓄墒与秸秆还田,减少地面蒸发。化学节水是积极推广应用抗旱剂、保水剂和其它化学调控试剂。管理节水主要是加强用水管理,完善管理制度,建立“农民用水者协会”。
【英文摘要】Hetao irrigation district is the largest single gravity irrigation district in China and even Asia.At present,the main problems of field irrigation in Hetao irrigation district are lack of water source,irrigation structure aging,low engineering standards,slow promotion of water-saving irrigation techniques,serious waste of irrigation water and others.To solve these problems,Hetao irrigation district should take account of some integrated technologies,such as engineering,agricultural,chemical,and management water saving,etc.Engineering water saving should start from channel lining,laser land leveling,small plot irrigation and others.At the same time,water-saving irrigation should be promoted actively and the groundwater should be use rationally.Agricultural water saving should focus on cultivation planning,agronomic water saving,deep plowing,straw returning,and surface evaporation reduction.Chemical water saving could be active promotion and application of drought-resistant reagents,super absorbent polymers,and other chemical regulation agents.Management water saving could include water management strengthening,system improving,and establishment of water user associations.

【题目】影响中苜2号苜蓿愈伤组织诱导的主要因素分析
【中文关键词】紫花苜蓿;愈伤组织;诱导;影响因素
【英文关键词】Radiation induction;Festuca arundinacea; Variation in phenotypic characteristics; Off-spring variation
【中文摘要】以MS为基本培养基,采用L16(45)正交试验设计,研究不同外植体类型及植物生长调节物质对中苜2号愈伤组织生长情况、诱导率的影响,筛选适合中苜2号愈伤组织诱导的最佳外植体类型和最优激素配比。结果表明,以下胚轴为外植体诱导的愈伤组织生长状况良好,诱导率高,为诱导愈伤组织的最佳外植体;2,4-D浓度是影响愈伤组织诱导率的最主要因素,其次是外植体类型;诱导中苜2号愈伤组织的最佳培养基为:MS+2,4-D 0·2mg/L+NAA 0·01mg/L+6-BA 1mg/L+KT 0·2mg/L。
【英文摘要】Seeds ofFestucaarundinaceacv. Houndog V were radiated with Co60ray to study variation in phenotypic characteristics and offspring growth rate, tillering capacity and phenotypic characteristics.The results showed that: 1)Festuca arundinaceacv. Houndog V radiated had an obvious variation in plant height, leaf length, leaf width, leaf thickness. Among them, plant height, leaf length, tiller number, number of grains per plant, density were decreased more than control; leaf width was significantly narrower than control; leaf thickness was very significantly thicker than control; 1000-grain weight was reduced; leaf color was not changed. 2) Growth rate and tillering capacity of offspring radiated were reduced. Growth rate was reduced most in jointing stage. 3) The offspring radiated had

obvious variation inphenotypic characteristics compared with control offspring.

【题目】中间偃麦草、长穗偃麦草及其杂交种抗旱性评价
【中文关键词】中间偃麦草;长穗偃麦草;杂交种;抗旱性评价
【英文关键词】Elytrigria intermedium; Elytrigria elongata; hybirds; evaluation of drought resistance
【中文摘要】:测定了杂交种植物组织相对含水量、脯氨酸、叶绿素、可溶蛋白、丙二醛生理指标,利用主成分分析、隶属函数综合评价偃麦草属不同材料[中间偃麦草(Elytrigia intermedia)、长穗偃麦草(E.elongata)及其杂交种]的抗旱性。结果表明,5个单项生理指标可综合为3个相互独立的综合指标;正交杂种(E.intermedia×E.elongata)的抗旱综合值为0.529,反交杂种(E.elongata×E.intermedia)为0.702,而其2个亲本中间偃麦草和长穗偃麦草仅为0.308和0.191,杂交种材料的抗旱能力远高于2个亲本,其中反交杂种的抗旱性最强。
【英文摘要】The principal components and membership functions analysis methods were used to evaluated the he drought resistance of three varieties inElytrigia genus (Elytrigria intermedium, E.elongataand their hybrids) by measuring relative water content, proline, chlorophyll, protein and malonaldehyde content of the shoots in this study. The results of this study showed that the 5 indexes could be classified into 3 kinds of independent comprehensive groups. The comprehensive value of drought tolerance for the hybrid ofE.intermedium×E.elongatawas 0.529, and that ofE.elongata×E.intermediumwas 0.702; however, the comprehensive values of drought tolerance ofE.intermediumandE.elongatawere 0.308 and 0.191 respectively. Drought tolerance of the hybrids was obviously stronger than that of their parents, and the drought tolerance of the hybrid betweenE.elongata×E.intermediumwas the best.

【题目】中间偃麦草、长穗偃麦草及其杂种F1代同工酶研究
【中文关键词】:中间偃麦草;长穗偃麦草;同工酶
【英文关键词】Elytrigia elongata(Host) Nevski;E. intermedia(Host) Nevski; Isoenzyme
【中文摘要】:通过对过氧化物酶(POD)、酯酶(EST)、超氧化物歧化酶(SOD)和多酚氧化酶(PPO)同工酶谱的分析,探讨中间偃麦草(Elytrigia elongata(Host) Nevski)、长穗偃麦草(E. intermedia(Host) Nevski)及其杂种F1代的酶谱特征和亲缘关系。结果表明:亲本同工酶酶带数目、迁移率、着色程度等差异不大,二者亲缘关系较近。与亲本相比,杂种F1代存在POD、SOD、PPO酶带丢失现象,但正、反交植株中均产生了一些亲本没有的新生带。杂种F1代EST酶谱与亲本基本相同,仅着色程度略有差异。杂种F1代植株的POD、PPO酶谱特征有偏向中间偃麦草的倾向,而SOD酶谱特征倾向于长穗偃麦草。杂种F1代同工酶具有多态性,可作为遗传标记用于杂种鉴定和后代株系目标性状的选择。
【英文摘要】Through the analysis of isozyme zymograms of peroxidase (POD), esterase (EST), superoxidedismutase (SOD), and polyphenol oxidase (PPO), the zymogram characteristics and relationship of Elytrigiahybrids,E. elongate×E. intermedia, and their parents were studied. The results are as follows: the band number, migration rate, and pigmentation degree of isoenzymes between parents had slight differences and their genetic relationship could be close. F1hybrids lacked of some bands of POD, SOD,and PPO isoenzyme as compared to their parents, but had some new bands in descendant of reciprocal cross; EST bands of hybrid F1were almost the same as the parents except the pigmentation degree. The characteristic of isozyme bands of POD and PPO of hybrid F1had the tendency toE. elongata, and the SOD isozyme band toE. intermedia. Isozyme Polymorphisms existed in hybrid F1which could be used

as the genetic marker to identify hybrids and determine the plants with target characteristics in descendant strains.

【题目】蒸发条件下脱盐吹填土的水盐动态
【中文关键词】吹填土;蒸发;水盐动态;碱化
【英文关键词】dredger fill ;evaporation ;water and salt t ransport ;alkalization
【中文摘要】使用吹填土进行围海造地是当前拓展沿海地区土地空间的主要方法。河北曹妃甸陆面基本上为吹填土围海造陆而成,针对该地区地下水埋深较浅和矿化度高、土质单一等特点,通过室内土柱模拟试验,研究了稳定蒸发条件下,不同地下水埋深脱盐土柱剖面的含水量变化规律、地下水通过土壤毛管上升作用的返盐规律、主要盐分离子的迁移行为以及土壤碱化问题。研究结果表明,地下水埋深50 cm(B1) 和100 cm(B2) 分别在15 天和51 天时达到埋深30 cm 处0. 3 %的设定含盐量,B1 表层返盐速率高于B2 ;试验中土柱B1 表面和B2 埋深为5 cm 处出现盐壳,且B1 和B2 地下水累计消耗量随时间线性变化;试验结束时B1 和B2 的平均含水量为18. 8 %和20. 1 % ,B1 和B2 的平均含盐量为0. 5 %和0. 4 %;在返盐过程中B1 和B2 的阳离子迁移速度均为Na + > Ca2 + > Mg2 + ,阴离子为Cl - > HCO3- > SO42 - ,且试验结束时土柱中未出现碱化现象,说明了土体能提供给植物生长一个良好的生境。该研究结果为曹妃甸以及类似地区进行生态建设和发展农业生产等方面提供吹填土的改良、盐分控制等方面的依据。
【英文摘要】Hebei Caofeidian region was formed by reclaiming dredger fill , and here has a single coarse sand soil2profile , and ot her feat ures which are disadvantage to ecumenical plant . Based on soil column simulation experiment in door , changes of water content of soil column profile and laws of salt accumulation when groundwater rose through capillary , the migration of salt ions , as well as t he problem of soil alkalization had been analyzed under t he condition of evaporation and different groundwater levels. St udies had shown t hat when groundwater level were 50 cm and 100 cm , t he test s had continued for 15 d and 51 d , and the ionmi2 gration speed is Na + > Ca2 + > Mg2 + ,Cl - > HCO3 - > SO42 - . Soil water content , wastage of groundwater and soil salt content were researched. St udied al so showed t hat soil can supplied plant a good habitat at t he end of test s. The result s can sever as a reference for ecological const ruction and afforestation of land which is made from dredger fill .

【题目】对计算机模拟在作物生长发育研究中应用的评价
【中文关键词】计算机模拟;作物生长发育;应用;评价
【英文关键词】Computer simulation; Crop growth and development research;Application; Evaluation
【中文摘要】【研究目的】为了全面、公正地分析与评价作物模拟这一研究方法,【方法】本文以系统学思想为指导,采用系统分析、比较及认识论挖掘等方法,【结果】从作物模拟在农业系统学中的地位、模拟的分类与最新发展趋势、模型与模拟的异同、模拟的步骤、认识论价值及其在实际应用中的一些问题等视角阐述了对计算机模拟在作物生长发育研究中应用的评价,【结论】作物模拟技术在增加作物系统可观察量、过程与步骤的认识论思想体现、提高了”实践—认识—实践”的速度等方面具有深刻的认识论价值。应进一步加大其研究和应用力度,使之在粮食安全与现代农业中发挥技术支撑作用。
【英文摘要】The objectives of this paper were to analyse and evaluate the method of computer simulation for crop growth and development (CSCGD) completely and justly,and further promote its research and application. Under directing for theory of system sciences, this paper evaluated applying computer simulation in crop growth and development research from the following area: the role of CSCGD in agricultural system science; classification and the newest development trend of CSCGD; similarities and differences between model and simulation;simulation steps; the values of epistemology for CSCGD and some questions in application,and so on. The result showed that the CSCGD had profound values in epistemology in the following areas: increasing the observed factors in crop system; reflecting thought of epistemology in processes and steps of the CSCGD; increasing velocity of practice – know – practice, and so on. Its research and application should be increased so that it will play an important role in food safety and modern agriculture.

【题目】基于多元指示克立格方法的土壤盐分空间分布评价
【中文关键词】土壤盐分;单元指示克立格;多元指示克立格;空间变异性
【英文关键词】soil salinity ;univariate indicator Kriging ;indicator Kriging ; spatial variability
【中文摘要】以内蒙古河套灌区农田为例,分别运用单元指示克立格和多元指示克立格对河套灌区中游约0. 8 万hm2农田0~20 cm、20~40 cm 深度内的土壤盐分的空间变异性进行了评价,并绘制了基于设定阈值土壤电导率概率分布图。结果表明:各层土壤盐分均不符合正态分布且存在特异值, 但采用指示克立格方法可以获得较为稳健的变异函数;受结构性因素影响, 各层土壤盐分的指示半方差均表现为强空间自相关性。依据综合概率分布图对土地资源利用的风险性进行了评价,对评价区域土地资源质量的决策管理提供了指导。
【英文摘要】An example was given for the farm field of Hetao irrigation area of Inner Mongolia. Univariate indicator Kriging and mutiple2variable indicator Kriging was applied to evaluate spatial variability of soil salinity at depth of 0~20cm and 20~40cm layers ,which was performed in the 12 million mu farm field of the middle course of Hetao irrigation area ,form the probability dist ribution map of soil salinity based on setting threshold value. The result s indicated that soil salinity didn ’ t follow normal dist ribution because of the existence of outliers , but robust semivariogram could be obtained by using indicator Kriging ; Two layers soil salinity exhibited intensive spatial autocorrelation due to compound impact of st ructural factors. In terms of the combined probability map , the risk ofutilizing land resources was further evaluated and the guide for the decision2making and management of the land resources quality at scales was supplied.

【题目】不同品种和氮肥条件下水稻根系主要几何参数动态的量化研究
【中文关键词】水稻根系;生物量;形态;几何参数;模型
【英文关键词】rice root system; biomass; morphology; geometric parameters; models
【中文摘要】【目的】建立基于生物量的水稻根系主要几何参数动态模型,为水稻功能-结构模型的研究奠定基础。【方法】于2008和2009年采用3个品种[两优108(V1,杂籼)、86优8(V2,杂粳)和南粳43(V3,常规粳稻)]和2个氮肥水平盆栽试验获取根系形态(加拿大Legent根系分析仪)及根干重等指标,利用SPSS v13.0与Excel. 2007处理试验数据,模型检验方法为RMSE。【结果】利用2008年观测资料,通过分析不同品种与施肥处理下水稻单株总根长及根直径与生物量间的定量关系,建立了基于生物量的水稻单株总根长动态模型;根据立体几何原理,构建了基于生物量的水稻总根体积与总根表面积动态模型。经2009年独立试验资料检验,单株总根长、总根体积及总根表面积实测值与模拟值的RMSE分别为490.660 cm/plant、131.859 cm2/plant和2. 532 cm3/plant,说明模型拟合度较好。【结论】所建水稻根系主要几何参数模型具有一定机理性、解释性和通用性,为功能-结构水稻模型研究及水稻可视化奠定了基础。
【英文摘要】【Objective】 The aim of this study was to build the biomass-based main geometric parameter dynamic models of rice root system. 【Method】 Three rice cultivars, “ Liangyou108 ” (Hybrid long-shaped rice, V1), “ 86you8 ” (Hybrid round-shaped rice, V2), and “ Nanjing43 ” (Round-shaped rice,V3), were planted in pots with two fertilizer levels in 2008 and 2009, fertilizer (N:3.6g/pot, P2O5:0.8g/pot, K2O:3.6g/pot in2008; N:4.4g/pot, P2O5:0.8g/pot, K2O:3.6g/pot in2009) , and no fertilizer (with loamy soil), to obtain the root system morphological characteristics (by Legent Root System Analysis Instrument made in Canada), the dry weight, etc., which were processed by SPSS v13.0 and Excel 2007. The models developed in this paper were verified using RSME.【Result】The biomass-based dynamic models of the total root length were set up through analyzing relationships between the total root length and the biomass per plant from the experimental data in 2008, and then, the biomass-based dynamic models of the total root volume and the total root surface area per plant also were developed according to the principles of solid geometry, which were tested by using the experiment data in 2009. The results showed that the RMSE between the simulated values and the observed values of the total root length, the total root volume, and the total root surface area per plant were 490.660 cm/plant, 131.859 cm2 / plant, and 2. 532 cm3 / plant, respectively. 【Conclusion】The models developed in this paper were reliable with mechanics, general adaptability, and interpretative characteristics in a certain extent, which would lay a basis for developing Functional-Structure Rice Models.

【题目】农田大尺度表层土壤电导率的序贯高斯模拟
【中文关键词】空间分布;克立格插值;条件模拟;表层土壤电导率;序贯高斯
【英文关键词】spatial dist ribution ; Kriging interpolation ;conditional simulation ; specific conductivity of surface soil ; sequential Gaussian
【中文摘要】以内蒙古河套灌区部分农田为例,将克立格插值法和序贯高斯条件模拟法分别应用于农田大尺度下表层土壤电导率的空间分布估值和模拟,并将1 次实现和多次实现取平均的条件模拟结果与克立格插值结果和实测数据进行了对比分析。结果表明:克立格法具有明显的平滑效应,它改变了电导率数据的空间结构,而条件模拟则能够在尊重实测数据情况下,再现变量的空间变化特点,而且模拟次数在2~3 次时可以更好的与原始数据符合。在进行变量的空间分布研究时,可用克立格法来估计,用条件模拟来重现波动性,两者结合才能充分发挥各自的优势,为生产实践提供全面的科学根据。
【英文摘要】An example is given for the farm field of Hetao Irrigation Area of Inner Mongolia. Kriging Interpolation Method and Se2 quential Gaussian Conditional Simulation Method is used to evaluate and simulate spatial dist ribution of specific conductivity of sur2face soil at large field2scale. The mean value af ter simulating 1 time , the mean value af ter simulating many times , the estimated value by Kriging Method and the measured value are compared. The result s indicate that the estimated value by Kriging Method show

ob2 viously smoothing effect and the original data configuration have been changed , while the simulated values had the same data configu2 ration as the measured values. When studying spatial dist ribution of variables , we use Kriging to estimate the variable and use condi2tional simulation to reconst ruct wave characters ,and 2~3 times simulation agree with original data better. When Kriging and conditional simulation are combined , they can supply overall scientific basis for production and experience better.

【题目】扁蓿豆不同品系ISSR标记遗传差异和遗传多样性。
【中文关键词】扁蓿豆;品系;ISSR;遗传差异;遗传多样性
【英文关键词】Melilotoides ruthenica;Srtains; ISSR; Genetic difference; Genetic diversity
【中文摘要】采用ISSR分子标记技术对扁蓿豆4个品系的遗传多样性、遗传差异和遗传结构进行了研究。用7个有效引物对4个品系进行PCR扩增,共获得73个等位基因位点,每条引物平均检测出10·4个位点,其中多态性位点69个,多态位点百分率为94·5%。各品系的Nei’s遗传多样性为0·2569,Shannon’s信息指数为0·4046。Nei’s指数估算和分子方差分析均表明,扁蓿豆4个品系的遗传多样性主要存在于品系内,4个品系间亦出现了较大的遗传分化(Gst=0·1324)。品系00-61、90-36、00-81和93-21的多态位点百分率分别为73·97%、79·45%、82·19%和83·56%;Nei’s遗传多样性(H)分别为0·2050、0·2153、0·2264和0·2474;Shannon’s信息指数(I)分别为0·3222、0·3396、0·3538和0·3821。各品系的遗传参数大小排序均为品系93-21>品系00-81>品系90-36>品系00-61。采用系统聚类和主坐标分析(PCA)两种方法所获得的聚类结果一致,即品系00-61和00-81遗传差异相对较小,其次是品系90-36,品系93-21与各品系的遗传差异较大。

【英文摘要】The genetic diversity, genetic difference and genetic structure of four strains ofMelilotoidesruthenicawere investigated with ISSR marker. Seven ISSR primers generated highly reproducible and stable DNA fragments. 69 of 73 loci were polymorphic (PPB=94.5%). The results of Popgen32 analysis indicated that Nei ’ s gene diversity(H) was 0.2569, Shannon information index(I) was 0.4046. Nei ’ s analysis and AMOVA analysis both indicated that the majority genetic variation ofM. ruthenicastrains occurred within strains, higher variations also occurred among the strains (Gst=0.1324). The PPB of strains 00-61,90-36,00-81 and 93-21 was 73.97%, 79.45%, 82.19% and 83.56%, respectively;Nei ’ s gene diversity(H) was 0.2050, 0.2153, 0.2264 and 0.2474, respectively;Shannon information index(I) was 0 · 3222, 0 · 3396, 0.3538 and 0.3821, respectively. The sequence of all genetic index above was 93-21>00-81>90-36>00-61.The results of cluster analysis and principal coordinate analysis (PCA) were similar. The genetic difference between strain 00-61 and 00-81 was relatively lower, second was strain 90-36, and strain 93-21 had higher genetic difference from other strains.

【题目】扁蓿豆育成品系遗传多样性的RAPD研究。
【中文关键词】扁蓿豆;RAPD;遗传多样性;聚类分析;主坐标分析
【英文关键词】Medicago ruthenica;RAPD;genetic diversity;cluster analysis;principal coordinate analysis
【中文摘要】:用RAPD分子标记对4个扁蓿豆育成品系进行遗传多样性分析。结果表明:筛选的12条多态性RAPD引物共检测出126个等位基因位点,平均每条引物检测到10.5个位点,多态位点比率占94.4%。扁蓿豆品系的Nei ’ s遗传多样性指数(H)为0.266 2,Shannon多样性指数(I)为0.414 5。Nei ’ s指数估算和分子方差分析(AMO-VA)均证实扁蓿豆品系的遗传多样性主要存在于品系内,品系间有一定的基因交流(基因流为2.756 7)。聚类结果表明,品系00-61和00-81遗传差异相对较小,品系90-36与前两者之间的遗传差异较大,品系93-21与各品系的遗传差异最大。
【英文摘要】FourMedicago ruthenicabreeding strains were studied for the analysis of genetic diversity byRAPD markers.Twelve effective primers were screened and totally 126 alleles were detected.The average number of alleles amplified by per primer was 10.5,and the polymorphism percentage was 94.4%.The result indicated that Nei ’ s gene diversity (H) was 0.266 2,Shannon information index (I) was 0.414 5.Nei ’ s analysis and AMOVA analysis both indicated that the majority genetic variation ofM.ruthenicastrains occurred within strains.Gene flow among strains (Nm) was 2.756 7,which proved that there was some gene intercommunion amongM.ruthenicastrains.The result of cluster analysis indicated that the genetic difference between strain 00-61 and 00-81 was

relatively lower,second was strain 00-61 and 00-81 withstrain 90-36,and strain 93-21 has high genetic difference with other strains.

【题目】扁蓿豆愈伤组织诱导和分化条件的研究
【中文关键词】扁蓿豆;组织培养;愈伤组织诱导;激素;愈伤组织分化
【英文关键词】Melilotoides ruthenica;Tissue culture;Callus induction;Exogenous hormones;Callus differentiation
【中文摘要】以扁蓿豆3个品系的下胚轴和子叶为外植体,研究不同培养基、不同激素种类和配比对愈伤组织诱导的影响,以及不同分化培养基对愈伤组织分化的影响。结果表明:下胚轴的愈伤组织诱导率普遍高于子叶;品系B1、B2最佳愈伤组织诱导培养基为MS+ 0・5mg/L 2,4-D+0・5mg/L 6-BA,品系B3最佳愈伤组织诱导培养基为MS+ 0・5mg/L 2,4-D+0・7mg/L 6-BA;适宜分化的培养基均为MS+1mg/L KT+1mg/L 6-BA。
【英文摘要】The cotyledon and hypocotyls of three strains ofMelilotoides ruthenicawere used to studythe effect of different mediums, different hormones in different concentration on callus induction and callus differentiation. The results indicated that the callus induction rate with hypocotyls was higher than cotyledons. The best medium for callus induction with hypocotyls of strain B1 and B2 was MS+ 0.5mg/L 2,4-D+0.5mg/L 6-BA, the best medium for callus induction with hypocotyls of B3 was MS+ 0.5mg/L 2,4-D+0.7mg/L 6-BA. The best medium for callus differentiation was MS+1mg/L KT+1mg/L 6-BA.

【题目】不同品系扁蓿豆种子蛋白指纹图谱研究.
【中文关键词】扁蓿豆;不同品系;种子贮藏蛋白;指纹图谱
【英文关键词】Melilotoides ruthenica;Different strains;Seed storage proteins;Fingerprints
【中文摘要】采用10%SDS-聚丙烯酰胺凝胶电泳,对扁蓿豆4个品系的种子可溶性蛋白和盐溶蛋白进行了研究,结果表明:扁蓿豆4个品系种子可溶性蛋白和盐溶蛋白总带数分别为62和31;相对迁移率分别在11・3%~92・6%和7・4%~92%之间;谱带分子量分别在5・90~107・62KD和14・64~107・38KD之间。4个品系在种子可溶性蛋白电泳图谱上都具有自己的特征带,品系之间在谱带数目、位置、宽窄和颜色深浅方面存在不同程度的差异。盐溶蛋白指纹图谱谱带数目相对较多,但依据带的出现、缺失、宽窄和颜色深浅差异,同样可以鉴定扁蓿豆不同品系。可溶性蛋白和盐溶蛋白指纹图谱一致表明,品系90-36具有较高的品系特异性。
【英文摘要】:Using 10% gel SDS-PAGE, the seed dissoluble proteins and seed salt soluble proteins offourMelilotoides ruthenicastrains were studied. The results showed that the total dissoluble protein bands and total salt soluble protein bands of the strains were 62 and 31,respectively;the relatively mobile rates were 11.3%~92.6% and 7.4%~92%, respectively;and the molecular weight of bands were 5.90~107.62KD and 14.64~107.38KD, respectively. All of the four strains have its own characteristic bands of seed dissoluble proteins. Bands were different in number, distribution, width, and concentration among strains. The band number of the seed salt soluble proteins were less than the seed dissoluble proteins,while the four strains could also be identified based on the appearance, lose, width and concentration of the bands. Both the seed dissoluble proteins and seed salt soluble proteins showed that the strain 90-36 was more distinctive.

【题目】不同秋眠级紫花苜蓿品种的生产性能 在郑州地区的表现
【中文关键词】紫花苜蓿;秋眠性;生产性能;产量
【英文关键词】alfalfa; fall dormancy; productivity; yield
【中文摘要】试验研究了2,3,4,5,7,8共6个秋眠级18个紫花苜蓿Medicago stiva品种的重要农艺性状表现。结果表明,秋眠级对紫花苜蓿的年鲜草产量、株高等有较大影响,其中秋眠级别为4级的紫花苜蓿品种的年鲜草产量极显著高于5级(P<0.01),显著高于7级品种(P<0.05),但与2,3,8级品种产量差异不显著(P>0.05),综合考虑,秋眠级为2,3,4的紫花苜蓿品种较适合在郑州地区种植;不同茬次对其生长性能有更大的影响,其中第1茬的产量和株高最大,其次为第2,3茬,第4,5茬最低,前3茬占全年产量的80%左右,应加强对前3茬的管理。
【英文摘要】The agronomic traits of 18 alfalfa varieties with different fall-dormancy classes ranging from2 to 8(except 6) were studied in two growing years. The result showed that fall-dormancy classes had significant influence on annual fresh yield and plant height. Fresh yield of class 4 was significantly higher than class 5(P<0.01)and class 7(P<0.05), but no significant difference was observed with classes 2, 3, and class8(P>0.05). It was concluded that alfalfa with classes 2, 3, 4 fall dormancy were suitable for Zhengzhou. Different cuttings had important influence on growth performance. The first cutting gave the highest yield and plant height, followed by the second, third, forth, and fifth cutting accordingly; The first three cuttings made up 80% of the total yield, so management should be focused on them.

【题目】不同秋眠类型苜蓿品种的生产性能研究
【中文关键词】苜蓿;生产性能;秋眠;干物质产量
【英文关键词】Alfalfa;Production performance;Fall dormancy;DM yield
【中文摘要】通过对国内外42个秋眠级为2~9级的紫花苜蓿品种4个生产年的研究,探讨苜蓿秋眠级与生产性能的关系。结果表明:(1)不同秋眠级苜蓿的干物质产量均呈第4年≈第3年>第1年>第2年的趋势,其中第2生长年(2003年)天气温度较低和降雨过量是其低产的直接原因;(2)在郑州地区,4、2秋眠级苜蓿干物质产量显著高于非秋眠品种,其他秋眠或半秋眠苜蓿产量也程度不同地高于非秋眠苜蓿;(3)不同秋眠级的苜蓿品种第1茬产量最高,其次为第2、3、4茬,第5茬产量最低;(4)苜蓿的秋眠级与年干物质产量、粗蛋白质(CP)含量呈负相关,与粗纤维(CF)呈正相关,认为郑州地区不宜选用非秋眠品种。
【英文摘要】Fall dormancy(FD)in alfalfa is related to regrowth,yield and plant height in autumn.The objectives of this research were to evaluate variability for agronomical traits among 42 alfalfa varieties with fall dormancy classes ranging from 2 to 9 in Zhengzhou,China.The results were as follows:(1)The dry matter yields(DM)of 42 varieties in 2004 and 2005 were higher than those in 2002,and the yield in 2002 was higher than that in 2003,due to the low temperature and high rainfall in 2003;(2)DM yields of fall dormant and semi-fall dormant alfalfa were higher than those of non-fall dormant alfalfa;(3)Cutting times had a significant effect on DM herbage yield,with the highest yield in the first cutting and the lowest in the fifth.The first 3 cuttings in the spring and early summer should be paid attention for the alfalfa yield;(4)The non-fall dormant alfalfa should not be selected in the production of Zhengzhou,because FD classes had extremely significant negative correlation with CP content and DM yield (P<0.01),and positive correlation with CF.

【题目】Metabolic Regulation of Mammary Gland Epithelial Cells of Dairy Cow by Galactopoietic Compound Isolated from Vaccariae segetalis
【中文关键词】Vaccaria segetalis, DBP, dairy cow, mammary gland epithelial cell, metabolic regulation
【英文关键词】Vaccaria segetalis, DBP, dairy cow, mammary gland epithelial cell, metabolic regulation
【中文摘要】In previous experiment, we isolated a compound dibutyl phthalate (DBP) from Vaccaria segetalis which had galactopoietic function on mammary gland epithelial cells of dairy cow (DCMECs). In this experiment, we ascertained the metabolic regulation function of DBP on DCMECs. Many genes related to lactation including Stat5, AMPK, -casein, Glut1, SREBP-1, PEPCK, and ACC were detected by real-time PCR. Furthermore, Stat5 and AMPK were detected by Western blot and immunofluorescence co-localization, respectively. The results showed that DBP stimulates the expression of Stat5 and p-Stat5, thus activates Stat5 cell signal transduction pathway and stimulates -casein synthesis. DBP also raises the activities of Glut1 and AMPK to stimulate glucose uptake and glycometabolism and activates the expression of AMPK downstream target genes PEPCK and ACC and expression of SREBP-1 to stimulate milk fat synthesis. In addition, the activities of HK, G-6-PDH, ICDH, ATPase, and energy charges were stimulated by DBP to increase the energy metabolism level of DCMECs. The results showed DBP stimulates energy metabolism related to galactopoietic function in DCMECs.

【题目】干旱胁迫对苗期紫花苜蓿3种生理指标的影响
【中文关键词】干旱胁迫;紫花苜蓿;丙二醛;抗坏血酸;过氧化物酶
【英文关键词】drought stress; alfalfa; MDA; AsA; POD
【中文摘要】:以紫花苜蓿Medicago sativa金皇后盆栽苗为试验材料,用改良空气干旱法进行0~6 h的干旱胁迫,试剂盒测定地上部分和地下部分的丙二醛(MDA)含量,抗坏血酸(AsA)含量和过氧化物酶(POD)活性的变化。结果表明:轻度干旱胁迫下,随着干旱时间的延长,紫花苜蓿地上部分和地下部分的MDA含量、AsA含量均在短时间内增加,地下部分的POD活性也在较短时间内增强,地上部分则无明显变化;紫花苜蓿地下部分比地上部分对干旱胁迫反应更为敏感;改良空气干旱法模拟干旱胁迫效果明显,可以作为一种模拟方法选用。
【英文摘要】The seedling of alfalfa (Golden Empress) were treated for 0 to 6 hours with the improvedair-drought method and the AsA content, MDA content and POD activity in aboveground and under-ground parts were tested. The results showed that under the condition of slight drought stress in a short time, the MDA content and AsA content increased along with the progress of drought stress.The POD activity also increased in underground parts, however, there was no significant change in aboveground parts. The underground parts were more sensitive to drought stress than aboveground parts. The improved air-drought method was proper to simulate the drought stress conditions.

【题目】嗜酸乳杆菌NCFM对Caco-2细胞基因表达谱的影响
【中文关键词】嗜酸乳杆菌NCFM; Caco-2 细胞; 基因芯片技术;Rea-l time RT PCR
【英文关键词】Lactobacillus acidophilus NCFM; Caco-2 cell; microarray technology; Real-time RT PCR
【中文摘要】《目的》嗜酸乳杆菌NCFM 作为一株具有良好益生功能的模式菌株, 采用基因芯片技术对其作用后的宿主细胞基因的变化情况进行分析, 在生物、食品等领域具有较大研究价值。《方法》将嗜酸乳杆菌NCFM 和Caco-2 细胞共同培养2h, 提取Caco-2 细胞的总RNA, 并将RNA 反转录成cDNA, 与Human Genome U133 Plus210 Array 基因表达谱芯片杂交, 杂交后进行图像扫描和数据分析, 并采用Rea-l t ime RT PCR 方法对差异表达的基因进行验证。《结果》采用基因芯片方法检测了Caco-2 细胞经嗜酸乳杆菌NCFM 作用2h 后的基因表达变化, 发现差异表达基因为508 个, 其中有473个基因上调, 35个基因下调, 初步推测Caco-2 细胞能诱导多个基因的表达, 以发挥嗜酸乳杆菌NCFM 的益生功能。并且经Rea-l time RT PCR 验证, 表达差异显著的3个免疫调节相关基因CCL2、PTX3 和TNFRSF9 的确在嗜酸乳杆菌NCFM 作用期间高表达。《结论》以上这些结果促进了对嗜酸乳杆菌NCFM 益生功能的认识, 也为揭示该乳酸菌的作用机理提供了理论基础。
【英文摘要】[Objective] Lactobacillus acidophilus NCFM is a probiot ic strain that promotes human health. We evaluated the influence of Lactobacillus acidophilus NCFM on the genetic expression patterns in the Caco- 2 cells. [Methods] Caco- 2 cells were treated with Lactobacillus acidophilus NCFM for 2h. The total RNA of cells was extracted. Hybridizat ion with Human GenomeU133 Plus 210 Array was performed. The image scanning and data analysis were performed subsequently. Genes with significant expression

changes were selected and analyzed. To support the microarray data, three striking difference genes were studied using Rea-l time RT PCR. [Results] Microarrays analysis showed that the expression levels of 508 genes were altered as compared with the control 473 of them were up-regulated, and 35 were down-regulated. It was supposed that many genes in Caco- 2 cell were induced, so that Lactobacillus acidophilus NCFM could play a part in immune system process, antioxidantact ivity, biological adhesion, cholesterol absorption and so on. Three striking difference genes CCL2, PTX3 and TNFRSF9 which involved immune system process were validated by Rea-l time RT PCR. And the results of Rea-l time RT PCR showed the same expression trend as in microarray. [Conclusion] Based on the results of gene expression alterations, the beneficial function of Lactobacillus acidophilus NCFM could be more greatly and deeply understood than ever before, and the mechanism of lactic acid bacteria would be revealed.

【题目】化学杂交剂在植物育种中的应用现状
【中文关键词】植物育种;化学杂交剂;作用机理
【英文关键词】plant breeding; chemical hybridizing agent;mechanism
【中文摘要】对化学杂交剂的主要研究工作进行了综述,重点讨论化学杂交剂作用机理、存在问题及在牧草杂交育种中应用的可能性。化学杂交剂的发展经历了对已知植物生长调节剂诱导作物雄性不育的研究、专门开发新化学杂交剂化合物和应用化学杂交剂育种3个阶段。化学杂交剂的作用机理目前还不是很清楚。资料表明,化学杂交剂EXP可以阻止油菜Brassica campestris体内支链氨基酸缬氨酸、亮氨酸和异亮氨酸的合成,致使雄性败育;SC2053、BAU-2、GENESIS使小麦Triticum aestivum花粉生活力下降、降低花药脯氨酸含量和酶活性等可致雄性不育。化学杂交剂在牧草育种上应用不多,主要集中在去雄效率的探讨上,在杂交育种获得杂交种子方面研究不多。
【英文摘要】The research results on chemical hybridizing agent were summarized, which included themechanism and existing problems of chemical hybridizing agent and its application possibility in forage hybridization breeding. The developing of chemical hybridizing agent experienced three stages such as research on growth regulator induced male sterility, exploitation new chemical hybridizing agent compounds and application of chemical hybridizing agent in plant breeding. The mechanism of chemical hybridizing

agent was not very clear at present, the information showed that EXP of chemical hybridizing agent could restrain the synthesis of branched-chain amino acids valine, leucine and isoleucine in vivo of rape, finally lead to male sterility. SC2053, BAU-2, GENESIS could induce male sterility by declining pollen viability on wheat, decreasing anther proline content and enzymic activity and so on.Chemical hybridizing agent had few applications on the forage breeding, they mainly focused on the discussion of the emasculation effective, however few study were about getting the forage hybrid seeds by this method.

【题目】加拿大披碱草_老芒麦杂种新种质的研究
【中文关键词】加拿大披碱草;老芒麦;杂种新种质;农艺性状
【英文关键词】E. canadensis; E. sibiricus; new germplasm; agronomy traits
【中文摘要】:对加拿大披碱草×老芒麦杂交后代的农艺学性状进行了比较研究,结果表明:F1和C1Ⅱ的生育期比母本加拿大披碱草短,其他杂种后代生育期偏向加拿大披碱草;在植株高度上,双亲和后代的株高排序依次为C1Ⅱ>老芒麦>F1>C1Ⅰ>加拿大披碱草>C0Ⅰ>C0Ⅱ;从分蘖数来看,C1Ⅱ>老芒麦>C1Ⅰ>C0Ⅱ>C0Ⅰ>F1>加拿大披碱草;产草量排序为C1Ⅱ>C0Ⅱ>C1Ⅰ>F1>C0Ⅰ>老芒麦=加拿大披碱草。杂交后代在产草量方面都体现了较强的杂种优势;在叶长、叶宽、叶面积、节间数和节间粗等方面,F1的各项指标介于双亲之间, C0Ⅰ、C1Ⅰ、C0Ⅱ和C1Ⅱ的茎叶指标也很高,接近或者超过了加拿大披碱草的指标;穗型上,杂种F1代、C0Ⅰ、C0Ⅱ介于双亲之间,半弯穗。C1Ⅰ和C1Ⅱ的穗形发生分离现象;杂种后代的蛋白质、粗脂肪的含量不同程度的体现了杂种优势。
【英文摘要】Agronomy traits ofhybrids ofElymus canadensis×Elymus sibiricuswas studied.The results showedthatgrowth period ofF1and C1Ⅱwere shorter than E. canadensis.Growth period of other hybrids tended to E. canadensis.The sequence ofplantheight form high to low was C1Ⅱ,Esibiricus, C1Ⅰ, C0Ⅱ, C0Ⅰ, F1and E. canadensis.And tillering ability form high to lowwasC1Ⅱ,E. sibiricus,C1Ⅰ,C0Ⅱ,C0Ⅰ, F1and E. canadensis.Yield ofgrass from high to lowwasC1Ⅱ,C0Ⅱ,C1Ⅰ,F1,C0Ⅰ,E. sibiricusandE. canadensis.Hybrids exhibited strong heterosis in yield ofgrass;The leaf length, leafwidth, leafarea,numberof internode and thick of internode ofF1were between parents.C0Ⅰ、C1Ⅰ、C0Ⅱand C1Ⅱwere close to orhigher thanE.canadensis.Spike type ofF1,C0Ⅰand C0Ⅱbelonged to se-mi-curedwhichwasbetween parents.Character segregationwere found in Spike type ofC1Ⅰand C1Ⅱ.Heterosis ofhybrids showed in crude protein and fat atdifferentdegrees.

【题目】加拿大披碱草与老芒麦及其杂种后代同工酶和RAPD遗传分析
【中文关键词】加拿大披碱草;老芒麦;杂交后代;遗传分析
【英文关键词】E.canadensis;E.sibiricus;Hybrids; Genetic analysis
【中文摘要】对加拿大披碱草、老芒麦、杂种F1、C0Ⅰ、C1Ⅰ、C0Ⅱ和C1Ⅱ7种材料进行了同工酶和RAPD的分析,旨在通过分子标记方法探讨供试材料的亲缘关系。结果表明:在不同的生育期,EST同工酶酶谱具有较高的多态性,酶谱差异较大,在分蘖期杂种的EST酶谱偏向母本加拿大披碱草,根据该生育时期的酶谱特征可以鉴定杂种后代的的真实性,其他生育时期,EST酶带偏向父本老芒麦,而且没有明显的差异。SOD酶谱的差异只是体现在表达量的多少上,并没有出现特异性的条带。RAPD分析表明,加拿大披碱草与老芒麦的遗传一致度为0·72,遗传距离为0·328 5,在7种材料中亲缘关系最远;杂种后代与母本加拿大披碱草的遗传距离较近,而与父本老芒麦的亲缘关系相对较远;因此用RAPD分析材料的遗传关系更为合适。
【英文摘要】Genetic analysis on isozymes and RAPD ofE.canadensis,E.sibiricus,F1,C0Ⅰ,C1Ⅰ,C0Ⅱand C1Ⅱwere done.The results showed that the polymorphism of EST isozymes were much more than that of SOD during the four breeding periods. Attillering stage,the results of esterase isozymes also showed thattrue hybrid could be identificate,and zymogram characteristics of esterase isozymes tended to thatof female parentE.canadensis. Atotherthree breeding periods,zymogram characteristics of esterase isozymes tended to that of male parent and there were little differences . Differences of SOD isozyme only lied in expression level,and there were no specific band. Analysis on RAPD showed that genetic identity and genetic distance ofE.canadensisandE.sibiricuswere 0.72 and 0.328 5 . Their genetic relationship was most furthest among 7 materials.And genetic relationship between hybrids and parents showed that

hybrids tended to female parentE.canadensis. But thatwas very far to maleE.sibiricus.Itwas much appropriate that RAPDwas used to analyze genetic relationship.

【中文摘要】优良的种质是产业发展的重要保证,品种更新和养殖技术的发展已经给世界农业带来了令人瞩目的成就,然而我国水产生物的育种工作刚处于起步阶段,而育种技术的研究则更是滞后。借鉴陆生生物中发展起来的相对成熟的研究方法,可以帮助加快海洋生物遗传育种相关研究的进度。本研究以我国北方海区重要的海洋经济动物-皱纹盘鲍为研究对象,从表型遗传、数量性状遗传等2个方面开展了皱纹盘鲍的遗传育种研究,同时从幼鲍培育密度与分选效应等方面研究了皱纹盘鲍的中间培育技术。
【英文摘要】Implementations of genetic improved varieties are fundamentals to agriculture. Looking back to the development of agriculture, genetic breeding together with cultivation techniques have brought great prosperities worldwide. However, the genetic breeding programs of aquatic organisms initiated recently, while researches on breeding techniques in aquaculture field are lacking in China. Establishment of genetic breeding system of marine animals should be based on the biological characteristics of objective animals and quantitative genetic models constructed in agricultural organisms. Pacific abalone, Haliotis discus hannai Ino is one of the most important mariculture species in northern China. Researches on gentic control of shell color, quantitative genetics relating to genetic improvement of Pacific abalone, and cultivation techniques on combined effects of sizes, stocking density and sorting on juvenile growths were reported in this study.

【题目】酪蛋白肽对小鼠抗氧化酶作用的研究
【中文关键词】酪蛋白肽;GSH-PX;SOD ;MDA
【英文关键词】casein peptides; GSH – Px; SOD; MDA
【中文摘要】目的 研究不同分子量范围酪蛋白肽对小鼠肝脏组织中抗氧化酶活性的影响。方法 将48 只雌雄各半的昆明种小鼠,平均分成肽分子量大于3ku、1k~3ku、小于1ku 和对照四个组。样品组每天灌胃10mg/ml 多肽溶液0.2ml,对照组灌胃蒸馏水。各组随机选取6 只,分别灌胃15d 和30d,断颈处死后取其脾脏和肝脏进行抗氧化指标测定。结果 酪蛋白肽能够使小鼠肝脏组织中谷胱甘肽过氧化物酶(GSH-Px)和超氧化物歧化酶(SOD)活性增强,使丙二醛(MDA)含量下降,且灌胃15d 与30d 时抗氧化酶活性差异显著。结论 酪蛋白肽可增强小鼠抗氧化性作用,肽分子量1ku 以下对小鼠抗氧化酶系作用显著。
【英文摘要】Objective To study the antioxidant effects of casein peptides with different molecular weights on liver tissue in mice. Methods Forty-eight mice were divided into four groups, and fed ig casein peptides in different molecular weights, <1ku, 1-3ku, >3ku and distilled water as control. Results Casein peptides could improve the antioxidation ability ofthe mice, as to increase glutathione peroxidase (GSH-Px) and superoxide dismutase (SOD) activities of liver tissue, and reduce malondialdehyde (MDA). The antioxidant enzymes activities after giving casein peptides for 30d and 15d were significantly different. Conclusions Casein peptides can enhance the antioxidation of the mice and especially more effect with the molecular weight <1000u.

【题目】披碱草与野大麦杂交种BC1F2代的同工酶分析
【中文关键词】披碱草;野大麦;杂种BC1F2;同工酶酶谱
【英文关键词】Bentgrass; Greens; Covering in winter
【中文摘要】采用不连续聚丙烯酰胺凝胶垂直平板电泳方法,对披碱草、野大麦及其杂种BC1F2代分蘖期叶片的过氧化物酶(POD)和酯酶(EST)同工酶进行分析,结果表明:杂种BC1F2代的POD、EST同工酶谱表现为双亲的互补类型;杂种BC1F2代的POD和EST同工酶谱中亲本的个别酶带有丢失现象,在EST同工酶谱中产生了1条杂种带(Rf=0.11);BC1F2代POD同工酶谱的酶带基本相同,EST酶带特征差异较大,出现双亲互补带和杂种带;BC1F2代的POD和EST同工酶谱明显地受轮回亲本野大麦的影响,说明回交使野大麦的某些性状在BC1F2代进一步加强。聚类分析结果表明,Y1F2-5(7号)与P1F2-1(12号)及Y1F2-3(5号)与Y1F2-4(6号)有极其近的遗传关系,野大麦与BC1F2代多数株系有较近的遗传关系;POD与EST同工酶具多态性,可作为遗传标记用于杂种鉴定和目标性状植株的检测。
【英文摘要】Under low irrigation frequency(30d each time), the bentgrass(Agrostis stolonifera) greenwas covered with green quilt, straw matting, leaves and plastic film in winter. The influence of these four kinds of materials on moisture content, soil temperature, turf appearance quality, underground biomass and aboveground biomass was studied. It indicated that the ability of water retention and heat preservation of green increased in difference extent under all four kinds of treatments. Heat preservation under straw matting and leaves was the best, water retention under leaves and plastic film was the best. Turf appearance quality was the best under straw matting, and then leaves and plastic film. Green quilt had poor ability to improve turf appearance quality. Underground biomass under four kinds of treatment showed that green quilt>straw matting>leaves>plastic film.

【题目】紫花苜蓿抗热性鉴定与评价的研究进展
【中文关键词】紫花苜蓿;高温;抗热性;鉴定方法;评价
【英文关键词】alfalfa; high temperature; heat resistance; identification; evaluation
【中文摘要】紫花苜蓿Medicago sativa因其营养丰富被广泛栽培,已成为草食家畜和奶牛养殖业的重要饲草,更是一种重要的生态改良草,在我国畜牧业发展和生态保护中起着不可比拟的作用。高温是影响紫花苜蓿生长的重要限制因子,研究发现高温胁迫致使植物发生一系列生理、生化及形态上的响应。在河南省,由于夏季高温的胁迫,致使紫花苜蓿夏眠,甚至死亡,严重影响其品质和产量。结合植物自身的调节机制,从植物形态及抗氧化系统综合阐述了高温条件下紫花苜蓿的抗热性鉴定方法和评价指标,旨为其抗热性鉴定和选育工作提供一定的科学参考。
【英文摘要】High temperature is one of the limiting factors in alfalfa production, which induces a seriesof responses in physiology and morphology. Alfalfa in Henan Province usually aestivate or died because of the high temperature stress, which affects quality and yield of the forage greatly. The progress of identification methods and evaluation indexes for heat resistance of alfalfa were summarized in this paper.

【题目】高压脉冲电场处理菠萝汁及其贮藏期间微生物变化研究
【中文关键词】菠萝汁 高压脉冲电场 冷冻浓缩 微生物 贮藏
【英文关键词】pineapple juice pulsed electric field freeze concentration microbiology storage
【中文摘要】探讨特定场强下脉宽、流速对高压脉冲电场杀菌的影响,确定合适的高压脉冲电场(PEF)处理菠萝汁的参数,并探讨菠萝原汁、热处理菠萝汁、PEF处理菠萝汁以及PEF处理冷冻浓缩菠萝汁在- 18℃下贮藏期间微生物的变化情况。结果表明:接受PEF处理时,冷冻浓缩菠萝汁比菠萝原汁能够获得更高的电压参数,在- 18℃下贮藏80d,热处理和经PEF处理菠萝汁的菌落总数和霉菌总数均下降。PEF处理和冷冻浓缩+PEF处理的菠萝汁,两者的菌落总数和霉菌总数相差不大,且变化趋势基本一致。
【英文摘要】Effects of pulse width and flow rate on Pulsed Electric Field(PEF) sterilization were discussed under Specific electric field strength. The appropriate parameters of PEF were determined in the process of pineapple juice. And the changes of Microbiology at 218°Cduring storage were discussed based on raw, heat treatment, PEF treatment, freeze concentrated treatment and freeze

concentrated with PEF treatment Pineapple juice respectively. The results indicate that freeze concentrated Pineapple juice could get a higher voltage parameter than Pineapple juice with PEF. The total number of Colonies and Streptomyces were reduced in Pineapple juice treated by heat and PEF respectively at 218°Cafter 80days, and which was less different between Pineapple juice with PEF and Freeze concentration +PEF and their changing trend was the same basically.

【题目】不同方法处理荔枝汁的品质研究
【中文关键词】荔枝汁 冷冻浓缩 高压脉冲电场 理化指标 感官评价
【英文关键词】Litchi juice;Freeze concentration;Pulsed electric field;Physical chemical properties;Sensory evaluation
【中文摘要】研究了荔枝原汁、热处理荔枝汁、冷冻浓缩荔枝汁和PEF结合冷冻浓缩荔枝汁Vc、总酸、总糖等理化指标在贮藏期间的变化情况并利用加权评分法对不同处理荔枝汁进行感官评价。结果表明,利用PEF处理能够较好的保持冷冻浓缩荔枝汁的营养物质,热处理荔枝汁营养成分损失较大。贮藏期间,4种不同处理的荔枝汁其Vc含量随着贮藏时间的延长而下降,总酸随着站藏时间的延长先减少后增加。而总糖随贮藏时间的延长先增加后减少。感官评定从高到低为:PEF-4-冷冻浓缩处理荔枝汁>冷冻浓缩荔枝汁>荔枝原汁>热处理荔枝汁。可见冷冻浓缩再经高压脉冲电场处理是荔枝汁处理的最佳方法之一。
【英文摘要】In this paper we are going to observe and discover the physical chemical properties And evaluation for the untreated Litchi juice,heat treatment Litchi juice,freeze concentration Litchi juice and PEF combined with freeze concentration Litchi juice.Then comparing their Vc,amine add,total sugar under these different treatments.The experimental results are showed as follows:The quality of Litchi juice treated by pulsed electric field is in the best condition by comparing to other three treatments.On the other hand,the nutrient compositions Of Litchi juice are destroyed badly under heat treatment; therefore,we can conclude the combination of PEF technology and freeze concentration is a better treatment to remain agood Quality for Litchi juice than the heating treatment.During storages,As time increases the Vc Of litchi Juices is decreasing,a-mine acid with Storage time after the first reduction.The total Sugar with the extension of storage time following the first in-crease.The sensory Evaluation of this four fresh litchi juice Made by different treatment methods from high to low is:freeze concentrated litchi juice>high pressure pulse electric field processing Of litchi juice>litchi juice>hot processing litchi juice.The method which takes into account all Assessment factors and overcomes the influence of artificial factors call acquire more objective conclusions.We find out that if we take into account of these two technologies,the product Obtain the color,flavor and taste of the fruit and Vegetable juice,the quality Of it is better than that heated by thermal pasteurization.

【题目】高压脉冲电场对冷冻浓缩荔枝汁非热杀菌的研究
【中文关键词】荔枝汁 高压脉冲电场 冷冻浓缩 巴氏杀菌 微生物
【英文关键词】litchi juice; pulsed electric field(PEF); freeze concentration; Pasteurization; microbial
【中文摘要】研究了温度 、电导率对大肠杆菌高压脉冲电场处理效果的影响以及温度对电导率的影响, 并在此基础上探讨了冷冻浓缩前后荔枝汁高压脉冲电场处理结果,最后分析了荔枝原汁 、 巴氏杀菌荔枝汁、高压脉冲电场处理的浓缩荔枝汁-18 ℃下贮藏期间的微生物变化情况。结果显示低电导率更有利于高压脉冲电场处理。采用冷冻浓缩技术制得的荔枝浓缩汁,在低温下能够获得更低的电导率,在接受脉冲电场处理时较原汁能够获得更高的处理参数,3 种不同处理果汁在

贮藏期间微生物变化趋势基本相同。
【英文摘要】In this paper, the steriliaztion effect of E. coli, on temperature and electrical conductivity had been studied, the impact of temperature on the conductivity was analyzed, and then the results of frozen concentration litchi juice treated by high-voltage pulsed electric field were also explored. Finally, changes of microorganisms in litchi juice, pasteurized litchi juice, and freeze concentration treated litchi juice by pulsed electric field was analyzed during storage under -18 °C. The results showed that the low conductivity was more conducive to the processing of pulsed electric field. Conductivity could be lower with the low temperature in concentration litchi juice by freezing concentration. And the processing parameters of frozen concentration litchi juice were higher than those of untreated litchi juice in a pulsed electric field processing. Three different litchi juices had roughly the same changing trend of the microorganisms during storage.

【题目】APPLICATION OF PEF AND FREEZE CONCENTRATION PROCESSING TECHNOLOGY ON LITCHI JUICE
【中文关键词】无
【英文关键词】non-thermal processing, PEF, freeze concentration, litchi juice
【中文摘要】无
【英文摘要】Pulsed electric field (PEF) is a technology that can effectively kill microorganism at ambient temperature, but it fails to inactivate enzymes that are responsible for the deterioration of quality. The present research treatment of PEF was attempted to utilize combination with freeze concentration to alleviate enzymatic degradation. Litchi juice was firstly treated by PEF at field strength of 20 kV/cm for 6.8 ms to eliminate food borne pathogens and other background flora, and then treated by freeze concentration so as to remove excess water. Under the condition of -1.5-4.7 ° C, litchi juice was concentrated from 14 to 40 ° Brix and stored at -18 ° C. The low temperature significantly reduced the enzymatic activities, and extended the shelf-life. After stored for 6 months, the concentrated juice was reconstituted with distilled water for sensory evaluation by the triangle method. The results showed that there were no significant differences between the freshly prepared juice ($p<0.01$) and the one treated by PEF and reconstituted.

【题目】西红柿汁的多级冷冻浓缩研究
【中文关键词】冷冻浓缩 西红柿汁 冰晶生长模型
【英文关键词】freezing concentration Tomato juice Crystal growth model

【中文摘要】在果汁的悬浮式冷冻浓缩过程中,对于低浓度的果汁为避免冰晶夹带过多,减少能耗和原材料的损失,通常采用多级浓缩的方式得到高浓度果汁。本文以西红柿汁为原料,先后进行了四级的冷冻浓缩,将西红柿原汁从4.2。Bx浓缩5.8倍到24.4。Bx,对试验数据回归模型参数,采用龙格一库塔法进行数值积分求得模型解,建立了西红柿汁的四级冰晶生长动力学模型。模犁建证后再对四级浓缩的生长曲线进行综合比较。试验结果表明:在每级的浓缩过程中都经历了缓慢浓缩,加速浓缩,缓慢浓缩三个阶段,同时随着冷冻浓缩的级数增加,浓缩速度逐级放缓,浓缩时间逐级延长,特别是在较高级别的浓缩的中后期,出现了试验数据部分低于拟合数据的现象,该阶段可以认为是冷冻浓缩过程中的一个“ 关键控制点 ”,这点为指导工业生产中的冷冻浓缩提供一定的理论依据和实践参考。

【英文摘要】After storage for 6 months, the concentrated juice was reconstituted with distilled water for sensory evaluation using the triangle method. Results showed that the PEF treated and reconstituted juice was not significantly different from the freshly prepared juice ($p< 0.01$).

【题目】高压脉冲电场处理瓶装饮用水的研究

【中文关键词】高压脉冲电场;杀菌效果;微生物;瓶装水

【英文关键词】pulsed electric field sterilization effect microbiology bottled water

【中文摘要】探讨高压脉冲电场处理瓶装水中大肠杆菌、啤酒酵母、青霉、金黄色葡萄球菌和沙门氏菌的杀菌效果。结果表明,PEF可以有效地杀灭瓶装水中常见微生物,其中大肠杆菌、啤酒酵母和青霉菌经48.39kV/cm场强的PEF处理,在不同时间之后均未有活菌检出,金黄色葡萄球菌和沙门氏菌在此场强下处理经295μs之后,活菌数分别减少了6.6和5.5个对数。另外在电场强度为48.39kV/cm、其他条件一致的情况下,处理时间分别为94μs、114μs、155μs、203μs、295μs,探讨不同处理时间对不同微生物的杀灭效果。结果表明,随着处理时间的延长,PEF的杀菌效果也有明显增强的现象。以大肠杆菌为例,通过方差分析可知处理时间和电场强度对杀菌效果的影响都是极显著的,其中场强较之更显著,是起主导作用的因素。

【英文摘要】To explore high pressure pulse electric field treatment bottled water E coli, beer yeast, blue mould, staphylococcus aureus and salmonella sterilization effect. The results show that PEF can effectively kill bottled water common microorganisms, including E coli, beer yeast and penicillium by 48.39 kV/cm field strength of PEF treatment, in different time after all no viable detection, staphylococcus aureus and salmonella in this field by 295 μ s under treatment after viable count are reduced to 6.6 and 5.5 logarithm. In the electric field intensity is 48.39 kV/cm, other conditions consistent with the case, the processing time is respectively 94 μ s, 114 μ s, 155 μ s, 203 μ s, 295 μ s, this paper discusses the different processing time for different microbial kill effect. The results show that, with the deal with the extension of time, PEF sterilization effect also has the obvious enhancement phenomenon. To E coli as an example, through the analysis of variance know the processing time and electric field intensity on the sterilization effect is very significant, the field strength than the more significant, is a leading role factors.

【题目】In vitro and in vivo evaluation of novel implantable collagen-chitosan-soybean phosphatidylcholine composite film for the sustained delivery of mitomycin C
【中文关键词】无
【英文关键词】chitosan; mitomycin c; film; implant; drug delivery
【中文摘要】无
【英文摘要】An implantable mitomycin C (MMC) delivery system (MMC-film), incorporating polylactide(PLA) – MMC nanoparticles in a composite film from blends of collagen – chitosan – soybean phosphatidylcholine(SPC) with a mass ratio of 4:1:1, was developed and evaluated. PLA – MMC nanoparticles were preparedusing an improved emulsion/solvent evaporation technique and then dispersed uniformly within the film toresult in a final MMC loading content of 0.8 mg/cm2. Drug release studies were performed in pH 7.4 PBS at371C with drug analysis using UV/vis spectrometer at 366nm. The MMC-film exhibited more fractionaldrug release and a longer time to reach release equilibrium as compared with PLA-MMC nanoparticles. Invivo, the MMC-film was implanted at subcutaneous tumor sites of hepatoma-bearing mice, and the curativeeffect was compared with those of drug-free film. The growth of the tumors was dose-dependently inhibitedby MMC-film. Histopathological analysis of specimens taken from tumor tissues harvested indicated thatMMC-film was lethal to hepatoma cells. Additionally, post mortem visual examination and microscopicimages showed no sign of internal infection and fibrous encapsulation in any animals after 20 days ofimplantation of the MMC-film or drug-free film. It was concluded that the system provides great potentialfor local sustained delivery of MMC at the site of tumor or tumor resection for therapeutic purposes.

【题目】New Method to Prepare Mitomycin C Loaded PLA-Nanoparticleswith High Drug Entrapment Efficiency
【中文关键词】无
【英文关键词】Mitomycin C PLA Nanoparticles
Drug release
【中文摘要】无
【英文摘要】The classical utilized double emulsion solventdiffusion technique for encapsulating water soluble MitomycinC (MMC) in PLA nanoparticles suffers from lowencapsulation efficiency because of the drug rapid partitioningto the external aqueous phase. In this paper, MMCloaded PLA nanoparticles were prepared by a new singleemulsion solvent evaporation method, in which soybeanphosphatidylcholine (SPC) was employed to improve theliposolubility of MMC by formation of MMC – SPC complex.Four main influential factors based on the results of asingle-factor test, namely, PLA molecular weight, ratio ofPLA to SPC (wt/wt) and MMC to SPC (wt/wt), volumeratio of oil phase to water phase, were evaluated using anorthogonal design with respect to drug entrapment efficiency.The drug release study was performed in pH 7.2PBS at 37 C with drug analysis using UV/vis spectrometerat 365 nm. MMC – PLA particles prepared by classicalmethod were used as comparison. The formulated MMC – SPC – PLA nanoparticles under optimized condition arefound to be relatively uniform in size (594 nm) with up to94.8% of drug entrapment efficiency compared to 6.44 lmof PLA – MMC microparticles with 34.5% of drugentrapment efficiency. The release of MMC shows biphasicwith an initial burst effect, followed by a cumulated drugrelease over 30 days is 50.17% for PLA – MMC – SPCnanoparticles, and 74.1% for PLA – MMC particles. The IRanalysis of MMC – SPC complex shows that their highliposolubility may be attributed to some weak physicalinteraction between MMC and SPC during the formation ofthe complex. It is concluded that the new method isadvantageous in terms of smaller size, lower size distribution,higher encapsulation yield, and longer sustaineddrug release in comparison to classical method.

【题目】Non-spherical racemic polylactide microarchitectures formation via solvent evaporation method
【中文关键词】无
【英文关键词】PDLLA; Non-sphericalmicroarchitectures; Assembly
【中文摘要】无
【英文摘要】Usually, amphiphilic or crystalline structure is necessary to prepare nano- or micro-structured materials with various morphologies. Racemic random polylactide (PDLLA) is completely amorphous in nature and was mainly prepared to be of spherical form for the use of sustained drug release. In this paper, we observed novel lath-, sheaf-like morphologies of PDLLA microarchitectures fabricated by the double emulsion-solventevaporationmethod in the presence of glycerol or epirubicin. These non-sphericalmicroarchitectures coexisted with amorphous PDLLA microspheres and crystallized poly(vinyl alcohol) (PVA) nanoparticles. On the basis of our experiments, the formation of lath-like microarchitectures is due to glycerol, while the formation of sheaf-like microarchitectures is owing to both glycerol and epirubicin. Therefore, novel assemblies of PDLLA have been developed and the formation mechanism is different from those of well-defined amphiphilic or crystalline polymers. These PDLLA non-sphericalmicroarchitectures might have potential application as non-spherical carriers in drug delivery system.

【英文关键词】Multi-walled carbon nanotube; Oxidative stress; Nuclear factor-κB
【中文摘要】探讨多壁碳纳米管对人肺上皮细胞A549核转录因子-κB(NF-κB)活性的影响及其活化机制.不同浓度的多壁碳纳米管作用于A549细胞后,用活性氧(ROS)敏感探针2′,7′-二氯荧光素二乙酸酯结合流式细胞仪检测细胞内氧化应激状态;用凝胶电泳迁移率改变这一分析技术检测A549细胞NF-κB DNA结合活性;用蛋白印迹检测A549细胞NF-κB p65蛋白和IκBα蛋白表达;用免疫荧光结合共聚焦显微镜观察A549细胞NF-κB p65蛋白的核转位情况.结果表明,多壁碳纳米管诱导A549细胞内ROS过量产生和NF-κB DNA结合活性;同时伴有p65蛋白核移位和IκBα蛋白胞浆降解.抗氧化剂N-乙酰半胱氨酸(NAC)可抑制多壁碳纳米管诱导的A549细胞内ROS产生、NF-κB DNA结合活性、p65蛋白核移位以及IκBα蛋白降解.结果表明,多壁碳纳米管可以通过诱导A549细胞氧化应激机制从而活化核转录因子NF-κB活性
【英文摘要】The present study was undertaken to examine the effects of multi-walled carbon nanotubes(MWCNTs) on nuclear factor(NF)-κB activation in human A549 lung epithelial cells. Cultured A549 cells were stimulated with various concentrations of MWCNTs in the presence or absence of antioxidants. The intracellular generation of reactive oxygen species(ROS) was detected by means of flow cytometry analysis with a redox-sensitive fluorescent probe 2′,7′-dichlorfluorescein-diacetate. NF-κB activity was measured by electrophoretic mobility shift assay(EMSA). The protein levels of p65 and IκBα were assessed by Western blot analysis. Translocation of p65 into the nucleus was examined by immunofluorescence confocal microscopy. The results showed increased ROS and NF-κB activity in response to treatment of A549 cells with MWCNTs. MWCNTs stimulated nuclear translocation of the p65 subunit of NF-κB, IκBα phosphorylation in A549 cells. Treatment of A549 cells with antioxidants prior to adding MWCNTs resulted in a significant reduction in ROS generation, NF-κB activity, p65 translocation and IκBα phosphorylation in A549 cells. These results indicate that MWCNTs are able to induce NF-κB activation in A549 cells mediated by oxidative stress.

【题目】Influence of Degree of Hydrolysis on Functional Properties, Antioxidant and ACE Inhibitory Activities of Egg White Protein Hydrolysate
【中文关键词】egg white protein hydrolysate, antioxidant,
ACE inhibition, functional property, ultrafiltration
【英文关键词】egg white protein hydrolysate, antioxidant,
ACE inhibition, functional property, ultrafiltration
【中文摘要】Functional properties, antioxidant, and angiotensin-I converting enzyme (ACE) inhibitory activities of eggwhite protein hydrolysate (EWPH) prepared with trypsin atdifferent degree of hydrolysis (DH) were investigated. TheDPPH radical scavenging activity, reducing power, lipidperoxidation inhibitory activity, and ACE inhibitory activityincreased with DH at first and then decreased gradually.Hydrolysates with 12.4% DH had the highest antioxidantand ACE inhibitory activities. As DH increased, thesolubility of EWPH increased while the emulsifying andfoaming properties decreased. The functional properties ofEWPH were also controlled by pH. Ultrafiltration of thehydrolysate with 12.4% DH revealed that the fractions ofmolecular weight lower than 3 kDa exhibited the highestantioxidant and ACE inhibitory activities. The resultsindicated that EWPH with different DH have differentbioactive and functional properties and EWPH by controlledhydrolysis may be useful ingredients in food and nutraceuticalapplications with potential bioactive properties.

【题目】Kinetics of Hydrolysis of Egg White Protein by Pepsin
【中文关键词】egg white protein; pepsin; enzymatic hydrolysis; kinetics; bioactive peptides
【英文关键词】egg white protein; pepsin; enzymatic hydrolysis; kinetics; bioactive peptides
【中文摘要】Taking into account the enzyme inactivation and substrate inhibition, the bioreaction mechanism and kinetics characteristic of egg white protein (EWP) enzymatic hydrolysis by pepsin were investigated. A logarithmic equation h = (1/b) ln (1 + abt) indicating the relationship between the degree of hydrolysis (DH) and time was established. For EWP-pepsin system, the reaction mechanism could be deduced from a series of experimental results at diferent temperatures, pH values, substrate concentrations, and enzyme concentrations. Te reaction kinetics and thermodynamic constants (KS =

3916.5 g/l, k2 = 17 202.86 min – 1, kd = 21 962.03, Ea = 56.89 kJ/mol, Ed = 51.99 kJ/mol) were responsible for the empirical equations. Te results of nonlinear regression of the proposed kinetic model agreed with the experimental data, i.e. the average relative error was less than 5%. As a conclusion, the kinetic equations can be used to ft the enzymatic hydrolysis process of egg white protein and to optimise the operating parameters of bioactive peptides preparation for the bioreactor design. Taking into account the enzyme inactivation and substrate inhibition, the bioreaction mechanism and kinetics characteristic of egg white protein (EWP) enzymatic hydrolysis by pepsin were investigated. 【题目】蛋清蛋白酶解物抗氧化与血管紧张素转换酶抑制活性的研究
【中文关键词】蛋清蛋白酶解物;抗氧化;ACE;超滤
【英文关键词】egg white protein hydrolysates; antioxidant; ACE; ultrafiltration
【中文摘要】目的 研究三种蛋白酶的蛋清蛋白酶解物(EWPH)的抗氧化及血管紧张素转换酶(ACE)抑制活性。方法 分别采用Fenton 体系、邻苯三酚自氧化体系和亚油酸自氧化体系测定胰蛋白酶、木瓜蛋白酶及alcalase碱性蛋白酶的EWPH清除羟自由基、超氧阴离子及抑制脂质过氧化的能力。利用高效液相色谱法测定ACE抑制活性。超滤分离上述三种蛋白酶的EWPH,检测各组分的抗氧化和ACE抑制活性。结果 抗氧化活性最强的是木瓜蛋白酶的EWPH,在浓度10mg/ml时,对羟自由基和超氧阴离子清除率分别为53.14%和27.87%,在浓度0.8mg/ml时,对亚油酸自氧化的抑制率73.72%(D7) 。ACE抑制效果最明显的是胰蛋白酶的EWPH,其IC50 值为0.985mg/ml。低分子量(Mw<3ku)组分酶解物的活性优于高分子量(Mw>3ku)组分。结论 三种蛋白酶的EWPHs均具有抗氧化和ACE抑制活性,但两种活性之间无明显的相关,且小分子组分的活性最强。
【英文摘要】Objective To find the impact of proteases and molecular weight on the antioxidant and angiotensin-I converting enzyne(ACE) inhibitory activities of egg white protein hydrolysates (EWPH). Method The hydroxyl radical, superoxide anion scavenging activities and lipid peroxidation inhibition of EWPH produced by trypsin, papain and alcalase were detected by the methods related to Fenton system, pyrogallol autoxidation, and linoleic acid emulsion system. The ACE inhibitory activity of EWPHs was measured by HPLC. Ultrafiltration was used to separate EWPHs and the antioxidant and ACE inhibitory activities of each fraction were measured. Results The EWPHs prepared by papain exhibited the highest antioxidant activity, The values of hydroxyl radical and superoxide radical scavenging activities were 53.14% and 27.87% at the concentration 10 mg/ml respectively. The percentages of inhibition of lipid peroxidation was 73.72% at the concentration 0.8mg/ml on D 7. The EWPHs of trypsin had much higher ACE inhibitory activity with IC50 0.985mg/ml. The fractions of low molecular weight owned the strongest antioxidant and ACE inhibitory activities. Conclusion EWPHs produced by these three proteases possessed the antioxidant and ACE inhibitory properties, but the two activities were not apparently related. Moreover, the antioxidant and ACE-inhibitory activities of EWPHs may be associated with its low molecular weight.

【题目】蛋清蛋白水解物体内抗氧化作用的实验研究
【中文关键词】蛋清蛋白;肽;抗氧化;MDA;GSH-PX;HYP
【英文关键词】albumen;peptide;antioxidant activity;malondialdehyde (MDA);glutathione peroxidase (GSH-PX);hydroxyproline (HYP)
【中文摘要】重点开展蛋清蛋白水解物体内抗氧化作用的实验研究,对比分析了2种蛋清蛋白水解物对受试30d小鼠的皮肤羟脯氨酸含量(HYP)、血清微量丙二醛(MDA)含量、血清谷胱甘肽过氧化物酶(GSH-PX)活性等指标的影响情况。结果表明:与灌胃蒸馏水的空白对照组比,蛋清蛋白水解物Ⅰ即5%浓度蛋清高F值寡肽能够提高受试小鼠血清中GAH-PX活性(p>0.05);能够显著提高受试小鼠皮肤中羟脯氨酸含量(p<0.01);能够显著降低(p<0.01)受试小鼠血清中MDA含量;能够显著提高受试小鼠免疫器官——脾脏的脏器系数(p<0.05),具有一定的抗氧化功效。
【英文摘要】Our aim was to study the antioxidant activity of egg white protein hydrolysate in vivo. The activity ofglutathione peroxidase (GSH-PX), the content of malondialdehyde (MDA) in mice blood serum and the content ofhydroxyproline (HYP) in skin of mice were determined to analysis the difference of antioxidant activity betweentwo kinds of egg white protein hydrolysates. The results showed that egg white protein hydrolysate Ⅰ which was 5%concentration of high Fisher ratio oligopeptide derived from egg white protein could promote the activity of GSH-PX(p>0.05), increase the content of hydroxyproline (HYP), decrease the content of malondialdehyde (MDA) inmice blood serum significantly(p<0.01)and increase the organ coefficient of spleen(p<0.05)which is the immuneorgan compared to the control group which mean it possessed the antioxidant activity.

【题目】蛋清蛋白肽体外血管紧张素转化酶 抑制活性及其消化稳定性
【中文关键词】蛋清蛋白肽;超滤;血管紧张素转化酶;氨基酸组成;胃肠道消化
【英文关键词】egg white-derived peptides; ACE; amino acid composition; gastrointestinal digestion
【中文摘要】目的 研究蛋清蛋白肽体外血管紧张素转化酶(ACE)抑制活性以及耐胃肠道消化稳定性。方法 采用超滤分离蛋清蛋白酶解产物;利用高效液相色谱法测定蛋白酶水解物及其超滤各组分的体外ACE抑制活性。氨基酸自动分析仪测定ACE抑制活性较高组分 (EWPH-III) 的氨基酸组成。 体外模拟胃肠道消化试验测定EWPH-III的消化稳定性。RP-HPLC法分析消化产物的组成变化。结果 蛋清蛋白水解物的ACE抑制活性随着分子量的降低而增强(P<0.05) ,分子量小于3ku组分(EWPH-III)的ACE抑制效果最好,其IC50 值为0.049 mg/ml。EWPH-III中疏水性氨基酸和必需氨基酸总量分别为49.51%和50.26%。经过胃肠道消化作用后,EWPH-III的ACE抑制活性有所降低,消化产物的RP-HPLC分析结果显示EWPH-III中多肽组分发生了明显的变化,胰酶消化产物中疏水性较强的多肽组分含量有所减少。结论 蛋清蛋白肽具有较强的ACE抑制活性并且具有很高的营养价值,其ACE抑制活性随着阶段性的胃肠道消化而发生改变。
【英文摘要】【Abstract】Objective To investigate the angiotensin I-converting enzyme (ACE) inhibitory activity of egg white-derived peptides and the impact of simulated gastrointestinal digestion on their stability in vitro. Method The egg white protein hydrolysate (EWPH) was separated by ultrafiltration. The ACE inhibitory activity of EWPH was measured by HPLC. Amino acid compositions of the most active compounds (EWPH-III) were detected by the automatic amino acid analyzer. In vitro simulated gastrointestinal digestion was carried out to study the stability of EWPH-III and the changes of composition were analyzed by RP-HPLC. Results EWPH showed significant decrease (P<0.05) in ACE inhibitory activity with an increase in molecular weight (MW) of fractions values. The fractions with MW <3000u (EWPH-III) exhibited the highest ACE inhibitory activity with IC50 values of 0.049 mg/ml. The total hydrophobic amino acids and essential amino acid contents were 49.51% and 50.26% respectively. After the simulated gastrointestinal digestion, the ACE inhibitory activity of EWPH-III decreased and the hydrophobic components of EWPH-III almost disappeared. Conclusion Egg white-derived peptides possessed potent ACE inhibitory activity and high nutritional value. The ACE inhibitory activity could be changed after the gastrointestinal digestion in vitro. 【题目】中温木质纤维素降解复合菌系BYND-8的筛选及其培养条件优化
【中文关键词】复合菌系;木质纤维素分解;培养条件;二次通用旋转组合设计
【英文关键词】microbial community; lignocellulose degradation; cultural conditions; universal quadratic rotation combination
【中文摘要】利用限制性培养技术,从沼液中筛选出1组木质纤维素降解复合菌系 采用木质纤维素失重法,对复合菌系的培养条件进行研究 单因素试验结果表明,稻秆经碱液浸泡后降解率最高,最佳氮源为蛋白胨+酵母浸粉+硝酸铵的复合氮源 采用五因素二次通用旋转组合设计进行培养条件的优化组合试验及分析,建立了碳源添加量 氮源添加量 pH 温度 接种量与秸秆降解率间的数学模型,确定最佳的碳 氮源添加量和培养条件为:稻秆 3.0 g L-1蛋白胨 4.0 g L-1酵母浸粉 0.8 g L-1硝酸铵1.2 g L-1,初始 pH7.5 8.0,接种量 7% (体积比),培养温度30 ,在此条件下,稻秆的降解率可达到64.98%
【英文摘要】A microbial community with capacity of degrading lignocellulose effectively was enriched from biogas slurry by the methodof limited cultivation. The effect of cultural conditions on the capability of lignocellulose degradation was investigated with gravimetry of rice straw. The results of single factor design indicated that the rice straw degradation ratio was the highest under the condition of pretreatment with sodium hydroxide among all pretreatments. The percentage of straw degradation was the highest by using peptone,yeast powder and ammonium nitrate as multiple nitrogen source. The five factors design of universal quadratic rotation combination was used to optimize cultural conditions. A mathematical model of the relation among carbon source, nitrogen source, pH,temperature, quantity of inoculation and percentage of straw degradation was established. The optimum cultural conditions were straw 3.0 g L-1 of carbon source, peptone 4.0 g L-1 plus yeast powder 0.8 g L-1 plus ammonium nitrate 1.2 g L-1 of nitrogen source, the pH value 7.5 to 8.0, 7% (v/v) of inoculation quantity and at 30 , respectively. The percentage of straw degradation was up to 64.98% under above conditions.

【题目】厌氧蛋白质氨化细菌筛选及对酸化液pH的影响
【中文关键词】厌氧蛋白质氨化细菌;氨态氮产生量;酸化液
【英文关键词】anaerobic protein-ammonifying bacteria; ammonia-N production; acidizing fluid
【中文摘要】将筛选的5株R/r大于3,酶活力200 300 U mL-1,氨态氮产生量大于100 mg L-1,且适宜在起始pH 5.0 6.0 35下生长的厌氧蛋白质氨化细菌应用于pH 5.5的酸化液 其中产低温酸性蛋白酶的k3B37和产低温偏酸性蛋白酶m1B94菌株,生物量为0.315和0.643时产酶活性达到302.2 271.7 U mL-1;使酸化液氨态氮含量分别提高了373.47 302.89 mg L-1,从而将酸

化液pH调至7.29 7.03,为产甲烷菌创造适宜生长 产气条件

【英文摘要】Five anaerobic protei n-ammonifying bacterias were isolated. The strains could produce larger hydrolysis cycles with R/r more than 3, their high enzymes activity reached 200 -300 U mL -1, ammonia -N production were higher than 100 mg L-1, and grew well in initial pH 5.0-6.0, temperature 35 . The islationswere applied at pH 5.5 acidizing fluid. The results showed that biomass of k3B37 produced low temperature acid protease and m1B94 produced low temperature partial acid protease were respectively 0.315, 0.643. Their enzyme activities reached 302.2 and 271.7 U mL -1. The strains made the contents of nitrogen ammunia increased by 373.47, 302.89 mg L-1 of acidizing fluid. Consequently, pH of acidizing fluid were adjusted to 7.29 and 7.03, respectively, the condition was suitable for growth and producing gas of methanogen.

【题目】高效木质纤维素分解菌复合系的发酵特性

【中文关键词】木质纤维素分解菌;复合菌系;分批发酵;分批补料发酵;

【英文关键词】lignocellulose degradation bacteria; compos ite bacteria sys tem; batch fermentation; fed-batch fermentation; pH

【中文摘要】试验以稻草为唯一碳源,50 静置培养,通过批次发酵和批次补料发酵的培养方式,对复合菌系的pH 溶解氧浓度(DO) 分解效率和发酵产物组成进行了研究 结果表明,批次发酵时,pH 由初始值 8.59 降为6.03 后回升,10 d 后稳定在 8.0 左右;培养 1 d 的 DO 值由初始的 4.34 mg L-1迅速下降到 0.22 mg L-1,此后一直维持在 0.07 0.10 mg L-1的范围内;发酵 3 d 时稻草的分解率达到 42.5%,随着发酵的进行,稻草分解速率显示逐渐降低的趋势;主要液相末端产物是挥发性脂肪酸(VFA),其中乙酸质量浓度占总 VFA 质量浓度的 90%以上 连续补料发酵时,每次添加稻草 24 h 后 pH 降到最低, 乙酸的含量也达到最大值,随后逐渐升高直到下一次添加稻草;而发酵体系内的 DO 值的变化与批次加料发酵相似

【英文摘要】To research the pH and dis solved oxygen concentration(DO) value, degradation ratio, pro-ducts from degradation of fermentation sys tem of an efficient microbial sys tem with cellulose degradation bacteria, we cultured them in the media used rice s traw as the limiting carbon source by means of batch fermentation and fed-batch fermentation under s tatic condition at 50 . The results showed that when the sys tems were cultivated by means of batch fermentation, the pH of fermentation sys tem decreased from initial 8.59 to 6.03, and after 10 d cultivation, it increased to 8.0 and was s table. The DO value was decreased from initial 4.34 to 0.22 mg L-1 within firs t day inoculation. Then the value was maintained at range of 0.07 to 0.1 mg L-1. The degradation ratio of rice s traw was 42.5% at the third day. Then the ratio decreased gradually. The main liquid phase products were volatile fatty acid (VFA). Over 90% VFA was acetic acid. Every time we had added rice s traw, the pH value decreased minimum and the content of acetic acid increased maximum after 24 h. Then the pH value had increased gradually until we added rices traw next time. The rule of DO changed as same as that of batch fermentation.

【题目】不同高径比反应器对厌氧发酵产气特性的影响

【中文关键词】高径比;反应器;厌氧发酵;产气特性

【英文关键词】H/D; reactor; anaerobic fermentation; biogas production

【中文摘要】圆柱形反应器的 H/D (高径比)是影响厌氧发酵效率的一个重要因素,为此研究了在发酵液浓度 接种量一定的情况下,对H/D为2.18 4.66 5.00 6.66四种不同高径比反应器对 COD (Chemical oxygen demand)去除率 容积气率及平均容积产气率的影响 结果表明, H/D为 2.18 的反应器COD去除率最大,容积产气率 平均容积产气率也大
【英文摘要】The ratio of height to diameter (H/D)of cylindrical reactor is an important factor to improve the efficiency of anaerobic fermentation. In this paper, the effect of four reactors with H/D of 2.18, 4.66, 5.00 and 6.66 on removal of chemical oxygen demand (COD), biogas production rate per volume and the average biogas production rate per volume was studied. It is shown that the reactor with H/D of 2.18 is optimal, with highest removal of COD and average biogas production rate per volume.

【题目】沼气高产菌群保藏条件的比较
【中文关键词】沼气; 菌群;保藏方法
【英文关键词】biogas; flora; preserved condition
【中文摘要】目的: 利用不同方法对沼气高产菌群进行保藏,比较各方法不同时间的保藏效果。方法:应用液体低温冷藏法、 液石蜡封存法、 液氮冷冻保藏法和低温冷冻干燥保藏法保藏的菌种, 分别在保藏后 1 个月、 3 个月、 6 个月及 1 年复苏菌种, 测定其产气速度、 产气量。结果: 以上几种方法均能够保证所保藏菌群在 1 个月内得到复苏并产气,低冷冻干燥法及液氮冷冻法保藏沼气产生菌菌群可达 1年以上, 产气速度、 产气量较为理想,优于液体低温冷藏法及液体石蜡法。
【英文摘要】Object ive: Compared different preservation methods of biogas yield flora. Method: Liquid low- temperature freezing method, paraff inwax preservation, liquid ni trogen freezing preservation and the low- temperature freeze- drying preservation preserved strains were tested. After one mon th, three months, six months and one year the recovery gas production were compared. Result : Those methods were more than able to guarantee the flora preserved withi n one month. Low- temperature freeze- drying method and liquid nitrogen freezing p reservation of biogas flora can last for up to one year, gas production rate and gas producing per formance is much better than those of the previous methods.

【题目】一株分离自高海拔土壤的梭菌的鉴定及代谢产物
【中文关键词】象牙海岸梭菌; 鉴定; 对甲苯磺酸盐
【英文关键词】Clostridium lituseburens; identification; p- toluene sulfonate
【中文摘要】目的 了解土壤环境中细菌的生理生化特性及代谢产物 方法 采用厌氧操作技术从西藏纳木错分离到一株厌氧梭状芽孢杆菌 P4- 1 采用生理生化鉴定结合 16S rDNA 序列的系统发育学分析确定该菌株的系统发育地位, 用气相色谱分析其代谢产物 结果 菌株 P4- 1 为严格厌氧革兰氏阳性菌, 菌体大小为0. 3 m × 1 m - 3 m, 单生或成对生长, 产生芽孢 生长温度范围是 13 - 40℃(最适温度 37℃) ;NaCl 浓度0% - 5% (最适为 0. 5% - 1%) ;pH 范围 5. 0 - 10. 0 (最适生长 pH 为 7. 5 - 8. 0) 能够利用葡萄糖 密二糖 甘露糖醇等多种碳水化合物, 发酵葡萄糖的产物是乙酸, 丙酸, 丁酸, CO2 , H2 菌株 P4- 1 的(G + C)mol%含为 30. 9%, 与 Clostridium lituseburense DSM 797(M59107)的相似性达 98. 7% 菌株 P4- 1 能够降解对甲苯磺酸盐, 并且在有酵母粉的情况下能明显提高其降解能力 结论 菌株 P4- 1 是从土壤中分离出的一株耐低温, 耐盐的厌氧菌, 其发酵葡萄糖产生的代谢产物有利于改善土壤中的微环境, 而且能够降解对甲苯磺酸盐, 在废水处理中有重要意义
【英文摘要】[Objective]We studied the physiological,biochemical properties and metabolism of Clostridium lituseburenseP4- 1 from soil in Namucuo. [Methods]We adopted Hungate anaerobic technique to get Strain P4- 1 from soil inNamucuo. Through physiological,biochemical and phylogenetic analysis,we identified the strain P4- 1. [Results]Cellswere Gram- positive and spore-forming. It grew between 13 and 40℃ (optimum at 37℃),between pH value 5. 0 and10. 0 (optimum at 7. 5 - 8. 0),and with the presence of NaCl between 0% - 5% . Strain P4- 1 could metabolize manycarbon sources including glucose,melibiose and mannitol. Metabolites of glucose were acetate,butyrate,propionate,CO2 ,and little H2 . Based on 16S rDNA studies,strain P4- 1 was most close to Clostridium lituseburense DSM 797(M59107) with 98. 7% similarity. Strain P4- 1 could degrade p- toluene sulfonate. [Conclusion]Strain P4- 1 toleratedlow temperature,salt and could degrade p- toluene sulfonate. Its metabolites produced by fermentation of glucose couldimprove the soil micro- environment. It was significant for strain P4- 1 to be utilized in the wastewater treatment.

【题目】蛋清的蛋白酶解物清除自由基能力的研究
【中文关键词】蛋清蛋白酶解物;水解度;羟自由基;超氧阴离子
【英文关键词】hydrolysates of egg white protein; degree of hydrolysis; hydroxyl radical; superoxide radical
【中文摘要】的 研究胃蛋白酶、胰蛋白酶、木瓜蛋白酶、中性蛋白酶及Alcalase碱性蛋白酶对蛋清蛋白的水解效果以及其酶解物对自由基的清除能力。方法 采用茚三酮法分析五种蛋白酶对蛋清蛋白的水解效果;通过Fenton 体系和邻苯三酚自氧化体系测定五种蛋白酶水解产物对羟自由基及超氧阴离子的清除能力。结果 五种蛋白酶在其最适反应条件下,水解度大小依次为:alcalase碱性蛋白酶>胰蛋白酶>木瓜蛋白酶>中性蛋白酶>胃蛋白酶;羟自由基清除能力强弱依次为:木瓜蛋白酶>alcalase碱性蛋白酶>胰蛋白酶>中性蛋白酶>胃蛋白酶;超氧阴离子清除能力强弱依次为:木瓜蛋白酶>alcalase碱性蛋白酶>中性蛋白酶>胃蛋白酶>胰蛋白酶。木瓜蛋白酶水解3h的产物对两种自由基清除能力最强,对羟自由基的清除率为65.63%,对超氧阴离子的清除率为38.40%。结论 蛋清的蛋白酶解物具有清除羟自由基及超氧阴离子的能力,且对羟自由基的清除能力大于超氧阴离子。
【英文摘要】Objective To determine the degree of hydrolysis (DH) and free radical scavenging activity of the hydrolysates of egg white protein (EWPHs) with pepsin, trypsin, papain, neutrase and Alcalase. Method The degree of hydrolysis of EWPH was measured by ninhydrin colorimetric method. The hydroxyl radical and superoxide anion scavenging activity was detected by the methods related to pyrogallol autoxidation and Fenton system. Results Under the optimal conditions the sequence of enzyme hydrolysis capacity was: alcalase>typsin>papain>neutrase>pepsin. The order of hydroxyl radical scavenging activity was: papain>alcalase>trypsin>neutrase>pepsin and the order of superoxide radical scavenging activity was: papain>alcalase>neutrase>pepsin>trypsin. The EWPHs with papain for 3h displayed the strongest radical scavenging activity. The values of hydroxyl radical and superoxide free radical scavenging activity were 65.63% and 38.40% respectively. Conclusion EWPHs exhibited free radical scavenging activity and the activity of scavenging hydroxyl radical were stronger than superoxide radical.

【题目】Effect of Trans10, cis12-conjugated linoleic acid on glucose consumption of insulin resistance chang liver cells
【中文关键词】conjugated linoleic acid ,insulin resistance ,t10, c12-CLA
【英文关键词】conjugated linoleic acid ,insulin resistance ,t10, c12-CLA
【中文摘要】The effect of conjugated linoleic acid (CLA) on insulin resistance (IR) was isomer specific. In the present study, we induced IR Chang liver cells by incubating cells with 100 nmol/L insulin for 24 h. Then the effect of trans10, cis12-conjugated linoleic acid (t10, c12-CLA) and cis9, trans11-conjugated linoleic acid (c9, t11-CLA) on IR cells were studied. 1 μmol/L, 2 μmol/L, 5 μmol/L and 10 μmol/L t10, c12-CLA, but not c9, t11-CLA were found to enhance glucose consumption of IR cells in a dose-dependent way. 2 μmol/L t10, c12-CLA for 12 h incubation significantly improved glucose consumption of IR cells and increased phospho-protein kinase B (p-PKB/p-Akt) protein level. The enhancement of glucose consumption of IR cells by t10, c12-CLA and the level of p-Akt was strongly inhibited by phosphatidylinositol 3-kinase (PI3K) inhibitor LY294002, indicating that PI3K/Akt insulin signaling pathway may be involved in the beneficial effect of t10, c12-CLA on alleviating IR.

【题目】蛋清肽酶解工艺及血管紧张素转化酶抑制活性研究*
【中文关键词】蛋清;ACE抑制肽;酶解;优化;纯化;鉴定
【英文关键词】Egg white protein, ACE-inhibitory peptides, Enzymatic hydrolysis, Optimization, Purification, Characterization
【中文摘要】采用酶法制备蛋清肽,色谱纯化ACE抑制活性组分并鉴定其一级结构。通过考察底物质量分数、加酶量、酶解温度和pH值对水解度的影响,结合多元线性回归设计和二次回归正交组合设计建立蛋清ACE抑制肽酶解工艺模型,并经液相色谱串联质谱鉴定其一级结构。结果表明:最佳酶解工艺为底物质量分数8%、pH值10·73、加酶量12·14%及酶解温度56·80℃,酶解物纯化后半抑制质量浓度为0·18 mg/mL。液相色谱串联质谱鉴定高活性组分中3种活性肽一级结构,氨基酸序列分别为Arg-Val-Pro-Ser-Leu-Met、Thr-Pro-Ser-Pro-Arg和Asp-Leu-Gln-Gly-Lys。
【英文摘要】Antihypertensive peptideswere derived from egg white, and then were purified and their primarystructurewas identified. Eggwhite hydrolysis processmodelwas established by examining the substrateconcentration, E/S, hydrolysis temperature and pH value on the impact of the hydrolysis degree,combinedwith multivariate linear regression combination of design and quadratic regression orthogonaldesign. Hydrolysates were purified by gel chromatography, and were characterized by liquidchromatography tandem mass spectrometry. The results showed that the optimal enzymatic hydrolysisprocesswas the substrate concentration of8%, pH value of10·73, E/S of12·14% and temperature of56·80℃. Hydrolysates were purified by sephadex G - 25, the 50% inhibitory concentration as0·18mg/mL. Liquid chromatography-quadrupole-linear ion trap tandem mass spectrometry confirmed thestructure of the active peptides in the componen,t the amino acid sequenceswere Arg-Val-Pro-Ser-Leu-Me,t Thr-Pro-Ser-Pro-Arg, andAsp-Leu-Gln-Gly-Lys, respectively.

【题目】酶解蛋清蛋白制备ACE抑制肽的工艺研究
【中文关键词】蛋清蛋白;酶解工艺;A C E 抑制肽;响应面法;胰蛋白酶
【英文关键词】egg white protein;enzymatic hydrolysis;ACE inhibitory peptides;response surface methodology;trypsin
【中文摘要】:为获取酶解蛋清蛋白制备血管紧张素转化酶(ACE)抑制肽的工艺参数,研究4 种蛋白酶酶解蛋清蛋白所得产物对ACE 的抑制活性,筛选出胰蛋白酶作为制备蛋清蛋白ACE 抑制肽的适宜用酶。运用响应曲面法研究酶解时间、底物浓度([S])和酶与底物质量比([E]/[S])对制备ACE抑制肽工艺的影响,建立以上3因素与ACE抑制率关系的数学模型。结果确

定胰蛋白酶酶解蛋清蛋白制备ACE 抑制肽的适宜酶解条件为酶解时间4.87h、 [S] 3.06%、 [E]/[S]2.91%、酶解温度45℃、pH7.4,此条件下制备的蛋清蛋白酶解产物ACE 抑制率达到50.73%。

【英文摘要】:In order to develop an enzymatic hydrolysis procedure for the preparation of egg white protein derived angiotensinconverting enzyme (ACE) inhibitory peptides, 4 proteases were used to hydrolyze egg white protein alone, and trypsin was theselected enzyme due to the largest ACE inhibitory ratio of hydrolyzed egg white protein. In order to optimize 3 parameters(namely hydrolysis time, substrate concentration and enzyme-to-substrate ratio) affecting the trypsin hydrolysis of egg whiteprotein, central composite design was employed to establish a mathematical regression model for the ACE inhibitory ratio ofhydrolyzed egg white protein with respect to the parameters, followed by employing response surface methodology (RSM) toinvestigate the interactive effects among the independent variables on the function. The results showed that the optimum valuesof the independent variables were found to be: hydrolysis time 4.87 h, substrate concentration 3.06% and enzyme-to-substrateratio 2.91% and that the corresponding value of the function was 50.73%.

【题目】乳源血管紧张素转移酶抑制肽在乳酸乳球菌中的表达

【中文关键词】乳源血管紧张素转移酶抑制肽, 乳酸乳球菌, 表达

【英文关键词】microcapsule, coacervation, orange oi,lmorphology, release

【中文摘要】在乳酸乳球菌中表达乳源血管紧张素转移酶抑制肽。选取了4种不同的来源于牛酪蛋白的血管紧张素转移酶(ACE) 抑制肽, 为了确保能够在人体消化液作用下正常发挥它们的ACE 抑制活性, 4种短肽以串联多肽(TP)的形式进行表达, 并在各短肽单体间引入了人体内主要消化酶的酶切位点。根据TP的氨基酸序列和乳酸乳球菌的偏爱密码子, 人工合成TP基因。然后将TP基因和绿色荧光蛋白(GFP)基因串联于载体pSEC E7,从而构建了pSEC TP: GFP质粒, 实现了2种蛋白在乳酸乳球菌中的共表达。经电击转化, 将该重组质粒转入乳酸乳球菌NZ9000中, 获得重组菌株NZ9000(pSEC TP: GFP)。用N isin诱导TP: GFP蛋白表达。RT PCR、激光共聚焦扫描显微镜和SDS PAGE 鉴定表达产物。RT PCR 结果表明, TP: GFP蛋白在RNA 水平表达成功; SDS PAGE表明目标产物是35 ku的条带。在乳酸乳球菌中实现了乳源血管紧张素转移酶抑制肽的表达。

【英文摘要】Themorphology changes during preparing process of coacervatem icrocapsules was mainly investigated in the paper. Furthermore, the effect of morphology and loading of microcapsules on the release was extensively discussed. The experimental results showed that when wallmaterial concentration was not more than 1% , coacervatem icrocapsules remained spherical andmu ltinuclear structure during the whole preparing process. However, the microcapsu les accumu lated during concention and gelation process made the morphology of microcapsules turn irregular. Compared with loading, the effect of morphology of microcapsules on orange oil releasew asmoresign ifican.t O vera l,l with excellent controlled release characteristics of the coacervate spherical multinuclear microcapsules, the optimum wallmaterial concentration was 1%.

【题目】乌审召滩地草场生产力与气候因素的灰色关联度分析

【中文关键词】草场,生产力,灰色关联分析,气候因素

【英文关键词】Grassland Productivity Grey correlation analysis Climatic factor
【中文摘要】应用灰色关联度方法, 对鄂尔多斯市乌审旗乌审召镇滩地草场1985- 2005 年天然草地产量与各年3- 7 月份降雨量、温度、相对湿度、日照时数的关联度进行分析, 以探讨气候因子对草地生产力的影响, 为草地合理管理和持续利用提供理论支持。结果表明: 降雨量和温度与草产量的关联度高, 是影响该地区天然草地产量的主要生态因子; 其中3 月份降雨量与草地产量的关联度最高; 5、6、7 月份在降雨量和温度均较好的情况下, 日照时数是影响草地产量的主要生态因子。
【英文摘要】In order to explore the effect of climatic factors on grassland yield and provide theoretical support for rational management and sustainable utilization of grassland, the correlation between grassland yield and monthly climatic factors including rainfall, sunshine hour, average temperature, and relative humidity was analyzed using grey correlation analysis for grassland in Wushengzhao Town, Erdos, Inner Mongolia Autonomous Region from March to July during 1985 to 2005. Results show that the grassland yield had highest correlation degree with temperature and rainfall amount and temperature and rainfall amount were the main ecology factors influencing grassland yield. The correlation degree between rainfall and yield was highest in March, while sunshine hour w as the main ecology factor affecting grassland yield from May to July when preferable rainfall and temperature conditions were available.

【题目】土地利用方式对陇中黄土高原土壤理化性状的影响
【中文关键词】草地,农田,土壤理化性状,黄土高原
【英文关键词】grassland cropland soil physical and chemical properties Loess plateau
【中文摘要】本文对陇中黄土高原至少50年传统耕作历史的农耕地和退耕20年的草地土壤理化性状进行了比较研究,探讨土地利用方式对土壤理化性状的影响,为该区土地的合理利用和保护提供技术支撑。
【英文摘要】In this study we analyzed soil physical and chemical properties in croplands which were cultivated under traditional tillage for ar least 50 years and grasslands which had been restored form cropping for 20 years in the Loess Plateau in Gansu Longzhou. 1) Different land uses resulted in significant differences in siol organic carbon (SOC), total nitrogen, total phosphorous, available phosphorous, soil bulk density and soil pH. In surface soil(0-10cm), SOC contents were significantlu higer in grasslands than those in croplands, while total nirtogen wea not significantly different, In the sol layers from 20 to 100 cm, SOC and total nirtogen contents were significantly ($P<0.05$) higher in croplands than those in grasslands. The soil total phosphorous was higher incroplands than that in grasslands but not significantly so. in the soil profile down to 100 cm, the C/N ratios in cropland were much higher than those in grasslands, except for the 0-10 cm layer. The soil pH in grasslands was significantly ($P<0.05$) higher than thar in croplands in each layer. The siol bulk densities in the grasslands were higher than in croplands, except for the 10-20cm layer. 2) The SOC and total nitrogen decreased with siol depth in grasslands, but this was only found in the soil layers below 30 cm in croplands; In the upper 30 cm soil layers, SOC increased with depth. Total phosphorous did not show significant differences in different soil layers in grasslands while in croplands, the changes of total phosphorous showed the same trends as those of SOC and total nitrogen. The available phosphorous contents decreased with soil depth in both grasslands and croplands while the siol pH was the reverse. 3) In both grasslands and croplands, soil organic carbon, total nitrogen, total phosphorous and available phosphorous showed significant negative corrlations with soil BD and soil pH. There were significant positive correlation between soil BD and soil pH. Significant positive correlations were also found between SOC, total nitrogen, total phosphorous and available phosphorous.

【题目】元素分析仪(Elementar Vario MACRO)测定石灰性土壤 C、 N 时存在问题的探讨
【中文关键词】元素分析仪; 土壤有机质; 土壤全氮; 灼烧测定土壤C、N
【英文关键词】Elementar Vario Macro Soil organic matter Soil total nitrogen Calcination measuring soil C N
【中文摘要】本文通过对比研究,探讨了元素分析仪在测定不同石灰性土壤C和N时存在的问题,为今后该方法在测定不同类型土壤C和N的使用提供了一定参考。
【英文摘要】The measure of soil total nitrogen and soil organic matter are extremly significant for agricultural production and scientific research. So in many laboratories,analysis of soil total nitrogen and soil organic matter were as a routine analysis of project.Handreds of years,it still use the way of Dumas and Kjeldahl determination to measure the Soil total nitrogen. Determination of soil organic matter method basically has 3 ways: dry heating method,chemical oxidation and burning method. In 1989,agriculture government promulgated the encoding standard GB9843 - 88," the determination method of soil organic matter" . Elementar Vario Macro is an automatic analysis machine which been used to measure C,H,N,S quantitative. In recent years,it is used more abroad in measuring C,N.The methods which use Elementar Vario Macro determine C,H,N belong to burn method,calcination temperature is 960 degrees,besides,it is undoubtedly the best way to measure of acid or neutral soil. Because it has some carbonate exist in lime soil,and carbonate will decomposed in high temperature burning which then formed to CO2,this process will made the result of soil organic become a little higher. Another way to measure is the reduce combustion tube temperature measurement,because the sample with the foil is packaged,foil in burning pipe burn for generating oxide tin exothermic reaction,it is an exothermic reaction when silver paper been burned in the combustion tube which also produced jewellers putty. Made the combustion tube's inside temperature higher than the settled temperature,and made the value of calcarea carbonica resolve measurement much higher,if the it is not exactly tight when settle of combustion tube's temperature is lower than carbonate's decomposition point,the result will lower than the truth. Using hydrochloric acid treat on soil organic matter,then measuring the organic matter,because the fulvic acid in soil is soluble in acid,the determined result were be lower. Therefore,Elementar Vario Macro is not suitable to determine of lime soil organic matter.

【题目】Expression profile analysis of intestinal cells effected by Lactobacillus acidophilus NCFM
【中文关键词】Lactobacillus acidophilus NCFM ,Caco-2 cells, reveale
【英文关键词】Lactobacillus acidophilus NCFM ,Caco-2 cells, reveale
【中文摘要】OBJECTIVE: Lactobacillus acidophilus NCFM is a probiotic strain that promotes human health. We evaluated the influence of Lactobacillus acidophilus NCFM on the genetic expression patterns in the Caco-2 cells.METHODS: Caco-2 cells were

treated with Lactobacillus acidophilus NCFM for 2h. The total RNA of cells was extracted. Hybridization with Human Genome U133 Plus 2.0 Array was performed. The image scanning and data analysis were performed subsequently. Genes with significant expression changes were selected and analyzed. To support the microarray data, three striking difference genes were studied using Real-time RT PCR.RESULTS: Microarrays analysis showed that the expression levels of 508 genes were altered as compared with the control 473 of them were up-regulated, and 35 were down-regulated. It was supposed that many genes in Caco-2 cell were induced, so that Lactobacillus acidophilus NCFM could play a part in immune system process, antioxidant activity, biological adhesion, cholesterol absorption and so on. Three striking difference genes CCL2, PTX3 and TNFRSF9 which involved immune system process were validated by Real-time RT PCR. And the results of Real-time RT PCR showed the same expression trend as in microarray.CONCLUSION: Based on the results of gene expression alterations, the beneficial function of Lactobacillus acidophilus NCFM could be more greatly and deeply understood than ever before, and the mechanism of lactic acid bacteria would be revealed.

【题目】沼泥及其富集物中微生物多样性和区系变化的分析

【中文关键词】沼泥; 富集培养; 微生物多样性; DGGE

【英文关键词】b i ogas s l udge ; enrichment culture ; m icrob i a l diversit y; DGGE

【中文摘要】对从北京周边地区户用沼气池中采集的沼泥进行了富集培养及基因组 DNA 的提取,以古菌和细菌的通用引物 PCR扩增 16S rDNA基因的 V3可变区, 结合应用变性梯度凝胶电泳 (DGGE)技术分析沼气池中微生物种群基因的多样性, 以及富集前后的微生物群落区系变化, 并回收优势的 DNA 片段进行序列分析。结果表明, 微生物群落在沼气池的不同层次上呈现出空间分布多样性的差异, 经过富集培养后,微生物种群的多样性及特异性发生了很大的差别。序列比对的结果显示,沼气池中的优势古菌菌群为甲烷鬃菌属 (M ethanosaeta)与甲烷螺菌属(Met hanosp iril lum),细菌为梭菌目 (C l o st r i diales)和互养菌属 (Syntrop hus)。经过富集培养后, 古菌以甲烷八叠球菌属 (Met hanosarcinamazei)为主,细菌除保持了原有的优势菌群外， 变形菌纲(Gamma p ro teobacterium)也占有绝对的优势。

【题目】一株兼性嗜冷小甲烷粒菌的生物学特性及系统发育学研究
【中文关键词】小甲烷粒菌; 产甲烷菌; 16S rDNA;系 统 发 育分 析
【英文关键词】Methanocorpusculum parvum; methanogen; 16S rDNA; phylogenetic analysis
【中文摘要】采用改进的亨盖特(Hungate)厌氧技术,从西藏林芝厌氧消化系统中分离到一株产甲烷菌菌株LZ-6. 该菌株为革兰氏阴性,不运动,球形,直径约0.3~0.6 μm. 该菌株利用H2/CO2, 微利用甲酸生长,不利用乙酸、 甲醇、 甲醇/H2、三甲胺、 甲胺,最适生长pH为6.8~7.2,最 适 生长 温 度25 ℃,最适Na +浓度0.2 mol/L. 菌株LZ-6 的16S rRNA基因序列与小甲烷粒菌(Methanocorpusculum parvum)相似性为99%. 生理、形态结构特征等生物学特性研究表明此株产甲烷古菌为兼性嗜冷产甲烷古菌.
【英文摘要】A strain of methanogen LZ-6 was isolated from an anaerobic digester in Tibet, China by Hungate anaerobic technique. Of the strain, the cells were Gram negative, nonmotile, cocci of 0.3~0.6 μm in diameter. The catabolic substrates used included H2 /CO2 and formate, but no acetate, methanol, methanol/H2 or methylated amines. Its growth was observed in a temperature range between 4 ℃ and 35 ℃ with an optimum at 25 ℃. The NaCl optimum for growth was 0.2 mol/L, and the fastest growth occurred within a pH range of 6. 8~7.2. Strain LZ-6 was 99% similar in 16S rRNA gene sequence to Methanocorpusculum parvum. Its physiological, morphological and structural characteristics reveal that the strain is a eurypsychrophile methanogen.

【题目】生物滴滤塔去除沼气中H2S过程的压降分析
【中文关键词】沼气; 生物滴滤塔; 硫化氢; 压降; 载体
【英文关键词】biogas; bio - trickling filter; hydrogen sulfide; pressure drop; model
【中文摘要】分别以活性炭 陶粒和聚氨酯为载体, 在连续运行条件下, 探讨了生物滴滤塔去除沼气中硫化氢过程中压降的变化规律 试验结果表明:随着运行时间延长, 各载体组的压降逐渐增大, 最后活性炭产生的压降最大(520 Pa), 其次为陶粒(480 Pa), 聚氨酯(343 Pa)最小 压降沿载体层不均匀分布, 其中滴滤塔底层的压降增加幅度最大, 向上依次降低 聚氨酯压缩严重引起了压降较大的变化 3 种载体的压降随着进气量的增大都成正比增加
【英文摘要】The changes of pressure drop of bio - trickling filter on removal of hydrogen Sulfide in biogas was analyzed,under the condition of continuous operation with activated carbon,ceramist,and polyurethane as carriers. The resultsshowed that the pressure drop of all the three systems increased with time,in the end of operation the activated carbonsystem achieved the maximum pressure drop of 520 Pa,followed by ceramist of 480 Pa,and polyurethane minimum of343 Pa. The bottom layer of bio - trickling reactor got the maximum of pressure drop,and the pressure drop decreasedwith the increasing of height. The compression of polyurethane played an important role in its pressure drop. The pressuredrop of all the three systems increased proportional with the increasing inlet flow.

【题目】沼气发酵复合菌系的筛选及培养条件优化
【中文关键词】复合菌系;沼气发酵;培养条件
【英文关键词】microbial community; biogas; cultural conditions

【中文摘要】利用限制性培养技术,构建了1组35 下遗传稳定的 产甲烷量高的沼气发酵复合菌系 采用单因素及正交试验分析方法,研究了 pH 接种量 底物浓度三个因素的培养条件对沼气复合菌系甲烷产率的影响 试验结果表明,在单一因素的影响下,发酵初始的pH值为7.0,接种量为10%,底物浓度为8%时产甲烷效果最好 采用正交试验进行培养条件的优化组合试验分析,确定最佳的沼气复合菌系发酵条件为:以牛粪为底物,复合菌系接种量5%,底物浓度为10%, pH自然,培养温度为35

【英文摘要】A microbial community capability of biogas production with genetic stability at 35 was enriched from biogas slurry withthe method of limited culture technique,and the optimum cultural conditions of microbial community were investigated with singlefactor analysis and orthogonal test analysis. The effect of different pH,inoculation quantities,substrate concentrations of microbialcommunity were investigated .The results of single factor design indicated that the optimum cultural conditions of microbialcommunity for biogas production were the pH value 7.0,10% of inoculation quantity,and 8% of substrate concentration,respectively. At the same time,the results of orthogonal test analysis showed that the optimum cultural conditions of microbialcommunity for biogas production using the cattle manure as material were 5% of inoculation quantity,10% of concentration ofsubstrate, natural pH and temperature 35 ,respectively.

【题目】牛粪螺旋压榨固液分离工艺参数优化

【中文关键词】粪,压榨机,分离,螺旋压榨,优化

【英文关键词】manures, presses, separation, screw press, optimization

【中文摘要】为了优化粪便固液分离工艺,用作者研制的固液分离机对鲜牛粪进行固液分离,以进料水料比、榨条间隙、螺旋转速作为影响因素,以分离后固形物料中总固体(TS)含量为主要考察指标,以处理牛粪生产率、液料中固体去除率为参考指标,采用 3 因素 5 水平进行二次正交旋转组合试验设计,探讨了螺旋压榨工艺参数对固液分离效果的影响,得到了优化的工艺参数:进料水料比为0.65,榨条间隙为1.5 mm,螺旋转速68 r/min时,分离后固形物料中总固体(TS)质量分数可以达到40%以上,研究结果可为牛粪固液分离提供参考依据。

【英文摘要】In order to optimizing the process of solid-liquid separation of manure, fresh dairy manure was separated using the developed solid-liquid separator. The water-food ratio, article squeeze gap and screw speed were selected as influence factors, total solid content (TS) after separation was as main inspected target, meantime, productivity of treated dairy manure and solid removal ratio of solid-liquid mixture were selected as independent variables. Based on the quadratic orthogonal rotating combinatorial method with three factors and five levels employed to design the experimental procedure, the effects of independent variables of screw extruded process on solid-liquid separation were analyzed. An optimum independent parameters combination for highest solid TS value of 40% was obtained with water-food ratio of 0.65, article squeeze gap of 1.5 mm and screw speed of 68 r/min. The research results can provide

a reference for solid-liquid separation process of dairy manure.

【题目】复合菌系BYND-8的菌种组成多样性及其对沼气产量的影响
【中文关键词】木质纤维素降解; 中温复合菌系; 菌种组成多样性; 变性梯度胶凝胶电泳; 沼气发酵
【英文关键词】lignocellulose degradation; mesophilic microbial community; bacterial diversity; denaturing gradient gel electrophoresis(DGGE) ; biogas fermentation
【中文摘要】为了明确1组在中温下(30°C)高效分解木质纤维素的复合菌系的菌群组成, 研究复合菌系预处理秸秆对沼气发酵的影响, 利用平板分离法和变性梯度凝胶电泳(DGGE)法研究了中温木质纤维素降解复合菌系 BYND-8 的菌种组成多样性, 通过添加该复合系菌液到以牛粪为原料的沼气发酵体系, 研究了添加秸秆降解液对沼气产量的影响. 利用平板法分离得到了 6 株细菌, 它们与 Serratia sp. PSGB 13 Serratia marcescens strain UFLA-25LS Serratia marcescens strain DAP33 Alcaligenes sp. YcX-20 Stenotrophomonas maltophilia strain C6 和 Bacillus cereus isolate BRL02-71 的相似率分别达到了 99% 100% 96% 100%100% 和 99% . 同时利用 DGGE 方法还检测到了 1 株利用平板分离法没有获得到的细菌, 它的 16S rDNA V3 区的序列与Uncultured bacterium clone ATB- KS-1446 具有 100% 的同源性. 稻秆经复合菌系 BYND-8 预处理后应用于沼气发酵中, 在发酵的前 15d 内, 累积产气量达到13 167 mL, 甲烷产量达到7 248 mL, 比对照分别提高了 44. 5% 和 95. 3% . 复合菌系具有较高的菌种组成多样性, 将复合菌系应用于沼气发酵的原料预处理过程中, 可以将产气时间提前, 并提高产气量.
【英文摘要】The biodiversity of a mesophilic microbial community BYND- 8 capable of degrading lignocellulose at 30°C was detected using denaturing gradient gel electrophoresis(DGGE) and the isolation of pure cultures,and the effect of the liquid of rice straw degradation by BYND-8 on biogas production was measured. Six bacterial strains were isolated using peptone cellulose solution medium,and the highest similarities of their 16S rDNA gene sequences to Serratia sp. PSGB 13,S. marcescens strain UFLA- 25LS,S. marcescens strain DAP33,Alcaligenes sp. YcX- 20,Stenotrophomonas maltophilia strain C6,Bacillus cereus isolate BRL02- 71 were 99% ,100% ,96% ,100% ,100% and 99% ,respectively. In addition,one band was detected besides six bands of cultured isolates on the DGGE gel,and it showed 100% sequence similarity to uncultured bacterium clone ATB- KS-1446. The cumulative biogas and methane productions ofbiogas fermentation system added with the liquid of rice straw degraded by BYND-8 were 13 167 mL and 7 248 mL,44. 5% and 95. 3% higher than those of the control,respectively,in the early 15 days of fermentation. The results showed that the biodiversity of microbial community BYND-8 was very high,and the time of producing biogas was put forward and biogas production was increased with application of microbial community for rice straw pretreatment during the biogas fermentation.

【题目】固液分离对牛粪资源化利用效果的影响
【中文关键词】厌氧发酵,沼气,固液分离,牛粪,压块成型
【英文关键词】anaerobic fermentation, biogas, solid-liquid separation, dairy manure, press mounding
【中文摘要】预处理可以提高牛粪利用的效果,该文研究了利用螺旋压榨固液分离机对牛粪加水固液分离后固形物和分离液的纤维含量,固形物的热值、分离液的黏度和碳氮比。利用压块成型机对分离后固形物进行压块,为沼气发酵增温保温提供燃料,并将分离液与未分离的原牛粪进行厌氧发酵对比试验,结果表明,分离液发酵可提高甲烷产率,缩短发酵水力停留时间。在(35±2)°C条件下,原料挥发性固体含量(VS)分别为 4.86%和 4.98%时,30%接种量,分离液的产气率比原牛粪提高

32.68%。研究结果对高寒地区牛粪资源化利用具有参考价值。
【英文摘要】Pretreatment may increase the effect of dairy manure utilization, In this paper, dairy manure with water was separated using screw solid-liquid separator, fiber content of solid matter and separated liquid, heat value of solid matter and viscosity coefficient and C/N ratio of separated liquid were investigated. Solid matters were pressed into block by press mounding machine, providing fuel for temperature raising and maintaining in biogas fermentation. Anaerobic fermentation tests were carried and contrasted by using separated liquid and integrated original dairy manure. Results showed that methane-producing rate could be improved and hydraulic retention time decreased for separated liquid fermentation. Gas-producing rate of separated liquid increased by 32.68% than that of original dairy manure when materials VS were 4.86% and 4.98% with 30% inoculums at (35±2)°C, respectively. The results can provide references for reclamation of dairy manure in high-cold areas.

【题目】Variations in bioactivity and conformation of trypsin adsorbed on different size nanoparticles
【中文关键词】trypsin;silica particles;adsorption;enzyme activity;surface hydrophobicity
【英文关键词】trypsin;silica particles;adsorption;enzyme activity;surface hydrophobicity
【中文摘要】The variations of conformation and enzyme activity of trypsin adsorbed on silica particles of various sizes (20 nm, 100 nm, 300 nm and amorphous level) had been studied. The adsorption amount of trypsin clearly decreased with the increase of silica particle size. The enzyme stability was strongly dependent on the size of the particles. Smaller silica particles enhanced trypsin stabilities in strongly denaturing environments to a greater extent than that of larger ones. When the silica-trypsin bioconjugates incubated at 80 °C for 1 h, the activity for trypsin adsorbed onto 20 nm, 100 nm, 300 nm and amorphous particles increased by 96.3%, 70.8%, 45.7% and 19.7% of its native activity, respectively. The effect of particle size on enzyme activity was depended on the change of enzyme structure after adsorption. And the fraction of activity lost correlated well with the increase of surface hydrophobicity, greater increase in surface hydrophobicity and lower retentive enzyme activity was observed for trypsin adsorbed onto larger nanoparticles under otherwise similar conditions.

【题目】Food sources of three bivalves living in two habitats of jiaozhou Bay (qingdao, china): indicated by lipid biomarkers and Stable isotope analysis

【中文关键词】bivalve, food sources, lipid biomarker, stable isotope
【英文关键词】bivalve, food sources, lipid biomarker, stable isotope
【中文摘要】In the present study, we selected three representative bivalve species living in intertidal area and subtidal raft-culturing farm in Jiaozhou Bay and determined their food sources using lipid biomarker and stable carbon isotope analysis. The relationship between bivalve ’ s diet composition and the potential food sources in the habitat was also discussed.
【英文摘要】Food sources of three filter-feeding bivalves from two habitats (intertidal oyster Crassostrea gigas, mussel Mytilus galloprovincialis, and subtidal cultured scallop Chlamys farreri) of Jiaozhou Bay (Qingdao, China) were determined by fatty acid and stable isotope analysis. Cultured scallop was characterized by significant diatom markers such as 16:1/16:0 close to 1 and high ratio of 20:5(n − 3)/22:6(n − 3), hence we assume that the scallop mainly feeds on diatoms. Fatty acid biomarkers specific to bacteria and terrestrial materials were also found in considerable amounts in scallop tissue, which suggested that there were substantial bacterial and terrestrial input into the food of the species. Intertidal oyster and mussel, however, exhibited significant flagellate marker, 22:6(n − 3), and lower level of diatom markers, which indicated that flagellates are also part of intertidal bivalves_planktonic food sources; meanwhile, high level of Chlorophyta fatty acid marker, S18:2(n − 6) + 18:3(n − 3), suggested that Ulva pertusa (Chlorophyta) seaweed bed supplied important food sources to intertidal bivalves. Additionally, result of stable isotope analysis showed that phytoplankton contributed 86.2 to 89.0% to intertidal bivalves_ carbon budget; macroalga U. pertusa origin source had a contribution of 8.7% to 11.0%, which indicated its role as an important supplemental food source to intertidal bivalves. From this study, it is concluded that the dietary difference of three bivalves probably relates to the different potential food sources in the scallop farm and intertidal zone in Jiaozhou Bay.

【题目】Observations on the spawning behavior of artificially matured Japanese eels Anguilla japonica in captivity
【中文关键词】Courtship; Anguillid; Hormone induction; Off-bottom swimming; Shelter
【英文关键词】Courtship; Anguillid; Hormone induction; Off-bottom swimming; Shelter
【中文摘要】In an attempt to better understand the spawning ecology of the Japanese eel in the wild and also to provide useful information for improving their artificial reproduction techniques, we made the first reported observation on the spawning behavior of artificially induced Japanese eels in a laboratory setting. This includes their general behavior, activity and off-bottom swimming behavior at spawning. Since almost all artificially matured eels were observed to stay in shelters if available prior to releasing eggs and ejecting sperm in captivity, and moreover, wild eels are estimated to spawn in a seamount area where maturing eels may use as shelters, we observed the maturing eels ’ behavioral response to shelter availability in this study in order to investigate if shelter is an effective elemental cue influencing their spawning.
【英文摘要】Spawning behavior of artificially matured Japanese eels Anguilla japonica in captivity was investigated using a DVDVideo image system. Following a routine hormone treatment technique for this fish, female eels were artificially matured by weekly intramuscular injections of salmon pituitary extracts (SPE) at a dosage of 40 mg kg − 1 BW for a total of 7 – 11 doses to induce ovarian maturation, while male eels received weekly intramuscular injections of human chorionic gonadotropin (HCG) at a dosage of 1000 IU kg − 1 BW for a total of 6 – 11 doses at 18 ° C to induce testicular maturation in a separate aquarium. In this experiment, three pairs of such hormone-treated matured eels were acclimatized in seawater in 1.5m3 experimental aquaria with or without shelters at 20 ° C for 24 h. Twenty four hours after the acclimatization terminated, the females received SPE injections to boost maturation and ovulation. Twenty four hours following these injections, the females received injections of HCG (1000 IU per fish, HCG injection) and 17 α - hydroxyprogesterone (2 mg per fish) to induce ovulation, while males were givenHCGinjections (1000 IU per fish, HCGinjection) to induce spermiation. Video taping started after the 24 h acclimatization terminated and last for a total of 96 h. Before the HCG injections, both sexes were inactive, staying on the bottom or in shelters if available. Following these HCG injections, they became active and frequently left the bottom swimming in the water column. During the 24 h following HCG injections, activity accounted for 67% and 45% of the total activity in no shelter treatment for females and males, respectively, in comparison with 77% and 78% in shelter treatment. Activity was significantly more pronounced during this phase than during other phases for each sex in either

shelter treatment. Egg release and sperm ejection occurred in the water column around the time eels ' activity reached peaks. Eels either returned into the shelters or stayed motionlessly on the bottom of the aquaria after egg release and sperm ejection. Eight out of nine (89%) females in no shelter treatment spontaneously released eggs with a total of 11 batches 14 – 18 h following HCG injections, in contrast with four out of nine (44%) females releasing eggs for 4 batches 16 – 20 h in shelter treatment. Males arrived at activity peaks 11 – 13 h following HCG injections in no shelter treatment, 2 – 4 h ahead of the females (14 – 16 h), in comparison with 8 – 11 h in shelter treatment with 5 – 6 h ahead of the females (14 – 17 h). Courtship behavior indicative of spawning such as pairing, chasing and touching bodies was not observed in the eels in this study. However, on many occasions, eels of both sexes (male – female or female – female) were found to " cruise together " in water column for a short time period or frequently come together prior to releasing eggs and ejecting sperm, suggesting the possibility of group mating in artificially matured Japanese eels.

【题目】Temperature influence on the spawning performance of artificially-matured Japanese eel, Anguilla japonica, in captivity

【中文关键词】Activity Off-bottom swimming Hormone-treated maturation Anguillid eel

【英文关键词】Activity Off-bottom swimming Hormone-treated maturation Anguillid eel

【中文摘要】In an attempt to better understand the spawning ecology of the Japanese eel in the wild and also to provide useful information for improving their artificial reproduction techniques, we have recently conducted a series of behavioral studies to look at how environmental factors like shelter availability (Dou et al. 2007) and temperature may affect the spawning performance of the artificially-matured eels in captivity. The current study focused on examining their behavioral responses to temperature changes at spawning. This includes their general spawning performance, activity and off-bottom swimming behavior. Since spawning of this eel was successfully triggered only at 20 – 228C (obviously a too narrow thermal range) in a laboratory setting, we set the temperatures at 14, 18, 22, and 278C for egg ovulating and releasing in this study to explore the possibility that spontaneous spawning can be realized at a wider thermal range.

【英文摘要】We studied the influence of temperature on the spawning performance of artificially matured Japanese eels, Anguilla japonica, in captivity. We used routine hormone injections to bring females and males to maturity in separate aquaria. We recorded the behavior of three pairs of such hormone-treated matured eels in an aquarium (2 replicates) at four temperatures: 14, 18, 22, and 278C, respectively. They became active and frequently left the bottom swimming in the water column, and spawning events occurred. Females released eggs in the water column around the activity peaks. Males preceded females in reaching activity peaks (presumably the timing of sperm ejection and egg release), possibly resulting in the low fertilization we observed in this experiment. Males and females returned back to the aquarium bottoms and became quiet after spawning. On several occasions, male-female or female-female pairs were observed to ' cruise together ' in the water column for several to tens of seconds prior to egg releasing, but no courtship behavior indicative of spawning such as pairing and chasing was observed in the eels in our study. Our results suggest that 18 – 228C might be the thermal preference for spawning for Japanese eels, which approximates the temperature range of the 500 m deep water layer around the Mariana Islands seamount area, the presumed spawning site for the Japanese eel.

【题目】Toxicity of lead, cadmium and mercury on embryogenesis, survival, growth and metamorphosis of Meretrix meretrix larvae
【中文关键词】Mercury Cadmium Lead Early development Meretrix meretrix Larvae
【英文关键词】Mercury Cadmium Lead Early development Meretrix meretrix Larvae
【中文摘要】it is necessary to find out how these heavy metals affect the entire early development of M. meretrix. Moreover, in contrast to the majority of bioassays which usually use embryos or larval stages, the sensitivity of the entire early life stages of bivalves to heavy metals has been less studied. This data will help us to establish dose-response relationships for each metal tested, and give biological criteria for the implementation of marine water quality standards to protect these organisms.
【英文摘要】In order to assess the toxicity of heavy metals onthe early development of Meretrix meretrix, the effects ofmercury (Hg), cadmium (Cd) and lead (Pb) on embryogenesis,survival, growth and metamorphosis of larvae wereinvestigated. TheEC50 for embryogenesis was 5.4 lg l-1 forHg, 1014 lg l-1 for Cd and 297 lg l-1 for Pb, respectively.The 96 h LC50 for D-shaped larvae was 14.0 lg l-1 for Hg,68 lg l-1 for Cd and 353 lg l-1 for Pb, respectively.Growth was significantly retarded at 18.5 lg l-1 (0.1 lM)for Hg, 104 lg l-1 (1 lM) for Cd and 197 lg l-1 (1 lM) forPb, respectively. The EC50 for metamorphosis, similar to48 h LC50, was higher than 96 h LC50. Our results indicatethat the early development of M. meretrix is highly sensitiveto heavy metals and can be used as a test organism for ecotoxicologybioassays in temperate and subtropical regions.

【题目】Toxic Effects of Zinc on the Development, Growth, and Survival of Red Sea Bream Pagrus major Embryos and Larvae
【中文关键词】Vertebrata ; Pisces ; Aquatic environment ; Developmental stage ; Heavy metal ; Pagrus major ; Pollutant ; Marine environment ; Environment ; Ecotoxicology ; Pollution ; Larva ; Embryo ; Survival ; Growth ; Zinc ; Toxicity ;
【英文关键词】Vertebrata ; Pisces ; Aquatic environment ; Developmental stage ; Heavy metal ; Pagrus major ; Pollutant ; Marine environment ; Environment ; Ecotoxicology ; Pollution ; Larva ; Embryo ; Survival ; Growth ; Zinc ; Toxicity ;
【中文摘要】In this study, we investigated the acute and subchronic toxicity of zinc to the development, survival, and growth of red sea bream during embryonic and larval stages in order to achieve two goals: (1) to investigate the mechanism underlining zinc toxicity to their ELS and (2) to clarify whether embryogenesis and larval development (e.g., hatching, survival, growth, and morphological abnormality) are sensitive bioindicators for evaluating waterborne zinc toxicity to their ELS
【英文摘要】This study investigated the zinc toxicity to red sea bream Pagrus major embryos and larvae at 18 ± 1_C (33 ± 1% in salinity) under laboratory conditions. The acute toxicity tests indicated that zinc 48-h LC50 to embryos and 96-h LC50 to larvae were 4.3 (3.3 – 6.3; 95% confidence limits) and 10.1 (9.0 – 11.4) mg l-1, respectively, suggesting that embryos were more sensitive than larvae to zinc exposure. The subchronic toxicity test, in which embryos and larvae were continuously exposed to 0, 0.1, 0.3, 0.5, 0.7, 1.0, 1.5, 2.0, and 2.5 mg Zn2? l-1 solutions for 10 days, demonstrated that waterborne zinc had distinctly toxic effects on the development, growth, and survival of red sea bream embryos and larvae. Zinc exposure at concentrations C 0.5 mg l-1 would lead to a low hatching rate (19 – 78%, vs. 98% in controls), high mortality (29 – 91%, vs. 10% in controls), and morphological abnormality (12 – 77%, vs. 0.3% in controls) in embryos and larvae, while it caused delay in time-to-hatch in embryos at concentrations C 1.0 mg l-1. These four biological parameters were zinc concentration dependent and could be effective bioindicators for evaluating the toxicity of zinc to the early life stage of this fish. Heartbeats of embryos (9 – 13 beats 10 s-1) were relatively low and were not significantly influenced by zinc concentration, although they rose remarkably with elevated zinc concentration in larvae at the end of the test, particularly when it was C 1.0 mg l-1 (36 – 38, vs. 31 beats 10 s-1 in controls). The total length (LT) of the larvae at the end of the test was reduced by 12.2% and 15.6% in the 1.0 and 2.0 mg l-1 solutions but did not vary significantly in other solutions in comparison with the controls. Heartbeat and LT were less sensitive to zinc exposure and might not be good biological parameters for determining the toxicity of zinc to the early life stage of red sea bream.

【题目】Feeding, morphological changes and allometric growth during starvation in miiuy croaker larvae
【中文关键词】Miichthys miiuy larvae . Delayed feeding Morphometrics . Growth and survival
【英文关键词】Miichthys miiuy larvae . Delayed feeding Morphometrics . Growth and survival
【中文摘要】The miiuy croaker, Miichthys miiuy, is an important commercial species that inhabits the coastal waters of China, Japan and Korea (Zhang and Hong 2000; Choi et al. 2002). Due to overexploitation, wild populations of this fish have drastically decreased in recent years. On the other hand, morphological deformity and high mortality in the artificially bred fingerlings have hindered their commercial mass production. So far, few studies have dealt with the morphological development (Zhong et al. 2005; Luo et al. 2006), growth, survival and digestive enzymes of miiuy croaker during their early life stage (Shan and Dou 2008; Shan et al. 2008a,b). Little information is available at present to understand how starvation may affect the development, growth and survival of the larvae. This study is to investigate the effects of delayed first feeding on these biological parameters in order to better understand their larval growth and survival strategies during starvation and provide information for feeding management in larval rearing.
【英文摘要】We investigated the effects of the timing of first feeding (larvae in F0, F1, F2, F3 and S were first fed on day 3, 4, 5, 6 days after hatching (DAH) and unfed, respectively) on feeding, morphological changes, survival and growth in miiuy croaker larvae at 24 ° C. The fed larvae initiated feeding on 3 DAH and reached point of no return (PNR) on 6 DAH. Larvae in F0 and F1 groups survived apparently better than F2 group at the end of the experiment on 36 DAH. High larval mortality occurred from 3 to 7 DAH in all feeding groups, accounting for 40% (F0, F1 and F2 groups) to 90% (F3 and S groups) of the total mortality. Larvae in F0 and F1 groups grew better than F2 group throughout the experiment. Eye diameter, body height, head height and mouth gape of the first feeding larvae were more sensitive to starvation than other morphometrics and could be used as indicators for evaluating their nutritional status. Results indicated that delayed first feeding over 1 day after yolk exhaustion could lead to poor larval survival and growth. To avoid starvation and obtain good growth in culturing, larvae feeding should be initiated within 1 day after yolk exhaustion at 24 ° C.

【题目】Ontogenetic development of digestive enzymes and effect of starvation in miiuy croaker Miichthys miiuy larvae
【中文关键词】Amylase Alkaline phosphatase Lipase Trypsin Delayed feeding Miichthys miiuy larvae
【英文关键词】Amylase Alkaline phosphatase Lipase Trypsin Delayed feeding Miichthys miiuy larvae
【中文摘要】The objective of this study was to investigate the effect of starvation on the ontogenetic development of amylase, lipase, trypsin, and alkaline phosphatase in miiuy croaker larvae. To accomplish this, we quantified and examined the development of the specific activities of these digestive enzymes in miiuy croaker larvae at different ages of first feeding.
【英文摘要】The ontogenetic development of the digestive enzymes amylase, lipase, trypsin, and alkaline phosphatase and the effect of starvation in miiuy croaker Miichthys miiuy larvae were studied. The activities of these enzymes were detected prior to exogenous feeding, but their developmental patterns differed remarkably. Trypsin activity continuously increased from 2 days after hatching (dah), peaked on 20 dah, and decreased to 25 dah at weaning. Alkaline phosphatase activity oscillated at low levels within a small range after the first feeding on 3 dah. In contrast, amylase and lipase activities followed the general developmental pattern that has been characterized in fish larvae, with a succession of increases or decreases. Amylase, lipase, and trypsin activities generally started to increase or decrease at transitions from endogenous to exogenous feeding or diet changes, suggesting that these enzymatic activities can

be modulated by feeding modes. The activities of all the enzymes remained stable from 25 dah onwards, coinciding with the formation of gastric glands and pyloric caecum. These results imply that specific activities of these enzymes underwent changes due to morphological and physiological modifications or diet shift during larval development but that they became stable after the development of the digestive organs and associated glands was fully completed and the organs/glands functioned. Trypsin and alkaline phosphatase were more sensitive to starvation than amylase and lipase because delayed feeding up to 2 days after mouth opening was able to adversely affect their activities. Enzyme activities did not significantly differ among feeding groups during endogenous feeding; however, all activities were remarkably reduced when delayed feeding was within 3 days after mouth opening. Initiation of larvae feeding should occur within 2 days after mouth opening so that good growth and survival can be obtained in the culture.

【题目】Effects of photoperiod on growth, mortality and digestive enzymes in miiuy croaker larvae and juveniles

【中文关键词】Miichthys miiuy ;Light regime ;Survival ;Growth; Enzymatic activity

【英文关键词】Miichthys miiuy ;Light regime ;Survival ;Growth; Enzymatic activity

【中文摘要】Miiuy croaker Miichthys miiuy is a promising candidate for culturing in China. However, high mortality and morphological deformity during larval development have hindered the industrialization and commercialization of this species (Shan and Dou, 2008). The purpose of this study is to investigate the effects of photoperiod on the growth, mortality and digestive enzymes of the miiuy croaker larvae and juveniles. This will help understand their growth and survival strategies at different photoperiods during early life stage and provide information about the photoperiod manipulation for fry culturing.

【英文摘要】The growth, mortality and digestive enzymes (trypsin, amylase and lipase) in miiuy croaker Miichthys miiuy larvae and juveniles (2 – 53 dph) were investigated at four photoperiods: 24L:0D, 18L:6D, 12L:12D and 0L:24D. Larvae could not feed at 0L:24D and did not survive up to 7 dph. In the 24L:0D, 18L:6D, 12L:12D groups, photoperiod had not significant effects on the growth of the miiuy croaker younger than 20 dph. However, their total length and specific growth rate (SGR) were significantly larger at 18L:6D and 24L:0D than 12L:12D after 20 dph. Photoperiod also affected the mortality of the first feeding larvae (5 dph), being apparently higher in 5 dph larvae at 0L:24D (60%) than at other photoperiods (20 – 27%), but no significant differences in mortality were found among other photoperiods. High mortality of the miiuy croaker in 12L:12D, 18L:6D and 24 L:0D groups mainly occurred from 5 (20 – 27%) to 11 dph (11 – 16%) and tended to decrease gradually from 15 dph onwards. Digestive enzymes activities in the miiuy croaker larvae and juveniles had a similar change trend with age at all photoperiods. They underwent drastic changes with age. The specific activity of lipase was significantly higher at 18L:6D and 24L:0D than 12L:12D, but there were no significant differences in specific activities of either trypsin or amylase among photoperiods. With regard to the total length, SGR, survival and digestive enzyme activities, our findings suggested that the optimal light regime for the culture of miiuy croaker during the early life stage was 18L:6D.

【题目】Potential of the seaweed Gracilaria lemaneiformis for integrated multi-trophic aquaculture with scallop Chlamys farreri in North China

【中文关键词】Gracilaria lemaneiformis ;Integrated Multi-trophic Aquaculture (IMTA) ;Nutrient uptake rate ; Nutrient reduction efficiency . Scallop

【英文关键词】Gracilaria lemaneiformis ;Integrated Multi-trophic Aquaculture (IMTA) ;Nutrient uptake rate ; Nutrient reduction efficiency . Scallop

【中文摘要】In this study, the nutrient (ammonium and phosphorus) uptake rates and nutrient reduction efficiency of G. lemaneiformis was determined in an IMTA system with the scallop Chlamys farreri. The objective of this study was to (1) determine if G. lemaneiformis can efficiently take up the dissolved ammonium and phosphorus from C. farreri excretion; and (2) evaluate the optimum ratio of seaweed to scallop for IMTA systems.

【英文摘要】In this study the red alga, Gracilaria lemaneiformis, was cultivated with the scallop Chlamys farreri in an integrated multi-trophic aquaculture (IMTA) system for 3 weeks at the Marine Aquaculture Laboratory of the Institute of Oceanology, Chinese Academy of Sciences (IOCAS) in Qingdao, Shandong Province, North China. The nutrient uptake rate and nutrient reduction efficiency of ammonium and phosphorus from scallop excretion were determined. The experiment included four treatments each with three replicates, and three scallop monoculture systems served as the control. Scallop density (407.9±2.84 g m − 3) remained the same in all treatments while seaweed density differed. The seaweed density was set at four levels (treatments 1, 2, 3, 4) with thallus wet weight of 69.3± 3.21, 139.1±3.80, 263.5±6.83, and 347.6±6.30 g m − 3, respectively. There were no significant differences in the initial nitrogen and phosphorus concentration between each treatment and the control group (ANOVA, p>0.05). The results showed that at the end of the experiment, the nitrogen concentration in the control group and treatment 1 was significantly higher than in the other treatments. There was also a significant difference in phosphorus concentration between the control group and the IMTA treatments (ANOVA, p<0.05). Growth rate, C and N content of the thallus, and mortality of scallop was different between the IMTA treatments. The nutrient uptake rate and nutrient reduction efficiency of ammonium and phosphorus changed with different cultivation density and time. The maximum reduction efficiency of ammonium and phosphorus was 83.7% and 70.4%, respectively. The maximum uptake rate of ammonium and phosphorus was 6.3 and 3.3 μ mol g − 1 DW h − 1. A bivalve/seaweed biomass ratio from 1:0.33 to 1:0.80 (treatments 2, 3, and 4) was preferable for efficient nutrient uptake and for maintaining lower nutrient levels. Results indicate that G. lemaneiformis can efficiently absorb the ammonium and phosphorus from scallop excretion and is a suitable candidate for IMTA.

【题目】Relationship between differential retention of Escherichia coli and Enterococcus faecalis and variations in enzyme activity in the scallop Patinopecten yessoensis

【中文关键词】Patinopecten yessoensis;Escherichia coli;Enterococcus faecalis;Bacterial retention;Enzyme activity

【英文关键词】Patinopecten yessoensis;Escherichia coli;Enterococcus faecalis;Bacterial retention;Enzyme activity

【中文摘要】The Japanese scallop Patinopecten yessoensis is now widely cultivated in northern parts of the Yellow Sea (China). In 2007, production of P. yessoensis in the Dalian area of Liaoning Province reached 1 _ 105 tons (Li et al., 2007). But in summer in recent years high mortality rates have resulted in an abrupt decrease in aquacultural outcome and profit. Heavy occurrence of bacteria may constitute a significant health risk to cultured animals at high temperature or in other specific conditions (Bonadonna et al., 2002). However, the roles of E. coli and E. faecalis in digestion of scallops remain unclear, and information relating to a host ’ s growth performance, innate immunity and disease outbreaks after a long-term exposure to non-pathogenic fecal bacteria is limited. Bacterial accumulation and variation in digestive and immune enzymes in scallop tissues must be better understood to clarify the interaction between marine microbes and bivalves, and to improve aquaculture environment and seafood safety. Integration of analyzing mollusc digestion and immune response also makes the thorough knowledge of two dominant approaches of bivalves to dealing with the microbial invasion emphasized. The objectives of this study were to investigate the difference of retention of two fecal indicators in scallops, and determine effects of long-term exposure on digestive and immune enzyme activities in P. yessoensis, and evaluate digestive response as a supplement to innate immunity in regulation of bivalve adoptions to a changing intestinal microflora.

【英文摘要】Uptake of Escherichia coli and Enterococcus faecalis and variations of trypsin amylase activity acid phosphatase and superoxide dismutase in tissue of the scallop Patinopecten yessoensis were detected. The results showed that P. yessoensis accumulated E. faecalis in larger numbers and more rapidly than E. coli, both with the highest concentration in the digestive tract and lowest in hemolymph. Compared to E. coli, all scallops exposed to E. faecalis showed significantly higher trypsin and AMS activity. SOD activity

in hemocytes and ACP activity in hemolymph was significantly higher in the treatments with 5 log10CFU/ml E. coli than with E. faecalis. But no significant differences in ACP activity of P. yessoensis exposed to a 3 log10CFU/ml inoculum of both bacteria were recorded. In conclusion, the mass retention of gut microflora in P. yessoensis is positively correlated with digestive enzymes activity and negatively correlated with ACP activity in the hemocyte.

【题目】Effects of salinity on energy budget in pond-cultured sea cucumber Apostichopus japonicus (Selenka) (Echinodermata: Holothuroidea)
【中文关键词】Apostichopus japonicus;Pond culture;Salinity]Food consumption;Scope for growth; Energy budget
【英文关键词】Apostichopus japonicus;Pond culture;Salinity]Food consumption;Scope for growth; Energy budget
【中文摘要】Compared with the coastal areas, culture ponds are limited in space and water exchange. Sea cucumbers inhabiting a pond are exposed to seasonal fluctuations in salinity due to several factors, such as water exchange, precipitation and evaporation, and icing and thawing. For example, salinity insea cucumber ponds inDalian varied from25 practical salinity units (psu) in summer to 36 psu inwinter and spring (Chang et al., 2004; Cai, 2007). The physio-ecological responses of holothurians to salinitymay be influenced by ontogeny. In general, A. japonicus larvae are more sensitive to salinity compared with those in the juvenile and adult stages (Sui and Liao, 1988). Some previous studies focused on the salinity tolerance limit of A. japonicus (e.g., Kashenko, 1992, 1997, 2000; Yuan et al., 2006b). However, no information is available on the effects of salinity on its energy budget. This study was designed to compare the bioenergetic responses of pond-cultured A. japonicus under different salinities. Such information could be helpful in understanding its physioecological regulation and improving pond aquaculture management
【英文摘要】Pond farming for sea cucumber has developed rapidly along the northern coast of China in the recent years. Holothurians inhabiting ponds undergo seasonal fluctuations of salinity. This study deals with the bioenergetic responses of pond-cultured sea cucumbers Apostichopus japonicus (wet weight of 37.5±1.8 g) to different water salinities [22, 27, 31.5, and 36 practical salinity units (psu)] at 15 ° C in the laboratory to determine the influence of water salinity on growth and energy allocation in this species. Results show that ingested energy and scope for growth (SFG) were highest at 31.5 psu and then decreased when water salinity was below or above this point. Although energy ingested was lowest at 36 psu, the lowest SFG occurred at 22 psu (only 102.68±14.26 J g − 1 d − 1) because animals reared at 22 psu spent much more consumed energy on feces (72.19%), respiration (21.70%), and excretion (2.59%), leaving less energy for growth (3.52%). Results suggest that pond-cultured sea cucumbers could tolerate chronic salinity fluctuations at a range of 22 to 36 psu and grew better between 27 and 31.5 psu, but decreased at salinities above and below the mentioned salinity range.

【题目】日本蟳捕食栉孔扇贝机制的初步研究
【中文关键词】日本蟳(Charybdis japonica); 栉孔扇贝(Chlamys farreri); 捕食; 水温
【英文关键词】Charybdis japonica; Chlamys farreri; predation; water temperature
【中文摘要】本研究在现场和室内条件下考察水温和扇贝规格对日本蟳捕食强度的影响, 以期为该海区进行栉孔扇贝底播生产提供科学依据。

【英文摘要】Predation of scallop Chlamys farreri by crab Charybdis japonica was examined in situ and in the laboratory at different water temperatures. It was found that the predation rate of small scallop (shell height < 5.0 cm) was increased with increasing water temperature, and the predation was negligible either when the shell height of scallop exceeded 5.9 cm or when the water temperature was blow 10 ° C. In situ predation rate was higher than that in the laboratory at the same seawater temperature; however, the Q10 values were similar at the two different situations. Our results indicate that the best way to enhance the survival of the bottom cultured C. farreri is to seed large scallops in autumn and winter, when the water temperature is low, and some mussels should also be put in the culture area as a sacrifice to reduce the predation of scallop by crab.

【题目】中国北方海域扇贝重金属含量的比较与质量评价
【中文关键词】重金属;质量评价;海湾扇贝(Argopecten irradians);栉孔扇贝(Chlamys farreri);北方海域
【英文关键词】Heavy metals;quality evaluation;Argopecten irradians;Chlamys farreri;northern China seas
【中文摘要】目前,产品质量安全问题已经成为发达国家对中 国水产品出口进行限制的主要借口,中国出口水产品 内在品质和卫生标准仍然处于弱势,致使水产品出口 难以突破国际贸易中的绿色壁垒。扇贝产品品质的调 查和质量评价十分迫切,具有重要的现实意义。作者 从中国北方7 个具有代表性的海域同步取样,从重金 属富集的角度对扇贝的品质进行调查,比较研究海域 扇贝的重金属含量,评估产品质量,为产品质量的控 制提供科学依据。
【英文摘要】Argopecten irradians and Chlamys farreri were collected in 7 mariculture areas in northern China seas, including Dalian Bay, Qinhuangdao, Laizhou Bay, Yantai, Weihai, Jiaozhou Bay and Jiaonan from Oct. to Nov., 2005. Contents of five kinds of heavy metals including As, Hg, Pb, Cu and Zn were investigated via atomic absorption spectrophotometry. The results indicated as follows: (1) The heavy metal contents in scallop leftover were usually higher than that in scallop adductor; (2) In the same area, the heavy metal contents in C. farreri were higher than that in A. irradians; (3) The average contents of five heavy metals can be arranged as: Zn>Cu>As>Pb>Hg; (4) In Jiaozhou Bay, the Zn contents in the adductor and leftover of C. farreri were 1.24 and 1.59 times that of legal limit, respectively, whereas in other areas, the levels of five heavy metals were below the legal limit.

【中文关键词】獐子岛;叶绿素;初级生产力;虾夷扇贝
【英文关键词】Zhangzidao Island; Chlorophyll a; Primary production; Japanese scallop Patino pecten yessoensis
【中文摘要】2005 年对大连璋子岛养殖海域叶绿素浓度和初级生产力进行一年四个季度的调查, 对叶绿素水平、 垂直 分布及季节变化进行了分析研究。同时, 结合所调查的营养盐分布特征, 分析了营养盐与浮游植物的关系, 为 深人了解该养殖海域的环境质量状况, 为养殖容量的评估和健康养殖模式的建立提供基础数据。
【英文摘要】Zhangzidao Island is the largest mariculture base for Japanese scallop Patinopecten yessoensis in China. Chlorophyll a (chLa) around this area (at 18 sampling stations) was investigated in March, May, July and October, 2005. Results showed that chLa concentrations in the area varied between 1. 23------2. 85mg/ m3 , with an annual average of 1. 78±0. 57mg/m3 • There was a significant seasonal variation in chla during the investigation period. The highest and lowest values of chla appeared in March and July, respectively; while the spatial distribution of chla did not vary significantly throughout the year, except in October. In October, The concentration of chla near the island was higher than that in the off-shore areas, which might be related to the feeding impact of cultivated scallops. The vertical distribution of chla was more uniform, with chla concentration a little higher at the surface than in the bottom. Seasonal variation of primary production was significant and differed to that of chla concentration. From March to October, the primary production increased from 30.4 mgC/m2 • d to 117.0 mgC/m2 • d,with an annual average of 76. 6±41. 9 mgC/m2 • d. Correlation analysis revealed significant positive correlations between primary production and water temperature or the concentration of dissolved inorganic nitrogen.

【题目】水稻叶曲线特征的机理模型

【中文关键词】水稻;叶形;叶曲线;定量模型;虚拟作物

【英文关键词】Rice; af shape; af curvature;Quantitative model;Virtual crop

【中文摘要】:通过对水稻叶片的受力分析,推导了叶曲线方程,并进行了影响系数的参数化和方程求解。对叶曲线方程的灵敏度分析表明,方程较好地体现了叶长、叶宽、叶形、比叶重和叶片形变系数等参数对叶曲线的综合影响,与生产中水稻株型特征变化相一致。进一步利用三维数字化仪获得的不同品种类型水稻拔节期和孕穗期叶脉空间坐标试验数据对叶曲线方程进行了模拟分析,结果表明叶曲线方程可以合理而可靠地定量描述水稻叶曲线特征的动态变化规律。

【英文摘要】Abstract:With the development of computer graphics and crop simulation,virtual crop study,intuitionally expressing crop growth on computer,attracted many scientists to focus on this field. Some scientists have made great progress on the visualization of wheat,maize,soybean,rice and cotton,etc. af shape is a very important characteristic in virtual cropgrowth modeling,and some empirical curves have been used to describe leaf morphology based on field experiments in the previous study.The fitting curves can help to understand organ morphogenesis,but the fitting parameters obtained from the ven leaves and time cannot suit to changed growth process of leaves. So developing a mechanism model to simulate theleaf morphology is critical for virtual crop growth.Organ morphogenesis of plant is decided to its forces.After force analysis on a flee leaf,the gravity fraction in leafnormal direction keeps equilibrium with elasticity,and then a dynamic leaf curvature equation was deduced with some assumption.Th e equation included the synthetic efect of leaf blade length,leaf blade width,initial leaf angle,specific leaf weight and deformation coeficient on leaf space shape.Th en the equation was solved with parameterization.Th e sensitivity analysis showed that the equ ation could well reflect the integrated effects of leaf length,leaf width,specific leaf weight and leaf deform ation coefficient,consistent with rice plant architecture in practice.A field experiment was conducted at the Nanjing Agricultural University for validating the equation.Two cultivars(SU63 and WYJ7)were nursed in dry—bed on May 20,and transplanted on June 20 with single seedling.Water and nutrients were supplied according to high yielding rice management.At jointing and booting stages of rice,the 3-dimension coordinates of several points in leaf midrib were measured with the 3D digitizer,and at the same time leaf blade length,width.initial leaf angle were obtained. I1len simulation analyses were conducted on the equation with the expe riment data.Th e results indicated that the leaf curvature equation could reasonably and reliably describe the change pattern of leaf shape characteristics of rice under different conditions.Th e leaf curve equation could dynamically simulate the space shape of leaves with diferent initial leaf angles andspecial leaf weights by reduced parameters of rice leaf,espe cially in modeling day-to-day crop growth.

【题目】水稻穗结构的定量特征与虚拟表达的初步研究
【中文关键词】水稻;穗;结构;虚拟
【英文关键词】Rice;Panicle;Architecture;Virtual
【中文摘要】连续观察了不同品种和不同氮肥处理条件下水稻穗结构,并对其进行了定量分析及参数化处理。结果表明,一次枝梗长与穗长之比随穗轴节位呈两次函数变化,不同品种类型之间的参数变异较大;一次枝梗上的二次枝梗数与一次枝梗长度呈线性变化;一次枝梗基本均匀着生于穗轴上,一次枝梗和二次枝梗的节间距离变化不大。进一步利用水稻生长模型输出的穗粒数和一次枝梗数分析了二次枝梗的空间分布。最后结合上述结构特征,进行了水稻穗结构的计算机模拟。
【英文摘要】Abstract:Visual simulation on crop architecture can help to better understan d crop growth processes and analyze the relationship between architecture an d fun ction.Panicle of rice is the critical organ for yield formation.Its architecture depends deeply on ecological environment and cultivation methods,and most crop growth models on rice can simulate theefects of ecological environment and cultivation methods on yield components,such as panicle number, ain number per panicle,seed—setting pe rcentage, 1000一 ain weight,an d number of primary branch.Therefore,combination t}l the OHtputs of crop growth mode1.developing architecture model will impmve its applicability.On the field expe riments t}ldiferent cultivars an d nitrogen applications.we analyzed the quan titative chamcteristics of panicle architecture in rice. e msults were as follows: e ratio of primary branch to panicle in length could be characterized by a qu adratic equation expressed in terms of nodal number of branch on panicle axis;these was a linear relationship be tween the number ofsecondary branch an d the length of primaty branch;the primary branch grew uniformly on panicle axis and the nodal distan ces of primary and secondary branch also had no significan t diference.Furthermore.based on the stability of spikelet number of primary branch and secondary branch,the outputs of growth model,such as ain number pe r panicle an d thenumber of primary branch,were used to analyze total number of secondary branch per panicle an d its space distribution.Thus panicle architecture could be described clearly. en the model of total number of secondary branch per panicle and panicle architecture were validated with indepe ndent da ta.Th e results indicate that the sim~ated values of total number of secondary branch pe r panicle are accordan t with the observed values ,and the simulated panicle architectures are similar with the observed.Panicle architecture can be simulated visually un der diferent conditions.

【题目】农业模型与数字农业发展探讨
【中文关键词】农业模型;数字农业;发展;探讨
【英文关键词】agricultural models;digital agriculture;development;discussion
【中文摘要】【目的】为了进一步深化与促进农业模型与数字农业发展,并融入国际潮流,【方法】本文以系统学思想为指导,采用系统分析及认识论挖掘等方法,【结果】提出并进一步明晰了农业模型概念与分类,农业模型与数字农业的相互关系、意义与评价,综述了国内外农业模型研究与应用新动态,通过分析存在问题,提出了进一步发展的对策和建议。广义上,农业模型是为研究农业问题的定量规律所建立数学模型的总称,包括农业生物模型、农业环境模型、农业技术模型以及农业经济管理模型等;狭义上,农业模型主要包括农业植物模型、农业动物模型、农业微生物模型、农产品贮藏与加工模型等。数字农业体系分为数字种植业、数字林业、数字畜牧业、数字渔业、数字农村工业以及数字农产品市场与管理等。【结论】农业模型之间发展不平衡但各有特色;农业模型间的协同较少;不同学科背景下农业模型之间缺乏开放源式的整合与互操作框架;农业模型的检验方法还需进一步完善;虽然目前数字农业的应用还较少,但随着中国农业的发展,特别是城乡结构比例的变化,未来它将具有广阔的应用和发展前景。

【英文摘要】【Objective】In order to deepen the studies of agricultural models (AMs) and digital agriculture (DA), promote its development, and be joined into international development tide,【Method】the methods of systematic analysis, classifying, and dig of epistemology, etc were used. 【Results】This paper put forward clearly the concepts and classifying of AMs, described the correlation, significant, and value between AMs and DA, reviewed the newest studies and application progresses of them in internal and abroad, analysed issues of their current studies and application, and some countermeasures and suggestions for their further development under guidance of idea from system science were presented. In broad sense, AMs are mathematics models on agricultural biology, agricultural environment, agricultural technology, and agricultural economics, and in narrow sense, AMs involve in agricultural plant models, agricultural animal models, agricultural microbe models, preservation and processing models for agricultural products, and agricultural management models. In that there are empirical, partially mechanistic, and mechanistic model in various AMs. The system for DA can be divided into digital cropping, digital forestry, digital husbandry, digital fishery, digital rural industry, and digital agricultural product markets and management.【Conclusion】The analysis showed that there were a imbalance development among various kinds of AMs, but the development of each kind of AMs had its own characteristics on ranges and depth of its studies and application; there was little links among various kinds of AMs; there was no a frame with open source for integrating and interoperability among AMs; the current validation methods for AMs still were not perfect; at present, though application for DA is little, it will have wide development and application foreground with development of agriculture in China, especially, changes in proportion of town and countryside.

【题目】Isolation of a Bacterium Strain that Could Degrade Agar[Received 27 May 2009
【中文关键词】菌活菌浓度,琼脂,降解
【英文关键词】bacterium;alive bacteria concentration;agar;degradation
【中文摘要】从堆肥中分离的58株细菌中只有琼脂和水的介质平板上生长的几天后表现出明显的殖民地。水悬浮液中只含有琼脂(2克・L-1,8克・L-1)的两个控制(生理盐水,LB培养基)接种的细菌(BR5-1),以查看是否有活着细菌浓度的增长在48小时后。结果表明,有显着上升琼脂悬浮液中的活菌浓度(6.5×103 CFU・mL-1的6.0×103 CFU・mL-1的)相比,在正常生理盐水对照组(6.1×102 CFU・mL的-1),远低于在LB(的Luria-Bertani)对照组(1.1×108个菌落形成单位・mL-1的)。最后,该细菌菌株(BR5-1)可降解琼脂。
【英文摘要】One among 58 strains of bacteria isolated from compost showed clear colonies after a few days of growth on the plates containing medium made of only agar and water. Water suspension contain only agar (2 g・L-1,8 g・L-1) with the two control (normal saline, LB medium) were inoculated with the bacterium (BR5-1) to see whether there are increasement of the alive bacteria concentration after 48 hours of growth. Results showed that there are significant rising of the alive bacteria concentration in the agar suspension(6.5×103 cfu・mL-1, 6.0×103 cfu・mL-1) compared to that in the normal saline control(6.1×102 cfu・mL-1), and far lower than that in LB(Luria-Bertani) control (1.1×108 cfu・mL-1). In conclusion, the bacteria strain(BR5-1) could degrade agar.

【题目】尖孢镰刀菌发酵混合糖产乙醇
【中文关键词】尖孢镰刀菌; 混合糖发酵;木糖;葡萄糖; 乙醇

【英文关键词】Fusarium oxysporum; mixed sugar fermentation; xylose; glucose; ethanol
【中文摘要】以尖孢镰刀菌(Fusariumoxysporum) cs- 28为研究对象,设置不同比例的葡萄糖木糖混合发酵生产乙醇。结果表明: 葡萄糖在混合糖中被优先利用。葡萄糖的存在限制了木糖的利用, 并且当葡萄糖消耗完,尖孢镰刀菌对木糖的利用也有个适应过程。在单糖发酵中,葡萄糖的消耗速率(0. 248g!L- 1!h- 1)高于木糖的消耗速率(0. 159g!L- 1!h- 1)。在葡萄糖发酵中, 最大乙醇产量为8. 50g!L- 1, 而木糖发酵中, 最大乙醇产量为5. 77g!L- 1。但菌体干质量正好相反, 在葡萄糖上最大菌体干质量为4. 67g!L- 1, 而在木糖上最大菌体干质量为6. 18g!L- 1。葡萄糖发酵周期(3d)比木糖发酵周期(7d)短。
【英文摘要】In order to Fusarium oxysporum (Fusariumoxysporum) cs- 28 as the research object, setting different ratios of glucose and xylose fermentationEthanol. The results showed that: in the mixed sugar glucose were preferentially use. In the presence of glucose limitation of xylose utilization, and when glucose is consumed, Fusarium oxysporum on xylose utilization also have a process of adaptation. In the fermentation of sugars, glucose consumption rate (0 248g 1 h-! L-! 1) higher than that of the xylose consumption rate (0 159G L- 1 h- 1!!). In the fermentation of glucose, the maximum yield of ethanol is 8 50g! L- 1, and xylose fermentation ethanol yield, maximum is 5 77g! L- 1. But the cell dry mass on the contrary, in glucose on maximum cell dry mass is 4 67g! L- 1, while in the xylose on maximum cell dry mass is 6 18G! L- 1. Glucose fermentation cycle (3D) than xylose fermentation cycle (7D) short.

【题目】Molecular and biochemical evidence for phenylpropanoid synthesis and presence of wall-linked phenolics in cotton fibers
【中文关键词】细胞壁;棉纤维;基因表达;酚类;苯丙烷类化合物合成代谢
【英文关键词】cell wall; cotton fiber; gene expression; phenolics;phenylpropanoid biosynthesis pathway
【中文摘要】成熟的棉花纤维是由单细胞发育而成,拥有特化加厚的次生细胞壁。本研究的目的是利用分子生物学技术,光谱分析和化学分析技术去探索棉纤维次生细胞壁发育过程中酚类物质的积累。定量RT-PCR分析表明棉花七个CAD同源基因中,GhCAD6和GhCAD1在纤维中显著的表达,并且GhCAD6与纤维次生细胞壁的发育时期上调表达。系统发生分析表明GhCAD6处于直接参与木质素单体合成的第I类CAD基因家族分支上,GhCAD1处于木质素单体补偿代谢的第III类CAD基因家族分支上。氨基酸序列比对分析表明GhCADs具有作为CAD蛋白特征的的辅助因子结合位点。而GhCAD1蛋白的底物结合位点同GhCAD6不尽一致,同时酶活分析也表明GhCAD1和GhCAD2具有不同的底物催化活性。细胞壁自发荧光,FTIR,HPLC以及化学分析都表明酚类物质附着于成熟棉纤维的细胞壁中。上述发现为棉纤维品质的遗传改良提供了新的思路。
【英文摘要】The mature cotton (Gossypium hirsutum L.) fiber is a single cell with a typically thickened secondary cell wall. The aim of this research was to use molecular, spectroscopic and chemical techniques to investigate the possible occurrence of previously overlooked accumulation of phenolics during secondary cell wall formation in cotton fibers. Relative quantitative reverse transcription-polymerase chain reaction analysis showed that GhCAD6 and GhCAD1 were predominantly expressed among seven gene homologs, only GhCAD6 was up-regulated during secondary wall formation in cotton fibers. Phylogenic analysis revealed that GhCAD6 belonged to Class I and was proposed to have a major role in monolignol biosynthesis, and GhCAD1 belonged to Class III and was proposed to have a compensatory mechanism for monolignol biosynthesis. Amino acid sequence comparison showed that the cofactor binding sites of GhCADs were highly conserved with high similarity and identity to bona fide cinnamyl alcohol dehydrogenases. The substrate binding site of GhCAD1 is different from GhCAD6. This difference was confirmed by the different catalytic activities observed with the enzymes. Cell wall auto-fluorescence, Fourier transform infrared spectroscopy (FTIR), high-performance liquid chromatography (HPLC) and chemical analyses confirmed that phenolic compounds were bound to the cell walls of mature cotton fibers. Our findings may suggest a potential for genetic manipulation of cotton fiber properties, which are of central importance to agricultural, cotton processing and textile industries.

【题目】棉花咖啡酸-O-甲基转移酶基因的克隆及特征分析
【中文关键词】棉花;咖啡酸-O-甲基转移酶基因;基因克隆;表达分析;原核表达
【英文关键词】Gossypium hirsuturm L.; caffeic acid O-methyltransferase; gene cloning; expression analysis; prokaryotic expression
【中文摘要】【目的】克隆棉花木质素合成关键酶基因GhCOMT1、GhCOMT2和GhCOMT3全长cDNA序列,分析其在不同组织部位的表达情况并进行原核表达研究。【方法】根据棉花纤维特异表达cDNA文库分析得到的EST序列设计引物,采用RT-PCR技术克隆基因,用生物信息学方法对获得的cDNA序列及推定的氨基酸序列进行分析。采用半定量RT-PCR方法研究GhCOMT1、GhCOMT2和GhCOMT3在不同组织中的表达。构建了基因的原核表达载体,经酶切鉴定后转化到大肠杆菌BL21(DE3)中并诱导表达。【结果】从发育的棉花纤维中克隆了3个COMT基因cDNAs, GhCOMT1(GenBank登录号为FJ479708)、GhCOMT2(GenBank登录号为FJ479709)和GhCOMT3(GenBank 登录号为FJ848869)分别具有1 101 bp、1 098 bp、1 071 bp的开放阅读框,各自编码366、365和356个氨基酸。GhCOMT1、GhCOMT2和GhCOMT3在棉花各个组织中都有表达,GhCOMT1和GhCOMT2在根部的表达量最高,GhCOMT3在茎中表达量最高。SDS-PAGE电泳分析表明,3个蛋白的最佳诱导表达条件均为0.2 mmol·L-1IPTG在37℃下诱导6 h。【结论】从棉花中克隆了3个木质素合成关键酶基因GhCOMT1、GhCOMT2和GhCOMT3,为进一步的生物学功能研究及其应用奠定了基础。
【英文摘要】【Objective】 In this study, full-length cDNA of a key enzyme genes GhCOMT1, GhCOMT2 and GhCOMT3 related to lignin metabolism in cotton (Gossypium hirsuturm L.) were isolated. Analysis of the expression of GhCOMT1, GhCOMT2 and GhCOMT3 genes in different tissues of cotton was carried out and the genes were also expressed in the prokaryote. 【Method】 According to the results of cotton fibre preferentially expressed cDNA library analysis, the primers of EST sequence were designed. RT-PCR method was used to clone GhCOMT1, GhCOMT2 and GhCOMT3 genes, bioinformatics methods were used to analyze the obtained cDNAs sequence and the amino acid sequences were deduced. The expression of GhCOMT1, GhCOMT2 and GhCOMT3 genes in different tissues of cotton was analyzed by semi-quantitative RT-PCR. The full-length open reading frames were fused into a prokaryotic expression vector pET-28a, and then introduced into E.coli BL21(DE3)cells. 【Result】 Three genes coding for COMT, designated as GhCOMT1 (GenBank accession no.FJ479708), GhCOMT2 (GenBank accession no.FJ479709) and GhCOMT3 (GenBank accession no.FJ848869) were isolated from the developing cotton fibres. GhCOMT1, GhCOMT2 and GhCOMT3 contain open reading frames of 1 101 bp, 1 098 bp and 1 071 bp encoding proteins of 366, 365 and 356 amino acid residues, respectively. Semi-quantitative RT-PCR analysis revealed that GhCOMT1, GhCOMT2 and GhCOMT3 were differentially expressed in different tissues, and GhCOMT1 and GhCOMT2 mRNA accumulated most abundantly in root, GhCOMT3 was highly expressed in stem. Analysis of SDS-PAGE indicated that the highest expression quantity of the three proteins were induced by 0.2 mmol·L-1 IPTG treatment for 6 h at 37°C. 【Conclusion】 This paper reported the isolation and characterization of three COMT cDNAs clones involved in the lignin biosynthesis of cotton plants. Furthermore, the structure and function of these genes were analyzed and predicted.

【题目】Influences of grassland degradation on forage availability by sheep in the Inner Mongolian steppes of China
【中文关键词】forage availability Inner Mongolian steppes rumen degradation sheep
【英文关键词】forage availability Inner Mongolian steppes rumen degradation sheep
【中文摘要】The objectives of this experiment were: (i) to investigate the effects of maturing stages and grassland degradationon the chemical composition of forages, and their rumen degradability of organic matter (OM), CP, NDF, non-fiber carbohydrates (NFC), and carbohydrates (CHO) using nylon bags incubated in sheep rumen; and (ii) to evaluate the forage availability for the undegraded and degraded grasslands in the Inner Mongolian steppes, China, based on effective degraded nutrients.
【英文摘要】In China and throughout the world, evaluation of the nutrient values of forages has always lagged behind research regarding the nutrient requirements of animals. In this study, the effective degradability and availability of forages wereevaluated on undegraded and degraded grassland using a technique where nylon bags were incubated in sheep rumen.We found that the concentrations of organic matter (OM), neutral detergent fiber (NDF), non-fiber carbohydrates (NFC) and carbohydrates (CHO) of forage were higher ($P < 0.05$) and the crude protein (CP) concentration was lower ($P < 0.05$)in the degraded grassland than in the undegraded grassland. The effective degradability (ED) of NFC (EDNFC) was higher ($P < 0.05$) and EDCHO and EDNDF were lower in the undegraded grassland than in the degraded grassland. The EDOM and EDCP were not affected by the type of grassland, which may explain why ED is an inadequate parameter for the evaluation of forage availability. According to an analysis of the ratio of effectively degraded N to OM and NFC, plants of the undegraded grassland can provide more digestive nutrients to meet the requirements of grazing animals compared to plants of the degraded grassland. Results suggested that it is inadequate to consider only chemical composition and effective degradability when evaluating forage availability with grassland degradation. The ratio of effectively degraded N to OM and NFC was an appropriate indicator.

【题目】Impact of Stocking Rate and Rainfall on Sheep Performance in a Desert Steppe
【中文关键词】live weight gain optimal stocking rate grazing management sheep Stipa breviflora Griseb. Inner Mongolia
【英文关键词】live weight gain optimal stocking rate grazing management sheep Stipa breviflora Griseb. Inner Mongolia
【中文摘要】本文章主要研究了内蒙古荒漠草原不同载畜率对放牧家畜生产性能的影响,并基于家畜的体重变化,提出了荒漠草原适宜的载畜率,为内蒙古荒漠草原草地管理提供了一定的理论参考。
【英文摘要】Livestock performance is a critical indicator of grassland production systems, and is influenced strongly by precipitation and stocking rates. However, these relationships require further investigation in the arid Desert Steppe region of northeastern China. We employed a randomized complete block design with three replications and four grazing treatments (non-grazed exclosure

[Control]), lightly grazed [LG], moderately grazed [MG] and heavily grazed [HG]) by sheep in a continuously grazed system (June to November), to test the effect of stocking rate on sheep performance. The planned stocking rates were 0, 0.15, 0.30 and 0.45 sheep · ha-1 · mo-1, for the control, LG, MG and HG treatments, respectively. However, actual stocking rates were calculated for each paddock in each year based on a 50 kg sheep equivalent (SE). Annual net primary production (ANPP) was determined at peak standing crop in August, 2004 to 2008. Live weight gain was determined for the summer and fall periods, as well as the total grazing period, in each year. ANPP decreased with increasing stocking rate and daily live weight gain per head decreased linearly with increasing stocking rates over the total grazing period but in a quadratic manner over the summer period with a plateau at the lower rates. Maximum sheep production per unit area over the total grazing season occurred at about 2 SE ha-1 for about a 5 month grazing period but individual gains per sheep were predicted to decline after about 1 SE ha-1 presumably because of forage limitations. However, in order to achieve stable annual production, we recommend that the Desert Steppe be grazed at about 0.77 SE ha-1 for a 5-month period (0.15 SE ha-1 mo-1). This estimate is based on published grazing strategies that consider an average ANPP with a recommended utilization rate of 30%.

【题目】Influence of increasing temperature and nitrogen input on greenhouse gas emissions from a desert steppe soil in Inner Mongolia
【中文关键词】Desert steppe Increasing temperature Methane N fertilizer application Nitrous oxide
【英文关键词】Desert steppe Increasing temperature Methane N fertilizer application Nitrous oxide
【中文摘要】本文章主要对内蒙古荒漠草原在增温和施氮条件下,温室气体排放的变化规律和趋势,对荒漠草原温室气体的研究具有一定的理论意义。
【英文摘要】We investigated the effect of increasing soil temperature and nitrogen on greenhouse gas (GHG: CO2, CH4 and N2O) emissions from a desert steppe soil in Inner Mongolia, China. Two temperature levels (heating vs. no heating) and two N fertilizer application levels (0 and 100 kg N ha-1 yr-1) were examined in a complete randomized design with 6 replications. The GHG surface fluxes and their concentrations in soil (0 to 50 cm) were collected bi-weekly from June 2006 to November 2007. CO2 and N2O emissions were not affected by heating or N treatment, but compared with other seasons, CO2 was higher in summer (average of 29.6 vs 8.6 mg C m-2 hr-1 over all other seasons) and N2O was lower in winter (average of 2.6 vs 4.0 mg N m-2 hr-1 over all other seasons). Desert steppe soil is a CH4 sink with the highest rate of consumption occurring in summer. Heating decreased CH4 consumption only in the summer. Increasing surface soil temperature by 1.3 ° C or applying 100 kg ha-1 yr-1 N fertilizer had no effect on the overall GHG emissions. Seasonal variability in GHG emission reflected changes in temperature and soil moisture content. At a average CH4 consumption rate of 31.65 μg C m-2 hr-1, the 30.73 million ha of desert steppe soil in Inner Mongolia can consume (sequestrate) about 85 *106 kg CH4-C, an offset equivalent to 711 *106 kg CO2-C emissions annually. Thus, desert steppe soil should be considered an important CH4 sink and its potential in reducing GHG emission and mitigating climate change warrants further investigation.

【题目】Grazer exclusion increases carbon storage in the world ’ s largest grassland (Inner Mongolia, China.

【中文关键词】grazing exclusion vegetation soil properties soil microbial biomass soil organic carbon soil inorganic carbon
【英文关键词】grazing exclusion vegetation soil properties soil microbial biomass soil organic carbon soil inorganic carbon
【中文摘要】This study used the establishment of the 5400km2 Helan Mountain Reserve as an opportunity to study the consequences of grazer exclusion on SOC and SIC pools within the plant soil system and to relate differences insoil C to changes in vegetation and soil properties.
【英文摘要】The Alxa desert steppe has been strongly degraded by overgrazing, contributing c. 22% of the total springtime dust originating from Asia. Previous work in this region has focused on the impacts of grazer exclusion on restoration of vegetation and soil fertility, yet carbon dynamics are not well known. The effects of 7 years of grazer exclusion on carbon dynamics were studied and related to changes in vegetation and soil properties. Removal of grazing resulted in a significantly greater plant cover and aboveground plant biomass compared with areas that had been subject to grazing, but this had no effects on belowground plant biomass. Removal of grazing resulted in significantly decreased soil bulk density in the 0_10 cm layer, increased soil water content (7% cf. 40%) and greater soil microbial biomass C (6% cf. 73%) compared with soils in the grazed area. Soil organic carbon (SOC) pools were lower and soil inorganic carbon (SIC) pools were higher in areas that were excluded from grazing. After 7 years of grazer exclusion, the total C pool in the plant_soil system was 10% greater (primarily due to 21% greater in SIC) than that in the area that had been grazed over that time period.

【题目】Can plant litter affect net primary production of a typical steppe in Inner Mongolia?
【中文关键词】Growing degree-days Leymus chinensis Litter addition Litter removal Soil moisture Stipa grandis
【英文关键词】Growing degree-days Leymus chinensis Litter addition Litter removal Soil moisture Stipa grandis
【中文摘要】本文章主要通过对比研究,得出添加和移除凋落物对内蒙古典型草原净初级生产力以及土壤水分和温度的影响,以期为草地的合理利用和可持续管理提供基础数据。
【英文摘要】Question: Litter (dead leaves or stems) affects production by conserving soil moisture. However, that role is not clear for grasslands where most precipitation falls during the growing season when the demand for water is high. Our question was: Does litter affect forage production in such an environment? Location: Typical steppe, Inner Mongolia. Methods: We examined the role of plant litter in two experiments where litter was either removed or added in a protected or heavily grazed site, respectively, in autumn and in spring in a split plot design. The treatments (control, moderate and heavy litter application) were applied once in five replications but repeated at new locations in each of 3 years. This was done to examine only the direct effect of litter on annual net primary production and selected plant characteristics and not potential secondary effects. We also measured soil moisture and soil temperature. Results: Removing litter caused a reduction in the amount of grass (Leymus chinensis) that was produced, but litter addition caused an inconsistent effect among years, with moderate applications producing the most positive effects. Litter removal resulted in shorter and less dense plants of L. chinensis and Carex duriuscula, while heavy litter addition in autumn reduced plant height of both Cleistogenes squarrosa and C. duriuscula. Conclusions: Litter was effective for enhancing soil moisture status and reducing soil heat units in the typical steppe of Inner Mongolia. Therefore, litter mass may serve as an index of grassland health in such environments.

【题目】Partitioning soil respiration and assessing the carbon balance in a Setaria italica (L.) Beauv. cropland on the Loess Plateau, Northern China

【中文关键词】Soil respiration Microbial respiration Root respiration Carbon balance Cropland Loess Plateau

【英文关键词】Soil respiration Microbial respiration Root respiration Carbon balance Cropland Loess Plateau

【中文摘要】A study was conducted in a Setaria italica (L.) Beauv. cropland on the Loess Plateau in order to partition total soil respiration (Rt) into microbial respiration (Rm) and root respiration (Rr) and to determine the carbon balance of the cropland ecosystem. This study aimed to (1) quantify the contribution of root respiration to total soil respiration (Rr/Rt ratios) during the different phenological stages, and for the whole growing season with trenching method; (2) describe the diurnal and seasonal variation in total soil respiration, microbial respiration, root respiration and Rr/Rt ratio; (3) analyze the main factors influencing each component of soil respiration; (4) calculate the C balance in the cropland system.

【英文摘要】A study was conducted in a Setaria italica (L.) Beauv. cropland on the Loess Plateau in order to partition total soil respiration (Rt) into microbial respiration (Rm) and root respiration (Rr) and to determine the carbon balance of the cropland ecosystem. A trenching method with micro-pore mesh was used to create root-free soil cores. Differences between mesh and non-mesh treatments were used to determine root respiration. Similar pattern was found in the diurnal variation of Rt and Rm with the minimum values at 3:00e6:00 h and the maximum at 13:00e15:00 h. The diurnal pattern of Rr was ompletely different, the minimum values appeared at 11:00e13:00 h and the maximum at 0:00e3:00 h. Soil temperature exerted predominant control over the diurnal variations of Rt and Rm. The daily mean values of Rt, Rm and Rr were close to the measurements taken at 9:00 h. On the seasonal scale, Rm was strongly dependent on soil temperature, with higher correlation with 2-cm-depth temperature (r2=0.79, P < 0.001) than with 5-cm-depth temperature. When the effects of both soil temperature and moisture were considered, a linear model provided more accurate prediction of Rm (r2 = 0.83, P < 0.0001). Root respiration (Rr) exhibited pronounced daily variation corresponding to changes in photosynthesis and seasonal variation related to crop phonological development. The seasonal variation in Rr was strongly correlated with leaf area index (LAI) (r2 ? 0.85, P < 0.05), and also positively, but marginally correlated with root biomass (RB, P = 0.073). Contribution of root respiration to total soil respiration (Rr/Rt ratio) showed pronounced diurnal and seasonal variations. The daily mean values of Rr/Rt ratios were close to the values obtained at 9:00 h. In different phenological stages, Rr/Rt ratios ranged from 22.3% to 86.6%; over the entire growing season, the mean Rr/Rt ratio was 67.3%. Total annual loss of C due to Rm in 2007 was estimated to be 121.3 g C m_2 at the study site, while the annual NPP (net primary production) was 262.1 g C m-2. The cropland system thus showed net carbon input of 140.8 g C m-2.

【题目】氮素添加对黄土高原典型草原长芒草氮磷重吸收效率及C:N:P化学计量特征的影响

【中文关键词】生态化学计量学, 黄土高原, 氮素添加,养分限制, 养分重吸收率

【英文关键词】ecological stoichiometry Loess Plateau nitrogen addition nutrient limitation nutrient resorption efficiency

【中文摘要】为了解氮素沉降对草地群落的影响, 通过人工氮肥添加模拟试验, 研究了黄土高原天然草地优势植物长芒草(Stipa bungeana)在不同施氮水平下叶片和立枯物碳(C)、氮(N)、磷(P)元素含量的变化特征, 探讨了N素增加对N、P重吸收率和C : N :P化学计量比的影响及其内在联系。进一步探讨土壤N、P养分格局对植物生长的相对限制性作用, 为科学管理草地提供依据。

【英文摘要】Aims Our purpose was to study the effects of deposition of nitrogen (N) on plant carbon (C), N, phosphorus (P), N and P nutrient resorption efficiencies, C : N : P stoichiometry and their internal relations on Stipa bungeana of Loess Plateau natural grassland. Methods Deposition of N was simulated by N fertilization at four levels. Changes of C, N and P contents were detected, and C : N : P and the N and P nutrient resorption efficiencies were estimated for S. bungeana. Important findings The C and N contents of leaves and N and P contents of standing litter increased significantly with N addition. However, the P content of leaves and C content of standing litter did not response to N addition. The N and P resorption efficiencies of S. bungeana decreased significantly with N

addition. When there was no N addition, N and P resorption efficiencies were highest (60.35% and 71.75%, respectively). Meanwhile, the P resorption efficiency was greater than that of N in same treatment. The C : N of S. bungeana decreased gradually with N addition, but the N : P and C : P increased with N addition. Values of the N : P were 18.25 – 29.01. The results showed the Loess Plateau natural grassland was mainly limited by P, and the strength of P limitation was enhanced with N deposition. Higher N and P resorption efficiencies were an important strategy for S. bungeana to survive soil infertility.

【题目】长芒草不同季节碳氮磷生态化学计量特征
【中文关键词】养分含量,生育阶段,生长速率,生态化学计量特征,内稳性
【英文关键词】nutrient dynamics growth phase specific growth rate stoichiometry homeostasis
【中文摘要】本文为探讨高等植物不同发育阶段碳(C) 、氮(N) 、磷(P) 元素含量及其计量比的内稳性特征以及与生长速率的关系, 研究了黄土高原天然草地建群种植物长芒草(S tip a bungeana) 地上组织C、N、P含量季节动态及其化学计量比的变化, 探讨家畜采食对植物体内元素内稳性的影响。
【英文摘要】Less is known about whether the Homeostasis Theory and Growth Rate Hypothesis work in higher plants. Our objective was to study the seasonal dynamics of carbon (C) 、 nitrogen (N) and phosphorus (P) content s and test the Growth Rate Hypothesis in wild higher plant s. Additionally, w e tried to explore the influence of grazing on plants homeostasis traits. T his study w as conducted at Semi Arid Climate and Environment Obwervatory of Lanzhou University in Loess Plateau (35 ° 57' N, 104 ° 09' E). We collected the above ground biomass o f Stip abungeana in the grazed and ex closure treatments in different seasons and quantified the C, N and P content s in the leaf t issue. The specific growth rates of plant S. bungeana were calculated and seasonal dynamics of C: N, C:P and N :P ratios were described. In the ex closure (1) the aboveground biomass of S. bungeana accumulated graduall, and the maximum specific growth rate occurred during the period from March to May. Meanwhile, during this period, plant grew with higher C : N, C :P, N : P ratios. Combined, these results did not support the Growth Rate Hypothesis; (2) the C content in S. bungeana increased significantly from March to May, but there were no differences among the C contents from May to September. The maximum values of N and P contents occurred in March, but the N and P contents decreased gradually from May to September. From March to September, the C :N and C : P ratios increased gradually , but N:P ratio increased firstly and then decreased. Finally, there w ere small variations in C content and N : P ratios (3. 65% and 6. 60% , respectively) during these four seasons, which showed strong homeostasis in both above parameters. However, there w ere huge variations in N、 P content s and C: N、 C :P ratios, and all of these values w ere bigger than 30% . In the grazed treatment (1) the dynamics of C and N content s in S . bungeana were similar to those in the ex closure, but the P content in September w as bigger than that in July. Additionally, grazing resulted in higher N and P content s compared to those in the ex closure, and lower C :N and C :P ratios in the grazed site. While, N :P ratios were bigger in grazed site than those in the excosure in both May and July. (2) there were also small variations in C content and N P ratios during these four seasons in the grazed treatment, but the variation of N :P ratios (21. 30%) is markedly bigger than that in the ex closure (6. 60%) .

【题目】放牧强度对内蒙古大针茅典型草原地下生物量及其垂直分布的影响
【中文关键词】放牧强度,地下生物量,垂直分布
【英文关键词】Grazing intensity underground biomass vertical distribution
【中文摘要】本文以内蒙古大针茅典型草原为研究对象,通过测定不同放牧强度下土壤各个层次中的地下生物量,探讨随放牧强度增加植物地下生物量及其垂直分布的变化情况,目的是研究植物地下生物量对放牧强度的响应,为草地合理管理提供基础数据。
【英文摘要】This paper takes Typical Stipa Grandis Steppe as research object,based on the change of the underground biomass in different grazing intensities of all soil layers,we discussed the underground biomass and its vertical distribution change with increasing grazing intensities ,in order to analyze the response of vegetation underground biomass to grazing intensities,and provide basic data for rational utilization of grassland. The results showed that,with increasing grazing intensity total underground biomass reduced in 0 - 100cm soil layer . By analyzing the vegetation underground biomass layer - by - layer ,we found underground biomass of surface layer increased in light grazing,while it decreased in moderate and heavy grazing. With increasing depth vegetation underground biomass reduced in all grazing intensities,however the reduced range gradually decreased . Grazing will influence vertical distribution of vegetation underground biomass,and increase inhomogeneity of vertical distribution of underground biomass,meanwhile the phenomenon of underground biomass tends to surface becomes more obvious.

【题目】载畜率对荒漠草原植物群落影响的研究
【中文关键词】荒漠草原,载畜率,多样性指数,重要值
【英文关键词】Desert steppe Stocking rate Diversity index Importance value
【中文摘要】本文对不同载畜率下短花针茅荒漠草原植物群落特征进行了比较,对比了不同载畜率下不同植物种的变化特征,并通过计算不同物种的重要值及群落的多样性指数,揭示了载畜率对内蒙古荒漠草原植被生态系统的综合影响。为草原生物多样性保护和草原生物资源的可持续利用提供依据。
【英文摘要】Through the research on the compare of the characteristics of plant community under different stocking rates on Stipa breviflora in desert steppe, the results showed that the coverage of different plant populations had the different response to the different stocking rates, the coverage of Cleistogenes songorica under light g razing w as the highest, and the highest coverages of Neopallasia pectinata in July and August were found in medium grazing areas and light g razing areas. The height of Stipa breviflora, Artemisia frigida, Convolvulus ammannii, Allium tenuissimum, Kochia prostrate decreased significantly as the stocking rate increasing. While there is no significant difference in height of Salsola collina under these four stocking rates. With the increasing stocking rate, the aboveground biomass of the plant community decreased, and it had a significant difference among different stocking rates. The status of community constructive species and dominant species were not significant different on different stocking rate. However, the importance value o f annual Salsola collina enhanced and reached the maximum under heavy grazing; Shannon- wiener index, Simpson index and Pielou evenness index reached the maximum under light grazing, the value of Shannon - wiener index and Simpson index showed that light grazing> moderate grazing> heavy g razing> no g razing, and there w ere significant differences between no grazing and light grazing.

【题目】放牧与围封对黄土高原典型草原植物生物量及其碳氮磷贮量的影响
【中文关键词】典型草原,放牧,植物生物量,碳,氮,磷
【英文关键词】typical steppe grazing plant biomass C N P
【中文摘要】本文将黄土高原典型草原植物亚生态系分为地上活体、立枯物、凋落物和地下根系4 个部分,进行放牧与围封草地植物生物量及其碳、氮、磷贮量的研究。结果表明,放牧与围封草地各组分碳、氮、磷贮量的季节动态模式与其对应生物量变化规律一致。放牧草地主要通过地上幼嫩器官生物量和氮、磷含量的增加来获得较大氮磷贮量,并以此提高草地利用率。
【英文摘要】The plant subsystem in typical steppe grassland of the Loess Plateau was divided into four components: live shoots, standing dead matter, litter, and underground roots. The plant biomass of these four components and t heir C, N, and P contents were studied in grazed (GG) and fenced (FG) grasslands. The seasonal dynamics of each component biomass was correlated with t heir C , N and P content s both in grazed and fenced grasslands. There were significant positive correlations between plant biomass and C, N , and P content s , with correlation coefficient s of 0.990, 0.899, 0.936(FG) and 0.990, 0. 891, 0.936 (GG), respectively. The differences in C, N, and P content s of each plant component were caused by t he difference in plant biomass. The total biomass , aboveground and underground biomass , standing dead matter and litter , and t heir C , N , and P content s were significantly (P < 0. 05) higher in fenced grassland than t hose in grazed grassland. The N and P content s in live shoot s were highest in July, and significantly (P < 0. 05) lower in fenced (1. 291 8 and 0. 083 7 g/ m2 for N and P respectively) than in grazed (1. 529 7 and 0. 100 2 g/ m2 for N and P respectively) grassland. The result s indicate t hat t he higher plant N , P storages in grazed grassland were mainly attributed to the in2 creases of young organ biomass and t heir N , P contents , which further improve t he utilization of grassland.

【题目】虾夷扇贝养殖群体数量性状遗传研究
【中文关键词】虾夷扇贝; 养殖群体; 家系; 数量性状; 遗传参数; 遗传力; 选择反应; 遗传获得; 自体受精; 近交衰退; 杂种优势;
【英文关键词】Japanese scallop; Patinopecten yessoensis Jay; Cultured Populations; Families; Quantitative traits; Genetic parameters; Heretability; Response to selection; Genetic gain; Self-fertilization; Inbreeding depression; Heterosis;
【中文摘要】本论文以虾夷扇贝养殖群体为对象,在评估其形态指标遗传参数的基础上,通过建立各种家系和群体,研究了生长、存活等生产性状的遗传力、选择反应、遗传获得、近交衰退、杂种优势,主要结果如下:1、养殖群体形态指标遗传参数的评估:采用相关分析研究了壳高、壳长、壳宽、闭壳肌重和全湿重等表型性状之间的相关性,发现各表型性状间均存在显著的相关,其中壳高与全湿重之间的相关系数最大;采用通径分析方法计算表型性状为自变量对全湿重为依变量的通经系数,结果表明:全湿重受壳高的直接影响为最大,闭壳肌重受壳宽的直接影响最大。此外,采用回归分析建立了全湿重/闭壳肌重与壳长、壳高、壳宽之间的方程。2、大群选择及遗传获得:利用截头选择法对养殖群体的壳高进行了双向选择。从第10天开始,显著性的差异始终存在于选择组与对照组间,壳高大小依次为上选组>对照组>下选组。一代选择后,上选

组和下选组的选择反应分别是0.473和0.380,现实遗传力分别是0.269和0.217,遗传获得分别为7.85%和6.60%。这些结果表明对于虾夷扇贝养殖群体生长进行群体选择是有效的。3、群体遗传力的估算:采用平衡巢式设计通过建立8个半同胞家系和32个全同胞家系,估算了虾夷扇贝养殖群体的狭义遗传力。1日龄幼虫壳长、壳高的遗传力为0.521±0.104和0.307±0.097,10日龄幼虫壳长、壳高的遗传力为0.307±0.074和0.311±0.075;20日龄幼虫壳长、壳高的遗传力为0.336±0.079和0.314±0.075;40日龄稚贝壳长、壳高的遗传力为0.318±0.081和0.280±0.075;60日龄稚贝壳长、壳高的遗传力为0.383±0.091和0.423±0.097;500日龄成贝的壳长、壳高、壳宽、全湿重的遗传力分别为0.375±0.096、0.358±0.094、0.513±0.116、0.420±0.103。4、自交与近交衰退的研究:利用虾夷扇贝养殖群体中的雌雄同体个体建立了10个自交系,并利用群体中的雌雄异体个体建立了1个混交对照系研究了虾夷扇贝雌雄同体的自交建系与近交衰退。结果表明,雌雄同体的虾夷扇贝能够自体受精,并可培育到养成期,但自交导致生产性状显著的近交衰退。壳长与壳高的近交衰退率在幼虫期、稚贝期、幼贝养成期中分别为7.73%、13.72%、15.14%和8.03%、13.90%、15.96%,存活的近交衰退率在幼虫期和养成期分别为35.52%和52.58%。5、群体间杂交及杂种优势的研究:对来自中国长海的亲本群体(C)和日本仙台的亲本群体(J)进行了完全双列杂交,研究了虾夷扇贝远不同养殖群体间的杂交。结果表明,虾夷扇贝不同养殖群体之间不但能够杂交,而且在受精、孵化、生长、存活等方面均能够产生明显的杂种优势。受精率和孵化率的杂种优势率分别为2.27%和5.35%;在各生长期,组合CJ壳长、壳高的杂种优势率分别为0.82%~13.33%、1.32%~14.28%,组合JC壳长、壳高的杂种优势率分别为1.72%~2.94%、2.35%~4.28%;稚贝期、养成期群体间杂交的中亲杂种优势居于群体C的单亲杂种优势和群体J的单亲杂种优势之间。

【英文摘要】Based on the estimation of genetic parameters in morphological traits, heritability,responses to selection, genetic gain, inbreeding depression, and heterosis for quantitative traits in growth and survival on the Japanese scallop Patinopecten yessoensis Jay were studied by establishing various cultured populations and families in this study. The main results were as the following:1. Estimation of genetic parameters in morphological traitsRelativity among shell length, shell width, shell height, adductor muscle weight and total weight was analysed and significant correlation was found among the five traits. Correlation coefficient between shell height and total weight is of the highest value. Meanwhile, path coefficients between dependent variable for total weight and adductor muscle weight and independent variable for the other traits were calculated by method of path analysis. Total weight was directly affected by shell height, whereas adductor muscle weight was directly affected by shell width. Moreover, the regression equations are calculated to estimate total weight and adductor muscle weight.2. Mass selection and genetic gainDivergent selection for growth in shell height was conducted in a cultured population. From 15 to 400 days, differences in shell length among the selected groups and control group were always significant and in the order of Up > Control > Down, indicating that divergent selection for growth is effective. Standardized response to selection (SR) and realized heritability (hR2) (0.473 and 0.269, respectively) for the upward selection line were significantly higher than that for downward selection (0.380 and 0.217, respectively), providing evidence for asymmetric response in two directions. Selection resulted in significant differences between the lines. It is a very promising that performance in shell height is improved by 7.85% in the Fast selection direction after one generation selection, suggesting that mass selection for faster growth in a cultured population of the Japanese scallop is effective.3. Estimation of heritability for a cultured populationEight half-sib families and thirty two full-sib families were obtained by a nested design of each male mated with four females. Heritability for shell length and shell height is 0.521±0.104 and 0.307±0.097 on day1, 0.307±0.074 and 0.311±0.075 on day 10, 0.336±0.079 and 0.314±0.075 on day 20, and 0.318±0.081 and 0.280±0.075 on day 40, 0.383±0.091 and 0.423±0.097 on day 60, respectively. Heritability for production traits including shell length, shell height, shell width, and total weight at harvest on day 500 is 0.375±0.096, 0.358±0.094, 0.513±0.116, 0.420±0.103, respectively.4. Self-fertilization and inbreeding depressionTen selfing families were established by self-fertilization using hermaphrodites and one mass-spawning family was established by crossing among ten dioecious individuals in order to study inbreeding depression. The results showed that self-fertilization was able to conduct in hermaphroditic Japanese scallop and selfing families were able to be reared to adult stage However, self-fertilization can cause inbreeding depression. The magnitude of inbreeding depression for shell length and shell height at larvae, spat and adult stage is 7.73%, 13.72%, 15.14% and 8.03%,13.90%,15.96%, respectively, which for survival at larvae and adult stage is 35.52% and 52.58%, respectively.5. Crosses between cultured populations and heterosisCrosses between different cultured populations were studied by a full diallel design with parents from two populations (Changhai in China and Xiantai in Japan) and four genetic groups (CC, CJ, JC and JJ) were produced. Crosses were not only conducted between different cultured populations but also can cause obvious heterosis for fertilization rate, hatching rate, survial rate and growth. The heterosis for fertilization rate and hatching rate was 2.27% and 5.35%, respectively. At different ages, the heterosis for growth (shell length, shell height) of CJ ranged from 0.82% to 13.33% and 1.32% to 14.28%, JC ranged from 1.72% to 2.94% and 2.35% to 4.28%. For crosses between two stocks C and J, mid-parent heterosis was smaller than single-parent heterosis of Stock C, but bigger than single-parent heterosis of Stock J

【题目】海湾扇贝微卫星标记的开发及遗传连锁图谱的构建
【中文关键词】海湾扇贝; 微卫星; 富集文库; 遗传多样性; 种群分化; 遗传连锁图谱; QTL;
【英文关键词】Bay scallop; Argopecten irradian; Microsatellite; Enrichment library; Genetic diversity; Linkage maps; QTLs;
【中文摘要】海湾扇贝(Argopecten irradians)不连续分布于美国大西洋沿岸和墨西哥湾沿岸,自1982年以来北部亚种(A. i. irradians)和南部亚种(A. i. concentricus)被先后引进到中国,由于其生长速度快、繁殖周期短和适宜温度范围广的特点,迅速成为我国海水养殖的重要品种。近年来飞速发展的分子标记技术为优良品种的选育注入了新的活力,相对于传统的表型选择来说,标记辅助选择不易受环境的影响,尤其是对于低遗传力性状和后期表达的性状,能增强选择效率,提高选择的准确度,缩短育种周期。本文通过构建海湾扇贝微卫星富集文库获得大量的微卫星DNA序列,筛选多态的微卫星标记构建了海湾扇贝的遗传连锁图谱,并应用复合区间作图法对生长相关性状进行了QTL定位。本研究利用富集文库-菌落原位杂交法筛选海湾扇贝微卫星DNA,吸附(AC)15和(AG)15探针的尼龙膜捕捉并富集含有微卫星序列的片段,菌落原位杂交结果显示阳性克隆率达到40%,测序比对后获得521个独立的阳性克隆,其中微卫星506个,小卫星15个。微卫星中,完美型248个,占49.0%,非完美型216个,占42.7%;复合型42个,占8.3%;AG/TC重复占大多数(356个,70.4%),AC/TG重复有150个(29.6%)。设计合成了382对引物,利用38个海湾扇贝个体对其中15个微卫星位点进行了遗传多样性评价,不同位点扩增得到的等位基因数从3到7个不等,期望杂合度和观测杂合度的范围分别为0.198~0.813和0.083~0.833,实验结果表明富集文库-菌落原位杂交法适合大规模筛选微卫星标记。利用8个微卫星标记对海湾扇贝1个野生种群和3个养殖群体的遗传多样性与分化进行了比较和分析。8个位点共扩增得到35个等位基因,平均每个位点4.38个等位基因,平均有效等位基因数为2.30,平均观测杂合度和期望杂合度分别为0.41和0.46。相比于野生群体(美国),养殖群体(北卡罗来那、浙江和胶南)的等位基因数和杂合度都有所降低,在封闭环境下养殖19代的浙江群体等位基因数丢失最严重,共有9个等位基因丢失(25.7%)。经过多代人工养殖后,海湾扇贝养殖与野生群体之间和养殖群体之间出现了明显的遗传分化,胶南群体与野生群体的遗传距离最大,而胶南群体与浙江群体的遗传距离已经超过了胶南群体(北部亚种)和北卡罗来那(南部亚种)群体的遗传距离,这种分化将有利于海湾扇贝的杂交选育。利用167个微卫星标记和1个壳色标记,以海湾扇贝2个全同胞F1代为作图群体,构建了海湾扇贝的性别遗传连锁图谱。整合的雌性连锁图谱含有118个标记,覆盖了16个连锁群,每个连锁群含有的标记数目从4到16个不等,平均每个连锁群上有7.4个标记,图谱总长度为761.0 cM,标记间的平均间隔为8.55 cM,图谱的覆盖率为73.5%;整合雄性连锁图谱含有126个标记,覆盖了17个连锁群,每个连锁群含有的标记数目从2到11个不等,平均每个连锁群上有7.4个标记,图谱总长度为729.1 cM,标记间的平均间隔为6.75 cM,图谱的覆盖率为74.7%。雌性亲本的重组率高于雄性,雌雄亲本共享标记间的重组率比值为1.18:1。偏分离标记在性别间呈现不对称分布,雄性亲本的偏分离高于雌性亲本,可能与雄性亲本来源于亚种间杂交的遗传背景相关。利用海湾扇贝微卫星遗传连锁图谱在两个作图家系中对5个生长性状的QTL进行了定位,5个生长性状的表型相关均达到极显著水平(P < 0.01),Pearson相关系数均超过0.781,总重、壳长、壳宽、壳高和壳重的QTL(LOD > 2.0)的数目分别为8、6、6、7和6个。这些QTL成簇分布于CC5家系的LG1、LG3、LG4、LG8和CC10家系的LG1、LG3、LG6、LG8、LG9连锁群,单个QTL可解释的表型方差为5.5%到29.2%,QTL成簇分布现象说明这些生长相关的性状可能具有共同的遗传基础,家系特异性QTL暗示在不同的遗传背景和环境下存在不同的主效QTL。本研究定位的QTL,尤其在两个家系中共享的QTL为下一步分子标记辅助选择提供了参考区间。
【英文摘要】The molecular genetic linkage map of bay scallop is essential for the identification and localization of quantitative trait loci (QTL) as well as for the maker-assisted selection program, which is great useful in enhancing breeding efficiency in this aquaculture important species. The purpose of this study includes four aspects. The first is to isolate lots of microsatellite DNA sequences by microsatellite-enrichment libraries. Second is to investigate the level of genetic differentiation between one wild population and three hatchery stocks of bay scallop. Third is to construct the genetic linkage map for bay scallop based on microsatellite DNA markers. The last is to localize some growth related QTLs by composite interval mapping.Microsatellite-enriched libraries, which enriched for (AC)15 and (AG)15 were constructed using the protocol of nylon membrane hybridization and colony hybridization. More than 1000 positive clones were sequenced, of which 516 were independent containing microsatellites after sequence alignment. The microsatellite sequences were divided into four categories: perfect repeats (49.0%), imperfect repeats (42.7%), and compound repeats (8.3%). Primers were designed and synthesized using sequence information from 382 clones. The polymorphisms of 15 markers were assessed with 38 individuals, and the results showed the number of alleles ranged from 3 to 7. The values of He and Ho ranged from 0.198 to

0.813 and 0.083 to 0.833 respectively. The results indicated that the method of screening microsatellite-enriched library is efficient and suitable to isolate a large number of microsatellite markers, and the markers developed will contribute significantly for the population genetic and linkage mapping study of bay scallop.Eight simple sequence repeats (SSR) were employed to investigate the level of genetic variation within one wild population and three hatchery stocks of bay scallop, and compare the degree of genetic differentiation between them. High polymorphism at the microsatellite loci was found within both wild and hatchery scallops. Compared to wild population, all the hatchery stocks showed less genetic variation as revealed in lower number of alleles and lower observed heterozygosity. The ZJ population lost 9 of out of 35 allels (25.7%) after 19 generations of isolation and genetic drift. Significant differentiation was found between the hatchery stocks and wild populations, and between the hatchery stocks. This study indicated that genetic compostion of cultured bay scallop population in China have been significantly affected by hatchery performance.We constructed sex-specific linkage maps for bay scallop (Argopecten irradians) based on 167 microsatellite DNA markers and one morphological character marker (shell color). Linkage mapping was performed on two unrelated families, and a composite linkage map for each sex was constructed by combining linkage information from the two reference families. The composite female map contained 118 markers in 16 linkage groups, spanning 761.0 cM; the male parent map had 126 markers in 18 linkage groups, covering 729.1 cM with an average interval 6.75 cM. Analysis of markers informative in both parents showed a higher recombination rate in the female parent, with an average female-to-male recombination ratio of 1.18: 1 between adjacent paired markers. Segregation distortion was asymmetrical between the sexes (9% in the female and 19% in the male), which supported the hypothesis that distortion resulted from heterospecific interactions between genome of the two subspecies of A. irradians.The location and effects of QTLs were estimated for five growth related traits in bay scallop based on two reference families. In total, 33 putative QTL (LOD > 2.0) were detected and mapped on sex-specific maps, including 8 for total weight, 6 for shell length, 6 for shell width,7 for shell height and 6 for shell weight. These QTLs were on LG1, LG3, LG4 and LG8 in family CC5 and on LG1, LG3, LG6, LG8 and LG9 in family CC10, explaining 5.5% to 29.2% of the trait variation. The common QTLs shared between two families would be very useful for improving growth related traits though marker-assisted selection in the future.

【题目】基于微卫星和SNP标记的皱纹盘鲍遗传连锁图谱及其应用
【中文关键词】皱纹盘鲍(Haliotis discus hannai); SSR; SNP; EST; 富集文库; 遗传连锁图谱; QTL定位; 基因定位;
【英文关键词】Pacific abalone (Haliotis discus hannai); microsatellite; single nucleotide polymorphism; expressed sequence tag; enrichment library; genetic linkage map; QTL; gene location;
【中文摘要】本研究通过构建皱纹盘鲍微卫星富集文库、筛查EST文库获得301个微卫星(SSR)标记,利用含有37个个体的皱纹盘鲍野生群体对其多态性进行评价,其中245个位点多态,扩增得到的等位基因数目从2到18个不等,期望杂合度和观测杂合度的范围分别为0.053~0.873和0.054~1.000。实验验证了EST文库筛查法是简便、低耗的方法,但不适合大规模筛选目标物种的微卫星标记,而富集文库法则是规模化开发微卫星标记的首选方案。通过筛查皱纹盘鲍的EST序列、PCR直接测序并借助多特异性等位基因PCR(PMASA)方法开发了15个单核苷酸多态(SNP)标记,其中核基因组SNP14个。利用上述野生群体对其多态性的评价,结果表明:最小等位基因频率范围为0.1216~0.4865。14个核基因组SNP的观测杂合度和期望杂合度的范围分别为0.189~0.865和0.217~0.507。经Bonferroni校正后,只有位点HdS82偏离哈迪-温博格平衡(Hardy-Weinberg equilibrium,HWE)。本研究开发的这些多态的分子标记为皱纹盘鲍的种群遗传学、系谱分析、遗传图谱构建和分子标记辅助育种提供有力工具。利用342个SSR标记、11个SNP标记和一个壳色标记,以皱纹盘鲍2个作图家系成功构建了皱纹盘鲍遗传连锁图谱。经过Bonferroni校正之后,整合的皱纹盘鲍连锁图谱含有324个标记,覆盖了18个连锁群,每个连锁群含有的标记数目从6到29个不等,平均每个连锁群上有18.0个标记,图谱总长度为810.32 cM,标记间的平均间隔为2.65 cM,图谱的覆盖率为88.8%。壳色标记被定位到LG9。利用该图谱进行了生长相关性状的QTL定位。在整合图谱上共定位了11个关于壳长、壳宽、全湿重和软体部重相关的QTLs。其中检测得到的壳长、壳宽、全湿重和软体部重相关的QTLs的数目分别为3、2、2和4个。这些QTLs成簇的分布于2个连锁群上,单个QTL可以解释表型方差范围为13.4%~29.1%。对该图谱上所有标记的原始序列进行分析,皱纹盘鲍14个的功能基因被定位在图谱上。这些生长相关性状的QTL及功能基因的定位为我们从事分子标记辅助育种和功能基因的图位克隆提供了参考区间。

【英文摘要】A total of 301 novel microsatellite markers (SSR) of the Pacific abalone were developed by microsatellite-enriched libraries and Expressed Sequence Tag (EST) database mining. The polymorphisms of 245 markers were characterized by genotyping a wild population comprising 37 unrelated individuals. The result showed the number of allele ranged from two to 18, and the values of expected and observed heterozygosities ranged from 0.053 to 0.873 and from 0.054 to 1.000, respectively. EST database mining was proven to be efficient and low-costly approach to obtaining new microsatellite markers, and microsatellite enrichment libraries construction was efficient and suitable to develop a large number of microsatellite markers.Fifteen single nucleotide polymorphism (SNP) markers were developed by EST database mining and PCR direct sequencing. The PCR Primers were designed by the method of polymerase chain reaction amplification of multiple specific alleles (PMASA). The polymorphisms of 15 markers were assessed with 37 unrelated individuals and the result showed that the minor allele frequency ranged from 0.1216 to 0.4865. For the fourteen nuclear SNPs, the value of observed heterozygosity ranged from 0.189 to 0.865, while the expected heterozygosity ranged from 0.217 to 0.507. Only one locus (HdS82) deviated significantly from Hardy-Weinberg equilibrium after Bonferroni correction.These polymorphic markers presented in this study provide a useful tool for population genetics, pedigree analysis, linkage map construction and marker-assisted selection (MAS) of H. discus hannai.The genetic linkage map of H. discus hannai was constructed using 342 microsatellite markers, 11 SNP markers and one shell color marker. Linkage mapping was performed using two F1 outbred families, and the integrated linkage map was generated by incorporating map information from the two families. The integrated linkage map contained 324 markers covering 810.32 cM with an average spacing of 2.65 cM and 88.8% of genome coverage. The number of linkage groups in the integrated linkage map was 18, which was consistent with the haploid chromosome number of H. discus hannai. The shell color marker was located in LG 9. The detection and location of QTLs were performed based on the composite linkage map. Ten putative QTLs (LOD≥3.8) associated with the growth of Pacific abalone were detected and located in the composite linkage map, among which three QTLs for the shell length, two for the shell width, two for the gross weight and four for the flesh weight, respectively. They were scattered on LG5 and LG6, explaining 13.4% to 29.1% of the trait variation. A total of 14 functional genes were located in the composite linkage map through the molecular markers. The location of functional genes and QTLs associated with the growth would be very useful for molecular marker-assisted selection and map-based cloning of functional genes.

【题目】皱纹盘鲍和杂色鲍的线粒体编码区序列分析

【中文关键词】皱纹盘鲍; 杂色鲍; 线粒体基因组; 编码区序列; SNP;

【英文关键词】Haliotis discus hannai Ino; Haliotis diversicolor Reeve; mitochondrial genome; sequences of coding region; SNP;

【中文摘要】本研究以腹足纲(Gastropoda),前鳃亚纲(Prosobranch),原始腹足目(Archaeogastropoda),鲍科(Haliotidae),鲍属(Haliotis)的皱纹盘鲍(H. discus hannai Ino)和杂色鲍(H. diversicolor Reeve)为研究对象,旨在通过对其线粒体编码区序列以及种内可变位点分布的测定,从而深入了解皱纹盘鲍线粒体基因组编码区SNP位点的数量与分布,以及杂色鲍线粒体基因组编码区序列的特点。本研究的主要内容分为以下两部分:一、皱纹盘鲍线粒体编码区序列的单核苷酸多态性(SNP)研究采用DNA测序技术分析了取自中国和日本16个皱纹盘鲍个体的线粒体基因组编码区全序列,在总长度为15,914-15,916bp的序列中共检测到单核苷酸多态性(Single Nucleotide Polymorphism, SNP)位点370个,其中有26个SNP位点导致了线粒体基因组编码氨基酸残基的改变。由SNP位点在蛋白编码区的分布可知,编码NADH复合体和ATP合成酶的基因进化速度较快,而编码细胞色素C氧化酶复合体和细胞色素b酶原的基因则更保守。本实验共发现26个地理群体间特异的SNP位点,可能为鉴定皱纹盘鲍不同地理群体的分子标记开发提供启示。二、杂色鲍线粒体基因组编码区研究本研究测定了全长15863bp的杂色鲍的线粒体编码区序列,与其他后生动物相似,编码区含有13个蛋白编码基因、2个rRNA基因和21个tRNA基因。杂色鲍线粒体基因排布顺序独特,与多板纲石鳖十分相似,仅有4个tRNA易位和trnP反转的不同,但却与同为腹足纲原鳃亚纲的Apogastropoda有较大差别。根据杂色鲍与Genbank中公布的3种鲍的Ka/Ks值的比较可知,相对于cox1和cox2这些保守基因来说,基因nad2、nad4L、nad6和atp8有更小的负选择压力。本研究还测定了另外两枚杂色鲍个体的线粒体编码区序列,并进行了比对分析,在3个个体的线粒体序列中共找到可变位点114个,其中绝大多数可变位点都未造成序列所编码氨基酸的改变。本研究表明,线粒体基因组可作为种内不同地理群体鉴别的工具。

【英文摘要】H. discus hannai Ino and H. diversicolor Reeve belong to Gastropoda, Prosobranch, Archaeogastropoda, Haliotidae, Haliotis. Their coding regions of mitochondrial genome have been researched. We investigated the sequences and variable nucleotide sites of coding regions of mitochondrial genome in order to find out the distribution and quantity of SNPs in coding region of mitochondrial genome of H.discus hannai Ino, and to find out the features of coding region of mitochondrial genome of H. diversicolor Reeve.1. Research on single nucleotide polymorphism(SNP) distributing in coding region of mitochondrial genome of Pacific abalone Haliotis discus hannai InoSampling from China and Japan, sixteen individuals ’ coding region of mitochondrial genomes of Pacific abalone Haliotis discus hannai Ino were sequenced in this study.370 Single Nucleotide Polymorphisms(SNPs) were found out of these sequences from 15914bp to 15916bp in length. Twenty-five amino acid residues are replaced owing to Twenty-six SNPs. According to distribution of SNPs in protein-coding genes we elicit that genes coding for the NADH complex is fast evolving, whereas genes for cytochrome c oxidase complex and cytochrome b apoenzyme are more conserved. Twenty-five SNPs differential in populations were gained in this study, some of them may be developmental for research of Molecular Markers identifying different populations of Pacific abalone Haliotis discus hannai Ino.2. Research on coding region of mitochondrial genome of Haliotis diversicolor ReeveThe coding region of mitochondrial genomes of the small abalone Haliotis diversicolor Reeve,15863bp in length, was sequenced in this research. The sequence contains 13 protein-coding genes,2 ribosomal RNAs, and 21 transfer RNAs found in other metazoan mtDNA. The H. diversicolor mtDNA gene order is novel, separated from the black chiton Katharina tunicata by the individual translocations of 4 tRNAs and reversion of trnP. Moreover, H. diversicolor and many species of Apogastropoda, all of which belong to Orthogastropoda, put up with distinct feature in gene order. To detect the influence of selection pressure in Haliotis, the numbers of Ka and Ks were calculated and their ratios have been plotted for comparisons. It suggests a relaxation of purifying selection in the nad2, nad4L, nad6 and atp8 genes compared with the more conservative genes such as coxl, cox2 and cob.The coding regions of mitochondrial genome of two other individuals of H. diversicolor were also sequenced and compared in the study.114 variable nucleotide sites were found in mtDNA genome of the three individuals, and most of the variable sites don ’ t change the amino acid coded by mtDNA. The research suggests that mitochondrial genome can be used for identification of different populations in H. diversicolor.

【题目】皱纹盘鲍配套杂交体系的建立、评价及应用

【中文关键词】皱纹盘鲍; 选育系; 配套杂交; 群体遗传; SSR; Hsp70; Hp90;

【英文关键词】Pacific abalone; selective breeding; crossbreeding; population genetics; SSR; Hsp70; Hsp90;

【中文摘要】皱纹盘鲍是国内经济价值最高的贝类,自然分布于山东和辽东半岛,现在我国大部分沿海均有养殖。过去15年,中日地理群体杂交育种取得了巨大的成就,但随着野生资源的逐渐匮乏及种质控制机制欠缺,此育种模式需大幅改进。一如畜禽育种,培育特性明显、品质稳定的优良选育系,建立选系间配套杂交的育种模式是皱纹盘鲍育种的未来。无论南方还是北方沿海,夏季高温对皱纹盘鲍都是死亡胁迫,因此增强其高温耐受能力可有效提高产量。据此现实,本研究以高温度耐受能力强的“ S ”南方选系和低温耐受能力强、生长迅速的“ 97 ”和“ 98 ”北方选系为材料研究了不同选系间配套杂交对皱纹盘鲍温度耐受能力的影响。2008年建立了97×S、98×S两个双列杂交体系,建立了9797、97S、S97、SS、9898、98S、S98这7个后代群体。早期生长发育阶段,配套杂交系统的杂交群体的壳长增长速率相对于中日杂交鲍具有明显的优势。首个度夏阶段,配套杂交群体的高温期存活率比北方选系高33.9%,说明与“ S ”选系的杂交显著提高了北方选系的高温耐受能力。在首个越冬阶段,所有杂交组合的存活率都高于“ S ”选系,说明与北方群体的杂交也显著提高了南方选系的低温耐受能力。在进行生产评价的同时,我们在室内对11月龄和20月龄的配套杂交稚鲍的温度适应能力进行了评价。11月龄配套杂交稚鲍在适宜温度中没有高于纯繁群体的生长优势,但在高温和低温中杂交稚鲍则表现出了显著的生长优势。杂交组合(除了98S)出现的最大壳长增长率的温度为24 ° C,高于9797,9898两个纯繁北方组合出现最大壳长增长率的温度(22 ° C)。20月龄稚鲍的生长速率及存活率受温度及遗传背景的影响下降,纯繁群体及杂交群体的生长及存活率在所有培育水温下(8 ° C-30 ° C)都没有显著的差异(P > 0.05)。多代不同地区的选育对来自同一祖先群体的“ 97 ”和“ S ”选系的遗传结构影响显著,两选系已经产生了显著的差异。北方选系(“ 97 ”)与南方选系(S)的实际杂合度(Ho)均小于预期杂合度(He),两个群体的预期杂合度相同(0.64),但是观测杂合度相差较大,北方选系的杂合度要比南方选系的杂合度高30%。南方

选系的观测杂合度显著小于其预期杂合度,这种明显的杂合子缺失可能与南方选系经历的高水温选择压力有关。长期的温度适应对皱纹盘鲍热激蛋白(Hsp70、Hsp90)基因的表达规律有显著的影响。长期的低温培育会降低皱纹盘鲍对外界温度刺激的敏感性,长期较高水温培育则提升鲍个体应对升温刺激的敏感性。Hsp70和Hsp90应对瞬时和长期温度刺激时表现出差异的表达规律,Hsp70在应对瞬时刺激时反应迅速,但在长期培育中Hsp90的调节作用更加显著。皱纹盘鲍根据所处的水温环境改变了其热激蛋白基因的表达规律,这提示我们可以在基因表达方面进一步探讨冷水适应性皱纹盘鲍适应南方海域高水温的机制。

【英文摘要】Pacific abalone (Haliotis discus hannai Ino) is the most valuable mollusk of economic important in China. Its wild population distributed in Shandong and Liaodong peninsula while the abalone aquaculture spread along most part of the coastline of China. In the past 15 years, great achievement has been made by hybriding between Pacific abalone from Chinese and Japanese wild populations. Today, the Chinese wild Pacific abalones are using up and little attention is paid on abalone genetic seeding. Following the successful breeding program of agriculture, crossbreeding should be introduced to the breeding of elite abalone seeds which will be the future of abalone breeding system. Stressful high temperature in summer could cause heavy mortality both in Northern and Southern Chinese abalone aquaculture regions. We established the crossbreeding system by reciprocal hybriding between “ 97 ”, “ 98 ” strains with high growth rate and S strain with high temperature acclamation ability.The hybriding F1 of the crossbreeding system grow faster than the traditional hybriding F1 of Chinese and Japanese wild populations. Hybriding progenies acquired 33.9% higher survival rate than pure “ 97 ” and “ 98 ” strain during the oversummer while they have higher survival rate than pure S strain during the overwinter. Abalones gained extended range of acclimation temperature through crossbreeding. Hybriding juveniles of 11 month old had highest growth rate at 24 ° C which is 2 ° C higher than that of pure “ 97 ” and “ 98 ” strains. Hybriding abalones performed almost the same growth rate under normal temperature, but they showed better growth rate under extreme high and low temperature. There was no significant difference (P>0.05) on growth and survival between hybriding and pure bred abalones under all the experimental temperature (8-30 ° C).We detected genetic differentiation between Northern stain (“ 97 ”) and Southern strain (“ S ”) after four generations of diverging selective breeding under different temperature environments. The heterozygosity is lower in S strain than that in “ 97 ” strain which probably caused by the extreme high culture temperature stress for S strain.Chronic acclimation to different temperature changed the expression patter of Hsp70 and Hsp90 in Pacific abalone drastically. Abalones acclimated to low temperature response slowly compared to the fast response of high temperature acclimated ones. Hsp70 and Hsp90 play different roles in acute and chronic thermal incubation. Abalones could vary their expression pattern according to the environment which enlighted us to find out how could Pacific abalone managed to survive in Southern China.

【中文摘要】皱纹盘鲍(Haliotis discus hannai Ino)是名贵养殖贝类。皱纹盘鲍主要以藻类为食,幼体皱纹盘鲍主要摄食卵形藻(Cocconeis sp)、舟形藻(Navicula sp)、菱形藻(Nitzschia sp)等底栖硅藻、而成体皱纹盘鲍则主要摄食大型海藻,尤其喜食海带(Laminaria japonica)。多糖类物质是藻类的主要组分,比如硅藻含纤维素和淀粉,海带含纤维素、褐藻胶和海带淀粉。本研究利用实时荧光定量PCR技术在转录水平研究不同生长、发育阶段皱纹盘鲍体内褐藻酸酶(hdaly)、纤维素酶(hdcel)、α-淀粉酶(hdamyl)和海带淀粉酶(hdlam)等多糖裂解酶基因的定量表达,同时分析了不同温度下长期培育的皱纹盘鲍体内多糖裂解酶基因的表达变化。旨在通过对4种多糖裂解酶基因表达的定量研究,揭示皱纹盘鲍在不同发育阶段和生理状态下对食物中各种多糖类物质的利用情况。现将主要结果摘要如下:1.皱纹盘鲍4种多糖裂解酶基因序列及表达的组织特异性根据已发表的盘鲍或皱纹盘鲍多糖裂解酶基因及皱纹盘鲍内参基因β-actin的cDNA序列信息设计适合实时荧光定量分析的特异性扩增引物,以皱纹盘鲍的DNA和cDNA为模板分别进行扩增,将扩增产物克隆、测序。以cDNA为模板分别得到褐藻酸酶、纤维素酶、α-淀粉酶、海带淀粉酶和β-actin基因的扩增产物116、162、188、177和175bp,及以DNA为模板的扩增产物116、829、626、177和175bp。生物信息学分析表明:(1)以cDNA为模板扩增得到的褐藻酸酶、α-

淀粉酶、海带淀粉酶及β-actin基因的序列与已发表的盘鲍(Haliotis discus discus Reeve)或皱纹盘鲍的相应序列完全一致,而纤维素酶基因则存在2个潜在的SNP位点,结果表明,我们设计的引物扩增到了相应的目的产物;(2)在纤维素酶和α-淀粉酶的基因组序列中分别扩增得到667bp,438bp的内含子序列。采用上述引物分别对成体皱纹盘鲍的鳃、肌肉、触角、外套膜和消化腺等组织样本进行定量分析,结果表明,4种多糖裂解酶基因均主要在消化腺中表达,其他组织中未检测到产物或表达量极低。2.皱纹盘鲍多糖裂解酶基因在不同发育阶段的表达变化我们比较了皱纹盘鲍幼体、幼鲍和成体阶段4种多糖裂解酶基因的表达变化。从受精卵到45日龄稚鲍的发育过程中,4种多糖裂解酶基因均有表达,且表达量在整个过程中均表现为先下降后上升的趋势,上升阶段基因的表达量分为三个水平。结果如下:0h-6d的早期胚胎发育阶段,4种多糖裂解酶基因的表达量均处于较低的表达水平,表现为先下降后上升的趋势,在24h处于最低点。7d-22d和30d-45d发育阶段,基因的表达量增加缓慢,但7d-22d表达量显著高于0h-6d的表达量,30d-45d表达量显著高于7d-22d的表达量。饵料转换期4种多糖裂解酶基因的表达量呈现先下降后上升的趋势,其表达量在剥离后24h内急剧下降,24h后表达量开始上升。3.不同温度下长期培育的皱纹盘鲍体内多糖裂解酶基因的表达变化设置7个温度处理:分别为8℃、12℃、16℃、20℃、22℃、24℃和30℃处理组,每个温度内设置3个重复。每个重复初始投放壳长在2.3cm左右的稚鲍70头,循环水系统中自然海水温度下适应一周之后,开始逐渐升/降温(1℃/日)操作,直至达到实验要求的目标温度,之后恒温培养。取消化腺RNA,采用实时荧光定量PCR技术,对4种多糖裂解酶基因的相对表达量进行分析。结果显示:不同温度下长期培育的皱纹盘鲍体内4个多糖裂解酶基因的表达量具有显著差异。在7个温度处理中,24℃时具有最高的相对表达量,8℃~24℃时,随着温度的升高,基因的相对表达量也随着升高,而24℃~30℃时,各基因的表达量呈下降趋势。

【英文摘要】Polysaccharides are major components of algae which adult abalone is naturally feed on. Diatoms includs cellulose and starch, kelp contains cellulose, alginate and laminarin, for example.The mRNA expression of alginate lyase, cellulase, α-amylase and laminarinase gene in Pacific abalone, Haliotis discus hannai Ino, on the process of growth and development has been researched with the Real-time RT-PCR technology in this article. We also analyzed the effect of temperature on mRNA expression of these four genes. We investigated mRNA expression of these four polysaccharidase genes in order to reveal utilization of polysaccharide in abalone at different developmental stages and physiological state.1. The sequence and tissue-specific expression of four polysaccharide lyase genes in Pacific abalone, Haliotis discus hannai InoReal-time PCR primers of polysaccharidase genes and β-actin gene were designed based on the cDNA sequences of Haliotis discus hannai Ino or Haliotis discus discus Reeve. Sequnences of cDNA PCR products of alginate lyase, cellulase, α-amylase, laminarinase gene and β-actin gene were 116bp, 162bp, 188bp, 177bp and 175bp, and the DNA PCR products of these genes were 116bp, 829bp, 626bp, 177bp and 175bp respectively. The results of bioinformatics analysis indicated that, (1) Sequences of cDNA PCR products of alginate lyase, cellulase, α-amylase, laminarinase gene and β-actin gene were almost the same as compared with the published sequences of certain corresponding gene, while two SNPs were found in intron of cellulase gene. (2) The DNA PCR products of the cellulase and α-amylase gene contain introns of 667bp and 438bp respectively.The mRNA expression of these genes has been researched in gill, muscle, antenna, pallium and digestive gland of Pacific abalone, Haliotis discus hannai Ino. The results show that these four genes have the highest mRNA expression in digestive gland there are low or no expression in other organizations. The distribution of these four polysaccharide lyase genes has the significant tissue-specific.2. The mRNA expression of four polysaccharide lyase genes on embryonic development period and food conversion period of Pacific abaloneThe expression of these four genes on the embryonic development period were decreased first and then increased. The results are as follows. 0h-6d in the early stages of embryonic development, the expression level of these four genes are at a low volume, and there was the lowest level at 24h. During the period of 7d-22d and 30d-45d, the expression was increased slowly. However the expression of these four genes on period of 7d-22d ware significantly higher than the expression of 0h-6d, and the expression of 30d-45d ware significantly higher than the expression of 7d-22d.The expression of these four genes was decreased sharply during 24 hours after spin-off on the food conversion period, and then increased after 24 hours.3. The effect of different temperature on mRNA expression of four polysaccharide lyase genes in Pacific abaloneWe set up seven treated groups. They were 8°C, 12°C, 16°C, 20°C, 22°C, 24°Cand 30°Cgroup. There were three repeats in every one group. And each repeat, there were seventy ones in the shell length of 2.3cm. We began to up/down (1°C/day) operation after a week of natural water temperature, until reached the target. The expression of these four genes from digestive gland of Haliotis discus hannai was researched with Real-time RT-PCR technology. The results showed that there was significant effect on the expression of these four genes. The expression of the 24°Cgroup was significant higher than that of the others.

【题目】皱纹盘鲍幼鲍对海水盐度的耐受性分析
【中文关键词】皱纹盘鲍; 盐度; 耐受性; 生理变化;
【英文关键词】Haliotis discus hannai Ino; salinity; tolerance; physiological change;
【中文摘要】皱纹盘鲍(Haliotis discus hannai Ino)是名贵养殖贝类,在我国仅黄海北部的辽东和胶东半岛近岸有皱纹盘鲍自然分布。目前皱纹盘鲍在辽东半岛、胶东半岛、福建沿海、广东东部沿海均有较大规模的养殖。鲍是狭盐性海洋生物,但是目前有关盐度对皱纹盘鲍影响的确切实验数据较少见。本研究旨在初步探讨盐度对皱纹盘鲍幼鲍的影响及幼鲍在适应盐度变化过程中的调节机制,包括皱纹盘鲍的盐度耐受能力,特别是对低盐的耐受力,并根据实验结果拟合出幼鲍存活率与盐度变化的函数式;低盐对皱纹盘鲍幼鲍生长的影响;皱纹盘鲍幼鲍在适应盐度变化过程中部分生理指标方面的变化。现将主要结果摘要如下:1幼鲍的盐度-存活率剂量效应曲线设置16、20、24、26、28、29、30、32、34、36、40、44共12个盐度梯度,每个盐度设置3个重复,每重复30个个体。培育42d时统计各组平均存活率如下:26、29、30、32和34盐度组幼鲍的存活率100%;28、24、20、16盐度组幼鲍的存活率分别是97.8%、85.6%、10%、0;36、40、44盐度组幼鲍的存活率分别是94.4%、88.9%、27.8%。上述结果表明:幼鲍对低盐更敏感;24及更低盐度的海水和40及更高盐度的海水均不适宜皱纹盘鲍幼鲍生存。同时,根据上述结果可拟合得到幼鲍培育42d后的盐度-存活率函数,如下所示,通过计算可得,幼鲍起始致死低盐和高盐分别为19和51,还可获得非实验点盐度的幼鲍存活率,能够更全面地探讨盐度对幼鲍生存的影响。2幼鲍在不同盐度下的死亡动力曲线幼鲍在16的低盐海水中48h,即有53%的个体死亡;11d时死亡率100%。在20的低盐海水中48h,幼鲍死亡率为15.6%;10d、20d、40d时死亡率分别为25.6%、51.1%、90%。在盐度44的高盐海水中10d,幼鲍死亡率为7.8%,20d和40d时死亡率分别为44.4%和71.1%。盐度24、28、36的海水中养殖的幼鲍大约4w才首次观察到个体死亡。3幼鲍对低盐的适应能力研究每5d左右降1个盐度,从32缓慢降到20,则幼鲍可逐渐适应低盐20的海水。在盐度20的低盐海水中培育15d才发现第一个死亡个体,培育40d,死亡率仅8.9%;养殖100d,死亡率仅24.4%。而从32直接降低盐度到20的对照组,则培育40d时死亡率已达90%。4幼鲍在不同盐度下长期培育的生长情况实验设置26、28、29、30、32共5个盐度梯度,每个梯度设3组重复,每组重复40个个体,初始壳长控制在40.4~43.0mm范围内。养殖65d后测量幼鲍的壳长、壳宽及体重。结果显示,所有盐度组幼鲍的存活率均达到97%以上,1龄幼鲍在盐度28~30的海水中生长最好,在盐度26的海水中,幼鲍的摄食率及壳长增长显著降低。5幼鲍在降盐过程中的血淋巴可溶性总蛋白及血蓝蛋白含量变化情况评价从自然海水盐度(30)降至不同低盐(26、20)及从低盐26降至更低盐度20,幼鲍的生理变化情况。取适应盐度30的幼鲍分别放入26和20的低盐海水中,同时将适应盐度26的幼鲍放入20的低盐海水中,均在21、24、27h取样测定血淋巴中可溶性总蛋白、血蓝蛋白的含量变化。结果显示,30降至26时幼鲍血淋巴总蛋白、血蓝蛋白含量均在21h出现峰值;而30降至20及26降至20时幼鲍均在24h出现峰值,且盐度降低的幅度越大,可溶性总蛋白、血蓝蛋白含量的变化幅度越小。初步表明幼鲍响应盐度胁迫的生理调节机制可能存在一定的限度。
【英文摘要】Pacific abalone (Haliotis discus hannai Ino) is one of the most commerciallyimportant cultured shellfishes, which naturally inhabit in Liaodong and Jiaodongpeninsula. Currently, H. discus hannai was cultivated in large-scale in Liaoning,Qingdao, Fujian and Guangdong coast areas in our country. H. discus hannai isstenohaline.While the exact experimental data on the salinity effects was quite limited.So, this study was aimed to exploit the effects of salinity on H. discus hannai and theregulatory mechanism of juvenile abalones adjusting to the different salinities,including the abalone ’s tolerance to salinity, especially low salinity and a piecewisefunction was fitted out according to our experimental data to fully evaluate the salinityeffects on abalone survive; the influence of low salinity on the abalone ’s growth; thechange of some physiological indexes by the stimulation of low salinity in short term.Main results were listed as follows:1salinity-survival curve of juvenile abalones, Haliotis discus hannai InoSalinity gradient:16,20,24,26,28,29,30,32,34,36,40,44. Ninety individualswere used in each gradient (3×30). After six weeks ’ cultivation, the survival rates areas follows: the survival rates of26,29,30,32and34groups were100%; the survivalrates of28,24,20and16were97.8%,85.6%,10%and0respectively; the survivalrates of36,40,44were94.4%,88.9%,27.8%. So it could be concluded that juvenileswere more sensitive to low salinity and the salinity lower than24or higher than40were not suitable for abalones. At the same time, a piecewise function was fitted outaccording to the above results to better describe the relationship between the survivalrate of juvenile abalones and different salinities. It could be calculated that theminimum salinity was19and maximum salinity was51for abalone. More survivalrates of juvenile abalones at different salinities could be calculated to help us studythe effects of salinity on abalones more comprehensively. 2dynamic death curve of juvenile abalones in different salinitiesIn salinity16, the mortality of juvenile abalones reached53.0%after48h and allindividuals died after11d; in salinity20, the mortality of juvenile abalones was15.6%after48h and reached25.6%,51.1%and90.0%respectively after10d,20d, and40d;in salinity44, the mortality were7.8%,44.4%and71.1%respectively after10d,20d,and40d. The first dead individual was observed after four weeks when transferred theabalones to24,28and36respectively.3the adaptive capacity of juvenile abalones to low salinityWhen the salinity of sea water gradually decreased1every5d, the juvenileabalones may adjust to low salinity20. The first dead individual was found after15d.The mortality rates

were only8.9%and24.4%after40d and100d. While the controlgroups, being transferred directly from32to20suddenly, nearly died totally (90.0%).4the growth rate of juvenile abalones in different salinities for long periodSalinity gradient:26,28,29,30,32.120individuals (3×40) were used in eachtreatment. The length of shells were controlled in the range of40.4~43.0mm. After65d, length and width of shells, and wet weight of abalones were measured. The survivalrates of all groups were more than97%. It was showed that individuals grew best atsalinity28to30. However, the feeding rate and shell growth rate of the individuals atsalinity26decreased significantly.5change of total soluble protein and hemocyanin in hemolymph ofjuvenile abalones when salinity decreasedThe change of total soluble protein and hemocyanin in hemolymph wereevaluated when the abalones were transferred directly to different low salinities. Threetest groups were set (salinity from30to26,30to20h,26to20). It showed that totalsoluble protein and hemocyanin in hemolymph maximized at21h when abalonestransferred from salinity30to26. Other abalones of the rest groups maximized at24h.The more decreasing of the salinity, the smaller change appearing of the total solubleprotein and hemocyanin in hemolymph. It suggested that the extent of the regulatorymechanism of abalone was limited.

【题目】Mapping of SMV resistance gene Rsc-7 by SSR markers in soybean
【中文关键词】无
【英文关键词】cM – centimorgan; MAS – marker-assisted selection; MLG – molecular linkage group; PCR – polymerase chain reaction; QTL – quantitative trait loci; R – resistant; RFLP – restriction fragment length polymorphism; RIL – recombinant inbred line; S – suscepti
【中文摘要】无
【英文摘要】Soybean mosaic virus (SMV) is one of the most prevalent pathogens that limit soybean production. In thisstudy, segregation ratios of resistant plants to susceptible plants in P1, P2, F1, F2 populations of Kefeng No.1 (P1) Nannong 1138-2 (P2) and derived RIL populations, were used to study the inheritance of resistanceto the SMV strain SC-7. Populations Kefeng No. 1 and F1 were found to be completely resistant to thisSMV strain while Nannong 1138-2 was susceptible to it. The F2 and RIL populations segregated to fit aratio of 3:1 and 1:1for resistant plants to susceptible ones, respectively. These results indicated that a singledominant gene, designated as Rsc-7, controlled resistance to the SMV strain SC-7 in Kefeng No.1. SSRmarkers were used to analyze the RIL population and MAPMAKER/EXP 3.0b was employed to establishlinkage between markers and this resistance gene. Combining the data of SSRs and resistance identification,a soybean genetic map was constructed. This map, covering 2625.9 cM of the genome, converged into 24linkage groups, consisted of 221 SSR markers and the resistance gene Rsc-7. The Rsc-7 gene was mapped tothe molecular linkage group G8-D1b+W. SSR markers Satt266, Satt634, Satt558, Satt157, and Satt698were found linked to Rsc-7 with distances of 43.7, 18.1, 26.6, 36.4 and 37.9 cM, respectively.

【题目】Estimates of relative contribution of biomass, harvest index and yield components to soybean yield improvements in China
【中文关键词】无
【英文关键词】biomass — Glycine max — harvest index — yield components — yield improvement
【中文摘要】无
【英文摘要】A method was developed to estimate the relative contribution ofincreased biomass, harvest index and yield components to seed yield gainof soybean. Data from four field experiments conducted in three soybeanproduction regions in China were used to measure the role of differenttraits (such as harvest index) in seed yield improvement by applying thismethod. The results indicated that harvest index was a larger contributorto the progress of soybean yield improvements than biomass in China.However, the estimates of improvements of yield components suggestedthat there could be several strategies for obtaining high yield. Highyielding would be achieved by improving all of the three yieldcomponents (pods per plant, seeds per pod and seed weight) simultaneously,or significantly improving one or two of the three components.

【题目】GmZFP1 encoding a single zinc finger protein is expressed with enhancement in reproductive organs and late seed development in soybean (Glycine max)
【中文关键词】无
【英文关键词】cDNA cloning mRNA expression Soybean GmZFP1 Zinc finger Development
【中文摘要】无
【英文摘要】The plant TFIIIA zinc finger proteins playimportant roles in plant growth and development. Inthis report, we isolated a single zinc finger gene,designated as GmZFP1, from soybean flowers by insilico mRNA subtraction strategy and RT-PCR.GmZFP1 is an intronless gene and encodes a proteinof 210 amino acid residues with a predicted molecularmass of 23.5 KDa. GmZFP1 contains a single zincfinger domain and a DLN-box/EAR-motif at theC-terminus. To localize GmZFP1 mRNA in varioustissues, semi-quantative RT-PCR assay was performed.GmZFP1 is expressed in all detected reproductiveorgans including flowers, developing seeds,pods, sepals, pistils with a low level, and more accumulatedin petals, stamens, but not found in alldetected vegetative organs with except of stem tips.Further, we found that the expression of GmZFP1was higher in late seed development than in earlyseed development. To our knowledge, GmZFP1 is thefirst characterized gene encoding for single zinc fingerprotein in soybean, and may play a role as a transcriptionalfactor in reproductive organs development,especially functioning in petals, stamens and latedeveloping seeds.

【题目】Genome-wide identification and characterization of putative cytochrome P450 genes in the model legume Medicago truncatula
【中文关键词】无
【英文关键词】ESTs · In silico · Medicago truncatula · P450 · TCs
【中文摘要】无
【英文摘要】In plants, cytochrome P450 is a group ofmonooxygenases existing as a gene superfamily andplays important roles in metabolizing physiologicallyimportant compounds. However, to date only a limitednumber of P450s have been identiWed and characterizedin legumes. In this study, data mining methodswere used, and 151 putative P450 genes in the modellegume Medicago truncatula were identiWed, including135 novel sequences. These genes were classiWed into 9clans and 44 families by sequence similarity, andamong those 4 new clans and 21 new families notreported previously in legumes. By comparison ofthese genes with P450 genes in Arabidopsis and rice, itwas found that most of the known P450 families indicot species exist in M. truncatula. The representativeprotein sequences of putative P450s were aligned, andthe secondary elements were assigned based on theknown structure P450BM3. Putative substrate recognitionsites (SRSs) and substrate binding sites were alsoidentiWed in these sequences. In addition, the ESTsderivedexpression proWles (digital Northern) of theputative P450 genes were analyzed, which was con-Wrmed by semi-quantitative RT-PCR analyses of severalselected P450 genes. These results will provide abase for catalogue information on P450 genes in M.truncatula and for further functional analysis of P450superfamily genes in legumes.Keywords ESTs · In silico · Medicago

【题目】Molecular cloning, sequence characterization and tissue-specific expression of six NAC-like genes in soybean (Glycine max (L.) Merr.).
【中文关键词】无
【英文关键词】NAC gene;
Phylogeny;
Seed development;
Soybean (Glycine
max (L.) Merr.);
Transcription factors
【中文摘要】无
【英文摘要】NAC proteins have been considered as one of the novel classes of plant-specifictranscription factors functioning in diverse and vital physiological processes duringplant development. In this study, six NAC-like genes from soybean, designated asGmNAC1 – GmNAC6, were cloned and characterized. They each contained two intronsand three exons and shared conservative structure of genomic organization. Thepredicted proteins, GmNAC1 – GmNAC6, were similar in sequences, especially in NACdomain regions. However, RT-PCR analysis indicated that each GmNAC geneexhibited a specific expression pattern in tissues examined. GmNAC2, 3, 4, and 6were expressed in most tested tissues while GmNAC1 and GmNAC5 were limited to afew tissues. In addition, expression patterns of GmNAC genes were characterizedduring seed filling and coordinated expression was observed between GmNAC genes.Finally, based on phylogenetic analysis, six GmNAC proteins were classed into fivesubgroups with different putative functions. To our knowledge, this is the first reporton molecular cloning and initial characterization of NAC-like genes in soybean. Ourresults may provide the basis for future investigations of NAC-like genes ’ roles inseed development and other physiological processes in this important crop.

【题目】Molecular cloning and characterization of a novel microsomal oleate desaturase gene from soybean
【中文关键词】无
【英文关键词】FAD2;
Microsomal oleate
desaturase;
Polyunsaturated
fatty acids (PUFAs);
Soybean (Glycine
max Merr. L)
【中文摘要】无
【英文摘要】In plants, the endoplasmic reticulum (ER)-associated oleate desaturase (FAD2) is thekey enzyme responsible for the production of linoleic acid in non-photosynthetictissues. In soybean three FAD2-like genes have been reported including two seedspecificgenes, FAD2-1A and FAD2-1B, and a house-keeping gene FAD2-2. In this study,we isolated a novel gene encoding FAD2 isoform, designated as FAD2-3. The deducedamino acid sequences of the FAD2-3 displayed the typical three histidine boxescharacteristic of all membrane-bound desaturases, and possessed a C-terminal signalfor ER retention. Phylogenetic analysis showed that FAD2-3 is grouped within planthouse-keeping FAD2 sequences. Yeast cells transformed with a plasmid constructcontaining the FAD2-3 coding region accumulated a considerable amount of linoleicacid (18:2), normally not present in

wild-type yeast cells, suggesting that theisolated gene encodes a functional FAD2 enzyme. Semi-quantitative RT-PCR and insilico analysis showed that FAD2-3 gene is constitutively expressed in both vegetativetissues and developing seeds. In soybean leaves, the level of linolenic acid (18:3)increases with the decrease of linoleic aicd (18:2) under cold treatment. However,no significant change of transcript levels of FAD2-2 and FAD2-3 genes was detected.These results indicated that the altered polyunsaturated fatty acid levels in leavestreated with cold stress have no direct correlation with the expression of these twomicrosomal oleate desaturase genes.

【题目】Polymorphisms of IFS1 and IFS2 gene are associated with isoflavone concentrations in soybean seeds
【中文关键词】无
【英文关键词】Association analysis
Isoflavone synthase
Linkage disequilibrium
Isoflavone
Soybean
【中文摘要】无
【英文摘要】Soybean isoflavones are associated with many health benefits of soy consumption, and isoflavone levelsare one of the most important output traits of soybean. Isoflavones are synthesized from thephenylpropanoid pathway. Isoflavone synthase (IFS) acts as the key metabolic entry point for theformation of all kinds of isoflavones. We have cloned, sequenced, and analyzed the IFS1 and IFS2 genomicregions from 33 Chinese soybean accessions including 16 Glycine soja and 17 Glycine max. The isoflavonelevels in these accessions vary greatly, ranging from 536.6 mg/g to 5509.1 mg/g dry seed weight. Highnucleotide diversity and low extent of linkage disequilibrium (LD) in these two genes provided sufficientgenetic resolution for association analysis of polymorphisms in these genes and soybean seed isoflavonelevels. As a result, three single nucleotide polymorphisms (SNPs) in IFS1 gene and two SNPs in IFS2 genewere found closely associated ($P < 0.05$) with all individual and total isoflavone levels in seeds, regardlessof population structure. These results indicated that IFS1 and IFS2 gene both contributed to the levels ofisoflavones in seeds. These polymorphisms may serve as important molecular markers for breeding.

【题目】4个太湖流域粳稻地方品种抗稻瘟病性的遗传分析
【中文关键词】粳稻; 地方品种; 稻瘟病; 抗性遗传; 等位性测定
【英文关键词】Oryza sativa subs. japonica ; landraces; Magnaporthe grisa; resistance genetics; allelism test
【中文摘要】以太湖流域粳稻地方品种薄稻、铁杆青、江南晚和缺儿糯等广谱、高抗稻瘟病为材料，与高感稻瘟病品种苏御糯杂交，获得杂交F1 、F2，分别接种日本稻瘟病鉴别菌系北1 和中国稻瘟病菌生理小种ZE3 、ZG1，根据P1 、P2 、F1 和F2 等不同世代植株的抗、感反应，分析地方品种对不同稻瘟病菌生理小种(菌系) 的抗性遗传机理。结果表明: 薄稻、铁杆青及缺儿糯对北1 菌系的抗性均可能由一对显性基因控制，江南晚对北1 的抗性则可能由两对抑制基因互作控制; 铁杆青及缺儿糯对ZE3 小种的抗性均可能由一对显性基因控制，薄稻和江南晚对ZE3 小种的抗性可能分别由两对显性基因和两对抑制基因互作控制; 铁杆青对ZG1 小种的抗性可能是由一对显性主基因控制，薄稻和江南晚对ZG1 小种的抗性则

可能由两对抑制基因互作控制。进一步将薄稻与12个日本稻瘟病菌鉴别品种杂交,用北1菌系接种不同组合的F1和F2,进行抗病基因的等位性测定。结果表明,薄稻对北1菌系的抗性基因与12个鉴别品种所携带的已知抗稻瘟病基因是不等位,将该基因暂定为Pi-bd1(t)。

【英文摘要】The crosses were made between four japonica rice (Oryza sativa L.) landraces Bodao, Tieganqing, Jiangnanwan and Queernuo from Taihu Lake region, which were highly resistant to the blast (Magnaporthe grisa), and a susceptible ja-ponica variety Suyunuo to produce F1 and F2 generations. The P1, P2, F1 and F2 generation from various combinations were inoculated separately with Japanese blast strain Hoku 1 and Chinese races ZE3 and ZG1 to study genetic patterns of resis-tance in the four landraces to the blast. Resistance in Bodao, Tieganqing or Queernuo to blast Hoku 1 might be controlled by a dominant gene, and in Jiangnanwan by two inhibiting effect genes. Resistance in Tieganqing or Queernuo to blast ZE3 might be controlled by one dominant gene, and in Bodao and Jiangnanwan by two independently dominant genes and two inhibiting effect genes, respectively. Resistance in Tieganqing to blast ZG1 might be controlled by a dominant gene, but in Bodao and Jiangnanwan by two inhibiting effect genes. The crosses were further made between landrace Bodao and 12 Japanese differential varieties possessing the known resistance genes to the blast to produce F1 and F2 generations. The plants of various generations were inoculated with strain Hoku 1 to confirm the resistance gene in Bodao was allelic with known resistance genes. The results show that the resistance gene in Bodao to strain Hoku 1 was non allelic with known resistance genes, and tentatively designated Pi-bd1 (t).

【题目】Overexpression of the Qc-SNARE geneOsSYP71 enhances tolerance to oxidative stress and resistance to rice blast in rice (Oryza sativa L.)

【中文关键词】无

【英文关键词】Oryza sativa L.;Qc-SNARE gene family;Expression pattern;Transgenic rice;Oxidative stress;Rice blast

【中文摘要】无

【英文摘要】OsSYP71 is an oxidative stress and rice blast response gene that encodes a Qc-SNARE protein in rice. Qc-SNARE proteins belong to the superfamily of SNAREs (soluble N-ethylmaleimide‐sensitive factor attachment protein receptors), which function as important components of the vesicle trafficking machinery in eukaryotic cells. In this paper, 12 Qc-SNARE genes were isolated from rice, and expression patterns of 9 genes were detected in various tissues and in seedlings challenge d with oxidative stresses and inoculated with rice blast. The expression of OsSYP71 was clearly up-regulated under these stresses.Overexpres sion of OsSYP71 in rice showed more tolerance to oxidative stress and resistance to rice blast than wild-type plants. These results indicate that Qc-SNAREs play an important role in rice response to environmental stresses, and OsSYP71 is useful in engineering crop plants with enhanced tolerance to oxidative stress and resistance to rice blast.

【题目】The g.243A>G mutation in intron 17 of MUC4 is significantly associated with susceptibility/resistance to ETEC F4ab/ac infection in pigs

【中文关键词】黏附;关联性;感染;MUC4;猪;SNP

【英文关键词】adhesion; association; infection; MUC4; porcine; SNP
【中文摘要】本研究通过扫描猪-苍鼠辐射杂交细胞克隆板将MUC4基因定位于SSC13q41,鉴别到内含子18中的两个SNPs(A243G和A334G),开展了白色杜洛克♂×二花脸♀资源家系F2代820头猪小肠刷状缘的ETEC F4ab/ac/ad黏附表型的测定,根据测定结果从中选择了20个全同胞家系的40个黏附表型极端个体,检测了这些个体在A243G和A334G位点的基因型,并分析了基因型与黏附表型的相关性分析。结果表明:A334G位点的多态性与ETEC F4ab/ac黏附表型无相关,A243G位点的多态性与ETEC F4ab/ac黏附表型相关性极显著,这种相关性在820个F2代个体分析中也得到了进一步验证($p<0.0001$),支持了ETEC F4ab/ac受体基因存在于SSC13q41的结论。
【英文摘要】Using a porcine radiation hybrid panel, we assigned the mucin 4 (MUC4) gene to SSC13q41, which harbours the enterotoxigenic Escherichia coli (ETEC) F4ab/ac receptor locus. In addition, we identified two SNPs in intron 17 of MUC4 (DQ124298:g.243A > G and DQ124298:g.334A > G) in the parental population of a White Duroc x Erhualian cross. Association analysis showed that the MUC4 g.243A > G mutation was strongly associated with ETEC F4ab/ac, and especially with F4ac adhesion phenotypes in the White Duroc x Erhualian resource population, indicating that this polymorphism was in a significant linkage disequlibrium with the ETEC F4ab/ac receptor locus. Because of different linkage disequlibrium values between the ETEC F4ab and F4ac adhesion phenotypes and the MUC4 g.243A > G mutation, we argue that the inheritance of F4ab and F4ac receptors might be under the control of two closely linked loci.

【题目】Characterization of polymorphisms of transferrin receptor and their association with susceptibility to ETEC F4ab/ac in pigs
【中文关键词】猪,ETEC F4ab/ac,TFRC,SNP,相关性
【英文关键词】association; ETEC F4ab/ac susceptibility; pig; polymorphism; transferrin receptor
【中文摘要】本研究以白色杜洛克×二花脸资源家系为实验材料,在F2群体中提取小肠刷状缘,开展ETEC F4ab/ac黏附实验。挑选4对全同胞黏附表型极端个体的小肠样本提取总RNA,通过一步法RT-PCR扩增获得含TFRC编码区的2.3 kb cDNA序列,经PCR产物直接测序搜寻到两个cSNP(SNP A330G和SNP A371G)和两个内含子区域的SNP(SNP G47C和SNPC291T),并建立了相应的基于基因组DNA的判型法。选择了56个F2个体,采用PCR-SSCP法对两个cSNP进行基因型判定;并且采用PCR-AluI-RFLP判定了40个F2极端个体在SNP C291T的基因型。相关性分析表明TFRC的多态变异与ETEC F4ab/ac受体基因存在较强的相关性。
【英文摘要】Diarrhoea caused by enterotoxigenic Escherichia coli (ETEC) expressing F4 (F4ab, F4ac and F4ad) fimbriae is a significant cause of mortality and morbidity in newborn and weaned pigs. The locus controlling susceptibility towards ETEC F4ab/ac has been mapped to SSC13q41, in which TFRC (transferrin receptor) was localized and considered as a positional candidate gene for ETEC F4ab/ac receptor. In this study we, determined susceptibility/resistance to ETEC F4ab/ac in a total of 755 F-2 animals from a White Duroc x Erhualian intercross using a microscopic enterocyte adhesion assay. We identified two TFRC polymorphisms (SNPs 591 A>G and 632 A>G) in a single exon after comparative sequencing analysis of 2371-bp amplicons containing the complete coding region of TFRC using RNA of eight full-sib F-2 animals with susceptible and resistant phenotypes. The intron sequences flanking the two exon polymorphisms were obtained, revealing an intron polymorphism (SNP 291 C>T). We genotyped the 19 founder animals of the White Duroc x Erhualian intercross for the identified polymorphisms, showing that only the 291 C>T polymorphism is a highly informative marker. We further genotyped all 59 F-1 and 755 F-2 animals for the 291 C>T polymorphism, and the association of this polymorphism with susceptibility/resistance to ETEC F4ab/ac in these F-2 animals was evaluated by the transmission disequilibrium test. The result showed that the 291 C>T polymorphism is not a causal mutation, however, has a significant linkage disequilibrium with the ETEC F4ab/ac, especially F4ac receptor locus.

【题目】Polymorphisms of three gene-derived STS on pig chromosome 13q41 are associated with susceptibility to enterotoxigenic Escherichia coli F4ab/ac in pigs
【中文关键词】ETEC;猪13号染色体长臂41区;F4;序列标签位点;主效位点
【英文关键词】pig; SSC13q41; sequence tagged sites (STS); Escherichia coli (ETEC) F4ab/ac; susceptibility
【中文摘要】本实验利用比较基因组学研究手段,选定了遗传标记S0075附近约1~2cM的范围,确定人3号染色体长臂21区段的11个已知基因(ADCY5、PTPLB、MYLK、CCDC14、ROPN1、KALRN、ITGB5、HEG1、SLC12A8、ZNF148和KPNA1),通过生物信息学方法在猪基因组上开发序列标签位点(Sequence tagged sites,STS),通过PCR-RFLP以及RH-Panel的方法进行基因判型和定位,从而确定以上11个基因在猪染色体上的基因分型和排列顺序,为以后进行单倍型分析、寻找致病基因的同源片断(Identical by descent,IBD)以及最终找到该致病基因的主效位点(Causative mutation)奠定了基础。
【英文摘要】Neonatal diarrhea caused by enterotoxigenic Escherichia coli (ETEC) F4 is a common and serious disease, resulting in significant economical loss in the pig industry. The locus encoding ETEC F4 receptor has been mapped to pig chromosome (SSC) 13q41, and one of the most significantly linked markers is S0075. In this study, we selected three genes including SLC12A8, MYLK and KPNA1 from a chromosomal region flanking S0075 on SSC13 to develop pig specific sequence tagged sites (STS). Seven single nucleotide polymorphisms were identified in the three pig STS using DNA of four full-sib susceptible and resistant animals in a White Duroc x Erhualian intercross. All grandparents, parents and 755 offspring in the intercross were genotyped for three polymorphisms, including SLC12A8 g.159A > G, MYLK g.1673A > G and KPNA1 g.306A > G. Family-based transmission disequilibrium test (TDT) revealed that all polymorphisms and the corresponding haplotypes are significantly associated with ETEC F4ab/ac (especially F4ac) brush border adhesion phenotypes, indicating that these polymorphism are in linkage disequlibrium with causal mutation(s) of the gene encoding ETEC F4ab/ac receptor. Our results strengthen the evidence for the involvement of SSC13q41 in high acquiring risk of ETEC F4ab/ac infection, and provide novel polymorphic markers for fine mapping of the ETEC F4ab/ac receptor locus.

【题目】Investigation of the porcine MUC13 gene: isolation, expression, polymorphisms and strong association with susceptibility to enterotoxigenic Escherichia coli F4ab/ac
【中文关键词】ETEC F4ac;易感性;MUC13;克隆;相关性
【英文关键词】ETEC F4ab/ac; MUC13; pig; susceptibility
【中文摘要】本文选取MUC13基因作为一个位置候选基因在白色杜洛克×二花脸资源家系中进行研究。通过扫描猪-仓鼠辐射杂交细胞克隆板的90个克隆将该基因定位到SSC13q41,应用比较基因组学和RACE分离得到其长2679 bp的cDNA序列,该基因编码320个氨基酸组成的粘液素蛋白。半定量RT-PCR分析表明MUC13为广谱表达基因,在小肠中高量表达,在气管、胃和肝中中度表达。通过测序分析在MUC13基因内鉴定到13个多态位点,其中7个错义突变位点、3个同义突变位点和3个内含子中的突变位点,选择c.576C>T、c.908A>G(Asp303Gly)和c.935A>C(Gln312Pro)3个多态位点检测其在资源家系个体中的基因型。2LD软件分析表明,所选的三个位点处于紧密连锁状态,经TRANSMIT软件构建出4种常见单倍型,Haplore软件鉴定出10种常见单倍型对。χ2检验表明,所有位点的纯合基因型和8种单倍型对均与ETEC F4ac的易感性极显著相关,而杂合基因型均未表现出相关性。传递不平衡检测表明,除c.908A>G位点和单倍型CAA外,所有的等位基因和单倍型均与ETEC F4ac的易感性极显著相关。以上结果表明,MUC13基因所在的单倍型区域与ETEC F4ac受体基因紧密连锁,进一步证明了SSC13q41存在控制ETEC F4ac易感性的因果基因,并为ETEC F4ac受体基因的精细定位提供了重要的分子标记。
【英文摘要】Enterotoxigenic Escherichia coli (ETEC) F4ab and F4ac are major determinants of piglet diarrhoea. The locus for the ETEC F4ab/ac receptor has been mapped to SSC13q41. MUC13 is a transmembrane mucin expressed predominantly in the epithelial

surface of the gastrointestinal tract and the MUC13 gene was assigned to SSC13q41, supporting it as a positional candidate gene for the ETEC F4ab/ac receptor. We herein determined the complete 2679-bp cDNA of pig MUC13, and proved that it was most highly expressed in the jejunum and moderately expressed in the trachea, stomach and liver. Furthermore, 13 MUC13 polymorphisms were identified in 19 founder animals of a White Duroc x Erhualian resource population, and a total of 727 F(2) animals with in vitro ETEC F4ab/ac adhesion phenotypes in this population were genotyped for three identified MUC13 polymorphisms including c.576C > T, c.908A > G and c.935A > C. The transmission disequilibrium test showed that the MUC13 alleles and haplotypes were significantly associated with susceptibility/resistance to ETEC F4ab/ac, especially between haplotype [C;G;A] and susceptibility to ETEC F4ac (P = 8.0e-18). Animals inheriting this haplotype were predominantly susceptible to ETEC F4ac (n = 291/303). Moreover, nearly all animals homozygous for haplotype [T;G;C] (n = 39/41) and a majority of those with the [C;A;A]/[T;G;C] haplotype pair (n = 79/88) were resistant to ETEC F4ab. Our results indicated that MUC13 is in strong linkage disequilibrium with the ETEC F4ab/ac receptor locus and provided potential markers for selection of ETEC F4ab/ac-resistant animals in the pig breeding scheme.

【题目】A pig-human comparative RH map comprising 20 genes on pig chromosome 13q41 that harbours the ETEC F4ac receptor locus

【中文关键词】猪13号染色体q41区,人3号染色体q21和q29区,保守的同线性断点

【英文关键词】Comparative map; ETEC F4ac receptor; SSC13q41

【中文摘要】猪13号染色体q41区(SSC13q41)与人3号染色体q21和q29区(HSA3q21和q29)同源。为了更精确地了解SSC13q41和HSA3之间的比较图谱,从HSA3上选择9个基因在猪基因组中定位,9个基因分别是ADCY5、MYLK、CCDC14、ROPN1B、KLF15、PLXNA1、SENP5、DLG1和LMLN。其中ADCY5、MYLK、CCDC14、ROPN1B、KLF15、PLXNA1共6个基因位于HSA3q21上,SENP5、DLG1、LMLN这3个基因位于HSA3q29上。根据UCSC网站上提供的相关信息,设计引物,在猪的基因组中克隆和分离目的基因,将克隆片段测序,并作BLAST比对验证克隆片段即为目的基因的一部分,然后用猪辐射杂交板(IMpRH panel)将上述9个基因定位在猪的染色体上。实验结果与迄今为止已发表的定位数据作比较,初步揭示了SSC13q41与HSA3q21和q29具有保守的同线性,但是发生了基因顺序的重排,同时认为SSC13q41与HSA3q21和q29保守的同线性断点就发生在ROPN1B和KLF15基因之间。本实验的研究结果不仅能够丰富猪的比较图谱,而且对定位在SSC13q41区的重要经济性状的候选基因的研究提供了方便。

【英文摘要】The enterotoxigenic Escherichia coli (ETEC) F4ac is a major cause of diarrhoea in newborn and young pigs. The locus for the intestinal ETEC F4ac receptor (F4acR) has been mapped to pig chromosome (SSC) 13q41 with known homology to human chromosome (HSA) 3q21 and q29. However, the causative gene and mutation(s) remain unknown. The aim of this study was to characterize gene-derived markers on SSC13q41 for fine mapping of the F4acR locus, and construct a high-resolution pig-human comparative map to select positional candidate genes for F4acR. Pig-specific sequence-tagged site markers were developed for 20 genes that are located in a 6.8-Mb region on HSA3q21 and q29, and a total of 34 single-nucleotide polymorphisms (SNPs) were identified in 14 of 20 markers developed. Eighteen markers were mapped to SSC13q41, while the other two markers (PLXNA1 and KLF15) were assigned to SSC13q32 and SSC7q13, respectively, by radiation hybrid mapping. This result showed that there was a small conserved segment on SSC7 corresponding to HSA3q21. A framework map comprising 18 markers on SSC13q41 was established, refining the synteny breakpoint on SSC13q41 to a region of 12.3 centiRay. The comparative radiation hybrid (RH) map revealed three interesting candidate genes for F4acR from the human genome, viz. MUC4, MUC13 and MUC20. Linkage analysis with six marker polymorphisms revealed that MUC4 had the most significant linkage with the F4acR locus.

【题目】Comparison of production traits between pigs with and without the Escherichia coli F4 receptors in a White Duroc x Erhualian intercross F-2 population
【中文关键词】ETEC F4黏附表型;生长性状;相关性;猪
【英文关键词】enterotoxigenic Escherichia coli F4 adhesion phenotype; performance; pig; relationship
【中文摘要】探讨了ETEC F4黏附性状与部分生长表型性状间的相关性,发现F4ac受体的存在在肥育期更加有利于个体的生长,但对肉质,脂肪沉积以及小肠长度等表型性状无显著影响。这表明F4ab/ac受体具有两面性:一方面易导致腹泻病而对个体早期活力产生不利影响,另外其在肥育期促进个体生长。推断F4ac黏附型表型的在西方商业猪种中的广泛存在是由长期选择平衡效应所致。
【英文摘要】To evaluate the influence of enterotoxigenic Escherichia coli (ETEC) F4 receptors on production traits in pigs, ETEC F4ab, F4ac, and F4ad adhesion phenotypes and 27 traits related to growth, carcass, meat quality, and length of the small intestine in a White Duroc x Erhualian intercross population were measured. Performance data revealed that pigs with the F4ab or F4ac receptor (adhesive phenotypes) had greater ($P < 0.01$) ADG during the fattening period (from 46 to 240 d) and carcass weight and length at 240 d than pigs lacking the receptors (nonadhesive phenotype). Conversely, animals having the F4ad receptor had less ($P < 0.01$) ADG during the fattening period and carcass weight than those lacking the receptor. In total, 8 adhesion patterns (A to H) for the 3 F4 strains were observed in this experimental population. Pigs with both F4ab and F4ac receptors (phenotype B) had greater ($P < 0.01$) ADG, carcass weight, and length at 240 d compared with pigs without the F4 receptors. No difference was found ($P > 0.05$) in traits related to meat quality, fatness, and length of the small intestine between pigs with or without the receptors. On the basis of the antagonistic relationship between susceptibility to F4ab/ac and production traits, we speculate that the prevalence of the ETEC F4ab/ac adhesive phenotype in pig populations is attributable to balanced natural and artificial selection.

【题目】
Distribution of Escherichia coli F4 adhesion phenotypes in pigs of 15 Chinese and Western breeds and a White DurocxErhualian intercross
【中文关键词】猪;ETEC F4;黏附表型;分布
【英文关键词】Swine;ETEC F4; adhension phenotype;distribution
【中文摘要】分析了三种ETEC F4血清型在10个中国地方品种、3个西方引进商业品种以及白色杜洛克×二花脸资源家系1093个F2/F3代个体中的流行情况,在中国地方品种及F2/F3代群体中鉴别到二种新的黏附表型(G和H),由此推论,在中国地方品种中,三种F4受体可能由不同基因位点所控制。另外,三种F4血清型的弱黏附在小猪及成年猪中均存在,但其遗传机制及其是否引发疾病目前尚不清楚。
【英文摘要】Diarrhoea in newborn and weaned piglets is mainly caused by enterotoxigenic Escherichia coli (ETEC) with fimbriae F4. To investigate the prevalence of resistance to three fimbrial strains, F4ab, F4ac and F4ad, among Chinese indigenous pigs and Western commercial pigs introduced into China, we determined the ETEC F4 adhesion phenotypes in 292 pure-bred piglets from three Western commercial breeds and 12 Chinese indigenous breeds, and a total of 1093 adult pigs in a White DurocxErhualian intercross, by an in vitro microscopic adhesion assay. All the Tibet and Lantang pigs and a majority of the Erhualian and Rongchang pigs were resistant (nonadherent) to ETEC F4 whereas all the Laiwu pigs and most of the Jiangquhai and Tongcheng pigs were susceptible (adhesive) to at least one of the F4 strains. Yushan Black pigs were uniformly resistant to F4ab, and Jinhua pigs were predominantly resistant to F4ac. Susceptible and resistant animals were observed in the other breeds, indicating that diarrhoea caused by ETEC F4 could be prevalent in these breeds. This study confirmed the existence of eight previously reported F4 adhesion patterns,

and supported the assumption that the three F4 receptors are encoded by distinct loci. Expression of the weakly adherent phenotype was observed in six pure-bred piglets and 90 adult F(2)/F(3) animals, and the inheritance of this phenotype and its correlation with susceptibility to disease are still not known.

【中文关键词】产肠毒素大肠杆菌,F41,987P,K99,菌毛,数量性状位点
【英文关键词】ETEC F41 987P K99 fimbriae QTL
【中文摘要】本实验利用显微镜观察小肠上皮细胞刷状缘与细菌的黏附情况,并以每个个体20个刷状缘微粒黏附细菌数作为该个体易感程度的表型。在白色杜洛克和二花脸杂交的F2群体中,一共检测了976头F2个体K99和835头F2个体F41、987P的黏附表型,并利用覆盖整个猪基因组的183个微卫星标记,进行全基因组QTL扫描来定位ETEC F41、987P和K99的受体基因位点。一共检测到1个1%基因组显著的QTL和4个5%染色体显著水平的QTL,分别位于4、5、7、13和15号染色体上。其中3个影响F41的黏附(位于4、5和15号染色体上),2个影响987P黏附的QTL(位于7和13号染色体),没有检测到影响K99黏附的QTL。4号染色体上的QTL受体基因来自杜洛克,而5号染色体的受体基因来自二花脸,这表明存在多个基因影响猪对F41的易感性,而且杜洛克和二花脸的受体基因分别位于两条不同的染色体上。
【英文摘要】Enterotoxigenic Escherichia coli (ETEC) is a major cause of diarrhoea in neonatal and postweaning pigs. F41 is one of ETEC fimbriae that adhere to the small intestinal epithelium and lead to development of diarrhoea. The genetic architecture of susceptibility to ETEC F41 remains elusive in pigs. In this study, we determined the in vitro adhesion phenotypes of ETEC F41 in a total of 835 F(2) animals from a White Duroc x Erhualian intercross, and performed a genome scan using both F(2) and half-sib analyses with 183 microsatellite markers to detect quantitative trait loci (QTL) for porcine susceptibility to ETEC F41. The two analyses consistently revealed a 1 genome-wide significant QTL on pig chromosome 4. Moreover, we determined F41 adhesion phenotypes in 14 purebred Erhualian and 14 White Duroc pigs. The results showed that both the founder breeds are segregating for the F41 adhesion phenotype, while less percentage of Erhualian pigs were adhesive to ETEC F41 compared to White Duroc pigs.

【题目】Association of B3GNT5 Polymorphisms with Susceptibility to ETEC F4ab/ac in the White Duroc x Erhualian Intercross and 15 Outbred Pig Breeds
【中文关键词】猪;ETEC F4ac;易感性;B3GnT5;B3GALT3;相关性
【英文关键词】Association; B3GNT5; ETEC F4ab/ac; Pig; Susceptibility
【中文摘要】本研究以白色杜洛克×二花脸资源家系以及293头中、西方猪种远缘群体仔猪为实验材料,开展猪小肠上皮细胞刷状缘的体外ETEC F4ac黏附实验。采用比较基因组法结合生物信息学法设计引物,开发序列标签位点(STS),同时利用资源家系F1代9头公猪每3个个体为一组构建3个DNA池为样本进行PCR扩增、产物纯化直接测序法搜寻单核苷酸多态位点(SNP),选择B3GnT5基因的g.668A>G、g.821C>T、g.908C>A、g.1055T>C位点和B3GALT3基因的g.245C>T、g.1180G>A位点采用PCR-RFLP法及SNaPshot法进行多态性检测。实验数据经Case Control分析、连锁不平衡检测及传递不平衡检测分析,结果显示:g.668A>G 、g.908C>A和g.1055T>C三个多态位点紧密连锁,处于同一连锁相,资源家系F2代群体g.908 C>A、g.245C>T和g.1180G>A位点的等位基因与ETEC F4ac易感性TDT分析的P值分别为3.19E-04、6.90E-05和5.16E-05,其余多态位点不显著。而在中、西方猪种远缘群体中仅g.821C>T位点与黏附表型存在相关性,本实验虽未在表明B3GnT5基因和B3GALT3基因鉴别到与表型共分离的多态位点,不能证实这两个基因是否为ETEC F4ac受体基因,但为进一步开展精细定位鉴别目的基因奠定了良好的工作基础。
【英文摘要】The B3GNT5 gene is a candidate for the F4ab/ac receptor conferring susceptibility to enterotoxigenic Escherichia coli (ETEC) F4ab/ac in pigs. In this study, we screened mutations in the complete coding region of the porcine B3GNT5 gene and identified four SNPs in the 30 untranslated regions. We genotyped the four SNPs across a large-scale White Duroc x Chinese Erhualian F-2 resource population (total F-2 = 755) and 292 purebred piglets representing 15 Chinese and Western breeds. We found that the g. 1476G -> A locus and haplotypes [A; T; G; T] and [A; G; G; T] had significant association with susceptibility to ETEC F4ac in the resource population. None of the B3GNT5 polymorphisms and haplotypes was associated with susceptibility to ETEC F4ab/ac in outbred piglets. This result, together with other reports, supports the conclusion that B3GNT5 is not the responsible gene encoding the ETEC F4ab/ac receptors.

【题目】Predicting the protein content of grain in winter wheat with meteorological and genotypic factors
【中文关键词】基因型的参数;降水;蛋白质含量的谷物;阳光小时;温度;冬小麦
【英文关键词】genotypic parameter; precipitation; protein content of grain; sunshine hours; temperature; winter wheat
【中文摘要】气象条件,包括温度、阳光和沉淀在晶粒生长的主要因素确定变化的蛋白质含量的谷物(PC)在小麦。田间试验的基础上,开发了一个简化的回归模型预测PC在冬小麦。从逐步回归分析,发现PC的高蛋白品种之间的区别是与每日最高和最低气温(δT)当δT变化环境下是重要的,但与交互的平均温度(Tmean)x总日照时间从开花到成熟(兽形杯)环境下与△T变异小于5%。在中等蛋白质品种,PC是与兽形杯,在低蛋白相结合的品种,总降雨量Tmean,从开花到成熟(TR)和兽形杯。气候因素影响PC进一步量化将五个遗传参数。δT和兽形杯呈线性相关,与PC,是quadratically Tmean与PC。降水量线性相关,与电脑如果它还不到50毫米,否则quadratically。一般的均方根误差(RMSE)值的估计PC相对于观测值小于7%,表明一个适合估计和观察之间的个人电脑。因此,得出目前的模型可以预测PC不同的冬小麦品种在不同气候环境。
【英文摘要】Meteorological conditions including temperature, sunshine and precipitation during grain growth are the primary factors determining the variation of the protein content of grain (PC) in wheat. On the basis of field experiments, a simplified regression model was developed for predicting the PC in winter wheat. From stepwise regression analysis, it was found that the PC of high-protein cultivars was correlated with the difference between daily maximum and minimum temperatures (Delta T) when Delta T variation under the environment was significant, but with the interaction of mean temperature (Tmean) x total sunshine hours from anthesis to maturity (TSUN) under the environment with Delta T variation less than 5%. In medium-protein cultivars, the PC was correlated with TSUN, and in low-protein cultivars, with the combination of Tmean, total rainfall from anthesis to maturity (TR) and TSUN. The climatic factors influencing PC were further quantified incorporating five genetic parameters. The Delta T and TSUN were linearly correlated with PC, and Tmean was quadratically correlated with PC. The precipitation was linearly correlated with PC if it was less than 50mm, otherwise quadratically. The average root mean square error (RMSE) values of the estimated PC relative to the observed value were less than 7 percent, indicating a good fit between the estimated and observed PC. Thus, it is concluded that the present model can predict the PC of different winter wheat cultivars under various climate environments.

【题目】Modeling plant nitrogen uptake and grain nitrogen accumulation in wheat
【中文关键词】小麦;氮吸收;再活化;谷物氮;动态建模
【英文关键词】wheat; nitrogen uptake; remobilization; grain nitrogen; dynamic modeling
【中文摘要】谷物氮(N)浓度是一个主要的质量参数的小麦谷物。因为一些报道量化的过程在两个粮食和N积累营养部分小麦(小麦l .),该研究旨在开发一个动态模型来模拟植物氮素吸收和谷物N积累在小麦通过关注的变异N堆积速率在个人谷物。五个不同基因型实验中,施用氮肥率和水政权支持模型进行开发和模型评价。该模型提出率的个人谷物N积累由N可用性和相互作用的影响因素作为温度、水和氮条件在植物在时间进程。N可用性的个人谷物的总额氮素吸收和重新活动从营养部分职位开花。邮报开花期氮素吸收表现出一个指数关系谷粒重量和N积累在开花期是取决于pre开花期氮素吸收。N重新活动从叶子被假定为减少与叶面积指数(LAI)。N重新活动从茎和chaffs(峰值没有谷物)是依赖于曲线和直线下降的N浓度和权重的茎和chaffs灌浆期间。两个基因型的参数被纳入到模型,即最高税率个人谷物N积累和生理充填时间的特定品种。的总体性能模型,验证了独立的数据集从三场实验跨越三年,包括各种基因型、氮和水位。RMSE模型组件的值与所有的治疗方式是平均为11%,表明一个合适的模拟和观测数据之间。看来,该模型可以给一个可靠的预测谷物N积累和蛋白质形成不同的小麦品种的各种生长条件下。(c),于2006年由爱思唯尔帐面价值
【英文摘要】Grain nitrogen (N) concentration is one of the main quality parameters of wheat grains. Since few reports have quantified the processes of N accumulation in both grain and vegetative parts in wheat (Triticum aestivum L.), this study was undertaken to develop a dynamic model for simulating plant N uptake and grain N accumulation in wheat by focusing on the variation

of N accumulation rate in individual grains. Five different experiments involving genotypes, N fertilization rates and water regimes were conducted to support model development and model evaluation. The model proposed that the rate of individual grain N accumulation was determined by the N availability and the interaction of influencing factors as temperature, water and nitrogen conditions within plants over the time course. N availability of individual grain was the sum of N uptake and remobilization from the vegetative parts post-anthesis. Post-anthesis N uptake exhibited an exponential relationship to grain weight and N accumulation at the time of anthesis which was determined by pre-anthesis N uptake. N remobilization from the leaves was assumed to decrease with leaf area index (LAI). N remobilization from the stems and chaffs (spikes without grains) was dependent on the curvilinear or linear decreases of the N concentrations and the weights of stems and chaffs during grain filling. Two genotypic parameters were incorporated into the model, i.e. the maximum rate of individual grain N accumulation and physiological filling duration of specific cultivars. The overall performance of the model was validated with independent data sets from three field experiments spanning 3 years and comprising various genotypes, nitrogen and water levels. The RMSE values for model components with all treatments were averaged 11%, indicating a good fit between the simulated and observed data. It appears that the model can give a reliable prediction for grain N accumulation and protein formation in different wheat cultivars under various growing conditions. 【题目】Modelling leaf shape dynamics in rice

【中文关键词】水稻;增长动力;叶形态;叶长度;叶宽度;叶子形状;仿真模型;亚洲栽培稻印度
【英文关键词】Rice; Growth dynamics; Leaf morphology; Leaf length; Leaf width; Leaf shape; Simulation model; Oryza sativa

【中文摘要】造型树叶的形状是一个有用的工具,用于设计优化植物的形状和可视化植物生长本研究的目的在于分析模式的改变叶片生长特性在植物开发、模型中的变化形态不同的叶子的水稻高产soma L)植物。在四个实验,观察时间进程在湿e的长度和宽度的叶子和惰轮的主茎水稻种植的植物在不同实验条件下三个实验提供了数据开发一个模型结果表明,膨胀过程的单个叶在主街和分蘖面对越来越多的学位天(GDD)遵循了一个缓慢的快速减缓模式,是很好的描述的物流功能的改变最终长度的普通叶放置在主茎被描述的二次函数,不同于函数的旗叶。最终叶长度的懒汉跟着的长度比同时扩大树叶舵柄的长度相应的叶子在主茎。叶宽度的变化与叶长度与GDD为单个叶在主街和潮流的是被一个二次函数的一般关系最终叶长度、最终叶宽度第一完全展开叶和旗叶在主茎和分蘖被描述的指数函数,而对于其他叶二次函数需要氮水平的影响和水的政权叶增长是通过使用叶氮量化和叶水内容模型。这是与独立验证数据从第四次实验,预测时间课程形态变化的叶子在主街和分蘖稻米与不同的氮和水位以及这项研究的结果可以导致更准确地描述具体稻叶在3 d空间的整合模型与形态发生模型的鞘。国米节点和圆锥花序的框架内植物拓扑此外,目前的叶体系结构模型可能加上一片叶子出现模型和叶曲率模型的数字表示光拦截和利用在叶林冠大米(C),于2009年由爱思唯尔B诉代表荷兰皇家农业科学学会。

【英文摘要】Modelling leaf shape is a helpful tool for designing optimal plant shape and visualizing plant growth The objectives of this study were to characterize the changes in patterns of leaf growth characteristics during plant development, and to model the changes in morphology of the different leaves of the rice (Oryza soma L) plant. In four experiments, time course observations wet e made on length and width of the leaves on the main stem and idlers of rice plants grown under different experimental conditions Three experiments provided the data for developing a model The results show that the expansion process of a single leaf on the main stem and tillers against growing degree days (GDD) followed a slow-rapid-slow pattern that was described well by a logistic function The changes in final length of the regular leaves positioned on the main stem were described by a quadratic function that differed from the function for the flag leaf. Final leaf length on the idlers followed the ratio of the length of the simultaneously expanding leaves on the tiller to the length of the corresponding leaves on the main stem. The changes in leaf width with leaf length in relation to GDD for a single leaf on the main stem and tide's were described by a quadratic function The general relationships between final leaf length and final leaf width for the first fully expanded leaves and the flag leaves on the main stem and tillers were described by exponential functions, whereas for the other leaves quadratic functions were needed The effects of nitrogen level and water regime on leaf growth were quantified by using leaf-nitrogen and leaf-water contents The model. which was validated with the independent data from the fourth experiment, predicted the time course morphological changes of leaves on the main stem and tillers of rice grown with different nitrogen and water levels well The results of this study can lead to a more accurate description of the rice leaf in a 3D space by integrating the model with the

morphogenesis models of sheath. inter node and panicle within the framework of plant topology In addition, the present leaf architecture model may be combined with a leaf emergence model and a leaf curvature model for digital representation of light interception and utilization within the leaf canopy of rice (C) 2009 Published by Elsevier B V. on behalf of Royal Netherlands Society for Agricultural Sciences.

【题目】Modeling plant carbon flow and grain starch accumulation in wheat
【中文关键词】仿真模型;碳流;淀粉积累;;冬小麦籽粒产量
【英文关键词】simulation model; carbon flow; starch accumulation; grain yield; winter wheat
【中文摘要】淀粉的积累的过程在粮食直接影响小麦产量和品质的形成。因为很少有研究是旨在建模谷物淀粉的积累,本研究旨在开发一个简化的流程模型预测的速度在小麦籽粒淀粉的积累通过关注植物碳的变化动态邮报开花。五个不同的实验中,基因型、氮率和水政权支持模型进行开发和模型评价。该模型提出淀粉积累速率(STR)在个体粮食是由碳源的可用性在植物(GCA(我))和淀粉合成的能力在谷物(f(一个(我))),如温度等诸多因素的影响,水和氮条件在植物。f(一个(我))可以被描述在一个双节的曲线与邮报开花期发育程度天(GDD),第一个指数增加,然后线性降低。甘氨胆酸的(我)是由碳同化和碳开花期后再活化从营养器官谷物。一个基因型的参数被纳入模型算法,即最高税率个人谷物淀粉的积累,区分的能力在品种淀粉的积累。的总体性能模型不同的数据集,验证了从三个领域跨越3年,组成的实验不同基因型、氮和水位。所有的治疗方式的RMSE值是平均为12.51%,这表明一个合适的模拟和观测数据之间。看来,该模型可以给一个可靠的预测谷物淀粉的积累在各种不同的小麦品种的生长环境。(c)2006爱思唯尔帐面价值保留所有权利。
【英文摘要】The process of starch accumulation in grain directly influences the yield and quality formation in wheat. Since few studies have been aimed at modeling the grain starch accumulation, this study was undertaken to develop a simplified process model for predicting the rate of starch accumulation in wheat grain by focusing on the variation of plant carbon dynamics post-anthesis. Five different experiments involving genotypes, nitrogen rates and water regimes were conducted to support model development and model evaluation. The model proposed that the starch accumulation rate (STR) in individual grain was determined by the availability of carbon source in plant (GCA(i)) and the ability of starch synthesis in grain (f(A(i))), as influenced by the factors of temperature, water and nitrogen conditions within plants. The f(A(i)) could be described in a two-section curve with post-anthesis growing degree days (GDD), first exponential increase and then linear decrease. The GCA(i) was determined by post-anthesis carbon assimilation and carbon remobilization from vegetative organs to grains. A genotypic parameter was incorporated into the model algorithm, i.e. the maximum rate of individual grain starch accumulation, to differentiate the ability of starch accumulation among cultivars. The overall performance of the model was validated with different data sets from three field experiments spanning 3 years and comprising various genotypes, nitrogen and water levels. The RMSE values for all treatments were averaged as 12.51%, indicating a good fit between the simulated and observed data. It appears that the model can give a reliable prediction for grain starch accumulation of different wheat cultivars under various growing conditions. (c) 2006 Elsevier B.V. All rights reserved.

【题目】Spatial distribution of leaf area index and leaf N content in relation to grain yield and nitrogen uptake in rice

【中文关键词】粮食产量;叶面积指数、叶N内容;N吸收;空间分布
【英文关键词】grain yield; leaf area index; leaf N content; N uptake; spatial distribution
【中文摘要】探索方法来优化空间分布的叶面积指数(LAI)和叶片氮含量(LNC)应该被用于增加粮食产量在水稻高产唾液)。摘要本研究的主要目的是为了描述的变化和LNC内赖分布林冠与籽粒产量和氮素吸收在大米。两个实验不同N施肥利率在常规和间歇灌溉(CI和二世,分别在2002年和2003年进行,使用Wuyujing9粳米品种。结果表明:籽粒产量和氮素吸收明显不同应用程序之间比率的N(N利率),但没有差别CI和II。全赖分布影响显著的标题N率但并不的灌溉方法。个人LAI与N率增加。达到一个高收益,合理分配赖在树冠上可以被设计为最大的2(nd)叶从顶部,其次是3(rd)和4(th)的叶子,最小的在顶部的叶。LNC两地区的基础上和干物质在15日内完整标题减少从上到较低的叶子在树冠上,与N率明显增加。粮食产量提高了线性随着N含量翻斗两叶,可是因为高N含量较低的叶子。这些结果表明,空间分布情况,都可以优化LNC和赖以获得最大的树冠光合作用和产量在大米。
【英文摘要】Exploring approaches to optimizing spatial distributions of leaf area index (LAI) and leaf nitrogen content (LNC) should be useful for increasing grain yield in rice (Oryza saliva). The primary objective of this study was to characterize the variation of LAI and LNC distributions within the canopy in relation to grain yield and N uptake in rice. Two experiments with different N fertilization rates under conventional and intermittent irrigation (CI and II, respectively) were conducted in 2002 and 2003, using Japonica rice cultivar Wuyujing9. The results showed that grain yield and N uptake were significantly different among application rates of N (N rates), but did not differ between CI and II. LAI distribution at full heading was affected significantly by N rate but hardly by the irrigation method. Individual LAI increased with the N rate. To achieve a high yield, the proper distribution of LAI in the canopy can be designed as the largest in the 2(nd) leaf from the top, followed by the 3(rd) and 4(th) leaves, and the smallest in the top leaf. LNC on the base of both area and dry matter at 15 days after full heading decreased from the top to lower leaves in the canopy, and significantly increased with the N rate. Grain yield was enhanced linearly with the increasing N content of the tipper two leaves, but hindered by the high N content of lower leaves. These results indicate that the spatial distributions of both LNC and LAI could be optimized to achieve maximum canopy photosynthesis and grain yield in rice.

【中文摘要】由土壤、品种、天气和管理数据库和集成基于流程的增长模型,模拟形态模型和可视化模型,提出一种基于数字和视觉小麦生长系统(MDVWGS)是使用基于组件的软件开发和可视化技术。该系统是由网络编程框架和语言的c#和CsGL库是用于实现2 d和3 d图形应用程序和可视化。实现的系统可以用于预测增长过程和可视化的小麦植株形态结构在各种环境中,基因型和管理策略,并有函数作为数据管理、动态模拟、战略评估,实时预测,时间和空间分析,可视化输出、专家咨询和系统的帮助。这个MDVWGS应该用于建设和应用数字农业系统和提供精确的和科学的工具品种设计、文化监管和生产力评估在不同的生长条件。
【英文摘要】Driven by soil, variety, weather and management databases and integrating process-based growth simulation model, morphological model and visualization model, a model-based digital and visual wheat growth system (MDVWGS) was developed using component-based software and visualization techniques. The system was programmed by the Net framework with the language of C# and CsGL Library was used for realizing 2D and 3D graphics application and visualization. The implemented system could be used for predicting growth processes and visualizing morphological architecture of wheat plant under various environments, genotypes and management strategies, and has the functions as data management, dynamic simulation, strategy evaluation, real-time prediction, temporal and spatial analysis,visualization output, expert consultation and system help. The MDVWGS should be useful for construction and application of digital farming system and provide a precise and scientific tool for cultivar design, cultural regulation and productivity evaluation under different growing conditions.

【题目】Development of a growth model-based decision support system for crop management.
【中文关键词】模拟
【英文关键词】SIMULATION
【中文摘要】增长基于模型的决策支持系统的开发GMDSSCM作物管理(包括基于流程模型的4不同的作物,如小麦、水稻、油菜和棉花。这个系统的目标是在促进仿真和应用的作物模型为不同的目的。个人模型模拟为每个包括六子形势的发展,器官形成、生物质生产、产量和品质的形成,作物水分关系、营养(N,P,K)平衡。实现的系统可以用于评估个体和综合管理策略基于作物生长模拟的结果在不同环境和不同基因型。4单机版(GMDSSCM,4)是建立在平台vc++和VB的特点,采用面向对象和基于组件的软件和与有效的集成和耦合的增长预测与决策功能。4基于web的系统(GMDSSCW是进一步发展在一个网络平台使用c#语言。这些GMDSSCM系统已被用于预测动态作物生长和做出决策对于管理系统。这个工具应该有利于建设和应用信息和数字农业系统。
【英文摘要】Growth model-based decision support system for crop management (GMDSSCM was developed including process based models of 4 different crops, i.e. wheat, rice, rapeseed and cotton. This system aims in facilitating simulation and application of crop models for different purposes. Individual models each include six submodels for simulating phasic development, organ formation, biomass production, yield and quality formation, soil-crop water relations, and nutrient (N, P, K) balance. The implemented system can be used for evaluating individual and comprehensive management strategies based on the results of crop growth simulation under various environments and different genotypes. 4 Stand-alone version (GMDSSCM,4) was established under the platforms VC++ and VB by adopting the characteristics of object-oriented and component-based software and with the effective integration and coupling of the growth-prediction and decision-making functions. 4 web-based system (GMDSSCW was further developed on a net platform using C# language. These GMDSSCM systems have been used to predict dynamically crop growth and to make decisions regarding to management systems. This tool should be helpful for construction and application of informational and digital farming systems.

【题目】水稻籽粒蛋白质积累的模拟模型研究
【中文关键词】水稻; 氮素积累; 氮素转运; 籽粒蛋白质; 模拟模型;
【英文关键词】Rice; Nitrogen accumulation; Nitrogen translocation; Grain protein; Simulation model;
【中文摘要】【目的】蛋白质含量是稻米的重要品质指标。通过解析和综合水稻植株氮素积累和转运的动态规律及其与环境因子和基因型的定量关系,构建一个基于氮流生理过程的水稻籽粒蛋白质形成模拟模型,以期为水稻生产中籽粒蛋白质指标的动态预测和管理决策提供量化工具。【方法】以田间试验资料为基础,结合已有水稻生长模型,采用生理发育时间作为定量生育进程的尺度,通过解析和综合水稻植株氮素积累和转运动态的基本规律及其与环境因子和基因型的定量关系,构建花前植株氮素吸收与积累、花后氮素吸收与转运及籽粒蛋白质形成过程的模拟模型。【结果】利用不同年份、不同生态点、不同品种类型和不同肥水条件下的大田试验资料对籽粒蛋白质形成模型进行了检验,籽粒蛋白质含量模拟值与观测值之间的决定系数大于0.84,根均方差(RMSE)小于0.26%。表明模型具有较好的通用性和可靠性,可以较准确地预测不同条件下的水稻籽粒蛋白质含量与蛋白质产量【。结论】基于植株氮素积累和转运的生理生态过程,以生理发育时间为主线,建立了较为简化的水稻籽粒蛋白质积累动态的模拟模型,模型的研究不仅为定量预测不同生态与肥水条件下不同水稻品种籽粒蛋白质含量与蛋白质产量的动态变化奠定了基础,而且是对国内外现有水稻生长与产量模拟模型的发展和完善。
【英文摘要】【Objective】Protein content of grain is an important quality index of rice product. Analyzing the dynamic rule of nitrogen assimilation and translocation in rice plant and relationship, this study will development a simulation model on formation of grain protein based on the development process to predict rice grain protein content and yield under different ecological environmental conditions.【Method】On the basis of the field experiments with different cultivars and nitrogen levels, using physiological development time (PDT) as general time scale of development progress, the fundamental dynamic relationships between plant nitrogen accumulation and translocation and environmental and genetic factors were quantified and a simplified and explanatory simulation model was established to predict the processes of nitrogen uptake and partitioning in plant and protein formation in grain of rice by integrating with a rice growth model (RiceGrow).【Result】The model was validated using the data sets of different years, eco-sites, varieties, N fertilization and irrigation conditions with the RMSE 0.22%-0.26%. The results indicate that the model is accurate and applicable for predicting grain protein content and grain protein yield of rice under various environments.【Conclusion】Using PDT as general time scale of development progress, this study developed the simulation model on rice grain protein formation based on nitrogen assimilation and translocation, which might predict rice grain protein content and yield under different ecological environment conditions, and expanded and perfected the exist rice growth models on quality prediction

【题目】水稻叶龄与叶面积指数动态的模拟研究

【中文关键词】水稻; 叶龄; 叶面积指数; 比叶面积; 模拟模型;

【英文关键词】rice; leaf age; leaf area index; specific leaf area; simulation model;

【中文摘要】依据不同类型品种的播期试验和氮肥试验结果,建立了水稻叶龄与叶面积指数(LAI)的模拟模型。叶龄模型采用幂函数描述叶片出生与播后累积热时间(TTS)的关系,TTS的计算定量了温度与出叶速率之间的非线性关系。叶面积指数模拟包括两个阶段:在指数生长阶段,LAI随播后累积生长度日(GDD)呈指数式增长,同时受到氮素营养水平调节;当LAI≥1.6时进入非指数生长阶段,采用比叶面积法模拟,LAI是比叶面积与绿叶干物质量的乘积。绿叶干物质量是绿叶分配指数与地上部干物质量的乘积,比叶面积(SLA)为GDD的函数,同时考虑植株氮素营养因子对SLA的影响。利用生态条件和栽培条件差异较大的试验资料对模型进行了验证。结果表明,模型能较好地模拟不同条件下叶片的出生动态和LAI变化动态,表现出较强的适用性,具有参数少、易确定、简便实用的特点。 更多还原

【英文摘要】Based on the field experiments using different type rice varieties under different sowing dates and nitrogen application levels,the leaf age and leaf area index(LAI)simulation models were established.A power function was used to describe the non-linear relationship between leaf appearance and accumulated thermal time after sowing(TTS).The LAI model contained two consecutive phases:at exponential expansion phase(LAI<1.6),LAI increased exponentially with the accumulated growing degree days after sowing(GDD)and was regulated by the nitrogen level;when LAI≥1.6,leaf area expansion was quantified on the bases of specific leaf area(SLA)and green leaf dry weight.SLA was mainly determined by GDD and nitrogen nutrition index,and green leaf dry weight was calculated as the product of its partitioning index and shoot dry weight.Validation of the models using the experiment data with a wide range of ecological and cultivated conditions showed that the two models could accurately simulate the leaf appearance and LAI dynamic under different environments.Thus,the models might be widely adaptable and applicable,which needs only a few and simple parameters.

【题目】水稻叶片伸长过程的模拟模型
【中文关键词】水稻; 叶长; 叶宽; 叶型; 动态; 模拟模型;
【英文关键词】Rice; Leaf length; Leaf width; Leaf shape; Dynamic; Simulation model;
【中文摘要】水稻叶片生长过程的动态模拟,对于实现水稻生长的数字化和可视化表达具有重要的理论意义和应用价值。本研究以4个不同株型的水稻品种为试验材料,通过对水分试验、氮素试验条件下不同叶位叶片的叶长、叶宽特征进行连续观测,综合分析了水稻叶片几何形态指标随生育进程和环境条件的变化规律,进而构建了水稻叶片生长过程的动态模拟模型。模型采用Logistic方程描述了水稻主茎及分蘖叶片随生长度日(GDD)的动态伸长过程;利用二次曲线描述了叶宽随GDD的动态变化过程;分别用幂函数和一元二次方程描述了叶形(不同叶长处的叶宽)的动态变化过程;另外,以叶片氮素和水分因子分别描述了不同水氮水平对叶片形态建成过程的定量影响。同时利用独立的水稻田间试验资料对所建模型进行了测试和检验,主茎和分蘖动态变化叶长、叶宽的均方根差(RMSE)分别为3.6cm、3.96cm以及3.15cm、3.56cm。表明本模型对水稻叶片的动态伸长过程具有较好的预测性和解释性。 更多还原
【英文摘要】Modeling leaf growth dynamics in rice is of significant importance for realizing virtual and digital plant growth. Based on time-course observations on leaf morphological properties (leaf length and leaf width) on main stems and tillers under different nitrogen rates and water regimes with four rice cultivars, the change patterns of leaf morphology with growth progress and environmental factors were characterized, and a dynamic model was developed to simulate time-course growth characters of different leaves on rice plant. The growth dynamics of leaf length on stem and tiller could be described with a logistic model, leaf width with conic equation, and leaf shape with exponential function and quadratic equation. The effects of nitrogen and water conditions on leaf growth were quantified by the effective values of leaf nitrogen concentration and water content. The model was validated with independent field experiment data of different nitrogen rates, and the mean RMSEs of dynamic leaf length were 3.60 cm and 3.96 cm, those of leaf width were 3.15 cm and 3.56 cm on main stem and tillers, respectively. The results indicated that the present model had a good performance in predicting morphological growth of leaf on stem and tiller in rice plant. 更多

【题目】基于模型与GIS的小麦籽粒品质空间差异分析
【中文关键词】小麦; 籽粒品质; 预测模型; GIS; 空间变异;
【英文关键词】wheat; grain quality; prediction model; GIS; spatial variation;
【中文摘要】【目的】基于小麦籽粒品质预测模型和GIS技术,探索主要籽粒品质指标区域模拟与空间变异分析的方法。【方法】首先利用文献资料对已有小麦籽粒品质预测模型进行验证和评价,并基于江苏省40个生态点2000-2003年逐日气象数据和5个生态点、6个品种类型的小麦田间试验数据,对籽粒品质预测模型进行先计算后插值(calculate first,interpolate later,CI)和先插值后计算(interpolate first,calculate later,IC)两种升尺度方法的研究与评价;在此基础上进行小麦籽粒蛋白质含量、湿面筋含量和沉降值3项籽粒品质指标的区域模拟;最后,运用GIS和地统计学方法,分析江苏省3项籽粒品质指标的空间变异,获取3项籽粒品质指标的空间分布栅格图。【结果】IC方法的模拟精度较高,3项籽粒品质指标在不同地点、不同品种上的模拟值与实测值的RMSE基本小于20%;江苏省3项小麦籽粒品质指标在最大变程7.16km范围内显著相关,表现为东西经向和南北纬向变异较大的各向异性分布;空间栅格图能直观显示3项籽粒品质指标的空间分布以及纬度和经度方向的变

异趋势。【结论】利用基于IC的小麦籽粒品质模型升尺度方法进行区域籽粒品质模拟和空间变异分析是可行的,为小麦籽粒品质的生态变异研究提供了参考。

【英文摘要】Objective The aim of this study is to explore the method of simulating the grain quality index and analyzing the spatial variation characteristics based on GIS and wheat quality index prediction model.Method Firstly,literature data with five varieties at five eco-sites were used for the evaluation of grain quality model at site scale.Secondly,based on the weather data sets of 2000-2003 at 40 eco-sites in Jiangsu province and experimental data from five eco-sites and six wheat cultivars,three main wheat grain quality indices at regional scale were calculated with two methods such as ’calculate first,interpolate later’(CI)and ’interpolate first,calculate later’(IC).Finally,the spatial variation characteristics of three wheat grain quality indices in Jiangsu province were analyzed,and three spatial distribution raster maps for grain protein content,wet gluten content and sedimentation were made based on the geo-statistics and GIS.Result The IC was suggested to be preferable for up scaling the grain quality model,with the RMSE less than 20% between simulated and observed values for three quality indices.The spatial autocorrelation of grain protein content,wet gluten content and sedimentation under research region was significant within the 7.16 km variation range,and the anisotropic structure varies more evidently in longitudinal and latitudinal directions.The spatial raster maps could show the distribution and the variation trend of regional grain quality effectively.Conclusion The result indicated that the IC based simulation on regional spatial variation of wheat grain quality is feasible.This study might provide reference for analysis of ecological variation on crop quality.

【题目】水稻冠层光合有效辐射的时空分布特征
【中文关键词】水稻; 光分布; 透光率; 光合有效辐射; 消光系数;
【英文关键词】rice(Oryza sativa L.); light distribution; transmittance; photosynthetically active radiation(PAR); extinction coefficient.;
【中文摘要】以2个不同株型水稻品种为材料,设置高、中、低3个施氮水平,利用SunScan冠层分析仪于灌浆期系统测定了不同施氮水平下不同株型水稻品种植株形态和冠层内光合有效辐射(PAR)的时空分布状况.结果表明:施氮量对水稻株高、穗弯曲度和茎叶夹角有明显影响;群体叶面积的垂直分布呈中部>上部>下部的分布特征,最大分层叶面积指数(LAI)出现在0.60相对高度处.冠层内平均PAR透光率从顶部向下递减,且在冠层上中部递减迅速,下部递减缓慢;平均PAR透光率随施氮量的增加而递减;平均PAR透光率日变化表现为早晚较低,中午较高;平均PAR透光率随向下累积LAI的增加呈指数递减,群体消光系数K的日变化表现为早晚较高,中午较低,灌浆期的K值介于0.35~0.50.水稻冠层内PAR的三维空间分布表现为冠层上中部水平面上PAR透光率高,光斑面积大;下部水平面上PAR透光率低,光斑少;同一冠层高度水平面上的PAR光强呈不均匀分布.株型紧凑的水稻品种,冠层透光率高,透光率日变化大,群体消光系数小.　更多还原
【英文摘要】Field experiments were conducted in Nanjing in 2007 and 2008,involving two rice cultivars and three nitrogen application rates.The plant morphology and spatiotemporal distribution of PAR at different canopy heights were measured at filling stage with SunScan canopy analysis system.Nitrogen application rate had significant effects on the plant height,panicle curvature,and leaf angle of rice.The leaf area was greater in mid canopy than in upper and basal canopy.The maximum leaf area index(LAI) layer appeared at 0.60 of relative canopy height.The average PAR transmittance decreased from top to bottom in rice canopy,exhibiting a quick attenuation within the upper and mid canopy and a slow reduction within the basal canopy.In addition,the average PAR transmittance at different canopy heights decreased with increasing nitrogen application rate.The diurnal variation of average PAR transmittance was greater at noon than in the morning and afternoon.With increasing LAI accumulation,the average PAR transmittance at different canopy heights decreased in an exponential pattern.The diurnal variation of population extinction coefficient(K) was smaller at noon than in the morning and afternoon,and the K value was in the range of 0.35 -0.50.The 3-dimensional distribution of PAR in rice canopy indicated that the PAR transmittance on horizontal plane was greater,and exhibited much more light flecks in upper and mid canopy than in basal canopy.The PAR density distribution at the same canopy height was non-uniform on the horizontal plane.Higher PAR transmittance,greater diurnal variation of PAR transmittance,and smaller population extinction coefficient were observed for the erect plant type rice cultivar.

【题目】小麦生长模拟模型(WheatGrow)的适应性评价
【中文关键词】小麦; WheatGrow模型; 适应性; 评价;
【英文关键词】Wheat; Model of WheatGrow; Adaptability; Evaluation;
【中文摘要】为对小麦生长模拟模型(WheatGrow)的稳定性和适应性进行测试与评价,基于IoA(一致性系数)、MAE(绝对平均误差)和NRMSE(标准根均方差)等指标,利用不同地点、年份、品种、氮素及播期的小麦田间试验资料对模型进行校正和检验。结果表明,WheatGrow模型对小麦生育期模拟值与实测值的误差为0~9 d,在南京、徐州、泰安和保定地区对叶面积指数、地上部干物重和产量的模拟值与实测值比较的NRMSE平均值分别为12.56%~20.78%、11.37%~20.85%和2.37%~6.99%,说明模型对各生态点具有较好的模拟效果,能较好地应用于区域适应性验证的研究。
【英文摘要】The objective of this study was to test and evaluate the stability and applicability of the model using the datasets involved various conditions based on WheatGrow model.WheatGrow model was calibrated and validated by datasets from different ecological sites,years,cultivars and treatments using statistics methods,i.e.,IoA,MAE,NRMSE,etc.The results showed that the errors between simulated and observed main development stage were 0-9 days,the mean NRMSE between simulated and observed LAI,dry matter

weight and yield were 12.56%~27.37%,11.37%~28.43% and 2.37~6.99% in Nanjing,Xuzhou,Tai＇an,and Baoding,respectively,which indicated that WheatGrow had a good predictability on various sites and would lay a foundation for wheat productivity and its early warning.

【题目】水稻地上部干物质积累动态的定量模拟
【中文关键词】水稻; 干物质积累; 辐热积; 生长分析; Richards方程;
【英文关键词】rice (Oryza sativa L.); dry matter accumulation; product of thermal effectiveness and PAR; growth analysis; Richards equation.;
【中文摘要】选用4个不同株型水稻品种进行不同施氮水平的田间试验,于主要生育期测定植株地上部干物质积累量(DMA),并对DMA及出苗至成熟期累积辐热积(TEP)进行归一化处理,建立了基于相对DMA(RDMA)和相对TEP(RTEP)的水稻相对干物质积累(RDMA)动态模型,进而定量分析了水稻干物质积累过程的动态特征.结果表明:Richards方程能够准确描述水稻地上部干物质积累的动态模式,具有明确的生物学意义,具体方程式为RDMA=1.0157/(1+e3.6329-7.5907×RTEP)1/0.5574,r=0.9938;利用独立的水稻田间试验资料对所建模型进行了检验,水稻不同RTEP所对应的DMA观测值与模拟值之间的根均方差为0.86t.hm-2.根据水稻地上部干物质积累速率方程的2个拐点,可将整个干物质积累过程划分为前、中和后期3个阶段,发现水稻干物质最大积累速率及其出现时的相对辐热积和相对干物质积累量分别为2.24、0.56和0.46. 更多还原
【英文摘要】A field experiment with four rice (Oryza sativa L.) cultivars and different nitrogen application rates was conducted,with the dry matter accumulation (DMA) in the cultivars aboveground part measured at their main growth stages. The dynamic model of relative dry matter accumulation (RDMA) was established with the normalized DMA and TEP (product of thermal effectiveness and PAR) from emergence to maturity,and the temporal characteristics of DMA changes was quantitatively analyzed based on the RDMA model. The dynamic changes of the RDMA could be well described with Richards equation,i.e.,RDMA=1.0157/(1+e3.6329-7.5907×RTEP)1/0.5574 (r=0.9938). The model was validated with independent field experiment datasets,involving different eco-sites,cultivars,and nitrogen application rates. The RMSE (root mean square error) between the simulated and observed values of DMA at varied RTEP was 0.86 t · hm-2. According to the two inflexion points of dry matter accumulation rate equation,the whole process of dry matter accumulation could be divided into early,middle,and late phases. The maximum dry matter accumulation rate (ARmax),relative TEP at ARmax,and relative dry matter accumulation at ARmax were found to be 2.24,0.56,and 0.46,respectively.

【题目】逐日气象要素空间插值方法的比较
【中文关键词】逐日气象要素; 空间插值方法; 栅格化;
【英文关键词】daily meteorological elements; spatial interpolation method; rasterization;
【中文摘要】采用距离反比权重法(IDW)、协克里格法(CK)和薄盘样条法(TPS)3种不同的空间插值方法,对我国1951—2005年气象数据完整的559个气象站点逐月第15日的平均基本气象要素(最高气温、最低气温、日照时数和降水量)进行了插值分析与评价.结果表明:3种插值方法中,TPS法对最高气温和最低气温插值的根均方差(RMSE)最小(1.02℃和1.12℃)、R2最大(0.9916和0.9913);不同季节中,TPS法对秋季最高气温、夏季最低气温进行插值的RMSE均最小(0.83℃、

0.86°C),R2均为秋季最高.对于日照时数和降水量而言,TPS法的RMSE最小(0.59h和1.01mm)、R2最大(0.9118和0.8135);不同季节中,TPS法对冬季日照时数进行插值的RMSE最小(0.49h)、R2最大(0.9293),TPS法对冬季降水量进行插值的RMSE最小(0.33mm),IDW法对夏季降水量进行插值的RMSE最小(2.01mm),CK法对春季降水量进行插值的R2最大(0.8781).TPS法可作为我国大量逐日基本气象要素的最优空间插值方法. 更多还原

【英文摘要】A comparative study was made to evaluate the methods of inverse distance weighting (IDW), co-kriging (CK), and thin plate spline (TPS) in interpolating the average meteorological elements (including maximum air temperature, minimum air temperature, sunshine hours, and precipitation) of the 15th day per month from the 1951-2005 comprehensive observation data of 559 meteorological stations in China. The results showed that the RMSEs for the maximum and minimum air temperature in a year interpolated by TPS were the smallest (1.02 °C and 1.12 °C, respectively), and the R2 between the observed and predicted values were the highest (0.9916 and 0.9913, respectively), compared with those interpolated by IDW and CK. In four seasons, the smallest RMSEs for the maximum and minimum air temperature interpolated by TPS were observed in autumn (0.83 °C) and summer (0.86 °C), respectively, and the R2 between the observed and predicted values interpolated by TPS were higher in autumn than in other seasons. The RMSEs for the sunshine hours and precipitation in a year interpolated by TPS were the smallest (0.59 h and 1.01 mm, respectively), and the R2 between the observed and predicted values were the highest (0.9118 and 0.8135, respectively), compared with those interpolated by IDW and CK. In four seasons, the RMSE for the sunshine hours in winter interpolated by TPS was the smallest (0.49 h), and the R2 between the observed and predicted sunshine hours was the smallest (0.9293). The RMSE for the precipitation in winter interpolated by TPS was the smallest (0.33 mm), while the RMSE for the precipitation in summer interpolated by IDW was the smallest (2.01 mm). The R2 between the observed and predicted precipitation in winter interpolated by CK was the highest (0.8781). It was suggested that TPS could be the optimal spatial interpolation method in interpolating and rasterizing the daily meteorological elements in China.

【题目】蚯蚓对果皮、菜叶混合垃圾堆制产物生物学性状的影响
【中文关键词】蚯蚓堆制;赤子爱胜蚓;果皮、菜叶混合垃圾;生物学性状
【英文关键词】Vermicomposting;Eisenia foetida;Pericarp and vegetable offal;Biological properties
【中文摘要】采自南京市卫岗菜市场的果皮、菜叶,加入不同比例木屑后,接种赤子爱胜蚓(Eisenia foetida)进行室内堆制处理,在室内堆制60 d后,分析了接种蚯蚓对堆制产物主要生物学性状的影响。结果表明:蚯蚓堆制处理显著增加了堆制产物的呼吸强度、脱氢酶活性和微生物量碳、氮含量;提高了堆制产物真菌的数量,降低了堆制产物细菌和放线菌的数量。木屑的加入进一步提高了微生物的活性,增加微生物的数量。其中,加入40%木屑处理接种蚯蚓后综合效果最佳,是提高和改善果皮、菜叶混合垃圾的生物学特性,并进而使其转化为作物生长基质的有效措施。
【英文摘要】Saw dusts were added to mixed waste of pericarp and vegetable offal sampled from Weigang food market of Nanjing. Eisenia foetida was used and inoculated in the mixture of pericarp, vegetable and saw dusts under optimal moisture, propriety temperature and inoculation density in laboratory. Effects of vermicomposting on biological properties of vermicomposts were studied. The results showed that Eisenia foetida significantly increased respiration intensity, dehydrogenase activity, microbial biomass C and microbial biomass N, increased the number of fungi, and decreased the numbers of bacteria and actinomyces of the vermicomposts. Furthermore, addition of saw dusts had improved the number and activities of microorganisms, and the effect of 40% saw dusts treatment was the best. That indicated that the addition of 40% saw dusts and inoculation of earthworms were effective measures to improve the biological properties of vermicomposts.

【题目】Mice Cloned from Induced Pluripotent Stem Cells (iPSCs)1
【中文关键词】无 无
【英文关键词】cloning, developmental biology, embryo, induced pluripotent
stem cell, nuclear transfer, reprogramming, stem cell
【中文摘要】无
【英文摘要】Differentiated somatic cells of various species can bereprogrammed into induced pluripotent stem cells (iPSCs) byectopically expressing a combination of several transcriptionfactors that are highly enriched in embryonic stem cells (ESCs).The generation of iPSCs in large animals has raised the possibilityof producing genetically modified large animals through thenuclear transplantation approach. However, it remains unknownwhether iPSCs could be used for generating clonedanimals through the nuclear transfer method. Here, we show thesuccessful production of viable cloned mice from inducibleiPSCs through the nuclear transfer approach, and the efficiencyis similar to that of using ESCs derived via normal fertilization.Furthermore, the cloned mice are fertile and can producesecond-generation offspring. These efforts strengthen the possibilityof utilizing iPSCs to generate gene-modified large animalsfor pharmaceutical purposes in the future.

【题目】Cloning of Tryptophan Monoxygenase Gene in Pseudomonas syringaeand Transformation into Cucumber
【中文关键词】iaaM基因 基因克隆 载体构建 黄瓜 转化
【英文关键词】iaaM gene, gene clone, vector construction, cucumber, transformation
【中文摘要】通过PCR从假单胞杆菌P. syringae pv. Syringae 3023中克隆得到色氨酸单加氧酶iaaM基因,结果表明克隆序列全长为1674 bp,GENBANK登录号为AY530536。采用同样的方法从番茄栽培种东农706中克隆得到启动子2A12。本试验构建了携带iaaM基因的载体pCAM-2AiaaT,该载体由果实特异性启动子2A12驱动。通过根癌农杆菌将iaaM基因转入黄瓜栽培种649中,并采用PCR和Southern杂交技术验证转基因黄瓜。
【英文摘要】Tryptophan monoxygenase iaaM gene was cloned from P. syringae pv. syringae3023 by PCR. The results of nucleotide sequence determination showed that thecomplete nucleotide sequence was 1674 bp in length, and the GENBANK accessionnumber was AY530536. The 2A12 promoter gene was cloned from tomato cultivarDongnong 706 by using the same method. We constructed the expression vectorpCAM-2AiaaT with the iaaM gene, and driven by fruit specific promoter 2A12. TheiaaM gene was transferred into cucumber cultivar 649 mediated by Agrobacteriumtumefaciens, and transgenic cucumber plants were confirmed by PCR and Southernblot.

【中文关键词】黄瓜 叶片 cDNA文库 细菌性角斑病
【英文关键词】Cucumis sativus L.,leaf,cDNA library, Pseudomonas syringae pv. Lachrymans
【中文摘要】文章以接种细菌性角斑病原菌48h的抗病品种‘D0462’黄瓜叶片为材料, 构建了黄瓜叶片cDNA文库,文库插入片段大小为0.45~2.1 kb 之间, 平均长度为1 kb。随机选取2966个克隆进行测序, 共拼接出2352个假定独立转录本(TUTs), 其中包括282个重叠群(Contigs), 2070个单拷贝EST(Singlets)。经BlastX 分析共获得已知功能和未知功能基因1848个,无序列相似性新基因504 个。文库中含有大量防御/抗病基因, 如金属硫蛋白、谷胱甘肽-S-转移酶、泛素、 β -1, 3-葡聚糖酶、锌指蛋白和半胱氨酸蛋白酶等, 这些基因很可能参与了植物与病原菌互作过程。

【英文摘要】A cDNA library was constructed from the leaves of the disease-resistant cucumber (Cucumis sativus L.) cultivar ‘ D0462 ’ challenged by Pseudomonas syringae pv. Lachrymans for 48 h. The inserted fragment sizes ranged from 0.45 to2.1 kb and the average inserted size was 1 kb. Sequencing analysis showed that 2 352 TUTs (Tentative unique transcripts),282 contigs, and 2 070 singlets were identified in the 2 966 ESTs derived from the cDNA library. The result of the BlastX analysis indicated that there were 1 848 ESTs with known or unknown function, 504 ESTs with no significant similarity matching with any protein or DNA sequence in the databases. In this library, many defense/disease-resistant related genes,such as metallothionein, glutathione S-transferase, ubiquitin, β - 1, 3-glucanase, zinc finger protein, and cysteine protease, which might participate in the plant and the pathogens, are inclued.

【题目】黄瓜叶片大小解剖结构的对比研究
【中文关键词】黄瓜叶片 解剖结构 对比
【英文关键词】words: cucumber leaf, anatomical structures, contrast
【中文摘要】通过制作石蜡切片对4个黄瓜品种在3个时期的解剖结构进行了观察。其中D9320、D2005 为叶面积大品种,D0455、D0401为叶面积小品种。结果表明,D9320、D2005叶面积大的原因是细胞平均面积大,而非数量多;D0401、D0455叶面积小的原因是细胞平均面积小,而非数量少。黄瓜叶为典型异面叶,表皮由一层紧密的形状不规则的表皮细胞组成,维管组织较发达,导管分布较多,上下表皮均分布有表皮毛,但以下表皮为主。
【英文摘要】Through the production of paraffin sections, anatomical structures of the four cucumber varietiesin three period were observed. D9320 and D2005 were big leaf area varieties, D0455 and D0401 were small leaf area varieties. The results showed that the big leaf area of D9320 and D2005 was the result of big average cell area, rather than cell quantity. Cucumber leaf was typical bifacial leaf, epidermis composed with cells that were close and irregular shapes, had more developed vascular tissue and more vessel, there were trichomes in upper epidermis and lower epidermis, but mainly in lower epidermis.

【题目】水果型黄瓜新品种东农804的选育
【中文关键词】水果型黄瓜 东农804 一代杂种
【英文关键词】Mini-cucumber, Dongnong 804, F1 hybrid
【中文摘要】东农804是利用优势育种法选育的水果型黄瓜一代杂种。母本D0420是强雌性自交系, 父本D0202是高代稳定自交系。植株长势强,叶片深绿色,茎秆粗壮,分枝少、主蔓结瓜,节成性好,第7~8节以上每节有瓜,高抗细菌性角斑病和枯萎病, 抗霜霉病、白粉病。瓜长22 ~ 24 cm, 瓜粗3cm左右,单瓜质量150~180g,标准瓜率大于85%。果实深绿色,有光泽,瓜腔小于瓜横径1/2,每667m2产量3800~ 4300kg。适宜在华北、东北地区春秋保护地栽培。
【英文摘要】“ Dongnong804 ”is a new mini-cucumber F1 hybrid bred by using heterosis breeding. Thefemale D0420 is strong female inbred line, and the male D0202 is inbred line. It grows vigo rously. Itsleaf is dark green and the vine is thick and strong. It bears fruits main ly in its main stem with high rate of fruit-setting and low rate of branch ing. It is highly resistant to bacterial augu lar leaf spot and Fusarium wilt,resistant to downy mildew and pow dery mildew. Its fruit is dark g reen,lustrous, 22 - 24 cm in length,about 3cm in diameter, and 150- 180 g in weight The standard fruit rate is above 85% . The length of fru it cavity is below 1/2. It yields 57.0- 64.5 t/ hm-2.

【题目】Transcriptome profile analysis of floral sex determination in cucumber
【中文关键词】黄瓜 雌性突变体 性别分化 Solexa测序 转录谱
【英文关键词】Cucumber Gynoecious Sex determination Solexa sequencing Transcriptome profile
【中文摘要】黄瓜作为一种花朵性别的模式植物被广泛研究。本试验采用Solexa技术,研究了雌性变种(Csg-G)和雌雄同株(Gsg-M)黄瓜根尖组织的全基因转录谱,以分离性别分化相关基因。图谱分析表明大部分基因表达的改变归因于突变,突变导致600个基因下降调节,143个基因上升调节。RT-PCR和qRT-PVR进一步证明了Solexa的数据结果。Geneontology(GO)分析表明基因表达的差异主要表现在细胞成分的发生、转化及形成,大分子和细胞生物合成、定位、确立、转化等活动。此外,雌性突变体一些相关基因的主要在花朵的发育阶段及花朵组织中表达。这些结果反映出调控黄瓜性别的两个重要改性,第一,相关基因的差异表达作用于植物的激素信号途径,如ACS, Asr1, CsIAA2, CS-AUX1和TLP,说明植物激素及其干扰作用在性别分化过程起到重要作用;第二,包括EREBP-9在内的转录因子的调控可能在发育过程中起到一定的作用。
【英文摘要】Cucumberhasbeenwidelystudiedasamodelforfloralsexdetermination.Inthisinvestigation,we performed genome-wide transcriptional profiling of apical tissue of a gynoecious mutant(Csg-G) and the monoecious wild-type(Csg-M) of cucumber in an attempt to isolate genes involved in sex determination,using the Solexa technology.The profiling analysis revealed numerous changes in gene expression attributable to the mutation,which resulted in the down-regulation of 600 genes and the up-regulation of 143 genes.The Solexa data were confirmed by reverse transcription polymerase chain reaction(RT-PCR) and real-time quantitative RT-PCR(qRT-PCR).Gene ontology(GO) analysis revealed that the differentially expressed genes were mainly involved in biogenesis,transport and organization of cellular component,macromolecular and cellular biosynthesis,localization,establishment of localization,translation and other processes.Furthermore,the expression of some of these genes depended upon the tissue and the developmental stage of the flowers of gynoecious mutant.The results of this study suggest two important concepts,which govern sex determination in cucumber.First,the differential expression of genes involved in plant hormone signaling pathways,such as ACS, Asr1, CsIAA2, CS-AUX1 and TLP,indicate that phytohormones and their crosstalk might play a critical role in the sex determination.Second,the regulation of some transcription factors,including EREBP-9, may also be involved in this developmental process.

【题目】黄瓜果实成熟衰老过程中几种物质的变化
【中文关键词】黄瓜果实 衰老 生理生化变化 膜脂过氧化
【英文关键词】Cucumber fruit, Senescence, Physiological and biochemical changes, Membrane lipid peroxidationw
【中文摘要】以黄瓜品种D0313 和649 为试材,对果实自然成熟衰老过程中外观形态和若干重要生理生化指标进行了研究。结果表明,两个黄瓜品种的脂氧合酶(LOX)活性前期上升后期下降;可溶性蛋白质含量有个迅速下降过程;谷氨酰胺合成酶(GS)活性前期保持稳定,衰老后期急剧上升。两个品种之间变化趋势基本一致,其中存在的差异可能是造成两个品种果实衰老表现不同的原因所在。初步认为,膜脂过氧化作用是导致黄瓜果实衰老的主要生理原因之一。
【英文摘要】In this paper, fruit morphology and several important physiological and biochemicalidentification indexes correlating with ripening and senescence were monitored for cucumber(Cucumis sativus L.)fruits from two different cucumber cultivars D0313

and 649. The results showed that LOX activities were increasing in early stage and decreasing later. The contents of soluble protein in these two varieties had a speedily decreasing process. GS activity was stabilizing in early stage and increasing rapidly in later stage of senescence. The changing trends of these two cucumber varieties were identical,but the existing differences between them may be the causes for their fruit different senescence conducts.The peroxidation of membrane lipid was considered to be one of the major physiological causes leading to senescence of cucumber fruit.

【题目】黄瓜抗病基因同源序列的表达分析
【中文关键词】黄瓜 RGAs cDNA 表达
【英文关键词】cucumber, RGAs,cDNA,expression
【中文摘要】对黄瓜抗霜霉病品种东农129进行霜霉菌诱导,以稳定表达的18S RNA基因做对照,用RT-PCR半定量的方法分析黄瓜抗病基因同源序列(RGAs)的表达情况。结果表明,霜霉菌能诱导RGA 基因的表达,经霜霉菌诱导后多数RGA基因相对表达量增强。说明了RGA 基因的表达情况和霜霉菌密切相关。用半定量RT-PCR研究RGA基因的表达具有操作简单,特异性高,可靠性强的优点。
【英文摘要】Downy mildew resistance of cucumber Dongnong129 was induced with P. cubensis byusing 18S gene of stable expression as the control. The experiment used RT-PCR semi-quantitative method to analyze the expression of cucumber resistance gene analogs (RGAs). The results showed that the P.cubensis could induce the expression of RGA gene. The relative expression of the majority of RGA gene enhanced after inducement. It illuminated that the gene expression of RGA was closely related with the P.cubensis . The method of semi-quantitative RT-PCR was simple, high specificity and reliability so as to study the RGAgene expression.

【题目】土壤环境因素对残留农药降解的影响
【中文关键词】农药残留 土壤 影响因素
【英文关键词】pesticide residue,soil, influence factor
【中文摘要】农药在土壤中的残留是对农业环境造成污染的一大根源。研究农药在土壤环境中的残留降解规律,探讨外界因素对其降解和转化的影响,对于采取有效措施、清除和减轻农药污染具有重要意义。本文介绍了农药在土壤中降解转化的主要途径及机理,包括微生物降解、水解和光解,分析了土壤中不同环境因素(有机质、湿度、温度、pH 值、根系分泌物和粒径等)对农药降解和转化过程的影响,展望了今后的研究方向,旨在为进一步治理和修复土壤的农药污染提供依据。
【英文摘要】Residue of pesticide in soil is an important reason for pollution of agricultural environment. It is essentially important to study the residue and degradation law of the pesticide in the soil and to investigate the influence factors, which aid in preventing soil pollution by pesticide. In this paper, the main path for pesticide degradation, including microbiological deterioration, hydrolysis and photolysis was introduced. Moreover, the influence, such as organic matter, humidity, temperature, pH, root exudates, soil particle size, and so on, were analyzed, and the research direction was prospected in future. It aims to provide data for the further remediationof contaminated soil by pesticide.

【题目】Genetic analysis and the SSR-based genetic linkage map of Blunted with Blossom trait in Cucumis sativus L
【中文关键词】黄瓜 花打顶 遗传 SSR
【英文关键词】Cucumis sativus L,inheritance,SSR,Blunted with blossom
【中文摘要】通过对极易花打顶黄瓜(Cucumis sativus L)品种D0462(dede)与正常黄瓜品系东农129(DeDe)的杂交后代BC1、F1和F2的统计分析,结果表明:在F1代,杂交组合的植株为正常植株,花打顶为隐性;BC1中花打顶与正常植株呈现1:1.12的分离,F2代花打顶与正常植株呈现分离,其比例为1:2.69,表明de基因是独立遗传的,即花打顶(de)对正常(De)为隐性。为了获得与黄瓜花打顶基因连锁的SSR分子(simple sequence repeat)标记,以129×D0462的F2代群体为试材,并利用BSA法构建基因池。对86对SSR引物亲本及DNA混合池之间进行筛选,得到了4对与化打顶性状相关的SSR引物,其中CWGATT01A、CSWGATT01C和CSWTAAA01三个标记位于同一连锁群上de基因位于这3个标记构建的连锁群中,具体位置为CSWGATT01C-de-CSWTAAA01 距离两侧标记的遗传距离分别为9.5cM和21.5 cM。
【英文摘要】In order to reveal the heredity of the “ blunt with blossom ” cucumbers (BBCs), the genetic analysis of BBCs traits and a genetic linkage map using simple sequence repeat (SSR) markers were constructed. Besides an F2 population consisting of 288 individuals, from a cross between D0462, a blossom cucumbers (BBCs) ecotype, and normal ecotype 129, the BC1 and F1 populations were used for the genetic analysis and genetic mapping. The results indicated that heterozygous F1 was not the BBCs, which indicated that the BBCs trait was recessive. In addition, the segregation rate between BBCs species and normal species in the BC1 and F2 populations was 1:1.2 and 1:2.69, respectively, which confirmed that the BBCs trait (de) is recessive to the normal trait (De). Further more, a total of 86 SSR markers were screened for loci and polymorphism using DNA from two parents and 288 F2 of the mapping population, and only 4 primer pairs were demonstrated to produce fragments of expected size. Of the 4 products, 3 (CWGATT01A、CSWGATT01C and CSWTAAA01) were mapped to the same linkage group by use of MAPMAKER/EXP, version 3.0b, and de was illustrated in the linkage group located between CSWGATT01C and CSWTAAA01 at 9.5 cM and 21.5 cM from the markers, respectively.

【题目】黄瓜基因组EST-SSRs 的分布规律及EST-SSR标记开发
【中文关键词】黄瓜,EST-SSR,分布, 多态性
【英文关键词】cucumber, EST-SSR, distr ibution, polymorphism
【中文摘要】从NCBI网站下载黄瓜EST序列6344条及本课题组对黄瓜叶片cDNA 文库测序研究所得的EST 163条,在除去载体、po lyA/T等序列后得到6129条无冗余EST序列,全长为2.98 ×106 bp.采用网络软件SSRIT从这些序列中搜索到784个SSR,分布于673条EST中,出现频率为12.79%,平均分布距离为3.80kb;单、二和三核苷酸重复是主导类型, 分别占EST-SSRs 总数的32. 91%、28. 19% 和29. 34%; A/ T 、AG/ CT 和AAG/ CT T 分别是单、二和三核苷酸的优势重复基元, 分别占EST-SSRs 总数的32. 40%、2 0. 66%和14. 41%. 经现已报道的评价方法分析表明,这些EST-SSRs具有较好的多态性和可用性.设计了30对EST-SSR引物对22份黄瓜材料进行PCR检测,18对引物检测到多态性.根据PCR结果,这些材料被聚为三类,聚类结果与材料本身特性一致.结果说明通过黄瓜EST数据库发掘SSR标记是一条可行的途径.
【英文摘要】A total of 6344 cucumber ESTs were obtained from NCBI database and sequencing cDNA libraryof cucumber leaf previously . Removal of vector sequence and poly A/T of the EST sequences gave 6129 non-redundant ESTs with total length of 2.98 ×106bp.SSRIT, a web tool for SSR hunting, was used to an alyze the sequences. 784 SSRs were obtained, dist ributing throughout 673 ESTs. The frequency of these EST-SSRs was 12.79% and mean distance was 3.80 kb in the non-redundant ESTs. Mononucleotide, dinucleot ide and trinucleotide repeats were major types, accounting for 32.91% , 28.19% and 29.34%, respect ively. A/T, AG/CT and AAG/CTT were respectively most frequent mot ifs in mononucleotide, dinucleot ide and trinucleotide repeats, accounting for 32.40% , 20.66% and 14.41%, respectively. Several criterio ns,which has been used to evaluate SSR polymorphism in currently reported literatures, were applied to analyze polymorphism of the EST-SSRs. The results showed that these EST-SSRs were polymorphic and applicable.Thirty EST-SSR primer pairs were designed and used for PCR amplification from 22 cucumber materials, of which eighteen primer pairs detected polymorphism. Based on the patterns of PCR amplif ication, the cucumber materials were clustered into three groups that agreed with the characteristic of the materials. All the results mentioned above revealeda practicable method for development of EST-SSR marker from cucumber EST database.

【题目】黄瓜叶绿体基因组全序列微卫星分布特征与标记开发
【中文关键词】黄瓜 叶绿体基因组 微卫星 标记
【英文关键词】cucumber (Cucumis sativus), chloroplast genome, microsatellites, makers
【中文摘要】对黄瓜叶绿体基因组 (chloroplast genomic DNA, cpDNA) 全序列中微卫星(chloroplastsimple sequence repeat,cpSSR) 的分布特征进行了全面分析。结果发现,cpSSR主要分布在25~40kb和100~130kb两个区域, 主要以完全重复和间隔重复为主。单碱基重复最多,占总数的79.3%,二碱基重复占10.1%, 三碱基和三碱基以上重复仅占10.6%。单碱基重复主要以(A)n和(T)n为主,二者共占总数的78.8%, 二碱基重复主要是(AT)n, 占总数的9.3%。在重复次数分布上,完全重复的(A)n和(T)n 均以最低重复次数为主, 而间隔重复的(A)n 和(T)n 以14 次或15 次为多。设计了6对引物,对7份黄瓜自交系cpDNA进行扩增。结果发现, 6对引物均有扩增产物, 每对引物平均能检测到2.2个等位基因。几乎所有引物都能在甜瓜、西瓜、葫芦和栝楼中通用, 5对引物在1~4 种远缘种中有扩增产物。上述结果表明, 从黄瓜cpDNA 中发掘cpSSR 标记是一条

可行的途径。
【英文摘要】Characterization of microsatellites in complete sequence of chloroplast genome (cpDNA) ofcucumber (Cucumis sativus) was analyzed in the round. The results showed that chloroplast simple sequence repeats (cpSSR) were mainly distributed in the two regions of cpDNA, 25-40 kb and 100-130 kb, most of the cpSSRs belonging to complete repeats and interrupted repeats. Of these cpSSRs, mononucleotide repeats were maximum types with the frequency of 79.3%, and dinucleotide repeats accounted for 10.1%, and all of the trinucleotide repeats and those repeats over trinucleotide in length only accounted for 10.6%. (A)n and (T)n were major repeats in mononucleotides, totally accounting for 78.8%. (AT)n was dominant dinucleotide repeats with frequency of 9.3%. As for repeat number, most of the complete repeats of (A)n and (T)n had the lowest repeat mumber, while 14or15 repeats were major for interrupted repeats of (A)n and (T)n. Six primer pairs were designed and used for PCR amplification of the cpDNA of 7 cucumber inbred lines. The results showed that all primer pairs had amplified fragments in cucumber materials and each of the primers detected mean 2.2 alleles. All of the primer pairs were almost transferable to melon, watermelon, gourd and Trichosanthes kirilowii. Five primer pairs could successfully amplify in 1-4 distantly related species. These results indicated that exploitation of cpSSR markers from cucumber cpDNA is practicable.

【题目】黄瓜cpSSR-PCR反应体系优化与应用
【中文关键词】黄瓜 cpSSR 体系优化 单倍型
【英文关键词】Cucumber, cpSSR, Optimization of system, Haplotype
【中文摘要】叶绿体微卫星(chloroplast microsatellite, cpSSR)是近几年发展起来的新型高效分子标记,在植物系统发育和基因漂移研究中有广泛应用。在前期开发黄瓜cpSSR引物的研究基础上,本文研究了Taq 酶量、MgCl2浓度、dNTPs 浓度、模板DNA 质量和浓度、循环次数等参数对cpSSR-PCR 扩增效果的影响,获得优化的反应体系,即15 μL体积包括:1×Taq酶缓冲液,0.5UTaq 聚合酶,0.2 μmol/L 引物,0.2mmol/LdNTPs,1.5mmol/L MgCl2,约10ng 模板DNA,循环25次。采用该优化体系,以已开发的黄瓜cpSSR引物,对12份黄瓜材料进行了重复性PCR 扩增。结果发现国外种质中存在3 种单倍型,而在国内种质中只检测到2种单倍型,说明在本研究所用的材料中,国外种质叶绿体遗传差异明显大于国内栽培种。此结果说明优化的cpSSR反应体系具有稳定性和可靠性。
【英文摘要】Chloroplast microsatellite (cpSSR), a newly developed efficient molecular marker, has been widely used in the field of plant phylogenetic development and gene flow. Based on the previous research on development of cucumber cpSSR primers, this article documented the effect of influencing factors, i.e., Taq polymerase dosage,MgCl2 concentration, dNTPs concentration, template DNA quality and concentration and cycle number, on cpSSR-PCR amplification; the optimized cpSSR reaction system was obtained as follows: 15 μL reaction volume containing 1× Taq polymerase buffer, 0.5U Taq polymerase, 0.2 μmol/L of each primer pairs, 0.2mmol/L of eachdNTPs,1.5mmol/L MgCl2, about 10ng template DNA and 25times of cycles. Using the optimized system as well as newly developed cucumber cpSSR markers, 12cucumber accessions were used for PCR amplification. The results showed that three haplotypes existed among exotic cucumber accessions but only two were detected in domestic accessions.That indicated that among the accessions used in this study, exotic accessions had higher-frequency variance in chloroplast DNA than domestic cultivated accessions. Also, this finding revealed stability and reliability of the optimized cpSSR reaction system.

【题目】甜瓜EST-SSR位点信息及标记开发
【中文关键词】甜瓜 EST-SSR 信息 标记
【英文关键词】melon,Cucumis melo L.,EST-SSR,information,marker
【中文摘要】对GenBank中35 547 条甜瓜EST 进行净化处理, 得到总长度为21 5 @ 107 bp 的无冗余EST 34408条。从这些序列中发现2877个SSR,分布于2119条EST中,出现频率为8136%, 分布密度为1/8172kb。单碱基、二碱基和三碱基重复是主导重复类型,分别占EST-SSR总数的16.61%、22.49%和46.09%。A /T、AG /CT和AAG /CTT分别是单碱基、二碱基和三碱基的优势重复基元,分别占15.88%、16.02%和28.61%。在所有的EST-SSR中,69.10%的重复次数为4 ~ 10次, 51.34%的长度为12~20bp。设计了30对EST-SSR引物, 分别对33份甜瓜自交系进行了PCR扩增, 24对引物能够扩增出期望长度的条带,22对引物产物表现多态性, 平均每对引物能检测到2173个等位基因。这些引物能比较准确地将甜瓜材料聚为不同类别。24对引物中, 有19对、16 对和15对分别在黄瓜、西瓜和葫芦中通用。以上结果说明,从甜瓜EST中开发SSR标记是一条简便、可行的途径。
【英文摘要】A total of 35547 melon ESTs were downloaded from GenBank (http: www.ncbi.nlm.nih.gov)and cleaned resulting in production of 34408 non-redundant ESTs with a total length of 2.5x107bp. From hese sequences, 2877 SSRs were sought out distributing in 2119 ESTs. The frequency of the EST-SSRs was 8.36% and mean distance was 8.72 kb in 34408 ESTs. Mononucleotide, dinucleo tide and trinucleotide repeats were major types, respectively accounting for 16.61%, 22.49% and 46.09%. A /T, AG /CT andAAG /CTT were most frequent motifs in mononucleo tide, dinucleo tide and trinuc leot ide, accounting for 15.88%, 16.02% and 28.61% , respectively. The frequency of the EST-SSR s w ith a repeat number of 4-10 was 69.10% and 51.34% of them had a length of 12- 20 bp. Thirty prim repairs were designed for partial EST-SSRs and used for PCR amplification of 33 melon inbred lines. Among the primer pairs, 24 pairs gave distinct bands with expected length and 22 pairs generated polymorphic bands with 2.73 alleles per primer pair. With the primers, melon materials could be exactly divided in to different groups, which accorded withthe actual situation of the materials. Among the 24 primer pairs, 19 pairs could be transferable to cucumber and 16 pairs to watermelon and 15 pairs to gourd. All these results indicated that exploitation of SSR markers from melon ESTs was convenient and practicable.

【题目】甜瓜EST 序列中微卫星的分布特征
【中文关键词】甜瓜 EST序列 微卫星 特征
【英文关键词】melon (Cucumis melo L.), EST sequence, microsatellite, characteristic
【中文摘要】GenBank 中35 547 条甜瓜EST 经去冗余处理后, 得到总长度为250.3 Mb 的无冗余EST 34 438 条。这些序列中有2813 个微卫星简单重复序列(Simple sequence repeat, SSR), 分布于2 107 条EST 中, 出现频率为8.16%, 平均分布距离为8.90kb。三核苷酸重复是主导重复类型, 占SSR总数的47.14%; 其次是二核苷酸和单核苷酸重复,分别占SSR总数的20.72%和16.99%。AAG/TTC 是优势重复基元, 占微卫星总数的29.26%, AG/CT 和A/T 分别占14.61%16.25%。在所有的SSR中,重复次数为4~10 次的占70.32%, 长度为12~20 bp 的占51.12%。并对这些SSR的多态性潜能进行了评价。
【英文摘要】34438 melon expressed sequence tags (ESTs) were obtained after the removal of redundant sequences from 35547 melon ESTs deposited in GenBank. In these ESTs, 2813 microsatellites (simple sequence repeat, SSR) were tested and distributed in 2107 ESTs. The occurrence frequency of SSR was 8.16% and the average distribution distance was 8.90 kb. Trinucleotide repeats were dominant repeat types and accounted for 47.14%. Dinucleotide and mononucleotide repeats accounted for 20.72% and 16.99%, respectively. AAG/TTC was most frequent repeat motif and accounted for 29.26% in all SSRs. AG/CT and A/T accounted for 14.61% and 16.25%, respectively. Among all SSRs, SSRs which repeated 4 to 10 times accounted for 70.32%, and SSRs which was 12 to 20 bp long accounted for 51.12%. The potential polymorphism of these SSRs was also analyzed.

【题目】鲜食切片黄瓜新品种夏炎的选育
【中文关键词】鲜食切片 黄瓜 夏炎 品种选育
【英文关键词】Fresh market and slicing,Cucumber,Xiayan,Variety breeding
【中文摘要】黄瓜新品种“夏炎”是以高代自交系HA-1-1-6-y为母本、8113-1-1-6-y为父本,杂交配制而成的一代杂种。该品种具有早熟、丰产、抗病、果实商品性好等特点。第一雌花节位4~6节,瓜长35cm,横径2.8~3.0 cm,果形指数大于12,果实硬度11.4 kg/cm2,腔径14.7 mm,单瓜鲜重226 g,产量约90000 kg/hm2,适宜于鲜食切片。该品种高抗霜霉病、白粉病、枯萎病等病害,耐高温,适宜于北方春季、夏茬或南方越夏栽培。
【英文摘要】New cucumber variety“Xia yan”is a hybrid which is bred through using high-generation inbred line HA-1-1-6-y as female parent and 8113-1-1-6-y as male parent. This variety is characterized by early maturity, high yield, disease resist ance and good commodity. Its main characteristics are as follow s: 4~6 joint in the first fem ale flower position, 35cm in fruit length,2. 8~3.0 cm in diameter, L/D being over 12, 11. 4 kg/cm2 in fruit hardness, 14.7 mm in cavity diameter, 226 g in fresh weight of sing le fruit, and approximately 90000 kg/hm2 in yield. This variety is suitable for fresh market and slicing. In addition, this variety is highly resistant to downy mildew, powdery mildew, blight and heat, and suitable for spring and summer cultivation in north China and over- summering cultivation in south China.

【题目】保护地黄瓜新品种旺世
【中文关键词】黄瓜 品种
【英文关键词】cucumber,cultivar
【中文摘要】‘旺世’为耐低温弱光,适于鲜食切片型黄瓜新品种。植株生长势强,耐低温弱光,早熟,主蔓节瓜为主,平均单瓜质量200g,产量可达150t·hm-2。瓜棒形,长约35cm,平均横径2.8~3.0cm,果形指数约12,瓜把短。瓜皮深绿色,稍有光泽,无棱,瘤小,刺密。果实脆甜清香,硬度10kg·cm-2。高抗枯萎病、白粉病,较抗霜霉病。适合河南、山东、河北、安徽、江苏、湖北、湖南等黄瓜产区早春保护地和秋延后保护地栽培。
【英文摘要】Wangshi’is a cucumber hybrid. The cultivar has strong growth vigor and moderatedark-green leaves. Fruits are produced mainly on the stem with the average per fruit 200g weight,and the yield is 150t·hm-2. The cultivar typically has long fruits(length/diameter ratio = 12)with dark-green epidermis,more tubercles and fine white spines. The fruit tastes very deliciously with about 10 kg·cm-2 fruit firmness. It is strongly resistant to powery mildew and wilt,moderately resistant to downy mildew.The cultivar is suitable in greenhouse and plastic channel in early spring and late-autumn in main cucumber production areas in China.

【题目】Analysis of cytoplasmic variation in a cucumber germplasm collection using chloroplast microsatellite markers
【中文关键词】黄瓜 叶绿体微卫星 细胞质变异 PCR标记
【英文关键词】Cucumber,Chloroplast microsatellite,Cytoplasmic variation,PCR marker
【中文摘要】从黄瓜叶绿体基因组非编码区域的微卫星中得到9条PCR标记,并用以检测叶绿体DNA的多态性,这些标记成功的得到了37种中国本土种质(CNG)和非中国本土种质(NCG)黄瓜的中间多态性。每个标记均发现了2和4个等位基因,这些标记的多样性指数为0.105到0.528.基于等位基因的大小,共有17个单体型从35种黄瓜品种(其中两个含有空白基因)。其中3个体倍体普遍存在于CNG中,而多数NCG仅含有一个单体型。在CNG和NCG中没有发现相同的单体型,反映出进一个世纪CNG和其他品种交换的缺失。研究发现野生种C. hystrix Chakr.与多种CNGs含有相同的单体型。本试验基于等位基因的Jaccard相似性指数通过构建系统发育树进一步分析了37种黄瓜亲缘关系,所有的CNGs鬼为一个类群(包括野生种),并明显区别与其他四个类群的NCGs,该结果也验证了单体型的分析结论。本研究为黄瓜育种提供了科学的材料与依据。
【英文摘要】Nine PCR-based markers were developed from the microsatellites in non-coding regions of chloroplast genome of Cucumis sativus and used to detect chloroplast DNA variation. These markers successfully detected intraspecific polymorphism among 37 cucumber accessions containing Chinese native germplasms (CNGs) and non-Chinese germplasms (NCGs). Each marker detected between two and four alleles and the diversity value of the makers ranged from 0.105 to 0.528. Based on the data from allele size variation, a total of 17 distinct haplotypes were identified from the 35 accessions (excluding the two accessions possessing null genes). Three haplotypes were prevalent among CNGs but most NCGs had unique haplotype. No identical haplotype was found between CNGs and NCGs, reflecting lack of exchange of CNGs with others in the 60 – 80s of last century. A wild species (C. hystrix Chakr.) tested herein shared a haplotype with some CNGs, suggesting that it could be the ancestry of C. sativus or at least had a common ancestral lineage. The genetic relationship among the 37 cucumber accessions was further analyzed through construction of dendrogram based on Jaccard coefficient of similarity obtained from the allele sizes. All the CNGs were clustered into a group (containing the wild accession) that distinctly differed from the other four groups containing NCGs. This result agreed with the findings above obtained from haplotype analysis. Our research documented here will offer useful information for cucumber breeding.

【题目】Development of novel chloroplast microsatellite markers for Cucumis (Cucurbitaceae) from sequence database
【中文关键词】葫芦科 单态性 多态性 转移性
【英文关键词】Cucurbitaceae,monomorphism, polymorphism, transferability
【中文摘要】本试验报道了葫芦科植物叶绿体微卫星(cpSSR)标记的研究进展,并对其多态性和转移性进行了分析。从Cucumis sativus叶绿体基因组全序列得到单核苷酸重复序列构成的15个微卫星标记,成功的检测到C. sativus和C. melo的中间差异,并得到每个cpSSR位点间的平均为1.6和1.9等位基因。C. sativus和C. melo中,除了cpSSR标记有两个外显子区域为单态性,其它的均为均为多态性片段。通过cpSSR标记在两个品种植物共得到34个多态性位点。通过41中葫芦科植物(属于12个不同的品种)检测了cpSSR标记的转移性,除了两个标记并未葫芦科植物均有扩增产物,其他标记在所有品种中均有发现。15个cpSSR标记中,有14个标记片段大小达到预期值,13个标记在品种中得到种内多态性,种内多态性在四个葫芦科植物中也有发现(除了C. sativus and C. melo)。
【英文摘要】The development of chloroplast microsatellite (cpSSR) markers in Cucumis species and analysis of their polymorphism and transferability were reported. Fifteen microsatellite markers, represented by mononucleotide repeats, were developed from the complete sequence of Cucumis sativus chloroplast genome. Intraspecific variation was successfully detected in C. sativus and C. melo and revealed mean 1.6 and 1.9 alleles per cpSSR locus, respectively. With the exception of two exon region-located cpSSR markers being monomorphic, each of the others amplified polymorphic fragments in C. sativus or C. melo. A total of 34 polymorphic loci were detected with these cpSSR markers in the two species. Transferability of the newly developed cpSSR markers was checked on an additional set of 41 Cucurbitaceae accessions (belonging to 12 different species), and except for two markers with no amplification in

Cucurbita maxima, the others could be transferable to all the accessions tested. Of the 15 cpSSR markers, 14 markers generated fragments with expected band sizes and 13 markers detected interspecific polymorphism among the accessions. Intraspecific polymorphism was also observed within four Cucurbitaceae species excluding C. sativus and C. melo.

【题目】Development of novel EST-SSR markers for cucumber (Cucumis sativus) and their transferability to related species
【中文关键词】黄瓜 表达序列标签(ESTs) 微卫星序列(SSRs) 多态性 转移性
【英文关键词】Cucumber, Expressed sequence tags (ESTs), Microsatellites (SSRs), Polymorphism, Transferability
【中文摘要】本试验报道了由黄瓜变种ESTs得到的SSR的研究进展,及其在相关品种的应用。根据GenBank,从6344个黄瓜ESTs共鉴定得到了533di到penta-的SSRs。大多数SSRs主要由di-和tri-核苷酸重复序列构成,其中以AG和AAG居多。共有392条含有unigene的SSR(非冗长ESTs/共有序列)适合作为引物。从中挑选35对因为作为代表,共有28条可利用标记,其中26条标记表明多态性分析得到21种黄瓜存在2-7个等位基因(均值=3.77),并且多态性信息含量(PIC)为0.091-0.748(均值=0.388)。本研究得到的多态性部分归因于零等位基因,该等位基因多发生于标记检测到的多同源位点。28个转移性EST-SSR标记在其他四种葫芦科植物(甜瓜、西瓜、南瓜和葫芦)进行了验证,其发生频率分别为92.9%, 57.1%, 53.6%和60.7%。EST-SSR标记可以补充常使用的基因组SSR标记,甚至可能在黄瓜及其相关品种的遗传研究中更有效用。
【英文摘要】We report on the development of novel simple sequence repeat (SSR) markers from publicly available Cucumis sativus expressed sequence tags (ESTs) and on their transferability among related species. In total, 533 di- to penta-type SSRs were identified from 6344 cucumber ESTs retrieved from GenBank. Identified SSRs mainly comprised of di- and tri-nucleotide repeats, of which AG and AAG motifs were much abundant. Atotal of 392 SSR-containing unigenes (non-redundant ESTs/consensus sequences) were suitable for primer design. From these, 35 primer pairs were designed as representative samples and 28 were usable markers. Twenty-six out of 28 usable markers revealed polymorphism among 21 cucumber accessions with 2 – 7 alleles detected (mean = 3.77) and their polymorphism information content (PIC) values ranged from 0.091 to 0.748 (mean = 0.388). The polymorphism observed herein partially arose from the null alleles which occurred at the multiple homoeoloci detected by the markers. Transferability of the 28 EST-SSR markers was investigated in four other cucurbits: melon, watermelon, pumpkin and gourd which showed frequency of 92.9%, 57.1%, 53.6% and 60.7%, respectively. The EST-SSR markers developed herein will complement the currently available genomic SSR markers and may be useful for genetic studies in cucumber and related species.

【题目】Utilization of a set of high-polymorphism DAMD markers for genetic analysis of a cucumber germplasm collection
【中文关键词】黄瓜 DAMD标记 遗传分析 多态性
【英文关键词】Cucumber ,DAMD marker,Genetic analysis,Polymorphism
【中文摘要】利用从水稻、人体和M13噬菌体得到的18条微卫星序列作DNA微卫星区域DNA(DAMD)扩增为引物,分析19中黄瓜品种的种植资源多态性。共扩增得到165条的多态性条带中,129条具有78.2%的多态性,引物的多态性负平均信息量为0.844,说明黄瓜有很大的差别。根据DAMD标记的accard相似度指数及矩阵分析,利用非权重配租法构建系统树状图,将19个分枝归为四个不同组,从而说明不同类型的种质之间的遗传关联。六个多态性扩增条带的测序得到了1个微卫星位点,说明微卫星数量的改变并非是DAMD多态性的唯一产生要素。

【英文摘要】Eighteen minisatellite core sequences, derived from rice, human and phage M13, were used as primers in a PCR technique, known as directed amplification of minisatellite-region DNA (DAMD), to genotype 19 cucumber (Cucumis sativus L.) accessions from a wide collection. All the primers amplified polymorphic bands across the accessions. Out of 165 bands scored, 129 were polymorphic with 78.2% polymorphism. The average of polymorphism information content of the primers was 0.844, revealing a high discrimination power in cucumber. Based on Jaccard ’ s similarity indices and matrix generated by the DAMD markers, a dendrogram was constructed using the unweighted pair group method using arithmetic averages and allowed for separation of the 19 accessions into four distinct groups which demonstrated genetic relationship among the different types of germplasms. Sequencing of six polymorphic amplicons resulted in the identification of only one minisatellite locus, which indicated that variation in minisatellite number was not always the factor underlying DAMD polymorphism.

【题目】A Study on the Overwintering of Cucumber Downy Mildew Oospores in China
【中文关键词】霜霉病 孢子 植物残片 土壤 生存力
【英文关键词】Pseudoperonospora cubensis, oospore, plant debris, soil, viability
【中文摘要】调查研究了中国10个地区(漠河、哈尔滨、长春、北京、聊城、银川、杨陵和海口)黄瓜霜霉病的孢子形态。除了海口,其他地区均发现了霜霉病孢子。研究了哈尔滨2009年1月10日到7月10日孢子的生存能力。包子的活力指数从4月10日开始上升,至5月末达到峰值(2009年5月25日达到14%),继而下降,这与哈尔滨每年霜霉病爆发的时间相一致(5月20-30日)。对哈尔滨地区孢子越冬进行了孵育试验,结果表明不论在温室还是户外,孢子均能够越冬,发病率为26.6-95.0%。在寒冷的中国北方地区,越冬孢子是霜霉病的原发感染源。
【英文摘要】Oospore formation of Pseudoperonospora cubensis was investigated in 10 Chinese locations: Mohe, Harbin,Changchun, Shenyang, Beijing, Liaocheng, Yinchuan,Xining, Yangling and Haikou. Oospores were observed in all but Haikou. Oospore viability was monitored from 10 January to 10 July 2009, in Harbin. Percentages of activated oospores increased from 10 April with a peak in late May (14.0% on 25 May 2009), and then decreased. This is in accordance with the usual time of downy mildew appearance in Harbin, 20 – 30 May. Inoculation tests using the oospores overwintered in Harbin, whether in the greenhouse or outdoors, showed that these were viable, with a disease occurrence of 26.6 – 95.0%. Oospores overwintering locally could be primary infection sources of downy mildew in cool temperate northern China.

【题目】不同滴灌方式对棉田土壤盐分的影响
【中文关键词】棉田;地下滴灌;膜下滴灌;土壤盐分;盐分离子
【英文关键词】cotton field;subsurface drip fertigation;mulched drip fertigation;soil salinity;salt ions
【中文摘要】采用田间抽样调查分析的方法,研究了不同滴灌方式对新疆棉田土壤盐分的影响。结果表明,采用滴灌施肥8年后,0~100cm土体土壤总盐平均质量分数膜下滴灌比地下滴灌高10.98%;在20cm以上土层,土壤总盐平均质量分数地下滴灌比膜下滴灌高出23.35%;在60~100cm土层,土壤总盐平均质量分数膜下滴灌比地下滴灌高出85.99%。造成不同灌溉方式下土壤总盐质量分数差异的主要离子为Cl-和Na+。膜下滴灌条件下,土壤Cl-和Na+的质量分数较高。试验区采用地下滴灌时,应防止地表盐分的积累,同时,应结合喷灌或地面灌溉,解决棉花苗期的土壤水和盐的问题。

【英文摘要】The method of field sampling and analysis was adopted to study the effect of different drip fertigation on soil salinity in cotton field in Xinjiang Uygur Autonomous Region, China. The results show tha tthe average total soil salinity in depth ranging from 0 to 100cm under the condition of mulched drip fertigation is 10.98%higher than that of subsurface drip irrigation,after 8 years fertilization by drip irrigation. The average total soil salinity in the shallow layers(above 20cm)is 23.35%higher,while it is 85.99% lower in the deep layers(60~100cm)for subsurface drip irrigation,compared with mulched drip fertigation.The major salt ions which cause the difference of total soil salinity between two irrigation methods are regarded as Cl- and Na+.Sprinkler and surface irrigation should be adopted to combined with drip irrigation for preventing the surface accumulation of soil salinity.

【题目】基于田间定位观测的地下滴灌毛管性能评价
【中文关键词】地下滴灌;毛管性能;毛管流量;降低率;使用寿命;评价
【英文关键词】subsurface drip irrigation (SDI) system; performance of drip line; variation of flux reductionrate; service duration; evaluation
【中文摘要】以新疆大田棉花地下滴灌系统(SDI)为研究对象,采用定量计时法对使用1~7年的SDI毛管的压力和流量进行了定位观测,研究了毛管水力性能的年内和年际变化规律。结果表明,在同一使用年限(灌水季节)内,随着灌水次数的增加和灌水时间的延长,毛管的流量降低率增加。毛管的性能变化与其所在的位置有关,靠近小区进口(支管首部)处毛管的流量降低率较小,随着距小区进口距离的增加,毛管流量降低率增大。毛管的流量降低率随使用年限的增加而增大。对设计使用寿命为3年的SDI毛管,使用3~4年时,毛管的流量降低率均未超过20%;使用6年时,80%以上毛管的流量降低率超过20%,1/3的毛管流量降低率超过25%,最大降低率为29·13%,此时,应加强系统运行管理,尽可能恢复SDI毛管水力性能,提高系统运行效率。
【英文摘要】The observation of drip line performance in subsurface drip irrigation system(SDl),serviced for 1 to 7 years,was carried out at fixed positions in cotton field of the xinjiang UygurAutonomous Region, China. The duration of given water volume were used to calculate the flux of drip line. The discharge of drip lines was surveyed under different pressure to evaluate the annual and inter-annual variation of performance. The results show that the drip line flux reduction rate increases with irrigation times and service hours of the SDI system in the same irrigation season or the same service year. The reduction rate varies with locations of line, it is smallerwhen the drip line is located closer to the inlet of sub-main and increaseswith service years. For the design life of a 3-year SDI system lateral, the reduction rate is within 10% and 20% from 1 to 4 years of service duration. After 6 years reduction rate of about 1/3 of total lineas will be higher than 25%. Management should be enhanced to recover the hydraulic performance of the drip lines on time for improving the efficiency of the irrigation system

【题目】不同滴灌形式对棉田土壤理化性状的影响
【中文关键词】灌溉,土壤,养分,棉田,地下滴灌,膜下滴灌,土壤盐分,土壤PH值
【英文关键词】irrigation,soils,nutrients,cotton field,subsurface drip irrigation,mulched drip irrigation,soil salinity,soil PH value
【中文摘要】为研究长期滴灌对土壤性质的影响,采用田间抽样调查的方法,对新疆棉田膜下滴灌和地下滴灌进行了对比分析,研究了滴灌形式对棉田土壤理化性状的影响。结果表明,采用滴灌8年后,膜下滴灌在10 cm处土壤体积质量相对较高,而地下滴灌的高体积质量土壤下移至60 cm上下。土壤盐分的分布规律与之相反,地下滴灌表层(0~20 cm)土壤的含盐量略高于膜下滴灌,而在20~100 cm土层,膜下滴灌的土壤含盐量明显高于地下滴灌;0~100 cm土体土壤平均电导率(EC值)膜下滴灌比地下滴灌高出19.2%。与膜下滴灌相比,地下滴灌条件下20 cm以上土层土壤PH值较低,0~100 cm土体土壤碱解氮的残留量也较少,而不同滴灌方式间土壤有效磷和有效钾的质量分数差异不明显。
【英文摘要】To investigate long-term impacts of drip irrigation on soil properties,fields sampling were adapted in the cotton field after 8 years fertigation with mulched drip irrigation(MDI)and subsurface drip irrigation(SDI)in Xinjiang, Northwest China.Results showed that soil bulk density at 10 cm was relatively higher in MDI,while higher soil bulk density of soil layers appears at 60 cm in SDI field.For soil EC,it had a slight lower in shallower soil layers and a significantly higher from 20 to 100 cm in MDI than that in SDI.The average soil EC value from 0 to 100 cm soil layer in MDI was 19.2%higher.The soil PH value in SDI was lower in shallower soil layers,and the residual of soil nitrogen was less than that in MDI.The differences of soil available P ’s and soil available K ’s content were not significant under two fertigation methods.

【题目】基于支持向量机模型和图像处理技术的甜椒叶面积测定
【中文关键词】支持向量机,模型,图像处理,甜椒,叶面积,测定
【英文关键词】support vector machine,models,image processing,sweet pepper,leaf area,determination
【中文摘要】叶片是作物进行光合作用的重要器官,是研究作物对光能吸收的一个主要的生物学指标。应用支持向量机理论,建立了支持向量机叶面积模型,输入参数为叶片长度、叶片最大宽度,输出参数为叶面积。通过对应用计算机图像处理技术测量所得到的样本数据进行训练,以叶片的长度、宽度作为输入参数对叶面积进行模拟及检验,并将模拟结果与线性回归和人工神经网络模型进行了对比。结果表明,支持向量机叶面积模型的最大误差为6.09%,平均误差为2.73%,模拟精度达到0.996。该方法能较真实地反映甜椒叶面积的实际大小,具有较好的实用价值和应用前景。
【英文摘要】As a vital organ for crop photosynthesis,leaf is one of the major biological indicators in the study on light absorption by crops.Support Vector Machine(SVM)theory was used to set up a SVM model for determination of leaf area of sweet pepper,the input parameters were the leaf length,maximum width of the leaf,and the output parameters were the leaf areas.Data measured by computer image processing technology were trained as samples,the length,maximum width of the leaf were used as input parameters to simulate and test the leaf area.The results were compared with those of linear regression and artificial neural network model.The results showed

that the maximum error of leaf area determined by support vector machine model was 6.09%,and the average error was 2.73%,the simulation accuracy was 0.996.This method can well reflect the actual size of leaf area of sweet pepper,and has good practical value and application prospect.

【题目】地下滴灌条件下土壤水能态研究
【中文关键词】地下滴灌,灌水器,正压,土壤水势
【英文关键词】subsurface drip irrigation,emitter,positive pressure,soil water potential
【中文摘要】研究灌水器与土壤界面处的能态是研究地下滴灌土壤水分运动的关键之一。该文通过理论和试验相结合的方法,探讨了地下滴灌土壤水势的分布状况。结果表明:根据灌水器的流量和土壤的导水性之间的关系,将其分为两种情况,在灌水器流量不大于土壤扩散能力时,灌水器出口处的土壤水势等于该处的土壤吸力,为非正压状态;否则,灌水器出口处的土壤水势为正。理论分析和室内试验结果均表明,对同一土壤,影响地下滴灌土壤水势分布的主要因素是灌水器的额定流量和土壤初始含水率,在一定的流量范围内,灌水器出口的稳定正压随灌水器流量的增大而增加,随土壤初始含水率的增大而降低。在此基础上,提出地下滴灌条件下土壤水势分布的近似计算式,并简要分析了这一特殊土壤水分分布对地下滴灌系统的影响。
【英文摘要】The research on the state of soil water potential adjacent to emitters(SWPAE)is the key to study soil water movement under subsurface drip irrigation(SDI).Distribution of soil water potential energy under SDI was studied by theoretical analyses and tests.The results showed that there were two kinds of SWPAE according to the relationship between emitter flow and soil water conductivity.The SWPAE equaled to the soil suction,which was negative,when

【题目】微灌用石英砂滤料的过滤与反冲洗试验
【中文关键词】微灌;过滤与反冲洗;出水浊度;石英砂滤料
【英文关键词】micro-irrigation; filtrate and backwashing; filtrated water turbidity; quartz sand media
【中文摘要】通过对微灌用砂石过滤器滤料的过滤和反冲洗试验,分别对5种泥沙含量的原水在5个过滤速度和5个反冲洗速度条件下,测定分析了出水浊度随时间的变化规律,提出了滤料对浊度的滤除比率的计算方法,试验结果表明:冲洗流速加大,出水浊度接近清水浊度的时间缩短,正常速度范围内反冲洗在6~7 min内完成;原水浊度与滤后水浊度成正比,过滤速度与滤后水的浊度成正比,浓度在0.1‰~1‰范围内,浊度的滤除比率在40%~60%之间;滤层同样有一个成熟期,在此期间滤后水浊度是变化的。
【英文摘要】Through the experiment of filtrating and backwashing of grit filter media in micro-irrigation, the change rule of water turbidity with the filter time was analyzed and the calculation method of the filter ratio of media to water turbidity from five different raw water concentrations was put forward at the condition of five filter rates and five backwashing rates. Results show that it can shorten the time of the backwashing water turbidity closing to the clear water turbidity by increasing the backwashing rates. The process of backwashing can be completed in 6~7 minutes at the normal rates. It is in direct relationships between raw water turbidity and filter water turbidity, between the turbidity of filtrated water and filtrate rates. The filtrate ratio of turbidity is in 40%~60% when raw water concentration changes from 0.1‰to 1‰. Similarly, the filter layer has a mature stage and the turbidity of filter water is changing.

【题目】全补偿微灌系统灌水均匀度参数之间的关系分析
【中文关键词】灌水均匀度;流量偏差系数;微灌系统
【英文关键词】irrigation uniformity; flow deviational coefficient; micro-irrigation system
【中文摘要】该文采用数理统计学方差估计理论,针对全补偿微灌系统的灌水均匀度系数进行了研究分析,从理论上推导出全补偿微灌系统均匀度系数与流量偏差系数之间基本关系式,同时采用传统的随机数字模拟方式对导出的公式进行了验证和分析,并且探讨了均匀度系数和流量偏差率之间的关系规律,最后通过实例说明了上述公式的运用价值。该研究成果为全补偿微灌系统的设计、工程灌水均匀度评价和补偿式灌水器制造偏差控制等提供了参考依据。
【英文摘要】Based on the theory of variance estimation of mathematical statistics, the parameters of irrigation uniformity in full equalizing micro-irrigation system were studied and the relational expression between coeffi- cients of the irrigation uniformity and the flow deviation were proposed. At the same time, the formula was vali- dated using simulation method with conventional random numbers and the relationships between the coefficients of irrigation uniformity and the flow deviation were discussed. The application worth of the formula was indicated through an example. The research provides reference for the plan of micro-irrigation system, appraising irrigation uniformity and controlling manufactuerable deviation of equalizing emitter.

【题目】滴灌施肥对棉田土壤速效养分的影响研究
【中文关键词】棉田;地下滴灌;膜下滴灌;土壤速效养分;影响
【英文关键词】cotton field; subsurface drip irrigation; mulched drip irrigation; soil available nutrient; effect
【中文摘要】采用田间抽样调查分析的方法,研究了滴灌施肥对西北内陆地区棉田土壤速效养分的影响。结果表明,地下滴灌条件下,土壤碱解氮和有效钾的含量随距离毛管位置增加而增加,而有效磷的趋势则相反;膜下滴灌施肥条件下,有效钾和有效磷的趋势与地下滴灌一致,而碱解氮的趋势则是毛管处最高;滴灌施肥条件下,0~100 cm土体中土壤养分残留量膜下滴灌一般高于地下滴灌,尤其是氮的残留量较高。
【英文摘要】Method of field sampling and analysis was adopted to study the effect of fertigation on soil available nutrients in the inland cotton field of Northwest China. The results showed that under the conditions of subsurface drip irrigation, content of soil alkali dissolved nitrogen and available potassium increased with the distance from drip line increasing, while the opposite trend in available phosphorus. Under the conditions of mulched drip irrigation, the trends of soil available potassium and available phosphorus were consistent with those of subsurface drip irrigation, while the trend of the nitrogen was higher near the drip line. The residual soil nutrients from 0 to 100 cm of mulched drip irrigation were generally higher than those of subsurface drip irrigation, especially the residual nitrogen.

【题目】微灌过滤系统反冲洗阀的性能参数试验
【中文关键词】过滤器;过滤;反冲洗;水动阀;微灌
【英文关键词】filter; filtering; back-flushing; hydraulically operated valve; micro-irrigation
【中文摘要】简述了微灌反冲洗过滤器的水动三向阀的结构和工作原理,并试验测试了水动三向阀在不同工作压力条件下的过流量、水头损失等水力性能指标及阀正常工作时的最小启闭压力、启闭时间和最大启闭次数等参数。测试结果表明:在过滤、反冲洗2个工作状态下,水动三向阀的水头损失值在合理的范围内,符合工程设计指标;启闭时的灵敏度较高,水压在0.05 MPa以上即可实现正常启闭,完成一个启闭过程需3~16 s的时间不等;最大启闭次数平均在1690次以上。以上指标均能满足过滤系统的规定要求,并达到较好的实际使用效果。
【英文摘要】In this article,it is introduced briefly the structure and the working principle of the back-flushing valve operated by water. We tested the current capacity and the loss of water head under the different working pressure condition. At the same time, we also tested the minimum pressure and the time needed in realizing a complete open-shut stage and the maximum in a normal open-shut. The test result indicates that the loss of water head produced during the filter and back-flushing statute is in reasonable rang and conforms to the design target; the sensitivity of open-shut is high, the valve can realizes work normally when the hydraulic pressure above 0.05 MPa, it needs 3~16 second different in completing a open-shut process; the average number of the greatest normal open-shut times is above 1690. All of the indexes can satisfied the stipulation request of the filter system and achieves good use effect in actual.

【题目】齿形迷宫流道滴头消能过程的试验研究
【中文关键词】滴头;齿形流道;消能过程
【英文关键词】emitter; flow path of gear profile; energy dissipation
【中文摘要】由于齿形迷宫流道滴头的内部尺寸很小,利用常规仪器难以对其流道内的水压力分布规律直接进行测量。利用自行研制的试验装置,对迷宫式滴头齿形流道内部的压力分布状况直接进行测量,结果表明:该装置切实可行。实测的齿形迷宫式滴头流道内能量损失并非均匀降低,在不同工作压力区间段内压力损失比例存在差异,且随工作压力的变化,各齿段的消能比例也在不断的变化;当压力达到一定范围后,各齿段间的消能比例系数基本稳定不变。
【英文摘要】The maze flow profile of the internal emitter is tiny, difficult to measure the hydraulic distribution directly with conventional equipments. Using self-developed test equipment, the distribution of pres- sure was measured in maze flow path of emitter. Results show that this device is practical. Energy loss is not uniform within the maze flow path. The reduction ratio of different pressure loss varies with the work- ing pressure range. The energy dissipation ratio among the maze flow path is changing by the working pressure. When the working pressure reaches a certain scope, the coefficient of energy dissipation ratio is stable among the internal maze flow path of emitter.

【题目】地下滴灌施肥条件下土壤中氮行为模拟
【中文关键词】地下滴灌;施肥灌溉;氮
【英文关键词】subsurface drip irrigation; fertigation; nitrogen
【中文摘要】以土壤水分运动的动力学方程和溶质运移的对流-弥散方程为基础,结合灌溉施肥过程中的初始和边界条件,建立了地下滴灌施肥条件下土壤水肥运动模拟模型,以SWM-2源代码为蓝本,模拟了新疆棉花地下滴灌施肥后土壤中氮的分布与变化过程。结果表明,地下滴灌条件下,施肥时机直接影响到土壤中氮的分布,施肥后冲洗管道1 h,使氮的运动在剖面上呈双峰曲线,以毛管为中心,氨态氮的运动局限于20 cm以内,其含量随时间延长而减少,同时向下层土壤运动;与氨态氮相比,硝态氮的运动范围略有增加,在垂直方向上向上运动大于向下运动。

【英文摘要】The dynamic equations of soil water movement and convection, diffusion equation of solute transport are used as the govern equation, combing the initial and boundary conditions of irrigation and fertilization process. A model is established to simulate the movement of soil water and fertilizer under subsurface drip fertigation. It is solved by a revised SWM-2 source code. Using this model, the distribution and process of soil nitrogen in cotton field is simulated with 1 hour flush under subsurface drip fertigation. Results show that the movement of nitrogen appears in a double front on such a condition. The movement area of ammonia nitrogen is confined from 20 cm to the center of drip line, and its consistence decreases slightly with timeincreasing while it moves to the sub- soil. Compared with the movement of ammonia nitrogen, the active area of nitrate increases slightly, and its upward movement is greater than the downward movement.

【题目】地下滴灌湿润比计算方法探讨
【中文关键词】地下滴灌;湿润比;计划湿润深度;灌水器;计算方法
【英文关键词】subsurface drip irrigation;wetting proportion;scheming wetted soil layer depth;emitter;calculation method
【中文摘要】最近几年地下滴灌在国内推广迅速,但其工程设计仍按地表滴灌模式进行,一定程度上阻碍了其应用。湿润比是微灌系统设计的重要参数之一,在前人研究的基础上,对地下滴灌湿润比计算方法进行了理论推导,给出了理论计算公式,并进行了相关误差分析。认为:地下滴灌湿润比计算公式与地表滴灌类似,但与计划湿润深度、灌水器埋深等参数相关;继续使用地表滴灌湿润比计算公式会产生误差,误差大小与计划湿润深度和湿润体形状密切相关;只有在一定取值范围内才可继续沿用20~30 cm深处土层的湿润面积来计算湿润比。
【英文摘要】Subsurface drip irrigation has been developed very fast in China in recent years, but its design is still based on the drip irrigation model, which has to some extent. Hindered application wetting proportion is one of the important parameters of the micro-irrigation system design. Based on previous studies, a theoretical research on wetted percentage of subsurface drip irrigation design is carried out in this paper. The computation formula has been got and its relevant error analysis has also been made. The results show that the formula of the wetting proportion of the subsurface drip irrigation is similar to that of the drip irrigation, but the value is related to the scheming wetted soil layer depth and buried depth of the emitter and so on. The errors will be produced when the computation formula of drip irrigation model is still applied to the subsurface and the value is related to the scheming wetted soil layer depth and shape of wetting soil. The wetting area of 20~30 cm deep soil layer may also be used to calculate the wetting proportion, but only within the range of some fixed value.

【题目】移动插入式灌水器的结构研究与抗堵塞试验分析
【中文关键词】插入式;地下滴灌;移动滴灌;抗堵塞
【英文关键词】inserted; subsurface drip irrigation; movable drip irrigation; anti-jamming
【中文摘要】通过对现有滴头、滴箭等产品结构的研究、改进与优化,设计开发出一种抗堵塞功能较强的插入式地下灌水器产品,整体上具有快速装拆、移动灵活、滴流量偏差小、水力性能稳定等特点。为检验其抗堵塞功能的优劣,分别进行了自由出流和插地出流条件的滴水试验。结果表明:移动插入式灌水器出流均匀,具有较强的抗堵塞性能,自由出流时的平均滴水量与多次间歇式插地出流时的平均滴水量相当,其波动范围在5%以内,较适合于在移动式地下滴灌系统中应用。
【英文摘要】Based on structural research, improvement and optimization of emitters, drip arrows and other existential drip products, a new kind of movable insertion subsurface emitters are studied and developed, which have a good function of anti-jamming and characteristics of being assembled and disassembled quickly, being moved easily, small deviation of flow rates and stable hydraulic performance. In order to test the effect of anti-jamming, we have tested its drip discharge at status of the free flow and the subsurface flow. Results show that the movable insertion subsurface emitters have high uniformity of drip flow and good performance of anti-jamming. The rang of the flow average data deviation is 5% at the both status, and the emitter adapts to the system of movable subsurface drip irrigation.

【题目】蓄水灌溉管网水力性能试验研究
【中文关键词】蓄水灌溉;管网;水力性能
【英文关键词】water storage irrigation;pipe network;hydraulic characteristics
【中文摘要】为蓄水灌溉田间应用提供理论依据,试验对不同管网的水力性能进行了试验研究。结果表明:随着供水管径的减小,各出水口的流量偏差率在逐渐增大,但对于同一管径的供水毛管,流量偏差率均随着供水压力的增大而逐渐减小。在相同供水时间内,蓄水袋的容量随着供水管口径、供水压力的增大而增大,并基本呈线性变化关系。蓄水袋的最大实际蓄水量与系统的供水压力有关,与供水管口径的关系不明显,提出当蓄水袋的供水管口径为Φ5 mm时较合适。
【英文摘要】The hydraulic characteristic of different pipe networks is studied in this paper to supply the theory basis for storage irrigation application in field. The results of experiment show that the flow percentage of deviation increases slowly with the decrease of the tube diameter, while it decreases slowly with the increase of the water supplying pressure under the same tube diameter. Under the same water supplying time, the volume of storage sack increases with the increasing of tube diameter and water supplying pressure, and

it changes as linear relationship. The maximum practical water retention capacity of storage sack is mainly linked to water supplying pressure while not water tube diameter. In the end, it is proposed that the appropriate water tube diameter of storage sack is Φ5.

【题目】高含沙水滴灌技术研究
【中文关键词】含沙水;滴灌;明暗结合式取水;抗堵塞
【英文关键词】high sediment-laden water; drip irrigation; combine open and hidden water intake; mitigating-clogging
【中文摘要】:滴头堵塞是滴灌系统运行中的一大难题,对于高含沙水来说更为突出。针对多泥沙河道取水时引水必将引沙的现状,在分析了我国主要河道水沙分布特点的基础上,结合天然河道“水小沙少、水大沙多”的特点,提出了明暗结合式取水模式,采用枯水期明引与洪水期暗引相结合的方式,为解决多泥沙河道取水提供了新思路。利用研发的小型移动式过滤设备、简易过滤装置、可拆式灌水器等高含沙水滴灌专用设备进行组装配套,形成了适合于高含沙水的滴灌系统,使系统配套性能和运行效率均得以提高。与现有滴灌系统相比,系统造价大幅降低,堵塞率控制在5%以内,为解决高含沙水滴灌系统的易堵塞、投资高的难题提供了新途径。
【英文摘要】Emitter-clogging is a puzzle in drip irrigation systems, especially with high sediment water resources. Based on analyzing the rule of water and sand distribution in nature river, a mode of open and hidden water intake from river was put forward, which can intake water and control sediment in flood and dry seasons. It provides a new way of water intake from a high sediment-laden river. Key equipments and products of drip irrigation systems were developed, such as movable filters, simple filters and renewable emitters. Patterns of field drip irrigation systems, which using high-sandy water, were assembled. The performance and efficiency of irrigation systems were improved. Compared with the existing drip irrigation system, cost of the system lower greatly, and clog ratio is less 5%. This model can be applied in the high-sandy water areas with mitigation clog state and lower investments.

【题目】自适应地下滴灌灌水器的设计开发
【中文关键词】土壤负压;灌水器;自适应地下滴灌
【英文关键词】self-adaptation; subsurface drip irrigation; emitter; soil negative pressure
【中文摘要】针对最为节水、高效用水的地下滴灌技术,主要分析了目前地下灌水器产品的结构、使用特点和功能,并运用土-水系统中土壤水分理论知识,提出并设计了一种非电子控制的地下滴灌灌水器产品。该产品以土壤负压为控制动力,以土壤水分为控制条件,当灌水器附近土壤发生干湿变化时,土壤表现出不同大小的负压,并作用于灌水器内部的弹性膜囊,使之发生变形,从而改变灌水器内部流道的通断,使灌水器的出流状况始终与土壤含水量自动相适应,具有出流量自调节的功能。
【英文摘要】Aiming at the subsurface drip irrigation technology, which is the most water-saving and the highest efficient water-using irrigation technology, the structure, use characteristic and functions of current subsurface emitter are analyzed in this paper. And u- sing the soil water theory in soil-water system, a type of non-electronic controlled subsurface emitter is designed. This product takes the soil negative pressure as control power, the soil moisture as control condition. When the soil moisture around the emitter changes, the soil will show different negative pressure, which affects and deforms the elastic membrane in the inner of emitter to change the open or close condition of its interior flow passage. So the flow condition of the emitter can automatically adapted to the soil moisture and the emitter has the function of self-adjusting flow capacity.

【题目】不同植物生长调节剂对新疆棉花干物质积累、产量和品质的影响
【中文关键词】植物生长调节剂;干物质积累;棉花产量;品质
【英文关键词】plant growth regulator; dry matter accumulation; cotton yield; quality
【中文摘要】通过大田试验研究了3种不同的植物生长调节剂及其施用方法对棉花干物质积累特性以及品质和产量的影响效应。试验设计为叶面喷施缩节胺、随水滴施多效唑、随水滴施促根剂和随水滴施多效唑+促根剂。结果表明:不同的化控处理棉株干物质积累均随生育期延长而持续增加,动态变化可用“S”曲线方程拟合。干物质积累速率呈单峰曲线变化,峰值出现在出苗后约75 d左右。多效唑与促根剂混合滴施,棉株地上部总干物质、茎叶干物质和蕾铃干物质生长的最快时期提前,关键时期持续期长,干物质积累量和积累速率增加,棉花单株铃数和单铃重显著增加,产量达到6 941.13 kg/hm2,分别较滴施促根剂处理、滴施多效唑处理和叶面喷施缩节胺处理提高了7.7%、9.6%和10.4%。从棉纤维品质性状来分析,多效唑与促根剂混合滴施进行综合调控,有效地改善了棉花的经济性状,提高了麦克隆值和衣分率,增强了纤维的断裂比强度。叶面喷施缩节胺在促进棉株干物质积累、产量和纤维品质方面均为最低。
【英文摘要】This paper, through experiment in farmland, studied the dry matter accumulation characteristics, quality and yield of cotton affected by 3 different kinds of plant growth regulators as well as application methods. Four treatments were designed in the experiment: spraying DPC on leaf, dripping PP333withwater, dripping rooting agent with water and mixed dripping PP333and rooting agent with water. The results showed that the dry matter accumulation of cotton was increasing with growth stage extending and appeared “S” curve. The dry matter accumulation rate changed as a single-peak curve and the peak value emerged about 75 d after seed emergence. The fast-growing period of total dry matter of shoot, stem and leaf dry matter and bud and boll dry matter were all advanced through the measures of mixed drippingPP333and rooting agent, and had a long time of crucial period, effectively increased dry matter accumulation amount and rate, significantly improved boll number per plant and single boll weight of cotton, so the yield came to 6 941.13 kg/hm2, in- creasing respectively by 7.7%, 9.6% and 10.4% compared to rooting agent treatment, PP333treatment and DPC treatment. Analyzing from the traits of cotton fiber quality, the micron value and lint button percent were increased under the measure of mixed dripping PP333and rooting agent, specific breaking strength was also strengthened, and economic characters of cotton were availably perfected. The treatment of spaying DPC had the lowest effect on increasing dry matter accumulation, yield and fiber quality of cotton.

【题目】基于人工神经网络理论的土壤水分预测研究
【中文关键词】土壤含水率;气象因子;BP模型;预测
【英文关键词】soil moisture;meteorological factor;BP model;prediction
【中文摘要】土壤水分含量是影响作物生长的重要因素,精确的预测技术对水资源的合理利用与管理具有重要的指导意义。利用人工神经网络理论,建立了以降水量、蒸发量、相对湿度和地下水埋深为输入因子,土壤水分含量为输出因子的预测模型,并对其预测精度进行了评价。结果表明,BP神经网络模型预测土壤含水率的最大误差为8.66%,平均误差为4.27%,预测精度达到0.989。模型具有较高的预测精度,其结果可为制定合理的水资源调配方案和调度计划提供科学依据。
【英文摘要】Soil water content is an important factor affecting crop growth, and the accurate prediction of water resources is an important guiding on their reasonable utilization and management. An artificial neural net work model was established, with rainfall, evaporation, relative humidity and groundwater table as the input factors, and soil moisture as the output factors and its prediction accuracy was evaluated in this paper. The results showed that the maximum error of predicting soil moisture for BP neural network model was 8.66%, average error was 4.27%, and prediction accuracy of 0.989.BP neural network model had higher prediction accuracy for the prediction of soil moisture. The results can be used for the allocation of irrigation water resources.

【题目】基于最小二乘支持向量机的灌区粮食产量预测研究(英文)
【中文关键词】无
【英文关键词】Yield; Prediction; LS-SVM; Model
【中文摘要】无
【英文摘要】Commonly used grain yield forecasting models were briefly reviewed, and a yield prediction model of irrigation district was established based on least squares support vector machines(LS-SVM).The grain yield in irrigation district was analog calculated. And the test samples were used to compare with gray prediction, and neural network model. The maximum predicted error of least squares SVM was 7.12%,with an average error of 4.81%.The results showed that LS-SVM model has high prediction accuracy and strong generalization ability. So it could be used as a new method for irrigation district yield prediction.

【题目】滴灌方式下库尔勒香梨生长特性及产量和品质试验研究
【中文关键词】库尔勒香梨;滴灌;生长特性;果实品质;产量
【英文关键词】Korla fragrant pear; Drip irrigation; Growing characteristics; Fruit quality; Yield
【中文摘要】在滴灌与漫灌方式下,通过覆盖地膜的栽培方式研究了库尔勒香梨生长特性以及对果实品质和产量的影响,试验结果表明:地膜覆盖处理显著提高了根际区土壤水分含量,特别是0~60cm层土壤含水量显著高于未覆盖处理和CK约0.9%和2.5%,且该土层含水量与叶片含水量之间的相关性显著高于60cm}100cm层。土壤含水量的提高增加了叶片含水量和叶绿素含量,且二者之间呈正相关关系。滴灌显著地促进了香梨枝条粗度的增加,这种促进作用明显地表现在进入果实膨大期以后,而大水漫灌则显著地促进了枝条长度的增加。覆盖地膜有利于果实体积的增大,尤其促进了果实纵径的增大,提高了一级果率和改善了果形指数,同时提高了果实品质,产量较不覆盖处理和CK提高15.5%和38.9%
【英文摘要】The dynamic change of growth and development of Korla fragrant pear and the effect on fruit quality and yield under drip irrigation and flood irrigation by film mulched mode. The result showed that the soil water content of the root zone of film mulched treatment is. Higher than non-covered treatment and CK 0.9% and 2.5%,especially in 0}60cm layers,in which the relationship between soil water content and leaf water content is higher than 60cm-100cm layer. Leaf water content and chlorophyll content appeared positive correlation and increased with soil water content increased. Drip irrigation treatment markedly increased shoot coarseness growth, while flood irrigation increased shoot length stretch, and the promotion effect appeared after the fruit expanding period. Film covered treatment increased the fruit volume enlarge especially accelerated the fruit vertical diameter. The ratio of the first grade fruit and fruit shape index are all improved. In the meantime, fruit quality is promoted and yield is increased 15.5% and 38.9% compared with non-covered treatment and CK.

【题目】冬小麦地下滴灌氟乐灵注入制度对根系生长及作物产量影响的试验研究
【中文关键词】地下滴灌;氟乐灵;根系入侵;根长密度;冬小麦
【英文关键词】subsurface drip irrigation; treflan; root intrusion; root length density; winter wheat
【中文摘要】通过田间试验,研究了地下滴灌施加氟乐灵对滴头根系入侵堵塞的控制效应及其对冬小麦产量、品质和根系分布的影响。试验选取施药日期和施药浓度2因素。施药日期取返青末期和抽穗初期2个水平,施药浓度取0,50,75mg/l和150mg/l共4个水平。冬小麦收获后,采用土钻法在滴头附近沿垂直方向分层取样,测定各土层的根长密度和氟乐灵含量,并统计各小区的产量。同时,在每个小区内随机抽取25个滴头,观测滴头流道内是否有根系残留,从而判断滴头是否发生根系入侵堵塞。试验结果表明,施药可以有效地削减滴头附近区域的根密度,从而减小根系入侵堵塞的发生。在对照小区内(0mg/l)抽取的25个滴头中有4个出现了根系堵塞现象(堵塞率16%),而在施药的各个处理中均未发现根系堵塞的滴头(堵塞率0)。施药浓度对根系分布及作物的产量、品质均无显著影响。而施药日期对冬小麦根系的垂直分布影响较为显著,晚期施药导致滴头埋设深度处小范围内(15~30cm深度)的根系有所减少,而早期施药则使滴头下方较大区域内(15~40cm深度)的根长密度显著减小。
【英文摘要】Field experiment was conducted to investigate the effects of treflan injection on dripper clogging and root distribution, yield and quality of winter wheat. Two treflan injection dates and four injection concentrations were designed as the experimental conditions. At harvest, root length density and treflan concentration at different soil layer were evaluated using soil auger method. The flow passages in 25 drippers randomly selected were carefully observed to check whether the root residue was existed to estimate the root clogging situation. The results show that treflan injection can reduce the root length density in the vicinity of dripper resulted in reduction of potential of root clogging. Four drippers with root intrusion problem were found for those without treflan injection but no intrusion problem happened for the drippers with application of treflan. Trefian concentration had insignificant effect on winter wheat root distribution, yield and quality. However, injection date influence the root vertical distribution significantly. Injection of treflan in latter growing season will influence the root distribution in close vicinity of the drippers only.

【题目】地下滴灌条件下水热运移数学模型与验证
【中文关键词】地下滴灌;水热运移;数学模型;验证
【英文关键词】subsurface drip irrigation; water-heat transport; mathematical model; verification
【中文摘要】基于土壤水、热运动基本方程,结合地下滴灌水分运动特点,建立了地下滴灌水热运移数学模型。利用HYDRUS-2D软件对模型进行了求解,并用田间实测数据进行验证。模拟和验证结果表明,模型对地下滴灌条件下的土壤水分和土壤温度运移变化动态的模拟效果较好,该水热运移数学模型可以用来监测和调控作物生长所需的土壤水、热环境条件。模拟值和实测值的结果对比表明,上层土壤的水分和温度的模拟值较下层土壤值差异较明显,且数值波动大,主要原因

是上层土壤易受到土壤蒸发和大气温度剧烈波动的影响。
【英文摘要】A mathematical model was set up by integrating the basic equation of soil water and heat movement with characteristics of water movement under subsurface drip irrigation,The HYDRUS-2D software was used to solve the mathematical model. The comparison of simulation value with observation data obtained from field measurement showes that the mathematical model can be satisfactorily used to describe the soil water and heat transport properties and can be used for monitoring and adjusting soil water and heat distribution. Finally,the comparison result between simulation value and the observation value reveales that the soil water and heat value in the upper soil layer exhibit the characteristics of obvious fluctuation and deviation comparing with those in lower soil layer,the main reason is that the water and heat transport in the upper soil layer is easily affected by soil evaporation and atmosphere temperature fluctuation.

【题目】滴灌模式对农田土壤水氮空间分布及冬小麦产量的影响
【中文关键词】灌溉,土壤,氮,滴灌模式,冬小麦,水分利用效率
【英文关键词】irrigation, soils, nitrogen, drip irrigation mode, winter wheat, water use efficiency
【中文摘要】大田作物最优滴灌模式的研究是滴灌技术深入推广应用过程中的重要研究内容,通过田间试验,选取地表滴灌和地下滴灌两种滴灌类型,研究其在4种不同灌溉制度下农田水、氮空间分布规律以及冬小麦产量的差异。试验结果表明,在土壤水分控制范围相同时,不同滴灌类型下冬小麦生育期内所需的灌水总量和灌水频率不存在显著差异;在施肥量和灌水定额基本相同时,地下滴灌较地表滴灌促使硝态氮向深层土壤运移的几率更大。但总体而言,不同滴灌类型相同灌溉制度下,硝态氮运移规律基本相似;同种滴灌类型不同滴灌制度下的各处理冬小麦产量存在显著差异。而且,在充分灌时,不同滴灌模式下的冬小麦产量差异性不显著;非充分灌时,滴灌模式对冬小麦产量存在显著影响。
【英文摘要】Study on best drip irrigation mode applied in field plants plays an important role in the promotion process of drip irrigation technology. Field experiments which choose two drip irrigation types and four different irrigation schedules were carried out to assess the effects of drip irrigation mode on spatial distribution of soil water, soil nitrogen and winter wheat yield. The results showed that drip irrigation mode had little effect on irrigation quantum and irrigation frequency in the period of winter wheat growth on the basis of the same soil water controlling range. And based on the same fertilizing amount and irrigation quota, subsurface drip irrigation impeled nitrogen to deep soil obviously compared with drip irrigation. The nitrate nitrogen transport had similar rules with different drip irrigation types but same irrigation schedules, and the irrigation schedule had obvious effect on winter wheat yield when adopted same drip irrigation types but different drip irrigation schedules. The drip irrigation mode exerted little effect on winter wheat yield under sufficient irrigation and had obvious effect on winter wheat yield under deficit irrigation.

【题目】额定压力及低压下内镶片式滴头抗堵塞性能试验
【中文关键词】灌水器,低压抗,堵塞性能
【英文关键词】Emitter,Low operating pressure,Anti-clogging performance
【中文摘要】依据ISO短周期滴头堵塞测试方法,测试了12种内镶片式齿型迷宫滴头在额定压力和低压情况下的抗堵塞性能。结果表明:滴头抗堵塞性能随着流道断面最小尺寸增加而提高,当滴头流道断面最小尺寸大于等于0.6 mm时滴头将获

得较好的抗堵塞性能,但在0.04 MPa时滴头流道设计形式对滴头抗堵塞性能有更为明显的影响。在过滤器滤网孔径大小选择方面,压力为0.10 MPa时,可选用流道断面最小尺寸的1/5作为有效孔径,而压力为0.04 MPa时,则应按流道最小断面尺寸的1/7来选择。研究还表明,滴灌系统在低压运行时,可通过间歇灌溉的方式来预防和减少滴头的堵塞。

【英文摘要】Based on short term clogging test procedure in ISO clogging test methods for drip emitters,twelve kinds of dental labyrinth emitters were tested for anti-clogging ability under different operating pressures. The results showed that as the minimum size of labyrinth passage section increased,the anti-clogging ability of emitters was improved.When the minimum size of labyrinth passage section was greater than 0.6 mm,the anti-clogging ability of emitters would be better.However,the design of labyrinth passage section showed more significant effect on the anti-clogging ability of emitters under 0.04 MPa operating pressure.Aperture of the filter can select 1/5 of the effective aperture of minimum size of labyrinth passage section under 0.10 MPa,and 1/7 of the minimum size of labyrinth passage section under 0.04 MPa.In addition,the results also showed that intermittent irrigation could contribute to the improvement of anti-clogging performance of emitters under low operating pressure.

【题目】常压灌水器在低压条件下水力性能试验研究

【中文关键词】灌水器;低压;水力性能;制造偏差

【英文关键词】emitters; low operating pressure; hydraulic performance; manufacturer’s variation

【中文摘要】鉴于目前国内低压滴灌系统中的滴灌带(管)基本沿用常压滴灌下使用的滴灌带(管),对常压滴灌系统中使用较多的国内6种单翼迷宫和内镶片式滴灌带在低压下的水力性能进行了试验研究,试验结果表明,在2~8 m和6~14 m水头压力范围拟合的流量与压力关系式不相同,在2~8 m水头压力范围的流态指数明显高于在6~14 m水头压力范围的流态指数。在较低压力下测定灌水器的制造偏差时,相比额定压力下所测定的结果表现出增大的趋势,即由于灌水器制造工艺和材料配方引起的制造偏差,在工作压力较低时表现的更为明显。

【英文摘要】According to common drip tape used low operating pressure of drip irrigation system, hydraulic performance of the different types of the emitters which are very popular on the market at present. The results show that the relationship of emitter discharge and pressure under low operating pressure(2~8 m water) was different from that under conventional pressure(7~12 m water). Low operating pressure of the manufacturer’s variation of emitters which compared with under operating pressure of the manufacturer’s variation of emitters trend to increase, because the manufacturer’s variation of emitters which resulted from materials and manufacturing processes is more obvious.

【题目】低压条件下滴灌带灌水均匀系数试验研究

【中文关键词】低压;滴灌带;灌水均匀系数;制造偏差

【英文关键词】low operating pressure; drip irrigation tape; uniformity coefficient; manufacturer’s variation

【中文摘要】对常压滴灌系统中使用较多的6种国产单翼迷宫和内镶片式滴灌带,在低压条件下进行了滴灌带铺设长度、压力水头、地形坡度3个因素对滴灌带灌水均匀系数影响规律的试验研究,试验结果表明,0坡低压条件下,在试验的滴灌带铺设长度范围内(60~120 m),滴灌带长度较短时,影响滴灌带均匀系数的主要因素为制造偏差,随着滴灌带长度的增加,滴灌带流量大小成为影响滴灌带灌水均匀系数的主要因素,而制造偏差变为次要因素;随着滴灌带进口压力的增大,各规格滴灌

带均匀系数也有所增加,当滴灌带铺设长度较大时,滴灌带的规格类型对滴灌带的灌水均匀系数存在显著影响;试验结果还表明,当滴灌带铺设坡度从逆坡-1%到顺坡1%变化时,灌水均匀系数呈逐渐增加的趋势,低压条件下逆坡对滴灌带灌水均匀系数影响尤为显著。

【英文摘要】Uniformity coefficient has been one of the most frequently used criteria for micro-irrigation de- sign and evaluation. A series of experiments about the effect of tapes ’ length, entrance pressure and slope gradient working on the emission uniformity were carried out in laboratory under low operating pressure. The experiment results show that uniformity coefficient declined with the increase of the drip tape length, when the drip tapes length changed form 60 m to 120 m in zero slope. When drip irrigation tapes are not very long, the main factor effecting uniformity coefficient is manufacturer ’ s variation, as drip irrigation tapes extending, the main factor goes to the flow of emitters while manufacturer ’ s variation becomes minor factor. Uniformity coefficient increased as the downhill slope increased with the increase of the slope in experimental range, especially the effect of uniformity coefficient was significant on the uphill slope.

【英文关键词】subsurface drip irrigation; dripper discharge; irrigation quantity; soil wetted front

【中文摘要】滴头流量与灌水量影响土壤湿润体的大小形状等特性,从而影响作物的生长生产。通过室内试验,研究了地下滴灌条件下不同滴头流量不同灌水量对湿润体特性的影响。结果表明:湿润锋运移与滴头流量的时间变化呈正相关;灌水量为5L时湿润体的横向和纵向尺寸达到50cm;湿润体含水率与滴头的距离具有良好的二次幂函数关系。这对于开展地下滴灌试验与设计具有一定的参考价值。

【英文摘要】The dripper discharge and irrigation quantity can affect the shape and size of soil wetted front, then the growth and production of crop can be affected. In this paper, dripper discharges and irrigation quantity affecting the soil wetted front is studied through subsurface drip irrigation laboratory experiments. The results show that there is a positive correlation between the soil wetted

front migration and the temporal variation of dripper discharge. When the dripper water is 5 L, both horizontal and vertical distances of wetted front reaches 50 cm. The moisture content of soil wetted front and its distance from the dripper have a good quadratic function. All these results arc valuable for designing subsurface drip irrigations carrying on relative experiments.

【题目】低压孔口式滴灌管出流规律试验分析
【中文关键词】低压滴灌;孔口式滴灌管;出流规律
【英文关键词】no
【中文摘要】在0. 25~5 m的水头下对孔口式滴灌管的出流规律进行了试验分析。结果表明:试验条件下孔口式滴灌管的出流均为紊流式出流,孔口流量随孔径增大而增大,增幅随管径的增大而增大。在相同的工作压力下, 0. 6 mm孔径滴灌管,孔距33 cm的孔口流量大于孔距100 cm的; 0. 9、1. 2 mm孔径滴灌管,孔距100 cm的孔口流量大于孔距33 cm的,孔距50 cm的孔口流量均最小。测试滴灌管灌水均匀度随工作水头有2种变化关系:一种是灌水均匀度随工作水头的增大而增大;另一种是灌水均匀度随工作水头的增大先增大后减小。当滴灌管处理与试验条件相似时,工作水头宜控制在1~2. 5 m。

【题目】不同流态条件下低压滴灌灌水器工作水头与灌水均匀度关系的研究
【中文关键词】低压滴灌;灌水器工作水头;流态;灌水均匀度
【英文关键词】low pressure drip irrigation; emitter working head; flow regime; irrigation uniformity
【中文摘要】依据滴灌灌水器的水力特性,基于水力学基本原理,分析研究了水平铺设的低压滴灌毛管在不同流态条件下灌水均匀度Cu与灌水器工作水头hd的关系,并通过实验验证了理论分析的结论;结果表明:在试验条件下滴灌毛管内不同水流流态、灌水器流态指数x时,Cu与hd的变化关系不尽相同,层流时不论x为何值, Cu随hd的增大而增大。层紊流共存时当0<x≤1/1.75,Cu随hd的增大而增大;当1/1.75<x<1,Cu随hd的增大而先增大后减小。紊流时,当0<x<1/1.75, Cu随hd的增大而增大,当x=1/1.75, Cu不随hd的变化而变化;当1/1.75<x<1, Cu随hd的增大而减小。
【英文摘要】Based on the hydraulic characteristics and the basic principles of hydraulics, the relationship between irrigation uniformity Cu and emitter working head hd in drip irrigation laterals of low pressure under different fluent regime conditions is analyzed, and relevant experiments have verified theoretical results. Results show that under experimental conditions, the change rule of irrigation uniformity Cu and emitter working head hd is different under different flow regime and emitter discharge exponent x conditions. Under laminar conditions, Cu increases along with hd increases and they are independent of x. Under laminar conditions with turbulence, Cu increases as hd increases when 0<x≤1/1.75; Cu increases first and then decreases as hd increases when 1/1.75<x<1. Under turbulent conditions, Cu increases as hd increases when 0.5<x<1/1.75;Cudoes not change as hd increases when x=1/1.75;Cu decreases as hd increases when 1/1.75<x<1.

【题目】低压条件下滴灌毛管水头损失试验研究
【中文关键词】低压滴灌;水头损失计算;滴灌毛管
【英文关键词】plastic mulched drip irrigation; space of drip-lines; cotton; distribution of root system; root length density
【中文摘要】对孔径0.9、1.2 mm,孔间距33 cm,管径为Φ12、Φ16PE滴灌毛管进行了0.25~2.4 m入口工作水头条件下的水力性能试验和分析。结果表明,在试验的工作水头下,使用达西-韦斯巴赫公式、经验公式计算出管道总水头损失值与实测值比较都有很大的偏差,通过对试验数据的回归分析,对常用的水头损失计算经验公式用以入口工作水头为变量的参数进行了修正,取得较好的计算精度。
【英文摘要】The experiments were carried out under plastic mulched drip irrigation to study the effects of the space of drip-lines on the distribution of cotton root and plant growing. With the space of drip-lines of 130 cm and 90 cm respectively, the distribution of cotton root system, height of cotton stem, and cotton leaves area were observed in cotton growing stages. The experiments results indicated that a large space of drip-lines resulted in large irrigation and soil deep seepage; soil moisture was non-uniform horizontally and the cottons at inside and outside rows grew non-uniformly; cotton root was thin, the density of root length was single-peak-parabolic distribution in horizontal and was largest in 14~28 cm soil layer over the soil depth. While a little space of drip-lines resulted in uniform soil moisture as well as the cottons planting at inside and outside rows; cotton root was thick, the density of root length was double-peak-parabolic distribution in horizontal and was largest in 0~14 cm soil layer over the soil depth Nevertheless, the growing performances of the cotton root, plant and leaves under the different space of drip-lines were similar respectively. These efforts are helpful to select the percentage of wetted soil volume and the space of drip- lines in the design of drip irrigation technique.

【题目】地下滴灌土壤水分运移分布规律试验研究
【中文关键词】地下滴灌;滴头流量;湿润体;平均含水率
【英文关键词】subsurface drip irrigation; dripper discharge; volume of soil wetting front; average soil moisture
【中文摘要】通过地下滴灌的室内试验,研究了不同滴头流量对土壤湿润体特性的影响。试验采用杨凌粘壤土,滴头流量分别为0.3、0.5、0.7、0.8 L/h,埋深为25 cm。结果表明,湿润体为轮廓线近似于抛物线的不规则形体;湿润锋运移与时间的变化呈显著幂函数关系;滴头流量0.7 L/h为平均含水率由稳态到紊乱态的拐点,该点可以作为地下滴灌设计的依据。
【英文摘要】Through subsurface drip irrigation laboratory experiments, different dripper discharge on the soil wetting front were analyzed. The experiment take the Yangling clay loam soil, and the experimental dripper discharges were 0.3,0.5,0.7,0.8 L/h, and the dripper was 25 cm deeply buried. The results indicated that the soil wetting front was irregular front which outline was irregular parabola; the soil bulk density and the change of time is a power function relation; dripper discharges 0.7 L/h express the average soil moisture from content to increase, and it can be as the design basis of subsurface drip irrigation.

【题目】滴灌土壤湿润体含水率分布规律的试验研究
【中文关键词】滴灌;滴头流量;湿润体体积;含水率增量
【英文关键词】drip irrigation; dripper discharge; volume of soil wetting front; increment in water content
【中文摘要】通过室内滴灌试验,研究了不同滴头流量对土壤湿润体变化过程的影响。试验所用的土壤为杨凌塿土,滴头流量分别为0.08、0.16、0.24、0.40、0.60、1.20、2.00、3.60 L/h。结果表明,从0.08~0.6 L/h的滴头流量,其湿润体体积和灌水量之间存在显著的线性关系,说明平均含水率是一定值;从1.2~3.6 L/h的滴头流量,其湿润体体积和灌水量之间存在显著的幂函数关系,说明平均含水率是逐渐增大的。
【英文摘要】Through drip irrigation laboratory experiments, different dripper discharge on the soil wetting front were analyzed. The experimental soils was Yangling Lou soil, while the experimental dripper discharges were 0.08,0.16, 0.24, 0.40, 0.60, 1.20, 2.00, 3.60 L/h, respectively. The results indicate that the dripper discharges from 0.08~0.6 L/h, the volume of wetted solum did not vary much with the dripping rate, description the average soil moisture was constant value. The dripper discharges from 1.2~3.6 L/h, the volume of wetted solum was vary much with the dripping rate, description the average soil moisture was increasing gradually. Through analysis, the dripper discharges was 0.65 L/h express the average soil moisture from content to increase.

【题目】不同覆盖对梨枣树萌芽展叶期和开花坐果期生长的影响
【中文关键词】梨枣树;地膜覆盖;秸秆覆盖;果树生长
【英文关键词】pear-jujube tree; plastic mulching; straw mulching; fruit tree growth
【中文摘要】通过桶栽试验,研究了地膜和秸秆2种覆盖方式对梨枣树生长的影响。结果表明,覆盖处理提高了桶内的土壤含水率,其中地膜覆盖的保水效应更为明显。受温度及果树自身生长的影响,保水效应在萌芽展叶期更显著。覆盖处理有明显的促进梨枣树生长的作用,新梢和枣吊等指标生长量大,且持续生长时间长,以地膜覆盖最为显著。不同处理对叶绿素相对质量分数影响较大,3个处理的叶绿素相对质量分数均呈增大趋势,其中秸秆覆盖在2个生育期中增量最大,达到了16.5%。
【英文摘要】Through the barrel planted test. The effects of plastic and straw mulching on pear-jujube tree growth was studied. The results show that mulching treatments increase the soil moisture content. And the water-saving effect of plastic mulching was more obvious. Influenced by the temperature and the fruit trees ’ own grow, the water-saving effect in sprouting-leaf unfolding stage was obvious. The treatments of mulching can promote fruit trees growth. the volume of new shoot and panicle growth was more. Continuous growth time was longer. the plastic mulching was the most significant. Effect of different treatments on SPAD value was huge. the three treatments SPAD value all presented trend of increase. During the two growth periods, the straw mulching's increase value was the most, reached 16. 5%.

【题目】低压PE滴灌毛管水头损失试验
【中文关键词】低压滴灌;毛管;水头损失计算
【英文关键词】low pressure trickle irrigation; laterals; calculation of head losses
【中文摘要】对内径为20 mm,壁厚1.36 mm,承压能力为0.2 MPa,60 cm孔距,出水孔径0.6 mm的PE滴灌管进行了低压条件下的水力性能试验和分析,结果表明:在试验的工作水头下,不考虑滴灌管出水孔水流扰动影响条件,测试滴灌管内的水流有层流和紊流两种流态,但主要以层流为主。用传统的水力学经验公式计算水头损失存在较大的误差,与实际情况差0~14.29%。
【英文摘要】Experiment carried with laterals which internal diameter is 20 mm and tube wall is 1.36 mm under low pressure condition. It can bear pressure which equals to 0.2 MPa and there are orifices which pore size is 0.6 mm spacing at 60 cm. Result indicated that under test condition, and do not taking into account of influence of orifices water disturbance, flow regimes are both laminar and turbulence. But main flow regime is laminar. Head losses calculated by traditional empirical hydraulics formula produces great error, and do not accord with the fact, the range of deviation is 0~14.29%.

【题目】亏水灌溉对开花坐果期梨枣树生长的影响
【中文关键词】梨枣;开花坐果期;含水率;直径;新梢;叶绿素
【英文关键词】pear-pjujube tree; flowering to fruit-setting stage; soil moisture content; diameter; shoot; SPAD value
【中文摘要】以2 a生梨枣为试材,采用桶栽的栽培形式,研究了不同灌水量对枣树开花坐果期生长的影响。试验设置了中度T2和重度T3两个亏水处理,对照为充分供水T1。结果表明:对桶栽进行复水后,T1(对照)和T2的土壤含水率下降明显,且明显分为两个阶段,T3下降速率缓慢;亏水抑制了直径的增粗;亏水处理同样抑制了新梢的增长,新梢生长呈现线性关系;由本试验可以看出:在亏水期间,亏水与对照处理之间叶绿素含量的变化并没有显著性差异。
【英文摘要】Jujube Mills of 2a was used in a barrel planting experiment to study the effects of different water deficit treatments on soil moisture and growth of the trees at the flowering to fruit-setting stage. Two deficit treatments were set in the experiment. The result indicated that after irrigation, the moisture of T1 (CK) and T2 dropped obviously, in addition, the process can be divided into two stages, and the descend rate ofT3 ’ s moisture was slow; Deficit irrigation re- strained the growth of the trees ’ diameter significantly; Deficit irrigation also restrained the growth of branches, and the growth of branches in three treatments presented linear relation. In the period of deficit irrigation, the spad value between the CK and the other treatments had no significant difference.

【题目】低压滴灌小孔出流孔前压力变化研究
【中文关键词】低压滴灌;毛管;毛管水头损失
【英文关键词】low pressure trickle irrigation; lateral; lateral head loss
【中文摘要】为了研究低压滴灌毛管压力变化规律,本试验对Φ16孔口式滴灌管在不同的入口水头(0.5~2.0 m)和不同管道铺设长度(20、40、60 m)状态下沿程压力进行了测定。结果表明,运用规范中给定的计算结果与试验测试结果进行比较,相差较大,规范中的沿程水头损失计算公式不能满足孔口式滴灌管在低压条件下的损失。在管道长度为20 m和40 m,工作水头为0.5 m时,试验测试水头损失约为规范公式计算结果的30倍多,但随着入口工作水头的增加,两者之间的比值有趋于减少的趋势。同时,Excel软件的拟合表明,低压滴灌孔口式出流沿程压力分布符合以入口水头为基本参数的指数函数关系,并给定了相关参数的经验取值范围,其中水头损失修正系数k=1.004~1.0183;指数修正系数θ的取值为0.004到0.021。
【英文摘要】In order to study the variation law of low pressure trickle irrigation laterals, under 0.5~2.0 m work head and different laterals with the length of 20, 40 and 60 m, orifice outlet drip irrigation laterals ’ linear pressure with a diameter of Φ16 are measured. The results show that there are great differences between calculation results calculated by formula according to the specifications and measured value. Linear head loss calculation formula in specifications can not meet the orifice outlet drip irrigation laterals ’ head losses calculation under low pressure condition. Head losses of measured values is bigger than that calculated by formula for more than 30 times under condition of 0.5 m work head and lateral with the length of 20 and 40 m, and the ratio of them has the tendency of reducing with the increasing of inlet work head. After fitting by excel, it shows that pressure distribution carried with laterals conforms to an exponent function relation which considers inlet pressure as a basic parameter, and gives the experimental value range of related parameters as: head losses correction coefficient k=1.004~1.0183 and exponent correction coefficient θ=0.004~0.021.

【题目】滴头埋设深度对土壤水分运移及草坪草生长的影响
【中文关键词】地下滴灌;埋设深度;湿润锋;含水率;高羊茅
【英文关键词】Subsurface drip irrigation, Emitter burying depth, Wetting front, Soil water content, Tall fescue
【中文摘要】草坪地下滴灌与喷灌相比,具有节水、方便管理等优点。为了掌握滴灌中滴头的适宜埋设深度,通过模拟及实地试验,对地下滴灌土壤水分分布及其对草坪生长的影响进行了观测分析。结果表明:在流量和灌水时间一定的情况下,随着埋深的增加,湿润锋在水平方向的运移距离减小,在垂直方向上增大;相同埋深时,滴头两侧的含水率分布对称。在高羊茅((Festuca arundinaceaSchreb. cv. Pixie))生长旺季,不同埋深处理对地上生物量影响显著(P<0.05),埋深20 cm显著高于其他处理(P<0.05);不同埋深处理植株密度差异不显著;不同埋设深度对高羊茅根系分布有一定的影响,在每个滴头附近的根系密度和重量明显增加。
【英文摘要】Subsurface drip irrigation is better in water saving and management for lawn in comparison with the spray irrigation. In order to explore the appropriate emitter burying depth of subsurface drip irrigation, the soil water distribution and turf grass growth characteristics under subsurface drip irrigation were observed and analyzed by the simulative experiment and filed test. The results show that the wetting front migration distance decreased in the vertical direction and increased in horizontal direction along with the increase in emitter burying depth at a given flow rate and irrigation time. For the same emitter burying depth, the water content

distribution was symmetrical on both sides from the emitter. The aboveground biomass under the treatment of 20 cm emitter burying depth was significantly higher than those under other treatments in quick growth stage (P<0.05). No significant effect of emitter burying depth on sward density was detected. Emitter burying depth affected root distribution to some degree, the root density and underground biomass increased obviously nearby the emitter of drip irrigation system.

【题目】地下滴灌对返青期高羊茅草坪生长状况的影响
【中文关键词】地下滴灌;高羊茅;生长状况
【英文关键词】Subsurface drip irrigation(SDI); Tall fescue; Growth
【中文摘要】为了发展节水灌溉,提高草坪灌溉水分的利用率,以高羊茅为研究对象,结合其生长发育特点,探讨了地下滴灌对返青期高羊茅的生长变化特征的影响。试验采用5种处理:滴头埋深10 cm,无水分扩散装置;滴头埋深15cm,有水分扩散装置;滴头埋深15cm,无水分扩散装置;毛管埋深15cm,无水分扩散装置;毛管埋深15cm,有水分扩散装置。研究表明,不同处理下高羊茅生长速度、地上生物量差异显著,且生长速度与地上生物量成正比例关系,两者受水分影响较大,而地下生物量和根冠比差异不明显。
【英文摘要】In order to develop the water -saving irrigation and increase the water use efficiency in lawn irrigation, taking the tall fescue as the object of study, discussed the impact of subsurface drip irrigation(SDI) on the period of returning green of tall fescue growth characteristics of changes. Test using five kinds of treatments: emitter depth of 10 cm, no water- proliferation devices; emitter depth of 15cm, a water -proliferation devices; emitter depth of 15cm, no water-proliferation devices; capillary depth of l5cm, no water-proliferation devices; capillary depth of 15cm,a water-proliferation devices. Research shows that the differences were remarkable on the growth rate and the above -ground biomass of tall fescue under different treatments, and the positive correlations were found between the growth rate and the above- ground biomass, and water great impact on the growth rate and the above-ground biomass, but the

under-ground biomass and the root/ shoot ratios had no significant differences among the different treatments.

【题目】滴灌模式和灌水下限对甜瓜耗水量和产量的影响
【中文关键词】甜瓜; 滴灌模式; 灌水下限; 耗水量; 产量
【英文关键词】Sweet melon, Drip irrigation mode l, Irrigation start point, Water consumption, Yield
【中文摘要】以膜下滴灌(MDI)、地表滴灌(DI)和地下滴灌(SDI)3种滴灌模式与4种不同灌水下限组合,在我国西北地区进行了滴灌模式和灌水下限对甜瓜耗水量和产量影响的试验研究。结果表明:同一灌水下限下,MDI较DI平均增产16・0%,较SDI平均增产7・5%, SDI较DI平均增产7・9%, 3种滴灌模式的单产均高于当地地面灌溉的单产(40・97 t/hm2);DI耗水量最大(平均239・3 mm), SDI次之(平均217・3 mm),MDI最小(平均193・0 mm)。同一滴灌模式下:伸蔓期灌水下限为60%田间持水量的处理较灌水下限为40%田间持水量的处理平均增产21・0%,耗水量平均增加9・2%;果实膨大期灌水下限为80%田间持水量的处理较灌水下限为70%田间持水量的处理平均增产9・3%,耗水量平均增加6・7%。甜瓜各生育阶段适宜土壤含水率下限(占田间持水量的百分比)分别为:苗期65%,伸蔓和开花坐果期60%,果实膨大期80%,成熟期55%。
【英文摘要】The field experiment was conducted to investigate the effect of irrigation models (drip irrigation under plastic mulching (MDI), drip irrigation (DI) and subsurface drip irrigation (SDI)) and irrigation start point on water consumption and yield of sweet melon. The results showed that under the same irrigation start point MDI increased the yield by 16・0% compared with DI; MDI increased the yield by 7・5% compared with SDI; SDI increased the yield by 7・9% compared with DI. The average water consumption for MDI, SDI and DI were 193・0mm, 217・3mm, 239・3mm respectively. Under the same drip irrigation model, the treatment of irrigation start point of60% field capacity in extension vine and flowering fruit stage, yield increased by 21・0% compared with the treatmentof40% field capacity; the treatment of irrigation start point of 80% field capacity in fruitage stage, yield increased by 9・3% compared with the treatmentof70% field capacity. The appropriate irrigation start points (the percentage of field capacity) for the sweet melon were: seedling stage (65%), extension vine and flowering fruit stage (60%), fruitage stage (80%), mature stage (55%).

【题目】不同施肥条件和滴灌方式对青椒生长的影响
【中文关键词】水分,灌溉,肥料,水肥耦合,青椒,地下滴灌,地表滴灌
【英文关键词】water, irrigation, fertilizers, water and nitrogen coupling, bell pepper, subsurface drip irrigation, surface drip irrigation
【中文摘要】该文通过大田试验,比较了地下滴灌与地表滴灌及其不同施肥量对青椒生长的响应。试验设置地下滴灌和地表滴灌2 个灌水处理和0、75、150、300 kg/hm2 4 个施肥水平,灌水周期为4 d。另外设1 个畦灌对照处理。结果表明,2 a中地下滴灌产量均高于地表滴灌,2007 年平均高4%,2008 年平均高13%。而地下滴灌耗水量低于地表滴灌,2007 年平均低6.7%,2008 年平均低7.3%。地下滴灌和地表滴灌0~40 cm 土层的根系总根长分别是畦灌的2.44 和1.46 倍,且地下滴灌10 cm 以下各层的根长占总根长的百分比,比地表滴灌高7%,这说明地下滴灌不仅促进作物根系的生长,而且使根系更多的扎入较深土层。地下滴灌150 kg/hm2 施氮量为青椒的最优灌溉施肥策略。
【英文摘要】A 2-year field experiment was conducted in 2007, 2008 to study the response of bell pepper to subsurface drip irrigation (SDI) and surface drip irrigation (DI). Four nitrogen levels of 0, 75, 150, 300 kg/hm-2 (N0, N75, N150, N300) comprised the fertigation treatments. The irrigation interval was 4 days. The results showed that, bell pepper yields for treatment SDI were higher than

that for DI by 4% in 2007, and 13% in 2008, respectively. The water consumption of SDI was lower than that of DI by 6.7% in 2007, and 7.3% in 2008, respectively. The root length density of SDI and DI was 1.46 and 2.44 times BI (border irrigation). The percent of root length under 10 cm of SDI were higher than that of DI by 7 percent, which means SDI not only promote the growth of crop root system, but also promote deep insertion of the root system. Treatment SDI N150 was recommended as the optimal strategy for improving bell pepper yield and WUE, reducing NO3--N leaching.

【题目】地下滴灌施氮及灌水周期对青椒根系分布及产量的影响
【中文关键词】地下滴灌,氮肥,产量,灌水周期,根系
【英文关键词】subirrigation, nitrogen fertilizers, yield, irrigation interval, root system
【中文摘要】地下滴灌是一项十分节水的灌溉技术,该文通过大田试验,研究了地下滴灌灌水周期和施氮量对青椒根系分布和产量的影响,以期获得较优的灌溉施氮制度。试验设置4、8 d两种灌水周期和0、75、150、300 kg/hm24个施氮水平。结果表明,当施氮量小于150 kg/hm2时,随着施氮量的增加,整根的根长、根表面积、根体积和根干质量和各层土壤的根密度均显著增加,但当施氮量增加到300 kg/hm2,整根特征参数均减少。施氮量一定时,4 d灌水周期条件下的青椒根系特征参数和产量高于8 d灌水周期。青椒产量与施氮量之间呈二次曲线关系,4 d灌水周期和150 kg/hm2施氮量组合获得最高产量。并发现小于2 mm的根系总长与产量之间呈明显的线性相关关系。
【英文摘要】Subsurface drip irrigation is a water-saving technology. A 2-year field experiment was conducted in 2007 and 2008 to investigate the effects of subsurface drip fertigation strategies on bell pepper yield and root distribution. Two irrigation cycles of four days and eight days(C4,C8)and four nitrogen application levels of 0, 75, 150, 300 kg/hm2(N0, N75,N150,N300)comprised the irrigation and fertigation treatments. The experimental results showed that the length, surface area, volume, weight, density of the roots significantly increased with the application rate of nitrogen less than 150 kg/hm2. The characteristic parameter of roots decreased with the nitrogen application rate increased to 300 kg/hm2. Four days irrigation cycle promoted the growth of root system and obtained higher yield than eight days irrigation cycle. The conics relationship between yield and nitrogen application rate was found. Maximum yield were obtained by treatment of 150 kg/hm 2 nitrogen application rate and four days irrigation cycle. The results show that there is remarkable linear relation between yield and total root length which is less than 2 mm.

【题目】水分调亏对地下滴灌夏玉米田水热动态的影响!
【中文关键词】夏玉米,地下滴灌,调亏灌溉,水热动态,水分利用效率
【英文关键词】Summer corn,Subsurface drip irrigation,Deficit irrigation,Soil moisture and temperature regimes,Water use efficiency
【中文摘要】通过北京地区地下滴灌夏玉米田间试验,研究了前期不同程度水分亏缺对土壤水热和夏玉米冠层温度、株高、叶面积指数及产量的影响。结果表明:在20~60 cm土层,除重度亏水处理外,其他处理的土壤含水率均在高位平稳变化;在60~100 cm土层,丰水处理的土壤含水率最大;对不同深度的土层,轻度与中度亏水处理两者间的土壤含水率差异较小。受作物覆盖度和亏水程度的影响,拔节期各处理间土壤温度和冠层温度有明显差异;在较浅土层(距地表30 cm和50 cm处)中,拔节期之前丰水处理的土壤温度较低,拔节期之后各处理间差异逐渐减小;在较深土层(距地表80 cm处)中,水分亏缺程度越大,土壤温度越高。轻度亏水处理能获得较高的产量,中度亏水处理能提高水分利用效率。

【英文摘要】In order to study the effects of regulated water deficit irrigation on soil moisture and temperature regimes in summer corn field of North China under subsurface drip irrigation,soil moisture and temperature,as well as canopy temperature,plant height,leaf area index,yield of summer corn in the ole growth stage were analyzed on the basis of a field experiment in Beijing.The results showed that treatments,except for severe water deficit treatment,kept soil moistures in 20~60 cm soil layer within a high and stable range; soil moistures for the well-watered control were higher than that for other water deficit treatments in 60~100 cm soil layer; in all different soil layers,soil moistures had little differences for low and moderate water deficit treatments.Influenced by the degree of crop cover and water deficit,differences of soil temperatures and canopy temperatures among treatments were remarkable the jointing stage; in upper soil layers(30~50 cm),soil temperatures for the well-watered control re lower than those for other water deficit treatments before the jointing stage,but the differences among treatments were reduced after that; in deeper soil layers(80 cm),the higher the deficit degree s,the higher the soil temperature would be.Finally,low water deficit treatment had higher corn yields,and moderate water deficit treatment greatly raised irrigation water use efficiency.

【题目】基于双线性理论的参考作物蒸发蒸腾量估算
【中文关键词】Penman-Monteith;ET0;双线性模型;简化双线性模型
【英文关键词】Penman Monteith; ET0; bilinear model; simplified bilinear model
【中文摘要】利用成都、乐山、内江和雅安在1951—2000年的气象资料和地理参数,用Penman-Monteith公式计算蒸发蒸腾量(ET0),将双线性理论用于ET0的计算,建立了多个计算ET0的双线性模型,进一步利用双线性模型计算的ET0再建立双线性模型,在已建立的双线性模型基础上,又建立了简化双线性模型。各双线性模型与P-M计算的ET0对比研究表明,空气温度与太阳净辐射、空气湿度与太阳净辐射所建立的ET0双线性模型计算精度较高;简化后的双线性模型的计算精度较低。
【英文摘要】According to the meteorological data and geographical parameters in 1951-2000, calculating crop the evapotranspiration (ET0)for Penman-Monteith model. Calculated of the ET0 in the bilinear theory .establishing the calculation of ET0 calculated by bilinear model, and to further utilize step bilinear model establishment of ET0 calculated by bilinear model, by analogy, establishing the simplified bilinear model. Through comparing the relative error of the absolute value of mean and the root-mean-square error with the different bilinear model, the bilinear model precision is high. Through mean absolute error and the average relative error are smaller in the simplified bilinear model. Therefore, in practice, we may use the simplified bilinear model for calculation of the ETA calculated based the precise demand.

【题目】基于形态参数的水稻根系三维建模及可视化

【中文关键词】水稻; 根系; 三维建模; 可视化;

【英文关键词】rice; roots; 3D modeling; visualization;

【中文摘要】构建基于形态特征参数的水稻根系几何模型,实现不同生长条件下水稻根系生长动态的三维可视化。本文通过分析水稻根尖生长随生育进程的变化模式,构建了水稻单根三维显示模型,包括根节点初始位置和生长方向的确定以及根轴的空间模拟等;进一步结合水稻根系拓扑结构,以生长度日(GDD)为驱动因子,建立了水稻根系三维重构模型,包括不定根初始发生时间和位置、不定根初始伸展角度、不定根伸长速率、不定根空间分布模型等;然后在Visual C++环境下,结合可视化显示模块、场景控制模块、人机交互界面和数据库模块等,研制了水稻根系三维可视化生长系统,并基于三维可视化生长系统模拟了不同条件下水稻根系的三维形态。研究结果为建立完整水稻植株可视化生长系统奠定了基础,同时也有助于为其他作物根系的可视化研究提供参考。

【英文摘要】The objective of this paper was to develop a morphological parameter-based root geometric model of rice and realize the dynamic three-dimensional visualization of rice roots under different growth conditions.The three-dimensional display model of single root of rice was developed by analyzing the change patterns of root-tip growth with development progress,including the sub-models of initial location and growth orientation of root node,and the spatial elongation curve of root axis.By integrating the topological structure of rice root,the whole three-dimensional visualization model of rice root was established using GDD as driving factor,including the sub-models of the initial emergence time and location,initial extension angle,elongation rate and spatial distribution of adventitious root in rice.Finally,by integrating the sub-modules of visualization display,scene control,human-machine interface and database management on the platform of Visual C++,the three-dimensional visualization system of rice root was established,and the three-dimensional morphology of rice root under different growth conditions was simulated based on this system.These results could lay a foundation for development of visual rice growth system,and for reference to visualization studies in other crops.

【题目】水稻叶鞘和节间生长过程的动态模拟
【中文关键词】水稻; 叶鞘; 节间; 模拟模型;
【英文关键词】rice; leaf sheath; internode; simulation model;
【中文摘要】通过对不同水分和氮素水平下不同类型水稻品种叶鞘和节间伸长过程的连续观测和定量分析,构建了水稻主茎和分蘖叶鞘与节间生长的模拟模型。采用Logistic方程描述了主茎和分蘖叶鞘及节间的动态伸长过程;基于同伸叶鞘间的关系用二次曲线描述了分蘖叶鞘长度的变化;基于节间长度与直径的线性关系描述了节间直径的变化。另外,用叶片含水量和含氮量描述了不同水分和氮素水平对叶鞘和节间生长的影响。利用独立的水稻田间试验资料对所建模型进行了测试和检验,结果显示,主茎和分蘖叶鞘(一级分蘖和二级分蘖)长度模拟值的根均方差(RMSE)分别为0.65、0.52和0.46 cm;节间长度和直径模拟值的RMSE分别为0.42、0.15 cm。本模型具有较好的预测性,能定量描述不同品种和环境条件下水稻叶鞘和节间的动态伸长过程。
【英文摘要】This study was conducted to build a dynamic simulation model on growth processes of leaf sheath and internode by making time-course observation and quantitative analysis of leaf sheath and internode growth at different leaf positions with the experiments of different varieties,Water regimes and nitrogen rates.The growth dynamics of leaf sheath and internode on main stem and tiller could be described with Logistic equation:the changes in leaf sheath length of tiller was described with quadratic equation based on the relationship of synchronous leaf sheaths,and the changes in internode diameter was described with linear equation on the relationship of length and diameter of internode.The effects of nitrogen and water conditions on leaf sheath and internode growth were quantified by the effectiveness values of nitrogen concentration and water content in leaf sheath and internode.The models were validated with the independent field experiment data involving different nitrogen rates.The root mean square error(RMSE)of leaf sheath length on the main stem,the primary tiller and the second tiller were 0.65 cm,0.52 cm and 0.46 cm,respectively,and the RMSE of length and diameter of internode were 0.42 cm and 0.15 cm,respectively.The results indicated that the present models had a good performance in predicting morphological growth of leaf sheath and internode on main stem and tiller in rice plant.

【题目】基于形态特征参数的稻穗几何建模及可视化研究
【中文关键词】水稻; 穗; 几何建模; 可视化;
【英文关键词】rice; panicle; geometry modeling; visualization;
【中文摘要】【目的】建立基于形态特征参数的稻穗几何模型,实现稻穗的可视化。【方法】通过对稻穗形态建成过程中关键特征的观测分析,利用三维几何建模技术,构建基于形态特征参数的稻穗几何模型,包括穗曲线、穗轴、次枝梗和小穗几何模型;用Bezier曲线来拟合穗曲线,将二维空间的穗曲线映射到三维空间,构建穗轴几何模型;用一段穗轴及圆柱体模拟一次枝梗和二次枝梗;并分别用椭球体及圆柱体模拟小穗的谷粒及小枝梗,最后基于稻穗的拓扑结构,构建稻穗几何模型。模型参数主要有穗长、穗倾角、一次枝梗长、一次枝梗数目、二次枝梗长、二次枝梗数目、谷粒大小等。【结果】在稻穗几何模型基础上,基于OpenGL图形平台,实现了稻穗生长过程的三维可视化,较好地描述了稻穗形态建成过程。【结论】稻穗的可视化为建立可视化水稻生长系统奠定了基础,同时对其它作物的可视化表达也有很好的借鉴意义。 更多还原
【英文摘要】【Objective】 The aim of the study was to develop an architectural parameter-based geometrical model and realize the visualization of panicle in rice. 【Method】 Based on measuring and analysing morphological structure of rice panicle, an architectural parameter-based geometrical model for rice panicle was developed by using 3D geometric modeling technology. The model included 4 submodels: panicle axis curve, panicle axis geometry, primary and secondary branch geometry, and spikelet geometry submodels. Bezier curves were used to simulate dynamics of the panicle axis curve, panicle axis geometry submodel was developed by mapping panicle axis curve to 3D, primary and secondary branch geometry submodel was developed with a part of panicle axis and a cylinder, spikelet geometry submodel was developed by a ellipsoid and a cylinder. Based on topographic structure of rice panicle, the rice panicle geometrical model was developed. The main parameters of the model were the length of panicle, the angle of panicle-neck, the length and number of primary and secondary branches, the grain size and so on. 【Result】 Based on the geometrical model for rice panicle and the platform of OpenGL, the dynamic growth processes of three-dimensional morphological structure of rice panicle was realized on the computer. 【Conclusion】 Rice panicle visualization could lay a foundation for development of visual growth system in rice

and be used for reference to the visualization of other crops.

【题目】基于图像分析的水稻根系形态特征指标的定量分析
【中文关键词】水稻; 根系形态; 定量分析; WinRhizo; 图像分析;
【英文关键词】Rice; Root morphology; Quantitative analysis; WinRhizo; Image analysis;
【中文摘要】利用图像分析方法定量研究水稻根系形态特征指标的变化规律。通过实施不同水氮处理和不同品种的水稻桶栽试验,选用WinRhizo(WR)软件的不同模式(LM和T200)分析根系图像,分别提取根直径范围0~0.30mm和0.25~1.80mm的根系形态数据,并与基于Image-Pro Plus6.0软件(IP)的根直径和不定根长的测量结果进行比较分析;确定了3种水稻品种不同类型根直径的范围;对不同生育时期水稻根长、根体积、根表面积、根系干重和不定根数量等水稻根系形态特征指标变化差异,以及分枝特征进行了分析。结果表明:(1)基于WR软件LM和T200模式下的根直径测量结果与基于IP软件的测量结果之间NRMSE分别为5.44%和10.95%。(2)界定细分枝根直径范围为0.03~0.10mm,扬稻6号(V3)粗分枝根和不定根分别为0.10~0.30mm和0.30~1.65mm,而日本晴(V1)和武香粳14(V2)分别为0.10~0.25mm和0.25~1.40mm,不定根长与IP测量结果进行比较,其NRMSE为10.78%~12.01%。(3)各指标抽穗前增长迅速,之后增长减缓或衰老下降;不同氮肥处理间各指标分蘖至成熟均差异显著,增施氮肥可促进根系生长,明显提高不定根比例;适当控水可促进根系生长,明显提高分枝根比例;品种V3自分蘖期到成熟期各指标均显著高于V1和V2,V1与V2间差异不显著。本研究表明,本方法具有较好的精度和可行性,为推进水稻或其他作物根系的定量研究提供了参考。
【英文摘要】The objective of this study was to quantitatively analyze the change patterns of rice root morphological characteristics based on image analysis method in pot experiments with different nitrogen rates,water regimes,and rice cultivars in different years.WinRhizo software (WR) was used as the root image analysis tool,and two modes of LM and T200 were used to measure the root diameter and adventitious root length under two ranges of root diameter as 0 – 0.30 mm and 0.25 – 1.80 mm,respectively.The measurement results from WR were compared with those from Image-Pro Plus 6.0 software (IP).Then,the diameter ranges of different types of root were determined.On the basis of the dataset from WR,the statistical analysis were performed on rice root morphological characteristic indices,including dry weight,total volume,total surface area,total adventitious root length and number per plant at different growth stages.The results were as follows: (1) The average NRMSEs between WR (LM and T200) and IP for root diameters were 5.44% and 10.95%.(2) The diameter range of fine lateral root was circumscribed within 0.03 – 0.10 mm for all the experiments,coarse lateral and adventitious root were circumscribed within 0.10-0.30 and 0.30 – 1.40 mm for V1 (Nipponbare) and V2 (Wuxiangjing 14),but 0.10 – 0.25 and 0.25 – 1.65 mm for V3 (Yangdao 6).Following this method,the NRMSEs for adventitious root length measured by WR and IP were 10.78 – 12.01%.(3) All indices increased rapidly in the growth process and reached or approached the maximum at heading,then increased slowly or decreased after heading.There were significant differences between treatments with different nitrogen rates from tillering to maturing on all indices.Increasing nitrogen rate accelerated the growth of roots,and especially enhanced the proportion of adventitious roots.Properly control of irrigation could promote the growth of roots and increase the proportion of lateral roots.All indices of V3 were significantly higher than these of other cultivars,and there were no significant differences between V1 and V2.The results indicated that it was feasible to measure morphological indices of different types of rice root by WR with different modes,and the methods used in this paper have a good accuracy and reliability.These results could provide a support for the quantitative analysis on root morphology of rice or other crops.

【题目】水稻冠层光截获与叶面积和产量的关系
【中文关键词】水稻; 冠层; 光合有效辐射; 光截获; 叶面积; 产量;
【英文关键词】rice (Oryza sativa L.); canopy; photosynthetically active radiation (PAR); light interception; leaf area; yield;
【中文摘要】【目的】旨在解析水稻(Oryza sativa L.)冠层光合有效辐射(PAR)截获量及其分布与叶面积和产量的关系。【方法】以2个不同株型水稻品种为材料,设置高、中、低3个施氮水平,构建不同的群体冠层结构,于拔节至成熟期系统测定水稻冠层PAR截获量及其分布、以及叶面积和产量。【结果】水稻群体向上累积叶面积指数的垂直分布呈S型曲线,符合Logistic方程(R2>0.99);抽穗期、抽穗后17d和成熟期的冠层最大叶面积密度分别出现在0.53、0.56和0.60的相对冠层高度左右;随生育进程的推进,冠层上中部的相对叶面积密度呈递增趋势,而冠层下部的相对叶面积密度呈递减趋势。PAR截获率(FIPAR)与向下累积叶面积指数之间的关系可用方程FIPAR=α×(1-e-K×LAI)来定量描述(R2>0.86);消光系数K随生育进程的推进而递减,其日变化表现为早晚较高、中午较低。冠层PAR截获量(AIPAR)随生育进程的推进呈多峰分布,最高峰出现在移栽后58-70d,即孕穗至抽穗期,且随施氮量的增加而增大;在典型晴天下,冠层PAR截获量的日变化呈单峰分布,最大值出现在11:00-13:00。【结论】水稻群体叶面积的垂直分布影响冠层光截获;水稻产量与PAR利用率呈正相关,而PAR转化率随PAR截获量的增加呈先增大后减小的趋势,因此维持一定的漏光损失量对水稻高产有利。
【英文摘要】【Objective】 The amount of photosynthetically active radiation (PAR) interception and distribution within canopy affects crop photosynthesis and biomass production. The primary objective of this study was to elucidate the relationship of PAR interception of canopy to leaf area and yield of rice (Oryza sativa L.) under different nitrogen rates for different cultivar types. 【Method】 Two field experiments were conducted at Nanjing in 2007 and 2008 rice growing seasons,involving two rice cultivars and three nitrogen rates. The amount of PAR interception and its distribution at different canopy heights,leaf area and yield of two cultivars were measured from jointing to maturity. 【Result】 The results indicated that the vertical distribution of upward cumulative leaf area index (LAI) followed a sigmoid curve,which could be described well with Logistic equation (R2>0.99). The maximum leaf area density in heading,17 days after heading and maturity stages appeared at 0.53,0.56 and 0.60 of relative canopy height,respectively. The relative leaf area density of upper and middle canopy increased with rice development progress,but the relative leaf area density of basal canopy decreased with rice development progress. The relationship between fraction of PAR interception (FIPAR) and downward cumulative LAI could be described with a negative exponential equation as FIPAR=α×(1-e-K×LAI) (R2>0.86). Diurnal variation of extinction coefficient (K) at noon was smaller than in the morning and afternoon,and the value of K decreased with rice development progress. The amount of PAR interception (AIPAR) showed multi-peaks distribution during rice development period,and the maximum peak appeared at 58-70 d after transplanting,around booting to heading stages. The AIPAR increased with increasing nitrogen application rate. Diurnal variation of AIPAR showed one peak distribution on the clear days,and the maximum AIPAR appeared at 11:00-13:00 in rice canopy. 【Conclusion】 The vertical distribution of leaf area affects PAR interception within rice canopy. The grain yield of rice was positively related to the PAR use efficiency,while PAR conversion efficiency first increased and then decreased with increasing PAR interception,thus it is benefit to have some penetration loss of PAR in rice canopy for high grain yield. 更多

【题目】三峡库区柑桔园土壤供肥特性及其对柑桔植株营养影响研究
【中文关键词】土壤;供肥特性;柑桔;营养
【英文关键词】Soil;Supplying fertility property;Citrus;nutrition
【中文摘要】分析研究了三峡库区柑桔园不同土层营养元素含量状况,柑桔植株体营养特征,岩石-土壤-柑桔三者之间的元素迁移与富集规律。结果表明,三峡库区柑桔园土壤呈微酸至微碱性,由于受母岩、降雨及生产措施等综合影响,从土壤表层到母质层其pH值呈升高趋势,土壤有效磷、速效钾、有效铜、有效锌、有效锰和砷的全量及有效含量则随土壤深度的增加而降低,交换性钙和镁的含量则随土壤深度的增加而升高;表层土壤速效钾与pH值、水解氮、有效磷呈极显著正相关,有效铜与水解氮、速效钾、有效铁呈显著正相关,有效铜与有效锌呈极显著正相关,交换性钙与有效铁、有效铜、有效锰

呈显著至极显著负相关,交换性镁与水解氮、速效钾呈显著至极显著负相关;柑桔果实中钾与氮含量最高,钙最低,营养元素含量钾 、 氮 > 镁 >鳞 > 钙;柑桔叶片和枝条中则是钙> 氮 >钾 > 镁 > 磷,柑桔根系中次序为钙 > 氮 >镁 > 钾 >磷。柑桔果实中N、K、Ca 、Mn、Zn、Fe和Cu随土壤中的元素有效含量增加而增加。

【英文摘要】The study on the content status of nutrient element of the different soil layers of citrus orchards, nutritional character of citrus plants and element migration and enrichment regularity of rock-soil-citrus system in the Three Gorges reservoir, was performed. The main results are described as follows. The range of soil pH of citrus orchards was from weak acid to weak alkaline. There was an increasing trend of pH from upper soil layer to parent material layer, which resulted from comprehensive influence, such as parent rock, rainfall and production measure. Therefore, the raising of the soil depth made the decrease of the total and effective contents of available P, K, Cu, Zn, Mn and As, and the increase of the contents of exchangeable Ca and Mg. There was a significant positive correlation between available K of upper soil layer and pH, hydrolyzable nitrogen and available P; there was a significant positive correlation between available Cu and hydrolyzable nitrogen, available K and Fe; there was a significant positive correlation between available Cu and Zn. Contrarily, there was a significant negative correlation between exchangeable Ca and available Fe, Cu and Mn; there was a significant negative correlation between exchangeable Mg and hydrolyzable nitrogen and available K. The contents of K and N in citrus fruits were highest and the content of Ca was lowest. The order of nutrient element contents was K, N>Mg>P>Ca, Ca>N>K>Mg>P in leaves and twigs and Ca>N>Mg>K>P in roots. The contents of N, K, Ca, Mn, Zn, Fe and Cu in citrus fruits increased with increasing corresponding effective contents of soil elements.

【题目】长三角新农村庭院植物多样性与配置模式

【中文关键词】新农村;庭院;植物多样性;植物配置

【英文关键词】New countryside;Courtyards:P1ant diversity;P1ant allocatio
【中文摘要】选择长三角地区代表性新农村,研究其农户庭院植物多样性和配置,分析庭院植物物种组成、多样性和相似性。按不同庭院类型分析了植物配置模式。结果表明:在被调查的400户庭院中,共栽种134种植物,隶属于68科113属,60户没有栽种任何植物;新建的农民集中居住区物种丰富度不高;不同地区庭院木本植物物种的相似性较高;庭院植物配置可以划分为3种庭院类型和16种配置模式。认为长三角地区新农村庭院已具备一定的绿化基础,乡土植物的应用和物种多样性有待提高,植物配置模式有待丰富,提出了相应的对策与建议。
【英文摘要】The purpose of this paper is to study the diversity and allocation pattern of courtyard plants in the representative new countryside in Yahgtze Rkrer Delta.Tile composition,diversity and similarity of plant species and the'allocation patternsfor difierent courtyard types were analyzed.A total of 1 34 species of plants.belonging to l】3 genera and 68 families.wereplanted in the 400 courtyards being surveyed,and 60 households didn ’ t plant anything in their courtyards.In the newlybuilt communities.the plant species is scarce.A big similarity in woody plant species was observed in the courtyards betweendiferent areas.The courtyards can be divided into three types.and the courtyard plants can be divided into 16 allocationpatterns.It is concluded that some green spaces already exist in the courtyardS of the Yangtze River Deha.but theapplication of the indigenous plants and the diversity of plant species still need to be improved,and the allocation patterns should be enriched.Some suggestions and countermeasures are proposed.

【题目】解析·保护·传承-李市古村空间解析与保护更新
【中文关键词】古村落;街巷空间;滨水空间;保护更新
【英文关键词】无
【中文摘要】江南水乡古村落是中国优秀人居环境的典型代表,李市古村作为江南众多历史村镇中的一个,由于良好的自然条件、密集的水网体系、悠久的历史文化和繁荣的经济条件等,形成了独特的空间格局。本论文通过对其街巷空间和滨水空间的解析,来阐述李市古村的村落肌理特征。同时,由于各种因素的影响,李市村出现了功能性衰退和各种设施的物质性老化,因此本论文尝试在分析的基础上,为激活古村活力、改善村民生活质量和生活环境,进行整体研究和思考。

【题目】果树喷雾用圆盘风扇三维气流速度场数值模拟与验证
【中文关键词】果树; 仿形喷雾; 圆盘风扇; 气流速度场; CFD模拟; 试验;
【英文关键词】Orchard; Profile modeling sprayer; Disk fan; Air-velocity field; CFD simulation; Experiment;
【中文摘要】为研究用于果树风送喷雾的圆盘风扇气流速度场分布特性,采用k-ε紊流模型和稳态求解方法,设置合适的边界条件,对单、双风扇不同出口风速的气流速度场进行三维稳态数值模拟和试验验证。结果表明,双风扇同时送风时,在离两风扇中心1~3m的范围内,中心区域的风速明显小于两边的风速,在3~5m的范围内中心区域的风速和两边的风速相差不大。模拟值与试验值对比表明变化趋势一致,二者的拟合直线决定系数R2分别为0.8044和0.7957,所建模型可以比较准确地模拟风扇气流速度场的分布。
【英文摘要】In order to investigate the characteristics of air-velocity field of disk fan used in orchard sprayer,a turbulence model by means of the standard sub-model with appropriate boundary condition was developed and 3-D steady state of air-velocity field of single and double fans was simulated and verified. The results showed that in the distance of 1m to 3m from the double fans center,the velocities of the center region were lower than the both sides,but in the distance of 3m to 5m,the air-velocity distribution of double fans was uniform. The results of comparison showed that the trends of simulated and measured curves were coincident,the correlation determination (R2) of single and double fans were 0.8044 and 0.7957,respectively. The model could accurately predict air-velocity distribution pattern.

【题目】绵羊羊膜上皮细胞分离培养及鉴定
【中文关键词】关键词:绵羊羊膜上皮细胞;分离;培养;细胞免疫荧光;RT-PCR
【英文关键词】无
【中文摘要】摘要背景:目前有研究发现人羊膜和大鼠羊膜分离消化培养后,可成功获得具有干细胞特性的人羊膜上皮细胞和鼠羊膜上皮细胞,在体外一些外源因子作用下具有向三胚层细胞分化的潜能。目的:获取绵羊羊膜上皮细胞,并对其干细胞特性进行鉴定。方法:采用机械方法剥离绵羊羊膜组织,运用低速旋转TrypLE(胰酶替代物)消化法对绵羊羊膜进行分离培养获得绵羊羊膜上皮细胞。结果与结论:细胞免疫荧光检测结果表明绵羊羊膜上皮细胞表达Oct-4、SSEA-1、SSEA-3、SSEA-4、TRA-1-60、TRA-1-81等胚胎干细胞标记蛋白;RT-PCR 技术鉴定结果显示绵羊羊膜上皮细胞的Oct-4、Sox-2、Rex-1 全能性相关基因表达,而Nanog 基因不表达。检测结果提示实验成功获得具有干细胞特性的绵羊羊膜上皮细胞。
【英文摘要】AbstractBACKGROUND: The amnion epithelial cells (AECs) with stem cells properties have been successfully obtained after isolating,digesting and culturing human and rat amnion and AECs have the potential to differentiate into cells of the endoderm (liver, lung,epithelium), mesoderm (bone, fat), and ectoderm (neural cells),OBJECTIVE: To obtain the Ovis aries AECs and detect the stem cell characteristics.METHODS: Ovis aries amnion tissue was peeled off by mechanical way and the low velocity-trypLE (pancreatic enzymereplacement) digestion method was used to isolate and culture the Ovis aries amnion, and the Ovis aries AECs were obtained.RESULTS AND CONCLUSION: The immunofluorescence observation showed that the labeled protein of AECs such as Oct-4,SSEA-1, SSEA-3, SSEA-4, TRA-1-60, TRA-1-81 could be expressed on Ovis aries AECs. RT-PCR experiments confirmed thatthe genes of Oct-4, Sox-2 and Rex-1 were expressed and Nanog was not expressed. The results indicate that the Ovis ariesAECs with stem cells properties have been achieved successfully.

【题目】Extraction of Wing Venation Characteristics by Image Analysis
【中文关键词】骨架,翅脉,分水岭变换
【英文关键词】Skeleton, Venation, Watershed transform ;
【中文摘要】翅脉是昆虫特有的且常用于昆虫识别的特征,包括翅脉节点坐标和翅脉骨架图。准确快速提取这些特征常采用图像分析方法。本文提出的图像分析算法能够同时提取翅脉骨架图并自动提取翅脉节点。该算法的主要过程为:首先采用阈值法将彩色图像转换为二值图,然后采用欧氏距离变换将二值图转换为距离变换图。随后采用分水岭算法提取翅脉骨架,最后采用查找表法从骨架图上自动获取翅脉的节点坐标。这种算法简单,且对图像质量的要求不高,同时试验结果表明本文算法的重复性较好,适用于翅脉特征的分析。
【英文摘要】Wing venation characteristics, such as the wing diagram and coordinates of vein junctions, are species-specific and are usually used in studies of insect identification. Image analysis methods are quick and precise means to measure these characteristics. An image analysis method is proposed that enables extraction of the wing diagram and automatic identification of vein junctions. A color image of an insect wing is converted to a binary image of wing venation based on thresholding. A distance-to-boundary map of the complement of the binary image is computed using a distance transform function. The vein skeleton is obtained by a watershed transform. The lookup table method is applied to find coordinates of vein junctions. The proposed method is capable of producing a smooth vein skeleton diagram and can extract the coordinates of vein junctions. This approach is not limited to high-quality images and is simple because the characteristics are obtained almost simultaneously. The experimental results showed that the proposed method is repeatable and useful for wing analysis.

【题目】圆盘风扇辅助喷雾对雾滴沉积分布影响试验研究
【中文关键词】圆盘风扇; 风送喷雾; 雾滴分布; 雾滴覆盖率;
【英文关键词】disk fan; air-assisted spraying; droplets distribution; spraying coverage;
【中文摘要】采用立体布样的方法,用5mg/L的"丽春红?2R"稀释水溶液代替农药在室内进行了圆盘风扇辅助喷雾雾滴沉积分布试验,研究了用于仿形喷雾的圆盘风扇的雾滴沉积分布影响规律。试验结果表明,无风助喷雾时,雾滴沉积在短距离内急剧下降,射程短。纸卡反面,雾滴沉积明显少于有风助喷雾的雾滴沉积。有风助喷雾时,沿射程方向雾滴沉积有急剧下降和缓慢下降两个阶段。不同采样高度上,出口风速对雾滴沉积分布影响不同。纸卡正面,采样高度1.8m时,出口风速对雾滴沉积影响不大,采样高度1.5m和1.2m时,雾滴覆盖率与风机转速成正比。纸卡反面,不同的采样高度上雾滴沉积覆盖率与出口风速线性关系均显著。
【英文摘要】By setting up three dimensional samples,and using the solution mixed biological dye of Ponceau-2R with water in concentration of 5mg/L,the droplets deposition and distribution of air-assisted spraying of disk fan in the laboratory was experimentally tested to study the droplets deposition and distribution of air-assisted spraying of disk fan used for simulation spray.The spraying coverage was attained by specialized software.Results showed that without any outlet wind velocity,the droplets deposition sharp descended with a short range.And the droplets deposition was less than it with a outlet wind velocity on the wrong side of cards.When there was a outlet wind velocity,the droplets deposition was divided into two stages in the range of spraying: sharp decline and slow decline.And the outlet wind velocity had different effects on the droplets deposition and distribution in different sampling heights.On the right side of cards,the outlet wind velocity had little effect on the droplets deposition on the upside(1.8m),in the meanwhile,the spraying coverage was proportional to the outlet wind velocity on the middle(1.5m) and lower(1.2m).On the wrong side of cards,the correlativity is remarkable between the outlet wind velocity and the spraying coverage in three sampling heights.

【题目】基于霍特林变换的稻米彩色图像粒形检测算法
【中文关键词】霍特林变换; 稻米; 彩色图像; 颜色通道; 粒形检测;
【英文关键词】Hotelling transform; rice; color image; color bands; grain type detection;
【中文摘要】利用稻米分割后轮廓灰度图与背景灰度图的灰度均值之差和灰度方差之差进行米粒图像分割效果定量评价,对7个彩色通道的稻米图像进行分割评判,选取I1(红色、绿色、蓝色通道的平均值)通道进行稻米图像分割。提取分割后标注的单粒米粒边界的二维坐标向量,对坐标向量进行霍特林变换,通过计算变换后米粒最小外接矩阵来表征稻米粒形,简化了现有的稻米粒形检测算法。检测稻米粒型时,算法在MATLAB7.5.0环境下运行。该算法所得米粒长宽比与人工检测结果的平均相对误差为1.65%,每幅图像平均耗时0.323s;而最小外接矩形算法的平均相对误差为2.24%,每幅图像平均耗时2.837s。
【英文摘要】An algorithm for rice grain type detection using color image segmentation and the Hotelling transform was proposed. The rice grain images were segmented in I1 band(the average of red, green and blue color bands) chosen from seven color bands according to quantitative analysis of segmentation performance. The coordinate vector of segmented image edge was converted by the Hotelling transform. Grain size features were extracted in the new coordinate system using minimum enclosing rectangle. This algorithm was run in MATLAB 7.5.0 to count rice grain ratio. The relative error compared with manual measurement were 1.65% and 2.24%, and the running times were 0.323 s and 2.837 s per image, respectively, for this algorithm and algorithm using minimum enclosing rectangle.

【题目】变量穴施水穴播机的变量施施水数学模型
【中文关键词】穴施水穴播机;变量施水;数学模型;人工神经网络

【英文关键词】Hil-l seeder, Variable rate irrigat ing, Mathematic model, Artif icial neural networks
【中文摘要】根据变量穴施水穴播机使用要求,建立了最小施水量数学模型和电磁阀控制时间数学模型。在自行开发的变量穴施水穴播机上进行静态试验,通过改变水箱水量、施水时间,获得不同的施水量。分别采用回归分析和人工神经网络预测2种方法,研究了水箱水量、施水时间及施水量之间的关系,建立了电磁阀控制时间的数学模型。回归试验表明,在水箱水量处于满箱、半箱和1/8 箱容积3种状态时,所对应的电磁阀控制时间线性回归模型的调整判定系数R2依次为0.992、0.991 和0.998,具有较高的拟合度。对回归方程进行的F检验结果表明,F计算值远大于查表值,回归方程极显著。采用2-5-1 型拓扑结构的人工神经网络对施水时间进行预测,结果表明,拟合的最大偏差为3.95ms,平均偏差仅为1.46ms,网络结构具有较高的预测精度。
【英文摘要】"Variable rate irrigating hill-seeder can automat ically adjust the amount of the irrigating water according to the variation in soil moisture content in the field to alleviate drought and save water. Mathematical models for minimizing water application and determining the control time of the electromagnetic valve are developed. Static experiment is conducted with the developed variable rate irrigating hill seeder. Changing water amount in tank and irrigating time, the water amount ejected from the electromagnetic valve varies. The mathematical models for the control time of the electromagnetic valve are established based on the relations among w ater amount in tank, irrigating time and water amount supplied using linear regression and artificial neural networks. Regression results show that the adjusted coefficients of determinat ion for the linear regression models are 0.992, 0.991 and 0.998 when the tank is 100% full, 1/2 full and 1/8 full, respectively. A 2-5-1 artificial neural network is used to predict irrigat ing time. The network provides high prediction accuracy with a maximum deviation of 3.95ms and an average deviation of 1.46 ms.

【题目】IMPROVED METHOD FOR ELIMINATION OF THE INTERFERENCEFROM NITRATE IONS ON OXALIC ACID IN RP-HPLC BYSOLID-PHASE EXTRACTION WITH NANOSIZED LaPO4
【中文关键词】干扰消除
【英文关键词】interference elimination, nanosized LaPO4, oxalic acid, RP-HPLC,
solid-phase extraction, xylem sap
【中文摘要】利用纳米磷酸镧消除反相色谱中硝酸对草酸的干扰
【英文摘要】An improved method using nanosized LaPO4 as solid-phase extractor for avoiding the interferencefrom nitrate ions on oxalic acid in RP-HPLC was developed. Nanosized LaPO4 possessed lowersolubility and higher adsorption ability for oxalic acid than previous adsorbent. Oxalic acid could beadsorbed selectively by nanosized LaPO4 rather than nitrate, formic acid, malic acid, lactic acid, orcitric acid, so the interference from nitrate ions was eliminated, and then the oxalic acid was determinedby RP-HPLC at the optimum chromatographic conditions after the solid-phase extraction procedure.The accuracy of the method was confirmed with an average recovery ranging between 97.7%and 107.3%, the relative standard deviations (RSD) were less than 3.0%. Thismethod improved theprevious work and was successfully applied to determine the oxalic acid in xylem saps of tomato.

【题目】牛雄性生殖系干细胞的体外诱导分化
【中文关键词】关键词: 牛, 雄性生殖系干细胞, 诱导分化, 长形精子
【英文关键词】Keywords: bovine, male germ-line stem cells (mGSCs), inducing differentiation, long sperm
【中文摘要】摘 要: 雄性生殖系干细胞(Male germ-line stem cells, mGSCs)是一群具有高度自我更新能力和分化潜能的细胞, 是雄性成体内唯一可复制的二倍体永生细胞。转基因技术与雄性生殖系干细胞异体及异种移植技术相结合, 将会为克隆动物、转基因动物生产及一些人类遗传性疾病的基因治疗提供新的机遇与途径。本试验采用组合酶消化和选择贴壁法, 对5 月龄、6 月龄牛胎儿及新生牛雄性生殖系干细胞体外培养及分化进行了研究。试验结果显示, 睾丸支持细胞对雄性生殖系干细胞体外增殖、分化所必需的, 同时对数期睾丸支持细胞对雄性生殖系干细胞贴壁、增殖与分化效果明显; 共培养16 d 后, 牛雄性生殖系干细胞分化为长形精子细胞, 试验建立了牛雄性生殖系干细胞体外诱导培养分化体系。
【英文摘要】Abstract: Male germ-line stem cells (mGSCs) have the capability of self-renewal and latent capability of differentiation. mGSCs isthe unique diploid immortal cell which can transfer genetic information to filial generation. The combination of transgenictechnology and mGSCs heterotransplanting will supply new opportunities and paths to cloning animal, transgenic animal and genetherapy of some human hereditary disease. We studied the isolation and cultivation of mGSCs that were isolated and purified from5 – 6 month old bovine fetal testis, new born bovine testis by adopting mixed enzymes digestion and different attaching velocitiesmethods. The results showed that sertoli cells were indispensable to mGSC ’ s proliferation and differentiation in vitro. The sertolicells in logarithmic phase have a significant effect on mGSC ’ s attaching, proliferation and differentiation. Co-culture with Sertolicells, mGSCs differentiated to long sperm after 16 days. A preliminary system for mGSC ’ s inducing differentiation was established.

【题目】基于颜色和形状特征的茶叶嫩芽识别方法
【中文关键词】茶叶嫩芽 识别 颜色特征 形状特征
【英文关键词】Tea sprout , Recognition, Color feature, Shape feature
【中文摘要】与人工采摘茶叶相比, 现有采茶机械虽能提高采摘速度, 但采摘时老叶、嫩叶一起采, 缺乏选择性, 并有部分叶片遭破损, 降低了原料品质。为此, 需要研究具有选择性、低损伤率的自动采摘方法。本文采用基于颜色和形状特征的图像处理方法, 实现茶叶嫩芽的计算机识别和检测。针对清明期陕西名茶“午子仙豪”茶叶, 首先在RGB颜色空间中提取茶叶图像的G分量, 并采用双阈值方法对图像进行分割; 然后根据茶叶嫩芽的形状特征, 检测茶叶嫩芽的边缘。实验结果表明: 基于颜色和形状特征的识别方法能有效分辨出茶叶嫩芽, 识别准确率为94%, 为实现茶叶嫩芽的自动采摘提供了一种有效方法。
【英文摘要】It is a big problem for China to have not enough workforces in picking tea sprout today, which usually result in missing the tea sprout’s optimum picking period. The picking machine currently used improves the picking efficiency indeed. However, the old leaves are picked together with the sprout, and the sprout is damaged at some time. Hence it is necessary to develop an intelligent picking machine that can recognize and pick the sprout with the minimum sprout damage. This paper presents an image process method based on the tea sprout color and shape features, which was used to recognize the “Wuzi Xianhao”(a famous green tea of Shaanxi, China) tea sprout grow n at Xixiang County of Shaanxi Province. Firstly, the green component of the tea leaf image in RGB color space w as extracted. Secondly, green component image w as segmented using double threshold method. Finally, the edge of tea sprout is detected according to it s shape feature. Experimental results indicate that this recognizing method of the tea sprout based on color and shape features can reach the right detect ion rate of 94%, and provide an effective method for automatic tea sprout picking .

【题目】Interaction between low molecular weight organic acids and hydroxyapatite with different degrees of crystallinity.
【中文关键词】吸收 溶解 结晶度 作用机理
【英文关键词】Adsorption Dissolution Crystallinity Interaction mechanism
【中文摘要】低分子量有机酸与不同晶化程度羟基磷灰石的相互作用
【英文摘要】In this study, two types of hydroxyapatite (HAP) with different degrees of crystallinity were prepared bya sol – gel method and a chemical precipitation method. Influences of crystallinity on the adsorption anddissolution properties of HAP, and the release of phosphorus (total phosphorus) during the adsorptionof organic acid were investigated. Results showed that crystallinity had a great effect on the adsorptioncapacity and dissolution properties of HAP, as well as the adsorption mechanisms of organic acids on HAPsurfaces. The poorly crystallized (the degree of crystallinity Xc = 0.23) HAP adsorbed greater amounts ofoxalic, citric, or malic acid than the well crystallized (Xc = 0.86) HAP, and the former could release morephosphorus in the presence of organic acids. The adsorption capacity of oxalic acid was much higherthan citric and malic acids on both the well and the poorly crystallized HAP, which was due to the strongcoordination of oxalic acid with calcium on HAP surface, and that physical adsorption was more inclinedto dominate the adsorption of malic or citric acid on the well crystallized HAP. These findings might beof importance in understanding the effects of crystallinity and organic acid binding on the dissolution ofcalcium phosphates and the adsorption characteristics of HAP.

【题目】双筛选标记打靶载体的构建及其功能鉴定
【中文关键词】关键词: 同源重组,绿色荧光标记,打靶载体,Cre-LoxP

【英文关键词】Keywords: homologous recombination, green fluorescent protein gene, gene targeting vector, Cre-LoxP
【中文摘要】摘 要: 利用DNA 同源重组方法 (基因打靶) 对动物基因组进行修饰是转基因研究的重要手段之一。为了构建一个高效的通用型基因打靶载体,本研究以pBS246 质粒为骨架,在两个LoxP 序列之间插入正筛选标记新霉素磷酸转移酶 (neo)基因和绿色荧光蛋白 (EGFP) 基因;在两个LoxP 序列外侧分别插入两组携带“ 8 碱基 ”酶切位点的多克隆位点序列 (MCS-1 和MCS-2) 和负筛选标记单纯疱疹病毒胸苷激酶 (HSV-tk) 基因,构建成通用型基因打靶载体pGT-V1,并且在C2C12 细胞中验证了载体中各个元件的功能。该载体具有如下特点:1) 在载体中引入绿色荧光标记,可以实时监控载体的转染效率,而转染效率的提高为高效基因打靶提供了保证;2) 在两个LoxP 位点间插入绿色荧光标记,可以直观监测打靶后遗留的筛选标记的去除情况,并且可以通过流式细胞仪或免疫磁珠法,将最终去除了筛选标记的阳性细胞(即丢失绿色荧光的细胞) 分选出来,降低筛选标记在中靶细胞中可能产生的负面影响;3) 采用“ 8 碱基 ”酶切位点的MCS 序列,便于DNA 大片段的连接和重组,极大提高了该载体的通用性。总之,该载体优化了基因打靶的技术手段,为有效开展基因打靶和转基因动物研究提供了新平台。
【英文摘要】Abstract: Homologous recombination is an important technique that is used to modify mammalian genome. Here, we constructedan efficient common gene targeting vector based on the plasmid pBS246. The vector consisted two positive selection markers,neomycin resistance gene (neo) and enhanced green fluorescent protein gene (EGFP) flanked by locus of X-over P1 (LoxP) sites.Two synthesized multiple cloning sequences MCS-1 and MCS-2 that contain several “ 8 bp cutter ” enzyme sites were placed inoutside of LoxP sites. Additionally, a negative selection marker HSV-tk (herpes simplex virus thymidine kinase) gene was locatedadjacent to MCS-1 site. The constructed vector was named pGT-V1, and its functions were characterized in C2C12 cells. The vectorhad the following unique features: 1) EGFP was used to monitor instantly the transfection rate that was essential for increasing theefficiency of gene knockout (KO); 2) The EGFP marker located between two LoxP sites was able to be removed from KO positivecells to avoid the potential damage of selection markers to the recipient cells. The process could be monitored visually and thepositive cells without selecting markers (the loss of green fluorescent cells) could be sorted out by either flow cytometry orimmunomagnetic beads; 3) “ 8 bp cutter ” restriction sites were embedded in MCS sequences, which then enhanced the versatility ofthis vector. In summary, the constructed plasmid optimized the vector of gene targeting and provided a new technique means for thetransgenic animal research.

【题目】Enhanced adsorption of fluoride from aqueous solution onto nanosized hydroxyapatite by low-molecular-weight organic acids

【中文关键词】脱氟 低分子量有机酸 纳米羟基磷灰石 吸附
【英文关键词】Defluoridation capacity
Low-molecular-weight organic acids
Nanosized hydroxyapatite
Adsorption
【中文摘要】低分子量有机酸促进纳米羟基磷灰石对氟的吸附
【英文摘要】In this study, the nanocrystalline hydroxyapatite (HAP) prepared by thermal decomposition of precursorswas used as the adsorbent, and the potential of nanocrystalline HAP for nitrobenzene removal from aqueoussolution was evaluated. Results indicated that nitrobenzene adsorption was initially rapid and the adsorptionprocess reached a steady state after 1 min. The adsorption isotherms were well described by the Langmuirand the Freundlich models, the latter being found to provide the better fit with the experimental data. Thenitrobenzene adsorption capability of the nanocrystalline HAP was investigated as a function of temperature,pH, ionic strength, fulvic acid, and the presence of solvent. According to the experimental results, decrease inpH and temperature resulted in increase in nitrobenzene adsorption capacity; Increasing ionic strength andthe presence of fulvic acid decreased the adsorption of nitrobenzene by nanocrystalline HAP; Acetoneappeared to inhibit nitrobenzene adsorption to an extent greater than the presence of methanol.Thermodynamics studied revealed that the adsorption of nitrobenzene by nanocrystalline HAP wasphysisorption, spontaneous and endothermic in nature. This study showed that nanocrystalline HAP could beused as an efficient adsorbent material for the removal of nitrobenzene from aqueous solution.

【题目】The antimicrobial properties and strain identification of Lactobacillus acidophilus NX2-6 screened from chigeee
【中文关键词】无
【英文关键词】No keywords available.
【中文摘要】略
【英文摘要】Chigee, a natural fermented dairy product and traditional food of Mongolian nomads, has received much attention for its various probiotic and antimicrobial substances. In this study, a strain of Lactobacillus acidophilus, NX2-6, was screened from Chigee. Morphological characteristics were assessed and physiological – biochemical analysis, carbohydrate fer-mentation and 16S rDNA sequence analysis were conducted. NX2-6 showed antibacterial activity at the beginning of the logarithmic growth phase. The production of the antibacterial substance increased continuously until 24 h in the stationary phase, and reached a maximum after 36 h, and then decreased. A 1480-bp 16S rDNA sequence was deposited in Gen-Bank under accession No. EU878007. An antimicrobial substance was purified by acetate and methanol extraction method from the fermented product of L. acidophilus NX2-6 grown in MRS broth, and strongly inhibited growth of Grampositive, Gram-negative bacteria and fungi. This antimicrobial substance has potential as a natural and safe preservative.

【题目】Discovery and transmission of functional QTL in the pedigree of elite soybean cultivar Suinong14

【中文关键词】无
【英文关键词】in silico mapping — soybean cultivar — ancestral line — QTL — transmission
【中文摘要】无
【英文摘要】Abs tractIn this study, we extended in silico mapping for single trait to analyse data from multiple environments by calculating intraclass correlations and to mapping pleiotropic QTL for multiple traits by defining new statistic to measure the correlation between multiple traits and the marker. Data sets include phenotypes of eight agronomic traits obtained from six different ecologic environments and years, and genotypic information from 477 polymorphic markers on 14 ancestral lines in the pedigree of Suinong14 . With in silico mapping, a total of 39 markers distributed on 14 linkage groups are detected as QTL responsible for eight agronomic traits and 10 QTL are identified as having pleiotropic effects. Tracing transmission of functional QTL in the pedigree indicated that certain QTL, such as Sat_036 on linkage group D1a, Satt182 on linkage group L, and Satt726 on linkage group B2 may be responsible for the contribution of exotic germ plasm to the improved cultivars.

【题目】Optimization of inactivation of endospores of Bacillus cereus by antimicrobial lipopetides from Bacillus subtilis fmbj strains using a response surface method
【中文关键词】略
【英文关键词】Lipopept ides; Bacillus cereus; Bacillus subtilis; Surfactin; Fengycin
【中文摘要】略
【英文摘要】Bacillus subtilis fmbj can produce a lipope ptide antimi crobia l substance, the main components of which are surfactin and fengycin. In this paper, the sensitivity of Bacillus cereus to antimicrobial lipopeptides from B.subtilis fmbj was observed, and the effect of the microstructure of antimicrobial lipopeptide on spores of B. cereus was inves-tigated. At the same time, the optimization of the inactivation of antimicrobial lipopeptides to spores of B. cereus by a response surface methodology was studied. Results showed that B. cereus had high sensitivity to it, whose minimal inhibitory concentration was 156.25 μg/ml. It could result in the death of spores by destroying the structure of resting spores and sprouting spores, as was observed by transmission electron microscopy. The optimization result indicated that spores of B. cereus could be inactivated by 2 orders of magnitude when the temperature was 9.6 ° C, the action time was 7.6 h, and the concentration was 3.46 mg · ml^ − 1.

【题目】Size-dependent defluoridation properties of synthetic hydroxyapatite
【中文关键词】纳米羟基磷灰石 脱氟 粒度效应
【英文关键词】Hydroxyapatite; Size-dependent; Defluoridation; Adsorption
【中文摘要】纳米羟基磷灰石脱氟的粒度效应
【英文摘要】Batch adsorption experiments were conducted to investigate the removal of fluoride from aqueous solution by the addition of synthetic hydroxyapatites (HAps) with different particle sizes. Results showed that size-dependent defluoridation properties of HAps. Better performances were obtained with smaller particle sized HAps, which presented higher adsorption efficiency. Bulk HAp, the HAp sample with the largest particle size, presented the lowest percentage of fluoride removal. The isotherm studies showed

that the Freundlich model was the best choice to describe the adsorption behaviors of nanosized HAps. However, the adsorption pattern of the bulk sample followed both Langmuir and Freundlich isotherms. All parameters that might influence the defluoridation process were assessed, which included the effect of adsorbent dose, initial fluoride concentration, contact time and the effect of temperature. The removal efficiency of fluoride increased with increasing adsorbent dose. Decrease of the initial fluoride concentration resulted in the increase of fluoride removal efficiency. The percentage of fluoride removal increased as the ambient pH decreased. Thermodynamic parameters suggested that the adsorption of fluoride onto HAp samples was physisorption and endothermic in nature. Moreover, adsorption kinetic study revealed that the adsorption process followed pseudo-second-order kinetics. This work indicated that synthetic hydroxyapatites, especially the smaller particle sized HAps, were efficient defluoridation materials.

【题目】Study on the fluoride adsorption of various apatite materials in aqueous solution

【中文关键词】水溶液 磷灰石材料 吸附 氟

【英文关键词】Adsorption; Apatite; n-HAp; Bone meal; Defluoridation capacity

【中文摘要】水溶液中不同磷灰石材料吸附氟的研究

【英文摘要】The aim of this study was to evaluate the defluoridation efficiencies of various sorbents in aqueous solution. These sorbents include synthetic nano-hydroxyapatite (n-HAp), biogenic apatite (bone meal), treated biogenic apatite (bone meal prepared by H(2)O(2) oxidation) and geogenic apatite (rock phosphate), which were characterized by XRD, FTIR, TEM and SEM. It has been observed that the defluoridation capacities follow the order: n-HAp > BH(2)O(2) > B > rock phosphate. The controlling factors, sorbent dose, initial fluoride concentration, pH, contact time and temperature were investigated. The defluoridation capacities increased with the increase in the initial fluoride concentration and contact time, decreased with the increase in the sorbent dose. The optimum pH range for removal of fluoride on various apatite sorbents was considered to be 5.0-6.0. The fluoride adsorption can be explained by Langmuir, Freundlich isotherms, and the adsorption kinetic data follow the pseudo-second-order model. Thermodynamic parameters such as Delta H(0), Delta S(0) and Delta G(0) indicated that the adsorption on various apatite sorbents was spontaneous and endothermic. These results showed that bone meal is a promising material for fluoride adsorption.

【题目】Separation and extraction of antimicrobial lipopetides produced by Bacillus amyloliquefaciens ES-2 with macroporous resin

【中文关键词】略

【英文关键词】Antibiotic lipopeptide; Bacillus amyloliquefaciens; Macroporous resin; Separation extraction

【中文摘要】略

【英文摘要】A new method for separation and extraction of antibiotic lipopeptides produced by Bacillus amylolique-faciens ES-2 with macroporous resin was carried out in this study. Among widely used twelve macroporous resins, X-5 resin had the highest adsorption capacity in static anddynamic tests, its non-polarity and configuration were suited for the lipopeptides (surfactin and fengycin). Dynamic adsorption and desorption experiments were performed using a column packed with X-5 resin to obtain optimal conditions, with 30 g/L resin concentration, 0.5 BV/h feed flow rate, 80% aqueous ethanol at 1 BV/h elute flow rate as eluant agent, the total content of lipopeptides in final product was 79.5% (surfactin content was 33.2% while fengycin content was 23.4%), which had

been improved about 150% compared with that of lipopeptide infermentation broth. Because of its low cost, high efficiency,procedural simplicity and scale up ease, the adsorptiondesorption method could be more efficient for the preparative eparation and extraction of antibiotic lipopeptide than the conventional acid precipitation method, which could provide scientific references for antibiotic lipopeptide production.

【题目】Mapping quantitative trait loci associated with chlorophyll a fluorescence parameters in soybean [Glycine max (L.) Merr.].
【中文关键词】无
【英文关键词】Chlorophyll a fluorescence parameters JIP-test Photosynthesis Quantitative trait loci (QTLs) Recombinant inbred line (RIL)Soybean (Glycine max(L.) Merr.)
【中文摘要】无
【英文摘要】Abstract Chlorophyll a fluorescence parameters can provide qualitative and quantitative information about photosynthetic processes in chloroplasts. JIP-test and modulated fluorescence (MF) parameters are commonly used chlorophyll a fluorescence parameters. This study was conducted to identify quantitative trait loci (QTLs) associated with JIP-test parameters, MF parameters, and photosynthetic rate (PN), and to examine the relationships among them in soybean (Glycine max(L.) Merr.). Pot and field experiments were performed to evaluate 184 recombinant inbred lines (RILs) for five JIP-test parameters (ABS/RC, TR o/ABS, ET o/TR o, RE o/ET O, and PI ABS), four MF parameters (Fv/Fm, Fv 0/Fm 0, U PSII, and qP), and P N .Significant correlations were commonly observed among JIP-test parameters, MF parameters, and PN. QTL mapping analysis identified 13, 9, and 4 QTLs for JIP-test parameters, MF parameters, and PN , respectively, of which 13 were stable. Four major genomic regions were detected: LG A2 (19.81 cM) for JIP-test parameters, LG C1 (94.31and 97.61 cM) for PN and MF parameters, LG M(100.51 cM) for JIP-test and MF parameters, and LG O(30.61 – 49.91 cM) for PN, JIP-test, and MF parameters. These results indicate that chlorophyll fluorescence parameters, especially UPSII and qP, could play an important role in regulating PN, and that JIP-test and MF parameters could be controlled by the same or different genes. The QTLs identified in this study will help in the understanding of the genetic basis of photosynthetic processes in plants. They will also contribute to the development of marker-assisted selection breeding programs for photosynthetic capacity in soybean.

【题目】Isolation and characterization of a co-producer of fengycins and surfactins, endophytic Bacillus amyloliquefaciens ES-2 from Scutellaria baicalensis Georgi

【中文关键词】略

【英文关键词】Fengycin; Surfactin; Bacillus amyloliquefaciens; Antimicrobial activity; Endophyte.

【中文摘要】略

【英文摘要】An endophytic bacterium was isolated from Chinese medicinal plant Scutellaria baicalensis Georgi. The phylogenetic and physiological characzterization indicated that the isolate, strain ES-2, was Bacillus amyloliquefaciens , which produced two families of secondary metabolites with broad-spectrum antibacte-rial and antifungal activities. Culture filtrate of ES-2 displayed antagonism against some phytopathogenic, food-borne pathogenic and spoilage bacteria and fungi owing to the existence of antimicrobial compounds. A HPLC-MS analysis showed two series of ion peaks from the culture filtrate. A further electrospray ionirzation/collision-induced dissociation spectrum revealed that the two series ion peaks represented different fengycin homologues and surfactin homologues, respectively, which had a potential for food preserva-tion and the control of several fungal plant diseases.

【题目】Roles of Organic Acids and Nitrate in the Long-Distance Transport of Cobalt in Xylem Saps of Alyssum murale and Trifolium subterraneum

【中文关键词】超积累植物 长距离运输 有机酸 硝酸 羟基磷灰石

【英文关键词】Cobalt; Xylem sap; Organic acids; Nitrate; Alyssum murale; Trifolium subterraneum

【中文摘要】超积累植物长距离运输钴过程中有机酸和硝酸的作用

【英文摘要】Roles of organic acids and nitrate in the long-distance transport of cobalt (Co) in xylem saps of hyperaccumulator Alyssum murale and non-hyperaccumulator Trifolium subterraneum were studied under hydroponic conditions. Organic acids (oxalic, malic, malonic, citric, and fumaric) and nitrate in xylem sap samples were separated and determined simultaneously by reversed-phase high performance liquid chromatography after solid-phase extraction with nanosized hydroxyapatite. Results indicated that Co treatment significantly increased the concentrations of xylem oxalic and malic acids for the hyperaccumulator A. murale compared to the control but significantly decreased the concentrations of xylem nitrate and malonic acid; concentrations of citric acid in xylem sap samples did not show significant difference between the control and Co treatments. By analyzing the relationship between the concentrations of organic acids, nitrate, and concentrations of Co in xylem saps, it could be concluded that oxalic and malic acids in xylem saps seemed to participate in the long-distance Co translocation process, and citric acid did not relate to the xylem Co transport of A. murale and T. subterraneum. Our work might be very useful for understanding the mechanism of long-distance transport of heavy metals in hyperaccumulator.

【英文关键词】Determination; HPLC; Interference elimination; Nanosized hydroxyapatite; Oxalic acid; Solid phase extraction
【中文摘要】利用纳米羟基磷灰石消除反相液相色谱中硝酸根离子对草酸的干扰
【英文摘要】A new method using solid phase extraction with nanosized hydroxyapatite for solving interference from nitrate ions on oxalic acid in reversed phase high performance liquid chromatography (RP-HPLC) was developed. The optimum experimental conditions for the separation and determination of oxalic acid were studied. After the interference was eliminated, oxalic acid was determined by RP-HPLC at the optimum chromatographic conditions with an average recovery ranging between 94.8% and 99.3%, and the relative standard deviations were less than 3.0%. This method was successfully applied to determine the oxalic acid in the xylem saps of tomato.

【题目】Genetic location and evaluation of chromosomal segments for drought tolerance at flowering stage in maize using selected backcross populations.
【中文关键词】无
【英文关键词】Zea mays— selected introgression lines — drought tolerance — maize
【中文摘要】无
【英文摘要】AbstractDevelopment and evaluation of introgression lines have become one of the promising approaches to understanding genetic mechanisms of important traits in crops. In this study, three sets of drought tolerance (DT) selected backcross populations in maize, including two BC 2S1 populations and one BC 3S1population, from a cross of Qi319 and Huangzaosi (recurrent parent) were developed by selecting for short anthesis-silking interval (ASI) under the condition of serious water stress at flowering stage. The introgression of chromosome segments was identified using microsatellite markers. The results showed that the marker allele introgression frequencies in the three DT populations significantly increased compared with the expected value under no selection. There was a notable increase of introgression frequency for the most of these markers which were located on all chromosomes except chromosome 8, but most concentrated on some chromosomes, especially on chromosomes 4 and 5. For example, chromosome 4 harboured the largest number of introgression regions, on which five segments were detected. The ASI in the DT populations significantly shortened compared with the initial BC 2 population.

【题目】Enhancement of surfactin production of Bacillus subtilis fmbR by replacement of the native promoter with Pspac promoter
【中文关键词】略
【英文关键词】surfactin; promoter; replacement; enhancement;Bacillus subtilis.
【中文摘要】略
【英文摘要】Bacillus subtillis fmbR-1 was obtained from wild-type B. subtilis fmbR by replacement of the native promoter of the surfactin operon with the inducible promoter Pspac. The recombinat B. subtillis fmbR-1 produced more antibacterial substances than the wild-type strain. The overproducing phenotype was related to the enhancement of antagonistic activities against Bacillus cereus. HPLC peaks of surfacin for recombinant fmbR-1 showed patterns of lipopeptides similar to those of the wild-type strain, and surfactin production of the recombinant fmbR-1 was up to about fivefold greater than that of the wild-type strain without inductioin by isopropyl β - α -1-thiogalactopyranoside. However, the production of surfactin increased to about 10-fold more than that of the wild-type strain when it was induced by isopropyl β - α -1-thiogalactopyranoside.

【题目】Screening and applying wheat microsatellite markers totrace individual Haynaldia villosa Chromosomes
【中文关键词】Triticum aestivurn; Haynaldia villosa; wheat microsatellites
【英文关键词】Triticum aestivurn; Haynaldia villosa; wheat microsatellites
【中文摘要】Wheat (Triticum aestivum L.) microsatellitemarkers were screened for detecting Haynaldiavillosa L. chromosomes introduced into wheat background. Two hundred and seventy six primer pairs mapped on 7 homeologous groups of wheat were used to amplify the gDNA of T. aestivum and H. villosa. The results showed that 148 of 276 microsatellite primers amplified polymorphic bands between common wheat cv. Chinese Spring and H. villosa. Primers wmc49 (1BS), wmc25 (2BS), gdm36 (3DS), gdm145 (4AL), wmc233 (5DS), wmc256 (6AL) and gwm344 (7BL) produced a specific polymorphic DNA fragment on chromosome IV to 7V of H. villosa, respectively. In addition, gwm469 (6DS) detected a specific band on 2V; gdm107 (2DS) amplified a specific band on 6V. These microsatellitemarkers were effective in identifying individualH. villosachromosomes in other T. aestivum-H. villosachromosome addition, substitution and translocation lines involved in different H. villosa accessions and wheat backgrounds. Therefore, these chromosome-specific microsatellitemarkers could be used as molecular markers for detection of chromosomes of H. villosa in common wheat.

【题目】小麦-大赖草易位系对赤霉病抗性的聚合
【中文关键词】普通小麦;小麦- 大赖草易位系;赤霉病抗性
【英文关键词】Triticum aestivum; Wheat-Leymus racemosus translocation lines; Wheat scab resistance
【中文摘要】利用C-分带、FISH、SSR技术,从小麦-大赖草易位系T01~T14中筛选出8个纯合易位系。将不同易位系相互进行杂交,配制了11个杂交组合,并对各易位系及其杂种后代进行赤霉病抗性鉴定。结果表明,大赖草各易位系对赤霉病的抗性接近于苏麦3号,但不同地点及年份间差异较大。涉及不同大赖草染色体的易位系间的杂种F1与其抗性较高的易位系亲本相比抗性有所提高,但涉及大赖草Lr.7或5Lr#1同一条染色体的不同易住系间杂种F1的抗性仅位于两亲本之间。这表明位于不同大赖草染色体上的抗赤霉病基因具有累加效应,通过不同大赖草染色体易位系的聚合,可提高赤霉病的抗性。
【英文摘要】Eight different homozygous wheat-Leymus. racemosus translocation lines were selected from T01~T14 by C-banding , FISH and SSR. Eleven different crosses were made between these w heat-L. racemosus translocation lines. Fusarium head blight (FHB, w heat scab) resistance of different homozygous translocation lines and their hybrids was evaluated. All these translocation lines showed scab resistance nearly as high as that of Sumai3, but the resistances were unstable in different years or different places. T he resistance level of hybrid F1 between the translocation lines involved different L.racemosus chromosomes was higher than that of the parent with higher resistance. But resistance level of the F1 between different translocation lines involved the same L . racemosus chromosome 5Lr# 1 o r Lr .7 was only between two parents in the crosses. It indicated that there w ere several FHB resistance genes located on different chromosomes of L . racemosus, and showed additive effect s. So FHB resistance could be enhanced by combining the resistance genes o n different L .racemosus chromosomes.

【题目】Cloning of a Resistance Gene Analog from Wheat and Development of a Codominant PCR Marker for Pm21
【中文关键词】Chromosome assignment; molecular marker; suppression subtractive hybridization(SSH); Ta-LRR2; Triticum aestivum-Haynaldia villosa 6VS/6AL translocation line.
【英文关键词】Chromosome assignment; molecular marker; suppression subtractive hybridization(SSH); Ta-LRR2; Triticum aestivum-Haynaldia villosa 6VS/6AL translocation line.
【中文摘要】To investigate the mechanism of resistance to wheat(Tricum aestivum L.)powdery mildew, suppression subtractive hybridization was conducted between an isogenic resistant line carrying Pm21 and itsreeur-rent parent Yangmai5 to isolate the resistance relative genes, A cDNA fragment specifically expressed in the resistant line was obtained and its full length was cloned by in silico cloning and RT-PCR. This gene encoded a deduced protein of 219 amino acids with a leuclne-rich repeat(LRR)motif, often found in plant resistance genes, and was designated as Ta-LRR2. Ta-LRR2 had an increased expression level in the resistant line after inoculation with Ervsiphegram Dc. f.sp. tritici Marchal. PCR analysis with different cytogenetic stocks suggested that Ta-LRR2 was specifically associated with chromosome arms 6VS and 6AS. Linkage analysis further showed that Ta-LRR2 could be used as a resistance gene analog polymer-phism marker of Pm21 for marker-assisted selection in germplasm enhancement and breeding practice. Moreover, how to isolated Pm21 based on the information obtained for Ta-LRR2 is discussed.

【题目】A sequence-specific PCR marker linked with Pm21 distinguishes chromosomes 6AS, 6BS, 6DS of Triticum aestivum and 6VS of Haynaldia villosa
【中文关键词】Haynaldia villosa -Triticum aestivum - homoeologous group 6 chromosomes - polymerase chain reaction marker - Pm21
【英文关键词】Haynaldia villosa -Triticum aestivum - homoeologous group 6 chromosomes - polymerase chain reaction marker - Pm21
【中文摘要】To investigate the mechanism of resistance to wheat(Tricum aestivum L.)powdery mildew, suppression subtractive hybridization was conducted between an isogenic resistant line carrying Pm21 and itsreeur-rent parent Yangmai5 to isolate the resistance relative genes, A cDNA fragment specifically expressed in the resistant line was obtained and its full length was cloned by in silico cloning and RT-PCR. This gene encoded a deduced protein of 219 amino acids with a leuclne-rich repeat(LRR)motif, often found in plant resistance genes, and was designated as Ta-LRR2. Ta-LRR2 had an increased expression level in the resistant line after inoculation with Ervsiphegram Dc. f.sp. tritici Marchal. PCR analysis with different cytogenetic stocks suggested that Ta-LRR2 was specifically associated with chromosome arms 6VS and 6AS. Linkage analysis further showed that Ta-LRR2 could be used as a resistance gene analog polymer-phism marker of Pm21 for marker-assisted selection in germplasm enhancement and breeding practice.

Moreover, how to isolated Pm21 based on the information obtained for Ta-LRR2 is discussed.
【英文摘要】To develop markers linked with Pm21 located on chromosome 6VS of Haynaldia villosa, a pair of primers (NAU/xibao15F and NAU/xibao15R) were designed according to the sequence of a serine/ threonine kinase gene (Contig17515), whose expression was induced by Blumeria graminis and selected from the gene expression experiment using the Barley GeneChip. Using genomic DNA of various genetic stocks including the wheat variety ‘ Yangmai#5 ’, H. villosa, Triticum durum – H. villosa amphiploid, seven T. aestivum – H. villosa addition lines involving chromosomes 1V – 7V, the translocation line T6VS • 6AL, and 21 nullisomic – tetrasomic and eight deletion lines of T. aestivum _Chinese Spring_ as templates, four amplicons specific for 6VS, 6AS, 6BS and 6DS, respectively, were produced. F2 individuals derived from the cross of ‘ Yangmai#5 ’ • T6VS • 6AL were analysed, and data indicate that NAU/xibao15902 could be used as a co-dominant marker for selecting Pm21 located on 6VS.

【题目】Genotypic and spike positional difference in grain phytase activity, phytate, inorganic phosphorus, iron, and zinc contents in wheat (Triticum aestivum L.)
【中文关键词】Wheat (Triticum aestivum L.); Phytase; Phytate; Iron; Zinc
【英文关键词】Wheat (Triticum aestivum L.); Phytase; Phytate; Iron; Zinc
【中文摘要】One hundred and eighty-six wheat genotypes from different areas of China were selected to evaluate the genotypic and positional differences in grain phytase activity, phytate, inorganic phosphorus, iron, and zinc contents. Results showed substantial differences in these chemical components among genotypes. Grain weight and phytate (r=-0.34**), inorganic phosphorus (r=-0.23**), and phytase activity (r= -0.43 **) were negatively correlated. In contrast, grain weight and iron (r=0.20**), phytate and zinc (r=0.37**), and iron and zinc (r=0.29**) were positively correlated. The effect of grain position on all these components was significant. Generally, grains on the third florets of the central spikelets had the lowest zinc and phytate contents within a spike. The significance of these results is discussed in relation to the improvement of wheat micronutrient quality.

【题目】两种检测小麦DON 含量方法的比较与应用
【中文关键词】小麦; 赤霉病; 脱氧雪腐镰刀菌烯醇; 液相色谱; 气质联用
【英文关键词】Triticum aestivum; Fusarium head blight or scab; Deoxynivalenol; HPLC; GC-MS
【中文摘要】为选育赤霉病毒素含量低的小麦品种, 减轻赤霉病危害, 在比较了免疫亲和柱液相色谱法(DON test-H PLC) 和气质联用法(GC-MS) 测定小麦中毒素含量的特点的基础上, 利用两种方法对自然发病和赤霉 病菌人工接种的小麦籽粒

DON含量进行测定。结果表明, DON test-H PLC 方法线性检测下限为0.1ng • l- 1 , 在添加0. 1~ 5. 0 mg • kg--1 DON 标准品时, 其平均回收率为85. 80%; GC-MS 方法提高了检测的可靠性, 灵敏度更高, 其线性检测下限为0. 025 ng L- 1 , 在添加0. 1~ 10. 0 mg • kg- 1 DON 标准品时, 其平均回收率为94. 68%, 而且能够同时检测多种毒素。相关性分析表明, 两种方法检测结果相关显著(R2 = 0. 9928) 。DON test-H PLC 简便、安全, 比较适宜于DON 含量较低品种或品系大样品的检测。GC-M S 更适宜小样品DON 及其衍生物含量的检测。

【英文摘要】Breeding wheat cultivars with low deoxynivalenol (DON) content is an effectiv e approach tocontrol the toxin contamination in wheat g rains caused by w heat scab. In this paper, two methods for the determination of DON content in wheat grains, DON test-HPLC and GC-MS, were compared. The result s indicated that both methods were fast and accurate, with the latter more credible and sensitive. T he linear lowest limit o f DON test-H PLC w as 0. 1 ng / L, it s average recovery rate w as 85.80% w hen 0.1~ 5.0 mg kg- 1 DON was added into the wheat grains. GC-MS method could detect as low as 0. 025 ng/ DON, with a recovery rate o f 94. 68% when 0. 1~ 10. 0 mg kg- 1 DON was added into the wheat grains. Moreover, GC-MS method could detect various toxin forms of DON, including 3-ADON, 15-A DON etc. in the same experiment , while DON test-H PLC could not distinguish different toxin forms. The two methods showed significant correlation (R 2 = 0. 9928) . Based on the present result s, DON test- HPLC w as suggested to be used in large samples for DON analysis, and GC- MS should be more helpful in small samples for both analysis on DON and it s derivatives.

【题目】小麦-簇毛麦6VS/6AL易位染色体在不同小麦背景中的遗传稳定性及其在配子中的传递
【中文关键词】小麦; 簇毛麦; P m21; 荧光原位杂交; 配子传递率
【英文关键词】Wheat ; Haynaldia villosa; Pm21 gene; FISH; Transmission frequency

【中文摘要】为研究小麦- 簇毛麦6VS/ 6AL 易位染色体在不同小麦背景中的遗传稳定性及其在配子中的传递, 利用高抗白粉病的普通小麦- 簇毛麦6VS/ 6AL 易位系92R137 与不抗白粉病的栽培品种百农64、百农9310、邯5310、小偃54、淮麦20、徐麦856 进行杂交, 并用这些品种分别与杂种F1 进行正反回交。对杂种F1 花粉母细胞减数分裂中期 I 的细胞学观察表明, 在减数分裂中期 I 易位染色体6VS/ 6AL 通常以6AL 与6A染色体配对形成棒状二价体。各杂种F1 高抗白粉病, 位于6VS 上的抗白粉病基因Pm21 呈显性, 在F2 中有69. 0%~ 74. 0%的植株抗白粉病, 接近1 对显性基因遗传的理论值。由于6VS 与6AS 在通常情况下不发生配对交换, 因此可通过白粉病抗性鉴定并结合利用6VS 上的分子标记来跟踪6VS/ 6AL 易位染色体的传递。测交结果表明, 以F1 作母本6VS/ 6AL 易位染色体通过雌配子的传递率为49. 2%(45. 8%~ 54. 9%) ; 以F1作父本6VS/ 6AL 易位染色体通过雄配子的传递率为44. 7% (43. 1%~ 46. 8%) , 均接近50%的理论值。但在各组合中, 6VS/ 6AL 易位染色体通过雄配子的传递率均低于通过雌配子的传递率。

【英文摘要】In order to study transmission o f 6VS/ 6AL chromo some through gametes and its genetic stability in different genetic backgound, the 6VS/ 6AL translocation line 92R137 (highly resistant to powdery mildew) w ere respectively crossed to common w heat varieties Bainong 64, Bainong 9310, Han 5310, Xiaoyan 54, Huaimai 20 and Xumai 856 introduced from different areas of China and the hybrids F1 w ere backcrossed as male and female. Fluorescence in situ hybridization (FISH) on hybrid F1 PMC MI w as used to study the pairing o f 6VS/ 6AL translocation chromosome o f hybrid F1 in different w heat background. The rod bivalent formed by 6AL of translocation chromosome and chromosome 6A w as observed in (translocation line different variety) F1 plants. All the F1 plant s expressed high resistance to powdery mildew. It indicated that Pm21 gene on 6VS inherited dominantly and expressed w ell w hen transferred to different w heat genotype. In hybrid F2 , there w ere 69. 0%~74. 0% plants highly resistant to powdery mildew , close to the transmission o f o ne dominant gene expected value o f 75%. In general situation, 6VS can not pair and crossover with 6AS, so powdery mildew resistance and molecular marker o n 6VS can be used to t race the transmission of 6VS/ 6AL translocation through gametes. The result of testcrosses showed that translocation chromosome 6VS/ 6AL can transmit to off spring s stably , and the transmission frequency of 6VS/ 6AL was higher through female gametes (49. 2%) than through male gametes (44. 7%) , but all o f them had not significant difference with expected value of 50% .

【题目】普通小麦籽粒DON 含量的配合力分析
【中文关键词】小麦; 赤霉病; 配合力; 脱氧雪腐镰刀菌烯醇; 遗传
【英文关键词】Triticum aestivum; Fusarium head blight (FHB) ; Combining ability; Deoxynivalenol (DON) ; Heritability
【中文摘要】为了选育抗赤霉病且籽粒毒素含量低的小麦品种以减轻赤霉病危害, 在对我国南方麦区地方品种进行赤霉病抗性鉴定的基础上, 选用8 个籽粒中脱氧雪腐镰刀菌烯醇(deoxynivalenol, DON) 含量水平不同的小麦品种作亲本, 按8×8半双列杂交配制28 个杂交组合, 以接种后成熟籽粒中DON 含量、病小穗数、病小穗率和病粒率为指标, 进行赤霉病抗性、一般配合力(GCA) 和特殊配合力(SCA) 遗传分析, 以及不同鉴定指标间比较和相关性分析。结果表明, 8 个品种中籽粒DON 含量以苏麦3 号最低(0. 5715 mg kg- 1) , Alondra ’ s 最高(13. 5560 mg kg- 1) , 各组合F1 的籽粒DON 含量均低于感病品种Alondra ’ s。品种间GCA 和SCA 存在显著差异, 籽粒DON 含量以加性效应为主, 存在部分显性效应。苏麦3 号、望水白和翻山小麦表现出较好的一般配合力效应。以苏麦3 号为亲本的5 个组合、望水白为亲本的4 个组合特殊配合力效应较大。扬麦158 一般配合力效应较小, 但有4 个组合表现较好的特殊配合力效应。籽粒DON 含量和病小穗数、病小穗率、病粒率呈极显著的正相关关系。感病品种Alondra s 和绵阳8545 的各个抗性鉴定指标的一般配合力在8 个品种的排序中表现一致, 抗病品种各个抗性指标的一般配合力在8 个参试材料间的排序有所差异。DON 含量的狭义遗传力为74.54%, 因此以抗DON 积累为指标的赤霉病抗性育种, 可以在早期世代进行选择。
【英文摘要】Fusarium head blight (FHB) caused by Fusarium spp. is an important disease of wheat in warm and humid areas in the world. In China, frequent epidemics of wheat FHB occurred mainly in the middle and lower reaches of the Yangtze River and the northeastern spring wheat growing area. FHB causes decrease of grain yield and quality. Moreover mycotoxins contamination of diseased wheat grains is harmful to humans and livestock. Deoxynivalenol (DON) is the main toxin in wheat in China. Many countries had regulations for DON contents in both food and feed. Development of scab resistant cultivars with minimizing DON content can reduce the damage from FHB. In the present research, to understand the inheritance of DON content in wheat grains, an 8 8 diallel crossing of Griffing analysis of DON content involving four landraces (Wangshuibai, Chimianxiaomai, Fanshanxiaomai, and Qiangweimai) and four cultivars (Alondra ’ s, Mianyang 8545, Sumai 3, and Yangmai 158) with different DON content was performed. F1 of 28 combinations and their parental lines were planted with two replications and artificially inoculated by single floret inoculation with a high DON producing isolate. Disease severity was evaluated by the number of diseased spikelets, percentages of diseased spikelets and diseased grains, and DON content in grains was analyzed by gas chromatography with mass spectrometry (GC MS) . The above four indices were compared and their correlation coefficients were estimated. General combining ability (GCA) and special combining ability (SCA) were also analyzed. Significant differences of DON content, GCA and SCA of DON content in wheat grains were measured among the eight parents. All F1 hybrids showed less DON contents than the susceptible cultivar Alondra s. The resistant cultivar Sumai 3 showed the lowest DON content (0. 5715 mg kg- 1) and the highest negative GCA values (- 1. 26) , and Alondra ’ s showed the highest grain DON content (13. 5560 mg kg- 1) and highest posit ive GCA values (2. 96) . Negative GCA effects of Sumai 3 (- 1. 26) , Wangshuibai (- 1. 16) and Fanshanxiaomai (- 1. 13) were similar and significant for decreasing DON content. Five combinations derived from Sumai 3, four from Wangshuibai and four from Yangmai 158 showed higher SCA for DON content reduction. From the results of the current research, the DON content in grains is mainly controlled by additive genetic components, with partial dominance effects. There were significant positive correlations among DON content, number of the diseased spikelets, percentages of diseased spikelets and diseased grains (r = 0. 5980- 0. 9889) . In addition, GCA of four parameters in susceptible cultivars(Alondra ’ s, Mianyang 8545) showed the same trend in the eight parents, while it varied among different resistant cultivars. The narrow sense heritability of DON content in grains was 74. 54%, indicating that it is feasible to select lines with low DON content in earlier generations.

【题目】加州野大麦染色体C-分带、荧光原位杂交及其核型分析
【中文关键词】双二倍体; 染色体C-分带; 荧光原位杂交; 核型分析; 加州野大麦;
【英文关键词】Anlphiploid; Sequential chromosome C—banding; Fluorescence in situ“ hybridization;Karyotype analysis;California barley(Hordeum californicum)
【中文摘要】以二倍体加州野大麦(Hordeum californicum)及普通小麦中国春(Chinese spring,CS)-加州野大麦的双二倍体为材料,进行依次染色体C-分带和荧光原位杂交(FISH)分析。结果表明:小麦背景中的加州野大麦染色体都显示较强的末端带,7对染色体之间带的数目和强弱均存在明显差异,可以和普通小麦染色体相互区分开来;以45srDNA为探针进行荧光原位杂交发现,二倍体和双二倍体中加州野大麦的NOR位点均位于第7对染色体短臂上;基于根尖细胞有丝分裂中期染色体C-分带和原位杂交结果,利用Motic images plus 2.0 ML软件“ 数码显微图像处理系统 ”进行核型分析,确定加州野大麦的核型为2n=2x=10 m(2SAT)+4 sm,属于较为对称性核型(A);加州野大麦染色体核型的建立,为利用远缘杂交和染色体工程转移加州野大麦的有利基因奠定了基础。
【英文摘要】Sequential chromosome C-banding/F1uorescence in situ hybridization was conducted on root—tip cell chromosomes of California barley(H.californicum),and wheat(Trticum aestivum c.v. Chinese Spring)-H.californicum amphiploid.The results show that most chromosomes of H.californicum had strong terminal bands. Different chromosomes could be distinguished by their unique band pattern and could be identified in the wheat background.The FISH results using labeled 45S rDAN as a probe revealed that there were two hybridized signals on a pair of H7 chromosomes of H.H.californicum.Based on the chromosome C-banding and FISH results,karyotype analysis was conducted using Motic images plus 2.O ML software.The karyotype formula of H.californicum was 2n一2x一10 m(2SAT)+4 sm.

【题目】分子标记辅助选育小麦抗白粉病、优质高分子量麦谷蛋白亚基聚合体
【中文关键词】小麦, 白粉病, 品质, 聚合体, 分子标记辅助选择
【英文关键词】Triticum aestivum L., Powdery mildew, Quality, Pyramided traits, Marker-assisted selection (MAS)
【中文摘要】现代小麦育种的目标是选育丰产、综合抗逆性好的优质小麦新品种,将分子标记技术与传统育种方法相结合可以大大提高育种效率。本研究利用与小麦抗白粉病基因Pm21紧密连锁的共显性PCR标记、以及优质高分子量麦谷蛋白亚基1Dx5+1Dy10特异的PCR标记对以小麦品种安农94212、安农92484为优质亲本和以抗白粉病小麦—簇毛麦易位系为抗病亲本的杂交高代材料进行标记位点的检测,结合田间抗病性鉴定结果,筛选、培育出聚合有Pm21和1Dx5+1Dy10的抗白粉病小麦聚合体,为小麦抗病、优质育种提供了具有重要利用价值的中间材料。
【英文摘要】Development of germplasms with pyramided high yield, good quality and disease resistance genesis very important for wheat breeding. The combination of marker-assisted selection (MAS) and conventional breeding methods will greatly improve the breeding effi ciency. In this research, one sequence tagged sites (STS) marker linked to wheat powdery mildew resistant gene Pm21, and two specifi c markers for high molecular weight glutin (HMWG) subunit 1Dx5+1Dy10 were used to identify new germplasms with pyramided traits by MAS combined with field resistance evaluation. One elite line with pyramided Pm21 and 1Dx5+1Dy10 was identified, and should be good parents in wheat improvement for disease resistance and good bread quality.

【题目】普通小麦-簇毛麦易位系T4VS#4VL-4AL 的选育与鉴定
【中文关键词】普通小麦; 簇毛麦; T4VS#4VL-4AL 易位; C- 分带; 荧光原位杂交; 分子标记
【英文关键词】Triticum aestivum; Haynaldia villosa; T4VS # 4VL-4AL translocation; C-banding; Fluorescent in situ
【中文摘要】利用染色体C- 分带和基因组原位杂交分析, 从普通小麦- 簇毛麦4V 染色体二体异附加系(DA4V) 与普通小麦农林26- 离果山羊草3C 染色体二体异附加系(DA3C) 杂种后代中选育出小麦- 簇毛麦纯合易位系T4VS#4VL- 4AL。SSR 和RFLP 标记分析表明, 该易位染色体包括4VS、4VL 近着丝粒部分区段和4AL 顶端区段; 该易位系具有良好的细胞学稳定性, 结实正常, 为杀配子染色体诱发形成的补偿型易位; 易位系T4VS#4VL- 4AL 高抗梭条花叶病, 是小麦抗病育种新种质。
【英文摘要】Chromosome 3C of Aegilops triuncialis are of the ability to be transferred preferentially in the case of its monosomic status in wheat background. Whereas, those gametes without 3C would result in chromosome structural changes including deletion and translocation. Haynaldia villosa is reported to be resistant to several wheat diseases, such as powderymildew, rust, take- all, eyespot, and wheat spindle streak mosaic viruses. Chromosome disomic addition lines involving all seven H . villosa chromosomes, disomic substitut ion lines involving chromosomes 4V have been developed and characterized. Eyespot and take- all resistance gene is mapped on chromosome 4VL. The objectives of this study were to develop more translocation lines involving chromosome 4V, and supply new germplasm for wheat breeding. Triticum aestivum-Haynaldia villosa 4V disomic addition line was crossed to T . aestivum / Norin 260-Ae. triuncialis 3C disomic addition line , and the hybrids F1 were then self pollinated. Both chromosome C- banding and fluorescent in situ hybridization (FISH) were applied to screen chromosome variations of 4V. In this case, total genomic DNA of H. villosa was labelled by fluorescein-t 12-dUTP as probes and total genomic DNA of Chinese Spring as the block. One heterozygous translocation line involved in 4V and 4A (J176- 33) was identified from F2, and a homozygous translocation line (CQZ55) was selected from the offspring of J176- 33 and confirmed by chromosome pairing analysis at meiosis Ñ of pollen mother cells (PMC) . The results of simple sequence repeat (SSR) and restrict ion fragment length polymorphism (RFLP) analyses indicated that CQZ55 is consisted of 4VS, a part of 4VL near the centromere and distal part of 4AL, and designated as T4VS#4VL-4AL. This translocation line showed high resistance to wheat spindle streak mosaic virus.

【题目】Effects of the 6VS.6AL translocation on agronomic traits and dough properties of wheat
【中文关键词】Grain yield Pm21 Powdery
mildew Triticum aestivum L Wide crosses
【英文关键词】Grain yield Pm21 Powdery
mildew Triticum aestivum L Wide crosses
【中文摘要】Nineteen common wheat cultivars and advanced lines carrying a 6VS.6AL translocation and five parents were sown at two locations in Jiangsu in 2004 – 05 season to assess the effects of the translocation on grain yield and dough properties. In general, there were no significant differences between 6VS.6AL lines and their recurrent parents in agronomic, mixograph and starch pasting traits, including grain yield, grains/spike, grain weight/spike, mixing time and peak viscosity. 6VS.6AL lines showed slightly but significantly higher thousand-kernel weight and plant height, and small negative effects on test weight, flour yield and flour colour. However, significant variation occurred for all traits among sister lines from the same cross, indicating that additional selection could lead to further improvement. It was concluded that the 6VS.6AL translocation can be used in wheat breeding programs as a donor of resistance to powdery mildew with no obvious undesirable effects on agronomic and quality traits.

【题目】Assessment of Genetic Diversity of Yunnan, Tibetan, andXinjiang Wheat Using SSR Markers
【中文关键词】Yunnan wheat; Tibetan wheat; Xinjiang wheat; genetic diversity; SSR markers
【英文关键词】Yunnan wheat; Tibetan wheat; Xinjiang wheat; genetic diversity; SSR markers
【中文摘要】A total of 206 SSR (Simple Sequence Repeats) primer pairs were used to detect genetic diversity in 52 accessions of three unique wheat varieties of western China. A total of 488, 472, and 308 allelic variants were detected in 31 Yunnan, 15 Tibetan and 6 Xinjiang wheat accessions with an average of PIC values 0.2764, 0.3082, and 0.1944, respectively. Substantial differences in allelic polymorphisms were detected by SSR markers in all the 21 chromosomes, the 7 homoeologous groups, and the three genomes (A, B, and D) in Yunnan, Tibetan, and Xinjiang wheat. The highest and lowest allelic polymorphisms in all the 21 chromosomes were observed in 3B and 1D chromosomes, respectively. The lowest and highest allelic polymorphisms among the seven homoeologous groups was observed in 6 and 3 homoeologous groups, respectively. Among the three genomes, B genome showed the highest, A the intermediate, and D the lowest allelic polymorphism. The genetic distance (GD) indexes within Yunnan, Tibetan, and Xinjiang wheat, and between different wheat types were calculated. The GD value was found to be much higher within Yunnan and Tibetan wheat than within Xinjiang wheat, but the GD value between Yunnan and Tibetan wheat was lower than those between Yunnan and Xinjiang wheat, and between Tibetan and Xinjiang wheat. The cluster analysis indicated a closer relationship between Yunnan and Tibetan wheat than that between Yunnan and Xinjiang wheat or between Tibetan and Xinjiang wheat.
【英文摘要】A total of 206 SSR (Simple Sequence Repeats) primer pairs were used to detect genetic diversity in 52 accessions of three unique wheat varieties of western China. A total of 488, 472, and 308 allelic variants were detected in 31 Yunnan, 15 Tibetan and 6 Xinjiang wheat accessions with an average of PIC values 0.2764, 0.3082, and 0.1944, respectively. Substantial differences in allelic polymorphisms were detected by SSR markers in all the 21 chromosomes, the 7 homoeologous groups, and the three genomes (A, B, and D) in Yunnan, Tibetan, and Xinjiang wheat. The highest and lowest allelic polymorphisms in all the 21 chromosomes were observed in 3B and 1D chromosomes, respectively. The lowest and highest allelic polymorphisms among the seven homoeologous groups was observed in 6 and 3 homoeologous groups, respectively. Among the three genomes, B genome showed the highest, A the intermediate, and D the lowest allelic polymorphism. The genetic distance (GD) indexes within Yunnan, Tibetan, and Xinjiang wheat, and between different wheat types were calculated. The GD value was found to be much higher within Yunnan and Tibetan wheat than within Xinjiang wheat, but the GD value between Yunnan and Tibetan wheat was lower than those between Yunnan and Xinjiang wheat, and between Tibetan and Xinjiang wheat. The cluster analysis indicated a closer relationship between Yunnan and Tibetan wheat than that between Yunnan and Xinjiang wheat or between Tibetan and Xinjiang wheat.

【题目】Phytase activity, phytate, iron, and zinc contents in wheat pearlingfractions and their variation across production locations
【中文关键词】Phytase; Phytate; Iron; Zinc; Pearling; Production locations; Wheat
【英文关键词】Phytase; Phytate; Iron; Zinc; Pearling; Production locations; Wheat
【中文摘要】Pearling is an effective method for evaluating the distribution of chemical components in wheat grain. Twelve pearling fractions(P1 – P12) of wheat grain were obtained using two rice polishers for 10 cultivars (six soft red wheats and four hard white wheats) grown attwo locations with different environmental conditions in Jiangsu Province, China. The results show that the effects of cultivar, location, and pearling on wheat flour phytase activity, phytate, iron, and zinc contents were all significant, with pearling having the greatest effect.All the four components showed a diminishing trend as pearling progressed from the outer layers to the inner part of wheat grain.Generally, the P2 fraction (the outer 4 – 8% layer of wheat grain) had the highest phytase activity and phytate and iron contents, whereasthe P1 fraction (the outer 0 – 4% layer) ranked the highest for zinc content. Growing location had a large influence on grain phytase,phytate, and iron, but the differences between locations decreased as pearling level increased.

【题目】云南、西藏及新疆小麦研究进展
【中文关键词】云南小麦; 西藏小麦; 新疆小麦; 分类学; 起源; 遗传多样性;
【英文关键词】Yunnan wheat; Tibetan wheat; Xinjiang wheat
【中文摘要】为了解目前云南、西藏和新疆小麦的研究现状,就三者的分类学地位、起源进化、独特性状和遗传多样性的研究进展进行了综述,并提出了进一步研究的问题和意见。分类学,形态学,染色体组组成,SSR分子标记等研究结果表明,云南、西藏小麦是普通小麦的一个亚种,而新疆小麦被划分为六倍体小麦内的一个独立的种(Tr.petropavlovskyio),推测云南小麦和西藏小麦可能是由中东等地传入中国的原始六倍体小麦的后代,而新疆小麦或许是外来原始六倍体小麦传入中国新疆后,再与新疆本地的波兰小麦杂交的后代。研究还表明,西藏小麦和云南小麦群体内的遗传多样性要大于新疆小麦。 更多还原
【英文摘要】To understand the research progresses of these three unique w heats including Yunnan wheat(Triticum aestivum ssp. yunnanense King) , Tibetan w heat (Triticum aestivum ssp. tibetanum Shao) and Xinjiang w heat (T.petropavloski Udats et Migusch) , the research progresses of these three unique w heat s in classification, origin and evolution, unique characters, genetic diversity w ere reviewed and further research directions and advices w ere pro posed. Based on morphology, chromo some constitution and SSR molecular markers analysis, Yunnan wheat and Tibetan wheat have been taxonomically classified as a subspecies in T.aestivum, and Xinjiang w heat has been taxonomically classified as an absolute species in T.aestivum. Yunnan wheat and Tibetan wheat might be the progenitor of the ancestor T. aestivum introduced from the Middle East. Xinjiang w eat might be the progenitor of the ancestor T.aestivum introduced from the Middle East and Chinese Polonicum. Yunnan w heat and Tibetan wheat have higher genetic diversity than Xinjiang wheat .

【题目】利用基于PCR的分子标记区分普通小麦—提莫菲维小麦渐渗系
【中文关键词】小麦; 提莫菲维小麦; 白粉病; Pm6; 渐渗系;
【英文关键词】wheat; Triticum timopheevii; powdery mildew; Pm6; introgression lines
【中文摘要】采用定位于小麦2B染色体上的72对分子标记对含小麦抗白粉病基因Pm6的8份普通小麦(T.aestivum L.)-提莫菲维(T.timopheevii zhuk.)渐渗系材料进行分析,通过分子标记标图确定8份材料中渗入的提莫菲维小麦染色体片段的大小,同时结合连锁图谱对这些材料进行了遗传和物理标图。参考本研究所用的分子标记在染色体2B上的定位结果,Pm6基因被位于2B染色体长臂近末端2BL-6区域,提莫菲维小麦2G染色体渐渗片断长度由短到长排列顺序为:IGV1-465<IGV1-464<IGV1-463<IGV1-468<(IGV1-448、IGV1-458)<IGV1-474<IGV1-466。研究结果与陶文静(1999)采用RFLP标记标图的结果基本吻合,进一步确认IGV1-465渐渗片段最小。本研究所鉴定的基于PCR的分子标记还可以用于区分该套渐渗系,这为这套材料在育种中的分子标记辅助选择和Pm6基因的克隆奠定了基础。
【英文摘要】In order to determine the fragment size of Triticum timopheevii chromosome segments introduced into wheat background and physically map the Pm6 gene, a total of 72 primers (including SSR and STS primers) were used to analyze the eight introduced introgression lines containing Pm6 gene. Referring to the available mapping information of the analyzed markers on chromosome 2B, Pm6 was physically located in distal part of the long arm of chromosome 2B at the region of Bin 2BL-6. The introgressed fragment sizes of the chromosome 2G in different introgression lines was determined to be as follow (from short to long): IGV1-465<IGV1-464<IGV1-463< IGV1-468<(IGV1-448,IGV1-458)<IGV1-474<IGV1-466. The results were coincide with the RFLP results and further confirmed that line IGV1-465 contained the minimum introgression segment. Using the 10 polymorphism PCR markers identified in the present research, it is feasible to differentiate seven introgression lines. This information will be helpful for marker assistant identification of these lines in wheat breeding program and for further isolation of the Pm6 gene.

【题目】小麦铁锌营养品质研究进展
【中文关键词】小麦; 铁; 锌; 营养品质;
【英文关键词】Wheat ; Iron; Zinc; Nut ritional quality
【中文摘要】“隐性饥饿”,即铁、锌等微量元素缺乏症,已成为困扰我国居民的首要营养不良问题。选育高铁、锌含量、强植酸酶活性或低植酸含量的“微量营养强化型”小麦品种对于改善我国西部居民的营养状况具有重要的意义。本文主要介绍小麦铁锌营养品质的遗传改良研究进展,包括铁锌营养品质的相关化学组分(铁、锌、植酸和植酸酶)及改善小麦铁锌营养品质的遗传途径等两方面,并指出了小麦铁锌营养品质的研究方向和工作重点。
【英文摘要】Micronutrient malnutrition, of ten called -Hidden Hunger. , now afflict s mo re than two billion people worldwide, and results in low working efficiency, high healthcare cost, increased rates of mortality and morbidity and permanent impairment o f cognitive abilities o f infants. People in developing countries are especially at risk, because they are inability to buy enough meat , poultry, fish, fruit s, and vegetables that are rich in micro nutrient s such as iron, vitamin A, iodine, and zinc. Wheat is a highly consumed cereal crop. On a worldwide scale, it contributes approximately 30% of the total cereal product ion, making it a major source of minerals for many people. Wheat is also o ne o f the most important food crops in China. In Western China, w here people are still

relatively poor, more than 50% children in the rural areas are iron or zinc deficient. So it is imperative to develop w heat cultivars with improved iron and zinc quality to alleviate malnutrition in these areas. The three major factors affecting the utilization o f iron and zinc in w eat grains are the content o f iron and zinc, the content of phytic acid and the activity of endogenous phytase. In this paper, pr ogress in studies o n biological aspect s of w heat micronutrient quality is reviewed. The main content includes the introduction of the significance o f iron, zinc, phytic acid, and phytase for human nutrition, and the molecular approaches to improve w heat micronutrient quality. Additionally, the perspective of research on w heat micronutrient quality is out lined.

【题目】簇毛麦6V染色体短臂特异分子标记的开发和应用

【中文关键词】簇毛麦; 抗病基因类似物(RGA); 位点标签序列(STS); 染色体特异分子标记; 缺失系

【英文关键词】Haynaldia villosa; Resistance gene analog (RGA) ; Site tagged sequence (STS) ; Chromosome-specific molecular marker; Deletion line

【中文摘要】为开发簇毛麦6V染色体短臂特异的分子标记,并利用这些标记对缺失系进行鉴定,选用11个RGA和17对STS引物进行多态性分析,其中1个RGA引物和1对STS引物在对普通小麦扬麦5号、簇毛麦及普通小麦-簇毛麦6VS/6AL易位系进行多态性分析时,分别检测到一条约1000bp和约800bp的多态性片段,将这两个标记转化为稳定的特异性分子标记,分别命名为CINAU17-1086和CINAU18-723。运用这两对引物对一系列材料进行扩增,只有含6V染色体短臂的材料才能扩增出相应的特异条带,表明这两个标记均位于簇毛麦6VS上。进一步利用簇毛麦6VS缺失添加系、易位系将CINAU17-1086标记定位在簇毛麦6VSFL0.58与FL0.70之间,将CINAU18-723标记定位在簇毛麦6VSFL0.45与着丝粒之间。利用这两个特异标记对通过花粉辐射获得的部分簇毛麦6VS结构变异材料进行PCR鉴定,其结果与细胞学鉴定结果一致。CINAU17-1086和CINAU18-723标记可用来快速检测和追踪导入普通小麦背景中的簇毛麦6VS染色体片段,并对缺失系的断点进行了初步界定。

【英文摘要】The resistance gene of powdery mildew was introduced from Haynaldia villosa into common wheat (Triticum aestivum) and located on 6VS and designated as Pm21 . In order to precisely map and clone Pm21 , more molecular markers and chromosome structural variants need to be developed. RGA and STS markers, usually from expressed sequences, have proved to be very effective DNA markers. In order to development and application of molecular markers specific to chromosome 6VS of H . villosa, the DNA polymorphic analysiswas performed on common wheat Yangmai 5, H. villosa and whea-t H . villosa 6VSP6AL translocation lines with 11 RGA and 17 pairs of STS primers. Two polymorphic fragments, about 1 000 bp and 800 bp, were amplified by a RGA primer Pto kin4 and a pair of STS primer, and then were cloned and sequenced, respectively. Based on the cloning sequences, two pairs of specific markers, CINAU17-1086 and CINAU18-723, were developed, and used to amplify common wheat Chinese Spring, Yangmai 5, Yangmai 158, H . villosa and T . durum-H. villosa amphiploid, whea-t H. villosa alien addition lines (1V- 7V) , whea-t H. villosa 6VSP6AL translocation line 92R137. The results indicated that two markers, CINAU17-1086 and CINAU18-723, were located on chromosome 6VS because only the materials with 6VS chromosome could amplify the specific patterns. Furthermore, CINAU17-1086 was located between FL0. 58 and FL0. 70 and CINAU18-723 between FL0. 45 and centromere on chromosome 6VS by using 6VS deletion addition lines and translocation lines. The results obtained from these two markers were consistent with those from the cytogenetic ident ification to variant materials of chromosome 6VS obtained by radiating pollen. Therefore, CINAU17- 1086 and CINAU18-723 markers could be used to rapidly detect the correspondent chromosome segments of 6V in common wheat and primarily identify the breakage points of delet ion lines.

【题目】Mass production of intergeneric chromosomal translocation through pollen irradiation of Triticum durum-Haynaldia villosa amphiploid

【中文关键词】genomic in situ hybridization; intergeneric chromosomal translocation; mass production; pollen irradiation; Triticum durum-Haynaldia
villosa amphiploid.

【英文关键词】genomic in situ hybridization; intergeneric chromosomal translocation; mass production; pollen irradiation; Triticum durum-Haynaldia
villosa amphiploid.

【中文摘要】Haynaldia villosa possesses a lot of important agronomic traits and has been a powerful gene resource for wheatimprovement. However, only several wheat – H. villosa translocation lines have been reported so far. In this study, weattempted to develop an efficient method for inducing wheat – H. villosa chromosomal translocations. Triticum durum-Haynaldia villosa amphiploid pollen treated with 1 200 rad 60Co- γ -rays was pollinated to Triticum aestivum cv. ‘ ChineseSpring ’. Ninety-eight intergeneric translocated chromosomes between T. durum and H. villosa were detected by genomicin situ hybridization in 44 of 61M1 plants, indicating a translocation occurrence frequency of 72.1%; much higher than everreported. There were 26, 62 and 10 translocated chromosomes involving whole arm translocations, terminal translocations,and intercarlary translocations, respectively. Of the total 108 breakage-fusion events, 79 involved interstitial regions and29 involved centric regions. The ratio of small segment terminal translocations (W • W-V) was much higher than that oflarge segment terminal translocations (W-V • V). All of the M1 plants were self-sterile, and their backcross progeny wasall obtained with ‘ Chinese Spring ’ as pollen donors. Transmission analysis showed that most of the translocations weretransmittable. This study provides a new strategy for rapid mass production of wheat-alien chromosomal translocations,especially terminal translocations that will be more significant for wheat improvement.

【题目】普通小麦近缘物种黑麦1R、簇毛麦1V及鹅观草1Rk#1染色体特异分子标记的筛选

【中文关键词】染色体特异分子标记; 表达序列标签; 位点标签序列; 黑麦(Secale cereale); 簇毛麦(Haynaldia villosa); 鹅观草(Roegneria kamoji); 小麦(Triticum aestivum);

【英文关键词】Chromosome specific marker ; Expressed sequence tag (EST) ; Site tagged sequence (STS) ; Secale cereale ; Haynaldia villosa ; Roegneria kamoji ; Triticum aestivum

【中文摘要】为筛选普通小麦近缘物种黑麦1R、簇毛麦1V及鹅观草1Rk#1染色体特异分子标记,根据已定位于普通小麦第一部分同源群的EST序列设计104对STS引物,对中国春、鹅观草、黑麦及簇毛麦进行多态性分析。在104对STS引物中,有

53对在对照普通小麦中国春与鹅观草、黑麦及簇毛麦之间存在多态性。利用普通小麦-黑麦1R~7R二体异附加系筛选出5对黑麦1R染色体特异标记,分别是CINAU 19-500、CINAU20-950、CINAU21-1500、CINAU22-310和CINAU23-2000;利用普通小麦-簇毛麦1V~7V二体异附加系筛选出5对簇毛麦1V染色体特异标记,分别是CINAU23-1700、CINAU24-1050、CINAU25-1650、CINAU26-500和CINAU27-620;利用鹅观草二体异附加系DA1Rk#1、异代换系DS1Rk#1(1A)、端体系DA1Rk#1L、易位系T1Rk#1S.W、长臂缺失系Del1Rk#1L筛选出5对鹅观草1Rk#1特异标记,分别是CINAU27-960、CINAU28-1360、CINAU29-480、CINAU30-560和CINAU31-520。研究表明,可以利用普通小麦的EST序列设计PCR引物,转化成STS标记,筛选普通小麦近缘物种黑麦、簇毛麦及鹅观草等染色体特异的分子标记,快速检测和追踪导入普通小麦背景中的黑麦1R、簇毛麦1V及鹅观草1Rk#1染色体或染色体片段,为深入研究普通小麦远缘杂种材料提供新的工具。

【英文摘要】Many useful genes of wheat2relative species have been transferred to common wheat by chromosome addition , substituation and translocation and need to be identified. The comparative genomics shows obvious colinearity between wheat and its relative species.A lot of molecular makers have been developed and used to identify alien chromosomes , chromosome segments and genes. Wheat EST sequences are especially valuable as molecular markers because they are derived from gene transcripts and are more likely to be conserved among species. In the present study , in order to develop chromosome-specific markers for chromosome 1R of Secale cereale , 1V of Haynaldia villosa and 1Rk # 1 of Roegneria kamoji , 104 STS primers were designed based on EST sequences downloaded from Graingenes distributed on chromosome 1A , 1B , and 1D of Triticum aestivum using software primer 5.10. Out of them, fifty-three pairs of primers amplified polymorphic bands between T.aestivum " Chinese Spring (CS) " and S. cereale , H. villosa , and R. kamoji. Five STS markers , CINAU 19-500 , CINAU20-950 , CINAU21-1500 , CINAU22-310 and CINAU23-2000 amplified specific fragments from S.cereal , T. aestivum-S. cereale amphiploid and 1R addition line , but not from CS and 2R-7R addition lines , were specificto 1R of S. cereale. Five STS markers , CINAU23- 1700 , CINAU24-1050 , CINAU25- 1650 , CINAU26- 500 and CINAU27-620 were specific to 1V of H. villosa because they amplified corresponding patterns from H. villosa , T. durum-H. villosa amphiploid, and 1V addition , not from CS and 2V-7V addition lines. And five STS markers , CINAU27- 960 , CINAU28- 1360 , CINAU29- 480 , CINAU30-560 and CINAU31- 520 specific to 1Rk# 1 of R. kamoji were screened by amplifying specific fragments from R. kamoji , Wheat-R. kamoji DA1Rk # 1 and DS1Rk # 1 (1A) . Furthermore , markers CINAU272960 and CINAU29-480 were located on the short arm, CINAU28-1360 and CINAU31-520 on the long arm and CINAU30-560 close to the region of centremere of chromosome 1Rk# 1 , respectively1 This result indicated that STS markers derived from the EST of common wheat are useful for identifying corresponding specific chromosomes of wheat relatives.

【题目】一个花粉辐射诱导的小麦-簇毛麦相互易位染色体系的分子细胞遗传学研究

【中文关键词】普通小麦;簇毛麦;6V;相互易位;外源大片段易位;外源小片段易位;小片段插入易位;白粉病抗性

【英文关键词】Triticum aestivum ; Haynaldia villosa ; 6V; Reciprocal translocation ; Large alien segment translocation ; Small alien segment translocation ; Intercalary translocation ; Powdery mildew resistance

【中文摘要】利用60Co γ --射线处理小麦-簇毛麦6V单体添加系花粉,并给中国春授粉,在一个M1单株减数分裂中期Ⅰ检测到一个由2条小麦-簇毛麦易位染色体和一条完整小麦染色体构成的三价体,说明参与易位的2个小麦片段均来自同一条小麦染色体,推测两条易位染色体由相互易位产生。将其中涉及外源大片段的易位染色体称为外源大片段易位(largealien segment translocation,LAST),涉及外源小片段的称为外源小片段易位(small alien segment translocation,SAST)。对后代中两个易位染色体均纯合的植株(LAST〞+SAST〞,2n=44)进行顺次C-分带和GISH研究,结果表明外源大片段易位染色体为T7BS-6VS.6VL,外源小片段易位染色体为T6VS-7BS.7BL,易位断点分别位于7B染色体短臂约FL0.60处及6V染色体短臂约FL0.70处。在M2代群体中检测到7种染色体组成类型,比例为
3(LAST〞+SAST〞):20(LAST′+SAST′):2(LAST〞+SAST′):1(LAST′+SAST〞):1LAST′:2SAST′:22(0型),其中外源大片段和外源小片段易位染色体往往相伴出现。抗病鉴定结果显示抗白粉病基因位于外源大片段易位染色体T7BS-6VS.6VL上。对LAST′+SAST′型(2n=43)M2代单株花粉母细胞减数分裂的GISH研究结果显示,88.5%的后期Ⅰ或末期Ⅰ细胞中出现T6VS-7BS.7BL和T7BS-6VS.6VL的共分离。此外,在个别后期Ⅰ细胞中观察到外源大片段易位染色体T7BS-6VS.6VL发生落后和着丝粒断裂现象,并在LAST′型单株(2n=42)的自交后代中筛选到一个通过着丝粒断裂-融合产生的外

源小片段插入易位T7BL.6VS-7BS,这为利用外源大片段易位进一步创制携带抗病基因的小片段插入易位提供了新的思路。还分别获得了T7BS-6VS.6VL和T6VS-7BS.7BL的纯合易位系。 更多

【英文摘要】The short arm of Haynaldia villosa chromosome 6V confers Pm21 that conditions immunity from or high resistance to almost all known powdery mildew races. In the middle of the 1990s , Cytogenetic Institute , Nanjing Agricultural University (CINAU) has obtained the T6VS・6AL translocation line by which some wheat cultivars with high yield and powdery mildew resistance have been developed. However , this translocation obviously has a large amount of redundant alien genes. To develop terminal and Por intercalary translocations with as short as possible alien chromosomal segments conferring Pm21 is more important in wheat breeding. In addition , the more translocations with different breakpoint positions at the length of 6VS are , the higher resolution of physical mapping of Pm21 is. In this research , our objective is to induce new translocations involving H.villosa chromosome 6V through pollen irradiation. Pollen of Triticum aestivum-Haynaldia villosa 6V monosomic addition lines (2 n = 43) , treated with 1 000 rad 60Co- γ - rays , was pollinated to T. aestivum cv. ‘ Chinese Spring ’. Pollen mother cells (PMCs) of M1 plants at meiotic metaphase Ⅰ were used for GISH analysis. A trivalent observed was formed by two T. aestivum-H. villosa translocation chromosomes and a wheat chromosome in a M1 plant , indicating that the translocation chromosomes might be resulted from a reciprocal translocation event. The translocation involving the large alien segment was called ‘ large alien segment translocation ’ (LAST) while the translocation involving the small alien segment was called ‘ small alien segment translocation ’ (SAST) .Sequential C- banding and GISH technique were used to identify a homozygous M2 plant (LAST ″ + SAST ″ , 2 n = 44) . The results showed that the reciprocal translocation involved T. aestivum chromosome 7B and H1 villosa chromosome 6V with the translocation breakpoints at about FL0.60 of 7BS and about FL0.70 of 6VS , respectively. The LAST chromosome was identified as T7BS-6VS・6VL while the SAST chromosome was identified as T6VS-7BS・7BL. Seven chromosome constitution types were observed in the M2 population with the ratio of 3(LAST ″ + SAST ″) :20 (LAST ′ + SAST ′) :2 (LAST ″ + SAST ′) :1(LAST ′ + SAST ″) :1LAST ′ :2SAST ′ : 22 (none alien) 1 The LAST chromosome occurred accompanied by the SAST chromosome at most times. Resistance analysis showed that the plant with a single LAST chromosome was resistant to powdery mildew. Then , Pm21 was located at the proximal region of FL0170 of 6VS.Meiotic analysis of M2 plants with the genome of 20 ⅡW + Ⅰ7B + Ⅰ T7BS26VS・6VL + Ⅰ T6VS27BS・7BL (2 n = 43) showed that T7BS-6VS・6VL and T6VS-7BS・7BL co- segregated at meiotic anaphase Ⅰ or telophase Ⅰ in 88.5 % of PMCs. The LAST chromosome T7BS-6VS・6VL stayed late or centric-misdivided in several PMCs at anaphase Ⅰ. An intercalary translocation , T7BL・6VS-7BS , arising from the centric breakage2fusion of 7B and T7BS26VS・6VL , was then detected in a progeny of a plant with the genome of 20 ⅡW + Ⅰ7B + Ⅰ T7BS26VS・6VL . It provided a new strategy for inducing intercalary translocations with alien chromosomal segments conferring resistance genes. Homozygous T7BS-6VS16VL and T6VS-7BS・7BL translocation lines were obtained in M3 generation.

【题目】SSR and STS markers for wheat stripe rust resistance gene Yr26

【中文关键词】Wheat ・ STS ・ SSR ・ Stripe rust resistance ・ Marker-assisted selection
【英文关键词】Wheat ・ STS ・ SSR ・ Stripe rust resistance ・ Marker-assisted selection

【中文摘要】Stripe (yellow) rust, caused by Puccinia striiformis f. sp. tritici (Pst), is one of the most devastating wheat diseases worldwide. Triticum aestivum-Haynaldia villosa 6VS/6AL translocation lines carrying the Yr26 gene on chromosome 1B, are resistant to most races of Pst used in virulence tests. In order to better utilize Yr26 for wheat improvement, we attempted to screen SSR and EST-based STS markers closely linked with Yr26. A total of 500 F2plants and the F2:3 progenies derived from a cross between 92R137 and susceptible cultivar Yangmai 5were inoculated with race CYR32. The analysis con-firmed that stripe rust resistance was controlled by asingle dominant gene, Yr26. Among 35 pairs of genomic SSR markers and 81 pairs of STS marker sderived from EST sequences located on chromosome1B, Yr26 was flanked by 5 SSR and 7 STS markers. The markers were mapped in deletion bins using CS aneuploid and deletion lines. The closest flanking marker loci, Xwe173 and Xbarc181, mapped in 1BLand the genetic distances from

Yr26 were 1.4 cM and6.7 cM, respectively. Some of these markers werepreviously reported on 1BS. Eight common wheat cultivars and lines developed from the T. aestivum-H.villosa 6VS/6AL translocation lines by different research groups were tested for presence of the markers .Five lines with Yr26 carried the flanking markers whereas three lines without Yr26 did not. The results indicated that the flanking markers should be useful in marker-assisted selection for incorporating Yr26 into wheat cultivars.

【题目】Inducement of chromosome translocation with small alien segments by irradiating mature female gametes of the whole arm translocation line

【中文关键词】irradiation, mature female gametes, small fragment translocation chromosome, wheat, Haynaldia villosa, genomic in situ hybridization
【英文关键词】irradiation, mature female gametes, small fragment translocation chromosome, wheat, Haynaldia villosa, genomic in situ hybridization

【中文摘要】Haynaldia villosa Schur. (syn. Dasypyrum villosum Candargy, 2n=14, VV) has been proved to be an important genetic resource for wheat improvement. The development of translocation with small alien chromosome segments, especially interstitial translocation, will be helpful for better utilization of its useful genes. Up to now, most of the reported Triticum aestivum – H. villosa translocation lines are involved in a whole arm or large alien fragments. In this paper, we report a highly efficient approach for the creation of small chromosome segment translocation lines. Before flowering, the female gametes of wheat-H. villosa 6VS/6AL translocation line were irradiated by 60CO- γ ray at 160 Rad/M dosage rate and three dosages (1600, 1920, 2240 Rad). Anthers were removed from the irradiated florets on the sameday and the florets were pollinated with normal fresh pollens of T. aestivum cv. Chinese Spring after 2-3 days. Genomic in situ hybridization (GISH) at mitosis metaphase of root-tip cell of M1 plants was used to detect the chromosome structural changes involving 6VS of H. villosa. Among the 534 M1 plants screened, 97 plants contained small segment chromosome structural changes of 6VS, including 80interstitial translocation chromosomes, 57 terminal translocation chromosomes and 55 deletion chromosomes. For the 2240 Rad dosage treatment, the inducement frequencies of interstitial translocation, terminal translocation and deletion were 21.02%, 14.01%, and 14.65%, respectively, which were much higher than those previously reported. The M2 seeds were obtained by backcrossing of 74 M1 plants involving 146 chromosomes structural changes of 6VS, and it was found that the structural aberrations in the M1 plants could be transmitted to their progenies. Irradiating mature female gametes of whole arm translocation is a new and highly efficient approach for creation of small segment chromosome structural changes, especially for interstitial translocations.

【题目】小麦抗赤霉病、优质高分子量麦谷蛋白亚基聚合体的分子标记辅助选育
【中文关键词】小麦; 赤霉病; 高分子量麦谷蛋白亚基; 聚合体; 分子标记;
【英文关键词】Fusarium Head Blight; Quality ; Pyramided traits; Molecular marker
【中文摘要】为了创制小麦抗病、优质育种的重要中间材料,加速丰产、优质、综合抗逆性好的小麦新品种选育进程,以抗赤霉病小麦品种苏麦3号和优质面包小麦安农94212、扬麦158等为亲本配置杂交组合,利用覆盖苏麦3号抗赤霉病主效QTL(Qfhs.ndsu-3BS)的4个SSR标记和优质高分子量麦谷蛋白亚基5+10特异分子标记在杂交F3代进行标记辅助选择,F4代选育到纯合的含有Qfhs.ndsu-3BS和5+10亚基的聚合体2个(J3316-8和J3316-10)。经田间赤霉病抗性鉴定,J3316-8自交后代的8个株系赤霉病抗性表现优于苏麦3号,J3316-10自交后代的2个株系赤霉病抗性与苏麦3号相当。两个聚合体农艺性状比苏麦3号有明显的改良,加之它们含有优质面包小麦高分子量麦谷蛋白亚基,因此可以作为小麦抗病和优质育种的中间材料。本研究结果进一步证明,将现代分子标记技术与传统育种方法相结合可以大大提高育种效率。
【英文摘要】Wheat scab is a destructive disease of wheat . The incoordinate of high yield, goo d quality and high resistance has been the main problem in w heat breeding for scab resistance. The purpose of this research is to develop parental materials and accelerate the process for breeding new varieties with high yield, good quality and high resistance. T he scab resistant w heat variety Sumai 3 w as crossed to Annong 94212 o r Yangmai 158, w hich are good for bread-making quality. Four simple sequence repeat s (SSR) markers flanking the major Q TL (Qfhs. ndsu-3BS) from Sumai 3 and two specific markers for high molecular weight (HMW) glutein subunit 1Dx 5+ 1Dy 10 w ere used for marker assisted selection (MAS) . Two pyramided lines with both homozygous Qfhs. dsu-3BS and 1Dx 5+ 1Dy10 were identified. Field identification o f scab resistance indicated that 8 pro genies o f line J3316-8 showed better scab resistance than Sumai 3, and 2 progenies of line J3316-10 showed similar scab resistance as Sumai 3. These lines also showed improved agronomic trait s than Sumai 3 and contain the good breadmaking HMW-GS, 1Dx5+ 1Dy10 , hence could be good parental materials for w heat breeding. These result s further proved that the combination o f MAS and traditional breeding methods would greatly enhance the breeding efficiency.

【题目】Structural changes of 2V chromosome of Haynaldia villosa induced by gametocidal chromosome 3C of Aegilops triuncialis.
【中文关键词】Triticum aestivum; Haynaldia villosa; gametocidal chromosome 3C; chromosome aberration; C-banding; genomic in situ hybridization; molecular marker
【英文关键词】Triticum aestivum; Haynaldia villosa; gametocidal chromosome 3C; chromosome aberration; C-banding; genomic in situ hybridization; molecular marker
【中文摘要】Haynaldia villosa (2n = 2X = 14, VV), a relative of wheat, plays important roles in wheat improvement mainly owing to itsdisease resistance. Powdery mildew resistance gene Pm21 has been successfully transferred into wheat by CytogeneticInstitute, Nanjing Agricultural University, China, and is widely used in the current wheat breeding programs. In thisresearch, our objective is to further transfer and utilize the beneficial genes such as eye-spot resistance, yellow rustresistance, and gene of the tufted bristles on the glume ridge (a remarkable morphology) mapped on 2V of Haynaldiavillosa. A disomic addition line with gametocidal chromosome 3C of Aegilops triuncialis added in Norin-26 was crossedto the wheat-H. villosa disomic substitution 2V(2D) and the hybrid F1 was then self-crossed. Chromosome C-banding,genomic in situ hybridization (GISH), and meiotic analysis in combination with molecular markers were applied to detectthe chromosome variations derived from hybrids F2 and F3. To date, four translocations including one small segmentaltranslocation T6BS · 6BL-2VS, two whole arm translocations (preliminarily designed as T3DS · 2VL and T2VS · 7DL) and oneintercalary translocation T2VS · 2VL-W-2VL, one deletion Del. 2VS · 2VL-, one monotelosomic Mt2VS, and one iso-chromosome 2VS · 2VS line have been developed and characterized. One wheat SSR marker Xwmc25-120 tagging 2VS andone wheat STS marker NAU/STSBCD135-1 (2BL) tagging 2VL were successfully used to confirm the alien chromosomesegments involved in the seven lines. The tufted bristles on the glume ridge appeared in lines T2VS · 7DL, Mt2VS,2VS · 2VS as well as the parent DS2V(2D), whereas in T3DS · 2VL, this trait did not appear. The gene controlling the tuftedbristles was located on 2VS. Gametocidal chromosome 3C of Aegilops triuncialis could successfully induce chromosome2V structural changes.

【题目】STS markers for powdery mildew resistance gene Pm6 in wheat
【中文关键词】Marker assisted selection
【英文关键词】Marker assisted selection
MAS Powdery mildew Sequence Tagged Site
STS Triticum aestivum Triticum timopheevii

【中文摘要】The powdery mildew resistance genePm6, transferred to common wheat from the tetraploid Triticum timopheevii, is effective in most epidemic areas for powdery mildew in China. RFLP probe BCD135 was previously associated with Pm6.In the present research, four STS primers (NAU/STSBCD135-1, NAU/STSBCD135-2, STS003 andSTS004) were designed from the sequence data ofBCD135. These primers were used for PCR amplification using the genomic DNA of resistant near-isogenic lines with Pm6 and their recurrent parent, cv. Prins. No polymorphic product was observed using primers STS003 and STS004; however, primersNAU/STSBCD135-1 and NAU/STSBCD135-2 amplified two and one bands, respectively, polymorphic between the resistant near-isogenic-lines and Prins. The two primers were then used to amplify the F2population from the cross IGV1-465 (FAO163b/7*Prins) • Prins. The amplification and the powdery mildew resistance identification data were analyzed using the software Mapmaker 3.0. The results indicated that both NAU/STSBCD135-1 and NAU/STSBCD135-2 were closely linked to Pm6 with a genetic distance of 0.8 cM. A total of 175 commercial varieties without Pm6 from different ecological areas of China were tested using marker NAU/STSBCD135-2and none of them amplified the 230 bp-specific band. This marker thus has high practicability and can be used in MAS of Pm6 in wheat breeding programs for powdery mildew resistance.

【题目】Development of Triticum aestivum - Leymus racemosus ditelosomic substitution line7Lr#1S (7A) with resistance to wheat scab and its meiotic behavior analysis

【中文关键词】Triticum aestivum, Leymus racemosus, telosomic substitution line, meiotic behavior analysis, scab resistance

【英文关键词】Triticum aestivum, Leymus racemosus, telosomic substitution line, meiotic behavior analysis, scab resistance

【中文摘要】Leymus racemosus is highly resistant to wheat scab (Fusarum head bright). The transfer of scab resistant gene from L. racemosus to Triticum aestivum is of great significance for broadening the base of wheat resistance. In the present study, the pollen of T. aestivum-L. racemosus monosomic addition line with scab resistance was treated by irradiation with 1200 R 60Co- γ -rays prior to pollinating to emasculated wheat cv. Mianyang 85-45. Nine plants with a telocentric chromosome 7Lr#1S were observed in M1, and one ditelosomic substitution line 7Lr#1S was selected from selfcrossing progenies and confirmed by chromosome C-banding and GISH. Furthermore, a co-dominant EST-SSR marker CINAU 31 was employed to identify this substitution line. A pair of chromosome 7A of common wheat were found to be replaced by a pair of telocentric chromosome 7Lr#1S, and further investigation showed that chromosome configuration of the substitution line at MI of PMCs after GISH was 17.50 II W + 2.19 II W + 0.42 II 7Lr#1S + 1.08 I7Lr#1S + 0.69 IW. Two telocentric chromosomes paired as a bivalent in 59.7% of PMCs. Abnormal chromosome behaviors of telocentric chromosomes were observed in part of PMCs at anaphase I and telophase I, including the moving of two telocentric chromosomes to the same pole, lagging and earlier separation of their sister chromatid. All these abnormal behaviors can be grouped into three distinct types of tetrads according to different numbers of 7Lr#1S in their daughter cells and various micronucleus in some tetrads. However, due to the high transmission frequency of the female and male gametes with a 7Lr#1S, 84% of the selfcrossing progeny plants had ditelosomic substitution. The substitution line showed high resistance to wheat scab in a successive two-year test

both in the greenhouse and field; hence, the line will be particularly valuable for alien gene mapping, small fragment translocation induction and telosomic cytological behavior analysis.

【题目】Characterization of T.aestivum - H.caifornicum chromosome addition lines DA2H and MA5H

【中文关键词】wheat; Hordeum californicum; alien addition lines; powdery mildew; sequential C-banding/FISH; sequence-tag-sites (STS)

【英文关键词】wheat; Hordeum californicum; alien addition lines; powdery mildew; sequential C-banding/FISH; sequence-tag-sites (STS)

【中文摘要】In order to transfer useful genes of Hordeum californicum into common wheat (Triticum aestivum L.), the T. aestivum c.v. Chinese Spring (CS)-H. californicum amphiploid was crossed to CS, and its backcrossing and self-fertilized progenies were analyzed by morphological observation, cytological, biochemical and molecular marker techniques. Alien addition lines with two H. californicum chromosomes were identified and their genetic constitution was characterized. STS-PCR analysis using chromosome 2B specific markers indicated that chromosome H3 of H. californicum belongs to homoeologous group 2, and was thus designated 2H. SDS-PAGE showed that chromosome H2 of H. californicum belongs to homoeologous group 5, and was designated 5H. The CS-H. californicum amphiploid and the chromosome addition lines (DA2H and MA5H) identified were evaluated for powdery mildew (Erysiphe graminis f. sp. triticii) resistance in field. The preliminary results indicated that the amphiploid showed higher powdery mildew resistance than CS. However, chromosome addition lines DA2H and MA5H were highly susceptible to powdery mildew, indicating that major powdery mildew resistant genes of H. californicum should be located on chromosomes other than 2H and 5H.

【中文摘要】随机选取定位于小麦和大麦7个部分同源群上的135对EST、27对STS和253对SSR引物对24个可能的普通小麦-纤毛鹅观草二体异附加系的基因组DNA进行扩增。结果表明,55对引物在亲本普通小麦中国春、Inayama Komugi、纤毛鹅观草和Inayama Komugi-纤毛鹅观草双二倍体间有多态性扩增,其中31对引物可以在异附加系中扩增到纤毛鹅观草特异条带。根据PCR扩增结果,异附加系07K02、07K06、07K39、07K201、07K202、07K255和07K256所添加的纤毛鹅观草染色体归属小麦第1部分同源群;07K07、07K08、07K09、07K11、07K14和07K17所添加的纤毛鹅观草染色体归属小麦第2部分同源群;07K15、07K16、07K21和07K47所添加的纤毛鹅观草染色体归属小麦第6部分同源群。
【英文摘要】A total of 135 EST, 27 STS, and 253 SSR primer pairs located in 7 homoeologous groups of wheat and barly were used for amplification of 24 possible Wheat-R. ciliaris disomic addition lines. Fifty-five primer pairs could amplified polymorphic bands between common wheat variety “ Inayama Komugi ” and the Inayama Komugi- R. ciliaris amphiploid, and 31 of the 55 could amplify the specific bands of R. ciliaris in the addition lines. According to the PCR (polymerase Chain Reaction) results, the added R. ciliaris chromosomes in lines 07K02, 07K06, 07K39, 07K201, 07K202, 07K255, and 07K256 belong to homoeologous group 1 of wheat; the added R. ciliaris chromosomes in lines 07K07, 07K08, 07K09, 07K11, 07K14, and 07K17 belong to homoeologous group 2 of wheat; the added R. ciliaris chromosomes in lines 07K15, 07K16, 07K21, and 07K47 belong to homoeologous group 6 of wheat.

【题目】DNA分子原位杂交(in situ hybridization)在植物分子细胞遗传学研究中的应用
【中文关键词】FISH; GISH; ISH; 分子细胞遗传学; 植物
【英文关键词】FISH, GISH, ISH, molecular cytogenetics, plant
【中文摘要】DNA分子原位杂交(in situ hybridization,ISH)是植物分子细胞遗传学研究的重要工具。简要回顾了DNA分子原位杂交的起源和发展,详细综述了基因组原位杂交(genomic in situ hybridization,GISH)在植物细胞遗传学研究中的应用以及荧光原位杂交(Fluorescence in situ hybridization,FISH)在植物物理作图和染色体识别中的应用。还介绍了Fiber-FISH、BAC-FISH以及Immuno-FISH等新兴技术,最后对FISH技术进行了展望。
【英文摘要】In situ hybridization is one of the most important techniques in plant molecular cytogenetics research. In this paper, we briefly introduced the origin and development of in situ hybridization, firstly. Then, application of genomic in situ hybridization (GISH) in plant cytogenetics research as well as fluorescence in situ hybridization (FISH) in plant physical mapping and chromosome identification were detailed reviewed. Some new techniques such as fiber-FISH, BAC-FISH, and immuno-FISH were also introduced in this paper. And a prospect about FISH was given out.

【题目】基于EST-PCR的簇毛麦染色体特异分子标记筛选及应用
【中文关键词】小麦; 簇毛麦; EST-STS标记; 小麦-簇毛麦异染色体系; 小麦-簇毛麦易位染色体;
【英文关键词】Wheat; Haynaldia villosa; EST-STS marker; Wheat-H. villosa alien chromosome line; Wheat-H. villosa translocation chromosome
【中文摘要】为定位、转移和利用簇毛麦有益基因,通过花粉辐射,获得一批包括小麦-簇毛麦易位染色体的异染色体系。为了鉴定这批材料中的簇毛麦染色体身份,根据水稻、小麦的EST序列合成了240对STS引物,其中34对引物在普通小麦中国春与簇毛麦间存在多态性;进一步对亲本及簇毛麦二体异附加系进行PCR扩增分析,标记CINAU32-300可追踪簇毛麦1V染色体,标记CINAU33-280、CINAU34-510、CINAU35-1100、CINAU36-380和CINAU37-400可追踪簇毛麦2V染色体,标记CINAU38-250可追踪簇毛麦3V染色体,标记CINAU39-950和CINAU40-800可追踪簇毛麦4V染色体,标记CINAU41-745和CINAU42-1050可追踪簇毛麦5V染色体,标记CINAU44-765和CINAU45-495可追踪簇毛麦7V染色体。加上本室已开发的2个6V染色体特异标记,用这些簇毛麦特异分子标记鉴定辐射诱导材料的部分回交后代,选育出小麦背景中只包含单条簇毛麦染色体的整套1V至7V染色体系,同时有18条易位染色体的簇毛麦身份得到确定,表明这些标记可以用来快速检测普通小麦背景中的簇毛麦染色体或染色体片段。
【英文摘要】To localize, transfer, and use interested genes of Haynaldia villosa, a series of wheat-H. villosa alien chromosome lines including translocation lines induced by irradiation have been developed. To identify H. villosa chromosomes or chromosome segments in these materials, 240 STS primer pairs were designed based on EST sequences of rice and wheat, and 34 of them could amplify specific polymorphic bands between common wheat cv. Chinese Spring and H. villosa. These 34 STS primer pairs were further used for screening markers specific to individual chromosomes of H. villosa using 1V to 7V disomic additional lines and their parents. The results showed that the marker CINAU32-300 could be used to trace chromosome 1V, CINAU33-280, CINAU34-510, CINAU35-1100, CINAU36-380 and CINAU37-400 to 2V, CINAU38-250 to 3V, CINAU39-950 and CINAU40-800 to 4V, CINAU41-745 and CINAU42-1050 to 5V, CINAU44-765 and CINAU45-495 to 7V. These EST-STS markers combined with the two 6V specific markers previously in our institute were used to identify the H. villosa chromosome and chromosome segments of backcrossed generations derived from pollen irradiation. A set of 1V to 7V addition lines and 18 translocation chromosomes involved in different H. villosa chromosomes were identified. Therefore, these chromosome-specific EST-STS markers could be used to detect chromosomes and chromosome segments of H. villosa in common wheat background.

【题目】Induction and transmission of wheat-Haynaldia villosa chromosomal
【中文关键词】Triticum durum-Haynaldia villosa amphiploid; pollen irradiation; chromosomal translocation; translocation transmission; genomic in situ hybridization
【英文关键词】Triticum durum-Haynaldia villosa amphiploid; pollen irradiation; chromosomal translocation; translocation transmission; genomic in situ hybridization
【中文摘要】In order to develop more wheat-Haynaldia villosa translocations involving different chromosomes and chromosome segments of H.villosa, T. durum-H. villosa amphiploid was irradiated with 60Co r-rays at doses of 800, 1,200, and 1,600 rad. Pollen collected from the spikes 1, 2, and 3 days after irradiation were transferred to emasculated spikes of the common wheat cv. ‘ Chinese Spring ’. Genomic in situ hybridization was used to identify wheat-H. villosa chromosome translocations in the M1 generation.

Transmission of the identified translocation chromosomes was analyzed in the BC1, BC2, and BC3 generations. The results indicated that all three irradiation doses were highly efficient for inducing wheat-alien translocations without affecting the viability of the M1 seeds. Within the range of 800 – 1,600 rad, both the efficiency of translocation induction and the frequency of interstitial chromosome breakage-fusion increased as the irradiation dosage increased. A higher translocation induction frequency was observed using pollen collected from the spikes 1 day after irradiation over that of 2 or 3 days after irradiation. More than 70% of the translocations detected in the M1 generation were transmitted to the BC1 through the female gametes. All translocations recovered in the BC1 generation were recovered in the following BC2, and BC3 generations. The transmission ability of different translocation types in different genetic backgrounds showed an order of ‘whole-arm translocation > small alien segment translocation > large alien segment translocation’, through either male or female gametes. In general, the transmission ability through the female gametes was higher than that through the male gametes. By this approach, 14 translocation lines that involved different H. villosa chromosomes have been identified in the BC3 using EST-STS markers, and eight of them were homozygous.

【题目】Characterization of a PDR type ABC transporter genefrom wheat (Triticum aestivum L.)

【中文关键词】wheat, deoxynivalenol (DON), ABC transporter, PDR (pleiotropic drug resistance)
【英文关键词】wheat, deoxynivalenol (DON), ABC transporter, PDR (pleiotropic drug resistance)

【中文摘要】DON, as a virulence factor, plays an important role in the infection of Fusarium graminearum in wheat. The infection ability of F. graminearum depends on its capacity of producing DON. The production of DON by F. graminearum is significantly decreased in the wheat varieties with scab resistance. In this study, GeneChip analysis indicated that an EST encoding an ATP-binding cassette (ABC) transporter was up-regulated by 45 times in a wheat landrace Wangshuibai, which is resistant to DON accumulation. A pair of EST-derived primers were designed based on the EST sequence, and a clone was then isolated from a wheat genomic DNA TAC library. The TAC clone was sequenced using chromosome walking and gene prediction was conducted using Softberry. A cDNA clone of this gene was subsequently isolated from Wangshuibai induced by DON using gene-specific primers designed according to the untranslated sequence of the gene. The genome size of the gene is 7377 bp, consisting of 19 exons with coding sequences of 4308 bp. It encodes a protein with 1435 amino acid residues and the calculated molecular weight is about 161 kD. BLAST analysis indicated that the gene may belong to pleiotropic drug resistance (PDR) sub-family, and hence designated as TaPDR1 (Triticum aestivum pleiotropic drug resistance). TaPDR1 was located on chromosome 5A of wheat using nullisomic-tetrasomic lines of Chinese Spring. TaPDR1 was up-regulated by induction of both DON and F. graminearum. Expression patterns of TaPDR1 were different in wild-type Wangshuibai and the fast-neutron induced Wangshuibai mutant lacking FHB1, a major QTL of FHB resistance and DON resistance in chromosome

arm 3BS. These results suggested that TaPDR1 might be a candidate gene responsible for DON accumulation resistance. The expression profile showed that TaPDR1 expression was neither induced by hormones typically involved in biotic stress, such as JA and SA, nor by abiotic stresses, such as heat, cold, wounding and NaCl. However, TaPDR1 expression was regulated by Al3+ and [Ca2+], indicating that [Ca2+]i might mediate the signal of TaPDR1 expression.

【英文摘要】DON, as a virulence factor, plays an important role in the infection of Fusarium graminearum in wheat. The infection ability of F. graminearum depends on its capacity of producing DON. 【题目】不同品质类型小麦戊聚糖含量及其与品质的关系

【中文关键词】普通小麦; 密穗小麦; 戊聚糖; 品质; 饼干;

【英文关键词】Triticum aestivum ; Triticum compactum ; Quality ; Pentosans ; Biscuit

【中文摘要】为给小麦品质的遗传改良提供依据,选用不同品质类型的7个小麦推广品种和1个密穗小麦,研究了戊聚糖含量及其与品质的关系。结果发现,中强筋小麦品种具有比弱筋小麦品种更高的戊聚糖含量,且不同筋力的推广品种戊聚糖含量表现出较大差异。弱筋小麦的水溶性戊聚糖含量与延展性、饼干直径呈极显著和显著负相关;非水溶性戊聚糖、总戊聚糖与饼干直径亦呈极显著负相关;与吹泡示功仪参数、RVA参数也具有较为丰富的相关性。本研究进一步证实宁麦9号和扬麦13具有良好的饼干品质。密穗小麦具有较低的戊聚糖含量,同时其饼干直径、厚度、直径/厚度均与弱筋小麦品种相近,可能是一个优良的弱筋、低戊聚糖含量的饼干小麦资源。

【英文摘要】The objective of this paper is to establish t he basis for wheat improvement of quality traits. Seven wheat varieties and an accession of Triticum compactum were used to elucidate t he relationship between pentosens content s and t heir end-use qualities. The pentosans content s were different among these cultivars , wit h higher pentosans content in high-gluten wheat varieties than that in t he low-gluten varieties. In low-gluten varieties, an inverse correlation between t he content of water-soluble pentosan and t he ductility and t he biscuit diameter was observed. The water-insoluble pentosan and the total pentosans content also showed a remarkable inverse correlation wit h t he biscuit diameter besides a higher relevance with Alveograph parameters and the RVA parameter s. This research also confirmed t hat Ningmai 9 and Yangmai 13 had good biscuit2making quality. In addition , t he biscuit diameter , thickness , diameter/ thickness of T. com p act um was similar as t hose of Ningmai 9 and Yangmai 13 , while T. com p act um had lower pentosan content and higher protein content . Thus, t he T. com p act um could be a new resource for high protein content and biscuit making quality.

【题目】不同基因型大豆GS1基因的克隆与分析
【中文关键词】大豆; GS1基因; 克隆;
【英文关键词】soybean; GS1 genes; clone;
【中文摘要】克隆了6个不同基因型大豆的GS1基因,序列比对分析结果表明,不同基因型大豆的GS1基因序列相似性较高。不同基因型大豆GS1基因序列间仍存在显著的差异,主要集中在非编码区。GS1基因分子进化树显示东农42、半野生大豆基因序列进化距离较近。不同基因型大豆GS1蛋白质序列具有很高的相似性,并且都具有两个保守的结构域、催化结构域(Gln-synt_N)和结合结构域(Gln-synt_C),说明它们都具有催化功能。GS1蛋白质序列的分子进化树显示东农46和东农42 GS1蛋白质序列进化距离较近,垦丰9和黑农35 GS1蛋白质序列进化距离较近。克隆了东农42 GS1基因的基因组序列,NetGene2软件、DNAMan软件的Dot metrix功能和NCBI在线spidey软件预测和分析结果表明,该基因具有12个外显子和11个内含子,外显子侧翼序列都符合GT、AG规则。
【英文摘要】GS1 genes from six different soybean varieties were cloned.The compare analysis of gene sequence showed that: sequence of GS1 genes from different soybean varieties were very identical.GS1 gene sequence from different soybean varieties still existed distinct difference which site mostly in non-coding region.Molecular evolutionary tree showed that evolution distance of GS1 genes sequence from DN42 and G.gracili were relatively near,they all had two conserved domains,catalyse domain(Gln-synt_N)and combine domain(Gln-synt_C),and showed that they all had function of catalyse.Molecular evolution tree showed that evolution distance of GS1 protein sequence of DN42 and DN46 was near,KF9 and HN35 was near.GS1 genome sequence of DN42 was cloned.The forecast result through NetGene2 software,Dot metrix function of DNAMan software and NCBI online spidey software showed that this gene had 12 exons and 11 introns,the flank sequence of exon were all accord with GT,AG rule.

【题目】Antifungal activity and mechanism of fengycin and surfactin from Bacillus subtilis fmbJ against Rhizopus stolonifer,
【中文关键词】略
【英文关键词】Rhizopus stolonifer, lipopeptide, antifungal activity, mechanism, fengycin, commercial surfactin
【中文摘要】略
【英文摘要】The antifungal activity and mech anism of fengycin in the presence and absence of commercial surfactin against Rhizopus stolonifer were investigated. The MIC (minimal inhibitory concentration) o f fengycin with-out commercial surfactin added was 0.4 mg/ml while the MIC of fengycin with commercial surfactin added was 2.0 mg/ml. Fengycin acted on cell membrane and cellular org ans and inhibited DNA synthesis. The antifungal effect of fengycin was reduced after commercial surf actin was added. All these results suggest that the fungal cell membrane may be the primary target of fengycin action and commercial surfactin may reduce the antifungal activity of fengycin

【题目】大豆对大豆疫霉根腐病抗性的遗传分析
【中文关键词】大豆;疫霉根腐病;遗传
【英文关键词】soybean; phytophthora root rot; inheritance
【中文摘要】摘要:【目的】研究大豆对大豆疫霉根腐病完全抗性和部分抗性两种抗性的遗传方式。【方法】利用不同抗性类型的品种(系)配置4个杂交组合,在分别采用下胚轴伤口接种法和根部接种法接种大豆疫霉菌株PNJ1条件下,研究两种抗性的遗传模式。【结果】豫豆25和郑92116对大豆疫霉菌的抗性由一对显性单基因控制,General和 Conrad对大豆疫霉菌的部分抗性由1对加性主基因+加性-显性多基因控制,F2 代主基因和多基因遗传率分别为41.31%~74.84%和15.60%~50.36%,F2:3 代主基因和多基因遗传率分别为54.21%~77.05%和13.52%~38.24%。大豆对疫霉根腐病完全抗性和部分抗性分别属于不同的遗传体系。【结论】两类抗性都有育种价值,并且在早世代选择是有效的。选育聚合有完全抗性和部分抗性的品种是使大豆获得疫霉根腐病高水平抗性和持久抗性的最佳途径。
【英文摘要】Abstract: 【Objective 】 The objective of this study was to reveal the mechanisms of resistance to Phytophthora sojae in soybean [Glycine max (L.) Merr]. 【Method】 Four crosses between materials with complete or partial resistance were used to reveal the inheritance of resistance using the hypocotyl s inoculation or root inoculation technique. 【Result】 The complete resistance in soybean cultivars (lines) Yudou25 and Zheng92116 was controlled by a single dominant gene (Rps), while the partial resistance in General and Conrad by one additive major gene plus additive- dominant polygene. The heritability values of resistance in development were about 90%, those of major and polygene were 41.31%-74.84% and 15.60%-50.36% in F2, and 54.21%-77.05% and 13.52%-38.24% in F2:3, respectively. The complete resistance and partial resistance were controlled by different genetic systems.【 Conclusion】 Both kinds of resistance can be used in soybean improveme nt, and it would be effective to conduct selection in early generations for high resistance in breeding, combining partial resistance with specific Rps genes to provide long term management of Phytophthora root rot as well as to avoid the boom-and-bust cycle of single gene deployment.

【题目】Preservative effect of the antimicrobial substance from Bacillus subtilis fmbJ on pasteurized milk during storage
【中文关键词】略
【英文关键词】Bacillus subtilis fmbJ, pasteurised milk, inhibition, preservation
【中文摘要】略
【英文摘要】Bacillus subtilis fmbJ was found to produce an antimicrobial substance, which exhibited inhibitory activ-ity against food spoilage microbes and pathogens. The inhibitory effect of the antimicrobial extracts ontwo Gram-positive bacteria, seven Gram-negative bacteria and five moulds had been identified. Pas-teurised milk samples with different concentrations of the antimicrobial substance ranging from 0 to2 mg/mL were stored at 4 ° C and 20 ° C. The preservative effect of the antimicrobial substance on pas-teurised milk was evaluated. The result indicated that 0.25 – 2.0 mg antimicrobial substance per mL can reduce significantly mesophilic bacteria in milk by 1 – 4 log units at 20 ° C, and 1 – 5 log units at 4 ° C after 15 days storage compared with control milk. Under the same experimental conditions, sensory quality of pasteurised milk with added 0.25 – 2 mg antimicrobial substance per mL could remain acceptable for 6 – 15 days at 20 ° C and 9 – 15 days at 4 ° C.

【题目】广适应大豆品种中黄13的光周期反应
【中文关键词】大豆 中黄13 广适应性 光周期反应
【英文关键词】Soybean Zhonghuang 13 Adaptability Photoperiod response
【中文摘要】中黄13是我国目前种植面积最大的大豆品种,适宜推广范围覆盖黄淮海流域夏大豆区、北方春大豆区、南部和南方多作大豆区部分区域,表现出较强的适应能力。为分析中黄13广适应的机制,在不同光周期条件下研究中黄13开花期、成熟期等生育期性状,株高、节数、分枝数等农艺性状和蛋白质含量、脂肪含量等品质性状对光周期的反应,比较中黄13不同性状间以及中黄13与成熟期相近的品种中黄24和凤交66—12间光周期反应敏感性的差异,并分析中黄13在各级区域试验中的产量稳定性,以期为中黄13的进一步推广和广适应大豆新品种选育提供理论依据。结果表明:中黄13在短日照(12h)、长日照(16h)和北京自然光照条件下均能正常开花结实,生育期性状的光周期反应敏感性弱于中黄24和凤交66—12。随光照长度的增加,中黄13的株型和农艺性状变化较为明显,但与中黄24和凤交66—12相比,其株高、主茎节数、分枝数、顶端花序荚数、单株有效荚数、单株粒数和单株粒重等性状的光周期反应敏感性均较弱,表现出较好的稳定性,但其蛋白质含量受光周期影响较大。综合分析光照处理和区域试验的结果,认为光周期反应相对钝感是中黄13广适应的重要原因。
【英文摘要】Zhonghuang 13. is the most widely-grown soybean varieties in China in recent years. It adapted to grow in the broad area of Yellow and Huaihe River Valleys, the southern part of North Spring Soybean Planting Area, and some part of South Multi-Planting Soybean Area in this country. In order to analyze the mechanism of its adaptability to changing environments ,the plants were treated with 12 h short-days (SD) , 16 h long-days (LD)and natural photoperiod treatments respectively, the experiments were conducted to study the photoperiodic responses of Zhonghuang 13 in growth period traits, agronomic traits and quality traits under different photoperiod conditions. Comparisons of photoperiod sensitivity were also made between the different traits of Zhonghuang 13 and between Zhonghuang 13 and other two varieties, Zhonghuang 24 and Fengjiao 66-12, with similar maturity;the performances of Zhonghuang 13 in different provincial uniform tests were analyzed as well. Zhonghuang 13 could bloom and mature normally under short-day (12 h), long-day (16 h), and natural photoperiod treatments. Photoperiod sensitivity of its growth period traits was weaker than that of Zhonghuang 24 and Fengjiao 66- 12. With increase of day length, the plant type and agronomic traits of Zhonghuang 13 changed significantly. However, the photo- period responses of the traits like plant height, node number on main stem, branch number, pod number on terminal raceme, seed number and seed weight per plant in Zhonghuang 13 were weaker than those of Zhonghuang 24 and Fengjiao 66-12, but its protein content was more sensitive to photoperiod than that in the other two varieties. From the above results,it was drawn that the less photoperiod sensitivity was the major reason for Zhonghuang 13 to adapt to wide areas.

【题目】诱导多能干细胞 (iPS) 的诱导培养与鉴定
【中文关键词】关键词: 诱导多能干细胞,转录因子,细胞重编程,诱导,胚胎干细胞
【英文关键词】Keywords: iPS, transcription factor, reprogramming, induction, embryonic stem cell
【中文摘要】摘 要: 通过外源转录调控因子的诱导,使成体细胞重编程为胚胎干细胞 (ES 细胞) 样的多能细胞,这种细胞称为诱导多能干细胞 (iPS 细胞),这一方法被称为iPS 技术。目前,iPS 技术已先后在小鼠、人、猕猴、大鼠和猪中成功应用,建立了相应的iPS 细胞系,并获得了iPS 细胞嵌合小鼠和四倍体克隆小鼠。尽管iPS 与ES 细胞在形态和生长特性上有许多相同之处,但iPS 细胞的建立需要较独特的诱导培养体系和鉴定方法。以下结合近年来iPS 技术的发展和本实验室的相关研究,对iPS 细胞的建立和培养体系的优化进行了深入探讨。
【英文摘要】Abstract: The somatic cells can be induced into ES-like stem cells when retrovirally infected the defined transcription factorsincluding Oct4, Sox2, Klf4 and c-Myc. These ES-like cells are named induced pluripotent stem (iPS) cells and this method is callediPS technology. Until the end of 2009, iPS cell lines have been generated in various animal species, such as mouse, human, rhesusmonkey, rat and pig. Mouse iPS cells are also used to generate chimera mice and viable mice through the tetraploid complementation.Although iPS cells are extremely similar to ES cells in both morphology and growth features, to generate iPS cells do need thedefined culture procedures. Based on the update global iPS technology development and the iPS studies in our laboratory, this paperfocused on the establishment of iPS cell lines and improvement of iPS cell culture condition.

【题目】RNAi-mediated Stable Silencing of HGPRT Expression in Rabbit Fibroblastsand SCNT Embryo Production
【中文关键词】无
【英文关键词】Key words RNA interference, rabbit fibroblast, HGPRT, nuclear transfer
【中文摘要】无
【英文摘要】Abstract The hypoxanthine-guanine phosphoribosyl transferase (HGPRT) gene mutation is responsible for gouty arthritis, kidneystone, and Lesch-Nyhan Syndrome (LNS). It has been reported that the expression of HGPRT is decreased or even absent in thesediseases. Rabbits are an ideal model for studying the pathology of these diseases. Therefore, the development of an HGPRT-knockdownrabbit model will be highly beneficial in such studies. Stable HGPRT-knockdown transgenic fibroblast lines were

generated bytransfecting rabbit fibroblasts with RNA interference (RNAi) plasmids. Polymerase chain reaction (PCR) analyses indicated that theaverage positive rate was 83.3%. The mRNA and protein levels of HGPRT in the transgenic fibroblast lines were significantly lowerthan that in the control. Transgenic rabbit blastocysts were derived after performing nuclear transfer. The results show that RNAi can beused to stably knock down expression of the HGPRT in rabbit fibroblasts and further improvements in related technologies willfacilitate the use of this method for the generation of HGPRT-knockdown rabbits.

【题目】以两种不同成纤维细胞为饲养层培养牛胚胎干细胞的比较
【中文关键词】关键词: 饲养层; 胚胎干细胞; 牛; 成纤维细胞
【英文关键词】wu
【中文摘要】摘要: 牛胚胎干细胞的培养一直未能确定最适合的饲养层, 寻找一种适合于其生长的饲养层对于成功培养牛胚胎干细胞有重要意义。本研究以胎鼠和牛胎儿为材料, 分别以含10% FBS 的高糖DMEM 和含10% FBS的DMEM F12为培养液, 分离并且获得2~ 5代的胎鼠成纤维细胞和5~ 6 代的牛胎儿成纤维细胞。在上述两种成纤维细胞为饲养层的条件下, 采用含10%胎牛血清、0 1 mm ol/L 巯基乙醇、0 1 mm ol /L 非必须氨基酸、100 U /mL青霉素、0 05 mg /mL链霉素、20 ng /m L LIF和10 ng/mL bFGF的DMEM F12 培养液培养牛胚胎干细胞, 来寻找一种适合于牛胚胎干细胞培养的饲养层。结果表明, 在相同的培养体系条件下培养牛胚胎干细胞, 以胎鼠成纤维细胞为饲养层的贴壁率显著高于以牛胎儿成纤维细胞为饲养层的贴壁率(P < 0 05), 以牛胎儿成纤维细胞为饲养层更利于胚胎滋养层的去除。

【题目】FFT快速整序算法的对比、改进及实现
【中文关键词】FFT整序; 组号; 组员; 序号分组; 逆序
【英文关键词】FFT permutation; group-index; group-member; indices grouping; inverse order
【中文摘要】提出了一种改进的用于基2的FFT整序算法。改进算法对逆序表的生成进行改进,同时给出另一种数据交换的方案。首先,将顺序号分成组号和组员两部分,采用两个数组存储各组号及组员的数,以(0,2,1,3)为初始逆序表,利用已知组员与组号对应的逆序号的大小关系,求出任意更高阶的逆序表。其次,在数据交换时,避免了常规整序中顺序号与逆序号的比较运算。在Windows操作系统下编制了相关算法的C++程序,比较了运行效率,实验表明,改进算法效率最高。
【英文摘要】A new improved permutation algorithm for radix 2 fast Fourier transforms(FFTs)is discribed.The algorithm provides an improved way for obtaining the bit reversal index table and affords an altemative data permutation methods.First,the algorithm divides an index with two parts,one is called group-index,which represents the index belonging to some group.and the other is called group-member which represents the order in the group.And then two arrays are used to store the values of the group-index and group-member power.According to the relationship between the bit reversal values of group.index and group-member,any bit reversal table can be obtained with the known one,which is(0,2,l,3).Second,when the data are needed to permute,the improved algorithm avoids the comparison operations between the index and its corresponding bit reversal value. which are required in tlle general permutation algorithm.In order to test its performance in the windows operation systems,several algorithms are programmed wim C++ language.and their operaion times are compared.The experiments show that the performance of the improved algorithm introduced in

this paper is superior to that of the relative algorithms.

【题目】基于SOM神经网络实现猪肉颜色的自动分级
【中文关键词】猪肉颜色;自动分级;图像处理;自组织映射神经网络
【英文关键词】pork color; automatic grading; image processing; self-organizing map neural network;
【中文摘要】结合图像处理和SOM神经网络对猪肉背最长肌断面颜色的分级进行了研究。通过摄像头采集猪肉背最长肌断面图像,对图像进行均值滤波后,将图像背景、脂肪去除,在此基础上,得到了肌肉颜色特征值向量H、S和L值。将H、S和L值输入自组织映射(SOM)神经网络进行聚类分析,以实现对猪肉颜色等级的划分。结果表明,对6个颜色等级分级准确率分别为73.2%、80.1%、90.5%、65.8%、54.7%和33.1%。大量的实验表明,计算机智能化分级系统具有很好的稳定性和一定的准确率,可以作为有效的猪肉颜色分级工具,但分级准确率还有待于进一步提高。
【英文摘要】The pork color was graded with Self-Organizing Map(SOM)neural network after processing the pork image.First,images of porcine longissimus dorsi muscle profile were captured by a camera,then the images were filtered with average weights template and the muscle pixels were separated by removing the background and fat pixels,at last the feature vector of the pork color was expressed by H,S,L values.The H value was a new value rather than the hue of the pork color,and the S,L values were saturation and luminance values respectively.By entering the H,S and L values of muscle into SOM neural network,73.2%,80.1%,90.5%,65.8%,54.7%,33.1% grading accuracy were obtained for each grade respectively.These results showed the grading results were credible in some certain extent,the computer intelligent automatic grading system can be used in the processing effectually,but accuracy rate need to be improved further.

【题目】计算机视觉技术预测肉糜斩拌终点的初步研究
【中文关键词】计算机视觉技术; 肉糜; 颜色; 斩拌终点
【英文关键词】computer vision; meat emulsion; color; chopping endpoint
【中文摘要】利用计算机视觉技术研究肉糜斩拌终点的判定方法,防止斩拌过程中斩拌不足或斩拌过度而引起的产品质量下降。本研究以猪后腿肉和背膘为主要原料,按照肥瘦比3/7 添加比例进行斩拌,分别于第6、7、8、9、10、12、14、16和18min取样,测定肉糜颜色和加工特性指标。结果表明:斩拌时间对肉糜的颜色、蒸煮损失、脂肪损失、硬度、弹性、Purge损失以及贮能模量(G’)均有影响,肉糜HSL颜色空间变量中亮度值(L)与蒸煮损失、脂肪损失、硬度等加工特性指标之间的相关性显著。因而,利用计算机视觉技术测定的肉糜亮度值用于预测肉糜斩拌终点是可行的。
【英文摘要】Prediction method of the chopping endpoint of meat emulsion was studied by computer vision to prevent excessive fat and water separation,and the subsequent decrease in quality of the final products.Porcine hindquarter and back fat were used to chop for meat emulsion with the fat/lean ratio of 3/7.During chopping,emulsion samples were obtained at each control time(at time intervals of 1min from 6min to 10min and then at time intervals of 2min up to 18min).The color and processing properties of meat emulsion were determined.The results showed that chopping time influenced color,cooking loss,fat loss,hardness,springiness Purge loss and Storage Modulus(G’).Moreover,L value of HSL’s color space of meat emulsion was significantly correlated with the index of processing properties,such as cooking loss,fat loss and hardness.As a result,it is feasible that L value of meat emulsion was used to

evaluate the chopping endpoint of meat emulsion by computer vision.

【题目】基于概率密度梯度方向的角点重定位技术
【中文关键词】概率密度梯度方向; 模糊定位; 角点重定位
【英文关键词】density gradient direction; fuzzy location positioning; corners relocation
【中文摘要】由于各种外界因素的影响, 角点检测算法检测的角点可能出现位置偏移。在分析该现象的基础上, 提出对角点进行重新的定位。首先, 通过计算角点的二阶模板值来进行角点模糊定位; 其次, 引入像素点的概率密度梯度方向, 通过比较角点和角点邻域内的像素点的概率密度梯度方向的关系来判断错误角点, 并找出所有的候选替代点;最后, 根据角点和候选像素点之间的关系, 寻找出新的角点。通过实验对比发现该算法能正确地对发生位置偏移的角点进行重新定位。
【英文摘要】As a result of the impact of external factors, corners detected by corner detection algorithm may be offset.Based on the analysis of this phenomenon, this paper proposed a new algorithm for corner relocation. Firstly, through calculating the second-order template value for every corner, the fuzzy corner relocation was carried out; secondly, the density gradient direction of pixel was introduced. Comparing the density gradient directions of the corners and the neighborhood pixels of the corners, the wrong corners were determined precisely and all candidates were found; finally, according to the relationship between the corner and the candidate pixels, new corner was found. Exper im enta l results show that the algorithmcan accurately relocate the wrong corners.

【题目】改进的样本块修补算法去除肉品图像反光
【中文关键词】肉品图像; 图像修复; 二次匹配; 接缝效应
【英文关键词】meat image; image inpainting; twice matching; seam effect
【中文摘要】由于肉品中存在水分,在可见光下采集图像就会产生反光区域,进而导致肌肉信息部分丢失。为了提高获取肉品图像相关信息的准确性,需尽量还原反光区域。在基于样本块的图像修补算法基础上,结合肉品图像特点,提出改进算法: 用Prewitt 算子代替Robert 算子,使信息缺损区域的线性结构得到更好的保持; 采用二次匹配法减少搜索最佳匹配块过程中的扫描数据量,比原算法节约约2/3 的修复时间; 在修复过程中加入α剪裁均值滤波消除接缝效应,使得修复结果更好地满足视觉心理学要求。实验结果表明,改进的修补算法在效率和修复效果上优于原算法,不仅可用于肉品图像反光区域的修复,对其他图像的修复也有效。
【英文摘要】Because of moisture in meat,there would be reflective area in the meat image under visible light,which lead tothe loss of some muscle information. In order to improve the accuracy of obtaining meat image ’s related information,it is necessary to restore the reflective area as much as possible. Based on the algorithm of image completion by exemplar path,with the feature of meat image,an improved algorithm is presented in this paper. First,replacing Robert operator with Prewitt,so that the LISREL of information lost area get better preserved. Then,by using twice matching method,the amount of scanning data is reduced in the process of searching the best matched block,and the repair time is saved about2/3 of original algorithm. After that,to eliminate seam effects,adding α-cut Mean Filter in the process of inpainting,it makes the repair results meet the requirements of visual psychology better.The experimental results show that both the inpainting efficiency and effect of improved algorithm are better than the original,and the method can not only repair thereflective area of meat image,but also be useful for other images ’inpainting.

【题目】大理石花纹评分与淮南猪背最长肌感官特性的关系研究
【中文关键词】大理石花纹;肉色;肌内脂肪;剪切力;多汁性;风味
【英文关键词】marbling; meat color; intramuscular fat; shear force; juiciness; flavor
【中文摘要】通过研究不同大理石花纹猪肉的感官特性,进一步阐明大理石花纹与猪肉感官特性的内在联系。根据第5~6根肋骨背最长肌横切面的大理石花纹分布程度,进行感官评分;以肉色相近且含有不同大理石花纹的淮南猪背最长肌腰段为原料,各大理石花纹等级随机选择10条,测定它们的肉色、肌内脂肪含量、剪切力、多汁性和风味等。结果表明:大理石花纹分为3 级, 1级、2 级和3 级的肌内脂肪含量范围分别是<2%、2%~4%和 > 4%。随着大理石花纹等级的增加,L* 值、b* 值和肌内脂肪含量明显增加(P<0.01),剪切力值明显降低(P<0.01)。大理石花纹等级3与等级1、等级2 之间的风味和多汁性存在显著性差异(P<0.05)。因此,大理石花纹评分越高,则肌内脂肪含量越高,剪切力值越低。多汁性和风味随着大理石花纹评分的增加而得到改善。
【英文摘要】The sensory properties of Huainan pig longissimus dorsi with marbling scores were investigated,and further to elucidate internal relation between marbling and pork sensory properties. Sensory scores were conducted on marbling of cut surface of the loin eye muscle between 5th and 6th rib. Huainan pig longissimus lumborum with similar color and different marbling were used. Meat color, intramuscular fat content, shear force, juiciness and flavor of 10 strips longissimus lumborum in every marbling grades were investigated. The marbling was divided into 3 grades, and the range of intramuscular fat content of every marbling grades :Grade 1(IMF: <2%), Grade2 (IMF:2%~4%) and Grade 3(IMF: > 4%). With marbling grades increased, L*-value、b*-value and the intramuscular fat content increased significantly (P<0.01), shear force decreased significantly (P<0.01). Significant difference were found in flavor and juiciness between grade 3 and grade 1, grade 2(P<0.05).With marbling scores increased, intramuscular fat content increased significantly and shear force decreased significantly. In addition, flavor and juiciness were improved, with marbling scores increased.

【英文关键词】marbling;gel properties;ionic strength;cooling method
【中文摘要】以猪背最长肌为材料,对第5~6 根肋骨背最长肌横切面的大理石花纹进行等级评定,在不同离子强度和冷却方式下,研究大理石花纹评分与猪背最长肌凝胶特性的关系。结果表明:在0.60mol/L NaCl 条件下,各等级花纹肉的凝胶特性好于同条件下离子强度0.45mol/L 的凝胶(P < 0.05)。在0.60mol/L NaCl 和同一冷却方式下,各等级之间的凝胶保水性(P < 0.01)和凝胶强度(P < 0.05)差异显著;而凝胶弹性差异不显著(P > 0.05)。在0.60mol/L NaCl和10℃冷却时,等级3 具有最好的凝胶特性。此外,花纹等级与凝胶保水性呈显著正相关(P < 0.05),与蛋白溶解度和凝胶强度达到极显著正相关(P < 0.01)。大理石花纹分为3 个等级,猪背最长肌的凝胶特性随着大理石花纹评分的增加而提高。
【英文摘要】The marbling in pig longissimus dorsi cross-section between the 5th and 6th ribswas evaluated by scoring. Along with this, the relationship between marbling score and gel properties of pig longissimus dorsi under varying ionic strength and cooling methods was addressed. Longissimus dorsi muscles between the 5th and 6th ribs could be divided into 3 grades by marbling score.Various marbling grades of longissimus dorsi muscles had better gel properties at 0.60 mol/L NaCl than at 0.45 mol/L NaCl (P<0.05). Significant differences in gel water-holding capacity (WHC) (P<0.01) and gel strength (P<0.05) were found among variousmarbling grades under the conditions of 0.60 mol/L NaCl and the same cooling methods, while gel elasticity did not show significance (P>0.05). Gel properties of grade 3 were the best under 0.60 mol/L NaCl and 10 °C cooling. In addition, marblinggrades had significantly positive correlation with gelWHC (P<0.05), and the correlationswith protein solubility and gel strength reached an extremely significantly positive level (P<0.01). Higher marbling grade of longissimus dorsi muscle had improved gel properties.

【题目】结合LLE流形学习和支持向量机的猪肉颜色分级
【中文关键词】机器视觉;支持向量机;无损检测;流形学习;局部线性嵌入;猪肉颜色分级
【英文关键词】computer vision;support vector machine; nondestructive detection; manifold learning; locally liner embedding; pork color grading
【中文摘要】猪肉颜色分级是肉品品质无损检测的重要内容。该文通过对猪肉彩色数字图像颜色规律的分析,结合猪肉红(R)、绿(G)、蓝(B)颜色分量及其亮度和饱和度值,构建了一个新的颜色维度。将采集的1070 份猪肉图像样本进行专家分级和标记后,给出了猪肉颜色的特征表示,并利用支持向量机(SVM)进行了颜色分级。试验结果表明,随着训练集样本数的增加,分级准确率有所提高。当将所有样本作为训练集时,分级准确率高达96.5%。针对SVM 分级后泛化能力不强的问题,采用流形学习LLE 维数变换,使其泛化能力由37%提高近1倍。结果表明LLE 可有效改善SVM 的分级准确率。该方法可为猪肉品质无损检测的研究与应用提供参考。
【英文摘要】Pork color grading is an important task of nondestructive detection of meat quality. With analyzing the colorfeature of pork image and combining its color component value of red, green and blue and its luminance and saturation values converted by RGB color format, a new color feature value was created for the purpose of better expression of pork color. Then, 1070 collected pork samples were graded and marked by experts, and the color feature values of each pork image with special grade mark was obtained after image processing. A series of experiments were conducted to test the pork color grading accuracy rate based on support vector machine. The results showed that along with the increment of training sample number, the pork color grading accuracy rate increased. When all samples were selected as training set, the accuracy reached up to 96.5%. In order to improve the prediction accuracy of SVM (about 37%), locally linerembedding (LLE), a manifold learning method, was applied to reduce or increase the dimensions of pork color feature.The results showed that the prediction accuracy rate of the grading procedure based on LLE and SVM was nearly twice as high as that of the procedure only relying on SVM. Hence, combining the LLE manifold learning method and SVM,pork color grading accuracy will be improved. This method can provide a reference for study and application of nondestructive detection of pork quality.

【题目】Cloning and functional characterization of an O -acetylserine(thiol)lyase-encoding gene in wild soybean (Glycine soja)
【中文关键词】无
【英文关键词】Cysteine synthesis,Gene cloning,GsOAS-TL1,Soybean (Glycine soja)
【中文摘要】无
【英文摘要】Abstract The terminal step of soybean cysteine synthesis is catalyzed by O -acetylserine(thiol)lyase (OAS-TL, EC 2.5.1.47). In this study, we isolated and characterized an OAS-TLgene from a wild soybean material (designated as GsOAS-TL1). GsOAS-TL1 cDNA sequence showed strict conservation at both nucleotide and amino acid levels compared with that from cultivated soybean. Genomic structure analysis ofGsOAS-TL1 indicated that it contained 10 exons and 9 introns in the coding region with

conserved exon sizes and intron locations compared with Arabidopsis thaliana OAS-TL -like genes. Among the complete GsOAS-TL1 cDNA and three part-deletion fragments, only expression of the full-length cDNA could rescue the NK3 cys-Escherichia coli auxotroph, which was coherent with the assayed enzyme activity of purified fusion proteins. For RT-PCR analysis in different wild soybean tissues,GsOAS-TL1 showed lower expression in roots and developing seeds, whereas total OAS-TL activity of corresponding tissues showed significantly higher level in seeds than other tissues. To our knowledge, this is the first report on cloning and characterization of an OAS-TL gene from wild soy-bean. Our results are informative to further elucidate the function and evolution of OAS-TL in soybean.

【题目】不同基因型大豆叶片蔗糖合成酶活性变化动态的研究
【中文关键词】大豆; 叶片; 蔗糖合成酶(SS); 活性; 动态;
【英文关键词】Soybean; Leaf; Sucrose synthase; Activity; Dynamics;
【中文摘要】选用6个不同基因型的大豆品种,运用框栽的方法,研究了大豆蔗糖合成酶(SS)含量的变化动态。结果表明:大豆叶片SS分解方向的活性在幼嫩叶片中呈先升高后降低的趋势,成熟叶片仅表现出有下降的趋势,但不同品种间没有显著差异;合成方向的酶活性在不同品种间、不同叶位上未表现出一致的规律性;SS分解方向的酶活性极显著高于合成方向的酶活性,说明在大豆叶片中SS主要起分解蔗糖的调节作用;SS活性与大豆叶片中的蔗糖含量间具有正相关性,其中绥农14和不结瘤大豆的幼嫩叶片中SS合成方向的酶活性与蔗糖含量间达到了显著水平(r值分别为0.765和0.732);不结瘤大豆成熟叶片的SS分解方向的酶活性与蔗糖含量间具有极显著的正相关性(r=0.986)。
【英文摘要】Six soybean varieties were used to investigate dynamic changes of sucrose synthase(SS) in soybean leaves.The results showed that the activity of SS(cleavage direction) increased at first and decreased in tender leaves,while decreased in mature leaves.However,no significant difference were observed among different varieties.There was no consistent regularity for the activity of SS(synthetic direction) among different varieties and different leaf positions.The activity of SS(cleavage direction) was significantly higher than that of synthetic direction,indicating that the role of SS was mainly decomposition in soybean leaves.The activity of SS and sucrose content showed a positive correlation in soybean leaves.The activity of SS(synthetic direction) had significant positive correlation with the sucrose content in tender leaves of SN14 and NON-NOD(r=0.765,r=0.732,respectively) and the activity of SS(cleavage direction) was very significantly correlated with the sucrose content in mature leaves of NON-NOD(r=0.986).

【题目】DNA fingerprinting and genetic diversity analysis of late-bolting radish cultivars with RAPD, ISSR and SRAP markers
【中文关键词】无
【英文关键词】Radish; Fingerprinting; Genetic diversity; SRAP; RAPD; ISSR
【中文摘要】无
【英文摘要】Three molecular marker systems, RAPD (random amplified polymorphic DNA), ISSR (inter-simple sequence repeat) and SRAP (sequence-related amplified polymorphism), were employed for identification and genetic diversity analysis of 35 elite late-bolting radish cultivars. Detected by 35 RAPD primers, 22 ISSR primers and 17 SRAP primer combinations, the proportions of polymorphic bands were 85.44%, 85.2% and 85.41%, respectively, and the mean genetic similarity coefficients between pairs of genotypes were 0.781, 0.787 and 0.764, respectively. Each of the three molecular marker systems can identify all the cultivars. Five sets of three-RAPD primers, 3 sets of three-ISSR primers and 16 sets of three-SRAP primer combinations were able to distinguish all the cultivars. A linear relationship was observed between Resolving power (Rp) of a primer and its ability to distinguish genotypes. The 35 cultivars were clustered into three major groups based on the RAPD, ISSR and marker combination data with UPGMA, which are in high accordance with their own origins and main characteristics. The results demonstrated that these three marker systems could be useful for identification and genetic diversity analysis of radish cultivars.

【题目】Characterization ofO-Acetylserine(Thiol)Lyase-Encoding Genes Reveals Their Distinct but Cooperative Expression in Cysteine Synthesis of Soybean [Glycine max(L.) Merr.]
【中文关键词】无
【英文关键词】Cysteine synthesis,Expression,O-acetylserine(thiol)lyase,Soybean [Glycine max(L .) Merr.]
【中文摘要】无
【英文摘要】In plants, the terminal step of cysteine biosynthesis is catalyzed by O-acetylserine(thiol)lyase (OAS-TL, EC 2.5.1.47). However, to date, there is limited information on those genes involved in this pathway in soybean. In this study, six soybean OAS-TL-like genes were obtained and designated as GmOAS-TL1, 2, 3, 4, 6, and 7. Phylogenetic analysis indicated that GmOAS-TL1, 2, 6, and 7 were similar and showed homology to cytosolic isoforms, while GmOAS-TL3 and 4 were homologous to β-cyanoalanine synthase (CAS, EC 4.4.1.9)-like and a plastidic isoform, respectively. Both genes seemed to belong to a small gene family as confirmed by Southern blot analysis. Expression of GmOAS-TL1, 3, 4, and 6 in the Escherichia coli cys − auxotroph resulted in bacterial growth and exhibited high enzymatic activity. Reverse transcription polymerase chain reaction analysis indicated that varying levels of expression were detected in different tissues and with distinct profiles. During the stage of seed-filling, expression patterns showed a cooperative trend that corresponded with total OAS-TL enzymatic activity. However, the enzymatic activity was highly negatively correlated with cysteine content in the developing seeds. These results suggest that cysteine synthesis in soybean might be an operation of multiple OAS-TL genes with homeostasis mechanisms for self-regulation. This finding should enhance our understanding of the molecular basis of soybean cysteine biosynthesis.

【题目】不同条件下有机物料在黑土中分解规律的 研究
【中文关键词】有机物料; 黑土; 分解规律;
【英文关键词】organic materials; black soil; decomposed regularity;
【中文摘要】通过在土壤中埋置砂滤管的方法明确不同积温、水分、pH以及有机物料与黑土不同配比条件下有机物料的分解情况。结果表明:小麦和草木樨秸秆分解不受温度高低的影响,低温条件下分解较快,分解速率为草木樨>小麦秸秆;在浇水条件下小麦和草木樨秸秆易于分解,表现为第一年分解速率较高,比正常条件下分解率高出20%左右,第二年分解缓慢平均分解率只有10%左右;玉米秸秆加入量最少分解最快。当加入量为1%时,第一年就分解了75.6%,第二年达88.8%;小麦秸秆在pH7时分解率为63.1%,在pH8.7时的分解率为75.6%,其余也都相差10%左右。埋管第二年,各种物料分解速率趋于平稳。因此,土壤有机物质的分解不仅因有机物料的种类而有差异,而且也受土壤的某些性质(如水分,pH)和气候(如温度)以及还田数量等因素影响。
【英文摘要】The method of sand strainer tube was used in this trial for studying the decomposing regularity of organic materials on the condition of different accumulated temperature, moisture, pH, materials and soil proportion. The result shows that: wheat and sweet clover straw were prone to decompose at low temperature, decomposition rate was sweet clover higher than wheat straw. In water condition, sweet clover and wheat straw were prone to decompose in the first year were 20% higher than normal, average decomposition rate was only 10% in the second year. The fastest decomposition, the least addition. When adding amount of 1% straw, the decomposition rate is 75.6% in first year, and the second year up to 88.8%. Wheat straw decomposition rate is 63.1% at pH 7 and 75.6% in pH 8.7, the remaining also have a difference of about 10%. Pipes next year, decomposition rate of various materials were stabilized. Therefore, soil organic matter decomposition not only because of the type of organic materials there are differences, but also by some properties of the soil (such as moisture, pH) and climate (such as temperature) as well as to field the quantity of factors.

【题目】不同还田方式下有机物料有机碳分解规律 研究
【中文关键词】有机物料; 秸秆还田方式; 有机碳; 分解率;
【英文关键词】organic material; incorporation method; organic carbon; decomposition rate;
【中文摘要】利用网袋法和砂滤管法模拟田间还田方式,研究不同处理下各有机物料有机碳的腐解特征。结果表明,网袋法玉米、大豆秸秆经过150 d后,其秸秆生物量有38.9%~46.6%被分解。秸秆还田分解趋势为:土埋处理>露天处理;土埋玉米秸秆>土埋大豆秸秆;露天大豆秸秆和玉米秸秆分解规律一致。从组织结构上看,玉米秸秆随着还田时间的增加,组织结构模糊、松散,基本组织和维管束遭到破坏,大豆秸秆组织结构变化不明显。不同还田方式下秸秆有机碳的分解规律为:玉米秸秆>大豆秸秆。在砂滤管模拟条件下玉米、大豆秸秆和根茬有机碳分解趋势基本相似,均表现为埋管初期分解较快,后期分解较慢,其有机碳分解率趋势为:玉米秸秆>大豆秸秆;降低C/N后,各有机物料有机碳分解率均高于不调节C/N。
【英文摘要】Net bag method and sand strainer tube were used to determine decomposition characteristics of corn and soybean stalks of organic carbon under different incorporation methods into the field.The results showed that after 150 d in net bag method,biology quantity of corn and soybean stalks were decomposed from 38.9% to 46.6%.The decomposition trend of stalks was soil coverage treatment >open air treatment,and corn stalk of soil coverage>soybean stalk of soil coverage,decomposing regularities of soybean and corn stalk in the open air were almost the same.From the view of tissue structure,tissue had become blurred and loose,when the basic

tissue and vascular bundle were broken in corn stalk the following time.But tissue structure of soybean stalk did not change significantly.The decomposition regularity of stalksorganic carbon in different incorporation methods was corn stalk>soybean stalk.Under simulated conditions of the sand strainer tubes,corn,soybean stalk and root stubble were similar trends in organic carbon decomposition.All the decomposition regularities were faster at the beginning of buried tubes,and slower at the later.The decomposition rate of organic carbon was corn stalk>soybean stalk.After reducing C/N,the organic carbon decomposition rate of various organic materials was higher than that of no adjusting.

【题目】萝卜干物重和可溶性总糖含量的遗传分析
【中文关键词】萝卜;营养品质;遗传模型;干物重;可溶性总糖含量
【英文关键词】radish; nutritional qualities; inheritance model; dry matter (DM) weight; total soluble sugar (TSS)
【中文摘要】以干物重、可溶性总糖含量差异显著的萝卜品种Nau17-XWH和Nau20-LHZ为材料,采用植物数量性状主基因+多基因混合遗传模型多世代联合分析方法,分析了萝卜干物重和可溶性总糖含量性状的遗传规律。结果表明:干物重的最适遗传模型为两对完全显性主基因+加性-显性多基因混合遗传模型,干物重的主基因遗传率为35.00% ,多基因遗传率为

55.00% ,因此,应在控制环境因素条件下进行轮回选择以使萝卜干物重性状的基因累积;可溶性总糖含量的最适遗传模型为两对加性-显性主基因+加性-显性多基因模型,可溶性总糖含量的主基因遗传率为98.33% ,因此,萝卜可溶性总糖含量性状的遗传受环境因素影响较小,可以在早期世代进行选择。

【英文摘要】Genetic analysis was conducted on dry matter (DM) weight and total soluble sugar (TSS) content of multip le generations, P1, P2, F1 and F2 derived from a cross between Nau17-XWH with higher DM weight and TSS content and Nau20-LHZ with lower DM weight and TSS content, using the method of major gene p lus polygenes m ixed inheritance model in quantitative traits of plants. It was concluded that the op timal model of DM weight was two complete-dom inant major genes plus additive-dom inant polygenes m ixed inheritance model, and the heritability of major genes in DM was 35.00% , and that of polygenes was 55.00%. They indicated that the loci for high DM weight could be pyramided with recurrent selection under the controlled conditions. The optimal model of TSS content was two additive-dom inant major genes plus additive-dom inant polygenes m ixed inheritance model, and the heritability of major genes in TSS was 98.33%. Therefore, the individuals w ith high TSS content, which was affected to a lower degree by environment, could be selected in early generation for the high heritability.

【英文关键词】No-tillage; Soil water content; Soil temperature; Soil bulk density; Soil penetration resistance; Soybean; Corn;

【中文摘要】在黑龙江垦区852农场研究了初期保护性耕作和秸秆还田对土壤温度、土壤水分、土壤容重和机械阻力等土壤物理特性及对玉米、大豆产量的影响,为中长期保护性耕作和秸秆还田的应用提供理论依据。试验于2009年进行,轮作顺序为大豆-玉米-玉米;大豆试验圃(前茬为玉米)和玉米试验圃(前茬为玉米)处理为免耕、灭茬还田、旋耕还田和传统耕作;玉米试验圃(前茬为大豆)处理包括免耕、直播还田、旋耕还田和传统耕作。结果表明:大豆试验圃(前茬为玉米)免耕和灭茬还田处理生育前期的土壤温度分别比传统耕作低3.38°C和2.6°C,玉米圃(前茬为大豆)免耕和直播处理同期的土壤温

度分别比传统耕作低1.93℃和1.39℃;春季播种期大豆试验圃(前茬为玉米)免耕和灭茬还田处理的土壤体积含水量分别高于传统耕作9.3%和4.8%,玉米试验圃(前作为大豆)免耕和直播还田处理的土壤体积含水量分别高于传统耕作16.0%和12.6%;此外,免耕模式的5~20 cm深度的土壤容重和0~25 cm的土壤机械阻力均显著高于传统耕作模式,但是均未达到对作物根系生长产生抑制的阀值;免耕和灭茬/直播还田模式前期的耕层低温并未对产量构成不利影响,与传统耕作相比并未显著减产。

【英文摘要】The objective of this work in Heilongjiang Reclamation Area was to study the effects of conservation tillage and stubble retention on soil temperature,soil water content,some other soil physical properties and yield performances of corn and soybean.This work would provide theoretical basis for mid-and long-term conservation tillage and stubble retention programs.The experiment was conducted in 2009 with the crop sequence of soybean-corn-corn.The experiment consisted of tillage treatments(no till,NT;root-stubble chopped off with stubble retention,RCSR;rotary tillage with stubble retention,RTSR;conventional tillage,CT) in soybean(corn as previous crop),corn(corn as previous crop) and corn(soybean as previous crop) plots.The soil temperatures were 3.38°C and 2.6°C lower under NT and RCSR than CT in soybean plots(corn as previous crop),and were 1.93°C and 1.39°C lower under NT and DDSR than CT in corn plots(soybean as previous crop),respectively.Soil volumetric water content,during the planting season,were 9.3 % and 4.8% higher on both NT and RCSR than on CT in soybean plots(corn as previous crop),and were 16.0 % and 12.6 % higher on NT and DDSR than on CT in corn plots(soybean as previous crop).Bulk density at 5-20 cm soil depth and penetration resistance at 0-25 cm were higher significantly on NT and SRRC/ DDSR than CT,however,they did not exceed their threshold values respectively.Lower temperature under NT and RCSR/ DDSR did not impact on soybean/corn yield adversely in contrast with CT during their first growing periods.

【题目】两个萝卜雄性不育材料胞质的细胞学与分子鉴定

【中文关键词】萝卜(Raphanus sativus L.), 胞质雄性不育, 小孢子发生, 胞质鉴定

【英文关键词】Radish (Raphanus sativus L.), Cytoplasmic male sterility, Microsporogenesis, Cytoplasm identification

【中文摘要】本研究以晚抽薹萝卜雄性不育系及其相应保持系为试材,石蜡切片法显微观察小孢子发生的细胞学结果表明:不育系NAURWA01、NAURWA13 败育方式相似,在四分体之前的小孢子与保持系没有明显差 别;单核小孢子早期绒毡层出现小液泡,逐渐汇集成大液泡,外粉壁变薄,绒毡层径向伸长异常膨大,挤压小 孢子,细胞质紧缩,绒毡层延迟解体,不能为核有丝分裂提供能量,致使小孢子败育,最后一同降解。利用2 对 特异引物扩增Ogura 相关基因,在不育系NAURWA01、NAURWA13 中扩增出与Ogura 相关基因分子量相 同的特异条带,而在保持系没有任何条带出现。对特异条带回收克隆测序发现与orf138 同源性很高,但是在 编码区有3 个碱基的差异。推测两个萝卜不育系属于Ogura CMS 的变异类型。

【英文摘要】Cytological and molecular study was conducted for identification of cytoplasm in late-bolting radish male-sterile line. The cytological results indicated that the microspore abortion of NAURWA01 was similar to that of NAURWA13. During the pollen mother cell and tetrad stages, no abnormality was detected. After the microspores were released, the tapetum cells bulged by severe cytoplasmic vacuolation, elongated in a radial manner and enlarged abnormally, pressing microspores seriously. The vacuolated and lagged disintegration of the tapetum could not provide energy for mitosis, which result in the microspore degenerated. The related gene conditioning Ogura cytoplasmic male sterility in radish was amplified with two primers. The amplification patterns from the Ogura specific primers were identical between the two CMS lines. The sequence of specific fragment showed highly identity with orf138 besides three nucleotides in the coding region. It could be concluded that the two cytoplasms in CMS lines were variants of Ogura CMS.

【题目】薄壁孔口PE滴灌管出流特性实验研究
【中文关键词】薄壁孔口;出流特性;水力计算
【英文关键词】thin-walled orifice;orifice characteristics;hydraulic calculation
【中文摘要】本文研究设计了一种以PE塑料管为材料的无滴头滴灌节水设备,即薄壁孔口PE滴灌管。实验材料采用直径为16mm,壁厚为1.5mm,最大爆破压力为0.25MPa的PE管。首先,通过采用长度为15mm、30mm、50mm的同径小管套作为消能方式,测量出孔口间距为0.33m,工作压力分别为120kPa、100kPa、80kPa、60kPa、50kPa,孔口直径分别为0.5mm、0.7mm、0.9mm的短管孔口出流量。通过同一管路孔口出流量的20%原则,初步判断实验数据是否合理,然后用excel回归得出不同孔口直径、不同工作压力、不同小管套长度时的流量-压力方程式q=k×hx,通过q=k×hx中的流量指数k和流态指数x比较,得出小管套长度为15mm时消能效果较好,因此,长管实验中消能小管套的长度便采用15mm。然后,对此种薄壁孔口的制造偏差进行分析,本课题中孔口满足了孔口制造偏差的要求。并对短管实验数据进行分析,包括孔口的类型,水头损失计算和水头损失与管首尾压差的关系三个方面,得出了短管出流时,水头损失与管首尾压差相等的结论。最后,对薄壁孔口主要性能指标进行分析,得出了薄壁孔口的主要性能指标满足滴头性能指标的要求的结论。 本文对短管实验及数据处理之后,对同样条件下的长管进行验证实验,测定孔口出流量,测三次取平均值,分析数据,剔除可疑数据。并且对长管进行灌水均匀度的分析和管道水力计算,包括灌水器设计允许工作水头偏差率、最大出水孔数和设计最大长度的计算。然后,根据不同作物的种植间距,用插值法得出作物种植间距时的孔口出流量。最后,对薄壁孔口的灌溉制度进行设计。 通过对薄壁孔口出流量的测量及数据处理,证明薄壁孔口确实可行,并把此薄壁孔口应用于莆田市涵江区松岭现代生态农业基地,其孔口出流量满足了茶树的需水量要求,这对薄壁孔口PE滴灌管的推广提供了参考借鉴意义。
【英文摘要】A kind of water-saving irrigation equipment that is called as punched drip irrigation tubingwas studied and designed in this paper.The experimental pipes were PE plastic tubings.Thediameter of experimental PE tubings is 16mm,the wall thickness is 1.5mm and the maximalbursting pressure is 0.25MPa.Firstly,Small tube sets which's length is 15mm,30mm and 50mmwere used to reduce energy.There were three PE tubings.Each has a single hole with diameter of0.5mm、0.7mm and 0.9mm and orifice spacing of 0.33m.Under120kPa、100kPa、80kPa、60kPa、50kPa work pressure,the flow of these three tubings were studied in this paper.By the 20%principle of orifice flow,whether the experimental data is reasonable was judged,and the flow-pressure equation(q=k×hx)was regressed.Comparing k and x,the way of reducing energy was the best when the length of small tube set was 15mm.After analyzing manufacture deviation ofthin-wall orifice,it was feasible.By analyzing flow of orifice,including orifice type,head losscalculation and the relationship between head loss and differential pressure of inlet and end.Values of head loss and differential pressure of inlet and end were the same.After analyzing mainperformance indexes of thin-wall orifice,they satisfied requirement of drippers. Based on the experiment of short tube and experimental data processing,the sameexperiment of long tube was did,including measuring the flow,taking average in three times,analyzing data and eliminating suspicious data.Then irrigation evenness of long tube wasanalyzed and hydraulic calculation was did,including design work rate of deviation,maximumnumber of the orifice and calculation of the maximum design length.Then,according to thedifferent crops,the flow was calculated in interpolation method.Finally,irrigation system of thethin-walled orifice was designed. Through this kind of thin-walled orifice of the flow measurement and data processing,feasibility of the thin-wall orifice was proved,and was applied in HanJiang PuTian modernecological agriculture base.The flow of orifice satified water requirement of tea.In order toprovide reference for the popularization of thin-walled orifice.

【题目】萝卜扩展蛋白基因RsEXPB1 克隆与表达特征分析
【中文关键词】萝卜(Raphanus sativus L.), 扩展蛋白, 基因克隆, 表达特征
【英文关键词】Radish (Raphanus sativus L.), Expansin, Gene cloning, Expression characterization

【中文摘要】本文根据GenBank 中扩展蛋白序列设计特异引物,从萝卜高代自交系“ NAU-LVYH06 ”中克隆到一个扩展蛋白基因RsEXPB1 (GenBank accession No. GQ387363, GQ387364)。其编码区基因组序列长度为1 430bp,包括4 个外显子和3 个内含子;RT-PCR 获得长度为898 bp 的cDNA,开放读码框(ORF)为29~820 bp,推　导编码263 个氨基酸,含有1 个组氨酸(His-Phe-Asp, HFD)功能域,ORF 和推导蛋白序列与拟南芥AtEXPB3 (GenBank accession No. NM118965)同源性分别为87%、92%。半定量RT-PCR 检测到该基因主要在萝卜生育前期的幼叶、肉质根木质部和韧皮部中表达,且表达丰度可能与该部位细胞生长分裂状态相关,差异较明显。

【英文摘要】Using the specific primers derived from the sequence of expansins in GenBank, the RsEXPB1 gene(GenBank accession No. GQ387363, GQ387364) was cloned from radish advanced inbred line NAU-LVYH06 in this study. The genome sequence of coding region was 1 430 bp including four exons and three introns. The cDNA consisted of 898 bp with an open reading frame (ORF) between 29 bp and 820 bp by RT-PCR, and the predicted protein of 263 amino acids, residues contained histidine function domain (His-Phe-Asp, HFD). The sequence of coding region and predicated amino acids showed the high homology of 87% and 92% with AtEXPB3 (GenBank accession No. NM118965) in Arabidopsis, respectively. With semi-Q RT-PCR the temporal and spatial expressionwere conducted. It was found that RsEXPB1 gene was expressed in young leaf, phloem and xylem of tap root with the significantly different abundant of transcript over early developmental stages, and gene expression may correlate with the cell development state.

【题目】Overexpression of a soybean O-acetylserine (thiol) lyase-encoding gene GmOASTL4 in tobacco increases cysteine levels and enhances tolerance to cadmium stress

【中文关键词】无

【英文关键词】Cadmium,Cysteine,O-Acetylserine,(thiol) lyase,Soybean,Transgenic tobacco

【中文摘要】无

【英文摘要】O-Acetylserine (thiol) lyase (OASTL, EC 2.5.1.47) catalyzes the final step in cysteine biosynthesis. The soybean GmOASTL4 gene was overexpressed in tobacco. Transgenic plants showed markedly increased accumulation of transcripts and higher cysteine content compared with the wild-type. Upon exposure to cadmium stress, OASTL activity and cysteine levels increased significantly in transgenic plants. Cadmium accumulation and the activity of both superoxide dismutase and catalase enzymes were enhanced in transformants. These results demonstrate that overexpression of GmOASTL4 in tobacco can enhance cysteine levels and increase tolerance to cadmium stress.

【中文关键词】长期施肥试验; 过氧化氢酶; 脱氢酶; 活性; 动力学特性;
【英文关键词】Long-term fertilization experiment; Catalase; Dehydrogenase; Activity; Kinetic characteristics
【中文摘要】土壤质量与土壤的生物学性质密切相关,施肥制度对土壤生物学特性的影响研究对土壤质量管理具有重要的意义。本文以沈阳农业大学长期肥料定位试验为基地,研究长期不同施肥制度对土壤理化性质,过氧化氢酶、脱氢酶活性和动力学特征的影响。主要研究结果:施用化肥、有机肥配施化肥降低土壤pH值,提高4种土壤全量养分(全C、全P、全S、全N)含量,有机肥配施化肥提高土壤速效N含量;低量化肥配施有机肥显著提高土壤过氧化氢酶活性及Vmax/Km值和Vmax值,低量化肥配施有机肥显著提高脱氢酶活性及Vmax/Km值,降低脱氢酶Km值。本文的研究表明,合理的化肥施用量及配施有机肥是提高土壤生物学活性的有效手段。 更多还原
【英文摘要】Our objective was to study the changes in oxidoreductase activity and kinetic parameters of brown earth under a long-term (30 years) field experiment involving fertility treatments(inorganic fertilizers and organic matter with fertilizers). The result showed that application of mineral and organic-mineral fertilizer decreased soil pH and increased the soil total C, P, S and N contents while application of organic-mineral fertilizer increased soil rapidly available N. Lower mineral fertilizer combined organic fertilizer increased catalase activity, its Vmax/Km and Vmax in these treatments increased dehydrogenase activity and its Vmax/Km value and decreased Km value. The research showed that reasonable application of fertilizes was effective methods to improve the soil biological activity

【题目】春大豆荚果发育过程中脂肪含量及其组分变化研究
【中文关键词】春大豆; 脂肪; 相关分析;
【英文关键词】Soybean; Oil; Correlation analysis;
【中文摘要】本研究选用了3个品质类型的5个春大豆品种,研究荚果发育过程中脂肪含量及其组分的动态变化。结果表明:脂肪含量随着开花天数的增加呈上升趋势,始花后68d达到最大值,5个品种表现一致的规律性;26~32d脂肪含量增加较为缓慢,开花32~50d是脂肪含量快速增加时期,50~68d增长缓慢;脂肪酸组分中亚麻酸、硬脂酸、棕榈酸所占比例呈降低趋势,亚油酸呈升高趋势,油酸先升高后降低;5个品种脂肪含量和油酸所占比例与始花后天数都呈极显著正相关关系;亚油酸所占比例与始花后天数没有达到显著正相关水平;硬脂酸、棕榈酸、亚麻酸所占比例与始花后天数呈负相关,但个别品种未达到显著水平;脂肪及其组分所占比例表现不同程度的相关性,脂肪与亚油酸、油酸呈显著或极显著正相关,脂肪与亚麻酸、硬脂酸、棕榈酸呈显著或极显著负相关关系。
【英文摘要】Five spring soybean varieties with three quality types were used to understand dynamic changes of content and components of fat during pod development.The results showed that the content of fat increased with the increase of the days after flowering,with maximum in 68 days after flowering.The content of fat slowly increased during 26~32 days after flowering,and fast increased during 32~50 days after flowering and then slowly increased during 50~68 days after flowering.The proportion of palmitic acid,stearic acid,linolenic acid decreased.Linoleic acid increased.Oleic acid increased first and then reduced.and the content and the proportion of oleic acid had significant correlation with the days after flowering.The proportion of stearic acid,palmitic acid and linolenic acid was negatively correlated with the days after flowering in some varieties.Linoleic acid,oleic acid had significant positive correlation with fat content.Linolenic acid,stearic acid and Palmitic acid had significant positive negative correlation with fat content.

【题目】春大豆荚果发育过程中酯酶同工酶酶谱分析
【中文关键词】春大豆; 酯酶(EST)同工酶; 酶谱分析;
【英文关键词】Soybean; Esterase isozymes; Zymogram analysis;
【中文摘要】本研究采用聚丙烯酰胺凝胶电泳(PAGE)技术,对3种品质类型的5个春大豆品种荚果发育过程中的酯酶(EST)同工酶进行分析。结果表明,5个春大豆品种从开花20~62d的发育过程中共出现23条酶带,Rf值集中在0.170~0.795间,可分为3个区,即A区(0.170~0.338)、B区(0.371~0.695)和C区(0.719~0.795)。不同品种、不同时期酯酶同工酶活性和条带数均有所差异;大豆荚果发育前期条带数少,集中在B区;随着荚果发育进程的进行,条带数明显增加,出现C区;接近成熟期时条带数减少,B区活性减弱,A区明显出现条带。
【英文摘要】This study was conducted with polyacrylamide gel electrophoresis(PAGE)to estimate the esterase(EST)isozymes of three quality types of five spring soybean varieties during the process of pod development.The results indicated that 23 enzymic bands appeared during the period from 20 days to 62 days after flowering.Rf values ranged from 0.170 to 0.795,which could be divided into three regions,i.e.A(0.170~0.338),B(0.371~0.695)and C(0.719~0.795).There were difference between esterase isozymes activities and bands at different stages or for varieties.At the first period of pod development,a few bands appeared and concentrated in the Bregion;then more bands appeared in the middle period of pod development and concentrated in the Cregion;and less bands appeared and concentrated in the A region at the end period of pod development.

【题目】高温胁迫下不同耐热性萝卜幼苗生理响应分析
【中文关键词】萝卜;高温胁迫;耐热性;生化指标
【英文关键词】Radish; Heat stress; Heat resistance; Biochemical index
【中文摘要】利用耐热性差异显著的萝卜自交系为材料,研究了高温(38 ℃)胁迫下萝卜幼苗丙二醛(MDA)、游离脯氨酸、可溶性蛋白和可溶性糖含量变化与耐热性的关系。结果表明:高温处理前耐热材料中可溶性蛋白含量高于不耐热材料;可溶性糖、游离脯氨酸和MDA 含量无显著差异。处理24、48、72 h, 耐热材料中可溶性蛋白、可溶性糖和游离脯氨酸含量均显著高于不耐热材料,MDA 含量显著低于不耐热材料。处理24 h,4 个指标的含量都比处理前显著增加,可溶性蛋白含量在处理48、72 h 时逐渐降低,但耐热材料下降得较慢。与处理24 h 相比,处理48、72 h 时可溶性糖、游离脯氨酸和MDA 含量在耐热材料中没有显著变化,而在不耐热材料中处理48 h 显著高于处理24 h 时的含量。表明这4 个指标的含量变化能准确反映萝卜幼苗耐热性差异,可考虑用于萝卜幼苗的耐热性鉴定评价。
【英文摘要】Under high temperature stress(38 ℃), the variation of MDA, soluble protein, solublesugar, free proline contents in radish(Raphanus sativus L.)seedling with different heat resistance were analyzed. The soluble protein content was higher in heat resistant inbred lines than that in heat-sensitive ones, while the content of soluble sugar, free proline and MDA exhibited no significant difference among inbred lines. Under the treatments of 38 ℃ for 24 h, 48 h and 72 h, the contents of soluble protein,soluble sugar and free proline in heat resistant inbred lines were significantly higher than those in heat-sensitive ones, while the MDA content was significantly lower in heat resistant materials. Under the treatment of 38 ℃ for 24 h, the contents of all the 4 indexes were significantly increased. The soluble protein content declined continuously for 48 h and 72 h, but it declined much slowly in heat resistantinbred lines. As compared with the treatment of 38 ℃ for 24 h, the contents of soluble sugar, free proline and MDA were significantly higher for 48 h in heat-sensitive materials, while in heat resistant materials,there were no significant increases for 48 h and 72 h. It was suggested that the variation of these 4 indexes was related with the heat resistance and could be used for evaluation of heat resistance in radish seedlings.

【题目】东南型温室降温智能控制系统
【中文关键词】温室降温;自动控制;温湿度;光照度;RS-485串口通信
【英文关键词】greenhouse cooling;control;temperature and humidity;illumination;RS-485 serial communication
【中文摘要】为了解决东南沿海地区的高温高湿天气造成温室降温控制难的问题,本课题研发了一套适合东南地区温室降温的以STC89C54RD+单片机为核心的控制系统。该系统利用温湿度传感器和光照度传感器对温室环境进行实时监测,实现半自动控制或自动控制温室内的相关设备,调节温室内的温湿度和光照度等微气候条件因子,为温室作物提供一个适合生长的环境。 该系统以各种环境因子为控制参数,控制温室内降温除湿设备的启停,如风机的开启与关闭、遮阳网的展开和折叠等。系统由PC终端机、RS485工业总线组网和主控制器组成,主控制器包括STC89C54RD+控制模块,温湿度及光照度采集模块、人机交互界面和驱动电路单元等模块电路。软件系统采用多模式独立运行并可互相切换的设计思路,同时引进多任务的编程思路,提高了程序运行的效率。本系统利用主从式多机通信数据采集方式,实现远程监控,从而为用户提供了一个便捷的控制平台。 本课题是计算机技术、通信技术与微机程序设计技术在现代农业自动化过程中的典型应用。通过实验验证,本文提出的控制方案能使所设计的系统有效、正常地运行。
【英文摘要】In order to solve the difficult problem of greenhouse cooling control which is caused byhot and humid weather in the southeast coastal areas,this subject develop a control systembased on STC89C54RD+MCU to suit the areas.The system uses the

temperature&humidity sensor and illumination sensor to monitor the greenhouse environment in real-time,realize the aim of semi-automatic or automatic control of the devices in greenhouse.It alsoadjusts the climatic factors like temperature,humidity and illumination in the greenhouse,sothe system can provide the crop with a suitable growing environment. The system uses environmental factors as control parameters to control the greenhousecooling dehumidification equipments,such as:the on/off status of the fan,the expansion andfolding of the shading networks,etc.The system is mainly made up of the following parts:PC,RS485 industrial bus network and the host controller,including temperature&humidityand illumination acquisition module,human-computer interaction interface,drive circuit unitand other peripheral circuits.The design idea of the software system applies a variety ofmodels which can operate independently of each other switch.Meanwhile,the multi-taskingprogramming ideas is also applied to improve the efficiency of the program.The system usesthe method of collecting data by master-slave multi-machine communication to achieveremote monitoring,so it can offer the customer a convenient control platform. This design is a typical application of 51 MCU and computer communications inautomation of modern agriculture.It proves that this system base on the control scheme in thethesis can run normally and reliably.

【题目】大豆不同碳代谢产物含量变化研究
【中文关键词】大豆; 可溶性糖; 蔗糖; 淀粉;
【英文关键词】Soybean; Soluble sugar; Sucrose; Starch;
【中文摘要】为明确不同碳代谢产物在大豆不同器官变化规律,在大田条件下,以三个栽培大豆品种为材料,测定不同生育时期不同器官可溶性糖、蔗糖、淀粉的含量。结果表明:随着生育进程推进,可溶性糖在茎秆、叶片、叶柄中及蔗糖在叶片、叶柄中含量呈"V"型变化,淀粉在茎杆中含量呈倒"V"型变化,R3期为转折点;可溶型糖在荚皮中含量及蔗糖在茎秆、荚皮中含量、淀粉在叶柄、荚皮含量呈逐渐升高趋势,叶片淀粉含量表现为升高-降低-升高趋势;不同品种大豆碳水化合物在植株体内变化规律相似。三种碳代谢产物含量在叶片中均表现为极显著正相关,而在茎秆中不同碳代谢产物含量相关性因品种而异。
【英文摘要】Carbon metabolism is an important process in soybean,however,there are few research on the variable rule of carbon metabolism product in different organs of soybean.Three soybean varieties were used to test the content of soluble sugar,sucrose and starch in different growing stages.With the growing process,the soluble sugar content appeared"V"-type changes in stem,leaves,and petioles,starch content also presented the same type in stem.The starch content presented inverted" V"-type changes in stem,and there was a turning point in R3 period.The soluble sugar content in pod shell,the sucrose content in stem and pod shell,the starch content in petioles and pod shell all appeared a gradually rising trend.The starch content appeared a trend of rising-decreasing-rising in leaves.It had familiar rules of carbohydrate accumulation in different varieties.The content of these three carbon metabolism products appeared significant positive correlation in leaves,while presented difference in stem for different varieties.

【题目】温室计算机监控系统的设计
【中文关键词】环境参数;温室监控;FX2N-8AD;五段变温
【英文关键词】Environmental parameters;greenhouse control;FX2N-8AD;five-paragraph changing temperature
【中文摘要】本文通过对农用温室的控制特点和主要参数要求的分析,提出采用PLC来实现温室主要参数控制的方法,该方法可同时对温室内的温度、湿度、光照度、CO2浓度进行有效的控制。 本文以中小型农用温室内的黄瓜栽培为例,阐述以PLC为核心的控制系统,该系统由信息采集系统、智能控制单元和执行机构三部分构成,信息采集系统利用FX2N-8AD模拟模块完成环境参数的采集和输入;主控单元FX2-32MT将传感器检测值与设定的温室参数值进行比较,输出相应的控制信号;执行机构根据控制信号,带动电机、电磁阀、风机等设备,以实现对温室的智能控制。通过GX-Simulator仿真软件的测试表明,该控制系统能够对相关环境参数在不同时段的控制要求方便地进行调节。 针对特定地区的气候条件,本文研究了以PLC为核心的温室计算机监控系统,该系统的主要特点是:首先,PLC的接口线路简单,外围元器件较少,整个系统运行可靠,可以保证温室的控制要求;其次,采用五段变温的控制方法,即在不同的时间段内设定不同的最适温度值,以便于最大限度的利用自然资源;最后,根据时间的不同及环境因子重要性的不同,在每一时段设置不同的优先级,以保证作物的优质发展。
【英文摘要】Based on the analysis of the control characteristics of agricultural greenhouse andrequirements of the main parameters,PLC is used to achieve controlling method of the mainparameters in greenhouse in this paper,this method could effectively control the greenhousetemperature,humidity,light intensity,CO2 concentration simultaneously. Taking cucumber cultivation in small and medium agricultural greenhouse as an example,thispaper presented control system which used PLC as a core,the system was consisted of threeparts,including information collection system,intelligent control unit and executive body,theinformation collection system used FX2N-8AD analog module to accomplish the environmentalparameters ’ collection and input;compared the values of sensor detections with greenhouse ’ sparameter,master control unit FX2-32MT outputted corresponding control signal;according tothe control signal,executive body drove motors,solenoid valves,fans and other equipments toachieve the intelligent control of greenhouse.GX-Simulator simulation software tests showedthat the control system could be adjusted easily relative environmental parameters which arebased on the different periods of control requirements. In the light of climatic conditions for a particular region,this paper studied computermonitoring system in greenhouse which used PLC as a core,The main feature of the system is:in the first place,PLC has a simple interface circuit and less external components,the systemensured the control requirements of greenhouse since it was reliable;Secondly,the system usedthe control method of five-paragraph changing temperature,in other words,the system set upspecial optimum temperature in different period to make use of maximum natural resources;Finally,according to the difference time and the different importance of environmental factors,the system set up different priorities slots in each time,so it could ensure high qualitydevelopment of crops.

【题目】大豆生育期间土壤无机态氮与植株硝态氮变化规律的研究
【中文关键词】大豆; 硝态氮; 铵态氮; 变化规律;
【英文关键词】Soybean; NO3--N; NH4+-N; Change Rule;

【中文摘要】试验以2个大豆品种,3种施氮肥水平(N0:0 kg hm-2、N75:75 kg hm-2、N150:150 kg hm-2),对大豆生育期间土壤无机态氮(铵态氮、硝态氮)与植株硝态氮含量及变化规律加以研究,结果表明,土壤中无机态氮与大豆植株中硝态氮含量均呈下降趋势,三种施氮肥水平相比,除土壤铵态氮含量表现为N150>N75>N0,土壤硝态氮与植株硝态氮含量在各氮肥水平处理间未表现出明显的差异,并且大豆茎、叶柄中硝态氮含量与土壤中硝态氮含量呈极显著正相关(r=0.9316**;r=0.9355**),土壤铵态氮与土壤硝态氮含量呈极显著正相关(r=0.8746**,)可以用茎、叶柄中硝态氮含量来表征土壤无机态氮营养状况。
【英文摘要】This study was conducted with two soybean cultivars and nitrogen treatments(N0:0 kg hm-2,N75:75 kg hm-2,N150:150 kg hm-2)t,o study the content of NO3--N in the soil and plant during the growth period.The results showed that the contents of NO3--N in the soil and plant were downtrend,and the contents of NH4+-N in the soil were N150>N75>N0.The contents of NO3--N in the soil and plant were no obvious differences among different nitrogen treatments,and there were highly significant correlations between the contents of NO3--N in stem and petioles and in soil(r=0.9316** and r=0.9355** respectively),and the correlation between the contents of NH4+-N and NO3--N in soil reached the positive correlative level(r=0.8746**.) In conclusion,the contents of NO3--N in stem and petioles could be used to characterize the nitrogen nutritional status.

【题目】不同氮源对大豆生长发育的影响
【中文关键词】大豆, 氮素, 生物量, 产量
【英文关键词】soybean,nitrogen,growth,production
【中文摘要】试验以东农47为材料,利用砂培方法研究了氮素对大豆生长及产量构成的影响。结果表明:高氮促进了大豆营养器官生长,以NH4+的效果最明显,NO3- 没有明显促进作用;以NH4+作为氮源,R5期之前高氮水平下干物质积累量显著高于低氮处理,R5期以后低氮条件下荚果干物质积累量显著高于高氮处理,致使R6 – R8期低氮条件下干物质积累量显著高于高氮;低氮促进了大豆根系的生长,以NO3- 效果明显;根冠比随生育进程呈下降趋势,V4 – R4期低氮水平下根冠显著高于高氮处理,R4期以后根冠比差异不大。 高氮条件下株高、节数显著高于低氮处理,单株粒数、单株子粒重显著低于低氮处理,收获指数和表观收获指数显著降低,高氮条件下促进了植株生长,但不利于产量形成
【英文摘要】This work was conducted using DN47 which was cultivated by sand culture to study the effects of nitrogen on the growth and production of soybean, the results were shown as follows: High nitrogen levels stimulated the growth of vegetative organs of soybean, especially with NH4+, but not significantly with NO3-. Dry matter accumulation of treatments with high nitrogen were higher than that of treatments with low nitrogen level during the period from V4 to R5. Pod dry matter accumulation of low nitrogen treatments were higher significantly than that of high nitrogen treatments from R5 to R8, so the dry matter accumulation of low nitrogen treatments were higher than that of high nitrogen treatments from R6 to R8. Low nitrogen levels stimulated the growth of root, especially with NO3-. The root/shoot ratio decreased along with growing stage, and the ratio of low nitrogen treatments was higher than that of high nitrogen treatments from V4 to R4, but there was no significant difference after R4. The height, nod number of high nitrogen treatments were higher than that of low nitrogen treatments, but the seed number and seed weight per plant were lower than that of low nitrogen treatments, harvest index and apparent index decreased along with growing stage. High nitrogen promoted the growth of soybean plant, but were not in favour of production.

【题目】生物发酵式猪舍缓解热应激小气候智能化调控系统的研究
【中文关键词】猪舍;温湿度指数(THI);垫料;单片机;RS485串口通讯
【英文关键词】Pigsty;THI;Litter;Single chip;RS485 Serial communication
【中文摘要】本课题针对我国南方夏季高温高湿气候对猪的影响及猪舍内的粪便以及废弃物对环境造成的污染,开发了一套适应我国南方气候的猪舍小气候环境调控系统。该调控系统的目的是以温湿度指数(THI)结合湿度、垫料温度以及氨气浓度为主控参数,并结合猪的生理特性,为猪舍环境制定出更为合理的控制方案,从而有效地改善猪舍环境,同时减轻猪舍对环境造成的污染。为此,本文运用传感器技术、自动检测技术、通讯技术和微型计算机技术实现对猪舍环境因子(包括空气温湿度、垫料温度以及氨气浓度)的监测管理,完成了猪舍环境参数采集子系统和数据综合管理子系统的开发。其中,采集子系统以STC8958RD+单片机为核心,通过设计的外围电路以及编写的功能程序实现对环境参数的采集、显示以及对猪舍内的降温设备(包括喷淋、湿帘、风机)进行控制;数据综合管理子系统,通过RS485接口与采集子系统进行通讯,实现对猪舍环境参数数据的显示、存储、查询以及统计,并且能够对猪舍内的降温设备进行远程手动控制,数据综合管理系统提供了简洁的人机交互界面,使用户操作更加直观、便捷。　　本文对调控系统的下位机控制单元的软硬件设计以及上位机数据综合管理系统的主要内容进行阐述,也对驱动单元进行了简单的介绍。整个调控系统最后安装到实际现场当中进行调试运行,系统各个功能都运行正常。
【英文摘要】The topic discusses about the influence on pig in the hot and humid climate in summer insouthern China,and the environmental pollution made from feces and waste in pigsty.We developa microclimate environmental control system which fit to the climate in South China.The purposeof the control system is based on temperature and humidity index(THI)combined with humidity,litter temperature and ammonia concentration as the main control parameters,and also combinewith the physiological characteristics of pigs to make up a rational control program to effectivelyimprove pig environment and reduce the environmental pollution caused by pigsty.Therefore,thispaper makes use of technology of sensor,automatic detection,communications andmicro-computer to keep monitoring environmental factors in the pigsty(including air temperature,humidity,litter temperature and ammonia concentration),and succesfully develop a sub-system forcollection of environmental parameters in pigsty,and a data management sub-system.Thecollection subsystem which used STC8958RD as the core realize function of collection anddisplay of environmental parameters,controling cooling equipment(including spray,curtain andfan)by programming and designing of peripheral circuits.Integrated data management subsystemrealize function of display storage,query and statistic for environmental parameters in pigsty byusing RS485 interface to communicate with the subsystem,and can realize a function of remotemanual control for those cool equipments in pigsty.Integrated data management system provides asimple interactive interface help users to operate more intuitive and convenient.　In this paper,we elaborate hardware and software design for lower machine unit in controlsystems and PC data management system,and also give a brief mention about drive units.Thewhole system operate smoothly and normally after setting up on-site and debugging for run.

【题目】稻草还田配施化学氮肥 对水稻生长发育、产量和品质的影响
【中文关键词】水稻; 秸秆还田; 产量; 品质;
【英文关键词】rice; straw return; yield; quality;
【中文摘要】研究寒地稻草还田对寒地水稻生长发育、产量和品质的影响。结果表明,不同还田量处理的水稻株高、地上部植株干重、叶绿素含量和叶面积指数在生育转换期较对照低,长穗期和结实期与对照无明显差异;不同还田量处理在每穗粒数和结实率上与对照相比均达到显著水平,产量、穗数和千粒重均未达到显著水平;秸秆还田处理的稻米出糙率和精米率高于对照,垩白率和垩白度低于对照。还田9t/hm2处理提高了蛋白质含量,同时也提高了直链淀粉含量,但降低了食味品质。
【英文摘要】The effects of straw return plus nitrogen fertilizer on growth and development,yield and quality in rice were studied.In comparison with the rice-straw removal treatment,the rice-straw return treatment reduced the plant height,dry matter

weight,chlorophyll content and leaf area index during growth transition period,whereas no significant differences between both the treatments were observed during the heading period and the grain-filling period.There were no significant differences in yield components (grain filed,Panicles and 1000-grain weight) except the spikelets per panicle and seed-setting rate between the two treatments.The rates of brown and milled rice increased while chalky rice rate and chalkiness decreased in the rice-straw return compared with those in the rice-straw removal treatment.Rice – straw return with 9t hm2 increased both the protein and amylose contents,which resulted in the decline of cooked rice quality.

【题目】典型黑土侵蚀区不同耕作措施的水土保持功效研究
【中文关键词】植被恢复; 径流量; 侵蚀量; 土壤储水量;
【英文关键词】vegetation recovery; runoff; sediment loss; soil moisture;
【中文摘要】利用田间定位实验来分析植被恢复措施的自我恢复能力和其水土保持功效,目的为黑土区土壤侵蚀治理和生态环境建设提供依据。结果表明,植被恢复措施从5月份开始,在4个月的时间内覆盖率可达100%,植物种类丰富。2007年和2008年植被恢复措施年径流水深分别比传统耕作低64.7%和99.7%,比裸地低98.1和99.9%;2008年植被恢复措施径流系数是2007年的19%。2007和2008年植被恢复措施侵蚀模数都少于传统耕作和裸地。2008年植被恢复措施侵蚀模数比2007年低97.2%。自然植被恢复措施能够有效的抑制土壤侵蚀和地表径流的发生,为植物生长提供更多的有效水分。相关分析表明,3种管理措施径流水深与I30和I60都达到极显著水平,地表径流主要发生在6-9月份,土壤侵蚀主要发生在6-7月份。
【英文摘要】Soil erosion is threatening the development of agriculture in black soil region Northeast China,and has been increased more pressure to local environment. The object of this study is to declare the recovery of natural vegetation affecting soil loss and provide method to manage local agriculture and protect environment. In this project,rainfall,runoff,soil loss,and soil moisture from 5 m×12 m plots were recorded in an experimental field under three management systems in 2007 and 2008. The Vegetation recovery management (VR) system,Keeping the land growing naturally; Conventional tillage management (CT) system,furrows were cultivated three times down slope in growing season,then rotated the whole field and rebuild the ridges; Bare management (B) Keeping the field bare from spring to fall. The runoff of Vegetation recovery in a year was reduced 99.7% and 64.7%,99.9% and 98.1%,than CT and B in 2008 and 2007,respectively. Sediment in VR was less than both CT and B in the two years. There were significant different between runoff and precipitation,runoff and I30,and runoff and I60 in all treatments. The most of runoff took place from June to September,and soil loss from June to July because higher density precipitations were mainly condensed in these months with lower residual cover rate in July. VR system reduced the runoff,saved much water for plants growing,and was strongly recommended as a good management to reduce soil loss in field. These results indicated VR was the feasible soil and water conservation practice in typical black soil Northeast China. VR adopted in local field can recover quickly and effectively reduce runoff and soil loss.

【题目】Association of toll-like receptor 2 polymorphisms with somatic cell score in Xinjiang Brown cattle
【中文关键词】新疆褐牛;TLR2基因;奶牛乳房炎;体细胞评分
【英文关键词】haplotype , SCS , SNP , TLR2, Xinjiang Brown cattle .

【中文摘要】本研究是为了寻找牛TLR2基因的多态性位点及单倍型,并分析基因型或单倍型个体间体细胞数的差异,了解TLR2基因在荷斯坦牛和新疆褐牛抗乳房炎中的作用。实验首先对TLR2基因的编码区序列进行扩增、测序和序列比对,接着分析TLR2基因型或单倍型间体细胞数的差异。结果显示TLR2基因中存在15个 SNPs (E+653, E+945, E+978, E+1010, E+1250, E+1688, E+1707, E+1779, E+1782, E+1891, E+1995, E+2025, E+2055, E+2214和E+2295),这些SNP位点在两个品种内均处于Hardy-Weinberg平衡状态(P >0.05);除E+945(P >0.05)位点外,其他10个位点在两个品种间的基因型分布差异都极显著(P <0.01)。分析每个SNP位点与SCS的相关性,显示在 11 SNPs (E+945, E+978, E+1010, E+1688, E+1707, E+1779, E+1782, E+1995, E+2025, E+2055 和E+2214)中, AB 基因型个体的SCS 显著低于AA基因型个体 (P < 0.05);由上面的11个位点构建单倍型进行分析,结果显示Hap5个体的SCS比 Hap3个体低 (P < 0.05)。提示Hap5可能在奶牛抗隐性乳房炎中其重要作用。

【英文摘要】This study aims to identify single nucleotide polymorphisms (SNPs) and haplotypes in the TLR2 gene, and analyze the association of SNPs or haplotypes and somatic cell scores in 151 Xinjiang Brown cattle and 138 Holsteins to evaluate the role of TLR2 during intramammary infections. TLR2 coding region was amplified by PCR and screened for SNP sequencing.Genotypes and frequencies of SNPs were identified. Finally, the associations of genotypes or haplotypes and somatic cell scores (SCS) were analyzed. The results showed that: (i) 15 SNPs (E +653, E +945, E +978, E +1010, E+1250, E+1688, E+1707, E+1779, E+1782, E+1891, E+1995, E+2025, E+2055, E+2214 and E +2295) were observed and detected from 289 cows; (ii) distribution of the 14 SNPs were significantly different from Xinjiang Brown cattle and Holstein (P < 0.001) except for the E +945 (P > 0.05); (iii) in 11 SNPs (E+945, E +978, E +1010, E+1688, E+1707, E+1779, E+1782, E+1995, E+2025,E+2055 and E +2214), the SCS of AB genotype was lower than AA (P < 0.05) in Xinjiang Brown cattle; and (iv) haplotypes composed of the above-mentioned 11 SNPs were constructed. The SCS of cattle with Hap5 was lower than that of Hap3(P < 0.05). This suggests that Hap5 might play an important role in sub-mastitis resistance in Xinjiang Brown cattle.

【题目】基于边缘流的水平集牛胴体眼肌图像分割
【中文关键词】水平集;边缘流;3-向概率;眼肌图像

【英文关键词】level set;edge flow;direction probability;rib—eye image
【中文摘要】牛肉在切割过程中常存在残留血液覆盖在脂肪表面,使得脂肪和肌肉对比减弱。针对生物体弱对比图像分割问题,采用了结合边缘流的水平集方法对牛肉眼肌图像进行分割,准确提取了眼肌边缘,分离出了眼肌内部脂肪与肌肉组织,准确率高。该方法避免了单纯边缘流算法提取边界不连续的问题,降低了水平集算法的迭代时间复杂度,避免了初始轮廓选取的主观性。并将实验结果与水平集方法进行了对比,基于边缘流的水平集方法避免了水平集方法在分割中小区域分割的准确性不高,不能准确分离脂肪与肌肉组织的弱点。实验结果证明,基于边缘流的水平集方法是对牛肉眼肌图像进行分割的有效新方法。
【英文摘要】In beef cutting process.residua1 blood usually covered on the fat surface.It caused the fat and muscle ’s contrast weaken.In the view of biologic weak image segmentation question,used level set method based on edge flow technology to carry on the segmentation of rib—eye image of beef carcass.It extracted the edge of rib—eye image.separated the muscle and fat tissue accurately.The rate of accuracy is high.This method avoided the disadvantage of edge flow method which could ’t gain continuous edge.Also it debased the time cornplexity of level set method and avoided subjectivity of selecting initially contour.To contrast the experimental result with level set method,this method avoided the disadvantage of level set methods which couldn ’t separate the fat and muscle tissue accurately,get the edge clearly and the veracity is not high in small region.The experiment result shows that level set method based on edge flow technology is the new effective method for the segmentation of rib—eye image of beef carcass.

【题目】果园环境智能监控系统设计
【中文关键词】果园;智能温湿度传感器;RS-485通信;自动调控系统
【英文关键词】orchard; intelligent sensor; RS-485 communication; auto-controlling system
【中文摘要】我国幅员辽阔,气候条件多样化,有些地区夏天炎热,冬天发生霜冻灾害,严重影响了农作物的生长。与传统的防止果园霜冻等灾害采用的物理或化学方法不同,本文提出并设计了一种实用型的果园防霜冻和抗高温的小气候自动调控系统。　根据果园内影响果树生长的环境因子,如温度、湿度等条件,提出系统的环境因子自动调控方案。由于不同的果

园,不同地区,不同的用户需求不同,本自动调控系统设计了三种组成模式,供用户根据需要合适地选择。 本文以STC89C51超强抗干扰、超低功耗微处理器为核心,使用DHT81智能温湿度传感器现场采集数据,采用红外遥控技术,方便用户操作。系统提供了时钟、温湿度显示、参数设置三种显示模式。运用RS-485多机通信技术,实现对果园的分区域控制。 系统对接收到的数据,进行去极值数字滤波等抗干扰的处理后,发送输出控制信号。软件方面,完成了各个模块的程序编写,完成了多任务时钟的设计,产生了可变时间的延时,为每个任务块调度时间。 本文的另一个模块是喷雾系统和防霜扇系统。提供了进行果园的整体规划,输配水管道系统、喷头及附属设备的设计方案,并说明了防霜扇系统的作用原理及使用前景。 通过实验验证,本文提出的果园防霜冻和抗高温的小气候自动调控系统能有效、正常地运行。最后,总结了全文,介绍了已完成的主要工作,说明了本文的主要特点和意义。同时,指出了系统设计的不足和改进思路,为今后课题的进一步深入研究做准备。

【英文摘要】With a vast territory, various types of climates, complicated natural conditions of hot summer and cold winter, what effects the growth of agricultural crops seriously. The thesis present and design a kind of auto-controlling system for the orchard environment of frost and high temperature resistance what is different from the traditional method auto-controlling system. According to the condition, control characteristics and control method of environment factors such as temperature, humidity which influence agricultural crops growing in orchard. The thesis put forward the project controlling these environment factors intelligently that was fit for this system. Considering different orchards, different areas, different request of different customers, the intelligent monitor and control system for environment was designed for the three kinds of constituting mode. According to actual demand, the customers can choose the fit mode. Adopting STC89C51 of strong anti-jamming and ultra-low-power consumption microcontroller as a core, the intelligent temperature and humidity sensors were used to collect data in spot , infrared remote control techniques was used to facility consumer use. There were three displaying modes of calendar, parameter setting, temperature and humidity. RS-485 multiprocessor communication was designed in the thesis to establish communication in the different parts of orchard. With the receiving data being coped with the method of digital filter such as extreme value controlling, the control signal was set out. In the aspect of software, program block design was given. The multi-task clock by which different delay time was set was adopted when designed, and the reliability and expansibility of the system was improved. It is another emphasis that sprinkler irrigation system and frost fans were designed in the thesis. It put forward system general layout in orchard, the method of selecting pipelines and water sprayers and prospect of the application of frost fans. Based on the device, lots of experiments prove that the system was right and viable. Finally, the thesis was summarized, the main work that the thesis completed was introduced, the main work that characteristics and the significance was explained, at the same time, the shortage and the improved idea were pointed out and the preparation was made for the further research in future.

【题目】黑土区耕作措施对春季耕层温度的 影响
【中文关键词】地温; 容积热容量; 净辐射通量; 土壤热通量;
【英文关键词】soil temperature; bulk heat capacity; net radiation flux; soil heat flux;
【中文摘要】本文通过长期定位试验,分析了免耕、少耕和旋松三种耕作措施下耕层黑土土壤容积热容量、土壤热通量、净辐射的变化,进而阐明了耕作措施对耕层土壤温度日变化的影响。研究表明:各处理0cm和5cm处土壤温度变化与净辐射通量变化存在极显著相关关系。5cm处土壤热通量日变化各处理均表现为"S"型波动曲线,日变化相对较大,10cm处相对较小。免耕秸秆覆盖日净辐射平均值为0.58MJ/m2,比少耕和旋松小0.04MJ/m2,受净辐射、容积热容量和5cm处热通量影响,0cm和5cm处土壤温度日变化较大,且有波动现象;受深层较低地温、容积热容量和10cm处热通量影响,10cm和15cm处土壤温度变化较小,且较平稳。所有耕作措施土壤温度随深度的增加出现滞后现象。免耕秸秆覆盖措施各耕层相对于其他处理地温均较低,影响春季地温的升高。
【英文摘要】This study determined soil temperature of spring under different tillage systems by analyzing heat transferred in soil under a long-term experiment.Soil moisture,bulk density,radiation,and soil temperatures were measured at the same time,and then they could be used to calculate bulk heat capacity,net radiation flux,soil heat flux,which were contributed to analyze the changing of soil temperature in the whole day.The results showed that there were significantly relationship between net radiation and temperature at the depth of 0cm and 10cm at P=0.01 level.The daily soil heat flux changed as "S"curves at the depth of 5cm,and this kind of variation were bigger than the depth of 10cm.The net radiations of minimum tillage and rotary tillage were more 0.04 MJ/m2 than no tillage.Based on the effect of soil heat flux and the net radiation,the temperatures fluctuated at the depth of 0cm,5cm were stronger than 10cm and 15cm,and the heat in the topper layer transferred faster than deeper layer.Compared with upper layers,soil temperatures variation were lag in deeper layer.Top layers soil temperatures of no tillage were the lowest among all treatments,which impacted the seeds burgeon during spring,in black soil area,Northeast of China.

【题目】秸秆还田对白浆土养分含量的影响
【中文关键词】秸秆还田; 大豆; 白浆土; 土壤养分;
【英文关键词】Straw returning; Soybean; Planosol; Soil nutrient;
【中文摘要】秸秆还田可以减少环境污染,培肥土壤,是未来农业生产的发展趋势。本试验研究了不同秸秆还田方式及数量对白浆土养分含量的影响。结果表明,两年的玉米秸秆还田能够增加土壤有机质含量,秸秆还田量越大效果越明显,但对土壤全氮的影响不大;秸秆全量还田可以增加大豆生长后期的土壤全磷和全钾含量,而根茬还田对其影响较小。秸秆还田增加了土壤碱解氮含量;而对土壤有效磷含量影响不大;秸秆全量还田增加了土壤速效钾含量,而根茬还田对土壤速效钾含量没有表现明显影响。
【英文摘要】Straw returning could reduce environmental pollution and improve the fertility of soil.The effects of straw returning on the Planosol nutrient content was investigated in this experiment.The results showed that the organic matter content of soil increased when straw of maize was returned for two years,and the effect became more obvious as the crop-residue incorporation increased,while there was no significant influence on soil total nitrogen.Whole straw returning could increase the content of soil total P and K in later growth stage of soybean,while stubble remaining in field had little effect on them.Straw returning increased the content of available nitrogen,while it had little effect on the content of available phosphorus.Whole straw returning increased the content of available potassium,while stubble remaining in field had little effect on it.

【题目】秸秆还田对水稻生育期间土壤溶液中养分变化的影响
【中文关键词】水稻; 秸秆还田; 养分;
【英文关键词】rice; straw returning; nutrient;
【中文摘要】水稻秸秆还田可以减少环境污染、培肥土壤,是未来水稻生产的发展趋势。试验设置水稻秸秆还田和不还田两个处理,研究了水稻生育期内土壤溶液中的无机氮(NH4+-N和NO3--N)、磷(P2O5)、钾(K2O)的含量变化。结果表明,秸秆还田使土壤溶液中铵态氮(NH4+-N)含量增加,而对硝态氮(NO3--N)含量的影响则是前期两个处理含量相近,而后期秸秆还田处理降低了土壤溶液中硝态氮(NO3--N)含量。秸秆的施入降低了水稻生育前期土壤溶液中磷的浓度,而随着生育期的推进,秸秆还田处理中磷的含量逐渐增加,并超过不还田处理中的含量。土壤溶液中钾的含量因秸秆施入变化最为明显,在整个生育期内,始终表现为秸秆还田处理高于不还田处理。
【英文摘要】Rice straw returning can reduce environmental pollution and improve the fertility of soil.This research was conducted in experiment and practical base of Northeast Agricultural University with two treatments,straw returning and no straw returning to rice field and study the change of inorganic nitrogen,phosphorus and potassium content in soil solution.The results showed that the content of NH4+-N increased in the treatment of straw returning,and the concentration of NO3--N showed as two main respects: two treatments were similar in earlier stage and NO3--N was reduced by straw returning in later period.The concentration of P was decreased by application of straws at earlier stage,and the content of P increased gradually and exceeded the content of no returning with growth stage progressing.The change of K was the most obvious because of straw application.The content of K in the straw returning treatment was higher than that of no returning during the whole growth period.

【题目】Over-expression of osa-MIR396c decreases salt and alkali stress tolerance
【中文关键词】无
【英文关键词】Alkali stress,Arabidopsis,miRNA target,osa-MIR396c,Rice,Salt stress
【中文摘要】无
【英文摘要】Salt and alkali stress are two of the main environmental factors limiting rice production. Thus, understanding the mechanisms of salinity and alkali stress tolerance is necessary to modify rice to increase its resistance to salinity and alkaline stress. MicroRNAs (miRNAs) are ~21-nucleotide RNAs that are ubiquitous regulators of gene expression in eukaryotic organisms. In plants, miRNAs constitute one of five classes of small RNAs that function primarily as negative regulators for gene expression at the posttranscriptional level. Several plant miRNAs, such as miR396, play vital roles in plant growth, development and resistance to stresses. In this study, we identified osa-MIR396c, which shows dramatic transcript change under salt and alkali stress conditions in Oryza sativa. We designed an experiment to detect miRNA – target interaction and demonstrated that several transcription factors related to growth, development, and stress tolerance are targeted by osa-MIR396c. Transgenic rice and Arabidopsis thaliana plants constitutively over-expressing osa-MIR396c showed reduced salt and alkali stress tolerance compared to that of wild-type plants. Overall, this study further established a link between salt and alkali stress and osa-MIR396c in rice.

【题目】A Single-repeat R3-MYB Transcription Factor MYBC1 Negatively Regulates Freezing Tolerance in Arabidopsis
【中文关键词】无
【英文关键词】R3-MYB; MYBC1; Transgenic plant; Mutant; Freezing; Arabidopsis thaliana
【中文摘要】无
【英文摘要】We had previously identified the MYBC1 gene, which encodes asingle-repeatR3-MYB protein, as a putative osmotic responding gene; however, no R3-MYBtranscriptionfactor has been reported to regulate osmotic stress tolerance. Thus, we sought to elucidate the function of MYBC1 in response to osmotic stresses. Real-time RT-PCR analysis indicated that MYBC1 expression responded to cold, dehydration, salinity and exogenous ABA at the transcript level. mybc1 mutants exhibited an increased tolerance to freezing stress, whereas 35S::MYBC1 transgenic plants exhibited decreased cold tolerance. Transcript levels of some cold-responsive genes, including CBF/DREB genes, KIN1, ADC1, ADC2 and ZAT12, though, were not altered in the mybc1 mutants or the 35S::MYBC1 transgenic plants in response to cold stress, as compared to the wild type. Microarray analysis results that are publically available were investigated and found transcript level of MYBC1 was not altered by overexpression of CBF1, CBF2, and CBF3, suggesting that MYBC1 is not down regulated by these CBF family members. Together, these results suggested that MYBC1is capable of negatively regulating the freezingtolerance of Arabidopsis in the CBF-independent pathway. In transgenic Arabidopsis carrying an MYBC1 promoter driven β-glucuronidase (GUS) construct, GUS activity was observed in all tissues and was relatively stronger in the vascular tissues. Fused MYBC1 and GFP protein revealed that MYBC1 was localized exclusively in the nuclear compartment.Gadget timed out while loading

【题目】适应条件对鱼类续航游泳能力的影响
【中文关键词】美国红鱼,黑鲷,适应流速,适应时间,加速时间,续航时间
【英文关键词】Sciaenops ocellatus,Acanthopagrus schlegel,acclimation flow velocity,acclimation time period,acceleration time period,sustained swimming time
【中文摘要】以续航时间作为鱼类游泳能力的评测指标,就适应流速、适应时间、加速时间等适应条件以及测试流速4种因素对美国红鱼及黑鲷续航游泳时间的影响进行了研究。试验采用均匀设计,其中美国红鱼采用4因素8水平试验方案,黑鲷采用4因素7水平试验方案。试验研究和理论分析表明,加速时间对大流速条件下的续航时间有较大影响,而对小流速条件下的续航时间影响可以忽略,具体影响大小与鱼类的品种和规格、流速大小、加速时间等有关;适应流速建议控制在1.5BL/s以内,以避免测试前鱼类过多的能量损失。尽管较长的适应时间更有利于鱼进行充分的调整以适应新的环境,但适应时间仍建议控制在60min以内;测试流速对鱼类的续航时间有极为显著的影响,两种鱼的续航时间均随测试流速的增加呈幂函数规律衰减。 更多还原
【英文摘要】Swimming performance is considered a critical character determining survival in many fishes in the natural circumstances.For many fishes,swimming is the main way to avoid the attack from their predators, obtain food,find a mate,and so on.Experimental tests are important means for measuring the swimming performance of fish.Many influence factors on fish ’s swimming performance have been studied extensively.However,important as they are,no study has been carried out on the influence of acclimation time period, acclimation flow velocity and acceleration flow velocity on fish ’s swimming performance.Experimental results measured under different acclimation conditions are incomparable and are always open to question.In this paper,the effects of acclimation flow velocity,acclimation time period,acceleration time period and testing flow velocity on the sustained swimming time of Sciaenops ocellatus and Acanthopagrus schlegel were studied.The Uniform Design method was used in the experiments where a 4-factor and 8-level design was applied to Sciaenops ocellatus tests and a 4-factor and 7-level design was applied to Acanthopagrus schlegel tests.The experimental results and theoretical analysis showed that the acceleration time period has greater effect on the sustained swimming time under stronger flow velocities than that under slower flow velocities.The influence of acceleration time period on the sustained swimming time is also related to fish species,fish size,current velocity,etc.It is suggested that the maximal acclimation velocity should be limited to 1.5 BL/s to avoid significant energy loss of testing fish.The acclimation time is recommended not to exceed 60 min though a longer time may be better for the fish to adjust itself to a new environment.A well-fitted power-function relationship was found between the sustained swimming time and the testing flow velocities.The sustained swimming time decreases significantly as the flow velocity increases.The conclusions obtained in this paper may give an important guidance to the testing approaches of fish ’s swimming performance

【题目】鱼类游泳速度分类方法的探讨
【中文关键词】游泳能力,最优巡航速度,最大续航速度,临界游泳速度,最大探顶游泳速度,冲刺游泳速度
【英文关键词】swimming performance,optimum swimming speed,maximum sustained swimming speed,critical swimming speed,maximum domed swimming speed,burst swimming speed
【中文摘要】游泳速度是评价鱼类游泳能力的重要指标。本文对常用的几种鱼类游泳速度概念和分类方法进行了总结。目前,以时间长度作为分类标准可将游泳速度分为巡航游泳速度(Cruising swimming speed,T>200min)、长时游泳速度(Prolonged swimming speed,200min>T>20s)、冲刺游泳速度(Burst swimming speed,T<20s)3类。但由于时间长度的选择缺乏令人信服的依据,很多学者并未遵循这一时间界定标准进行各类试验,致使游泳速度的界定出现混乱,从而使以时间长度作为分类依据的方法失去意义。作者综合多数学者的研究方法,以鱼类的游泳状态作为依据,重新对鱼类游泳速度进行分类,并在这一分类基础上拓展引申出最大探顶游泳速度这一新概念,并对其推求方法和实际意义进行了探讨。根据新的分类方法,鱼类游泳速度主要分为5大类:最优巡航速度(Optimum swimming speed)、最大续航速度(Maximum sustained swimming speed)、临界游泳速度(Critical swimming speed)、最大探顶游泳速度(Maximum domed swimming speed)、冲刺游泳速度

(Burst swimming speed)。其他游泳速度概念基本可以按照上述分类进行归并。借助最大探顶游泳速度这一概念,作者进一步探讨了其与最大续航速度、临界游泳速度3者之间的联系,认为在某种程度上这3种游泳速度作为评价鱼类游泳能力的指标具有一致性。

【英文摘要】Swimming speeds are the most important indices for evaluation of fish swimming performance.The terminologies and classification of fish swimming performance were summarized in this paper.Based on the duration times for which fishes swam,fish swimming speeds can be divided into cruising swimming speed(T>200min),prolonged swimming speed(200 min>T>20 s)and burst swimming speed(T<20 s)by a recommended classification method.However,this classification method has not been generally accepted due to lack of convincible physiological and ecological evidence.Much wider time range has been used by many researchers,which makes the definition confusing and the classification be of little meaning.Taking most evaluation methods of fish swimming performance uesd by different researches into consideration,a new classification method of fish swimming performance is proposed in the paper.And a new concept of swimming speed,maximum domed swimming speed,is introduced into this new classification framework together with a discussion on its calculation method and practical significance.According to the new classification system,fish swimming speeds are classified into five kinds:optimum swimming speed,maximum sustained swimming speed,critical swimming speed,maximum domed swimming speed and burst swimming speed.Other concepts of swimming speeds can be ultimately merged into the above five kinds respectively.Furthermore,possible relevance among maximum sustained swimming speed,critical swimming speed,and maximum domed swimming speed was discussed.It is regarded that common consistence may exist among these three swimming speeds.

【题目】SNPs discovery and CAPS marker conversion in soybean
【中文关键词】无
【英文关键词】Soybean,SNP,High-through sequences,CAPS,Association analysis
【中文摘要】无
【英文摘要】To discover new SNPs and develop an easy assay method in soybean, we compared the high-throughput pyrosequencing ESTs with whole genome sequences in different soybean varieties and identified 3899 SNPs. Transitions were found to be much more frequent than transversions in these SNPs. We found that SNPs were widely distributed in the soybean genome, targeting numerous genes involved in various physiological and biochemical processes influencing important agronomic traits. A set of 16 SNPs were validated in nine soybean varieties, and seven SNPs were converted into CAPS. From functional gene association analysis, the marker CAPS282 on the 3′-UTR of gene Glyma07g03490 was identified as associated with 100-seed weight in soybean. The SNP discovery and CAPS markers conversion system developed in this study is fast and cost effective, and holds great promise for molecular-assisted breeding of soybean.

【题目】Profiling of cold-stress-responsive miRNAs in rice by microarrays
【中文关键词】无

【英文关键词】MicroRNA,Cold stress,Microarray,Oryza sativa
【中文摘要】无
【英文摘要】MicroRNAs (miRNAs) are small single-stranded RNAs with a length of about 21 nt; these non-coding RNAs regulate developmental and stress responses in plants by cleaving mRNAs. Coldstress is one of the most severe abiotic stresses and adversely affects rice yields by restraining sowing time, causing tissue damage, and stunting growth. Although many miRNAs have been identified in rice, little is known about the role of miRNAs in the response to coldstress. In this study, we identified 18 cold-responsivericemiRNAs using microarrays. Most were down-regulated. Members of the miR-167 and miR-319 families showed similar profiles. Intriguingly, members of miR-171 family showed diverse expression patterns. Three miRNAs derived from transposable element sequence were clustered within an intron and proved to be co-transcribed with the host gene only under coldstress. The existence of hormone-responsive elements in the upstream regions of the cold-responsivemiRNAs indicates the importance of hormones in this defense system mediated by miRNAs. Two miRNA target pairs validated by 5′ RACE showed opposite expression profiles under coldstress. Finally, the predicted stress-related targets of these miRNAs provided further evidence supporting our results. These findings confirm the role of miRNAs as ubiquitous regulators in rice.

【题目】Over-expression of a glutathione S-transferase gene,GsGST, from wild soybean (Glycine soja) enhances drought and salt tolerance in transgenic tobacco
【中文关键词】无
【英文关键词】Glutathione S -transferase,Soybean,Stress tolerance,Transgenic tobacco,Wild soybean
【中文摘要】无
【英文摘要】Glycine soja is a species of soybean that survives in adverse environments including high salt and drought conditions. We constructed a cDNA library from G. soja seedlings treated with NaCl and isolated a glutathione S-transferase gene (GsGST: GQ265911) from the library. The cDNA encoding GsGST contains an open reading frame of 660 bp and the predicted protein belongs to the tau class of GST family proteins. Tobacco plants over-expressing the GsGST gene showed sixfold higher GST activity than wild-type plants. Transgenic tobacco plants exhibited enhanced dehydration tolerance. T-2 transgenic tobacco plants showed higher tolerance at the seedling stage than wild-type plants to salt and mannitol as demonstrated by longer root length and less growth retardation.

【题目】Genome-wide analysis of FK506-Binding protein genes in Populus trichocarpa
【中文关键词】生物信息学;叶绿体;FK506结合蛋白;肽基-脯氨酰顺反异构酶;毛果杨;温度应力
【英文关键词】Bioinformatics ;Chloroplast ;FK506 -binding proteins ;Peptidyl – prolylcis/trans isomerization activity;Populus trichocarpa;Temperature stress
【中文摘要】FK506结合蛋白(FKBPs)具有肽基-脯氨酰顺反异构酶活性,在不同的生物体中肽基-脯氨酰顺反异构酶具有类似分子伴侣的作用。本实验对毛果杨中的FKBP基因进行了全基因组分析,发现31个FKBP基因,分别分布在11条染色体上。运用了生物信息学的方法对对毛果杨中的FKBP基因进行了亚细胞的定位、和其他植物中该基因的进化关系以及亚族的功

能验证。根据FKBP基因的蛋白序列构建了进化树,同时研究了毛果杨FKBP基因与其他植物中FKBP家族基因的进化关系,包括拟南芥和水稻。FKBP基因复制在其进化过程中起到重要的作用。对叶绿体中的FKBP基因进行了不同光照处理的表达,同时对所有的FKBP基因进行了不同温度处理的表达。本实验为进一步研究毛果杨和其他植物中FKBP基因的特征提供的信息。

【英文摘要】FK506 -binding proteins (FKBPs) are characterized by peptidyl – prolylcis/transisom erization activity that may confer analogous functions to molecular chaperones invarious organisms. In this study, genome-wide analysis of FKBP genes in Populus trichocarpa was performed. A totalof 31 genes were identified to encode FK506 -binding proteins in P.trichocarpa . These genes were distributed on chomosomes. The subcelluar locations and evolutionary relations hips of FKBPs in P. trihocarp a and other plant were analyzed, and the functions of the FKBPs isofo rms were deter mined bioi nformatic ally. A phylog enetic tree was geneated from alignments of PtFK BP prote in sequenc es,while phylogenetic relationships were also examined betweenPtFKBPs an d FKBP in Arab idop si s t halia naan d Ory za s ativ a.Duplication played a significant role in poplar FKBP gene family evolution and expansion . The expression patterns of chloroplastic FKBP genes inresponse to different periods ofillumination were measured , indicating that many FKBP genes are regulated by light. Meanwhile, several PtFKBPs were differentially regulated at the transcriptional level under cold and heat stress. This study provides new information that should permit further studies to characterize the functions of FKBPs i n P.trichocarpa and other plants.

【题目】Genome-wide analysis of BURP domain-containing genes in Populus trichocarpa.

【中文关键词】生物胁迫;生物信息学;BURP基因;毛果杨

【英文关键词】abiotic stress; bioinformatics; BURP gene; Populus trichocarpa .

【中文摘要】基因的不同表达控制着生物的不同性状,BURP蛋白家族是植物界中广泛存在的基因家族,具有保守结构域。在植物性状表达中起着多种重要功能,但在毛果杨中尚不清晰。本文利用生物信息学对毛果杨进行全基因组分析,18个PtBURP基因被确定,根据它们在染色体上的定位被命名为PtBURPs,并对这18个基因进行相关特征分析;通过PtBURP蛋白的序列比对构建了毛果杨PtBURP基因的进化树,同时研究了毛果杨PtBURP基因与其他植物中BURP家族基因的进化关系,包括水稻、大豆、玉米和高粱。依据同源关系PtBURP基因可分为PG1β-like, BNM2-like, USP-like, RD22-like 及 BURP V五大类。对PtBURP序列进行了MEME基序分布及多重序列比对分析,并根据10个PtBURP基因在不同处理下的表达水平分析对毛果杨BURP家族基因的复制和进化,以及表达模式和功能进行了讨论。

【英文摘要】BURP domain-containing proteins have a conserved structure and are found extensively in plants. The functions of the proteins i n t his f amily are diverse, but remain unknown in Populus trichocarpa .In the present study, a complete genome of P. trichocarpa was analyzed bioinformatically. A total of 18BURP family genes, named PtBURPs, were identified and characterized according t o t heir physical positions on theP. trichocarpa chromosomes. A phylogenetic tree was generated f rom alignments of PtBURP protein sequences, while phylogenetic r elationships were also examined betweenPtBURP s and BURP family genes in other plants, including rice, soybean, maize and sorghum. BURP genes in P. trichocarpawere classified i nto five classes, namely PG1β-like, BNM2-like, USP-like, RD22-like and BURP V. The multiple expectation maximization f or motif elicitation (MEME) and multiple protein sequence alignments of PtBURPs were also performed. Results from the transcript level analyses of 10 PtBURP genes under different stress conditions revealed the expression patterns in poplar and led to a discussion on genome duplication and evolution, expression profiles and f unction of PtBURP genes.

【题目】Genome-wide survey and characterization of the WRKY gene family in Populus trichocarpa.
【中文关键词】WRKY;杨树;基因复制;系统进化;表达谱分析
【英文关键词】WRKY; Poplar ;Phylogenetic analysis ;Duplication ;Expression patterns
【中文摘要】WRKY蛋白是一类广泛参与植物生长和发育过程的转录因子家族,其序列的N端含有高度保守的WRKYGQK序列,在其序列的C端,含有一个C2H2或C2HC型的新型锌指结构。近年来,有关WRKY基因家族在草本植物全基因组中研究较多,对木本植物基因组WRKY基因进行鉴定和分析,将有助于完善该家族的功能及进化信息。本研究以杨树最新基因组序列为材料,利用生物信息学方法分析杨树全基因组WRKY转录因子基因的数目、种类、基因复制现象和表达谱。结果表明,杨树中共预测到104个可能的WRKY基因。以WRKY保守结构域进化树的结果以及锌指结构特征为基础对杨树WRKY基因进行分类,共分为三个组和7个亚组,即III组,II组包括IIa、IIb、IIc、IId和IIe亚组,I组包括Ia亚组和Ib亚组。通过对全基因组WRKY基因进行物理位置和基因家族分析,发现杨树第14号染色体上存在WRKY基因聚集热点,其大小为2.3Mb。统计学分析表明大约有83 %的WRKY基因在进化过程中存在明显的基因复制现象,其中有69%的基因参与了片段复制事件,说明杨树WRKY基因增多主要是由于基因片段复制现象频繁造成的。利用半定量RT-PCR技术,对杨树WRKY第III组基因进行了逆境胁迫下(低温、干旱、高盐和水杨酸)的表达谱分析。结果表明WRKY基因在不同胁迫处理下表达量存在明显差异。同时,PtWRKY76基因在0.1mM水杨酸或25 %PEG-6000胁迫后,表达量显著升高。这一发现将为下一步克隆重要功能基因奠定基础。
【英文摘要】Abstract WRKY transcription factors participate in diverse physiological and developmental processes in plants. They have highly conserved WRKYGQK amino acid sequences in their N-termini, followed by the novel zinc-finger-like motifs, Cys2His2 or Cys2 HisCys. To date, numerous WRKY genes have been identified and characterized in a number of herbaceous species. Survey and characterization of WRKY genes in a ligneous species would facilitate a better understanding of the evolutionary processes and functions of this gene family. In this study,104 poplar WRKY genes (PtWRKY) were identified in the latest poplar genome sequence. According to their structural features, the predicted members were divided into thepreviously defined groups I – III, as described in rice. In addition, chromosomal localization of the genes demonstrated that there might be WRKY gene hot spots in 2.3 Mb regions on chromosome 14. Furthermore, approximately 83% (86 out of 104) WRKY genes participated in geneduplication events, including 69% (29 out of 42) gene pairs which exhibited segmental duplication. Using semi-quantitative RT-PCR, the expression patterns of subgroup IIIgenes were investigated under different stresses [cold,drought, salinity and salicylic acid (SA)]. The data revealed that these genes presented different expression levels in response to various stress conditions. Expression analysis exhibited PtWRKY76 gene induced markedly in 0.1 mM SA or 25% PEG-6000 treatment. The results presented here provide a fundamental clue for cloning specific function genes in further studies and applications.Key message This study identified 104 poplar WRKY genes and demonstrated WRKY gene hot spots on chromosome 14. Furthermore, semi-quantitative RT-PCR showed variable stress responses in subgroup III.

【题目】Genome-wide analysis of the heat shock transcription factors in Populus trichocarpa and Medicago truncatula
【中文关键词】热激蛋白转录因子;杨树;苜蓿;半定量PCR技术
【英文关键词】Bioinformatics analysis;DBD domain;HSFs;RT-PCR
【中文摘要】研究表明热激蛋白在植物耐逆方面起着重要的作用,热激蛋白转录因子是一类重要的调控热激蛋白表达的基因,而且其功能尚未研究清楚,尤其是杨树和苜蓿这两种植物中。本研究中,我们运用多种生物信息学的理论和方法,对杨树和苜蓿热激蛋白转录因子进行全基因组分析,分别获得28和16个家族成员,并且依据保守结构域的特征将这些成员归为3种不同类型的转录因子。RT-PCR实验表明,在杨树热激蛋白转录因子中有6个家族成员的表达明显受到逆境的诱导。这些结果为以后杨树和苜蓿热激蛋白转录因子的克隆、表达和功能分析提供借鉴。

【英文摘要】Abstract Research has provided substantial evidences that heat shock proteins (HSPs) play essential roles in extreme physiological conditions. Heat shock transcription factors (HSFs) are important HSPs regulators, but their functions are poorly understood, particularly in Populus and Medicago. In this study, a comprehensive bioinformatics analysis of the HSFs was performed inPopulus trichocarpa and Medicago truncatula. Twenty-eight Populus HSFs and 16 MedicagoHSFs were identified, and comparative analyzes of the two plants were carried outsubsequently. HSFs were divided into three different classes and they were diverse and complicated transcription factors. The results of semi-quantitative RT-PCR inPopulus suggested six genes (PtHSF - 03, PtHSF - 13,PtHSF -15, PtHSF -21, PtHSF - 22 and PtHSF -23) were markedly increased by heat stress. The results presented here provide an important clue for cloning, expression and functional studies of the HSFs in Populus and Medicago.

【题目】Genome wide identification and characterization of the cyclin gene family in Populus trichocarpa.
【中文关键词】周期蛋白基因,杨树,进化分析,表达模式
【英文关键词】Cyclins;Poplar;Phylogenetic analysis;Expression pattern
【中文摘要】细胞周期过程由许多不同分子相互作用来完成,其中周期蛋白家族与周期蛋白依赖性蛋白激酶相互作用,在细胞周期过程中起重要作用。目前,对拟南芥,水稻和人类的细胞周期和周期蛋白家族的功能研究比较广泛与完善,然而在杨树中研究较少。在本研究中,通过与拟南芥全基因家族比较,从进化树、染色体定位,蛋白结构域以及表达模式四个方面进行了分析和比较。 以cyclin_N为周期蛋白保守结构域,将45个周期蛋白基因分为A-, B-, C-, D-, Q-, T-, 和Z七个类群。进化分析表明,杨树周期蛋白基因有五个和拟南芥相同, 其中D基因家族类群绞拟南芥和水稻要大,Q和Z基因家族作为一类新型蛋白基因家族,仅含有一个基因。选择特殊的周期蛋白基因Q和 Z类群以及D3 亚群基因进行半定量分析发现,D3亚家族蛋白基因在不同的组织中都表达,Q周期蛋白基因在根和茎中表达,而Z基因仅在根中表达。对杨树周期蛋白家族的分析为细胞周期蛋白机理与功能研究提供参考和依据。
【英文摘要】The cell cycle is controlled by the interplay of many different molecules. Foremost in this process are the cyclin family of proteins that serve to regulate the cell cycle by interacting with cyclin-dependent kinases (CDKs). To date, the cell cycle and functions of the cyclin gene family have been extensively analyzed in Arabidopsis, rice, and humans. However, the cyclin gene family in poplar has rarely been researched. In the present study,cyclin genes were predicted in the poplar draft genome sequence by comparison with Arabidopsis cyclin genes, and analyzed by phylogenetic relationships, chromosomal distributions, protein motifs, and expression patterns. A conserved cyclin_N domain distinguished poplar, and 45predicted cyclin genes were classified into seven types,including A-, B-, C-, D-, Q-, T-, and Z-types. Phylogenetic analyses indicated that five of the seven cyclin types were consistent withArabidopsis types, the poplar cyclin D genesubfamily exhibited more classes than observed in Arabidopsis and rice, and Q- and Z-types each possessed only one cyclin gene, which we defined as new putative types of poplar cyclin genes. We selected the special cyclin genes (Q- and Z-types and D3 subgroups) to study the expression patterns in different tissues by semiquantitative reversetranscription polymerase chain reaction (RT-PCR). The outcomes indicated that almost all of the D3 subgroupgenes were expressed in various tissues, the Q cyclin gene was detected in roots and stems, and the Z cyclin gene was only identified in roots. Analysis of the poplar cyclin gene family provides insights into cell cycle mechanisms and cyclin gene functions.

【题目】利用15 N标记确定氮素营养水平对大豆籽粒氮素构成的影响
【中文关键词】大豆; 外源氮; 15N标记; 根瘤固氮; 产量
【英文关键词】Soybean; Exogenous-N; 15N labeling; Nodulation-N; Yield
【中文摘要】以东农47为试材,采用15N标记的(NH4)2SO4为氮源,利用砂培方式研究了氮素营养水平对大豆籽粒氮素构成和产量的影响。结果表明:随外源氮水平增加,大豆产量呈先增加后降低的变化趋势,营养液中氮为50 mg.L-1时产量最高;前期高氮后期低氮处理时,随高氮处理的时间延长产量降低;于R4或R5期提高外源氮水平可以增加大豆产量。对大豆产量与籽粒中肥料氮所占比例、大豆产量与根瘤固氮所占比例分别作回归分析,经求导分析得出大豆籽粒中外源氮所占比例为39.1%、根瘤固氮所占比例为61.5%时大豆产量最高。由此推断,当外源氮对籽粒的贡献率为40%左右、根瘤固氮贡献率为60%左右时,能够同时满足大豆对根瘤固氮和外源氮的需求,有利于大豆产量的提高。
【英文摘要】Labeled 15N ammonium sulfate was used as nitrogen source to study the effects of nitrogen nutrition levels on soybean(cultivar Dongnong 47) nitrogenous constitution and yields by sand culture.The results were shown as following: the crop yield increased at first and decreased later as the exogenous-N level heightened.When the nitrogen concentration was 50 mg · L-1,crop yield was the highest.Heightened exogenous nitrogen level between R4 and R5 could increase yield of soybean.The regression between yield and proportion of fertilizer-N in seed,yield and proportion of nodulation-N were analyzed.The result of derivation analysis showed that highest yield could be obtained when the proportion of soil-N and nodulation-N was 39.1% and 61.5%,respectively.We could deduce that when the contribution rate of exogenous nitrogen and nodulation-N was about 40% and 60% in seeds,respectively,these would satisfy the requirement of soybean seeds and benefit soybean yield formation.

【题目】群体分布与大豆农艺性状关系的研究
【中文关键词】大豆; 群体分布; 农艺性状; 补偿效应; 产量
【英文关键词】Clycine max; group distribution; agronomic traits; compensation effect; yield
【中文摘要】研究了大豆(Clycine max)群体分布与其生长农艺性状的关系,为构建合理的群体分布提供理论依据。2009年以合丰45、红丰11为材料,设计6个不同的群体分布进行田间试验,采用LSD法比较分析群体分布对农艺性状的影响,计算了单位面积茎数的补偿效应,分析了产量变化趋势及其与农艺性状和群体分布的关系,并对农艺性状进行主成分分析。结果表明:1)群体分布显著影响农艺性状,株距较行距对农艺性状的影响更显著,无品种株型差异。2)株距减小产生的单位面积茎数补偿效应值随行距增大呈二次抛物线变化趋势;行距增大产生的2组单位面积茎数补偿效应值随株距增大变化趋势不一致,且单位面积茎数补偿效应值存在株型差异。3)群体分布显著影响产量,获得产量极值的群体分布存在品种差异;产量与茎粗、行距显著正相关。4)本研究分析得到2个主成分生长性状因子、产量性状因子,其中,生长性状因子具有较强的品种特异性,群体分布对2因子的影响不同。
【英文摘要】The relationship between group distribution and agronomic traits in Clycine max was studied to provide a theoretical basis for constructing a reasonable group distribution.The field experiment was carried out with C.max cultivar Hefeng45,Hongfeng11 by setting 6 different group distributions in 2009,LSD method was used to compare and analyze change of agronomic traits in the different group distribution,compensation effect of stem numbers in unit area was calculated,the change trend of yield and its relationships with agronomic traits and group distribution were studied,and agronomic traits were analyzed by principal component.The results showed that,1) Significant effect of group distribution was acquired for agronomic traits,effect of plant spacing significantly higher than that of row spacing,there were not difference of genotype.2) Change with compensation effect value of stem numbers in unit area by decreasing of plant spacing showed the quadratic parabola curve with increasing row spacing;the two group compensation effect by increasing row spacing were not consistent with increasing plant spacing;there was difference of genotype on the compensation effect.3) Group distribution had significant effect on yield,the group distribution which was found for the highest yield showed difference of varieties;there were significant positive correlation between plot yield with stem thickness and row spacing.4) Two principal components were obtained as growth traits factor and yield traits factor,growth traits factor had higher specificity in varieties,and effects of group distribution were different on the two factors.

【题目】施氮水平对大豆氮素积累与产量影响的研究
【中文关键词】大豆; 氮素积累; 产量;
【英文关键词】soybean; nitrogen accumulation; yeild
【中文摘要】以绥农14为材料,利用砂培和15N标记的方法研究了施氮水平对大豆氮素积累及产量的影响。结果表明:随着施氮水平的提高,大豆全株氮素积累量及叶柄、荚皮、籽粒中氮素积累量呈现先增加后下降的趋势;高氮水平增加了叶片和茎中氮素积累量,N150较N0处理叶片的氮素积累量增加了3倍,而茎增加了5倍,但减少了根中氮素积累,降低了大豆全株和籽粒中根瘤固氮量及其所占比例,降低了肥料氮和根瘤氮的收获指数,其中根中氮素积累N150较N50处理降低了60.3%,全株根瘤氮和籽粒中根瘤氮N150较N0分别降低了74.9%、85.7%,肥料氮的收获指数N150较N50降低19.8%,根瘤氮的收获指数N150较N0降低25.5%。随着施氮水平的增加,大豆产量也呈现先增加后下降的趋势,施氮水平的增加促进了大豆植株株高、结荚高度和始荚节位的显著增加,但对节数没有明显影响,N150和N0比较株高增加了55.2%,结荚高度增加了199.7%,始荚节位增加了142.9%。
【英文摘要】Methods of sand cultre and 15N tracing were used to study the effects of nitrogen application on yield and nitrogen accumulation in soybean variety SN14. The results showed as follows: accumulated nitrogen in the whole plant, petiole,pod shell and seed increased at the beginning and then decreased with the increase of nitrogen levels; Nitrogen accumulation in leaf and stem increased in 3 and 5 times for N150 than that of N0,which indicated that high nitrogen levels promoted the nitrogen accumulation in leaf and stem,however compared with N0,nitrogen accumulation in root, Nodulation-N accumulated in the whole plant and seed of N150 decreased by 60. 3% ,74. 9% and 85. 7% respectively, and Fertilizer-N harvest index of N150 decreased,which was 19. 8% lower than that of N50,as well as Nodulation-N harvest index 25. 5% lower than that of N50. The nitrogen levels of soybean yield also firstly increased and then decreased; Compared with N0,plant height,pod height and lowest pod nodes of soybean treated with N150 increased by 55. 2% ,199. 7% and 142. 9% respectively,while no effects were found on node number.

【题目】Effects of sulfated polysaccharides and their prescriptions on immune response of ND vaccine in chicken
【中文关键词】无
【英文关键词】Sulfated polysaccharide prescription; peripheral lymphocyte proliferation; serum antibody titer; Newcastle disease vaccine
【中文摘要】无
【英文摘要】In order to select the sulfated polysaccharide prescription (sPSP) with the best immunoenhancement, 270 14-day-old chickens were averagely divided into nine groups and vaccinated with ND-IV vaccine. The chickens in seven experimental groups were intramuscularly injected with three sulfated polysaccharides and their four prescriptions (sPSPs). The serum antibody and peripheral lymphocyte proliferation were measured. On day 23 after vaccination, all chickens except for Negative control group were challenged with Newcastle disease virus. The morbidity, mortality and immune protective rate were calculated and their serum antibody titers were determined. The results showed that all sulfated polysaccharides and their prescriptions could obviously or significantly enhance the immune response of ND vaccine in vaccinated chicken and increase the immune protective rate in challenged chicken. sPSP1 possessed the best efficacy, stronger than its components as well, and would be expected as a candidate of new-type immune adjuvant.

【题目】Adjuvant activities of saponins from traditional Chinese medicinal herbs
【中文关键词】Saponin, Medicinal herb, Adjuvant, Traditional Chinese medicine (TCM)
【英文关键词】Saponin, Medicinal herb, Adjuvant, Traditional Chinese medicine (TCM)
【中文摘要】New generation vaccines such as recombinant, antigen purified and DNA vaccines are poorly immunogenic due to the lack of an innate immune stimulus. Therefore, search of newadjuvants for these vaccines has become a topic of interesting. In new adjuvant development, saponins are outstanding candidates. Recently, increased attention has been received on plant-derived saponins in search of new adjuvant candidates fromtraditional Chinesemedicinal herbs such as Panax ginseng, Astragalus species, Panax notoginseng, Cochinchina momordica, Glycyrrhiza uralensis and Achyranthes bidentata. Many of the saponins have been found to have adjuvant effects on purified protein antigens. The chemical structures of the saponins are related to their adjuvant activities, and influence the nature of the immune responses. Saponin adjuvants have been reported to stimulate secretion of a broad range of cytokines, suggesting that saponins may act by triggering innate immunity. As these plant-originated adjuvants may promote different branches of the immune system, they have the potential to be used in design of new vaccines so as to induce a desired immune response.

【题目】Effect of the extract made from Cochinchina momordica seeds on the humoral immune responses of mice to a commercial foot-and-mouth disease vaccine (serotypes O and Asia 1)
【中文关键词】Cochinchina momordica seeds, foot-and-mouth disease, vaccine
【英文关键词】Cochinchina momordica seeds, foot-and-mouth disease, vaccine
【中文摘要】This study was designed to evaluate the adjuvant effect of ginsenoside Re isolated from the root of Panax ginseng on the immune responses elicited by split inactivated H3N2 in fl uenza virus antigen in a mouse model. Forty-eight ICR mice were randomly distributed into six groups with 8 mice in each group. All animals were subcutaneously (s.c.) immunized twice on weeks 0 and 3 with 50 μg Re, inactivated H3N2 in fl uenza virus antigen equivalent to 10 or 100 ng of hemogglutinin (HA) or inactivated H3N2 in fl uenza virus antigen equivalent to 10 ng HA adjuvanted with Re (25, 50 or 100 μg). Two weeks after the boost, blood samples were collected for measurement of serum IgG, the IgG isotypes and HI titers. Splenocytes were separated for the detection of lymphocyte proliferation and production of IFN- γ and IL-5 in vitro. Results showed that co-administration of Re signi fi cantly enhanced serum speci fi c IgG, IgG1, IgG2a and IgG2b responses, HI titers, lymphocyte proliferation responses as well as IFN- γ and IL-5 secretions, indicating that both Th1 and Th2 were activated. Considering the adjuvant effect demonstrated in this study, Re deserve further studies for improving the quality of vaccines where mixed Th1/Th2 immune responses are needed.

【英文摘要】The extract from ECMS was investigated for its effect on the humoral immune responses to foot-and-mouth disease vaccination. Fifty-sixmicewere randomly divided into seven groupswith eight animals in each.Mice in groups 5 to 7 were subcutaneously (s.c.) injected with 0.5mgDEX daily for 4 days to induce immunosuppression. The animals were then orally given ECMS (200 μg in 250 μl saline) in groups 3 and 6 or 250 μl saline in group 2, or s.c. injected with ECMS (50 μg in 100 μl saline) in groups 4 and 7 or 100 μl saline in group 5. After that, the animals in groups 2 to 7 were s.c. immunized twice with 100 μl of commercial oil-adjuvanted bivalent FMDV vaccine (serotypes O and Asia 1) at intervals of 21 days. Mice in group 1 received injection of 100 μl saline only. After 2 weeks, blood was sampled to determine FMDV-specific IgG and isotype IgG1, IgG2a, IgG2b and IgG3. Results indicated that oral administration or s.c. injection of ECMS augmented responses of specific IgG and most IgG isotypes. Giving ECMS tended to enhance serum-specific IgG and IgG isotype responses of mice immunosuppressed by s.c. injection of DEX. Considering the safety and immunomodulatory effect of ECMS in both normal and immunosuppressed mice demonstrated in the present study, this extract deserves further investigation to evaluate its potential in improving FMD vaccination in farmanimals such as pigs, sheep and cattle.

【题目】Ginseng stem-leaf saponins (GSLS) and mineral oil act synergistically to enhance the immune responses to vaccination against foot-and-mouth disease in mice.
【中文关键词】Foot-and-mouth disease; Adjuvant; Ginseng Saponin
【英文关键词】Foot-and-mouth disease; Adjuvant; Ginseng Saponin
【中文摘要】Saponins extracted from ginseng stems and leaves (GSLS) as well as the synergistic effect between GSLS and oil emulsion were investigated for their adjuvant effects on the immune responses of mice to vaccination against foot-and-mouth disease virus (FMDV) serotype Asia 1. In experiment A, ICR mice were subcutaneously immunized twice with FMDV antigen with or without GSLS (0, 1, 5, 10 and 20_g) at 3 week intervals. Highest FMDV-specific IgG level was observed 2 weeks after the boosting in mice immunized with FMDV antigen plus 10_g of GSLS. In experiment B, mice were subcutaneously injected with FMDV antigen with or without GSLS (10_g), or in oil emulsion with or without GSLS (10_g) on days 1 and 21. Results indicated that when co-administered with a mixture of oil and GSLS, FMDV antigen induced significantly higher IgG titer and IgG1, IgG2a, IgG2b and IgG3 responses, production of IFN- γ (Th1 cytokine) and IL-5 (Th2 cytokine) by splenocytes, as well as T and B lymphocyte proliferation in response to Con A and LPS than when FMDV antigen was used alone or mixed with either GSLS or oil. This suggests that GSLS and oil adjuvant synergistically promote both Th1 and Th2 immune responses. As protection against FMDV requires both cellular and humoral immune responses, the combined effects of GSLS and oil deserve further study in other animals such as cattle and pigs in order to induce effective immunity against FMDV infection.

【题目】ISCOMs and ISCOMATRIXTM
【中文关键词】ISCOMs; ISCOMATRIXTM; Adjuvant Preparation; Immune responses; Protection Mechanism
【英文关键词】ISCOMs; ISCOMATRIXTM; Adjuvant Preparation; Immune responses; Protection Mechanism
【中文摘要】mmunostimulatory complexes (ISCOMs) are particulate antigen delivery systems composed of antigen, cholesterol, phospholipid and saponin, while ISCOMATRIXTM is a particulate adjuvant comprising cholesterol, phospholipid and saponin but without antigen. The combination of an antigen with ISCOMATRIXTM is called an ISCOMATRIXTM vaccine. ISCOMs and ISCOMATRIXTM combine the advantages of a particulate carrier system with the presence of an in-built adjuvant (Quil A) and consequently have been found to be more immunogenic, while removing its haemolytic activity of the saponin, producing less toxicity. ISCOMs and ISCOMATRIXTM vaccines have now been shown to induce strong antigen-specific cellular or humoral immune responses to a broad range of antigens of viral, bacterial, parasite origin or tumor in a number of animal species including non-human primates and humans. These vaccines produced by well controlled and reproducible processes have also been evaluated in human clinical trials. In this review, we summarize the recent progress of ISCOMs and ISCOMATRIXTM, including preparation technology as well as their application in humans and veterinary vaccine designs with particular emphasis on the current understanding of the properties and features of ISCOMs and ISCOMATRIXTM vaccines to induce immune responses. The mechanisms of adjuvanticity are also discussed in the light of recent findings.

【题目】Platycodin D Improves the Immunogenicity of Newcastle Disease Virus-Based Recombinant Avian Influenza Vaccine in Mice

【中文关键词】Platycodin D; Immunogenicity; Newcastle Disease Virus
【英文关键词】Platycodin D; Immunogenicity; Newcastle Disease Virus
【中文摘要】The development of an effective influenza vaccine is urgently important for controlling outbreaks of the highly pathogenic avian influenza virus (HPAIV) and reducing the impact of pandemics. The use of an adjuvant in such a vaccine can significantly contribute to improve the immunogenicity. To explore a novel and safe adjuvant for improving the potency of influenza vaccines, platycodinD(1), a saponin from the root of Platycodon grandiflorum, was evaluated for the adjuvant potentials on the specific cellular and humoral immune responses to Newcastle disease virus-based recombinant avian influenza vaccine (rL-H5) in mice. Compound 1 significantly promoted the concanavalin A (Con A)-, the lipopolysaccharide (LPS), and the antigen-induced splenocyte proliferation and enhanced the serum antigenspecific IgG, IgG1, IgG2a, and IgG2b antibody titers ($P<0.05$, $P<0.01$, or $P<0.001$) in mice immunized with rL-H5. The mRNA expressions of Th1/Th2 cytokines (IFN-g and IL-10) and transcription factors (T-bet and GATA-3) in splenocytes were also markedly up-regulated by 1, compared with the control group immunized with rL-H5 alone ($P<0.01$ or $P<0.001$). In addition, 1 remarkably increased the killing activities of natural killer (NK) cells from splenocytes in the immunized mice ($P<0.05$), which may have important implications for the vaccination against the avian influenza virus.We concluded that 1 could improve the immunogenicity of the rL-H5 vaccine by enhancing both humoral and cellular immune responses in mice, and that 1 is a promising adjuvant for influenza vaccines.

【题目】人参茎叶皂甙对口蹄疫病毒灭活疫苗免疫后抗体产生的影响
【中文关键词】人参茎叶皂甙;白油;口蹄疫;疫苗;佐剂
【英文关键词】ginsenosides of stems and leaves, oil, foot and mouth disease, vaccine, adjuvant
【中文摘要】分别用人参茎叶皂甙(GSL)、白油或两者混合物作为免疫佐剂,与Asia—I型口蹄疫病毒(FMDV)灭活疫苗混合免疫小鼠,检测免疫后的血清特异性抗体水平。结果表明,GSL具有佐剂作用,能显著促进机体产生抗FMDV抗体的水平,其佐剂作用呈量效关系。当GSL和白油混合形成复合佐剂时,具有组合效应,能产生比2种佐剂单独应用时更强的抗体效价;且GSI和白油混合产生的组合效应主要促进IgG2a和IgG2b的产生。
【英文摘要】ICR mice were injected with porcine foot and mouth disease (FMD) attenuated vaccine combined with the mice for determination of antibody responses. The results indicated GSI had significant adjuvant activities on theginsenosides of stems and leaves (GSI), oil or GSL+oil. After vaccination, the blood samples were collected from production of antibodies against FMD with dose dependent effect. Combination of GSI and oil promoted significantly higher antibody level than that of GSI or oil alone, especially in the production of IgG2a and IgG2b.

【题目】Epimedium polysaccharide and propolis flavone can synergistically stimulate lymphocyte proliferation in vitro and enhance the immune responses to ND vaccine in chickens
【中文关键词】Prescription; Lymphocyte proliferation; Serum antibody titer; Newcastle disease vaccine; Immune protection
【英文关键词】Prescription; Lymphocyte proliferation; Serum antibody titer; Newcastle disease vaccine; Immune protection
【中文摘要】Four prescriptions, epimedium flavone plus propolis flavone (EF – PF), epimedium flavone plus propolis extracts (EF – PE), epimedium polysaccharide plus propolis flavone (EP – PF) and epimedium polysaccharide plus propolis extracts (EP – PE), were prepared and their immune-enhancing effects were compared. In test in vitro, the effects of them on chicken peripheral lymphocyte proliferation were determined by MTT method. The results showed that EP – PF group presented the highest stimulating index at most concentrations. In immune test, 300 14-day-old chickens were randomly divided into six groups and vaccinated with ND vaccine except for blank control (BC) group, re-challenged at 28 days of age. At the same time of the first vaccination, the chickens in four experimental groups were injected, respectively, with four prescriptions. The changes of the lymphocyte proliferation and antibody titer were determined. On day 28 after the first vaccination, the chickens except for BC group were challenged with NDV, the immune protective effect was observed. The results displayed that in EP – PF group, the antibody titers, lymphocyte proliferation and protective rate were the highest, the morbidity and mortality were the lowest. In dose test, 14-day-old chickens were randomly divided into five groups. The treatment and determinations were the same as the immune test except that the chickens in experimental groups were injected, respectively, with high, medium and low doses of EP – PF. The results revealed that in medium dose group, the antibody titers, lymphocyte proliferation and protective rate were the highest, the morbidity and mortality were the lowest. These results indicated that EP and PF possessed synergistically immune enhancement, EP – PF had the best efficacy, especially at medium dose, and would be expected to exploit into a new-type immunopotentiator.

【题目】Astragalus polysaccharide and oxymatrine can synergistically improve the immune efficacy of Newcastle disease vaccine in chicken

【中文关键词】Astragalus polysaccharide; Oxymatrine; Newcastle disease vaccine; Lymphocyte proliferation; Antibody titer; Interleukin-2

【英文关键词】Astragalus polysaccharide; Oxymatrine; Newcastle disease vaccine; Lymphocyte proliferation; Antibody titer; Interleukin-2

【中文摘要】Three hundred and sixty 14-day-old chickens were divided into seven groups. The chickens, except for blank control group, were vaccinated with Newcastle disease vaccine, repeated at 28 days old. At the same time of the first vaccination, the chickens in three astragalus polysaccharide-oxymatrine (AP-OM) groups were orally administrated respectively with the mixture of AP-OM at high, medium and low concentrations, in astragalus polysaccharide (AP) group and oxymatrine (OM) group, with corresponding medicine, in non-medicine (NM) control group, with equal volume of physiological saline, once a day for 3 successive days. On 14, 21, 28, 35 and 42 days after the first vaccination, the changes of peripheral lymphocyte proliferation and serum antibody titers of the chickens were determined by MTT method and hemagglutination inhibition test. On 14, 28 and 42 days after the first vaccination, the serum IL-2 concentration was determined by Enzyme-linked Immunosorbent Assay (ELISA). The results showed that at most time points, the lymphocyte proliferation, antibody titers and IL-2 concentrations of 5 medicineadministrating groups were significantly higher than that of corresponding NM group. At some time points, the lymphocyte proliferation, antibody titers and IL-2 concentrations in high and medium doses of AP-OM groups were significantly or numberly higher than those in AP group andOMgroup. It indicated that AP-OM could significantly improve the immune efficacy of Newcastle disease vaccine, astragalus polysaccharide and oxymatrine possessed synergistical immunoenhancement.

【题目】Sulfated modification can enhance the immune-enhancing activity of lycium barbarum polysaccharides

【中文关键词】Sulfated lycium barbarum polysaccharides; Lymphocyte Proliferation rate;Serum antibody titer

【英文关键词】Sulfated lycium barbarum polysaccharides; Lymphocyte Proliferation rate;Serum antibody titer

【中文摘要】In test in vitro, four sulfated lycium barbarum polysaccharides (sLBPSs) with different degrees of sulfation (DS), sLBPS0.7, sLBPS1.1, sLBPS1.5 and sLBPS1.9, were added into cultured chicken peripheral lymphocytes and the changes of lymphocytes proliferation were compared by MTT assay taking the nonmodified LBPS as control. Two sLBPSs with better efficacy, sLBPS1.5 and sLBPS1.9 were selected. In test in vivo, one hundred 14-day-old chickens were averagely divided into five groups randomly. The chickens except blank control group were vaccinated with Newcastle disease vaccine, repeated vaccination at 28 days

old. At the same time of the first vaccination, the chickens in three experimental groups were injected with 0.5 mL of sLBPS1.5, sLBPS1.9 and LBPS at 4 mg mL_1, in vaccination control group, with 0.5 mL of physiological saline, once a day for three successive days. On days 7, 14, 21 and 28 after the first vaccination, the changes of peripheral lymphocytes proliferation and serum HI antibody titer were determined. The result showed that two sLBPSs could significantly promote lymphocytes proliferation and enhance serum antibody titer. These results indicated that sulfated modification could enhance the immune-enhancing activity of LBPS, which there was a certain relativity with the DS of sulfated polysaccharide. sLBPS1.5 possessed the best efficacy and would be expected as the component drug of a new-type immunopotentiator.

The chickens except blank control group were vaccinated with Newcastle disease vaccine, repeated vaccination at 28 days old. At the same time of the first vaccination, the chickens in three experimental groups were injected with 0.5 mL of sLBPS1.5, sLBPS1.9 and LBPS at 4 mg mL_1, in vaccination control group, with 0.5 mL of physiological saline, once a day for three successive days. On days 7, 14, 21 and 28 after the first vaccination, the changes of peripheral lymphocytes proliferation and serum HI antibody titer were determined. The result showed that two sLBPSs could significantly promote lymphocytes proliferation and enhance serum antibody titer. These results indicated that sulfated modification could enhance the immune-enhancing activity of LBPS, which there was a certain relativity with the DS of sulfated polysaccharide. sLBPS1.5 possessed the best efficacy and would be expected as the component drug of a new-type immunopotentiator.

【题目】Effects of sulfated lentinan on cellular infectivity of avian infectious bronchitis virus

【中文关键词】Lentinan; Sulfated modification; Infectious bronchitis virus; Chicken embryo fibroblast (CEF); Cellular infectivity
【英文关键词】Lentinan; Sulfated modification; Infectious bronchitis virus; Chicken embryo fibroblast (CEF); Cellular infectivity

【中文摘要】In order to investigate the possibility of sulfating modification in improving the anti-viral activity of lentinan (LNT), three kinds of sulfated LNTs (sLNT), sLNT1, sLNT2 and sLNT3 with the degree of substitution of 0.69, 0.98 and 1.37 were prepared by chlorosulfonic acid – pyridine method with three modification condition, respectively. The sLNTs and avain infectious bronchitis virus (IBV) were added into chicken embryo fibroblast (CEF) in three manners, pre-adding polysaccharide, post-adding polysaccharide and mixed adding polysaccharide with IBV, respectively, taking non-modified LNT as control. The anti-viral activities of three sLNTs were compared by MTT method. The results showed that all of sLNTs and LNT at a certain concentration could significantly inhibit IBV growth in three manners. The effects of modified sLNTs were better than that of non-modified LNT. It indicated that sulfated modification could enhance the anti-viral activity of LNT.

【题目】Lycium barbarum polysaccharide inhibits the infectivity of New castle disease virus to chicken embryo fibroblast
【中文关键词】Sulfated lycium barbarum polysaccharide; Newcastle disease virus; Cellular infectivity; Virus inhibitory rate
【英文关键词】Sulfated lycium barbarum polysaccharide; Newcastle disease virus; Cellular infectivity; Virus inhibitory rate
【中文摘要】Lycium barbarum polysaccharide (LBPS) was extracted by water decoction and ethanol precipitation. After purification, four sulfated lycium barbarum polysaccharides (sLBPSs), sLBPS0.7, sLBPS1.1, sLBPS1.5 and sLBPS1.9, were prepared by chlorosulfonic acid – pyridine method respectively at four designed modification conditions. Four sLBPSs at 5 concentrations, within the safety concentration scope, and Newcastle disease virus (NDV) were added into cultivating system of chick embryo fibroblast (CEF) respectively in three modes, pre- and post-adding polysaccharide and simultaneous adding polysaccharide and virus after being mixed. The effects of sLBPSs on cellular infectivity of NDV were assayed by MTT method taking the non-modified LBPS as control. The results showed that sLBPS1.5, sLBPS1.9 and sLBPS1.1 in three sample-adding modes, sLBPS0.7 in simultaneous adding after being mixed could significantly inhibit the infectivity ofNDVto CEF. The viral inhibitory rate of sLBPS1.5 in pre- and simultaneous adding and sLBPS1.9 in post-addingwasthe highest. Non-modified LBPS did not present significant effect in any sample-adding mode. These results indicated that sulfated modification could significantly enhance the antiviral activity of LBPS, which was correlated with the degree of sulfation (DS) of sLBPS. sLBPS1.5 and sLBPS1.9 possessed better activity and would be as the compositions of antiviral prescription.

【题目】Epimedium polysaccharide and propolis flavone can synergistically inhibit the cellular infectivity of NDV and improve the curative effect of ND in chicken
【中文关键词】Epimedium polysaccharide; Propolis flavone; Newcastle disease virus; Cellular infectivity; Curative effect
【英文关键词】Epimedium polysaccharide; Propolis flavone; Newcastle disease virus; Cellular infectivity; Curative effect
【中文摘要】Four prescriptions, epimedium flavone plus propolis flavone (EF-PF), epimedium flavone plus propolis extracts (EF-PE), epimedium polysaccharide plus propolis flavone (EP-PF) and epimedium polysaccharide plus propolis extracts (EP-PE), were prepared and their antiviral effects were compared. In test in vitro, the four prescriptions within safety concentration scope and Newcastle disease virus (NDV) were added into cultured chick embryo fibroblast (CEF) in three modes, pre-, post-adding drug and

simultaneousadding drug and virus after being mixed, the cellular A570 values were determined by MTT method and the highest virus inhibitory rates were calculated to compare the antiviral activity of four prescriptions. In test in vivo, three hundred 21-day-old chickens were randomly divided into 6 groups and challenged with NDV except for blank control group. After 24 h the chickens in four prescription groups were injected with corresponding drugs respectively, in virus control and blank control groups, with physiological saline, once a day for three successive days. On days 3, 7 and 14 after challenge, the serum antibody titer was determined. On day 15 after challenge, the mortality, morbidity and cure rate in every group were counted. The results showed that the most of A570 values in EP-PF group were numberly or significantly larger than those of the corresponding virus control group and the highest virus inhibitory rates of EP-PF at optimal concentration group were the highest among four prescription groups in three drug-adding modes, which confirmed that EP-PF could significantly inhibit the infectivity of NDV to CEF, its action was stronger than those of other three prescriptions; in EP-PF group, the antibody titers and cure rate were the highest and the mortality and morbidity were lowest presenting numberly or significantly differences in comparison with other three prescription groups. These results indicated that epimedium polysaccharide and propolis flavone possessed synergistical action, EP-PF prescription could significantly inhibit the cellular infectivity of NDV, improve the curative effect of ND in chicken and would be expected to exploit into a new-type antiviral drug.

【英文摘要】Four prescriptions, epimedium flavone plus propolis flavone (EF-PF), epimedium flavone plus propolis extracts (EF-PE), epimedium polysaccharide plus propolis flavone (EP-PF) and epimedium polysaccharide plus propolis extracts (EP-PE), were prepared and their antiviral effects were compared. 【题目】Screening on the immune-enhancing active site of Siberian solomonseal rhizome polysaccharide

【中文关键词】Siberian solomonseal rhizome polysaccharide; Immunoenhancement; Active site; Antibody titer; Lymphocyte proliferation

【英文关键词】Siberian solomonseal rhizome polysaccharide; Immunoenhancement; Active site; Antibody titer; Lymphocyte proliferation

【中文摘要】The total Siberian solomonseal rhizome polysaccharide (SRPSt) and four fractional SRPS30, SRPS50, SRPS70 and SRPS80, were extracted by one-step or stepwise ethanol precipitation method. In test in vitro, their effects on chicken peripheral lymphocytes proliferation were compared. The result showed that SRPS70 and SRPS50 presented better effect. In test in vivo, 14-day-old chickens were injected, respectively, with SRPS50, SRPS70 and SRPSt, at the first vaccination of ND vaccine, once a day for three successive days. On days 7, 14, 21 and 28 after the first vaccination, the peripheral lymphocytes proliferation and antibody titer were determined. The result indicated that lymphocyte proliferation and antibody titers in SRPS50 group at all time points were the highest, significantly higher than those of non-adjuvant control group and most of another two SRPSs groups. These results confirmed that

SRPS50 possessed the strongest action and was the immune-enhancing active site of SRPS

【题目】Optimization of sulfated modification conditions of tremella polysaccharide and effects of modifiers on cellular infectivity of NDV

【中文关键词】Tremella polysaccharide (TPS); Sulfated modification; Newcastle disease virus (NDV); Virus inhibitory rate
【英文关键词】Tremella polysaccharide (TPS); Sulfated modification; Newcastle disease virus (NDV); Virus inhibitory rate

【中文摘要】Based on our previous research, sulfated modification conditions of Tremella polysaccharide (TPS), the chlorosulfonic acid to pyridine (CSA-Pry) ratio, reaction temperature and time, were optimized by L9 (34) orthogonal design taking the yield and degree of sulfation (DS) of modifiers as indexes. Two TPSs, TPStp and TPS70c, were modified under optimized conditions. The effects of two modifiers, sTPStp and sTPS70c, on cellular infectivity of NDV were determined by MTT method taking the non-modified TPStp, TPStc and TPS70c as controls. The results showed that the optimized modification conditions were reaction temperature of 80 oC, CSA-Pry ratio of 1:6 and reaction time of 1.5 h. Five polysaccharides at proper concentrations could significantly inhibit the infectivity of NDV to CEF. The virus inhibitory rates of sTPStp at 1.563_gmL − 1 group were the highest and significantly higher than those of other three non-modified polysaccharide groups in three sample-adding modes. This indicated that sulfated modification could significantly improve the antiviral activity of TPS. sTPStp possessed the best efficacy and would be as a component of antiviral polysaccharide drug.

【题目】正交试验优选党参多糖的硫酸化修饰条件
【中文关键词】党参多糖;硫酸化修饰;正交试验
【英文关键词】Codonopsis pilosulapolysaccharides (CPPS); sulfated modification; orthogonal test
【中文摘要】目的 优选党参多糖硫酸化工艺。方法 用氯磺酸-吡啶法对党参多糖进行硫酸化修饰,以取代度和产物得率为指标,用L9(34)正交试验对试剂配比、反应温度、反应时间进行优选,用氯化钡-明胶法测定硫酸基的取代度。结果 试剂配比和反应时间分别对产物得率和取代度的影响最大,氯磺酸与吡啶配比为1∶6时产物得率最高;反应时间为3 h时取代度最高,达1.83;各因素不同水平对产物得率和取代度的影响无显著差异。结论 综合考虑最适宜的修饰条件为氯磺酸与吡啶配比为1∶6、反应温度80℃、反应时间3 h。
【英文摘要】Objective To optimize the sulfated modification conditions ofCodonopsis pilosulapolysaccharides (CPPS). Methods CPPS was modified by chlorosulfonic acid-pyridine L9(34) Orthogonal test was used to optimize reagent ratio, reaction temperature, and reaction time, taking substitution degree and productivity as index. Results The effects of reagent ratio and reaction time respectively on productivity and substitution degree were the strongest · When the ratio of chlorosulfonic acid to pyridine was 1∶6, the productivity was the highest. When reaction time was 3 h, the substitution degree was the highest reaching 1.83. There were no significant differences among different levels of each factor. Conclusion The optimum modification conditions are the ratio of chlorosulfonic acid to pyridine of 1∶6, reaction temperature of 80℃, and reaction time of 3 h in synthetical consideration.

【题目】硫酸化多糖复方对鸡脾脏和外周血淋巴细胞增殖的影响
【中文关键词】硫酸化多糖复方;鸡;淋巴细胞增殖
【英文关键词】sulfated polysaccharide prescription; chicken; lymphocyte proliferation

【中文摘要】筛选出具有增强鸡淋巴细胞增殖作用的硫酸化多糖复方。以前期筛选出的硫酸化黄芪多糖sAPS60、硫酸化淫羊藿多糖sEPS5和硫酸化香菇多糖sLNT2组成4个复方sPSP1、sPSP2、sPSP3和sPSP4,测定它们对鸡脾淋巴细胞的安全浓度后,取安全浓度范围内的各复方分别单独或与植物血凝素(PHA)、细菌脂多糖(LPS)或伴刀豆素球蛋白(ConA)加入到培养的鸡脾脏或外周血淋巴细胞的培养体系中,培养48 h后,用四甲基偶氮唑蓝(MTT)法测定淋巴细胞增殖的变化。4种硫酸化多糖复方可以单独或协同PHA、LPS显著刺激鸡脾淋巴细胞增殖、协同ConA显著刺激外周血淋巴细胞,且有一定的浓度依赖关系,综合评价以sPSP1、sPSP2的作用最强。

【英文摘要】To select the effective sulfated polysaccharide prescriptions (sPSPs) on enhancing the lymphocyte proliferations, four sPSPs (sPSP1, sPSP2, sPSP3and sPSP4) were preparedwith sulfated astragalus polysaccharides (sAPS60), sulfated epimedium polysaccharide (sEPS5) and sulfated lentinan (sLNT2) selected in previous experiment. After the safe concentrationswere tested, the four sPSPswere added into the cultivation system of chicken splenic or peripheral lymphocyte, singly or synergisticallywith PHA, LPS or ConA. After cultivated for 48 h, the lymphocyte proliferationswere determined by MTT method. The results showed that the four sPSPs could significantly stimulate the splenic lymphocyte proliferation singly or synergistically with PHA and LPS, and stimulate peripheral lymphocyte proliferation synergistically with ConA. There were definite dose-effect relationships beween the concentrations of sPSPs and the stimulation effects. In comprehensive evaluation, sPSP1 and sPSP2 possessed the best efficacy.

【题目】Molecular Phylogeny of Tree Citrus Fruit Trees Group (Aurantioideae, Rutaceae) as Inferred from AFLP Marker and Chloroplast DNA Sequence
【中文关键词】无
【英文关键词】Rutaceae, Aurantioideae, true citrus fruit trees group, molecular phylogenetics, cpDNA sequence
【中文摘要】无
【英文摘要】The genus Citrus L. has a long controversial taxonomy history, and a well-resolved molecular phylogeny of the“ true citrus fruit trees ” group in the future will provide new information for advancing breeding techniques and developing better conservation strategies. In the present study, three cpDNA fragments (TrnL-TrnF, PsbH-PetB, and TrnS-TrnG) of 30 genotypes chosen from the six genera of the“ true citrus fruit trees ” group were analyzed. A molecular phylogenetic tree of the“ true citrus fruit trees ” group was reconstructed based on plastid DNA sequences. The results confirmed that the“ true citrus fruit trees ” group was monophyletic, and thereby the group was divided into genera as previously suggested based on morphological characters. The cpDNA data also suggested that Poncirus might be the first genus separated from the other five genera in the group. The genus Fortunella were of hybrid origin and Citrus might be as its putative paternal parent. The genera Microcitrus, Eremocitrus, and Clymenia were possibly monophyletic and their common ancestor might branch out from Citrus. Furthermore, the phylogenetic relationships within the Citrus genus were discussed.

【题目】Taxonomic and phylogenetic Relationships among the Genera of True Citrus Fruit Trees Group (Aurantioideae, Rutaceae) based on AFLP markers
【中文关键词】无
【英文关键词】AFLP, evolution, molecular phylogeny, the True Citrus Fruit Trees Group
【中文摘要】无
【英文摘要】Fifty-nine genotypes representing six genera of the True Citrus Fruit Trees Group(Aurantioideae, Rutaceae) were analyzed using AFLP technique to study their taxonomic and phylogenetic relationships. Fifteen primer combinations (out of 64

screened) were selected based on the polymorphism and quality of the bands produced by the primer and used in the present study. A total of 312 bands were obtained, of which 305 (97.8%) were polymorphic. The UPGMA tree of all genotypes was constructed based on the AFLP data using PAUP* beta version 4.0b8 software. Our AFLP molecular tree clearly confirms that the True Citrus Fruit Trees Group is monophyletic and supports the division of the group into genera mainly based on morphological characters, except that the genus Fortunella was nested within the genus Citrus cluster (as a monophyletic sub-branch). The subdivision of the genus Citrus into subgen. Papeda and subgen. Eucitrus as suggested by W. T. Swingle based on morphological characters and the point of view that C. medica, C. grandis and C. reticulata are the three basic species of the subgen. Eucitrus were also supported by our molecular data. In addition, contrary to the expectation based on morphological data, however, our molecular data demonstrated that C. ichangensis is more closely related to C. junos of the subgen. Eucitrus than to the C. hystrix of the subgen. Papeda. Furthermore, our study provided the first evidence that C. mangshanensis is basal to all the loose-skin citrus types. Finally, the taxonomic and phylogenetic relationships among the six genera and the important genotypes of the genus Citrus were discussed in detail.

【题目】Construction of DNA Fingerprinting Database for Citrus Cultivars
【中文关键词】无
【英文关键词】Citrus; Cultivar identification; SSR; ISSR; Fingerprinting database
【中文摘要】无
【英文摘要】【Objective】 The aims of this study were to construct a DNA fingerprinting database for major citrus cultivars, which could provide the possibility to establish a technical standard system for purity and authenticity identification of citrus nursery trees.【Method】Simple Sequence Repeat (SSR) and Inter-Simple Sequence Repeat (ISSR) markers were used to analyze the DNA fingerprinting of 102 citrus cultivars(lines) and then to choose suitable primers for the construction of DNA fingerprinting database for citrus cultivars (lines).【Result】12 SSR primer pairs, with high polymorphisms and good repeatability, regarded as specific primers, which could identify 42 cultivars (lines), were selected from 200 SSR primer pairs. Meanwhile, 40 ISSR primers were used to analyze the DNA fingerprinting of 60 cultivars (lines) that can not be distinguished by SSR markers and 2 ISSR specific primers were chosen. As a result, a total of 70 citrus cultivars (lines) could be identified by the 12 SSR primers and 2 ISSR primers. Finally, a DNA fingerprinting database containing 70 major citrus cultivars (lines) was constructed by using those 12 SSR and 2 ISSR primers.【Conclusion】The results indicated that SSR and ISSR markers are suitable for the construction of DNA fingerprinting database for citrus cultivars (lines). Moreover, the fingerprinting database will provide the basis for genetic purity and authenticity fast evaluation of citrus nursery trees.

【题目】Agrobacterium-mediated trandformation of citrus with Hepatitis A virus Capsid protein fusion gene
【中文关键词】无
【英文关键词】Citrus reticulata Banco; Agrobacterium tumefaciens; HAV protein fusion gene; Genetic transformation;
【中文摘要】无
【英文摘要】Citrus cultivar Shinanui (Citrus reticulate×Citrus sinensis) was transformed through agrobacterium and the plantlets were obtained which carried the foreign Hepatitis A virus capsid protein fusion gene. The results showed that survival of mature axillary

buds of Shinanui in graft was related to the culture time of orange rootstocks in virto. The survival ratio in graft was highest, up to 90% when the orange rootstocks were cultured 15 days; Furthermore the identified by the 2 ISSR primers combining with the 12 SSR makers. Finally, a standard DNA fingerprinting database containing 70 major citrus cultivars was constructed using 12 SSR primers and 2 ISSR primers. The results indicated that SSR and ISSR makers were suitable for the fingerprinting analysis of citrus cultivars. Moreover, the database wikk provide a powerfull tool for evaluating the genetic purity and authenticity of citrus seedling.

【题目】桉树炼苗温湿度控制系统的设计研究

【中文关键词】桉树;炼苗;温度控制;湿度控制

【英文关键词】Eucalyptus;acclimatization;temperature control;humidity control

【中文摘要】伴桉树(Eucalyptus) 是世界4大速生树种之一。其具有速生、适应性强、轮伐期短、木材用途广、经济效益高等优点而成为最重要的人工用材林造林树种之一,是我国国家工业原料林造林的首选树种,也是福建省建设绿色海峡西岸的主要造林树种之一。 目前桉树苗是从桉树瓶苗(试管苗)开始,实验室培育一段时间后把桉树瓶苗移植到温室苗床,生长到一定程度再移植到生长地。本论文研究桉树瓶苗在温室苗床生长这个时间段的生长控制。拟建造大棚,开发和研制温室环境监控系统,对桉树组培苗的温湿度以及光照进行控制,模拟适于桉树苗生长的气候条件,创造人工环境,使之适合于从试管瓶移植出来的桉树苗生长,并可以提高桉树苗移植到场地的成活率、加快练苗的成长速度,降低育苗成本。 由于普通温室设施比较简单,环境调控能力比较差,难以满足以上控制要求。为了实现桉树苗的高效和高产,开发和研制环境智能监控系统适是十分必要的。 为了实现上述目的,首先通过查资料并对特定的桉树苗进行初步的实验,找出桉树苗生长的最佳温度、湿度与光照。进而开发一种低成本,低价格、功能齐全、集数据采集和环境检测、控制于一体的温室环境智能监控系统。此系统适合于桉树苗的生长,并有价格优势,可为普通农户所接受。 论文详细描述了大棚温湿度控制系统总体设计和低成本温室智能环境监控系统功能模块设计。实验验证了该温湿度控制系统运行稳定,满足桉树苗所要求的温湿度条件。并将该系统控制下的桉树苗生长与普通的温室进行对比实验,实验证明该系统对提高桉树苗的成活率,增加其生长速度,具有明显的效果。

【英文摘要】Eucalyptus is one of the world's fourth fast-growing tree species. For the advantages of its rapid growth、strong adaptability、short rotation and the broad use、high economic efficiency of the lumber and so on, it has become the most important tree species of artificial forest afforestation tree, and is the first choice of industry forest afforestation tree species for our country national industrial raw materials afforestation, and is also one of the main tree species to construct a green coast for the West Bank of Taiwan Strait in Fujian province. At present, the eucalyptus seedling starts from the eucalyptus bottle seedling (test tube seedling). After a period time of the laboratory cultivation, the eucalyptus bottle seedling is transplanted to the greenhouse seedbed, and then is transplanted again to growth place after a certain degree growth. The growth control of this time section in the greenhouse seedbed of the eucalyptus bottle seedling is investigated in this thesis. Because the outside climatic environment is bad, it does not favor the transplant of the Eucalyptus container seedlings. The research and the practice indicated that Eucalyptus container seedlings are the test tube seedlings, which are quite immature, and the temperature of nature is not to the will of man, that is why the Eucalyptus seedlings' survival rate reduces significantly and the growth speed is relatively slow, causing human and material resources are wasting a lot. After the greenhouse control cultivation on the greenhouse of the container seeding, we will be able to transplant the eucalyptus seedlings to the ground and improve the survival rate of Eucalyptus seedlings, saving costs, and smooth development of eucalyptus plantations. Because of the simpler establishments and the poorer abilities to regulate the environments, the ordinary greenhouses are difficult to meet the requirements for controlling above. In order to realize the high effectiveness and the high production of the eucalyptus seeding, developing an intelligent environment monitored control system is very necessary. In order to achieve the above purposes, we first consult the relative materials and make preliminary experiments for the specific eucalyptus seeding, then find out the optimal temperature, humidity and light. Then we develop a kind of low-cost, low-price intelligent monitored control system for the environment in the greenhouses further, which must has the completely functions and must set the data sampling, environment checking and controlling in one. This system is suitable for the growth of the eucalyptus seeding and has its advantage in the price, so it can be accepted by the ordinary farmers. The thesis detail described of the temperature and humidity control system design and low-

cost greenhouse smart environmental monitoring system function module designs. Experimental results show that the temperature and humidity control system running stable, and the required temperature and humidity conditions for the growth of the eucalyptus seedlings are met. And the result of comparing the growth of the eucalyptus seedling under the control of this system to the nominal greenhouse experiment proves that the system to improve the survival rate of eucalyptus seedlings and to increase their growth speed has significant effect.

【题目】Variation of flavonoids in different juices of citrus cultivated in China
【中文关键词】无
【英文关键词】Orange, flavanone glycosides, polymethoxylated flavones
【中文摘要】无
【英文摘要】The aim of this study was to determine the levels of ten flavonoids in hand-squeezed juices from 51 citrus varieties (15 mandarins, 21 sweet oranges, 2 lemons, 4 grapefruits, 3 pumelos and 6 citrus hybrids) cultivated in China. Hesperidin was found to be the major flavonoid followed by narirutin and didymin in orange juice and mandarin juice. The contents of narirutin and didymin in orange juice were considerably higher than those in mandarin juice, respectively. Naringin and narirutin were the major flavonoids in grapefruit juice and pumelo juice, and the total FGs content in grapefruit juice was observably higher than pumelo juice. Only hesperidin and narirutin were detected in lemon juice, which the total FGs content was the lowest among all the citrus juices. PMFs were only detected in orange juices and mandarin juices. The major PMFs in orange juice were sinensetin, nobiletin, and tangeretin, while nobiletin, tangeretin and sinensetin in mandarin juice. The ratios of flavonoids in different species were compared, and there were great differences among different species. For example, the ratios of hesperidin to narirutin in common sweet orange, navel orange, Ponkan and Satsuma mandarins were 6.59, 3.74, 12.26 and 2.59, respectively. The results showed the flavonoids could be used as marker for orange juice adulteration.

【题目】Efficient procedure for isolating methylated catechins from green tea and effective simultaneous analysis of ten catechins, three purine alkaloids,and gallic acid in tea by high-performance liquid chromatography with diode array detection
【中文关键词】儿茶素;高效液相色谱,甲基化儿茶素;嘌呤生物碱,茶,TOYOPEARL HW-40S柱层析
【英文关键词】Catechin;HPLC-DAD;Methylated catechin;Purine alkaloid;Tea;Toyopearl HW-40S column chromatography
【中文摘要】用80%的乙醇两次洗脱Toyopearl HW-40S柱色谱,成功地制备了表没食子儿茶素(EGC),表没食子儿茶素没食子儿茶素没食子酸酯(EGCG),表儿茶素(EC)和儿茶素没食子酸单体。通过热异构化EC, EGC, EGCG,和ECG,应用半制备色谱分离纯化得到C,GC,GCG,CG。本研究以制备得到的儿茶素单体为标准品,建立了茶叶中没食子酸、茶叶儿茶素和嘌呤碱的高效的HPLC分离分析方法。以pH 2.5的甲酸溶液作为流动相梯度洗脱ODS-100Z C18反相液相色谱柱,实现了14种茶叶成分在15分钟内的快速分离。与现有的没食子酸、茶叶儿茶素(包括甲基化儿茶素)和嘌呤碱分析方法(40 – 105 min)相比,本HPLC 分析方法的分析时间缩短了2.5-7倍。在波长280nm条件下,绝大多数成分的检测限在0.1-1.0ng之间。应用此方法分析绿茶、乌龙茶、红茶和普洱茶样品,方法的重现性很高,同一天内多次进样和不同天不同此进样后测得的峰面积偏差<6%。回收率一般在92 – 106%之间,其标准偏差小于4.39%。因此,本方法应用常规使用的液相色谱实现了在分离分析方

法上的进步,将有助于茶叶儿茶素类物质的分析、临床和其他研究。

【英文摘要】Monomers of (-)-epigallocatechin (EGC), (-)-epigallocatechin gallate (EGCG), (-)-epicatechin (EC),(-)-epicatechin gallate (ECG), (-)-epigallocatechin 3-O-(3-O-methyl) gallate (EGCG3 Me) and (-)-3-O-methyl epicatechin gallate (ECG3 Me) (purity, >97%) were successfully prepared from extract of green tea by two-time separation with Toyopearl HW-40S column chromatography eluted by 80% ethanol. In addition, monomers of (-)-catechin (C), (-)-gallocatechin (GC), (-)-gallocatechin gallate (GCG), and (-)-catechin gallate (CG) (purity, >98%) were prepared from EC, EGC, EGCG, and ECG by heat-epimerization and semi-preparative HPLC chromatography. With the prepared catechin standards, an effective and simultaneous HPLC method for the analysis of gallic acid, tea catechins, and purine alkaloids in tea was developed in the present study. Using an ODS-100Z C18 reversed-phase column, fourteen compounds were rapidly separated within 15 min by a linear gradient elution of formic acid solution (pH 2.5) and methanol. A 2.5 – 7-fold reduction in HPLC analysis time was obtained from existing analytical methods(40 – 105 min) for gallic acid, tea catechins including O-methylated catechins and epimers of epicatechins,as well as purine alkaloids. Detection limits were generally on the order of 0.1 – 1.0 ng for most components at the applied wavelength of 280 nm. Method replication generally resulted in intraday and interday peak area variation of <6% for most tested components in green, Oolong, black, and pu-erh teas. Recovery rates were generally within the range of 92 – 106% with RSDs less than 4.39%. Therefore, advancement has been readily achievable with commonly used chromatography equipments in the present study, which willfacilitate the analytical, clinical, and other studies of tea catechins.

【题目】Evaluation of Characters in Transgenic Citrus Containing Bivalent Anti-bacterial Peptide Genes ShivaA-CecropinB

【中文关键词】无

【英文关键词】Mature axillary bud;Transformation;Horticultural characteristics;Canker resistance

【中文摘要】无

【英文摘要】The axillary buds from mature branch of Jicheng Orange (Citrus sinenis Osbeck) and Newhall navel orange (C. sinenis Osbeck) were used for Agrobacterinm-based transformation. PCR and Southern blotting analysis verified that the ShivaA and CecropinB genes had been integrated into the genome of transgenic plants. The transgenic plants began to blossom and to bear fruits in the 3rd year after grafted on trifoliate orange (Poncirus trifoliate Raf) rootstocks in greenhouse. Through evaluating in greenhouse, no significant differences were observed on the total soluble solids, total acidity, reducing sugar and fruit shape index of characteristics between transgenic and non-transgenic mature lines. Extract of transgenic citrus leaves could suppress the growth of citrus canker pathogen (Xanthomonas axonopodis pv. citri) in vitro, which suggests that the ShivaA and CecropinB had expressed efficiently in some transgenic citrus and exhibited anti-bacterial activity. By artificially inoculating with the canker pathogen in greenhouse and field, the different resistance capabilities to canker were observed among transgenic and control lines, and we had selected 11 significantly enhanced canker resistance lines from 40 transgenic lines.

【题目】一株铅镉抗性菌株WS34的生物学特性及其对植物修复铅镉污染土壤的强化作用

【中文关键词】重金属抗性细菌;生物学特性;铅;镉;植物修复
【英文关键词】heavymetal-resistant bacterium; biological characteristics; lead; cadmium; phytoremediation
【中文摘要】从土壤样品中筛选出一株对碳酸铅、碳酸镉活化能力最强的铅镉抗性细菌WS34,并研究其生物学特性. 经生理生化特征及16S rDNA序列分析,菌株WS34被鉴定为伯克霍尔德氏菌属(B urkholderia sp. WS34) . 菌株WS34对多种重金属和抗生素具有抗性,具有溶磷、分泌吲哚乙酸、产生铁载体和ACC脱氨酶的能力,并对温度、pH、盐浓度具有一定耐受性. 利用盆栽试验研究了菌株WS34、EDTA及EDTA和WS34复合3种处理下对印度芥菜和油菜生长及富集铅镉能力的影响. 结果表明,菌株WS34能促进供试植物生长,使印度芥菜和油菜的干重分别比对照增加21. 4%~76. 3%和18. 0%~236% ,铅镉积累量比对照增加9. 0% ~46. 4%和13. 9% ~329%,且油菜中的增加量大于印度芥菜. EDTA能使印度芥菜和油菜的铅镉积累量比对照分别增加25. 1% ~475%和10. 1%~84. 5%. 0. 5mmol · kg- 1 EDTA +菌株WS34的复合处理下,植物的重金属吸收量与EDTA处理相当甚至高于EDTA处理.
【英文摘要】Microbe2enhanced phytoremediation has been considered as a p romisingmeasure for the remediation of heavymetal2contaminated soils. In thisstudy, the lead and cadmium2resistant bacteriumWS34 was isolated from heavymetal2contaminated soil and identified asB urkholderia sp. WS34 based onthe analysis of its physical and biochemical characteristics and its 16S rDNA gene sequence. The biological characteristics of the strainWS34 were alsocharacterized. The effects of the strain WS34 and ethylenediaminetetraacetic acid (EDTA) or their combination on the growth and heavy metalaccumulation by India mustard and rape were evaluated in pot experiments. StrainWS34 could p roduce indole acetic acid (IAA) , a siderophore, and12aminocyclop ropane212carboxylate deaminase. It could also solubilize inorganic phosphate. Strain WS34 also showed resistance to high levels of heavymetals and antibiotics and solubilized carbonic lead and carbonic cadmium. StrainWS34 was temperature resistant and pH and salt tolerant. Inoculationwith strainWS34 p romoted the p lant growth and the accumulation of Pb and Cd in root and shoot tissues. Compared to the non2inoculated control, the dryweights of the India mustard and rape treated with strainWS34 were increased from 21. 4% to 76. 3% and from 18. 0% to 236% and the Pb and Cdcontents of the India mustard and rape increased from 9. 0% to 46. 4% and from 13. 9% to 329%, respectively. The Pb and Cd contents of the Indiamustard and rape treated with EDTA were increased from 25. 1% to 475% and from 10. 1% to 84. 5% , respectively compared to the control. Treatmentwith the combination of one2half dose of the tested bacterium and EDTA helped the p lants to accumulate the same or more Pb and Cd compared to theEDTA treatment alone.

【题目】HMBi对生绒期辽宁绒山羊氮、硫代谢的影响
【中文关键词】HMBi;氮硫代谢;辽宁绒山羊
【英文关键词】HMBi;nitrogen; sulfur; Liaoning cashmere goats
【中文摘要】试验研究不同水平HMBi对生绒期辽宁绒山羊氮、硫代谢的影响。采用4×4拉丁方设计,选择4只辽宁绒山羊羯羊为试验动物,配制HMBi水平为0%(对照日粮)、0.85%(试验日粮A)、1.27%(试验日粮B)、1.70%(试验日粮C)的4种日粮,试验分4个时期进行。试验期每日收集粪、尿,测定其中的氮、硫。试验结果显示,生绒期辽宁绒山羊日粮中添加HMBi能显著减少粪氮和尿氮,增加沉积氮和可消化氮(P<0.05);添加HMBi粪硫和尿硫显著增加,但可消化硫、沉积硫亦显著增加(P<0.05);添加HMBi能显著提高氮、硫的表观消化率、总利用率及生物学价值(P<0.05)。综合分析认为,生绒期辽宁绒山羊日粮中HMBi的适宜添加量为1.27%

【英文摘要】This experiment was conducted to study the effect of HMBi on Nitrogen&Sulfur Metabolism in Liaoning cashmere goats during cashmere growing period. In a 4×4 Latin-square experiment design, four wether Liaoning cashmere goats were selected, fed one of diets formulated with HMBi 0% (Control diet), 0.85% (Experimental diet A), 1.27% (Experimental diet B), 1.70% (Experimental diet C) respectively in four stages. Fecal and urine were collected every day and nitrogen and sulfur content were determined. The results showed that: HMBi decreased fecal nitrogen and urine nitrogen and increased retained nitrogen and digestible nitrogen significantly (P<0.05), and increased fecal sulfur, urine sulfur, digestible sulfur and retained sulfur (P <0.05); HMBi increased apparent digestibility, total utilization ratio and biological value of nitrogen and sulfur (P<0.05). The findings indicate that the optimum dietary HMBi level is 1.27 % in Liaoning cashmere goats during cashmere growing period.

【题目】两种细度测量仪对羊毛纤维直径测定的对比分析
【中文关键词】奥达2000动物纤维自动测量仪; OFDA100细度仪; 羊毛纤维直径测定; 对比分析
【英文关键词】AODA2000; OFDA100; measurement of wool-fiber diameter; comparative analysis;
【中文摘要】为了检验国产动物纤维细度自动测量仪奥达2000的稳定性和准确性,分别用进口的OFDA100细度仪和国产动物纤维细度自动测量仪对来自314只细毛羊的毛样进行测定,再对两者测得的数据作配对性t检验。检验结果表明,二者间差异不显著(P>0.05)。因此,国产动物纤维细度自动测量仪奥达2000性能与OFDA100细度仪没有差异,可以代替进口细度仪OFDA100。
【英文摘要】To test the accuracy of domestic fibre diameter measurement instrument,AODA2000,wool samples from 314 wool sheep and foreign fibre diameter measurement instrument,OFDA100,were used.Each sample was measured by the tow instruments(AODA 2000,domestic;OFDA100,imported),respectively.Then,the Paired-Sample T Test was done.The results showed that there was no significant difference(P>0.05) in fineness measurement between the two instruments.

【题目】日粮硫水平对辽宁绒山羊产绒性能及绒品质的影响
【中文关键词】硫; 产绒性能; 绒品质; 辽宁绒山羊
【英文关键词】sulfur; cashmere production performance; cashmere quality; Liaoning cashmere goats
【中文摘要】选用4只装有瘤胃和十二指肠近端瘘管的辽宁绒山羊羯羊(2周岁左右),按4×4拉丁方设计,系统研究了4种不同日粮硫水平(0.11%、0.17%、0.23%、0.29%)对辽宁绒山羊产绒性能的影响。研究结果表明:日粮硫水平对辽宁绒山羊的产绒性能及羊绒品质影响显著(P<0.05);日粮添加硫可显著提高辽宁绒山羊绒生长速度、产绒量、绒长度(P<0.05),但对绒的细度没有显著影响(P>0.05);综合分析认为,日粮硫水平为0.23%(N:S为7.39:1)对提高辽宁绒山产绒性能较为适宜。
【英文摘要】In a 4×4 Latin-square experiment design, four castrated Liaoning cashmere goats aged two years old and installed with permanent ruminal cannulas and duodenal cannulas, were used to study the effects of dietary sulfur levels (0.11%, 0.17%, 0.23%, 0.29%)on cashmere production performance and cashmere quality in Liaoning cashmere goats. The results showed that: there were significant effects of dietary sulfur levels on cashmere production performance and cashmere quality (P<0.05).

【题目】IGF-1和EGF对辽宁绒山羊初级毛囊体外培养的影响
【中文关键词】IGF-1;EGF;毛囊;体外培养;绒山羊
【英文关键词】IGF-1; EGF; hair follicles; in vitro; cashmere goat
【中文摘要】为研究不同剂量的IGF-1 和EGF 对辽宁绒山羊毛囊体外生长及毛囊形态的影响,采用显微分离法分离绒山羊初级毛囊, 分别测定不同浓度IGF-1(0.1,1,10,100ng · mL-1)、不同浓度EGF(0.2,2,20,100ng · mL-1)和联合添加IGF-1 与EGF(分别添加10 ng · mL-1 和20ng · mL-1)对毛囊形态变化及生长长度的影响。结果表明:IGF-1 刺激毛乳头和毛母质细胞分裂增殖;EGF 促进毛囊 外根鞘细胞分化;联合添加刺激毛球部增大。IGF-1 和EGF 对毛囊体外生长均具有正向调节作用,作用大小与剂量有关,最适宜 浓度IGF-1 为10ng · mL-1,EGF 为20ng · mL-1,10d 后生长长度分别达1.075mm 和1.117mm;IGF-1(10ng · mL-1)和EGF(20ng · mL-1) 联合添加对毛囊生长促进作用优于单独添加,10d 后生长长度达1.413mm
【英文摘要】The experiment was aimed to study the effects of IGF-1 and EGF on the fibre growth and follicle morphology of primary follicle from Liaoning cashmere goat in vitro. Microdissection separation method was used to isolate primary follicles. The follicle morphology and fibre growth were observed to investigate the effects of different concentrations of IGF-1 (0.1, 1, 10, 100 ng • mL-1), or different concentrations of EGF (0.2, 2, 20, 100 ng • mL-1), or addition of IGF-1(10 ng • mL-1) and EGF (20 ng • mL-1) in combination. The division of dermal papilla and matrix cell were proliferated by IGF-1, the cell differentiation of outer root sheath was regulated by EGF and hair bigger bulb was stimulated by IGF-1 and EGF in combination.The positive effect was promoted by IGF-1 or EGF, the most suitable concentration was 10 ng • mL-1 and 20 ng • mL-1for IGF-1 and EGF respectively. Compared with supplementation of only IGF-1 or EGF, the supplementation of IGF-1 (10 ng • mL-1) and EGF (20 ng • mL-1) in combination in vitro could significantly stimulate hair follicle growth.

【题目】4个绵羊品种双肌臀基因基因型的检测
【中文关键词】PCR2RFL P ;双肌臀基因;单核苷酸多态性;绵羊
【英文关键词】PCR2RFL P ; Cal l i p y ge gene ; SNP ; sheep
【中文摘要】绵羊的双肌臀(Callipyge , CL PG) 基因表型为后臀肌肉增大近30 % ,是由位于绵羊18 号染色体GTL2 基因上游32. 8 kb处存在1 个A →G的单核苷酸多态性(SNP) 标记(命名为SNPCLPG) 产生的,该SNP 标记的存在与CL PG表型完全吻合。通过对SNPCLPG的分子检测,期望发现CL PG基因型种羊,为今后选育肉用性状更优异的新品系奠定基础。为此,选择设 计合成了1 对引物,采用聚合酶链式反应2限制性片段长度多态性(PCR2RFL P) 方法,分别以引进的纯种陶塞特羊、特克塞尔 羊、夏洛莱羊和美利奴羊作为研究样本,进行了SNPCLPG位点的PCR 检测。获得了预期的493 bp 扩增片段,并检测到CL PG 基因型特征性的SNPCLPG突变(A →G) 。
【英文摘要】The buttocks muscle can be increased about 30 % by Callipyge (CL PG) , resulting f rom an apparent A →G muta2 tion in 32. 8 kb upst ream of GTL2 in the ovine chromosome 18. The mutation polymorphism is referred to as SNPCLPG , which was later shown to be the only difference between the callipyge and wild2type chromosome. The objective of the research is to select carriers of the callipyge gene by the molecular biological techniques , which is the basis of selection of the excellent meat t rait s. The SNPs were detected by PCR2rest riction f ragment length polymorphisms (PCR2RFL P) with one pairs of primers in genome of Dorset sheep , Texel sheep , Charolais sheep and Merino sheep. A →G substitution was found and one special prod2 uct s (493 bp) were amplified.

【题目】影响中国美利奴羊(新疆型)羔羊初生重的非遗传因素分析
【中文关键词】中国美利奴羊(新疆型); 非遗传因素; 初生重;

【英文关键词】Chinese Merino sheep(Xinjiang type); non-genetic factors; birth weight
【中文摘要】【目的】为了探讨主要非遗传因素对中国美利奴羊(新疆型)羔羊初生重的影响,收集2×104条中国美利奴羊(新疆型)羔羊鉴定记录。【方法】利用SAS8.1软件的GLM程序,分析出生类型、性别、群别、出生年以及月份对中国美利奴羊(新疆型)羔羊初生重的影响。【结果】公母羔的平均初生重分别为3.609和3.501 kg;性别对羔羊初生重有极显著影响(P<0.01);产羔数对羔羊初生重也有极显著影响(P<0.01),单羔的初生重高于双羔。群别和出生年对羔羊初生重也存在着极显著影响(P<0.01);出生月份对羔羊初生重无显著影响(P>0.05)。【结论】分析大量的记录资料讨论了出生类型等5个非遗传因素对中国美利奴羊羔羊(新疆型)初生重的影响,以期为今后估计美利奴羊遗传参数和育种值时固定效应的划分和选育提供一定的依据。
【英文摘要】【Objective】This study was carried out to discuss the influence of non-genetic factors the lamb birth weight collected from 2 million sheep identification record.【Method】The Effect of non-genetic factors such as birth type,birth sex,group,birth year and birth month on the birth weight of Chinese merino sheep(Xinjiang type) was studied form 1999 to 2008.In this study,a total number of 11,893 records were analyzed by use of GLM procedure in SAS(8.1)software.【Result】 The statistical analysis indicated that the average birth weight between male lambs and female lambs were 3.609 and 3.501 respectively.The influences of birth sex on lambs birth weight were significant(P<0.01).The influences of the number of lambs on birth weight also was significant(P<0.01),and the birth weight of single lamb was higher than that of double lamb.The influence of birth month on birth weight was not significant(P>0.05).【Conclusion】The influence of 5 non-genetic factors on Chinese merino sheep(Xinjiang type)to provide the key basis for estimating merino sheep genetic parameters and breeding value fixed efficient of breeding value.

【题目】8个微卫星位点在甘肃高山细毛羊肉毛兼用品系中的遗传多样性研究

【中文关键词】微卫星; 甘肃高山细毛羊肉毛兼用品系; 遗传多样性

【英文关键词】microsatellite; Gansu alpine fine wool sheep that used for both mutton and wool; genetic polymorphism

【中文摘要】利用8个微卫星位点对甘肃高山细毛羊肉毛兼用品系进行遗传检测,计算了等位基因频率、有效等位基因数、群体杂合度和多态信息含量。结果表明,位点BM3501的有效等位基因数、群体杂合度和多态信息含量都最高(Ne=7.30,H=0.866,PIC=0.848);位点BM3413的有效等位基因数、群体杂合度和多态信息含量都最低(Ne=2.33,H=0.573,PIC=0.478);8个微卫星位点在甘肃高山细毛羊肉毛兼用品系中多态性丰富,除位点BM3413表现为中度多态外,其余位点均表现为高度多态。因此,甘肃高山细毛羊肉毛兼用品系遗传杂合度较高,遗传多样性丰富,选择余地较大;8个微卫星位点可用于甘肃高山细毛羊肉毛兼用品系遗传多样性评估,并可用于对其羊毛性状和肉用性状的进一步研究

【英文摘要】The polymorphism of eight microsatellite loci were analysed in Gansu alpine fine wool sheep that used for both mutton and wool.Allele frequencies,effective number of alleles,heterozygosity and polymorphisms information content were calculated for all microsatellite loci.The results indicated that Ne,H,PIC at BM3501 were the highest(Ne=7.30,H=0.866,PIC=0.848).Ne,H,PIC at BM3413 were the lowest(Ne=2.33,H=0.573,PIC=0.478).There were remarkable polymorphism at eight microsatellite loci in Gansu alpine fine wool sheep that used for both mutton and wool.The eight microsatellite loci were highly genetic polymorphism except BM3413 intermediately genetic polymorphism.Therefore,genetic heterozygosity of Gansu alpine fine wool sheep that used for both mutton and wool was higher,genetic polymorphism was plentiful.There has a vast leeway to be selected.And not only could these eight microsatellite loci be used for genetic polymorphism evaluation in Gansu alpine fine wool sheep that used for both mutton and wool,but also those loci could be applied in further study about wool and meat traits.

【题目】敖汉细毛羊育种目标性状的确定及边际效益的计算

【中文关键词】敖汉细毛羊; 育种目标; 边际效益

【英文关键词】Aohan merino sheep; Breeding objective; Marginal benefit

【中文摘要】[目的]为敖汉细毛羊的遗传选育提供理论依据。[方法]根据内蒙古赤峰市敖汉种羊场细毛羊群1997~2004年的早期性状和母羊产毛性状的鉴定记录,确定敖汉细毛羊的育种目标性状,并利用"差额法"对各育种目标性状的边际效益进

行计算。[结果]从敖汉细毛羊3类性状(产毛性状、繁殖性状和生长发育性状)中共确定了6个育种目标性状,即净毛量、羊毛细度、羊毛长度、育成羊剪毛后体重、成年羊剪毛后体重、断奶羔羊数。其中成年母羊和育成羊净毛量的边际效益和相对重要性较大,分别为32.081、30.477和43.137%、36.870%。敖汉细毛羊产毛性状、繁殖性状、生长发育性状的相对重要性之比为7∶2∶1。[结论]净毛量是敖汉细毛羊最重要的育种目标性状。

【英文摘要】[Objective] The aim was to provide the theoretical basis for genetic breeding of Aohan merino sheep.[Method] According to the identification record of early traits of merino sheep herd and wool traits of female merino sheeps from Aohan sheep breeding farm in Chifeng City of Inner Mongolia in 1997-2004,the breeding objective traits of Aohan merino sheep were determined.And the marginal benefit of different breeding objective traits was calculated with difference method.[Result] From 3 kinds of characteristics(wool trait,reproductive traits, growth and development trait) of Aohan merino sheep,6 breeding objective traits such as wool yield,fiber diameter,fiber length,body weight after shearing of yeanling group and adult sheep,number of weaned lambs were determined.Among which,the marginal benefit and relative value of wool yield of adult female sheep and yeanling sheep were bigger,being 32.081,30.477 and 43.137%,36.870% resp.The ratio of relative value of wool traits,productive trait and growth traits was 7∶2∶1.[Conclusion] Wool yield was the most important breeding objective traits of Aohan merino sheep.

【题目】不同保存条件对绵羊卵巢组织卵泡存活的影响

【中文关键词】保存条件; 卵泡存活; 绵羊; 卵巢

【英文关键词】no

【中文摘要】研究旨在通过组织学方法评估卵巢保存形式、温度、时间、保存液对绵羊卵巢组织短期保存以及培养后卵泡存活的影响。结果表明:碎块或整个卵巢组织39°C保存6 h或12 h后,正常卵泡比例与新鲜组织和其他组比较显著下降(P<0.05)。经过6 d的组织培养后,在生理盐水中4、20°C保存6、12 h和39°C保存2 h以及在MEM中39°C保存2 h的组织碎块中正常卵泡比例显著低于整个卵巢保存后组织中正常卵泡比例(P<0.05)。在MEM中4°C保存6 h或12 h,培养后卵泡存活率显著高于相同条件保存于生理盐水中的组织(P<0.05)。此外保存12 h培养后正常卵泡比例显著低于保存2 h处理组(P<0.05)。表明在生理盐水和MEM中整个卵巢4、20°C保存2~6 h,或者卵巢碎块20°C保存在MEM中2~6 h都可以用于卵巢体外培养的研究。

【题目】不同因素对绵羊卵母细胞体外受精效果的影响

【中文关键词】绵羊; 体外受精; 发情血清; 卵裂率; 囊胚率;

【英文关键词】sheep; IVF; heat serum; cleavage rate; blastocyst rate

【中文摘要】本试验研究了发情羊血清、不同个体的冷冻精液和新鲜精液、精子密度、受精时颗粒细胞的有无及不同培养液对绵羊体外受精效果的影响。结果表明,发情3d的血清与发情当天的血清相比,对卵裂率和囊胚率有极显著的影响(P<0.01);不同个体的冷冻精子对卵裂率和囊胚率都有显著的影响(P<0.05),但鲜精和冷冻精子的受精效果与个体有关;精子密度在2×106~6×106个/mL之间对受精效果没有影响(P>0.05);颗粒细胞对受精的作用不明显(P>0.05);不同的培养液对受精效果没有显著影响(P>0.05)。因此,选用好的公羊个体精子,用发情3d的发情羊血清能显著提高受精效果。

【英文摘要】The study was conducted to determine the effect of diffent heat serum, diffent sheep individuals,sperm density,cumulus ’effect and different culture media on the development of embryos from in vitro fertilization.The results showed that heat three days serum affect greatly the cleavage rate (CR) and the blastocyst rate (BR)(P<0.01);and the different sperm how ever they are freezed or fresh have significant affect on CR and BR. No significant differences in CR and BR were found both sperm densities of 2×106 to 6×106 sperms/mL.The cumulus of oocyte have no effect on IVF;there were no different effect on BR and CR of the culture media of SOF and CRLaa.

【题目】抗坏血酸、表皮生长因子和促卵泡素对绵羊卵巢皮质体外培养的影响
【中文关键词】绵羊; 原始卵泡培养; 抗坏血酸; 促卵泡素; 表皮生长因子
【英文关键词】sheep; ovarian tissue; ascorbic acid; follicle stimulating hormone; epidermal growth factor
【中文摘要】本研究旨在评估抗坏血酸(VC)、表皮生长因子(EGF)、促卵泡素(FSH)对绵羊原始卵泡体外培养的影响以及它们之间的相互关系。实验按照2×2×2因子试验设计分为8组,分别为:MEM(对照组),MEM+VC(50 μg/mL),MEM+EGF(100ng/mL),MEM+FSH(50ng/mL),MEM+VC+EGF,MEM+VC+FSH,MEM+EGF+FSH,MEM+VC+EGF+FSH。在培养0(未培养对照组)、2、6、12d后,对培养的卵巢皮质薄片进行组织学和增殖细胞核抗原(PCNA)检测以及透射电镜(TEM)观察。结果表明,与未培养组(发育卵泡比例15.4%±1.9%,正常卵泡比例88.2%±4.6%)比较,所有培养组中发育卵泡比例显著增加(P<0.05),正常卵泡比例下降(P<0.05)。培养12d后,与对照组(卵泡直径(34.5±3.3) μm,卵泡存活比例(38.9%±3.9%))比较,MEM+VC+FSH和MEM+EGF+FSH组中卵泡直径(分别为(39.7±3.4) μm和(42.5±5.1) μm)和卵泡存活比例(分别为58.5%±4.3%和59.3%±3.7%
【英文摘要】In this study,we evaluated the effects of ascorbic acid (VC),epidermal growth factor (EGF) and follicle stimulating hormone (FSH) on in vitro culture of sheep ovarian cortical tissue.Using 2×2×2 factor experimental design,we cultured sheep ovarian cortex fragments in 8 media with MEM (control),MEM+VC (50 μg/mL),MEM +EGF (100 ng/mL),MEM+FSH (50 ng/mL),MEM+VC+EGF,MEM+VC+FSH,MEM+EGF+FSH,MEM+VC+EGF+FSH.After 0 (non-cultured control),2,6,12 days of culture,the pieces of ovarian cortex were proceed to histological and proliferating cell nuclear antigen (PCNA) examination,or observed by transmission electron microscopy (TEM).The percentages of developing follicles were increased (P<0.05) and the percentages of healthy follicles were reduced (P<0.05).When compared to the MEM group,the addition of FSH with VC or EGF promoted a significant increase of follicles diameter and follicles survival rate (P<0.05),and stimulated the proliferation of granulosa cells.After 12 days of culture,medium supplemented with MEM+VC+EGF resulted the lowest proportion of developing follicles (49.3%±3.2%),follicles diameter((32.3±2.3) μm),follicles survival rate (41.6%±3.1%) and the proportion of PCNA stained follicles (26.4%±1.2%,P<0.05).In contrast,MEM+VC+EGF+FSH resulted the highest follicles diameter ((42.5±5.1) μm),follicles survival rate (59.7%±6.1%) and proportion of PCNA stained follicles (43.5%±4.1%,P<0.05).Ultrastructural analysis confirmed the integrity of follicles cultured in VC+EGF+FSH group,while follicles cultured in MEM+VC+EGF groups showed more degeneration characters.In conclusion,the addition of VC and EGF to culture medium inhibited follicular development,VC+EGF+FSH was the most effective treatment to maintain follicular integrity and promote sheep primordial follicular activation and growth during in vitro culture.

【题目】海州香薷(Elsholtzia splendens)根际铜抗性细菌的筛选及生物多样性

【中文关键词】铜抗性细菌;生物多样性;ACC 脱氨酶;海州香薷

【英文关键词】Rhizosphere Cu-resistant bacteria ; biodiversity ; ACC deaminase ; Elsholtzia splendens

【中文摘要】【: 目的】重金属耐性植物海州香薷根际铜抗性细菌的筛选及生物多样性研究将有助于了解微生物- 超富集植物相互关系和植物修复机理、开发微生物- 香薷重金属修复新技术。【方法】采用稀释平板涂布法从海州香薷根际筛选铜抗性菌株,测定菌株溶磷和产生吲哚乙酸、铁载体、12氨基环丙烷212羧酸(ACC) 脱氨酶的特性,采用16S rDNA 限制性酶切多态性分析(amplified rDNA restriction analysis , ARDRA) 研究铜抗性细菌的遗传多样性,根据16S rDNA 相似性对产ACC 脱氨酶的菌株进行了鉴定。【结果】分离纯化到27 株抗Cu2 +20 mgPL 的细菌,所有菌株均能产生吲哚乙酸或其衍生物,4414 %的分离菌株能够分泌高量的铁载体。分离菌株在60 %相似性水平上可聚类分为7 个群。5 株细菌具ACC 脱氨酶活性,菌株2EBS12、2EBS13、2EBS15、3EBS11 属于不动杆菌属(Acinetobacter) ,菌株2EBS14 属于产碱菌属(Alcaligenes) 。【结论】海州香薷根际铜抗性细菌具有丰富多样的生物学特性和遗传多样性,不动杆菌属和产碱杆菌属细菌具ACC 脱氨酶活性。

【英文摘要】[Objective] Isolation and characterization of rhizosphere copper2resistant bacteria from a copper accumulator plantElsholtzia splendens were investigated. [Methods] Cultivable Cu2resistant bacteria were isolated by plating and screening fromrhizosphere soils of Elsholtzia splendens growing on a copper mine tailing. Bacteria were characterized regarding characteristicsthat may be relevant for a beneficial plant2microbe interaction —Cu tolerance , phosphate2solubilizing , 12aminocyclopropane212carboxylic acid (ACC) deaminase , siderophore and indoleacetic acid production , and further classified by restriction analysis of16S rDNA (ARDRA) . Strains that produced ACC deaminase were identified by 16S rDNA sequence analysis. [Results]Twenty2seven Cu2resistant strains were isolated from rhizosphere soil of Elsholtzia splendens and classified by ARDRA in 7different taxonomic groups at the similarity level of 60 %. All strains produced IAA or their derivatives , 4414 % of the strainsproduced a very high level of siderophores , and five strains were able to grow on ACC as the sole nitrogen source. Strains2EBS12 , 2EBS13 , 2EBS15 and 3EBS11 were identified as Acinetobacter , strain 2EBS14 was essentially consistent Alcaligenes .[Conclusion] Cu2resistant rhizobacteria isolated from Elsholtzia splendens have abundant characteristics relative to promotingplant growth and genetic diversity , rhizobacteria Acinetobacter sp. and Alcaligenes sp. contained ACC deaminase activity.

【题目】osa-MIR393: a salinity-and alkaline stress-related microRNA gene

【中文关键词】无
【英文关键词】MicroRNA,Rice,Arabidopsis,Salinity stress,Alkaline stress,miR393
【中文摘要】无
【英文摘要】Salinity and alkalinity are the two main environmental factors that limit rice production. Better understanding of the mechanisms responsible for salinity and alkaline stress tolerance would allow researchers to modify rice to increase its resistance to salinity and alkaline stress. MicroRNAs (miRNAs) are ~21-nucleotide RNAs that are ubiquitous regulators of gene expression in eukaryotic organisms. Some miRNAs acts as an important endogenous regulator in plant responses to abiotic stressors. miR393 is a conservative miRNA family that occurs in a variety of different plants. The two members of the miR393 family found in rice are named osa-MIR393 and osa-MIR393b. We found that the osa-MIR393 expression level changed under salinity and alkaline stress, whereas that of osa-MIR393b did not. Target genes of osa-MIR393 were predicted, and some of these putative targets are abiotic related genes. Furthermore, we generated transgenic rice and Arabidopsis thaliana that over-expressed osa-MIR393, and the phenotype analysis showed that these transgenic plants were more sensitive to salt and alkali treatment compared to wild-type plants. These results illustrate that over-expression of osa-MIR393 can negatively regulate rice salt-alkali stress tolerance.

【题目】A novel Glycine soja tonoplast intrinsic protein gene responds to abiotic and dehydration tolerance in transgenic Arabidopsis thaliana
【中文关键词】无
【英文关键词】Abiotic stress tolerance,Aquaporin (AQP),Glycine soja,Major intrinsic protein (MIP),Tonoplast intrinsic protein (TIP)
【中文摘要】无
【英文摘要】Tonoplastintrinsicprotein (TIP) is a subfamily of the aquaporin (AQP), also known as major intrinsicprotein (MIP) family, and regulates water movement across vacuolar membranes. Some reports have implied that TIP genes are associated with plant tolerance to some abiotic stresses that cause water loss, such as drought and high salinity. In our previous work, we found that an expressed sequence tag (EST) representing a TIP gene in our Glycinesoja EST library was inducible by abiotic stresses. This TIP was subsequently isolated from G. soja with cDNA library screening, EST assembly and PCR, and named as GsTIP2;1. The expression patterns of GsTIP2;1 in G. soja under low temperature, salt and dehydration stress were different in leaves and roots. Though GsTIP2;1 is a stress-induced gene, overexpression of GsTIP2;1 in Arabidopsisthaliana depressed tolerance to salt and dehydration stress, but did not affect seedling growth under cold or favorable conditions. Higher dehydration speed was detected in Arabidopsis plants overexpressing GsTIP2;1, implying GsTIP2;1 might mediate stress sensitivity by enhancing water loss in the plant. Such a result is not identical to previous reports, providing some new information about the relationship between TIP and plant abiotic stress tolerance.

【题目】GsGASA1 mediated root growth inhibition in response to chronic cold stress is marked by the accumulation of DELLAs
【中文关键词】无

【英文关键词】Chronic cold response,DELLA,GASA,Glycine soja,Root elongation limitation
【中文摘要】无
【英文摘要】Low, but not freezing temperatures are a major factor limiting plant vegetative growth and development. It is not clear what signaling mechanism is used to limit plant growth in response to chronic low temperatures, thus it is important to continue to isolate and characterize genes whose activity/expression correlate well with coldresponses. In this study, a novel GASA gene was isolated from Glycine soja and named GsGASA1. Quantitative real-time PCR analysis indicated that GsGASA1 expression responded to exogenous gibberellic acid (GA) and abscisic acid (ABA) treatments. Compared with wild-type plants under long-term cold treatment, the constitutive expression of GsGASA1 in transgenic Arabidopsis plants enhanced the inhibition of root elongation, while also increasing the transcript levels of RGL2 and RGL3, two of five DELLA genes in Arabidopsis. DELLA is a class of transcriptional regulators in GA signaling pathway restraining plant growth. Our results imply that GsGASA1 participates in chroniccold-induced rootgrowthinhibition with the accumulation of DELLA genes. Lastly, a subcellular localization study using a yellow fluorescent protein (YFP) fusion protein indicated that GsGASA1 was localized to the plasma membrane, cytoplasm and nucleus.

【题目】GsTIFY10,a novel positive regulator of plant tolerance to bicarbonate stress and a repressor of jasmonate signaling
【中文关键词】无
【英文关键词】Bicarbonate stress tolerance,GsTIFY10,Jasmonate signaling,Repressor,Glycine soja
【中文摘要】无
【英文摘要】Recent discoveries show that TIFY family genes are plant-specific genes involved in the response to several abiotic stresses, also acting as key regulators of jasmonate signaling in Arabidopsis thaliana. However, there is limited information about this gene family in wild soybean, nor is its role in plant bicarbonate stress adaptation completely understood. Here, we isolated and characterized a novel TIFY family gene, GsTIFY10, from Glycine soja. GsTIFY10 could be induced by bicarbonate, salinity stress and the phytohormone JA, both in the leaves and roots of wild soybean. Over-expression of GsTIFY10 in Arabidopsis resulted in enhanced plant tolerance to bicarbonate stress during seed germination, early seedling and adult seedling developmental stages, and the expression levels of some bicarbonate stress response and stress-inducible marker genes were significantly higher in the GsTIFY10 overexpression lines than in wild-type plants. It was also found that GsTIFY10 could repress JA signal transduction. The roots of plants overexpressing GsTIFY10 grew longer than wild-type in the presence of MeJA, and some JA response and JA biosynthesis marker genes were suppressed in the GsTIFY10 overexpression lines. Subcellular localization studies using a GFP fusion protein showed that GsTIFY10 is localized to the nucleus. These results suggest that the newly isolated wild soybean GsTIFY10 is a positive regulator of plant bicarbonate stress tolerance and is also a repressor of jasmonate signaling, from hormone perception to transcriptional activity.

【题目】Identification and characterization of a new member of the SINE Au retroposon family (GmAu1) in the soybean, Glycine max(L.) Merr., genome and its potential application
【中文关键词】无

【英文关键词】Glycine maxsoybean,Retroposon,Short interspersed element (SINE),SCAR markers
【中文摘要】无
【英文摘要】A plant short interspersed element (SINE) was identified in Glycine max after re-sequencing of the soybean sequence characterized amplified region (SCAR) markers. Detailed analysis revealed that this newly recognized SINE element consisted of a tRNA-related region, a tRNA non-related region, direct flanking repeat sequences, and a short stretch of Ts at the 3′-terminal region. These features are similar to previously characterized SINEs. To investigate the evolution of the SINE retroposon, BLASTN was used to search against genome sequences of other plants. Since it is homologous with the retroposon Au in Aegilops umbellulata (wheat) and its homology in soybean, the SINE is named as GmAu1. Genome analysis of the Glycine max var. Willimas 82 uncovered more than 847 copies of GmAu1 per haploid genome of soybean. Examination of the regions flanking the inserted GmAu1 sequences indicated a preference for introns over exons or other noncoding regions. Considering the flanking insertion sequences, 146 primers were designed in order to detect insertion mutations by a PCR-based method. Seventy-seven primers displayed polymorphism and were used to develop corresponding GmAu1-based SCAR markers. The retroposon GmAu1 and its related SCAR markers identified in this study will prove valuable to future investigations into the genetic mapping, phylogeny, and evolution of the Glycine genus.

【题目】东海区带鱼底拖网昼夜渔获率差异的统计分析
【中文关键词】东海区;带鱼;昼夜差异;渔获率;底拖网;LSD检验
【英文关键词】Hairtail;the East China Sea;bottom trawl;circadian moving regularity;catch rate;LSD test
【中文摘要】以2004年和2005年东海区重点渔场底拖网渔业资源监测资料,从中选取带鱼渔获率作为指标值,并将昼夜不同网次渔获率分成4组,应用最小显著性差异法(LSD)对东海区带鱼昼夜渔获率进行了统计学分析,以揭示带鱼昼夜的活动规律,并利用样本均值的95% 置信区间法估算带鱼昼夜渔获率的差异程度,为东海区渔业资源大面定点调查带鱼昼夜网次间渔获率的差异修正提供量化指标。结果表明,东海区带鱼昼间与夜间的渔获率具有统计学上的显著性差异,昼间的渔获率显著地高于夜间的渔获率,带鱼昼间栖息于底层和近底层,夜间垂直移动到中上层;使用拖网规格为100。×4 m/88 m、网囊网目为25 mm的调查网具,2004年昼间和夜间带鱼渔获率均值的95% 置信区间分别为:220.89±12.94和128.23±10.75;2005年昼间和夜间带鱼渔获率均值的95%置信区间分别为:176。28±20.63和105.23±9.71;取2年带鱼昼夜差异程度的平均值,最保守的估计是昼间网次的渔获率均值是夜间的1.69倍。本研究从统计学分析角度证实了以往的无量化的带鱼昼夜渔获率存在差异的观察结果,推断了带鱼具有昼夜垂直移动的习性,其意义在于利用LSD法可以分析其它鱼种的昼夜栖息特征并提供昼夜渔获率均值差异程度的量化指标。
【英文摘要】Abstract:Based on the data collected from bottom trawl surveys conducted in the East China Sea during 2004.2005.this paper iS discussed on the analysis of the circadian difference related with the catch rate of hairtail inthe East China Sea.The catch rates obtained at the different time points of one day were divided into fourgroups.W ith a confidence level of 95% ,the difference between the four groups was tested statistically byusing LSD test.It could be recognize the circadian moving regularity of hairtail and grasp the method how totransforiB the survey data collected at different time of one day.The results showed that there was significant difierenee of diel catch rate variation. Hairtail inhabited at the bottom or near bottom.while it migratedvertically to surface of the water.The catch rate obtained in the daytime was significantly greater than thatobtained at night.The 95% confidence interval for the mean catch rate of hairtail in the daytime and nightwere 220.89± 12.94 and 128.23 ±10.75 respectively in 2004 .176.28±20.63 and 105.23 ±9.71respectively in 2005,the conservatively estimated average catch rate of hairtai conducted with the pair—trawlersin the day was I.69 times greater than that conducted at night. It could be inferred there diel verticalmigration patterns. The analysis was statistically confirmed that there may be deviation of form er researchresults with lack of quantitative analysis of value differences of mean catch rate.The significance of this paperwas that a quantitative index was proposed to evaluate differences degree of the mean values of catch ratebetween daytime and night,and it could be used to analyse the diel distribution patterns for other species byusing LSD test

【题目】菲律宾蛤仔(Ruditapes philippinarum)海洋橙品系两个世代的杂交与近交效应
【中文关键词】菲律宾蛤仔, 海洋橙品系, 世代, 杂种优势, 近交衰退
【英文关键词】Ruditapes philippinarum, Ocean orange strains, Generation, Heterosis, Inbreeding depression
【中文摘要】于2009年8月以菲律宾蛤仔海洋橙品系的全同胞子一代和子二代上选10%的个体作为亲本,通过建立近交组合(F22、F33)、杂交组合(F23、F32)和设置对照组(C22、C33),研究了两个近交世代的杂交效应及近交效应,以提高菲律宾蛤仔海洋橙品系的表型性状。结果表明,杂交使幼虫和稚贝的生长性状得到了部分改良,但存活性状尚未得到提高。幼虫和稚贝表现出微弱的生长优势,正反交组单亲生长优势表现出正负不对称性。杂交效应主要受到母本效应的影响,母本效应贯穿于幼虫期及稚贝期。近交使世代F33的生长性状得到了改良,且两个世代的存活性状均有不同程度的提高。表型性状的近交效应在幼虫期主要受到交配方式的影响,而在稚贝期主要受到世代效应的影响。通过上选,杂交与近交的有机结合,有效改良了海洋橙品系的表型性状。 更多还原
【英文摘要】In order to improve the phenotypic characteristics of Ocean Orange strain of Manila clam Ruditapes philippinarum, the effect of hybridization and inbreeding between two generations on this strain were investigated by establishing inbreeding groups (F22, F33), hybrid groups (F23, F32), and control groups (C22, C33) with the parent of full-sib F1 and F2 (the up-selection rate 10%), in August of 2009. The results showed that the characteristics on growth of larvae and juveniles were partially improved, whereas the survival rate did not show any sign of improvement through hybridization. The slight improvement in growth through heterosis was observed on larvae (1.68) and juvenile (2.40); Single-parents heterosis of reciprocal groups were asymmetry, the heterosis of larval and juvenile for F23 were 3.64 and 11.71, for F32 were -0.13 and -5.02, respectively. The mid-parent survival weakness of larvae and juvenile were -1.54 and -5.59; the survival weakness of F23 for larvae and juveniles were -3.37 and -7.65, for F32 were -0.55 and -3.61, respectively. Influences from maternal mainly impacted hybrid from larvae to juvenile. Survival rate of two generations and growth of F33 were improved by inbreeding. The inbreeding depression rate of growth for larval and juvenile for F22 was 2.33 and 7.59, whereas for F33 was -3.09 and -8.05, respectively. The inbreeding depression rate of survival for larval and juvenile for F22 were -4.75 and -1.04, and for F33 were -11.09 and -7.63, respectively. The mating strategy was the major factor for inbreeding effects during the larval period, then the generation effect became the major factor during juvenile period. The phenotypic characteristics of this strain were effectively improved by close combination among up-selection, hybridization and inbreeding.

【题目】南黄海族小黄鱼昼夜渔获率差异的统计学分析
【中文关键词】小黄鱼;南黄海族;昼夜栖息;渔获率;LSD法
【英文关键词】words:Small yellow croaker;the southern Yellow Sea school;circadian moving regularity;catch rata;LSD test
【中文摘要】利用2004年度东海区重点渔场底曳拖网渔业资源监测资料,从中选用小黄鱼网次渔获率作为指标值,应用LSD方法对南黄海族小黄鱼昼夜渔获率差异进行了统计学分析,以揭示小黄鱼昼夜的活动规律。结果表明,小黄鱼在不同的洄游阶段昼夜网次间渔获率无显著性差异,昼夜无垂直移动现象,常年处于底层,为典型的底层鱼类;在利用底曳拖网船进行渔业资源调查时,无需修正昼夜网次间小黄鱼的渔获率,用获取的调查数据即可估算资源量。
【英文摘要】Abstract:Based on the data collected from bottom trawl surveys conducted in 2004.the paper dealed with theanalysis on the circadian difference of the catch rate of small yellow croaker in the southern Yellow Sea shcoolused LSD test.Through the analysis.It could be recognized the circadian moving regularity of small yellowcroaker. The results showed that small yellow croaker iS a demersal

fish inhabited at the bottom of seaperennially and don ’ t migrate vertically.Statistically,there were no significant differences in the catch rate ofsmall yellow croaker between day and night.So there are no need to transform the survey data when one evaluatesthe resources of small yellow croaker used the survey data from different colleting time on the same day.

【题目】GsZFP1,a new Cys2/His2-type zinc-finger protein, is a positive regulator of plant tolerance to cold and drought stress
【中文关键词】无
【英文关键词】C2H2-type zinc-finger protein (ZFP),Functional analysis, Marker gene,Stress tolerance,Transcription factor,Wild soybean
【中文摘要】无
【英文摘要】Plant acclimation to environmental stress is controlled by a complex network of regulatory genes that compose distinct stress-response regulons. The C2H2-type zinc-finger proteins (ZFPs) have been implicated in different cellular processes involved in plant development and stress responses. Through microarray analysis, an alkaline (NaHCO3)-responsive ZFP gene GsZFP1 was identified and subsequently cloned from Glyycine soja. GsZFP1 encodes a 35.14 kDa protein with one C2H2-type zinc-finger motif. The QALGGH domain, conserved in most plant C2H2-type ZFPs, is absent in the GsZFP1 protein sequence. A subcellular localization study using a GFP fusion protein indicated that GsZFP1 is localized to the nucleus. Real-time RT-PCR analysis showed that GsZFP1 was induced in the leaf by ABA (100 μM), salt (200 mM NaCl), and cold (4 ° C), and in the root by ABA (100 μM), cold (4 ° C), and drought (30% PEG 6000). Over-expression of GsZFP1 in transgenic Arabidopsis resulted in a greater tolerance to cold and drought stress, a decreased water loss rate, and an increase in proline irrespective of environmental conditions. The over-expression of GsZFP1 also increased the expression of a number of stress-response marker genes, including CBF1, CBF2, CBF3, NCED3, COR47, and RD29A in response to cold stress and RAB18, NCED3, P5CS, RD22, and RD29A in response to drought stress, especially early during stress treatments. Our studies suggest that GsZFP1 plays a crucial role in the plant response to cold and drought stress.

【题目】miR167c is Induced by High Alkaline Stress and Inhibits two Auxin Response Factors in Glycine soja
【中文关键词】无
【英文关键词】ABA, Alkaline stress, ARF, Glycine soja,MicroRNA
【中文摘要】无
【英文摘要】Soil alkalinity is one of the major environmental factors limiting crop productivity worldwide. MicroRNAs (miRNAs) are small (21 – 25 nucleotides) single-stranded non-coding RNAs that regulate developmental and stress responses in plants by cleaving target mRNAs. However, little is known about the role of miRNAs in the response to alkaline stress. In this study, we identified the miR167c as a high alkaline-responsive miRNAs in wild soybean based on genome microarray and RNA gel blot. The presence of a cis-acting abscisic acid (ABA) responsive element (ABRE) in the upstream region and the ABA inducement of primiR167c suggested that miR167c might be regulated by ABA. We also showed that two auxin response factors (ARF), Gs14g03650 and Gs18g05330, were target genes of the alkaline-inducible miR167c and rapidly down-regulated following alkaline treatment. Our results reveal that miR167c regulated the expression pattern of ARFs, which could be vital for both development and stress adaptation.

【题目】Over-expression of a novel JAZ family gene from Glycine soja, increases salt and alkali stress tolerance
【中文关键词】无
【英文关键词】GsJAZ2,Functional analysis,Salt and alkali stress tolerance,Marker gene,Glycine soja
【中文摘要】无
【英文摘要】Salt and alkalistress are two of the main environmental factors limiting crop production. Recent discoveries show that the JAZfamily encodes plant-specific genes involved in jasmonate signaling. However, there is only limited information about this genefamily in abiotic stress response, and in wild soybean (Glycinesoja), which is a species noted for its tolerance to alkali and salinity. Here, we isolated and characterized anovelJAZfamilygene, GsJAZ2, from G. soja. Transcript abundance of GsJAZ2 increased following exposure to salt, alkali, cold and drought. Over-expression of GsJAZ2 in Arabidopsis resulted in enhanced plant tolerance to salt and alkalistress. The expression levels of some alkalistress response and stress-inducible marker genes were significantly higher in the GsJAZ2 overexpression lines as compared to wild-type plants. Subcellular localization studies using a GFP fusion protein showed that GsJAZ2 was localized to the nucleus. These results suggest that the newly isolated wild soybean GsJAZ2 is a positive regulator of plant salt and alkalistresstolerance.

【题目】Identification of wild soybean (Glycine soja) TIFY family genes and their expression profiling analysis under bicarbonate stress
【中文关键词】无
【英文关键词】TIFY gene family,Sequence analysis,Bicarbonate stress response,Expression comparison,Glycine soja
【中文摘要】无
【英文摘要】Wild soybean (Glycine soja L. G07256) exhibits a greater adaptability to soil bicarbonate stress than cultivated soybean, and recent discoveries show that TIFY family genes are involved in the response to several abiotic stresses. A genomic and transcriptomic analysis of all TIFY genes in G. soja, compared with G. max, will provide insight into the function of this gene family in plant bicarbonate stress response. This article identified and characterized 34 TIFY genes in G. soja. Sequence analyses indicated that most GsTIFY proteins had two conserved domains: TIFY and Jas. Phylogenetic analyses suggested that these GsTIFY genes could be classified into two groups. A clustering analysis of all GsTIFY transcript expression profiles from bicarbonate stress treated G. soja showed that there were five different transcript patterns in leaves and six different transcript patterns in roots when the GsTIFY family responds to bicarbonate stress. Moreover, the expression level changes of all TIFY genes in cultivated soybean, treated with bicarbonate stress, were also verified. The expression comparison analysis of TIFYs between wild and cultivated soybeans confirmed that, different from the cultivated soybean, GsTIFY (10a, 10b, 10c, 10d, 10e, 10f, 11a, and 11b) were dramatically up-regulated at the early stage of stress, while GsTIFY 1c and 2b were significantly up-regulated at the later period of stress. The frequently stress responsive and diverse expression profiles of the GsTIFY gene family suggests that this family may play important roles in plant environmental stress responses and adaptation.

【题目】西藏农业经济的空间差异分析
【中文关键词】农业经济; 空间差异; 农牧结合; 西藏
【英文关键词】agricultural economy ; spatial difference ; coupling of farming and animal husbandry ; Tibet
【中文摘要】西藏农业经济区域差异是影响经济发展与社会稳定的重要因素. 利用Theil 系数对西藏农业经济结构及区域差异的演变进行了定量分析,研究发现:种植业经济差异值大于牧业,县际间畜牧业差异有所减缓,而农业县域之间的差距拉大;依据三个类型区和行政区划两种空间分层尺度计算的总体差异值相同,但二者的地区内和地区间差异值差别很大. 研究认为,农牧结合可增强农业经济风险抵御能力,基于县域农业均衡发展,提出了缩小农业经济差异的政策性建议.
【英文摘要】The regional difference of Tibet ′ s agricultural economy plays an important role in economic development and social stability. The components and evolution of economic development gap of Tibetan agriculture are quantitatively analyzed by using Theil coefficient. It shows that the value of economic disparities of animal husbandry is less than that of farming ,and it slows down among countries , which is opposite to farming. Through dividing the Tibet autonomous region with three regions and administ rative divisions , the agricultural economic differences are the same between two spatial scales in Tibet , but both of regional and interregional differences vary greatly. The coupling of farming and animal husbandry can enhance the resilience of agricultural economic risk. Based on the balanced agricultural development among countries , a few suggestions in order to reduce the agricultural economic disparities in Tibet are finally put forward.

【题目】南京栖霞重金属污染区植物富集重金属效应及其根际微生物特性分析
【中文关键词】土壤重金属污染; 根际细菌; 超积累植物
【英文关键词】Heavy metal contaminated soil; Rhizospere bacteria;Hyperaccumulator plant
【中文摘要】以南京栖霞重金属污染区5 种植物及其根际土壤为研究对象,对植物富集重金属特征以及重金属含量与根际土壤细菌数量、土壤酶活性等的相关性进行了调查分析。结果发现,植物根际重金属污染物以Zn 和Cd 为主; 重金属污染地区的植物有较强的吸收重金属能力,龙葵和茼草具备了超积累植物的基本特征; 植物根际细菌和Pb 抗性细菌的数量达到了107 CFU g - 1 土; 根际土壤酶活性未受到重金属的毒害或受到的毒害很小; 植物体中重金属含量与土壤重金属含量及其存在状态、土壤酶、土壤重金属抗性细菌有显著的正相关性。根际土壤细菌尤其是具有重金属抗性的活性细菌可能会促进土壤重金属的活化,由此促进植物体对重金属的吸收和转运。
【英文摘要】Five species of plants and their rhizospheric soils were sampled and collected from heavy metal contaminatedsoils in Qixia,Nanjing for analysis and exploration of characteristics of phyto-accumulation and relationships of contentsof heavy metals with population of bacteria and activity of soil enzymes in the soil. It was found that the heavy metalpollutant in the rhizosphere was dominated with Zn and Cd; and the plants growing therein were quite high in heavy metalabsorbing capacity. Beckmannia grass and Solanum nigrum featured the characteristics of a heavy metal hyperaccumulatorplant. The numbers of bacteria and Pb-resistant bacteria in the rhizospheric soil both reached up to 107 CFU g - 1 ofsoil. The activities of soil enzymes were little inhibited. Significant positive relationships were observed of heavy metals contentsin the plant with contents and forms of the heavy metals in the soil,soil enzymes activity,and Pb-resistant bacteria.Soil bacteria in the rhizosphere,heavy metal-resistant bacteria in particular,may improve bioavailability

of heavy metals insoil,thus promoting uptake and transport of heavy metals by plants.

【题目】铜耐性优势植物根际土壤铜抗性菌株的筛选及其对铜的促溶作用
【中文关键词】铜矿废弃地;铜抗性菌株;铜促溶作用;有机酸;节杆菌属;微杆菌属
【英文关键词】Copper mining wasteland; Copper-resistant strains; Copper solubilization; Organic acids; Arthrobacter sp.; Microbacterium sp.
【中文摘要】从铜矿废弃地重金属耐性优势植物根际土壤中分离筛选到两株抗高浓度Cu 的细菌菌株HQN2 和JYC17。对菌株HQN2 和JYC17 溶解难溶性Cu 的作用进行了研究。结果表明:菌株HQN2 和JYC17 具有明显的溶解碳酸铜的能力,与接灭活菌对照相比,菌株HQN2 和JYC17 分别使培养液中水溶性Cu 含量增加306%和136%,培养液的pH 由初始的7.00 分别降低到4.08和4.46,另外,Cu 能促进供试菌株有机酸(葡萄糖酸、苹果酸和乙酸等)的合成。菌株HQN2 和JYC17 对土壤中难溶性Cu 亦有明显的促溶作用。与接灭活菌对照相比,菌株JYC17 和HQN2 分别使土壤中交换态Cu 含量增加110%和270%。经生理生化特征分析及16S rDNA 序列分析,菌株HQN2 和JYC17 分别被鉴定为节杆菌属(Arthrobacter sp.)和微杆菌属(Microbacterium sp.)。
【英文摘要】In this study two copper-resistant bacterial strains, HQN2 and JYC17, were isolated from rhizospheric soils of heavymetal-tolerant dominant plants growing in copper mining wasteland. Copper solubilization of strains HQN2 and JYC17 were investigated insolution culture and copper-contaminated soil. Compared to the control treatment (CK), water-soluble Cu concentrations released fromCu2(OH)2CO3 by strains HQN2 and JYC17 increased by 306% and 136%, respectively. pH values in the bacterial inoculation treatments decreasedfrom 7.00 to 4.08 (strain HQN2) and 4.46 (strain JYC17) respectively. Copper could promote the production of organic acids (such as gluconic,malic and acetic acids) by the tested strains. The two strains could significantly increase the exchangeable Cu compared to CK. The exchangeableCu concentrations increased by 110% and 270% respectively compared to CK. Based on the physiological and biochemical tests as well as 16SrDNA gene sequence analysis, the bacterial strains HQN2 and JYC17 were identified as Arthrobacter sp. and Microbacterium sp. respectively.

【题目】西藏农业结构特征及调整效应研究
【中文关键词】农业结构; 偏离份额; 农业经济增长; 西藏
【英文关键词】agricultural structure ;shift-share method ;agricultural economic growth ;Tibet
【中文摘要】在简要总结西藏农业产业结构演进特征的基础上, 运用偏离份额方法深入分析了1987~1996 年、1997~2006 年两个时段西藏农业产业结构和内部各部门的偏离程度及其对农业经济增长的影响变化, 并测算了农业结构变动对西藏农业经济增长的贡献份额。结论如下: 西藏农业在全国农业中的竞争力弱, 农业产业、种植业与畜牧业结构渐趋合理, 近几年农业增长的结构效应显著, 农业结构调整初现成效, 但对政策优惠与资金投入的依赖性较大, 结构效应的后续潜力不足。最后提出了实现西藏农业跨越式发展的一些措施。
【英文摘要】Based on the summary of the evolutional character of agriculture structure in Tibet ,this paper analyses the quantitative deviation and its impact on the agricultural economic growth of the agricultural structure and its internal four departments in the two typical periods of 1987 - 1996 and 1997 - 2006 by using the SSM method ,then calculates the contributive share that the structural

alteration affects the agricultural economic growth. The conclusions are as follows : Tibet ’s agriculture has weak competitiveness comparing with the other regions. The structures of agricultural industry and farming and animal husbandry have gradually become rational and the structural effect on agricultural economic growth is distinct in recent years ,but it has great dependence on the preferential policies and investment. Finally ,the writer put forward a few suggestions in order to achieve a leap forward development of agriculture in Tibet.

【题目】日喀则市农业生态足迹研究
【中文关键词】日喀则; 农业; 生态足迹; 资源产量法
【英文关键词】Shigatse City ; agriculture ; ecological footprint ; Resource Yield method
【中文摘要】采用水资源足迹和化石能源供给地概念,对日喀则市2005 年农业活动的生态足迹进行实证分析. 结果表明:日喀则市农业综合足迹为334153.27 hm2 ,占日喀则市总足迹的77.6 % ,其中,化石能源地足迹仅占农业综合足迹的13.3 % ,表明农业现代化程度不高. 对农业综合足迹贡献最大的是耕地和牧草地,二者合占65.6 % ,主要原因是大量使用农用化学品和牧草地严重超载;生产足迹占农业综合足迹的82.8 % ,说明农村占用的大部分资源主要用来进行资源再生产. 对日喀则市农业综合足迹的实证研究表明,资源产量法可以有效减小土地面积法引起的生态赤字扩大化现象,将肉、蛋、奶产品作为次级产品更能反映牧草地利用现状.
【英文摘要】The concepts of water resource footprint and fossil energy supplying areas were adopted to calculate the agricultural footprint of Shigatse City in 2005. It indicates that the agricultural footprint is 334153.27 hm2 , accounting for 77.6 % of the total ecological footprint in the city. Among them , the fossil fuel footprint is only 13.3 %. This shows the low level of agricultural modernization. Arable land and grazing land are the largest two contributors of agricultural footprint , accounting for 65.6 % of the total. This is due to the use of mass agrochemicals and serious overloading. The farmer's agricultural producing footprint accounts for 82.8 % of the total agricultural footprint , indicating that themost resources are used for resource-reproducing in the countryside. It also indicates that Resource Yield method could effectively reduce the expansion of ecological deficit which results from Land Area method , and better reflect the grazing land use status if taking livestock products as secondary products.

【题目】西藏一江两河地区种植业比较优势分析
【中文关键词】西藏;一江两河地区;比较优势;农作物
【英文关键词】Tibet;Three Rivers area; Comparative advantage; Crops
【中文摘要】分析了西藏一江两河地区农作物的生产效率优势、生产规模优势和综合比较优势。结果表明,拉萨市具有综合比较优势的农作物依次是小麦、油菜籽、蔬菜和青饲料,山南地区具有综合比较优势的农作物依次是小麦、青饲料、油菜籽、豆类,日喀则地区具有综合比较优势的农作物依次是豆类、青稞、蔬菜。除粮食作物外,其他作物空间布局尚未符合比较优势原则,但粮食种植比例偏高,作物间种植比例有待调整。提出未来几年种植业发展应该以提高粮食品质和生产效率为突破点,压缩发展粮食作物,适度发展经济作物,大力发展饲料作物。
【英文摘要】The efficiency advantage indicators, scale advantage indicators, and aggregate advantage indicators of crops in different areas are analyzed. The results show that the aggregate advantage crops are wheat, cole, vegetable and fodder in Lhasa, wheat, fodder,

cole and bean in Lhoka, bean, highland barley and vegetable in Shigatse. The research also shows that only food crops' layout is according with the comparative advantage principle,so it is necessary to adjust the major planting structure. Then, some proposals for planting industry in the future are put forward, such as improving the quality of food production and productivity, decreasing the planting area of food crops, developing economic crops moderately, developing fodder crops vigorously.

【题目】Isolation and characterization of a heavy metal-resistant Burkholderia sp.from heavy metal-contaminated paddy field soil and its potential in promoting plant growth and heavy metal accumulation in metal-polluted soil.
【中文关键词】伯克霍尔德氏菌J62菌株;重金属;植物促生根际细菌;生物有效性;植物提取
【英文关键词】Burkholderia sp. J62; Heavy metals; Plant growth promoting rhizobacteria; Bioavailability; Phytoextraction
【中文摘要】从重金属污染土壤中分离筛选到一株伯克霍尔德氏菌.对该菌株的重金属和抗生素抗性,溶解难溶性重金属的能力以及在盆栽条件下对植物生长,富集重金属的影响进行了研究.结果表明,该菌株对多种重金属,抗生素均具有抗性,能溶磷和难溶性铅和镉,菌株可以产生生长素,铁载体,ACC脱氨酶.盆栽试验表明,该菌株可以显著促进植物生长和对重金属铅,镉的富集.该研究结果表明,重金属抗性和植物促生细菌对于促进植物生长和对重金属的修复有重要作用.
【英文摘要】A heavy metal-resistant bacterial strain was isolated from heavy metal-contaminated soils and identified as Burkholderia sp. J62 basedon the 16S rDNA gene sequence analysis. The heavy metal- and antibiotic resistance, heavy metal solubilization of the isolate were investigated.The isolate was also evaluated for promoting plant growth and Pb and Cd uptakes of the plants from heavy metal-contaminatedsoils in pot experiments. The isolate was found to exhibit different multiple heavy metal and antibiotic resistance characteristics. Atomicabsorption spectrometer analysis showed increased bacterial solubilization of lead and cadmium in solution culture and in soils. Theisolate produced indole acetic acid, siderophore and 1-aminocyclopropane-1-carboxylate deaminase. The isolate also solubilized inorganicphosphate. Inoculation with the isolate was found to significantly ($p < 0.05$) increase the biomass of maize and tomato plants.Increase in tissue Pb and Cd contents varied from 38% to 192% and from 5% to 191% in inoculated plants growing in heavy metal-contaminatedsoils compared to the uninoculated control, respectively. These results show that heavy metal-solubilizing and plant growthpromoting bacteria are important for plant growth and heavy metal uptake which may provide a new microbial enhanced-phytoremediationof metal-polluted soils.

【题目】大豆鼓粒期对肥料氮的吸收与分配研究
【中文关键词】大豆; 鼓粒期; 肥料氮; 根瘤固氮;
【英文关键词】soybean; seed filling stage; fertilizer-N; nodulation-N;
【中文摘要】采用15N分阶段标记的方法,研究了鼓粒期间大豆植株对氮素的同化吸收,尤其是肥料氮在各器官中的积累与分配。结果表明:1)5次标记试验期间积累的氮素总量为291.4 mg/plant,占标记试验Ⅴ结束时(鼓粒末期)大豆植株氮素积累总量的48.9%,说明鼓粒期间的氮素积累对于大豆氮素积累具有重要作用;2)从鼓粒始期到鼓粒末期,大豆植株氮素阶段积累量急剧降低,由标记试验Ⅰ的109.5 mg/plant下降到标记试验Ⅴ的19.6 mg/plant;3)鼓粒期大豆植株所吸收的氮素主要来自根瘤固氮,该部分氮占总同化量的67.4%,而肥料氮只占32.6%;4)根瘤固氮和肥料氮的同化量均随着鼓粒进程的推进而下降,分别由标记试验Ⅰ的67.5和42.0 mg/plant下降到标记试验Ⅴ的10.8和8.8 mg/plant;5)5次标记试验中,不同器官中肥料氮的积累

量均表现出一致的规律性,为子粒>叶片>茎>根系>荚皮,并且分配到子粒中的肥料氮比例是逐渐增加的,由标记试验Ⅰ的27.9%增加到标记试验Ⅴ的85.0%。

【英文摘要】This experiment was conducted by using15N labeling method with staged design to study nitrogen assimilation and absorption by the soybean plant during the seed-filling period,especially the distribution of fertilizer N among different organs of soybean.The results show that total nitrogen accumulation during the five labeling experiments(0-25 d after beginning of seed-filling) plays an important role in nitrogen accumulation in soybean plant,which is about 291.4 mg/plant,occupies 48.9% to the total nitrogen accumulation in the labeling experiment Ⅴ.The nitrogen accumulation is decreased sharply during the seed filling period,which is from 109.5 mg/plant in the labeling experiment Ⅰ(0-5 d after beginning of seed-filling) to 19.6 mg/plant in the labeling experiment Ⅴ. Nodulation-N is the main source of the plan assimilated N,which is about 67.4%,and nodulations-N accumulation is decreased from 67.5 mg/plant in the labeling experiment Ⅰ to 10.8 mg/plant in the labeling experiment Ⅴ.Fertilizer-N accumulation is also decreased with the seed-filling process,from 42.0 mg/plant in the labeling experiment Ⅰ to 8.8 mg/plant in the labeling experiment Ⅴ.Fertilizer-N accumulation in different organs of soybean in different labeling experiments exhibits the same orders: seeds>leaves>stems>roots>pod walls,and the proportion of seed N accumulation from the fertilizer is increased from 27.9% to 85.0% during the labeling period.

【题目】苔藓植物分布及其物种多样性的研究评述

【中文关键词】苔藓植物; 物种多样性; 分布; 分析方法

【英文关键词】Bryophytes; Species diversity; Spatial distribution; Analyzing methods

【中文摘要】苔藓植物由于其重要的生态功能及其在植物界中的系统位置而日益受到人们的重视, 但是随着全球气候的变化, 其多样性受到严重的威胁。文中综述了苔藓植物分布和物种多样性的研究进展, 并对其影响因素作了分析, 认为环

境条件, 包括植被、气候、干扰度等均对分布和多样性产生重要影响。对苔藓植物研究方法进行了探讨,认为应对研究方法进行广泛深入的研究, 引入新的研究方法和思路, 为开展大尺度的苔藓植物综合研究和为生物多样性保护奠定基础。
【英文摘要】Due to their important ecological function and systematic position in the plant kingdom,bryophytes have been studied widely. Changes in the global climate, however, have seriouslythreatened bryophyte diversity. We reviewed the latest advanced study on the diversity anddistribution of bryophytes, the environmental factors involved, vegetation, climate, and humanactivities. The methods for analyzing bryophytes distribution and diversity, including quantitative ecological analysis, modeling, and GIS are discussed in this paper. It is important that Chinese researchers advance their methodology and utilize new techniques, so as to develop large spatial scale studies of bryophytes to help increase the foundation of information for biodiversity protection.

【题目】保护性耕作对土壤部分物理特性及大豆产量的影响(英文)
【中文关键词】耕作; 土壤水分; 土壤温度; 土壤物理特性; 大豆产量;
【英文关键词】Tillage; Soil water; Soil temperature; Soil physical properties; Soybean yields;
【中文摘要】研究了免耕和少耕对松嫩平原地区农田土壤温度、土壤水分、土壤紧实性等物理特性和大豆产量的影响。结果表明:在春季大豆播种期,免耕处理(NT)土壤含水量高于少耕(RT)和传统耕作(CT)。在大豆生长前期,免耕条件下的土壤平均温度低于传统耕作和少耕,传统耕作和少耕接近,免耕模式的土壤温度日较差低于少耕和传统耕作。5~20 cm深度内,免耕条件下的土壤容重高于传统耕作,在10~20 cm深度内,免耕和少耕接近。不同模式间的土壤机械阻力表现出差异,在0~20 cm深度内,免耕高于少耕和传统耕作。不同耕作模式间的大豆产量差异不显著。短期保护性耕作试验结果表明:在当地气候和土壤条件下应用少免耕模式,能够减少春季播种期间土壤水分损失和沙尘暴侵袭造成的危害,同时对大豆产量并没有造成不利影响。
【英文摘要】The great challenge in north Songnen Plain,China is soil degradation and dry period and sandstorm attacking during soybean planting season.The objective of this work is to assess the effects of no-tillage and reduced tillage systems on soil temperature,soil water storage,soil compaction and its effects on soybean yields in a productive soil.The determinations were carried out in 2008.Notillage(NT) showed higher water storage than both reduced tillage(RT) and conventional tillage(CT) during the soybean planting season.Mean soil temperatures were lower under NT than under both RT and CT,and similar between RT and CT during the initial period.Thermal amplitude was lower under NT than under both RT and CT,and was similar between RT and CT during the first growing stage(June 4 to June 19).Bulk density was higher under NT than under CT at 5-20 cm depth,and no different between RT and NT at 10-20 cm soil depth.Penetration resistance performed differences between tillage systems,being higher under NT than under RT and CT at 0-20 cm depth.Grain yields showed no significant differences between tillage systems.Results suggested that application of NT/RT at local climatic and soil conditions could reduce soil water deficiency/sandstorm-attacking during soybean growing season without affecting soybean grain yields in short terms of conservation tillage.

【题目】不同株型大豆群体分布对产量形成的影响
【中文关键词】大豆; 群体分布; 补偿效应; 密度效应; 产量;

【英文关键词】soybean; group distribution; compensation effect; density effect; yield;
【中文摘要】以合丰45和红丰11为材料,设计6个不同的群体分布,株距(cm)×垄上行距(cm)分别为:8×8,8×10,8×12,10×8,10×10和10×12进行田间试验。采用LSD法比较分析群体分布对产量及其性状的影响。结果表明:群体分布显著影响合丰45和红丰11的产量及其性状;合丰45的补偿效应值大于红丰11,红丰11的密度效应值则高于合丰45;补偿效应值和密度效应值均受群体分布影响;8 cm株距时,2个品种的产量与行距呈线性回归关系,10 cm株距时,2个品种的产量与行距表现出开口向下的抛物线回归关系;株型的差异导致产量极值出现在不同的群体分布水平上,具体表现为合丰45和红丰11分别在10 cm×10 cm和8 cm×12 cm群体分布时产量最大。
【英文摘要】The propose of this study was to analyze the effect of population distrabution on yield formation of different soybean types to provide valuable information for soybean high-yield cultivation.This research was carried out with Hefeng45 and Hongfeng11 soybean cultivars by setting 6 different population distributions,which were 8×8,8×10,8×12,10×8,10×10 and 10×12 in plant spacing(cm) ×row spacing(cm),respectively.LSD method was used to analyse changes of yields and yield traits.The values of compensation effect and density effect were calculated.The results showed population distribution had significant effect on yield and yield traits,the value of compensation effect of Hefeng 45 was higher than that of Hongfeng 11 and the value of density effect of Hongfeng 11 was higher than that of Hefeng 45.Population distribution had effects on both compensation and density effect value.Yields of the 2 cultivars changes showed a linear regression relationship and downward convex quadratic parabola regression relationship respectively in plant spacing of 8 cm and 10 cm.The yield extreme value varied with plant type,and that of Hefeng 45 and Hongfeng 11 appeared in the 10 cm×10 cm and 8 cm×12 cm population distribution level,respectively.

【题目】Biosynthesis and immobilization of biofunctional allophycocyanin
【中文关键词】His标签蛋白,一步法纯化,纳米磁颗粒,亲合层析,螺旋藻,大肠杆菌,结合肽,红藻,藻胆体
【英文关键词】His-tiding-tagged proteins; one-step purification; coated magnetic nanoparticles; affinity-chromatography; Spirulina platensis; Escherichia coli; binding peptide; red algae; phycobilisomes
【中文摘要】别藻蓝蛋白的α亚基据报告有多种药理用途,通过大肠杆菌发酵发达的方法制备出具有StrepⅡ和His双标签的别藻蓝蛋白。由StrepⅡ标签获得的链霉亲和素结合能力经Western blot验证证实。另外,由His标签获得的金属螯合能力不仅能够促进对别藻蓝蛋白的纯化而且可以增强Zn离子在硅胶磁性纳米颗粒上的固定。磁性纳米颗粒将来可以用作药物载体。因此,在基因技术和纳米技术的基础上,我们获得一种很有前景的方法对药理性的蛋白进行生物改造并进行有目的的载送。
【英文摘要】The holo-allophycocyanin-α subunit, which has various reported pharmacological uses, was biosynthesized with both StrepII-tag and His-tag at the N-terminal in E.coli. The streptavidin-binding ability resulting from the Strep II-tag was confirmed by Western blot. Additionally, the metal-chelating ability deriving from the His-tag not only facilitated its purification by immobilized metal-ion affinity chromatography but also promoted its immobilization on Zn(II)-decorated silica-coated magnetic nanoparticles. The holo-allophycocyanin-α subunit with streptacidin-binding ability was thereby immobilized on magnetic nanoparticles. Magnetic nanoparticles are promising as drug delivery vehicles for targeting and locating at tumors. Thus, based on genetic engineering and nanotechnology, we provide a potential strategy to facilitate the biomodification and targeted delivery of pharmacological proteins.

【题目】Purification of 6×His-tagged phycobiliprotein using zinc-decorated silica-coated magnetic nanoparticles
【中文关键词】His标签;藻胆蛋白;硅壳磁性纳米颗粒;Zn(Ⅱ);纯化;吸附行为
【英文关键词】6×His tag; Phycobiliprotein; Silica-coated magnetic nanoparticles; Zn(II); Purification; Adsorption behavior
【中文摘要】通过将Zn离子吸附在硅胶上制备成Zn离子修饰硅壳磁性纳米颗粒。这些纳米颗粒被证明可以应用于对组氨酸标签藻胆蛋白的快速分离。用透射电子显微镜可以表征经过Zn离子吸附修饰后的磁性纳米颗粒表面发生的变化。该颗粒对组氨酸标签藻胆蛋白的等温吸附曲线满足Langmuir吸附定律。通过十二烷基硫磺钠聚丙烯酰胺凝胶电泳显示,在不影响藻胆蛋白光谱特性的情况下,该颗粒可以实现菌体破碎液中组氨酸标签藻胆蛋白的单条带纯化。因此,Zn离子修饰硅壳磁性纳米颗粒对组氨酸标签藻胆蛋白的分离和载送可以作为一种有效的工具。
【英文摘要】Zinc-decorated silica-coated magnetic nanoparticles were prepared by adsorbing zinc onto colloidal silica. These nanoparticles were used for the rapid purification of 6×His-tagged recombinant phycobiliprotein. The surface changes in the magnetic nanoparticles after zinc adsorption were characterized by transmission electron microscopy. The adsorption of the 6×His-tagged phycobiliprotein onto ZnSiMNPs in 10mM PBS at 25°C was found to follow the Langmuir isotherm. ZnSiMNPs could be used to extract 6×His-tagged phycobiliprotein from lysate to single-band purity, as determined by sodium dodecyl sulfate-polyacrylamide gel electrophoresis. No spectral variation was observed in the purified phycobiliprotein. Thus, ZnSiMNPs serverd as a useful tool for the magnetic separation and delivery of the 6×His-tagged phycobiliprotein.

【题目】Genetic and marine cyclonic eddy analyses on the largest macroalgal bloom in the world
【中文关键词】东海,绿潮,黄海,浒苔,rDNA间区,石莼科,多样性,沉积物
【英文关键词】East China Sea; green tides, Yellow Sea, Enteromorpha prolifera; rDNA spacer; Ulvophyceae; diversity; sediments
【中文摘要】2008年5月到7月,大量漂浮浒苔(Ulva prolifera)迅速出现在中国黄海南部,在其发展的顶峰时,生物量达到300万吨,覆盖了大约1.29×104 km2 的海域。浒苔生物量快速增长的机理已经得到阐释。黄海浒苔样品的分子系统发生分析表明这些漂浮浒苔属于一个单一的种群,另外黄海海域在春末夏初形成的暂时的冷涡可能通过为浒苔提供足够的生长时间、丰富的营养盐和理想的发育环境而促进了浒苔的生长。对于海洋冷涡和漂浮海藻运动路径之间的关系的首次研究,扩展了我们对漂浮大型海藻由出现到爆发的机理的认识。
【英文摘要】In 2008, a massive Ulva prolifera bloom, with a 3-million-ton biomass covering an area of 1.29×104 km2 at its largest, suddenly appeared from May to July in South Yellow Sea. The mechanism behind the rapid growth of these seaweeds was investigated. Molecular phylogenetic analysis of free-floating algal samples from the Yellow Sea suggested that U.prolifera belong to one population, and that temporary cyclonic eddies in the Yellow Sea in late spring and early summer may help promote the proliferation of this bloom by providing seaweeds with sufficient growth time, abundant nutrition, and favorable habitats. The initial investigation on the relationship between marine cyclonic eddies and the route of free-floating algae extends our knowledge on how the emergence of free-floating macroalgal blooms in coastal areas could yield a large biomass.

【题目】Optimization of dilute acid hydrolysis in Enteromorpha
【中文关键词】浒苔;酸水解;酒精可发酵性糖
【英文关键词】Enteromorpha ; acid hydrolysis; ethanol fermentable sugars
【中文摘要】酸水解是将生物多糖水解成可发酵的糖类的一种简单便捷的方法。为了提高发酵糖类的生产效率以及将其转化成燃料酒精的经济开发型,我们对浒苔分别用H2SO4, HCl, H3PO4 和C4H4O4进行了酸水解。在121°C下,分别对其进行了不同时间梯度(30,60,90分钟)和不同酸浓度(0.6, 1.0, 1.4, 1.8, and 2.2%, w/w)的试验处理。通过实验得出,H2SO4的酸水解效率最高。于是,我们通过高效液相色谱仪继续对H2SO4的酸水解特性进行了更详细分析研究。当硫酸的浓度为1.8%处理时间为60分钟时,酒精可发酵性糖类的产量很高,在总还原性糖中可达到48.6%。因此,浒苔是一种很好的生产可燃性酒精的生物。在接下来的工作中,我们会继续研究温度、生物量浓度对酸水解的影响以及将水解产物转变成可燃性酒精的发酵方法。
【英文摘要】Acid hydrolysis is a simple and direct way to hydrolyze polysaccharides in biomass into fermentable sugars. To produce fermentable sugars effectively and economically for fuel ethanol, we have investigated the hydrolysis of Enteromorpha using acids that are typically used to hydrolyze biomass: H2SO4, HCl, H3PO4 and C4H4O4 (maleic acid). 5%(w/w) Enteromorpha biomass was treated for different times (30, 60, and 90 min) and with different acid concentrations (0.6, 1.0, 1.4, 1.8, and 2.2%, w/w) at 121 ° C. H2SO4 was the most effective acid in this experiment. We then analyzed the hydrolysis process in H2SO4 in detail using high performance liquid chromatography. At a sulfuric acid concentration of 1.8% and treatment time of 60 min, the yield of ethanol fermentable sugars (glucose and xylose) was high, (230.5 mg/g dry biomass, comprising 175.2 mg/g glucose and 55.3 mg/g xylose), with 48.6% of total reducing sugars being ethanol fermentable. Therefore, Enteromorpha could be a good candidate for production of fuel ethanol. In future work, the effects of temperature and biomass concentration on hydrolysis, and also the fermentation of the hydrolysates to ethanol fuel should be focused on.

【题目】Ulva and Enteromorpha (Ulvaceae, Chlorophyta) from two sides of the Yellow Sea: analyses of nuclear rDNA ITS and plastid rbcL sequence data
【中文关键词】ITS;生物亲缘地理;rbcL;石莼科;暖流;黄海
【英文关键词】ITS; phylogeography; rbcL; Ulvaceae; warm current; Yellow Sea
【中文摘要】石莼科绿藻在世界各地都有分布;最近几年,它们在黄海大量爆发形成绿潮,不仅导致了许多海洋生态问题,这也是一个社会问题。我们调查了石莼科两个主要的属,石莼属和浒苔属,采集并分析了黄海两侧这两个属样品的质体rbcL序列和细胞核的ITS序列。通过rbcL序列构建的进化树显示,采集的样品中浒苔属有五个种(扁浒苔、曲浒苔、肠浒苔、缘管浒苔和浒苔),石莼属有三个种(孔石莼、硬石莼、U.ohnoi)。我们在韩国济州岛的两个地方发现了U.ohnoi,而这种石莼本应该是一种亚热带或热带种。另外,在扁浒苔的5.8S rDNA 和ITS2序列中我们发现了四种核酸型。核酸型进化网络揭示中国、韩国和欧洲种群所拥有的共同的核酸型与欧洲和中国/日本的有联系。虽然采集的是黄海两侧同种的样品,但是每个种的种内遗传多态性在世界各地的样品中水平是比较低的。
【英文摘要】Ulvacean green seaweeds are common worldwide; they formed massive green tides in the Yellow Sea in recent years, which caused marine ecological problems as well as a social issue. We investigated two major genera of the Ulvaceae, Ulva and Enteromorpha, and collected the plastid rbcL and nuclear ITS sequences of specimens of the genera in two sides of the Yellow Sea and analyzed them. Phylogenetic trees of rbcL data show the occurrence of five species of Enteromorpha (E.compressa, E.flexuosa, E.intestinalis, E.linza and E.prolifera) and three species of Ulva (U.pertusa, U.rigida and U.ohnoi). However, we found U.ohnoi, which is known as a subtropical to tropical species, at two sites on Jeju Island, Korea. Four ribotypes in partial sequences of 5.8S rDNA and ITS2 from E.compressa were also found. Ribotype network analysis revealed that the common ribotype, occurring in China, Korea and Europe, is connected with ribotypes from Europe and China/Japan. Although samples of the same species were collected from both sides of the Yellow Sea, intraspecific genetic polymorphism of each species was low among samples collected worldwide.

【题目】Genetic transformation of Platymonas (Tetraselmis) subcordiformis (Prasinophyceae, Chlorophyta) using particle bombardment and glass-bead agitation
【中文关键词】bar基因,珠磨法,细胞核转化,粒子轰击,亚心形扁藻
【英文关键词】bar; glass-bead agitation; nuclear transformation; particle bombardment; Platymonas subcordiformis
【中文摘要】扁藻属(Tetraselmis)亚心形扁藻(Platymonas subcordiformis)是单细胞海洋绿藻。通过敏感性测试发现亚心形扁藻对除草剂Basta非常敏感,表明Basta可以作为一种选择剂,bar基因是可行可靠的标记基因。包含bar基因表达盒的载体通过粒子轰击法和珠磨法导入亚心形扁藻,转化株利用Basta进行筛选。最终,DNA杂交印记分析表明这两种转化方法中bar基因都已经成功融合至亚心形扁藻的核基因组中,而且珠磨法转化方法效率略高于粒子轰击法。这是亚心形扁藻稳定转化的第一次报导,并且将会促进其的基础研究以及扩大其的应用。
【英文摘要】Platymonas (Tetraselmis) subcordiformis is a unicellular marine green alga. It was found to be very sensitive to the herbicide Basta through a sensitivity test indicating it could be employed as a selective agent. The bar gene is a practicable and selectable marker gene. The vector containing the expression cassette of the bar gene was transferred to P. subcordiformis by both particle bombardment and glass-bead agitation and transformants were then selected using Basta. Finally, Southern blotting analysis indicated that the bar gene had been successfully integrated into the nuclear genome of P. subcordiformis using both of the transgenic techniques, with the transformation efficiency of the glass-bead method being slightly higher than that of particle bombardment. This is the first report on stable transformation of P. subcordiformis, and will improve fundamental research and enlarge application of this alga.

【中文关键词】珠磨法,绿色荧光蛋白,亚心形扁藻,原生质体,转基因
【英文关键词】Glass-bead method, Green fluorescent protein, Platymonas subcordiformis, Protoplast, Transgenosis
【中文摘要】本文构建了单细胞海洋绿藻亚心形扁藻(Platymonas subcordiformis)的瞬时转化系统。我们通过珠磨法将pEGFP-N1载体导入亚心形扁藻。亚心形扁藻利用溶壁酶(鲍鱼丙酮粉和纤维素酶溶液)降解细胞壁,制作可行的原生质体条件为pH 6.5,25℃,酶解3h,当酶解液中初始亚心形扁藻的添加浓度为107 ml-1,原生质产率为61.2%,原生质体立即通过珠磨法导入pEGFP-N1载体,转化效率约为10-5,在阴性或空白对照组中并未观察到绿色荧光蛋白活性。这项研究表明绿色荧光蛋白是亚心形扁藻的灵敏的转化报告标记,并且细胞壁酶解法和珠磨法是亚心形扁藻转化的可行方案。
【英文摘要】A transient transformation system for the unicellular marine green alga, Platymonas subcordiformis, was established in this study. We introduced the pEGFP-N1 vector into P. subcordiformis with a glass bead method. P. subcordiformis was incubated in cell wall lytic enzymes (abalone acetone powder and cellulase solutions) to degrade the cell wall. The applicable conditions for production of viable protoplasts were pH 6.5, 25°C, and 3h of enzyme treatment. The protoplast yield was 61.2% when P. subcordiformis cells were added to the enzyme solution at a concentration of 107cell ml-1. The protoplasts were immediately transformed with the pEGFP-N1 vector using glass-bead method. The transformation frequency was about 10-5, and there was no GFP activity observed in either the negative or the blank controls. This study indicated that GFP was a sensitively transgenic reporter for P. subcordiformis, and the method of cell wall enzymolysis followed by glass bead agitation was applicable for the transformation of P. subcordiformis.

【题目】Establishment of a concocelis-mediated transformation system for Porphyra by biolistic PDS 1000/He
【中文关键词】紫菜,丝状体,基因枪,lacZ报告基因,SV40启动子
【英文关键词】Porphyra,concocelis,particle delivery system,lacZ reporter gene,SV40 promoter
【中文摘要】以坛紫菜和条斑紫菜的自由丝状体为材料,利用基因枪法分别转化CaMV35S、 SV40、FCP、Amt、Ubi 5种启动子与报告基因组合,转化后48h进行原位组织化学染色检测, 首次针对重要经济红藻紫菜的自由丝状体建立并优化遗传转化技术,为紫菜研究提供了 新工具。结果显示,SV40启动子可以驱动lacZ报告基因(编码J3一半乳糖苷酶)在紫菜丝 状体中的瞬间表达,空白与阴性对照未检测到本底;其它4种启动子未检测到基因表达。 进一步优化实验发现,在可裂膜650psi、轰击距离6cm下获得最高转化效率为8.0×10_。, 经定量检测与双因子方差分析,是最佳转化参数,提示基因枪参数对外源基因转化效率具 显著影响。
【英文摘要】Using a biolistic PDS lO00/He system,free—living conchocelis of Porphyra haitanensis(Rhodophyta)and P. yezoensis are bombarded respectively to test five heterologous promoter--reporter gene cassettes under different biolistic parameters.According to the results of in situ histochemical staining 48 hours after transformation,this is the first report on optimization of Porphyra coneocelis.mediated transfonnation.The established transient expression technique could serve as a new tool for Porphyra research in the concocelis stage,and be ready to set up a stable expression system.It is showed that only the SV40 promoter could drive the transient expression of/LacZ reporter gene without background in either blank control or negative control,whereas CaMV35S,FCP,Amt and Ubi promoters all failed to be recognized effectively by Porphyra concocelis.The highest transformation efficiency of SV40.1acZ is obtained as 8. 0×10-5.suggesting that 650 psi rupture—disc pressure and 6cm of bombardment distance are optimal biolistic parameters for Porphyra conco. cells,and it is also proved by quantitative determination to Lac Z expression.

【题目】三角褐指藻(Phaeodactylum tricornutum)通用转化载体的构建
【中文关键词】bar基因; 三角褐指藻; 通用转化载体
【英文关键词】bar gene; Phaeodactylum tricornutum; general transformatin vector
【中文摘要】三角褐指藻(Phaeodactylum tricorutum)是开展微藻生物柴油研究的理想材料。克隆了内源fcp基因簇的多个调控序列(启动子终止子) ,构建了包括fcpB启动子bar基因fcpA终止子以及 启动子多克隆位点(MCS) fcpA终止子、两个表达盒的通用转化载体pfcpA-MCS/fcpB-bar,其特征是以bar基因作为选择标记,MCS区方便插入一至多个目的基因。新载体可用于三角褐指藻的重组蛋白表达、或油脂代谢相关基因的功能验证和代谢调控研究。
【英文摘要】Phaeodactylum tricorutum is an ideal material for biodiesel research. In this paper, several endogenous elements, i.e. promoters and terminators, from fcp (fucoxanthin, chlorophyll a/c-binding protein) gene clusters were cloned, and a transformation vector pfcpA-MCS/fcpB-bar including two expression cassettes which were fcpB promoter-bar gene-fcpA termination and fcpA promoter-MCS (multiple cloning site)-fcpA termination was constructed and characterized by using bar gene as selection marker. It carried a large MCS easy for insertion of one or more funciton genes. This vector will be used for lipid metabolic engineering for Phaeodactylum tricornutum.

【题目】Settlement of vegetative fragments of Ulva prolifera confirmed as an important seed source for succession of a large-scale green tide bloom
【中文关键词】大型藻藻华,微繁体库,浒苔,绿藻,石莼,水产业,多样性
【英文关键词】Macroalgal blooms; propagule banks; Enteromorpha; Chlorophyta; Ulvophyceae; aquaculture; diversity
【中文摘要】在过去三年的中国黄海水域发生的绿潮中浒苔是最多的大型藻。从卫星图像中可以清楚的看到绿潮的形成,但对于他们的起源地仍然还是不清楚。2009年对江苏省的沿海岸的调查和两艘船的跟踪调查显示纤维状的石莼藻在江苏省的各环境中都分布广泛,其包括紫菜养殖的浮筏,池塘,河口,堤坝,潮间带的石头,码头以及湿地海岸。通过5S进化性分析知黄海上的绿潮并不是陆源生物。
【英文摘要】Methodology Principal Findings:To identify miRNAs in Porphyra yezoensis, a small RNA library was constructed. Solexa technology was used to perform high throughput sequencing of the library and subsequent bioinformatics analysis to identify novel miRNAs. Specifically, 180,557,942 reads produced 13,324 unique miRNAs representing 224 conserved miRNA families that have been identified in other plants species. In addition, seven novel putative miRNAs were predicted from a limited number of ESTs. The potential targets of these putative miRNAs were also predicted based on sequence homology search. Conclusions/Significance: This study provides a first large scale cloning and characterization of Porphyra miRNAs and their potential targets. These miRNAs belong to 224 conserved miRNA families and 7 miRNAs are novel in Porphyra. These miRNAs add to the growing database of new miRNA and lay the foundation for further understanding of miRNA function in the regulation of Porphyra yezoensis development.

【题目】‘Green tides’ are overwhelming the coastline of our blue planet: taking the world’s largest example
【中文关键词】绿潮,多样性,环境波动
【英文关键词】Green tide Diversity Environmental fluctuation
【中文摘要】在全世界范围内普遍发生的绿潮是由于沿海地区的海水营养盐水平升高引起的。绿潮发生在许许多多的地点,涉及各种各样种类的藻,引发了不同的后果,以及存在很多可能的原因。关于绿潮发生的频率以及明显的蔓延,我们研究了自然以及人为的环境波动对其产生的影响。本文着重介绍了跨学科研究的需要,旨在揭示绿藻在沿海海域的发生和蔓延的基本机制并进行有效控制。这将导致更有效地管理和减缓的绿潮的影响,从而保障沿海海洋生态系统的内在价值和商业价值。
【英文摘要】A broad spectrum of events that come under the category of green tide are recognized world-wide as a response to elevated levels of seawater nutrients in coastal areas. Green tides involve a wide diversity of sites, macroalgal species, consequences, and possible causes. Here we review the effect of natural and maninduced environmental fluctuations on the frequency and apparent spread of green tides. This article highlights the need for interdisciplinary research aimed at shedding light on the basic mechanisms governing the occurrence and succession of green algae in coastal seas. This will result in more effective management and mitigation of the effects of green tides, thus safeguarding the intrinsic and commercial value of coastal marine ecosystems.

【题目】Pyrolytic characteristics and kinetic studies of three kinds of red algae
【中文关键词】藻,单细胞,海红头,热解动力学分析
【英文关键词】Algae, Pophyra yezoensis, Plocamium telfairiae Harv, Corallina pilulifera, Pyrolysis, Kinetic analysis
【中文摘要】海洋藻类具有成为第三代生物燃料原料的巨大潜能。在惰性气体中,我们对三种红藻(条斑紫菜、海红头和小珊瑚藻)研究在10、30和50°C条件下每分钟的加热率。最可能的作用机理和活化能指前因子通过Popescu, FWO and KAS计算。热解包括三部分:水分蒸发、初步液化处理和剩余残渣分解。不同藻类样品的平均活化能、热稳定性、剩余残渣和反应速率具有显著性差异。不同样品的第二状态可用Avramic-Erofeev 方程式描述。通过不同的方法计算发现,所有样品具有相似的平均活化能。同时发现前指因子和活化能的动力学补偿效应。
【英文摘要】Marine algae have great potential as a third generation biofuel feedstock. The pyrolyt ic and kinetic characteristics of three kinds of red algae (Pophyra yezoensis, Plocamium telfairiae Harv and Corallina pilulifera) were studied at heating rates of 10, 30 and 50°C min-1 under an inert atmosphere. The most probable mechanism function and activation energy pre-exponential factors were calculated by the Popescu, FWO and KAS methods. Three stages appeared during pyrolysis: moisture evaporation, primary devolatilization and residual decomposition. Significant differences in the average activation energy, thermal stability, final residuals and reaction rates of the algae samples were observed. Stage II of the samples could be described by the Avrami c-Erofeev equation. The average activation energy of all samples was similar when calculated by different methods. Kinetic compensation effects of the pre-exponential factors and activation energy were also observed

【题目】Rapid estimation of lipid content in an Antarctic ice alga (Chlamydomonas sp.) using the lipophilic fluorescent dye BODIPY505/515
【中文关键词】南极衣藻ICE-L,油脂含量,BODIPY505/515,快速估算
【英文关键词】Chlamydomonas sp. ICE-L . Lipid content . BODIPY505/515 . Rapid estimation
【中文摘要】从南极海洋环境中分离得到一株高产油的藻株为ICE-L,它可以用于生产生物能源。荧光染料BODIPY505/515可用于估算藻体中油脂的含量。油脂颗粒经荧光染料染色后发出绿色荧光,可以通过计算球体体积的方程来估算这些油脂颗粒的体积。本研究主要探讨了在缺氮和紫外照射条件下油脂含量的变化。结果表明缺氮和紫外照射均可促进油脂颗粒的聚集。在完全培养基中培养12天可以收获到最大油脂含量即84 μL L－1,但在缺氮条件下不能达到。接种需要在对数期的后期进行接种。主要原因是在缺氮培养基中细胞数量基本上不增加,总油脂含量的增加被低生长速率所抵消。南极衣藻ICE-L中油脂含量高,在后期中可以考虑作为生物能源的原料。
【英文摘要】Chlamydomonas sp. ICE-L, isolated from Antarctic coastal marine environments, was selected as a high lipid producer, which may be useful for biodiesel production. The lipophilic fluorescent dye BODIPY505/515 was used to determine the algal lipid content. Lipid bodies stained with BODIPY505/515 have a characteristic green fluorescence, and their volumes were determined using the sphere volume formula. In this study, lipid accumulation by Chlamydomonas ICE-L was analyzed under different cultivation conditions (nitrogen deficiency and UV-B radiation). The results demonstrated that nitrogen deficiency and UV-B radiation could significantly promote the accumulation of lipid content per cell. The highest yields of total lipid content (reaching 84 μL L − 1) were obtained in full Provasoli medium after 12 days of cultivation, but not in the nitrogendeficient medium. The inoculum used in this experiment was obtained from the late-exponential growth phase. The main reason was that the cell numbers in nitrogendeficient medium had not increased and total lipid contents were offset by the lower growth rate. Considering the high lipid content in Chlamydomonas sp. ICE-L, this alga might be a promising alternative species for production of microalgal oil for the production of renewable biodiesel in the future.

【题目】A multidomain galectin involved in innate immune response of pearl oyster Pinctada fucata
【中文关键词】合浦珠母贝;珍珠贝;凝集素;β-半乳糖苷;先天性免疫
【英文关键词】Pinctada fucata;Pearl oyster;Lectin; β-Galactoside;Innate immunity
【中文摘要】半乳凝素能够特异地结合β-半乳糖苷,并在脊椎动物和无脊椎动物的先天免疫中起到重要作用。本研究中,在合浦珠母贝中克隆获得一个含有多个糖基识别区域(CRDS)的半乳凝素cDNA序列(PoGal)。半乳凝素PoGal基因全长2138bp,包括120bp的5’非编码区(UTR)、350bp的3’非编码区以及2个细胞激素RNA不稳定序列(ATTTA)。开放阅读框(ORF)为1668bp,编码555个氨基酸,分子量为63.4 KDa,等电点为4.8。PoGal含有4个糖基识别区域CRDs,每一个CRDs都含有保守的糖基结合序列H-NPR和WG-ER。同源性分析表明,PoGal与仅含有4个多个糖基识别区域(CRDS)的海湾扇贝和东部牡蛎的相似性分别为43.7%和62.9%。系统树分析表明所有含有4个多个糖基识别区域(CRDS)的半乳凝素形成一个分支。组织表达结果表明,PoGal mRNA在所有检测的组织中均有表达。在溶藻弧菌(Vibrio alginolyticus)刺激下,PoGal mRNA在消化腺、外套膜、血液、性腺以及肠中的表达量均显著上调。应急实验表明,在溶藻弧菌(Vibrio alginolyticus)刺激下,在4h、8h以及12h合浦珠母贝消化腺中PoGal基因的表达量显著上调。这些结果表明PoGal是一种可诱导的急性期蛋白质,可能参与了合浦珠母贝先天性免疫反应。
【英文摘要】Galectins could specifically bind to β-galactoside residues and play crucial roles in innate immune responses of vertebrates and invertebrates. In this study, the cDNA of a galectin with multiple carbohydrate-recognition domains (CRDs) was cloned from pearl oyster Pinctada fucata (designated as PoGal). PoGal cDNA was 2138 bp long and consisted of a 5′-untranslated region (UTR) of 120 bp, a 3′-UTR of 350 bp with two cytokine RNA instability motifs (ATTTA), and an open reading frame (ORF)

of 1668 bp encoding a polypeptide of 555 amino acids with an estimated molecular mass of 63.4 kDa and a theoretical isoelectric point of 4.8. PoGal contained four CRDs, each CRD of PoGal all had the conserved carbohydrate-binding motifs H-NPR and WG-ER. PoGal shared 43.7% and 62.9% identity to those of bay scallop and eastern oyster, respectively, which were only two galectins with four CRDs. The phylogenetic analysis revealed that all galectins with four CRDs formed a single clade. PoGal mRNA was constitutively expressed in all detected tissues, and the expression level of PoGal mRNA was significantly up-regulated in digestive gland, mantle, haemocyte, gonad and intestine after Vibrio alginolyticus stimulation. The expression profile analysis showed that the expression level of PoGal mRNA was significantly up-regulated at 4, 8 and 12 h after V. alginolyticus stimulation. These results suggested that PoGal was a constitutive and inducible acute-phase protein that perhaps involved in innate immune response of pearl oyster.

【题目】Molecular characterization and expression analysis of cathepsin L1 cysteine protease from pearl oyster Pinctada fucata

【中文关键词】珍珠贝;合浦珠母贝;组织蛋白酶L;半胱氨酸蛋白酶;免疫应答

【英文关键词】Pearl oyster;Pinctada fucata;Cathepsin L;Cysteine protease;Immune responses

【中文摘要】组织蛋白酶L是一种参与免疫应答的重要超家族酶。在本研究中,从合浦珠母贝获得一个组织蛋白L cDNA全长(poCL1),合浦珠母poCL1 cDNA全长1160bp,5’非编码区(Untranslated region,UTR)长15bp,3’-UTR长149bp,polyA尾巴前11bp出有聚腺苷酸化信号序列(AATAAA),开放阅读框(Open reading frame,ORF)为996bp,编码331个氨基酸组成的多肽链。poCL1蛋白由信号肽(Met1-Ala16),前体域(Thr17-Asp113)和成熟域(Leu114-Val331)组成,存在一个潜在的糖基化位点(Asn98),六个底物结合位点(Leu182,Met183,Ala249,Leu276,Gly279和Cys325),以及半胱氨酸(Cys138)、组氨酸(His278)和天冬酰胺(Asn298)残基构成的催化三联体。poCL1含有两个组织蛋白酶L保守签名序列ERFNIN和GNYD。同源性分析表明,poCL1与其他物种的相似性为62.5%~72.5%,同源性为42.9%~56.0%。系统树分析表明poCL1与无脊椎动物的组织蛋白酶L聚为一类,与淡水螺(Radix peregra),海参(Stichopus japonicus),海胆(Strongylocentrotus sala)组织蛋白酶L亲缘关系最近。组织表达分析表明,poCL1 mRNA在消化腺、外套膜、性腺、闭壳肌、肠、血淋巴、鳃组织中均表达,其中在消化腺表达量最高。应激实验表明,在溶藻弧菌(Vibrio alginolyticus)刺激下,肝脏中poCL1 mRNA在4h和8h显著上调,在12h和24h后显著下调,表明poCL1可能参与了合浦珠母贝的先天免疫应答反应,暗示其在合浦珠母贝先天免疫调控中发挥重要作用。

【英文摘要】Cathepsin L is one of the crucial enzyme superfamilies and involved in the immu ne responses. In this study, a cDNA encoding cathepsin L cysteine protease was identified and characterized from pearl oyster Pinctada fucata (designated as poCL 1). The poCL1 cDNA was 1160 bp lon g and consis ted of a 5,-untranslated region (UTR) of 15 bp, a 3,-UTR of 149 bp with a polyadenylation signal (AATAAA) at 11 nucleotides upstream of the poly(A) t ail, and an open reading frame (ORF) of 996 bp encoding a polypeptide of 331 amino acids, which contained a typical signal peptide sequence (Met1 -Ala16), a prodo-main (Thr17-Asp113) , and a mature domain (Leu114-Val331). The preproprotein contained the oxyanion hole(Gln), the active triad formed by Cys, His and Asn, and the conserved ERFNIN, GNFD motifs, which is characteristic for cathepsin L protease s. Homology analysis revealed tha t the poCL1 shared 62.5-72.5%similarity and 42.9-56.0% identity to other known cathepsin L sequences. The phylogenetic tree showed that the poCL 1 clustered with the invertebrate cathepsin L cysteine proteases and was closely related to Stichopus japonicus CL, Strongylocentrotus salar CL1 and Radix peregra CL. The mRNA expression of the poCL1 in blank group and bacterial challenge group could be detected in all studied tissues with the higher level in digestive gland. The expression level of poCL1 mRNA was significantly up-regulated at 4 h and 8 h, and then significantly down-regulated at 12 h and 24 h in digestive gland after Vibrio alginolyticus stimulation. These results provided important information for further exploring the roles of pearl oyster cathepsin L in t he immune responses.

【题目】Molecular characterization and expression analysis of interferon- γ -inducible lysosomal thiol reductase (GILT) gene from pearl oyster Pinctada fucata
【中文关键词】珍珠贝;合浦珠母贝;干扰素 – γ -诱导溶酶体硫醇还原酶;先天免疫
【英文关键词】Pearl oyster; Pinctada fucata; Interferon- γ -inducible lysosomal thiol reductase; Innate immunity.
【中文摘要】干扰素 – γ -诱导溶酶体硫醇还原酶(GILT)是一个重要的巯基还原酶,它参与物种MHC限制的抗原在哺乳动物中的二硫键还原催化处理。本文中,我们鉴定和描述了合浦珠母贝的干扰素 – γ -诱导溶酶体硫醇还原酶基因,命名为poGILT。poGILT基因全长为1273bp,包括一个24bp的5’UTR,一个484 bp的3’UTR,3’UTR包括两个RNA细胞不稳定因子ATTTA,开放阅读框为765bp。预测poGILT蛋白包含254个氨基酸,分子量大小为28.9KDa,理论等电点为7.4。poGILT基因的N-末端推测有一个裂解位点在19-20氨基酸的信号肽。SMART分析显示,poGILT包含一个GILT活化位点C69PDC72区域和一个GILT标签序C115QHGKEECIGNLIETC130。利用Mat-GAT软件对poGILT以及其他已知物种的GILT序列进行同源性分析,结果显示,poGILT跟其他物种分别有42.9 – 67.3%的相似性和22.9 – 49.8%的同源性。poGILT 的mRNA表达水平显示,其在消化腺的表达量最高,在闭壳肌,鳃,性腺,肠和外套膜的表达量次之,在血细胞中的表达量最低。应激表达实验表明,在脂多糖或溶藻弧菌的刺激下,合浦珠母贝poGILT基因在鳃和消化腺中的表达均显著上调。这一结果表明,合浦珠母贝poGILT基因受脂多糖或溶藻弧菌的刺激而激活,是一种可诱导的急性期蛋白质,可能参与了合浦珠母贝的先天免疫反应。
【英文摘要】Interferon- γ --inducible lysosomal thiol reductase (GILT) is an important thiol reductase, involved in class, MHC-restricted antigen processing by catalyzing disulfide bond reduction in mammals. Herein, we describe the identification and characterization of pearl oysterPinctada fucataGILT (designated as poGILT). The poGILT cDNA was 1273 bp long and consisted of a 5,-untranslated region (UTR) of 24 bp, a 3’-UTR of 484 bp with two cytokine RNA instability motifs (ATTTA), and an open reading frame (ORF) of 765 bp encoding a polypeptide of 254 amino acids with an estimated molecular mass of 28.9 kDa and a theoretical isoelectric point of 7.4. The N-terminus of the poGILT was found to have a putative signal peptide with a cleavage site amino acid position at 19 – 20. SMART analysis showed that the poGILT contained a GILT active-site C69PDC72

【中文关键词】合浦珠母贝;珍珠贝;凝集素; β -半乳糖苷;先天免疫
【英文关键词】Pinctada fucata; Pearl oyster; Lectin; β -galactoside; Innate immunity
【中文摘要】半乳凝素能够特异地识别和结合 β -半乳糖苷,并在脊椎动物和无脊椎动物的先天免疫中起到重要作用。本文克隆了一个合浦珠母贝合浦珠母贝半乳凝素基因(PoGal2)。半乳凝素PoGal2基因序列全长1347bp,包括3p的5’非编码区(UTR)、297bp的3’非编码区以及1个细胞激素RNA不稳定序列(ATTTA)。开放阅读框(ORF)为1047bp,编码349个氨基酸,分子量为38.1KDa,等电点为8.5。PoGal2含有2个糖基识别区域CRDs,均含有保守的糖基结合序列H-NPR和WG-EE。 同源性分析表明,PoGal 2与皱纹盘鲍(Haliotis discus)和菲律宾蛤(Venerupis philippinarum)的相似性分别为50.6%和50.9%。系统树分析所检测的不同物种半乳凝素形成两个分支,其中软体动物的聚为一支,线性虫类的聚为一支。每个分支中CRD-N 和CRD-C聚类到不同的分支中。组织表达结果表明,PoGal 2 mRNA 在所有检测的组织中均有表达。在溶藻弧菌(Vibrio alginolyticus)刺激下,PoGal2 mRNA在消化腺、鳃以及血液中的表达量均显著上调。应急实验表明,在溶藻弧菌(Vibrio alginolyticus)刺激下, 在8h、12h以及24h合浦珠母贝消化腺中PoGal2基因的表达量显著上调。这些结果表明PoGal 2是一种可诱导的急性期蛋白质,可能参与了合浦珠母贝先天性免疫反应。

【英文摘要】Galectins can recognize and specifically bind to β-galactoside residues, playing crucial roles in innate immune responses of vertebrates and invertebrates. We cloned the cDNA of a tandem-repeat galectin from the pearl oyster Pinctada fucata (designated as PoGal2). PoGal2 cDNA is 1347 bp long and consists of a 5 ' -untranslated region (UTR) of 3 bp, a 3 ' -UTR of 297 bp with one cytokine RNA instability motif (ATTTA), and an open reading frame of 1047 bp, encoding a polypeptide of 349 amino acids, with an estimated molecular mass of 38.1 kDa and a theoretical isoelectric point of 8.5. PoGal2 contains two carbohydrate recognition domains (CRDs); both have the conserved carbohydrate-binding motifs H-NPR and WG-EE. PoGal2 shares 50.6 and 50.9% identity with those of abalone (Haliotis discus) and the Manila clam (Venerupis philippinarum), respectively.Phylogenetic analysis revealed that the tandem-repeat galectins formed two clades for the different species. Molluscan tandem-repeat galectins were clustered into a single clade, and nematode tandem-repeat galectins were clustered into another single clade. In both clades, CRD-N and CRD-C were divided into different groups. PoGal2 mRNA was constitutively expressed in all tissues analyzed, and the expression level of PoGal2 mRNA was found to be significantly up-regulated in digestive glands, gills and hemocytes after Vibrio alginolyticus stimulation/infection. Expression profile analysis showed that the expression level of PoGal2 mRNA was significantly up-regulated at 8, 12 and 24 h after V. alginolyticus infection. These results suggest that PoGal2 is a constitutive and inducible acute-phase protein involved in the innate immune response of pearl oysters.

【题目】Molecular characterization and mRNA expression of catalase from pearl oyster Pinctada fucata
【中文关键词】合浦珠母贝;珍珠贝;过氧化氢酶;活性氧;免疫应答
【英文关键词】Pincatada fucata;Pearl oyster;Catalase;Reactive oxygen species
Immune response

【中文摘要】过氧化氢酶(Catalase)是机体内一类重要的抗氧化酶,能保护细胞免受活性氧的破坏,在生物体抗氧化能力以及免疫防御方面起到重要作用。本文研究了合浦珠母贝过氧化氢酶基因结构特征和在应激状态下的表达调控机制,合浦珠母贝过氧化氢酶基因PoCAT的cDNA序列全长为2428bp,其中5’-UTR为140 bp,3’-UTR为749 bp,ORF为1539 bp,可编码512个氨基酸,分子量大约为58.05 kDa,等电点为8.4。利用MatGAT软件对PoCAT氨基酸序列和其它物种CAT序列进行同源性和相似性分析,结果表明PoCAT与其它物种CAT序列具有较高的保守性,同源性为62.3%-82.2%,相似性为73%-92%。序列分析表明PoCAT中存在CAT家族的签名序列351RLFSYSDT358、活性位点序列61FNRERIPERVVHAKGAGA78、三个催化位点His72, Asn145 和Tyr355、两个N糖基化位点N436YS438 、 N478FS480以及过氧化物酶体导向信号ASL。组织表达模式分析表明PoCAT mRNA在消化腺、鳃、性腺、肠和外套膜中都有表达。免疫应激实验结果显示,在2 h、4 h和12h时PoCAT基因在肠中的表达显著上调,表明PoCAT可能参与了合浦珠母贝的先天免疫应答反应。

【英文摘要】Catalase (EC 1.11.1.6) is an important antioxidant enzyme that protects aerobic organisms against oxidative damage by degrading hydrogen peroxide to water and oxygen. In the present study, a catalase cDNA of peal oyster Pincatada fucata (designated as PoCAT) is cloned and characteri zed by expressed sequence tag (EST) and rapid amplification of cDNA ends (RACE) methods. PoCAT is 2428 bp long and consists of a 5 ′ -UTR of 140 bp, an unusually long 3 ′ -UTR of 749 bp, and an open readi ng frame (ORF) of 1539 bp. The ORF of PoCAT encodes a polypeptide of 512 amino acids with molecular weight of 58.1 kDa and the theore tical isoelectric point of 8.4 . PoCAT shares 62.3 – 82. 2% ide ntity and 73.0 – 92 .0% similarity to other catalase amino acid sequences. Sequence alignment indicates that PoCAT contains the proximal heme-ligand signature sequence(R351LFSYSDT358), the proximal active site signature (F61NRER IPERVVHAKGGGA78), and the three catalytic amino acid residues (His72, Asn145, and Tyr355). PoCAT has two potential glycosylation sites (N436YS438andN478FS480) and a peroxisome targeting signal (ASL). PoCAT mRNA was ubiquitously expressed in all detected tissues, and the expression level of PoCAT mRNA was higher in intestine and mantle. The expression profile analysis showed that the expression level of PoCAT mRNA in intestine was significantly up-regulated at 2, 4 and 12 h after Vibrio alginolyticus stimulation. These results demonstrated that PoCAT is a typical member of catalase family and might be involved in innate immune responses of pearl oyster.

【题目】A macrophage migration inhibitory factor like oxidoreductase from pearl oyster Pinctada fucata involved in innate immune responses
【中文关键词】珍珠贝;合浦珠母贝;巨噬细胞迁移抑制因子;氧化还原活性
【英文关键词】Pearl oyster;Pinctada fucata;Macrophage migration inhibitory factor;Oxidoreductase activity
【中文摘要】巨噬细胞迁移抑制因子是一种重要的细胞因子并在先天性免疫反应中起着关键调控作用。PoMIF cDNA全长1544 bp,5’-非编码区(Untranslated region,UTR)长45 bp,3’-非编码区长1139 bp包括polyA 尾巴及其上游15核苷酸处有一个多核苷酸加尾信号(AATAAA)。开放阅读框(Open reading fragment,ORF)为360 bp,编码120个氨基酸组成的多肽链,分子量是13.3 kDa,理论等电点为6.1。SMART分析表明PoMIF 蛋白包含拓扑异构酶活性位点(Pro2 和 Lys33)、氧化还原酶活性功能域C57GSV60以及MIF家族的特征序列D55PCGSVEVYSIGALG69。同源性分析PoMIF与其他MIF已知序列的相似性是40.3%-65.5%,同源性是26.9%-45.0%。组织表达分析说明,PoMIF在消化腺、腮、外套膜、性腺、血细胞、闭壳肌和肠七个组织中均有表达,其中在消化腺中表达量最高。在溶藻弧菌(Vibrio alginolyticus)刺激8 h时,PoMIF在消化腺、腮、血细胞和肠中表达量显著上调。在PoMIF蛋白活性研究中,将编码PoMIF成熟蛋白的PCR产物连接到质粒pREST上构建重组表达载体pREST-PoMIF,转化到大肠杆菌,经IPTG诱导,产生融合蛋白rPoMIF。功能分析显示rPoMIF具有氧化还原酶活性并能利用二硫苏糖醇(Dithiothreitol,DTT)还原胰岛素。
【英文摘要】Macrophage migration inhibitory factor (MIF) is an important cytokine and plays a crucial role as a pivotal regulator of innate immunity. In this study, a MIF cDNA was identified and characterized from the pearl oyster Pinctada fucata (designated as PoMIF). The full-length of PoMIF was 1544 bp and consisted of a 5′-untranslated region (UTR) of 45 bp, a 3′-UTR of 1139 bp with a polyadenylation signal (AATAAA) at 12 nucleotides upstream of the poly (A) tail. The open reading frame (ORF) of PoMIF was 360 bp which encoded a polypeptide of 120 amino acids with an estimated molecular mass of 13.3 kDa and a predicted pI of 6.1. SMART analysis showed that PoMIF contained the catalytic-sites P2 and K33 for tautomerase activity, a motif C57GSV60 for oxidoreductase activity and a MIF family signature D55PCGSVEVYSIGALG69. Homology analysis revealed that the PoMIF shared 40.3-65.5% similarity and 26.9-45.0% identity to other known MIF sequences. PoMIF mRNA was constitutively expressed in seven selected tissues of healthy pearl oysters, with the highest expression level in digestive gland. Eight hours after P. fucata was injected with Vibrio alginolyticus, the expression of PoMIF mRNA was significantly upregulated in digestive gland, gills, hemocytes and intestine. The cDNA fragment encoding mature protein of PoMIF was subcloned to expression vector pRSET and transformed into Escherichia coli BL21 (DE3). The recombinant PoMIF (rPoMIF) was expressed and purified under optimized conditions. Function analysis showed that rPoMIF had oxidoreductase activity and could utilize dithiothreitol (DTT) as reductant to reduce insulin.

【题目】Photosynthetic responses of thalli and isolated protoplasts of Bryopsis hypnoides (Bryopsidales, Chlorophyta) during dehydration
【中文关键词】鲜羽藻;叶绿素荧光法;脱水;原生质体;脉冲放大;调制荧光系统。
【英文关键词】Bryopsis hypnoides; chlorophyll fluorescence; dehydration; protoplasts pulse amplifiedmodulation fluorescence system.

【中文摘要】鲜羽藻是潮间带一种特殊的绿藻,它挤压出的原生质能够在海水中自发的聚集产生许多新的细胞,能够发育为成熟的藻体。在研究中,使用脉冲调制的荧光剂来检测藻体和孤立原生质体在脱水状态下的反应。结果显示,初始阶段,藻体的光合作用速率保持,初始阶段之后,持续的干燥使得光系统I和光系统II的速率明显下降。然而,暴露在空气中(CO2浓度为600±700 mg/L)的原生质体在脱水20%时光合作用速率轻微增大,但是随着水分的继续流失,其光合作用速率逐渐减小。当原生质体暴露在CO2(浓度为40±80 mg/L)缺乏的条件中时,其光合作用速率稳定的减少,并没有初始增大的现象。这些结果表明了藻体和孤立的原生质体能够有效的利用周围环境中的CO2,而藻体和原生质体在脱水状态下的光合性能有明显的差别。因此原生质体可能是研究压力耐受性很好的一个体系。

【英文摘要】Bryopsis hypnoides Lamouroux is a unique intertidal siphonous green alga whose extruded protoplasm can aggregate spontaneously in seawater to form numerous new cells that can develop into mature algal thalli. In this study, the photosynthetic responses during dehydration of both the thalli and protoplasts isolated from B.hypnoides were measured using a Dual-PAM(pulse amplitude modulation)-100 fluorometer. The results show that the photosynthetic rates of B. hypnoides thalli were maintained for an initial period, beyond which continued desiccation resulted in reduced rates of PSI and PSII. However, the photosynthetic performances of the isolated protoplasts dehydrated in air (CO2 concentration 600±700 mg/L) showed a slight increase of Y(II) at 20% water loss, but the rates decreased thereafter with declining water content. When protoplasts were dehydrated in CO2 deficient conditions (CO2 concentration 40±80 mg/L), the values of Y(II) declined steadily with increased dehydration without an initial rise. These results indicated that the thalli and isolated protoplasts of this alga can utilize CO2 in ambient air effectively, and the photosynthetic performances of the isolated protoplasts were significantly different from that of the thalli during dehydration. Thus the protoplasts may be an excellent system for the study of stress tolerance.

【题目】Sequence and phylogenetic analyses of the chloroplast 16S rRNA, tufA, and rbcL genes from Bryopsis hypnoides

【中文关键词】鲜羽藻;羽藻目;生物地理差异;进化分析;tufA基因。

【英文关键词】Bryopsis hypnoides; Bryopsidales; biogeographic divergence; phylogenetic analysis; tufA gene.

【中文摘要】使用鸟枪法序列数据,获得青岛本地种鲜羽藻的叶绿体16S rRNA和tufA基因的全长。在16S rRNA基因上有两个内含子区,跟羽毛藻在结构上有很大的相似性。叶绿体编码的tufA基因长度为1230bp,富含AT序列,为61.5%,与以前发表的羽藻属的基因很相似。基于叶绿体16S rRNA和tufA基因的进化分析证实了初始的假设,绒羽藻属不属于钙羽藻科。生物进化分析显示了羽藻属与德氏藻是姐妹种,然而这个进化枝缺乏有力证据。此外,根据Genbank 数据库获得的rbcL序列构建的系统进化树,结合羽藻属的地理分布,鉴定了亚洲三个不同分布的羽藻属种,初步结果显示它们是完全不同的种。

【英文摘要】Using shotgun sequencing data, the complete sequences of chloroplast 16S rRNA and tufA genes were acquired from native specimens of Bryopsis hypnoides (Qingdao, China). There are two group I introns in the 16S rRNA gene, which is structurally similar to that of Caulerpa sertularioides (Bryopsidales, Chlorophyta). The chloroplast-encoded tufA gene sequence is 1 230 bp long, very AT-rich (61.5%), and is similar to previously published 16S rRNA sequences of bryopsidinean algae. Phylogenetic analyses based on chloroplast 16S rRNA and tufA gene sequence data support previous hypotheses that the Bryopsidineae, Halimedineae, and Ostreobidineae are three distinct lineages. These results also confirmed the exclusion of Avrainvillea from the family Udoteaceae. Phylogenetic analyses inferred that the genus Bryopsis as sister to Derbesia; however, this clade lacked robust nodal support. Moreover, the phylogenetic tree inferred from rbcL GenBank sequences, combined with the geographical distributions of Bryopsis species, identified a strongly supportive clade for three differently distributed Asian Bryopsis species. The preliminary results suggesting that these organisms are of distinct regional endemism.

【题目】Photosynthetic performance of regenerated protoplasts from disintegrated cells of Bryopsis hypnoides (Chlorophyta)
【中文关键词】鲜羽藻;叶绿素荧光法;全叶片荧光成像;氧测量;原生质体;光合作用。
【英文关键词】Bryopsis hypnoides; chlorophyll fluorescence; imaging-PAM; oxygen measurements; protoplasts; Photosynthesis
【中文摘要】用叶绿素荧光法和氧测量法分别测定海水里培养了1小时,6小时,12小时和24小时鲜羽藻再生原生质体的光合作用。结果显示,对于再生原生质体,色素含量,光合作用速率与呼吸作用的比率,最大PSII量子产率和有效PSII量子产率,随着原生质体的重建过程逐渐降低,暗示了这些新形成的原生质体的PSII系统活动在24小时的重建过程中有一个显著地降低。我们假定在再生原生质体的重建过程中有不同的光合作用活力,而他们其中仅仅有一小部分能够成长为成熟的藻体。总的来说,上述结果显示了再建原生质体在每个时间段的光合作用特点,而不是单独的再建原生质体的光合作用活力。进一步的研究表明原生质体的大小和它们活力之间存在一定关系。实验结果显示中等大小的群体在培养24小时之后占总数的大部分。四个直径大小不同的原生质体群体(i.e. < 20, 20 – 60, 60 – 100, and > 100 μm)在最大光系统II量子产率和有效光系统II量子产率的不同显示了20 – 60 μm直径的原生质体有几个小时的最大的吸收和转化光能的潜能。
【英文摘要】The photosynthetic performances of regenerated protoplasts of Bryopsis hypnoides, which were incubated in seawater for 1, 6, 12, and 24 h, were studied using chlorophyll (Chl) fluorescence and oxygen measurements. Results showed that for the regenerated protoplasts, the pigment content, the ratios of photosynthetic rate to respiration rate, the maximal photosystem II (PSII) quantum yield (Fv/Fm), and the effective PSII quantum yield (ΦPSII) decreased gradually along with the regeneration progress, indicated that during 24 h of regeneration there was a remarkable reduction in PSII activity of those newly formed protoplasts. We assumed that during the cultivation progress the regenerated protoplasts had different photosynthetic vigor, with only some of them able to germinate and develop into mature thalli. The above results only reflected the photosynthetic features of the regenerated protoplasts at each time point as a whole, rather than the actual photosynthetic activity of individual aggregations. Further investigation suggested a relationship between the size of regenerated protoplasts and their viability. The results showed that the middle-sized group (diameter 20 – 60 μm) retained the largest number of protoplasts for 24 h of growth. The changes in Fv/Fm and ΦPSII of the four groups of differently sized protoplasts (i.e. < 20, 20 – 60, 60 – 100, and > 100 μm) revealed that the protoplasts 20 – 60 μm in diameter had the highest potential activity of the photosynthetic light energy absorption and conversion for several hours.

【题目】The Bryopsis hypnoides plastid genome: multimeric forms and complete nucleotide sequence
【中文关键词】绿藻门,细胞质,基因组,质体,细胞器,系统发育,序列分析,DNA
【英文关键词】Chlorophyta; Cytoplasm; Genome, Plastid; Plastid, Organelles; Phylogeny; Sequence Analysis, DNA
【中文摘要】背景:薛羽藻是一种管状绿藻,它挤出的原生质体能够在海水中自发的聚集并发育成成熟的个体。薛羽藻的叶绿体是细胞中最大的细胞器,它有很强的自主性。为了更好地的了解薛羽藻的叶绿体,我们对这种绿藻的叶绿体基因组进行测序和分析。主要发现:薛羽藻叶绿体基因组共鉴定出111个功能基因,包括69个可能的蛋白编码基因,5个核糖体RNA基因,37个tRNA基因。薛羽藻叶绿体DNA的基因组的大小(153,429 bp),基因排列顺序和反向重复缺失结构与小球藻叶绿体基因组相似。此外,我们利用脉冲场电泳(pulsed-field gel electrophoresis ,PFGE)和Southern杂交技术所做的细胞遗传学分析表明,薛羽藻叶绿体DNA存在多聚体结构,包括单体、二聚体、三聚体、四聚体甚至多聚体,这与之前在高等植物叶绿体基因组中发现的高级组织结构是相似的。根据分子杂交分析结果,四种多聚叶绿体DNA的相对数量关系约为1、1/2、1/4和1/8。基于叶绿体蛋白序列排列顺序的系统发生分析表明薛羽藻与绿藻纲所有种都是相似的,并且这种位置关系也得到了一些支持。结论:所有的结果表明薛羽藻叶绿体的自主性与叶绿体DNA的大小和所含的基因并无多大关系,叶绿体的反向重复缺失结构间接表明多聚体分子可能是由复制中间体的随机剪切和接合形成的,而不是DNA重组产生的。

【英文摘要】Background: Bryopsis hypnoides Lamouroux is a siphonous green alga, and its extruded protoplasm can aggregate spontaneously in seawater and develop into mature individuals. The chloroplast of B.hypnoides is the biggest organelle in the cell and shows strong autonomy. To better understand this organelle, we sequenced and analyzed the chloroplast genome of this green alga. Principal Findings: A total of 111 functional genes, including 69 potential protein-coding genes, 5 ribosomal RNA genes, and 37 tRNA genes were identified. The genome size (153,429 bp), arrangement, and inverted-repeat (IR)-lacking structure of the B.hypnoides chloroplast DNA (cpDNA) closely resembles that of Chlorella vulgaris. Furthermore, our cytogenomic investigations using pulsed-field gel electrophoresis (PFGE) and southern blotting methods showed that the B.hypnoides cpDNA had multimeric forms, including monomer, dimer, trimer, tetramer, and even higher multimers, which is similar to the higher order organization observed previously for higher plant cpDNA. The relative amounts of the four multimeric cpDNA forms were estimated to be about 1, 1/2, 1/4, and 1/8 based on molecular hybridization analysis. Phylogenetic analyses based on a concatenated alignment of chloroplast protein sequences suggested that B.hypnoides is sister to all Chlorophyceae and this placement received moderate support. Conclusion: All of the results suggest that the autonomy of the chloroplasts of B.hypnoides has little to do with the size and gene content of the cpDNA, and the IR-lacking structure of the chloroplasts indirectly demonstrated that the multimeric molecules might result from the random cleavage and fusion of replication intermediates instead of recombinational events.

【题目】白车轴草多糖提取工艺的研究
【中文关键词】白车轴草;多糖;水提法;正交试验
【英文关键词】white clover;polysaccharide;water extraction;orthogonal experiment
【中文摘要】本试验采取热水浸提法提取白车轴草多糖,研究其最佳提取工艺。以白车轴草为原料,多糖提取得率为指标,分别对4 个提取参数:浸提温度、料液比、浸提时间和浸提液pH 值进行了单因素试验;然后对上述4 个因素采用L9(3X4)正

交试验进行优化。结果表明,白车轴草多糖提取得率随着温度的升高而提高,在100 ℃时达到最大;料液比、浸提时间和浸提液pH 值对多糖得率的影响为单峰曲线,上述条件分别为1∶15、4 h 和8 时多糖得率最高。pH 值、料液比、温度和提取时间对白车轴草多糖得率的影响都存在极显著差异(P < 0.001),影响多糖得率的各因素主次关系为:pH 值> 料液比> 温度> 提取时间,浸提液pH 值对白车轴草多糖得率的影响最大。白车轴草多糖的最佳提取工艺参数为:提取时间5 h,料液比1∶15,温度100 ℃,浸提液pH 值为9。经验证试验测得,此条件下白车轴草多糖得率为2.26 %。试验结果揭示,白车轴草多糖的提取得率受提取工艺(浸提温度、料液比、浸提时间和浸提液pH 值)的影响显著,调整提取工艺可获得更高的多糖得率。

【英文摘要】The experiment was conducted to study the optimum water extraction condition for polysaccharide from white clover by single-factor experiment (extraction temperature,material to water ratio,extraction time and pH value)and L9 (3X4) orthogonal experiment.The results showed that the recovery rate of polysaccharide from white clover increased with the extraction temperature and get the highest recovery rate at the temperature of 100 ℃.The material to water ratio,extraction time and pH to the recovery rate were expressed in a single peak curve with the peak of material to water ratio at1∶15,extraction time at 4 h and pH value at 8.The recovery rate of polysaccharide was significantly affected by extraction temperature,material to water ratio,extraction time and pH value (P < 0.001).The sequence of the primary relation of the different factors were pH value > material to water ratio > extraction temperature > extraction time.And the results of ANOVA for L9(34)orthogonal experiment showed that the optimium condition was extraction time 5 h,material to water ratio 1∶15,extraction temperature 100 ℃,and at a pH of 9,under this condition,the recovery rate was 2.26 %.These results indicated that the recovery rate of polysaccharide from white clover was changed with the water extraction condition significantly and could be increased by adjusting the extract condition.

【英文关键词】deep-water net cage;mooring line;force;in-situ test
【中文摘要】选择广东省湛江市深水网箱养殖基地作为实测地点。通过实测试验测量深水网箱在实际海流条件下的锚绳受力状况,给出了单个网箱和组合网箱分别在3种不同网衣方案情况下的锚绳受力结果,旨在为深水网箱的设计及其锚泊系统的优化提供重要参考数据。结果表明,锚绳力随流速的增大而增大,锚绳受力与流速具有一定的正比关系;在3种不同网衣方案条件下,小网目网衣方案(网目40 mm)的锚绳受力最大,单个网箱的锚绳力峰值和锚绳合力分别为3.73 kN和5.01 kN,组合网箱的锚绳力峰值和锚绳合力分别为5.67 kN和20.83 kN;单纯浮架受力在整体网箱的受力中所占比重较小。结论认为,鉴于实际海况下网箱同侧各道锚绳的受力差异较大,在评价锚绳的安全性能时,应取各道锚绳受力峰值中的最大值作为单锚绳的允许受力值

【英文摘要】Mooring system,a component of deep-water net cage,need to have adequate safety and reliability to ensure cage culture production with severe conditions such as strong winds,currents and storms in deep-water offshore area. The loading of mooring lines of net cage located in open ocean is the focus of concern to cage designers.Based on the in-situ measurement of forces on mooring lines of full-scale cages in sea current,the data of mooringline forces from three different net modes for single net cage and composite net cage(a group of 4 cages) were presented in this paper,which will provide an important reference data to deep-water net cage designing as well as mooring system optimization. The geometry shape of test net was truncated cone with upper perimeter of 39 m,lower perimeter of 29 m and height of 5.8 m. The test results from this study showed that with the increase of current velocity,the mooring line forces increased obviously and had a certain proportional relationship with current velocity;among the three different net modes(no net,net with small mesh size of 40 mm,net with large mesh size of 75 mm),the mooring line forces under the net mode with small mesh size of 40 mm was the largest. The peak value of mooring line forces and composite force of mooring lines for the single net cage were 3.73 kN and 5.01 kN,while both of them were 5.67 kN and 20.83 kN for the composite net cage;circular floating system accounted for low proportion ofmooring line forces of whole net cage. According to the fact that the forces on different mooring lines on the same side of net cage in practical sea conditions have great difference,in the evaluation of the safety performance of mooring line,it was recommended that the maximum value of forces on the different mooring lines be taken as the load permission of single rope.

【题目】Down-regulated expression of RACK1 gene by RNA interference enhances drought tolerance in rice.
【中文关键词】水稻;RACK1基因;RNA干涉;转基因植株;抗旱性;实时荧光定量PCR;基因表达
【英文关键词】Oryza sativa; receptor for activated C-kinase 1 gene; RNA interference; transgenic plant; drought stress; real-time quantitative RT-PCR; gene expression
【中文摘要】RACK1是一种多功能支架蛋白,广泛参与植物生长发育过程的调节。利用RNA 干涉技术抑制水稻RACK1基因的表达,分析了RACK1基因在响应干旱胁迫中的功能。实时定量PCR对获得的转基因植株的RACK1基因表达分析结果表明,转基因水稻RACK1基因表达受抑制程度达5O 左右。与非转基因水稻(对照)相比,转基因水稻耐干旱能力显著强于对照,其膜的过氧化酶和丙二醛的产生显著低于对照,而超氧化物歧化酶活性极显著高于对照。表明RACK1蛋白质调节水稻对干旱胁迫的耐性,并且这种调节在很大程度上与植株体内的氧化还原系统有关。
【英文摘要】The receptor for activated C-kinase 1 (RACK1) is a highly conserved scaffold protein with versatile functions, and plays important roles in the regulation of plant growth and development. Transgenic rice plants, in which the expression of RACK1 gene was inhibited by RNA interference (RNAi), were studied to elucidate the possible functions of RACK1 inresponses to drought stress in rice. Real-time PCR analysis showed that the expression of RACK1 in transgenic rice plants was inhibited by more than 50%. The tolerance to drought stress of the transgenic rice plants was higher as compared with the non-transgenic rice plants. The peroxidation of membrane and the production of malondialdehyde were significantly lower,and the superoxide dismutase activity in transgenic rice plants was significantly higher than those in non-trangenic rice plants. It is suggested that RACK1 negatively regulated the redox system-related tolerance to drought stress of rice plants.

【题目】圆形网衣在水流作用下的运动变形特性
【中文关键词】圆形网衣;水流;运动变形;集中质量法;数值模拟
【英文关键词】cylinder net;current;movement and deformation;lumped mass method;numerical simulation
【中文摘要】研究网衣在水流作用下的运动变形是深入了解网箱耐流特性的关键。本研究基于集中质量点法,建立了圆形网衣在水流作用下的数值计算模型,并利用前人的试验结果对数值模型进行了验证。验证结果表明,无论是网衣的变形还是受力情况,模拟结果都与试验结果吻合良好。在此基础上,针对实际应用中的圆形网衣,在不同配重(GW1=400 kg、GW2=800 kg)和流速(U=0.3 ~ 0.9 m/s)条件下,对网衣变形、网衣底端前后点位移、网衣底端倾角进行了数值模拟,探讨了流速、配重大小对网衣运动变形特性的影响。结果表明,水流速度的增大会加剧网衣的变形,在配重GW1、流速U=0.75 m/s时,网衣容积损失率达到50% 以上。网衣底端前点的水平位移大于后点的水平位移,前点的垂直位移则小于后点的垂直位移,随着流速的增大,网衣底端前后点的位移差异将更为明显。当配重增加时,网衣底端位移、倾角以及网衣容积损失率可相应减小,网衣变形得到一定改善。数值模拟证明,本研究所建立的数值计算模式具有较好的稳定性和解的收敛性,可为下一步波浪、流联合作用下的整体网箱模拟奠定良好的理论基础
【英文摘要】Flexible net,an important component of deep-water net cage,is the most complex loading part of cage system. Studying the movement characteristics of cylinder net exposed to current is a key to deeply understand the properties of withstanding strong current about net cage. In this paper,based on the lumped mass method,a numerical model for 3-D nets in steady current was set up. To verify the validity of the numerical model,model test results made by other authors were cited and compared with the numerical results. The numerical results for the drag force on the net and the net deformation agreed well with experimental ones. On the basis of that,accordingto practical cylinder net,under the conditions of two weight modes(GW1=400 kg,GW2=800 kg) and five kinds of current velocities(U=0.3-0.9 m/s),the net deformation,the displacement and the pitch angles of the net bottom were calculated,and the influences of current velocity and weight size on the movement and deformation characteristics of the net were discussed. The calculated results indicated that the increasing of current velocity could intensify the net deformation. The volume reduction rate of the net with weight mode GW1 when U=0.75m/s reached more than 50%. For different weight modes and current velocities,the horizontal displacement of the fore point at the bottom of the net was great than that of the rear one,while the vertical displacement of the fore point was less than that of the rear one. With current velocity increasing,the displacement difference between the two points had become more obvious. When the weight increases,the displacement,the pitch angles of the net bottom and the volume reduction rate of the net could all decrease accordingly

【题目】高盐低温胁迫下水稻转录因子基因表达谱分析
【中文关键词】转录因子;表达谱;高盐;低温;水稻
【英文关键词】transcription factor;expression profile;salt stress;low temperature stress;rice
【中文摘要】为探索水稻响应高盐低温逆境胁迫的分子调控机制,采用Affymetrix 水稻表达谱芯片,分析研究了高盐低温胁迫下水稻转录因子基因的表达谱。检测到491 个差异表达的水稻转录因子基因,属于56 个转录因子家族。其中17 个转录因子基因,高盐低温处理后表达均显著上调,4 个转录因子基因,高盐低温下表达均显著下调,9 个转录因子基因经高盐、低温处理后表达水平向相反方向变化。进一步采用实时荧光定量PCR,验证了6 个转录因子基因在高盐低温胁迫条件下的差异表达变化,其结果和芯片杂交结果基本一致。
【英文摘要】Numerous studies have shown that transcription factors play important roles in regulating plant responses to environmental stresses. In this study,we used the Affymetrix Rice GeneChip to deduce the expression profiling of rice transcription factor genes under salt-stress or low temperature-stress treatment. A total of 491 differentially expressed ricetranscription factor genes were identified under high salt or low temperature,these genes could be classified into 56 transcription factor families,of which 17 transcription factor genes were consistently up-regulated and 4 consistently downregulated under high salt or low temperature stress,while 9 genes showed opposite expression change directions under high salt or low temperature stress. In addition,the differential expression patterns of six representative candidate genes were confirmed by real-time quantitative RT-PCR and the results showed that the expression changes of these candidates were generally consistent with the microarray results detected by Affymetrix Rice GeneChip.

【题目】高压水射流水下洗网机旋转射流打击力计算
【中文关键词】水射流;洗网机;旋转;射流打击力;网衣
【英文关键词】water2jet; net2washingmachine; rotating; jet hitting force; net
【中文摘要】依据水力学公式计算出歧管式高压水射流水下洗网机旋转的射流角速度和射流打击力。分析结果表明:旋转的射流打击力随偏转角增大而递减,但随射流压力、旋转半径和喷嘴孔径增大而增大;合理选择喷嘴孔径对旋转的射流打击力的增强作用明显,而增大旋转半径对射流打击力的增强作用较弱;旋转的射流打击力比非旋转的射流打击力更有利于提高清洗网衣的效率。海上清洗试验表明,在合理的压力和流量条件下,旋转的射流打击力清洗网衣的效果良好
【英文摘要】The paper obtained the rotating jet angular velocity and hitting force of the high2p ressure water2jet manifold underwater net2washingmachine, according to hydraulic dynamics and the self2rotating of the model. Analyses showed that the rotating hitting force F diminished with the deflection angle α increasing, but in2 creased with the p ressure p, gyration radius R and the nozzle diameter d increasing; a reasonable choice of nozzle diameter d would significantly enhanced the role of the rotating hitting force F, while the increase of the gyration radius R had not good effect of the jet hitting force F; the rotating jet hitting force ismore conducive to raising the efficiency of washing net than that of the non2rotating jet hitting force. Sea washing experiments demonstrated that the rotating jet hitting force washed net well under the suitable p ressure and flux.

【题目】Soybean GmPHD-Type Transcription Regulators Improve Stress Tolerance in Transgenic Arabidopsis Plants
【中文关键词】空
【英文关键词】soybean;stress tolerance;transcription
【中文摘要】空
【英文摘要】Background: Soybean [Glycine max (L.) Merr.] is one of the most important crops for oil and protein resource. Improvement of stress tolerance will be beneficial for soybean seed production. Principal Findings: Six GmPHD genes encoding Alfin1-type PHD finger protein were identified and their expressions differentially responded to drought, salt, cold and ABA treatments. The six GmPHDs were nuclear proteins and showed ability to bind the cis-element ‘‘GTGGAG’’. The N-terminal domain of GmPHD played a major role in DNA binding. Using a protoplast assay system, we find that GmPHD1 to GmPHD5 had transcriptional suppression activity whereas GmPHD6 did not have. In yeast assay, the GmPHD6 can form homodimer and heterodimer with the other GmPHDs except GmPHD2. The N-terminal plus the variable regions but not the PHD-finger is required for the dimerization. Transgenic Arabidopsis plants overexpressing the GmPHD2 showed salt tolerance when compared with the wild type plants. This tolerance was likely achieved by diminishing the oxidative stress through regulation of downstream genes. Significance: These results provide important clues for soybean stress tolerance through manipulation of PHD-type transcription regulator.

【题目】GmDREB2, a soybean DRE-binding transcription factor, conferred drought and high-salt tolerance in transgenic plants
【中文关键词】空
【英文关键词】Abiotic stress; DREB transcription factor; Glycine max L.; Drought tolerance; High-salt tolerance; Free proline
【中文摘要】空
【英文摘要】A novel DREB (dehydration responsive element binding protein) homologous gene, GmDREB2, was isolated from soybean. Based on its similarity with AP2 domains, GmDREB2 was classified into A-5 subgroup in DREB subfamily in AP2/EREBP family. Expression of GmDREB2 gene was induced by drought, high salt, and low temperature stresses and abscisic acid treatment. The GmDREB2 bound specifically to DRE element in vitro. Furthermore, the overexpression of GmDREB2 activated expression of downstream genes in transgenic Arabidopsis, resulting in enhanced tolerance to drought and high-salt stresses and did not cause growth retardation. Analysis of free proline contents in transgenic tobacco indicated that the overexpression of GmDREB2 accumulated higher level of free proline compared to the wild type plants under drought condition. The results from this study indicate that this novel soybean GmDREB2 gene functions as an important transcriptional activator and may be useful in improving of plant tolerance to abiotic stresses in plants.

【题目】Isolation and characterization of a novel EAR-motif-containing gene GmERF4 from soybean
【中文关键词】空
【英文关键词】Abiotic stress Ethylene responsive factor Soybean Transcriptional repressor
【中文摘要】空
【英文摘要】Transcriptional repressors are emerging as central regulators of development and stress responses in different organisms. The ERF-associated amphiphilic repression (EAR) motif was identified as essential for transcriptional repression. To gain a better understanding of this type of protein, we reported here a novel GmERF4 protein from soybean. Sequence alignment showed that GmERF4 contains one AP2/ERF domain, two putative nuclear localization signal regions and one EAR motif. The GmERF4 protein was preferentially localized to the nucleus of onion epidermis cells and bound specifically to the GCC box and DRE/CRT element in vitro. Furthermore, the expression of GmERF4 was induced by ethylene, JA, SA, cold, salt, drought, and soybean mosaic virus, and repressed by ABA. Constitutive expression of GmERF4 in transgenic tobacco plants increased tolerance to salt and drought stresses compared with wild-type plants, but did not exhibit detectable resistance against bacterial infection.

【题目】核蛋白筛选系统(NTT)的建立及鉴定
【中文关键词】核蛋白;核定位信号;酵母筛选系统
【英文关键词】Nuclear proteins;Nuclear localization signals;Yeast selective system
【中文摘要】为了研究植物核蛋白的组成及其在各种环境条件下的动态变化,利用核蛋白的核定位信号(nu—clear localization signals,NLS)筛选编码核蛋白的基因,建立了一套快速、省力、低成本的核蛋白筛选系统(nuclear transportation trap,NTT)。通过鉴定发现,将合成的SV4O蛋白大T抗原的核定位信号序列插入筛选载体的多克隆位点,转化酵母EGY48,插入核定位信号的筛选载体转化酵母后可以在选择性培养基(SD/His一/Leu-)上生长,而没有插入核定位信号的筛选载体转化酵母后不能在选择性培养基上生长,从而证明此核蛋白筛选系统有效。比较实验表明,本研究构建的核蛋白筛选系统与已报道的系统相比筛选效率更高。利用此系统从cDNA文库中分离编码核蛋白的基因,对于研究核蛋白的动态组成、了解核蛋白基因在调控细胞发育及其环境胁迫条件下的作用机制具有重要的意义。
【英文摘要】To study the composition of nuclear proteins and its dynamic variation under various environmental conditions,a high efficiency nuclear transportation trap (NTT)system was constructed toclone genes encoding nuclear proteins that contain all kind of nuclear localization signals (NLS)sequence in this research.To identify the nuclear transportation trap system ,NLS sequence of the large T antigen of SV40 protein was synthesized,inserted into multi—cloning site of selective vector of NTT system and transferred into yeast strain EGY48.The results showed that yeast transferred with selective vector with NLS sequence could grow on SD/His一/Leu—selective medium,whereas yeast without NLS sequence couldn't grow,which indicated that NTT system could work.Moreover,comparing analysis showed that the selective efficiency of the vector constructed in this study is higher than that of the vectors reported.The NTT system will be helpful in the screening of genes encoding nuclear proteins from cDNA library,which is very important to study the dynamic changes of nuclear proteins and the modulating network of all genes in nuclear.

【题目】Association of the circadian rhythmic expression of GmCRY1a with a latitudinal cline in photoperiodic flowering of soybean
【中文关键词】空
【英文关键词】blue light , cryptochrome ,photoperiodism , photoreceptor
【中文摘要】空
【英文摘要】Photoperiodic control of flowering time is believed to affect latitudinal distribution of plants. The blue light receptor CRY2 regulates photoperiodic flowering in the experimental model plant Arabidopsis thaliana. However, it is unclear whether genetic variations affecting cryptochrome activity or expression is broadly associated with latitudinal distribution of plants. We report here an investigation of the function and expression of two cryptochromes in soybean, GmCRY1a and GmCRY2a. Soybean is a short-day (SD) crop commonly cultivated according to the photoperiodic sensitivity of cultivars. Both cultivated soybean (Glycine max) and its wild relative (G. soja) exhibit a strong latitudinal cline in photoperiodic flowering. Similar to their Arabidopsis counterparts, both GmCRY1a and GmCRY2a affected blue light inhibition of cell elongation, but only GmCRY2a underwent blue light- and 26S proteasome-dependent degradation. However, in contrast to Arabidopsis cryptochromes, soybean GmCRY1a, but not GmCRY2a, exhibited a strong activity promoting floral initiation, and the level of protein expression of GmCRY1a, but not GmCRY 2a, oscillated with a circadian rhythm that has different phase characteristics in different photoperiods. Consistent with the hypothesis that GmCRY1a is a major regulator of photoperiodic flowering in soybean, the photoperiod-dependent circadian rhythmic expression of the GmCRY1a protein correlates with photoperiodic flowering and latitudinal distribution of soybean cultivars.We propose that genes affecting protein expression of the GmCRY1a protein play an important role in determining latitudinal distribution of soybeans.

【题目】Over-expression of an AT-hook gene, AHL22, delays flowering and inhibits the elongation of the hypocotyl in Arabidopsis thaliana
【中文关键词】空
【英文关键词】Arabidopsis thaliana ,AT-hook ,Flowering time ,Hypocotyl ,Photomorphogenesis
【中文摘要】空
【英文摘要】The Arabidopsis genome encodes 29 AHL (AT-hook motif nuclear localized) proteins, but the function for most of them remains unknown. We report here a study of the AHL22 gene, which was originally identified as a gain-of-function allele that enhanced the phenotype of the cry1 cry2 mutant. AHL22 is a nuclear protein with the binding activity for an AT-rich DNA sequence. AHL22 overexpression delayed flowering and caused a constitutive photomorphogenic phenotype. The loss-of-function AHL22 mutant showed no clear phenotype on flowering, but slightly longer hypocotyls. However, silencing four AHL genes (AHL22, AHL18, AHL27, and AHL29) resulted in early flowering and enhanced ahl22-1 mutant phenotype on the growth of hypocotyls, suggesting genetic redundancy of AHL22 with other AHL genes on these plant developmental events. Further analysis showed that AHL22 controlled flowering and hypocotyl elongation might result from primarily the regulation of FT and PIF4 expression, respectively.

【题目】Evaluation of putative reference genes for gene expression normalization in soybean by quantitative real-time RT-PCR
【中文关键词】空
【英文关键词】gene expression;Qrt-pcr
【中文摘要】空
【英文摘要】Background Real-time quantitative reverse transcription PCR (RT-qPCR) data needs to be normalized for its proper interpretation. Housekeeping genes are routinely employed for this purpose, but their expression level cannot be assumed to remain constant under all possible experimental conditions. Thus, a systematic validation of reference genes is required to ensure proper normalization. For soybean, only a small number of validated reference genes are available to date. Results A systematic comparison of 14 potential reference genes for soybean is presented. These included seven commonly used (ACT2, ACT11, TUB4, TUA5, CYP, UBQ10, EF1b) and seven new candidates (SKIP16, MTP, PEPKR1, HDC, TIP41, UKN1, UKN2). Expression stability was examined by RT-qPCR across 116 biological samples, representing tissues at various developmental stages, varied photoperiodic treatments, and a range of soybean cultivars. Expression of all 14 genes was variable to some extent, but that of SKIP16, UKN1 and UKN2 was overall the most stable. A combination of ACT11, UKN1 and UKN2 would be appropriate as a reference panel for normalizing gene expression data among different tissues, whereas the combination SKIP16, UKN1 and MTP was most suitable for developmental stages. ACT11, TUA5 and TIP41 were the most stably expressed when the photoperiod was altered, and TIP41, UKN1 and UKN2 when the light quality was changed. For six different cultivars in long day (LD) and short day (SD), their expression stability did not vary significantly with ACT11, UKN2 and TUB4 being the most stable genes. The relative gene expression level of GmFTL3, an ortholog of Arabidopsis FT (FLOWERING LOCUS T) was detected to validate the reference genes selected in this study. Conclusion None of the candidate reference genes was uniformly expressed across all experimental conditions, and the most suitable reference genes are conditional-, tissue-specific-, developmental-, and cultivar-dependent. Most of the new reference genes performed better than the conventional housekeeping genes. These results should guide the selection of reference genes for gene expression studies in soybean.

【题目】Analysis of Clock Gene Homologs Using Unifoliolates as Target Organs in Soybean (Glycine max)
【中文关键词】空
【英文关键词】Flowering; LHY/CCA1; Soybean (Glycinemax); TOC1; Unifoliolates
【中文摘要】空
【英文摘要】Soybean is a typical short-day crop, and its photoperiodic response of flowering is critical to its yield. This phenomenon was well studied during the last century, but the molecular mechanism governing it is unknown. The clock-genehomologs, GmLCL1 and GmLCL2 (Glycinemax LHY/CCA1 Like 1 and 2) and GmTOC1 (Glycinemax TOC1) were cloned from Glycinemax L. KN18, and their expression patterns were analyzed using a system developed in this study. We employed 8 h light/16 h dark and 18 h light/6 h dark as short- and long-day conditions, respectively, because in these conditions soybean plants had significant indexes of flowering time. We also used unifoliolates, not the whole plant as Arabidopsis, as targetorgans for gene expression analysis. GmLCL1 and GmLCL2 had similar circadian expression patterns and both were morning genes, while GmTOC1 was an evening gene and peaked in the evening. The expressions of GmLCL1 and GmLCL2 were obviously antiphase to that of GmTOC1.Our study provided a system that simplified the experiments without compromising the quality of data obtained and was suitable for analyzing the molecular mechanism of flowering in soybean. GmLCL1, GmLCL2 and GmTOC1 may be the components of central clock in soybean

【题目】大豆GmCOL4基因的克隆与分析
【中文关键词】CONSTANS; 生物信息学; 生物节律钟; 光周期; 大豆
【英文关键词】CONSTANS; Bioinformatics; Circadian clock; Photoperiod; Glycine max L.
【中文摘要】CONSTANS (CO)是植物光周期开花途径中的关键基因之一。通过RT-PCR 和生物信息学的方法, 克隆了大豆GmCOL4 基因并分析其结构特征, 用实时荧光定量PCR (quantitative real-time RT-PCR, qRT-PCR)研究了其转录特点。结果表明, GmCOL4 的4 个外显子编码一个具有B-box 和CCT 保守结构域的CO-like 蛋白, 在序列上与拟南芥(Arabidopsis thaliana) COL9 相似性最高, 为64.3%。分析其转录特征发现, GmCOL4 表达主要受生物节律的影响, 受光的调节作用较弱。器官特异性表达分析发现, GmCOL4 主要在大豆叶片中表达, 表达模式与COL9 相似。这为大豆中CO 基因家族的功能研究提供了重要的依据
【英文摘要】The model plant Arabidopsis thaliana has been identified to have four major flowering pathways. Among them, the photoperiod pathway integrates the light signal including light/dark cycle, light spectrum, light intensity, and light duration, to mediate flower initiation. CONSTANS (CO) is a key gene in photoperiodic flowering pathway and acts between genes of the circadian clock and meristem identity. CO encodes a protein containing two zinc finger regions (B-box I and II) near the amino terminus and a CCT (CO, CO-like, TOC1) domain near the carboxy terminus. The CO from Arabidopsis thaliana is one member of the family comprised of 17 members, which can be classed into three subgroups based on their characters of functional domains. To elucidate the function of CO in flowering in soybean, cloned one of CO-like gene, named as GmCOL4, from Glycine max L. Kennong 18. Bioinformatics analysis revealed that GmCOL4 encoded a protein embedded two conserved domains, B-box and CCT, and belonged to subgroup III. Phylogenetic analysis based on the critical amino acid sequences indicated that GmCOL4 was much close to COL9 with similarity of 64.3%. The expression profiles of GmCOL4 by quantitative real-time RT-PCR (qRT-PCR) showed a similar pattern to that of COL9. GmCOL4 was largely regulated by biological circadian, while the light appeared weak effect on it. And GmCOL4 expressed mainly in leaves and had its highest amount in anthesis. The results suggested that GmCOL4 is one of the important genes in the regulation of flowering and photoperiodic in soybean. It paves a way to study the function of CO family in soybean and its application in soybean molecular breeding.

【题目】植物实时荧光定量PCR内参基因的选择
【中文关键词】实时荧光定量RT-PCR 内参基因 geNorm 基因表达
【英文关键词】real-time quantitative reverse transcription PCR reference genes geNorm gene expression
【中文摘要】实时荧光定量RT-PCR(real-time quantitative reverse transcription PCR,qRT-PCR)具有定量准确、灵敏度高和高通量等特点,已被广泛应用于基因的表达分析.常规qRT-PCR采用相对定量进行分析,其关键步骤是选择合适的稳定内参基因进行校正和标准化.持家基因被广泛用作内参基因,但在所有生理条件下均稳定表达的理想内参基因并不存在.大多数传统内参基因已不能满足qRT-PCR准确定量的要求.基于基因芯片表达数据和EST数据库并结合qRT-PCR,可以筛选稳定性好的新的内参基因.简要综述了植物qRT-PCR内参基因的研究进展,并就内参基因的选择中应注意的问题进行了探讨.
【英文摘要】Real-time quantitative RT-PCR(qRT-PCR) technology,with quantitative accuracy,high sensitivity and high-throughput characteristics,has been widely used in gene expression analysis.Based on the relative quantitative analysis,qRT-PCR data must be normalized with one or more proper and stable internal reference genes.House-keeping genes are customarily used as endogenous references for relative quantification.But not a single gene can act as a universal reference reported so far.Most of the traditional housekeeping genes are unable to ensure accurate normalization in qRT-PCR.Based on the tremendous gene-chip expression data and public deposited EST data,new reference genes with superior stability were selected and verified with qRT-PCR.The research progress of reference genes in plant qRT-PCR was reviewed and aspects to be considered in future reference gene selection were also discussed.

【题目】Identification, inheritance and gene mapping of resistance to a virulent Soybean mosaic virus strain SC15 in soybean
【中文关键词】空
【英文关键词】Soybean mosaic virus ,virulent strain SC15 ,screening for resistance sources , genetic analysis ,gene mapping
【中文摘要】空
【英文摘要】Soybean mosaic virus (SMV) is one of the major pathogens for soybeans worldwide. Among the 21 strains identified under uniform identification system in China, SC15 can infect all 10 of the differentials, is the most virulent strain and has been prevalent especially in Southern China. In this study, 10 elite accessions resistant to SC15 were identified from 205 soybean lines. P1, P2, F1, F2 and 200 recombinant inbred lines (RIL) of the cross _RN-9_ (resistant, R) · _7605_ (susceptible, S) were used to study inheritance of resistance to SC15. F1 was identical to _RN-9_, F2 segregated in a 3R : 1S phenotypic ratio, whereas RILs segregated in a 1R : 1S genotypic ratio. This indicated that a single dominant gene, designated as RSC15, conferred the resistance. A genetic linkage map of a segment of C2 linkage group was constructed using SSR markers identified by bulked segregant analysis of RIL population, where RSC15 was mappedbetween Sat_213 and Sat_286 with distances of 8.0 and 6.6 cM to the respective flanking markers.

【题目】Identification and Distribution of Soybean mosaic virus Strains in Southern China
【中文关键词】空
【英文关键词】Soybean mosaic virus (SMV), strain identification, strain distribution, strain clustering
【中文摘要】空
【英文摘要】From 1,417 leaf samples with Soybean mosaic virus (SMV)-like symptoms collected from about1,500 fields of 117 counties of 13 provinces in Southern China during 2004 to 2006, 201 SMVisolates were obtained after biological purification with single-lesion isolation and serologicaldetermination. Based on disease reactions on 10 differentials used in China as a representativefrom various reported differential cultivar systems, the isolates were grouped into 12 strains.Among them, eight were the same as those previously reported from Northeast China and theHuang-Huai Valleys while the other four were new and were designated as SC18, SC19, SC20,and SC21. Strains SC15 and SC18, which were predominant and widespread in Southern China,accounted for 32.3 and 26.4% of the total isolates and were distributed in 9 and 10 provinces,respectively. Thus far, 21 strains have been identified in the three soybean-producing regions inChina under the uniform differentials system. According to their responses on the 10 differentials,the strains were clustered into five groups at similarity coefficient 0.6. Among them, SC15in cluster V is the most virulent strain because it infects all differentials. Therefore, specificattention should be placed on control of its prevalence in soybean production.

【题目】Fine mapping of resistance gene RSC14 to soybean mosaic virus by residual heterozygous lines derived from a recombinant inbred line
【中文关键词】空
【英文关键词】Fine mapping Resistance gene
Soybean mosaic virus (SMV)
Residual heterozygous line (RHL)
【中文摘要】空
【英文摘要】Soybean mosaic virus (SMV) disease isone of the most destructive soybean (Glycine max(L.) Merr.) diseases worldwide, causing yield lossesand significant deterioration in seed quality. ‘ QihuangNo.1 ’ has a wide resistance spectrum and is extensivelyused in breeding programs in China. Thedominant SMV resistance gene RSC14Q from thecultivar Qihuang No.1 was previously mapped to a4.2 cM region on soybean chromosome 13 (formerlylinkage group (LG) F). Fine mapping of RSC14Q isessential for high efficiency of marker-assistedselection (MAS) and its map-based cloning. Residualheterozygous lines (RHLs) derived from a soybeanrecombinant inbred line (RIL) were used to finemap RSC14Q. The RILs were obtained from across between ‘ Qihuang No.1 ’ (resistant) and ‘ Nannong1138-2 ’ (susceptible). The genomic sequence inan approximately 6 cM interval between the markersSatt334 and Sct_033 flanking RSC14Q was used todevelop five simple sequence repeats and two InDelmarkers. Linkage analysis between inoculation phenotypeand genetic markers localized RSC14Q to theinterval between Satt334 and MY750, with geneticdistances of 0.6 and 0.5 cM, respectively, correspondingto a physical distance on the ‘ Williams 82 ’ draft assembly (Glyma1.13) of 1.18 Mb. Based onthe genes sequences in the RSC14Q locus region withpredicted functions for resistance, one SNP

marker,MY525, was developed between Satt334 andMY750. Thus, the genomic region containing theRSC14Q was further narrowed to a 616 kb interval.

【中文摘要】选择不同来源中国大豆品种23 份和国外引进的成熟期近等基因系35 份进行SSR 分析, 目的是鉴定与成熟期基因型紧密连锁的标记, 进而推测中国大豆品种的成熟期基因型。结果表明, (1)210 对SSR 标记中125 对在成熟期近等基因型中具有多态性, 推测与成熟期有关的标记有8 个; (2)在Clark 近等基因系中, 筛选出成熟期基因E3/e3 特异性标记Satt229, E4/e4 的特异SSR 标记Sct_010、Satt294、Satt247、Satt452 和Satt156; 在Clark 和Harosoy 近等基因系中, 筛选出E7/e7 的特异性SSR 标记为Satt071、Satt178; (3)根据8 个与成熟期相关的标记的分子数据, 构建了国外大豆近等基因系的UPGMA 聚类图, 共聚为4 类, 背景来源相同或相似的品系被聚为一类, 明显分为Clark 近等基因系和Harosoy 近等基因系。(4)与近等基因系成熟期基因(E7)分子标记比对, 推测出25 份中国大豆品种的成熟期基因。
【英文摘要】In order to find the tightly linked diagnostic SSR (simple sequence repeat) markers on soybean LG related to the maturity genotype and further deduce the maturity genotype of Chinese varieties, 215 pairs of SSR marker were selected to analyze 23 Chinese soybean varieties and 35 introduced maturity Near-Isogenic Lines (NIL) from U.S.A. Among them, 125 SSR markers were polymorphic and 8 SSR markers were related to the maturity genotype. In detail, on Clark background, Satt229 tightly linked to E3/e3 locus, five markers including Sct_010, Satt294, Satt247, Satt452, and Satt156 tightly linked to E4/e4 locus; on both Clark and Harosoy background, Satt071 and Satt178 tightly linked to E7/e7 locus. Anyway, considered the NILs on Harosoy background, only two markers (Satt071and Satt178) could be used to deduce the genotype of Chinese soybean varieties. Therefore,the maturity genotypes of 25 varieties from China were deduced. The clustering tree based on UPGMA was constructed with the molecular data of 8 SSR markers correlated to maturity genes, and four groups were formed The result showed that the NILs with the same genetic background were clustered together, in which the NILs with Clark background were clearly different from those with the Harosoy background.

【题目】Artificial selection for determinate growth habit in soybean
【中文关键词】空
【英文关键词】comparative genomics | domestication | diversification | point mutation
【中文摘要】空
【英文摘要】Determinacy is an agronomically important trait associated with the domestication in soybean (Glycine max). Most soybean cultivars are classifiable into indeterminate and determinate growth habit, whereas Glycine soja, the wild progenitor of soybean,

is indeterminate. Indeterminate (Dt1/Dt1) and determinate (dt1/dt1) genotypes, when mated, produce progeny that segregate in a monogenic pattern. Here, we show evidence that Dt1 is a homolog (designated as GmTfl1) of Arabidopsis terminal flower 1 (TFL1), a regulatory gene encoding a signaling protein of shoot meristems. The transition from indeterminate to determinate phenotypes in soybean is associated with independent human selections of four distinct singlenucleotide substitutions in the GmTfl1 gene, each of which led to a single amino acid change. Genetic diversity of a minicore collection of Chinese soybean landraces assessed by simple sequence repeat (SSR) markers and allelic variation at the GmTfl1 locus suggest that human selection for determinacy took place at early stages of landrace radiation. TheGmTfl1 allele introduced into a determinate-type (tfl1/tfl1) Arabidopsis mutants fully restored the wild-type (TFL1/ TFL1) phenotype, but the Gmtfl1 allele in tfl1/tfl1 mutants did not result in apparent phenotypic change. These observations indicate that GmTfl1 complements the functions of TFL1 in Arabidopsis. However, theGmTfl1 homeolog, despite its more recent divergence from GmTfl1 than from Arabidopsis TFL1, appears to be sub- or neofunctionalized, as revealed by the differential expression of the two genes at multiple plant developmental stages and by allelic analysisat both loci.

【题目】青藏高原高寒草甸植株性状和生物量分配的海拔梯度变异
【中文关键词】青藏高原 气候胁迫 生物量分配 地上/地下比值 植物性状 细根
【英文关键词】无
【中文摘要】通过亚高山带(3700 m)、高山带(4300 m)和亚冰雪带(5000 m 以上)3 个海拔常见的双子叶草本、禾草和莎草3种功能型57 种草本植物单株植物性状和生物量分配模式来检验假设:随海拔升高植物将更多的生物量分配到地下部分, 特别是地下储存器官, 以利于萌发再生和抵御高寒环境胁迫. 结果基本验证了这一假设, 但不同器官分配存在一定差异. 随着海拔升高地上生物量呈减少的趋势, 亚高山带植物分配给储存器官的生物量比例((7±2)%)显著低于高山带((23±6)%)和亚冰雪带((21±6)%), 而分配给叶的生物量比例随海拔升高变化不大. 从亚高山带到亚冰雪带, 茎、花的生物量分别下降45%和41%, 细根的生物量却升高86%和102%.随着海拔的升高, 双子叶草本、禾草比叶面积、单株叶面积均减小, 莎草则呈现相反趋势, 3种功能型植物叶面积比、叶根比随海拔升高降低而细根生物量增加. 高山植物生物量分配随海拔的变化主要表现在地上繁殖器官的降低和地下细根增加, 而叶生物量分配比例比较稳定,表明高山植物通过稳定光合器官的投入和增加细根的吸收表面积, 以补偿高山低温和养分限制环境下的碳供给和养分吸收. 与双子叶草本和禾草相比, 莎草类植物在高海拔地区, 叶、根性状和生物量分配模式对其获取资源更加有利, 细根生物量在高山带显著升高是对莎草菌根形成能力弱的一种补偿.

【题目】波浪作用下圆形网箱浮架系统的运动特性分析
【中文关键词】深水网箱;波浪;浮架系统;运动特性;数值模拟
【英文关键词】deep-water net cage; wave; floating collar; movement characteristics; numerical simulation
【中文摘要】摘要:作为深水养殖网箱的重要组成部分,浮架系统在网箱抗风浪性能中扮演着极为重要的角色,研究浮架系统在波浪作用下的运动特性是深入了解网箱抗风浪性能的关键。基于集中质量法将圆形浮架离散成众多微元,并运用线性波浪理论和刚体运动学原理,建立了波浪作用下网箱浮架系统的运动响应数学模型。针对圆形浮架的实际尺寸参数,在不同波高(H = 4. 2~7. 0 m)和周期(T = 7. 2, 8. 6 s)条件下,采用计算机数值模拟方法,对浮架前后点运动轨迹、浮架质心水平和垂直位移、浮架倾角进行了数值计算。通过对计算结果的比较及分析表明: (1)浮架垂直位移幅度大于水平位移幅度,波浪周期对浮架垂直位移的影响要小于对水平位移的影响; (2)浮架水平位移、垂直位移以及倾角都和波高具有显著的正比关系。在波高H = 4. 2~7. 0 m 范围内,周期T = 7. 2 s时,水平位移、垂直位移和倾角的增量分别为1. 84 m、1. 0 m 和7. 18 °;周期T = 8. 6 s时,三者的增量分别为1. 66 m、1. 05 m 和5. 43 °; (3)周期增大,浮架垂直位移增加,水平位移和倾角减小。
【英文摘要】Abstract: Floating collar, an important component of deep-water net cage, plays a great important role in the performance of withstanding strong winds and waves for net cage, studying the movement characteristics of floating collar exposed to waves is a key to deeply understand the properties of withstanding strong winds and waves about net cage. In this paper, based on the lumped mass method, floating circular collar is discreted with lots of micro-elements, and by using the linear wave theory and the rigid body kinematics principle, a numerical model for movement response of floating collar exposed to waves is set up. Reference to practical floating collar parameters: 40m in circumference, 12.7kN in total weight, 15m in water depth, r=125mm, t=15mm, ρ =953kg • m-3. under the conditions of different wave heights(H=4.2~7.0m)and wave periods(T=7.2s、8.6s), the motion trajectories of the fore and rear points of the floating collar、the horizontal and vertical displacement of the central point of floating collar、pitch angles of floating collar are calculated in the way of computer numerical simulation method. By comparing and analyzing, the calculated results show that:(1)The vertical motion amplitude of the collar is larger than the horizontal one, and the influence of wave period on the vertical displacement of the collar is less than that of the horizontal one;(2)The horizontal displacement, the vertical displacement and the pitch angle of the collar all have direct proportional relation with wave height. Under the condition of wave height of 4.2~7.0m, the increase of the horizontal displacement, the vertical displacement and the pitch angle of the collar are 1.84m, 1.0m and 7.18 ° when T=7.2s, while they are 1.66m, 1.05m and 5.43 ° when T=8.6s;(3)When wave period increase, the vertical displacement of the collar increase accordingly, while the horizontal displacement and the pitch angle of the collar decrease.

【题目】Changes in individual plant traits and biomass allocation in alpine meadow with elevation variation on the Qinghai-Tibetan Plateau

【中文关键词】无
【英文关键词】Qinghai-Tibetan Plateau, climate stress, biomass allocation, shoot/root ratio, plant traits, fine roots
【中文摘要】无
【英文摘要】Plant traits and individual plant biomass allocation of 57 perennial herbaceous species, belonging to three common functional groups (forbs, grasses and sedges) at subalpine (3700 m ASL), alpine (4300 m ASL) and subnival (≥5000 m ASL) sites were examined to test the hypothesis that at high altitudes, plants reduce the proportion of aboveground parts and allocate more biomass to belowground parts, especially storage organs, as altitude increases, so as to geminate and resist environmental stress. However, results indicate that some divergence in biomass allocation exists among organs. With increasing altitude, the mean fractions of total biomass allocated to aboveground parts decreased. The mean fractions of total biomass allocation to storage organs at the subalpine site (7%±2% S.E.) were distinct from those at the alpine (23%±6%) and subnival (21%±6%) sites, while the proportions of green leaves at all altitudes remained almost constant. At 4300 m and 5000 m, the mean fractions of flower stems decreased by 45% and 41%, respectively, while fine roots increased by 86% and 102%, respectively. Specific leaf areas and leaf areas of forbs and grasses deceased with rising elevation, while sedges showed opposite trends. For all three functional groups, leaf area ratio and leaf area root mass ratio decreased, while fine root biomass increased at higher altitudes. Biomass allocation patterns of alpine plants were characterized by a reduction in aboveground reproductive organs and enlargement of fine roots, while the proportion of leaves remained stable. It was beneficial for high altitude plants to compensate carbon gain and nutrient uptake under low temperature and limited nutrients by stabilizing biomass investment to photosynthetic structures and increasing the absorption surface area of fine roots. In contrast to forbs and grasses that had highmycorrhizal infection, sedges had higher single leaf area and more root fraction, especially fine roots.

【题目】平面网衣在水流作用下的受力和变形特性数值模拟研究
【中文关键词】平面网衣; 数值模拟; 水流; 集中质量
【英文关键词】p lane net; numerical simulation; current; lumped mass
【中文摘要】基于集中质量点法和牛顿第二定律, 建立了网衣在水流作用下的受力和运动响应数学模型。采用计算机数值模拟方法, 研究了水流作用下网衣的动态变形情况以及网衣受力平衡后的空间分布形状。在2 种配重(GW1 = 4112 N、GW2 = 16138 N) 和6种流速(U = 0117、0122、0128、0133、0139和0144 m·s- 1) 条件下对网衣稳定后沿水流方向的总水流力、网衣底端的水平及垂直位移进行了数值计算。计算结果表明, 配重及流速大小对网衣受力和变形特性具有较大的影响。随着水流速度的增大, 网衣在水流作用下的运动变形加剧, 且当配重增大时, 网衣变形减小, 网衣受力随流速的变化增幅明显加快。为了验证模型的正确性和有效性, 文章还将数值模拟结果与前人的试验结果进行了比较, 效果良好。
【英文摘要】Abstract: Based on the lumped massmethod and Newton ′s second law, the numericalmodel of the force and movement response for fishing nets in currentwas set up, and then the dynamic deformation and the equilibrium configuration of the p lane net in current along the positive direction of x2axis were studied bymeans of computer numerical simulation method1 In this paper, under the conditions of two weightmodes (GW1 = 4112 N, GW2 = 16138 N) and six current velocities (U = 0117, 0122, 0128, 0133, 0139 and 0144 m · s- 1) , the total drag force in the forward flow and the horizontal and vertical disp lacements of the net bottom were calculated after the plane net getting equilibrium in current1 The calculated results showed that the influences ofweight system and current velocity on the characteristics of drag force and deformation of p lane net are significant1With the increase of flow velocity, the motion deformation of the p lane net in currentwas intensified obviously1Moreover, when the weight increased, the deformation of the net decreased accord2 ingly, and the enhancement of the total drag force accelerated apparently with the flow velocity increasing1 Simulated results consisted well with other investigator ′s experimental data, which verified the accuracy and efficiency of the model1

【题目】西藏河谷区人工牧草地的苔藓植物群落研究
【中文关键词】人工牧草地; 苔藓植物群落; 物种多样性; CCA; 西藏
【英文关键词】planted pasture; bryophyte community; species diversity; CCA; Tibet
【中文摘要】在西藏河谷区拉萨、山南、日喀则的6 个人工牧草地及其边界共设置了28 个样地, 通过样方调查和标本采集, 鉴定得到苔藓植物2 科6 属13 种, 其中真藓(Bryum argenteum) 为调查区广布种。该地苔藓植物群落的特点表现为各试验地之间物种丰富度区别明显, 而物种均匀度的变化较小; CCA 分析表明, 小生境的温度与相对湿度对苔藓生长与分布的影响较大。在人工牧草地边界、种植一年以上的牧草地和一年以内的牧草地等3 种类型样地中, 由于人为干扰程度的差异, 人工牧草地边界的苔藓物种最丰富, 而一年内的牧草地几乎没有苔藓植物; 随着土壤稳定时间的延长, 才逐渐形成以真藓

属为优势的苔藓植物群落。在牧草种植过程中, 1 年内采用刈割方法而不进行放牧活动, 将有助于保障人工牧草的正常生长和防止水土流失, 降低荒漠化发生的可能性。

【英文摘要】28 plots of 6 sites were invest igated to ident ify the bryophytes communities on planted pastures in valley area of Tibet , China. 3~ 5 quadrates of 25 cm ∀ 25 cm with 100 grids were selected to count the coverage of bryophytes in each plot. The result showed that there were 13 species of bryophytes (including 2 varieties) , belonging to 6 genera and 2 families, and Bryum argenteum was widely distributed in the whole research area. The bryophytes communities were obviously different on species richness among the plots, but on species evenness. The similarity between any two communities was higher if their niches were more similar to each other. Based on Canonical Correspondence Analysis (CCA) of relationship between bryophytes and environmental factors, it indicated that the distribution of bryophytes was more affected by temperature and relative humidity of the niche. The highest species diversity was located around planted pastures and the lowest (almost no bryophyte) was located inside the planted pastures which were planted this year. As time went on, the bryophyte communities, dominated by genera Bryum, would be formed in the new planted pastureswith decrease of the disturbances and stabilization of the topsoil. It consented that the results above can be applied for avoiding soil and water erosion, and reducing the possibility of desertification as well if the planted pasture will be cut in stead of being grazed around the first planted year.

【题目】覆膜对青饲玉米生长发育及杂草的影响
【中文关键词】青饲玉米; 覆膜; 杂草; 日喀则
【英文关键词】Silage maize; Film mulching; Weed; Shigatse
【中文摘要】[目的]为西藏相关地区青饲玉米生产提供参考。[方法]研究了覆膜对青饲玉米生育期、生长性状和产量的影响及对杂草的作用。[结果]覆膜能够促使青饲玉米各生长期提前7~ 16 d,使植株高度、茎围、叶面积等增加, 使产量提高了75. 9%, 按2008年市场青饲玉米价格可增收22 500元/hm2; 青饲玉米田中共有13种杂草, 分属于8科13属, 其中禾本科杂草共6种, 稗(E chinochloa crusgalli)和狗尾草(Setaria vir idis)为该研究区优势杂草; 覆膜可完全防除平车前(P lantago depressa)、画眉草(Eragrostis p ilosa)和中华野葵(Malva verti cillata var. chinensis), 并对除稗以外的其他杂草具有一定防效。[结论]覆膜青饲玉米对西藏畜牧业发展和农牧民增收具有积极意义。
【英文摘要】[Objective] The aim was to provide scientific reference for the production of silage maize in correlated regions of Tibet. [Method] Effects of film mulching on the growth period, growth traits and yield of silage maize and weed were analyzed. [Result] Under the treatment of film mulching, the growth period of silage maize could be advanced for 7- 16 d; the plant length, stem diameter and leaf area were increased;and the grain output was increased by 75.9%. According to the market price of silage maize in 2008, 22500 Yuan/hm2 was increased. There were 13 kinds of weeds in silage maize field, which belonged to 13 genus, 8 family. Among them, 6 kinds of weeds belonged to gramineae, among which Echinochloa crusgalli and Setaria viridis were dominated in the weed communities. Plantago depressa, Eragrostis p ilosa and Malva verticillata var. chinensis could be totally controlled by the film mulching, meanwhile the others could be also controlled in a certain degree except E chinochloa crusgalli. [Conclusion] The plastic mulching planting is worth popularizing for the developing of anmial husbandry and the incoming of the local farmers in Tibe.

【中文关键词】西藏;紫花苜蓿;刈割管理
【英文关键词】Tibet;Medicago sativa;cutting management
【中文摘要】通过对西藏拉萨河谷地区紫花苜蓿的刈割试验,构建了拉萨河谷地区紫花苜蓿刈割生长动态模型,并分析了刈割次数对紫花苜蓿干鲜草积累量、刈割高度、干鲜比、营养成分的影响。分析结果表明,紫花苜蓿在西藏拉萨河谷地区具有很大的发展潜力,在管理措施保障条件下,紫花苜蓿刈割1次的干草年积累量可达1645g/m2,刈割2次达2128g/m2,刈割3次达2201g/m2;多次刈割可提高紫花苜蓿鲜草年积累量90%以上,而对干草年积累量提高约55%;同时,建议拉萨河谷地区紫花苜蓿宜采用分枝期一年刈割3次的刈割方案,分别于5月下旬、7月中旬和9月初实施,可获得干草积累量最大,草产品质量最好的紫花苜蓿干草。
【英文摘要】Through systematic research of the cutting areas in the Lhasa river valley,dynamic models of Medicago sativa growth were structured to simulate and forecast the accumulation of dry matter and fresh forage of M.sativain different cutting schemes.The effects of cutting times on accumulation of dry matter and fresh forage,height,dry weight/fresh weight ratio,nutrient component of M.sativa were studied and different cutting schemes were developed to suit different objectives.Cutting three times a year at branching for M.sativa pasture gave the maximum dry matter and best quality of M.sativa hay in the Lhasa river valley.

【题目】Highly Efficient Shoot Regeneration from Cotyledonary Nodes of Vegetable Soybean
【中文关键词】无
【英文关键词】cotyledonary node, genotype, multiple shoot, regeneration frequency, thidiazuron (TDZ)
【中文摘要】无
【英文摘要】To establish a highly efficient system for shoot regeneration in vegetable soybean (Glycine max (L.) Merrill), explants were obtained from six genotypes and adventitious shoots were regenerated from cotyledonary nodes cultured on medium supplemented with different concentrations of N-phenyl-N′-1, 2, 3-thiadiazol-5-ylurea (thidiazuron TDZ) and 1-naphthylacetic acid (NAA). The most effective combination of plant growth regulators was selected first and then the effects of medium types, inoculation methods and genotypic differences on shoot regeneration were studied. The explants were inserted either vertically or horizontally into the medium and five basal media, including B5, ½ B5, MS, ½ MS, and MSB (MS salts and B5 organics), were tested. The shoot regeneration frequency of the six genotypes ranged from 53.5% to 88.9% and three of them reached 88.9%, 87.5% and 83.3%, respectively, on B5 medium supplemented with 1 mg L-1 TDZ, 0.05 mg L-1 NAA, and 5 mg L-1 AgNO3. The shoot regeneration frequency of explants cultured on B5 medium was significantly higher than that of the other four basal media. The vertically inserted explants were found to yield a higher shoot regeneration frequency than that of horizontally inserted ones; the maximum difference of regenerating percentages between the two methods was 37.5%. In summary, TDZ was an efficient plant growth regulator for shoot induction. B5 medium and vertically inserted explants promoted shoot regeneration. We believe this highly efficient shoot regeneration system will provide foundation for the further transgenic studies in vegetable soybean.

【题目】温度和光照对双齿围沙蚕卵细胞生长的影响
【中文关键词】双齿围沙蚕;温度;光照;卵细胞;生长
【英文关键词】Perinereis aibuhitensis;temperature;photoperiod;oocyte;growth
【中文摘要】通过研究不同温度和光照时间条件下双齿围沙蚕Perinereis aibuhitensis卵细胞的生长状况,分析了沙蚕卵细胞发育与环境因子的关系。结果表明:对于卵黄合成期的双齿围沙蚕,升温和延长光照时间可以加速卵细胞生长。在直接升温且光照周期为L:D=16:8和L:D=8:16的条件下,沙蚕卵细胞的生长速度分别为(2.46±O.O6)×10~、(2.26±0.1)X10~ Il3/d;在经历低温后再升温且光照周期为L:D=16:8和L:D=8:16的条件下,沙蚕卵细胞的生长速度分别为(3.21 4-0.09)×10~、(2.56-t-O.05)×10 Jn3/d。双因素方差分析结果显示:恒定低温对卵黄合成期的沙蚕卵细胞快速生长有促进作用,其与未经历低温的沙蚕卵细胞生长速度比较差异极显著(P<0.01);光照对卵细胞生长速度的影响差异极显著(P <0.01);低温和光照的交互作用对沙蚕卵细胞的生长速度影响差异极显著(P<0.01)。另外,低温对沙蚕卵径变异系数影响极显著(P<0.01),光照对沙蚕卵细胞变异系数影响不显著(P>0.05),低温和光照对卵细胞变异系数的交互影响不显著(P>0.05)。
【英文摘要】The growth of germ cells in sludge worm Perinereis aibuhitensis was determined at various temperature and photoperiods.The growth ofthe germ cells in the direct wanning group was found to be(2.46 4-0.06)×10 m /d and(2.26±0.1)×10_ m /d at L:D=16:8 and L:D=8:16,respectively.In the cooling group,however,the germ cells had growth rate of(3.21±0.09)×10—2p.m /d and(2.56±0.05)×10一 m。/d at L:D = 16:8 and L:D=8:16.respectively.Two factor analysis of variance indicated that the diference in growth of germ cells in stages of vitellogenesis in constant low temperature was very significant(P<0.01),and that the diference in

photoperiod was significant(P<0.01).The effect of growth of germ cels on the interaction between low temperature and photoperiod was very significant(P<0.01).In addition,the effect of the low temperature on variation in diameters of germ cells was very significant(P<0.01).The effect of the photoperiod on diameters of germ cells was not significant(P>0.05),and the efect of the interaction between low temperature and photoperiod on variation in growth of germ cells was not significant(P>0.05).

【题目】双齿围沙蚕金属结合蛋白(MpII)基因克隆与表达

【中文关键词】双齿围沙蚕;MP//cDNA;RACE;Cd2+;realtime PCR

【英文关键词】Perinereis aibuhitensis; MP//cDNA;RACE;Cd 2+:quantitative PCR

【中文摘要】根据已知杂色沙蚕(Nereisdiversicolor)金属结合蛋白II(MPII)部分基因序列设计引物,应用RACE技术从双齿围沙蚕(Perinereis aibuhitensis)中克隆得到]/eDNA序列全长为904 bp,其中,开放阅读框为357 bp,编码119个氨基酸。Blast比对结果显示,由双齿围沙蚕MP]/eDNA序列推导的氨基酸序列与多毛类Periserrula leucophryna 蚯蚓血红蛋白(Hr)、杂色沙蚕(Nereis vP fc0for)蚯蚓肌血红蛋白(MHr)及星虫类Themiste zostericola Hr氨基酸序 列的同源性分别为81.51%、77.12%和61.02%,由此推断该cDNA序列可能属于血红蛋白家族。应用Rea1.time PCR方法,分别研究了沙蚕暴露于Cd 质量浓度为40 mg/L的环境中l2、24、48和72 h后MP 基因表达水平的变化,以及3种质量浓度5、10和20 mg/L Cd2 暴露15 d后MP 基因的表达水平。实验结果表明:(1)沙蚕暴露于40mg/LCd 72 h后,MP//mRNA表达量显著增加,为空白对照组的12.6倍,表现出极显著差异(尸l<0.01);(2)不同质量浓度cd 诱导15 d后,各组J=l]/mRNA表达量均呈显著升高(0.05),达到空白对照组的4.8倍以上,且随Cd2浓度增大,MP]/mRNA表达量增加。据此认为,MPII对cd2+的应激调控发生于转录水平。本研究为海洋沉积环境早期污染的生态风险预测提供了分子生物学依据。

【英文摘要】:In the present study,the partia1 cDNA of metalloprotein II(MPI/)was amplified from the total RNA of epidermis muscle of the polychaete,Perinereis aibuhitensis,by reverse transcription polymerase chain reaction wim the primers designed based upon the homologous eDNA sequence of MP11 from reis versicolor.Other primers were designed according to the partia sequence of Perinereis aibuhitensis MPlI and two fragments of approximately 600 bp and 250 bp were obtained using 3 and 5 .RACE.andsequenced.Sequence analysis revealed a 904 bp eDNA containing an 81 bp 5 untranslated region,463 bp 3'-untranslated regions,and 357 bp open reading frame putatively encoding a protein of 1 1 9 amino acids.The deduced amino acid sequence of MPI1 was subjected to BLAST search for similarity with published sequences and it was found that MPII shared high identity(8 1.5 1%1 with Periserrula leucophryna hemerythrin,also with myohemerythrin of reis diversicolor (77.12%1,and with the hemerythrin of zemiste zostericola(61.02%).Furthermore,the deduced amino acid sequence of MPII contained the conserved motif(HX29HX3EX16HX3HX23/28HX4D)of the hemerythrin family of proteins.suggesting that MPII belongs to the hemerythrin family.The expression levels of尸erinereis aibuhitensis MPI1 were detected after exposure to 40 mg/L Cd2 for l2,24,48,and 72 h using quantitative PCR.The expression levels of MPII mRNA during 1 5 d were also detected under three concentrations of Cd .The current study showed that the expression levels of the MPI1 were approximately 12.6一fold higher(P<0.01)than control group at 40 mg/L Cdz+after 72 h. The level of P mRNA produced in the muscle tissue of sandworm increased significantly following exposure to Cd2 of 5,1 0,and 20 mg/L after 1 5 d,and were above 4.8一fold than control grouprP<0.05).Therefore。the expression level of the MPII increased with increasing concentrations of C .We suggest that heavy metal Cd is associated with the induction of MPII expression.and

the present study provided molecular support for the assessment of early ecological risks for monitoring the marine sediment environment based on the health of clamworm.

【题目】双齿围沙蚕CYP4基因的克隆及序列分析
【中文关键词】双齿围沙蚕;CYP4;RACE;生物信息学分析
【英文关键词】P nereis aibuhitensis;CYP4;RACE;sequence analysis
【中文摘要】根据已知的绿沙蚕Nereis virens细胞色素氧化酶CYP342A1保守区设计引物,采用RACE技术首次从双齿围沙蚕Perinereis aibuhitensis体壁肌肉中克隆出细胞色素氧化酶CYP4基因全长序列。分析结果表明, 该序列全长为1 857 bp,5 端非翻译区为186 bp,3 端非翻译区为225 bp,阅读框为1 446 bp,编码为481 个氨基酸。第422~431氨基酸序列符合P450所具有的结构保守共有序列FxxGxxxCxG,第319~322氨基酸序列为K螺旋特征基序ExxR区,第282~294氨基酸序列含有CYP4家族特征序列EVDTFMFEGHDTF。经Blast与GenBank中已知物种的氨基酸序列进行同源性比对,CYP4与多毛类绿沙蚕Nereis CYP4BB1、CYP342A1(AY453408)氨基酸同源性为73%、36%,与多毛类小头虫CapiteUa capitata CYP4ATI(AY574044)同源性为39%。据此推断,双齿围沙蚕CYP4基因属于CYP4B亚家族。
【英文摘要】In the present study,the partial cDNA of CYP4 was amplified from the tota. RNA of epidermis muscle of the polychaete。Perinereis aibuhitensis。by reverse transcription with the primers based upon the CYP342A1 from ereis virens.Then other primers were designed according to the partial gene of Peri~reis aibuhitensis CYP4,and two fragments about 37 1 bp and 1044 bp were obtained by using 3 RACE and 5 RACE.Sequence analysis revealed a 1857 bp eDNA containing the 186 bp 5 -untranslated region.225 bp 3 -untranslated regions and 1 446 bp open reading frame encoding 48 1 amino acid.The identity rate of deduced amino acid sequence of CYP4 was subjected to Blast searching in NCBI.The results showed that the CYP4 shared 73%identity with CYP4BB1,36%identity with CYP342A1 of Nere/s virens and 39%identity with cYPgAT1 of Capitella capitate.The deduced amino acid se— quence of CYP4 contained the conserved motifs of P450 family(FxxGxxxCxG)and had K-helix motifs of P450 family(ExxR).In addition,it has the characteristic sequences of CYP4 family(EVDTFMFEGHDTr).So it is inferred that the cDNA sequence might belong to the subfamily of CYP4B.

【题目】The influence of cadmium on the antioxidant enzyme activities in polychaete Perinereis aibuhitensis Grube (Annelida: Polychaeta)
【中文关键词】双齿围沙蚕,镉,抗氧化酶,生物标记物,生物检测
【英文关键词】Polychaete (Perinereis aibuhitensis)
cadmium
antioxidant enzyme
biomarker
biomonitoring
【中文摘要】本文论述了抗氧化酶活性,包括超氧化物歧化酶(SOD),过氧化氢酶(CAT),谷胱甘肽过氧化物酶(GSH-Px)的中底内动物多毛类的P.双齿围沙蚕暴露了一系列的亚致死浓度,并开展了短期暴露(1-8 D的急性毒性试验。结果表明,在双齿

围沙蚕的SOD和GSH-Px活性受刺激先降低再升高,然后更新到原来的水平。 CAT活性的蠕虫病毒在早前曝光时间减少,但会增加在以后的曝光时间的控制值。实验结果对海洋沉积质污染的早起风险评价具有指导作用。

【英文摘要】The infaunal polychaete Perinereis aibuhitensis Grube, distributed widely along Asian coasts and estuaries, is considered a useful animal model in ecotoxicological tests and a promising candidate in biomonitoring programs. This paper deals with the activities of antioxidant enzymes including superoxide dismutase (SOD), catalase (CAT), and glutathione peroxidases (GSH-Px) in infaunal polychaete P. aibuhitensis exposed to a series of sublethal water-bound cadmium (Cd) concentrations (0, 0.34, 1.72, 3.44, 6.89, and 17.22 mg L − 1) under a short-term exposure (1 – 8 d). The results indicate that the SOD and GSH-Px activities in P. aibuhitensis are stimulated first and then renewed to the original level. The CAT activity of worms decreases at an earlier exposure time but increases to the control values at a later exposure time. Our study suggests that Cd can interfere with the antioxidant defense system of P. aibuhitensis. However, the changes in antioxidant enzyme activities for this species do not show the best promise as biomarkers in Cd biomonitoring of estuarine and coastal zones because weak or non-dose-effect relationships between the antioxidant enzymes activities and Cd levels are found.

【题目】石油对翅碱蓬生长及生理特性的影响

【中文关键词】翅碱蓬;石油污染;生理指标;抗氧化酶系统

【英文关键词】Suaeda heteroptera; oil contamination; physiological indexes; antioxidant enzymes

【中文摘要】通过盆栽试验,测定不同石油浓度下翅碱蓬的生长生理指标及土壤中石油含量的变化,研究石油对翅碱蓬萌发、生长、生理 特性和抗氧化酶系统的影响及翅碱蓬对土壤中石油的降解。结果表明,随着石油含量的升高,翅碱蓬种子发芽率、苗高、苗重和苗中叶绿素、粗蛋白含量逐渐下降,电导率上升,石油浓度在 5 000 mg ・kg-1以上,影响显著。石油对翅碱蓬糖的合成有明显抑制作用。当石油浓度为 1 000~5 000 mg・kg-1 时,翅碱蓬抗氧化酶能够快速、长效地提高活性来抵御逆境,使其不受到伤害或减轻伤害,可溶性蛋白保持在高水平;当石油浓度达到 10 000 mg・kg-1 时,抗氧化酶系统迅速作出反应,酶活性急剧提高,但因毒性超出了其可以承受的范围,而无法维持较长时间,随后会降至对照组以下,同时可溶性蛋白也急剧下降,仅为对照组的 9% 。石油浓度为 1 000~5 000mg ・kg-1 时,石油去除率在 63.53%~83.21%,达到 10 000 mg・kg-1 时,则下降到 40.14% 。

【英文摘要】The aim of this paper was to determine some growth and physiological indexes of Suaeda heteroptera at different oil concentration and variation of oil concentration of soil, and study the effects of oil on germination, growth, physiological characteristic and the antioxidant system of Suaeda heteroptera and the removal of oil in soil by the experiment. The results indicated that with the concentration of oil increasing, the germination rates of the seed, the heights and weights of the plant, the contents of chlorophyll and crude protein in the plants decreased gradually, and the data of electrical conductivity increased, the harms of Suaeda heteroptera were significant in the concentration of oil over 5 000 mg ・kg-1 or more. The synthesis of soluble sugar of Suaeda heteroptera was remarkable restrained by oil. The antioxidant enzymes could improve activity rapidly and long-term to against adversity rapid in the concentration of oil 1 000~5 000 mg ・kg-1, it could make Suaeda heteroptera to avoid or reduce the damages, and make the contents of soluble protein keep a high level.The antioxidant enzymes activity was increased sharply, but no lasting longer owing to oil toxicity beyond the scope of Suaeda heteroptera ′s affordable in the concentra- tion of oil 10 000 mg ・kg -1, the enzymes activity would decrease below the control groups soon, meanwhile the contents of soluble protein sharply dropped to only 9% of the control groups. The removal rates of oil were 63.53%~83.21% in the concentration of oil 1 000~5 000 mg ・ kg-1, but it was only 40.14% in 10 000 mg ・kg-1.

【题目】雄激素受体干扰物的活性预测模型的研究
【中文关键词】雄激素受体;干扰物活性;分子参数,;多元线性回归; 主成分分析方法
【英文关键词】androgen receptor, molecular indices, PCR
【中文摘要】目的在于定量预测雄激素受体干扰物活性,并确定最佳建模方法。选择150个分子作为数据集,随机选38个分子作为检验集,其它分子为训练集。每个化合物分子计算了193个分子参数。通过采用多元线性回归和主成分回归等方法,建立数学模型,并用验证集检验了所建模型的预测能力。结果发现逐步筛选法和主成分分析方法所建模型都表现出较强的预测能力应用于检验集的相关系数分别为R=0.61,R=0.52。以上研究将有助于新药雄激素受体抑制剂的筛选和开发。
【英文摘要】To quantitatively predict the activity of androgen receptor ligands. A dataset composed of 150 diversified compounds was built based on multivariate linear regression analysis and principal component analysis(PCA). 38 compounds served as test set and the rest as training set. For eash molecule ,193 molecular indices were calculated. From the analysis of the models , the predictability of stepwise method(R=0.61)for molecular descriptors and PCA(R=0,52) are satisfactory. All these models are helpfull for aiding screening and development of androgenic compounds.

【题目】沿海滩涂镉吸附细菌的分离、 鉴定及生长特性的研究
【中文关键词】镉 ; 细菌吸附 ; 细菌鉴定 ; 生长特性
【英文关键词】Cd2 + ; bacterial adsorption ; identification of bacterium ; growth
【中文摘要】采用常规细菌分离技术从沿海滩涂的泥样中分离出两株对重金属 Cd 具有吸附作用的细菌 (编号为 J2 和 J6) ,并采用原子吸收法测定了菌株及培养液中 Cd2 +的含量。结果表明 : 两株菌在培养液中培养 7d 后 ,上清液中 Cd2 + 的含量与对照组相比显著降低 (P < 0. 05) ,菌体细胞中 Cd2 + 含量与对照组相比显著增加 (P < 0. 05) ; 电镜下观测,两株菌均为短杆状 ,革兰氏染色为阴性 ,有鞭毛 。生理生化特征测定结果 显示,两株菌均符合弧菌属的特征,用 O / 129 纸片测试为敏感 ,TCBS 中生长变为黄色,与过氧化氢酶、氧化酶 、硝酸盐还原反应为阳性 ,生长均需要 Na+。结合 16S rDNA 序列分析 ,J2 菌株被鉴定为 Vibrio p aci- nii ,J6 菌株被鉴定为溶藻弧菌 Vibrio alginnolyticus 。J2 菌株生长的最适 pH 为 7 ,温度为 20 ℃ ,NaCl 为 30 g / L ; J6 菌株生长的最适 pH 为 7. 5 ,温度为 30 ℃ ,NaCl 为 40 g / L 。
【英文摘要】Two Cd2 + adsorption strains of bacteria J2 and J6 were isolated from coastal beach by general technique , and the adsorption of Cd2 + was detected by Atomic Absorption Spectroscopy (AAS) . The growth and biological char- acteristics of J2 and J6 were tested to identify the strains. The results showed that they can reduce Cd2+ consistency in culture medium ,while the amount of Cd2 + in bacterial cells was found to be increased compared with the control (P < 0 . 05) 7 days after culture. The J2 and J6 showed gram negative ,rod shape ,O129 paper sensitive ,yellow colony in TCBS ,catalase positive ,oxidase positive ,nitrate reduction positive and requirement of Na + for growth. The J2 and J6 were identified as genus Vibrio. The sequence of 16S rRNA gene of J2 was found to be accorded with Vibrio p acinii with identity of 99% ,and J6 was accorded with Vibrio alginnolyticus with identity of 99% . The opti- mum growth of J2 was observed under the conditions of pH 7 ,20 ℃ ,NaCl of 3% and J6 pH 7 . 5 ,30 ℃ ,and NaCl of 40% .

【题目】Effects of Perinereis aibuhitensis activities on biomass and absorption of heavy metals of Suaeda heteroptera kitagawa
【中文关键词】双齿围沙蚕,翅碱蓬,重金属,生物修复
【英文关键词】Perinereis aibuhitensis; Suaeda heteroptera kitagawa; heavy metal contaminated sedment; bioremediation
【中文摘要】重金属污染不仅破坏环境,植物的生长,而且还通过食物链危害动物健康。本文的实验通过测定沙蚕、沿海沉积物,生物量的影响,并进行了研究和Cu和Pb,沉积物中可用N,速效P,总的有机碳含量和pH值进行测定。结果表明,pH值的沉积物增加,可用的N和P的沉积物可用提出了在对照组中,由双齿围沙蚕的活动,蠕虫和植物的生物量得到改善分别为134.1。双齿围沙蚕活动可以增强金属的生物利用度。这为植物修复的重金属污染提高了工作效率提供了基础。
【英文摘要】Heavy metal pollution is not only damaging to the environment, plant growth, but also harming animal and hunman health through the food chain. The experimental environment in this paper was coastal sediment, the effects of the biomass and the absorption of heavy metal of Suaeda heteroptera kitagawa by perinereis aibuhitensis activities were studied by the concentration of Cu and Pb in the body of Suaeda heteroptera kitagawa and the concentration of Cu and Pb,the available N, the available P,the total organic carbon and pH value in the sediment were measured. The results showed that the pH value of sediment was increased, the available N and the available P of sediment were raised and the biomass of the plant were improved in control groups by Perinereis aibuhitensis activities, the differece of fresh weight between with worm and without worm were 134.1. Perinereis aibuhitensis activities raised the concentrations of CaCl2-Cu snd DTPA-Pb in the sedment,enhanced metal bioavailability and promoted the Cu and Pb absorption of Suaeda heteroptera kitagawa, the Cu concentrations and the PB concentrations in the body of plant of under ground with worm was 1.14-2.89 times and 1.33-7.57 times that of without worm. Those provided the basis for improving the efficiency of phytoremediation of the heavy metal contaminated sedment.

【题目】日粮铜钼水平对绒山羊产绒性能和血液相关激素的影响
【中文关键词】绒山羊; 铜; 钼; 激素; 产绒性能
【英文关键词】Cashmere goat; copper; molybdenum; hormone; cashmere; performance;
【中文摘要】研究日粮铜(Cu)钼(Mo)添加水平对快速长绒期绒山羊产绒性能和血液相关激素的影响。采用2×3完全随机试验设计,选取36只1.5周岁辽宁绒山羊,随机分为6组,每组6只,分别在基础日粮中添加3个水平的Cu(0、19和38mg/kg,DM)和2个水平的Mo(0和5mg/kg,DM)进行饲喂。结果表明:基础日粮中添加Cu19mg/kg绒山羊绒毛长度和绒生长速率明显增加(P<0.05),而对绒纤维细度没有影响(P>0.05);添加38mg/kg的Cu有抑制羊绒生长的趋势(P>0.05),且显著降低了羊绒细度(P<0.05)。Cu与Mo的互作对细度的影响极显著(P<0.01)。日粮Cu、Mo水平对血液褪黑激素(MT)、甲状腺激素(T3和T4)水平均无影响(P>0.05);在日粮不加Mo和添加5mg/kg的条件下,添加Cu19mg/kg均明显提高血液类胰岛素生长因子-Ⅰ(IGF-Ⅰ)的水平(P<0.05);低Mo水平下,添加19mg/kg的Cu,提高血液MT的水平(P>0.05)。高Mo则抑制IGF-Ⅰ的分泌(P>0.05),且显著降低了催乳素(PRL)(P<0.05)。未观测到Cu、Mo的互作对血液相关激素的影响(P>0.05)。在绒山羊长绒期,日粮低Mo水平下,适宜添加19mg/kg,DM的Cu;高Mo时,添加38mg/kg,DM的Cu对绒山羊产绒性能效果最好。Cu促进山羊绒生长除与MT分泌有关外,还与IGF-Ⅰ有关,可能与PRL、T3和T4无关。
【英文摘要】This research was conducted to study the effect of adding copper and molybdenum either singly or in combination in diets on cashmere performance and blood hormone in cashmere goats during the cashmere growing period. A 2×3 factorial completely randomized experiment design was used. Thirty-six (1.5-year-old) Liaoning cashmere goats were randomly selected by weight into six groups fed with diets at different levels of copper (0,19 and 38 mg/kg,DM) and molybdenum (0 and 5 mg/kg,DM).

【题目】Potential of the seaweed Gracilaria lemaneiformis for integrated multi trophic aquaculture with scallop Chlamys farreri in North China.
【中文关键词】无
【英文关键词】Gracilaria lemaneiformis - Integrated Multi-trophic Aquaculture (IMTA) - Nutrient uptake rate - Nutrient reduction efficiency - Scallop
【中文摘要】In this study the red alga, Gracilaria lemaneiformis, was cultivated with the scallop Chlamys farreri in an integrated multi-trophic aquaculture (IMTA) system for 3 weeks at the Marine Aquaculture Laboratory of the Institute of Oceanology, Chinese Academy of Sciences (IOCAS) in Qingdao, Shandong Province, North China. The nutrient uptake rate and nutrient reduction efficiency of ammonium and phosphorus from scallop excretion were determined. The experiment included four treatments each with three replicates, and three scallop monoculture systems served as the control. Scallop density (407.9 ± 2.84 g m − 3) remained the same in all treatments while seaweed density differed. The seaweed density was set at four levels (treatments 1, 2, 3, 4) with thallus wet weight of 69.3 ± 3.21, 139.1 ± 3.80, 263.5 ± 6.83, and 347.6 ± 6.30 g m − 3, respectively. There were no significant differences in the initial nitrogen and phosphorus concentration between each treatment and the control group (ANOVA, $p > 0.05$). The results showed that at the end of the experiment, the nitrogen concentration in the control group and treatment 1 was significantly higher than in the other treatments. There was also a significant difference in phosphorus concentration between the control group and the IMTA treatments (ANOVA, $p < 0.05$). Growth rate, C and N content of the thallus, and mortality of scallop was different between the IMTA treatments. The nutrient uptake rate and nutrient reduction efficiency of ammonium and phosphorus changed with different cultivation density and time. The maximum reduction efficiency of ammonium and phosphorus was 83.7% and 70.4%, respectively. The maximum uptake rate of ammonium and phosphorus was 6.3 and 3.3 μ mol g − 1 DW h − 1. A bivalve/seaweed biomass ratio from 1:0.33 to 1:0.80 (treatments 2, 3, and 4) was preferable for efficient nutrient uptake and for maintaining lower nutrient levels. Results indicate that G. lemaneiformis can efficiently absorb the ammonium and phosphorus from scallop excretion and is a suitable candidate for IMTA.
【英文摘要】In this study the red alga, Gracilaria lemaneiformis, was cultivated with the scallop Chlamys farreri in an integrated multi-trophic aquaculture (IMTA) system for 3 weeks at the Marine Aquaculture Laboratory of the Institute of Oceanology, Chinese Academy of Sciences (IOCAS) in Qingdao, Shandong Province, North China. The nutrient uptake rate and nutrient reduction efficiency of ammonium and phosphorus from scallop excretion were determined. The experiment included four treatments each with

【题目】The potential for utilizing fouling macroalgae as feed for abalone Haliotis discus hannai.

【中文关键词】fouling macroalgae; abalone Haliotis discus hannai; diet; nutritional value

【英文关键词】fouling macroalgae; abalone Haliotis discus hannai; diet; nutritional value

【中文摘要】In order to assess the potential of utilizing fouling macroalgae as feed for abalone Haliotis discus hannai, the species, biomass and total stock of fouling macroalgae attached on the aquaculture facility-lines were investigated and assessed at Sungo Bay, China, in August 2007. The nutritional value of four fouling macroalgae (Codium fragile, Sargassum muticum, Ulva pertusa and Laminaria japonica) and one cultured macroalgae (Gracilaria lemaneiformis) as the diet of abalone was assessed by analysis of the chemical composition of the macroalgae and by measuring bioavailability and digestibility to abalone H. discus hannai under laboratory conditions in August 2007. The results showed that the biomass of fouling macroalgae at the two sites was 243.61 ± 26.23 and 1078.15 ± 50.28 g m − 1 respectively. The contents of protein of G. lemaneiformis and C. fragile were 18.30% and 17.60%, respectively, which were significantly higher than the others. The five macroalgae were accepted by the abalone, and growth energies (P) and growth efficiency (%) were positive. However, significant differences were found among the different macroalgae. The growth efficiencies of abalone show a negative relationship with the levels of dietary lipid and a positive relationship with the protein contents. These results suggest that fouling macroalgae have a great potential to be used as diets of abalone.

【题目】獐子岛养殖海域氮磷的分布特征
【中文关键词】营养盐 营养盐结构 叶绿素 獐子岛 底播养殖
【英文关键词】Nutrient Nutrient composition Chlorophyll Zhangzi Island Bottom mariculture
【中文摘要】根据2005年4个季节的调查资料,研究了獐子岛养殖海区的氮、磷营养盐的季节变化及平面分布特性,重点分析了7月营养盐、叶绿素及环境因子的相关性,探讨了与底播养殖的可能内在联系。结果表明,溶解性无机氮、活性磷酸盐的平面分布和垂直分布较均匀,仅在7月,表底层的氨氮浓度及磷酸盐浓度存在显著性差异。根据氮磷摩尔比和浮游植物生长的阈值分析,在该海区氮、磷营养盐限制呈季节性交替变化,7月磷限制的潜在性较大,3月和5月氮限制的潜在性较大。尽管目前的养殖生产活动并未对该海区的营养盐浓度产生较大的影响或压力,但是,3、5和7月底层水的无机氮以氨氮为主以及贝类养殖密度较大的区域叶绿素浓度较低的现象,可能与养殖活动有关,应引起关注
【英文摘要】
The distribution and composition of dissolved nutrients in Zhangzi Island maricultural areas were discussed based on the data collected in March, May, July and October, 2005. The results showed that because of large current velocity,the horizontal distribution of nitrogen and phosphorous were symmetrical and there were no obvious stratification between surface and bottom water(except in July). The nutrient level of DIN and PO4^3- in the surveyed areas belong to oligothrophic state. Nutrient limitations were assessed according to the ratio of Nitrogen/Phosphorus(N/P) and the concentration threshold,results showed that the limiting nutrients may change with seasons. There was high potential for phosphorous limitation of the photosynthesis of phytoplankton in July and nitrogen limitation in March and May. Though this survey revealed that there was little effect or impact of mariculture on the environment,the nutrients structure had change somewhat. For example, in March, May and July, DIN were the major component of ammonia the bottom water,and the relatively low concentrations of chlorophyll usually found at the extensive bottom culture areas may all reflect the activity of mariculture, which needs further study in the future.

【题目】大连獐子岛海域虾夷扇贝养殖容量.
【中文关键词】虾夷扇贝 养殖容量 食物限制性指标 獐子岛 初级生产力 滤水率 浮游植物 养殖海域 叶绿素浓度 滤水效率
【英文关键词】Patinopecten yessoensis carrying capacity food limited index Zhang Zidao Island
【中文摘要】现场测定了獐子岛海域的叶绿素a浓度、初级生产力的季节性变化和养殖虾夷扇贝的种群结构;采用生物沉积法,测定了不同规格的虾夷扇贝的滤水率和虾夷扇贝的基本生物学特性。调查结果显示,叶绿素浓度在1.23~2.85mg·m-3范围内,均值为(1.78±0.57)mg·m-3;初级生产力的平均值为(76.6±41.9)mgC·m-2·d-1,虾夷扇贝单位个体的滤水率为(0.55±0.25)L·h-1。结合虾夷扇贝的年产量、海域面积和有关的水文状况等数据,计算了食物限制性指标的数值,摄食压力和调节比率在0.05和1.0之间,而滤水效率小于0.05。结果显示,由于该海域的叶绿素浓度和初级生产力水平较低,海水流速大,因此,水交换带来的悬浮颗粒物为主要食物来源。目前的虾夷扇贝的养殖量(32亿粒)接近生态容量,如果开展筏式养殖,利用整个海域的水体,养殖量增大20倍的空间并达到养殖容量,预计年产量将达到256亿粒。
【英文摘要】
Zhang Zidao Island became the largest base for mariculture of Japanese scallop Patinopecten yessoensis fro

m 1995. Total culture areas of the scallops are about 47 000 hm^2, annual yields arrived at 40 000 t in this area. In order to keep the aquaculture industry sustainability and to utilize the limited water areas reasonably and sufficiently, the carrying capacity of the scallop for Zhang Zidao Island was assessed by the methods of food limited indexes. Environment factors (tide change, water movement), chlorophyll a and primary production were measured. The clearance rates of different size scallop Patinopecten yessoensis were determined with flow-through system and its population shell height-frequency distributions of the scallop within the areas were measured in July and October. Results showed the average concentration of chlorophyll a was at the range of 1.23 - 2.85 mg-m^-3 [with the annual average of (1.78±0.57) mg · m^-3], primary production was (76.6±41.9) mg C · m^-2 · d^-1. The average clearance rate of the scallop was (0.55±0.25) L · h^-1 · ind^-1. Based on the above investigated data and annual yields and mariculture areas etc, food limited indexes (clearance efficiency, filtration pressure and regulation ratio) were calculated and the ecological carrying capacity and production carrying capacity were assessed. Both food limited indexes: filtration pressure and regulation ratio were between 0.05 and 1.0, clearance efficiency was lower than 0.05, which mean the suspended particle organic materials mainly come from the water exchange. Results showed that if the total water volume is used by the cultivated scallops, current cultured biomass of the scallop in Zhang Zidao Island was at the level of ecological carrying capacity (total individual is 12.8×10^8), which means at current status, the scallop cultivated behaviour has not great influence on the environment and there will be 20 times developing potential to get the level of production carrying capacity, the potential annual yield will be 32×10^8 individual.

【题目】不同光照强度对刺参幼参生长的影响
【中文关键词】刺参 光照强度 饵料 生长 幼参
【英文关键词】Apostichopus japonicus Light intensity Feedstuff Growth Juvenile sea cucumber
【中文摘要】采用室内受控的实验方法研究了不同光照强度对刺参幼参生长的影响。实验设暗光、微强光、强光3个光照处理,同时每个光照处理组分别投喂两种饵料(人工配合饲料、人工配合饲料加底栖硅藻)。研究结果表明,不同光照强度下,幼参的生长差异显著(P〈0.05),每种饵料处理下强光处理组幼参的特定生长率和日增重明显高于暗光处理组,而相同光照强度下两种饵料处理对幼参生长的影响差异不显著(P〉0.05)。3个光照处理下幼参的特定生长率平均分别为0.26%、0.63%、0.98%/d,日增重为0.53、1.39、2.26g/d
【英文摘要】The effects of three light intensities(0. 77-5. 57lx, 650-2 900lx, 2 700-11 000lx)on the growth of juvenile sea cucumbers Apostichopus japonicus were studied. Two diets were fed to the animals in each light intensity treatment groups, respectively. Results showed that the daily weight gain (DWG) and specific growth rate (SGR) of juvenile A. japonicus were significantly affected by light intensity (P〈0. 05). The SGR and DWG of the higher light intensity treatments were greater than the lower light intensity treatments. But the DWG and SGR were not significantly affected by feedstuff (P〉0.05). The SGR of different light intensity treatments was 0.26%,0.63% and 0.98%/d, respectively, and the DWG was 0.53,1.39 and 2.26 g/d, respectively.

【题目】高温下不同盐度对刺参幼参和1龄参呼吸排泄的影响.
【中文关键词】刺参 盐度 呼吸 排泄
【英文关键词】Apostichopus japonicus salinity respiration ammonia excretion
【中文摘要】在实验室中模拟研究了高温(25.3~26.5℃)条件下,不同盐度对刺参(Apostichopus japonicus)幼参和1龄刺参呼吸排泄的影响。根据对盐度的耐受性不同,分别将体质量为(0.03±0.002)g的幼参暴露于盐度梯度为20、23、26、30、35的水体中,体质量为(22.73±9.46)g的1龄刺参暴露于盐度梯度为16、20、25、30、35的水体中进行盐度变化对其呼吸排泄的影响实验,测定其耗氧率和排氨率。结果表明,盐度变化对刺参的呼吸排泄影响显著(P〈0.05)。幼参在23~30盐度、1龄参20~30盐度范围内,耗氧率[Rwr,mg/(g·h)]和排氨率[Rwe,μmol/(g·h)]随着盐度的升高而降低,当盐度升高至35时,两者都明显升高(以盐度30为对照),当盐度降至20(幼参)、16(1龄参)时,刺参耗氧率和排氨率均降低。盐度对刺参O:N比值的影响不显著(P〉0.05),各盐度条件下,2种规格刺参的O:N比值平均在14左右,表明本实验条件下该刺参代谢所需要的能量主要由脂肪和碳水化合物提供。从呼吸和排泄的角度来看,在本实验高温(25.3~26.5℃)条件下,幼参在23~35盐度、1龄参20~35盐度范围内具有较好的渗透压调节能力,而幼参在20盐度、1龄参在16盐度下代谢功能较弱。
【英文摘要】Effects of salinity on the respiration and ammonia excretion of A.japonicus between the temperature of 25.3-26.5°Cwere studied in the laboratory.The animals were divided into two size groups with body weight o(0.03±0.002) g and(22.73±9.46)g respectively.Because of different salinity tolerance of the animals,the trail was set up with five salinity gradients(20,23,26,30,35 for juveniles and 16,20,25,30,35 for bigger ones)on a series of sudden and gradual salinity changes.The weight specific respiration rate[Rwr,mg/(g·h)]and the weight specific excretion rate[Rwe,μmol/(g·h)]were determined in order to investigate the impact of salinity changes on the respiration and ammonia excretion of A.japonicus.Results showed that the respiration and ammonia excretion were significantly affected by the salinity changes(P〈0.05).At the salinity of 30,the animals respired and excreted at a low level.The respiration rate and ammonia excretion rate increased significantly at higher salinity of 35 and at lower salinity of 23 for the juvenile group or 20 for the one year old group.The salinity had no significant impacts on the ratio of O:N(P〉0.05). The values of O:N ratios were 14.21±2.37(mean±SD),which indicated that the sea cucumbers in the experiment mainly utilized carbohydrate and lipid as their energy sources.Results indicated that the sea cucumbers in the optimum salinity range have the ability of osmoregulation at temperature of 25.3-26.5°Cwhile metabolic function weakened at the critical salinity.

【题目】虾夷扇贝摄食生理研究
【中文关键词】虾夷扇贝 温度 体重 摄食率 吸收率
【英文关键词】Patinopecten yessoensis Temperature Dry tissue weightFeeding rate Assimilation efficiency
【中文摘要】在实验室条件下,采用静水法测定了温度、体重对虾夷扇贝摄食率的影响。分别对5、10、15、20、25℃5个温度梯度下,A、B、C、D、E5个规格虾夷扇贝的摄食率进行了测定。实验结果表明,软体部干重对虾夷扇贝的摄食率影响显著(P〈0.05),且相关回归分析表明,体重(X)与摄食率(Y)呈正相关幂指数关系:Y=aXb。扇贝个体吸收率随着体重的增加而减小,但是不同规格扇贝吸收率差异不显著(P〉0.05);在实验温度5~25℃范围内,温度对虾夷扇贝的摄食率和吸收率影响极显著(P〈0.01),温度(T)与摄食率之间的相关方程为:FR=b0+b1T+b2T2+b3T3,虾夷扇贝最大摄食率的温度值为15℃,最大吸收率的温度值为10℃
【英文摘要】
The experiment was carried out under laboratory conditions to study the effects of temperature and body weight on feeding rate of scallop Patinopecten yessoensis. The feeding rate of the scallop of 5 levels of dry tissue weight was determined at temperatures of 5,10,15,20 and 25 ℃. The results showed that the feeding rate of P. yessoensis was affected significantly by temperature and body weight (P0.05). The relationship between feeding rate and temperature or dry tissue weight can be described as FR=b0+b1T+b2T2+b3T3 and Y=aXb. The assimilation efficiency of P. yessoensis was affected significantly by temperature (P0.01),but not significantly by dry tissue weight (P0.05). The maximum feeding rate of P. yessoensis occured at 15 ℃,and the maximum assimilation efficiency was found at 10 ℃.

【题目】温度变化对虾夷扇贝耗氧率和排氨率的影响
【中文关键词】虾夷扇贝 温度骤变 温度缓变 耗氧率 排氨率
【英文关键词】Patinopecten yessoensis acute temperature change chronic temperature change oxygen consumption rate ammonium excretion rate
【中文摘要】为探索虾夷扇贝(Datinopecten yessoensis)夏季大量死亡的生理原因,模拟虾夷扇贝筏式养殖区夏季水温变化情况,采用室内控温实验,研究了温度剧烈和缓慢变化对虾夷扇贝耗氧率和排氨率的影响及其影响的差异性。实验设置10℃、15℃、20℃、25℃4个温度梯度,设计温度骤变(每小时升温5℃)和温度缓变(每天升温1℃)2种温度处理方式,测定升温前后耗氧率和排氨率。结果显示,温度变化对虾夷扇贝耗氧率和排氨率影响显著(P〈0.05)。温度缓变组耗氧率变化范围为1.910~2.722mg(/g·h),排氨率变化范围为1.499~5.003μm/(g·h),耗氧率(OR)和排氨率(NR)与温度(T)之间的相关方程为OR=2.303+0.425T-0.133T^2(R^2=0.941)和NR=-1.536+4.384T-0.893T^2(R^2=0.435)。温度骤变组耗氧率和排氨率大于温度缓变组,且温度骤变组耗氧率在15℃、20℃和25℃,排氨率在20℃和25℃与温度缓变组差异显著(P〈0.05)。
【英文摘要】
In order to investigate the reason of massive mortality of scallop,Patinopectenyessoensis in summer,the effects of water temperature variation on oxygen consumption and ammonium excretion rates of scallops were studied in laboratory by simulating changes of water temperature in raft culture area in summer.Scallops were exposed under four temperature of 10℃,15℃,20℃and 25℃.Each temperature was achieved by rapid(5℃/h)and chronic(1℃/day) changing respectively.Oxygen consumption rate and ammonia excretion rate were

measured before and after chang.The result showed that the rates of oxygen consumption and ammonium excretion of P.yessoensis were affected significantly by temperature variation(P〈0.05).In the test with chronic temperature variation,the oxygen consumption rates ranged from 1.910mg(/g·h)to 2.722mg(/g·h)and the excretion rates ranged from 1.499 to 5.003μm(/g·h).The relationship between temperatur(eT)and oxygen consumption rat(eOR)or ammonia excretion rate(NR)were described as ORmg(/g·h)=2.303+0.425T-0.133T^2(R^2=0.941)and NRμmol(/g·h)=-1.536+4.384T-0.893T^2(R^2=0.435),respectively.In the test with acute temperature variation,the oxygen consumption rates at 15°C,20°Cand 25°Cand ammonia execretion rates at 20°Cand 25°Cwere significantly higher than those of chronic temperature test(P〈0.05).

【题目】Effects of Source of Supplemental Zinc on Performance, Nutrient Digestibility and Plasma Mineral Profile in Cashmere Goats
【中文关键词】无
【英文关键词】Cashmere Goat, Nutrient Digestibility, Performance, Plasma Mineral Profile, Zinc
【中文摘要】无
【英文摘要】This experiment was designed to evaluate the effects of source of supplemental zinc (Zn) on performance, nutrient digestibility and plasma mineral profile in Cashmere goats during the cashmere fiber growing period. Twenty-seven Liao Ning Cashmere wether goats (9-10 month of age; initial BW = 19.31±0.32 kg) were fed a basal diet (containing 22.3 mg Zn/kg DM) with no supplemental Zn (control) or 20 mg of supplemental Zn/kg of DM from Zn sulfate (ZnSO4) or Zn methionine (ZnMet) for 60 days including a 10-day metabolism trial. Average daily gain (ADG) ($p<0.05$) and gain:feed (G/F) ($p<0.05$) were increased by Zn supplementation, but no differences were noted between Zn sources ($p>0.05$). The length and diameter of cashmere fiber did not differ among treatments ($p>0.05$). Zn supplementation had no influence on digestibility of DM, CP, EE and NDF ($p>0.05$). However,ADF digestibility in the group supplemented with ZnMet was significantly higher than in other treatments ($p<0.05$). Plasma Zn was increased ($p<0.05$) and Cu tended to be decreased ($p = 0.057$) by Zn supplementation, but no differences were found between Zn sources ($p>0.05$). Plasma alkaline phosphatase activity (AKP) was improved by Zn supplementation ($p<0.05$) and was higher in the ZnSO4than the ZnMet group ($p<0.05$). Zn retention was increased ($p<0.05$) and apparent absorption rate was decreased ($p<0.05$) by Znsupplementation. The results indicate that supplementation of 20 mg Zn/kg DM either as ZnSO4or ZnMet in the basal diet containing 22.3 mg Zn/kg DM can improve growth performance in Cashmere goats, and effectiveness of the two sources is similar on performance measurements.

【题目】Effects of dietary copper on growth performance, nutrient digestibility and fiber characteristics in cashmere goats during the cashmere slow-growing period
【中文关键词】无

【英文关键词】Copper; Growth performance; Nutrient digestibility; Fiber characteristics; Cashmere goats;
【中文摘要】无
【英文摘要】Thirty-six 2.5-year-old wether Inner Mongolian White Cashmere Goats (IMWG) (BW= 42.7±3.44 kg) were used to determine the effects of dietary copper (Cu) concentration on growth performance, nutrient digestibility and fiber characteristics during the cashmere slow-growing period. Wethers were stratified by weight and randomly assigned to four dietary treatments, which included a control diet containing 5.60mgCu/kg DM, the control diet supplied, respectively, with 10, 20 and 30mgCu/kg DM (total dietary Cu level of 5.60, 15.6, 25.6 and 35.6 mg/kg DM). The experiment lasted 50 days including a 10-day preliminary trial and 10-day metabolism trial. Average daily feed intake (ADFI) did not differ among treatment groups (P > 0.05), except that the supplement providing 30mgCu/kg DM decreased average daily gain and gain efficiency (P < 0.05). Copper supplementation had no influence on digestibility of DM, CP and ADF (P > 0.05), however, NDF digestibility of the treatment group supplemented with 30mgCu/kgDMwas lower compared with that of other groups (P < 0.05). Length and growth rate of cashmere fiber were higher in the treatment group supplemented with 20mgCu/kg DM compared with other groups (P < 0.05), but cashmere diameter was not affected by Cu supplementation (P > 0.05). In conclusion, supplementation of Cu at the levels of 10, 20 and 30 mg/kg DM to the basal diet containing 5.60mgCu/kg DM had no influence on ADFI or nutrient digestibility of DM, CP and ADF in cashmere goats, while 30mgCu/kg DM supplementation had a negative effect on growth performance and NDF digestibility. However, 20mgCu/kg DM supplementation of the basal diet enhanced cashmere growth. Hence, the appropriate supplemental level during the cashmere slow-growing period is deemed to be 20mgCu/kg DM (total dietary Cu level of 25.6 mg/kg DM).

【题目】轻型移动式水下洗网装置设计
【中文关键词】深水网箱;洗网装置;设计计算;叶轮
【英文关键词】deep2water sea cages; net-washing equipment; design and calculation; impeller
【中文摘要】摘要: 针对深水网箱特殊的工作环境,依据高速水流驱动叶轮旋转的工作原理,研制出一种用于养殖网箱的便携式水下网衣清洗装置。根据驱动叶轮的结构形式以及设计参数,基于动量定理及力矩平衡方程,对洗网装置的动力参数进行了理论计算,得到的喷嘴出口流速值为50. 04 m / s,水流对叶轮的冲击力为28. 56 N。在此基础上,结合能量方程,确定出所需工作泵的相关性能参数分别为流量37. 71 L /min、压力2. 9 MPa、功率2. 95 kW。试验测试结果表明,在工作泵选型满足工作压力条件下,该装置的综合性能达到了设计要求。
【英文摘要】Abstract: Taking into consideration the special working conditions of deep2water sea cages, based on the working principle of the impeller rotation driven by the high2velocity flow, a portable underwater net2washing equipment is designed for

aquaculture cages. According to the structure forms and design parameters of driving impeller coupled with the momentum theorem and the torque equilibrium equation, the paper theoretically calculates the dynamic parameters of the net2washing equipment. The calculated results of nozzle exit velocity and the impact force of the impeller given by the high2velocity flow are 50. 04 m / s and 28. 56 N, respectively. Furthermore, the performance parameters such as pressure and required power are ascertained on the basis of the energy equation. the data are as follows: capacity 37. 71 L /min, working pressure 2. 9MPa, power 2. 95kW. The testing results show that composite performances of the underwater net2washing equipment has reached the design requirement when the selected working pump satisfy the condition of working pressure

【题目】远程气力输送自动投饵系统分配器设计初步研究
【中文关键词】自动投饵 分配器 气力输送 多路换向阀 S形弯管
【英文关键词】Automatic feeding Distribution valve Pneumatic conveying
【中文摘要】摘要 设计制造了一套远程压力输送自动投饵系统,简要介绍了其基本原理、工作流程和功能特点。详细阐释了系统配备的分配器设计原则和设计方法。在分析S形弯管内物料运动状态的基础上初步确定了滑管式分配器的基本设计原则:将分配器的类型根据支管布置形式的不同区分为上半圆式和下半圆式;再选择合适的“弯曲半径一管径一支管数”组合使S形弯管的物料流动性能最优,且使分配板上的支管孔边缘距离符合电子定位器件和密封器件的安装要求;使弯管管径小于前端直管管径;使分配器的全尺寸尽可能地小。根据基本设计原则进行了计算公式推导和设计演示,获得了弯曲半径、孔边距和全尺寸的计算公式及其与管径、支管数组合的优化选择方法,进而确定了分配器的基本设计流程和方法,为同类型分配器的设计提供参考。
【英文摘要】ABSTRACT The principle,work flow and functions of the centralized air—powered feeding systems were briefly introduced.The principle and method for designing distribution valve of the feeding systems were discussed in detail.The movement of particles in S—shaped pipes was analyzed.The analysis showed that the influence of bending radius on velocity reduction was different when position of the pipe changed,and velocity reduction could be minimized by choo—sing an appropriate radius at the same pipe diameter.The friction factor between inner surface of pipes and the particles was also an important parameter for velocity reduction. According to the results of the analysis,the design principle of the distribution valve was obtained:there were two types of partition distribution valves according to the different disposal of the offset pipes,the upper—half circularity and the lower—half circularity valves;to optimize the performance of feed bullets moving in S-shaped pipes and to make sure that the space between each neighboring offset pipes was sufficient for fitting electro—localization system and seal components by choosing right combination of “ bend diameter+ pipe diameter+ number of offset pipes ” :tO guarantee that the diameter of S-shaped pipe is smaller than the front straight pipes';and then to minimize the dimension of the distribution valve,etc.Based on the design principle,mathematical calculations and design demonstration were done.Bend diameter,space between each neighboring offset pipes and dimension of the distribution valve were obtained,then the work flow and method for designing the distribution valve were achieved.

【题目】The LCB2 subunit of the sphingolip biosynthesis enzyme serine palmitoyltransferase can function as an attenuator of the hypersensitive response and Bax-induced cell death

【中文关键词】农杆菌介导瞬时表达;激发子;过敏反应;程序化细胞死亡;病毒诱导基因沉默
【英文关键词】Agrobacterium-mediated transient expression; elicitor; hypersensitive response (HR); programmed cell death (PCD); virus-induced gene silencing (VIGS)
【中文摘要】丝氨酸棕榈转移酶(serine palmitoyltransferase, SPT)含有两个亚基(LCB1,LCB2),参与合成神经鞘脂的第一步,且该神经鞘脂参与调节细胞凋亡(Perry et a., 2000)。神经鞘脂及其代谢产物神经酰胺, 鞘氨醇和鞘氨醇-1-磷酸调控植物细胞许多生理生化过程,如抗病反应、膜的加固和抗干旱(Hannun et al., 2000; Ng et al., 2001)。在本试验中,我们用从Phytophthora boehmeriae中获得的PB90处理不结球白菜(Brassica campestris ssp.chinensis), 在早期过敏反应时上调的基因中筛选到一个LCB2基因,该基因编码SPT的一个亚基。在本试验中该基因在PB90处理不结球白菜后上调表达。我们通过RACE的方法获得了BcLCB2的全长并在植物叶片中过量表达发现LCB2(BcLCB2)可抑制PB90、elicitin、 MgNEP1、 hrf1xoo等激发子及烟草野火病菌、诱导的过敏反应。而烟草植株经过病毒诱导基因沉默后,发现激发子诱导的过敏反应有所加快。同时我们也发现BcLCB2也可以抑制Bax引起的酵母细胞凋亡和提高酵母细胞对氧化剂t-BHP的耐受性。该结果表明BcLCB2在植物和酵母中都参与了细胞凋亡进程,且有可能是通过阻止活性氧的积累来抑制细胞凋亡,提示植物过敏反应和酵母细胞凋亡的信号传导有相同的通路。
【英文摘要】 • Previous results showed that expression of the gene encoding the LONG-CHAINBASE2 (LCB2) subunit of serine palmitoyltransferase (SPT), designated BcLCB2, fromnonheading Chinese cabbage (Brassica campestris ssp. chinensis) was up-regulatedduring hypersensitive cell death (HCD) induced by the Phytophthora boehmeriaeelicitor PB90. • Overexpression of BcLCB2 in Nicotiana tabacum leaves suppressed the HCDnormally initiated by elicitors and PB90-triggered H2O2 accumulation. BcLCB2also functioned as a suppressor of mouse Bcl-2 associated X (Bax) protein-mediatedHCD and cell death caused by Ralstonia solanacearum. BcLCB2 overexpressionsuppressed Bax- and oxidant stress-triggered yeast cell death. Reactive oxygen species(ROS) accumulation induced by Bax was compromised in BcLCB2-overexpressingyeast cells. • The findings that NbLCB2 silencing in Nicotiana benthamiana enhanced elicitor-triggered HCD, combined with the fact that myriocin, a potent inhibitor of SPT,had no effect on Bax-induced programmed cell death, suggested that suppressionof cell death was not involved in the dominant-negative effect that resulted fromBcLCB2 overexpression. A BcLCB2 mutant assay showed that the suppression was notinvolved in SPT activity. • The results suggest that plant HCD and stress-induced yeast cell death mightshare a common signal transduction pathway involving LCB2, and that LCB2 protectsagainst cell death by inhibiting ROS accumulation, this inhibition being independentof SPT activity.

【题目】基于单回波检测跟踪的深水网箱生物量评估模型研究
【中文关键词】单回波检测;低通滤波;深水网箱;生物量评估
【英文关键词】single echo detection;low-pass filter;deep water net cages;biomass estimation
【中文摘要】摘要:构造了基于声纳信号处理的深水网箱生物量评估数学模型。运用单回波脉宽检测和跟踪方法,结合二维低通滤波器,对声纳数据进行处理,去除背景噪声和其他回波,在单体鱼连续的回波踪迹中可以检测出鱼的游速和方向。同时,结合图像分析有效压缩噪声,提取有用特征来识别检测到的鱼迹,形成一种自动计数方法,提高生物量的检测概率。该方法通过提取和使用原始的回声图像,检测出运动目标,同时压缩回声图中的噪声,从而在低信噪比数据中实现对网箱中生物量的检测和估计,适合实际工程应用。
【英文摘要】Abstract:The mathematiea1 model for biomass estimation in deep water net cages is constructed based on so.nar signal processing.Signal echo detection and tracking method for pulse width together with 2-D low—pass fil—ter is applied to process sonar data in order to dismiss background noises and other echoes.The swimmingspeed and direction of a single fish can be detected from its continuous echo track.Image analysis is also add—ed to compress noises eficiently and pick up useful features to identify detected fish tracks,and then producean automatic counting method to improve the biomass detection probability.This method is used to detect nov—ing objects and compress image noises by picking up and employing original echo images,and accordingly achieves the detection and estimation for the biomass by means of low signal to noise ratio data,which is suitable for engineering application

【题目】Determination of flavanone glycosides and polymethoxylated flavones in peels of selected citrus cultivars by high-performance liquid chromatography
【中文关键词】无
【英文关键词】flavanone glycosides;polymethoxylated flavones;high-performance liquid chromatography
【中文摘要】无
【英文摘要】A reversed-phase high-performance liquid chromatographic method has been developed for the simultaneous determination of 5 flavanone glycosides (FGs) and 3 polymethoxylated flavones (PMFs) in different citrus fruit peels. This technique permits the quantitation of five FGs (narirutin, naringin, hesperidin, neohesperidin, didymin,) and three PMFs (sinensetin, nobiletin, and tangeretin). This eight flavonoids were separated using 0.2% acetic acid solvent and acetonitrile as the mobile phase at 25 °C, using a C18 reversed-phase column. The method was linear in the 0.01~20 mg/L concentration range for all eight flavonoids. The concentrations of the 5 FGs and 3 PMFs in peels of selected citrus cultivars (15 mandarins, 17 sweet oranges, 2 citrus hybrids) grown in China were determined by this method. The results showed that all the citrus cultivars analysed contained at least six of the eight major flavonoids quantified, and the total contents of citrus flavonoids were ranged from 151.14 mg/g to 30.27 mg/g (DW). The major FGs in peels were hesperidin, followed by narirutin and didymin, and the major PMFs was nobiletin. Naringin and neohesperidin were only detected in citrus hybrids peels. Ponkan peel contained the highest quantity of PMFs (104.01 mg/g) among all the varieties, which was considerably higher than the average content (14.62 mg/g). The content of FGs (146.9 mg/g) of Jinshancheng orange (C.reticulata Blanco × C.grandis Blanco × C.grandis) was highest, and it also contained the highest quantity of neohesperidin (113.85 mg/L), which was not detected in peels of other varieties. This study suggests that the peels obtained from citrus juice production might serve as potential sources of relatively large quantities of flavonoids, which could be used as the functional materials for the nutraceutical and pharmaceutical industries.

【题目】The role of respiratory burst oxidase homologues in elicitor-induced stomatal closure and hypersensitive response in Nicotiana benthamiana
【中文关键词】活性氧;过敏反应;本氏烟;气孔运动;病毒诱导基因沉默
【英文关键词】AOS; elicitor; hypersensitive response; Nicotiana benthamiana; stomatal closure; virus-induced gene silencing
【中文摘要】活性氧是一类重要的信号分子,和细胞死亡紧密相连;且外源和内源的AOS都能诱导气孔关闭。激发子被非寄主识别后,产生活性氧;大量的活性氧如不能及时被植物自身的抗氧化系统清除,会产生毒害效应,经过一系列信号的传递,导致过敏性反应和气孔关闭。前人研究表明植物NADPH氧化酶,RBOH是植物体内负责AOS产生的一类重要的酶。本实验室采用VIGS技术分别获得了NbrbohA、NbrbohB单基因沉默,以及NbrbohA和NbrbohB双基因沉默的本氏烟植株,分别以激发子boehmerin (Phytophthora boehmeriae),INF1 (Phytophthora infestans)和harpin (Xanthomonas oryzae)处理上述烟草,3-24小时内进行H2O2染色观察,发现H2O2的迸发减少,2天后均观察到过敏反应,且基因沉默对激发子诱发的PR基因的表达和胞内Ca2+没有影响;表明RBOH是激发子诱发的氧迸发中一类主要的酶,但在激发子诱发的过敏性细胞死亡并不是个关键因子。同时基因沉默的植株抑制了激发子诱发的气孔关闭且保卫细胞中NO的迸发减少,进一步对上述基因沉默的烟草表皮的保卫细胞进行AOS染色观察,发现所有的激发子均能激发上述烟草保卫细胞中AOS的产生。 综上,RBOH引起的H2O2和NO减少和激发子诱导的气孔关闭相关,而由于植物体内还存在其它的活性氧产生的途径,且AOS/NO之间的平衡状态决定了植物细胞的存亡。
【英文摘要】Active oxygen species (AOS) are central components of the defence reactions of plants against pathogens. Plant respiratory burst oxidase homologues (RBOH) of gp91(phox), a plasma membrane protein of the neutrophil nicotinamide adenine dinucleotide phosphate (NADPH) oxidase, play a prominent role in AOS production. The role of two RBOH from Nicotiana benthamiana, NbrbohA and NbrbohB that encode plant NADPH oxidase in the process of elicitor-induced stomatal closure and

hypersensitive cell death is described here. NbrbohA was constitutively expressed at a low level, whereas NbrbohB was induced when protein elicitors exist (such as boehmerin, harpin, or INF1). The virus-induced gene-silencing (VIGS) method was used to produce single-silenced (NbrbohA or NbrbohB) and double-silenced (NbrbohA and NbrbohB) N. benthamiana plants. The hypersensitive response (HR) of cell death and pathogenesis-related (PR) gene expression of these gene-silenced N. benthamiana plants, induced by various elicitors, are examined. The HR cell death and transcript accumulation of genes related to the defence response (PR1) were slightly affected, suggesting that RBOH are not essential for elicitor-induced HR and activation of these genes. Interestingly, gene-silenced plants impaired elicitor-induced stomatal closure and elicitor-promoted nitric oxide (NO) production, but not elicitor-induced cytosolic calcium ion accumulation and elicitor-triggered AOS production in guard cells. These results indicate that RBOH from N. benthamiana function in elicitor-induced stomatal closure, but not in elicitor-induced HR.

【题目】转反义OsRACK1基因增强水稻抗旱能力
【中文关键词】反义RNA,干旱胁迫,水稻,RACK1基因,转基因植株
【英文关键词】anti-sense RNA,drought stress,Oryza sativa,RACK1 gene, transgenic plants
【中文摘要】RACK1是一种多功能支架蛋白,广泛参与植物生长发育过程的调节。利用反义RNA技术抑制水稻(Oryza sativa)RACK1基因的表达,分析了RACK1基因在响应干旱胁迫中的功能。采用实时定量PCR对获得的转基因植株的RACK1基因表达进行分析,结果表明转基因水稻RACK1基因表达受抑制程度达到50%左右。与非转基因水稻(对照)相比,转基因水稻耐干旱能力强,膜脂过氧化程度低且丙二醛的含量少,SOD活性高。这些结果表明,RACK1蛋白负调节水稻对干旱胁迫的耐受过程,并且这种调节作用在很大程度上与植株体内的氧化还原系统有关。
【英文摘要】RACK1 is a scaffold protein with versatile functions and plays important roles in the regulation of plant growth and development.Transgenic rice(Oryza sativa),with the expression of OsRACK1 anti-sense construct.was used to study possible functions of OsRACK1 in response of rice to drought stress.Real—time PCR analysis showed that the expression of OsRACK1 in transgenic rice plants was reduced by more than 50% .The tolerance to drought stress was stronger in transgenic than in nontransgenic rice plants.The epioxidation of membrane and production of malonaldehyde were significantly lower and the superoxide dismutase(SOD)activity was significantly higher in transgenic plants than in non—transgenic plants.OsRACK1 may negatively regulates tolerance of rice to drought stress,which is associated with the redox system in rice.

【题目】波浪变态模型试验相似关系探讨
【中文关键词】变态模型;相似关系;折射;绕射
【英文关键词】distorted model; similitude relationship; wave refraction; wave diffraction
【中文摘要】摘 要: 对于波浪折射、绕射和反射的影响都较显著的情形,考虑到按传统的波浪变态模型相似关系将模型中的试验数据换算到原型后的偏差较大,论文尝试采用将正态模型时间比尺应用到变态模型中并反推出变态模型波长比尺的方法提出了一种不同的波浪运动相似关系即λL=λl·λthkh。通过工程实例计算表明,该相似关系条件下的变态模型计算结果与原型数值计算结果的偏差要明显小于传统的波浪折射和绕射相似的情况。

【英文摘要】Abstract: When the influence of wave refraction, diffraction and reflection is significant in case of large wave movement, the method based on traditional similitude relationship converting the test results of a distorted model to full2scale case, may cause larger deviations. A new similitude relationship (λL = λl • λthkh) ofwave movement is p resented in a way that the time scale of undistorted model is app lied to calculate the wavelength scale of distorted model. The calculated results of a p roject case show that the error between distorted model and prototype under λL = λl • λthkh is less than that under wave refraction and diffraction similitude

【题目】The role of vacuolar processing enzyme (VPE) from Nicotiana benthamiana in the elicitor-triggered hypersensitive response and stomatal closure
【中文关键词】活性氧;激发子;过敏反应;本氏烟;气孔运动;病毒诱导基因沉默
【英文关键词】AOS; elicitor; hypersensitive response; Nicotiana benthamiana; stomatal closure; virus-induced gene silencing
【中文摘要】激发子诱导的过敏性反应和气孔关闭是植物的一种免疫机制。VPEs位于植物液泡中,是种半胱氨酸蛋白酶,属于豆类天冬氨酸蛋白内切酶(legumain) 家族,对天冬氨酸和天冬酰胺残基羧基端的肽键具有底物专一性。最初认为VPEs负责种子贮藏性液泡中大多数蛋白质的加工活性,通过裂解前体的天冬酰胺和谷氨酰胺间的肽键产生多种有功能的蛋白质.最近又发现VPEs通过促进液泡中蛋白质的水解进而导致液泡的破裂而发挥类似动物caspases调控程序化细胞死亡(PCD)的功能。本实验研究了本氏烟VPE1a、VPE1b在不同来源的激发子(harpin, Nep1 and boehmerin)信号中的功能,这些激发子分别来自于细菌、真菌和卵菌的PAMP。通过基因沉默的方法,我们得到了单基因(NbVPE1a-和NbVPE1b-)和双基因沉默(NbVPE1a/1b-)的植株,VPE沉默不影响激发子诱发的H2O2积累,NbVPE1a-和NbVPE1a/1b-沉默的植株抑制了harpin诱发的HR;而其它VPE沉默的植株,在boehmerin 和Nep1处理后,均产生了正常的过敏反应。说明harpin诱发的过敏反应是依赖于VPE的。同时基因沉默的植株抑制激发子诱发的气孔关闭且保卫细胞中NO积累减少。通过保卫细胞AOS染色观察显示所有的激发子均能激发上述烟草保卫细胞中AOS的产生,且双沉默负调控保卫细胞中AOS的积累。转录分析显示VPE调节了活性氧相关的基因NbrbohB和转录因子WRKY2的转录。综上,VPE是第一个报道的具有caspase 活性的基因参与了激发子诱发气孔关闭。结合气孔在植物免疫中的功能,说明VPE参与病原触发的抗性(PAMP-triggered immunity (PTI))。
【英文摘要】Elicitors/pathogen-associated molecular patterns (PAMPs) trigger the plant immune system, leading to rapid programmed cell death (hypersensitive response, HR) and stomatal closure. Previous reports have shown that the vacuolar processing enzyme (VPE), a cysteine proteinase responsible for the maturation of vacuolar proteins, has caspase-1-like activity and mediates TMV- and mycotoxin-induced cell death. The role of VPE from Nicotiana benthamiana in the response to three elicitors: bacterial harpin, fungal Nep1, and oomycete boehmerin, is described here. Single-silenced (NbVPE1a or NbVPE1b) and dual-silenced (NbVPE1a/1b) N. benthamiana plants were produced by virus-induced gene silencing. Although NbVPE silencing does not affect H(2)O(2) accumulation triggered by boehmerin, harpin, or Nep1, the HR is absent in NbVPE1a- and NbVPE1a/1b-silenced plants treated with harpin alone. However, NbVPE-silenced plants develop a normal HR after boehmerin and Nep1 treatment. These results suggest that harpin-triggered HR is VPE-dependent. Surprisingly, all gene-silenced plants show significantly impaired elicitor-induced stomatal closure and elicitor-promoted nitric oxide (NO) production in guard cells. Dual-silenced plants show increased elicitor-triggered AOS production in guard cells. The accumulation of transcripts associated with defence and cell redox is modified by VPE

silencing in elicitor signalling. Overall, these results indicate that VPE from N. benthamiana functions not only in elicitor-induced HR, but also in elicitor-induced stomatal closure, suggesting that VPE may be involved in elicitor-triggered immunity.

【题目】In vitro and in vivo Studies on the Antioxidant Effects of Soymilk Fermented with Streptococcus thermophilus grx02
【中文关键词】S. thermophilus; fermented soymilk; antioxidant; acute alcohol-induced liver injury
【英文关键词】S. thermophilus; fermented soymilk; antioxidant; acute alcohol-induced liver injury
【中文摘要】Soymilk fermented with Streptococcus thermophilus grx02 (FSM) was evaluated for its antioxidant properties. Antioxidant effects of FSM in vitro were measured with 2, 2-diphenyl-1-picrylhydrazyl (DPPH) based assay and by determining the inhibitory 15 effect on the formation for malonyldialdehyde (MDA), and on the ability to chelate ferrous ions; the respective average IC50 values were 49.5, 24.2 and 8.7 mg/mL. Antioxidant enzymatic activities in liver of alcohol-fed mice, biochemical markers in serum and an index of lipid peroxidation were determined, and additionally the changes in hepatocytes of ICR mice were compared. The results showed that, compared with 20 the control group, alanine transaminase (ALT) activity, aspartate transaminase (AST) activity and triglycerides (TG) of negative group increased ($p < 0.05$). Moreover, the serum ALT and AST activities of FSM group was lower than negative group ($p < 0.05$). However, there was no significant difference ($p > 0.05$) in the albumin (ALB) and total protein (TP) values (in positive, negative, control, and FSM groups) in the serum. 25Compared with the negative group, alcohol dehydrogenase (ADH), superoxide dismutase (SOD) activities and glutathione (GSH) content increased in liver ($p < 0.05$) in FSM group. The MDA of FSM group in liver was lower than the negative group ($p < 0.05$).

【题目】Novel and efficient method for immobilization and stabilization of beta-D-galactosidase by covalent attachment onto magnetic Fe3O4-chitosan nanoparticles
【中文关键词】磁性Fe3O4纳米粒子;壳聚糖;β-D-半乳糖苷酶的固定化;低聚半乳糖
【英文关键词】Magnetic Fe3O4 nanoparticle; Chitosan; beta-D-Galactosidase; Immobilization; Galactooligosaccharide
【中文摘要】本研究制备了磁性Fe3O4-壳聚糖纳米颗粒作为一种新型、高效的米曲霉来源的β-D-半乳糖苷酶的固定化载体。通过Fe2+和Fe3+共沉淀的方法制备磁性Fe3O4纳米颗粒。通过壳聚糖在磁性Fe3O4纳米颗粒表面的静电相互作用制备Fe3O4-壳聚糖复合纳米颗粒。通过透射电子显微镜,X射线衍射,傅里叶变换红外光谱仪,振动样品磁分析和热重分析表征制备得到的材料。应用戊二醛作为活化剂将β-D-半乳糖苷酶通过共价键固定在的纳米复合材料表面。通过试验固定化时间,交联时间,酶浓度,戊二醛浓度,戊二醛的初始pH值和酶溶液优化酶固定化的过程中。结果,固定化酶比游离酶表现出更高的存储,pH值和热稳定性。以果糖为底物,用这种磁性纳米材料固定化酶是,当乳糖的水解率达到50%时,低聚半乳糖的合成产率达到最高15.5% (w/v)。因此,磁性Fe3O4-壳聚糖纳米颗粒是一种有效的β-D-半乳糖苷酶的固定化载体。
【英文摘要】A novel and efficient immobilization of beta-D-galactosidase from Aspergillus oryzae has been developed by using magnetic Fe3O4-chitosan (Fe3O4-CS) nanoparticles as support. The magnetic Fe3O4-CS nanoparticles were prepared by electrostatic adsorption of chitosan onto the surface of Fe3O4 nanoparticles made through co-precipitation of Fe2+ and Fe3+. The resultant material was characterized by transmission electron microscopy. X-ray diffraction, Fourier transform infrared spectroscopy, vibrating sample magnetometry and thermogravimetric analysis. beta-D-Galactosidase was covalently immobilized onto the nanocomposites using glutaraldehyde as activating agent. The immobilization process was optimized by examining immobilized time, cross-linking time, enzyme concentration, glutaraldehyde concentration, the initial pH values of glutaraldehyde and the enzyme solution. As a result. the immobilized enzyme presented a higher storage, pH and thermal stability than the soluble enzyme. Calactooligosaccharide was formed with lactose as substrate by using the immobilized enzyme as biocatalyst, and a maximum yield of 15.5% (w/v) was achieved when about 50% lactose was hydrolyzed. Hence, the magnetic Fe3O4-chitosan nanoparticles are proved to be an effective support for

the immobilization of beta-D-galactosidase.

【题目】Determination of polyphenolic content and antioxidant activity of kudingcha made from Ilex kudingcha C.J. Tseng
【中文关键词】抗氧化活性,DPPH,FRAP,高效液相色谱法;苦丁茶CJ曾苦丁茶多酚含量; TEAC
【英文关键词】antioxidant activity; DPPH; FRAP; HPLC; Ilex kudingcha CJ Tseng; kudingcha; Polyphenol content; TEAC
【中文摘要】本研究应用 Folin-Ciocalteu试剂法测定了苦丁茶中的总多酚含量,并且分别应用DPPH, FRAP 和 TEAC法测定了苦丁茶的抗氧化活性。本研究制备了苦丁茶初提物,对初提物进行分部萃取,制备得到了其氯仿(CFF),乙酸乙酯(EAF),正丁醇(NBF),和水(WTF)萃取物,应用高效液相色谱法分析、测定了苦丁茶初提物及其分部萃取组分中的抗氧化物的组成。研究发现苦丁茶提取物中含有大量的咖啡酰奎尼酸(CQA)的衍生物,包括3-CQA,5-CQA,3,4-diCQA,3,5-diCQA,和4,5-diCQA,表现出较强的抗氧化活性。用DPPH 法和 FRAP法测得的苦丁茶及其各萃取组分的抗氧化活性强弱从高到低排列顺序如下:EaF > nBF > CE > WtF > CfF。用TEAC法测得的实验结果中CfF的抗氧化活性要高于WtF。更重要的是苦丁茶总酚含量与抗氧化活性之间具有很强的相关性。
【英文摘要】The total polyphenol content and the antioxidant activity of kudingcha made from flex kudingcha C.J. Tseng were determined by Folin-Ciocalteu reagent, and DPPH, FRAP, and TEAC methods, respectively. The crude extract (CE) of kudingcha and its four fractions of chloroform (CfF), ethyl acetate (EaF), n-butanol (nBF), and water (WtF) were prepared and subjected to antioxidant evaluation and analysis by high performance liquid chromatography. The extracts of kudingcha contained large amounts of caffeoylquinic acid (CQA) derivatives, including 3-CQA, 5-CQA, 3,4-diCQA, 3,5-diCQA, and 4,5-diCQA, and showed potent antioxidant activity. The antioxidant activities of CE and its fractions decreased in the order of EaF > nBF > CE > WtF > CfF, according to the DPPH assay and FRAP assay, which were the same, with the exception of the rank order of CfF and WtF, as the TEAC assay. Furthermore, a satisfactory correlation between total polyphenol content and antioxidant activity was observed.

【题目】The role of vacuolar processing enzymes
【中文关键词】过敏性细胞死亡;激发子;气孔运动;病程相关分子模式;植物先天免疫;程序化细胞死亡
【英文关键词】hypersensitive cell death, elicitor, stomatal closure, pathogen-associated molecular patterns, plant innate immunity, programmed cell death
【中文摘要】蛋白酶在植物先天免疫反应中具有非常重要作用。本文就液泡蛋白酶VPE在植物先天免疫中作用的最新研究进展进行了综述。该蛋白酶是植物中最早鉴定的与caspase-1类似的一种蛋白酶,过去几年中发现该酶植物多种细胞死亡中具有非常重要的作用。早期发现该VPE作为液泡中一种水解酶参与液泡中蛋白的成熟。后来发现本氏烟中的VPE通过调控细胞膜的塌陷调控TMV诱导N基因烟草的过敏性细胞死亡。拟南芥中VPE参与真菌毒素诱导的细胞死亡。然而VPE在激发子诱导的细胞死亡中的信号途径尚不清楚。我们最近的研究证明VPE在激发子诱发的植物免疫中具有非常重要作用,它参与激发子诱发气孔关闭、防卫反应和过敏性细胞死亡。
【英文摘要】Proteases play important roles in plant innate immunity. In this mini-review, we describe the current view on the role of a plant protease, vacuolar processing enzyme (VPE), and the first identified plant caspase-1-like protein, in plant immunity. In the past several years, VPEs were determined to play important roles in various types of cell death in plants. Early studies demonstrated the identification of VPE as a vacuolar hydrolytic protein responsible for maturation of vacuolar proteins. Later, Nicotiana benthamiana VPE was reported to mediate virus- induced hypersensitive response by regulating membrane collapse. The ortholog of VPE in Arabidopsis is also suggested to be involved in both mycotoxin-induced cell death and developmental cell death. However, the role of VPE in elicitor- signaling is still unclear. Our recent studies demonstrated the involvement of VPE in elicitor signal transduction to induce stomatal closure and defense responses, including defense gene expression and hypersensitive cell death.

【题目】Immunological evaluation of Lactobacillus casei Zhang: a newly isolated strain from koumiss in Inner Mongolia, China
【中文关键词】乳酸菌 免疫学
【英文关键词】MOUSE LYMPHOCYTE-PROLIFERATION; HUMAN DENDRITIC CELLS; LACTIC-ACID BACTERIA; IMMUNE FUNCTION; MILK DRINK; SHIROTA; IMMUNOMODULATION; INFECTION

【中文摘要】lactic acid bacteria fermented milk
【英文摘要】Background: There is increasing evidence to suggest an immunomodulation function both within the intestines and systemically upon consuming probiotic species. We recently isolated a novel LAB, Lactobacillus caseiZhang (LcZhang) from koumiss. LcZhang exhibited favorable probiotic properties, such as acid resistance, bile resistance, gastrointestinal (GI) colonization ability, etc. In order to examine the immunomodulatory qualities of LcZhang, we administered LcZhang to healthy mice with varying doses of either live or heat-killed LcZhang and measured various parameters of the host immune response. Results: The study was performed in four separate experiments via oral administration of live and heat-killed LcZhang to BALB/c mice for several consecutive days. We investigated the immunomodulating capacity of LcZhang in vivo by analyzing the profile of cytokines, T cell subpopulations, and immunoglobulin concentrations induced in blood serum and intestinal fluid in BALB/c mice. Only live bacteria elicited a wide range of immune responses, which include the increased production of interferon-gamma (IFN-gamma), and depression of tumor necrosis factor-alpha (TNF-alpha) levels. In addition, interleukin-2 (IL-2) and IL-2 receptor gene transcription increased significantly, but the proportion of T cell subsets appeared to be unaffected. We also observed that LcZhang was capable of inducing gut mucosal responses by enhancing the production of secretory Immunoglobulin A (sIgA) as well influencing the systemic immunity via the cytokines released to the circulating blood

【题目】A Survey on Chemical and Microbiological Composition of Kurut,Naturally Fermented Yak Milk from Qinghai in China
【中文关键词】乳酸菌 牦牛奶 理化成分 微生物组成
【英文关键词】kurut; Qinghai; chemical composition; microbiological composition
【中文摘要】bacteria
【英文摘要】Thirty-two batches of samples of kurut (naturally fermented yak milk) were collected at four locations in Qinghai, China, and their chemical and microbiological composition was analyzed. Average levels of major components were: total solids 14.3 +/- 1.52 g/100 ml, fat 5.37 +/- 1.04 g/100 ml, total protein 5.44 +/- 1.06 g/100 ml, lactose 2.34 +/- 0.172 g/100 ml, ash 0.860 +/- 0.080 g/100 ml and titratable acidity 158 +/- 16.3 degrees T. Results showed that the kurut had richer nutrients than the yoghurt. The HP (kurut samples from Plateau yaks in the northwest of Qinghai) had better chemical nutrients density than the MH (kurut samples from Huanhu yaks in the south of Qinghai) and LH (kurut samples from Huanhu yaks in the east of Qinghai). Sodium dodecyl sulfate-PAGE and densitometry analysis results demonstrated that kurut was rich in casein, immunoglobulins, serum albumin, beta-lactoglobulin, alpha-lactallburnin, and two unknown fractions in part samples. Microbiological enumeration revealed that the kurut contained larger lactic acid bacteria and yeast than those of the traditional fermented milk referred, with the average counts of lactic acid bacteria of 9.18 +/- 0.851 log cfu/ml and the yeast 8.33 +/- 0.624 log cfu/ml. The lactic acid bacteria dominated in the HP and LH kurut while the yeast dominated in MH kurut. The kurut was judged nutritional and indicates the latent value for people's health.

【题目】In vitro comparation of probiotic properties of Lactobacillus casei Zhang, a potential new probiotic, with selected probiotic strains.

【中文关键词】乳酸菌 发酵乳
【英文关键词】Probiotic properties; Lactic acid bacteria; Fermentation characterization
【中文摘要】bacteria
【英文摘要】Since 2004, our research group has isolated 240 Lactobacillus strains from Koumiss, a traditional fermented alcoholic beverage prepared from mare's milk in Inner Mongolia, Xinjiang of China and Mongolia. Among these Lactobacillus strains a novel strain with potential probiotic properties, Lactobacillus casei Zhang, was screened out and studied extensively for its probiotic properties, health-promoting effects and fermentation characteristics. In vitro tests indicated that L casei Zhang had high tolerance to simulated gastric, intestine juices and bile salts, similar to commercial probiotic strains such as Lactobacillus acidophilus NCFM, Lactobacillus rhamnosus GG, L casei Shirota and Bifidobacterium animalis Bb12. Higher acid-production activity and proteolytic activity was observed in the fermented milk inoculated with L casei Zhang during the refrigerated storage than in the samples inoculated with the selected commercial probiotics. The yogurt samples fermented with L casei Zhang exhibited similarer viable count (1.0 x 10(9) cfu/mL) as the other samples after 28 d of refrigerated storage. The results suggested that L casei Zhang showed good potential for application in functional foods and health-related products. (C) 2009 Elsevier Ltd. All rights reserved.

【题目】ACE-inhibitory activity and gamma-aminobutyric acid content of fermented skim milk by Lactobacillus helveticus isolated from Xinjiang koumiss in China
【中文关键词】乳酸菌 血管紧张素转化酶 高血压
【英文关键词】ACE-inhibitory activity; Lactobacillus helveticus; gamma-Aminobutyric acid; Fermented milk; Koumiss
【中文摘要】lactic acid bacteria
【英文摘要】Eighty-one strains of Lactobacillus were isolated from the koumiss collected in Xinjiang, China. The strains were cultivated in skim milk medium, ACE inhibitory activity and GABA concentrations in the culture supernatants were measured. Screening results revealed that ACE inhibitory activity of 16 strains was higher than 50% and two strains produced GABA. The Lactobacillus-ND01 strain produces both the high ACE inhibitory activity and GABA. The sequence of 16S rDNA of the Lactobacillus-ND01 showed 99% homology to L. helveticus. The first identification of the newly isolated Lactobacillus-ND01 strain which produces both high ACE inhibitory activity and GABA revealed differences from reported species in our study. The L. helveticus ND01 was resistant to acidic condition. The results suggest that L. helveticus ND01 showed good potential for application in the management of hypertension.

【题目】Analysis of microbial composition in acid whey for dairy fan making in Yunnan by conventional method and 16S rRNA sequencing
【中文关键词】乳酸菌 乳扇
【英文关键词】TRADITIONAL FERMENTED MILK; LACTOBACILLUS; CHEESE; CULTURES; STRAINS; MICROORGANISMS; IDENTIFICATION; BIODIVERSITY; DIVERSITY; BACTERIA

【中文摘要】lactic acid bacteria
【英文摘要】Dairy fan is a traditional milk product made by adding 'acid juice' and heating up. It has been consumed by people of minority ethnic region in Yunnan Province of China for over 1,000 years. In order to improve the quality of dairy fan for further industrial-scale production, we investigated the microbial composition, especially Lactic Acid Bacteria (LAB), by conventional method and 16S rRNA sequences analysis in acid whey, which was the starter culture for traditional dairy fan making. Twenty samples of acid whey were collected from Yunnan. Ninety-one phylotypes of LAB were isolated from these samples and identified by conventional method and 16S rRNA sequencing analysis. The results showed that all isolates belonged to three genera and nine different species. Moreover, Lactobacillus helveticus was the predominant population among these samples, mesophilic and thermophilic LAB could be considered as the major microbial composition of acid whey in the Yunnan Province of China. This paper systematically studied the LAB composition of acid whey, which may be valuable for designing starter culture for dairy fan production

【题目】Complete nucleotide sequence of plasmid plca36 isolated from Lactobacillus casei Zhang
【中文关键词】乳酸菌 质粒
【英文关键词】Lactobacillus casei zhang; toxin-antitoxin system; relBE; comparative analysis
【中文摘要】lactic acid bacteria
【英文摘要】The complete 36,487 bp sequence of plasmid plca36 from Lactobacillus casei Zhang was determined. Plca36 contains 44 predicted coding regions, and to 23 of them functions could be assigned. For the first time, we identified a relBE toxin-antitoxin (TA) locus in a Lactobacillus genus, perhaps indicating a potential role for plca36 in host survival under extreme nutritional stress. A region encoding a cluster of conjugation genes (tra) was also identified. The cluster showed high similarity and co-linearity with tra regions of pWCFS103 and pMRC01 from Lactobacillus plantarum and Lactococcus lactis, respectively. Comparative gene analysis revealed that plasmids from the genus Lactobacillus may have contributed to the environmental adaptation mainly by providing carbohydrate and amino acid transporters. In addition, two chromosome-encoded relBE systems in Lactobacillus johnsonii and Lactobacillus gasseri were identified. (C) 2008 Elsevier Inc. All rights reserved.

【题目】Identification of Lactobacillus from Koumiss by Conventional and Molecular Methods
【中文关键词】乳酸菌 降血脂
【英文关键词】lactobacilli; koumiss; identification; 16S rRNA sequencing analysis
【中文摘要】bacteria
【英文摘要】Lactobacilli are considered to be one of the most important potential probiotics in the dairy industry. Twelve strains of Lactobacillus were isolated from home-made koumiss samples, a traditionally fermented mare milk in China. The isolates were identified based on physiological and biochemical characteristics and analysis of 16S RNA sequences. They were proven to be Lactobacillus helveticus, Lactobacillus fermentum, Lactobacillus casei and Lactobacillus plantarum. The results demonstrated that both methods were essential to identify an isolate accurately.

【题目】Fermentation characteristics and transit tolerance of probiotic Lactobacillus casei Zhang in mare milk during storage
【中文关键词】乳酸菌 发酵乳
【英文关键词】Lactobacillus casei Zhang; Mare milk; Fermentation characteristics; Transit tolerance
【中文摘要】lactic acid bacteria fermentation
【英文摘要】The fermentation characteristics of Lactobacillus casei Zhang in mare milk and transit tolerance during refrigerated storage for 28 days were evaluated. There were no dramatic changes in the viable counts of L. casei Zhang in the fermented mare milk samples during storage at various inoculation levels. L. casei Zhang showed good tolerance to the simulated transit juice and maintained high viability in mare milk (above 10(8)cfu/g) during storage. Our results showed that L. casei Zhang had good probiotic properties, and suggest that mare milk could serve as the vehicle for the delivery of L. casei Zhang.

【题目】The acid tolerance association with expression of H+-ATPase in Lactobacillus casei
【中文关键词】乳酸菌 基因
【英文关键词】Acid tolerance; H+-ATPase; RT-PCR; Lactobacillus casei
【中文摘要】lactic acid bacteria
【英文摘要】Acid and bile salt tolerance are considered as important properties for lactic acid bacteria to act as probiotics. Moreover, H+-ATPase is acting for the production of ATP to the transmembrane proton motive force and can either generate ATP or generate a PMF using ATP produced by fermentative substrate-level phosphorylation. In this work, we isolated a potential probiotic organism from home-made koumiss and detected the expression of H+-ATPase in distinct acid conditions using the reverse transcription polymerase chain reaction method. The results show that Lactobacillus casei Zhang can be considered as potentially probiotic to some extent: and that the expression of H+-ATPase is associated with the acidity of the environment in L. casei.

【题目】Comparison of nutrition and microbiological compositions between two types of fermented milk from Tibet in China
【中文关键词】乳酸菌 理化成分 微生物组成
【英文关键词】Tibet; Yak milk; fermented milk; chemical composition; microbiological

【中文摘要】lactic acid bacteria
【英文摘要】Twenty-nine traditional fermented yak milk (kurut) and 15 traditional fermented Mongolian cow milk (FMCM) samples were collected from three regions of Tibet in China, and their chemical composition and microbiological properties were analyzed. Average levels of the major composition of kurut and FMCM, respectively, were as follows: total solid, 16.91 +/- 1.30 g/100 g and 12.65 +/- 1.14 g/100 g; fat, 6.83 +/- 1.18 g/100 g and 3.92 +/- 0.92 g/100 g; total protein, 4.93 +/- 0.36 g/100 g and 3.33 +/- 0.71 g/100 g; free amino acid, 8.57 +/- 3.22 mmol/l and 2.23 +/- 0.62 mmol/l; calcamin, 117.26 +/- 9.66 mg/100 g and 86.51 +/- 7.55 mg/100 g; and phosphorus, 109.28 +/- 7.97 mg/100 g and 78.86 +/- 6.99 mg/100 g. The average bacteria count of lactic acid bacteria in kurut and FMCM were 7.66 +/- 0.71 and 8.03 +/- 0.68 log colony-forming units (cfu)/ml, respectively. Moreover, the average yeast counts of these two samples were 6.48 +/- 0.81 and 5.92 +/- 0.52 log cfu/ml, respectively. The result showed that the major nutritional composition content of kurut was significantly higher than that of FMCM, which indicated that kurut can be considered an invaluable fermentation product for human being

【题目】Rapid identification of Lactic Acid Bacteria Isolated from Home-made Fermented Milk in Tibet
【中文关键词】乳酸菌 多态性
【英文关键词】identification; lactic acid bacteria; restriction fragment length polymorphism (RFLP); 16S rDNA sequence analysis
【中文摘要】lactic acid bacteria
【英文摘要】Fermented milk is a very delicious and nutritional food distributed in the international markets. Rapid preliminary identification of lactic acid bacteria to the species level is an important issue for the fermentation industry. One hundred seventy-one strains of lactic acid bacteria (LAB) were isolated from twenty-nine kurut samples and fifteen traditional fermented mongolian cattle milk (FMCM) samples in Tibet, China. All of the strains were isolated and divided into bacilli or cocci by phenotype, and then differentiated by restriction fragment length polymorphism (RFLP) analysis using a set of restriction enzymes, AluI, HaeIII, BsmaI, TspRI and HinfI. Restriction pattern analyses indicated that the lactobacilli could be clearly identified at the species level and the LAB cocci at the genera level by the five restriction enzymes. Further studies on 16S rDNA sequences of representative and undefined strains showed that the combination of RFLP analysis of polymerase chain reaction (PCR) for amplifying 16S rDNA and 16S rDNA sequence analysis is rapid, easy to perform, and effective for large-scale preliminary identification of LAB.

【题目】Molecular Cloning and Characterisation of Alpha Subunit of H+-ATPase in Lactobacillus casei Zhang
【中文关键词】乳酸菌 水解酶
【英文关键词】H+-ATPase; clone; sequence; Lactobacillus casei Zhang; phylogenic trees
【中文摘要】lactic acid bacteria
【英文摘要】The acid tolerance is an important property of Lactic acid bacteria as potential probiotics. H+-ATPase is considered a key gene in several bacteria with the ability of acid tolerance. We cloned and sequenced the full length cDNA of alpha subunit of H+-ATPase gene in Lactobacillus casei Zhang, which had been isolated from traditional home-made koumiss in Inner Mongolia of China. The results showed that the respective cDNA sequence is composed of 1530 nucleotides and codes a putative protein including 509

amino acids. In addition, we also reconstructed the phylogenic trees for H+-ATPase gene based on amino acids sequences of diverse strains of Lactic acid bacteria

【题目】Evaluation of potential probiotics properties of the screened Lactobacilli isolated from home-made koumiss in Mongolia
【中文关键词】乳酸菌 嗜酸乳杆菌
【英文关键词】koumiss; Lactobacillus; cholesterol removal; adhesiveness; probiotics
【中文摘要】lactic acid bacteria
【英文摘要】Among thirty Lactobacillus strains, which were isolated and identified from the home-made koumiss in Mongolia, Lactobacillus helveticus MG2-1 was screened out for the best acid tolerance in artificial gastric juice at pH 3.0 after incubating for 3 h with the survival rate 96.15 +/- 4.22%. Further in vitro assessment revealed MG2-1 showed high tolerance to the artificial gastrointestinal juice and bile salts. Moreover, other desired probiotic proper-ties, including the ability of sodium taurocholate deconjugation (with the amount of cholic acid liberated 2.95 +/- 0.11 mu M), cholesterol removal (cholesterol removal rate 51.74 +/- 0.04%) and adhesion to Caco-2 cells (the adhesive rate 1.51 +/- 0.11%), were also observed. The results highlighted the probiotic potential of MG2-1, which deserved further investigation in in vivo studies to elucidate its health benefits

【题目】Isolation and Identification of Dominant Microorganisms Involved in Naturally Fermented Goat Milk in Haixi Region of Qinghai, China
【中文关键词】乳酸菌 青海
【英文关键词】isolation; identification; lactic acid bacteria; traditional fermented goat milk; Qinghai
【中文摘要】lactic acid bacteria fermentation
【英文摘要】Based upon morphological, physiological and biochemical analysis, 33 strains of lactic acid bacteria were isolated and identified from 11 samples of traditional natural fermented goat milk collected from different individual households in Haixi region of Qinghai. The counts of lactic acid bacteria were 2.5 x 108 similar to 3.0 x 10(9) CFU/mL, while yeasts were 2.6 x 10(6)similar to 1.6 x 10(8) CFU/mL. Strains were identified as follows: 7 strains of Lactobacillus delbrueckii subsp. lactis, 4 strains of Lactobacillus delbrueckii subsp. bulgaricus, 3 strains of Lactobacillus acidophilus, I strain of Lactobacillus coryniformis subsp. coryniformis, 12 strains of Streptococcus thermophilus, I strain of Leuconostoc mesenteroides subsp. mesenteroides, 3 strains of Pediococcus acidilactici, and 2 strains of Aerococcus urinaeequi comb. nov.

【题目】Analysis of free amino acids in Chinese teas and flower of tea plant by high performance liquid chromatography combined with solid-phase extraction
【中文关键词】茶叶游离氨基酸;衍生HPLC-DAD;固相萃取
【英文关键词】Tea; Free amino acids; Derivatisation; HPLC-DAD; Solid-phase extraction
【中文摘要】应用O-phthaladehyde柱前衍生化结合固相萃取,本研究制定了高效地用于测定茶叶中游离氨基酸含量的高效液相色谱法。茶汤在进行衍生化之前,先通过C18预柱处理,结果显示在ZORBAX Eclipse XDB-C(18)柱分离效果得到了很大的改进。然后,应用这种方法,我们测定了中国的绿茶,红茶,乌龙茶和茶树花中的游离氨基酸的含量。结果表明,茶氨酸是茶叶中含量最丰富的一种氨基酸,与发酵茶相比,绿茶含有更高含量的游离氨基酸。然而,茶树花中的游离氨基酸的含量和组成与茶叶中完全不同。茶花中含有含量更高的游离氨基酸。在绿茶中,组氨酸是仅次于茶氨酸第二大类氨基酸。
【英文摘要】An effective liquid chromatographic method that involved precolumn derivatisation with o-phthaladehyde combined with solid-phase extraction has been developed for the determination of free amino acids in tea. Firstly, tea infusion was treated by C18 cartridge before derivatisation, resulting in great improvement of separation by Zorbax Eclipse XDB-C(18) column. Then, the contents of free amino acids in Chinese green, black, and Oolong teas and the flower of plant Camellia sinensis have been determined. The results showed that theanine was the most abundant amino acid in teas, and green tea contained much higher amounts of free amino acids than fermented ones. While the contents and composition of free amino acids in tea flower were quite different from those of teas. The tea flower contained much higher content of free amino acids. Furthermore, although theanine was the most abundant amino acid in tea flower as tea, histidine became the second one.

【题目】Expression of a harpin- encoding gene in rice confers durable nonspecific resistance to Magnaporthe grisea
【中文关键词】附着胞, 防卫反应基因,持久非小种专化抗性,hrf1基因, 稻瘟病菌
【英文关键词】appressorium, defence-related genes, durable nonspecific resistance,hrf1 gene,Magnaporthe grisea,rice

【中文摘要】通过基因工程研究获得持久的非小种专化抗性的品种是植物育种工作的最终目标。由于稻瘟病小种变异频繁,虽然人们经采用多种途径致力于这方面的研究,至今还是没有达到预期的研究目标。在本研究中,我们在水稻中表达了来自水稻白叶枯病菌编码蛋白类激发子harpin 的基因hrf1,获得了对稻瘟病菌多个小种非专化抗性的转基因水稻。这些转基因水稻在T1-T7代高抗长江中下游地区的主要稻瘟病菌小种。在转基因抗病水稻中,多种防卫反应基因诱导表达;侵染稻瘟病菌的重要结构—附着胞不能形成。这些结果表明,harpin 蛋白可能为作物产生广谱抗病性提供新的机会。已经获得广谱抗稻瘟病水稻经过转基因抗病水稻通过安全性评价后,可以作为抗病品种直接用于生产,也可以作为抗病种质资源改良其他品种的稻瘟病抗性。目前,正在用稻瘟病菌诱导表达启动子代替组成性表达启动子,获得的稻瘟病抗性转基因系将更加经济和符合生产应用需求。

【英文摘要】Engineering durable nonspecific resistance to phytopathogens is one of the ultimate goalsof plant breeding. However, most attempts to reach this goal fail as a result of rapid changesin pathogen populations and the sheer diversity of pathogen infection mechanisms. In thisstudy, we show that the expression of a harpin-encoding gene (hrf1), derived fromXanthomonas oryzaepv.oryzae,confers nonspecific resistance in rice to the blast fungusMagnaporthe grisea. Transgenic plants and their T1 – T7progenies were highly resistant to allmajorM. grisearaces in rice-growing areas along the Yangtze River, China. The expressionof defence-related genes was activated in resistant transgenic plants, and the formation ofmelanized appressoria, which is essential for foliar infection, was inhibited on plant leaves.These results suggest that harpins may offer new opportunities for generating broadspectrumdisease resistance in other crops.

【题目】Overexpression of a Harpin-encoding gene hrf1 in rice enhances drought tolerance

【中文关键词】Harpin;hrf1;抗旱性;脱落酸;转基因水稻

【英文关键词】Abscisic acid, drought tolerance, Harpin, hrf1, transgenic rice.

【中文摘要】Harpin蛋白作为激发子,能够植物的多种反应,如系统获得抗病性(system acquired resistance,SAR)、过敏反应(hypersensitive response,HR)、促进植物生长以及增强植物对蚜虫和干旱的抗性等。超表达Harpin编码基因增强了烟草、水稻、油菜和棉花等作物的抗病性。然而,至今仍未有内源表达Harpin编码基因增强植物抗非生物胁迫能力的报道。本研究证实,超表达Harpin编码基因hrf能激发水稻ABA信号通路,增强水稻植物抗旱性。超表达hrf1诱导水稻植株ABA浓度的升高,促进气孔关闭。转基因系的保水能力显著增强,脯氨酸和可溶性糖水平显著升高,抗氧化胁迫和清除活性氧的能力显著增强,四个干旱相关基因,OsLEA3-1、OsP5CS、Mn-SOD和NM_001074345在干旱条件下的表达水平比对照明显上升。这些结果证明,超表达hrf1赋予了转基因系对干旱的抗性,表明Harpin蛋白为农作物抗旱性改良提供了新的契机。

【英文摘要】Harpin proteins are well known as eliciters that induce multiple responses in plants, such as systemic acquired resistance, hypersensitive response, enhancement of growth, resistance to the green peach aphid, and tolerance to drought. Overexpression of Harpin-encoding genes enhances plant resistance to diseases in tobacco, rice,rape, and cotton; however, it is not yet known whether the expression of Harpin-encoding genes in vivo improves plant tolerance to abiotic stresses. The results of this study showed that overexpression of a Harpin-encodinggene hrf1 in rice increased drought tolerance through abscisic acid (ABA) signalling. hrf1-overexpression induces an increase in ABA content and promotes stomatal closure in rice. The hrf1 transgenic rice lines exhibited a significant increase in water retention ability, levels of free proline and soluble sugars, tolerance to oxidative stress, reactive oxygen species-scavenging ability, and expression levels of four stress-related genes, OsLEA3-1,OsP5CS, Mn-SOD, and NM_001074345, under drought stress. The study confirmed that hrf1 conferred enhanced tolerance to drought stress on transgenic crops. These results suggest that Harpins may offer new opportunities for generating drought resistance in other crops.

【题目】Systematic examination of various fabrication parameters for chitosan-tripolyphosphate nanoparticles as delivery of tea catechins
【中文关键词】壳聚糖,壳聚糖 - 三聚磷酸钠纳米颗粒;控制释放;封装;纳米粒子表面电荷的纳米粒子的大小,茶叶中的儿茶素
【英文关键词】chitosan; chitosan-tripolyphosphate nanoparticles; controlled release; encapsulation; nanoparticle surface charge; nanoparticle size; tea catechins
【中文摘要】本研究的目的在于制备壳聚糖(CS)-三聚磷酸钠(TPP)纳米颗粒作为茶叶儿茶素的输送载体。系统地研究了在制备CS-TPP纳米颗粒的过程中由聚阴离子引发的凝胶化过程。结果表明,CS-TPP纳米粒子的粒径和表面电荷可以通过改变制备条件得以控制和调节。 系统地研究了在制备负载有茶叶儿茶素的CS-TPP的纳米颗粒过程中,调制CS与茶叶儿茶素共混时间、CS分子质量、CS浓度、CS-TPP质量比、CS溶液的初始pH值、茶叶儿茶素初始浓度等对包封率和体外释放性能的影响。研究发现,茶叶儿茶素在CS-TPP纳米颗粒中的包封率从24%到53%之间。此外,FT-IR分析表明, 在制备负载有儿茶素的CS-TPP纳米颗粒子的过程中儿茶素和CS之间相互作用形成了共价键和氢键。更重要的是,儿茶素的体外释放曲线研究表明,使用CS-TPP纳米颗粒包封儿茶素能够实现儿茶素的控制释放。
【英文摘要】This work investigated the polyanion-initiated gelation process in fabricating chitosan-tripolyphosphate (CS-TPP) nanoparticles intended to be used as carriers for delivering tea catechins. The results demonstrated that the particle size and surface charge of CS-TPP nanoparticles could be controlled by fabrication conditions. For preparation of CS-TPP nanoparticles loaded with tea catechins, the effects of modulating conditions including contact time between CS and tea catechins, CS molecular mass, CS concentration, CS-TPP mass ratio, initial pH value of CS solution, and concentration of tea catechins on encapsulation efficiency and the release profile of tea catechins in vitro were examined systematically. The study found that the encapsulation efficiency of tea catechins in CS-TPP nanoparticles ranged from 24 to 53%. In addition, FT-IR analysis showed that the covalent bonding and hydrogen bonding between tea catechins and CS occurred during the formation of CS-TPP nanoparticles loaded with tea catechins. Furthermore, studies on the release profile of tea catechins in vitro demonstrated that the controlled release of tea catechins using CS-TPP nanoparticles was achievable.

【题目】TPC in the leaves of 116 sweet potato (Ipomoea batatas L.) varieties and Pushu 53 leaf extracts
【中文关键词】红薯叶多酚含量,抗氧化活性,DPPH,ABTS,FRAP;高效液相色谱法;生物多样性未充分利用的绿叶蔬菜,食品分析,食品成分
【英文关键词】Sweet potato leaf; Polyphenol content; Antioxidant activity; DPPH; ABTS; FRAP; HPLC; Biodiversity; Underutilized green leafy vegetable; Food analysis; Food composition
【中文摘要】本研究应用Folin-Ciocalteu方法测定了116种中国红薯叶提取物中的总多酚的含量(TPC)。Pushu 53号红薯叶中的总酚含量最高。制备得到Pushu 53号红薯叶的粗提物,进行分部萃取,得到氯仿,乙酸乙酯,正丁醇和水的萃取组分。测定了初提物和个分部萃取组分的总多酚含量,应用DPPH。 ABTS和FRAP法测定了其抗氧化活性,并且用高效液相色谱法(HPLC)和高效液相色谱-质谱联用技术分析鉴定了多酚类物质的组成。我们的研究结果表明,提取物表现出很强的抗氧化活性,其抗氧化活性与总多酚含量之间存在显著的相关性。此外,研究表明红薯叶中发挥抗氧化活性的主要的生物活性物质是多酚类化合物,尤其是其中的咖啡酰奎尼酸(CQA)的衍生物,如5-CQA,3,4-diCQA,3,5-diCQA,和4,5-diCQA 。他们的含量分别为0.41,3.41,4.09,和1.04%,占粗提物总多酚含量的79.6%。
【英文摘要】The total polyphenol contents (TPC) of leaf extracts from 116 varieties of sweet potato cultivated in China were determined by Folin-Ciocalteu method. In addition, the crude extract (CE) of Pushu 53 leaves, with relatively higher TPC and its

fractions of chloroform, ethyl acetate, n-butanol and water, were prepared and subjected to the determination of TPC, evaluation of antioxidant activities in vitro by assays of DPPH. ABTS and FRAP, and analysis of phenolic constituents by high performance liquid chromatography (HPLC) and HPLC-mass spectrometry. Our results show that the extracts demonstrated potential antioxidant activity, and that a satisfactory correlation between TPC and antioxidant activity was observed. In addition, the main bioactive compounds for the antioxidant activity of the extract were polyphenols, especially derivatives of caffeoylquinic acid (CQA), such as 5-CQA, 3,4-diCQA, 3,5-diCQA, and 4,5-diCQA. Their contents (8.95%) were 0.41, 3.41, 4.09, and 1.04%, respectively, accounting for 79.6% of TPC in CE (11.24%).

【题目】水稻稻瘟病菌诱导表达启动子OsQ16p的克隆与功能分析

【中文关键词】转基因水稻; 诱导型启动子; OsQ16p; GUS; 稻瘟病菌

【英文关键词】Transgenic rice; Inducible promoter; OsQ16p; GUS; Magnaporthe grisea

【中文摘要】qRT-PCR 分析表明, 日本晴OsQ16 基因受稻瘟病菌诱导表达。利用PCR 技术从日本晴基因组中克隆了该基因编码区5′端上游1 229 bp 的启动子序列, 命名为OsQ16p。用其取代pBI121 中gus 基因上游的CaMV35S 启动子, 构建重组表达载体pBIQ16p, 经农杆菌介导转化日本晴, 获得转基因植株。GUS 组织化学染色和qRT-PCR 分析表明: gus 基因在抗性愈伤组织和阳性转基因植株中均能表达; 转基因植株在接种稻瘟病菌后12 h, GUS表达量是处理前的2.7 倍;抗病相关信号分子水杨酸(salicylic acid, SA)和茉莉酸甲酯(methyl jasmonate, MeJA)喷施转基因植株叶面后12 h, GUS表达量分别为处理前的3.1 倍和3.5 倍。以上结果表明, OsQ16p 启动子具有启动活性, 并明显受稻瘟病菌、MeJA 和SA 诱导表达。

【英文摘要】The qRT-PCR analysis showed that, in Nipponbare (Oryza sativa L. ssp japonica), the expression of OsQ16 gene was induced by Magnaporthe grisea. The 1 299 bp-fragment of 5'-end of OsQ16 gene, named as OsQ16p, was amplified by PCR from Nipponbare. The plasmids pBIQ16p was constructed by replacing the CaMV35S promoter of pBI121 with the OsQ16p, and transformed into Nipponbare through Agrobacterium-mediated transformation. The analysis of GUS activity and qRT-PCR showed that gus gene could express in transgenic plants and calli. The expression of gus gene in transgenic plants was obviously enhanced by M. grisea. After treatment with the resistance-related signaling molecules SA and MeJA, the GUS activities in transgenicplants were increased by 3.1- and 3.5-fold, respectively. It suggested that M. grisea, SA, and MeJA were inductive factors of OsQ16p promoter.

【英文关键词】Induced promoter OsN1p;transgenic rice;gus gene;Magnaporthe grisea
【中文摘要】将OsN1 基因上游881 bp 启动子(OsN1p) 序列取代pBI121 中gus 基因上游的35S 启动子,构建植物表达载体pBIN1p,经农杆菌介导转化水稻品种‘日本晴爷,获得转基因植株。GUS 组织化学染色结果表明,由该启动子驱动的gus 基因能在愈伤组织中较低水平地表达;稻瘟病菌接种转基因植株24 h 后,GUS 活性为未接种前的4. 2 倍;5 mmol · L-1 水杨酸(SA)和0. 5 mmol · L-1 茉莉酸甲酯(MeJA)分别喷施转基因植株叶面6 h 后,GUS 活性分别为处理前的5. 9 和2. 4 倍。表明,OsN1p 启动子具有启动活性,同时明显具有受稻瘟病菌、SA 和MeJA 诱导表达的特性。
【英文摘要】The 881 bp putative promoter region of OsN1 gene was isolated from the genomic DNA of ‘ Nipponbare爷,named as OsN1p.OsN1p substituted for the 35S promoter in vector pBI121 to construct a new plant expression vector pBIN1p. Transgenic plants were obtained through Agrobacterium鄴mediated transformation. The analysis of GUS activity showed that the gus expressed low level in transgenic callus. GUS activity in transgenic plants was 4. 2 times higher than untreated control when they inoculated 24 h with Magnaporthe grisea;6 h after spraying with 5 mmol · L-1 salicylic acid(SA)or 0. 5 mmol · L-1 methyl jasmonate(MeJA),GUS activity in leaves of the transgenic plants was 5.9 and 2.4 times respectively higher than untreated control. It suggested that M. grisea,SA and MeJA were inductive factors for OsN1p promoter.

【题目】东北地区部分细毛羊羊毛品质检测分析
【中文关键词】羊毛; 品质; 检测
【英文关键词】wool; quality; test
【中文摘要】为了深入了解东北地区细毛羊的羊毛品质状况,更好地开展细毛羊品种选育与推广工作,试验进行了东北部分地区细毛羊毛样的长度、长度离散度、细度、细度离散度、净毛率、油脂含量、色度以及部分毛样的毛尖、毛中、毛根细度检测及羊毛品质分级。结果表明:所测毛样组成为细羊毛(71.97%)、半细羊毛(2.28%)、等外级(7.19%)和超细型(18.56%)4类。说明东北地区拥有符合细羊毛纺织标准的当地细毛羊品种和符合高档毛纺原料需求的超细型细毛羊种群,同时广泛分布着以毛肉兼用为主的细毛羊生产群。
【英文摘要】To understand the wool quality of fine wool sheep in northeastern China,and get better development of fine-wool sheep breeding and promotion,the wool samples were tested including length,length dispersion,fineness,fineness dispersion,clean wool yield,oil content and color,etc.were tested.The grading method of wool quality was also used,the results showed that the measured samples composed four types with fine wool(71.97%),half fine wool(2.28%),class outer(7.19%) and superfine wool(18.56%).

【题目】水稻中与水稻白叶枯病菌harpin编码基因同源序列hpfr的克隆与表达
【中文关键词】hrf1 基因; hpf r1 基因; 过敏反应; 烟草花叶病毒; 抗性
【英文关键词】hrf1 gene ; hpf r1 gene ; hypersensitive response ; tobacco mosaic virus ; resistance
【中文摘要】利用PCR 技术从粳稻R109 中克隆到与hrf1 同源的序列,命名为hpf r1 ,与hrf1 基因的同源性为92 %。推导的氨基酸同源性为7418 %。hpf r1 基因连接到含T7 启动子的高表达载体pET30a(+) 上构建重组质粒pHOSJ4 ,并转化宿主菌BL21 (DE3) 产生表达菌株BL21 (DE3) /pHOSJ4。hpf r1 与hrf1 基因在起始密码子ATG至225 个碱基处完全相同。将ATG至225 碱基的序列克隆,并构建表达载体pHOSJ42225 ,表达产物注射烟草能引起过敏反应。BL21 (DE3) /pHOSJ4 和BL21 (DE3) / pHOSJ42225 的蛋白抽提物诱导烟草抗烟草花叶病毒病均达极显著水平,浓度为60 μl/ ml 时防效最显著,分别为96135 %、9514 % ,与harpinXoo防效(9519 %) 相近。
【英文摘要】Hpf r1 , a homological sequence of hrf1 , was cloned from a japonica cultivar R109 by PCRanalysis. The homologies of hpf r1 compared with hrf1 are 92 % and inferred homologies of amino acid from hpf r1 compared with that from hrf1 are 7418 %. Hpf r1 gene was ligated into expression vector pET30a (+) which has T7 promoter to construct recombinant plasmid pHOSJ41 The function of this protein is similar to harpinXoo and causes HR in non2host plant . The seguences of hpf r1 and hrf1 are the same from the initiation code ATGto 225 bp site. The sequences from ATG to 225 bp site were cloned and constructed expression vector pHOSJ422251 The crude recombinant proteins also cause HR in Xanthi tobacco. Sprays of the proteins onto Xanthi tobacco induce the resistance of tobacco to TMV remarkably.The contrast analyses of LSD indicate that the protein extraction of BL21 (DE3) / pHOSJ4 and BL21 (DE3) / pHOSJ42225 can dramatically enhance tobacco resistance to TMV.

【题目】Phosphatidic acid mediates salt stress response by regulation of MPK6 in Arabidopsis thaliana
【中文关键词】拟南芥,促分裂原活化蛋白激酶6,磷脂酸, 磷脂酶D, 盐胁迫
【英文关键词】Arabidopsis thaliana, mitogen-activated protein kinase 6, phosphatidic acid, phospholipase D, salt stress
【中文摘要】磷脂酶D(PLD)催化磷脂产生磷脂酸和一个头部基团,参与各种环境胁迫反应,包括盐胁迫。本文中,我们确定了拟南芥磷脂酶Dα(PLDα)和磷脂酸(PA)在通过调节促分裂蛋白激酶(MAPK或MPK)介导盐胁迫信号中的作用。用电喷雾串联质谱法对NaCl诱导的磷脂酸含量和组成变化(ESI-MS／MS)进行了定量分析。一个特殊的磷脂酸分子种(a MAPK 16:0 – 18:2 PA)在NaCl处理后大量增加,亲和力分析和ELISA发现其与MPK6结合。磷脂酸对MPK6活性的作用通过凝胶分析得到证实。16:0 – 18:2磷脂酸激活拟南芥叶片提取液中MPK6免疫沉淀反应的活性。NaCl处理能够诱导野生型植株中MPK6的瞬时激活,但是在plda1突变体植株中未出现此现象。一个质膜Na+／H+逆向转运蛋白(SOS1)被鉴定为MPK6的下游靶标。MPK6磷酸化SOS1的羧端部分。MPK6对SOS1的磷酸化受NaCl处理促进,并直接被磷脂酸激活。这些结果表明磷脂酸在耦合MAPK级联反应参与盐胁迫反应中具有重要作用。
【英文摘要】Phospholipase D (PLD) hydrolyzes phospholipids to produce phosphatidic acid (PA) and a head group, and is involved in the response to various environmental stresses, including salinity. Here, we determined the roles of PLDa and PA in the mediation of salt (NaCl)-stress signaling through the regulation of mitogen-activated protein kinase (MAPK or MPK) inArabidopsis thaliana. NaCl-induced changes in the content and composition of PA were quantitatively profiled by electrospray ionization – tandem

mass spectrometry (ESI-MS／ MS). A specific PA species (a MAPK 16:0 – 18:2 PA), which was increased in abundance by exposure to NaCl, bound to a MPK6, according to filter binding and ELISA. The effect of PA on MPK6 activity was tested using in-gel analysis. 16:0 – 18:2 PA stimulated the activity of MPK6 immunoprecipitated from Arabidopsisleaf extracts. Treatment with NaCl induced a transient activation of MPK6 in wild-type plant, but the activation was abolished in the plda1 plant mutant. A plasma membrane Na+／H+ antiporter (SOS1) was identified as a down-stream target of MPK6. MPK6 phosphorylated the C-terminal fragment of SOS1. The MPK6 phosphorylation of SOS1 was stimulated by treatment with NaCl, as well as directly by PA. These results suggest that PA plays a critical role in coupling MAPK cascades in response to salt stress.

【题目】Rice Phospholipase Dα is involved in salt tolerance by the mediation of H+-ATPase activity and transcription
【中文关键词】磷脂酶Dα,盐胁迫,液泡膜H+-ATPase,质膜H+-ATPase,水稻
【英文关键词】Phospholipase Dα, Salt Tolerance,TP H+-ATPase,PM H+-ATPase, rice
【中文摘要】磷脂酶Dα(PLDα)参与植物对盐胁迫的响应,但其作用机制仍不清楚。我们研究了水稻PLDα(OsPLDα)的定位及在响应NaCl过程中对液泡膜(TP)和质膜(PM)H+-ATP酶活性及转录的影响。用100 mM NaCl处理水稻悬浮培养细胞,细胞提取物中PLDα的活性被瞬时激活,在处理1小时后增加了三倍。NaCl处理后,细胞质组分中OsPLDα蛋白数量略有下降,而在TP中该蛋白数量显著增加。我们利用RNA干扰(RNAi)的方法获得了OsPLDα1敲除突变体的细胞。NaCl诱导的液泡膜和质膜H+-ATP酶活性的增加在OsPLDα1-RNAi 细胞中显著受到抑制。OsPLDα1的敲除抑制了由NaCl诱导的OsVHA-A (编码液泡膜H+-ATP酶)、OSA2 (编码质膜H+-ATP酶)和OsNHX1 (编码液泡膜Na+/H+逆向转运蛋白)转录水平的增加。NaCl处理时,OsPLDα1-RNAi突变体中死亡细胞的数目比野生型中的多。这些结果表明,OsPLDα通过调节H +-ATP酶的活性和转录参与水稻耐盐性。
【英文摘要】Phospholipase Dα (PLDα) i s i nvolved in plant r esponse t o salt stress, but the m echanisms remain unclear.We investigated rice PLD α (OsPLD α) l ocalization and its effect on tonoplast (TP) and plasma m embrane(PM) H+-ATPase activity and transcription in response t o NaCl. When rice suspension-cultured cells weretreated with 100 mM NaCl, PLD α activity i n cell extracts showed a t ransient activation with a threefoldincrease at 1 h. The amount of OsPLD α protein decreased slightly in the cytosolic fractions, whereasit increased significantly i n t he TP after NaCl t reatment. OsPLDα1 knockdown cells were developedusing RNA interference (RNAi) m ethods. The increase in TP and PM H+-ATPase activity i nduced by NaClwas significantly i nhibited i n OsPLDα1-RNAi cells. Knockdown of OsPLDα1 prevented t he NaCl-inducedincrease in the t ranscript l evel of OsVHA-A(encodes TP H+-ATPase) and OSA2 (encodes PM H+-ATPase),as well as OsNHX1 (encodes TP Na+/H+antiporter). The cells died more in OsPLDα1-RNAi mutant thanin wild type when they were treated with NaCl. These results suggest that OsPLD α is involved in salttolerance i n r ice t hrough the mediation of H+-ATPase activity and transcription.

【题目】Quantitative dissection of lipid degradation in rice seeds during accelerated aging.
【中文关键词】加速老化,脂谱,磷脂酶D,脂氧合酶
【英文关键词】Accelerated aging, Lipid profiling, Phospholipase D, Lipoxygenase

【中文摘要】水稻种子储存过程中会因自然老化而降低种子活力和营养品质。在拟南芥中,磷脂酶D(PLD)作用造成的脂质降解是造成种子老化的原因,但单子叶植物水稻中该过程的机制尚不清楚。在本研究中,我们对水稻种子进行了脂谱分析,发现主要膜脂包括磷脂酰胆碱(PC),磷脂酰乙醇胺(PE)和磷脂酰甘油(PG)在加速老化过程中含量降低,而由PLD催化的水解产物磷脂酸(PA)的含量则增加。有趣的是,在水稻中由加速老化(2天)引起的PA增加的程度比在拟南芥中高得多(200% vs. 30%)。此外,PC和PE中含量降低的分子种在PA中含量有所增加,表明PA可能来自由PLD介导的脂质水解。OsPLDα1和α3是水稻种子中主要的PLD,其转录在种子老化过程中显着增加。老化处理诱导了OsPLDα蛋白的表达和活化。对三个脂氧合酶(LOXs)的分析发现,OsLOX2的转录水平在种子老化过程中显著升高。我们的研究结果显示水稻种子老化过程中多种磷脂出现降解,并讨论了种子老化过程中脂质降解与过氧化之间的关系

【英文摘要】Aging during storage negatively affects riceseed viability and nutrition quality. Lipid degradationcaused by phospholipase D (PLD) activity is known to beresponsible for seed deterioration in Arabidopsis , but themechanisms of this process in monocotyledonous plant riceremain unclear. In this study, we carried out lipid profilinganalysis for rice seeds, and found that the main membranelipids phosphatidylcholine (PC), phosphatidylethanolamine(PE) and phosphatidylglycerol (PG) declined duringaccelerated aging. In contrast, phosphatidic acid (PA), ahydrolysis product produced by PLD, increased. Interest-ingly, the degree of PA increase induced by acceleratedaging (at 2 days) was much higher in rice than that inArabidopsis (200% vs. 30%). Moreover, the decreasedmolecular species in PC and PE were well fit with thosethat were increased in PA, suggesting that PA may bederived from PLD-mediated lipid hydrolysis. OsPLD a 1and a 3 were the major PLD a s in rice seeds, and theirtranscription increased significantly during the agingprocess. The aging treatment induced OsPLD a proteinexpression and activation. Three lipoxygenases (LOXs)were analyzed, and OsLOX2 transcription was inducedsignificantly during seed aging. Our results reveal detailedinformation regarding lipid degradation during rice seedaging, and we go on to discuss the relationship betweenlipid degradation and peroxidation during seed aging.

【题目】转hrf1基因水稻对稻瘟病多小种非专化的稳定抗性

【中文关键词】转基因水稻;harpin编码基因;稻瘟病;非专化抗性;抗性机制

【英文关键词】Transgenic rice, harpin-encoding gene, rice blast, nonspecific resistance, mechanism of resistance

【中文摘要】以表达水稻白叶枯病菌(Xanthomonasoryzaepv.oryzae)编码harpin广谱抗性激发子的hrf1基因的转基因系为材料,在温室和田间病圃鉴定它们对稻瘟病菌的抗性,分析转基因水稻抗稻瘟病的作用机制。研究结果显示,转hrf1基因水稻对稻瘟病菌ZC3、ZD1和ZG1小种表现高抗,对ZB13表现中抗,表明hrf1基因在水稻中表达可以产生非小种专化抗性。在稻瘟病圃中对水稻稻瘟病抗性鉴定结果显示,转hrf1基因水稻在T1、T3、T5和T7代对稻瘟病菌都表现很好的抗性,表明转hrf1基因水稻对稻瘟病菌的抗性能稳定遗传。转hrf1基因抗病水稻中防卫反应基因OsPR1a、OsPR1b、PAL和 Chia4a以及正向调控水杨酸介导信号传导的NPR1基因的表达显著增强。转基因抗病水稻中硅含量显著提高。Harpin 编码基因在水稻中表达,可能通过激发水稻中防卫反应基因的表达,提高水稻中硅含量等,从而使水稻产生对稻瘟病菌的广谱抗性。

【英文摘要】The harpin-encoding gene (hrf1), derived from Xanthomonas oryza pv. Oryzae, was transferred into a rice variety R109. Expressing hrf1 in rice enhanced the resistance to ZC3, ZD1 and ZG1 races of M.grisea, and only a few lesions developed on leaves of transgenic plants infested with ZB13 races, showing that the expression of hrf1 confers non-specific resistance in rice to M. grisea. Transgenic plants and their T1, T3, T5 and T7 progenies were highly resistant to major M. grisea groups in rice-growing areas. The expression of several key defense genes (OsPR1a, OsPR1b, PAL, and Chia4a) and signal transduction gene NPR1 (non-expressor of PR geness) were enhanced in transgenic lines which were resistant to rice b last. Silicon content, which often correlates with resistance to M. grisea, was increased in transgenic lines. The results indicated that expressing harpin-encoding gene in rice exhibited stable non-specific resistance, suggesting that the expression of harpin-encoding genes may provide effective controls on rice blast and offer new hope for generating broad spectrum resistance in other crops.

【题目】人工诱导杂色鲍雌核发育受精细胞学观察
【中文关键词】杂色鲍;雌核发育;受精细胞学;紫外线辐射;细胞松弛素B
【英文关键词】Holiotis diversicolor; gynogenesis; cytology; UV-irradiation; cytochalasin B
【中文摘要】应用组织切片方法,比较观察了杂色鲍普通二倍体、人工诱导三倍体、人工诱导雌核发育单倍体和雌核发育二倍体在成熟分裂和第一次卵裂期间的细胞学变化,以探讨人工诱导杂色鲍雌核发育的细胞学机制。结果表明,精子经紫外线辐射进行遗传失活处理后,仍然能够进入卵子,并激动卵子发育,卵子能够正常完成两次减数分裂,与普通受精卵没有明显差别。精子入卵后形成精核,大多能够逐渐解凝、液化并膨大,最终形成形态正常的雄性原核,但在第一次卵裂早期退化成浓缩的染色质小体(DCB),并在胞质分裂时随机地分配到其中一个子细胞里的分裂沟附近。在人工诱导三倍体和雌核发育二倍体受精卵中,受精卵经细胞松弛素B处理后,染色单体在第二次成熟分裂期分离,但胞质分离受抑制,留在卵质中的两套染色体形成两个染色质团,并发育成两个雌性原核。
【英文摘要】To obtain useful information about the mechanism of the artificial induction of gynogenesis in Haliotis diversicolor,we observed the cytological images of diploid control group,triploid group,haploid gynogenetic group and diploid gynogenetic group during meiosis and first cleavage.After being incorporated into the egg cytoplasm,the UV-irradiated sperm nuclei could activate eggs to complete meiosis,and sperm nuclei discondensed gradually,liquefied and expanded.Most sperm nuclei eventually developed into the male pronuclei, just like the normal sperms, excpet that sperm nuclei in a few zygotes kept dense throughout the fertilization process. Dense chromosome body (DCB) was seen at the nuclear area during the prophase of first mitosis, and in the middle of spindle at metaphase of first mitosis. At completion of cytokinesis of first cleavae, the DCB was seen in the cytoplasm of one of the two blastmeres near the cleavage furrow. In the cytochalasin B-treated group, both sets of female chromosomes hold in cytoplasm for chromosomes segregated as in normal zygote but the cytoplasm division was inhibited, formed two chromatin bodies and eventually developed into two pronuclei.

【题目】不同单胞藻饵料培养九孔鲍早期稚贝的研究
【中文关键词】九孔鲍;稚贝;底栖硅藻;亚心形扁藻;生长;存活
【英文关键词】Haliotis diversicolor supertexta; post larva; benthic diatom; Platymonas subcordiformis.; growth; survival
【中文摘要】以单种培养的6种底栖硅藻和具有底栖习性的亚心形扁藻(Platymoras sp.)为饵料,培养九孔鲍(Haliotis diversicolor supertexta)受精后12 d的早期稚贝并观察其生长和存活,培养期为28 d,目的是筛选能维持早期稚贝高存活率和生长率的藻种。实验结果表明,培养稚贝成活率最高的3个藻种由大到小依次是爪哇曲壳藻亚缢变种(Achnanthes javanica var.)、流水双眉藻(Amphora fluninensis)和亚历山大菱形藻(Nitzschia alexandrina),使稚贝生长最快的3个藻种由大到小依次是流水双眉藻、爪哇曲壳藻亚缢变种和亚历山大菱形藻。研究结果揭示了适宜的底栖硅藻种类对鲍早期稚贝阶段生长和存活的重要性。个体小或者胞外产物量大的藻类很可能对九孔鲍早期稚贝的培养是有利的。
【英文摘要】Haliotis diversicolor supertexta was one of the most important economic mollusca in south China. Because of high motality of this specie in their postlarval phase, which almost destroyed its seedling breeding, it is an urge to study the postlarval feeding ecology for its culture. In this study, six species of benthic diatom and Platymonas sp. with deposit ing habitat w ere assayed to evaluate their food value for the post larvae of Haliotis diversicolor supertexta. Survival rate and growth of 12 day age post larvae were recorded continuously by rearing with the seven species alega for 28 d. The high survival rates of post larvae of Haliotis diversicolor supertexta were found in the treatment s of Achnanthes javani cavar. , Amphora fluninensis and Nitzschia alexandrina with the relative potency progressively weaker in order. On the other hand, post larvae of Haliotis diversicolor supertexta grew fast in the treatments of Amphora fluninensis , Achnanthes javanicavar. and Nitzschia al exandrina with the relative potency progressively weaker in order. The result s of present work suggest s that rearing with appropriate marine benthic diatom species be important to growth and survival of abalone post larvae. Algae with small size or high extracellular polymers production should be good to post larvae culture of Haliotis diversicolor supertexta.

【题目】沉默载体的构建及转OsDUF500基因水稻对白叶枯病的抗性
【中文关键词】OsDUF500;转基因水稻;白叶枯病;抗性
【英文关键词】OsDUF500 gene;transgenic rice;Xanthomonas oryzaepv.oryzae;resistance
【中文摘要】:以编码HarpinXoo 的hrf1 转基因水稻NJH12的cDNA 为模板,克隆到了DUF500 的保守功能区。序列分析表明,OsDUF500 是DUF500 家族成员,功能未知。构建OsDUF500 的沉默载体,用土壤根癌农杆菌介导的方法转化粳稻R109,用Hpt抗生素做抗性筛选,获得9个再生株系。经分子鉴定,8个为沉默株系(ABD-2~9)。与野生型相比,ABD株系株高变矮,叶片变短,出现白色空秕谷。白叶枯病抗性鉴定结果表明,OsDUF500 沉默株系对水稻白叶枯病的抗性存在差异,病斑长度比野生型明显缩短,病斑面积均在30%以下,株系ABD-3和ABD-5病斑面积分别为12.3%和15.7%,显示出较好的抗性。推测在稻瘟病抗性中上调表达基因OsDUF500 对水稻白叶枯病抗性起负调控作用。
【英文摘要】Conserved functional region of DUF500 was cloned by PCR from cDNA of expression HarpinXoo (hrf1)transgenic rice NJH12.OsDUF500 encodes an unknown function member of DUF500 family. Calli from mature embryos of rice cultivar R109 were transformed by Agrobacterium tumefacienss train EHA105/ABD::pVec8. There were eight OsDUF500 transgenic lines from nine

hygromycin resistant lines by PCR analysis. Compared with the wild type,the down-expressed lines ABD are characterized by reduced plant height,shortened leaf and white blighted grain.Disease assays of transgenic rice plants infected by Xanthomonasoryzae pv.oryzae (PXO99)indicated that different transgenic lines had different resistance to rice leaf blight.Lesion length of the down-expression lines reduced significantly and lesion area all bellowed 30%. Lesion areas of the ABD-3and ABD-5 were 12.3% and 15.7%,respectively.Thus,we predicted OsDUF500 gene,which was up-regulated in rice blast,maybe was a negative regulator on bacterial blight resistance.

【题目】水稻OsN1基因5`端启动子不同区域序列分析
【中文关键词】启动子;转基因水稻;GUS
【英文关键词】promoter; transgenic plant; GUS
【中文摘要】研究启动子有助于了解基因转录调控表达模式及其调控机制,对更好的控制外源基因在转基因植物中的表达具有重要意义。本研究将OsN1基因ATG(ATG中的A为+0)上游-1089bp、-881bp、-489bp和-245bp的启动子序列分别取代pBI121中的35S启动子,构建植物表达载体pBIN1.1p、pBIN0.9p、pBIN0.5p和pBI0.2p。将构建好的重组载体经农杆菌介导转化水稻日本晴,获得转基因植株。此外,本研究对启动子的表达特点和启动活性进行分析。结果表明,由启动子(-1089bp、-881bp和-489bp)驱动的gus基因能在愈伤组织中表达,启动子(-245bp)不能驱动gus基因在愈伤组织中表达,表明启动子OsN1p具有启动活性的最小启动序列为ATG上游的-489bp。启动子(-489bp)驱动的gus基因在转基因植株的根中表达,在根冠不表达。用5mM SA喷施转基因植株叶片,GUS定量分析表明转基因植株的GUS活性增高,启动子(-881bp)的GUS活性比启动子(-1089bp)活性高。由此表明,启动子OsN1p具有组织特异性表达和受SA诱导表达的特性。
【英文摘要】Study promoters helps to understand the mechanisms of gene expression and it is of great significance to control exogenous gene expression in transgenic plants. The fragments of -1089bp, -881bp, -489bp, -245bp putative promoter region of OsN1 gene was isolated from the genomic DNA of Nipponbare, were amplified using PCR, and then substituted for the 35S promoter upstream of gus gene in vector pBI121 to construct a new plant expression vector pBIN1.1p, pBIN0.9p, pBIN0.5p and pBI0.2p. Transgenic plants were obtained through Agrobacterium-mediated transformation. Analysis of GUS activity showed that the gus expressed in transgenic callus, it had been found that the minimal promoter was mapped at the region from -489bp. Promoter(-489bp) drived gus gene express in the root of transgenic plant but not in the root cap. After spraying with 5mM SA, GUS activity in leaves of the transgenic plants (-881bp) was higher than that of transgenic plants (-1089bp). It suggested that promoter had tissue-specific expression characteristics and SA was inductive factor for OsN1p promoter.

【题目】水稻OsSsr1基因的生物信息学分析、亚细胞定位及其表达模式
【中文关键词】水稻;OsSsr1;启动子;亚细胞定位;表达分析
【英文关键词】rice; OsSsr1; promoter; subcellular localization ; expression analysis
【中文摘要】实验室前期芯片数据显示,OsSsr1基因表达量上调。对其进行序列分析表明,OsSsr1的开放阅读框为2004 bp,编码一个由667个氨基酸组成并含有5个跨膜区的蛋白,该蛋白N端含有一个信号肽。其启动子序列包含TGACG-motif、ABRE、TCA-element、Box-W1、W box和Box S等多个与胁迫相关的顺式作用元件。GFP融合表达显示,OsSsr1蛋白定位于

细胞膜。RiceXPro database中数据分析表明,OsSsr1基因在水稻不同发育期的不同组织中均有表达,但在叶和根中的表达量最高,胚中的表达量最低。Real-Time PCR结果表明,OsSsr1表达水平受干旱、高温、高盐、低温、机械伤害、稻瘟病菌、MeJA和ABA的诱导上调。

【英文摘要】According to our previous survey, OsSsr1 gene was up-regulated. The sequence analysis showed that OsSsr1 consisted of an ORF with a length of 2004 bp, encoding a 667 amino acids protein containg five transmembrane regions, and also contained a signal peptide in the N-terminal domain. The promoter sequence contained several stress-related cis-acting elements, such as TGACG-motif, ABRE, TCA-element, Box-W1, W box, Box S etc. The expression of OsSsr1-GFP fusion protein shown that OsSsr1 protein mainly appeared in cell membrane. The analysis of expression data in RiceXPro database revealed that OsSsr1 was expressed in rice different tissues and different periods, but the highest expression level was in leaf and root, the lowest was in embryo. The Real-time PCR analysis indicated that OsSsr1 was up-regulated under kinds of environmental stimulus, including drought, drought, high temperature, high salt, low temperature, wound, Magnaporthe grisea, MeJA and ABA.

【题目】超表达OsSsr1基因增强烟草耐盐性

【中文关键词】OsSsr1;转基因烟草;盐胁迫;活性氧;耐盐性

【英文关键词】OsSsr1; Transgenic tobacco; Salt stress; Reactive oxygen species; Salt tolerance

【中文摘要】本研究从水稻品种R109中克隆了OsSsr1基因(GenBank Accession No. NM_001065574),并用土壤根癌杆菌介导的方法,把OsSsr1基因转入本氏烟(Nicotiana benthamiana)中,提高了转基因植株的耐盐性。生理指标测定结果表明:在盐胁迫下,转基因和野生型植株中的丙二醛(MDA)、脯氨酸的含量以及 过氧化物酶(POD)和超氧化物歧化酶(SOD)的活性都呈上升趋势,但转基因烟草中MDA含量升高速率明显低于野生型,而脯氨酸的含量以及POD、SOD活性的升高速率明显高于野生型烟草。因此,OsSsr1转基因烟草耐盐性的增强,可能是脯氨酸含量和活性氧清除能力的提高引起的。

【英文摘要】OsSsr1 gene (GenBank Accession No. NM_001065574), isolated from rice R109 by RT-PCR , was transferred into tobacco (Nicotiana benthamiana) by Agrobacterium tumefaciens, enhanced Salt Tolerance of transgenic tobacco. The results of physiological and biochemical indices showed that the contents of proline, MDA and POD activity increased with the salt treating time In the 5-week-old tobacco plants. But the MDA content in transgenic tobacco was lower than wild type tobacco. The accumulation of proline, SOD and POD activity were higher than wild type tobacco. Therefore, we speculate that the salt tolerance of transgenic tobacco lines is due to improving proline content, and increasing the metabolism of reactive oxygen species.

【题目】根癌农杆菌介导hrf1基因转化小麦增强赤霉病抗性

【中文关键词】农杆菌介导;转hrf1基因小麦;赤霉病抗性

【英文关键词】Agrobacterium-mediated transformation, hrf1 transgenic wheat, Scab resistance;

【中文摘要】将hrf1基因由根癌农杆菌(Agrobacterium tumefaciens)EHA105介导,采用剪去颖壳和直接注射小穗两种侵染方法,转入江苏省重要小麦品种扬麦158。经硫酸卡那霉素抗性筛选和PCR检测,获得转基因阳性株系599个,两种侵染方法的转化率分别为0.8%和1.5%,本方法不需要诱导愈伤组织,相对于传统的花粉管通道法也不需要侵染时去雄,操作简便易行。经抗性分析表明,T1代对小麦赤霉病防效为28.3%,其中高抗株系78个;这78个株系的T2代对赤霉病防效为59.7%,高抗株系

34个。结果表明,转hrf1基因小麦株系对小麦赤霉病有较好的抗病性。
【英文摘要】Wheat scab (Fusarium head blight, FHB) ,Caused Fusarium graminearum (Fusarium graminearum Schw.), is a worldwide wheat fungal diseases. The disease is not only lead to decline, but also can produce a variety of toxins, poisoning people and livestock, seriously affecting the quality and commercial value of wheat. With the continuous development of plant genetic transformation technology in recent years,pollen tube pathway, Agrobacterium tumefaciens, gene gun bombardment can be successfully used for wheat genetic transformation, which makes improveing wheat varieties by genetic technology is possible. hrp gene cluster encoding a particular gene product ,that is a unique nature harpins protein elicitor. Exogenous application of harpins can stimulate many useful phenotypes. In this study,we combination of Agrobacterium and the pollen tube firstly, used two infection methods of cutting hull and directing injection spike. In Agrobacterium EHA105-mediated, we first time harpins gene hrf1 into important wheat in Jiangsu Province in Yangmai 158.599 transgenic lines were positive detected by PCR analysis and Kanamycin Sulfate resistance selection. The transformation efficiency of two infection methods was 0.8% and 1.5%,respectively.This method didn`t require induct callus,compared with traditional pollen tube pathway method didn`t require emasculation.The analysis results showed that the control efficacy of T1 generation to F.graminearum was 28.3% and 78 strains were 0-class disease resistance. The control efficacy of T2 generation was 59.7% and 34 strains were 0-class disease resistance. These results suggested that hrf1 gene might offer new opportunities for disease resistance to F.graminearum

【题目】杂色鲍肌动蛋白启动子的克隆与序列分析
【中文关键词】杂色鲍; 肌动蛋白; 启动子; 序列特征
【英文关键词】H.diversicolor diversicolor; Actin; promoter; sequence character
【中文摘要】杂色鲍(H.diversicolor diversicolor)是我国华南地区重要的海水养殖对象,作为利用转基因技术改良杂色鲍品质研究工作的首要部分,作者利用PCR和染色体步移(Genome Walking)方法克隆了杂色鲍肌动蛋白基因编码区部分序列和启动子序列(GenBank登陆号:EU622901).所分离的肌动蛋白基因DNA序列片段全长为1 990 bp,与GenBank中彩虹鲍(Haliotis iris)肌动蛋白A1基因序列和肌动蛋白A1a基因序列有非常高的相似性(99%和96%).在基因编码区中间发现了一个内含子区,在编码区之前发现一个类启动子区,经过Promoter Prediction在线软件分析,发现了该启动子序列和转录起始位点,同时也发现了该启动子特有的启动元件两个标准的CAAT BOX和一个TATA BOX.这些实验结果表明所克隆的杂色鲍肌动蛋白和启动子序列符合实验的目的,并且这一实验的成功也为下一步利用所分离的启动子做杂色鲍转基因工作打下基础.
【英文摘要】H.diversicolor diversicolor(the small abalone) is the important aquaculture species in South China.As the primary part of the study in the transgenic small abalone,the sequence fragment of the Actin gene and its promoter was cloned and characterized by using the technique of PCR and Genome Walking(GenBank Accession No.EU622901).The length of the isolated sequence fragment of the small abalone Actin is 1990 bp,which has high similarity with the A1 gene and A1a gene(99% and 96%) of the Haliotis iris.A Promoter-like sequence and an intron sequence before the Actin gene coding region was conjectured by sequence analysis. Starting element s ,two CAAT BOXes and a TATA BOX ,have also been identified by using online software Promoter Prediction. All these experimental result s show that the sequence of the Actin gene we cloned f rom the small abalone is in according with the experiment purpose ,and these result s could be the foundation for transgenic operation.

【题目】转杂色鲍抗冻肽-Ⅲ基因表达载体pIRES2-EGFP－AFP -HdiActinP的构建
【中文关键词】杂色鲍; 抗冻肽; 启动子; 载体构建
【英文关键词】Haliotis diversicolor; antifreeze peptide; promoter; construction vector
【中文摘要】现代转基因技术是一种快速改良品种特性的有效方法.采用转基因技术提高我国南方重要贝类经济养殖品种——杂色鲍的耐低温特性是扩大其养殖范围的重要手段.以pIRES2 EGFP为基本载体,以合成并经过功能鉴定的抗冻肽(AFP)和杂色鲍肌动蛋白启动子(HdiActinP)为插入元件,首先用限制性内切酶BamHⅠ和 EcoRⅠ对基本载体pIRES2 EGFP和AFP Ⅲ进行双酶切,目的酶切产物被回收后再连接得到载体pIRES2 EGFP AFP.随后利用限制性内切酶SacⅠ和 EcoRⅠ对载体pIRES2 EGFP AFP和HdiActinP进行双酶切,目的酶切产物被回收后再连接最终得到杂色鲍转AFP Ⅲ的表达载体pIRES2 EGFP AFP HdiActinP,经过聚合酶链式反应和测序验证证明载体构建成功.
【英文摘要】Small abalone,Haliotis diversicolor is one of important maricultural species which distributes in South China.Modern transgenic technique is a rapid and direct way to improve characterization of aquaculture species.It enables us to breed a new line of small abalone which has a low temperature resistant feature so that it can be cultured in wider areas than now.In this study,pIRES2 EGFP was used as the basic vector,and the antifreeze peptide Ⅲ and HdiactinP were used as inserting elements.Firstly the vector pIRES2 EGFP and segment AFP were digested with the restriction endonuclease BamHⅠ and EcoRⅠ.The target components of the digested product were ligated consequently and the vector pIRES2 EGFP AFP was constructed.Secondly the vector pIRES2 EGFP AFP and segment HdiactinP were digested with restriction endonuclease SacⅠand EcoRⅠ.Then the target components of the digestion product were ligated.Finally the transgenic H.diversicolor antifreeze peptide expression vector pIRES2 EGFP AFP HdiActinP was constructed,which was confirmed by polymerase chain reaction (PCR) and sequencing.In summary,our result provided a potential basis for the consequent development of the transgenic H.diversicolor researches.

【题目】杂色鲍×盘鲍杂交及亲本自繁群体的AFLP分析
【中文关键词】杂色鲍; 盘鲍; 种间杂交; AFLP
【英文关键词】Haliotis diversicolor ; H. discus; interspecific hybridization; AFLP
【中文摘要】应用AFLP 技术研究了杂色鲍(SS) 、盘鲍(JJ) 及其正反交群体(SJ 和JS) 的遗传关系, 并比较了各群体内的遗传多样性. 3 对选择性引物共扩增出344 个位点. 双亲自繁群体SS 和JJ 的AFLP 图谱差异很大, 平均遗传距离达1. 425.因此, AFLP 图谱可以用于两物种及其杂交种的种质鉴别. 正反交群体SJ 与JS 的AFLP 图谱很接近于母本自繁群体,平均遗传距离分别为0. 111(SJ 与SS 之间) 和0. 134(JS 与JJ 之间) , 而与父本自繁群体则有较大区别, 平均遗传距离分别达1. 408(SJ 与JJ 之间) 和1. 394(JS 与SS 之间) . 将4 个群体分为SS/ SJ 和JS/ JJ 两组, 进行三水平的AMOVA 分析,结果显示: 84. 74%遗传变异来源于母本不同的两组之间(SS/ SJ 组和JS/ JJ 组之间) , 12. 66%变异存在于群体内个体之间, 正反交群体与母本之间的变异仅有2. 60%. 另一方面, 正反交F1 群体的多态性位点比例、Nei s 遗传多样度、香农多样性指数均低于母本自繁群体. 综合群体内多样性和群体间遗传关系分析结果, 杂色鲍与盘鲍正反交F1 的遗传物质组成有别于同时含有双亲基因组的实质性杂交, 而与母本有着高度的遗传同质性, 且遗传多样性水平略低于母本自繁群体.
【英文摘要】In this paper, genetic relationship iter-populations and genetic diversity intra-populations from reciprocal hybrid and pure crosses of Haliotis diversicolor (S) and H. discus discus(J) were investigated with AFLP.Totally,344 loci were detected with 3 pairs of selective primers. AFLP could be served as a tool to distinguish genetic material of Haliotis diversicolor, H. discus discus and their hybrid, since the AFLP band patterns of SS population and JJ population were quite different. The genetic distance between SS and JJ populations were calculated as 1. 425. The AFLP band patterns of hybrid F1 were similar to those of the female parent but quite different from those of t he male parent. The mean genetic distances between hybrid F1 and their female parent were 0. 111(between SJ and SS) and 0. 134 (between JS and JJ) , while those between hybrid F1 and their male parent w ere 1. 408 (between SJ and JJ) and 1. 394 (between JS and SS) respectively. The results of AMOVA analysis showed that 84. 74% of variance was between two groups (with different female parent) , 12. 66% of variance was among individuals in groups, and only 2. 60% of variance w as between hybrid

population and female population. On the other hand, all examined diversity indexes of the hybrid populations, including of the proportion of polymorphic loci, Nei's genetic diversity and Shannon diversity index , were lower than those o f the population from pure crossof female parent. Above all, the hybrid F1 were different from true hybrid composed of genome from both parent, but shared high genetic similarity with their female parent.

【题目】水稻侧根发育及分蘖相关基因OsO2g0198200的初步研究
【中文关键词】钙结合EF手型结构蛋白;侧根;分蘖;顶端发育
【英文关键词】Lateral root;Tiller;Calcium-binding EF hand-like protein; Apex development
【中文摘要】Os02g0198200基因编码1个钙结合EF手型蛋白,以农杆菌转化Os02g0198200基因到水稻R109中,成功获得转基因植株。转基因植株苗期根部无侧根,茎部分蘖;随着植株生长,部分冠根部生出侧根,茎部苗期的分蘖死亡。这表明Os02g0198200基因参与了侧根发育及分蘖的调控,进一步研究Os02g0198200基因的功能,对揭示侧生组织发生机理和相关基因的网络调控,促进农业、林业、果树、蔬菜和花卉等生产实践的发展有重大的意义。
【英文摘要】Comparing gene expression of harf1 transgenic rice with its Initial plant, we found a differentially expressed gene which is called Os02g0198200. Os02g0198200 encodes a Calcium-binding EF hand-like protein. We transformed this gene into rice R109, and obtained transgenic plants. In the seedling stage, the transgenic rice lines have no lateral roots, and have a large number of tillers, but when it grew up, lateral roots growth from some crown roots, and it almost lost all of its tillers. This indicates that,Os02g0198200 gene involved in genes regulation of rice ’s apex development. It is probably that it is associated with the regulation of plant hormone.

【题目】Determination of protein composition and host-derived proteins of Bombyx mori nucleopolyhedrovirus by two-dimensional electrophoresis and mass spectrometry
【中文关键词】家蚕
【英文关键词】Bombyx mori nucleopolyhedrovirus Occlusion-derived virus 2-dimensional electrophoresis Mass spectrometry
【中文摘要】家蚕
【英文摘要】Objective: The occlusion-derived form of baculovirus is speciallyadapted for primary infection of host midgut epithelialcells. The virion contains proteins essential for host-rangedetermination and initiation of infection. Determination ofprotein composition of the occlusion-derived virus (ODV)will help us to understand this virion ’ s infection mechanism.Methods: We obtained the ODV virion of Bombyx mori nucleopolyhedrovirus(BmNPV) by sucrose density gradientcentrifugation, and used SDS-PAGE, 2-dimensional electrophoresisand mass spectrometry to identify – for the firsttime – proteins present within or associated with the ODVvirion. Results: 20 proteins, including 16 major proteins ofthe virion encoded by BmNPV and 4 proteins of the silkworm,were identified with confidence. Conclusion: ThreeBmNPV proteins (orf40, P95 and protein tyrosine phosphatase),which had not been detected as components of ODVpreviously, were identified in this study. We propose that thehost-derived proteins may be important for the assemblyand maturation of the ODV capsid.

【题目】一株高产琼胶酶菌株MA-B22的分子鉴定与产酶条件优化
【中文关键词】琼胶酶; 酶活力; 培养基;
【英文关键词】agarase; enzyme activity; culture medium;
【中文摘要】琼胶酶在多糖降解应用中的作用日益重要,而从海洋微生物中筛选琼胶酶高产菌株成为一个重要途径。本研究从养殖的杂色鲍体内分离到一株高产琼胶酶的菌株MA-B22。该菌为革兰氏阴性菌,经16S rRNA序列鉴定表明,与Tamlana agarivorans sp.nov.具有99%同源性,因此初步定为Tamlana sp.。在2216E培养基中该菌株在培养时间60h,温度25℃,起始pH为6.0条件下产酶活性最高。基于上述培养条件,通过单因素和正交实验确定了培养基的最佳基本组成:氮源为牛肉膏(其最适浓度为6.0‰),碳源为琼脂(其最适浓度为2.5‰),配制培养基的人工海水的最适盐度为25。经培养条件优化后,该菌胞外琼胶酶活力可达1021.79U/mL,较优化前提高8.82倍。实验首次对Tamlana sp.属的琼胶酶活性进行确定并优化其产酶条件,为构建琼胶酶高产工程菌株提供了基础,并可能为今后鲍养殖提供潜在的益生菌。
【英文摘要】Agarase plays a key role in degrading many complex polysaccharides. The screening of agar-degrading bacteria from marine environment and organisms becomes an important means. A gram-negative bacteria strain,MA-B22 with high agarase activity was isolated from small abalone Haliotis diversicolor. By 16S rRNA analysis,this strain has 99% homology to Tamlana agarivorans sp. nov.,it was named Tamlana sp. in this report. Under 2216E medium, the optimal temperature, pH value and culture time are 25 °C,6.0

and 60h respectively. With one-factor-at-a-time method and orthogonal designed experiment, the optimal compositions of the ferment medium were confirmed. It contained 2. 5‰ agar, 6. 0‰ beef extract based on the salinity of 25. The highest enzyme activity of agarase was detected by DNS method at 1021. 79U /mL , which is 8. 82 times higher than before. MA-B22 demonstrated high-performance characteristics of enzyme production. This is the first report on the agar-degrading Tamlana sp. and optimal cultivation to enhance its enzyme activity. The results provide a bas is for constructing engineering bacterium for express ion agarase genes and potential probiotics of abalone aquaculture in the future.

【题目】Characterization of Bombyx mori nucleopolyhedrovirus orf74,a novel gene involved in virulence of virus
【中文关键词】家蚕病毒
【英文关键词】Bombyx mori nucleopolyhedrovirus
BmNPV orf74 Baculovirus DNA virus
【中文摘要】家蚕病毒
【英文摘要】orf74 of Bombyx mori nucleopolyhedrovirus(BmNPV) is a homologue of uncharacterized orf91 ofAutographa californica multicapsid NPV, predicted toencode a protein of 17.3 kDa. RT-PCR showed that thetranscription of orf74 was initiated at 12 h post-infectionstage. Expression assay indicated that ORF74 localized inthe nucleus of infected BmN cells. To study the function ofORF74, an orf74-knockout virus was constructed usingbacmid technology. Analysis of the production of buddedvirions and occlusion bodies, the formation of nucleocapsids,and the level of viral DNA revealed no significantdifference among the mutant, the control, and the orf74-repaired virus. Interestingly, bioassay showed that themedian lethal time of the orf74-knockout virus was 14.7 hlonger than the control virus, but the virus yield was similarto that of control virus. Thus, our data indicated that ORF74is most likely implicated in the virulence of BmNPV, and isnot essential for virus replication.

【题目】对构建的家蚕抗核型多角体病毒病近等基因系的评估
【中文关键词】家蚕; 家蚕核型多角体; 近等基因系; 随机多态性DNA
【英文关键词】silkworm
【中文摘要】为了从DNA、RNA和蛋白质水平上研究家蚕抗核型多角体病毒病的抗性基因紧密连锁的分子标记及相关的抗性基因和蛋白,选用抗性和感性的亲本,通过杂交和回交技术构建了近等基因系。为了从分子水平上评估这个模型的准确性,尤其是对构建的抗性近等基因系与感性的轮回亲本之间遗传背景的高度相似性的评估。本研究中我们对随机多态性DNA和双向电泳的一些结果进行了分析,比较了以前构建的近等基因系和轮回亲本之间在DNA 和蛋白质水平的差异,证明其相似性虽比理论值低,但这个模型对研究抗性仍然是有价值的,对研究家蚕其他的差异基因是有借鉴作用的。

【题目】Transcription and Expression of Major VP Gene of Bombyx Mori Parvo-like Virus
【中文关键词】家蚕
【英文关键词】Bombyx mori parvo-like virus, Major VP protein gene, Transcription, Expression, qPCR
【中文摘要】家蚕
【英文摘要】The Bombyx mori parvo-like virus (China Zhenjiang isolate), termed as BmDNV-Z, replicates only in host’s midgutcolumnar cells and causes flacherie disease. The viral genome is composed of two sets of different single-strandedlinear DNA molecules, Viral DNA 1(VD1) and Viral DNA 2(VD2). Here we cloned the major VP gene from theplasmid contained viral DNA fragments. The gene consists of 1500 nucleotides and the deduced protein has 499 aminoacid residues, with the predicted molecular weight of 54934.24Da, isoelectric point of 6.73. The coding sequence wasinserted into expression plasmid vector pET-30a and expressed in Escherichia coli BL21 (DE3) under the inducible promoter LacZ. The expressed product was detected by Western blotting with anti-His antibody. Interestingly, there arefour laddered band instead of one. We speculated that this virus may use leaky scanning mechanism to express fourproteins in one ORF. And we investigated the major VP gene transcriptional time phase in susceptible silkworm throughreal time quantitative PCR (qPCR). The result showed that the mRNA level of VP gene increased greatly after 24 hourspost inoculation.

【题目】Sedimentation in the Riparian Zone of the Three Gorges Reservoir, China
【中文关键词】三峡库区,消落带,侵蚀
【英文关键词】sedimentation; riparian zone; water level fluctuation; Three Gorges Reservoir
【中文摘要】三峡库区消落带泥沙沉积和侵蚀研究
【英文摘要】Annual water levels in the Three Gorges Reservoir (TGR) fluctuate by approx. 30 m, which can influence the riparian zone. Such changes include soil stabilization or restoration, re-vegetation, landscape management and environmental sanitation. However, there is a lack of information on the rates, magnitude and variability of sedimentation processes in this riparian zone. A field monitoring programme was conducted along the middle reach of the TGR during 2007-2009. Fifteen monitoring transects were instrumented with columnar sediment traps and erosion pins. Mean sediment deposition rates were 5.8 cm year-1 at the 145-150 m level and 2.3 cm year-1 at the 150-175 m level. The mean sediment deposition rate was approx. 12 cm year -1 at tributary inlets and shoals and a maximum of 18 cm year -1 occurred at the 145-150 m level. Sedimentation processes in riparian areas along the TGR will likely have an impact on the ecology and long-term operation of the TGR

【题目】Three-dimensional fluorescence spectral characterization of soil dissolved organic matters in the fluctuating water-level zone of Kai County, Three Gorges Reservoir
【中文关键词】土壤,不可溶性,有机碳
【英文关键词】water-level-fluctuation zone (WLFZ); soil; dissolved organic matter (DOM); three-dimensional fluorescence spectra
【中文摘要】土壤不可溶性有机碳研究
【英文摘要】Three-dimensional fluorescence spectroscopy was used to investigate the fluorescent properties of soil dissolved organic matter (DOM) in the water-level-fluctuation zone (WLFZ) of Kai County, Three Gorges Reservoir (TGR). Most of the soil DOM analyzed in this study was found to contain four fluorescence peaks. Peaks A and C represent humic-like fluorescence, whereas peaks B and D represent tryptophan-like fluorescence. Peaks E and F, which represent tyrosine-like fluorescence, only appeared in certain soils. Soil humus was the main source of DOM in soil, and higher concentration of soil DOM was found in the exposed soil than submerged soil. Compared to the peaks A and B, the fluorescence intensities of peaks C and D were strongly influenced by the fluctuating water level. Analysis of fluorescence intensities of different peaks in soil DOM showed that WLFZ soil was not contaminated significantly. Soil DOM contained at least two types of humic-like fluorescence groups and two types of protein-like fluorescence groups. The proportion of the content of peak A in soil organic matter was quite stable. The soil DOM in exposed soil had relatively high humification and aromaticity, and periodic submerging and exposure of soil had an impact on the humification of soil DOM.

【题目】三峡库区腹心地带消落带土壤氮磷含量调查研究
【中文关键词】三峡库区,消落区,土壤全氮,土壤全磷
【英文关键词】Three Gorges Reservoir area; water fluctuation zone; soil total nitrogen; soil total phosphorus
【中文摘要】消落区土壤中氮磷是上覆水体营养物质的潜在来源之一。在2008年底三峡蓄水至172 m之前,采样分析了小江(澎溪河)等库区5条典型支流淹没前的消落区土壤氮磷含量分布情况。在研究样区范围内,消落区土壤全氮均值为1.317±0.484 mg/g,变化范围在0.459-2.735 mg/g,而土壤全磷均值为0.676±0.282 mg/g,变化范围在0.314-2.799 mg/g。不同的土地利用方式消落区土壤全氮含量有明显差异,耕地消落区和园林地消落区的全氮值明显高于河滩地消落区。不同流域之间氮素差异也达到极显著水平,朱衣河和大宁河流域消落区土壤氮素要明显高于其他3条支流。但是,不同土地利用方式的消

落区之间全磷差异不显著,不同流域之间磷素差异也不显著。相比长江中下游一些浅水湖泊的底泥,库区消落区土壤中全氮和全磷含量水平已处于偏高状态,向上覆水体释放的风险较大。小江流域的丰乐镇和养鹿镇、朱衣河的胡家坝地区是研究范围内释放风险高的区域

【英文摘要】Soil nitrogen and phosphorus in water fluctuation zone are one of the potential sources and the nutrients for the upper layer water column.Nitrogen and phosphorus concentration among five representative tributary in Three Gorges Reservoir Area were analyzed before the impoundment of Three Gorges Reservoir to a water level of 172 m at the end of 2008.It was found that mean of soil total nitrogen in study area was 1.317±0.484 mg/g with variation range of 0.459~2.735 mg/g,while that of phosphorus was 0.676±0.282 mg/g with a range of 0.314~2.799 mg/g.Soil total nitrogen from different type of land-use showed significant difference.Soil nitrogen in agriculture farmland and fruit gardens was remarkably higher than those in riverbank and flood plains.Difference of soil nitrogen was also observed among different tributaries,the soil nitrogen in Zhuyi Basin and Daning Basin was obviously higher than in the other basins.However,the soil phosphorus among various types of land-use in the study area as well as different basins showed no significant difference.Compared with some shallow lakes in the downstream plain of the Yangtze basin,soil total nitrogen and total phosphorus were high relatively,and had a potential risk of releasing to the upper layer water column.Fengle town and Yanglu town in Xiaojiang River and Hujiaba town in Zhuyi River were the highest risk to release nitrogen and phosphorus in study areas.

【题目】Tillage Pedogenesis of Purple Soils in Southwestern China
【中文关键词】耕作,西南地区,成土作用
【英文关键词】Tillage impact; pedogenesis; purple soil; micromorphology; southwestern China
【中文摘要】中国西南部耕作成土作用研究
【英文摘要】Land cultivation and tillage process, and their consequent impacts on soil erosion, have been criticized as the main cause of degradation of land or soil quality. However, purple soils, classified as Regosols in FAO Taxonomy or Entisols in USDA Taxonomy, are formed from purple rocks of the Trias-Cretaceous system, have been developed or at least accelerated the development due to continual tillage operation, especially digging and ridging. The present study took micromorphological investigation on the sedimentary rocks and the soils under different operations of tillage. Results show that the purple rock of Feixiangguan Formation of the Trias system (T1f) is the easiest to physical weathering and the most fertile soil material enriched in nutrients, and it has been, therefore, mostly cultivated and intensively tilled around the year. It has the fastest soil formation rate. Soil formation rate in the cropland with conventional tillage is higher than that in the forestland and the grassland. It implies that the artificial brokenness and tillage disturbance play a great role in physical weathering and initiating soil formation processes.

【题目】岷江上游土壤侵蚀与土地利用的耦合关系研究
【中文关键词】土壤侵蚀; 土地利用; GIS; 耦合关系; 岷江上游; 土壤侵蚀强度指数
【英文关键词】soil erosion; land use; GIS; coupling relationship; upper reache of Minjiang River; soil erosion intensity index;
【中文摘要】利用岷江上游地区2005年土地利用数据和土壤侵蚀数据,在GIS技术支持下,研究了该地区土壤侵蚀强度与土地利用类型之间的耦合关系。结果表明,土壤侵蚀与土地利用具有很大的关系,土地利用直接影响着土壤侵蚀强度及空间分布。岷江上游土地利用以林地和草地为主,裸岩和建设用地侵蚀面积仅占0.11%。不同土地利用方式下的土壤侵蚀强度指数不同,依次为:旱地(低盖度草地(其他林地(中盖度草地(水域(高盖度草地(建设用地(疏林地(灌木林地(有林地(水田(裸岩。土壤侵蚀以微度水蚀为主,占35.43%,主要发生在有林地和灌木林地,分别占研究区总面积14.24%和11.70%;轻度及中强度水蚀则多发生在中盖度草地;随着土壤侵蚀强度增加,旱地侵蚀面积逐渐增大,且远远大于水田;冻融侵蚀占研究区总面积26.96%,多分布在中盖度草地,为20.89%。因此,合理土地利用方式的选择,土地利用格局的优化,对于减轻水土流失,控制土壤侵蚀,提高土地利用效益至关重要,也对促进该流域社会经济发展具有重要意义。
【英文摘要】Coupling relationship between soil erosion intensity and land use types in the upper reaches of Minjiang River was studied by using the data of land use and soil erosion in 2005 with the support of GIS technology.Close relationship was found between soil erosion and land use,and the soil erosion intensity and spatial distribution were directly influenced by land use.Forests and grassland were the main land use types,bare rock and construction land area accounted for only 0.11%.Different land use patterns had different soil erosion intensity indices,and in the order of dry land>grass land with low coverage >other forest land>moderate coverage grass>water area>high coverage grass>construction land>open forest land>shrub land> forest land>paddy field>bare rock.Slight water erosion was the main type of soil erosion,accounting for 35.43%,and mainly occurring in forest land and shrub land,accounting for 14.24% and 11.70% of the study area respectively.Low and moderate intensive water erosion occurred in the grass land with moderate coverage.With the increase of the soil erosion intensity,erosion area of dry land gradually increased,and far greater than paddy fields.Frozen erosion accounted for 26.96% and mainly occurred in the grass land with moderate coverage,accounting for 20.89%.Therefore,reasonable land use type and optimized land-use pattern are essential for the control of soil erosion,protection of land resources and improvement land use efficiency,as well as for the promotion of socio-economic development of the basin.

【题目】Phosphorus fractions and soil release in alternately waterlogged and drained environments at the water-fluctuation-zone of the Three Gorges Reservoir
【中文关键词】三峡库区,消落带
【英文关键词】Three Gorges Reservoir; water-fluctuation-zone; P fractions; phosphorus release
【中文摘要】三峡库区消落带相关研究
【英文摘要】The Water-Fluctuation-Zone (WFZ) of the Three Gorges Reservoir (TGR) has a special combination of aquatic and terrestrial ecological systems that are exposed to human activity. In this work, three kinds of soil were sampled along the Yangzi River in the TGR-WFZ. Our study focused on phosphorus (P) sorption characteristics and the change in inorganic P fractions for soils in alternately waterlogged and drained environments in the TGR-WFZ. Experiments were carried out to assess P sorption capacities and their relation to chemical properties in different soils. Concentration changes for different P fractions (e.g. Ca-2-P, Ca-8-P, Al-P, Fe-P, O-P and Ca-10-P) in soils were investigated to study P sorption and desorption characteristics in the soil and to assess effective factors in alternately waterlogged and drained environments. Results showed that, for different soil types, the maximum P-sorption capacities (Q(m)) had the following order: yellow earth > purple soil > fluvo-aquic soil. Under cyclic waterlogged and drained conditions, the Q. of waterlogged soil was higher than for drained soil. There was a decreasing trend for Olsen-P concentrations in soils after each draining process. The concentration of Ca-10-P in purple, yellow and fluvo-aquic soil increased from 31.3%, 40.0% and 42.6% (before inundating) to 38.7%, 48.9% and 51.5%, respectively, after three inundating-draining processes. The percent of stable fractions in soils increased after the inundating-draining process. Total P levels for all types of fractions decreased after every inundating-draining process. This suggests the existence of a P release trend from WFZ soils into the TGR water body, making P in soils a potential threat toward water eutrophication in the TGR.

【题目】三峡库区消落带几种两栖植物的适生性评价
【中文关键词】三峡库区; 消落带; 生态重建; 植物筛选;
【英文关键词】Three Gorges Reservoir; water-fluctuation-zone; restoration and reconstruction of ecosystems; adaptability of plants growth;
【中文摘要】根据三峡库区消落区的环境特征,两年间通过在库区消落区山地实验基地的种植及实地淹没试验,对几种备选用于生态修复的两栖植物进行适生性评价筛选研究。结果表明:狗牙根(Cynodon dactylon)、野地瓜藤(Ficus tikoua)、尼泊尔蓼(Polygonum nepalense)、水花生(Alternanthera philoxeroides)、百喜草(Paspalum Notatum)、香根草(Vetiveria zizanioides)、苏丹草(Sorghum sudanense)在100~150d的低水位出露期内均可完成生长、发育成熟过程,可作为消落区生态恢复的备选物种。其中,苏丹草可作为速生物种,能迅速恢复水位下降后消落区的植被覆盖率;复合群落在生长期间比单一种群提前5~10d完成对地表的覆盖,群落的稳定性、耐淤积性及抗干扰性较强,次年的萌发也更好,有利于构建稳定的生态系统;狗牙根、尼泊尔蓼和野地瓜藤根系生长良好,其中狗牙根在一个生长季内根系最长可达75cm,有利于消落区控制水土流失;在自然水淹最深为15m,淹没时间6d的情况下,复合群落组植物、尼泊尔蓼、野地瓜藤、狗牙根和苏丹草的植物均能短期耐水淹和淤泥,水花生则是在水淹较深处能够生长良好;180d水下1.0~1.5m的连续淹水实验结果表明,狗牙根和野地瓜藤的耐淹性较强,经过长达半年的淹水过程能够成活,并在次年自然萌发;同时5~25m的深部淹水实验表明,随着深度增加,狗牙根的落叶率逐步提高,在180d的淹没后能够成活,并在次年自然萌发,可作为构建消落区生态系统的两栖植物物种。

【英文摘要】Experiments were conducted for the purpose of choosing adaptable plants to restore and reconstruct the ecosystem in Water-Fluctuation-Zone(WFZ)of the Three Gorges Reservoir in Wenzhou,Chongqin.Nine species including Cynodon dactylon,Ficus tikoua,Polygonum nepalense,Alternanthera philoxeroides,Vetiveria zizanioides,Trifolium repens,Lolium perrnne,Paspalum Notatum and Sorghum sudanense were selected for in situ growth and submerging tests for 2 years according to the characteristics of local ecological conditions.Results indicated that C.dactylon,F.tikoua,P.nepalense,A.philoxeroides,P.notatum,V.zizanioides and S.sudanense could complete their growth during 100-120 days under low water level conditions in the WFZ of the Three Gorges Reservoir and were considered as the candidate species for ecosystem restoration.Among the candidate species,S.sudanense could quickly restore the vegetation cover ratio after flooding due to its rapid growth.The complex plant community was better than a single specie community for reconstructing a stable ecosystem,as the complex community could develop a complete vegetation cover during growth period 5-10 days ahead and could have a greater tolerance to siltation after flooding compared to the single specie community.C.dactylon,F.tikoua and P.nepalense developed a strong root system which benefited soil erosion control.The flooding experiment showed that the complex community plants,C.dactylon,F.tikoua,P.nepalense,and S.sudanense could survive and recover after being submerged under 15 m of water for 6 days,indicating their high tolerance for flooding and siltation.C.dactylon and F.tikoua survived under 1.0-1.5m of water during the 180 day submerging experiment and matured under non-flooding conditions the following year.The ratio of shed leaves of C.dactylon increased with increase of water depth at the level from 5-25 m.Having survived for the 180 day submerged experiment and subsequent maturation under non-flooding conditions the following year,C.dactylon was considered a promising aquatic specie for re-vegetation in WFZ of the Three Gorges Reservoir.

【题目】Intensive tillage effects on wheat production on a steep hillslope in the Sichuan Basin, China

【中文关键词】深耕,陡坡耕地,小麦

【英文关键词】Soil erosion; intensive tillage; crop production

【中文摘要】深耕对陡坡耕地小麦产量影响研究

【英文摘要】Two treatments (5- and 15-tillage operations) were conducted to assess intensive tillage effects on wheat production in the Sichuan Basin, China. After intensive tillage, wheat grain yields were 55% and 41% in areas of soil loss lower than those in areas of soil accumulation by 5- and 15-tillage operations, respectively. The redistribution pattern in soil depth affected wheat production with a logarithmic correlation between them, resulting in wheat aboveground biomass and grain yield increased along the downslope transect. A much larger decline in production with loss of soil depth than the increase in production with increase in depth was found. Therefore, fields subject to these patterns of soil redistribution could be expected to be subject to decline in average yield. The variations suggest that over time crop production reduction would gradually become serious in areas of soil loss by tillage.

【中文摘要】为更好地理解侵蚀土壤质量变化,该文利用137Cs技术探讨了川中丘陵区紫色土陡坡耕地土壤侵蚀对土壤生物学肥力的影响。结果表明,与无侵蚀的坡地相比,陡坡耕地土壤微生物量碳含量及碱性磷酸酶、蔗糖酶活性分别显著降低41%、44%、17%,土壤生物学肥力退化指数MFDI达-35%。陡坡耕地土壤蔗糖酶活性与137Cs浓度显著正相关(r=0.643,p=0.024),表明蔗糖酶活性随土壤侵蚀强度增大而降低。耕作侵蚀造成的陡坡耕地上坡土壤损失导致土壤微生物量碳含量、碱性磷酸酶、脲酶及蔗糖酶活性最低,而耕作侵蚀造成的陡坡耕地坡底土壤堆积导致这4个微生物特性最高,结果陡坡耕地这些微生物特性的空间变异分别增大2.8、0.8、1.4、4.5倍。紫色土陡坡耕地土壤生物学肥力退化与空间变异性增大在今后的土地管理中应引起关注。
【英文摘要】In order to better understand erosion-induced changes in soil quality, soil erosion impacts on soil microbial fertility of a purple soil with steep sloping farmland were explored in the Sichuan Basin of China by using 137Cs technique. Results showed that the contents of soil microbial carbon (MBC) and activities of soil alkaline phosphate and invertase significantly decreased by 41%, 44% and 17%, respectively, in these farmlands compared to a control slope, resulting in an obvious deterioration in soil microbial fertility with a 35% decrease in MFDI (soil microbial fertility degradation index). A significantly positive correlation was found between soil invertase activity and 137Cs inventory (r=0.643, p=0.024), suggesting soil invertase activity decreases with increasing soil erosion. Soil erosion by tillage resulted in the lowest soil MBC contents and enzyme activities in upslope positions, whereas soil accumulation by tillage created the highest soil MBC contents and enzyme activities in bottom positions. As a result of soil redistribution, the variations in soil MBC, alkaline phosphate, urease and invertase increased by 2.8, 0.8, 1.4 and 4.5 times, respectively, in these farmlands than those in the control slope. Land management strategies should involve combating the deterioration and increased spatial variation in soil microbial fertility in purple soil with steep sloping farmland

【题目】Effect of soil erosion on soil properties and crop yields on slopes in the Sichuan Basin, China
【中文关键词】土壤侵蚀,产量,土壤性质
【英文关键词】(137)Cs inventory; linear slope; soil degradation; tillage erosion; water erosion
【中文摘要】土壤侵蚀对作物产量和土壤特性影响研究
【英文摘要】Roles of tillage erosion and water erosion in the development of within-field spatial variation of surface soil properties and soil degradation and their contributions to the reduction of crop yields were studied on three linear slopes in the Sichuan Basin, southwestern China. Tillage erosion was found to be the dominant erosion process at upper slope positions of each linear slope and on the whole short slope (20 m). On the long slope (110 m) and medium slope (40 m), water erosion was the dominant erosion process. Soil organic matter and soil nutrients in the tillage layer were significantly related to slope length and (137)Cs inventories on the long slope; however, there was no significant correlation among them on the short slope, suggesting that water erosion lowered soil quality by transporting SOM and surface soil nutrients selectively from the upper to lower slope positions, while tillage erosion transported soil materials unselectively. On the medium slope, SOM, total N, and available N in the tillage layer were correlated with slope length and the other properties were distributed evenly on the slope, indicating that water erosion on this slope was still the dominant soil redistribution process. Similar patterns were found for the responses of grain yield, aboveground biomass, and harvest index for slopes. These results indicated that tillage erosion was a major cause for soil degradation and grain yield reduction on the linear slopes because it resulted in displacement of the tillage layer soil required for maintaining soil quality and plant growth.

【题目】Effects of tillage erosion on soil redistribution in a purple soil with steep sloping terraces
【中文关键词】耕作侵蚀,土壤再分布,西南地区
【英文关键词】Compensatory tillage; Tillage erosion model; Cs-137; Three Gorges Reservoir region; China
【中文摘要】耕作侵蚀对土壤再分布影响研究
【英文摘要】This study sought to contribute to the understanding of soil redistribution by tillage erosion, the extent and causes of soil erosion and the contribution of tillage erosion to total soil erosion on the sloping terraces. The total soil erosion derived from caesium-137 (137Cs), while tillage erosion was assessed using tillage erosion model within four sloping terraces. Tillage erosion rates were estimated at 77.34, 38.67, 28.84, 24.60 t ha-1 yr-1 for Terraces A, B, C, D, respectively, while the total soil erosion rates were 90.93, 52.80, 44.75 and 37.41 t ha-1 yr -1 on Terraces A, B, C and D, respectively. The contribution of tillage erosion to thetotal erosion were 85.05%, 73.23%, 64.43% and 65.75% on Terraces A, B, C, D, respectively, indicating that tillage erosion could be a dominant process of soil erosion. To prove the truth of soil erosion rates derived from tillage erosion model, high resolution digital elevation models (DEMs) were also used to assess tillage erosion rates on the one of sloping terraces. Mean soil flux rate due to tillage erosion which obtained by the DEMs was 25.02 t ha-1 yr-1 on Terrace C, suggesting that the tillage erosion models is a reliable method to investigate rates and patterns of tillage erosion on the sloping terraces. This study indicates that tillage erosion redistributes soil in amounts that dwarf the effect of water erosion on the steep sloping terraces. Therefore, the results of our study confirm that tillage erosion is one of the important soil redistribution processes on the sloping terraces.

【题目】紫色土坡耕地土壤物理性质空间变异对土壤侵蚀的响应
【中文关键词】水力侵蚀,耕作侵蚀,空间变异,物理特性
【英文关键词】water erosion, tillage erosion, spatial variability, physical properties
【中文摘要】为了研究不同坡度和坡长的耕地上土壤侵蚀对土壤物理性质空间变异的影响,通过地形测量、137Cs示踪、土壤物理性质分析等方法对川中丘陵紫色土区土壤物理性质对土壤侵蚀的响应进行了研究,结果表明:在中等坡度(16.60%~25.10%)的梯坡地上,耕作侵蚀处于主导地位,是导致耕层土壤物理性黏粒含量和容重在梯坡地上总体差异不大(CV〈6.3%),且与137Cs含量不相关的主要原因;在已退耕还林的陡梯坡地上(35.60%),水蚀占据主导地位,导致耕层土壤物理性黏粒含量和容重均与137Cs的含量显著相关。在长坡耕地上(10.10%),具有分选搬运能力的水力侵蚀占据主导地位,致使耕层土壤物理性黏粒含量与137Cs的含量具有显著的相关关系,而容重却与137Cs含量没有显著的相关关系。川中丘陵区坡耕地上,耕作侵蚀和水蚀共同作用于土层深度,使土层深度在坡顶、上坡最浅,在坡脚最深,顺坡向下逐渐增加。因此,在川中丘陵区不同坡长的坡耕地上,占主导地位的土壤侵蚀类型导致坡耕地上土壤物理性质出现相应的变化
【英文摘要】In order to study the effects of soil erosion on spatial variability of soil physical properties in farmlands with different lengths and slopes, the response of spatial variability of soil physical properties to soil erosion was explored in the Sichuan Basin of China, with topography measurement, 137Cs tracer method and analysis of soil physical properties. The results showed that tillage erosion, which was the dominant erosion process on the short slopes with the gradients of 16.6%~25.1%, played an important role in redistributing soil and resulted in no significant variation in soil physical properties (i.e., soil texture and bulk density) of tillage layer along the slope (CV<6.3%). Meanwhile, the soil physical properties of tillage layer had insignificant correlation with 137Cs contents due to tillage erosion. On the steep slope (35.6%), water erosion was the predominant erosion process due to reforestation, with evidence of 137Cs contents correlated closely with soil physical properties of tillage layer. Furthermore, on the long slope (10.1%), water erosion with separation and transport capacity was the predominant erosion process, which resulted in significant variation in soil physical properties with 137Cs contents, but there was no significant correlation between bulk density and 137Cs contents. Soil depth was affected both by tillage erosion and water erosion in slope farmlands in the Sichuan Basin of China. The erosion resulted in the fact

that the thinnest soil layer was present at the summit and upper slope positions, and there was the thickest soil layer at the foot of the slope. In general, soil depth increased towards the downslope direction. Therefore, due to the differences in the predominant soil erosion process the soil physical properties varied with slope lengths in the Sichuan Basin.

【题目】耕作导致的土壤再分布对土壤水分入渗的影响
【中文关键词】耕作侵蚀 耕层深度 土壤紧实度 入渗 坡耕地
【英文关键词】tillage erosion depth of tillage layer soil compaction infiltration sloping farmland
【中文摘要】利用梯级法、DEM和模型法研究三峡库区传统锄耕条件下的耕作侵蚀速率,同时采用双环法测定未进行耕作扰动区、耕作侵蚀区和堆积区土壤入渗特性的变异。结果表明,本研究区坡度为12.63%的线性坡的单次耕作侵蚀速率为25.02 t/hm2;各小区的土壤入渗速率和入渗时间均可以用Kostiakov公式(f=a · t-b)进行很好的拟合,然而耕作侵蚀区、耕作堆积区和未扰动区之间由于土壤紧实度和耕层深度变化而对土壤水分的入渗特性具有非常显著的影响。相对于耕作堆积区,耕作侵蚀区的土壤初始入渗速率、稳定入渗速率和累计入渗量均具显著减低,因而会显著地加强水蚀作用。与此同时,单纯耕作松土导致的土壤紧实度变小被证明能够显著增强土壤入渗能力,因而能够显著地增加入渗量,从而减少水蚀强度。
【英文摘要】Tillage erosion rates under conventional hoeing tillage on the linear slope were assessed using the digital elevation model(DEM),trapezoid-step method and tillage erosion model.And the field double-ring method was used to examine soil infiltration on a purple soil of the uncultivated plot,tillage erosive region and accumulative region.The results showed that mean soil flux rates due to tillage erosion which obtained by DEM and trapezoid-step method was 25.02 t/hm2 on the linear slope.Meanwhile,the process of infiltration in the uncultivated land,tillage erosive region and accumulative region could be well described with the equation of Kostiakov(f=a · t-b).Since soil compaction and depth of tillage layer has significant difference between the tillage erosive region and accumulative region,there were significant differences in the process of infiltration between two regions.Compared to the accumulative region,there is a significant reduction of initial infiltration rate,steady infiltration rate,and cumulative infiltration in the tillage erosive region,resulting in more serious water erosion.Meanwhile,tillage operation which decreases soil compaction will increase water infiltration and reduce water erosion.

【题目】Chemical and Strontium Isotopic Compositions of the Hanjiang Basin Rivers in China: Anthropogenic Impacts and Chemical Weathering
【中文关键词】汉江平原,同位素
【英文关键词】Hanjiang River; South-to-North water transfer project; Sr isotopic ratio; Chemical weathering; CO(2) consumption
【中文摘要】汉江平原化学和同位素组成特征
【英文摘要】The Hanjiang River, the largest tributaries of the Changjiang (Yangtze) River, is the water source area of the Middle Route of China's South-to-North Water Transfer Project. The chemical and strontium isotopic compositions of the river waters are determined with the main purpose of understanding the contribution of chemical weathering processes and anthropogenic inputs on river solutes, as well as the associated CO(2) consumption in the carbonate-dominated basin. The major ion compositions of the Hanjiang River waters are characterized by the dominance of Ca(2+) and HCO(3) (-), followed by Mg(2+) and SO(4) (2-). The increase in TDS and major anions (Cl(-), NO(3) (-), and SO(4) (2-)) concentrations from upstream to downstream is ascribed to both extensive influences from agriculture and domestic activities over the Hanjiang basin. The chemical and Sr isotopic analyses indicate that three major weathering sources (dolomite, limestone, and silicates) contribute to the total dissolved loads. The contributions of the different end-members to the dissolved load are calculated with the mass balance approach. The calculated results show that the dissolved load is dominated by carbonates weathering, the contribution of which accounts for about 79.4% for the Hanjiang River. The silicate weathering and anthropogenic contributions are approximately 12.3 and 6.87%, respectively. The total TDS fluxes from chemical weathering calculated for the water source area (the upper Hanjiang basin) and the whole Hanjiang basin are approximately 3.8 x 10(6) and 6.1 x 10(6) ton/year, respectively. The total chemical weathering (carbonate and silicate) rate for the Hanjiang basin is approximately 38.5 ton/km(2)/year or 18.6 mm/k year, which is higher than global mean values. The fluxes of CO(2) consumption by carbonate and silicate weathering are estimated to be 56.4 x 10(9) and 12.9 x 10(9) mol/year, respectively.

【题目】Effects of terracing and agroforestry on soil and water loss in hilly areas of the Sichuan Basin, China
【中文关键词】梯田,农林,四川盆地,土壤侵蚀
【英文关键词】agroforestry; sediment transport; runoff; sloping terrace; soil and water conservation
【中文摘要】梯田和农林措施对四川盆地坡耕地的影响研究
【英文摘要】Soil erosion in hilly areas of the Sichuan Basin is a serious concern over sustainable crop production and sound ecosystem. A 3-year experiment was conducted using the method of runoff plots to examine the effects of terracing and agroforestry in farmland systems on soil and water conservation of slope fields in the hilly areas in Jianyang County, Sichuan Province, Southwestern China. A power function (Y = aX(b)) can statistically describe the relationship between water runoff (Y) and rainfall (X). The regression equation for the treatment of sloping terraces with crops (Plot 2) is remarkably different from that for the treatment of sloping terraces with grasses and trees (Plot 1) and the conventional up-and down-slope crop system (Plot 3) regarding equation coefficients, while regression equations are similar between Plot 1 and Plot 3. Water runoff amount and runoff coefficient of slope fields increased by 21.5 similar to 41.0 % and 27.5 similar to 69.7 % respectively, compared to those of sloping terraces, suggesting that terracing notably reduced the water runoff in the field. In the case of sloping terraces, lower amount of water runoff was observed on sloping terraces with crops than on sloping terraces with grasses and trees. Sediment yields on the slope fields in the normal year of rainfall distribution were notably higher (34.41 similar to 331.67 % and 37.06 similar to 403.44 % for Plot 1 and Plot 2, respectively) than those on sloping terraces, implying that terracing also plays a significant role in the reduction in soil erosion. It is suggested that terracing with crops is significantly effective for soil and water conservation in cultivated farmland, while the conventional practice of up-and down-slope cultivation creates high rates of water runoff and soil sediment transport. Terracing with grasses and fruit trees shows a less reduction in

water runoff than terracing with crops, which was observed in the 3-year experiments.

【题目】An investigation of soil translocation and erosion by conservation hoeing tillage on steep lands using a magnetic tracer
【中文关键词】磁性示踪剂,犁耕侵蚀,四川
【英文关键词】Tillage erosion; Tillage translocation; Conservation tillage; Hoeing tillage; Magnetic tracer
【中文摘要】利用磁性示踪剂研究犁耕侵蚀
【英文摘要】The mechanism of tillage erosion has been increasingly recognized for nearly two decades, irrespective of mechanized or non-mechanized agriculture areas. Yet, control measures on tillage erosion were relatively less studied. A type of conservation tillage approach, referred to as "non-overturning hoeing tillage" was studied in comparison with conventional tillage in hilly areas of Chongqing, near the Yangtse Gorges reservoir areas, southwestern China. The magnetic tracer was used to label experimental plots of soil to measure soil translocation in the tillage direction. A comparison experiment between conventional and conservation tillage was conducted on a series of hillslopes with slope gradients ranging from 0.08 to 0.65 m m(-1), with paired plots at neighboring sites on the same hillslope. Mean soil displacement in the downslope direction by conservation tillage, being 0.11 m was much shorter than that by conventional tillage with 0.33 m. Tillage transport coefficients were 17 and 35 kg m(-1) tillage pass(-1) when conservation tillage was conducted, and 37 and 118 kg m(-1) tillage pass(-1) under conventional tillage, respectively, for k(3) and k(4). Tillage erosion rates by conservation tillage, estimated at 28 Mg ha(-1) year(-1) significantly decreased with a reduction of 63%, when compared to those by conventional tillage estimated at 78 Mg ha(-1) year(-1). The magnetic tracer method is an efficient and effective one for measuring tillage translocation, and therefore, estimating tillage erosion rate. It is suggested that non-overturning hoeing tillage largely diminishes soil downslope translocation and results in a significant reduction in tillage erosion. (C) 2009 Elsevier B.V. 【题目】Heating treatment schemes for enhancing chelant-assisted phytoextraction of heavy metals from contaminated soils
【中文关键词】土壤温度;植物修复;重金属;玉米;螯合剂
【英文关键词】Soil temperature; Phytoremediation; Heavy metals; Zea mays L.; Chelant
【中文摘要】近来研究表明,螯合剂强化植物提取方法常常需要高剂量的螯合剂应用到土壤中。本研究主要集中在研究减少螯合剂的使用提高植物提取效率的修复过程。利用盆栽试验研究提高土壤温度对玉米和绿豆茎吸收重金属的效果。在使用EDDS或EDTA后,土壤用2种高温处理(50 或80 ° C)3小时可以显著提高植物茎中重金属浓度。在螯合剂加入后热处理2天比热处理前或同时加入螯合剂然后热处理2天植物吸收更多的重金属。与用25 ° C螯合剂溶液相比,在螯合剂施用2天后用沸水灌溉或直接灌溉100 ° C螯合剂溶液也可以显著提高植物对重金属的提取效率。另外,与常温处理相比,一种新的利用地下聚氯乙烯管来提高土壤温度的方法可以提高螯合剂强化玉米提取铜的效率达10-14倍,和强化绿豆提取铜的效率达5倍。这种新的技术可能为金属污染土壤的植物修复提供一种有效的途径。
【英文摘要】Recent research has shown that chelant-assisted phytoextraction approaches often require a high dosage of chelant applied to soil. The present study focused on optimization of phytoremediation processes to increase the phytoextraction efficiency of metals at reduced chelant applications. Pot experiments were carried out to investigate the effects of increased soil temperature on shoot uptake of heavy metals by corn (Zea mays L.) and mung bean (Vigna radiat L. Wilczek) from heavy metal – contaminated soils. After

the application of S,S-ethylenediaminedisuccinic acid or ethylenediaminetetra-acetic acid, soils were exposed to high temperatures (50 or 80 ° C) for 3 h, which significantly increased the concentration of heavy metals in shoots. The heating treatment2 d after the chelant addition resulted in higher concentrations of metals compared with those treatments 2 d before or simultaneously with the chelant application. Irrigation with 100 ° C water 2 d after the chelant addition, or irrigation with 100 ° C chelant solutions directly, also resulted in significantly higher phytoextraction of metals in the two crops compared with 25 ° C chelant solutions. In addition, a novel application method to increase soil temperature using underground polyvinyl chloride tubes would increase the chelant-assisted extraction efficiency of Cu approximately 10- to 14-fold in corn and fivefold in mung bean compared with those non heating treatments. In a field experiment, increasing soil temperature 2 d after chelant addition also increased the shoot Cu uptake approximately fivefold compared with those non heating treatments. This new technique may represent a potential, engineering oriented approach for phytoremediation of metal-polluted soils.

【题目】不同饵料对杂色鲍幼鲍生长及存活的影响

【中文关键词】杂色鲍; 饵料; 生长; 存活率;

【英文关键词】Haliotis diversicolor; diets; growth; survival rate;

【中文摘要】选用南方鲍养殖业中常用的4种大型海藻细基江蓠、菊花江蓠、龙须菜和海带,研究在单一饵料、混合饵料、轮流饵料3种不同的投喂方式下共12个饵料处理组对杂色鲍(Haliotis diversicolor)幼鲍生长、存活的影响.实验进行40 d,结果表明:1)不同饵料处理组幼鲍均保持较高的存活率,其中细基江蓠组的存活率最低;2)不同饵料处理组的生长存在显著性差异(p<0.05).在单一饵料组中,海带组的特定生长率显著高于其他3种单一饵料组(p<0.05).在混合饵料组和轮流饵料组中,细基江蓠和菊花江蓠饵料组合的特定生长率明显低于其他的饵料组合(p<0.05).而相同的饵料组合在混合、轮流两种投喂方式下特定生长率无明显差异(p>0.05).另外常用的表征生长速度的指标如壳长日增长、日增重、壳长增长率、增重率均具有相似的趋势;3)海带组的日摄食率和体质量壳长比显著大于细基江蓠组(p<0.05),各饵料处理组的食物转化率无显著差异(p>0.05).实验结果表明:采用混合饵料和轮流饵料与单一饵料的投喂方式相比,可明显提高鲍的生长速度.

【英文摘要】The experiment lasted 40 days was conducted to assess the effects of twelve different diet treatments on the survival and growth of juvenile small abalone Haliotis diversicolor. The four marine microalgae which are commonly used in the south china abalone aquaculture industry were used in this research: Gracilaria tenuistipitata , G. lichenoides, G. lemaneiformis and salted Lamina2 ria japonica . Three feeding methods used in the experiment were single diet, mixed diets and rotaion diets. The results showed that the juvenile abalone under different diet treatments all maintained high survival rate, among them, the survival r ate of the juvenile abalone fed with G. tenuistipitata was lowest. Among the single diet groups, the specific growth r ate (SGR) of the juvenile abalone fed with salted L. j aponica was significantly higher than other s(p < 0. 05) . Among the mixed diet and rotation diet groups, the SGR of the juvenile abalone fed with a diet combination of G. tenuistipitata and G. lichenoides was significantly lower than the other groups (p< 0. 05) . However , there was not significant difference of the SGR(p> 0. 05) of the juvenile abalone fed with the same diet combination in different feeding methods. T he differences of some other growth index, for example, daily length growth(DLG) , daily weight growth (DWG) , length growth rate (LGR) and weight growth r ate(WGR) were also significant(p < 0. 05) under the twelve diet treatments. The daily feeding rate (DFR) and body weight to shell length ratio(BW/ SL) of the juvenile abalone fed with salted L. japonica were significantly higher than the group fed with G. tenuistipitata (p < 0. 05) . T he food conversion efficiency (FCE) did not have significant differences under the twelve diet treatments(p > 0. 05) . T he results indicated t hat mixed diet s and rotation diet s can improve growth rate of the juvenile abalone compared to single diet.

【题目】Bioinformatics of NS3 Gene and Inverted Terminal repeats (ITR) of Bombyx Mori Parvo-like Virus (China Zhenjiang Isolate)
【中文关键词】家蚕
【英文关键词】BmDNV-Z, NS3, Bioinformatics, ITR
【中文摘要】家蚕
【英文摘要】Bombyx mori Parvo-like virus (China Zhenjiang isolate) had termed as BmDNV-Z.NS3 is one of the three nonstructuralproteins that is responsible for the replication of virus DNA. To explore the nature of NS3 and determine how it differsfrom other NS3 sequence, we extracted amino acid sequences of NS3 from four sequenced DNV genomes, and carriedout sequence-based phylogenetic and structural analyses. In addition, to investigate the importance of the ITR as asignal for some viral and /or cellular factors further, we performed a computer analysis for prediction of secondarystructure. We found that Comparisons of protein sequence with those of the databases showed low homologies withNS-3 of JcDNV (30% identity), GmDNV (26% identity), MlDNV (26% identity). But zinc-finger motifs appear to beconserved greatly. Further the structural importance of the terminal sequence (CTS) common to VD1 and VD2 was alsopredicted by a DNA folding web.

【题目】利用流式细胞仪技术研究杂色鲍血细胞的吞噬率
【中文关键词】海洋生物学;流式细胞仪技术;杂色鲍;吞噬;胁迫
【英文关键词】Marine biology; Flow cytometry; Haliotis diversicolor; Phagocytosis; Intimidation
【中文摘要】利用流式细胞仪技术(FCM)检测了杂色鲍血细胞在体内和体外对不同含量荧光微球悬液的吞噬率(%)。证明体内注射法测定吞噬率的方法不可行。体外吞噬中,荧光微球为血细胞含量的68.2倍时吞噬率达98.43%±1.27%,随着荧光微球含量的降低血细胞吞噬率也随着降低。荧光微球为血细胞含量的6.82倍时吞噬率为63.45%±6.05%,以这一含量进行血细胞吞噬率的测定恰当。利用这一含量测定了正常鲍与经过低盐海水胁迫24h后鲍的血细胞吞噬率的变化,正常鲍的吞噬率为68.71%±10.05%,低盐海水胁迫后鲍的吞噬率为49.49%±10.18%,吞噬率出现了显著的下降($p<0.05$)。实验结果表明利用流式细胞仪技术检测杂色鲍血细胞吞噬活性是方便可靠的。
【英文摘要】Flow cytometry was used to test the phagocytizing activity of blood corpuscles in suspensions with different fluorescent microsphere concentrations in Haliotis diversicolor in vivo or in vitro. The results showed that induction of phagocytosis in vivo via injection was not feasible. During in vitro testing, when the microsphere concentration was 68.2 fold that of blood cells, the phagocytizing rate (PR) was 98.43%±1.27%. In addition, the PR of blood corpuscles decreased as the level of microspheres decreased. Specifically, the PR was reduced to 63.45%±6.05% if the proportion was 6.82 to 1, which is a suitable value for evaluation of the phagocytizing activity of blood corpuscles in Haliotis diversicolor. Under this proportion, we determined the PR of normal and low salinity seawater intimidated abalones. The PR of treated abalones was 49.49%±10.18%, which was significantly ($p<0.05$) lower than that of the normal abalones (68.71%±10.05%). These results showed that flow cytometry is a feasible and convenient method of evaluating the phagocytizing activity of blood corpuscles in abalone.

【题目】Promotion of growth and Cu accumulation of bio-energy crop (Zea mays) by bacteria: Implications for energy plant biomass production and phytoremediation
【中文关键词】金属抗性和植物促生细菌;能源植物;细菌种群;植物提取;玉米
【英文关键词】Metal-resistant and plant growth promoting bacteria; Energy plant; Bacterial communities; Phytoextraction; Maize
【中文摘要】对3株金属抗性和植物促生细菌(Burkholderia sp. GL12, Bacillus megaterium JL35 和 Sphingomonas sp. YM22)溶解碱式碳酸铜的能力以及对生长在高浓度铜污染土壤中的玉米(一种能源植物)的生长和铜的吸收效应进行了研究。同时对菌株对土壤中有效态铜和玉米根际土壤细菌种群的影响也进行了分析。研究表明,供试菌株可以溶解碱式碳酸铜并增加溶液中水溶性铜含量(20.5 to 227 mg L-1),与对照相比,接菌处理不仅显著提高了玉米根(48-83%)和地上部(33-86%)干重,而且提高了根(69-107%)和地上部(16-86%)铜含量。与对照相比,接菌处理也显著地提高了玉米根际土壤中水溶性铜含量(63-94%)。DGGE和基因序列分析表明,供试菌株可以在玉米根际土壤定殖并改变土壤细菌种群组成。这些结果表明,金属抗性和植物促生细菌可以用于高度铜污染土壤中能源植物生产和植物修复。
【英文摘要】Three metal-resistant and plant growth-promoting bacteria (Burkholderia sp. GL12, Bacillus megaterium JL35 and Sphingomonas sp. YM22) were evaluated for their potential to solubilize Cu2 (OH)2CO3 in solution culture and their plant growth promotion and Cu uptake in maize (Zea mays, an energy crop) grown in a natural highly Cu-contaminated soil. The impacts of the bacteria on the Cu availability and the bacterial community in rhizosphere soils of maize were also investigated. Inductively coupled-plasma optical emission spectrometer analysis showed variable amounts of water-soluble Cu (ranging from 20.5 to 227 mg L-1) released by the bacteria from Cu2 (OH)2CO3 in solution culture. Inoculation with the bacteria was found to significantly increase root (ranging from 48% to 83%) and above-ground tissue (ranging from 33% to 56%) dry weights of maize compared to the uninoculated controls. Increases in Cu contents of roots and above-ground tissues varied from 69% to 107% and from 16% to 86% in the bacterial-inoculated plants compared to the uninoculated controls, respectively. Inoculation with the bacteria was also found to significantly increase the water-extractive Cu concentrations (ranging from 63 to 94%) in the rhizosphere soils of the maize plants compared to the uninoculated controls in pot experiments. Denaturing gradient gel electrophoresis and sequence analyses showed that the bacteria could colonize the rhizosphere soils and significantly change the bacterial community compositions inthe rhizosphere soils. These results suggest that the metal-resistant and plant growth-promotingbacteria may be exploited for promoting the maize (energy crop) biomass production and Cu phytoremediation in a natural highly Cu-contaminated soil.

【题目】Characterization of Bombyx mori parvo-like virus non-structural protein NS1
【中文关键词】家蚕
【英文关键词】Bombyx mori parvo-like virus NS1
Helicase
【中文摘要】家蚕
【英文摘要】NS1 gene of Bombyx mori parvo-like virus(China Zhenjiang isolate, BmDNV-Z) codes a predicted316-amino acid protein, but its function remains unknown.Results of the current study showed that purified recombinant69His-NS1 protein possesses ATP binding, ATPase,DNA binding, and helicase activities. Only one proteinwas captured in infected Bombyx mori midgut cells againstNS1 target protein by employing co-immunoprecipitation,which was identified to be a viral protein by mass spectrometry.The NS1-interacting protein is encoded byBmDNV-Z ORF4 and its molecular is about 100 kD.Analysis of His pull-down confirmed that binding ofidentified viral protein to purified recombinant 69His-NS1protein in vitro. Taken together, our results indicated thatBmDNV-Z NS1 was a multifunctional protein, which maybe involved with virus replication.

【题目】Characterization of lead-resistant and ACC deaminase-producing endophytic bacteria and their potential in promoting lead accumulation of rape
【中文关键词】鸭跖草;金属抗性植物内生细菌;植物生长促进作用;ACC脱氨酶;铅;油菜;植物提取
【英文关键词】Commelina communis; Metal-resistant endophytic bacteria; Plant growth promotion;
ACC deaminase; Pb; Rape; Phytoextraction
【中文摘要】从生长在铅锌尾矿废弃地中的鸭跖草中分离到49株铅抗性细菌,其中筛选到7株具ACC脱氨酶活性菌株并对菌株的重金属抗性,产ACC脱氨酶、生长素、铁载体能力进行了分析。选择了2株高产ACC脱氨酶菌株研究了菌株在添加不同含量(0 and 100mg kg − 1 of Pb)铅的石英砂中促进油菜生长和铅吸收的能力。供试菌株对多种重金属具有抗性,不同的菌株具有不同的ACC脱氨酶活性,供试菌株中有6株产生长素,5株产铁载体。在添加铅(100 mg kg − 1)的砂培试验中,接菌处理油菜地上部和根的干重分别比对照增加39-71%和35-123%,油菜地上部铅的含量比对照增加58-62%。
【英文摘要】Forty-nine lead (Pb)-resistant endophytic bacteria were isolated from metal-tolerant Commelina communis plants grown on lead and zinc mine tailing, of which, seven 1-aminocyclopropane-1-carboxylate (ACC) deaminase-producing endophytic bacteria were initially obtained and characterized with respect to heavy metal resistance and production of ACC deaminase, indole-3-acetic acid (IAA) as well as siderophores. Two isolates (Q2BJ2 and Q2BG1) showing higher ACC deaminase activity were evaluated for promoting plant growth and Pb uptake of rape grown in quartz sand containing 0 and 100mg kg − 1 of Pb in pot experiments. The seven Pb-resistant and ACC deaminase-producing endophytic bacterial isolates were found to exhibit different multiple heavy metal resistance characteristics and to show different levels of ACC deaminase activity (ranging from 12.8 μM α-KB mg − 1 h − 1 to 121 μM α-KB mg − 1 h − 1). Among the seven isolates, six isolates produced indole acetic acid, whilst five isolates produced siderophores. In experiments involving rape plants grown in quartz sand containing 100 mg kg − 1 of Pb, inoculation with the isolates resulted in the increased dry weights of above-ground tissues (ranging from 39% to 71%) and roots (ranging from 35% to 123%)

compared to the uninoculated control. Increases in above-ground tissue Pb contents of rape cultivated in 100 mg kg − 1 of Pb-contaminated substrates varied from 58% to 62% in inoculated-rape plants compared to the uninoculated control.

【题目】Cloning and characterization of the densoviruses susceptible gene +nsd-2 in the silkworm, Bombyx mori
【中文关键词】家蚕
【英文关键词】BmDNV-Z, +nsd-2, RT-PCR, transporter protein, baculovirus expression
【中文摘要】家蚕
【英文摘要】Recently, a silkworm gene responsible for the susceptibility to BmDNV-2 (a parvo-like virus) has beendiscovered and designated as +nsd-2, which encodes a 12-pass transmembrane protein. BmDNV-Z,isolated in Zhenjiang of China, has a high homology with BmDNV-2 in serological characteristics andgenome structure. However, it is still uncertain whether +nsd-2 is also responsible for susceptibility toBmDNV-Z. In this study, we cloned +nsd-2 gene from Chinese silkworm strain (HuaBa35) that issusceptible to BmDNV-Z. DNA sequencing confirmed that +nsd-2 from HuaBa35 is the same with that fromNO.908 susceptible to BmDNV-2. RT-PCR analysis showed that the gene +nsd-2 was only expressed inlarval midgut and widely expressed in every instar of larva. Bioinformatic study showed that +nsd-2 is aputative amino acid transporter with three glycosylation sites and located on chromosome 11. Inaddition, +nsd-2 gene was also expressed by baculovirus expression system in Sf9 cell. Our analysis willcontribute to the detailed investigation on the infection mechanism of BmDNV.

【题目】Overexpression and characterization in Bacillus subtilis of a positionally non-specific lipase from Proteus vulgaris.
【中文关键词】普通变形杆菌脂肪酶;位置非特异性脂肪酶;外源过表达;诱导;枯草芽孢杆菌
【英文关键词】Proteus vulgaris lipase;Positionally nonspecific lipase;Heterologous overexpression;
Induction;Bacillus subtilis
【中文摘要】普通变形杆菌T6是本实验室筛选保存的另一个产脂肪酶的菌株,所产脂肪酶具有位置非特异性,对长链脂肪酸醋具有较好的亲和性。本实验将T6脂肪酶基因(pvL)与pET-DsbA载体连接,转化到大肠杆菌BL21(DE3)内表达,成功获得了重组脂肪酶,并对表达条件进行了优化。
【英文摘要】A Proteus vulgaris strain named T6 which produced lipase (PVL) with nonpositional specificity hadbeen isolated in our laboratory. To produce the lipase in large quantities, we cloned its gene, which had an opening reading frame of 864 base pairs and encoded a deduced 287-amino-acid protein. The PVL gene was inserted into the Escherichia coli expression vector pET-DsbA, and active lipase was expressed in E. coli BL21 cells. The secretive expression of PVL gene in Bacillus subtilis was examined. Three vectors, i.e., pMM1525 (xylose-inducible), pMMP43 (constitutive vector, derivative of pMM1525), and pHPQ (sucrose-inducible, constructed based on pHB201), were used to produce lipase in B. subtilis. Recombinant B. subtilis WB800 cells harboring the pHPQ-PVL plasmid could synthesize and secrete the PVL protein in high yield. The lipase activity reached 356.8 U/mL after induction with sucrose for 72 h in shakeflask culture, representing a 12-fold increase over the native lipase activity in P. vulgaris. The characteristics of the heterologously expressed lipase were identical to those of the native one.

【题目】Characterization of ACC deaminase-producing endophytic bacteria isolated from copper-tolerant plants and their potential in promoting the growth and copper accumulation of Brassica napus
【中文关键词】重金属抗性植物内生细菌;植物促生作用;ACC脱氨酶;油菜;植物提取
【英文关键词】Heavy metal-resistant-endophytic bacteria; Plant growth promotion; ACC deaminase; Rape; Phytoextraction
【中文摘要】从铜耐性植物中分离到100株铜抗性内生细菌,其中筛选到8株具ACC脱氨酶活性菌株并对菌株的重金属抗性,产ACC脱氨酶、生长素、铁载体以及溶磷能力进行了分析。利用高产ACC脱氨酶(213 to 370 μ M a-ketobutyrate mg-1 h-1)菌株Ralstonia sp. J1-22-2, Pantoea agglomerans Jp3-3, 和 Pseudomonas thivervalensis Y1-3-9 研究菌株在添加不同含量(0, 2.5, and 5 mg kg-1 of Cu)铜的石英砂中促进油菜生长和铜吸收的能力。供试菌株对多种重金属表现出抗性、具有不同的ACC脱氨酶活性和产生长素的能力,有些菌株产铁载体并能够溶解无机磷。盆栽试验表明,供试菌株(J1-22-2, Jp3-3, 和 Y1-3-9)能够提高油菜生物量。接菌处理油菜地上部铜含量比对照处理增加9-31%和3-4倍。接P. agglomerans Jp3-3处理油菜吸收的铜最大。这些结果表明,重金属抗性和植物促生内生细菌在植物生长和铜富集中起着重要的作用,该研究结果还可能为铜污染土壤内生细菌强化植物修复提供新的途径。
【英文摘要】One hundred Cu-resistant-endophytic bacteria were isolated from Cu-tolerant plants grown on Cu mine wasteland, of which, eight Cu-resistant and 1-aminocyclopropane-1-carboxylate (ACC) deaminase-producing endophytic bacteria were obtained based on the ACC deaminase activity of the bacteria and characterized with respect to metal resistance, production of ACC deaminase, indole-3-acetic acid (IAA) as well as siderophores and mineral phosphate solubilization. Ralstonia sp. J1-22-2, Pantoea agglomerans Jp3-3, and Pseudomonas thivervalensis Y1-3-9 with higher ACC deaminase activity (ranging from 213 to 370 μ M a-ketobutyrate mg-1 h-1) were evaluated for promoting plant growth and Cu uptake of rape grown in quartz sand containing 0, 2.5, and 5 mg kg-1 of Cu in pot experiments. The eight bacteria were found to exhibit different multiple heavy metal resistance characteristics, to show different levels of ACC deaminase activity and to produce indole acetic acid. Seven bacteria produced siderophores and solubilized inorganic phosphate. Pot experiments showed that inoculation with the strains (J1-22-2, Jp3-3, and Y1-3-9) was found to increase the biomass of rape. Increases in above-ground tissue Cu contents of rape cultivated in 2.5 and 5 mg kg-1 of Cu-contaminated substrates varied from 9% to 31% and from 3 to 4-fold respectively in inoculated-rape plants compared to the uninoculated control. The maximum Cu uptake of rape was observed after inoculation with P. agglomerans Jp3-3. The results show that metal-resistant and plant growth promoting endophytic bacteria play an important role in plant growth and Cu uptake which may provide a new endophytic bacterial-assisted phytoremediation of Cu-contaminated environment.

【题目】Proteomic analysis of nucleopolyhedrovirus infection resistance in silkworm,
【中文关键词】家蚕
【英文关键词】Silkworm
Nucleopolyhedrovirus
Near-isogenic line

Two-dimensional gel electrophoresis
Mass spectrometry
Hemolymph
Beta-N-acetylglucosaminidase 2
【中文摘要】家蚕
【英文摘要】Silkworm hemolymph is an important defense tissue to resist bacteria and virus infections. To study theresponse of silkworm hemolymph in the resistance of Bombyx mori L. nucleopolyhedrovirus (BmNPV), weconstructed a near-isogenic silkworm line with BmNPV resistance using highly resistant and highly susceptibleparental strains. In this paper, two-dimensional gel electrophoresis (2-DE) and Matrix-AssistedLaser Desorption/Ionization (MALDI)-mass spectrometry were employed to investigate the differences ofprotein patterns in the hemolymph of the highly resistant, highly susceptible and near-isogenic silkwormstrains after BmNPV was administrated to the larvae. A comparison between the proteomes of these threesilkworm strains led us to identify two differentially expressed proteins, beta-N-acetylglucosaminidase 2and aminoacylase. The expression levels of these proteins were higher in the BmNPV resistant strains.

【题目】Identification of Structural Proteins of Bombyx mori Parvo-like Virus (China Zhenjiang isolate)
【中文关键词】家蚕
【英文关键词】Bombyx mori　Parvo-like virus　Viral structural protein
【中文摘要】家蚕
【英文摘要】Objective: Bombyx mori parvo-like virus is a type of viruscontaining two single-stranded linear DNA molecules (VD1,VD2). In the present work, the structural proteins of B. moriparvo-like virus (China Zhenjiang isolate) (BmDNV-Z) wereidentified. Methods: The virions were purified by cesiumchloride density gradient centrifugation from the feces of B.mori larvae infected with BmDNV-Z and analyzed by SDSPAGE,Western blotting and MALDI-TOF/mass spectometry.Results: There were seven polypeptides of the virions,named P1 to P7, which reacted with the anti-virion serum. Inaddition, two polypeptides, P5 and P6, were recognized bythe antibody against a viral protein encoded by VD1-ORF3.Conclusion: The results showed that the viral polypeptideswere mainly composed of 7 proteins named P1 to P7. Westernblotting with anti-virion serum indicated that structuralproteins P5, P6 and P7 had molecular weights of around 50,55 and 130 kDa, respectively. They were the major immunogensof the virion. Among them, P5 and P6 were coded byVD1-ORF3 and P7 was encoded by VD2-ORF1. Taken together,three viral structural proteins encoded by VD1-ORF3 andVD2-ORF1 were identified in BmDNV-Z for the first time.

【题目】Genetic diversity and characterization of heavy metal-resistant-endophytic bacteria from two copper-tolerant plant species on copper mine wasteland
【中文关键词】重金属抗性植物内生细菌;多样性;特性;海州香薷;鸭趾草
【英文关键词】Heavy metal-resistant-endophytic bacteria; Diversity; Characteristics; Elsholtzia splendens; Commelina communis

【中文摘要】利用可培养和未培养技术对海州香薷和鸭趾草内生细菌的多样性进行了研究。基于16S rDNA 序列分析的系统发育分析表明,分离的铜抗性细菌属于3个主要的细菌门:厚壁菌门、放线菌门和变形菌门。Bacillus 和 Acinetobacter是主要种属。克隆文库和基因测序分析表明,植物根部的种群为Alpha-, Beta-, Gamma-变形菌门,厚壁菌门、放线菌门和拟杆菌门,其中Gamma-变形菌门是主要的细菌种群。对分离到的32株植物内生细菌的重金属抗性和植物促生特性进行了研究。在添加4 mg kg-1铜的蛭石培养试验中,接菌处理的根和地上部干重分别比对照增加132-155%和71-83%,油菜地上部铜含量比对照增加63-125%。

【英文摘要】The diversity of endophytic bacteria from the copper-tolerant species Elsholtzia splendens and Commelina communis was evaluated by using cultivation and cultivation-independent techniques. Phylogenetic analysis based on 16S rDNA sequences showed that the Cu-resistant isolates belonged to three major phylogenetic groups: Firmicutes, Actinobacteria and Proteobacteria. Bacillus and Acinetobacter were predominant among the Cu-resistant isolates. Sequence analysis from the 16S rDNA clone libraries of the two plant roots revealed sequences of Alpha-, Beta-, Gamma-Proteobacteria, Firmicutes, Actinobacteria and Bacteroidetes. Gammaproteobacteria was predominant in the two 16S rDNA clone libraries. Thirty-two endophytic bacteria were isolated and characterized with respect to heavy metal resistance and production of plant growth-promoting factors. In experiments involving rape plants grown in vermiculite containing4 mg kg-1 of Cu, inoculation with the isolates was found to increase the dry weights of roots (ranging from 132% to 155%) and above-ground tissues (ranging from 71% to 83%) compared to the uninoculated control. Increase in above-ground tissue Cu content varied from 63% to 125% in inoculated-rape plants cultivated in Cu-contaminated substrate compared to the uninoculated control.

【题目】Characterization and Localization of the Vacuolar-Type ATPase in the Midgut Cells of Silkworm (Bombyx mori)

【中文关键词】家蚕

【英文关键词】Bombyx mori, Midgut, V-ATPase B Subunit

【中文摘要】家蚕

【英文摘要】The vacuolar ATPase (V-ATPase) is a multifunctional enzyme that consists of severalsubunits. Subunit B is a part of the catalytic domain of the enzyme. The result of the RTPCRsuggested that the V-ATPase B subunit is a ubiquitous gene. 24 h after the larvae wereinfected with the Bombyx mori nucleopolyhedrovirus (BmNPV), the expression level ofthe V-ATPase B subunit in the midgut of the resistant strain NB was about 3 times higherthan in the susceptible strain 306, and then the expression level of the V-ATPase B subunitdecreased rapidly to a very low level. This indicated that the virus may cause a lot ofchanges of physiological conditions in the midgut. Localization of the V-ATPase B subunitwas attempted in midgut cells of Bombyx mori by immunohistochemistry. The immunohistochemicallocalization with the antibody against the B subunit revealed a positive stainingin goblet cell apical membranes of Bombyx mori midgut cells as well as in the midgut ofManduca sexta. This sequence has been registered in GenBank under the accession numberEU727173.

【题目】Characterization of copper-resistant bacteria and assessment of bacterial communities in rhizosphere soils of copper-tolerant plants

【中文关键词】重金属抗性根际细菌;变性梯度凝胶电泳;细菌种群;铜耐性植物;铜矿废弃地

【英文关键词】Heavy metal-resistant rhizobacteria; DGGE; Bacterial community; Copper-tolerant plants; Copper mining wasteland

【中文摘要】从生长在铜矿废弃地上的铜耐性植物中分离到13株铜抗性细菌。并对分离菌株进行了16S rRNA 基因序列分析,同时对菌株重金属抗性和植物促生特性进行了研究。采用DGGE技术分析了铜耐性植物根际土壤细菌种群结构。结果表明,分离菌株对多种抗生素都具有抗性。菌株SZY6, YJ7 和JYC17能够产生生长素、铁载体、ACC脱氨酶并能溶磷。平皿促生试验表明,菌株MT16, JYC17, SZY6, GZC24, 和YJ7能够增加(16-41%)油菜幼苗根长。根际土壤细菌种群结构相似,同时DGGE图谱表明,根际土壤有效态铜浓度对细菌种群结构没有明显的影响。

【英文摘要】Thirteen copper-resistant bacteria were isolated from copper-tolerant plant species growing on a copper mine wasteland. The isolates were identified by 16S rRNA gene sequence analysis and characterized by their resistance to heavy metals and plant growth-promoting characteristics. The assessment of the bacterial communities in the rhizosphere soils of copper-tolerant plants was measured as bands in denaturing gradient gel electrophoresis (DGGE) obtained directly from rhizosphere soil DNA extracts. The isolates were found to exhibit different multiple heavy metal resistance characteristics. Strains SZY6, YJ7 and JYC17 were found to produce indole acetic acid (IAA), siderophore, 1-aminocyclopropane-1- carboxylate (ACC) deaminase or to solubilize phosphate. Root elongation assay conducted on rape under gnotobiotic conditions with strains MT16, JYC17, SZY6, GZC24, and YJ7 demonstrated increase (from 16 to 41%) in root elongation of inoculated rape seedlings compared to the control plants. In the rhizosphere soil samples the DGGE profiles of the direct DNA extracts were similar. The DGGE profiles indicated that there was no significant correlation between the concentration of available copper in the rhizosphere soils and the number of the visible bands in the DGGE pattern.

【题目】“东优1号”杂色鲍及其亲本群体的形态特征和养殖性能比较

【中文关键词】杂色鲍;“东优1号”;形态特征;存活率;生长速度;

【英文关键词】Haliotis diversicolor; "Dongyou No.1"; morphological characteristics; survival rate; growth rate;

【中文摘要】以杂交种"东优1号"杂色鲍及其亲本群体为研究对象,对三者的外形特征和养殖性能进行了比较。结果表明,在壳形和密度相关的参数中,壳宽/壳长指标差异最为显著,日本群体的壳宽/壳长指标显著地大于台湾群体(P<0.05),而"东优1号"的值则介于双亲群体之间。采用海区延绳式吊养和陆地工厂化养殖两种养成模式,分别在福建、广东和海南对"东优1号"杂色鲍及其亲本群体进行为期一年的养殖对比试验。结果表明,杂色鲍台湾群体受养成期暴发性死亡症的严重影响,存活率极低;日本群体虽然具有较好的抗病能力,但生长速度却显著慢于"东优1号"和台湾群体;"东优1号"杂色鲍的生长速度和存活率在3个实验点都表现出较为显著的优势。研究结果表明"东优1号"杂色鲍是适合在亚热带和热带地区进行养殖的优良鲍新品种。

【英文摘要】Small abalone Haliotis diversicolor is an economically important shellfish speices in southern China. The new variety"Dongyou No. 1"was crossbred by Japan selective strain as male and Taiwan selective strain as female. Morphological characteristics and grow-out performance in "Dongyou No. 1 "and its parental populations of small abalone were studied recently. The results for morphological characteristics showed that parameter of W/L was significantly different among three groups. The W/L for Japan population was significantly larger than Taiwan population(P <0.05) and the value for “ Dongyou No.1 ” was between them.These three groups were cultured in the coast of Fujian with suspended long-line cages farming model,Guangdong and Hainan with land-based intensive farming model for one year.The survival rate and shell length for three groups were calculated each three months. The results showed that Taiwan population experienced high mortality during grow-out period in the whole three areas.Japan population showed high disease-resistantability with high survival rate. But the growth rate for Japan population was significantly slower than Taiwan population(P <0.05) . “ Dongyou No. 1 ” showed excellent grow-out performance in all three areas.The results indicated that “ Dongyou No.1 ” was the suitable new variety of small abalone for farming in the subtropical and tropical areas.

【题目】Increased cadmium and lead uptake of a cadmium hyperaccumulator tomato by cadmium-resistant bacteria
【中文关键词】镉抗性细菌;特性;金属溶解;镉;铅;植物提取;镉超富集番茄
【英文关键词】Cd-resistant bacteria; Characterization; Solubilization of metals; Cd; Pb; Phytoextraction; Cd-hyperaccumulator tomato
【中文摘要】对两株镉抗性细菌假单胞菌RJ10和芽胞杆菌J16对镉、铅的溶解能力以及对镉超富集植物番茄的生长和吸收镉、铅的效应进行了研究。结果表明,与对照相比,接菌处理土壤中CaCl2提取态镉、铅的含量分别增加了58-104% 和67-93%。供试菌株能够产生生长素、铁载体、ACC脱氨酶。平皿促生试验表明,接菌处理可以增加植物根长。接菌处理比对照植物地上部镉、铅含量分别增加92-113%和73-79%。这些结果表明,供试菌株可以用于镉、铅污染土壤细菌强化植物修复中。
【英文摘要】Two cadmium (Cd)-resistantstrains Pseudomonas sp. RJ10 and Bacillus sp. J16 were investigated for their effects on the soil Cd and lead (Pb) solubilization and promotion of plant growth and Cd and Pb uptakes of a Cd-hyperaccumulator tomato. In the heavy metal-contaminated inoculated soil, the CaCl2-extractable Cd and Pb were increased by 58 – 104% and 67 – 93%, respectively, compared to the uninoculation control. The bacteria produced indole acetic acid, siderophore and 1-aminocyclopropane-1-carboxylatedeaminase. Root elongation assay conducted on tomato under gnotobiotic conditions demonstrated increase in root elongation of inoculated tomato seedlings compared to the control plants. An increase in Cd and Pb contents of above-ground tissues varied from 92% to 113% and from 73% to 79% ininoculated plants growing in heavy metal-contaminated soil compared to the uninoculation control, respectively. These results show that the bacteria could be exploited for bacteria enhanced- phytoextraction of Cd-and Pb-polluted soils.

【题目】温度对杂色鲍不同群体生长率与存活率的影响
【中文关键词】海洋生物学; 杂色鲍; 群体; 温度; 生长; 基因型与环境互作;
【英文关键词】marine biology; Haliotis diversicolor; population; temperature; growth; genotype×environment interaction;
【中文摘要】在16、20、24和28℃这4个设定的水温下,以杂色鲍(Haliotis diversicolor)日本群体、台湾群体、越南群体和"东优1号"为材料,进行为期40 d的养殖试验,对4个杂色鲍群体在不同温度下的壳长日增长率(LGR)和体重日增长率(WGR)进行比较.结果表明,"东优1号"杂色鲍群体在28℃时的LGR和WGR值分别达到162.23±15.79 μm/d和46.52±6.89 mg/d,在4个温度下的LGR和WGR值都优于其他3个群体,台湾群体在较高温度(24和28℃)条件下的LGR和WGR值要高于日本群体,而日本群体在较低温度(16和20℃)时的值则高于台湾群体.双因素方差分析的结果进一步表明,温度对杂色鲍不同群体的生长率指标具有显著影响.
【英文摘要】The small abalone, Haliotis diversicolor, is naturally distributed along the coastal waters of East Asia and is a commercially important species cultured along the coast of southern China. The current study genetically characterized four different small abalone populations(Japan, Taiwan, Vietnam, and "Dong You No.1") that were reared at 16,20,24,and 28°C for 40 days, and the values of length growth rate(LGR) and weight growth rate(WGR) were investigated. The study revealed that the Dong You No.1 and the Vietnam populations had the highestand lowest values of LGR and WGR,respectively.Dong You No.1 reached 162.23 ± 15.79

μm/d for LGR and 46. 52 ± 6.89 mg /d for WGR at 28℃. In terms of LGR and WGR,the Taiwan population performed better than the Japan population at higher temperatures (24 and 28℃) ,while the Japan population performed better than the Taiwan population at lower temperatures (16 and 20℃).The impact of population and temperature on LGR and WGR was investigated by two-way analysis of variance. The current study indicated that the impact of population and temperature on growth were both highly significant ($p < 0.01$) ,and a significant association ($p < 0.05$) between population and temperature was also found. The results provide useful information for optimal growth conditions for thesmall abalone industry.

【题目】小球藻和光合细菌在大菱鲆育苗中对水质调节作用的研究
【中文关键词】苗种培育　小球藻　光合细菌
【英文关键词】Larvae culture　Chlorella pyrenoidosa Chick　Photosynthetic bacteria(PSB)
【中文摘要】在大菱鲆苗种培育池中添加小球藻和光合细菌,通过测定开口后0~16d以及第8天全天池水中氨氮和亚硝酸盐浓度的变化,证明小球藻和光合细菌能显著吸收和抑制这两种营养盐,净化苗池水质;而小球藻对这两种营养盐的抑制作用更为明显。同时,在苗池中添加小球藻和光合细菌也能满足仔鱼及其活饵料的营养需求,促进仔鱼生长发育,是一种值得推广应用的方法。
【英文摘要】Chlorella pyrenoidosa was added separately or in combination with photosynthetic bacteria(PSB) Rhodobacter sphaeroides to larvae rearing tanks for turbot Scophthalmus maximus, and the concentrations of NH+4 andNO-2 were measured every two days during 0~16 d and every two hours on day 8. It was found that Chlorella and PSB assimilated and thus suppressed the increase of these two nutrients, so that the water quality of the treatment tanks was improved. And it was found that Chlorella played a major role in absorbing these two nutrients. At the same time, these micro algae and microbes were good nutritional supplements for the fish larvae or their live feed, and would duly improve the growth performance of the larvae. It is suggested that Chlorella and PSB are effective in water quality control and should be widely applied in hatchery.

【题目】Influence of several non-nutrient additives on nonspecific immunity and growth of juvenile turbot,Scophthalmus maximus L.
【中文关键词】无
【英文关键词】Growth
non-nutrient additives
nonspecific immunity
turbot
【中文摘要】无
【英文摘要】The effects of three non-nutrient additives on nonspecific immunity and growth of juvenile turbot (Scophthalmus maximus L.) were studied in this feeding experiment. The five treatments are basal diet alone, basal diets containing three different additives [0.4 g kg - 1of xylo-oligosaccharides (XOS), 1.3 g kg- 1 of yeast cell wall and 0.8 g kg- 1 of bile acids] individually or in combination. Two hundred and twenty-five turbots (average initial weight 151.3 ± 11.3 g) were randomly allotted in five treatments with three replicates within each treatment in a 72-day period. Comparing with basal diet group, activities of C3, C4, phagocyte, lysozyme, specific growth rate and feed conversion rate in yeast cell wall, XOS and the combined groups was enhanced significantly (P < 0.05); however, these parameters in bile acid groups were increased slightly (P > 0.05) except for phagocyte (P < 0.05); superoxide dismutase activity in additive groups was not significantly increased (P > 0.05) except for the combined group (P < 0.05). In conclusion, supplementation of yeast cell wall and XOS enhanced the nonspecific immunity of juvenile turbot. Synergistic or additive effect of the three additives was not observed.

【题目】Influence of dietary protein levels on growth,digestibility,digestive enzyme activity and stress tolerance in white-legshrimp,Litopenaeus vannamei(Boone,1991)reared in high density tank trial
【中文关键词】无
【英文关键词】Litopenaeus vannamei
dietary protein
growth
digestive enzymes
digestibility
【中文摘要】无
【英文摘要】The effects of dietary protein (DP) levels on the growth, digestibility, digestive enzyme activity and stress tolerance of Litopenaeus vannamei (Boone, 1931) were investigated in high-density (375 m-3) tank trials. Shrimps (6.2 ±0.2 g) were fed diets with five different protein levels (31 % , 35 % , 39 % , 43 % and 47 %) for 60 days. The results showed that variations in DP significantly (

P<0.05) influenced the growth performance, digestibility, enzyme activity and their ability to tolerate stress. Weight gain showed a linear increase in relation to crude protein (CP) up to 43 % and showed as light decrease with a further increase to 47 % . Feed convers ion ratio was observed to be the lowest in C P 43 % : 2.53. A higher protein efficiency ratio was observed with the low-protein diet CP 31(1.07); however, it was not significantly different from the rest of the dietary treatments. Protein digestibility was the highest (75.71 %) i n CP 47 and the lowest (71.94 %) i n C P 31. Protease activity ranged between 63.7 and 70.2(U Protein-1), and showed a positive correlation with the DP levels. Shrimp fed CP43 well tolerated a sudden decline in salinity and survived for 548.3 min in fresh water. Observations from this study indicate that a DP level around 43% could be optimum for L.vannamei in high-density culture systems in the absence of natural productivity.

【题目】高密度养殖凡纳滨对虾蛋白质生态营养需要量与水质及消化特征

【中文关键词】凡纳滨对虾 生态营养需要量 高密度养殖 水环境 消化率

【英文关键词】Litopenaeus vannamei eco-nutrition requirement high density environment factors digestibility

【中文摘要】在高密度养殖条件(平均养殖密度 3.1 kg/m3)下 ,用5种蛋白质水平(31%、35%、39%、43%、47%,分别以 A ~E组表示)的饲料,投喂体质量(6.2±0.2)g 的凡纳滨对虾 (Litopenaeus vannamei),每个处理组设3个重复,每个重复30尾虾,实验期 60 d,探讨蛋白质营养对生长、环境因子、排泄与饲料消化特征的影响。结果表明:(1)饲料蛋白水平>39% 时具有显著促进对虾生长的效果。随着蛋白水平的提高,增重率先增加后降低,饲料系数则相反。(2)养殖水体中氨氮、亚硝氮和磷酸盐浓度随饲料蛋白质水平增加而显著升高,E 组与其他各组差异显著(P<0.05)或极显著(P<0.01)。(3)随着饲料蛋白质含量增加 ,饲料总消化率显著下降,而蛋白质消化率显著升高。(4)创新建立的对虾日粮蛋白质水平与日增氮、日排有害氮的定量动态变化关系,使蛋白质生态营养需要量得以量化确定。高密度养殖凡纳滨对虾获得最大增重的蛋白质需要量为 43.73%,获得最佳生长和氮减排的蛋白质需要量为 40.42%。

【英文摘要】An experiment was conducted for 60 days to determine the relationship between different dietary protein levels and growth performance,environment factors and digestive characteristics of white shrimp Litopenaeus vannamei in high density culture system. Four hundred and fifty white shrimps with average initial weight of 6.2±0.2g were assigned randomly to five treatments groups with three replicates and were fed diets with 5 different protein levels which were 31%,35%,39%,43% and 47%,respectively in average stock density of 3.1 kg/m3. The results were as follows:(1)As the protein levels increased,the weight gain rate rose at first and then decreased,while the feed conversion ratio had the opposite tendency. Shrimps fed with 43% dietary protein got the best growth performance. (2)Seawater factors such as NH4+-N,NO2--N,PO43--P and suspended substance (SS) were affected significantly by dietary protein levels(P < 0.05),and all of them increased with protein levels increasing. The environmental factors of the group fed with 47% dietary protein were different from those of other groups significantly(P < 0.05). (3) Total apparent digestion rate decreased with the increase of protein level,while the protein digestion rate increased significantly(P <0.05). (4) We have innovatively qualified the dynamic relationship between nitrogen excretion or nitrogen gain and the increasing dietary protein levels,so that the exact requirement of protein can be calculated. Based on the growth performance,43.73% may be recommended as the conventional requirement of protein with the biggest growth rate for adult white shrimps in high density culture system. However,40.42% may be recommended as the eco-nutrition requirement of protein with the optimum growth and nitrogen excretion

【题目】蛋白质与饱食度对工厂化养殖半滑舌鳎生长与免疫的影响
【中文关键词】半滑舌鳎　蛋白水平　饱食度　生长性能　免疫力
【英文关键词】Cynoglossus semilaevis G　nther　Protein levels　Satiation degree　Growth performance　Immunity activity
【中文摘要】海水养殖鲽形目鱼的营养需求研究和生产提供科学参考。
【英文摘要】The 5×3 two-factor random animal experiment was conducted for 108 days to determine the effects of protein levels and satiation degrees on growth performance and immunity activity of juvenile Cynoglossus semilaevis G　nther (with average initial weight of 110±25g) in the industrial culture condition with closed recirculation seawater. The trial fish were randomly allocated into 15 triplicated treatments, with five diets at protein levels of 43%, 46%, 49%, 52%, 56%(A-E groups) and three satiation degrees of feeding(100%, 90%and80%, as Ⅰ Ⅱand Ⅲ degree). The results indicated that: (1)the best weight gain were found in both the highest protein level and the highest satiation degree. Weight gain ratio in group E was significantly higher than the other groups (13.75%~50.16%), and that of degree Ⅰ was significant higher than degree Ⅱand Ⅲ(7.57% and 14.08%), respectively; higher protein efficiency ratio and the minimum mortality appeared in the intermediate protein level , mortality ratio of group C was lower than the others (50%~75%) the highest feed conversion ratio and protein efficiency ratio were present in the lowest satiation degree, for which degree Ⅲ was higher than the others (4.78% and 5.32%), respectively. (2) the intermediate protein level and the highest satiation degree were stimulative to enhancing SOD activity, group C was significantly higher than the other groups (4.2%~ 34.79%) degree Ⅰ was significant higher than degree Ⅱand Ⅲ (15.27% and 25.70%), respectively; the intermediate protein level and 90%satiation were good for promoting LZM activity, group C was significant higher than the other groups(4.61%~18.07%), degree Ⅱwas significant higher than degree Ⅰ and Ⅲ(12.03% and 4.58%), respectively; the intermediate and higher protein level and the highest satiation degree were stimulative to enhancing complement C3, C4 activity; (3) the protein level of feed for maximum growth of juvenile C. semilaevis G　nther in the industrial culture condition was 56%, but for optimal immunity activity and protein efficiency ratio was 49%~52%.

【题目】蛋白质营养对高密度养殖南美白对虾生长与免疫力的影响
【中文关键词】凡纳滨对虾(Litopenaeus vannamei)　蛋白质水平　生长性能　免疫力　抗胁迫　水质因子
【英文关键词】Litopenaeus vannamei　proteinlevels　growthperformance　immunity　anti-stress ability
【中文摘要】在高密度养殖条件下, 进行单因素随机设计动物试验。用5种饲料(蛋白质水平31%、35%、39%、43%、47%,以A~ E组表示) 分别投喂平均体质量6. 2g? 0. 2g、平均养殖密度3. 1kg/ m3的凡纳滨对虾(Litopenaeus vannamei) ,探寻蛋白质营养对虾生长、免疫、水质、抗胁迫的影响特征。结果表明:(1) 中高蛋白质水平具有显著促进对虾生长的效果,随着蛋白水平的提高, 特定生长率先增加后降低, 饲料系数正好相反, D组两指标最佳, 分别为110.98%和2.54; C、D、E组差异不显著。(2) 中高蛋白质水平有利于提高对虾多数免疫指标的活力,血淋巴中血细胞浓度、T-AOC活力、POD活力、总蛋白含量、白蛋白、血蓝蛋白含量, 随着蛋白质水平提高先增加后降低,前5指标含量均以D组最高,比A组显著提高16.8%~33.9%;而血蓝蛋白含量C组最高,比A组提高15.0%。(3) 高蛋白质水平有利于提高对虾SOD活力,也显著增强抗低盐胁迫的能力, 但同时极显著加大了水环境中氨氮和亚硝氮的污染。(4) 在我国北方集约化高密度养殖条件下,凡纳滨对虾中后期生长阶段适宜的饲料蛋白质营养水平为39%~ 43%。
【英文摘要】An experiment was conducted for 60 days to determine the relationship between the different dietary protein content and the growth and immunity of Litopenaeus vannamei in high density culture system.450 white shrimps(average initial weight 6. 2±0. 2g) were assigned randomly to five treatments with three replicates within each treatment and were fed diets with 5 different protein levels 31%, 35%, 39%, 43% and 47% respectively in average density 3. 1kg/m3. The results were as follows: (1) Shrimps fed 43% dietary protein had the maximal special growth rate and the minimal feed conversion, there was no significant difference when the protein level was above39%. (2) The total hemocyte counts, T-AOC activity, POD activity, total protein content, and white protein content in haemolymph were increased at first and then decreased with the increase of protein content in the diet. Compared with 31% protein content, the above 5 indicators of 43% protein content which was the best group were enhanced from 16. 8% to 33. 9%(P<0.05). The

SOD activity and oxyhemoly content reached a peak in 47% and 39% protein content respectively.(3) The concentrations of total ammonia, nitrite in the feeding water were increased significantly with the increasing of dietary protein level. The best group under low salinity stress has 43% protein content and had a significant difference with the shrimps fed 31% protein content. (4) Based on the results of the special growth rate, immune indicators, water quality and anti stress abilities, the optimum protein requirement in the diet for sub-adult white shrimps in high density culture is 39%~ 43%.

【题目】工厂化养殖半滑舌鳎生长、摄食和水质的变化特征及规律
【中文关键词】半滑舌鳎 工厂化养殖 生长 摄食 水质
【英文关键词】Cynoglossus semilaevis Industrial culture Growth characteristics Feed intake Water quality
【中文摘要】在封闭循环水养殖条件下,进行6×2双因素随机设计动物试验, 即6个体重阶段(45~550g)和2个密度水平(高密度比正常密度提高20%~30%), 共形成12个处理, 每处理3个重复, 试验期44d。探寻我国北方工厂化养殖半滑舌鳎生长、摄食和水质的变化特征及规律。结果表明: (1)日增重、日均摄食量、饲料系数等绝对指标与体重阶段呈正相关;氨氮、COD等水质指标相对浓度与体重阶段呈负相关; (2)常规水质条件下, 高密度养殖不利于生长、摄食和降低水体有害物, 其副作用起初并不明显, 随着试验时间的推移不断加大; (3)新发现半滑舌鳎的日摄食率为0. 43%~0. 92%, 对常规鱼类投饲率推荐范围(2%~ 5%)提出了质疑, 为现代海水养殖精准饲喂和清洁生产提供了科学依据; (4)本试验条件下, 体重45~ 550g阶段半滑舌鳎的特定生长率为(1. 42%~0150%) /d,饲料系数为0. 68~ 0. 86,水中氨氮为8. 45~ 1. 51mg/(kg • h)。
【英文摘要】The 6×2 bi-factor random experiment was conducted to investigate the effect of bodyweight (6 groups, 45~550g) and stocking density (two levels, normal and high-added 20~30% on normal level) on growth performance, feed intake and water quality for Cynoglossus semilaevis G nther intensively cultured in recirculation aquaculture system for 44d. Totally 345 individuals of fish were randomly allotted into 12 treatments with triplicate per treatment The results shown that: (1) daily weight gain, daily feed intake and FCR were positively correlated to body weight but SGR and daily feeding rate negatively; the comparative concentration of water quality parameters(NH4+-N, NO2 --N, COD, PO4-) also negatively; (2) under the condition of general water quality, highStocking density resulted in a decrease in growth and intake of the fish, and an increase in the content of harmful waste in water; (3) in this study it is found that daily feeding rate(0. 43%~0. 92%) was significantly lower than the conventional one (2%~5%) recommended by previous studies; (4) under conditions of this experiment the SGR of C. semilaevis was(1. 42%~0. 50%) /d, the FCR 0. 68~0. 86, the ammonia concentration in water 8. 45 ~1. 51mg/(kg • h).

【题目】弧菌拮抗菌的筛选及其对凡纳滨对虾的抑菌防病作用
【中文关键词】凡纳滨对虾 弧菌病 需钠弧菌FS-1 弧菌拮抗菌 短小芽孢杆菌H2
【英文关键词】Litopenaeus vannamei vibriosis Vibrio natriegens FS-1 probiotics Bacillus pumilus H2
【中文摘要】从海洋沉积物中分离到 2 株弧菌拮抗菌 (H2 和H4), 经生理生化特性、16S rRNA 基因序列分析分别鉴定为短小芽孢杆菌(Bacillus pumilus H2) 和地衣芽孢杆菌(Bacillus licheniformis H4). H2和H4菌株均对需钠弧菌的生长有显著的抑制作用; 但只有 H2菌株在模拟养殖动物小肠环境中生长良好. 选择H2进行模拟试验(20尾凡纳滨对虾虾苗为1 组). 结果表明,对照组 (不接种) 虾苗存活 32h, 接种弧菌的试验组虾苗仅存活 16h, 同时接种 H2菌株和弧菌的试验组虾苗存活48h, 而仅

接种 H2菌株的试验组虾苗存活了72h, 说明菌株 H2可显著提高凡纳滨对虾的存活时间 .现场试验中,100L 养殖池中(50尾虾/池), 分别接种 0 (对照), 103, 104 CFU/mL 的H2菌株并养殖14d, 再用 104 CFU/mL需钠弧菌处理 14d. 接种104 CFU/mL H2菌株的试验组,虾的死亡率仅为 12.5%, 显著低于对照组的30.8%(P<0.05). 接种104 CFU/mL 菌株H2的试验组, 虾的体长、体重都略高于对照组,但各试验组之间差异不显著(P >0.05).

【英文摘要】Two bacterial strains, H2 and H4, were isolated from marine sediment and identified as Bacillus pumilus H2 and Bacillus licheniformis H4, respectively, based on their physiological properties and the analysis of 16S rRNA gene sequence. Both strains showed significantly inhibitory effects against the growth of Vibrio natriegens by antimicrobial activity assay. However, only strain H2 could survive in th e intestinal conditions as revealed by the simulated gastro intestinal tract (GIT) test, keeping cell number stably at 1010 CFU/mL. B. pumilus H2 was also benefit to the survival of juvenile shrimp (Litopenaeus vannamei) as revealed by the flask bottle test (20 shrimp fries for every bottle as a group). Probiotic effect of B. pumilus H2 to juvenile shrimp was carried out in aqu aculture tanks with 100L each with 50 shrimps. Juvenile shrimp were exposed to B. pumilus H2 at 0 (as control), 103 and 104 CFU/mL for 14d before a challenge with Vibrio natriegens at 104CFU/mL for 1 d infection. The final mortality of the shrimp group treated with 104CFU/mL B. pumilus H2 was only 12.5%, much lower than the group treated with 103 CFU/mL B. pumilus H2 (28.3%) and the control group (30.8%, P<0.05); and the average weight and length of the shrimp group treated with 104 CFU/mL B. pumilus H2 were also a bit higher than those of the control group.

【题目】竹子填料海水生物滤器除氮性能和硝化细菌群落变化研究
【中文关键词】海水生物滤器 竹子填料 氨氮去除 硝化细菌 养殖废水
【英文关键词】Marine biofilters Bamboo medium NH+4-N removal Nitrifying bacteria Aquaculture wastewater
【中文摘要】生物滤器是循环水养殖系统的关键水处理单元, 主要用于去除水体中水溶性的氮化物。采用人工模拟海水养殖废水, 在系统运行的水力停留时间HRT为1h, 水温为18~25℃ , 气水比为3:1, 初始C/ N=3:1, pH为8.05~ 8.53条件下, 对竹子填料浸没式生物滤器的挂膜过程和稳定运行阶段系统去除氨氮的运行特性, 以及挂膜过程中的硝化细菌群落变化进行了实验研究。结果表明, 在较低的NH+4-N浓度条件下, 采用竹子填料的生物滤器有较快的挂膜速度, 挂膜成功后滤料表面

上生长的氨氧化细菌和亚硝酸氧化细菌的数量分别为4.5×105、1.5×105(光面)和1.1×106CFU/ml(粗面)。具有较高且稳定的氨氮去除效果,氨氮去除效率达到80%,出水浓度小于0.06mg/L,满足海水循环养殖系统中的应用要求。

【英文摘要】Biofilter is the key water treatment unit of marine RAS(Recirculating Aquaculture System), and it plays an important role in water-soluble nitrogen removal. A pilot-scale experiment study was systematically carried out with synthetic aquaculture wastewater. The performances of ammonia removal in start-up and steady-state period were examined in the marine biofilters packed with bamboo medium. The hydraulic retention time, temperature, gas/water ratio, C/N and pH were 1 hour, 18~25℃, 3:1, 3:1 and 8.05~8.53, respectively. Results showed that marine biofilter packed with bamboo substrate enabled the nitrifying bacteria to grow rapidly, and the number of ammonia-oxidizing bacteria and nitrite-oxidizing bacteria was 4.5×105CFU/ml、1.5×105 CFU/ml(smooth) and 1.1×106 CFU/ml(crude) in steady-state period, respectively. The ammonia removal rate of biofilter was highly efficient. The ammonia nitrogen concentration in the effluent of bamboo biofilters was below 0.06mg/L, which was much lower than the toxic level for almost all the aquaculture species.

【题目】循环水养殖系统中自然微生物生物膜形成过程实验研究

【中文关键词】循环水养殖系统 自然微生物 生物膜 生物载体

【英文关键词】recirculating aquaculture systems naturalmicrobes bio-film microbialcarrier

【中文摘要】进行了不同初始NH4-N浓度,在实验水温20~24℃条件下,利用微生态制剂辅助,循环水养殖系统中自然微生物生物膜形成过程的实验研究。结果表明:不同NH4-N浓度对自然微生物生物膜形成产生显著影响,5、10和20mg/L高浓度NH4-N更易于微生物的扩繁生长和生物膜形成,其生物膜达到预期水质净化效果的形成周期,即生物挂膜成熟周期,约需要35~40 d。生物挂膜成功后,形成很好的硝化作用,实验生物滤池中的NH4-N、NO2-N浓度均保持低于0.05mg/L,COD浓度低于3mg/L,显示出对NH4-N、NO2-N和COD很高的去处效果,但对PO4-P处理效果不明显。而1和2mg/L低浓度NH4-N不易于微生物的扩繁生长,难以形成具有较好水质净化效果的生物膜,即生物挂膜难以成功。

【英文摘要】The studied on the experiment of process of formed bio-film of the natural microbes was conducted by the microbial ecological agent assisted in different tammonia-nitrogen concentrations in re-circulating aquaculture systems, under the condition of water temperature 20 to 24°C. The results of experiments showed that different ammonia-nitrogen concentrations had a significant impact on bio-film formation of natural microbes in bio-filter. The bio-film was prone to expand, grow and for min high ammonia-nitrogen concentrations 5mg/L, 10mg/L, 20mg/L, and could complete the formation period of anticipating purifying effect of water quality, mature periods of bio-film formation were needed about 35~40 days. After the bio-film formation, the complete nitrification was established, ammonia-nitrogen and nitrite-nitrogen concentrations kept below 0.05mg/L, and COD concentration was under 3mg/L, but the treatment effect of phosphate was not obvious in experimental bio-filter. Contrarily, in the low ammonia concentrations of 1mg/L, 2mg/L, the microbes were not prone to expand and grow, and were difficult to form the bio-film of preferable purifying effect of water quality, that was to say, it was difficult to form the bio-film successfully.

【题目】微生态制剂对生物挂膜及牙鲆生长的影响研究

【中文关键词】循环水养殖 生物挂膜 微生态制剂 牙鲆(Paralichthys olivaceus)
【英文关键词】re-circulating aquaculture bio-film formation microbial ecological agent Paralichthys olivaceus
【中文摘要】针对工厂化循环水养殖系统中生物滤池去除有害污染物质的核心问题, 采用单因素梯度设计,添加50(1#), 100(2#), 250(3#), 500(4#), 1 000(5#), 1 500(6#)g 微生态制剂辅助自然微生物在生物载体上进行人工挂膜, 挂膜2 周后, 进行40 d 循环水养殖牙鲆(Paralichthys olivaceus), 培养生物膜去除NH4+-N,NO2－-N 模拟实验。结果表明:不同质量浓度微生态制剂有利于自然微生物挂膜,与对照组相比, 在进水中较低的NH4+-N, NO2－-N质量浓度下, 生物膜能够显著地降低NH4+-N, NO2－-N质量浓度;除1#组NH4+-N, NO2－-N平均去除率分别为13.0%, 14.4%外, 其余组都在20% 以上, 但去除效果差异不显著(P >0.05); 实验组牙鲆平均体质量、体长、体质量增长率、饵料系数与对照组相比, 呈显著性差异(P <0.05), 且4#组牙鲆体质量增长效果最明显, 与对照组相比, 牙鲆的平均体质量增长量比对照组多增长了76%, 饵料系数最低,为1.16; 对照组牙鲆成活率为72%, 各实验组在76%~84% 之间。4#生物滤池处理水质效果较好, 能够有效地将养殖水中的NH4+-N, NO2－-N转化为 NO3－-N, 且养殖效果较好, 可作为工厂化循环水养殖系统生物滤池中添加微生态制剂辅助自然微生物挂膜的参考依据。
【英文摘要】To solve the core issue of removal of harmful pollutants in bio-filter of industrial re-circulating aquaculture system, by a single factor gradient design, artificially bio-film formation was conducted on the biological carrier packing by adding 50(1#), 100(2#), 250(3#), 500(4#), 1000(5#) and 1500(6#) g microbial ecological agent to assist natural microbe. After two weeks bio-film formation, simulation experiment that Paralichthys olivaceus were reared in re-circulating water to ex amine the removal of ammonia-nitrogen and nitrite-nitrogen by culturing bio-film were carried out for forty days. The results showed that different concentrations of microbial ecological agent were beneficial to the bio-film formed by natural microbes, leading to more efficient removal of mmonia-nitrogen and nitrite-nitrogen concentrations; except that the mean removal rates of ammonia-nitrogen and nitrite-nitrogen in group 1# were 13.0% and 14.4%, respectively, the other experimental groups were more than 20%, but no significant difference between their removal effect being seen (P > 0.05); compared with control group, the mean body weight, body length, weight gain rate, and feed conversion rate of P. olivaceus were significantly difference in experimental groups, the effect of weight gain being obviously significant (P <0.05) for group 4#, with the mean body weight of P. olivaceus increased by 76% over than control group, and the lowest feed conversion rate being 1.16 in experimental groups; the control group ’s survival rate of P. olivaceus was 72% ,and the experimental groups were between 76% and 84%. The better water quality was associated with 4# bio-filter, which effectively conversed ammonia-nitrogen and nitrite-nitrogen into nitrate-nitrogen, leading to better farming. The 4# sys-tem can be used as a reference of bio-film formation aided the addition of microbial ecological agent in industrial re-circulating aquaculture system.

【题目】滤食性双壳贝类对工厂化养殖废水中悬浮物的生物滤除研究
【中文关键词】工厂化海水养殖 悬浮颗粒物 滤食性双壳贝类 半滑舌鳎 生物滤除 沉积物
【英文关键词】industrial seawater aquaculture suspended particles filter-feeding bivalve Cynoglossus semilaevis G ü nther bio-filter sediment
【中文摘要】针对海水鱼类半滑舌鳎养殖池排出水中大量絮状悬浮物难以用常规机械过滤法去除的问题,选择适应能力强的滤食性双壳贝类长牡蛎(Crassostrea gigas)和紫贻贝(Mytilus galloprovincialis),通过现场实验测定了它们对鱼类养殖排出水中悬浮物的生物滤除能力。结果表明,在海水流速为100L · h-1条件下,牡蛎[壳高(9.80±0.45)cm,湿重(117.0±10.0)g]和贻贝[壳高(6.54±0.26)cm,湿重(29.7±2.4)g]对养殖排出水悬浮物的生物沉积速率分别为40.28~45.30mg · ind-1 · d-1[平均(43.40±2.16)mg · ind-1 · d-1]和6.96~8.87mg · ind-1 · d-1[平均(7.66±0.99)mg · ind-1 · d-1];在实验海水流速为150L · h-1条件下,牡蛎[壳高(9.33±0.99)cm,湿重(95.8±31.4)g]和贻贝[壳高(6.39±0.91)cm,湿重(28.0±15.4)g]对悬浮物的生物沉积速率分别为13.68~22.50mg · ind-1 · d-1[平均(17.35±4.59)mg · ind-1 · d-1]和5.37~5.67mg · ind-1 · d-1[平均(5.55±0.15)mg · ind-1 · d-1]。表明长牡蛎和贻贝两种双壳贝类对半滑舌鳎养殖池出水中悬浮物具备很强的生物滤除潜力,且能吸收和利用悬浮物中的有机质实现养殖废物的生物资源化利用。
【英文摘要】In industrial aquaculture wastewater, there occur large quantities of suspended particles from undigested remains and fish feces that are easily physically broken up. Especially it is difficult to remove the flocculent suspended solids from culture pond of

Cynoglossus semilaevis G ü nther with conventional mechanical filter methods. In this study, we chose two kinds of filter-feeding bivalves, the Pacific oyster Crassostrea gigas and the blue mussel Mytilus galloprovincialis to remove the suspended solids from fish aquaculture wastewater in flow through systems. Results showed that when water flow speed was 100L · h-1,the biologically filter-removing rate of suspended particles by C. gigas (shell height 9.80±0.45 cm; individual wet weight 117.0±10.0 g)and M. galloprovincialis (shell height 6.54±0.26 cm; individual wet weight 29.70±2.44 g)were 40.28~45.30 mg · ind-1 · d-1 (average 43.37 mg · ind-1 · d-1) and 6.96~8.87 mg · ind-1 · d-1 (average7. 66 mg · ind-1 · d-1),respectively; and when the flow waste-water speed was 150 L · h-1,the biologically filter-removing rate of suspended particles by oysters(shell height 9.33±0.99 cm; individual wet weight 95.78±31.44 g)and mussels(shell height 6.39±0.91 cm; individual wet weight 28.03±15.4 g) were 13.68~22.50(average 17.35) mg · ind-1 · d-1and 5.37~5.67(average 5.55) mg · ind-1 · d-1,respectively. Also, we found that the POM, and C, N, and P in sediments of oyster system were significantly lower than those of the control system. We conclude that the two species C. Gigas and M. galloprovincialis have a considerable potential to filter and remove suspended particles from aquaculture wastewater, and simultaneously yield the biological resource use.

【题目】凡纳滨对虾幼体采食不同蛋白日粮的免疫与消化率特征研究
【中文关键词】凡纳滨对虾 蛋白质营养 免疫力 蛋白质消化率 生长性能
【英文关键词】Litopenaeus vannamei Protein levels Immunity Protein digestibility Growth performance
【中文摘要】在室内养殖条件下,进行单因素随机设计动物试验,即5种饲料蛋白质水平(31%、35%、39%、43%、47%,以A~E组表示)处理,投喂平均体重0.2g的凡纳滨对虾(Litoenaeus vannamei)幼体,养殖60d。研究结果表明,蛋白质营养对幼虾的生长、免疫与抗氧化指标和消化率特征影响显著。随着饲料蛋白水平的升高,特定生长率显著增加,饲料系数下降,E组的2项指标最好,分别为5.52%/d和1.96。高蛋白质含量饲料有利于提高对虾免疫指标水平,血淋巴中血细胞浓度、T-AOC活力、POD活力、溶菌酶活力、总蛋白含量随着饲料蛋白质水平提高而显著增加,各项指标E组最高,比A组分别显著提高133.7%、21.1%、16.8%、20.8%、19.7%(P<0.05);而SOD活力C组最高,与A组差异显著。凡纳滨幼虾对蛋白质的消化率随饲料蛋白质含量增加显著升高(P<0.05),E组比A组提高8.2%。通过饲料蛋白质水平与特定生长的回归分析,获得凡纳滨对虾幼体最大生长饲料蛋白质需要量为46.5%。
【英文摘要】The consequences of dietary protein levels on growth performance, immunity, anti-oxidation and feed digestibility of Litopenaeus vannamei were investigated in tank trials. Shrimps (0.2 g) were fed diets with five different protein levels (31%, 35%, 39%, 43% and 47%) for 60 days. The results showed that variations in dietary protein significantly (P<0.05) influenced growth performance, immunity, anti-oxidation and feed digestibility. As the increasing of dietary protein levels, the SGR increased significantly and the FCR decreased significantly; Shrimps fed 47% dietary protein diet had the maximal special growth rate (5.52% /d) and the minimal feed conversion(1.96). The total hemocyte counts, T-AOC activity, POD activity, LZM and total protein content in haemolymph were enhanced with the increase of protein content in the diet. Comparing with 31% protein content group, the above 5 indicators of 47% protein content which was the best group were enhanced by 133.7%、 21.1%、16.8%、20.8%、19.7% respectively (P < 0.05).The protein digestibility ranged between 75.06% and 81.20%,and showed a positive correlation with the dietary protein levels. Based on the regression of the special growth rate and dietary protein levels, the optimum protein requirement for juvenile white-leg shrimps is 46.5%.

【题目】生物滤器处理海水养殖水过程中亚氮积累与影响因素
【中文关键词】生物滤器 海水养殖水体 亚硝酸盐氮积累 溶解氧 反硝化作用
【英文关键词】Biofilter Cynoglossus semilaevis mariculture wastewater accumulation of nitrite nitrogen dissolved oxygen denitrification
【中文摘要】实验研究了竹环填料曝气生物滤器在处理高盐度、低氨氮负荷的海水养殖水体过程中NO2--N的积累现象,考察了进水有机负荷、NH4+-N负荷、温度、pH值和溶解氧等运行条件以及反硝化作用对NO2--N积累的影响.结果表明,在进水有机负荷为0.65~0.75kg/(m3·d)、NH4+-N负荷为0.058~0.077kg/(m3·d)、温度为20.9~22.2℃、pH值为7.50~8.14和溶解氧为7.43~9.73mg/L条件下,生物滤器内较低的溶解氧(0.91~1.36mg/L)是NO2--N积累的主要原因.同时,研究了反硝化过程中低溶解氧、不同碳氮比(C/N)及碳源类型等因素对NO2--N积累的影响,查明了生物滤器内含氮化合物的浓度变化与反硝化细菌的数量和功能,验证了反硝化过程对NO2--N积累的影响,明确了反硝化作用对NO2--N积累的促进作用.

【英文摘要】The experiment studied the accumulation of nitrite nitrogen in biofilter packed with bamboo ring while treating Cynoglossus semilaevis mariculture wastewater with high salinity and low ammonia nitrogen loading. Some operating parameters were carried out, including influent organic loading, ammonia nitrogen loading, temperature, pH and dissolved oxygen as well as the denitrification to the influence of nitrite nitrogen accumulation. When the influent organic loading was 0.65~0.75kg/(m3 · d),the ammonia nitrogen loading was 0.058~0.077kg/(m3 · d),the temperature for 20.9~22.2°C ,pH for 7.50~8.14°C and the dissolved oxygen was under 7.43~9.73mg/L, the low dissolved oxygen in biofilter was the primary cause for nitrite nitrogen accumulation. Meanwhile, the influential factors on nitrite nitrogen accumulation were investigated, including the low dissolved oxygen, the carbon nitrogen ratio (C/N) and the carbon source type in the denitrification process. The denitrification process was potential to create nitrite nitrogen accumulation under the operating conditions. It was confirmed that the denitrification process was affected in the nitrite nitrogen accumulates through further study on nitrogen compounds concentration variation in the biofilter and the denitrifying bacteria. The conclusion showed clearly that the denitrification promoted the nitrite nitrogen accumulates.

【题目】世界橙汁供求状况和我国橙汁产业竞争力分析
【中文关键词】世界和中国;橙汁;生产和消费;产业竞争力
【英文关键词】world and china;orange juice;production and consumption;industry competitive force
【中文摘要】对2000年以来世界橙汁生产和消费的变化情况做了介绍和分析,也描述了中国橙汁生产和消费变化,并对中国今后橙汁生产和消费做了预测;作者还比较和分析了中国橙汁产业竞争力,指出中国生产的橙汁同美国和巴西的相比,在价格、色泽和加工成本上具有明显优势,在原料生产规模、单产和供应期、吨耗率、品质和冷链贮运销系统等方面有劣势。但是改变劣势的潜力很大,一旦化劣势为优势,中国的橙汁生产会像苹果汁生产一样,跃居世界第一。
【英文摘要】Supply and demand situation of orange juice in world since 2000 was discussed,including change and outlook of the situation in China.The competitive force of orange juice industry in China was analyzed and compared with that in USA and Brazil.Chinese orange juice industry had obvious competitive advantages on juice price,color and cost,but disadvantages onProduction scale,productivity and supply term of juice oranges,juice yield by unit oranges,juice quality and storage,transport and sale system under refrigeration condition comparing with that in USA and Brazil.However,the possibility to improve the disadvantages was great, as long as they become advantages,production of orange juice would be the same as apple juice production.Chinese orange juice production would be No one in the world.So it was projected that Chinese orange juice production had gotten into a speedy development stage.

【题目】杂色鲍的遗传育种研究进展
【中文关键词】杂色鲍; 遗传; 育种; 生物技术;
【英文关键词】Haliotis diversicolor; genetics; breeding; biotechnology;
【中文摘要】杂色鲍是我国南方重要的海水养殖种,但近年来因种质退化等原因导致暴发性病害频发,杂色鲍的遗传改良研究对于杂色鲍养殖产业的可持续健康发展十分重要.综合厦门大学贝类遗传育种课题组近10年的研究成果,评述了近年来杂色鲍的生物学特征、选择育种、杂交育种、雌核发育、DNA分子标记开发和利用、遗传图谱构建和QTL定位、功能基因及转基因鲍等方面的研究进展,并提出了今后杂色鲍遗传育种研究的发展思路.

【英文摘要】Haliotis diversicolor is an economically important shellfish species in southern China. However,massive mortality of the Haliotis diversicolor has occurred at post-larval and grow-out stages and production of Haliotis diversicolor has dramatically reduced in recent years. Genetic improvement plays an important role in sustainable development for Haliotis diversicolor aquaculture industry. This review concentrated on advances in genetic and breeding in Haliotis diversicolor, such as biological characteristics, selective breeding, crossbreeding , gynogenesis, molecular markers, genetic linkage map and QTL mapping, functional genes and transgenosis. The further research directions in these topics were also proposed.

【题目】杂色鲍与盘鲍杂交F_1的早期生物学表现
【中文关键词】杂色鲍(Haliotis diversicolor); 盘鲍(H. discus discus); 种间杂交; 卵裂间隔时间; 成活率
【英文关键词】Haliotis diversicolor; Haliotis discus discus; interspecific hybridization; mitotic cycle;survival rate
【中文摘要】比较研究杂色鲍(Haliotis diversicolor)(S)与盘鲍(H. discus discus) (J)正反交F1 及其亲本自繁后代的卵裂速度和孵化速度, 以及杂色鲍与盘鲍杂交F1 及杂色鲍自繁幼体的成活率。在22~23 °C下, 杂色鲍自繁后代的早期发育速度快于盘鲍自繁后代。杂色鲍和盘鲍2 细胞期分别为授精后45.3 min±8.9 min和59.3 min±8.9 min, 卵裂间隔时间分别为21.7 min±2.9 min 和27.0 min±2.6 min, 孵化时间分别为授精后563.4 min 和711.8 min。SJ 和JS 杂交F1 的第一次卵裂速度均比他们的双亲慢, 2 细胞期分别为69.3min±17.5 min 和71.7 min±5.8 min; 而卵裂间隔时间(τ 0)表现出较强的母本效应, 略长于母本, 分别为22.2 min±4.7 min 和31.3 min±6.1 min; 孵化速度均慢于其母本自繁后代, 分别为授精后632.7 min 和授精后874.3 min。计算结果表明, 自繁和杂交胚胎过程发育经历细胞周期数相当, SS、SJ、JJ 和JS 的从2 细胞到孵化经历时间分别相当于23.9 τ 0、25.4 τ 0、24.1 τ 0 和24.8 τ 0。另一方面, SJ 杂交F1 在附着变态阶段大量畸形、死亡, 变态后成活率仅为母本自繁组合的1.2 %, 显现出较高程度的杂交不亲和。本文的研究结果为杂色鲍与盘鲍杂交F1的后续应用开发提供了依据, 也为进一步研究杂交F1的遗传本质及父母本的基因互作关系奠定基础。
【英文摘要】In present study, mitotic intervals, hatching speed and survival rate of embryos produced from reciprocal hybrid cross and pure cross of small abalone (S, Haliotis diversicolor) and Japanese abalone (J, H. discus discus) were investigated. At 22~23 °C, the small abalone developed faster than the Japanese abalone at early stage. The times to reach the two-cell stage were 45.3 min ± 8.9 min post insemination (p.i.) for the small abalone and 59.3 min ± 8.9 min for the Japanese abalone. The small abalone took 21.7 min ± 2.9 min to complete a cleavage cycle and 563.4 min to hatch out, while the Japanese abalone took 31.3 min ± 6.1 min and 711.8 min, respectively. SJ and JS hybrid F1 took more time to two-cell stage than the offspring from both of the control crosses, while their cleavage speed and the hatching speed manifested maternal effect and slower than those of the offspring from the pure cross of their female parent. The calculation result showed that the numbers of mitotic cycles among the crosses were almost equivalent, 23.9 τ 0 for SS, 25.4 τ 0 for SJ, 24.8 τ 0 for JS, and 24.1 τ for JJ. On the other hand, the survival rate of SJ hybrid F1 was very low, only 1.19% relative to the larvae of pure cross of small abalone after attachment and metamorphosis, showing strong hybridization incompatibility. The results of present study would provide essential data for developing further application of hybrid F1 between Haliotis diversicolor and H. discus discus.

【题目】太湖流域粳稻地方品种黑壳子粳抗稻瘟病基因的分子定位
【中文关键词】水稻; 地方品种; 稻瘟病菌; 抗性遗传; 基因定位
【英文关键词】rice; landrace; Magnaporthegrisea; resistance inheritance; genemapping
【中文摘要】以广谱、高抗稻瘟病的太湖流域粳稻地方品种黑壳子粳与感病品种苏御糯杂交,产生F1、F2、F2B3及F5B6重组自交系群体,用日本稻瘟病鉴别菌系北1接种鉴定。黑壳子粳对北1的抗性是由1对显性主效基因控制的,定名为P-i hk1(t)。根据不同杂交世代群体对北1的抗、感反应,结合SSR分子标记,将黑壳子粳中的P-i hk1(t) 基因定位在水稻第11染色体长臂末端,与RM7654和RM27381两个标记的遗传距离分别为0.9cM和1.6cM。
【英文摘要】Abstract: A japonica landrace Heikezijing from the Taihu Lake area, with high resistance to rice blast (Magnaporthe grisea), was crossed with a susceptible variety Suyunuo to get F1, F2 andF2B3 populations. The recombined inbred lines F5:6 were obtained from F2 generation by means of single seed descendant method. The parents, F1, F2, F2:3 andF5:6 populations were inoculated with Japanese blast strain Hoku1 to illustrate the inheritance of resistance to the rice blast in Heikezijing. The resistance toHoku1inHeikezijing was controlled by one dominant gene, tentatively designated as P-i hk1(t). The gene P-i hk1(t) was further mapped based on the reaction to the rice blast in various generations, combined with SSR molecular markers. It was located on the end of long arm of chromosome11 and linked to the markers RM7654 and RM27381, with a distance of 0.9cM and 1.6cM, respectively.

【题目】提高石榴坐果率及不同负载量对果实横径、单果重的影响初报
【中文关键词】石榴、坐果率、果实纵横经、单果重
【英文关键词】Kashi,pomegranate,setting percentage,fruit diameter,fruit weight
【中文摘要】【目的】提高喀什噶尔甜石榴坐果率、增大单果重及果实横径,以增加其商品性。【方法】以6年生喀什噶尔甜石榴为试材,调查春季施肥、花期喷施不同药剂和不同负载量对石榴坐果率、平均单果重、果实横径的影响。【结果】GA3可显著提高坐果率,高于CK29.0%以上,不同浓度GA3以20和30mg/L表现最好;GA3与花蕾保、硼砂、磷酸二氢钾及CK之间差异显著。8种施肥组合对头茬花坐果率影响差异不显著;施肥组合a、A可显著提高二茬花的坐果率,分别较CK高5.37%和6.00%。不同负载量对果实横径及单果重的增大效果均为20>30>40(果),单株留20、30与40果的果实横径间差异显著,3种留果量的单果重之间无差异。单株留20、30果的单果重均在400g以上,达到一级优质果。8种施肥组合对单果重的影响无差异。【结论】花期喷施20和30mg/L的GA3可显著提高坐果率;施肥组合a、A可显著提高二茬花的坐果率;3种负载量对单果重和果实横径的增大效果依次为20>30>40(果)。
【英文摘要】Abstract: Objective ,To raise setting percentage, increase fruit diameter and weight per f rui t to improve fruit quality. Method, The effect of spring fertilizer application, spraying dif ferent a gents and load quantity on these thing percentage, fruit diameter and weight per fruit were investigated based on 6 year old Kashi pomegranate.Result,GA3 can raise the setting percentage significantly, which were 29.0% higher than CK. Both 20 mg/ L and30 mg/ L GA3 were sui table to raise setting percentage. There were significant differences between GA3, other treatments (Hualeibao, Borat, KH2PO4) and CK. The fertilizer combination a, A can raise setting percentage significantly, it was 5. 37% and 6. 00% higher than CK. Augment effect of different load quantity on f rui t diameter and

weight per fruit both were 20 fruits> 30 fru ts> 40 fruits. The weight per fruit of retained 20, 30 fruits per plant both were over 400 g, which reached high class. The effect of 8 fertilizer combinations on weight per plant showed no difference. Conclus -ion,The setting percentage were raised significantly by GA3 (20 mg/L and 30 mg/ L) and fertilizer combination(a , A) . Augment effect of 3 crop loads on weight per fruit and fruit diameter was sequenced as follows: 20 fruits> 30 fruits> 40 fruits.

【题目】扁桃棉花间作对棉花品质的影响
【中文关键词】扁桃棉花间作,品质,影响
【英文关键词】almond and cotton intercropping, quality, influence
【中文摘要】目的:探明扁桃棉花间作对棉花品质的影响。方法:以大田棉花为对照(CK) , 与 22 年生扁桃树下间作棉花品质进行比较研究。结果:扁棉间作降低了树冠附近棉花的品质, 棉花的棉纤维长度、 整齐度、 强度、 伸长率、 可纺系数和成熟度指数 6个指标 CK> 树冠外侧 2 m 处> 垂直树冠处> 树冠内侧第一行, 距离树干越近,棉花各指标数值越小; 棉花短绒指数和马克隆值 2 个指标 CK< 树冠外侧 2 m处< 垂直树冠处< 树冠内侧第一行,距离树干越近, 数值越大。=结论>扁桃棉花间作系统中扁桃树冠对棉花品质影响显著, 距离树干越近,影响越大, 测试的 8个指标中扁棉间作对棉纤维长度、 纤维强度和马克隆值的影响最为显著。
【英文摘要】Abstract: Objective, To investigate the effect of almond and cot ton intercropping quality on the quality of cotton . Method, Using field cotton as CK, the quality of the cot ton intercropped under the 22- year old almond tree was compared and analyzed. =Result>Almond and cotton intercropping decreased the quality of cotton close to the tree canopy. When comparing the six indexes of the cotton fiber length, uniformity, CN/ tex elongation, SCI and maturity, the result was that CK> cotton around 2 m at the external canopy > vertical canopy> firs t row inside canopy. The closer to the tree trunk, the samller of the value of each index . For the cotton SFI and Micronaire values, the result was CK< cotton around 2 m at the external canopy< vertical canopy< first row inside canopy. The closer the tree trunk, the bigger of the value of each index. Conclusion, Quality of cotton was influenced by almond and cotton intercropping, and the almond tree canopy has significant effect on cotton quality. The closer to the tree trunk, the bigger the effect is . For the eight tested indexes, almond and cotton intercropping has the most significantimpact on the length, CN/ tex and Micronaire of cotton fiber.

【题目】引进美国扁桃品种间授粉坐果率的比较
【中文关键词】美国扁桃; 授粉方式;坐果率
【英文关键词】American almond; pollination method; fruit setting percentage;
【中文摘要】目的,确定引进美国扁桃品种间授粉搭配最佳的组合。方法,以 Nonpareil、 Sonora、 Mission、 Thompson、 Nepulusultera、 Butte 6个品种花粉对其坐果率的影响为研究对象。结果,用 Nonpareil、 Sonora、 Mission、 Thompson、 Butte对 Nepulusultera 授粉, 其平 均坐 果率为 31%、 19%、 14%、 15% 和 29%。用 Sonora、 Mission、 Thompson、 Nepulusultera、 Butte对 Nonpareil 授粉, 其平均坐果率为 35%、 32%、 22%、 31% 和 38%。用 Nonpareil、 Mission、 Thompson、 Nepulusultera、 Butte 对 Sonora 授粉, 其平均坐果率为 37%、 31%、 31%、 33% 和 20%。结论, Sonora、 Butte、 Nonpareil 为 Nepulusultera最佳授粉品种, Missi on、 Sonora、 Butte、 Nepulusultera 为 Nonpareil 最佳授粉品种,Nonpareil、

Thompson、 Nepulusul tera、 Mission 为 Sonora最佳授粉品种。
【英文摘要】Abstract : Objective, To confirm the optimum combination of the introduced American almonds with pollination between varieties. Method, Taking the six varieties of Nonpareil, Sonora, Mission, Thompson, Nepulusultera and Butte and study the effect of their pollens on fruit setting percentage. Result, The result shows that: the average fruit setting percentage were 31%, 19%, 14% , 15% and 29% respectively, by Nepulusultera pollinated with Nonpareil, Sonora, Mission, Thompson and Butte; the average fruit setting precentage were 35%,32% , 22%, 31% and 38%, by Nonpareil pollinated with Sonora, Mission, Thompson, Nepulusultera and Butte;the average fruit setting percentage were 37% , 31%, 31%, 33% and 20% , by Sonora pollinated with Nonpareil ,Mission, Thompson, Nepulusultera and Butte. Conclusion, Sonora, Butte and Nonpareil are the optimum pollination varieties for Nepulusultera; Mission, Sonora, Butte and Nepulusultera are the optimum pollination varieties for Nonpareil; Nonpareil, Thompson, Nepulusultera and Mission are the optimum pollination varieties for Sonora.

【题目】影响喀什石榴裂果相关因素的初步研究
【中文关键词】喀什; 石榴;裂果
【英文关键词】Kashi; Punicaceae punica L. ; frui t cracking
【中文摘要】目的,探寻降低喀什石榴裂果率的措施, 以提高其商品性。方法,以 6年生喀什噶尔甜石榴为试材,研究间作、套袋、 喷施 CaCl2和激素、 树盘覆盖及土壤负压等对裂果的影响。=结果>果实膨大期果面喷 GA3 可显著降低裂果率, GA3较 CK 可降低裂果率近 20%, GA3 各浓度间无差异;果面喷 20 mg/ L NAA 的裂果率高于CK 并与 GA3 差异显著, 其余浓度与GA3间均无差异。果实膨大期树冠喷施 CaCl2 溶液有利于降低裂果率, 可降低 7%左右。树盘覆草、 覆膜对降低成熟期石榴裂果率有一定效果,其中覆膜的效果较好,可降低裂果率近9%。套袋可较 CK 降低裂果率 7. 4%。不同间作物对石榴裂果的影响略有不同。初步认为 64 kPa 是石榴裂果明显增加的土壤负压阈值,在出现裂果之前将土壤负压控制在 64 kPa以下有利于控制裂果。结论,果实膨大期果面喷GA3可显著降低裂果率, 果面喷 NAA 亦可降低裂果率,但其效果明显逊于 GA3; 果实膨大期树冠喷施 CaCl2溶液可降低裂果率 7%左右;套袋有利于降低裂果率,可较 CK 降低 7. 4%; 树盘覆盖杂草和薄膜对降低成熟期石榴裂果率有一定效果。
【英文摘要】Abstract: Objective, The main aim of this study was to depress the percentage of fruit cracking to improve fruit quality. Method, The experimentation such as intercropping, bagging, spraying CaCl2 and hormone, covering ridge, soil under pressure were studied by using 6 years old Kashi pomegranate. Result, Spraying GA3 on fruit can reduce fruit cracking percentage in fruit expansion period by 20% by comparison with CK. The fruit cracking percentage of the fruit sprayed with NAA 20mg/ l was higher than that CK and was significantly diferent with GA3.Spraying CaCl2 on tree crown can decrease the fruit cracking percentage by 7% than CK. Covering ridge with weeds and plastic f i lm are helpful to reduce the fruit cracking percentage, plastic film can decrease the fruit cracking percentage by 9% . Bagging paper bag can reduce by 7. 4% compared with CK. Initial result showed that 64 kPa is threshold value of soil under pressure that fruit cracking percentage increase obviously. Control ling the soil under pressure under 64 kPa is of help of reducing the fruit cracking percentage before fruit cracking. Conclusion,Spraying GA3 on fruit at expansion stage can reduce fruit cracking percentage significantly. Spraying NAA is advantageous effectively to depress fruit cracking percentage but it inferior to GA3. Spraying CaCl2 on tree crown can depress the fruit cracking percentage by 7% than CK. Bagging can depress the fruit cracking percentage by 7. 4% than CK. Covering ridge with weeds and plastic film are helpful to depress the fruit cracking pecentage.

【题目】蜜蜂辅助授粉对新疆扁桃坐果率的影响
【中文关键词】蜜蜂; 辅助授粉;扁桃; 坐果率
【英文关键词】honeybees; assistant pollination; almond; fruit setting percentage
【中文摘要】目的,利用蜜蜂辅助授粉提高新疆扁桃的坐果率。=方法>以不放蜜蜂扁桃园为对照(CK) , 通过对扁桃园花期蜜蜂的放蜂量、 放蜂时间和蜜蜂的传粉距离的比较研究。结果,放蜂量越大,扁桃的坐果率越高,花蕾露红期放蜂量为1箱/ 1 334 m2 (2 亩)时效果最宜,扁桃坐果率比对照提高了 7. 47倍, 差异显著; 蜜蜂是沿花行进行采蜜的,距蜂箱越远扁桃坐果率越低,蜜蜂的传粉距离在 100 m 左右。=结论>新疆扁桃园放蜂可显著提高扁桃的坐果率,在扁桃花蕾露红期放蜂,放蜂量不少于 1 箱/ 1 334 m2(2亩) ,且每隔 100 m 摆放蜂箱。
【英文摘要】Abstract: Objective, In order to raise fruit setting percentage of Xinjiang Almond. Method, The comparative study was conducted on scalar and deliver time of honeybee and dislance of pollination using the almond garden without honeybee as CK. =Result>the result showed that (1) the more honeybee scalar there are in the almond garden , the higher the fruit setting percentage is. The delivering amount of honeybee in one box every two mu is the most suitable at initial budding stage. The fruit setting percentage of almond is 7. 47 times higher than that of CK; (2)Honeybee gather nectar from flowers along the flower rows. The longer the distance between boxes there is , the lower the fruit setting percentage is. Usually, honeybee gather pollination from flowers within distance of 100 m. Conclusion, The delivering honeybee in almond garden could raise fruit setting percentage in Xin jiang. The suitable method is as follows: Honeybee are delivered at initial budding stage. There is one honeybee box every two 100 m.

【题目】欧洲李不同品种授粉结实性试验研究
【中文关键词】欧洲李; 品种;授粉; 坐果率
【英文关键词】P . domestica L. ; variety; pollination; fruit setting percentage
【中文摘要】摘 要:目的,筛选欧洲李适宜授粉品种, 为新疆欧洲李研究和生产上合理配置授粉品种提供技术依据。方法,以法兰西、 斯泰勒和女神 3个欧洲李品种为试材,对不同品种自花坐果率、 自然坐果率和人工异花授粉坐果率进行了试验研究。结果,(1) 3 个欧洲李品种自花坐果率为 0%~ 3. 05%; (2) 不同的人工异花授粉组合坐果率比对照提高了- 4. 59% ~ 11. 49%;结论,3 个品种自花坐果率低或极低, 均为自交不亲和品种;法兰西自然坐果率低,斯泰勒和女神中等; 最佳授粉组合为法兰西和女神, 斯泰勒和女神可互为授粉品种。
【英文摘要】Abstract: Objective and Method,The self-pollination setting percentage, natural setting percentage, and artificial cross-pollination setting percentage were stuidied on three varieties of P . domestical. (France, Stanley, Empres s) to select the suitable pollinator and provide technology basis for the research on P. domestica L. in Xinjiang and the reasonable disposal of pollination varieties for its production. Result, The result showed that the self-pollination fruit setting percentage of three P . domestica L. were 0% ~ 3. 05% . The setting percentage of artificial cross-pollination combination were - 4. 59~ 11. 49% higher than CK. =Conclusion>Three varieties show self- incompatibility, they have a very low self- pollination setting percentage. The natural setting percentage of France was low, Stanley and Empress were better than France. The best combinations are France @ Empress, Stanley and Empress can pollinate effectively with each other.

【题目】欧洲李不同品种晾晒制干特性研究
【中文关键词】欧洲李; 品种;晾晒制干
【英文关键词】Prunus domestica; variety; open sun drying
【中文摘要】目的,研究欧洲李不同品种在南疆地区晾晒制干特性,为欧洲李干制品种选择和制干提供借鉴。方法,以新疆喀什地区伽师县种植的 3 个欧洲李品种法兰西、 斯泰勒、 女神为试验材料,在果实成熟后进行自然晾晒制干,分析 3 个品种果实经济性状、 成熟期、 失水率等对晾晒制干的影响, 对 3 个品种晾晒制干特性进行评价。结果,品种法兰西由于成熟早、 可溶性固形物含量高, 自然晾晒 30 d 能够干燥; 斯泰勒较法兰西晚熟10~ 15 d, 果实较大,自然晾晒 36 d能够干燥; 女神成熟最晚, 果实最大, 自然晾晒需要的时间长且不易干燥。结论,在南疆地区采用自然晾晒的方法,法兰西和斯泰勒 2 个欧洲李品种适宜自然晾晒制干,品种女神则不适宜自然晾晒制干。
【英文摘要】Abstracts : Objective, To study the open sun drying characteristics of different European plums (Prunus dome stica L.) varieties in the southern part of Xinjiang in order to provide references for the drying of European plums and variety selection. Method,Using three varieties of European plums of France, Stanley and Empress which were planted in Peyziwat county of Kashi Prefecture as the experimental materials, collected different varieties fruits on the harvest date and using the method of open sun drying, analysed the effect of fruit economic characteristics, harvest date and dehydration rate on open sun drying, and then evaluated the drying characteristics of different varieties. Result, The research results demons trated that as France has early harvest date and higher soluble solids content , it dries in 30 days; the harvest date of Stanley was 10- 15 days later than France and its fruit was bigger than France, drying days was 36 days; Empress has latest harvest date and biggest fruit , which makes drying difficult and takes longer time. Conclusion,It can be concluded that when using the method of open sun drying in the southern part of Xinjiang, France and Stanley are suitable for natural open sun drying, while Empress is not suitable for such drying.

【题目】阿月浑子快速建园技术研究初报
【中文关键词】阿月浑子,层积处理,直播
【英文关键词】Pistachio, stratification, direct seeding
【中文摘要】以阿月浑子种子为试材,研究不同层积处理时间对种子发芽的影响,探讨阿月浑子直播、小营养钵移栽、大营养袋移栽3种建园方式对苗木生长及嫁接成园的影响。提出适合于南疆地区的阿月浑子快速建园方式和技术操作要点。结果表明:阿月浑子种子层积40d的发芽率可达90%以上,延长层积时间能够促进未开裂种子开裂发芽。3种建园方式中,直播建园具有操作简便,建园成本低等优点,同时直播建园和小营养钵移栽建园方式的苗木成活率、嫁接成苗率都较大营养袋移栽建园方式更高。以阿月浑子快速建园为目标,实际生产中以直播建园为主,配合小营养钵移栽补苗的方式为最佳建园方式。
【英文摘要】Using pistachio seeds as the experimental materials, the effect of different stratification time on seed germination were studied and the influence of three orchard establishing methods direct seeding, small nutrition pot transplanting and nutrition pot transplanting on seeding growth and grafting were investigated, then the methods and major technologies of rapid establishing pistachio orchard which was suitable for the area of southern xinjiang was developed.As a goal of rapid establishing orchard of pistachio, in actual production, direct seeding primarily, coordinate small nutrition pot transplanting was the best recommendation.

【题目】鲍体表黏液的几种免疫酶比活力的比较
【中文关键词】鲍; 杂色鲍; 体表黏液; ACP; AKP; T-SOD;
【英文关键词】abalone; H.diversicolor; body surface mucus; ACP; AKP; T-SOD;
【中文摘要】为探索鲍体表黏液的免疫机制,利用生化测定的方法对杂色鲍(Haliotis diversicolor)、皱纹盘鲍(Haliotis discus)、西氏鲍(Haliotis sieboldii Reeve)及杂色鲍不同杂交群体鲍体表黏液中的酸性磷酸酶(ACP)、碱性磷酸酶(AKP)、总超氧化物歧化酶(T-SOD)的比活力进行了测定,并比较了它们之间的差异.结果表明在3种不同鲍中,西氏鲍体表黏液中AKP、T-SOD的比活力最强,显著高于杂色鲍台湾群体,这与生产实践中西氏鲍抗逆性强、存活量高相吻合,推测AKP、T-SOD是较好的免疫指标性酶;而在杂色鲍不同的杂交群体间,台湾♀×F1♂杂交群体与F1♀×台湾♂杂交群体体表黏液中3种酶比活力均最高,推测这种杂交方式能够产生较强的杂种优势.本研究有助于为鲍的选育和病害的防治提供参考.
【英文摘要】Abalone is the most important breeding species in south of China, in recent years, because of aggravated germplasm, environmental pollution and degradation, abalone farms face serious disease threat. Need to understand mucus immunity. In this paper,using the method of biochemical, in Haliotis diversicolor, Haliotis discus hannai, Haliotis sieboldii Reeve and different hybrid populations of H.diversicolor abalone body surface mucus,the specific activities of total superoxide dismutase(T-SOD), acid phosphatase(ACP), alkaline phosphatase(AKP) were measured and compared. The results show that AKP and T-SOD specific activity of the H. sieboldii Reeve are highest in three different species abalones body surface musus, significantly higher than that of Taiwan abalone populations, the results consistent with strong resistance and high survival rates of H. sieboldii Reeve during production practices. The results suggest that AKP and T-SOD are better indicator of immune activity. In different hybrid populations of H. diversicolor, the body surface mucus are the highest enzyme specific activity in the hybrid populations of F1♂× ♀ Taiwan and Taiwan♂× F1♀, it suggest that this hybrid approach maybe produce strong heterosis. This study contributes to abalone breeding and disease prevention.

【题目】2-A Mutation at Exon 3 of KIF-1 Gene of Three Goat Breeds in China
【中文关键词】无
【英文关键词】KIF ; PCR-RFLP, SNP, genotype
【中文摘要】无
【英文摘要】Keratin Intermediate-Filament (KIF) proteins form the main structural elements of a wool fibre. In this study, PCR-RFLP and DNA sequencing methods were used to detect polymorphisms of KIF-1 gene in 786 samples of 3 Xinjiang local goat breeds (Xinjiang, Nanjiang Cashmere and Bogeda Cashmere goat). The results showed that KIF-1-P3 locus has polymorphisms. The frequencies of genotype AA were 0.675, 0.577 and 0.766, genotype AB were 0.296, 0.400 and 0.234, genotype BB were 0.030, 0.023 and 0.000 for Xinjiang, Nanjiang Cashmere and Bogeda Cashmere goat breeds, respectively. The genotypic distributions were in disagreement with Hardy-Weinberg equilibrium in Nanjiang Cashmere goat breed. In addition, the mutation was detected at KIF-1-P3 locus by DNA sequencing method, a novel of SNP was revealed in exon 3 (Genebank M23912: c.3212 C>T) and it belongs to synonymous mutation. However, there is no significant difference in Xinjiang goat breed between polymorphisms of the KIF-1 gene and cashmere production traits (fineness, thickness, yield and body weight after combing). Moreover, analysis of variance indicated that various genotypes in the 3 Xinjiang goat breeds were highly significant ($p<0.01$).

【题目】氯霉素暴露对杂色鲍免疫活性的影响
【中文关键词】海洋生物学; 杂色鲍; 氯霉素; 免疫; 吞噬; 高温胁迫
【英文关键词】marine biology; Haliotis diversicolor; chloromycetin; immunity; phagocytosis; high temperature stress
【中文摘要】杂色鲍的免疫机能主要是由血细胞以吞噬的方式来完成.本研究将杂色鲍分别暴露在1、2、5μg/cm3不同含量氯霉素的水体中60 d(每天暴露4 h),检测其主要免疫指标的变化.实验结果表明,经氯霉素暴露实验后,杂色鲍的主要免疫指标出现了下降.对照组与各药物含量组(1、2、5μg/cm3)中杂色鲍血细胞对溶藻弧菌的吞噬率分别为89.83%±3.66%、75.33%±4.89%、68.67%±5.05%和37.00%±9.21%;其吞噬指数分别为3.84±0.27、2.54±0.35、2.12±0.47和1.18±0.32;其血细胞密度分别为(2.72±0.33)×107、(1.87±0.09)×107、(1.46±0.17)×107、(1.03±0.14)×107个/cm3.对照组与各药物含量组在水温31°C高温胁迫下杂色鲍半致死时间(LT50)分别为10、8、6、4 h.各实验组的壳长、体重生长率、成活率与对照组比较,高含量组均显著小于对照组.含量为1μg/cm3和2μg/cm3的氯霉素暴露对杂色鲍的生长有轻微的促进作用.各实验组酸性磷酸酶(ACP)、碱性磷酸酶(AKP)、超氧化物歧化酶(SOD)的酶活指标变化与氯霉素的暴露含量无明显相关性。
【英文摘要】Antibiotics are often used for disease prevention in the breeding of abalone.However,the effect of antibiotics on abalone disease prevention is often unstable,and the abuse of antibiotics has had adverse effects on the ecological environment,and may in fact endanger food safety. Furthermore,antibiotics may damage the immune system of abalone and increase the death rate of abalone. Therefore,studying the influence of antibiotics on immune characteristics in Haliotis diversicolor has important practical significance and application value.After exposure in 0,1,2,and 5 μg /cm3 chloromycetin for 60 days (4 h every day) ,the main immune indices of H.diversicolor were measured. Our study indicated that some indices declined upon treatment with antibiotics.The phagocytosisrate (%) of blood corpuscles to Vibiro alginolyticus in 0,1,2,and 5 μg /cm3 were 89.83 ± 3.66,75.33 ± 4.89,68.67 ± 5.05,and 37.00 ± 9.21,respectively. The phagocytosis index for each treatment was 3.84 ± 0. 27,2.54 ± 0.35,2.12 ± 0.47,and 1.18 ± 0.32,respectively. The blood corpuscles density also decreased after chloromycetin exposure,with (2.72 ± 0.33) × 107 cells /cm3,(1.87 ± 0.09) × 107 cells /cm3,(1.46 ± 0. 17) × 107 cells /cm3,and (1.03 ± 0.14) × 107 cells /cm3 for 0,1,2,and 5 μg /cm3 chloromycetin,respectively.The activity of the exposed abalone was determined by stressing at 31°C water temperature. The LT50 for 0,1,2,and 5 μg /cm3 treatments were determined to be 10,8,6,and 4 h,respectively. The shell growth,weight growth and survival rate,under treatments were significantly lower than those of the control group. The 1 and 2 μg /cm3chloromycetin exposures were observed to have a slight positive effect on the growth of H. diversicolor.However,changes in activities of ACP,AKP,and SOD had no correlation with chloromycetin exposure. The current study showed thatmultiple immune indices all declined in H.diversicolor after the treatment with chloramphenicol; therefore,longtermuse of antibiotics is likely to have adverse effects on immune and other physiological functions important for the breeding of abalone.

【题目】Characterization of plant growth-promoting Bacillus edaphicus NBT and its effect on lead uptake by Indian mustard in a lead-amended soil
【中文关键词】土壤芽胞杆菌;铅;特性;印度芥菜;铅积累
【英文关键词】Bacillus edaphicus NBT; Pb; Characteristics; Indian mustard; Lead accumulation

【中文摘要】对重金属抗性细菌土壤芽胞杆菌NBT菌株的特性进行了分析。同时在添加不同含量铅的土壤中分析了该菌株对印度芥菜生长和富集土壤铅的影响。研究表明,该菌株能够溶解碳酸铅和活化土壤中的铅,产生生长素、铁载体和ACC脱氨酶。在铅污染土壤中该菌株增加印度芥菜根和地上部生物量。接菌处理可以显著提高植物对铅的富集能力。该菌株能够在印度芥菜根际土壤中成功定殖。

【英文摘要】The plant growth promotion characteristics of a heavy metal-resistant strain of Bacillus edaphicus NBT was characterized. The strain was also evaluated for promoting plant growth and lead uptake of Brassica juncea L. Czern (Indian mustard) in soil artificially contaminated with 0, 400 and 800 mg • kg-1 of Pb. Atomic absorption spectrometer (AAS) analysis demonstrated that strain NBT could release water-soluble Pb from lead carbonate in the solution. Strain NBT had the capacity to produce indole acetic acid (IAA), siderophores and 1-aminocyclopropane-1-carboxylate (ACC) deaminase. Low and high Pb treatments significantly decreased the growth of Indian mustard. Inoculation with strain NBT was found to increase root dry weight (ranging from 16% to 22%) and above-ground tissue dry weight (ranging from 24% to 30%) of Indian mustard in the Pb amended soil. Strain NBT was able to mobilize Pb efficiently in plants in Pb-amended soil. In the soil treated with 400 mg and 800 mg Pb • kg-1, increase in Pb uptake varied from 18 to 46% in live bacterium-inoculated Indian mustard plants compared to dead bacterium-inoculated control. The strain was also able to colonize and develop in the rhizosphere soil of Indian mustard after root inoculation.

【题目】Characterization of heavy metal-resistant endophytic bacteria from rape (Brassica napus) roots and their potential in promoting the growth and lead accumulation of rape

【中文关键词】重金属抗性植物内生细菌;植物促生作用;生长素;铁载体;1-氨基-环丙烷-1-羧酸;油菜;植物提取

【英文关键词】Heavy metal-resistant endophytic bacteria; Plant growth promotion; IAA; Siderophore; ACC; Rape; Phytoextraction

【中文摘要】从重金属污染土壤中生长的油菜根内分离筛选到两株内生细菌并对其特性进行了分析。盆栽条件下研究了菌株对油菜生长与富集铅的影响。经16S rDNA 分析该菌株被鉴定为荧光假单胞菌和微杆菌。供试菌株对多种重金属和抗生素均表现出抗性,能够溶解难溶性铅,产生生长素、铁载体和1-氨基-环丙烷-1-羧酸脱氨酶,试验表明供试菌株可以显著促进植物生长和对重金属铅的吸收能力。另外,供试菌株可以在油菜根际土壤中成功定殖。

【英文摘要】Two lead (Pb)-resistant endophytic bacteria were isolated from rape roots grown in heavy metal-contaminated soils and characterized. A pot experiment was conducted for investigating the capability of the two isolates to promote the growth and Pb uptake of rape from Pb-amended soil. The two isolates were identified as Pseudomonas fluorescens G10 and Microbacterium sp. G16 based on the 16S rDNA gene sequence analysis. Strains G10 and G16 exhibited different multiple heavy metal and antibiotic resistance characteristics and increased water-soluble Pb in solution and in Pb-added soil. Root elongation assays demonstrated increases in root elongation of inoculated rape seedlings compared to the control plants. Strain G16 produced indole acetic acid, siderophores and 1-aminocyclopropane-1-carboxylate deaminase. Increases in biomass production and total Pb uptake in the bacteria-inoculated plants were obtained compared to the control. The two strains could colonize the root interior and rhizosphere soil of rape after root inoculation.

【题目】Effects of inoculation of biosurfactant-producing Bacillus sp. J119 on plant growth and cadmium uptake in a cadmium-amended soil
【中文关键词】表面活性剂产生菌;镉;植物修复;油菜;玉米;苏丹草;番茄
【英文关键词】Biosurfactant-producing bacterium; Cd; Phytoremediation; Rape; Maize; Sudangrass; Tomato
【中文摘要】对一株分离自重金属污染土壤中的产生物表面活性剂芽胞杆菌J119菌株的植物促生特性和重金属、抗生素抗性进行了分析。盆栽条件下研究了该菌株对油菜、玉米、苏丹草和番茄生长和吸收重金属镉的效应。结果表明,该菌株对多种重金属(铅、镉、铜、镍和锌)和抗生素(卡那霉素、链霉素、氨卞青霉素、四环素和利福平)表现出抗性。菌株能够产生长素和铁载体。镉处理没有显著降低番茄、玉米和油菜的生长,但显著降低了苏丹草的生长。在镉污染土壤中,接菌处理番茄地上部和根生物量分别比对照增加24%和59%。接菌处理与接灭活菌对照相比,玉米和苏丹草地上部和根的生物量没有明显差异。在镉含量为50 mg Cd kg − 1的土壤中,接活菌处理的植物地上部镉含量比接灭活菌对照增加39-70%。另外,在供试植物中番茄对镉的富集能力最好。该菌株能够在植物根际土壤成功定殖。
【英文摘要】A biosurfactant-producing Bacillus sp. J119 isolated from heavy metal contaminated soils was investigated for its effects on the plant growth promoting characteristics and heavy metal and antibiotic resistance. A pot experiment was conducted for investigating the capability of the biosurfactant-producing bacterial strain Bacillus sp. J119 to promote the plant growth and cadmium uptake of rape, maize, sudangrass and tomato in soil artificially contaminated with different levels of cadmium (Cd) (0 and 50 mg kg − 1). The strain was found to exhibit different multiple heavy metal (Pb, Cd, Cu, Ni and Zn) and antibiotic (kanamycin, streptomycin, ampicillin, tetracycline and rifampin) resistance characteristics. The strain had the capacity to produce indole acetic acid (IAA) and siderophores. Cd treatment did not significantly decreased growth of tomato, maize and rape plants, but Cd treatment significantly decreased growth of sudangrass ($p < 0.05$). In the Cd-added soil, above-ground biomass and root dry weights of tomatoes were increased by 24 and 59%, respectively, in live bacterial inoculation compared to dead bacterial inoculation control. There were no obvious differences in the above-ground tissue and root dry weight of maize and sudangrass between live bacterial inoculation and dead bacterial inoculation. In the soil treated with 50 mg Cd kg − 1, increase in above-ground tissue Cd content varied from 39 to 70% in live bacterium-inoculated plants compared to dead bacterium-inoculated control. In addition, among the inoculated plants, tomato was the greatest Cd accumulator. The bacterial strain was also able to colonize and develop in the rhizosphere soils after root inoculation.

【题目】中国美利奴羊CTNNB1基因SNP与羊毛直径关联分析
【中文关键词】中国美利奴羊; CTNNB1; 多态性; 羊毛纤维直径
【英文关键词】Chinese Merino sheep; CTNNB1; polymorphism; wool fiber diameter
【中文摘要】以874只中国美利奴羊为研究对象,通过对与毛囊发生相关的CTNNB1基因SNP检测,应用SAS软件拟合线性模型,对CTNNB1基因SNP位点与羊毛直径性状进行关联分析。发现CTNNB1基因的819G>A、974A>G等2个位点与羊毛纤维直径显著相关,其中819G>A位点中,GA基因型对羊毛纤维直径是优势基因;974A>G位点中AA对羊毛纤维直径是优势基因型。上述结果为CTNNB1基因819G>A、974A>G位点作为细毛羊羊毛直径性状的分子标记提供了理论依据。
【英文摘要】874 Chinese Merino sheep were used to examine the SNP(single nucleotide polymorphism)of CTNNB1 gene.A G/A mutation was identified at position of 819G>A in CTNNB1 gene,another A/G mutation was identified at position of 974A>G.The effects of the mutations on the WFB(wool fiber diameter)traits were analyzed.The results showed that genotype GA was dominant for WFD at position of 819G>A.The AA genotype of 974A>G was the dominant genotype for WFD.The two mutations might be good markers for the wool fiber diameter of fine wool sheep

【题目】利用数字图像分析法评价油菜种子颜色
【中文关键词】油菜;种子颜色;数字图像分析;颜色空间
【英文关键词】rape;seed color;digital image analysis;color space
【中文摘要】为了客观方便地评价油菜种子颜色,研究探索了数字图像分析评价方法.随机选取籽粒颜色不同的甘蓝型油菜30份,采用扫描仪获取种子的数字图像,通过建立色彩描述文件(ICC Profile)对图像进行颜色校正后,再运用自行编制软件"RSCA"采集种子颜色值.主要对油菜种子颜色在颜色空间RGB、CIEL*a*b*、HSB中的特征,目测颜色等级与各颜色分量的相关性进行了分析.结果表明:RGB颜色模型的R分量是一个理想的油菜种子颜色等级衡量尺度,数字图像分析法评价油菜种子颜色是可行的.
【英文摘要】In order tO evaluate rape seed color obj ectively and conveniently,a method for evaluating rapeseed color by digital image analysis was explored.The sample consisted of thirty accessions of randomlyselected rape seed with different color.The seed digital images were obtained by a scanner and the colorvalues of the seeds were colleted by self—written software “ RSCA ’ ’after the digital images were calibratedby ICC Profile.The characteristics of rape seed color in color space RGB,CIEL a b and HSB,and thecorrelation between color index(CI)and each color factor were discussed.The result indicated that R fac—tor of color ’ space RGB is an ideal scale for evaluating the color index of rape seed,and Using digital imageanalysis tO evaluate the color of rape seed is feasible.

【题目】我国绵羊与山羊品种资源的研究进展
【中文关键词】品种资源; 绵羊; 山羊品种; 遗传多样性; 山羊育种; 波尔山羊; 亲缘关系; 研究进展; 本地山羊; 小尾寒羊;
【英文关键词】no

【中文摘要】在国际市场上,中国绵羊、山羊的饲养量、出栏量、羊肉产量、羊皮产量、羊绒产量均居世界首位。中国绵羊、山羊品种资源类型十分丰富,分布范围广泛,经数千年来的驯化、培养和选育,在不同的生态类型下形成了对当地自然环境适应性很强的品种和类群,包括有繁殖率高、产绒量高、羔皮用和裘皮用等专门化的品种,在生产性能方面表现出了各自的特点,满足了不同的社会需求。改革开放之后,我国更是加强了对绵羊、山羊品种资源的基础性研究工作,并随着近年的分子生物学、分子遗传学、基因工程等科技手段的广泛运用,开展了对重要品种种质特性、开发利用、遗传特性等方面的系统研究。

【题目】吉林省超细毛羊选育与羊毛分级拍卖
【中文关键词】超细毛羊选育 羊毛分级 拍卖
【英文关键词】no
【中文摘要】自90 年代初开始,人们对毛纺服饰需求发生了显著变化,轻薄高档毛织品受到青睐,毛纺企业对细型毛和超细毛需求逐渐增加,羊毛细度对价格的形响程度也不断扩大,羊毛越细纺织加工附加值越高。在肉毛比价方面,近十年来羊毛价格一直处于劣势。在与化学纤维的竞争当中,普通类型羊毛没有优势。 世界主要细毛羊生产国都积极发展细毛型和超细型细毛羊,使毛纺织品在高端纺织品市场能够继续占有份顿,促进细毛羊业发展。在农业部的组织下,新疆和吉林两地区于2002 年培育成功新吉细毛羊,属于细毛型。在选育过程当中也出现了被毛细度为80支的个体,吉林省以此为基础开展超细型选育,在细毛羊优势地区向生产细型、超细型精品细羊毛方向发展,提高饲养细毛羊生产经济效益

【题目】枯草芽孢杆菌fmbJ株产生的脂肽抗球虫作用研究
【中文关键词】枯草芽孢杆菌;脂肽;抗球虫指数;溶血;柔嫩艾美耳球虫;
【英文关键词】Bacillus subtilis;lipopeptide;anticoccidial index;hemolysis;Eimeria tenella;
【中文摘要】目的探讨枯草芽孢杆菌fmbJ株产生的脂肽抗鸡柔嫩艾美耳球虫的效果,并对其溶血活性进行测定。方法选取7 d龄雏鸡75只随机分为5组,分别为感染不用药组、抗球虫药(氨丙啉)饮水组、灌胃脂肽组、肌肉注射脂肽组及不感染不用药组。除不感染不用药组外各组均人工感染1×105个孢子化卵囊。于感染后第7 d收集粪便、第9 d剖杀观察各组抗球虫效果。脂肽的溶血活性利用比色法测定。结果感染不用药组、抗球虫药饮水组、灌胃和肌肉注射脂肽组对柔嫩艾美耳球虫的抗球虫指数(ACI)分别为18.71、185.45、161.40和109.83。溶血活性测定表明,其溶血程度随着脂肽浓度的增加而升高。结论口服枯草芽孢杆菌fmbJ株产生的脂肽具有中效抗柔嫩艾美耳球虫效果,但低于已知的抗球虫药氨丙啉,并且多次口服给药效果要高于一次肌肉注射给药。溶血实验表明其具有溶血活性。

【题目】Molecular cloning, characterization and expression of two orthologs of Arabidopsis thaliana phenylalanine ammonia-lyase 1 (AtPAL1) from rapeseed (Brassica napus L.)
【中文关键词】无
【英文关键词】Arabidopsis thaliana Brassica napus L. Cloning Expression Phenylalanine ammonialyase (PAL)
【中文摘要】无
【英文摘要】Phenylalanine ammonia-lyase (PAL) plays important roles in determining flavonoid- and lignin-related traits. Two PAL full-length cDNAs,BnPAL1-1 and BnPAL1-2, were isolated from Brassica napus. BnPAL1-1 is 2460 bp encoding a 722-aa protein, while BnPAL1-2 is 2396 bp encoding a 719-aa protein. BnPAL1-1 shares 86.8% nucleotideidentities and 94.9%/97.0% identities/positives at protein level to BnPAL1-2. NCBI BLAST, pairwise alignment and preferential amino acid analysisindicated that they are orthologs of Arabidopsis thaliana PAL1 (AtPAL1), suggesting that the divergenceof AtPAL1 and AtPAL2 preceded the divergenceof genera Arabidopsis and Brassica. Southernhybridization and EST analysis showed that B. napushas 2 – 6 orthologs of AtPAL1. High ratios of synonymousto non-synonymous substitutions suggest thatin Brassicaceae PAL1 orthologs evolve under high pressure of purification selection, while among PAL1paralogs this pressure is a little lower. Escherichia coli-expressed 6 • His-tagged BnPAL1-1 and BnPAL1-2 were both bioactive, but BnPAL1-2 was much higher in tested catalytic activity. BnPAL1-1 and BnPAL1-2 are transcribed in all the 11 organs tested, but most abundant in flower. BnPAL1-1 shows declined expression in late-stage seed, and BnPAL1-2 shows stronger organ specificity. Transcription of these two genes in middle and late stages of seed development of yellow-seeded line L2 is obviously lower than near-isogenic black-seeded line L1, indicatingthe correlation of yellow-seed trait to down regulation of PAL transcription, but this is probably caused by suppressed seed-specific upstream regulatory signal or by seed-specific feedback inhibition from downstream pathways

【题目】Screening the main factors affecting extraction of the antimicrobial substance from Bacillussp. fmbJ using the Plackett – Burman method
【中文关键词】略
【英文关键词】Antimicrobial substance, Bacillus sp. fmbJ, extraction, JMP software, Plackett-Burman design, main factors
【中文摘要】略
【英文摘要】The Plackett – Burman screening method was utilized as a tool to evaluate the importance of the selected six factors, including methanol, ethanol, propanol, butanol, pH and time, which are relevant to the extraction of the antimicrobial substance produced by Bacillus sp. fmbJ. The main factors that affected the extraction of the antimicrobial substance were determined as methanol (P < 0.0001), ethanol (P < 0.0001), pH (P ¼ 0.0032), and time (P < 0.0001) by using the JMP soft ware. Within the test ranges, methanol, ethanol , and tim e showe d a significant positive relativity to the total extracted amounts respectively; while pH had a significant negative effect. The maximum prediction profile indicated that the total extra cted amounts for the antimicrobial substance would reach 50.21 mg/1 00 ml with 99.64% proba bility.

【题目】甘蓝型油菜胚色素成分的QTL定位
【中文关键词】甘蓝型油菜;种胚;色素;QTLs;重组自交系
【英文关键词】Brassica napus L.;Embryo pigment;Quantitative trait locus(QTL);Recombinant inbred lines(RILs)
【中文摘要】以甘蓝型黄籽油菜GH06和甘蓝型黑籽油菜中油821为亲本杂交,后代通过“一粒传法”连续自交7代构建重组自交系,2007年分别在重庆市北碚区和万州区两个试验基地种植重组自交系群体,利用本实验室已构建的遗传连锁图谱和复合区间作图法(CIM),分析种胚色素的4种主要成分的QTL。结果共检测到31个QTL,分别位于14个不同的连锁群,其中5个花色素含量有QTL,分别位于第1、5、10、16和20连锁群,单个QTL解释表型变异的6.08%~11.67%;10个类黄酮含量有

QTL,分别位于第1、3、6、7、12、20和25连锁群,单个QTL解释表型变异的4.48%~11.10%;8个总酚含量有QTL,分别位于第1、2、12、16和20连锁群,单个QTL解释表型变异的5.24%~10.37%;8个黑色素含量检测到QTL,分别位于第5、8、10、12、14和22连锁群,单个QTL解释表型变异的5.44%一11.32%。解释表型变异大于10%的5个QTL,包括2个类黄酮含量QTL,色素含量、总酚含量和黑色素含量QTL各1个,它们分别解释11.10%、10.20%、l1.67%、10.37%和11.32%的表型变异。研究结果表明胚色素表现为多基因控制的数量性状,基因表达受环境影响较大,胚与种皮色素的QTL吻合度不高,推测种皮和胚色素合成可能受不同遗传体系控制,与这些QTL紧密相关的分子标记可以用于胚主要色素的分子标记辅助选择。

【英文摘要】The quality of rapeseed oil is greatly afected by embryonic pigments.However it has been little research report on theOTL of embryonic pigment components.The objective of this study was to identify QTL controlling embryonic pigment compo—nents in Brassica napus using the composite interval mapping(CIM)method.The recombinant inbred lines(RIL1 populationselfed for 7 successive generations by single seed propagating was derived from a cross between black..seeded male parent culti—.var Zhongyou 821 and yellow—seeded female parent line GH06.The population was grown at Beibei an d W anzhou in Chongqingin 2007.Four kinds of embryonic pigment components were identified by constructed genetic map.A total of 3 l OTL were detected on 14 different linkage groups.Five QTL for anthocyanidin content were located on linkage groups 1,5,10,16,and 20,respectively,explaining 6.08-1 1.67%of phenotypic variation;ten QTL for flavonoid content were located on linkage groups l,3,6,7,12,20,and 25,respectively,explaining 4.48—1 1.10% of phenotypic variation;eight QTL for total phenol content werelocated on linkage groups l,2,12,16,and 20,respectively,accounting for 5.24—10.37%of phenotypic variation;and eight QTLfor melanin content were located on linkage groups 5,8,10,12,14,and 22,respectively,explaining 5.44一-l1-32% of phenotypicvariation.Five major QTL explaining over 10% of phenotypic variation were found,including 2,1,l,and 1 for flavonoid,antho—cyanidin,total pheno1 and melanin content(qFCB一3—2,qFCW-1—1,qACW-IO.1,口 C ’ J2—1,and qMCB一22.5),which accountedfor 11.1O% ,l0.20% ,l1.67% ,1O-37% ,an d l1.32% of phenotypic variation respectively.These results suggest that the embryonicpigments are controlled by several minor-efect genes,with a paRem of quantitative trait inheritance。and出e expression of theOTL is afected by environmental factors.QTL for seed coat pigments showed little overlapping with those for embryonic pig.ments,implying that seed coat pigments and embryonic pigments might be controlled by diferent genetic systems.M olecularmarkers closely linked with these QTLs could be applied in marker-assisted selection of embryonic pigment components in Bras—sica napus

【题目】吉林省细毛羊产业技术需求调研报告

【中文关键词】细毛羊; 技术需求; 调查报告;

【英文关键词】Fine-wool Sheep; technical Needs; Findingsreport

【中文摘要】受肉毛比价严重失调影响,吉林省细毛羊产业资源正处于萎缩时期。尽管如此,由于吉林省养羊业是以细毛羊生产为基础的,细毛羊产业优势仍然存在,2007年细羊毛产量比例占全国12%。目前,大部分养羊户采取肉毛兼用生产模式,细毛羊繁育技术没有得到广泛应用。从产业发展出发,根据调研归纳整理,技术需求主要表现在细毛羊品种、繁育技术、质量管理、疫病防治、羊毛分级整理、圈舍设计与环境控制等方面。本文还归纳了细毛羊产业今后五年需要解决的关键技术。

【英文摘要】As the effect of serious price imbalance between meat and wool, the fine wool sheep industry resources are shrinking in Jilin Province.Nevertheless, as a result of the sheep industry in Jilin Province is based on the production of fine wool sheep, there are still advantages of fine-wool sheep industry, fine wool production in 2007 accounted for 12% of the country.At present, the majority of household production patterns is for meat as well as wool, fine-wool sheep breeding technology has not been widely used.For the industry developing, according to survey and analyze, main technology needs are:Fine-wool sheep breeds, breeding technology, quality management, disease prevention and control, wool grading, sheepcot design and environment control.This article also summarizes the key technologies need to be resolved in the sheep industry of the next five years.

【题目】甘蓝型油菜种子发芽率QTL定位及相关生理性状
【中文关键词】甘蓝型油菜; 数量性状基因座(QTL); 发芽率; 生理性状
【英文关键词】Brassica napus L.; quantitative trait locus (QTLs); germination rate (GR); physiological traits
【中文摘要】利用 GH06×P174 组合衍生的183 个重组自交系进行种子发芽率遗传分析及种子发芽期间种子生理性状分析。用复合区间作图法对在室温下保存两年的种子(STY)、保存1 年的种子(SOY)与新收获种子(FS)发芽率进行QTL 定位。另外对保存两年的种子及新收获的种子萌发期间脂肪酶活性、电导率、还原糖含量、总糖含量及根系活力进行了测定,并对结果进行分析。结果表明3 批种子的发芽率QTL 位点各不相同, 保存两年的种子在第9、14、17 条连锁群上分别检测到1 个位点, 保存1 年的种子在第5、9 条连锁群上各检测到1 个位点, 新收获的种子在第4、18 条连锁群上分别测检到1 个位点。研究发现, 3 批种子的发芽率相关性不显著, 发芽率差异达到极显著水平, 同时保存不同年份种子的发芽率QTL 各不相同, 这表明甘蓝型油菜发芽率受很多不同因素所控制。保存两年及新收获种子的发芽率与电导率之间的相关性均达到极显著负相关, 表明可以通过电导率的测定估测发芽率, 电导率的研究对种子发芽率的研究具有重要意义。
【英文摘要】One hundred and eighty-three recombinant inbred lines from the cross between GH06 and P174 were used forgenetic analysis of seed germination rate and physiological trait analysis of Brassica napus L. Composite interval mapping(CIM) was applied to identify QTL associated with seed germination rate (GR) of the seeds that stored for two years (STY),one year (SOY), and fresh seeds (FS), respectively. The activity of lipases, seed conductivity, reducing sugar content, totalsugar content, and root vitality of STY and FS were investigated. The QTL for seed GR of various stored seeds were different.Three QTLs for STY were detected on the linkage group (LG) 9, 14, and 17. Two QTL for SOY were mined on LG 5and 9. Two QTLs for FS were detected on LG 4 and 18. The germination rate of seeds from three years was significantlydifferent, and the QTL of GR was not identical, which indicated that the seed germination was controlled by many loci.Furthermore, the seed germination rate was negatively correlated with seed conductivity, which means that measurement ofseed conductivity can be used to estimate GR, and the study of conductivity is important for GR research.

【题目】中国苜蓿市场分析
【中文关键词】苜蓿;市场分析;产业;苜蓿进口
【英文关键词】null
【中文摘要】本文阐述了我国现代苜蓿产业的发展历史,将产业发展分为三个阶段,辩证分析了7个主要因素对苜蓿市场变化的影响,对今后我国苜蓿市场发展趋势做了分析,结果表明基于奶牛规模化,集约化,标准化和一体化养殖的发展和苜蓿收购价的提高,国产苜蓿数量会明显增加;由于美国优质苜蓿在中国奶牛饲养方面的影响力和市场开拓,国产苜蓿在外压之下,将会彻底改变以往只注重产量,而忘却质量的生产观念,国产苜蓿质量和销售价格会逐步提高,产业会走上一个新的台阶;由于我国土地资源匮乏,国产苜蓿在数量和质量上不可能满足日益增长的市场需求,国外苜蓿凭借在质量和稳定供货数量方面的优势,将长期占据我国一定份额的苜蓿市场,中国终将成为世界苜蓿进口大国,中国苜蓿市场将会出现中外企业相互竞争、相互关联和相互融合的新局面。

【题目】甘蓝和白菜紫色酸性磷酸酶17 基因家族的克隆和比较分析
【中文关键词】白菜; 甘蓝; 紫色酸性磷酸酶; 基因家族; 磷饥饿
【英文关键词】Brassica rapa; Brassica oleracea; Purple acid phosphatase; Gene family; Phosphate starvation
【中文摘要】从甘蓝和白菜中分别克隆到2 个PAP17, 根据序列相似性, 将PAP17 分为类型I (BoPAP17-1 和BrPAP17-1)和类型II (BoPAP17-2 和BrPAP17-2)。Southern 杂交表明, 白菜和甘蓝中均只存在2 个PAP17 成员, 与克隆结果吻合。系统发育和分子进化分析表明, PAP17 基因家族受纯化选择, 编码低分子量PAP 蛋白。荧光定量PCR 结果表明, PAP17在所检测的9 个组织器官中均有表达, 尤以花和蕾中的表达量特别高, 种子中也有一定程度的表达, 表明其与体内储备态磷的动用有关, 尤其在花和蕾的发育阶段。磷饥饿诱导表达结果表明, 除BrPAP17-2 在幼苗叶片中表达受抑制外, BrPAP17 和BoPAP17 在幼苗根部和叶片中均受磷饥饿诱导, 表达量先降后升, 诱导4 d 或8 d 后达到峰值; 恢复供磷4 d 后, 表达量迅速降低至基础表达水平以下。与幼苗叶片相比, 白菜和甘蓝幼苗根部的PAP17 磷饥饿诱导表达似乎更为强烈。这些结果表明PAP17 在白菜和甘蓝根部可能参与了根外磷的活化与吸收及无机磷由根部向其他组织器官的转运。
【英文摘要】Two PAP17 genes were cloned from parent species of Brassica napus, B. oleracea, and B. rapa, respectively. Accordingto sequence similarity, PAP17 genes could be divided into two types, type I (BoPAP17-1 and BrPAP17-1) and type II(BoPAP17-2 and BrPAP17-2). Southern hybridization resulted in two bands both in B. oleracea and B. rapa, this is accordancewith former cloning results. Phytogenetic and molecular evolution analysis indicated that PAP17 genes in Brassica species underwentpurifying selection, and their deduced proteins are typical low molecular weight PAP proteins. Expression patterns ofBoPAP17 and BrPAP17 genes were assayed by fluorescent quantitative PCR. The results revealed that PAP17 genes expressed inall nine tested tissues and organs, with the extremely high expression in flower and bud, and certain expression in seeds at differentstages, implying these PAP17 genes most likely mobilize phosphorus reserves in plants, particularly during flower and buddevelopment stages. Under phosphate starvation conditions, expression of BrPAP17-2 in seedling leaf was restrained, while thatof BrPAP17 and BoPAP17 in seedling root and leaf was induced, the expression levels declined in the first 24 hours, and thencontinuously increased with the maximal levels between four days and eight days after treatment. After four days of Pi-resupply,their expression declined below un-induced basal levels. In comparison with seedling leaf, it seems that BrPAP17 and BoPAP17showed stronger phosphate starvation induced expression in seedling root. These results thus suggested that PAP17 genes in B.oleracea and B. rapa may be involved in external phosphorus assimilation and transferring inorganic phosphate from root to othertissues or organs.

【题目】Genomic relationships between wild and cultivated Brassica oleracea L. with emphasis on the origination of cultivated crops
【中文关键词】无
【英文关键词】Brassica oleracea　Cultivated form Genomic relationships　Sicily　Wild taxa
【中文摘要】无
【英文摘要】Wild taxa in Brassica oleracea L. play animportant role to improve cultivated crops, but thegenomic relationships between wild and cultivatedforms have not been well clarified. An overall surveyof genomic relationships among 39 accessions covering10 wild and 7 cultivared types in B. oleraceawas performed using amplified fragment lengthpolymorphism and simple sequence repeat. Thecultivated types were clustered together withB. oleracea ssp. oleracea, B. incana, B. bourgeaui,B. montana, B. cretica and B. hilarionis, while 4wild taxa from Sicily, B. rupestris, B. insularis,B. macrocarpa and B. villosa formed the other group.It implies the low

possibility that current B. oleraceacrops originated in Sicily.

【题目】Types and distribution of mucous cells of the abalone Haliotis diversicolor
【中文关键词】杂色鲍;粘液细胞;类型;分布
【英文关键词】Haliotis diversicolor; mucous cells, types, distribution.
【中文摘要】采用阿尔辛蓝和高碘酸-希夫染色(AB-PAS)反应和组织学方法对杂色鲍粘液细胞的种类和分布进行观察和分析。根据粘液细胞的染色反应,可分为四种类型: Ⅰ型,纯红细胞,II型,纯蓝细胞,III型,紫色偏红细胞; IV型,蓝紫色细胞。外套膜内绝大部分粘液细胞为粘液细胞类型II,呈杯状或棒状。鳃轴和鳃丝上皮细胞富含粘液细胞,其中大部分是II型和III型,呈圆状,杯状和棒状。在斧足存在粘液细胞,主要是II型上皮细胞,而足腺分布高密度的粘液细胞,或大或小,主要是II型和IV。在口周围分布很多粘液细胞,其中大部分为中型大小,呈杯形的II型。在食道从前端到后端粘液细胞的数目逐渐减少,而在远肠端粘液细胞数目比近肠端多,且大部分呈多呈杯形和圆形,主要是II型。
【英文摘要】The types and distribution of mucous cells of Haliotis diversicolor were observed and analyzed using the alcian blue and periodic acid schiffs (AB-PAS) reaction and histological procedures. According to the color of the mucous cells, they were divided into four types: Type I, pure red; type II, pure blue; type III, purple reddish; type IV, blue purple. Most of the mucous cells in the mantle were type II, with cup- or stick-like shape. Gill axis and gill filament epithelia were rich in mucous cells and most of them were type II and III, with circle-, cup- and stick-like shapes. There were a few mucous cells in the pedal epithelia, mainly type II, whereas, the pedal gland had a great density of mucous cells, which were large or small and mainly type II and IV. There were many mucous cells in the epithelia around the mouth, most of which were medium-sized cup-shaped type II. In the esophagus, the number of mucous cells decreased gradually from the anterior to posterior, whereas in the distal intestine mucous cells, there were more than in the proximal one and they were more cup – shaped and circle – shaped, mainly type II.

【题目】不同规格穴盘及保水剂用量对甘蓝幼苗生长的影响
【中文关键词】保水剂;穴盘;黄瓜育苗
【英文关键词】Sky gel water conservation; Cell plug; Chloroplast of cabbage (Brassica oleracea L. var. capitata L.) seedling
【中文摘要】研究了Sky gel保水剂对不同规格穴盘(72 孔和128 孔)甘蓝育苗用量的影响。结果表明: 2种规格穴盘,在测定的3个育苗时期内,基质含水量都随着保水剂浓度的增加而增加,呈线形正相关;基质含水量在测定周期内变化范围较小,说明Skygel 保水剂的反复吸水能力较强。通过对甘蓝幼苗各形态指标进行测定,表明72 孔穴盘较128孔穴盘更适合甘蓝幼苗的生长,保水剂浓度为基质中加入2 g/ L 保水剂较适合甘蓝幼苗生长。综合各因素表明,采用72孔穴盘、 保水剂浓度为2 g/ L 时,甘蓝幼苗生长茁壮,商品出苗率高。
【英文摘要】Through studied on the different used amount of skygel water conservation on different plug size(72 cell and 128 cell) of chloroplast of cabbage seedling, it showed that : among the days of sowing, water content of substrate w as always increasing by the amount of skygel water conservation increased, it showed the positive linear correlation, The water retention capacity was also preserved very well and repeatedly in an small size adjustment . Though studied on the different index of chloroplast of cabbage seedling, it showed that: the treatment of 72 cell plug and 2 kg/ L sky gel water conservation was the best.

【题目】保水剂与养分交互作用对茄子幼苗生长的影响
【中文关键词】保水剂;全营养肥;茄子育苗
【英文关键词】Water retaining gel ; Full nutrition fertilizers ; Eggplant seedling
【中文摘要】研究了不同保水剂浓度与不同的全营养液肥浓度的交互条件下对茄子育苗生长的影响。结果表明:基质持水量随着保水剂浓度的增加而增加,但随养分供应浓度的增加,基质持水量并未随着保水剂浓度的增加而呈直线上升。基质EC值随养分浓度增加而极显著增加(P=0. 01) ,随保水剂浓度增加而显著下降(P = 0. 05)。基质pH值随着养分浓度的变化范围较小(P< 0. 05) ,随着保水剂浓度的变化而发生极显著变化(P = 0. 01) ,表现为随着保水剂浓度的增加,基质pH值增加。通过对茄子幼苗的形态指标测定,表明在每升基质中加入2 g全营养肥,茄子幼苗生长较为茁壮;保水剂浓度在每升基质中加入2g较为适宜茄子幼苗生长。在养分浓度和保水剂浓度适中的条件下,两者的交互作用可提高茄子幼苗的根系活力和叶片的叶绿素含量。综合各因素认为,A2B2处理为最优处理,即全营养肥2g/L ,保水剂浓度2g/L时,较适合茄子幼苗生长。
【英文摘要】Through studied on the interaction effects of water retaining gel and full nutrition fertilizers of eggplant seedling , it showed that : Among the days of sowing , water content of substrate was always increasing by the amount of skygel water retaining gel

increased , but it showed not the exactly positive linear correlation when the content of fertilizers increased , The water retention capacity preserved showed a little bit of declination when the content of fertilizers increased. The EC of substrate was increasing while the content of fertilizers increased(P=0. 01) , meanwhile pH of substrate was declining while the content of fertilizers increased(P < 0. 05) and pH of substrate was increasing while the content of water retaining gel increased(P = 0.01) , Though studied on the different index of eggplant seedling , it showed that : the treatment of 2 g/ L full nutrition fertilizers and 2 g/ L sky gel water retaining gel was the best , the interaction of them helped the growing of eggplant seedling.

【题目】水分胁迫对辣椒光合作用及相关生理特性的影响
【中文关键词】辣椒;水分胁迫;光合作用;叶绿素荧光;气孔;叶绿体
【英文关键词】water stress; photosynthesis; chlorophyll fluorescence; stomata; chloroplast
【中文摘要】【目的】研究水分胁迫对辣椒光合作用及相关生理特性的影响, 揭示水分胁迫与辣椒光合作用及生理指标之间的关系,为辣椒栽培管理,抗性筛选提供理论参考。【方法】采用盆栽的方式,分别在正常供水和水分胁迫条件下,研究辣椒生长形态及相关生理指标,光合参数,叶绿素荧光参数,叶片气孔特征及叶绿体超微结构的变化。【结果】水分胁迫显著抑制了辣椒的生长,植株总的干物质含量下降,并且干物质含量向根的分配比例增加,向茎叶的分配比例减少。叶片水势(Ψ)、叶片相对含水量(RWC)、叶绿素(Chl.)及类胡萝卜素(Car.)的含量显著下降,叶片中丙二醛(MDA)含量,游离脯氨酸(Pro)的含量,超氧化物歧化酶(SOD),过氧化物酶(POD)的活性均有所提高。叶片净光合速率(Pn)、气孔导度(Gs)、蒸腾速率(Tr)、胞间 CO2浓度(Ci)、PSⅡ光化学量子效率 (ΦPSⅡ) 、 光化学猝灭系数 (qP) 及光合电子传递速率 (ETR) 均下降,非光化学猝灭系数 (NPQ)和水分利用效率(WUE)提高。水分胁迫后叶片气孔密度、气孔长度、气孔宽度均有所下降,大部分气孔关闭深陷。叶绿体变圆,基粒片层和基质片层弯曲排列紊乱,淀粉粒减少或消失。【结论】水分胁迫下辣椒光合速率的下降主要是由气孔限制引起的。光合参数、叶绿素荧光参数、叶片气孔特征以及叶绿体超微结构的变化与品种的

抗性密切相关。
【英文摘要】【Objective】 The effects of water stress on photosynthesis and associated physiological characters of capsicum were studied, the aims were to reveal the relationship between photosynthetic traits and drought tolerance of two cultivars. 【Method】 The experiment was conducted under two water levels: no stress (75%-80% of field capacity) and stress (30%-40% of field capacity). The responses of plants growth, physiological changes, photosynthetic parameters, chlorophyll fluorescence, stomatal characters, ultrastructure of chloroplast were investigated. 【Result】 The results showed that, under the water stress condition, the growth of the plants was inhibited, the total plant dry weight declined significantly, and root/ shoot increased. Leaf water potential, leaf relative water content and leaf pigment decreased, the contents of malondialdehyde, the proline as well as the activities of superoxide dismutase and peroxidase increased. The Pn, Gs, Tr, Ci, ΦPSII, ETR and qP decreased, but the NPQ and WUE increased. The stomata became smaller and the density decreased, and most of them closed. The chloroplasts became round in shape, the lamellae arranged disorderly and the number of starch grain decreased or disappeared. 【Conclusion】 The decrease of net photosynthetic rate was considered as a result of stomatal restriction. The changes of photosynthetic parameters, chlorophyll luorescence, stomata characters and the ultrastructure of chloroplast correlated significantly to drought resistance.

【题目】不同贮藏温度下辣椒中丙二醛含量的变化
【中文关键词】辣椒;贮藏温度;MDA;变化
【英文关键词】pepper;storage temperature;MDA
【中文摘要】以宁夏某设施蔬菜基地的辣椒为试材,将辣椒采收后立即进行预冷处理,分别在 2,4,7,10,12,20 的条件下贮藏30 d,每隔3 d 测定 MDA含量 结果表明,在不同的贮藏温度下,随着贮藏时间的延长,MDA含量呈规律性变化趋势,说明这种变化与贮藏温度 贮藏时间及耐寒性有关系 同时考虑其他生理生化指标 (如过氧化物酶电导率 硬度等)的变化,在 7,10,12 贮藏温度下,辣椒的贮藏性能好,这可以作为辣椒贮藏保鲜时选择合适贮藏温度的依据。

【英文摘要】Pepper of a vegetable- based in Ningxia was chose as raw materials. Pepper were precoolinged immediately after harvest. Then,pepper were storaged respectively at 2,4,7,10,12,20 for 30 days. MDA content were determined every 3 days. As a result,at different storage temperatures,with the extension of storage time,change trends of MDA contentshowed regularity. It was to demonstrate the change with storage temperature, time and cold resistance related. When temperature of storage was at 7,10,12 ,at the same time,changes of other physiological and biochemical indicators such as peroxidase,conductivity,hardness,etc. were considered,storage performances of pepper were good. So,these temperature points can be used as the selection conditions of appropriate temperature of storage and preservation.

【题目】氮素供应对土壤酶活性及设施番茄生理抗性和产量的影响
【中文关键词】设施;氮素供应;生理抗性;酶活性;番茄
【英文关键词】greenhouse ;N application ;physiological activity ;enzyme activity ;tomato
【中文摘要】以土壤酶活性及保护酶系统作为反馈指标,以产量为最终评价因素,探讨宁夏设施栽培条件下,氮素胁迫对土壤生境及植株生理抗性的影响。结果表明:除过氧化氢酶外,供氮量对土壤酶活性影响显著,其中,土壤蔗糖酶活性随施氮量增加而极显著下降,土壤磷酸酶和脲酶活性在低氮供应下增高,高氮供应下(> 600 kg/ hm2)遭胁迫;设施番茄体内保护酶系统对氮肥施用量反应敏感,适量施氮CAT 活性显著回升,但高施氮量(> 600 kg/ hm2)胁迫使番茄 SOD、 CAT和 POD活性显著下降,而 PRO活性显著增加。施氮量的差异最终显著影响番茄产量,供试条件下,设施番茄最高产量施氮量为479. 41 kg/ hm2,最大利润施氮量为364. 71 kg/ hm2。
【英文摘要】Soil and plant enzyme activities, as well as yield of tomato were adopted to evaluate the influence of Nitrogen over application on soil and tomato. The results showed that N application significantly effects soil enzyme activities except soil catalase. Invertase activity was significantly decreased along with increased N application rate. Phosphatase and urease activity were increased under low N application rate , yet severe restrained under high amount of N application(> 600 kg/ hm2) . The inner protective enzyme system was sensitive to N application. Reasonable N application ratestimulate catalase of tomato. High rate of N application(> 600 kg/ hm2) severe restrict SOD , CAT and POD activities ,but significantly promote Pro activity. Tomato yield was significantly effected by N application. The maximum N application rate for the highest yield of tomato was 479. 41 kg/ hm2. The reasonable application rate for

the highest profit yieldof tomato was 364. 71 kg/ hm2.

【题目】保水剂与供水方式对辣椒幼苗生长的影响
【中文关键词】保水剂;供水方式;辣椒幼苗
【英文关键词】water retaining agent; water supply mode; pepper seedlings
【中文摘要】采用穴盘育苗,研究不同浓度下旱露植宝多功能保水剂与供水方式交互对辣椒幼苗生长的影响。结果表明:辣椒穴盘苗底部供水方式下灌水次数及灌水量均少于上部供水,可节约用水,最高节水率为36. 98%;底部供水方式下保水剂浓度为4 g/ L 时对辣椒幼苗的生长量、 形态指标及生理指标差异影响显著,可促进辣椒出苗,提高秧苗质量。
【英文摘要】The effect s on the seeding growth of pepper(Cap sicum Annuum L.) by using different content of skygel water retention agent s and water supply modes through adopting plug seedling were studied. The result s showed that the irrigation times and irrigation quantity of pepper plug seedling under bottom water supply w ere less than upper watersupply, it can save water, and the water saving rate reached 36. 98%; There w as concentration of water retention agents with 4 g/L on pepper's growth, morphological index and physiological index, and the seedling emergence rate and seedling quality were promoted.

【题目】黑暗条件下不同贮藏方式和温度对辣椒穴盘苗质量的影响
【中文关键词】黑暗;辣椒;贮藏方式;温度;穴盘苗质量
【英文关键词】darkness; pepper; storage means; temperature; seedling quality
【中文摘要】以中椒22号辣椒为试材,在黑暗条件下研究不同贮藏方式及25、 15、 7°C 温度对辣椒秧苗主要形态及生理指标的影响。结果表明:在贮藏过程中,辣椒秧苗的干重/ 鲜重、 根冠比、 根系活力、 叶绿素含量明显下降,且7°C 处理的下降幅度小于15 °C 和25°C 处理;穴盘秧苗贮藏的横放效果好于竖放。贮藏结束后(9 d) , 15°C 和25°C 处理秧苗顶端会出现褐化现象。当秧苗定植到大田后, 7 °C处理的秧苗整体较其它处理生长速度快。表明7 °C 处理更适宜辣椒穴盘秧苗的贮藏。
【英文摘要】The growth and physiological changes of pepper seedlings by different storage methods and temperatures in the darkness were studied. Seedlings were stored vertically and horizontally. For vertical storage, seedlings w ere not removed from the plug. For horizontally storage, seedlings were removed from the plug and placed horizontally. The pepper plug seedlings w ere treated of 25 °C (control) , 15 °C and 6 °C , respect ively. The results showed that dry mass/ fresh mass, root/shoot ratio, root activity, chlorophyll content decreased significantly, and the minimum decline was observed at 7 °C .From the results of the some of the modality and physiological indexes, we can conclude that the quality of seedlings stored horizontally w as higher than that of vertical seedlings. After a long storage(9 d) period, the seedlings appeared browning in the top. When transplanted to the field, the growth of seedlings treated under 7°C were faster than those of other treatments. The current study indicated that the opt imal storage temperature for the pepper seedlings w as 7 °C .

【题目】不同规格穴盘及保水剂用量对黄瓜幼苗生长及生理研究
【中文关键词】保水剂; 穴盘;黄瓜育苗
【英文关键词】sky gel water conservation; cells plate; culture of cucumber seedling
【中文摘要】通过 sky gel 保水剂对不同规格穴盘(72孔和 128孔) 黄瓜育苗用量的研究表明, 2 种规格穴盘, 在测定的3 个育苗时期内, 基质含水量都随着保水剂质量浓度的增加而增加,呈线形正相关;基质含水量在测定周期内变化范围较小,说明保水剂的反复吸水能力较强. 通过对黄瓜幼苗各形态指标进行测定, 表明 72 孔穴盘较 128 孔穴盘更适合黄瓜幼苗的生长,保水剂质量浓度为 2 g / L 较适合黄瓜幼苗生长. 综合各因素表明, 采用 72 孔穴盘、 保水剂质量浓度为 2 g/ L 时,黄瓜幼苗生长茁壮, 出苗率高.
【英文摘要】Through different amount o f sky gel water conservation in different size of cells plates (72 cell and 128 cells) for culturing cucumber seedlings, the result s showed that during 3 stages for culturing seedling s, water content s in substrates w ere increasing with the increase of the amount of sky gel water conservation, which showed linear positive correlation. The water content s in substrates had small variation during testing period, which illustrated that sky gel water conservation had strong capability for repeated absorption of water. Though testing different indices of cucumber seedlings, it showed that the cell plate of 72 cells was better than the cell plate of 128 cells and strong and more seedlings could be cultured in the cell plate of 72 cells with the concentration o f 2 kg / L sky g el water conservation.

【题目】水分胁迫对番茄生长及光合系统结构性能的影响
【中文关键词】番茄; 水分胁迫; 光合作用; 叶绿素荧光; 气孔特性; 叶绿体超微结构

【英文关键词】chlorophyll fluorescence; chloroplast ultra-structure; photosynthesis; stomata character ; tomato; water stress
【中文摘要】以普通番茄和樱桃番茄为试材,分别在正常供水和水分胁迫条件下,研究不同生态型番茄生长指标及光合系统结构的变化。水分胁迫显著抑制了番茄的生长,叶片水势及叶片相对含水量显著下降,普通番茄和樱桃番茄单株总干重分别下降了59.36%和51.17%,二者的根冠比分别上升了37.93%和29.17%。水分胁迫后,叶片净光合速率(Pn)、气孔导度(Gs)、蒸腾速率(Tr)、胞间CO2浓度(Ci)、PSII光化学量子效率(5PSII)、光化学猝灭系数(qP)及光合电子传递速率(ETR)均下降,非光化学猝灭系数(NPQ)和水分利用效率(WUE)提高。水分胁迫后叶片气孔密度、气孔大小均有所下降,大部分气孔关闭且深陷。叶绿体变大变圆,基粒片层排列紊乱,淀粉粒减少或消失。
【英文摘要】The experiment was conducted under two water levels: no stress (75% - 80% of field capacity), stress (30% - 40% of field capacity). The changes of growth and photosynthetic system characters of tomato were investigated. The results showed that, under the water stress condition, the growth of the plants was inhibited, leaf water potential and leaf relative water content decreased. The total plant dry weight declined significantly and the reduction was 59.36% for Meifen 22 and 51.17% for Hongsheng, respectively. The root/shoot ratio increased 37.93% for Meifen 22 and 29.17% for Hongsheng. The net photosynthesis rate (Pn), stomata conductance (Gs), transpiration rate (Tr), intercellular CO2 concentration (Ci), the actual photosynthesis efficiency of PSII in the light (5PSII), the electron transport rate (ETR) and photochemical quenching (qP) decreased where as the non 2photochemical quenching (NPQ) and water use efficiency (WUE) increased. The stomata became smaller and the density decreased, most of them closed. The chloroplasts became round in shape, the lamella e arranged disorderly and the number of starch grain decreased or disappeared.

【题目】干旱胁迫对黄瓜幼苗生长、光合生理及气孔特征的影响
【中文关键词】干旱胁迫;光合作用;叶绿素荧光;气孔特征
【英文关键词】drought stress; photosynthesis; chlorophyll fluorescence; stomata characters
【中文摘要】采用盆栽方式研究不同干旱程度(对照的基质含水量为田间持水量的70%~80%,轻度胁迫的基质含水量为田间持水量的40%~50%,重度胁迫的基质含水量为田间持水量的20%~30%)对2个不同黄瓜品种(千秋五号和千春七号)的形态指标、叶片气体交换参数、叶绿素荧光参数、生理生化指标和气孔特征的影响。结果表明:干旱胁迫下,2个品种的生长都受到显著抑制,叶片相对含水率、净光合速率(Pn)、气孔导度(Gs)和蒸腾速率(Tr)显著降低;在轻度干旱胁迫下,光合速率的下降主要是由气孔因素引起;而在重度干旱胁迫下,胞间CO2含量(Ci)升高,表明此时光合速率的下降是由非气孔因素引起的。干旱胁迫下,PSII光化学量子效率(ΦPSII)、光化学猝灭系数(qP)、光合电子传递速率(ETR)和PSII吸收的光能用于光化学反应的份额(P)也都显著下降,而非光化学猝灭系数(NPQ)和用于天线热耗散的份额(D)显著增加。光合色素含量呈下降趋势,叶片中丙二醛(MDA)含量、游离脯氨酸(Pro)含量、超氧化物歧化酶(SOD)、过氧化物酶(POD)和过氧化氢酶(CAT)的活性显著升高。叶片气孔密度,开放气孔的比例,开度大小都呈下降趋势,胁迫后的叶片下表皮气孔变圆并且下陷,表皮毛的密度增加。试验显示,千春七号比千秋五号表现出更强的抗旱性。
【英文摘要】The responses of morphological indexes, photo synthetic gas exchange, chlorophyll fluorescence, physiological indexes and stomata characters to different water stress (70%-80% of field capacity as no stress, 40%-50% of field capacity as light stress, 20%-30% of field capacity as high stress) in seedlings of two cucumber cultivars (var. ‘Qianqiu No. 5’ and var. ‘Qianchun No. 7’). The growth of the two cultivars was inhibited under the drought stress. The water stress resulted in progressively decreases in relative water content of leaves, net photo synthesis rate (Pn), stomatal conductance (Gs), transpiration rate (Tr), the actual photo synthesis efficiency of PSII in the light (ΦPSII), the electron transport rate (ETR), photo chemical quenching (qP) and proportion of PSII photochemistry (P), but the non-photo chemical quenching (NPQ) and proportion of antenna heat dissipation (D) increased. The intercellular CO2 concentration (Ci) decreased at light stress, but increased at high stress, which indicated that the decline of Pn was considered as a result of stomatal restriction under light stress, but non-stomatal restriction under high stress. The leaf pigment decreased, but increased for the contents of alondialdehyde, the proline as well as the activities of superoxide dismutase, peroxidase and catalase. The density of leaf stomata, open stomata proportion decreased progressively. The stomata were of smaller, low density, and most closed. Density of trichomes decreased. The cucumber cv. ‘Qianchun No. 7’ was more drought-tolerant than

var. ‘ Qianqiu No. 5 ’.

【题目】不同物料及配比对设施土壤与番茄产量、品质的影响
【中文关键词】日光温室;有机肥;化肥;沙土;土壤酶活性;番茄
【英文关键词】Greenhouse; Organic fertilizer; Inorganic fertilizer; Sandy soil; Enzyme activity; Tomato
【中文摘要】研究了有机肥、化肥、青沙等不同物料及配比对二代日光节能温室内土壤营养状况,番茄生长、产量及品质的影响。研究结果表明,施有机肥的土壤 pH 值和容重显著降低,土壤全盐、有机质、速效氮、磷、钾、田间持水量和总孔隙度均增加;单施化肥的,土壤 pH 值和容重也显著降低,除土壤田间持水量外,全盐、有机质、速效氮、磷、钾,总孔隙度均增加。在施有机肥的基础上进一步配施化肥和沙子等物料,全盐、速效氮、磷、钾均显著增加。化肥和有机肥施用都显著提高了土壤磷酸酶、脲酶和蔗糖酶的活性,显著增加了番茄的株高和冠幅,最终显著增产;化肥加沙和有机肥加沙处理增加了土壤通气性,显著促进了茎粗的增长,有利于植株健壮,不同物料处下番茄果实中可溶性糖显著增加,总酸度显著下降,糖酸比显著增大,改善了番茄的风味,尤其是在化肥和有机肥配合并掺和沙子的情况下,番茄 VC 含量最高,但也显著增加了番茄的硝态氮含量。
【英文摘要】Field experiments were adopted to study the effects of different materials and their mixtures on soil properties, growth, yield and quality of tomato in secondary generation greenhouse of Ningxia. The results showed that soil pH and bulk density was significantly decreased but soil total salt, available N, P and K, as well as total porosity was increased under organic and inorganic fertilizer application. Field capacity was significantly decreased for organic fertilization but for inorganic fertilization. Soil total salt, available N, P and K also was increased under application the mixture of organic, in organic fertilizer and fine sand particles. Soil phosphatase, urease, and invertase activities, as well as height, width of shoots and thus yield of tomato were increased after applied organic and inorganic fertilizer. Stem thick was significantlypromoted due to increased soil porosity by application mixture of organic and inorganic fertilizer with fine sand. Increased solvable sugar content but decreased total acidity of tomato significantly augment ratio of sugar and acidity duo to the application of different materials, which improve the quality of tomato. Both VC and NO3--N content was promoted by application the mixtures of organic and inorganic fertilizer with sandy soil.

【题目】宁夏机修日光温室建棚导致的土壤板结问题的研究
【中文关键词】重型机械; 日光温室;土壤退化; 土壤板结
【英文关键词】heavy machinery; greenhouse; soil degradation; soil compaction
【中文摘要】针对当前二代节能日光温室大型机械打墙所产生的土壤板结、 渗透性变差等问题, 系统分析了机修温室内土壤紧实度、 容重、 孔隙度、 田间持水量等土壤物理性质的变化。结果表明:大型机械碾压和夯实后, 土壤物理性质退化严重,从大田到墙边水平方向上土壤紧实度最高达到 150 kg, 增加了 90 k g , 田间持水量降低了35 g, 容重增加了0.42 g/cm3、 总孔隙度减少了17 个百分点,非毛管孔隙度降低了 14 个百分点;垂直方向上, 打墙后 0~ 60 cm 土壤耕作层紧实度、容重、 总孔隙度、 非毛管孔隙度均随着深度增加而降低,田间持水量增加,60cm 以下层土壤紧实度和田间持水量受机械碾压和夯实的影响不大、 土壤容重增加、 总孔隙度和非毛管孔隙度降低。

【英文摘要】Caused by the second- generation greenhouse wall constructed by heavy machine. This article was designed to study soil compaction, permeability deterioration and other problems caused by . This article analyzed the soil compaction, bulk density, porosity, field water holding capacity and other soil physical properties changes in greenhouse. The results showed that : After large mechanical rolling and compaction, from the field to the horizontal wall the soil physical properties were seriously degenerated , the soil compact ion increased by 90 kg, field water capacity decreased by 35 g and bulk density increased by 0. 42 g/ cm3, the total porosity decreased by 17% , non-capillary porosity decreased by 14%. On the vertical direction, from 0- 60 cm, bulk density ofplough layer, porosity, non- capillary porosity decreased with increasing of the depth. The soil bulk density below60 cm plough layer and field water capacity were little affected by mechanical operation.

【题目】Creatine kinase is a bacteriostatic factor with a lectin-like activity
【中文关键词】文昌鱼,肌酸激酶,急性时相反应
【英文关键词】Amphioxus; Lancelet; Cephalochordate; Creatine kinase; Acute phase response
【中文摘要】肌酸激酶(CK)是一种催化ADP转化成ATP的酶,这种酶与文昌鱼的急性免疫有关,但是它的免疫功能特性并不清楚。然而我们已经证明,文昌鱼的CK基因(BbCK)可以被LPS诱导,重组的BbCK可以结合革兰氏阴性大肠杆菌并抑制大肠杆菌的生长。然而这种抑制作用可以被以下几种糖类打破:N-乙酰基-D-甘露糖胺,N-乙酰基-D-葡糖胺,升-岩藻糖,D-甘露糖,D-果糖和D-葡萄糖。相反BbCK基因对革兰氏阳性金黄葡萄球菌的抑制作用并不明显。这些实验证据表明,BbCK基因在抑菌过程中起着一种类似于凝集素的作用,能够抑制革兰氏阴性大肠杆菌的生长。这是我们第一次发表关于CK基因在免疫系统中的作用,而CK基因正是通过识别并且抑制革兰氏阴性大肠杆菌来发挥作用的。
【英文摘要】Creatine kinase (CK), an enzyme catalyzing the conversion of adenosine diphosphate (ADP) to adenosine triphosphate (ATP), has been shown to be an acute phase reactant in the amphioxus Branchiostoma belcheri. However, immune and functional characterization of this protein remains lacking. Here we demonstrate clearly that the expression of B. belcheri gene, BbCK, was inducible by the challenge with LPS, and the recombinant BbCK was capable of binding to the Gram-negative bacterium Escherichia coli and inhibiting the bacterial growth. Moreover, the bacteriostatic activity of the recombinant BbCK against E. coli was able to be suppressed by some sugars including N-acetyl-d-mannosamine, N-acetyl-d-glucosamine, l-fucose, d-mannose, d-fructose and d-

glucose. In contrast, BbCK exerted little effect on the growth of the Gram-positive bactterium Staphylococcus aureus. Taken together, these data suggest that CK is a bacteriostatic factor with a lectin-like activity, capable of specifically inhibiting the growth of the Gram-negative bacteria like E. coli. This is the first report exhibiting the integrative role of CK in immunity via its pleiotropic effects on recognizing the Gram-negative bacterium E. coli and inhibiting its growth.

【题目】Functional characterization of the ELR motif in piscine ELR+CXC-like chemokine

【中文关键词】类ELR+CXC趋化因子,重组,突变,ELR结构域;

【英文关键词】ELR+CXC-like chemokine; Recombinant; Mutant; ELR motif; Chemotaxis

【中文摘要】为了阐明鱼类中不完全ELR的活性位点,我们在大肠杆菌M15中合成了它的CXC重组体ELR(+)CXC和其突变体(mELR and mLoop),合成时我们参考黑鲷中编码CXC趋化因子(BS rCXC)的氨基酸序列。实验显示,不同剂量的BS rCXC在黑鲷和鲤鱼中可以诱导中性粒细胞和头肾巨噬细胞的迁移(10 to 200 ng)。虽然ELR活性位点和ELR(+)CXC氨基酸的N末端在趋化因子的活动和与受体结合过程中起着必要的作用,但是相识剂量下,与完全rCXC相比,(mELR and mLoop)突变体并没有显示出对中性粒细胞有明显的影响。人类的突变体IL-8能够明显诱导鱼类中中性粒细胞的迁移却并不影响巨噬细胞,即使ELR(+)CXC突变成ELR,BS rCXC在高等脊椎动物中却做不到这一点。BS rCXC和它的突变体能够促进黑鲷和鲤鱼中中性粒细胞和头肾巨噬细胞的作用,而在小鼠体内却不起作用。实验结果证明,ELR(+)CXC起着类似于CXC祖先的作用,在哺乳动物中ELR并没有表现出很明显的功能。

【英文摘要】To elucidate the functional role of piscine incomplete ELR motif, the recombinant CXC and its mutants (mELR and mLoop) were produced in Escherichia coli M15 based on the predicted mature peptide coding sequence of the black sea bream CXC (BS CXC) chemokine. Assays showed that the BS rCXC proteins displayed strong ability to induce fish blood neutrophils and head kidney (HK) macrophage migration in a dose-independent manner (10 to 200 ng), both in black sea bream and common carp. Although the ELR motif and the N-terminal loop of ELR(+)CXC chemokines are essential for chemotactic activity and receptor binding in mammals, the mELR and mLoop mutants showed no significant difference in their induction of chemotaxis of fish blood neutrophils compared with the full-length rCXC at the same dose. Human recombinant IL-8 (hrIL-8) can clearly induce piscine blood neutrophil migration and has no effect on macrophages, whereas the BS rCXC cannot induce chemotaxis in higher vertebrates, such as rat blood neutrophils or macrophages, even if the incomplete ELR motif in rCXC was mutated to ELR. The BS CXC and its mutants can promote the phagocytosis ability of piscine blood neutrophils and HK macrophages both in black sea bream and common carp, but have no effect on rat neutrophils or macrophages. Results showed that the piscine ELR(+)CXC-like chemokine represents an ancient version of a CXC chemokine; the ELR motif still does not show the higher specific polarization of function as found in mammalian.

【题目】Bipolar properties of red seabream (Pagrus major) transforming growth factor-beta in induction of the leucocytes migration

【中文关键词】嘉鲷 TGF-beta 生物极性,免疫调控

【英文关键词】Red seabream (Pagrus major); TGF-beta; Bipolar property; Immune regulatory

【中文摘要】TGF-β是一种多效性细胞因子,在免疫调节和随后的愈合反应中起着重要的作用。我们在体外表达并纯化了TGF-β重组体(rTGF-β)。rTGF-β能够诱导头肾和周边白细胞与的迁移且这种迁移与rTGF-β的剂量有关。然而当白细胞是由LPS(脂多糖)激活时,这种迁移活动就会受到抑制。rTGF-β的这种抑制和激活作用表明,鱼类的TGF-β和哺乳动物的一样,具有两极性。此外,结果还表明TGF-β对白细胞迁移的诱导作用不是先天的,而是需要趋化因子的诱导。这是第一次有关于TGF-β两极性的报道。

【英文摘要】TGF-beta is one of the pleiotropic cytokines and plays a pivotal role in immune regulation and orchestrating the subsequent healing response. Recombinant red seabream TGF-beta (rTGF-beta) mature peptide was expressed and purified under native conditions in vitro. Bio-assay showed that the rTGF-beta could significantly induce head kidney (HK) and peripheral blood (PB) leucocytes migration in a dose dependent manner, whereas the rTGF-beta suppressed HK and PB leucocyte migration when the leucocytes was activated by primed with lipopolysaccharide (LPS). Both enhancing and suppressing roles of rTGF-beta on the HKL and PBL chemotactic activity indicated that the fish TGF-beta shared the similar bipolar nature with mammalian TGF-beta. Furthermore, the results indicated that the activity of TGF-beta induction of leucocyte migration appears not to be an innate feature but function by regulation the chemokines activity. This is the first time we reported that fish TGF-beta has innate bipolar property in regulation of fish immune function. (C) 2010 Elsevier Ltd. All rights reserved.

【题目】Identification and analysis of a Cu/Zn superoxide dismutase from Haliotis diversicolor supertexta with abalone juvenile detached syndrome

【中文关键词】SOD,AJDS,Cu,Zn,环境压力

【英文关键词】Haliotis diversicolor supertexta; Cu/Zn superoxide dismutase; Abalone juvenile detached syndrome (AJDS)

【中文摘要】通过文库筛选,我们获得了AJDS综合症鲍鱼中含有Cu/Zn超氧化物歧化酶的一段cDNA序列。通过RACE我们可以用这段Cu/Zn SOD cDNA序列扩增出全长为988bp的cDNA,这段全长包括462bp的开放阅读框(ORF)(编码154个氨基酸),49bp的5'-和477bp的非翻译区。编码区与已知的Cu/Zn SODs相似性很高。我们推测编码的氨基酸序列包括一些保守的几何功能域和两个典型的Cu/Zn SOD结构域(Cu/Zn结构域较为保守),此外半胱氨酸参与了二级结构的形成。我们让abSOD(鲍鱼Cu/Zn SOD重组体)在大肠杆菌中表达,在蛋白变性的条件下将其纯化,然后让其在缓冲液或者凝胶中复性。纯化后的蛋白功能可以在有1 mu M Cu(2+)或1 mu M Cu(2+) + 1 mu M Zn(2+)的情况下得到加强。在AJDS鲍鱼中,与对照组相比abSOD的转录显著增加。但是蛋白的表达和SOD酶的活性却显著降低。这些都表明在AJDS鲍鱼中,SOD发挥了重要作用,且这种疾病与环境压力有关。

【英文摘要】A partial cDNA sequence of a putative Cu/Zn Superoxide dismutase (SOD) from Haliotis diversicolor supertexta with abalone juvenile detached syndrome (AJDS) was isolated by suppression subtractive hybridization library screening. The full 988 base pair (bp) abalone Cu/Zn SOD cDNA representing full cDNA coding sequence was obtained by rapid amplification of cDNA ends (RACE), and included a 462-bp open reading frame encoding 154 amino acids, plus 49 bp of 5'-, and 477 bp of T-untranslated region. The coding sequence shared high similarity and identity with known Cu/Zn SODs. The deduced amino acids contained two typical Cu/Zn SOD motifs and the conserved geometry active sites. Moreover, the cysteines involved in dimer formation, and the copper- and zinc-binding sites were conserved. Recombinant abalone Cu/Zn SOD (abSOD) was expressed in Escherichia coli, purified under denaturing conditions, and refolded by direct buffer exchange or gel gradient recovery. The activity of the purified protein was enhanced by 1 mu M Cu(2+) or 1 mu M Cu(2+) plus 1 mu M Zn(2+). The transcription of abSOD was significantly increased in AJDS abalones compared to controls, while protein expression and SOD enzyme activity both decreased significantly, suggesting that SOD may play an important role in AJDS, and that the disease etiology may be related to environmental stress.

【题目】Cloning and bioactivity analysis of a CXC ligand in black seabream Acanthopagrus schlegeli: the evolutionary clues of ELR+CXC chemokines
【中文关键词】ELR+CXC趋化因子,黑鲷
【英文关键词】ELR(+)CXC chemokines black seabream Acanthopagrus schlegeli
【中文摘要】ELR+CXC趋化因子有多种功能,它与将白细胞补充到有炎症感染的地方有关。因为ELR+CXC的序列与哺乳动物的IL-8很相似,所以鱼类中与IL-8相似的CXC基因被命名为鱼类IL-8,并且有ELR前缀。但是这个命名并没有功能相似或者进化上的依据。在这篇文章中,我们克隆了黑鲷的类似于IL-8的同源基因BS CXC。分析表明,它与鱼类和哺乳类的CXC趋化因子的基因和三级结构都很相似,无论是ELR-CXC 还是ELR+CXC,即使它与ELR-CXC相似性要比ELR+CXC低。与其它IL-8相似,BS CXC有一个不完全ELR活性位点,对于哺乳动物来说,这个位点是ELR+CXC能够攻击粒细胞所必备的。生物活性分析表明,大肠杆菌产生的BS rCXC能够显著抑制鱼类体内中性粒细胞和巨噬细胞的迁移,但在小鼠体内对两种细胞却没有影响。然而hrIL-8在鱼类体内诱导中性粒细胞产生了很强的趋药性,但对巨噬细胞却没有影响。BS CXC的功能似乎介于ELR-CXC和ELR+CXC之间。这些实验表明,BS CXC在ELR-CXC向ELR+CXC进化过程中,处在进化的中间阶段,所以把它称作piscine CXC with an incomplete ELR是比较合适的。
【英文摘要】The ELR+CXC chemokines are multifunctional mediators that are mainly responsible for the recruitment of leucocytes to sites of inflammation and infection. Because of their high sequence identity with mammalian IL-8, fish IL-8-like CXCs have been named as piscine 'IL-8' and included in the ELR+ subgroup, even though there is no reliable functional or evolutionary evidence to support this classification. RESULTS: In this investigation, a homologue of piscine 'IL-8' from black seabream (Acanthopagrus schlegeli), called BS CXC, has been cloned and analyzed. The results revealed that BS CXC has a high gene similarity and tertiary structure similarity with piscine and mammalian CXC chemokines, both ELR-CXC and ELR+CXC, although it has a lower identity with ELR-CXC, compared with ELR+CXC chemokines. Like other piscine IL-8, BS CXC has only an incomplete ELR motif, which is essential for the mammalian ELR+CXC ability to attract granulocytes. Bioactivity assay demonstrated that the BS rCXC produced in E. coli significantly stimulated migration of fish neutrophils and macrophages, but had no effect on rat neutrophils and macrophages, whereas hrIL-8 induced strong chemotaxis of fish neutrophils but did not affect fish macrophages. BS CXC seems show some structural and functional properties of the intermediate between ELR-CXC and ELR+CXC. CONCLUSION: As an incomplete ELR+CXC chemokine from a modern fish, BS CXC provides some clues on the evolution from ancient ELR-CXC to ELR+CXC by retaining some properties of the intermediate stage in evolution, and it may be more appropriate to call this molecule 'piscine CXC with an incomplete ELR', instead of terming it fish 'IL-8'.

【题目】Molecular cloning, characterization and expression analysis of an ILF2 homologue from Tetraodon nigroviridis
【中文关键词】黑青斑河豚 细胞介素2增强子结合因子 克隆 体内表达 共线性
【英文关键词】chromosome synteny; cloning; gene organization; interleukin-2 enhancer binding factor 2; in vivo expression study; Tetraodon nigroviridis
【中文摘要】白细胞介素-2 (IL-2)是T细胞反应的中央细胞因子。ILF2是在人类和哺乳动物的功能进行了鉴定。但在硬骨鱼所知甚少。在这篇文章中,从黑青斑河豚克隆ILF2基因,并进行鉴定,是为了进一步研究ILF2在硬骨鱼中的功能。其全长1380bp,包含1164bp的一个开放阅读框(ORF),编码 387个氨基酸的蛋白质,分子量42.9kDa,含有一个5 '的57 bp非翻译区和一个3 '的159bp非翻译区,含有polyA的尾巴。推导的多肽序列与其它已知的序列有58% - 93%的相似度,并包含两个N糖基化位点,两N-乙酰化位点,一个RGD细胞附件序列,六蛋白激酶C磷酸化位点,一个富含RGG的氨基末端的单链RNA结合域和一个

DZF锌指核酸结合域,其中大多数是通过物种序列比对而高度保守。ILF2的组织表达检测了以下部位:腮、肠道、头肾、脾、肝、脑和心脏。最高的表达量是在心脏,其次是肝脏、肾脏和大脑。LPS刺激并不能显著改变其表达。基因组织分析表明: ILF2基因有15个外显子,多于已知人类和老鼠的ILF2基因,上游和下游序列分别与Rpa12, Peroxin-11b, Smad4, Snapap and Txnip 同源,这不同于人类和老鼠。

【英文摘要】nterleukin-2 enhancer binding factor 2 (ILF2) was reported to regulate transcription of interleukin-2 (IL-2), a central cytokine in the regulation of T-cell responses. This property of ILF2 was well characterized in human and mammals, but little is known in bony fish. In this paper, an ILF2 homologue was cloned and well characterized from Tetraodon nigrovirid is for the further investigation of the function of ILF2 in bony fish. The full-length Tetraodon ILF2 cDNA was 1380 by in size and contained an open reading frame (ORF) of 1164 by that translates into a 387 amino-acid peptide with a molecular weight of 42.9 kDa, a 5' untranslated region (UTR) of 57 bp, and a 3' UTR of 159 by containing a poly A tail. The deduced peptide of Tetraodon ILF2 shared an overall identity of 58%-93% with other known ILF2 sequences, and contained two N-glycosylation sites, two N-myristoylation sites, one RGD cell attachment sequence, six protein kinase C phosphorylation sites, one amino-terminal RGG-rich single-stranded RNA-binding domain, and a DZF zinc-finger nucleic acid binding domain, most of which were highly conserved through species compared. Constitutive expression of Tetraodon ILF2 was observed in all tissues examined, including gill, gut, head kidney, spleen, liver, brain and heart. The highest expression was detected in heart, followed by liver, head kidney and brain. Stimulation with LPS did not significantly alter the expression of Tetraodon ILF2. Gene organization analysis showed that the Tetraodon ILF2 gene have fifteen exons, one more than other known ILF2 genes in human and mouse. Genes up- and down-stream from the Tetraodon ILF2 were Rpa12, Peroxin-11b, Smad4, Snapap and Txnip homologue, which were different from that in human and mouse.

【题目】Molecular cloning, characterization and expression analysis of an IL-21 homologue from Tetraodon nigroviridis

【中文关键词】青斑河豚,白细胞介素21;分子克隆;鉴定,表达量分析
【英文关键词】Tetraodon nigroviridis; interleukin-21; molecular cloning; characterization; expression analysis

【中文摘要】白介素21(IL- 21)是一个重要的免疫细胞因子,是在人类和哺乳动物中进行了鉴定,但在鱼类所知甚少。此研究,从青斑河豚克隆了IL-21,并进行了鉴定。全长为849bp,包括一个438bp的开放阅读框,编码145个氨基酸的多肽,含有一个5 '的69 bp非翻译区和一个3 '的342bp非翻译区。推导的多肽序列与其它已知的序列有20%-49%的相似度。IL-21基因有6个外显子,人类和河豚的IL-21基因只包含五个外显子。共线性分析表明在进化过程中基因是非常保守的。体内研究表明,此基因只在健康的鱼的有限的组织,包括肠道、鳃和性腺低水平表达,LPS刺激会增加这些组织的表达量,可以诱导肾、脾和皮肤的表达,表明IL- 21是一种炎性应力诱导基因,起到抗菌防御的作用。我们的研究提供了进一步的证据,证明鱼中存在IL-21,并为进一步研究IL- 21基因的免疫功能提供了参考。

【英文摘要】Interleukin-21 (IL-21) is an important immune cytokine that was well characterized in human and mammals, but little is known in fish. In present study, an IL-21 homologue was cloned and well characterized from Tetraodon nigroviridis. The full-length Tetraodon IL-21 cDNA was 849 bp in size, containing an open reading frame (ORF) of 438 bp that translated a 145 amino-acid peptide, a 5' untranslated region (UTR) of 69 bp, and a 3' UTR of 342 bp. The deduced peptide shared identity of 20-49% with other known IL-21 sequences. The Tetraodon IL-21 gene had six exons while both human and Takifugu IL-21 gene contained only five exons. However, the level of synteny between human, Takifugu and Tetraodon genomes was well conserved during evolution. In vivo expression study showed that Tetraodon IL-21 mRNAs were constitutively expressed at a low level and only in limited tissues, including gut, gill and gonad in healthy fish, and stimulation with LPS increased the expression of IL-21 in these tissues and induced the expression of IL-21 in kidney, spleen and skin, indicating that IL-21 is an inflammatory stress inducible gene associated with the anti-bacterial defense in fish. Our study provided further evidence for the existence of IL-21 in fish, and gained further insight into the immunological functions of IL-21 gene in fish. (c) 2006 Elsevier Ltd. All rights reserved.

【题目】Construction of a recombinant plasmid containing multi-copy CpG motifs and its effects on the innate immune responses of aquatic animals
【中文关键词】CpG序列;重组质粒;先天免疫反应;鲫鱼;日本尖吻鲈;太平洋白虾
【英文关键词】CpG motif; recombinant plasmid; innate immune responses; Crucian carp; Japanese seabass; Pacific white shrimp
【中文摘要】细菌的DNA合成的寡脱氧核苷酸包含未甲基化的CpG 二核苷酸,已经证明了它能够引发潜在的免疫反应。在本研究中,我们设计了一个重组质粒包含多拷贝CpG序列。并观察对鱼和虾的先天免疫反应的效果。结果表明,这样的质粒DNA相对空质粒而言,可以在体外高度诱导鲫鱼和鲈鱼的头肾巨噬细胞的激活和的外周血白细胞的增殖。可以在凡纳滨对虾体内激活蛋白防御机制和血淋巴的抗菌活性。这意味着含有多拷贝CpG序列的质粒可以有潜在提高宿主抵抗水中病原体的能力,并在水产养殖方面有高效、经济和应用广泛的优势。
【英文摘要】Bacterial DNA and synthetic oligodeoxynucleotides (ODNs) containing unmethylated CpG dinucleotides (CpG motifs) have been shown to induce potential immune responses. In this study, we designed a recombinant plasmid containing multi-copy CpG motifs. and observed its effects on innate immune responses of fish and prawn. The results showed that such plasmid DNA, compared to the vacant vector, can highly induce the activation of head kidney macrophages and the proliferation of peripheral blood leukocytes in Carassius auratus and Lateolabrax japonicus in vitro, as well as the activity of Immoral defense proteins and the antibacterial activity of haemolymph in Litopenaeus vannamei in vivo. It implies that the multi-copy CpG motifs harboured in plasmid could contribute to these innate immunostimulatory effects. Therefore, the study suggested that the plasmid containing multi-copy CpG motifs might have its potential application in improving host resistance to pathogen insults in aquaculture, and have its notable advantages of high efficacy, economical cost and application to a broad range of aquatic species.

【题目】Cloning and characterisation of two natural killer enhancing factor genes (NKEF-A and NKEF-B) in pufferfish, Tetraodon nigroviridis
【中文关键词】自然杀伤细胞;比较基因定位分析;组织特异性表达;绿色斑点河豚;青斑河豚
【英文关键词】Spotted green pufferfish; Tetraodon nigroviridis; NKEF-A; NKEF-B; Gene cloning; Characterization
【中文摘要】自然杀伤细胞增强因子(自然杀伤性细胞)属于高度保守的过氧化物还原酶(Prx)家族。它的功能是参与免疫细胞毒性、凋亡、细胞增殖、分化和抗氧化活性。本研究从绿色斑点河豚和青斑河豚分离了两个自然杀伤性细胞基因,自然杀伤性细胞-A和自然杀伤性细胞-B,并进行了鉴定。比较基因定位方法进行鲀类和人的自然杀伤性细胞-A 和自然杀伤性细胞-B的共线性分析,表明自然杀伤性细胞-A和自然杀伤性细胞-B基因与哺乳动物自然杀伤性细胞-A和自然杀伤性细胞-B分别编码的基因同源。在不同物种中这两个基因的染色体类似,包含一个非编码的外显子,5个编码外显子和5个内含子。推导出的两个基因的氨基酸序列与哺乳动物自然杀伤性细胞-A和自然杀伤性细胞-B是高度同源,包括两个非常保守的缬氨酸-半胱氨酸-脯氨酸序列。组织特异性的表达分析显示:这两个基因在整个机体表达。LPS刺激后会抑制大多数组织的自然杀伤性细胞-A 和自然杀伤性细胞-B的表达,但是会增加这两个基因在脾脏中的转录。这是首次报道自然杀伤性细胞-B存在于鱼中。
【英文摘要】Natural killer cell enhancing factor (NKEF) belongs to a highly conserved peroxiredoxin (Prx) family. Its functions are involved in immune cytotoxicity, apoptosis, cell proliferation, differentiation and antioxidant activity. In present paper, two NKEF genes, NKEF-A and NKEF-B, were isolated and characterised in spotted green pufferfish, Tetraodon nigroviridis. Comparative

genomic location analysis shows conserved syntenies within the NKEF-A and NKEF-B regions between Tetraodon and human, indicating that the Tetraodon NKEF-A and NKEF-B genes are orthologs for mammalian NKEF-A and NKEF-B encoding genes, respectively. The genomic organisation of the two genes is similar in different species, containing one non-coding exon, five coding exons and five introns. The deduced amino acids of the two genes are highly homologous with mammalian NKEF-A and NKEF-B proteins, including two well conserved Val-Cys-Pro (VCP) motifs. Tissue specific expression analysis by RT-PCR reveals that both genes are globally expressed. Stimulation with LPS inhibits both NKEF-A and NKEF-B gene expression in most tissues but enhances NKEF-A and NKEF-B transcriptions in spleen. This is the first report on the existence of a NKEF-B homologue in fish.

【题目】Molecular cloning and characterization of IL-15R alpha gene in rainbow trout (Oncorhynchus mykiss)
【中文关键词】虹鳟;IL-15受体α链;分子克隆;组织分布;选择性剪切
【英文关键词】rainbow trout; IL-15R alpha; molecular cloning; tissue distribution; alternative splice
【中文摘要】IL-15受体复合物的α链是高亲和力的,与IL-15结合的特异的亚单位。它与IL-2受体α链有共同的结构和功能特性。这里我们首次报道了大麻哈鱼的IL-15的α链的分子克隆、鉴定和序列分析。基因全长包括167bp的5 '的非翻译区,732bp的开放阅读框和3 '的630bp的非翻译区,在所有组织中都有表达。另外两个变异体来自选择性剪切。通过southern 印记得到虹鳟的IL-15的α链有两个拷贝。而且,在其它鱼类中有表达序列标签的追踪证据。推导得的虹鳟的IL-15的α链有243个氨基酸,包含N端的17个氨基酸的信号肽和C端的一个重复序列,并且有一个典型的胞外区。系统进化树分析将虹鳟的IL-15的α链与其它物种的IL-1的α链聚为一类,但是没有与IL-2的α链聚为一类。除此之外,在胞外区发现了一个假定的序列,这个序列在所有物种中是保守的和功能多样的,并且可能与细胞因子识别有关。
【英文摘要】The alpha-chain of IL-15 receptor complex serves as a high-affinity, specific subunit for IL-15 binding. It shares functional and structural features with IL-2 receptor alpha-chain. Here we report for the first time that the molecular cloning, characterization and sequence analysis of the teleostean IL-15R alpha from Oncorhynchus rnykiss. The full-length cDNA comprises of a 5' untranslated region (UTR) of 167 bp, an open reading frame of 732 bp and a large 3'UTR of 630 bp, constitutively expressed in all the tissues examined. Another two variants are found derived from alternative splicing. Two copies of rainbow trout IL-15Ra (rtIL-15R alpha) were detected in the genome by Southern blot hybridization. Moreover, EST evidence is also traced from other fishes. The deduced rtIL-15R alpha of 243 amino acids contains a 17aa signal peptide at N-terminus and a transmembrane region at C-terminus, as well as a typical sushi domain included in the extracellular region. Phylogenetic tree analysis groups rtIL-15R alpha with other IL-1R alpha s but separates it from IL-2R alpha s. In addition, a putative sequence was found in the sushi domain which is conserved and versatile among all species and this might relate to cytokine recognition.

【题目】Identification and characterization of suppressor of cytokine signaling 3 (SOCS-3) homologues in teleost fish
【中文关键词】SOCS-3(3-型细胞信号抑制因子),克隆,等电点,进化树
【英文关键词】Socs-3,clone evolution tree
【中文摘要】3-型细胞信号抑制因子(SOCS-3)属于一类新发现的蛋白家族的成员,这类蛋白家族调控着诸多免疫因子反应,诸如:干扰素,白细胞介素2,白细胞介素6等等,它们通过抑制JAK信号转导以及激活途径来进行调控。尽管3-型细胞信号抑

制因子在哺乳动物中已得到了详尽的研究,但其在鱼类中任鲜有研究。在最近的研究中,我们在三种鱼中检测并确定了SOCS-3的基因,它们分别是河豚,斑马鱼,红鳍东方纯。结果显示,河豚鱼的SOCS-3基因长度为2666bp,位于3号染色体上,转录得到长度为1445bp的信使RNA,该RNA包含5’端273bp的非翻译区,606bp的开放读码框,3’端566bp的非翻译区。河豚鱼的SOCS-3是一段具有201个氨基酸残基,相对分子量为22.76kDa,理论等电点为8.99的蛋白质。斑马鱼的SOCS-3基因长度为3617bp,位于3号染色体上,转录得到1927bp的信使RNA,该RNA包含178bp的5’端非翻译区,624bp的开放读码框,1125bp的3’端非翻译区,其蛋白质有207的氨基酸残基,其相对分子量为23.68kDa,其理论等电点为9.19。红鳍东方纯的SOCS-3基因长度为2842bp,转录得到1528bp的信使RNA,包含有5’端209bp的非翻译区,606bp的开放读码框,713bp的3’端非翻译区,其蛋白质含有201个氨基酸残基,其相对分子质量22.76kDa,理论为等电点8.18。鱼类编码的SOCS-3基因与哺乳动物的结构相同,,包含有两个外显子,一个包含在5’端非翻译区的单一内含子。据此可以推断出,鱼类SOCS-3与哺乳动物有60.7%-61.7%的相似性,与鸟类有62.3%-63.2%的相似性,与两栖类有55.3%-57.8%的相似性。由进化树分析可知,鱼类SOCS-3属于一单一类群。在河豚鱼中,SOCS-3在其10种组织中的表达结果显示,它在10种特定组织中均有表达,且能够显著的被LPS诱导。以上这些结果说明,SOCS-3作用存在于炎症反应中。本文首次阐述了SOCS-3基因在鱼类中的克隆及功能鉴定。

【英文摘要】Although SOCS-3 was well characterized in several mammal species, there was still no report in fish. In present study, we initially identified and characterized the SOCS-3 genes from three fishes. Phylogenetic analysis separates the fish SOCS-3s into an exclusive group. Expression study of Tetraodon SOCS-3 mRNA in ten selected tissues showed that it was constitutively expressed and induced by lipopolysaccharide, (LPS) strikingly. These results indicated that SOCS-3s in fish may be involved in inflammatory responses. This is the first report of cloning and characterization of SOCS-3 cDNAs and genes in fish

【题目】Molecular cloning and identification of macrophage migration inhibitory factor (MIF) in teleost fish

【中文关键词】鱼,MIF,克隆,表达,实时定量PCR

【英文关键词】fish; MIF; cloning; characterization; expression; gene organization; real time PCR

【中文摘要】我们在凹鼻鮰中克隆得到了MIF基因并从其他六种硬骨鱼中得到了相应的MIF基因。该结果说明鱼类的MIF基因与哺乳动物MIF基因拥有相同的结构,包括:3个外显子和2个内含子。凹鼻鮰MIF基因定位于1号染色体上,长度为1091bp,转录得到500bp的信使RNA序列,其中包含14bp的5’端非翻译区,348bp的开放读码框,138bp的3’端非翻译区。凹鼻鮰MIF蛋白质还有115个氨基酸残基,相对分子量为12.5kDa,理论等电点为6.81。据此得到的硬骨鱼氨基酸序列与哺乳动物MIF蛋白质有64.1%-73.5%的相似性,与鸟类有61.5%-70.1%的相似性,与两栖动物有55.6%-62.5%的相似性,在硬骨鱼中有着74.4%-97.4%的种内相似性。进化树分析表明,硬骨鱼MIF基因属于唯一的类群。通过Southern杂交的方法确定了凹鼻鮰MIF基因只有一种拷贝。RT-PCR和real-time PCR分析表明在所选10种特定组织中其均有表达,该基因在肾脏及脾脏中表达能显著被LPS诱导。其生物活性通过MMI得以被检测。MMI的结果显示TnMIF的结合作用能抑制巨噬细胞的吞噬作用。以上个结果表明MIF蛋白在鱼类中的作用可能与免疫反应相关。

【英文摘要】Macrophage migration inhibitory factor (MIF) is one of the first cytokines to be identified, which have been emerged to be an important mediator of the innate and adaptive immune system. Although MIF was well characterized in several mammal species, there was still little report in fish. In present study, we cloned the MIF gene from Tetraodon nigroviridis, and identified other six MIF genes from other teleost fishes, Fundulus heteroclitu, Oncorhynchus mykiss, Ictalurus punctatus, Danio rerio, Salmo salar and Haplochromis chilotes. The results showed that the fish MIF genes with the same organization as the mammalians consist of three exons and two introns. Tetraodon MIF gene located within a 1091bp genomic fragment of chromosome 1, transcribed into a 500bp mRNA including 14bp 5' untranslated region (UTR), 348bp ORF and 138bp 3'-UTR. Tetraodon MIF with 115aa has a calculated molecular mass of 12.5kDa and a theoretical pI of 6.81. The deduced amino-acid sequences of the teleost fish MIFs showed 64.1-73.5% sequence identity to mammalian MIFs, 61.5-70.1% to avian MIFs, 55.6-62.4% to amphibian MIFs, 74.4-97.4% among the teleost fishes. Phylogenetic analysis separates the teleost fish MIFs into an exclusive group. Genomic Southern blotting analyses suggest that Tetraodon has one copy of the MIF gene. RT-PCR and real-time PCR analyses reveal that Tetraodon MIF (TnMIF) mRNA was constitutively expressed in 10 selected tissues and induced by lipopolysaccharide (LPS) strikingly in head kidney and spleen. The bioactivity of recombinant TnMIF was tested by macrophage migration inhibition (MMI) assay. The result of MMI assay showed that

the recombinant TnMIF inhibited the macrophage cells migration at rate of 35% (P<0.04). These results indicated that MIFs in fish may be involved in immune responses.

【题目】Identification and characterization of suppressor of cytokine signaling 1 (SOCS-1) homologues in teleost fish
【中文关键词】河豚,斑马鱼,SOCS-1,选择性剪切,细胞信号
【英文关键词】Tetraodon nigroviridis; Danio rerio; Fugu rubripes; Gasterosteus aculeatus; SOCS-1; alternative splicing; cytokine signaling
【中文摘要】1-型细胞信号细胞因子(SOCS-1),正如其名所示,是调节细胞信号转导途径的一种蛋白质,它通过抑制在转到哪途径中其关键作用的络氨酸磷酸化酶的受体及信号分子来实现调控作用。尽管哺乳动物SOCS-1同源蛋白在很多物种被得以研究,但在鱼类中还没进行类似的研究。在本文中,我们首次在河豚和斑马鱼内克隆得到了SOCS-1基因,而后在红鳍东方纯及三刺鱼内得到 另外两种SOCS-1蛋白。本结果显示,鱼类SOC-1蛋白编码的基因包含两个外显子和一个独立的内含子,这种结构在SOCS家族中是独有的结构特征。另外,两种剪切体编码的蛋白含有220个氨基酸残基和196个氨基酸残基也在河豚鱼中被发现,这证明了这两种剪切体的存在于鱼中与高等脊椎动物有所不同。经过反转录和实时定量PCR研究基因表达表明,这两种剪切体在主要组织中均广泛表达,同时我们还发现其表达量能够被体外注射LPS诱导而显著增加,这说明其与炎症反应有关系。本研究首次进行了对鱼类socs-1蛋白基因全序列的克隆及分析
【英文摘要】The suppressor of cytokine signaling 1 (SOCS-1), as the name implies, is a member of proteins that regulate cytokine signaling pathways by inhibiting the events of key tyrosine phosphorylation on cytokine receptors and signaling molecules such as Janus kinase family members. Although mammalian SOCS-1 homologues were characterized in several species, no similar research work has been reported in fish yet. In this paper, we initially cloned the SOCS-1 genes from 4 fishes. By PCR and real-time quantitative PCR, gene expression studies indicated that both two alternatively spliced transcripts of Tetraodon SOCS-1 were expressed extensively in major tissues as we examined and their corresponding expression levels could be strikingly raised at 3 h postinjection with lipopolysaccharide, which strongly suggested that SOCS-1 proteins in fish might be involved in inflammatory responses. This is the first report of cloning and characterization of SOCS-1 complementary deoxyribonucleic acids and genes in fish.

【题目】Cloning, characterization and expression analysis of pufferfish interleukin-4 cDNA: the first evidence of Th2-type cytokine in fish
【中文关键词】河豚,IL-4,克隆,组织表达,Th-2型细胞素
【英文关键词】Tetraodon nigroviridis; IL-4; cloning; characterization; tissue expression; Th2-type cytokine
【中文摘要】4-型白细胞介素(IF-4)是Th2介导的免疫反义中起关键作用的细胞因子之一,它用来调节许多免疫因子的反应诸如:r-干扰素,1-型白细胞介素,还有a-TNF。对于IL-4的研究在哺乳动物以及人类中已经做了很多,唯有在鱼类中却鲜有研究。在本研究中,我们在河豚鱼中克隆并确定了IL-4 cDNA全长,其包长度为834bp,5’端39bp的非翻译区,3’端375bp的非翻译区,以及420bp的开放读码框,转录得到139个氨基酸残基,现对分子量为16.131kDa的蛋白质。河豚鱼IL-4基因与哺乳动物有着相同的结构,及四个外显子和三个内含子,该蛋白与其他物种有着11%-16%的相似性,我们用RT-PCR的方法确定其表达情况,结果显示它在头肾,脾,肝脏,脑,胸鳍,肌肉心脏中广泛表达,其中在头肾,肝脏,脾脏中表达量较低,IL-4的广泛表达性与其

免疫作用有着很大的关系,将鱼经过ConA,PHA,PMA刺激后能够显著增加IL-4的表达量,从而间接促进IL-4炎症免疫反应。本文首次在鱼类中克隆及确定得到IL-4基因及分析其功能。

【英文摘要】Interleukin-4 (IL-4) is one of the key cytokines in Th2 mediated immune responses, which has been shown to regulate the responses of many immune cytokines, such as interferon-gamma (IFN-gamma), interleukin-1 (IL-1) and TNF-alpha. Much work on IL-4 has been done in human and several mammal species while little in fish. In this study, we have cloned and characterized the full-length cDNA of IL-4 in Tetraodon. The Tetraodon IL-4 cDNA is 834 bp in length and contains a short 5'UTR of 39 bp, a 3'UTR of 375 bp and an open reading frame of 420 bp translating into a protein of 139 aa with a predicted molecular mass of 16.131 kDa. The Tetraodon IL-4-encoding gene with the same organization as the mammalians and birds consists of four exons and three introns. The encoded protein shows 11-16% identities to other homologues. RT-PCR was optimized to estimate the expression level of IL-4 in Tetraodon. The results showed that IL-4 is constitutively expressed in all selected tissues, including head kidney, spleen, liver, brain, gill, muscle and heart, although low levels were observed in head kidney, spleen, and liver. The ubiquitous expression of IL-4 is consistent with a postulated role in immune cytokines regulation. Stimulating the fish with a mixed stimulant that contained 2 mu g ConA, 2 mu g PHA, and 2 mu g PMA, significantly up-regulated the expression of IL-4 in most tissues examined, which potentially indicated that IL-4 was involved in the immune inflammatory responses triggered by mitogens. This is the first report of cloning and characterization of IL-4 cDNA and gene in fish.

【题目】Global identification and comparative analysis of SOCS genes in fish: insights into the molecular evolution of SOCS family

【中文关键词】SOCS,鱼类进化,基因组复制

【英文关键词】suppressors of cytokine signaling (SOCS); fish; evolution; gene duplication

【中文摘要】SOCS家族基因在免疫、发育和生长过程中很重要,但其进化史并不清楚。本文研究了120个socs基因,66个新发现,55个鱼类的,11个来自两栖类昆虫和鸟类。分析表明,鱼类至少有12个SOCS家族吗,包括哺乳动物已知的8个成员(CISH, SOCS-1-7)以及4个新成员(SOCS-3b, -5b, -8 and -9)。鱼类SOCS高度保守。LPS处理后CISH, SOCS-1-5 and SOCS-9上调表达,可能与免疫反应有关。进化分析表明可分为两个亚家族,且SOCS祖先基因经过了至少3基因组复制产生现在的基因家族。

【英文摘要】The suppressors of cytokine signaling (SOCS) family play important roles in regulating a variety of signal transduction pathways that are involved in immunity, growth and development of organisms. However, the family members in early vertebrate species and their evolutionary history and relationships remain largely unknown. In present study, totally 120 SOCS genes from various species were globally investigated, among of which 66 new SOCS genes were identified, including 55 SOCS genes from five fish species, Tetraodon nigroviridis, Danio rerio, Takifugu rubripes, Gasterosteus aculeatus and Oryzias latipes, 11 from amphibian, avian and insects. The results showed that fish possess at least 12 SOCS family members, including eight known mammalian SOCS members (CISH, SOCS-1 - 7) and four. novel members (SOCS-3b, -5b, -8 and -9). Fish SOCS proteins share strikingly high levels of sequence similarity in SH2 domain and SOCS box region with higher vertebrate counterparts, and the organization of SOCS genes are conserved during vertebrate SOCS evolution. The expression levels of the most fish SOCS genes, such as CISH, SOCS-1 - 5 and SOCS-9, were increased after LPS challenge, indicating that they are involved in inflammatory response. Phylogenetic analyses clearly showed that the SOCS gene family could be divided into two subfamilies (named as types I and II subfamily). Type I subfamily consists of vertebrate SOCS-4 - 7, SOCS-5b, SOCS-9 and all invertebrate SOCS genes. Type II subfamily contains vertebrate CISH, SOCS-1 - 3, SOCS-3b and SOCS-8. Only SOCS-5, -6 and -7 like genes existed in invertebrate, which may be generated by twice-ancient duplication events. Type II subfamily members were likely derived from a certain type I member by gene duplication in the vertebrate lineages after the divergence of vertebrate from invertebrate. In type II subfamily, SOCS genes formed two separate monophyletic groups, respectively, which suggests that another duplication event occurred in the early stage of evolution. The fact that SOCS-9, SOCS-5b, SOCS-3b and SOCS-8 present only in teleostei suggests that even more duplication events occurred before teleostei and higher vertebrates diverged. Results suggest that the SOCS multi-gene family derived from the expansion of an ancestral SOCS gene through at least cubical duplication events during evolution process.

【题目】Characterization, expression and evolution analysis of Toll-like receptor 1 gene in pufferfish (Tetraodon nigroviridis)
【中文关键词】Toll样受体(TLR);鲀属;生物学分析
【英文关键词】Toll like receptor pufferfish bioanalysis
【中文摘要】Toll 样受体(TLR)家族是病原体关联的模式识别受体家族的一种分子,它在先天性免疫系统激活中有很重要的作用。TLR1作为TLR的一个重要成员,可以与TLR2形成异质二聚体参与酰基化脂蛋白和非典型的分支杆菌代谢物的识别。虽然TLR1的部分序列通过生物信息学分析已经在河豚和鲀鱼中预测出来,但是这个基因在鱼类中的分子克隆和特征描述仍然很不清楚。这里我们报道了一种河豚的TLR1基因全长序列,并为它在鱼类中存在提供了实验证据。已经克隆出的鲀属TLR1(TnTLR1)的cDNA片段长2587个碱基,它包括一个122个碱基的5’非翻译区、2391个碱基的开放阅读框和一个74个碱基的3’非翻译区。TLR1在大多数组织中的表达量比较低,然而,被脂多糖刺激后在脾脏中的表达量有很明显的上升(3倍,这说明鱼类中的TLR1可能和与细菌内毒素或革兰氏阴性菌感染引起的炎症反应有关系。TnTLR1的基因结构和哺乳动物及鸟类很相似,并且与他们的染色体共线性高度保守。蛋白序列与已知的TLR1成员有33.7-77.3%的同一性。TnTLR1与其他鱼类TLRs的进化树分析结果表明,他们与哺乳类和鸟类的TLR1不在同一支上,且他们也不在同一分支上。TnTLR1的氨基酸数为796,预测的分子量为90.69kDa,理论等电点为8.43。在结构上,TnTLR1有一个T1R结构域(是一个跨膜结构域)和富含亮氨酸重复的结构域(标记TLR家族的结构域)。进化树分析证明TnTLR1与哺乳类TLR1、TLR6及TLR10很相似,并且看起来是他们的共同的祖先。总体上来说,这篇鲀属TLR1基因的报道将有助于我们进一步研究鱼类TLRs的功能和进化。
【英文摘要】Here we report the full-length sequence of TLR1 gene in the pufferfish (Tetraodon nigroviridis), providing experimental evidence to its existence in fish. The cloned Tetraodon TLR1 (TnTLR1) cDNA exhibited 2587 bp in length and contains a 122-bp 5' untranslated region (UTR), a 2391-bp open reading frame and a 74-bp 3' UTR. Expression of TLR1 transcripts in most selected tissues were detected at lower levels; however, the transcripts in spleen was markedly increased (threefold) after stimulation with lipopolysaccharide, indicating that TLR1 in fish may be involved in the inflammatory responses to bacterial endotoxin or Gram-negative bacteria infection. Gene organization of TnTLR1 is similar to mammalian and avian, and a high degree of conservation of chromosome synteny exists between them. The protein sequence shares 33.7-77.3% identity with known TLR1 members. Phylogenetic analysis grouped TnTLR1 with other fish TLRs on a separated branch, excluded from mammalian and avian TLR1s. TnTLR1 with 796 amino acids has a calculated molecular mass of 90.69 kDa and a theoretical pI of 8.43. Structurally, TnTLR1 has a Toll/interleukin-1 receptor (TIR) domain, a transmembrane domain and leucine-rich repeat domain which are the hallmarks of TLR family. Phylogenetic analysis provided evidence that the TnTLR1 was very close to mammalian TLR1, TLR6 and TLR10 and seemed to be their common ancestor. This report of the full-length TLR1 gene in Tetraodon will provide us further insights into the study of both function and evolution of fish TLRs as a whole.

【题目】Lipopolysaccharide induces apoptosis in Carassius auratus lymphocytes, a possible role in pathogenesis of bacterial infection in fish
【中文关键词】脂多糖(LPS);淋巴细胞;细胞凋亡; 信号通路

【英文关键词】lipopolysaccharide (LPS); lymphocyte; apoptosis; signaling pathway
【中文摘要】脂多糖是革兰氏阴性细菌的内毒素。在人和动物中,脂多糖能够引起一系列病理学效应,包括内毒素休克,组织损伤和死亡。它也能潜在的刺激B淋巴细胞及巨噬细胞起始增殖,分化和激活,结果造成像TNF-alpha,IL1-beta,IL6,IL-8和IL-12等免疫因子的变化,也可以增强免疫反应。但是,对于脂多糖诱导淋巴细胞凋亡的作用还鲜为人知。在目前的研究中,鲫鱼的淋巴细胞被应用于此次凋亡的研究中。细胞在不同的时间段被暴露在各种不同剂量的脂多糖中,然后通过仔细的凋亡特征分析,例如还染色质凝集,基因组DNA破碎和凋亡小体的形成,此次研究第一次证实了脂多糖按时间和剂量依赖性的方式诱导鱼的淋巴细胞凋亡。脂多糖可以诱导细胞内活性氧增加,线粒体膜电位丢失,ATP产量损耗,Bcl-2表达下调,Bax和线粒体NO合成酶表达上调以及选择性激活caspase-9而不是caspase-8.每一个观察结果都暗示了脂多糖主要是通过线粒体凋亡途径诱导鲫鱼淋巴细胞凋亡。这个发现不同于脂多糖通过TNF-alpha介导的死亡受体途径诱导哺乳动物巨噬细胞或胸腺细胞凋亡。我们的研究暗示了革兰氏阴性细菌在感染鱼甚至哺乳动物中可能存在一个新的治病机理,这个发现或许有助于细菌性疾病的治疗。同时,这个研究也可以提供对于感染性休克和脂多糖诱导的免疫抑制和自主免疫的机制更多的见解。
【英文摘要】In the present study, the lymphocytes from Carassius auratus were employed for this purpose. The cells were exposed to LPS at various doses for different time periods. By careful apoptotic characteristic analysis, such as condensation of nuclear chromatin, fragmentation of genomic DNA and formation of apoptotic bodies, it provided the first evidence that LPS had apoptotic-inducing effect on fish lymphocytes in a time- and dose-dependent manner. LPS exposure induced significant increase of intracellular reactive oxygen species (ROS), loss of mitochondrial transmembrane potential (DeltaPsi), depletion of ATP production, down-regulation of Bcl-2 expression, up-regulation of Bax and mitochondrial NO-synthase (mNOS) expression, and selective activation of caspase-9 rather than caspase-8. Each of these observations suggests that the LPS-induced apoptosis in C. auratus lymphocytes occurs largely via the mitochondrial apoptotic pathway. This observation was different from the mechanism behind the LPS-induced apoptosis in mammalian macrophages/thymocytes that occurs via the TNF-alpha-mediated death-receptor pathway. Our study suggested the existence of a possible novel role in the pathogenesis of Gram-negative bacterial infection in fish and even in mammals, which may contribute to the therapy of bacterial diseases. Also, it will help to gain more insights into the mechanisms of septic shock and of LPS-induced immunosuppression and autoimmunity.

【题目】Pre-B cell colony-enhancing factor in lower vertebrates: first evidence of this cytokine being involved in antioxidant activity by reconstruction of a novel NAD salvage pathway in E. coli
【中文关键词】B细胞前体增强因子;抗氧化活性;河豚
【英文关键词】pre-B cell colony-enhancing factor pufferfish antioxidant activity
【中文摘要】在哺乳类中已被鉴定的B细胞前体增强因子是一种很重要的细胞因子,它涉及到很多功能,比如,免疫调节,细胞增殖和分化。然而,他们在低等脊椎动物中的存在和功能所知甚少。因此,我们研究了它在低等脊椎动物模式生物河豚中的特征、表达和生物功能。我们关注的问题是低等脊椎动物的B细胞前体增强因子是否通过吡啶核苷酸循环参与NAD的生物合成过程进而参与NAD介导的抗氧化作用。实验结果证明,通过转化鱼B细胞前体增强因子到大肠杆菌,NAD和NADP的量有显著的升高,细胞抗氧化活性也有很大的提高。这是关于脊椎动物B细胞前体增强因子在大肠杆菌中作为烟酰胺转磷酸核糖酶行使功能重建吡啶核苷酸循环途径三的首次报道,并且通过上调NAD生物合成在抗氧压力中起重要的作用。我们希望我们的发现可以丰富B细胞前体增强因子的研究,并且有助于对低等脊椎动物和哺乳动物的B细胞前体增强因子的分子和功能进化有一个更好的理解。
【英文摘要】The pre-B cell colony-enhancing factor identified in mammals is an important cytokine involved in multiple functions, such as immunoregulation, cellular proliferation and differentiation. However, little is known about its existence and function in lower vertebrates; therefore, we investigated the characterization, expression and especially the biofunction of this factor in Tetraodon nigroviridis, a model organism of lower vertebrates. We focus on the question of whether the pre-B cell colony-enhancing factor of lower vertebrates contributes to the NAD mediated antioxidant activity by its involvement in the biosynthesis of NAD through pyridine nucleotide cycles. Experimental data demonstrated that by transforming fish pre-B cell colony-enhancing factor into Escherichia coli

cells, the amounts of NAD and NADP significantly increased, and cellular antioxidant activity greatly improved. This is the first report about vertebrate pre-B cell colony-enhancing factor acting as a nicotinamide phosphoribosyltransferase to reconstruct a pyridine nucleotide cycle III pathway in E. coli and playing an important role in antioxidant stress by up-regulation of NAD biosynthesis. We hope that our observations may enrich the study of pre-B cell colony-enhancing factor, and contribute to a better understanding of the molecular and functional evolution of the pre-B cell colony-enhancing factor family in both lower vertebrates and mammals as a whole.

【题目】CD154-CD40 interactions are essential for thymus-dependent antibody production in zebrafish: insights into the origin of costimulatory pathway in helper T cell-regulated adaptive immunity in early vertebrates
【中文关键词】CD154;CD40;斑马鱼
【英文关键词】CD154 CD40 ZEBRAFISH
【中文摘要】CD154-CD40介导的共同刺激通路在哺乳动物T-B细胞在胸腺依赖的免疫反应中起关键的作用。然而,关于它在低等脊椎动物中的存在和发生了解不多。这里,我们关于来源于斑马鱼的CD154和CD40的同系物的鉴别和功能描述做了报道。斑马鱼CD154是一种类型2膜约束蛋白,在它的细胞外C端区域有一个TNF同源结构域,这个结构域和人类的TNF成员一样有一个三明治结构包括两个“果冻卷”拓扑学饥结构,斑马鱼CD40是类型1的膜约束蛋白,它有在细胞外N端有四个富含半胱氨酸的结构域。在斑马鱼CD40中也存在和哺乳类的CD40一致的TNFR相关因子2和TRAF6结合模体,这说明它也有和高等脊椎动物相似的信号转导机制。斑马鱼CD154和CD40是广泛分布的,并且可以被胸腺依赖的抗原上调。IgM的产生可以被抗CD154的抗体和可溶的CD40显著的降低,但是它可以被可溶的CD154或体外编码CD154的质粒促进。胸腺依赖的抗原诱导的CD154表达可以被环孢素A抑制,这说明CD154在功能上和T细胞有联系。双荧光染色表面CD40和膜IgM在B细胞中共存。CD154-CD40结合实验表明在同株已核形式中CD154特异性的结合CD40。我们的结果首次为鱼类中CD154-CD40介导的共激活途径和基于适应性免疫的辅助T细胞调节机制的存在提供了证据。
【英文摘要】The CD154-CD40-mediated costimulatory pathway is critical for T-B cell cooperation in thymus-dependent (TD) immune response in mammals. However, little is known about its existence and occurrence in lower vertebrates. Here, we report on the identification and functional characterization of CD154 and CD40 homologs from the zebrafish (Danio rerio) model. Zebrafish CD154 is a type II membrane-bound protein with a TNF homology domain in its extracellular C-terminal region, whose tertiary structure is a sandwich containing two stacked sheets with "jelly roll" topology, just as the human TNF members do. The zebrafish CD40 is a type I membrane-bound protein with a sequence pattern of four cysteine-rich domains in its extracellular N-terminal region. The consensus TNFR-associated factor (TRAF)2- and TRAF6-binding motifs in mammalian CD40 are found in the cytoplasmic tail of zebrafish CD40, which indicates similar signal transduction mechanisms to higher vertebrates. Zebrafish CD154 and CD40 are widely distributed and can be up-regulated by thymus-dependent Ag. The production of IgM was dramatically decreased by anti-CD154 or soluble CD40, and it was enhanced by soluble CD154 or CD154-encoding plasmid in vivo. Thymus-dependent Ag-induced CD154 expression was inhibited by cyclosporin A, suggesting that CD154 functionally associates with T cells. Double immunofluorescence staining showed that CD40 and membrane IgM colocalized in B cells. CD154-CD40 binding assays showed that CD154 specifically binds to CD40 at homodimeric form. Our results provide the first evidence for the existence of the functional CD154-CD40-mediated costimulatory pathway and helper T cell regulatory mechanism underlying adaptive immunity in a fish species.

【题目】The DC-SIGN of zebrafish: insights into the existence of a CD209 homologue in a lower vertebrate and its involvement in adaptive immunity
【中文关键词】DC-SIGN; 斑马鱼
【英文关键词】DC-SIGN ZEBRAFISH
【中文摘要】由于树突状细胞特异ICAM-3抓斗式非整合素(DC-SIGN/CD209)在免疫应答和免疫逃逸中的非常重要的作用,DC-SICN/CD209已经成为近来研究中很热的话题。CD209在人和其他几个哺乳动物中已经有了详细的报道,但是在低等脊椎动物中却很少有报道。这个研究第一次报道了鉴别和功能特征一个鱼的DC-SIGN/CD209分子。斑马鱼的C-SIGN/CD209 cDNA翻译成一个含有3个结构保守的343个氨基酸的蛋白。一个必需与Ca2+结合的的EPN基序和一个包含识别甘露糖的基序已经别鉴定了。几个保守的对于内在化和信号转导的关键的基序也存在尾端的羧基端。系统进化树分析支持CD209家族成员从一个共同祖先分歧。DC-SIGN/CD209在免疫组织组织中可以被外源的Ags和IL-4上调表达。这个分子与许多APCs有关,包括巨噬细胞,B淋巴细胞和一个可能的树突状细胞样(CD8(+)CD80(+)CD209(+))群体。CD209可以显著地抑制T细胞激活,Ab(IgM)产生和细菌疫苗接种引起的免疫保护,同时体内钥孔戚血蓝素的刺激或者受到嗜水气单胞菌的威胁都可以封锁CD209的这些抑制功能,这些暗示了DC-SIGN/CD209对于斑马鱼适应性免疫的起始和发育非常关键。吞噬实验表明DC-SIGN/CD209并没有参与吞噬KLH Ag, 暗示了另外的机制或许参与到DC-SIGN/CD209的下游。我们希望目前的研究将助于个更好的理解DC-SIGN/CD209家族在不同物种间的进化。
【英文摘要】This is the first report on the identification and functional characterization of a fish DC-SIGN/CD209 molecule. The zebrafish DC-SIGN/CD209 cDNA translates into 343 aa organized into three domains structurally conserved among vertebrates. An EPN motif essential for interacting with Ca(2+) and for recognizing mannose-containing motifs has been identified. Several conserved motifs crucial for internalization and signal transduction are also present within the cytoplasmic tail. Phylogenetic analysis supports the hypothesis that CD209 family members diverged from a common ancestor. The expression of DC-SIGN/CD209 in immune-related tissues can be significantly up-regulated by exogenous Ags and IL-4. This molecule associates with various APCs, including macrophages, B lymphocytes, and a possible dendritie cell-like (CD83(+)/CD80(+)CD209(+)) population. Functionally, T cell activation, Ab (IgM) production, and bacterial vaccination-elicited immunoprotection can be dramatically inhibited by a CD209 blockade after stimulation with keyhole limpet hemocyanin (KLH) in vivo or challenged with Aeromonas hydrophila, suggesting that DC-SIGN/CD209 in zebrafish is crucial for the initiation and development of adaptive immunity. Phagocytosis analysis showed that DC-SIGN/CD209 does not participate in the uptake of KLH Ag, suggesting that other mechanisms might exist that underlie DC-SIGN/CD209 involvement. We hope that the present study will contribute to a better cross-species understanding of the evolutionary history of the DC-SIGN/CD209 family.

【题目】Novel antibiotic-free plasmid selection system based on complementation of host auxotrophy in the NAD de novo synthesis pathway
【中文关键词】喹啉酸磷酸核糖转移酶基因;可选择标记;大肠杆菌
【英文关键词】QAPRTase GENE A SELECTABLE MARKER E. COLI
【中文摘要】抗生素抗性基因的质粒会引起潜在的生物安全和临床危险,例如抗性基因的横向传播,或者感染多重抗药致病菌。本文介绍了一种新的营养缺陷性补充系统,该系统能够高效地选择质粒和宿主细胞,并且不需要抗生素。质粒上的抗性基因被大肠杆菌或者老鼠的喹啉酸磷酸核糖转移酶基因替换。这样只有喹啉酸磷酸核糖转移酶的表达才能保证大肠杆菌在基本培养基中存活。这是首次用脊椎动物基因构建非抗生素选择系统,并且能够广泛用于DNA疫苗和基因治疗。因为从细菌到脊椎动物,喹啉酸磷酸核糖转移酶基因是普遍存在,所以不存在基因水平转移的问题。
【英文摘要】The use of antibiotic resistance genes in plasmids causes potential biosafety and clinical hazards, such as the possibility of horizontal spread of resistance genes or the rapid emergence of multidrug-resistant pathogens. This paper introduces a novel auxotrophy complementation system that allowed plasmids and host cells to be effectively selected and maintained without the use of

antibiotics. An Escherichia coli strain carrying a defect in NAD de novo biosynthesis was constructed by knocking out the chromosomal quinolinic acid phosphoribosyltransferase (QAPRTase) gene. The resistance gene in the plasmids was replaced by the QAPRTase gene of E. coli or the mouse. As a result, only expression of the QAPRTase gene from plasmids can complement and rescue E. coli host cells in minimal medium. This is the first time that a vertebrate gene has been used to construct a nonantibiotic selection system, and it can be widely applied in DNA vaccine and gene therapy. As the QAPRTase gene is ubiquitous in species ranging from bacteria to mammals, the potential environmental biosafety problems caused by horizontal gene transfer can be eliminated.

【题目】Characterization of C1q in teleosts: insight into the molecular and functional evolution of C1q family and classical pathway
【中文关键词】C1q;经典补体途径;斑马鱼
【英文关键词】C1q classical complement pathway zebrafish
【中文摘要】C1q是补体系统的关键成分。在人类及哺乳动物中,人们已经对C1q进行了深入的研究,但鱼体内C1q的功能尚未有报道。我们克隆了斑马鱼(Danio rerio) 的C1qA、C1qB和C1qC全长,并且证实斑马鱼C1q高度保守。我们利用大肠杆菌体外表达了它们的球状结构域。溶血抑制试验显示,鲤鱼血清的溶血活性能够被斑马鱼C1qA、C1qB和C1qC的抗体抑制,这表明它们参与经典补体途径,并且在功能上从鱼到人类高度保守。斑马鱼C1q还能够特异性结合热聚的斑马鱼IgM以及人的IgG和IgM。在C1q依赖的经典补体途径中,由哺乳动物C1q球状结构域参与C1q与IgG或IgM的结合,斑马鱼的C1q同样如此,表明了其功能在进化上的保守性。本文拓展了人们对C1q家族及C1q介导的免疫反应的理解。
【英文摘要】C1qs are key components of the classical complement pathway. They have been well documented in human and mammals, but little is known about their molecular and functional characteristics in fish. In the present study, full-length cDNAs of c1qA, c1qB, and c1qC from zebrafish (Danio rerio) were cloned, revealing the conservation of their chromosomal synteny and organization between zebrafish and other species. For functional analysis, the globular heads of C1qA (ghA), C1qB (ghB), and C1qC (ghC) were expressed in Escherichia coli as soluble proteins. Hemolytic inhibitory assays showed that hemolytic activity in carp serum can be inhibited significantly by anti-C1qA, -C1qB, and -C1qC of zebrafish, respectively, indicating that C1qA, C1qB, and C1qC are involved in the classical pathway and are conserved functionally from fish to human. Zebrafish C1qs also could specifically bind to heat-aggregated zebrafish IgM, human IgG, and IgM. The involvement of globular head modules in the C1q-dependent classical pathway demonstrates the structural and functional conservation of these molecules in the classical pathway and their IgM or IgG binding sites during evolution. Phylogenetic analysis revealed that c1qA, c1qB, and c1qC may be formed by duplications of a single copy of c1qB and that the C1q family is, evolutionarily, closely related to the Emu family. This study improves current understanding of the evolutionary history of the C1q family and C1q-mediated immunity.

【题目】Identification and characterization of a novel immunoglobulin Z isotype in zebrafish: implications for a distinct B cell receptor in lower vertebrates
【中文关键词】斑马鱼;免疫球蛋白;IgZ-2;B细胞受体
【英文关键词】Zebrafish; Immunoglobulin; IgZ-2; BCR

【中文摘要】普遍认为,硬骨鱼只存在IgM和IgD,而在斑马鱼及其它鱼类体内新发现的IgZ/类IgZ分子丰富了我们对低等脊椎动物免疫球蛋白家族的认识。此次,我们在斑马鱼体内发现了第二种IgZ相似类型,命名为IgZ-2,增加了硬骨鱼免疫球蛋白成员。IgZ-2的重链编码基因与先前报道的IgZ基因有着76.5%的一致度。该IgZ蛋白包括胞外的四个恒定区,一个跨膜区,还有一个短的胞质尾区。我们在序列中找到了一系列的保守区域或保守氨基酸残基,例如四个Ig域,Ig折叠需要的半胱氨酸,符合CART域的亲疏水氨基酸等等。进化分析显示,IgZ-2可以归为IgZ类基因。IgZ-2在免疫相关组织广泛表达,并且在LPS刺激是显著上调。然而在胚胎发育过程中,直到受精两周后,IgZ-2才开始表达。我们证实IgZ-2与IgM共作于B细胞表面。流式细胞分析显示,白细胞介素4会剧烈刺激表达有IgZ-2的细胞。以上结果显示,IgZ-2可以视为一种新的B细胞受体。这增加了硬骨鱼免疫球蛋白家族的多样性,帮助人们更好地理解获得性免疫的进化历史。

【英文摘要】It was generally believed that teleost fish possess only few immunoglobulin isotypes such as IgM and IgD. The newly discovered IgZ/IgZ-like molecules in zebrafish and several other fish species greatly enriched our knowledge of immunoglobulin family in lower vertebrates. In the present study, we report a second IgZ-like isotype in zebrafish, which was designated as IgZ-2, adding a novel member to the immunoglobulin family in teleost fish. The IgZ-2 heavy chain encoding gene exhibited 76.5% nucleotide sequence identity to the previously reported IgZ. The putative IgZ-2 protein consists of four constant regions in its extracellular region, a transmembrane domain, and a short cytoplasmic tail. A number of conserved domains or residues such as the four Ig domains, cysteines required for Ig fold, hydrophobic and hydrophilic residues consistent with the CART domain, and Thr, Set, Tyr residues known to be essential for association with the B cell co-receptors CD79A/B, were identified. Phylogenetic analysis showed that IgZ-2 grouped with IgZ and other known teleost IgZ-like sequences. The IgZ-2 transcripts were widely expressed in immune-related tissues, and could be significantly up-regulated by in vivo stimulation with LIPS in various tissues including head kidney, spleen, intestine, skin, and gill. However, hardly IgZ-2 transcripts were detected during embryonic development until 2 weeks after fertilization. Double immunofluorescence staining showed that IgZ-2 and IgM were co-localized on B cell surfaces. Flow cytometric analysis showed the percentage of IgZ-2-positive cells could be dramatically up-regulated by interleukin-4 (IL-4), a cytokine known to activate the proliferation and differentiation of B cells. These observations indicated that the newly cloned IgZ-2 could be a novel B cell receptor. Our results will add new insights into the immunoglobulin class diversity of teleost fish, and also help us understand better the evolutionary history of adaptive immunity from fish to mammals as a whole

【题目】Deep sequencing-based transcriptome profiling analysis of bacteria-challenged Lateolabrax japonicus reveals insight into the immune-relevant genes in marine fish

【中文关键词】海水鱼 深度测序 免疫相关

【英文关键词】marine fish deep sequencing immune related gene

【中文摘要】在研究免疫系统的起源过程中,对鱼类免疫基因的系统研究是必不可少的,受到测序技术的限制,这一直是一项艰巨的任务。新开发的Solexa/Illumina RNA-seq和Digital gene expression (DGE)技术是一种高通量测序技术并已发展为转录组水平上的有力工具。我们用RNA-seq和DGE对细菌刺激的鲈鱼转录组进行了测序,发现:RNA-seq在48,987个功能转录本测序中产生了169,950个非冗余序列。其中超过52%的转录本可能涉及大约219种已知的新陈代谢或信号通路,而2673个转录本与免疫有关。另外,大约8%的转录本是之前未被发现的鱼类特异性基因。DGE分析显示,哈氏弧菌刺激的鲈鱼转录组可能发生了改变,有1224个强烈的感染应答转录本。以上结果说明,在鱼类及其它脊椎动物先天和获得性免疫中,所有成分保守但转录组发生了改变。结论:本文提供了一个宿主抵抗细菌入侵的研究方法,研究结果对深入研究鱼类免疫相关基因提供了帮助。

【英文摘要】Background: Systematic research on fish immunogenetics is indispensable in understanding the origin and evolution of immune systems. This has long been a challenging task because of the limited number of deep sequencing technologies and genome backgrounds of non-model fish available. The newly developed Solexa/Illumina RNA-seq and Digital gene expression (DGE) are high-throughput sequencing approaches and are powerful tools for genomic studies at the transcriptome level. This study reports the transcriptome profiling analysis of bacteria-challenged Lateolabrax japonicus using RNA-seq and DGE in an attempt to gain insights into the immunogenetics of marine fish.Results: RNA-seq analysis generated 169,950 non-redundant consensus sequences, among

which 48,987 functional transcripts with complete or various length encoding regions were identified. More than 52% of these transcripts are possibly involved in approximately 219 known metabolic or signalling pathways, while 2,673 transcripts were associated with immune-relevant genes. In addition, approximately 8% of the transcripts appeared to be fish-specific genes that have never been described before. DGE analysis revealed that the host transcriptome profile of Vibrio harveyi-challenged L. japonicus is considerably altered, as indicated by the significant up-or down-regulation of 1,224 strong infection-responsive transcripts. Results indicated an overall conservation of the components and transcriptome alterations underlying innate and adaptive immunity in fish and other vertebrate models. Analysis suggested the acquisition of numerous fish-specific immune system components during early vertebrate evolution.Conclusion: This study provided a global survey of host defence gene activities against bacterial challenge in a non-model marine fish. Results can contribute to the in-depth study of candidate genes in marine fish immunity, and help improve current understanding of host-pathogen interactions and evolutionary history of immunogenetics from fish to mammals.

【题目】Cloning, expression, purification, and characterization of AmphiTip30, a member of short-chain dehydrogenases/reductases family from the amphioxus Branchiostoma belcheri tsingtauense

【中文关键词】文昌鱼;鉴定;克隆;脱氢酶活性;表达;TIP30

【英文关键词】amphioxus Branchiostoma belcheri; characterization; cloning; dehydrogenases/reductases activity; expression; TIP30

【中文摘要】我们克隆并体外表达了青岛文昌鱼TIP30基因,并进行了功能分析。青岛文昌鱼TIP30cDNA为1499bp长,由一个开放阅读框编码,含有23个氨基酸的信号肽,147bp的5’非翻译区和638bp的3’非翻译区。多序列比对显示,青岛文昌鱼TIP30高度保守。进化树分析显示脊椎动物TIP30源于AmphiTIP30。我们重组表达并用组氨酸亲和层析纯化了TIP30蛋白,进行了结合试验和酶活测定,蛋白质印迹和免疫组化分析显示文昌鱼天然TIP30大约26kDa,在卵中大量表达。最后,我们讨论了TIP30的原始功能。

【英文摘要】In this paper we describe the cloning, expression and identification study of the TIP30 gene from amphioxus (Branchiostoma belcheri). The amphioxus TIP30 cDNA is comprised of 1499 bp and is translated in one open-reading frame to give a protein of 237 amino acids, with a predicted 23 amino acids signal peptide, a 147 bp 5'-UTR and a 638 bp 3'-UTR. A multiple alignment of TIP30 from amphioxus with other known TIP30 sequences shows the conservation of most amino acid residues involved in the peculiar structural domains found within TIP30's. Phylogenetic analysis places AmphiTIP30 at the base of the phylogenetic tree, suggesting that AmphiTIP30 is the archetype of the vertebrate TIP30 genes. We express the amphioxus TIP30 gene in Escherichia coli. driven by T7 promoter. The recombinant amphioxus TIP30 protein was purified by HisTrap affinity column. Subsequently, the binding constant and enzyme activity was mensurated. Western blot and immunohistochemistry analysis confirmed that amphioxus has a native molecular mass of approximately 26 kDa, and TIP30 was strongly expressed in ovary. Finally, the initial function of TIP30 is discussed.

【题目】Expression, mitogenic activity and regulation by growth hormone of growth hormone/insulin-like growth factor in Branchiostoma belcheri

【中文关键词】生长激素;胰岛素样生长因子;肝盲囊;文昌鱼;文昌鱼;青岛文昌鱼
【英文关键词】Growth hormone; Insulin-like growth factor; Hepatic caecum; Amphioxus; Lancelet; Branchiostoma belcheri
【中文摘要】生长激素(GH)/胰岛素样生长因子(IGF)轴在所有脊椎动物物种中是独一无二的,但它的进化起源尚清楚。因此,我们克隆了编码文昌鱼IGF(BbIGF)的cDNA。 BbIGF以组织特异性的方式表达,在假定肝脏前体肝盲囊表达最丰富。体外表达的重组BbIGF能够刺激牙鲆鳃细胞增殖显示有丝分裂的活性,这是脊椎动物IGF的一个特点。实时定量PCR显示,重组大鼠GH能显着上调BbIGF在肝盲囊表达。此外,Western印迹揭示了在肝盲囊存在大鼠GH受体相似分子。这些结果表明,BbIGF的表达是由外源性哺乳动物生长激素诱导,表明在青岛文昌鱼中存在一个GH / IGF轴。文章对BbIFG的表达和脊椎动物肝脏的起源之间的关系进行了探讨。
【英文摘要】The growth hormone (GH)/insulin-like growth factor (IGF) axis is unique to all the vertebrate species but its evolutionary origin is ill-defined. We therefore cloned a cDNA encoding Branchiostoma belcheri IGF (BbIGF). BbIGF was expressed in a tissue-specific manner, with the most abundant expression in the hepatic caecum, the putative liver precursor. The recombinant BbIGF expressed in vitro showed mitogenic activity capable of stimulating cell proliferation in the flounder gill, a characteristic of vertebrate IGF. Quantitative real-time polymerase chain reaction demonstrated that the recombinant rat GH was able to induce a significant up-regulation of BbIGF expression in the hepatic caecum. Moreover, Western blotting revealed the presence of a molecule similar to rat GH receptor in the hepatic caecum. These results suggest that BbIGF expression is inducible by exogenous mammalian GH, suggesting the presence of a GH/IGF axis in B. belcheri. The relationship between BbIFG expression and the origin of the vertebrate liver is discussed.

【题目】Identification and expression of a novel class of glutathione-S-transferase from amphioxus Branchiostoma belcheri with implications to the origin of vertebrate liver
【中文关键词】谷胱甘肽-S-转移酶;文昌鱼;原位杂交;免疫组化;肝盲囊
【英文关键词】glutathione-S-transferases; amphioxus; in situ hybridization; immunohistochemistry; hepatic caecum
【中文摘要】到目前为止,胱甘肽-S-转移酶已经在研究的所有生物物种中被发现,但是它们在能了解脊椎动物的起源和进化的模式生物文昌鱼中的起源鲜有人知。我们已经从肠道cDNA文库分离出编码一个文昌鱼预测分子量为约26 kDa的谷胱甘肽-S-转移酶的cDNA。它与包括鱼类和绿藻的水生生物中发现的谷胱甘肽-S-转移酶有43.7-51.8%的同源性,但是它与其他胞浆谷胱甘肽-S-转移酶类有少得多的同源性(<27%)。进行系统发育分析表明文昌鱼谷胱甘肽-S-转移酶与大多数鱼和藻类的谷胱甘肽-S-转移酶相聚集,与其他胞浆谷胱甘肽-S-转移酶类相分离。此外,文昌鱼谷胱甘肽-S-转移酶有一个斑马鱼公认的GST基因,红鲷鱼GSTR1基因和鲽鱼GSTA1基因的外显子-内含子的组织结构。重组谷胱甘肽-S-转移酶已经成功地表达纯化,并表现出对1 - 氯-2,4 - 二硝基苯比较高的催化活性(3.37±0.1u/ mg)和对依他尼酸的中度活性(0.41±0.01u/ mg),没有检测到其对1,2 - 二氯-4 - 硝基苯,4 - 羟基,4 - 硝基苄基氯和氢过氧化异丙苯的活性。此外,我们已经发现了一个在青岛文昌鱼中组织特异性表达模式的谷胱甘肽-S-转移酶基因,其在肝盲肠表达量最丰富。所有这些表明文昌鱼谷胱甘肽-S-转移酶属于一种谷胱甘肽-S-转移酶新颖的rho类型,并且具有组织特异性表达模式。谷胱甘肽-S-转移酶在文昌鱼肝盲囊的表达和脊椎动物肝脏起源之间的关系也进行了讨论。
【英文摘要】Glutathione-S-transferases have been identified in all the living species examined so far, yet little is known to date about them in amphioxus, a model organism for insights into the origin and evolution of vertebrates. We have isolated a cDNA encoding an amphioxus (Branchiostoma belcheri) glutathione-S-transferase with a predicted molecular mass of approximately 26 kDa, from the gut cDNA library. The glutathione-S-transferase had 43.7-51.8% identity to most glutathione-S-transferases identified from aquatic organisms including fish and green alga, but it was much less identical (<27%) to other cytosolic glutathione-S-transferase classes. The phylogenetic analysis revealed that the glutathione-S-transferase was grouped together with most piscine and algal glutathione-S-transferases, separating from other cytosolic glutathione-S-transferase classes. Moreover, the glutathione-S-transferase had an exon-intron organization typical of zebrafish putative GST, red sea bream GSTR1 and plaice GSTA1 genes. The recombinant glutathione-S-transferase has been successfully expressed and purified, which showed a relatively high catalytic activity (3.37+/-0.1 unit/mg) toward 1-chloro-2, 4-dinitrobenzene and a moderate activity toward ethacrynic acid (0.41+/-0.01 unit/mg), although it had no detectable activity

toward 1, 2-dichloro-4-nitrobenzene, 4-hydroxynonenal, 4-nitrobenzyl chloride and cumene hydroperoxide. In addition, we have revealed a tissue-specific expression pattern of the glutathione-S-transferase gene in B. belcheri, with the most abundant expression in the hepatic caecum. All these indicate that the amphioxus glutathione-S-transferase belongs to a novel rho-class of glutathione-S-transferases with a tissue-specific expression pattern. The relation between the glutathione-S-transferase expression in amphioxus hepatic caecum and the origin of vertebrate liver is also discussed.

【题目】Fibrinogen-related protein from amphioxus Branchiostoma belcheri is a multivalent pattern recognition receptor with a bacteriolytic activity

【中文关键词】文昌鱼;FREP;溶菌活力;模式识别受体

【英文关键词】Branchiostoma; amphioxus; FREP; bacteriolytic activity; pattern recognition receptor

【中文摘要】包括类血纤维蛋白原(FBG)区域的血纤维蛋白原相关蛋白(FREPs)已被证明参与无脊椎动物和脊椎动物的免疫反应,但潜在的机制仍然待定义。在这项研究中,我们分离出编码文昌鱼FREP同源物的cDNA--BbFREP。 BbFREP编码一个286个氨基酸组成的蛋白质,其中包括一个C-末端的FBG域,这个蛋白质与人纤维蛋白原β和γ链聚集在一起。实时定量PCR结果显示,BbFREP在脂多糖(LPS)或脂磷壁酸(LTA)的刺激下表达量显著上调。在巴斯德毕赤酵母(Pichia pastoris)中表达的重组BbFREP能够特异性地识别细菌表面的包括LPS,肽聚糖(PGN)和LTA的病原体相关分子模型(PAMPS),并对革兰氏阴性细菌的大肠埃希氏菌和革兰氏阳性菌金黄色葡萄球菌显示强烈的溶菌活动。BbFREP还能够绑定到大肠杆菌和金黄色葡萄球菌上。原位杂交表明,BbFREP主要在肝盲囊和后肠表达,与脊椎动物的FREP在肝脏的基本表达相一致。所有这些都表明,BbFREP可以通过与LPS,LTA和PGN作用具有溶菌活性来充当一个模式识别受体。它支持文昌鱼肝盲囊相当于脊椎动物肝的概念,在急性期作为一个主要组织。

【英文摘要】Fibrinogen-related proteins (FREPs) containing fibrinogen-like (FBG) domain have been shown to be involved in immune responses in both invertebrates and vertebrates, but the underlying mechanisms remain ill-defined. In this study we isolated a cDNA encoding amphioxus (Branchiostoma belcheri) FREP homolog, BbFREP. BbFREP encoded a protein of 286 amino acids, which included a C-terminal FBG domain and clustered together with human fibrinogen beta and gamma chains. Quantitative real time PCR revealed that the expression of BbFREP was significantly up-regulated following challenge with lipopolysaccharides (LPS) or lipoteichoic acid (LTA). The recombinant BbFREP expressed in Pichia pastoris was able to specifically recognize the pathogen-associated molecular patterns (PAMPs) on the bacterial surfaces including LPS, peptidoglycan (PGN) and LTA, and displayed strong bacteriolytic activities against both Gram-negative bacterium Escherichia coli and Gram-positive bacterium Staphylococcus aureus. BbFREP was also able to bind to both E. coli and S. aureus. In situ hybridization indicated that BbFREP was mainly expressed in the hepatic caecum and hind-gut, agreeing basically with the primary expression of vertebrate FREP genes in the liver. All these suggest that BbFREP can function as a pattern recognition receptor with a bacteriolytic activity via interaction with LPS, LTA and PGN. It also bolsters the notion that the hepatic caecum of amphioxus is equivalent to the vertebrate liver, acting as a major tissue in acute phase response.

【题目】Ovochymase in amphioxus Branchiostoma belcheri is an ovary-specific trypsin-like serine protease with an antibacterial activity

【中文关键词】文昌鱼,卵糜酶 抑菌

【英文关键词】Amphioxus; Lancelet; Branchiostoma; Ovochymase; Antibacterial activity

【中文摘要】卵糜酶在脊椎动物中存在,但在无脊椎动物中是否存在不清楚。本研究在文昌鱼中克隆了文昌鱼卵糜酶BbOvc,其cDNA长1248bp,编码415氨基酸。演化分析表明BbOvc与脊椎动物聚为一枝,说明它属于脊椎动物类型的卵糜酶。组织表达分析表明它分布于成熟卵中,胚胎原位分析表明在1-16细胞期BbOvc表达也较强。体外表达和功能分析表明BbOvc有类似胰蛋白酶的功能;除此以外,BbOvc抑制大肠杆菌和副溶血弧菌的生长,因此,BbOvc属于新型卵糜酶具有抑菌活性,可能参与母源免疫。

【英文摘要】Ovochymases have been shown to be present in vertebrates; little information is available at present regarding ovochymase in invertebrates. Here we isolated a cDNA encoding an ovochymase homolog from amphioxus Branchiostoma belcheri, named BbOvc. The cDNA contained a 1248bp open reading frame corresponding to a deduced protein of 415 amino acids with a predicted molecular mass of approximately 44.4kDa. Phylogenetic analysis showed that BbOvc was located at the base of its vertebrate counterparts, suggesting that it represents the archetype of vertebrate ovochymases. BbOvc is found to display a tissue- and stage-specific expression pattern, with a predominant expression in the ovary of sexually matured females and in the early stage embryos (1-16-cell embryos). The recombinant ovochymase expressed in vitro shows a trypsin-like activity capable of hydrolysing the trypsin prototypic substrate N(a)-benzoyl-l-arginine ethyl ester (60UBAEE/mg), which can be inhibited by the trypsin-specific inhibitor soybean trypsin inhibitor. It also exhibits an antibacterial activity capable of inhibiting the growth of bacteria like E. coli and V. parahaemolyticus. Taken together, these data indicate that BbOvc is a novel ovochymase with an antibacterial activity and offer first clues to its role as an immune-relevant molecule which may protect the early embryos from pathogenic attacks.

【题目】Molecular and immunochemical demonstration of a novel member of Bf/C2 homolog in amphioxus Branchiostoma belcheri: implications for involvement of hepatic cecum in acute phase response

【中文关键词】文昌鱼;补体;B因子;肝

【英文关键词】amphioxus; Branchiostoma; complement; factor B (Bf); liver

【中文摘要】在文昌鱼中已经证实存在与脊椎动物类似的补体替代途径,但B因子作为这一途径中的关键因子在文昌鱼中是否存在还不清楚。本研究通过免疫印迹和基因克隆证实了在文昌中肝盲囊存在类B因子。青岛文昌鱼类B因子包含CCP结构域,vWFA结构域以及一个丝氨酸蛋白酶结构域。而且在CCP1和CCP2结构域之间还含有EGF_CA结构域,因此BbBf/C2含有CCP-EGF_CA-CCP-CCP-vWFA-SP复杂结构域,是BbBf/C2家族新成员,LPS处理后BbBf/C2在肝盲囊中的表达迅速上调,同时这一分子在后肠瞬时较高表达。同时,印记杂交显示肝盲囊和后肠中表达量较高。所有这些结果表明,在LPS处理后文昌鱼的肝盲囊和后肠都参与免疫反应,而前者在急性时相反应中起主要作用。

【英文摘要】A complement system operating via the alternative pathway (AP) similar to that of vertebrates has been demonstrated in the primitive chordate amphioxus. However, the factor B (Bf), a key specific protease in the AP, remains elusive in amphioxus to date. We demonstrate in this study the presence of a factor B-like protein in amphioxus Branchiostoma belcheri by both immunoblotting and molecular cloning. The factor B-like protein was immunohistochemically localized in the hepatic cecum. The B. belcheri factor B-like gene, BbBf/C2, encoded a mosaic protein with three complement control protein (CCP) domains, a von Willebrand factor A (vWFA) domain and a serine protease (SP) domain. Peculiarly, BbBf/C2 had an epidermal growth factor-like domain (EGF_CA) located between CCP1 and CCP2, therefore BbBf/C2 had a modular structure of CCP-EGF_CA-CCP-CCP-vWFA-SP, making it a novel member of Bf/C2 family proteins. Real-time PCR assay revealed that lipopolysaccharide (LPS) challenge resulted in a quick and continuously significant up-regulation of BbBf/C2 expression in the hepatic cecum, while BbBf/C2 was only expressed for a short time in the hind-gut following LPS challenge though the expression level was temporarily higher than that in the hepatic cecum. Similarly, immuno-dot blotting showed that challenge with LPS triggered a significant elevation of BbBf/C2 synthesis in the hepatic cecum and hind-gut, with a higher rise in the former tissue. These results indicate that both hepatic cecum and hind-gut may be involved in the

immune response induced by LPS, but the hepatic cecum, like the vertebrate liver, is the primary tissue synthesizing BbBf/C2 in response to LPS challenge, thereby playing a major role in the acute phase response.

【题目】Human TRP14 gene homologue from amphioxus Branchiostoma belcheri: identification, evolution, expression and functional characterization
【中文关键词】文昌鱼;进化;表达;硫氧还蛋白相关蛋白
【英文关键词】amphioxus; Branchiostoma; evolution; expression; thioredoxin-related protein
【中文摘要】TRP14是分子质量为14kDa的硫氧还蛋白相关蛋白,先前只在人类中被确定。在此我们报道了文昌鱼TRP14基因的克隆和表达,命名为AmphiTRP14,这是在非哺乳动物中的第一个这样的数据。AmphiTRP14包含一个372bp的开放阅读框,编码123个氨基酸,预测的相对分子质量是14.kDa。它和人的TRP14有56%的相似性并且有一个高度保守的CPDC结构域。通过序列的比较显示TPR14基因有4个外显子和3个内含子,这是非常保守的。AmphiTRP14成功的在大肠杆菌中表达并已纯化。重组蛋白具有和人TRP14相同的特性,包括对胰岛素的还原酶活性。原位杂交和免疫组化分析显示AmphiTRP14具有组织特异性的表达方式,在肝盲囊,卵巢和肠中大量表达。这显示了AmphiTRP14具有一个基础的而不是组织特异的角色,或者有选择性的不同在容易被氧化破坏的组织中。
【英文摘要】Thioredoxin-related protein of 14 kDa, TRP14, has previously been identified only in humans. Here we report the identification and expression of an amphioxus TRP14 gene, named AmphiTRP14, the first such data in a non-mammalian organism. AmphiTRP14 consists of a 372-bp open reading frame coding for a 123-amino-acid protein with a calculated molecular weight of 14 kDa. It shares 56% identity with human TRP14 and possesses a highly conserved motif CPDC. Sequence comparison suggests the evolutionary appearance of the four-exon-three-intron organization of TRP14 genes after the split of protostome/deuterostome, which is highly conserved since then. AmphiTRP14 has been successfully expressed in Escherichia coli and purified. The recombinant protein exhibited features characteristic of human TRP14, including a reductase activity towards insulin. Both in situ hybridization histochemistry and immunohistochemistry revealed that AmphiTRP14 was expressed in a tissue-specific manner, with the most abundant expression in the hepatic caecum, ovary and hind-gut. This suggests that AmphiTRP14 plays a fundamental but tissue-specific role, or alternatively reflects differences in the tissue susceptibility to oxidative damage.

【题目】The ycaC-related protein from the amphioxus Branchiostoma belcheri (BbycaCR) interacts with creatine kinase
【中文关键词】文昌鱼;肌酸激酶;异解酶超家族;ycaC相关蛋白
【英文关键词】amphioxus; Branchiostoma; creatine kinase; isochorismatase superfamily; ycaC-related protein
【中文摘要】ycaC相关的基因,ycaCR,直到现在都没有很清楚的被认识。在此我们报道了文昌鱼的ycaC相关基因,BbycaCR,编码一个新的异解酶家族,主要定位在染色体片段上。Pull-down 和反向Pull-down分析显示了BbycaCR能和肌酸激酶起作用,它涉及能量传导功能,还能结合到相同的分子上形成一个同源二聚体。有趣的是,BbycaCR没有异分支酸酶和烟酰胺酶及酰胺水解酶的活性,尽管它具有预测的催化三分子:19位的天冬氨酸,84位的亮氨酸和118位的半胱氨酸。组织原位杂交和免疫组化分析显示BbycaCR在文昌鱼中广泛的表达,尽管表达水平不一样,说明了BbycaCR在文昌鱼中具有保守的基础性的细胞内角色。推测BbycaCR可能间接的设计能量转化。

【英文摘要】The ycaC-related gene, ycaCR, is uncharacterized, and has no assigned function to date. Here we clearly showed that the ycaC-related gene from the amphioxus Branchiostoma belcheri, BbycaCR, coded for a novel member of the isochorismatase superfamily, which is mainly localized in the mitochondrial fraction. Both pull-down and reverse pull-down analyses revealed that BbycaCR was able to interact with creatine kinase, an enzyme involved in energy transduction, in addition to binding to native ycaCR, forming a homopolymer. Surprisingly, neither isochorismatase, nicotinamidase nor N-carbamoylsarcosine amidohydrolase activity was detected for BbycaCR, although it possessed the putative catalytic triad of Asp19, Arg(Lys)84 and Cys118 that is found in ycaC proteins. Both tissue section in situ hybridization and immunohistochemistry showed that BbycaCR was ubiquitously expressed in amphioxus, although at different expression levels, suggesting that BbycaCR plays a conserved fundamental cellular role in amphioxus. It is proposed that BbycaCR may be indirectly involved in energy transduction.

【题目】Identification, expression and antibacterial activity of a tachylectin-related homolog in amphioxus Branchiostoma belcheri with implications for involvement of the digestive system in acute phase response
【中文关键词】文昌鱼;原索动物;凝集素;消化系统
【英文关键词】Amphioxus; Protochordate; Branchiostoma; Lectin; Digestive system
【中文摘要】Tachylectin相关的蛋白已经在粘液菌到海绵到多骨鱼的各种各样的组织中被界定,但至今在处于脊椎动物和无脊椎动物之间的文昌鱼中很少被认识。另外,这个蛋白是否作为一个免疫相关的分子仍然存在争议。在此我们在文昌鱼中阐述了tachylectin相关基因的表现。预测的基因产物,命名为BbTL,由305个氨基酸组成,有一个推测的N端信号肽和6个30-33个氨基酸的tachylectin型串联重复序列。原位杂交和免疫组化表达模型分析在成体文昌鱼显示在肝盲囊和肠中大量表达。实时定量PCR揭示了LPS刺激导致了BbTL在肠中的重要上调,另外,在毕赤酵母中重组表达的BbTL能抑制革兰氏阴性菌大肠杆菌的生长在一个剂量依赖性的方式。所有的这些结果显示BbTL,像更多的其他tachylectin相关蛋白一样,涉及寄主的免疫保护,并且文昌鱼的消化系统显示出是主要的免疫组织在回应LPS的刺激。
【英文摘要】Tachylectin-related proteins have been identified in various organisms from slime molds to sponges to bony fish, yet little is known to date about it in protochordate amphioxus, an important organism occupying a nodal position from invertebrates to vertebrates. Moreover, if the protein acts as an immune-relevant molecule remains controversial. Here we demonstrated the presence of a tachylectin-related gene in Branchiostoma belcheri. The predicted gene product, termed BbTL, consists of 305 amino acids with a putative N-terminal signal peptide and 6 tachylectin-typical tandem repeats of 30-33 amino acids. In situ hybridization histochemistry indicates a tissue-specific expression pattern of BbTL in adult amphioxus with the most abundant expression in the hepatic caecum and hind-gut. Quantitative real-time PCR reveals that challenge with LPS results in a significant up-regulation of BbTL expression in the guts. In addition, the recombinant BbTL expressed in Pichia pastoris is able to inhibit the growth of Gram-negative bacterium Escherichia coli in a dose-dependent manner. All these suggest that BbTL, like most other tachylectin-related proteins, is involved in the host immune defense, and the digestive system of B. belcheri appears the major immune tissue responding to LPS challenge.

【题目】Identification and expression of a ferritin homolog in amphioxus Branchiostoma belcheri: evidence for its dual role in immune response and iron metabolism

【中文关键词】文昌鱼;铁蛋白;LPS;铁
【英文关键词】amphioxus; Branchiostoma; ferritin; lipopolysaccharide; iron
【中文摘要】铁蛋白在细胞铁代谢过程中扮演了一个重要的角色包括铁的贮存和解毒,铁蛋白已经在许多物种中包括细菌,真菌,植物和动物中被界定,但很少在原睡物类中被发现。在此我们在文昌鱼中阐述了铁蛋白的同源蛋白BbFRT的表现。分析BbFRT的序列发现它存在一个假设的铁反应原件和一个假设的颈环结构。BbFRT编码172个氨基酸包含保守的亚铁氧化酶类型的motif,它存在于脊椎动物铁蛋白的重链上。序列比较显示BbFRT和脊椎动物的铁蛋白的轻链有更多的相似性为68%,比重链的46-51%更多。原位杂交和免疫组化揭示了BbFRT在文昌鱼中广泛的表达,另外,LPS刺激后,BbFRT的表达在转录水平上上升了1.6倍,在翻译水平上上升了1.5倍。相似的结果显示了在人的体液中上升了1.6倍。这些结果说明BbFRT是一个双重功能的蛋白在免疫反应和铁代谢中起重要作用。
【英文摘要】Ferritin plays a key role in cellular iron metabolism including iron storage and detoxification, which has been identified in a wide range of organisms including bacteria, fungi, plants and animals. However, little information is available regarding ferritin in the protochordates to date. Here we demonstrate the presence of a ferritin gene homolog, BbFRT, in amphioxus Branchiostoma belcheri. Analysis of the BbFRT 5'-UTR indicated the existence of a putative iron-responsive element (IRE) with a predicated stem-loop structure. BbFRT encoded a deduced protein of 172 amino acids with the conserved motif for ferroxidase center typical of heavy chains of vertebrate ferritins. Sequence comparison showed that BbFRT shared more identity to H-chains (68%) of vertebrate ferritins than to the L-chains (46-51%). Both in situ hybridization histochemistry and immunohistochemical staining revealed that BbFRT was ubiquitously expressed in B. belcheri. In addition, BbFRT expression was up-regulated by 1.6-fold and 1.5-fold, respectively, following exposure to LPS at both transcriptional and translational levels. Similarly, exposure to iron resulted in about 1.6-fold increase in BbFRT in the humoral fluids. These suggest that BbFRT seems a protein with a dual function functioning in both immune response and iron metabolism.

【题目】Vitellogenin functions as a multivalent pattern recognition receptor with an opsonic activity
【中文关键词】卵黄蛋白原;免疫;母体;吞噬
【英文关键词】Vg immune, maternal, phagocytosis
【中文摘要】卵黄蛋白原(Vg),一个重要的母体蛋白,在鱼类中已经和感染联系在一起。然而,Vg在涉及抗感染反应的潜在机制还不是很清楚。通过蛋白-微生物的相互作用分析和酶联免疫分析,我们第一次阐明了Vg作为一个模式识别受体具有多特异性能识别细菌和真菌并区分自身因子,并且作为调理素起作用来加强巨噬细胞的吞噬活性。这个研究显示了鱼的Vg作为一个综合的功能在调节免疫反应通过多向性的效应在识别病原相关的分子和促进巨噬细胞的吞噬活性。这个结果也支持这些因子涉及雌性生产过程中依赖Vg来促进卵母细胞的发育这个这个结果。
【英文摘要】BACKGROUND: Vitellogenin (Vg), a major reproductive protein, has been associated with infection-resistant response in fish. However, the underlying mechanisms by which Vg is involved in anti-infectious response are not understood. METHODOLOGY/RESULTS: By both protein-microbe interaction analysis and enzyme-linked immunosorbent assay as well as phagocytosis test, we demonstrate for the first time that fish Vg acts as a pattern recognition molecule with multiple specificities that can recognize bacteria as well as fungus rather than self components from fish, and functions as an opsonin that can enhance macrophage phagocytosis. CONCLUSIONS: This study shows that fish Vg plays an integrative function in regulating immunity via its pleiotropic effects on both recognizing pathogen-associated molecular patterns and promoting macrophage phagocytosis. It also supports the notion that factors normally involved in control of female reproduction are associated with immunity in organisms that rely on Vg for oocyte development.

【题目】Vitellogenin is a cidal factor capable of killing bacteria via interaction with lipopolysaccharide and lipoteichoic acid
【中文关键词】卵黄蛋白原;免疫;杀菌
【英文关键词】Vitellogenin; Antibacterial activity; Protoplasts; Fish immunity; Hexagrammos otakii
【中文摘要】已有研究表明卵黄蛋白原(Vg)参与宿主的免疫防御。然而,Vg潜在的作用机制研究得还远远不够,Vg中发挥免疫作用的组分也未知。此文中,我们清楚地证明Vg能够杀死革兰氏阴性菌大肠杆菌和革兰氏阳性菌金黄色葡萄球菌的整个细胞而不是它们的原生质体:Vg有特异性结合LPS、LTA和PGN的直接位点。有趣的是,Vg和细菌细胞壁的不同结合位点结合会产生不同的影响:Vg通过LPS与大肠杆菌的结合以及通过LTA与金黄色葡萄球菌的结合是致死的,然而Vg通过PGN与金黄色葡萄球菌的结合却不致死。此外,Vg显示类似凝集素的活性,因为它的抗菌活性能被D型甘露糖、氮-乙酰氨基葡萄糖和D型海藻糖所抑制。另外,Vg多肽链的完整性和糖类残基对其抗菌活性来说是必不可少的,但脂化和磷酸化是不起作用的。总之,Vg是一个杀菌因子,它是通过与细菌细胞壁表面的LPS和LTA相互作用来杀死大肠杆菌和金黄色葡萄球菌的,而不是通过攻击细菌的质膜。
【英文摘要】Vitellogenin (Vg) has been shown to be involved in host immune defense. However, the underlying mechanism by which Vg functions is largely unknown, and which component in Vg is essential for the execution of its immune role remains lacking. Here, we demonstrate clearly that fish Vg is capable of killing the whole cells of Gram-negative bacterium Escherichia coli and Gram-positive bacterium Staphylococcus aureus rather than their protoplasts: and that Vg has distinct binding sites specific for lipopolysaccharide (LPS), lipoteichoic acid (LTA) and peptidoglycan (PGN), respectively. Of note, the interaction between Vg and bacterial cells via the different binding sites results in distinct effects: the binding of Vg to E. coli via LPS and to S. aureus via LTA is lethal, whereas the binding of Vg to S, aureus via PGN is not. Moreover, Vg exhibits a lectin-like activity because its antibacterial activities can be suppressed by the carbohydrates like D-mannose, N-acetyl-D-glucosamine and D-fucose. Finally, the polypeptide chain integrity and carbohydrate residues of Vg are indispensable for its antibacterial activity, but the lipidation and phosphorylation are not necessary. Taken together, Vg is a bacteriocidal factor capable of killing E. coli and S. aureus whole cells via interaction with LPS and LTA existing in the bacterial cell walls rather than attacking their plasma membranes.

【题目】Alternative complement activity in the egg cytosol of amphioxus Branchiostoma belcheri: evidence for the defense role of maternal complement components
【中文关键词】文昌鱼 卵 母体 免疫
【英文关键词】Amphioxus egg maternal immunity
【中文摘要】背景:大多数无脊椎动物的卵是体外发育的,因此它们的胚胎是暴露在充满微生物的环境中的,而其中很多微生物是能杀死配的致病菌。无脊椎动物发育中的胚胎怎样抵抗病原菌的攻击是生物学家非常感兴趣的问题,而且研究的不多。方法和结果:我们的研究表明,无脊椎动物文昌鱼新孵化的卵所制得的卵浆能抑制革兰氏阴性菌鳗弧菌和革兰氏阳性菌葡萄球菌的生长。所有的实验结果都表明:补体系统通过选择性途径来起抑菌作用。结论和意义:这是首次证明无脊椎动物卵中的母源性补体组分有功能,这为其他体外发育的无脊椎动物的母源性免疫研究提供的基础。这也与早期发育的胚胎享有成体的一些防御机制的观点是一致的。
【英文摘要】BACKGROUND: The eggs in most invertebrates are fertilized externally, and therefore their resulting embryos are exposed to an environment full of microbes, many of which are pathogens capable of killing other organisms. How the developing embryos of invertebrates defend themselves against pathogenic attacks is an intriguing question to biologists, and remains largely unknown. METHODOLOGY/PRINCIPAL FINDINGS: Here we clearly demonstrated that the egg cytosol prepared from the newly

fertilized eggs of amphioxus Branchiostoma belcheri, an invertebrate chordate, was able to inhibit the growth of both the Gram-negative bacterium Vibrio anguillarum and the Gram-positive bacterium Staphylococcus aureus. All findings point to that it is the complement system operating via the alternative pathway that is attributable to the bacteriostatic activity. CONCLUSIONS/SIGNIFICANCE: This appears to be the first report providing the evidence for the functional role of the maternal complement components in the eggs of invertebrate species, paving the way for the study of maternal immunity in other invertebrate organisms whose eggs are fertilized in vitro. It also supports the notion that the early developing embryos share some defense mechanisms common with the adult species.

【题目】Characterization and expression of gamma-interferon-inducible lysosomal thiol reductase (GILT) gene in amphioxus Branchiostoma belcheri with implications for GILT in innate immune response
【中文关键词】文昌鱼 GILT蛋白 先天性免疫
【英文关键词】amphioxus; Branchiostoma; characterization; expression; gamma-interferon-inducible lysosomal thiol reductase (GILT); gamma-interferon (IFN-gamma)
【中文摘要】本文从文昌鱼肠中克隆出编码GILT蛋白的文昌鱼GILT基因。它编码含254个氨基酸的蛋白,这个蛋白具有GILT蛋白的所有主要特点,如信号序列CQHGX(2)CX(2)NX(4)C、CXXC基序和11个保守的半胱氨酸。系统进化分析表明文昌鱼GILT基因和海胆GILT基因亲缘关系最近,都处于脊椎动物GILT基因分支上,这表明文昌鱼GILT和海胆GILT可能具有与脊椎动物GILT蛋白原型相似的一些特征。弗罗里达文昌鱼的基因组DNA包含七个外显子和六个内含子,这与脊椎动物GILT外显子—内含子的分布是相似的。文昌鱼GILT基因的表达是组织特异的,在消化系统中表达最多,如肝和肠。我们还发现,哺乳动物gamma干扰素对文昌鱼GILT基因的表达量影响很小,而人和小鼠的GILT基因在gamma干扰素的影响下表达量变化却很大。由于文昌鱼缺乏适应性免疫系统(包括MHC二类分子和淋巴细胞),所以文昌鱼GILT很有可能在文昌鱼的先天性免疫应答中发挥作用。
【英文摘要】An amphioxus cDNA, AmphiGILT, encoding GILT protein was isolated from the gut cDNA library of Branchiostoma belcheri. It codes for a deduced protein of 254 amino acids, which has all the main features typical of GILT proteins including the signature sequence CQHGX(2)CX(2)NX(4)C, CXXC motif and 11 conserved cysteines. Phylogenetic analysis showed that AmphiGILT and sea urchin GILT clubbed together and positioned at the base of vertebrate GILT clade, suggesting that both AmphiGILT and sea urchin GILT might share some characteristics of the archetype of vertebrate GILT proteins. The genomic DNA sequence of B. floridae contains seven exons and six introns, which is similar to vertebrate GILT exon-intron organization. AmphiGILT was expressed in a tissue-specific manner with the most abundant mRNA in the digestive system including hepatic caecum and hind-gut. It was also found that mammalian IFN-gamma only exerted a slight effect on the expression of GILT gene in amphioxus, forming a contrast to the marked induction of human and mouse GILT expression by IFN-gamma. Taken the absence of the adaptive immune system including MHC class II molecules and lymphocytes into consideration, these results suggest that AmphiGILT is highly likely to play a role in the innate immune responses in amphioxus.

【题目】A transferrin-like homolog in amphioxus Branchiostoma belcheri: Identification, expression and functional characterization

【中文关键词】转铁蛋白 文昌鱼 抑菌 急性反应
【英文关键词】Amphioxus; Lancelet; Branchiostoma; Transferrin; Antibacterial activity
【中文摘要】先前的研究表明transferrin (Tf)在无脊椎动物和脊椎动物中都是普遍存在的,但是还没有关于处于无脊椎动物和脊椎动物边界的原索动物文昌鱼的Tf的研究。我们从文昌鱼中分离得到一个Tf-like基因,这个基因编码含1256个氨基酸的蛋白,含一个氨基端信号肽、一个位于氨基端的保守的转铁蛋白区域(此区域有一个由63位的天冬氨酸和188位的酪氨酸组成的离子结合位点)、一个位于羧基端的转铁蛋白区域(此区域包含305个氨基酸)。系统进化分析表明文昌鱼Tf1与所有无脊椎动物的Tf处于同一个分支。实时定量PCR结果显示大肠杆菌和鳗弧菌能使BbTfl在文昌鱼肠内的表达量在12-24小时时显著升高,这表明BbTfl在文昌鱼的免疫防御中是一种阳性的急性期反应物。重组表达的BbTfl氨基端能结合离子,并且能抑制大肠杆菌和金黄色葡萄球菌的生长。另外,在高离子浓度条件下,BbTfl的抗菌活性显著地被抑制。所有这些结果为离子结合和抑制细菌生长之间的联系提供了直接的实验证据。这也显示BbTfl的表达具有组织特异性,在肝盲囊、后肠和卵巢中表达量最高,这与消化系统是急性期应答的初生组织的观点是一致的。
【英文摘要】Previous studies have shown the universal presence of transferrin (Tf) in both invertebrates and vertebrates, but little information is available regarding Tf in amphioxus, a protochordate on the evolutionary boundary between invertebrates and vertebrates. Here we isolated a Tf-like homolog from Branchiostoma belcheri, which encodes a deduced protein, BbTfl, of 1256 amino acids containing a N-terminal signal peptide, a conserved transferrin domain in its N-terminal lobe, with a putative iron-binding site consisting of Asp63 and Try188 and another transferrin domain in its C-terminal lobe with an long intervening sequence of 305 amino acids. Phylogenetic analysis shows BbTfl is grouped together with all the invertebrate Tfs and located at the base of melanotransferrins and other Tfs. Quantitative PCR analysis reveals that exposure to Escherichia coli and Vibrio anguillarum causes a significant increase in BbTfl expression mainly in the gut within 12-24h, suggesting that BbTfl is a positive acute phase reactant involved in the immune defense of B. belcheri. The recombinant N-terminal lobe, BbTflN, is able to bind iron and to inhibit E. coli and Staphylococcus aureus growth. Moreover, the antibacterial activity of BbTflN markedly decreases in the presence of excess iron. All these results provide a direct empirical evidence establishing a definitive link between binding to iron and bacterial growth-inhibiting activity. It is also shown that BbTfl is expressed in a tissue-specific manner, with the most abundant expression in the hepatic caecum, hind-gut and ovary, supporting the idea that the digestive system including the hepatic caecum of amphioxus is the primary tissue involved in acute phase response.

【题目】Characterization of a pattern recognition molecule vitellogenin from carp (Cyprinus carpio)
【中文关键词】模式识别分子 Vg 抑菌 调理
【英文关键词】Vitellogenin; Antibacterial activity; Agglutinating; Phagocytosis; Opsonin; Pattern recognition
【中文摘要】模式识别蛋白通过与病原菌表面的分子结合而在先天性免疫应答中发挥作用,并起始宿主的防御。为了研究卵黄蛋白原(Vg)在鱼类先天性免疫中的作用,我们用亲和层析的方法从鲤鱼中纯化出了Vg。抗菌活性分析表明Vg能抑制大肠杆菌和金黄色葡萄球菌的活性。Vg能结合到革兰氏阴性菌和革兰氏阳性菌的表面。Vg也能凝集大肠杆菌和金黄色葡萄球菌,也能轻微地凝集酵母菌。Vg与革兰氏阴性菌表面的脂多糖结合力很强。Vg能促进巨噬细胞对大肠杆菌和金黄色葡萄球菌的吞噬作用。Vg能与巨噬细胞结合而作为调理素来促进嗜菌作用。这些结果表明Vg在抗菌防护中作为模式识别分子起作用,并是鱼类先天性免疫中的效应器。
【英文摘要】Pattern recognition proteins function in innate immune responses by binding to molecules on the surface of invading pathogens and initiating host defense reactions. To explore the role of vitellogenin (Vg) in fish innate immunity, we purified Vg from Carp by gel filtration combined with diethylaminoethyl (DEAE) chromatography. The purified Vg was confirmed by MALDI-TOF mass spectrometry. Antibacterial activity analysis showed that Vg inhibited bacterial activity to Escherichia coli and Staphylococcus aureus in a dose-dependent manner. Vg bound to the surface of Gram-negative and Gram-positive bacteria. It also agglutinated E. coli and S. aureus and weakly to Saccharomyces cerevisiae. Vg showed a strong binding activity to lipopolysaccharides from Gram-negative bacteria. Vg-treated macrophage enhanced phagocytosis to E. coli and S. aureus. Vg also bind with macrophage function as opsonins to promote phagocytosis. The results suggest that Vg serves as a pattern recognition molecule and opsonins in antibacterial defense and

as an effector in fish innate immunity.

【题目】Immune parameters in the humoral fluids of amphioxus Branchiostoma belcheri challenged with Vibrio alginolyticus
【中文关键词】文昌鱼;体液;溶藻弧菌;溶菌酶;抗菌活性;凝集素;血凝素
【英文关键词】Amphioxus; Branchiostoma belcheri; Humoral fluid; Vibrio alginolyticus; Lysozyme; Antimicrobial activity; Microbial agglutinin; Haemagglutinin
【中文摘要】对于文昌鱼的体液免疫我们了解甚少。本文测量了在溶藻弧菌感染文昌鱼之前和之后体液中的几个参数包括溶菌酶,抗菌活性,凝集素和血凝素。当感染溶藻弧菌后,溶菌酶活性、对大肠杆菌、溶藻弧菌的抗生长活性和对微球菌、枯草杆菌和金黄色葡萄球菌的粘合能力都显著增强,并且,对兔子和人体液中的A 和O红细胞的凝集能力过早的增强了。相反,对体液中的哈维弧菌和大肠杆菌的黏合能力降低了,而且对人红细胞B的凝集能力在之后的时间里氏增强的。
【英文摘要】The knowledge concerning the humoral immunity is scarce in amphioxus Branchiostoma belcheri. This study measured the humoral parameters including lysozyme, antimicrobial activity, microbial agglutinin and haemagglutinin in amphioxus humoral fluids before and after Vibrio alginolyticus challenge. After challenged with V. alginolyticus, the lysozyme activity, growth inhibiting activities against Escherichia coli and V. alginolyticus and microbial agglutinating activities against Micrococcus lysodeikticus, Bacillus subtilis and Staphylococcus aureus were all increased significantly and haemagglutinating activities against rabbit and human A and O erythrocytes in the humoral fluids were all increased earlier. In contrast, the agglutinating activities against Vibrio harvey and E. coli in the humoral fluids were reduced in response to V. alginolyticus challenge and the haemagglutinating activity against human B erythrocytes increased later.

【题目】Vitellogenin is an acute phase protein with bacterial-binding and inhibiting activities
【中文关键词】Vg;大肠杆菌;金黄色酿脓葡萄球菌;抗菌活性
【英文关键词】Vg E,coli, Sp, antibacteria
【中文摘要】之前有报道称卵黄蛋白原是一种免疫相关分子,但是它在体内的免疫学功能仍是不清楚的。我们把LPS和LTA迅速的注射到雄性的斑马鱼中,诱导Vg在转录水平和翻译水平上迅速增强。之后,血清中的Vg产生会抑制大肠杆菌和金黄色酿脓葡萄球菌的生长。这些数据表明斑马鱼血清中Vg是一种与细菌相关的急性蛋白并有抗菌作用。这也支持了在卵母细胞发育中依赖Vg的生物中,一些控制雌性生殖的因子可能是与免疫相关的概念
【英文摘要】Previous studies have shown that vitellogenin (Vg) is an immune-relevant molecule, but its potential immunological role in vivo remains obscure. We demonstrated here that injection of lipopolysaccharide (LPS) and lipoteichoic acid (LTA) into male Danio rerio rapidly induced a significant up-regulation of Vg at both transcriptional and translational levels, and that serum Vg produced was able to bind to both Escherichia coli and Staphylococcus aureus and to inhibit their growth in a dose-dependent manner. All these data suggest that serum Vg in zebrafish D. rerio is an acute phase protein with bacterial-binding and inhibiting activities. It also bolsters the notion that factors normally involved in control of female reproduction are linked with immunity in organisms that rely on Vg for oocyte development.

【中文摘要】补体的发展在鱼类中认识很少,并且很少信息能够利用关于获得全部补体活性。在这个研究中,我们阐述了经典途径、可选择途径、凝集素途径和细胞溶解酶途径中关键补体基因(C3, C1r/s, C4, C6, Bf, MBL and MASP)的个体发育和不同的表达,和它们在发育过程中回应LPS刺激的反应。除了C6以外,所有的成分表现出了表达量升高的相同趋势在影线期以后。Bf和C3的转录本标志性的增加通过LPS刺激,然而C1r/s和MASP的表达没有提高。LPS刺激后C4的表达是先降低在升高。在受精18天后LPS刺激引起MBL的表达上升。在回应LPS的刺激时,C6异常的表达:在影线期前减少,然后有大量的上调在影线期后。总之,这些结果显示在斑马鱼卵影线期补体已经有能力回应LPS的刺激。
【英文摘要】The development of complement in fish is poorly understood, and little information is available about the acquisition of full complement capacities. In this study we demonstrated the ontogenic and differential expression of complement key component genes (C3, C1r/s, C4, C6, Bf, MBL and MASP) of the classical pathway (CP), alternative pathway (AP), lectin pathway (LP) and lytic pathway, and their responses to challenge with LPS during development. All components, except C6, showed a similar trend of increasing expression after hatching. The contents of Bf and C3 transcripts were both markedly increased by challenge with LPS soon after hatching, while the expression levels of C1r/s and MASP transcripts were not elevated. The expression of C4 mRNA was first down-regulated by LPS challenge and then fluctuated. The expression of MBL mRNA was up-regulated by LPS challenge after 18 days post fertilization. In response to LPS challenge, C6 was peculiarly expressed: it was significantly decreased before hatching, followed by a

significant up-regulation post hatching. Taken together, these suggest that the complement operating via the AP is already competent by responding to challenge with LPS in the hatched larvae of Danio rerio.

【题目】Maternal transfer and protective role of the alternative complement components in zebrafish Danio rerio
【中文关键词】斑马鱼;胚胎;母体;免疫;补体
【英文关键词】zebrafish, complement maternal immunity complement
【中文摘要】绝大多数鱼的胚胎发育过程中都暴露在水生环境中,这些环境中充满了病原体,然而胚胎仅有有限的能力来掌控有效的免疫反应。鱼的胚胎怎样在病原体的攻击下保持完好没有被很好的认识。这篇文章中我们报道了雌性斑马鱼的母体免疫用福尔马林杀死的嗜水汽单胞菌能引起C3和Bf大量的表达,并且在子代有相应的上升,并且诱导母体和子代的胚胎活性大量上升。另外,从被免疫的母体产下的胚胎比没有免疫的母体产下的胚胎对嗜水汽单胞菌有更多的耐受力。这些结果清晰的显示了斑马鱼胚胎抵抗嗜水汽单胞菌的保护能力能通过母体的转移通过可选择途径来体现。这篇文章第一次提供了在体内可选择途径在斑马鱼早期胚胎中的保护角色的证据,引出了研究体内其他母体转移因子功能的思路
【英文摘要】Embryos of most fish develop externally and are exposed to an aquatic environment full of potential pathogens, whereas they have little or only limited ability to mount an efficient and protective response. How fish embryos survive pathogenic attacks remains poorly defined. Here we demonstrate that the maternal immunization of female zebrafish with formalin-killed Aeromonas hydrophila causes a significant increase in C3 and Bf contents in the mother, a corresponding rise in the offspring, and induces a remarkable increase in the hemolytic activities in both the mother and offspring. In addition, the embryos derived from the immunized mother are significantly more tolerant to A. hydrophila challenge than those from the unimmunized fish, and blocking C3 and Bf activities by injection of the antibodies against C3 and Bf into the embryos render them more susceptible to A. hydrophila. These results clearly show that the protection of zebrafish embryos against A. hydrophila can be achieved by the maternally-transferred immunity of the complement system operating via the alternative pathway. This appears to be the first report providing in vivo evidences for the protective role of the alternative complement components in the early embryos of zebrafish, paving the way for insights into the in vivo function of other maternally-transferred factors in fish.

【题目】Responses of alternative complement expression to challenge with different combinations of Vibrio anguillarum, Escherichia coli and Staphylococcus aureus: evidence for specific immune priming in amphioxus Branchiostoma belcheri
【中文关键词】文昌鱼;补体;免疫刺激
【英文关键词】Amphioxus; Lancelet; Branchiostoma; Complement; Immunological priming
【中文摘要】关于特异性免疫在第二次被侵染的保护作用在无脊椎动物中的存在仍然存在争议。通过探索文昌鱼的C3和C6,这两个关键基因涉及可选择的补体途径,在不同的3种细菌的侵染下的表达模式的改变,显示了重新暴露在相同的细菌中导致文昌鱼C3和C6的一个重要的上升。并且在第二次表达时表达最高峰比第一次要提前。相反,重新暴露在不同的细菌中没有这样的反应。这些特征显示了和脊椎动物中的免疫记忆相类似的现象,说明文昌鱼有区分不同微生物的能力。另外,我们的结果第一次第一次建立了可选择补体途径和特异性免疫之间的联系
