【题目】Molecularly imprinted polymer layer-coated silica nanoparticles toward dispersive solid-phase extraction of trace sulfonylurea herbicides from soil and crop samples
【中文关键词】无
【英文关键词】Molecular imprinting；Dispersive solid-phase extraction；Programmed heating；Nanosilica Sulfonylurea herbicides；Trace analysis
【中文摘要】无
【英文摘要】This paper reports the preparation of metsulfuron-methyl (MSM) imprinted polymer layer-coated silica nanoparticles toward analysis of trace sulfonylurea herbicides in complicated matrices. To induce the selective occurrence of surface polymerization, the polymerizable double bonds were first grafted at the surface of silica nanoparticles by the silylation. Afterwards, the MSM templates were imprinted into the polymer-coating layer through the interaction with functional monomers. The programmed heating led to the formation of uniform MSM-imprinted polymer layer with controllable thickness, and further improved the reproducibility of rebinding capacity. After removal of templates, recognition sites of MSMwere exposed in the polymer layers. As a result, the maximum rebinding capacity was achieved with the use of optimal grafting ratio. There was also evidence indicating that the MSM-imprinted polymer nanoparticles compared with nonimprinted polymer nanoparticles had a higher selectivity and affinity to four structure-like sulfonylurea herbicides. Moreover, using the imprinted particles as dispersive solidphase extraction (DSPE) materials, the recoveries of four sulfonylurea herbicides determined by highperformance liquid chromatography (HPLC) were 80.2 – 99.5%, 83.8 – 102.4%, 77.8 – 93.3%, and 73.8 – 110.8% in the spiked soil, rice, soybean, and corn samples, respectively. These results show the possibility that the highly selective separation and enrichment of trace sulfonylurea herbicides from soil and crop samplescan be achieved by the molecular imprinting modification at the surface of silica nanoparticles.

【题目】Tuning of the vinyl groups’ spacing at surface of modified silica in preparation of high density imprinted layer-coated silica nanoparticles: A dispersive solid-phase extraction materials for chlorpyrifos
【中文关键词】无
【英文关键词】Molecular imprinting；Modified silica nanoparticles；Grafting to；Dispersive solid-phase extraction；Phosphate pesticides
【中文摘要】无
【英文摘要】This paper reports the preparation of high density imprinted layer-coated silica nanoparticles towardselective recognition and fast enrichment of chlorpyrifos (CP) from complicated matrices. The molecularlyimprinted polymers (MIPs) were successfully coated at the surface of modified silica through using thechemical immovable vinyl groups at the nanoparticles’ surface, followed by the graft copolymerizationof methacrylic acid (MAA) and ethylene glycol dimethacrylate (EGDMA) in the presence of templates CP.It has been demonstrated that the space of end vinyl groups at the surface of silica can be controlled bychanging the condition of chemical modification, regulating the thickness of imprinted shells and thedensity of efficient imprinted sites. After removal of templates by solvent extraction, the recognitionsites of CP were created in the polymer coating layer. The CP-imprinted nanoparticles exhibited highrecognition selectivity and binding affinity to CP analyte. When the CP-imprinted nanoparticles wereused as dispersive solid-phase extraction (dSPE) materials, the high recovery yields of 76.1 – 93.5% fromvarious spiked samples with only 1 ug/mL analyte were achieved by one-step extraction. These resultsreported herein provide the possibility for the separation and enrichment ofCPfrom complicated matricesby the molecular imprinting modification at the surface of common silica nanoparticles.

【题目】An efficient hybrid design to prepare highly dense imprinted layer-coated silica particles for selective uptake of trace metsulfuron-methyl from complicated matrices
【中文关键词】无
【英文关键词】Molecular imprinting; “ Grafting from ”; “ Grafting through ”; Quantum mechanics; Metsulfuron-methyl
【中文摘要】无
【英文摘要】This work presents an approach called ‘ ‘ hybrid design ’ ’ which combines ‘ ‘ grafting from ’ ’ and ‘ ‘ grafting through ’ ’ methods, in order to prepare highly dense imprinted layer-coated silica particles for improved binding capacity to metsulfuron-methyl (MSM). The imprinted conditions including the kind of solvent and molar ratio of template to functional monomer were carefully optimized by quantum mechanics method. The obtained imprinted materials were evaluated by transmission electron microscopy and rebinding experiments, exhibiting well-controlled shell thickness (up to 30 nm) and high binding affinity to MSM. Moreover, the rebinding amount of MSM-imprinted particles to MSM was nearly 1.6- and 1.4-folds that of normal surface-imprinted particles, respectively. When the MSM-imprinted particles were used as dispersive solid-phase extraction materials, the recoveries (RSDs) of MSM determined by high-performance liquid chromatography (HPLC) were 93.4% (1.5%), 86.8% (3.2%) and 88.4% (2.7%) in the spiked water, soil and wheat samples, respectively. Therefore, the method will provide new opportunities for enrichment and detection of trace MSM from complicated matrices.

【题目】Molecularly imprinted layer-coated silica nanoparticles toward highly selective separation of active diosgenin from Dioscorea nipponica Makino
【中文关键词】无
【英文关键词】Molecular imprinting；Seed-directing；Thermally cleavable reaction；Diosgenin Separation
【中文摘要】无
【英文摘要】This paper reports the molecularly imprinted layer-coated silica nanoparticles toward highly selective separation of active diosgenin (DG) from the crude extracts of Dioscorea nipponica Makino (DNM). It has been demonstrated that DG templates were efficiently imprinted into the silica layer by the use of thermally cleavable urethane bonds between DG and 3-isocyanatopropyltriethoxysilane (IPTS), which was synchronously coated onto the surface of silicamother nanoparticles through a seed-directing surface condensation reaction between DG-IPTS and tetraethoxysilicane (TEOS). After removal of templates by simple thermal cleavage reaction, a high density of recognition sites of DG were created in the silicacoatinglayer. Afterwards, the DG-imprinted silica nanoparticleswere evaluated by rebinding experiments and showed a higher selectivity and affinity to DG than commercial silica. When the imprinted particles were used as solid-phase extraction (SPE) sorbents, the recovery yield of DG was up to 90% by one-step extraction from the hydrolysate of DNM, and the purity of DGwas larger than 98% by HPLC analysis. These results reported herein provide the possibility for the highly selective separation and purification of activeDG from DNM by the molecular imprinting modification at the surface of common silica adsorbents.

【题目】磺酰脲类除草剂在水、土壤及小麦中残留分析的前处理方法研究
【中文关键词】磺酰脲类除草剂; 前处理; 固相萃取; 高效液相色谱
【英文关键词】Sulfonylurea herbicides; Pretr eatment; High performance liquid chramatography
【中文摘要】分别采用不同的前处理方法处理水、土壤和小麦样品。水样采用C18固相萃取小柱净化和富集; 土壤样品以二氯甲烷为提取剂, 超声波提取, 液2液分配净化; 小麦样品经二氯甲烷超声波提取, 氟罗里硅土柱净化、富集。样品中磺酰脲除草剂甲磺隆、氯磺隆、苄嘧磺隆的残留量采用高效液相色谱2紫外检测器同时测定。三种磺酰脲除草剂在0. 1~ 4. 0 mg L- 1范围内线性良好, 相关系数在0. 9996~ 0. 9997 之间。水样、土壤样品和小麦样品的平均加标回收率分别为82. 0% ~ 107. 0%、84. 5% ~ 100. 6%、80. 0% ~ 98. 5% , 相对标准偏差在0. 7%~ 11. 2%之间。
【英文摘要】Several pretr eatment methods were used for analysis of metsulfur on2methyl (MSM) ,chlorsulfuron(CS) and bensulfuron-methyl(BSM) in water, soil and wheat. Residues in water were purified by the SPE2C18 column. Soil samples were also extracted with dichloromethane by ultrasonic wave and purified by liquid2liquid extraction. Wheat samples were first extracted with dichloromethane by ultrasonic wave, and followed by passing through a SPE2Florisil column. T he MSM, CS and BSM residues in samples were then determined by high per formance liquid chromatography with UV detector. The linear range was 0. 1~ 4. 0 mg L- 1 with correlation coefficients of 0. 9996~ 0. 9997. T he recoveries were in the range of 82. 0% ~ 107. 0%, 84. 5% ~ 100. 6%, 80. 0% ~ 98. 5%, with relative standard deviations (RSDs) of 0. 7% ~ 2. 0% , 0. 9% ~ 10. 1%, 1. 0% ~ 11. 2% for the spiked water, soil and wheat samples, respectively.

【题目】水、土壤和蔬菜中毒死蜱、甲基毒死蜱残留检测前处理方法
【中文关键词】：毒死蜱；甲基毒死蜱；残留；前处理；高效液相色谱法
【英文关键词】chlorpyrifos; chlorpyrifos-methyl; residues; preparation; HPLC
【中文摘要】：建立了环境中水、土壤和蔬菜中毒死蜱和甲基毒死蜱残留量同时检测的前处理方法和高效液相色谱法分析方法。 水样直接用LC-18固相萃取小柱分离、净化和富集；采用乙酸乙酯-石油醚(体积比2∶1)振荡提取，LC-18固相萃取小柱分离和净化，测定土壤中毒死蜱和甲基毒死蜱残留量；以乙腈为提取剂，LC-18固相萃取小柱分离、净化，测定蔬菜样品中毒死蜱和甲基毒死蜱的残留量。 结果表明：高效液相色谱法检测毒死蜱和甲基毒死蜱的线性范围为0.1~8.0 mg/L，相关系数分别为0.999 6、0.999 4，最低检测质量浓度分别为10、5 μg/L。 水样中毒死蜱和甲基毒死蜱加标平均回收率分别为80.5%~81.0%和88.8%~92.4%，相对标准偏差为0.5%~1.4%和2.1%~4.6%；土壤中加标平均回收率为80.7%~98.0%和85.0%~95.5%，相对标准偏差为0.4%~1.0%和1.1%~3.9%；蔬菜中加标平均回收率为80.4%~84.4%和80.7%~83.7%，相对标准偏差为0.8%~3.0%和1.8%~3.3%。
【英文摘要】A preparation method for simultaneous determination of pesticides chlorpyrifos and chlorpyrifos-methyl in water, soil and vegetable by high-performance liquid chromatography (HPLC) was developed. Water samples were exacted and collected by solid-phase extraction LC-18 column. Soil samples were extracted by ethyl acetate-petroleum ether(2:1, by vol) and purifi ed and collected by solid-phase extraction LC-18 column. Vegetable sample was extracted by acetonitrile and purifi ed and collected by solid-phase extraction LC-18 column. The calibration curves of the method were determined in the range of 0.1 to 8.0 mg/L both

chlorpyrifos and chlorpyrifos-methyl, with the correlation coeffi cients (r 2)were 0.9996 and 0.9994 respectively. With the minimal detection limits being 10 and 5 μg/L. The spiked recoveries of chlorpyrifos and chlorpyrifos-methyl in water sample ranged from 80.5 to 81.0% and 88.8 to 92.4%, the soil sample from 80.7 to 98.0% and 85.0 to 95.5%, the vegetable sample from 80.4 to 84.4% and 80.7 to 83.7%, respectively. With the relative standard deviations (RSD) in water, soil and vegetable samples were from 0.5 to 1.4% and 2.1 to 4.6%, 0.4 to 1.0% and 1.1 to 3.9%, 0.8 to 3.0% and 1.8 to 3.3% respectively.

【题目】Yan Peng, Jing Luo, Qing Lu, Xuemei Chen, Ying Xie, Lina Chen,Wei Yang, Shuhu Du*. HPLC analysis, semi-preparative HPLC preparation and identi fi cation of three impurities in salidroside bulk drug
【中文关键词】无
【英文关键词】Salidroside bulk drug；Impurities；Identification；HPLC；Determination
【中文摘要】无
【英文摘要】Salidroside is a bioactive compound mainly distributed in Rhodiola L. (Crassulaceae). It has been widely used in Chinese traditional medicine. In this paper, three impurities were found during the analysis of salidroside bulk drug. The enrichment of impurities was carried out by ODS column chromatography, using methanol – water (13:87, v/v) as eluent and the purification of impurities was achieved by semi-preparative HPLC, using methanol – water (11:89, v/v) as mobile phase, respectively.Three impurities were characterized as 4-(2-hydroxylethyl)-phenol-1-O- -d-glucopyranoside,4-hydroxyphenacyl-d-glucopyranoside and p-acetylphenyl-O- -d-glucopyranoside by a variety of spectral data (IR, UV, MS, 1H NMR, 13C NMR, DEPT and 2D NMR). The simultaneous quantitative determination of salidroside and its impurities (Imp. 1, 2 and 3) was performed by reverse-phase HPLCmethod with UV detection. Specificity, linearity, sensitivity, precision and accuracy were evaluated.

【题目】籼梧粤泰B成熟胚愈伤组织诱导培养条件初探
【中文关键词】籼稻；粤泰B；成熟胚；愈伤组织；诱导
【英文关键词】Indica rice; Yue-tai B ; 成熟胚；callus; induce
【中文摘要】对籼稻HL-CMS保持系粤泰B种子成熟胚的愈伤组织诱导培养条件进行了初步探讨。结果表明，将存储的成熟种子于50℃预处理2d，种子表面消毒清洗后，晾干2～3h，在12 h 1 800 μmo1·m-2·s-1光照12h /黑暗12h、温度为24～30℃的较大的组织培养室内，采用pH 5.9～6.0、添加3.0 mg·L-1 2，4-D的N6培养基上粤泰B种子的愈伤诱导率可达93%，且愈伤组织的生长状况很好，为不育基因向籼稻HL-CMS保持系粤泰B的遗传转化奠定了基础。
【英文摘要】 In this paper the inducing and culturing condition of callus for indica rice YueTai B were studied. The results showed that under the improved combinative condition the inducible ratio for callus is more than 93%, and the status of the callus growth is very well. The combinative condition included that treating the storage rice seed with 50°C for 2 days, airing the seeds for 2-3 hours after sterilizing and washing, culturing under 12 h 1800 μmo1·m-2·s-1 light/12 h darker, 24-30°C, pH 5.9-6.0 N6 medium with 3.0 mg·L-1 2, 4-D. This result provided a basis for the genetic transformation of indica rice HL-CMS maintainer Yue-tai B.

【题目】红莲型细胞质雄性不育(HL-CMS)水稻不育系与保持系中3个ANTs基因表达模式的比较
【中文关键词】水稻; ANTs; 实时荧光定量PCR; 基因表达
【英文关键词】rice (Oryza sativa); ANTs; real-time quantitative PCR; gene expression
【中文摘要】探讨红莲型细胞质雄性不育(HL-CMS)水稻不育系‘粤泰A’(‘YTA’)和保持系‘粤泰B’(‘YTB’)中3个腺苷酸转位酶(ANT)基因在三叶期根、茎、叶以及不同发育时期的幼穗中的表达模式。结果表明: ANT1和ANT2在‘YTA’和‘YTB’三叶期的根、茎、叶中的表达量都较高, 而在生殖生长不同时期的幼穗中表达量较低。‘YTA’中ANT1在不同时期的幼穗中表达量都较低, 而ANT2的表达量到穗生长期II的幼穗才较低。‘YTB’中ANT1在生殖生长的穗生长期III的幼穗具有很高的表达。ANT3的表达水平在研究的各组织中的表达都较低, 在‘YTB’穗生长期V的幼穗中表达最高。相对于‘YTA’, ‘YTB’中只有ANT3在穗生长期III和穗生长期V的幼穗中呈现明显的优势表达, 而相对于‘YTB’, ‘YTA’中ANT2和ANT3在穗生长期I、ANT2在穗生长期VI幼穗具有明显的优势表达。3个ANTs基因在HL-CMS不育系‘YTA’和保持系‘YTB’不同组织及发育时期的表达模式的差异, 暗示它们可能与HL-CMS水稻不育系和保持系的发育调控有关。
【英文摘要】The expression mode of the three adenine nucleotide translocase (ANT) genes in roots, stems and leaves at the 3-leaf stage, and in spikes at the different developmental phases of sterile line ‘Yuetai A’(‘YTA’) and its maintainer line ‘Yuetai B’(‘YTB’) of Honglian-type cytoplasmic male sterile (HL-CMS) rice was studied in this paper. The results showed that the expression of ANT1 and ANT2 was obviously higher in roots, stems, leaves at the 3-leaf stage than in the spikes at the reproductive stage in both ‘YTA’ and ‘YTB’. Compared with the higher ANT1 expression at spike development stage III in ‘YTB’, the lower expression of ANT1 was observed during the whole reproductive phases in ‘YTA’, and the lower expression of ANT2 was present only after the spike development stage II. The expression of ANT3 at all the detected stages of both ‘YTA’ and ‘YTB’ was lower than ANT1 and ANT2, although a relatively high expression was observed at the spike development stage V in ‘YTA’. There were

the preponderant expressions of ANT2 at the spike development stage I and spike development stage VI in ‘ YTA ’, while ANT3 had the preponderant expression at the spike development stage III and spike development stage V in ‘ YTB ’. The expression mode differences among the three ANTs between ‘ YTA ’ and ‘ YTB ’ may be involved in the developmental control of sterile line and its maintainer line of HL-CMS rice.

【题目】栽培稻与O. officinalis相似群野生稻基因组VDAC基因的比较研究
【中文关键词】栽培稻；野生稻；VDAC基因；比较研究
【英文关键词】cultivated rice; wild rice; VDAC gene; comparative research
【中文摘要】根据水稻基因组文库日本晴的基因组VDAC基因的序列，设计引物分别扩增6种不同基因组的野生稻（BB、CC、BBCC及CCDD）和2种栽培稻（AA基因组）的基因组DNA的VDAC基因片段。所有分别代表8个VDAC基因的8对引物中，除引物VDAC3外，其它7对引物均能扩增出预期大小的特异条带，其中一些片段是所有实验材料共有的，而另一些则具有明显的基因组或种的特异性。AA、BB、CC基因组均具有VDAC1、4、7、和8 引物的扩增位点，而DD基因组则不能确定。VDAC6的引物位点是AA基因组所特有。VDAC2引物的扩增位点存在于基因组AA、BB、DD，而CC基因组中则无此位点。而VDAC5则可区分同为CCDD的宽叶野生稻和高杆野生稻。栽培稻种与野生稻种基因组相比能扩增出更多的VDAC基因片段的实验结果，为进一步研究稻属中VDAC基因的起源及进化关系提供了基础。
【英文摘要】 According the sequence from the rice date base, 8 primer pairs for 8 VDAC genes were designed. The fragments of 8 VDAC genes were amplified with the template DNA of different wild rice (with BB, CC, BBCC and CCDD genome) and cultivated rice (AA genome) through the VDAC 1-8 primers. Within the 8 primers, there were 7 primer pairs that special bands were amplified. The results showed that some VDAC fragments appeared in all studied materials, and some represent the difference between the different genomes or species. AA, BB, CC genome all have the primer sites of VDAC1、4、7 and 8， and DD genome was unconfirmed. The primer site of VDAC6 was special for AA genome. Only in CC genome there was no the primer site of VDAC2。And O. latifolia and O. alta， which both with CCDD genome, could be distinguished by using the primer VDAC5. The results of the cultivated rice have more VDAC sites than the O. Officinalis group wild rice supplied some basic for studying the origin and the evolution of VDAC genes in Oryza L.

【题目】水稻HL-CMS不育系中两个雄性不育候选基因表达模式的初步研究
【中文关键词】水稻；细胞质雄性不育；实时荧光定量PCR；基因表达
【英文关键词】Rice; Cytoplasmic male sterility; Real-time PCR; Gene expression
【中文摘要】采用实时荧光定量PCR技术，比较研究了水稻红莲型细胞质雄性不育(HL-CMS)不育系粤泰A(YTA)中的两个雄性不育候选基因HLsp和 orfH79在根、茎、叶以及减数分裂期小穗和三核期花药中的表达模式。结果表明，HLsp和orfH79均在减数分裂期小穗中表达最高，而在营养生长的根、茎、叶及成熟花粉中表达很低。HLsp在粤泰A不同组织中的表达均低于orfH79，但HLsp在减数分裂期小穗中的表达量与在其它组织中的表达量的差异明显比orfH79的大。两个不育候选基因HLsp和orfH79在HL-CMS不育系YTA不同组织及发育时期的表达差异，暗示二者在水稻HL-CMS的发生中可能行使不同的功能

【英文摘要】The expression mode of two male sterile candidate genes, HLsp and orfH79, in root, stem, leaf, meiosis spikelet, and trinucleate pollen of HongLian cytoplasmic male sterile (HL-CMS) sterile line, YTA, were studied through Real-Time PCR. The results showed that the expressions of both HLsp and orfH79 were much higher in meiosis spikelet than that in the root, stem, leaf, and trinucleate pollen. And the HLsp expression level was lower than that of orfH79 in different tissues of YTA, but the expression difference of HLsp between meiosis spikelet and other tissues was higher than that of orfH79. This difference may be indicates that HLsp and orfH79 play a different role in the process of HL-CMS pollen abortion.

【题目】不同基本培养基对籼稻粤泰A与粤泰B成熟胚愈伤组织诱导及继代的影响
【中文关键词】籼稻；愈伤组织；诱导；继代
【英文关键词】Indica; callus; induce; Subculture
【中文摘要】本实验选用红莲型细胞质雄性不育籼稻不育系粤泰A与保持系粤泰B成熟胚为材料，比较了4种不同基本培养基(N6、NB、MS、CC)对二者愈伤组织诱导率及初愈组织的继代生长的影响。结果表明N6、NB、MS 3种培养基均可用于YTA和YTB种子愈伤的诱导，而用NB及N6培养基进行第1次继代培养效果较好，4种基本培养基均不适合于YTA和YTB进行二次继代培养。在相同培养基上，YTB愈伤诱导率、愈伤生长状况及继代培养时的褐化率都优于YTA，这证明细胞质基因型对愈伤的诱导和生长有重要影响。
【英文摘要】The effects of 4 different basic substrates (N6, NB, MS and CC) on callus inducing and subculturing for indica rice Yue-Tai A and Yue-Tai B, both with same nucleolus and different cytoplasm, were compared. The results showed that N6、NB、MS are suitable for the callus inducing of YTA and YTB, and the first subculture of the callus was better on the NB and N6 medium than MS and CC. 4 kinds of medium were all not suitable for the second subculture of the callus of YTA and YTB. On the same medium, the inducible ratio for callus, status of the callus growth and callus browning in subculture of YTB were better than YTA. This indicated that the genotype of cytoplasm take on important effects on the inducing and growth of callus.

【英文关键词】rice； protokaryotic expression；affinity purification；antibody
【中文摘要】以常规基因重组技术，将orf216基因克隆入含有内含肽标签的原核表达载体pTYB1中，得到重组质粒pTYB1-orf216，经鉴定正确后，转化至大肠杆菌ER2566感受态细胞，15℃下0.8 mmol/L IPTG诱导15 h后，SDS-PAGE检测到大小约85kD的特异性蛋白条带，融合蛋白以可溶组分形式存在。融合蛋白经亲和纯化后制备多克隆抗体，Western blot分析表明多克隆抗体具有较高的特异性，可与免疫原特异结合。本研究为orf216的下一步研究工作奠定了基础。
【英文摘要】The recombinant prokaryotic expression vector pTYB1-orf216 with the intein tag was constructed and transformed into E.coli ER2566. The optimized protein expression induction condition in E. coli was 0.8 mmol/L IPTG (isopropy- β -D-thiogalacto side) at 15℃ for 15 hours. A band with 85kD of molecular weight was observed on SDS-PAGE, and the protein was mainly existing in the soluble composition. This protein was isolated and purified through affinity chromatography, and then polyclonal antibody was prepared. The results of Western Blotting indicated that the prepared polyclonal antibody was with high specificity.

【题目】 籼稻成熟胚愈伤组织继代培养过程中内源多胺含量的测定
【中文关键词】水稻；成熟胚；愈伤组织；高效液相色谱；多胺
【英文关键词】rice; callus; HPLC; polyamines
【中文摘要】采用高效液相色谱法对诱导产生的籼稻粤泰B(YTB)成熟胚愈伤组织继代培养过程中内源多胺组分和含量进行了测定。结果表明采用XDB-C18 柱流动相梯度（从50%甲醇到80%甲醇）洗脱可以使Put、Spd和Spm 3种多胺组分得到很好的分离。水稻粤泰B成熟胚愈伤组织继代培养5d后体内Put和Spd的含量明显增加，而Spm的含量基本不变。推测Put和Spd对水稻愈伤组织的生长发育可能有重要的作用，可为优化水稻愈伤组织培养基的组分提供参考。
【英文摘要】The composing of content of polyamines in callus from matured embryo of indica rice YTB during subculturing was mensurated through HPLC in this paper. The results showed that 3 composion of polyamines, putrecine(Put)、spermidine (Spd)and spermine (Spm), can be separated on XDB-C18 column with a mobile phase of grads(from 50％H2O-50％methanol to 20％H2O-80％methanol)。The content of Put and Spd in the callus from matured embryo at 5 d after subculturing were obviously increased than that at 1 d, and the content of Spm was no variety in 5 d. This suggested that Put and Spd may have effect on the growth and development of rice callus. This results can support a reference for optimizing the composing of the substrate for the culture of rics callus.

【题目】一个烟草糖基转移酶启动子在拟南芥中的表达
【中文关键词】拟南芥；GT-MS启动子；甲基茉莉酸；水杨酸；基因表达
【英文关键词】Arabidopsis thaliana; GT-MS promoter; methyl jasmonate; salicylic; gene expression
【中文摘要】本实验室从烟草中克隆到一个受甲基茉莉酸和水杨酸双重诱导的糖苷转移酶基因GT-MS，本实验将其翻译起始位点5’上游 -800~+1启动子序列取代pCAMBIA1301质粒的35S启动子，构建GT-MS启动子与Gus基因融合的植物表达载体，采用花序浸染法转化拟南芥，得到阳性植株。对转基因植株进行组织化学染色的结果表明GT-MS启动子在拟南芥不同生长发育时期及不同器官均有表达，但主要是在维管组织表达，且韧皮部的表达高于木质部。MeJA和SA诱导后GUS活性增强，Gus基因RNA表达量成倍增加。这表明GT-MS启动子与在烟草中相似，在拟南芥中也受MeJA和SA诱导。
【英文摘要】A glycosyltransferase gene (GT-MS) induced by both methyl jasmonate and salicylic acid was cloned from Tobacco early. In this study the fusion vector of the GT-MS promoter (5’-800 ~ +1) and Gus gene within pCAMBIA1301 was constructed，and transferred to Arabidopsis thaliana through dipping flower. The results of histochemical staining of GUS activity showed that the GT-MS promoter expressed in different period for growth and development and different organs of transgenic plants, but mainly in the canaliculus, and higher in phloem than in xylem. GUS activity and Gus RNA expression were increased after the leaves were treated with methyl jasmonate and salicylic. These results showed that the GT-MS promoter was also induced in Arabidopsis thaliana by MeJA and SA, as it was in Tobacco.

【题目】具有血管紧张素转化酶抑制活性益生菌筛选的研究进展

【中文关键词】降压肽;益生菌;筛选方法
【英文关键词】Antihypertensive peptide; probiotics; screening

【中文摘要】高血压是常见的心血管疾病,是危害人类健康的一个主要因素。目前我国临床常用的抗高血压药 ACEIS,虽具有很好的降压效果,但都具有一定的副作用或不良反应。而来源于食物中的血管紧张素转化酶抑制肽 ACEI 具有降压效果显著、无毒副作用、安全性高、成本低、易吸收等特点,更加符合患者的需求。近几年来,利用酶技术已从鱼、贝、鸡蛋、大豆、大蒜等各种食品蛋白质中分离出不同的血管紧张素转化酶抑制肽。特别随着微生物发酵技术制备乳源 ACE抑制肽.方法的建立也为乳源 ACE抑制肽市场的开发提供了可行性。产生具有特异吸收特性的物质。通过对加入 ACEI前后这种同时,随着消费者对益生菌产品要求的不断提高,具有降压活物质吸收特性的差异变化计算出 ACEI的抑制的大小。ACE性的益生菌将会成为新型降压药物的主流。本文参阅益生菌的降压机制及大量国内外有关 ACE抑制肽筛选方法的研究,为高效、快捷的筛选出具有 ACE抑制活性的益生菌菌株提供参考
【英文摘要】"Hypertension is a common cardiovascular disease, is harmful to human health, a major factor. China's current anti-hypertensive drugs commonly used in clinical ACEIS, although a good antihypertensive effect, but all have certain side effects or adverse reactions. The food from the angiotensin-converting enzyme inhibitory peptides with antihypertensive effect of ACEI significant toxic side effects, safe, low cost, easy to absorb and so on, more in line with the needs of patients. In recent years, the use of enzyme technology from fish, shellfish, eggs, soy, garlic and other food proteins isolated from different angiotensin-converting enzyme inhibitory peptides. Particularly with the preparation of milk-derived microbial fermentation technology ACE inhibitory peptides. The establishment of methods for milk-derived ACE inhibitory peptides provides market development feasibility. Have a specific absorption characteristics of the material. ACEI around this by adding the same time, as consumers of probiotic products requires continuous improvement, with blood pressure differences in absorption characteristics of living matter to calculate the change in the size of the inhibition of ACEI. ACE of probiotics will become the mainstream of new antihypertensive drugs. See this step-down mechanism and a large number of probiotic domestic and foreign ACE inhibitory peptide screening methods for the efficient and fast screening of ACE inhibitory activity of a probiotic strain to provide a reference."

【题目】Morphology modulation of polymeric assemblies by guest drug molecules:TEM study and compatibility evaluation
【中文关键词】无
【英文关键词】Drugdelivery
Self-assembly
Nanoparticles
【中文摘要】无
【英文摘要】"Amphiphilic copolymers with poly(N-isopropylacrylamide) and ethyl tryptophan,ethyl4-amino-benzoate,orethyl glycinate as side groups weresynthesized.Assemblies based on these copolymerswere employed as model systems to investigate the morphology transformation upon loading of varioushydrophobic drugs.TEM bservation suggested that the loading of non-steroidal anti-inammatorydrugs,including ibuprofen,ketoprofen,indomethacin,naproxen and mefenamic acid,can triggera signicant morphological transformation of assemblies based on copolymers with low substitution ofhydrophobic group.On the other hand,the introduction of steroidal anti-inammatory drugs(medroxyprogesterone acetate,prednisone acetate and dexamethasone)andaliphatic acids(caprylicacid,tetradecanoic acid and stearic acid)has no signicant effect on the morphology of assembliesderived from the samecopolymers,although they do have some effect on the morphology of assembliesbased on copolymers with high content of hydrophobic group.In addition,the morphology of assembliesis well correlated with drug loading efciency.An occurrence of morphology transformation meansahigher drug loading,and vice versa.Various physicochemical parameters including partition coef-cient,molecular volume and solubility parameters were calculated according to group contributionmethod.Analysis of these data pointed to the fact that acombination of molecular volume and solubilityparameters can be used as a measure to judge whether one molecule is active or neutral.This rulel also be applied to evaluate the compatibility between candidate drugs and nanocarriers based on

thesecopolymers."

【题目】Prenatal exposure to lipopolysaccharide alters the intrarenal renin – angiotensin system and renal damage in offspring rats
【中文关键词】无
【英文关键词】inflammation;offspring;prenatalstress;RAS
【中文摘要】无
【英文摘要】"Prenatal exposure to inflammation produces offspring that are hypertensive in adulthood. This study explored alterations of the renin-angiotensin system(RAS)during the development of hypertension induced by prenatal exposure to lipopolysaccharid(LPS).Inaddition,the effects of an inhibitor of the nuclear transcription factor(NF)-kB(pyrrolidine dithiocarbamate,PDTC)onthis process were assessed.Pregnant rats were randomly divided into four groups(n=8):a control group,an LPS group,a PDTC1group and an LPS+PDTC group.The rats in these groups were intraperitoneally administered vehicle,0.79mgkg-1LPS, 100mgkg-1PDTC or LPS plus PDTC,respectively.LPS was given on the 8th,10th and 12th days,whereas PDTC was givenfrom the 8th to the 14th day during gestation.At various ages from day1to 25 weeks,plasma renin activity,plasma angiotensinII(AngII)levels,renal function,glomerular number,mRNA expressionl evels of renal cortex renin and angiotensin-convertingenzyme(ACE),the number of AngII-positive cells and NF-kB activation were determined.The results showed that prenatal exposure to LPS resulted in significantly lower glomerular numbers and creatinine clearance rates and higher urinary protein andrenal cortex ACEmRNA expression in adult offspring.Prenatal LPS also decreased the renal cortex renin mRNA expression and the number of Ang II-positive cells in offspring at 1day of age,but these increased at7,16 and 25 weeks,whereas the plasma renin activity and AngII concentration remained unchanged.Simultaneously,PDTCtreatment markedly reversed the action of LPS.In conclusion,prenatal exposure to LPS resulted inalteration of the intrarenal RAS and renaldamage in adult offspring rats."

【题目】Bama Miniature Pigs (Sus scrofa domestica)as a Model for Drug Evaluation for Humans:Comparison of In Vitro Metabolism and In Vivo Pharmacokinetics of Lovastatin
【中文关键词】无
【英文关键词】intrinsic clearance; CYP, cytochrome P450; HA, -hydroxyacid lovastatin; TAO, triacetyloleandomycin
【中文摘要】无
【英文摘要】"The objective of this study was to demonstrate that Bama miniature pigs are a suitable experimental animal model for the evaluation of drugs for man. To this end, in vitro lovastatin metabolism at the minipig liver microsomal level and in vivo pharmacokinetics were studied. Results were compared with those obtained from humans. Our data indicate that the main metabolites and enzyme kinetic parameters of lovastatin metabolism are similar in pigs and humans. Triacetyloleandomycin, a speciic inhibitor of human CYP3A4, inhibited the metabolism of lovastatin in pig and human liver microsomes. In addition, the pharmacokinetic parameters and absolute bioavailability suggested that the absorption and elimination of lovastatin in Bama miniature pigs were similar to those in humans. Lovastatin was distributed across many organs in pigs, but the highest levels were found in the stomach, intestines, and liver. Within 96 h, 7% and 82% of the given dose was excreted in the urine and feces, respectively. In addition, no signiicant species

differences in the plasma protein binding ratio of lovastatin and the rates of lovastatin hydrolysis to -hydroxyacid lovastatin were apparent. From these results, we conclude that Bama miniature pigs are suitable for use in drug evaluation studies."

【题目】An in vitro assessment of inhibitory effect of 16 strains of probiotics on the germination of Candida albicans
【中文关键词】无
【英文关键词】Candida albicans, antifungal drugs, germ tube, probiotics, butyric acid.
【中文摘要】无
【英文摘要】"The purpose of the study was to evaluate the antagonistic activity of probiotics isolated from products to germination of Candida albicans in vitro. The spent culture supernatant, live bacteria, heat-killed bacteria of 16 strains of probiotics and main bacterial short-chain fatty acids were applied to inhibit the germination of C. albicans in vitro by crystal violet-based germ tube assay. Neutral SCS of all the probiotcis evaluated in this research could decrease germination significantly and live bacteria of Lactobacillus rhamnosus LGG, Lactobacillus plantarum LA, Lactobacillus johnsonii JCM1022, Bacillus Longum-2, Bacillus sub. and Bacillus lich could partially inhibit the conversion of yeast to germ. However, all the heat-killed bacteria failed to control the germ tube formation. Furthermore, only butyric acid blocked the conversion of yeast to hypha among all the SCFAs. These results suggest that L. rhamnosus LGG, L. plantarum LA and L. johnsonii JCM1022, B.Longum-2, Bacillus sub. and B. lich maybe potential strains to use as antifungal drugs and the inhibition seems to have direct correlation to the metabolites butyric acid. 【题目】罗非鱼片渗透处理中的水分传递特性
【中文关键词】罗非鱼 鱼片 渗透 水分 传递
【英文关键词】tilapia, fish fillet, osmotic, moisture, transfer
【中文摘要】选择罗非鱼片为研究对象,采用食盐溶液作为渗透液,在改变渗透液浓度、固液比和鱼片厚度的条件下,研究了罗非鱼片的水分迁移变化特性。结果表明,鱼片在10%浓度的盐水溶液中表现为吸水增重,在20%以上的盐水中才会出现渗透脱水现象;在渗透液浓度和鱼片厚度不变的条件下,鱼片的脱水率随着固液比的增大而升高;同时厚度对鱼片脱水率的影响与渗透时间有关,渗透时间的延长会降低较薄鱼片的脱水率。
【英文摘要】The characteristic of moisture transfer in osmotic treatment of tilapia fillets was investigated in this paper. The changes of weight were quantitatively determined during osmotic treatments of fresh tilapia fillets with the sodium chloride concentration (10-30%), ratio of solid to liquid (1:5-1:15) and fillet thickness (3-10mm) as the independent treatment factors. Results were as follows: First, the weight of fillets was increased when fresh tilapia fillets were soaked in 10% sodium chloride (NaCl) solution. The osmotic dehydration of fillets occurred in 20% NaCl solution or more. Second, if the osmotic solution concentration and fillet thickness were set, the dehydration rate (DH) of fillets was found to increase with increasing of ratio of solid to liquid, which means ratio of weight fillets to solution. Finally, effect of fillet thickness on DH was found to be related to osmotic time. The DH of thinner fillets would be reduced when treatment time was prolonged.

【题目】罗非鱼片的热风微波复合干燥特性
【中文关键词】罗非鱼;热风微波复合干燥;特性

【英文关键词】tilapia fillets; hot-air and microwave drying; characteristics
【中文摘要】研究了罗非鱼鱼片分别在不同热风温度下干燥后,又分别于微波下干燥不同时间的干燥速率变化和热风微波干燥对鱼片品质的影响。结果表明,在热风初干温度和时间不变的条件下,当微波干燥时间一定时,罗非鱼片的含水率随微波功率的增大而降低;当微波功率一定时,罗非鱼片的含水率随微波干燥时间的延长呈现先快后慢的速率下降。在热风初干温度不同时,较高的热风温度有利于鱼片在微波干燥阶段的含水率的降低。罗非鱼片在热风微波后的收缩率和复水率随微波功率的升高而增加,当微波功率一定时,收缩率和复水率随热风初干温度升高而增加。而复原率则随微波功率的增加而降低,当微波功率一定时,热风初干温度如果越高,那么复原率越低。
【英文摘要】The Characteristics of combined hot-air and microwave drying(AMD) of 3 mm of fresh tilapia fillets during drying at different microwave powers (200W-600W)and different hot-air temperatures(40℃-60℃) were investigated . At the same time, the effects of AMD conditions on quality of dried tilapia fillets were determined in this paper. Results showed that an increase in microwave power resulted in a decrease in moisture content of tilapia fillets when other factors including hot-air drying temperature, AMD time were hold. Secondly, the higher the hot-air temperature was, the faster the AMD velocity of fillets was. Thirdly, the shrinkage and rehydration rate of AMD fillets were increased as microwave power or air temperature was improving. However, the change of the recovery rate was contrary to the shrinkage and rehydration rate. Therefore, low air temperature and microwave power were beneficial to keep the quality of dried tilapia fillets.

【英文关键词】fish swimbladder; microwave technology; extraction; protein;coomassie brilliant blue
【中文摘要】选取新鲜鱼鳔为原料,以蛋白质提取率为指标,采用考马斯亮蓝法测定提取液中的蛋白质含量,分别研究了微波功率、微波萃取时间和固液比等因素对鱼鳔蛋白提取的影响,并通过正交试验优化了微波提取鱼鳔蛋白的工艺,得出在固液比1∶30,萃取时间2.5 min,萃取功率300W条件下,鱼鳔蛋白质的提取率最高。研究结果为开发微波技术在鱼鳔加工中的应用提供依据。
【英文摘要】A fresh fish swimbladder was used to extract protein by microwave treatment technology. Effect of microwave power, microwave treatment time and ratio of solid to liquid on the extraction rate of proteins, determined by using coomassie brilliant blue G-250, were investigated in this paper. The conditions of extracting protein from swimbladder by microwave treatment were optimized by orthogonal experiment. The results indicated that the optimized conditions were ratio of material to liquid of 1∶30, extraction time of 2.5 min, and the power microwave of 300W respectively. This provided a basis for the development of application of microwave technology in the processing of fish swimbladder.

【题目】罗非鱼片真空微波干燥特性及其动力学研究
【中文关键词】真空;微波;罗非鱼片;干燥;动力学
【英文关键词】Vacuum;Microwave;Tilapia Fillets ;Drying ;Kinetics
【中文摘要】研究了3mm罗非鱼片在真空度0.03、0.06、0.09MPa和微波功率100W、200W、300W下进行了真空微波干燥实验的水分比与时间关系,结果表明:增大微波功率能提高干燥速率;提高真空度能降低最终的水分含量;在高真空度下,微波功率对干燥速率的影响不明显。此外,通过实验数据建立罗非鱼真空微波干燥模型,发现Page模型最适合于拟合微波真空干燥薄层罗非鱼片,并用拟合的模型曲线与真实值进行验证,证明Page模型具有良好的效果。
【英文摘要】Vacuum-microwave drying of tilapia fillets during different vacuum(0.03 to 0.09MPa) and different microwave power(100 to 300W) was investigated. Results showed that the higher microwave power is, the MR decreased more obviously. The higher the vacuum is , the smaller MR is at the end of drying. Meanwhile, the power of microwave had less noticeable influences under high vacuum .In addition, the suitable mathematical model which can be used to describe the relationship of moisture ratio and drying time was established in this paper. The results showed that the model of Page is the most suitable model to predicted values consistent with the observed values. After comparison of fitting curves and the observed values, we find out the model of Page is good at fitting Tilapia Fillets during vacuum-microwave drying.

【题目】罗非鱼脱腥技术比较研究
【中文关键词】罗非鱼; 脱腥; 真空微波干燥
【英文关键词】tilapia; deodorization; vacuum microwave drying;
【中文摘要】鱼类所特有的腥臭味让许多消费者难以接受,本文利用酵母、红茶、绿茶、菊花茶、紫苏、白酒、醋以及活性炭八种物质对罗非鱼片进行脱腥处理,以感官评定为标准,确定了各种脱腥方法的最佳工艺条件。结果表明,各种脱腥方法都能在不同程度上去除鱼腥味,且一般随着时间的延长和浓度的增加而使腥味变淡,其中使用1%白酒加3%紫苏和1%白醋2h即可完全去除腥味,且口感好,有特殊香味,脱腥效果最好。 更多还原
【英文摘要】It is hard for most customers to accept the unique unpleasant smell of fish. Deodorizations of tilapia meat by yeast,black tea,green tea,chrysanthemum tea,basil,white wine,vinegar,as well as activated carbon were investigated,and the optimum conditions of each method were determined by sensory evaluation as a criterion. The results showed that the fish smell can be removed to varying degrees by a variety of methods,and it generally got lighter with the longer time and the increase of processing aids in concentration. The optimum deodorizing condition was that using 1% white wine plus 3% basil and 1% vinegar to deal with the tilapia meat for 2h,which can completely remove the smell,and the fish tasted good,with special fragrant smell.

【题目】真空微冻罗非鱼片保鲜研究
【中文关键词】罗非鱼片; 微冻; 真空包装; 新鲜度
【英文关键词】tilapia fillet; partial freezing; vacuum packaging; freshness;
【中文摘要】为探索罗非鱼片的保鲜方法,采用真空包装和微冻处理罗非鱼片,对其在贮藏过程中的感官特性、水分散失率、僵硬期、肌肉硬度、挥发性盐基氮(TVB-N)和水分活度等进行比较分析,评价罗非鱼片在真空包装和微冻条件下的保鲜效果。结果表明:罗非鱼在3℃水中经30min即可致死,鱼片比自然死亡的僵硬时间可延长约100min;先真空包装再微冻处理比先微冻再真空包装的水分散失率减少约2.6%。经-7℃和-4℃条件贮藏15d,鱼片的TVB-N≤15mg/100g;-7℃条件贮藏的鱼片TVB-N比-4℃的低约25%。
【英文摘要】Changes in physical and chemical properties such as sensory quality,water-loss rate,stiffness period,hardness degree,total volatitle base-nitrogen (TVB-N) value and water activity during the storage of tilapia fillets subjected to both partial freezing and vacuum packaging at-4 ℃ or-7 ℃ were analyzed to evaluate the fresh-keeping effect of vacuum package and partial freezing storage. Results indicated that tilapia lived in 3 ℃ water for 30 min would die. Its stiffness period was extended to 100 min compared with that of the normally dead tilapia. Initial vacuuming treatment followed by partial freezing treatment could reduce water loss rate by 2.6%,when compared with partial freezing first and then vacuum packaging. After 15 days of storage at-4 ℃ or-7 ℃,(TVB-N) values of tilapia fillets were less than 15 mg/100 g,and the values after the storage period at-7 ℃ were approximately 25% lower than those at-4 ℃

【题目】Proteomics reveals the effects of gibberellic acid (GA3) on salt-stressed rice (Oryza sativa L.) shoots
【中文关键词】Gibberellic acid (GA3); Salt stress; Proteomics; Rice (Oryza sativa L.)
【英文关键词】Gibberellic acid (GA3); Salt stress; Proteomics; Rice (Oryza sativa L.)
【中文摘要】Salt decreases gibberellic acid (GA3) content in rice. Nevertheless, GA3 may exert a beneficial effect on salt-stressed rice. In our analysis, GA3 reduced NaCl-induced growth inhibition in rice (Oryza sativa L. cv. Nipponbare) in a concentration-dependent manner, including the length of root tissue. However, remains unclear. We employed a comparative proteomic analysis to elucidate the mechanism of GA3 activity in this phenomenon. 5-Day-old seedlings treated with salt and gibberellic acid (H2O, 0.5% NaCl, 0.5% NaCl + 100 mM GA3, and 100 mM GA3) for 48 h were used for the proteomics analysis. Eleven proteins differently regulated by salt and GA3 were revealed by 2D PAGE and were identified by MALDITOF MS. These proteins were identified as glutamyl-tRNA reductase, enolase, salt stress-induced protein (SALT protein), Os09g0249700, hypothetical protein OsJ_014066, putative chaperonin 21 precursor, Os04g0659300, hypothetical protein OsJ_025258, ribulose bisphosphate carboxylase, isoflavone reductase-like protein

and phosphoglucomutase. Some of these proteins are involved in biochemical pathways such as photosynthesis and glycolysis, but others were found to be novel proteins involved specifically in the response to salt in rice. GA3 had a significant influence on the abundance of some saltregulated proteins. Our studies have provided new insight to reveal the modulating effect of GA3 on salt stress in rice

【英文摘要】Salt decreases gibberellic acid (GA3) content in rice. Nevertheless, GA3 may exert a beneficial effect on salt-stressed rice. 【题目】小麦叶片胞间洗脱液的蛋白质组学检测分析
【中文关键词】小麦 叶片 胞间洗脱液 蛋白质组学 双向电泳
【英文关键词】Wheat(Triticum aestivum) Leaf Intercellular washing fluid(IWF) Proteomics Two-dimensional gel electrophoresis(2-DE)

【中文摘要】植物叶片胞间液蛋白主要是一些低丰度蛋白,其中某些种类在植物抗病反应中起着重要的作用。通过改进已有的技术方法,结合超滤和丙酮沉淀处理,从500 g 抗条锈病近等基因系小麦Taichung29* 6/Yr5 的叶片中获得了1. 5 mg 可溶性的胞间洗脱液蛋白。SDS-PAGE 电泳分析显示,胞间洗脱液蛋白样品和总蛋白样品存在着明显的差异。进一步的双向电泳分析证实,两个样品在胶图上可分别检测到1 241 ±59(n =3) 和1 849 ±138(n =3) 个蛋白点,其中胞间洗脱液样品有1 042 ±47(n =3) 个不同于总蛋白样品的蛋白点,与总蛋白样品共有的蛋白点仅198 ±13(n =3) 个。随意取100 个差异蛋白点进行MALDI-TOF 质谱分析,鉴定到一些已被确证存在于小麦胞间液中的蛋白质,如β-1,3-葡聚糖酶、葡聚糖-β-D-1,3-葡萄糖苷内切酶、几丁质酶、过氧化物酶等。从蛋白质组学角度初步分析了小麦叶片胞间洗脱液的组成,为进一步探索小麦叶片胞间液中低丰度蛋白的抗病功能提供依据。

【英文摘要】The proteins in the intercellular fluid of plant leaves are mostly low abundance proteins and some of them play an important role in disease resistance. In this study,the intercellular washing fluid (IWF) was obtained from 500 g wheat leaves,and then 1. 5 mg soluble apoplast proteins were extracted using an improved method,which combining ultrafiltration and acetone precipitation. In following analysis,significant differences could be detected between IWF protein and wheat leaf total protein on SDS-PAGE gel. When separated using 2-DE,a total of 1 241 ±59 (n =3) spots were detected on IWF protein images and 1 849 ±138 (n =3) spots in total protein images. And there were 198 ±13(n =3) common spots and 1 042 ±47(n =3) particular spots in IWF protein images when compared with total protein images. 100 particular spots that were randomly chosen from2-DE gels have been analyzed by MALDI-TOF-MS, identified some proteins which have been conformed and proved were intercellular protein of wheat leaves,such as β-1, 3-glucanase,glucan endo-1, 3- β-D-glucosidase,chitinase,peroxidase and thioredoxin.In our study,protein constitutes of the intercellular fluid from wheat leaves have been detected by using proteomic technology. This work should be helpful for further understanding of disease resistance functions of the low abundance proteins in wheat intercellular fluid.

【题目】抗条锈病小麦品系Taichuang29*6/Yr5接种条锈菌CY32后的蛋白质组学分析
【中文关键词】蛋白质组学;小麦;抗条锈;二维凝胶电泳;肽质量指纹图谱
【英文关键词】proteomics;wheat;stripe rust resistance;two-dimensional gel electrophoresis;PMF
【中文摘要】【目的】了解抗条锈小麦受条锈菌侵染后的蛋白表达变化情况,采用比较蛋白质组学技术鉴定接种条锈菌小种CY32后的抗条锈小麦品系Taichuang29*6/Yr5和同时期未接种对照之间的差异蛋白。【方法】提取接种48 h和同期未接种小麦的叶片蛋白,进行双向电泳分离和分析,选取差异显著的蛋白点进行MALDI-TOF质谱分析及数据库搜索鉴定。【结果】发现13个体积百分比变化大于1.5倍,符合t检验(P<0.05)的显著差异蛋白点,通过MALDI-TOF MS获得了这些差异蛋白点的肽指纹图谱,经数据库搜索,共鉴定出11个蛋白,包括Pathogenesis-related homeodomain protein,beta-glucosidase,glutathione transferase等。【结论】经蛋白质功能分析,推测小麦叶片中这些差异蛋白可能与条锈菌小种CY32的侵染有关
【英文摘要】【Objective】To investigate the biochemical changes of wheat resistance to stripe rust after infected with the stripe rust,a resistive line of wheat(Taichung29*6/Yr5)infected with stripe rust CY32 was compared to mock-inoculated wheat by comparative proteomics technology.【Method】Proteins were extracted from leaves infected with a virulent race of stripe rust CY32 and control group after 48 hours of inoculation,and then separated by using two-dimensional electrophoresis(2-DE).The differential protein spots were selected for MALDI-TOF MS analysis and database searching.【Result】By using 2-DE,2 uniquely expressed spots,5 up-regulated spots and 6 down-regulated spots were observed in Taichung29*6/Yr5 leaves inoculated with stripe rust CY32. Total of 11 proteins,including pathogenesis-related homeodomain protein,beta-glucosidase,glutathione transferase etc,were identified.【Conclusion】Through analysis of protein function,it is presumed that these differential proteins are correlated with the infextation of stripe rust race CY32.

【题目】一种简易高效的小麦叶片胞间液蛋白提取方法的建立
【中文关键词】细胞间液小麦叶片蛋白质蛋白质组学提取
【英文关键词】Intercellular fluid Wheat leaf Protein Proteomics Extraction
【中文摘要】植物细胞间液中的蛋白在植物生长发育和抗病抗逆反应及其信号传导过程中发挥着重要作用,是植物学研究的新热点。由于细胞间液含量低,容易因组织细胞损伤性受到胞内成分污染,高纯度的细胞间液蛋白的提取相对困难,参考相关文献报道,建立了一种简易高效的小麦叶片细胞间液蛋白的提取方法。选取小麦品种“铭贤169”幼苗叶片为材料,用50mmol /L NaAc 缓冲液充分浸润,负压处理20 min 后,30 × g 离心5 min 除去叶片表面缓冲液,随后2 000 × g 离心15 min,收集小麦叶片胞间液。将获得的小麦叶片胞间液冷冻干燥后,进行SDS-PAGE 分离分析。电泳胶图上显示出细胞间液提取物与叶片组织提取物的蛋白质组成有极显著差异,使用MALD-TOF/TOF MS 技术分析SDS 胶上的细胞间液蛋白条带,共鉴定到9种非高丰度或假定的蛋白,其中有两种是已报道过的植物细胞间液蛋白。试验结果表明,本方法简易高效,适用于小麦蛋白质组学研究中高纯度的细胞间液蛋白的提取。
【英文摘要】It has been recognized that the proteins of plant intercellular fluid play important roles in the process of growth,disease resistant,degeneration resistant and signal transduction. However, it is not easy to extract these proteins for proteomics research,because of the low abundance of intercellular fluid proteins and the difference of separation of intercellular fluid proteins from plant tissue. Referencing previous reports,we developed a simple method for efficient extraction of proteins from wheat leaf intercellular fluid. With wheat variety “ Mingxian 169 ” as the material,young leaves were completely soaked in 50 mmol /L NaAc buffer and then vacuumed

for 20 min. After that the buffer was removed by centrifugation at 30 × g for 5 min, and the intercellular fluid was collected by centrifugation at 2 000 × g for 15 min. Finally, the proteins were obtained by ultrafiltrating or freeze drying the intercellular fluid. SDS-PAGE was used todetect and separate proteins extracted from wheat leaf intercellular fluid. Observed on electrophoresis gel, intercellular fluid proteins were significantly different with total proteins extracted from wheat leaves. We divided the intercellular fluid proteins into 45 slim straps,and detected them by MALDI-TOF/TOF MS. With this method,9 proteins were identified. Among the identified proteins, two have been reported as plant extracellular proteins. The results indicated that the method is suitable for extracting intercellular fluid in proteomicsresearch.

【题目】赤霉素对盐胁迫抑制水稻种子萌发的缓解作用的蛋白质组分析
【中文关键词】水稻; 赤霉素; 盐胁迫; 蛋白质组
【英文关键词】Rice; Gibberellin; Salt stress; Proteome
【中文摘要】用粳稻日本晴(Oryza sativa L. cv. Nipponbare), 研究了盐胁迫对水稻种子萌发的抑制作用和赤霉酸(GA3)对盐胁迫的缓解作用; 分别以H2O(对照), 5 g L − 1 NaCl(处理I), 5 g L − 1 NaCl + 100 μ mol L − 1 GA3 (处理II)培养水稻种苗48 h, 提取芽中的蛋白质, 利用双向电泳(2-DE)和基质辅助激光解吸电离飞行时间质谱(MALDI-TOF MS)技术分析了水稻蛋白质组的变化。结果表明, 在盐胁迫条件下, 日本晴种子的萌发显著受到抑制, 而GA3 能显著缓解这种抑制作用; 用ImageMaster 软件分析2-DE 凝胶,发现有4 个蛋白质斑点表现出显著的变化, 在盐胁迫下斑点S1、S2 和S3 表达下调而斑点S4 消失, 在GA3 与盐共处理时, 这4 个蛋白质点的表达均有不同程度的恢复; 经MALDI-TOF MS 分析, 其中2 个蛋白质斑点(S1, S3)分别被鉴定为isoflavone reductase-like 蛋白与葡萄糖磷酸变位酶, 这些蛋白可能与GA3 提高水稻耐盐性途径相关。
【英文摘要】Salinity stress is a major abiotic stress to most plant including rice. It has been reported that gibberellic acid (GA3) can exert a natural beneficial effect on salt stressed rice. In this paper, the effect of salt stress on rice (Oryza sativa L. cv. Nipponbare) seed germination and the effect of GA3 on salt-stressed rice were investigated. A proteomic approach was employed to further understand the relieving effect of gibberellin on the inhibition of rice seed germination by salt stress. The 5-day-old rice seedlings were treated with H2O (control), 5 g L − 1 NaCl (treated group I), and 5 g L − 1 NaCl + 100 μ mol L − 1 GA3 (treated group II) for 48 h respectively. The proteins extracted from buds were separated by two-dimensional gel electrophoresis (2-DE) and analyzed with Matrix Assisted Laser Desorption/Ionization Time of Flight Mass Spectrometry (MALDI-TOF MS). The results showed that the seed germination of Nipponbare was inhibited by salt stress significantly, while GA3 could reduce the inhibition significantly.Four protein spots showed differential expression in 2-DE. Three of these proteins were down-regulated (spots 1 – 3) and one proteindisappeared (spots 4) under salt stress. Expression levels of these proteins were recovered partly when treated with GA3 andNaCl at the same time. Two protein spots were identified as isoflavone reductase-like protein and phosphoglucomutase. Thesedifferential expression proteins may play important role in the mechanism of the relieving effect of gibberellin on the inhibition ofrice germination by salt stress.

【题目】小麦叶片类囊体膜蛋白复合体的分离和分析技术研究

【中文关键词】蓝绿温和胶电泳 类囊体膜蛋白复合体 电洗脱 SDS-PAGE 低丰度

【英文关键词】BN-PAGE Thylakoid membrane protein complexes Electroelution SDS-PAGE Low-abundance

【中文摘要】膜蛋白复合体在生命活动中执行着重要的生物化学功能,具有重要的研究意义,但由于其低表达和高度疏水的特点,完整状态和低丰度的膜蛋白复合体的分离分析仍是一大挑战。首先,采用蓝绿温和胶非变性电泳作为第一维分离技术,大量分离制备叶绿体类囊体膜蛋白复合物; 其次,采用电洗脱方法差异富集第一维电泳分离到的各种蛋白复合体; 最后,采用SDS-PAGE 作为第二维分离技术,分析差异富集的不同种蛋白复合体的亚基构成。研究结果表明,利用这种分离分析模式,能有效地富集膜蛋白复合体尤其是低丰度膜蛋白复合体,明显提高第二维分离分析的分辨率和蛋白覆盖率。

【英文摘要】Membrane protein complexes perform important biochemical function in cellular process,but the analysis of membrane protein complexes is a significant challenge due to their hydrophobic properties and relatively low abundance. In this study,blue-native polyacrylamide gel electrophoresis(BN-PAGE) was used to separate and prepare a large number of chloroplast thylakoid membrane protein complexes in the first dimension. Then, electroelution was performed to differentially enrich various native protein complexes separated in the first dimension. Electroeluted protein complexes were analyzed to determine the subunit composition with sodium dodecyl sulfate polyacrylamide gel electrophoresis (SDS-PAGE) in the second dimension. The application of the BN/SDS-PAGE strategy to the separation and analysis of membrane protein complexes,especially in relative low-abundance,demonstrated that a high resolution and protein coverage was achieved by enrichment of low-abundant membrane protein and separation of complexes subunits in the second -dimensionalSDS /PAGE.

【题目】A one-step real time RT-PCR assay for quantifying rice stripe virus in rice and in
【中文关键词】水稻条纹病毒,灰飞虱,一步实时定量RT-PCR
【英文关键词】Rice stripe virus (RSV),Small brown planthopper (Laodelphax striatellus),Rice,One-step real time RT-PCR,Quantitative
【中文摘要】水稻条纹病毒(RSV)是亚热带和温带地区水稻的重要病害,本文建立了用于定量检测RSV的One Step Real Time RT-PCR方法,在RSV CP序列保守区域内设计特异性的引物和探针;通过在GenBank中用BLAST进行比对,证实引物探针特异性很高。对RSV One Step Real Time RT-PCR反应体系最佳的引物和探针终浓度均为0.2 μ mol/L,检测灵敏度可达到20拷贝/20 μ l体系,比ELISA检测技术的灵敏度高。可应用其对灰飞虱不同部位和水稻不同组织内的RSV进行定量检测。
【英文摘要】Rice stripe virus (RSV) is an important pathogen affecting rice production in subtropical and temperate regions. One-step real time RT-PCR methods using the TaqMan probe are described for quantitative detection of RSV in rice tissues and in Laodelphax striatellus Fallen, the small brown planthopper (SBPH). Primers and probe for specific detection of RSV were designed ithin the conserved region identified within the coat protein (CP) gene sequence. A DNA fragment was amplified for mimicking the

complementary RNA by PCR-based gene assembly, and was used for generation of standard RNA templates. A sensitivity assay showed that the detection limit of the assay was 20 copies, and the standard curve had a linear range from 20 to 2×105 copies, with good reproducibility. An internal control assay designed to target the riceubiquitin 5 gene (UBQ5) was included in detecting RSV in different infected rice tissues. Simultaneously,a real time RT-PCR assay was used to detect the RSV CP gene in viruliferous SBPH. The results showed that the numbers of RSV CP genes in different tissues were variable. Accumulation of the RSV CP gene was greater in rice leaf and SBPH thoraco-abdominal tissue than in rice stem and SBPH head, respectively.As determined by an end-point dilution comparison, one-step real time RT-PCR was close to 104-fold more sensitive than the indirect enzyme-linked immunosorbent assay (ELISA) for RSV detection. This quantitative detection assay provides a valuable tool for diagnosis and molecular studies of RSV biology.

【题目】Transmission by Laodelphax striatellus Fallen of Rice black-streaked dwarf virus
【中文关键词】水稻黑条矮缩病毒,灰飞虱,冰冻毒源,传毒
【英文关键词】transmission, Rice black-streaked dwarf virus (RBSDV), Laodelphax striatellus, frozen infected leaves
【中文摘要】在自然界,水稻黑条矮缩病毒(Rice black-streaked dwarf virus ,RBSDV)由灰飞虱(Laodelphax striatellus)、白脊飞虱(Unkanodes sapporona)和小鬼飞虱(U. albifascia)以持久性方式传播,其寄主有重要农作物水稻、玉米、大麦、小麦等。介体传毒试验是病毒鉴定、品种抗病性筛选及评价的基础。本文给出了一种简便、快速、可靠的利用无毒灰飞虱活化水稻黑条矮缩病毒冰冻毒源的方法,并成功的接种到健康的水稻和玉米植株。利用RT-PCR技术对饲食冰冻毒源,且通过10天、15天、22天循环期的灰飞虱进行检测,介体带毒率分别为0、25%和71.43%。而饲食新鲜发病水稻植株叶片介体的带毒率分别为0、28.25%和71.43%。传毒试验结果表明:从饲食冰冻毒源获、通过22天循环期的灰飞虱可以传播病毒,分别接种8株水稻和玉米,其中3株水稻和4株玉米表现出典型症状,发病率分别为37.5%和50%。利用饲食新鲜病叶灰飞虱接种水稻和玉米,其发病率为分别为50%和66.67%。所有表现症状的水稻和玉米植株RT-PCR检测均表现为阳性反应。上述结果表明,利用灰飞虱能有效地从冰冻毒源获得RBSDV病毒,并能将其传播到健康水稻、玉米植株上。
【英文摘要】Rice black-streaked dwarf virus (RBSDV) is transmitted naturally to important crops such as rice, maize,barley and wheat in a persistent manner by the planthoppers,Laodelphax striatellus, Unkanodes sapporona and Unkanodes albifascia. Insect vector transmission tests are the basis for identifying viral incidence, evaluating the resistance of varieties and selecting resistance sources for rice and maize breeding. A simple, rapid and reliable method is described by which virus-free small brown planthoppers (L. striatellus) acquired RBSDV from frozen infected rice leaves and transmitted it to healthy rice and maize plants. After feeding on frozen infected rice leaves, the planthoppers were tested by RT-PCR for the presence of virus after 10,15, and 22 days, respectively. The percentages of RBSDV-containing insects were 0, 25 and 71.43% of L. striatellus fed on frozen infected rice leaves comparedto 0, 28.25 and 71.43% of L. striatellus fed on fresh infected rice leaves, respectively. In transmission tests, three of eight rice seedlings (37.5%) and four of eight maize seedlings (50%) were inoculated by the planthoppers that had fed previously on frozen leaves and had allowed a 22 days latent period and showed typical disease symptoms. As a positive control, four of eight rice seedlings (50%) and four of six maize seedlings (66.67%) became infected. All rice and maize plants expressing disease symptoms were identified as virus-positive by RT-PCR. These results indicated that the planthoppers acquired RBSDV from frozen infected leaves and transmitted the virus to healthy plants.

【题目】Class-specific molecularly imprinted polymers for the selective extraction and determination of sulfonylurea herbicides in maize samples by high-performance liquid chromatography – tandem mass spectrometry
【中文关键词】类特异性;分子印迹聚合物;微球 ;光谱学
【英文关键词】Class-specific; Molecular imprinting polymer; Beads; Spectroscopy
【中文摘要】
【英文摘要】A novel method based on the molecularly imprinted solid-phase extraction (MISPE) procedure has been developed for the simultaneous determination of concentrations of sulfonylurea herbicides such as chlorsulfuron (CS), monosulfuron (MNS), and thifensulfuron methyl (TFM) in maize samples by liquid chromatography – tandem quadrupole mass spectrometry (LC – MS/MS). The molecularly imprinted polymer (MIP) for sulfonylurea herbicides was synthesized by precipitation polymerization using chlorsulfuron as the template molecule, 2-(diethylamino)ethyl methacrylate (DEAMA) as the functional monomer, and trimethylolpropane trimethacrylate (TRIM) as the cross-linker. The selectivities of the chlorsulfuron template and its analogs on the molecularly imprinted polymer were evaluated by high-performance liquid chromatography (HPLC). The extraction and purification procedures for the solid-phase extraction (SPE) cartridge with a molecularly imprinted polymer as the adsorbent for the selected sulfonylurea herbicides were then established. A molecularly imprinted solid-phase extraction method followed by high-performance liquid chromatography – tandem mass spectrometry for the determination of chlorsulfuron, monosulfuron, and thifensulfuron methyl was also established. The mean recoveries of these compounds in maize were in the range 75 – 110% and the limits of detection (LOD) of chlorsulfuron, monosulfuron, and thifensulfuron methyl were 0.02, 0.75, and 1.45_gkg − 1, respectively. It was demonstrated that the MISPE – HPLC – MS/MS method could be applied to the determination of chlorsulfuron, monosulfuron, and thifensulfuron methyl in maize samples.

【题目】Effects of abamectin selection on the genetic differentiation within Plutella xylostella (Lepidoptera: Plutellidae) based on ampli fi ed fragment length polymorphism
【中文关键词】阿维菌素抗性;扩增片段长度多态性标记;遗传分化;小菜蛾
【英文关键词】abamectin resistance;AFLP;genetic differentiation;Plutella xylostella
【中文摘要】小菜蛾是极易产生抗性的害虫之一。本研究中,采用扩增性片段长度多态性(AFLP)技术,评价小菜蛾对阿维菌素产生抗性的遗传分化程度,且利用软件STATISTICA及UPGMA算法,构建了遗传距离的树状图。结果表明,相对敏感种群,在抗性种群中随着抗性倍数的增加,其杂合频率逐渐降低。在抗性倍数低于4.3时,在DNA水平上抗敏之间没有明显遗传分化现象,但在抗性倍数达到5.8时,分化程度开始出现,且抗性倍数在8.1以上时,出现明显遗传分化。结果说明,阿维菌素抗药性和不断增强的小菜蛾遗传多态性相关。
【英文摘要】Diamondback moth, Plutella xylostella (L.) is one of the most serious insect pests for its remarkable ability to develop resistance to virtually every insecticide that has been used against it. In the present study, amplified fragment length poly-morphism (AFLP) is used to study the genetic differentiation as well as the effects of abamectin-selection on population genetic differentiation for P. xylostella. A dendrogram was constructed from the matrix of genetic distances using the STATISTICA software (Version 4.5) and unweighted pair-group method with arithmetic averages (UPGMA). The data demonstrated that compared to the susceptible strain (ABM-s), the heterozygosity in the abamectin-resistant strain (ABM-r) decreased with the increased selection pressure and resistant level. When the resistance ratio was below 4.3, there was no significant differentiation at the genome DNA level. When the resistance ratio reached 5.8, a fairly significant differentiation began to appear, and when the resistance ratio reached and exceeded 8.1, there appeared a significant genetic differentiation. The results suggest that abamectin selection is associated with increased genetic polymorphism in P. xylostella.

【题目】Effects of injecting cadherin gene dsRNA on growth and development in diamondback moth Plutella xylostella (Lep.: Plutellidae)

【中文关键词】小菜蛾;钙粘蛋白基因;生长发育;RNA干扰

【英文关键词】Plutella xylostella, cadherin gene, diamondback moth, growth and development, RNA interference

【中文摘要】两个小菜蛾种群(DBM.1Ac-S,敏感种群;DBM.1Ac-R,抵抗Cry1Ac 毒素种群)三龄期若虫,在注射钙粘蛋白双链dsRNA后,即钙粘蛋白基因表达沉默后,比较研究其生长发育的响应。结果表明,通过一些基本生物学参数比较,如死亡率、孵化率、繁殖力、蛹重及羽化比例等,发现在双链注射后,种群的死亡率和性比明显增加。另一方面,相比对照,孵化率、繁殖力、蛹重、雌雄虫的羽化率和寿命都显著降低,且卵和蛹长度没有什么显著区别,但卵和蛹宽度显著增加。因此,结果说明钙粘蛋白双链注射会延缓小菜蛾若虫的生长和发育,同时可以为RNAi干涉技术在钙粘蛋白上的应用提供理论基础。

【英文摘要】Two laboratory diamondback moth (DBM) strains were used to study the effects of injecting cadherin gene double-stranded RNA (dsRNA) on the growth and development of Plutella xylostella (L.). Speci fi cally, the susceptible strain named DBM.1Ac-S and the low resistant strain DBM.1Ac-R selected with Cry1Ac toxin were studied. The third larvae of the two strains were injected dsRNA of cadherin gene and their corresponding controls, DBM.1Ac-RH and DBM.1Ac-SH, were both injected diethypyro-carbonate (DEPC)-treated water respectively. The basic biological properties such as death rate, hatching ratio, fecundity, weight of pupa and eclosion rate of the strains mentioned above were likewise studied. Meanwhile, the length and width of the egg and pupa were also measured. The results showed that the cadherin gene dsRNA injection resulted in a significant increase of the death rate and sex ratio. On the other hand, hatching ratio, fecundity, weight of pupa, eclosion rate and adult longevity for male and female of treatments decreased compared to their corresponding controls. As such, there was no signi fi cant difference on the length of egg and pupa in between treatments and the corresponding controls. However, their width increased inversely with their corresponding controls. Hence, the results suggest that cadherin gene dsRNA injection retarded the larval growth and development of P. xylostella. Also, these results can help reveal the function of cadherin gene through the RNA interference technique.

【题目】MOLECULAR CLONING, GENOMIC STRUCTURE, AND GENETIC MAPPING OF TWO RDL -ORTHOLOGOUS GENES OF GABA RECEPTORS IN THE DIAMONDBACK MOTH, Plutella xylostella

【中文关键词】小菜蛾;狄氏剂抗性;GABA受体;可变剪切;Z染色体

【英文关键词】Plutella xylostella; Rdl; GABA receptor; alternative splicing; Z chromosome

【中文摘要】GABA受体是潜在的狄氏剂抗性功能基因(Rdl)。环戊二烯类杀虫剂的抗性分子机制涉及Rdl的单氨基酸替代(位点302,丙氨酸,丝氨酸或甘氨酸)。本研究在小菜蛾敏感种群中,克隆及测序两种GABA受体的Rdl直系同源基因(PxGABARa1和PxGABARa2)。在氨基酸水平,PxGABARa1和PxGABARa2分别和果蝇的Rdl基因的同源性分别达到84%和77%。PxGABARa1和PxGABARa2编码区都含有10个外显子,在第三外显子具有2个可变剪切形式。在和果蝇同源的Rdl基因302位点丙氨酸位置,PxGABARa1的Rdl基因282位点具有一个保守的丙氨酸,而PxGABARa2在同样位置具有一个保守的丝氨酸。利用两个成熟的DNA markers,将PxGABARa1和PxGABARa2定位在小菜蛾的Z染色体上。

【英文摘要】The Resistance to dieldrin (Rdl) gene encodes a subunit of the insect g-aminobutyric acid (GABA) receptor. Cyclodiene resistance in many insects is associated with replacement of a single amino acid (alanine at position 302) with either a serine or a glycine in the Rdl gene. Two Rdl-orthologous genes of GABA receptors (PxGABARa1 and PxGABARa2) were cloned and sequenced from a susceptible strain (Roth) of Plutella xylostella. PxGABARa1 and PxGABARa2 showed 84% and 77% identity with the Rdl gene of Drosophila melanogaster at an amino acid level, respectively. The coding regions of PxGABARa1 and PxGA-BARa2 both comprise ten exons, with two alternative RNA-splicing forms in exon 3 of both genes. At the orthologous position of alanine-302 in D. melanogaster Rdl, PxGABARa1 has a conserved alanine at position 282. PxGABARa2 has a serine instead of an alanine at the equivalent position. With two informative DNA markers, both PxGABARa1 and PxGABARa2 were mapped onto the Z chromosome of P. xylostella.

【题目】Characterization of resistance to Bacillus thuringiensis toxin Cry1Ac in Plutella xylostella from China
【中文关键词】小菜蛾;Bt毒素;Cry1Ac;抗性;毒素结合
【英文关键词】Plutella xylostella;Bacillus thuringiensis;Cry1Ac;Resistance;Toxin binding
【中文摘要】2002年在中国广东深圳地区寄主甘蓝上收集的一个小菜蛾大田种群材料(SZ),对比室内铭感种群(ROTH),生测结果发现,对Cry1Ab具有2.3倍抗性,对Cry1Ac具有30倍抗性,对Cry1F具有2.1倍抗性,对Cry2Aa具有5.3倍抗性以及对Btk具有6倍抗性。在室内,用Cry1Ac对种群SZ进行连续20代的汰选得到种群SZBT后,相对ROTH,SZBT对Cry1Ac抗性倍数达到1200倍左右,且对Cry1Aa, Cry1Ab, Cry1F和 Btk抗性倍数分别达到31-, 1900-, > 33- 和17-倍,但对Cry1B, Cry1C and Cry2Aa发现基本没有交互抗性。通过杂交遗传分析发现,SZTB的Cry1Ac抗性被单基因,常染色体,不完全隐性基因控制。通过125 I-标记的Cry1Ac结合试验发现,SZTB中肠的BBMVs不能结合Cry1Ac。通过互补等位基因测试发现,控制Bt 抗性的转座子和Cry1Ac-R种群的一样,都是“ mode 1 ”模式。120对成虫(SZTB和三个2008年收集的大田种群之间)F1代的遗传方式研究发现,云南种群的Cry1Ac抗性等位基因频率是0.156,而广州和惠州种群的Cry1Ac抗性等位基因频率分别是0.375和0.472。
【英文摘要】A field population (SZ) of Plutella xylostella, collected from the cabbage fi eld in Shenzhen, Guangdong Province of China in 2002, showed 2.3-fold resistance to Cry1Aa, 110-fold to Cry1Ab, 30-fold to Cry1Ac, 2.1-fold to Cry1F, 5.3-fold to Cry2Aa and 6-fold resistance to Bacillus thuringiensis var. kurstaki (Btk) compared with a susceptible strain (ROTH). The SZBT strain was derived from the SZ population through 20 generations of selection with activated Cry1Ac in the laboratory. While the SZBT strain developed 1200-fold resistance to Cry1Ac after selection, resistance to Cry1Aa, Cry1Ab, Cry1F, and Btk increased to 31-, 1900-,>33- and 17-fold compared with the ROTH strain. However, little or no cross-resistance was detected to Cry1B, Cry1C and Cry2Aa in the SZBT strain. Genetic cross analyses between the SZBT and ROTH strains revealed that Cry1Ac-resistance in the SZBT strain was controlled by a single, autosomal, incompletely recessive gene. Binding studies with 125 I-labeled Cry1Ac showed that the brush border membrane vesicles (BBMVs) of midguts from the resistant SZBT insects had lost binding to Cry1Ac. Allelic complementation tests demonstrated that the major Bt resistance locus in the SZBT strain was same as that in the Cry1Ac-R strain which has ‘ ‘ mode 1 ” resistance to Bt. An F 1 screen of 120 single-pair families between the SZBT strain and three fi eld populations collected in 2008 was carried out. Based on this approach, the estimated frequencies of Cry1Ac-resistance alleles were 0.156 in the Yuxi population from Yunnan province, and 0.375 and 0.472 respectively in the Guangzhou and Huizhou populations from Guangdong province.

【题目】苏云金芽孢杆菌毒素受体鞘糖脂的研究进展
【中文关键词】苏云金芽孢杆菌;受体;鞘糖脂;抗性;糖基转移酶
【英文关键词】Bacillus thuringiensis(Bt); recepter; glycosphingolipids; resistance; glycosyltransferase
【中文摘要】鞘糖脂(Glycosphingolipids, GSLs)是一类以神经酰胺为母体,由神经酰胺的1-位羟基被糖基化而成的糖苷化合物,参与细胞膜脂筏的构成,影响脂筏结构致密,保证细胞膜结构的稳定性和强度,同时GSLs还参与细胞膜上信号转导,启动信号传递。GSLs作为苏云金芽孢杆菌(Bacillusthuringiensis,Bt)杀虫晶体蛋白受体之一,影响靶标生物对Bt毒素的敏感性。GSLs首先通过特异糖基结构被Bt毒素识别,然后引导毒素插入靶标生物细胞膜,导致靶标生物中肠穿孔,最终死亡。综述了GSLs的分类及其在生物体内的分布与功能、GSLs结构的分析方法、GSLs与Bt毒素的关系以及参与GSLs合成的相关糖基转

移酶等相关研究进展。
【英文摘要】Glycosphingolipid(GSLs) is a class of glucoside compounds, taking ceramide asmaternalstructure and being glycosylated on1-hydroxylgroup of ceramide. As compounds of lipid rafts,GSLs ensure the stability and strength of themembrane structure, and involved in the signal transduction of cellmembrane and activate signal transmission. As one of the receptors ofBacillus thuringiensis(Bt) crystalproteins in invertebrates, GSLs impact the sensitivity of targetorganisms toBt toxins. GSLs are firstly identified by Bt toxins through glycosylation-specific structure, then they guide the Bt toxins inserting into the cellmembrane, resulting in perforation ofmidgut in the target organism and finally the organism die. The classification, distribution and function of GSLs in organisms, the analysismethods of the structure of GSLs, the relationship between GSLs and Bt toxins, theglycosyltransferases involving in synthesis ofGSLswere reviewed.

【题目】小菜蛾烟碱型乙酰胆碱受体α亚基cDNA的克隆、序列分析与不同发育阶段表达分析
【中文关键词】小菜蛾;烟碱型乙酰胆碱受体;α亚基; cDNA克隆;半定量RT-PCR

【英文关键词】Plutella xylostella; nicotinic acetylcholine receptor; α subuni;t cDNA cloning; semi-quantitativeRT-PCR

【中文摘要】烟碱型乙酰胆碱受体(nAChR)介导昆虫中枢神经系统中胆碱能突触兴奋性神经递质的快速传递,也是新烟碱类杀虫剂和多杀菌素的作用靶标。本研究利用RT-PCR和RACE技术,克隆了小菜蛾Plutella ylostellanAChR α 亚基的一个新基因(Px α 8)的全长cDNA(GenBank登录号为EU914853)。Px α 8的cDNA序列全长1 744 bp,开放阅读框为1 602 bp,编码534个氨基酸,具有nAChR α 亚基的典型特征,与其他昆虫nAChR α 8亚基具有77% ~96%的相似性,与果蝇nAChR β 2亚基具有76%的相似性。Px α 8的开放阅读框存在单核苷酸多态性位点,导致多个位点氨基酸的替换。雌性4龄幼虫的多态性位点多于雄性4龄幼虫,而且雌、雄4龄幼虫的多态性位点均不相同。半定量RT-PCR研究结果表明,Px α 8mRNA在成虫期表达量高于蛹期和4龄幼虫期。本研究结果为进一步研究小菜蛾nAChR亚基的多样性和对多杀菌素的靶标抗性机制提供重要基础。

【英文摘要】Nicotinic acetylcholine receptors (nAChR) mediate the fast action of excitatoryneurotransmitter atcholinergic synapses in the centralnervous system of insects and are also the targetsite forneonicotinoids and spinosad. ByusingRT-PCR andRACE technique, the full-length cDNA ofa novel nAChR α subunit (Px α 8) was cloned fromPlutella xylostella(GenBank accession no. EU914853). Sequence analysis showed that the full-length cDNA is1 744 bp in length and contained an open reading frame (ORF) of1 602 bpwhich encodes534 amino acid residues. The deduced amino acid sequence of Px α 8shared typical features of nAChR α subunits and showed 77% -96% amino acid similarity with insectnAChR α 8 subunitorthologues. Interestingly, it also showed 76% amino acid similaritywith the nAChR β 2 subunitofDrosophila melanogaster. There aremany single nucleotide polymorphism (SNP) sites in theORF ofPx α 8, some ofwhich resulted in amino acid substitution. There are more SNPs in female 4th-instar larvae than inmale 4th-instar larvae, and the SNP sites are differentbetween the femaleandmale 4th-instar larvae. Semi-quantitativeRT-PCR analysis indicated that themRNA expression level of Px α 8was higher at adult stage than at either pupal or 4th-instar larval stage. These findings provide importantbasis for further study on diversity of nAChR subunits and mechanism of target resistance to spinosad inP. xylostella.

【题目】Inheritance of resistance to a new non-steroidal ecdysone agonist, fufenozide,in the diamondbackmoth, Plutella xylostella (Lepidoptera: Plutellidae)

【中文关键词】小菜蛾;呋喃虫酰肼;抗性;遗传;现实遗传力

【英文关键词】Plutella xylostella; fufenozide; resistance; inheritance; realised heritability

【中文摘要】背景介绍:小菜蛾是一种危害十字花科蔬菜的世界性害虫。呋喃虫酰肼是一种新性非甾族的蜕皮激素激动剂农药,在中国用于防治鳞翅目害虫效果显著。我们在实验情况下筛选得到呋喃虫酰肼的抗性小菜蛾种群,并研究其抗性遗传方式。实验结果:经过实验室抗性筛选,得到对呋喃虫酰肼302.8倍的抗性小菜蛾种群。利用抗性种群与敏感种群小菜蛾正反交得到的F1代,经过毒理测定表明:小菜蛾对呋喃虫酰肼的抗性为常染色体不完全显性,抗性显性度为-0.664。F1代子代与抗性种群回交,经卡方检验分析小菜蛾对呋喃虫酰肼的抗性很可能由多基因遗传控制。抗性现实遗传力(h2)为 0.08,说明小菜蛾不容易对呋喃虫酰肼产生抗药性。

【英文摘要】BACKGROUND: The diamondback moth (DBM), Plutella xylostella (L.), is a cosmopolitan pest of cruciferous crops. Fufenozide, a novel non-steroidal ecdysone agonist, exhibits good efficacy and plays an increasingly important role in the control of Lepidopterous pests in China. A laboratory strain of DBM was selected for resistance to fufenozide, and the genetic basis of resistance was studied. RESULTS: The resistant strain, selected under laboratory conditions, exhibited a higher level of resistance to fufenozide (302.8-fold based on LC50s) than the laboratory susceptible strain. Mortality data from the testing of F1 progeny of reciprocal crosses of resistant and susceptible DBM indicated that resistance was autosomal and incompletely recessive with a degree of dominance of − 0.664. Chi-square analysis from responses of a backcross of crossed F1 progeny and the resistant strain and F2 progenywere highly significant, suggesting that the resistancewas probably controlled bymore than one gene. The estimated realised heritability (h2) of fufenozide resistance was 0.08, indicating that diamondback moth may have a lower chance of developing resistance to fufenozide than other kinds of insecticide.

【题目】Sequencing and characterization of two cDNAs putatively encoding prophenoloxidases in the diamondback moth, Plutella xylostella (L.) (Lepidoptera: Yponomeutidae)
【中文关键词】基因表达;小菜蛾;酚氧化酶;荧光定量PCR;酪氨酸酶
【英文关键词】Gene expression;Plutella xylostella;Prophenoloxidase;Real-time PCR;Tyrosinase
【中文摘要】摘要:有研究发现,酚氧化酶(EC 1.14.18.1) 对昆虫表皮固化、创伤修复、微生物侵入后的黑化等昆虫重要的生命活性起到重要作用。本研究中,我们利用活性PAGE电泳技术,鉴定出小菜蛾两个酚氧化酶酶原 (PPO, 化胶素酶酶原),利用SDS-PAGE 鉴定其分子量。利用RT-PCR 得到PxPPO1、 PxPPO2两个基因的全长序列。全长PxPPO1 和PxPPO2分别编码了682 和 696个氨基酸,蛋白分子量分别为 78.3 和79.7 kDa。氨基酸序列比对,发现两个PxPPOs的同源性只有48.4% ,与其他昆虫PPOs的同源性在40到 80%之间。荧光定量PCR 分析发现, PPO 在昆虫各个时期都有所表达,预蛹期最高,这与其具有PO活性一致。在大部分时期,PxPPO1基因的表达高于PxPPO2基因的表达。本实验结果为小菜蛾PPOs基因的研究提供了参考。
【英文摘要】Abstract It has long been suggested that phenoloxidases (EC 1.14.18.1) are very important in a variety of biochemical processes for the successful survival of insects, including cuticular sclerotization, wound healing, and melanotic encapsulation of invading microorganisms. In this study, two prophenoloxidases (PPO, zymogen of phenoloxidase) were identified in the diamondback moth, Plutella xylostella, by native-polyacrylamide gel electrophoresis (PAGE), and their molecular masses were determined by SDS-PAGE. Their cDNAs, PxPPO1 and PxPPO2, were also cloned by reverse transcription polymerase chain reaction (RT-PCR). The full-length cDNAs of PxPPO1 and PxPPO2 encoded 682 and 696 amino acids with calculated molecular masses of 78.3 and 79.7 kDa, respectively. Deduced amino acid sequence identity between the two PxPPOs was only 48.4% whereas identities against other insect PPOs ranged from approximately 40 to 80%. Quantitative real-time PCR analysis showed that the PPO genes were expressed in all developmental stages, with the highest in prepupae; this pattern was consistent with that of PO activity. The level of expression of PxPPO1 was significantly higher than that of PxPPO2 in most developmental stages. These results offer basic knowledge for further study of the function of PPOs in P. xylostella.

【题目】利用RNAi技术沉默小菜蛾类钙粘蛋白基因
【中文关键词】小菜蛾;苏云金芽胞杆菌;类钙粘蛋白; RNA干扰;基因沉默
【英文关键词】Plutella xylostella; B;t cadherin-like protein; RNA;i gene silencing
【中文摘要】RNA干扰(RNA interference, RNAi)是一种调控基因表达的方法,其通过体外合成一段与内源靶基因同源的双链RNA(dsRNA)或siRNA,导入生物体内,使内源靶基因中同源mRNA降解,从而达到阻抑基因表达的目的。类钙粘蛋白(cadherin-like protein)是位于昆虫中肠刷状缘膜囊(brush bordermembrane vesicles, BBMV)上与钙粘蛋白(cadherin)结构相似的物质,是多种昆虫体内Bt杀虫蛋白的受体。本研究利用基因特异引物通过RT-PCR扩增了小菜蛾类钙粘蛋白基因的2个片段(CAD1和CAD2),合成相对应的双链RNA(double-stranded RNA, dsRNA);并将dsRNA通过显微注射导入小菜蛾3龄幼虫体内,测定了不同靶位点、不同剂量、不同检测时间对目的基因mRNA表达量的影响。结果表明:将70 nL CAD1对应的dsRNA注射到幼虫体内48 h后,基因表达量显著下降, 72 h后恢复。免疫印迹检测结果表明,类钙粘蛋白在注射dsRNA 48 h后

幼虫BBMV中的含量明显下降。本实验成功实现了小菜蛾类钙粘蛋白基因的沉默,该体系的成功建立为利用RNAi技术分析小菜蛾及其他鳞翅目昆虫基因的功能提供了参考。

【英文摘要】RNA interference (RNAi) is the process of sequence-specific post-transcriptional gene silencing initiated by double-stranded RNA (dsRNA) which is homologous in sequence to the silenced gene. The cadherin-like protein, similar to cadherin, lies in brush bordermembrane vesicles (BBMV) of insec.t Ithad been confirmed to be a receptor ofBacillus thuringiensis(Bt) insecticidal protein in several insects. In this study, two cDNA segments (CAD1andCAD2) encoding the cadherin-like protein genewere cloned through RT-PCR technique using gene specific primers; double-strandedRNA (dsRNA) was synthesized byusing the two gene segments respectively, andmicroinjected into 3rd instar larvae ofPlutella xylostella; and the effectsof differenttargetsites, dose and silencing time on cadherinmRNA expression levelwere assayed. The results showed that the expression of cadherin-like genewas reduced sharply at48 h after the dsRNA corresponding toCAD1segmentwas injected and restored at72 h. The immunoblotting results indicated that cadherin-like protein in BBMV ofP. xylostellawas reduced markedly at48 h after injection. The cadherin-like gene was silenced successfully in this experimen,t and the establishment ofRNAi technique can help reveal the gene function ofP. xylostellaincluding cadherin-like gene.

【题目】茄子航天诱变后代变异及其SSR 标记多态性研究

【中文关键词】茄子;航天诱变;SSR 标记

【英文关键词】eggplant; spaceflight mutation; SSR molecular maker

【中文摘要】以“ 实践八号 ”育种卫星搭载的3 个茄子高代自交系为材料,分析茄子航天诱变后代的变异及其SSR 多态性。结果表明:航天诱变处理能显著影响茄子当代(SP1) 种子的萌发,诱使株高、株型、叶片、果形等植物学性状在二代(SP2) 发生变异,多数变异性状可在三代(SP3) 稳定遗传;不同基因型材料对航天诱变处理的敏感度不同,长茄05-18 的敏感性最高,圆茄05-9 较05-7 敏感性高;SSR 多态性检测结果显示,变异株系与其未经航天处理自交系间存在不同程度的多态性,说明航天诱变可以使茄子在分子水平上发生变异。关键词:茄子;航天诱变;SSR 标记

【英文摘要】Seeds of three eggplant varieties (05-7,05-9 and 05-18) were carried by “ Shijian 8 ” satellite for spaceflight treatment. The space flight mutation effects on eggplant were studied and the genetic diversity of mutant lines was analyzed using SSR markers. The results showed that space flight had obvious effects on the seed germination in eggplantSP1 generation and other characters such as plant height,plant type,leaf shape,fruit shape in the second generation .Most of the mutated characters could stably inherit in the third generation. The results also indicated that different eggplant genotypes resporded different to the space flight mutation; the long eggplant 05-18 was much more sensitive than other two varieties. Great variation between variant lines and their original varieties were detected by SSR markers,suggesting that space flight could induce molecular variation in eggplant.

【题目】日光温室热环境模拟模型的构建

【中文关键词】日光温室;模拟模型; 热环境

【英文关键词】Chinese solar greenhouse;simulation models;thermal environment

【中文摘要】该文建立了日光温室热环境模拟模型,定量描述了日光温室内的太阳辐射、对流换热、辐射换热、热传导、自然通风和水分相变带来的潜热对日光温室热环境的影响,根据质能平衡和传热学理论,得到一组关于覆盖物、室内空气、温室分层后墙、分层地面土壤、分层后坡和作物热平衡的微分方程组。利用MATLAB的强大计算能力与VB的良好用户界面建立模拟计算软件,可求得温室各组成部分的温度。通过试验验证,该模型能够比较准确预测日光温室环境温度。
【英文摘要】The simulation model for thermal environment in Chinese solar greenhouse was established,in which the solar radiation,heat radiation,heat convection,heat conduction,natural ventilation and water phase transformation were described quantitatively.And the impacts on thermal environment were analyzed.According to thermodynamic law of conservation of mass and energy and heat transfer theory,a group of differential equations on thermal balance of cover,thermal balance of indoor air,thermal balance of multi-layers of north wall, thermal balance of multi-layers of soil, thermal balance of multi-layers of north roof and thermal balance of plant were built. The simulation model was developed with MATLAB procedures used to solve differential equations, and good user interface of VB, and the temperatures of different parts could be calculated. It shows that the model canaccurately predict the temperature in greenhouse environment from experimental results.

【题目】热阻帘在日光温室墙体热量释放调节中的应用初报
【中文关键词】日光温室;热阻帘;北墙热通量;热量调节
【英文关键词】Chinese Solar Greenhouse; Heat isolation curtain; Heat flux; Thermal release controlling
【中文摘要】日光温室昼夜温差大,北墙作为主要蓄热体对温室夜间温度调节具有重要影响。冬季凌晨时段日光温室内空气温度较低,对作物生长不利,针对这一现象本文提出在日光温室北墙内侧使用“ 热阻帘 ”以延迟墙体热量释放的时间、从而提高凌晨低温时段室内空气温度的方法。通过在北京地区冬季的试验证明,夜间热阻帘覆盖墙体内表面时(晴天16：00-4：00,阴天16：00-3：00)试验温室墙体内表面热通量比对照温室分别减小38.5%、38.9%,热阻帘卷起后的时段内(晴天4：00-8：30,阴天3：00-8：30)墙体内表面热通量比对照温室分别增大7.2%、13.5%,在此低温时段内试验温室跨中空气温度比对照温室高0.28~0.32°C。
【英文摘要】The north wall is a significant thermal storage structure in Chinese Solar Greenhouse,which could adjust indoor temperature.Low temperature during early morning in the greenhouse could prevent plants growth.So an effective method to increase indoor temperature in early morning was put forward in the study.Heat isolation curtain could adjust the walls thermal flux.The practice in Beijing showed that the curtain covered on the north wall(sunny 16：00-4：00,cloudy 16：00-3：00) prevented 38.5% heat releasing in sunny day and 38.9% in cloudy day. After curtain taken off (sunny 4:00- 8:30, cloudy 3:00- 8:30) , the amount of heat flux was 72% higher than CK greenhouse in sunny day and 13.5% in cloudy day, which mean the indoor temperature was 0.28 ~ 0.32 higher than CK greenhouse during whole early morning.

【中文关键词】MAS,蜂产品,追溯平台
【英文关键词】MAS,Bee Product, Traceability Platform
【中文摘要】利用MAS技术研究开发蜂产品追溯平台。
【英文摘要】Bee product traceability platform has been set up based on Chinese law and global standards, which can be used to identify every process from farm to table. An integrated bee product traceability system includes the whole process of supply chain, meanwhile, the traceability data will be open to consumer. Thus it can enhance consumer confidence on bee products. In bee product traceability platform, original data acquisition is vital and the data must be secure, precise and timely.In this paper, data acquisition system is developed to solve the problems such as collecting data, managing original data and realizing data interaction in a timely and accurate manner through bee product traceability architecture which is based on multi-agent system (MAS). Thanks to MAS ’ special attributes and features, data acquisition agent and management agent could obtain data as well as apply safety and reliable data for bee product traceability platform.

【题目】Application and estimation of wheat production emulation system in Hebei provinc
【中文关键词】冬小麦,仿真系统,生长发育,模拟模型
【英文关键词】winter wheat, emulation system, growth and development, simulation model
【中文摘要】运用系统工程方法、作物模拟技术、计算机技术,遵循小麦生长发育规律,结合品种特性、气象数据、土壤水平、栽培管理等基础数据资料,建立基于小麦生理生态过程的生长发育协同模型,包括小麦生长模型、阶段发育模型、水分平衡模型、氮素平衡模型等。在协同模型基础上,进一步构建小麦生产仿真系统,主要功能有品种特性参数确定、播种方案决策、生育期和生产性状模拟、氮素淋洗预警、水肥胁迫度模拟、小麦生长三维显示等。利用河北省四个季度的实际试验数据对系统进行校正和验证,结果显示产量和干物质重的预测值与实测值的相关系数分别为0.931和0.832,均达到极显著相关水平;RMSE与实测值平均数的比值分别为5.89%和8.94%,表明系统机理性强、预测性能好,具有较强的通用性和普适性。
【英文摘要】In according with wheat ecophysiological characteristics, the author applied technologies of system engineering method, crop simulation and computer to build wheat developing process cooperative models including growth model, developmental phase models, water balance model and nitrogen balance model etc. with the support of basic data such as variety characteristics, weather data, soil level and cultivation management, then further constructed Wheat Production Emulation System (WPES) with several additional functions such as determining variety characteristic parameters, deciding the planting design, simulating wheat phenology stages and production features, warning of the nitrogen leaching in advance, simulating the water and nitrogen deficit degree and wheat growth three-dimensional display. This system was validated and calibrated through actual experiment for four wheat growing seasons in Hebei province. Predicted yield and biomass were significantly correlated with observed data (R2>0.47), and the Root Mean Square Error were 5.89% and 8.94% of its observed average yield and biomass. The results verified its strong mechanism and prediction performance as well as its universal adaptation.

【中文关键词】agent,农林经济,决策支持系统
【英文关键词】agent; agricultural and forestry economies;
decision support system

【中文摘要】agent,农林经济,决策支持系统
【英文摘要】In this paper, we focus on the commonproblems of current information analysis and supportdecision systems in agricultural and forestry economies,such as frequent manual interventions, lackof cooperation among sub-systems, lack of supportfrom distributed computing and group decision making.This research aims to resolve these problems byrebuilding the system with agent technology, anda prototype of the agricultural and forestry economydecision support system (AFEDSS) based onagent is designed and implemented. The AFEDSSis composed of interface agent, management agent,model agent, forecast agent, assistant decision agent,data management agent. The results show that thenew system can simulate and deal with the complexprocesses of agricultural and forestry economies inreasonably short computational times and with lesssubjective uncertainty. This paper also discussesthe decision processes and internal mechanisms inAFEDSS especially on cooperating with dynamicanalysis, evaluation, forecast and optimisation.

【题目】Tomato yellow leaf curl virus infection of tomato does not affect the performance of the Q and ZHJ2 biotypes of the viral vector Bemisia tabaci
【中文关键词】无
【英文关键词】Bemisia tabaci, performance, tomato, Tomato yellow leaf curl virus, virus infection
【中文摘要】无
【英文摘要】 To better understand the etiology of begomovirus epidemics in regions under invasion we need to know how indigenous and invasive whitefly vectors respond to virus infection. We investigated both direct and indirect effects of infection with Tomato yellow leaf curl virus (TYLCV) on the performance of the invasive Q biotype and the indigenous Asian ZHJ2 biotype of whitefly Bemisia tabaci. The Q biotype performed better than the ZHJ2 biotype on either uninfected or virus-infected tomato plants. However, virus-infection of host plants did not, or only marginally affected, the performance of either biotype of whiteflies in terms of fecundity, longevity, survival, development and population increase. Likewise, association of the vectors with TYLCV did not affect fecundity and longevity of the Q or ZHJ2 biotypes on cotton, a non-host of TYLCV. These results indicate that the alien Q biotype whitefly, but not the indigenous ZHJ2 biotype, is likely to become the major vector of TYLCV in the field and facilitate virus epidemics.

【题目】Comparative Analysis of Population Genetic Structure in Bemisia tabaci (Gennadius) Biotypes B and Q Based on ISSR Marker
【中文关键词】无
【英文关键词】Invasive mechanism, Bemisia tabaci biotype B, Bemisia tabaci biotype Q, genetic structure; ISSR
【中文摘要】无
【英文摘要】Bemisia tabaci (Gennadius) biotypes B and Q are two invasive biotypes in the species complex. The comparison of the population genetic structure of the two biotypes is of significance to show their invasive mechanism and to their control. The intersimple sequence repeats (ISSR) marker was used to analyze the 16 B-biotype populations and 4 Q-biotype populations worldwide with a rialeurodes vaporariorum population in Shanxi Province, China, and a B. tabaci non-B/Qbiotype population in Zhejiang

Province, China, was used as control populations. The analysis of genetic diversity showed that the diversity indexes of biotype Q including Nei ' s gene diversity index, Shannon informative index, and the percentage of polymorphic loci were higher than those of biotype B. The high genetic diversity of biotype Q might provide the genetic basis for the excellent ecological adaptation. Cluster analysis suggested that the ISSR could not be used in the phylogenetic analysis though it could easily distinguish the biotypes of B. tabaci. The difference of the population genetic structure between the biotype B and the biotype Q exists based on the ISSR marker. Meanwhile, the results suggested that the molecular marker has its limitation in the phylogenetic analysis among the biotypes of B. tabaci.

【题目】线粒体细胞色素氧化酶I序列分析揭示扶桑绵粉蚧复合种存在隐存谱系
【中文关键词】扶桑绵粉蚧, 生物入侵, 复合种, 隐存谱系, mtCOI, 发育系统分析
【英文关键词】无
【中文摘要】过去约20年间扶桑绵粉蚧在许多国家造成严重危害。近年来该害虫传入我国,对农业生产构成严峻威胁。外来入侵物种的快速准确鉴定是科学研究及其管理的基础。本研究对来自海南三亚和陵水地区的扶桑绵粉蚧的线粒体细胞色素氧化酶I测序并与美国佛罗里达州的扶桑绵粉蚧序列进行了比较。系统发育树表明该物种存在两个遗传支系,即海南支系与佛罗里达支系;这两个支系的遗传距离约3%。只是利用mtCOI分子标记对我国扶桑绵粉蚧的首次分子鉴定。这些结果提示:(1)扶桑绵粉蚧可能是至少含有两个隐存谱系或姊妹种的复合种;(2)新入侵我国海南三亚和陵水地区的扶桑绵粉蚧是该复合种内的一个隐存谱系或物种,且海南三亚和陵水种群可能不是来自美国佛罗里达州。扶桑绵粉蚧隐存谱系的发现对于该物种的分子鉴定及其入侵生态学研究具有重要意义。

【题目】烟粉虱生物型的监测及其遗传结构研究
【中文关键词】生物入侵, 烟粉虱, 生物型监测, 遗传结构
【英文关键词】无
【中文摘要】烟粉虱Bemisia tabaci (Gennadius) 是一种重要的农业害虫并包括许多生物型,其中B 型和Q 型是入侵性较强的2 种生物型。文章着重介绍近年来在烟粉虱生物型的监测及其遗传结构方面的研究进展。B 型烟粉虱和Q 型烟粉虱这2 个生物型均已入侵我国,其中多数地区烟粉虱是B 型烟粉虱,局部地区有Q 型烟粉虱并呈现不断蔓延趋势。微卫星(SSR) 分子标记分析结果表明我国B 型烟粉虱的入侵来源具有多元化,而云南地区Q 型烟粉虱来源比较单一。化学农药的使用能够影响室内种群的遗传结构,降低种群的遗传多样性。基于RAPD、ISSR 分子标记的分析结果表明,Q 型烟粉虱种群各项遗传多样性指数均比B 型烟粉虱的高。今后加强烟粉虱入侵生物型的遗传结构及其种群动态关系等方面的研究,对于揭示烟粉虱的灾变机制及其控制具有重要的意义。

【题目】低温冷藏对豚草天敌广聚萤叶甲存活和生殖力的影响
【中文关键词】广聚萤叶甲, 低温冷藏, 存活率, 繁殖力, 豚草
【英文关键词】无
【中文摘要】广聚萤叶甲是豚草的一种重要天敌。为探明广聚萤叶甲的低温冷藏条件,测定了在相对湿度为60%~70%,黑暗条件下,在4℃、6℃、8℃、10℃和12 ℃等5个梯度低温贮藏不同时期对广聚萤叶甲蛹存活率的影响及羽化后成虫的繁殖力。结果表明,冷藏20d后,5个低温处理储藏的广聚萤叶甲蛹的存活率仍比较高,且存活率随温度的增加而升高。30的后蛹存活率急剧降低,最高仅为3.9%。不同低温冷藏20d后羽化出来的成虫其繁殖力差异较大,产卵数量随冷藏温度的升高而增加。与常温处理的个体相比,4℃~12℃低温下持续冷藏20d,其成虫产卵量下降26.4%~70.4%;不同低温冷藏30d后,羽化的成虫不能产卵。因此,广聚萤叶甲蛹冷藏的适宜温度范围应在8~12℃,冷藏时间不宜超过20d。

【题目】Continuous Immunoassay for Sulfamethazine by Surface Plasmon
【中文关键词】
【英文关键词】Surface plasmon resonance;Biosensor;Kinetics;Continuous detection;Rectopamine
【中文摘要】
【英文摘要】Regeneration of the sensor chip surface is difficult in many surface plasmon resonance (SPR) biosensor assays. Improper regeneration will reduce life span of the sensor chip and decrease the quality of the data. Considering the advantages of reducing the regeneration frequency, a theoretically feasible continuous SPR biosensor immunoassay for sulfamethazine (SMT) was developed. In the continuous inhibitive immunoassay, the sensor chip surface is regenerated only once after a definite number of tests instead of every test. The SMT-bovine serum albumin (BSA) conjugate was covalently immobilized to a carboxymethyldextran modified gold film. The immobilization conditions of the antigen were studied and the working dilution of the antibody was optimized. The antibody was mixed with SMT of different concentrations prepared with PBS buffer to construct the calibration curve. The limit of detection was 0.5 ngmL_1. The continuous SPR biosensor assay was proved to be simpler and more practical than a normal one.

【中文摘要】:对真菌农药含孢量的检测过程中容易造成误差的关键环节进行了探讨和验证。试验确定,制备孢子悬浮液时可用吐温.80作润湿剂,以高速组织捣碎机8000r/min搅拌60s可使孢子充分分散,单孢率达98% 以上;进行浓度稀释时,应根据预计的含孢量尽量采用较小的稀释梯度间隔和减少稀释次数;点样时应预先固定盖玻片,并用小量程范围的可调微量移液器调节至30~50/A吸取样液点样,得到的计数结果误差较小且稳定性好。试验结果为建立含孢量的标准检测方法提供必要依据。

【题目】苏云金芽孢杆菌与绿僵菌对椰心叶甲的协同控制作用
【中文关键词】绿僵菌, 苏云金芽胞杆菌, 椰心叶甲, 协同作用
【英文关键词】无
【中文摘要】测定了3个苏云金芽胞杆菌菌株F6、NBT-18、Rt184与绿僵菌菌株HK4复配剂对椰心叶甲致死作用。结果表明,3株Bt菌株对绿僵菌控制椰心叶甲的效果都有不同程度增强。在HK4孢子含量为1O 个/mL时,F6与HK4、NBT 18与HK4的复配剂处理椰心叶甲,5 d后死亡率分别达71.67 、61.35 ,与单独用HK4分生孢子处理(死亡率为3O.71)相比,具有显著差异;而Rt184和HK4复配剂处理的死亡率与HK4单独处理无显著差异。在HK4孢子含量为1o 个/mL时,3种复配剂处理椰心叶甲5 d后,死亡率分别为82.74 、83.O7 、68.6l ,均与绿僵菌HK4单独处理(死亡率61.49)有显著差异;且3个Bt菌株均能使绿僵菌HK4菌株侵染椰心叶甲的致死时间提前。

【题目】基因工程改良在昆虫病原真菌中的应用
【中文关键词】昆虫病原真菌, 基因工程, 转化方法, 菌株改良
【英文关键词】无
【中文摘要】昆虫病原真菌是自然界控制害虫种群的主要生物因子,其研究开发越来越受到重视。但由于存在致死速度慢、防效不稳定、对环境条件要求高等缺点,限制了昆虫病原真菌的应用。近年来,通过基因工程技术对昆虫病原真菌进行遗传改造,提高菌株的致病性和毒力,创造高效、稳定的工程菌株取得了较大进展。对昆虫病原真菌选择标记、遗传转化方法、基因工程改良及应用等方面最新研究进展进行了综述。

【题目】BenA3基因双元载体的初步构建及转化绿僵菌189的初步研究
【中文关键词】BenA3基因, pCAMB, IA13002BenA3, 农杆菌, 双元载体, 绿僵菌, 转化
【英文关键词】无
【中文摘要】用XhoⅠ和SalⅠ分别双酶切植物表达载体pCAMB IA1300和含有目的基因的pMD192T2BenA3,定向连接得到重组质粒pCAMB IA13002BenA3,将其导入农杆菌AGL21。经PCR鉴定后,得到可用于绿僵菌转化的农杆菌双元载体。采用的预培养时间、菌液浓度、共培养时间、乙酰丁香酮浓度的条件下,进行农杆菌介导绿僵菌的遗传转化,得到可以稳定性遗传的绿僵菌转化子,随机挑选转化子进行苯菌灵抗性基因的PCR扩增表明,绿僵菌转化子含有了苯菌灵抗性基因。该转化体系的建立,将有利于绿僵菌生防功能基因的克隆和作用机制的研究。

【题目】绿僵菌与椰甲截脉姬小蜂对椰心叶甲的协同控制作用
【中文关键词】绿僵菌, 椰甲截脉姬小蜂, 椰心叶甲, 生物防治
【英文关键词】无
【中文摘要】在室内条件下,研究了金龟子绿僵菌小孢变种Metarhizium anisopliae var. anisopliae 侵染和椰甲截脉姬小蜂寄生两种生防措施之间的相互影响,并对两种措施协同控制椰心叶甲的效果进行了评价。结果表明,绿僵菌菌株HK4 对椰甲截脉姬小蜂成虫安全; 但绿僵菌侵染使姬小蜂对椰心叶甲的寄生率显著降低。在先接种绿僵菌后接入姬小蜂的情况下,椰甲截脉姬小蜂对椰心叶甲的寄生率仅为10123 %,显著低于其单独寄生的寄生率79155 %; 绿僵菌对椰心叶甲的侵染率为96159 %,高于绿僵菌单独处理的侵染率84109 %,但不显著。而在先接蜂后接种绿僵菌的处理中,绿僵菌对椰心叶甲的侵染率仅为69109 %,显著低于绿僵菌单独处理。对椰心叶甲的生测结果显示,先接种绿僵菌再接入姬小蜂、先姬小蜂寄生再接种绿僵菌、同时接种绿僵菌和接入姬小蜂3 种处理的校正死亡率分别为100 %、100 %、98.86 %,显著高于绿僵菌单独侵染和姬小蜂单独寄生。

【题目】紫茎泽兰水提液的化感潜力及其渗透压的干扰效应
【中文关键词】紫茎泽兰, 水提液, 化感潜势, 渗透压
【英文关键词】无

【中文摘要】采用3种方法(整株、剪碎和风干)和处理时间(6、24和48 h) ,制备了紫茎泽兰地上部分植株不同类型的水提液,分别评价了它们对旱稻种子萌发和幼苗生长的化感潜势,比较分析了不同类型水提液的渗透压值,并检测了该范围内的渗透压对旱稻种子萌发和幼苗生长的影响。结果表明:紫茎泽兰不同类型水提液对旱稻产生了明显的化感抑制潜势, 3种处理方法的水提液化感潜势大小依次为风干、剪碎和整株,且这种作用随着水提液处理时间的延长而增强。不同处理方法的水提液渗透压大小也依次为风干、剪碎和整株,并随着处理时间和浓度的增加,水提液渗透压也在增强。对应于不同处理水提液而逐渐增加的渗透压对旱稻种子萌发和幼苗生长产生了逐步增强的抑制作用。表明渗透压是紫茎泽兰水提液化感潜势评估重要的干扰因子,尤其在剪碎或风干植株的处理中,建议采用整株水提法。

【题目】紫茎泽兰淋溶主效化感物质对旱稻幼苗根尖解剖结构的影响
【中文关键词】紫茎泽兰, 泽兰二酮, 羟基泽兰酮, 旱稻, 解剖结构
【英文关键词】无
【中文摘要】采用营养液培养法和石蜡切片技术,研究了紫茎泽兰淋溶主效化感物质(泽兰二酮和羟基泽兰酮) 对旱稻幼苗根尖解剖结构的影响。结果表明:两个化感物质分别处理后,旱稻幼苗的根呈现短小肿胀、侧根缺乏、且对营养液的吸收明显减少,这些症状随着化感物质浓度的增加而加剧。石蜡切片的结果表明,和对照相比,化感物质处理后的旱稻幼苗根尖的解剖结构发生了明显的变化,主要表现在顶端分生组织、静止中心和根冠的细胞排列混乱,细胞间隙加大,皮层薄壁组织细胞变得短而粗,以及表皮层细胞大量脱落等。讨论认为,旱稻幼苗根的形态结构变化,主要与紫茎泽兰化感物质对受体植物吲哚乙酸的干扰相关。

【题目】日光蜂对苹果绵蚜的自然控制作用及其保护和利用
【中文关键词】日光蜂, 苹果绵蚜, 控制作用, 保护和利用
【英文关键词】无
【中文摘要】日光蜂是苹果绵蚜的一种重要寄生性天敌,为了更好地发挥其对苹果绵蚜的控制作用,在山东省莱阳市田间调查研究了日光蜂对苹果绵蚜的自然控制作用,并测定了不同保护措施下日光蜂的越冬羽化率。结果显示,苹果绵蚜在5月底至7月底和9月中旬至10月中旬有2个发生高峰;在整个生长季节日光蜂对苹果绵蚜均有一定的控制作用, 7月上旬至9月上旬温度较高时,日光蜂的田间种群数量较多,对苹果绵蚜的田间自然寄生作用达到高峰,寄生率在50%~90% , 4—5月是日光蜂对苹果绵蚜的控制空缺时期。在使用化学农药的果园,日光蜂的数量和寄生率均降低。田间缚草或采集日光蜂黑蛹放置于室内或室外阳面,越冬存活率均显著高于放置在室外阴面和田间未缚草的日光蜂黑蛹,表明3种越冬保护措施可以有效地增加日光蜂越冬虫源基数。

【题目】农杆菌介导的cry1Ia8基因转化甘蓝的研究
【中文关键词】结球甘蓝;小菜蛾;Bt基因;cry1Ia8;转基因;抗虫性
【英文关键词】cabbage;Plutella xylostella;Bt gene;cry1Ia8;transformation;resistance
【中文摘要】以结球甘蓝(Brassica oleracea var. capitata)的下胚轴和具柄子叶为外植体,通过根癌农杆菌(Agrobacterium tumefaciens)介导法将苏云金芽孢杆菌(Bacillus thuringiensis)杀虫蛋白基因cry1Ia8导入结球甘蓝中,共获得38株卡那霉素抗性植株。PCR检测和Southern blot证实甘蓝的基因组已经成功导入和整合了cry1Ia8基因;RT-PCR检测和Western blot表明cry1Ia基因在转录和翻译水平有一定的表达。转化植株叶片离体饲喂敏感小菜蛾(Plutella xylostella)和抗性小菜蛾的实验表明,该基因不仅对敏感小菜蛾有很强的抗性,对Cry1Ac蛋白抗性小菜蛾也具有较强的抗虫性。
【英文摘要】cry1Ia8 gene was transferred to the hypocotyl segments and cotyledon with petiole of cabbage (Brassica oleracea var. capitata) via Agrobacterium tumefaciens, 38 transformants with kanamycin-resistant were obtained. PCR and Southern blot showed that the cry1Ia gene was transferred and integrated into the genome of cabbage. Moreover, RT-PCR and Western blot analysis demonstrated that cry1Ia8 was expressed in RNA and protein level. Bioassay results with the susceptible and resistant diamondback moth (DBM, Plutella xylostella) displayed that most of the transgenic plants were strong resistance to the larvae of susceptible diamondback moth and also to the insect strain which is resistant to Cry1Ac toxin.

【题目】蛋白质转导结构域增加Cry1Ac对小菜蛾的毒力研究
【中文关键词】TAT; Cry1Ac; 小菜蛾
【英文关键词】TAT; Cry1Ac; Plutella xylostella

【中文摘要】蛋白质转导结构域是一类能自动穿透细胞膜,并能作为载体将其他生物大分子携带进入细胞膜内的一段富含精氨酸的多肽。本研究通过遗传重组的方法,构建蛋白质转导结构域TAT与Bt杀虫蛋白Cry1Ac的融合基因及其表达载体TAT—Cry1Ac,对表达蛋白的生测结果表明,TAT极为显著地增加Cry1Ac对小菜蛾的杀虫毒力,增效倍数达到5.54倍,预示着TAT在微生物杀虫蛋白领域可能有着良好的应用前景。

【英文摘要】TAT is a kind of protein transduction domain (PTD),which can penetrate into bio-membrane automatically and act as a vector that take other biological macromolecules into cells. Two fusion genes,namely pET21b-TAT-Cry1Ac and pET21b-Cry1Ac,were constructed and expressed in E.coli. The LC50 analyses of the two expressed proteins to diamondback moth showed that TAT could significantly enhance the susceptibility of DBM to Cry1Ac and its synergistic ratio reached 5.54 folds. The results indicated that TAT might be used in the field of microorganism insecticidal proteins.

【题目】RNAi技术在昆虫功能基因研究中的应用进展

【中文关键词】RNA干扰(RNAi); 双链RNA(dsRNA); 昆虫; 基因功能; 应用

【英文关键词】RNA interference (RNAi); double-stranded RNA (dsRNA); insect; gene function; application

【中文摘要】RNA干扰(RNA interference,RNAi)是指外源或内源的双链RNA(dsRNA)特异性地引起基因表达沉默的现象,它作为一种有效的工具用来产生转录后沉默,从而抑制特定基因的表达,成为基因功能研究的一种新方法,除了在模式昆虫如果蝇Drosophila中广泛应用之外,也在非模式昆虫中得到成功应用.近年来,RNAi技术在导入方法和基因功能分析方面都取得了飞速发展,且与转基因技术相结合成功应用于害虫防治领域.本文综述了RNAi技术在导入方法、昆虫功能基因组功能分析及害虫防治等领域新近的研究成果,并展望了该技术的应用前景.

【英文摘要】RNA interference (RNAi) is a kind of phenomenon that in vitro or in vivo dsRNA induced knockdown of gene expression. RNAi as one of the most promising techniques to knockdown the expression of corresponding gene has been extensively used for sequence-specific loss of gene function in model insects like Drosophila and also in non-model insects. The methods to introduce dsRNA and the functional analysis of gene have been frequently developed, and RNAi technique combined with transgenic technique has been applied to control agriculral pests in recent years. In this revies, we described the application and prospect of RNAi technique in studying gene functions in insects and in pest management.

【题目】双Bt基因提高青花菜对菜粉蝶和小菜蛾抗性
【中文关键词】双价转基因; Cry1Ac; Cry1C; 抗虫性; 青花菜
【英文关键词】Double-transgenes; Cry1Ac; Cry1C; Insect resistance; Broccoli
【中文摘要】以青花菜(Brassica oleracea L.ssp.italica)下胚轴为外植体,通过农杆菌介导的遗传转化方法将苏云金芽胞杆菌(Bacillus thuringiensis)晶体毒蛋白基因Cry1Ac和Cry1C分别导入青花菜栽培品种绿彗星中,各获得35株卡那霉素抗性植株.分别以Cry1Ac和Cry1C特异引物对转基因植株进行PCR扩增,结果得到27株Cry1Ac阳性植株和13株Cry1C阳性植株.以目的基因Cry1Ac和Cry1C为探针,进行Southern blot分析,证明多数植株目的基因已经整合到青花菜基因组中.对含有单拷贝目的基因植株自交纯合后通过有性杂交获得带有Cry1Ac和Cry1C双价的转基因青花菜.利用RT-PCR检测Bt基因在转基因植株中的表达情况,发现不同株系间在RNA水平上存在显著的表达差异,部分株系中双价Bt同时得到表达.ELISA检测转基因植株Bt毒蛋白含量为0.12~0.82 μg/gFW.结合室内和田间饲虫试验,证明抗虫效果与Bt毒蛋白表达水平正相关.通过多世代选择,获得高抗菜粉蝶(Pieris rapae L.)和小菜蛾(Plutella xylostella L.)的纯合转基因青花菜材料.双价抗虫基因共同作用,提高了青花菜的抗虫性.
【英文摘要】Bt gene either Cry1Ac or Cry1C was individually transferred into broccoli (Brassica oleracea L. ssp. italica) genome via Agrobacterium-mediated transformation method using Green Comet hypocotyls as explants. And thirty five kanamycin-resistant broccoli plants respectively harboring Cry1Ac or Cry1C were obtained. PCR analysis with primers specific to Cry1Ac or Cry1C identified 27 Cry1Ac positive plants and 13 Cry1C positive plants. Southern blotting analysis with Cry1Ac or Cry1C as probes indicated the Bt gene was intergrated into plant genome. Transgenic broccoli lines with single copy transgene were inbreeded to homozygote and crossed to each other to obtain transgenic lines with double Bt genes. RT-PCR analysis showed the various expression levels in different transgenic lines. The Bt endotoxin protein was about 0.12~0.82 μg /g FW by ELISA assays. Both in vivo bioassays in laboratory and field test supported the improved insect resistance and the resistance level correlated with Bt expression level. Homozygotic broccoli lines with resistance to diamondback moth (Plutella xylostella L.) and imported cabbageworm (Peris rapae L.) were obtained trough selection in successive generations. Double Bt genes improved insect resistance in transgenic broccoli in this study.

【题目】观赏羽衣甘蓝高频再生体系的建立
【中文关键词】羽衣甘蓝; 离体培养; 外植体; 不定芽
【英文关键词】Brassica oleracea var.acephala; In vitro culture; Explant; Adventitious shoot
【中文摘要】观赏羽衣甘蓝是一种赏食兼用的耐冻优良景观植物。为了通过基因工程手段赋予其抗虫性,并进一步提高其低温耐受性,获得新的抗性种质,本研究以优良育种品系为试材,详细探讨了影响离体培养不定芽再生的因素,建立了高效再生体系。以8份不同类型羽衣甘蓝基因型的带柄子叶、子叶、下胚轴为外植体,研究了不同基因型、不同外植体、不同的培养基激素浓度配比及添加AgNO3对不定芽诱导的影响。结果表明:无论基因型及使用的培养基,带柄子叶均为最佳外植体;不同的基因型、不同外植体其最佳的芽诱导培养基不同;筛选出两份材料,其带柄子叶分别在L6(MS+6-BA1.0mg/L+NAA0.1mg/L)及L3(MS+6-BA1.5mg/L)培养基中不定芽诱导率为100%,下胚轴诱导率最高也能达88.33%;培养基中添加4mg/L AgNO3不利于羽衣甘蓝的不定芽诱导;再生株生根以MS+NAA0.1mg/L效果好,生根率可达100%。
【英文摘要】Ornamental kale (Brassica oleracea var. acephala) is an edible freezing tolerant excellent landscape plant. To endow it with pest insect resistance and increase the minus temperature tolerance further, genetic engineering will be operated. In this research, the elite breeding lines of ornamental kale were selected as the material, and factors affecting the adventitious shoot regeneration in vitro were studied in detail. A high efficient shoot regeneration system was established. Different explants of eight genotypes representing the main phenotypes of ornamental kale were inoculated on the mediums, and effects of explants, genotypes, phytohormone combination and addition of AgNO3 in the medium on shoot regeneration were examed. The results indicated that whatever the genotypes and culture mediums, cotyledon with petiole was the best explant; the optimum medium for shoot induction varied in different genotypes and different explants; two genotypes with 100% shoot induction rate on L6 or L3 medium respectively using cotyledon with petiole as explants were screened out. Results also proved that the addition of AgNO3 in the medium has negative effect for shoot regeneration of ornamental kale. The feasible rooting medium was MS+NAA 0.1 mg/L and the rooting rate reached to 100%. Rooted plants can be transplanted into greenhouse successfully.

【题目】农杆菌介导的Btcry1Ⅰa基因转化花椰菜的研究
【中文关键词】花椰菜; 农杆菌介导转化; cry1Ⅰa基因; 转基因植株
【英文关键词】cauliflower; Agrobacterium-mediated transformation; cry1Ia gene; transgenic plants
【中文摘要】利用苏云金芽胞杆菌(Bacillus thuringiensis,简称Bt)cry1Ⅰa基因构建了双T-DNA边界的植物表达载体pCS1Ⅰa-LR,以瑞士雪球花椰菜具柄子叶和下胚轴为外植体,通过农杆菌介导法将cry1Ⅰa基因导入花椰菜中,共获得30株转化植株,经PCR检测,其中18株为PCR阳性植株,PCR阳性率为60%;RT-PCR和Western杂交检测结果表明,cry1Ⅰa基因在转基因花椰菜中可以正常转录和正确表达。转基因植株用小菜蛾幼虫进行饲虫试验,结果表明,转cry1Ⅰa基因花椰菜对小菜蛾具有很强的毒杀作用,昆虫幼虫的校正死亡率高达100%。获得的转基因花椰菜可用于下一步的抗虫花椰菜的培育。
【英文摘要】The double T-DNA border expression vector pCS1Ⅰa-LR harboring Bacillus thuringiensis cry1Ⅰa gene was introduced into the cotyledon petioles and hypocotyls of cauliflower(Brassica oleracea var.botrytis) mediated by Agrobacterium.Thirty regenerated plants were obtained,18 of them were positive by PCR detection,which demonstrated that cry1Ⅰa gene was integrated into the cauliflower genome.The PCR positive rate is 60%.Moreover,RT-PCR and Western blot analysis showed that cry1Ⅰa gene were transcripted and translated,respectively in transgenic cauliflower.Bioassay results showed that the transgenic cauliflowers harboring cry1Ⅰa gene had the high toxicity to diamondback moth and the mortality of insect larvae was accounted for 100%.The transgenic cauliflower can be used for further insect resistant cauliflower breeding.

【题目】北京市通州区农田表观氮素平衡及空间特征分析
【中文关键词】作物; 施肥; 氮素输入; 氮素输出; 土壤表观氮素平衡; OECD 模型
【英文关键词】crop ; fertilizer ; nutrient inp ut ; nutrient output ; surface soil nitrogen balance ; OECD model
【中文摘要】本研究利用OECD 土壤表观氮素平衡模型,通过建立1991 —2004 年北京市通州区农田的氮素平衡核算的框架和数据库,结合GIS 技术对该区域氮素平衡强度及特征进行了分析,通过农户调查通州区典型种植模式和典型作物的肥料投入情况。结果表明:通州区农田氮素输入总量从1991 年的4 万t 降低到了2004 年的117 万t ,平均氮素输入量从567. 86 kg/ hm2 增加到了585. 22 kg/ hm2 ,氮素平衡强度从1991 年的355184 kg/ hm2 增加到了2004 年的389139 kg/ hm2 。将氮素平衡强度划分为5 级,结合空间分布特征分析发现,通州区下属各乡镇的农田氮素平衡量普遍提高,其中近半数氮素平衡强度从1991 年的Ⅰ、Ⅱ级上升到了2004 年的Ⅳ、Ⅴ级。城郊地区氮素平衡强度变化正与城郊农业种养结构调整密切相关,蔬菜作物播种面积的增加和养殖业的发展使农田氮素输入量持续增加,氮素平衡量提升明显,空间变异加大,对农田污染潜在威胁提高。农户调查表明,粮食作物的肥料施用量是比较合理的,而蔬菜作物的施肥量过大。
【英文摘要】The present studies aim to discuss about the nitrogen balance circumstances in Tongzhou area , and to provide helpful data for optimized managing farmland nutrition and controlling p ollution. By applying OECD surface soil nitrogen balance methodology , the framework and database for nitrogen balance budget in Tongzhou District , Beijing were established to evaluate the

imp act of nutrient balance on agricultural production from 1991 to 2004. The regional nitrogen balance intensity was analyzed with the help of GIS. The input of fertilizer of the typical planting patterns and the typical crops were surveyed. Results showed that the nitrogen input quantity in Tongzhou District has been decreased from 40000t in 1991 to 17 000t in 2004 , while the nitrogen input intensity has been increased from 567. 86 kg/ hm2 in 1991 to 585. 22 kg/ hm2 in 2004. The nitrogen balance intensity has been increased from 355. 84 kg/ hm2 in 1991 to 389. 39 kg/ hm2 in 2004. By classifying the nitrogen balance intensity into five grades (Ⅰ to Ⅴ) , combined with analysis of spatial characteristic , it could be shown the general improvement of the nitrogen balance intensity has happened in the townships , Tongzhou District . Nearly half of them increased from Ⅰ, Ⅱ grades in 1991 to Ⅳ, Ⅴ grades in 2004. In suburban area , the changes of the nitrogen balance intensity were closely correlated with the changes of farming and feeding structure in the suburb agriculture . The nitrogen balance intensity together with thenitrogen input intensity has been increasing , and so does the spatial variability , which increases the potential pollution

【题目】不同氮肥水平对黄瓜产量、土壤硝态氮累积及土壤水溶液硝态氮含量的影响
【中文关键词】环境容量;施肥量;土壤硝态氮;土壤水溶液
【英文关键词】:Environment capacity ;Rate of fertilizer applied ;Soil nitrate2N;Soil solution
【中文摘要】通过在北京通州区的肥料定位试验,研究了不同施肥量对黄瓜产量、土壤硝态氮累积量及土壤水溶液硝态氮累积量的影响。结果表明,施氮量为260 kg/ hm2 时,达到作物最高产量,并取得最佳经济效益,从而确定该施肥量为最佳氮肥投入量通过对不同施肥量条件下土壤NO3- – N 累积量的研究,将该研究区土壤对氮肥环境容量确定为N一年260 kg/ hm2 ;通过测定作物收获后0~90 cm 土壤硝态氮累积量能够有效反映对当茬作物的施肥量水平;土壤0~90 cm水溶液NO3- – N 浓度随着氮肥投入量的增加而增大;作物收获后0~90 cm 土壤水溶液中NO3- – N 含量与其土壤NO3- – N 含量具有显著相关性;通过对0~90 cm土壤水溶液硝态氮含量的测定,能有效反映不同施肥水平对地下水的污染潜力。
【英文摘要】The effects of different nitrogen fertilization levels on yield of cucumber ,the soil nitrate – N content and the soil solution nitrate – N concentration were studied by the experiment in Tongzhou of Beijing. The results showed that cucumber yield was highest at the N rate 260 kg/ ha ,also got best gross economic returns at this N rate ,it was the best N rate input . This studied evaluated the soil nitrate – N content under different nitrogen fertilization levels ,the results showed that the environment capacity of the soil to N fertilizer was preliminarily determined as N 260 kg/ (ha • year) .An end – of – season soil NO3 - – N test in the 0 - 90 cm appeared to be capable of evaluating cucumber N management practices.Nitrate N concentration in the soil solution increased as the total of N applied to the soil .A significant relationship was found be – tween the total mass of NO3 - – N in the 0.9 m soil profile following harvested and the amount of NO3 - – N concentrations in the 0.9 m. It would be useful to predict the potential for nitrate (NO3 -) leaching to the drinking water through the amount of NO3 - – N concentrations test in the 0.9 m.

【题目】不同种植模式对土壤矿质氮累积量的影响
【中文关键词】种植模式; 蔬菜田; 大田; 硝态氮; 铵态氮
【英文关键词】cropping systems ; vegetable field ; crop field ; nitrate-N; ammonium-N

【中文摘要】运用对通州区的调查资料和试验结果,分析了不同典型种植模式对0-2 m土壤矿质氮累积量的影响。结果表明,不同种植模式对0-2 m土壤矿质氮提取利用能力顺序为: 向日葵—向日葵> 冬小麦—夏玉米(玉米秸秆还田) > 冬小麦—夏玉(玉米秸秆不还田) > 冬小麦—大豆> 玉米—玉米。在大田作物生产中,应进行合理的作物轮作、增加地面覆盖度、轮作中加入有固氮能力的豆科作物、注重与根系发达或深根作物进行轮作,能有效地提取利用土壤深层NO3--N ,并能有效减少氮素向土壤下层的淋洗。蔬菜生产田0-2 m土壤含有较高的NO3--N 和NH+4-N ,累积量达1935.03 kg/ hm2 和201.8 kg/ hm2 ,因此,应通过减少氮肥投入量,优化轮作种植模式以提高作物对深层土壤NO3--N 的回收利用。

【英文摘要】The effects of different cropping systems on soil inorganic nitrogen accumulation was analyzed using survey and experiments date. The results showed that the ability to recover nitrogen fertilizer under different cropping systems was as follows : continuous sunflower >wheat-corn rotation (field covered with crops) > wheat-corn rotation (without covering) >wheat-soybean rotation > continuous corn. Reasonable rotation (i . e. rotation with N2 -fixing legumes , rotation with deep-rooted crops) and stubble-mulch , were recommended because they could utilize NO3- -N from the subsoil , preventlosses of nutrients from leaching. The amount of NO3- -N accumulation and NH4+-N accumulation in vegetable field in 0-2 m soil layer was 1935.03 kg/ ha and 201.8 kg/ ha respectively. The high concentration of residue NO3- -N indicated that the rate of N input should be reduced , and cropping sequence should be adopted to enhance the utilization efficiencyof NO3- -N from the soil at depths below the rooting zone.

【题目】不同施氮水平对春玉米氮素利用及土壤硝态氮残留的影响

【中文关键词】春玉米;氮素利用效率;硝态氮;氮平衡

【英文关键词】spring maize;N utilization eficiency;soil nitrate;N balance

【中文摘要】过量施用氮肥造成的环境问题日益严重,氮肥合理使用成为了人们研究的热点。通过研究不同施氮水平对春玉米氮素利用及土壤硝态氮残留的影响,为氮肥的合理利用提供依据。通过在北京市通州区农业技术推广站进行田间小区试验,研究了不同施氮量(O、50、100、200和300kg.hm-2)对春玉米产量及氮素利用效率、氮平衡和土壤硝态氮累积量的影响。结果表明:(1)春玉米在施氮量为200kg·hm-2时达到最高产量,为9006.4kg.hm-2 ,不同氮肥水平的氮肥利用率在19.7%-25.8%之间,在100 kg.hm-2 时的利用效率最高,达到25.8%。(2)作物吸氮量随输入量的增加而增加,氮盈余主要以土壤残留为主,表观损失在氮盈余中的比例虽小,但随施氮量的增加而增加的趋势更加明显。(3)硝态氮在180cm土层中的累积量随氮素输入量的增加而显著增加,在300kg·hm-2时达到最高值,为195kg·hm-2,在施氮水平为100 kg.hm-2 时作物生长的需要就基本上能够得到满足,而在高施氮水平下(200和300 kg.hm-2)时土壤中的硝态氮出现富集现象,对环境形成一定的威胁。

【英文摘要】The environmental problem caused by excessive use of nitrogen fertilizer is becoming a very important issue and rational use of nitrogen fertilizer has become the focus of concern increasingly.In order to provide evidence for reasonable Use of nitrogen fertilizer,this paper analyzed the effects of nitrogen level on spring maize nitrogen utilization and soil nitrate nitrogen residua1.With 5 level of nitrogen rates(0,50,100,200 and 300 kg · hm-2),this experiment were conducted at Tong zhou District,Beijing.The effects on spring maize production,nitrogen use efficiency,nitrogen balance and nitrate-nitrogen accumulation in soil were discussed in this paper.The results show as following:(1) the highest spring maize yield reached to 9 006.4 kg · hm-2:the nitrogen use efficiency ranged from 19.7% to 25.8% under different rates of nitrogen fertilization,which reached the highest 100 kg.hm-2 when 100 kg · hm-2 was applied; (2)the nitrogen uptake by spring maize increased with the nitrogen fertilizer increasing and surplus nitrogen in soil profile dominated the residual N.Despite apparent nitrogen loss Was a small part of nitrogen surplus,the apparent nitrogen loss significantly increased with the nitrogen fertilizer increasing;(3)The residual Nmin accumulated increased significantly with the nitrogen fertilizer increasing in 180 cm soil profile,which reached to the highest value 195 kg.hm-2 at the rate of300 kg · hm-2 leve1.The nitrogen at the rate of 100 kg · hm-2 could satisfy the spring maize demand.The environment would be threatened when the nitrate Was cumulated in the soil at the rate of 200 and 300 kg · hm-2 .

【题目】含有机硅助剂的阿维菌素微乳剂的研制
【中文关键词】有机硅助剂;阿维菌素;微乳剂;药效;低容量喷雾
【英文关键词】o rganosilicon co2form ulant; abam ectin; m icroem ulsion; eff icacy; low volum e sp ray
【中文摘要】研制了含有机硅助剂的阿维菌素微乳剂,并以常规阿维菌素微乳剂或乳油为对照,从制剂质量技术指标、理化性能及生物学效应等方面进行了评价。所配制的含有机硅助剂(S ilw et 408)的1.8%阿维菌素微乳剂(含质量分数为6%的环己酮、4%的二甲基亚砜、7%的0203B和5%的Silwet408,余量为自来水)不仅达到一般微乳剂的质量要求,阿维菌素热贮分解率为1.12%,有机硅助剂的热贮分解率也低于1% ,而且通过溶剂优化,节约了70%的有机溶剂用量和7%的表面活性剂用量,还比常规微乳剂和乳油的表面张力降低10 mN /m 左右、减小液滴接触角10 ° 以上、增大液滴的扩展面积5 mm2 以上,药液的润湿时间从乳油和常规微乳剂难于润湿降低到1min以内。每公顷7.2 g (有效成分含量)含有机硅助剂的阿维菌素微乳剂对菜青虫的田间防效为96.8% ,显著高于相同剂量的乳油制剂(防效94.5%) ; 特别是低容量喷雾增效更为显著,每公顷3.6g的微乳剂防效为88. 4% ,明显高于同剂量的大容量喷雾(防效82.7%) 。试验结果表明,含有机硅助剂的阿维菌素微乳剂比常规微乳剂或乳油性能更为优越,防效更显著,特别适合于低容量喷雾
【英文摘要】A new form ulation, abamectin microemulsion, was prepared using organosilicon coformulant (Silwet408) .Technical specification, physical-chemical characteristics and biological efficacy of the new formulation was compared with common microemulsion or emulsifiable concentrate (EC) of abamectin. The quality specification of the new formulation [6.0% (W /W) cyclohexanone, 4.0% dimethylsulfoxide, 5.0% Silwet 408,7% 0203B, tapwater were consisted in the optimum formulation] not only met the quality standard of common microemulsion, but also saved 70% solvent and 7% surfactant by optimizing the solvent system. The test of thermal stability showed that the decomposed ratio of abamectin was 1.12%, and that of Silwet 408was below 1.0%, after being stored at (54±2)°Cfor 14 days. The diluted solution of the new preparation showed decreased surface tension by 10 mN /m,reduced contact angle by more than 10 ° , increased spread area by 5 mm2 , and dropped wetting time to less than 1min comparing with common microemulsion or emulsifiable concentrate of abamectin. Field control efficacy of mic- roemulusions containing

Silwet408 against the pest at application rate of 7.2 g (a.i.) / hm2 , was 96. 8% , while that of EC was only 94.5%. When using low volume spray at application rate of 3. 6 g (a. i.) / hm2 , the field control efficacy was 88.4% , higher than that of high volume sprayat the same application rate, which was 82.7%. The trial results suggested that the physical-chemical characteristics and control efficacy of microemulsions containing Silwet 408 was superior to that of common microemulsion or emulsifiable concentrate of abamectin, and it was more suitable to be applied by low volume spray.

【题目】大棚生菜平衡施肥研究
【中文关键词】保护地; 肥料利用率; 平衡指数
【英文关键词】green house, fertilizer recovery, balance indexes
【中文摘要】为了探索保护地土壤供肥特点和氮、磷、钾肥施用效应, 以生菜为供试作物, 在北京顺义杨镇松各庄布置了“ 3414 ”平衡施肥试验。结果表明, 施氮210 (kg/hm2)、磷(P2O5) 90 (kg/hm2)和钾(K2O) 150 (kg/hm2)时, 生菜产量最高, 达59967.0 (kg/hm2)。施磷、钾肥对产量无显著影响, 揭示大棚土壤并不缺磷钾。回归分析表明, 氮164 (kg/hm2), 为最佳经济施肥量, 此时生菜产量为59115.8 (kg/hm2)。该田块肥料利用率低, 钾最高只12.0%, 氮肥最高利用率为5.9%, 而磷肥最高也只有5.1%左右。在氮、磷、钾养分平衡指数中最高的钾只有1.73, 最低的磷只有0.27。生产实践中应及时监测土壤养分状况, 合理施肥, 避免资源浪费
【英文摘要】For studying on soil nutrient supply status under greenhouse and effect of N,P,K fertilization on lettuce, a balance fertilization experiment with “ 3414 ” design was carried out on a facility field in Songgezhuang village, Shunyi district of Beijing. The results showed that when N was 210 (kg/hm2), P2O5 was 90 (kg/hm2) and K2O was 150 (kg/hm2), the yield was 59967.0 (kg/hm2), and the phosphorus and potassium fertilizer had no significant influence on lettuce yields, demonstrated that the experimental soil was not lack of available phosphorus, and potassium. Regression analysis indicates that the dose of 164 (kg/hm2) N can give the best economic yield of 59115.8 (kg/hm2). The result also showed that the fertilizer recoveries by lettuce were very low, in which the highest value was potassium with only 12.0%, nitrogen was 5.9% and phosphorus was no higher than 5.1%. In the balance indexes of nutrition for N, P, K, the highest index for K was only 1.73, and the lowest one for P was 0.27. These results also indicated that the recoveries of chemical fertilizer nutrient were very low, so the soil nutrition needs to be monitored regularly, and fertilizing carefully, avoiding from resources waste

【题目】阴阳型日光温室环境条件初探
【中文关键词】日光温室 温度 阴阳棚 保温
【英文关键词】sunlight greenhouse temperature cool-house insulation
【中文摘要】日光温室具有保温性能好、造价低等特点,在北方地区广大农村得到广泛推广。但其受自然天气条件的影响大,土地利用率不高,使其进一步推广应用受到制约。近年来在一些地区试验推广的阴阳型日光温室具有土地利用率高,阴棚对阳棚具有较好的保温作用,受到多方关注。为了更好地了解这种温室的性能,本文设计了阴阳型日光温室与传统日光温室的对照试验。试验研究表明,在测试期间(2009年3月)阴阳型日光温室阳棚的平均温度比对照温室提高5.9℃,最低温度提高4~7℃;阴棚内温度比室外温度高5℃,基本都保持在7℃以上。在阴棚内种植耐寒作物能够安全生产,且阴棚对阳棚的保

温作用明显。
【英文摘要】Sunlight greenhouse is good at thermal performance and lower in construction cost compared with gutter-connected greenhouse,so it is widely used in China s north areas.As it is a passive solar greenhouse,the thermal performance is closely related to the outside weather condition,and the available cultivation soil is far less than the gutter-connected greenhouse,thus the application is restricted in a certain content In recent year,a kind of sunlight greenhouse with cool-house on its back was developed.The cool house can be used to cultivate cool-tolerance plants and it can also be used as an insulation cover on the unlight greenhouse. In this way, the cultivation soil area is increased and the insulation of the greenhouse is improved. In order to understand and master the environment situation in the greenhouse, a test greenhouse and a reference greenhouse were designed and tested. The investigation results showed that the average temperature is 5.9°C higher and the lowest temperature in everyday is 4~7°C higher in the test greenhouse than the reference greenhouse; the temperature in cool-house was more than 7°C and was 5°C higher than outside temperature during the test period of March 2009. From the results, we can deduce that some cool-tolerant plant can be safely produced in the cool-house and the cool-house has a great contribution on its connected sunlight greenhouse.

【题目】草菇SCAR遗传标记建立及其杂种鉴定应用
【中文关键词】草菇; SCAR; SRAP; 温度梯度; 遗传转化;
【英文关键词】Volvariella volvacea; SCAR; SRAP; temperature gradient; genetic transformation;
【中文摘要】草菇菌丝细胞多核且无锁状联合,缺乏明显的形态标记,遗传育种存在难题。采用SRAP法筛选出亲本单26和亲本单28的遗传差异条带4条,经克隆测序,并根据序列设计的引物优化扩增温度条件后,成功转化成SCAR遗传标记,其中SCAR1与SCAR4为亲单26所特有,SCAR2与SCAR3为亲单28所特有。应用这4个遗传标记,成功地鉴定了菌株2628的杂种性,并将应用于杂种后代单孢分离物的遗传分析等研究,为揭示草菇的性遗传模式提供有效的手段。
【英文摘要】There are multi-nucleus in hypal cells and no clamp-connections in morphology onVolvariellavolvacea . That makes its difficulty to cross breeding. In this study, using SRAP method for screen out different genetic bands between single-spore strain 26 and strain 28, and optimizing temperature conditions of PCR primers designed on sequence of bands, finally, we got four different SCAR genetic markers, which SCAR1 and SCAR4 belong to strain 26 specially, SCAR2 and SCAR3 belong to strain 28 specially. This four SCAR genetic markers have successful identified the hybrid nature of the strains 2628 and will be applied to genetic analysisof hybrid offspring. It reveals the nature of the genetic model of straw mushroom and provides an effective means.

【题目】人工湿地中不同深层基质净化畜禽养殖废水的研究
【中文关键词】垂直流人工湿地;基质;畜禽养殖;净化
【英文关键词】Vertical Flow Wetland, substrates, livestock and poultry breeding, purification
【中文摘要】选用活性炭与炉渣(3∶1)、陶粒和火山岩作为垂直流人工湿地基质,进行不同基质净化畜禽养殖废水的效果研究。结果表明:3种基质对总磷(TP)都有很好净化效果,最大去除率分别得到了99.8%、82.2%和93.3%;三者对浊度也有很强的去除效果,分别得到了99.3%、90.6%和82.8%。活性炭与炉渣混合基质对生物需氧量(COD)和总氮(TN)去除比陶粒和火山岩强,可达到93.2%和68%。在0-5 天这个时间段,模型内污水各项指标降低迅速,随后对废水的净化效果趋于稳定

【英文摘要】Selected activated carbon, slag, ceramsite and volcanic as the substrates of vertical flow wetlands and studied the effect of different substrates on livestock and poultry breeding waste. The results indicate that all of the three substrates had good purification effect on total phosphate (TP), the maximum degradation was 99.6%,79.8% and 92.3% respectively, Three of all had good degradation effect on turbidity and they were 98.5%,90.6% and 82.8% respectively. Among substrates the mixture of activated carbon and slag needed more COD (biological oxygen demand) and had better degradation effect of TN (total nitrogen) than ceramsite and volcanic, they achieved 93.2% and 68%. For the time span from 0 to 5 days, criteria of polluted water reducedquickly then the purification effect of polluted water trended to be stable

【题目】亚致死浓度多杀菌素对西花蓟马解毒酶系活力的影响
【中文关键词】西花蓟马;多杀菌素;亚致死浓度;解毒酶系
【英文关键词】Frankliniella occidentalis; spinosad; sublethal concentration; detoxifying enzymes
【中文摘要】采用亚致死浓度(LC 2 5)多杀菌素对西花蓟马 Franklinie l la o cci denta lis相对敏感(SS)种群进行连续选育,获得亚致死(Sub)种群。处理 36代后, Sub种群对多杀菌素的敏感性下降到 SS种群的 5 . 2倍。用 SS和 Sub种群各自的 LC 10和 LC 25浓度多杀菌素分别处理两种群的 2龄若虫,1、6、 12、24和 48 h后测定羧酸酯酶(C arE)、 谷胱甘肽 S 转移酶 (G ST s)和多功能氧化酶(M FO s)的比活力。结果表明, Sub种群对照组 C arE和 G ST s比活力在除第 48 h外的其他时间段都高于 SS种群对照组,且 6 h时两者 C arE比活力差异显著, Sub种群是 SS种群的 1 . 37倍; Sub种群对照组M FO s比活力在各时间段都高于 SS种群对照组,在 1和 6 h时差异显著, 前者分别是后者的 1. 62和 1. 36倍。再经各自的LC 10和LC 25浓度多杀菌素处理后,在各时间段 Sub种群的 C arE比活力均高于 SS种群; LC 25浓度处理后, Sub种群的 G ST s和MFO s比活力虽在短时间内低于 SS种群,但随处理时间的延长其比活力均高于 SS种群。说明 SS种群经亚致死浓度多杀菌素选育 36代后, 其体内 C arE、G ST s和MFO s比活力有上升趋势;继续用亚致死浓度多杀菌素处理, 则 Sub种群体内解毒酶活力的动态调节能力要强于 SS种群。
【英文摘要】A sublethal strain of western flower thrips (WFT), Frankliniella occidentalis (Sub) was obtained by selecting the relative susceptible strain of WFT (SS) with LC 25 of spinosad. After 36 generations of selection, its sensitivity to spinosad decreased 5.2 fold compared to the SS strain. The second in star larvae o f the SS and Substrains were treated with LC 10 or LC 25 of spinosad and the specific activity of the detoxifying enzymes was deter mined after 1, 6, 12, 24 and 48 h, respectively . The results showed that for the untreated control group the specific activity of the carboxy lesterase (CarE) and the glutathione S-transferase (GST s) in the Sub strain were higher than those in the SS strain except 48 h after treatment. in addition, the difference of CarE activity between the two strains after treatment for 6h was significant, the difference was 1.37 fold . The activity of the mixed function oxidases (MFO s) of the Sub strain were higher than those of the SS strain , and showed significant difference between 1 h and 6 h after treatment The differences were 1.62 fold and 1.36 fold, respectively . For the spinosad treated gro ups a tLC 10 o rLC 25 , the CarE activity in the Substrain was higher than that in the SS strain. The G ST s andM F O s activity in the Substrain was lower than that in the SS strain shortly after treatment by LC 25 of spinosad, but turned to be higher with the tim e prolonged. The results indicated that after the SS strain was selected with sublenthal concentration of spinosad for more than 36 generations , the activity of the detoxification enzymes showed an increasing trend. The Sub strain had stronger ability of regulating the detoxifying enzymes than that of the SS strain when treated with sublethal concentration of spinosad .

【题目】拮抗南方根结线虫PKS基因的筛选及活性评价
【中文关键词】PKS,南方根结线虫,杀线活性,土壤宏基因组文库
【英文关键词】Meloidogyne incognita ; active against nematodes; metagenomic fosmid library
【中文摘要】"土壤环境中蕴藏着巨大的微生物资源,而99%的土壤微生物不能用传统的纯培养。本研究基于西藏米拉山高寒草甸土壤微生物宏基因组Fosmid文库,采用PCR方法从文库中筛选PKS基因,以南方根结线虫(Meloido-gyne incognita)为靶标测定其杀线活性,并验证温室盆栽防效。从Fosmid文库中筛选得到2个含PKS基因的克隆K99和K82。K99属于Ⅰ型PKS,K82属于杂合PKS/NRPS;K99发酵液、热处理发酵液浸泡南方根结线虫J2 12 h后,杀线活性为100%。温室盆栽防效结果表明,K99的发酵菌液对南方根结线虫的防效为89%。K99能产生一种外分泌有杀线活性的物质,其热稳定性好,具有重要的开发利用价值。
【英文摘要】Microorganisms dominate the soil ecosystem, but their roles are unclear due to the limitations associated with the uncultivability of at least 99% o f the microorganisms. Clones containing PKS KS domain we e screened by PCR method from a soil

Fosmid metagenomice library from Tibet Mila Mountain, and the actives of PKS clones against root - knot nematodes were also identified according to control efficiency in plots in greenhouses. The results showed that two clones (K99 and K82) containing PKS were obtained, of which K99 was type PKS and K82 the hybrid PKS/ NRPS. The control effects o f crude zymotic fluid and heat treatment fermentation liquid of K99 clone on J2 of root - knot nematode in 12 hours was 100%, and the control efficiency in plots in greenhouse s to nematode w as 89%. Clone K99 produced some active substances that could kill root - knot nematode and had a property of thermal stability. Therefore it was well worth exploiting and utiliz ing.

【题目】西藏米拉山土壤微生物PKS基因和NRPS基因系统发育分析
【中文关键词】聚酮合成酶,非核糖体多肽合成酶,土壤,西藏米拉山草甸
【英文关键词】polyketide synthase; nonribosomal peptide synthetase; soil; meadows of Mila Mountain in Tibet
【中文摘要】"为了解西藏米拉山草甸土壤中的聚酮合成酶(PKS)基因和非核糖体多肽合成酶(NRPS)基因多样性,采用直接提取土壤总DNA,PCR扩增Ⅰ型PKS基因KS域和NRPS基因A域,并在NCBI进行Blast比对,分析其系统进化发育.得到27个PKS基因KS片段,经NCBI比对,主要来自蓝细菌(Cyanobaeteria)、α-和γ-变形菌(Proteobaeteria)和不能培养的微生物,得到NPRSA片段32个,主要属于变形菌门、蓝细菌门等.
【英文摘要】The modular polyketide synthase(PKS) and nonribosomal peptide synthetase(NRPS) were found to be involved in natural product synthesis in many microorganisms. Study on their diversities in natural environment may provide important ecological insights besides opportunities for antibacterial drugs development. The phylogenetic analysis of amino acid(AA) sequences indicated that the identified ketosynthase(KS) domains were clustered with those from diverse bacterial groups, including Cyanobaeteria, Proteobaeteria and some uncultured symbiotic bacteria. The NRPS included Cyanobaeteria and Proteobaeteria. One new branch belonging to hybrid PKS/NRPS enzyme complexes and five independent clades were found on the phylogenetic tree. These results revealed the great diversity and novelty of both PKS and NRPS genes from Mila Mountain in Tibetan Plateau.

【题目】南方根结线虫促分裂原活化蛋白激酶(MAPK)基因的R NAi效应分析
【中文关键词】南方根结线虫;卵块;促分裂原活化蛋白激酶(MAPK);RNAi
【英文关键词】Meloidogyne incognita;eggs mass;mitogen—activated protein kinase(MAPK);RNAi
【中文摘要】促分裂原活化蛋白激酶(mitogen—activated protein kinase,MAPK)在线虫的生长发育等方面具有重要作用,本研究探索利用RNAi技术沉默南方根结线虫mapk-j基因来抑制线虫的生长发育。根据mapk-1基因的cDNA序列设计引物,通过体外转录合成约550 bp的dsRNA对南方根结线虫的卵进行RNAi以沉默mapk-1基因。试验结果表明,将南方根结线虫的卵块浸泡在含有2 mg/mL dsRNA的M9缓冲溶液中,24 h后卵块孵化出的2龄幼虫数量明显多于对照组(无dsRNA),但孵化出的幼虫死亡率高达90%,而对照组的死亡率低于5%,说明mapk-1基因的沉默抑制了卵块的孵化和线虫的生长,同时将孵化的幼虫接种番茄,14 d后番茄根部无根结产生,35 d后无卵块产生;而浸泡72 h后卵块孵化出的2龄幼虫几乎全部死亡,并且孵化的线虫数量明显少于对照。提取导入dsRNA的卵块的RNA进行半定量PCR分析,结果表明mapk-1基因的mRNA被降解。
【英文摘要】Mitogen—activated protein kinase(MAPK)plays an important role in development of nematode.Byusing RNA interference technique,controlling was studied the expression of mapk-1 .Primers were designed based on the cDNA sequence of

mapk-1 and a dsRNA about 550 bp was synthesized by vitro transcription to soak the egg masses of Meloidogyne incognita.The results showed that the amount of J2 in egg masses treated with 2 mg/mL dsRNA for 24 hours was significantly greater than that in control group,but the mortality rate in treated group was reached 90% ,however,the value in control group was not more than 5% .In addition,the tomato roots had no knot at 14 days postinfection(dpi)and no egg mass at 35 dpi when inoculated the J2. When egg masses were soaked in 2 mg/mL dsRNA for 72 hours,the morality rate of J2 was almost 100% and the amount of J2 was markedly less than control group.RT—PCR an alysis showed lower tran script abundance for the targeted mRNAs than contro1.

【题目】南方根结线虫M i-flp-16基因的克隆及原位杂交分析
【中文关键词】南方根结线虫; FLP基因; 基因克隆; 原位杂交
【英文关键词】M eloidogyne incogn ita; FLP gene; Gene cloning; In situ hybridization
【中文摘要】以南方根结线虫2龄幼虫为材料, 根据已知南方根结线虫f lp基因的EST序列设计引物, 利用末端快速扩增法(RACE) 获得FLP基因Mi-flp-16的cDNA全长(GenBank登录号为EU549831) 。该基因全长690 bp, 包括一个528 bp的完整开放阅读框(ORF) , 编码一条176个氨基酸残基的多肽。序列分析表明Mi-flp-16编码3个FLP肽, 即2 个AQTFVRF和1 个GQTFVRF。原位杂交结果显示此基因表达位置在围喉神经环。
【英文摘要】To clone and characterize the encoding FMRFamid-like pep tides genes from M eloidogyneincogn ita, total RNA was extracted from the J2 nematodes. One gene was obtained by RACE and named M i-f lp-16 (GenBank: EU549831). The full length cDNA sequence of M i-f lp-16 was 690 bp, with a 528 bp ORF and encoding a 176 amino acids protein. The protein has three FLPs, including two AQTFVRF and one GQTFVRF. Using in situ hybridization technique to detect the exp ression of M i-f lp-16, found that it was expressed in neurones associated with the circumpharyngeal nerve ring.

【题目】Ras蛋白信号途径及其对线虫生长发育的调控作用
【中文关键词】Ras蛋白 信号传导途径 调控作用 突变体RTK
【英文关键词】Ras protein Signal transduetion pathway Regulation Mutant RTK
【中文摘要】Ras蛋白是一个分子质量为21 kD左右的单体GTP酶,具有两种构象:GTP结合构象(Ras.GTP)及GDP结合构象(Ras.GDP),这两种构象在一定备件下可发生互变。由生长因子介导的Ras信号传导途径是诸多信号途径中与细胞增殖、分化密切相关的重要信号途径。受体型TPK/Ras/MAPK信号转导途径是是目前研究的最为清楚的受Ras蛋白调节的信号传导途径,该途径包括受体型酪氨酸蛋白激酶(RTK)、接头蛋白、鸟苷酸释放因子(GNEF)、Ras蛋白以及MAPK级联反应体系。目前,TPK/Ras/MAPK信号转导途径在秀丽杆线虫(Caenorhabolitis elegans中研究的最为清楚:Ras信号途径对于许多发育进程是必需的,包括阴门、子宫、交合刺、Pl2以及排泄管细胞的诱导分化;控制着性肌原细胞迁移、轴突导向;对细胞减数分裂粗线期具有促进作用。对C.elegans的研究加深了对TPK/Ras/MAPK信号途径结构、突变体表型以及与其他信号途径的互作的了解,将会促进Ras信号途径对植物寄生线虫调控作用的研究。
【英文摘要】Ras protein is a single GTPase that cycles between an inactive GDP—bound state,and an active GTP—bound state,and its molecule weight is about 2 1 kD.TPK/Ras/MAPK signal transduction pathway regulated by Ras protein has been well studied,including receptor tyrosine kinase(RTK),adaptor protein,guanine nucleotide exchange factors(GNEF),Ras protein and

mitogen activated protein kinase(MAPK)cascade reaction system.In Caenorhabditis elegans,it is clear that TPK/Ras/MAPK pathway is required for multiple developmental events,including induction of vulval,uterine,spicule,P1 2 and excretory duct cell fates,control of sex myo—blast migration,axon guidance,and promotion of germline meiosis.Studies of C.elegans have provided insight into the basic framework of this RTK/Ras/MAPK signaling pathway,the phenotype of its mutants,and how interacts with other signaling pathways,all of whichwould promote the researches on plant parasite nematodes.

【题目】SSR data mined from expressed sequence tags of phytoparasitic nematodes.
【中文关键词】microsatellites, expressed sequence tags, plant parasitic nematodes
【英文关键词】microsatellites, expressed sequence tags, plant parasitic nematodes
【中文摘要】SSR markers have become the most popular resource for studying population genetic variation in eukaryotes. However, few studies with SSR markers have been carried out with phytoparasitic nematodes. In this study a primary survey on EST-SSRs was made utilizing bioinformatics methods to derive SSRs from expressed sequence tags (ESTs) of 16 species of PPN, which belong to 7 genera and 5 families. The results showed that trinucleotide repeats were the most abundant SSRs in coding ESTs, while tetranucleotide SSRs were predominant in non-coding ESTs and genome sequences. AG/CT, AAC/GTT and (AAAN)n motifs were predominant, and CG/GC, ACT/AGT motifs were scanty in the ESTs of most genera and species. SSRs were more abundant in non-coding ESTs than in coding ESTs. The distribution frequencies of SSR motifs in coding ESTs, non-coding ESTs and genomes are different. Our results will provide useful information for screening SSRs from each genus and species for further genetic study of phytoparastic nematodes.

【题目】Life history of western flower thrips, Frankliniella occidentalis (Thysan., Thripae), on five different vegetable leaves
【中文关键词】西花蓟马,生活史,蔬菜叶片
【英文关键词】Frankliniella occidentalis, life history, vegetable leaves
【中文摘要】西花蓟马在5种不同蔬菜(黄瓜Cucumis. sativus L.品种为中农8号、甘蓝Brassica oleracea L.京丰1号、甜椒Capsicum. annuum L.中椒5号、菜豆Phaseolus vulgaris L.供给者和番茄Lycopersicon esculentum M.中杂9号)叶片上的生物学特性表现明显差异。总体上,西花蓟马在黄瓜叶片上的表现最好:发育历期最短、净增殖率和种群增长指数最高,相反在辣椒上的表现最差。西花蓟马在黄瓜、甘蓝、菜豆、辣椒和番茄上从卵到成虫的发育历期分别为9.22 ± 0.13、10.19 ± 0.08、10.42 ± 0.06、12.15 ± 0.07和 12.91 ± 0.04天,在黄瓜、甘蓝和番茄上的存活率较高,为75%-80%,而在辣椒上仅50%发育到成虫。西花蓟马在甘蓝上的繁殖能力最强,平均每雌的一龄若虫数达76.62 ± 11.79头,在黄瓜上的产卵速率最快,平均每雌每天

的若虫数为6.12 ± 1.81头,而在辣椒上繁殖能力和产卵速率都最低,分别仅7.67 ± 3.35和1.89 ± 0.91。西花蓟马在黄瓜上的内禀增长率最高,达到0.208,在甘蓝、菜豆、番茄和辣椒上内禀增长率分别为0.184、0.164、0.100和0.017。

【英文摘要】Biological characteristics of western flower thrips, Frankliniella occidentalis (Pergande) (Thysan., Thripae), were investigated on excised leaves of five vegetables: cabbage (Brassica oleracea L. var. Jingfeng 1), cucumber (Cucumis sativus L. var. Zhongnong 8), capsicum (Capsicum annuum L. var. Zhongjiao 5), kidney bean (Phaseolus vulgaris L. var. Gonggeizhe) and tomato (Lycopersicon esculentum M. var. zhongza 9). The developmental time from egg to adult on the cucumber, cabbage, bean, capsicum and tomato leaf was 9.22 ± 0.13, 10.19 ± 0.08, 10.42 ± 0.06, 12.15 ± 0.07 and 12.91 ± 0.04 days, respectively. Survivorship of immatures on cucumber, cabbage and tomato was high (75 – 80%) but low on capsicum (50%). The total number of first instars produced was highest on cabbage (76.62 ± 11.79), while the daily first instar production was highest on cucumber (6.12 ± 1.81), whereas the total and daily first instar production rates were lowest on capsicum (7.67 ± 3.35 and 1.89 ± 0.91). F. occidentalis had the highest intrinsic rate of increase (rm) on cucumber (0.208), followed by cabbage (0.184), bean (0.164), tomato (0.100) and capsicum (0.017). The results indicate that cucumber was the most suitable host plant for F. occidentalis, whereas capsicum was the least suitable.

【题目】光合细菌PSB07-15对水培黄瓜体系中甲氰菊酯污染的生物修复

【中文关键词】甲氰菊酯;沼泽红假单孢菌PSB07-15;水培黄瓜;生物修复

【英文关键词】fenpropathrin; Rhodopseudomonas palustris PSB07-15;hydroponic cucumber;bioremediation

【中文摘要】为了探索光合细菌PSB07-15降解甲氰菊酯的应用潜力,在实验室研究了光合细菌PSB07-15对水培黄瓜体系中的甲氰菊酯污染的生物修复效率。研究结果表明:培养30 d,光合细菌PSB0-15对黄瓜营养液中100 mg · L-1甲氰菊酯降解率达到47.63%,黄瓜中甲氰菊酯降解率达59.73%。光合细菌PSB07-15可以显著使黄瓜的根长和生物量增加,而黄瓜的根活力以及根H2O2酶活力增加并不显著。本研究工作为利用光合细菌的生物修复提供了理论依据。

【英文摘要】The bioremediation efficiency of fenpropathirn by photosynthetic bacterial strain PSB07-15 in hydroponic cucumber system was evaluated in lab, for actual application of bioremediation by photosynthetic bacterium. The results showed that the strain PSB07-15 could degrade fenpropathrin effectively in hydroponic system. Fenpropathrin was degraded, up to 47.63% at the level of 100 mg · L-1 by the strain PSB07-15 in hydroponics nutrient solution and degraded, up to 59.73% at day 30. The strain PSB07-15 significantly enhanced root-length increment and biomass increment but not the root activity value and root catalase activity value of cucumber. The results indicated this strain PSB07-15 may have an important role in bioremediation in agricultural practice.

【题目】甲氰菊酯对蔬菜土中微生物数量的影响

【中文关键词】甲氰菊酯;微生物;蔬菜土;降解

【英文关键词】fenpropathrin; microorganism; vegetable soil; degrade

【中文摘要】在模拟的土壤生态系统中研究了甲氰菊酯对蔬菜土中微生物数量的影响。结果表明:低浓度甲氰菊酯对蔬菜土中微生物数量影响不大,高浓度甲氰菊酯短期内,对土壤微生物具有抑制作用,17 天后恢复至对照水平。土壤微生物30天对土壤中120 mg/kg的甲氰菊酯的降解率为37.71%。

【英文摘要】The effects of fenpropathrin on vegetable soil microbial population was investigated in a microcosm mimicking soil ecosystem. The results showed that the microbial population was slightly inhibited by fenpropathrin at low concentration, but significantly at high concentration. The vegetable soil microorganism could degrade 120 mg/kg fenpropathrin up to 37.71% in 30 d.

【题目】Genetic Mapping of the Scab Resistance Gene in Cucumber
【中文关键词】黄瓜;黑星病;SSR标记;分子标记辅助选择
【英文关键词】Cucumis sativus, Ccu, SSR, marker-assisted selection, MAS
【中文摘要】利用SSR标记将黄瓜抗黑星病基因定位在黄瓜第二染色体,获得了可以用于分子标记辅助选择育种的SSR标记。
【英文摘要】Scab, caused by Cladosporium cucumerinum Ell. et Arthur, is a prevalent disease of cucumber (Cucumis sativus L.) worldwide. Scab can cause serious losses for cucumber production, especially in protected culture such as high tunnel production. Resistance to cucumber scab is dominant and is controlled by a single gene, Ccu. Breeding for resistant cultivars is the most efficient way to control the disease. Selection for resistance might be made easier if the gene were mapped to linked markers. Thus far, there are no tightly linked (genetic distance less than 1 cM) simple sequence repeat (SSR) markers for the Ccu gene, and no studies on mapping of the Ccu gene in cucumber using SSR markers. The objective of this study was to identify SSR markers for use in molecular breeding of scab resistance. In this study, we used a population of recombinant inbred lines (RILs). The population included 148 ndividuals derived from the cucumber inbred line 9110 Gt (Ccu Ccu) crossed with line 9930 (ccu ccu). The Ccu gene was mapped to linkage group 2, corresponding to chromosome 2 of cucumber. The flanking markers SSR03084 and SSR17631 were linked to the Ccu gene with distances of 0.7 and 1.6 cM, respectively. The veracity of SSR03084 and SSR17631 wastested using 59 diverse inbred lines and hybrids, and the accuracy rate for the two markers was 98.3%. In conclusion, two SSRs closely linked to scab resistance gene Ccu have been identified and can be used in a cucumber breeding program.

【题目】Effect of spaceflight duration of subcellular morphologies and defense enzyme activities in earth-grown tomato seedlings propagated from space-flown seeds
【中文关键词】番茄,太空飞行,亚细胞,酶活
【英文关键词】tomato,spaceflight,subcellular morphologies,defense enzyme activities
【中文摘要】比较没经过太空辐射的种子, 在平号空间站经过6年长期飞行的种子和在卫星上经过27天短暂飞行的种子的亚细胞结构和酶活的变化, 一些经过和平号空间站搭载的植株的第一代,部分叶绿体片层结构变得弯曲和松散,部分线粒体的外膜被打破。一些经过卫星搭载的植物,线粒体数目增加,部分叶绿体片层的结构变得弯曲和松散,部分线粒体嵴消失。与地面的对照植株相比, 平号空间站搭载的植株的第一代,第二代,第三代和卫星搭载的植株中叶绿体中淀粉粒的平均数都增加了,但这种差异并不显著。与地面对照相比,经过平号空间站搭载的植株和经过卫星搭载的植株的叶片细胞中的叶绿体数量显著增加。经过卫星搭载的植株中氧化物歧化酶(SOD),过氧化物酶氧化物歧化酶(POD)和过氧化氢酶(CAT)这三种防御性酶活性显著高于地面对照和经过空间站搭载的植株中的这三种酶的活性,但丙二醛含量(MDA)含量则显着下跌。SOD、POD和CAT的酶活和MDA含量在变异系数,以在和平号空间站搭载过的植株最大。经过和平号空间站搭载的第

一,第二和第三代的植株的三种防御性酶的变异系数都高于地面对照植株。一些经过和平号空间站搭载的植株防御酶的活性显著增加。

【英文摘要】Subcellular changes and enzymes activities were compared between Earth-grown plants from the original tomato seeds, 6-year long-term flown in the Mir Station and 27-day short-term flown in the satellite. In some first generation Mir-flown plants, the lamellae ’s structure of some chloroplasts became curved and loose, and some mitochondrial outer membranes were broken. In some satellite-flown plants, the number of mitochondria increased, the lamellae ’s structure of some chloroplasts became curved and loose, and some mitochondrial cristae disappeared. The number of starch grains per chloroplast in first generation, second generation, third generation Mir-flown plants and satellite-flown plants increased significantly compared with the ground control, but the difference between the number of starch grains per chloroplast in Mir-flown plants (include three generations) and satellite-flown plants was not significant. The number of chloroplasts per leaf cell in Mir-flown plants and satellite-flown plants increased significantly compared with the ground control. The activities of three defense enzymes supperoxide dismutase (SOD), peroxidase dismutase (POD) and catalase (CAT) in the satellite-flown plants increased significantly as compared with those of the ground controls and the Mir-flown plants, but the content of malondialdehyde (MDA) decreased significantly. Coefficients of variation of the activities of SOD, POD, CAT and the content of MDA in the satellite-flown plants were lest, and those in the Mir-flown plants were maximum. Coefficient of variation of the activities of SOD, POD, and CAT in the first, second and third generation Mir-flown plants were more than that in the ground control. The activities of defense enzyme in some Mir-flown plants increased significantly.

【题目】1,3-Dichloropropene Distribution and Emission after Gelatin Capsule Formulation Application

【中文关键词】无

【英文关键词】1,3-Dichloropropene; distribution; emission; leaching; gelatin capsule

【中文摘要】无

【英文摘要】The gelatin capsule (gel cap) formulation of 1,3-dichloropropene (1 ,3-D) was developed as a potential means of reducing 1,3-D emissions. The objective of this study was to determine the distribution, emission, and leaching of 1,3-D after applying the gel cap in soil columns. Comparable 1,3-D soil gas concentrations were obtained between a conventional liquid injection control and the gel cap application with film treatment. When the soil surface was irrigated with 39.6 mm water per day during the first 4 days, 1,3-D soil gas concentration was higher than the film treatments at depths below 20 cm, but lower concentrations were observed at 0一15 cm depth. The application of 1,3-D gel cap relatively reduced total 1,3-D emission by about 41%compared to liquid injection with film cover, and total 1,3-D emission was only 0.13% for 1,3-D gel cap application with 4 days ofirrigation without a tarp. The results indicated that 1,3-D gel cap could be a promising new technology for reducing environmental emissions and potential human exposure.

【题目】空间环境诱变甜椒基因组DNA变异的分子检测

【中文关键词】甜椒; 空间环境; DNA变异

【英文关键词】sweet pepper; space environment; DNA variation
【中文摘要】为明确空间环境对甜椒后代的诱变影响,本研究以空间诱变的甜椒第4代及其地面对照为主要研究材料,采用RAPD技术对二者的基因组DNA进行了扩增分析,并对部分差异片段进行了测序。结果发现:空间诱变的甜椒后代与其地面对照变异情况相比,SP4的基因组DNA发生了变异,共检测出8个多态性位点,在对照和变异体中各扩增出4个位点。对其中2条特异片段进行回收测序,序列同源性为97%。研究认为空间环境条件可以诱导甜椒后代植株基因组DNA发生变异。
【英文摘要】To study effects of space environment on genomic DNA variation in the offsprings of sweet pepper,the 4th offspring and its ground control were used as materials.The genomic DNA variation was detected by random amplified polymprphic DNA(RAPD),parts of the different fragments were sequenced.The results showed that the genomic DNA of SP4 after space mutation changed compared to the ground control.Eight polymorphic bands were detected.Four polymorphic bands were amplified in the ground control and variant separately.Two special fragments were sequenced and sequence homology was 97% .So space environment could induce the changes of the genomic DNA in the offsprings of sweet pepper

【题目】3个辣椒花药培养再生株群体主要农艺性状及苗期抗病性研究
【中文关键词】辣椒; 花药培养; DH群体; 农艺性状; 抗病性
【英文关键词】Capsicum annuum L.; Anther culture; DH population; Agronomic traits; Virus resistance
【中文摘要】对3个辣椒花药培养再生株DH-R2群体的主要农艺性状,包括株高、株幅、首花节位、叶色、单果质量、商品果横径、商品果纵径、果形指数、老熟果色等进行了较详细的测量和统计分析。结果表明:辣椒花药培养再生株群体的农艺性状存在基因型偏性;再生株群体的单果质量、商品果纵径、果形指数这3个性状都表现为低于供体,株高、株幅、首花节位、商品果横径这4个性状都表现为近似于供体;通过单倍体培养途径可以得到不同颜色层次的老熟果色的辣椒纯系,证明了该途径是多基因控制性状育种的有效途径;对耐TMV和CMV的亲本与感病亲本的杂种进行花药培养,获得了兼具TMV和CMV抗性的株系,证明了单倍体培养途径可以创造新的超亲抗病种质。 更多还原
【英文摘要】Measurement and statistic analysis were taken for the main agronomic traits and virus resistance in 3 double haploid(DH) population derived from anther culture of Capsicum annuum L.Results showed that genotype leaning was existed for the main agronomic traits in the DH population.Data of single fruit weight,longitudinal diameter of fruit,fruit shape index were lower than that of donor plant.Data of plant height,plant breadth,the number of leaves below the first flower bud,transverse diameter of fruit were close to the donor plant.It was proved that homozygous lines with various hiberarchy colored mature fruits could be obtained by DH inducing,and this is a powerful pathway in the new variety breeding for multigene controlling traits.One DH line with high resistance to both TMV and CMV was screened out from the population derived from the hybrid donor plant whose parents were sensitive or tolerant to the both viruses.This result proved that ideal lines with excelled traits could be got in the DH population.These results were utlizable for reversely guiding the choice of donor plant,predicting the phenotype of the regenerated plants,increasing the ratio of aimed plants and so on,which was very significant for the application of anther culture in the breeding of pepper

【题目】芸薹种作物抽薹相关基因BrFLC1的CAPS标记

【中文关键词】白菜类作物;抽薹;BrFLC1基因;CAPS 标记
【英文关键词】Brassica rapa L syn campestris L; bolting; BrFLC1 gene; CAPS marker
【中文摘要】以16份白菜类作物DH系为试材,通过人工春化处理对其抽薹性状进行了鉴定,明确了材料间抽薹早晚存在显著差异;根据BrFLC1基因序列设计引物进行PCR扩增发现,所有16份材料均获得980 bp的片段。多序列比对与抽薹性的关联分析发现,材料的抽薹早晚与扩增片段的碱基变异相关联,并发现关联位点的碱基变异为限制性内切酶Mva I的识别位点;利用该酶对PCR产物酶切可以将材料明显区分开来,从而建立了BrFLC1基因的CAPS标记(命名为G-Mva I)。利用此标记对96份白菜类作物DH材料的验证表明,该基因的分子标记结果与抽薹时间表型显著相关,用该标记可以进行分子标记辅助选择。
【英文摘要】Bolting time of 16 Brassica rapa accessions were investigated under artificial vernalization treatment. The result showed that there was a wide range variation of bolting time among these accessions. Polymerase Chain reaction (PCR) with a primer pair based on the BrFLC1 gene sequence generated a 980 bp fragment from all accessions. A base variation located at P3 was significantly associated with bolting time, and the base variation at this position is the recognition site of restriction enzyme Mva I. Therefore, a Cleaved Amplified Polymorphic Sequnence (CAPS) marker designated as G-Mva I was developed for this locus by digesting the amplified fragment with Mva I. The marker was verified in 96 B. rapa DH lines, displaying a significant association between the bolting phenotypes and the genotypes of G- Mva I. These results indicated that G-Mva I can be easily used for marker-assisted selection (MAS) in late bolting or bolting-resistance breeding.

【题目】活性炭和振荡培养对提高大白菜游离小孢子胚诱导率的研究
【中文关键词】大白菜; 游离小孢子培养; 小孢子胚; 诱导率; 活性炭; 振荡培养
【英文关键词】Chinese cabbage; Microspore culture; Microspore- derived embryos; Embryogenesis frequency; Activated charcoal; Agitation culture
【中文摘要】以11 个大白菜品种(品系) 为材料, 采用NLN 培养基进行游离小孢子培养,研究了活性炭和振荡培养对小孢子胚诱导和形成的影响。结果表明: 11 个大白菜品种有9 个诱导出胚, 每花蕾诱导胚数0.056~12.67 个。在NLN- 13 培养基中添加活性炭(0.5 g/L) , 有利于小孢子胚的诱导和形成, Y536 和Y585 胚诱导率分别提高了16.1 和4.8 倍, 极难诱导出胚的材料Y516 也诱导出胚; 采用振荡培养方式(65 r/min) , Y531 和Y445 胚诱导率较静置培养分别提高了18.23% 和30.91%, 出胚时间提早2~4 d。
【英文摘要】Influence of activated charcoal and agitation culture on embryogenesis from isolated microspore of Chinese cabbage was studied in this project. Embryos were obtained from the isolated microspores of 9 varieties among that l1 varieties tested with the yield of 0.056 to 12.67 embryos per flower bud. Adding activated carbon (0.5 g/L) to NLN- 13 medium improved the embryogenesis, Y536 and Y585 produced 16.1 and 4.8 times more embryos compared with control.Y516, a genotype with difficult to produce embryos, produced embryos with addition of activated charcoal in the culture medium. Frequency of embryogenesis of genotypes Y531 and Y445 increased 18.23% and 30.91% on agitation culture (65 r/min) . The embryogenesis was 2- 4 days earlier on agitation culture.

【题目】游离小孢子培养育成早熟大白菜新品种‘豫新58’
【中文关键词】大白菜; 游离小孢子培养; 品种
【英文关键词】Chinese cabbage; isolated microspore culture; cultivar
【中文摘要】‘豫新58’是采用游离小孢子培养双单倍体育种技术育成的大白菜一代杂种。该品种早熟,生育期58~60 d。叶球矮桩叠抱, 单球质量115~210 kg。叶质柔嫩, 口感略甜, 风味佳, 生食、熟食皆宜。净菜产量6818 t · hm- 2。抗病性好。
【英文摘要】‘Yuxin 58’is a new Chinese cabbage hybrid, its parents are self2incompatible double haploid lines induced by isolated microspore culture. It is early-maturing and takes 58 to 60 days from sowing to maturaty. A head mass ranges from 115 to 210 kg. The mean yield is 6818 t · hm- 2. It has dwarf-head with leaf-tips overlapping on head top. The leaves are tender, crisp and slightly sweet and suitable for both salad and cooking. It has perfect resistant to virus disease, soft rot, downy midew and black spot.

【题目】大白菜遗传图谱的构建及与染色体关联分析
【中文关键词】大白菜; 分子标记; 遗传图谱; 染色体关联
【英文关键词】Chinese cabbage; Molecular marker; Genetic linkage map; Chromosome assignment
【中文摘要】为构建大白菜遗传图谱,并与国际上公认的白菜参照图谱相关联。以大白菜晚抽薹DH 系Y177-12 和早抽薹DH 系Y195-93 为亲本建立的183 个DH 系为作图群体,利用SRAP、SSR、AFLP、STS、ESTP 和CAPS 等多种分子标记和形态标记构建大白菜遗传图谱,通过参照图上的锚定标记确定连锁群,并用最新的连锁群命名法进行命名。构建了包含10 个连锁群、233 个标记位点的分子遗传图谱,其中包括145 个SRAP 标记、62 个SSR 标记、12 个AFLP 标记、6 个STS 标记、4 个ESTP 标记、3 个形态标记和1 个CAPS 标记。图谱总长度1 036 cM,标记间的平均图距为4.4cM。通过其中的38 个SSR,4 个ESTP 和2 个STS 标记将各个连锁群与国际上认可A1-A10 的参照连锁群相关联。该图谱的构建将为不同图谱的比较与整合及重要农艺性状的基因定位奠定基础。
【英文摘要】The objective of the present study is to construct a genetic linkage map associated with internationally agreed reference linkage map in Chinese cabbage (Brassica rapa L. ssp. pekinensis) . 183 DH lines derived from a cross of two DH lines,Y177-12 and Y195-93,were used for map construction. Six kinds of marker systems including SRAP, SSR,AFLP, STS,ESTP and CAPS loci were used for polymorphic marker screening. The assignment of linkage groups to their chromosomes was determined by using markers which have been mapped in the reference map. A genetic linkage map was constructed for Chinese cabbage, covering 1 036 cM,with an average mapping interval of 4. 4 cM. 233 loci including 145 SRAP, 62 SSR, 12 AFLP,6 STS,4 ESTP,1 CAPS and 3 morphological markers were integrated into 10 linkage groups using JoinMap 3. 0. 38 SSRs,4 ESTPs and 2 STSs provided anchors to previously published linkage map for B. rapa and B. napus and the consensus nomenclature of A1-A10 was adopted in this study. A genetic linkage map of Chinese cabbage associated with chromosomes was constructed,which enabled the alignments and integration between sets of maps and populations and would be useful in gene localization, comparative genomes research and QTL mapping of important agronomic traits for Chinese cabbage.

【题目】大白菜细胞核隐性雄性不育系恢复基因BrMf2的标记及定位
【中文关键词】大白菜;细胞核隐性雄性不育;基因定位;分子标记;SRAP
【英文关键词】Brasscia rapa L. ssp. pekinesis; recessive genic male sterile (RGMS); gene mapping; molecular marker; SRAP
【中文摘要】【目的】筛选大白菜细胞核隐性雄性不育(RGMS)育性基因(Mf)的连锁标记,通过定位该基因,为克隆雄性不育基因打下基础。【方法】939A不育系与YQD56A杂交F1S4后代为试材,利用混合分组分析法(BSA),应用SRAP和SRAP-AFLP标记技术筛选引物1 256对。【结果】获得与大白菜细胞核隐性雄性不育恢复基因连锁的标记2个,PM8K4和Me2M49,与恢复基因的遗传距离分别为2.98 cM和10.92 cM。通过调查PM8K4标记在大白菜DH作图群体中的多态性,将该基因定位在A8连锁群,即大白菜第9染色体。【结论】标记PM8K4可以在苗期对大白菜细胞核雄性不育性状进行标记辅助选择。
【英文摘要】【Objective】 Recessive genic male sterility (RGMS) is one of the important methods for F1 seeds production in Chinese cabbage (Brassica rapa L. ssp. pekinensis). Identification of molecular markers linked to RGMS restoring gene not only can accelerate breeding programs, but also can provide information for cloning of RGMS gene by mapping this gene on the corresponding chromosome. 【Methods】 A segregating population was developed from a cross between a male sterile line 939A and a fertile line YQD56A. SRAP and SRAP-AFLP techniques and bulked segregant analysis (BSA) were used to screen markers linked to the RGMS restoring gene. 【Result】 Among the 1256 primer combinations, only PM8/K4 and Me2/M49 showed polymorphism between bulks of male sterile and fertile. The polymorphic bands were named as PM8K4 and Me2M49. The distance of PM8K4 and Me2M49 was 2.98 cM and 10.92 cM, respectively. PM8K4 was subsequently mapped on linkage group A8 (Chr9) using a doubled-haploid mapping

population. 【Conclusion】 The SRAP and SRAP-AFLP markers developed here can be used in breeding programs for Chinese cabbage.

【题目】大白菜小孢子提取液中的蔗糖和甘露醇对胚胎发生的影响
【中文关键词】大白菜;小孢子培养;胚胎发生;预处理;蔗糖;甘露醇
【英文关键词】Chinese cabbage; microspore culture; embryogenesis; pretreament; sucrose; mannitol
【中文摘要】研究了大白菜游离小孢子提取过程中,培养基中的蔗糖和甘露醇对后期小孢子胚胎发生的影响。结果表明在小孢子短期的提取过程中提高B5提取培养基的蔗糖浓度或添加甘露醇对小孢子的活力无影响,但会大幅度提高小孢子的胚胎诱导效果,其中17%蔗糖处理和8%甘露醇处理效果最佳,与对照相比平均出胚量都达到极显著水平,同时也促进了难诱导材料的胚胎发生。
【英文摘要】The effects of short-term pretreament were studied on embryogenesis of isolated microspores in Chinese cabbage. The results showed that B5 washing medium addition mannitol and with higher concentration of sucrose during isolation of microspores were not influence microspores viability but can significantly increased the frequency of embryogenesis . In our experiments, all nine cultivars responded to the treatment. B5 washing medium with 17% sucrose treatment and B5-13 washing medium with 8% mannitol treatment were the optimal treatment of two group tests .

【题目】大白菜细胞核显性雄性不育基因连锁标记的筛选
【中文关键词】大白菜;雄性不育基因;RAPD标记;SCAR标记
【英文关键词】Chinese cabbage; Male sterile gene; RAPD marker; SCAR marker
【中文摘要】【目的】筛选出大白菜细胞核显性雄性不育基因的连锁标记,利用该标记对显性不育基因跟踪、鉴定,提高选择效率,缩短转育周期,加快育种进程。【方法】以大白菜细胞核显性雄性不育基因的分离群体B00160([938A ×太NB]-2X3-1X2)的115个单株为试材,采用BSA方法和RAPD技术,对400个随机引物进行筛选。【结果】获得了一个与核基因显性雄性不育基因连锁距离为1.74 cM的RAPD标记M264300。将该多态性片段克隆、测序和序列分析,设计了一对长20 bp的特异性引物,成功地将RAPD标记转化成为SCAR标记SM264300。该标记与雄性不育基因的遗传连锁距离为2.61 cM。利用该SCAR标记对另外2份育性分离群体的不育基因进行检测,准确率达到100%。【结论】该标记可用于大白菜核显性不育基因转育过程中的辅助选择。
【英文摘要】【Objective】 Dominant genic male sterility has been playing an increasingly inportant role for efficient production of hybrids in Chinese Cabbage [Brassica rapa L.ssp pekinensis (Lour.) Olsson]. Using marker assisted selection of the dominant male sterile gene can accelerate breeding programs. 【Method】 Bulked segregant analysis was used to identify RAPD markers linked to a dominant male sterile gene in the population of ‘ B00160 ’, a sterile and fertile segregating populatuon in Chinese cabbage.【Result】One RAPD marker, M264300 was identified in the segregating population tightly linked the gene. The polymorphic fragments were cloned and sequenced.A sequence characterized amplified region (SCAR) marker was devveloped besed on the nucleotide sequence information. The SCAR marker showed the same size and pattern of segregation as the original RAPD marker with a map distance of 2.61 cM and the RAPD maker was converted into SCAR maker. 【Conclusion】 The marker developed here will facilitate the breeding for new elite homozygous sterile lines of Chinese cabbage.

【题目】白菜的内多倍化现象
【中文关键词】内多倍体; 白菜; 流式细胞仪; C值
【英文关键词】Endopolyploidy; Chinese cabbage; Flow cytometry; C-value
【中文摘要】研究和了解植物内多倍化现象的发生规律和特点对于有效调控器官分化过程, 加速有用器官形成具有重要意义。本文分别以白菜及其近缘属种为材料, 运用流式DNA分析技术, 系统检测了不同发育阶段、不同组织器官以及不同种属植物叶片的内多倍化水平。结果表明, 白菜的内多倍化特点同样具有组织、发育阶段和种属特异性。一些木质化程度较高的输导组织如幼根、胚轴、茎和叶柄比其他非输导组织的叶片、子叶、苞叶具有更高的内多倍化程度; 在给定的组织器官中内多倍化水平随该器官的发育进程而提高, 当器官成熟时, 内多倍化水平也趋于稳定; 显微观察结果表明, 不同倍性的细胞核大小差异悬殊, 呈无规律状态散布于白菜表皮组织相邻的细胞内; 最高倍性水平的细胞核, 在白菜叶片中为64C, 而在甘蓝、芥菜和拟南芥中分别为32C、16C、16C, 在同科的不同植物中显示了不同的内多倍化水平。
【英文摘要】The endopolyploidization is a universal phenomenon existing in the higher plant. The endopolyploidization, on which plant cells maintained a faster growth rate, is an important way of increasing copies of function genes which is necessary for plant to adapt its growing environment. The knowledge and research on the occurring and the feature of plant endopolyploidization phenomenon would be favorite to regulate efficiently differentiation of organs and accelerate the formation of valuable organs. In this paper, the Chinese cabbage and its relatives were used to determine the endopolyloidization level in tissues, organs, and leaves at different developmental stages with the technique of flow DNA analysis. The results showed that in Chinese cabbage the feature of endopolyploidization was also specific for tissues, developmental stages like in other plants reported previously. Some conducting tissues with higher lignification degree such as primary root, hypocotyls, stem and petiole demonstrated higher endopolyploidization level than other nor-conducting tissues such as bract, cotyledon, laminae. In a given organ, the endopolyploidization level was raised in

the progress of the organ development. When the organ was up to maturity its endopolypoidization level tended to be stable. The micros-graph revealed that the nuclei with different ploidies showed obvious difference in size and were scattered randomly into adjacent pellicle tissue cells of petiole of Chinese cabbage. The highest ploidy level of nuclei was 64C in leaves of Chinese cabbage, but 32C, 16C, and 16C in leaves of cabbage, mustard and Arabidopsis thaliana respectively, indicating that the endopolyploidization level of the different plants in the same family is different.

【题目】A Naturally Occurring Splicing Site Mutation in the Brassica rapa FLC1 Gene is Associated with Variation in Flowering Time
【中文关键词】Flowering time, Splicing site mutation, BrFLC1, Splicing pattern
【英文关键词】Flowering time, Splicing site mutation, BrFLC1, Splicing pattern
【中文摘要】FLC是影响白菜抽薹的一个重要基因。本研究发现FLC1基因存在一个G-A的突变,形成可变性剪切,从而形成不同的产物蛋白,导致FLC1基因功能的完整或缺失。
【英文摘要】FLOWERING LOCUS C (FLC), encoding a MADS-domain transcription factor in Arabidopsis, is a repressor of flowering involved in the vernalization pathway. This provides a good reference for Brassica species. Genomes of Brassica species contain several FLC homologs and several of these colocalize with flowering time QTL. Here we report on the analysis of sequence variation of BrFLC1 in Brassica rapa and its association with the flowering time phenotype. The analysis revealed that a G-to-A polymorphism at the 5 ’ splice site in intron 6 of BrFLC1 is associated with flowering phenotype. Three BrFLC1 alleles with alternative splicing patterns including two with different parts of intron 6 retained and one with the entire exon 6 excluded from the transcript were identified, in addition to alleles with normal splicing. It was inferred that aberrant splicing of the pre-mRNA leads to loss-of-function of BrFLC1. A CAPS marker was developed for this locus to distinguish Pi6+1(G) and Pi6+1(A). The polymorphism detected with this marker was significantly associated with flowering time in a collection of 121 B. rapa accessions and in a segregating Chinese cabbage DH population. These findings suggest that a naturally occurring splicing mutation in the BrFLC1 gene contributes greatly to flowering time variation in B. rapa.

【题目】应用XAFS研究草酸根和胡敏酸对As(V)在红壤中吸附的影响
【中文关键词】As(V);吸附;草酸根;胡敏酸; XAFS;红壤
【英文关键词】Arsenate; Sorption; Oxalate; Humic acid; XAFS; Red soil
【中文摘要】结合吸附实验和X光吸收精细结构光谱(XAFS)分析,研究了草酸根和胡敏酸对As (V)在红壤中吸附的影响,分析了As (V)在红壤中的化学形态和微观结构以及草酸根、胡敏酸的影响特征。结果表明,当pH 6.0时,红壤主要是通过基团交换反应吸附As (V) ,草酸根和胡敏酸可以通过竞争吸附位点抑制红壤中As(V)的吸附,其抑制作用随浓度增大而增强。XAFS光谱学数据表明,红壤中吸附的砷以+5价态存在,主要与铁铝矿物形成以约0.317 nm As-Al和0.328 nm As-Fe原子间距为特征的双齿双核结构的内层复合物,复合物结构类型不受砷浓度和草酸根、胡敏酸的影响。
【英文摘要】Arsenic sorption is the primary factor that governs bioavailability and mobility of arsenic in soils. However, studies on arsenate (As(V)) sorption have been mainly limited to soil minerals, and sorption reactions in soils as a whole in the presence of dissolved organic carbon are poorly understood. Mechanisms of As(V) sorption on red soil in the presence of oxalate or humic acid

(HA) were studied using sorption isotherms and X2ray absorption fine structure (XAFS) spectroscopy. Arsenate, mainly as H2AsO4- in soil solution at pH 6.0, was extensively sorbed by red soil mainly through ligand exchange. Both oxalate and HA could significantly decrease As(V) sorption through competing for sorption sites, and the competition was getting stronger with increasing concentrations of oxalate and HA. The XAFS data indicated that the sorbed As(V) formed inner-sphere complexes of bidentate binuclear configurations characterized by an As-Albond distance of about 0.317 nm and an As-Fe bond distance of about 0.328 nm in red soil. The two As(V) complexes were stable regardless of As(V) loadings varying in the range studied. Their structures were free from the influence of oxalate and HA. This study illuminated the characteristics of As(V) sorption on red soil in the presence of oxalate and HA from molecular level and the findings might be of practical importance in controlling arsenate mobility and toxicity in soils.

【题目】Genotypic variations in the accumulation of Cd exhibited by different vegetables
【中文关键词】vegetables; cadmium; accumulation; genotypic variations
【英文关键词】vegetables; cadmium; accumulation; genotypic variations
【中文摘要】It is an important approach to use the Cd-contaminated soils properly by growing low accumulator or excluder plants for Cd to produce safe foods. To find the suitable vegetable species for growing in Cd-contaminated soils, in the present study the variations in the Cd accumulation for twenty eight vegetable species and several cultivars of five common vegetables (cowpea, kidney pea, bitter gourd, cucumber and squash) were investigated in two soil Cd levels (1 and 2 mg/kg Cd). Experimental results showed that highly significant differences in Cd concentration were evident among 28 vegetables. For example, spinach Cd concentrations were 110-fold and 175-fold higher than that of sweet pea under the 1 and 2 mg/kg Cd exposures, respectively. For Cd accumulation, the order ofvegetable species was: leafy vegetables > solanaceous vegetables > kale vegetables > root vegetables > allimus > melon vegetables > legumes. Distinctive differences were also identified when comparing different cultivars of the five common vegetables with an average range of 0.003 – 0.094 mg/kg Cd. Our results indicated that a large genotypic variation existed among vegetable species or cultivars

when subjected to Cd exposure. Therefore, it is important and feasible to elect/breed vegetable species/cultivars with low accumulation of Cd, especially in mildly Cd-contaminated soils.

【题目】An inventory of trace element inputs to agricultural soils in China

【中文关键词】Trace element; Contamination; Atmospheric deposition; Livestock manures

【英文关键词】Trace element; Contamination; Atmospheric deposition; Livestock manures

【中文摘要】It is important to understand the status and extent of soil contamination with trace elements to make sustainable management strategies for agricultural soils. The inputs of trace elements to agricultural soils via atmospheric deposition, livestock manures, fertilizers and agrochemicals, sewage irrigation and sewage sludge in China were analyzed and an annual inventory of trace element inputs was developed. The results showed that atmospheric deposition was responsible for 43-85% of the total As, Cr, Hg, Ni and Pb inputs, while livestock manures accounted for approximately 55%, 69% and 51% of the total Cd, Cu and Zn inputs, respectively. Among the elements concerned, Cd was a top priority in agricultural soils in China, with an average input rate of 0.004 mg/kg/yr in the plough layer (0-20 cm). Due to the spatial and temporal heterogeneity of the sources, the inventory as well as the environmental risks of trace elements in soils varies on a regional scale. For example, sewage sludge and fertilizers (mainly organic and phosphate-based inorganic fertilizers) can also be the predominant sources of trace elements where these materials were excessively applied. This work provides baseline information to develop policies to control and reduce toxic element inputs to and accumulation in agricultural soils.

【英文摘要】It is important to understand the status and extent of soil contamination with trace elements to make sustainable management strategies for agricultural soils. The inputs of trace elements to agricultural soils via atmospheric deposition, livestock manures, fertilizers and agrochemicals, sewage irrigation and sewage sludge in China were analyzed and an annual inventory of trace element inputs was developed. The results showed that atmospheric deposition was responsible for 43-85% of the total As, Cr, Hg, Ni and Pb inputs, while livestock manures accounted for approximately 55%, 69% and 51% of the total Cd, Cu and Zn inputs, respectively. Among the elements concerned, Cd was a top priority in agricultural soils in China, with an average input rate of 0.004 mg/kg/yr in the plough layer (0-20 cm). 【题目】重金属污染土壤原位钝化修复研究进展
【中文关键词】重金属;污染;原位钝化;修复;土壤
【英文关键词】heavy metal; contamination; in situ immobilization; remediation; soil.
【中文摘要】重金属原位钝化技术是一种污染土壤的修复方法,指向污染土壤添加一些活性物质(钝化修复剂) ,以降低重金属在土壤中的有效浓度或改变其氧化还原状态,从而有效降低其迁移性、毒性及生物有效性. 本文基于原位钝化修复剂种类、研究方法、评价指标、作用机制以及风险评价等方面的研究,深入分析了该领域的研究现状和存在问题,并提出了今后研究的重点. 目前广泛使用的钝化修复剂主要有粘土矿物、磷酸盐、有机堆肥及微生物材料等. 由于土壤结构和组分的复杂性,钝化修复剂的作用机制尚不完全清楚,其可能的机制主要包括沉淀反应、化学吸附与离子交换、表面沉淀、有机络合和氧化还原等. 今后应加强从分子水平研究重金属的钝化机制,重点关注钝化修复重金属污染土壤时存在的潜在风险以及钝化修复的长期田间效应.
【英文摘要】In situ immobilization of heavy metals in contaminated soils by adding extraneous active amendments has been considered as a cost effective measure for contaminated soil remediation. Application of immobilization amendments can decrease the available fractions of heavy metals or change their redox states, and thus, effectively decrease the mobility, bioavailability, and toxicity of the heavy metals in soils. This paper summarized the present researches about the in situ immobilization of heavy metals in soils, including kinds of immobilization amendments, research methods, immobilization indexes, immobilization mechanisms, and relevant environmental risk assessment. The mostly applied amendments include clay minerals, phosphates, organic composts, and microbes. Due to the complexity of soil matrix and the limitations of current analytical techniques, the exact immobilization mechanisms have not been clarified, which could include precipitation, chemical adsorption and ion exchange, surface precipitation, formation of stable complexes with organic ligands, and redox reaction. The prospects and limitations of in situ immobilization of heavy metals in soils were discussed. Future work should focus on the elucidation of immobilization mechanisms at molecular scale, with specific attention be paid to the potential risks of applying immobilization amendments and its long term effects on field soils.

【题目】不同钝化剂和培养时间对Cd 污染土壤中可交换态Cd 的影响
【中文关键词】镉;原位钝化;可交换态;重金属;污染土壤
【英文关键词】cadmium; In-situ immobilization; exchangeability; heavy metals; contaminated soil
【中文摘要】原位化学钝化技术是修复重金属污染土壤的重要途径之一,通过施入一些钝化剂以降低土壤中重金属有效态含量,从而减少其迁移及对植物的毒害。选取羟基磷灰石(HA)、磷矿粉(PRX和PRH)、沸石、赤泥、新鲜植物残体、玉米秸秆粉末以及相应的处理共21 种钝化剂,在同一培养条件和添加浓度下,比较其对人工Cd 污染土壤中可交换态Cd 含量的影响,并分析了其在不同培养时间对钝化效果的时间效应,试验的结果对于筛选Cd 污染土壤钝化剂有着重要的意义。结果表明,纳米化赤泥、羟基磷灰石和纳米化酸洗赤泥可显著降低土壤中可交换态Cd 含量,钝化比例高达35%~55%;赤泥、酸洗赤泥、沸石达15%~25%;富含巯基植物蒜苗、油菜、大葱植物残体也可达20%~25%。磷矿粉、大葱粉末、玉米秸秆和巯基化玉米秸秆的钝化效果相对较差;HA、铵型沸石、纳米赤泥、酸洗纳米赤泥、干油菜粉末、酸洗赤泥对可交换态Cd 的钝化效果的时间效应不明显;赤泥、大葱残体、特别是玉米秸秆和巯基玉米秸秆随时间增长钝化效果增加显著,在8 周和16 周时段钝化效果较好。
【英文摘要】In-situ immobilization of heavy metals by adding extraneous amendments in contaminated soils has been identified as a cost-effective measure for soil remediation. The immobilizing amendments could decrease the concentrations of available heavy metals,

and thus effectively decrease their mobility, toxicity/bioavailability in soils. In the present study, hydroxyapatite (A) phosphate rock powder RH and PRX) zeolite, red mud, plant offal, and their modified products were applied to the Cd-contaminated soils to assess the efficiency of these materials in immobilization of soil Cd. After incubation for different times, the concentration of exchangeable Cd was determined. The results showed that the concentration of exchangeable Cd in soils was decreased using red mud nanoparticles and HA by 35%~55%, using red mud, acid-treated red mud, and zeolite by 15%~25%, and using the sulphydryl (-SH) containing materials including garlic leaf, scallion, rape offal by 20%~25%. The immobilization by PRX, PRH, scallion powder, maize straw and sulfhydrylated maize straw were less effective compared with the above materials. The immobilizing effects of HA, ammonium saturated zeolite, red mud nanoparticles, and acidtreated red mud were stable at different incubation times, while the immobilizing effects of red mud, scallion offal, maize straw and its sulfhydrylation dispose increased along with the incubation times, especially for maize straw and its sulfhydrylated materials after eight weeks or longer incubation time. The results in the present study might be of practical importance in screening of amendments for remediation of soils contaminated with cadmium.

【题目】蜈蚣草对污染土壤中As、Pb、Zn、Cu的原位去除效果
【中文关键词】重金属污染;土壤;植物修复;蜈蚣草;修复潜力
【英文关键词】heavy metal contamination;soil;phytoremediation;Pteris vittata L.;removal potential
【中文摘要】通过2年的原位修复试验,探讨了蜈蚣草对污染土地中As、Pb、Zn、Cu的修复(去除)潜力。研究结果表明,蜈蚣草除了能富集As外,对Pb也有较强的富集能力,地上部Pb含量可高达1303 mg·kg-1。蜈蚣草生物量达到了极大值时,地上部As、Pb、Zn、Cu含量可分别高达1455、937、365、101 mg·kg-1。蜈蚣草对As和Pb都具有良好的修复效果,每年刈割2次蜈蚣草,As、Pb分别能够去除15. 5 kg·hm-2·a-1和8. 5 kg·hm-2·a-1。蜈蚣草对As、Pb、Zn有很强的耐性,在土壤中Pb、Zn、Cu含量高达10913、2511、510 mg·kg-1时,不会显著降低蜈蚣草的生物量。
【英文摘要】Pteris vittata L. is a promising hyperaccumulator in the phytoremediation of arsenic-contaminated soil. However, little is known about its phytoremediation potential for multimetal contaminated soil. A two-year field experiment was carried out to investigate the capacity of P. vittata to phytoremediate As, Pb, Zn and Cu from contaminated soils. The results showed that P. vittata hyperaccumulated both As and Pb. The concentration of Pb in shootswas as high as 1303 mg·kg-1, and the biomass of P. vittata reached a maximum when As, Pb, Zn and Cu concentrations in shoots were 1455, 937, 365 and 101 mg·kg-1, respectively. P. vittata removed 15. 5 kg·hm-2 (As) and 8.5 kg·hm-2 (Pb) per year (with 2 harvests). P. vittata also had a very strong tolerance to As, Pb and Zn. The biomass of P. vittata was not significantly decreased when the heavymetal concentrations of soil were as high as 10913 mg·kg-1 (Pb), 2511 mg·kg-1 (Zn) and 510 mg·kg-1(Cu).

【题目】植物修复过程中蜈蚣草对土壤养分的吸收动态: 5年田间定位试验
【中文关键词】吸收动态; 土壤养分; 蜈蚣草; 植物修复; 砷污染土壤
【英文关键词】dynamics; soil nutrients; Pteris vittata L.; phytoremediation; As-contaminated soils
【中文摘要】鉴于砷超富集植物蜈蚣草已被成功地用于修复砷污染土壤,本研究通过连续5年的植物修复田间试验,研究了土壤氮、磷、钾的消减动态和蜈蚣草对土壤氮、磷和钾的吸收动态。结果表明:种植蜈蚣草可使土壤全氮含量降低约

25%(2100-2700mg/kg),土壤全磷和全钾含量的年际变化不明显;蜈蚣草地上部氮、磷和钾含量分别为1.23-2.38、0.14-0.47和1.10-2.01g/kg,地上部带走的总氮、总磷和总钾量分别为23-89、4.4-13.0和21-69kg/hm2/a;与水稻和小麦相比,蜈蚣草对氮、磷和钾的吸收量都较低,但如果在连续种植过程中不施肥,蜈蚣草则可能会出现养分亏缺问题。

【英文摘要】The As-hyperaccumulator Pteris vittata L. has been applied for phytoremediation of A s-contaminated soil in field projects. In order to improve the removal efficiency, a five-year field trial was conducted to study the dynamics of N, P and K contents of soils and the accumulation of these elements in P. vittata during phytoremediation. The results showed that the total N contents of soils in 3 plots with different levels of arsenic decreased significantly (25%) while the total P or K contents of soils in the 3 plots did not decrease obviously by the end of five-years of remediation. The total N, P and K conten ts in shoots of P. vittata were 1.23~2.38, 0.14 ~0.47 and 1.10 ~ 2.01 g/kg, respectively. The annua l accumulation of N, P and K in P. vittata were 23~ 89, 4.4 ~13.0 and 21~ 69 kg/hm2/a-1, respectively. The total quantities of all nutrients accumulated by P. vi ttata from soils were less than that of rice and wheat, so nutrient deficiency might be a problem for growth of P. vittata without fertilizer during continuous remediation.

【题目】不同磷肥对砷超富集植物蜈蚣草修复砷污染土壤的影响

【中文关键词】蜈蚣草;砷;磷肥;植物修复

【英文关键词】Pteris vittata L.;arsenic;phosphorus fertilizer;phytoremediation

【中文摘要】施肥是提高重金属污染土壤的植物修复效率的必要强化措施之一。通过研究农业生产中常用磷肥对砷超富集植物蜈蚣草生长、砷累积及氮磷钾吸收的影响,确定可提高蜈蚣草修复砷污染土壤能力的最佳磷肥类型。结果表明,与不施砷对照组相比,添加砷处理中施用相应磷肥的蜈蚣草总生物量中蜈蚣草均有所降低(除钙镁磷肥外);在添加砷的情况下,钙镁磷肥、磷酸二氢钙和磷酸二氢铵等3个施磷处理总生物量相对较高,显著高于其他磷肥处理和不施磷处理(0.83g/pot);地上部砷累积量由大到小的顺序为:磷酸二氢钙>钙镁磷肥>磷酸二氢铵>磷酸二氢钾>磷酸二氢钠>不施磷》过磷酸钙;磷酸二氢钙处理的砷去除效率高达7.28%。由此可见,磷肥能一定程度提高砷超富集植物的修复能力,但不同磷肥对其砷去除效率的影响可达数倍之差,磷酸二氢钙是首选磷肥类型,综合考虑土壤pH、N、P和有效态砷等各种因子,磷酸二氢铵和钙镁磷肥也可作备选肥料类型。

【英文摘要】Fertilization has become one of the essential measures for enhancing efficiency of phytoremediating contaminated soils with heavy meta1.In order to screen optimal P fertilizer for As—phytoremediation,a greenhouse study was conducted on the growth,As—accumulation and uptake of N,P and K by Pteris vittata L.in As—contaminated soils with diferent forms of P fertilizers.The results indicated that the biomass of plant with As addition decreased compared to no As—addition treatments except fused calcium magnesium phosphate(CaMg—P)treatment.The plants in As addition soils with CaMg-P,calcium dihydrogen phosphate(CDP)and diammonium phosphate(nAP)had higher biomass than those with other P fertilizer and control(0.83 g/pot).The As accumulations of plant aboveground in As addition soils are in order of CDP> CaMg—P> DAP> Potassium Phosphate Monobasic> Monosodium phosphate> control》 Calcium superphosphate.The efficiency of As removal from As addition soils with CDP was the highest.7.28% .Thus it can be seen the ability of phytoremediation using P.vittata could be improved by P fertilization,which CDP should be recommended preferentially and CaMg—P and DAP is considered as replaceable fertilizer for sake of pH,N,P and available As in phytoremediated soils.

【题目】潜在外来入侵甜菜孢囊线虫在中国的适生性风险分析
【中文关键词】适生性风险分析; 甜菜孢囊线虫; 入侵线虫; GARP; MAXENT
【英文关键词】potential g eog raphic distr ibut ion; H eter oder a s chachtii; alien invasiv e nematode; GARP; MAXENT
【中文摘要】本文应用MAXENT 与GARP 两种生态位模型对甜菜孢囊线虫在中国的适生性进行了风险分析和预测。结果表明甜菜孢囊线虫可在中国17 个省市生存, 适生范围为26 N~ 48 N, 77. 6 E~ 136 E。甜菜孢囊线虫入侵的高风险区: 内蒙古南部、新疆西部、河北中南部、山西东北部、宁夏、甘肃北部; 中风险区: 北京、天津、陕西、山西大部、内蒙古西部和东南部、吉林西部、新疆北部; 低风险区: 河南、陕西南部、山东、内蒙古中东部、新疆中部、辽宁、吉林大部、黑龙江南部、江苏、安徽、湖北、湖南、江西、浙江北部; 而青海、新疆南部、西藏、四川、重庆、云南、贵州、广西、广东、福建、海南、内蒙古少数地区和黑龙江部分地区属于基本不发生区。我国内蒙古、新疆、辽宁等省市甜菜种植区均适合甜菜孢囊线虫发生, 对上述地区的进出口岸应加强甜菜孢囊线虫的检疫工作。
【英文摘要】The sugar beet cyst nematode, Heterodera schachtii, is one of the important quarantine nematodes in China as well as in the world. The invasion risk of this nemato de is becoming a more and more serious pro blem with regard to international trade. It is urgent to analyze the potential geographic distribution of H. schachtii in China.MAXENT and GARP, the two models, have been widely used to predict the potential geographic distribution of alien inv asive species. The potential distribution of this nematode in China had been predicted with M AXENT and GARP models. The results indicated that H.schachtii can be distributed in at least 17 provinces in China. The potential distribution region in China is bet ween 26 N - 48 N, 77. 6 E- 136 E. Risk assessment indicated that H.schachtii could occur at the major sugar beet gr ow ing areas of North China. It was suggested that the quarantine measure sat the ports in po tential areas should be strengthened.

【题目】CLIMEX-GIS预测大豆北方茎溃疡病菌在中国的潜在分布
【中文关键词】大豆北方茎溃疡病菌; CLIMEX; GIS; 适生区
【英文关键词】Diaporthe phaseolorum var. caulivora; CLIMEX; GIS; potential distribution areas
【中文摘要】大豆北方茎溃疡病菌是大豆的重要病原菌, 广泛分布于世界主要大豆产区, 造成严重的产量和品质损失。本文应用生物模型CLIMEX 结合GIS 软件预测大豆北方茎溃疡病菌在中国的适生区, 并根据EI 值划分相应的适生等级。结果表明, 大豆北方茎溃疡病菌在我国绝大部分地区适合生长, 其中东北地区、华北地区和云贵高原地区处于中适生区或高适生区。该菌在我国还未报道, 通过分析其在我国潜在分布区对于防止病菌的传入、传播和蔓延有重要的检疫意义。
【英文摘要】Diap of the phaseolorum var. caulivora is one of the most important pathogenson soybeans. The pathogen distributes in major soybean production areas throughout the world and can cause serious yield loss and poor seed quality. In this study, potential distribution areas of D. phaseolorum var . caulivora in China were predicted by using CLIMEX and GIS tools, and its risklevel forpotent ialsurvival areas wasassessed. The results showed that D.phaseolorum var. caulivor a could survive and develop in many provinces of China. Northern area and northeast area,the major soybean production areas of China, were ediumor high risk areas for the pathogen survival. Also most of the south western areas were the high risk areas for the pathogen survival. D. phaseolorum var. caulivora has not been reported in China, so it is urgent to make management measures for preventing invasion, diffusion and expansion of the pathogen.

【题目】香蕉细菌性枯萎病菌在中国的潜在适生区域
【中文关键词】香蕉细菌性枯萎病 GARP MAXENT 潜在适生区域
【英文关键词】moko disease GARP MAXENT potential distribution area
【中文摘要】青枯菌2号小种引起的香蕉细菌性枯萎病(mokodisease)是香蕉生产上最具毁灭性的病害之一。为指导香蕉细菌性枯萎病的预防控制和制定相关的检疫政策,该研究根据EPPO公布的香蕉细菌性枯萎病在全球范围内的分布资料,分别采用GARP和MAXENT两种预测模型对其在中国的潜在适生区域进行分析预测。结果显示,GARP和MAXENT的预测结果基本一致,均表明香蕉细菌性枯萎病菌在中国的潜在适生区域集中分布于东南部的云南、广西、广东、海南、福建、台湾、江西、湖南、贵州、四川、重庆、浙江、湖北等13个省(市、自治区),其中高风险适生区域包括广东、广西、台湾、海南、福建和云南省.
【英文摘要】Moko disease, caused by race 2 of Ralstonia solanacearum, is a devastating disease of banana, plantain and Heliconia. In order to prevent and manage invasion of R. solanacearum effectively, it is necessary to research the potential geography distribution of this alien species. Based on current geographical distribution of R. solanacearum race 2, both MAXENT and GARP methods were used to predict the potential distribution area of R. solanacearum race 2 in China. The potential distribution areas predicted by GARP and MAXENT are almost identical. The result of two models showed that the potential distribution area of R. solanacearum include Yunnan, Guangxi, Guangdong, Hainan, Fujian, Taiwan, Jiangxi, Hunan, Guizhou, Sichuan, Chongqing, Zhejiang and Hubei provinces. The high suitable probability areas include Guangdong, Guangxi, Taiwan, Hainan, Fujian and Yunnan provinces.

【题目】新疆大豆疫霉的来源分析
【中文关键词】大豆疫霉菌; 遗传多样性; 遗传关系; SSR 标记
【英文关键词】Phytophthor asojae, genetic diversity, genetic relationship, SSR marker
【中文摘要】应用SSR 标记对新疆地区大豆疫霉菌(Phytophthora sojae Kaufmann & Gerdemann) 的遗传多样性和与美国、黑龙江、福建等3 个不同地理来源大豆疫霉菌的遗传关系进行研究。结果表明, 新疆地区大豆疫霉菌遗传多样性相对较低, 遗传背景单一, 推断为外来生物。与大豆疫霉菌美国分离物和福建分离物相比, 新疆分离物与黑龙江分离物的遗传关系最近, 表明新疆大豆疫霉菌可能从黑龙江传入。
【英文摘要】Phytophthora root rot caused by Phytophthora sojae is one of the most destructive diseases of soy bean. This disease has occurred in Xinjiang Auto nomous Region. In this study, the genetic diversity of P. sojae isolates from Xinjiang and relationships between Xinjiang sisolates and isolates from USA, Hei long jiang or Fujian provinces were assessed by using SSR markers. T he results indicated that there was a relatively low genetic diversity and simple genetic background in Xinjiang's P. sojae, and suggested Xin jiang P. sojae should be exotic species. Compared with USA or Fujian isolates, there was the closest genetic distance between Xinjiang isolates and Heilongjiang isolates. It was assumed that P. sojae in Xin jiang might be introduced from Heilongjiang .

【题目】基于CLIMEX和D IVA-GIS的瓜实蝇潜在地理分布预测
【中文关键词】瓜实蝇; 潜在地理分布; CLIMEX; 地点比较模型; DIVA-GIS; BIOCLIM
【英文关键词】Bactrocera cucurbitae; potential geographical distribution; CLIMEX; compare location model; D IVA-GIS; BIOCLIM
【中文摘要】根据瓜实蝇Bactrocera cucurbitae(Coquillett)的生物学数据和已知地理分布信息,采用CLIM.EX软件的地点比较和DIVA—GIS软件的BIOCLIM两种模型研究瓜实蝇的潜在地理分布。结果表明两种模型均能准确预测出我国34.7~18.1°N,97.5~122.6°E范围内的19个省(市、自治区)是瓜实蝇的潜在地理分布区。广东、广西、海南、福建南部、云南南部、台湾西部以及四川盆地为高度适生区,江西、湖南、贵州、重庆、上海以及四川、云南、福建、浙江、江苏、安徽、湖北、陕西、河南、甘肃局部地区为中低度适生区。对全球的潜在分布区预测结果表明:瓜实蝇目前的地理分布还未达到其最大潜在地理分布范围,瓜实蝇随国际贸易进一步扩散的风险较高。对两种模型的进一步分析表明:在物种相关资料完整的情况下,CLIMEX的地点比较模型预测结果的准确性要高于DIVA—GIS的BIOCLIM模型。
【英文摘要】The paper analyzed the potential geographic distribution of Bactrocera cucurbitae Coquillett)by CLIMEX ’s compare location and DIVA-GIS ’s BIOCLIM models, based on the information of its biological characteristics and current geographical distribution. The results showed that both of two models can accurately predict the B.cucurbitae could prevail in 34. 7 - 18. 1 ° N, 97. 5 - 122. 6 ° E area of 19 districts in China. The high suitable probability areas include Guangdong, Guangxi, Hainan, Sichuan basin, west of Taiwan and south of Yunnan, Fujian. The medium or low suitable probability areas include Jiangxi, Hunan, Guizhou, Chongqing,Shanghai, and parts of Sichuan, Yunnan, Fujian, Zhejiang,J iangsu, Anhui, Hubei, Shaanxi, Henan, Gansu. The global prescient results showed that the current global geographical distribution of B.cucurbitae is still far from itsmaximum potential geographical scope,and the risk of farther sp reading ofmelon fruit fly by international trade is high. Further analysis of two models revealed that the prescient results of CLIMEX ’s compare location model was better then DIVA GIS ’s B IOCLIM model, if the correlate information of the species is sufficient.

【题目】不同干扰措施对松材线虫入侵松林内物种多样性的影响
【中文关键词】松材线虫;入侵;马尾松林;伐除;干扰措施
【英文关键词】Bursaphelenchus xylophilus; invasion; masson pine forest; removal; disturbance ways
【中文摘要】经野外调查发现:松材线虫入侵松林后,对原先林型相同的两块染病松林而言,经过人为伐除和保留受害木这两种干扰措施后,任其自然恢复更新,后恢复的林型会大不相同,即对受害木采取不同的干扰措施会对染病松林内林下植被的更新产生不同的影响。基于以上出发点,以松材线虫入侵后采取不同伐除干扰措施的2 个马尾松受害群落为研究对象,针对受害木移除和保留两种处理方式,选择α 多样性指数函数R é nyi 指数为测量单位,探讨了不同受害木处理方式下植物多样性的变化规律。结果表明:受害木及时移走的松林内林下灌草多样性比受害木保留的要高。
【英文摘要】Through field investigations it was observed that after Bursaphelenchus xylophilus (Steiner and Buhren) Nickle (pine wood nematode) invaded a pine forest, subsequently formed forest types would be significantly different from each other if two managing ways such as human removal and reserving damaged trees were taken before a natural regeneration, namely differentdisturbance measures taken for damaged trees would affect regeneration direction of understory vegetation of an infected pine forest. Based on the above observation, the dynamics of plant diversity under different managements of damaged trees were studied by choosing two Masson pine communities that were subjected to managements of removal and reserving damaged trees,respectively, after the invasion of pine wood nematode. α diversity index function—R é nyi index was used as a measurement. The results showed that the species diversity of shrub and herb layers of the pine forest in which damaged trees were removed timely was higher than that in which damaged trees were reserved.

【题目】一种新发生的大豆茎枯病病原菌鉴定
【中文关键词】大豆,大豆拟茎点种腐病菌,大豆茎枯病
【英文关键词】Glycine max,Phomopsis longicolla,Soybean stem blight
【中文摘要】鉴定了一种新发生的大豆茎枯病病原菌。在酸化PDA培养基上所有病原菌分离物菌落呈白色,气生菌丝呈密集的卷毛状,有时部分区域显黄绿色;培养基背面开始无色,随后产生大的、扩展的黑色子座。在接种的大豆茎秆上产生大小不等的黑色子座和分散的分生孢子器。共产生2类分生孢子,其中α型分生孢子丰富,无色,单孢,椭圆至纺锤状形,大小4.05~7.57μm×1.48~3.25μm,含2个油滴;β型分生孢子极少见,无色,线形。在培养基及大豆茎秆上未发现有性态。致病性测定表明选择的分离物引起合丰25大豆100%植株发病和种子腐烂。用AluI、RsaI和HhaI酶切通用引物对ITS4/ITS5扩增的rDNA-ITS产物,所有分离物都产生与大豆拟茎点种腐病菌Phomopsis longicolla一致的酶切谱带;序列比对发现测序的2个分离物ITS序列与GenBank中9个.longicolla分离物ITS序列100%同源。这是我国首次报道大豆田间发现P.longicolla,而且能引发严重的大豆茎枯病。
【英文摘要】The pathogen causing soybean stem blight disease was newly identified. The isolate produced floccose dense white colonies with occasional green-yellowish areas on acidified PDA medium was newly identified. The stromata were large, black and widespread. It was observed that the pycnidia produced both alpha-and beta-conidia when inoculated on soybean stem. Alpha conidia were hyaline, ellipsoidal to fusiform, and guttulate with sizes of 4.05 to 7.57 μm ×1.48to 3.25 μm. Beta-conidia were rare, hyaline, filiform and hamate. Four isolates selected caused seeds rotten and 12-day-old seedlings diseased when inoculated on soybean cultivar Hefeng 25. To indentified the pathogen, rDNA-ITS fragment was amplified using universal primer ITS4 and ITS5, and followed by digesting with Alu I, Rsa I and Hha I restriction enzymes. Phomopsis longicolla characteristic band spectrum was shown in every isolate PCR products. Two isolated ITS sequences were identical to 9 isolates of P.longicolla in GenBank. The results indicated that the pathogen of severe soybean stem blight was just P.longicolla. It was the first report of P. longicolla being isolated from soybean in China.

【题目】Impact on forest growth and related growth model of the Pinus massoniana population invaded by Bursaphelenchus xylophilus
【中文关键词】无
【英文关键词】invasion, Pinus massoniana, Pleioblastus amarus, niche
【中文摘要】无
【英文摘要】When pine trees are invaded by pine wilt diseases, the severely infected pine trees will die and fall down, or they will be removed when found to be damaged by the disease. It gives rise to the invasion of other species in these empty niches originally occupied by pine trees, i.e., competing surrounding trees or understory shrubs will invade the empty niches during the following years.As a result, the spatial distribution and pattern of the main tree species in a pine forest will change, and a niche variety in the main population will occur. In the end, the direction of the succession and restoration of the pine forest ecosystem will be affected. In our study, a Pinus massoniana forest with the dominant shrub, Pleioblastus amarus, was invaded by pine wood nematode and was clear cut. Selecting this community as our research object, we studied the effect of the invasion of the pine wood nematode on the growthof the dominant shrub, P. amarus, in this Pinus massoniana forest. Our results show that, after the attacked pine trees were removed,the niche was occupied by Pleioblastus amarus and other shrubs, which benefited the growth of P. amarus to its climax. Growth of P.amarus at the climax stage was greater compared with the unhealthy pine forest and the control group.

【题目】The potential geographic distribution of Radopholus similis in China
【中文关键词】无
【英文关键词】Radopholus similes, niche model, GARP, MAXENT, suitable distribution area
【中文摘要】无
【英文摘要】The burrowing nematode (Radopholus similis) is one of the main quarantine pests in China, and the risk of invasion posed by this nematode is becoming more and more serious with regard to the international trade being intensified day by day.It is urgent to analyse the potential geographic distribution of R. similis in China. Genetic algorithm for rule-set predictionmodeling system (GARP) and maximum entropy (MAXENT), the two niche models which have been widely used to predict the potential geographic distribution of alien species, were used to predict the distribution of R. similis in China.We also presented a model comparison of the results by both threshold-dependent and threshold-independent evaluations.It has been shown that the two niche models could be used to predict the potential distribution of R. similis reliably. The potential distribution of R. similis should be constricted within the south of China, such as Hainan, Guangdong, Guangxi,Fujian, Yunnan provinces, and Taiwan of China. The MAXENT gives a better prediction than that of GARP. R. similis can be introduced to China by flowers and nursery stock ’s international shipping. The predicted results indicate that R.similis can occur in south coastal area of China and Yunnan Province, which are the main flower and nursery stock ’s import export areas in China. Consequently, a strong quarantine program is needed at the ports of such areas to prevent the pest from being introduced to China.

【题目】Crop Response to Long-Term Potassium Application as Affected by Potassium‐Supplying Power of
【中文关键词】作物产量,土壤供钾能力,长期施钾,华北平原
【英文关键词】Crop yield, long-termpotassiumapplication, northern China, potassiumsupplying power of soils
【中文摘要】在我国十三个省的试验点,通过田间试验研究了长期施钾肥对土壤供钾能力、作物产量和钾肥利用率的影响,用土壤缓效钾评价发现,土壤供钾能力在中国北方从东到西表现增加,而作物产量呈现出与土壤供钾能力一直的趋势。
【英文摘要】Potash resources in China are very scarce. It is especially important to correctly evaluate the potential potassium-supplying power of soils in northern China in order to use soil potassium sufficiently and potash fertilizer properly.Regional differences in crop yield responses to long-term potassium application in northern China were determined in this study. Twenty-five representative soilsamples from 13 provinces, municipalities, and autonomous regions of major agricultural regions in northern China were collected from the surface layer (0 – 20 cm) before crop seeding in 1993. A soil potassium-depletion study was carried out in a pot experiment with successive planting of corn seedlings for 10 harvests in the 25 soils. Since 1993, field trials on wheat and corn response to long-term potassium application were conducted at the fixed sites of HLJ-SC (Shuangchengof Heilongjiang), JL-LFZ (Liufangzi of Jilin), HB-XJ (Xinji of Hebei), SX-LF (Linfen of Shanxi), QH-NKY (Nongkeyuan of Qinghai), and XJ-CJ (Changji of Xinjiang). Soil-available potassium, slowly available potassium, total potassium, main clay minerals, cation exchange capacity, particle size, other available nutrients, and potassium concentration in plants were measured. The resultsshowed that potential potassium-supplying powers of the 25 tested soils, which were respectively evaluated by the contents of slowly available potassium in soils and the amount of total net potassium uptake in the pot experiment, generally tended to increase from eastern to western regions in northern China. Significant wheat yield responses to long-term potassium application in the field trials werefound since 2000 in the north-central region but not observed until 2004 in the northwestern region. Significant corn yield responses to long-term potassium application in the field trials were found starting in soils of the northeastern region, following in soils of the north-central region, and then in soils of the northwestern region. These were consistent with potential potassium-supplying power of the soils, which tended to increase from east to west regions.

【题目】纳米TiO2 光半导体溶胶对植物光合机能的影响
【中文关键词】纳米; TiO2; 光半导体; 光合作用
【英文关键词】nanometer, TiO2, photosemiconductor, photosynthesis
【中文摘要】TiO2 半导体颗粒的光催化机理类似于人工模拟光合作用, 笔者初步探讨了其在植物体上对光合机能的影响; 以锐钛型纳米TiO2 光半导体溶胶为材料, 在栽培试验中, 对黄瓜喷施不同浓度的纳米TiO2溶胶, 然后测定光合参数、根系活力及叶片丙二醛含量的变化; 结果表明, 黄瓜叶片喷施一定浓度的纳米TiO2 溶胶材料后, 在叶片表面形成透明、连续、稳定的TiO2 薄膜, 能显著促进光合速率的增加, 同时根系活力得到提高。这为纳米TiO2 光半导体材料在农业上的应用提供了一定的理论依据和技术参考。
【英文摘要】The mechanism of TiO2 semiconductor photocatalysis had similarity with artificial photosynthesis.The effects of nano-TiO2 photosemiconductor sol on the photosynthesis of cucumber plants had been firstlyreported in this paper. Anatase TiO2 semiconductor used in the experiment was synthesized by sol- gel methods,and its effects on photosynthesis, activities of root systems and contents of leaf cell malondialdehyde hadbeen studies after spray different concentration of nano- TiO2 sol on cucumber leaves in culturing experiments.The experimental results showed that nano- TiO2 sol could form perfectly adhesive, transparent, continuingand stable films on the surfaces of leaves by which net photosynthetic rates and activities of root systemhad been significantly promoted. These results provided some scientific and technical references for applicationof nanomaterials which using TiO2 as effective ingredients in agricultural research.

【题目】Effect of Potassium on Ultrastructure of Maize Stalk Pith and Young Rootand Their Relation to Stalk Rot Resistance
【中文关键词】钾,玉米茎腐病,超微结构,抗病能力
【英文关键词】potassium (K), maize stalk rot, ultrastructure, disease resistance
【中文摘要】本文利用电镜、植物生理学技术研究了施钾提高玉米抵抗茎腐病的机理,结果表明,施钾可以提高玉米茎杆细胞稳定性,增加细胞壁强度,降低细菌对细胞的浸染。
【英文摘要】To study the mechanism of potassium (K) application on improvement of maize resistance to stalk rot at cellular level,scanning electron microscope and transmission electron microscope were used to observe the effect of K on the ultrastructureof maize stalk pith tissue and young root tip cell influenced by K and pathogen. In K deficient treatment, parenchyma cellsof stalk pith had abnormal structure, and the cell wall between upper and lower adjacent cell was damaged, resulting in theloss of connections between vascular cells and insufficient supporting capacity. However, an improved K nutritionhelped to keep a quite tight arrangement of root cell with thick cell wall, and prevent the invasion of pathogen effectively.Moreover, K treated root cell had abundant golgi apparatus, which could excrete large amount of secretions to degradeмycelium. Papillary and highly electronic intensity dot were accumulated at the invading point to prevent the developmentof the mycelium. Improved K nutrition could increase the resistant ability of maize plant to stalk rot, through keeping cellstructure stability, preventing the expansion of intracellular space to reduce the chances of pathogen invasions, andthrough reinforcing cell wall and formation of intercellular and intracellular material to restrict further development ofpathogen in host cell.

【题目】纳米二氧化硅表面改性及其对阿维菌素吸附和缓释性能
【中文关键词】改性纳米二氧化硅;阿维菌素;控制释放
【英文关键词】Modified nano-SiO2; avermectins; controlled-release
【中文摘要】以纳米SiO2 为原材料,采用硅烷偶联剂KH-570 对其进行表面改性,制备了具有疏水性的改性纳米SiO2,通过SEM、IR 光谱分析以及元素分析,探讨了纳米SiO2 改性后的形貌结构变化,以及其对阿维菌素的吸附和缓释性能。结果表明,经过硅烷偶联剂改性后的纳米SiO2 分散性和亲油性都有了较好的改善,在乙醇中对阿维菌素的吸附率从13.98%提高到31.36%,并对阿维素具有较好的缓释效果,在溶出介质中对阿维菌素的控制释放时间可以持续80 h,所以,经硅烷偶联剂改性后的纳米SiO2 可以作为疏水性药物的控释载体
【英文摘要】Nano-SiO2 surface was modified with the silicon coupling reagent KH570, modified nano-SiO2 was used as a carrier for adsorption and release of avermectins. The experimental results showed that KH-570 was bonded to the nano-SiO2 surface by Fourier infrared(FTIR) spectroscopy, element analysis, the result also indicated the dispersibility of modified nano-SiO2 was improved by scanning electron microscopy(SEM), it has a high absorption capability for avermectins from 13.98% to 31.36% in alcohol with a controlled-release for 80h in medium. Thus, Modified nano-SiO2 can be used as an excellent carrier for hydrophobic drugs.

【题目】Effects of applied urea and straw on various nitrogen fractions in two Chinese paddy soils with differing clay mineralogy
【中文关键词】土壤微生物氮,酸溶有机氮,15N示踪,水稻土
【英文关键词】Soil microbial biomass nitrogen . Clay mineral
type . Acid-hydrolysable organic nitrogen fractions . 15N
tracer. Paddy soils
【中文摘要】用盆栽试验研究了化肥、有机肥和秸秆处理对不同土壤组分氮素存在形态的影响。结果表明,与施用尿素氮相比,秸秆还田显著增加了土壤总氮、酸溶态氮、氨基酸态氮和未知态氮,而降低了土壤固定态铵的含量,增加微生物量氮的比例。同时土壤种不同形态氮的比例受土壤矿物类型和微生物量影响较大。
【英文摘要】Combined application of synthetic nitrogen (N) fertilizers and organic materials can enhance soil quality,but little is known about the distribution of fertilizer N among different soil fractions after crop harvest. A pot experiment using 15N tracer was employed to address this question with three treatments, i.e., labeled urea-only (15NU), labeled urea + rice straw (15NU-S) and labeled rice straw + urea (15NS-U) applied to a Ferallic Cambisol (1:1 type soil clay mineral) and a Calcaric Fluvisol (2:1 clay mineral). Soil microbial biomass N, fixed ammonium (fixed NH4 +), exchangeable ammonium and soil organic N fractions by hydrolysis (6 N HCl) and their isotope abundance were determined after the rice harvest. Soil newly formed N in urea + straw (U-S) treatments (15NU-S, 15NS-U) was the sum of labeled urea-N in 15NU-S andlabeled straw-N in 15NS-U. Compared with 15NU, U-S significantly (P<0.05) increased the content and percentage of newly formed total soil N, acid insoluble N, amino acid N, and hydrolysable unknown N in both soils. In U-S treatment, straw amendment significantly (P<0.05) reduced the content and percentage of newly formed fixed-NH4 +-N in Fluvisol as compared with 15NU treatments. Soil microbes contributed to the larger percentage of newly formed amino acid N (P<0.01) in Cambisol as compared with Fluvisol. Fertilizer N in various soil fractions was therefore strongly affected by clay mineral type and microbes after the combined application of organic materials and synthetic N fertilizer. Keywords Soil microbial biomass

【题目】Effects of Potassium Application on Flavor Compounds of Cherry Tomato Fruits
【中文关键词】钾,樱桃西红柿,口味,风味
【英文关键词】potassium, cherry tomato (l. esculentum var. carasiforme), flavor, volatile compounds, taste compounds
【中文摘要】通过盆栽试验研究了施用钾肥对西红柿果实中挥发性物质、味觉复合物等的影响。结果表明,增加施钾量提高了可滴定酸含量,降低了可溶性糖与可滴定酸的比率。同时发现各种挥发性复合物、可溶糖与可溶性固体关系密切。适量施钾可提高西红柿的风味和口感。
【英文摘要】Apot experimentwas conducted to determine the effects of potassium (K) application onvolatile compounds, taste compounds, and firmness of fresh tomato fruits. Each pot wasfilled with 8 kg of clean sand. The experiment consisted of six K application rates with 0,1.25, 2.5, 5.0, 10.0, and 20.0 mmol K L − 1 in the nutrient solution. Volatile compounds,soluble sugars, soluble solids, titratable acidity, and firmness of fresh tomato fruits weremeasured. The results show that the concentrations of 3-methylbutanal, 1-penten-3-one, hexanal, cis-3-hexenal, 2-methyl-4-pentenal, trans-2-hexenal, 2E-4E-hexadienal,6-methyl-5-hepten-2-one, phenylacetaldehyde, phenylethanol, soluble sugars, and solublesolids tended to increase at first and then decrease between 0 to 10.0 mmol K L − 1.K application rate obtaining the highest values of the concentrations ranged from 1.4 to3.0 mmol K L − 1, with the exception of cis-3-hexenal (1.1 mmol K L − 1), phenylacetaldehyde(4.5 mmol K L − 1), and phenylethanol (4.8 mmol K L − 1). By contrast, increasingK supply increased the concentration of titratable acidity, decreased the ratios of solublesugars to titratable acidity and soluble solids to titratable acidity. Close correlations wereobserved between the concentrations of various volatile compounds, soluble sugars, andsoluble solids. Based on contributions of these compounds to tomato flavor, we assumethat moderate K supply (1.4 – 3.0 mmol K L − 1) improves tomato flavor, whereas tomatofruits with either no K or high K fertilization have poor flavor due to having undesirablelevels of flavor compounds.

【题目】Evaluation of Agro Services International Soil Test Method for Phosphorus and Potassium
【中文关键词】ASI方法,磷,钾,土壤测试
【英文关键词】ASI method, phosphorus, potassium, soil testing, systematical approach
【中文摘要】通过与常规方法比较,验证ASI法在土壤测试和肥料推荐中的可靠性和稳定性。结果表明,ASI 法提取的土壤速效磷与Mehlich 3 P浸提磷的相关性高于其与 Olsen P的相关性,ASI 法提取的土壤速效钾与Mehlich 3 P和醋酸铵浸提钾的相关性均较高。温室试验表明,ASI法浸提的土壤速效磷和钾可反映土壤肥力水平,可用于土壤养分测试和肥料推荐。
【英文摘要】Soil testing is widely adopted as an essential diagnostic tool for identifying soil nutrientfactors that limit sustained crop production. A systematic approach for rapid soil test- 10ing and fertilizer recommendation has been introduced and widely used in China byAgro Services International (ASI), USA. To verify the usefulness and reliability of theASI method in soil testing and fertilizer recommendation in comparison with other commonlyused traditional soil testing methods, 294 soil samples from major agriculturalregions and soil types in China with a wide range of soil pH, from 5.1 to 8.9, were 15taken and analyzed for available phosphorus (P) and potassium (K) by the ASI multielementextraction solution and selected traditional methods, Olsen extractant for P,ammonium acetate (NH4OAc) extractant for K, and multielement extractant Mehlich 3for P and K. Also, 46 soils were selected from

northern China regions for a greenhousetrial with sorghum seedlings to determine if the soil testing values correlate well with 20plant response. Results indicated that the amount of soil P extracted by the ASI method(ASI P) was correlated to both soil extractable P tested by the Olsen extractant (OlsenP) and Mehlich 3 extractant (Mehlich 3 P). The correlation coefficient of ASI P withMehlich 3 P (R2 = 0.86) was greater than that of ASI P with Olsen P (R2 = 0.74) acrossall selected soils. A good correlation was also found between the exchangeable K from 25the ASI method with the traditional ammonium acetate method (R2 = 0.81) and theMehlich 3 method (R2 = 0.85). The results from the greenhouse trial showed that theextractable P and exchangeable K by the ASI multielement extraction solution could beused to represent the fertility status of soil P and K for the selected soils. Regressionanalysis indicated that the relative dry-matter yield of the sorghum plants can be pre- 30dicted with either ASI P and ASI K values with the correlation coefficients (R2) valuesof 0.78 and 0.72 respectively and could be a good measure for soil testing and fertilizerrecommendation in the selected soils and regions in China.

【题目】Performance of an Optimized Nutrient Management System for Double-Cropped Wheat-Maize Rotations in North-Central China

【中文关键词】优化氮肥管理,小麦。玉米,轮作

【英文关键词】Optimized Nutrient Management,Double-Cropped,wheat,maize

【中文摘要】通过田间试验评价了优化的养分管理对华北小麦-玉米轮作体系的作物产量、氮积累、氮肥利用率和效益的影响。结果表明,与农民习惯施肥相比,OPT施肥处理提高了作物产量、养分利用率和效益。

【英文摘要】Overapplication of N and P and insuffi cient supply of K are considered primary reasons for restriction of yield improvement inthe North China Plain. Optimized nutrient management practices based on soil testing and yield targets have been developed.Other large scale fi eld experiments have indicated that additional improvement for yield and nutrient use benefi ts is needed.Th e objective of this study was to evaluate the eff ects of the optimized nutrient management system on yield, nutrient uptake,nutrient utilization, and profi t in the North China provinces of Shanxi, Hebei, Shandong, and Henan. Treatments consisted ofa check without fertilizer use (CK); a balanced, optimum nutrient application (OPT); the farmers ’ practice (FP); and a series ofnutrient omission treatments (minus N, P, and K, respectively). Th e results indicated that the OPT optimized grain yield, nutrientuse effi ciency, and profi tability. Maize (Zea mays L.) yield increased by 12.2% at Shanxi and 18.5% at Hebei, respectively.Inputs of N and P across the wheat (Triticum aestivum L.) and maize system at the four sites was reduced by 13% (266 kg N ha − 1)and 45% (430 kg P2O5 ha − 1), while K input was increased by 43% (265 kg K2O ha − 1). Th e OPT improved both measurementsof nitrogen use effi ciency (NUE); agronomic nitrogen effi ciency (AEN) and nitrogen recovery effi ciency (REN) in the majorityof cases. Although the OPT tested in this study increased yields and nutrient uptake, there remains considerable potential toimprove AEN and REN further for this intensive winter wheat – summer maize rotation system.

【题目】Simulating water content, crop yield and nitrate-N loss under free and controlled tile drainage with subsurface irrigation using the DSSAT model

【中文关键词】作物系统模型,轮作,模型矫正,模型评价
【英文关键词】Cropping system model, Crop rotation,Corn Soybean, Model calibration ,Model evaluation
【中文摘要】通过田间试验与模型模拟相结合,验证DSSAT模型在模拟作物产量方面的作用。结果表明DSSAT模型在模拟地表水含量,土壤硝态氮含量影响和作物产量方面是十分有用的工具。
【英文摘要】In southwestern Ontario, rain-fed crop production frequently fails to achieve its yield potential becauseof growing-season droughts and/or uneven rainfall distribution. The objective of this study was to determineif the Decision Support System for Agrotechnology Transfer (DSSAT) v4.5 model could adequatelysimulate corn and soybean yields, near-surface soil water contents, and cumulative nitrate-N lossesassociated with regular free tile drainage (TD) and controlled tile drainage with optional subsurface irrigation(CDS). The simulations were compared to observations collected between 2000 and 2004 fromboth TD and CDS field experiments on a Perth clay loam soil at the Essex Region Conservation Authoritydemonstration farm, Holiday Beach, Ontario, Canada. There was good model-data agreement for cropyields, near-surface (0 – 30 cm) soil water content and cumulative annual tile nitrate-N loss in both thecalibration and validation years. For both TD and CDS, the CENTURY soil C/N model in DSSAT simulatedwater content and cumulative tile nitrate-N loss with normalized root mean square error (n-RMSE) valuesranging from 9.9 to 14.8% and 17.8 to 25.2%, respectively. The CERES-Maize and CROPGRO-Soybean cropsystem models in the DSSAT simulated corn and soybean yields with n-RMSE values ranging from 4.3 to14.0%. It was concluded that the DSSAT v4.5 model can be a useful tool for simulating near-surface soilwater content, cumulative tile nitrate-N losses, and corn and soybean yields associated with CDS and TDwater management systems.

【题目】Using the DSSAT-CERES-Maize model to simulate crop yield and nitrogen cycling in fields under long-term continuous maize production
【中文关键词】DSSAT模型,作物系统模型,模拟,长期定位试验,
【英文关键词】DSSAT, Cropping system model,CSM-CERES-Maize , Sequential simulation ,Long-term experiment
【中文摘要】研究利用DSSAT和CERES-Maize模型描述了一个50年长期定位试验的作物产量和土壤氮动力学特征,结果表明,模型虽不能预测作物产量,但模拟的产量与其他研究者的结论相符较好,能较好反映出土壤表层的硝态氮变化动态,能反应出施肥处理对作物产量和土壤氮变化的影响。
【英文摘要】Simulation models, such as the DSSAT (Decision Support System for Agrotechnology Transfer)Crop System Models are often used to characterize, develop and assess field crop production practices. In this study, one of the DSSAT Cropping System Model, CERES-Maize, was employed to characterize maize (Zea mays) yield and nitrogen dynamics in a 50-year maize production study at Woodslee, Ontario, Canada (42_130N, 82_440W). The treatments selected for this study included continuous corn/maize with fertilization (CC-F) and continuous corn/maize without fertilization (CC-NF) treatments. Sequential model simulations of long-term maize yield (1959 – 2008), near-surface (0 – 30 cm) soil mineral nitrogen (N) content (2000), and soil nitrate loss (1998 – 2000) were compared to measured values. The model did not provide accurate predictions of annual maize yields, but the overall agreement was as good as other researchers have obtained. In the CC-F treatment, near-surface soil mineral N and cumulative soil nitrate loss were simulated by the model reasonably well, with n-RMSE = 62 and 29%, respectively. In the CC-NF treatment, however, the model consistently overestimated soil nitrate loss. These outcomes can be used to improve our understanding of the long-term effects of fertilizer management practices on maize yield and soil properties in improved and degraded soils.

【题目】Yield Gaps, Indigenous Nutrient Supply, and Nutrient Use Efficiency of Wheat in China
【中文关键词】小麦,基础养分供应能力,养分利用率,产量差
【英文关键词】yield gap, wheat ,indigenous nutrition suppply, nutrition use efficiency
【中文摘要】研究收集并分析了我国长江中下游和华北平原1022个大田试验的资料,处理包括不施肥对照、OPT处理和农民习惯施肥。结果表明,土壤基础养分供应能力为133.0, 30.2和131.7 kg ha – 1,全国范围内OPT处理下的平均N、P、K农学效率分别为9.8, 19.2和7.2 kg kg-1,养分回收率分别为37.9, 19.0和27.0%。从2000年至2008年,施肥量的增加导致养分利用率均降低,但提高了土壤的基础肥力。
【英文摘要】Great advances in food production have been made in China, but the continuous increase of nutrient inputs has caused a seriesof environmental problems. Nutrient management for crops must be improved. Yield gaps, indigenous nutrient supplies, andnutrient use efficiencies (NUEs) must be assessed to design management strategies for further yield increase. In this study, datafrom 1022 field experiments with wheat (Triticum aestivum L.) conducted between 2000 and 2008 in north central China, themiddle and lower reaches of the Yangtze River, and northwest China were analyzed. Treatments in these experiments consistedof a check without fertilizer use, an optimum nutrient application, the farmers ’ practice, and a series of nutrient omission treatments.The results showed that gaps between attainable yields and yields in experimental plots with farmers ’ practices averaged0.76 Mg ha – 1. Indigenous nutrient supplies of N, P, and K averaged 133.0, 30.2, and 131.7 kg ha – 1, respectively, in the regionsstudied. On a national scale and under optimum fertilization, agronomic efficiency of N, P, and K were 9.8, 19.2, and 7.2 kg kg – 1,while recovery efficiencies were 37.9, 19.0, and 27.0%, respectively. Compared with values obtained 10 yr previous, agronomicefficiencies and recovery efficiencies determined between 2000 and 2008 were lower but also lower than world averages. Successiveinputs of large amounts of nutrients significantly increased the indigenous nutrient supply and therefore are contributing tolower NUE because recommendations for N, P, and K have not been adjusted downward in China.

【题目】施氮对高淀粉玉米和普通玉米子粒可溶性糖和淀粉积累的影响
【中文关键词】玉米,糖,淀粉,
【英文关键词】maize, sugar,starch
【中文摘要】:采用田间试验、植株生理生化分析和电镜观察等方法,研究了不同氮肥用量对高淀粉玉米吉单535和普通玉米军单8号子粒糖分与淀粉形成的影响。结果表明,在施氮量0-200kg/ha之间,两品种玉米子粒淀粉含量随着施氮量的增加而增加,过量施氮则淀粉含量降低。灌浆期吉单535子粒蔗糖、果糖、葡萄糖含量均高于军单8号,适量施氮使子粒灌浆期保持较高的蔗糖、果糖和葡萄糖含量,有利于淀粉合成。高淀粉玉米在成熟期淀粉粒充满了细胞,大小均匀,排列有序;普通玉米的淀粉粒则没有充满细胞,大小不一,排列混乱。适宜施氮下淀粉粒大小较为均匀,淀粉粒之间挤压轻微,而过量施氮下淀粉粒相互挤压成多面体状。
【英文摘要】firld experiment was conducted to study the effect the applicatin of N on maize sugar,starch formation in different maize varies.the resuls indicated that the over-fertilizer N decreas the sugar content in maize grain.

【题目】施氮对不同土壤肥力玉米氮素吸收和利用的影响
【中文关键词】春玉米; 氮肥; 土壤肥力; 产量; 肥料利用率
【英文关键词】sp ringmaize; nitrogen fertilizer; soil fertility; yield; nitrogen efficiency
【中文摘要】采用田间试验,研究了吉林省高、低肥力条件下不同氮肥用量对春玉米产量及氮素吸收和利用的影响。结果表明,范家屯和榆树试验点的最高产量施氮量分别为N 251和206 kg/hm2 ,最佳经济施氮量分别为N 227和134kg/hm2。两试验点的最高产量和最佳经济产量均表现为范家屯试验点高于榆树试验点。适宜增加施氮量可显著提高范家屯低肥力试验点玉米氮素最大吸收速率和吸收总量,提前最大吸收速率出现的天数。玉米收获后0—30cm土层残留的硝态氮呈现出随着施肥量的增加而增加的趋势,其中榆树高肥力试验点土壤硝态氮积累明显高于范家屯低肥力土壤。范家屯低肥力试验点氮素的农学利用率、表观回收率和偏因子生产力高于榆树高肥力试验点。范家屯低肥力条件下可通过增施氮肥提高产量;而榆树高肥力条件下则可通过控制氮肥用量达到提高产量和氮肥利用率的双重目标。
【英文摘要】Field experiments were conducted to study the effect of different nitrogen app lication rates on maizeyield, nitrogen up take and utilization under different soil fertilities in J ilin p rovince. The results showed that, the highestN app lication rates undermaximum yieldswere N 251 and 206 kg/ha for Fanjiatun and Yushu respectively,and the economic op timum N app lication rates under economic op timum yieldswere N 227 and 134 kg/ha for Fan jiatun and Yushu respectively. The maximum N absorp tion rate and totalN up take were significantly imp roved with the increasing N app lication rates, and the date of the maximum N absorp tion rate occurred earlier in Fanjiatunsite. The residual nitrate nitrogen in 0 - 30 cm soil p rofile increased with N app lication rates, and nitrate accumula tion in 0 - 30 cm soil p rofile was observed higher in Yushu than that in Fanjiatun. The nitrogen agronomic efficiency, nitrogen recovery efficiency and nitrogen partial factor p roductivity in Fanjiatun with lower soil fertility were higher than those in Yushu with higher soil fertility. In summary, it was suggested that for the site like Fanjiatun with lower soil fertility, the high yield could be reached by increasing N app lication rate, while for the site like Yushu with higher soil fertility, N app lication rate should be controlled in order to increase the yield and imp rove Nuse efficiency.

【题目】施氮对春玉米氮素利用及农田氮素平衡的影响
【中文关键词】春玉米; 施氮量; 土壤硝态氮; 氮肥利用率
【英文关键词】maize; N application; soil NO3-N; N recovery efficiency
【中文摘要】田间试验研究了玉米对不同土壤氮素供应水平下作物氮素吸收利用、土壤氮素供应以及农田氮素平衡的影响。结果表明, 玉米产量随施氮量的增加而显著提高, 当施氮量高于N 240 kg/ hm2 时, 产量有减少趋势; 氮素当季利用率随施氮量的增加逐渐降低。土壤中硝态氮含量在玉米整个生育时期呈现先迅速下降后缓慢升高的趋势; 玉米成熟期, 施氮处理的各层土壤中硝态氮含量显著高于不施氮处理, 各层硝态氮含量基本随施氮量的增加而升高。适量施氮促进玉米对氮素的吸收和利用, 进而提高玉米生物量和产量; 过量施氮导致硝态氮在土壤中大量累积, 提高了硝态氮淋溶风险。施氮处理显著提高了收获后土壤中残留无机氮(Nmin) , 土壤残留Nmin随施氮量的增加而增加; 当施氮量高于N 240 kg/ hm2 时, 残留Nmin有下降趋势。氮素表观损失随施氮量的增加而增加。在本试验条件下, 综合产量、氮肥利用率和土壤硝态氮累积情况考虑, 合理施氮量应控制在N 180~240 kg/ hm2 左右。
【英文摘要】Field experiment was carried out to invest igate N application on plant N uptake and utilizat ion, soil N supply and N balance in spring maize. Results obtained showed that , maize yield increased significantly with the increment of N application rate, and with the trend of decreasing when the nitrogen application rate was higher than N 240 kg/ ha. N recovery efficiency decreased with the N applicat ion rate. Nitrate content in the soil profile throughout the growth stages showed the trends of decreasing rapidly first, and then rose slowly. Nitrogen application signif icantly increased nitratecontent in all layers of soil profile, and nitrate content rose with N application rate. Appropriate rate of nitrogen promoted plant N uptake and utilization, and plant biomass and yields as well. Over use

of N resulted in luxury nitrate accumulation in soils, and therefore enhanced the risk of nitrate leaching into the underground water. At harvest, nitrogen application significantly increased residue mineral N (Nmin) in soils. The residue Nmin in soils rose with N application rate, but the value decreased when N application rate was over N 240 kg/ ha. Under the experimental condit ions, with the consideration of yield, nitrogen ut ilization and soil nitrate accumulation, a reasonable amount of nitrogen application should be controlled at about N 180- 240 kg/ ha.

【题目】不同氮效率玉米干物质形成及氮素营养特性差异研究
【中文关键词】氮效率; 玉米; 干物质; 氮素; 转运
【英文关键词】nitrogen efficiency; maize; dry matter; nitrogen; transportation
【中文摘要】通过田间小区试验, 开展了两个氮素供应水平(N0 和N180) 下, 两个不同氮效率玉米品种[氮高效品种先玉335(V1) 低效品种吉单535(V2)] 干物质形成与氮素营养特性差异研究。结果表明, 在氮素胁迫条件下, 氮高效品种先玉335具有较高的耐低氮能力, 表现为N0 处理其干物质量及吸氮量均显著高于氮低效品种吉单535 的N180 处理。成熟期, 先玉335 的子粒干物质量和吸氮量均显著高于吉单535, 且N180 处理显著高于N0 处理; 品种和氮素处理间的交互作用达极显著水平, 表现为N180 处理先玉335 子粒干物质量和吸氮素最高。另外, 两品种子粒中85.%~97.6%的碳来源于粒重形成阶段叶片的光合作用, 仅2.%~ 14.%源于抽雄前营养体的碳素转移。先玉335 子粒氮素来源更多依赖于生育后期根系对氮素的吸收和转移, N0 和N180 处理中, 根系氮素吸收转移量对子粒的贡献分别为45.%和59.%; 而吉单535 子粒的氮素来源则以生育前期地上部营养体的氮素转移为主, N0 和N180 处理中, 转移量对子粒贡献分别为65.%和67.%。先玉335 的氮肥回收利用率、氮肥农学效率及氮肥偏生产力均高于吉单535。
【英文摘要】Field experiment was conducted to investigate dry matter accumulation and N uptake under two N levels (N0and N180) in two maize cultivars with contrasting N use efficiency. The results indicated that Xianyu 335 with high N efficiency had great tolerance to N stress. The dry matter weight and N absorption of Xianyu 335 in N0 treatment were both higher than those of Jindan 535 in N180 treatment. In maturity stage, the dry matter weight and N absorption of grain in Xianyu 335 was significant higher than Jidan 535, and those in N180 treatment was higher than N0 treatment . Moreover,the interaction between variety and N application reached extremely significant level. The dry matter weight and N absorption of grain was highest in Xianyu 335 with 180 kg/ ha N application. In addition, a majority of grain carbon (85.% - 97.%) relied on photosynthesis in the stage of grain formation, only a minority of grain carbon (2.% -14.%) relied on carbon translocat ion from vegetative organs. For Xianyu 335, nitrogen in grain mainly relied on N uptake by root at reproduct ive stage, which accounted for 45.% and 59.% of total N of grain in N0 and N180 treatmentrespectively; but for Jidan 535, N in grain mainly relied on N translocation from vegetative 335 the nitrogen recovery use efficiency (NRUE) , nitrogen agronomic eff iciency (NAE) and nitrogen partial factor productivity organs, which accounted for 65.% and 67.% of total N grain in N0 and N180 treatment respect ively. In Xianyu (NPFP) were all higher than Jidan 535.

【题目】不同氮肥管理措施在华北平原冬小麦上的应用效果
【中文关键词】冬小麦,氮肥管理,基肥,追肥

【英文关键词】Winter wheat; Nitrogen fertilizer management; Basal nitrogen; Topdressing nitrogen
【中文摘要】在河北省衡水和辛集两试验点,采用田间试验研究了不同氮肥用量和不同基追比例对冬小麦生长、产量和土壤氮素变化的影响。结果表明,在衡水试验点,由于土壤基础肥力较高,土壤本底供氮量能满足小麦返青期前的正常生长,施氮肥对小麦增产无效,但与施基肥处理相比,不施基肥、仅在拔节和孕穗期2:1分次追肥显著提高了氮肥利用率;在辛集,不施基肥显著影响小麦返青前的生长,60 kg N /ha能满足小麦拔节前的正常生长,不施基肥、仅在拔节后追肥不能消除前期氮缺乏对小麦生长和高产的影响,240 kg N /ha以基追比1:3施用时能获得较高的产量和氮肥利用率。冬小麦生育期田间氮肥表观损失主要来源于冬前追肥,但中后期追肥比例过大也增加了收获后土壤的无机氮残留。由于土壤的肥力和质地不同,相同的氮肥管理方法在两试验点对小麦的生长、产量和氮肥利用率的影响差异较大,因此,为达到作物高产和氮肥高效,对氮肥的同步调控应结合作物养分阶段需求、土壤养分供应特征和土壤肥力、质地的区域分异特征分区进行。
【英文摘要】The field experiments were conducted to investigate the effects of different nitrogen fertilizer rates and the ratio between basal nitrogen and topdressing nitrogen on winter wheat growth, grain yield and the change of soil nitrogen content in Hengshui and Xinji, in Hebei province, respectively. The results showed that indigenous nitrogen supply could meet the demand of nitrogen for winter wheat normal growth befor regreen stage because of higher soil fertility, and the applied nitrogen fertilizer did not significantly increase wheat grain yield in Hengshui sites, but the application of topdressing nitrogen only at shooting and booting stages at the ratio of 2:1 significantly increased nitrogen use efficiencycompared with the treatments applied basal nitrogen and topdressing nitrogen; in Xinji site, 60 kg N /ha could meet the demand of nitrogen for wheat growth before shooting satge, and all nitrogen were applied as topdressing at shooting stage did not eliminate the effect of nitrogen deficient at early growth stage on wheat growth and high grain yield, the application of 240 kg N /ha at the ratio of 1:3 between basal nitrogen and topdressing nitrogen at shooting stage achieved higher grain yield and nitrogen use efficiency compared with other treatments. The apparent nitrogen loss during winter wheat growth season mainly came from basal nitrogen, but high topdressing nitrogen rates at mid- later stages also increased soil Nmin residual after harvest. Because of the variation of soil fertility and textures, the effect of the same nitrogrn managements method on winter wheat growth, yield and nitrogen use efficiency in two sites were different, so for higher crop yield and higher nitrogen fertilizer use efficiency, the synchronizing regulation of nitrogen fertilizer should combine crop nutrient demand, nutrient supply from soil and regions variation characters of soil fertility and textures.

【题目】吉林省玉米种植区土壤养分空间变异特征研究
【中文关键词】GIS; 空间变异; 地统计学; 克里格插值
【英文关键词】GIS; spatial variability; geostatistics analysis; Kriging
【中文摘要】本文以吉林省中部玉米种植区9 县市为研究区域,采用传统统计学和地统计学相结合的研究方法,探讨研究区域表层土壤(0—20 cm) 有机质、全氮、碱解氮、有效磷、速效钾和pH 值的空间变异特征。结果表明: 各养分的变异系数在10% ~ 100%之间,属中等变异; 有机质、碱解氮、有效磷和速效钾的块金值(C0) 与基台值(C0 + C) 比值介于25% ~ 75%之间,表现出中等强度的空间自相关,而全氮和pH 值表现强烈的空间自相关; 根据决定系数(R2) 和残差平方和(RSS) 进行模型选择,几种养分均用指数模型拟合的效果较好; 依据GIS 所做的养分空间变异图可以很好地反应该地区的土壤养分空间分布状况,可以为该地区土壤养分的综合评价和施肥管理决策提供依据
【英文摘要】Statistics and geostatistics methods were adopted to study spatial variations of soil nutrients including total nitrogen (N) ,available N,available phosphorus (P) ,available potassium (K) ,organic matter and pH in top soils from nine counties /cities in main production areas of Jilin province.The results show that the variation coefficients of the soil nutrients are from 10% to 100%,which indicate that the variations are at their medium levels.The spatial structures (nugget /sill) of available N,available P available K and organic matter are from 25% and 75%,which indicate moderate spatial self-correlations,while pH and total N are strong spatial self-correlations.According to thedecisive coefficients and the least residual sums of squares(RSS) for the model selections,all nutrients are fitted to exponential model well.The GIS-based nutrient spatial variability figures can reflect spatial distributions of the soil nutrients and provide theoretical bases for soil nutrient management and decision-making in the study area.

【题目】最佳养分管理对华北冬小麦养分吸收和利用的影响
【中文关键词】冬小麦; 最佳养分管理; 养分吸收和利用
【英文关键词】winter wheat; optimum nutrient management; nutrient up take and utilization
【中文摘要】针对华北地区小麦施肥过量和不平衡、产量和肥料利用率较低的现象,进行了河南、山东、河北3个小麦主产区最佳养分管理、农民习惯施肥和减素处理对冬小麦产量、养分吸收、利用和经济效益影响的田间试验。结果表明,在山东和河北较高肥力地区,最佳施肥处理(OPT)与农民习惯施肥(FP)处理相比在减少氮肥施用5.%和43.%的情况下,分别提高氮肥回收利用率7.和4.个百分点; 在河南低肥力地区,OPT处理在比FP处理增加10%氮肥施用量的情况下,冬小麦增产12.%,氮肥回收利用率提高了13.个百分点。同时,OPT处理钾肥和磷肥的回收利用率也有不同程度的提高。由于地区土壤肥力和养分供应能力变异较大,基于土壤养分测定和目标产量的优化养分管理很有必要且切实可行。
【英文摘要】Over-se and unbalanced fertilization is the most important problem forwheat p roduction in North China Plain, and it is one of reasons for low yield and low nutrient use efficiency. Field experiments were conducted to study the effects of op timum nutrient anagement practice (OPT) , farmers practice (FP) and a check without fertilization (CK) on wheat yield, nutrient up take and

utilization, and net return of winter wheat production in Henan,Shandong and Hebei Provinces. The results show that the N recovery efficiencies of the OPT treatment in fields with high soil nutrient levels in Shandong and Hebei Provinces are increased by 7.7% and 4.5% respectively, under the reductions of N fertilizer by 5.4% in Shandong and 43.8% in Hebei; While in Henan Province with low soil nutrient level, winter wheat yield and N recovery efficiency are increased by 12.5% and 13.0% under the balanced OPT treatmentwith only 10% more N fertilizer input. In addition, P and K recovery efficiencies of the OPT treatment are improved as well. Because there are significant variations of soil fertility and nutrient supplying ability among regions, the soil test and target yield management practice is a feasible approach for optimum fertilization.

【题目】氮肥减施对稻-麦轮作体系作物氮素吸收、利用和土壤氮素平衡的影响
【中文关键词】氮肥减施; 稻-麦轮作; 氮肥利用率; 土壤无机氮
【英文关键词】reducing N application; rice-wheat rotation; N use efficiency; soil mineral N
【中文摘要】田间试验研究了稻-麦轮作体系中减施氮肥对作物氮素吸收、利用和土壤氮素平衡的影响。结果表明,与当地习惯施肥(小麦: N 225 kg/hm2 ,基肥与分蘖肥各半; 水稻: N 210 kg/hm2 ,基肥和分蘖肥为3∶2)相比,减氮20%~30%处理产量并没有降低,而氮肥当季利用率、氮素农学利用率以及氮素偏因子生产力则有所增加; 而且,氮肥分次追施,能增加子粒产量,并减少氮肥成本。虽然减氮20% ~30%处理0—40 cm土层无机氮含量较习惯施肥处理降低,但是并没有降低植株地上部对氮素的吸收。在小麦和水稻收获期,减施氮肥处理0—100 cm土壤无机氮残留量低于习惯施肥处理; 且稻-麦轮作系统中氮的表观损失主要发生在水稻季。初步认为,在长江中下游平原稻-麦轮作体系氮素过量施用地区,第一个轮作周期减施氮肥20% ~30%不仅不影响产量,而且可提高氮素利用率,有利于保护环境。
【英文摘要】The effects of reducingN application on plan N uptake, utilization, and soil N balance in rice-wheat rotation system were studied using field experiments. The results show that compared with farmers p ractice for N fertilization, N 225 kg/ha for wheat with 1 /2 basal and 1 /2 topdressing at the tillering stage and N 210 kg/ha for rice with the ratio of 3 ∶ 2 for the basal and tillering applications, the grain yields are not decreased under the N app lication amounts with a reduction by 20%- 30% , while the N recovery efficiency, N agronomic efficiency, and N partial factor productivity are increased. Moreover, topdressing N fertilization can increase the grain yields and reduce the cost of the fertilization. Although both soilmineral N content and accumulation are reduced, the N absorptions by crops are not reduced accordingly. There is less residual soil mineral N in 0 - 100 cm layer at the harvest stagesof wheat and rice compared to that of the farmerps practice. In addition, the loss of apparent N in the rice-wheat system is mainly occurred in the rice season. Therefore, it is preliminarily concluded that the reducing N app lication by 20%- 30% is a feasible N management practice under the first rice-wheat rotation system in the middle-lower Yangtze plain with over N fertilization.

【题目】氮肥减量后移对土壤氮素供应和夏玉米氮素吸收利用的影响
【中文关键词】氮肥后移;夏玉米;氮肥利用率;硝态氮
【英文关键词】Posting N application; Summer maize; N use efficiency; NO3--N
【中文摘要】采用田间试验研究了氮肥减量后移对土壤氮素供应和夏玉米氮素吸收利用的影响。结果表明,与农民习惯施肥(N240 kg/hm2,基肥和大喇叭口追肥为1:2)相比,氮肥减量后移(N168kg/hm2,基肥、大喇叭口肥和吐丝肥为1:3:1)处理的产

量、植株干物质积累量、植株氮积累量和积累速率均没有降低,而氮肥利用率显著增加。氮肥减量后移可使耕层无机氮供应与作物吸收较好的同步,降低收获期0-100cm土层硝态氮积累,减少氮素的田间表观损失。基于夏玉米不同生育阶段的氮素吸收特征进行氮肥减量后移可节省氮肥30%,是较为理想的氮素施用方式。

【英文摘要】Field experiment was conducted to investigate the effect of reducing and postponing N application on soil N supply、plant N uptake and utilization in summer maize. The result showed, reducing and postponing N application (N 168kg/hm2, 1/5 basal, 3/5 topdressing at stalk enlongation stage and 1/5 topdressing at silking stage respectively) improved N use efficiency without decreasing of grain yield、dry biomass accumulation、N accumulation and N accumulation rate compared with farmers ’ practice (N 240 kg/hm2, 1/3 basal and 2/3 topdressing at booting stage, respectively). Moreover, reducing and postponing N application can improve synchronization of soil N supply and crop demand during maize growth stage, decrease NO3--N accumulation of 0-100 cm soil profile and reduced field apparent N loss at maturity. Therefore it was concluded that reducing and postponing N application based on summer maize N uptake at different growth stages was a feasible N management practice, and nitrogen fertilizer could be saved by 30% as compared with farmers ’ practice.

【题目】氮肥运筹、配施有机肥和坐水种对春玉米产量与养分吸收转运的影响

【中文关键词】氮肥运筹; 春玉米; 产量; 干物质积累; 养分吸收转运

【英文关键词】nitrogen fertilizer management ; spring maize ; yield ; dynamics of dry matter accumulation ; nutrient uptake and translocation

【中文摘要】采用田间试验方法,研究了氮肥运筹、配施有机肥和坐水种对春玉米产量与养分吸收转运的影响。结果表明,适宜氮肥运筹方式、配施有机肥和坐水种均能显著增加春玉米产量,氮肥两次追肥处理的产量较一次追肥处理的产量增加10.6 %~17.0 % ,配施有机肥增产10.3 %~18.0 % ,坐水种增产9.1 % ,配施有机肥并坐水种增产20.4 %。氮肥两次追施、配施有机肥及配施有机肥并坐水种均能显著提高春玉米干物质最大积累速率和积累总量,分别提高干物质最大积累速率11.1 %~29.5 %、28.0 %~28.8 %和32.1 % ,依次提高干物质积累总量11.9 %~15.5 %、21.2 %~24.4 %和26.9 %。氮肥两次追施、配施有机肥和坐水种均可提高N、P、K养分最大吸收速率和吸收总量,养分最大吸收速率以K最高,N 居中,P 最低; 养分吸收总量以N 最高,K居中,P 最低; 养分最大吸收速率出现的时间以K最早(57.2~60.4 d) ,N 居中(65.3~68.5 d) ,P 最晚(71.4~74.8 d) ,三者均早于干物质积累最大速率出现的时间(82.5~89.3 d) 。氮肥两次追施、配施有机肥和坐水种均有利于N、P、K养分由营养体向子粒的转运量、转运效率、子粒中养分含量以及氮肥利用率的提高,养分转运效率以P 最高(59.3 %~66.1 %) ,其次是N (41.5 %~55.1 %) ,K最低(35.9 %~38.0 %) 。在本实验条件下,施氮量为225 kg/ hm2 ,基肥∶拔节肥比1∶3 ,配施有机肥结合坐水种,为最佳施肥处理。

【英文摘要】This study was conducted to determine the effects of nitrogen fertilizer management , organic manure application and bed-irrigation sowing on maize yield , dry matter accumulation , uptake and translocation of N , P and K, and nitrogen recovery rate. The results showed that proper nitrogen fertilizer management , organic manure application and bed- irrigation sowing significantly increased spring maize yield. The average yield increase was 10.6 %- 17.0 % for nitrogen fertilizer top-dressing for two times, 10.3 %- 18.0 % for organic manure application , 9.1 % for bed-irrigation sowing ,and 20.4 % for the combined organic manure application and bed-irrigation sowing compared to nitrogen fertilizer top-dressing for one time , respectively. Significant increase in rate of maximum dry matter accumulation and total accumulation amount of dry matter was observed by nitrogen fertilizer top-dressing for two times , organic manure application , and the combined organic manure application and bed-irrigation sowing compared to nitrogen fertilizer top-dressing for one time , with respective increase of 11.1 %- 29.5 % , 28.0 %- 28.8 % and 32.1 %for rate of maximum dry matter accumulation , and 11.9 %- 15.5 % , 21.2 %- 24.4 % and 26.9 %for total accumulation amount of dry matter. Maximum uptake rate and total uptake amount of N , P and Kincreased obviously by nitrogen fertilizer top-dressing for two times , organicmanure application , and the combined organic manure application and bed-irrigation sowing. A general order was followed by K > N > P for maximum nutrient uptake rate , N > K > P for total nutrient uptake amount , and K (57.2- 60.4 d) > N (65.3 – 68.5 d) > P (71.4 – 74.8 d) for the appearing time of maximum nutrient uptake rate , whichwere earlier than that of maximum accumulation rate of dry matter (82.5 - 8913 d) . Remarkable increase in translocation amount and efficiency of N , P , Kfrom vegetative organs to grains ,

nutrient content in grain , and nitrogen recovery rate was found by nitrogen fertilizer top-dressing for two times , organic manure application and bed-irrigation sowing , and proportion of nutrients in grains was followed by P (59.3 %- 66.1 %) > N (41.5 %- 55.1 %) > K (35.9 %- 38.0 %) .Under the experiment conditions , the recommend fertilizer formula was nitrogen applied 225 kg/ ha with 1/ 4 nitrogen fertilizer applied as basic fertilizer and 3/ 4 as jointing fertilizer combined with organic manure application and bed-irrigation sowing.

【题目】氮肥运筹对水稻农学效率和氮肥利用率的影响
【中文关键词】氮肥,SPAD值,氮肥利用率,产量
【英文关键词】N, SPAD values, nitrogen use efficiency, yield
【中文摘要】通过田间试验,以不同氮肥量级为参照,结合关键生育期叶片叶绿素含量(SPAD值)指导氮肥施用,以探明潜江地区水稻关键生育期的氮肥适宜用量。结果表明,在施N 90~180 kg/hm2之间水稻产量差异不显著,当超过N 180 kg/hm2,产量降低。根据水稻产量(y)和施氮量(x)拟合得出一元二次关系式:y=-0.0728x2+22.335x+6811.5,R2=0.9442。结合当年水稻价格,肥料投入费用等计算出水稻的经济效益(y)和施氮量(x)之间的函数式:y=-0.134x2+37.097x+12533-M,R2=0.9331;由此得出经济效益最大时水稻的施氮量是N 138 kg/hm2。该施氮量下水稻的氮肥表观利用率、农学利用率和氮肥偏生产力可保持在40.9%、11.5 kg/kg和63.2 kg/kg,与完全依据SPAD值指导关键生育期的氮肥施用量相近似(N 140 kg/hm2),保证了水稻最大的经济效益,同时也保持了较高的氮肥利用率,降低氮素表观损失。
【英文摘要】the field experiments were conducted to study the appropriate N rates in critical growing stages for rice.the results indicated that the application of N at critical growing stages of rice based on SPAD values of leaves can decrease N loss,obtain high N ue,grain yield and profits.

【题目】氮钾水互作对玉米苗期植株生长及钾素吸收的影响
【中文关键词】氮钾水互作; 植株生长; 钾素吸收
【英文关键词】ppotassium, plant grow,potassiun uptake
【中文摘要】采用盆栽试验方法探讨了氮钾水互作对玉米苗期植株生长及养分吸收的影响。结果表明, 水分适宜能明显增加玉米植株株高和干物重, 水分适宜条件下玉米株高和干物重较水分亏缺条件的分别增加7 8% 和13 8%。增施氮肥能显著增加玉米植株株高和干物重, 水分适宜条件下中氮水平的玉米株高和干物重分别较低氮水平的增加10 4%和8 7%, 而水分亏缺条件下株高和干物重均随施氮水平的增加而明显增加; 水分亏缺条件下, 中高量施钾能显著增加玉米植株干物重。水分适宜条件下增施氮肥能明显促进玉米对钾素的吸收, 在水分适宜和亏缺条件下, 不同氮水平的玉米钾素吸收均随施钾水平的增加而显著增加。
【英文摘要】A pot experiment was conducted to study the interactive effects of nitrogen, potassium and water on plant growth and potassium uptake of corn seedling. The results showed that height and dry weight of corn plant under appropriate water condition significantly increased by 7.8% and 13.8% than those under deficit water condition. Significant increases in height and dry weight of corn plant by increasing nitrogen application were found, with respective increase of corn height and dry weight by application of medium nitrogen level being 10.4% and 8.7% under the appropriate water condition, and distinct increasing tendency with increasing nitrogen application under the deficit water condition. Distinct increase in dry weight of corn plant by application of medium and high potassium levels under the deficit water condition was observed. Increasing nitrogen application significantly promoted potassium uptake of corn plant under the appropriatewater condition. Whereas potassium uptake of corn plant under the appropriate or deficit water condition remarkably tended to increase with increasing potassium for different nitrogen levels. Key wor ds: interactive effects of nitrogen, potassium and water; plant growth; potassium uptake

【题目】影响农杆菌介导草菇遗传转化的因素研究
【中文关键词】草菇; 农杆菌; 遗传转化; 转化效率
【英文关键词】Volvariella volvacea; Agrobacterium tum efaciens; transformation; transfer efficiency
【中文摘要】以草菇Volvariella volvacea菌株V51为受体材料,用农杆菌Agrobacterium tum efaciens介导法转入抗冷冻蛋白基因(afp) ,探索不同的转化受体、农杆菌种类、乙酰丁香酮(AS)的浓度、共培养的温度、时间等因素对转化效率的影响,并采用PCR及Southern杂交检测afp基因是否整合到草菇的基因组中. 结果表明:以D660 nm为0115的EHA105为侵染的农杆菌菌株,加入200 μ mol/L AS进行预培养,侵染菌丝球后转入含有AS为200 μ mol/L的IMA培养基上, 28 ℃,共培养60 h为最佳转化条件. PCR与Southern杂交结果证明afp基因已整合到草菇的基因组中.
【英文摘要】afp gene was transformed into Volvariella volvacea via Ag robacterium tum efaciens. We evaluatedsome critical factors influenced transfer efficiency, including exp lant, Agrobacterium strain, concentrationof acetosyringone (AS) , temperature and time of co2culture. The integration of afp gene into V. volvaceagenome was determined by PCR and Southern blot. The results showed that effective transformation wasacquired when mycelium pellets inoculated with A. tum efaciens strain EHA105 with a op tical density atD660 nm of 0115, p re2culture with 200 μ mol/L AS, co2cultivation for 60 h at 28 ℃ on IMA medium contai2ning 200 μ mol/L AS.

afp gene had been introduced into V. volvacea with Agrobacterium 2mediated transfor2mation successfully.

【题目】玉米不同器官元素分布对施肥的响应
【中文关键词】:元素分布;施肥;玉米
【英文关键词】element distribution; fertilizer application; maize
【中文摘要】设置不施肥(CK)、施氮磷肥(NP)、施氮钾肥(NK)、施磷钾肥(PK)、施氮磷钾肥(NPK)5 个处理,用田间试验方法研究了成熟期农大108 玉米茎秆、叶片、籽粒的干重以及N、P、K、Cu、Zn、Fe、Mn 等元素分布对不同施肥处理的响应。玉米干重及元素含量在不同器官的分布存在差异,N 含量为叶片>籽粒>茎秆,P 含量为籽粒>叶片>茎秆,K 含量为茎秆>叶片>籽粒,Fe 含量为叶片>茎秆>籽粒。施肥降低了不同器官间N、P、K、Fe 元素含量的差异,改变了不同器官干重与Cu、Zn 元素含量在整株中的相对比值。除个别处理外,N、P、Fe 与Cu、Zn 元素的对施肥的响应趋势具有一致性。同时,玉米不同器官元素分布对不同肥料组合的响应存在差异性,N、P、K 元素对不同肥料组合响应程度较大,Cu、Zn、Fe、Mn 微量元素响应较小;玉米茎、叶对不同肥料组合响应程度较大,籽粒较小。从总体上看,NPK 处理对玉米元素分布的影响高于NP、NK、PK 处理。另外,玉米不同器官元素的分布受肥料交互效应的影响。不同肥料配施对玉米不同器官元素分布影响的趋势与程度既存在共性也存在差异性,通过调整施肥可以改善作物养分在不同器官的分布,促进养分的吸收和良性循环,从而达到优质高效生产的目的。
【英文摘要】Five fertilizer treatments were designed, i.e.no fertilizer (CK), nitrogen-phosphorus fertilizer (NP), and nitrogen-potassium fertilizer (NK),phosphorus-potassium (PK), and nitrogen-phosphorus-potassium fertilizer (NPK). A field experiment on the response of biomass dry weight and N, P, K, Cu, Zn, Fe, Mn element distribution in stem, leaf and seed of maize to different fertilizer application treatments was carried out. The results showed that dry weight, element content of various organs of maize were different. N content in various organs was in the order of leaf >seed>stem; P content was in the order of seed>leaf>stem; K content was in the order of stem>leaf>seed; Fe content was in the order leaf >stem>seed. Fertilizer application reduced the differences in N, P, K, and Fe content in various organs, and changed the ratio of between dry weight and the Cu, Zn contents in leaf, seed and stem. Except for afew treatments, the response trend of N, P, Fe elements to fertilizer application was similar to Cu and Zn. The response of element content in various organs of maize to different fertilizer combinations was also different. The response extent of the major elements of N, P and K to fertilizer application was larger than microelements Cu, Zn, Fe, and Mn. The response extent of stem and leaf was larger than seed. The response of elements to NPK fertilizer treatment was bigger than NP, NK, and PK. On the whole, response differences of element distribution to various fertilizer treatments were not remarkable. Besides, element distribution in various organs of maize was also influenced by the mutual effect of fertilizer varieties. The response trend and extent of various element distributions to different fertilizer treatments had both similarities and differences. Adjusting fertilizer application could change the biomass dry weight and element distribution in various organs of maize, thus promoting the uptake and cycle of nutrients. This investigation has provided a useful information for high yield production.

【题目】相对SPAD值用于不同品种夏玉米氮肥管理的研究

【中文关键词】夏玉米,相对SPAD值,氮肥管理,营养诊断
【英文关键词】Summer maize, relative SPAD values, nitrogen fertilizer management, nutrient diagnose
【中文摘要】采用田间试验研究了相同氮肥处理不同玉米品种和生育期间的SPAD值差异和基于相对SPAD阈值的氮肥管理对氮肥用量、籽粒产量、氮肥利用率和土壤氮素变化的影响。结果表明,玉米各关键生育期的SPAD值随施氮量的增加而增加,不同玉米品种和不同生育期间的绝对SPAD值差异显著,利用相对SPAD值可消除不同品种和生育期间的SPAD值差异;生育期追肥量和总施肥量均随相对SPAD阈值的增加而增加,基于相对SPAD阈值的氮肥管理能在保持高产的同时较农民习惯施肥显著降低氮肥用量、田间氮素表观损失和收获后土壤无机氮残留、提高氮肥利用率;本试验条件下,保持两品种玉米高产高效的适宜相对SPAD阈值为0.95-0.98。
【英文摘要】The field experiments were conducted to investigate the differences of SPAD values between different maize varieties and growth stages and the effects of nitrogen(N)fertilizer management methods based on relative SPAD critical values on N rates, grain yield, N use efficiency and the change of soil N content. The results showed that maize SPAD values of critical growth stages increased with increasing N rates, the differences of absolute SPAD values among maize varieties and growth stages were significant, the relative SPAD values can eliminate the differences among different maize varieties and growth stages. The rates of topdressing N and total N increased with increasing provided relative SPAD critical values, N fertilizer management methods based on relative SPAD critical values can decrease N rates, field N apparent loss, soil imorgance N residual after maize harvest and increase N use efficiency while keeping higher grain yield compared with farmer fertilizer practice; in this experiment condition, the feasible relative SPAD critical values range ensuring higher grain yield and higher N use efficiency of two maize varities was 0.95-0.98.

【题目】节水灌溉对黄淮海地区冬小麦水分消耗与
【中文关键词】冬小麦; 节水灌溉; 耗水特性; 光合特性
【英文关键词】Winter wheat; water-saving irrigation; water consumption characteristics;photosynthetic and physiological characteristics

【中文摘要】2008~2009年在大田试验条件下研究了节水灌溉对冬小麦耗水特性、光合特性、产量及水分利用效率(WUE)的影响。结果表明,小麦播种至拔节期,以消耗0-40 cm土层水分为主,在此期间42 mm降水条件下,不灌冻水处理在拔节前0-40 cm土层达到重度水分亏缺,灌冻水处理只为轻度水分亏缺。前期重度水分亏缺对后期根系吸收深层水分和旗叶光合速率起到显著影响。轻度水分亏缺条件下,气孔导度下降,蒸腾速率随之降低; 而光合速率可得以维持,单叶水分利用效率提高。随灌水次数增加,总耗水量加大,土壤水和降水的消耗比例显著降低。产量、WUE与耗水量均呈二次曲线关系,但变化趋势不一致,两曲线在耗水量360 mm处相交,为两者理论上最佳结合点。本试验中,冻水+拔节水处理产量最高,达到7753 kg/hm2 ,比不灌水处理(W0)提高了40.2% ,WUE值为119 kg/m3 ,与W0处理差异不显著,为本试验的最优节水高产灌溉方案。

【英文摘要】Field experimentswere conducted during 2008 - 2009. The objective of the research was to find effects ofWater-saving irrigation on water consump tion, photosynthetic characteristic, grain yield and water use efficiency (WUE) of winterwheat. The results showed that, during sowing to jointing stages, under 42 mm p recip itation condition, available water content of 0 - 40 cm soil layer decreased significantly, 0 - 40 cm soil layer of all treatments (excep twintering and jointing treatment)was under seriouswater stress, while wintering and jointing treatment only under lightwater stress. Seriouswater stress before jointing stages remarkably affected root to absorb water in deep soil layer and photosynthetic rate ofwheat in late stages. With increase of irrigation times, totalwater consumption increased, but the percentage of soil-water consump tion and p recip itation consump tion decreased. Under lightwater stress condition, stomatal-conductivity decreased, consequently reduced transp iration rate, but p reserved the netphotosynthetic rate, soWUE of leaves increased. There was a conic relationship between grain yield, WUE and water consump tion, but the two conics did not have the same variation tendency. A point of intersection at 360 mm water consump tion was found which indicated the best combining site of grain yield andWUE. Grain yield of winte-ring and jointing treatment was 7753 kg/ha, which increased 40.2% compared to no irrigation treatment (W0).WUE of wintering and jointing treatmentwas 1.9 kg/m3 , which did not differ withW0. To this effect, wintering and jointing treatmentwas the best water-saving and high yielding treatment under experimental conditions.

【题目】钾素对玉米茎腐病抗性反应中糖类物质代谢的影响
【中文关键词】钾; 玉米茎腐病; 抗性; 糖代谢; 酶活性
【英文关键词】potassium; corn stalk rot resistance; sugar metabolism; enzyme activity
【中文摘要】通过砂培试验比较人工接种禾谷镰刀菌(Fusarium gram inearum)后, 不同钾处理对玉米幼根中糖含量及糖代谢关键酶活性和基因表达的影响。结果表明, 不施钾处理中, 接菌比未接菌处理玉米幼根中蔗糖和葡萄糖含量显著降低, 且蔗糖的下降速率高于葡萄糖的下降速率。随着病原菌入侵时间的延长, 不施钾处理葡萄糖与蔗糖比值显著升高, 接菌8 d后, 缺钾幼根葡萄糖与蔗糖的比值是充足供钾幼根的近10 倍。此外, 钾素有利于病原菌入侵,中蔗糖合成酶(SS)和蔗糖磷酸合成酶(SPS)活性提高, ss和sp s 基因表达量增加; 而缺钾处理中, ss基因的表达量几乎没有发生变化, sp s基因的表达量在接菌后6 d才有所增加。说明在病原菌入侵后, 钾素可以通过调节受侵染组织糖代谢相关酶的活性, 协调受侵染部位糖代谢过程, 增强抗病能力。
【英文摘要】The effects of potassium on sucrose and glucose content, sugar metabolism related enzyme activity and the expression of related genes in maize root infected with Fusar iumgram inearum were studied under sand- culture experiment. The results showed that under K stress, pathogen infection led to significant decrease of sucrose and glucose contents. The sucrose content declinedmore quickly than that of glucose. With the process of infection, the ratio of glucose to sucrose increased in no potassium applied treatment; 8 days after infection, the ratio was 10 times higher in K deficient roots than in K adequate roots. Besides, after inoculation, the activity of sucrose phosphate synthase (SPS) and sucrose synthase (SS) were increased as well as the gene expression of spsandssin potassium treated maize root .In K-treatment, spsgene expression increased in 6 days after inoculation, and nochange of ssexpression was observed in K-stressed root. This study demonstrated that K could enhancemaize resist-ance to stalk rot by regulating sugar metabolism elated enzyme, consequently, mainta in the optimal sugarme tabolism in infected position, and enhance the resistance to stalk rot.

【题目】钾素营养对玉米生育后期干物质和养分积累与转运的影响
【中文关键词】玉米; 干物质; 氮; 磷; 钾; 养分积累; 转运
【英文关键词】maize ; dry matter ; nitrogen ; phosphorus ; potassium; accumulation ; translocation
【中文摘要】为揭示钾素营养与玉米产量形成的关系,研究了3 个施钾水平(K2O 0、113 和225 kg/ hm2) 对玉米生育后期植株不同器官干重及氮、磷、钾积累和转运的影响。结果显示,施钾能显著提高玉米产量。随着施钾量的增加,玉米生育后期干物质积累的最大速率和平均速率提高,最大速率出现时间提前。玉米干物质在各器官中的分配比例随生长发育中心的转移而变化。生育后期干物质和养分由营养体向子粒转运,其中干物质和氮、磷主要来源于穗部营养体的转运,而钾则主要来源于叶片的转运。子粒中氮、磷、钾的积累量分别占总积累量的50.3 %~57.1 % ,59.6 %~67.2 %和14.0 %~33.3 %。施钾不但能增加子粒中干物质和氮、磷、钾养分的分配比例,而且还有助于提高干物质和氮、磷、钾养分向子粒转运的转运率。氮的转运率以K1 处理(K2O 113 kg/ hm2) 最大,为45.7 %; 干物质、磷和钾的转运率以K2 处理(K2O 225 kg/ hm2) 最大,分别为7.4 %、62.6 %和22.4 %; 子粒养分中54.5 %~60.6 %的氮,56.0 %~85.8 %的磷及52.4 %~100.0 %的钾可以依赖于营养体的转运。
【英文摘要】Field experiment was conducted to study the effect of potassium (K) nutrition on dry matter and nutrient accumulation and distribution under three Klevels (K2O 0 , 113 and 225 kg/ ha) at reproductive stage of maize to explore the relationship between K nutrition and grain formation in maize. Results indicated that maize yield was significantly increased by K application. Both the maximum and average dry matter accumulation rate was accelerated , and the maximum dry matter accumulation rate occurred early by K application. The distribution proportion of dry matter in different organs varied distinctly. Dry matter , N and P in grain were mainly translocated from spike , and K in grain was mainly translocated from leaves. The contribution percentage of grain nutrient absorption to the whole plant at maturity was50.3 % - 57.1 % ,59.6 % - 67.2 % , and 14.0 % - 33.3 %for N , P and K, respectively. Kapplication could not only increase the distribution proportion of dry matter , N , P , and K nutrition to grain , but also enhance their

translocation rates. The maximum N translocation rates of 45.7 % was obtained by K1 treatment K2O 113 kg/ ha , while the maximum dry matter , P and K translocation rate of 7.4 % , 62.6 % and 22.4 % was achieved by K2 treatment K2O 225 kg/ ha.54.5 % - 60.6 %of N , 56.0 % - 85.8 %of P and 52.4 % - 100.0 %of Kin grain relied on nutrient translocation from vegetative parts.

【题目】长期施钾及小麦秸秆还田对北方典型土壤固钾能力的影响
【中文关键词】长期施钾;小麦秸秆还田;北方典型土壤;固钾能力
【英文关键词】long-term application of K fertilizer; wheat straw to soil; selected soils from northern China; K fixation capacity
【中文摘要】探索在连续13 年的钾肥施用及小麦秸秆还田条件下耕层土壤对外源钾素的固定能力。【方法】在各点同一氮磷用量水平上长期进行不同用量钾肥投入以及小麦秸秆还田,定位13 年后对不同试验点各处理土壤样品进行不同浓度的KCL 溶液浸泡处理,以研究中国北方典型土壤的固定钾素能力。【结果】长期连续施用钾肥或秸秆还田可显著降低土壤对外源钾素的固定,环境溶液中钾素浓度从1 000 mg · L-1 上升至4 000 mg · L-1时,土壤固钾量亦随之增加。一年两作种植制度下土壤的固钾量较单作制高。土壤固钾能力表现出明显的地带性分布规律,自西向东土壤对钾的固定能力逐渐增强。在环境溶液中钾为1 000 mg · L-1 浓度下,取自西北、华北和东北试验点只施氮磷肥(NP)处理土壤的平均固钾量分别为349、443 和469 mg · kg-1。【结论】连续耗竭及连续施钾的土壤固钾能力差异亦是判断土壤钾素状况的重要特征之一。
【英文摘要】Experiments were conducted to study the difference of potassium fixation capacity. 【Method】Fixed-site researches on cultivated layer of soil under long-term application of K fertilizer and wheat straw to soil for 13 continuousyears in selected regions of north China were carried out. After 13 years, soil samples of different treatments collected from eachfixed-site were treated with different concentrations of KCl solution to study K fixation capacity of typical soil in northern China.【Result】 The results showed that continuous application of K fertilizer and wheat straw could reduce the fixation rate of added Ksignificantly, and when the concentration of K increased from 1 000 mg · L-1 to 4 000 mg · L-1 in the soil solution, K fixation capacityof soils increased at the same time. In the same region, K fixation rate of soils in double cropping regime was higher than that insingle cropping regime. K fixation capacity of soil showed a clear increasing trend of distribution from the west to the east. When theK concentration in the surrounding solution was 1 000 mg · L-1, the average K fixation rates of soils in NP treatment were 348.5, 442.9,and 468.5 mg · kg-1 in Northwest, North China and Northeast China, respectively. 【Conclusion】 Difference in potassium fixation ratebetween soils with depletion of K successively and soils supplied with K successively is an important character for judging the condition of soil potassium.

【题目】钾素对玉米茎髓和幼根超微结构的影响及其与茎腐病抗性的关系
【中文关键词】钾(K);玉米茎腐病;超微结构;抗病性
【英文关键词】potassium (K); maize stalk rot; ultrastructure; disease resistance
【中文摘要】采用扫描电镜和透射电镜分别观察施钾后玉米茎髓组织和接菌后施钾与不施钾幼根根尖细胞超微结构的变化。缺钾处理的玉米茎髓薄壁细胞,结构不规则,长边较长。而不缺钾处理茎髓细胞结构规则,呈长方形,整齐排列。缺钾导致维管束间的薄壁细胞破裂,致使茎髓中维管束间失去连接细胞,支撑能力变差。另外,施钾有利于寄主幼根表皮细胞排列紧密而整齐,细胞壁增厚,有效阻碍病原菌的入侵。而且施钾处理细胞中拥有丰富的高尔基体,可以产生大量分泌物将菌丝降解。钾素还有利于菌丝入侵部位乳突的形成及高电子致密物的积累,以阻止菌丝的扩展。钾素能通过稳定细胞结构,防

止细胞间隙的扩大,加固细胞壁,来降低病原菌侵入的机率;通过形成位于胞间及胞内的闭塞物来限制病原物在寄主细胞的进一步发展。

【英文摘要】Scanning electron microscope and transmission electron microscope were used to observe the effect of K on the ultrastructure of maize stalk pith tissue and young root tip cell influenced by K and pathogen.In K deficient treatment, parenchyma cells of stalk pith had abnormity structure and the cell wall between upper and lower adjacent cell was broken, resulting in the loss of connections between vascular cells and bad supporting capacity. In addition,improved K nutrition also helped in keeping a quite tight arrangement of root cell with thick cell wall, prevented the invading of pathogen effectively. Moreover, K treated root cell had abundant golgi apparatus, which could excrete large amount of secretions to degrade mycelium. Papillary and highly electronic intensity dot were accumulated in the invading point to prevent the development of the mycelium. Improved K nutrition could increase the resistant ability of maize plant to stalk rot, through keeping cell structure stability and preventing the expansion of intracellular space to reduce the chances of pathogen invasions; through reinforcing cell wall and formation intercellular and intracellular material to restrict pathogen further development in host cell.

【题目】限水灌溉下施氮量对冬小麦产量、氮素利用及氮平衡的影响

【中文关键词】限水灌溉; 冬小麦; 产量; 氮素利用; 氮平衡

【英文关键词】lim ited irrigat ion; w interw hea;t gra in y ield; N utilizat ion; N balance

【中文摘要】2008~ 2009年通过大田试验, 研究了限水灌溉条件下, 不同施氮量对冬小麦产量、氮素利用、土壤硝态氮动态变化及氮素平衡的影响。结果表明, 施用氮肥显著增加小麦穗数和穗粒数, 对千粒重无显著影响。作物产量、吸氮量与施氮量均呈抛物线关系, 施氮量超过N 240 kg /hm2, 产量和吸氮量随施氮量增加略有降低。小麦起身期后,0- 100 cm 土层都有硝态氮分布, 且随土层深度增加而减少; 相同土层则随施氮量的增加而增加。土壤硝态氮积累量随生育期推进而降低, N0 和N120处理分别在拔节期和开花期后表现出氮素亏缺; 成熟期, 土壤表观盈余以残留为主, 表观损失量占小部分。氮肥表观利用率、农学利用率随施氮量增加呈降低趋势, 而氮素残留率随施氮量增加呈增加趋势。在本试验条件下, 施氮量在N 180~ 220 kg /hm2 水平可以达到产量、氮素表观利用率、氮素残留率的较好结合, 是限水灌溉下兼顾经济效益与环境效益的适宜施氮量。

【英文摘要】Effects of different N application rates on grain yield and N utilization of winterwheat and soil N balance were studied using field experiment under water-limited irrigation during 2008- 2009. The results show that spike numbers and per spike grains of winterwheat are significantly increased underN applications, while the 1000-gra in weight is not significant increased. The relation ships between grain yield, N uptake and the N app licat ion rates are parabolic, and grain y ield and N uptake are reduced when N app lication rates ex ceed N 240 kg /ha. Soil NO-3 -N is found at 0- 20, 20- 40, 40- 60, 60-80 and 80- 100 cm so il layers a fter the erecting stage of w interw hea.t So ilNO- 3 -N contents are decreased w ith increase of soil layer depth under the same trea tmen,t and are increased w ith increase ofN application rates at the same layer. So ilNO- 3 -N accumu la tions decreasew ith w interwheat grow th and deve lopment. Under the N0 and N120 treatments, there are NO- 3 -N deficienc ies after the jo inting stage and anthesis stage. In the harvest stage, so il residualN in 100 cm soil layer is the main part o f surplus N, and so il lostN accounts for little percentage. W ith increase o fN application rates, N utilization efficiency and N agronomy efficiency appear downtrend, wh ile theN residual e ff iciency appears uptrend. Under th is experim ent cond ition, N app lication rates from N 180 to 220 kg /ha has good combinations of g rain y ield, N ut ilization effic iency and N residual efficiency. Therefore, theN 180- 220 kg /ha are idea lN rates considering both econom ic benefit and env ironmenta lbenefit under water-lim ited irrigation.

【题目】动物多聚免疫球蛋白受体研究概况
【中文关键词】plgR/SC;IgA/IgM;抗体转运;黏膜免疫
【英文关键词】pIgR/SC; IgA/lgM; antibody transportation; mucosa immune
【中文摘要】多聚免疫球蛋白受体(polymeric immunoglobulin receptor,pIgR)是主要组织相容性复合物(MHC)家族中的重要成员,是分泌性免疫系统(SIS)的重要组成成分,在IgA/IgM的转运和黏膜免疫中发挥着重要的作用。作者结合近年来的研究综述了pIgR的分子结构、生物学功能和研究概况。
【英文摘要】Polymeric immunoglobulin receptor(abbreviation as pIgR)is the key member of major histocompatibility complex(MHC)and secretary immune system(SlS).It plays an important role in IgA or IgM transportation and mucosa immune.This article summarizes the molecular structures,biological functions and research advances of pIgR based on recent researches.

【题目】EPA/DHA对体外发酵及瘤胃液脂肪酸组成的影响
【中文关键词】EPA/DHA;人工瘤胃;瘤胃发酵;t11C18:1;c9t11 CLA
【英文关键词】EPA/DHA;artificial rumen;ruminal ferment;transll Cl8:1;cis 9,trans11 CLA
【中文摘要】试验旨在研究日粮中添加不同水平的DHA/EPA对体外发酵和瘤胃液脂肪酸变化的影响。试验通过采用持续动态人工瘤胃装置,向发酵罐中添加EPA/DHA,连续培养7 d,分析脂肪酸组成的变化及发酵模式的改变。试验结果表明,日粮添加EPA/DHA使瘤胃液pH升高(与CK相比,Trtl和Tn2分别升高了o.11和o.35),Trt2与cK相比差异极显著(P<o.01),与CK相比处理组3种主要挥发酸中乙酸浓度下降(P<o.01),丙酸浓度升高(P<o.01),丁酸浓度下降(P<o.01),总挥发性脂肪酸浓度与对照组相比略有下降但差异不显著(P>O.05),日粮添加EPA/DHA使瘤胃液脂肪酸成分发生改变。与CK相比处理组C18,o含量显著下降(P<O.01);t_11 C18-1含量显著升高(P<o.01);c-9,t-11 CLA含量显著升高(|P<O.01),但是两组之间差异均不显著。因此,日粮中添加不同水平的EPA/DHA可以改变瘤胃发酵模式,影响不饱和脂肪酸瘤胃氢化过程,使脂肪酸组成发生改变,为采用新的营养措施调控反刍动物产品中CLA的含量提供理论依据。
【英文摘要】The objectives of this study were to examine the changes of composition and content of fatty acid in ruminal fluid and the changes of volatile fatty acid in ruminal fluid when EPA/DHA was added in diet.The experiment using the RUSITEC(rumen-simulation technique)apparatus.Treatments of the experimental diet were as follows: basal diet(CK,40 : 60 forage to concentrate),or a basal diet plus O.65%EPA/DHA(Trtl),or basal diet plus 1.30%EPA/DHA(Tn2).Experimental period was consisted of 6 d for adaptation and 1 day for sampling. Culture fluid was collected every 2 h over a 12 h period on the last day of the experimental period.Compared with CK,C1 8:O decreased by 76.93%and 80.35%in Tnl and Tn2,respectively; while the concentration of transllCl8:1 increased by 185%and 127%in Trtl and Trt2,respectively,and c9t11CLAincreased by 147%and 222%in Trtl and Trt2,respectively compared with CK.The concentration of VFA,transCl8 :1 and c-9t11CLA in different sampling time were different.EPA/DHA supplementation could markedly affect VFA and fatty acids profile in rumen fluid.

【题目】2007~2008年国际反刍动物营养研究进展Ⅰ.瘤胃微生物多样性和功能
【中文关键词】瘤胃微生物群落;多样性;分子生态学;元基因组学
【英文关键词】rumen microflora;diversity;molecular ecology;metagenomies
【中文摘要】随着试验生物学和生物信息学的快速发展,对瘤胃微生物的多样性和功能开展了系统的研究。笔者综述了2007~2008年在CNKI、ADSA—ASAS大会和PubMed等数据库中与瘤胃微生物分子多态性和元基因组学相关的32篇文献。瘤胃微生物群落在“属”分类水平上多样性水平较低,在亚种或菌株水平上表现出极大的多样性,多样性指数估计表明,瘤胃内细菌种类约为900多种,而菌株类型(独特序列型)约为97000种。瘤胃微生物群落结构受到宿主遗传背景、生长发育阶段、日粮、环境条件等多种因素的影响。瘤胃微生物组中蕴藏了大量具有应用潜力的遗传资源,这些结果为准确了解瘤胃微生物群落结构、功能及其调控方式提供了重要的基础。
【英文摘要】The rumen was inhabited by numerous microbes,which form a complex microbial community that deeply affects ruminant physiology.This microbiota is dominated by relatively few divisions that are highly diverse at the strain/subspecies level,which together with its collective genomes(microbiome)provide us with genetic and metabolic attributes the ruminanthave not been

required.New studies taking advantage of molecular microecological and metagenomie are revealing how the ru ’ men microbiota has coevolved with us and how it manipulates and complements our biology in ways that are mutually beneficial.However,how certain keystone members of the macrobiotic operate to maintain the stability and functional adaptability of this microbial organ still need to be answered.which necessitate the combination of high throughput methods and multivariable analysis.

【题目】N1 型纳豆芽孢杆菌对泌乳期奶牛产奶量及乳品质的影响
【中文关键词】纳豆芽孢杆菌;牛奶品质;生产性能
【英文关键词】Bacillus subtilis natto; milk quality;production performance
【中文摘要】试验旨在研究N1型纳豆芽孢杆菌(Bacillus subtilis natto)对泌乳期奶牛生产性能及乳品质的影响。试验选用泌乳期、胎次、产奶量、体重相近的荷斯坦奶牛36头。试验设计采用完全随机区组设计,分成3个处理组,分别是试验1组添加N1型纳豆芽孢杆菌固体制剂30 g,试验2组添加N1型纳豆芽孢杆菌固体制剂60 g,对照组不添加。试验期为60 d,预试期10d,分别在试验期的0、30、60 d采集奶样,每周测定1次产奶量。试验结果表明,El粮中添加N1型纳豆芽孢杆菌能够提高产奶量,提高乳脂校正乳产量(P<o.05);提高乳脂含量、乳蛋白含量、干物质含量,提高乳脂产量、乳蛋白产量(P<O.05)、干物质产量(P<O.05),对乳糖含量没有影响;牛奶中体细胞数有降低趋势。
【英文摘要】36 cows with similar age,party and day in milk(DIM)were used to study the effect of dietary Bacillus subtilis natto on milk production and milk composition in lactating dairy COWS.All COWS were randomly allocated to 3 groups.The feeding trial lasted for 60 days.The milk samples were collected in 0,30,60 d,and the milk production was measured every week.The results showed that milk production,milk fat and milk protein were higher than those which are from COWS in control whereas somatic cell counts decreased.

【题目】反刍动物共轭亚油酸合成及影响因素与生理功能
【中文关键词】反刍动物;共轭亚油酸;影响因素;生理功能
【英文关键词】Ruminant animals; Conjugated linoleic acid; Influencing factors; Physiological function
【中文摘要】共轭亚油酸(Coniugated linoleic acid,CLA)是指与亚油酸的不饱和双键位置和空间构型不同的一类脂肪酸同分异构体的混合物,CLA的双键在第9和第11位或第10和第12位碳原子上,可呈顺式或反式构型.其具有很强的生理功能,主要有抗癌、抗动脉粥样硬化、抗氧化、降低胆固醇、促进生长、抑制脂肪累积、增强机体免疫能力等功能.共轭亚油酸最早由Pariza等(1983)从研磨的牛肉中发现,以后Shantha,N.C.等(1992)与Boyaval,P.等(1995)发现奶及其制品中也含有CLA(每克脂肪含3~9 mg).近几年的研究发现,C12,t10-CLA异构体的生物活性比C9,t11-CLA异构体强.共轭亚油酸成为目前动物营养等研

究领域的热点

【题目】Growth simulation of Fraxinus chinensis stands damaged by Hyphandria cunea in Beijing area.
【中文关键词】无
【英文关键词】Hyphandria cunea, damage simulation, Forest Vegetation Simulator (FVS)
【中文摘要】无
【英文摘要】Hyphandria cunea is an insect that can damage hundreds of plants in its larval phase and needs to be placed under quarantine at an international level. Its hosts involve 600 plant species, including forest and fruit trees, shrubs, crops, vegetables, weeds and others. In 2006, we surveyed two Fraxinus chinensis Roxb stands, damaged to different degrees, after the invasion of H. cunea in the Changping district of the Beijing area. Given our survey of individual trees and investigation of bio-environmental factors, we provide a preliminarily simulation of the growth situation of F. chinensis stands, damaged by H. cunea, by using the Forest Vegetation Simulator software (FVS), which is supported by the “ 948 ” project from the State Forestry Administration of China. The results will provide a valuable reference in forecasting the effect of H. cunea and other invasive pests in China on forest ecological values.

【题目】Traits of Masson pine affecting attack of Pine Wood Nematode
【中文关键词】无
【英文关键词】Bursaphelenchus xylophilus; invasion; Pinus massoniana; resistance; susceptibility; tree characteristics.
【中文摘要】无
【英文摘要】Masson pine characteristics were analyzed in five sample plots in Zhejiang Province, China. Bursaphelenchus xylophilus (Steiner et Buhrer) Nickle (pine wood nematode, PWN) carried by Monochamus alternatus predominately attacked Masson pines in the lower diameter classes. Among the 10 tree characteristics examined, mean crown width, percentage of bole with crown, 5-year cumulative diameter growth, and resin amount showed significant variation between successfully attacked and unattacked trees. The attacked trees had a lower percentage of the bole covered with tree crown, lower crown width, lower radial growth in the last 5 years, and produced less induced resinosis than unattacked trees. Results allowed for effective ranking of the pine forest based on individual tree resistance to PWN. This index of resistance should be considered throughout the development of an “ Evaluation Criterion and Indicator System ”. The preceding ranking can be used to evaluate the resistance and resiliency of the pine forest ecosystem to PWN ’ s invasion, which is similar to Pest Risk Analysis (PRA).

【题目】Biological activity of the essential oil from the leaves of Piper sarmentosum Roxb and its chemical constituents on Brontispa longissima
【中文关键词】无
【英文关键词】Piper sarmentosum Roxb. Essential oil Brontispa longissima (Gestro)
Biological activity Chemical composition Myristicin Enzyme activity
【中文摘要】无
【英文摘要】The results showed that the essential oil from Piper sarmentosum has strong antifeedant and toxicity effects on Brontispa longissima. The best antifeedant and contact toxicity effects were observed in the 1st – 2nd instar larvae. The essential oil also displayed a notable fumigation effect on the eggs and pupae of B. longissima. It took the control-treated insects 43.34 d to complete one generation, while the insects treated with 2000 mg/L essential oil needed 73.58 d. The essential oil was analyzed by gas chromatography/mass spectrometry and 41 components were identified. Myristicin (65.22%) and trans-caryophyllene (13.89%) were the major components. Myristicin exhibited strong antifeedant and contact toxicity effects on both the 3rd instar larvae and the imagoes of B. longissima, when it showed a significant fumigation effect on the eggs and pupae of B. longissima. Another P. sarmentosum essential oil and myristicin all showed a strong inhibiting effect on the growth and development of B. longissima along with the activity of AChE, CarE, GSTs and Na+, K+-ATPase in B. longissima larvae.

【题目】Effects of dietary Saccharomyces cerevisiae fermentation product (DVAQUA ®) on
【中文关键词】无
【英文关键词】Saccharomyces cerevisiae fermentation product, DVAQUA, Intestinal autochthonous bacterial community, Non-specific immunity, Hybrid tilapia, Oreochromis niloticus ♀×O. aureus ♂
【中文摘要】无
【英文摘要】In the present study, hybrid tilapias (Oreochromis niloticus ♀ × O. aureus ♂) were fed six isonitrogenous and isoenergetic experimental diets in cages. The diets contained six levels of Saccharomyces cerevisiae fermentation product

(DVAQUA ®): 0 (CK), 0.125 (G1), 0.25 (G2), 0.5 (G3), 1.0 (G4) and 2.0 (G5) g kg − 1 diet. The purpose of this study was to evaluate the effects of dietary DVAQUA on growth performance, intestinal autochthonous bacterial community by using 16S rDNA and denaturing gradient gel electrophoresis (DGGE), and non-specific immunity of hybrid tilapia. Supplementation of dietary DVAQUA showed no effects on growth performance, diet conversion and survival rate of the hybrid tilapia. However, supplementation of DVAQUA affected the autochthonous gut bacteria community. Various potentially beneficial bacteria werestimulated by dietary DVAQUA at different feeding period, while potential harmful species such as Escherichia coli serotype O20: H42-like, uncultured Bacilli bacterium clone MS030A1_F02-like, and Pseudomonas fluorescens strain YC0357-like were depressed by dietary DVAQUA. Non-specific immunity of hybrid tilapia such as serum lysozyme activity, serum alternative complement pathway (C3 and C4) activities, head kidney macrophage phagocytic activity, and head kidney macrophage respiratory burst activity were improved by dietary DVAQUA. The optimum dose of dietary DVAQUA for hybrid tilapia determined based on a broken-line approach varies depending on the variables used: 0.226, 0.467, 0.492 or 0.50 g kg − 1 diet for lysozyme, C3, C4, or phagocytic activity, respectively.

【中文关键词】鸭;空肠液;消化酶;离子浓度;pH

【英文关键词】Ducks; Jejunal juice; Digestive enzymes; Ion concentration; pH

【中文摘要】本试验旨在通过研究日粮类型及肠液的体外储存条件对鸭空肠液组成的影响, 为人工鸭小肠液的制备提供参考。试验一探讨日粮类型对鸭空肠液组成的影响, 采用完全随机设计, 将36 只安装有空肠T 型套管的成年公鸭随机分成2组, 每组6个重复, 每个重复3只鸭, 分别饲喂玉米—豆粕型日粮和玉米—豆粕—菜粕—棉粕型日粮, 试验期35 d。试验二利用2 x 3 (2 个储存温度: -20 和-70 ℃,3个储存时间:3 0、6 0 和90 d) 完全随机设计, 研究鸭空肠液有效生物学活性的适宜储存条件。结果表明, 2 种日粮条件下鸭空肠液在胰蛋白酶、糜蛋白酶的活性及Mg2+和Cl-浓度上有显著差异(P<0.0 5) , 而在淀粉酶和脂肪酶活性, K + 、Na + 和Ca 2+浓度及pH 上无显著影响(P>0.05)。肠液的储存温度对鸭空肠液的pH有显著影响(P<0.05) , 而对消化酶活性无显著影响(P>0.0 5)。肠液的储存时间对玉米—豆粕—菜粕—棉粕型日粮条件下鸭空肠液胰蛋白酶和淀粉酶活性以及2 种日粮条件下空肠液pH有显著或极显著影响(P<0.05 或P<0.01)。由此可见, 日粮类型是影响鸭空肠液生物学特性的主要因素之一,储存条件对鸭空肠液生物学特性的影响因口粮类型的不同而有所差异。

【英文摘要】Two experiments were conducted to study the effects of dietary type and in vitro storage conditions on the composition and character of jejunal juice in ducks. In experiment 1, a completely random design was used to study the effects of dietary type on the composition and character of jejunal juice in ducks. Thirty-six male adult ducks fitted with a T-cannula in the jejunum were randomly assigned to 2 groups with 6 replicates each and 3 ducks in each replicate, and fed corn-soybean meal diet and corn-soybean meal-rapeseed meal-cottonseed meal diet, respectively. The trial lasted for 35 days. In experiment 2, a 2×3 completely random design of two kinds of storage temperature (-20 and -70 °C) and three storage periods (30, 60 and 90 d) was conducted to study the appropriate in vitro storage conditions of jejunal juice. Results showed that dietary type diets significantly affected the activities of trypsin, chymotrypsin and the concentrations of Mg2+ and Cl- of jejunal juices (P<0.05). But the activities of amylase and lipase, the concentrations of K+, Na+ and Ca2+, pH were not significantly different in two treatments (P>0.05). The storage temperature could significantly affect the pH (P<0.05), but could not significantly affect (P>0.05) the digestive enzyme activity of jejunal juice. The storage time could significantly affect the pH of jejunal juices in these two groups, and the activities of trypsin and amylase of jejunal juice in ducks fed corn-soybean meal-rapeseed meal-cottonseed meal diet (P<0.05 or P<0.01). In conclusion, dietary type was one of the important factors which could affect the biological characters of jejunal juice in ducks, and effects of storage conditions on the biological characters of jejunal juice could be dependent on the dietary type.

【题目】12个豆粕样品鸭代谢能值及氨基酸消化率的比较研究
【中文关键词】鸭 代谢能 氨基酸真消化率
【英文关键词】Duck ; Metabolizable energy; True amino acid digestibility
【中文摘要】本试验旨在通过研究鸭对12个豆粕样品的能量和氨基酸生物学利用率的差异,探讨豆粕原料中主要养分生物学效价的变异因素。试验采用单因素完全随机设计,以每个豆粕样品为1个处理,每个处理4个重复,每个重复3只鸭,以排空强饲法测定12个豆粕样品的代谢能值及氨基酸真消化率。结果表明,3#豆粕样品的鸭代谢能值最高,显著高于4#、8#、9#、10#、11#、12#豆粕样品的代谢能值(P0.05)。7#豆粕样品的鸭代谢能值次之,显著高于8#、11#、12#豆粕样品的代谢能值(P0.05)。在氨基酸消化率的差异上,7#、8#、9#豆粕样品的总氨基酸真消化率显著高于1#、2#、3#、4#、5#、12#豆粕样品(P0.05)。除6#、7#、8#、9#豆粕样品间、2#、3#豆粕样品与1#、4#样品间在17种氨基酸的真消化率上无显著性差异外(P0.05),其他样品两两间在某些氨基酸的真消化率上均存在显著性差异(P0.05)。从豆粕的化学成分与代谢能及氨基酸真消化率的相关关系看,不同来源豆粕代谢能值的差异可能与豆皮的含量有关,而氨基酸真消化率的差异可能与大豆的来源及生产工艺有关。
【英文摘要】The differenees in metabolizable energy and true amino acid digestibility of 12 s o y bean meal sa mples using adult ducks as experimental animals were investigated to study the variation in the bioavailability of macronutrients of soybean meals .A completely randomized design was used an d each samPle of soy bean meal was a treatment with 4 replicates each and 12 ducks in each re plicate . Sibbald ’ s emptying 一fo rce 一feeding method was used to determine the metablizable energy and true amino acid digestibility of soybean meals. The results showed that the metabolizable energy of sample 3was significantly higher than that of samPles 4 , 8 , 9 , 1 0 , 1 1 , 1 2 (P < 0.0 5) and sample 7 was significantly higher than that of samples 8, 11 ,12 (P < 0.0 5). The true digestibilities of total amino a cids of sample 7 , 8 , 9 were significantly higher than those of samples1 , 2 , 3 , 4 , 5 , 1 2 (P < 0.0 5).T here was no significant difference in the true digestibilities of 17 amino acids among samples6 , 7 , 8 , 9 , and between samples 2, 3 and sample s l , 4 (P > 0 . 0 5). T here was significant difference in the true digestibility of some amino acids among other samples (P < 0.0 5). In conclusion , according to the relationship between the chemieal compositions and metabolizable energy, true amino acid digestibility of 12 soybean meals , the difference in metabolizable energy of soy bean meals was probably related to the percentage of soybean hull, however , the difference in true amino acid digestibility was related to the origin of soybean and production process.

【题目】苹果货架期的近红外光谱定性分析
【中文关键词】苹果;近红外光谱;货架期;定性分析
【英文关键词】apple; near infrared spectroscopy; shelf life; qualitative analysis
【中文摘要】以嘎啦苹果为试材,使用ASD公司的FieldSpec3光谱仪在常温条件下进行近红外光谱采集,应用OPUS软件的快速比较法和电子称重数据对苹果样品的近红外光谱信息进行处理。结果表明,苹果样品在室内常温及通风条件下10d失重率即可达到5%;货架期苹果的近红外光谱在水分吸收峰1 440nm和1 936nm发生显著变化;快速比较法在使用二阶导数预处理方法可以准确、有效地进行定性鉴别。
【英文摘要】Gala apples as material, apple ’ s near-infrared spectral information was processed. Apple samples reached 5% weight loss at room temperature and ventilation in indoor conditions in 10 days; Near infrared spectroscopy of apples in shelf life changed significantly in the 1 440nm and 1936 nm water absorption. Quick comparison using the second derivative pretreatment can make qualitative identification accurately and effectively.

【题目】苹果近红外光谱采集影响因素研究
【中文关键词】苹果; 近红外光谱; 影响因素
【英文关键词】Apple;Near infrared spectroscopy;Influence factors
【中文摘要】[目的]对不同影响因素条件近红外光谱信息的准确性进行研究,优化嘎啦苹果近红外光谱采集试验条件[方法]以嘎啦苹果为试材,使用ASD公司的filedspec3 光谱仪在常温条件下进行近红外光谱采集,探索了环境杂散光仪器稳定性不同测距不同色差不同部位 不同货架期等条件对采集光谱的影响[结果]杂散光对近红外光谱的可见光区域有明显影响; 固定光谱阵列检测器型光谱仪器在9h内重复测量的稳定性高; 裸光纤在除0mm外的2.5-12.5mm测距上吸光度保持重复稳定; 同一苹果的不同色差对光谱的影响在可接受区间内; 苹果赤道面上的光谱稳定性较果柄和果鄂部好; 常温条件下,不同货架期对苹果样品的近红外光谱产生显著影响[结论]该研究可为苹果近红外研究人员和分析工作者提供参考.
【英文摘要】[Objective] The aim was to optimize experimental conditions of Gala apple NIR (Near Infrared) spectroscopy acquisition through studying on the accuracy of NIR spectroscopy information under different influence factors. [Method]Gala apple was taken as the experimental material,and FieldSpec3 spectrometer (Analytical Spectral Device Company,America) was employed to acquire the NIR spectroscopy at room temperature. Then,the effects of different conditions including the environmental stray light,instrument stability,different distance,different chromatic aberration,different sites and different shelf-life on spectroscopy acquisition were investigated. [Result] The stray light had asignificant effect on the visible light region of NIR spectroscopy;FieldSpec3 spectrometer had higher stability in 9 h; the measure distance of 2.5-12.5 mm could obtain good repeatability of absorbance; the effects of different chromatic aberration of the same apple on spectra was acceptable;the spectral stability of equatorial plane of the apple was better than those of the bottom and stalk;at room temperature;different shelf-life could make significant influence to NIR spectroscopy of the apple simple. [Conclusion]This study will provide reference for the researchers and analysis workers of apple NIR spectroscopy.

【题目】基于可见/近红外光谱的土壤有机质快速测定方法研究
【中文关键词】土壤,有机质,近红外,样本,快速测定
【英文关键词】Soil; Organic matter; Near-infrared; Sample; Fast detection
【中文摘要】[目的]研究在野外直接测定土壤有机质含量的方法。[方法]以重铬酸钾容量法(外加热法)测定土壤样本有机质含量作为真实值,在不进行土壤样本预处理的前提下,利用近红外光谱直接扫描未作处理的土壤样本,测定土壤有机质含量,以其作为土壤有机质含量的预测值。[结果]利用620nm和1900nm的波长组合,可以较好地预测土壤有机质含量,预测模型(定标模型)的相关系数为0.9,极为显著。[结论]经过模型检验,表明该模型对同类土壤有机质含量的预测效果很好,预测值与实测值的相关系数达到0.95。本文未研究模型对不同类型的土壤有机质含量的预测效果。
【英文摘要】[Objective] The research aimed to study the methods for direct determination of organic matter content in the fields. [Method]Take the organic matter content of the soil samples determined by the hydroquinone volumetric method (Heating Method) as a truth value. With the condition of no pretreatment of soil sample, researcher use of near infrared spectral scanning untreated soil sample directly and measuring soil organic matter content In order to make it as predictive value.[Result]It could be good for predict

the content of soil organic matter by use of a combination of wavelength between 620nm and 1900nm. The data for prediction model (calibration model) is 0.9 and effect is very remarkable. [Conclusion] A testing of the model shows that the model has good prediction effect on the content of similar soil organic matter. The correlation coefficient between the predict value and the real value reached 0.95. It is not considered in this paper that the forecast validity of the model for different kinds content of soil organic matter.

【题目】Research on Orchard Field Data Service System
【中文关键词】果园,现场数据服务,多终端,服务果农,精准管理
【英文关键词】orchard; field data service; diversified terminals; service for orchard workers; precise management
【中文摘要】果园的精确的管理不能没有支持各种果园现场数据,果园现场数据服务器是一个有效的解决方案。果园现场数据服务器由数据采集单元、数据通信单元、数据分析单元和支持多样的用户终端个人电脑(PC)、笔记本电脑、移动电话和电话。果园里的工人可以根据需求设置数据采集周期,处理过的数据可以在很多方面为果园工人。经过在辽宁和北京等地的许多果园的推广和应用,证明系统使用方便、效果可靠,所以,这个项目取得了良好的社会效益、生态效益和经济效益。
【英文摘要】The precise management of orchards cannot do without the support of various orchard field data, and the orchard field data server is an effective solution thereto. The orchard field data server consists of data acquisition unit, data communication unit, data analysis unit and such diversified server sockets of user terminal as supportive personal computer (PC), notebook computer, mobile phone and telephone. The orchard workers can set data acquisition cycle according to the requirements, and the processed data can serve the orchard workers in many respects. After its promotion and application in many orchards in such regions as Liaoning and Beijing, the said system has been proved to be of easy use and reliable effect, so that the project has achieved good social, ecological and economic benefits.

【题目】The potential geographical distribution of Bactrocera dorsalis in China based on emergence rate model and Arcgis
【中文关键词】无
【英文关键词】Radopholus similes, niche model, GARP, MAXENT, suitable distribution area
【中文摘要】无
【英文摘要】The burrowing nematode (Radopholus similis) is one of the main quarantine pests in China, and the risk of invasion posed by this nematode is becoming more and more serious with regard to the international trade being intensified day by day.It is urgent to analyse the potential geographic distribution of R. similis in China. Genetic algorithm for rule-set prediction modeling system (GARP) and maximum entropy (MAXENT), the two niche models which have been widely used to predict the potential geographic distribution of alien species, were used to predict the distribution of R. similis in China.We also presented a model comparison of the results by both threshold-dependent and threshold-independent evaluations.It has been shown that the two niche models could be used to predict the potential distribution of R. similis reliably. The potential distribution of R. similis should be constricted within the south of China, such as Hainan, Guangdong, Guangxi,Fujian, Yunnan provinces, and Taiwan of China. The MAXENT gives a better prediction than that of GARP. R. similis can be introduced to China by flowers and nursery stock ’s international shipping. The

predicted results indicate that R.similis can occur in south coastal area of China and Yunnan Province, which are the main flower and nursery stock ’s import-export areas in China. Consequently, a strong quarantine program is needed at the ports of such areas to prevent the pest from being introduced to China.

【题目】应用相似离度法预测红火蚁在中国适生区域及其入侵概率

【中文关键词】外来入侵物种;红火蚁;相似离度;气候相似理论;适生区域;入侵概率;预警级别

【英文关键词】Radopholus similes, niche model, GARP, MAXENT, suitable distribution area

【中文摘要】依据气候相似理论,采用相似离度法预测红火蚁在中国的适生区域及其入侵概率。【方法】收集红火蚁在世界范围的分布数据和国内外气候站点的气候数据,建立红火蚁原产地和严重发生地气候站点集合,采用相似离度法找到与气候站点集合最相似的地区。在气候因素影响下,相似程度相对百分比认为是红火蚁入侵中国政区和气候区的概率值,并且建立了预警级别。【结果】预测结果表明,香港、澳门、广东、广西的入侵概率均大于80%,处于红色警报区;安徽、江苏、上海、江西、浙江、福建、台湾、贵州、云南、海南的入侵概率在50%~80%,处于橙色警报区,其它地区均处于黄色警戒区和绿色小风险区。【结论】红、橙警报区需要采取适当的防控措施,川渝地区和云南东南部的气候与原产地气候较为相似,尽管目前尚未发现有红火蚁入侵,但由于红火蚁对气候具有很强的适应性,因此也应该采取相应的预防措施。此外,相似离度法尽管多用于气象研究领域,但在预测外来物种分布范围时也起到了良好的辅助效果。

【题目】早熟油桃紫金红1号亲本的SSR鉴定

【中文关键词】油桃;SSR;亲本鉴定

【英文关键词】Nectarine;SSR;Parenta1 analysis

【中文摘要】油桃新品种紫金红1号是从早熟油桃中实生选育的,果实经济性状优良。以23个疑似亲本的油桃品种为试材,利用SSR标记共显性的特点,进行了紫金红1号亲本鉴定。SSR.PCR扩增结果表明,163对SSR引物中有48对能在试材中扩增出多态性良好、谱带清晰的产物,其中17对SSR引物扩增出的20个SSR位点呈现共显性带型。基于185个SSR等位基因信息的亲缘关系分析发现,紫金红l号与早红2号之间的亲缘关系最近,相似系数为0.881,在树状图上也聚为一类。经共显性SSR位点遗传规律分析,使用3个SSR引物(CPPCT15、BPPCT031、UDP96—018)的扩增位点,可排除早红2号以外的其他品种作为紫金红l号亲本的可能。认为早红2号自交获得紫金红l号可能性很大,或至少是其亲本之一。

【英文摘要】New nectarine variety Zijinhongl was selected from naturally pollinated seedlings of early matured neetarine because of its superior quality in economic traits.However,its parents were still unknown.Twenty three nectarine varieties which were suspected to be its parents,as well as Zijinhongl itself,were used as plant material,and SSR markers for its CO—dominant characteristic were used to analyze the probable parents.The results of SSR—PCR showed that 48 primers out of 1 63 could produce polymorphism and legible

alleles.Twenty loci amplified by 17 primers performed CO—dominant pattern.Genetic relationship based on 1 85 alleles showed that EarlyRed 2 was the most similar variety to Zijinhongl with a SM coeficient of 0.88 1,and the two varieties were clustered into one group in dendrograme.According to the statistic of inheritance of CO—dominant loci,three loci amplified by CPPCT15,BPPCr031 and UDP96.018,respective1y,could dispose all tested varieties possibly to be the parents of Zijinhongl except EarlyRed 2.So Zijinhongl may most probably selected from self-cross seedlings of EarlyRed 2,or EarlyRed 2 was at least one parent of Zijinhong1。

【题目】红肉桃果实发育过程中色素和糖酸含量的变化
【中文关键词】红肉桃;果肉颜色;花色苷;动态变化;果实发育过程
【英文关键词】Blood- fleshed peach; Flesh color; Anthocyanins; Dynamic changes; Fruit development
【中文摘要】以红肉、白肉和黄肉3 种不同果肉颜色的12 份桃品种为材料分析成熟时果肉中花色苷的含量变化,结果表明,红肉桃与白肉、黄肉品种间花色苷含量差异显著,且红肉桃品种间的花色苷含量差异也很大。利用3 个不同果肉颜色的桃品种进一步研究果实发育过程中色素及其相关物质的变化,结果表明,红肉桃品种天津水蜜在盛花后25 d果肉中花色苷含量较高,而后逐渐减少;直至进入盛花后45 d 才缓慢回升,并在果实发育后期(盛花后86 d) 含量迅速增加;与此对应,该品种果皮在幼果期(盛花后35~45 d) 和果实发育后期(盛花后86 d) 2 次出现红色, 但果肉直到盛花后86 d 才明显变红;在整个果实发育过程中,天津水蜜果肉其它内含物的变化与白肉桃品种豫白和黄肉桃品种NJC83 相似:叶绿素含量逐渐减少;类胡萝卜素和可溶性糖不断增加;可滴定酸前期上下波动变化;但近成熟时天津水蜜的可滴定酸显著高于其它2 个品种。
【英文摘要】The changes of content of anthocyanins in the mesocarp of 12 peach cultivars, including blood- fleshed, white fleshed and yellow fleshed were measured and analyzed. The results showed the contents of anthocyanins were remarkably different among the tested cultivars. 3 of them, Tianjinshuimi (blood- fleshed), Yubai (white fleshed) and NJC83 (yellow fleshed), were used as materials for studying the dynamic changes of contents of pigments (including anthocyanin, carotenoid and chlorophyll), soluble sugar and titratable acid in the mesocarp during fruit development. Result showed that the anthocyanincontents of Tianjinshuimi were higher during the young fruit development, then decreased, but slowly rose again after 45 d after full bloom (DAFB) , and rapidly increased after 86 d of DAFB. The contents of chlorophyll decreased straight on during fruit development, and the contents of carotenoids and soluble sugar increased gradually. Compared with Yubai and NJC83, the content of titratable acidity in the mesocarp of Tianjinshuimi was significantly higher after 86 d of DAFB

【题目】直接饲喂微生物培养物对奶牛瘤胃发酵产甲烷及生产性能的影响
【中文关键词】温室效应;酵母培养物;芽孢杆菌培养物;产甲烷量;生产性能
【英文关键词】greenhouse effect;yeast culture;bacillus culture;methane production;production performance
【中文摘要】一个甲烷分子的地球变暖潜力是一个二氧化碳分子的20倍。据预测地球变暖引发的温室效应1/4归咎于大气层中不断增加的甲烷浓度。地球变暖效果的2%是由家畜产生甲烷引起的。家畜所产生的甲烷大部分来源于反刍动物瘤胃发酵。有必要找到一种有效降低反刍动物产生甲烷的方法。本试验包括2个部分。①采用短期人工瘤胃发酵的方法研究了6种不同直接饲喂微生物培养物——酵母培养物和芽孢杆菌培养物对奶牛瘤胃发酵产甲烷的影响。试验分酿酒酵母、热带假丝酵母、扣囊酵母、地衣芽孢杆菌、蜡样芽孢杆菌、枯草芽孢杆菌、空白7个处理,每个处理20个重复,每个重复一支短期人工瘤胃发酵用注射器。于39℃培养24 h,结果表明,3种酵母培养物中的酿酒酵母组和扣囊酵母组显著提高了甲烷产量(P<o.05),热带假丝酵母组显著降低了甲烷产量(P<o.05);3种芽孢杆菌培养物中的地衣芽孢杆菌组显著降低了甲烷产量(P<o.05),蜡样芽孢杆菌组和枯草芽孢杆菌组也降低了甲烷产量,但差异不显著(P>o.05)。②选用32头体况、胎次、泌乳日龄相近的中国荷斯坦奶牛,随机分成4组即地衣芽孢杆菌培养物组、蜡样芽孢杆菌培养物组、枯草芽孢杆菌培养物组和对照组,每组8头,每组设8个重复,每个重复l头。预饲期15 d,试验期3 d。结果表明,地衣芽孢杆菌组显著提高了产奶量(p<o.05)。其它组和对照组比较差异不显著(P>0.05)。
【英文摘要】Each molecule of methane has about 20 times the global warming potential of a carbon dioxide molecule.Increasing atmospheric concentrations of methane are believed tO be responsible for about a quarter of the predicted global warming associated with the SO—called greenhouse effect.The methane produced by livestocks are believed to be responsible for 2%of the global warming of which a great part produced by ruminant animal ’s rumen fermentation.It ’s necessary to find a effective way to decrease the methane production produced by ruminant animals.Two parts were involved in this experiment.1 The short term rumen simulation technique was used in this experiment in order to study the effect of different direct-fed microbial on methane production in the rumen.Seven treatments,i.e.,Saccharo mycopsis fibuligera、Candidatropicalis、Saccharomyces cerevistae,Bacillus Licheniformis,Bacillus Subtilis、Bacillus cereus var.mycoides were used.Each treatment had ten replicates.Each treatment was kept at 39°Cfor 24 hours.Results showed that Candida tropicalis groupand Licheniformis group decreased the methane production(P<O0.05).Saccheromyces cerevisiae group and Saccharomy copsisfibuligera group increased the total gas

production(P<0.05),but both of them had no significant effect on methane production(P>0.05)、Bacillus Subtilis group and Bacillus cereus var.mycoides group decreased the methane production(P>0.05).2 Thirty-two Chinese Holstein COWS with similar body condition、lactation number and days in milk were selected inthis experiment.The Cows were randomly divided into four groups.Four treatments,i.e.,Bacillus Licheniformis group、Bacillus Subtilis group、Bacillus cereus vat.mycoides group and control group.Each treatment had eight replicates,each replicate had one COW.Results showed that Bacillus Licheniformis group increased the milk yield(P<0.05).The other two groups didn't have significant effect on milk yield than the control group(P>0.05).

【题目】A fine map for maternal lineage analysis by mitochondrial hypervariable region in 12 Chinese goat breeds
【中文关键词】分子变异分析,线粒体系谱,种系发生,地理系统发生,群体扩张
【英文关键词】analysis of molecular variance, mitochondrial lineage, phylogeny, phylogeography, population expansion.
【中文摘要】正如基因组研究不断确认动物线粒体分支的快速步伐一样,许多独立研究需要一个有力的种系发生推论已经十分明显。本研究的目的是用中国不同的山羊品种更广泛的分析进一步描绘中国西南部起源的山羊母系系谱,最后我们测定到了12个中国山羊品种145个个体的线粒体高变区1(HVR1),系统进化分析显示中国山羊被分为4个不同的分支(A, B, C 和D),这与之前的报道一致,A Mantel test和ANOVA显示中国山羊品种没有明显的地理结构,在错配分布和Fu's统计技术上进行群体扩张分析,在11和29个突变时间单位以前,中国山羊发生过2扩张事件,暗示在B分支中2个星状节点对应2个群体扩张事件。而且B分支的仅仅出现在西南群体及周边群体中。来自本研究和以前的研究多久偶表明B分支起源于中国西南地区。
【英文摘要】As the fast pace of genomic research continues to identify mitochondrial lineages in animals, it has become apparent thatmany independent studies are needed to support a robust phylogenetic inference. The aim of this study was thus to furthercharacterize the maternal lineage, proposed to originate in southwestern region of China, using a wider survey of diversegoat breeds in China. To this end, we sequenced the mitochondrial hypervariable region 1 (HVR1) of the mtDNA controlregion in 145 goats of 12 Chinese breeds. Phylogenetic analysis revealed that Chinese goats were classified into fourdistinct lineages (A, B, C and D) as previously reported. A Mantel test and the analysis of Analysis of Molecular Variance(ANOVA) indicated that there was not an obvious geographic structure among Chinese goat breeds. Population expansionanalysis based on mismatch distribution and Fu's Fs

statistic indicate that two expansion events in Chinese goats occurredrespectively at about 11 and 29 mutational time units ago, revealing two star-like subclades in lineage B corresponding totwo population expansion events. Moreover, lineage B sequences were presented only in the breeds of southwestern orsurrounding regions of China. Multiple lines of evidence from this study and previous studies indicate that for Chinesegoats mtDNA lineage B originated from the southwestern region of China.

【题目】含水量对糖处理豆粕过瘤胃蛋白影响的研究
【中文关键词】葡萄糖;豆粕;干物质降解率;蛋白质降解率;尼龙袋法
【英文关键词】glucose;soybean meal;degradability of DM;degradability of CP;the method of nylon bag
【中文摘要】本试验以3头装有永久性瘤胃瘘管的中国荷斯坦奶牛为试验动物,采用尼龙袋法研究在不同水分舍量下(15%、20%、25%、30%、35%)葡萄糖处理豆粕,在奶牛瘤胃内不同时间点干物质(DM)、粗蛋白质(CP)消失率及其动态降解率的作用效果。结果表明:在不同时间点下。随着含水量的增加,DM、CP消失率先降低后升高,所有处理组与对照组差异均显著(P<0.05),DM、CP有效降解率降低最高分别达18.50%和36.10%,含水量在20%以下,DM、CP有效降解率最低,表明以含水量20%的葡萄糖加热处理豆粕保护效果最好。
【英文摘要】This study was carried out to determine the effects of soybean meal(SBM)treated by glucose which was under different water content(15%,20%,25%,30%,35%)on degradability characteristics in situ rumen.In the experiment,three ruminally cannulated Holstein cows were used to measure the degradability characteristics of dry matter(DM)and crude protein(CP)of soybean meal samples at different times.The results showed that rumen effective protein and dry matter degradability values of SBM at different time in the treatments showed down first and then up.by increasing the content of water,and there were significantly differences between the test group and control group(P<O.05).The great reduction in the effective degradability of CP and DM WSS 36.10%and 18.50%.respectively.However,the lowest effect degradability was under the water content of 20%.It concluded that SBM proteins can be effectively protected from degradation in the rumen by glucose treatment and the suitable water content was 20%.

【题目】Establishment and characterization of a fibroblast line from Simmental cattle
【中文关键词】西门塔尔牛,成纤维细胞系,鉴定
【英文关键词】Simmental cattle,Fibroblast line,Establishment identification
【中文摘要】运用直接培养和低温保存技术成功构建西门塔尔牛成纤维细胞系SCF36,生物学分析表明,生物学分析表明,细胞扩增时间为42.8小时,冻存前细胞的平均活率为96.8%,解冻为91.5%,乳酸脱氢酶和苹果酸脱氢酶同工酶分析表明与其他品种间没有交叉污染,核型分析表明二倍染色体数2n = 60几率大于90%,细菌、真菌、病毒和支原体检测均为阴性。加强型银光蛋白(绿色、黄色、红色pEGFP-N3, pEYFP-N1 and pDsRed1-N1)表达基因表达效率11.3%-28.8%之间。荧光蛋白在胞质和细胞核中都有分布,本细胞系不仅在细胞水平保存了这个牛品种的种系信息,而且也为基因组、后基因组合克隆研究提供有价值的材料。这些方法的建立可能为家畜和家禽遗传资源保存提供技术和理论支持。
【英文摘要】A fibroblast line (named SCF36) from ear marginal tissue of Simmental cattle was established successfullyby direct culture of explants and cell cryopreservation techniques. Biological analysis showed that thepopulation doubling time of the thawed cells was 42.8 h. The average viability of the cells was 96.8%before freezing and 91.5% after thawing. Measurements of lactic dehydrogenase and malic dehydrogenaseisoenzymes showed no cross-contamination of this cell line with other species. Karyotyping showedthat the frequency of cells with chromosome number 2n = 60 was more than 90%. Tests for bacteria,fungi, viruses and mycoplasmas were negative. The efficiencies of expression of enhanced green, yellowand red fluorescent protein genes (pEGFP-N3, pEYFP-N1 and pDsRed1-N1) were between 11.3% and 28.8%after transfection; fluorescence was well distributed in the cytoplasm and nucleus except for some cryptomericvesicles. This Simmental cattle fibroblast line not only contains the germline of this importantcattle breed, which is preserved at the cellular level, but valuable material has also been provided forgenomic, postgenomic and somatic cloning research. Moreover, the establishment of these methodsmay provide both technical and theoretical support for preserving the genetic resources of other livestockand poultry at the cellular level.

【题目】多功能微生物制剂对农田栽参土壤容重及人参皂苷的影响研究
【中文关键词】人参;微生物制剂;改土;人参总苷
【英文关键词】Panax Ginseng;Microbial Fertilizer;Soil Improvement;Total Ginsenoside
【中文摘要】以多功能微生物制剂、EM微生物肥料、猪粪和鹿粪作为改良剂对农田栽参土壤进行了改良土壤理化性状及对人参皂苷含量影响的试验研究。结果表明:多功能微生物制剂对土壤结构改良效果良好,可明显降低农田土壤容重,施用量以 50g/m2为宜;多功能微生物制剂可提高人参的总苷含量,以 150g/m2施用量最好;施用方法以将多功能制剂用水浸泡 24h 后施入土壤效果最佳。本研究为多功能微生物肥料在人参上的应用提供了科学指导。
【英文摘要】:In the Study,multi- microbial manure, EM microbial fertilizer,pig manure and deer manure were used as soil conditioner to improve soil physical and chemical properties and theginsenoside content .The results showed:that Multi- microbial manure significantly improved soil structure and significantly reduced soil bulk density. The optimal quantity of multi- microbial manure was 50g/m2. The quantityof 150g/m2 was the best for improving the total ginsenoside content,and to put the multi- microbial manure in the water soaked after 24hours pouring into the soil had the best results. For the multi- microbial fertilizer application on the

ginseng provides scientific guidance.

【题目】利用MAXENT预测玉米霜霉病在中国的适生区
【中文关键词】玉米霜霉病; 适生性分析; MAXENT
【英文关键词】maize downy mildew ; suitability analysis ; MAXENT
【中文摘要】玉米霜霉病是我国重要的对外植物检疫对象,本文用MAXENT 软件对引起玉米霜霉病的5 种检疫性病原菌Peronoscleros pora maydis 、P. sacchari、P. philippinensis、P. sorghi 和S clerophthora rayssiae var. zeae 在我国的潜在分布进行了预测。结果表明,5 种病原菌中P. sorghi 在我国的适生范围最广,根据适生值的大小,其在华北平原、长江中下游平原、东北中部地区、两广、福建及云南西部,均有不同程度的发生风险。在这些地区内种植有大面积的玉米,为玉米霜霉病菌的定殖提供了良好的寄主。加强这些区域的调查监测和检疫对保护当地的玉米生产有重要意义。
【英文摘要】The maize downy mildew caused by Peronoscleros poramaydis, P. sacchari, P. philippi nensis, P.sorghi or Sclerophthora rayssiae var. zeae was important quarantine disease in maize. The potential risks of these pathogens in China were analyzed by using the software MAXENT. The results indicated that P. sorghi had the largest suitable areas among the 5 kinds of pathogens in China. Areas of moderate and high risk covered the North China Plain , middle and lower plain of Yangtze River, central northeastern regions of China , Guangxi Province and Guangdong Province, Fujian Province as well as western Yunnan Province. There are large areas of maize planted in these regions , which could provide available host for maize downy mildew colonization. It is therefore necessary to quarantine and monitor maize downy mildews for maize production in China.

【题目】Microsatellite analysis revealed genetic diversity and population structure among Chinese cashmere goats
【中文关键词】中国绒山羊,遗传多样性,微卫星,群体结构
【英文关键词】Chinese cashmere goat, genetic diversity, microsatellite, population structure.
【中文摘要】绒山羊大多分布在我国的北部和蒙古,因为他们能为纺织工业提供高品质的天然纤维而被视作珍贵资源,用14对ISAG/FAO的引物首次对9个中国绒山羊群体进行遗传多样性和群体结构分析,此外2个伊朗群体和一个西非山羊群体作为对照也被分析。结果显示中国绒山羊的遗传多样性十分丰富,但略低于伊朗群体。中国群体间所有的配对FST值都差异显著,暗示他们应该被作为单独的品种,最后,聚类分析将中国绒山羊分为至少2个分支,西藏河谷山羊为单独一支,在中国群体中发现广泛的混群(除了河谷山羊),这将对育种管理具有重要的意义。
【英文摘要】Most cashmere goats are found in northern China and Mongolia. They are regarded asprecious resources for their production of high quality natural fibre for the textile industry.It was the first time that the genetic diversity and population structure of nine Chinesecashmere populations has been assessed using 14 ISAG/FAO microsatellite markers. Inaddition, two Iranian populations and one West African goat population were genotyped forcomparison. Results indicated that the genetic diversity of Chinese cashmere goats was rich,but less than those of the Iranian goat populations. All pairwise FST values between theChinese cashmere goat populations reached a highly significant level ($P < 0.001$), suggestingthat they should all be considered as separate breeds. Finally, clustering analysisdivided Chinese cashmere goats into at least two clusters, with the Tibetan Hegu goats alonein one cluster. An extensive admixture was detected among the Chinese goat breeds (exceptthe Hegu), which have important implications for breeding

management.

【题目】排空-强饲法测定鸭饲料氨基酸真消化率的研究

【中文关键词】北京鸭 氨基酸真消化率 排空-强饲法

【英文关键词】Beijing duck;True digestibility of amino acids;Emptylag-force-feeding method

【中文摘要】本试验旨在通过研究"排空-强饲"条件下,鸭饲料氨基酸的排泄规律是否满足Sibbald"排空-强饲"法的基本条件,为Sibbald法是否适合于鸭饲料氨基酸真消化率的测定提供参考。试验采用单因素完全随机设计,将84只成年公鸭随机分配到7个处理中,即饥饿组和6种试验日粮组(豆粕在试验日粮中的比例分别为0、10%、20%、30%、40%、50%),每个处理4个重复,每个重复3只鸭,以"排空-强饲"法测定日粮的氨基酸排泄量。结果表明,在以豆粕为唯一氨基酸来源的日粮中,成年公鸭17种氨基酸的排泄量与摄入量间呈极显著的线性关系(P0.01)。无氮日粮条件下内源性组氨基酸的排泄量显著地高于饥饿条件下所测值(P0.05),而其他内源性氨基酸的排泄量在饲喂无氮日粮与饥饿条件下无显著差异。鸭氨基酸排泄量与摄入量间回归直线截距中仅精氨酸、组氨酸及甘氨酸的回归截距显著地高于饥饿法所测相应的内源性氨基酸值(P0.05),而其他14种氨基酸的回归截距与饥饿法所测相应的内源性氨基酸无显著差异。因此,Sibbald"排空-强饲"法可以用于鸭饲料氨基酸真消化率的测定。然而,客观、准确地估测内源性氨基酸的量对"排空-强饲"法氨基酸真消化率的测定值至关重要。

【英文摘要】The relationship between output and intake of amino acids in ducks was investigated to study the feasibility of Sibbald ’s emptying-force-feeding method for true digestibility of amino acids determination.Eighty four male adult ducks were randomly divided into 7 treatments with 4 replicates per treatment and 12 ducks per replicate.One treatment was fasted treatment and other 6 treatments were fed with soybean meal with 6 levels in diets<O%,10%。20%,30%,40%,and 50%respectively).Sibbald ’s emptying-force-feeding method was used to determine the volume of amino acid output.The results showed that the significant linear relationship between amino acids output and intake was appeared in these 6 diets using soybean meal as the only protein source<P<O.01).The endogenous losses of 17 amino acids except His were not significantly different between the ducks fed with nitrogen-free diet and the fasted treatment(P<O.05).In the regression intercepts of output and intake of amino acids in ducks,only the regression intercepts of Arg,His and Gly were significantly higher than the corresponding endogenous amino acids value of fasting ducks(P<O。05),In conclusion,Sibbald ’s emptying-force-feeding method can be used for measuring the true digestibility of amino acids of duck feedstuff,but the accuracy of the determination of endogenous amino acids losses is important to the true digestibifity of amino acids in ducks.

【题目】棉籽蛋白质饲料猪消化能值估测模型的研究
【中文关键词】化学法 棉籽蛋白质饲料 消化能模型 估测模型 化学成分 相关关系 消化能值 通径分析 试验设计 中性洗涤纤维
【英文关键词】Chemical composition; Cottonseed Meal; Model of digestible energy
【中文摘要】本试验旨在通过研究棉籽蛋白质饲料中的营养物质(NM)和非营养物质(NNM)对其消化能值的影响,探讨通过棉籽蛋白质饲料的化学成分估测其猪消化能值的可行性,为建立棉籽蛋白质饲料猪消化能估测模型提供科学方法。选取体重(35±2)kg、遗传基础接近、健康良好的杜×长×大三元杂交去势公猪8头,采用2个4×4拉丁方试验设计,用全收粪套算法测定8种棉籽蛋白质饲料的消化能(DE),通过分析饲料中CP、EE、CF、Ash、NDF、ADF、ADL、GE与DE的相关关系及对DE变异的影响筛选出用于估测棉籽蛋白质饲料DE的最佳估测因子及估测模型。结果表明,棉籽蛋白质饲料的EE、CP、Ash与DE无显著的相关关系(|r|≤0.51,P0.05),而CF、NDF、ADF、ADL、GE与DE呈高度的相关(|r|≥0.9 5,P0.0 1),但CF、NDF、ADL和GE对DE的影响主要是通过ADF对DE的影响来实现的,因此,估测棉籽蛋白质饲料DE的最佳回归模型为DE(MJ/kg)=1 6.5 2-0.2 8×ADF%(R2=0.95,RSD=0.51,P0.01)。该模型具有较高的估测精度、最少的估测因子和较强的可操作性。
【英文摘要】The relationship between the digestible energy (DE) and nutritive matter (NM) , no nnutritive matter (NNM) were investigated in order to study the feasibility to predict the DE in cottonseed meal with chemical composition. Eight Duroc×Landrance×Largewhite castrate male pigs which w ere about 35 kg in initial body weight were sorted according to Two 4×4 Latin Square design. The DE o f 8 cottonseed meal were determined by difference method. The factor s and models for predicting the DE in cottonseed meal were selected with correlation relationship between DE and NM, NNM. The result showed, there was no significant correlation relationship between DE and EE, C P and Ash(| r | ≤ 0. 51, P> 0. 05) , but the simple correlation relationship between DE and CF (r = - 0. 98) , NDF (r= - 0. 95) , ADF (r = - 0. 97) , ADL (r= - 0. 73) and GE (r = 0. 99) was high significant in cottonseed meal, the influences of CF, NDF, ADL and GE o n the variation of DE were not from themselves directly but from the influence o f ADF on D E, so the best regression equation is DE(M J/ kg)= 1 6. 52- 0. 28 ×AD F% (R2 = 0. 95 , RSD= 0. 5 1, P < 0.01) .

【题目】直接法与差量法测定豆粕鸭代谢能值的比较研究
【中文关键词】北京鸭 代谢能 直接法 差量法
【英文关键词】Metabolizable energy; Direct method; Difference method
【中文摘要】本试验旨在通过比较研究直接法与差量法测定豆粕鸭代谢能值的差异,为豆粕鸭代谢能值的客观评定提供参考。试验采用单因素完全随机设计,将84只成年公鸭随机分配到7个处理中(豆粕在试验日粮中的比例分别为0%、10%、20%、30%、40%、50%、100%),每个处理4个重复,每个重复3只鸭,以排空强饲法测定日粮的代谢能值。结果表明,日粮中豆粕的含量从10%升高到50%时,日粮的AME和TME的实测值均显著高于其计算值(P0.05)。然而,在试验日粮中豆粕含量为40%时,试验日粮的AMEn和TMEn实测值与计算值无显著差异(P0.05)。在试验日粮中豆粕含量分别为10%、20%、30%时,由差量法测得的豆粕鸭代谢能值(AME、TME、AMEn和TMEn)显著高于直接法测值(P0.05)。在试验日粮中豆粕含量分别为40%、50%时,差量法测得的豆粕AME、TME值显著高于直接法测值,但在AMEn、TMEn上与直接法无显著差异。因此,在鸭的代谢能值测定中,差量法应要求日粮的豆粕含量达到40%~50%。豆粕的AMEn和TMEn值既可选用直接法,也可选用差量法测定,但在AME、TME的测值上建议使用差量法。

【英文摘要】This study was conducted to establish a reasonable method for determining the metabolizable energy (ME) of soybean meal in ducks by comparing direct method with difference method in ME determination. Eighty-four adult ducks were randomly divided into seven treatments with four replicates each and 12 ducks in each replicates. Seven treatments were fed with 7 diets containing 7 levels of soybean meal (0%, 10%, 20%, 30%, 40%, 50%, and 100%, respectively). Sibbald ’ s method was used to determine ME. The results showed that the determined AME and TME values of 5 diets (soybean meal content of 10%, 20%, 30%, 40%, 50%) were significantly higher than their calculated values (P<0.05). However, there was no significant difference between determined value and calculated value of AMEn and TMEn in the diet with 40% soybean meal. When dietary soybean meal contents were 10%, 20%, and 30%, the ME values (AME, TME, AMEn, TMEn) of soybean meal determined with difference method were significantly higher than those determined with direct method (PP0.05).When dietary soybean meal contents were 40% and 50%, the AME and TME values of soybean meal determined with difference method were higher than those determined with direct method (P<0.05), but there was no significant difference in the AMEn and TMEn values determined with these two methods (P>0.05). In conclusion, to determine the ME values of soybean meal with difference method, the optimal dietary soybean meal content should be 40%~50%. The AMEn and TMEn value of soybean meal can be determined with both direct method and difference method, but when determining AME and TME determined values,it was suggested to use difference method.

【题目】内标法同时测定挥发性脂肪酸和乳酸的方法探究
【中文关键词】气相色谱;挥发性脂肪酸;乳酸;内标法
【英文关键词】gas chromatogram; volatile fatty acids; lactic acid; intemal standard method
【中文摘要】选用巴豆酸作为内标物,以内标标准曲线法定量,探讨无需任何前处理便能同时测定挥发性脂肪酸和乳酸的最佳色谱条件。用HP-INNOWAX(19091N-133)毛细管柱,以高纯氮作为载气,用氢火焰离子化检测器对挥发性脂肪酸和乳酸进行测定。结果表明:其理想检测条件为载气总压力160kPa,气化室温度250℃,检测室温度270℃,柱温采用程序升温法,初始温度120℃,然后以10℃/min升温速率升至220℃,保持2min。
【英文摘要】Without any pretreatment, the optimal chromatographic conditions for simultaneous determination of VFAs and lactic acid was explored with crotonic acid as an internal standard. By using the HP-INNOWAX, FID and nitrogen as the carrier, the optimal conditions were nitrogen pressure at 160 kPa, injection temperature at 250℃, detection temperature at 270℃. A temperature programmed capillary GC method was used. The initial temperature was at 120℃, then elevated to 220℃ with the rate of 10℃/min

and retention for 2 min.

【题目】锰对肉仔鸡生长性能、胴体性能和血清生化指标的影响
【中文关键词】锰;肉仔鸡;生长性能;血清生化指标
【英文关键词】无
【中文摘要】采用2×3两因子完全随机设计,选用240只1日龄AA雏鸡,按体重随机分为5个处理,每个处理8个重复,每个重复6只鸡,分别饲喂不添加锰的玉米—豆粕型基础饲粮(对照组)和在基础日粮基础上分别添加100mg/kg和200mg/kg锰(源于硫酸锰和氨基酸锰)的饲粮,试验期为42d。结果表明:添加100mg/kg锰显著降低后期F/G(P0.10),添加100和200mg/kg锰组的肝脏锰含量显著高于对照组(P0.10),同时有提高腿肌率,降低腹脂率的趋势;添加100mg/kg氨基酸锰添加组血清总蛋白(TP)显著高于硫酸锰添加组(P0.10),而添加100mg/kg硫酸锰组的血清高密度脂蛋白胆固醇(HDL-C)含量显著低于对照组(P0.10),添加100mg/kg氨基酸锰和硫酸锰组分别较对照组升高碱性磷酸酶活性35.7%和21.0%(P0.10)。结论:添加100mg/kg锰可降低肉鸡生长后期的耗料/增重比、提高肝脏锰含量,但是两种锰源间差异不显著。

【中文关键词】橘小实蝇, 气候因子, 生长发育, 地理分布
【英文关键词】Bactrocera dorsalis , climatic factors , growth , geographical distribution
【中文摘要】文章概述橘小实蝇Bactrocera dorsalis (Hendel) 生活史、地理分布和生态要求的基础上,分析温度、湿度、降雨以及气候因子与橘小实蝇生长发育的关系,以及对橘小实蝇地理分布的影响。综述结果表明:喜湿热,厌干冷是橘小实蝇主要的生态学特征,低温与干旱不利于其生长发育;温度是橘小实蝇纬度分布中最主要的影响因子,冬季低温是中高纬度分布的主要限制因子,夏季高温是低纬度地区的限制因素之一,降雨影响橘小实蝇在经度上的分布范围。
【英文摘要】Based on the life history , geographical distribution and requirement for the ecological environment of Oriental fruit fly , Bactrocera dorsalis (Hendel) , the relationship between its growth and climatic factors were analyzed in order to clarify the influence oftemperature , humidity , rainfall and other climatic factors for the geographical distribution. The results showed that Oriental fruit fly tended to live in the wet and hot environment , but low temperature and drought was detrimental to its growth and development. Temperature was the main factor on the latitudinal distribution , i. e. , low temperature in winter was the major limited factor in middle and high latitudes , and the high temperature in summer was one of the limited factors in the low latitudes. Rainfall may influence the longitudinal range of Oriental fruit fly.

【题目】应用生态位模型研究外来入侵物种生态位漂移
【中文关键词】胜红蓟; 生态位漂移; 生态位模型; 适生图
【英文关键词】Ageratum conyzoides; niche shift; ecolog ical nichem ode;l hab itat suitab ility map
【中文摘要】由于基础生态位和实际生态位的改变,外来入侵物种在入侵地成功定殖、扩散后常会发生生态位漂移,而物种生态位漂移往往很难直接证明。生态位模型在假设入侵物种的生态位需求保守的前提下,以物种在其原产地的生态位需求为基础,预测其在入侵地的潜在分布,通过比较预测分布与实际分布的差异可以从一定程度上得到外来入侵物种的生态位是否发生漂移的间接证据。以我国入侵杂草胜红蓟在原产地的生态位需求为基础,应用生态位模型预测其在其他地区的潜在分布。研究结果表明,生态位模型可以很好地预测胜红蓟在亚太平洋地区和非洲地区的分布,但在我国,其预测分布与实际分布存在较大差别。胜红蓟在我国预测分布主要为云南、海南、台湾部分地区,而胜红蓟入侵我国后现已广泛分布于长江以南地区,其实际分布比预测分布广泛得多,由此推测胜红蓟在入侵我国后其生态位已经产生了漂移。
【英文摘要】Due to the change of the fundam ental and realized n iche, an invas ive alien species (IAS) often shifts niches after it has established successfully and spread w idely at the invaded reg ion. Usually the d irect evidence of the n iche shift is difficu lt to ach ieve. The ecological niche m odels (ENM s) can be em ployed to predict the potential distribution of an invas ive spec ies in the invaded area based on the niche requirem ent o f the species in its origin areas, g iven that its niche conserved when invaded in another region. Som e indirect evidences of niche sh ift during b iolog ical invasion w ere found by comparing the difference between predicted and actual distribut ion in the invaded areas. The potent ia l d istribution of A geratum conyzoides, a reg ional serious invaded weed in China, is predicted in non-native reg ions based on the niches require in its orig in area us ing ENM s. The previous resu lts showed that the distribution of A. conyzoides in non-native reg ions such as As ia-pac ific region and Africa region could be well pred icted by us ing ENM s, but there was a rem arkable

【题目】ROC曲线分析在评价入侵物种分布模型中的应用
【中文关键词】受试者工作特征曲线, 外来物种, 模型评价, 适生区, Radopholus similis
【英文关键词】ROC curve, alien species, model evaluation, suitable distribution area, Radopholus similis
【中文摘要】生态位模型(ecological niche models, ENMs)已广泛应用于物种潜在分布区预测, ENMs的应用也为外来入侵物种的风险分析提供了重要的定量化分析工具, 但如何评价不同模型之间的预测效果成了当今研究的热点问题。本文介绍了受试者工作特征(ROC)曲线分析在评价不同生态位模型预测效果中的应用原理和分析方法, 并以一种植物病原线虫—相似穿孔线虫(Radopholus similis)为例, 应用ROC曲线分析法对其5种模型(BIOCLIM, CLIMEX,DOMAIN, GARP, MAXENT)的预测结果进行了比较分析。5种模型的ROC曲线下面积AUC(Area Under Curve)值分别为0.810, 0.758, 0.921, 0.903和0.950, 以MAXENT模型的AUC值最大, 表明其预测效果最好; 方差分析结果表明,除GARP与DOMAIN模型之间AUC值差异不显著外, 其余各模型之间差异显著。
【英文摘要】Ecological niche models (ENMs), which are widely employed to predict the potential geographicdistribution of species, provide an important tool to quantify the risks imposed by invasive alien species. The problem of how to evaluate the performance of different models as attracted more and more attention. In the present paper, we introduced the principle of the method of Receiver Operating Characteristic (ROC) curve analysis in assessing the accuracy of different ENMs. We predicted the suitable distribution area of Radopholus similis, an important banana toppling disease nematode, with five widely used ENMs and evaluated the performance of different models by ROC curve analysis. The area under ROC curve (AUC) for BIOCLIM,CLIMEX, DOMAIN, GARP, and

MAXENT models was 0.810, 0.758, 0.921, 0.903, and 0.950, respectively.Among these, the biggest value of AUC was assigned to MAXENT, indicating that the result gained by MAXENT should be better than the other four models. According to the results of analysis of variance (ANOVA), there was a remarkable difference in AUC between each model except for DOMAIN and GARP.

【题目】Establishment and characterization of a fibroblast cell line derived from Texel sheep
【中文关键词】特克塞尔羊,成纤维细胞系,建立,鉴定
【英文关键词】Texel sheep, fibroblast cell line, establishment, identification.
【中文摘要】运用直接培养和低温保存技术成功构建特克赛尔羊成纤维细胞系TSF19,生物学分析表明,该细胞系为贴壁生长,细胞扩增时间为24.9小时,染色体分析表明,二倍染色体几率大于90%,乳酸脱氢酶和苹果酸脱氢酶同工酶分析表明与其他品种间没有交叉污染,细菌、真菌、病毒和支原体检测均为阴性。将编码荧光蛋白(pEGFP-N3, pECFP-N1, pDsRed1-N1, 和pEYFP-N1)的质粒转染该细胞,研究外源基因在细胞中的表达,转染效率为21.8%-46.5%,该细胞系不仅保存特科塞尔羊这种重要的遗传资源,而且也为基因组、后基因组合克隆研究提供有价值的材料。
【英文摘要】A Texel sheep ear marginal tissue fibroblast cell line (named TSF19) was successfully established by using aprimary explant technique and cell cryoconservation technology. TSF19 cells were adherent, with a population doublingtime of 24.9 h. Chromosome analysis showed that >90% of cells were diploid prior to cell passage 4. Isoenzyme analysesof lactate dehydrogenase and malate dehydrogenase showed that the TSF19 cells had no cross-contamination with otherspecies. Tests for cell line contamination with bacteria, fungi, or mycoplasmas were also negative. Plasmids encoding thefluorescent proteins pEGFP-N3, pECFP-N1, pDsRed1-N1, and pEYFP-N1 were transfected into cells to study exogenousgene expression in the cells. The plasmid transfection efficiency was between 21.8% and 46.5%. This newly establishedcell line will not only preserve the genetic resources of the important Texel sheep at the cell level but will also provide avaluable resource for genomic, postgenomic, somatic cloning research.

【题目】Establishment and biological characteristics of Ujumqin sheep fibroblast line
【中文关键词】乌珠穆沁羊,成纤维细胞系,生物学特性,低温保存
【英文关键词】Ujumqin sheep , Fibroblast line,Biological characteristics ,Cryopreservation
【中文摘要】运用直接培养和低温保存技术成功构建33只乌珠穆沁羊耳缘组织成纤维细胞系,该细胞系存在在147个冻寸管中,每管细胞数为4.9X106,细胞形态学上符合成纤维细胞的特点,生长曲线为典型的“S”型,细胞数量经过停滞期、对数生长期和平台期,细胞倍增时间为72小时,细菌、真菌、病毒和支原体检测均为阴性。同工酶检测表明细胞在体外的遗传特性是稳定的。核型分析表明,正常染色体数2n=54几率达到95.4%,六个荧光蛋白(pEGFP-N3, pEGFP-C1, pDsRed-N1, pEYFP-N1, pECFP-N1 and pECFP-mito)的最佳转染效率为18.5%-30.1%,转染时间为48小时。细胞系符合ATCC的所有标准,不仅该绵羊品种资源得以在细胞水平保存,该技术平台也为其他畜禽的遗传资源保存提供技术和理论支持。
【英文摘要】A Ujumqin sheep ear marginal tissue(USEM) fibroblast line, frozen in 147 cryovials with4 9 106 cell each, was successfully established from33 Ujumqin sheep ear marginal tissues using explantculture and cryopreservation techniques. The cellswere morphologically consistent with fibroblasts. Thegrowth curve was typical S-shape and the cellpopulation passed through a lag phase, a logarithmicphase and a plateau phase. The population doublingtime (PDT) was approximately 72 h. Tests forbacteria, fungi,

viruses and mycoplasma were allnegative. Isoenzyme polymorphism indicated that thegenetic characteristics of the cell line were stable invitro. Karyotyping analysis indicated that the chromosomenumber of a normal cell was of 2n = 54 and95.4% of the entire population was diploid. Thetransfection efficiencies of six fluorescent proteins(pEGFP-N3, pEGFP-C1, pDsRed-N1, pEYFP-N1,pECFP-N1 and pECFP-mito) optimal at 48 h werefrom 18.5% to 30.1%. The cell line met all criteriafrom the American Type Culture Collection (ATCC).Not only has the germline of this important sheepbreed been preserved at the cell level, but alsovaluable material had been provided for genome,postgenome and somatic cloning research. Moreover,the establishment of this technical platform mayprovide both technical and theoretical support forstoring the genetic resources of other animals andpoultry at the cell level.

【题目】奶牛p I gR 基因5＇侧翼区SNP 检测及其与IgA 和IgM含量的相关性研究
【中文关键词】奶牛PIgR基因;IgA和IgM;SNP;单倍型
【英文关键词】dairy cow;pIgR gene,IgA and IgMI SNP;haplotype
【中文摘要】本试验研究了PIgR基因5＇侧翼区的多态性及其对IgA争IgM含量的影响。从NCBI上的Map Viewer数据库下载牛PIgR基因的5＇侧翼区的序列(NW_174143),长度为3.2 kb,设计4对引物进行PCR扩增,通过对25头奶牛的PCR产物直接测序发现并确定SNP位点,并用SNP Stream标签微列阵基因分型系统对189头牛进行基因分型,将其与牛奶和血液中的IgA和IgM的含量进行关联分析。结果表明,PIgR基因在-3128、-3072、-2834、-2348和-515位发现了5个SNP位点,其中SNPl和SNP2为A/G突变,SNP3、SNP4和SNP5为T/C突变。方差分析结果表明,SNPl对牛奶IgM和血液IgA含量有显着的影响(P<0.05),SNP3和SNP5对血液IgM含量有显着影响(P<o.05),其他SNP位点与单倍型组合对乳及血液中IgA和IgM的含量均没有显著影响(P<0.05);多重比较分析表明,SNPl位点的基因型AB个体与BB个体的牛奶IgM和血液IgA含量的最小二来均数差异显著(P<0.05),SNP3和SNP5的不同基因型对血液IgM含量的最小二乘均数分别达到了显著水平(P<0.05)。因此得出,牛pIgR基因5 7侧翼区的多态性影响牛奶和血液中的IgA和lgM的含量,这为进一步研究牛奶中IgA和lgM分泌转运机理提供了理论依据。
【英文摘要】The objective of this study was to detect the polymorphism in the 5＇upstream region of pIgR gene and their association with IgA and IgM concentration in blood and milk. Based on the pIgRgene 5＇flangking region sequence (NW_174143) downloaded from the map viewer database of NCBI, 25 genomic DNA samples of dairy cows were used for SNP detection. The 12-plex SNPstream genotyping was applied to 189 dairy ciws and the association between the polymorphisms and the IgA and IgM concentrations in milk and blood were detected. We found five SNP loci; SNP1 and SNP2 were A/G variation and SNP3, SNP4 and SNP5 were the T/C variation. Statistical analysis indicated that the SNP1 was siginificantly (P<0.05) associated with milk IgA and blood IgM concentrations, whera=eas SNP3 and SNP5 significantly affected blood IgM concentration (P<0.05); other SNPs and diplotypes had no effect on the IgA and IgM concentrations. Cows with genotype AB of SNP1 were significantly(P<0.05) different in milk IgM and blood IgA concentration than cows with genotype BB. The different genotypes of SNP3 and SNP5 had considerable effects on blood IgM concentration (P<0.05). These findings implied that the polymorphisms of 5＇flanking region in bovine pIgR gene had an effect on IgA and IgM concentrations in milk and blood. Our results could provide references for further reaearch on the mechanism of transportation of IgA and IgM into milk.

【题目】六个不同品种牛的瘤胃微生物群落的比较分析
【中文关键词】牛; 瘤胃细菌群落; 16S rDNA ; 多样性
【英文关键词】bovine ; rumen bacterial community ; 16S rDNA; diversity
【中文摘要】分析不同品种牛的瘤胃微生物群落结构的差异,构建了1 个鲁西肉牛瘤胃细菌16S rDNA 文库,并从公共数据库中搜集来自荷斯坦奶牛、晋南牛、牦牛、黄牛和Hanwoo 的9 个16S rDNA 文库,对序列多样性和文库组成等进行比较分析。结果发现:鲁西肉牛瘤胃细菌16S rDNA 文库共有122 个克隆,可分为109 个操作分类单元。文库中91 %的克隆来自未培养细菌,拟杆菌(B acteroi dales) 和梭菌(Clost ri diales) 是其中的优势菌群。文库的定性和定量比较表明饲喂不同日粮的5 个荷斯坦奶牛16S rDNA 文库组成类似,而与鲁西肉牛等亚洲品种的文库存在显著差异。结果表明,牛的品种是瘤胃细菌群落差异的重要因素,对瘤胃细菌群落组成的影响大于日粮或其他因素。
【英文摘要】To improve our unders tanding of factors that may influence the s tructure of rumen microbial community , wecons tructed bacterial 16S rDNA clone libraries from Chines e Nooxi s teers , extracted nine 16S rDNA libraries from thep ublic databas e and then subjected them to ecological s tatistical analysis . Res ults showed that the Nooxi 16S rDNAlibrary contained 122 clones , covered a re asonable fraction of rumen bacterial community and could be us ed for librarycomp aris on. Princip al comp onent analysis and nonp arametric es timates of library comp aris ons indicated that five 16Slibraries from Holstein cow fed with different diets clus tered together and were clearly dis tinguishable from thos elibraries from Nooxi , J innan cattle , yak , Yunan Yellow cattle and Hanwoo , indicating that the hos t sp ecies is animportant factor influencing the comp osition of rumen bacterial community.

【题目】免疫小鼠乳腺乳铁蛋白基因表达变化研究
【中文关键词】小鼠; 免疫刺激; 乳腺; 乳铁蛋白; 基因表达
【英文关键词】immune state ; mammary gland ; lactoferrin; gene expressions
【中文摘要】研究小鼠不同生理阶段以及免疫条件下,乳腺内乳铁蛋白基因mRNA 表达量的变化。选择120 只健康昆明小白鼠,于分娩后4 d 进行如下制剂处理:脂肪酶蛋白(Lipase) 、空免疫刺激复合物(ISCOM) 和Lipase 。于分娩后8 和12 d (即注射后4 和8 d) 用间接EL ISA 法测定乳中和血清中的特异性IgG含量,用Real Time PCR 检测小鼠乳腺中乳铁蛋白基因的相对表达量。另外,正常生理状态乳腺内乳铁蛋白基因mRNA 表达量的变化分别是在分娩后1 、4 、8 和12 d 进行检测。结果表明,正常状态下,小鼠分娩后1 d 时,乳腺内乳铁蛋白基因mRNA 表达量相对较高,而在分娩后4 、8 和12 d 时较低;免疫条件下,乳腺内乳铁蛋白显著上升。免疫刺激可以引起小鼠乳腺乳铁蛋白基因表达上调。
【英文摘要】Using mice as a model animal , we determined changes in the relative expres sion of lactorferrin gene in themammary gland under different natural s tages and the immune s tate . One hundred and twenty KunMing White micewere divided into four groups . They were treated differently at days 4 after p arturition as follows : group A2injectingisotonic Na chloride , group B2injecting Lipase + isotonic Na chloride , group C2 injecting ISCOM, and group D2injectingLip as e + ISCOM. Samples of blood , milk and mammary gland is s ues were collected at days 8 and days 12 afterp arturition (days 4 and days 8 after injecting) , resp ectively. The sp ecific IgG concentration in s erum and milk wasdetermined by indirect ELISA. We us ed the Re al Time PCR to detect the relative expres sion of lactorferrin in themammary gland. In addition , relative expres sion of lactorferrin in the mammary gland under natural s tage weredetected four times (1 , 4 , 8 and 12 days after p arturition) . In the normal s tate , the relative expres sion of lactorferrinon day 1 after p arturition was quite high , but quite low on days 4 - 12. In addition , the relative expres sion oflactorferrin in the mammary gland increas ed significantly under the immune state .

【题目】全混合日粮裹包贮存效果及对奶牛生产和血液生化指标的影响
【中文关键词】裹包TMR; 贮存; 奶牛; 生产性能; 血液指标
【英文关键词】baled TMR; storage; dairy cow; milk production; blood indices
【中文摘要】研究全混合日粮(TMR)裹包贮存效果及裹包TMR饲喂对泌乳末期奶牛生产性能和血液生化指标的影响。TMR饲粮水分含量调整为40%、50%和60%,利用裹包技术将新鲜制作的TMR饲粮进行裹包,分别存放0、3、7、15和30 d后进行营养物质含量和发酵指标的测定。结果表明:随着贮存时间的延长,TMR饲粮中的营养物质含量由于干物质的损失而有相应的增加,裹包TMR饲粮的pH值显著降低(P<0.05),氨态氮含量显著增加(P<0.05),且随着TMR饲粮初始水分含量增高,pH值降得越低(P<0.05),氨态氮生成量越高(P<0.05)。另外,选择24头泌乳末期荷斯坦奶牛,以常规饲喂(精粗分开)作为对照组,比较裹包TMR饲喂对奶牛生产和血液指标的影响。结果表明:裹包TMR饲喂比对照可显著提高产奶量(14.37 kg/d vs.12.38 kg/d)和产奶效率(0.84vs.0.72)(P<0.05),除血糖(P<0.05)外,其他血液生化指标与对照差异均不显著(P>0.05)。因此认为,裹包技术可以用来在规模化牛场和大型饲料厂进行TMR饲粮的裹包生产,从而实现TMR饲粮的有效贮存和运输,以达到中、小规模养牛场和个体养殖户也可以应用TMR饲喂技术的目的.
【英文摘要】The objective was to study the storage effect of total mixed ration (TMR) wrapped by stretch film and the effect of baled TMR on milk production, milk composition, and blood indices of late lactation dairy cows. The moisture contents of the TMR were adjusted to 40%, 50%, and 60%, respectively. Fresh TMR were wrapped and baled using stretch film. After 0, 3, 7, 15, and 30 days storage, the nutrient content and fermentation quality were determined. The results demonstrated that the nutrient content increased compared with fresh TMR owing to the dry matter losses during storage. The pH of baled TMR showed significant decrease(P~0.05)and the NH3-N content embodied significant increase(P<0.05)along with the proceeding of storage. The pH dropped significantly (P<0.05) and the NH3-N content increased significantly P〈0.05 when the moisture content of initial TMR increased. Twenty-four late lactation dairy cows were selected and randomly assigned to two treatments to compare the effect of baled TMR on milk production and blood indices with separate feeding strategy. The result showed that baled TMR feeding significantly increased the milk yield (14. 37 kg/d vs. 12.38 kg/d)and feed efficiency(0.84 vs. 0. 72)(P<0. 05). There was no significant difference(P>0.05) between two treatments on blood indices except blood glucose(P<0.05). So, it was concluded that baling technology can be used at big dairy farms and feed factory to oroduce baled TMR, and make it be achieved that TMR diet can be stored and delivered, and then make the small-scale farms and individual farms also can use TMR technique.

【题目】奶牛日粮添加共轭亚油酸和二十二碳六烯酸对瘤胃纤维素酶活性的影响
【中文关键词】奶牛;LA;DHA;纤维素酶
【英文关键词】dairy cows;LA:DHA;cellulase
【中文摘要】试验旨在研究在奶牛日粮中添加亚油酸(Linoleic acid,LA)和二十二碳六烯酸(Docosahexaenoicacid,DHA)对奶牛瘤胃液中纤维素酶(水杨苷酶、木聚糖酶、羧甲基纤维素酶)活性的影响。结果表明,日粮中添加LA会抑制瘤胃中木聚糖酶的活性,但可提高水杨苷酶和羧甲基纤维素酶的活性,而DHA对3种酶的活性均有提高作用,其中LA和DHA对水杨苷酶和羧甲基纤维素酶活性的提高具有协同作用。木聚糖酶和水杨苷酶的活性均在饲喂后2 h达到最高点,而羧甲基纤维素酶的活性则随着时间的变化呈降低趋势。

【题目】瘤胃微生物基因组文库中BAC 末端序列分析
【中文关键词】瘤胃微生物;宏基因组文库;BAc末端序列;Blast比对
【英文关键词】rumen microflora;metagenome;BAC end sequences;blast analysis
【中文摘要】基于前期从瘤胃微生物基因组文库中筛选的功能酶克隆菌,利用T7和pIBRP引物.测定功能酶克隆菌的BAc末端序列。并利用NCBI Blast系统对BAC末端序列进行分析.结果表明:共得到26条BAc末端序列,经Blast比对分析,与已知编码基因的匹配度低。而大部分BAc末端序列与阪崎肠杆菌和环境中的微生物匹配度高,说明瘤胃中的微生物与其它环境中的微生物具有一定的相似性。进一步丰富了对瘤胃微生物的认识.
【英文摘要】The bacterial artificial chromosome(BAC)end sequences of enzyme positive clones screenedfrom the microbial metagenomic library of rumen were sequenced using the primers of T7 and pIBRP.Then the BAC end sequences were blasted to NCBI database. The results revealed that 26 BAC end sequences were attained. These sequences had poor identity to known encoding genes,and had the best identity to Enterobacter sakazarkii and environmental uncultured bacterial. Rumen contained some microbessimilar to other environmental microbes,which deepen the knowledge of rumen microbes.

【中文摘要】DDGS(Distillers Dried Grains with Solubles),是使用粮食作物生产酒精后将滤液干燥浓缩再与滤渣混合干燥而获得的饲料,能值、粗蛋白水平均较高,具有较高的饲用价值。DDGS广泛应用于畜禽和水产饲料中,已经成为国内外常用的饲料原料。由于DDGS是一种工业副产物,所以不同的原料、工艺、产地对于DDDGS营养含量和消化率有着很大影响。在我国,DDGS在猪饲料中的应用比较普遍,但是几乎没有文章研究我国市场上DDGS营养成分的消化率问题。本研究以体内法测定了6种DDGS(Distillers Dried Grains with Solubles)在生长育肥猪饲料中的能量和氨基酸消化率。试验一采用全收粪尿法测定了6种DDGS的消化能和代谢能值,采用7×7拉丁方试验设计,应用套算法测定。总共七个试验期,每期7 d,分为4 d预饲期和3 d收粪期。试验选择体重46.0±2.5 kg的健康去势公猪(长白×大白)7头。正试期间准确收集各试验猪每天(24小时)所排粪样、尿样。每天对所收集的全部粪样称重,放入-16℃冰箱中保存备用。正试期间,每天对收集的全部尿样称重,充分混匀后再按1/20取样,取样后放入-16℃冰箱中保存备用。正试期结束后,把3天所取的全部粪样充分混匀,取样于75℃烘箱中烘干,回潮24 h,恒重,粉碎过40目筛备测,把3天所取的全部尿样充分混匀,装瓶,于-16℃冰箱中保存备测。试验二使用回肠末端简单T型瘘管法测定了6种测定6种DDGS饲料的氨基酸标准回肠消化率,采用7×7拉丁方试验设计,以无氮日粮法测定内源氮损失,以Cr_2O_3为指示剂。总共7个试验期,每期7 d,分为4 d预饲期和3 d食糜收集期。试验选择体重43.3±1.7 kg的健康去势公猪(长白×大白)7头。采用简单T型瘘管法收集食糜,以Cr_2O_3为指示剂(添加量0.4%)。为了减少收集食糜对伤口的影响,每半小时更换样品袋。每次换下的小塑料袋立即放入-16℃冰箱中保存。正试期结束后,把3d所收集的全部食糜充分混匀,冷冻干燥后回潮24h,恒重,粉碎过40目筛,装瓶备测。目前正在检测样品、分析数据中。

【题目】体内法评定鸡饲料原料中矿物元素生物学利用率的研究进展
【中文关键词】饲料原料;矿物元素;综述;生物学利用率;鸡
【英文关键词】feedstuffs; minerals; a review; bioavailability; poultry
【中文摘要】动物营养研究的最终目标之一是实现以饲料养分的有效含量来满足动物对饲料养分的有效需要量。目前,无机和有机矿物元素添加剂中矿物元素的生物学利用率评定已受到人们的重视,但对动植物性饲料原料中矿物元素生物学利用率的评定还少见报道。本文综述了体内法评定鸡饲料原料中矿物元素生物学利用率的主要方法、研究进展及存在的问题,并提出了今后进一步的研究方向。
【英文摘要】One of the ultimate objectives of the research of animal nutrition is to meet the effective requirements of animals with available contens of nutrients in feed. At present, the evaluation of bioavailability of minerals in organic and inorganic mineral additives has been emphasized. However, less information was available about the evaluation of bioavailability of minerals in feedstuffs. This article reviewed methods, recent advances, and problems in the evaluation of bioavailability of minerals in feedstuffs for poultry in vivo. Research prospects in the future were also suggested in this paper.

【题目】鸡用饲料氨基酸评定方法研究进展
【中文关键词】氨基酸消化率;回肠末端法;“ TME ”;真代谢能法;鸡
【英文关键词】无
【中文摘要】饲料氨基酸消化率是评定饲料原料营养价值和可利用性的一项重要指标。饲料原料氨基酸消化率的获得为动物可消化氨基酸需要量的测定和更准确地设计日粮配方提供参考数据。本文介绍了〝TME〞真代谢能法(饥饿-强饲-收粪法) 和回肠末端法评定鸡饲料氨基酸消化率过程中的操作方法, 并就存在的问题进行了探讨。

【题目】马铃薯蛋白粉在仔猪上的营养价值评定
【中文关键词】仔猪;马铃薯蛋白粉;无氮日粮;氨基酸消化率
【英文关键词】piglets; potato protein meal; N- free diet; amino acids digestibility
【中文摘要】选择体重为(16±1.66)kg PIC仔猪18头,在测定马铃薯蛋白粉(PPM)养分、氨基酸含量的基础上进行消化代谢试验。以PPM和豆粕(SBM)分别作为唯一蛋白源配制半纯合日粮,采用无氮日粮法测定两者猪回肠末端氨基酸的表观消化率和真消化率。结果表明:PPM含消化能18.84MJ/kg,可消化粗蛋白质74.08%,蛋白质生物学效价76.87%。均显著高于豆粕。同时,PPM中大部分氨基酸,尤其是Glu、Lys、Pro等的含量、表现消化率或真消化率显著或极显著高于豆粕,回肠真可消化Glu、Lys、Pro的含量分别为20.67%、5.58%、8.16%,分别比豆粕高194.92%、110.34%、94.87%。可见,PPM的能量和蛋白质

氨基酸营养价值明显优于豆粕。
【英文摘要】A digestibility trial to evaluate the nutritional value of potato protein meal(PPM)was conducted on the basis of analyzing nutrients and amino acid content.Eighteen crossbred PIC piglets with 16±1.66 kg were allocated into 3 groups to feed diets with PPM or soybean meal (SBM) as only protein source, and N- free diet to determine endogenous amino acid excretion to calculate amino acid true digestibility.Results showed that the PPM contained 18.84 MJ/kg digestible energy and 74.08 % digestible protein which were higher than those of SBM (P < 0.05) .Biological value of protein was 76.87 % for PPM.Apparent or true ileal digestibilities for most amino acids in PPM, especially for Glu, Lys and Pro, were higher than those of SBM.Contents of true ileal digestible Glu, Lys and Pro were 20.67 %, 5.58 %, 8.16 % respectively, which were higher than those of SBM with the increase by 194.92 %, 110.34 %, 94.87 % respectively.It was concluded that potato protein meal had higher nutritional value in terms of energy and protein than soybean meal.

【题目】马铃薯蛋白粉对断奶仔猪的应用效果研究
【中文关键词】马铃薯蛋白粉; 断奶仔猪; 生长性能; 腹泻率
【英文关键词】无
【中文摘要】选择30 日龄断奶体重为(6.94±0.69) kg 的二元杂种商品仔猪184 头, 按照窝别、性别、体重相近的原则分为5 组, 饲喂不含马铃薯蛋白粉的基础饲粮和以2%、4%、6%的马铃薯蛋白粉及4%的血浆蛋白粉等氮替代基础饲粮中豆粕的饲粮, 每组4~5 个重复, 每个重复8 头仔猪, 进行28 d的饲养试验。试验第15 d 称重后, 每个重复选择1 头体重接近该圈平均体重的仔猪前腔静脉采血, 测定血液生化指标; 试验第15~18 d, 以圈为单位, 收集粪样, 测定蛋白质表观消化率。研究马铃薯蛋白粉在断奶仔猪上的应用效果, 确定其适宜添加量。结果表明, 饲粮中添加2%马铃薯蛋白粉组, 与基础饲粮组相比, 试验全期可以提高日增重6.14%(P>0.05) 、降低料重比10%(P<0.01) ,降低腹泻率6.24 个百分点(P>0.05) , 效果相当于甚至优于4%血浆蛋白粉。饲粮中添加4%和6%马铃薯蛋白粉, 仔猪生长性能显著或极显著低于基础饲粮组。但6%马铃薯蛋白粉组蛋白质表观消化率高于基础饲粮组和2%马铃薯蛋白粉组(P<0.05), 血浆蛋白粉组蛋白质表观消化率略高于基础饲粮组(P>0.05); 2%马铃薯蛋白粉组血清总蛋白、白蛋白、球蛋白、胆碱酯酶含量最高; 4%血浆蛋白粉组血清尿素氮显著低于基础饲粮组, 极显著低于马铃薯蛋白粉组; 6%马铃薯蛋白粉组谷丙转氨酶活性高于4%、2%马铃薯蛋白粉组(P<0.05) ; 各个处理血液谷氨酰胺、谷氨酸含量以及谷草转氨酶活性差异不显著。由此结论, 马铃薯蛋白粉在断奶仔猪饲粮中的适宜添加量为2%。

【题目】喷雾干燥破膜血球蛋白粉在断奶仔猪上的营养价值评定
【中文关键词】血球蛋白粉; 营养价值; 氨基酸消化率; 仔猪
【英文关键词】spray- dried animal blood cells; nutritional value; amino acids digestibility; piglet
【中文摘要】试验选用体重(15.6±1.98) kg 杜长大仔猪12 头, 在测定血球蛋白粉常规养分和氨基酸含量基础上进行消化代谢试验。采用单因子试验设计, 用无氮日粮和血球蛋白粉半纯合日粮法测定血球蛋白粉中粗蛋白质和能量的消化利用率及猪回肠末端氨基酸的表观消化率。结果表明: 血球蛋白粉含粗蛋白质91.87 %, 总能20.96 MJ/ kg, 总氨基酸71.85 %, 其中主要限制性氨基酸: 赖氨酸、蛋氨酸、苏氨酸和异亮氨酸含量分别为6.32 %、0.91 %、2.30 %、0.36 %。粗蛋白质表观和真消

化率分别为92.69 %和94.34 %, 总氨基酸回肠表观消化率80.83 %, 消化能19.28 MJ/ kg, 代谢能19.03 MJ/ kg。
【英文摘要】A digestibility trial to evaluate the nutritional value of spray- dried animal blood cells (SDBC) was conducted on the basis of analyzing the common composition and amino acid content.Twelve Duroc ×Londrance ×Yolk piglets with body weight (15.6±1.98) kg were used in the experiment to determine the digestibility of crude protein, energy and amino acids of SDBC.N- free diet and semi- purified diet with SDBC as only protein source were used in two treatments each with 6 replications.The results showed that: SDBC contains crude protein 91.87 %, GE 20.96 MJ/kg, general amino acids 71.85 %, some of its main limited amino acid were: Lys 6.32 %, Met 0.91 %, Thr 2.30 %, Ile 0.36 %.The apparent and true digestibility of the crude protein were 92.69 % and 94.34 %, the apparent ileal amino acids digestibility was 80.83 %, the digestible energy and metabolic energy were 19.28 MJ/kg and 19.03 MJ/kg.

【题目】喷雾干燥破膜血球蛋白粉替代鱼粉对断奶仔猪生长性能的影响
【中文关键词】血球蛋白粉;血粉;仔猪;生产性能
【英文关键词】spray- dried blood cells;blood meal;weaned piglet;growth performance
【中文摘要】试验采用单因子试验设计,选用60 头(28±2)日龄断奶,体重(7.08±0.82)kg 二元杂交仔猪,随机分为3 组,每组5 个重复,每个重复4 只猪,分别用0、1.76%、3.52%喷雾干燥破膜血球蛋白粉(SDBC)取代仔猪基础日粮(玉米- 豆粕型,添加4%的血粉)中血粉的0、50%、100%,研究SDBC 部分或全部替代血粉对断奶仔猪生长性能、养分消化率和血液指标的影响。经过28 d 的试验,结果表明:与对照组相比,1.76% SDBC 组和3.52% SDBC 组均可显著提高仔猪ADG、降低F/G。而且1.76% SDBC组的ADG 和F/G 分别比对照组提高了24.7%和降低了14.1%,其养分消化率也最高。由此可见,SDBC能够完全替代血粉,但以添加1.76% SDBC 替代50%的血粉效果最好。
【英文摘要】The design of single factor was adopted to determine the effects of SDBC on growth performanceof weaned piglets compared to blood meal. There were three treatments. Sixty crossbred piglets(7.08±0.82) kg were adopted to determine the effects of SDBC on growth performance of weaned piglets compared to blood meal. 0, 50% and 100% blood meal of diets was substituted with 0,1.76% and 3.52% SDBC respectively and all treatments diets contained the similar level of nutrients. The result indicated that the ADG, ADFI, G/F of the diet containing 1.76% and 3.52% SDBC treatments were higher than blood meal treatment. Compared to 1.76% SDBC and blood meal treatments, the ADG and G/F of 1.76% SDBC treatment increased by 24.7% and decrease 14.1%.The digestibility of nitrogen, energy for 1.76% SDBC group was highest. With the increase of SDBC in diet, the content of total protein (TP), serum urea nitrogen(BUN) increased.The content of serum glucose(Glu) for 1.76% SDBC group was highest.

【题目】柠条替代部分粗料对泌乳奶牛产奶量及乳品质的影响
【中文关键词】奶牛;柠条;产奶量;乳品质
【英文关键词】Caragana korshinskii;dairy cattle;milk yield;milk quality
【中文摘要】为了探索不同柠条水平对奶牛产奶量及乳品质的影响,试验选用6头年龄、胎次相同,体质量、泌乳天数相近的中国荷斯坦奶牛,随机分为3组,1组对照组,2组试验组,每组2头牛.整个试验期分为3阶段,进行3×3重复拉丁方饲养试验.2组试验组分别用柠条替代15%和30%的粗料,3组配方为等能等氮,研究柠条的最适添加量.结果表明:3组之间采食量差异均不显著(P>0.05);30%组产奶量高于15%组,略低于对照组,但差异不显著(P>0.05);乳蛋白、乳糖、乳密度和非脂固形物各组差异均不显著(P>0.05);对照组乳脂肪含量显著低于30%组(P<0.05),与15%组差异不显著(P>0.05),30%组与15%组乳脂率差异不显著(P>0.05).
【英文摘要】For evaluating the effect of different Caragana korshinskii levels on milk yield and quality ofmilking cow,the total six Chinese Holstein cows with same age and parities,similar body weight and lactation period were randomly divided 3groups including one control group and two experimental groups.The entire trial period was divided into three stages,repeated for 3×3Latin square feeding trial.For study the best concentration of Caragana korshinskii,two experimental groups rations were replaced theroughage with 15%and 30%of Caragana korshinskii in three rations with same energy and nitrogen level,respectively.The results showed that the feed intake and milk yield between three groups were not significant(P>0.05),the milk yield of experimental group of feeding 30%Caragana korshinskii_____ was higherthan the group that feeding 15%Caragana korshinskii but lower than control group.Milk protein,lactose,milk density and solid of evil fat were no significant difference(P>0.05)among groups,but milk fatcontent of the control group was significantly lower than the group that feeding 30%Caragana korshinskii(P<0.05).The milk fat percentages were not significant between experiment groups(P>0.05).

【题目】添加不同水平双乙酸钠对裹包TMR贮存效果的影响
【中文关键词】裹包TMR; 双乙酸钠; 贮存效果
【英文关键词】baled TMR; sodium diacetate; storage effect
【中文摘要】[目的]研究裹包全混合日粮(Total mixed ration, TMR) 中添加不同水平的双乙酸钠(SDA) 对贮存效果的影响。[方法]在裹包TMR 中分别添加鲜重质量分数0, 0. 1%, 0. 3%和0. 5% 的SDA, 于贮存后第0, 3, 7, 15和30 天, 对裹包TMR 的感官、营养成分、发酵指标和有氧稳定性进行分析。 结果 0. 3%和0. 5% SDA 添加组的裹包TMR 可以良好贮存30 d。SDA 添加水平越高, 裹包T MR 的有氧稳定性越好。添加SDA 对裹包TMR 的感官和营养成分影响差异较小。与其他2 个处理相比, 0. 3%和0. 5% SDA 添加水平可以显著降低裹包TMR 的pH 值(P <0. 05) 和NH3-N/ TN 值(P< 0. 05) 。[结论]从经济效益和添加效果考虑, 在裹包TM R 中添加0. 3%SDA 为适宜水平。
【英文摘要】[Objective] This trial was designed to study the storage effect of different levels of sodium diacetate (SDA) on storage of the baled total mixed ration (TMR) of forage to concentrate ratios 50 :50 and moisture content 50%. [Method] The SDA supplement s

w ere 0, 0. 1%, 0. 3%, and 0. 5% of the fresh weight of TMR. After 0, 3, 7, 15, and 30 days of storage, the sensory was evaluated and the chemical composition, fermentation characteristics, and aerobic stability were determined. [Result] The results indicated the baled TMR of 0. 3% and 0. 5% SDA addition could strewell for 30 days. The effects of different lev els of SDA supplement on sensory evaluat ion and chemical compositions were not different. The baled TMR with higher SDA level had hig her aero- bic stability. The baled TMR of 0. 3% and 0. 5% SDA additio n had low er pH(P< 0. 05) and NH3-N/ TN (P < 0. 05) compared with other groups. [Conclusion] Considering the economic benefit and addition effects, it is suggested that the opt imal level of SDA supplement be 0. 3% .

【题目】晋南牛瘤胃中古菌分子多样性的研究
【中文关键词】晋南牛; 产甲烷菌; 16S rRNA 基因克隆库; 分子多样性
【英文关键词】Jinan Cattle; methanogens; clone; molecular diversity
【中文摘要】采用3 对古菌特异性引物扩增瘤胃古菌16S rRNA 基因分别建立克隆库来研究晋南牛瘤胃古菌的多样性。每个克隆库随机挑选100 个克隆。引物Arch f364/1386 建立的克隆库中, 克隆分为四类, 分别与四种甲烷短杆菌1Y (61%)、SM9 (23%)、NT7 (14%)和AK-87(2%)相似。引物1Af/1100Ar 建立的克隆库中, 克隆分为两类, 分别与Methanobacterium aarhusense(72%) 和Methanosphaera stadtmanae DSM 3091 (28%)相似。引物Met86F/Met1340R 建立的克隆库反映的古菌种类较为全面, 除以上4 种甲烷短杆菌(所占比例分别为47%、26%、11%和3%)外, 还有Methanomicrobium mobile(2%)、以及类似Methanobacterium aarhusense(1%)和Methanosphaerastadtmanae(3%) 的序列, 还有7% 的未匹配序列。系统进化分析表明, 这些克隆属于Methanobrevibacter、Methanobacterium、Methanosphaera、Methanomicrobium, 和未知广域古菌等5 个分支。有25 类属于广域古菌的未知序列, 提示瘤胃中存在大量的未知产甲烷菌。
【英文摘要】Molecular diversities of rumen archaea of Jinnan (South Shanxi Province, China) cattle was analyzedand compared by 16S rRNA gene sequencing from three clone libraries generated using three different archaea-specific primer sets, respectively. DNA from rumen of 4 Jinnan cattle was extracted, and methanogen 16SrRNA gene was amplified using archaea-specific primer sets. Three clone libraries were generated by using vectorpGEM-T and cloning into E.coli JM109. One hundred clones were randomly picked up for each library and RFLPwas analyzed for each clone to obtain OTUs. Sequences from each OTU were analyzed and compared with availablesequences in GenBank. The first library, generated with primers Arch f364/1386, produced four groups ofsequences, affiliated with 4 Methanobrevibacter strains, 1Y (61% of clones), SM9 (23% of clones), NT7 (14% ofclones), and AK-87(2% of clones). The second library, generated with primers 1 Af/1100Ar, two groups of sequences,one affiliated with Methanobacterium aarhusense(72% of clones) and the other with Methanosphaerastadtmanae DSM 3091 (28% of clones). The third library, generated with primers Met86F/Met1340R, produced ahigh degree of diversity. It included the sequence groups found in the first and the second libraries, as well as sequencesaffiliated with the Methanomicrobium mobile (2% of clones) and uncultured euryarchaeote sequences (7% ofclones). The phylogenetic analysis indicated that archaea found in the three libraries were clustered in Methanobrevibacter,Methanobacterium, Methanosphaera, Methanomicrobium, and unidentified euryarchaeote of the Euryarcharota.There were 25 unidentified sequences belonged to Euryarchaeota. This suggests the existence of novelmethanogens in the rumen of Jinnan cattle.

【题目】鸭空肠液中淀粉酶、胰蛋白酶、糜蛋白酶活性变异的研究
【中文关键词】北京鸭; 空肠液; 消化酶
【英文关键词】Peking duck; jejunal fluid; digestive enzyme
【中文摘要】本试验旨在通过研究鸭空肠套管中食糜流量及空肠液中消化酶活性的变异, 探讨获取相对可比的空肠液样品的适宜采样方案, 为鸭小肠中消化酶酶谱的研究提供依据。采用3×6(日期×时间) 完全随机设计, 每4 h 采集1 次空肠食糜, 每采集1 h 后间隔3 h, 隔日重复采样过程, 共采集3 d。试验1, 随机选择15 只荷术鸭, 分成5 个重复, 每个重复3 只鸭, 测定空肠套管中食糜的流量。试验2, 从鸭群中随机选择24 只荷术鸭, 分成6 个重复, 每个重复4 只鸭, 测定空肠液中淀粉酶、胰蛋白酶、糜蛋白酶的活性。结果表明: 空肠套管内的食糜流量呈现出日间及日内变异, 日内食糜流量呈现出先升后降的总体规律。日内采样时间对空肠液中淀粉酶、胰蛋白酶、糜蛋白酶活性有极显著的影响(P< 0.01) 。不同日间, 淀粉酶、糜蛋白酶的日平均活性有显著差异(P< 0.05) , 而胰蛋白酶日间平均活性没有显著差异(P = 0.28) 。3 种消化酶活性均呈现出同一日内随采样时间而逐渐降低的总体现象。鉴于上述现象, 通过套管获取反映鸭空肠中消化酶活性生理水平的采样方案为: 白天采集3 次样品, 每次采集1 h 间隔3h, 隔日重复采样, 共采集3 d。
【英文摘要】The variation of jejunal digesta flux in cannula and digestive enzymes activities in jejuna fluid of Peking duck were investigated to study the scheme of represent ivejejunal fluid sample. The 3 ×6 factorial treatment was performed in two experiments and jejunal digesta samples were collected for 1 h out of every 4 h o n d 16, 18 and 20 of the experiment . In experiment 1, fifteen male Peking ducks of 18 wk of age fitted a Ttype jejunal cannula were randomly allotted into 5 replication with 3 birds per replication. The volume per h of jejunal digesta in cannula was determined. In experiment 2, twenty-four cannulated ducks were randomly selected and divided into 6 replicat ion with 4 birds per replication. T he amylase, trypsin and chymotrypsin activities in jejunal fluid were determined. The result s showed that there was obvious variation of digesta flux in cannula with collection time and collect ion day . Collection time significantly affected the average activities of amylase, trypsin and chymotrypsin in 24 h cycle (P < 0. 01) . Significant dif ferences were also found in the average activities of amylase and chymotrypsin among days (P < 0. 05) .Three digestive enzymes activities were declining with collection time in a 24 h cycle. According to the results, it is possible to develop a representat ive sampling scheme that sampling for 1 h out of every 4 h in the day light at 1 day interval for 5 days for studying in endogenous digestive enzymes.

【中文关键词】普通玉米;鸭;代谢能
【英文关键词】无
【中文摘要】试验旨在通过比较研究不同品种普通玉米的鸭代谢能值,探讨不同品种玉米的鸭代谢能值的差异及与其化学成分间的关系,为饲料有效能数据中玉米品种是否为其样品描述的必需元素提供依据。采用单因素完全随机设计,将84只成年公鸭随机分成7组,每组4个重复,每个重复3只鸭,采用TME法测定6种普通玉米(白单9、农大108、登海3、掖单981、郑单958、迪卡656)的代谢能值。结果表明:6种普通玉米可分为鸭代谢能值差异显著(P<0.05)的两组,其表观代谢能值分别为3671 kcal/k和3814 kcal/kg。玉米的鸭代谢能值与其中性洗涤纤维的含量显著地负相关(｜r｜≥0.96,P<0.05)。对6种玉米以NDF含量的差异进行分组,可以获得与以代谢能差异的显著性进行分组类似的结果。因此,在鸭饲料原料数据的描述中,玉米的NDF含量可以替代品种对代谢能值的差异进行标识。

【题目】体外法添加苹果酸与饱和脂肪酸对瘤胃功能菌群数量的影响
【中文关键词】硬脂酸, 苹果酸, Real-time PCR
【英文关键词】Stearic acid, Malic acid, Real-time PCR
【中文摘要】本试验在添加饱和脂肪酸即硬脂酸(Stearic acid, SA)的基础上添加不同水平的苹果酸(Malic acid, MA), 采用体外法对瘤胃微生物进行培养, 通过实时定量(Real-time)PCR 方法检测在添加脂肪酸和苹果酸后, 对瘤胃功能微生物如纤毛虫、产甲烷菌, 纤维分解细菌、氢化细菌以及脂肪分解菌的数量的影响。实验结果表明, 添加硬脂酸后对脂解厌氧弧杆菌(Anaerovibrio lipolytica)和产琥珀酸丝状杆菌(Fibrobacter succinogenes)数量产生了显著影响, 脂解厌氧弧杆菌数量减少了95.8%(P<0.001), 产琥珀酸丝状杆菌数量增加了52.5%(P<0.05)。添加苹果酸后, 添加5 mmol/L MA处理组的脂解厌氧弧杆菌数量减少了91.2%(P<0.001), 添加10 mmol/L MA 处理组, 减少了94.8%(P<0.001), 而MA10 组比MA5 组的该菌数量减少了41.3%(P<0.05)。本研究结论是硬脂酸和苹果酸分别对瘤胃部分微生物产生了显著的影响。二者对瘤胃微生物的互作影响并不显著。
【英文摘要】Using real-time PCR to detect the effect of supplementing with Malic acid and stearic acid onrumen main functional microbe, including ciliate protozoa, methanogen, cellulolytic bacteria, hydrogenatedbacteria and lipolysis bacteria in vitro. The result showed there were significant effect on the quantities ofAnaerovibrio lipolytica, which decreased 95.8%(P<0.001), and Fibrobacter succinogenes, which increased52.5%(P<0.05) after supplemented with Stearic Acid. The quantities of Anaerovibrio lipolytica were decreasedby 91.2%(P<0.001) on 5 mmol/L MA group and 94.8%(P<0.001) on 10 mmol/L MA group, and thelatter were decreased 41.3%(P<0.05) than the former. The conclusion was stearic acid and malic acid were significantly effected on part of rumen microbe respectively, however, both of them were not obviously effectedon them.

【题目】肉鸡回肠氨基酸消化率测定方法研究进展
【中文关键词】氨基酸; 表观消化率; 标准消化率; 真消化率; 肉仔鸡
【英文关键词】amino acid, apparent digestibility, standardized digestibility, true digestibility, broilers
【中文摘要】在家禽饲料营养价值评定中, 回肠氨基酸消化率是评价氨基酸生物利用率的敏感指标, 测定饲料回肠氨基酸消化率的精确性和准确性同样重要。回肠氨基酸消化率的测定受试验日粮、试验动物、日龄、性别等的影响。阐明了表观回肠消化率、真回肠消化率和标准回肠消化率3 个术语之间的关系, 并对肉鸡回肠氨基酸消化率测定的注意事项以及影响其测定的因素进行了综述。
【英文摘要】It is recognized that ileal amino acid digestibility is a sensitive indicator of amino acid availability in dietary ingredient for poultry. It is important to be able to determine ileal amino acid digestibility in feedstuffs with both accuracy and precision. Ileal digestibility were affected by many factors, such as diet, animal, age, sex, and so on. Apparent ileal digestibility, true ileal digestibility, standardized ileal digestibility and their interrelation were discussed. Some important tips and affecting factors about ileal amino acid digestibility determination in broilers were reviewed in the article.

【题目】标准回肠氨基酸消化率在肉鸡饲料原料氨基酸营养价值评定中的应用
【中文关键词】标准回肠氨基酸消化率; 基础损失; 肉鸡; 饲料原料
【英文关键词】standardized ileal amino acid digestibility; basal losses; broilers; feed ingredients
【中文摘要】为了获得最佳生产性能,配制满足家禽营养需要的日粮配方和将排泄到环境中的过多养分降到最低,已显得尤为重要。关于蛋白质饲料原料,多通过表观回肠消化率反映其利用率。以表观回肠消化率值为基础配制日粮,低估了饲料原料的氨基酸消化率,导致排泄物中养分含量增加。通过内源氨基酸基础损失校正表观回肠消化率所得的标准回肠消化率,能克服表观回肠消化率的局限性。作者讨论了标准回肠氨基酸消化率和内源氨基酸基础损失的估测方法,并对其在肉鸡饲料原料氨基酸营养价值评定中的应用作一总结。
【英文摘要】For optimal performance, it is important to formulate diets that meet the nutrient requirements for poultry while minimizing the excretion of excess nutrients into the environment. With respect to protein feed ingredients, apparent ileal digestibility is widely used to reflect its bioavailability . If diet formulations are based on apparent ileal digestibility values, the digestibility of amino acid in feedstuffs will be underestimated and may result in an increased level of nutrient excretion. The concept of standardized digestibility system in which corrections are made for basal endogenous amino acid losses as a mean of overcoming the limitations of apparent digestibility estimates is proposed. Standardized ileal amino acid digestibility and t he method of evaluating basal endogenous amino acid losses are discussed. The application of standardized ileal amino acid digestibility in amino acid nutrient evaluation of feeding redients in broilers are reviewed in this article.

【题目】人体肠道微生物多样性和功能研究进展
【中文关键词】肠道微生物; 多样性; 16S rRNA; 元基因组学; 代谢组学
【英文关键词】Gut microflora; diversity; 16SrRNA; metagenomics; metabolomics
【中文摘要】人体肠道中庞大而复杂的微生物群落对人体自身代谢表型有深远的影响。肠道微生物群落在亚种或菌株水平上表现出极大的多样性。利用微生物分子生态学、元基因组学和代谢组学研究方法,发现肠道微生物与宿主表现出共进化的特点,肠道微生物群落及其基因组为宿主提供了互补的遗传和代谢功能,表现出互惠共生关系。但是,肠道微生物群落中影响宿主代谢表型的关键功能菌鉴定及其作用模式问题仍然悬而未决,综合运用多种高通量研究方法和多维数据分析方法可能成为解决这个问题的突破口。
【英文摘要】The human intestine is inhabited by numerous microbes, which form a complex microbial community that deeply affects human physiology. This microbiota is dominated by relatively few divisions that are highly diverse at the strain /subspecies level

which together with its collective genomes (microbiome) provide us with genetic and metabolic attributes we have not been required to evolve on our own. New studies taking advantage of molecular microecological metagenomic and metabolomic methods are revealing how the gut microbiota has coevolved w ith us and how it manipulates and complements our biology in ways that are mutually beneficial. However, how certain key stone members of them icrobiotaoperate to maintain the stability and functional adapt ability of this microbial organ still need to be answered, which necessitate the combination of high through put methods and multivariable analysis.

【题目】环境微生物群落结构与功能多样性研究方法
【中文关键词】群落生态学; 群落遗传学; 种间相互作用; 元基因组学; 鲁棒性
【英文关键词】community ecology; community genetics; interspecies interaction; metagenomics; robustness
【中文摘要】微生物群落的结构及群落内种间相互作用是影响其生态功能的决定性因素。尽管微生物群落是地球生物化学循环的主要驱动者, 但是由于传统的微生物培养方法只能分离约1% 10%的环境微生物, 对复杂的环境微生物群落结构和功能多样性了解甚少。元基因组学、单细胞分析和群落遗传学等方法的出现, 及其与微生物学的交叉融合, 使得人们能够从微生物群落组成、物种功能、种间相互作用和预测模型等方面分析微生物群落。重点综述了元基因组学、单细胞分析和群落遗传学等方法及其在环境微生物群落结构和功能多样性中的应用进展。
【英文摘要】Microbial community structure and interspecies interactions are the key factors that determine the function of the community. Although these communities are the major drivers of many biosphere processes, due to the fact that only 1%-10% of naturalm icrobes could be recovered by classical culture-dependent methods, relatively little is known about their structure and function. Some recently emerged novel methods, e. g. metagenomics, single cell analys is and community genetics enable researcher could decipher the ecological properties of microbial communities on the basis of the questions being asked: the composition of the community, the function of individual species, the model of interspecies interaction and predictive modeling at the commun ity level. In the present review, we describe the current concept and application of metagenom ics, single cell analys is and community genetics to study microbial ecology and progress toward predictive modeling.

【题目】体外法添加苹果酸与不饱和脂肪酸对瘤胃发酵及瘤胃功能菌群的影响
【中文关键词】苹果酸;不饱和脂肪酸;瘤胃发酵;瘤胃功能菌;体外法
【英文关键词】malic acid; unsaturated fatty acid; rumen fermentation; rumen functional microbe; in vitro
【中文摘要】采用体外法在不饱和脂肪酸油酸(oleic acid,OA)、亚油酸(linoleic acid,LA)和亚麻酸(linolenic acid,LNA)的基础上添加不同水平苹果酸(malic acid, MA),研究苹果酸和不饱和脂肪酸对瘤胃发酵模式与瘤胃主要功能菌群的影响。结果表明,添加不饱和脂肪酸和苹果酸后,丙酸浓度随着脂肪酸不饱和度的增加显著升高(P <0.01),总产气量和CH4产量显著降低(P <0.01),其它挥发性脂肪酸(VFA)均随着脂肪酸不饱和度的增加显著降低(P <0.01)。添加不饱和脂肪酸LA 与LNA 的甲酸甲烷杆菌(Methanobactrium formicicum) 数量显著增加(P <0.01);白色瘤胃球菌(Ruminococcus albus) 与黄色瘤胃球菌(Ruminococcus flavefaciens)数量比CK 组显著增加(P <0.05);而脂解厌氧弧杆菌(Anaerovibrio lipolytica)和溶纤维丁酸弧菌(Butyrivibrio fibrisolve)数量比CK 组却显著下降(P <0.05)。联合添加苹果酸和不饱和脂肪酸组中,只有在添加10 mmol/L 苹果

酸的OA 组的甲酸甲烷杆菌(M. formicicum),数量明显减少(P <0.05)。研究结果提示,不饱和脂肪酸和苹果酸能够改善瘤胃发酵模式,但二者对体外CH4抑制作用之间没有直接的联系。并且联合添加二者对于瘤胃主要功能菌群没有显著影响。

【英文摘要】This study was conducted to determine the effects of supplementing different level of malic acid (MA) and unsaturatedfat acid, including oleic acid (OA), linoleic acid (LA) and linolenic acid (LNA) on rumen fermentation and microbe species in vitro.The result showed the concentration of propionate acid significantly increased (P <0.01), total gas and CH4 gas production obviouslydecreased (P <0.01), and other volatile fatty acids (VFA) significantly decreased (P <0.01) accompanied with increasing unsaturationof fatty acid;Methanobactrium formicicum in LA and LNA obviously increased (P <0.01),Ruminococcus flavefaciens and R. albussignificant increased (P <0.01) when compared with CK. However, Anaerovibrio lipolytica and Butyrivibrio fibrisolve decreased (P<0.05) than that of CK.Methanobactrium formicicum in 10 mmol/L MA-OA decreased obviously (P <0.05). It can be concluded thatunsaturated fatty acid and malic acid can effectively change rumen fermentation pattern but there were no directly relationshipbetween them to inhibit CH4 production, and no obviously effect of supplementing malic acid and unsaturated fat acid on main rumenmicrobial population.

【题目】反刍动物饲料中乳源性成分与牛羊肉骨粉的区分
【中文关键词】反刍动物饲料;奶粉;肉骨粉;16S rDNA;PCR
【英文关键词】ruminant feedstuffs; milk powder; meat and bone meal; 16S rDNA; PCR
【中文摘要】利用奶粉的溶解性,通过水和0.5%次氯酸钠溶液洗涤混有乳源性成分和牛、羊肉骨粉的饲料样品,去除饲料中的乳粉成分后,再使用16S rDNA PCR 方法进行动物源性检测。结果表明,实验所建立的方法能够完全区分饲料中的乳粉与肉骨粉。当乳粉含量分别为25%、50%和75%时,混合饲料中牛、羊肉骨粉的检出限分别为2%、0.5%和0.1%。此方法操作简单,容易掌握,可用于鉴别反刍动物饲料中非乳源性成分的牛、羊源性成分。

【英文摘要】A method was established to distinguish milk powder and bovine or ovine meat and bone meal in feedstuffs, whichwere all ruminant-derived. Milk powder in feedstuffs was washed and removed by water and 0.5% sodium hypochlorite solution, subsequently,the ruminant-derived materials were identified using PCR according to 16S rDNA sequence. The detected limitation ofbovine or ovine in feedstuffs with 25%, 50% and 75% milk powder concentrations were 2%, 0.5% and 0.1%, respectively. Taken altogether,this method is a simple and easily grasped way for identification and distinction of the bovine or ovine-derived meat and bonemeal and milk powder in feedstuffs.

【题目】奶牛瘤胃微生物元基因组文库中脂肪酶的筛选与酶学性质
【中文关键词】瘤胃微生物, 元基因组文库, 脂肪酶, 底物特异性, 最适pH, 热稳定性
【英文关键词】rumen bacterium, metagenome library, lipase, substrate, optimum pH, thermo stability
【中文摘要】利用含有三油酸甘油酯的脂肪酶选择性筛选培养基, 从奶牛瘤胃微生物元基因组文库15 360 个克隆中, 筛选得到了18 个脂肪酶阳性克隆, 其插入片段大约为60 kb, 并且各个克隆的插入片段各不一样。利用p-NPP 法对脂肪酶克隆的脂肪酶活性分析, 表明均具有大小不等的脂肪酶活性。底物特异性分析表明Lipase6、Lipase7 和Lipase8 分别对C16底物(对硝基苯棕榈酸酯)、C12 底物(对硝基苯月桂酸酯)和C16 底物(对硝基苯棕榈酸酯)水解能力最强。Lipase 6、Lipase7、Lipase

8 的脂肪酶最适pH 为7.5; Lipase8 的脂肪酶活性半衰期随反应温度的升高而缩短, 70oC 时能达到30 min。本研究所筛选的脂肪酶具有不同的底物特异性和较好的热稳定性, 这对于工业化生产具有一定的应用潜力。

【英文摘要】Using lipase segregation agar containing trioleoylglycerol, we obtained 18 lipase positive clones by screening from ametagenome library of dairy rumen microflora containing 15 360 clones. The average insert size of lipase positive clones was about60 kb. Lipase enzyme activity analysis by p-NPP method indicated that Lipase6, Lipase7 and Lipase8 had higher lipolytic activitiesto substrates of p-nitrophenyl palmitate (C16), p-nitrophenyl alaurate (C12) and p-nitrophenyl palmitate (C16) respectively. Theoptimum pH of Lipase 6, Lipase 7 and Lipase 8 were 7.5. The halflife period of Lipase 8 with the value of 15 min in 70oC decreasedwith the increase of temperature. In conclusion, the lipases screened in this study had different substrates specificity and good thermostability, which laid a basis for large-scale industrial application.

【题目】幽门螺杆菌培养及抗原蛋白的分离纯化

【中文关键词】幽门螺杆菌; 培养; 尿素酶; 空泡毒素; 毒素相关蛋白; 脂多糖

【英文关键词】Helicobacter pylori ; Culture; Urease; Vacuolization cytotoxin A; Cytotoxin associated antigen A; Lipopolysaccharides

【中文摘要】幽门螺杆菌(H pylori)是一种生存于人胃中的弯曲状菌, 能导致人的慢性胃炎, 消化性溃疡和胃癌, 其治疗多用抗生素治疗, 但其副作用较大. 给奶牛免疫H pylori 疫苗后, 其分泌的牛奶中含抗H pylori 的免疫球蛋白, 能够预防和治疗人类H pylori 感染, 且没副作用. 在生产免疫乳时, H pylori 疫苗制备是基础性工作, 并且在亚单位疫苗中, 抗原蛋白的制备和分离纯化又最为关键. 本文就H pylori 的培养(固体和液体培养)和抗原蛋白(尿素酶、空泡毒素、毒素相关蛋白和脂多糖)的理化性质、重组表达以及分离纯化方法进行比较研究.

【英文摘要】Helicobacter pylori (H pylori) live in the stomachof human. It is a kind of curve bacteria whichcan lead to chronic gastritis, peptic ulcer andgastric cancer. Usually, antibiotics are used totreat the patients, but they have a lot of sideeffects. Milk of milch cow immunized withH pylori vaccine can prevent and treat theinfection of H pylori without side effects. Duringthe production of immune milk, the basic workis to prepare vaccine. During the preparationof sub-unit vaccine, key is to isolate and purifythe antigen protein. In this article, we discussthe culture of H pylori (solid and liquid culture),the recombinant expression and purificationof its antigen protein (urease, VacA, CagA andlipopolysaccharide).

【题目】Effects dietary yeast culture (DVAQUA) on growth performan- ce, intestinal autochthonous bacterial community and non-specific immunity of hybrid tilapia (Oreochromis niloticus ♀ X O. aureus ♂) cultured in cages.
【中文关键词】无
【英文关键词】Saccharomyces cerevisiae fermentation product; DVAQUA; Intestinal autochthonous bacterial community; Non-specific immunity; Hybrid tilapia; Oreochromis niloticus female xO. aureus male
【中文摘要】无
【英文摘要】In the present study, hybrid tilapias (Oreochromis niloticus female x O. aureus male) were fed six isonitrogenous and iscrenergetic experimental diets in cages. The diets contained six levels of Saccharomyces cerevisiae fermentation product (DVAQU (R)): 0 (CK). 0.125 (G1), 0.25 (G2),0.5 (0), 1.0 (G4) and 2.0 (G5) g kg(-1) diet. The purpose of this study was to evaluate the effects of dietary DVAQUA on growth performance, intestinal autochthonous bacterial community by using 16S rDNA and denaturing gradient gel electrophoresis (DGGE), and non-specific immunity of hybrid tilapia. Supplementation of dietary DVAQUA showed no effects on growth performance, diet conversion and survival rate of the hybrid tilapia. However, supplementation of DVAQUA affected the autochthonous gut bacteria community. Various potentially beneficial bacteria were stimulated by dietary DVAQUA at different feeding period, while potential harmful species such as Escherichia coli serotype 020: H42-like, uncultured Bacilli bacterium clone M5030A1-F02-like, and Pseudomonas fluorescens strain YC0357-like were depressed by dietary DVAQUA. Non-specific immunity of hybrid tilapia such as serum lysozyme activity, serum alternative complement pathway (C3 and C4) activities, head kidney macrophage phagocytic activity, and head kidney macrophage respiratory burst activity were improved by dietary DVAQUA. The optimum dose of dietary DVAQUA for hybrid tilapia determined based on a broken-line approach varies depending on the variables used: 0.226, 0.467,0.492 or 0.50 g kg(-1) diet for lysozyme, C3, C4, or phagocytic activity, respectively. 【题目】Molecular characterization of the autochthonous microbiota in the gastrointestinal tract of adult yellow grouper (Epinephelus awoara) cultured in cages
【中文关键词】无
【英文关键词】Gastrointestine (GI); Autochthonous bacteria; Epinephelus awoara; Denaturing gradient gel electrophoresis (DGGE)
【中文摘要】无
【英文摘要】The present study used 16S rDNA PCR denaturing gradient gel electrophoresis (PCR-DGGE) technology to investigate the communities of autochthonous microbiota in the gastrointestinal (GI) tract; including stomach (ST), pyloric caeca (PC), proximal intestine (PI), mid intestine (MI) and distal intestine (DI) of the adult yellow grouper (Epinephelus awoara) cultured in cages. Twenty-two DGGE bands were successfully sequenced. However, ten of these bands were classified as unculturable according to the phylogenetic analysis. The dominant autochthonous bacteria in the GI tract belonged to Proteobacteria, but other bacteria identified belonged to Firmicutes, Bacteroidetes, Deinococcus-Thermus, Spirochaetes and unclassified-bacteria. Pantoea sp. and uncultured Proteobacterium were ubiquitous in all five sections of the GI tract. Empedobacter sp. PH7-1 and Acinetobacter sp. N15 were unique for the ST section, while uncultured bacterium clone F6-37 and gamma-Proteobacterium and Acinetobacter radioresistens Philippines-11 were only observed in PI, MI and DI sections. Furthermore, Lactococcus lactis, Bacteroides and uncultured Streptococcus sp. were also detected in the present study. (C) 2008 Elsevier B.V. All rights reserved.

【题目】Predicting metabolizable energy of normal corn from its chemical composition in adult Pekin ducks
【中文关键词】无
【英文关键词】duck; corn; metabolizable energy; prediction model
【中文摘要】无
【英文摘要】Two experiments were conducted to establish an ME content prediction model for normal corn for ducks based on the grain's chemical composition. In Experiment 1, observed linear relationships between the determined ME content of 30 corn calibration samples and proximate nutrients, acid detergent fiber (ADF), and neutral detergent fiber (NDF) were used to develop an ME prediction model. In Experiment 2, 6 samples of corn selected at random from the primary corn-growing regions of China were used for testing the accuracy of ME prediction models. The results indicated that the AME, AME(n), TME, and TMEn were negatively correlated with crude fiber (r = -0.905), ADF (r = -0.915), and NDF (r = -0.95) contents, and moderately correlated with gross energy (GE; r = -0.55) content in corn calibration samples. In contrast, no significant correlations were found for CP, ether extract, and ash contents. According to the stepwise regression analysis, both NDF and GE were found to be useful for the ME prediction models. Because the maximumabsolute difference between the in vivo ME determinations and the predicted ME values was 61 kcal/kg, it was concluded that, for White Pekin ducks, the latter could be used to predict the ME content of corn with acceptable accuracy.

【题目】Apparent digestibility of various feedstuffs for bluntnose black bream Megalobrama amblycephala Yih
【中文关键词】无
【英文关键词】apparent digestibility; Megalobrama amblycephala Yih
【中文摘要】无
【英文摘要】The apparent digestibility of 66 different feedstuffs by the bluntnose black bream Megalobrama amblycephala Yih was determined in digestibility trials in a recirculation aquaculture system. The ingredients consisted of 26 distinct energy feedstuffs, 18 nonanimal protein feedstuffs and 22 animal protein feedstuffs. In each of three trials, a reference diet was mixed with various test ingredients in a 70 : 30 ratio; reference and test diets were fed to the fish, and faecal samples were collected using a hand-held screen system. Energy availability for the 26 energy feedstuffs varied between -23.0% (silkworm manure) and 89.5% (millet grain), protein digestibility for the 18 nonanimal protein ingredients varied from 58.0% (pea protein meal) to 98.1% (soybean meal), and protein digestibility for the 22 animal protein feedstuffs varied between -5.7% (feather meal) and 99.1% (fermented dried blood meal). The average protein digestibility of 85.9% for the nonanimal protein feedstuffs was significantly higher than that for the animal feedstuffs ($P < 0.05$), partly validating the assumption that herbivorous bluntnose black bream would digest proteinic nutrients in nonanimal feedstuffs better than in animal ingredients under intensive aquaculture. Finally, the energy availability of nonanimal protein feedstuffs was significantly lower than that of animal feedstuffs ($P < 0.05$).

【题目】The Effects of Dietary Yeast Culture or Short-chain Fructo-oligosaccharides on the Intestinal Autochthonous Bacterial Communities in Juvenile Hybrid Tilapia, Oreochromis niloticus female x Oreochromis aureus male
【中文关键词】无
【英文关键词】GRADIENT GEL-ELECTROPHORESIS; TROUT ONCORHYNCHUS-MYKISS; SALVELINUS-ALPINUS L.; RAINBOW-TROUT; ARCTIC CHARR; GASTROINTESTINAL-TRACT; PHYLOGENETIC ANALYSIS; RIBOSOMAL-RNA; FISH LARVAE; AQUACULTURE
【中文摘要】无
【英文摘要】The effects of dietary yeast culture (YC) or short-chain fructo-oligosaccharides (FOS) on intestinal autochthonous bacterial communities in juvenile hybrid tilapia, Oreochromis niloticus female x Oreochromis aureus male were studied by 16S rDNA denaturing gradient gel electrophoresis (DGGE). Ninety Tilapias in tanks (10 fish per tank) were randomly and equally divided into three groups. At the end of an 8-wk feeding period of CK (the control treatment), YC (3 g/kg), or FOS (1 g/kg), autochthonous gut bacteria were analyzed in intestinal samples of all fish in each tank of a recirculating aquaculture system. The clear differences in the banding patterns indicated the obvious effects of dietary prebiotics on intestinal communities in hybrid tilapia. Higher variation was detected within the dietary YC group. This difference might be due to the effects of certain immune-stimulating agents in YC on the immunity response of hybrid tilapia. It was concluded that dietary prebiotics, YC, and FOS obviously affected the intestinal bacterial community in hybrid tilapia with different patterns for different kinds.

【题目】奶牛乳腺脂肪酸合成相关基因研究进展
【中文关键词】乳腺; 脂肪酸; 摄取和转运; 内源合成; 酯化; 基因网络
【英文关键词】Mammary gland; Fatty acid(FA); Uptake and transport; de novo synthesis; Esterify; Gene network
【中文摘要】数量和种类繁多的脂肪酸构成了牛奶中不同分子量和饱和度的甘油三酯, 也是乳脂的主要成分。链长不同的脂肪酸来源也不尽相同, 几乎所有的短链和中链脂肪酸都由乳腺内源合成, 长链脂肪酸主要是由血液中转运而来, 奶牛乳腺在转运和合成脂肪酸过程中起着重要作用。近年来, 研究人员将传统营养与分子生物学研究相结合, 发现了大量与乳脂合成相关基因, 并揭示了其功能和相互之间的作用。就奶牛乳腺的脂肪酸摄取和转运, 脂肪酸的内源合成, 乳腺重要酶类, 脂肪酸酯化和相关基因网络调控几方面对脂肪酸合成相关基因进行归类, 对其研究进展进行介绍。
【英文摘要】Fatty acids with various molecular weight and saturation degree in milk, make up of the triacylg lycero ls which also constituted the main components of milk fat. Shot and medium chain fatty acids are almost exclusively the results of de novo synthesis in mammary gland, while long chain fatty acids are mainly imported from the plasma. Mammary gland plays a pivota l role in the who leprocess of uptaking, importing and synthesizing fatty acid. In recent years, researchers have app lied molecular biology technologies intraditional nutrition field, identified abundance of regulated genes of fatty acid synthesis, and suggested the irfunctions and relationship of these genes. In this paper, these genes regarding to uptaking and importing fatty acid, de novo synthesis o f fatty acid, important enzymes of mammary, esterifing of fatty acid were reviewed.

【题目】基于18S rRNA 基因的PCR/DGGE 技术研究山羊瘤胃原虫动态变化
【中文关键词】山羊; 瘤胃原虫; 18S rRNA; PCR/DGGE
【英文关键词】Goat; Rumen protozoa; 18S rRNA; PCR/DGGE
【中文摘要】应用PCR/DGGE 技术对山羊采食前后瘤胃原虫的多样性随时间的变化进行了研究。采食前和采食后1、2、4 和8h 分别采集瘤胃内容物样品, 对瘤胃原虫特异性的18S rRNA 基因经PCR 扩增、DGGE 电泳分析。结果显示,采食前后DGGE 图谱由10 条左右清晰可辨的谱带组成, 图谱上的泳带反映了瘤胃内的优势原虫, 泳带数量和位置的复杂性说明了瘤胃原虫的多样性。并对其中两个优势条带切胶测序, 基因序列分析分属于毛口目和内毛目。瘤胃原虫区系相似性分析, 采食前为90.5%~94.1% ; 采食后相似性发生改变, 且存在个体差异。多样性指数由采食前的0.82 逐渐上升到采食后8h 的0.90(P>0.05) 。DGGE 指纹技术有效地反映了不同样品中原虫优势种的组成, 并可通过此技术跟踪研究瘤胃原虫区系在不同条件下的动态变化。
【英文摘要】The goats rumen protozoal communities were investigated, and the change of which were monitored byusing PCR/DGGE technique based on 18S rRNA gene. The protozoal diversity and similarity were determined on thebase of the position and number of bands in DGGE gel. The results showed that over ten bright bands were showedand differences were observed for four goats immediately prior to feeding and after feeding at 1, 2, 4 and 8 hour.Different profiles in gel were observed, the amount and position of bands represented respectively the rumen predominantprotozoal species and community variation of different samples. The similarity indices of the protozoa were between90.5%~94.1%, while variation of the similarity were found after feeding. These indicate that the components and thechanges of the rumen predominant protozoa can be reflected effectively by using PCR/DGGE technique, tracing andresearching the variation of the protozoal community at different situation.

【题目】体外法研究延胡索酸二钠对瘤胃微生物发酵活力及甲烷产量的影响
【中文关键词】延胡索酸二钠; 瘤胃微生物; 甲烷; 批次培养
【英文关键词】disodium fumarate; mixed rumen micro organism; methane; batch fermentation
【中文摘要】为探讨延胡索酸二钠对瘤胃甲烷产量及瘤胃微生物发酵活力的影响, 本研究共设计了3 个试验来阐明该问题。试验1 采用体外批次培养, 研究了不同日粮条件下(高牧草日粮、中等水平牧草的日粮和低牧草日粮) 添加延胡索酸二钠(0, 4 和7 mmol/ L) 对山羊瘤胃微生物发酵及甲烷产量的影响。结果表明, 较对照相比, 添加延胡索酸二钠显著提高了累积产气量、pH 值和TVFA 产量(P< 0. 05) , 降低了甲烷产量(P < 0. 05) , 其中高牧草日粮组下降幅度最大。试验2 探讨了延胡索酸二钠对黄化瘤胃球菌发酵粗饲料活力的影响。结果表明, 与对照组相比; 添加延胡索酸二钠显著提高了黄化瘤胃球菌数量及其对黑麦草的降解率(P < 0. 05) ; 试验3 探讨了延胡索酸二钠对瘤胃真菌发酵粗饲料活力的影响, 结果显示, 延胡索酸二钠显著降低了厌氧真菌发酵的总产气量、干物质消失率及羧甲基纤维素酶酶活(P< 0. 05) 。结果说明, 延胡索酸二钠在降低甲烷产量方面与发酵底物的天然特性有关, 其中对高牧草日粮的作用效应最为显著; 延胡索酸二钠可提高瘤胃混合微生物与瘤胃纤维降解菌发酵粗饲料的能力, 但对瘤胃真菌的发酵活力具有抑制效应。
【英文摘要】Three experiments were conducted to investigate the effects of disodium fumarate on CH4 pro duction and fermentation by rumen micro organisms. In experiment 1, rumen contents were collected from three local goats. Disodium fumarate

was added to the incubation bottles to achieve final concent rations of 0, 4 and 8mmol/ L fumarate. Results showed that disodium fumarate addition increased the final pH and the production of acetate and propionate linear ly (P< 0. 001) , and reduced the amount o f NH3- N in the cultures. Compared with the control, adding disodium fumarate to batch cultures r educed CH4 product ion. In experiment 2, the effect of disodium fumarate on the fermentation activity of Ruminococcus flavefaciens was investigated. Disodium fumarate was added to the incubation bottles to achieve final concentrations of 0, 4, 7 and 10 mmol/ L.Disodium fumarate addition increased the dry matter loss, T VFA product io n, and the count s of R . flavef aciens. In experiment 3, the effect of disodium fumarate on ryegrass fermentation by rumen fungi was investigated. Disodium fumarate addition (0, 4, 7, and 10 mmol/ L) reduced the dry mat ter loss and the cumulat ive g aspro duct ion (P < 0. 01) . T hese result s indicate that the ef fect s o f disodium fumarate on rumen fermentation mainly depend on the nature of the incubated substrate, with the high forage diet showing the greatest response. Disodium fumarate addition increased the fermentation activity of the mixed rumen micro organisms and of R . f lavefaciens, but reduced the fermentation activity o f the rumen fungi.

【题目】生长抑素对泌乳大鼠乳腺发育的作用
【中文关键词】生长抑素; 耗竭剂; 乳腺发育; 调节; 大鼠
【英文关键词】Soma tostatin; Exhaust agents; Mammary gland development; Regulation; Rat
【中文摘要】给泌乳SD大鼠皮下注射生长抑素及其耗竭剂, 用RT- PCR法和放射免疫法检测大鼠乳腺中相关基因的表达水平及乳腺和血清生长抑素的水平, 探讨生长抑素与相关因子间的关系。结果表明: 生长抑素能提高大鼠血清和乳腺生长抑素的含量, 下调ER 、PR、GHR、PRLR基因的表达, 上调Leptin和LEPR 基因的表达; 其耗竭剂的作用相反, 降低血清和乳腺中生长抑素的含量, 上调ER 、PR、GHR、PRLR基因的表达, 下调Leptin和LEPR基因的表达。说明生长抑素通过调节乳腺中相关因子的表达对大鼠乳腺发育起作用。
【英文摘要】The lactating Sprague- Dawley rats were subcutaneously injected by somatostatin(SS) and its exhaust agents, the expression of related genes in mammary development, the SS content in serum and mammary gland w ere detected using the RT – PCR and radicalization immunity assay methods to study the correlation of SS to other factors. The results showed that SS improved the SS content in serum and mammary gland of lactating rat, down- regulated ER, PR, GHR and PRLR mRNA expression, up-regulated Leptin and LEPR mRNA expression. On the contrary, its exhaust agents reduced the SS content in serum and mammary gland of lactating rat, up-regulated ER, PR, GHR and PRLR mRNA expression, down- regulated Leptin and LEPR mRNA expression. Somatostatin regulated mammary development by regulating the expression o f the related factors.

【题目】STUDY ON SOIL NUTRIENT MANAGEMENT AND FERTILIZATION MODEL IN NING XIA COUNTYTERRITORY WITH GIS
【中文关键词】GIS;土壤养分;施肥模型;目标产量;施肥参数
【英文关键词】GIS, Soil nutrient; Fertilizer model, Goal output, Fertilizer parameter
【中文摘要】采用GIS技术,以宁夏地图、宁夏全区土壤养分图及其他相关文档数据为基础,对资料进行分类和筛选,建立空间数据库和属性数据库。将宁夏土壤养分数据以县域为界划分,与地理图形有机联系起来,使枯燥的表格数据可视化。在土壤养分数据库基础上,采用三元二次回归正交组合设计方法,建立数学模型,并对数学模型寻优得出了最高产量、最低产量时的氮磷钾肥施用量,将与施肥有关的因素通过计算机进行处理、判断、分析,给出常用肥和专用复合肥的具体配方及用量,从而极大地方便了数据分析和辅助决策,实现了宁夏特色作物施肥配方的自动化。
【英文摘要】By adopting the GIS technology, this thesis tries to collect and recognize the existing pedological map, the soil nutrient graphic document and other related documents data of Ningxia. And with the classification and filtration to the material, the spatial databases and the attribute database can be established to combine the county territory soil nutrient data and the geography graph together to make the uninteresting form data visualized. Based on the soil nutrient database, the mathematical model is established by means of the design of the regression orthogonal combination. And Through the mathematical model optimization, the quantity of nitrophoskas which is employed at the maximum production rate as well as at the lowest can be obtained. With these, the paper proposes a model which can dispose, judge and analyze all the factors related to the fertilization to achieve the concrete formula and the amount of commonly used fat and the special-purpose compound fat. Therefore, the data analysis and the auxiliary decision-making enormously facilitate, and the automatization and the rationalization of all kind of crop's fertilization scheme in Ningxia can be realized.

【题目】人眼视觉特性在植物叶片图像提取中的应用
【中文关键词】植物叶片;图像质量;人眼视觉特性
【英文关键词】Plant leaf image;Image quality; Human visual system
【中文摘要】通过叶片图像分析植物生长状况是目前农林领域的热点问题之一。此类图象中,如何去除背景干扰,获得视觉兴趣区域是研究的重点内容。为将外界噪声降到最低,本文采用灯箱设备采集植物叶片图像,考虑到人眼视觉特性,将图像划分成a×b个大小相等的分块,计算出各分块图像的视觉影响权重因子,并据此从原始图像中去除背景区域,划分出人眼视觉感兴趣的区域图像;随着a、b取值的不同以及图像提取的不断深入,可极大限度的去除无关背景区域。较之原始图像,利用该方法得到的区域图像符合人眼视觉特征,在图像质量和尺寸大小方面均有改善;为提取植物叶片视觉兴趣区域提供了一种新思路。
【英文摘要】Analyzing situation of plant growth from leaf images is one of the hottest issues in the field of agriculture and forestry. How to remove background interference and get region of interest image is important content for this kind of images.In this paper, in order to minimize external noise, use light equipment to acquire leaf images and then evaluate the image quality . According to the characteristics of human vision, image was partitioned into several blocks with equal size. Then abstract the part of interest image from original image by calculating each sub-block image ’ s weight of visual impact and mark off region of interest from the original image. With different values of a,b and deepening of image extraction, background region can be greately removed.Compared to that of original image, image quality and image size for the part of interest image have been improved to some extent. The method based on human visual system, which provides a new way for extraction visual region-of-interest of plant leaf image.

【题目】OPTIMIZATION OF ILLUMINATION ENVIRONMENTAL FACTORS BASED ON ORTHOGONAL TEST
【中文关键词】图像采集;漫反射;正交试验,光照强度;光照均匀度
【英文关键词】Image acquisition, Diffuse reflection, Orthogonal test, Illumination intensity, illumination uniformity
【中文摘要】本文将自行设计光照箱内的不同成像环境影响因素进行组合,采用正交试验法设计了9次实验,通过对实验结果进行对比分析力求获得最佳参数组合。物距、灯管数目、灯管高度、灯管侧距4个参数被作为影响成像质量的主要环境因素。为减少试验次数,运用L9(34)正交试验表安排试验,结果表明:在不同的参数组合条件下,图像的光照强度和光照均匀性受物距和灯管数量影响较大。通过上述实验可以得到两个可取的参数组合,经过进一步验证分析和讨论,最终确定了最佳成像参数组合。在该条件下进行图像采集,可以使被测对象获得均匀且具有一定强度的照明效果。
【英文摘要】Rice leaf diseases have occurred all over the world,including china.They have had a significant impact on rice quality and yield.Now,the control method rely mainly on artificial means.In this study,BP neural network classifiers were designed for classifying the healthy and diseased parts of rice leaves.This paper select rice brown spot as study object,the training and testing samples of the images are gathered from the northern part of Ningxia Hui Autonomous Region.The result shows that the scheme is feasible to identify rice brown spot using image analysis and BP neural network classifier.

【题目】基于多层感知神经网络的水稻叶瘟病识别方法
【中文关键词】多层感知器,特征提取,分类器,图像识别,水稻叶瘟病
【英文关键词】multilayer neural networks, feature extraction, classifiers, image recognition, rice leaf blast
【中文摘要】为实现水稻叶瘟病的快速诊断,综合利用图像处理技术和神经网络来进行叶瘟病斑的识别研究。该文设计了3个多层感知分类器来进行病斑识别准确率的对比验证,分别采用叶片正常区域和病斑区域的纹理特征、颜色特征以及纹理和颜色的组合特征作为不同分类器的输入单元; 输出层采用 1 个单元用于输出病斑区域和正常区域的识别结果。 首先,该文将采集到的 RGB 图像转换成灰度图像,利用灰度共生矩阵分别提取叶片正常区域与病斑区域的能量、对比度、熵、逆差距作为纹理特征;紧接着,将 RGB 彩色空间转换至 HIS 和 Lab 空间,分别提取病斑区域和正常区域的 L、a、b 值作为颜色特征。最后,采用不同的 BP 神经网络分类器进行病斑区域识别。该文共采用 120 副图像作为待测对象,试验结果表明,采用颜色和纹理的组合特征进行识别,准确率要比单独使用纹理特征和颜色特征高 10%~15%。本文的研究结果为进一步实现水稻病害自动诊断打下了基础。
【英文摘要】In order to achieve the rapid diagnosis of rice leaf blast, authors utilized image processing techniques and neural network comprehensively for the recognition of leaf blast lesion. For the accuracy rate of comparative analysis on lesion identification, three multilayer perception classifiers were designed. Three features of normal and lesion part which were texture, color and combined feature of texture and color were selected as input unit for different classifierrespectively. Output layer adopted one unit for the identify results of lesion and normal region. First of all, grayscale image was transformed from RGB image, using gray level co-occurrence matrix to extract energy, contrast, entropy,inverse gap as texture features from leaf lesion region and normal region respectively. The RGB color space was transformed to HIS and Lab space, and L, a, b values were extracted as color features from lesion area and normal region respectively, using different BP neural network classifier to identify lesion region.120 images were selected as testobjects. The

experimental results showed that if the combined feature of color and texture was used as input parameters,the accuracy rate would be 10%-15% higher than that of texture features and color features alone. The results of this paper laid a foundation for realization of the automatic diagnosis of rice diseases.

【题目】基于图像评价的灯箱最佳成像环境因素确定方法
【中文关键词】水稻叶部病害; 图像采集; 正交试验; 图像质量评价
【英文关键词】Rice leaf disease;image acquisition;orthogonal test;image quality evaluation
【中文摘要】为获得高质量的水稻叶部病害图像,在自行设计的灯箱中充分考虑了物距、 灯管数目、 灯管高度、 灯管、侧距等成像环境因素对图像质量的影响,通过主客观评价方法对不同成像环境因素水平下拍摄的照片进行质量评价,最终得出最佳成像环境因素取值水平。该过程分为三步:首先采用正交试验法设计各环境因素取值水平并拍摄照片,然后采用客观评价方法进行图像质量评价,最后通过与主观评价方法对比确定成像环境因素最佳取值水平。经过大量实验分析得出:在不同成像环境因素取值水平下,所拍摄照片的质量是有差别的。因此,基于质量评价的方法来确定最佳成像环境因素取值是可行的,为规范水稻叶部病害图像采集环境提供了新思路。
【英文摘要】In order to obtain high-quality rice leaf diseases images, a image-gathering system based on lamp-box was proposed.The best value of environmental factors could be acquired by image quality evaluation using subjective and objective methods. Shoot distance, lamp number, lamp height, lamp side distance were selected as impact factors.During the orthogonal test and image quality evaluation,the process were seperated:①takeing photo under the level of environmental factors which were designed by orthogonal test.②using objective method to evaluate image quality.③the best environment factors level was determined by the comparison of subjective and objective methods. Through a large number of experimental analysis,the result can be drawed:there are some differences between image quality when taking photos under different level of environmental factors. So, the method which based on quality evaluation to determine the best value of environmental imaging factors is feasible and provides a new way for standard image gathering environment of rice leaf diseases.

【题目】作物叶片图像采集系统的设计与研究
【中文关键词】图像采集;正交试验;光照强度;光照均匀性
【英文关键词】image acquisition; orthogonal test; illumination intensity; illumination uniformity
【中文摘要】本文研制了一套基于数码相机的图像采集系统,用于拍摄作物叶片。该系统采用漫反射式的多光源正面照明设计方案,具有实时、高效、可控的特点。研究通过正交试验对照明系统参数进行优化,运用matlab对照明箱中光照的均匀性和光照强度进行分析。试验结果表明:光照强度和光照均匀性与灯管数目的多少和灯管的高度关系密切,通过对比验证试验,获得了该图像采集系统的最佳参数。在该条件下进行图像采集,可以使被测对象获得均匀且具有一定强度的照明效果。
【英文摘要】In this paper, a image acquisition system based on digital camera was manufactured for research of crop leaf.The system has some characteristics of real-time, efficient and controllable ,which adopt a blue print of diffuse reflection that use Multi-light source at positive light. Study optimized the parameters of lighting system through orthogonal test, Matlab is used to analyse the illumination

intensity and illumination uniformity of light box. The result show that the illumination uniformity and illumination intensity closed to number and high degree of the lamp. Best parameters of the image acquisition system were obtained by comparing test. When image acquisition under these conditions, illumination uniformity and a certain illumination intensity could be provided for the detected object.

【题目】克伦特罗对映体的生物活性及分离分析研究进展
【中文关键词】克伦特罗 对映体 分离 生物活性 高效液相色谱 毛细管电泳
【英文关键词】Clenbuterol Enantiomer Separation Bioactivity high performance liquid chrom -atography Capillary electrophoresis
【中文摘要】克伦特罗因其在动物食品中的残留危害受到了世界各国的高度关住,研究表明克伦特罗的生物活性主要来源于(-)-R对映体,因此分离其对映体以进行相关的研究具有重要意义。目前用于克伦特罗对映体分离分析的方法报道较多,主要有高效液相色谱法、毛细管电泳法等,本文对这些方法及对映体的生物活性研究进展进行了综述,并对未来的研究重点进行了展望。
【英文摘要】Clenbuterol has been highly given attention in world because of its harm of residue in animal food. Some studies showed that the bioactivity of Clenbuterol mainly originates from its (-)-R-eantiomer, so it ’ s very important to separate two enantiomers of Clenbuterol to carry out relevant studies. At present, some methods including high-performance liquid chromatography and capillary electrophoresis were already reported for enantiomeric separation of Clenbuterol. In this paper, research progresses on resolution and bioactivity of Clenbuterol enantiomers were summarized, and some research contents in the future were proposed.

【题目】Enantiomeric Separation and Circular DichroismDetection of Metalaxyl Acid Metabolite by ChiralHigh Performance Liquid Chromatography
【中文关键词】甲霜灵 代谢物 对映体分离 圆二色谱
【英文关键词】Metalaxyl Metabolite Enantiomeric separation
Circular dichroism
【中文摘要】采用纤维素-3,5-二甲基苯基氨基甲酸酯作为手性固定相在高效液相色谱上分离了甲霜灵酸代谢物的对映体,考察了流动相组成、流速和柱温等对拆分的影响。采用正己烷/异丙醇/三氯乙酸作为流动相获得了最好的拆分。圆二色谱检测结果表明甲霜灵酸具有与甲霜灵相似的圆二色谱吸收行为,然而甲霜灵中间体的圆二色谱信号可能随着检测波长的改变而改变。
【英文摘要】The enantiomers of metalaxyl acid metabolite (MX-acid) were separatedby HPLC using cellulose- tris- (3,5-dimethylphenyl-carbamate) (CDMPC)as chiral stationary phase. The effects of mobile phase composition,flow rate and column temperature on the resolution were investigatedand good separation was achieved with n-hexane/2-propanol/trifluoro-acetic acid as mobile phase. The circular dichroisms detection showedthat metalaxyl-acid has similar absorption behaviour to metalaxyl with CDsignals reverse to optical rotation direction of S(+)- and R(-)-enantiomerand CD signals of metalaxyl intermediate enantiomers may be reversedwith change of CD wavelength.

【题目】莱克多巴胺免疫亲和柱的制备与应用研究
【中文关键词】免疫亲和柱 莱克多巴胺 β2受体激动剂 检测
【英文关键词】immunoaffinitycolumn ractopamine β2receptor agonist determination
【中文摘要】用多元酸酐与混合酸酐相结合的方法合成了莱克多巴胺(Rac)抗原, 免疫动物获得特异性抗体, 并以蛋白A柱纯化得到IgG抗体。琼脂糖凝胶(Sepharose4B)经溴化氰(CNBr)活化后与IgG抗体偶联, 制备莱克多巴胺免疫吸附剂。据此建立了尿液中莱克多巴胺的免疫亲和柱净化/液相色谱-荧光法(HPLC- FL)测定的分析方法。免疫制备特异抗体50%抑制浓度(IC50)为5 μg/L。Sepharose4B经CNBr活化后与2mg抗体的偶联率达8714%。1mL吸附剂的柱容量为67157ng。尿液中莱克多巴胺的回收率为76%~90%。
【英文摘要】Apolyclonal antibody2based immunoaffinitycolumn(IAC) was developed as a cleanupMethod for the detection of ractopamine(Rac). Anti-rac specific antibody was gotten with immunized NewZealand rabbit. The IgG was isolated from antiserum with HiTrap Protein AHP column(PrA) and SephadexG25 cartridge. The lmmunosorbents were prepared by coupling anti-Rac IgG with sepha-rose 4B actived by cyanogens bromide. Rac was cleaned up with the prepared immunoaffinity columnand detected by high-performance liquid chromatography with fluorescent detection(HPLC-FL). The titer of anti-Rac antibody was more than 6400 by indirect ELISA and the IC50 was 5 μg/L by indirect competitive ELISA method. The coupling efficiency of 2mg antibody with actived Sepha-rose 4B was 87.4% and the column capacity for 1mL immunosorbents was 67.57ng. The optimal clean-up condition for immunoaffinity column was sequentially rinsed with 5mL phosphate buffer solution, 5mL 10% methanol and eluted with 5mL 95% ethanol (pH=410). The recoveries of fortified samples at levels of 1, 5, 15, 30, 50 ng Rac in 1mL blank pig urine were in the range of 76%- 90%. The immunoaffinity column could keep stable for 3 months in PBS containing 0.02% NaN3 at 4°C.

【题目】改变半抗原与载体间隔臂的长度对环丙沙星抗体特性的影响
【中文关键词】环丙沙星 间隔臂 特异性抗体 间接竞争酶联免疫吸附法
【英文关键词】Ciprofloxacin Spacer specific antibody indirect competitive ELISA
【中文摘要】目的 在用乙二胺化牛血清白(BSA)为载体合成环丙沙星,免疫原已制备了高特异性抗体(IC50达1 ng/ml)的基础上,尝试延长间隔臂长度,以己二胺进一步修饰BSA,合成免疫原制备抗血清,探索其对环丙沙星抗体灵敏度及特异性的影响。方法 以己二胺修饰BSA,合成环丙沙星免疫原,免疫Balb/c小鼠制备多克隆抗体,同时以天然 乙二胺及己二胺化鸡卵清白蛋白(OVA)为载体合成包被原CIP-OVA、CIP-EDA-OVA和CIP-HMD-OVA,用间接竞争酶联免疫检测方法(ic-ELISA)对抗血清进行评价。结果获得了更高特异性的环丙沙星抗血清,IC50达0.1 ng/ml,抗体的交叉反应性也明显降低,且与CIP-EDA-OVA、CIP-HMD-OVA包被原相比,以CIP-OVA为包被原可显著提高环丙沙星ELISA灵敏度。结论 改变抗原间隔臂长度对特异性抗体的产生有较大影响,且改变包被原间隔臂的结构可显著提高的灵敏度。
【英文摘要】Based on the result that highly specific antibody can be obtained via immunogen prepared by ethylenediamine cationized BSA, this study is aimed to explore the effects of lengthening spacer arm between hapten and carriers on the sensitivity and specificity of antiserum against ciprofloxacin(CIP). Hexamethylenediamine was employed to cationize BSA for preparing CIP immunogen, then polyclonal antibodies were raised in Balb/c mice immunized with CIP immunogen. Moreover coating antigens were synthesized using OVA and cationized O-VA as carriers to screen antisera. The results showed that higher specificity and lower cross-reactivity antibody was raised with IC50 values of 0.1 ng/ml, which indicated that the length of spacer arm involved in immunogen has great effects on the raising of specific antibody. Furthermore, the heterology of space arm incorporated in coating antigen has great influence on the sensitivity of ELISA.

【中文关键词】环丙沙星 特异性抗体 ELISA
【英文关键词】ciprofloxacin CIP specificantibodies ELISA
【中文摘要】目的:制备抗环丙沙星(CIP)的特异性抗体,以ELISA方法对其进行评价,为进一步研制CIP快速检测试剂盒打基础。方法:以阳离子化牛血清白蛋白(cBSA)为载体合成免疫原CIP-cBSA,免疫新西兰长耳白兔和BALB/c小鼠,同时以天然、阳离子化鸡卵清白蛋白(nOVA、cOVA)为载体合成包被原CIP-nOVA、CIP-cOVA进行抗血清的筛选,以间接(竞争)ELISA法测定抗血清的效价及特异性。结果:本试验获得7种抗血清,其中2种高特异性CIP抗血清,IC50达1μg/L,效价分别为4000和2000(以A450值为1.0时的抗血清稀释倍数表示),两种抗血清与恩诺沙星(ENR)、诺氟沙星(NOR)、氧氟沙星(OFL)存在不同程度的交叉反应,与青霉素(PEN)、卡那霉素(KAN)和庆大霉素(QEN)无交叉。
【英文摘要】AIM:To prepare specific antibodies against ciprofloxacin(CIP) and characterize the antibodies properities with ELISA, then laythe foundation for development of CIP rapid detection ki.t METHODS: New Zealand white rabbitsand BALB/cmicewere mi munizedwith CIP cBSA conjugate, CIP-nOVA and CIP-cOVA serving as coating antigen were used to screen antisera, indirect (competitive)ELISAwasdeveloped todetermine the titer and specificity of the antisera. RESULTS: Seven antisera against CIP were obtained, two of themwere high specific to CIPwith IC501μg/L, the titer ofwhichwas4000and2000, respectively.The antisera had some degree cross reactivitywith ENR,NORand OFL, but had hardly cross reactivitywith PEN,KANand QEN. CONCLUSION: The antibodieswith high specificity developed in thisstudycan be used to develop CIP detecting kit.

【题目】An Internet-Based Expert System Platform for Assistant Identification of Agricultural Pests
【中文关键词】专家系统;互联网;树状结构;农业病虫害;鉴定
【英文关键词】Expert System, Internet, Dendriform Hierarchical Structure, Agricultural Pests, Identification
【中文摘要】互联网为智能软件的研究和开发提供了很好的环境。基于互联网的专家系统为专家组织与农业病害虫种类和它们的特点相关的知识提供了平台,并依此建立应用型专家系统。系统开发采用服务器/浏览器(S/B)架构,使用PHP语言。用树状结构组织系统中与病害虫种类和特点相关的知识,它可以让专家在知识库里更易进行管理病虫害的信息的,如添加,删除,修改等。专家也可以通过系统索引引擎的索引规则将库中的病虫害种类信息与特点相连接。基于平台系统建立起来的应用型专家系统可以为普通用户提供服务,用户只需准确输入农业病害信息,系统就能鉴定病虫害种类。该系统还具有自学习性。
【英文摘要】The Internet provides a fertile ground for research and development of intelligent software applications. An Internet-Based Expert System was designed to be a platform or tool for experts to organize the knowledge related to the agricultural pest species/category and their characteristics according to their features and to establish the application expert system. The system developed in PHP with AJAX is based upon a Server/Browser(S/B) architecture which employs a user interface that is accessible with standard web browsers. Dendriform hierarchical Structures are employed to organize the knowledge related to the pest species/categories and characteristics in the system, which can make it easier for the experts to manage, such as add, delete or modify, the information of pest insects and diseases and their characteristics in the knowledge-base. Experts can also connect the species/category information to the characteristics in the database as the reference rules for the reference engine in the system. The application expert system could be established on the platform system, and can provide services for the identification of the agricultural pest insects and diseases to common users, it is easy for an ordinary person to tell accurately what the pest is, regardless of their lack of the professional knowledge of the pests. And it can be constantly expanded without any limitation.

【中文关键词】无
【英文关键词】MaSE, Multi-Agent System, Wheat Growth Model, AOP, Agent Cooperation
【中文摘要】无
【英文摘要】The advent of multi-agent systems has brought together many disciplines and given us a new way to look at intelligent, distributed systems. However, traditional ways of thinking about and designing software do not fit the multi-agent paradigm. Based on agent theory, technology research and multi-agent environment, this paper describes agent oriented programming software development method – MaSE and analyzed wheat growth model. Through requirement analysis, system design and system modeling, this paper builds manage agent, fertilize agent, irrigate agent, weather agent, soil agent, growth agent and simulation agent and develops wheat growth multi-agent system.

【题目】Maize Production Emulation System based on cooperative models
【中文关键词】无
【英文关键词】maize; cooperative models; simulation; emulation system
【中文摘要】无
【英文摘要】Based on the maize ecophysiological characteristics, the maize developping process-based cooperative models including growth model, developmental phase models, water balance model and nitrogen balance model etc. was built combined with the basic data such as variety characteristics, weather data, soil level and cultivation management with the technology support of system engineering method, crop simulation and computer. On the basis of cooperative models, this paper further constructed Maize Production Emulation System (MPES) with several additional functions such as, determining variety characteristic parameters, deciding the planting design, simulating maize phenology stages and production features, warning of the nitrogen leaching in advance, simulating the water and nitrogen deficit degree and maize growth three-dimensional display. The system reproduces the maize production process in digital form. MPES was test through actual experiment, and the results veritied its strong mechanism and prediction performance as welll as its universal adaptation.

【题目】Study on digital maize management system based on model,
【中文关键词】无
【英文关键词】Physiological stages, Simulation model, Maize, 3D visualization
【中文摘要】无
【英文摘要】Based on consulting literatures, using modeling experiences of other countries for reference and arranging field experiments, this paper applied system analysis method and dynamic simulation technology to build physiological stages-based maize growth simulation model system. In accordance with the simulation data, the 3D visualization model was designed implemented by means of 3D animation and image processing technologies, which can simulate maize's configuration. Adopting standardization interface and module encapsulation technologies, maize growth model and 3D visualization model were integrated to Digital Maize Management System. System functions include maize phenology stages simulation, yield and grain quality prediction, water and nitrogen management, soil pollution accumulation and 3D visualization for maize's configuration etc. The results of model calibration and validation showed this system possessed of good prediction performance and universal adaptation

【题目】Designing and algorithm implementing of the expert system platform for assistant identification of agricultural pests based on a dendriform hierarchical structure
【中文关键词】树状结构;专家系统;辅助鉴定,病虫害;算法实现
【英文关键词】Dendriform Hierarchical Structure, Expert System, Assistant Identification, Pest,Algorithm implementation
【中文摘要】用树状结构对繁多的病虫害种类进行分类,并在数据库管理系统(DBMS)中对其数据进行管理,用表格存储病虫害的种类和特征点信息,这些特征是与分类相关的,依此建立一个接点表(x/ref)作为专家系统中病虫害鉴定的知识库,表中包括所有种类的鉴定特征。采用关系演算法来估算潜在的病虫害种类与用户选择的病虫害特征集及知识库中的鉴定特征

集之间的关系。该系统是一个开放的灵活的系统,可以为植保专家建立一个新的应用型专家系统,并为普通农业用户提供病虫害鉴定服务。

【英文摘要】being numerous, the insect and disease pests were organized within classifications described as a dendriform hierarchical(tree-shaped) structure. The data of the structure were managed by database management system(DBMS), tables were designed to store the information about the species/catagory and related characteristics. The characteristics were related to the species/catagory to construct a junction/x-ref table as the knowledge base of expert system for insect and desease pest identification, including sets of identification characteristics for all species/catagory in the table. Relational calculus was employed to estimate the potential species/category of the insect and desease pests in relation to inclusion of the set of characters selected by users and the sets of identification characteristics in the knoledge base of the system. The system can be used as an open and flexible platform for profissional users involved in plant protection to establish new expert application system that provide pest identification services for common agricultural users.

【题目】Design of Portable Image Capturing Device for Remote Crop Disease Diagnosis System
【中文关键词】作物远程诊断,图像采集,嵌入式系统
【英文关键词】crop remote diagnosis; image capturing; embedded system; Linux;
【中文摘要】无
【英文摘要】With the computer technology applied in agriculture more and more widely, crop disease diagnosis system based on image processing technology has gradually been applied to agricultural production。The intelligent diagnostic system presented in this paper is an interactive distance diagnositc tool for the diagnosis and identificaiton of diseases and insects. The objective of this system is to realize the automaton of the diagnostic process based on interaction of growers and diagnosistic centre via the wireless communication system, to enable diagnosis in crops at the earliest possible stage, using images captured by the portable image capturing device(PICD). The time required to perform a diagnosis with this system was much less than that needed during traditonal diagnosis. At the practical application of system, the reliably accurate acquisition and timely transmission of the clear images of diseased plants is very crucial to the whole diagnosis.

【题目】THREE-DIMENSION VISUALIZATION FOR PRIMARYWHEAT DISEASES BASED ON SIMULATION MODEL
【中文关键词】无
【英文关键词】3-dimension, visualization, wheat diseases, simulation model
【中文摘要】无
【英文摘要】Crop simulation model has been becoming the core of agricultural production management and resource optimization management. Displaying crop growth process makes user observe the crop growth and development intuitionisticly. On the basis of understanding and grasping the occurrence condition, popularity season, key impact factors for main wheat diseases of stripe rust, leaf rust, stem rust, head blight and powdery mildew from research material and iterature, we designed 3D visualization model for wheat growth and diseases occurrence. Themodel system will help farmer, technician and decision-maker to use crop growth simulation model better and provide decision-making support. Now 3D visualization model for wheat growth on the basis of simulation model has been developed, and the visualization model for primary wheat diseases is in the process of development.

【题目】Agent-based Cooperative Analysis and Assistant Decision-MakingMethod for Regional Agricultural Economic Information
【中文关键词】无
【英文关键词】region ; agricultural economy; agent; cooperation; analysis; assistant decision-making
【中文摘要】无
【英文摘要】A method of applying agent technology to study agricultural economic information and construct decision-making system was provided by means of analyzing the problems existed in current assistant decision support system. The design idea and development technologies were discussed. The prototype of agent-based agricultural economic information analysis and decision-making system was built, and realize agricultural economy information and software sharing, cooperation analysis and group decision making in distributed system. Combining with various analyzing models and knowledge models, we implemented the cooperation and integration between prediction function and decision-making function.

【题目】An Image-Based Diagnostic Expert System for Corn Diseases
【中文关键词】无
【英文关键词】expert system, disease diagnosis, disease image, corn
【中文摘要】无
【英文摘要】The annual worldwide yield losses due to pests are estimated to be billions of dollars. Integrated pest management (IPM) is one of the most important components of crop production in most agricultural areas of the world, and the effectiveness of crop protection depends on accurate and timely diagnosis of phytosanitary problems. Accurately identifying and treatment depends on the method which used in disease and insect pests diagnosis. Identifying plant diseases is usually difficult and requires a plant pathologist or well-trained technician to accurately describe the case. Moreover, quite a few diseases have similar symptoms making it difficult for non-experts to distinguish disease correctly. Another method of diagnosis depends on comparison of the concerned case with similar ones through one image or more of the symptoms and helps enormously in overcoming difficulties of non-experts. The old adage ‘a picture is worth a thousand words’ is crucially relevant. Considering the user’s capability to deal and interact with the expert system easily and clearly, a webbased diagnostic expert-system shell based on production rules (i.e., IF < effects > THEN < causes >) and frames with a color image database was developed and applied to corn disease diagnosis as a case study. The expert-system shell was made on a 32-bit multimedia desktop microcomputer. The knowledge base had frames, production rules and synonym words as the result of interview and arrangement. It was desired that 80% of total frames used visual color image data to explain the meaning of observations and conclusions. Visual color image displays with the phrases of questions and answers from the expert system, enables users to identify any disease, makes the right decision, and chooses the right treatment. This may increase their level of understanding of corn disease diagnosis. The expert system can be applied to diagnosis of other plant pests or diseases by easy changes to the knowledge base.

【题目】基于Fisher判别分析的玉米叶部病害图像识别
【中文关键词】玉米; 叶部病害; 特征提取; 遗传算法; 费歇尔判别分析;
【英文关键词】maize; leaf disease; feature extraction; genetic algorithm; Fisher discrimination analysis;
【中文摘要】【目的】利用计算机视觉技术实现玉米叶部病害的自动识别诊断。【方法】在大田开放环境下采集病害图像样本,综合应用基于H阈值分割、迭代二值化、图像形态学运算、轮廓提取等算法处理病害图像,抽取病斑,提取病害图像的纹理、颜色、形状等特征向量,采用遗传算法优化选择出分类特征,并利用费歇尔判别法识别普通锈病、大斑病和褐斑病3种玉米叶部病害。【结果】研究中提取了墒、相关信息测度、分形维数、H值、Cb值、颜色矩、病斑面积、圆度、形状因子等28个特征向量,利用遗传算法优选出H值、颜色矩、病斑面积、形状因子等4个独立、稳定性好、分类能力强的特征向量,应用费歇尔判别分析法识别病害,准确率达到90%以上。【结论】综合运用数字图像处理技术、图像纹理、颜色、形状特征分析方法、遗传算法、费歇尔判别分析方法可以有效识别基于田间条件下采集的病害图像,为田间开放环境下实现大田作物病虫害的快速智能诊断提供借鉴。
【英文摘要】【Objective】 The recognition and diagnosis methods of main maize leaf diseases using machine vision were studied in this paper.【Method】 The diseases pictures of different varieties or periods were taken in fields,methods of threshold segmentation based on hue,iteration binarization,image morphological operation and contour extraction were adopted for image processing and image segmentation,then the texture,color and shape features were extracted.Genetic algorithm was used to get approximate features.Finally ...

【题目】基于G-MRF 模型的玉米叶斑病害图像的分割
【中文关键词】Gauss; Markov; 玉米叶部病斑; 图像分割;
【英文关键词】Gauss; Markov; maize disease spots; segmentation;
【中文摘要】【目的】图像分割是作物病害自动识别系统实现的难点之一,前人研究大多采用基于阈值或聚类的分割算法,方法简单、易于实现,但分割精度较低。本文引入高斯模型的Markov随机场分割模型(G-MRF),对玉米叶部病斑图像进行分割试验,以期提高分割精度。【方法】在VC6.0下实现了G-MRF分割模型,G-MRF既利用了图像像素的灰度信息,又通过像素类别标记的Gibbs光滑先验概率引入了图像的空间信息,是能较好地分割含有噪声图像的算法。采用该算法对大斑病、小斑病、灰斑病和弯孢菌叶斑病等4种主要玉米叶部病害的图像进行了分割测试,并与基于阈值和基于Gauss模型的分割算法进行比较。【结果】基于G-MRF分割模型的分割,目标区域的一致性和边缘的清晰方面明显好于基于阈值和Gauss模型的分割算法,其平均正确分类率达96.35%,分别较基于阈值和基于Gauss模型的分割算法高出3.75%和4.03%,差异达到显著水平。【结论】基于G-MRF模型的分割算法鲁棒性高,能够有效地将病斑区域从叶片部分离,分割正确分类率达96.35%,可用于玉米叶斑类病害图像的分割。
【英文摘要】【Objective】 Image segmentation is one of the difficult issues in crop disease automatic identification systems, in present research, algorithms based on threshold or based on clustering were mostly used. These methods are simple and easy of implementation, but the precision is low. In order to improve the segmentation precision of maize disease spots, Gauss-MRF model was introduced to segment maize disease spot images. 【Method】 The algorithm was implemented on VC6.0. Gauss-Markov random field model takes ad...

【题目】基于图像规则的玉米病害诊断系统的设计与实现
【中文关键词】玉米; 病害诊断; 规则推理; 专家系统;
【英文关键词】Maize; Disease diagnosis; Rule-based reasoning; Expert system
【中文摘要】针对传统病害诊断系统在病症推理过程中借助语言文字描述规则诊断病害让农户难以理解和应用的问题,将图像指认方法与传统文字规则推理技术相结合,建立的病害诊断系统更适合于农户使用,并改善了专家系统的应用效果,利于其在玉米生产中的应用。介绍了基于图像规则的玉米病害诊断系统的设计思想、功能特点和实现方法。
【英文摘要】Designing ideas, structure, functions, features and implementation method of the maize disease diagnosis system were introduced minutely in this paper based on image rules. The new method combined image and liter-al rules, which overcomes the disadvantages of understanding and applying problems caused by traditional liter-al-based system, and was more suitable for peasant household. In addition, the system effectively improved the application effect ,and is favorable to be applied and popularized in future.

【题目】Cre/lox System and PCR-Based Genome Engineering in Bacillus subtilis
【中文关键词】基因的框内删除、基因组的重排
【英文关键词】in-frame deletion、genome rearrangement
【中文摘要】现有的枯草芽孢杆菌遗传操作系统依赖于载体的构建和枯草芽孢杆菌自身的重组系统,耗时长、效率低。本文将Cre/loxP定点重组系统和重叠延伸PCR技术结合建立了一套快捷高效的枯草芽孢杆菌基因组操作方法。用重叠延伸PCR技术代替载体构建快速地将目标敲除位点的上下游同源臂和抗性标记盒融合起来,用Cre/loxP定点重组系统代替菌体

自身的重组系统高效的删除抗性标记,整个操作过程可以在2天内完成,大大提高了效率。应用该方法实现了枯草芽孢杆菌的基因敲除、基因的框内删除以及基因组大片断的删除。该方法还适用于基因组的重排和大规模的基因敲除。
【英文摘要】We have developed a fast and accurate method to engineer the Bacillus subtilis genome that involves fusing by PCR two flanking homology regions with an antibiotic resistance gene cassette bordered by two mutant lox sites (lox71 and lox66). The resulting PCR products were used directly to transform B. subtilis, and then transient Cre recombinase expression in the transformants was used to recombine lox71 and lox66 into a double-mutant lox72 site, thereby excising the marker gene. The mutation process could also be accomplished in 2 days by using a strain containing a cre isopropyl- -D-thiogalactopyranoside (IPTG)-inducible expression cassette in the chromosome as the recipient or using the lox site-flanked cassette containing both the cre IPTG-inducible expression cassette and resistance marker. The in vivo recombination efficiencies of different lox pairs were compared; the lox72 site that remains in the chromosome after Cre ecombination had a low affinity for Cre and did not interfere with subsequent rounds of Cre/lox mutagenesis. We used this method to inactivate a specific gene, to delete a long fragment, to realize the in-frame deletion of a target gene, tointroduce a gene of interest, and to carry out multiple manipulations in the same background. Furthermore,it should also be applicable to large genome rearrangement.

【题目】与桃树性高/矮性状相关的SRAP标记
【中文关键词】桃,矮生性状,SRAP标记
【英文关键词】Peach;Dwarf trait;SRAP marker
【中文摘要】利用矮生型进行密植栽培是桃树生产发展的一个重要方向。利用SRAP标记技术以寿星桃A20(Prunus persica var. densa Makino)与普通桃(P. persica L.Batsch)品系‘ 99-12-34 ’的F1杂交分离群体共l23个单株(矮生型63株,普通型60株)为试材,对控制桃高/矮性状的基因进行分子定位,从而为明确桃的矮化机理提供依据。用分离群体分组分析法(Bulked Segregant Analysis,BSA),通过对336对SRAP引物的筛选,获得了一个与高/矮性状连锁距离为3.2cM 的SRAP标记。利用该标记对本试验群体以外的34个桃品种的DNA进行扩增,符合率达到88.2%,初步认为可以用于桃的分子辅助育种。
【英文摘要】Close planting by brachytic dwarf peach is one of the main direction for peach industry.About123 (1-year—old)hybrid individuals derived from the cross of Shouxing Tao peach (Prunus persica var.densa Makino)A20 and peach[P persica(L.)Batsch]99-12-34 which was used to identify SRAP markers linked to the character of tall normal/brachytic dwarf for understanding of the dwarfing mechanism.Theindividuals were divided into two types.About 63 individuals have the character of brachytic dwarf and 60individuals have the character of tall norma1.Altogether.336 pairs of SRAP primers were screened bybulked segregant analysis(BSA).Finally,a SRAP marker,Me l 1 Era25,which linked to the character of tall normal/brachytic dwarf at a distance of 3.2 cM ,was selected.The marker wea used to test in 34 varieties and has the coincidence rate of 88.2% .The results showed the marker could be used for molecular assisted selection(MAS)in peach.

【题目】桃不同类型果实发育的解剖结构特性
【中文关键词】桃; 果实发育; 解剖结构
【英文关键词】Peach; Fruit development; Anatomical structure
【中文摘要】为探讨普通桃、油桃、蟠桃和油蟠桃果实发育期表皮、亚表皮和中果皮细胞的解剖结构差异,试验以同一杂交群体内的这4 种类型(各2 株)为试材,通过显微和超微观察果实表皮、亚表皮和中果皮细胞发育。结果表明,4 种类型果实的横径发育皆呈双S 曲线,果实亚表皮细胞前期变化较小,开始膨大期为盛花后42 d。普通桃、油桃和油蟠桃中果皮细胞在整个果实发育期持续膨大,类型间变化趋势基本一致,而蟠桃中果皮细胞在盛花后70-84 d 存在膨大延缓期。盛花后42-98 d,普通桃和蟠桃亚表皮与中果皮细胞膨大倍数之比大于油桃和油蟠桃。分析认为,果实有毛/无毛基因单独影响着表皮细胞形状和亚表皮与中果皮细胞膨大倍数之比, 而无毛基因与扁平基因共同影响着亚表皮淀粉粒数目,并且这种作用有累加

现象。
【英文摘要】The developmental process of the fruit epidermis, sub-epidermis and mesocarp cells of 4 peach fruit types including common peach, nectarine, flat peach and flat nectarine collected from the trees derived from same crossed population were studied through micro and super-microstructure observation. The results showed that the growth pattern of the transverse fruit section of in 4 types of peach were all of double sigmoid curves. Sub-epidermis cell expanded with a steady speed from the 42th day after full bloom; mesocarp cells of peach,nectarine and flat nectarine expanded with a high rate during total fruit development period,but the mesocarp cells of flat peach had a period from the 70th to 84th day after full bloom with a slow cell expansion. During the period from 42th to 98th day after full bloom the expanded times of the sub-epidermis and mesocarp cell in peach and flat peach was higher than nectarine and flat nectarine. This study indicated that the epidermis cell shape and the ratio of sub-epidermis to mesocarp cell expansion times were influenced by glabrous gene,the additive effect by two gene, glabrous and saucer shape genes on starch grain number were found in the experiment.

【题目】桃果肉颜色性状的SSR 标记及其在品种中的验证
【中文关键词】桃; 果肉颜色; SSR; 分子标记
【英文关键词】Peach; Flesh color; SSR; Molecule marker
【中文摘要】桃果肉颜色是与果品加工密切相关的一种重要经济性状。以桃栽培种瑞光19(白肉)×Summergrand(黄肉)杂交的104 株F1 后代分离群体为试材,对桃白肉/黄肉的SSR 分子标记进行研究,以期为该性状的分子标记辅助育种奠定理论基础。结果表明,筛选的135 对引物中有4 对引物,CPDCT024、pchgms3、CPPCT026 和BPPCT011,在白肉和黄肉单株以及混合基因池间扩增出差异。分析性状与标记的连锁情况表明,CPDCT024 与白/黄肉性状遗传距离最近,为7.8 cM。试验构建了桃白/黄肉性状的连锁群,根据4 个SSR 标记与参考图谱T×E 和P2175×GN 比对,将控制白/黄肉性状的基因定位在参考图谱第1 连锁群, 对应于桃的第1 条染色体。以CPDCT024 和参考图谱上另一个与白/黄肉性状连锁距离较近的标记CPPCT026 在20 个白肉和黄肉品种上验证,CPDCT024 检测的准确率为70%,优于CPPCT026。
【英文摘要】Flesh color characteristic of peach is very important for processing. In this study,104 individuals of the F1 population derived from Ruiguang 19×Summergrand were used as materials for screening SSR markers linked to flesh color gene to establish the foundation for marker assisted selection in peach breeding. Difference bands were found among the amplified fragment using four primers,CPDCT024,pchgms3,CPPCT026 and BPPCT011 between bulked gene pool of white flesh and yellow flesh varieties,which indicated that the markers should be linked to flesh color character. The nearest marker,CPDCT024,with a distance of 7.8 cM linked to white/yellow flesh color characteristics was acquired. Flesh color gene was located on the group 1 (Chromosome 1) according to the order of SSR marker in reference map. Four SSR loci in common with a saturated reference linkage map T×E and P2175×GN allowed a comparative analysis to be made between the three maps,and homologies were found among the respective linkage groups. CPDCT024 was screened with 20 varieties to validate the marker as well as CPPCT026,a nearer marker linked to flesh color gene in reference map,the results showed that CPDCT024 was more efficiency with a score of 70% in predicating the flesh color prior to CPPCT026.

【题目】桃花粉育性与花药颜色的关系及其SSR分子标记
【中文关键词】桃;花粉育性;花药颜色;分子标记
【英文关键词】Peach; Po llen fertility; Anther color; Mo lecule marker
【中文摘要】以李属桃亚属的637份桃品种种质和栽培种瑞光19 ×Summ ergrand杂交的138株F1群体为试材, 对桃花粉育性与花药颜色的关系及其SSR 分子标记进行研究。结果表明: 在所有品种中, 橘红花药最多, 占总份数的91.2%, 其中绝大部分花粉可育; 橘黄和黄色花药的种质数量次之; 白色和浅褐花药的种质最少, 且均表现为花粉不稔; 整体表现为红色和黄色花药与花粉可育具有较强的正相关性。本试验从122对SSR 引物中筛选出2 对与花粉育性性状连锁的标记CPDCT013 和CPSCT012, 根据这2个标记参考整合参考图谱的位置, 将控制花粉育性的基因定位在桃第6条染色体上端。对已经报道的2个桃花粉育性标记CPPCT004和NN J I以及第6条连锁群的其他SSR 位点在花粉育性不同的24个品种上验证, 结果表明只有UDP96- 001(125bp) 可以用于桃花粉育性的分子标记辅助育种。
【英文摘要】637 peach cultivars and 138 F1 hybrid seedlings derived from the cross of Ruiguang 19 and Summer grand(Prunus persica (L.) Batsch.) were used to investigate there lationship between anther color and pollen fertility, and screen the SSR markers linked to the pollen fertility. 91.2% o f all cultivars were jac in thanthor, and the most o f them had fertile pollen; the number of cultivars w ith orange and yellow anther took the second p lace, cultivars with white and sandy beige anthor with sterile pollen were the fewest Positive corre lation w as found between red and yellow anther co lo r and pollen fertility. 122 SSRs located at Prunus reference genetic map were screened using bulked segregant analysis(BSA) , and two SSR markers, CPDCT013 and CPSCT012, were found to be linked to fertile/sterile character. Po llen fertility gene was located on the group 6 (chromosome 6) according to the location of two marker in the reference map. CPPCT004 and NNJ I, the pollen fertility markers in peach which reported in other papers together with whole SSR in group 6, were also screened in 24 cultivars with different pollen fertility. The results showed thatUDP96-001 had a higher accuracy when be used for selecting fertile pollen cultivar.

【中文关键词】桃; 遗传图谱; 雌蕊发育; 重瓣; 分子标记
【英文关键词】peach; genetic linkage map; p istil development; double petal; molecularmarker
【中文摘要】以桃‘红垂枝’与其近缘种山桃‘白花山碧桃’杂交的52株F1群体为试材,采用SSR、AFLP和SRAP分子标记进行遗传分析。筛选扩增稳定且多态性丰富的38对SSR引物、61对AFLP引物和38对SRAP引物进行群体分离分析, 获得符合1∶1分离的标记441个,亲本为双杂合位点的标记52个。应用Mapmaker分析软件将符合1∶1分离的标记和雌蕊发育性状一起构建了包含11个连锁群的遗传图谱, 该图谱共206个标记(18个SSR,126个AFLP、61个SRAP和1个形态学标记),全长1 19312 cM。每个连锁群的平均长度为10815 cM, 标记间平均图距为518cM。根据18个SSR标记与T×E参考图谱比对,本试验中的11个连锁群对应于参考图谱的G1至G8, 标记的线性符合度较好。雌蕊发育性状标记定位在第1连锁群,对应于1号染色体。应用Mapmaker分析软件将亲本为双杂合位点标记和花单瓣/重瓣性状一起分析,获得1个新单瓣/重瓣基因的两个AFLP标记。
【英文摘要】A linkage map of peach was constructed with SSR, AFLP and SRAPmarkers in 52 F1 population derived from the cross of Prunus persica (L.) Batsch.‘ Hongchuizhi ’and P. david iana (Carr.) Franch.‘ Baihuashan Bitao ’. The selected p rimers including 38 SSR, 61 AFLP and 38 SRAP with rich polymorphism and steady bandswere tested in p rogeny. Four hundred and forty2one markers in 1∶1 ratio by μ2 test and 52 markers for double heterozygous lociwere scored. Mapmaker software were used to assigned the markers in 1∶1 ratio and p istil abortion trait to 11 linkage group s, the map was composed of 206 loci (18 SSRs, 126 AFLPs, 61 SRAPs, and one morphological trait) distributed in 11 linkage group s, the map covers 1 19312 cM of the peach genome. The average length of 11 group s is 10815 cM, the average distance between adjacent loci is 518cM. Eighteen SSR loci in common with a saturated reference linkage map (T×E) of Prunus allowed a comparative analysis to be made between the two map s, homologieswere found among the respective linkage group s, the map in this study showed better identitywith peach reference map. Pistil development

trait, were p laced on the group 1 (chromosome 1). Two AFLPs linked to a new double petal gene were obtained through analysis of the markers for double heterozygous loci.

【题目】The phylogeographic system survey of native sheep breeds in The phylogeographic system survey of native sheep breeds in
【中文关键词】亚洲东南部,遗传分化,本地绵羊,种系发生类群
【英文关键词】Eastern and Southern of Central Asia; genetic
differentiation; native sheep; phylogenetic
group.
【中文摘要】本研究旨在对中亚东南部本地绵羊品种的遗传多样性和种系发生进行分析。聚类分析、主成份分析,结构分析及F 统计分析都显示这一地区的本地绵羊品种被分为2个遗传类群,蒙古-西藏绵羊类群,亚洲南部-东南部类群。蒙古羊类群和西藏羊类群在古代就有一定程度的基因交流,本研究证明中国本地绵羊属于蒙古-西藏绵羊类群。然而,中国的蒙古绵羊类群间在地理距离上没有明显的相关性。
【英文摘要】The genetic diversity and phylogenetic survey of native sheep breeds inthe eastern and southern Central Asia were assessed in the presentstudy. The clustering, principal components, structure and F statistics alldemonstrate that the native sheep breeds in these regions be classifiedinto two genetic groups: Mongolia-Tibetan sheep group and South-Southeast Asia sheep group. The Mongolia sheep group and the Tibetansheep group had a certain degree of gene communication from theancient times. In the present study we demonstrated that the Chinesenative sheep populations belonged to Mongolia-Tibetan sheep group.However, the relationships among the sheep populations in Mongoliasheep group in China were not closely related to the geographical distanceamong sheep populations.

【题目】黄瓜抗病基因类似序列(RGA) 的同源性分析和Southern鉴定
【中文关键词】黄瓜; 抗病基因类似序列; 同源性; Southern杂交
【英文关键词】Cucumber; Cucum is sativus L. ; RGA; Homology; Southern hybridization
【中文摘要】使用ClustalW和DNAMAN 3.0分析了本实验室克隆的15个黄瓜抗病基因类似序列(RGA)之间以及与烟草的N基因、亚麻的L6基因和拟南芥的RPS2基因之间的同源性, 并对这些RGA进行了PCR和Southern验证与分析。结果表明: 15个黄瓜RGA中, 核苷酸序列同源性最高的是CsRGA2、CsR2GA4和CsRGA5, 其次是CsRGA6、CsRGA7、CsRGA8和CsRGA9、CsRGA1和CsRGA3也存在较高的同源性; 其余的RGA同源性较低。在氨基酸序列上也表现了相同的特征。与N、L6和RPS2等抗病基因的产物之间同源性最高46% , 最低22%。根据核苷酸序列设计了15对特异引物, 用PCR方法验证了所有黄瓜RGA的存在, 其中CsRGA3在黄瓜品种间表现出多态性。利用特异引物PCR方法合成了15个黄瓜RGA的地高辛探针, 与EcoR Ⅴ酶解的黄瓜‘ 215 ’、‘ 129 ’和‘ L18 ’的基因组DNA进行Southern杂交, 证实了各个RGA在基因组上的存在, 同时发现, CsRGA9、CsRGA11~CsRGA15都是多拷贝, CsRGA3是单拷贝, 其余为双拷贝。
【英文摘要】The homology among fifteen RGAs of cucumber cloned in authorsplaboratory and the homology between the RGAs and N gene from tobacco, and L6 gene from flax, and RPS2 gene from Arabidopsiswas analyzed using ClustalW and DNAMAN 3.0 program. The fifteen RGA s were identified by PCR and Southern hybridization. The results showed that the highest homology of

nucleotide sequence existed between CsRGA2, CsRGA4 and CsRGA5. Higher homology existed between CsRGA6, CsRGA7, CsRGA8 and CsRGA9, also existed between CsRGA1 and CsRGA3, Less homology existed in the other RGAs. The amino acid sequence homologies of the products translated from the RGAs were also similar to the above. The highest homology, 46% , and the lowest homology, 22% , between the RGAs and three novel disease resistance genes, N, L6 and RPS2, were exhibited. The RGA s were identified using PCR with fifteen pairs of special primers based on the nucleotide sequence of the RGAs. CsRGA3 showed polymorphism in cucumber varieties. The fifteen digoxin (DIG) labeling probe, which produced by performing special primer PCR, hybridized with genomic DNA of 215, 129 and L18, digested by EcoR V , using Southern blotmethod. The existence of the RGAs in cucumber genome was certified. CsRGA9, CsRGA11 - CsRGA15 had multicopies, respectively, CsRGA3 had single copy, the others had two copies.

【题目】黄瓜抗霜霉病相关基因cDNA片段的克隆与分析
【中文关键词】黄瓜; 霜霉病; 抗病相关基因; mRNA 差异显示
【英文关键词】cucumber; downym ildew; disease resistance-related genes; mRNA differential display
【中文摘要】以抗霜霉病黄瓜‘东农129’为试材, 利用基因差异显示技术(DDRT-PCR) 研究了黄瓜接种霜霉病菌前后基因表达的差异。共分离出4个接菌后在叶片中特异表达的cDNA 片段, 分别命名为49-2、50-5、50-7和52-14。同源性比对发现, 50-7号片段与黄瓜脂氧合酶基因部分同源, 其余为未知新基因序列。表达分析显示, 所筛选的4个差异表达基因片段与黄瓜感染霜霉病菌有密切关系。49-2号片段在所检测的整个感染过程都有很强的表达; 50-5号片段与病菌侵染也有较密切的关系, 但相对49-2表达延迟;50-7和52-14仅在接种24 h有一定表达, 显示出与病菌诱导之间的特殊关系。
【英文摘要】Differential display reverse transcriptase PCR (DDRT- PCR) method was used to explore the differential gene expression in cucumber resistant cultivar‘ Dongnong 129 ’ before and after inoculated with P seudoperonospora cubensis. Four special expressed cDNA segments were obtained in the inoculated cucumber leaves, which were named as 49-2, 50-5, 50-7 and 52-14. BLAST analysis revealed that the nucleo tide sequence of 50-7 was homologous partly to the lipoxygenase-9 in cucumber, and the others were the unknown sequences of novel genes. Further analysis on expression showed that the 4 fragments were closely related with the infection of P. cubensis. The fragment of 49-2 expressed intensely during the total time of infection; the fragment of 50-5 also had a close relationship with pathogen infection and its expression was delayed than that of 49-2; the fragments of 50-7 and 52-14 only expressed at 24 h after inoculation, which showed the special relation with the pathogen inoculation. This study provided some useful information for further understanding of them echanism of resistance to downymildew in cucumber and isolating the resistance gene for application of molecular breeding

【题目】益生素对奶牛生产性能及瘤胃发酵影响的研究
【中文关键词】益生素; 瘤胃发酵; 生产性能; 甲烷产量
【英文关键词】Probiotic; Rumen fermentation; Performance;Methane production
【中文摘要】试验分为 3 个部分。一、 选用 32 头体况、 胎次、 泌乳日龄相近的中国荷斯坦奶牛, 随机分成 3 个处理组, 即地衣芽孢杆菌培养物组 (菌号: 1.813) 、 枯草芽孢杆菌培养物组 (菌号: 1.1086) 和对照组, 每组 8 头, 用液- 固两相方法进行菌体制备。 每克培养物中含有 1× 109cfu 菌体, 每头牛每天饲喂 50g,预饲期 15d, 试验期 3d, 记录全天产奶量。 结果表明 , 地衣芽孢杆菌组显著地提高了产奶量 (p<0.05) , 枯草芽孢杆菌组和对照组比较差异不显著(p>0.05)。 地衣芽孢杆菌组显著提高了乳蛋白的浓度和产量 (p<0.05) 。枯草芽孢杆菌处理组和对照组比较差异不显著 (p>0.05) 。二、采用 3× 3 拉丁方试验设计, 选用体况良好、 平均体重 550kg、 安装有永久性瘤胃瘘管的中国荷斯坦奶牛 3 头作为试验牛。分 3 期进行, 每期 20d, 中间为间隔 15d 的过渡期, 过渡期饲喂试验组饲粮, 在 3d 试验期进行采样分析。试验结果表明地衣芽孢杆菌组显著提高了奶牛瘤胃的细菌总数(p<0.05)、 显著降低了氨态氮的浓度(p<0.05)、 提高了总挥发性脂肪酸的浓度(p>0.05)及乙酸和丙酸的比例 (p>0.05) 。三、 采用短期人工瘤胃发酵技术研究了三种培养物对奶牛瘤胃发酵甲烷产量的影响。试验设地衣芽胞杆菌培养物、 枯草芽胞杆菌培养物和对照组三个处理。每个处理设10 个重复, 每个重复用一支人工瘤胃发酵用注射器。 结果表明地衣芽孢杆菌培养物降低了甲烷的产量 (p<0.05) , 降低了能量损失, 并可降低由于反刍动物瘤胃发酵产生甲烷所引起的温室效应。
【英文摘要】Three parts were involved in this experiment. 1.Thirty- two Chinese Holstein cows with relatively similar body condition, lactation number and days in milk were selected in this experiment. The cows were randomly divided into three groups. Three treatments, i.e., Bacillus Licheniformis group (1.813) , Bacillus Subtilis group (1.1086) , and the control group. Each treatment had eight replicates.The cultures were prepared byliquid cultivation and solid fermentation. Bacillus cultures contained 1× 109 live cells/g , Everycowwas fed 50gculture per day . Pretrial periodwas 15 days. Post - trail periodwas 3 days, andDailymilk yieldwas recorded in this period.Results showed thatBacillus Licheniformis group increased themilkyield (p<0.05) . The other group didn' t have significant effect on milk yield than the control group (p>0.05) . Lincheniformis group increased the concentration and yield of milk protein (p<0.05);2.Three Chinese Holstein cows with permanent fistula were used in this part. 3× 3 Latin square design was used in this part which had three periods. Each period was 20 days. Interval period was 15 days. The ruminal fluid samples were collected and analyzed on the last three days in each period. Bacillus Licheniformis culture increased total ruminal micro- organism (p<0.05),decreased the ammonia nitrogen concentration (p<0.05). Bacillus Licheniformis culture increased the total volatile fatty (p>0.05), increased therate of acetic acid to propionate acid (P>0.05); 3.The short term rumen simulation technique was used to study the effect of different bacillus cultures on methane production in vitro. Three treatments i.e. Lincheniformis, Subtilis and control group were involved in this experiment. Each treatment had ten replicates. Each replicate had one syringe for the use of rumen simulation technique. Results showed that Lincheniformis culture decreased the methane production (p<0.05), which will play a role to promote the situation of energy utilization, and decrease the socalled green house effect via rumen fermentation in dairy cattle.

【题目】黄瓜果瘤的遗传及SSR 标记
【中文关键词】黄瓜; 遗传; 分子标记; SSR; 果瘤
【英文关键词】无
【中文摘要】通过对以荷兰温室无瘤黄瓜(cucumis sativus)品种Z1 和Z3为母本(tutu), 有瘤黄瓜品系东农129为父本(TuTu)的杂交后代F1 和F2的统计分析, 结果表明:在F1 代,2个组合果实都有果瘤, 有果瘤为显性; 凡代果实有瘤与无瘤呈现分离, 其比

例分别是2.92:1和2.95:1, 表明Tu基因是独立遗传的, 即有瘤(Tu)对无瘤(tu) 为显性。为了获得与黄瓜果瘤基因连锁的SSR(simple sequence repeat)标记, 从129×Z3F2群体中选取有瘤、无瘤单株的DNA各10个, 构建有瘤、无瘤近等基因池。用86对SSR引物在亲本及DNA 混合池之间进行筛选, 并对F2群体的75个单株进行验证。筛选得到了5对与果瘤相关的SSR引物, 经MAPMAKER/EXP version 3.0b 其中CSSWGATT01B、CSSWGATT01C、CSCT335和CSSWGATT01A四个标记位于同一连锁群上.Tu基因位于这4个标记构建的连锁群中, 具体位置为CSSWGATT01C-Tu-CSCT335,距离两侧标记的遗传距离分别为20.0CM和14.1cM

【题目】日粮不同NFC\RDP水平对围产期奶牛血液NEFA、BHBA、ALB和TP浓度的影响
【中文关键词】围产期奶牛 NFC/RDP 非酯化脂肪酸 羟丁酸 白蛋白 总蛋白
【英文关键词】Transition cows; NFC/RDP; BHBA; NEFA; ALB; TP
【中文摘要】本文旨在研究围产前期日粮不同 NFC/RDP 水平对奶牛血液 NEFA BHBA ALB 和 TP 浓度的影响 选择 2 5胎产奶量 体重和体况评分值相近的围产期荷斯坦牛 48 头 随机分为六组 每组 8 头 于产前第 28 天开始 各组分别饲喂 NFC/RDP 为 5.14 Ⅰ 3.46 Ⅱ 4.00 Ⅲ 5.12 Ⅳ 3.35 Ⅴ 2.87 Ⅵ 的日粮 分娩后各组均饲喂相同的产奶日粮 至产后第 7 天结束 结果表明 产后第 7 天, Ⅲ组血清 NEFA 浓度显著低于Ⅵ组 P<0.05 低于其余四组 但差异不显著 P>0.05 产后第 1 天 Ⅲ组血清 BHBA 水平显著低于Ⅵ组 P<0.05 低于其余四组,但差异不显著 P>0.05 从产前第 14 天到产后第 7 天, Ⅲ组血清 ALB 浓度均高于其余五组 但差异不显著 P>0.05 产后第 7天 Ⅲ组 TP 浓度显著高于Ⅰ组和Ⅳ组 P<0.05 高于Ⅱ组 Ⅴ组和Ⅵ组 但差异不显著 P>0.05 在本试验条件下NFC/RDP 为 4.00 Ⅲ 的日粮饲喂效果最佳
【英文摘要】Abstract The research was con ducted to investigate the effect of different level of NFC/RDP during the prepartum period on serum concentrations of NEFA, BHBA, ALB and TP in transition Holstein Cows. Forty-eight transition Holstein cows were randomly allocated into six groups according to the parity,milk production,body weight and body condition score. The NFC/RDP level was 5.14 Ⅰ ,3.46 Ⅱ ,4.00Ⅲ ,5.12 Ⅳ ,3.35 Ⅴ and 2.87 Ⅵ , respectively, from the day 28 prior parturtum to calving. After calving, all the cows were offered the same lactation ration to the day 7 postpartum. The result showed that: the concentration of serum non-esterified fatty acids(NEFA) of cows in Ⅲ group was evidently lower than that of Ⅵ group P<0.05 , lower than that of other four groups(P>0.05 at the seventh day after calving; the concentration of serum -hydroxybutyric acid(BHBA)of cows in Ⅲ group was evidently lower than that of Ⅵ group P<0.05 , lower than that of other four groups(P>0.05 at the first day after calving; the concentration of serum albumin(ALB) of cows in Ⅲ group was higher than that of other five groups(P>0.05 from the day 14 prepartum to the day 7 postpartum; the concentration of serum total protein(TP) of cows in Ⅲ group was evidently higher than that of Ⅰ and Ⅳ groups P<0.05 , higher than that of Ⅱ, Ⅴ and Ⅵ groups(P>0.05 at the seventh day after calving.Analysis indicated that Ⅲ group with the NFC/RDP level was 4.00 was the best among the six diets.

【题目】与大白菜干烧边性状相关的SSR和SRAP标记分析
【中文关键词】大白菜,干烧心,SSR ,SRAP,QTL

【英文关键词】Chinese cabbage (Brassica campestris L. ssp. pekinensis), Burntip trait, SSR, QTL
【中文摘要】以大白菜感干烧边品种A67和抗干烧边品种A53配制的F2群体为材料,采用混合集群分析法构建构建大白菜的感病池和抗病池,对104对SSR引物和320对SRAP引物进行筛选,并对与干烧边性状相关的QTL和对应的连锁关系进行了初步分析。获得2个与大白菜干烧边性状相关的QTL,同时获得3个与这2个QTL连锁的标记,其中S29-890和E6-400标记与其最近QTL位点的连锁距离分别为1.6cM和7.1cM。为大白菜抗干烧边性状的分子辅助育种奠定了基础。
【英文摘要】英文摘要　population of F2 generation including 141 individual plants was derived from the cross between the susceptible lines A67 and the resistance lines A53.In this paper,104 pair SSR primers and 230 pair SRAP primer were employed in constructing a molecular genetic map and mapping QTL controlling tipburn disorder resistance in Chinese cabbage. Results showed that 25 primer pair combinations could amplify polymorphic bands stably between two gene pools and 2 QTLs concerning tipburn were detected. 3 markers(S29-890 and E6-400) were found to be linked with their nearest QTLs at a distance of 7.1cM and 1.5cM,resprctively.These markers provided a scientific tool to marker-assisted selection for tipburn resistance in Chinese cabbage breeding

【题目】Development of molecular markers linked to Cladosporium fulvum resistant gene Cf-6 in tomato by RAPD and SSR methods
【中文关键词】番茄;叶霉病;Cf-6抗病基因;分子标记
【英文关键词】Cf-6 resistant gene,Cladosporium fulvum, molecular markers
【中文摘要】番茄叶霉病是一种非常严重的病害,它由番茄叶霉病菌引起。本试验采用一系列鉴别寄主对来自中国东北三省的叶霉病主要生理小种进行了鉴定,结果显示目前的主流生理小种为1.2.3, 1.3, 3,1.2.3.4和1.2.4,试验中使用的F1, F2和BC1番茄植株来自抗叶霉病品种03748(含有Cf-6抗病基因)和感病品种03036杂交组合。采用抗感池分析法对210对RAPD引物和50对SSR引物进行筛选,获得了3对10碱基RAPD引物和2对SSR引物用于进一步的作图分析。这些筛选出的引物可以在亲本,F1和F2代植株中扩增出多态性条带,证明这些标记是和Cf-6基因连锁的。3个RAPD标记的遗传距离分别为8.7 cM, 20.3 cM, 和 33.4 cM.2个SSR标记的遗传距离分别为12.6 cM 和9.7 cM。通过对S674619/559标记进行转化,获得了可以在抗感材料中扩增出差异性条带的SCAR标记,这些标记将在今后的番茄抗病育种工作中发挥重要作用。
【英文摘要】Leaf mold, caused by the fungus Cladosporium fulvum, is a serious disease of tomato. In the current study, the main physiological races of C. fulvum collected from three northeastern provinces of China were identified using a set of identification hosts.The results showed that the prevalent pathogenic physiological races were 1.2.3, 1.3, 3,1.2.3.4, and 1.2.4. F1, F2, and BC1 tomato

plants were obtained by crossing C. fulvumresistant cultivar 03748 carrying the Cf-6 gene and susceptible cultivar 03036. Three 10-mer oligonucleotide random amplified polymorphic DNA (RAPD) primers and two simple sequence repeat (SSR) primers were selected for the further molecular marking analysis after 210 RAPD primers and 50 SSR primers were screened using the bulked segregate analysis method. The polymorphic DNA bands were amplified among parents, 10 F1 plants, 184 F2 plants including 145 resistant plants and 39 sensitive plants using three RAPD primers and two SSR primers so that three RAPD molecular markers and two SSR molecular markers linked to the Cf-6 loci were identified. Three RAPD markers were linked to the Cf-6 resistant locus separated with 8.7 cM, 20.3 cM, and 33.4 cM. Also, one RAPD codominant marker S374619/559 was found. The locations of the two SSR markers were 12.6 cM and 9.7 cM away from the Cf-6 locus. After cloning and sequencing two specific DNA fragments closely connected to the Cf-6 resistant and susceptible alleles respectively, in the RAPD codominant marker S374619/559 and one codominant sequence characterized amplified region marker S674619/559 was converted from RAPD marker S374619/559. In the RAPD marker S374619/559, the length difference of two specific fragments, 619-bp fragment and 559-bp fragment, is the result of one insertion (60 bp) in the 619-bp fragment. These markers will facilitate the selection of resistant tomato germplasm containing the Cf-6 gene and cloning of Cf-6 to breed new C. fulvum resistant tomato cultivars.

【题目】番茄耐热性相关的SSR和RAPD标记筛选
【中文关键词】番茄;耐热性;数量性状位点
【英文关键词】tomato;heat tolerance;quantitative trait loci(QTL)
【中文摘要】以番茄热敏感材料01137和耐热材料CIN200lA杂交产生的256个FZ单株为作图群体,应用SSR和RAPD分子标记技术筛选得到与耐热性相关的l个SSR标记和l个RAPD标记,对其耐热性遗传的贡献率分别为5.2%和7.7%。利用单标记法在第3和第7连锁群上几各检测到l个与耐热性有关的QTL。利用筛选出的与番茄耐热性显著相关的2个分子标记对43份番茄耐热、热敏种质资源进行SSR和RAPD分析,将43份番茄种质资源分成2组,耐热组和热敏组的分组准确率分别为93.3%和96.5%

【英文摘要】A F2 population was derived from a cross between a heat sensitive line 01137 and a heat toler- ance line CLN2001A of tomato.The colony was analyzed using SSR and RAPD techniques to select molecular markers related to tomato heat tolerance.One SSR marker and one RAPD marker were detected,and the ge- netic contribution rates of these markers for heat tolerance were 5.2% and 7.7%,respectively.Two QTLs were mapped in linkage group 3 and linkage group 7.The SSR and RAPD techniques were used to evaluate the genetic diversity of 43 tomato germplasm materials in heat resistance and susceptibility.Two markers (Tom59-60 and OPN02-600)which were significantly interrelated to the heat—tolerance of tomato were used to group the 43 tomato germplasm materials under two groups,the heat • tolerance and the heat—sensitive,and the veracity of grouping were 93.3%and 96.5%.respectively。

【题目】番茄资源对叶霉病抗性鉴定和SSR标记遗传变异分析
【中文关键词】番茄;叶霉病;抗病性; SSR
【英文关键词】Cladosporium fulvum; resistance; SSR
【中文摘要】摘要:对62份番茄种质资源进行了抗番茄叶霉病鉴定,共筛选出抗病材料17份,其中对全部生理小种(1.2.3、1.2、2.3、1.2.3.4、1.2.4)均表现抗病或免疫的材料9份;抗3个生理小种的材料4份;抗2个生理小种的材料2份;抗4个生理小种的材料2份。并应用SSR标记技术对62份种质资源进行了遗传多样性分析,50对SSR引物中筛选出11对多态性明显、条带清晰、反应稳定的引物,共扩增出94条谱带,平均每个引物扩增出8.55条带,多态性条带比例达63.94%,遗传相似系数在0-1之间,表现出丰富的遗传多态性,可将番茄野生种和栽培种分开,反映了种间的遗传差异
【英文摘要】Sixty-two tomato germplasms were evaluated for resistance to all races(1.2.3、1.2、2.3、1.2.3.4、1.2.4) of Cladosporium fulvum.Seventeen varieties were resistant.Among them,nine were resistant or immune to 5 races,four were resistant to 3 races,two were resistant to 2 races and two were resistant to four races.At the same time,their relationships were analyzed with SSR.Eleven primers were selected from 50 SSR primers,and 94 DNA fragments were amplified from 62 samples including 7 wild species and 55 ltivated species. Of which, 94 fragments were polymo rphic(percentage of polym orph icbands was 63. 94%) , and the average number o f DNA bands was 8. 55 perprimer. The genetic similarity among all species ranged from0 to 1. The results indicated that SSR technique possessed better stability and was useful in revealing the genetic diversity and genetic relationships among tomato species.

【题目】加工番茄粘稠度性状的配合力和遗传力分析
【中文关键词】加工番茄;粘稠度;配合力;遗传力
【英文关键词】processing purpose tomato;viscoelasticity;combining ability;heritability
【中文摘要】试验以加工番茄7个品系为试验材料,采用Griffing第2种方案配制21个杂交组合,对番茄粘稠度性状进行配合力分析和遗传力分析。结果表明,粘稠度性状一般配合力较高的亲本80、77和81,其杂交后的组合77×80、77×81的特殊配合力也最高;粘稠度性状是以基因的非加性效应为主,狭义遗传力较低,不宜早期时代进行选择。但杂种一代值具有超亲优势现象,存在杂种优势。因此,高粘稠度品种育种应以优势育种为主,辅之以杂交育种。
【英文摘要】Seven strains in processing tomato are selected as the experimental samples 21 hybrid com-binations were designed according to No.2 Griffing principle to analyze the combining ability and heritability of viscoelasticity.The results showed that general combining abilities of parents 80,77 and 81 were high.Special combining abilities of hybrid combinations 77×80 and 77×81 were highest in all hybrid combinations.The inheri-tance of viscoelasticity was mainly from additive effect,and its narrow heritability is low,not suitable for selection in early generations.The heterosis of viscoelasticity Was obvious.Therefore,heterosis breeding should be mainly used for breeding hish viscoelasticity tomato cuhivars.

【题目】奶牛日粮阴阳离子差对采食量影响的Meta分析
【中文关键词】M e t a分析 日粮阴阳离子差 干物质采食量 泌乳前期奶牛
【英文关键词】Meta-analysis;DCAD;DMI;Early lactating dairy cows
【中文摘要】Meta分析作为一种科学客观的定量综述形式,已经广泛应用于国外农业研究。本文利用这一方法,分析奶牛干物质采食量(DM I) 与日粮阴阳离子差(DCAD) 的潜在关系。研究所用资料取自已发表的8篇关于泌乳前期奶牛日粮阴阳离子平衡对 DM I影响的文献数据, 对实际观测值进行了研究间效应的校正。分析结果表明, 泌乳前期奶牛校正后的 DM I随 DCAD增加呈二次增加(P<0 .01, R2=0 . 7 4) ,在 DCAD为2 9 8 .3 mmol /kg DM 时达到最高值;校正后的 DM I随血液 HCO 3- 浓度以及血液P H增加而二次增加(P<0 .01, R2=0 .91 ; P<0 . 01,9 R2=0 .87) , 在血液 HCO 3- 浓度为2 9.2mm ol/L时达到最大。校正后的 DM I与血液 HCO 3- 以及血液P H的关系分析表明, DM I与泌乳前期奶牛体内酸碱平衡相关性很大 ODCAD通过影响机体的酸碱平衡, 并最终影响奶牛的自由采食量。
【英文摘要】The Meta-analysis has been widely used in the agriculture research abroad and is considered to be a new scientific way for quantitative summarizations of literature data.A meta-analysis was conducted to examine the potential empirical relationships between dietary cation-anion difference(DCAD) and the dry matter intake(DMI) .The database was developed from 8 studies in which the effect of the DCAD was observed in the early lactating dairy cows .Observed DMI values were adjusted for study effects .There sults showed that , adjusted DMI increasing with DCAD (quadratic;P<0.01.R2=0.74),peaking at 298.3 mmol/kg DM;adjusted DMI also increased with the increasing blood HCO3- concerntrations (quadratic;P<0.01.R2=0.0.91)with peaking at 29.2 mmol/L; adjusted DMI increased with increasing acid-base status in early lactating dairy cows, and that DCAD affacted systemic acid-base balane, which in turn affacted voluntary intake of lactating dairy cows.

【题目】瘤胃甲烷调控方法评述
【中文关键词】反刍动物:瘤胃:甲烷:氢利用
【英文关键词】Ruminant animals: rumen: methane: hydrogen use
【中文摘要】反刍动物释放的甲烷不仅消耗6%~10%的能量摄入,而且是重要的温室效应气体。过去20多年以来,研究人员围绕瘤胃甲烷生成及其调控展开了大量的研究,目前采取的主要措施包括:(1)提供电子释放新途径;(2)利用疫苗、生物控制剂(噬菌体和细菌素)以及化学抑制剂等抑制产甲烷菌,以及(3)去原虫、添加植物提取物或有机酸等促进产乙酸菌增加.降低产甲烷菌可利用的氢。瘤胃生态系统是一个复杂的生态系统,能够将复杂碳水化合物转化成为挥发性脂肪酸.这个过程部分依赖于甲烷的生成和氢的消耗。因此,虽然各种调控措施能够在短期内抑制甲烷生成.但瘤胃微生态系统能够恢复原有的甲烷生成水平,这表明我们对瘤胃中氢代谢仍然认识不足。进一步提高对瘤胃内氢和甲烷生成的微生物生化机制的了解.有助于我们找到有效的甲烷调控措施。

【题目】牛奶风味影响因素的研究进展
【中文关键词】日粮;牛奶;牛奶风味;风味活性物质
【英文关键词】diet, milk, milk flavor, active substances
【中文摘要】牛奶风味的影响因素包括多个方面,其主要取决于复杂的风味活性物质。一些风味活性物质直接来源于奶牛的饲料成分,但有些风味活性物质的来源还不确定。介于风味活性物质的复杂性,一些相关的信息较少,主要有两个假设,一是来源于动物所采食的饲料成分,一是消化产物的衍生物。
【英文摘要】Flavor of milk depends on many aspects and active substances play a major role in flavor of milk. Active substancesare composed of a variety of chemical compounds, derived from numerous sources. Some compounds found in milk are directlylinked to the diet of the animal producing the milk. In many cases, it is uncertain where the compounds originated. Given thecomplexities of flavor analysis, even cow milk research is very limited. Two main hypotheses are that they originated in the plantseaten by the animal or they are products of digestion of precursors.

【中文关键词】奶粉;唾液酸;高效液相色谱法(HPLC)

【英文关键词】milk powder; sialic acid; high performance liquid chromatography(HPLC)
【中文摘要】利用酸水解法可释放出奶粉中的蛋白结合态的唾液酸,以邻苯二氨盐酸盐为衍生化试剂,80°C水浴衍生40min,采用SymmetryC18柱(250mm*4.6mm,5um),流动相为1.0%的四氢呋喃水溶液(含0.2%磷酸)-乙腈(92:8),流速为1.0ml/min,紫外检测波长227nm。结果表明,唾液酸在质量浓度为20-500mg/L范围内线性良好,平均回收率为96.8%。该方法具有灵敏度高,重复性好等特点,可准确测定奶粉中唾液酸的质量浓度。
【英文摘要】Protein-binding sialic acid in milk powder was released by acid hydrolysis, and the samples were derivated with O-pheny-lenediamine.2HCL(10 mg/mL) at 80°C for 40 min. Using Symmetry C18 column (250 mm*4.6mm, 5um), 1.0% tetrahydrofunan (containing 0.2% phosphoric acid)-acetonitrile (92:8) as the mobile phase, sialic acid could be separated at flow rate of 1.0 mL/min. The detection wave length was 227nm. The results indicated that the linear rang of sialic acid was 20-500ug/mL and the average recovery was 96.8%; The method has the characteristic of good reproducibility and high sensitivity. It can be used to determine the contents of sialic acid in milk powder.

【题目】瘤胃尼龙袋法和体外产气法评定反刍动物饲料营养价值的比较,
【中文关键词】瘤胃尼龙袋法;体外产气实验;反刍动物
【英文关键词】NiLongDai rumen method; The gas production in vitro experiment; Ruminant animals
【中文摘要】试验通过评定菜籽粕、玉米、米糠、苜蓿、玉米青贮和玉米秸秆的营养价值来比较瘤胃尼龙袋法和体外产气实验。结果表明:各种饲料的干物质有效降解率分别为52 90%、54 27%、65.70%、40 76%、37 24%和38 17%,精饲料干物质有效降解率(EDMD)中,a部分占比例较高(其中米糠达到64 51%);每克饲料DM的渐进产气量(A)分别为105 00、180 51、109 30、172 71、147 76和148.66mL,粗饲料的产气量普遍高于精饲料;两种方法中,产气参数A、B与EDMD均呈负相关(r=-0.55和r=-0.61)。从速率曲线来看,降解速率曲线主要反映了b部分的降解情况,而饲料产气的速率曲线却能明显反映出两相的发酵情况。

【题目】葡萄糖处理豆粕对蛋白质保护效果的研究
【中文关键词】葡萄糖;豆粕;干物质降解率;蛋白质降解率;尼龙袋法
【英文关键词】Glucose; Soybean meal; Dry matter degradation rate; Protein degradation rate; NiLongDai method
【中文摘要】以3头装有永久性瘤胃瘘管的中国荷斯坦奶牛为试验动物,采用尼龙袋法研究分别添加0、1%、3%、5%、7%、9%葡萄糖保护豆粕,对奶牛瘤胃内不同时间点DM、CP消失率及其动态降解率的作用效果。结果表明:在不同时间点下,提高葡萄糖添加量可使DM、CP消失率逐渐降低,所有试验组与未处理组差异均极显著(p<0.01),DM、CP有效降解率降低最高分别达28.78%和24.82%,不同添加量下,添加量为7%、9%的2组组间差异不显著(P>0.05)。本试验结果证明,葡萄糖加热处理是一种有效保护豆粕蛋白质的方法,且葡萄糖的适宜添加水平为7%。

【题目】结球甘蓝抗 TuMV 基因的 RAPD 和 SCAR 标记研究
【中文关键词】甘蓝, TuMV, RAPD, SCAR
【英文关键词】Cabbage, TuMV, RAPD, SCAR
【中文摘要】运用 RAPD 技术, 采用混合分组分析法,获得了 2 个与甘蓝抗 TuMV 基因连锁的RAPD 标记 U16/660 和 AG13/2000。 利用BSA 法需要构建抗感基因池,试验结果的可靠性依赖于抗病植株和感病植株的准确鉴定, 本试验中采用的抗病性鉴定方法是通用的标准方法, 能够确保抗病性鉴定结果的准确。由于 RAPD 标记是用 10 个核苷酸的随机引物进行 PCR扩增得到的,对反应条件的变化很敏感,目前应用很少。SCAR 标记与 RAPD标记相比有更多的优势, 不仅缺少了其它片段的干扰,而且,退火温度可以提 高到 50~60 ℃,特异性增强,扩增条带也更明显。 但是通常情况下, SCAR 标记转换的成功率是很低的, 这也是目前发展 SCAR 标记的一个主要困难。 转化SCAR标记失败的RAPD标记多态性位点有可能位于引物的 3 ’端。Vidlal 等人提出了解决 SCAR 转化失败的新方案:根据测序结果在10碱基随机引物的3'端增加 4~8 个碱基, 可检测到原有的多态性,同时提高了扩增稳定性。本研究借鉴前人试验中的经验, 设计的引物经过实验检验是成功的,表明两个 RAPD标记 U16 和 AG13 已经分别转化成了SCAR 标记 USC16 和 ASC13。
【英文摘要】One hundred and forty-four F2 individuals from a cross combination between 1047 (susceptible) and A21(resistant) were analyzed for the presence of random amplified polymorphic DNA (RAPD) markers linked to Turnip Mosaic Virus （TuMV) resistant gene in cabbage by using bulked segregant analysis(BSA). Two polymorphic markers were screened out of 200 random primers. These two RAPD fragments were linked to the resistant gene at 7.7cM and 8.38 cM respectively and converted to SCAR markers successfully.

【题目】Genetic diversity analysis of Brassica oleracea L.by SSR
【中文关键词】甘蓝,遗传多样性,亲缘关系.
【英文关键词】Brassica oleracea.L,SSR,Genetic diversity,Relationship
【中文摘要】本文用 SSR 标记从 DNA 水平上对 30个供试的甘蓝类蔬菜材料进行遗传多样性分析,从 36 条引物中选出 5条扩增效果较好的引物, 扩增产物用其 6.0%变性聚丙烯酰胺凝胶检测,银染观察并照相。利用NTSYSpc2.1软件计算品种间的遗传相似性系数并用类平均法(UPGMA)进行聚类。结果表明:5 对多态性引物扩增的等位基因数为 21 个,每对引物扩增等位基因为 2-5 个, 平均为 4.2 个。 PIC为 0.257-0.921,平均为 0.543。品种之间 SSR 遗传相似性系数平均为0.423。聚类分析除了来自日本的 3个品种以外, 实验中所采用的国内品种分为 4 大类:夏甘蓝、春甘蓝、大型晚熟甘蓝、秋甘蓝。
【英文摘要】SSR are short tandem nucleotide repeats of 1-6bp that can be repeated up 100 times (Tautz&Schlotterer, 1994).But in different literature there are different definitions on repeat times and the number of tandem repeat unite. According to difference in the number of repeats between plant varieties and high rate of mutation, so SSRs can provide an abundant class of polymorphisms among plant genomes. The size of SSR can be determined by PCR with a pair of specific primers designed on microsatellite flanking regions. So SSRs typically require the development of genomic libraries for identification, cloning and sequencing of repeats, from which flanking sequences are used to develop specific primers (Munammet &Philip, 2004). Library construction is time consuming, expensive, which have restricted the development of SSR markers. But these kinds of DNA markers offer the advantage of being simpler (easy) to use, less time-consuming than RFLPs (Powell, et al.1996) or AFLP (Lanham and Brenner 1999). They can be conveniently used to rapidly evaluate plant genetics and plant breeding including genetic mapping, cultivar discrimination, and detection of genetic diversity. SSRs are relatively recent molecular markers that have been mainly used in human and animal genetics(Weber 1990)and, more recently, in such plants as soybean (Maughan et al. 1995), wheat (Prasad et al., 2000), apple (Hokanson et al.,1998), grape(Lamboy&Alpha,1998) to measure genetic similarity.The aim of this study was estimate genetic diversity and relationships among Brassica oleracea L cultivars by using SSRs.

【题目】甜椒雄性不育两用系AB91不育株与可育株花药同工酶分析
【中文关键词】甜椒;雄性不育;同工酶;电泳
【英文关键词】sweet pepper; male sterility; isoenzyme; electrophoresis
【中文摘要】本文通过聚丙烯酰胺凝胶电泳法(PAGE)对甜椒核雄性不育两用系AB91不育株与可育株的花药POD、CAT和酯酶同工酶谱带的分析,以及对其SOD同工酶活性的分析。结果表明这几种同工酶的活性和谱带均与不育性有一定的关系,具体表现为POD、CAT、酯酶在不育株谱带数少,而可育株谱带数多;POD、SOD的活性不育株高于可育株,而CAT、酯酶的活性则是可育株高于不育株。
【英文摘要】By means of vertical slab polyacryla mide gel electrophoresis, isoenzymecs of peroxidase (POD)、esterenzyme、catalase in the anther of male sterile lines in sweet pepper were analyzed,the activities of SOD was analyzed. Results showed that isoenzyme bands and activities of four enzymes existed in the male sterile line and its maintainer. The POD, CAT, EST enzymes showed more isoenzyme bands in the male sterile line than that in its maintainer. The activities of POD, SOD are higher in the male sterile line than that in its maintainer, the activities of CAT, EST are lower in the male sterile than that in its maintainer.

【题目】利用雄性不育系育成大果型甜椒新品种‘ 冀研13号 ’
【中文关键词】甜椒;雄性不育两用系;品种
【英文关键词】Sweet pepper; Male sterile lines; Cultivar
【中文摘要】‘ 冀研13号 ’是利用甜椒雄性不育两用系AB91-ZH4-7-2为母本,以优良自交系DL-1-1-4H为父本配制成的大果型甜椒杂交一代新品种。该品种植株生长势较强,中熟,果实灯笼形,深绿色,果大肉厚,果长11~12cm,果宽9~10cm,果肉厚0.65~0.75 cm,单果质量220~350 g,商品性好。抗CMV,耐TMV和疫病,适宜保护地栽培,一般产量60 000kg·hm-2。

【英文摘要】‘ Jiyan13 ’is a hybrid of sweet pepper selected from the crossing the genic male sterile line AB91-ZH4-7-2 with inbred line DL-1-1-4H. The cultivar has an middle maturity and healthy growth. It is resistant to CMV, tolerant to TMV and Phytophthora blight. It has large fruit size and good quality. The fruit is lantern-like with green, and is 11-12 cm in length, 9-10 cm in width, and 0.65-0.75 cm in flesh thickness. The fruit weights is 220-350 g, The variety is suitable for protected field production. The yield is about 60 000kg • hm-2.

【中文关键词】辣椒;双列杂交;植株性状;遗传参数估算
【英文关键词】Pepper(Capsicam annuum L.);Diallel crosses;Plant character;Genetic parameter estimation
【中文摘要】用辣椒(Capsicam annuum L.)6个亲本,按(1/2)n(n-1)双列杂交法配制15个杂交组合,用Hayman双列杂交分析法估算了5个植株性状的遗传参数。Wr对Vr的回归分析结果表明,侧枝数、株高、株幅、主茎高和首花节位的遗传都符合加性一显性模型。Wr+Vr 与Yr间相关分析表明,侧枝数、株高、株幅、主茎高呈负相关,说明含有更多显性基因的亲本具有较小的Wr+Vr值;首花节位呈正相关,且达到极显著水平,说明含有更多显性基因的亲本具有较大的 Wr+Vr值。遗传参数估算表明侧枝数、株幅、主茎高和首花节位性状的遗传以加性效应为主,加性效应比显性效应更加重要。株高的遗传中加性效应和显性效应都很重要。
【英文摘要】Six pepper(Capsicam annuum L.)parents were used to produce 1 5 combinations by dialle1 crosses excluding reciprocals.Genetic parameters for 5 plant characters were estimated according to Hayman's method.Analysis of regression Wr against Vr indicated that inheritance of lateral branches per plant, plant height,plant spread,main stem height and the first flower node conformed to the additive-dominant mode1. Correlation analysis showed that there was a negative correlation between Wr+Vr and Yr for lateral branches per plant,plant height,plant spread and main stem height.implying that the parents possessing more dominant genes have lower Wr+Vrvalue.However.there was a positive corelation between Wr+Vr and Yr for the first flower node at 1% significant level,which means that the parents possessing more dominant genes for larger value of the first flower node have relatively high Wr+Vr value. The genetic parameters estimated indicate that the additive effect was main genetic effect,more importance than the dominance effect in inheritance of lateral branches per plant,plant spread,mainstem height and the first flower node.However,the dominance effect variance and additive effect variance were allvery importance in inheritance of plant height.

【题目】培养基中附加物质对辣椒花药培养的影响
【中文关键词】辣椒;花药培养;愈伤组织;胚状体;附加物质
【英文关键词】hot pepper;anther culture;callus;embryoids;adjunctions
【中文摘要】以辣椒红艳为试材,采用均匀设计法考察培养基中不同含量的活性炭、蔗糖和单核苷酸对辣椒花药培养中愈伤组织诱导率和胚状体诱导率的影响。结果表明各因素对辣椒花药愈伤组织诱导率和胚状体诱导率的影响大小均为:蔗糖含量>活性炭含量>单核苷酸含量。诱导愈伤组织的最优条件是1.5g/L 活性炭、65 g/L蔗糖和3O mg/L 单核苷酸的组合;诱导胚状体的最优条件为1.5g/ L活性炭,3O g/L蔗糖和3O mg/L单核苷酸的组合。
【英文摘要】In order to studv the effects of different contents of active carbon, sucrose and mononucleotide on the callus induction rate (CIR)and embryoids induction rate (EIR)0f anther culture of hot pepper,the expefiments were conducted with uniform design method and hot pepper Hongyan.The results showed that the effects of each factor on CIR and EIR 0f hot pepper anther were as the following descending order:content of sucrose>content of active carbon>content of mononuc1eotide.The optimum condition of callus induction was the combination of 1.5 g/L carbon, 65 g/L sucrose and 30 m/L mononucleotide; the optimum condition of embryoids induction was the combination 0f 1.5g/L active carbon,30 g/L sucrose and 30 mg/Lmononucleotide was the best conditions of embryoids yields.

【题目】白菜紫色性状RAPD 连锁标记的筛选与染色体定位研究
【中文关键词】紫色性状; RAPD标记; 同源性分析; 染色体定位
【英文关键词】purple character; RAPD marker; identity analysis; chromosome location
【中文摘要】以紫菜薹自交系95T2-5、大白菜自交系94S17-1及其F1、F2、BC1 植株为材料, 进行RAPD分析,从640个随机引物中筛选出2个引物S79和S123, 分别能扩增出与紫色性状连锁的条带S79-934和S123-750。连锁分析发现,标记S79-934和S123-750与紫色基因间的遗传距离分别为13. 73cM和18.65cM,并且位于紫色基因的两边。回收S79-934特异带,克隆转化并测序, 比较分析表明其与大白菜1号染色体上已知克隆KBrH077A05的全序列(113253bp) 有99%的相似性,初步推断控制紫色性状的主基因位于大白菜1号染色体上。
【英文摘要】Using the genomic DNA extracted from inbreed lines` young leaves of Chinese cabbage inbred line 94S17-1, purple cai-tai inbred line 95T2-5(Brassica compestris L. var. purpurea Bailey) and its hybrids F1, F2, BC1, 640 random primers were analyzed with RAPD technique. S79 andS123 could generate differential profiles linking to purple character among F2 and its parents. Primer S79 could generate characteristic band S79-934andS123 could generate band S123-750. The linkage analysis showed that the distances to purple gene are 13. 73cM (band S79-934) and18. 65cM (band S123-750) respectively, which are located in both sides of purple gene. Furthermore, characteristic bands S79-934was reclaimed, cloned, transformed and sequenced, its sequence had 99% identity with whole sequence (113253bp) of the clone KBrH077A05 from 1st chromosome of Chinese cabbage by BLAST analysis. Therefore, a speculation was that main gene controlled purple character was located in1st chromosome of Chinese cabbage.

【题目】大白菜带柄子叶离体不定芽再生过程中的组织学观察
【中文关键词】大白菜; 带柄子叶;不定芽再生; 组织学变化
【英文关键词】Brassica campestris L. ssp. pekinensis (L.) ; Chinese cabbage; Cotyledons with petiole; Adventitious shoot regeneration; Histological change
【中文摘要】以普通大白菜品种秋早55和彩色大白菜材料06J28的带柄子叶为试验材料, 对离体带柄子叶不定芽再生过程中的组织学变化进行了观察研究。结果表明, 在带柄子叶离体培养过程中,培养2~ 3d, 子叶柄切口端皮层及维管束薄壁细胞开始启动,细胞迅速分裂形成分生细胞团, 秋早55和06J28分别在培养5d、6d时出现明显芽原基,不定芽的产生方式为直接出芽, 在秋早55中还观察到有个别芽再生发生于愈伤组织内部,为内起源。
【英文摘要】The cotyledons with petiole were used as explants from common Chinese cabbage ” Qiuzao55 ” and orange-heading Chinese cabbage ” 06J28 ” . Investigation was carried out on histological change during the process of in vitro shoot regeneration from cotyledons with petiole. It was found that the cortex and vascular parenchyma cells on petiole incision end were induced to start division at 2~ 3 days cultured, then the cells divided rapidly and formed meristematic cells mass. At 5 days cultured, the bud primordial appeared from the cut section of petiole of “ Qiuzao55 ” ; at 6 days, the bud primordia were formed from ” 06J28 ” . The results of histological observation indicated that the adventitious shoots regenerated directly from the cut end of cotyledons with petiole. It was also observed that the individual shoot of ” Qiuzao 55 ” regenerated from internal callus and was endogenius.

【题目】大白菜温敏雄性不育系育性转化相关基因的cDNA-AFLP分析
【中文关键词】大白菜; 温敏雄性不育;TsCMS7311,cDNA-AFLP
【英文关键词】Chinese cabbage; TsCMS; cDNA-AFLP
【中文摘要】为了分析大白菜温敏雄性不育系TsCMS7311育性转化的相关基因,先对现蕾的TsCMS 7311低温处理, 然后不同时间连续提取幼蕾(≤ 1. 0mm, 包括顶端分生组织) 的RNA,进行cDNA-AFLP表达差异分析. 结果表明,用256对引物扩增出连续性差异片段212条,按照时间顺序, 划分为4种差异带类型,即“ 无→有→无"、“ 有→无→有"、“ 无→有"、 ”有→无".在175条低温诱导产生的差异带型中, “ 无→有→无"类型165条, 占总差异带的78%; ” 无→有"类型10条,占总差异带的5%.对部分差异片段进行回收、克隆、测序,共得到100条序列,其大小为100~700bp. 经BLAST序列比对分析发现, 温度调控的育性转化与新陈代谢、能量、防御、细胞构建、蛋白质合成及运输、转录翻译、细胞通信及信号转导等相关蛋白有关.
【英文摘要】In order to finding the genes related in the fertility changeover of TsCMS7311, a thermo-sensitive CMS of Chinese cabbage (Brassica campestris L. ssp. pekinensis) , the plants of TsCMS7311with flower buds were treated under low temperature first, then the RNAs were extracted from small buds(≤1. 0mm, including apical meristem) within10continues days, and were analyzed with cDNA-AFLP(cDNA amplified fragment length polymorphism). The results showed that 212 differentially-expressed fragments were obtained with 256 primer pairs, and which was divided into four types as the day going: they were “ absent →present →absent", “ present →absent →present", “ absent →present", “ present →absent" respectively. Among the fragments, the type of “ absent →present →absent" was occupied 78% and “ absent →present" was occupied 5%, which means that most differentially-expressed fragments were produced by low temperature inducement. 100 ESTs were obtained by recovered, cloned and sequenced. By Blasting search to NCBI dbEST, we found that the low temperature inducing fertility-changeover was related to many proteins, such as metabolism, energy, defense, cell construction, protein synthesis and transport, transcription and translation, cellular communication/ signal transduction mechanism correlative protein and so on, which maybe form a network.

【题目】利用体外法研究不同水平维生素A对奶牛瘤胃内环境参数的影响
【中文关键词】维生素 A ;瘤胃内环境参数;体外法
【英文关键词】VA ; Ruminal envi ronmental p a ramete rs ; In vi t ro
【中文摘要】本研究以 3 只安装有永久性瘤胃瘘管的荷斯坦奶牛作为试验动物,利用体外培养法研究 3 个不同水平的VA (分别为 813 ×10 - 2mg/ mL (A 组) 、 215 ×10 - 1mg/ mL (B 组)和 4117 ×10 - 1mg/ mL (C 组))对瘤胃 p H、 氨氮(N H32N) 、尿素氮和挥发性脂肪酸 (V FA) 浓度随时间的动态变化的影响以及 VA 在瘤胃中的消失情况。结果表明,随着 VA 添加量的增加培养液 p H 呈上升趋势,N H32N 和 V FA 的平均浓度呈下降趋势但差异不显著(P >0105) 。C 组培养液尿素氮浓度极显著高于 A、 B 两组(P < 0101) 。在高产奶牛的 TMR 日粮条件下,培养液 VA 浓度随着 VA 添加量的增加而增加,且不同 VA 水平下,培养液中 VA 浓度的峰值均出现在培养 8 h 后。
【英文摘要】To study t he ef f ects of dif f e rent levels of VA on t he ruminal envi ronmental p a ramete rs in vi t ro , t hree Holstein cows f it ted wit h t he ruminal cannula we re used t o determine t he ef f ects of VA on p H , ammonia2N (N H32N) , urea2 2N , volatile f at ty acids (V FA) concent rat ion in culture f luid in vi t ro. Three levels of VA we re 813 ×10 - 2mg/ mL (A) ,215 ×10 - 1mg/ mL (B) , 4117 ×10 - 1mg/ mL (C) respectively. The results showed 1) p H increased , as well as N H32N and urea2N concent ration in culture f luid decreased wit h t he increase of VA. The re were no signif icant dif f e rences in p H , N H32N concent rat ion among t hree levels of VA (P > 0105) ; 2) t he highest urea2N concent ration was observed in level C , much higher t han t hat in level A

and B (P < 0101) ; 3) higher VA supplement increased t he VA concent ration of culture f luid. Little VA was detected during 0~8 h of incubation. The highest VA concent ration were observed af te r incubating 8 h in culture fluid.

【题目】日粮添加LA 和DHA 对乳脂脂肪酸含量及比值的影响
【中文关键词】亚油酸;二十二碳六烯酸;乳成分;脂脐酸;奶牛
【英文关键词】Linoleie acid;Doeosahexacnoic acid;Milk COWS
【中文摘要】试验选用带有永久性瘸胃、十二指肠和回肠瘘管的泌乳荷斯坦奶牛4头,采用4×4拉丁方试验设计,研究日粮添加亚油酸(LA)和二十=碳六烯酸(DHA)对乳常规组成、消化道各段食糜pH以及现脂脂肪酸梅成的影响。实验结果表明:添加LA和DHA不影响乳蛋白和乳糖含量(P>O.05),而添加DHA有显著降低乳脂含量的趋势(P>O.05);日粮共同添加LA和DHA能提高十二指肠消化道的PH,但差异不显著(P>O.05),而单独添加DHA显著降低了回肠的PH (P<O.05);日粮单独添加DHA增加乳脂中C23:0脂肪酸的含量,但并不降低乳脂中总饱和脂肪酸量。与对照组相比,LA和DHA共同添加时乳脂中总多不饱和脂肪酸增加了100%(P<O.05)。LA和DHA共同添加是乳脂中饱和脂肪酸/不饱和脂肪酸由3.18降低至1.24(P<O.05)。添加DHA使乳脂中总不饱和脂肪酸/多不饱和脂肪酸由5.94降低至3.00(P<O.05)。上述研究结果表明,日粮添加LA和DHA可改变乳脂中脂肪酸的组成与比例,有利于人体健康,但DHA使产奶量有一定程度的降低。
【英文摘要】The obiective of this study was to evaluate milk fatty acid profiles and milk composition of lactating COWS when LA and DHA were supplemented in diets.Four dairy COWS with ruminal,ileac and duodenal fistulas were randomly assigned to control(CK,without additional oil supplementation),basal diet with 2.7%从(LU,2.7%LA plus 0.5%DHA(LA+DHA), or 0.5%DHA(DHA)in a 4×4 latin square with 12一week durational periods。The results showed that compared with CK,milk yield and milk fat content decreased when DHA was supplemented,but there were no significant differences amongfour treatments(P>0.05).The pH in duodenal digesta numerically increased with LA and DHA combinational addition(P>0。05)。The pH of ileac digesta decreased significantly(P<O。05)only when DHA was supplemented compared with CK.C23:0 content of milk fat in DHA treatment increased,while total saturated fatty acid concentration did not change in contrast with CK.Compared with CK,total polyunsaturated fatty acid was improved by 100%in milk fat from combinational addition of LA and DHA(P<O.05).In addition。saturated fatty acids to unsaturated fatty acids ratio in milk fat decreased(P<O.05)from 3.18 in CK to 1.24 in LA+DHA treatment,while monounsaturated to polyunsaturated fatty acid ratio decreased(P<0.05)from 5.94 in CK to 3.OO in DHA treatment.In conclusion,our study indicated that fatty acid profiles were changed.and milk quality was improved by dietary LA and DHA supplementation.However,DHA addition in diets had slight negative effect on milk yield

【题目】妊娠期小鼠下丘脑-垂体-卵巢轴中PrRP和PrRP-R mRNA表达规律的研究
【中文关键词】催乳素释放肽;受体;妊娠;小鼠
【英文关键词】prolactin2releasing peptide ; receptor ; pregnancy ; mouse
【中文摘要】为探讨妊娠期小鼠下丘脑2垂体2卵巢轴中催乳素释放肽(PrRP)及其受体(PrRP2R) mRNA 的表达规律 ,选用妊娠 6、 12、 18 d 小鼠(n = 6) ,取下丘脑、 垂体、 卵巢组织 ,利用半定量 PCR 方法测定下丘脑2垂体2卵巢轴中PrRP和PrRP2R mRNA 表达水平 ,另外利用放射免疫法(RIA)测定血浆孕酮(P) 、 雌二醇(E2)和催乳素(PRL) 水平 ,探究下丘脑2垂

体2卵巢轴 PrRP和 PrRP2R mRNA 与血浆 P、 E2、 PRL 的相关关系。结果表明: 妊娠期小鼠下丘脑、 垂体、 卵巢中都有 PrRP、 PrRP2R mRNA 的表达 ,其中卵巢 PrRP mRNA 表达量较高 ,而下丘脑 PrRP2R mRMA的表达量较高。妊娠期小鼠血浆 P水平与垂体 PrRP mRNA 表达量呈显著负相关 ,而垂体 PrRP mRNA 与下丘脑PrRP2R mRNA 表达量呈显著正相关 ,结果提示妊娠期血浆高水平的 P 可能通过抑制垂体 PrRP mRNA 的表达 ,进而作用于下丘脑参与妊娠相关调控。妊娠期小鼠血浆 PRL 水平与下丘脑、 垂体、 卵巢 PrRP 和 PrRP2R mRNA的表达量均无显著相关关系 ,提示血浆 PRL 水平可能不受上述组织 PrRP的影响。

【英文摘要】To investigate PrRP and PrRP2R mRNA exp ression in hypot halamus-pit uitary-ovaryaxis during pregnancy ,hypot halamus , pit uitary and ovary were sampled on 6 , 12 and 18 days of pregnancy respectively for determination of PrRP and PrRP2R mRNA exp ression level s using semi2RT2PCR met hod. The concent ration of plasma progesterone (P) , est rodiol (E2) and prolactin (PRL) were measured by RIA to probe t heir cor relations wit h PrRP and PrRP2R mRNA. Results indicated t hat bot h PrRP and PrRP2R mRNA were expressed in hypot halamus , pit uitary and ovary during pregnancy. Ovary had highest PrRP mRNA level and hypot halamus had highest PrRPR mRNA level . Correlation analysis result s showed that plasma P had significant negative cor relation wit h PrRP mRNA in pit uitary , and PrRP mRNA in pit uitary had significant positive correlation wit h PrRP2R mRNA in hypot halamus , which suggested that higher plasma P level during pregnancy might inhibit pit uitary PrRP mRNA expression , then worked on hypot halamus to participate in pregnant regulation. The result s showed t hat plasma PRL level had no signifant cor relation wit h PrRP in pot halamus , pituitary and ovary ,which f urt her proved t hat plasma PRL level might not be regulated by tissue PrRP.

【题目】10 个山羊品种线粒体DNA 的遗传多态性

【中文关键词】山羊;线粒体DNA;D-loop;遗传多态性

【英文关键词】goat; mitochondrial DNA;D-loop;genetic diversity

【中文摘要】用PCR-SSCP 分析了10 个山羊(Capra hircus)品种的线粒体DNA 编码区变异情况,这些品种分别来自我国9 个省和自治区,1 个国外品种安哥拉山羊,共计465 个个体。根据PCR-SSCP 的结果挑选出118 个个体进行D-loop 第1 高变区测序,并截取测定序列的481 bp 进行分析,系统建树显示,10 个山羊品种很明显地分成了4 个支系A、B、C 和D。对所有样本进行分子差异等级分析(AMOVA),品种内的方差组分占77.77%,表明10 个山羊品种间没有出现显著的遗传分化,品种间表现弱的遗传结构。对118 条序列进行歧点分布分析表明,整个山羊群体曾经历过2 次群体扩张事件。

【英文摘要】PCR-SSCP were used to analyze the mitochondrial DNA (mtDNA) encode region variation of 465 individuals of 9native goat (Capra hircus)breeds from 9 provinces and autonomous region in China and 1 foreign breed Angora goat. According tothe results of PCR-SSCP, the mitochondrial hypervariable region 1 (HVR1) of 118 individuals were sequenced. The analysis of thesesequences revealed that the goat breeds were classified into four distinct lineages A, B, C and D. The variation (77.77%) within breedssuggested that most of the total genetic variation was due to variation within populations, and revealed a weak phylogeographicalstructure in the goat breeds. Mismatch distribution analysis showed that 2 population expansions happened among goat populations.

【题目】RSAP标记技术新引物设计及其反应体系的优化
【中文关键词】限制性位点扩增多态性;引物设计; 反应体系;体系优化
【英文关键词】restriction site amplified polymorphism; primer design; reaction system; optimization
【中文摘要】【目的】 对限制性位点扩增多态性(Restriction site amplified polymorphism, RSAP) 标记技术进行改进,并优化了其反应体系。【方法】 遵循引物设计原则, 使限制性位点序列位于中间, 在其3`端增加3个选择性碱基,5`端设计为10~12个碱基的随机序列,设计了14条长为19bp的限制性位点扩增多态性(RSAP) 新引物。以大白菜、紫菜薹自交系及其F1、F2 的DNA为模板,对新引物的反应体系进行了优化,并对其重复性和适用性进行了检验。【结果】新设计引物PCR扩增的前5个循环退火温度为35°C ,后35个循环为52°C ;在25 μL优化反应体系中, 模板DNA用量为2.0 μL (20.0ng/ μL) Mg2+ 3.0 μL (25mmol/ L)、Taq 酶(5U/ μL)1.5U、dNTPs 2.0 μL (2.5mmol/L)、引物各0. 6 μL (10 μmol/L) ;新引物扩增出的谱带较原引物更多, 多态性更好; 只改变选择性碱基,新设计引物就能扩增出新的谱带;新设计引物的重复性、稳定性好, 在荞麦和小麦品系, 以及紫菜薹、大白菜及其F1、F2 中,新引物均能扩增出清晰谱带。【结论】 新引物适用性和重复性好,可广泛应用于其他作物的基因组DNA分析。
【英文摘要】[Objective] RSAP marker technique was improved and its reaction system was optimized. [Method] The sequence of restriction site (4-6bases) located in the middle, three selective nucleotides were added to its 3`end and 10 to12 bases long of random sequence lied in its 5`end. Fourteen new primers of restriction site amplified polymorphism (RSAP) were redesigned 19 nucleotides long. Then, using DNA from inbreed lines` young leaves of Chinese cabbage (Brassica campestris L. ssp. pekinensis), Purple-caitai (Brassica compestris L. var. purpurea Bailey) and their F1 , F2 as trial materials, its reaction system was optimized and reproducibility and applicabtivity were tested. [Result] PCR amplification of new primers was run for the first 5 cycles with an annealing temperature of 35°C, followed by 35 cycles with an annealing temperature of 52°C; the optimum PCR reaction system of 25 μL included 2.0 μL DNA templates (20.0ng/ μL), 3.0 μL of Mg2+ (25mmol/ L), 1.5U of Taq DNA polymerase, 2.0 μL of dNTPs (2.5mmol/L), and 0. 6 μL of each primers (10 μmol/ L) . New primers could amplify more strips and polymorphism was better than former primers. In the varieties of buckwheat and wheat, new primer could amplify vivid strips too. [Conclusion] The applicability and reproductivity of new primers were very good, and application would be broad.

【题目】体内和体外法比较保护蛋氨酸和赖氨酸产品在瘤胃和小肠的释放率
【中文关键词】蛋氨酸;赖氨酸;瘤胃;小肠;释放率;体外;体内
【英文关键词】met hionine ; lysine ; rumen ; small intestine ; release rate ; i n si t u ; i n vi t ro
【中文摘要】采用不同材料制得 6 种保护蛋氨酸和 4 种保护赖氨酸产品 ,蛋氨酸分别以丙烯酸树脂 IV号(M1) ,丙烯酸树脂 IV 号和乙基纤维素(M2) ,丙烯酸树脂 IV 号和乙基纤维素及羟丙基甲基纤维素(M3) ,乙基纤维素(M4) ,丙烯酸树脂 IV 号和氢化植物油(M5) ,氢化植物油(M6)包被;赖氨酸分别以丙烯酸树脂 IV号和乙基纤维素(L1) ,丙烯酸树脂IV 号和羟丙基甲基纤维素(L2) ,丙烯酸树脂 IV 号和氢化植物油(L3) ,乙基纤维素和氢化植物油(L4)包被。对 10种产品进行了体外和尼龙袋法稳定性检验。结果表明 ,用尼龙袋在 4 头荷斯坦奶牛瘤胃中培养 4、 8、 24、 48 h ,丙烯酸树脂 IV 号和氢化植物油保护的 M5 和 L3 的释放率最低 ,分别为 11. 72 %~50. 67 %、 35. 70 %~72. 09 %;其在p H6. 6 缓冲溶液中培养相应时间的释放率分别为 24167 %~38144 % ,42105 %~75102 % ,体外法与尼龙袋法测定结果显著相关 ,相关系数分别为 RM2= 01867 5 , RL2= 01963 0。M5 和L3 在真胃和小肠及在p H214 缓冲溶液中的释放率均为 100 %。
【英文摘要】Rumen 2p rotected methionines (RPMet) were obtained f rom polyoxylate IV(M1) ,polyoxylate IVand et hyl2cellulose (M2) , polyoxylate IVand et hyl2cellulose and hydroxyprpoyl met hylcellulose (M3) , et hyl2cellulose (M4) , polyoxylate IVand hydrogenated vegetable oil (M5) ,and hydrogenated vegetable tallow (M6) . Rumen2protected lysines (RPLys) were obtained wit hpolyoxylate IVand et hyl2cellulose (L1) , polyoxylate IVand hydroxyprpoyl met hylcellulose (L2) ,polyoxylate IVand hydrogenated vegetable oil (L3) ,et hyl2cellulose and hydrogenated vegetable oil(L4) . The stability of RPMet and RPLys was tested by i n vi t ro and i n si t u. Af ter incubating for4 , 8 , 24 and 48 h in t he rumen ,the ruminal release rate of nit rogen was lower and ranged f rom11172 % - 50167 % and 35170 % - 72109 % in M5 and L3 , respectively . However ,when incuba2ted in the buffer solution (p H = 616) for 4 , 8 , 24 and 48 h , nit rogen release rate ranged f rom24167 %- 38144 % and 42105 % - 75102 % in M5 and L3 , respectively.

There was a significantpositive linear relationship (RM2= 01867 5、 RL2= 01963 0) of t he degradability of RPMet andRPLys between i n vi t ro and i n si t u. Nit rogen release rate was 100 % in M5 and L3 in the small intestine and t he buffer solution (p H = 214) .

【题目】达草灭对橙色大白菜愈伤组织中类胡萝卜素含量的影响
【中文关键词】橙色大白菜; 达草灭; 愈伤组织; 类胡萝卜素; 高效液相色谱
【英文关键词】orange-heading Chinese cabbage; norflurazon; calli; carotenoid; HPLC
【中文摘要】依据橙色大白菜的愈伤组织呈现橙色, 而普通大白菜的愈伤组织呈现浅黄色这一现象, 以橙色大白菜‘金冠1号’和普通大白菜‘秦白2号’培养的愈伤组织为材料, 在培养基中添加0.1 mmol·L-1的八氢番茄红素脱氢酶抑制剂达草灭分别处理5、10、20和40 d。用HPLC法测定处理后的愈伤组织中各种类胡萝卜素含量的结果表明:‘秦白2号’愈伤组织中以β-胡萝卜素为主,‘金冠1号’愈伤组织中的类胡萝卜以番茄红素和β-胡萝卜素为主, 且类胡萝卜素总含量比‘秦白2号’高出10.4倍; 随着达草灭处理时间的延长, 愈伤组织的颜色逐渐变白, 其中番茄红素和β-胡萝卜素的含量逐渐下降, 而八氢番茄红素的含量则逐渐升高,至处理40 d时, 两品种的愈伤组织中积累的八氢番茄红素差异不明显。据此, 推论橙色大白菜中类胡萝卜素的积累并不是由于类胡萝卜素生物合成能力的提高引起的。
【英文摘要】According to the phenomenon that the calli derived from ‘Qinbai 2’ seedlings showed a light yellow color and the calli derived from ‘Jinguan 1’ exhibited orange yellow, the calli from ‘Qinbai 2’ and ‘Jinguan 1’ were treated for 5d, 10d, 20d and 40d with 0.1 mmol·L-1 norflurazon, an effective inhibitor of phytoene desaturase. The carotenoid content of treated calli were measured by High Pressure Liquid Chomatography (HPLC). The results showed that β-carotene was the main component of carotenoid in the calli derived from ‘Qinbai 2’, lycopene and β-carotene were the main components of carotenoid in the calli derived from ‘Jinguan1’. The total carotenoid content in ‘Jinguan 1’ was 10.4 times more than that in ‘Qinbai 2’. With the treatment of norflurazon, the growing calli became white and the contents of lycopene and β-carotene were decreased but phytoene content increased. After the treatment of norflurazon for 40 d, there was no obvious difference of phytoene accumulation between the ‘Qinbai 2’ and ‘Jinguan 1’ calli. These results suggested that carotenoid accumulation in the orange-heading Chinese cabbage didn’t result from an increased capacity of carotenoid biosynthesis.

【题目】大白菜游离小孢子胚诱导及植株再生
【中文关键词】大白菜;小孢子;胚状体;再生植株
【英文关键词】Heading Chinese cabbage; Microspore; Embryoid; Plantlet
【中文摘要】以15个大白菜 [Brassica campestris ssp. Pekinensis (Lour .) Olsson]自交系和杂交种为试材进行游离小孢子培养,研究了影响胚状体发生及植株再生的几个主要因素。结果表明,有12个品种的游离小孢子在NLN-13液体培养基上诱导出胚;各品种间小孢子胚产量差别很大,每个花蕾产胚在0. 25~65. 4个之间;将成熟的子叶形胚及时转移至再生培养基上,对提高植株获得率至关重要;在NLN-13液体培养基上附加0.2mg·L-1的6-BA对胚状体的发生和发育有促进作用;B5 +0.2mg·L-1 6-BA+ 0.02mg·L-1 NAA的培养基有利于小孢子胚发育成植株;1/ 2MS+0.1mg·L-1 NAA为小孢子植株生根最适宜的培养基。

【英文摘要】Isolated microspore culture was carried out with15 F1 hybrids and inbred lines of heading Chinese cabbage (Brassica campestris ssp. Pekinensis (Lour.) Olsson). Major factors influenced embryogenesis in Chinese cabbage during microspore culture were investigated. The results showed that 12 varieties of heading Chinese cabbages were cultured in NLN-13 liquid medium and produced microspore-derived embryos and plantlet regeneration. The production of microspore-derived embryos varied remarkably among these varieties. Embryo yield per bud ranged from 0.25 to 65.4. Transferring mature cotyledonary embryos to the regeneration medium in time was essential to increase plantlet regeneration rate. The effect of different hormone concentrations in NLN medium on embryogenesis was compared. It showed that NLN-13 medium added with 0.2mg • L-1 6-BA promoted genesis and development of the embryoids. Microspore-derived embryos on B5 medium with 6-BA 0.2mg • L-1 and NAA 0. 02 mg • L-1 were favorable to regenerating plantlets. For rooting of microspore plantlets,1/2 MS added with 0.1mg • L-1 NAA was suitable.

【题目】大白菜花蕾败育相关基因的cDNA-AFLP差异表达分析
【中文关键词】大白菜;花蕾败育;cDNA-AFLP技术;ESTs
【英文关键词】Chinese cabbage, Aborting bud, cDNA-AFLP technology, ESTs
【中文摘要】本研究以大白菜(Brassica campestris ssp. Pekinensis (Lour.) Olsson) 败育花蕾到正常花蕾的10个连续时期的花蕾为材料,采用cDNA-AFLP技术和生物信息学分析等方法研究了败蕾过程中的基因表达差异,获得了192个大白菜败蕾相关差异表达片段,随机挑选88个序列进行测序,获得72个新表达序列标签(ESTs),将长度大于100bp的67个ESTs在GenBank进行了登录,登录号为GR308155-GR308221。根据生物信息学分析结果,其中 Blastx比对分值大于80的62条ESTs可分为能量和新陈代谢膜和运输转录和翻译氨基酸合成和加工信号传导防御及分类不确定7类。其中EST46、EST3-1、EST13-2、EST20-1和EST30-2等5个ESTs为大白菜花蕾败育材料中新发现的。
【英文摘要】Abstract cDNA-AFLP technology and bioinformatics analysis were used to analyze gene expression difference at 10 consecutive periods bud from bud aborted to normal bud in Chinese cabbage (Brassica campestris ssp. pekinen- sis (Lour.) Olsson), 192 differentially expressed sequences were obtained, then 88 sequences were chosen randomly to sequence, 72 novel expressed sequence tags (ESTs) were obtained after sequencing. 67 ESTs which size is longer than 100 bp had been entered to GenBank, their entering number were GR308155-GR308221. 62 ESTs which Blastx score is greater than 80, were divided into seven types by bioinformatics analyzing, such as energy and metabolism, membrane and transport, transcript and translation, amino acid synthesizing and processing, signal conduction, and unclear classified et al, moreover, 5 ESTs, such as EST46, EST3-1, EST13-2, EST20-1 and EST30-2, were newly found in Chinese cabbage bud aborting.

【题目】4 个绵羊品种双肌臀基因基因型的检测
【中文关键词】PCR2RFL P ;双肌臀基因;单核苷酸多态性;绵羊
【英文关键词】PCR2RFL P ; Callipyge gene ; SNP ; sheep
【中文摘要】绵羊的双肌臀(Callipyge , CL PG) 基因表型为后臀肌肉增大近30 % ,是由位于绵羊18 号染色体GTL2 基因上游32. 8 kb处存在1 个A →G的单核苷酸多态性(SNP) 标记(命名为SNPCLPG) 产生的,该SNP 标记的存在与CL PG表型完全吻合。通过对SNPCLPG的分子检测,期望发现CL PG基因型种羊,为今后选育肉用性状更优异的新品系奠定基础。为此,选择设计合成了1 对引物,采用聚合酶链式反应2限制性片段长度多态性(PCR2RFL P) 方法,分别以引进的纯种陶塞特羊、特克塞尔羊、夏洛莱羊和美利奴羊作为研究样本,进行了SNPCLPG位点的PCR 检测。获得了预期的493 bp 扩增片段,并检测到CL PG基因型特征性的SNPCLPG突变(A →G) 。
【英文摘要】The buttocks muscle can be increased about 30 % by Callipyge (CL PG) , resulting f rom an apparent A →G muta2tion in 32. 8 kb upst ream of GTL2 in the ovine chromosome 18. The mutation polymorphism is referred to as SNPCLPG , whichwas later shown to be the only difference between the callipyge and wild2type chromosome. The objective of the research is toselect carriers of the callipyge gene by the molecular biological techniques , which is the basis of selection of the excellent meatt rait s. The SNPs were detected by PCR2rest riction f ragment length polymorphisms (PCR2RFL P) with one pairs of primers ingenome of Dorset sheep , Texel sheep , Charolais sheep and Merino sheep. A →G substitution was found and one special prod2uct s (493 bp) were amplified.

【题目】11 个绵羊品种MSTN 基因非翻译区的变异
【中文关键词】MSTN; UTR; PCR-RFLP; MicroRNA; 多态性
【英文关键词】MSTN; UTR; PCR-RFLP; MicroRNA; polymorphism
【中文摘要】利用PCR-RFLP 技术对特克塞尔羊、夏洛莱羊、小尾寒羊、蒙古羊、乌珠穆沁羊、阿勒泰羊、呼伦贝尔羊、塔什库尔干羊、多浪羊、湖羊和岗巴羊11 个品种的345 个个体的肌肉生长抑制素(Myostatin, MSTN)基因非翻译区(UTR)的变异进行了多态性分析。结果表明大小为271 bp 和1 003 bp 的扩增片段经限制性内切酶Mbo Ⅱ和Bsa Ⅰ酶切后表现多态, 经卡方检验所有品种在该基因座位均处于平衡状态(P>0.05), 3 种基因型在11 个绵羊品种中的分布差异极显著(P<0.01)。通过限制性内切酶HpyCH4IV 酶切实验, 证明我国9 个地方绵羊品种不存在特克塞尔绵羊中发现的导致肌肉发达的SNP 位点, 并在3 ′ UTR 区发现了个别碱基突变位点能够形成miRNA 作用的靶基序, 测序表明3 ′ UTR 区的突变频率较高。
【英文摘要】PCR-RFLP was applied to analyze the polymorphism of MSTN gene UTR in 345 sheep that comprised of elevensheep breeds, namely Texel sheep, Charolais sheep, Small-tailed Han sheep, Monggolian sheep, Ujumqin sheep, AltayFat-rumped sheep, Hulunbeir sheep, Tashikurgan sheep, Duolang sheep, Hu sheep, and Gangba sheep. A 271 bp and a1 003 bp long PCR products were digested with Mbo Ⅱ and Bsa Ⅰ to demonstrate polymorphism in the eleven sheep breeds,which were all at Hardy-Weinberg equilibrium (P>0.05). The distribution of 3 genotypes in 11 sheep breeds was significantlydifferent (P<0.01). Digestion of the PCR products with HpyCH4IV proved that 9 domestic local sheep breeds weredifferent from Texel sheep in the SNP site that was associated

with muscularity. The individual mutation base could generatethe motifs for miRNA in the 3′UTR, and sequencing analysis demonstrated high frequency of mutation in the 3′UTR region

【题目】Analysis of Cell Wall Components and Ultra-structure for Brittleness Mutation Rice
【中文关键词】脆性突变水稻;细胞壁组分;超微结构;饲料稻;
【英文关键词】Brittleness mutation rice;Cell wall component;Ultra-structure;Fodder-rice
【中文摘要】细胞壁的组件和大植物比较脆性突变(BM)水稻种子获得的伽马射线(γ)治疗和它从Zhonghua-11野生型粳稻品种在这个研究。纤维素含量的叶、茎和根的BM-rice显著降低(P < 0.01)18.99%、37.29%和23.34%,相比那些野生型的分别,而半内容在叶、茎、根BM-rice显著增加(P < 0.01),分别为46.07%、85.26%和61.96%。叶子的薄壁大很多的BM-rice比野生型水稻扫描电镜的观察。对于BM-rice,厚壁组织的叶子是萎缩,维管束的叶子被减少,strumae的外表皮干细胞是稀疏和链接的韧皮部根拆散和分散。将层次结构墙厚壁组织细胞的BM-rice叶不明显,观察的瞬变。此外,安排的薄壁组织细胞BM-rice茎的无序和外观的薄壁组织细胞BM-rice knaggy墙的根。总之,BM-rice有潜在的优势在利用作为一个fodder-rice。
【英文摘要】The cell wall component and ultra-structure of plant were compared between brittleness mutation (BM) rice obtained by seed gamma-ray (γ) treatment and its wild type from japonica variety Zhonghua-11 in this study. The cellulose content in leaf, stem, and root of BM-rice significantly decreased (P<0.01) by 18.99%, 37.29% and 23.34% compared with those of wild type, respectively, while the hemi-cellulose content in leaf, stem and root for BM-rice significantly increased (P<0.01) by 46.07%, 85.26% and 61.96%, respectively. The leaf parenchyma of BM-rice was much larger than that of wild type rice by the observation of SEM. For the BM-rice, the sclerenchyma of leaves was shrunken, vascular bundle of leaves was reduced, the strumae of outer epidermis of stem was sparse and the link of phloem of root was loosed and dispersed. The hiberarchy of sclerenchyma cell wall of BM-rice leaf was not obvious by the observation of TEM. Besides, the arrangement of parenchyma cells of BM-rice stem was disordered and the exterior of parenchyma cell wall of BM-rice root was knaggy. In conclusion, BM-rice has potential advantages in utilization as a fodder-rice.

【题目】Polyamine Accumulation in Transgenic Tomato Enhances the Tolerance to High Temperature Stress
【中文关键词】高温胁迫处理,番茄,多胺,酿酒酵母,硫腺苷甲硫氨酸脱羧酶,转化
【英文关键词】heat stress; Lycopersicon esculentum; polyamines; Saccharomyces cerevisiae; S-adenosylmethionine decarboxylase; transformation
【中文摘要】多胺在植物抵抗非生物胁迫中具有重要的作用。硫腺苷甲硫氨酸脱羧酶(SAMDC)是多胺合成中的关键酶。为了验证多胺合成在番茄抗高温胁迫中的作用,将从酿酒酵母中分离出的 SAMDC cDNA转入到番茄中,并通过 Southern 和 Northern 来检验转基因的表达情况。在高温胁迫条件下,转基因番茄的亚精胺和精胺的合成量是野生植株1.7-2.4倍。这表明与野生番茄相比,转基因番茄的抗高温(38°C)能力有所提高。本实验证明,在植物中提高多胺的合成量可能是培育抗高温种质的有效途径。
【英文摘要】Polyamines play an important role in plant response to abiotic stress. S-adenosyl-l-methionine decarboxylase (SAMDC)is one of the key regulatory enzymes in the biosynthesis of polyamines. In order to better understand the effect ofregulation of polyamine biosynthesis on the tolerance of high-temperature stress in tomato, SAMDC cDNA isolated fromSaccharomyces

cerevisiae was introduced into tomato genome by means of Agrobacterium tumefaciens through leafdisc transformation. Transgene and expression was confirmed by Southern and Northern blot analyses, respectively.Transgenic plants expressing yeast SAMDC produced 1.7- to 2.4-fold higher levels of spermidine and spermine than wildtypeplants under high temperature stress, and enhanced antioxidant enzyme activity and the protection of membranelipid peroxidation was also observed. This subsequently improved the efficiency of CO2 assimilation and protected theplants from high temperature stress, which indicated that the transgenic tomato presented an enhanced tolerance to high temperature stress (38 ◦ C) compared with wild-type plants. Our results demonstrated clearly that increasing polyaminebiosynthesis in plants may be a means of creating high temperature-tolerant germplasm.

【题目】Identification of two AFLP markers linked to bacterial wilt resistance in tomato and conversion to SCAR markers.
【中文关键词】番茄; DNA-AFLP; SCAR;青枯病
【英文关键词】Tomato; DNA-AFLP; SCAR; Bacterial wiltdecarboxylase; transformation
【中文摘要】在热带、亚热带及湿润地区,番茄青枯病(BW)是影响产量的重要因素。本研究筛选出了与BW的抗性基因连锁的AFLP分子标记。为了达到研究目的,我们在F2代群体中利用混合分组分析法来筛选。F2代是源于抗BW的栽培种T51A和感病栽培种 T9230杂交。遗传分析发现BW是由两个不完全显性基因控制的。我们利用CTAB法并加以改良来提取感病番茄叶片DNA,利用256对引物进行筛选,其中有2个AFLP标记与BW抗性基因连锁。随后我们将这两个AFLP标记改造成为共显性的 SCAR标记,并命名为 TSCAR AAT/CGA 和TSCARAAG/CAT。连锁分析发现,两个标记在 TRSR-1的两侧。TSCAR AAT/CGA和 TRSR-1的遗传距离为 4.6 cM,TSCARAAG/CAT和 TRSR-1的遗传距离为8.4 cM。
【英文摘要】Tomato bacterial wilt (BW) incited by Ralstoniasolanacearum is a constraint on tomato production in tropical, subtropical and humid regions of the world. In this paper, we present the results of a research aimed at the identification of PCR-based markers amplified fragment length polymorphism (AFLP) linked to the genes that confer resistance to tomato BW. To this purpose, bulked segregant analysis was applied to an F2 population segregating for the BW resistant gene and derived from the pair-cross between a BW resistant cultivar T51A and the susceptible cultivar T9230. Genetic analysis indicated that tomato BW was conferred by two incomplete dominant genes. A CTAB method for total DNA extraction, developed by Murray and Thompson with some modifications was used to isolation the infected tomato leaves. Thirteen differential fragments were detected using 256 primer combinations, and two AFLP markers were linked to the BW resistance. Subsequently, the AFLP markers were converted to co-dominant SCAR markers, named TSCAR AAT/CGAand TSCAR AAG/CAT. Linkage analysis showed that the two markers are on the contralateral side of TRSR-1. Genetic distance between TSCAR AAT/CGA and TRS-1 was estimated to 4.6 cM, while 8.4 cM between TSCARAAG/CAT and TRS-1.

【题目】植物腺苷甲硫氨酸脱羧酶研究进展
【中文关键词】腺苷甲硫氨酸脱羧酶; 多胺; 生物学功能
【英文关键词】S-adenosylmethionine decarboxylase; polyamine; biological function
【中文摘要】多胺对植物生长发育的调控以及生物或非生物逆境胁迫反应中起着重要的作用。腺苷甲硫氨酸脱羧酶(S-adenosylmethionine decarboxylase, SAMDC)是植物体多胺生物合成途径中一个关键酶, 催化腺苷甲硫氨(S-

adenosylmethionine, SAM)形成脱羧的SAM, 为多胺生物合成提供氨丙基供体。现对植物中 SAMDC 的种类、SAMDC 基因的特征以及功能研究现状进行了综述。

【英文摘要】olyamine plays important roles in plant growth and the response to biotic and abiotic stress. S-adenosylmethionine decarboxylase (SAMDC) is a key enzyme involved in the biosynthesis of the polyamines. The substrate for the SAMDC is S-adenosylmethionine (SAM) and the product is decarboxylated SAM which provides the aminopropyl groups for subsequent synthesis of spermidine and spermine. This article reviews the progress on classification, evolution, structure character and biological function of SAMDC genes in plants.

【题目】Isolation of a novel tomato caffeoyl CoA 3-O-methyltransferase (CCoAOMT) gene following infection with the bacterium Ralstonia solanacearum.

【中文关键词】番茄; DNA-AFLP; 混合分组分析法; CCoAOMT,青枯病

【英文关键词】Tomato; DNA-AFLP; SCAR; Bacterial wilt decarboxylase; transformation

【中文摘要】将 cDNA- AFLP与混合分组分析法(BSA)进行结合,筛选番茄青枯病抗性基因。F2代中的抗性基因源于野生的抗性群体T51A和野生的感病群体 T9230杂交。利用cDNA- AFLP技术在F2代抗池(BR)、F2代感池(Bs)、T51 A抗池(BA)及T9230感池(BB)进行筛选,共筛选出34个只能在BR和BA中有条带的标记。通过在F2代抗性植株中进行进一步的单株验证,从中筛选出一个编码乙酰CoA 3-O – 甲基转移酶 (CCoAOMT)的基因,这个基因在番茄中从未有报道,但与烟草和马铃薯的CCoAOMT类似。这个基因可能在自身抵抗病原菌侵害中发挥着重要作用。CCoAOMT基因在愈创木基木质素合成中发挥重要作用,并且为紫丁香基木质素的合成提供原料。

【英文摘要】We combined cDNA amplified fragment length poly-morph ism (cDNA - AFLP) with bulked segregant analysis (BSA) to detect genes that control tomato(Lycopersicon esculentum) bacterial wilt infected with Ralstonia solanacearum , resistance in F2 population derived from a cross between a bacterial wilt-resistant variety, T51 A, and a bacterial wilt-susceptibl e variety, T92 30. In c DNA-AF LP analysis among bulked-resistant F2(BR) pool, bulked-susceptible F2(BS) pool ,bulked-resistant T51 A (BA) pool and bulked-susceptible T92 30 (BB) pool , 34 differentially expressed transcript-derived fragments (DE- TDF s) that were present in only BR and BA pools were detected. Analysis ofdifferential DE -TDF expression in individual resistant F2 resulted in the isolation of a caffeoyl CoA 3-O – methy- ltransferase (CCoA OMT) gene not previously described from tomato and which showed similarity to an CCoAO MT gene from tobacco and potato plants .This CCoAO MT gene may play a role in innate generalized response to pathogen infection as it was down-regulated in suscept -ible tomato following infection with the bacterium. CCoAOMT gene plays an essential role in the synthesis of guaiacyl lignin units and supply substrates for the syn- thesis of syringyl lignin units .

【题目】酵母SAMdc基因表达载体构建以及农杆菌介导转化番茄的研究.

【中文关键词】SAMDC基因; E8启动子;番茄;载体构建;农杆菌介导

【英文关键词】SAMDCgene; E8 promoter; tomato; vector construction; Agrobacterium tumefaciensgene transformation

【中文摘要】SAMDC(腺苷甲硫氨酸脱羧酶)是参与植物多胺合成的一个关键酶.通过GenBank上已经发表的序列,设计两对引物,分别以酵母基因组DNA和番茄基因组DNA为模板克隆出SAMDC基因和E8启动子.构建了以CaMV35S和E8为启动

子的两个SAMDC基因植物表达载体,酶切分子鉴定后,经农杆菌介导以叶盘法转入番茄中,获得了转基因植株.经PCR检测和X2Gluc组织化学染色检测,目的基因已经成功转入番茄中.为研究多胺在番茄中代谢活性以及SAMDC基因对番茄抗逆性和番茄果色的影响提供了研究基础.

【英文摘要】S-adenosylmethionine decarboxylase (SAMDC) is a key enzyme involved in the biosynthesis of the polyamines, viz. spermidine and spermine. Two pairs of primers were designed based on the published sequences in the GenBank. The SAMDC gene and E8 promoter were amplified using yeast and tomato genome DNA as templates, respectively. Then two SAMDC gene expression vectors containing CaMV35S and E8 promoters separately were constructed. The SAMDC gene was introduced into tomato genome by Agrobacterium tumefaciens mediated transformation. The PCR and X2Gluc histochemical assay results showed that SAMDC had been integrated into the genome of tomato successfully. The results provided a helpful tool for understanding the physiological function of polyamines and the effects of SAMDC gene on resistance to abiotic stress and fruit color in tomato.

【中文关键词】滩羊; TSA ;成纤维细胞;乙酰化

【英文关键词】Tan sheep ; TSA ; fibroblast cell ; acetylation

【中文摘要】为探索成纤维细胞作为供体细胞的潜能和Trichostatin A(TSA) 处理供体细胞的适合浓度,提高克隆胚胎的发育水平。本研究分别利用100 、50 、25 、10 ng ・mL - 1 TSA 处理滩羊成纤维细胞,观察细胞形态,统计细胞活率,利用流式分选技术分析处理前后细胞的周期时相,同时通过间接免疫荧光法检测细胞乙酰化水平,并以经过10~50 ng ・mL - 1 TSA 处理的成纤维细胞作为供体细胞,检测其重构胚发育水平。结果发现,当TSA 的浓度达100ng ・mL - 1时,细胞大量死亡,不同浓度TSA 处理细胞24 h 后,细胞周期被明显抑制在G0 / G1 期,乙酰化水平明显高于对照组,其中供体细胞经10 ng ・mL - 1 TSA 处理的克隆胚胎卵裂率和囊胚率明显升高(P < 0. 05 , (85. 2 ±3. 4) % vs (68. 6 ±6. 7) % , (35. 6 ±5. 7) % vs (10. 4 ±8. 3) %) 。结果表明,经10 ng ・mL - 1 TSA 处理的滩羊成纤维细胞周期同步化明显,乙酰化维持较高水平,重构胚胎发育水平明显提高,适合作为成纤维细胞的处理方法和浓度。

【英文摘要】In order to investigate t he potential of fibroblast s as donor cell s , and find out t he opti2mal concent ration of TSA used to t reat fibroblast s , and f urt her to improve t he developmental lev2el of cloned embryos , the fibroblast s were t reated wit h 100 , 50 , 25 , 10 ng ・mL - 1 TSA , cellmorp hology and viability were investigated. Flow cytomet ry were adopted to analyse cell cycle.Acetylation level was detected by indirect immunofluorescence , and t he developmental level ofcloned embryos was evaluated. Most cell s t reated with 100 ng ・mL - 1 TSA were dead , but a sig2nificant increase of acetylation level was detected ; the cell cycle was arrested at G0 / G1 checkpointwit h t he existence of TSA ; generally ,there was a higher proportion of cleavages and blast ulas (P< 0. 05 , (85. 2 ±3. 4) % vs (68. 6 ±6. 7) %, (35. 6 ±5. 7) % vs (10. 4 ±8. 3) %) when the cell swere t reated wit h 10 ng ・mL - 1 TSA. The result s suggested t hat acetylation level , cell morp hol2ogy and embryonic developmental level were imp roved and optimal for t he donor cell s t reated wit h10 ng ・mL - 1 TSA.

【题目】鸡鸭异种间转基因嵌合体的制备

【中文关键词】鸡;鸭;原始生殖细胞;种间嵌合体;转基因鸡;p EGFP2N3
【英文关键词】chicken ; duck ; primordial germ cell s ; inter2species chimeras ; t ransgenic chicken ; p EGFP2N3
【中文摘要】为研究异种间嵌合体的制作方法及供体和受体的嵌合情况,同时探讨绿色荧光蛋白(p EGFP2N3) 基因作为报告基因在转基因动物制作中的应用价值。本研究利用脂质体介导法将外源p EGFP2N3 质粒转入到北京鸭原始生殖细胞(PGCs) 中,将转染后的PGCs 以微注射法转移至受体北京油鸡的胚下腔,探索转基因鸡鸭嵌合体的制作方法。结果显示: PGCs 在转染后6 h 开始有外源基因的表达,体外培养24 h 后获得了33. 6 %的转染效率。120枚蛋在整个孵化期中共有33 枚鸡胚发育,但最终无孵化成活鸡。在13 个鸡胚中检测到有外源基因的存在,阳性率为10. 8 %。PCR 扩增禽类W染色体特异性的重复序列发现,8 只嵌合体公鸡的性腺都嵌合了供体异性的细胞。研究结果表明所采用的嵌合体制作方法制备转基因禽类是可行的。鸭PGCs 能够迁移并定居到鸡胚性腺中,并有可能在鸡性腺中增殖分化成有功能的配子。
【英文摘要】In this st udy , plasmid p EGFP2N3 was int roduced into t he duck PGCs via lipofectaminei n vi t ro. The t ransfected PGCs were injected into t he subgerminal cavity of t he recipient chickento find a kind of met hod which would produce inter species duck/ chicken chimeras and cont ributeto t ransgenic st udy via chimeras. The Beijing duck was used as t he donor and t he Beijing Fat tychicken was t he recipient , t he duck/ chicken chimeras were const ructed via Windowing technique.The exogenous gene was expressed in PGCs t ransfected for 6 h later , and cult ured for 24 h i nvi t ro , t he t ransfection rate reached 33. 6 %. 33 chicken embryos of 120 chicken eggs were ob2tained. Event ually 13 chimeric embryos were obtained , but t here was no a surviving chicken. Theexogenous gene were detected in 10. 8 % (13/ 120) of t he embryos examined. Heterosexual cell swere found in the gonads of 8 chimeras t hrough PCR to amplify the W2specific repeating se2quences. The result s indicated t hat it was possible to produce t ransgenic avians by const ructingchimeras wit h t he met hod adopted in t his st udy. Furt hermore , t hese result s suggested t hat duckPGCs could migrate , colonize and proliferate in chicken gonads toget her with chicken ′ s PGCsduring development .

【题目】驯养经济动物养殖及种群遗传多样性的研究方法
【中文关键词】野生动物; 驯养经济动物; 遗传多样性
【英文关键词】wild animal ; economic domesticated animal ; genetic diversity
【中文摘要】我国貉、银狐、北极狐、水貂、梅花鹿等野生动物养殖作为一项新兴的产业已成为建设新农村新的经济增长点,但是无论是野外资源的保护成效,还是人工驯养繁殖业的发展状况以及野生动物及其产品的经营利用秩序与社会需要和客观要求相比,还存在着相当大的差距。与野外环境中的种群比较,圈养种群是进行遗传学研究的最好的模型对象,对于研究野生种群近交与群体灭绝间的关系是非常合适的材料。目前国内外对于驯养经济动物与野生种群遗传多样性的研究主要集中于线粒体DNA、核糖体DNA、微卫星分子标记及主要组织相容性复合体等几个方面。作者针对目前国内外尤其是国内有关驯养经济动物养殖现状及其与野生种群形态、遗传多样性差异几个重要研究技术方面的研究进行了详细的论述和探讨,旨在通过利用我国养殖的野生小种群遗传学特性,为珍稀野生动物种群保护遗传学研究及加快国内经济动物养殖提供理论支持。
【英文摘要】In China , wild animals breeding has been the new rural const ruction of the new point of economic growth , suchas racoon Dog , silver fox , Arctic fox , mink , deer and other wild animals. However , both the effectiveness of the protection ofwild resources and the development of artificial breeding as well as the operation of order and social needs and the objective re2quirement , there is still a considerable gap. The domesticated population genetics research is the best model for studying wildpopulations inbreeding. Now , the genetic diversity research between domesticated population and wild population focused onmitochondrial DNA , ribosomal DNA , microsatellite markers and the major histocompatibility complex. Access to a large num2ber of this year of relevant researches , we discussed breeding status of wild animals , the difference of morphology and geneticdiversity , and it was aimed to supply a theoretical support for rare wild animals genetics research and wild animal breeding.

【题目】寿光鸡腺苷酸琥珀酸裂解酶ADSL 基因的表达与克隆化细胞株的筛选
【中文关键词】寿光鸡;腺苷酸琥珀酸裂解酶;基因结构;基因表达;基因定位
【英文关键词】Shouguang chicken ; adenylo succinate lyase ; gene st ruct ure ; gene expression ; subcel2
lular location ;
【中文摘要】利用RT2PCR 与RACE 方法检测寿光鸡心、肝、脾、肺、肾、脑、腿肌与胸肌8 种组织腺苷酸琥珀酸裂解酶(ADSL) 基因mRNA 的差异表达水平,构建A DSL 基因融合表达载体p GEX2ADSL ,转化大肠杆菌BL21 (DE3) ,筛选阳性克隆,IPTG诱导表达,通过构建真核表达载体p EGFP2ADSL ,利用脂质体介导法转染寿光鸡成纤维细胞,并进行阳性细胞的克隆化筛选与检测。结果表明: A DSL 基因开放阅读框序列长为1 455 bp ,编码485 个氨基酸;5′端非转录调控区具有典型管家基因的特征,在邻近起始密码子- 28 bp 处发生C →T 突变,该突变使该位点变为核呼吸因子2 (NRF22) 结合位点;经SDS2PAGE 电泳显示,p GEX2ADSL 重组融合蛋白在分子量约为8015 ku 处有特异的蛋白条带出现,与预期分子量大小一致,等电点为6179 ,纯化后用Western2blot 检测为寿光鸡ADSL 蛋白。p EGFP2ADSL 转染寿光鸡成纤维靶细胞后24 、48 和72 h ,转染率在2614 %~4112 %之间,绿色荧光均匀分布于细胞质与细胞核中,随表达量的增加,绿色荧光在细胞核中聚集成团块状或颗粒状,经药物筛选和克隆化培养,获得表达p EGFP2ADSL 融合蛋白的阳性克隆细胞株,经RT2PCR 扩增与Western2blot 检测确认ADSL 融合蛋白基因已经整合到寿光鸡成纤维细胞的基因组中,获得正常表达。研究结果为揭示我国优良地方鸡种的风味基因结构,研究其生物学功能奠定基础。
【英文摘要】The specific expression of A DSL gene in 8 different tissues of Shouguang chicken wasinvestigated by RT2PCR and RACE in t his st udy. The f usion expression vector p GEX2ADSL wasconst ructed and t ransformed into Escherichi a col i BL21 (DE3) , po sitive cloning screened , in2duced and expressed by IPTG. Eukaryotic expression vector p EGFP2ADSL was t ransfected intoShouguang chicken fibroblast cell s using lipofectin met hod. The result s of sequences analysisshowed t hat the open reading f rame

of 1 455 nucleotides encode a protein of 485 amino acids ; Thepromoter of chicken A DSL cDNA showed typical feat ures of house keeping genes ,t here was a C-28 T mutation which caused t he site mutate to NRF22 binding site. The SDS2PA GE elect rop hore2sis result s showed t hat there were specific bands , about 8015 ku and an isoelect ric point of 6179 ,and Western2blot analysis showed that t he f used protein was ADSL. Af ter t ransfection 24 , 48and 72 h , t ransfection rate of p EGFP2ADSL were between 2614 % - 4112 %, and green fluores2cent could be observed in cytoplasm and nucleus well2dist ributed except cryptomere vesicle. Bot hof RT2PCR and Western2blot confirmed that the p EGFP2ADSL had been integrated into t heShouguang chicken fibroblast cell genome , and accessed to t he normal f usion protein expression.This research revealed the A DSL gene st ructure of excellent native chickens of China , establishedt he foundation for f urt her research wit h it s biological f unction.

【题目】Rapid prototyping of paper-based microfluidics with wax for low-cost, portable bioassay
【中文关键词】无
【英文关键词】Bioassay Microfluidics Paper-based microfluidics Wax
【中文摘要】无

【英文摘要】Here we present a simple and low-cost production method to generate paper-basedmicrofluidic devices with wax for portable bioassay. The wax patterning method weintroduced here included three different ways: (i) painting with a wax pen, (ii) printingwith an inkjet printer followed by painting with a wax pen, (iii) printing by a wax printerdirectly. The whole process was easy to operate and could be finished within 5 – 10 minwithout the use of a clean room, UV lamp, organic solvent, etc. Horse radish peroxidase,BSA and glucose assays were conducted to verify the performance of wax-patternedpaper.

【题目】供体细胞的不同选择和处理对重编程过程的影响
【中文关键词】供体细胞; 核移植; 重编程
【英文关键词】donor cell; nuclear transfer; reprogramming
【中文摘要】供体细胞核移入去核的卵母细胞后, 必定要经过表观遗传修饰的重编程过程, 回到胚胎开始发育的全能状态。若重编程过程不完全, 必定会导致克隆效率降低。但是, 体细胞核的重编程能力不仅仅是在其移入去核的卵母细胞后所体现, 它在不同的供体细胞当中的潜能也是不尽相同的。并且, 对供体细胞进行不同的处理,也会导致其重编程的能力和程度不同。文章首先阐述了供体细胞的类型、代数、周期、年龄以及物种的不同选择对其核移植后重编程过程的不同影响, 其后又通过对供体细胞的冷冻保存, 血清饥饿以及不同试剂的处理等方面对重编程过程所起到的作用作出了概况性的论述与分析。
【英文摘要】The donor nucleus must experienced the epigenetic modification of the process reprogramming and went back tothe initial state after the donor cell was injected into the oocytes. If the reprogramming is not completed, the efficiency ofcloning will be reduced. However, reprogramming of nucleus muct was not only embodied in its ability after it wastransferred into the oocytes. It was different in the potential if the cell type was not identical. In addition, different treatmentto the donor cells resulted in different ability and the level of reprogramming. This paper described different effects of thetype, algebra, cycles, age, and species of the donor cells after nuclear transplantation on the reprogramming. An overview ofthe exposition and analysis through the donor cell cryopreservation, serum starvation, and different reagent treatments werediscussed

【题目】Microvalves actuated sandwich immunoassay on an integrated microfluidic system
【中文关键词】无
【英文关键词】Human immunoglobulin G / Immunoassay / Integration / Microfluidics / Microvalve
【中文摘要】无
【英文摘要】In this study, we developed an integrated and automatic microfluidic immunoassaysystem, which comprised a multi-layer immunoassay microfluidic chip and a rotaryconfocal LIF scanner. The normally closed elastomeric microvalves were integrated onthe multi-layer microfluidic chip to realize flexible reagents delivery for the rapidimmunoassay. The various operations of immunoassay including coating, blocking andwashing could be performed on a single chip with reduced reagents consumption andanalysis time. The homemade rotary LIF scanner was able to detect the signals from themultichannels sequentially in a short period of time, enabling the potential capability forhigh-throughput immunoassay. The performance of this system was demonstrated bythe sandwich immunoassay of human immunoglobulin G with a LOD o10 ng/mL(S/N53). The linear range was from 500 ng/mL to 100 mg/mL. This system has alsobeen applied to the measurement of human immunoglobulin G from 15 real samples,demonstrating the potential of this platform for biomedical applications.

【题目】Development of micropump-actuated negative pressure pinched injection for parallel electrophoresis on array microfluidic chip
【中文关键词】无
【英文关键词】Array / Injection / Microfluidic chip / Microvalve
【中文摘要】无
【英文摘要】A micropump-actuated negative pressure pinched injection method is developed forparallel electrophoresis on a multi-channel LIF detection system. The system has ahome-made device that could individually control 16-port solenoid valves and a highvoltagepower supply. The laser beam is excitated and distributes to the array separationchannels for detection. The hybrid Glass-PDMS microfluidic chip comprises twocommon reservoirs, four separation channels coupled to their respective pneumaticmicropumps and two reference channels. Due to use of pressure as a driving force, theproposed method has no sample bias effect for separation. There is only one high-voltagesupply needed for separation without relying on the number of channels, which issignificant for high-throughput analysis, and the time for sample loading is shortened to1 s. In addition, the integrated micropumps can provide the versatile interface forcoupling with other function units to satisfy the complicated demands. The performanceis verified by separation of DNA marker and Hepatitis B virus DNA samples. And thismethod is also expected to show the potential throughput for the DNA analysis in thefield of disease diagnosis.

【题目】3 种吸附剂对黄曲霉毒素B1 吸附能力的研究
【中文关键词】吸附剂;黄曲霉毒素B1;吸附能力
【英文关键词】absorbent; AFB1; absorption efficacy
【中文摘要】【目的】体外试验评价3 种吸附剂(吸附剂A:主成分为酵母细胞壁提取物;吸附剂B:主成分为水合铝硅酸盐;吸附剂C 为复合物,主成分是酵母细胞壁及水合铝硅酸盐)对黄曲霉毒素B1(AFB1)的吸附效果,并通过吸附剂对摄入AFB1 肉仔鸡生长性能及血清蛋白水平的影响验证体外试验结果。【方法】(1)pH 为2.0、6.0、8.0 的磷酸盐缓冲溶液(PBS 溶液)、人工胃液和人工肠液环境下吸附剂对AFB1 的吸附能力;(2)吸附剂对AFB1 的结合速率;(3)吸附剂结合AFB1 形成的复合体的稳定性;(4)240 只1 日龄雄性AA 肉仔鸡,随机分为8 个处理,比较吸附剂对摄入AFB1 肉仔鸡生长性能及血清蛋白水平的影响。【结果】(1)5 种酸碱条件下吸附剂结合AFB1 的能力大小顺序为B>C>A;(2)吸附剂B 在10 min 内对AFB1 吸附率达到97.69 %,且60 min 内一直处在96.03 %以上,而吸附剂A、C 在60 min 内对AFB1 的吸附能力不稳定;(3)与吸附剂A、C 相比较,体外条件下吸附剂B 与AFB1 形成的复合体解吸附率最低;(4)与基础组比较,AFB1 组肉仔鸡采食量、体重增加显著下降,料重比显著增加(P<0.05),血清总蛋白(TP)、白蛋白(ALB)、球蛋白(GLOB)水平均显著下降(P<0.05)。3 种吸附剂均能提高肉仔鸡生长性能,吸附剂B 能显著改善摄入AFB1 污染日粮(98.98 μg·kg-1)的肉仔鸡血清蛋白水平的降低,添加吸附剂A 或C 效果不显著。【结论】3 种吸附剂对AFB1 均有一定的吸附作用,吸附剂B 的作用效果优于吸附剂A 和吸附剂C。结果提示,将吸附剂B 应用于被AFB1 污染的家禽饲料中,与其它霉菌毒素管理措施相结合,能降低AFB1 对肉仔鸡的危害。
【英文摘要】【Objective】 In this study, the in vitro sorption of aflatoxin B1(AFB1) onto different absorbents was characterized,and the in vitro assay result was verified by comparing growth performance and serum protein levels of broilers exposed toaflatoxin-contamination feed. Three absorbents were product A (the main component is yeast cell extracts), product B (the maincomponent is HSCAS) and product C (the compound of yeast product and HSCAS). 【Method】 AFB1 binding capacity by threeadsorbents at pH 2.0, 6.0, 8.0, simulated gastric fluid and simulated intestinal fluid condition, were compared. AFB1 binding speed bythree absorbents in vitro conditions were compared. Stability of absorbent-AFB1 complexes in vitro conditions were studied. A totalof 240 broilers were assigned to 8 treatments, and the effects of three adsorbents on growth performance and serum protein levelswere compared. 【Result】 Product B showed the highest in vitro affinity for AFB1, followed by product C and product A. Product Bbounded 97.69% of the AFB1 in solution in 10 min, and it remained over 96.03% in 60 min at pH 8.0. Product A and product C didnot show the same efficacy as product B. The product B-AFB1 complex was much stronger than the other two kinds of complex invitro condition. Feed intake and weight gain decreased (P<0.05) and feed gain ratio increased (P<0.05) in the treatment fedaflatoxin-contaminated feed as compared with the control. Serum total protein (TP), albumin (ALB), globulin (GLOB) levels weresignificantly decreased (P<0.05). Product B (0.15%) increased growth performance and improved serum protein levels, product Aand product C did not show so effectively as product B. 【Conclusion】 Three absorbents all showed binding capacity for AFB1 insome extent and product B could bind AFB1 more effectively than products A and C. These results indicated that product B couldalleviate some of the toxic effect in broilers. It might prove to be beneficial in the management of aflatoxin-contaminated feedstuffsfor poultry.

【题目】Low cost, portable detection of gold nanoparticle-labeled microfluidic immunoassay with camera cell phone
【中文关键词】无

【英文关键词】Camera phone / Detection / Gold nanoparticle / Immunoassay / Microfluidics
【中文摘要】无
【英文摘要】This paper describes the use of camera cell phone to detect the gold nanoparticle-labeledimmunoassay results on microfluidic chip. On-chip heterogeneous immunoassaybetween anti-human IgG and human IgG (hIgG) was performed and the results wereamplified by gold nanoparticle-enhanced silver staining to transform the nano-scaleprobe into detectable silver precipitation film. The detection results obtained by cameraphone showed good correlation with the concentration of hIgG. This detection scheme issimple, low cost and easy to use and has significant promise for portable diagnosis andpoint of care testing on microfluidic platform.

【题目】Micropumps actuated negative pressure injection for microchip electrophoresis
【中文关键词】无
【英文关键词】Integrated micropump / Microchip electrophoresis / Negative pressure pinched
injection
【中文摘要】无
【英文摘要】A simple negative pressure pinched sample injection method was presented. Thismethod combined diaphragm micropumps and a single voltage supply to generatecontrollable well-defined sample plug, and led to effective electrophoresis separation. Thepinched plug was found to be favorable for obtaining representative and reproducibleresults that the RSD of the migration time and peak height of sodium fluorescein were0.5 and 2.1%, respectively (n525). The established method had been applied inseparation of amino acid samples. This method has the advantages of well-defined plug,free sample bias effect, high reproducibility and convenience of controlling the negativepressure by the integrated pumps on the microchip. In addition, the single high voltagesupply and the world-to-chip interface simplified the instrumentation, which is of benefitto the minimization and automation. These advantages demonstrate the potential of thismethod for a wide range of applications.

【题目】A microfluidic device integrated with multichamber polymerase chain reaction and multichannel separation for genetic analysis
【中文关键词】无
【英文关键词】Microfluidic
Parallel analysis
Multichamber polymerase chain reaction
Pathogen detection
Genotyping
【中文摘要】无
【英文摘要】This work describes a microfluidic device integrated with multichamber polymerase chain reaction (PCR)and multichannel separation for parallel genetic analysis. The microdevice consists of three functionalunits: temperature control, multiple

PCR (four chambers PCR), and multiple channel separation (four separationchannels, each channel connected to a PCR chamber). Platinum (Pt)/titanium (Ti) microheater wasused to ensure homogeneous temperature field, and Pt-chip sensor was used for temperature monitoring.The interface between chip-PCR and chip separation was simplified by connecting the PCR chamber withseparation channel directly. After chip-PCR, PCR products were introduced into parallel separation channelsfor subsequent separation/detection by applying an electric field automatically. This microdevicewas successfully applied for detection of pathogens including hepatitis B virus (HBV) and Mycobacteriumtuberculosis (MTB), and genotyping of human leucocyte antigen (HLA)-B27 as well, demonstrating thefeasibility of the integrated microdevice for parallel genetic analysis

【题目】A simple photolithography method for microfluidic device fabrication using sunlight as UV source

【中文关键词】无

【英文关键词】Microfabrication Photolithography
Sunlight-photolithography

【中文摘要】无

【英文摘要】A straightforward method for microfluidicdevices fabrication using sunlight as the ultraviolet (UV)source is established in this work. This method is based onphotolithography, but obviates the need for specialized UVexposure facility. Substrates coated with photoresist wereplaced directly under sun in a perpendicular direction to thesunlight for exposure. Exposure conditions were optimizedfor patterning features with different kinds of photoresist,photoresist of different thicknesses and dimensions.Exposure time can be adjusted to obtain designed featureson a mask with good lateral structure according to theenergy measured by UV meter (with a constant intensity ofUV in sunlight). Masters produced under optimum exposureconditions were used for the fabrication of severalmicrofluidic devices with different materials, structures, orfunctions. Resultant devices were shown eminently suitablefor microfluidic applications such as electrophoreticseparation, multiple gradient generator, and pneumaticvalve-based cell culture. This photolithographic method issimple, low cost, easy to operate, and environmentalfriendly. Especially, the masters can be obtained in parallelsimultaneously, which is suitable for chip fabrication formass production. It is also more attractive for the laboratories,in which the support for photolithographic facility isnot available.

【题目】Binding Capacity for Aflatoxin B1 by Different Adsorbents

【中文关键词】无

【英文关键词】adsorbent, AFB1, absorption efficacy

【中文摘要】无

【英文摘要】In this article, in vitro adsorption of aflatoxin B1 (AFB1) onto different adsorbents was characterized and the result wasverified by comparing the growth performance and serum protein levels of broilers exposed to aflatoxin-contamination feed.Main components of adsorbents selected were yeast cell extracts (Product A), HSCAS (Product B), and a mixture of yeastproduct and HSCAS (Product C), respectively. A total of 240 broilers were assigned to eight treatments, and the effects ofthree types of adsorbents on growth performance and serum protein levels were evaluated. Results indicated that ProductB had the highest in vitro affinity for

AFB1, followed by Product C and Product A. Product B bound 97.69% of the AFB1 insolution in 10 min, and it remained over 96.03% in 60 min at pH 8.0. The B-AFB1 complex was much stronger than the othertwo complexes in vitro condition (P < 0.05). Feed intake (FI) and average daily gain (ADG) decreased (P < 0.05) and feed gainratio increased (P < 0.05) in the treatment fed aflatoxin-contaminated feed versus treatment on the basal feed. Serum totalprotein (TP), albumin (ALB), and globulin (GLOB) levels were significantly decreased (P < 0.05). Product B (0.15%) increasedgrowth performance and improved serum protein levels, Product A and Product C were not as effective as Product B. Threeadsorbents tested here had sufficient potential to AFB1 in some extents and Product B could bind AFB1 more effectively thanProduct A and Product C. These results indicated that Product B could alleviate some of the AFB1 toxic effect in broilers.

【题目】Screening and determination of melamine residues in tissue and body fluid samples
【中文关键词】无
【英文关键词】Melamine
Enzyme-linked immunosorbent assay
Gas chromatography – mass spectrometry
Quantification
【中文摘要】无
【英文摘要】Melamine is a chemical product that was sporadically mixed into animal feeds to boost protein content.Excessive melamine in animal feed can induce renal failure and even death in animals. Theresidue of melamine in edible animal products also threatens human health. Currently, there is noreal-time and high throughput method to detect residual melamine in animal tissues. Successful developmentof such methods is very important for fast and on-site screening of melamine residue inanimal tissues to eliminate the potential threat to human health. Here we demonstrate the detectionof residual melamine from swine and chicken tissues and body fluids using indirect competitiveenzyme-linked immunosorbent assay (ELISA) method. A detection sensitivity of 0.5 gmL − 1 and alimit of detection of 0.05 gmL − 1 were achieved with this method. A gas chromatography – massspectrometry (GC – MS) method was also developed to act as a confirmatory and quantitative procedurefor the ELISA results. The limits of quantitation (LOQ) of were 0.01 gg − 1 and 0.005 gmL − 1for tissues and body fluids, respectively. The two methods showed good agreement (r2 > 0.992). Themethod developed was performed on samples of tissues from chickens fed with melamine-spiked feed.

【题目】不同吸附剂对黄曲霉毒素B1 吸附效果的研究
【中文关键词】吸附剂;AFB1 ;吸附效果;肉仔鸡
【英文关键词】absorbent ; AFB1 ; absorption efficacy ; broilers
【中文摘要】作者通过体外试验和动物饲养试验,研究3 种吸附剂对黄曲霉毒素B1 (AFB1) 的吸附效果。3 种吸附剂分别是吸附剂A(主成分为酵母培养物提取物) 、吸附剂B(主成分为水合铝硅酸盐) 、吸附剂C(为复合物,主成分为酵母培养物及水合铝硅酸盐) 。体外试验研究p H 为2. 0 、6. 0 、8. 0 的磷酸盐缓冲液(PBS 溶液) 、人工胃液和肠液环境下3 种吸附剂对AFB1 的吸附能力,比较p H 8. 0 条件下3 种吸附剂对AFB1 的结合速率。结果表明,各种条件下吸附剂B 的吸附能力最强。p

H 8. 0 条件下,吸附剂B 在10 min 内对AFB1 吸附率达到97. 69 % ,且60 min 内吸附率一直处在96. 03 %以上。吸附剂A 和吸附剂C 对AFB1 的作用效果较吸附剂B 弱。动物饲养试验选择240 只1 日龄健康雄性AA 肉仔鸡,随机分为8 个处理,每个处理3 个重复,每个重复10 只鸡,饲养周期21 d。结果表明,与基础组相比较,AFB1 组(污染水平为98. 8 μg/ kg) 肉仔鸡生长性能和肝脏功能发生显著变化,吸附剂A、B、C 均能不同程度地缓解AFB1 对肉仔鸡生长性能和肝脏损伤方面的毒性作用,与吸附剂A、C相比,吸附剂B 能更有效的防止肉仔鸡黄曲霉毒素B1 中毒。结果提示,使用吸附剂B 能很好的降低AFB1 对肉仔鸡的危害程度。

【英文摘要】The aim of this paper was to study the efficacy of three absorbent s to sorb aflatoxin B1 (AFB1) . The main com2ponent of product A is yeast product , the main component of product B is HSCAS , and product C is the compound of yeastproduct and HSCAS. I n vi t ro t rial , AFB1 binding capacity by three sorbent s at different in vi t ro condition and AFB1 bindingspeed by three sorbent s at p H 8. 0 in vi t ro condition were compared. Product B showed the highest in vi t ro affinity for AFB1 ,and the rate of sorption reached to 97. 69 % in 10 min and it remained over 96. 03 % in 60 min at p H 8. 0. Product A and prod2uct C did not showed so efficacy as product B. I n vi vo t rial , a total of 240 broilers were assigned to 8 t reatment s (3 pens of 10broilers per t reatment) . Af ter 21 d , the aflatoxin2contaminated feed significantly decreased the growth performance and the liv2er function of broilers. The three product s tested alleviated the adverse effect s caused by aflatoxin , but compared with productA and C , product B could alleviate some of the toxic effect s of AFB1 more effectively.

【题目】改良彗星实验检测黄曲霉毒素B1 致雏鸭DNA 损伤
【中文关键词】黄曲霉毒素B1 ;彗星实验;DNA 损伤;雏鸭
【英文关键词】aflatoxin B1 ; comet assay ; DNA damage ; duckling
【中文摘要】试验旨在通过改良彗星实验检测黄曲霉毒素B1 (aflatoxin2B1 ,AFB1) 对雏鸭肝细胞DNA 损伤的影响。雏鸭经AFB1 灌胃染毒,2 h 后分离肝细胞,并通过改良彗星实验测定DNA 损伤。结果显示,AFB1 能够导致雏鸭肝细胞DNA 损伤,表现为尾长、尾部DNA 百分含量、尾矩、Olive 尾矩等彗星参数与空白和溶剂对照组相比显著增加(P < 0. 05) 。表明改良彗星实验能够用于AFB1 导致肝细胞DNA 损伤的检测,试验还提示,在体肝细胞彗星实验能够作为雏鸭AFB1 暴露的遗传毒性标志物。
【英文摘要】:The present study was to use modified comet assay to detect DNA damage induced by aflatoxin B1 (AFB1) in duckling hepatic cells. Ducklings were administered orally with AFB1 and the samples of liver cells were isolated at 2 h post treatment . The modified comet assay was performed and the DNA damage was determined by an increase in the comet parameters in tested animals. The result s showed that AFB1 exposure could significantly increase tail length , the percentage of tailDNA (tail DNA %) , tail moment and Olive tail moment compared with blank and solvent cont rol , indicating that the assay can be used for the assessment of primary DNA damage caused by AFB1 . The result also suggested that the modified comet assay performed liver cells was a valuable genotoxic marker for exposure to AFB1 in duckling.

【题目】高速逆流色谱法分离制备蓖麻籽中的蓖麻碱
【中文关键词】蓖麻籽;蓖麻碱;两相溶剂体系;高速逆流色谱;纯化
【英文关键词】caster bean;ricinine;two-phase solvent system;high-speed counter-current chromatography (HSCCC); purification
【中文摘要】利用高速逆流色谱法对蓖麻籽中蓖麻碱粗提物进行纯化,以液相色谱对纯化结果进行检测,用质谱、核磁对纯化产物进行结构确定。去壳后的蓖麻籽经过石油醚- 乙醚(2:1,V/V)脱脂,以95% 乙醇索式提取,所得产物浓缩、冻干后得到蓖麻碱粗提物。采用三氯甲烷- 甲醇- 水(2:1:1,V/V)两相溶剂体系对粗提物进行高速逆流色谱纯化一次进样100mg,可得到74mg 样品。纯化所得主要组分经面积归一化法确定其纯度达到9.62%。质谱、核磁验证纯化产物为蓖麻碱。高速逆流色谱可用于大量制备高纯度蓖麻碱。
【英文摘要】The preparative high-speed counter-current chromatography (HSCCC) method was applied to isolate and purifyricinine from the crude extract of Ricinus cammunis L. seeds, and the purity of purification product was measured by HPLC andits structure was analyzed by MS and NMR. After being defatted using a mixture of petroleum ether and ethyl ether (2:1, V/V) twice, caster bean seeds without shell was subjected to ricinine extraction using 95% ethanol in a Soxhlet extractor followed by vacuum concentration and freeze drying. The preparative HSCCC was performed using a two-phase solvent system composedof chloroform, methanol and water (2:1:1, V/V). A total amount of 70 mg of ricinine with over 99.62% purity was obtained from 100 mg of the crude extract. Ricinine was identified as the main component in the crude extract by MS and NMR. The preparative HSCCC is suitable for large-scale preparation of ricinine with high purity.

【中文摘要】以棕榈粕为底物,用中性β-甘露聚糖酶降解得到甘露寡糖粗品,并对其采用纸层析法分离纯化其中的各组分,最终得到甘露二糖、甘露三糖和甘露四糖三种寡糖组分。通过气相色谱(GC)检测可知,这三种寡糖中只含有甘露糖和葡萄糖,且甘露糖和葡萄糖的比例依次为119 ∶1、318 ∶1和318 ∶1。采用基质辅助激光解析电离飞行时间质谱(MALD I-TOF-MS)测定分离得到的三种寡糖的结构。

【题目】免疫亲和- 光化学柱后衍生高效液相色谱 荧光法测定花生粕中黄曲霉毒素的研究
【中文关键词】免疫亲和柱; 光化学衍生; 高效液相色谱; 黄曲霉毒素; 花生粕
【英文关键词】immunoaffinity column; photochemical derivatization; HPLC; Aflatoxin; peanut residues
【中文摘要】研究建立了光化学柱后衍生- 高效液相色谱(HPLC) - 荧光检测器测定花生粕中黄曲霉毒素B1、B2、G1 和G2 的方法。甲醇/ 水提取样品中黄曲霉毒素B1、B2、G1 和G2, Afla- P 黄曲霉毒素免疫亲和柱净化, 经高效液相色谱分离后, 由光化学柱后衍生, 通过荧光检测器测定。结果表明: 在优化条件下, 黄曲霉毒素B1、B2、G1 和G2 的检出限分别为1.0、0.3、1.0 μg/ kg 和0.3 μg/ kg, 回收率为67.0 % ~117 %, 相对标准偏差(RSD) 低于18.2 %。该方法简便快速、灵敏度高、重现性好, 满足饲料用花生粕中黄曲霉毒素检测的需要。
【英文摘要】A method for determination of Aflatoxin B1, B2, G1 and G2 by using photochemical derivatization-HPLCfluorescencedetector was developed.The Aflatoxin B1, B2, G1 and G2 in samples were extracted by methanol / water andwere cleaned up by immuno affinity columns.The separation of Aflatoxin B1, B2, G1 and G2 was conducted by HPLC, thedetermination was carried out by fluorescence detector after photochemical derivatization.Under optimum conditions, thelimits of determination of Aflatoxin B1, B2, G1 and G2 were 1.0, 0.3, 1.0 μg/kg and 0.3 μg/kg respectively, the recoveries of analytes were from 67.0 % to 117 % and the relative standard deviations were below 18.2 %.The method is simple, high sensitive and good repeatability, which is suitable for the determination of Aflatoxin in peanut residues.

【题目】气相色谱2质谱法确证分析饲料中6 种利尿剂的研究
【中文关键词】利尿剂; 配合饲料; 气相色谱2质谱
【英文关键词】Diuretics ; Animal feed ; GC2MS
【中文摘要】研究建立了气相色谱2质谱确证分析配合饲料中依他尼酸、氢氟噻嗪、氯噻嗪、呋噻米、氯噻酮和氢氯噻嗪等6 种利尿剂的方法。本研究用磷酸盐缓冲液和甲醇混合提取液提取饲料中6 种利尿剂, 通过液液提取净化, 在碳酸钾催化下用碘甲烷衍生, 气相色谱2质谱定性和定量分析。确定了磷酸盐缓冲液和甲醇的提取体系, 优化了6 种利尿剂的色谱分离条件和质谱检测条件。在优化条件下, 6 种利尿剂线性范围为0. 05~1. 0 μgPmL , 线性相关系数高于0. 99 , 方法的定量限为0. 5 μgPg。在饲料样品中, 不同添加浓度水平回收率高于57. 6 % ,相对标准偏差低于12 %。该方法适用于饲料样品中6 种利尿剂的定性和定量分析。
【英文摘要】A stable method for the confirmation analysis of six kinds of diuretics including ethacrynic acid , hydroflumethiazide , furosemide , chlorthalidone , chlorothiazide and ydrochlorothiazide in animal feed by gas chromatography mass spectrometry was developed. The diuretics in animal feed were extracted with phosphate buffer and methanol , thecleaning procedure was carried out by liquid2liquid extraction , the diuretic derivatives were gained in acetone by using methane iodide , and the determination was performed by GC2MS. The extraction solution and the parameters of GC2MS for diuretics were optimized. Under optimum condition , there is a good linear correlation (the correlation coefficient isabove 0199) in the range of 0105~110 μgPmL. The limits of quantitation were 015 μgPg. The recoveries of all diuretics in animal feed were above 5716 % , the relative standard deviation was below 12 %. The method is suitable for the determination of the diuretics in animal feed , and it possesses some advantages including simple operation procedure , high sensitivity and precision.

【题目】维生素E对赭曲霉毒素A 毒性的缓解作用研究
【中文关键词】小鼠 脂质过氧化 赭曲霉毒素A(OTA) 维生素E
【英文关键词】无
【中文摘要】研究不同水平赭曲霉毒素A 对小鼠肾组织脂质过氧化的影响,同时观察维生素E 对赭曲霉毒素A(OTA) 引起小鼠肾毒性作用的影响。将体质量为22~25 g 健康的108 只ICR 雄性小鼠随机分为9 组,每组12 只鼠,经灌胃给药。在第7 天试验结束后采集小鼠血清和肾组织,测定血清和肾组织中丙二醛(MDA) 含量,超氧化物歧化酶(SOD) 和谷胱甘肽过氧物酶(GSH - Px) 酶活力单位。试验结果表明,OTA 可引起小鼠肾组织脂质过氧化反应加剧,降低组织和血清中GSH - Px 活性,而添加维生素E 可有效缓解小鼠肾组织脂质过氧化反应的程度,显著提高肾组织和血清中GSH - Px 活性,同时使SOD 活性呈

升高趋势,最终提高机体的抗氧化能力。

【题目】液相色谱2串联质谱法同时检测饲料中7种精神类药物
【中文关键词】液相色谱-串联质谱; 饲料; 精神类药物
【英文关键词】Liquid chromatography2tandem mass spectrometry; Feed; Mental drug
【中文摘要】建立了液相色谱2串联质谱同时检测饲料样品中7种精神类药物(硝西泮、奥沙西泮、氯丙嗪、异丙嗪、地西泮、奋乃静、硫利达嗪)的方法。通过对提取溶剂、净化等预处理条件及LC2MS/MS分析条件的优化,可以同时检测饲料中7种违禁精神类药物。饲料样品经乙腈/水(9∶1, V /V)提取后,过MCX固相萃取柱净化,氮吹至干,用1 mL乙腈/水(2∶8, V /V)溶解后测定,采用SRM模式进行定性与定量分析。7种精神类药物在饲料中的回收率为53. 9% ~110. 2%; 相对标准偏差为3. 4%~18. 4%;硝西泮、奥沙西泮、氯丙嗪、异丙嗪的检出限为1. 0 ng/g;对地西泮、奋乃静、硫利达嗪的检出限为5. 0 ng/g。结果表明,本方法可用于饲料中7种精神类药物的测定。
【英文摘要】A method was established for the simultaneous determination of seven mental drugs yLC2MS/MS.In this method, the conditions of app rop riate extracting solvent, SPE cartridge and LC2MS/MS were op timized. The drugs were extracted with acetonitrile /water (9 ∶1, V /V) , and then purified by MCX solid2phase extraction (SPE) column. The elution was evaporated by nitrogen blow, dissolved in acetonitrile / water (2∶8, V /V) and analyzed by LC2MS/MS. The limit of detection (LOD) was 1. 0 ng/g of nitrazepam, oxazepam, p romethazine and chlorp romazine, and 5. 0 ng/g of diazepam, perphenazine; and thioridazine.The recoverieswere 53. 9% - 110. 2% , and RSDswere 3. 4% - 18. 4%. Results showed that this developed method was very reliable for the determination of seven mental drugs in feeds.

【题目】用HPLC- MS/MS 研究动物毛发中 克伦特罗的残留及代谢规律
【中文关键词】高效液相色谱串联质谱; 猪毛发; 盐酸克伦特罗; 代谢
【英文关键词】LC- MS/MS; swine hairs; clenbuterol; residue elimination
【中文摘要】研究建立了高效液相色谱- 串联质谱(HPLC- MS/MS) 测定毛发中盐酸克伦特罗残留的方法。猪毛发以0.1 moL/ L 盐酸溶液提取, MCX 固相萃取柱净化, 流动相溶解定容。以SB- C18 柱为分离柱, 1%乙酸水溶液和甲醇(60∶40,V∶V)作为流动相, MS/MS 进行定性和定量分析。在优化条件下的最低检出限为0.05 μg/ kg, 定量限为0.2 μg/ kg。毛发样品中添加不同浓度盐酸克伦特罗, 测得回收率在79.0 %~86.2 %之间, 变异系数均低于15.2%。应用该方法研究了盐酸克伦特罗在猪毛发中的代谢并初步探讨其代谢机理。结果表明:在较高饲喂浓度(10 mg/ kg)时, 用药5 d 后, 黑色猪毛发有少量盐酸克伦特罗残留, 而白色猪毛发中未检出。从第7 天起猪毛发中盐酸克伦特罗蓄积量逐渐增加, 最高蓄积浓度为4852.5 μg/ kg。
【英文摘要】A method for determination of clenbuterol hydrochloride residue in swine hairs by using high performance liquid chromatography coupled with tandem mass spectrometry was developed. The clenbuterol hydrochloride was extracted from swine hair samples by employing 0.1 mol/L hydrochloride acid aqueous solution, the cleaning procedurewas performed by MCX solid phase extraction cartridge. The clenbuterol hydrochloride was determined by HPLC- MS/MSon SB- C18 column with 1% acetic acid aqueous solution : methanol (60 ∶40) as the mobile phase. Under optimumconditions, the recoveries of different quantities of clenbuterol hydrochloride in swine hairs were from79.0 % to 86.2 %, white the relative standard deviation was below 15.2%. The limit of determination and limit of quantitative for the method were 0.05 μg/kg and 0.20 μg/kg, respectively. The developing method was applied to study the metabolize behavior andmechanism of clenbuterol hydrochloride in swine hair. The result indicated that a little of clenbuterol hydrochloride wasfound in black hairs of swine which were feed clenbuterol hydrochloride after five days while no found in white swine hair. From the seventh day, the content of clenbuterol hydrochloride in swine hairs was increased gradually, and the highest content of clenbuterol hydrochloride was 4852.5 μg/kg。

【题目】黄曲霉毒素B1致雏鸭肝脏细胞DNA的损伤效应
【中文关键词】黄曲霉毒素B1;DNA损伤;彗星试验;雏鸭
【英文关键词】aflatoxin B1; DNA damage; comet assay; duckling
【中文摘要】【目的】(1)研究黄曲霉毒素B1(AFB1)不同染毒水平(3, 30, 300 μg · kg-1 BW)染毒后,在不同时间点导致雏鸭肝细胞DNA损伤情况;(2)探明AFB1染毒剂量及染毒时间与雏鸭肝细胞DNA损伤之间的关系,为AFB1遗传毒性提供研究模型。【方法】96只雄性北京鸭雏鸭,随机分为16组,每组6只。第1组为对照组,第2至6组为低剂量(染毒)组、第7至11组为中

剂量(染毒)组、第12至16组为高剂量(染毒)组。对照组、低剂量组、中剂量组、高剂量组雏鸭分别灌胃25% DMSO水溶液,0.25,2.5,25μg·mL-1溶液各1 mL,对照组于灌胃1 h后,各剂量染毒组分别于灌胃染毒1、2、8、24、48 h用彗星试验检测肝细胞DNA损伤。【结果】试验表明,雏鸭对于AFB1导致的肝细胞DNA损伤非常敏感,肝细胞DNA损伤程度与AFB1摄入量以及摄入时间有关。经口染毒2 h左右DNA损伤达到高峰,所有染毒组在尾长、尾部DNA百分含量、尾矩、Olive尾矩等指标上均显著高于对照组(P<0.05);随着AFB1染毒剂量增加,DNA损伤程度加深、持续时间延长。【结论】(1)AFB1致雏鸭肝细胞DNA损伤的效应非常强,低剂量(3 μg〃kg -1 BW)AFB1暴露就能够引起雏鸭肝细胞DNA发生显著损伤。(2)经口染毒AFB1 2 h后雏鸭肝细胞DNA损伤达到高峰,此时DNA损伤程度与AFB1暴露之间的量效关系最为明显。(3)雏鸭是研究AFB1遗传毒性的一个良好动物模型,彗星试验能够反映AFB1致雏鸭肝细胞DNA损伤的量效关系。

【英文摘要】【Objective】 Aflatoxin B1 (AFB1) is one of the most potent naturally occurring carcinogens and classified as a group I carcinogen. This study has two objectives: (1) To evaluate the effect of 3, 30, 300 μg·kg-1 BW on DNA damage in hepatic cells in Beijing ducklings at different times after administrated by oral feeding. (2) To study the relationship between the level of DNA damage and concentration of AFB1, time after exposed to AFB1, to provide research model for genotoxicity of AFB1. 【Method】 Ninety-six male Beijing ducklings were randomly divided into 16 groups with 6 ducklings in each one. Each duckling in group 1 was administered orally with 1 ml 25% DMSO solution as control, and low (group 2 to 6), moderate (group 7 to 11), high (group 12 to 16) AFB1 exposure groups were given 1 ml with 0.25, 2.5, 25 μg·mL-1 25% DMSO solution by gavage, respectively. The modified comet assay was performed at 1 h in control group, and at 1, 2, 8, 24, 48 h in AFB1 exposure groups on hepatic cells after AFB1 administration. 【Result】 The results showed that ducklings were sensitive to hepatic DNA damage induced by AFB1, and the level of DNA damage was associated with concentration and time after AFB1 intake. DNA strand breaks reached peak value at 2 h of exposure, and all different doses of AFB1 could induce significantly higher tail length, tail DNA%, tail moment, Olive tail moment than in control group (P<0.05). With AFB1 concentration increasing, the duration of DNA damage prolonged, and under thecondition of the same treatment time, the DNA damage was more serious. 【Conclusion】 From the results, three conclusions were drawn as follows: (1) Ducklings are sensitive to DNA damage in live cells induced by AFB1, and low level (3 μg·kg-1 BW) exposure of AFB1 can induce significantly hepatic DNA damage in ducklings. (2) The level of DNA damage reached the peak at 2 h after a single oral administration of AFB1, and at this time the dose-effect relationship was obvious in this experiment. (3) Duckling is an ideal animal model for study of AFB1 genotoxicity, and comet assay is an useful tool for monitoring the hepatic DNA damage induced by AFB1 in ducklings.

【题目】Integrated microfluidic immunoassay for the rapid determination of clenbuterol

【中文关键词】无

【英文关键词】microfluidic chip

【中文摘要】无

【英文摘要】An integrated microfluidic immunoassay system was established for high throughput analysis ofclenbuterol. This system consisted of an integrated microchip and a linear confocal laser inducedfluorescence (LIF) scanner. The microchip was composed of three layers: a fluidic channel layer,a PDMS membrane layer and a pneumatic control layer. The multi-layer chip was integrated with36 pneumatic micro-valves and multiple micro-pumps to realize the flexible reagent delivery,facilitating the automatic assays with less consumption of samples and reduced analysis time. Thehomemade LIF scanner was able to simultaneously detect multi-channels and provide the potentialcapability of high throughput assays. The performance of the system was demonstrated by thedetermination of clenbuterol, one of the most widely used b-agonists. Under the optimal conditions,the linear range and the limit of detection of clenbuterol were 0 5.0 ng mL 1 and 0.088 ng mL 1,respectively. The recovery rates determined with pig urine samples of 1.0 ng mL 1 and 2.0 ng mL 1were 98.74% and 102.51% (n ¼ 3), respectively. The total detection time was less than 30 min. Thesystem had the potential application for rapid detection of multiple b-agonists in clinical,pharmaceutical and chemical analyses.

【题目】微波消解-石墨炉原子吸收光谱法测定花生中镉含量
【中文关键词】花生; 镉; 微波消解; 石墨炉原子吸收法
【英文关键词】Peanuts; Cadmium; Microwave digestion; Graphite furnace atomic absorption spectrometry
【中文摘要】本文研究了高脂肪高蛋白材料花生中镉含量测定方法。采用微波消解法处理花生样品,使用石墨炉原子吸收光谱法测定花生中镉含量。从广东、湖北和辽宁3省随机抽取收获的 9 个花生样品进行检测,镉含量范围为0.061~0.529mg /kg,RSD为1.22%~8.75%(n = 6,c = 0.859~7.409ng /mL) 。该方法检出限为0.000 19mg /kg,加标回收率为95.4% ~ 100.1%,具有灵敏、快速、准确的特点,可用于高脂肪高蛋白样品中镉含量的测定。
【英文摘要】A method for determination of cadmium in high fat and high protein peanut samples was established by graphite furnace atomic absorption spectrometry and microwave digestion for pretreatment. Cadmium content in peanuts from Guangdong, Hubei and Liaoning provinces was analyzed by this method. Results showed that the cadmium content was 0.061~0.529mg /kg with RSD 1.22% ~8.75%(n = 6,c = 0.859 ~ 7.409ng /mL) . The minimum amount could be detected by this method was 0.000 19mg /kg and the recovery rate was between 95.4% to 100.1%. This method was sensitive,fast and precise in testing cadmium content in high fat and high protein peanuts

【题目】土壤类型与作物基因型对花生籽实镉积累的影响
【中文关键词】土壤类型;基因型 ;花生; 籽实; 镉; 积累
【英文关键词】soil type; genotype; Arachis hypogaea L.; kernel; Cadmium; accumulation.
【中文摘要】选择花生主产区的棕壤和潮土为供试土壤,种植面积最大的白沙1016、花育22和湛油27基因型花生(Arachis hypogaea L.)为供试作物,采用不添加Cd和添加Cd(1.5 mg • kg-1)处理进行盆栽试验,研究了土壤类型和作物基因型对花生籽实Cd积累的影响.结果表明:无论何种土壤中,3种基因型花生籽实Cd含量在未加Cd处理下均低于国家食品安全标准0.5

mg • kg-1(GB2762-2005),而在加Cd处理下均高于食品安全标准.无论土壤未加Cd处理还是加Cd处理,3种基因型花生籽实Cd含量在同种土壤中差异显著(P < 0.05),均表现为湛油27>白沙1016>花育22,且棕壤土中的花生籽实Cd含量皆高于潮土.棕壤土中花生籽实吸收积累的Cd总量显著高于潮土(P < 0.05),这与棕壤中较高的肥力水平和较多的生物可利用性有效态Cd有关.3种花生基因型中,湛油27花生籽实对土壤Cd积累能力最强.尽管加Cd处理提高了湛油27花生籽实产量,但籽实Cd积累的不利效应远远超过其产量的增加效应.3种基因型花生籽实Cd生物富集系数在未加Cd处理下均大于1.00,而在加Cd处理下大多小于1.0,表明花生籽实对土壤中固有Cd的累积能力较强,且籽实对土壤Cd的生物富集能力随土壤Cd处理含量的增加而降低

【英文摘要】A pot experiment was conducted to elucidate the effect of soil types and genotypes on Cd accumulation in kernels of peanut(Arachis hypogaea L.)without or with Cd spiked at 1.5 mg • kg-1 in the soil. Three peanut genotypes (Baisha1016, Huayu22 and Zhanyou27) widely grown and two soil types (burozem and fluvo-aquic soil) broadly distributed in the main peanut producing areas in China were used. The results showed that no matter what kind of soil, Cd concentrations in kernels of three peanut genotypes under the condition of non-Cd spiked control were lower than 0.5 mg • kg-1(Maximum levels of contaminants in foods in China, GB2762-2005).However, Cd concentrations in kernels of all genotypes under the condition of Cd spiked treatment were higher than 0.5 mg • kg-1. Both in the conditions of non-Cd spiked control and Cd spiked treatment, Cd concentrations in kernels of three peanut genotypes under the same condition of soil had significant differences (P < 0.05). The ability of Cd accumulation in kernels of different genotypes of peanut was Zhanyou27>Baisha1016>Huayu22. Cd concentrations in kernels of all genotypes under the condition of burozem were higher than that of fluvo-aquic soil. In addition, total Cd uptake in kernels of all genotypes under the condition of burozem were significantly (P < 0.05) higher than that of fluvo-aquic soil. These were related with the higher fertility levels and the more effective bioavailability of Cd in burozem. Among three genotypes of peanut, the strongest Cd accumulation ability was found in the kernel of zhanyou27 peanut. Although Cd spiked treatment increased the kernel biomass of zhanyou27 genotype, the adverse effect of Cd accumulation in kernels was far more than the increasing effect of its production. Cd bioaccumulation factors in kernels of three peanut genotypes under the condition of non-Cd spiked control were higher than 1.0. By contrast, most of Cd bioaccumulation factors under the condition of Cd spiked treatment were lower than 1.0. These showed that peanut kernels had the stronger accumulation abilities to inherent Cd in soils and the Cd bioaccumulation ability in peanut kernel decreased with the increasing of Cd treatment in soils.

【题目】不同土壤类型对花生籽实镉积累特性的影响

【中文关键词】花生籽实;土壤类型;镉;棕壤;潮土;生物富集量
【英文关键词】peanut (Arachis hypogaea L.) kernel; soil type; Cd; burozem; fluvo-aquic soil; bioaccumulation capacity

【中文摘要】为了在不同土壤环境下选育出低镉(Cd)积累型花生品种以提高花生品质, 以‘ 白沙1016号 ’ 品种花生(Arachis hypogaea L.)为供试作物,棕壤和潮土为供试土壤,采用盆栽试验的方法, 研究了2种类型土壤对花生籽实Cd积累特性的影响。结果表明:2种类型土壤条件下的花生籽实生物量差异显著(P<0.05);在供试土壤Cd处理范围内(≤10.0 mg/kg),籽实生物量均随2种土壤Cd处理浓度增加呈“ 低促高抑 ”现象。花生籽实对土壤Cd的生物富集系数均随2种土壤Cd处理增加呈显著降低趋势(P<0.05),且土壤类型间差异不显著。花生籽实Cd含量和Cd生物富集量均随2种土壤Cd处理的增加而显著增加(P<0.05),但两者在棕壤介质中均显著大于潮土(P<0.05)。土壤类型对花生籽实Cd积累差异的影响主要体现在籽实Cd含量和生物富集量方面。而土壤pH、 氧化还原电位(Eh)等均是影响籽实对Cd积累差异的重要因素。

【英文摘要】To select peanut cultivars of low absorption in different soil and improve the quality of peanut, a pot experiment was conducted with one kernel variety of ‘ Baisha 1016 ’ under two soil of types (burozem and fluvo-aquic soil) to study the effect of the two soil types on characteristics of Cd accumulation in kernels of peanut (Arachis hypogaea L.). The results indicated that biomass of peanut kernel in two types of soil tread with the same Cd concentration have no significant at 95% probability .Within the range of soil Cd treatments in the experiment, the biomass of peanut kernels exhibited the phenomenon of “ hormesis effect ” with the increasing of Cd concentrations in soil. Bioaccumulation factor (BF) of Cd in kernels of peanut decreased significantly (P<0.05) with the increasing

of Cd concentrations in soil and there was no significant difference between the two types of soil (P>0.05). Cd contents and bioaccumulation capacity in kernels of peanutincreased significantly (P<0.05) with the increasing of Cd concentrations in soil and were higher in burozem than that in fluvo-aquic soil. The effect of soil type on Cd accumulation in kernels of peanut was mainly reflected in the bioaccumulation capacity of Cd in kernels of peanut.Peanut kernels accumulation ability to Cd in soil was related with the soil Ph,redox potential and so on.

【题目】香菇中镉含量的检测与分析
【中文关键词】镉富集,品种,地区,潮次,形态部分
【英文关键词】cadmium accumulation, variety, region, times of harvest, morphological portion
【中文摘要】为了解影响香菇镉富集的一些因素,对不同品种、不同地区、不同潮次的香菇以及香菇不同形态部分中的镉含量进行了比较研究。结果表明:不同品种香菇、不同地区以及不同潮次香菇中的镉含量具有一定的差异;此外,香菇的不同形态部分中镉的含量也不一样,其镉含量从高到低的顺序为:菌褶>菌盖>菌柄
【英文摘要】As a toxical element, cadmium in Lentinula edodes has been drawn much attention. In order to investigate the accumulation mechanisms of cadmium in Lentinula edodes, the effects of varieties, cultivation regions, times of harvest and morphological portions on accumulation of cadmium in Lentinula edodes have been studied. The results showed that, the distinction of cadmium content would be resulted from all the four factors above. The contents of cadmium in different part of Lentinula edodes fruit body were ranked as follow: gill > cap > stipe.

【题目】不同区域与品种的海带中砷富集特征的差异
【中文关键词】海带; 总砷; 无机砷; 富集规律
【英文关键词】kelp; total arsenic; inorganic arsenic; accumulation regularity
【中文摘要】通过分析不同养殖海域 不同品种海带中无机砷和总砷含量在养殖期间的变化,研究海带中总砷及无机砷的富集规律 结果显示,在生长期内海带对总砷的富集呈增长趋势,而无机砷含量则逐渐降低,其占总砷的比例由3月份1 36% ~ 1.47% 下降到 7 月份的 0.41% ~0.57%; 同一海域、 不同品种的海带对总砷和无机砷的富集具有差异性; 同时期在不同养殖海域采收的同品种海带总砷和无机砷含量差异显著 基于监测数据对海带中的无机砷进行分析,所有海带样品中无机砷含量远低于现行食品卫生标准中的限量要求,不对食用安全性造成影响
【英文摘要】The experiments aim to study the enrichment regularity of inorganic arsenic and total arsenic inkelp by analyzing the variation of inorganic and total arsenic in kelps which are from different maritime regions and different species during their growth. The content of inorganic arsenic is detected by HPLC- AFS,while the content of the total arsenic is examined by hydride atomic fluorescence spectrophotometry in GB /T 5009.11-2003.The results show that the enrichment in kelps of total arsenic displays an increase trend in growing season,whereas the content of inorganic arsenic is decreasing. The percentage of inorganic arsenic in total arsenic decreased from 1.36% 1. 47% (March) to 0.41% 0.57% (July) .The enrichment of inorganic and total arsenic varies from kelp to kelp even they are cultivated in the same maritime region,meanwhile, the same types of kelps have dramatically different contents of inorganic and total arsenic,whichdepends on the variety of maritime regions.Judging from the data,the contents of inorganic arsenic in

all examined kelps are far below the MRL and will have no negative effects on food safety.The study provides relevant theory foundation for food safety and processing.

【题目】海藻中铝的化学形态分析
【中文关键词】海藻; 铝; 形态
【英文关键词】seaweed; aluminium; speciation
【中文摘要】首次对我国主要养殖海藻中的总铝含量进行调查,结果显示海藻中总铝含量差异很大,含量在53 2 ~ 2714. 6 mg /kg,其中坛紫菜中总铝含量最高.利用连续平衡静态浸提法研究了海带和紫菜中铝的化学形态 .研究结果表明,海藻中铝存在多种形态,主要以稳定的、不易被生物体吸收的有机铝(AlONL) 形态存在,占总铝的82.0% ~ 87. 6%,而毒性较高的无机态铝含量很低,占3.75% ~ 4.94% 。本实验进一步证明,以总铝含量作为评价海藻铝食用安全的评价标准具有一定局限性, 亟需针对不同形态铝建立不同限量标准, 对海藻及其制品进行科学的食用安全评价,以保障海藻产业顺利发展。
【英文摘要】The aluminum content in seaweed was first researched in out country.The results showed that thealuminum content ranged from 53. 2 mg /kg to 2 714. 6 mg /kg, especially for laver which had highest averagevalue.The speciation analysis of aluminum was first conducted in seaweed using sequential chemical extraction.There were several forms of aluminum in seaweed and the main speciation was organic aluminum which was stable and not easy to be absorbed by organism.It accounted for 82.5%-87.6% of the total aluminum.The inorganic aluminum which had higher toxicity accounted for only 3.75%-4.94% of the total amount.The present research further proved that it was not enough to use total aluminum as the standard to evaluate the safety of the seaweed, and it was urgent to establish different limitation standards according to different aluminum speciation in order to accurately evaluate the safety of the seaweed and guarantee thehealthy development of the seaweed industry

【题目】加工方式对海带和紫菜中砷及其形态的影响
【中文关键词】加工方式;海带;紫菜;总砷;砷形态
【英文关键词】无
【中文摘要】本文研究了浸泡、油炸、水煮和烘烤四种加工方式对海带和紫菜中总砷及其形态含量的影响,并对其食用安全性进行评价。研究结果表明:浸泡和水煮都能减少海带和紫菜中总砷和四种砷化合物含量。油炸和高温烘烤过程影响砷形态和含量的变化:油炸样品中总砷含量减少,DMA、MMA和无机砷含量变化表现出不一致性;除250°C外,其他温度烘烤的样品总砷含量均增加,DMA、MMA、无机砷含量随着温度的升高而增加,到250°C时最多增加了近3倍,对食用安全性带来一定的影响;在150°C油炸15min和200°C烘烤的样品中有新的砷化合物生成,其结构和毒性尚难确定。 一般常用的加工方式和烹饪方式的热处理温度都在150°C以下,所以水煮、低温油炸和烘烤不会对海带和紫菜的食用安全性造成大的影响
【英文摘要】The aims of experiment are to study the influence on the contents and forms of total arsenic and different arsenic compounds in kelp and Porphyra by different ways of processing including soaking, deep-frying, water cooking and baking, and to evaluate the edible safety of the foods by those cooking methods. The results showed that the contents of four arsenic compounds decreased in nearly all soaking and water cooking samples. Both the form and contents of arsenic changed in the cooking process of deep-frying and high-temperature baking. The contents of total arsenic decreased in deep-fried samples, while increased in baking

samples except for temperaturein 250°C. As for the forms of arsenic compounds, the changes of content of DMA, MMA and inorganic arsenic are discordant in deep-fried samples, while increased with a rise in temperature and increased by nearly 3 tim es at 250°Cin baking samples, which brought some effects to the edible safety. A kind of arsenic compound was found in the fried samples at 150°C for 15m in and the baked samples at 200°C for 7m in, w ith the structure and toxicity hard to be definited. In the traditional methods for processing and cooking, the temperature is almost below 150°C, so, the edible safety of kelp and Porphyra has been hardly affected by those methods including water cooking, deep-frying and baking in low temperature

【题目】海带中砷脱除方法研究
【中文关键词】海带;总砷;无机砷;砷脱除率;
【英文关键词】kelp; total arsenic;inorganic arsenic;obviation rates
【中文摘要】本文以总砷和无机砷脱除率为考察指标,通过最佳食用脱除剂选择、单因素试验、正交试验和感官评定选出最佳脱砷工艺。结果表明,以 3%柠檬酸为脱除剂,料液比为 1:15,温度为40°C,时间为40min 的脱砷工艺效果较为理想,总砷脱除率达到65.71%,无机砷脱除率达到 74.39%。对脱砷后的海带样品进行基本营养成分分析发现,粗蛋白、粗脂肪、氨基酸和总糖含量均显增加,灰分和矿物质元素含量有所减少,未对营养成分造成影响
【英文摘要】In this study, using the obviation rates of total arsenic and inorganic arsenic as index, the optimum dearsenification conditions of kelp was fixed through food removal agent selection, single-factor test, orthogonal design and organoleptic investigation. The results showed that the optimal dearsenification conditions were as follows: 3% citric acid (removal agents), 1:15 (W/V ratio), 40°C(process temperature) and 40 min (process time), under these conditions, the obviation rates of total arsenic and inorganic arsenic were 65.71% and 74.39%, respectively. The contents ofcrude protein, crude fat, amino acid and total sugar of kelp increased after dearsenification, with the diminution of ash content and mineral elements. Therefore, the nutrient content was not influenced in this process

【题目】食源性健康风险评估的二维蒙特卡罗方法
【中文关键词】风险评估;蒙特卡罗;变异性;不确定性
【英文关键词】Risk assessment Monte Carlo,Variability,Uncertainty
【中文摘要】目的 探讨食源性健康风险评估中变异性和不确定性的定量描述策略。方法 对变异性和不确定性分别用不同的概率分布来描述,用二维蒙特卡罗方法对变异性和不确定性作定量研究, 并将结果与一维蒙特卡罗方法做对比。结果 多重一维蒙特卡罗方法可以获得与二维蒙特卡罗方法相接近的结果。在参数不确定性的来源较多时, 二维蒙特卡罗方法具有更高的执行效率。结论 二维蒙特卡罗方法可以给出任意百分位风险取值的概率分布, 可为风险管理者判定特定百分位的风险值是高于还是低于所关注的风险水平提供分析依据
【英文摘要】Objective T his paper aimed to discuss strategies to quantitatively describe the variability and uncertainty in food-borne health risk. Methods The methodology were to use two- imensionalMonte Carlo analysis to quantitativel y characterize the variability and uncertainty described with different probability distributions , and compared the result with that obtained by one dimensi onal Monte Carlo analysis . Results The simulation result in dicated that although the multiple one di mensional Monte Carlo simulations

and two dimensional Monte Carlo analysis could yield the sa meresul , the latter was more efficient when there were numerous sources of uncertainties . Concl usion In conclusion, the two-dimensional Monte Carlo analysis can provide probability distribut ion of ris k value at any percentile , which allows risk managers to determine the ris k(above or b elow a risk level of concern) regarding to the level of certainty .

【题目】暴露评估中稻米重金属汞污染的适宜采样量
【中文关键词】稻米;汞;暴露评估;We i b u ll 分布;百分位数;采样量
【英文关键词】milled rice;mercury;exposure assessment;Weibull distribution;percentile;sample size
【中文摘要】稻米中的重金属汞是风险评估的热点。考虑其污染检测数据呈右偏分布的特殊性,在暴露评估中,适宜的采样量是评估高效准确的保证。本研究用Weibull分布拟合稻米中汞的检测数据,就评估关注的高百分位数估计与采样量的关系进行模拟研究。结果表明:峰右侧的百分位数越高,准确估计其所需的采样量就越大。且估计值随采样量的加大趋近理论值,精度也随之增大。采样量达到400、7 0 0 和 1 5 0 0 时,即可保证相应的 P 9 5、P97.5和P99 估计值的准确度与精确度。但1500 的采样量仅能保证对P99.9 估计值的准确度,无法满足精度要求。而采样量的不足极可能造成对高百分位数的低估,而最终导致对风险的低估。在实施稻米重金属汞的暴露评估时,对其污染检测数据采样量的关注可避免结果偏差及人力物力的浪费
【英文摘要】The mercury exposure in milled rice has become a hotspot in risk assessment. Considering the positively skewed contamination data, an economic and effective assessment must be based on an appropriate sample size. With the benefit of computer simulation, this paper set out to study the relationship between sample size and percentile estimate with Weibull distribution, which was used to fit the mercury contamination data. The simulation results showed that accurately estimating a higher percentile of positively skewed distribution, specially the one on the right side of peak, would require a larger sample size. And a larger sample size always resulted in a more accurate and more stable estimated percentile. As sample size increased to exceed 400, 700 and 1500, estimates of P95, P97.5 and P99 could obtain guaranteed accuracy and precision respectively, while a sample size of 1500 could only satisfy the accuracy but not precision of P99.9 estimates. Furthermore, insufficient samples would always lead to an underestimate of high percentile, and then lead to an underestimate of risk. When it comes to risk assessment of mercury exposure in milled rice, the in-depth study of sample size promises not only a possibility of an accurate result, but also an economical resource allocation

【题目】南方6省稻米总汞含量调查及其膳食暴露评估
【中文关键词】稻米;总汞;膳食暴露;概率评估
【英文关键词】milled rice; total mercury; dietary exposure; probabilistic assessment
【中文摘要】为评价中国南方6省稻米中总汞污染现状,于2009年在江西 、湖北、 湖南 、广东、 广西和四川 6 省抽样检测了 1 321 份稻米样品,结合中国居民20个性别年龄组人群的稻米消费量和体重信息,采用非参数概率方法对稻米中总汞的膳食暴露量进行了评估。 总汞含量采用电感耦合等离子体质谱仪(ICP-MS)测定,检出限(LOD)为0.000 8 mg kg-1。结果表明,稻米的总汞含量在地区间存在着差异,虽然有 76.2%的样本总汞含量(0.000 8 0.063 4 mg kg-1)高于检出限,但仅有 2.3%的样本超出了最高限量(ML 0.02mg kg-1) 将评估结果比照JECFA 推荐的总汞暂定每周耐受摄入量(PTWI) 5 g(kg bw) -1,我国居民食用这 6省稻米产生的汞暴露风险较小 但在 99.9的高百分位水平下, 14岁以下人群的摄入量相对较高,占 PTWI 的 41.5% 62.9%,其中 2 4 岁儿童和 4 7 岁男童的摄入量占PTWI 的60%以上,潜在风险较大 建议应对稻米中重金属汞的含量进行追踪监测
【英文摘要】The study aims to investigate the occurrence of total mercury in milled rice from 6 provinces of Southern China during harvest in 2009, and determine the dietary exposure of target population using a non-parameter probabilistic model with information on rice consumption and body weight. Altogether 1 321 milled rice samples were collected from Jiangxi, Hubei, Hunan, Guangdong, Guangxi and Sichuan Provinces. Total mercury was measured by inductively coupled plasma-mass spectrometry (ICP-MS) , and the limit of detection (LOD)for it was 0.000 8 mg kg-1. The analytical results showed that 76.2% of the samples contained detectable concentrations of total mercury, which ranged from 0.000 8 to 0.063 4 mg kg-1, but levels were generally low, with only 2.3% of the samples having concentrations above 0.02 mgkg-1, the maximum level (ML) . On the other hand, there was an apparent regional difference found for the concentrations of total mercury in milled rice. The provisional tolerable weekly intake (PTWI)of mercury, as recommended by Joint FAO/WHO Expert Committee on Food Additives (JECFA)is 5 g(kg bw) -1. The estimated exposure values for populations of interest were compared to the PTWI. For the relevant population, this study confirmed the low probability of health risks from total mercury via the milled rice from the 6 provinces of Southern China. But exposure to total mercury for the population below 14 years old at 99.9 represented 41.5% 62.9% of the PTWI. While for children aged 2 4 years and boy aged 4 7 years, their estimated exposure at 99.9 were all over 60% of the PTWI. Considering the potential risk, this study suggests that a yearly monitoring program for total mercury in milled rice is necessary

【题目】中国花生镉含量调查与膳食风险评估
【中文关键词】花生;铬;膳食暴露;风险评估
【英文关键词】peanut; cadmium; dietary exposure; risk assessment
【中文摘要】为考察中国花生中铬元素含量水平及地区、品系间的差异,对其膳食暴露风险进行评估,2009、 2010 年在安徽等 13 个花生主产省对多个品系抽样检测了 2578 份花生样品,结合中国居民 4 个消费人群及其亚群的花生消费量与体重信息,采用非参数概率方法对花生铬的膳食暴露量进行了估计。 铬含量采用原子吸收分光光度计 TAS-986(G)测定,最低检

测限(LOD)为 0.0001 mg' kg-1 ,定量限(LOQ)为 0.0003 mg' kg-1 。 检测结果表明:花生俑元素的平均含量为 0. 1634 mg'kg飞仅有 2.4%的样品俑含量超出最高限量(ML , 0.5 mg'kg-1); 各省花生中铺含量的差异不明显,不同年份、品系间及品系内的铺含量存在一定差异。 将膳食暴露评估结果比照 JECFA 推荐的暂定每月耐受摄入量(凹'MI)25 问. (kg ' bw) -1 ,花生铺的膳食暴露风险,总体轻微。 一般消费水平下,人群的暴露量远低于 PTMI 值;高消费水平下,人群中有 5%的个体暴露量接近或超过 PTMI 值,有一定潜在风险

【英文摘要】This study aims to investigate the variation of cadmium levels in peanut in China classified according to different region and plant strains, and determine its dietary exposure to tbe target population. Altogether 2578 peanut samples were collected from Anhui and other provinces in 2009-2010. Cadmium was measured by atomic absorption spectrophotometer TAS-986(G). A non-parameter probabilistic model was used to assess the potential risk of cadmium from dietary exposure based on the information of peanut consumption and body weight oin four consumer groups and their subgroups. The limit of detection (LOD) for cadmium determination was 0.000 1 mg' kg-1 , and its limit of quantification(LOQ) was 0.0003 mg' kg-1 . The analytical results showed tbat tbe average cadmium level of peanut was 0.1634 mg' kg with only 2.4% of the samples having concentration above 0.5 mg' kg-1 , the maximum limit(ML). The cadmium levels in peanut didn't show regional difference, however, it exhibited differences among years, in different strains and within the same strains. The provisional tolerable monthly intake(PTMI) of cadmium, as recommended by Joint FAOIWHO Expe时 Committee on Food Additives(JECFA) is 25 ug' (kg' bW)-I. The established exposure values for populations of interest were compared to the PTMI.This study claimed that in general, the probability of healty risk of cadmium via peanuts exposure to Chinese population was low. In tbe normal consumption level, the exposure values of 4 consumer groups were far below the PTMI. In tbe high consumption level, five percent of individuals had tbe exposure values close to or over PTMI, which have potential risk.

【题目】基于U-V模拟分析方法的农产品质量安全评估模型
【中文关键词】食用农产品;质量安全;风险评估,U-V模拟,RAMA模型
【英文关键词】edible agro-products; quality and safety; risk assessment; U-V simulation; RAMA model
【中文摘要】为加强监测信息利用,提升我国现有农产品质量安全评估水平,本研究基于Monte Carlo和Bootstrap抽样方法,结合概率建模理论,提出了质量安全概率评估的U-V模拟分析方法,并在此基础上用R和Java语言开发出基于Web应用的RAMA模型。实例分析结果表明:相对于@Risk和SAS软件,RAMA模型不仅分析结果可信,且具有执行效率高、操作简便、便于推广应用等特点。RAMA模型的建立填补了我国农产品质量安全概率评估模型的空白,对促进农产品质量安全风险管理、丰富风险决策信息等方面具有重要的现实意义

【英文摘要】In order to make better use of monitoring information, and enhance the level of quality and safety assessment for agro-products in China, U-V simulation analysis method based on monte carlo and bootstrap sampling was proposed. Then, integrating probabilistic modeling theories, RAMA(Risk Assessment Model for Agro-products), a web-based probabilistic model was formed in R and Java language. The results of case study showed that: compare to @ Risk and SAS, RAMA model not only got accurate results but also behaved effect, feasible and friendly. The establishment of RAMA could fill the gaps in the field of probabilistic risk assessment for agro-products, enrich decision information and be favorable to risk management

【题目】HPLC法测定香菇中有机酸含量的检测技术研究
【中文关键词】HPLC;香菇;酸提;有机酸
【英文关键词】HPLC;Lentinus edodes;Acid extraction;Organic acids
【中文摘要】本实验建立了HPLC法同时测定香菇中酒石酸、苹果酸、乙酸和柠檬酸的方法。在酸提条件下,利用Agela Venusll MP C18 色谱柱,以2% CH3OH – 20 mM (NH4)2HPO4 (pH 2.40)为流动相,流速为1.0 mL/min,柱温为35℃,检测波长为210 nm,进样量为10 μL。四种有机酸均在8 min内出峰。本法准确、可靠、快速、简便,检出限较低,适合于大批量样品的分析与检测。
【英文摘要】In this experiment, a HPLC method for determination of organic acids in Lentinus edodes was developed. These organic acids contained tartaric acid, malic acid, acetic acid and citric acid. Under acid extraction, Agela Venusll MP C18 column was used at 35℃ and mobile phase was 2% CH3OH – 20 mM (NH4)2HPO4 (pH2.40), with the flow rate of 1.0 mL/min. Detection wavelength was 210nm. Four organic acids were well separated in 8 minute. The method is accurate, reliable, rapidly and simple with low detection limit. It is suitable for the analysis and determination of samples in large quantity

【题目】Effect of thermal treatments on arsenic contents in Porphyra
【中文关键词】无
【英文关键词】arsenic, Porphyra, thermal treatments
【中文摘要】The contents and forms of total arsenic and different arsenic compounds in Porphyra were determined by different thermal treatments including soaking, water cooking, deep-frying, baking and microwave treatment. The results showed that the contents of four arsenic compounds decreased in nearly all soaking and water cooking samples. The contents of total arsenic decreased in deep-fried samples, while increased in baking samples except for temperature in 190℃. As for the forms of arsenic compounds, the changes of content of DMA, MMA and inorganic arsenic are discordant in deep-fried samples, while increased with a rise in temperature and increased by nearly 2 times at 200℃ in baking samples,which brought some effects to the edible safety. With the microwave power streagthening, the content of DMA, MMA and inorganic arsenic content showed a rapid increase tread in general, and the content of DMA is higher than that of MMA. Commonly used thermal treatment impaced the content and compouds of arsenic obviously. A relative low tempreture treatment will reduce the safety risk.

【题目】Speciation Analysis of Arsenic in Fruits and Vegetables by High Performance Liquid Chromatography-Hydride Generation-Atomic Fluorescence Spectrometry with Ultrasonic Extraction
【中文关键词】Speciation Analysis; HPLC; Atomic Fluorescence
Spectrometry; Fruit; Vegetable; Ultrasonic Extraction
【英文关键词】Speciation Analysis; HPLC; Atomic Fluorescence
Spectrometry; Fruit; Vegetable; Ultrasonic Extraction
【中文摘要】A method was developed for simultaneously determination of four arsenic speciation including trivalent arsenic (As (III)), pentavalent arsenic (As (V)), monomethylarsinic acid (MMA) and dimethylarsinic acid (DMA) in fruits and vegetables. Arsenic speciation in samples were extracted with methanol/water (50/50, v/v) after samples were dried at 105 ° C, and then detected by high performance liquid chromatography-hydride generation- atomic fluorescence spectrometry (HPLC-HG-AFS). The recoveries of four arsenic speciation were 81.7% 103.9% with RSD of 0.88% 5.03%, and detection limits were 0.8 2.0 μg/kg. This indicates that the developed method has good accuracy and high sensitivity. The method was then applied to detect eleven types of fruits and vegetables samples randomly purchased from supermarkets. The analytical results showed that the main arsenic speciation were As (III) and As (V) in vegetables and As (III) in fruits. The concentrations of As (III) in vegetables were obviously higher than those in fruits

【题目】Quality safety traceability technologies for cereal and oil products
【中文关键词】无
【英文关键词】Traceability, Tracking, Code, RFID and Agricultural Products
【中文摘要】无
【英文摘要】Food companies and governments in many countries are putting increasing emphasis on establishment of food traceability systems. Food traceability has become an effective way in food safety management. Aimed at food safety problems of cereal and oil products existing in the production, processing, warehousing, distribution and other links in the supply chain, this paper firstly proposes a new traceability framework combines the information flow with critical control points and quality indicators. Then it introduces traceability database design and data access mode to realize the framework. In practice, Code design for tracing is a challenge, so this paper put forward a code system based on UCC/EAN-128 standard. Middleware and Electronic terminal design are also briefly introduced to accomplish traceability system for cereal and oil products.

【题目】粮食龙头企业质量安全可追溯系统研究与实现
【中文关键词】农产品质量安全; 可追溯系统; 农业企业; 粮食产品;
【英文关键词】Agricultural Products Quality Safety; Traceability System; Agriculture Enterprise; Cereal Product;
【中文摘要】粮食产品是我国人民广泛食用的农产品,在人们日常饮食中占据着主导地位。特别对我国这样以植物类食品消费为主的国家来说,其质量安全问题显得尤为重要。本论文以粮食龙头企业为切入点,以禾谷类作物物中的小麦和油料中的花生为主要研究对象,针对粮食产品在种植、检验、仓储、加工、流通等核心环节存在的主要质量问题,从危害源、污染途径、污染种类到安全生产与质量检测等角度出发,开展粮食产品可追溯方法与系统研究,以期对完善农产品质量安全体系、提高农业企业质量安全管理水平做出微薄的贡献。本论文的研究工作主要包含以下三方面:(1)梳理农产品与食品质量安全法律法规规章,构建粮食产品质量安全法律体系。在收集、整理和分析现有农产品和食品法律法规规范的基础上,针对粮食产品的基本属性,提出了从原粮生产、原粮存储到原粮精深加工的粮食产品质量法律体系,基本覆盖了从农业生产投入品直到粮食产品市场流通的粮食产品供应链过程。(2)依据粮食产品质量安全法律体系,结合粮食龙头企业实际情况,确定企业质量安全可追溯系统设计准则。在分析企业主要业务流程规则与质量安全管理实例的基础上,重点针对粮食龙头企业在原粮采购、生产加工和产品销售过程中的质量安全问题,充分利用企业质检信息,建立基于粮食产品质量安全技术标准的可追溯系统架构。(3)面向粮食龙头企业,开发粮食产品质量安全可追溯系统。利用Web Services和XML技术,选用Visual Studio 2005+SQL Server 2005为基础开发平台,开发粮食龙头企业可追溯系统,实现基于产品批次编号、原料批次编号、生产班组的多角度质量安全信息可追溯,向企业、监管部门和消费者提供公开准确的粮食产品质量安全信息。在研究过程中,笔者采用了法律体系、供应链管理和HACCP等理论和方法,对粮食龙头企业质量安全可追溯系统的设计和构建进行了综合性研究。通过研究,本论文从理论和实践上证明了在粮食龙头企业目前的管理和技术条件下,可以构建基于产品批次编码的可追溯系统,为农产品全程质量安全可追溯研究提供了方法和技术上的支持。 更多
【英文摘要】Cereal products are the majority of consumable agricultural products in China and play a significant role in diets of ordinary people. Particularly to China, a country which plant food contains key parts, the importance of cereal products becomes indispensable.Taking key cereal enterprise as entering point and choosing wheat (grain) and peanut (oil plant) as targets, this paper mainly focuses on the primary problems in planting, capturing, storage, process and logistics. Starting with analysis on pollution sources and pollution tracks, specific researches are launched on methods of constructing cereal product traceability systems. It is expected that the dissertation would make contribution to improve agricultural product quality safety management in enterprise and in food chain.The major research work and contributions of this dissertation are as follows:(1) Coordinate quality safety laws, regulations and procedures on agricultural product and food, and then build cereal product quality safety legal system. On the analysis of existing laws and regulations of Food Quality Safety, it puts forward "From Farm to Table" Cereal Product Quality Safety Legal System which contains basic parts from production input to end product circulation.(2) Based on cereal product quality safety legal system and combined with enterprise practice, this paper establishes designing rules of building traceability system. On basis of investigation of procurement, production and delivery, it makes fully use of information on the department of quality safety management and consequently build the framework of traceability system.(3) Oriented key cereal enterprises, this paper develops the traceability system. By adopting XML and Web Services and on the development platform constitute of Visual Studio 2005 and SQL Server 2005, it designs and develops traceability system grounded on cereal product batch number. Hence, it could provide comprehensive traceability information from the point of view of customer, surveillance and enterprise itself.Several research methods are utilized in the total process of dissertation, such as legal system, supply chain management and HACCP. Through research and implementation, it is demonstrated that traceability system is practicable and feasible to the key cereal enterprise in terms of its management and technology abilities. It will support the construction Project of Cereal Product Quality Safety Traceability on Whole Course in the future.

【题目】Design and implementation of quality traceability label for cereal and oil products based on UCC/EAN-128 Bar Code
【中文关键词】无
【英文关键词】none
【中文摘要】无
【英文摘要】Compared with animal products, fruit &vegetable products and marine products, cereal and oil products have a longer supply chain, involving much more links and even more complicated factors. In order to carry out cereal and oil products quality safety tracking and tracing, provide an easy way for consumer and inspector to get the quality safety information, this paper design the traceability code based on the UCC/EAN-128 encoding rules. The code is made up of commodity identification code, which includes enterprise identification code and commodity item code, and batch code. Generate the tracing number based on the traceability code according to “ Guideline for Numbering of Agriculture Products for Tracing ”, and then print the tracing number on traceability label with the component technology automatically.

【题目】Change of soil organic matter as affected by household land use based on 3S technology in urban fringes of north China.
【中文关键词】土壤有机质
【英文关键词】3S; household land-use behaviour; SOM; urban fringe
【中文摘要】土壤有机质变化
【英文摘要】Different land-use managements accompany different land-use objectives in the changingphases of household economic development. These management changes lead to a number of changes in soil nutrients such as in soil organic matter (SOM). This article, with support from global positioning system (GPS) and geographic information system (GI S) monitoring, analyses and compares SOM change in an area of urban fringe in north China from 1982 to 2000 and then from 2000 to 2006. SOM increased by 27% (5.43 g kg – 1 – 6.90 g??? kg – 1) duringthe first period but decreased by 7% during the second. In the first period, with the implementation of the “ Household Responsibility System ”, material inputs, especially of fertiliser was very high when the central household objective was to “ have a fullstomach ”. Yields also increased quickly, so there were corresponding increases in the amount of organic materials returned to the fields and SOM also increased during this earlier period. In the second period, household objectives developed making a trade-off between consumption and income above subsistence level. Land-use types evolved from subsistence field cropping to the growing of cash crops. Changing material inputs and managements between the different cropping systems affected soil nutrients such as SOM. SOM decreased in most of the region during this second period. Dynamic monitoring (GPS and GIS) is needed in the regionto conduct scientific research on fertiliser use and management.

【题目】Study and development of mobile tracing terminal for agricultural products quality tracking based on GPRS
【中文关键词】无

【英文关键词】cereal and oil products - full supply chain - traceability - tracking - electronic terminal - RFID
【中文摘要】无
【英文摘要】Traceability system has become an important means for food safety management. Global food industry and many countries have paid increasing attention to the construction of food traceability system, but rarely referred to tracing terminal. According to the technical requirements of cereal and oil products quality safety tracing process, we design and develop a mobile tracing terminal based on GPRS for agricultural products quality tracking to facilitate quality supervisors and consumers to track and trace the quality of related agricultural products anytime ,anywhere.

【题目】基于FMECA的粮油产品质量安全追溯链的研究
【中文关键词】粮油产品; 追溯; 质量安全; 元数据; FMECA;
【英文关键词】Grain and Oil Products; Traceability; Quality and Safety; Metadata; FMECA;
【中文摘要】粮油产品是我国主要农产品,其质量安全问题必然是当前政府、社会普遍关注的重点。构建“从农田到餐桌”的食品全程可追溯体系已成为加强食品质量安全监管的重要手段之一,其核心是构建相应的全程追溯链。由于全程追溯链涉及供应链中各类组织和各个生产环节,其复杂性可想而知,因而加强对追溯链的可靠性进行研究具有重要的意义。本文的研究工作主要包含以下三个方面:1.制定了粮油产品追溯链的元数据,包括追溯链控制环节元数据和控制要素元数据,实现对粮油产品追溯链的规范化描述。在分析了粮油产品追溯链控制环节和控制要素共性特点和参考国内外元数据标准的基础上,制定了粮油产品追溯链的控制环节和控制要素元数据,并据此组织了花生油追溯链控制环节和控制要素的数据。2.采用 FMECA 技术研究分析粮油产品追溯链的关键控制点,包括关键控制环节和关键控制要素。以花生油为例,在采用追溯链元数据对追溯链的控制环节和控制要素进行规范化描述的基础上,应用 FMECA 方法,通过分析影响追溯链断裂或追溯信息丢失的故障及其危害度,确定了追溯链的关键控制环节和关键控制要素。3.设计和实现了基于 FMECA 的追溯链的管理系统。利用 ASP.NET 技术,选用 Visual Studio2005+SQL Server 2000 为基础开发平台,开发了基于 FMECA 的追溯链管理系统。该系统具有对追溯链的管理和分析功能,能够实现对追溯链控制环节和控制要素的元数据和具体数据的维护,基于 FMECA 的追溯链分析,确定追溯链的关键控制环节和关键控制要素。本文在研究粮油产品质量安全追溯链的结构特点基础上,利用通用的元数据描述方法制定了追溯链元数据标准(草案),从而实现了对粮油产品追溯链的规范化描述。在此基础上,构建了FMECA 的应用模型,实现对追溯链的可靠性分析,为粮油产品追溯体系的有效实施提供了一个重要的基础前提,对追溯制度和理论的进一步完善将有一定的推动作用。
【英文摘要】Grain and oil products are widely consumed by the Chinese people as major agricultural products.Their quality and safety problems must be the focus of the current government, and the community‘ sattention. Constructing‘ from farmland to dining table’ food system, the core of which is building fulltraceability chain, has become one of the important means to strengthen the monitoring of food qualityand safety. Because the full traceability chain is involved in various organizations and productionprocesses , any lack of coordination of which may leads to fragmentation of traceability chain or loss ofimportant information. As a result, study on the reliability of the traceability grain has becomeindispensable.The major research work and contributions of this dissertation are as follows:(1) Establish a metadata standard to describe the traceability chain of grain and oil products, including control links’ metadata and control elements’ metadata. Based on core data standards of agricultural science and technology information metadata, it establish a metadata standard of control links and control elements’ metadata for grain and oil products’ traceability chain, after studying the traceability chain of grain and oil products. Taking peanut oil as an example, it identified the data of peanut oil’s control links and control elements in traceability chain.(2) FMECA is applied to find key points of grain and oil products’ traceability chain, including keycontrol links and key control elements. Take peanut oil as an example, FMECA is applied to find the key points, according to the criticality of the fault leading to fragmentation of the grain and oil products traceability chain or the loss of important information. Finally, several suggestions are proposed to improve the effectiveness of FMECA’s application in analysis of traceability chain.(3) Design and implement a management system of traceability system based on FMECA. By adopting ASP.NET technology and the development platform constitute of Visual Studio 2005 and SQL Server 2000, it designs and develops a system to maintain the metadata and specific data of grain and oil products, to analysis the traceability chain based on FMECA, in order to find the key control links and control elements.This paper has studied the structural features of traceability chain of grain and oil products, andestablished a metadata to describe it, based on which FMECA is applied to find the key points of the chain. It provides an important prerequisite for the effective implementation of Grain and oil products’ traceability system and play a certain role in raising the level of quality and safety of food.

【题目】区域优质小麦生产示范效果分析(I)——陕西省岐山县小麦生产现状调查
【中文关键词】小麦 县域 优质品种 品质性状

【英文关键词】Wheat County region Good quality variety Quality property
【中文摘要】优质小麦生产是一项系统工程,涉及到种子供应、栽培技术、品质检验、收购贮藏、政策支持等。为了解陕西省岐山县小麦生产的状况以及优质小麦品种推广的效果,以岐山县为区域,直接在农户田间抽取收获的小麦样本,现场调查相关生产要素,分析该县的小麦生产现状及存在的问题。结果表明,岐山县属于硬粒、高蛋白质、高筋、强筋小麦产区;田间调查表明,通过优质小麦的推广,主栽品种的比例提高,品种数量减少;稳产、高产、管理简单、便于机械收获、适宜间套的小麦品种深受当地农民欢迎。政府部门应在减少生产品种数量、落实优质优价政策方面做更多的工作。
【英文摘要】Production of good quality wheat is a systematic project involving the seed supplying, cultivation managing, quality testing, purchasing, storage and policy supporting. In this investigation, in order to investigate the present situation of wheat production and the promotion effective of good quality wheat varieties in Qishan county, Shaanxi province, drawing harvesting wheat sample directly from the farming field, the factors related to the production on-site were investigated, and present situation and problem of the local wheat production were analyzed. The results showed that the Qishan county was belong to the region where could produce hard kernel, high protein, and strong gluten wheat product. Field surveys showed that through the extension of good quality wheat variety, the proportion of major varieties increased, and the amount of varieties on the farming field decreased. The wheat variety which was stable and high yield, simple managing, easy for mechanical harvesting and suitable for setting of inter-planting was welcomed by local farmers. Governmental departments should do more works for decreasing the amount of wheat varieties on the farming field, and establishing the policies for good quality with high price.

【题目】县域优质小麦生产效果分析 II.陕西省岐山县优质小麦示范效果调查
【中文关键词】小麦; 县域; 生产示范; 品质性状;
【英文关键词】Wheat; County region; Production and Demonstration; Quality property;
【中文摘要】为了给优质小麦品种的生产、示范和推广提供依据,以国家审定品种小偃503为材料,以陕西关中平原岐山县10个小麦主产乡镇示范点为基地,研究小偃503的生产优势、籽粒品质变化,分析其示范效果。结果表明,示范田生产的小麦达到了国家优质强筋小麦标准,籽粒品质整体优于农户田间样品和当地商品小麦,且性状相对均匀一致,有利于加工企业加工优质产品;小偃503的品质性状在年度之间和地点之间变异系数较大。这些结果说明,不能忽视优质小麦的生产管理措施;通过优质小麦生产示范,可以大批量生产优质小麦原料。
【英文摘要】Good quality wheat variety is defined by the kernel property which is suitable to make a foodtype, and has high economic and ecological benefits. The production situation and efficiency of good quality wheat varieties are problem that are valuable to trace and study. In this experiment, wheat variety Xiaoyan 503 as good quality variety was studied at 10 demonstration fields with a scale of 100 Mu (1 Mu=1/15 ha) in 10 towns of Qishan county. The kernel productivity potential and kernel quality stability of the wheat variety were studied, and the demonstration efficiency was analyzed. The results showed that the wheat kernel quality produced from the demonstration fields reached national good quality wheat standards. Between years and between towns, there were larger variation coefficients in the quality properties of Xiaoyan 503. Therefore, the production and management measures for good quality wheat could not be ignored. The kernel quality of Xiaoyan 503 harvested in the demonstration fields was relatively uniform, so that processing enterprises could enhance processing efficiency, and ensure product quality. Production demonstration of good quality wheat helps to provide large scale good quality wheat products.

【题目】县域优质小麦生产效果分析 III.陕西省岐山县商品小麦质量调查
【中文关键词】商品小麦; 县域; 品质性状;
【英文关键词】Commercial wheat; County region; Quality property;
【中文摘要】为了探明优质小麦在一个县域范围的发展变化情况,以陕西省岐山县优质小麦示范区3年11~12个粮食贮备库商品小麦质量变化为依据,对该县优质小麦生产和示范效果进行了跟踪研究。结果表明,调查年份该县商品小麦品质性状有所改善,表现为蛋白质含量有逐年提高的趋势,粉质参数中的软化度明显降低,面粉质量值有所改进,虽然优质示范田小麦样品品质明显优于商品小麦,但优质小麦示范和推广对商品小麦的质量改进效果迟缓。建议在建设优质小麦基地时,应考虑持续推广一组优质小麦品种;除了改进优质小麦的生产技术外,管理和政策因素的改善也越来越迫切。
【英文摘要】he effectiveness of demonstration and extension for good quality wheat should be measured byhow far to meet the demands on the market and consumption. And the improvement of wheat quality in demonstration region is one of important evaluation properties. This research based on the investigation on the wheat quality analysis of 12, 12, 11 state silos in demonstration region of Qishan county during 3 years. The results showed that the protein content increased year by year during 3 years, and the softening degree of Farinograms reduced significantly, the quality value of flour improved, and the improving effec-tiveness of demonstration and extension of good quality wheat variety on the commercial quality in state si-los was relatively slower. A group of good quality wheat varieties should be considered to extend continu-ally when establishing the demonstration region of good quality wheat. The production of good quality wheat was affected by the factors of management and policy more and more, except the factors of technique.

【题目】番木瓜长尾实蝇在中国的适生性初步研究
【中文关键词】番木瓜长尾实蝇;适生性分析;DYMEX;ArcGIS
【英文关键词】Taxotrypana curvicauda;potential geographical distribution;DYMEX;ArcGIS
【中文摘要】番木瓜长尾实蝇Toxotrypana curvicauda Cerstaecker 是美洲地区严重危害水果生产的重要害虫。本研究采用DYMEX地点比较模型与ArcGIS分析相结合的预测方法对该实蝇在我国的适生性进行初步研究。研究发现番木瓜长尾实蝇在我国南方适生性较高,其中台湾的西南部、广东的南端、比海南的大部分地区、广西、云南、四川的零星地区为高度适生区。建议进一步加强针对番木瓜长尾实蝇的植物检疫措施力度,严防该虫传入我国。
【英文摘要】Papaya fruit fly ,Toxotrypana curvicauda Gerstaecker is one of the important danderous insect pests causing considerable economic losse of fruits in America. The potential geographical distribution of papaya fruit fly in China was predicted in this study using DYMEX and ArcGIS.The results showed that the papaya fruit fly had a wide potential distribution area in south of China,in which southwest of Taiwan,south of Guangdong,vast areas of Hainan,several small parts of Guangxi,Yunnan,Sichuan were predicted with high suitability.According to the potential geographical distribution of papaya fruit fly in China,plant quarantine measures should be en hanced in order to prevent the introduction of this dangerous fruit fly.

【题目】Effect of CO2 Elevation on Root Growth and Its Relationship with Indole Acetic Acid and Ethylene in Tomato Seedlings
【中文关键词】CO2 enrichment, hormones, plant growth, root development, root hairs
【英文关键词】CO2 enrichment, hormones, plant growth, root development, root hairs
【中文摘要】A hydroponic experiment was carried out to study the effect of elevated carbon dioxide (CO2) on root growth of tomato seedlings. Compared with the control (350 μL L − 1), CO2 enrichment (800 μL L − 1) significantly increased the dry matter of both shoot and root, the ratio of root to shoot, total root length, root surface area, root diameter, root volume, and root tip numbers, which are important for forming a strong root system. The elevated CO2 treatment alsosignificantly improved root hair development and elongation, thus enhancing nutrient uptake. Increased indole acetic acid concentration in plant tissues and ethylene release in the elevated CO2 treatment might have resulted in root growth enhancement and root hair development and elongation.

【题目】双钩异翅长蠹在我国潜在的适生性分析.
【中文关键词】双钩异翅长蠹;风险分析;Maxent生态位模型;地理信息系统
【英文关键词】Heterobostrychus aequalis;risk analysis;maxent ecological niche models;geographical information system
【中文摘要】双钩异翅长蠹(Heterobostrychus aequalis)是破坏性最大的一种钻蛀性甲虫之一,该虫食性杂,寄主广,破坏性大,是现代竹、木、藤质装饰的重要害虫。本文选用Maxent生态位模型与地理信息系统相结合,综合分析影响双钩异翅长蠹生长发育的环境因素,结合寄主分布特征,非常直观的定量地获得了双钩异翅长蠹在我国的潜在发生区,计算结果经ROC曲线分析法验证,Maxent生态位模型的AUC值为0.965(非常接近于1),表明预测获得了较好的效果,研究可为双钩异翅长蠹的检疫及防治决策的制定提供科学依据。
【英文摘要】Heterobostrychus aequalis is one kind of wood—boring beetle.It is characterized by omnivorous habit,broad host range and severe destruction.At present,it is one kind of important pest of modem bamboo-wood and vine furniture.Ecological environment factors affecting its growth and development and the spatial distribution characteristicsof plant autoeciousness of Heterobostrychus aequalis were comprehensively analyzed by combining Maxent ecological niche models with geographical information system technique in this paper.The relatively exactly potential distribution region of Heterobostrychus aequalis in the whole China was obtained quantitatively and intuitively.The checked result conducted by ROC curve analysis method showed that the AUC value of Maxent ecological niche models reached 0.965(very close to 1),indicating that the predicted results was fairly wel1.This study would provide scientific proofs for making the policies on the quarantine,the prevention and the control of Heterobostrychus aequalis.

【题目】Genetic diversity of Ralstonia solanacearum strains
【中文关键词】无
【英文关键词】Genetic diversity . Phylogeny. Phylotype .Ralstonia solanacearum . Sequevar
【中文摘要】无
【英文摘要】A survey of bacterial wilt in China collected 286 strains of Ralstonia solanacearum from 17 plant species in 13 Chinese provinces to investigate genetic diversity using the biovar (bv.) and phylotype classification schemes. A phylotype-specific multiplex-PCR showed that 198 isolates belonged to phylotype I (bv. 3, 4 and 5) and 68 to phylotype II (bv. 2 and bv. 1). A phylogenetic analysis examined the partial sequence of the egl and hrpB gene of all strains and the genetic diversity of 95 representatives was reported, demonstrating that Chinese strains are partitioned into phylotype I (Asia) and II (Americas). Phylotype I strains (historically typed bv. 3, 4 and 5), had considerable phylogenetic diversity, including 10different sequevars: seven previously described.

【题目】山西晋南黄牛的超数排卵配种研究
【中文关键词】黄牛; 超数排卵; 冲胚; 促黄体素释放激素A3
【英文关键词】Huangniu; superovulation; collect the embryo; luteinizing hormone releasing hormone A3 for injection
【中文摘要】试验采用两种不同来源的促卵泡素对山西晋南黄牛进行了超排处理, 并对发情配种过程中注射促黄体素释放激素A3 的超排效果进行了观察。结果表明, 超排处理时使用国产的促卵泡素平均每头可用胚胎达3.9 枚, 平均可用胚胎率为51.5%, 与新西兰产的促卵泡素平均每头可用胚率23.1%比较, 差异显著(P<0.05) 。在配种的同时注射促黄体素释放激素A3 后冲胚, 对照组获取的平均可用胚胎(34.1%) 较试验组(75.8%) 的差异显著(P<0.05) , 说明超数排卵过程中使用国产激素也能获得较好的效果, 同时在超排过程中使用促黄体素释放激素A3, 可以获得更加理想的效果。
【英文摘要】Superovulation was very important for embryo transplantation, which was affected by many factors, types andquality of hormone, reaction of hormone on individual (sensitivity) were key factors for Superovulation. Shanxi JinnanHuangniu was treated with two follicle stimulating hormone. The effect of Luteinizing hormone releasing hormone A3 for injectionwas observed in the experiment of estrus and mating. The result showed that average 3.9 embryos were got by usingdomestic FSH during superovulation experiment, the average percentage of available embryo was 51.5%, there was significantdifference (P<0.05) between the domestic group and Newzealand group (23.1%) . Domesetic FSH was better than FSH ofNewzealand. Luteinizing hormone releasing hormone A3 for injection was used to collect embryo during the mating experiment,there was significant difference (P<0.05) between experimental group (75.8%) and control group (34.1%) on averageavailable embryo. The result showed that using domesetic hormone and Luteinizing hormone releasing hormone A3 for injectionin the superovulation could gain better effects.

【题目】亮甲酚蓝染色对牛未成熟卵母细胞体外成熟与体外受精的影响

【中文关键词】牛;卵母细胞;体外受精;亮甲酚蓝
【英文关键词】Cow;oocytes ; IVF;brilliant cresyl blue
【中文摘要】为研究亮甲酚蓝(BCB) 染色对牛未成熟卵母细胞体外成熟与体外受精(IVM2IVF) 的影响,在牛卵母细胞成熟培养前用亮甲酚蓝进行染色选择,通过IVF 检测选择效果。本试验以未进行染色处理的牛卵丘2卵母细胞复合体(COCs) 作为对照组,在成熟培养前用26 μ mol/ L 亮甲酚蓝染色90 min 作为处理组,将处理组依照胞质的颜色分为蓝色组(BCB +) 和无色组(BCB -) 。成熟培养后进行体外受精,授精后48 h 统计卵裂率,7~8 d 后检查囊胚率。结果表明: (1) 染色后着色的卵母细胞成熟率(80. 83 %) 与对照组(60. 20 %) 和无色组(51.92 %) 差异显著(P < 0. 05) ; (2) IVF 后蓝色组囊胚率(32. 99 %) 较对照组(17. 64 %) 和无色组(3. 57 %) 差异显著(P < 0. 05) 。由此可见,亮甲酚蓝对牛卵母细胞染色的选择被证明可以作为判断卵母细胞质量的一个标记。
【英文摘要】The aim of this investigation was to study the effect of brilliant cresyl blue (BCB) staining on IVM2IVF in cow.For this purpose ,oocytes were stained by BCB and selected by IVF examination before mature culture. COCs without BCBstaining was considered as control group , and COCs stained with BCB in 26 μ mol/ L for 90 min as treatment group beforemature culture. Treated oocytes were divided into BCB - (colourless cytoplasm) and BCB + (coloured cytoplasm) . AfterIVM, oocytes were fertilized in vitro (IVF) . The cleavage rate of eggs at 48 h and the proportion of blastocysts at 8 d afterIVF were compared. The results showed that : (1) The BCB + oocytes had a significantly higher proportion of mature rate(80. 83 %) than control group and BCB2 oocytes (60. 20 % and 51. 92 %) (P < 0. 05) ; (2) The BCB + oocytes had a sig2nificantly higher proportion of blastocysts (32. 99 %) than control group and BCB2 oocytes (17. 64 % and 3. 57 %) (P <0. 05) . These results showed that the staining of bovine cumulus2oocyte complexes with BCB before IVM could be a usefulmethod for determining the oocyte quality.

【题目】亮甲酚蓝染色对牛卵母细胞体外成熟的影响
【中文关键词】牛;卵母细胞;体外成熟;亮甲酚蓝染色;浓度;葡萄糖262磷酸脱氢酶
【英文关键词】cow ;oocytes ; IVM;brilliant cresyl blue ;concent ration ; G6PDH
【中文摘要】为了探讨不同浓度亮甲酚蓝对牛卵母细胞染色选择后对其体外成熟(IVM) 的影响,本研究在牛卵母细胞成熟培养前直接用不同浓度梯度的亮甲酚蓝进行不同时间的染色。结果表明: ①经过不同浓度的亮甲酚蓝染色后,所选择卵母细胞染色后着色的百分率及其成熟率是不同的。用26 、39 、52 μ mol/ L 的亮甲酚蓝染色后所得到的胞质蓝色组(27. 7 %、27. 6 %、31. 9 %) 较13 μ mol/ L 的亮甲酚蓝染色后所得到的胞质蓝色组(2. 1 %) 差异显著(P < 0. 05) ; ②经过不同浓度的亮甲酚蓝染色后,胞质蓝色组(77. 4 %) 较胞质无色组(51. 3 %) 和对照组(60. 2 %) 成熟率差异显著(P < 0. 05) ; ③不同浓度亮甲酚蓝染色的胞质蓝色组间成熟率差异不显著(P > 0. 05) ; ④不同浓度亮甲酚蓝染色组与对照组卵母细胞的成熟率差异不显著(P > 0. 05) ;⑤经过不同时间的亮甲酚蓝染色后,所选择卵母细胞着色的百分率是不同的。用26 μ mol/ L 的亮甲酚蓝染色90 min 后所得到的胞质蓝色组(75 %) 较亮甲酚蓝染色60 、30 min 后所得到的胞质蓝色组(57. 14 % ,40 %) 差异显著(P < 0. 05) 。以亮甲酚蓝染色为基础的牛卵丘2卵母细胞复合体的区分可以用来有效的选择更具发育活力的牛卵母细胞。
【英文摘要】The aim of the present investigation was to study the effect of IVM of cow with different concent ration brilliantcresyl blue (BCB) staining on the oocytes selection. For this purpose , Compact cumulus oocyte complexes (COCs) were recov2ered f rom slaughterhouse2collected bovine ovaries and classified as cont rol group , which were cultured immediately without ex2posure to BCB stain ;t reatment group were stained with different concent rations BCB(13 ,26 ,39 and 52 μ mol/ L BCB) for differ2ent time before culture. Treated oocytes were then classified according to their cytoplasm coloration : oocytes with a blue cyto2plasm or grown oocytes (BCB +) and oocytes without a blue cytoplasm or growing oocytes (BCB -) . Oocytes were stained withdifferent concent ration BCB for different time before culture in this study. The result showed that : ①The percentage of Colour2ing and mature for selected oocytes was different by t reated with different concent rations BCB. The percentages of BCB + oo2cytes obtained after staining with 26 μ mol/ L (27. 7 %) ,39 μ mol/ L (27. 6 %) and 52 μ mol/ L BCB (31. 9 %) were higher (P <0. 05) than those obtained with 13 μ mol/ L (2. 1 %) ; ②BCB + oocytes exhibited a higher (P < 0. 05) maturation rate (meanrate :77. 4 %;n = 62) than BCB2(51. 3 %;n = 236) and cont rol oocytes (60. 2 %;n = 98) ; ③There were no significant differencesin the percentages of BCB + oocytes reaching the MII stage among BCB concent rations ; ④There were no significant differencesin nuclear maturation between cont rol and BCB2 exposed oocytes (BCB

+ plus BCB -) ,independent of the BCB concent ration ;⑤Af ter exposure different time BCB , the result showed that the percentage of BCB + oocytes were different . The percentagesof BCB + oocytes obtained af ter staining with 26 μ mol/ L BCB for 90 min (75 %) were a higher (P < 0. 05) than those oocytes ob2tained af ter staining with 26 μ mol/ L BCB for 60 min (57. 14 %) and 30 min (40 %) . These result s show that the staining of cowcumulus2oocyte complexes with BCB before in vit ro maturation could be used to select developmentally competent oocytes.

【题目】与黄瓜白粉病抗病基因紧密连锁的SSR分子标记研究
【中文关键词】黄瓜;白粉病;SSR
【英文关键词】Cucumis sativus; Powdery mildew;SSR
【中文摘要】黄瓜白粉病是影响黄瓜生产的主要病害,为建立黄瓜抗白粉病分子标记辅助选择体系,我们以黄瓜抗白粉病亲本WIS2757和感白粉病亲本19032以及它们的F2群体为试材,采用SSR分析技术,对相对抗性基因的连锁分子标记进行了研究。获得了2个与黄瓜白粉病主效抗病基因连锁的SSR分子标记SSR97-200,SSR273-300,连锁距离分别为5.13cM,这些SSR标记可以作为黄瓜抗白粉病辅助选择的分子标记。
【英文摘要】Powdery mildew was one of the major diseases in Cucumis sativus L. production. In order to establish its molecular marker-assisted selection system, we aimed to identify molecular markers linked to the resistant gene. With a F2 population between a resistant parent(WIS2757) and susceptible parent(19032), we found two co-dominant SSR markers SSR97-200 and SSR273-300 were linked to the powdery mildew resistant gene, the genetic distances was 5,13cM respectively. These SSR markers could be useful in marker-assisted selection in cucumber breeding.

【题目】黄瓜抗病毒性状的序列特征性扩增区域标记
【中文关键词】黄瓜;西瓜花叶病毒(WMV);抗性基因;AFLP;SCAR
【英文关键词】cucumber;Watermelon mosaic virus(WMV);resistant gene;AFLP;SCAR
【中文摘要】以抗西瓜花叶病毒(Watermelon mosaic virus,WMV)的黄瓜(Cucumis sativus)品种秋棚和感该病毒的欧洲八号为亲本,构建了120个F6重组自交系群体。根据苗期抗病接种鉴定结果进行遗传分析,发现黄瓜抗WMV的基因是由隐形单基因控制。利用集团分离分析法和相关分子标记技术,获得的特异片段E-ACT/M-CTT-427与WMV的抗性基因连锁,连锁距离为8cM,双亲差异片段测序结果显示感病亲本目标片段存在6个T碱基的缺失。根据测序结果设计了1对与目的基因遗传距离为8cM的序列特征性扩增区域(SCAR)引物,该引物可用于黄瓜抗WMV病毒的分子标记辅助育种。

【英文摘要】Markers linked to Watermelon mosaic virus (WMV)resistant gene in cucumber (Cucumis sativus)were identified using 120 recombinant inbreed lines(RIL6)made between a resistant and susceptible parent(Qiupeng x No.8 European). Genetic analysis based on virus inoculation at the seedling stage showed that the resistant trait in Qiupeng was controlled by a single recessive locus.The AFLP marker E-ACT/M-CTT427 was linked to the resistant gene with a genetic distance of 8 cM.The polymorphism came from a 6 bp deletion of poly(T)repeat in the susceptible parent.And this AFLP marker was conveged into a co-dominant sequence-characterized amplified region(SCAR)marker which could be useful in marker—assisted breeding for WMV resistance.

【题目】Identification of SCAR markers linked to or, a gene inducing beta-carotene accumulation in Chinese cabbage
【中文关键词】无
【英文关键词】Chinese cabbage (Brassica rapa L. ssp.
pekinensis) · Orange head leaf gene (or) · SCAR
markers · Gene mapping · Marker-assisted selection
【中文摘要】无
【英文摘要】Identification of SCAR markers linked to or, a gene inducing beta-carotene accumulation in Chinese cabbage | Chinese cabbage (Brassica rapa L. ssp pekinensis); orange head leaf gene (or); SCAR markers; gene mapping; marker-assisted selection | The or mutation in Chinese cabbage (Brassica rapa L. ssp. pekinensis) is a recessive, single-locus mutation that causes the head leaves of the plant to accumulate carotenoids and turn orange. In China, considerable attention has been focused in recent years on breeding the variety with orange head leaves. In this study, sequence-characterized amplified region (SCAR) markers linked to the or gene were identified based on random amplified polymorphic DNA (RAPD) and amplified fragment length polymorphism (AFLP) by performing a bulked segregant analysis (BSA) using a doubled haploid (DH) population derived from the F-1 cross between 91-112 (white head leaves) and T12-19 (orange head leaves) via microspore culture. Two RAPD markers-OPB01-845 and OPAX18-656-and 1 AFLP marker, namely, P67M54-172, were identified to be linked to the or gene, and they were successfully converted into the SCAR markers SCR-845, SCOR204, and SCOR127, respectively. In a linkage analysis, these 3 SCAR markers and 2 previously published simple sequence repeat markers, namely, BRMS-51 and Ni4D09 (located on R9 linkage group), were mapped to the same linkage group with the or gene at a LOD score of 6.0, indicating that the or gene should be located on the linkage group R9 of the A genome. In addition, accuracies of 92%, 90%, and 89.1% were obtained when 110 different inbred breeding lines of Chinese cabbage were used for investigation with these 3 SCAR markers, indicating that these makers could be used in marker-assisted selection in orange head leaf breeding programs for Chinese cabbage.

Non-heading Chinese cabbage (Brassica rapa ssp. chinensis L.)

Plant chitinase Plant defensin Real-time quantitative PCR

Systemic acquired resistance

【中文摘要】无

【英文摘要】Two cDNA clones for a pathogen inducedgenes in non-heading Chinese cabbage (Brassica rapa ssp.chinensis L. cv. Suzhouqing) were isolated and character-ized. The two full-length cDNA clones, designated Bcchiand BcAF were isolated during the resistance response toPeronospora parasitica. Sequence analysis of corre-sponding cDNA clones con fi rmed the translation productsof both genes showed high degree of homology to otherplant chitinases and plant defensins, respectively. GenomicDNA Southern blot analysis indicated that each gene rep-resented a small multi-gene family. Upon inoculation withP. parasitica, both genes transcripts were rapid accumu-lated in the infected leaves. Tissue-speci fi c expression ofboth genes showed that 24 h post-inoculation the highestexpression tissue of Bcchi mRNA was leaves, and 12 hpost-inoculation the highest expression tissue of BcAFmRNA was leaves. These data revealed that both genesmay be involved in plant resistance against fungal patho-gen infection.

提供依据。
【英文摘要】Several factors affecting isolated microspore culture of non-heading Chinese cabbage were studied. The results showedthat the genotypewas themost important factor on the inducing rate ofmicrospore-derived embryos, and no significant differencewas observed between reciprocal cross. The best inflorescence age of the donorplantswas 6-10 d afterbloom. Higher agar concen-tration from 8 g · L-1to 12 g · L-1could significantly promote the regeneration of embryos. Based on the flow cytometry andidentification of themorphological characteristics, a high levelof the spontaneous doubling efficiency from microspore-derived plantswas observed in non-heading Chinese cabbage, even to 90%, and therewere obvious differences between genotypes.

【题目】不结球白菜感染芜菁花叶病毒后4种防御酶活性变化及其抗病相关性
【中文关键词】不结球白菜;芜菁花叶病毒;超氧化物歧化酶;过氧化氢酶;苯丙氨酸解氨酶;多酚氧化酶
【英文关键词】non-heading Chinese cabbage;Turnipmosaic virus(TuMV); SOD; CAT; PAL; PPO
【中文摘要】经TuMV抗源鉴定与筛选试验,不结球白菜的不同品种对TuMV的抗性存在着明显差异,本试验采用苗期接种的方法研究了不结球白菜不同抗性品种感染TuMV后SOD、CAT、PAL、PPO在20 d内的动态变化,为探索不结球白菜抗TuMV机制和抗病育种提供理论依据。
【英文摘要】Four inbred lines of different resistance toTurnip mosaic virus(TuMV) of non-heading Chinese cabbage (Brassicacampestrisssp · chinensisMakino) 003-R-5, Y3-R-2, 109-S-8 and 003-S-13 were conducted in studying the relationship between theresistance and the activities ofSOD, CAT, PAL, and PPO. The activity ofSOD, CAT, PAL, and PPO was tested after the in-

oculation at seedling stage and a simple linear regression analysiswasmade associated with the disease index. The resultswere asfollows: the resistance varieties had higher values ofCAT, PAL, PPO and lower SOD than the susceptible varieties in uninfectedplants. Compared with controlgroup these fourprotective enzyme activities increased significantly after inoculationwithTuMV, andthe resistance varietiesweremore sensitive than the susceptible varieties. Correlative analysis revealed thatSOD, CAT, PAL andPPO were positive correlated to the resistance toTuMV of non-heading Chinese cabbage inbred lines, and the correlate coefficientwere 0・776 0, 0・959 1, 0・977 4, 0・999 1, respectively. The activity of PPO correlated very significantly with the resistance,and the activity ofPAL of8th day leaves after inoculation correlated significantlywith the resistance (r=0・937 5).

【题目】Mapping QTLs for mineral accumulation and shoot dry biomass under different Zn nutritional conditions in Chinese cabbage (Brassica rapa L. ssp. Pekinesis)
【中文关键词】无
【英文关键词】Brassica rapa L. ssp. pekinensis .
Quantitative trait loci (QTL) .Minerals . Zinc response
【中文摘要】无
【英文摘要】Chinese cabbage (Brassica rapa L. ssp.pekinensis) is one of the most important vegetables inChina. Genetic dissection of leaf mineral accumula-tion and tolerance to Zn stress is important for theimprovement of the nutritional quality of Chinesecabbage by breeding. A mapping population with 183doubled haploid (DH) lines was used to study thegenetics of mineral accumulation and the growthresponse to Zn. The genetic map was constructedbased on 203 AFLPs, 58 SSRs, 22 SRAPs and fourESTPs. The concentration of 11 minerals was determined in leaves for 142 DH lines grown in anopen field. In addition shoot dry biomass (SDB)under normal, deficient and excessive Zn nutritionalconditions were investigated in hydroponics experi-ments. Ten QTLs, each explaining 11.1 – 17.1% of theNa, Mg, P, Al, Fe, Mn, Zn and Sr concentrationvariance, were identified by multiple-QTL model(MQM) mapping. One common QTL was foundaffecting SDB under normal, deficient and excessiveZn nutritional conditions. An additional QTL wasdetected for SDB under Zn excess stress only. These results offer insights into the genetic basis of leafmineral accumulation and plant growth under Znstress conditions in Chinese cabbage.

【题目】The TLR expression pattern on monocyte-derived macrophages for Lipopolysaccharid stimulation of calves
【中文关键词】样受体,牛,巨噬细胞,脂多糖
【英文关键词】TLR, bovine, macrophage, LPS
【中文摘要】在本文中,单核细胞来源的巨噬细胞Toll样受体的表达模式(毒素)的脂多糖刺激检查。颈内静脉血液样本来自4个日本犊牛获得和外周血单个核细胞(细胞)分离。外周血单个核细胞培养7天,单核细胞来源的巨噬细胞在收集repcell。外周血单个核细胞刺激脂多糖的24小时和基因表达模式的受体和细胞因子的单核细胞来源的巨噬细胞(mod-mφ)分析。结果表明,内毒素刺激mod-mφ可能增加的表达水平的基因的肿瘤坏死因子-α,IL - 6,IL - 8和。此外,表达水平的基因的肿瘤坏死因子-α6组中的脂多糖刺激的最显着(<0.01)高于对照组的表达水平TLR 1,3,5,8,和10均显着(<0.05)降低脂多糖刺激后。没有任何差异的基因表达tlr2,4,6,和7组之间的控制和脂多糖刺激。此外,表达TLR 9没有被发现。它建议

,单核细胞来源的巨噬细胞响应脂多糖和他们可能起重要作用的先天免疫。重要功能的细胞可能有助于更好的疾病的治疗。

【英文摘要】In this paper, toll-like receptor expression pattern in monocytes-derived macrophages by lipopolysaccharid (LPS) stimulation was examined. Jugular venous blood samples from 4 Japanese calves were obtained and the peripheral blood mononuclear cells (PBMC) were isolated. The PBMC were cultured for 7 d so as to collect monocytes-derived macrophages in Repcell.The PBMC were stimulated by LPS for 24 h and the mRNA expression pattern of TLR and cytokines in monocytes derived macrophages (Mod-Mφ) was analyzed. Results showed that LPS stimulation of Mod-Mφ could increase the mRNA levels of the genes of TNF-α, IL-6, and IL-8. In addition, the mRNA levels of the genes of TNF-α and IL-6 in the group of LPS stimulation were most significantly ($P < 0.01$) higher than those in control group and the mRNA levels of TLR1, 3, 5, 8, and 10 were significantly ($P < 0.05$) decreased after LPS stimulation. There was no difference in the mRNA expressions of TLR2,4, 6, and 7 between the groups of the control and LPS stimulation. Besides, expression of TLR9 was not found. It suggested that monocytes-derived macrophages could respond to LPS and they might take an important role in the innate immunity. The important function of the cells might contribute to better disease treatment.

【题目】Effects of super-absorbent polymers on the physical and chemical properties of soil following different wetting and drying cycles

【中文关键词】无

【英文关键词】Super-absorbent polymer; soil moisture; bulk density; available P; available K; drying; wetting cycle

【中文摘要】无

【英文摘要】Super-absorbent polymers (SAPs), a group of new water-saving materials and soil conditioners, have been widely adopted in agriculture, but little is known about their effects on soil physical and chemical properties under alternating dry and wet conditions. This study assesses soil moisture, bulk density, pH, electrical conductivity (EC) and available P and K after different wetting and drying cycles. Four types of SAPs, labelled BF, JP, BJ and WT, with organic macromolecules were mixed with sandy soils to give concentrations of 0%, 0.05%, 0.1%, 0.2% and 0.3%, with the aim of determining water retention and soil properties after amendment with the SAPs. Soil moisture increased by 6.2-32.8% with SAP application, while soil bulk density was reduced by 5.5-9.4% relative to the control, especially with a moderate water deficit when the relative soil moisture contents were about 40-50%. The largest increase in

soil moisture and the greatest reduction in bulk density resulted from the WT treatment. The effects of SAPs on soil pH and EC were contrary. Soil available P increased slightly while available K significantly decreased, except following the first wetting and drying cycle. Available K increased with drying, but the opposite effect was observed for available P. Particular SAPs (JP and WT) seem more suitable under alternating dry and wet conditions. The effects on soil-water retention and other soil properties varied according to the structure of the SAP and soil moisture.

【中文关键词】典型棉区;地膜应用回收;残膜污染
【英文关键词】cotton planting area; use and recovery of plastic film; pollution from plastic mulch film
【中文摘要】残膜污染已经成为影响棉区农田生态环境的重要因子,以黄河流域棉区(河北邯郸)和西北内陆棉区(新疆兵团)典型覆膜棉田为研究对象,通过农户问卷调查和典型样点采集的方式,对地膜的应用、回收及污染现状进行系统的研究。结果表明,由于气候条件和生产方式的不同,两个棉区地膜投入量差异很大,河北邯郸地区地膜投入量为33.0 kg · hm-2,农田覆膜比例为46.4%,而新疆地区地膜投入量为61.4 kg · hm-2,农田覆膜比例高达84.8%。两个棉区地膜回收率基本相当,但由于投入量不同,新疆地区棉田土壤残膜量远大于邯郸地区,河北邯郸地区棉田0~30 cm 土层残膜量平均为80.5 kg · hm-2,而新疆地区则达到208.5 kg · hm-2,是邯郸地区的2.59 倍。残膜在土壤中主要分布在0~20 cm 的耕层中,从各层次残膜分布比重来看,新疆棉田土壤残膜污染程度更深。农户调查表明,绝大多数农民已经意识到地膜污染的危害性,特别是在新疆地区,但在回收处理以及再利用等方面还存在技术制约,影响了残膜的回收和污染治理。
【英文摘要】Pollution caused by residual plastic film in agricultural fields has been an important factor that is contributing to the deterioration of the agricultural environment. This study was conducted in the Yellow River Basin cotton planting area(Handan city in Hebei Province)andin the western inland cotton planting area(production and construction corps in Xinjiang Province)in 2007. The input of plastic film, recovery and pollution of residual plastic film in the study areas were evaluated by means of farmer survey and field sampling. The results showed that the input amount of plastic film varied in the different cotton planting region due to the difference of climate condition and farming system.The input amount of plastic film was 33 kg · hm-2 in Handan, but in Xinjiang it reached 61.4 kg · hm-2. There was no significantly different recovery ratio observed between both sites, but the amount of residual plastic film was quite different due to the difference of input amount. The average amount of residual plastic film in the soil (0~30 cm)was 80.5 kg · hm-2 in Handan, but in Xinjiang it was 208.5 kg · hm-2. The residual plastic film was mainly distributed in the tilled soil layer (0~20 cm)in both sites and the pollution in Xinjiang was more seriousthan that of Handan viewed from the depth of polluted soil layer. Most farmers had realized the pollution of plastic film, but due to the lack of a suitable technique to recove and reuse, the plastic film pollution continuesd to be a big problem in these areas, especially in Xinjiang.

【题目】4 种保水剂吸持水特性的比较研究
【中文关键词】保水剂;吸水性;持水性;释水性;pH
【英文关键词】superabsorbent ; water absorbing ; water retaining ; water releasing ; pH

【中文摘要】通过室内试验,比较研究了白金子(BJ) ,沃特(WT) ,巴斯夫(BF) ,黑金子(HJ) 等4 种保水剂的吸持水特性及对不同酸碱溶液的反应。结果表明,4 种保水剂在蒸馏水中的吸水倍率最大,其次为1∶5 的土壤浸提液中,在0. 9 %的NaCl 溶液中的最小;且在土壤浸提液中,吸水倍率大小依次为:白金子(BJ) > 沃特(WT) > 巴斯夫(BF)> 黑金子(HJ) 。4 种保水剂在pH 5~9 的范围内,能吸收比自身重200 多倍的水分。保水剂在蒸馏水中重复使用6 次后,其吸水倍率仍可达到初始吸水倍率的50 %以上。4 种保水剂中,BF 和WT 具有快速吸水、缓慢释放的特性。初步认为测试的4 种保水剂中BF 的吸持水特性最好,其次为WT ,最后是BJ 和HJ 。

【英文摘要】Experiment was made to compare water absorbing and retaining characteristics of four superab2sorbent s , and their corresponding response to different alkali - saline solutions. The result s indicated that the water absorption rate was the largest in distilled water , while in 0. 9 % NaCl solution , it was the least . In 1 :5 soil saturation ext ract , the water absorption rate of the superabsorbent s was compared as the following : BJ >WT >BF > HJ . The four superabsorbent s could absorb water more than 200 times of their own weight , and the water absorption rate maintained over 50 % of their original water absorption rate , even when they were reused for six times. BF and WT had the ability to absorb water quickly and release water slowly. We concluded that BF had the best water absorbing and retaining characteristics in four superabsorbent s ; secondly , it was WT. BJ and HJ were relatively worse.

【题目】华北典型农区棉田土壤中地膜残留特点研究

【中文关键词】华北地区,棉田,地膜残留,时空分布

【英文关键词】North China,cotton field,residue ofmulching plastic film,spatio- temporal pattern

【中文摘要】以华北典型农区- 河北省邯郸市作为研究对象, 对不同覆膜年限棉田地膜残留状况进行了分析研究, 力求揭示棉田土壤中残膜数量、形态的时空变化特点。结果显示, 邯郸地区棉田地膜平均残留量在59.1~103.4 kg · hm-2 之间。土壤中残膜含量与覆膜年限有关, 覆膜年限越久, 残留量越高。连续覆膜2a、5a 和10a 的棉田中地膜残留量分别为59.1、75.3 和103.4 kg · hm- 2, 且土壤中的残膜数量分别为393 万片 · hm-2、544 万片 · hm-2 和965 万片 · hm-2。残留地膜主要集中在表层土壤中, 3 个土层(0~10 cm、10~20 cm、20~30 cm) 中的残膜数量依次约占总量的75%、20%和5%。研究结果还显示覆膜时间越长, 深层土壤残膜量越高。小块膜明显多于大块膜, 3 种不同面积大小(<4cm2,4~25cm2,>25 cm2) 的残膜片数分别约占总量的65%、30%和5%。

【英文摘要】Handan in Hebei province was selected to investigate the status and the spatio- temporal pattern of residual mulching plastic film in the typical cotton field that was mulched with agricultural plastic filmfor different years. The paper ′ s aim was to identify the spatio- temporal pattern of residual mulching plastic film. The results indicated that the average amount of residual plastic film in cotton field was from 59.1~103.4 kg · hm- 2, which increased with the increasing of mulched years. And the total amount of residual plastic film in cotton field were 59.1, 75.3 kg · hm- 2and 103.4 kg · hm- 2 for 2 years, 5 years and 10 years respectively. The total piece amount of residual plastic film in cotton field in 2 years, 5 years and 10 years were 3.93, 5.44 and 9.65 million per hectare respectively. Most of residual mulching plastic film was distributed in top soil, and the percentage of residual plastic filmin three layers of soil (0~10 cm, 10~20 cm, 20~30 cm) were 75%, 20% and 5% respectively. With the mulched years increased, the amount of residual mulching plastic film in deep soil and small piece of residual mulching plastic filmincreased, and which percentages of three kinds piece of residual piece of mulching plastic film (<4 cm2, 4~25 cm2, >25cm2) accounted for are about 65%, 30% and 5% respectively.

【题目】农用地膜残留污染的现状与防治
【中文关键词】农用地膜,残留污染,防治对策
【英文关键词】mulching plastic film; residue pollution of mulching plastic film; prevent ion and controlling measures
【中文摘要】农用地膜良好的增温保墒效果已对中国农业产生了重大的、积极的作用,但同时随着地膜覆盖技术的普及,残留农用地膜也已经带来了一系列的负面影响,大量的残留地膜破坏土壤结构、危害作物正常生长发育并造成农作物减产,进而影响到农业环境,通过对中国有关地膜残留研究文献的综述,对农用地膜的应用现状、残留地膜的分布特征及影响因素,以及残留地膜的危害特点进行了综合分析,并针对目前存在的实际情况,提出了农用地膜残留污染的防治技术措施。
【英文摘要】Increasing temperature and keeping soil moisture effect of mulching plastic film have brought apositive and important progress in agricultural productivity , and also the residue of mulching plastic film in the field has already become a negative factor that affected agricul tural environment , which destroyed soil structure and harmed growth of crop. Based on results of domestic study on this issue, the authors comprehensively analyzed the application situation of mulching plastic film in agriculture, and the distribut ion characteristics as w ell as the influencing factors, the harm ways of the residue of mulching plastic film. According to the actualsituat ion, the techniques of preventing and controlling measures for residue pollution of mulching plastic film were put forward.

【题目】我国地膜应用污染现状及其防治途径研究
【中文关键词】地膜;残膜污染;防治途径
【英文关键词】plastic film; pollution by plastic film residue; measures of prevention and controlling
【中文摘要】地膜是农业生产的重要物质资料之一,我国每年地膜应用量近百万吨,地膜覆盖面积1000 多万hm2,覆盖作物达40 多种。地膜技术的应用极大地促进了我国农业的发展,但随着地膜应用量和使用年限的不断增加,大量残留地膜造成的“白色污染”不但严重影响了农业生产的进行,而且对农业环境的安全与健康也构成了巨大的威胁。农田残留地膜已经成为影响农业环境、破坏土壤结构、危害作物正常生长发育并造成农作物减产的重要因素之一。通过对统计数据的整理分析,以及在国内外研究文献总结和归纳的基础上,对我国农用地膜应用、污染现状进行了全面的分析和论述。在此基础上,针对我国的地膜污染的现状,从地膜的标准化生产、节约使用、高效回收以及未来需要研发的新材料、新技术等方面提出相应的防治技术途径。
【英文摘要】Abstract:Plastic film covers are important in the Chinese agricultural production. In recent years, one million ton per year of plastic film hasbeen applied in the agricultural fields of China. The coverage area has reached over ten millions hectares. Application of plastic film raises agriculturalproduction. With the increase of plastic film application amounts, the pollution by residue of mulching plastic film in the field has become a serious problem. It has affected the neighboring environment, destroyed soil structure, and harmed crops ’ normal growth. This study analyzed application of and pollution by the mulching plastic film based on a former domestic study results and analysis of statistical data, discusses the field distribution characteristics, the influencing factors and the harmful effects of mulching plastic film residue, and the techniques for preventing and controlling mulching plastic film pollution as well as the development trend in the future are proposed based on forecasted agricultural production situation.

【题目】新疆石河子地区棉田土壤中地膜残留研究
【中文关键词】石河子地区,棉田,地膜残留
【英文关键词】Shihezi district; cotton field; plastic film residue
【中文摘要】以新疆石河子棉区作为研究对象, 对连续20a覆膜单作棉花、棉花-西红柿轮作和连续10a单作棉花棉田的地膜残留状况进行了调查, 研究结果显示石河子地区棉田地膜残留污染十分严重, 土壤中平均残留量高达(300. 65±49. 32)kg# hm-2。土壤中残膜量与覆膜年限有关, 覆膜年限越久, 残留量越高。连续覆膜20a和10 a棉田中地膜残留量分别为(307.9±35.84)kg# hm-2和(259.7±36.78) kg# hm-2, 同时, 种植模式对残膜量也存在一定的影响, 连续20a覆膜种植棉花-西红柿的土壤中残留量最高, 达到(334.4±47.88) kg# hm-2, 且层间分布均匀。3种种植模式下棉田土壤中残留地膜的片数都非常多, 在1000~2000万片/hm2 之间, 主要集中在0~10cm 的表层土壤中。研究结果还显示大多数残膜面积较小, 集中在1~25cm2之间, 小于25cm2 的片数超过总片数的80%以上。
【英文摘要】The study investigated effects of mulching plastic film residue in mono-cotton planting system w ith mulched plastic film lasting for 20 years, and cotton-tomato, and mono-cotton planting system mulched plastic film lasting for 10 years in Shihezi district. The result shows that there has been a very serious pollution. The average amount of residue of mulchingplastic film remained in the cotton field soils is (300.65±49.32) kg# hm-2, and the distribution of residue is relatively uniformity in 0-30 cm layer. The amount of plastic film residue depends on duration of utilization ofmulching plastic film,and the longer the duration of utilization, the more plastic film residue is left in the field. For the mono cotton planting system mulched plastic film for 10 years and 20 years, the amount of plastic film res iduesare (307.9±35.84) kg# hm- 2 and (259.7±36.78) kg# hm- 2, respectively. At the sametime, it is found that the amount of plastic film residue is also affected by the planting method. For the cotton-tomato rotation system mulched plastic film lasting 20 years, the plastic film residuegave a maxmium value of about (334.4±47.88) kg# hm . The pieces are from 10 to 20 million per hectare, most of them are pieces are of small size area of about 1-25 cm2 and over 80% of the residue piece are less than 25cm2.

【题目】不同基因型小白菜硝酸盐积累差异及筛选研究
【中文关键词】小白菜;硝酸盐;基因型差异;筛选
【英文关键词】chinese cabbage; nitrate; genotypic differences; screen
【中文摘要】采用溶液培养方法研究了/& 种基因型小白菜在不同硝铵比条件下体内硝酸盐含量的变化情况。结果表明,不同基因型小白菜的硝酸盐含量差异较大,东妃青梗菜、上海白叶四月蔓和夏优高抗为低硝酸盐含量基因型小白菜,而高雄甜脆小白菜、宝大矮棋青和苏州青为高硝酸盐含量基因型小白菜。硝铵比%" F %" 是最适宜筛选的氮素形态比例,而叶片中的硝酸盐含量也是最适宜的筛选指标。对上述, 个基因型小白菜进一步分析结果表明,不同部位硝酸还原酶、根系硝态氮最大吸收速率以及亲和力这三个因素对小白菜各部位的硝酸盐积累都有显著的影响,但在不同部位,这三个因素所起的贡献率不同。
【英文摘要】hydroponic experiments were carried out to study the nitrate accumulation of 43 chinese cabbage genotypes under the nutrient solution of different NO3-/NH4+ ratio. the results indicated that the discrepancies in nitrate contents among different genotypes were significant, and accordingly, Dongfei, Shanghai baiye and Xiaoyou gaokang as the low nitrate concentration genotypes, and Gaoxiong tiancui, Baoda aiqi, Suzhouqing as the high nitrate concentration genotypes were screened out. Here, the nitrate source of NO3-/NH4+ 50/50 and nitrate content in leaves can be considered as the best nutrient solution and index for nitrate accumulation screening. Furtehr study on these six genotypes of chinese cabbage suggested that the effects of nitrate reductase, maximum nitrate uptake and affinity on nitrate accumulation were significant, while showed different contribution in different part of plants.

【题目】保水剂对土壤水分垂直入渗特征的影响
【中文关键词】积水入渗;入渗率;土壤含水率;保水剂;湿润锋
【英文关键词】ponding infiltration; infiltration rate; soil water content; super absorbent polymer; wetting front
【中文摘要】为了探明保水剂对土壤水分入渗性能及变化过程的影响,该文通过室内积水入渗试验,比较分析了保水剂作用下土壤水分的入渗率、累积入渗量及湿润锋等的动态变化。结果表明:保水剂对入渗率的影响具有稳定性和一致性。上层混施(0~10 cm)和层施(5 cm)保水剂会限制土壤水分向下运移,30 min 后累积入渗量分别比对照显著减少了17.3%~36.6%和5.5%~46.6%;而且随着保水剂用量增加,抑制效应增大。相比较而言,这种减缓入渗的程度在保水剂层施,且用量为0.1%时更为明显。下层(10~20 cm)混施和层施(10 cm 和15 cm)保水剂对土壤水分入渗的抑制是有限的,约比对照降低了4.9%~11.9%;但当保水剂层施量为0.1%时,土壤水分入渗反而会随着入渗进程而增加,累积入渗量可达到对照的1.1 倍。层施保水剂后,保水剂层及保水剂下层土壤含水率会普遍增加1.1~1.9 倍。
【英文摘要】In order to determine the effects of super absorbent polymer on characteristics and dynamic changes of soil water infiltration, the dynamic changes of infiltration rates, cumulative infiltration, and wetting front of soil water under super absorbent polymer were analyzed through the lab experiments. The results showed that the influences of super absorbent polymer on infiltration rate were stable and consistent. Mixed (0-10 cm) and layered (5 cm) application of super absorbent polymer in upper soil layer would restrict soil water downward movement. After 30 minutes, the cumulative infiltration significantly decreased by 17.3%-6.6% and 5.5%-46.6% compared with the control. The restraining effect was increased with the increasing concentration of super absorbent polymer, and it was more obvious in layered application, especially in the concentration of 0.1%. Whereas, mixed (10-20 cm) and layered (10 cm and 15 cm) application of super absorbent polymer in lower soil layer had limited inhibitory effect, it reduced by 4.9%-11.9% compared with the control. While in layered application (10 cm and 15 cm) with the concentration of 0.1%, infiltration capacity of soil water would be enhanced, and the relevant cumulative infiltrations were about 1.1 times larger than the control. The water content in the soil layer with super absorbent polymer and the corresponding under soil layer would increase 1.1-1.9 times through layered application.

【题目】马铃薯孢囊线虫在我国的适生性风险分析与控制预案
【中文关键词】马铃薯白线虫生物学风险分析
【英文关键词】无
【中文摘要】马铃薯金线虫Globodera rostochiensis和马铃薯白线虫G.pallida,是马铃薯等茄科植物上两种最重要的孢囊线虫,一般造成马铃薯产量损失9%~20%,在热带地区,为害严重时造成产量损失80%~90%,甚至绝收。马铃薯金线虫在全世界72个国家有发生和分布,马铃薯白线虫在全世界51个国家有发生和分布,全世界100多个国家都将马铃薯金线虫和白线虫列为重要的对外检疫性有害生物,我国目前尚无马铃薯金线虫和白线虫发生为害的报道,因此是我国重要对外检疫性有害线虫。根据国外现有马铃薯金线虫和白线虫发生分布信息,利用生态位GARP和MAXENT模型,对马铃薯金线虫和白线虫在我国的适生区进行了风险分析。MAXENT模型预测马铃薯金线虫在我国的高风险区包括河北南部、江苏、安徽、河南东南部、湖北东部、湖南东部、贵州北部;中风险区包括辽宁中部、河北东南部、山东大部、河南西部、陕西南部、甘肃东南部、云南北部。运用MAXENT生态位模型预测马铃薯白线虫在我国的适生区,江苏东南部、云南西部、海南大部、广东西南部、四川东南部等是高度风险区,江苏南部、云南东部、贵州西部、广西中部、浙江北部为中风险区。根据马铃薯孢囊线虫在我国的适生性风险分析结果,提出了应急处理措施和控制预案。作者认为对马铃薯孢囊线虫的控制,主要是要加强检疫封锁,并对其适生区进行适时和定点监测,筑牢防范其入侵的第一道防线。

【题目】Factors affecting the transfer of immunoglobulin G1 into the milk of Holstein cows
【中文关键词】免疫球蛋白类;转移;牛奶;荷斯坦奶牛生产的因素;
【英文关键词】Immunoglobulin G1; Transfer; Milk; Holstein cow; Production factors
【中文摘要】免疫球蛋白(免疫球蛋白)的浓度牛奶荷斯坦奶牛来确定是否转移和集中在 fl 严重的生产因素(一些哺乳期,哺乳阶段,每天产奶量,乳成分)(牛奶脂肪,蛋白质,乳糖,和总固形物含量)或血清IgG 1浓度。二百九十九中国荷斯坦奶牛,随机选择四个群共含1600以上的哺乳期的动物。浓度的牛奶和血清IgG 1抗体酶联免疫吸附试验测定。牛奶IgG 1浓度之间0.030和0.614毫克/毫升和意义 fi 主要与哺乳号码,哺乳阶段,每天的牛奶产量和体细胞数。IgG 1群众被发现高度相关,哺乳期,哺乳阶段,每日牛奶产量和乳蛋白含量。哺乳数量有直接关系的最高阳性IgG 1浓度。
【英文摘要】Immunoglobulin (Ig) G1 concentrations in milk from Holstein cows was measured to determine if transfer and concentration was in fl uenced by production factors (lactation number, stage of lactation, daily milk production), milk composition (milk fat, protein, lactose, and total solids content) or by serum IgG1 concentration. Two hundred and ninety-nine Chinese Holstein cows were randomly selected from four herds containing a total of more than 1600 lactating animals. The concentration of IgG1 in the milk and serum was determined by ELISA.Milk IgG1 concentrations varied between 0.030 and 0.614 mg/mL and signi fi cantly correlated with lactation number, stage of lactation, daily milk production and somatic cell count. The IgG1 mass was found to highly correlate with lactation number, stage of lactation, daily milk production and milk protein content. Lactation number had the highest positive direct relationship with IgG1 concentration

【题目】充分与非充分灌溉条件下冬小麦光合速率与产量的关系
【中文关键词】冬小麦;水分;光合速率;产量;相关性
【英文关键词】W inter wheat; Water; Photosynthetic rate; Yield; Correlation
【中文摘要】选用北方栽培的10个冬小麦品种,设定充分灌溉和非充分灌溉(自然降水)两种水分条件,旨在分析光合速率与产量的关系。结果表明:充分灌溉条件下冬小麦的光合速率和产量均高于非充分灌溉;在生殖生长期光合速率与产量具有显著的正相关关系,自然光下光合速率在抽穗开花期和灌浆初期与产量的相关性最显著,给光下光合速率在抽穗开花期、灌浆初期、灌浆中期与产量的相关性最显著。因此,在抽穗开花期和灌浆期适当增加灌溉量,可提高光合速率,促使小麦增产。
【英文摘要】Ten species ofwinterwheatwhich grown in Northern China were selected in this study, theywere treated by two water conditions: Full Irrigation and Insufficiency Irrigation (Rainfall). Tthen we analyzed the correlation between the photosynthetic rate and the yield. The result showed that under Full Irrigated condition, both the photosynthetic rate and the yield were higher than that under insufficiency irrigation ’s. The positive correlativity between the photosynthet ic rate and the yield was remarkable during the p rocreate growth period. During the heading blooming and the beginning of grain2filling stage, the correlation between the photosynthetic rate (Natural light) and the yield was the most remarkable. For the photosynthetic rate (LED) , the most remarkable correlation was during the stage of heading-blooming, the beginning grain2filling and the mid-grain filling. Therefore,more irrigation during heading blooming and grouting stage could enhance the photosynthetic rate and increase the yield of winter wheat.

【中文关键词】王不留行,舒张压,奶牛,乳腺上皮细胞,信号转导,微RNA
【英文关键词】Vaccaria segetalis, DBP, dairy cow, mammary gland epithelial cells, signal transduction, miRNAs
【中文摘要】催乳机制的王不留行仍然是未知的。了解邻苯二甲酸二丁酯(舒张压)脱离王不留行的表达的信号转导基因的哺乳期乳腺上皮细胞,包括催乳素受体,雌激素受体α,Ak t1,SOCS 2,激活γ和elf5,将有助于揭示的分子机制。免疫印迹和qrt-pcr被用来研究的变化,而α,总之,SOCS 2,激活γ,和elf5在基因和蛋白水平的表达。定位表达催乳素受体(催乳素受体)和雌激素受体α(雌α)观察免疫荧光;表达变化为(21,143,和195的,)和分泌β-酪蛋白和乳糖检测qrt-pcr和反相高效液相色谱法。结果表明,王不留行活性化合物也有类似的作用雌激素和/或催乳素(催乳素)在奶牛乳腺上皮细胞(dcmecs),表达的增加,而α,蛋白质,和elf5基因,而压抑的激活γ表达式。舒张压促进SOCS 2基因表达,但其表达的压抑。此外,双方舒张压和泌乳素可以抑制表达mirna-125b,mirna-143和mirna-195在dcmecs。舒张压可以压制表达mirna-21,而影响泌乳素mirna-21不certain.dbp可促进泌乳能力的dcmecs调节和催乳素受体细胞信号转导通路。
【英文摘要】The galactopoietic mechanism of Vaccaria segetalis is still unknown. Understanding dibutyl phthalate (DBP) separated from Vaccaria segetalis on the expression of lactation signal transduction genes of mammary gland epithelial cells,including prlr, er α , akt1, socs2, ppar γ and elf5, will be helpful to reveal the molecular mechanism.Western blot and qRT-PCR were used to study the change of prlr, er α , akt, socs2, ppar γ , and elf5 expression at mRNA and protein level. Colocalization expression of prolactin

receptor (PRLR) and estrogen receptor α (ERα) was observed by immunofluorescence; the expression changes of miRNAs (21, 125b, 143, and 195) and the secretion of β-casein and lactose were detected by qRT-PCR and RP-HPLC. The results showed that Vaccaria segetalis active compound had similar fuctions as estrogen and/or prolactin (PRL) in dairy cow mammary gland epithelial cells (DCMECs), increased the expressions of prlr, erα, akt1,and elf5 genes, while repressed pparγ expressions. DBP promoted socs2 mRNA expression, but its protein expressions were repressed. Furthermore, both DBP and PRL could repress the expressions of miRNA-125b, miRNA-143 and miRNA-195 in DCMECs. DBP could repress the expression of miRNA-21, while the influence of PRL on miRNA-21 was not certain.DBP could promote the lactation ability of DCMECs by regulating the ER and PRLR cellular signal transduction pathway.

【题目】Influence of fish/soybean oil supplementation on milk conjugated linoleic acid and mammary gland SCD gene expression in dairy cows

【中文关键词】鱼油,共轭亚油酸,猝死

【英文关键词】Fish Oil, Conjugated Linoleic Acid, SCD

【中文摘要】本研究的目的是审查的影响,添加鱼油、豆油对奶牛乳脂c18:2顺9跨11共轭亚油酸(共轭亚油酸)和乳腺猝死基因的表达。十八中国荷斯坦奶牛(176±16点心)在随机设计是基本的饮食喂养(细胞),或基底饮食补充鱼油或2%(对)或结合2%鱼油和2%大豆油(sbfo)。基础日粮含40%和60%集中混合饲料。油添加取代玉米饲料。实验时间为9周。饮食中平均16.6±0.3%和1.56,1.64和1.72多通道/千克马克细胞,和sbfo,分别。牛奶产量记录每天和牛奶样品收集每周连续3乳品和分析的组成和脂肪酸(英格兰)简介。在每个治疗,3头牛被用于乳腺活检取样。乳腺组织是从后方季度结束时的治疗期。相对基因表达数据分别计算了2-ΔΔ方法。β-肌动蛋白是用来作为参考的基因。方差分析的变量使用的是混合进行。意义被宣布在<0.05。饲料和牛奶产量没有不同处理间。奶牛和sbfo治疗2.50b和2.86b %脂肪的牛奶,分别比3.63a %细胞。油酸的比例(弗吉尼亚州)和独联体- 9跨11共轭亚油酸异构体0.75b,7.88a,和8.54a,0.56b,大师和4.15a %足总甲酯,和sbfo,分别。中所占的比例不饱和足总杯的增加和附近的治疗相比,细胞。丰富的猝死基因在乳腺减少了50%和57%附近比较细胞。喂养2%鱼油()或2%鱼油加2%大豆油(sbfo)奶牛共轭亚油酸含量的增加和牛奶中的乳脂含量下降560%和26%相比,细胞无油。

【英文摘要】The objective of this study was to examine the effect of adding fish oil and soybean oil to dairy cows on milk fat C18:2 cis-9 trans-11 conjugated linoleic acid (CLA) and mammary gland SCD gene expression. Eighteen Chinese Holstein dairy cows (176 ± 16 DIM) in a randomized design were fed a basal diet (CTL), or basal diet supplemented with either 2% fish oil (FO) or a combination of 2% fish oil and 2% soybean oil (SBFO). The basal diet contained 40% forage and 60% concentrate mix. Oils were added by replacing the corn in the diet. Experimental duration was 9 wk. Diets contained an average 16.6 ± 0.3% CP and had 1.56, 1.64 and 1.72 Mcal NEL/kg DM in CTL, FO and SBFO, respectively. Milk yields were recorded daily and milk samples were collected weekly from 3 consecutive milkings and analyzed for composition and fatty acid (FA) profile. Within each treatment, 3 cows were used for mammary gland biopsy sampling. Mammary gland tissues were taken from a rear quarter at the end of the treatment period. Relative gene expression data were calculated by 2-ΔΔCT method. β-actin was used as the reference gene. Analysis of variance for variables was conducted using the MIXED procedure of SAS. Significance was declared at P < 0.05. Feed DMI and milk yields were not different among treatments. Cows in FO and SBFO treatments had 2.50b and 2.86b % fat in milk, respectively compared to 3.63a % in CTL. The proportions of vaccenic acid (VA) and cis-9 trans-11 CLA isomer were 0.75b , 7.88a , and 8.54a , 0.56b , 3.20a and 4.15a percent of total FA methyl esters in CTL, FO and SBFO, respectively. The proportions of unsaturated FA were increased in FO and SOFO treatments compared to CTL. The abundance of SCD mRNA in the mammary gland was reduced by 50% in FO and 57% SOFO compared to CTL. Feeding 2% fish oil (FO) or 2% fish oil plus 2% soybean oil (SBFO) to dairy cows increased the content of VA and CLA in milk by 560% and decreased the milk fat content by 26% compared to CTL without oil.

【题目】Flow of fatty acids to the duodenum and fatty acid profile of milk from cows fed diets differing in forage fiber level
【中文关键词】饲料,脂肪酸,奶牛
【英文关键词】Forage, Fatty Acids, Dairy Cow
【中文摘要】一项研究进行了评价的影响,饮食不同饲料中性洗涤纤维(fndf)的　流脂肪酸(英格兰)的十二指肠和牛奶足总杯概况。四荷斯坦奶牛(483±21kg体重;175±6点心)安装永久性瘤胃和简单的T形套管近端十二指肠中使用了一个4×4拉丁方设计实验。每一期为21d。前2周被认为是适应的饮食和测量了在过去一周在每一个时期。饮食在4治疗fndf含量为46.71(trt-1),37.01(trt-2),26.43(trt-3)和18.50%(干物质基础trt-4)。不同层次的fndf饮食是由不同比例的饲料和浓缩型饲料。牧草用于制定饲料玉米青贮或苜蓿干草,羊草。在制定了饮食是低脂肪。足总杯内容的饮食是0.86,1.14,1.46和1.71在治疗1至4,分别为。在最后一周在每一个时期样品的rumenuid和十二指肠食糜收集研究流动的足总杯。牛奶样品进行分析的足总杯概况。瘤胃液PH值为6.56a,6.55,6.45和6.26在治疗1至4,分别为。减少fndf含量的饮食往往增加流动的C18 : 1跨11(弗吉尼亚州;<0.09)。流动c18:0C16,18 : 1,独联体- 9和c18:2到十二指肠增高减少fndf在饮食治疗。流动的c18:2顺9跨11异构体的共轭亚油酸(共轭亚油酸)并不受饮食疗法。不同的fndf在本研究中没有影响牛奶脂肪酸的个人资料包括共轭亚油酸的含量。结果表明,不同饲料中性洗涤纤维含量从46.7到18.5%的饮食糖尿病流动脂肪的饮食(2%的饮食)影响不大,牛奶脂肪酸剖面。
【英文摘要】A study was conducted to evaluate the effects of diets differing in forage NDF (fNDF) on the　flow of fatty acids (FA) to the duodenum and milk FA profile. Four Holstein cows (483±21kg BW; 175±6 DIM) fitted with permanent ruminal and simple T-shaped cannulae in the proximal duodenum were used in a 4×4 Latin square design experiment. Each period was 21 d. First 2 wk were considered as adaptation to the diets and measurements were made during the last week in each period. Diets in 4 treatments had fNDF content of 46.71(Trt-1), 37.01(Trt-2), 26.43 (Trt-3) and 18.50% (Trt-4) on dry matter basis. The different levels of fNDF in diets were achieved by varying the ratio of forage and concentrate and type of forage. The forages used to formulate diets were corn silage, Chinese wildrye or Alfalfa hay. The diets were formulated to be low-fat. The FA content of the diets was 0.86, 1.14, 1.46 and 1.71 in treatments 1 through 4, respectively. During the last week in each period samples of the rumenuid and duodenal chyme were collected to study the flow of FA. Milk samples were analyzed for FA profiles. Ruminal fluid pH was 6.56a , 6.55 a , 6.45 a and 6.26 b in treatments 1 through 4, respectively. Decreasing fNDF content of the diets tended to increase the flow of C18:1 trans-11 (VA; P < 0.09). The flow of C16:0, C18:0, C18:1 cis-9 and C18:2 to the duodenum increased signicantly with decreasing fNDF in the treatment diets. The flow of C18:2 cis-9 trans-11 isomer of conjugated linoleic acid (CLA) was not affected by dietary treatments. Varying the fNDF in the present study had no influence on milk fatty acid profile including CLA content. The results suggest that varying forage NDF content from 46.7 to 18.5 % of diet DM in flow fat diets (< 2% of diet) had little effect on milk fatty acid profile.

【题目】Fatty acids composition of milk from cows fed oilseeds
【中文关键词】油料,牛奶脂肪酸,激素
【英文关键词】Oilseeds, Milk Fatty Acids, Hormones
【中文摘要】本研究的目的是审查的影响在　油料补充牛奶脂肪酸(英格兰)亲　乐和等离子体参数奶牛。四十荷斯坦奶牛(150±25点心)被随机分配到四个治疗。在四个治疗喂基础日粮(细胞)或基底饮食补充或者整个大豆(财政司司长),膨化大豆(胚胎),或混合整个棉籽,整个大豆和大豆(混合)。饮食中1.57,1.59,1.60和1.64通道/千克干细胞,财政司司长,和混合处理。所有饮食iso-nitrogenous和包含了平均16.50%的实验时间为6周处长。测量了在过去3周。日采食量和产奶量记录。每周

的牛奶样品进行分析的组成和脂肪酸　乐。血液样本取自尾静脉或动脉在3小时后喂养的最后一天,实验和分析血液化学。统计分析使用混合程序和一个完全随机设计反复措施。产量的牛奶,脂肪和蛋白质之间没有不同的治疗。比例的短期和中链(C4 : 0 – c12:0)均降低,长链足总增加奶牛喂食种子与牛细胞。膨化大豆喂养奶牛胚胎治疗增加了c18:2顺9跨11共轭亚油酸异构体在牛奶84%与细胞治疗。浓度的共轭亚油酸在牛奶是一样的,财政司司长和混合处理。平均浓度的血浆胆固醇,脂蛋白胆固醇,游离脂肪酸,瘦素,血糖,甘油三酯,胰岛素和β-羟丁酸之间并没有不同的治疗。结果表明,膨化大豆喂养奶牛提高c18:2顺9跨11共轭亚油酸异构体在不影响　饲料摄入量,产奶量,乳成分和血液参数。

【英文摘要】The objective of this study was to examine the in　uence of oilseeds supplementation on milk fatty acid (FA) pro　le and plasma parameters in dairy cows. Forty Holstein dairy cows (150 ± 25 DIM) were randomly assigned to four treatments. Cows in four treatments were fed a basal diet (CTL) or basal diet supplemented with either whole soybeans (FS), expanded soybeans (ES), or a mix of whole cottonseed, whole soybeans and expanded soybeans (MIX). Diets contained 1.57, 1.59, 1.60 and 1.64 NEL/kg DM in CTL, FS, ES and MIX treatments. All diets were iso-nitrogenous and contained an average 16.50% CP. Experimental duration was 6 week. Measurements were made during the last 3 weeks. Daily feed intake and milk yield were recorded. Weekly milk samples were analyzed for composition and fatty acid pro　le. Blood samples were taken from the coccygeal vein or artery at 3h post-feeding on the last day of experiment and analyzed for blood chemistry. Statistical analysis was conducted using the MIXED procedure of SAS for a completely randomized design with repeated measures. Yields of milk, fat and protein were not different among treatments. The proportions of short and medium chain (C4:0 – C12:0) were decreased and long chain FA increased in cows fed oil seeds compared with cows in CTL. Feeding expanded soybeans to cows in ES treatment increased the C18:2 cis-9 trans-11 isomer of CLA in milk by 84% compared with CTL treatment. The concentrations of CLA in milk were the same in CTL, FS and MIX treatments. Mean concentration of plasma cholesterol, lipoprotein cholesterol, NEFA, Leptin, glucose, triglyceride, insulin and β-hydroxybutyric acid was not different among treatments. Results suggest that feeding expanded soybeans to dairy cows enhances the C18:2 cis-9 trans-11 isomer of CLA without in　uencing feed intake, milk yield, milk composition and blood parameters.

【题目】Relationship between milk odd and branched-chain fattyacids and duodenal flow of microbial protein

【中文关键词】奇数和支链脂肪酸,微生物蛋白,奶牛

【英文关键词】odd and branched-chain fatty acids, microbial protein,
dairy cows

【中文摘要】影响精制二十二碳六烯酸(二十二碳六烯酸)和精制游离亚油酸(洛杉矶)或其组合上奇数和支链脂肪酸(obcfa)概况牛奶进行了研究。之间的相关性是obcfa分泌和十二指肠流动微生物蛋白在哺乳期的奶牛。四个产荷斯坦奶牛奶牛瘤胃和十二指肠瘘管平均139±10点心中使用了一个4×4拉丁方设计实验。有4个时期,每3周。奶牛饲料喂养65%和35%集中饮食。除了基础日粮奶牛收到0(控制)或0.5%,2.73%,和0.5% +2.3%组合。脂肪的添加取代谷物的饮食。牛奶和十二指肠食糜样品收集17,18,19,16,17,18,分别为。数据统计分析的使用过程中的混合。饲料摄入量不影响脂肪补充控制相比。牛奶产量18.6,17.2,18.4,和17公斤/天,鱼油,洛杉矶,和二十二碳六烯酸+洛杉矶治疗,分别和不影响脂肪补充磷>0.05。牛奶脂肪和蛋白质的比例是相同的脂肪补充治疗和控制。与对照组相比,浓度线性不饱和脂肪酸(15 : 0和c17:0)牛奶减少了洛杉矶的治疗,然而,脂肪酸补充剂并没有显着(>0.05)影响的浓度iso-fatty酸或anteiso-fatty酸。没有强烈的线性关系(注册商标=0.166)之间obcfa乳汁分泌和十二指肠流动胞嘧啶进行观察研究,表明牛奶obcfa不能被用作标记十二指肠流动微生物蛋白质时,提供饮食与脂肪酸补充剂。

【英文摘要】Effects of refined docosahexaenoic acid (DHA) and refined free linoleic acid (LA) or their combination on odd and branched-chain fatty acids (OBCFA) profiles of milk was studied. A correlation was developed between OBCFA secretion and duodenal flow of microbial protein in lactating dairy cows. Four multiparous Holstein-Friesian dairy cows with ruminal and duodenal cannulas averaging 139±10 DIM were used in a 4 × 4 Latin square design experiment. There were 4 periods of 3 wk each. Cows were fed 65% forage and 35% concentrate diet. In addition to the basal diet cows received either 0 (Control) or 0.5% DHA, 2.73% LA, and 0.5% DHA + 2.3% LA in combination. Fat was added by replacing grain in the diet. Milk and duodenal digesta samples were collected on 17, 18, 19 d and 16, 17, 18 d, respectively. Data were analyzed statistically by using PROC MIXED of SAS. Feed intake was not

affected by fat supplement compared to control. Milk yields were 18.6, 17.2, 18.4, and 17.0 kg/d for control, DHA, LA, and DHA+LA treatments, respectively and were not affected by fat supplementation P > 0.05. Milk fat and protein percentages were the same in fat supplemented and control treatment. Compared with control, the concentrations of linear odd-chain fatty acids (C15:0 and C17:0) in milk were reduced by LA+DHA treatment, however, fat supplements had no significant (P>0.05) effects on the concentrations of iso-fatty acids or anteiso-fatty acids. No strong linear relationship (R=0.166) between milk secretion OBCFA and duodenal flow of cytosine were observed in this study, suggesting that milk OBCFA could not be used as a marker for duodenal flow of microbial protein when cows offered diets with fat supplements.

【题目】Effects of duodenal infusion of linolenic acid on milk fatty acid composition in dairy cows
【中文关键词】亚麻酸,营养物质消化率,牛奶的组成
【英文关键词】linolenic acid, nutrient digestion, milk composition
【中文摘要】提高亚麻酸含量的牛奶脂肪可能是可取的,以满足消费者的偏好。我们的目标是确定可能改变的内容含量的牛奶中的十二指肠灌注高含量的游离脂肪酸混合物。四产中国荷斯坦奶牛(体重=556±19公斤,暗=93±9)配备十二指肠插管管理的2个治疗交叉设计。治疗的均质混合物水溶液α－亚麻酸(低噪声放大器;82.4%个独联体－9,独联体－12,独联体－15：3;独联体14.7%－9,独联体12－2;2.8%个独联体－918：1)或控制只含有乳化成分。控制输注由15克/天的黄原胶,5克/天海藻酸钠,和25克/天吐温80在10升的水。每一期长达5周,其中2头牛每年收到的金额(0,40,80,120,和160克/天)的低噪声放大器每1周,和其他2个奶牛收到承运人只输注。测量了在过去3天的每个输液量。数据统计分析的使用过程中的混合。多项式的反差是由线性,二次,三次量的影响及处理。意义是宣布在<0.05。增加的数额低噪声放大器注入十二指肠线性浓度增加338动画。脊髓损伤。87卷,e-suppl。2 / J乳品科学。92卷,e-suppl。1独联体－9,独联体－12,独联体－15含量(0.16,6.49,12.42,18.75,和25.38%低噪声放大器注入0,40,80,120,160克/天,分别)和独联体－9,独联体－12c18:2(2.38,2.94,3.19,3.77,和4.16%)。提高低噪声放大器下降百分比的短链脂肪酸,c14:0,并使之≤C16总足总杯(65.2,60.7,57.8,51.4,46%)呈线性下降。提高低噪声放大器线性下降百分比独联体－9C18：1(17.4,16.6,13.7,11.7,11.5%)与顺9,反－11c18:2(0.37,0.37,0.28,0.26,0.18%)牛奶中的脂肪。牛奶的脂肪含量－5独联体,独联体－8,独联体－11,cis-14,独联体－17c20:5(0.09,0.18,0.22,0.21,0.22%)是二次影响,而浓度c18:0,跨18：1－9,反－11C18：1,和反－10,独联体－12c18:2没有影响。增加供应的亚麻酸对小肠的线性增加,亚麻酸牛奶脂肪和明显改变牛奶的脂肪成分。
【英文摘要】Increasing the linolenic acid content of milk fat might be desirable to meet consumer preference. Our objective was to determine the potential to alter the content of C18:3 in milk by duodenal infusion of a high C18:3 free fatty acid mixture. Four multiparous Chinese Holstein cows (BW = 556 ±19 kg, DIM = 93 ± 9 d) fitted with duodenal cannulas were administered 2 treatments in a crossover design. Treatments were homogenized aqueous mixtures of α－linolenic acid (LNA; 82.4% cis－9, cis－12, cis－15 18:3; 14.7% cis－9, cis－12 18:2; 2.8% cis－9 18:1) or control containing only the emulsifying ingredients. The control infusate consisted of 15 g/d of xanthan gum, 5 g/d sodium alginate, and 25 g/d of Tween 80 in 10 L of water. Each period lasted 5 wk, in which 2 cows received each amount (0, 40, 80, 120, and 160 g/d) of LNA for 1 wk each, and the other 2 cows received only the carrier infusate. Measurements were made during the last 3 d of each infusion amount. Data were analyzed statistically by using PROC MIXED of SAS. Polynomial contrasts were constructed of linear, quadratic, and cubic effects of amount by treatment. Significance was decleared at P < 0.05. Increasing the amount of LNA infused into the duodenum linearly increased concentrations of 338 J. Anim. Sci. Vol. 87, E-Suppl. 2/J. Dairy Sci. Vol. 92, E-Suppl. 1 cis－9, cis－12, cis－15 C18:3 (0.16, 6.49, 12.42, 18.75, and 25.38% for LNA infused at 0, 40, 80, 120, 160 g/d, respectively) and cis－9, cis－12 C18:2 (2.38, 2.94, 3.19, 3.77, and 4.16%). Increasing LNA decreased percentages of short-chain fatty acids, C14:0, and C16:0 so that total FA ≤16C (65.2, 60.7, 57.8, 51.4, 46.0%) decreased linearly. Increasing LNA linearly decreased percentages of cis－9 C18:1 (17.4, 16.6, 13.7, 11.7, 11.5%) and cis-9, trans－11 C18:2 (0.37, 0.37, 0.28, 0.26, 0.18%) in milk fat. Milk fat content of cis－5, cis－8, cis－11, cis-14, cis－17 C20:5 (0.09, 0.18, 0.22, 0.21, 0.22%) was quadratically affected, whereas concentrations of C18:0, trans－9 C18:1, trans－11 C18:1, and trans－10, cis－12 C18:2 were not affected. Increasing the supply of linolenic acid to the small intestine linearly increased linolenic acid in milk fat and markedly altered milk fat composition.

【题目】Diversity of ureC genes from rumen microflora metagenomic library
【中文关键词】宏基因组,尿酶素C多样性,瘤胃微生物多样性
【英文关键词】metagenome, ureC diversity, rumen microflora
【中文摘要】原因是,大多数细菌瘤胃仍然落后,信息瘤胃脲酶基因序列及系统发育多样性的恐慌。要解决这个问题,一个功能屏幕urease-active无性系进行了瘤胃细菌人工染色体图书馆从奶牛瘤胃微生物。聚合酶链反应简并引物的基础上urec基因是保守的ureolytic细菌被用来设计和放大urec基因的阳性克隆。通用16细菌引物扩增基因基因的阳性克隆。序列与Gen Bank数据库进行抨击,和进化树建造的巨型4软件。十六系(u1-u16)被确定为ureolytic积极采用尿素酶分离琼脂。四系(U 1,U 5,u13和u15)含有urec基因被确定。进化树的基础上urec透露,U 5,u13和u15聚集,厚壁, ε -变形菌, β -变形菌、放线菌,分别为。所克隆包含一个部分基因序列最有身份的金黄色,这是协议urec系统发育分析。考虑在一起,这项研究提供了第一个证据的系统发育多样性的ureolytic从奶牛瘤胃细菌。
【英文摘要】Due the fact that the majority of rumen bacteria were still uncultured, information about ruminal urease gene sequence and phylogenetic diversity were scare. To resolve this problem, a functional screen for urease-active clones was conducted for a rumen bacterial artificial chromosome library from dairy cow rumen microflora. Polymerase chain reaction degenerate primers based on the ureC gene which was conserved in ureolytic bacteria were designed and used to amplify the ureC genes from positive clones. The universal 16s bacterial primers were used to amplify the 16s rRNA gene of positive clones. Sequences were blasted against GenBank database, and phylogenetic tree were built by Mega 4.0 software. Sixteen clones (U1-U16) were identified as ureolytic positive using urease segregation agar. Four clones (U1, U5, U13 and U15) containing ureC genes were identified. The phylogenetic tree based on ureC revealed that U1, U5, U13 and U15 clustered to Firmicutes, ε -Proteobacteria, β -Proteobacteria and Actinobacteria, respectively. U1 clone contained a partial 16s rRNA sequence had the most identity to Staphylococcus, which was in agreement with ureC phylogenetic analysis. Taking together, this study provided first evidence for the phylogenetic diversity of ureolytic bacteria from cow rumen.

【题目】Effects of protein sources in calf milk replacers on growth and fecal score of dairy calves
【中文关键词】犊牛,大豆蛋白,牛奶蛋白质
【英文关键词】calves, soybean protein, milk protein
【中文摘要】本研究的目的是评估大豆和牛奶的蛋白质来源的牛奶替代品前和断奶后生长的女性荷斯坦奶牛牛犊。四十八个小牛犊(房屋户外个人窝在蒙牛澳大利亚国际乳品农场)受阻的体重和随机分配的块一两个牛奶替代品的治疗:牛奶替代品含有大豆蛋白(mr-s,3.07美元/千克)或牛奶蛋白(mr-m,4.31元/公斤)。牛奶替代品含有大豆蛋白(大豆浓缩蛋白提供50%的总蛋白)或牛奶蛋白(乳清蛋白)。喂犊牛500 g /糖尿病分为相等的喂养混合成2升的水每喂养,从D - 4到10,然后减少到400克/天从11到断奶。牛奶替代品含有22%和18%脂肪。体重,枯萎身高,胸围和血液样本进行测量和收集出生,然后在11,18,25,32,39,46,53,断奶,60。小腿起动(政务司司长,$0.55/公斤)和水提供广告随机消费和政务司司长的D - 4,饲料拒绝每日测定。没有干草喂。粪便分数记录每日。断奶的标准是最低的基础上每日摄入900克的起动机≥连续2天。体重,枯萎身高,胸围,干物质摄入量从母乳替代品和小腿简化版,并获得饲料的比例没有差异处理。和所有选定的血液代谢物(尿素氮,葡萄糖,游离脂肪酸和bhba)也没有什么不同从出生到60。粪便分数之间出生和14均显着高于(<0.05)犊牛喂mr-s与mr-m,但并没有不同的15至28,29和断奶,断奶60老。饲料成本(包括母乳替代品和起动)每小腿明显大于(<0.01)犊牛喂mr-m.这项研究的条件下,与牛奶蛋白的牛奶替代品,犊牛喂mr-s取得同样水平的身体生长和降低饲料成本26%。
【英文摘要】The objective of this study was to evaluate soybean and milk protein sources in milk replacer on pre- and post-weaning growth of female Holstein dairy calves. Forty-eight calves (housing outdoors in individual hutches at Mengniu Australia International Dairy Farm) were blocked by BW and assigned randomly within block to one of two milk replacer treatments: milk replacer containing soy protein (MR-S, $3.07/kg) or milk protein (MR-M, $4.31/kg). Milk replacers contained soybean protein (soy protein concentrate to provide 50% of total protein) or milk protein (whey protein). Calves were fed 500g/d DM divided into two equal feedings mixed into 2 liters water per feeding, from d-4 to 10, and then reduced to 400 g/d from d-11 until weaning. Milk replacers contained 22% CP and 18% fat. Body weight, wither height, heart girth and blood samples were measured and collected at birth, and then on d 11, 18, 25, 32, 39, at weaning, 46, 53, and 60. Calf starter (CS, $0.55/ kg) and water were offered for ad libitum consumption from d-4, and CS feed refusals were measured daily. No hay was fed. Fecal scores were recorded daily. Weaning criterion was based on a minimum daily starter intake of ≥900 g for 2 consecutive days. Body weight, wither height, heart girth, dry matter intake from both milk replacer and calf starter, and gain to feed ratio were not different between treatments. And all of the selected blood metabolites (BUN, GLU, NEFA and BHBA) were also not different from birth to 60d. Fecal scores between birth and 14 d were significantly higher(P<0.05) for calves fed MR-S versus MR-M, but did not differ for d 15 to 28, 29 to weaning, and weaning to 60 d old. Feed cost(including milk replacer and starter) per calf was significantly greater (P<0.01) for calves fed MR-M. Under conditions of this study, compared with the milk protein milk replacer, the calves fed MR-S achieved the same level of body growth and reduced feed cost by 26%.

【题目】The potential geographic distribution of Radopholus siimilis in China
【中文关键词】无
【英文关键词】Radopholus similes niche model GARP MAXENT suitable distribution area
【中文摘要】无
【英文摘要】The burrowing nematode (Radopholus similis) is one of the main quarantine pests in China, and the risk of invasion posed by this nematode is becoming more and more serious with regard to the international trade being intensified day by day. It is urgent to analyse the potential geographic distribution of R. similis in China. Genetic algorithm for rule-set prediction modeling system (GARP) and maximum entropy (MAXENT), the two niche models which have been widely used to predict the potential geographic distribution of alien species, were used to predict the distribution of R. similis in China. We also presented a model comparison of the results by both threshold-dependent and threshold-independent evaluations. It has been shown that the two niche models could be used to predict the potential distribution of R. similis reliably. The potential distribution of R. similis should be constricted within the south of China, such as Hainan, Guangdong, Guangxi, Fujian, Yunnan provinces, and Taiwan of China. The MAXENT gives a better prediction than that of GARP. R. similis can be introduced to China by flowers and nursery stock ’s international shipping. The predicted results indicate that R. similis can occur in south coastal area of China and Yunnan Province, which are the main flower and nursery stock ’s import-export areas in China. Consequently, a strong quarantine program is needed at the ports of such areas to prevent the pest from being introduced to China.

【题目】基于领域本体的智能检索技术应用研究
【中文关键词】领域本体,构建,推理,Oracle 11
【英文关键词】domain ontology, construction, reasoning, Oracle 11g
【中文摘要】目前,万维网的信息每天以爆炸式增长,如何高效地获取有价值的目的信息是信息检索研究面临的最大挑战。传统信息检索系统主要基于内容分类目录的检索和基于关键词的检索,基于关键词的检索很大程度上由用户的经验所左右,而且关键词容易产生语义混淆;而基于内容分类目录的检索虽然通过人工加入了人类的知识,但是加入的人类知识很难保证及时性和准确性。因此,传统信息检索系统帮助用户找到的信息资源总是差强人意。针对传统信息检索系统存在的问题,本研究设计了基于领域本体的信息检索系统框架。该系统框架以领域知识的定义和分类为基础,构建了领域本体,并采用Oracle 11g对领域本体中的概念集合和概念之间的关系集合进行存储,通过用户自定义的领域规则进行选择推理,从而提高检索精度。本研究的主要研究内容与成果如下:(1)深入研究了语义web和本体技术的基本理论,如本体的基本要素、本体描述语言、本体建设工具等。深入研究了本体构建方法,并使用prot é g é 构建领域本体。要实现专业领域的检索系统,需充分发挥语义在检索系统上的优势,提供专业化的优于大型通用检索系统的网络信息检索服务。因此,需要建立充分、完整、权威性的领域本体库,并在本体库中充分利用和体现该领域的特点,以达到更佳效果。利用自定义规则使用jena实现向上推理,利用它作为逻辑推理和语义分析的工具和平台,为实现语义Web提供基础,重新设计检索系统,使检索系统更具智能化,检索结果更能符合用户的需求,提高搜索结果集的查准率。利用JSP技术,基于Eclipse3.1+Tomcat5.0+Lomboz3.0构建本体检索系统,实现领域用户和服务器的动态交互。(2)本研究不仅构建了领域本体知识库,还实现了专业领域的检索系统。由于引用了jena推理机,使用用户自定义的推理规则进行选择推理,系统在查全和查准方面都有所提高。系统利用了JSP技术加强领域用户和服务器的交互,而且借助本体库资源,设计出更容易被用户接受的人机接口智能化界面。本研究还采用了Oracle 11g数据库持久化本体,这使得我们维护为本体更为方便容易。

【英文摘要】Currently, the World Wide Web's information grow explosively every day, how to obtain valuable information efficiently is biggest challenge. Traditional information retrieval system searching information mainly based on content categories and keyword-based. The system based on keywords mainly depends on the user's experienc, but keywords are prone to be semantic confusion. And retrieval system of content-based categories has been joined by artificial human knowledge, but joining the human knowledge is difficult to ensure timeliness and accuracy. Therefore, the traditional information retrieval system is always unsatisfactory.To deal with problems of traditional information retrieval system, this research designs a framework of domain ontology-based information retrieval system. Based on the definition and classification of domain knowledge, the framework constructs domain ontology, uses Oracle 11g to deposit the concept sets and the relationship sets among the concepts of domain ontology and infers the related knowledge with a user-defined rulebase, which improves retrieval accuracy.The research contents and results are as follows: (1) Deep study the semantic web and the basic theory of ontology technology, such as the basic elements of ontology, ontology language and ontology building tools. Deep study the method of building ontology, and use the prot é g é build domain ontology. To construct the domain intelligence search engine and to release full potential energy of the semantic on search engine will need professional search engine better than the large general network information retrieval services. Therefore, it is necessary to establish the full, complete and authoritative domain ontology library and be full use of the library and reflect the characteristics of the field in order to achieve better results. Using custom defining rules, achieving up reasoning using jena, using its logical and semantic analysis tools and platforms can provide the basis for the Semantic Web, make search engine re-design more intelligent, reflect the user's demand better and improve search precision ratio result. Using JSP technology, based on Eclipse3.1 + Tomcat5.0 + Lomboz3.0 building ontology retrieval systems can achieve the interaction of domain users and servers.(2) This study not only build the domain ontology knowledge library, but also realize domain search engines. Because of using jena reason machine and using user-defined rules to reason, the system improve the recall and precision rates. The system also uses JSP technology to strengthen the interaction of the domain users and server, and the use of ontology library resources is easy to design the intelligent human-machine interface which is accepted by the users. The study also uses Oracle 11g database to persist ontology, which makes it more convenient for us to maintain the ontology easily.

【题目】Transformation of Sulfate and Organic S in Rice Straw in Flooded Paddy Soils and Its Availability to Plants Using Sulfur-35 Labeling.

【中文关键词】35S;硫酸盐;转化;有效性;水稻田土壤
【英文关键词】35S; Sulfur fraction; Transformation; Availability; Flooded paddy soil

【中文摘要】硫的转化及植物有效性在黑龙江黑土和江西红壤两种水稻土进行了调查。在一个封闭的系统使用35S标记无载体35S－SO42－及35S标记稻草,孵化后120天,51.1%和60.3%标记的S分别发现两种水稻土的硫酸盐中。种植水稻后,土壤pH和氧化还原电位增加,造成硫化物－和OI-S可以转化为植物可以利用的硫酸盐。植物吸收利用的35S绝大多数来自sulfate－35S, sulfide－35S and OI－35S,少量来自C－O－35S, C-bonded 35S 和 NRO－35S。在35S标记的水稻秸秆处理中,23.3%和26.4%的35S标记发现硫酸盐中,25.3%和26.3%－硫化物、6%和6.1% OI－35S、16.4%和14% C－O－S、18.9%和18.9%C-bonded S分别发现在培育120天的两种水稻土中。来自水稻秸秆C－O－35S, C-bonded 35S and NRO－35S,与来自35S标记无载体35S－SO4相比,具有更高的植物有效性。

【英文摘要】Sulfur transformation and its availability to plants in two flooded paddy soils, derived from Black soil in Heilongjiang (soil 1) and from Red earth in Jiangxi (soil 2), were investigated in a closed incubation system using carrier-free 35S－SO42－ and 35S-labeled rice straw. After incubation for 120 days, 51.1% and 60.3% of the 35S added in the Na235SO4 treatment were found in the sulfate－S fraction, 14.0% and 11.1% as sulfide－S, 5.2% and 5.3% as other non-sulfate inorganic S fraction (OI-S), 9.5% and 6.0% as C－O－S, 8.1% and 7.3% as C-bonded S, and 12.1% and 10.0% as non-reducible organic S fraction (NRO-S) for soil 1 and soil 2, respectively. Since soil Eh increased greatly after planting the rice, sulfide－S and OI-S could be transformed into sulfate as plant-available S. Most of the 35S uptake by plants came from sulfate－35S, sulfide－35S and OI－35S, with little contribution from C－O－35S, C-bonded 35S or NRO－35S. In the treatment with 35S-labeled rice straw, 23.3% and 26.4% of the 35S applied was found in the sulfate－S fraction, 25.3% and 26.3% as sulfide－S, 6.0% and 6.1% as OI-S, 16.4% and 14.0% as C－O－S, 10.1% and

8.3% as C-bonded S, and 18.9% and 18.9% as NRO-S at 120th day of incubation in these two soils, respectively. Higher availability of C – O – 35S, C-bonded 35S and NRO – 35S from 35S-labeled straw was observed in the 35S-labeled straw treatment, compared to the carrier-free Na235SO4 treatment.

【题目】晋北半干旱区免耕对玉米光合和蒸腾特性的影响
【中文关键词】免耕;覆盖;玉米;蒸腾速率;光合速率
【英文关键词】No-tillage; mulch; maize; transpiration; photosynthesis
【中文摘要】采用田间小区试验,对覆盖免耕、留茬免耕和传统翻耕三种耕作方式下玉米不同生育期土壤温度、土壤含水量以及玉米蒸腾速率和净光合速率进行观测。结果表明:免耕与翻耕相比,可降低土壤温度,覆盖免耕对玉米地土壤温度降低幅度较大,而留茬免耕则较小,免耕对土壤温度的降低幅度随着玉米的生长发育而减弱。免耕能够提高土壤含水量,尤其是0-60cm土层。免耕与翻耕相比,在玉米苗期,玉米蒸腾与光合速率降低,其中覆盖免耕玉米日平均蒸腾与光合速率比翻耕分别降低了8.5%和9.7%,差异显著;留茬免耕略有降低,但差异不显著。在拔节前期免耕与翻耕玉米蒸腾与光合速率无显著差异。在拔节后期、抽穗期和灌浆期,覆盖免耕玉米蒸腾与光合速率比翻耕显著提高;留茬免耕在灌浆期玉米蒸腾与光合速率比翻耕显著提高,其它时期与翻耕差异不显著
【英文摘要】The experiment was carried out in the field with three treatments: i.e. conventional till (CT), non-till retaining maize stubble (NT), and mulch-till with un-chopped maize straw mulch (MT).The soil temperature, soil water content, transpiration and photosynthesis of maize which were sowed with three kinds of tillage (CT, NT, MT) were observed. The results indicate: the soil water content and soil temperature are different under different tillage, and so is the photosynthesis and transpiration of maize. The temperature of soil in MT and NT at early stage is lower than CT, These differences gradually become smaller at later stage. Also, MT and NT can significantly improve the soil water content, especially in 0~60cm depth. Compared with CT, The photosynthesis and transpiration rate of maize in MT and NT, at early stage are lower .At early jointing stage they have no significant differences. Compared with CT, the photosynthesis and transpiration rate of maize in MT are significantly increased after the jointing stage. At the filling stage, The photosynthesis and transpiration rate of maize in NT are higher than CT .At other they have no significant differences between CT and NT.

【题目】水分对苜蓿叶片光合特性的影响
【中文关键词】灌水量, 苜蓿, 原初光能转换效率, 光合速率, 蒸腾速率
【英文关键词】irrigation amount, Medicago sativa, original light conversion efficiency, photosynthesis rate, transpiration rate
【中文摘要】采用田间试验, 对每茬灌水3次(W3)、2次(W2)、1次(W1)和不灌水(W0)四种条件下的土壤水分, 苜蓿(Medicago sativa)叶片的叶绿素荧光参数、气孔导度(Gs)、净光合速率(Pn)和蒸腾速率(Tr)进行测定。结果表明, 灌水提高了苜蓿叶片的原初光能转换效率(Fv/Fm)、Pn和Tr, 并随着灌水量的增加而增加。苜蓿叶片的Fv/Fm、Pn和Tr的日均值与土壤含水量均呈极显著正相关关系。苜蓿叶片的Pn与Fv/Fm和光合有效辐射(PAR)的乘积呈正相关关系。灌水还改变了苜蓿叶片Pn的日变化格局。灌水较多的处理(W3和W2), 苜蓿叶片没有出现光合“午休”现象, Pn的日变化趋势呈现“单峰

”型。而灌水较少和不灌水的处理(W1和W0),苜蓿叶片出现了明显的光合“午休”现象,其Pn的日变化进程呈现“双峰”型。在相同的水分条件下,初花期苜蓿叶片的Pn高于再生期的,Tr则相反。

【英文摘要】Aims Alfalfa (Medicago sativa) is the most extensive perennial leguminous forage. In the semi-arid region, wateris the most important limiting factor for alfalfa growth. Our objective was to study the effect of soil water contenton physiological properties of alfalfa.Methods Our field experiment consisted of four treatments: non-irrigation (W0) and irrigated (75 mm each) once(W1), twice (W2) and three times (W3) for each crop. We evaluated soil moisture, leaf chlorophyll fluorescenceparameters, stomatal conductance (Gs), transpiration rate (Tr), and net photosynthetic rate (Pn).Important findings The original light conversion efficiency (Fv/Fm), Gs, Tr, and Pn of alfalfa were significantlyimproved by increasing irrigation. Moreover, correlation analysis showed that the mean value of the day of Fv/Fm,Gs, Tr, and Pn had significantly positive relationships with the average soil water content of 0 – 280 cm depth. Pnhad a significantly positive relationship with Fv/Fm × PAR (photosynthetically active radiation). Additional irrigationalso changed the diurnal courses of leaf Pn. Photosynthesis of alfalfa under W2 and W3 treatments did notpresent the “midday depression”, and the diurnal courses were unimodal. Nevertheless, treatments W1 and W0exhibited an apparent “midday depression” phenomenon, and the diurnal variation was bimodal. There were differentphysiologically activities at different growth stages of alfalfa. Pn of alfalfa in the early flowering stage wasobviously higher than in the regeneration stage, in contrast Tr was lower at the early flowering stage.

【中文关键词】谷子 大豆 地膜覆盖 条带种植
【英文关键词】Millet, Soybean, Plastic mulching, Strip-planting

【中文摘要】通过谷豆条带种植技术、谷子覆膜穴播栽培技术、大豆膜际条播栽培技术的进一步集成,形成一套新的高产高效种植模式。该模式发挥了3种技术的优势,能够充分利用自然光热资源,明显改善谷子和大豆的光合、呼吸及水分交换环境。谷子光合速率(Pn)分别比普通条带谷子和单作谷子提高19.2%、32.4%,气孔导度(Cleaf)分别提高6.3%、42.2%,蒸腾速率(E)与单作谷子相近;大豆光合速率分别比普通条带大豆和单作大豆提高5.6%、56.1%,蒸腾速率分别提高3.1%、46.1%,气孔导度分别提高31.3%、148.9%;谷子水分利用效率(WUE)分别比普通条带谷子和单作谷子提高32.3%和31.9%,大豆水分利用效率分别比普通条带大豆和单作大豆提高2.6%和7.0%。模式总产量显著高于单作大豆,与单作谷子相近,比普通谷豆条带种植模式高17.7%;总效益比单作谷子增加1 413.75 元・hm－2,比单作大豆和普通谷豆条带种植模式分别增加2 242.5 元・hm－2、1 542.0 元・hm－2。模式具有显著的增产、增收、节水效果。

【英文摘要】A new strip-planting pattern under plastic mulching of millet and soybean is developed by integration and optimization ofalternate strip-planting technique of millet and soybean, spot-planting technique under film mulching of millet and strip-plantingtechnique under film mulching of soybean. The new planting pattern is more advanced because not only photosynthesis, respirationand water utilization of millet and soybean are improved, but the yields are higher as well. Compared with the ordinary models ofalternate strip-planting and monocropping millet, leaf photosynthetic rate (Pn) of millet in the new pattern increases by 19.2% and32.4% respectively. Stomatal conductance of leaves (Cleaf) is higher by 6.3% and 42.2% respectively, while leaf transpiration rate (E)is similar to that in monocropping millet. For soybean, Pn under the new pattern is higher by 5.6% over that under ordinary alternatestrip-planting; and by 56.1% over that under monocropping soybean. E increases by 3.1% and 46.1% respectively. Cleaf also increasesby 31.3% and 148.9% respectively. Under the new pattern, water use efficiency (WUE) of millet and soybean are markedly enhanced,especially in millet where WUE exceeds 30% increment over the two old planting patterns. Total output is obviously higher than thatin monocropping soybean, very close to that for monocropping millet. Yield increases by 17.7% compared with ordinary alternatestrip-planting. Total economic benefit respectively increases by 1 413.75 yuan・hm－2, 2 242.5 yuan・hm－2 and 1 542.0 yuan・hm－2over monocropping millet and monocropping soybean, and alternate strip-planting system.

【题目】旱地农业研究支撑我国农业发展
【中文关键词】旱地农业;科学技术;农业发展;中国
【英文关键词】Dryland farming; Science and technology; Agricultural development; China
【中文摘要】经过20多年的旱地农业综合研究,系统划分了我国北方旱地农业类型区、查明了我国北方旱农区的降水利用状况,揭示了我国北方旱地农田水分动态和水分平衡规律,探明了我国北方旱农区降水生产潜力开发的障碍因素和适宜开发度,研制了一系列抗旱节水关键技术,发展了若干旱地高效用水的种植模式及配套技术体系,集成了寿阳旱地农业综合发展模式,取得了累累硕果,并以此为基础,研究编制了与旱地农业有关的农业发展战略和农业发展规划,为我国旱农地区农业的发展提供了强有力的科技支撑。
【英文摘要】Through over 20 years of dryland farming comprehensive researches, many achievements had been obtained. The dryland agricultural types in north China were systematically classified. The basic information on rainfall utilization was obtained, the rules of field water dynamic movement and water balance of the north dryland farming areas were revealed. The obstacle factors and suitable extent of exploitation were clarified for the precipitation production potentialities of dryland farming in north China. A series of key technologies for drought resistance and water saving were produced, and a few of planting model and adaptable technology systems for high efficient water use were developed. Based on all these results, agricultural developing strategies and plans related to dryland farming were worked out, all these achievements provide strong scientific and technological support for the agriculture development of dryland farming areas in China.

【题目】The delineation of agricultural management zones with high resolution remotely sensed data

【中文关键词】快鸟影像,管理区,优化的土壤调整植被指数,冬小麦
【英文关键词】Quickbird imagery, Management zone (MZ), Optimized soil-adjusted vegetation index (OSAVI), Winter wheat
【中文摘要】遥感(RS)技术已被广泛认为是一种很有前途的土地管理的决定的信息源。本研究的目的是在冬小麦上发展和比较划定管理区的方法。采集了土壤样品和小麦产量,五个主要作物养分分析:总氮(TN),硝酸盐氮(NN),有效磷(AP)提取钾(EP)和有机物(OM)。在小麦抽穗期,一个场景植被QuickBird卫星影像获取和处理和优化调整土壤指数(OSAVI)被确定。模糊k-means聚类算法被用来MZS定义,沿着模糊性能指数(FPI),和修改分区熵(MPE)确定最优簇数目。结果表明,最优目前的研究领域MZS数量是三个。三个的的MZS被划定方式;根据土壤和产量数据,农作物遥感信息和土壤的结合,产量和遥感信息。每个组MZS评价结果表明,三种方法划定区域,都可以减少作物养分的变异,小麦光谱参数和不同的区域内的产量。考虑到一致的关系之间的作物养分,小麦产量和小麦的光谱参数,卫星遥感检测显示承诺作为评估土壤性质变化的工具和产量的影响耕地面积。这项研究的结果表明,采用遥感数据进行管理区的划定是可靠和可行的。
【英文摘要】Remote sensing (RS) techniques have been widely considered to be a promisingsource of information for land management decisions. The objective of this study wasto develop and compare different methods of delineating management zones (MZs) in afield of winter wheat. Soil and yield samples were collected, and five main crop nutrientswere analyzed: total nitrogen (TN), nitrate nitrogen (NN), available phosphorus (AP),extractable potassium (EP) and organic matter (OM). At the wheat heading stage, a sceneof Quickbird imagery was acquired and processed, and the optimized soil-adjusted vegetationindex (OSAVI) was determined. A fuzzy k-means clustering algorithm was used todefine MZs, along with fuzzy performance index (FPI), and modified partition entropy(MPE) for determining the optimal number of clusters. The results showed that the optimalnumber of MZs for the present study area was three. The MZs were delineated in threeways; based on soil and yield data, crop RS information and the combination of soil, yieldand RS information. The evaluation of each set of MZs showed that the three methods ofdelineating zones can all decrease the variance of the crop nutrients, wheat spectralparameters and yield within the different zones. Considering the consistent relationshipbetween the crop nutrients, wheat yield and the wheat spectral parameters, satellite remotesensing shows promise as a tool for assessing the variation in soil properties and yield in arable fields. The results of this study suggest that management zone delineation using RSdata was reliable and feasible.

【题目】Influence of long-term nitrogen fertilization on micronutrient density in grain of winter wheat (Triticum aestivum L.)
【中文关键词】微量元素;氮肥;小麦籽粒;研磨组分
【英文关键词】Micronutrient; Nitrogenfertilization; Wheatgrain; Milling fraction
【中文摘要】采用长期定位试验(1999 – 2007)研究三种施肥水平下(0, 130, and 300 kg N/ha)氮肥对小麦籽粒微量元素营养及制粉性状的影响。在成熟期,谷物收获分离为面粉、次粉和麸皮,用于微量营养素和氮分析。与对照相比,施用氮肥增加了小麦iron (Fe), zinc (Zn), 和copper (Cu)含量。但是当施肥水平从130增加到 300 kg N/ha,并没有增加小麦谷物中三种微量元素的浓度。麸皮中的各种微量元素高于面粉中的各种微量元素。在三种磨成的粉末中,施用N肥增加Zn 和Cu浓度; 增加了次粉和麸皮中Fe的浓度,没有增加面粉中Fe的浓度。增施氮肥没有改变小麦谷物中manganese (Mn)的浓度。施用氮肥改变了面粉和麸皮Fe 和 Cu的比例,并不影响Zn在小麦谷物中的分布。因为氮肥增加了小麦谷物中微量元素的积累,所以优化的氮肥管理有利于提高小麦营养品质。
【英文摘要】A long-term (1999 – 2007) field experiment was conducted to investigate the effects of three nitrogen (N) fertilization rates (0, 130, and 300 kg N/ha) on micronutrientdensity in wheatgrain and its milling fractions. At maturity, grains were harvested and fractionated into flour, shorts, and bran for micronutrient and N analysis. N fertilization increased iron (Fe), zinc (Zn), and copper (Cu) density in wheatgrain compared to the control. Increase of N application rate from 130 to 300 kg N/ha, however, did not further increase the three micronutrientdensities in grain. Micronutrient concentrations were usually highest in the bran and lowest in the flour. High N application increased Zn and Cu densities in all three milling fractions and increased Fe concentration in shorts and bran but not in flour. N application did not affect the manganese (Mn) concentration in grain. N fertilization changed the proportions of Fe and Cu in flour and bran but did not affect the distribution of Zn. Because N fertilization increased micronutrient accumulation in wheatgrain, proper management of N fertilization has the potential to enhance the nutritional quality of this important food.

【题目】Effects of B, Mo, Zn, and their interactions on seed yield of rapeseed (Brassica napus L.)
【中文关键词】硼;油菜;钼;籽粒产量;锌
【英文关键词】boron ;Brassica napus;molybdenum;seed yield ;zinc
【中文摘要】大田试验研究B、Mo 、Zn 配合对甘蓝型油菜双低品种华双4号产量和品质的影响。结果表明,沙质土壤施用硼肥,与对照相比,增加种子产量46.1%;与单独应用钼和锌肥相比,也种子产量也显著增加,这表明本试验中硼是油菜双低品种华双4号产量的一个主要限制因素。油菜产量的增加主要是由于施用B肥增加了单株角果数量以及单角果种子数量。B 、Mo 和 Zn肥共同施用比单独施用B 、Mo 和 Zn肥油菜产量显著提高,高出对照产量68.1%。油菜种子干物质积累呈一个典型的S形曲线。与对照相比,各种处理下油菜种子的产油量微量增加、品质有所改善。上述结果表明,在贫瘠土壤优化施用B 、Mo 和 Zn肥可以显著提高种子产量和产油品质。
【英文摘要】A field experiment was conducted to study the effects of boron (B), molybdenum (Mo), zinc (Zn) and their interactions on seed yield and yield formation of rapeseed (Brassica napus L. var. Huashuang 4). Application of B fertilizer to a sandy soil increased the seed yield by 46.1% compared to the control (CK) and also created a considerably higher seed yield than the two treatments solely applying Mo and Zn fertilizers, which suggested that B was a main constraint for the seed yield of Huashuang 4 in this experiment. The effect of B fertilizer on the seed yield was attributed to an increase in the number of seeds per silique and siliques per plant. The combined application of B with Mo or Zn resulted in higher seed yield than the application of B, Mo or Zn alone, and the seed yield of the B+Mo+Zn treatment was the highest in all treatments, 68.1% above the control. Dry matter accumulation of seed followed a typical S-shaped curve and it was higher in plants supplied with B than in plants without B. A small but significant increase in the seed oil content and an improvement in the oil quality were also observed in all treatments compared with the control. These results suggested that optimal micronutrient application could provide both yield and quality advantages for rapeseed in poor soil.

【题目】4个甘蓝型油菜双低品种干物质积累及养分吸收动态研究
【中文关键词】双低油菜; 氮磷钾; 干物质积累; 养分吸收;
【英文关键词】double-low rapeseed; N; P; K; accumulation of dry matter; nutrient uptake;
【中文摘要】采用田间试验研究了4种双低油菜整个生育期内干物质积累及氮磷钾养分吸收动态。结果表明:播种后140d(苗期)、140~170d(蕾薹期)、170~199d(花期)和199~212d(角果期)4个油菜品种的干物质积累比例分别为12.7%~20.9%、15.3%~20.0%、60.3%~71.7%和-27.4%~-9.1%;氮素积累比例分别为33.3%~47.8%、11.9%~14.7%、15.5%~28.1%和17.7%~28.8%;磷素积累比例分别为23.4%~37.9%、22.5%~29.4%、32.7%~54.1%和-17.2%~-3.0%;钾素积累比例分别为24.7%~33.9%、16.2%~35.9%、31.0%~53.3%和-43.0%~-23.5%。表明油菜干物质累积与养分吸收量的变化趋势基本相同,氮素积累量最大时期为苗期,干物质、磷、钾积累量最大时期为花期,干物质及氮磷钾养分积累速率最大时期均为花期。每生产100 kg 籽粒养分的需求量平均为N 4. 3 kg、P2O5 2. 7 kg 和K2O 8. 7 kg。在同等施肥量水平下,4个油菜品种中,华油杂9 号籽粒产量最高,达3 574 kg/ hm2 ;N、P、K养分偏生产力顺序为:中双9 号> 华油杂9号> 华双5 号> 华双4 号。
【英文摘要】A field experiment was conducted to st udy the dry matter accumulation and nut rient up-take of 4 double-low rapeseed varieties. The result s showed that t he proportion of dry matter accumulation during t he period of seedling (140 d af ter sowing)

,budding (140~170 d after sowing) , blooming (170~199 d after sowing) and podding (199~212 d after sowing) were 12. 7 %~20. 9 % ,15. 3 %~20. 0 %,60. 3 %~71. 7 % and - 27. 4 %~ - 9. 1 % , respectively. The uptake proportion of nit rogen (N) were 33. 3 %~47. 8 % ,11. 9 %~14. 7 % ,15. 5 %~28. 1 % and 17. 7 %~28. 8 %,of p hosp horus (P2 O5) were 23. 4 %~37. 9 % ,22. 5 %~29. 4 % ,32. 7 %~54. 1 % and~17. 2 %- 3. 0 % ,of potassium (K2 O) were 24. 7 %~33. 9 % ,16. 2 %~35. 9 % ,31. 0 %~53. 3 % and - 43. 0 %- 23. 5 % , respectively. These result s demonst rated t hat t he dry matter accumulation and nut rient uptake t rends were similar among t he 4 varieties. Seedling stage was t he maximum stage of nit rogen absorption ,and t he largest quantity of dry matter accumulation ,p ho sp horus and potassium absorption occurred during blooming. The maximum accumulation rate of dry mat ter and N , P , K nut rient s were all in blooming period. The amount s of N , P2O5 and K2O required by double-low rapeseed for producing every 100 kg seeds were 4. 3 ,2. 7 and 8. 7kg. Under t he same fertilizer level ,t he seed yield of H YZ No. 9 wit h 3 574 kg/ hm2was t he highest amongt he 4 varieties rapeseed. The order of nut rient efficiency was ZS No.9 > H YZ No. 9 > HS No. 5 > HS No. 4.

【题目】Estimation of vertical distribution of chlorophyll concentration by bi-directional canopy reflectance spectra in winter wheat
【中文关键词】冬小麦,双向反射差函数,叶绿素浓度,垂直分布,冠层叶绿素反向指数
【英文关键词】Winter wheat, Bi-directional reflectance difference function, Chlorophyll concentration, Vertical distribution, Canopy chlorophyll inversion index
【中文摘要】作物管理中,在大尺度范围内测定叶片叶绿素含量(Chl)来确定施肥量可能是一种非常有效的工具。本研究的目的是探讨双向反射差函数(BRDF)数据枝叶叶绿素层垂直分布的反演,以提供监测冬小麦的生长和发展提供指导的理论基础化肥的应用。遥感可以提供一个功能强大的工具,为大面积的叶绿素估计。由于在小麦干叶的垂直分布,叶绿素的垂直分布特征表明,从树冠顶部到地面明显的下降趋势。转化叶绿素吸收反射指数(TCARI)的比例,优化土壤调节植被指数(OSAVI)被称为冠层叶绿素反演指数(CCII)在这项研究中。煤炭信息研究院在dir的值,±20和±30度,在最低点,±30,±40度,并在最低点,±50和±60度视角的选择和组装,底层叶绿素反演指数(BLCI),中间层叶绿素反演指数(MLCI的),和上层叶绿素反演指数(ULCI),分别为叶绿素反演,在垂直的底层,中间层,上层。根之间的BLCI的,MLCI的,衍生ULCI-和实验室测量叶绿素为0.7841,0.9426,1.7398,分别垂直枝叶叶绿素反演,可以用来监测作物生长状况和平方误差(RMSE)指导施肥和灌溉管理。结果表明,从双向反射光谱(例如,BLCI,ULCI,MLCI的)派生的植被指数来反演叶绿素的垂直分布能获得满意的结果。
【英文摘要】An effective technique to measure foliage chlorophyll concentration (Chl) at a large scale and within a short time could be a powerful tool to determine fertilization amount for crop management. The objective of this study was to investigate the inversion of foliage Chl vertical-layer distribution by bi-directional reflectance difference function (BRDF) data, so as to provide a theoretical basis for monitoring the growth and development of winter wheat and for providing guidance on the application of fertilizer. Remote sensing could provide a powerful tool for large-area estimation of Chl. Because of the vertical distribution of leaves in a wheat stem, Chl vertical distribution characteristics show an obvious decreasing trend from the top of the canopy to the ground surface. The ratio of transformed chlorophyll absorption reflectance index (TCARI) to optimized soil adjusted vegetation index (OSAVI) was called the canopy chlorophyll inversion index (CCII) in this study. The value of CCII at dir, ±20 and ±30 , at nadir, ±30 and ±40 , and at nadir,±50 and ±60 view angles were selected and assembled as bottom-layer Chl inversion index (BLCI), middle-layer Chl inversion index (MLCI), and upper-layer Chl inversion index (ULCI), respectively, for the inversion of Chl at the vertical bottom layer, middle layer, and upper layer. The root mean squared error (RMSE) between BLCI-, MLCI-, and ULCI-derived and laboratory-measured Chl were 0.7841, 0.9426, and 1.7398, respectively.The vertical foliage Chl inversion could be used to monitor the crop growth status and to guide fertilizer and irrigation management. The results suggested that vegetation indices derived from bi-directional reflectance spectra (e.g., BLCI, ULCI, and MLCI) were satisfactory for inversion of the Chl vertical distribution.

【题目】Analysis on DNA sequence of KiSS-1 gene and its association with litter size in goats
【中文关键词】山羊;Kiss-1;性早熟;产羔数;PCR-RFLP
【英文关键词】Goat;Kiss-1;Sexual precocity;Litter size;PCR-RFLP
【中文摘要】克隆了山羊KiSS-1基因4118 bp的序列,预测含408 bp的ORF,编码135 aa。该蛋白质含有一个17 aa的信号肽,是一个分泌型蛋白。其序列与牛、绵羊的同源性较高,分别为91.11%和95.24%,与人、小鼠、大鼠、猪的同源性较低,分别为60.53%、58.12%、59.66%、72.50%。在山羊KiSS-1内含子1中发现3个突变位点(G296C、G454T和T505A),外显子2中没有发现突变位点,内含子2中发现一个18 bp缺失(-)/插入(+)突变(1960-1977),外显子3中发现两个突变位点(G3433A[A86T]和C3688A)。这些突变位点在性早熟和性晚熟山羊品种之间的基因型分布没有规律性差异。296位点CC型济宁青山羊产羔数比GG、GC型分别多0.80只 (P<0.01)和0.77只(P<0.01),GG与GC基因型个体间产羔数差异不显著。1960-1977位点-/-个体比+/+、+/-个体产羔数分别多0.77只(P<0.01和0.73只(P<0.01),+/+与+/-间差异不显著。其他4个位点基因型间产羔数差异不显著。本研究初步表明山羊KiSS-1基因296位点C等位基因和1960-1977位点的(-)等位基因可能与济宁青山羊的高产羔数有关。
【英文摘要】Three pairs of primers were designed to clone the goat KiSS-1 and scan polymorphisms and four pairs to detect polymorphisms in sexual precocious and sexual late-maturing goat breeds. A 4118 bp DNA fragment was obtained, which contains an ORF of 408 bp and encodes 135 amino acids, having a high homology with other mammals. The protein was predicted containing a signal peptide of 17 amino acids. There are two mutations (G3433A [A86T] and C3688A) in exon 3, three mutations (G296C, G454T and T505A) in intron 1 and a 18 bp deletion (-)/insertion (+) (1960-1977) in intron 2 and no mutations in exon 2. The genotype distribution didn't show obvious difference between sexual precocious and sexual late-maturing goat breeds and no consistency within the sexual late-maturing breeds. For the 296 locus, the Jining Grey goats with genotype CC had 0.80 ($P < 0.01$) or 0.77 ($P < 0.01$) kids more than those with genotype GG or GC, respectively. No significant difference ($P > 0.05$) was found in litter size between GG and GC. For the 1960-1977 locus, the Jining Grey goat does with genotype -/- had 0.77 ($P < 0.01$) or 0.73 ($P < 0.01$) kids more than those with +/+ or +/-, respectively. No significant difference ($P > 0.05$) was found in litter size between +/+ and +/- genotypes. For the other four loci, no significant difference ($P > 0.05$) was found in litter size between different genotypes in Jining Grey goats. The present study preliminarily indicated an association between allele C of the 296 locus and allele (-) of the 1960-1977 locus in KiSS-1 and high litter size in Jining Grey goats.

【题目】Polymorphisms of coding region of BMPR-IB gene and their relationship with litter size in sheep
【中文关键词】骨形态发生蛋白受体IB基因,PCR-SSCP,高繁殖力,绵羊
【英文关键词】Bone morphogenetic protein receptor IB gene, PCR-SSCP, Prolificacy, Sheep
【中文摘要】无
【英文摘要】The bone morphogenetic protein receptor IB (BMPR-IB) was studied as a candidate gene for the prolificacy of sheep. Nine pairs of primers (P1-P9) were designed to detect single nucleotide polymorphisms (SNPs) of exons 1-4 and 6-10 of the BMPR-IB gene in both high (Small Tail Han and Hu sheep) and low prolificacy breeds (Texel and Chinese Merino sheep) by polymerase chain reaction (PCR)-single strand conformation polymorphism (SSCP). Only the products amplified by primers P2, P5, P6, P7, P8 and P9 displayed polymorphisms. The present study identified 22 SNPs in partial coding regions of ovine BMPR-IB, in which 20 SNPs were reported for the first time. In total of the 22 mutations, 18 DNA variations were originated from the Hu breed, three were found in the Small Tail Han breed (two of them were found in other sheep breeds), three in the Chinese Merino breed, and none in the Texel breed.

These results preliminarily demonstrated that BMPR-IB is a major gene affecting the hyperprolificacy in Small Tail Han and Hu sheep, and could be used as a molecular genetic marker for early auxiliary selection for hyperprolificacy in sheep.

【题目】Association between expression of reproductive seasonality and alleles of melatonin receptor 1A in goats
【中文关键词】山羊,繁殖季节性,褪黑激素受体1A基因,PCR-RFLP
【英文关键词】Goat, Reproductive seasonality, Melatonin receptor 1A gene, PCR-RFLP
【中文摘要】无
【英文摘要】To determine whether a link exists between reproductive seasonality and the structure of the melatonin receptor 1A (MTNR1A) gene, the latter was studied in year-round estrous breeds (Jining Grey and Boer goats) and seasonal estrous breeds (Liaoning Cashmere, Inner Mongolia Cashmere, Wendeng milk and Beijing native goats). A large fragment of exon 2 of MTNR1A gene was amplified by PCR using sheep sense and antisense primers in 260 does of six breeds. The uniform 824 bp PCR product was digested with restriction endonucleases MnlI and RsaI, and checked for the presence of restriction sites. No polymorphism at the MnlI cleavage sites was detected in all six goat breeds and no relationship could be established between the MnlI cleavage sites of MTNR1A gene and reproductive seasonality in goats. For polymorphic RsaI cleavage site at base position 53, only genotype RR (267 bp/267 bp) was detected in Jining Grey goats, both genotype RR and genotype Rr (267 bp/320 bp) were found in all other goat breeds, no genotype rr (320 bp/320 bp) was detected in all six goat breeds. Frequency of genotype RR was obviously higher, and frequency of genotype Rr was obviously lower in year-round estrous goat breeds than in seasonal estrous goat breeds. Sequencing revealed one mutation (G52A) in genotype Rr compared with genotype RR. For polymorphic RsaI cleavage site, the differences of genotype distributions were significant ($P<0.05$) between year-round estrous goat breeds and seasonal estrous goat breeds. These results preliminarily showed an association between genotype RR and year-round estrus in goats, and an association between genotype Rr and seasonal estrus in goats.

【题目】Association between PCR-SSCP of bone morphogenetic protein 15 gene and prolificacy in Jining Grey goats
【中文关键词】骨形态发生蛋白15基因,山羊,PCR-RFLP,高繁殖力
【英文关键词】Bone morphogenetic protein 15 gene, Goat, PCR-SSCP, Prolificacy
【中文摘要】无
【英文摘要】The Jining Grey is a prolific local goat breed in P.R. China. Bone morphogenetic protein 15 (BMP15) gene that controls high fecundity of Inverdale, Hanna, Lacaune, Belclare, Cambridge, and Small Tailed Han ewes was studied as a candidate gene for the prolificacy of Jining Grey goats. According to the sequence of ovine BMP15 gene, six pairs of primers were designed to detect single nucleotide polymorphisms in exon 1 and exon 2 of the BMP15 gene in both high fecundity breed (Jining Grey goats) and low fecundity breeds (Boer, Liaoning Cashmere, and Inner Mongolia Cashmere goats) by single strand conformation polymorphism (SSCP). Two pairs of primers (F1/R1 and F2/R2) were used to amplify the exon 1. Four pairs of primers (F3/R3, F4/R4, F5/R5, and F6/R6) were used to amplify the exon 2. Only the products amplified by primer F5/R5 displayed polymorphism. Results indicated that two genotypes (AA and AB) were detected in prolific Jining Grey goats and only one genotype (AA) was detected in low fecundity goat breeds. In Jining Grey goats frequencies of genotypes AA and AB were 0.10 and 0.90, respectively. Sequencing revealed two point mutations

(G963A and G1050C) of BMP15 gene in the AB genotype in comparison to the AA genotype. In Jining Grey goats the heterozygous AB does had 1.13 ($p < 0.01$) kids more than the homozygous AA does. These results preliminarily showed that the BMP15 gene is either a major gene that influences the prolificacy of Jining Grey goats or a molecular genetic marker in close linkage with such a gene.

【题目】Polymorphisms of BMPR-IB gene and their relationship with litter size in goats
【中文关键词】山羊,高繁殖力,骨形态发生蛋白受体IB基因,PCR-SSCP
【英文关键词】Goat,Prolificacy,Bone morphogenetic protein receptor IB gene,PCR-SSCP
【中文摘要】无
【英文摘要】The bone morphogenetic protein receptor IB (BMPR-IB) gene was studied as a candidate gene for the prolificacy of goats. According to mRNA sequence of ovine BMPR-IB gene, ten pairs of primers were designed to detect single nucleotide polymorphisms (SNPs) of exon 1, exon 2, exon 6 to exon 10 and 3' untranslated region (UTR) of the BMPR-IB gene in both high prolificacy breed (Jining Grey goat) and low prolificacy breeds (Wendeng Dairy and Inner Mongolia Cashmere goats) by polymerase chain reaction (PCR)-single strand conformation polymorphism (SSCP) method. Only the products amplified by primers P8 and P10 of the 3'UTR displayed polymorphisms. For primer P8, three genotypes (AA, AB and BB) were detected in Jining Grey and Wendeng Dairy goats, two genotypes (AA and AB) were in Inner Mongolia Cashmere goats. Sequencing revealed one mutation (71C-->T) of the BMPR-IB gene in genotype BB compared with AA. The differences of least squares mean (LSM) for litter size between genotypes AA, AB and BB were non-significant ($P > 0.05$) in Jining Grey goats. For primer P10, three genotypes (CC, CD and DD) were detected in Jining Grey and Wendeng Dairy goats and one genotype (CC) in Inner Mongolia Cashmere goats. Sequencing revealed one mutation (130T-->C) of the BMPR-IB gene in genotype DD compared with CC. The differences of LSM for litter size between genotypes CC, CD and DD were non-significant ($P > 0.05$) in Jining Grey goats. These results preliminarily showed that the detected loci of the BMPR-IB gene had no significant effect on prolificacy of Jining Grey goats.

【题目】Association between sexual precocity and alleles of KISS-1 and GPR54 genes in goats
【中文关键词】山羊,GPR54,KISS-1,PCR-SSCP,高繁殖力,性早熟
【英文关键词】Goat;GPR54 (G protein-coupled receptor 54); KISS-1; PCR-SSCP; Prolificacy; Sexual precocity
【中文摘要】无
【英文摘要】KISS-1 and GPR54 were regarded as key regulators for the puberty onset and fundamental gatekeepers of sexual maturation in mammals. To explore the possible association between variations in KISS-1 and GPR54 with sexual precocity, mutation screening of exon 1 of KISS-1 and exon 1, exon 3, and partial exon 5 of GPR54 was performed in a sexual precocious breed (Jining Grey goats) and sexual late-maturing breeds (Inner Mongolia Cashmere, Angora, and Boer goats) by PCR-SSCP. The results showed that five novel mutations were identified in exon 1 and partial exon 5 of GPR54 including C96 T, T173C, G176A, G825A, and C981 T. The Jining Grey goats with genotype BB or AB had 1.07 ($P < 0.05$) or 0.40 ($P < 0.05$) kids more than those with AA. The Jining Grey goats with genotype DD or CD had 1.80 ($P < 0.05$) or 0.55 ($P < 0.05$) kids more than CC, respectively. The present study preliminarily showed an association between alleles B and D of GPR54 with high litter size and sexual precocity in Jining Grey goats.

【题目】哺乳动物性早熟相关基因的研究进展
【中文关键词】性早熟,初情期,基因,生殖,调控
【英文关键词】sexual precocity;pubety;gene;reproduction;modulation
【中文摘要】人类的性早熟是一种病理状态,而在动物上,性早熟可能是一个在生产上具有价值的数量性状。一些物种在进化过程中形成了性早熟的特性并能在群体中稳定遗传。性早熟在很大程度上与遗传密切相关,是一个由多基因决定的复杂性状。文章主要介绍了KiSS-1基因、GPR54基因、LHR基因、FSHR基因、CYP基因家族、ER基因、TGFα基因、IGF-Ⅰ基因、GNAS1基因、HSD382基因、SHBG基因、VDR基因等与哺乳动物性早熟的关系。
【英文摘要】In mammals and humans,reproductive capacity is attained at pubety as the end-point of a complex series of developmental and neuroendocnne events that lead to true sexual maturity.As for humans,sexual precocity looks like a pathologic status.While for some animals,sexual precocity may be a valuable quantitative character.For some species,the character of sexual precocity was developed in the evolutionary process and stably tran smitted to future generations.Sexual precocity is a complex character determined by polygenes.This review introduced the association between KISS-1,GPR54,LHR,FSHR,CYP,ER,TGFet,IGF-1,GNAS1,HSD3B2,SHBG,VDR genes and sexual precocity mammals.

【题目】哺乳动物繁殖季节性相关基因的研究进展
【中文关键词】繁殖季节性,基因,多态性
【英文关键词】reproductive seasonality; gene; polymorphism
【中文摘要】光照周期或季节更替调控松果体褪黑激素的分泌,下丘脑-垂体-性腺轴接收来自褪黑激素的信息并整合机体内部生理状态后调控下丘脑GnRH的脉冲释放,确保动物在一年中最适宜的时间进行繁殖。哺乳动物在长期进化过程中形成了一定的繁殖节律,已确定一些基因与繁殖的季节性有关。笔者简要介绍了褪黑激素受体1A基因、褪黑激素受体1B基因、KiSS-1/GPR54基因等与哺乳动物繁殖季节性的关系。
【英文摘要】In mammals, the melatonin secreted by pineal gland was modulated according to the photoperiod and season. The hypothalamic-pituitary-gonadal axis accepted the messages from melatonin and integrated both external and internal status and appropriately altered the activity of the GnRH . All these supported mammals to maximize reproductive success and avoid breeding during inappropriate conditions. Reproductive rhythm was formed and fixed in the process of long evolution in mammals and some genes were identified to be related with reproductive seasonality . This review briefly introduced the relationships between MTNR1A, MTNR1B and KiSS-1/GPR54 genes and reproductive seasonality in mammals.

【题目】神经肽Y-Y1受体基因(NPY-Y1R)多态性及其与山羊繁殖性能关系
【中文关键词】山羊,繁殖性能,神经肽Y-Y1受体基因,多态性
【英文关键词】goat; reproductive performance; neuropeptide Y-Y1 receptor gene (NPY-YIR); polymorphism
【中文摘要】设计5对引物(P1~P5),用限制性片段长度多态性(RFLP)和单链构象多态性(SSCP)方法检测神经肽Y-Y1受体(neuropeptide Y-Y1 receptor,NPY-Y1R)基因在山羊(Caprar hircus)性早熟、高繁殖力品种(济宁青山羊),性晚熟、中等繁殖力品种(波尔山羊)以及性晚熟、低繁殖力品种(安哥拉山羊和内蒙古绒山羊)中的单核苷酸多态性(SNP),同时研究该基因对济宁青山羊性早熟和高繁殖力的影响。结果发现仅引物P2、P4和P5的扩增片段具有多态性。引物P2在济宁青山羊、安哥拉山羊和内蒙古绒山羊中检测到AA、AB和BB型,在波尔山羊中只检测到AA和AB型;测序发现BB型与AA型相比存在1个突变(C625G),没有引起氨基酸变化;济宁青山羊AA、AB与BB基因型之间产羔数差异均不显著(P>0.05)。引物P4在4个山羊品种中均检测到CC和CD基因型;测序发现CD型与CC型相比发生了G1141A突变,没有引起氨基酸变化;济宁青山羊CC和CD基因型之间产羔数差异不显著(P>0.05)。引物P5在济宁青山羊中检测到EE和EF基因型,在其余3个山羊品种中只检测到EE型;测序发现EF型与EE型相比发生了C1330T突变,没有引起氨基酸变化;济宁青山羊与波尔山羊、安哥拉山羊和内蒙古绒山羊之间NPY-Y1R基因型分布差异均达到极显著(P<0.01)水平,后3个品种之间均无显著差异(P>0.05);EF型济宁青山羊产羔数均值比EE型多0.58只(P<0.01)。研究结果初步表明NPY-Y1R基因的F等位基因与济宁青山羊性早熟和高繁殖力相关。
【英文摘要】Five pairs of primers (P1~P5) were designed to detect single nucleotide polymorphism(SNP) of neuropeptide Y-Y1 receptor (NPY-Y1R) gene in goat (Caprar hircus) sexual precocity and high fecundity breed (Jining Grey goat), sexual precocity and moderate fecundity breed (Boer goat) and sexual late-maturing and low fecundity breeds(Angora and Inner Mongolia Cashmere goats)by PCR-RFLP and PCR-SSCP. The results showed that only the products amplified by primers P2, P4 and P5 displayed polymorphisms. As for P2, three genotypes (AA, AB and BB) were detected in Jining Grey, Inner Mongolia Cashmere and Angora goats, only two genotypes (AA and AB) were in Boer goats. Sequencing revealed one mutation (C625G) in genotype BB compared with genotypeAA, which caused no amino acid change. No significant difference (P >0.05) was found in litter size between AA, AB and BB genotypes in Jining Grey goats. As for P4, two genotypes (CC and CD) were detected in four goat breeds. Sequencing revealed one mutation (G1141A) in genotype CD compared with genotype CC, which caused no amino acid change. No significant difference(P>0.05) was found in litter size between CC and CD genotypes in Jining Grey goats. As for P5, two genotypes (EE and EF) were detected inJining Grey goats, only one genotype EE was in other three goat breeds. Sequencing revealed one mutation (C1330T) in genotype EF compared with genotype EE, which caused no amino acid change. The differences of genotype distribution were highly significant (P <0.01) between Jining Grey goats and three late-maturing breeds, and no significant difference (P >0.05) was found between three late-maturing breeds. The Jining Grey goat does with genotype EF had 0.58 (P <0.01) kids more than those with genotype EE. These results preliminarily indicated that F allele of NPY-YIR gene is associated with sexual precocity and prolificacy in Jining Grey goats.

【题目】棉花单叶黄萎病病情严重度高光谱反演模型研究
【中文关键词】棉花;黄萎病;病情严重度;高光谱特征变量;反演模型
【英文关键词】Cotton;Verticfllium wilt;Severity level;Hyperspectral characteristic variables;Retrieval model
【中文摘要】对棉花单叶黄萎病病情严重度与原始及一阶微分光谱反射率、高光谱特征参数进行相关分析,构建病情严重度反演模型。结果表明:可见光和短波红外波段光谱反射率随病情严重度增加而增大,且可见光波段光谱反射率差异比短波红外波段更为显著。以红边面积为自变量的线性模型(r一0.669 6)及以波长694nlrl处原始光谱反射率为自变量的对数模型(r一0.679 4)均能较好反演病情严重度。通过模型精度检验发现,以714 nin处一阶微分光谱反射率为自变量的线性模型为病情严重度诊断的最佳模型,即:-282.3x+3.811 2,该模型具有最大相关系数(拟合r一0.699 2,预测r一0.941 0),最小均方根误差(O.257 1)和相对误差(12.74)。文章结果对深人研究棉花黄萎病遥感监测机理提供了理论依据,对利用高光谱遥感数据获取病害信息具有重要应用价值。
【英文摘要】The correlation of cotton leaf verticillium wilt severity level with raw hyperspectral reflectance,first derivative hyperspectral reflectance,and hyperspectral characteristic parameters was analyzed.Using linear and nonlinear regression methods,the hyperspectral remote sensing retrieval models of verticillium wilt severity level with remote sensing parameters as independ—ent variables were constructed and validated.The result showed that spectral reflectance increased significantly in visible and short infrared wave band with the increase in the severity level,and this is especially significant in visible band.The raw spectral reflectance has the maximum coefficient of determ ination at 694 nIn(R 一0.461 6)with severity leve1 and the logarithm mode1constructed with reflectance at this point iS the better one as compared to linear mode1.By the precision evaluation of retrieva1 models,the linear model with the first derivative reflectance at 717 nin as independent variable was proved to be the best,with R —0.488 9,RMSE=0.257 1,and relative error= l2.74 ,f0r the estimation of verticllium wilt severity leve1 of cotton leaf.The results provide a good basis for further studying monitoring mechanism of cotton verticiltium wilt by remote sensing data,and have an important application in acquiring cotton disease information using hyperspectral remote sensing.

【题目】不同水分条件对小麦-玉米两熟制作物生长和水分利用的影响
【中文关键词】小麦; 玉米; 两熟制; 土壤水分; 水分利用; 秸秆覆盖; 保水剂;
【英文关键词】Wheat; Corn; Two crops harvest; Soil moisture; Water utilization; Straw mulching; Water-retaining agent
【中文摘要】为探明不同水分条件对小麦-玉米两熟制水分利用的影响,通过秸秆覆盖和施用保水剂等水分调控措施,进行了不同灌水量对小麦、玉米生长发育和产量、土壤水分及水分利用等方面的影响研究。结果表明:合理灌水有益小麦群体发育,提高成穗数量、株高、穗粒数和千粒重,从而促进小麦增产,其中以补充灌水1 200 m3/hm2效果最佳,增产11.83%;但过多灌水反而影响小麦产量,补充灌水2 400 m3/hm2减产1%,并影响玉米产量。小麦灌水处理的玉米分别比对照增产7.31%~16.15%,其中补充灌水1 800 m3/hm2增产效果最佳,增产16.15%。夏秋两季作物产量结果表明,河南省中产灌区在秸秆覆盖和施用保水剂的情况下,小麦-玉米两熟制最佳补充灌溉量为1 200~1 800m3/hm2。土壤含水量动态变化表明,秸秆覆盖与保水剂相结合,并进行适量补充灌水有利于改善和补偿土壤水分,而且有影响全年作物生长的趋势。。玉米收获后,土壤有效养分和有机质有所下降,表明种植夏玉米应追施适量磷、钾肥,同时加大夏季作物秸秆的还田量,以提高土壤有机质。
【英文摘要】To investigate the effect of different water condition on water use of wheat-corn,application of the straw-mulching,nutrition water-retaining agent and different irrigation were carried out to research the wheat-corn growth,yield,soil moisture and water utilization.The result indicated that rational irrigation plays an active role to wheat population dynamics developing and improve wheat spike length,plant height,spike grains,1 000 grains weight and yield.The highest wheat yield was 1 200 m3 /ha of supp lement irrigation, it increased 11183% comparing to CK. The worst one was 2 400 m3 /ha of supp lement irrigation, itminus 110%. The more important thingwas the irrigation of wheat could affect the corn yield,which of them imp roves 7131% to 16115% comparing to CK, and the best one was 1 800 m3 /ha of supp lement irrigation. The result ofwheat2corn yield stated the best volume of comp lement irrigation was 1 200 m3 /ha to 1 800 m3 /ha under the app lication of straw2mulching and nutrition water2retaining agent for wheat2corn two crop s harvest system in mid2p roduction irrigated zone in Henan p rovince. The changes of soilmoisture stated p rogressively that the straw2mulching and nutrition water2retaining agent app lication could imp rove and compensate soilmoisture and affect the tendency of crop growth and development in a year. The result of soil nutrition changes stated it ’ s necessary to app ly phosphate and ium fertilizer and add straw recession volume for autumn crop.

【题目】催乳素受体基因多态性及其与部分山羊品种产羔数关系
【中文关键词】山羊,产羔数,催乳素受体基因,PCR-SSCP
【英文关键词】goat; little size; prolactin receptor gene; PCR-SSCP
【中文摘要】催乳素(prolactin,PRL)是一种垂体前叶肽类激素,PRL的所有功能都由催乳素受体(prolactin receptor,PRLR)调节。本研究采用单链构象多态(single strand conformation polymorphism,SSCP)方法检测PRLR基因外显子3至外显子9和内含

子9在高繁殖力山羊品种(济宁青山羊)和低繁殖力山羊品种(辽宁绒山羊和安哥拉山羊)中的多态性,并对具有SSCP多态性的DNA片段进行测序比较分析,旨在寻找与产羔数相关的遗传标记,为山羊高繁殖力的标记辅助选择提供科学依据。

【题目】绵羊和山羊BMP15基因FecX~R突变的检测
【中文关键词】绵羊,山羊,繁殖力,骨形态发生蛋白15基因,FecXR突变,PCR-SSCP
【英文关键词】sheep ; goat ; prolificacy ; BMP15 gene ; FecXR mutation ; PCR-SSCP
【中文摘要】为了检测骨形态发生蛋白15(BMP15)基因在绵羊和山羊中的突变,本研究采用PCR-SSCP方法在高繁殖力绵羊品种(小尾寒羊和湖羊)、山羊品种(济宁青山羊和波尔山羊)和低繁殖力绵羊品种(多赛特和特克塞尔)、山羊品种(内蒙古绒山羊和安哥拉山羊)中检测BMP15基因FecXR突变,并对小尾寒羊和济宁青山羊扩增片段进行核苷酸和氨基酸序列分析。结果表明,这8个羊品种均没有发生与Rasa Aragonesa绵羊相同的FecXR突变;小尾寒羊核苷酸序列与GenBank中绵羊BMP15序列(AF236079,NM_001114767)完全一致,济宁青山羊与小尾寒羊相比存在3处碱基不同(T529G、C530G和T576C)和2个氨基酸差异(V155G和S171P)。可见BMP15基因影响Ra-sa Aragonesa绵羊高繁殖力的突变FecXR对小尾寒羊、湖羊、济宁青山羊和波尔山羊的繁殖力均没有显著影响。
【英文摘要】To detect the mutations of bone morp hogenetic protein 15 (BMP15) gene in both highprolificacy breeds (Small Tail Han sheep , Hu sheep , Jining Grey goat and Boer goat) and low prolificacy breeds (Dorset sheep , Texel sheep , Inner Mongolia Cashmere goat and Angora goat) ,the method of PCR-SSCP was used. Both the nucleotide sequences and the amino acid sequences were compared in the amplification fragments of both Small Tail Han sheep and J ining Grey goat.The results indicated that none of the four sheep and the four goat breeds carried the same FecXR mutation of the BM P15 gene as Rasa Arag nesa sheep . The nucleotide sequence of Small Tail Han sheep was completely identical with that of the sheep BMP15 sequence (AF236079 , NM_001114767) in the GenBank. Three base substit utes (T529G, C530G and T576C) and two amino acid changes (V155G and S171P) were found in Jining Grey goat compared with Small Tail Han sheep . The FecXR mutation of t he BM P15 gene had no significant effect on high prolificacy of Small Tail Han sheep , Hu sheep , Jining Grey goat and Boer goat .

【题目】山羊促黄体素受体基因(LHR)外显子11的PCR-SSCP分析
【中文关键词】山羊,性早熟,促黄体素受体基因,PCR-SSCP
【英文关键词】goat; sexual precocity; luteinizing hormone receptor gene; PCR-SSCP
【中文摘要】设计6对引物,用聚合酶链式反应-单链构象多态性(PCR-SSCP)和序列分析方法检测促黄体素受体(luteinizing hormone receptor,LHR)基因外显子11在性早熟、高繁殖力山羊(Caprahircus)品种(济宁青山羊)和性晚熟、低繁殖力品种(波尔山羊、安哥拉山羊和内蒙古绒山羊)中的单核苷酸多态性,同时研究该基因对济宁青山羊性早熟和高繁殖力的影响。结果发现,仅引物P3和P6的扩增片段具有多态性。引物P3在波尔山羊中检测到AA、AB和BB基因型,在济宁青山羊和安哥拉山羊中均检测到AA和AB基因型,在内蒙古绒山羊中只检测到AA基因型;测序发现BB基因型与AA基因型相比存在1个突变(G1522A),导致505位氨基酸由缬氨酸变为甲硫氨酸(V505M);济宁青山羊AA和AB基因型频率分别为0.919和0.081,在P3位点上处于哈迪-温伯格平衡状态($\chi 2$=0.26,P=0.877);济宁青山羊与波尔山羊、安哥拉山羊和内蒙古绒山羊之间LHR基因型分布差异分别达到极显著(P<0.001)、显著(P<0.05)和不显著(P>0.05)水平;济宁青山羊AA和AB基因型之间产羔数差异不显著(P>0.05)。引物P6在4个山羊品种中均检测到CC和CD基因型;测序发现CD与CC基因型相比发生了A2039G突变,导致677位氨基酸由谷氨酰胺变为精氨酸(Q677R);济宁青山羊CC和CD基因型频率分别为0.161和0.839,在P6位点上处于哈迪-温伯格不平衡状态($\chi 2$=77.79,P=0.000);济宁青山羊与波尔山羊、安哥拉山羊和内蒙古绒山羊之间LHR基因型分布差异分别达到极显著(P<0.001)、极显著(P<0.001)和显著(P<0.05)水平;济宁青山羊CC和CD基因型之间产羔数差异不显著(P>0.05)。研究结果初步表明LHR基因外显子11对济宁青山羊的性早熟和高繁殖力没有显著影响。
【英文摘要】The luteinizing hormone receptor (LHR) gene was studied as a candidate gene for the sexual precocity of Jining Grey goats (Capra hircus). Six pairs of primers were designed to detect single nucleotide polymorphisms of LHR gene exon 11 in sexual precocity and high prolificacy breed (Jining Grey goat) and delayed puberty and low prolificacy breeds (Boer, Angora and Inner Mongolia Cashmere goats) by sequence analysis and PCR-SSCP. The results showed that only the products amplified by primers P3 and P6 displayed polymorphisms. For primer P3, three genotypes (AA, AB and BB) were detected in Boer goats, two genotypes (AA and AB) were in Jining Grey and Angora goats, only AA genotype was in Inner Mongolia Cashmere goats. Sequencing revealed one mutation (G1522A) in genotype BB compared with genotype AA, which caused valine substitution with methionine (V505M). The frequency of AA and AB genotypes was 0.919 and 0.081 in Jining Grey goats. The fitness tests showed that the Jining Grey goatpopulation was in Hardy-Weinberg equilibrium ($\chi 2$ =0.26, P =0.877). Genotype distributions of LHR gene were at different levels (P<0.001, P <0.05, P >0.05) between Jining Grey goats and Boer, Angora and Inner Mongolia Cashmere goats. No significant difference (P >0.05) was found in litter size between AA and AB genotypes in Jining Grey goats. For primer P6, CC and CD genotypes were detected in four goat breeds. Sequencing revealed one mutation (A2039G) of genotype CD compared with genotype CC, which resulted in amino acid substitution of Q677R. The frequency of CC and CD genotypes was 0.161 and 0.839 in Jining Grey goats. Thefitness tests showed that the Jining Grey goat population was not in Hardy-Weinberg equilibrium ($\chi 2$ =77.79, P =0.000). Genotype distributions of LHR gene were at different levels (P <0.001, P <0.001, P <0.05) between Jining Grey goats and Boer, Angora andInner Mongolia Cashmere goats. No significant difference (P >0.05) was found in litter size between CC and CD genotypes in Jining Grey goats. The results preliminarily indicated that exon 11 of LHR gene had no significant influence on the sexual precocity and prolificacy in Jining Grey goats.

【题目】促黄体素β基因多态性及其与济宁青山羊产羔数的关系
【中文关键词】山羊,繁殖力,促黄体素β亚基基因,PCR-SSCP
【英文关键词】无
【中文摘要】为了解促黄体素β基因多态性与济宁青山羊产羔数的关系,采用PCR-SSCP技术检测促黄体素β亚基(Luteinizing hormone beta-subunit,LHβ)基因5′调控区和3个外显子在高繁殖力(济宁青山羊)、中等繁殖力(波尔山羊)和低繁殖力山羊品种(辽宁绒山羊和安哥拉山羊)中的单核苷酸多态性,同时研究该基因对济宁青山羊高繁殖力的影响。结果表明:山羊与绵羊的LHβ基因核苷酸序列相似性为98%。6对引物中,仅引物P1和P5扩增片段存在多态性。对于P1扩增片段,在4个山羊品种中均检测到AA、AB和BB 3种基因型;测序分析发现BB与AA基因型相比在5′调控区存在2处突变202C→A和210C→T;济宁青山羊3种基因型之间产羔数差异均不显著(P>0.05)。对于P5扩增片段,在济宁青山羊中检测到CC、CD和DD 3种基因型,辽宁绒山羊中检测到CC和CD2种基因型,波尔山羊和安哥拉山羊中都只检测到CC基因型;测序分析发现DD与CC基因型相比在外显子2存在单碱基突变1124C→T;济宁青山羊CC、CD和DD基因型频率分别为0.38、0.44和0.18;DD和CD基因型济宁青山羊平均产羔数分别比CC基因型的多0.99(P<0.01)和0.87只(P<0.01)。济宁青山羊在P1、P5两个座位上都处于哈迪-温伯格平衡状态(P1座位:χ2=1.66,P=0.437;P5座位:χ2=1.22,P=0.544)。

【题目】KISS-1/GPR54基因及其在生殖中的作用
【中文关键词】KISS-1基因,GPR54基因,Kisspeptin,生殖,调控
【英文关键词】KISS-1 gene; GPR54 gene; kisspeptin; reproduction; modulation
【中文摘要】KISS-1及其受体GPR54基因对青春期的正常启动具有重要作用。青春期开始前后,动物下丘脑中KISS-1和GPR54 mRNA水平很高,Kisspeptins(KISS-1基因产物)通过激活GPR54增加促性腺激素的释放,KISS-1基因的表达受性腺类固醇激素的调控。GPR54基因突变可以导致人和鼠的特发性促性腺激素分泌不足性腺机能减退症和促性腺激素依赖性性早熟。文章还介绍了KISS-1、GPR54基因的结构、表达、多态性以及和其它生殖调控因子之间的相互关系。

【英文摘要】KISS-1 gene and its receptor gene GPR54 play key roles in the initiation of puberty onset. The peptide product of the KiSS-1 gene, Kisspeptins stimulate gonadotrophins release to initiate puberty through the expression of GPR54 gene in the brain. So the level of KISS-1 and GPR54 mRNA in hypothalamus was very high on the onset of puberty. The expressionof KISS-1gene was regulated by steroid hormone in different nuclei within the forebrain to control the reproduction in puberty. Loss of function mutations of GPR54 gene could cause idiopathic hypogonadotropic hypogonadism (IHH) and gonadotrophin-dependant premature puberty. This review also introduced the structure, expression, homology comparison,polymorphism of KISS-1 and GPR54 genes and their interrelation with other regulators of reproduction.

【题目】哺乳动物性晚熟相关基因的研究进展
【中文关键词】性晚熟,基因,突变
【英文关键词】delayed puberty;gene;mutation
【中文摘要】人和哺乳动物性的发育和成熟源于下丘脑性腺激素释放激素(gonadotropin releasing hormone,GnRH)脉冲式释放。GnRH释放受到抑制或破坏,就会导致性腺机能减退,人在发育前和发育期就会出现发育迟缓和性发育不良,表现为无精症或闭经;动物则表现为初情期延迟、生殖能力下降等表型。编码促性腺激素及其受体基因的突变可能引起哺乳动物性晚熟。笔者简要介绍了GPR54、GnRH/GnRHR、FSH/FSHR、LH/LHR基因与哺乳动物性晚熟的关系。
【英文摘要】Sexual maturation of humans and mammals was driven by an intermittent discharge of gonadotropin-releasing hormone(GnRH)generated by a network of hypothalamic neurons known as the GnRH pulse generator.Reproductive disorder will present once GnRH release was suppressed or destroyed, which will result in hypothalamic hypogonadism. As for humans,this disorder presents azoospermatism and amenorrhea resulted from hypoevolutismus and sex hypoplasia.Animals affected by hypothalamic hypogonadism present puberty delay and reproductive capacity degression.Mutations of the genes encoding gonadotrophins and their receptors may cause delayed puberty.This review briefly introduced the relationships betweenGPR54,GnRH/G'nRHR,FSH/FSHR,LH LHR genes and delayed puberty in mammal.

【题目】山羊神经肽Y基因外显子克隆及序列分析
【中文关键词】山羊,神经肽Y基因,PCR-SSCP
【英文关键词】goat;neuropeptide Y gene;PCR-SSCP
【中文摘要】采用PCR-SSCP技术检测神经肽Y(neuropeptide Y,NPY)基因全部3个外显子在高繁殖力山羊品种(济宁青山羊)、中等繁殖力山羊品种(波尔山羊)和低繁殖力山羊品种(内蒙古绒山羊和安哥拉山羊)中的单核苷酸多态性,分析该基因对济宁青山羊高繁殖力的影响;并对济宁青山羊NPY基因3个外显子进行克隆测序,推导出编码的氨基酸序列,同时将济宁青山羊核苷酸和氨基酸序列与绵羊、牛、人、大鼠、小鼠和鸡6个物种的序列进行比较。结果表明,在4个山羊品种中未检测到NPY基因3个外显子的多态性;这7个物种的核苷酸和氨基酸序列的同源性分别为71.6%~99.7%和81.4%~100%;与牛、人等6物种相比,济宁青山羊NPY基因氨基酸序列38位存在特有突变(E38D)。可见,物种间NPY基因保守性强,NPY基因可能不是影响山羊高繁殖力的主效基因。
【英文摘要】The neuropeptide Y(NPY)gene was studied as a candidate gene for high prolificacy in some goatbreeds(Capra hircus).Single nucleotide polymorphisms (SNPs) ofall three exons (exons1,2 and 3) of NPY gene were detected in high prolificacybreed (JiningGreygoat), medium prolificacybreed (Boergoat) and low prolificacy breeds (InnerMongolia Cashmere and Angora goats) by polymerase chain reaction-single strand conformation polymorphism (PCR-SSCP). No polymorphism was detected in the amplified region in the fourgoatbreeds tested. DNAfragments of exons1,2 and 3 ofJiningGrey goatNPYgenewere cloned into pGEM-TEasy vector.The positive clones were further identified by PCR. The nucleotide sequenceswere detected and the amino acid sequences of these three fragmentswere deduced. The comparison of the fragments ofall three exons of Jining Grey goat NPY gene with those of human, cattle, sheep, ra,t mouse and chicken NPYgene showed that the homologies of the nucleotide sequences and amino acid sequences of the fragments among these seven specieswere from 71・6% to 99・7% and from 81・4%to 100% respectively. One specialvariationwas found in the 38th position ofamino acid sequence, whichwas aspartic acid in JiningGrey goats and glutamic acid in other species.The results indicated that theNPYgene was highly conserved amongmammals, andmay notbe amajorgene that affects the high prolificacy in goats.

【题目】济宁青山羊多羔性候选基因BMP15的研究
【中文关键词】山羊,多羔性,骨形态发生蛋白15基因,PCR-SSCP
【英文关键词】goat;prolificacy;bone morphogenetic protein 15 gene;PCR—SSCP
【中文摘要】根据绵羊骨形态发生蛋白15(bone morphogenetic protein 15,BMP15)基因序列设计2对引物(P1和P2),分别扩增随机选取的安哥拉山羊和济宁青山羊各5个个体的BMP15基因外显子1、2并克隆测序。测序结果与绵羊BMP15基因外显子1(AF236078)相比,山羊BMP15基因外显子1在第268-270位插入3个核苷酸CTT(268insCTT),导致编码的氨基酸第12位插入亮氨酸(12insL);山羊BMP15基因外显子2序列长度与绵羊(AF236079)一致,但存在7处核苷酸不同,引起4个氨基酸变化,济宁青山羊与安哥拉山羊相比在963位存在核苷酸变化(A963G)。依据A963G变异设计引物P3,利用PCR-SSCP方法检测BMP15基因外显子2在高繁殖力品种(济宁青山羊)、中等繁殖力品种(波尔山羊)和低繁殖力品种(安哥拉山羊和内蒙古绒山羊)中的单核苷酸多态性,分析该基因对济宁青山羊多羔性的影响。结果在济宁青山羊中检测到AA、AG和GG基因型,在波尔山羊中检测到AG和GG基因型,在安哥拉山羊和内蒙古绒山羊中仅检测到AA基因型;测序分析发现GG与AA基因型相比存在1个突变(A963G),导致第300位的丝氨酸变为甘氨酸(S300G);济宁青山羊AA、AG和GG基因型频率分别为0.008、0.059和0.933;高

繁殖力山羊品种与中、低繁殖力山羊品种之间BMP15基因型分布存在显著(P<0.05)和极显著(P<0.001)差异;GG基因型济宁青山羊产羔数最小二乘均值比AG和AA基因型的分别多0.71只(P<0.05)和1.57只(P<0.05),AG基因型比AA基因型的多0.86只(P<0.05)。本研究结果初步显示BMP15基因可能是影响济宁青山羊多羔性的一个主效基因或是与之紧密连锁的一个标记。

【英文摘要】According to the sequence of sheep bone morphogenetic protein 15(BMP15)gene,twopairs of primers(P1 and P2)were designed to amplify the exons 1 and 2 of BMP15 gene in fiverandomly selected individuals from Angora and Jining Grey goats, respectively. Sequencingshowed that sequences of BMP15 exon 1(P1 amplification)of Angora and Jining Grey goats wereidentica1.There were three nucleotides (CTT) insertion from 268 to 270 positions in goat BMP15 exon 1 compared with that of sheep (AF236078),which caused a leucine insertion at the12th position in amino acid sequence.Sequence length of goat BM P15 exon 2(P2 amplification)was identical with that of sheep(AF236079),but there were seven nucleotide and four amino acid changes between goat and sheep. The nucleotide at the 9 6 3 rd position in BMP15 exon 2 was A for Angora goat and sheep,and G for Jining Grey goat.Based on A963G mutation,primer P3 was designed to detect SNP of BM P15 exon 2 in high prolificacy breed (Jining Grey goat),moderate prolificacy breed (Boer goat)and low prolificacy breeds(Angora and Inner Mongolia Cashmere goats)by PCR—SSCP.Three genotypes(AA,AG and GG)were detected in Jining Grey goats,tWO genotypes(AG and GG)in Boer goats,only AA genotype in Angora and Inner M ongoliaCashmere goats.Sequence analysis revealed one mutation (A963G) in genotype GG comparedwith genotype AA。and this mutation resulted in an amino acid change of serine glycine(S300G).In Jining Grey goats,frequencies of AA ,AG and GG genotypes were 0.008,0.059and 0.933,respectively.Genotype distributions of BM P15 gene were significantly different(P<0.05 Or P< O.001)among Jining Grey goats and Boer,Angora,Inner Mongolia Cashmere goats.In Jining Grey goats,the individuals with genotype GG had 0.71(P< O.05)or 1.57(P<0.05) kids more than those with genotypes AG or AA ,the individuals with genotype AG had 0.86(P< O.05)kids more than those with genotype AA. These results preliminarily indicated that the BMP1 5 gene is either a maj or gene which affects the prolificacy in Jining Grey goats or a molecular marker in close linkage with such a gene.

【题目】山羊胰岛素样生长因子Ⅰ基因多态性及序列分析
【中文关键词】山羊,胰岛素样生长因子Ⅰ基因,PCR-SSCP
【英文关键词】goat; insulin like growth factor gene; PCR-SSCP
【中文摘要】采用PCR-SSCP技术检测胰岛素样生长因子Ⅰ(insulin like growth factor Ⅰ,IGF-Ⅰ)基因外显子在性早熟、高繁殖力品种(济宁青山羊)和性晚熟、中等繁殖力(波尔山羊)以及性晚熟、低繁殖力品种(安哥拉山羊和内蒙古绒山羊)中的单核苷酸多态性,分析该基因对济宁青山羊性早熟和高繁殖力的影响;并对济宁青山羊IGF-Ⅰ基因扩增片段进行克隆测序,拼接出山羊IGF-Ⅰ基因4个外显子序列,将济宁青山羊IGF-Ⅰ基因外显子核苷酸序列和推导的氨基酸序列与绵羊、牛、人、大鼠、小鼠和鸡6个物种的序列进行比较。结果表明,IGF-Ⅰ基因4个外显子在所检测的4个山羊品种中均不存在多态性;这7个物种的核苷酸和氨基酸序列同源性分别为79.6%~99.3%和77.8%~99.4%;与牛、人等6物种相比,济宁青山羊IGF-Ⅰ基因氨基酸序列不存在特有变化。可见,物种间IGF-Ⅰ基因保守性强,IGF-Ⅰ基因可能不是影响济宁青山羊性早熟和高繁殖力的主效基因。

【英文摘要】The insulin like grow th factor (IGF) genew as studied as a candidate gene for sexual precocity and high prolificacy in some goat (Capra hircus) breeds. Single nucleotide polymorphisms (SNPs) of all exons of IGF gene were detected in sexual precocity and high prolificacy breed (Jining Grey goat) and sexual late maturing andmoderate fecundity breed (Boer goat) and sexual late maturing and low fecundity breeds (Angora and InnerMongolia Cashmere goats) by polymerase chain reaction single strand conformation polymorphism (PCR-SSCP) . No polymorphism was detected in the amplified region in the four goat breeds tested. DNA fragments amplified in this research were cloned in to pGMT vector. The posit ive clonesw ere further identified by PCR. The nucleotide sequencs of four exons in goat IGF were spliced and the correspond ing am inoacid sequences were deduced. The comparison of the fragments of all four exons of Jining Grey goat IGF gene with those of human, cattle, sheep, rat, mouse and chicken showed that the homologies of the nucleotide sequences and amino acid quences o f the fragments among these seven species w ere

from 79 6% to 99 3% and from 77 8% to 99 4% respectively. No specia l variation was found in amino acid sequence of Jining Grey goat The results ind icated that the IGF gene was high ly conserved amongmamma ls, and may not be a major gene that affects the sexual precocity and high prolificacy in Jining Grey goats.

【题目】山羊雌激素受体(ESR)基因部分外显子多态性分析
【中文关键词】山羊,雌激素受体基因,PCR-SSCP
【英文关键词】goat;estrogen receptor(ESR)gene;PCR-SSCP
【中文摘要】雌激素受体(estrogen receptor,ESR)与雌激素专一性地结合,并通过与雌激素的相互作用来调节生殖机能相关基因的表达,在动物繁殖中起着重要作用。研究采用PCR-SSCP和测序方法分析ESR基因外显子1、4在部分山羊(Capra hircus)品种中的单核苷酸多态性,并研究该基因对山羊繁殖力的影响。结果表明:ESR基因外显子1、4在所检测的济宁青山羊、波尔山羊、安哥拉山羊和内蒙古绒山羊中均不存在多态性;山羊扩增片段核苷酸和氨基酸序列与人、牛、猪、马、绵羊、大鼠、小鼠和鸡8个物种的同源性分别为51.3%~97.3%和64.5%~98.3%;山羊ESR基因氨基酸序列存在2处特有突变,分别是外显子1第81位插入一个脯氨酸(P)和外显子4第4位由天冬氨酸突变为天冬酰胺(D4N)。哺乳动物ESR基因外显子1、4序列保守性强,该区域可能不是影响山羊高繁殖力的功能结构域。
【英文摘要】The estrogen receptor (ESR)plays an important role in animal reproduction through binding specifically with estrogen and interacting with estrogen to regulate the expression of related genes of reproductive function,and was studied as a candidate gene for prolificacy in some goat(Capra hircus)breeds.Single nucleotide polymorphisms (SNPs)of exons 1 and 4 of ESR gene were detected in high prolificacy breed(Jining Grey goat),moderate prolificacy breed(Boer goat)and low prolificacy breeds(Inner Mongolia Cashmere and Angora goats)by polymerase chain reaction—single s~and conformation polymorphism (PCR—SSCP).Results showedthat no polymorphism was detected in the amplified region in the four goat breeds tested.The nucleotide sequences of these two flagments were detected and the corresponding amino acid sequences were deduced.The comparison ofthe fi-agments ofexons 1 and 4 of goat ESR gene with those of human,cattle,pig,horse,sheep,rat,mouse and chicken ESR gene showed that the homologies of the nucleotide sequences and amino acid sequences ofthe fragments with these eight species were from 5 1.3% to 97-3% and from 64.5% to 98-3%respectively.Two special variations were found in amino acid sequence ofgoats,which were 81st(proline insertion)in exon 1 and 4th (D4N)in exon 4.The results indicated that the ESR gene was highly conserved among mammals,and exons 1 and 4 may not be the functional domains that affect the high prolificacy in goats.

【题目】坡缕石/聚丙烯酸(钠)高吸水复合材料的溶胀行为
【中文关键词】坡缕石;矿物/聚丙烯酸(钠);高吸水复合材料;溶胀行为
【英文关键词】palygorskite; mineral/PAANa; superabsorbent composites; swelling behavior
【中文摘要】以水溶液聚合法制备了坡缕石/聚丙烯酸(钠)(PAANa)高吸水复合材料,对复合材料的吸水溶胀性能进行了研究,并采用FTIR对复合材料进行表征。结果表明:10%坡缕石/PAANa复合材料吸蒸馏水和0.9 wt%盐水倍率分别达1666 g/g、115 g/g,较纯PAANa的724 g/g、58 g/g明显提高;坡缕石/PAANa复合材料具有优异的保水及反复吸水性能;坡缕石/PAANa的吸液倍率随电解质溶液离子强度的升高而降低,降低程度顺序为Al3+Ca2+Na+;坡缕石/PAANa复合材料与其他6种矿物

/PAANa复合材料相比,吸液性能特别是吸蒸馏水及0.9 wt%盐水性能大幅提高。
【英文摘要】Palygorskite / poly (sodiumacrylate) (PAANa) super absorbent composites were synthesized via aqueous solution polymerization with palygorskite and acrylate acid (AA) as raw materials. Swelling properties of palygorskite / PAAN a superabsorbent composites were investigated. The superabsorbent composite was characterized by Fourier transform infrared spectroscopy (FTIR). The results show that the distilled water absorbency and physiological saline solution absorbency of 10% palygorskite/PAANa superabsorbent composites reach 1666 g/g and 115g / g, respectively. In comparison to the distilled water absorbency and physiological saline solution absorbency of PAANa, 724 g / g and 58 g / g, the performance of palygorskite / PAANa composites is improved largely. Palygorskite / PAANa composites have excellent water retention and repeat water absorbency properties. Palygorskite / PAANacomposites water absorbency reduces along with the electrolyte solution ion intensity ascension, the reduction degree orderbeing Al3+>Ca2+.Na+.

【题目】海泡石矿物含量对海泡石/ 聚丙烯酸(钠) 复合材料吸水保水性能的影响
【中文关键词】非金属矿物/ 高分子高吸水保水复合材料;海泡石粘土;聚丙烯酸(钠) ;性能
【英文关键词】mineral/ polymer superabsorbent composites ; sepiolite clay ; polyacrylic acid nat rium; property
【中文摘要】利用水溶液聚合法制备了海泡石粘土/ 聚丙烯酸(钠) 高吸水保水复合材料,研究了海泡石粘土在0 %~10 %及20 %~150 %添加量范围对复合材料的吸水保水、重复吸水及抗电解质溶液性能的影响。结果表明,海泡石添加量在4 %和40 %~60 %范围时,复合材料的吸蒸馏水倍率达到极大值。海泡石添加量大于60 %时,复合材料吸水倍率急剧下降。复合材

料的保水率随着海泡石添加量的增加而小幅增加;海泡石粘土添加量在40 %~60 %范围时,复合材料的重复吸水性能比较稳定;复合材料吸蒸馏水的倍率随各电解质溶液离子强度的升高而不断降低,且海泡石粘土添加量高的复合材料对外界溶液离子强度的敏感程度较高。

【英文摘要】Sepiolite/ PAA (PAAS) super absorbent composite was prepared using solution polymerization method. Effect of sepiolite clay content at the range of 0 %~10 % and 20 %~150 %on water absorbency , water holding performance , repeated water absorbency , elect rolyte resistance and microst ructure of the as2synthesized composite was discussed respectively. The result s show that the maximum distilled water absorbency and the maximum 0. 9 % saline water absorbency of composite are both received when sepiolite mineral content is equal to 4 %. Sepiolite mineral/PAA (PAAS) composite reaches to the maximum distilled water absorbency (800 g/ g) within the range of 40 %~60 %. Water absorbency of composite is declining sharply within the range of 60 %~150 %. It is noticeable that water absorbency of composite containing sepiolite clay mineral is larger than that of polyacrylic acid nat rium f ree sepiolite clay. Water holding of composite increases ratherish along with sepiolite content augmentation. Repeated waterabsorbency of composite is steady2going while sepiolite clay content within the range of 40 %~60 %. The distilled water absorbency of composite is decreased simultaneously when ionic st rength of elect rolyte solution enlarges. The higher the compsite with sepiolite clay content , the faster the exoteric elect rolyte solutions absorbency descend.

【题目】不同类型保水剂性能及其对玉米生长效应的比较
【中文关键词】保水剂; 吸水保水;玉米;菌根;生长速率
【英文关键词】water retentive agent; water swelling and conservation; maize; mycorrhiza; growth speed
【中文摘要】为了比较各类保水剂在同等条件下的性能和应用效果差异,促进保水剂在抗旱节水中的合理应用。本文对国内聚丙烯酸钠、淀粉接枝丙烯酸钠、凹凸棒(元机)/聚丙烯酸钠(有机)、腐殖酸/聚丙烯酸钾4种主要类型农用保水剂进行性能测定,比较其吸水倍率、吸水速率、抗离子特性、pH值、反复吸水性等性能的差异。结果表明,不同类型保水剂的性能差异较大,单一性保水剂聚丙烯酸盐在吸水倍率、吸水速率和保水性等方面表现最好,但反复吸水时吸水率降低较快;淀粉接枝丙烯酸钠第7次吸水时已丧失吸水性;复合型保水剂凹凸棒/聚丙烯酸钠、腐殖酸/聚丙烯酸钾抗二价(Ca ”,M92+)和三价(Fe ”)离子特性明显,反复吸水性能好;盆栽玉米实验证明,复合型保水剂及其与菌根配比使用能显著促进玉米生长。
【英文摘要】In order tO understand the property of different kinds of water retentive agents and the appfied effects SO that to use it reasonably on drought resistance and water saving.The paper is to test the capabilities of major four kinds of water retentive agents,including Poly(acrylate sodium),Starch—sodium acrylate graft copolymers,Poly(acrylate sodium)/attapulgite,Poly(acrylic acid—potassium acrylate)/humic—acid.It was analyzed the ab—sorbency,swelling rate,anti—ionic property,pH,frequent absorbency and SO on.The results showed that the ca—pabilities of four different kinds of water retentive agents is very different and the best one of them is Poly(acry—late sodium)that recapitulate swelling rate is decreased fast in re—absorbent swelling;Starch—sodium acrylate graft copolymers has lose the capacity of water swelling in 7th process of water swelling;multi—component water reten—tive agents,such as Poly(acrylate sodium)/attapulgite and Poly(acrylic acid—potassium acrylate)/humic—acid have a special characteristic on anti—ion with bivalent(Ca2+,M92+)and anti—ion with three combination(Fe3+)marked—ly,respectively,and they all have a good capacity on recapitulate swelling rate.The pot experiments showed that Poly(acrylate sodium)/attapulgite and Poly(acrylic acid—potassium

acrylate)/humic—acid,compared to Poly(acry—late sodium) and starch——sodium Acrylate Graft Copolymers as well as mixed use of water retentive agents and mycorrhiza can increase the growth of maize.

【题目】保水剂对土壤氮素淋溶及脲酶活性的影响
【中文关键词】保水剂; 氮素; 尿素; 淋溶; 脲酶
【英文关键词】super absorbent polymer(SAP); nitrogen; urea; urease; eluviations
【中文摘要】施用化学各处理的土壤脲酶活性与氮素淋溶量达到了显著正相关是减小土壤氮素淋溶和提高氮素利用效率的重要途径。为了分析保水剂对土壤氮素淋溶效应和土壤脲酶活性影响。本文通过模拟试验,对施用同量尿素条件下,三种不同类型高分子保水剂(聚丙烯酸钠保水剂、有机-无机复合保水剂、腐植酸型保水剂)对尿素淋溶和土壤脲酶活性进行比较。多次浇水淋溶实验表明,三种保水剂都明显降低了土壤尿素淋失量,8 次浇水后氮素淋溶累积量分别比对照减少37.44%、33.05%、31.66%。多次浇水中保水剂对氮肥淋溶量动态变化表明,保水剂减小氮素淋溶损失的重要机理是保水剂具有缓冲氮素释放作用;保水剂处理有效促进土壤脲酶活性,土壤脲酶活性与氮素淋溶量显著正相关。相对而言,聚丙烯酸钠盐保水剂降低氮素流失,提高氮肥利用效率效果较优。
【英文摘要】Chemical agent application is an important way to decrease nitrogen fertilizer losing and raise the use efficiency. In order to analyze the inference of super absorbent polymer(SAP) on nitrogen eluviations and the urease activity of soil,it was used simulation experiment to study the effects of three kinds of SAP, including polyacrylic acid SAP, organic-inorganic hybrid SAP and humic acid-contained SAP, on urea eluviations and the urease activity of soil. Under same level of urea fertilizer application, the experiment was shown that three kinds of SAP all strongly restrained the leaching loss of urea in soil,and the urea losing amount was decreased 37.44%、33.05%、31.66% than that of the control. In the processing of different time watering, the mechanism of nitrogen eluviations decreasing was cushion action of SAP to nitrogen releasing. SAP can enhance a urease activity that is corresponded with the nitrogen leaching amounts. And relativity, the urea maintaining effect of polyacrylic acid SAP is the most obviously.

【题目】CTS—g—PAA/SH高吸水性树脂的缓释和保水性能
【中文关键词】高吸水性树脂;腐殖酸钠;保水性能;缓释功能
【英文关键词】Superabsorbent,Sodium humate,Water retention capacity,Slow-release
【中文摘要】以壳聚糖(CTS)、丙烯酸)和腐殖酸钠(sH)为原料,在水溶液中通过接枝共聚反应合成壳聚糖接枝聚丙烯酸/腐殖酸~tJ(CTS-g—PAA/SH)高吸水性树脂;考察CTS—g—PAA/SH树脂在不同浓度盐溶液中的溶胀行为、反复吸抽}生能、SH的缓释性能和在土壤中的实际保水效果;在SH含量为10%时,CTS—g—PAA/SH树脂在蒸馏水和生理盐水中的吸水倍率分别达到183g/g和41g/g;CTS-g-PAA/SH 高吸水性树脂具有较好的反复吸水性能;与CTS—g—PAA相比,含有1.0%CTS-g-PAA/SH树脂的沙土,20d后仍然具有6.75%的保水率;SH能与AA发生聚合反应,形成网络结构,"-3 SH含量超过30%时,过量的SH是以物理填充方式存在于高吸水性树脂的交联网络中,且容易释放; SH能改善cTs—g—PAA的吸水性,CTS—g—PAA/SH高吸水性树脂不仅可降低产品成本,而且还具有缓释腐殖酸的功能。
【英文摘要】A novel superabsorbent of chitosan-g-poly (acrylic acid)/sodium humate (CTS—g-PAA/SH)was synthesized through graft polymerization among chitosan,acrylic acid and sodium hu—mate in aqueous solution. The water absorbency in various s~ine solutions,resweling behaviors,the slow—release behavior of SH and the pracfic~ water ab sorbency in soil of CTS—g—PAA/SH superab sorbent were systematically investigated. The CTS—g-PAA/SH superabsorbent with 10%sodium humate gave water absorbency of 183g/g in distilled water and 41g/g in 0.9% NaC1 solution.The CTS—g—PAA/SH superab—sorbents have better resweling behaviors.Comparing with C11s—g—PAA,6.75% of water can still be saved in the san d soil containing 1.0% superabsorbent after 20 days.SH reacts with PAA during the polymerization process an d forms a more intact polym eric network.When the SH content is above 30% in superabsorbent,the excess SH on1v acts aS filler in the polymeric network and the slow—release of SH is easy. IntroducingSH could improve water absorbency of the CTS—g—PAA superab sorbent.CTS-g—PAA/SH superabsorbent not only Can reduce significan tly production cost,but also have slow-release capacity of humic acid.

【题目】氮、磷、钾、硼肥对甘蓝型油菜籽品质的影响
【中文关键词】油菜; 施肥; 含油量; 蛋白质含量; 硫甙; 芥酸
【英文关键词】Brassica napus ; fertilization ; oil content ; protein content ; glucosinolate ; erucic acid
【中文摘要】以多个正在大面积应用的甘蓝型油菜品种为研究对象,在长江流域冬油菜主产区的10 个省(市) 布置氮、磷、钾和硼肥田间肥效试验共284 组,通过多点试验分别探讨当前生产条件下施用氮、磷、钾、硼肥对双低和双高甘蓝型油菜籽含油量、蛋白质、芥酸、硫甙的影响。结果表明,双低油菜籽平均含油量为41166 % ,双高油菜含油量明显低于双低油菜,仅为38192 %。氮、磷、钾和硼肥施用对油菜籽的品质效应在不同试验点表现不尽相同,其总体趋势是: 在磷、钾、硼肥基础上施用氮肥提高籽粒蛋白质含量而降低油分含量,且随氮肥用量的增加效果更明显,施氮对双高油菜油分及蛋白质含量的影响程度大于双低油菜; 施磷、钾或硼肥有提高油菜籽含油量而降低蛋白质含量的趋势; 施肥对油菜籽硫甙和芥酸含量有一定影响,但对品质影响不大。油菜籽含油量与收获指数、千粒重显著正相关,与蛋白质含量呈负相关。研究结果显示,在施氮的基础上配合施用磷、钾和硼肥能减少因施氮引起的油分损失。
【英文摘要】284 field experiments were conducted in 10 main rapeseed product provinces along the Yangtze River Basin. Our research aimed at the effects of nitrogen(N) , phosphorus (P) , potassium(K) and boron (B) on rapeseed main quality items such as concentration of oil , protein , glucosinolate and eurcic acid in seed of double low rape (Brassica napus . with low glucosinolate and erucic acid content) and double high rape (Brassica napus .with high glucosinolate and erucic acid content) . The average oil content of double low rape was 41166 % , which was 2174 % higher than double high rape. The effects of N, P , K and B fertilizer on rapeseed qualities were not uniform at different experimental sites. Oil concentration was significantly decreased , and protein concentration in the seed was increased with the increasing of N application rate. The effect of N fertilizer application on oil and protein content in double high rape was stronger than that in double low rape. Seed oil content was enhanced with the application of P, Kand B fertilizer. Fertilization also influenced the glucosinolate and erucic acid content, but the effect was not significance. Oil content was positively correlated with harvest index and 10002seed weight, negatively correlated with seed protein content . It was concluded that the combination of P, K and B fertilizer with N could alleviate oil content losses caused by unique N fertilizer application.

【题目】东北黑土玉米单作体系氨挥发特征研究
【中文关键词】黑土;氨挥发;优化施氮;玉米
【英文关键词】Black soil;Ammonia volatilization; Optimized N application; Maize
【中文摘要】采用通气法测定了东北黑土玉米单作体系田间土壤的原位氨挥发.试验设5个氮肥处理,即:施氮量(N)分别为0、150、225和300 ks/hm2(分别用N0、N1、N2和N3表示),N1、N2和N3处理基施氮肥和拔节期追肥各1/2,其中N3为习惯施肥;同时,设置优化施肥处理N4,用量为N 225 kg/hm2,基施氮肥、拔节肥和孕穗期肥各1/3.结果表明,来自肥料的氨挥发持续时间较短,一般发生在施肥后的7 d内.由于追肥期高温低湿,追肥期氨挥发量显著高于基施氮肥.随施氮量增加,氨挥发损失增加;优化施肥(N4)的氨挥发损失量明显低于习惯施肥,N1、N2、N3和N4处理来自氮肥的氨挥发依次为N 5.09、9.18、13.47和7.14 kg/hm2,相当于施氮量的3.39%、4.08%、4.49%和3.17%.可见,优化施肥对于我国东北集约化农区节省氮肥和提高氮肥利用率有晕要意义.
【英文摘要】Ammonia volatilization (AV) from soil is an important pathway for fertilizer N loss from field, while less information is available on AV from black soil in Northeast China. For understanding the seriousness of AV in this area, a venting method was used to investigate AV from black soil in maize monoculture system, treatments of nitrogen fertilizer (Urea) application included: (1) N0 (Control, no nitrogen application); (2) N1 (N 150 kg/hm2); (3) N2 (N 225 kg/ hm2); (4) N3 (N 300 kg/ hm2).The N3 represented the

traditional N application, and for N1, N2, and N3, 1/2 was used before sowing as basal, and 1/2 used at jointing stage as top-dressing. One more treatment was added as N4 (N 225 kg/ hm2), 1/3 the total amount was used respectively before sowing, at jointing stage,and at booting stage, and this represented optimized N application approach. In field condition,it was found that ammonia volatilization lasted short,and took place within a week after N application. The amount of AV from N fertilizer as top-dressing was found to be higher than that as basal, due to the higher temperature and the lower soil moisture at jointing stage and booting stage. The N loss through AV increased with the application rate of nitrogen fertilizer. For N1, N2 , N3 and N4 treatment, the amount of AV from N fertilizer were N 5.09, 9.18, 13.47 and 7.14 kg/ hm2,which were equivalent to 3.39%, 4.08%, 4.49% and 3.17% of fertilizer N applied, respectively. Optimized N application approach lowered the N loss by AV greatly compared to traditional N application. Therefore, optimized fertilization is of great importance for increasing N use efficiency and saving N fertilizer in intensive cropping area in Northeast China.

【题目】Study on superabsorbent composites. XXI. Synthesis, characterization and swelling behaviors of chitosan-g-poly(acrylic acid)/organo-rectorite nanocomposite superabsorbents
【中文关键词】无
【英文关键词】nanocomposite superabsorbent; chitosan;rectorite; water absorbency; swelling rate
【中文摘要】无
【英文摘要】A novel chiston-g-poly(acrylic acid)/organo-rectorite (CTS-g-PAA/OREC) nanocomposite superabsorbent was synthesized by aqueous polymerization using N,N'-methylenebisacrylamide as a crosslinker and ammonium persulfate as an initiator. Rectorite was organified with four different degree of hexadecyltrimethyl ammonium bromide, and the organification of rectorite was proved by FTIR and XRD. The effect of organification degree of rectorite on water absorbency of CTS-g-PAA/OREC with different organo-rectorite content was investigated. The swelling behaviors in distilled water and various pH solutions were also studied. The results from IR spectroscopy and XRD data show that acrylic acid had been grafted polymerization with chitosan and organo-rectorite and formed nanocomposite. Introducing organo-rectorite into the CTS-g-PAA polymeric network can improved water absorbency and swelling rate of CTS-g-PAA/OREC.

【题目】基于多时相棉花长势遥感的棉田质量诊断
【中文关键词】棉花长势;多时相;遥感监测;棉田质量
【英文关键词】Cotton growth; Multi-temporal; Remote-sensing monitoring; Cotton field quality
【中文摘要】【目的】研究多时相遥感信息对棉田质量进行诊断的技术和方法,为棉花生产提供具有针对性的管理方案,促进棉田均衡增产、增效。【方法】研究分析多时相遥感数据对地物信息的动态分析与评判能力,以及棉花长势指标动态变化与棉田质量的关系,对棉花生长盛期多时相的LANDSAT-5 多时相遥感数据进行融合,将棉田质量状况划分为健康棉田、有障碍棉田和疑似有障碍棉田三类。【结果】数据分析结果表明,棉花生长盛期(花铃期)单时相的LANDSAT-5 反射率数据可以作为棉田生长状况的判断指标,划分健康生长与生长障碍的阈值为0.820;利用多时相遥感数据的棉田质量划分方法,可以将棉田质量分为健康、有障碍和疑似有障碍三类。依据此方法对新疆建设兵团148 团约1 1705.3 ha 的417 块棉田

进行分类,得出健康、有障碍和疑似有障碍三类棉田所占比例分别为36.4%、34.1%和29.5%;经过8 块条田(426.5 ha)的地面同步调查证实了这种方法的准确性,造成该区棉田质量障碍的主要因素为耕地盐渍化、不平整、土壤质地不匀。【结论】研究表明棉田多时相遥感数据进行棉田质量诊断是可行的。利用这种方法,结合不同质量棉田形成机理,能够得到棉田质量状况及影响因素精细分布的信息,为进一步进行的棉田土壤改良与生产管理采取针对性的措施提供数据支撑。

【英文摘要】【Objective】The cotton field quality was diagnosed with the remote sensing technology, and the results wouldprovide the technology support to take the active measurements for cotton industry, and would promote to increase the yield andefficiency.【Method】In terms of the determination ability of multi-temporal remote sensing data for dynamic information, and therelationship between cotton growth and cotton field quality, the multi-temporal remote sensing of the flower-boll stages data wasfused in the years form A.D. 2005 to A.D.2006. The cotton field quality conditions were divided into the three styles of the healthycotton field, handicapped cotton field and suspected cotton field with handicap.【Result】The results showed that the 0.82 ofLANDSAT-5 TM4 reflective was reasonable to divide the healthy and handicapped cotton fields with the single-time remote sensingimages in the flower-boll stages of cotton, and then 417 cotton fields about 1 1705.3 ha was classified using the method with themulti-temporal data, the results were that the three-style proposition of cotton field quality was 36.4%, 34.1% and 29.5% respectively;the validity of classification was proved by the synchronization investigation based on the eight cotton field (426.5 ha), and thetesting results of soil character and total salt indicate that the main factors of handicapped cotton field were salting, disunity ofcharacter, difference of level.【Conclusion】It was believed to diagnose the cotton field with multi-temporal remote sensing data ofcotton growth and map the information of cotton field quality on the base of the its mechanism , the precise information of cottonfield quality would provide the data support to improve the cotton soil conditions.

【题目】氮肥后移对土壤氮素供应和冬小麦氮素吸收利用的影响

【中文关键词】氮肥后移;冬小麦;土壤硝态氮;氮肥利用率

【英文关键词】postponing N application;winter wheat;soil NO3-N;N use efficiency

【中文摘要】采用田间试验研究了氮肥后移对土壤氮素供应和冬小麦氮素吸收利用的影响。结果表明,与农民习惯施氮(N 300 kg/hm2,基肥和拔节肥各占1/2)比较,氮肥后移处理(N210kg/hm2,基肥、拔节肥和孕穗肥各占1/3)在不降低小麦产量的同时,大大提高了氮肥利用率,且全生育期氮素表观损失极低。过量施用氮肥(N 300 kg/hm2)明显提高了60 cm以下土层硝态氮含量,增加了其向地下水淋溶迁移的风险。氮肥后移可提高小麦成熟期0-20cm土层硝态氮积累量,降低其在20-100cm土层的积累。基于冬小麦不同生育阶段的氮素吸收量而进行氮肥后移是可行的,氮肥后移可节省氮肥30%,是较为理想的施氮方式。

【英文摘要】Field experiment was carried out to investigate postponing N application on soil N supply, plant N uptake and utilization in winter wheat. Results obtained showed that, compared with farmers’ practice (N 300 kg/ha, 1/2 basal and 1/2 topdressing at jointing stage, respectively), postponing N application treatment (N 210kg/ha, 1/3 basal, 1/3 topdressing at jointing stage and 1/3 topdressing at booting stage, respectively) improved N use efficiency greatly, and minimized apparent N losses without grain yield losses. Excessive N application (N 300 kg/ha) increased NO3--Ncontent below 60 cm soil profile at different growth stage, which would result in high risk of NO3--Nleaching into underground water. Postponing N application increased nitrate accumulation in the soil of 0-20 cm and reduced nitrate accumulation in 20-100 cm soil profile. Therefore it was concluded that postponing N application based on plant N uptake at different growth stage is a feasible N management practice, and nitrogen fertilizer could be saved by 30% as compared with farmers’ practice.

【题目】湖北省油菜氮肥效应及推荐用量研究
【中文关键词】油菜;氮肥;产量;经济效益;氮肥推荐用量
【英文关键词】Rapeseed (Brassica napus L.) ; Nitrogen (N) ; Yield; Profit; Optimized N recommendation rates
【中文摘要】通过15个田间试验,研究湖北省油菜主产区氮肥效应和适宜用量。结果表明适量施用氮肥对油菜具有明显的增产增收效果,施氮比不施氮对照增收油菜籽402~2 759kg/hm2 ,平均增产1270kg/hm2 ,平均增产率达133. 0%;施氮纯利润平均为3 403 元/hm2 , 产投比平均达6. 00; 氮肥偏生产力和农学利用率平均分别为17. 6kg/kg N和8. 0kg/kg N。根据肥料效应方程,在当前生产条件下,油菜生产的氮肥最佳经济用量为120. 1~325. 4kg N /hm2 ,平均用量为199. 6kg N /hm2。土壤碱解氮含量与油菜氮肥最佳经济推荐用量呈极显著负相关性 (r = - 0. 773 43 3, n = 12) ,根据土壤碱解氮含量(x,单位为mg/kg)水平,湖北省目前油菜生产适宜用氮量(y,单位为kg/hm2)可通过公式y 553. 72 . 74. 699Ln (x)求得。
【英文摘要】15 field trialswere carried out to study the response to nitrogen (N) and the op timal result from N app lication were recommended for rapeseed in Hubei Province. The results showed that N app lication significantly increased both rapeseed yield and p rofit. Yield increment ranged from 402 kg/hm2 to 2 759kg/hm2 , the average increment was 1 270kg/hm2. This was a 133. 0 percent increase compared with the controlwhich had no N app lication. The average net p rofit of N app lication was 3 403Yuan /hm2 and the value cost ratio (VCR) was 6. 00. The average partial factor p roductivity of app lied N (PFPN) and agronomic N use efficiency (ANUE) were 17.6kg/kg N and 8. 0kg/kg N respectively. According to fertilizer response equations, the economical N app lication rateswere 120. 1kg/hm2 to 325. 4 kg/hm2, with the average rates 199. 6kg/hm2. The result indicated that the economical N app lication rates had significant negative correlation with soil available N level and the correlation coefficient (r) was 0. 773 4 (n = 12). The economical N app lication rates of rapeseed can be obtained through the equation y =553. 72 - 74. 699Ln (x) (y is app lied rate of N and x is soil available N content.) in Hubei Province.

【题目】马γ-干扰素单克隆抗体的制备及其特性的鉴定
【中文关键词】马γ- 干扰素; 单克隆抗体
【英文关键词】equine IFN- γ ; monoclonal antibody (McAb)
【中文摘要】将原核表达的重组马γ- 干扰素成熟蛋白(mEIFN- γ) 免疫BALB/c 小鼠(Mus musculus) , 经4 次免疫后, 取脾细胞与SP2/0 骨髓瘤细胞进行融合, 以昆虫杆状病毒表达系统获得的重组马γ- 干扰素作为检测抗原进行间接ELISA 检测, 共筛选并最终得到了12 株能稳定分泌抗体的单细胞克隆株。利用间接免疫荧光(IFA) 试验对12 株单克隆抗体进行鉴定, 结果证实所获得的12 株细胞分泌的抗体均为针对马γ- 干扰素的特异性抗体。单克隆抗体亚型鉴定结果显示, 4 株为IgG1、2 株为IgG2a、3株为IgG2b 和3 株为IgM, 而且所有单克隆抗体的轻链均为" 链。将此12 株单克隆抗体分别与用原核系统分节段表达的重组马γ- 干扰素GST-mEIFN- γ (1~84) 和GST-mEIFN- γ (80~146) 蛋白进行特异性ELISA 检测, 结果表明有7 株单克隆抗体识别GST-mEIFN- γ (1~84), 而另5 株单克隆抗体与GST-mEIFN- γ (80~146)发生反应, 说明所获得的12 株单克隆抗体至少针对2 个或2 个以上不同的抗原表位。
【英文摘要】BALB/c mice (Mus musculus) were immunized intraperitoneally with purified recombinant mEIFN- γ protein. Murine myeloma cells were fused with splenocytes of the immunized mice. An indirect ELISA with recombinant mEIFN- γ derived from faculovirus expression system as antigen was used to screen antibody-producing hybridomas. Twelve hybridomas cells could produce McAbs steadily after 3 cycles of subcloning. Additionally, all McAbs showed positive reaction to mEIFN- γ in indirect fluorescence assay (IFA) tests. Four McAbs were IgG1, two McAbs were IgG2a, three McAbs were IgG2b and three McAbs were IgM isotype,respectively. The light chains of all McAbs were " chain. Furthermore, seven McAbs showed positive reaction to GST-mEIFN- γ (1~84) protein, and the others showed positive reaction to GST-mEIFN- γ (80~146) protein in specific ELISA tests. The results

indicated that 12 McAbs could recognize two or more mEIFN- γ epitope. Therefore, these McAbs can be useful as a basis of detection methods for equine IFN- γ , monitoring immune state and investigating immunologic mechanism.

【题目】优化施肥条件下华北冬小麦/夏玉米轮作体系的土壤氨挥发
【中文关键词】冬小麦;夏玉米;优化施肥;土壤氨挥发
【英文关键词】winter wheat ; summer corn ; optimized fertilization ; soil ammonia volatilization
【中文摘要】采用密闭室间歇通气法研究优化施肥条件下华北冬小麦/夏玉米体系的土壤氨挥发损失。结果表明,肥料氮素氨挥发损失主要发生在施肥后的14 d 内, 冬小麦和夏玉米两个生长季氨挥发损失总量及其损失率均表现出随施氮量的降低而降低,玉米季氨挥发损失高于小麦季。习惯施肥小麦季和玉米季氨挥发总量是氮肥减量后移的2.28和2.03倍,而氮肥减量后移处理的小麦和玉米产量显著高于习惯施肥。氮肥后移可节省氮肥30%,是降低氨挥发损失的理想施肥方式。
【英文摘要】An enclosed intermittent vent method was adopted to determine ammonia volatilization (AV) from soil of winter wheat-summer corn rotation system in North China. Results showed that AV from soil in both winter wheat and summer corn growing season occurred mainly within 14 days after fertilization, and the cumulative AV amount from fertilizer N in winter wheat growing season was found to be less than that in summer corn growing season. Cumulative AV amounts from soil of winter wheat-summer corn rotation system were observed to be reduced with decreasing of N application rate. Total AV amounts under conventional fertilization were 2.28 and 2.03 times as high as that under optimized N fertilization, where N application rate was decreased by 30%. Compared with conventional fertilization (N 300 kg/ha), the N rate was decreased by postponing N application, but the grain yield was significantly increased. Therefore, 30% of nitrogen fertilizer could be expected to be saved by optimized fertilization, and postponing N application is a rational and practicable N fertilization method for reducing AV in winter wheat-summer corn rotation system.

【题目】优化施肥下华北冬小麦/夏玉米轮作体系农田反硝化损失与N2O排放特征
【中文关键词】冬小麦 ; 夏玉米 ;氮肥优化施用 ;反硝化 ;氧化亚氮
【英文关键词】winter wheat;summer corn;optimized N fertilization;denitrification;N2O
【中文摘要】在田间条件下,应用乙炔抑制-原状土柱培养法测定优化施肥下华北冬小麦/夏玉米轮作体系土壤反硝化和N2O的排放特征。研究表明:冬小麦和夏玉米整个生育期反硝化速率和N2O排放通量均表现出明显的季节性变化,且均与土壤水分和无机氮浓度呈显著正相关。小麦季和玉米季的反硝化损失量及N2O排放量均表现出随施肥量的降低而降低,夏玉米季的反硝化损失量和N2O排放量均高于小麦季。小麦季的反硝化损失量和N2O排放量习惯施肥处理是氮肥减量后移处理的1.62和1.67倍,玉米季分别为2.01和2.00倍。氮肥减量后移可能是通过改变土壤无机氮浓度而降低反硝化损失量和N2O排放量。
【英文摘要】A field experiment was conducted characterize denitrification and N2O emission from soil under optimized nitrogen fertilization in winter wheat-summer corn rotation system in North China using acetylene inhibition-intact soil core incubation technique. Results showed that there were significant seasonal variations of denitrification rate and N2O emission flux during winter wheat-summer corn growth periods, and positive correlations existed between inorganic nitrogen concentration (NH4+-N, NO3--N) and denitrification rate. Total denitrification losses and N2O emission amounts from soil in winter wheat-summer corn rotation system

were observed to be reduced with decreasing of N application rate, and which in winter wheat season were found to be less than those in summer corn season. Total denitrification losses and N2O emission amounts under conventional N fertilization were respectively 1.62 and 1.67 times as high as those under optimized N fertilization during winter wheat growth periods, and 2.01 and 2.00 times during summer corn growth periods, which N application rate decreased by 30% and postponing N application as compared with conventional N fertilization with an application rate of N300 kg/hm2. Therefore, postponing N application could reduce denitrification losses and N2O emission through modifying soil inorganic nitrogen concentration.

【题目】优化施氮下稻-麦轮作体系氮肥氨挥发损失研究

【中文关键词】稻麦轮作 ;氨挥发;水稻土; 优化施氮

【英文关键词】wheat-rice rotation system;ammonia volatilization ;paddy soil ;optimizing N application

【中文摘要】采用密闭室连续通气法研究了优化施氮下湖北稻-麦轮作体系农田氨挥发损失。结果表明,肥料氮素氨挥发损失量随施肥量增加而增加。施肥处理小麦季氨挥发损失量为N 11.37~17.05 kg/hm2,肥料氮氨挥发损失率为4.75%~5.43%,氨挥发峰值大约发生在施肥后的第3~5 d,肥料氨挥发过程持续7~10 d;水稻季氨挥发损失量为N 32.50~62.82 kg/hm2,肥料氮氨挥发损失率为8.24%~19.38%,氨挥发峰值大约发生在施肥后的第2~3 d,氨挥发过程持续5~ 7 d。水稻季和小麦季氨挥发之间差异显著,整个稻-麦轮作体系氨挥发主要发生在水稻季,约占整个轮作体系的74.08%~78.65%。同习惯施氮相比,基于作物阶段氮素吸收增加追肥比例和施肥次数的优化施氮能有效减少肥料氮的氨挥发损失。

【英文摘要】Abstract: A continuous airflow enclosure method was used to measure the ammonia volatilization (AV) from paddy field under the wheat-rice rotation system in Hubei Province. The results indicated that total amount of AV loss generally increased with the urea application rate. In wheat growing season, AV loss varied from N 11.37-17.05 kg/ha which accounted for 4.75 to 5.43 percent of applied N, the AV from fertilizer N lasted for 7-10 days and peak of AV occurred within 3-5 days after fertilization ; While in rice growing season, AV loss varied from N 32.50-62.82 kg/ha which ranged from 8.24 to 19.38 percent of applied N, the AV from fertilizer N lasted for 5-7 days and the peak occurred within 2-3 days after fertilizer was applied. Most of the AV loss occurred in the rice season, which ranged from 74.08% to 78.65% of total AV loss in the entire rotation system. Compared to farmer practice, optimizing N application associated with increasing ratios of dress N to base N fertilizer and times of split application based on plant N uptake at different growth stages could obviously reduce the AV loss under the rice-wheat rotation system.

【题目】不同施氮量棉花冠层高光谱特征研究
【中文关键词】棉花; 冠层; 高光谱; 氮素敏感波段; 监测
【英文关键词】Cotton ; Canopy ; High spect ral ; Nitrogen sensitive band ; Monitoring
【中文摘要】棉花精准生产对于无损、快速的植株氮含量监测技术有迫切需求。研究棉花冠层光谱特征及其与植株氮含量间的定量关系, 可以实现棉株氮素的无损监测。通过连续两年不同施氮量试验, 采集棉花冠层高光谱数据并同步测定冠层植株氮含量, 分析不同氮肥处理下棉花冠层高光谱特征及其与棉株氮含量间的关系。结果表明: 不同时期棉株氮含量与光谱反射率在可见光波段(400~700 nm) 显著负相关, 在近红外700~1 300 nm 波段显著正相关, 而在短波红外1 300~1 800 nm 波段的相关性较为复杂。冠层尺度下, 在棉花整个生育阶段, 可见光波段均为棉株氮含量的敏感波段, 而近红外波段仅在盛铃期是棉株氮含量的敏感波段; 短波红外波段仅在盛蕾期是棉株氮含量的敏感波段。利用不同时期棉株氮素敏感波段可以构建棉株氮素监测指标。
【英文摘要】Cotton production for accurate nondest ructive , rapid monitoring of plant nit rogen content there is an urgent demand. Canopy spect ral characteristics of the cotton plant and it s quantitative relationship between nit rogen content , can achieve non destructive monitoring of cot ton nit rogen. Two consecutive years by different nit rogen test , cotton canopy hyperspect ral data collection and simultaneous determination of canopy nit rogen content , analysis of different fertilizer t reatment s of cotton canopy spect ral characteristics and the relationship between nit rogen content of cotton , the results show that: nit rogen content of cotton plant in different periods and spect ral reflectance in the visible band (400~700 nm) was negatively related to the near infrared 700~1 300 nm band was a significant positive correlation , and in the short2wave inf rared 1 300~1 800 nm band correlation is more complicated. Canopy scale , the whole growth stage of cotton , the visible band are sensitive to nit rogen content in cotton band , and near2inf rared only is the cotton boll nitrogen content of the sensitive band ; shortwave infrared band only in the budding period Cotton nit rogen sensitive band. Using nit rogensensitive bands in different periods can be const ructed Cotton Cotton Nitrogen monitoring indicators.

【题目】棉花黄萎病病叶光谱特征与病情严重度的估测

【中文关键词】棉花;黄萎病;高光谱;识别模型
【英文关键词】Cotton; Verticillium wilt; Hyper spectrum; Recognition model
【中文摘要】【目的】阐明棉花黄萎病病叶光谱特征并对其病情严重度进行估测,为今后通过航空、航天遥感大面积监测棉花黄萎病提供依据。【方法】试验采用不同品种棉花黄萎病的病叶材料,在不同发病时期的病谱田和大田同步测定其光谱和发病严重度,定性和定量地分析病叶光谱反射特征、微分光谱特征差异。【结果】棉花不同品种、不同发病时期的黄萎病的病叶光谱均随发病严重度的增加而表现出有规律的变化,可见光(400~700nm)到近红外区(700~1 300 nm)波段,光谱反射率随病情加重呈现上升趋势,可见光520~680 nm 波段范围内尤为明显。当病叶严重度达到b2(25%)时,可作为病害识别的临界,对其进行早期诊断。对光谱一阶微分特征研究表明,在红边范围内(680~780 nm)处理间变幅最大,分析后发现红边斜率减小,红边位置发生了“ 蓝移 ”,表现出了病害特有的特征。试验证明:434~724 和909~1 600 nm 为棉花黄萎病病叶光谱敏感波段,建立的多个遥感估测模型均达到极显著水平。【结论】棉花黄萎病病叶光谱特征明显,建立的相应病害反演模型中利用一阶微分光谱723 nm 建立的模型精度最高,可用来定量反演棉花单叶黄萎病的发生情况。
【英文摘要】【Objective】The aims are elucidation of spectrum characteristics of cotton leaf infected by verticillium wilt and estimation of its SL (severity level) and providing theoretic foundation for further monitoring cotton verticillium wilt at large scale using airborne and airspace remote sensing. 【Method】The spectrum reflectance of cotton single leaf infected by verticillium wilt was measured in cotton disease nursery and field in different growth phases, in the meanwhile, SL of single leaf infected by verticillium wilt was investigated. The method of first derivative spectrum was used to estimate accurately the disease of cottonsingle leaves infected by compared with the reflectance spectrum of different single leaves infected by verticillium wilt. 【Result】 The results indicated that spectrum characteristics of cotton leaf infected by verticillium wilt had better regularity with the increaseof SL in different periods and varieties. Spectrum reflectance increased significantly in visible light region (400-700 nm) and near-infrared region (700-1 300 nm) with the increase of the SL, and especially significant in visible light regions (525-680 nm).When SL attained b2 (25%), cotton leaf infected by verticillium wilt could be used as a threshold and diagnose index in early period. There were evident different characteristics of first derivative spectra in these diseased leaves, it changed significantly inred edge ranges (680-780 nm) in different SL, red edge of first derivative spectrum swing decreased, and red edge position equal moved to the blue. The results indicated that 434-724 nm and 909-1 600 nm should be selected out as sensitive bands region to SL of single leaf. Some inversion models for estimating cotton leaf SL of verticillium wilt all reached the best significant level.【Conclusion】The results suggested that different spectrum characteristics of cotton leaf infected by verticillium wilt were marked. The model in which the first derivative spectra at 723 nm could invert accurately the cotton leaf SL, and it may be used to forecast the position of cotton leaf infected by verticillium wilt quantitatively.

【题目】微生物生产共轭亚油酸的研究进展
【中文关键词】共轭亚油酸 微生物 气相色谱法
【英文关键词】Conjugated linoleic acid; microbe; gas chromatography;
【中文摘要】共轭亚油酸(CLA)是一种具有多种生理活性的天然脂肪酸,具有抗癌、抗粥状动脉硬化、提高机体免疫力等作用。就CLA的微生物合成、分析方法等方面,对国内外的研究进行了综述。乳酸菌、丙酸菌及丁酸弧菌可以特异性地转化合成CLA,气相色谱法能够对CLA的各种异构体进行分析。
【英文摘要】Conjugated linoleic acid (CLA) is a naturally occurring fatty acid found in animal and dairy fats that exhibits a number of health benefits. It has been proved to reduce mutagenesis, carcinogenesis and body fat. The advances in CLA production by microbial fermentation and the analysis methods were reviewed. The Lactobacillus spp., Butyrivibrio spp. and Propionibacterium spp. appear to produce CLA effectively. The most simple and efficient analytical method is gas chromatography.

【题目】离子注入诱变植物乳杆菌选育CLA高产突变株的研究
【中文关键词】离子注入; 诱变; 共轭亚油酸(CLA); 高产菌株;
【英文关键词】implantation; mutation; CLA; high yield strain;
【中文摘要】以A6-1为出发菌株,采用N+离子注入的方法进行诱变处理,注入能量为50keV,注入剂量为1×1013、3×1013、5×1013、8×1013、10×1013、30×1013、50×1013、80×1013、100×1013ion/cm2,真空度为10-3Pa。结果显示,菌体的存活率随离子注入剂量的增加呈"马鞍型"曲线,"鞍脊"出现在30×1013ions/cm2~50×1013ions/cm2之间,此时菌体的存活率在20%~35%之间。综合考虑存活率、总突变率、正突变率和突变幅度等因素,推荐30×1013ions/cm2作为离子注入植物乳杆菌的适宜诱变剂量。从所有的注入处理中挑选CLA转化能力提高了50%以上的突变株进行传代稳定性试验,发现F菌株经8次传代后产CLA的稳定性最好。该突变株各代的产量平均为162.5μg/ml,比出发菌株提高了69.87%,将此突变菌株命名为A6-1F。
【英文摘要】The initial lactic acid bacteria strain A6-1 was treated by N~ + ions implantation of 50 keV with doses of 1×10~ 13 , 3×10~ 13 , 5×10~ 13 , 8×10~ 13 , 10×10~ 13 , 30×10~ 13 , 50×10~ 13 , 80×10~ 13 , and 100×10~ 13 ions/cm~2. The survival curve showed a saddle model, and the high survival rate was 20%~35% from the treatments of 30×10~ 13 ions/cm~2 and 50×10~ 13 ions/cm~2 implantation. Considering the survival rate, positive mutation and range of mutation rate, N~ + ions implantation of 30×10~ 13 ions/cm~2 wa...

【题目】二倍体小麦种间气孔与光合特征差异
【中文关键词】二倍体;小麦;光合特性;气孔特征;基因型
【英文关键词】dip loidy; wheat; photosynthetic and stomatal characteristics; genotype
【中文摘要】选取5个二倍体小麦种为实验材料,利用数码图像显微镜处理系统、气体交换参数测定系统和叶绿素荧光动力学参数测定系统,研究了二倍体小麦种间气孔特征与光合特性的差异。结果表明,二倍体小麦种间气孔和光合特征存在较大的差异:其中S基因型(Ae. Sect. S itopsis)的气孔长度、周长和面积最大,而其宽度、密度和气孔指数却是最小的; D基因型(Ae. Tauschii)的气孔宽度、密度和气孔指数最大,而其长度、周长和面积却是最小的; D基因型(Ae. Tauschii)的净光合速率最大,而S基因型(Ae. Sect. S itopsis)的净光合速率最小。气孔周长与气孔面积呈显著正相关关系,而气孔密度与气孔面积呈显著负相关关系。二倍体小麦的净光合速率与气孔导度呈显著正相关关系,同时气孔限制值的变化趋势与细胞间隙CO2浓度的变化趋势相反,说明二倍体小麦的光合能力主要受气孔限制。在几个种中,乌拉尔图小麦(T. urartu)具有较高的净光合速率和气孔导度,同时细胞间隙CO2浓度最低,气孔限制值最大,在光合能力和耐光抑制方面有较明显的优势;而野生一粒小麦(T. boeoticum)则在光合能力和耐光抑制方面不存在优势。同时,乌拉尔图小麦(T. urartu)的叶绿素含量最高,而野生一粒小麦(T. boeoticum)最低,叶绿素含量可能也是造成二倍体种间光合能力差异的原因之一。
【英文摘要】Five dip loidy wheat species were chosen as research materials in this research to determine the differences in stomatal and photosynthetic characteristics. The results of the study showed that specieswith S genomes (Ae. Sect. S itopsis) had the largest values in stomatal length, girth and area, and the lowest values in stomatal width, density and index. On the contrary, the specieswith D genomes (Ae. Tauschii) had the highest values in stomatalwidth, density and index, and the lowest values in stomatal length, girth and area. The net photosynthetic rate (Pn) and stomatal conductance (Gs) were higher in species with D genomes (Ae. Tauschii) and lower in species with S genomes (Ae. Sect. S itopsis) , respectively. The net photosynthetic rate showed significant correlation with stomatal conductivity, and the changes of intercellular CO2 content showed the opposite trend to the changes of stomata limitation, indicating that the stomatal conductivity is the main factor limiting the photosynthetic rate. T. urartu with higher net photosynthetic ability showed higher values in stomatal conductivity and stomata limitation, and lower values in intercellular CO2 content. However, T. boeoticum showed the opposite trend. T. urartu had higher values in chlorophyll content of flag leaf area while T. boeoticum had lower values, indicating that higher chlorophyll contentmight be another reason for its higher photosynthetic ability among dip loidy wheat species.

【题目】小麦进化过程中叶片气孔和光合特征演变趋势
【中文关键词】小麦;进化;气孔特征;基因型
【英文关键词】evolution; genotype; stomatal characteristics; wheat
【中文摘要】根据小麦属内种间的进化关系选取21种小麦品种为实验材料,研究了小麦进化过程中气孔特征和光合特征的演变趋势。结果表明,无论是A,B,D染色体组还是A, G染色体组,气孔长度、宽度、周长、面积均随倍性水平的升高而呈增大趋势,而气孔指数无显著变化;A,B,D染色体组气孔密度随倍性升高呈减少趋势。二倍体小麦的Pn值最高,六倍体小麦的Fv/Fm 值较高,二倍体小麦叶片叶绿素含量显著高于四倍体和六倍体小麦。不同倍性小麦的净光合速率与气孔导度间均存在

极显著相关关系,表明气孔传导力是小麦光合能力的主要限制因 素之一。气孔导度与单一气孔特征之间无显著相关关系。A,B,D染色体组不同倍性小麦叶片气孔密度差异显著,其大小顺序为二倍体>四倍体>六倍体; A, B,D染色体组不同倍体小麦叶片的气孔长度、宽度、周长、面积差异显著,顺序均为六倍体>四倍体>二倍体,气孔密度降低可能是A,B,D染色体组六倍体小麦光合能力降低的原因。随着倍性的升高,小麦的抵抗光抑制能力越强,因此光化学能转换效率可能不是小麦进化过程中光合能力变化的原因。A,B,D染色体组中二倍体的叶绿素含量显著大于四倍体和六倍体,而A, G染色体组中倍体间叶绿素含量差异不显著,说明叶绿素的降低可能是A,B,D染色体组六倍体光合能力降低的原因之一。

【英文摘要】According to the evolution relationship s among Triticum varieties, 21 wheat varieties were chosen as research materials in this experiment to determine the evolutional trends of stomatal and photosynthetic characteristics. The results showed that as p loidy increase, the stomatal length, width, girth and area were found to increase. The stomatal densitywas found to decrease in A,B,D genomes; however, no differenceswere found in stomatal indices among p loidies indicating that the stomata became larger but were less in evolution p rogress. The Dip loidy had the highest Pn, which was less in Hetrap loidy, and was the least in Hexap loidy. On the contrary, the Hexap loidy had the highest values in Fv /Fm. The Dip loidy had the highest chlorophyll content. The net photosynthetic rate had significant correlationship with stomatal conductivity, however, no significant relationship was found among stomatal conductivity and any stomatal characteristics, indicating that the stomatal conductivity is one of the factors limited the photosynthetic rate while the single stamatal characteristics is not the reason that inducing the photosynthetic rate change. The stomatal density showed significant differences among ploidy materials in A,B,D genomes and the trend of genotype was in order of 2n > 4n > 6n; the stomatal length, width, girth and area showed significant differences among p loidy materials and the trends of genotype was in the order 6n > 4n > 2n. The results indicate that the low density might induce the low conductivity and low photosynthetic ability in Hexap loidy. Furthermore, the Dip loidy had higher values in chlorophyll content of flag leaf area among ploidy materials in A, B, and D genomes, indicating that higher chlorophyll content might be a reason for higher photosynthetic ability in Dip loidy wheat species.

【题目】保水剂重复吸水性能的比较研究

【中文关键词】保水剂; 重复吸水性; 吸水倍率; 吸水形态;
【英文关键词】super-absorbent polymer; repeated water-absorbing capacity; water absorbency; water-absorbing status;
【中文摘要】通过模拟试验,比较研究了4种高分子树脂类保水剂在不同介质中的重复吸水性能。结果表明:相比蒸馏水,在自来水和土壤介质中,保水剂的初次吸水倍率和重复使用性有不同程度的降低;水质对保水剂初次吸水能力降低的效应大于土壤介质;保水剂用量的增加对其吸水能力有明显的促进效应,但随着重复使用次数的增加,促进效应递减。初步分析认为,4种保水剂中,日本触媒(JP)的持续使用性最好,巴斯夫(BF)和沃特(WT)次之,白金子(BJ)最差。保水剂的使用寿命与其自身吸水形态、吸水稳定性和凝胶结构有关。
【英文摘要】In different solutions,the repeated water-absorbing capacities of four types of super-absorbent polymers (SAPs) with organic macromolecules were comparatively studied by simulated experiments. The result showed that in tap water and soil solution,the original water absorbency and repeated water-absorbing capacity of SAPs were reduced relative to those in distilled water. The reduced effect of water quality on the original water absorbency of SAP was higher than that of soil solution. The water-absorbing abilities of SAPs would be increased in higher concentrations, but the increase were reduced with the repeated utilization. It was preliminarily considered that among four types of SAPs labeled BF, JP, BJ and WT, JPconduct the best performance in sustaining use, BF and WT took the second place, while BJ was the worst. The sustaining effects of SAPs varied according to their water-absorbing status, stability and gel structure.

【题目】病害胁迫下棉花叶片色素含量高光谱遥感估测研究
【中文关键词】棉花; 病害胁迫; 高光谱; 色素含量; 估测模型
【英文关键词】Cotton; Disease stress; Hyperspectra; Pigment contents; Estimation models
【中文摘要】通过小区和大田同步调查棉花黄萎病, 在不同生育期测定病叶光谱及其色素含量。将病叶光谱反射率、一阶微分及相应的特征参数与色素含量进行相关分析, 建立病叶色素含量估测模型并检验。结果表明: 病叶叶绿素a, b 及a+ b 含量可见光反射率、与一阶微分光谱在蓝边、黄边和红边处与除红边振幅(Dr)外的其他光谱特征参数间均达极显著相关。转换叶绿素吸收反射指数(T CARI) 和新建归一化植被指数(NDVI[702, 758]) 对叶绿素a, b 及a+ b 含量的估测精度最高, 相对误差均小于11 3%。考虑到NDVI [702,758] 建立的模型更实用, 可做为病叶叶绿素a, b 和a+ b 含量的最佳估测模型。研究结果对高光谱信息定量估测病害棉叶色素含量, 对利用高光谱监测棉花长势及病害影响评价均具有较高的实用价值。
【英文摘要】The spectrum reflectance and pigment contents of co tton leaves inf ected w ith Ver ticillium w ilt wer e measured in cotton disease nur ser y and field in differ ent g rowth phases, and sever ity level of Vert icillium w ilt w as inv est igat ed. T he cor relation between pigment co nt ents o f co tton leaves w ith Ver ticillium wilt and spectra reflectance, the fir st derivativ e of reflectance and spectral character istic parameters w ere analy zed respectively. T he estimat ion models about leaves pigment contents of disease cottonwer e established and tested. The results indicated that the correlations were best significant between chloro phy ll a, b and a+ b contents of leaves and spectral reflectance invisible wave bands, the first derivative spectrum at the wav elength regions of blueedge, yellow edge and red edge, and all spectral char acter istic parameter s (excluding r ed edge swing Dr) . The models of tr ansformed chlor ophyll absorptio n in reflectance index (TCAR) and the new model of normalized differ ence vegetat ion index (NDVI[702, 758]) had best estimated pr ecision, and the relative err ors w ere in aver age w ithin 11 3%. Giv en that the model o f NDVI[702, 758] is ver y simple and practical, it w as commended as a best model to estimate chlor ophyll a, b and a+ b co ntents of disease cotton. T his study show s that leav es hyperspectr a data can be used to estimat e the pigment contents o f cott on leaves quantitatively. This conclusion has also g reat pr act ice and applicatio n value for mo nitor ing the growth state and disease influence evaluation on cotton by using hyper spectral remot e sensing.

【题目】基于机器视觉的棉花群体叶绿素监测
【中文关键词】棉花群体; 机器视觉; 叶绿素; RGB; HIS; 图像覆盖度
【英文关键词】Cotton population; Machine vision; Chlorophyll content; RGB; HIS; Percent ground cover of image
【中文摘要】研究了利用机器视觉技术快速获取棉花群体叶绿素信息的方法, 以期获得预测性高的颜色特征参数。结果表明, RGB 颜色系统的G- R、(G - R)P(G+ R)、r 与g 的组合值和棉花功能叶叶绿素含量、群体绿色指数呈极显著相关,而且拟合度较高; HIS 颜色系统的Hue 值和棉花功能叶叶绿素含量、群体绿色指数之间也极显著相关。对筛选出的两组模型进行检验, 预测精度在84107%~ 93104%之间, 推荐预测精度最高的G - R 参数作为获取棉花群体叶绿素信息的最佳颜色指标。G- R 预测叶绿素含量和群体绿色指数的模型分别为y= - 113008+ 01 2125(G - R) - 010038(G - R) 2(R2 = 01 8669* *) 和y= - 019726+ 011227(G - R) - 010016(G - R) 2(R2 = 017487**) 。
【英文摘要】Machine vision have been successful applied tomonitor crop morphological and physiological status, such as leaf area index, nitrogen content, chlorophyll content and so on. The trials was conducted from 2004 to 2006 at the experiment station of Shehezi University located in Shihezi, Xingjiang Province to monitor cotton canopy chlorophyll information under field conditions by processing cotton populat ion digital image, which is one measurement method with advantages of convenient, real time, quick and nondestructive. In order to obtain uniform cotton canopy digital images, the assistant device was used. In the field, the cotton canopy images were taken by a digital photo camera (OLYMPUS) at the squaring stage, early flowering stage, full flowering stage, peak boll stage and opening boll stage, respectively. The color characteristics of cotton population images were extracted with the image processing software developed by our lab. The correlation between color parameters of cotton canopy digital image and chlorophyll content of cotton functional leaf was analyzed. The results showed that the correlation of the color characteristics such as G - R, (G- R)P(G + R) , rPg, gPr , and g- r in the RGB color system, and Hue in the HIS color system with chlorophyll content of functional leaf was significant at P< 01011 There was also a significant correlation between the population greenness index (PGI) and colorparameter. The chlorophyll predicted modelswere established. The tested results about the regression models suggested that G- R was the best parameter to monitor cotton population chlorophyll information. The relative error of chlorophyll content and PGI estimations was about 6196% and 11160%, and RMSE was 011138 and 0116431 The chlorophyll contentpredicted model was y= - 113008+ 012125(G- R) - 010038(G- R) 2(R2= 018669**) , and PGI predict model was y = - 019726+ 011227(G- R) - 010016(G- R) 2(R2= 017487* *) .

【题目】基于高光谱反射率的冬小麦生长后期氮素丰度监测研究
【中文关键词】氮素丰度(NR);反射率差值(ΔR);冬小麦;模型;监测
【英文关键词】Nitrogen richness(NR);Reflectance difference(ΔR);Winter wheat;Model;Monitoring
【中文摘要】生物量、氮素含量和LAI(leaf area index)是生态系统中表征作物长势最重要的参数,叶干重、叶片氮素含量和LAI实时动态监测对小麦氮素营养诊断和管理调控具有重要意义。选用了五个小麦品种和四个氮素水平的比较实验,研究不同处理冬小麦抽穗到黄熟期氮素丰度(NR)与光谱反射率差值(ΔR)的关系,建立冬小麦后期氮素丰度监测模型。结果表明,不同品种的冬小麦冠层叶片氮素丰度随生育进程推进而增加,不同氮素处理氮素丰度大小为N0>N3>N1>N2,光谱参量TCARI和VD672与氮素丰度的相关性最好,相关系数(r)分别为0.870和0.855,其建立氮素丰度估测模型的决定系数分别为0.757和0.731,预测准确率达84.56%和80.13%。光谱参数TCARI和VD672可以有效地评价小麦后期冠层叶片氮素状况,可以对氮素丰度进行准确可靠的监测。
【英文摘要】Biomass,leaf area index(LAI)and nitrogen status are important parameters for indicating crop growth potential and photosynthetic productivity in wheat.Nondestructive,quick assessment of leaf dry weight,LAI and nitrogen content is necessary for

nitrogen nutrition diagnosis and cultural regulation in wheat production.In order to establish the monitoring model of nitrogen richness in winter wheat of growth anaphase,studying the relationship between the nitrogen richness(NR)containing nitrogen density,LAI and leaf dry weight and the difference of hyperspectral reflectance rates(Δ R),we conducted a comparableexperiment with five winter wheat varieties under nitrogen application level of 0,100,200and 400kg · N · ha-1.The resultsindicated the NRs of the different varieties of winter wheat leaves increased with increasing growth stage while in the different nitrogen levels it was sequenced as:N0>N3>N1>N2.Twelve vegetation indices were compared with corresponding NR.The NR had significantly negative correlation to TCARI and VD672in those vegetation indices,and their correlations(r)arrived at0.870and 0.855,respectively.The coefficients of determination(R2)of two models were 0.757and 0.731by erecting model with the two indexes and NR.Root mean square error(RMSE),relative error(RE)and determination coefficient betweenmeasured and estimated NR were employed to test the model reliability and predicting accuracy.Accuracy rates of the models based on TCARI and VD672achieved 84.56%and 80.13%.The overall results suggested that leaf nitrogen status of growth anaphase in winter wheat has stable relationships with some vegetation indexes,especially index of TCARI and VD672.

【题目】动物季节性繁殖分子调控机理研究进展
【中文关键词】季节性繁殖,分子调控,褪黑激素,Kiss1,促甲状腺素
【英文关键词】seasonal reproduction; molecular regulation; melatonin; Kiss1; thyroid-stimulating hormone
【中文摘要】动物季节性发情繁殖涉及下丘脑-垂体-性腺轴系统复杂的神经内分泌过程,并受光照周期等环境因素的影响。褪黑激素则作为光周期信号分子调控动物季节性繁殖活动。近年来研究发现,对GnRH分泌有重要影响的Kiss1/GPR54系统既受褪黑激素的调控又受到性腺类固醇激素反馈调节,Kiss1/GPR54系统很可能是调控动物季节性繁殖的关键因子;同时动物季节性繁殖很可能还存在一条涉及TSH-DIO2/DIO3系统的逆向调控通路,该系统同样显著影响GnRH合成释放并受褪黑激素调控。文章就褪黑激素中心信号,特别是Kiss1/GPR54和TSH-DIO2/DIO3系统对繁殖季节性调控的最新研究进展进行综述。
【英文摘要】Animal seasonal reproduction involves complicated neuroendocrine processes of the hypothalamo-pituitary-gonadal axis. It is dominantly regulated by photoperiod, a crucial environmental cue. Melatonin, as internal photoperiod signal, regulates seasonal reproduction of animals. In recent years, it has been found that Kiss1/GPR54 system,which may influence GnRH secretion evidently, is regulated by both melatonin and feedback action of gonadal steroidhormones. Consequently, Kiss1/GPR54 system may play a key role in seasonal reproduction. Additionally, there exists another potential retrograde control pathway of seasonal breeding, which involves TSH-DIO2/DIO3 system. TSH-DIO2/DIO3 system affects synthesis and secretion of GnRH and is regulated by melatonin, as well as Kiss1/GPR54 system. In this article, melatonin signal, especially the research advances of Kiss1/GPR54 system and TSH-DIO2/DIO3 system werereviewed.

【中文关键词】镉;石灰;水稻;稻田;海泡石
【英文关键词】Cadmium, lime, rice, paddy soil, sepiolite
【中文摘要】本研究旨在评估后水稻应用土壤改良剂石灰(的Ca(OH)2)和海泡石萃取镉(Cd)和镉的吸收。在镉污染的稻田进行了一个水稻(Oryza sativa)栽培试验。采用石灰,海泡石,以及两者的混合物作为土壤改良剂,土壤pH值呈显着增加(P <0.05)后,和硝酸钠,氯化钙,和DTPA提取土壤中的镉,减少了61-100%52-98%,12-15%,分别为(P <0.05)。交换镉量显着减少(P <0.05)显示,在所有的治疗,我们发现在碳酸盐结合形式的比例增加,铁/锰氧化物的约束,残留在土壤中的镉,作为测量连续提取法。粮食或稻草量既没有显着影响任何实验修正案,而大米中镉的吸收,显着降低所有治疗(P <0.05)。结果表明没有任何优势,在应用比单独适用于固定在土壤中的镉海泡石海泡石和石灰的混合物。用石灰混合使用的海泡石,海泡石或超过有效地固定在土壤中的镉,单独使用石灰。因此,我们建议海泡石修复镉污染的水稻土作为土壤改良剂
【英文摘要】This study aimed to assess the extractability of cadmium (Cd) and Cd uptake by rice after applying soil amendments of lime (Ca(OH)2) and sepiolite. A rice (Oryza sativa) cultivation experiment was conducted in a Cd-contaminated paddy field. After applying lime, sepiolite, and a mixture of the two as soil amendments, soil pH showed a significant increase (p<0.05),and Cd in soil extracted with NaNO3, CaCl2, and DTPA, was reduced by 61 100%, 52 98%, and 12 15%, respectively (p<0.05). The amount of exchangeable Cd showed a significant decrease in all treatments (p<0.05), and we found increases in the proportion of forms of carbonate-bound, Fe/Mn oxide-bound, and residual Cd in the soils, as measured by a sequential extraction method. The grain or rice straw biomass was neither significantly influenced by any amendment in the experiment, while the uptake of Cd by rice significantly decreased in all treatments (p<0.05). The results reveal no advantage in applying a mixture of sepiolite and lime compared with applying sepiolite alone in immobilizing Cd in the soil. The use of sepiolite or sepiolite mixed with lime was more effective than the use of lime alone in the immobilization of Cd in the soil. We therefore recommend sepiolite as a soil amendment to remediate Cd-contaminated paddy soil.

【题目】石灰和海泡石对镉污染土壤的修复效应与机理研究
【中文关键词】石灰; 海泡石; 土壤镉污染修复; 水稻; 萝卜
【英文关键词】lime; sepiolite; remediation of Cd contaminated soil; rice; radish
【中文摘要】研究了稻作和旱作两种种植制度下,施用石灰、海泡石及两种改良剂配施对镉污染土壤pH值、土壤镉形态变化及作物对镉的吸收等的影响。结果表明,施用改良剂使稻作条件下的土壤pH提高0.3~1.8个单位,旱作条件下土壤pH提高幅度为0.3~2.0个单位;两种种植制度下,作物有效性较高的酸提取态镉含量显著减少,而作物有效性较低的可还原态和残渣态镉含量显著增加,进而引起了水稻和萝卜对镉的吸收量降低。其中以石灰和海泡石配施的效果最好,单施海泡石次之,单施石灰效果最差,且各处理均随改良剂用量的增加效果增强。虽然,施用改良剂可以有效降低土壤中镉的作物有效性,但对水稻产量和生物量及镉在水稻和萝卜两种作物地上部分的分配规律均没有明显的影响。

【英文摘要】The effects of lime,sepiolite and lime in combination with sepiolite on soil pH,speciation of cadmium in soil and uptake of Cd by rice and radish by field experiments in a contaminated paddy soil and an arable soil,respecitively.The results indicated: Compared with the CK treatment,amendments significantly increased soil pH by 0.3 to 1.8 units in the paddy soil and by 0.3 to 2.0 units in the arable soil.The percents of acid extractable Cd in soil were significantly decreased,whilst the reducible Cd and residual Cd were significantly increased in both soils.The increasing of soil pH and redistribution of Cd speciation in soils caused the decrease of uptake of Cd by both crops.The efficiencies of different amendments in increasing soil pH and immobilizing Cd in soils was follow the order as: lime in combination with sepiolite > sepiolite > lime,and it was becoming better as long as the applied amount of amendments increased.However,the application of amendments decreased the bioavailability of Cd in soils,no increase of the productivity and biomass of rice was observed and the distribution of Cd in over ground parts of neither rice nor radish was affected.

【题目】不同轮作制度下红壤旱地水分时空变化对稻草覆盖的响应
【中文关键词】红壤旱地; 轮作制度; 稻草覆盖; 土壤水分
【英文关键词】upland in red soil hilly region; cropping rotation system; rice straw mulching; soil moisture
【中文摘要】依托湖南桃源红壤旱地轮作施肥长期定位试验,研究了不同轮作制度下(甘薯-油菜,绿豆-蚕豆)两种类型旱地(平旱地、坡旱地)土壤水分时空变化对稻草覆盖的响应差异。结果表明,随着土层的加深,红壤旱地土壤水分含量增加,稳定性增强,其中坡旱地的含水量和变异幅度均高于平旱地(尤其在0-20 cm,20-40 cm土层);稻草覆盖后,同一轮作制度坡、平两种类型旱地0-20 cm表土层水分含量均有增加,平旱地效果更为明显,20-40 cm,40-60 cm土层土壤含水量则明显下降;同在坡旱地覆盖稻草,绿豆-蚕豆轮作地土壤绝对含水量明显增加(0-20 cm,40-60 cm效果更加明显),而甘薯-油菜轮作明显提高了0-20 cm表土层水分含量,吸收消耗了20-40 cm,40-60 cm深层相对丰裕的水分;夏季持续高温干旱时期各处理0-20 cm表土层水分含量均呈持续下降趋势,与休闲地相比,除平旱地甘薯-油菜+稻草覆盖外,其它处理土壤含水量均有不同程度的增加,表明稻草覆盖是亚热带红壤旱地季节性干旱防御的有效措施。
【英文摘要】Based on the long-term field experiment of cropping rotation and fertilization in Taoyuan county,Hunan,the paper reported the response of spatial and temporal variation of soil moisture to rice straw mulching in different cropping rotation systems(i.e.,sweet potato-rape cropping rotation and horsebean-mung bean cropping rotation) in different upland types(mellowing upland and slope upland).The results showed that the content and stability of soil water in red upland increased with soil depth;moreover,the content and variation range of soil water was larger in slope upland especially in the layer of 0-20 cm and 20-40 cm than that in mellowing upland.After rice straw mulching,the content of soil water in the 0-20 cm layer under the same rotation system in two uplands increased to some degree,and it did more obviously in mellowing upland.The content of soil water in the layers of 20-40 cm and 40-60 cm decreased clearly due to more roots distributed and strong transpiration,which indicated the efficiency of water was improved.In the slope upland under rice straw mulching,the soil moisture increased visibly in the horsebean-mung bean cropping rotation especially in the layers of 0-20 cm and 40-60 cm,while that in 0-20 cm layer in sweet potato-rape cropping rotation gained greatly owe to having depleted comparative rich water from the layers of 20-40 cm and 40-60 cm.During the period of drought with high temperature in summer,the content of soil water in 0-20 cm in all the treatments declined.Compared with the corresponding fallow,the soil moisture increased to some extent except the sweet potato and rape cropping rotation in mellowing upland,which demonstrated that straw mulching was an effective measure to withstand seasonal drought in hilly red soil region.

【题目】湖南省主要蔬菜土壤的肥力特征与蔬菜硝酸盐污染现状研究
【中文关键词】蔬菜基地; 土壤肥力特征; 产品硝酸盐污染; 湖南省
【英文关键词】vegetable production bases; soil fertility properties; nitrate pollution; Hunan Province
【中文摘要】通过典型区域调研,全面查明了湖南省主要蔬菜基地的主要肥力特征与环境硝酸盐的污染现状,阐明了土壤硝态氮和地下水硝酸盐的分布特点与成因,发现菜园土硝态氮的含量主要与距施氮时间长短密切相关;系统分析各类蔬菜硝酸盐的污染现状及其分布特征,探明了蔬菜硝酸盐的污染与其施氮水平和生态环境等的关系及其发展趋势,指出叶菜类的硝酸盐污染最为严重,是蔬菜硝酸盐污染防控研究的重点。
【英文摘要】With field survey in typical region, the soil fertility properties of the main vegetable production bases and nitrate pollution status in the environment were found out. The distribution of soil nitrate and grounder water nitrate, together with the reasons of their changing were revealed. Nitrate content in vegetable garden soil was mainly determined by the time since nitrogen fertilizers application last time. The nitrate pollution status and regional distribution characteristics of the main vegetable products were analyzed systematically. The changing trend of the vegetable nitrate pollution and the correlations between the nitrate pollution of vegetable and the amount of applied nitrogen fertilizer, growing conditions were also investigated and revealed. It is pointed out that the nitrate pollution of leafy vegetable were most serious and should be paid more attention.

【题目】稻草易地还土对丘陵红壤团聚体碳氮分布的影响
【中文关键词】水稳定性团聚体; 有机碳; 全氮; 分布; 丘陵红壤
【英文关键词】water-stable aggregates; organic C; total N; distributions; hilly red soils
【中文摘要】利用新垦坡地、熟化旱地两个定位试验的典型处理(不施肥、化肥、稻草+NP),研究稻草易地还土对丘陵红壤水稳定性大团聚体(>0.25 mm)内碳、氮分布的影响。结果表明,稻草易地还土提高了土壤大团聚体含量;团聚体粒径越大,有机碳和全氮的含量越高;与对照相比,稻草易地还土提高大团聚体内的有机碳含量10.1%~78.5%、全氮含量9.4%~63.6%(p<0.05),同时也显著提高二者在较大粒径(1~2 mm,2~5 mm)团聚体内的分配比例;与化肥处理相比,稻草易地还土提高>0.5 mm各粒级大团聚体内的有机碳含量6.5%~46.1%,也提高了0.5~1 mm,1~2 mm,2~5 mm团聚体内的全氮含量8.7%~16.1%(p<0.05)。水稳定性大团聚体对土壤碳、氮具有强富集和物理保护作用;稻草易地还土提高水稳定性大团聚体内碳、氮的含量和分配比例,是改良丘陵红壤结构、提高并协调土壤肥力的有效保育措施。
【英文摘要】Two experiments in newly-culltivated slope land and upland with three treatments,Nil(CK),NPK(NPK),Straw+NP(SNP),were selected to analyze the effects of ex situ rice straw incorporation on the distribution of organic carbon and nitrogen in water-stable macro-aggregates of hilly red soils.Results showed that,ex situ incorporation of straw increased water-stable macro-aggregates and the concentrations of organic carbon and nitrogen increased with increase of water-stable aggregate-size;ex situ incorporation of straw significantly increased the concentrations of organic carbon and nitrogen in water-stable macro-aggregates by 10.1%~78.5% and 9.4%~63.6%(p<0.05),and also increased the ratios of organic carbon and nitrogen in water-stable macro-aggregates(2~5 mm or 1~2 mm) to soil;Compared to inorganic fertilizer,ex situ incorporation of straw significantly increased the concentrations of organic carbon by 6.5%~46.1% in 0.5~1 mm,1~2 mm,2~5 mm,>5 mm water-stable aggregates and nitrogen by 8.7%~16.1% in 0.5~1 mm,1~2 mm,2~5 mm water-stable aggregates.Water-stable macro-aggregates have high potential to accumulate organic C and N,and ex situ incorporation of straw increased the concentrations and distributions of organic C and total N in water-stable macro-aggregates,which increased the ability of regulating soil fertility.Therefore,ex situ incorporation of straw was effective measure to improve soil structure,enhance and regulate soil fertility in hilly red soils.

【题目】Changes of local agricultural landscape patterns induced by land consolidation in hilly and mountainous Southwestern China
【中文关键词】无
【英文关键词】land consolidation; land use; local agricultural landscape pattern; landscape patch; hilly and mountainous in Southwestern China
【中文摘要】无
【英文摘要】Land consolidation (LC), as a type of human disturbance, improves land production efficiency and changes landscape distribution through land parcel reallocation. The objective of this study was to comparatively analyze the changes of landscape patches before and after a land consolidation project (LCP) and the effects of land levelling, irrigation and drainage work and road engineering on the landscape structure. FRAGSTAT3.3 and buffer zone analysis were used to investigate those changes. The results suggest that the heterogeneity of landscape depressed, and tended to simplification after LC. Dry land was the most highly variable land use pattern, and the change of forestland was least due to its locations at a gradient larger than 25 ° . LC resulted in a more rational use of land, and could be an important step in promoting rural development in depressed and fragmented agricultural areas through unused land exploitation, small-patch combination, irrigation and water conservancy, and road construction. Land levelling leveled off the gradient field surface and decreased the slope. The fragmentized patches were much more incorporated with increasing slope. On the other hand, the ridge of a field became longer so that the length of field surf ace and area of patch were increased. Land levelling regulated, simplified and combined patches, so that the complexity degree was reduced. It is found that the buffer distance of 35 m was a turning point of human disturbance by irrigation and drainage systems, and patches presented flaky distribution when the buffer distance was smaller than 35 m. Meanwhile, the distance range between 25 m to 50 m was an impressible area for road engineering, which was sensitive to human actions, and the changes of all landscape metrics were larger than those in other buffer zones. In general, LC not only reallocated fragmented parcels, but als o improved agricultural conditions.

【题目】保护性耕作对丘陵区水稻土团聚体稳定性的影响
【中文关键词】团聚体,稳定性,有机碳,保护性耕作,水稻土
【英文关键词】aggregates, stability, organic carbon, conservation tillage, paddy soil
【中文摘要】长期保护性耕作通过增加土壤有机碳而成为稻田土壤结构改良的一项有效措施,而保护性耕作对土壤团聚体稳定机制的影响尚未完全清楚。本文供试土样采自耕作制定位试验水旱轮作、冬水免耕、垄作免耕和厢作免耕耕层(0~20 cm)土壤,土样经过糊化作用、湿润作用和再次糊化作用等预处理,用以阐明稻田土壤团聚体的破碎机制。研究结果表明:糊化作用和湿润作用后紫色水稻土团聚体稳定性差异不明显,而保护性耕作显著影响团聚体的稳定性。糊化作用后团聚体水稳性强弱顺序为:垄作免耕>厢作免耕>冬水免耕>水旱轮作,湿润作用后团聚体水稳性强弱顺序为:厢作免耕>垄作免耕>冬水免耕>水旱轮作。糊化作用下团聚体稳定性与有机碳浓度相关性不显著(r=0.432,p>0.05),湿润作用下团聚体稳定性与有机碳浓度呈极显著正相关(r=0.626,p<0.01)。因此,研究结果说明保护性耕作有利于紫色水稻土大团聚体有机碳含量提高,进而增强团聚体的水稳性。
【英文摘要】Long-term conservation tillage is an effective agricultural management to improve soil structure in severely destroyed paddy soil by increase of soil organic carbon (SOC). More work is still needed to understand the impacts of conservation tillage on the

mechanisms of aggregates stability.Soil samples in 0-20 cm layer were adopted from the long-term tillage experiment: (1) paddy-upland rotation and plain culture (rice-rape) (PU-R-RR), (2)no-tillage and ridge culture (rice-fallow) (NT-R-RF), (3) no-tillage and ridge culture (rice-rape) (NT-R-RR) and (4) no-tillage and plain culture (rice-rape) (NT-P-RR).Different pretreatments, such as slaking in fast wetting, wetting and subsequent slaking, were applied to simulate the breakdown mechanisms of aggregates in paddy soil. The results showed that no significant difference of aggregate stability between slaking and wetting pretreatments was observed, while tillage patterns affected greatly aggregate stability. The aggregate stability under slaking and wetting pretreatment ranked in the order of NT-R-RR > NT-P-RR > NT-R-RF > PU-R-RR and NT-P-RR > NT-R-RR > NT-R-RF > PU-R-RR, respectively. The organic carbon concentrations in aggregates were significantly positive related to the aggregates stability under wetting ($r=0.626$, $p<0.01$), while low correlation linear relationships were observed under slaking treatment ($r=0.432$, $p>0.05$). The results suggest that long-term conservation tillage favorably led to the increase of SOC concentrations in aggregates and the enhancement of aggregates water stabilization.

【题目】Effects of different fertilization and precipitation on balances of nutrients of farmland soil and nitrogen use efficiency in northeast China
【中文关键词】施肥;长期田间试验;氮肥利用率;土壤养分收支;玉米
【英文关键词】Fertilization; Long-term field trial; Nitrogen use efficiency; Soil nutrient budget; Maize
【中文摘要】基于16年长期定位试验与气象数据,研究了不同降雨年份施肥对农田土壤养分收支与氮肥利用率的影响。无肥对照处理产量仅为3,520 kg ha-1,而N、P、K与循环有机肥配施时玉米产量最高,达7,470 kg ha-1。NPKM处理玉米对养分的吸收量也可达对照处理的2-3倍。不同施肥条件下,平水年份玉米产量最高,旱年或涝年玉米产量最低,仅为平水年份产量的44.7 – 58.5%。同时,降水条件改善后玉米对NPK养分吸收较旱涝年份更为强烈。当仅施化肥N或仅有循环有机肥施用时,土壤N含量明显降低,而土壤N降低幅度最大的仍未对照处理,1990至2005年间N素亏缺557 kg ha-1。N肥的施用也加剧了P素养分的亏缺,NP或N的施用同样造成更为严重的土壤K赤字。土壤P赤字最为严重的是空白和N处理,土壤K赤字最为严重的为NP处理。通过本研究发现化肥N用量为150 kg N ha-1 year-1时,不足以平衡土壤N收支,仅靠循环有机肥也无法阻止土壤P、K养分赤字。化肥N、P、K肥用量为150 kg N ha-1 year-1, 25 kg P ha-1 year-1 和 60 kg K ha-1 year-1,并配合2-3吨有机肥有利于保持土壤肥力水平。N肥利用率随降水条件的改善和均衡施肥而明显提高,NPK与NPKM处理在平水年份均可得到较高的N肥利用效率。综上,本研究的结果表明化肥配施有机肥更利于提高作物产量、改善N肥利用效率和保持土壤肥力水平。
【英文摘要】Based on a consecutive 16-year field trial and meteorological data, the effects of fertilization on the nutrient budget and nitrogen use efficiency in farmland soil under different precipitation years were studied. With no fertilization treatment, the grain yield of maize was 3,520 kg ha-1 (mean yield over 13 years). But the maximum yield increased to 7,470 kg ha-1 when treated with mineral N, P and K fertilizers and recycled manure. The nutrient uptake also increased by twofold to threefold in NPKM treated field compared with that in the control treatment. The highest yields were obtained in years with normal precipitation, despite the different fertilization schemes. The lowest yields were obtained in drought or waterlogging years, which were 44.7 – 58.5% of the yields in years with normal precipitation. It also appeared that the deficits of N, P and K were greater in the years with proper precipitation than those in arid or flood years, because more production was removed from the field. Soil total N decreased significantly when treated with mineral fertilizer or recycled manure alone. The maximum deficit of soil total N was observed in control treatment (557 kg ha-1) from 1990 to 2005. The N treatment resulted in a significant negative balance of P, due to the high yield of the crop in response to applied N. The application of NP or N to soils resulted in a greater negative K balance than that of the control. The greatest negative balance of total P and available P were obtained under the control and N treatment, and the highest deficit of soil total K and exchangeable K were obtained under NP treatment. We found that the rate of 150 kg N ha-1 year-1 was inadequate for maintaining soil N balance, and amendment of soil with organic source could not stop the loss of soil P and K. The applying rates of 150 kg N ha-1 year-1, 25 kg P ha-1 year-1, and 60 kg K ha-1 year-1 combined with 2 – 3 t ha-1 organic manure were recommended to maintain soil fertility level. The nitrogen use efficiency (NUE) was greatly improved in the years with proper precipitation and balanced fertilization. Higher NUE and

grain yields were achieved under NPK and NPKM treatments in years with normal precipitation. The results clearly demonstrated that both organic and mineral fertilizers were needed to increase crop production, improve NUE and maintain soil fertility level.

【中文摘要】水质监测和预报,在现代集约化养鱼管理中起着重要的作用。本文介绍了在集约化养鱼的水质在线监测系统中国,Web服务器的嵌入式技术与移动通信技术相结合。根据历史数据,该系统的设计与人工神经网络水质预测(人工神经网络)和水质控制时间,以减少灾难性的损失。预测模型溶解氧提前半小时已与实验数据的验证。结果表明:多参数,长途电话和在线监测水质资料使用此建立的监测系统,准确地获取和预测。
【英文摘要】Water quality monitoring and forecasting plays an important role in modern intensive fish farming management.This paper describes an online water quality monitoring system for intensive fish culture in China, which combined web-server-embedded technology with mobile telecommunication technology. Based on historical data, this system is designed to forecast water quality with artificial neural networks (ANNs) and control the water quality in time to reduce catastrophic losses. The forecasting model for dissolved oxygen half an hour ahead has been validated with experimental data. The results demonstrate that multi-parametric, long-distance and online monitoring for water quality information can be accurately acquired and predicted by using this established monitoring system.

【中文关键词】反射光谱;母质;有机质;水分;耕作措施
【英文关键词】Spectral reflectance; Parent material; Organic matter; Soil moisture; Tillage practice
【中文摘要】以黑土高光谱反射率为研究对象,运用去包络线处理、光谱角度/特征匹配方法,分析黑土反射光谱特征主要影响因素。结果表明,成土母质决定了土壤反射光谱的基本特征;有机质是小于1000nm范围黑土反射光谱特征的决定因素,同时由于有机质与土壤水分、机械组成的相关关系,间接影响着大于1000nm的波谱范围;土壤光谱反射率随含水量的变化过程可以用三次方程模型进行定量描述;铁对黑土反射光谱特性影响较小;粗糙度主要影响土壤反射率的大小;秸秆覆盖对土壤反射率大小与形状特征的影响均较大;不同耕作措施土壤反射率大小依次为免耕、翻耕、组合、少耕、旋松。
【英文摘要】To develop soil properties quick measuring methods, promote the development of quantitatively remote sensing studies relating to terrestrial ecosystem, and deepen the application of remote sensing in agriculture, the hyperspectral reflectance of black soil in Songnen Plain, northeast China, was analyzed with spectral analysis methods (continuum removal, spectral angle match and spectral feature fitting) and statistic methods to discover the reflectance spectral characteristics and its influencing factors. The results are as follows: the soil parent material determines the basic characteristics of reflectance of the black soil, which is the mixture of montmorillonite and illite, and consistent with mineral analysis result. Organic matter is the main factor determining the curve shape of black soil reflectance in the region shorter than 1 000 nm, and indirectly influencing the reflectance in the region longer than 1 000 nm because of the correlation with soil moisture and mechanical composition. The varying process of soil reflectance with changing soil moisture can be quantitatively described with cubic equation, and moisture mainly changes the reflectance value but not the curve shape. Black soil reflectance is not influenced significantly by Fe, which is different from soils of south China. Roughness mainly impacts on the soil reflectance value but not the shape feature. The spectral feature of straw reflectance is remarkably different to that of black soil, and impacts on both the value and curve shape of black soil reflectance. Different soil tillage measurements result in different moisture holding ability and the amount of straw for different farm fields, and influence the reflectance further, with the order of soil reflectance from high to low is: no tillage, moldboard tillage, combination tillage, reduced tillage, and rotary tillage.

【题目】中国东北黑土带土壤线空间变异规律
【中文关键词】土壤;植被;辐射;土壤线;MODIS;叶面积指数
【英文关键词】Soils; Vegetation; Radiation; Soil line; MODIS; Leaf area index
【中文摘要】利用遥感影像分析土壤参数和监测植被长势要求准确的土壤线参数。利用MODIS反射率产品计算东北黑土带不同分区土壤线参数,研究其空间分布规律;并利用不同分区土壤线参数计算与土壤线性相关的植被指数,分析不同植被指数与作物叶面积指数、光合有效辐射分量之间的相关关系。结果表明:东北黑土带土壤线斜率的总体趋势是,由北向南先增加后减小,最大值(1.5921)在北纬47°~47.7°之间的黑土带范围(对应行政范围为海伦南部,望奎北部);最低值(1.1319)在德惠南部与九台中部。与土壤线性相关的植被指数与作物两个生理参数的相关关系显著高于归一化植被指数(NDVI);改进的转换型土壤植被指数(ATSAVI)对土壤线参数的敏感性最高,利用分区不同土壤线参数计算的ATSAVI与作物生理参数的相关系数高于利用单一土壤线参数计算的结果;引入土壤线参数可以提高植被指数反演作物生理参数的精度。
【英文摘要】Accurate soil line parameters are significant for monitoring vegetation or crop and analyzing soil properties with remote sensing images. Soil line parameters of different areas in black soil zone, Northeast China were calculated with MODIS reflectance products to analyze the spatial distribution of soil line parameters; then the vegetation indices relating to soil line were established, and

the correlation coefficients between vegetation indices and crop leaf area index, the fraction of photosynthetically active radiation were analyzed. The results were as follows: the overall distribution of soil line slope in black soil zone was that from north to south, the value increased and reached maximum at south Hailun city and central Wangkui County (47 ° N-47.7 ° N), then decreased, the minimum value lay at south Dehui City and central Jiutai City. The correlation coefficients between vegetation indices relating to soil line and crop leaf area index, the fraction of photosynthetically active radiation were significantly greater than that between Normalized Difference Vegetation Index and crop physiological parameters; the most sensitive vegetation index to soil line parameters was Adjusted Transformed Soil-adjusted Vegetation Index, and the vegetation indices calculated with soil line parameters in different zones showed more significant correlation with leaf area index and the fraction of photosynthetically active radiation than that calculated with single soil line parameter. With the introduction of soil line parameters, the precision of crop physiological parameters predicted with vegetation indices is much better.

【题目】不同土地利用类型下土壤活性有机碳库的变化
【中文关键词】土地利用类型;土壤活性有机碳;活性有机碳分配比例
【英文关键词】Land use type; Soil active organic carbon; allocation proportion of active organic carbon
【中文摘要】分析了中国科学院沈阳生态试验站不同土地利用类型长期定位试验土壤0~40 cm活性有机碳含量,结果表明:0~20cm土层内荒地土壤有机碳、易氧化碳、微生物生物 量碳、溶解性有机碳和轻组有机碳含量高于割草地和裸地,而割草地颗粒有机碳含量略高 于荒地;在20~40cm土层,割草地土壤有机碳、易氧化碳和颗粒有机碳含量较高,而荒地 微生物量碳、溶解性有机碳和轻组有机碳含量较高。不同土地利用类型土壤活性有机碳含 量均随着土层加深而递减。土壤微生物量碳、溶解性有机碳和轻组有机碳的分配比例为荒 地>割草地>裸地,易氧化碳和颗粒有机碳的分配比例为割草地>荒地>裸地。土壤活性 有机碳的分配比例随土层加深而下降,但溶解性有机碳的分配比例变化趋势相反。
【英文摘要】The measurement of active organic carbon content in 0-40 cm soil layer under different land use types in Shenyang Eco-experiment Station of Chinese Academy of Sciences showed that in 0-20 cm soil layer, the contents of organic carbon (OC), readily oxidizable carbon (ROC), microbial biomass carbon (MBC), dissolved organic carbon (DOC) and light fraction organic carbon (LFOC) were higher in fallow field than in mowing field and bare field, while the content of particulate organic carbon (POC) was relatively higher in mowing field than in fallow field. In 20-40 cm soil layer, the contents of OC, ROC and POC were higher in mowing field, while those of MBC, DOC and LFOC were higher in fallow field. The profile distribution of soil active organic carbon under different land use types appeared a declining trend with soil depth. The allocation proportion of MBC, DOC and LFOC in soil active organic carbon followed the order of fallow field> mowing field > bare field, while that of ROC and POC was in the order of mowing field > fallow field > bare field. The allocation proportion of soil active organic carbon had a declining trend with depth, while that of DOC was in adverse.

【题目】大田玉米长势的三维图像监测与建模
【中文关键词】图像分析,监测,模型,大田玉米,双目立体视觉,NURBS 曲面,三维重建

【英文关键词】image analysis, monitoring, models, corn plant parameters inspection, binocular stereovision, NURBS surface, 3D reconstruction

【中文摘要】基于双目立体视觉对大田间玉米生长参数进行测量,并建立玉米三维生长模型,以实现大田玉米生长参数的实时测量和生长过程的三维虚拟显示。以上次测量的平均株高平面为测量区域基准面,利用大津法提取测量区域的玉米叶片。对测量区域进行均匀网格分割,通过对左右网格的匹配,求得覆盖面积和平均颜色。对网格的形心,通过左右视觉的对应进行三维重建,获得形心点云的三维数据和平均株高。利用标杆的测量方法佐证了三维株高测量的正确性。利用上述测量参数,构建了玉米的三维生长模型,并利用OpenGL 实现了玉米生长过程的三维虚拟显示。为下一步玉米生物量的实时无损检测以及更精确的玉米三维虚拟建模奠定了基础。

【英文摘要】Some growth parameters of corn plants were measured in field based on binocular stereovision technology, and a 3D structure model of corn plants was established. The average height of corn plants measured in previous period was established as the base plane of measure area, which binarized by Ostu method. The measure region was divided into grids. The plant area and the average color were measured by matching these grids on left and right visions. Thepoint cloud consisted of grid ’s core was established by the 3D reconstructing of these grids. The average height of corn plant was calculated by using the point cloud, and validated by measuring the labeled pole. The 3D structure model of corn plant was established with above data by OpenGL. This study established a base work to real time measure theplant value without scathe, and to model the 3D plant more accurately.

【题目】基于成像光谱仪的冬小麦苗期冠层叶绿素密度监测

【中文关键词】冬小麦; 苗期; 冠层; 叶绿素密度; MSI200 型成像光谱仪; ASD Fieldspc FR2500 型非成像地物光谱仪

【英文关键词】Winter wheat; Seedling; Canopy; Chlorophyll density; Imaging spectrometer MSI200; Non-imaging spectrometer ASD Fieldspc FR2500

【中文摘要】利用自主研发的MSI200 型成像光谱仪对冬小麦苗期叶绿素密度进行遥感监测, 并与ASD Fieldspc FR2500型非成像地物光谱仪测定数据相比。结果表明, 两种仪器所得R720、FD660、FD550、TCARI、GNDVI、PPR(550, 450)、NRI等光谱特征参量均与叶绿素密度显著相关, 拟合度较高, 说明MSI200 型成像光谱仪测定的作物光谱数据是可靠的。对筛选出的模型进行检验, ASD Fieldspc FR2500 模型的预测精度达86.61%~92.79%, MSI200 达91.26%~95.54%,其中PPR 对叶绿素密度预测精度最高, RMSE 分别为0.8391 和0.0979。与传统非成像地物光谱仪相比, 成像光谱仪能够提取纯冠层光谱信息, 所得模型精度高、误差小, 筛选的植被指数和特征波段对于航天、航空遥感器的定标有重要意义。

【英文摘要】Imaging spectrometer is a new kind of remote sensing sensor, which receives images of ground objects and their spectrum components. It has great potentials in accurately quantitative analysis with remote sensing of high spatial and spectral resolutions. MSI200 is an imaging spectrometer manufactured by the authors. It was used in this study to monitor canopy chlorophyll density in winter wheat (Triticum aestivum L.) at seedling stage in comparison with ASD Fieldspc FR2500, a well-known non-imaging spectrometer. Correlation analysis showed that R720, FD660, FD550, TCARI, GNDVI, PPR (550, 450), and NRI obtained by the 2 spectrometers were both significantly correlated (P<0.01) with canopy chlorophyll density. This primarily indicated the reliability of MSI200. The precisions of predicted model on chlorophyll density were 91.26 – 95.54% and 86.61 – 92.79% for MSI200 and ASD Fieldspc FR2500, respectively. Among these parameters, PPR was the best one to monitor canopy chlorophylldensity with root mean square error (RMSE) of 0.0979 and 0.8391 for MSI200 and ASD Fieldspc FR2500, respectively. Compared with the traditional non-imaging spectrometers, MSI200 predicted better the canopy chlorophyll density in wheat with smaller errors, and the selected wavelengths were important to spaceflight and airborne remote sense.

【题目】基于叶片光谱透过特性的植物氮素测定
【中文关键词】叶绿素含量,含氮量,光谱特征参数,分光光谱透过率,无损检测
【英文关键词】chlorophyll content, nitrogen content, spectral feature parameter, spectral transmittance, nondestructive detection
【中文摘要】该文通过不同施氮水平下营养液栽培的水稻和黄瓜叶片在300~1100 nm 的分光光谱透过率,与其叶绿素含量和含氮量的相关性分析,确定了560、650 和720 nm 作为特征波长,940 nm 作为参比波长可用于植物营养的快速无损诊断。以上述波长的光谱透过率构建的21 组光谱特征参数中,(T940-T560)/(T940+T560)、log(T940/T560)和log(T940/T650)与水稻和黄瓜叶片的叶绿素含量和含氮量的相关性较好,且经回归估测检验的相对误差均小于8%。因此,上述光谱特征参数可作为植物氮素营养指标用于植物叶片的叶绿素含量和含氮量的快速无损估测,从而为植物营养无损诊断提供技术支持。
【英文摘要】Spectral transmittances in wavelength ranged from 300 to 1100 nm of rice and cucumber leaves treated with culture solution in five different nitrogen levels were measured in this study. The correlated relationships between the above spectral transmittances and their chlorophyll contents and nitrogen contents indicated that the 560, 650, and 720 nm as feature wavelength and 940 nm as reference wavelength were useful for plant nutrient diagnosis. Correlationanalysis and their regression examination between 21 spectral feature parameters composed by the transmittances a above wavelength, and the leaf chlorophyll contents and nitrogen contents showed that spectral feature parameters of (T940-T560)/(T940+T560), log(T940/T560) and log(T940/T650) were available for plant nutrient diagnosis with less than 8%relative error in measurement tests of rice and cucumber leaves. Therefore, the above spectral feature parameters as plant nitrogen indices can be used to estimate the chlorophyll content and nitrogen content and thus support for nondestructive plant nutrient detection.

【题目】可控环境下光照时间对铁皮石斛组培苗生长发育的影响
【中文关键词】叶绿素含量;可控环境;光合速率;多糖含量
【英文关键词】chlorophyll content; controlled environment; photosynthetic rate; polysaccharide content
【中文摘要】在人工光型密闭式植物工厂的可控环境条件下,光照时间会影响铁皮石斛(Dendrobium off icinale)组培苗的生长发育。将鲜重约为300 mg的铁皮石斛单腋芽作为外植体在温度22 ±1℃、湿度65 ±5%、光照强度68 ±9 μmol · m- 2 · s- 1、光期的CO2浓度800 ±50 μmol · mol- 1的环境条件下,设置光照时间为6 h · d- 1、9h · d- 1、12 h · d- 1、15 h · d- 1、18 h · d- 1的5组试验区进行培育。该可控环境下培育92 d后,光照时间为12h · d- 1的试验区的铁皮石斛组培苗的净光合速率和叶绿素含量较高,干重和腋芽数增加较多,表现出良好的生长与繁殖能力。因此,人工光型密闭式植物工厂内铁皮石斛组培苗的适宜光照周期为12 h · d- 1。
【英文摘要】The effect of photoperiod on growth and development of Dendrobium off icinale in vitro was studied under controlled environment in a closed p lant factorywith artificial lighting. Single exp lant each with 300 mg fresh mass of D. officinale were p lanted in five treatmentswith photoperiods of 6, 9, 12, 15, and 18 h · d- 1 under controlled environment atair temperature of 22 ±1℃, relative humidity of 65 ±5%, lighting intensity of 68 ±9 μmol · m- 2 · s- 1 , and CO2 concentration of 800 ±50 μmol · mol- 1 in photoperiod. The net photosynthetic rate, chlorophyll content, dry mass, and buds in treatment of photoperiod of 12 h · d- 1 were higher than that in other treatments, and resulted in greater growth andreproduction forD. officinale production in vitro after the exp lantswere cultured 92 days. Therefore, the photoperiod of 12h · d- 1 forD. officinale production in vitro is suitable in the closed plant factorywith artificial lighting.

【题目】基于熵权法赋权的区域耕地整理潜力评价
【中文关键词】耕地整理; 潜力评价; 熵权法; 重庆市
【英文关键词】Cultivated land consolidation and rehabilitation; Potentiality evaluation; Entropy weight method; Chongqing municipality

【中文摘要】在构建区域耕地整理潜力评价指标体系的基础上, 将熵权法与综合评价法结合起来对重庆市耕地整理潜力进行了定量化评价。重庆市耕地整理潜力评价结果表明, 在评价指标权重分布上, 投入产出率> 林地面积比重提高率> 耕地产出提高率> 增加耕地系数, 耕地整理潜力由大到小可划分为4 个等级, 从潜力等级的分布来看, 耕地整理潜力最大的区域主要分布在三峡生态经济区, 而耕地整理潜力次之的区域主要在渝西地区。就重庆市耕地整理潜力而言, 渝西地区经济基础比较好, 发展速度相对较快, 投入产出率高, 耕地整理投入优势显著, 而三峡库区未来生态效益较高, 耕地整理对实现资源可持续利用有利。

【英文摘要】Based on constructing evaluation index system for regional potentiality of land consolidation and rehabilitation, potentiality of cultivated land consolidation and rehabilitation in Chongqing municipality was quantificationally evaluated using entropy weight method and synthetical evaluation method . Results indicated that indicator weight was followed such a sequence : input - output rate >increasing ratio of forestland pro-portion >increasing ratio of cultivated land output > increased cultivated land coefficient. The potentiality of cultivated land consolidation and rehabilitation was divided into four grades, and it was highest in ecological economic zones in Three Gorges reservoir area and higher in Western Chongqing Region. Western Chongqing Region, whose development rate and input - output rate were higher , played an important role in the economic development of Chongqing, thus the advantages of cultivated land consolidation potentiality were prominent. The ecological benefits of Three Gorges reservoir area were so high that cultivated land consolidation and rehabilitation could achieve the sustainable development.

【题目】密闭式植物工厂的嵌入网络式环境监控系统

【中文关键词】Closed plant factories using artificial lighting will be extended commercially because of the large scale requirement s of the transplant sorplant such as vegetables, forest tree, m edicinal herb, and spice plant in the 21st century. In o rder to research the optimal environmental control and electronic consumption accounting in the closed plant factories, a web based environmental control system was developed using MSSQL Server 2000 and Visual Basic 6. 0. The control strategy and control targets can be adjusted by end user in local or remo teareas via any browsers and the controlled equipment can be adjusted or improved easily with different levels of system security. All control variables and measured environmental data and plant images are monitored dynamically using web server embedded technology. The environm ental control and electriccon sumption accounting were carried out in a pilottype closed plant factory operated for two years in China Agricultural University.

【英文关键词】control stratagy; electric power consumption; environmental monitoring; predicted control;
web server embedded technology

【中文摘要】21 世纪对蔬菜、林木、药草、香料等各类种苗或植物的大量需求将推动完全使用人工光源的密闭式植物工厂的大力发展。为了配合密闭式植物工厂内的适度环境控制和能源收支核算的研究需要, 基于关系数据库M S SQL Server 2000和面向对象的程序设计语言V isualBasic 6. 0 开发了通用型嵌入网络式环境监控系统软件。用户可根据实际生产需要选择适当的控制策略和控制目标, 也可调整控制参数来增减或改善执行机构的运行。植物工厂内所有控制参数和实时监测的数据和图像都可以动态地进行W EB 发布, 用户界面友好并实施各级安全自动管理。经过近两年的实际运行, 该环境监控系统软件有效地实现了人工光型密闭式植物工厂内的嵌入网络式动态环境监控和电能消耗自动计量。

【题目】铁皮石斛在人工光型密闭式植物工厂的适宜光照强度
【中文关键词】叶绿素含量; 可控环境; 光合速率; 多糖含量
【英文关键词】Chlorophyll, Controlled environment, Photosynthetic rate, Polysaccharide content
【中文摘要】人工光型密闭式植物工厂适于高附加值植物尤其是珍贵药用植物的大规模/低成本化生产,其环境调控对珍贵药用植物的产量和质量有重要影响。笔者研究探索在控制温度、湿度、CO2浓度和光周期的条件下,光照强度对铁皮石斛(Dendrobium officinale)组培苗生长发育的影响,以期找到铁皮石斛组培阶段在人工光可控环境下的适宜光照环境。鲜重约300 mg的铁皮石斛单腋芽作为外植体在温度24±1℃、湿度65±5%、光周期12 h/d、及光期CO2浓度800±50 μmol/mol的环境条件下,设置光照强度为37、68、92、120 μmol/(m2·s)的4组试验区,并使用容积为380 mL的方型聚碳酸酯组培容器在人工光型密闭式植物工厂中培育92d。组培容器的顶部留2个直径为10 mm的圆孔覆盖高分子透气膜用来与容器外进行气体交换。铁皮石斛组培苗的生长发育和生理活性在光照强度为68 μmol/(m2·s)时最佳,超过92 μmol/(m2·s)时呈现明显的光抑制;多糖含量随着光照强度的增强而增加,超过92 μmol/(m2·s)时呈下降趋势,但是68和92 μmol/(m2·s)光照强度试验区的多糖含量没有显著性差异。因此,铁皮石斛组培苗在人工光型密闭式植物工厂内培育的适宜光照强度为60~70 μmol/(m2·s)。
【英文摘要】Closed plant factory under artificial lighting is suitable for producing value - added plantespecially trueborn medicinal herbs in low cost and large scale, and the controlled environments are important for their yield and quality. The suitable lighting intensity with controlled temperature, humidity, CO2 concentration and photoperiod were studied for Dendrobium officinale in vitro in a closed plant factory using fluorescent lamps as the lighting source. Single D. officinale explants each with 300 mg fresh mass were planted in polycarbonate culture vessels with volume of 380 mL and filtered by twoф10 mm gas - permeable filters on the vessel tops. The four treatments with lighting intensities of 37, 68, 92, 120 μmol/(m2·s) were controlled at air temperature of 24±1℃, relative humidity of 65±5%, photoperiod of 12 h/d and CO2 concentration of 800 ±50 μmol/mol for 92 days for the D. officinale in vitro. The growth and physiological characters of D. officinale in vitro on day 92 were better in the treatment with lighting intensity of 68 μmol/(m2·s) and were shown in photoinhibition over lighting intensity of 92 μmol/(m2·s). The polysaccharide contents increased with increasing lighting intensity less than 92 μmol/(m2·s), but nosignificant differences were found between treatments with lighting intensities of 68 and 92 μmol/(m2·s).Therefore, the suitable lighting intensity for D. officinale in vitro is 60~70 μmol/(m2·s) in the closed plant factory under artificial lighting.

【题目】下辽河平原降雨中氮素的动态变化
【中文关键词】降雨; 氮素; 农田生态系统; 下辽河平原
【英文关键词】precipitation; nitrogen; agroecosystem; lower reach of Liaohe River Plain
【中文摘要】为了了解降雨中氮对农田生态系统的影响,分析了2004-2006年下辽河平原连续3年定位收集的降雨观测资料与历史资料.结果表明:降雨中氮输入量季节变化显著,夏季最高,这主要与降雨量及空气中NH4 -N浓度变化有关;降雨中DON量与NO3--N含量相当,均接近24%,是雨水中氮的重要组分;与1985年相比,近3年降雨输入到该地区农田生态系统的年氮通量已有较大提高,降雨较多的2005年输入的无机氮量更是20年前的2倍以上;2004-2006年随降雨输入农田生态系统的氮平均占可利用肥料氮的28.3%,对农田生态系统有着重要影响
【英文摘要】To understand the effects of nitrogen(N) in precipitation on agroecosystems, the precipitation samples at the Shenyang Ecological Station located in lower reach of Liaohe River Plain were collected from 2004 to 2006,and their N forms and amounts were measured. The results showed that the N amount in precipitation had an obvious seasonal change, being the highest in summer due to the higher concentrations of NH4 -N in precipitation and atmosphere. The proportions of dissolved organic nitrogen(DON) and NO3--N to total nitrogen(TN) in precipitation were all about 24%,and the annual N flux imported to the agroecosystems by wet deposition was more abundant in recent three years than 20 years ago. The N amount in precipitation in 2005 was increased by one time, compared with that in 1985.On average, the N import from precipitation in 2004-2006 accounted for 28.3% of the applied

fertilizer N, suggesting that the N input from precipitation had greater effects on agroecosystem.

【题目】烟草生产环境监测系统的开发与应用
【中文关键词】环境监测; 紫外辐射; 日照全辐射; GSM
【英文关键词】environment monitoring ; UV radiation ; sunshine radiation ; GSM
【中文摘要】开发了一个烟草生产环境监测系统, 该系统可对烟草生产过程中环境温度、湿度、降雨量、日照全辐射和紫外辐射进行监测。系统测试的数据可通过GSM 网络传送到数据中心, 用户可通过访问数据中心服务器查询到相关的生产环境数据; 为保证数据的安全性,系统采集到的数据还被保存到SD 卡上; 可将多个系统组建成为一个监测网络, 用于对多个生产基地生产环境进行动态监测; 监测系统已经在红塔集团烟叶基地部署了20 台, 并正常运行半年; 系统的部署, 为企业原料采购提供重要的决策支持。
【英文摘要】A tobacco production environmental monitoring system has been developed to collect t he data on temperature , humidity , rainfall , solar radiation and UV radiation. The data collected is t ransmitted to t he data center server t hrough t he GSM network where users canquery data. For t he data security , all t he data are replicated and stored in a SD card in t he system. Multiple systems can be formed into a monitoring network for monitoring of some production areas. Twenty monitoring systems have been deployed in bases of Hongta TobaccoGroup , which functioned normal for half a year , providing an important support for t he Group in decision making for procurement of raw materials.

【题目】长期定位试验下施肥对潮棕壤活性碳库及碳库管理指数的影响
【中文关键词】施肥; 易氧化碳; 溶解性有机碳; 微生物量碳; 土壤碳素有效率; 土壤碳库管理指数
【英文关键词】Fertilization; Readily oxidizable carbon; Dissolved organic carbon; Microbial biomass carbon; Available ratio of soil carbon; Soil carbon pool management index
【中文摘要】分析了长期不同施肥制度对潮棕壤活性碳库及碳库管理指数的影响。结果表明:长期施肥不同施肥制度对土壤活性碳库、碳素有效率及碳库管理指数有很大影响,长期施用有机循环肥处理,尤其是循环肥配合均衡化肥(NPK+O)施用处理的土壤有机碳、易氧化碳(ROC)、溶解性有机碳(DOC)、微生物量碳含量(MBC)、土壤碳素有效率及土壤碳库管理指数明显高于对照处理的土壤。潮棕壤活性碳库中不同形态的碳素含量大小顺序为:CROC>CMBC>CDOC,同一施肥处理水平下,不同形态碳素有效率以ACC>ABC>AAC。相关分析表明:土壤碳素有效率和碳库管理指数与土壤的化学性质尤其是土壤养分因子呈显著或极显著相关,反应了农业生产措施对土壤碳库的影响,运用土壤碳库管理指数可以很好地反映出土壤碳库的动态变化。
【英文摘要】The effect of long-term different fertilization on soil available carbon pool and carbon pool management index in aquic brown soil was discussed in the paper. The results indicated that different fertilization had great effect on soil available carbon pool and available ratio of soil carbon. Treatments of recycled manure, especially the NPK with recycled manure treatment had higher contents of soil organic carbon, readily oxidizable carbon, dissolved organic carbon, microbial biomass carbon, also had higher available ratio of soil carbon and soil carbon pool management index than CK treatment. In aquic brown soil of available carbon pool the order of different type of carbon was CROC>CMBC>CDOC. In the same treatment, the order of available ratio of soil carbon was

ACC>ABC>AAC. Correlation analysis showed that there were significant or extremely significant relationships between available ratio of soil carbon, soil carbon pool management index and chemical properties of soil, especially nutrient factors, the indexes were sensitive to agricultural measures, which indicated that it was practical to assess soil carbon pool under different management practices using carbon pool management index.

【题目】下辽河平原不同水-肥条件下玉米地土壤养分收支及氮肥利用效率
【中文关键词】下辽河平原; 玉米; 长期田间试验; 降水; 施肥; 土壤养分收支; 氮肥利用效率
【英文关键词】Low Reach of Liaohe River Plain; Maize; Long-term field trial; Precipitation; Fertilization; Soil nutrient budget; Fertilizer-nitrogen use efficiency;
【中文摘要】【目的】了解下辽河平原地区施肥与水分条件对玉米地土壤中氮、磷、钾养分收支以及氮肥利用效率的影响。【方法】利用持续16年的长期田间试验结果结合气象观测资料,对不同水肥条件下玉米农田养分收支与氮肥利用效率进行研究。【结果】施肥条件差异可使玉米移出农田的养分量高出无肥处理2~3倍。水分条件对农田养分移出量的作用虽不如施肥明显,但在较好的降水条件下,即使较为理想的施肥模式,玉米地土壤中养分仍有可能出现赤字;氮肥的施用加剧了土壤磷的赤字,而氮、磷肥施用可加剧土壤钾收支赤字,有机肥的施用可以使养分收支赤字得到缓解;水分条件的改善则加速了养分收支赤字的出现,但适宜的水分供给对氮肥利用效率的提高作用显著。【结论】在下辽河平原地区,水肥条件对玉米土壤养分收支有显著影响,水分条件适宜土壤养分收支出现赤字的可能性增大,但保持农业系统养分循环再利用并根据土壤肥力适当施用化肥,既可满足作物丰产的养分需求又有利于平衡土壤养分收支,提高氮肥利用效率,减少农业对环境的影响。
【英文摘要】【Objective】The objectives of this paper are to elucidate the effects of nutrient-water on the nutrient budget of N, P, K and the fertilizer-nitrogen use efficiency in farmland soil. 【Method】 The effects were studied by the information of long-term field trial and meteorological observation data.【Result】The quantity of nutrients uptaken by maize were more significantly influenced by fertilization than precipitation, and increased by two or three times with different fertilization conditions. It was also possible that the deficit of soil nutrient appeared with proper precipitation, even under the best fertilization pattern. N fertilizer made the deficit of soil P larger; and the fertilizer of N and P made the deficit of K higher. Nutrient deficit in soil were getting smaller with manure applying. It is easy to occur to nutrients deficit with precipitation condition improving. The appropriate precipitation can improve fertilizer-nitrogen use efficiency significantly. 【Conclusion】In Low Reach of Liaohe River Plain, soil nutrient budget in maize farmland was influenced by water and fertilization conditions obviously. There was a high possibility that the nutrient deficit would appear in normal precipitation year. The use of recycled nutrients in the farming systems with appropriate amount of fertilizer applied according to the soil nutrient supplying ability could not only produce high crop yield but also balance the soil nutrient budget and improve fertilizer-nitrogen use efficiency so that there were no significant surplus of nutrients which may emit or leach out of soil into environment.

【题目】土地利用方式对潮棕壤微生物群落影响研究
【中文关键词】潮棕壤; 土地利用方式; 农田生态系统; 自然生态系统; 土壤微生物; 季节变化

【英文关键词】Aquic brown earth; Land use patterns; Agroecosystem; Natural ecosystem; Soil microbe; Seasonal variation
【中文摘要】以中国科学院沈阳生态试验站的长期定位试验为平台,研究了不同土地利用方式下土壤三大类微生物细菌、放线菌、真菌和农业上常见致病菌灰霉菌、枯萎菌、镰刀菌的分布及动态变化。结果表明,在农田生态系统中,施肥特别是氮磷钾配施循环猪圈肥能够提高土壤微生物总量,施用氮磷钾和氮磷钾配施循环猪圈肥均提高了细菌和放线菌数量,但化肥配施有机肥降低了真菌数量;不同土地利用方式下微生物分布存在差异,有机物料归还量较大的荒地和林地微生物数量较高,每年移出地表植物的割草处理略低,而裸地处理最低,细菌和放线菌分布规律一致,均为:荒地>林地>割草>裸地,真菌分布略有差别,为:荒地>割草>林地>裸地,土壤微生物含量和比例可大致反映土地利用类型;不同生态系统中,灰霉菌、枯萎菌、镰刀菌的分布不同,农田生态系统中的致病菌数量普遍高于自然生态系统,尤其是枯萎菌,仅在农田生态系统中检测到;微生物数量随着季节的变化而变化,随着温度的升高有增加的趋势,在七月左右达到最大值。
【英文摘要】Through a consecutive 15 years field trial on the aquic brown soil in Shenyang suburb of Northeast China, in this paper, the seasonal variations in the number of bacteria, actinomyces, fungi, botrytis cinerea, fusarium oxysporum f.sp and fusarium in the soils of agroecosystems and natural ecosystems were studied. The results indicated that fertilization enhanced the amount of soil microbe in agroecosystems, especially bacteria and actinomyces, NPK and application with NPK and recycled manure enhanced the amount of bacteria and actinomyces while application with NPK and recycled manure decreased the amount of fungi; microbial allocation differed under different land use patterns in natural ecosystems, the microbial numbers of the waste land and the forest land are higher, the mowing land is lower, and the bared land is the lowest; bacteria allocation is accorded to actinomyces: waste land > forest land > mowing land > bared land,fungi allocation is: waste land > mowing land > forest land > bared land, soil microbial amounts and ratio could reflect land use pattern roughly; the allocation of botrytis cinerea, fusarium oxysporum f.sp and fusarium is different under different ecosystems, they are higher in natural ecosystem than in agroecosystem, fusarium oxysporum f.sp exists only in agroecosystem; the amount of microbes increased with temperature, it got the highest pot in July.

【题目】Effects of land use patterns on soil aggregate stability in Sichuan Basin, China
【中文关键词】无
【英文关键词】aggregate size distribution; soil aggregate stability; fractal dimension; land use pattern; purple soil; Sichuan Basin; China
【中文摘要】无
【英文摘要】Soil aggregate stability as a key indicator of soil structure, is a product of interactions between soil environment, management practices, and land use patterns. The objective of this study was to analyze the impact of various land use patterns on soil aggregate stability in Sichuan Basin of Southwestern China. The dry- and water-stable aggregate size distributions were determined by manual dry sieving procedure and Yoder's wet sieving procedure, respectively, while microaggregates and its mechanical and chemical stabilities by Kachisky's method, oscillator method, and citrate-dithionate (C-D) reagent method, separately. The results indicated that fractal dimension and surface fractal dimension were useful indicators to reflect soil aggregate distribution. Land use patterns have an obvious influence on soil aggregate stability. In the study area, water stability, mechanical stability, and chemical stability followed the sequence, Barren land > forestland > orchard > cropland, and the original stability and collapse velocity were sensitive to soil properties and soil structure. The difference of aggregate stability under different land use patterns is mainly due to the intensity of human disturbance and cultivation. Improper land use patterns will lead to breakdown of unstable aggregates, producing finer and more-easily transportable particles and microaggregates. In the future, inappropriate cultivation and land use patterns should be changed to protect soil structure, to improve soil aggregate stability and soil fertility in Sichuan Basin. 【题目】光谱数据变换对玉米氮素含量反演精度的影响
【中文关键词】叶片光谱反射率;数据变换;氮素;反演精度
【英文关键词】leaf spectral reflectance;data transformation;nitrogen;retrieval precision
【中文摘要】通过对玉米叶片光谱数据进行6种变换,分析了变换后的光谱值与叶片氮素含量的相关关系,探讨了550nm和680nm两波段处不同形式光谱变量对氮素含量反演的精度。结果表明,微分处理(D(R)、D(Log(R))和D(N(R)))显著改变了氮素含量与光谱值的相关性,归一化(N(R))次之,对数处理几乎无变化(R与Log(R),N(R) 与Log(N(R)))。不同的变换形式之间,与氮素含量相关性高的,则所建立的回归模型的决定系数也高,模型的精度也较高。在波段550nm和680nm波段处,光谱数据的归一化对数处理(Log(N(R)))能显著提高回归模型对氮素含量的反演精度。
【英文摘要】It was analyzed that correlation between the transformed spectrum value and leaf nitrogen content, further more it was researched that retrieval precision for the nitrogen content with different form spectrum variables in 550nm and 680nm wave band by carrying on 6 kind of transformations to the corn leaf spectrum data. The results showed that differential form(D(R),D(Log(R))and D(N(R))) could significantly change the correlation between the nitrogen content and the spectrum value, and the normalized form(N(R))was next and the last was logarithm form(R and Log(R), N(R)and Log(N(R))). In addition, determined coefficient of regression model was larger and the model precision was higher correspondingly with better correlation between different form spectrum variables and nitrogen content. In this study, the normalized logarithm form(Log(N(R))) parameter of spectrum data could significantly improve the precision of regression model for retrieval nitrogen content in 550nm and 680nm wave band.

【题目】基于光谱分析的玉米氮素营养诊断
【中文关键词】玉米;氮素营养;光谱特征参量;诊断模型
【英文关键词】Corn, N nutrition, Spectral characteristic parameters, Diagnosis model
【中文摘要】利用光谱技术实时、快速、无损监测作物氮素营养状况是现代农业的研究热点之一。本研究的目的是基于池栽试验的系统观测资料,寻求基于叶片水平的玉米氮素营养光谱诊断模型。本试验根据玉米氮素营养的生理特点,在关键生育期有针对性的选择第6片完全展开叶和第12片完全展开叶(果穗叶)进行光谱监测。结果表明:被考察的19个光谱特征参量中,红边斜率(Dr)、绿峰最大反射率(Rg)、比值植被指数(RNIR/Red)和归一化差值植被指数(R(NIR-Red)/(NIR+Red))与叶片氮含量均存在较好的相关关系。考虑到诊断模型的简单实用性,选择RNIR/Red与叶片氮含量建立估测模型;根据RNIR/Red在玉米生育前期和后期与不同叶片氮含量的相关性,确立在玉米生育前期以第6片完全展开叶为诊断对象,在生育后期以第12片完全展开叶(果穗叶)为诊断对象;经过回归分析和验证, RNIR/Red与叶片氮含量建立的对数模型和指数模型分别在生育前期和生育后期具有较高的可靠性和稳定性,确立玉米生育前期以对数模型,生育后期以指数模型为氮素营养的光谱诊断模型。该结果为研发低成本便携式作物氮素营养光谱诊断仪具有实际意义。
【英文摘要】It is one of modern agriculture research focuses which real-time, fast, nondestructively monitoring crops nitrogen nutrition condition by using the spectrum technology. Its research goal was that spectrum diagnosis models were constructed on the leaf blade level for corn nitrogen nutrition on the base of the whole pooled experimental data. In this study, according to the physiological characteristics of corn (Zea mays L.) nitrogen nutrition, the 6th and 12th (fruit leaf) full-expanded leaf were acted as observed object using the spectrum technology at key growth stages. Results showed that as follows: among 19 spectrum characteristic parameters, better correlation between the red-edge slope (Dr), green summit maximum reflectance (Rg), ratio vegetation index (RNIR/Red), normal differential vegetation index (R(NIR-Red)/(NIR+Red)) and leaf nitrogen content was expressive, respectively. In view of simpleness and practicality of diagnosis models, ratio vegetation index (RNIR/Red) was chosen to acted as spectrum variable and with leaf N content together, spectrum models for corn N nutrition diagnosis were constructed. Based it on that correlation relationship between RNIR/Red and different leaf N content was higher in the 6th leaf than in the 12th leaf at early growth stage, and higher in the 12th leaf than in the 6th leaf at late growth stage, so it was made it certain that the 6th full-expanded leaf was acted as object for nutritional diagnosis at early growth stage and the 12th full-expanded leaf was acted as object for nutritional diagnosis at late growth stage. Passed through regression analysis and validation, logarithmic model and exponential model with variables RNIR/Red and leaf N content had high reliability and stability, respectively at early growth stage and at late growth stage. So those models with variables RNIR/Red and leaf N content were regarded as diagnosis models for corn nitrogen nutrition at different growth stage. The results were provided with practical significance for researching and exploiting low cost and portable crop nitrogen nutrition diagnosis instrument.

【题目】长期施肥对潮棕壤无机磷形态的影响
【中文关键词】潮棕壤; 长期定位施肥; 化肥; 循环猪圈肥; 无机磷; 有效磷
【英文关键词】Aquic brown-soil; Long-term fertilization; Chemical fertilizer; Circulated pig manure; Inorganic phosphorus; Available phosphorus
【中文摘要】为提高磷肥利用效率、维持并提高土壤供磷力,在潮棕壤上进行了15年的定位施肥试验,试验处理涵盖了中国典型的8种施肥模式:不施肥(CK)、施循环猪圈肥(M)、单施氮肥(N)、施氮肥+循环猪圈肥(N+M)、施氮磷肥(NP)、施氮磷肥+循环猪圈肥(NP+M)、施氮磷钾肥(NPK)、施氮磷钾肥+循环猪圈肥(NPK+M),对不同施肥模式下耕层(0~20cm)土壤无机磷进行了分级测定。研究表明:有效或缓效态无机磷(Ca2-P、Ca8-P、Al-P、Fe-P)含量在无化学磷肥直接投入的情况下均有不同幅度的下降,导致土壤无机磷库亏损;在有化学磷肥直接投入的情况下这些形态的无机磷不但能满足当季作物需求还有盈余,且以NP+M处理盈余最多,丰富了土壤无机磷库。各处理O-P、Ca10-P形态的无机磷均有所增加,且其中部分可由盈余的有效磷素缓慢转化而来。循环猪圈肥(M)的施用能减缓各形态无机磷含量的下降;氮肥和钾肥均能极大促进

植物对磷素的吸收,加速土壤磷库亏损。NP+M施肥模式最有利于短期提高土壤供磷力,促进土壤供磷力发展。本研究还发现,有效或缓效态无机磷(Ca2-P、Ca8-P、Al-P、Fe8P)与有效磷相关性很好,这进一步完善了土壤供磷力的指标体系。

【英文摘要】In order to enhance the utilization ratio of P fertilizer and to improve supply capacity of soil phosphorus, a 15-year trial of 8 classical modes of fertilization, CK (non-fertilization), M (circulated pig manure fertilization), N (nitrogen fertilization), N + M, NP (nitrogen and phosphorus fertilization), NP + M, NPK (nitrogen, phosphorus and potassium fertilization) and NPK + M, was conducted in aquic brown-soils. Inorganic phosphorus (P~) content in 0 - 20 cm soil layer was then investigated. The results show rapid or slow decreases in soil available Pi (Ca2-P, Ca8 -P, Al-P and Fe-P) under no chemical phosphorus fertilization, resulting in soil P~ pool deficit. It is, however, the contrary under chemical phosphorus fertilization, especially for NP + M treatment. This is because chemical phosphorus fertilizer not only meet plant growth requirement, but also enriches soil Pi pool. In the short-run, NP + M treatment has the most favorable conditions for improving supply capacity of soil phosphorus. Though O-P and Ca10 -P are not available to plants, they both increase yearly, part of them are from the transformation of excess Pi (Ca2-P, Ca8 -P, Al-P or Fe-P). Circulated pig manure slows down reduction of the different forms of Pi, while nitrogen and potassium fertilizers accelerate plant absorption of phosphorus, leading to soil phosphorus pool deficit. The relationship between available phosphorus and Ca2-P, Ca8-P, Al-P, Fe-P is significant, providing more indexes for soil phosphorus supply capacity evaluation.

【题目】不同施肥制度对肥料利用率的影响

【中文关键词】N肥; P肥; K肥; 肥料利用率

【英文关键词】N fertilizer; P fertilizer; K fertilizer; Fertilizer utilization efficiency

【中文摘要】通过17年的长期定位肥料试验,研究了不同施肥制度对肥料利用率的影响,以期为合理施肥提供理论依据。结果表明:N、P、K肥的当季利用率随施肥不同差异较大,施用有机肥的处理作物对N、P、K的利用率高于单施化肥的处理。P肥累积利用率在各个处理中均有明显的增加,表现出极好的残效;除单施N肥处理外,其他处理的N肥累计利用率均呈增加趋势;K肥的累计利用率在施用有机肥的处理上表现出明显的增加趋势,其他处理不明显。

【英文摘要】Based on a consecutive 17 years field trial, this paper was to explore the effects of different fertilization systems on the fertilizer utilization efficiency, in order to give guidance for application of fertilizers. The result indicated that there were differences in annual fertilizer utilization efficiency with different fertilization. Annual N、 P and K fertilizer utilization efficiency were higher with manure than those without manure. There was a significant increase on accumulated P fertilizer utilization efficiency in each treatment, and there was a significant increase in accumulated N fertilizer utilization efficiency in each treatment, expect for treatment of N fertilizer application. There was a significant increase on accumulated K fertilizer utilization efficiency with manure application, and no difference in other treatments.

【题目】不同水肥条件对大豆产量的影响

【中文关键词】长期肥料试验; 大豆产量; 水肥交互作用; 降雨

【英文关键词】Long-term fertilization experiment; Soybean yield; Water-nutrient interaction; Precipitation

【中文摘要】以沈阳生态试验站一组持续17年的长期定位试验为平台,研究了不同降水年景作物对施肥的增产反应,估算了下辽河平原地区水肥交互作用对大豆产量的影响。结果表明,该地区大豆蒸散耗水与其生育期内降水之间关系密切,且不同的施肥处理对大豆消耗水分量影响不大;肥料对产量的影响大于水分的影响,钾肥的施用提高了大豆抗旱能力,随着水分条件的改善磷肥增产作用提高,而水分过多会对大豆造成毒害作用。该地区平、丰水年份磷、钾肥交互作用以叠加效应为主,平水年份各处理大豆产量均达到最高,水肥交互作用对大豆增产贡献亦达到最大。

【英文摘要】The response of increase of soybean yield to fertilization was investigated based on a long-term experiment in 17 successive years.The effect of water-nutrient interaction on soybean yield was estimated in different precipitation years.The results showed that there was significant correlation between soybean evapotranspiration and the precipitation in the growing period,and the water consumption of soybean was similar under different fertilization treatments.The soybean yield was strongly affected by fertilizer supply.The drought resistance of soybean was enhanced by application of potassium(K) fertilizer.The increment of yield induced by phosphorus(P) fertilizer was improved in moderate water condition.However,excessive water supply might reduce the soybean yield.Accumulation effect of P and K on soybean yield was shown in normal and higher precipitation years.The soybean yield reached the maximum,and the effect of water-nutrient interaction on soybean yield was the most significant with appropriate water supply(normal precipitation).

【题目】农田生态系统微生物多样性研究方法及应用

【中文关键词】微生物多样性; 研究方法; 分子生物学; 农田生态系统

【英文关键词】Microbial diversity; Research method; Molecular biology; Agro-ecosystem

【中文摘要】微生物在农田生态系统中占据着很重要的作用,其结构和功能的多样性及变化在一定程度上反映了农田生态系统的基本状态,因此非常有必要应用有效的方法来研究农田微生物的多样性、分布及行为等。但是通过传统的微生物培养和鉴定方法得到的微生物信息很片面,不足以代表微生物在农田生态系统中的真实情况。而近几十年来兴起的微生物研究新方法突破了传统方法的限制,极大地促进了微生物学的发展。本文介绍了现在常用的微生物多样性研究方法及其在农田生态系统中的应用现状。

【英文摘要】Microorganism plays a key role in agro-ecosystem,and microbial diversity of structure and function,to a certain extent,reflects the status of agro-ecosystem.It is very important to investigate microbiological diversity,distribution and action with,effective technology.It is unilateral to study microorganism with traditional cultural method,which could not reflect microbial true situation in agro-ecosystem.The improvement of new microbial technology breaks the limitation of traditional cultural method and promotes the development of microbiology.This paper gave a review on the main microbial methods and application in agro-ecosystem.

【题目】区域土地利用变化驱动力研究前景展望
【中文关键词】土地利用变化;区域尺度;驱动力;驱动机制;过程模拟
【英文关键词】Land use change; Regional scale; Drivers; Driving mechanism; Process simulation.;
【中文摘要】区域土地利用变化驱动力研究旨在从典型区域角度揭示土地利用变化背后的真正动因及其作用机理,进而动态模拟、预测区域土地利用变化过程。土地利用系统的自组织性及其内驱动因子作用的复杂性,决定了其研究必须与某一特定区域相联系,以便确定合适的可定量指标来体现外生驱动因子的驱动效果。系统地识别土地利用系统在不同控制状态下的驱动因子及其多种时空尺度效应,建立具有综合模拟的区域土地利用变化动态模型,能减少土地利用系统通常受临界域和突变所左右的局面。区域土地利用变化驱动因子识别、区域土地利用变化驱动机制分析、区域土地利用变化驱动过程模拟到呢个的研究现状表明,为更好地理解区域土地利用变化的机制和原因,测度现有及未来土地利用变化的速率、过程和地点,支持政府相关决策的制定与实施,促使区域土地利用变化向有利于人类的方向发展。区域土地利用变化驱动力分析应优先考虑的研究领域:(1)驱动力因子识别及其作用效应的尺度依赖性;(2)驱动力因子的贡献量化及其在具体区域的非均一分布;(3)驱动力因子作用过程的自然反馈机制模型化。
【英文摘要】This paper reviews the research on the drivers of regional land use change. The study of regional land use change drivers is to reveal the realmotivation behind the land use change and its inter acting mechanism in the aspect of the typical region, so as to simulate and predict the process of land use change. Presently, studies rooting from different natural and socioeconomic backgrounds, and from different scales, have deepened the under-standing and cognition of regional land use change driving forces. In order to confirm the fit quantifiable index to embody the driving effect of outer driving factor, the study in the future need to be related with a special region determined by the self-organization of land use system and the complexity of its inner driving forces function. To comprehensively identify the driving factor of land use system under the control of different states and its multiple spatial temporal scales domino effect and to establish the regional land use change dynamic models of comprehensive simulation, will reduce the situation of land use system impacted by critical threshold and break. Providing a scientific understanding of the causes and process of regional land use change, the measurements of how, why and where 'of current or future changes in regional land use, the impacts of different land use decisions, and the ways that decisions are affected by a changing environment and increasing ecological variability are priority areas for research: (1) identification of divers of regional land use change and scale dependency of their effects; (2) contribution quantification of drivers of regional land use change and their non-uniform distributions in specific region; and (3) incorporation of biophysical feedbacks in land use change models. These issues are very basic. The incorporation of dynamic feedbacks between changing regional land use and changing environmental conditions and vice versa, therefore needs to focus on solving these problems. These findings will be useful to supply fine ground and knowledge for establishing appropriate land use practices, and be important policy implications for the promotion of environmentally and economically sound land use.

【题目】重庆岩溶区土壤有机碳库的估算及其空间分布特征
【中文关键词】土壤有机碳密度;有机碳储量;有机碳丰度指数;重庆岩溶区
【英文关键词】soil organic density; soil organic carbon storage; the index of soil organic abundance; Chongqing karst area
【中文摘要】基于重庆市第二次土壤普查和2007年测土配方施肥的1412个土壤剖面数据,结合重庆岩溶区土壤图、土地利用现状图和行政区划图,在地理信息系统技术的支持下,对重庆岩溶区土壤有机碳密度及储量进行了估算,同时引入有机碳丰度指数这一指标,对有机碳在不同土壤和不同景观中的分布特征进行了分析。结果表明:重庆岩溶区20cm和100cm深度的土壤有机碳储量分别为1. 43×1011kg和3. 29×1011kg。不同土地利用方式下重庆岩溶区土壤有机碳密度分布不均匀,20cm深度的土壤有机碳密度介于1. 26~7. 20kgm- 2之间,100cm深度的土壤有机碳密度介于1. 43~25. 72kgm- 2之间。重庆岩溶区土壤有机碳库在不同土壤和不同景观中的分布具有高度的空间变异性, 20cm深度的土壤和景观有机碳丰度指数分别在0. 73~1. 74和0. 39~1. 20之间,100cm深度的土壤和景观有机碳丰度指数分别在0. 32~3. 00和0. 46~1. 70之间。与全国的平均水平相比,单位面积上20cm深度土壤有机碳储量重庆岩溶区高于全国的平均水平,但单位面积上100cm深度土壤有机碳储量重庆岩溶区低于全国的平均水平,总体而言,重庆岩溶区是土壤有机碳储量相对贫乏的区域
【英文摘要】The estimation of soil organic carbon storage is very important to the research of carbon cycle. The soil organic carbon density and storage of Chongqing karst area was estimated, using the data of 1412 soil profile from the second soil survey of China and formulating fertilization for soil conditions in2007. Integrating the soil map, land use status quo map and district map of Chongqing karst area, the index of soil organic abundance were introduced and the characteristic of soil organic distribution indifferent soil and land scapes were analyzed. Results showed: the storage of soil organic carbon of Chongqing karst area to the depths of 20 cm and 100 cm were 1.43×1011kg and 3.29×1011kg, respectively. Carbon density of 20 cm soil was 1. 26-7. 20 kg m-2 , and carbon density of 100 cm soil was 1. 43-25.72 kg m-2. The amount of soil organic carbon varied significantly at different soils and landscapes, the index of soil organic abundance of soils and landscapes at 20cm depth ranged from 0.73-1.74 and 0.39-1.20, and that at 100 cm depth changed between 0. 32-3.00 and 0. 46-1.70, respectively. The soil organic carbon storage of unit area at 20 cm depth was above the average level of China, but that at 100 cm depth was below the average level of China in Chongqing karst area. In a word, the soil organic carbon storage was relatively indigent in Chongqing karst area.

【题目】不同氮营养冬小麦冠层光谱红边特征分析
【中文关键词】冬小麦;冠层;氮水平;红边参数
【英文关键词】Winter wheat; canopy; nitrogen level; red edge parameters
【中文摘要】利用光谱仪测定了不同氮素处理冬小麦冠层光谱,分析其红边特征变化规律及其与农学成分的相关关系。结果表明,波长550nm,680nm,980nm,1100nm,350-680nm,750-1100nm可作为氮素营养诊断的敏感特征点与波段范围。随着施氮量的提高,拔节期、抽穗期以及灌浆期的红边位置、红谷位置与光谱反射率一阶微分极大值均增大,红边宽度则有减小的趋势。总体上看,施氮与无氮处理在整个生育期均存在较大差异,施氮处理之间差异较小。冠层反射光谱的红边位置、红谷位置随生育期向长波方向移动,呈现“红移”现象;从抽穗期开始逐渐减小,呈现“蓝移”现象。冬小麦红边参数中红边位置与农学组分之间的相关性优于其他参数,除与地上部生物量正相关显著外,与叶面积指数、叶含水率、叶绿素含量、叶可溶性蛋白含量、叶鲜重、叶含氮量均呈正相关且达到极显著水平。红谷位置则与叶面积指数、叶含水率、叶绿素含量、叶鲜重以及@B)G 值呈极显著正相关,与可溶性蛋白呈显著正相关。红边宽度与叶面积指数、叶含水率、叶氮含量、叶绿素含量以及叶鲜重均呈极显著正相关,与可溶性蛋白含量呈显著正相关。反射率一阶导数极大值与叶面积指数、叶含水率、叶鲜重呈极显著正相关,与叶含氮量极显著负相关。通过红边参数与农学组分稳定良好的数学关系,可以对农学组分进行预测估算。

【英文摘要】The spectrometer measured at different Nitrogen for Winter Wheat Canopy spectral analysis of the variation of red edge characteristics and agronomic composition relationship. The results show that the wavelength of 550nm, 680nm, 980nm, 1100nm,350-680nm,750-1100nm can be used as Nitrogen Nutrition Diagnosis sensitive feature points and the wavelength range. With the amount of nitrogen increases, the red edge position of the jointing, heading and filling stage, the great value of the first derivative of the position and spectral reflectance in the Red Valley are increased, the width of the red edge tends to decrease. Overall, nitrogen and nitrogen processing in the whole growth period there is a big difference, small difference between the N treatment. The red edge position of the canopy reflectance spectra, with the growth period, the Red Valley location to move to longer wavelengths, showing the "red shift" phenomenon; from heading gradually decreases, showing a "blue shift" phenomenon. Red Edge Parameters correlation between the red edge position and agricultural components is superior to other parameters, and aboveground biomass positively correlated significantly outside with the leaf area index, leaf moisture content, chlorophyll content, leaf soluble protein content leaf fresh weight, leaf nitrogen content showed a positive correlation reached a significant level. Red Valley location with the leaf area index, leaf moisture content, chlorophyll content, leaf fresh weightAnd @ B) G values were highly significant positive correlation with the soluble protein was significantly positively correlated. The red edge width and leaf area index, leaf moisture, leaf nitrogen content, chlorophyll content and leaf fresh weight showed a very significant positive correlation with the soluble protein content was significantly positively related. Maxima of the first derivative reflectance and leaf area index, leaf moisture, leaf fresh weight was highly significant positive correlation was significantly negatively correlated with leaf nitrogen content. The mathematical relationship of the red edge parameters and agricultural components, the forecast estimates on the agriculture component.

【题目】基于SPAD-502 与GreenSeeker 的冬小麦氮营养诊断研究

【中文关键词】冬小麦 氮 营养诊断 SPAD-502 GreenSeeker

【英文关键词】Winter wheat, Nitrogen, Nutrition diagnosis, SPAD-502, GreenSeeker

【中文摘要】用GreenSeeker 和SPAD-502 测定了不同氮素处理的冬小麦冠层NDVI 与叶片SPAD 值, 分析了它们与叶片全氮、叶绿素含量及产量间的关系。结果表明: 冬小麦抽穗期SPAD 值和NDVI 值均与叶绿素含量呈极显著正相关; 除抽穗期和返青期外, SPAD 值与叶氮含量、叶绿素含量的相关系数在其余各生育期均达到显著或极显著水平; NDVI 值与叶氮含量、叶绿素含量在拔节期、乳熟期的相关性同SPAD 值一致; SPAD 值可以进行叶绿素的诊断, NDVI 值可以进行氮的诊断。氮营养诊断时期应该选择拔节期。通过回归建立了基于SPAD值、NDVI 值的产量估测模型, 可以通过SPAD 值、NDVI 值对冬小麦产量进行估算。

【英文摘要】Leaf SPAD and canopy NDVI of winter wheat under different nitrogen treatments were analyzed using GreenSeeker and SPAD-502 with the aim of building a quick, timely and accurate method for diagnosing nitrogen nutrition. The results show significant positive correlations among leaf SPAD, canopy NDVI and chlorophyll content. Correlation coefficients for leaf SPAD and leaf N and chlorophyll content are significant, except during heading and reviving stages. Correlations for canopy NDVI with leaf N and chlorophyll content at jointing and milking stages are similar to that for leaf SPAD. While SPAD can be used to evaluate chlorophyllcontent, NDVI can be used to assess nitrogen content. The recommended period for diagnosing nitrogen status is jointing stage. Using SPAD and NDVI, a linear regression model is developed for assessing yield of winter wheat.

【题目】Effect of tillage system on distribution of aggregates and organic carbon in a Hydragric Anthrosol
【中文关键词】无
【英文关键词】aggregates; Hydragric Anthrosol; organic carbon; tillage system
【中文摘要】无
【英文摘要】The effect of different tillage systems on the size distribution of aggregates and organic carbon distribution and storage in different size aggregates in a Hydragric Anthrosol were studied in a long-term experiment in Chongqing, China. The experiment included three tillage treatments: conventional tillage with rotation of rice and winter fallow (CT-r) system, no-till and ridge culture with rotation of rice and rape (RT-rr) system, and conventional tillage with rotation of rice and rape (CT-rr) system. The results showed that the aggregates 0.02-0.25 turn in diameter accounted for the largest portion in cacti soil layer under all treatments. Compared with the CT-r system, in the 0-10 cm layer, the amount of aggregates > 0.02 turn was larger under the RT-rr system, but smaller under the CT-rr system. In tire 0-20 cm layer, the organic carbon content of all fractions of aggregates was the highest under the RT-rr system and lowest under the CT-rr system. The total organic carbon content showed a positive linear relationship with the amount of aggregates with diameter ranging from 0.25 to 2 mm. The storage of organic carbon in all fractions of aggregates under the RT-rr system was higher than that under the CT-r system in the 0-20 cm layer, but in the 0-60 cut soil layer, there was no distinct difference. Under the CT-rr system, the storage of organic carbon in all fractions of aggregates was lower than that under the CT-r system; most of the newly lost organic carbon was front the aggregates 0.002-0.02 and 0.02-0.25 mm in diameter.

【题目】Soil Aggregation and Its Relationship with Organic Carbon of Purple Soils in
【中文关键词】无
【英文关键词】aggregation of soil primary particle, soil structure, soil organic carbon, aggregate size distribution, complexing of organo-mineral, purple soil
【中文摘要】无
【英文摘要】The interaction of soil aggregate dynamics with soil organic carbon is complex with varied spatio-temporal processes in macro-and micro-aggregates. This paper is to determine the aggregation of soil aggregates in purple soils (Regosols in FAO Taxonomy or Entisols in USDA Taxonomy) for four types of land use, cropland [corn (Zea mays L.)], orchard (citrus), forestland (bamboo or cypress), and barren land (wild grass), and to explore their relationship with soil organic carbon in the Sichuan basin of southwestern China. Procedures and methods, including manual dry sieving procedure, Yoder's wet sieving procedure, pyrophosphates solution method, and Kachisky method, are used to acquire dry, wet, and chemically stable aggregates, and microaggregates. Light and heavy fractions of soil organic carbon were separated using 2.0 g mL -1 HgI 2 -KI mixed solution. The loosely, stably, and tightly combined organic carbon in heavy fraction were separated by extraction with 0.1 M NaOH and 0.1 M NaOH-0.1M Na4P2O7 mixed solution (pH 13). The results show that the contents of dry and wet macroaggregates > 0.25 mm in diameter were 974.1 and 900.0 g kg-1 highest in red brown purple soils under forestland, while 889.6 and 350.6 g kg-1 lowest in dark purple soil and lowest in grey brown purple soils under cropland, respectively. The chemical stability of macroaggregates was lowest in grey brown purple soil with 8.47% under cropland, and highest in red brown purple soil with 69.34% under barren land. The content of microaggregates in dark purple soils was 587 g kg -1 higher than brown purple soils, while 655 g kg -1 in red brown purple soils was similar to grey brown purple soils (651 g kg -1). Cropland conditions, only 38.4% of organic carbon was of the combined form, and 61.6% of that existed in light fraction. Forestland conditions, 90.7% of organic carbon in red brown purple soil was complexed with minerals as a form of humic substances. The contents and stability of wet aggregates > 0.25 mm, contents and stability of chemically stable aggregates > 0.25 mm, contents of microaggregates > 0.01 mm, contents of aggregated primary particle (d < 0.01 mm) and degree of primary particles (d < 0.01 mm) aggregation were closely related to the concentrations of total soil organic carbon, and loosely and tightly combined organic carbon in heavy fraction. Soil microaggregation could be associated with organic carbon concentration and its combined forms in heavy fraction.

There was a direct relationship between microaggregation and macroaggregation of soil primary particles, because the contents of wet aggregates > 0.25 mm and its water stability of aggregates were highly correlated with the contents of aggregated primary particle (d < 0.01 mm) and the degree of primary particles (d < 0.01 mm) aggregation.

【题目】农业活动对景观格局的影响
【中文关键词】景观格局; 人为干扰; 放牧; 植树造林; 农作物种植; 土地整理
【英文关键词】Landscape pattern, Human disturbance, Grazing, Afforesting, Cropping, Land consolidation and rehabilitation
【中文摘要】景观格局是自然和人类共同作用的结果, 并随着经济发展和人口增长, 农业活动在景观格局中起着愈来愈大的作用。放牧过程导致土壤退化和生物群落的不稳定, 间歇式放牧会提高物种丰富度, 促进生态系统的进化; 植树造林不但有利于生态恢复和重建, 而且对经济建设有巨大作用, 更是保护生物多样性的手段; 农作物种植包括物理干扰和化学干扰过程, 改变了微生物的活性, 同时对土壤性质产生影响; 土地整理是人为的、强制性、时效性强的一种干扰, 能在短期内对生态系统及景观格局产生剧烈影响, 通过调整景观结构、改善景观破碎化, 改变农业土地利用结构, 使得社会效益、生态效益和环境效益均有所增加。
【英文摘要】Landscape pattern is acted on natural and human disturbance. With economic development and increasing population, agriculture practice have played a very important role in society. Grazing results in soil degradation and instability of biology community. The rotation grazing enhances the species abundance and advance ecosystem evolvement. Afforesting is propitious to ecological environment renew and reconstruction, favor in economy, and even to be a method of protecting ecological diversity. The disturbances of cropping are divided into physical and chemical perturbation processing, which accelerate microbial character, and influence the soil properties. Land consolidation and rehabilitation is the strongest perturbation in all kinds of human disturbances, and make the benefit of social, ecological and environmental incremental by adjusting landscape structure, meliorating fragmentation of landscape, increasing the area of the farmland, and changing the structure of agricultural land- use.

【题目】长期定位施肥对土壤养分与作物产量的影响
【中文关键词】长期定位试验; 有机肥; 化肥; 土壤养分; 作物产量
【英文关键词】long-term located experiment; organic manure; chemical fertilizer; soil nutrient; crop yield
【中文摘要】【目的】研究探讨长期施用有机肥、化肥、有机无机结合等不同施肥条件下的作物增产效果与土壤养分演变规律【方法】以在山东禹城连续22年的长期施肥定位试验为依据,对历年土壤养分和作物产量测试结果进行系统总结试验采用冬小麦一夏玉米一年二熟栽培制度,分别设置①无肥对照,②常量有机肥无机肥配施,③常量有机肥,④常量化肥,⑤高量有机肥,⑥高量化肥,共6个施肥处理【结果】在作物产量方面,试验之初的8-10年间表现为化肥对冬小麦的增产作用优于有机肥,而在夏玉米上则表现出相反结果,有机无机结合处理大部分年份作物产量处于较高水平;随着试验时间的延长,各施肥处理产量逐渐趋于一致;22年间土壤有机质含量始终表现出随有机肥施用量的增加而增高,且有逐年增长之趋势;化肥在提高土壤有机质、全氮等营养方面受生物产量和根茬残留量影响而与施肥量无明显关系,增施化肥可以迅速提高速效养分含量,并在一定水平上保持相对稳定【结论】长期施用有机肥与化肥均表现出持续提高作物产量的良好作用,且二者效果不相上下,常规栽培条件下,当产量提高到一定水平后,继续高量施肥无助于作物产量的提高;有机肥与化肥均表现出持续提

高土壤有机碳、氮含量之作用,有机肥效果明显优于化肥,且表现出随有机肥用量的增加而增加而继续提高化肥施用量无助于土壤有机碳、有机氮的积累;一向被认为钾素含量的黄淮海平原土壤在连续施用氮磷化肥5-8年左右作物即表现明显缺钾现象,由此揭示出高产条件下氮磷钾平衡施肥的重要作用;在对提高土壤速效养分效果方面的差异表现在,化肥可以迅速提高速效养分含量并在这一水平上保持相对稳定,而有机肥则具有持续提高土壤速效养分含量的作用。

【英文摘要】[Objective] To evaluate the effect of organic manure and fertilizers long term located application on soil nutrients and crop yield. [Method] The results of crop yields and soil nutrients were measured and collected based on a 22-year long-term located application of organic manure and fertilizers experiment in Yucheng city of Shandong Province chemical fertilizers on winter wheat yield was better than organic manure during the first 8-10 years, [Result] The effect of chemical fertilizers on winter wheat yield was better than organic manure during the first 8-10 years, but the reverse result was observed in summer maize yield. The combined effect of chemical fertilizers with organic manure on wheat and maize yields was very obvious. However, with prolonged application, the yields of each treatment, no matter with organic manure or chemical fertilizer or combined, turned out similar. Soil organic matter content increased with time and application level of organic manure during the 22 years. Soil organic matter and total nitrogen contents were found unrelated to the application rate of chemical fertilizers in this long term experiment. Increased application of chemical fertilizer could enhance soil available nutrient contents and at the same time be kept relatively stable to some extent. [Conclusion] The effect of chemical fertilizer on winter wheat yield was better than organic manure during the first 10 years, however, a reverse result was observed in summer maize yield, and after that the crop yields of all treatments were found similar. Therefore, increased application of fertilizer did not improve the crop yield. The effect of organic manure on soil organic C and N content increase was much better than chemical fertilizer, and the soil organic C and N content increased with the application rate of organic manure. Soil organic C and N content could not be improved by application increase of chemical fertilizer. With prolonged application, organic manure could improve soil available nutrients content continually, and its effect was found much obvious than that of chemical fertilizer.

【题目】增值尿素对氨挥发和土壤脲酶活性的影响
【中文关键词】增值尿素; 土壤培养; 氨挥发; 脲酶活性
【英文关键词】Value-added urea; Soil incubation; Ammonia volatilization; Soil urease activity
【中文摘要】通过向普通尿素中添加不同类型有机物料增值剂,利用熔融造粒工艺研制出不同类型的增值尿素新产品,在25°C、土壤培养条件下与普通尿素比较,研究了不同类型增值尿素的氨挥发、土壤脲酶活性及二者之间的关系。结果表明,培养4周后,与普通尿素(U)相比,增值尿素品种F-5和H-5的氨挥发累积量分别减少了15.2%和13.3%,其中前者推迟了氨挥发高峰出现的时间,两者显著降低了氨挥发的峰值,且在整个培养期表现出了较好的稳定性。F-5和H-5品种在施肥后的前1周都显著降低了土壤脲酶活性,延缓了尿素态氮在土壤中的转化进程。与普通尿素相比,F类和H类增值尿素在减少氨挥发损失和抑制脲酶活性方面表现效果良好。

【英文摘要】Soil incubation under 25°C was applied to study the ammonia volatilization and soil urease activity of normal urea and value-added urea which was manufactured by melted urea with different organic synergists.The results showed that the value-added urea F-5 and H-5 decreased the accumulation of ammonia volatilization by 15.2% and 13.3% compared to the normal urea.The peak of ammonia volatilization was deferred by the treatment F-5 and the peak value was brought down by the two treatments whose variation curves were relatively stable.The treatment F-5 and H-5 could inhibit the soil urease activity and prolong the release time of urea.Compared with normal urea,the effects of F and H value-added urea on the ammonia volatilization reduction and the soil urease activity inhibition were significant.

【题目】硝酸磷肥生产除钙过程中钾携带问题研究
【中文关键词】硝酸磷肥; 除钙; 钾携带
【英文关键词】nitric phosphate; decalcium; potassium carrying
【中文摘要】硝酸磷肥生产中采用硫酸钾除钙离子,可以生产氮磷钾三元复合肥,但是在生成石膏沉淀的过程中会有少量硫酸钾与硫酸钙生成复盐形式析出。研究了沉淀温度、浓度、硫酸钾加入量、硫酸钾加入方式等因素对钾携带的影响。当采用56%稀硝酸分解磷矿粉所得的酸解液加入400g硫酸钾/L水的悬浮液,沉淀温度100℃,钾石膏沉淀中的钾含量低于0.5%,总带出量小于1%,钾石膏生成量较大,钙离子沉淀完全。
【英文摘要】NPK compound fertilizer was produced by adding potassium sulphate to decomposite slurry product of nitric phosphorite, but a small quantity of potassium sulphate was lost by coprecipitating with precipitaed gypsum phase. The effects of precipitating temperature, concentration, quantity of potassium sulphate addition and state of added potassium sulphate on potassium carrying was studied. When nitric acid(56% mass fraction) decomposing phosphorite, the optimum reaction conditions were obtained: materialmass ratio m(K2SO4)in (H20) was 0.4:1, precitating temperature was 100°C,and K2O content in gypsum was under 0.5%, potassium loss was under 1%, and calcium was precipitated completed.

【题目】湿法磷酸净化生产工业磷酸一铵研究
【中文关键词】湿法磷酸净化; 工业磷酸铵; 肥料磷酸铵
【英文关键词】wet process phosphoric acid purification; industrial monoammonium phosphate; fertilizer grade monoammonium phosphate
【中文摘要】磷酸铵用作灭火剂、阻燃剂等工业领域需要有较高的纯度。传统的湿法磷酸氨化法生产的磷酸铵杂质含量高,主要用作农业肥料,无法作为工业品使用。工业用磷酸铵一般采用热法磷酸来生产,成本高、污染重。研究了将湿法磷酸净化来生产工业用磷酸铵的方法,同时副产肥料级磷酸铵。研究结果表明,该方法可以生产磷(以五氧化二磷计)质量分数在59%以上的工业用磷酸铵,磷(以五氧化二磷计)收率在70%以上,副产的肥料级磷酸铵有效磷(以五氧化二磷计)质量分数在30%~40%,有效磷收率为15%~20%。
【英文摘要】Monoammonium phosphate(MAP) used as fire extinguishing agent and anti combustion additive etc requires a higher purity MAP produced by traditional wet process phosphoric acid(WPA) amination method is mainly applied in agriculture fertilizers and can not be used as industrial product because of high content of impurities. Industrial is usually produced from thermal phosphoric acid, however, the cost is high and the pollution is severe. The method that through purification of WPA to produce MAP and by producing fertilizer grade MAP at the same tine was studied. Results showed that the industrial MAP prepared by this method with mass fraction of phosphorus(as P2O5) was more than of 59% and absorption ratio of phosphorus(as P2O5) was above 70%; mass fraction of available phosphorus(as P2O5) by produced fertilizer grade MAP was 30%-40% and absorption ratio of available phosphorus was 15%-20%.

【题目】含氯钾肥的低温脱氯试验研究
【中文关键词】氯化钾; 低温脱氯; 研究
【英文关键词】potassium chloride; low-temperature dechlorination; study
【中文摘要】比较了曼海姆法和硫酸氢钾法的优缺点,选择了反应条件进行研究,即浓硫酸与氯化钾的投料摩尔比0.5-1.0,反应温度取160-300℃。试验结果表明:当浓硫酸与氯化钾摩尔配比为0.6、0.7和0.8,反应温度为160-300℃,反应时间2-6h,总氯根脱除率都能达到96.5%以上,大部分试验样的第2步反应氯根脱除率可达92.0%以上,反应条件均比较温和,在工业生产上更易于实现。
【英文摘要】The merits and demerits of the Mannheim process are compared with those of the potassium bisulfate process, and reaction conditions are chosen for carrying out the study,viz., the feed mole ratio of concentrated sulfuric acid and potassium chloride at 0.5-1.0 and the reaction temperature at 160-300°C. The test results show that when the mole ratio is 0.6, 0.7 and 0.8,the reaction temperature is 160-300°C, and the reaction time is 2-6h, then over 96.5% of the total chloride is removed, over 92.0% of the second-step reaction chloride in most test samples is removed, the reaction conditions are rather mild, and this is easy to be realized in industrial production.

【题目】腐植酸尿素氨挥发特性及影响因素研究
【中文关键词】熔融造粒; 腐植酸尿素; 氨挥发; 脲酶活性; 溶出率; 铵态氮
【英文关键词】melting granulating; humic acid urea; ammonia volatilization; urease activity; leaching rate; NH4+-N
【中文摘要】采用室内模拟,研究了腐植酸尿索在土壤培养条件下其氨挥发特性及其与土壤脲酶活性、氮溶出率以及土壤铵态氮、硝态氮含量变化的关系。结果表明,研制的4种腐植酸尿索氨挥发量分别比普通尿素降低了48.14%、47.99%、30.89%、59.22%,其中水溶性腐植酸含量11.78%的腐植酸尿素降低最多。腐植酸尿素降低氨挥发量与其养分释放模式和形成的土壤环境密切相关。土壤氨挥发总量与脲酶活性在培养前期相关系数较高,培养48和96h分别达到0.825和0.808;土壤氨挥发总量与肥料累积溶出量相关系数为0.903,培养前期土壤氨挥发量与铵态氮含量相关系数达到0.869。
【英文摘要】Behaviors of humic acid compound urea in soil were studied under laboratory conditions. Results show that compare with common urea,the total ammonia volatilization from four humic acid compound urea fertilizers were decreased by 48.14%, 47.99%, 30.89 % and 59.22%, among them the compound urea with water soluble humic acid content being 11.78% decreased most The ammonia volatilization reduction of humic acid urea correlated significantly with its nutrient-release mode and soil ambient. The

total ammonia volatilization correlated significantly with soil urease activity during initial period of incubation, the correlation coefficient between total ammonia volatilization and soil urease activity was 0.825 and 0.808 for the fertilizer incubated for 48 hours and 96 hours,respectively. The correlation coefficient between total ammonia volatilization and N leaching rate was 0.903. The correlation coefficient between total ammonia volatilization and content of NH4+-N was 0.869 at the initial stage of incubation.

【题目】熔融造粒腐植酸尿素的缓释性能研究
【中文关键词】熔融造粒; 腐植酸; 尿素; 缓释性
【英文关键词】melting granulating; humic acid; urea; slow-release property
【中文摘要】用碱处理风化煤得到水溶性腐植酸和沉淀混合物以及未处理的风化煤细粉(80目)分别与熔融尿素混合造粒,制得3种类型的腐植酸尿素产品,并利用土柱淋洗方法研究不同腐植酸尿素产品的缓释性能。结果表明,除添加10%的未处理风化煤处理外,其余腐植酸尿素产品与普通尿素相比,均表现出具有氮缓释性能。其中,以添加水溶性腐植酸的产品缓释性最强,且当水溶性腐植酸与尿素比例为3∶7时,肥料的缓释效率最高。在本试验条件下,风化煤类腐植酸熔融造粒工艺下制成腐植酸复合尿素的缓释性能,与添加腐植酸的数量呈正相关;水溶性腐植酸添加比例与腐植酸复合尿素缓释性能相关性较低。3种类型的腐植酸复合尿素,以添加水溶性腐植酸的肥料质量最稳定。对风化煤进行活化后提取水溶性腐植酸,适量添加到熔融尿素中进行造粒,可生产出具有较好缓释性能的腐植酸尿素产品。
【英文摘要】Weathering coal was treated with alkaline to get water soluble humic acid and deposition.Weathering coal,humic acid and deposition were compounded with melted urea respectively to produce the three kinds of compound ureas.Slow release properties of the ureas were studied by using the nitrogen soil leaching method.The results show that nitrogen release capacities of all compound ureas are slow except for the urea of adding 10 percent weathering coal,and the release capacity of urea of adding humic acid is lowest.The slow release efficiency of the compound urea of adding 30 percent humic acid is the highest.The slow release capability of weathering coal are different among three kinds of compound ureas,and there is a positive correlation between the slow release capability and the adding amount of humic acid.However,there is poor correlation between the slow release capacity and humic acid adding percent.The compound urea of adding water soluble humic acid has stable quality as a fertilizer.To use water soluble humic acid extracted from weathering coal,and introduce a suitable proportion of the acid and urea could produce humic acid compound urea with a better slow release property.

【题目】长期定位施肥对盐化潮土土壤腐殖质组分的影响
【中文关键词】长期施肥; 腐殖质; 胡敏酸; 富里酸
【英文关键词】Long-term fertilization; Humus; Humic; Fulvic acid
【中文摘要】本文以中国农业科学院禹城试验站轻壤质盐化潮上(黄河冲积平原土壤)的20年肥料长期定位试验为平台,系统研究了长期施用无机肥、有机肥及有机无机配施对土壤腐殖质形态和组分的影响。结果表明:长期施用有机肥不仅能显著或极显著提高土壤有机碳、腐殖质及胡敏酸、富里酸的含量,而且能提高HA/FA比值,促进土壤有机碳活化与更新,改善腐殖质的品质,而且其含量随有机肥用量的增加而提高;长期施用化肥虽然也能在一定程度上提高土壤有机碳、胡敏酸等的含量,但其含量基本不受化肥用量增加的影响。在等氮量的条件下,长期有机无机肥配施比常量有机肥处理更能提高耕

层上壤HA/FA。
【英文摘要】The experiment was designed to evaluate the influence o long-term located fertilization for 20 years on humus form and composition in light-loamy salinized fluvo-aquic soil(the Alluvial soils by the Yellow River). The results showed that long-term application of organic manure could increase the contents of organic carbon, humus humic acid and fu1vic acid and the ratio of Humic acid-Fulvic acid(HA /FA) remarkab1ely, promote the activation and renewal of organic carbon in soi1 and improve the quality of soil humus and the humus content increased with the use level of organic manure. Although chemical fertilizer had the similar effects on the contents of humus and its composition to same extent, their contents were not influenced by the amount of chemical fertilizer. At the same amount of nitrogens combined application of organic and inorganic fertilizers increased HA/FA in arable layer more than constant organic fertilizer.

【题目】有机无机肥料长期配施对作物产量及氮素吸收利用的影响
【中文关键词】长期施肥; 有机无机肥料配施; 作物产量;氮素吸收利用
【英文关键词】Long-term fertilization; Combined application of organic and inorganic fertilizers; Crop yield; Nitrogen uptake
【中文摘要】以中国农业科学院禹城试验站轻壤质盐化潮土(黄河冲积平原土壤)20年肥料长期定位试验为平台,系统研究了有机无机肥料长期配施对作物产量及氮素吸收利用的影响。结果表明:在等氮量条件下,长期施用常量无机肥虽然小麦和玉米秸秆的含氮量较高,但向籽粒氮转移量和生理效率却较低;长期施用常量有机肥小麦和玉米生理效率较高,而含氮量和氮转移量却较低;只有常量有机无机肥料配施才能逐步提高小麦和玉米产量、经济系数、含氮量、氮素转移量和生理效率。
【英文摘要】Based on the 20 year fertilization experiment in light-loamy salinized fluvo-soil(alluvial soil by the Yellow River) in Yucheng experiment station of Chinese Acadamy of Agricultural Science, the research system atically studied the effects of long-term combined application of organic and inorganic fertilizers on crop yield and nitrogen uptake. The results were as follows. At the same amount of nitrogen in the treatment of long-term fertilization of normal inorganic fertilizer, the nitrogen content in wheat and maize stalk was higher but the nitrogen quantity transported to grain and its physiological efficiency was lower. In the treatment of long-teen fertilization of organic manure the nitrogen physiological efficiency in wheat and maize was higher while the nitrogen content and nitrogen transfer amount were lower. Only long-term combined application of organic and inorganic fertilizers had increased the grain yield, economic coefficient, nitrogen contents, nitrogen transfer amount and its physiological efficiency.

【中文关键词】山东省; 施肥演变; 有机肥料; 施肥结构; 施肥量; 边际产量
【英文关键词】Shandong province; evolution of fertilization; organic fertilizer; fertilization structure; fertilization quantity; marginal yield
【中文摘要】采用统计资料和农户调查相结合的方法,对山东省历年养分投入的数量、结构、比例以及平衡状况进行系统地分析。结果表明,山东省有机肥料投入严重不足,粮食作物的边际产量急剧下降,化肥养分利用效率相对较低,氮磷钾比例的失调仍然存在。增加有机肥料投入,提高化肥的利用效率,减少化肥的浪费和对环境的污染是今后全省施肥工作的重点

。
【英文摘要】On the basis of the statistical data and peasants household investigation, the fertilization status including nutrients quantity, fertilization structure, proportion and balance in recent years in Shandong province is systematically analyzed. It shows that there are series of problems on fertilization such as seriously deficient input of organic fertilizers, sharply descended marginal yield, lower fertilizer efficiency and relatively unreasonable NPK proportion. In the future, increasing organic fertilizer input, raising fertilizer efficiency reducing wastes and decreasing environmental pollution should be the focuses of fertilization in Shandong province.

【中文关键词】长期施肥; 灰漠土; 矿物颗粒; 结合有机碳; 演变特征
【英文关键词】long-tem fertilization; gray desert soil; organic carbon associated with particle-size fractions; evolution characteristics
【中文摘要】采用物理分组方法分析了长期(1990~2007年)不同施肥条件下灰漠土各粒径矿物颗粒结合有机碳含量和分布差异及其随施肥时间的演变特征,结果表明:与不施肥相比,配施有机肥对增加各有机碳组分的效果最显著,并以砂粒有机碳含量的增速(0134g · kg-1 · a-1)最高,对施肥最敏感;撂荒地可以显著增加不同豁粉粒结合有机碳含量;秸秆还田仅能维持各级矿物颗粒结合有机碳的含量;长期施用化肥不利于各级颗粒结合有机碳含量的增加。从分配比例来看,以粗粉粒(27119%)和粗黏粒(2711%)有机碳所占比例最高,是固持有机碳的重要组分;配施有机肥使砂粒有机碳比例显著提高11914%,细粉粒和粗黏粒有机碳比例却分别降低了4013%和3719%,从而提高了颗粒有机碳含量(WPOC)与矿物结合有机碳含量(WMOC)的比值,改良了土壤有机碳性质。长期配施有机肥是增加灰漠土各级矿物颗粒结合有机碳积累和提升灰漠土肥力的最佳万式。
【英文摘要】Physical fractionation technique was used to analyze the content distribution and temporal evolution of organic carbon associated with particle-size fractions of grey desert soil under 1ong-term(1990- 2007) fertilization. Compared with no fertilization, a combined application of manure and chemical fertilizers increased the organic carbon associated with particle-size fraction significantly, with the highest increment(0134 g · kg-1 · a-1) in sand Fallowing also increased the organic carbon associated with clay and silt significantly. Straw return to crop land only maintained the organic carbon content in different particle-size fractions, while long-term application of chemical fertilizers was not beneficial to the organic carbon increase in particle-size fractions. Coarse silt and coarse clay had the highest distribution rates of organic carbon(2719% and 2711%, respectively), being the important fractions in sequestrating organic carbon. When manure was applied with chemical fertilizers, the organic carbon in sand was significantly increased by 11914%, while that in fine silt and coarse clay was significantly decreased by 4013% and 3719%, respectively which resulted in the increase in the ratio of particulate organic carbon content(WPOC) to mineral-associated organic carbon content(WMOC), and improved soil carbon properly Long-tem application of manure combined with chemical fertilizers was best mode to increase the organic carbon content in particle-size fractions and improve the fertility of grey desert soil.

【题目】长期定位施肥对灰漠土钾素形态的影响
【中文关键词】长期定位施肥; 灰漠土; 钾素形态

【英文关键词】Long-term located fertilization; grey desert soil; potassium forms
【中文摘要】灰漠土钾素含量较高,主要是以矿物钾和难交换性固定钾的形式存在,占土壤全钾的98.6%。水溶性钾和交换性钾含量较低,仅占土壤全钾的1.2%左右。土壤中各种形态钾素之间紧密相关,土壤水溶性钾、交换性钾和非特殊吸附钾与土壤速效钾之间达显著相关,是植物易吸收利用的有效性钾。特殊吸附钾与土壤速效钾之间呈负相关关系,是土壤交换性钾中植物不能直接吸收利用的钾。长期定位施肥改变了土壤钾素存在形态,配施有机肥使土壤有效性钾含量增加24%~56%,并促进土壤特殊吸附钾转化为其它形态的钾;施化肥钾使土壤水溶性钾含量平均均增加35%,提高了土壤钾素的供应水平,同时加速了土壤特殊吸附钾的积累。
【英文摘要】The content of potassium was very high in the desert soil. Mineral K and Non-exchangeable was its main form, which was 98.6% of total K. The content of water soluble K were low, 1.2% of total K. Potassium forms in the soil had close correlation. correlation. Water soluble K, exchangeable K, specific absorbed K and available K in the soil had significant correlation, and the plant was easy to make use of them. There was negative correlation between specific absorbed kand and the plant could not absorb it directly in exchangeable K of soil. The combined application of organic manure could make the content of available K in the soil increase by 24%~56%, transform specific absorbed K into other form potassium in the treatments of organic manure. The content of water soluble K in the soil increased by 35%, K supply level was improved, and specific K accumulation in the soil was increased in the treatments of potassium fertilizer.

【题目】聚合物包膜尿素氮释放特性及其对高羊茅草坪生长的影响.
【中文关键词】高羊茅; 包膜尿素; 初期溶出率; 微分溶出率; 草坪质量
【英文关键词】tall fescue; coated urea; preliminary solubility; differential solubility; turf quality
【中文摘要】通过静态水溶试验和草坪施肥试验,研究了高分子聚合物包膜尿索(PCU)的养分释放特性及春季次性施用对高羊茅草坪生长的影响。结果表明,由于肥料所处环境温度不同导致实验室静态水溶法测定PCU养分释放速度快于其在田间的实际释放速度。田间试验中一次性施用该肥料可以满足高羊茅草坪整个春季生长对氮索养分的需要;与尿素和市场上的草坪肥料相比,草坪质量无显著差异,且草坪生长速度均匀,草屑量相对较少,起到了减少草坪修剪次数降低养护强度的作用。

【英文摘要】The nitrogen release characteristic of macromolecule polymer coated urea(PCU) by laboratorymethod of water dissolve and the effects of applied PCU on tall fescue turf as basal application in spring was studied. The results showed that the rate of PCU nitrogen release by laboratory method of water dissolve is faster than the rate in the turf field because of their different circum stance temperature affect. Applying PCU once in early spring could meet nitrogen need of tall fescue growth in spring season. Compared with urea and turf special fertilizer, no significant difference was observed in turf quality. So, applied PCU play an important role in reducing turf maintenance strength through keeping even growth of turf grass and less clippings production.

【题目】分光光度法测定树脂包衣尿素溶出的研究
【中文关键词】对二甲氨基苯甲醛分光光度法; 包衣尿素溶出; 测定
【英文关键词】dimethylam ino-benzaldehyde spectrophotometry method; coated urea release rate; detection
【中文摘要】研究了对二甲氨基苯甲醛分光光度法应用于树脂包衣尿素养分溶出测定的可行性。对二甲氨基苯甲醛与尿素在酸性条件下生成黄色物质,其吸光值与尿素溶液的浓度成正比。结果表明,该方法与蒸馏后滴定法测定尿素相关性非常好,测定过程中缩二脲和硝态氮、铵态氮的干扰少。树脂包衣尿素养分溶出测定期间尿素样品分解量少,分光光度法与蒸馏后滴定法的测定结果相关性非常好。试验证明两种方法测定包衣尿素溶出均可给出满意的结果,但分光光度法更快速、简便,适用于大批量样品的测定。
【英文摘要】This article refers to dimethylam ino-benzaldehyde spectrophotometry method used in the detection of coated release rate. Dimethylam ino-benzaldehyde and urea react to form a stable yellow complex in thin hydrochloric acid solution, the color could maintain for more than 24 hours. Biuret, nitrate and amonium had little interference. During the examination of coated urea released rate, the urea sample decompose little, the results using spectrophotometry method and the digest-distill method had good correlationship. The two methods could all give out satisfied results, but spectrophobmetry method was simple and rapid in operation, and suit to mass samples.

【题目】包膜控释肥料在旱地农田的应用研究进展与展望
【中文关键词】控释肥料; 养分释放;环境影响
【英文关键词】Upland crops; Controlled-release fertilizer; Nitrogen release; Environmental effects
【中文摘要】就国内外控释肥料在旱地农田中的应用效果、田间养分释放,以及高效施用做了综述,重点总结了控释肥料在不同作物上的增产效果和当前应用研究中存在的问题。施用控释肥料可以提高肥料利用率,减少氮素淋溶损失,并具有增加作物产量和改善蔬菜品质的优点,但控释肥料应用中也存在着养分在土壤中的转化和去向不明,养分释放与作物生长对应性差,忽视环境条件对养分释放影响等问题。并对今后高效施用控释肥的技术研究进行了展望。
【英文摘要】Recent advances of application of controlled-release fertilizer are reviewed in this article. The author summarized the agronomic effects, methods and nutrients release of controlled-release fertilizer applied in upland field, especially focused on the yield-increase and problems in application. We can conclude from many experiments mainly that the controlled-release fertilizer particularly polyolefin-coated fertilizers, showed higher nitrogen recovery rate, less nitrogen leaching, yield-increase and quality improving comparing to common readily available nitrogen fertilizers. However, there are still some problems unresolved, such as the unclear

transformation and fate of controlled-release nitrogen in the field soil, non-synchronization between controlled-release nitrogen supplying and crop uptaking, and ignoring environmental effects on nitrogen release. Future outlook in technologies related to efficient using controlled-release fertilizer is also discussed.

【题目】不同释放期的包衣尿素在夏玉米上的应用效果研究
【中文关键词】包衣尿素; 释放期; 夏玉米; 产量; 氮肥利用率
【英文关键词】Coated Urea; Release duration; Summer Corn; Nitrogen use efficiency
【中文摘要】通过田间试验比较研究了释放期分别为35天和60天的包衣尿素(以下称PCU35和PCU60)全量基施与普通尿素分次施用对夏玉米生长、产量、氮肥利用率的影响。结果表明,包衣尿素在田间的溶出较实验室慢,包衣尿素的养分溶出过程可以用y=ax2+bx+c的双曲线方程模拟。施氮在夏玉米生长和增产方面的作用不明显,不同处理间的夏玉米株高、最大叶幅和叶片叶绿素含量差异不大。施氮处理的夏玉米产量增幅在0.91%~11%之间,氮肥利用率在11.74%~22.98%之间,PCU35处理的夏玉米产量和氮肥利用率不仅高于PCU60,而且也高于施用普通尿素的处理。综上所述,在京郊正常气候条件下,选用释放期较短(如PCU35)的包衣尿素更易满足夏玉米生长期对氮素的需求。
【英文摘要】Field experiment was conducted to investigate impacts of coated urea of different release duration (35 d and 60 d) with single basal application and urea with split application on summer corn ’s growth, yield and nitrogen use efficiency. The results showed that the nutrient release of coated urea under field condition was slower than that of laboratory method, and relative low soil water content was the main limited factor of nutrient release, the nutrient release pattern of coated urea under field condition could be simulated by the hyperbolical formula of y=ax2+bx+c. N application didn ’t markedly increase summer corn ’s growth, and the difference of plant height, maximum leaf width and chlorophyll content among treatments was not significant. N application increased summer corn ’s yield in the range of 0.91% to 11%, the corresponding figure of nitrogen use efficiency was 11.74% to 22.98%, the yield and nitrogen use efficiency of PCU35 was not only higher than those of treatment with urea, but also higher than those of PCU60. In summary, in the conventional climate of Beijing suburb, coated urea with relative short release duration (such as PCU35) could comparably match the N need of summer corn.

【题目】伊犁地区土壤培肥技术
【中文关键词】新垦区; 贫瘠土壤; 培肥; 地力提升
【英文关键词】无
【中文摘要】土地资源质量的高低,最终体现在土壤的生产能力上,而生产能力的高低,主要取决于土壤不断供给植物生长所需的水-肥-气-热的能力,即土壤肥力。国内外对新垦贫瘠土壤的培肥熟化研究已较为全面,取得很多有特色的研究成果。针对伊犁河流域新垦贫瘠土壤的快速培肥,应以当地农业生产结构为指导,发展农区畜牧业,搞好农区内部农、林、牧之间的结构调整,实行农牧结合;增施有机肥料,推广秸秆还田技术,节能增效,实现粮多(草多)-畜多-肥多-粮多(草多)的良性循环;推广草田轮作、麦棉轮作和间套作栽培技术,增加黄豆、绿肥等作物茬口,满足作物吸收利用营养元素即不同而又具有互补的作用,使作物能均衡地利用土壤养分,充分发挥土壤的生产潜力;重视推广平衡施肥技术,提高化肥利用率。在采取平衡施肥、作物推荐施肥的基础上,兼顾"种养结合、农牧结合"的种植模式,达到既能快速培肥土壤,同时又能快速增产增效

。

【题目】新疆灰漠土区不同肥料配比土壤氨挥发原位监测
【中文关键词】氨挥发; 长期定位试验; 氮肥利用率; 原位监测
【英文关键词】ammonia volatilization; long-term field experiment; nitrogen use efficiency; in situ monitoring
【中文摘要】在17a的新疆国家灰漠土土壤肥力与肥料效益长期定位试验区,采用通气法对春小麦种植体系8种处理,即(1)对照(种植、不施肥,CK)、(2)施氮肥(N)、(3)施氮磷肥(NP)、(4)施氮钾肥(NK)、(5)施氮磷钾肥(NPK)、(6)施氮磷钾肥+有机肥增量(NPKM1)、(7)施氮磷钾化肥+有机肥常量(NPKM2)、(8)施氮磷钾化肥+秸秆还田(NPKS)的氨挥发损失与不同肥料配比、长期不同施肥土壤特性变化之间关系进行研究。结果表明:(1)在当地春小麦种植典型施肥模式,,即“基肥撒施后机械翻耕,追肥撒施后灌水”下,在施氮量为84.97~241.5 kg·hm-2的条件下,不同处理基肥氨挥发累积量为0.194~2.236 kgN·hm-2之间;追肥氨挥发累积量在0.078~0.210 kgN·hm-2之间,远低于基肥氨挥发量;基肥和追肥氨挥发损失氮素之和占总施氮量的0.39%~1.23%。(2)相同施氮量241.5 kg·hm-2的N、NP、NK、NPK4个处理,氨挥发累积量分别为1.017、0.944、1.988、2.437kg N·hm-2,氨挥发量与不同处理土壤速效钾含量相关性达显著水平(r=0.951,P<0.05,n=4)。(3)施氮量分别为151.8、84.9、216.7 kgN·hm-2有机肥处理NPKM1、NPKM2、NPKS的氨挥发累积量分别为1.404、1.041、1.583 kgN·hm-2,氨挥发量与氮肥使用量呈显著正相关(r=0.581,P<0.05,n=18)。以上结果表明,氨挥发不是新疆灰漠土长期定位试验春小麦体系氮肥损失的主要途径;不同肥料配比和长期不同肥料配比造成土壤特性的变化是7种施氮肥处理氨挥发差异的主要原因。
【英文摘要】Ammonia volatilization loss of nitrogenous fertilizers in Grey Desert soil Field of Xinjiang were monitored in situ by the method of phosphoric acid and glycerol-sponge venting chamber.Ammonia volatilization loss Characteristics were measured under different fertilization-cropping systems in the oasis of Xingjiang.The fertilizer treatments were CK(without fertilizer),N alone,N+P,N+P+K,N+P+K+M1(M1-manure at increased application rate),N+P+K+M2(manure at normal application rate),and N+P+K+S(S-plant residue returned to field).The obtained results are summarized as follows:(1) In the long-term spring wheat cropping system,with a typical fertilization mode of "field ploughed deeply after basal fertilizer application and irrigation conducted immediately after topdressing application",ammonia volatilization loss was 0.27-2.48kg hm-2 with the N fertilizer application rates of 84.97-241.5kg·hm-2,and the loss represented 0.39%-1.23% of the total applied fertilizer N,The ammonia volatilization loss from basal fertilizers was higher than that from topdressing.(2)At the same N rate,the accumulated N loss by ammonia volatilization was 1.02,0.94,1.99,and 2.44 kg·hm-2,respectively for N,N+P,N+K,and N+P+K treatment and significantly correlated with available K in the soils(r=0.951,P<0.05,n=4).(3) the accumulated volatilization N loss was 1.40,1.04,and 1.58 kg·hm-2,respectively for the N+P+K+M1,N+P+K+M2,and N+P+K+S treatment and significantly correlated with N fertilizer rate(r=0.581,P<0.05,n=18).These results indicate that ammonia volatilization loss from N fertilizers was not the major pathway of N losses under the current dominant cropping system(spring wheat).The differences in volatilization N loss in the green belt of Xinjiang are mainly caused by various combinations of organic and inorganic fertilizers,which change soil properties in the long run.

【题目】包膜控释尿素对高羊茅草坪建植期生长的影响
【中文关键词】包膜控释尿素; 高羊茅; 建植期; 生物量
【英文关键词】coated controlled-release urea; tall fescue; growth stage; biomass
【中文摘要】应用盆栽试验研究了释放期为30d(U30)和80d(U80)的控释包膜尿素一次性基施对高羊茅Festuca arundinacea草坪建植期生长情况的影响。结果表明:在施氮量相等的情况下,单一施用U80处理草坪成坪时间最短,仅为51d,播种85d后,其叶绿素仪读值(SPAD)高于其他处理。出苗后各处理地上生物量呈现先升高后降低的单峰变化趋势。单一施用U80处理草坪成坪后,生长速度较其他处理更为平缓。此外,单一施用U80处理和U80配施30%普通尿素处理,草坪地下生物量积累总量明显高于单一施用普通尿素处理。 更多还原
【英文摘要】The effect of coated controlled-release urea on the growth of tall fescue (Festuca arundinacea) was studied in potted condition and two types of coated controlled-release urea (U30 and U80, the release duration was 30 days and 80 days) were used. The results indicated that the turfgrass growing time was the shortest (only 51 days) treated with U80 and its content chlorophyll was higher than other treatments after 85 days growth. The aboveground biomass of turfgrass showed a pattern of increasing at the beginning and declining later. The underground biomass of turfgrass treated with U80 or U80 plus 30% of common urea was significantly higher than other treatments only with common urea (P<0.05).

【题目】有机肥与无机肥氮素平行施用对土壤硝态氮积累与玉米产量的影响
【中文关键词】有机氮肥与无机氮肥; 硝态氮储量; 效益
【英文关键词】Organic and inorganic fertilizer nitrogen; Nitrate-N reserves; Efficiency
【中文摘要】通过有机肥与无机肥对比定位试验,揭示氮肥肥效与硝态氮在土壤储存的一些规律。结果表明,有机氮肥能够实现作物高产,有机氮肥最高产量13092 kg hm-2、无机氮肥最高产量12773 kg hm-2。玉米作物产投比1.0时的最佳推荐施氮量有机氮为:252.72 kg hm-2、无机氮为:381.84 kg hm-2。施氮量在120~300 kg hm-2范围内,有机肥处理的土壤硝态氮储量高于无机氮处理。有机氮用量在80 kg hm-2以下,不会引起土壤硝态氮储量增加;无机氮用量在160 kg hm-2以下,不引起土壤硝态氮储量增加。
【英文摘要】By the comparison of organic and inorganic fe rtilizers located experiment, the mechanics of nitrogen fertilizer efficiency and soil nitrate-N reserves were revealed. The results showed as follows. High yield could be achieved by organic fertilization and the highest maize yield was 13092 kg hm-2,while that amended with inorganic fertilization was 12773 kg hm-2.In the condition of output/input ratio being 1.0,the optimum recommended amounts of organic and inorganic fertilizers were respectively 252.72 kg hm-2 and 381.84 kg hm-2.When the applied nitrogen rates were between 120-360 kg hm-2,soil nitrate-N reserves in organic fertilization were higher than inorganic fertilization.Soil nitrate-N reserves did not increase as the rate of organic fertilizer-N being lower than 80 kg hm-2 or that of inorganic fertilizer-N being lower than 160 kg hm-2.

【题目】Overexpression of ethylene response factor TERF2 confers cold tolerance in rice seedlings
【中文关键词】无
【英文关键词】Cold,TERF2, Oryza sativa ,Transcriptional regulation , Reactive oxygen species
【中文摘要】无
【英文摘要】Rice (Oryza sativa L.) is a warm-season plant exposed to various stresses. Low temperature is an important factor limiting extension of rice cultivation areas and productivity. Previously, we have demonstrated that tomato ERF protein TERF2

enhances freezing tolerance of transgenic tobacco and tomato plants. Herein, we report that overexpression of TERF2 enhances transgenic rice tolerance to cold without affecting growth or agronomic traits. Physiological assays revealed that TERF2 could not only increase accumulation of osmotic substances and chlorophyll, but also reduce reactive oxygen species (ROS) and malondialdehyde (MDA) content and decrease electrolyte leakage in rice under cold stress. Further analysis of gene expression showed that TERF2 could activate expression of cold-related genes, including OsMyb, OsICE1, OsCDPK7, OsSODB, OsFer1, OsTrx23, and OsLti6, in transgenic rice plants under natural condition or cold stress. Thus, our findings demonstrated that TERF2 modulated expression of stress-related genes and a series of physiological adjustments under cold stress, indicating that TERF2 might have important regulatory roles in response to abiotic stress in rice and possess potential utility in improving crop cold tolerance.

【题目】西南丘陵山区土地整理方案比选研究

【中文关键词】西南丘陵山区; 土地整理; 净耕地系数; 系统效益; 方案比选;

【英文关键词】the hilly and mountainous in southwestern China; land consolidation; net cultivated land coefficient; systemic benefits; comparisons;

【中文摘要】新增耕地潜力是土地整理项目立项决策的重要依据,而新增耕地率是新增耕地潜力的反映,直接影响项目工程布局、投资预算以及效益问题。该文以重庆市忠县拔山土地整理项目为例,依据国土资源部不同土地开发整理项目新增耕地的两种最低门槛值10%和3%,进行土地整理方案比选设计,计算得到两种土地整理方案的新增耕地率分别为10.3%和4.02%,并从经济、生态和社会3方面,分别采用动态投资评估法、可拓物元分析法、综合指数法对两方案进行比选分析。结果表明:旱地坡改梯工程布局是造成两种土地整理方案新增耕地面积差异的主要原因;农田水利、道路工程以及防护林工程布局差异不大,只存在布局力度上的差异;从方案的系统效益看,新增耕地率10.3%的方案无论是动态投资回收年、生态环境关联度、社会效益指数,还是系统效益指数均优于新增耕地率为4.02%的方案;通过典型田块采用加权算法计算净耕地系数,可以作为西南丘陵山区土地整理项目净耕地系数的计算方法,但该方法中修正系数确定需要经过实地勘测和类比,这样可避免典型田块选择的主观性。

【英文摘要】Newly-increased cultivated land potential is an important foundation of decision-making for land consolidation projects, and is reflected by newly-increased cultivated land ratio. Based on 10% and 3% of newly-increased cultivated land ratio from criterion of the Ministry of Land and Resources, two schemes whose newly-increased cultivated land ratio were 10.3% and 4.02% in Bashan land consolidation project were designed; mean-while, dynamic investment evaluation method, extension element model and comprehensive index method were used to comparatively analyze their integrative benefits separately. The results indicate that newly-increased cultivated land area is greatly dependent on terracing slope fields in dryland and there are no significant difference among irrigation and drainage engineering, road engineering and shelter-belt engineering except their layout intensity. Scheme, that newly-increased cultivated land ratio is 10.3%, is much better in payback period for dynamic investment, annual net benefits, eco-environment correlation value, social benefit index and systemic bene-fit index than another one which cultivated land ratio is 4.02%. Choosing representative farmlands and using weighted algorithm are effective methods to calculate net cultivated land coefficient, thus providing scientific foundation for studying newly-increased cultivated land in hilly and mountainous, southwestern China. And using analogism and field survey, the subjectivity of choosing representative farmlands could be avoided.

【题目】Functional analyses of ethylene response factor JERF3 with the aim of improving tolerance to drought and osmotic stress in transgenic rice

【中文关键词】无

【英文关键词】Drought,ERF protein JERF3,Osmotic stress,Rice,Transcriptional regulation

【中文摘要】无

【英文摘要】Ethylene response factor (ERF) proteins play important roles in regulating plant stress response and development. Our previous studies have shown that JERF3 activates the expression of oxidative stress responsive genes in transgenic tobacco and enhances tolerance to salt, drought, and freezing, indicating that JERF3 is a very important transcriptional regulator in dicot plants. In the study reported here, we further addressed the regulatory function of JERF3 in a monocot, rice, by generating transgenic rice plants overexpressing JERF3 and comparing these with non-transgenic rice plants for physiological and molecular alterations and tolerance to drought and osmotic stresses. Growth and development under normal growth conditions were the same in both the transgenic and non-transgenic rice. Interestingly, the JERF3 transgenic plants exhibited better stress tolerance, whereas the non-transgenic rice seedlings showed serious stress symptoms and ultimately died after the drought and osmotic treatments. Biochemical analysis revealed that the contents of soluble sugars and proline were significantly increased in transgenic rice compared with non-transgenic plants under dehydration conditions. In addition, overexpression of JERF3 in rice led to the up-regulated expression of two OsP5CS genes in response to drought treatment compared with their expression in non-transgenic plants. JERF3 also activated the expression of stress-responsive genes, including WCOR413-like, OsEnol, and OsSPDS2, in transgenic rice under normal growth conditions. These data suggest that JERF3 plays important roles in transgenic rice and that it is likely to be beneficial in engineering crop plants with improved tolerance to drought and osmotic stresses.

【题目】基于AHP和熵权法赋权的区域土地开发整理潜力评价

【中文关键词】土地开发整理,区域规划,环境评价,潜力评价,AHP,熵权法,重庆市

【英文关键词】land consolidation; regional planning; environmental assessments; potentialities evaluation; AHP; entropy weight method; Chongqing province

【中文摘要】针对耕地整理、未利用土地开发、废弃土地复垦和农村居民点整理构建多层次区域土地开发整理潜力评价指标体系,将改进AHP、熵权法与综合评价法结合起来对重庆市土地开发整理潜力进行了定量化评价。重庆市土地开发整理潜力评价结果表明,土地开发整理潜力由大到小可划分为4个等级,耕地整理潜力是土地开发整理潜力的主要组成部分,耕地整理投入产出率和林地比重提高率是重庆市土地开发整理潜力的主导影响因素。同时未利用土地开发和废弃土地复垦潜力在重庆市土地开发整理潜力也占有重要的地位,未利用地空间规模指数、废弃土地复垦新增园林地系数和空间规模指数也是重庆市土地开发整理潜力的重要影响因素。此外,农村居民点整理在主城区及其周边经济快速发展地区地发展有重要的意义。

【英文摘要】Multi-hierarchy index system for regional land consolidation was established for cultivated land consolidation, virgin land reclamation,disused land reclamation and country residential area consolidation. And land consolidation potentialities were evaluated based on AHP, entropy weight method and synthetically evaluation method in Chongqing. Results indicated that cultivated land consolidation potentialities were the central portion of land consolidation potentialities, and the ratio of input-output and the improved ratio of woodland for cultivated land consolidation which were primary influencing factors in Chongqing. In the same way, virgin land reclamation potentialities and disused land reclamation potentialities were also the significant portions of land consolidation potentialities and the special scope index for virgin land reclamation and the improved ratio of woodland and special scope index for disused land reclamation, which were similarly important factors in Chongqing. Moreover, country residential area consolidation is important to development in the main city zone and neighbor areas.

【题目】四川盆地丘陵区农户行为对耕地质量的影响
【中文关键词】土地利用,数学方法,农户行为,耕地质量评价,四川盆地丘陵区,影响力系数,Cobb-Douglas生产函数
【英文关键词】land use; mathematical method; household behavior; cultivated land quality assessment; the hilly and mountainous areas in Sichuan Basin; influence coefficient; Cobb-Douglas production function
【中文摘要】农户行为是耕地质量变化的直接推动者,农户对不同质量耕地的响应直接影响耕地现实生产能力。该文采用BP神经网络模型对重庆市大足县耕地自然质量进行评价,发现研究区水田自然质量等级以二等地和三等地为主,旱地以一等地和二等地为主,耕地自然质量总体偏高;但耕地自然质量仅仅是耕地自然属性的反映,因此在基于对研究区农户行为调查的基础上,采用“影响力系数”对耕地自然质量进行修正,并将农户收益作为耕地质量货币化价值的表现,进一步讨论了耕地自然质量和农户投资结构对这种价值的影响以反映对耕地质量的影响。结果显示,耕地自然质量指数和农户收益间的数学关系以三项式模型、二项式模型等曲线方程模拟效果最佳,重庆市大足县大部分乡镇都是受到某单一投入因素的制约,通过分析弹性系数大小可以调整研究区农户投资结构。该文阐明耕地质量不仅仅取决于耕地自然属性,还受到农户行为诸如投入水平、管理方式、种植模式等因素的制约,因此,应进一步规范农户行为以提高耕地质量。
【英文摘要】Household behaviors are the leading driving forces for the change of cultivated land quality, and their responses to cultivated land quality will affect the actual productivity. Cultivated land quality was assessed by BP neural network in Dazu County, Chongqing.The assessment results showed that paddy lands were mainly of the second-grade and third-grade,while dry lands were mainly of the first-grade and second-grade. It illustrated the high natural quality of the cultivated land, but the natural quality only reflected land natural characteristics. Therefore, influence coefficient was used to modify natural quality index based on the investigation to households. At the same time, by using the household income as the value of cultivated land, the impact of natural quality and investment structure on the value were further discussed. The results showed that trinomial equation and binomial equation were fitted to reflect the relationship between natural quality and income. In other words, household incomes were not only depended on natural attributes of cultivated land, but also affected by input and management. Because most of studied towns in Dazu County are restricted by one of investment factors,the elasticity coefficient can used to adjust the investment structure. The study shows that the cultivated land quality is not only determined by its natural properties, but also by investment, management, crop patterns and so on. Hence, measures should be taken to regulate the household behaviors in order to improve land quality.

【题目】土地整理工程影响下农业生态系统服务价值的变化
【中文关键词】土地整理; 生态服务价值; 成本效益分析; 工程影响; 合川;
【英文关键词】land consolidation; ecosystem services value; cost-benefit analysis; project effect; Hechuan;
【中文摘要】以重庆市合川土地整理项目区为例,对项目区整理前(2003年)、后(2007年)农业生态系统功能的变化进行量化描述,将工程设计和影子价格法相结合对干扰功能进行了量化,并采用成本效益分析法进一步解释生态系统功能的经济学意义,分析了工程影响下区域农业生态系统服务价值的变化.结果表明:与土地整理之前相比,研究区农业生态系统服务价值在整理后有所改善,其中增幅最大的是养分循环功能,变化最小的是土壤保持功能;在土地整理项目中,农田水利、田间道路和土地平整工程带来的生态服务价值改变主要体现为干扰功能的变化.项目建成后第7年到第35年,研究区成本效益率处

于高速增长期,之后趋于稳定,表现为较弱的生态压力和较少的生态服务价值损失,有利于区域生态环境的改善.
【英文摘要】This paper quantitatively described the changes of agroecosystem functions before (2003) and after (2007) the implementation of Gaolong land consolidation project in Hechuan o Chongqing. Engineering design and shadow price were integrated to quantify the effects of the project on the functions, and cost-benefit analysis was used to further explain the economic meaning so the functions, and to analyze the changes of the agroecosystem services value under effects of the project. Compared with that before the land consolidation, the agroecosystem services value after the land consolidation was somewhat improved, with the largest increment of nutrient cycling function and the smallest change of soil conservation function. In the implementation of the project the changes of the agroecosystem services value induced by farmland water conservancy, field road building, and land-leveling engineering mainly manifested in the change of disturbance function. From the 7th to35th year after the project the cost benefit would have a rapid increase, and tended to be stable after then, giving a weak ecological pressure and little services value loss, and benefiting the improvement of regional ecological environment.

【题目】未来区域土地利用驱动力研究的重要命题:尺度依赖
【中文关键词】土地利用; 驱动力; 尺度依赖; 尺度转换;
【英文关键词】Land use; Driving forces; Scale; Scaling;
【中文摘要】尺度问题的处理是亚全球土地利用情景分析中一个复杂而又关键的新前缘。现有研究实现了尺度转换或尺度效应,加深了人们对土地利用驱动因素的多时空变化的理解和认识。但土地利用的信息和过程特征使得众多研究主题局限于某一领域。要实现不同尺度间土地利用数据信息的转换,理解不同尺度众多驱动因素间的作用过程,并正确描述土地利用轨迹,未来与土地利用有关的尺度问题应注重尺度推绎:①借助高分辨率/局地数据和低分辨率/区域数据的结合获取多空间尺度数据信息,减少尺度转换过程中土地利用数据的损失;②把握土地利用不同类型和方式间的流向,识别诱导其发生演变的主导驱动变量及其相互作用;③理解土地利用效应的跨尺度相互作用对环境管理的影响,弄清局地效应放大和区域影响根植于局地的过程;④考虑土地利用政策的跨尺度交互作用,联合自上而下和自下而上的方法确定不同尺度间政策运用新问题的解决思路。这些问题以及它们间的复杂依赖性,仍然是理解土地利用及其影响间的间接和跨尺度链接所面临的挑战。
【英文摘要】Land use systems are characterized by complex interactions between human decision-making and physical environment.Scale issues is a key to the sub-global land use scenarios analysis that have attracted much attention from researches due to their ecological and socio-economic implications.Nowadays,many studies on land use have already presented and discussed scaling and scale effects, and deepened the understanding of the spatial-temporal properties of land use and the change of multi spatial-temporal driving forces. However, a large number of research topics focused on a particular area or a single discipline due to the characteristics of data and process of land use. To achieve the conversions of land use data, understand the processes of many drivers and characterize correctly the patterns and processes of land use among different scales , the research on scale issue of land use might be focused on scale extrapolation in the future , which means using the integrations of high and low resolution or local and regional data to obtain land use data of multi-spatial scale , and to reduce the loss of land use data scaling; grasping the flows of different land use types and patterns , and identifying the dominant drivers and their interactions resulting in land use change ; understanding the impacts of the interactions of cross2 scale land use effects on the environmental management , and measuring the processes of the amplification of local land use effects and the impacts of regional land use rooted in local land use; and considering the interactions of cross-scale land use policies , and determining the resolution for problems resulted from the operations of land use policies among different scales. These issues and their complex interdependency pose challenges to understand indirect and cross-scale linkages between the scale of land use and their impacts.

【题目】重庆市浅丘带坝区土地利用与景观空间格局分析
【中文关键词】土地利用; 景观空间格局; 景观格局指数; GIS; 浅丘带坝区; 重庆市;
【英文关键词】land use; landscape spatial pattern; landscape pattern metrics; GIS; shollow hill region; Chongqing City;
【中文摘要】选取重庆市沙坪坝区陈家镇为研究区,采用其建立的土地利用现状数据库,运用GIS的图形处理与空间分析功能,生成6种景观格局图并输入Fragstats for ArcView3.X软件,提取景观格局指数,借助于景观格局指数在生态过程与土地利用间所建立的一种关联,分析并探讨土地利用诱发下景观空间格局特征的响应。其结果:水田景观在景观类型中占据着绝对优势,其连接度表现较高,是景观类型明显的基质,受人类活动干扰强;冬水田景观要素接近于水田景观本底,且冬水田景观要素斑块个数、类型面积随着河流缓冲区距离的增大而增加;旱地景观中各景观要素斑块总体上分布比较零散,规律性不强;农村居民点景观要素是建设用地景观的主要类型,其斑块几何形状简单、规整,各斑块间的相似性强,外围边界接近于正方形或者矩形。
【英文摘要】Taking Chengjiaqiao Town in Shapingba District, Chongqing as a study area, this paper adopted the current land use database, re-modified the classification of land use, and created six landscape pattern maps relying on the spatial analysis and graphics processing of ArcGis8.3 and ArcView3.2 software. Individual landscape metrics were calculated by function of Fragstats3.3 software. Landscape metrics is seen as a bridge between ecological process and land use, thus the paper analyzed and explored characteristics of landscape pattern resulting from land use. The result indicated that in the study area, the paddy land landscape was dominant landscape types. They were landscape matrix and the main location of human activities, and controlled landscape patterns and their evolvements too. Winter water-stored paddy field landscape element is closely approach to background of paddy land landscape. Moreover, their patch number and area were raised along with the distance of river's buffer zone by Buffer analysis. The patches of dry land landscape element distributed erratically in dry land landscape. Rural settlement landscape element was dominant in the construct land landscape. Their patches are simple, trim, and con form.

【题目】Rolling circle amplification-mediated hairpin RNA (RMHR) library construction in plants.
【中文关键词】RMHR发夹结构系统,植物
【英文关键词】Rolling circle amplification-mediated hairpin RNA, plant
【中文摘要】长发夹RNA诱导基因沉默,RMHR发夹结构系统可以成功地营养在拟南芥等多种物种。
【英文摘要】Long hairpin RNA (lhRNA) construct-induced genesilencing facilitates the study of gene functionin plants and animals, but constructing multiplelhRNA vectors using traditional approaches is bothtime-consuming and costly. Also, most of the existingapproaches are based on sequence-specificcloning of individual sequences, and are thereforenot suitable for preparing hpRNA libraries from apool of mixed target sequences. Here we describea rolling-circle amplification (RCA)-mediated hpRNA(RMHR) construction system suitable for generatinglibraries of lhRNA constructs from any gene of interestor pool of genes. Using RMHR we successfullygenerated a lhRNA library from a Arabidopsis cDNApopulation containing known and unknown genes,with an average size of 500 – 800 bp for the invertedrepeatinserts. To validate the RMHR system, lhRNAconstructs targeting the b-glucuronidase (GUS)gene were tested using Agrobacterium infiltrationand shown to be effective at inducing GUS silencingin tobacco leaves. Our results indicate that theRMHR technique permits rapid, efficient and lowcostpreparation of genome-wide lhRNA expressionlibraries.

【题目】Transcriptional modulation of ethylene response factor protein JERF3 in the oxidative stress response enhances tolerance of tobacco seedlings to salt, drought, and freezing
【中文关键词】JERF3,乙烯反应,转录调控,氧化逆境
【英文关键词】JERF3, ethylene responses, transcriptional regulation, oxidative stress responses
【中文摘要】JERF3能在转录水平上调控乙烯介导的氧化逆境反应。
【英文摘要】Abiotic stresses such as drought, cold, and salinity affect normal growth and development in plants. The production andaccumulation of reactive oxygen species (ROS) cause oxidative stress under these abiotic conditions. Recent research haselucidated the significant role of ethylene response factor (ERF) proteins in plant adaptation to abiotic stresses. Our earlierfunctional analysis of an ERF protein, JERF3, indicated that JERF3-expressing tobacco (Nicotiana tabacum) adapts better tosalinity in vitro. This article extends that study by showing that transcriptional regulation of JERF3 in the oxidative stressresponse modulates the increased tolerance to abiotic stresses. First, we confirm that JERF3-expressing tobacco enhancesadaptation to drought, freezing, and osmotic stress during germination and seedling development. Then we demonstrate thatJERF3-expressing tobacco imparts not only higher expression of osmotic stress genes compared to wild-type tobacco, but alsothe activation of photosynthetic carbon assimilation/metabolism and oxidative genes. More importantly, this regulation of theexpression of oxidative genes subsequently enhances the activities of superoxide dismutase but reduces the content of ROS intobacco under drought, cold, salt, and abscisic acid treatments. This indicates that JERF3 also modulates the abiotic stressresponse via the regulation of the oxidative stress response. Further assays indicate that JERF3 activates the expression ofreporter genes driven by the osmotic-responsive GCC box, DRE, and CE1 and by oxidative-responsive as-1 in transient assays,suggesting the transcriptional activation of JERF3 in the expression of genes involved in response to oxidative and osmoticstress. Our results therefore establish that JERF3 activates the expression of such genes through transcription, resulting indecreased accumulation of ROS and, in turn, enhanced adaptation to drought, freezing, and salt in tobacco.

【题目】EMB1211 is required for normal embryo development and influences chloroplast biogenesis in Arabidopsis
【中文关键词】EMB1211,质体发育,胚胎发育,拟南芥
【英文关键词】EMB1211, chloroplast biogenesis, embryogenesis, Arabidopsis
【中文摘要】质体发育与植物胚胎和幼苗的发育密切相关。EMB1211的突变导致胚胎发育异常、幼苗死亡。电镜结果显示胚胎的质体发育异常,EMB1211:GUS转基因植物发现该基因的转录定位在胚胎。
【英文摘要】Chloroplast biogenesis is tightly linked with embryogenesis and seedlingdevelopment. A growing body of work has been done on the molecularmechanisms underlying chloroplast development; however, the molecularcomponents involved in chloroplast biogenesis during embryogenesis remainlargely uncharacterized. In this paper, we show that an Arabidopsis mutantcarrying a T-DNA insertion in a gene encoding a multiple membraneoccupation and recognition nexus (MORN)-containing protein exhibits severedefects during embryogenesis, producing abnormal embryos and therebyleading to a lethality of young seedlings. Genetic and microscopic studiesreveal that the mutation is allelic to a previously designated Arabidopsisembryo-defective 1211 mutant (emb1211). The emb1211 +/− mutant plantsproduce approximately 25% of white-colored ovules with abnormal embryossince late globular stage when primary chloroplast biogenesis takes place,while the wild-type plants produce all green ovules. Transmission electronmicroscopic analysis reveals the absence of normal chloroplast development,both in the mutant embryos and in the mutant seedlings, that contributes tothe albinism. The EMB1211 gene is preferentially expressed in developingembryos as revealed in the EMB1211::GUS transgenic plants. Taken together,the data indicate that EMB1211 has an important role during embryogenesisand chloroplast biogenesis in Arabidopsis.

【题目】Determination of folate content in rice germplasm (Oryza sativa L.) using tri-enzyme extraction and microbiological assays
【中文关键词】营养,育种,水稻种质,叶酸缺乏
【英文关键词】Nutrition, breeding, rice germplasms, folate deficiency
【中文摘要】叶酸缺乏导致神经管发育缺陷等疾病。利用三酶法和微生物法来分析78个水稻种质的叶酸含量多样性。研制新的煮饭方法对保持熟饭中高的叶酸含量非常重要
【英文摘要】Nutritional deficiencies of folate cause neural tube defects and several other diseases. The tri-enzyme method andmicrobiological assays were used to investigate folate variation in 78 rice germplasms. The effects of storage and cooking onfolate content were also analyzed. Folate contents of brown rice varied substantially from 13.3 to 111.4 mg/100 g, whereas milledrice varied from 10.3 to 77.7mg/100 g. Four cultivars from South China with high folate levels were identified in both subspecies.The average folate losses caused by storage and cooking were 23% and 48.3%, respectively. The highest folate content incv. Laoshuya when cooked was 26.3 mg/100 g, about 25% of the recommended dietary intake (400mg/day), assuming a dailyper-capita consumption of 400 g/day cooked rice. The results suggested that it is potentially possible to screen for higher folatecontent varieties in germplasm and in breeding. It is also essential to develop new processing methods for maintaining higherfolate contents in cooked rice.

【题目】Wax crystal-sparse leaf2, a rice homologue of WAX2/GL1, is involved in synthesis of leaf cuticular wax
【中文关键词】角质蜡层,水稻,非常长链脂肪酸,蜡质稀疏叶片突变2
【英文关键词】Cuticular wax,Rice (Oryza sativa L.),Verylong-chain fatty acid (VLCFA),Wax crystal-sparse leaf2
【中文摘要】角质蜡层对于植物防护UV和物理抗病都非常重要。本文描述了水稻基因WSL2的突变导致的性状并通过图位克隆克隆岛该基因。该基因突变主要导致非常长链脂肪酸的品质急剧下降。
【英文摘要】Epicuticular wax in plants limits non-stomatal water loss, inhibits postgenital organ fusion, protects plants against damage from UV radiation and imposes a physical barrier against pathogen infection. Here, we give a detailed description of the genetic, physiological and morphological consequences of a mutation in the rice gene WSL2, based on a comparison between the wild-type and an EMS mutant. The mutant's leaf cuticle membrane is thicker and less organized than that of the wild type, and its total wax content is diminished by ~80%. The mutant is also more sensitive to drought stress. WSL2 was isolated by positional cloning, and was shown to encode a homologue of the Arabidopsis thaliana genes CER3/WAX2/YRE/FLP1 and the maize gene GL1. It is expressed throughout the plant, except in the root. A transient assay carried out in both A. thaliana and rice protoplasts showed that the gene product is deposited in the endoplasmic reticulum. An analysis of the overall composition of the wax revealed that the mutant produces a substantially reduced quantity of C22-C32 fatty acids, which suggests that the function of WSL2 is associated with the elongation of very long-chain fatty acids.

【题目】ZmCBF3 overexpression improves tolerance to abiotic stress in transgenic rice (Oryza sativa) without yield penalty
【中文关键词】非生物逆境,CBF,转基因植物,转录激活,水稻
【英文关键词】Abiotic stress tolerance, CBF,Transgenic plants,Transcriptional activator,Rice
【中文摘要】玉米ZmCBF3在胚胎发育过程中被ABA和低温诱导表达。将该基因转入水稻发现转基因植物对干旱、高岩和低温逆境的抗性都得到明显提高,与此相关的基因转录水平都被激活。
【英文摘要】Plant productivity is greatly affected by environmentalstresses such as drought, salt, and freezing. Wepreviously described a C-repeat binding transcription factorfrom maize (ZmCBF3) that was upregulated by bothabscisic acid and low-temperature and actively expressedduring embryogenesis. To understand the stress response inrice, transgenic ZmCBF3 rice with ubiquitin promoter wasdeveloped. T3 generation was planted and analyzed. Theresults showed that overexpression of ZmCBF3 in rice didnot cause growth retardation under normal growth conditionswith improved tolerance to drought, high-salt, andlow-temperature stresses. Moreover, the transgenic ricegrain yield was similar to wild type plants under normalconditions. The transgenic plants showed enhanced survivalrate and reduced malondialdehyde content and relativeconductivity under drought, salt, and low-temperaturestresses. ZmCBF3 overexpression in transgenic riceincreased the transcript levels of stress-induced genes andenhanced the tolerance to drought, salt, and low-temperaturestresses.

【题目】Land Consolidation-induced Effects on Local Landscape Patterns in Hilly and Mountainous Southwestern China
【中文关键词】无
【英文关键词】Land Consolidation Project, landscape pattern, landscape pattern metrics
【中文摘要】无
【英文摘要】Land Consolidation Project (LCP), as a kind of drastic disturbance by human intentional activities, significantly changes landscape pattern. The information of landscape pattern from land-use map and planning map (scale: 1:2000) were extracted by taking the land consolidation project in hilly and mountainous area of Bashan Town, Zhong County, Chongqing, Southwestern China as an example. The whole landscape structure and each land use type class level metrics of landscape pattern were calculated. Then their effects on local landscape patterns were estimated by Fragstats for Arcview. Sixteen metrics had been chosen to describe the changes before and after LCP. The total area of the research region was 1037.45 hm2 , and arable land area accounted for 80.95%, therefore heterogeneous map was mosaic. Land Leveling Project (LLP) got each patch of arable land expanded. The fragmentation was sharply reduced .The complex of patches edge was decreased. The shape of each field was ruled. And all above were beneficial for the growth of crop and plantation, especially in a large scale. LCP could reallocate fragment parcels and improve agricultural conditions.

【题目】转录因子ABP9基因过表达对植物生长发育的影响分析.

【中文关键词】转录因子ABP9;ABRE;植物激素ABA:生长发育调节:
【英文关键词】Transcription factor ABP9,A BRE,A BA,Plant growth and development
【中文摘要】【研究目的】为分析玉米ABA/逆境响应转录因子ABP9基因过量表达对植物生长发育的影响以利用该基因开展抗逆分子育种。【方法】本研究构建了35S启动子驱动ABP9组成型表达的植物表达载体。获得了过表达ABP9基因的拟南芥转基因株系,并在正常生长条件下。比较了转基因植株和野生型在种子萌发、营养生长和生殖生长阶段的形态和生理变化,分析了可能的分子机制。【结果】结果表明,正常生长条件下。转基因植株与野生型相比表现出萌发。幼苗生长以及开花阶段的生长抑制;气孔开度减小.叶片内源A鲋含量降低;ABA信号传导基因表达增强。而ABA合成基因表达降低;而且这些效应在ABP9基因表迭相对较强的转基因株系中表现更明显。【结论】说明ABt@基因过量在正常生长条件下即诱导转基因植株产生耐逆反应,抑制植株的生长发育。因此.在利用A曰尸9基因进行转基因抗逆育种时须考虑控制ABP9基因适时适量表达。
【英文摘要】Abstract:[OBJECTIVEIln order to analyze the effects on plant growth and development of over——expressingABP9,an ABA/stress-responsive transcription factor gene from maize,aiming at genetic engineering cropsfor abiotic stress toleranee,[METHOD]an plant expression vector on which the expression of ABP9 is drivenby 35S promoter was constructed and transgenic Arabidopsis lines over-expressing ABP9 were obmined.Themorphological,developmental,physiological and gene expression changes in transgenic plants comparing towild type were analyzed at germination,vegetative and reproductive growth stages.[RESULTSIThe resultsshowed that under normal growth conditions,comparing to that of wild type plants,the growth anddevelopment of transgenic plants was delayed at germination,seedling growth and flowering stages;thestomata pores and leaf ABA levels reduced;the expression of genes involved in A BA signaling increasedwhereas that of A BA biosynthetic genes decreased.All of the effects are positively correlated with theexpression levels of ABP9.[CONCLUSION]The data indicates that ABP9 OVer-expression induces stressresponses in transgenic plants even under normal growth conditions and retards growth and development.This suggests that the timing and kVels of A BP9 expression should be tightly controlled when using it toimprove plant stress tolerance.

【题目】原、异位保存东乡野生稻主要农艺性状的比较研究
【中文关键词】东乡野生稻;原位保护;异位保存;农艺性状
【英文关键词】Dongxiang wild rice;In—situ conservation;Ex—situ conservation;Agronomic characteristics
【中文摘要】为了解原、异位保存东乡野生稻主要农艺性状的变化,对庵家山普通野生稻原、异位群体进行了考察和比较分析。结果表明,原、异位保存的东乡野生稻在每穗总粒数、每穗实粒数、结实率等方面存在较大的差异,如异位保存的东乡野生稻每穗总粒数平均为58.28粒,比原位多11.44粒,但其每穗实粒数却较少,为9.89粒,结实率降低了45.43%。从种植环境可以发现,异位保存圃的环境不适宜东乡野生稻的生长,应该选择与原生境相类似的种植环境,以便于东乡野生稻的保存、研究与利用。
【英文摘要】To find out the differences of the main agronomic characteristics between wild rice populations in-situ and ex-situ conserved in Dongxiang County,Jiangxi Province,the comparative analysis was done on several characteristics using wild rices in AnJiaShan in-situ and ex-situ conservation.The results indicated there were some variations on total grains per panicle,full grains per panicle and seeds setting rate etc.The total grains per panicle of ex-situ conservation was 58.28,more than in-situ conservation wild rice. However, its number of full grains per panicle was 9.89,less than in-situ population,while its seeds setting rate was reduced 45.43%. The field survey results showed the environment of ex-situ conservation was not suitable for the growth of Dongxiang wild rice.meaning that the ex-situ conservation nursery of Dongxiang wild rice must be re-built in the area where the environment is similar to the original habitat

【题目】贵州喀斯特矿区废弃地土壤环境问题的现状及治理对策
【中文关键词】喀斯特矿区;废弃土地;土壤环境问题;土壤修复;贵州
【英文关键词】karst mining area;derelict land; edatope problem problem; soil rehabilitation; Guizhou
【中文摘要】分析贵州喀斯特矿区及矿山废弃地的分布、开发与利用现状,得出矿区废弃土地生态环境主要存在以下问题:(1金)属重污染严重。研究发现赫章等地土壤中锌含量达到162.23-877.88m g/kg-37.24mg/kg,镉为0.50mg /kg-16.43mg/kg,大大超过当地土壤的背景值;(2)生境干旱; (3)水土流失加剧。据调查,贵州矿山土壤的平均侵蚀模数一般都高达5000-15000t/km2·a;(4)多物生样性差。进而介绍矿区污染土壤的修复和复垦现状,并提出贵州喀斯特矿区废弃地土壤环境治理的关键问题及相关研究技术:喀斯特矿山土壤机制改良研究;植物—微生物综合治理手段研究;循环利用技术研究。
【英文摘要】According to the analysis on the distribution and development as well as using status of the karst mining derelict land in Guizhou Province, it is found that there are four edatope problems: 1) serious heavy metal pollution, such as the Zn contelt gets up to 162. 23-877.88mg/kg , Pb 37 . 24- 305.56 mg /kg and Cd0. 50-16. 43mg/kg in Hezhang and some other regions, which have significantly surpass the local background level; 2)drought habitat; 3) intensifying soil loss, with average erosion modulus up to 5000-15000 t/km2 • a in most case according to the investigation; 4)low bio - diversity. The status quo of the rehabilitation and reclaimation to the delelict land are also introduced in the paper. Furthermore, the key problems and related technique needed to be studied for the harness of edatope problem in karst mining derelict land in Guizhou, such as amelioration for soil, synthetic botanic and microbial harnessing methods, recycling techniques etc, are put forth.

【题目】Genetic diversity of Chinese indigenous sheep breeds inferred from microsatellite markers
【中文关键词】无
【英文关键词】Chinese sheep
Microsatellite
Genetic diversity and differentiation
Bayesian clustering
【中文摘要】无
【英文摘要】To determine the genetic diversity and phylogenetic relationships among Chinese sheep,10 indigenous breeds and one introduced breed were genotyped for 19 microsatelliteloci. The mean number of alleles per breed ranged from 5.44 (Guide Black Fur sheep)to 9.13 (Ujumqin sheep and Hulunbeier sheep), the expected heterozygosity variedfrom 0.623 (Guide Black Fur sheep) to 0.737 (Zhaotong sheep), and the allelic richnessranged from 5.169 (Guide Black Fur sheep) to 7.610 (Zhaotong sheep). The deviationfrom Hardy – Weinberg equilibrium (HWE) was statistically significant ($P < 0.05$) at threeloci (SRCRSP5, OarAE129 and DYMS1) in most of the breeds. Chinese sheep breeds hadmaintained a high level of within-population genetic differentiation (95.23%), with theremainder explained by differentiation among populations (4.77%). The genetic differentiationpattern and genetic relationships among Chinese sheep breeds displayed a highconsistency with the traditional classification. Both the Bayesian cluster and principal componentanalyses showed a reliable clustering pattern, which revealed three major clustersin Chinese indigenous sheep (Mongolian sheep, Kazakh sheep and Tibetan sheep), exceptZhaotong and Guide Black Fur sheep. There were probably caused by different breeding history,geography isolation and different levels of inbreeding. This study will help to interpretthe genetic characters of Chinese indigenous sheep and benefit to the future conservationprograms.

【英文关键词】sheep;H.FABP;SNP

【中文摘要】:以小尾寒羊(48只)、宁夏滩羊(121只)、滩寒杂交羊F1(23只)、无角陶塞特(48只)、萨福克(24只)5个绵羊群体为实验材料,利用PCR—SSCP和DNA测序技术对心脏型脂肪酸结合蛋白(H—FABP)基因(GenBank登录号:AY157617)~b显子2和内含子2部分序列进行单核苷酸多态性(SNPs)检测及遗传多态性分析。结果表明:(1)5I物2的PCR扩增产物中存在981(G/A)、1014(A/C)、1019(T/C)和1058(一/G)4个SNP位点,表现为AA、BB、CC、AB、AC、BC、AD、CD和BD 9种基因型,其中AA为优势基因型。经)c2检验后,除滩羊和萨福克羊外,其他群体的基因频率和基因型频率均处于Hardy—Weinberg平衡状态。群体遗传多态性分析表明:宁夏滩羊、小尾寒羊和无角陶塞特羊3个群体中的多态信息含量

(P1C)均处于0.25和0.50之间,为中度多态,萨福克羊和滩寒杂交羊F 为低度多态(PIC<O.25),表明脂肪酸结合蛋白基因在不同绵羊品种中具有单核苷酸多态性,可以进一步作为候选基因来分析其与肌内脂肪含量性状的关联性。(2)引物4的PCR扩增产物中检测到1个SNP多态位点为2407(T/C),表现为HH、 和hh 3种基因型,基因型频率大小为HH>Hh>hh,经jc2检验后,在滩羊和无角陶塞特羊中均为达到Hardy—Weinberg平衡状态,其多态信息含量均为低度多态(PIC<O.25),而在小尾寒羊、滩寒杂交羊F.和萨福克羊均没有多态出现。

【英文摘要】Abstract:PCR—SSCP and DNA sequencing approaches were applied to assess the single nucleotide polymorphisms(SNPs)and analyze the genetic polymorphisms at partial exon 2 and intron 2 of H—FABP(Heart fatty acid—binding pro—tein)gene.and five sheep populations that comprised of Small—Tailed Han sheep(SH,48),Ningxia Tan sheep(Tan,121),Tan X SH F1(23),Poll Dorset(48)and Suffolk(24)sheep were screened in this stuty.The result showed:(1)four SNPs at981(G/A),1014(A/C)1019(T/C)and 1058(_/G)and nine genotypes(AA,BB,CC,AB,AC,BC,AD,CD and BD)weredetected using primer 2.tI1e AA was the predominant genotype.A chi—square analysis suggested that the allele frequencie and genotype frequencies of H-FABP were in Hardy—Weinberg equilibrium except the Tan and Suffolk populations.Stmisticalanalysis revealed a low polymorphism information content(P/C)in the Suffolk and Tan X SH F1 populations(PIC<0.25)but an intermediate P/C in the remaining three populations(0.25<PIC<0.50).It meant that the fragment of H—FABPhad polymorphisms,which could be used as a candidate gene associated gene with phenotypic traits like intramuscular fatcontent in different sheep populations.(2)Three genotypes(H Hh and hh)determ ined by a SNP at 2407(T-C)were de—tected using primer 4.The genotype frequencies were in the order of HH >Hh>hh.A chi—square an alysis suggested thatthe allele frequencies and genotype frequencies of H-FABP were in Hardy—Weinberg equilibrium in the Tan and Poll Dorsetpopulations。and the PIC values were low LPIC<o.25).However there was no polymorphisms in SH,Tan X SH Fl andSuffolk populations.

【题目】中国7个绵羊品种mtDNA D—loop区序列的系统发育与起源研究
【中文关键词】:绵羊;线粒体DNA;控制区;起源
【英文关键词】words:sheep;mtDNA ;control region;origin
【中文摘要】:为探讨中国绵羊的起源、进化及遗传多样性,对新疆、内蒙古、西藏、云南、宁夏、山东等地区7个地方绵羊品种和1个外来品种共59个体的线粒体D-loop全序列进行了测序分析。7个地方绵羊群体的单倍型多样度(Hd)和核苷酸多样度( )分别平均为0.996 0和0.030 6,表明我国地方绵羊品种的控制区遗传变异丰富。系统发育和网络进化分析均将中国绵羊分为3个明显的支系,揭示中国绵羊存在3个独立的母系起源;并发现欧洲摩佛仑羊与支系B聚在一起,表明摩佛仑羊与中国绵羊有较近的亲缘关系。对mtDNA D-loop的3个支系进行核苷酸不配对分布曲线分析和Fu,S中性检验,结果显示3个支系的分布曲线均呈单峰形,且中性检验差异显著,表明绵羊3个支系可能曾经历群体扩张。
【英文摘要】To investigate the origin, evolution and genetic diversity of Chinese dom estic sheep(ovis).complete D-loop sequences of 59 individuals from 7 local breeds from Xinjiang,InnerM ongolia,Tibet,Yunnan,Ningxia and Shandong and 1 imported breed were sequenced. H aplo—type diversity (Hd)and nucleotide diversity(7c)among 7 Chinese sheep population were 0.996 0and 0.030 6 averagely,which indicate genetic variance within control region of Chinese sheep is a—bundant.Ne our-j oining tree was constructed based on 5 9 D-loop sequences from 8 domesticsheep populations together with previously published wild sheep sequences. It supports there arethree distinct lineages(A,B and C) in Chinese sheep.M ouflon was clustered with lineage B,which showed that it had close relationship with Chinese sheep.Further median—joining networkanalysis also showed three lineages were determined in Chinese sheep. The result suggests thatChinese sheep derived from three independent maternal ancestors.Analysis of mismatch distribu—tion showed unimodal distribution of three lineages.And Fu ’ S test of selective neutrality revealedthat three lineages were in departure from the neutrality,which the difference were significant(Pd 0.001).It implies three lineages of Chinese sheep ever experienced population expansion possi—bly.

【题目】转基因猪异种器官移植应用前景
【中文关键词】:转基因;猪;异种移植;异种排斥;内源性逆转录病毒
【英文关键词】Transgenic; pig; xenotransplantation; xenograft rejection; PERV
【中文摘要】:转基因猪能为人类提供可移植的异种器官,解决移植器官短缺的问题。但是,异种移植后产生的免疫排斥反应,主要包括超急性排斥反应和迟发性排斥反应,它们最终将导致移植物的致命损伤,是限制异种器官广泛应用的最大障碍。最近的一些研究,在克服免疫排斥方面已经取得了可喜的成果。作为异种器官供体,猪携带的内源性逆转录病毒也可能对人体产生潜在的威胁。迄今,还没有研究证明其不会感染人类机体。本文针对异种器官移植后的免疫排斥发生的机理,克服免疫排斥的方法以及逆转录病毒的潜在感染等方面进行了综述和讨论。
【英文摘要】Transgenics can provide organs of xenotransplantation for human to solve the shortage of organs. But the major limitationto more widespread utilization is immune rejection after transplantation, including hyperacute rejection and delayed rejection,which will eventually lead to graft a fatal injury. A number of recent studies have achieved encouraging results in overcoming the immunerejection .As for donor of xenogenic organs, pigs carrying the to humans may have a potential threat. To date, no studays prove thatthe endogenous retrovirus will not infect human body. This article reviews xenograft rejection and biosafety issues on genetically modifiedpigs for xenotransplantation. This paper reviewed and discussed mechanismof immune rejection, the method of overcoming immunerejection and potential infection of endogenous retrovirus after xenotransplantation.

【题目】Preventing protein aggregation by its hyper-acidic fusion cognates in Escherichia coli
【中文关键词】Protein aggregation, Hyper-acidic, Fusion cognate, TEL-SAM, Ab42
【英文关键词】Protein aggregation, Hyper-acidic, Fusion cognate, TEL-SAM, Ab42
【中文摘要】Preventing protein aggregation is crucial for various protein studies, and has a large potential for remedy of protein misfolding or aggregates-linked diseases. In this study, we demonstrated the hyper-acidic protein fusion partners, which were previously reported to enhance the soluble expression of aggregation-prone proteins, could also significantly prevent aggregation (or improve the solubility) of disease-associated and amyloid/fibril-forming polypeptides such as TEL-SAM and A β 42 in Escherichia coli cells. Further and most importantly, the solubility of all poorly soluble target proteins examined was greatly elevated by their corresponding highly soluble hyper-acidic fusion cognates when they were co-expressed, in despite of a concomitant compromise of the cognates' solubility. The extent of such a solubility enhancement appeared to be in parallel with the ratio of the levels of co-expressed hyper-acidic fusion cognate and target protein. The hyper-acidic fusion cognates might function as intermolecular solubilizing effectors to prevent aggregation of the target proteins, and a plausible model for interpreting these results is also proposed.

【题目】水稻L-半乳糖途径相关基因的表达特性
【中文关键词】水稻(Oryza sativa);抗坏血酸;L-半乳糖途径;基因表达分析
【英文关键词】rice(Oryza sativa) ascorbic acid L-galactose pathway gene expression
【中文摘要】摘要: 维生素C又称抗坏血酸(AsA),在植物中不仅是重要的抗氧化剂,还具有许多其它重要的生理功能。研究发现L-半乳糖途径是双子叶植物拟南芥AsA合成的主要途径,但单子叶植物水稻中AsA合成的L-半乳糖途径的功能和调控机理还不清楚。通过同源序列比对,在水稻基因组中检索到与拟南芥L-半乳糖途径相关酶的同源基因,通过分析水稻根与叶中及持续光、暗处理下叶片中AsA含量变化及L-半乳糖途径中相关酶基因的表达,初步探究了水稻L-半乳糖途径中调控AsA合成的关键酶基因。
【英文摘要】Vitamin C or ascorbic acid (AsA), is not only an important antioxidant, but also an active substance with many other physiological functions. The L-galactose pathway has been proven to be the key pathway of ascorbic acid in Arabidopsis thaliana. However, limited information about L-galactose pathway of ascorbic acid synthesis in rice is reported. In this research, through sequence alignments, the homologous genes putatively encoding rice L-galactose pathway enzymes were obtained. Then based on analysis of tissue specificity and leaf treatment with continuous light or darkness, AsA content and gene expression related to L-galactose pathway enzyme were determined, preliminarily evidencing the key genes controlling the synthesis of AsA in rice.

【题目】Phosphorus efficiency in long-term (15 years) wheat – maize ropping systems with various soil and climate conditions
【中文关键词】小麦,玉米,磷,长期,产量,效率,平衡
【英文关键词】Wheat,Maize,Phosphorus,Long-term,Yield,Efficiency,Balance
【中文摘要】Long-term (over 15 years) winter wheat (Triticum aestivum L.) – maize (Zea mays L.) crop rotation experiments were conducted to investigate phosphorus (P) fertilizer utilization efficiency, including the physiological efficiency, recovery efficiency and the mass (the input – output) balance, at five sites across different soil types and climate zones in China. The five treatments used were control, N, NP, NK and NPK, representing various combinations of N, P and K fertilizer applications. Phosphorus fertilization increased average crop yield over 15 years and the increases were greater with wheat (206%) than maize (85%) across all five sites. The wheat yield also significantly increased over time for the NPK treatments at two sites (Xinjiang and Shanxi), but decreased at one site (Hunan). The P content in wheat was less than 3.00 g kg_1 (and 2.10 g kg_1 for maize) for the N and NK treatments with higher values for the Control, NP and NPK treatments. To produce 1 t of grain, crops require 4.2 kg P for wheat and 3.1 kg P for maize. The P physiological use efficiency was 214 kg grain kg_1 P for wheat and 240 kg grain kg_1 P for maize with over 62% of the P from P fertilizer. Applying P fertilizer at 60 – 80 kg P ha_1 year_1 could maintain 3 – 4 t ha_1 yields for wheat and 5 – 6 t ha_1 yields for maize for the five study sites across China. The P recovery efficiency and fertilizer use efficiency averaged 47% and 29%, respectively. For every 100 kg P ha_1 year_1 P surplus (amount of fertilizer applied in excess of crop removal), Olsen-P in soil was increased by 3.4 mg P kg_1. Our study suggests that in order to achieve higher crop yields, the long-term P input – output balance, soil P supplying capacity and yield targets should be considered when making P fertilizer recommendations and developing strategies for intensively managed wheat – maize cropping systems.

【题目】施用污泥堆肥对土壤和小麦重金属累积的影响
【中文关键词】污泥堆肥,重金属,小麦
【英文关键词】Sewage compost, heavy metals, wheat

【中文摘要】以小麦为供试作物,以施用化学肥料为对照,通过施用不同量的污泥堆肥和化肥配合,研究了污泥堆肥对土壤和小麦重金属累积的影响。结果表明:土壤中zn、Cu、Cd、As、Hg等5种重金属含量随污泥堆肥用量的增加而增加;植株中Zn、As、Cr含量随污泥堆肥用量的增加而增加。各处理土壤中8种重金属Hg、Cd、Pb、As、Zn、cu、cr、Ni含量均未超出“GB 15618—1995(《土壤环境质量标准》)”的二级标准。小麦籽粒中Hg、cd、Pb含量未超出国家食品卫生标准的标准值,污泥用量18 000 kg~n2时As含量超出标准值0.02 mg/kg;微量元素zn、Cu在秸秆中的含量小于籽粒中的含量,而其他重金属在秸秆中的含量是籽粒的2~40倍。由此推断,适量污泥堆肥农用短期内不会引起土壤重金属污染,也不会影响可食部分的食用,重复使用多年后应及时监测。

【英文摘要】A field experiment was conducted to study the heavy metals accumulation in soil and winter wheat supplied with different rates of sewage sludge and chemical fertilizer.The results showed that the content of Zn,Cu,Cd,As,Hg in soil were increased responding to sewage sludge proportion.The same tendency with Zn,As,Cr in wheat.The content of Hg,Cd,Pb,As,Zn,Cu,Cr and Ni were not exceed the second class of the standard of soil environmental quality.Hg,Cd,Pb in wheat grain was not exceeding the national food and healthy standard value.While as content was exceeded standard value by 0.02 mg/kg at the amount of 1 8 000 kg/hm2。Level of sludge compost.Zn,Cu content in straw was lower than grain,and other heavy metals content was 2—40 times of grain.So in a short time,proper amount of sewage sludge fertilizer will not caused pollution in soil,or bring effectsin edible part,either.But years of repeated application demand timely monitoring.

【题目】Correlation between polymorphisms in ADSL and GARS-AIRS-GART genes with inosine 5'-monophosphate (IMP) contents in Beijing-you chickens

【中文关键词】水溶性前体;牛肉味;肌苷-5' -磷酸;温度;肌肉

【英文关键词】WATER-SOLUBLE PRECURSORS; BEEF FLAVOR; INOSINE-5'-MONOPHOSPHATE; TEMPERATURE; MUSCLE

【中文摘要】无

【英文摘要】1. The association of single nucleotide polymorphisms identified within the ADSL (adenylosuccinate lyase deficiency) gene and GARS-AIRS-GART (glycinamide ribonucleotide synthetase-aminoimidazole ribonucleotide synthetase-glycinamide ribonucleotide transformylase) gene with the content of inosine 5'-monophosphate (IMP) was studied in a population of male Beijing-you (BJY) chickens slaughtered at 90 d of age. 2. A single nucleotide polymorphism in exon 2 of the ADSL gene had an effect on IMP content. Chickens inheriting the positive allele at ADSL, both homozygous and heterozygous genotypes, had a higher content of IMP in breast muscle than did individuals without it. 3. Similar results were obtained for the GARS-AIRS-GART gene. The marker at the 5' untranslated region (UTR) of the GARS-AIRS-GART gene was also significant for the IMP value. Chickens inheriting the genotypes with the positive allele at this locus had a much higher content of IMP than did those homozygous for the unfavourable one. 4. Interactions between ADSL and GARS-AIRS-GART were detected for such traits as body weight and muscle yields in the tested population. The two loci acted in an additive fashion. Because IMP is one of the most important flavour components in meat, markers developed at these two genes, as well as the combination genotypes, could be used as potential molecular markers for improving chicken quality.

【题目】Determining critical values of soil Olsen-P for crop yields using long-term experiments under various soil and climate conditions in China

【中文关键词】长期,临界值,玉米,模型, Olsen磷,冬小麦

【英文关键词】Long-term,Critical value,Maize,Model,Olsen-P,Winter wheat

【中文摘要】The critical value of soil Olsen-P is the point above which the probability of crop yield response to fertilizer P is small or nil. Determining this critical value is fundamental when making appropriate P fertilizer recommendations. In this study, the critical values were determined for continuous maize (Zea mays L.)-winter wheat (Triticum aestivum L.) cropping systems from a 15-year field experiment across three sites in China using linear-linear, linear-plateau and Mitscherlich models. The mean critical values for maize using the three models ranged from 12.1 to 17.3 mg P kg − 1 (average 15.3 mg P kg − 1) and for winter wheat from 12.5 to 19.0 mg P kg − 1 (average 16.3 mg P kg − 1) among study sites. The mean critical value for maize was approximately 7% lower than that for winter wheat across all sites based on the three models. Critical values identified by the Mitscherlich model were 1.4 to 2.1 times those from linear-linear and 1.3 to 1.9 times of those from linear-plateau and were crop and site dependent. There was a significant negative correlation (P<0.05) between the mean critical value from the three models and the observed P uptake by either maize or wheat. Our study shows that the critical values can vary with sites, crops and models used, and thus caution should be taken when selecting the most appropriate one when making P fertilizer recommendations for agronomic return and to minimize chances of negative environment impact from overfertilization.

【英文摘要】The critical value of soil Olsen-P is the point above which the probability of crop yield response to fertilizer P is small or nil. Determining this critical value is fundamental when making appropriate P fertilizer recommendations. 【题目】Phosphorus efficacy in four Chinese long-term experiments with Different soil properties and climate characteristics

【中文关键词】作物轮作, 肥料, 水稻, 小麦

【英文关键词】Crop rotation, fertilizers, rice, wheat

【中文摘要】Four long-term experiments in China were used to study the efficacy of phosphorus (P) fertilizers in soils. The results showed that the increased yield by P fertilization varied with different crops: early rice . late rice. We suggest applying the P fertilizer heavily on winter wheat and early rice. The P agronomic efficiency was about 27 kg rice grain kg21 and 30.8 – 55.7 kg wheat grain kg21. The P recovery efficiency by plants was .80% in three of four sites, and the fertilizer-use efficiency was 34% on average. The current applications of about 40 kg P ha21year21 for rice – rice rotation could maintain yields of 8 – 11 t ha21 year21, and 65.5 kg P ha21 year21 applied for wheat – maize rotation could maintain yields of 5.3 – 6.2 t ha21 for wheat and 4.2 – 6.0 t ha21 for maize, although no P was added to maize. However, sustaining higher yields will require soil P-supplying capacity and farm-specific management targets and strategies.

【题目】Nitrogen efficiency in long-term wheat – maize cropping systems under diverse field sites in China

【中文关键词】小麦, 玉米,氮, 长期效率

【英文关键词】Wheat Maize Nitrogen, Long-term efficiency

【中文摘要】Efficiency of fertilizer N is becoming increasingly important in modern agricultural production owing to increasing food requirement and growing concern about environments. However, there is almost no study regarding its long-term efficiency in wheat and maize cropping systems. Long-term (15 years) experiments involving wheat (Triticum aestivum L.) and maize (Zea mays L.) rotations at five field sites with various soil and climate characteristics in China were used to determine the nitrogen (N) efficiency, including the physiological efficiency, recovery efficiency and N mass balance of soil – plant systems in response to different fertilization treatments. The present study consisted of nine treatments: unfertilized, N, phosphorus, potassium, straw and manure or their combinations. The contribution of N fertilizers to wheat yield was higher than to maize and suggested that wheat could be given priority over maize when determining N application rates. Uptake of 1 kg N produced 35.6 kg of wheat grain and 39.5 kg of maize grain. The deficit of N in soils without applied N ranged from 40 to 103 kg N ha − 1 year − 1, while N surpluses in soils with applied N fertilizers ranged from 35 to 350 kg N ha − 1 year − 1. The apparent accumulated N recovery efficiency (NREac) varied widely from 4% to 90%: unbalanced fertilization and other soil limiting factors (such as aluminium toxicity) were associated with low NREac. In the treatments of combination of N, phosphorus and potassium with normal application rates, the average of NREac in four out of five sites reached 80%, which suggested that best management of N fertilizers could recover most of N fertilizers applied to soils. The results will be helpful to understand the long-term fate of N fertilizers and to optimize the N fertilization for agricultural practices and environment protection.

【题目】不同种植年限和施肥量对日光温室土壤锌累积的影响
【中文关键词】有机肥;温室土壤;重金属;锌
【英文关键词】organic manure; greenhouse soil; heavy metal; zinc
【中文摘要】以辽宁省沈阳市郊某黄瓜生产基地较为常见的5a、2a和1a温室大棚作为研究对象,对表层土壤(0~10、10~20、20~40cm)进行分析,探讨不同种植年限和施肥条件下温室土壤锌的累积情况及其来源。结果表明,不同种植年限的温室土壤锌含量均未超过国家土壤环境质量一级标准(Zn≤100mg·kg-1),其中种植年限为5a的温室土壤锌含量最高,达到47.17mg·kg-1。土壤锌含量随土壤深度的增加呈下降趋势,而且与温室种植年限呈极显著正相关(P0.01),与土壤有机质呈极显著正相关(P0.01)。通过设置不同有机肥施肥处理(0、10、20、40和60t·hm-2)的田间小区试验发现,所有年限温室土壤锌含量都高于对照(1a温室施10t·hm-2有机肥处理除外),并且随着施肥量的增加而增加,说明有机肥是蔬菜温室土壤锌累积的重要来源。
【英文摘要】Soil samples (0~10, 10~20 and 20~40 cm)were collected from a greenhouse having been planted with cucumber for 1, 2, and 5 years in Shenyang suburb to explore the effects of different planting years and organic manure fertilization on Zn accumulation in soil, and toidentify the source of the Zn. The results showed that under the condition of no organic manure fertilization, the Zn content in the soils withdifferent planting years in greenhouse did not surpass the Chinese Environmental Quality Standard for Soils (GB 15618—1995)(SEPAC,1995)(Zn≤100 mg·kg-1), being the highest (47.17 mg·kg-1)in the soil planted for 5 years. The soil Zn content had a decreasing trend with soil depth, and had significant positive correlations with planting year (P<0.01)and soil organic matter content (P<0.01). After organic manure fertilization(10, 20, 40, and 60 t·hm-2), the Zn content of soils with different planting years was higher than the contrast, except the soil planted for 1 year and applied with 10 t·hm-2 of organic manure, and increased with increasing fertilization rate, suggesting that the Zn accumulation in greenhouse soil was mainly attributed to organic manure.

【题目】Evaluation of heavy metal accumulation in greenhouse soils in Shenyang, Northeast China
【中文关键词】温室土壤;重金属;多变量分析;源
【英文关键词】Greenhouse soil, Heavy metal, Multivariate analysis, Source
【中文摘要】本文以以新民市大民屯镇设施蔬菜生产基地为研究对象,通过田间调查、小区实验,阐明了设施菜地重金属的来源及累积规律,研究发现,所有调查的温室均未发生土壤重金属污染,只有Cd高于国家土壤环境质量一级标准(Cd≤0.2mg·kg-1),略低于无公害食品设施蔬菜产地土壤环境质量标准(Cd≤0.3mg·kg-1,pH 6.5-7.5),对设施菜地土壤安全构成潜在威胁。通过多元统计和对肥料样品的抽样分析,认为有机肥、化肥及农药等农用化学品的使用是导致温室表层土壤Cu、Zn、Cd和As积累的主要原因,而Cr和Pb主要来自于母质。有机肥小区试验的结果也表明有机肥的使用是导致土壤重金属累积的原因之一,发现土壤重金属Cu、Zn、Cd全量和有效态含量都会随着有机肥施用量的增加而增加,并且随着土壤深度的增加表现出递减趋势,说明有机肥的“激活”效应是导致土壤有效态重金属含量显著提高的主要机制。
【英文摘要】Soil heavy metals are considered being originated from two major sources, natural and anthropogenic. With the spring-up of greenhouse farming in the suburbs of big cities, heavy metals accumulation in greenhouse soil is becoming a serious environmental problem. In order to evaluate and ascertain the accumulation status and origins of heavy metals in the greenhouse soils of Shenyang suburb, the Cu, Zn, Cd, As, Cr and Pb contents in soil samples collected from the greenhouse fields with different cultivation years were determined by using atomic absorption spectroscopy (AAS) and hydrogen-atomic fluorescence spectrometer (HG-AFS), and the origins of these heavy metals were analyzed by employing correlation analysis, principle component analysis (PCA) and hierarchical cluster analysis (HCA). No obvious soil heavy metals accumulation was observed, but the Cu, Zn, Cd and As contents in greenhouse soils increased with increasing years of cultivation. Two significant components were extracted by PCA, explaining 70.013% of total variance. The Cu, Zn, Cd and As in test soils were mainly associated with anthropogenic input, whereas Cr and Pb were related to parent rocks. HCA confirmed and completed the results obtained by PCA, classifying the data in two groups representing different origins. Cluster Ⅰ included Cu, Zn, Cd and As representing human inputs, while Cluster Ⅱ included Cr and Pb representing natural sources. Moreover, the results obtained by the correlation analysis also agreed with PCA and HCA, also helping in elucidating the relationship between heavy metals and soil properties. More attention should be paid to the anthropogenic inputs of Cu, Zn, Cd and As in Shenyang greenhouse fields, especially for those having been cultivated for 5 years or more.

【题目】沈阳张士灌区6种蔬菜的镉污染现状及积累特征研究
【中文关键词】张士灌区; 蔬菜; 镉污染; 土壤; 低积累植物
【英文关键词】Zhangshi irrigation area; vegetables; cadmium pollution; soil; low accumulated plants.
【中文摘要】在张士Cd 污灌区蔬菜种植地采集了6 种季节性蔬菜(莴笋、辣椒、茄子、花椰菜、西红柿和大葱) 及土壤样品,进行了Cd 含量分析,采用超标倍数法评价了蔬菜可食部Cd 的吸收积累,采用富集系数和转移系数法评价了Cd 从土壤至蔬菜的吸收转运能力。结果表明: 在6 种蔬菜中,莴笋、辣椒和茄子的可食部Cd 较高,分别为4. 01、1. 78 和1. 24 mg·kg - 1DW; 其可食部Cd 分别超标1. 92、2. 28 和2. 01 倍(叶菜类标准0. 20 mg·kg - 1 FW,茄果类标准0. 05 mg·kg - 1 FW) ; 西红柿

、花椰菜和大葱可食部Cd 未超标,分别为1. 02、1. 20 和0. 83 mg • kg - 1 DW; 花椰菜、大葱和西红柿的富集系数分别为0. 28、0. 36 和0. 52,符合低积累蔬菜标准,莴笋的富集系数1. 26,在张士及类似污染水平土壤中种植将产生较大生态风险。

【英文摘要】Six seasonal vegetable species (lettuce,pepper,eggplant,cauliflower,tomato andwelsh onion) and soil samples were collected from the vegetable growing farmland of Zhangshiwastewater irrigation area for Cd analysis. The uptake and accumulation ability of Cd in the ediblepart of the vegetable was evaluated using over proof multiple method,and the enrichment coefficient(EE) and translocation coefficient (TC) was employed to assess the efficiency of Cd uptakeand transportation from soil to vegetables. Results indicated that Cd concentrations in the edibleparts of lettuce,pepper and eggplant were higher among the six vegetables investigated,being4. 01,1. 78 and 1. 24 mg • kg - 1 DW,respectively. The overpro of amount of Cd in the edible partof these vegetables corresponded to 1. 92,2. 28 and 2. 01 times of that of the national food limitedstandards (0. 20 mg • kg - 1 FW for leaf vegetables,and 0. 05 mg • kg - 1 FW for solanaceous vegetables). Cd concentrations in the edible part of the rest vegetables were within the national foodlimited standards. The Cd concentration was 1. 02,1. 20 and 0. 83 mg • kg - 1 DW for tomato,cauliflower and welsh onion,respectively,with EE of 0. 28,0. 36 and 0. 52,respectively,whichmatched to the standard for low accumulated vegetables. EE was higher for lettuce with a value of1. 26,which indicated a comparatively large eco-risk if lettuce is to plant in Zhangshi soil or soilwith similar Cd concentration level.

【题目】作物叶酸代谢工程

【中文关键词】作物;叶酸;生物合成;代谢工程

【英文关键词】Keywords: food crops folate;biosynthesis;metabolic engineering

【中文摘要】叶酸是指四氢叶酸及其衍生物的一类物质,是介导一碳单位转移的重要辅助因子。人体自身不能合成叶酸,必须从食物中获取。当人体叶酸缺乏时,贫血、神经系统疾病、心血管病及癌症等发病率显著增加。结合本实验室的工作,系统阐述了番茄、水稻和玉米作物的叶酸代谢工程研究策略以及研究进展,对叶酸合成前体喋呤和对氨基苯甲酸(PABA)含量与叶酸合成之间的关系进行了深入分析,并对今后叶酸代谢工程的发展进行了展望。

【英文摘要】Folate includes tetrahydrofolate (THF) and its derivatives are a kind of important cofactor for one-carbon (C1) transferring, which cannot be synthesized in human and must be taken up from foods. Suboptimal folate intake perturbs C1-metabolism, which increased the risks of megaloblastic anemia, neural tube defects, cardiovascular disease and certain cancers. Combining the work of our lab, this paper reviews the current status of folate metabolic engineering in crops such as tomato, rice and maize; makes a deep analysis on association between the contents of pteridine, p-aminobenzoate moiety and folate biosynthesis; and finally prospects the development of folate metabolic engineering in the future.

【题目】大豆2-甲基-6-植基-1,4-苯醌甲基转移酶基因(Gm VTE3)的克隆及对转基因烟草种子中生育酚组成的影响

【中文关键词】大豆;2-甲基-6-植基-1,4-苯醌甲基转移酶(VTE3);生育酚;转基因烟草

【英文关键词】soybean; 2-methyl-6-phytyl-1,4-benzoquinol methyltransferase (VTE3); vitamin E; transgenic tobacco

【中文摘要】【目的】克隆大豆2-甲基-6-植基-1,4-苯醌甲基转移酶基因(Gm VTE3),研究其在烟草中过量表达对转基因烟草种子中生育酚(维生素E)组分的影响。【方法】利用EST 拼接和RT-PCR 技术,从大豆中分离了大豆2-甲基-6-植基-1,4-苯

醌甲基转移酶(VTE3)的全长cDNA 序列,通过烟草转化研究过量表达VTE3 对转基因植株维生素E 组分的影响。【结果】Gm VTE3 全长1 026 bp,编码342 个氨基酸,与其它物种的VTE3 氨基酸同源性很高,在烟草中过量表达该基因使烟草种子中γ-生育酚与δ-生育酚的比值最高增加2 倍。【结论】首次克隆了大豆2-甲基-6-植基-1,4-苯醌甲基转移酶基因Gm VTE3,它能够催化烟草植株中2-甲基-6-植基-1,4-苯醌(MPBQ)的甲基化,从而改变烟草种子中生育酚的组成成分。说明可以利用克隆的Gm VTE3 来改变植物种子中生育酚的组成和提高α-生育酚的含量。

【英文摘要】【Objective】 VTE3 is a key enzyme in vitamin E pathway. A VTE3 like gene (Gm VTE3) was cloned from soybean,and the expression of Gm VTE3 in tobacco and effect on tocopherol composition of seed were studied. 【Method】 A putative VTE3was cloned and characterized from soybean via EST sequence splicing and RT-PCR, the expression was analyzed and the effect ofoverexpression of Gm VTE3 on tocopherol composition of seed was studied in tobacco.【Result】The full-length cDNA of Gm VTE3is 1 026 bp, which encodes a polypeptide of 342 amino acids. The amino acid homologies of MPBQ MT among different speciesshare higher similarities. Expression of Gm VTE3 in transgenic tobacco increased the ratio of γ-tocopherol and δ-tocopherol by twotimes compared with the control. 【Conclusion】 Gm VTE3 is the first VTE3 cloned in soybean and may catalyze the methylation of2-methyl-6-phytyl-1,4 benzoquinol in tobacco plant and alter seed tocopherol composition. These findings demonstrate that the geneidentified in Glycine max may be used to alter the tocopherol composition of other commercial seed oils.

【题目】大豆2-甲基-6-植基-1,4-苯醌甲基转移酶基因(Gm VTE3)对转基因拟南芥生育酚组成的影响

【中文关键词】关键词:大豆;拟南芥;维生素E;生育酚;大豆2-甲基-6-植基-1,4-苯醌甲基转移酶

【英文关键词】soybean;Arabidopsis thaliana ; vitamin E; tocopherol; MPBQ-MT

【中文摘要】2-甲基-6-植基-1,4-苯醌甲基转移酶(MPBQ-MT,VTE3)是维生素E合成途径中的关键酶之一,通过转化模式植物拟南芥,研究大豆VTE3(GmVTE3)基因在拟南芥中过量表达对维生素E组分含量的影响。成功构建了植物表达载体pZP212-GmVTE3,将其转入模式植物拟南芥,获得转基因纯系植株6个;利用HPLC检测技术对转基因拟南芥种子和叶片中维生素E含量进行了测定。结果表明:6 个转基因纯系植株种子中,γ-生育酚/δ-生育酚比值均比野生型有所提高,为野生型的1.7 倍;叶片中未检测到δ-生育酚。表明GmVTE3可以有效地把δ-生育酚转化为γ-生育酚,从而改变植物体内VE的组成。

【英文摘要】MPBQ-MT (2-methyl-6-phytyl-1,4-benzoquinone methyltransferase,VTE3) was a key enzyme inthe biosynthesis of vitamin E,GmVTE 3 was transformed intoArabidopsis thaliana for investigating the effectof its overexpression on the content and composition of vitamin E. In the study, plant expression vectorpZP212-GmVTE3 was constructed forArabidopsis transformation, and obtained six homozygous lines, andvitamin E were measured in the seeds and leaves of transgenic lines by HPLC. The results showed that theratio of γ -tocopherol / δ -tocopherol in the seeds of six transgenic homozygous lines was 1.7 times of wildtype, and in the leaves δ-tocopherol was undetectable, thus indicating thatGmVTE 3 gene was able to increasethe content of γ -tocopherol and decrease the content of δ-tocopherol, and then changed the content andcomposition of vitamin E .

【题目】SUMO基因的内在原核启动子活性及其在大肠杆菌蛋白表达系统中的应用

【中文关键词】SUMO 基因,原核启动子,SUMO 融合系统,共表达,大肠杆菌

【英文关键词】SUMO gene, prokaryotic promoter, SUMO fusion system, co-expression, Escherichia coli
【中文摘要】SUMO 融合系统已成为目前大肠杆菌重组蛋白生产的重要手段,但在载体构建效率和蛋白可溶性等方面仍有待改进。本研究在PCR 克隆酿酒酵母SUMO 基因Smt3(Sm) 时意外发现Sm 具有组成型原核启动子活性;而且经软莓BPROM 程序预测发现大多数物种SUMO 基因编码区都具有依赖σ70 的原核启动子。进一步通过整合Sm 启动子和Sm 3′末端Stu Ⅰ位点特性以及引入His 标签和超酸增溶标签,构建了基于Sm’-LacZα 融合基因的一系列通用克隆表达载体,并通过蓝白斑筛选和SDS-PAGE 分析进行了多个靶蛋白基因的克隆和表达,结果表明实现了基因表达载体的快速构建、蛋白高可溶性表达和关联蛋白的共表达等目标。因此,集成诸多特性而改良的SUMO 融合技术可以成为大肠杆菌蛋白表达系统的有力工具,建立的共表达载体系统还可以用作研究细胞内蛋白间的相互作用。
【英文摘要】Nowadays, SUMO fusion system is important for recombinant protein production in Escherichia coli, yet a fewaspects remain to be improved, including the efficacy for vector construction and protein solubility. In this study, we found theSUMO gene Smt3 (Sm) of Saccharomyces cerevisiae conferred an unexpected activity of constitutive prokaryotic promoter duringits PCR cloning, and the gene coding regions of SUMOs in most species had a σ70-dependent prokaryotic promoter embedded,through the prediction via the BPROM program developed by Softberry. By combining the characters of Sm promoter activity andthe Stu I site (added at the 3’-terminal of Sm), and introducing a His-tag and a hyper-acidic solubility-enhancing tag, we furtherconstructed a set of versatile vectors for gene cloning and expression on the basis of Sm’-LacZα fusion gene. Experimentallystarted from these vectors, several target genes were subcloned and expressed through blue-white screening and SDS-PAGEanalysis. The results manifest a few of expectable advantages such as rapid vector construction, highly soluble protein expressionand feasible co-expression of correlated proteins. Conclusively, our optimized SUMO fusion technology herein could confer alarge potential in E. coli protein expression system, and the simultaneously established co-expression vector systems could also bevery useful in studying the protein-protein interactions in vivo.

【题目】水稻品种中VC含量及抗氧化特征分析
【中文关键词】VC;抗氧化剂;水稻品种;抗逆性
【英文关键词】Vitamin C antioxidant rice varieties stress resistance
【中文摘要】VC(Vitamin C)又叫抗坏血酸(ascorbic acid, AsA),是植物体内重要的抗氧化剂,在植物抗氧化胁迫应答过程中具有重要的调控作用。VC在植物如拟南芥、小麦抗氧化功能方面已有许多研究,但在水稻中的相关研究较少。通过比较水稻品种中花17、日本晴、扬稻6号和扬稻2号中的VC含量,发现不同品种间VC含量存在明显的差异。结合MV(methyl viologen)处理,进一步比较了由于VC含量的差异导致氧化胁迫下超氧阴离子、H2O2的含量的变化。结果表明VC含量与水稻抗氧化作用可能存在密切的联系。本研究进一步证明了VC在水稻的抗氧化胁迫中的重要作用,从而为提高水稻的抗逆性提供依据。
【英文摘要】Vitamin C (VC), also known as ascorbic acid (AsA), is a pivotal antioxidant in response to plant oxidative stress. Many research results have revealed that VC functions in resistance to oxidative stress in different plant species including Arabidopsis and wheat, but little is known in rice. In this paper, the VC contents in rice varieties Zhonghua17, Nipponbare, Yangdao6 and Yangdao 2 were compared. and found that their VC contents were obvious different. Combining with the treatment of MV (Methyl Viologen), changes in superoxide anion and H2O2 levels among these varieties were also compared. The results showed that there was close relationship between VC contents and oxidative stress resistance of rice. Those results proved that VC played an important role in rice resistance to oxidative stress, which provided a basis for improving rice resistance to stress.

【中文摘要】肠杆菌科来源的半乳糖苷酶异源表达
【英文摘要】A gene encoding a glycoside hydrolase (GH) family 36 alpha-galactosidase was cloned from Yersinia pestis biovar Microtus str. 91001 and expressed in Escherichia coli. The purified recombinant alpha-galactosidase (Aga-Y) was optimally active at 37 degrees C and pH 6.8. The features of temperature profile, thermoliability, kinetics, and amino acid composition indicated that Aga-Y had properties of a cold-adapted enzyme.

【题目】不同农业利用方式对土壤重金属累积的影响及原因分析
【中文关键词】土壤;土地利用方式;重金属;累积
【英文关键词】soil; land use types; heavy metal elements; accumulation
【中文摘要】【目的】探讨不同农业利用方式下土壤中重金属的累积及其影响要素,制定有效降低土壤中重金属含量的技术和策略。【方法】系统采集了吉林省四平市部分区域内设施菜地、露天菜地、大田玉米地及林地4 种土地利用类型的148 个样品,分析了其Cr、Ni、Cu、As、Cd 、Pb、Zn 等重金属的含量,并进行了相应的调查。【结果】在研究区域内,不同利用方式对土壤中Cr、Ni、Cu、As、Cd、Zn 的含量有较大的影响,平均含量顺序均为:设施菜地>露天菜地>大田>林地,但对Pb 含量的影响不显著。4 种土地利用方式中,以设施菜地中Cr、Ni、Cu、As、Cd、Zn 的累积最多,其次是露天菜地、大田玉米地,林地未出现累积。研究的7 种重金属元素中以Cd 的累积较严重,其次是Cu。其中设施菜地的Cd 含量平均达0.467 mg·kg-1,超过了《土壤环境质量标准》(GB15618-1995)中II 级标准(0.3 mg·kg-1,6.5<pH<7.5),也相当于自然状态下林地Cd 含量平均值的5.2 倍;但4 种利用类型中其它重金属含量的平均值均低于国家II 级标准。分析认为,与土地利用年限相比,农用化学品、特别是肥料的质量和数量是导致不同利用方式下土壤重金属含量差异的重要原因。【结论】土地利用方式对Cr、Ni、Cu、As、Cd、Zn 的累积具有显著影响,其中以设施菜地累积较显著,避免重金属含量较高化肥、有机肥和农药的施用是防止土壤重金属累积、促进土壤健康和可持续利用的重要保障。
【英文摘要】【Objective】 Heavy metals accumulation and their influential factors were studied in different land use soils, which will provide a theoretical basis for controlling the content of heavy metals in soils. 【Method】 To identify the effects of land use on the accumulation of heavy metals in soils, 148 samples were collected from four land use types including greenhouse, open vegetable field, maize field and forest land in Siping area, Jilin Province, and Cr, Ni, Cu, As, Cd, Pb, and Zn contents of those samples were determined with ICP-Mass. 【Result】 The result showed that there was a rather large difference in effects of the accumulation of Cr, Ni, Cu, As, Cd, Zn in soils under different land use types, except Pb. Based on the assessment compared with background concentrations in soil, the higher accumulation of heavy metals was found in greenhouse and open vegetable field, lesser in maize field and forest field. The order of mean contents of heavy metals in soils was greenhouse>open vegetable field>maize field>forest field. Cd , Cu had relatively serious accumulation in soils compared with Cr, Ni As and Zn. The mean content of Cd in greenhouse was 0.467 mg·kg-1, which exceeded the Grade II of Chinese Soil Quality Criterion GB15618-1995 (6.5<pH<7.5) for Cd standard of 0.3 mg·kg-1, and was 5.2 times of Cd in forest field. The mean contents of Cr, Ni, Cu, As, Pb, Zn in soils under four land use types were lower than grade II of Chinese Soil Quality Criterion. Compared with the age of land use, agricultural chemical compounds application (especial the quality and quantity of applied fertilizer) was the important reason for leading to difference in accumulation of heavy metals in soils under the studied land use types. 【Conclusion】 Heavy metals (Cr, Ni, Cu, As, Cd, Zn) accumulation in soils was significantly affected by land use types, soil in greenhouse accumulates more heavy metals than others. It is suggested that the application of high contents of heavy

metals in chemical fertilizer, organic fertilizer and pesticides should be avoided to prevent the accumulation of heavy metal and keep high quality soils for sustainable use.

【题目】改良剂对镉污染酸性水稻土的修复效应与机理研究
【中文关键词】改良剂;cd污染;酸性水稻土;水稻;cd有效性;提取态cd;cd形态
【英文关键词】Amendment; Cadmium pollution;Acid paddy soil; Ricc;Cd availadility; Extractable Cd;Cd fraction
【中文摘要】为探明田间条件下施用石灰、钙镁磷肥、海泡石和腐殖酸等改良剂对Cd污染酸性水稻土的修复效应和作用机理, 通过在Cd污染区建立田间小区试验, 研究了改良剂单施和与石灰配施对Cd污染酸性水稻土中Cd作物有效性的影响。结果表明, 施用改良剂有效地改变了土壤中Cd的存在形态, 除腐殖酸外, 其他改良剂均使土壤酸提取态Cd不同程度地转化为可还原态Cd和残渣态Cd; 施用改良剂可使0.1 mol·L-1 NaNO3和 0.01 mol·L-1CaCl2提取态Cd 降低26%~97%, 降低效果为石灰+海泡石>海泡石>石灰+钙镁磷肥>钙镁磷肥>石灰>石灰+腐殖酸>腐殖酸; 改良剂使水稻地上部分的Cd吸收量降低6%~49%。试验结果还显示, 施用改良剂提高土壤pH是引起土壤中Cd作物有效性降低的主要原因之一。根据田间试验的结果, 海泡石可推荐作为Cd污染酸性水稻土的改良剂, 而腐殖酸则不宜使用。
【英文摘要】A field experiment was conducted to study Cd immobilization in Cd contaminated soils. The study analyzed the remediation effects of lime (L), fused calcium magnesium phosphate (P), sepiolite (S), humic acid (H) and mixed lime amendments (LP, LS and LH) on Cd bioavailability in a Cd contaminated acid paddy soils. The results indicate that amendments significantly change the proportion of Cd forms in contaminated soils. Except for H, the other 3 amendments lower acid extractable fraction of Cd, while increasing oxidation fraction and residual Cd. The 4 amendments reduce the 0.1 mol·L-1 NaNO3 and 0.01 mol·L-1 CaCl2 extracted Cd by 26%~97%. The order of reduction is LS > S > LP > P > L > LH > H. The content of Cd in the aboveground parts of rice decreases by 6%~49% under amendment application. Amendment increasing soil pH is the main factor influencing soil Cd immobilization. In conclusion therefore, sepiolite could be a suitable amendment of Cd contaminated acid paddy soils. However, humic acid is not so suitable for remediating Cd contaminated acid paddy soils.

【题目】高耐砷真菌的分离及其耐砷能力
【中文关键词】砷,真菌,分离,耐砷能力
【英文关键词】arsenic; fungi; isolation; arsenic-tolerant ability.
【中文摘要】从湖南石门县及郴州市重金属矿周边地区采集的6 个砷污染土壤样品中,初步分离得到13 株具有较强耐砷能力的真菌菌株,其中3 株真菌的耐砷能力最强,经形态与分子鉴定分别为微紫青霉(Penicillin janthinellum) 、尖孢镰刀菌(Fusarium oxysporum) 和棘孢木霉(Trichoderma asperellum) . 培养试验表明: 微紫青霉、尖孢镰刀菌和棘孢木霉分别在30000 mg·L - 1、30000 mg·L - 1和20000 mg·L - 1的砷胁迫平板中表现出很好的菌落生长状况; 在砷浓度分别为0 ~ 50、0 ~ 50 和0 ~ 80 mg·L - 1的液态培养基中培养2 d 后,尖孢镰刀菌、棘孢木霉和微紫青霉的生物量均随砷浓度增加而增加,且在相应最高浓度(50、50、80 mg·L - 1) 下的生物量显著高于不加砷的对照. 此外,高浓度砷对该3 株真菌的产孢能力没有影响
【英文摘要】A total of thirteen fungal strains with higher arsenic (As) -tolerance ability were isolatedfrom six As-contaminated soil samples collected from the mining areas of Shimen County and Chenzhou City in Hunan Province. Among the strains

isolated,Penicillin janthinellum,Fusarium oxysporum,and Trichoderma asperellum had the highest As-tolerance ability,based on the morphological identification and phylogenetic analysis. Culture experiment showed that on the solid plates with 30000,30000,and 20000 mg·L-1 of As,P. janthinellum,F. oxysporum,and T. asperellum had a better colony growth,and after cultured in the liquid medium with 0-50,0-50,and 0-80 mg·L-1 of As for 2 days,respectively,the dry mycelia masses of the three strains all increased with increasing As concentration. When the As concentration reached 50,50,and 80 mg·L-1,respectively,the fungal biomass of F. oxysporum,T. asperellum,and P. janthinellum increased significantly,compared with CK. High concentration As had no significant effects on the sporalation of the three fungal strains.

【题目】PEI介导外源基因进入植物细胞的瞬时表达
【中文关键词】聚乙烯亚胺;纳米基因载体;植物细胞;瞬时表达;拟南芥
【英文关键词】polyethylenimine; nano-gene vector; plant cell; transient expression; Arabidopsis thaliana
【中文摘要】【目的】医学方面的大量研究证实,聚乙烯亚胺(polyethylenimine,PEI)作为一种新型阳离子多聚物基因载体可以吸附和浓缩DNA,通过与细胞膜亲和粘附和细胞吞噬作用运载外源基因进入细胞并实现表达。本实验研究旨在探索PEI作为非病毒基因载体介导外源基因进入植物细胞并获得瞬时表达的可能性。【方法】制备PEI/DNA复合物,利用凝胶阻滞分析PEI与DNA的结合情况,采用电子显微镜观察PEI/DNA复合物的形态。以绿色荧光蛋白基因为报告基因研究不同N/P比条件下PEI/DNA复合物对拟南芥原生质体细胞的转化效率,并与PEG转化方法进行比较分析。【结果】PEI与DNA的质量比为5∶1~1∶4,PEI可以与DNA稳定结合,形成粒径约100~200 nm的球形复合物。PEI/DNA复合物对拟南芥原生质体细胞的转化效率随其N/P比的增大而提高,N/P=5时PEI的转化效率达到最高且明显高于PEG介导的转化效率,N/P>5时转化效率反而下降,容易使细胞破碎和变形。【结论】PEI作为一种新型的外源基因运送载体对拟南芥原生质体细胞具有良好的介导基因转移效果。
【英文摘要】【Objective】 The experimental research was carried out to investigate the possibility and method of gene delivery into plant cells by nano-vector polyethylenimine (PEI) and obtain transient expression of gene, based on some research results that PEI can condense DNA into granules of nanometer size for delivering gene into cells in the field of medical science. 【Method】PEI/DNA complexes were prepared. The ability of PEI to combine and protect DNA was investigated by agarose gel electrophoresis retardation assay. The surface characteristics of PEI/DNA complexes were observed with transmission electron microscope. For Arabidopsis thaliana protoplasts, transformation efficiency of PEI/DNA at different charge ratios (N/P) was analyzed and compared with PEG. 【Result】 When the quality rate of PEI and DNA is in range of 5∶1-1∶4, PEI could bind and condense DNA, and form stable PEI/DNA complexes with nanoparticles diameter in 100-200 nm. Transformation efficiency of PEI/DNA can be improvedwith the increase of N/P ratios and reached highest at N/P=5. There was higher transformation efficiency of PEI/DNA complexes than PEG at N/P=5, but began to decrease at N/P>5 with higher toxicity to cells. 【Conclusion】 The experimental results confirmed that PEI is a new kind of efficient gene vector for transferring genes into Arabidopsis thaliana protoplasts.

【题目】Effects of cadmium on growth and photosynthetic activities in pakchoi and mustard

【中文关键词】镉;生长;光合活性
【英文关键词】Cadmium; Growth; Photosynthetic activities
【中文摘要】在这个研究中,我们评价了温室条件下不同浓度土壤镉(0-24mg·kg-1)对盆栽小白菜和芥菜生长及叶片光合活性的影响。小白菜和芥菜的地上和根重都随Cd浓度增加而减少;总叶绿素含量与土壤Cd浓度呈负线性关系:白菜(r2=-0.681, P<0.01) ,芥菜(r2=-0.463, P<0.05);随镉浓度增加,净光合速率和气孔导度下降;对于这个研究我们发现,小白菜的光合活性比芥菜更敏感。
【英文摘要】In this study, we determined the effects of different concentrations of soil cadmium (0-24mg·kg-1) on growth and photosynthetic activities in leaves of pakchoi and mustard using pot experiments under greenhouse conditions. Both shoot and root weight decreased progressively with increasing Cd concentration for pakchoi and mustard. Negative linear relationships were observed between total Chlorophyll contents and Cd concentrations in soils in pakchoi (r2=-0.681, P<0.01) and mustard (r2=-0.463, P<0.05). In comparison to the controls (Cd=0mg·kg-1), significant reductions of chlorophyll-a and chlorophyll-b were both observed at 24 mg Cd kg-1soil. The increase in cadmium concentration also caused a decline in the net rate of photosynthesis(Pn) and stomatal conductance (Gs). At lower concentrations of Cd (e.g. 6 mg·kg-1), a retarded development was observed only in mustard. However, a significant decrease of Gs for both plants was observed at concentrations above 12 mg Cd kg-1 soil. From this study, we found the photosynthetic activity of pakchoi more sensitive to Cd stress than that of mustard.

【题目】苯并(a)芘对蚯蚓细胞色素P450和抗氧化酶影响
【中文关键词】苯并(a)芘;蚯蚓(Eisenia fetida);细胞色素P450;抗氧化酶;生物标记物
【英文关键词】Benzo (a) pyrene;earthworms;cytochrome P450;antioxidant enzymes;biomarker
【中文摘要】研究了苯并(a)芘(BaP)低剂量污染胁迫下对蚯蚓(Eisenia fetida)体内细胞色素P450 酶系和抗氧化酶系的影响。通过滤纸接触染毒法,按指数递增设计暴露质量浓度为10-6 到10-2mg·mL-1,染毒时间48h,检测指标分别为蚯蚓细胞色素P450 含量、超氧化物歧化酶(SOD)、过氧化物酶(POD)和过氧化氢酶(CAT)活性。结果表明,在供试质量浓度范围内,蚯蚓体内P450 含量和SOD 活性与苯并(a)芘污染胁迫存在明显的响应关系,POD 活性在BaP 的最大暴露质量浓度下(10-2mg·mL-1)被显著诱导,而CAT 活性对BaP 暴露无明显的指示作用。这表明,BaP 的代谢过程诱发了蚯蚓体内P450 含量的增加,同时又抑制了SOD 酶活性,从而使生物体对活性氧自由基的防御能力下降而更易受到毒害,这可能是BaP 对生物体毒性作用的机制之一。
【英文摘要】The effects of Benzo (a) pyrene on cytochrome P450 and antioxidant enzymes of earthworms (Eisenia fetida) were studied to use these responses as biomarkers for monitoring PAH-contaminated soil in sublethal concentrations and to elucidate the possible metabolic mechanisms of BaP in earthworms. By contacting with contaminated filter paper, earthworms were exposed to the pollutant. The concentrations of pollutant were ranged from 10-6 to 10-2 mg/mL. After48 hours’ exposure, the whole body of earthworm was used to detect total cytochrome P450 content, the activities of superoxide dismutase (SOD), peroxidase (POD) and catalase (CAT). Results showed that, within the test concentrations limits, total P450 content and SOD activity were very sensitive to the toxicity of Benzo (a) pyrene. POD activity was elevated only when earthworms exposed to the maximum BaP concentration (10-2mg·mL-1). CAT activity did not show any response to BaP exposure. The results revealed that BaP metabolism in earthworm induced the increase of P450 content and also at the same time inhibited SOD activity. The decrease of SOD activity weakened the protection organism from the oxidative stress. This may be one of the mechanisms for BaP toxicity to organism.

【题目】好气条件下不同形态外源砷在土壤中的转化
【中文关键词】好气条件, 土壤 ,砷, 形态转化
【英文关键词】aerobic condition; soil; arsenic form; transformation.
【中文摘要】在35%的田间持水量下,通过模拟试验研究了外源二甲基砷酸盐(DMA) 、一甲基砷酸盐(MMA) 、五价无机砷[As(V)]在土壤中的形态转化. 结果表明: 外源砷进入土壤后,其含量均有随时间推延而逐渐下降的趋势,两种不同形态的有机砷DMA 和MMA 在土壤中主要发生脱甲基化过程,经150 d 的恒温恒湿培养,其在土壤中主要转化为As(V) ,DMA 处理仅在120 d 时检测到少量MMA,而MMA 处理则在7 ~ 60 d 内均有少量的DMA 生成. 培养结束时土壤中DMA 和MMA 含量均显著降低(P < 0. 01) ,降幅分别为99. 5%、94. 3%,而两者的主要转化产物As(V) 的含量则分别显著增加了4. 61 和5. 15 倍.表明外源有机态砷在土壤中基本上被转化为无机形态; 与有机态外源砷相比,外源As(V) 进入土壤后其形态基本上没有发生转化.
【英文摘要】An incubation test was conducted to study the transformation of exogenous dimethylarsenic acid (DMA) ,monomethylarsenic acid (MMA) ,and arsenate [As(V)]in soil under the condition of 35% of water-holding capacity. After added into soil,the concentrations of test arsenic forms all showed a decreasing trend with time. The DMA and MMA were mainly demethylated,and after 120 days incubation at constant temperature and humidity,transformed into As(V) . A small amount of MMA was detected in the treatment with added DMA on the 120th day of incubation,and a small amount of DMA was detected in the treatment with added MMA during the period of 7 - 60days incubation. By the end of the incubation test,the concentrations of added DMA and MMA in soil decreased significantly (P < 0. 01) ,with the decrement being 99. 5% and 94. 3% and the concentrationof transformed As(V) increased by 4. 61 and 5. 15 times,respectively. Comparing withDMA and MMA,the As(V) after added into soil had less form transformation.

【题目】介孔活性炭阿维菌素载药系统的性能研究
【中文关键词】介孔活性炭;阿维菌素;载药系统;缓释;控释;光降解
【英文关键词】mesoporous activated carbon; abamectin; delivery system; sustained release; controlled release; photo-degradation
【中文摘要】研究了介孔活性炭对阿维菌素的载药特性,以判断其作为阿维菌素载体的可能性。以扫描电子显微镜、比表面积分析仪和粒度分析仪对其进行了物理性状表征。将其负载阿维菌素的能力与常规农药载体进行比较,并进一步分析和评价了该载药系统的吸附动力学特性、缓-控释性能和抗紫外光降解能力。结果表明:供试活性炭载体为不规则球形颗粒状介孔材料,平均粒径为814nm,比表面积为1719.25 cm2/g,孔容积为0.043 cm3/g,孔径为4.80 nm。吸收动力学数据符合伪二级动力学模型,对阿维菌素的载药量为220.6 mg/g,显著高于其他常规农药载体,呈现了优良的吸附性能;载药系统的释药时间从90 h延长到672 h以上,表现出了良好的缓释效果;在紫外光照射72h后,阿维菌素原药的分解率为77%,而有活性炭载体保护的阿维菌素的分解率为30%,表明该载药系统有效地减缓了阿维菌素的光降解速率。研究表明,以介孔活性炭作为阿维菌素载体,可显著改善药物的缓-控释特性以及分散性和光稳定性。
【英文摘要】The loading properties of mesoporous activated carbon for abamectin were studied to determine its potential as the carrier of abamectin. Physical properties of mesoporous activated carbon were characterized by scanning electron microscope,specific surface area analyzer and particle size analyzer. Drug-loading capacity of mesoporous activated carbon was compared with other conventional pesticide carriers, and the adsorption kinetics, sustained- release properties and resistance to UV degradation of the drug delivery system were analyzed and evaluated. The results showed that the trial mesoporous activated carbon were irregular spherical particles with specific surface area of 1719.25cm2/g , pore volume of 0.043cm3/g and average pore diameter of 4.80nm and its drug-loading capacity for abamectin reached 220.6mg/g and was significantly excellent over other conventional pesticide carriers. The adsorption processes followed a pseudo second-order kinetic rate equation. Drug release time was extended from 90 h to 672 h, which may significantly extend the duration of drug. The drug degradation rate was 77% in the original drug of abamectin , while in abamectin delivery system with mesoporous activated carbon only 31% decomposed under UV radiation, which showed that mesoporous activated carbon effectively inhibited the photo-degradation of the drug. These results indicated that mesoporous activated carbon can be used as drug carrier for abamectin to improve properties of sustained-controlled release, dispersity in water and photo- stability.

【题目】植物CytP450和抗氧化酶对土壤低浓度菲、芘胁迫的响应
【中文关键词】土壤; 植物; CytP450; 抗氧化酶; 菲; 芘
【英文关键词】soil; plant; CytP450; antioxidant enzymes; phenanthrene; pyrene
【中文摘要】以小麦(Triticum acstivnm)为供试植物,草甸棕壤为供试土壤,以微粒体细胞色素P450及抗氧化酶SOD、POD和CAT酶活性为指标,进行了土壤中菲、芘单一及复合胁迫响应研究。结果初步表明,菲、芘胁迫引起植物体内解毒代谢和抗氧化防御酶反应。菲、芘单一胁迫浓度为1mgkg-1时对细胞色素P450产生显著诱导;4mgkg-1时P450酶含量明显被抑制,表明低浓度菲、芘单一胁迫对植物代谢解毒系统产生损伤;而菲、芘复合1mgkg-1时P450酶含量明显被抑制,说明菲、芘复合胁迫对植物的代谢解毒具有协同毒性效应。土壤中菲、芘单一胁迫未引起SOD酶活性的明显改变,复合胁迫下SOD酶活性出现微弱下降;菲、芘单一胁迫对CAT和POD酶活性具有显著抑制作用;复合胁迫对CAT产生抑制作用,而POD酶活性并未对菲、芘复合产生增强毒性响应。研究从代谢解毒和抗氧化防御酶系统两方面,为土壤低浓度PAHs污染诊断提供了实验依据。
【英文摘要】Wheat(Triticum aestivum) was chosen to analyze the effect of two polycyclic aromatic hydrocarbons(PAHs),Phenanthrene(PHE) and Pyrene(PY) in brown meadow soil at low concentrations.The effects of PHE and PY were determined by analyzing the changes in activity of Cytochrome P450(CytP450) and antioxidant enzymes superoxide dismutase(SOD), peroxidase (POD) and catalase (CAT).Results indicated that both PHE and PY caused changes in activity of CytP450 and the antioxidant enzymes, SOD,POD and CAT.CytP450 activity was significantly stimulated with 1 mg kg-1 of both PHE

and PY individually and significantly inhibited with 4 mg kg-1,which showed that pollution stress of PHE or PY can damage the metabolism and detoxification systems of plants. Moreover, as PHE and PY combined at 1 mg kg-1, CytP450 was increased significantly more than when PHE and PY were applied individually, which illustrates obvious synergistic effects. No significant variation were found in activity of SOD in response to individual exposure of PHE or PY in soil, but SOD activity decreased slightly in response to a combined PHE and PY exposure. Great decrease variation was found in CAT and POD activity in response to individual exposure of PHE or PY in soil. No enhanced toxic effects were shown by POD in response to a PHE and PY combined exposure, however CAT showed increased inhibition. From the aspects of metabolism and detoxification as well as antioxidant enzyme activity, our study has provided experimental basis for the pollution diagnosis of PAHs in soils at low concentrations.

【中文关键词】积温; 动态变化; GIS; 黄河流域
【英文关键词】accumulated temperature; dynamic variation; GIS; Yellow River Basin
【中文摘要】论文应用国家气象局提供的黄河流域109个气象站点40a的气象资料和中国数字高程模型,采用“回归分析计算+残差插值”法对黄河流域≥0°C和≥10°C的积温进行栅格化,得到10a尺度的栅格面,在ArcGIS中分别对≥0°C和≥10°C的积温栅格面进行空间分析和统计分析。结果表明: 40a间≥0°C积温保持不变的面积占84159% ,积温段ⅰ(< 2 000°C)升到积温段ⅱ(2 000~3 000°C)的为2107% ,积温段ⅱ升到ⅲ(3 000~4 000°C)的为3114% ,积温段ⅲ升到ⅳ(4 000~5 000°C)的为3135% ,积温段ⅳ升到ⅴ(> 5 000°C)的为3176%; 40a间≥10°C积温保持不变面积占85158% ,积温段ⅱ升到ⅲ的为7131% ,积温段ⅰ升到ⅱ、积温段ⅲ升到ⅳ和积温段ⅳ升到ⅴ占的面积较小,分布不集中。总体来说黄河流域≥0°C、≥10°C年积温值呈升高的趋势,主要是受全球气候变暖的影响。
【英文摘要】Based on the meteorological data from 1961 to 2000, longitude and latitude of 109 me2teorological stations in the Yellow River Basin (YRB) from ChinaMeteorological Administration,and Chinese GTOPO30, rasterizing accumulated temperature data was conducted using “ modelbased computation result p lus spatialized residues ”. Spatial analysis and statistical analysis werecarried out on eight ten2year2scale grid surfaces with accumulated temperature≥0°C and ≥10°Cwith accumulated temperature in ArcGIS. The intensity and characteristic of dynamic variationwith ≥0°C accumulated temperature in recent 40 years in the YRB indicated that the areaunchanged was 84159% , the area of accumulated temperature segment ⅱ rising from ⅰ was2107% , the area of accumulated temperature segment ⅲ rising from ⅱ was 3114% , the area ofaccumulated temperature segment ⅳ rising from ⅲ was 2107% , and that the area of ⅴ risingfrom ⅳ was 2107%. And the characteristic of dynamic variation of ≥10°C accumulated tempera2ture showed that the area remained unchanged was 85158% , the area of accumulated temperatureSegment ⅲ rising from ⅱ was 7131%, and that the other variation area was small, whose distribution was sporadic. In a word, the annual increasing trend of the value of accumulated temperature was caused by global climate change.

【题目】山西寿阳县旱作农业土地生产潜力
【中文关键词】土地生产潜力,机制法,GIS,寿阳县,北方旱区

【英文关键词】land potential productivity, mechanism method, GIS, Shouyang county, northern arid region
【中文摘要】北方旱区是中国最具开发潜力的农业生产基地,土地生产潜力作为土地最本质的属性,它的研究越来越受到人们的重视。该文以山西寿阳县33 a 气候数据、土壤理化数据和图件资料为基础,采用“ 机制法 ”对土地生产潜力分别进行了光合、温度、水分和土壤的逐级订正,估算土地生产潜力。研究结果表明:水分不足是气候生产潜力的主要限制因子,经水分订正后,多年平均气候生产潜力相对光温生产潜力减少了三分之二;土地生产潜力分布特点基本满足地形地貌类型的分布特点,河谷盆地生产潜力较高,山地部位生产潜力较低,而土壤养分总体含量较低,存在重用轻养现象,肥力补偿差。
【英文摘要】It is widely acknowledged that northern arid region is agricultural production base considered as the most promising potential area. Land potential productivity (LPP) as land essential attribute is drawing increasing attention.Based on the climate data from 1967 to 1999, soil physiochemical data and maps, with the support of geographic information system (GIS), LPP was computed according to the factors such as radiation, temperature, precipitation, and soil using mechanism method. The results show that water deficiency is the main limiting factor of climatic potential productivity, because climatic potential productivity becomes one third of light-temperature potential productivity according to water correction coefficient; the distribution characteristic of LPP is influenced by many factors, which is same as distribution characteristic of landform. The value of land potential productivity in the basin valley is the highest,and the value in mountain is the lowest.

【题目】黄河流域积温数据栅格化方法优选
【中文关键词】栅格化;积温;黄河流域
【英文关键词】rasterizing; spatial distribution; accumulated temperature; Yellow River Basion
【中文摘要】在获得黄河流域109个气象站点45a的逐日平均气温、各气象站的经纬度以及海拔高度数据和中国数字高程模型的基础上,采用Cokriging、积温垂直递减和“ 回归分析计算+残差插值 ”三种方法对黄河流域≥0℃的积温栅格化进行了探讨,结果表明:相关性为“ 回归分析计算+残差插值 ”>积温垂直递减>Cokriging,T检验的双尾显著性概率Sig.:“ 回归分析计算+残差插值 ”<积温垂直递减<0.05<Cokriging,Cokriging方法结果差异不显著,“ 回归分析计算+残差插值 ” 方法比积温垂直递减差异性更显著,比较分析可知“ 回归分析计算+残差插值 ”是最适合的

【英文摘要】Based on the average temperature from 1961 to 2005, longitude and latitude, height above sea level of 109 meteorological stations in the Yellow River Basin (YRB), and China DEM, accumulated temperature data were rasterized using different methods, viz, Cokriging, accumulated temperature vertically descending and “ model based computation result plus spatialized residues ”. The results show that the magnitudes of the correlation coefficients can be ranked in the following order, “ model based computation result plus spatialized residues ” > accumulated temperature vertically descending>Cokriging. But also, the magnitudes of the T-test Sig. can be ranked in the following order, “ model based computation result plus spatialized residues ” < “ model based computation result plus spatialized residues ” <0.05<Cokriging. Therefore, “ model based computation result plus spatialized residues ” has the highest accuracy.

【题目】山东寿光不同农业利用方式下土壤铅的累积特征
【中文关键词】农业;土壤;铅;设施菜地
【英文关键词】agriculture; soil; lead; greenhouse vegetable field
【中文摘要】采用田间实地调查、地统计学和ICP-MS 等方法,研究了基于GIS 分析的山东省寿光市农业土壤中铅的含量及其空间分布特征,并比较了农业利用方式的影响。结果表明,研究区域农田中铅的平均含量为(17.97±1.22)mg·kg-1,与1990 年山东省土壤背景值比较,有8.59%的样本出现了累积趋势,而以国家土壤质量Ⅱ级标准(GB 15618—1995)为基础进行分析则尚未发现超标样本;研究区域内4 种主要农业利用方式比较,小麦/玉米/棉花为主的传统种植模式下土壤的铅含量最高,达(19.83±5.34)mg·kg-1,其后依次为露天菜地、设施菜地和对照土壤;研究区域内土壤铅含量在空间分布上以东北部、西部和西南部较高,且有由东北和西南向中部逐渐降低的趋势。设施种植条件下,土壤铅含量有随设施年限增加而升高的趋势(P<0.05),年累积速率为0.40 mg·kg-1,导致这种结果的原因可能在一定程度上与含铅量较高的有机肥大量施用有关。总体来说,目前研究区域土壤中铅含量尚处于正常范围,但从长远看仍需要注意其累积问题。
【英文摘要】Abstract:Through field survey, geostatistics and ICP-MS technology, the lead(Pb)content and its spatial distribution characteristics in agricultural soils in Shouguang City of Shandong Province were investigated. The effect of different land-use type on the soil lead content was analyzed as well. The results indicated that the average content of lead in Shouguang City was by(17.97±1.22)mg·kg-1. Compared to the soil background value of Shandong Province in 1990, the lead content of 8.59% samples of the total samples showed an accumulated trend, while it was not exceeded, compared to the National Soil Quality Level Ⅱ(GB 15618—1995). Among the four kinds of the land-use patterns, thelead content in the soils was the highest by wheat, maize and cotton fields under traditional farming pattern, which was with(19.83±5.34)mg·kg-1, whereas it was followed by field vegetable, greenhouse vegetable and forest soils, which was as control soils. The spatial distribution of lead contents made by using GIS technology showed that the relative high lead content was found in the Northeast, West and Southwest and a decreasing trend of the lead contents from the Northeast and Southwest to the central part. The lead content in the greenhouse vegetable soilsincreased significantly at P<0.05 level as the cultivation time prolonged, and yearly accumulation rate of lead was by 0.40 mg·kg-1. The reason for the lead accumulation in greenhouse vegetable field could be related to the application of the high lead content organic fertilizer. Generally, the lead contents in the studied areas were in the commen range, but it was necessary to pay attention to the lead accumulation in agricultural soils in the long run.

【题目】黄河流域干燥度时空格局变化研究
【中文关键词】黄河流域;干燥度;Penman - Monteith 法;时空格局;克里格法
【英文关键词】Yellow River Basin (YRB) ; arid index ; Penman - Monteith method ; spatial - temporal pat2
tern ; Kriging
【中文摘要】根据国家气象局整编的1957~2001 年(45 a) 黄河流域93 个气象站点气象资料,应用1998 年FAO 最新推荐的Penman - Monteith 法计算干燥度中的潜在蒸散项,并在此基础上使用克里格(kriging) 插值法生成黄河流域干燥度的分布图。研究结果显示,黄河流域多年平均干燥度空间分布格局受气候、地形地貌等多种因素的影响,具有明显的地域性差异,干燥度总的特点是北大南小,呈现由北向南逐渐递减趋势;从时间尺度上看,自1957 年以来,干燥度总体上呈波动增大趋势,干燥度季节变化为冬季> 春季> 秋季> 夏季,全年以7~9 月份干燥度最小,11月~翌年3 月最大,且不同区域之间存在着明显的差异。
【英文摘要】The arid index was calculated with Penman - Monteith method recommended by the FAO in1990 , based on climatic data of 93 meteorological stations in Yellow River Basin (YRB) authorized by the Na2tional Meteorological Bureau f rom 1957 to 2001 , and the arid index dist ribution in Yellow River basin was alsocreated through the kriging method. The result shows that the spatial dist ribution of arid index is st rongly af2fected by climatic and geographical factors , and the arid index decreases f rom the north to the south. From 1957to the end of 1990s , the t rend of arid index was stable at first and then increased. At the same time , the season2al variation of the arid index was obvious , which was winter > spring > autumn > summer. The maximum valueof the arid index occurred in J uly ,August and September in the upper , middle and lower reaches of the YRB re2spectively , and the minimum values were f rom November to the next March with a distinct regional variation.

【题目】设施菜地重金属的剖面分布特征
【中文关键词】设施菜地 土壤剖面 重金属 累积
【英文关键词】facility vegetable field; soil p rofile; heavy metal; accumulation.
【中文摘要】以山东省寿光市种植1~12年的蔬菜大棚及相邻的小麦地为对象,研究了设施菜地中As、Cd、Cu、Zn、Cr、Ni 6种重金属在土壤剖面中的分布特征. 结果表明:在0~150 cm土层内,随着土层深度的增加,设施菜地与小麦地中6种重金属含量均呈下降趋势;与小麦地相比,相同土层设施菜地中6种重金属的含量均明显较高,设施菜地0~20 cm土层中As、Cd、Cu、Zn、Cr、Ni的含量分别比小麦地相同土层高出3510%、14612%、6516%、3614%、2115%和1410% , 120~150 cm土层分别高出1016%、17815%、1914%、2012%、1512%和913% , 20~120 cm各土层中的含量亦高于小麦地. 设施菜地0~20 cm土层中, Cd、Cu、Zn含量与种植年限呈显著正相关,随着种植年限的增加,其累积速率分别为01027、11153和21830 mg·kg-1·a-1;设施菜地中6种重金属的含量与土壤有机碳、全氮含量呈正相关,除Ni和As外的4种重金属含量亦与土壤全磷含量呈极显著相关,有机肥等的施用可能在一定程度上导致设施菜地中重金属的累积.
【英文摘要】Taking the facility vegetable fields having been p lanted for 1 - 12 years and the adjacent wheat land in Shouguang City of Shandong Province as test objects, this paper studied the distribution characteristics of arsenic (As) , cadmium (Cd) , copper (Cu) , zinc (Zn) , chromium (Cr) ,and nickel (Ni) in their soil p rofiles (0 - 150 cm). W ith the increase of soil dep th, the test heavy metals contents in the soil p rofiles all had a decreasing trend, and in the same soil layers, the contentswere obviously higher in facility vegetable fields than in wheat land. Comparing with those inthe same soil layers of wheat land, the average contents ofAs, Cd, Cu, Zn, Cr, and Ni in 0 – 20 and 120 - 150 cm soil layers of facility vegetable fieldswere 3510%, 14612% , 6516% , 3614%, and 2115% , and 1016% , 17815%, 1914%, 2012% , 1512% , and 913% higher, respectively, and the average contents of the heavy metals in 20 - 120 cm soil layer of facility vegetable fields were also higher in some degree. In the 0 - 20 cm soil layer of facility vegetable fields, the Cd, Cu, and Zn contents had significant positive correlationswith p lanting years (P < 0105) , with the accumulation rates of Cd, Cu, and Zn being 01027, 11153, and 21830 mg·kg-1·a-1 , respectively. In facility vegetable fields, the test six heavy metals contents were significantly positively correlated with the contents of soil organic carbon and total nitrogen, and the Cd, Cu, Zn, and Cr contentswere significantly

correlated with the content of soil total phosphorus (P < 0101). App lying organic fertilizer could induce the heavy metals accumulation in the soils of facility vegetable fields to some extent.

【题目】施用有机肥对高砷红壤中小白菜砷吸收的影响
【中文关键词】猪粪 鸡粪 土壤有效砷 小白菜
【英文关键词】pig dung; chicken manure; soil available arsenic; pakchoi (B rassica ch inensis).
【中文摘要】通过盆栽试验,研究了施用猪粪和鸡粪条件下红壤中的砷对小白菜生长和吸收的影响及土壤有效态砷含量的变化. 结果表明:向高砷红壤中施用猪粪和鸡粪两种有机肥均使小白菜的生物量有不同程度的增加,其中,施用猪粪处理的小白菜生物量显著高于对照处理(P < 0105) ;猪粪和鸡粪两种有机肥的施用可导致土壤有效砷含量明显提高,施用猪粪后土壤有效砷含量增幅达39419% ~103316%,而施用鸡粪的土壤有效砷含量增幅为3014% ~9411%; 施用有机肥明显促进了小白菜对砷的吸收,其中猪粪处理下小白菜的砷吸收量比对照增加2017%~5319%. 根据本研究结果,对砷含量较高的高风险农田,施用猪粪、鸡粪等有机肥可能会在一定程度上提高土壤有效砷含量和作物对砷的吸收量,使农产品质量和环境风险增加
【英文摘要】A pot experimentwith arsenic contaminated red soilwas conducted to study the effects ofapp lying pig dung and chicken manure on the growth and arsenic absorption of pakchoi (B rassicachinensis) , and on soil available arsenic. App lying p ig dung and chicken manure to the arsenic2contaminated red soil increased the biomass of pakchoi to some extent. Comparingwith the control,app lying p ig dung increased the pakchoi biomass significantly (P < 0105). The soil available arsenic content after app lying pig dung increased by 39419% - 103316% (P < 0105) , and that after app lying chicken manure increased by 3014% - 9411%. Organic fertilization p romoted the arsenic absorp tion of pakchoi, with the arsenic up take after app lying pig dung increased by 2017% -5319%. The app lication of p ig dung and chicken manure to arsenic2contaminated red soil could somewhat increase the soil available arsenic content and the arsenic up take by crop s, and thus, increase the risks of agricultural p roduct quality and environment.

【题目】马-干扰素双抗体夹心ELISA检测方法的建立
【中文关键词】马γ-干扰素; 夹心ELISA
【英文关键词】equine IFN-γ; sandwich ELISA
【中文摘要】目的: 建立检测马γ2干扰素的双抗体夹心EL ISA,为马传染病的免疫学研究提供新方法。方法: 将识别不同表位的抗马γ2干扰素的2株单克隆抗体(mAb, A5和SB10)纯化后, 利用生物素标记试剂盒对其中1株纯化的mAb (SB10)进行标记, 通过对重组马IFN2γ进行EL ISA检测来建立马γ2干扰素双抗体夹心EL ISA。结果: 经过方阵滴定实验确定捕获抗体的最佳浓度为1 mg/L, 检测抗体的工作效价为1∶1 000。利用建立的方法对不同稀释度的重组马γ2干扰素和丝裂原刺激的马外周血单核细胞培养上清进行检测。结论:此方法检测敏感度达到1μg/L, 特异性良好, 为马的细胞免疫学研究提供了方法, 并为建立马γ2干扰素EL ISPOT检测方法奠定了基础。
【英文摘要】AIM : To develop a quantitaive ELISA by measuring interferon (IFN-γ) of equine lymphocytes. METHODS: Sandwich ELISA for equine IFN-γ was developed using mAb A5 as a capture antibody and biotinylated mAb SB10 as a detection antibody. RESULTS: The detection limit of the sandwich EL ISA for equine IFN-γ was 1μg /L and did not show cross-reactivity with recombinant equine L-18. Equine IFN-γ was detected by ELISA inculture medium of the peripheral blood mononuclear cells (PBMC

s) stimulated with ConA or PMA / Ionomycin. CONCLUSION: This method can be used to help understand the role of this cytokine in various equine diseases and develop specific cell-mediated immunity assay.

【题目】Differential Responses Between Monocytes and Monocyte-Derived Macrophages for Lipopolysaccharide Stimulation of Calves
【中文关键词】Toll样受体,单核细胞,单核细胞来源的巨噬细胞,牛
【英文关键词】Toll-like receptor, monocyte, monocyte-derived macrophage, bovine
【中文摘要】在这个实验中Toll样受体的表达模式的单核细胞和单核细胞来源的巨噬细胞内毒素(脂多糖)刺激检查。颈内静脉血收集了来自四个日本牛犊,和外周血单个核细胞(单核细胞)分离。细胞单核细胞直接用于收集磁性细胞分选和培养7天收集的单核细胞来源的巨噬细胞在repcell。然后,我们分析了基因表达模式的受体和细胞因子的单核细胞和单核细胞来源的巨噬细胞内毒素刺激后24小时内毒素刺激单核细胞和单核细胞来源的巨噬细胞都导致增加的转录水平的肿瘤坏死因子-　,IL - 6和IL - 8。此外,肿瘤坏死因子-　和白细胞介素- 6基因表达明显增强内毒素刺激单核细胞来源的巨噬细胞。受体基因表达不变后,内毒素刺激单核细胞,而受体基因表达的单核细胞来源的巨噬细胞是复杂的。TLR 1,3,5,8和10均显着降低脂多糖刺激后,有没有不同的基因表达TLR 2,4,6和7之间的对照组和内毒素刺激。此外,没有表达TLR 9被发现。作为抗原呈递细胞,单核细胞和单核细胞来源的巨噬细胞的反应不同,所以他们可能有不同的职能的先天免疫系统。
【英文摘要】In this experiment Toll-like receptor expression pattern in monocytes and monocyte-derived macrophages by lipopolysaccharide (LPS) stimulation was examined. Jugular venous blood was collected from four Japanese calves, and the peripheral blood mononuclear cells (PBMCs) were isolated. The cells were directly used for collecting monocytes by magnetic cell sorting or cultured for 7 days to collect monocyte-derived macrophages in Repcell. Then we analyzed the mRNA expression pattern of TLRs and cytokines in monocytes and monocyte-derived macrophages after LPS stimulation for 24 h. LPS stimulation of both monocytes and monocyte-derived macrophages resulted in an increase in the levels of mRNA transcripts for TNF-　, IL-6 and IL-8. Moreover, TNF-　and IL-6 mRNA expressions were significantly augmented by LPS stimulation in monocyte-derived macrophages. TLRs mRNA expressions were unchanged after LPS stimulation of monocytes, while TLRs mRNA expressions in monocyte-derived macrophages were complicated. TLR1, 3, 5, 8 and 10 were significantly decreased after LPS stimulation and there were no differences in the mRNA expressions of TLR2, 4, 6 and 7 between the groups of control and LPS stimulation. Besides, no expression of TLR9 was found. As antigen presenting cells, monocytes and monocyte-derived macrophages respond differently to LPS, so they may have different functions in the innate immune system

【题目】石门雄黄矿周边地区土壤砷分布及农产品健康风险评估
【中文关键词】矿区;土壤;砷;风险
【英文关键词】mining area; soil; arsenic; risk.
【中文摘要】对石门雄黄矿区周边土壤和作物进行了系统研究. 结果表明: 矿区表层(0 ~ 20 cm)土壤砷含量平均为99. 51 mg • kg - 1,比湖南省土壤砷含量背景值高出5. 34 倍,为当地普通农田土壤的9. 70 倍; 矿区水田和旱地表层土壤砷含量分别为43. 51 和115. 1 mg • kg - 1,分别超出国家土壤环境质量II 级标准0. 45 和1. 87 倍,相应的表层土壤样本超标率分别为62.

5%和50. 0%; 矿区粮食作物、蔬菜和水果可食部位砷含量分别为0. 16、0. 06、0. 01 mg·kg - 1,作物样本超标比例由高至低的顺序为粮食作物> 蔬菜> 水果,其中以稻米、红薯中砷含量超标较严重,稻米砷含量最高达0. 84 mg·kg - 1,超过国家食品质量标准4. 6 倍,样本超标率达62. 5%. 土壤砷含量与作物砷含量呈极显著正相关(P < 0. 01) ,当地居民通过食用矿区农产品进入人体的平均日摄取砷量为6. 416 μg·kg - 1· d - 1,远高于WHO 的推荐标准,相应人群健康风险指数为21. 39,是对照区的15. 39 倍.

【英文摘要】A systematic investigation was carried out on the arsenic content in the soils and plants surrounding Shimen arsenic sulphide mine. The arsenic content in top soils (0 - 20 cm) was averagely 99. 51 mg·kg - 1,being 5. 34 times higher than that of the background value in Hunan Province and 8. 70 times higher than that of local farmland soil. The topsoil arsenic content in paddy field and dry land was 43. 51 and 115. 1 mg·kg - 1,respectively,being 0. 45 and 1. 87 times higher than that of the grade II level (paddy field 30 mg·kg - 1 ; dry land 40 mg·kg - 1) commended by the National Soil Quality (GB 15618 - 1995) ,and the corresponding arsenic exceeding rate was 62. 5% and 50. 0%,respectively. The arsenic content in edible parts of foodstuff,vegetables,and fruits was 0. 16,0. 06,and 0. 01 mg·kg - 1,respectively,and the arsenic exceeding rate of crop samples compared to food security standard ranked in the order of foodstuff > vegetables > fruits.Rice and sweet potato were relatively seriously contaminated by arsenic. The highest arsenic content of rice was up to 0. 84 mg·kg - 1,which was 4. 6 times higher than that of the National Standard,with the exceeding rate of 62. 5%. Statistical analysis demonstrated that there was a positive correlation between the arsenic contents of soil and plant. The average daily intake of arsenic by local people through the consumption of the crops was 6. 416 μg·kg - 1·d - 1,which was much higher than the standard commended by WHO,and the related health risk index was 21. 39,which was 14. 39 times higher than that in the control region.

【中文关键词】马γ-干扰素, 抗病毒活性测定, 单克隆抗体

【英文关键词】equine IFN-γ, antiviral assay, monoclonal antibody

【中文摘要】为了测定大肠杆菌和杆状病毒表达的重组马γ-干扰素是否具有抗病毒活性, 利用这两种干扰素处理马胎肾细胞(EFK-78), 然后接种表达绿色荧光蛋白(GFP)的重组水泡性口炎病毒(VSV*GFP), 观察干扰素对病毒表达GFP 的抑制,测出其抗病毒活性单位分别为1×103 AU/mL、1×105 AU/mL。评价了制备的九株抗重组马γ-干扰素单克隆抗体是否可抑制重组马γ-干扰素抗病毒活性, 证实其中一株可中和重组马γ-干扰素的抗病毒活性。结果表明: 杆状病毒表达的马γ-干扰素具有较高的抗病毒活性, 其活性可被一株制备的抗重组马γ-干扰素单克隆抗体抑制; 首次获得原核表达的具有抗病毒活性的马γ-干扰素。

【英文摘要】Equine interferon-gamma (eIFN-γ) expressed both in E. coli and baculovirus were evaluated for antiviral activity against recombinant Vesicular Stomatits Virus expressing green fluorescence protein (rVSV-GFP) in EFK-78 cells. The assays were conducted in 96-well plate. Virus infectivity was measured by quantifying GFP-positive cells, instead of quantifying the CPE reduction. Prior to infection of EFK-78 cells with rVSV-GFP, the cells were incubated with eIFN-γ. The GFP expression in the EFK-78 cells dramatically decreased in the cells treated with eIFN-γ in a dose-dependent manner, comparing with the mock-treated cells. The titers of antiviral activity were 1×103AU/mL and 1×105AU/mL of eIFN-γ expressed from E. coli and baculovirus,respectively. The antiviral activities of the recombinant eIFN-γ were highly efficient and specific, as it was blocked by mAbs against eIFN-γ.

【题目】土壤中砷的形态转化及其分析方法
【中文关键词】土壤 砷 转化 分析方法
【英文关键词】soil; arsenic; transformation; method of analysis.
【中文摘要】在分析土壤中砷的来源及存在形态的基础上,简要探讨了不同形态砷之间相互转化的过程. 对土壤砷形态的提取和检测方法进行了较系统的比较,认为高效液相色谱2氢化物发生2原子荧光光谱(HPLC2HG2AFS)联用技术具有灵敏度高、检测限低、选择性强、运行成本低、不同形态砷之间相互转化较少的优点,可以作为砷形态检测的首选方法. 结合相关研究结果,对土壤中砷形态转化及相关研究的发展方向进行了讨论.
【英文摘要】Based on the analysis of the sources and existing forms of soil arsenic, this paper ap2 p roached the inter2transformation of different arsenic forms in soil. In the meanwhile, the extractionand determination methods of different soil arsenic formswere also compared. Itwas considered that HPLC2HG2AFS had the advantages of high sensitivity, low detection limit, better selectivity, low operation cost, and less inter2transformation of different arsenic forms, being able to be used as the p riormethod for the detection of different arsenic forms. Combiningwith p revious research results,the form transformation of arsenic in soil and the p romising research aspectswere also discussed.

【题目】外源二甲基砷对油菜生长及土壤中砷生物有效性的影响
【中文关键词】二甲基 砷 油菜 生物有效性 去甲基化
【英文关键词】dimethylarsinic acid; Brassica campestris; bioavailability; demethylation.
【中文摘要】通过盆栽试验研究了土壤中添加外源二甲基砷(DMA) 对油菜(Brassica campestris)生长及土壤中砷生物有效性的影响. 结果表明: 随着外源DMA 添加量的增加,油菜的出苗率和生物量均在一定程度上表现出了低浓度促进而高浓度抑制的现象. 当外源DMA 添加量达到90 mg • kg - 1 时,第2 季盆栽油菜的出苗率和生物量与对照相比分别下降了9. 5% 和57. 0%,表明DMA 对油菜生长的影响具有长期性; 随着外源DMA 浓度的增加,土壤中有效态砷及油菜体内的砷含量均表现出增加的趋势,相关性分析表明,该三者间具有极显著相关关系; 添加入土壤中的DMA 主要发生去甲基化作用,产物主要为As(V) 及少量的As(III) ,且随着外源DMA 添加量的增加,As(V) 和As(III) 的浓度均表现出增加的趋势.
【英文摘要】A pot experiment was conducted to study the effects of exogenous dimethylarsinic acid(DMA) on the growth of Brassica campestris and the bioavailability of soil arsenic (As) . With the increasing concentration of applied DMA,the emergence rate and biomass of B. campestris increased at low concentration DMA,but decreased at high concentration DMA. When the DMA concentration reached 90 mg • kg - 1,the emergence rate and biomass of B. campestris in the second cropping decreased by 9. 5% and 57. 0%,respectively,compared with those in the control,indicating that exogenous DMA had longer term effects on the growth of B. campestris. The soil available As and the As uptake by B. campestris all increased with increasing concentration of exogenous DMA,and there existed significant correlations among them. After applied into soil,the exogenous DMA demethylated,with As(V) as the main product and lesser amount of As (III) ,and the concentrations of soil As(V) and As(III) increased with increasing application rate of exogenous DMA.

【题目】重组马白细胞介素-18生物学活性的测定及单克隆抗体中和活性鉴定
【中文关键词】马白细胞介素-18; 生物学活性; 单克隆抗体
【英文关键词】equine interleukin-18(EIL-18); bioactivity; monoclonal antibody
【中文摘要】应用实时荧光定量RT-PCR 方法评价了大肠杆菌表达的重组马白细胞介素-18 (rEIL-18) 刺激马外周血单核细胞(PBMCs)产生马IFN-γ (EIFN-γ)的活性。在重组人IL-12(rhIL-12)的协同作用下,rEIL-18 在体外刺激马PBMCs 产生EIFN-γ 的效应是阴性对照的20 倍,并且在一定rhIL-12 浓度的条件下,rEIL-18 在体外诱导马PBMCs 产生EIFN-γ 的能力呈一定的剂量依赖性。此外,评价了制备的9 株抗rEIL-18 单克隆抗体中和rEIL-18 的生物学活性的能力,证实其中1 株可中和rEIL-18 的生物学活性,并且呈一定的剂量依赖性
【英文摘要】To examine the bioactivity of recombinant equine interleukin-18 (rEIL-18) obtained from Escherichia coli, rEIL-18 was evaluated to see if it showed a synergistic effect with recombinant human interleukin-12 (rhIL-12) for the induction of equine interferon-γ (EIFN-γ) gene expression from equine peripheral blood mononuclear cells (PBMCs) by Real-time RT-PCR. REIL-18 could induce EIFN-γ mRNA expression from equine PBMCs about 20-fold higher than that of negative control in the presence of rhIL-12.And the effect to induce EIFN-γ gene expression was dose-dependent with rEIL-18 in a fixed concentration of rhIL-12. Nine anti-rEIL-18 monoclonal antibodies (mAbs) were also evaluated if they could neutralize the bioactivity of rEIL-18. And one of the 9 mAbs could neutralize rEIL-18 bioactivity and its effect was dose-dependent.

【题目】外源砷形态和添加量对作物生长及吸收的影响研究
【中文关键词】砷形态;小油菜;生长;吸收
【英文关键词】outer source arsenic; small rape (Brassica campestris); growth; absorb
【中文摘要】采用盆栽模拟试验,研究了不同形态外源砷对小油菜生长及吸收砷的影响。结果表明,添加低量砷有利于提高小油菜的出苗率,而高量砷则导致出苗率显著下降。其中,当砷添加量为90 mg·kg-1 时,二甲基砷(DMA)和As(V)处理下小油菜的出苗率比对照分别降低了20.7%和19.5%。随着砷添加量的增加,添加DMA 处理小油菜的生物量不断下降,而添加As(V)处理在添加量小于15mg·kg-1 时对小油菜具有一定的增产效果,超过15 mg·kg-1 时则随着添加量的增加而下降。无论是添加DMA 还是As(V),小油菜植株中的砷含量均有随添加量增加而升高的趋势。与此同时,随着外源砷添加量的增加,土壤中有效态砷的含量亦呈显著增加的趋势(P<0.01),其中,添加DMA 时的增加趋势更为明显,且其生物有效性和植物毒性均大于As(V)。
【英文摘要】The pot experiments under simulated condition were conducted to study the influence of the different speciation and added amounts of outer source arsenic (As) on rape (Brassica campestris) growth and absorption of arsenic. The results indicated that the low added amount of As was beneficial to improve the seeding rate of rape, while the high added amount of As led to decrease of the seeding rate significantly. As the added amount of As was up to 90 mg·kg-1, the seeding rate of rape in Dimethylarsinic Acid (DMA) and As (V) treatments deceased by 20.7% and 19.5% respectively. With the added amount of DMA increased, the biological yield of rape continuously decreased. However, the biological yield of rape increased as the added amount of As in the As(V) treatment was lower than 15 mg·kg-1. Only when the added amount of As(V) exceeded 15 mg·kg-1, the biological yield of rape decreased. The arsenic concentration in rape plant was gradually increased with the increase of the added amount of both DMA and As (V). Meanwhile, the available arsenic concentration in soils was significantly increased with the increase of the added arsenic content(P<0.01), which was more obvious in the DMA treatment. In comparison with As (V), the DMA had much higher biological validity and toxicity for rape plant.

【题目】微生物对砷的作用机理及利用真菌修复砷污染土壤的可行性
【中文关键词】砷 真菌 生物累积 生物挥发
【英文关键词】arsenic; fungi; bioaccumulation; bio-volatilization.
【中文摘要】利用真菌修复砷污染土壤和水体具有很大的发展潜力,是环境科学领域研究的热点. 环境中存在的砷虽然不能像有机污染物那样被微生物降解,但可以通过微生物对砷的氧化/还原、吸附/解吸、甲基化/去甲基化、沉淀/溶解等作用影响其生物有效性,从而达到降低环境中的砷毒害、修复砷污染环境的目的. 本文阐述了微生物对砷的作用机理,综述了真菌对砷累积与挥发研究的最新进展,探讨了其在修复砷污染土壤方面的可行性,旨在为利用真菌来修复砷污染土壤提供理论依据.
【英文摘要】Utilizing fungi to remediate arsenic-contaminated soil and water body has a great potential,which has been focused and highlighted in environmental sciences. Though the arsenic in environment can not be biodegraded as organic contaminants,its bioavailability can be affected by microorganisms via the processes oxidation /reduction,absorption /desorption,methylation /demethylation,and precipitation /dissolution,etc. ,and thereby,its toxicity could be reduced,and the arsenic-contaminated environment could be remediated. This paper introduced the action mechanisms of microorganisms on arsenic,summarized the research progress in the arsenic bioaccumulation and bio-volatilization by fungi,and discussed the feasibility of utilizing fungi in the remediation of arsenic-contaminated soil,aimed to provide theoretical reference for the bioremediation strategies of arsenic-contaminated soils.

【题目】长期不同施肥制度对土壤微生物生物量碳、氮、磷的影响
【中文关键词】长期肥料试验; 施肥制度; 土壤微生物生物量碳; 土壤微生物生物量氮; 土壤微生物生物量磷
【英文关键词】long-term fertilization exp eriment ; fertilization sys tems ; s oil microbial biomas s carbon ; s oil microbial biomas s nitrogen; soil microbial biomas s phosphorus
【中文摘要】通过设置在北京昌平区的长期肥料定位试验,研究16 年的长期不同施肥制度下,土壤微生物生物量碳、氮、磷的状况。试验设置冬小麦2夏玉米复种连作和小麦2玉米→小麦2大豆复种轮作2 种不同种植制度以及长期撂荒处理(CK0) ,其中冬小麦2夏玉米复种连作种植制度(种植方式Ⅰ) 包括4 个施肥处理,分别为:对照(CK,不施肥,但种植作物) 、氮磷钾(NPK) 、氮磷钾+ 猪厩肥(NPK + M) 、氮磷钾+ 玉米秸秆(NPK + S) ;小麦2玉米→小麦2大豆复种轮作种植制度(种植方式Ⅱ) 包括1 个施肥处理为氮磷钾+ 种植方式Ⅱ(NPKF) 。试验结果表明:1) 长期撂荒土壤的有机质和全氮的含量、微生物量碳(SMB2C) 和氮(SMB2N) 均显著高于2 种不同种植制度的农田土壤,但土壤微生物生物量磷含量较低; 2) 2 种不同的种植制度中,施肥处理(NPK、NPKM、NPKS 和NPKF) 农田的土壤养分含量、微生物量生物量碳、氮、磷均高于不施肥但种植的农田(CK) ,与CK 相比,NPK、NPK + M、NPK + S 和NPKF 处理的微生物量生物量碳增加了26 %、70 %、36 %和46 %,微生物量生物量氮增加了92 %、251 %、130 %和159 % ,以及微生物量生物量磷增加了519 %、1 495 %、898 %和712 %; 3) 小麦2玉米→小麦2大豆复种轮作并且施氮磷钾肥(NPKF) 农田的土壤微生物量生物量碳、氮和磷高于长期小麦2夏玉米复种连作并且施氮磷钾肥(NPK) 的农田;4) 在施肥处理中(NPK、NPK+ M、NPK + S 和NPKF) ,长期氮磷钾化肥与有机肥配合施用的处理(NPK + M)的土壤上述指标高于其他施肥处理(NPK、NPK+ S 和NPKF) ; 5) 土壤微生物与土壤养分之间具有很好的相关性,其中土壤微生物生物量碳、氮与土壤有机质、全氮呈极显著的正相关,土壤微生物生物量磷与土壤全磷和速效磷呈显著正相关。
【英文摘要】A s tudy of s oil microbial biomas s carbon (SMB2C) , microbial biomas s nitrogen (SMB2N) , and microbialbiomas s phosphorus (SMB2P) in arable s oils with different fertilizer regimes was carried out bas ed on a 152ye ar longterm fertilizer exp eriment in a Fluvo2aquic soil in Beijing. Thirte en treatments were es tablished in 1990. Six tre atmentswere chos en for this work : Four were in a wheat2maize rotation receiving either no fertilizer (CK) , mineral fertilizers(NPK) , mineral fertilizers plus farmyard manure (NPKM) or mineral fertilizers with maize straw incorp orated (NPKS) .One tre atment was in a wheat2maize/ whe at2soybe an rotation receiving NPK (NPKF) . The other was an abandonedarable land (CK0) colonized by weeds . The amount (kg/ hm2) of chemical fertilizer p er ye ar was 150 N , 75 P2O5 , 45K2O , and (t/ hm2) 2215 manure and 2125 maize s traw. The main results were as follows : The s oil organic C(SOC) andtotal N(STN) as well as microbial biomas s C and N were higher in long2term (15 ye ars) abandoned arable s oils than incultivated arable soils . However , the microbial biomas s P in the fallow s oil was lower than that in tre atments withfertilizer application. The s oil nutrient concentration and microbial biomas s C , N and P were higher in treatments withfertilizer application (NPK、NPKM、NPKS and NPKF) than the no fertilizer tre atment (CK) . The above s oil p arameterswere als o higher in whe at2maize/ wheat2s oybean rotation than continuous whe at2maize cropping sys tem. Among thefertilizer application treatments , NPKM had relatively higher s oil nutrients and microbial biomas s C , N and P than otherfertilizer tre atments (NPK、NPKS and NPKF) . The correlation between soil microbial biomass and soil fertility wassignificant . There was a positive correlation between the soil microbial biomass C & N and the contents of organic matter andtotal N. A positive correlation was also found between the soil microbial biomass P and Total P and Olsen P.

【题目】我国农田生态系统重金属的循环与调控
【中文关键词】重金属 农田生态系统 循环 调控

【英文关键词】heavy metal; agro2ecosystem; cycling; regulation.
【中文摘要】本文系统分析了我国农田土壤重金属的含量状况,探讨了农田生态系统中重金属的输入、输出及其平衡. 农田生态系统中重金属存在一定的累积效应,但整体上超标风险较小,而部分作物、特别是蔬菜可能存在一定的超标风险. 在采矿区和冶炼厂周边地区,以及废弃物利用强度较大的农区,土壤和作物中重金属超标的风险较大,是普通农区的十倍甚至数十倍以上. 针对我国农田重金属污染现状,提出了调控农田生态系统重金属循环的有效措施,并对相关领域今后的研究进行了展望.
【英文摘要】This paper analyzed the current situation of heavy metal contamination in crop land soils in China, and discussed the input, output, and balance of heavymetals in crop land ecosystems. It was considered that heavy metals had definite accumulation in crop land ecosystems, but overall speaking, this accumulation had relatively small environmental risk, and only some p lants, especially vegetables, accumulated heavymetals over the standards. In mining areas, adjacent areas of smelting p lants, and the farming areas using larger amounts of related wastes, the heavymetals content in p lants and soilswas at least ten times higher than that in normal crop lands, existing larger environmental risk. Aiming at the current situation of heavymetal contamination of farmland soils in China, some effective regulation measures for the heavy metal cycling in the crop land ecosystems were p roposed, and the further research p rospects in related fieldswere discussed.

【题目】淹水条件对土壤砷形态转化的影响
【中文关键词】土壤 淹水 砷 形态转化
【英文关键词】soil; flooding; arsenic; form transformation.
【中文摘要】通过淹水条件下的培养试验,探讨了外源二甲基砷酸(DMA) 、一甲基砷酸(MMA) 、砷酸盐[As(V)]在土壤中的动态转化规律. 结果表明: 随着培养时间的推移,加入土壤中的DMA 和MMA 均主要转化为As(V) ,且土壤中As(V) 含量均呈增加趋势,培养到150 d 时土壤中As(V) 含量均显著高于1 d 时的含量(P < 0. 01) . 外源DMA 通过脱甲基化作用,在30 d内即基本转化为As(V) ,且有少量的亚砷酸盐[As(Ⅲ)]生成; 而外源MMA 的转化速度相对较慢,培养60 d 后才基本完成向As(V) 的转化,同时伴随少量DMA 和As(Ⅲ) 的生成; 在淹水条件下外源As(V) 含量随培养时间的增加而逐渐降低,该过程中除有少量As(Ⅲ) 生成外,其形态基本未发生改变.
【英文摘要】An incubation test was conducted to study the dynamics of exogenously supplied dimethylarsenic acid (DMA) ,monomethylarsonic acid (MMA) ,and As(V) in soil under flooding. With the increasing time of incubation,the exogenously supplied DMA and MMA were mainly transformed into As (V) ,and the As (V) concentration increased,being significantly higher after incubated for 150 days,compared with that after incubated for 1 day. The exogenously supplied DMA was demethylated into As(V) within 30 days,accompanied by a little As(III) ,while the transformation rate of exogenously supplied MMA was rather slow within 60 days,accompanied by a little As(Ⅲ) and DMA. The exogenously supplied As(V) decreased with increasing time of incubation, and its form had less change except that a little As(Ⅲ) occurred.

【题目】基于多元回归方法的土壤水分预测模型研究

【中文关键词】土壤水分;多元回归;预测模型
【英文关键词】soilmoisture;multip le regression; forecasting model
【中文摘要】通过对气象因子与土壤水分相互关系分析,并采用多元回归法中“后退法”和“逐步前进法”进行自变量筛选. 两种回归方法所选择标准虽然不同,但却得到了基本相同的结果,同时,研究结果也显示两种方法各有优点,“后退法”善于发现联合作用较强的变量,而“前进法”则善于发现单独作用较强的变量1通过多元回归法构建了延安地区0~50 cm共计5层土壤湿度的预测模型,分别是: Y1 = 681154 9 + 01619x1 - 012110x2 + 11294 8x3 + 01187 5x6;Y2 = 1081906 5 + 01537 4x1 - 01226 9x2 + 01716 9x3 + 01339 0x6 + 01132 5x7; Y3 = 1311937 2 + 01441 2x1 - 01241 5x2 +01265 3x3 + 01423 1x6 + 012257x7 + 011444x8; Y4 = 1491489 8 + 013859x1 - 013143x2 - 012404x4 + 01303 3x5 + 01501 4x6 +01307 9x7 + 01239 3x8 + 01177 4x9; Y5 = 1441892 3 + 01303 3x1 - 01302 0x2 - 01276 9x4 + 01359 2x5 + 01443 6x6 + 01312 4x7 +01268 6x8 + 01207 8x91通过验证发现模型预测值和实测值可以发现二者之间具有较好的一致性
【英文摘要】By analyzing the relationship of climate factors and soil moisture, it selects the independentvariableswith the backward elimination and forward regression of multip le regression method. Althoughthe selection standards of the two methods have some differences, the selection results are basically thesame. At same time, we also found the two methods have different advantages, and it is easy to get the u2nite variable with the back regression, and solitude variable with forward regression. With the methods,the five equations constructed are as follows: Y1 =681154 9 + 01619x1 - 012110x2 + 11294 8x3 + 01187 5x6 ;Y2 =1081906 5 + 01537 4x1 - 01226 9x2 +01716 9x3 +01339 0x6 +01132 5x7 ; Y3 =1311937 2 +01441 2x1 -01241 5x2 + 01265 3x3 + 01423 1x6 + 01225 7x7 + 01144 4x8 ; Y4 = 1491489 8 + 01385 9x1 - 01314 3x2 -01240 4x4 + 01303 3x5 + 01501 4x6 + 01307 9x7 + 01239 3x8 + 01177 4x9 ; Y5 = 1441892 3 + 01303 3x1 -01302 0x2 - 012769x4 +013592x5 +014436x6 +013124x7 +012686x8 +01207 8x91And the validated resultshows that the forecasting value and the model and measured value are consistent.

【题目】减蛋综合征病毒环介导等温扩增检测方法的建立
【中文关键词】减蛋综合征病毒;环介导等温扩增;检测
【英文关键词】egg drop syndrome virus ;loop2mediated isot hermal amplification ;detection
【中文摘要】根据GenBank 登录的减蛋综合征病毒(EDSV) 六邻体基因的保守区,设计了3 对环介导等温基因扩增(LAMP) 引物,优化反应体系,并对其灵敏性、特异性进行验证. 结果表明:LAMP 优化后的反应体系为外引物浓度0. 1 μ mol ・L - 1 ,内引物浓度0. 8 μ mol ・L - 1 ,环引物浓度0. 4 μ mol ・L - 1 ,Mg2 + 浓度8. 0 mmol ・L - 1 ,dNTP 浓度0. 8 mmol ・L - 1 ,甜菜碱浓度0. 5 mmol ・L - 1 ,BstDNA 聚合酶浓度8 U ,最佳反应温度65 ℃;扩增出的EDS V 基因呈特征性梯状条带,显色反应呈绿色荧光;检测EDSV 的灵敏度高,是普通PCR 检测的10 倍,可检测到60 个拷贝的基因组DNA ;特异性强,与鸡新城疫病毒(NDV) 、传染性法氏囊病毒(IBDV) 、传染性支气管炎病毒(IBV) 、鸡胚致死孤儿病毒(CELO) 无交叉反应;该方法重复性好,稳定性高,可准确快速地进行减蛋综合征病毒的检测
【英文摘要】In order to develop an efficient ,rapid and highly specific loop2mediated isot hermal gene am-plification (LAMP) assay to detect egg drop syndrome virus (EDSV) ,t hree pair s of primer s were designed according to hexon conservative region of EDSV. The LAMP was performed using Bst DNA polymeraselarge f ragment under the effect of isot hermal amplification. The LAMP reaction system was optimized and the sensitivity and specificity were tested. The result s showed t hat a bat ter amplification of LAMP was abtained wit h t he reaction system containing 0. 1 μ mol ・L - 1 outer primer ,0. 8 μ mol ・L - 1 imner primer ,0. 4 μ mol ・L - 1 ring primer , 8 mmol ・L - 1 mg2 + , 0. 8 mmol ・L - 1 dN TP , 0. 5 mmol ・L - 1 betaine , 8 UBst DNA polymerase ,reaction temperat ure was 65 ℃. The product s amplified by LAMP f rom EDSV were distinctively ladder-like band in agarose gel elect rop horesis ,and green fluorescence should be seen in color-able reaction. The sensitivity of LAMP assay developed in t his st udy was 10 times higher t han t hat of PCR.It had no cross reaction wit h NDV , IBDV , IBV and CELO. The LAMP assay was more simple and conven-ient ,which could be used economically and effectively in both laboratorial and pen-side testing.

【题目】Bioaccumulation and Biovolatilisation of Pentavalent Arsenic by Penicillin janthinellum, Fusarium oxysporum and Trichoderma
【中文关键词】
【英文关键词】Bioaccumulation 、Biovolatilisation、arsenic
【中文摘要】
【英文摘要】Some fungi are able to control and remediatearsenic (As)-contaminated soil, sediment, or water. Here,we investigate potential accumulation and volatilisation ofAs by three fungi strains. Results indicated that the highestlevel of As was accumulated by Penicillin janthinellumwith 39.54 lg after 10 days in the culture system amendedwith 2,500 lg As(V), which represents 50 mg/l As.Fusarium oxysporum showed the highest amount of vo-latilised As with 304.06 lg after 15 days. The As contentin the treated system (fi lter paper ? As ? fungi) was sig-ni fi cantly higher than that in the control (fi lter paper ? As; fi lter paper ? fungi; fi lter paper). Trichoderma asperellumand F. oxysporum showed superior abilities for theabsorption of extracellular As and accumulation of intra-cellular As, which accounted for 82.2 and 63.4% of thetotal accumulated As, respectively. However, P. janthin-ellum presented an equal distribution of intracellular andextracellular As. Scanning electron microscope (SEM)analysis suggested that little impact on mycelium growth ofthe three fungal strains was seen after exposure to 50 mg/lAs(V) for 5 days, while the growth of fungi in the controlwas inhibited. The present results demonstrate thatP. janthinellum, F. oxysporum, and T. asperellum would beexpected to tackle As-contaminated environments.

【题目】The arsenic speciation transformation in artificially
【中文关键词】
【英文关键词】As(V); MMA; DMA; conversion; adsorption-desorption
【中文摘要】
【英文摘要】Arsenic (As) speciation transformation often accompanies adsorption-desorption when exogenous arsenide is poured into soil. Disregarding the speciation transformation when evaluating adsorption-desorption of As can greatly influence the experimental results. In this study, batch experiments were conducted, and the results in-dicated that exogenous monomethylarsonic acid (MMA) or dimethylarsinic acid (DMA) added to fluvo-aquic soil collected from agricultural area in Beijing of China, was completely converted into As(V) after cultivated for 60 or 90 days. However, when exogenous As(V) was added to the soil, no speciation transformation of As(V) was observed. Furthermore, although the total As concentration, which was 6.55 or 11.55 mg/kg in aqueous extracts of the soil to which MMA or DMA had been added, respectively, remained stable after cultivated for 30 or 60 days, the As speciation transformation of MMA or DMA into As(V) in soil still occurred. Differences in As speciation can result in different fates and behaviors of As in soil, and As speciation transformation should be taken into ac-count when evaluating the adsorption-desorption of As

【题目】Arsenic biotransformation by arsenic-resistant fungi Trichoderma asperellum
【中文关键词】
【英文关键词】Arsenic,Speciation transformation,Fungi
Cultivation period,Eh,pH
【中文摘要】
【英文摘要】Bioremediation of arsenic (As)-contaminated soil using microorganisms has been a focus of research because it is environment friendly and cost-effective. The As-resistant fungi Trichoderma asperellum SM-12F1, Penicil-lium janthinellum SM-12F4, and Fusarium oxysporum CZ-8F1 were exposed to 50 mg l − 1 of As(V), and the biotransformation of As and the concomitant variance of Eh and pH in the media were studied. Fresh weights of all three isolates increased and then decreased depended on cultivation period. After cultivation for 2 or 3 days, the As(V) added to the media had been completely changed into As(III), whilst As(V) was predomi-nate in fungal cells with concomitantly little As(III) during cultivation. After 15 days, little monomethylarso-nic acid (MMA) and dimethylarsinic acid (DMA) besides of As(V) and As(III) were found in the cells of T. asperellum SM-12F1, and the total As content was the highest in cells of P. janthinellum SM-12F4 (about 41.5 μg) according to the quantitative analysis of As speciation in cultures. Moreover, when cultivation period reached 3 days, the Eh and pH in the media of T. asperellum SM-12F1 (312.5 mV and 4.8), P. janthinellum SM-12F4 (411.1 mV and 4.2), and F. oxysporum CZ-8F1 (269.4 mV and 4.8) might not responsible for the reduc-tion of As(V) based on the previous study. Therefore, it is speculated that import/export, reduction, and methylation of As are conducted in fungal cells. Future studies investigating the biochemical behaviour of fungi responding to As are needed to gain a better understanding of bioremediation of As-contaminated soils

【题目】北方旱区保护性耕作对农田土壤水分的影响
【中文关键词】保护性耕作,土壤水分,农田水分平衡,DSSAT 模型
【英文关键词】conservation tillage, soil water, field water balance, DSSAT model
【中文摘要】土壤水分是中国北方旱区农业生产的主要限制因子,研究保护性耕作技术体系下土壤水分的动态变化,明确不同耕作模式下的水分平衡规律,对于选择适宜的保护性耕作技术,提高北方旱区土壤水分的利用效率具有重要的指导意义。该文在2 a 田间试验的基础上采用DSSAT 模型对4 个不同保护性耕作处理的土壤体积含水量、水分平衡以及水分利用效率进行了模拟和检验。结果表明干旱年份保护性耕作处理土壤体积含水量较传统耕作高,RMSE 误差在0.025~0.063;干旱年份传统耕作土壤储水量减少最多,为144.6 mm,降水较多年份减少也最多,为46.1 mm;干旱年份水分利用效率1.52~1.78 kg/m3,免耕覆盖水分利用效率最高,降水较多年份水分利用效率1.70~1.71 kg/m3,各处理间差异并不显著。研究结果为保护性耕作技术对农田土壤水分的影响研究提供了理论依据
【英文摘要】Soil water content is the key factor that affect the agriculture production in northern arid regions of China. It ishelpful to select proper tillage methods and improve water productivity based on the study of soil water content changing. Soilwater content, water balance and water use efficiency were simulated and checked used the DSSAT model based on two-yearfield experiment. The results show that in dry year the soil water content of conservation tillage is higher than the conventionaltillage, RMSE is 0.025-0.063. In dry year, and the largest decrease of soil water storage is conventional tillage (144.6 mm), andthe same in normal year (46.1 mm). Water use efficiency in dry year is 1.52-1.78 kg/m3, the largest is no tillage with residuecover treatment, in the normal year is 1.70-1.71 kg/m3. The differences between different treatments are not obvious. Theresults provide theoretical foundation for the research of effects of

conservation tillage on soil water in the field.

【题目】Genetic Mapping of the Scab Resistance Gene (Ccu) in cucumber (Cucumis sativus L.)
【中文关键词】黄瓜;黑星病;SSR标记;分子标记辅助选择
【英文关键词】cucumis sativus L.; Ccu gene;SSR marker; marker assisted selection (MAS)
【中文摘要】完成了黄瓜黑星病抗性基因的染色体定位,获得了准确率高的SSR标记用于分子标记辅助选择育种。
【英文摘要】Scab, caused by Cladosporium cucumerinum, is an important disease of cucumber, Cucumis sativus L., worldwide. Scab can cause serious losses for cucumber production, especially in protected culture, such as high tunnel production. Resistance to cucumber scab is dominant and controlled by a single gene, Ccu. Breeding for resistant cultivars is the most efficient way to control the disease. Selection for resistance might be made easier if the gene were mapped to linked markers. So far, there are no tightly linked (genetic distance less than 1 cM) SSR markers for the Ccu gene, and no studies on mapping of the Ccu gene in cucumber using SSR markers. The objective of this study was to identify SSR markers for use in molecular breeding of scab resistance. In this study, we used a population of recombinant inbred lines (RILs). The population included 148 individuals derived from the cucumber inbred line 9110 Gt (Ccu Ccu) crossed with line 9930 (ccu ccu). The Ccu gene was mapped to linkage group 2, corresponding to chromosome 2 of cucumber. The flanking markers SSR03084 and SSR17631 were linked to the Ccu gene with distances of 0.7 and 1.6 cM, respectively. The veracity of SSR03084 and SSR17631 was tested using 59 diverse inbred lines and hybrids, and the accuracy rate for the two markers was 98.3%. In conclusion, two SSRs closely linked to scab resistance gene Ccu have been identified, and can be used in a cucumber breeding program.

【题目】栽培黄瓜种质遗传多样性的SSR鉴定
【中文关键词】黄瓜;遗传多样性;SSR;聚类分析;主成分分析
【英文关键词】Cucumber; Genetic diversity; SSR; Cluster analysis; PCA
【中文摘要】利用62对多态性SSR引物对59份黄瓜材料进行了遗传多样性分析。聚类分析结果将供试材料分为7大类群,第1类包含6个欧洲温室型材料,全为无刺瘤类型;第2类是4个美国类型种质,属于小果型材料;版纳黄瓜D59单独聚为第三类,且与其他材料的遗传距离均大于0.33;疑为华南型种质的D38,单独聚为第四类,其果实为乳白色;第五类包括D13及其父本D39,两者含有欧洲和华北血缘;第六类为叶色突变材料D28,是欧洲型和华北型黄瓜的后代;第七类包括33个华北型材料、7个华南型材料、4个日本型材料。主成分分析与系统聚类分析结果基本一致。两种分析方法的分类结果与形态学分类相吻合。
【英文摘要】62 polymorphic SSR primers were used to study the genetic relationships of 59 cucumber materials. The germplasms used in this study were divided into 7 groups by cluster analysis. Six European greenhouse ecotype materials with no spines were in the 1st group . Four American ecotype germplasms with small fruits belonged to the 2nd group. The Xishuangbanna cucumber D59 formed the 3th group. The genetic distance between D59 and other materials were more than 0.33. The white fruited accession D38 belonged to 4th group. The accession D13 and its male parent D39 which were the progenies of European greenhouse ecotype and North China ecotype cucumber were in the 5th group.The leaf color mutant D28, was the only accession in the 6th group. The 7th

group were consisted of 33 north China type materials, 7 south China type accessions and 4 Japanese type germplasms. The results obtained from the principal coordinate analysis were consistent with those from the cluster analysis, which were in according with the morphological taxonomy on cucumber.

【题目】基因型和6-BA对黄瓜子叶节再生频率的影响
【中文关键词】黄瓜; 子叶节; 基因型; 6 - BA
【英文关键词】Cucumber; Cotyledon nodes; Genotypes; Phytohormone
【中文摘要】以华北、华南类型, 欧洲、日本类型及美国加工类型黄瓜为材料, 研究了基因型和激素(6 - BA) 对黄瓜子叶节再生频率的影响。结果表明: 基因型是子叶节再生频率的主要影响因素之一, 不同基因型 黄瓜子叶节在同一培养基上每外植体再生芽数明显不同; 6 - BA是子叶节分化所需的重要激素, 材料228、 185、65G随着6 - BA浓度的升高, 每外植体再生芽数增加; 四川白瓜、吉林旱瓜、K2148随6 - BA浓度的升 高, 每外植体再生芽数反而降低; 其中, 四川白瓜的再生频率最高, 在MS1 (MS + 015 mg · L - 1 6 - BA + 210 mg · L - 1 AgNO3) 培养基上, 每外植体再生芽数可达6.4个。
【英文摘要】The effects of genotypes and phytohormone (6 - BA) were studied by using cucumber (Cucum is sa tivus L1) cotyledon nodes as exp lant in this experiment. The results showed that genotype was one of the main influencing factors on shoot regeneration frequency, the cotyledon nodes of different geno2 types cultured in the same medium showed different shoot regeneration frequency. Moreover, 6 - BA was essential for the regeneration of cotyledon node. The shoot regeneration frequency of material 228, 185, 65G increased with the increasing concentration of 6 - BA, while the shoot regeneration frequency of ‘ Si2 chunbaigua ’, ‘ J ilinhangua ’, K2148 decreased along with the increasing concentration of 6 - BA. The highest shoot regeneration frequency happened on ‘ Sichuanbaigua ’, which reached 614 shoots per exp lant cultured inMS1 (MS + 015mg · L - 1 6 - BA + 210 mg · L - 1 AgNO3) medium.

【题目】A novel highly acidic β-mannanase from the acidophilic fungus Bispora sp. MEY-1: gene cloning and overexpression in Pichia pastoris.
【中文关键词】无
【英文关键词】acidic, beta-mannanase, Bispora sp. MEY-1
【中文摘要】无
【英文摘要】Using degenerate polymerase chain reaction (PCR) and thermal asymmetric interlaced PCR, a 1,347-bp full-length complementary DNA fragment encompassing the gene man5A, which encodes a 429-amino acid beta-mannanase with a calculated mass of 46.8 kDa, was cloned from acidophilic Bispora sp. MEY-1. The deduced amino acid sequence (catalytic domain) displayed highest identity (54.1%) with the Emericella nidulans endo-beta-1,4-D-mannanase, a member of the glycoside hydrolase family 5. Recombinant MAN5A was overexpressed in Pichia pastoris, and its activity in the culture medium reached 500 U ml(-1). The enzyme was acidophilic, with highest activity at pH 1.0-1.5, lower than any known mannanases, and optimal temperature for activity was 65 degrees C. MAN5A had good pH adaptability, excellent thermal and pH stability, and high resistance to both pepsin and trypsin. The specific activity, K(m), and V(max) for locust bean gum substrate was 3,373 U mg(-1), 1.56 mg ml(-1), and 6,587.6 micromol min(-1)

mg(-1), respectively. The enzymatic activity was not significantly affected by ions such as Ca(2+), Cr(3+), Co(2+), Zn(2+), Na(+), K(+), and Mg(2+) and enhanced by Ni(2+), Fe(3+), Mn(2+) and Ag(+). These favorable properties make MAN5A a potential candidate for use in various industrial applications.

【题目】狂犬病病毒糖蛋白在Bac- to- bac 杆状病毒系统中的表达及应用
【中文关键词】狂犬病病毒;糖蛋白;杆状病毒表达系统
【英文关键词】rabies virus; glycoprotein; baculovirus expression system
【中文摘要】为表达狂犬病病毒(RV)糖蛋白(G),本研究通过RT-PCR 方法克隆RV Flury LEP 病毒株G 基因,将其克隆至质粒pFastBac HT α 中,重组质粒pFastBac-RV-G 转化DH10Bac 感受态细胞,经同源重组获得重组杆状病毒穿梭质粒Bacmid-RV-G,将其转染昆虫细胞sf21 获得含有G 基因的重组杆状病毒。采用SDS-PAGE 和western blot 对重组蛋白进行鉴定及抗原性分析,以重组G 蛋白作为包被抗原的ELISA 检测36 份犬血清样品。结果表明,在Bac-to-bac 杆状病毒系统中表达的RV G 蛋白能与his-tag 单克隆抗体及RV 阳性血清发生特异性反应,其相对分子量为60 ku;与以RV 为包被抗原的商品化ELISA 试剂盒相比,以重组RV G 蛋白为抗原建立的间接ELISA 的敏感性、特异性和符合率分别为80%、81.8 %和80.6 %,表明杆状病毒系统表达的RV G 蛋白是检测RV 抗体的理想抗原蛋白,作为一种亚单位疫苗具有潜在的应用前景.
【英文摘要】The glycoprotein gene of rabies virus Flury LEP strain was amplified by RT-PCR and cloned into pFastBacHTa vector. The resultant recombinant plasmid was transformed into competent cells of E. coli DH10Bac to construct recombinant bacmid. The recombinant baculovirus was generate by transfection of recombinant bacmid into sf21 insect cells. Expression of the recombinant glycoprotein (rG) was detected by SDS-PAGE with a MW of 60 ku, which was recongized with both ant-his tagmonoclonal antibody and rabies virus positive serum by western blot test. A indirect ELISA was establish with rG as coating antigen, comparing with a commercial ELISA kit coating rabies virus as antigen, tested on 36 clinic serum samples,the indirect ELISA had 80.6% coincidence.

【题目】A xylanase with high pH stability from Streptomyces sp. S27 and its carbohydrate-binding module with/without linker region truncated versions.
【中文关键词】无
【英文关键词】xylanase,high pH stability,Streptomyces sp. S27 ,carbohydrate-binding module
【中文摘要】无
【英文摘要】A xylanase gene, xynAS27, was isolated from a genomic library of Streptomyces sp. S27. The full-length gene consists of 1,434 bp and encodes 477 amino acids, including a putative signal peptide of 41 residues at its N-terminus. The mature xylanase comprises two functional domains, a family 10 glycoside hydrolase, and a family 13 carbohydrate-binding module (CBM), which were joined by a short Gly/Pro-rich linker region. The intact, the CBM-truncated and the CBM-linker-truncated versions of the mature proteins were expressed in Escherichia coli BL21 (DE3), purified to electrophoretic homogeneity and subsequently characterized. XynAS27 showed high pH stability over the pH range 2.2-12.0. XynAS27 may be a compelling tool for the food industry because it generates xylobiose (85% w/w) as the main product of xylan hydrolysis. The truncated versions showed less pH and thermal stability, and less affinity and hydrolytic activity to insoluble substrate than the intact one. These results indicate that the CBM of XynAS27 plays

a key role in the hydrolysis of insoluble substrate, and the CBM and linker region are also important for the enzyme stability, and the linker region contributes more.

【题目】猪圆环病毒2 型间接ELISA 抗体检测试剂盒的研制及初步应用
【中文关键词】猪圆环病毒2 型;Cap 蛋白;间接EL ISA ;抗体检测试剂盒
【英文关键词】porcine circovirus serotype 2 ; capsid protein ; indirect EL ISA ; antibody detection kit
【中文摘要】以大肠杆菌原核表达系统表达的猪圆环病毒2 型Cap 蛋白为抗原,建立猪圆环病毒2 型间接EL ISA 检测方法,优化EL ISA 反应条件,研制猪圆环病毒2 型EL ISA 抗体检测试剂盒。与商品化试剂盒相比,该检测试剂盒敏感性、特异性和符合率分别为95. 12 %、92. 86 %和94. 55 %;同时与猪圆环病毒1 型(PCV1) 、猪瘟病毒(CSFV) 、猪繁殖与呼吸综合征病毒(PRRSV) 等多种病毒阳性血清无交叉反应。试剂盒具有较好的重复性,在- 20 ℃至少可保存1 年以上,将其应用于临床血清样品的检测,结果安徽、广东、广西采样猪场的PCV2 阳性率分别为100 %、48. 39 %、100 %。
【英文摘要】Using the purified Cap recombinant protein as coating antigen of indirect EL ISA ,detecting kit was developed by the optimal reaction conditions of EL ISA. In comparative experiment s with commercial EL ISA kit for detection of 55 serum samples , the sensitivity , specificity and coincidence rate of the established EL ISA method were 95. 12 % ,92. 86 % and 94. 55 % respectively. The established EL ISA method had no cross-reactivity with the reference sera of other swine viruses (PCV1 , CS-FV , PRRSV , PPV , PRV) . The int ra-assay variation coefficient was 2. 3 % to 4. 5 % , inter2assay variation coefficient was 1. 12 % to 2. 63 % respectively. The EL ISA antibody detection kit could be stable at - 20 ℃ at least for one year. 66 serum samples of three pig farms f rom Anhui , Guangdong , Guangxi were detected by detection kit , and the positive rate was 100 % , 48. 39 % , 100 % respectively.

【题目】Paenibacillus sp. Strain E18 Bifunctional Xylanase-Glucanase with a Single Catalytic Domain.
【中文关键词】无
【英文关键词】Paenibacillus sp.,Bifunctional, Xylanase, Single Catalytic Domain
【中文摘要】无
【英文摘要】Xylanases are utilized in a variety of industries for the breakdown of plant materials. Most native and engineered bifunctional/multifunctional xylanases have separate catalytic domains within the same polypeptide chain. Here we report a new bifunctional xylanase (XynBE18) produced by Paenibacillus sp. E18 with xylanase and beta-1,3-1,4-glucanase activities derived from the same active center by substrate competition assays and site-directed mutagenesis of xylanase catalytic Glu residues (E129A and E236A). The gene consists of 981 bp, encodes 327 amino acids, and comprises only one catalytic domain that is highly homologous to the glycoside hydrolase family 10 xylanase catalytic domain. Recombinant XynBE18 purified from Escherichia coli BL21(DE3) showed specificity toward oat spelt xylan and birchwood xylan and beta-1,3-1,4-glucan (barley beta-glucan and lichenin). Homology modeling and molecular dynamic simulation were used to explore structure differences between XynBE18 and the monofunctional xylanase XynE2, which has enzymatic properties similar to those of XynBE18 but does not hydrolyze beta-1,3-1,4-glucan. The cleft containing the active site of XynBE18 is larger than that of XynE2, suggesting that XynBE18 is able to bind larger substrates such as barley beta-glucan and lichenin. Further molecular docking studies revealed that XynBE18 can accommodate xylan and beta-1,3-1,4-glucan, but XynE2 is only accessible to xylan. These results indicate a previously unidentified structure-function relationship for substrate specificities among family 10 xylanases.

【题目】转录因子ABP9基因在不同启动子驱动下对转基因拟南芥生长发育的影响
【中文关键词】诱导型启动子;转录因子;ABP9;生长发育
【英文关键词】inducible promoter;ttranscription factor;A8P9;growth and development
【中文摘要】本研究构建了由IND(6xABRE.mini35s)和Pabp9启动子分别驱动AB尸9基因的两种诱导型表达的植物表达载体,得到拟南芥转基因株系;并在正常生长的条件下,与转空载体pcH乃和转35s—ABP9的两种转基因株系在种子萌发、根系伸长、营养和生殖生长等方面进行比较,分析转录因子A曰尸9基因在不同启动子的驱动下,对转基因拟南芥各生长发育时期的影响。研究结果表明,在转基因拟南芥中,利用上述两种诱导型启动子驱动A胼)9基因表达能够一定程度上的解除由组成型表达A曰尸9基因导致的生长延迟。
【英文摘要】Plant expression vechors in which the expression 0f ABP9 is driven by IND(6xABRE-mini35s)or Pabp9 promoter were constructed in this research,and the transgenic Arabidopsis plants respectively transformed with IND- ABP9 and pabp9-ABP9 were obtained. Morphological,developmental and physiological changes at germination,Vegetadve and reproductive growth stages were examined between these transgenic plants and the others which wererespectively transformed with vector pCHF3 and ABP9 driven by routine 35s promoter,to evaluate the effects 0f transcription factor ABP9 driven by different promoters on plant growth and development.The results indicated that the growth retardation defect caused by constitutive expression of ABP9 can be alleviated by expressing ABP9 with aninducible promoter.

【题目】An α-galactosidase from an acidophilic Bispora sp. MEY-1 strain acts synergistically with β-mannanase.
【中文关键词】无
【英文关键词】α-galactosidase ,acidophilic, Bispora sp. MEY-1 ,synergistically
【中文摘要】无
【英文摘要】An alpha-galactosidase gene (AgalB) was cloned from the acidophilic fungus Bispora sp. MEY-1 and expressed in Pichia pastoris. The deduced amino acid sequence showed highest identity (35%) to the alpha-galactosidase from Penicillium simplicissimum, belonging to the glycosyl hydrolase family 27. The purified recombinant alpha-galactosidase (r-AgalB) exhibited optimal activity at pH 3.5 and 55 degrees C, was stable at pH 2.2-8.0, and showed higher hydrolytic activity towards galactomannan polysaccharides (guar gum and locust bean gum) than toward small galacto-oligosaccharides (melibiose, raffinose and stachyose). A synergistic (3-fold) increase in guar gum hydrolysis was observed when beta-mannanase Man5A from Bispora sp. MEY-1 and r-AgalB were combined. Further, an increase in the reaction time from 5h to 12h or increase of the temperature from 37 degrees C to 55 degrees C enhanced guar gum degradation by the enzyme combination. These properties make r-AgalB a good candidate for extensive application in the pulp/paper, food, and feed industries.

【题目】BF2/肽四聚体的构建及其在特异性T细胞检测上的应用
【中文关键词】BF2/肽四聚体;传染性支气管炎病毒;核蛋白;特异性T细胞
【英文关键词】BF2/peptide tetramer; Infectious bronchitis virus (IBV); nucleoprotein; specific T cells
【中文摘要】为构建可溶性鸡组织相容性复合体(MHC)Ⅰ类分子(BF2)/肽复合物,大量表达并纯化了可生物素化的MHCⅠ类分子重链(BF2-BSP)和轻链(Chβ2m),并合成了鸡传染性支气管炎病毒(IBV)核蛋白N71~78T细胞表位肽,将其与纯化后的重组蛋白BF2-BSP和Chβ2m在重折叠缓冲液中复性。复性后在快速蛋白液相色谱仪(FPLC)上分离出复性组装成功的BF2/肽单体复合物。将该单体复合物在体外进行生物素化,其产物再次采用FPLC通过分子筛分离出生物素化后的BF2/肽单体复合物;然后将生物素化后的BF2/肽单体复合物与藻红蛋白(PE)标记的链霉亲和素按一定比例反应生成BF2/肽四聚体。为了检测所制备BF2/肽四聚体是否能应用于检测特异性T细胞,从感染IBV H52株10 d后的SPF鸡分离外周血单核细胞(PBMC),染色后采用流式细胞术检测,结果表明,所制备的BF2/肽四聚体可用于检测IBV N蛋白特异性T淋巴细胞,检测1周龄SPF鸡接种H52后10 d时针对N蛋白的特异性T细胞比率为3.65%。
【英文摘要】For the construction of BF2/peptide tetramer, large amount of recombinant chicken major histocompatibility complex (MHC) Ⅰ heavy chain (BF2-BSP) and light chain Chβ2m were expressed and purified. And a peptide originated from avian Infectious bronchitis virus (IBV) nucleoprotein (N71~78) was synthesized. Afterwards, BF2-BSP and Chβ2m were refolded with IBV N71~78 in refolding buffer to generate the monomer of BF2/peptide complex. Then the folded product was treated with enzymatic biotinylation by BirA enzyme and followed by a gel filtration column to purify the BF2/peptide fraction. Finally, the BF2/peptide tetramer wasformed by mixing purified, biotinylated monomer with phycoerythrin(PE)-labeled streptavidin at a molar ratio of 5∶1. In order to test if the prepared BF2/peptide tetramer could be employed to detect the efficiency of specific T cell, the peripheral blood mononuclear cells(PBMCs) were isolated from the SPF chickens infected with IBV H52 at 10 days post infection and subjected to flow cytometry staining.The cytotoxitic T lymphocytes (CTLs) response of IBV-infected chicks was evaluated with the prepared

BF2/peptide tetramer and 3.65% of CTLs frequency specific to IBV N was detected. All these results indicated that the prepared BF2/peptide tetramer can be used to evaluate the specific T cell immune responses of IBV.

【题目】含禽源启动子的禽流感病毒核蛋白表达载体的构建及其免疫原性的检测
【中文关键词】禽流感;核蛋白;真核表达载体;血清抗体
【英文关键词】Avian influenza virus (AIV); nucleoprotein; eukaryotic expression vector; serum antibody
【中文摘要】为了研究禽流感病毒核蛋白(nucleoprotein,NP)在鸡体内所引起的免疫反应,将其NP 基因从重组质粒pVAX-NP上酶切后亚克隆至含禽源启动子的真核表达载体pCAGGS 中,经筛选鉴定后获得重组子pCAGGS-NP,将鉴定正确的阳性重组子体外转染真核细胞,利用间接免疫荧光法检测目的基因的瞬时表达;采用腿部肌肉注射途径将重组子免疫SPF 鸡,利用ELISA 检测免疫后血清抗NP 蛋白抗体效价。结果表明,该重组子无论在体外还是体内均能正确表达禽流感NP 蛋白,且所表达的蛋白均具有良好的免疫原性。
【英文摘要】In order to investigate the immune responses to the nucleoprotein (NP) of Avian influenza virus, NP gene cut from recombinant plasmid pVAX-NP was subcloned into a eukaryotic expression vector pCAGGS with an avian-derived promoter. The recombinant plasmid pCAGGS-NP was obtained after PCR identification and sequencing. Then the positive pCAGGS-NP was subjected to transfect eukaryocyte and to immunize SPF chickens. Indirect florescent assay (IFA) was engaged to detect the transient expression of NP, and ELISA was used to detect the serum antibody of the immunized chickens which was resistant to NP protein. The resultsshowed that NP was successfully expressed both in vitro and in vivo and had good immunoreactivity.

【题目】鸡IFN-γ DNA 壳聚糖纳米粒的制备及外源基因表达
【中文关键词】壳聚糖;纳米颗粒;鸡γ - 干扰素基因;体外转染
【英文关键词】Chitosan; Nanoparticals; ChIFN-γ gene; transfection
【中文摘要】为检测纳米载体对表达重组质粒的保护效果,本实验构建了鸡γ 干扰素(IFN-γ)真核表达重组质粒pCAGGS-ChIFN-γ;并将其与200 μg/mL 壳聚糖醋酸溶液制备成DNA/壳聚糖纳米颗粒(CNPs)。透射电镜观察CNPs 呈不规则球形,光子相关色谱(PCS)仪测定显示CNPs 的平均粒径为172.6 nm±5.1 nm;Zeta 电位为20.8 mV±2.9 mV;CNPs 重组质粒包埋效率和载药量分别为91.21 %±2.54 %和31.93 %±0.16 %。鸡胚成纤维细胞(CEF)体外转染实验表明:携带的外源基因能在CEF 中释放、表达,其表达效率约为阳离子脂质体转染试剂LipofectamineTM 2000 转染后的16.3 %,同时CNPs 对细胞基本无毒性。CNPs 稳定实验也证实其稳定性良好。
【英文摘要】In present study, the protection of nanoparticles on recombinant plasmid was investigated by evaluating the DNA-chitosan nanoparticles (CNPs) carrying chicken interferon-γ (ChIFN-γ) recombinant plasmid. The nanoparticles were spherical shape with a mean diameter of 1726 nm under the electronic microscope and had the Zeta potential of 20.8 mV±2.9 mV measured by the Photon Correlation Spectroscopy (PCS). The encapsulation efficiency of DNA was 91.21 %±2.54 % and the DNA content in the nanoparticles was 31.93 %±0.16 %. The capsulated DNA could be protected from the degradation by DNase Ⅰ.The transfection efficiency of CNPs was about 16.3% of that the LipofectamineTM 2000 reagent. Our results also showed that CNPs could express successfully in the CEF cells, and were nontoxic to cultured cells.

【题目】鸡白细胞介素2(IL-2) DNA- 壳聚糖纳米粒的制备及体外转染
【中文关键词】壳聚糖;纳米粒子;表征;转染
【英文关键词】chitosan; nanoparticles; characterize; transfection
【中文摘要】构建了携带鸡白细胞介素2(IL-2)编码基因的重组真核表达质粒,通过复凝聚法制备了含有该重组真核表达质粒的壳聚糖纳米粒子。对制备的IL-2 DNA- 壳聚糖纳米粒子(IL-2 DNA-chitosan nanoparticles)进行了表征。纳米粒子呈球形,粒径分布范围为50~500 nm,表面带正电,电势为+17.8 mV,DNA 质量占纳米粒子总质量的40.2%。DNA 酶保护性、稳定性和体外释放试验证明,制备的纳米粒子在微酸性(pH 6.0)和微碱性(pH 7.4)环境中稳定性较高,可保护携带的DNA 分子不被0.6~0.8U/mL DNA 酶的降解。用制备的纳米粒子转染Df-1 细胞系,间接免疫荧光检测结果证明,该纳米粒子可携带质粒DNA 进入细胞,使携带的外源基因获得表达。流式细胞术检测证明,纳米粒子的转染效率为0.2%,与裸DNA 转染对照组相比较,包封入壳聚糖纳米粒子中可提高DNA 的转染效率。
【英文摘要】The plasmid carrying chicken interleukin-2 (IL-2) gene was constructed and used to prepare DNA-chitosan nanoparticles by complex coacervation process. The important parameters of the nanoparticles were investigated. The nanoparticles synthesized were globule and the diameter ranged from 50 to 500 nm. The nanoparticles were positively charged with a zeta potential of +17.8 mV. DNA counted for 40.2% of the weight of the nanoparticles. Enzyme protection test, stability test and in vitro release test showed that the nanoparticles prepared were stable at pH 6.0 and pH 7.4, and could protect the encapsulated plasmid DNA from nuclease degradation at the nuclease concentration of 0.6~0.8 U/mL. Df-1 cells were transfected by nanoparticles, the result of indirect immuno-fluorescence test demonstrated that the nanoparticles could take the plasmid DNA into cells and the exogenous gene could beexpressed by the cells. The transfection efficiency was 0.2% studied by flow cytometry, higher than that of naked DNA transfection control. It demonstrated that encapsulating into nanoparticles can improve the transfection efficiency of DNA.

【题目】抗马干扰素-单克隆抗体的异硫氰酸荧光标记及应用
【中文关键词】马干扰素-γ;单克隆抗体;异硫氰酸荧光素;细胞内细胞因子染色
【英文关键词】Equine IFN-γ; Monoclonal antibody; Fluorescein isothiocyanate(FITC); Intracellular cytokine staining(ICS)
【中文摘要】目的用异硫氰酸荧光素(FITC)标记抗马干扰素-γ(IFN-γ)单克隆抗体,为建立马IFN-γ 细胞内细胞因子染色方法提供实验材料。方法利用FITC 标记纯化的抗马IFN-γ 单克隆抗体(SB10),荧光抗体经系列稀释后,对马外周血单核细胞(PBMC)进行细胞内细胞因子IFN-γ 单染色的流式细胞术检测,同时与商品化FITC 标记的抗牛IFN-γ 单克隆抗体(CC302)进行流式细胞术检测对比试验。结果FITC-CC302 染色马PBMC,1 μl 荧光抗体染色106 个细胞时,分泌IFN-γ 的细胞频率为9. 35%,而FITC-SB10 经系列稀释染色,在用0. 25 μl 荧光抗体染色106 个细胞时,分泌IFN-γ 的细胞频率为9. 90%。结论所制备的FITC 标记的抗马IFN-γ 单克隆抗体,可为建立马细胞免疫学研究方法奠定物质基础,进而为建立监测马机体免疫状态和研究机体免疫机制提供技术平台。
【英文摘要】Objective To label equine IFN-γ monoclonal antibody(McAb)with fluorescein isothiocyanate(FITC)and provide an experimental material for intracellular cytokine staining (ICS)assay of IFN-γ in equine lymphocytes. Methods Purified equine IFN-γ McAb SB10 was labeled with FITC, then diluted serially and used for ICS assay of IFN-γ in equine PBMCs by flow cytometry.The result was compared with that of flow cytometry by using commercial FITC-labeled bovine IFN-γ McAb CC302. Results When 106 PBMCs were stained with 1 μl of FITC-CC302, the frequency of PBMCs secreting IFN-γ was 9. 35%. However, when 106 PBMCs were stained with 0. 25 μl of FITC-SB10, the frequency was 9. 90%. Conclusion The prepared FITC-labeled equine IFN-γ McAb laid a material foundation of developing the methods for immunological study on equine cells and provided a technical platform for monitoring the immune state and investigating the immunological mechanism.

【题目】检测马白细胞介素-18双抗体夹心ELISA方法的建立
【中文关键词】马白细胞介素218; 单克隆抗体; 夹心ELISA
【英文关键词】无
【中文摘要】目的: 建立检测马白细胞介素218 (equine interleu2 kin218, EIL218)的双抗体夹心ELISA, 为马传染病的免疫学研究提供新方法。方法: 将识别不同表位的EIL218的2株单克隆抗体(mAb)B1G1和S6A3纯化后, 利用生物素标记试剂盒对B1G1 株mAb进行标记, 以重组马白细胞介素218 (rEIL2 18)为捕获抗原进行ELISA 检测来建立EIL218 双抗体夹心ELISA。结果: 经过方阵滴定试验确定捕获抗体的最佳浓度为4 mg/L, 检测抗体的工作效价为1∶2 000。建立的方法可检测马血清中的EIL218, 与猪、牛和羊血清中的IL218不发生交叉性反应, 此方法检测敏感度达到15 ng/L, 特异性良好。结论: 成功建立了

EIL218的双抗体夹心EL ISA, 为马细胞免疫学研究提供了方法, 也为下一步E IL218 ELISA试剂盒的商品化开发奠定了坚实基础。

【题目】鸡γ-干扰素基因(ChIFN-γ)的瞬时表达及其抗病毒活性检测
【中文关键词】鸡γ-干扰素基因;瞬时表达;抗病毒活性检测
【英文关键词】ChIFN-γ gene; transient expression;antiviral assay
【中文摘要】采用PCR 技术从质粒pET-ChIFN-γ 中扩增得到鸡(Gallus gallus) γ-干扰素(chicken interferon gamma, ChIFN-γ)基因,将其亚克隆到真核表达载体pCAGGS 中。将鉴定正确的克隆命名为pCAGGS-ChIFN-γ,体外转染鸡胚成纤维(CEF)细胞,24 h 后经间接免疫荧光(IFA)和免疫印迹(Western blot)检测,表达蛋白具有良好的免疫原性。然后利用表达绿色荧光蛋白(GFP)的重组水疱口炎病毒(VSV*GFP)在CEF 细胞上检测表达的ChIFN-γ 抗病毒活性(AVA),经检测其抗病毒活性为2×103AU/mL,并且其活性可被抗鸡IFN-γ 的多克隆抗体阻断。
【英文摘要】The chicken interferon gamma (ChIFN-γ) gene was amplified from a recombinant plasmid pET-ChIFN-γ by PCR and subcloned into a eukaryotic expression vector pCAGGS and the recombinant vector was designated as pCAGGS-ChIFN-γ. CEF cells were transfected by the high quality prepared pCAGGS-ChIFN-γ. IFA and Western blot showed that the ChIFN-γ was expressed transiently in the CEF cells. In this study, recombinant VSV*GFP (Vesicular stomatitis virus expressing green fluorescence protein) and CEF cells were used in the antiviral assay (AVA) of the recombinant ChIFN-γ. The recombinant ChIFN-γ could inhibit the replication of the VSV*GFP in CEF cells and its antiviral activity were 2 ×103 AU/mL. The antiviral activity of ChIFN-γ could be inhibited by the antibodies against ChIFN-γ.

【题目】载牛冠状病毒N 蛋白壳聚糖微球的免疫效果评价
【中文关键词】壳聚糖;牛冠状病毒核衣壳蛋白;吸附;动物接种;缓释作用
【英文关键词】chitosan; bovine coronavirus N protein; absorption; animal inoculation; slow-release effect
【中文摘要】为了对壳聚糖分子作为佐剂的缓释效果进行免疫学评价,本研究合成了牛冠状病毒DB2 毒株N 蛋白基因的3'端第487 位~1287 位碱基,用大肠杆菌对其进行了高效表达,通过SDS-PAGE 电泳分离、电洗脱纯化该牛冠状病毒N 蛋白(BCV N)。以戊二醛为交联剂,采用乳化交联的方法制备空白壳聚糖微球。利用吸附法制备载BCV N 蛋白的壳聚糖微球,通过肌肉注射途径免疫BALB/c 小鼠,用间接ELISA 方法检测免疫鼠血清中的抗体水平,由此评价壳聚糖微球对BCV N 的缓释作用和佐剂效应。结果表明,壳聚糖微球的形态较好、表面光滑、分散性较好,平均粒径为6.50±1.77 μm,电势分布在36 mV,吸附BCV N 蛋白的壳聚糖微球在体内所产生的免疫效果明显优于唯N 蛋白组,说明载BCV N 蛋白的壳聚糖微球在体内具有一定的缓释效果,使N 蛋白在体内缓慢释放而长时间诱导抗体的产生,该研究结果为以壳聚糖微球作为疫苗佐剂积累了实验数据。
【英文摘要】A DNA fragment corresponding to the 3' terminus 487-1 287 bases of the N protein gene of bovine coronavirus DB2 strain were artificially synthesized and expressed in E. coli. Blank chitosan microspheres were prepared using glutaraldehyde as crosslinkers followed by emulsification. The expressed BCV N protein was purified by electric elution and loaded on to chitosan

microspheres by absorptive method. These microspheres were used to immunize BALB/c mice. The dynamic antibody level in serum was monitored by indirect ELISA to evaluate the slow-release and adjuvanted effect of the BCV N-loaded chitosan microspheres. The results showed that the microspheres had a good shape with smooth surface and an average size of 6.50±1.77 μm. The BCV N-loaded chitosan microspheres induced better antibody response than the N protein alone in mice, indicating that the BCV N-loaded chitosan microspheres had slow-release effect as adjuvant.

【题目】Cadmium Accumulation in Vegetable Plantation Land Soils under Protected Cultivation: A Case Study
【中文关键词】积累,镉,设施栽培,土壤,蔬菜
【英文关键词】Accumulation, cadmium, greenhouse, soil, vegetable
【中文摘要】admium (Cd) accumulation in vegetable plantation land soils under a greenhouse was investigated in Shouguang County, Shandong Province, China. A total of 128 soil samples were collected from different agricultural fields. Soil samples were digested with the mixture of hydrogen peroxide (H2O2) and nitric acid (HNO3), and Cd content in the digested solution was detected with inductively coupled plasma – mass spectrometry (ICP-MS). The results indicated that the concentration of Cd in the greenhouse vegetable field was significantly more than that in open vegetable field, cotton field, wheat/maize field, and uncultivated soils. Cadmium concentration increased with the cultivation age, and the related accumulation rate was 0.0289mg Cd kg-1y-1 in a greenhouse vegetable field. Organic fertilizer such as livestock manure was the major source for Cd accumulation in the greenhouse vegetable field with the average input amount of 70.7 g Cd ha-1 y-1from organic manure. Thus, a decrease of Cd input from organic fertilizer into greenhouse soils is necessary.

【题目】反应时间、芯壁比及表面活性剂用量对阿维菌素微囊制备的影响
【中文关键词】阿维菌素;微囊悬浮荆;甲基丙烯酸甲酯;聚合时间;载药量;粒径
【英文关键词】abamectin;capsule suspensions;methyl methacrylate;polymerization time;drug—loading rate;particle size
【中文摘要】以甲基丙烯酸甲酯为壁材,采用乳液聚合法制备了阿维菌素微囊悬浮剂。研究了聚合反应时间、芯壁比(芯材与壁材的质量比)和表面活性剂(十二烷基硫酸钠,SDS)用量对所制备微囊的包裹率、栽药量和粒径的影响规律,并对其贮存稳定性和释放性能进行了测定。结果发现:所制备微囊的包裹率、载药量和粒径均与聚合反应时间呈正相关,包裹率和载药量在聚合反应3 h后达到相对稳定,粒径在聚合反应l h后变化幅度明显减小;芯壁比对所制备微囊的载药量和粒径影响较为明显,随着芯壁比的增加,载药量增加、粒径减小,当芯壁比从l:5增大到l:2时,载药量由15.59%增加到30.33%,平均粒径(D∞)由5.47减小到2.18 ¨ m,但芯壁比对微囊包裹率的影响不明显;SDS用量对所制备微囊的包裹率和栽药量影响较小,对粒径的影响较大,当SDS的质量分数为8%时,微囊的D,。最小且更为均一。研究表明,反应时间等3个因素对阿维菌素微囊悬浮剂成囊均有一定的影响,当反应时间大于3 h、芯壁质量比为l:3至l:2、SDS质量分数为6%至8%时,有利于形成粒径均一、形态规则、包裹率和载药量都较高,且具有良好的贮存稳定性和释放特性的阿维菌素微囊悬浮剂。
【英文摘要】Abamectin capsule suspensions(CS)with methyl methacrylate as wall material wereprepared by emulsion polymerization.The influence of polymerization time,ratio of COle material to wall material(core to wall)and percentage of SDS on the entrapment rate,drug-loading rate and mean size of CS was studied,stability at high and low temperature and the controlled release effect were also studied.The results showed that the entrapment rate,drug—loading rate and mean size of CS Were positive correlation witll the polymerization time.The entrapment rate and drug—loading rate were relatively steady when the polymerization time was more than 3 hours,and the change of mean particle size Was obviously reduced when the polymerization time Was more than 1 hours.The drug—loading rate and mean size were significantly affected by COre to wall.As the core to wall increased from 1:5 to 1:2,the drug—loading rate increased from 15.59%tO 30.33%and the D∞varied from 5.47 o.m to2.1 8 ixm.The influence of percentage of SDS on entrapment rate and drug—loading rate was not evident,but it was evident on mean particle size.When the percentage of SDS Was 8%,the Dso of CS was smallest and the particles were more uniform.It indicated that each of the three factors had certain effects on the microencapsulation of abamectin.The acceptable abamectin capsule suspensions which had uniform mean size,regular shape,high entrapment rate and drug—loading rate,good stability at high and low temperature and good sustained release effect could be made when the polymerization time Was more than 3 h,the COre to wall was between 1:3 and 1:2 and the percentage of SDS was between 6%and 8%.

【题目】激活蛋白PeaT1诱导烟草对TMV的系统抗性
【中文关键词】激活蛋白;TMV;病程相关基因;系统获得抗性
【英文关键词】elicitor PeaT1;TMV ;pathogenesis—related gene;SAR
【中文摘要】枯斑三生烟草(Samsun—NN)经激活蛋白PeaT1诱导后接种烟草花叶病毒(Tobacco mosaic virus,TMV),对TMV产生了明显的系统获得抗性,枯斑抑制率达54.15% ,枯斑大小也受到一定程度的限制。研究结果表明,PeaT1处理烟草植株下位三片叶不同时间后,其上部叶片中PPO、POD和PAL 3种抗病防御酶活性均比对照提高,第4 d酶活性达到最高值。实时荧光定量PCR检测结果显示,经PeaT1诱导4 d后烟草叶片中抗病相关基因PR1a、PRlb、NPR1在转录表达水平上较未诱导对照都有不同程度的上调。由以上结果我们推测PeaT1诱导烟草产生了系统获得抗性,本研究为进一步阐明PeaT1诱导植物抗病的信号传导途径奠定了基础。
【英文摘要】The systemic resistance to tobacco mosaic virus(TMV)was induced aher treatment of Samsun—NN tobacco leaves with elicitor PeaT1,the inhibition rate of necrosis was up to 54.15% . Smaller size of TMV lesions was also detected on these leaves. W hen the three lower leaves of tobacco plants were treated with PeaT1 by foliar spraying。 the significant increase of PPo ,POD and PAL activities was observed in an treated upper leaves.and the maximum of them appeared at the 4 day after treatment.The real—time Q—PCR study revealed that the level of resistance related genes PRl a,PRl b,NPRl expression was also increased compared with contro1.The results indicated that elicitor PeaT1 could induce disease resistance in tobacco plant,which would lay a basis for studying signal transduction of disease resistance induced by PeaT1 in plant

【题目】猪T细胞受体α链基因的克隆、序列分析
【中文关键词】猪T细胞受体α链基因;基因克隆;序列分析;生物信息学
【英文关键词】Porcine T cell receptor alpha chain gene (pTCR2α) ; Gene cloning; Sequence analysis;Bioinformatics
【中文摘要】旨在为研究猪T细胞受体分子结构与功能,并首次在国内克隆了猪T细胞受体α链基因。以GenBank上登载的猪T细胞受体(T cell recep tor, TCR) α链(AB087988)为参考序列,从甘肃合作猪外周血液淋巴细胞中用RT2 PCR的方法克隆了TCR2α链基因(pTCR2α) 。结果表明:克隆的TCR2α基因具有完整的ORF,全长819 bp,编码272个氨基酸,预测蛋白分子量为30 kDa,含18个强碱性氨基酸, 23个强酸性氨基酸, 87个疏水性氨基酸和103个极性氨基酸,含有一段20个氨基酸的信号肽序列;与GenBank上登载的TCR2α参考序列(AB087988)的同源性为94. 6% ,与其他具有完整ORF的猪TCR2α相比,同源性为54. 4%~80. 3%。推测可能是一新的TCR2α基因转录本。同时,应用生物信息学技术分析了其基因序列及编码蛋白的结构特征,这为猪T细胞受体分子结构与功能的研究奠定了基础。
【英文摘要】In order to studymolecular structure and function of T cell receptor, porcine T cell receptor alpha chain gene was cloned from peripheral2blood lymphocyte (PBL) of Gansu hezuo pig at the first time in domesdic. The sequence analysis shows that the ORF of total pTCR2α gene is 819 bp in length, encoding 272 amino acids with a signal peptide composed of 20 amino acids. The protein molecularweight is about 30 kDa,with 18 StronglyBasic (+) Amino Acids, 23 Strongly Acidic (-) Amino Acids, 87 Hydrophobic Amino Acids and 102 PolarAmino Acids. The homology of nucleotide sequence of porcine TCR2α with the referenced sequence (AB087988) is up to 94. 6%. Compared with other porcine genes of TCR2α published in GenBank, the homology is about 54. 4% - 80. 3%. It may be a novel transcript of TCR2α family. In order to research molecular structure and function of T cell receptor, this study also uses bioinformatics to ana2lyze its gene sequences and structural feature of encoding protein.

【题目】Molecular Clone, Expression, and Prediction of Construction and Function to Key Genes of Interleukin Family of Porcine
【中文关键词】无
【英文关键词】porcine interleukin, gene family, analysis of homologies, prediction of construction
【中文摘要】无
【英文摘要】This research was to clone, express, and analyze the structure and function of major olecules of porcine interleukin family. Genes of porcine interleukin family were cloned by RT-PCR from stimulated porcine PBMC by LPS and PHA, and then expressed in E. coli, and the structure and function of these molecules were predicted by ExPASY. The results showed that genes of IL-4, IL-6, and IL-18 were successfully cloned and expressed. Furthermore, the expression productsof recombinant IL-4 and IL-6 both have multiple biological activities. By analyzing these genes with the NCBUGenBank data, the homologies of the nucleotide acid sequence are 99.25, 99.21, and loo%, respectively, and have great species differences when compared with other animal species. The results of the prediction showed that all these molecules contain several phosphorylation, glycosylation, protein kinase, and signal transduction bonding sites in secondary structure, and all are compact globularity protein in space configuration. These characteristics of structure are the basis for their multiple biological functions. The genes, structure and function of key molecular of porcine interleukin family were successfully cloned, expressed, and analyzed in this paper.

【题目】近红外光谱技术(NIRS)测定玉米粉碎粒度的研究
【中文关键词】近红外光谱技术;粉碎粒度;偏最小二乘法
【英文关键词】Near Infrared Reflectance Spectroscopy (NIRS), Particle Size, Partial Least Squares
【中文摘要】本文研究了近红外光谱技术(NIRS)快速测定玉米粉碎粒度的应用。建立的近红外定量预测模型定标决定系数Rc2为0.9463,相对标准差RSD为6.5619%,相对分析误差RPD为4.3771,定标结果较好;并对模型的预测能力进行了验证,其中验证决定系数Rv2为0.9186,相对标准差RSD为6.8646%,相对分析误差RPD为4.0856,预测能力较好,表明近红外技术具有较高的准确度。本实验研究结果对饲料生产过程中粉碎粒度的控制具有重要的实际意义。
【英文摘要】In the present paper, measuring the particle size of grinding maize by Near Infrared Reflectance Spectroscopy(NIRS) was studied. As to the NIRS model, the coefficient of determination in calibration (Rc2) was 0.9463, the Relative Standard Deviation (RSD) was 6.5619%, and the Relative Predictive Determination (RPD) was 4.3771.The statistical data showed a good result. Then used the model to predict the validation set samples, the coefficient of determination in prediction (Rp2) was 0.9186, the Relative Standard Deviation (RSD) was 6.8646%, and the Relative Predictive Determination (RPD) was 4.0856.The prediction ability was satisfactory and the NIRS could replace the conventional method. The present research is of great practical importance in paticle size control of feed processing.

【题目】颗粒饲料淀粉糊化度的快速检测方法研究
【中文关键词】淀粉糊化度;近红外光谱分析方法;快速黏度分析法
【英文关键词】degree of Starch gelatinization,Near Infrared Reflectance Spectroscopy (NIRS), Rapid Visco-analysis
【中文摘要】淀粉糊化度是评价颗粒饲料加工质量的重要指标,直接影响畜禽吸收利用饲料中能量物质的效率,进而影响饲料的转化效率和畜禽生长状态。本实验研究建立了颗粒饲料淀粉糊化度的两种快速检测方法,其中近红外光谱分析方法(NIRS)检测淀粉糊化度的定标和验证模型的决定系数(R2)分别为0.8759和0.9608;而快速黏度分析法(RVA)预测淀粉糊化度的定标和验证模型的决定系数分别为0.8025和0.8746。实验结果表明近红外光谱分析技术和快速黏度分析法均可快速且较准确地预测颗粒饲料的淀粉糊化度,在一定程度上能较好满足实时监测饲料加工过程淀粉糊化程度、实现颗粒饲料精细加工的需要。

【题目】蕨麻猪白细胞抗原Ⅰ类分子3 基因的克隆和序列分析
【中文关键词】蕨麻猪; SL A23 基因;序列分析;克隆;生物信息学

【英文关键词】J uema swine ; SL A23 ; sequencing ;cloning ;bioinformatics
【中文摘要】参照GenBank 上登录的猪SL A23 基因序列(GenBank 登录号:AF464010) 设计1 对引物,从经ConA 刺激的蕨麻猪外周血液淋巴细胞中提取RNA ,进行克隆、测序以及同源性分析和蛋白结构预测分析. 结果表明:克隆的蕨麻猪SL A23 基因大小为1 086 bp ,含一个完整的开放阅读框,编码361 个氨基酸,还含有一段21 个氨基酸的信号肽序列;核苷酸序列与GenBank 上登录的SL A23 参考序列的同源性为93. 1 %;与牛、绵羊、山羊的同源性较高,而与鸡的同源性最低. 蛋白分子结构预测表明,猪SL A23 基因编码的蛋白分子是由胞外区(303 个氨基酸) 、跨膜区(23 个氨基酸) 和胞内区(35 个氨基酸) 组成的一种跨膜蛋白.
【英文摘要】Swine lymp hocyte antigen23 (SLA23) gene was cloned by reverse t ranscription2polymerasechain reaction (RT2PCR) from perip heralblood lymp hocyte stimulated by ConA in J uema swine. These 2 quence analysis showed that the SL A23 gene was 1 086 bp in lengt h and encoded 361 amino acids which was about 40 KD wit h 36 strongly basic (+) amino acids ,44 st rongly acidic (-) amino acids ,110 hydrophobic amino acids and 102 polar amino acids ,including a signal peptide of 21 amino acids. The similarity of nucleotide sequence of porcine SL A23 to t he p ublished (AF464010) was up to 93. 1 %. The homology of nucleotide sequence of SL A23 to those of B os taurus ,Ovisaries , Caprahircus was much higher than as of Homosa piens Pongo , G. gorilla , Pant roglod ytes , Equus cabal l us , Fel is cat us and t he lowest was that of Gallus gallus . The protein st ruct ure prediction demonst rated that the SL A23 was at ransmembrane protein composed of ext racellular domain ,transmembrane domain and intracellular domain.

【题目】Application of identified QTL-marker associations in rice quality improvement through a design breeding approach
【中文关键词】chromosome segment substitution lines, QTL, double cross, selection methodology
【英文关键词】chromosome segment substitution lines, QTL, double cross, selection methodology
【中文摘要】A permanent mapping population of rice consisting of 65 non-idealized chromosome segment substitution lines (denoted as CSSL1 to CSSL65) and 82 donor parent chromosome segments (denoted as M1 to M82) was used to identify QTL with additive effects for two rice quality traits, area of chalky endosperm (ACE) and amylose content (AC), by a likelihood ratio test based on stepwise regression. Subsequently, the genetics and breeding simulation tool QuLine was employed to demonstrate the application of the identified QTL in rice quality improvement.When a LOD threshold of 2.0 was used, a total of 16 chromosome segments were associated with QTL for ACE, and a total of 15 segments with QTL for AC in at least one environment.Four target genotypes denoted as DG1 to DG4 were designed based on the identified QTL, and according to low ACE and high AC breeding objectives. Target genotypes DG1 and DG2 can be achieved via a topcross (TC) among the three lines CSSL4, CSSL28, and CSSL49. Resultsrevealed that TC2: (CSSL4 · CSSL49) · CSSL28 and TC3: (CSSL28 · CSSL49) · CSSL4 resulted in higher DG1 frequency in their doubled haploid populations, whereas TC1: (CSSL4 · CSSL28) · CSSL49 resulted in the highest DG2 frequency. Target genotypes DG3 and DG4 can be developed by a double cross among the four lines CSSL4, CSSL28, CSSL49, and CSSL52. In a double cross, the order of parents affects the frequency of target genotype to be selected. Results suggested that the double cross between the two single crosses (CSSL4 · CSSL28) and (CSSL49 · CSSL52) resulted in the highest frequency for DG3 and DG4 genotypes in its derived doubled haploid derivatives. Using an enhancement selection methodology, alternative ways were investigated to increase the target genotype frequency without significantly increasing the total cost of breeding operations.

【题目】国家种质库保存大豆和菜豆种质的种传病毒检测
【中文关键词】大豆,菜豆,种质,种传病毒,检测

【英文关键词】Soybean, Common bean, Germplasm, Seed-borne virues, Detection
【中文摘要】本研究以国家种质中期库提供的300份大豆、100份菜豆种质为材料,分别采用血清学和分子生物学方法,对种传病毒的种类进行了检测。结果表明:在大豆种质中检测出大豆花叶病毒(SMV)、黄瓜花叶病毒(CMV)、苜蓿花叶病毒(AMV)三种病毒,阳性检出率分别为24.67%(74份)、12.67%(38份)和4.67%(14份)。大豆种质中还存在大豆花叶病毒与黄瓜花叶病毒、大豆花叶病毒与苜蓿花叶病毒的复合侵染。在菜豆种质中检测出菜豆普通花叶病毒(BCMV)阳性材料92份,种质带毒率高达92%。这些信息将会对今后采取相关措施提高入国家种质库保存的豆类种质的质量提供帮助。
【英文摘要】In this study, 300 soybean and 100 common bean germplasm conserved in National Crop GeneBank were screened for seed-borne viruses by serological and molecular biological methods. For the soybean germplasms, 74(24.67%), 38(12.67%) and 14 (4.67%) were positive to Soybean mosaic virus (SMV), Cucumber mosaic virus (CMV), and Alfalfa mosaic virus (AMV) respectively. Some were infected by two viruses, such as SMV and CMV, or SMV and AMV. In common bean 92% were infected by Bean common mosaic virus (BCMV). These information will be useful to understand the status of seed-borne viruses in leguminous crops in genebank and to take measures for control virus diseases during seed reproductions in field.

【题目】牦牛α-干扰素基因的克隆及其原核表达的研究
【中文关键词】牦牛IFN-α-A 基因; 牦牛IFN-α-Ⅱ基因; 分子克隆; 遗传演化关系; 表达分析
【英文关键词】yak interferon-α-A; yak interferon-α-Ⅱ gene; molecular cloning; phylogenetic analysis; expression analysis
【中文摘要】植物血凝素(PHA) 诱导培养牦牛外周血淋巴细胞, 提取总RNA, 采用RT-PCR 技术扩增牦牛IFN-α-A 和IFN-α-Ⅱ基因, 分别经PCR、酶切鉴定及测序分析后, 再分别构建原核表达重组质粒, 用SDS-PAGE 和Western blot 分析IPTG 诱导表达的重组蛋白。序列分析表明, 牦牛IFN-α-A 基因ORF 为570 bp,与NCBI 上发表的奶牛IFN-α-A 参考序列同源性为94.4 %, 与黄牛IFN-α-B 基因(M10953)的同源性最高, 为97.0 %; 牦牛IFN-α-Ⅱ基因ORF 为588 bp, 与NCBI 上发表的奶牛IFN-α-Ⅱ参考序列同源性为94.2 %, 与黄牛IFN-δ-1 基因(XM-871297)的同源性最高, 为96.1 %。分子遗传进化树分析表明牦牛IFN-α-A 和IFN-α-Ⅱ与黄牛、奶牛和水牛亲缘关系最近, 与猪、马、人的次之, 与其它动物都较远, 说明这两基因均具有种属差异性。诱导表达重组蛋白分析表明, pGEX4T/IFN-α-A 和pGEX4T/IFN-α-Ⅱ在大肠杆菌中得到了正确表达, 均可表达约44 ku 的融合蛋白, 主要以包涵体形式存在, 且具有与抗血清发生反应的生物活性。
【英文摘要】Total RNA was isolated from yak peripheral blood lymphocytes stimulated with PHA. The yak interferon-α-A (IFN-α-A) and the yak interferon-α-Ⅱ(IFN-α-Ⅱ) cDNAs were amplified by RT-PCR, and sequenced. The yak IFN-α-A gene contained a ORF of 570 bp in length, which shared 94.4 % sequence homology with the cow IFN-α-A gene and 97.0 % with cattle IFN-α-B (M10953) gene. The yak IFN-α-Ⅱgene had a ORF of 588 bp in length, and shared 94.2 % and 96.1 % sequence identities with that of cow and cattle IFN-δ-1 (XM-871297). Phylogenetic analysis showed that the yak IFN-α-A and IFN-α-Ⅱ genes were both species-specific. The yak IFN-α-A and the IFN-α-Ⅱ were cloned into vector pGEX4T-1, respectively, and expressed in BH21 E.coli cells by IPTG induction. SDS-PAGE analysis showed that both fusion proteins of about 44 ku were expressed in the form of inclusion bodies. Western blot analysis showed that yak IFN-α-A and IFN-α-Ⅱ were both expressed with specific antigenic activities.

【题目】Inclusive composite interval mapping (ICIM) for digenic epistasis of quantitative traits in biparental populations
【中文关键词】epistasis, QTL, inclusive composite interval mappping, two-dimensional scanning
【英文关键词】epistasis, QTL, inclusive composite interval mappping, two-dimensional scanning
【中文摘要】It has long been recognized that epistasis or interactions between non-allelic genes plays an important role in the genetic control and evolution of quantitative traits. However, the detection of epistasis and estimation of epistatic effects are difficult due to the complexity of epistatic patterns, insufficient sample size of mapping populations and lack of efficient statistical methods. Under the assumption of additivity of QTL effects on the phenotype of a trait in interest, the additive effect of a QTL can be completely absorbed by the flanking marker variables, and the epistatic effect between two QTL can be completelyabsorbed by the four marker-pair multiplication variables between the two pairs of flanking markers. Based on this property, we proposed an inclusive composite interval mapping (ICIM) by simultaneously considering marker variables and marker-pair multiplications in a linearmodel. Stepwise regression was applied to identify the most significant markers and marker-pair multiplications. Then a two-dimensional scanning (or interval mapping) was conducted to identify QTL with significant digenic epistasis using adjusted phenotypic values based on thebest multiple regression model. The adjusted values retain the information of QTL on the two current mapping intervals but exclude the influence of QTL on other intervals and chromosomes. Epistatic QTL can be identified by ICIM, no matter whether the two interacting QTL have any additive effects. Simulated populations and one barley doubled haploids (DH) population were used to demonstrate the efficiency of ICIM in mapping both additive QTL and digenic interactions.

【题目】Establishment and biological characterizations of the fibroblast cell line from the Langshan Chicken
【中文关键词】Langshan chicken; fibroblast line;biological characteristic;cryopreservation
【英文关键词】Langshan chicken; fibroblast line;biological characteristic;cryopreservation

【中文摘要】Objective: We needed to establish an embryonicfibroblast cell line from the Langshan chicken(LSCEF61) to preserve their important geneticresources at the cellular level.Material and methods: The cell line was establishedfrom 9-day-old embryos by direct explant cultureand cryopreservation techniques. Cell morphology,dynamic proliferation and any contamination presentwere tested, and the karyotype and levels of isoenzymesof lactic dehydrogenase and malic dehydrogenasewere analysed. Four types of fluorescent proteinexogenous genes for pEGFP-C1, pEGFP-N3, pEYFP-N1 and pDsRed1-N1 were transfected into thecells.Results: Results showed that the cells were healthyand were of spindle shaped structure, without changein morphology. Cell growth curves were of typicalS-shape. Assays for microbial contamination werenegative. The LSCEF61 line showed no cross-contaminationwhen assessed by isoenzyme analysis.Chromosome number (2n) = 78 on more than 90%of occasions. The four types of fluorescent proteinextro-genes appeared to be expressed effectivelywith high transfection efficiency between 15.6% and38.6%.Conclusion: The cell line met each of the qualitycontrol standards required for the American TypeCulture Collection. It had not only preserved thegenetic resources of the important Langshan chickenat the cellular level, but also provided valuable materialfor genomic, post-genomic and somatic cell cloningresearch and other applications.

【题目】Establishment and characterization of a Chinese Game chicken embryo fibroblast bank.

【中文关键词】Chinese Game chicken fi broblasts ; biological characteristics ; genetic conservation
【英文关键词】Chinese Game chicken fi broblasts ; biological characteristics ; genetic conservation

【中文摘要】For preserving the genetic resources of the Chinese Game chicken and exploring a new method to preserve endangered animals, a Chinese Game chicken embryo fi broblast cell bank was established by the attachment culture method and the cryopreservation biotechniques. Th is bank includes 43 embryo samples and has stocks of 178 cryovials, with each containing 4.0×10 6 cells respectively. Quality assays and biological characteristics of the bank established showed that the cells cultured in vitro were all typical fi broblast and the cell population doubling time (PDT) was about 2 days. Th e cell viability before freezing was 97.37% ± 2.25% and 91.43% ± 3.22% after thawing. Tests for microbial contamination by bacteria, fungus, viruses and mycoplasmas were all negative. Th e frequency of cells having the diploid number of chromosomes (78) was 94.65% ± 3.29%. Isoenzyme analysis confi rmed that there was no cross-contamitation in the culture. Th e fl uorescence could be observed well-distributed in cytoplasm and nucleus except for some cryptomere vesicles at 24 h after transfection, and the expression effi ciency of pEGFP-C1, pEGFP-N3, pEYFP-N1, pECFP-N1, pECFP-mito and pDsRed1-N1 were all between 9.5%~34.6% at 24 h, 48 h and 72 h after transfection. Th is research provided both technical and theoretical support for preserving the genetic resources of other animals and poultry at the cell level.

【英文摘要】For preserving the genetic resources of the Chinese Game chicken and exploring a new method to preserve endangered animals, a Chinese Game chicken embryo fi broblast cell bank was established by the attachment culture method and the cryopreservation biotechniques. Th is bank includes 43 embryo samples and has stocks of 178 cryovials, with each containing 4.0×10 6 cells respectively. Quality assays and biological characteristics of the bank established showed that the cells cultured in vitro were all

【题目】Establishment and biological characteristics of Qingyuan partridge chicken fibroblast line.

【中文关键词】Qingyuan partridge chicken; fibroblast line;biological characteristic;cryopreservation

【英文关键词】Qingyuan partridge chicken; fibroblast line;biological characteristic;cryopreservation

【中文摘要】The aim of this work was to seek a different approach to conserving important domestic animals in imminent danger. A Qingyuan partridge chicken embryonic fibroblast line, containing 336 cryovials with 8x10(6) cells each, was successfully established from 60 Qingyuan partridge chicken embryos using explant culture and cryopreservation techniques. The cells were morphologically consistent with fibroblasts. The growth curve was a typical "S" shape having a detention phase, a logarithmic phase, and a plateau phase. The population doubling time was approximately 72 h. Tests for bacteria, fungi, viruses, and Mycoplasma were all negative. Isoenzyme polymorphism indicated that the genetic characteristics of the cell line were stable in vitro. Karyotyping analysis suggested that the chromosome number of a normal cell was 2n=78 and 93.4% of the entire population was diploid. The transfection efficiencies of 6 fluorescent proteins (pEGFP-C1, pEGFP-N3, pDsRed-N1, pEYFP-N1, pECFP-N1, and pECFP-mito) optimal at 48 h were from 15.1 to 39.8%. The cell line met all of the criteria from the American Type Culture Collection. Not only has the germline of this important chicken breed been preserved at the cell level, but also valuable material has been provided for genome, postgenome, and somacloning research. Moreover, the establishment of this technical platform may provide both technical and theoretical support for storing the genetic resources of other animals and poultry at the cell level.

【题目】Isolation, Culture and Biological Characteristics of Primordial Germ Cells from Beijing Fatty Chicken.
【中文关键词】Beijing fatty chicken;Biological Characteristic;differention;Primordial Germ Cells
【英文关键词】Beijing fatty chicken;Biological Characteristic;differention;Primordial Germ Cells
【中文摘要】The aim of this study was to explore the isolation and culture process of Beijing fatty chicken primordial germ cells (PGCs) and investigate their biological characteristics. The PGCs isolated from the genital ridges of Beijing fatty chicken (Gallus domesticus) embryos after 5.5 days of incubation were co-cultured with mice embryonic fibroblasts (MEF). The results showed that the PGCs of the Beijing fatty chicken were positive for periodic acid Schiff (PAS) and alkaline phosphatase (AKP) staining. These cells could proliferate for a prolonged time in vitro and maintain diploid karyotype. Immunocytochemical staining showed that they expressed SSEA-1, SSEA-4, TRA-1-60 and TRA-1-81, and real-time PCR showed that they expressed Cvh, CDH and Dazl. They could form simple embryoid bodies and differentiate into osteoblasts in vitro. In addition, after transfected with pEGFP-N3, pEYFP-N1 and pDsRed-N1 vectors by liposomal transfection, enhanced green, yellow and red fluorescent protein-positive cells could be visualized using a laser confocal microscope. The above results suggested that PGCs from the Beijing fatty chicken not only had strong self-renewal ability, but also had the potential to differentiate towards mesoblast cells. These cells are suitable for genetic manipulation as nuclear donors.

【题目】Derivation and characteristics of pluripotent embryonic germ cells in duck
【中文关键词】Beijing duck , embryonic germ cell , biological characteristic , derivation
【英文关键词】Beijing duck , embryonic germ cell , biological characteristic , derivation
【中文摘要】Embryonic germ (EG) cells derived from primordial germ cells are undifferentiated and pluripotent stem cells. In our study, primordial germ cells isolated from the genital ridges of Beijing duck (Anas domestica) embryo at stage 28 were co-cultured with mice embryonic fibroblasts. Duck EG cells grew with a high nuclear:cytoplasm ratio and were positive for periodic acid-Schiff and alkaline phosphatase staining. The duck EG cells could proliferate for more than a month in repeated subculture and maintain a diploid karyotype. They expressed the pluripotent markers such as stage-specific embryonic antigen-1, stage-specific embryonic antigen-4, tumor rejection antigen-1-60, and tumor rejection antigen-1-81. Furthermore, the EG cells could form embryoid bodies and differentiate to osteoblast in vitro. This study explored the isolation and culture process of duck EG cells using the culture methods of chicken EG cells and investigated biological characteristics of Beijing duck EG cells. Our results showed that methods published for the culture of chicken EG cells could be applied to the culture of duck EG cells. Duck EG cells will be useful for the differentiation of EG cells in avian species.

【题目】Establishment and Characterization of a Fibroblast Line from Landrace
【中文关键词】Landrace, fi broblast, cell bank, biological characteristics
【英文关键词】Landrace, fi broblast, cell bank, biological characteristics
【中文摘要】Up to 32 Landrace ear marginal tissue samples were used for establishing a fibroblast cell bank by the means of primary explantation and cryopreservation. Biological analysis suggested that the Population Doubling Time (PDT) of the cell line was approximately 24h. The diploid accounted for 97.2% of the whole population; isozyme analysis of Lactic Dehydrogenase (LDH) and Malic Dehydrogenase(MDH) disproved cross-contamination from other cell lines. The results of bacterium, fungus, virus and mycoplasma tests were all negative. The transfection rates of three fluorescent proteins were high, indicating that the exogenous genes could be effectively expressed in the cells. It had not only preserved the precious germplasm resource of the Landrace on the cell level but also provided valuable material for the researches of genomics, postgenomics, somatic cloning and so on.

【题目】Establishment and characterization of a fibroblast cell line from the Mongolian horse
【中文关键词】Mongolian horse;Fibroblast line;Establishment;Characterization
【英文关键词】Mongolian horse;Fibroblast line;Establishment;Characterization
【中文摘要】A fibroblast line was successfully established from Mongolian horse ear marginal tissue by using a primary explant technique and cell cryogenic preservation technology. Biological analysis showed the following: The cells were adherent and exhibited

density-dependent inhibition of proliferation; assays of microbial contamination from bacteria, fungi, and mycoplasma were negative; the population doubling time of the cells was 33.9 h; and a 2n chromosome number of 64 at a frequency higher than 80%. A lack of cross-contamination of this cell line with other species was confirmed by isoenzyme analysis of lactic and malic dehydrogenases. In order to study exogenous gene expression, four fluorescent proteins, pEGFP-N3, pEGFP-C1, pDsRed1-N1, and pEYFP-N1, were transfected into the cells. The corresponding fluorescence was distributed throughout the cytoplasm and nucleus 12 h after transfection. This cell line not only preserves the genetic resources of the Mongolian horse at the cellular level but also provides valuable materials for genomic, postgenomic, and somacloning research in this species.

【题目】Establishmen and Characterization of the Fibroblast Line from Silkie Bantam

【中文关键词】Silkie Bantam, Embryo Fibroblast Line, Establishment, Identification

【英文关键词】Silkie Bantam, Embryo Fibroblast Line, Establishment, Identification

【中文摘要】A Silkie Bantam embryo fibroblast line (named SBF59 line) was successfully established by using direct explant culture and cryopreservation techniques. Cell morphology, viability, dynamic growth and contamination were tested and the karyotype and levels of isoenzymes of lactic dehydrogenase and malic dehydrogenase were analyzed. Four kinds of fluorescent protein extrogenes, including pEGFP-N3, pECFP-N1, pEYFP-N1 and pDsRed1-N1 were transfected into the cells. The results showed that the cells were healthy and possessed a fibrous structure without a change in morphology. The average viability of the cells was 96% before freezing and 90.5% after thawing. The growth curve appeared as typical “ S ” shape and the cell growth passed through a detention phase, a logarithmic phase and a platform phase; the estimated population doubling time (PDT) was 38.5 h; assays for the presence of bacteria, fungi, viruses and mycoplasmas were negative; the cell line showed no cross contamination when assessed by isoenzyme analysis; the chromosome number was 2n = 78 on more than 88% of occasions; four kinds of fluorescent protein extro-genes appeared to be expressed effectively with a high transfection efficiency between 18.3% and 42.3%. The cell line met the required quality control standard. It not only preserves the genetic resources of the important Silkie Bantam at the cellular level but also provides valuable materials for genomic, post-genomic, somatic cell cloning research and other applications.

【题目】Establishment and characterization of a fibroblast cell line derived from Jining Black Grey goat for genetic conservation
【中文关键词】Jining Black Grey goat;Fibroblast cell bank;Characteristics;Genetic conservation
【英文关键词】Jining Black Grey goat;Fibroblast cell bank;Characteristics;Genetic conservation
【中文摘要】An ear marginal fibroblast cell bank was established from the Jining Black Grey (JBG) goat using attachment culture and freezing biotechniques. This bank included 32 ear samples (15 males and 17 females) and has stocks of 168 cryogenically preserved vials, each vial contained 4.0×106 cells per milliliter. The cells of the bank that were checked for the quality and the biological characteristics showed a typical fibroblast morphology when they cultured in vitro. The growth curve consisted of a growth curve consisting of a latent phase, logarithmic growth phase and stationary phase, cell population doubling time (PDT) of 48 h. The chromosome analysis showed that the frequency of cells having the diploid number of chromosomes (60) was 98.65±2.89%, and no microbe contamination (bacteria, epiphyte, virus or mycoplasma) was detected. In addition, lactate dehydrogenase (LDH) and malate dehydrogenase (MDH) zymography indicated that this cell bank was free of crosscontamination. At 24, 48 and 72 h after transfection, the expression efficiency of pEGFP-C1, pEGFP-N3, pEYFP-N1, pECFP-N1, pECFP-mito and pDsRed1-N1 were between 11.8% and 56.3%. The fluorescence could be observed well-distributed in cytoplasm and nucleus except for some cryptomere vesicles at 24 h after transfection. These newly established cell lines meet all the quality control standards established by the American Type Culture Collection. We have employed a new method for conserving the genetic resources of an important and endangered animal breed. The fibroblast bank that we have established from the JBG goat also provides an invaluable material resource for future studies that will utilize molecular and cell biology applications.

【题目】Differentiation potential of bone marrow mesenchymal stem cells in duck
【中文关键词】duck; mesenchymal stem cells; induction; differentiation
【英文关键词】duck; mesenchymal stem cells; induction; differentiation
【中文摘要】The bone marrow mesenchymal stem cells (MSCs) are multipotent stem cells which can differentiate into mesenchymal cells in vitro. In this study, MSCs in duck were isolated from bone marrow by density gradient centrifuge separation, purified and expanded in the medium. The primary MSCs were expanded for passages. The different-passage MSCs were induced to differentiate into osteoblasts and neuron-like cells. Karyotype analysis indicated that MSCs kept diploid condition and the hereditary feature was stable. The different-passage MSCs expressed CD44, ICAM- and SSEA-4, but not CD34, CD45 and SSEA-when detected by immunofluorescence staining. There was no significant difference among the positive rates of passages 2, 6 and 8 ($P > 0.05$), but a significant difference existed among those of passages 2, 6, 8 and 11 ($P < 0.05$). After the osteogenic inducement was added, the induced different-passage MSCs expressed high-level alkaline phosphatase (ALP), and are positive for tetracycline staining, Alizarin Red staining and Von Kossa staining. After the neural inducement was added, about 70% cells exhibited typical neuron-like phenotype, the induced different-passage MSCs expressed Nestin, neuron-specific enolase (NSE) and glial fibrillary acidic protein (GFAP) when detected by immunofluorescence staining. There was no significant difference among the positive rates of passages 3, 4 and 6 ($P>0.05$), but a significant difference existed among those of passages 3, 4, 6 and 8 ($P<0.05$). These results suggest that MSCs in duck were capable of differentiating into osteoblasts and neuron-like cells in vitro.

【中文关键词】White ear lobe chicken embryo; Fibroblast bank; Biological characteristics

【英文关键词】White ear lobe chicken embryo; Fibroblast bank; Biological characteristics

【中文摘要】A white ear lobe chicken embryo (WELCE) fibroblast cell bank, containing 322 tubes of frozen cells, was successfully established fromprimary explants of 57 embryo samples. The cells were morphologically consistent with fibroblasts, and the growth curve was sigmoidal witha population doubling time (PDT) of 48 h. Karyotyping and G-banding indicated a total chromosome number of 2n ¼ 78; the rate of diploidy inthe cell bank was 97.62%. The cells were also free from bacterial, fungal, viral and mycoplasma contamination. Analysis of lactate dehydrogenase(LDH) and malate dehydrogenase (MDH) isoenzymes ruled out cross-contamination between cells. In order to study exogenous geneexpression, six fluorescent proteins were transfected into the WELCE cells. The transfection efficiency of these genes was between 10.1 and41.9%. The corresponding fluorescence was distributed throughout the cytoplasm and nucleus 24 h after transfection. The results indicate thatthe quality of the cell line meet the quality requirements of the ATCC (American Type Culture Collection).

【题目】Vitamin E antagonizes UVB-induced apoptosis of chicken embryonic fibroblasts
【中文关键词】Apoptotic model; Beijing fatty chicken; Embryonic fibroblast line; Ultraviolet light; Vitamin E; Ca2+
【英文关键词】Apoptotic model; Beijing fatty chicken; Embryonic fibroblast line; Ultraviolet light; Vitamin E; Ca2+
【中文摘要】Apoptosis researches were focused on several model species in the past decades, 2 while fields concerning non-mammalian vertebrate, particularly that of birds, were 3 almost untouched. According to the exigent situation to expand the biodiversity of 4 apoptotic researches, an apoptotic model of Beijing fatty chicken embryonic 5 fibroblasts by ultraviolet radiation was established through primary explantation and 6 serial passage. A myriad of antioxidants were able to antagonize UVB-induced 7 apoptosis by virtue of scavenging reactive oxygen species. For a better understanding 8 of the possible anti-apoptotic effects and mechanisms of Vitamin E against 9 UVB-induced apoptosis in chicken embryonic fibroblasts, the cells treated with 10 Vitamin E upon UVB irradiation were stained with AO/EB and Fluo-3/AM to 11 visualize chromatin distribution and calcium homeostasis respectively and subjected 12 to flow cytometry to detect mitochondrial transmembrane potential, cell cycle 13 progression and apoptotic rates. RT-PCR was also performed to analyze the 14 expression of some apoptosis-related genes. Typical events including cell shrinkage, 15 blebbing and nuclear condensation occurred after radiation. With the existence of 16 Vitamin E, positive cells upon ultraviolet light decreased; cases of Ca2+ were reduced 17 temporarily; cell cycle arrested at S/G2 checkpoint were modified nearly to normal. 18 fas decreased while procaspase-3 remained nearly unchanged with and without 19 Vitamin E, and bcl2/bax ratio was upregulated, indicating possible anti-apoptotic 20 mechanisms through mitochondrial pathway. This research caulked the vacancy of 21 apoptosis researches on birds especially poultry, expand the species spectrum of 22 apoptosis investigations, and hence contribute tremendously to further development of 23 apoptosis theories for interested researchers.

【题目】玉米低温冷害远程诊断管理系统的设计

【中文关键词】玉米低温冷害; 决策支持系统; 远程诊断; 网络管理; J2EE;

【英文关键词】maize chilling damage; decision and support system; remote diagnosis; web-based management; J2EE;

【中文摘要】夏季低温冷害是中国低温灾害的主要类型之一,尤其在东北地区发生比较频繁,造成影响相当严重,基于此,笔者旨在为玉米低温冷害设计一个基于网络的远程诊断与管理的系统平台。通过对基于web的远程诊断管理系统关键技术的分析,在总结东北地区玉米低温冷害领域专家经验和知识的基础上,初步实现了一个基于web技术的玉米低温冷害远程诊断与管理系统。该系统采用J2EE技术规范和Java语言进行开发,并且与无线远程监测系统相结合,使之具有实时管理功能。用户可以通过访问该系统,实现玉米低温冷害主动和被动防御、低温冷害实时监控管理、专家知识浏览和系统维护等功能。该系统具有可靠性、易维护、易操作和普适性等性能,并可通过重建知识库和数据库,为更多种类作物气象灾害提供远程诊断及管理服务。 更多还原

【英文摘要】Chilling damage is one of the main types of China ’s low-temperature disasters which particularly happens in the northeast and causes very serious impact. Because of this, the author provides a web-based remote diagnosis and management system platform for maize chilling damage. Through investigating the key technologies of the remote diagnosis and management system,a web-based management system was presented on the basis of collecting and processing the experience and knowledge related to maize chilling damage in northeast China. For the computer program, this system was developed by J2EE and Java. Combined with analysis of the environmental data acquired from the wireless telemonitoring system setting up in the field, the real-time forecast of maize chilling damage may be made out just through the Internet. By logging in this system, users can get the following services: choosing active and passive countermeasures for reducing maize chilling damage, making real-time management, getting reference of experts ’ knowledge and executing system administration, etc. Besides reliability, easy maintenance and operation, the system also has wide applicability that could provide an universal system platform of remote diagnosis and management for more crops meteorological disasters by rebuilding the data-base and knowledge base. 更多

【题目】Association and haplotype analysis of purH gene with inosine monophosphate content in chickens
【中文关键词】无
【英文关键词】Chicken; Inosine monophosphate content; Meat quality; purH gene; Single nucleotide polymorphism
【中文摘要】无
【英文摘要】The current study was designed to investigate the effects of the purH gene on chicken muscle inosine monophosphate (IMP) content. Muscle IMP content was measured in five chicken breeds. Single nucleotide polymorphisms (SNPs) were detected by PCR-SSCP and DNA sequencing. Two SNPs were detected, A/T substitution at position 8023 in exon 9, and T/C substitution at position 17446 in exon 16. The results indicated that only T17446C polymorphism was associated with IMP content. The haplotype effect was higher than the single genotype effect. We tentatively conclude that purH gene is a candidate locus or linked to a major gene that affects muscle IMP content. Haplotypes are superior to single genotypes as potential molecular markers for meat quality traits in chicken.

【题目】Correlation analysis between single nucleotide polymorphisms in ADSL and IMP content in chicken
【中文关键词】无
【英文关键词】ADSL gene; Chicken; SNP; Inosine monophosphate content
【中文摘要】无
【英文摘要】This study was designed to investigate the effect of adenylosuccinate lyase (ADSL) gene on inosine monophosphate content (IMP) in chicken. Exogenous Recessive White chicken and indigenous Chinese chicken breeds such as Silkies, Baier, Tibetan and Xiaoshan were used. Thirteen pairs of primers were designed to scan all exons of ADSL gene by PCR-SSCP, mutation detected was directly sequenced. A silent mutation at 3484bp in exon 2 was substitute C/T SNP, whereas point mutation at 9839bp in exon 9, was alter C/A SNP and his corresponding amino acid (Pro -> Thr). Individuals with TT genotype in exon 2 had significantly higher IMP content than those with CT and CC genotype; in contrast different genotypes in exon 9 were no significantly affected IMP content. We Putatively drew the conclusion that SNP in exon 2 of ADSL gene could be used as the potential molecular marker for meat quality trait in chicken.

【题目】Genetic diversity and relationship between genetic distance and geographical distance in 14 Chinese indigenous chicken breeds and red jungle fowl
【中文关键词】无
【英文关键词】genetic diversity; microsatellite; genetic distance; geographical distance; chicken
【中文摘要】无
【英文摘要】Genetic diversity and the relationship between genetic distance and geographical distance in red jungle fowl and 14 Chinese indigenous chicken breeds were evaluated using 29 microsatellite loci. The number of alleles per locus ranged from 2 to 25 and the average expected heterozygosity and PIC of all loci were 0.6683 and 0.50, respectively. The average number of alleles per locus ranged from 3.41 in Gushi chicken breed to 6.28 in Wannan Three-yellow chicken breed. The overall expected heterozygosity of 15 Chinese chicken breeds was 0.6686 +/- 0.0254 and all breeds showed relatively large heterozygosity. The average of genetic differentiation among populations was 16.4% ($P < 0.001$). Red jungle fowl and Gushi chicken had distant genetic relationship from other breeds, while Huainan Partridge and Tibetan chicken were more closely related with other breeds. The results did not provide enough support for a significant correlation between the genetic and geographical pair-wise distances

【题目】Identification of Single Nucleotide Polymorphism of H-FABP Gene and Its Association with Fatness Traits in the Chicken.
【中文关键词】无
【英文关键词】chicken; H-FABP gene; single nucleotide polymorphism (SNP); fat deposition traits; PCR-SSCP
【中文摘要】无
【英文摘要】Heart fatty acid-binding protein gene (H-FABP) is an important candidate gene for meat quality. One of the objectives of this study was to screen single nucleotide polymorphisms (SNP) of chicken H-FABP gene among 252 individuals that included 4 Chinese domestic chicken breeds (Fengkai Xinghua (T04), Huiyang Huxu (H), Qingyuan Ma (Q), Guangxi Xiayan (Sl)), 2 breeds developed by the Institute of Animal Science, Guangdong Academy of Agricultural Sciences (Lingnan Huang (DC), dwarf chicken (E4)) and one introduced broiler (Abor Acre (AA)). Another objective of this study was to analyze the associations between polymorphisms of the H-FABP gene and fat deposition traits in chickens. PCR-SSCP was used to analyze SNPs in H-FABP and 4 SNPs T260C, G675A, C783T and G2778A) were detected. Associations between polymorphic loci and intramuscular fat (IMF), abdominal fat weight (AFW) and abdominal fat percentage (AFP) were analyzed by ANCOVA method. The results showed that the T260C genotypes were significantly associated with IMF ($p = 0.0233$) and AFP ($p = 0.0001$); the G675A genotypes were significantly associated with AFW, AFP ($p < 0.01$) and IMF ($p < 6.05$); at the C783T locus, AFW and AFP differed highly between genotypes. However, the G2778A loci did not show any significant effect on fat deposition traits in this study. In addition, we found that there were some differences between AFP and definite haplotypes through a nonparametric statistical method, so the haplotypes based on the SNPs except G2778A loci were also significantly associated with IMF, AFW (g) ($p < 0.05$) and AFP (%) ($p < 0.001$). Significantly and suggestively dominant effects of H4H4 haplotype were observed for IMF and the H2H3 was dominant for AFW (g) and AFP (%). The results also revealed that H5H7 haplotype had a negative effect on IMF, while the H5H6 had a positive effect on AFW (g) and AFP (%).

【题目】Associations of A-FABP and H-FABP markers with the content of intramuscular fat in Beijing-you chicken
【中文关键词】无
【英文关键词】A-FABP; Chicken; Genetic marker; H-FABP; Intramuscular fat
【中文摘要】无
【英文摘要】This study has assessed the association of single nucleotide polymorphisms (SNP) identified in the adipocyte fatty acid binding protein (A-FABP) and heart-type fatty acid binding protein (H-FABP) genes with the content of intramuscular fat (IMF) in a population of male Beijing-You chickens. A previously described SNP in the chicken A-FABP gene had a significant (P0.05) effect on IMF content. Chickens inheriting the homozygous BB genotype at A-FABP had a significantly higher content of IMF in thigh muscles and breast muscles than did those inheriting the AA and AB genotypes. A novel SNP, identified here, in the H-FABP gene was also significantly (P0.05) associated with IMF content in thigh and breast muscle. Chickens inheriting the genotypes of DD and CD had much higher content of IMF than those inheriting the homozygous genotype of CC. Markers at the A-FABP and H-FABP genes were associated with IMF content in the studied population. Chickens inheriting the BB genotype at A-FABP, along with the CD genotype at H-FABP, produced muscles with a much higher content of IMF when compared with all other genotypes. A weak interaction between A-FABP and H-FABP was detected (P0.09) for IMF content in the tested population. The statistical significance of interaction is tentative because of the limited number of observations for some genotypic combinations. Markers identified within the A-FABP and H-FABP genes are suitable for future use in identifying chickens with the genetic potential to produce more desirable muscle with higher IMF content, at least in the population of Beijing-You male chickens.

【题目】Sensitivity and specificity of High-Resolution Melting analysis in screening unknown SNPs and genotyping a known mutation
【中文关键词】无
【英文关键词】A-FABP; CAPN1; chicken; HRMA; SSCP analysis
【中文摘要】无
【英文摘要】High-resolution melting analysis (HRMA) was used to screen potential SNPs in the exons of chicken CAPN1 (mu-calpain/large subunit) gene. A total of 312 DNA samples from Beijing-you chickens were used for detection. Twelve pairs of primer were designed to amplify twelve different exons and SNPs were detected in five of them. HRMA was also compared with PCR-SSCP analysis for genotyping of a known SNP site in the chicken adipocyte fatty acid binding protein gene (A-FABP). Amplicons of 275-bp fragment, bracketing the polymorphic site, were grouped by PCR-SSCP into three genotypes designated as CC, TT and CT. Small amplicons (56 bp) within the 275-bp fragments were designed to maximize the Tm difference between homozygotes and to genotype all possible three genotypes after a single melting analysis successfully. Results from different methods were cross-validated and sequencing results from randomly selected heterozygotes and homozygotes confirmed the specificity of HRM technique. The full consistency proved that HRMA was a useful tool for rapid, close-tube genotyping of polymorphic sites. It has great potential for SNPs detection and scanning especially on a large scale.

【英文关键词】native chicken breeds; body measurement traits; carcass traits; egg laying traits; ecological traits; canonical correlation
【中文摘要】对中国部分地方鸡品种的体尺性状、屠宰性状、产蛋性状和生态性状等4组性状间的17个变量关系进行了典型相关分析。结果表明,体尺性状和屠宰性状间、体尺性状与生态性状间以及屠宰性状与生态性状间的第1个典型相关系数达极显著水平,分别占总相关信息的38.17%、42.73%和42.13%,其典型相关系数分别为0.998、0.997和0.998;体尺性状与产蛋性状间和产蛋性状与生态性状间的第1个典型相关系数达显著水平,分别占总相关信息的42.55%和66.79%,其典型相关系数分别为0.965和0.984。研究结果对于鸡的遗传育种具有一定的参考价值。
【英文摘要】Seventeen variants of four sets of traits including body measurement traits,carcass traits,egg laying traits and ecological traits were analysed using canonical correlation analysis in Chinese native chicken breeds.The results showed that highly significant correlation coefficients of the first canonical correlation were obtained between body measurement traits and carcass traits(0.998),body measurement traits and ecological traits(0.997),as well as between carcass traits and ecological traits(0.998).They accounted for 38.17%,42.73% and 42.13% of total correlation,respectively.The first canonical correlation coefficient between body measurement and egg laying traits(0.965),as well as between egg laying traits and ecological traits(0.984)were significant.They a ccounted for 42.55% and 66.79% of total correlation,respectively.The results of analysis may be useful for genetics and breeding of chickens.

【题目】5个地方鸡种肌肉脂肪酸相对含量比较及主成分分析
【中文关键词】地方鸡种; 脂肪酸; 因子分析; 聚类分析
【英文关键词】无
【中文摘要】以5个地方鸡品种(白耳鸡、狼山鸡、萧山鸡、北京油鸡、泰和乌骨鸡)为研究对象,比较13项肌肉脂肪酸组成指标的相对含量在品种间的差异,并对13项脂肪酸组成指标进行因子分析和系统聚类分析.结果表明:泰和乌骨鸡和狼山鸡的饱和脂肪酸相对含量最高(分别为44.96 %和43.26 %),均与白耳鸡的饱和脂肪酸相对含量之间存在显著差异(P<0.05).白耳鸡的不饱和脂肪酸相对含量最高(63.99 %),与泰和乌骨鸡、狼山鸡的不饱和脂肪酸相对含量之间存在显著差异(P<0.05).白耳鸡的必需脂肪酸相对含量最高(6.76 %),且与狼山鸡(3.84 %)、泰和乌骨鸡(4.17 %)相对含量间存在显著差异(P<0.05),但与萧山鸡(5.98 %)、北京油鸡相对含量(6.72 %)之间差异不显著(P>0.05).主成分分析获得的前3个主成分可以解释全部变异的94.865 %,其中第1、2、3主成分分别解释总变异的58.632 %、22.479 %和13.754 %.基于主成分值的UPGMA聚类图和3-D聚类图,将5个地方鸡种聚为3大类,萧山鸡、狼山鸡和北京油鸡聚为一类,白耳鸡、泰和乌骨鸡分别形成独立分支.

【题目】6个地方鸡种羽毛性状遗传的研究
【中文关键词】地方鸡种;羽型;羽色;羽速;遗传规律
【英文关键词】无
【中文摘要】:以丝羽乌骨鸡(s)、仙居鸡(x)、固始鸡(G)、萧山鸡(XIS)、北京油鸡(Y)、狼山鸡(L)6个地方鸡种为试验素材,通过品种间的正反交试验、回交试验、横交试验,观测羽型性状、羽色性状、羽速性状在不同组合下产生的F。和F2代中的表现和分离比例,分析各性状遗传规律。结果表明:羽型性状受常染色体基因H/h控制,片状羽型对丝状羽型为显性,片状羽型在仙居鸡、固始鸡、萧山鸡、北京油鸡、狼山鸡群体中均为显性纯合,遗传符合孟德尔遗传规律,观测值与理论值相一致(P>0.05);狼山鸡的黑羽,北京油鸡的红羽和萧山鸡、仙居鸡、固始鸡的黄羽对丝羽乌骨鸡隐性白羽的遗传方式是完全显性遗传;各鸡种具有独特的羽速种质特性,丝羽乌骨鸡、仙居鸡为快羽型,固始鸡、北京油鸡、萧山鸡为慢羽型。狼山鸡为快慢羽混合型,伴性快慢羽基因(k/K)在6个地方鸡种中遗传稳定,符合伴性遗传规律,观测值与理论值相一致(P>O.05)。

【题目】ADSL和GARE-AIRS-GART基因多态位点及聚合基因型对白耳鸡胸肌肌苷酸含量的效应分析
【中文关键词】ADSL;GARS.AIRS—GART基因;自耳鸡;基因聚合;肌苷酸
【英文关键词】无
【中文摘要】肌苷酸(IMP)是影响肌肉鲜味的重要物质,已成为衡量肉质优良的重要指标。基因聚合(gene pyramiding)就是将分散在不同品种或同一品种中的优良性状基因通过杂交、回交、复合杂交等手段聚合到同一个品种或个体中。白耳鸡是我国优良的地方鸡种,具有成熟早、产蛋性能高等特性。本文以国家地方禽种资源基因库保存的白耳鸡为素材组建基础群,研究ADSL基因和GARS-GART AIRS基因多态位点及聚合基因型对胸肌肌苷酸含量的影响,以进一步提高白耳鸡肉品质
。

【题目】G-A-G基因编码区多态性对鸡肉IMP含量影响的研究
【中文关键词】鸡;GARS-AIRS-GART基因;肌苷酸;单核苷酸多态性
【英文关键词】chicken;GARS-AIRS-GARTgene;IMP;single nueleotide polymorphism
【中文摘要】以鸡GARS-AIRS-GART基因为侯选基因,隐性白羽鸡、丝羽乌骨鸡、萧山鸡、白耳鸡、藏鸡为实验材料,采用PCR-SSCP法对GARS-AIRS-GART基因所有外显子进行SNPs检测.结果在外显子3、4和21中各发现了一个单核苷酸多态性位点.方差分析结果表明:外显子3和外显子21的基因型与IMP含量之间不存在显著关联;外显子4中的6　545处的C→A突变位点对胸肌IMP含量的影响在不同鸡种之间的表现不完全一致.在隐性白羽鸡、萧山鸡和白耳鸡群体中,三种基因型个体之间的IMP含量差异均不显著.在丝羽乌骨鸡和藏鸡群体中,AA型个体的IMP含量显著高于AC型和CC型,推测该位点的基因型效应可能是其等位基因与丝羽乌骨鸡、藏鸡群体中的特殊遗传背景之间存在交互作用,或者是与影响肌肉IMP含量的QTL之间存在着暂时的连锁不平衡的缘故.
【英文摘要】This study W&S designedtOinvestigatethesingle nucleotidepolymorphism(SNP)of GARS-AIRS-GARTgene in variousbreeds,including RecessiveWhitechickens,Silkies chickens,Baier chickens,Tibetan chickens and Xiaoshan chickens.The primers for a11 the 21exonsin GARS-AIRS-GART gene were designed andthe SNPs were detectedby PCR-SSCP and DNA sequencing.Three SNPs were detected in the exon3,exon 4andexon21.The results from analysis of variation suggested that there wasnosignificant relationship betweenexon3 andexon21 SNP sites andIMPcontentin chickens,the effect of exon4 polymorphicsiteonIM.Pcontentof breast muscle werenotconsistent in different chicken breeds.No difference ofIMPcontentWas found among CC,AC and AA individuals inRW,XSand BE populations.In SC and TC.IMPcontentof individuals with AA genotype was significantly higher thanthat of individuals with AC and CCgenotype.Wearguedthatthegenotypeeffects of this locus may beaninteraction between its allele and the specificbackgroundsof Silkies and Tibetan chickens,oratemporary linkage disequilibrium between the lOCUS and the QTLwhich affects IMPcontentsof muscle in chickens.

【题目】不同鸡种对新城疫和禽流感的免疫性能差异分析
【中文关键词】新城疫;禽流感;抗体
【英文关键词】无
【中文摘要】随机抽取如皋、文昌和安卡鸡各80只,经新城疫和禽流感免疫后分别于30、41、56、71和89日龄检测抗体水平变化。结果表明,如皋鸡公母抗体水平无明显差异,而文昌鸡和安卡鸡在性别之间差异显著。文昌鸡新城疫抗体在所有检测日龄均低于如皋鸡和安卡鸡,而安卡鸡禽流感抗体在所有检测日龄均极显著低于如皋鸡和文昌鸡(P0.01)。本研究初步表明,就新城疫和禽流感而言,不同鸡种以及性别之间的免疫性能存在明显差异。

【题目】不同鸡种早期生长规律比较及其生长曲线拟合
【中文关键词】鸡;生长规律;kgistic模型;生长曲线
【英文关键词】chickens; developmental biology; domesticated birds; ontogenesis
【中文摘要】采用Logistic模型进行生长曲线拟合对0-12周龄如皋鸡、文昌鸡和安卡鸡的体重生长规律进行了研究.结果显示,不同性别间除初生重之外其余周龄体重均呈显著差异,但生长发育变化呈现一致趋势.不同品种间生长发育存在较大差异,除如皋鸡和文昌鸡之间6周龄相对生长率和12周龄日绝对生长量差异不显著,以及如皋鸡和安卡鸡10周龄相对生长率差异不显著外,其余周龄品种间的生长发育均呈显著差异.Logistic模型生长曲线对3个品种均能较好的拟合(R20.99),预测体重与实际体重较为接近.
【英文摘要】The study was conducted to determine the growth and growth curves of 0-12-week-old Rugao chicken (RG), Wenchang Chicken (WC), and Anka Chicken (AK). The nonlinear curves of Logistic model were used to fit the growth model. Results revealed that there were significant differences (P<0.05) in the body weight between male and female birds at 2-12-week-old, but the growth and development were the same. There were significant differences among the chicken breeds because the growth and development were significantly different among the breeds, but there was no significant difference in the relative growth rate of 6-week-old and absolute mass growth per day on 12-week-old RG and WC, and the relative growth rate of 10-week-old RG and AK. The growth of all three chicken breeds can be demonstrated by Logistic model (R 2>0.99). The predicted body weight was close to the true body weight.

【题目】鸡AIRC基因多态性及其对肌肉肌苷酸含量的遗传效应分析
【中文关键词】AIRC基因; 单核苷酸多态性; 肌苷酸含量; 合并基因型; 鸡
【英文关键词】AIRC gene; SNPs; inosine monophosphate content; combined genotype; chicken
【中文摘要】以鸡AIRC基因为侯选基因,以丝羽乌骨鸡、萧山鸡、白耳鸡、藏鸡、隐性白羽鸡为试验材料,采用PCR-SSCP方法对AIRC基因所有外显子及部分内含子区域进行SNPs检测,在外显子3和8中各发现1个单核苷酸多态位点。各种基因型与胸肌肌苷酸(IMP)含量的方差分析结果表明,外显子3中CC基因型个体的肌肉IMP含量显著高于TC和TT基因型个体,TC基因型个体也稍高于TT型,但差异不显著;外显子8中CG基因型个体的肌肉IMP含量显著高于GG和CC基因型个体,GG基因型个体的胸肌肌苷酸含量也显著高于CC型。外显子3和8的合并基因型对IMP含量也有显著的影响,合并基因型为CCCG的个体比TTCC合并基因型的个体高2.25mg.g-1,合并基因型的遗传效应大于最优秀的单个基因型效应。因此,可以利

用该合并基因型对鸡的肉质风味性状进行标记辅助选择。
【英文摘要】Single nucleotide polymorphisms(SNPs) of AIRC gene were investigated in various breeds(including Recessive White chickens,Silkies chickens,Baier chickens,Tibetan chickens and Xiaoshan chickens)by PCR-SSCP and DNA sequencing methods.Two SNPs were detected in exon 3 and 8.The least square analysis showed that birds with CC genotype had significant higher IMP content than those with TC and TT genotypes,birds with TC genotype also had a little higher IMP content than those with TT genotype,but the difference was not significant in exon 3;In exon 8,CG was the excellent genotype,individuals with CG genotype had significant higher IMP content than those with GG and CC genotypes,birds with GG genotype also had significant higher IMP content than those with CC genotype.The combined genotypes of exon 3 and 8 also had significant genetic effect on IMP content.The IMP content of the individuals with CCCG combined genotype was 2.25 mg · g-1 higher than the individuals with TTCC combined genotype.The genetic effect of the combined genotype was larger than that of excellent single genotype.Therefore,it was concluded that the combined genotypes could be used as the molecular genetic marker to select the chicken for meat quality traits.

【题目】鸡Apo VLDLII基因内含子多态性与肉质关联分析
【中文关键词】鸡; PCR-SSCP; Apo VLDLⅡ; 多态性; 肉质
【英文关键词】chicken; PCR-SSCP; Apo VLDLⅡ; polymorphism; meat quality
【中文摘要】根据鸡Apo VLDLⅡ基因3个内含子序列设计9对引物,采用PCR-SSCP技术对如皋黄鸡、安卡肉鸡2个品种进行多态性检测,探讨其与肉质的相关性。结果表明:Apo VLDLⅡ基因内含子1发生了3处突变,分别为2522处A/C、2705处A/C及2793处C/T。突变对应的基因型在这2个品种间的分布差异极显著(P<0.01);单个引物所对应的不同基因型间肉质性状差异不显著(P>0.05),不同合并基因型在嫩度、pH和肉色3个性状上差异显著(P<0.05)。
【英文摘要】The polymorphism of Apo VLDLⅡ gene was investigated with PCR-SSCP in two chicken breeds:Rugao yellow chicken and Anak red broilers.9 primers were designed according to the introns of Apo VLDL Ⅱgene and the mutations were detected by PCR-SSCP method.Three mutations were found among all the individuals,which were:2522(A/C),2705(A/C)and 2793(C/T)in intron Ⅰ.The statistic results showed that the genotypes of Anak red broiler was significantly different from Rugao yellow chicken(P<0.01);the least square analysis showed that there were remarkable differences of the meat quality(tenderness,pH and meat color)between combined genotypes(P<0.05),but not the genotypes of single primer(P>0.05).

【题目】鸡白细胞介素-1β基因内含子1、2多态与部分免疫性状的相关性分析
【中文关键词】白细胞介素-1β基因;单核苷酸多态性;免疫性状;鸡
【英文关键词】IL-1β gene;SNP;immune traits;chicken
【中文摘要】[目的]以白细胞介素-1β(Interleukin-1 β,IL-1 β)基因为候选基因,研究其单核苷酸多态性(single nucleotide polymorphisin,SSP),及其与部分免疫性状的关系.[方法]根据红色原鸡IL-1 β基因序列设计引物一对,利用PCR-SSCP方法检测了如皋鸡、文昌鸡以及安卡鸡IL-1 β基因内含子1,2的SNP,同时检测了56日龄的血清IL-1浓度、异嗜性粒细胞/淋巴细胞(heterophil/lymphocyte,H/L)值,绵羊红细胞(sheep red blood cell,SRBC)抗体滴度.新城疫(newcastle disease,ND)抗体滴度、禽流感(avian influenza,AI)抗体滴度5个免疫性状,并进一步分析了SNP位点与免疫性状的关系.[结果]共检测出6个SNP位点,分别为T107G突变、T130A突变,C143T突变、A208C突变、T241G突变及T274C突变.经关联分析,发现107、208、241及274位点存在显著的基因型效应(P<0.05或P<0.01),基因型组合对H/L值及ND抗体滴度两个性状上存在显著效应(P<0.05).[结论]241位点突变型个体3个免疫性状均优于野生型,有望在鸡的抗病育种中筛选为新的标记位点.利用基因型组合选择效果优于对单个位点的选择.
【英文摘要】[Objective]The SNPs of IL-1β gene and their correlations with some immune traits were tested. [Method]A pair of primers were designed as the sequence of IL-1 β of red jungle fowls,and the SNPs of intron 1 and 2 of IL-1β gene in Rugao Chicken(RG),Wenchang Chieken(WC),and Anka Chicken(AK) were detected using PCR-SSCP.Meanwhile,concentration of IL-1,H/L value,SRBC andbody filer,ND antibody tiler and AI antibody filer were detected at 56 days of age.Then,the correlation between SNP sites and immune traits were analyzed. [Results]Totally 6 SNP sites were detected at T107G,T130A,C143T,A208C,T241G and T274C.Furthermore,the mutation at 107,208,241 and 274 sites were found association with immune traits (P<0.05 or P<0.01),and some genotype combinations significantly affected H/L value and ND antibody tiler (P<0.05).[Conclusion]The mutation at 241 site may be selected as a new candidate mark in disease resistance breeding because of its better performance in three immune traits than that of wild type chickens.Selecting breeder chickens by genotype combinations had more effect than by single.genotype of SNPs.

【题目】鸡肌内脂肪性状的多基因聚合效应分析
【中文关键词】多基因聚合; 单核苷酸多态性; 鸡; 肌内脂肪

【英文关键词】polygene pyramiding; single nucleotide polymorphism(SNPs); chicken; intramuscular fat
【中文摘要】以如皋鸡为试验材料,采用PCR-SSCP技术对影响鸡肌内脂肪性状的3个候选基因(H-FABP,A-FABP和Δ9-FAD)进行单核苷酸多态性和基因聚合效应分析。结果发现,在3个基因中分别检测到A2980G,A1763G和C197T的SNP突变及3种基因型。肌内脂肪最小二乘差异显著性检验表明,H-FABP和Δ9-FAD基因中BB型与A-FABP基因中AB型为优势基因型,显著高于其他两种类型(P<0.05);但聚合基因型(两基因和三基因)并未表现出其相应的优势,无明显遗传规律可循,可见简单的优势基因型聚合并不是最佳的聚合方案,应建立在单个候选标记遗传效应明确且一致的基础上,尤其是针对复杂的肉质性状如肌内脂肪等。
【英文摘要】Single nucleotide polymorphisms (SNPs)and effect of polygene pyramiding of 3 candidate genes affecting Rugao chicken intramuscular fat trait,H-FABP,A-FABP and Δ9-FAD,were analyzed by PCR-SSCP technique. Three mutations of A1243G,A1763G and C197T and three kinds of genotypes were detected. As a result,BB genotype of H-FABP and Δ9-FAD gene and AB genotype of A-FABP gene were significantly higher than the other two types in intramuscular fat content by test of minimum least-squares analysis (P<0.05). But the pyramiding genotypes,whether belong to two genes or three genes,had not shown the corresponding advantages with the single gene,and obvious genetic rules to follow. It was concluded that pyramid simply each advanced genotype was not the best pyramiding plan. It should be based on the clear and consistent genetic effect of each single candidate marker,especially for complex traits such as intramuscular fat and other meat traits.

【题目】狼山鸡核型参数与生产性能的关系研究
【中文关键词】狼山鸡; 生产性能; 核型参数
【英文关键词】Langshan chickens; production performance; karyotypic parameter
【中文摘要】对狼山鸡核型参数与生产性能的关系进行研究,结果表明,狼山鸡No.1染色体相对长度水平与屠宰性状、产蛋性状存在较大的关联,当No.1染色体相对长度水平为4(22.00%<RL≤23.00%)时,屠体重、半净膛重、全净膛重、腿肌重和胸肌重往往表现较低;当No.1染色体相对长度水平为3(21.00%<RL≤22.00%)时,总产蛋量、开产蛋重往往表现较低,说明家鸡的No.1染色体的相对长度可用于辅助育种。
【英文摘要】The relation between karyotypic parameter with productive performances of Langshan chickens was analyzed in this study. The results showed that the dressed weight,semi-eviscerated weight,eviscerated weight,breast muscle weight and leg muscle weight of Langshan chickens were lower at level 4 of relative length for chromosome 1 (22.00%<RL≤23.00%)than other levels. Besides,egg production and egg weight of first laying were lower at level 3 of relative length for chromosome 1 (21.00%<RL≤22.00%)than other levels. The results implied that the karyotypic parameter could be used as an important criteria for assisted breeding.

【题目】三鸡种白细胞介素-1β基因多态与血清中白细胞介素-1含量相关性分析
【中文关键词】白细胞介素-1; 白细胞介素-1β基因; 单核苷酸多态性; 鸡
【英文关键词】interleukin-1; IL-1β gene; SNP; chicken
【中文摘要】本研究旨在通过检测鸡白细胞介素-1β(interleukin-1β,IL-1β)基因部分区域单核苷酸多态位点,以期查找与血清中IL-1含量相关的遗传标记。根据红色原鸡IL-1β基因序列设计2对引物,利用PCR及单链构象多态性(Single-Strand Conformation Polymorphism,SSCP)方法对如皋鸡、文昌鸡和安卡鸡进行单核苷酸多态性(Singlenucleotide polymorphism,SNP)分析,并利用试剂盒ELISA法对56日龄血清IL-1含量进行检测。结果表明血清中IL-1含量安卡鸡极显著高于如皋鸡(P0.01)和文昌鸡(P0.001)。IL-1β基因476位点发生G→A突变、482位点发生T→C突变、1 215位点发生C→T突变、1 507位点发生T→C突变。对多态位点和IL-1含量作关联分析,只发现1 215位点与IL-1含量有关,TT基因型个体IL-1含量显著高于CC型个体。本研究初步表明IL-1β基因1 215多态位点可以作为抗病育种中的候选遗传标记。
【英文摘要】The aim of the present study was to detect single nucleotide polymorphism(SNP) in some areas of IL-1β gene of chicken to find genetic marker influencing on IL-1 content in serum.Two pairs of primers were designed according to the sequence of IL-1β gene of red jungle fowls,and the SNP of Rugao chicken(RG),Wenchang chicken(WC),and Anka chicken(AK) were analysed by PCR-SSCP,meanwhile,the IL-1 content in serum were detected at 56 days with reagent kit by ELISA.The results showed that the IL-1 content in serum of AK was significantly higher than that of RG(P<0.01) and WC(P<0.001).The mutation were found at four sites in all three breeds,and they were mutation G→A at 476 site,mutation T→C at 482 site,mutation C→T at 1 215 site and mutation T→C at 1 507 site.Then,the correlation between polymorphic sites and content of IL-1 were analysed,and only 1 215 site had relationship with IL-1 content in serum,which showed that chicken with TT genotype had significantly higher IL-1 content in serum than those with CC genotype.This study indicated that the 1 215 polymorphic site could be a genetic marker for IL-1content in serum.

【题目】文昌鸡肌肉脂肪酸组分的气相色谱-质谱联合分析
【中文关键词】文昌鸡; 脂肪酸; 气相色谱—质谱
【英文关键词】Wenchang chicken; fatty acids; GC-MS
【中文摘要】应用气相色谱—质谱联合技术对文昌鸡肌肉脂肪酸组分进行分析,并以面积归一法,计算各脂肪酸的相对百分比含量。结果表明,文昌鸡肌肉中共分离和鉴定出16种脂肪酸,其中饱和脂肪酸7种,包括n-十二烷酸、n-十四烷酸、十五烷酸、n-十六烷酸、十七烷酸、n-十八烷酸和二十烷酸,其含量分别为0.75%、1.23%、0.43%、23.86%、2.04%、11.18%、0.13%,占总脂肪酸的39.63%;不饱和脂肪酸9种,包括11-十四碳烯酸、9-十六碳烯酸、9-十八碳烯酸、9,12-十八碳二烯酸、6,9,12-十八碳三烯酸、11-二十碳烯酸、10,13-二十碳二烯酸、7,10,13-二十碳三烯酸及5,8,11,14-二十碳四烯酸,其含量分别为0.15%、1.79%、25.84%、21.99%、0.48%、0.32%、0.45%、0.61%、8.75%,占总脂肪酸含量的60.37%。多不饱和脂肪酸占

总脂肪酸含量的32.29%,而必需脂肪酸占总脂肪酸含量的31.23%。这一结果为家禽肌肉中脂肪酸成分分析及营养价值的评定提供了基础依据。

【英文摘要】The components of fatty acids in Wenchang chicken were analyzed by gas chromatogrphy-mass spectrometry technology(GC-MS),and the relative content of each fatty acid were calculated.16 kinds of fatty acids were seperated from Wenchang chicken.Among them,7 kinds of fatty acids,including lauric anid,myristic acid,pentadecanoic acid,palmitic acid,margaric,stearic acid and eicosanoic,were saturated fatty acids.The content of those 7 fatty acids were 0.75%,1.23%,0.43%,23.86%,2.04%,11.18%,0.13%,accounts for 39.63% of the total fatty acid.9 kinds of fatty acids,including 11-teteadecenoic acid,9-hexadecenoic acid,9-vaccenic acid,9,12-octadecadienoic acid,6,9,12-octadecatrienoic acid,11-eicosenoic acid,10,13-eicosenoic,7,10,13-eicosatriennoic and 5,8,11,14-arachidonic acid,were unsaturated fatty acids.The contens of 9 kinds of fatty acids were 0.15%,1.79%,25.84%,21.99%,0.48%,0.32%,0.45%,0.61%,8.75%,accounts for 60.37% of the total fatty acid.The polyunsaturates fatty acids accounted for 32.29% of the total fatty acids and the essential fatty acids accounted for 31.23%.The results provided the basis for analysis on fatty acid acid component and evaluation on the nutritive value.

【题目】植物气孔气态失水与SPAC系统液态供水的相互调节作用研究进展

【中文关键词】植物气孔; 水力信号; 等水行为; 午休现象; 木质部气穴; 气穴逆转

【英文关键词】plant stomata; hydraulic signal; isohydric behavior; midday depression; xylem cavitation; cavitation reversal

【中文摘要】讨论了植物气孔气态失水与SPAC系统液态供水相互作用研究领域的一些重要现象和行为.当植物水力信号和化学信号共同作用促进气孔对叶水势的调节时,植物对叶水势的调节表现为等水行为.气孔对环境湿度变化响应的反馈机制可用来解释土壤干旱条件下气孔和光合的午休现象,以及气孔导度和水流导度之间的相关关系;而气孔对环境湿度变

化响应的前馈机制,则可用来解释气孔导度对大气-叶片间水汽饱和差的滞后反应.植物最大限度地利用木质部传输水分的策略,要求气孔快速响应以避免木质部过度气穴化和短时间内将气穴逆转的相应机制.

【英文摘要】Some important phenomena and behaviors concerned with the coordination effect between vapor water loss through plant stomata and liquid water supply in SPAC were discussed in this paper.A large amount of research results showed that plants show isohydric behavior when the plant hydraulic and chemical signals cooperate to promote the stomatal regulation of leaf water potential.The feedback response of stomata to the change of environmental humidity could be used to explain the midday depression of stomatal conductance and photosynthesis under drought condition,and also,to interpret the correlation between stomatal conductance and hydraulic conductance.The feedforward response of stomata to the change of environmental humidity could be used to explain the hysteresis response of stomatal conductance to leaf-atmosphere vapor pressure deficit.The strategy for getting the most of xylem transport requires the rapid stomatal responses to avoid excess cavitation and the corresponding mechanisms for reversal of cavitation in short time.

【题目】猪T细胞受体γ链基因的克隆及生物信息学分析

【中文关键词】猪T 细胞受体γ 链;基因克隆;生物信息学;结构预测

【英文关键词】porcine T cell receptor gamma chain; gene cloning; bioinformatics; structure prediction

【中文摘要】目的:克隆猪T 细胞受体γ 链(pTCR-γ)基因,用以研究猪T 细胞受体分子结构与功能。方法与结果:以GenBank 上登载的pTCR-γ 基因为参考序列,用RT-PCR 法从猪外周血淋巴细胞中克隆pTCR-γ 基因。序列分析表明,pTCR-γ 基因开放读框为1026 bp,编码341 个氨基酸残基,含有由23 个氨基酸残基构成的信号肽序列;与参考序列相比,在核苷酸和推导氨基酸序列上的同源性分别为95.6%和88.8%;系统进化分析发现,该基因与绵羊、恒河猴、人、马、牛的同源性相对较高,与褐鼠、家犬、家鼠、家猫的同源性次之,而与禽类、鱼类的同源性最低;生物信息学结构预测表明猪T 细胞受体γ 链含2 个结构域,其中1 个为IG_LIKE1 结构域(IGv 结构域),由第14~114 位共101个氨基酸残基组成;另一个为IG_LIKE2 结构域(IGc 结构域),由第143~238 位共96 个氨基酸残基组成。结论:克隆并应用生物信息学技术分析了猪T 细胞受体γ 链基因序列及编码蛋白的结构特征,为进一步研究γ 链的结构与功能奠定了基础。

【英文摘要】Objective: To clone porcine T cell receptor gamma chain(pTCR-γ) gene for the study on molecular structure and function of porcine T cell receptor. Methods & Results: Based on the gene sequence of pTCR-γ from the GenBank database, pTCR-γ gene was cloned by reverse transcription-polymerase chain reaction from porcine peripheral-blood lymphocyte. Sequence analysis showed that pTCR-γ gene was 1026 bp in length and encoded 342 amino acids, including a signal peptide of 23 amino acids. Comparing with the reference sequence,pTCR-γ gene shared 95.6% homology with the published sequence of nucleotide and 88.8% homology of amino acids. The homology was high comparatively with Ovis aries, Macaca mulatta, Homo sapiens, Equus caballus and Bos taurus, second with Rattus norvegicus, Mus musculus, Canis lupus familiais and Felis catus, the lowest with Gallus and Paralichthys. Two domains had been found by the structure prediction of bioinformatics, one was IGv domain that contains 101 amino acids with position of 14~114, another was IGc domain that contains 96 amino acids with position of 143~238. Conclusion: The porcine T cell receptor gamma chain gene was cloned, and its gene sequences and structural feature of encoding protein were analyzed by bioinformatics. This study laid a foundation for further research of structure and function of porcine T cell receptor gamma chain.

【英文关键词】porcine T cell receptor beta chain gene ;gene cloning ;bioinformatics ; st ruct ure prediction
【中文摘要】以GenBank 上登载的猪的T 细胞受体β(p TCR2β) 基因为参考序列,用RT2PCR 法从猪的外周血淋巴细胞中克隆了TCR2β链基因,并进行生物信息学分析. 结果表明: p TCR2β基因含有一个完整的开放阅读框架(ORF) ,大小为849 bp ,编码283 个氨基酸,且含有一段27 个氨基酸的信号肽序列,与参考序列相比,在核苷酸序列上的同源性为80. 4 % ,在氨基酸序列上的同源性为70. 3 %;生物信息学结构预测发现2 个结构域,一个为IG结构域,由第32 - 138 位共107 个氨基酸残基组成;另一个为IG_L IKE 结构域,由第164 - 211 位共48 个氨基酸残基组成.
【英文摘要】Based on t he gene of porcine T cell receptor beta chain (AB079529) f rom the GenBank data2base , T cell receptor beta chain gene was cloned by rever se t ranscription2polymerase chain reaction (RT-PCR) from porcine perip heral2blood lymp hocyte (PBL) . Sequence analysis showed t hat p TCR2β gene was 849 bp in length and encoded 283 amino acids ,including a signal peptide of 27 amino acids ,comparing with the reference sequence p TCR2β gene shared 80. 4 % homology with the p ublished sequence of nucleotide and shared 70. 3 % homology of amino acids ; two domain had been found by the st ruct ure prediction of bioinformatics ,one was IG domain t hat contained 107 amino acids wit h position of 32 - 138 ,another was IG_like domain that contained 48 amino acids with position of 164 - 211. The p TCR2β gene was cloned successfully ,which provided a foundation for the study of structure and function of beta chain.

【题目】猪白介素-4重组表达质粒在小鼠体内的组织分布及环境释放安全性

【中文关键词】猪白介素24 ;小鼠;重组表达质粒;生物安全性;组织分布;基因组整合;转移和扩散

【英文关键词】swine IL24 ;mouse ; recombinant expression plasmid ; biosafety ; tissue dist ribution ; genomic integra2 tion ;t ransfer and spreading

【中文摘要】为了探讨pcDNA3.1/IL24 重组表达质粒作为疫苗佐剂进入临床应用的生物安全性,本试验就pcDNA3.1/IL24 重组表达质粒在小鼠体内的组织分布和环境释放安全性进行了研究。将pcDNA3.1/IL24 重组表达质粒经肌肉途径免疫BALB/c小鼠,免疫后不同时间剖杀动物并摘取各种组织,抽提基因组DNA。利用PCR 技术分析其在组织内的分布及与细胞基因组发生整合的可能性,同时检测了免疫动物现场环境,以监测pcDNA3.1/IL24 重组表达质粒上的猪IL24 基因、CMV 启动子基因和抗性基因是否在环境细菌中发生转移和扩散。结果表明,免疫后1 d在3/ 3 小鼠各组织中仅注射部位肌肉存在重组表达质粒,免疫后5 d 仅有1/ 3 小鼠于注射部位肌肉中存在重组表达质粒,免疫后15 d 所有小鼠的各组织中无重组表达质粒存在;未发现pcDNA3.1/IL24 重组表达质粒整合到宿主细胞基因组和转化到环境其他细菌中。因此,认为pcDNA3.1/IL24 重组表达质粒对动物和环境是安全的。

【英文摘要】In order to evaluate the biosafety of recombinant pcDNA3. 1/ IL24 plasmid before it will be used as aimmunological adjuvant ,We investigated it s tissue dist ribution and biosafety in mice. Recombinant pcDNA3. 1/ IL24 plasmid was inoculated through int ramuscular injection , then the animals were slaughtered at the different time points for extracting the gDNA. The tissue dist ribution and integration of recombinant pcDNA3. 1/ IL24 plasmid in mice was analyzed by PCR. The environmental fecal and soil samples in the experimental site were also tested for the presence of plasmid DNA in native bacteria. The result s showed that plasmid DNA was only detected in muscle of all mice at 1 d af ter injection. The f ragment of plasmid was amplified f rom the muscle of one2third mice by PCR at 5 d.The plasmid existed in tissue for no more than 15 days af ter injection and no integration was detected. The results also demonst rated that the recombinant pcDNA3. 1/ IL24 plasmid was not detected in environmental bacteria. Therefore ,we concluded that the recombinant pcDNA3. 1/ IL24 plasmid is safe to both mice and the surrounding environment .

【题目】牦牛外周血单个核细胞cDNA文库的构建及部分差异表达分子的克隆分析

【中文关键词】关键词:外周血单个核细胞(PBMC);诱导刺激;抑制消减杂交,cDNA 文库

【英文关键词】PBMC; stimulation; suppression subtractive hybridization(SSH); cDNA libraries

【中文摘要】为筛选牦牛外周血单核细胞(PBMC)差异性基因,以刀豆素A (ConA)和脂多糖(LPS)联合刺激的PBMC cDNA为实验组,未经诱导刺激的PBMC cDNA 为驱动组,利用抑制性消减杂交技术(SSH)构建了丝裂原诱导刺激PBMC 的消减文

库并对其部分阳性克隆进行了EST 序列分析。从消减文库中随机挑取16 个阳性克隆,进行PCR 鉴定,显示克隆的重组率大于93 %,插入片段大小大部分集中在200 bp~1 000 bp 之间。随机挑取100个克隆进行测序及同源性分析,初步获得27 条差异表达基因片段,其中24 个为已知基因,3 个为新ESTs 序列;随机选择非重复的6 个差异表达的序列设计引物,以半定量PCR 方法验证其消减效率。结果显示,均从构建的消减文库中扩增到目的片段,其中5 个为诱导性差异表达分子,1 个为诱导特异性表达分子,说明该文库有较高的质量。本研究应用抑制消减杂交技术构建了牦牛PBMC 的差异表达cDNA 文库,并高通量克隆鉴定了相关功能基因片段,表明该技术手段有助于快速发现牦牛新功能基因。

【英文摘要】SA subtractive cDNA library was constructed by suppression subtractive hybridization (SSH) using cDNA from Yak peripheral blood mononuclear cells (PBMC) treated with lipopolysaccharide (LPS) and concanavalinA (ConA). The library contained 93% recombinants with insert size ranged from 200 bp to 1000 bp. One hundred positive clones were randomly sequenced and analyzed, and 24 differentially expressed genes and 3 novel ESTs were identified. The subtraction efficiency of the SSH cDNA library was confirmed by randomly testing 6 non-repeat sequences by semi-quantitative RT-PCR, of which 5 differential expression molecules were detected. These results suggest that SSH is an effective technique to study gene differentialexpression gene.

【题目】Interactions Between Markers Can Be Caused by the Dominance Effect of Quantitative Trait Loci

【中文关键词】F2 populations, dominance, interactions, inclusive linear model

【英文关键词】F2 populations, dominance, interactions, inclusive linear model

【中文摘要】F2 populations are commonly used in genetic studies of animals and plants. For simplicity, most quantitative trait locus or loci (QTL) mapping methods have been developed on the basis of populations having two distinct genotypes at each polymorphic marker or gene locus. In this study, we demonstrate that dominance can cause the interactions between markers and propose an inclusive linear model that includes marker variables and marker interactions so as to completely control both additive and dominance effects of QTL. The proposed linear model is the theoretical basis for inclusive compositeinterval QTL mapping (ICIM) for F2 populations, which consists of two steps: first, the best regression model is selected by stepwise regression, which approximately identifies markers and marker interactionsexplaining both additive and dominance variations; second, the interval mapping approach is applied to the phenotypic values adjusted by the regression model selected in the first step. Due to the limited mapping population size, the large number of variables, and multicollinearity between variables, coefficients in the inclusive linear model cannot be accurately determined in the first step. Interval mapping is necessary in the second step to fine tune the QTL to their true positions. The efficiency of including marker interactions in mapping additive and dominance QTL was demonstrated by extensive simulations using three QTL distribution models with two population sizes and an actual rice F2 population.

【题目】我国主要畜禽粪便养分含量及变化分析
【中文关键词】畜禽粪便;养分含量;分析
【英文关键词】animal manure; nutrient content; annlysis
【中文摘要】取样并分析了我国 20 个省(市)主要畜禽粪便的养分含量。结果表明,畜禽粪便中养分含量变异很大,鸡粪和猪粪的氮(N)、磷(P2O5)、锌(Zn)、铜(Cu)含量明显高于牛粪和羊粪,而钾素(K2O)含量相当。鸡粪中 N、P2O5、K2O、Zn、Cu 平均含量分别为 2.08%、3.53%、2.38%、306.6 mg · kg-1和 78.2 mg · kg-1;猪粪中分别为 2.28%、3.97%、2.09%、663.3 mg · kg-1和 488.1 mg · kg-1;牛粪中分别为1.56%、1.49%、1.96%、138.6 mg · kg-1和 48.5 mg · kg-1;羊粪中分别为 1.31%、1.03%、2.40%、88.9 mg · kg-1、23.5 mg · kg-1。按照德国腐熟堆肥的标准,鸡粪中 Zn、Cu 的超标率分别为 27.1%和 15.3%;猪粪中 Zn、Cu 的超标率分别为 62.5%和 70.0%;牛粪中 Zn、Cu 的超标率分别为 3.8%和 9.6%;羊粪中 Zn、Cu 不超标。与上世纪 90 年代相比,鸡粪、猪粪、牛粪中 P2O5的平均含量分别增加 65.7%、93.7%和 52.0%;鸡粪、猪粪、牛粪、羊粪 K2O 的平均含量分别增加 138.7%、54.8%、71.9%、50.9%;鸡粪和猪粪中 Zn 的平均含量分别增加92.1%和 383.5%,猪粪含 Cu 量增加近 12 倍。畜禽粪便的电导率(EC)值主要集中在 50~150 mS · cm-1,pH 主要集中在 7.0~8.0。这一研究为畜禽粪便的安全合理施用提供了参考。

【英文摘要】Nutrient contents in animal manure from 20 provinces in China were analyzed and discussed. Results indicated that the contents of N, P, Zn, Cu were obvious higher in chicken and pig manures than in cattle and sheep manures, but K contents were similar. The average content of N, P2O5, K2O, Zn and Cu was 2.08%, 3.53%, 2.38%, 306.6 mg · kg-1 and 78.2 mg · kg-1 in chicken manure, 2.28%, 3.97%, 2.09%, 663.3 mg · kg-1 and 488.1 mg · kg-1 in pig manure, 1.56%, 1.49%, 1.96%, 138.6 mg · kg-1 and 48.5 mg · kg-1 in cattle manure, 1.31%, 1.03%,2.40%, 88.9 mg · kg-1and 23.5 mg · kg-1 in sheep manure, respectively. For Zn and Cu about 27.1% and 15.3% of chicken manure samples, 62.5% and 70.0% of pig manure samples, 3.8% and 9.6% of cattle manure samples exceed the limits of mature compost in Germany. Compared with the results investigated in 1990s, the average P2O5 content in chicken manure, pig manure and cattle manure increased by 65.7%,93.7% and 52.0%, respectively. The average K2O content in chicken, pig, cattle and sheep manure increased by 138.7%, 54.8%, 71.9% ,50.9%, respectively. Zn content in chicken and pig manure increased by 92.1% and 383.5%, respectively, and Cu content in pig manure was12 times higher. Electrical conductivity (EC) of most samples is in the range of 50 to 150 mS · cm-1 and pH is in the range of 7.0 to 8.0 in most samples.

【题目】猪Toll样受体9基因的克隆、序列分析及其结构预测
【中文关键词】猪Toll 样受体9 基因;基因克隆;序列分析;生物信息学
【英文关键词】Porcine Toll2like receptor 9 gene (p TLR9) ;gene cloning ; sequence analysis ;bioinformatics
【中文摘要】本研究应用反转录2聚合酶链式反应(RT2PCR) 扩增技术,从猪脾脏淋巴细胞中,克隆了猪Toll 样受体9 基因(p TLR9) 。基因序列分析表明,克隆的p TLR9 基因ORF 为3 093 bp ,编码1 030 个氨基酸,含1815 %的亮氨酸,含有24 个氨基酸的信号肽序列,属于 I 型跨膜受体,具有富含亮氨酸的重复序列(LRR) 和Toll/ IL21R 同源区结构域;与GenBank 上登载的p TLR9 参考序列(A Y859728) 的同源性为9913 % ,与牛、马、羊和人的同源性较高,与家鼠、褐鼠的次之,TLR9 的演化关系与亲缘关系密切。
【英文摘要】In this study ,porcine Toll2like receptor 9 (p TLR9) gene was cloned by reverse transcriptionpolymerase chain reaction (RT2PCR) from porcine mesenteric lymph nodes (MLNs) . The sequence analysis shows that the totalp TLR9gene is 3 093 bp in length ,encoding 1 030 anino acids with a signal peptide composed of 24 amino acids and 18.5 % leucines. The structure prediction demonst rates that the p TLR9 is a typical type I t ransmembrane proteincomposed of ext racellular region ,t ransmembrane region and int racellular region. The pTLR9 contains multiple tandem copies of LRR motif in the ext racellular domain ,and the intracellular region contains a very conserved st ructure named the Toll/ IL21R receptor homologus (TIR) domain. The homology of nucleotide sequence of porcine TLR9 withthe published sequence A Y859728) is up to 99. 3 %. The homology of nucleotide sequence of p TLR9 with those of cattle ,equine ,sheep and human is much higher than that of mice.

【题目】猪CD8β基因的克隆、表达及其结构与功能分析

【中文关键词】猪CD8β 基因; 克隆; 表达; 结构预测

【英文关键词】porcine CD8β; gene cloning; expression; structure analysis

【中文摘要】本研究应用RT-PCR 技术, 从猪胸腺细胞总RNA 中扩增、克隆了猪CD8β 基因, 序列分析表明CD8β 含621 bp 的开放阅读框, 编码207 个氨基酸, 与NCBI/GeneBank 已发表的参考基因的核苷酸及推导氨基酸序列的同源性分别为97.8 %和96.8 %, 与人、小鼠和鸡CD8β 蛋白的氨基酸同源性分别为75.7 %、67.9 %和33.3 %。根据大肠杆菌密码子偏嗜性改造目的基因, 构建了pET28a/PCD8β 原核表达系统, 并经诱导获得高效表达的分子量为24 ku 的重组蛋白(rPCD8β), 表达量占菌体蛋白总量的30 %。利用生物信息学和分子生物学软件对猪CD8β 基因编码的蛋白进行结构预测, 表明猪CD8β 成熟蛋白为跨膜蛋白, 其中172aa 在胞外区, 22aa 在跨膜区, 10aa 在胞内区; 蛋白骨架内含有较多的柔性区域, 而且分布不均匀, 能形成结构松散的球状蛋白; 猪CD8β 分子V 区三维结构与鼠的具有非常相似的空间结构, 与人的差别较大, 这为猪CD8β 蛋白结构与功能的进一步研究奠定了基础。

【英文摘要】A CD8β gene was amplified by RT-PCR from total RNA of porcine thoracic gland lymphocytes and sequenced.The gene contained a 621 bp open reading frame encoding a 207 amino acids and shared 97.8 % sequence identities at the nucleotide level and 96.8 % at amino acid level with published sequences, The homology at the amino acid level with human,mouse, rat, and chicken was 75.7 %, 67.9 %, 67.8 % and 33.3 %, respectively. The CD8β gene was inserted into expression vector pET28 and expressed in E.coli. SDS-PAGE analysis showed that the expressed protein had a molecular weight of 24.0 ku and accounted for 30.0 % of total mass of bacterial proteins. In addition, structural prediction indicated the porcine CD8β might be a typical transmembrane protein comprising an extracellular region, a transmembrane region and an intracellular region,respectively. It contained many flexible regions and maldistributed, forming a globule protein. The three-dimensional structure of V region of the protein was similar to that of mouse but different from the human.

【题目】猪IFN-γ和IL-4重组质粒对口蹄疫疫苗的免疫佐剂效应研究

【中文关键词】重组质粒;佐剂效应; CD4 + / CD8 + T 细胞;口蹄疫

【英文关键词】recombinant plasmid ; adjuvant effect ; CD4 + / CD8 + ; foot2and2mout h disease
【中文摘要】为了研究猪IFN2γ和IL24 对疫苗的免疫佐剂效应,用pcDNA311/ IFN2γ和pcDNA311/ IL24 的重组质粒与口蹄疫双价疫苗配伍免疫小鼠, 检测小鼠抗口蹄疫抗体水平和CD4+/CD8+T 细胞比值的动态变化, 观察其免疫佐剂效应。结果表明pcDNA311/ IFN2γ和pcDNA311/ IL24 重组质粒都能显著提高小鼠抗口蹄疫抗体水平(P <0101) ,其中pcDNA311/ IFN2γ提高亚洲Ⅰ型FMD 抗体水平的佐剂效应较pcDNA311/ IL24 的显著(P< 0101) ,而pcDNA311/ IL24 提高O 型FMD 抗体水平的佐剂效应显著高于pcDNA311/ IFN2γ(P < 0101) ,pcDNA311 也显示出了一定的佐剂效应;免疫后不同时间pcDNA311/ IFN2γ和pcDNA311/ IL24 组CD4 + / CD8 + T 细胞比值显著高于其他组(P < 0101) ,且第21 天与第7 、45 天的差异极显著(P < 0101) 。
【英文摘要】In order to certify t he immunological adjuvant effect of recombinant pcDNA311/ IFN2γ and pcDNA311/ IL24 plasmid , we investigated t he changes of antibody level s and the CD4 + /CD8 + relative value induced by a vaccine against foot2and2mont h disease and t he mentioned adjuvant s. The result s showed that t he recombinant plasmids significantly increased t he level of antibody against foot2and2mouth disease (P < 0101) , and t he adjuvant effect of pcDNA311/ IFN2γ was much higher t han that of pcDNA311/ IL24 concerning the antibody level of Serotype Asia Ⅰ(P < 0101) ,whereas the adjuvant effect of pcDNA311/ IL24 was more obvious t han t hat of pcDNA311/ IFN2γ concerning t he antibody level of Serotype O(P < 0101) . Relative values of CD4 + /CD8 + in group s pcDNA311/ IFN2γ and pcDNA31 1/ IL24 were statistically significantly higher than that of the other group s (P < 0101) , and that on 21 d post immunization was statistically significantly higher than both on 7 and 45 d (P < 0101) .

【题目】猪IFN-α1基因的原核表达及其蛋白质结构的预测
【中文关键词】猪IFN2α1 基因;克隆;原核表达;结构预测
【英文关键词】porcine interferon2α1 gene ;cloning ;p rokaryotic expression ; st ructure prediction
【中文摘要】利用RT2PCR 技术,从被诱导的猪外周血单核细胞中克隆出了猪α1 干扰素(IFN2α1) 基因。序列分析表明,克隆的猪IFN2α1 基因序列与GenBank 上登录的猪IFN2α1 基因的同源性为97. 8 %。用克隆的猪IFN2α1 基因构建了重组表达质粒p GEX24 T212IFN2α1 。探讨了猪IFN2α1 基因表达的最佳条件,并在大肠杆菌中对此基因进行了表达。结果表明, IPTG的最佳诱导浓度为0. 5 mmol/ L ,最适诱导温度为42 ℃,诱导9h 表达量最大,表达产物约占菌体总蛋白的30 %。SDS2PA GE 分析表明,表达产物的分子质量为45 ku ,且目的蛋白主要以包涵体的形式存在。经预测,猪IFN2α1 蛋白为一结构松散的球状蛋白。
【英文摘要】Using RT2PCR ,porcine IFN2α1 gene was cloned f rom porcine PBMC stimulated by L PS and PHA. Af ter sequencing , compared with Po IFN2α1 gene p ublished in GenBank , t he cloned gene shared 97.8% homology. Then ,the recombinant expression plasmid (p GEX-4 T-1-IFN-α1) was const ructed and expressed with induction of IPTG. The result s showed t hat t he optimal temperat ure ,concent ration of IPTG,and induction time for the recombinant expression plasmid were 42 ℃,0.5 mmol/L and 9 h ,respectively.SDS-PAGE analyses showed that the fusion protein with a molecular mass of 45 ku existed in inclusion bodies and the expressed protein made up above 30 % of t he total proteins. It was predicted that porcine IFN2α1 was a loose globular protein.

【题目】猪TOLL 样受体2 基因在CHO - K1 细胞中的表达
【中文关键词】猪Toll 样受体2 ; CHO - K1 细胞;转染
【英文关键词】porcine Toll2like receptor 2 ;CHO - K1 cell s ;t ransfection
【中文摘要】将含猪TLR2 (猪Toll 样受体2 ,p TLR2) 基因的真核表达载体PcDNA3. 1/ CT - GFP - p TLR2 ,采用脂质体法转染到CHO - K1 细胞,用G418 持续筛选获得了阳性细胞克隆. 阳性细胞克隆系经PCR 和RT - PCR 检测表明: p TL R2 基因得到稳定整合并能成功地转录. 荧光显微镜观察,转染细胞可见绿色荧光,表明获得了表达p TL R2 的克隆细胞系.
【英文摘要】The recombinant plasmid PcDNA3. 1/ CT - GFP - p TL R2 was t ransfected into the CHO -K1 cell s by lipofectin and the positive cell clone was obtained af ter screening by G418 for 2~3 weeks. Analysis of the exogenous gene by PCR and RT - PCR indicated t hat t he p TL R2 gene was integrated into the CHO - K1 cells. The expression of pTLR2 - GFP fusion protein was observed by intensity fluorescence microscope at different time after transfection. The results indicated t hat p TLR2 - GFP f usion protein was successf ully expressed in the cells and these cells could be further used to investigate t he f unctions of pTLR2.

【题目】Simultaneous selection of major and minor genes: use of QTL to increase selection efficiency of coleoptile length of wheat (Triticum aestivum L.).
【中文关键词】quantitative trait loci, simultaneous selection, marker-assisted selection, phenotypic selection
【英文关键词】quantitative trait loci, simultaneous selection, marker-assisted selection, phenotypic selection
【中文摘要】Plant breeders simultaneously select for qualitative traits controlled by one or a small number of major genes, as well as for polygenic traits controlled by multiple genes that may be detected as quantitative trait loci (QTL). In this study, we applied computer simulation toinvestigate simultaneous selection for alleles at both major and minor gene (as QTL) loci in breeding populations of two wheat parental lines, HM14BS and Sunstate. Loci targeted for selection included six major genes affecting plant height, disease resistance, and grain quality, plus 6 known and 11 ‘ ‘ unidentified ’ ’ QTL affecting coleoptile length (CL). Parental line HM14BS contributed the target alleles at two of the major gene loci, while parental line Sunstate contributed target alleles at four loci. The parents have similar plant height, but HM14BS has a longer coleoptile, a desirable attribute for deep sowing inrainfed environments. Including the wild-type allele at the major reduced-height locus Rht-D1, HM14BS was assumed to have 13 QTL for increased CL, and Sunstate four; these assumptions being derived from mapping studies and empirical data from an actual HM14BS/Sunstatepopulation. Simulation indicated that compared to backcross populations, a single biparental F1 cross produced the highest frequency of target genotypes (six desired alleles at major genes plus desired QTL alleles for long CL). From 1,000 simulation runs, an average of 2.4individuals with the target genotype were present in unselected F1-derived doubled haploid (DH) or recombinant inbred line (RIL) populations of size 200. A selection scheme for the six major genes increased the number of target individuals to 19.1, and additional marker-assistedselection (MAS) for CL increased the number to 23.0. Phenotypic selection (PS) of CL outperformed MAS in this study due to the high heritability of CL, incompletely linked markers for known QTL, and the existence of unidentified QTL. However, a selection scheme combining MAS and PS was equally as efficient as PS and would result in net savings in production and time to delivery of long coleoptile wheats containing the six favorable alleles.

【题目】Investigating the efficiency of the single backcrossing breeding strategy through computer simulation

【中文关键词】single backcrossing, breeding strategy, computer simulation, single backcrossing breeding strategy(SBBS)

【英文关键词】single backcrossing, breeding strategy, computer simulation, single backcrossing breeding strategy(SBBS)

【中文摘要】A strategy combining single backcrossing with selected bulk breeding has been successfully used in wheat improvement at CIMMYT to introgress rust resistant genes from donor parents to elite adapted cultivars. In this research, the efficiency of this breeding strategy was compared to other crossing and selection strategies through computer simulation. Results indicated this breeding strategy has advantages in retaining or improving the adaptation of the recurrent parents, and at the same time transferring most of the desired donor genes in a wide range of scenarios. Two rounds of backcrossing have advantages when the adaptationof donor parents is much poorer than that of the adapted parents, but the advantage of three rounds of backcrossing over two rounds is minimal. We recommend using the single backcrossing breeding strategy (SBBS) when three conditions are met: (1) multiple genes govern the phenotypic traits to be transferred from donor parents to adapted parents, (2)the donor parents have some favorable genes that may contribute to the improvement of adaptation in the recipient parents, and (3) conventional phenotypic selection is being applied, or individual genotypes cannot be precisely identified. Weenvisage that all three conditions commonly exist in modern breeding programs, and therefore believe that SBBScould be applied widely. However, we do not exclude the use of repeated backcrossing if the transferred genes can be precisely identified by closely linked molecular markers, andthe donor parents have extremely poor adaptation.

【题目】中国蔬菜土壤重金属含量及来源分析
【中文关键词】中国;菜地;重金属含量
【英文关键词】China;Vegetable land;Content of heavy metal
【中文摘要】为系统了解并客观评价中国菜地土壤的重金属含量状况,促进中国蔬菜生产向优质高效方向发展。【方法】系统收集了1989年以来中国蔬菜土壤重金属研究的相关资料,并利用相关方法对所收集到的数据进行了统计分析。【结果】中国菜地土壤重金属中以Zn含量最高,其次是Cr,再次是Cu;而毒性较大的元素As、Hg、Cd的含量相对较低,其平均含量分别为8.03、0.12、0.28 mg·kg-1。与国家土壤质量II级标准GB15618-1995(6.5<pH<7.5)相比,Cd含量超标的问题较为突出,全国约24.1%的菜地样本超标;Hg含量其次,样本超标率为10.3%;As的超标率为9.2%。各种重金属按含量超标率排序为:Cd>Hg>As>Zn>Cu>Cr>Pb。若按地区比较,则东部地区Cd含量超标较为严重,其次是Hg和Zn;中部地区以As和Cd含量超标为主,亦存在少量的Hg、Zn、Cu超标;西部地区亦以As、Cd超标为主,并伴随有少量的Cu、Cr和Hg超标。不同类型菜地比较,工矿/污灌区菜地的As、Cd、Hg、Zn含量均最高,尤其是其Hg含量平均高达2.36 mg·kg-1,超出其它类型菜地含量的10.5~21.1倍;设施菜地的Cu、Cr含量在所有类型中是最高的,而城市郊区菜地则Pb含量相对较高。对全国各地的蔬菜基地进行单独分析,发现除Pb含量稍高外,其它几种重金属的含量均较低,全国普通菜地的整体质量状况较好。【结论】在中国当前菜地利用方式下,除工矿/污灌菜地、市郊菜地土壤中个别重金属含量超标外,中国菜地土壤、特别是蔬菜基地土壤的重金属含量基本上未超过国家标准,整体质量状况较好。
【英文摘要】The objective of this investigation was to study the content of heavy metals in soils of vegetable lands systematically through assessment objectively to promote the development of vegetable production with high quality and efficiency. 【Method】 Statistical analysis of reported data on the heavy metals in Chinese vegetable plantation soils,from previous literatures published since 1989 was carried out systematically in this investigation.【Result】It is concluded that Zn,Cr,Cu had relatively high concentrations while the mean concentrations of toxic metals,As,Hg,Cd was 8.03,0.12,0.28 mg·kg -1 separately with comparatively low concentrations in vegetable lands in China.Compared to Chinese Soil Quality Criterion GB 15618-1995(6.5< pH<7.5),about 24.1%,10.3%,9.2%of the total samples was contaminated by Cd,Hg and As respectively,and the descending order of heavy metals was Cd>Hg>As>Zn>Cu>Cr>Pb.When compared among different regions,the relatively serious heavy metal contamination was found in eastern China vegetable lands and the main contamination elements were Cd,Hg and Zn.In the mid region,vegetable plantation land soil was mainly polluted by As and Cd,as well as Hg,Zn and Cu in some extent.In the west region of China,Cd and As contamination was also observed in some degrees,along with few soil samples exceeding the grade II level of GB 15618-1995(6.5<pH<7.5)for Cu,Cr and Hg content.Compared to the five vegetable plantation land patterns,the highest concentration of As,Cd,Hg and Zn occurred in the industrial/sewage irrigation vegetable lands,especially for Hg with 2.36 mg·kg-1 content which is 10.5-21.1 times higher than other four types of vegetable lands in average.The highest oncentration of Cu and Cr occurred in greenhouse vegetable land soils,and urban vegetable land soil had the highest Pb content comparing to other types of vegetable plantation land patterns.Through analysis of heavy metal content under different vegetable land patterns,it was found that vegetable producing base soil had relatively low heavy metal concentrations except for Pb with a little higher amount in city suburbs.The soil quality of common vegetable land was good with the lowest concentrations for most heavy metals.【Conclusion】Under present utilization patterns of vegetable land,the soil quality in Chinese vegetable base land was good with comparatively low concentrations of heavy metals and mostly not exceeding the grade II level of Chinese Soil Quality Criterion GB 15618-1995(6.5<pH<7.5).However,comparatively serious contamination was found in industrial/sewage irrigation and city suburb vegetable land soils.Key words:

【题目】Simulation Modeling in Plant Breeding: Principles and Applications
【中文关键词】breeding simulation, genetic model, breeding strategy, design breeding
【英文关键词】breeding simulation, genetic model, breeding strategy, design breeding
【中文摘要】Conventional plant breeding largely depends on phenotypic selection and breeder ’ s experience, therefore the breeding efficiency is low and the predictions are inaccurate. Along with the fast development in molecular biology and biotechnology, a large amount of biological data is available for genetic studies of important breeding traits in plants,which in turn allows the conduction of genotypic selection in the breeding process. However, gene information has not been effectively used in crop improvement because of the lack of appropriate tools. The simulation approach can utilize the vast and diverse genetic information, predict the cross performance, and compare different selection methods. Thus,the best performing crosses and effective breeding strategies can be identified. QuLine is a computer tool capable of defining a range, from simple to complex genetic models, and simulating breeding processes for developing final advanced lines. On the basis of the results from simulation experiments, breeders can optimize their breeding methodology andgreatly improve the breeding efficiency. In this article, the underlying principles of simulation modeling in crop enhancement is initially introduced, following which several applications of QuLine are summarized, by comparing the different selectionstrategies, the precision parental selection, using known gene information, and the design approach in breeding. Breeding simulation allows the definition of complicated genetic models consisting of multiple alleles, pleiotropy, epistasis, and genes, by environment interaction, and provides a useful tool for breeders, to efficiently use the wide spectrum of geneticdata and information available.

【题目】山东寿光不同种植年限设施土壤的酸化与盐渍化
【中文关键词】寿光;设施菜地;酸化;盐渍化
【英文关键词】greenhouse soil; acidification; salinization; ShouguangCity
【中文摘要】以山东寿光不同种植年限设施菜地为对象,研究并分析了土壤的酸化与盐渍化状况,结果表明:设施菜地土壤pH值平均为6. 86,全盐含量为2.47 g.kg-1,与露天菜地、自然土相比有较明显的酸化与盐渍化现象;设施菜地在连续种植0-12.7a间,土壤pH值随种植年限增加而降低,12. a后则出现随种植年限增加而升高的现象,土壤全盐含量则表现出与pH值相反的变化趋势,其发生变化的转折年限约为8.4a;设施土壤中的Na+,Mg2+,Cl-,SO42- 含量随种植年限的变化均表现出与土壤全盐量相同的趋势,且与种植年限的相关性均达到显著水平,这4种离子含量的变化可能是导致土壤全盐量随种植年限变化的重要原因;从土壤盐分离子组成来看,设施菜地土壤主要以SO42-、Cl-、Ca2+为主,分别占全盐量的62.4%、10.6%、9.3%,设施菜地中SO42-、Cl-、Mg2+、Na+含量与全盐量均呈极显著相关,其中相关性程度最大的为SO42- (r=0. 9291)和Mg2+(r=0.7224)。设施菜地中SO42-含量与pH值变化存在极显著相关(r=-0. 5508),其大量累积可能是造成调查区域设施土壤酸化的重要原因。
【英文摘要】The acidification and salinization in greenhouse soilofdifferent cultivating years of Shouguang City in Shandong provincewere studied. The results showed that the pH and total salts in greenhouse soil were 6.86 and 2.47g • kg-1, respectively, and the significant acidification and salinizaion were found in greenhouse soil compared with open vegetable soil and natural soil; In two planting periods of 1-12.7a and 12.7-15a of greenhouse soil, the trends of pH values were observed to decrease gradually and then it increased again, but the opposite changing trend with pH was observed for the total salts and the turning point was 8.4a. With the increasing of cultivating years the contents of Na+, Mg2+, Cl-, SO42- showed ($P<0.05$) to increase gradually and then it had decreasing trends and it had smiilar trendswith the changing trend of the total salts, the change in Na+, Mg2+, Cl-, SO42- contents brought about the change for the total salts with the increasing of cultivating years. Studies on salt ions in greenhouse soil indicated that a large part of total salts was accounted by SO42-, Cl-, Ca2+, the proportions were 62.4%, 10.6%, 9.3%, respectively. The very significantly correlations were obtained between SO42, Cl-, Mg2-, Na+and total salts. However, it was most to SO42- (r=0.9291) and Mg2+ (r=0.7224) among these correlations;The correlation between SO42-and pH was very remarkable, and a large accumulation of SO42-was one of the mi portant reasons for the acidification in greenhouse soil.

【题目】山东寿光不同利用方式下农田土壤有机质和氮磷钾状况及其变化
【中文关键词】寿光;不同利用方式;有机质;氮磷钾
【英文关键词】Shouguang; different soil using styles; soil nutrients
【中文摘要】通过对山东省寿光市不同利用方式下土壤相关性质的比较,探讨了农田土壤有机质和氮磷钾含量状况,并分析了设施菜地种植年限与有机质、全量氮磷含量的相互关系。研究结果表明:山东寿光农田土壤有机质和全量氮磷含量与第二次土壤普查时比较均有较大幅度增加,其中以设施菜地增加幅度最大,分别达120%、160%和364%,但全钾含量的增加幅度很小,仅为17.5%;不同利用方式比较,设施菜地土壤有机质、全氮、全磷含量均明显高于露天菜地、小麦/玉米地及棉花地,而全钾含量则低于小麦/玉米地和棉花地;从养分含量的分级结果看,设施菜地有机质、全量氮磷钾含量主要分布于>20g.kg-1、>1.2g.kg-1、>1.0 g.kg-1、20~25g.kg-1的级别中;设施菜地种植年限与土壤有机质、全量氮磷含量变化间有显著相关性,且均可用Y=a+bX+cX2的形式来表示,即随种植年限增加,有机质与氮磷含量首先呈逐步增加的趋势,并分别在第9.6年、8.9年和11.4年时达到最高值,之后则有随种植年限延长而下降的趋势
【英文摘要】The contents oforganicmatter, nitrogen, phosphorus, potassium in different agricultural soilswere analyzed to study the status and changes of these nutrients. The relationship between nutrient contents and cultivated yearswas also studied. The results indicated that comparedwith the results from the SecondNationalSoilSurvey, the contents of organic matter, total nitrogen and phosphorus were largely increased, which even increased by 120%, 160% and 364%, respectively, in greenhouse soils; while the potassium contentwas only increased by 17.5%. In comparison with those among different-used soils, the content of Organic Matter, Nitrogen, Phosphorus in greenhouse soil was higher than that in other used soils, while the content of potassium in greenhouse soil was lower than that in the soil of wheat/corn field and cotton field. The contents of Organic Matter, Nitrogen, Phosphorus, Potassium were respectively in the levels of > 20g • kg-1, > 1.2g • kg-1, > 1.0 g • kg-1, 20-25 g • kg-1 in greenhouse soil. The studies on the relationship between cultivating years and the contents of nutrients indicated that with the increasing of cultivating years, the contents of Organic Matter, Nitrogen, Phosphorus in greenhouse soil were increased, and the greatest levels of them appeared after 9.6, 8.9, and 11.4 years of cultivation, respectively. Thereafter the contents of nutrients were found to decrease. The decrease of greenhouse soil quality has been a very prevalent problem after a long farming time.

【题目】Identification of Indica rice chromosome segments for the improvement of Japonica inbreds and hybrids
【中文关键词】chromosome segment substitution (CSS) lines, heterosis, Quantitative trait loci
【英文关键词】chromosome segment substitution (CSS) lines, heterosis, Quantitative trait loci
【中文摘要】Exploitation of heterosis has brought significant advance in plant breeding and agricultural production, although its genetic basis is still poorly understood. In this study, a total of 66 chromosome segment substitution (CSS) lines, derived from a cross between japonica rice inbred line Asominori (as the recurrent parent) and indica rice inbred line IR24 (as the donor parent), were used to investigate the genetic basis of heterosis in indica 9 japonica inter-subspecific rice hybrids. Each CSS line was crossed with the background parent Asominori, and the heterosis of F1 hybrids was estimated by comparing the F1 performancewith its two parental lines. Field experiments were carried out across six different environments to evaluate yield and yield-related traits in the 66 CSS lines and their 66 corresponding F1 hybrids. Quantitative trait loci (QTL) analyses were conducted using a likelihood ratio test based on the stepwise regression. Thirty-six QTL were identified withsignificant effects in CSSL, 21 with significant effects in hybrids and 13 with significant effects in both. On the basis of average dominance degree, of all the 70 QTL affectingyield-related agronomic traits, 28.6% (20) showed an overdominance, 35.7% (25) a partial dominance and 30% (21) an additive effect, indicating that all effects contribute to trait variation in japonica – indica rice hybrids. Effects of these QTL were examined to identify Indica rice chromosome segments of interest for the improvement of japonica inbred lines and hybrids.

【题目】冬小麦品种抗霜力鉴定与霜冻害防御新对策
【中文关键词】冬小麦; 霜冻害; 拔节期; 磷脂酶D;
【英文关键词】winter wheat; frost damage; jointing stage; phospholipase D;
【中文摘要】冬小麦发育进入拔节期和出现霜冻低温是形成其霜冻害的两个要素。霜冻低温的出现主要与气候因素有关。而拔节期的早晚则受初春气温、播种期和选用品种等多种因素的影响。影响品种抗霜力的重要因素是幼穗分化时期。品种抗霜力的鉴定必须在相同的幼穗分化期,建议在药隔期进行。品种的抗霜力还与第1茎节的长度有关,而与抗冻力和叶片可溶性糖含量的相关性不显著。通过研究,提出了下列抗霜对策:在把握地区霜冻温度出现规律的基础上,合理规划抗霜品种与避霜品种的布局;通过常规育种和基因工程手段,改良品种的抗霜力;通过遗传操作磷脂酶D基因,改良冬小麦的抗霜性。
【英文摘要】Developing into jointing stage and occurrence of frost temperature are two main factors for frost damage of winter wheat.The occurrence of frost temperature is mainly impacted by local climate condition,while the time of jointing stage is determined by many factors as mean air temperature in early spring,sowing time,and the varieties selected etc.Differentiation stage of young ears is an important factor that affects frost resistance of winter wheat. Therefore,evaluation of frost resistance of different varieties is suggested to be performed at a same stage in order to get reliable result.Among those stages,anther connective stage is recommended as an appropriate evaluation stage. Frost resistance of winter wheat varieties correlates with the length of the first internode,and no significant correla- tion are found between freezing resistance and content of soluble sugar of leaves.Following strategies for preventing frost damage to winter wheat are proposed:planning the planting pattern for frost resistant and frost avoiding varie- ties feasibly according to the occurrence of frost temperature in local area,improving frost resistance of the varieties through breeding and genetic engineering and enhancing frost resistance of winter wheat through genetic manipula- tion of phospholipase D

【题目】双季稻田改制对作物生长及土壤养分的影响
【中文关键词】种植制度;作物生长;经济效益;土壤养分

【英文关键词】Cropping system;Crop growth;Economic benefit;Soil nutrient
【中文摘要】【目的】探讨红壤地区双季稻田改制对作物生长及土壤养分变化的影响,为灌溉条件较差稻田种植制度改革提供有效模式。【方法】利用田间定位试验方法,研究了双季稻田改种牧草、水旱轮作及旱作等模式对作物生长、产量和经济效益的影响,并分析了土壤有机质和养分含量的变化。【结果】按各处理生产产品的市场价格进行折算,稻田改制可增加产值、提高产投比。各处理比较,以水旱轮作产值最高,分别比对照、牧草和旱作处理增加34.7%、21.4%和2.2%,且牧草和旱作处理也分别较对照增加11.0%31.8%;牧草、水旱轮作和旱作处理产投比值分别比对照高0.9、0.6和0.3。种植牧草对提高土壤有机质和全氮、全磷及速效磷含量有较好效果,但各处理土壤碱解氮、全钾、速效钾的含量均有一定幅度下降,说明在本研究的施肥水平下,有必要增加氮素、特别是钾素养分的投入。【结论】在当前红壤地区双季稻田肥力状况、气候及作物栽培管理条件下,对灌溉条件较差的稻田进行改制是可行的,其中,种植牧草或实行水旱轮作对提高经济效益、提升土壤肥力有较好效果。
【英文摘要】【Objective】This paper aimed to determine the effects of cropping system change for red soil paddy field with double harvest rice on crops growth and soil nutrient.It also aimed to provide with optimum pattern for cropping system reform under bad irrigation condition.【Method】Through located field experiments,effects on crops growth,yield and economic benefit were studied under different cropping systems.These included systems from paddy field with double harvest rice to pasture, paddy-upland rotation,upland cropping et al,and the change of related soil organic matter and nutrient content under various cultivation systems was also investigated.【Result】The results proved that economic benefit and the ratio of output to input were all increased in terms of the market price for the crops under various treatments.The greatest economic benefit occurred in the treatment of paddy-upland rotation,and the corresponding economic benefit was increased by 34.7%, 21.4% and 2.2% in comparison with equivalent of control (rice-rice-astragali), pasture,upland cropping treatments. The economic benefit from pasture, upland cultivation treatments was increased by 11.0% and 31.8% respectively compared to the equivalent of control.The ratio of output to input under pasture, paddy-upland rotation, upland cropping treatments was enhanced 0.9, 0.6 and 0.3, respectively, in comparison with that of control. It is acceptable to plant pasture grass for improving soil fertility since the contents of soil organic matter,total nitrogen, total phosphorus and available phosphorus were all enhanced obviously. However, the concentrations of soil available nitrogen, total potassium, available potassium was some what reduced for all the treatments, suggesting that increasing the input of nitrogen, particularly potassium, was necessary under present fertilization level.【Conclusion】Based on the condition of the fertility, climate, cultivation and management in red soil paddy with double harvest rice regions, it is feasible to change the cultivation system of paddy fields with bad irrigation conditions. In particular, such cultivation systems as Pasture and Paddy-Upland Rotation were worth adopting for better economic benefit and improvement of soil fertility in the purpose region.

【题目】Nitrogen fixation island and rhizosphere competence traits in the genome of root—associated Pseudomonas stutzeri A1501
【中文关键词】无
【英文关键词】genome sequencing root-associated diazotroph
【中文摘要】无
【英文摘要】The capacity to fix nitrogen is widely distributed in phyla of Bacteria and Archaea but has long been considered to be absent from the Pseudomonas genus. We report here the complete genome sequencing of nitrogen-fixing root-associated Pseudomonas stutzeri A1501. The genome consists of a single circular chromosome with 4,567,418 bp. Comparative genomics revealed that, among 4,146 protein-encoding genes, 1,977 have orthologs in each of the five other Pseudomonas representative species sequenced to date. The genome contains genes involved in broad utilization of carbon sources, nitrogen fixation, denitrification, degradation of aromatic compounds, biosynthesis of polyhydroxybutyrate, multiple pathways of protection against environmental stress, and other functions that presumably give A1501 an advantage in root colonization. Genetic information on synthesis, maturation, and functioning of nitrogenase is clustered in a 49-kb island, suggesting that this property was acquired by lateral gene transfer. New genes required for the nitrogen fixation process have been identified within the nif island. The genome sequence offers the genetic basis for further study of the evolution of the nitrogen fixation property and identification of rhizosphere competence traits required in the interaction with host plants; moreover, it opens up new perspectives for wider application of root-associated diazotrophs in sustainable agriculture.

【题目】成年蜜蜂脑神经细胞的培养和电生理特征
【中文关键词】蜜蜂 神经元 兴奋性 钠电流 钾电流 膜片钳
【英文关键词】Apis mellifera neuron excitability sodium current potassium current whole-cell patch-clamp
【中文摘要】为了研究杀虫剂等对蜜蜂毒性作用的神经机制,需在体外建立成年蜜蜂脑神经细胞的分离培养和电生理记录技术并研究其正常电生理特征,而对成年蜜蜂脑神经细胞的分离培养和电生理特性的研究报道甚少。我们采用酶解和机械吹打相结合的方法获得了数量较多且活力较好的成年意大利蜜蜂Apis mellifera 脑神经细胞,并用全细胞膜片钳技术研究了成年意大利蜜蜂脑神经细胞对电流和电压刺激的反应,获得了成年意蜂脑神经细胞的基本电生理特征以及钠电流和钾电流的特性。全细胞电流钳的记录结果表明,在体外培养条件下,细胞无自发放电发生,注射电流后仅引起细胞单次放电,引起细胞放电的阈电流平均为60.8±6.3 pA ;细胞动作电位产生的阈电位平均为-27.4±2.3 mV。用全细胞电压钳记录了神经细胞的钠电流和钾电流。钠电流的分离是在电压刺激下通过阻断钾通道和钙通道实现。细胞的内向钠电流在指令电压为-40~-30 mV 左右激活,-10 mV达峰值,钠通道的稳态失活电压V1/2为-58.4 mV;外向钾电流成份至少包括较小的快速失活钾电流和和较大的缓慢失活钾电流(占总钾电流的80%),其半激活膜电位V1/2 为3.86 mV,无明显的稳态失活。结果提示缓慢失活钾电流的特征可能是细胞单次放电的机制之一。
【英文摘要】To explore the neuronal mechanisms underlying pesticides intoxication in adult honeybees, the primary culture of brain neurons of adult honeybees and electrophysiological recordings are required. However, little is known of the electrophysiological properties and sodium currents or potassium currents in normal adult honeybee brain neurons. We first dissociated neurons from

brains of adult Apis mellifera by gentle trituration after a 15-min incubation with papain. This preparation resulted in a large number of isolated viable neurons. Using the whole-cell configuration of the patch-clamp technique, we investigated the neuronal responses of the isolated neurons to the current or voltage stimulation. Current-clamp date showed that the tested neurons showed no spontaneous discharges but were capable of firing a single action potential in response to depolarizing current injection. The mean current threshold for action potential was 60.8±6.3 pA and the mean voltage threshold -27.4±2.3 mV. Under voltage clamp, sodium currents were isolated by blockade of potassium channel and calcium channel. The sodium current was activated at command potentials more positive than -40mV with a maximum around -10mV and a half-maximal voltage for inactivation of -58.4mV. The neurons expressed at least two distinct K+ currents, a small transient current and a large sustained current (80% of total K+ current) with a half-maximal voltage for activation of 3.86mV. The large sustained potassium current showed little or no inactivation. The results suggest that the prominent sustained potassium current might account for the a single spiking in the recorded adult honeybee neurons.

【题目】氨肽酶N(APN)与鳞翅目昆虫对Bt抗性的关系
【中文关键词】苏云金芽孢杆菌(Bt) 氨肽酶N (APN) 受体 突变 抗性
【英文关键词】Bacillus thuringiensis (Bt) aminopeptidase N (APN) receptor mutation resistance
【中文摘要】使用Bt Cry 毒素防治农业害虫是作物生产上的一个革命性的进步, 受体与Bt杀虫蛋白结合能力的改变可能是昆虫对B t产生抗性的主要原因。氨肽酶N (am inopeptidase N, APN) 是一类存在于昆虫中肠内的Bt毒素受体蛋白, 通过讨论APN与Bt毒素的结合作用, 综述了APN基因变异与鳞翅目昆虫Bt抗性相关的分子机理, 并介绍了(Bt) Cry毒素与APN相关的作用方式新模型。
【英文摘要】The use of Cry toxins from Bacillus thuringiensis (Bt) to control insect pests is a revolutionary progress in crop production. Change in binding ability between Bt insecticidal proteins and its receptors may be the main mechanism of Lepidoptera insect resistance to Bt toxin. Aminopeptidase N (APN) is one kind of receptors for Bacillus thuringiensis (Bt) toxin in insect midguts. Through discussing its binding capability with Bt toxin, this paper sumarizes the molecular biology mechanism of APN gene and Bt resistance of Lepidoptera, and introduces a new model for the mode of Cry1Ac toxin action.

【题目】Recombinant Bacillus thuringiensis strain shows high insecticidal activity gainst Plutella xylostella and Leptinotarsa decemlineata without affecting nontarget species in the field
【中文关键词】无
【英文关键词】Bacillus thuringiensis bioassay microbial population variation nontarget organisms recombinant strain
【中文摘要】无
【英文摘要】Aims: To construct a recombinant Bacillus thuringiensis (Bt) strain with broad insecticidal spectrum and investigate its impact on nontarget organisms in field. Method and Results: The cry-type gene of wild Bt strain UV17 was identified and a novel cry1Ba gene was cloned. The cry3Aa7 gene, which was highly toxic to coleopteran pests, was introduced into UV17, and a recombinant strain designated as UV173A was obtained. Bioassay results showed that UV173A was not only highly toxic against Plutella xylostella (50% lethal concentration [LC50] = 18.03ug ml – 1), but also against coleopteran Leptinotarsa decernlineata (LC50 = 0.19 mg ml – 1).

The recombinant strain was then tested in field trials to monitor its spatial variation of population and to investigate the impact on nontarget invertebrates. Conclusions: A recombinant Bt stain UV173A with broad insecticidal spectrum was obtained, and it did not cause adverse effects on the population of nontarget organisms. Significance and Impact of the Study: The results obtained here indicated that cry1Ba3 gene may be useful for the resistance management of P. xylostella, and the recombinant stain UV173A was potential for field application against some crucifer vegetable pests as well as L. decemlineata.

【题目】Insecticidal action of Quinomycin A from Streptomyces sp. KN—0647, isolated from a forest soil
【中文关键词】无
【英文关键词】Insecticidal activity Quinomycin A 16S rRNA gene Streptomyces sp.
【中文摘要】无
【英文摘要】An actinomycete strain KN-0647 was isolated from a forest soil sample collected from Dali Cangshan mountain, Yunnan Province, China. The strain was identified as Streptomyces sp. according to the morphological, physiological characteristics and whole nucleotide sequence analysis of 16S rRNA gene, and could not be identified up to species level, just suggesting a potential new taxon. The ethyl acetate extract from this strain displayed growth inhibition on the test pathogenetic insects, such as Spodoptera exigua, Dendrolimus punctatus, Plutella xylostella, Aphis glycines and Culex pipiens. The active compound was isolated and identified through a combination of spectral and chemical methods (UR, MS, and HNMR) as quinomycin A. This is the first report on the insecticidal activity of antibiotic quinomycin A.

【题目】A novel RPMXR motif among class II 5-enolpyruvylshikimate-3-phosphatesynthases is required for enzymatic activity and glyphosate resistance
【中文关键词】无
【英文关键词】Class II 5-enolpyruvylshikimate-3-phosphate synthase RPMXR motif Enzymatic activity Glyphosate resistance Pseudomonas stutzeri A1501
【中文摘要】无
【英文摘要】The shikimate pathway enzyme 5-enolpyruvylshikimate-3-phosphate (EPSP) synthase is an attractive target for drugs and herbicides. Here we identified a novel RPMXR motif that is strictly conserved among class II EPSP synthases. Site-directed mutational analysis of this motif showed that substitutions of the four strictly conserved amino acid residues, Arg127, Pro128, Met129, and Arg131, resulted in complete loss of enzymatic activity, whereas changes in the non-conserved Asn130 residue strongly influenced glyphosate resistance (all numbering according to Pseudomonas stutzeri A1501 EPSP synthase). These experimental results, combined with 3D structure modeling of the location and interaction of the RPMXR motif with phosphoenolpyruvate (PEP) and shikimate-3-phosphate (S3P), demonstrate that the novel motif is required for enzymatic activity and glyphosate resistance of class II EPSP synthases.

【题目】Quantitative measurement of pH influence on SalR regulated gene expression in Acinetobacter baylyi ADP1
【中文关键词】无
【英文关键词】Acinetobacter baylyi ADP1 Bioluminescence LysR-type transcriptional regulator pH tolerance Salicylate
【中文摘要】无
【英文摘要】The influence of medium pH conditions on regulation of the sal operonwas quantitatively measured by using a genetically engineered Acinetobacter baylyi ADP1 strain ADPWH_lux. Live-cell based bioluminescence assays determined that the SalR, a LysR-type transcriptional regulator (LTTR), functioned in a range of medium pH conditions. During exponential growth, SalR regulated bioluminescence production peaked at the neutral pH and tolerated medium pH changes of 5.5 – 9.0. In the stationary phase, the SalR regulated gene expression reached 20 – 35% of the maximum productivity during the exponential phase. This report reveals the influence of pH conditions on a LTTR system and demonstrates that the biosensor strain can be a useful tool for understanding transcriptional regulations in different environments.

【题目】Mutation of an aminopeptidase N gene is associated with Helicoverpa armigera resistance to Bacillus thuringiensis Cry1Ac toxin
【中文关键词】无
【英文关键词】Aminopeptidase N1 Helicoverpa armigera Cry1Ac Bt resistance
【中文摘要】无
【英文摘要】A Cry1Ac-resistant strain (Bt-R) of Helicoverpa armigera, with 2971-fold resistance, was derived by selection with Cry1Ac toxin for 75 generations.We used cDNA-amplified fragment length polymorphism analysis to identify those genes differentially expressed in the Cry1Ac-resistant and -susceptible strains, which revealed 212 differentially expressed transcripts among 2000 screened cDNAs. Among these transcript-derived fragments (TDFs), 37 showed some homology to known sequences, including Aminopeptidase N (APN), which is expressed in the midgut epithelium and has been implicated as a Cry1A subfamily receptor in several moths, including H. armigera.We confirmed the TDF by RT-PCR and identified a deletion mutation of apn1 in the Bt-R strain. We expressed the TDF in bacteria. The partial HaAPN1-96S wild-type protein, bound to Cry1Ac on ligand blots, whereas HaAPN1-BtR did not. This suggested that HaAPN1 is a receptor for Bt Cry1Ac and that its deletion mutation is associated with Cry1Ac resistance in H. armigera. The absence of one binding site is responsible for its resistance to Cry1Ac. We developed an allele-specific PCR to monitor whether the apn1 gene in an H. armigera field population produced a similar mutation. No deleted mutants were found in 2250 individuals collected from the field in 2006 – 2007.

【题目】Construction of a Bacillus thuringiensis engineered strain with high toxicity and broad pesticidal spectrum against coleopteran insects
【中文关键词】无
【英文关键词】Bacillus thuringiensis Engineered strain Homologous recombination Anomala corpulenta Holotrichia parallela
【中文摘要】无
【英文摘要】A newly engineered strain, denominated BIOT185, was constructed through integrating the cry8Ca2 gene into the endogenous plasmid of BT185 (contains cry8Ea1) by homologous recombination. The thermosensitive plasmid vector was eliminated by the rising temperature of recombinant cultures. No antibiotic gene or other unnecessary genes were introduced to the new strain. Sodium dodecyl sulfate – polyacrylamide gel electrophoresis and Western blot analysis demonstrated that the cry8Ca2 gene was expressed normally and produced a 130-kDa protein in the BIOT185 strain. Bioassay results showed that the new strain had high toxicity to the pests Anomala corpulenta and Holotrichia parallela, which often damage the same fields.

【题目】Application of oligonucleotide microarray for the detection and genotyping of cry genes in Bacillus thuringiensis
【中文关键词】无
【英文关键词】oligonucleotide microarray cry genes genotyping random primer labeling bioinformatics
【中文摘要】无
【英文摘要】Bacillus thuringiensis d-endotoxin toxin – DNA protoxin – DNA aggregation We have developed a parallel, rapid, high-throughput oligonucleotide microarray-based assay for the reliable detection and genotyping of three cry genes (cry1, cry2 and cry9) in Bacillus thuringiensis (Bt). After the nonpolymerase chain reaction (PCR), amplified Bt genomic DNA were fluorescent-labeled using a random primer. The corresponding oligonucleotide probes were designed for the different cry genes that can hybridize Bt genomic DNA after cluster analysis and were printed on glass slides. This microarray has unambiguously detected and identified the cry genes in 10 isolates and reference Bt. Our data demonstrates that the microarray assay is simple and rapid for the detection and genotyping of genes. This type of assay is also a potentially valuable tool for identification and characterization of bacterial functional genes in general.

【题目】Effect of bacteriaphage and exopolysaccharide on root colonization and rhizosphere competence by Pseudomonas fluorescens
【中文关键词】无
【英文关键词】Pseudomonas fluorescens Root colonization Rhizosphere competence . Bacteriophage Exopolysaccharide
【中文摘要】无
【英文摘要】Pseudomonas fluorescens TC222 is a biocontrol agent. In this study, we focused on the influence of bspA encoding bacteriophage signal peptide protein and epsB encoding a putative Mig-14 family protein on the rhizosphere colonization and competence. After inoculation with each of strains individually, the number of each mutated strain was much lower than that of the wild-type strain. Both mutants inoculated with the wild-type strain at a ratio of 1:1 were outcompeted by the wild-type strain. Furthermore, both mutants showed a reduced biocontrol activity to Rhizoctonia solani and Gaeumannomyces graminis. To our knowledge, this is the first report that bspA and epsB are involved in root colonization and rhizosphere competence by P. fluorescens.

【题目】转双价抗真菌病害基因大豆对根际土壤微生物群落结构的影响
【中文关键词】转基因大豆 变性梯度凝胶电泳 土壤微生物 群落结构
【英文关键词】transgenic soybean denaturing gradient gel electro phoresis soil microorganism comunity structure
【中文摘要】采用传统的平板计数法和变性梯度凝胶电泳技术,对转chi+rip(几丁质酶和核糖体失活蛋白)双价抗真菌 基因大豆转基因G0431以及其亲本非转基因大豆黑农35种植后的根部土壤可培养细菌(含芽胞杆菌、产荧光假单胞菌)、真菌、放线菌进行平板计数及细菌和真菌的群落结构分析. 结果表明,二者根部土壤可培养细菌(含芽胞杆菌和 产荧光假单胞)、真菌和放线菌的数量并无显著差异;此外,变性梯度凝胶电泳图谱的聚类分析结果显示,时间变化 是造成根部土壤细菌和真菌群落结构变化的主要因素,而同一时间内转基因G0431和黑农35根部土壤的细菌和真菌群 落结构之间并无显著不同. 在大豆的整个生长期内,根部土壤细菌群落多样性指数为5.32~5.37,群落分布均匀度指数 为0.91~0.95;根部土壤真菌群落多样

性指数为4.78~4.91,群落分布均匀度指数为0.81~0.89. 以上结果说明,几丁质酶和 核糖体失活蛋白双价基因的导入并没有对大豆根际可培养细菌(含芽胞杆菌和产荧光假单胞)、真菌和放线菌的数量 以及细菌和真菌的群落结构产生显著影响. 图4 表2 参22

【英文摘要】G0431 is the genetically modified soybean by transformation of two anti-fungus genes, “ chi ”(chitinase gene from bean) and “ rip ”(barley ribosome-inacti vating protein gene) into the natural strain, Heinong 35. The methods of classical plate counting and denaturing gradient gel electro phoresis (DGG E) were em ployed to analy ze the amounts of culture microbes in rhi zos phere soil and the comunity structure of bacteria (including Bacillus and fluorescent Pseudomonas), fungi and actinomycetes . The results showed that there was no significant difference between the amounts of culture soil microorganisms in the rhi zos phere soil of the transgenic G0431 and Heinong 35. Moreo ver, the results of cluster analysis of DGG E profile of bacteria and fungi indicated that the time was the main factor which afected the comunity structure of rhi zos phere soil microbes . For the two in vestigations, the Shanon ’ s inde x of the bacterial comunity in the rhi zos phere soil was 5.32~5.37 and the evenness inde x was 0.91~0.95; the Shanon ’ s inde x of the fungal comunity in the rhi zos phere soil was 4.78~4.91 and the evenes inde x was 0.81~0.89. The same as the comunity structure of bacteria and fungi , there was no remar kable diference in the rhi zos phere soil betwen the transgenic and non-transgenic soybean in the numbers of culture bacteria (including Bacillus and fluorescent Pseudomonas), fungi and actinomycetes . It im plied that the transformation of the two extra antifungus genes into soybean didn ’ t cause any significant efect on the amounts and comunity structure of its rhi zos phere soil microbes . 【题目】对Bt 蛋白抗性和敏感的棉铃虫中肠细菌群落的比较

【中文关键词】棉铃虫 中肠菌群 16S rDNA 变性梯度凝胶电泳 抗性 苏云金芽孢杆菌

【英文关键词】Helicoverpa armigera bacterial community 16S rDNA DGGE resistance Bacillus thuringiensis

【中文摘要】[目的]通过比较Cry1Ac蛋白抗性及敏感棉铃虫中肠细菌群落的结构组成,研究中肠微生物是否与棉铃虫Bt抗性产生有关.[方法]首先提取了棉铃虫中肠微生物基因组DNA,通过PCR扩增获得了16S rDNA全长片段及V3区.采用基于16S rDNA的免培养技术-16S rDNA文库建立和变性梯度凝胶电泳(DGGE)研究了国内特有的Bt抗性和敏感品系棉铃虫中肠细

菌群落组成,并对其进行分析和比较.[结果]16S rDNA文库测序结果表明,抗性品系与敏感品系棉铃虫中肠细菌群落特别是优势菌群非常相似,但在部分劣势菌群上存在差异.抗性品系中主要优势菌有:不可培养微生物(Uncultured bacterium)占56.4%,鹑鸡肠球菌(Enterococcus gallinarum)占17.0%,铅黄肠球菌(Enterococcus casseliflavus)占17.0%;敏感品系中主要优势菌为不可培养微生物(Uncultured bacterium)60.2%,鹑鸡肠球菌(Enterococcus gallinarum)占19.3%,铅黄肠球菌(Enterococcus casseliflavus)占14.7%.随后进行的PCR验证表明,部分有差异的劣势菌在两种品系虫体都存在.DGGE图谱分析表明,这两个品系棉铃虫中肠菌群相似性达到92.3%.[结论]敏感品系与抗性品系棉铃虫肠道菌群组成极其相似,推测抗性的产生与肠道微生物无直接关系.

【题目】Identification of the minimal active fragment of the Cry1Ah toxin

【中文关键词】无

【英文关键词】Bacillus thuringiensis Cry1Ah Toxicity Minimal active fragment Plutella xylostella

【中文摘要】无

【英文摘要】cry1Ah1, a novel holo-type gene cloned from Bacillus thuringiensis strain BT-8, encoded a protein exhibiting strong insecticidal activity against lepidopteran insects. To identify the minimal active fragment of the Cry1Ah toxin, 9 pairs of primers were designed to generate different PCR products. Seven PCR products were amplified by different primers using the cry1Ah1 gene as a template and cloned into a pET-21b vector. These positive clones were separately transformed into Escherichia coli. Insecticidal activity against 2nd-instar larvae of Plutella xylostella was performed using the leaf-dip bioassay: the minimal active fragment of the Cry1Ah toxin was located between amino acid residues 50I and 639E.

【题目】The role of DNA binding with the Cry8Ea1 toxin of Bacillus thuringiensis
【中文关键词】无
【英文关键词】Bacillus thuringiensis d-endotoxin toxin – DNA protoxin – DNA aggregation
【中文摘要】无
【英文摘要】The Cry8Ea1 protoxin is a DNA – protein complex. Both forms of the Cry8Ea1 toxin (with or without DNA binding) were obtained separately, and their stability and ability to insert into a phospholipid monolayer in vitro were compared. The presence of DNA can prevent the toxin from aggregation. Data regarding the penetration of the Cry8Ea1 toxin and Cry8Ea1 toxin – DNA complex into the air/water interface without a phospholipid monolayer show that the Cry8Ea1 toxin – DNA complex is more likely to move towards the air/water interface and is more hydrophobic. Experiments examining the protein interaction with the phospholipid monolayer show that the ability of the Cry8Ea1 toxin – DNA complex to insert into the lipid bilayer is much greater than that of the Cry8Ea1 toxin without DNA.

【中文关键词】精氨酸激酶 免疫力 抗性进化 特异性表达
【英文关键词】Arginine kinase Immunity Resistance Evolution Specific-tissue expression
【中文摘要】在无脊椎动物体内,精氨酸激酶(arginine kinase) 在能量代谢过程中发挥着重要的作用。随着研究的深入,越来越多的数据表明,精氨酸激酶的作用不仅限于提供和维持能量的平衡,而且对生命活动的调控起到重要作用。综述无脊椎动物体内精氨酸激酶的进化历程、蛋白特性、特异表达及生物学功能等方面的研究进展,为深入研究无脊椎动物的抗性调控机制提供必要的参考。此外,对无脊椎动物精氨酸激酶的重要性和研究中存在的问题进行讨论。
【英文摘要】In invertebrate,arginine kinase(AK) plays a critical role in energy metabolism. With the deeply study,increasing data show that the functions of arginine kinase not only are confined to provide energy and maintain the balance of power,but also play an important role in regulating the activities during invertebrate ’s whole life. We reviewed the evolution of AK protein,the AK protein characterization,the specific-tissue expressions that mediate unique biological functions and the application in production and life of arginine kinase in invertebrate. Meanwhile,the significance and existent problems of the related studies were also discussed.

【题目】冬小麦抗霜性与抗冻性的关系
【中文关键词】冬小麦; 霜冻害; 抗霜性; 抗冻性;
【英文关键词】winter wheat; frost damage; frost resistance; freezing resistance;
【中文摘要】拔节期霜冻害是制约冬小麦生产的主要因素之一。然而关于冬小麦拔节期抗霜性的鉴定工作,国内外的研究报导还很少。选取了13个起源地和春化特性不同的小麦品种,通过利用人工霜箱模拟田间自然霜冻发生过程的试验方法,在小麦幼穗分化进程中的低温敏感期——药隔期进行抗霜性鉴定。同时,对这13个小麦品种越冬期间的抗冻性进行了鉴定。最后对冬小麦品种的抗冻性与抗霜性之间的相关性进行了分析。结果表明:抗霜性与抗冻性之间不存在显著的相关关系。抗冻力较强的冬性品种,抗春霜冻的能力不一定就强;相反,抗冻力较低、发育进程快的早熟品种也可能具有较强的抗霜性。
【英文摘要】Frost injury of winter wheat during its jointing stage has become one of the factors that restricting winter wheat production.But fewer studies on evaluation of frost resistance in jointing stage had been reported up to now. In this study,13 winter wheat varieties were selected as research materials,which differ in original place and ver- nalization characteristic.Frost resistance of those varieties were identified using an artificial frost chamber to simu- late natural frost at anther connective formation phase,low temperature sensitive phase in proceeding of young ear ’ s differentiation phase.Meanwhile,freezing resistance in wintering stage were also evaluated for these varieties. Thereafter,the relationship between frost resistance and freezing resistance of winter wheat varieties was analyzed to explore if a strong correlation exist between them.The result indicates that no significant correlation exist between the two kinds of resistance.Varieties with high freezing resistance may not be of strong frost resistance.Contrarily, freezing sensitive varieties that develop into maturation earlier can also be of frost resistance.

【题目】Development rule of intramuscular fat content in Chicken
【中文关键词】无
【英文关键词】Chicken;intramuscular fat;breast muscle;age;breed;development rule
【中文摘要】无
【英文摘要】The content of Intramuscular Fat (IMF) of Anka chicken, Wenchang chicken and Rugao chicken from 4-12 weeks old were tested in this study. The results showed that Intramuscular fat content in three chicken breeds increased with the age. Herein, the IMF of breast muscle in Anka chicken sharply increased after 8 weeks old and was higher than that of Wenchang and Rugao chicken. But, there was no significant difference between different breeds before 8 weeks old. The IMF of hen is higher than that of cock in all three breeds, but only in Wenchang chickens the significant difference were detected between different sex.

【题目】夏季高温下快大黄羽肉种鸡产蛋后期最适能量和蛋白质水平的研究
【中文关键词】黄羽肉种鸡; 夏季高温; 蛋白质; 能量; 生产性能
【英文关键词】无
【中文摘要】试验选取55周龄快大黄羽肉种鸡1350只,随机分为9组,每组10个重复,每重复15只。在夏季高温环境下[平均舍温(30.09±3.12)℃],进行不同能量和蛋白质水平对肉种鸡生产和孵化性能影响的试验。采用3个能量水平(11.08、11.29、

11.50MJ/kg)×3个蛋白水平(15.5%、16.5%、17.5%)的双因子交叉试验设计9种不同能量、蛋白水平的日粮进行饲喂,试验期8周。试验结果表明,不同蛋白水平对种鸡生产性能有显著影响,低蛋白水平的D、G两组比高蛋白的C、F、I三组在日均采食量、产蛋率、合格种蛋率、受精率、活胚率、入孵蛋孵化率等指标上均表现优异,有些指标差异达显著水平(P<0.05)。而不同能量水平对这些指标影响不显著。所以夏季高温环境下,过多提高日粮的蛋白质水平不一定有利于提高或保持种鸡的产蛋和孵化性能。试验得出的最适宜营养水平为:代谢能11.29~11.50MJ/kg,蛋白质15.5%,蛋能比为13.48~13.73g/MJ。

【题目】运用模型分类法分析9个地方鸡品种间遗传结构和亲缘关系
【中文关键词】微卫星; 地方鸡种; 模型聚类法; Structure程序
【英文关键词】Microsatellite; indigenous chicken breeds; Model-based cluster method; Structure program
【中文摘要】以16个中度或高度多态性微卫星标记,运用基于模型分类法的Structure程序推断9个地方鸡品种群体遗传结构,构建聚类图分析相互间亲缘关系,并鉴定群体中迁移个体和具有复杂遗传基础个体的分布。结果表明:Structure程序在预先未标明品种起源的条件下准确推断出9个地方鸡种群体所属类别,揭示按照体型外貌、地理分布等为依据划分的9个地方鸡品种类型,也真实反映了其在遗传上的差异。Structure聚类图在K=2时将9个地方鸡种分为轻体型的鸡种(包括茶花鸡、藏鸡、仙居鸡、固始鸡和白耳鸡)和重体型的鸡种(包括大骨鸡、北京油鸡、鹿苑鸡和萧山鸡)两个类别;K=4、5、6时北京油鸡、固始鸡、大骨鸡分离出来形成独立类群;仙居鸡与白耳鸡在K=6、萧山鸡与鹿苑鸡在K=7、藏鸡与茶花鸡在K=8时仍聚在同一类别中,这与9个地方鸡种的地理分布及形成历史相吻合。9个地方鸡品种群体中均有具有复杂遗传基础的个体分布,迁移个体只分布在藏鸡、萧山鸡和鹿苑鸡群体中。
【英文摘要】The Structure program,based on model clustering method,was used to infer the genetic structure of nine indigenous chicken breeds,assign individuals to populations,and identify migrants and admixed individuals using 16 microsatellite markers.The results showed that Structure program properly inferred the presence of genetic structure at the condition of not defining the origin of individuals.It indicated that the nine chicken breeds defined by locations,phenotypes or culture reflected the underlying genetic variations.At K=2,nine breeds were divided into two main clusters,one was light weighted(including CHA,TIB,XIA,GUS and BAI),the other was heavy weighted(including YOU,XIS,LUY and DAG).YOU,GUS and DAG were classified into independent clusters respectively at K=4、5、 6.XIA and BAI,XIS and LUY,TIB and CHA were still belongs to one cluster at K=6、7、8.This was consistent with locations and breeding history of the nine breeds.The admixed individuals distributed in all the nine breeds,but migrants only distributed in TIB,XIS and LUY populations

【英文关键词】cell proliferation; flow cytometry; immune organ; Gushi chicken
【中文摘要】应用流式细胞术研究了固始鸡免疫器官内细胞增殖的动态变化。结果表明:(1)固始鸡不同免疫器官内细胞均以G1期细胞为主,少量细胞为S期和M期,无异倍体细胞。不同免疫器官细胞周期动态变化相似,部分发育阶段之间存在差异。(2)不同发育阶段固始鸡免疫器官细胞增值指数由大到小依次是脾脏、法氏囊和胸腺;在8周龄(胸腺)、或12周龄(脾脏和法氏囊)以前,免疫器官细胞增值指数处于上升阶段,而后逐渐下降,这一结果与固始鸡免疫器官生长发育的测定及其动态变化的分析基本一致。
【英文摘要】Dynamic changes for cell proliferation in immune organs of Gushi chickens were measured and analyzed with flow cytometry.The results indicated that:(1) the majority of cells,in different immune organs of Gushi chickens,were in G1 phase,and a few in S phase and M phase.Heterploid cells were not found.The dynamic changes of cell cycles in different immune organs were similar to each other,but significant differences existed between some developmental stages.(2) The proliferous indexes(PI),from large to small,were spleen,Bursa and thymus in order during different developmental stages.The PI increased before 8 weeks(thymus) or 12 weeks(spleen and Bursa),and then decreased gradually.The latter result was basically as same as the study on the growth and development of immune organs of Gushi chickens.

【题目】鸡白细胞中抗菌肽的分离纯化及活性鉴定方法的建立
【中文关键词】鸡白细胞; 抗菌肽; 纯化; 活性检测
【英文关键词】chicken leucocyte; antimicrobial peptide; purification; activity identification
【中文摘要】【目的】建立鸡白细胞中抗菌肽的分离纯化及活性鉴定方法。【方法】通过腹腔注射酪蛋白生理盐水,从鸡人工腹水中得到白细胞;将收集的白细胞,通过超声波反复破碎、体积分数10%乙酸浸提、低温高速离心、旋转蒸发除去乙酸和冷冻干燥等方法,得到抗菌肽粗提物;将得到的粗提物,经CM-Sepharose Fast Flow弱酸性阳离子交换层析和反相高效液相色谱(RP-HPLC)纯化,收集分离的各组分,使用微量琼脂糖弥散法检测各组分的抗菌活性和最小抑菌浓度。【结果】共获得鸡抗菌肽粗提物0.270 g,经RP-HPLC分离纯化,抗菌肽离子交换阳性组分共分离出18个峰,其中6个峰对3种细菌均表现较强的抑菌活性,对鸡大肠杆菌E.coliO78(峰13)、金黄色葡萄球菌S.au-reus1056MRSA(峰15)和白色念珠菌C.albicansATCC10231(峰15)的最小抑菌浓度分别为0.627,0.001和0.035 μg/mL。【结论】该法可以在实验室中用于鸡抗菌肽的提取及活性鉴定。
【英文摘要】【Objective】 The study was to extablish isolation,purification and activity identification method of chicken leucocyte antimicrobial peptides.【Method】 Sterile peritoneal exudates were harvested from chicken after injecting saline with starch,then the white blood cells were collected.The white blood cells were sonicated to release the neutrophil granules.These granules were suspended in acetic acid and mixed overnight to extract the antimicrobial peptides.Iox-exchange chromatography and reversed phase high performance liquid chromatography(RP-HPLC) were used to seperated the components present in the crude extract.Antimicrobial activity and the minimum inhibitory concentrations(MICs) were determined by the radial diffusion plate assay method.【Result】 0.270 g chicken crude extract was obtained.Using RP-HPLC the components in the active cationic fraction were separated into 18 peaks;peak 8 had good activity against all three test organisms;the minimum inhibitory concentrations of peak 13 against chicken E.coli O78,peak 15 against S.aureus 1056MRSA and peak 15 against C.albicans ATCC10231 was 0.627,0.001 and 0.035 μg/mL respectively.【Conclusion】 This method could be widely used to purify chicken antimicrobial peptides and identify antimicrobial activity in laboratory.

【题目】固始鸡免疫器官内细胞凋亡相关蛋白Bax和Bcl-2的动态表达
【中文关键词】细胞凋亡; Bax; Bcl-2; 凋亡相关蛋白; 免疫组织化学; 免疫器官; 固始鸡
【英文关键词】apoptosis; Bax; Bcl-2; apoptosis related protein; immunohistochemistry; immunity organ; Gushi chicken
【中文摘要】应用免疫组织化学技术和Leica显微图像处理系统,对细胞凋亡相关蛋白Bax和Bcl-2在固始鸡免疫器官内的动态表达进行了研究。结果:Bax蛋白在不同发育阶段固始鸡免疫器官内均有表达,但表达量不同;Bax蛋白表达于固始鸡免疫器官内淋巴细胞细胞膜、细胞质和细胞核;Bax蛋白表达阳性细胞在固始鸡不同免疫器官内分布位置不同,呈散在或簇团状分布:脾脏内不同部位均有分布,主要在动脉周围淋巴鞘、红髓、淋巴小结边缘、边缘区,很少出现在淋巴小结内;胸腺内主要分布于胸腺小叶的皮质与髓质交界处,其次是胸腺小叶髓质,极少出现于皮质;法氏囊内阳性细胞主要分布于黏膜靠近上皮细胞的固有膜层内、淋巴滤泡间的区域,在淋巴滤泡边缘的少量淋巴细胞也有Bax蛋白表达,淋巴滤泡内极少有阳性细胞。Bcl-2蛋白在固始鸡免疫器官内的表达与Bax相似,但表达量与Bax相比较少。以上结果表明,细胞凋亡相关蛋白Bax和Bcl-2参与了固始鸡免疫器官内淋巴细胞发育分化过程中的凋亡调控,对免疫器官的稳定发挥重要作用。 更多还原
【英文摘要】Study on dynamic expression of the apoptosis related protein Bax and Bcl-2 in immunity organs of Gushi chickens was performed and analyzed by using immunohistochemistry technology and Leica Microsystems.The results showed that the expressions of Bax protein in different immunity organs were observed,however,numbers of the positive cells of Bax protein were different on different developmental stages.The positive Bax-protein was found in cell membrane,cytoplasm and nucleus of lymphocytes.The positive cells were dispersedly(or in clusters) distributed in different places for different immunity organs.Most of the positive cells,in spleen,were found in periarterial lymphatic sheath,red pulp,edge of splenic nodules and marginal zone,few of them in inner of splenic nodules.The positive cells,in thymus,were localized mainly in the connective zone of thymic cortex and thymic medulla,secondly in thymic medulla,and a few in thymic cortex.In Bursa,the majority of positive cells were observed in lamina propria of mucous membrane and areas between lymphoid follicles,a few in edge of lymphoid follicles,and few in inner of lymphoid follicles.The expression of Bcl-2 in the immunity organs of Gushi chickens was similar to that of Bax,but the expression level of Bcl-2 was less than that of Bax.All results mentioned above indicated that the apoptosis related protein Bax and Bcl-2 participated in the regulation of apoptosis of thymocytes and lymphocytes,and played the important roles in keeping the immunity organs stable.

【题目】如皋鸡Mx基因2032位点多态性与经济性状的关联分析
【中文关键词】Mx基因; 抗性基因; 经济性状; 鸡
【英文关键词】Mx基因; 抗性基因; 经济性状; 鸡
【中文摘要】采用错配PCR-RFLP对如皋鸡Mx基因2032位点多态性进行检测,结果如皋鸡Mx基因2032位点经RsaⅠ酶切后,检测到AA、AG和GG3种基因型,基因型频率分别为0.161、0.678和0.161,抗性等位基因A的频率为0.500。χ2适合性检验表明,如皋鸡Mx基因在RsaⅠ酶切位点上等位基因的分布显著偏离Hardy-Weinberg平衡状态。分析这3种基因型与如皋鸡一些经济性状间的关联性,结果表明:抗性纯合子AA基因型的个体各阶段体重、体尺以及主要屠宰性状均小于AG和GG基因型

的个体,但是除了体斜长和胫围外,AA基因型个体的重要经济性状包括常规肉质与AG和GG基因型的个体差异不显著。 更多还原

【英文摘要】The Mx gene in Rugao chicken was analyzed with mismatch PCR-RFLP method,the results showed that M2032 locus of Mx gene digested by restriction endonuclease Rsa Ⅰ could be divided into three kinds of genotypes,AA,GG and AG.The frequencies of these genotypes were 0.161,0.678 and 0.161,respectively.The frequency of resistance allele A was 0.500.The result of Chi Square test indicated that the frequencies of Mx gene digested by Rsa Ⅰ were significantly deviated from Hardy-Weinberg equilibrium in this study.The correlation between the three genotypes and some commercial traits was analyzed,the results showed that the body weight of different developmental stage,body size and mainly slaughter traits of the individuals with resistant genotype AA were lower than those with susceptible genotype AG and GG,but except for bias length and shank circumference,all other commercial traits including meat quality of the individuals with resistant genotype AA were not significantly different with those individuals with AG and GG genotypes in Rugao chicken.

【题目】优质肉鸡矮小型母系品系(S2系)产蛋性状的通径分析

【中文关键词】优质肉鸡; 矮小型品系; 产蛋性状; 通径分析

【英文关键词】quality chicken; dwarf line; laying traits; path coefficient analysis

【中文摘要】以4429只优质肉鸡矮小型母系品系(S2系)核心群个体产蛋数据为试验材料,运用通径分析法研究开产日龄(X1)、开产体重(X2)、开产蛋重(X3)、24周产蛋数(X4)、28周产蛋数(X5)5个产蛋性状因子与43周产蛋总数的关系。结果表明:各性状因子的通径系数分别为-0.17576、0.051788、-0.02997、0.259459、0.597501;28周产蛋数是影响43周产蛋数的主要决定因子。各性状(Xi)对43产蛋数(Y)的最优回归方程为:Y=56.826-0.292X1+0.006X2-0.030X3+0.770X4+3.106X5(P<0.01),总相关系数为0.8760,决定系数为0.7674。 更多还原

【英文摘要】Laying traits data of 4 429 dwarf female line(age at first egg,body weight at first egg,egg weight at first egg, egg number at 24 weeks old,egg number at 28 weeks old,egg number at 43 weeks old) were used to analyze correlation coefficient and path coefficient. The results showed that correlation coefficients were -0.17576,0.051788, -0.02997, 0.259459,0.597501,respectively. Egg number at 28 weeks old had a main effect on egg number at 43 weeks old. The path coefficient analysis was revealed the exact relationship between independent variables and dependent variable. We established the best regression equation:Y=56.826-0.292X1+0.006X2-0.030X3+0.770X4+3.106X5. Correlation coefficient and decision coefficient between all traits and egg number at 43 weeks old were 0.8760 and 0.7674,respectively.

【题目】PURH基因对鸡肉肌苷酸含量的遗传效应及其表达.
【中文关键词】鸡; 发育性变化; 肌苷酸; PURH基因; 单核苷酸多态性
【英文关键词】chicken; developmental stage; inosine monophosphate content; PURH gene; single nucleotide polymorphism
【中文摘要】以鸡氨基咪唑氨甲酰核苷酸转甲酰基酶/次黄嘌呤核苷酸环水解酶基因(PURH)为影响肌肉肌苷酸(IMP)含量的侯选基因,以鸡(Gallus gallus)5个品种为材料,采用PCR-SSCP与测序相结合的方法对PURH基因所有外显子及部分内含子区域进行单核苷酸多态性(SNPs)检测;同时采用实时荧光定量PCR方法对PURH基因在白耳鸡不同组织中的发育性表达进行了初步研究。结果共发现2个单核苷酸多态性位点,分别为外显子9中的A8023T突变和外显子16中的T17446C突变,仅T17446C位点的多态性与肌肉肌苷酸含量存在显著的关联,两个位点单倍型的效应要高于单个基因型的效应,推测PURH基因可能是影响IMP含量的主效基因或与主效基因相连锁,以单倍型作为鸡肉质性状的潜在的分子标记更有优势。在白耳鸡不同生长阶段不同组织中均检测到PURH mRNA的表达,其表达量呈明显的时序性变化,提示PURH基因的表达对肌苷酸的沉积具有一定程度的影响。
【英文摘要】The effects of the 5-aminoimidazole-4-carboxamide ribonucleotide formyltransferase/ inosine monophosphate(IMP) cyclohydrolase gene(PURH) on chicken(Gallus gallus)muscle IMP content and its expression characterization were investigated.Muscle IMP content was measured in five chicken breeds.Single nucleotide polymorphisms(SNPs) were detected by PCR-SSCP and DNA sequencing.The developmental pattern of PURH mRNA expression in different tissues in Baier chickens were determined by quantitative real-time PCR.Two SNPs were detected, A/T substitution at position 8023 in exon 9, and T/C substitution at position 17 446 in exon 16.Only T17446C polymorphism was associated with IMP content.The haplotype effect was higher than that of the single genotype effect.It could be concluded that PURH gene is a candidate locus or linked to a major gene that affects muscle IMP content.Haplotypes are superior to single genotypes as potential molecular markers for meat quality traits in chicken.The mRNA of PURH gene was detected in different tissues of different growth stages;and the pattern of developmental changes of PURH mRNA in different tissues were similar, which increased with the age before 12-week-old, the peak level be found at 12-week-old, and then declines.This result suggested that PURH gene expression has a certain extent effect on IMP content.

【题目】Mx基因抗性位点在12个地方鸡种中的分布及遗传结构分析.
【中文关键词】鸡种; Mx基因; 遗传结构; 聚类分析
【英文关键词】chicken breed; Mx gene; genetic structure; clustering analysis
【中文摘要】通过PCR-RFLP技术检测Mx基因S631N位点的抗性等位基因A和敏感性等位基因G在我国地方鸡种中的分布差异。结果表明:PCR-RFLP能准确检测出抗性等位基因A与敏感性等位基因G在12个地方鸡种内的突变,抗性等位基因A在所有群体内的基因频率平均为0.304,敏感性等位基因G的频率平均为0.696;12个地方鸡种群体Mx基因S631N位点的观察杂合度平均为0.657 2,Shannon信息指数平均为0.524 0。在该位点上,12个地方鸡种除仙居鸡显著偏离Hardy-Weinberg平衡

(P<0.01)外,其余11个群体均处于Hardy-Weinberg平衡状态(P>0.05);经Ewens-Watterson中立性检验,该位点在各群体内(除白耳鸡群体外)都属于中立性选择。基于该位点等位基因频率构建的UPGMA聚类图将12个地方鸡种分为3大类,聚类结果反映了12个地方鸡种在Mx基因抗性方面存在的差异和优势。

【英文摘要】In the experiment,PCR-RFLP technique was used to detect the diffrences of the resistant and sensitive alleles distribution of S631N locus of Mx gene in twelve Chinese indigenous chicken populations.The results showed that the PCR-RFLP technique properly detected the mutation between resistant allele A and sensitive allele G.Among the twelve populations,the average frequencies of resistant allele A and sensitive allele G were 0.304 and 0.696,respectively.The average value of observed heterozygosis and Shannon ' s index at this locus were 0.657 2 and 0.524 0,respectively.Except for Xianju chicken,the other eleven populations were all in Hardy-Weinberg equilibrium at this locus(P>0.05).Except for Baier chicken,the Ewens-Watterson test indicated that this locus was neutral in all the other populations.The dendrograms based on allele frequency divided the twelve indigenous chicken populations into three clusters,which reflected the difference and advantage of Mx antiviral property in twelve indigenous chicken populations. 更多

【题目】日粮添加苜蓿草粉对固始鸡体重、体尺指标和内脏器官发育的影响

【中文关键词】固始鸡; 苜蓿草粉; 体重; 体尺指标; 内脏器官

【英文关键词】Gushi chickens; Alfalfa meal; Body weight; Body measurements; Internal organs

【中文摘要】本试验旨在研究日粮不同苜蓿草粉添加水平对同始鸡体重、体尺指标和内脏器官发育的影响,探讨固始鸡对饲粮中苜蓿草粉的耐受水平。选取同批孵化的健康固始鸡慢羽纯系雏鸡1 152只,随机分为6组,每组设4个重复,每个重复48只,公母各占1/2,分别饲喂含0、5%、10%、15%、20%和25%苜蓿草粉的日粮,试验期8周。结果表明:在2、4、6及8周龄时试验组固始鸡体重、各肠段长度、大多数内脏器官重和器官指数、8周龄时体尺指标与对照组间差异均不显著(P>0.05)。试验结果表明,日粮中添加0~25%苜蓿草粉对1~8周龄固始鸡体重和体尺指标没有产生显著影响;对其大多数内脏器官发育没有产生显著影响。说明固始鸡对粗饲料有一定的耐受能力,其日粮中可以添加较高水平的苜蓿草粉。

【英文摘要】This experiment was conducted to study the effects of alfalfa meal addition in diet on body weight,body measurements and internal organs development of Gushi chickens,and to find out alfalfa meal addition level that Gushi chickens could tolerate in diet.One thousand one hundred and fifty-two healthy Gushi chickens were selected and randomly assigned to six groups with four replicates in each group and forty-eight chickens (half male and half female) in each replicate.Six groups were fed diets with 0,5%,10%,15%,20% and 25% alfalfa meal,respectively.The experiment lasted for 8 weeks.The results showed that there were no significant effects on body weight,body measurements,length of duodenum, jejunum,ileum and cecum,weight and indices of most internal organs of Gushi chickens at 2,4,6,8 weeks of age between control group and exprimental groups (P>0.05).These results indicated that there were no significant effects on body weight,body measurements and most internal organs development of Gushi chickens with alfalfa meal content from 0 to 25% in diets.Gushi chickens could tolerate certain level of crude fiber in diet,and higher level alfalfa meal could be added to the diet of Gushi chickens.

【题目】固始-安卡鸡F2资源群Δ-9脂肪酸脱氢酶基因第4、5、6外显子SNP及其脂肪酸相关性研究
【中文关键词】鸡; Δ-9脂肪酸脱氢酶基因; 单核苷酸多态性; PCR-SSCP; 脂肪酸
【英文关键词】Chicken; Δ-9 desaturase gene; SNP; PCR-SSCP; Fatty acid
【中文摘要】利用PCR-SSCP(single strand conformation polymorphism)方法,对固始-安卡鸡F2代资源群△-9脂肪酸脱氢酶基因第4、5、6对外显子多态性进行分析,发现存在一个单核苷酸多态(SNP,single nucleotide polymorphisms)位点。在△-9脂肪酸脱氢酶基因第4外显子编码区(89nt)发生了碱基的转换突变(G→A)。在整个F2代资源群中进行了该多态位点与脂肪酸性状的相关分析,结果表明:在8个脂肪酸性状中,AA型个体十六碳二烯酸(C16∶2)含量显著高于GG型和GA型个体(P<0.05);家系1中AA型的C16∶0、C16∶2、C18∶0含量均显著高于GG型和GA型(P<0.05);家系3中AA型的C14∶0含量显著高于GG型和GA型(P<0.05)。
【英文摘要】PCR-SSCP technology was used to analyze the polymorphisms of extron 4,5,6 of △-9 desaturase gene in F2 chickens derived from Gushi chick to Anka chick.A SNP locus and G→A mutation at 89 nt of the extron 4 were found.The correlation statistical analysis indicated that F2 chickens with genotype AA had significantly higher C16∶2 content(P<0.05).Family 1 chickens with genotype AA had significantly higher C16∶0,C16∶2,C18∶0 content(P<0.05).Family 3 chickens with genotype AA had significantly higher C14∶0 content(P<0.05).

【题目】神经肽(NPY)基因多态性与邵伯鸡繁殖性状的关联性分析
【中文关键词】邵伯鸡; SNP; NPY基因; 繁殖性状
【英文关键词】Shaobo chicken; SNP; NPY gene; reproduction traits
【中文摘要】以神经肽(NPY)基因为候选基因,利用PCR-SSCP技术检测该基因的SNPs,并分析基因多态性与邵伯鸡母系母鸡的开产日龄、开产蛋重、开产体重以及300日龄总产蛋数之间的关联性。结果显示,在NPY基因上发现1个SNP位点,带有1对等位基因A和B,基因频率分别为0.35和0.65;不同基因型仅与开产体重性状间有显著相关,表现为基因型AA个体的平均开产体重比基因型AB个体的平均开产体重重119.03 g,且差异显著(P<0.05),基因型AA个体的平均开产体重比基因型BB个体的平均开产体重重47.6 g,但差异不显著(P>0.05);基因型BB个体的平均开产体重比基因型AB个体的平均开产体重重71.43 g,差异显著(P<0.05)。
【英文摘要】In this study,neuropeptideY(NPY) gene was used as a candidate gene to analyze the association of polymorphisms sites with reproduction traits in female line of Shaobo chicken,which included age at first egg(AFE),weight at first egg(WFE),the body weight at first egg(BWFE) and the total number of eggs with 300 age(EN).The result indicated that a SNP site was detected by PCR-SSCP.Frequencies of allele A and B at the SNP site were 0.35 and 0.65,respectively.The significant difference was found only between genotypes and the body weight laying at first egg.The average body weight at first egg of genotype AA is 119.03 g and 47.6 g more than that of genotype AB and BB,respectively,and the difference between genotypes AA and AB is significant(P<0.05);The average body weight at first egg of genotype BB is 71.43 g more than that of genotype AB,and the difference between the two genotypes is not significant(P>0.05). 更多

【题目】秸秆还田技术在中国生态农业发展中的作用
【中文关键词】秸秆; 生态农业; 土壤有机质
【英文关键词】straw, ecological agriculture, soil organic matter
【中文摘要】中国的秸秆资源丰富,含有大量的营养元素,是宝贵的可再生资源。秸秆还田技术可以大面积以地养地,是低耗持续的农业生产方式,对提高土壤有机质的含量和质量,改善土壤的物理性状,培肥土壤,增加土壤微生物活性,提高农作物增产的潜力,防止农田土壤沙化和改善农业生态环境有重要的作用。同时,通过秸秆还田技术,减少农业生产造成的污染,实现秸秆的资源化利用,促进循环农业的快速发展。
【英文摘要】The straw is not only abundance in our country, but also is valuable regenerative resource containing lots of nutrient element. It is low and sustaining consumption mode of production in agriculture of the technology of straw returning to field, which can use soil to cultivate terra, enhance the content and quality of the soil organic matter , meliorate the soil fertility, improve the soil physical properties, fortify the activity of the edaphon, increase the crop yield, prevent the land from deserting and improve the

agricultural entironment. At the same time, we can achieve the resource utilization of straw, reduce the pollution by agriculture production and promote the fast development of cyclic agriculture by the technology of straw returning to field.

【题目】冬小麦品种抗霜冻力的影响因素分析
【中文关键词】冬小麦; 幼穗; 抗霜冻力; 发育期;
【英文关键词】Winter wheat; Young ear; Frost resistance; development stage;
【中文摘要】应用移动式人工霜箱,研究了冬小麦幼穗抗霜冻力随发育期的变化规律。结果表明,随发育期进程,幼穗抗霜冻力呈下降趋势,从药隔前期开始进入低温敏感期。利用室内人工霜箱,在药隔前期对21个品种进行了抗霜冻力鉴定,进而分析了不同品种、冬春性、越冬抗冻力以及叶片可溶性糖含量等对冬小麦抗霜冻力的影响。结果表明,除少数品种有一定抗霜冻力外,多数品种抗霜冻力无显著差异。品种抗霜冻力与其冬春性和越冬抗冻力均无显著相关性,与叶片可溶性糖含量之间亦无显著相关性。
【英文摘要】Frost often causes young ear injury at the elongation stage of wheat,the frost-sensitive period,leading to yield reduction.The objectives of this study were to understand how frost resistance of young ears(FRYE) varied with development progression to find the most frost-sensitive stage,and the factors affecting the FRYE,which is of importance for determining the feasible phase to evaluate the frost resistance of different wheat cultivars and,providing guidance to select the cultivars with frost resistance,as well as developing the frost prevention technologies.In this study,change in FRYE with development progression was investigated with 4 cultivars of winter wheat(Triticum aestivum L.),using the Movable Artificial Climate Chamber.Frost resistance of young ears of 21 cultivars were tested at earlier stage of anther connective formation phase(ACFP) using the Room Climate Chamber and the effects of several factors on FRYE,such as cultivars,varietal types,winter hardiness,and soluble sugar content of leaves were analyzed.Degree of injury was examined using the microscopes.The results showed that there was a decreasing trend for FRYE with procession of development and a sharp drop at the beginning of ACFP,suggesting that the sensitive phase to low temperature for young ears started with ACFP.Frost resistance of young ears closely related to development progression,and difference in frost injury among cultivars was mostly caused by differences in plant development progression;no significant differences could be found among most of the cultivars,except a few ones with a strong frost resistance;no significant correlations existed between varietal pattern and FRYEs,between FRYEs and winter hardiness,and between FRYEs and soluble sugar contents of leaves.Therefore,evaluation of FRYE and selection of cultivars with frost resistance need to perform in same development stage,especially in the frost-sensitive stage.And some indices for winter hardiness can not be used to estimate frost resistance of cultivars.

【题目】黄淮麦区小麦拔节后霜害的风险评估
【中文关键词】冬小麦; 拔节期; 霜害; 风险评估;
【英文关键词】winter wheat; jointing stage; frost injury; risk assessment;
【中文摘要】小麦拔节后抗寒力迅速减弱,遇强冷空气侵入会发生霜害。该文首先分析了黄淮麦区小麦拔节期的变化规律和霜害温度出现的规律。结果表明:逐日进入拔节期的概率随日序的变化可以用正态分布函数来表示;霜害温度出现的累积概率随日序的变化可以用指数方程表示。根据拔节期和霜害温度出现的规律,建立了霜害的风险评估模式。给出了霜害

风险度的地区分布,并指出利用模式中的参数值可以判断几种防御措施的有效性。

【英文摘要】The resistance of the winter wheat drops rapidly when the plants begin to joint in early spring,in which season air temperatures fluctuate frequently.Winter wheat plants are prone to spring frost injury once strong cold air invades.The variation in wheat jointing date and the occurrence of low temperatures for frost injury(LTFI) in Huang-Huai wheat production areas are analyzed.The jointing date is affected mainly by cultivars growth.The occurrence of LTFI is mainly determined by the local climate.The variation in probability of wheat developing into jointing stage with Gregorian day could be expressed well by normal distribution function,and the accumulative probability of the occurrence of LTFI by exponential function.Based on these analyses,the mathematical model for assessing the degree of frost injury risk(DFIR) is then established.DFIR is mainly determined by such parameters as the termination date for some frost temperature(μ),the earliest jointing date(K),the standard deviation of the jointing date(σ),and the rate of variation in the accumulative probability of frost temperature with Gregoran day proceeding(b) etc.Parameters in the assessment model differ among the counties located in Huang-Huai and around area,leading to the different DFIR.According to the DFIR function,the zone with high DFIR is from the upriver region of Hanshui River that lies to the south of the Qinling Mountain,via the western Huang-Huai plain,to the plain lying in the mid-lower region of Huaihe River.The DFIR tends to drop gradually northwards and southwards,more rapidly for the former than the latter.Some effective measures could be chosen according to the properties of the parameters in the given area.In the area with high b value and low σ value,postponing the jointing stage may reduce the DFIR effectively;while in the area with high σ value,avoiding wheat jointing particularly early,appropriate cultivars and sowing date seem to be a good strategy to reduce DFIR;for the area of high DFIR calculated from the function with combined parameters,growing the frost resistant varieties becomes the most effective measure to avoid frost injury.

【题目】不同农业利用方式下土壤铜和锌的累积

【中文关键词】农田; 铜含量; 锌含量; 累积

【英文关键词】farmlands; copper content; zinc content; accumulation

【中文摘要】通过对山东寿光表层农业土壤(0~20cm)铜和锌的调查研究,了解不同农业利用方式下土壤铜和锌含量的差异,揭示其空间分布规律及其累积特征。从研究区域采集来自设施菜地、露天菜地、小麦/玉米/棉花地和自然土壤等4类当地主要农业利用方式的土壤(n = 127) ,样点覆盖寿光整个农业生产区域。结果表明,山东寿光农业土壤的铜含量均值为26.43mg.kg- 1,极差69 11 mg.kg- 1,锌含量均值为80.50mg.kg- 1,极差210. 8 mg.kg- 1。不同农业利用方式的土壤铜锌含量从高至低的顺序均为:设施菜地>露天菜地>小麦/玉米/棉花地>自然土壤,不同农业土壤铜锌含量均出现了明显累积趋势,其中,以设施菜地的累积问题最为突出,其铜锌含量分别为33.91、124.2mg·kg- 1,显著高于其它农业利用土壤类型,但均未超过国家土壤环境质量II级标准;从研究区域铜锌含量的空间分布看,当地农业土壤铜锌含量均表现为北部、南部区域较低、中部地带较高的趋势;在集约化种植模式下,设施菜地铜锌含量随着设施年限的延长显著增加(p < 0.05),其累积速率分别为1.49mg·kg- 1.a- 1和2. 59 mg.kg- 1.a- 1,这可能与铜锌含量相对较高的有机肥大量施用有关。

【英文摘要】This paper presented the differences among the content of copper and zinc in the upper soils (0 - 20cm) under different agricultural practices and their corresponding spatial distribution through the investigation in Shouguang, Shandong province. The characteristics of accumulation of copper and zinc content in the farmlands and natural field of the studied region were also discussed. In this study, a total of 127 soil samples were collected from greenhouse vegetable field, open vegetable field, wheat /maize / cotton field and natural field. The sampling location covered all the agricultural production region of Shouguang County. The results indicated that the range for the content of copper in local agricultural lands was 69.11 mg.kg- 1 with the average content 26.43 mg.kg- 1 , and the range for zinc was 210.8 mg·kg- 1 with the average amount of 80.50 mg.kg- 1. In comparison with different agricultural lands, the highest concentration for copper and zinc appeared in the vegetable land under p rotected cultivation with the average content of 33.91 mg.kg- 1 for copper, 1. 38 -1.56 times higher than that of any other agricultural land, and the content of zinc was 124. 2 mg.kg- 1 , which is also 1.49 - 1.69 times higher than that in soils of other agricultural lands. The content of copper and zinc in different soils ranked in this order: Greenhouse vegetable field > Open vegetable lands > Wheat /maize / cotton field > Contrast soils. Though accumulation of copper and zinc in agricultural soils occurred in different agricultural lands, the content of copper and zinc did not

exceed the permitted limit. The spatial distribution map of copper and zinc showed that relatively higher content occurred in the middle part, and relatively lower concentration appeared in the northern and southern region. Under the pattern of intensive farming, the content of copper and zinc in vegetable land under p rotected cultivation increased significantly in linear trend ($p < 0.05$) with the cultivation years p rolonged, and related accumulation rate in soils was 1.49 mg kg- 1 a - 1 for copper and 2.59 mg.kg- 1 a - 1 for zinc, which was probably related to application of abundant organic fertilizer with high content of copper and zinc.

【题目】一株新的溶磷棘孢青霉菌Z32的分离、鉴定及其土壤定殖与溶磷特性
【中文关键词】溶磷菌;刺孢青霉;定殖;无机磷分级
【英文关键词】phosphate-dissolving microorganism; Penicillium aculeatum; colonization; inorganic-P fraction
【中文摘要】【目的】从植物根部土壤中分离到一株高效溶磷真菌Z32,进行了分类学鉴定和土壤定殖与溶磷特性的初步研究。为溶磷微生物的应用提供新的菌株。【方法】通过形态特征、培养特征和ITS rDNA 序列分析方法进行菌株鉴定。通过菌株Z32 在土豆液体培养基培养过程中培养液pH 的变化确定溶磷菌株的溶磷能力。利用菌株土培试验,进行菌株的土壤定殖和土壤中不同形态无机磷转化试验。【结果】菌株Z32 鉴定为棘孢青霉菌(Penicillium aculeatum)。菌株Z32能在4d内完全溶解固体培养基中的磷酸三钙,18h内将土豆液体培养基的pH值从7.0降低到1.5左右。菌株Z32在20°C时的定殖效果最好,21d 时,菌数达到起始的9 83倍,而且能够保持到49d 不消亡。在20°C时,添加菌株Z32的土培实验在21d 时,土壤中Ca8H2(PO4)6·5H2O、AlPO4和FePO4等难溶无机磷向可溶性的CaHPO4转化,CaHPO4含量增加了58.83%。49d时,土壤中的Ca8H2(PO4)6·5H2O、AlPO4和FePO4被转化后,没有随着微生物的减少而完全被固定。【结论】筛选到一株新的溶磷菌株Z32在土壤中很好定殖,能够转化土壤中多种形态的难溶无机磷为可溶性的CaHPO4,显著增加土壤CaHPO4的含量。同时阻滞了Ca8H2(PO4)6·5H2O、AlPO4和FePO4等难溶无机磷的固定。
【英文摘要】[Objective]To obtain new strains that can dissolving phosphate,we screened and identified a new strain Z32capabile of phosphate dissolving from soil samples. We studied the colonization and phosphate-dissolving characteristics ofZ32 in soil. [Methods] Morphological,growth on various media,and ITS rDNA sequences homology analysis were performed to identify the strain Z32. We conducted a soil experiment in pot to investigate the colonization and the capbility of the different forms of inorganic phosphorus transformation of the strain Z32. [Results]The strain Z32 was identified as Penicillium aculeatum. Z32 dissolved all Ca3(PO4)2 in solid culture for 4 days and decreased the pH from 7. 0 to 1. 5 in potato liquid culture for 18 hours. Z32 presented high colonization ability in soil and the optimum colonization temperature was 20°C. The number of Z32 increased 9. 83 times in 21 days and kept alive in 49 days at the optimum temperature. Z32 promoted the transformation of insoluble phosphate like Ca8H2(PO4)6·5H2O,AlPO4 and FePO4 to soluble CaHPO4 and the CaHPO4 content increased by 58. 83% in soil compared to CK at the 21st d at 20°C. [Conclusion]A new strain Z32 with high performance of phosphate dissolving had colonized well in soil. Z32 showed high phosphate-dissolving ability for different kinds of inorganic phosphorus in soil. At the same time,Z32 inhibited the transformation of CaHPO4 to insoluble phosphate.

【题目】纤维素降解真菌Y5的筛选及其对小麦秸秆降解效果
【中文关键词】筛选; 真菌; 赭绿青霉; 酶活力; 纤维素降解
【英文关键词】isolation; fungi; Penicillium ochrochloron; cellulase activity; cellulose degradation
【中文摘要】为了利用纤维素降解菌促进作物秸秆快速腐解还田,解决秸秆资源浪费和污染环境问题,进行了高效秸秆纤维素降解微生物的筛选和降解效果研究. 采用固体平板和液体摇瓶培养,从黑龙江黑土样品中筛选出1 株能够降解羧甲基纤维素、秸秆木质纤维素、高产纤维素酶的丝状真菌Y5,通过形态学观察和ITS rDNA 序列分析对该真菌进行了初步鉴定. 利用DNS 还原糖方法,对菌株在不同的培养时间、纤维素类型、氮源种类以及初始pH 值情况下纤维素酶活力进行了研究. 采用失重法、液体摇瓶法对菌株降解小麦秸秆的能力进行了研究. 结果表明,筛选的秸秆降解菌株Y5 经鉴定为赭绿青霉(Penicillium ochrochloron)。菌株Y5 液体培养4 d 的全酶活(FPA) 和内切酶活(EG) 最高,分别为53 IU /mL和55 IU /mL,比对照

菌株(绿色木霉AS3. 3711) 高出22. 6% 和18. 2% ;Y5 菌株以小麦秸秆为作用底物时的酶活最高,2 种酶活分别比对照菌株提高27. 5% 和24. 8% ;以NaNO3为氮源时酶活性最大,FPA 和EG 比菌株AS3. 3711 分别提高35. 7% 和14. 9% ;培养液初始pH 为6 时全酶活最大为51. 4 IU /mL. 菌株Y5 培养10 d 降解小麦秸秆纤维素、半纤维素、木质素分别达到了43. 5% 、49. 7% 和9. 3% ,对小麦秸秆纤维素与半纤维素降解能力强. 赭绿青霉Y5 对小麦秸秆纤维素具有很强的降解能力,其纤维素酶活高于已报道的菌株,该菌株的获得为秸秆降解菌剂的研究与应用提供了具有较高潜力的菌种.

【英文摘要】In order to promote the decomposition of crop straw and return it to soil rapidly and solve the problems such as the waste of straw resources and pollution,we screened the bacterial or fungi with high-efficient degradation of straw lignocelluloses and studied its capability of degradating wheat straw. An isolate of filamentous fungus with higher cellulase activity and ability to decompose CMC and straw lignocellulose was screened from black soil samples taken from Heilongjiang province by using the soil dilution,plating and liquid culture methods. Morphological status on various media,and ITS rDNA sequences homology analysis were performed to identify the taxonomy of the isolate. The effects of different time,different N resources,different cellulose resources and different pH values on enzyme activities produced by fungus was analyzed,and The ability of wheat straw degradation of Y5 was determinated by using weigh. loss method and liquid culture. The fungus was identified as Penicillium ochrochloron and named Y5. Filter paper activity(FPA) and endo-1,4- β -D-glucanase (EG) were both reached the maximum after the first fourth day inoculated,averaged 53 IU /mL and 55 IU /mL,respectively,which were 22. 6% and 18. 2% higher than that of strain Trichoderma viride(AS3. 3711) ,respectively. Enzyme activities were the highest under the condition of wheat straw used as C resources,which were 27. 5% and 24. 8% higher than that of AS3. 3711. The FPA and EG activities were 35. 7% and 14. 9% higher than the AS3. 3711 strain with NaNO3 as nitrogen source. The optimal pH value of liquid culture was 6. The cellulose,hemicellulose and lignin contents were degraded by 43.5% ,49.7% and 9.3% after the first 10 days inoculated,respectively,which indicated that Y5 had strong enzyme activities on degradation of cellulose and hemicelluloses of wheat straw. The Penicillium ochrochloron Y5 has strong ability of wheat straw cellulose degradation,and its cellulase activities are higher than some published researches. The Penicillium ochrochloron Y5 strain has the great potential in research and development for inoculant of crop straw decomposition.

【题目】土壤中砷的形态和生物有效性研究现状与趋势
【中文关键词】砷;价态;形态分析;生物有效性;测定方法
【英文关键词】arsenic;valence; speciation analysis; bioavailability; determination methods
【中文摘要】砷在自然界中分布极为广泛,与人类生活密切相关,在工农业生产活动中得到了广泛应用。但砷是高毒元素,在微量水平上就能对动植物体产生一定危害。砷的危害通过生物有效性予以表达,其生物有效性与其在土壤中的累积量及形态密切相关。本文就砷在土壤中的存在价态、与土壤胶体的结合形态、砷生物有效性及不同形态砷的测定技术与方法等方面进行了简要综述,并对未来相关领域的研究发展趋势作了展望,以期为深入开展土壤中砷形态及其生物有效性研究提供科学参考。

【英文摘要】Arsenic is distributed widely in nature and closely related to human life. It has been widely used in industrial and agricultural production activities. However, arsenic is a highly toxic element, and harmful to animals and plants, even at low concentration. The hazards of arsenic are usually expressed by bioavailability, which has a close relationship with the accumulated amount and its speciation in soils. This paper is mainly discussed the valence of arsenic, the combination of soil colloidal forms, the bioavailability and the determination methods of different arsenic forms, and the future trend in interrelated fields was also discussed for providing scientific reference on further research of the soil arsenic speciation and bioavailability.

【中文摘要】本文根据黄淮地区及其周边地区1981~2000年农业气象资料,导出1个计算小麦拔节后遭遇霜冻温度风险度(F)的经验方程,以F为指标做出黄淮麦区小麦霜冻的农业气候区划。进而根据F和方程中的参数,评价各类防御措施在各分区的必要性、有效性和可行性。
【英文摘要】Winter wheat becomes sensitive to frost injury once in elongation stage.Based on agricultural climatic data of Huang-Huai Area and the environs,an assessment function was developed to assess the degree of risk(F)wheat encounters in frost temperature.The agricultural climatic division of frost was then plotted out,using F as an indicator.Based on F and the function parameters,application of frost preventive measures in the different divisions was discussed in terms of necessity,validity and feasibility.

【题目】河北种质库部分作物种子生活力监测分析
【中文关键词】作物;发芽率;长期贮藏;河北种质库
【英文关键词】Crops;Seed germination percentage;Long-term storage;Hebei Genebank
【中文摘要】对河北省种质库中21种作物1.3万多份种子进行了生活力监测,结果表明,①贮存12~17年后,94.55%以上的被监测种子发芽率仍保持在80%以上,但有292份种子(占被监测份数的2.00%)发芽率出现了明显下降(从80%以上降至70%以下)。②不同作物种子发芽率的变化趋势不完全相同,燕麦和冬小麦亲本两种作物种子平均监测发芽率出现了显著下降。同一作物不同品种、荞麦、冬小麦和玉米不同类型、燕麦入库不同批次、夏大豆不同收获年代等贮藏后发芽率的变化也存在明显差异。与黄粒玉米相比,白粒玉米监测发芽率显著低于入库发芽率,但尚需扩大监测品种数量以验证其普遍性。
【英文摘要】Seed viability of 13137 accessions in 21 crops was monitored after storage for 12-17 years in Hebei Genebank, China. More than 94.5% accessions still maintained high germination percentage (GP) (over 80%). The GP of 292 accessions, accounting for 2% in total monitoring accessions, declined significantly from over 80% to under 70%. The change tendencies of seed viability of different crops were not completely same after storage. Mean GP declined significantly in oats and winter wheat parents after storage. Many factors including different varieties in the same crop, different types in buckwheat and winter wheat and corn, different storing sets in oat, different harvesting years in summer soybean, resulted in obvious difference of GP after storage. Mean GP of white corn declined significantly compared with yellow corn after storage, but further experiments with more accessions need to be done in order to test its universality.

【题目】河北省绿子叶黑豆种质资源表现型和ISSR标记遗传多样性分析

【中文关键词】绿子叶黑豆;种质资源;农艺性状;ISSR;遗传多样性
【英文关键词】Green-cotyledon black soybean; Germplasm; Agronomic character; ISSR ; Genetic diversity
【中文摘要】为了揭示河北省绿子叶黑豆种质资源的遗传多样性,为其研究利用提供理论根据,以46份原产河北省的绿子叶黑豆种质资源为试验材料,对其基于表型性状及ISSR标记鉴定结果进行了聚类分析,结果表明:7个ISSR引物共检测出60个等位变异,平均每个位点有8.6个等位变异,变幅为5~17个;ISSR引物的多态性信息量PIC变幅为0.721~0.927,平均0.820;利用表型性状和ISSR标记数据进行品种间遗传多样性分析,遗传相似系数变化范围分别为0.07~0.53和0.43~1.00,平均为0.284和0.704,遗传相似性变幅较大,河北省不同绿子叶黑豆品种间存在着丰富的遗传多样性。聚类结果显示,类群与品种来源地有关。
【英文摘要】The genetic diversity of green-cotyledon black soybean cultivars native to Hebei province was evaluated based on ISSR and agronomic characters. The results indicated that 60 alleles of 7 ISSR markers were detected among 46 cultivars with an average of 8.57 alleles per ISSR marker, and the number of alleles per primer ranged from 5 to 17. The value of allelic polymorphism information content (PIC) ranged from 0.721 to 0.927, on the average of 0.82 per primer. The value of genetic similarity (GS) indices of 46 cultivars based on the 14 agronomic traits and ISSR data varied from 0.067 to 0.533 and 0.43 to 1.0 respectively, with an average of 0.284 and 0.704, indicating that the genetic diversity among green-cotyledon black soybean cultivars from Hebei is abundant. The clustering results showed that the groups could reflect the origin of the cultivars.

【题目】磷脂酶Dδ参与植物的低温驯化过程
【中文关键词】低温驯化; 磷脂酶Dδ; 信号转导;
【英文关键词】cold acclimation; phospholipase Dδ; signaling;
【中文摘要】对经低温驯化和未经低温驯化的磷脂酶Dδ(PLDδ)基因敲除突变体与野生型植株进行冻害胁迫处理后,比较2种基因型植株的抗冻性。结果发现,经低温驯化的PLDδ敲除突变体的抗冻性明显低于野生型,而未经低温驯化的PLDδ敲除突变体与野生型的抗冻性没有显著差异,表明PLDδ参与植物的低温驯化过程。对PLDδ的作用途径进行分析,发现PLDδ在低温驯化过程中不参与抗氧化酶活性的调节,对脯氨酸和可溶性糖的积累起负调节作用,但是参与低温信号转导物质ABA诱导抗冻性的过程。
【英文摘要】We compared cold-acclimated and non-acclimated phospholipase D (PLD) δ-knockout and wild-type Arabidopsis thaliana plants for tolerance to freezing.PLDδ-knockout plants showed lower freezing tolerance than did wild-type plants with cold acclimation;without cold acclimation,the two genotypes did not differ in freezing tolerance.Therefore,the PLDδ gene is involved in the process of cold acclimation.The pathways through which PLDδ acts in the process of cold acclimation were then analyzed.During cold acclimation,PLDδ was not involved in the activation of SOD,CAT,or POD anti-oxidative enzymes;it negatively regulated the accumulation of proline and soluble sugar,and mediated the process of freezing resistance induced by the low temperature signaling molecule ABA.

【题目】脂质组学研究方法及其应用

【中文关键词】色谱; 脂质组学; 质谱; 代谢组学; 软电离;
【英文关键词】chromatogram; lipidomics; mass spectrometry; metabolomics; soft ionization;
【中文摘要】脂质不仅是生物膜的骨架成分和能量贮存物质,越来越多的证据表明,脂质也参与细胞的许多重要功能。脂质组学是代谢组学的一个重要分支,主要研究生物体内所有的脂质分子的特性以及它们在蛋白质表达和基因调控过程中的作用。脂质组学是依赖技术驱动的科学。近年来,随着人们对脂质研究的重视,脂质组学研究方法和策略有了突破性进展,在动物上开发出的脂质组学分析方法已经扩展应用到植物上。该文重点介绍脂质组学的研究方法及其应用,以期推动脂质组学,特别是植物脂质组学的进一步发展。
【英文摘要】Lipids provide both the structural basis of the cell membrane and fuel for metabolism. In plants, increasing evidence has demonstrated roles for lipids in cellular processes. As one of the most important branches of metabolomics, lipidomics may be a comprehensive strategy to study the cellular lipidomes and their biological roles in terms of protein expression and gene regulation involved in lipid metabolism and function. Progress in lipidomics has been driven by development in analytical methods and approaches. In recent years, with the increasing attention to and interest in lipidomics, great progress has been made in analytical strategies for lipidomics. Some advanced strategies to analyze lipid composition in animals have been successfully extended to plants. This review gives an overview of the current strategies in lipid profiling, to promote the development of lipidomics, especially plant lipidomics.

【题目】Critical Research for Dryland Conservation Agriculture in the Yellow River Basin,China
【中文关键词】Yellow River Basin; Rainfed field; Farming systems; Conservation agriculture
【英文关键词】Yellow River Basin; Rainfed field; Farming systems; Conservation agriculture
【中文摘要】Yellow River Basin (YRB) is the cradle of Chinese civilization. Agriculture production plays a very important role in regional food security.Currently, soil erosion, poverty and water shortages are three major problems that affect the development of agriculture in YRB. Severesoil erosion is leading to loss of fertile topsoil and decreasing soil productivity. These processes are particularly evident in dry and slopinglands associated with rainfed agriculture. How to face and resolve these problems in agriculture? And what are the key techniques toimprove rainwater use efficiency? According to the results in the drylands conservation agriculture research and practice, CA is the mostpromising approach for sustainable development in agriculture, such as harvesting of rainwater using residue mulches, which canincrease crop production, and the reduction of soil tillage and construction of water harvesting and supplementary irrigation system. Notonly does it generate immediate benefits in terms of increased farm productivity, it also offers social benefits of great relevance to YRB.

【题目】甘薯种质资源遗传稳定性及遗传多样性SSR分析
【中文关键词】甘薯;遗传稳定性;遗传多样性;SSR
【英文关键词】Sweetpotato; Genetic stability; Genetic diversity; SSR
【中文摘要】应用SSR标记检测国家种质徐州甘薯试管苗库中离体保存5年和8年的24份种质资源及其对应的田间圃材料的遗传稳定性,同时对24份甘薯种质的遗传多样性进行分析。20对SSR引物分析表明,24份甘薯材料扩增得到了清晰的DNA条带30条,其中多态性条带21条,多态性百分率为70%,全部品种在两种保存方式下谱带一致,说明两种保存方式的效果相同。应用NTSYS软件对材料进行遗传相似性和UPGMA聚类分析,24份甘薯种质资源遗传相似系数在0.57-0.93之间,平均为0.74。在0.72的相似系数上24份材料可以聚成三大类,表明我国的甘薯品种种质资源还是比较丰富的。该研究为甘薯种质资源长期离体保存及甘薯杂交育种提供理论依据。
【英文摘要】Genetic stability of 24 sweetpotato germplasm maintained in vitro more than 5 years in the National Sweetpotato in vitro Genebank in Xuzhou, was analyzed using Simple Sequence Repeat (SSR) molecular markers. 20 pairs SSR primers were used. The result showed that all sweetpotato germplasm stored in vitro had the same amplified products as the controls preserved in field nursery, indicating that the two different methods have the same effect on preserving sweetpotato germplasm stability. Meanwhile, we analyzed the genetic diversity of 24 sweetpotatoe germplasm. The dendrogram generated by UPMGA showed the genetic relationship among 24 accessions. The genetic similarity among 24 accessions varied from 0.57 to 0.93. The total number of bands and polymorphic bands in the 20 primer combinations were 30 and 21 respectively. The 24 accessions were divided into 3 groups by cluster analysis. The results may provide a theoretical basis for sweetpotato germplasms maintained in vitro and the breeding of sweetpotato.

【题目】Rainfed conservation agricultural systems in the Yellow River Basin, China
【中文关键词】rainfed farming system; agricultural research; No‐till; stubble mulch; water productivity; soil and water conservation
【英文关键词】rainfed farming system; agricultural research; No‐till; stubble mulch; water productivity; soil and water conservation
【中文摘要】The agricultural sector of the Yellow River Basin (YRB) plays an importantrole in national food security. It contains 15.3 million hectares of cultivatedland, representing about 12.4% of the total cultivated land in China. Some63% of the cultivated land of the YRB lies in central portion of the Basin andmost of it can be characterized as dry, rainfed, farming systems. In the YRB,the main dryland food grain crops are wheat, maize and millet, and the maincash crops are cotton, oil seeds (peanut, sesame and rape), tubers, fruit(notably apple) and sugar beet. Typically, one crop is grown per year in theupper and central regions, whereas in the downstream areas in Henan andShandong Provinces two crops per year are common, with the main rotationsbeing wheat‐maize, wheat‐soybean and wheat‐potato. Soil erosion, povertyand water shortages are three major problems that constrain thedevelopment of agriculture in the YRB. Severe soil erosion is leading to lossof the most fertile topsoil and decreasing soil productivity, particularlyevident in dry and sloping lands associated with rainfed agriculture whererural poverty is also widespread. Water use efficiency is generally quite lowin rainfed agriculture in the Basin due to high evaporation rates and runoff.Conservation agriculture (CA) is the most promising option for sustainableagriculture in the YRB. Not only does CA generate immediate benefits interms of increased farm productivity, it also offers social benefits of greatrelevance to YRB. Results from Shouyang County in 2007 and 2008 show thatno tillage and reduced tillage can increase soil water availability and soilorganic carbon (SOC stocks). Straw retention in tilled and no till systemssignificantly increased grain yield in both years, however yields with tillagewere significantly higher than no‐till, both with and without residueretention, and the reasons for this require further investigation.

【题目】Modeling the effects of conservation agriculture on land and water productivity of rainfed maize in the Yellow River Basin, China.

【中文关键词】tillage, mulch, incorporation, residues, CERES, DSSAT
【英文关键词】tillage, mulch, incorporation, residues, CERES, DSSAT

【中文摘要】In the dryland regions of North China, water is the limiting factor for rainfedcrop production. Conservation agriculture (featuring reduced or zero tillage,mulching, crop rotations and cover crops) has been proposed to improve soiland water conservation and enhance yields in these areas. Conservationagriculture systems typically result in increased crop water availability andagro – ecosystem productivity, and reduced soil erosion. To evaluate thepotential of conservation agriculture to improve soil water balance andagricultural productivity, the DSSAT crop model was calibrated using thedata of a field experiment in Shouyang County in the semi – arid northeasternpart of the Yellow River Basin. The average annual precipitation at the site is472 mm, 75% of which falls during the growing season. The site had a maizefallow – maize rotation. We used data from two crop seasons (2005 and 2006)and four treatments for calibration and analysis. The treatments were:conventional tillage (CT), no – till with straw mulching (NTSM), all – strawincorporated (ASRT) and one – third residue left on the surface with no – till(RRT). The calibration results gave satisfactory agreement between fieldobserved and model predicted values for crop yield for all treatments exceptRRT, and for soil water content of different layers in the 150cm soil profile forall treatments. The difference between observed and predicted values was inthe range of 3 – 25% for maize yield and RMSE was in the range of 0.03 – 0.06cm3/cm3 for soil water content measured periodically each croppingseason. While these results are encouraging, more rigorous calibration andindependent model evaluation are warranted prior to makingrecommendations based on model simulations. Medium – term simulations(1995 – 2004) were conducted for three of the treatments using the calibratedmodel. The NTSM and ASRT treatments had similar or higher yields (by upto 36%), higher crop water productivity by up to 28% and reduced runoff ofup to 93% or 43 mm compared to CT.

【题目】不同储藏温度下油菜种子生活力的基因型差异

【中文关键词】油菜; 储藏; 基因型; 种子生活力

【英文关键词】Rapeseed; Storage; Genotype; Seed viability

【中文摘要】以发芽率为指标,研究了40 份甘蓝型、白菜型和芥菜型油菜在-20°C、4°C、25°C、37°C、60°C温度储藏3个月、6 个月、12 个月后种子生活力的变化。结果显示: -20°C和4°C储藏下,不同基因型间种子发芽率变异较小,而25°C、37°C和60°C储藏下,基因型间种子生活力存在明显差异,选择60°C高温储藏不同时间的种子进行生活力鉴定,从甘蓝型、白菜型和芥菜型油菜中均筛选得到耐储藏的基因型。

【英文摘要】Commercial varieties of rapeseed need to survive hot summer from harvest to next planting in Yangtze River area - the main production area of China.Therefore retaining seed viability is important. Genotype effect on seed storage was shown to be crucial apart from environmental factors as low moisture and low temperature.In present study,germination rate was used to evaluate seed viability. 40 genotypes of Brassica napus,Brassica juncea and Brassica rapa were tested at temperature of -20°C,4°C,25°C,37°C,60°C for 3 months,6 months and 12 months respectively. Results showed that germination rate did not change significantly at low temperature of -20°C and 4°C. But it declined slightly with storage time at temperature of 25°C,37°C and 60°C. So the seed viability at high temperature of 60°C was chosen to be a criterion for evaluating the storage resistant genotype. The criterion was used to screen materials from B.campestris,B.rapa and B.juncea. Excellent germplasms with slow declining in seed viability were found in this study. They showed potential on heat - storage resistant breeding and on preserving seed viability in production.

【题目】国家作物种质库油菜种子发芽和出苗监测研究

【中文关键词】油菜;种子;贮藏;发芽;出苗;国家作物种质库

【英文关键词】rape; seeds; storage; germination; seedling emergence; national crop genebank of China

【中文摘要】【目的】了解国家作物种质库中不同贮藏时间的油菜种子发芽和出苗状况,明确影响油菜种子发芽力变化的关键因素,评估野生近缘种质的保存效果,为国家作物种质库贮存油菜种子及其它作物种子生活力监测及更新方案的制定提供参考,达到长期安全保存种质资源的目的。【方法】监测在国家作物种质库贮藏8—22 年的347份具有代表性的油菜种子的发芽与出苗情况,采用SPSS 10.0 软件进行相关分析、t 测验及方差分析,对不同起始发芽率、不同贮藏时间以及不同种

质类型种子的保存效果进行综合评价。【结果】83.6%的种子在国家作物种质库贮存8—22 年后其发芽率仍保持在油菜种质栽培种入库最低标准85%以上;有29 份种质(占被监测份数的8.3%)的发芽率出现了明显下降,从80%以上下降至70%以下;有142 份(占被监测份数的40.9%)材料发芽率显著下降(在2.5%水平下)。总体上讲,随着起始发芽率的下降或者贮藏时间的延长,发芽率显著下降(在2.5%水平下)的份数所占监测份数的比例不断增加。油菜种子在长期库中保存15 年后,发芽率出现显著下降。油菜野生近缘种发芽率显著下降种质的比例明显高于栽培种。【结论】入库起始发芽率95%为长期库种子安全贮藏的分界限,起始发芽率在95%以上的种子入国家作物种质库保存会更安全;对于在国家作物种质库中贮藏的野生近缘种或者贮藏时间在15 年以上的种子,应进行生活力的密集监测并及时安排繁殖更新。

【英文摘要】【Objective】The objective was to study seed germination and seedling emergence of rape accessions stored in the National Crop Genebank of China (NCGC), and to realize the key factors on germinating ability variation of seeds including initial germination percentage level and storage-time, and to assess the effect of storage on rapeseed wild relatives, and to provide a scientific basis for monitoring seed viability and making renewal protocols of rapeseed and other crops stored in the NCGC.【Method】 Seed germination and seedling emergence of 347 rapeseed accessions stored in the NCGC for 8-22 years were monitored. The effect of storage on stored seeds of different initial germination percentages, storage-time and germplasm-type were analyzed with Pearson Correlation, T-test and One-way ANOVA by the software SPSS 10.0.【Result】The results showed that after8-22 years ’ storage in the NCGC, more than 83.6% of the 347 monitored accessions of rape seeds maintained a germination percentage above 85%, the lowest initial viability standard for rape cultivated species seeds when put into a low-temperature genebank. The germination percentage of 29 accessions, accounting for 8.3% of the total, declined significantly from above 80% to below 70%. The germination percentage of 142 accessions, accounting for 40.9% of the total, declined significantly (α =2.5%).The ratio of significant declining (α =2.5%) of germination percentages increased along with the declining of initial germination percentage level or with the extending of storing-time of rapeseed as a whole. After above 15 years of storage, the seed germination percentage of rape accessions stored in the NCGC significantly declined. The ratio of significant declining of germination percentages of rapeseed wild relatives was remarkably higher than that of cultivated rapeseed species.【Conclusion】For the safe storage of germplasm resources, the initial germination percentages standard should be above 95% for most of the rapeseeds in the NCGC. The seeds of wild rape relatives or that being stored for above 15 years in the NCGC should be monitored intensively and arranged timely for breeding.

【题目】HPLC 法分析油菜种子油中维生素E 的组成与含量
【中文关键词】油菜; 维生素E; 生育酚; 高效液相色谱法
【英文关键词】Qilseed rape; Vitamin E; Tocopherol ; HPLC
【中文摘要】利用HPLC 法分析了50 份遗传背景丰富的白菜型油菜、甘蓝型油菜、芥菜型油菜和芸芥种子油中维生素E 的组成与含量。研究结果显示,油菜种子油中主要含α-生育酚和γ-生育酚,且α-生育酚、γ-生育酚和维生素E 总量均存在明显的基因型差异,甘蓝型油菜种子油中维生素E 含量总体水平最高,平均总量较高,为123.11 mg /100g 油,维生素E 含量最高的Omega,总量为144.73 mg /100g 油,α/γ-生育酚比值最高可达0.77。α-生育酚、γ-生育酚和维生素E 总量与类胡萝卜素含量均呈现显著负相关,种子油中α-生育酚与含油量呈现显著正相关,α-生育酚、γ-生育酚和维生素E 总量与生育期均呈现显著或极显著正相关,α-生育酚和维生素E 总量与株高均呈现显著正相关,维生素E 总量与千粒重呈显著正相关,而α-生育酚、γ-生育酚和维生素E 总量与全株角果数和每角粒数相关不显著。

【英文摘要】Seed oil tocopherol content in 50 divergent genotypes of oilseed rape of Brassica campestris L., Brassica napus L.,Brassica juncea Coss. and Eruca stiva Mill. were analyzed by HPLC method,the results indicated that α-tocopherol and γ-tocopherol are two dominant tocopherols in seed oil,which significant variation in both composition and content could be found among different genotypes. tocopherol content in seed oil of Brassica napus L. is the highest among all species,with a average content of 123. 11 mg /100g oil,the genotype Omega has the highest total content of 144.73 mg /100g oil,the highest ratio of α-tocopherol and γ-tocopherol is 0.77. α-tocopherol, γ-tocopherol and total tocopherol content showed significant negative correlation with carotenoid content,a significant positive correlation were found between α-tocopherol content and oil content. α-tocopherol, γ-tocopherol and total tocopherol content presented significant positive correlation with growth peroid, α-tocopherol and total

tocopherol content were significantly correlated with plant height,total tocopherol content demonstrated significant positive correlation with 1000 seeds weight. However, α -tocopherol, γ -tocopherol and total tocopherol content showed no correlation with number of siliques and Seeds number per silique.

【题目】Efffects of no-tillage management on soil biochemical characteristics in northern China.
【中文关键词】no-tillage
【英文关键词】no-tillage
【中文摘要】Field experiments (15 years) were carried out to study the effects of no-tillage (NT) and conventionaltillage (CT) management practices on the soil chemical properties, microbial biomass, soil enzymaticactivities and winter wheat yield on a cinnamon soil in Shanxi, on the Chinese Loess Plateau.Compared to CT, NT increased soil organic carbon, soil total nitrogen and soil total phosphorus inthe 0 – 100 mm layer by 25, 18 and 7%, respectively. Microbial biomass C and N contents under NTwere 41 and 57% greater than under CT on the same layer. In general, higher enzymatic activitieswere found in the more superficial layers of soil under NT than under CT in the same layer. Winterwheat yield was c. 20% higher under NT than under CT. These findings have implications forunderstanding how conservation tillage practices improve soil quality and sustainability in therainfed dryland farming areas of northern China.

【题目】中国作物分子设计育种
【中文关键词】作物; 分子设计育种; 育种模拟; 目标基因型; 育种策略
【英文关键词】作物; 分子设计育种; 育种模拟; 目标基因型; 育种策略
【中文摘要】分子设计育种通过多种技术的集成与整合, 对育种程序中的诸多因素进行模拟、筛选和优化, 提出最佳的符合育种目标的基因型以及实现目标基因型的亲本选配和后代选择策略, 以提高作物育种中的预见性和育种效率, 实现从传统的“ 经验育种 ”到定向、高效的“ 精确育种 ”的转化。分子设计育种主要包含以下3 个步骤: (1)研究目标性状基因以及基因间的相互关系, 即找基因(或生产品种的原材料), 这一步骤包括构建遗传群体、筛选多态性标记、构建遗传连锁图谱、数量性状表型鉴定和遗传分析等内容; (2)根据不同生态环境条件下的育种目标设计目标基因型, 即找目标(或设计品种原型), 这一步骤利用已经鉴定出的各种重要育种性状的基因信息, 包括基因在染色体上的位置、遗传效应、基因到性状的生化网络和表达途径、基因之间的互作、基因与遗传背景和环境之间的互作等, 模拟预测各种可能基因型的表现型, 从

中选择符合特定育种目标的基因型; (3)选育目标基因型的途径分析, 即找途径(或制定生产品种的育种方案)。本文评述近几年来我国在遗传研究材料创新、重要性状遗传分析、育种模拟工具开发和应用、设计育种实践、分子设计育种技术体系建设等方面取得的重要进展, 结合国内外研究现状对分子设计育种的未来进行展望, 最后指出我国近期应加强育种预测方法和工具、基因和环境互作、遗传交配设计、作物功能基因组学、生物信息学方法和工具、设计育种技术体系和决策支持平台等领域的研究, 同时重视人才培养和团队建设。

【题目】牦牛IFN-γ基因的表达及其产物的生物学活性分析

【中文关键词】牦牛; IFN2γ基因;表达;生物学活性

【英文关键词】yak ;interferon2γgene ;expression ;bioactivity

【中文摘要】用植物血凝素和脂多糖诱导牦牛外周血淋巴细胞,提取细胞总RNA ,利用RT2PCR 技术克隆了牦牛IFN-γ(YakIFN-γ) 基因,然后设计了1 对表达引物,从p GEM2YakIFN-γ载体上扩增YakIFN2γ成熟蛋白基因,将牦牛IFN-γ基因与表达载体pET230a 连接,构建了重组表达质粒pET-30-YakIFN-γ。用IPTG诱导表达的可溶性表达产物经镍柱亲和纯化,用纯化的重组YakIFN-γ蛋白进行了MTT、抑制肿瘤细胞增殖和细胞病变抑制的生物学特性研究。结果显示,成功克隆和表达了YakIFN-γ基因;序列分析表明:克隆的YakIFN-γ基因序列与GenBank 上登录的黄牛IFN2γ基因序列的同源性为99. 0 %。SDS-PAGE 分析和Western-blot 检测证实,获得了高纯度的重组YakIFN-γ蛋白。重组YakIFN-γ(r YakIFN-γ) 对伪狂犬病病毒的活性单位为2. 2 ×103 U/ mg。表明表达并纯化的r YakIFN-γ蛋白具有较高的生物学活性和干扰病毒

【英文摘要】Total RNA was extracted from yak perip heral blood lymphocytes stimulated with phytohemagglutinin (PHA) and lipopolysaccharide (LPS) . The Yak interferon-γ(YakIFN2γ) cDNAs were amplified by RT-PCR. One pair of primers were designed to amplify the gene encoding YakIFN-γ from p GEM-T2 YakIFN-γ,and cloned it into pET-30a vector ,named pET-30a-YakIFN-γ. The expressed YakIFN-γ protein was purified by Niagaro segel . The p urified expressed product was analyzed by SDS-PAGE and Western-blot . The biological characteristics of YakIFN2γ(r YakIFN-γ) protein was examined by MTT , tumor cell proliferation test . Homology analysis showed that YakIFN-γ gene shared 99. 0 % with bovine IFN-γ gene available in GenBankTM . The activity of r YakIFN2γagainst pseudorabies virus (PRV) was about 2. 2 ×103 U/ mg.

【题目】适应玉米生产的溶磷真菌筛选及其应用
【中文关键词】溶磷菌;玉米;定殖;适应性
【英文关键词】phosphate-dissolving microorganism; corn; colonization; adaptability
【中文摘要】【目的】从土壤中筛选溶磷菌株,提供适应玉米生产的溶磷微生物。【方法】利用难溶磷无机盐培养基从作物根际土壤样品中筛选溶磷菌株,通过菌株在土豆液体培养基培养过程中培养液pH 的变化确定溶磷菌株的溶磷能力。利用菌株在平板和土壤中对玉米根系的适应性,选择对玉米适应性好的菌株应用到盆栽实验和大田实验。【结果】从土壤中筛选到具有较高溶磷效果的真菌15 株,经鉴定其中9 株为草酸青霉,2株为变幻青霉,1 株为刺孢青霉、1 株为绿色木霉、1 株为黑曲霉、1 株为构巢曲霉。15 株真菌能够显著降低PDB 溶液的pH 值,其中5 株能够将溶液的pH 从7. 0 降到2. 0 以下。实验室平板和土培试验发现菌株Z15 + 、ZQ3、ZI1、Zh 和Z30 能够在以玉米根系分泌物为C 源的平板和土壤中很好地生长、定殖,表明这5 株菌能够有效利用玉米的根系分泌物。将这5 株菌进行盆栽种植玉米,菌株ZI1 和Zh 处理后,能显著的提高土壤中的有效磷含量,在第49 天时,有效磷含量分别高于土壤初始含量的28. 05% 和37. 04% ,收获的玉米干重比对照分别高26. 04% 和20. 21%。将菌株ZI1 和Zh 制成菌剂进行大田试验,试验结果表明菌剂Zh 使大田玉米产量提高13. 22% ,达到10873. 05 kg / hm2。而使用ZI1 菌剂的大田玉米产量与CK 相比没有显著差异。【结论】本实验获得的适应玉米的溶磷菌株Zh 为构巢曲霉。
【英文摘要】[Objective]To obtain phosphate-dissolving strains which can be suitable for cornproduction. [Methods]We screened phosphate-dissolving strains from soil samples. We conducted the plate experiment and soil experiment in laboratory,pot experiment in greenhouse and field experiment to test the insoluble phosphate dissolving ability of thestrains. [Results]Fifteen strains of phosphate-dissolving fungi were isolated from soil samples,including 9 Penicillium oxalicum,2 Penicillium variabile,1 Penicillium aculeatum,1 Trichoderma viride,1 Aspergillus niger,and 1 Aspergillus nidulans. The 15 strains could obviously drop the pH in culture media. Five strains (Z15 + 、ZQ3、ZI1、Zh and Z30) reduced the pH value from 7. 0 to below 2. 0 in 18 h. The plate experiment and soil experiment in laboratory indicated that these 5 strains could propagate in plates and soil by using the root secretion of corn as sole carbon source. The pot experiment inoculating with the 5 strains was conducted in greenhouse by planting corn. The result demonstrated that thecontent of available phosphorous was increased remarkably with strains ZI1 and Zh. The content of available phosphorous at 49th day increased 28. 05% and 37. 04% ,respectively,than initial content in strains ZI1 and Zh treatment. The dry matter yield of corn significantly increased 26. 04% and 20. 21% than the control,respectively. Then strains ZI1 and Zh were used in field experiment as microbial inoculums. The yield of corn treated with strain Zh increased 13. 22% than that of the control,reaching 10873. 05 kg / ha. However,the yield of corn treated with strain ZI1 presented no significant difference with the control. [Conclusion]The phosphate-dissolving strain Zh obtained in this experiment was identified as Aspergillus nidulans ,which is suitable for corn production.

【题目】产纤维素酶真菌QSH3-3的筛选及其特性研究
【中文关键词】纤维素酶、木聚糖酶,产酶条件,酶学性质
【英文关键词】Cellulase; Xylanase;Optimized fermentation; Characterization of the enzymatc reactions conditions
【中文摘要】在富含纤维素类物质的土壤中筛选到一株产纤维素酶菌株QSH3-3,通过形态观察和ITS序列分析,鉴定为草酸青霉Penicillium oxalicum QSH3-3。摇瓶产酶试验结果表明,得出最佳产酶条件为在0.5% 碱处理过的玉米粉,0.2% 硫酸铵,起始pH为7 ,接种量5% ,30°C下培养4 d,FPase、CMCase、木聚糖酶活力最高,分别为12 U/mL、33 U/mL、605 U/mL。该菌株在15°C即可产生高峰值70% ~80% 的酶活力。部分酶学性质研究表明,FPase、CMCase、木聚糖酶属于酸性酶,最适作用pH值分别为5、4、5,最适反应温度均为50°C,在pH值4 ~9 范围内均具有较高的酶活,具有较强耐碱性,FPase、CMCase在40~50°C热稳定性较好,木聚糖耐热性较差。

【英文摘要】one strain QSH3-3 of fungi producing cellulases was screened and isolated from the soil, classified as Penicillium oxalicum QSH3-3 by the analysis of its morphology and 18S rRNA gene sequences. According to the effect of various substance on the cell growth and activity of cellulase,the components of optimized medium and fermentation conditions were confirmed.Different conditions including incubating tirne, carbon source, nitrogen source, initial pH, inoculating quantities, temperature were 4d, alkali maize cellulose, ammonia sulfate, pH 7, 5%, and 30°C. Under optimized conditions, 12 U/mL of FPase, 30 U/mL of CMCase and 605 U/mL of Xylanase in cultured supernatant were obtained after 4d fermentation. The enzyme activity can reached the 70%~80% of the highest value at 15°C. FPase, CMCase and xylanase of the optimal conditions for the enzymatic reaction were all of about 50°C and pH5, 4, 5, respectively; and pH4~9 the enzyme showed high activity and good stability, FPase、 CMCase showed high activity and good stability under50°C,and xylanase showed poor thermal stability.

【题目】Development of a Web-Based Wireless Telemonitoring System for Agricultural Environment
【中文关键词】数据采集,无线移动网络(GPRS / CDMA),网络TCP / IP的软件设计,
【英文关键词】Data collection, wireless network (GPRS/CDMA), the network of TCP/IP software design,
【中文摘要】为了满足这些需求的权威数据采集,一个项目计划的无线远程控制系统被标绘出根据农业的特点scattered-sites远离发达社区,多个环境因素、可变的条件被自然灾害,等等。结合现代信息技术(IT),环境数据采集系统,称为WITSYMOR V1.0,研制出了被设计成兼容绝大多数普通传感器(如温度和水分对空气和土壤、技术、气压、标准杆,总太阳辐射、土壤的pH值和EC,等等。内核技术是实现无缝连接的无线移动网络(GPRS / CDMA)和网络TCP / IP的软件设计,数据从远程农业网站的期权获得和传播到中央数据库服务器,可以浏览、下载和应用授权用户随时随地在任何地方。目前,它已经成立,在一些农业站、园艺温室、methane-gas池以及在动物收容所。结果表明,该系统工作稳定,而且更自适应监测各种农业环境因素在站点很远。
【英文摘要】In order to satisfy the requirements of agro-environmental data acquisition,a project scheme of wireless telemonitoring system was plotted out according to the agricultural characteristics of scattered-sites far from developed community,multiple environmental factors,mutable conditions disturbed by natural disasters,and so forth.Integrated with modern information technology (IT),an environmental data acquisition system,named WITSYMOR V1.0, was developed,which was designed to be compatible with most of common sensors,such as temperature and moisture for air and soil,CO_2,air pressure, PAR,total solar radiation,soil pH and EC,etc.The kernel techniques were to realize a seamless connection between wireless mobile network (GPRS/CDMA) and Internet with TCP/IP software design,the data from the remote agricultural sites were real-timely acquired and transmitted to the central database servers,and could be browsed,applied and downloaded by authorized users at anytime and in anywhere.At present,it has been set up in some agricultural stations,horticultural greenhouses,methane-gas pools,as well as in animal shelters.The results show that the system works stably,and it is much adaptive to monitor various agricultural environmental factors in the sites far away.

【题目】Absorption and accumulation of cadmium by ramie (Boehmeria nivea) cultivars: A field study
【中文关键词】品种,稻田土壤,植物修复,苎麻
【英文关键词】Cultivar, paddy soil, phytoremediation, ramie.
【中文摘要】苎麻是来自中国的有很大的能力,容忍和积累重金属的纤维作物。这项研究分析苎麻品种的能力,吸收和积累,通过两年的微区域实地镉(Cd)研究表明,压力和镉的高浓度下显着影响苎麻生物量25mg/kgCd促进增长和发展的苎麻品种苎麻1和9。 Cd含量在不同部分苎麻韧皮以下排名:皮>茎>叶。镉浓度不同苎麻品种有显着不同,土壤中的镉浓度增加显着增加。苎麻有能力,积累了大量的镉,25和100mg/kg条件下,三次苎麻丰收,每年除去0.76和0.97 kg Cd/ha。从这项研究的结果表明苎麻品种的植物修复镉污染农田的可行性,已经取得镉积累通过筛选和培训的能力。
【英文摘要】Ramie is a fibre crop originating from China that has great ability to tolerate and accumulate heavy metals. This study has analysed the capacity of ramie cultivars to absorb and accumulate cadmium (Cd) through two years of micro-regional field study and shown that stress under high concentration of Cd significantly affects the biomass of ramie; 25 mg kg 1Cd treatment promotes the growth and development of ramie cultivars B. nivea 1 and 9. The Cd contents retained in different parts of ramie are ranked as the following: bast>stems>leaves. Cd concentrations in shoot systems among different ramie cultivars are significantly different and increase dramatically in association with the increasing Cd concentration in the soil. Ramie has the ability to accumulate large amounts of Cd; under the treatment with 25 and 100 mg kg-1 of Cd, three times of ramie harvest annually remove 0.76 and 0.97 kg hm-2a-1 of Cd respectively. The results from this study demonstrate the feasibility of phytoremediation of Cd-contaminated farmland by ramie cultivars that have obtained Cd accumulating capacity through screening and training.

【题目】Water infiltration in urban soils and its effects on the quantity and quality of runoff
【中文关键词】压实,渗透率,径流系数,城市生态,城市土壤
【英文关键词】Compaction . Infiltration rate . Runoff coefficient .Urban ecology. Urban soils
【中文摘要】目的:城市土壤的特性,特别是土壤物理性质,是由于压实戏剧性的变化TION由密集的人类活动,这可能会导致在雨季洪水频发事件。的宗旨,本研究旨在探讨水渗透字符istics的城市不同程度的压实土壤并确定对环境的影响渗透在市区的问题。材料和方法:十大典型土地利用方式各种植被和年龄选择在南京城,中国确定由双环入渗率方法。三个复制网站在同一结合模式。在同一时间,其他土壤的物理和化学性质,可能会影响入渗率分别为还决心。此外,城市地表径流系数根据最终渗透和估计ficients降雨强度在不同程度的土壤板结。从强烈的暴雨洪水中的质量在南京的主要道路进行了分析。结果与讨论:城市的最终入渗率土壤高度可变(从很慢的速度非常快)。土壤入渗率较低等许多因素相关;然而,城市土壤板结的领先者之一。增加散装入渗率下降密度和充气孔隙度减少。因此,大量的孔隙增加入渗率减少地表径流。COM的径流系数低渗透率pacted土壤高,尤其是非常压实土壤。因此,患病率洪水是在压实土壤高,质量在水浸事件减少地表径流水。 浓度的NO3-氮,总氮,钼活性磷,总磷,悬浮城市地表径流中的材料均显着高于比那些在森林或农业流域中观察

到。结论:在城市地区,造成低渗透率土壤板结对生态的负面影响环境,提高城市和结果在瞬时neous洪水和地表水环境质量较差。因此,要改善市区生态环境,金额必须增加绿地土壤和土壤板结减少。

【英文摘要】Purpose Urban soil characteristics, especially soil physical properties, are subject to dramatic changes due to compaction by intensive human activities, which may cause frequent flood events during the rainy seasons. The aim of this study was to explore the water infiltration characteristics of urban soils with different degrees of compaction and to determine the effects of infiltration on environmental problems in urban areas.Materials and methods Ten typical land use patterns with various vegetation and age were selected in Nanjing City, China to determine the infiltration rates by the dual-ring method. Three replicated sites were done in the same combined mode. At the same time, other soil physical and chemical properties that may affect infiltration rate were also determined. In addition, urban surface runoff coefficients were estimated according to final infiltrations and rain intensities in the different degrees of soil compaction. The quality of flood water from a strong rainstorm in a main road in Nanjing was analyzed.Results and discussion The final infiltration rates of urban soils were highly variable (from very slow to very fast). Low soil infiltration rates are related to many factors; however, urban soil compaction is the leading one. Infiltration rates decreased with an increase in the bulk density and with a reduction in the air-filled porosity. Thus,large amounts of macropores increase the infiltration rateand reduce surface runoff. Runoff coefficients of compacted soils with low infiltration rates were high, especially for extremely compacted soil. As a result, the prevalence of flooding is high in compacted soils, and the quality ofsurface runoff water is reduced during flooding events. The concentrations of NO3-N, total nitrogen, molybdate-reactive phosphorus, total phosphors, and suspended material in urban surface runoff were significantly higher than those observed in forested or agricultural watersheds. Conclusions In urban areas, low infiltration rates caused by soil compaction have negative effects on the ecoenvironment of the city and result in increased instantaneous flooding and poor surface water quality. Thus, to improve the eco-environment of urban areas, the amount ofgreenbelt soil must be increased and soil compaction must be reduced.

【题目】猪MyD88基因的克隆及其结构预测分析

【中文关键词】猪MyD88 基因;分子克隆;序列分析;结构预测

【英文关键词】porcine mydoid differentiation factor 88 (pMyD88) ;molecular cloning ; sequence analysis ; structure prediction

【中文摘要】应用反转录-聚合酶链反应(RT2PCR) 技术,从猪的脾脏淋巴细胞中克隆了猪MyD88 基因(pMyD88) 。基因序列分析表明,克隆的pMyD88 基因含一个完整的开放阅读框(ORF) ,大小为882 bp ,共编码293 个氨基酸,分子质量33. 28 ku ,A + T = 41.38 % , G + C = 58.62%。DNA Star 软件分析发现,与GenBank 上登载的猪AB292176 核苷酸和氨基酸序列同源性分别为99.5 %和100 % ,与其他物种的核苷酸序列同源性均在80 %以上,说明MyD88 基因在各物种间相对保守,在遗传系统发生上亲缘关系密切。对猪MyD88 蛋白分子的结构预测发现, α2螺旋占41.3 % ,伸展结构占14.33 % ,无规则卷曲占44.37 %;存在N 端的死亡区和C 端的Toll 区两个结构域,表明MyD88 是Toll 受体的关键接头分子。

【英文摘要】The pMyD88 gene was cloned successf ully ,this provides a foundation for the studing the role of TLR signaling pathway and the role of the disease. In this report , MyD88 gene was cloned from porcine perip heral blood mononuclear cells (PBMC) by RT-PCR. Sequence analysis showed that pMyD88 gene contained a 882 bp open reading frame , encoding 293 amino acids , with the molecular weight of 33. 28 ku.The content s of A + T and G+ C were 41. 38 % and 58. 62 % , respectively. The nucleotide acide sequence and deduced amino acide sequence of the cloned pMyD88 gene shared 99.5 % and 100% homologies with that of porcine MyD88 gene published in Genbank , respectively. And the similarity between the nucleotide acide sequence of the cloned pMyD88 gene and t hat of ot her species was up to 80 %. These data implied that MyD88 gene was relatively conserved among different species. St ructure prediction found that α -helix ,extended strand and random coil in pMyD88 molecular were 41. 3 % , 14. 33 % and 44. 37 %, respectively.Furthermore , there were a death domain at its N terminus and toll-like receptor homologous domain at its C terminus , which showed that MyD88 was an important adaptor molecular for TLR.

【题目】E ff ect of Land Use Conversion from Rice Paddies to Vegetable Fields on Soil Phosphorus Fractions
【中文关键词】无机磷,有机磷,城郊农业,磷富集,土壤肥力
【英文关键词】inorganic phosphorus, organic phosphorus, peri-urban agriculture, phosphorus accumulation, soil fertility
【中文摘要】过剩的农业土壤磷(P)的水体富营养化。样本(N= 60)从稻田已转换为0到菜地网站,<10,10-20,和> 20岁和分析五个无机磷(Pi)的分数,三个有机磷(PO)馏分,和一些土壤参数,以探讨土地利用转换的影响在中国的城郊地区,许多农业区土壤特性的PI和PO分数亚洲。可溶性和松散的PI(SL-PI)显着增加33,281,293和438毫克公斤1铝结合PI(AL-PI),钙结合PI(CA-PI)和铁结合PI(FE-PI),分别从水稻转换后稻田菜地。渭增加最多的是铁丕形式,从8总磷(TP),上升百分之对水稻土>20年蔬菜种植土壤,其次是铝皮,从2%提高到19%至31%总磷。宝组分,是在P浓度没有显着的变化。从水田的土地用途转换高强度菜田造成土壤中的磷组分的显着变化。管理做法引起土壤磷的积累,主要是在铁PI分数,其次是钙皮和铝皮分数。如果目前的趋势继续下去,TP的30%-70%的增长,可望在未来的20年。在该地区的农民,应减少磷使用,以最大限度地提高磷的吸收。
【英文摘要】Excess phosphorus (P) from agricultural soils contributes to eutrophication in water bodies. Samples (n = 60) weretaken from sites where rice paddies have been converted to vegetable fi elds for 0, < 10, 10 – 20, and > 20 years and analyzedfor fi ve inorganic P (Pi) fractions, three organic P (Po) fractions, and several soil parameters to investigate how land useconversion a ff ects Pi and Po fractions in a peri-urban area of China with soils characteristic of many agricultural areasof Asia. Signi fi cant increases of 33, 281, 293, and 438 mg kg − 1 were found for soluble and loosely bound Pi (SL-Pi),aluminum-bound Pi (Al-Pi), calcium-bound Pi (Ca-Pi), and iron-bound Pi (Fe-Pi), respectively, after conversion from ricepaddies to vegetable fi elds. Most of the increase in Pi was in the form of Fe-Pi, which increased from 8% of total P (TP)on paddy soil to 31% on the soil with > 20-year vegetable cultivation, followed by Al-Pi, which increased from 2% to 19%of TP. For Po fractions, there was no signi fi cant change in P concentrations. The conversion of land use from paddy fi eldsto high intensity vegetable fi elds was causing signi fi cant changes in soil P fractions. Management practices were causinga buildup of soil P, primarily in the Fe-Pi fraction, followed by Ca-Pi and Al-Pi fractions. If current trends continue, a30% – 70% increase in TP could be expected in the next 20 years. Farmers in the area should reduce P application anduse to maximize P uptake.

【题目】湖南省丘岗茶园土壤的酸化特征及其对土壤肥力的影响
【中文关键词】丘岗茶园; 土壤酸化; 土壤肥力; 湖南
【英文关键词】Tea garden in hillock; Soil acidification; Soil fertility; Hunan
【中文摘要】通过对湖南省10个丘岗茶园土壤的调查取样与室内分析,研究了亚热带丘岗茶园土壤的酸化现状及其对土壤肥力的影响。结果表明:在所调查的10个茶园中,仅1个茶园的土壤处于茶树生长的适宜pH值范围,3个茶园土壤的pH值在4.5以下,平均低于4.0,土壤酸化十分严重;随着土壤pH值的下降,交换性酸和交换性Al3+含量增加,土壤pH值和交换性酸及交换性Al3+之间表现为极显著的负相关关系;土壤酸化导致土壤全磷、全钾、全钙和缓效钾等含量降低,土壤供应氮、磷、钾的能力下降。
【英文摘要】Through the survey and sampling of 10 tea garden soils in hillock of Hunan Province, the tea garden soils acidification current status and its impact on soil fertility were researched. The results showed as follows: (1) Among 10 tea gardens, only one tea garden soil pH value was suitable for tea growth, and three tea garden soils pH values were below 4.5, with averages below 4.0. Soil acidification was very serious. (2) The contents of exchangeable acid and exchangeable Al3+ increased with the decline of soil pH value, and there were significantly negative correlation between soil pH value and the contents of exchangeable acid and exchangeable Al3+, respectively. (3) Soil acidification leaded to the decrease of total P, K, Ca and slowly released K, and therefore the supplying ability of N, P and K in soil drops.

【题目】海泡石对典型水稻土镉吸附能力的影响
【中文关键词】海泡石; 水稻土; 镉; 吸附
【英文关键词】sepiolite; paddy soil; cadmium; sorption
【中文摘要】通过吸附解吸实验研究了添加海泡石后典型水稻土对Cd的吸附解吸特性及其对吸附溶液pH值变化的响应。结果表明,Freundlich方程可以较好地拟合红黄泥、黄泥田和红沙泥3种典型水稻土对Cd的等温吸附过程(R2>0.962)。在溶液初始Cd浓度相同的情况下,添加海泡石可使3种水稻土对Cd的吸附量增加20%以上,增强土壤对Cd的吸附强度,有效降低吸附Cd的解吸率,其效果随海泡石添加量的增大而增强。3种水稻土吸附Cd的解吸率均高于70%,而且都随吸附量的增加而上升。溶液的pH值是影响土壤吸附Cd的一个重要因素,在低pH值的条件下(pH<4),随着溶液pH值的降低,土壤对Cd的吸附量迅速降低,当溶液pH值高于5时,pH值的变化对吸附量的影响较小。在溶液初始pH值2~8范围内,添加海泡石均能有效提高3种水稻土对Cd的吸附能力。 更多还原
【英文摘要】The adsorption-desorption of cadmium(Cd) by clay minerals or soils have been extensively studied,however,the effect of the application of sepiolite on Cd adsorption-desorption in soils remains poorly understood.The aim of this study was therefore to investigate Cd sorption and desorption by 3 typical paddy soils pretreated with sepiolite through a batch equilibration method.Our results indicated that the sorption amount of Cd on each tested soil increased with the Cd equilibrium concentration,after adding cadmium ion ranged from 0 to 20 mg.L-1,but did not reach a maximum.Freundlich equations were fitted well(R2> 0.962) to all the sorption experimental results.Sepiolite not only enhanced Cd adsorption,but also increased the retention of Cd by the three soils.At the same initial Cd concentrations,sepiolite added at 5 and 10 mg.kg-1 increased the adsorption amount by 17%~34% and 25%~60%,and decreased the release percentage by 1.4%~13.6% and 10.3%~25.0%,respectively,as compared with the controls.Solution initial pH was also an important factor affecting the adsorption of Cd in soil.The enhancement of Cd sorption caused by the solution initial pH increase was apparent with the pH ranged from 2 to 4,but the effect was minimal with the pH ranged from 5 to 8.Moreover,addition of

sepiolite obviously increased the sorption amount of Cd by the 3 soils with the pH ranged from 2 to 8.These results provide support for the feasibility of sepiolite used as amendment for the immobilization of Cd in pad-dy soil.

【题目】The effect of glycolic acid monomer ratio on the emulsifying activity of PLGA in preparation of protein-loaded SLN
【中文关键词】无
【英文关键词】Lactic/glycolic acid copolymers (PLGA)
Emulsifying activity
Glycolic acid monomer
Solid lipid nanoparticles (SLN)
【中文摘要】无
【英文摘要】Our previous work demonstrated that lactic/glycolic acid copolymer (PLGA) was an efficient emulsifier for the primary w/o emulsion in the formulation of protein-loaded solid lipid nanoparticles (SLN)by w/o/w double emulsion-solvent evaporation technique. In this work, the effect of PLGA composition on the emulsifying activity was studied with PLGA of different lactic/glycolic acid ratios (90/10,75/25, 50/50). The results demonstrated that the glycolic acid monomer ratio significantly affected the emulsifying activity of PLGA. Increasing the glycolic acid monomer ratio from 10% to 50% decreased the minimum PLGA content needed to produce stable w/o emulsions. With same PLGA contents, increase of the glycolic acid monomer ratio increased the stable time of the w/o emulsion, yielded smaller and narrower-distributed SLN, and enhanced the encapsulation efficiency and loading capacity.

【题目】Effects of poly (lactic-co-glycolic acid) as a co-emulsifier on the preparation and hypoglycemic activity of insulin-loaded solid lipid nanoparticles
【中文关键词】无
【英文关键词】Poly (lactic-co-glycolic acid) (PLGA)
Polymeric emulsifier
Emulsification
Solid lipid nanoparticles (SLN)
Hydrophilic protein
【中文摘要】无
【英文摘要】Most proteins are hydrophilic and poorly encapsulated into the hydrophobic matrix of solid lipid nanoparticles(SLN). To solve this problem, poly (lactic-co-glycolic acid) (PLGA) was utilized as a lipophilic polymeric emulsifier to prepare hydrophilic protein-loaded SLN by w/o/w double emulsion and solvent evaporation techniques. Hydrogenated castor oil (HCO) was used as a lipid matrix and bovine serum albumin (BSA), lysozyme and insulin were used as model proteins to investigate the effect of PLGA on the formulation of the SLN. The results showed that PLGA was essential for the primary w/o emulsification.In addition, the stability of the w/o emulsion, the encapsulation efficiency and loading capacity of the nanoparticles were enhanced with the increase of PLGA concentration. Furthermore, increasing PLGA concentration decreased zeta potential significantly but had no influence on particle size of the SLN. In vitro release study showed that PLGA significantly affected the initial burst release, i.e. the higher the content of PLGA, the lower the burst release. The released proteins maintained their integrity and bioactivity as confirmed by sodium dodecyl sulphate-polyacrylamide gel electrophoresis (SDS-PAGE) and biological assay. These results demonstrated that PLGAwas an effective emulsifier for the preparation of hydrophilicprotein-loaded SLN.

【题目】苎麻镉耐受性及其修复镉污染土壤潜力研究
【中文关键词】苎麻; Cd; 土壤污染; 植物修复
【英文关键词】ramie; Cd; contaminated soil; phytoremediation
【中文摘要】为阐明苎麻修复Cd污染土壤的可行性,应用田间微区试验,研究了苎麻对Cd的耐受能力、累积特性及其对土壤Cd污染修复的潜力。结果表明,低浓度Cd处理(添加<10 mg/kg土)能促进苎麻生长,高浓度Cd处理(添加>10 mg/kg土)则引起毒害,但添加Cd浓度达到100 mg/kg土时,苎麻仍可完成正常生理周期,原麻产量仅比对照降低27.6%。苎麻出麻率受土壤Cd污染影响较小。添加Cd量在65 mg/kg内时,随添加量的增大,苎麻对Cd的富集量增加,而富集系数在1.01~4.55范围内逐渐减小。在中低程度Cd污染土壤种植苎麻可以切断食物链,产生较好的经济和环境效益,应用前景良好,但其修复Cd污染土壤需要较长时间,应进一步选育Cd超积累苎麻品种。
【英文摘要】To illuminate the phytoremediation feasibility of ramie for cadmium contaminated soil,a farmland microplot experiment was made to study the potential of tolerance,accumulate trait and remediation for Cd.The results showed that with low Cd application(<10 mg/kg soil),the growth of the ramie was improved;ramie injured when Cd concentration exceeded 10 mg/kg soil.The ramie could tolerate concentration of Cd as high as 100 mg/kg with the biomass of the aboveground of ramie was 27.6% lower than the control.The uptake of Cd by ramie increased as the addition amount(<65 mg/kg soil) of Cd increased,the bioaccumulation coefficient(BC) reduced from 4.55 to 1.01.For low or moderate Cd contaminated soil,using ramie could prevent the harm of Cd apart from the food chain,and bring great economical and environmental benefits,has bright application prospects.Forecasting result show

that a longer period of time would be needed for improving the Cd contaminated soil,a further selection and cultivation of Cd hyperaccumulator ramie is essential.

【题目】用于表征三七种植区土壤中可利用态砷的化学提取剂的筛选
【中文关键词】三七; 砷; 植物可利用态; 化学提取剂
【英文关键词】Panax Notoginseng; arsenic; phytoavailability; chemical extracting agents
【中文摘要】为正确表征云南文山三七种植区土壤中植物可利用态砷,选取NaH2PO4(0.5mol · L-1)、H2O、H3PO4(0.2mol · L-1)、EDTA(0.0625mol · L-1,pH=7)、NH4C(l1.0mol · L-1)和(NH4)2SO(40.05mol · L-1)6种提取剂,比较了它们对土壤中砷的提取效果,及其所提取的砷与三七植株各部位砷含量之间的相关关系。结果表明,NaH2PO4、H3PO4和(NH4)2SO4这3种提取态砷与土壤总砷呈极显著正相关,相关系数分别为0.8359、0.8177和0.8810。NaH2PO4和H3PO4的提取效率较高,平均提取效率分别为6%和11%;而(NH4)2SO4提取效率较低,平均仅为0.084%。NaH2PO4和(NH4)2SO4提取态砷与三七主根、须根和茎部砷含量呈显著正相关,H3PO4提取态砷与三七主根和须根砷含量呈显著正相关。综合考虑认为NaH2PO(40.5mol · L-1)是最佳提取剂,H3PO(40.2mol · L-1)提取剂次之,这两种提取剂均可较好地表征土壤中砷的三七可利用性。
【英文摘要】In order to characterize the plant availability of arsenic(As) in the soil of a Panax notoginseng plantation in Wenshan(Yunnan Province,China),six chemical extracting agents including 0.5 mol · L-1 NaH2PO4,H2O,0.2 mol · L-1 H3PO4,0.062 5 mol · L-1 EDTA(pH=7),1.0 mol · L-1 NH4Cl,and 0.05 mol · L-1(NH4)2SO4 were selected to extract As from soil samples.The correlation between the As concentrations of the soil extracts and the total As in the soil were analyzed.The results showed that the As concentrations in the soil solutions extracted by 0.5 mol · L-1 NaH2PO4,0.2 mol · L-1 H3PO4 and 0.05 mol · L-1(NH4)2SO4 were correlated well with the total As concentration in the soils,with correlation coefficients of 0.835 9,0.817 7,and 0.881,respectively.The extract efficiencies of 0.5 mol · L-1 NaH2PO4 and 0.2 mol · L-1 H3PO4 were 6% and 11%,respectively,which were much higher than that of 0.05 mol · L-1(NH4)2SO4.The correlation of As concentrations between the extract and different parts of the plant is important for selecting appropriate chemical extracting agents.The As concentrations in the 0.5 mol · L-1 NaH2PO4 and 0.05 mol · L-1(NH4)2SO4 extracts were significant positively correlated with the As concentrations in the taproot,fiber and stem of P.notoginseng,whereas that of the 0.2 mol · L-1 H3PO4 extract was significantly positively correlated only with the taproot and fiber portion.In conclusion,NaH2PO4(0.5 mol · L-1) and H3PO4(0.2 mol · L-1) both could be selected to characterize soil bio-effective As on Panax Notoginseng.

【题目】强烈人为作用下城镇周围汞的空间变异及其积累迁移规律
【中文关键词】汞; 土壤; 水稻; 大气沉降; 城镇发展
【英文关键词】Mercury; Soil; Rice; Atmospheric deposition; Urban development
【中文摘要】究土壤中汞(Hg)元素积累的空间变异和迁移转化规律对土壤利用、环境评价和污染修复具有重要参考价值。本研究选择经济发展迅速的苏南某地为研究区域,对土壤、水稻和大气降尘中的Hg进行了详细分析。结果表明,该区域土壤全汞平均含量达1 345 μg kg-1,有效汞(HC l-Hg)平均含量51 μg kg-1,水稻Hg平均含量20 μg kg-1,大气Hg沉降量为5.13 g km-230 d-1。土壤和水稻高含量Hg主要积聚于城镇周边,随着与城镇距离的增加其含量逐渐减少。大气Hg沉降量在空间上变化不大。进入土壤中的Hg主要在土壤表层0~20 cm范围内富集,但直至60 cm深处依然存在积累现象,整个剖面土壤活

性态汞和半活性态汞含量占全汞的比例变化不大。研究区土壤出现了明显Hg积累,导致水稻Hg吸收明显增加,不少样点超过了国家土壤环境质量二级标准(300μg kg-1)和国家食品污染物限量标准(20μg kg-1),可能对环境和人体健康产生危害。较低的大气Hg沉降量和土壤积累的Hg已与土壤条件达到平衡的事实表明,目前Hg的积累已明显减少。今后应采取措施修复污染土壤或者通过改变作物种类来减少土壤Hg含量或抑制作物对Hg的吸收,达到环境治理的目的。

【英文摘要】The research on spatial variability,accumulation and transfer of soil mercury(Hg) has great reference values to soil utilization,environmental assessment and polluted soil remediation.Mercury in the soil,rice and atmospheric deposition in an area with fast developing economy in the South Jiangsu was analyzed.It was found that on average,the soil total Hg was 1 345 μg kg-1,available(HCl-extractable or HCl-Hg) 51 μg kg-1,Hg in rice 20 μg kg-1 and Hg in atmospheric deposition 5.13 g km-2 30 d-1.Spatially,high Hg concentrations in soil and rice were found mainly in places closely around the town,and the concentration decreased exponentially with the distance of the sampling site from the town.Atmospheric Hg deposition was found low in variability within the whole study area.Mercury in the soil accumulated mainly in the 0~20 cm soil horizon,however,Hg accumulation could still be found at 60 cm in depth.The percentages of soil Hg in mobile and semi-mobile state to total Hg did not vary much in the whole soil profile.Obvious soil Hg accumulation observed in the studied area led to higher Hg concentrations in rice.The concentration in quite a number of sampling sites already exceeded the second grade criterion of the National Standard for Soil Environmental Quality(300 μg kg-1) and the National Food Safety Standard(20 μg kg-1),and would bring about hazard to the environment quality and human health.The fact that balance is maintained between the soil conditions and Hg accumulation in soil and that the low atmospheric Hg deposition indicate that the ongoing accumulation is not as significant.Measures such as remediation of the polluted soil or rotation of low-Hg-uptake crop species should be taken to reduce soil Hg or to inhibit Hg uptake by crops,and hence to achieve the target of environmental management.

【题目】基于密切值法的湖南省水资源利用现状评价

【中文关键词】水资源; 密切值; 湖南省

【英文关键词】ter resource; osculating value method; Hu ’nan Province

【中文摘要】应用密切值法,对湖南省14个设(区)市的水资源利用现状进行分区评价,并利用各设(区)市密切值的散点图,将其开发利用发展水平分成3类:开发利用低度区、中度区和高度区,绘出了分区等级图。结果表明,湖南省水资源开发利用低度区有5个,开发利用中度区有6个,开发利用高度区有3个,其中开发利用低度区占35.7%,开发利用中度区、高度区共占64.3%。整体而言,湖南省的水资源利用非常不均衡,需要在不同的地区采取合适的开发利用措施。 更多还原

【英文摘要】A zonal evaluation of water resource use in the fourteen cities of Hu ’nan Province was carried out using the osculating value method.According to the scatter plot of the osculating values,the utilization level of water resource was categorized into three zones:(1) weakly developed zone,(2) moderately developed zone,and(3) highly developed zone.A detailed map was drawn based on the classification.The results show that among the fourteen cities,five cities were classified as weakly developed zone,six cities as moderately developed zone and three cities as highly developed zone.The weakly developed zone accounts for 35.7% of the total area.Overall,the water resource use in Hu ’nan Province is imbalanced.Appropriate practices are need in areas with different development levels.

【题目】湖南省稻谷成本构成要素分析
【中文关键词】谷价格; 劳动力成本; 差异性补贴
【英文关键词】Price of Rice; Cost of Labour; Differentiate Subsidy
【中文摘要】为了充分调动农民的种粮积极性,达到同工同酬的目的,通过大量现场调研并对湖南省典型地区生产成本、销售成本和政府补贴的综合计算和分析提出具有可操作性的直接补贴参考标准。结果表明,早、中、晚稻的生产成本存在明显的类型差异性和地区差异性,特别是地区差异非常显著;最高地区的日工资为71元,还未达到市场工资标准,但已是最低地区的2.6倍;为了达到同工同酬的目标,有必要实施地区差异性补贴。拟将湖南省各地区分为4个梯度,进行差异性补贴,使日工资基本接近,从而缩小农村内部的贫富差距,提高农民生产的积极性。 更多还原
【英文摘要】To stimulate farmers’initiatives effectively and to make sure that people get the same amount of wage for doing the same kind of work,a criterion of direct subsidies was provided on the basis of lots of field work.Calculation and analysis of the typical areas of Hunan Province based on the production cost,cost of sales and government subsidies indicated that in terms of production cost of early,middle and late rice,significant differences in types and areas were found.Differences among areas were especially noticeable.The highest daily wage of some areas,though failed to reach the standard wage set by the market,was 2.6 times that of other areas,which was at the bottom.Therefore,to make sure that people in different areas get the same amount of wage for doing the same kind of work,it is quite necessary to implement the differentiated subsidy policy.And at this stage,in order to narrow the financial gap among farmers and to stimulate farmers’initiatives,this program plans to divide Hunan Province into four districts of various production-cost gradients,so as to implement the differentiated subsidy policy well.

【题目】Yak interferon-alpha loaded solid lipid nanoparticles for controlled release
【中文关键词】无
【英文关键词】Yak IFN-α
Solid lipid nanoparticles
Antiviral activity
Toxicity

Controlled release
【中文摘要】无
【英文摘要】To explore the potential of a novel animal interferon formulation for controlled release, the yak interferon-alpha (IFN-α) glutathione S-transferase (GST) fusion protein was expressed in Escherichia coli(E. coli) and the purified recombinant IFN-α was encapsulated into solid lipid nanoparticles (SLN) by double emulsion solvent evaporation (w/o/w) method. The particle size and zeta potential of IFN-α-loaded SLN were 124.2 ± 10.2 nm and 11.2 ± 0.6 mV. The encapsulation efficiency of IFN-α and loading capacity of the SLN were 83.7 ± 4.5% and 1.73 ± 0.15%, respectively. In vitro release study and antiviral assay demonstrated that the IFN-α released from the SLN in a 16-day period exhibited antiviral activity in Madin – Darby bovine kidney (MDBK) cells against vesicular stomatitis virus (VSV), and showed a release pattern of an initial burst release followed by a sustained and slow release. Cytotoxicity assay in cell culture demonstrated that the SLN were not toxic. The results of this exploratory study suggest that the IFN-α-loaded SLN could be a useful formulation for controlled release in veterinary therapeutics.

【题目】Effect of PLGA as a polymeric emulsifier on preparation of hydrophilic protein-loaded solid lipid nanoparticles
【中文关键词】无
【英文关键词】Poly (lactic-co-glycolic acid) (PLGA)
Polymeric emulsifier
Emulsification
Solid lipid nanoparticles (SLN)
Hydrophilic protein
【中文摘要】无
【英文摘要】Most proteins are hydrophilic and poorly encapsulated into the hydrophobic matrix of solid lipid nanoparticles(SLN). To solve this problem, poly (lactic-co-glycolic acid) (PLGA) was utilized as a lipophilic polymeric emulsifier to prepare hydrophilic protein-loaded SLN by w/o/w double emulsion and solvent evaporation techniques. Hydrogenated castor oil (HCO) was used as a lipid matrix and bovine serum albumin (BSA), lysozyme and insulin were used as model proteins to investigate the effect of PLGA on the formulation of the SLN. The results showed that PLGA was essential for the primary w/o emulsification. In addition, the stability of the w/o emulsion, the encapsulation efficiency and loading capacity of the nanoparticles were enhanced with the increase of PLGA concentration. Furthermore, increasing PLGAconcentration decreased zeta potential significantly but had no influence on particle size of the SLN. In vitro release study showed that PLGA significantly affected the initial burst release, i.e. the higher the content of PLGA, the lower the burst release. The released proteins maintained their integrity and bioactivityas confirmed by sodium dodecyl sulphate-polyacrylamide gel electrophoresis (SDS-PAGE) and biological assay. These results demonstrated that PLGAwas an effective emulsifier for the preparation of hydrophilic protein-loaded SLN.

【题目】不同地区城郊用地土壤重金属含量特征的比较

【中文关键词】城郊区;重金属;变异系数;累积指数
【英文关键词】Suburb area, Heavy metals, Variation coefficient, Cumulative index
【中文摘要】对京津唐、张家港和长株潭3 个地区的露天菜地、设施菜地、水田和旱地进行的调查表明,城郊区大部分农田土壤重金属含量尚低于国家相关的土壤质量二级标准,但部分重金属含量超出了当地背景值,说明重金属在城郊土壤中有所积累。菜地土壤重金属含量总体上要高于水田和旱地,说明高强度利用投入会导致土壤重金属累积。对长株潭一个污染区的研究表明,发生污染的土壤很难再恢复利用。京津唐城郊区的土壤重金属含量的变异系数总体上高于张家港地区。
【英文摘要】In this paper, on the base of the investigation of open vegetable fields, facility vegetable fields, dry fields and paddy fields in Zhangjiagang region, Chang-Zhu-Tan region and Jing-Jin-Tang region, it found that heavy metal contents in most suburb fields were lower than the national 2nd standard of soil quality, but some heavy metal contents were higher than the local background values, which indicated that heavy metals accumulated in suburb fields. Heavy metal contents in vegetable fields were usually higher than paddy and dry fields due to the higher intensive input and use. The study in a special region of Chang-Zhu-Tan showed that it is difficult to reuse the fields after the soil was seriously contaminated. The variation coefficients of soil heavy metals in Jing-Jin-Tang region was higher than Zhangjiagang region.

【题目】Ion-pairing high-performance liquid chromatography determination of amitrole in apple after solid-phase extraction and precolumn derivatization
【中文关键词】无
【英文关键词】Amitrole . Precolumn derivatization .
4-Chloro-3,5-dinitrobenzotrifluoride (CNBF) .
High-performance liquid chromatography . Apple
【中文摘要】无
【英文摘要】A novel method based on solid-phase extraction was studied for the extraction of amitrole (3-amino-1,2,4-triazole), and its residue determination in apples has been developed. The samples were derivatized with 4-chloro-3,5-dinitrobenzotrifluoride (CNBF). The derivatization conditions and the influence of elution composition on the separation were investigated. In pH 9.5 H3BO3 – Na2B4O7 media, the reaction of amitrole with CNBF was complete at 60 ° C after 30 min. The separation of derivatized amitrole was achieved at room temperature within 13 min by gradient elution mode with cetyltrimethylammonium bromide in mobile phase as ion-pair reagent. The method correlation coefficient was 0.9996, in concentrations rangingfrom 1.66 to 415 mg L − 1. The calculated recoveries of the proposed method were from 94.17% to 105.67%, and relative standard deviations were 1.57% to 6.44% in the application to the quantitative determination of amitrole in apples. The detection limit of amitrole was 0.10 mg L − 1 with a signal-to-noise ratio of 3.

【题目】Residue Determination of Glyphosate in Environmental Water Samples with High-performance Liquid Chromatography and UV Detection after Derivatization with 4-Chloro-3,5-Dinitrobenzotrifluoride

【中文关键词】无
【英文关键词】Glyphosate
Pre-column derivatization
4-Chloro-3,5-dinitrobenzotrifluoride
High-performance liquid chromatography
【中文摘要】无
【英文摘要】A pre-column derivatization high-performance liquid chromatographic method for glyphosateanalysis has been developed. Derivatization of glyphosate was performed with 4-chloro-3,5-dinitrobenzotrifluoride (CNBF). In pH 9.5 H3BO3 – Na2B4O7 media, the reaction of glyphosate with CNBF completed at 60 ◦ C for 30 min. The labeled glyphosate was separated on a Kromasil C18 column(250mm×4.6mm, 5 m) at room temperature and UV detection was applied at 360 nm. The separation of labeled glyphosate was achieved within 15 min by gradient elution mode. Compared to other precolumn derivatization, this derivatization was performed more mildly, the derivative was more stable, and the detection limits of a few reagents were higher than CNBF, except 9-fluorenylmethyl chloroformate (FMOC-Cl) using fluorescence and mass spectrometry, however, this reagent avoid to be removedafter derivatization like FMOC-Cl. The detection limit of glyphosate was 0.009mgL − 1 (S/N = 3) without preconcentration and reach MRL, which is set at the level of 0.1mgL − 1 in China. The method linearity correlationcoefficient was 0.9999, in concentrations ranging from 0.3 to 48.5mgL − 1. The proposed methodhas been applied to the quantitative determination of glyphosate in environmentalwater with recoveries of 91.80 – 100.20% and R.S.D. of 2.27 – 6.80, depending on the sample investigated.

【题目】Determination of Biogenic Amines in beer with Pre-chromatographic Derivatization by High Performance Liquid Chromatography
【中文关键词】无
【英文关键词】Biogenic amines
Pre-column derivatization
4-Chloro-3,5-dinitrobenzotrifluoride
(CNBF)
High performance liquid chromatography
Chinese beer
【中文摘要】无
【英文摘要】Eighteen samples of commercially available Chinese beerwere analyzed in order to determine the content of biogenic amines. The method involves pre-column derivatization of the amines with 4-chloro-3,5-dinitrobenzotrifluoride (CNBF) and subsequent analysis by RP-HPLC (reversed phase-high performance liquid chromatography) with diode array detection. The labeled biogenic amines were separated on a Kromasil C18 column (250mm×4.6mm, 5 m) at room temperature and UV detection was applied at 254 nm. The separation of seven labeled biogenic amineswas achieved within 22 min by elution acetonitrile and HAc – NaAc buffers. The method linearity, calculated for each biogenic amine, has a correlation coefficient higher than 0.9925, in concentrations ranging from 2.9 μ mol L − 1 to 565 μ mol L − 1. Detection limits of biogenic amineswere 0.056 – 0.87 μ mol L − 1, at a signal-to-noise ratio of 3. The proposedmethodhas been applied to the quantitative determination of spermine, phenethylamine, spermidine, histamine, tyramine, tryptamine and putrescine in beer with recoveries of 91.9 – 103.1% and R.S.D. of 2.86 – 5.63%.Quantitation is relative to external standards. The results showed that each kind of beer examined contained at least three biogenic amines. Putrescine, histamine and tyramine were detected in all samples. Spermidine was detected in 89% of the beers. Spermine, tryptamine and phenylethylamine occurred in 78%, 61% and 44% of the beers examined, respectively. These levels were below the level that may elicit direct adverse reactions for most consumers.

【题目】An intramolecular disulfide bond is required for the thermostability of methyl parathion hydrolase, OPHC2
【中文关键词】甲基对硫磷水解酶;二硫键;定向进化;热稳定性
【英文关键词】Methyl parathion hydrolase; Disulfide bond; Site-directed mutagenesis; Thermostability
【中文摘要】在本文中介绍了关于影响甲基对硫磷水解酶结构稳定性的一个关键因素(二硫键)。
【英文摘要】OPHC2, a methyl parathion hydrolase (MPH) from Pseudomonas pseudoalcaligenes C2-1 (CGMCC 1150), can degrade a wide range of organophosphate pesticides. Compared with other MPHs, OPHC2 exhibits high thermostability. Its thermostability mechanism, however, remains unknown. In the present study, sequence analysis demonstrated that two cysteines (Cys110 and Cys146) exist in OPHC2, but not in other MPHs. The three-dimensional structural model of OPHC2 performed by computer-assisted homology modelling revealed a potential stacking network with residues Cys110 and Cys146, which probably formed an intramolecular disulfide bond. Furthermore, both sodium dodecyl sulphate-polyacrylamide gel electrophoresis and thiol-titration analyses indicated that OPHC2 contains a disulfide bond. Substitution of the disulfide bond-forming cysteines with alanine, leucine or methionine residues substantially decreased the thermostability of OPHC2, suggesting that disulfide bond formation affects conformational stability. These results, combined with three-dimensional structural modelling, demonstrated that the formation of a C110-C146 disulfide bond may stabilise the conformation of OPHC2, contributing to its thermostability.

【题目】High yield expression of an AHL-lactonase from Bacillus sp. B546 in Pichia pastoris and its application to reduce Aeromonas hydrophila mortality in aquaculture.
【中文关键词】高效表达, 毕赤酵母
【英文关键词】HIGH-LEVEL EXPRESSION; QUORUM-SENSING MOLECULES; PSEUDOMONAS-AERUGINOSA; ERWINIA-CAROTOVORA; ENZYMATIC DISRUPTION; QUENCHING ENZYMES; SIGNAL MOLECULES; LUXRI HOMOLOGS; VIRULENCE; INFECTION
【中文摘要】本文介绍了毕赤酵母高效表达N-酰化高丝氨酸内酯酶及腹腔注射预试实验。
【英文摘要】Background: Aeromonas hydrophila is a serious pathogen and can cause hemorrhagic septicemia in fish. To control this disease, antibiotics and chemicals are widely used which can consequently result in "superbugs" and chemical accumulation in the food chain. Though vaccine against A. hydrophila is available, its use is limited due to multiple serotypes of this pathogen and problems of safety and efficacy. Another problem with vaccination is the ability to apply it to small fish especially in high numbers. In this study, we tried a new way to attenuate the A. hydrophila infection by using a quorum quenching strategy with a recombinant AHL-lactonase expressed in Pichia pastoris.Results: The AHL-lactonase (AiiA(B546)) from Bacillus sp. B546 was produced extracellularly in P. pastoris with a yield of 3,558.4 +/- 81.3 U/mL in a 3.7-L fermenter when using 3-oxo-C8-HSL as the substrate. After purification with a HiTrap Q Sepharose column, the recombinant homogenous protein showed a band of 33.6 kDa on SDS-PAGE, higher than the calculated molecular mass (28.14 kDa). Deglycosylation of AiiA(B546) with Endo H confirmed the occurrence of N-glycosylation. The purified recombinant AiiA(B546) showed optimal activity at pH 8.0 and 20 degrees C, exhibited excellent stability at pH 8.0-12.0 and thermal stability at 70 degrees C, was firstly confirmed to be significantly protease-resistant, and had wide substrate specificity. In application test, when co-injected with A. hydrophila in common carp, recombinant AiiA(B546) decreased the mortality rate and delayed the

mortality time of fish.Conclusions: Our results not only indicate the possibility of mass-production of AHL-lactonase at low cost, but also open up a promising foreground of application of AHL-lactonase in fish to control A. hydrophila disease by regulating its virulence. To our knowledge, this is the first report on heterologous expression of AHL-lactonase in P. pastoris and attenuating A. hydrophila virulence by co-injection with AHL-lactonase.

【题目】Molecular characterization of the auto- chthonous microbiota in the gastrointestinal tract of adult yellow grouper (Epinephelus awoara) cultured in cages.
【中文关键词】无
【英文关键词】Gastrointestine (GI); Autochthonous bacteria; Epinephelus awoara; Denaturing gradient gel electrophoresis (DGGE)
【中文摘要】无
【英文摘要】The present study used 16S rDNA PCR denaturing gradient gel electrophoresis (PCR-DGGE) technology to investigate the communities of autochthonous microbiota in the gastrointestinal (GI) tract; including stomach (ST), pyloric caeca (PC), proximal intestine (PI), mid intestine (MI) and distal intestine (DI) of the adult yellow grouper (Epinephelus awoara) cultured in cages. Twenty-two DGGE bands were successfully sequenced. However, ten of these bands were classified as unculturable according to the phylogenetic analysis. The dominant autochthonous bacteria in the GI tract belonged to Proteobacteria, but other bacteria identified belonged to Firmicutes, Bacteroidetes, Deinococcus-Thermus, Spirochaetes and unclassified-bacteria. Pantoea sp. and uncultured Proteobacterium were ubiquitous in all five sections of the GI tract. Empedobacter sp. PH7-1 and Acinetobacter sp. N15 were unique for the ST section, while uncultured bacterium clone F6-37 and gamma-Proteobacterium and Acinetobacter radioresistens Philippines-11 were only observed in PI, MI and DI sections. Furthermore, Lactococcus lactis, Bacteroides and uncultured Streptococcus sp. were also detected in the present study.

【题目】Effects of dietary Saccharomyces cerevisiae fermentation product (DVAQUA (R)) on growth performance, intestinal autochthonous bacterial community and non-specific immunity of hybrid tilapia (Oreochromis niloticus female xO. aureus male) cultured in cages
【中文关键词】酵母培养物,肠道定植菌群,非特异性免疫,罗非鱼
【英文关键词】Saccharomyces cerevisiae fermentation product; DVAQUA; Intestinal autochthonous bacterial community; Non-specific immunity; Hybrid tilapia; Oreochromis niloticus female xO. aureus male
【中文摘要】本文介绍了用于阳性对照的酵母培养物的罗非鱼应用实验。
【英文摘要】In the present study, hybrid tilapias (Oreochromis niloticus ♀ × O. aureus♂) were fed six isonitrogenous andisoenergetic experimental diets in cages. The diets contained six levels of Saccharomyces cerevisiaefermentation product (DVAQUA ®): 0 (CK), 0.125 (G1), 0.25 (G2), 0.5 (G3), 1.0 (G4) and 2.0 (G5) g kg − 1diet.The purpose of this study was to evaluate the effect s of dietary DVAQUA on growth performance, intestinalautochthonous bacterial community by using 16S rDNA and denaturing gradient gel electrophoresis (DGGE),and non-speci fi c immu nity of hybrid tilapia. Supplementation of dietary DVAQUA

showed no effects ongrowth performance, diet conversion and survival rate of the hybrid tilapia. However, supplementation ofDVAQUA affected the autochthonous gut bacteria communi ty. Various potentially benefi cial bacteria werestimulated by dietary DVAQUA at different feeding period, while potentia l harmful species such as Escheri-chia coli serotype O20: H42-like, uncultured Bacilli bacterium clone MS030A1_F02-like, and Pseudomonas fluorescens strain YC0357-like were depressed by dietary DVAQUA . Non-speci fi c immunity of hybrid tilapia such as serum lysozym e activity, serum alternative complement pathway (C3 and C4) activities, head kidney macrophage phagocytic activity, and hea d kidney macrophage respiratory burst activity were improved by dietary DVAQUA . The optimum dose of dietary DVAQUA for hybrid tilapia determined based on a broken-lineapproach varies dependin g on the variables used: 0.226, 0.467, 0.4 92 or 0.5 0 g kg − 1 diet for lysozym e, C3, C4,or phagocytic activity, respectively.

【题目】Effects of dietary potassium diformate (KDF) on growth performance, feed conversion and intestinal bacterial community of hybrid tilapia (Oreochromis niloticus female x O. aureus male)

【中文关键词】罗非鱼,二甲酸钾,黄霉素,喹烯酮,肠道菌群

【英文关键词】Oreochromis niloticus female x O. aureus male; Potassium diformate (KDF); Flavomycin; Quinocetone; Intestinal bacterial community

【中文摘要】本文介绍了用于阳性对照的二甲酸钾在罗非鱼中的应用研究。

【英文摘要】The aim of the present study was to investigate the effect of dietary inclusion of potassium diformate (KDF), a possible non-antibiotic growth promoter, and two widely-used antibiotics, flavomycin and quinocetone, on growth performance, feed conversion ratio and gut microbiota of hybrid tilapia. An 8 week feeding trial was conducted with five levels of KDF: 0 (C), 3.0 (KDF3), 6.0 (KDF6), 9.0 (KDF9), and 12.0 (KDF12) g kg(-1) diet and three antibiotic treatments: flavomycin (8 mg kg(-1), AF), quinocetone (100 mg kg(-1), AQ), and flavomycin (4 mg kg(-1)) + quinocetone (50 mg kg(-1)) (AFQ). At the end of the experiment, fish were starved for one day and bulk weighed. Pooled gut contents sampled from four replicate tanks were analyzed for bacterial community by 16 S rDNA PCR, denaturing gradient gel electrophoresis (DGGE) and Bio-1D++ software. The results indicate that the addition of dietary KDF and antibiotics had no significant effect on tilapia growth performance, feed conversion ratio or survival compared to the control group. Among the experimental groups, however, fish fed the KDF3 and KDF6 diets showed improved growth performance and feed conversion ratio with higher final body weight and specific growth rate and lower feed conversion ratio compared to those fed the AFQ diet. Dietary KDF and antibiotics showed effects on the gut microbiota. Dietary KDF3 and KDF6 improved the relative richness of some intestinal allochthonous bacteria such as Mycobacterium sp. partial MHSD12-like, Mycobacterium peregrinum-like, Pseudomonas sp. HMPB4-like and six uncultured bacterium-like species. However, alpha Proteobacterium IMCC1702-like, Rhodococcus sp. P14-like, and three uncultured bacterium-like species were depressed in the gut. Based on these results, the possible beneficial effects of KDF on gut bacteria will be discussed.

【题目】Solid-phase extraction and residue determination of glyphosate in apple by ion-pairing reverse-phase liquid chromatography with pre-column derivatization

【中文关键词】无
【英文关键词】Apple / 4-Chloro-3,5-dinitrobenzotrifluoride (CNBF) / Glyphosate / Ion-pairing reversephase liquid chromatography / Pre-column derivatization
【中文摘要】无
【英文摘要】A new method for glyphosate residue determination in apple has been developed. A SPE cartridge was used to clean up the samples before derivatization. Glyphosate was derivatized with 4-chloro-3,5-dinitrobenzotrifluoride (CNBF) and quantified by reverse ion-pair liquid chromatography using cetyltrimethylammonium bromide (CTAB) as ion-pair reagent. In pH 9.5 H3BO3 – Na2B4O7 medium, the reaction of glyphosate with CNBF was complete after 30 min at 608C. The stability of the derivative on exposure to light at room temperature in methanol – water was demonstrated.The labeled glyphosate was separated on a Kromasil C18 column (25064.6 mm,5 μ m) at room temperature and UV detection was applied at 360 nm. Separation was achieved within 15 min in gradient elution mode. The correlation coefficient for the method was 0.9998 at concentrations ranging from 0.1 to 50 lg/g. The calculated recoveries for glyphosate in apple were from 86.00 to 99.55%, and the relative standard deviations (n = 6) were from 1.43 to 6.32. The limit of detection was 0.01 μ g/g for glyphosate in apple.

【题目】Determination of Amitrole in Environmental Water Samples with Precolumn Derivatization by High-Performance Liquid Chromatography
【中文关键词】无
【英文关键词】Amitrole; precolumn derivatization; 4-chloro-3,5-dinitrobenzotrifluoride (CNBF); high-performance liquid chromatography
【中文摘要】无
【英文摘要】Amitrole is a nonselective polar herbicide that can easily pollute ground and surface waters because of its high solubility in water. A precolumn derivatization high-performance liquid chromatographic method for amitrole analysis has been developed. Derivatization of amitrole was performed with 4-chloro-3,5-dinitrobenzotrifluoride (CNBF). The derivatization conditions and the influence of elution composition on the separation were investigated. In pH 9.5 H3BO3-Na2B4O7 media, the reaction of amitrole with CNBF was complete at 60 C after 30 min. The stability of the derivative under light irradiation and room temperature in methanol-water samples was demonstrated. The derivatized amitrole was separated on a K C18 column (250 mm 4.6 mm, 5 μ m) at room temperature, and UV detection was applied at 360 nm. The separation of derivatized amitrole was achieved within 18 min by gradient elution mode. The method correlation coefficient was 0.9995, in concentrations ranging from 1.59 to 318 mg L-1. The detection limit of amitrole was 0.16 mg L-1 with a signal-to-noise ratio of 3. The proposed method was applied to the quantitative determination of amitrole in environmental water with recoveries of 92.0-103.0% and RSDs of 2.22-6.26, depending on the sample investigated. This method has good accuracy and repeatability that can be used to quantify amitrole in environmental water.

【题目】High-performance liquid chromatographic method for determination of amino acids by precolumn derivatization with 4-chloro-3,5-dinitrobenzotrifluoride

【中文关键词】无
【英文关键词】Amino acids
Precolumn derivatization
4-Chloro-3,5-dinitrobenzotrifluoride
Liquid chromatography
【中文摘要】无
【英文摘要】This work presents an high-performance liquid chromatography method for the determination of amino acids after precolumn derivatization with 4-chloro-3,5-dinitrobenzotrifluoride (CNBF) which can readily react with both primary and secondary amines. The precolumn derivatization conditions, including the CNBF concentration, reaction pH, temperature and reaction time were investigated for method optimization.In pH 9.0 borate buffer, the reaction of amino acids with CNBF was carried out at 60 ◦ C for 30 min,the optimized concentration of CNBF was 70mmol*L − 1 and the molar ratio of amino acids to CNBF was1:5.25. The chromatographic separation of 19 amino acids derivatives was performed on a Kromasil ODS C18 column (250mm × 4.6mm, 5 μ m) with good reproducibility, and ultraviolet detection was applied at260 nm. The mobile phase was a mixture of phase A (acetonitrile) and phase B (acetate buffer, acetonitrile,triethylamine; 82.8:17:0.2, pH 4.9), and the flow rate was 0.4mLmin − 1. The separation of all the labeled amino acids was achieved within 45 min at room temperature by gradient elution mode. The method linearity,calculated for each amino acid, had a correlation coefficient higher than 0.9979, in concentrations ranging from 9.60 to 3330.00 mol L − 1. The detection limits of amino acids were 2.40 – 6.50 μ mol*L − 1, at a signal-to-noise ratio of 3. The proposed method was applied for the determination of amino acids in beer with recoveries of 97.0 – 103.9% and relative standard deviations of 2.62 – 4.22%, respectively. This method showed good accuracy and repeatability that can be used for the quantification of amino acidsin real samples.

【题目】Preparation of Ag-doped TiO2 nanoparticles for photocatalytic degradation of acetamiprid in water
【中文关键词】无
【英文关键词】Ag-doped TiO2; photocatalytic degradation; acetamiprid
【中文摘要】无
【英文摘要】BACKGROUND: Surface modification by doping with metal ions and organic polymers has been proven to be an efficient route to improve the photocatalytic activity of TiO2. Pesticide photocatalysis has been conducted with fine TiO2 particles suspended in an aqueous phase.RESULTS: It has been found that the Ag dopant accelerates TiO2 anatase to rutile transformation. At relatively low Ag concentrations (2 – 6%), anatase grain sizes decreased and specific surface areas of the TiO2 powders increased. The presence of Ag in crystalline TiO2 was found to increase the photocatalytic activity of TiO2 in the photocatalytic degradation of acetamiprid at 25 ◦ C.CONCLUSION: All photocatalytic degradations of acetamiprid followed pseudo-first-order degradation kinetics(Ct = C0e − kt) and parameters like the concentration of doped Ag appeared to play an important role affecting the reaction rate. The photocatalytic degradation velocity constant (k) was found to increase quickly with the Ag content, increasing from n = 0.02 to 0.06, and decreased slowly from n = 0.08 to 0.12. The half-lives of degradation(t1/2) were 18.8, 11.3, 16.2, 10.0, 6.9, 8.4 and 14.7min at n = 0, 0.02, 0.04, 0.06, 0.08 and 0.12, respectively. The optimal mole percentage of Ag in TiO2 should be between 4% and 8%.

【题目】Immunogenicity and protective efficacy of a replication-defective infectious bronchitis virus vaccine using an adenovirus vector and administered in ovo.
【中文关键词】无
【英文关键词】Infectious bronchitis virus
S1
Immune responses
【中文摘要】无
【英文摘要】In ovo vaccination remains an attractive option for a cost effective, uniform and mass application of vaccines for commercial poultry. However, the vaccines which can be delivered safely by this method are limited and there is no currently licensed embryo-safe vaccine against infectious bronchitis virus(IBV). In this study, a recombinant adenovirus expressing the S1 gene of nephropathogenic IBV (rAd-S1) was constructed and the immune responses and protective efficacy against homologous challenge were evaluated after in ovo vaccination. The results showed that the rAd-S1 led to dramatic augmentation of humoral and cellular responses in birds vaccinated in ovo followed by an intramuscular inoculation.Both IFN- and IL-4 in chicken ’s lymphocytes were produced by this strategy. Following challenge with IBV, the chickens vaccinated with recombinant adenovirus showed fewer nephropathic lesions and lesssevere clinical signs as compared to those receiving wild-type adenovirus or PBS. The construction of non-replicating human adenovirus vector encoding S1 gene of IBV and its in ovo delivery demonstrated the potential of an alternative vaccination strategy against IBV.

【题目】Effects of dietary energy and protein contents on the pH and electrolyte ion concentrations of jejunal fluid in Pekin ducks
【中文关键词】无
【英文关键词】jejunal fl uid, electrolyte, duck
【中文摘要】无
【英文摘要】The pH and electrolyte ion concentrations of intestinal fl uid play an importantrole in the activities of digestive enzymes and some amino acid transporters inintestine. Because energy and protein are the main macronutrients in poultrydiets, research to determine the response of intestinal pH and electrolyte ionconcentrations to dietary ME and CP content is warranted to explain nutrientutilization of ducks. The present experiment was conducted to investigatethe effect of dietary ME and CP content on jejunal pH and electrolyte ionconcentrations of Pekin ducks. Seventy-two male cannulated ducks wererandomly alloted into 4 groups. Four treatments consisting of combinationsof 3,050 and 2,800 kcal of ME/kg and 17.50 and 14.40% CP content wereavailable ad libitum. Jejunal digesta samples were collected for 1 h every 4h from 0930 h to 1830 h on d 31, 33, and 35 of the experiment. The jejunalfl uid was prepared by centrifuging jejunal digesta. Subsequently, the pH andconcentrations of sodium, potassium, chloride, calcium, and magnesium ions injenunal fl uid were determined. Dietary energy and protein contents did not affectthe pH of jenunal fl uid in Pekin ducks. Greater dietary ME content increased thechloride ion concentration ($P < 0.05$) but did not affect the sodium, potassium,calcium, and magnesium ion concentrations of jenunal fl uid. Greater dietaryCP content increased the sodium and calcium ion concentrations in the jenunalfl uid ($P < 0.05$) but did not change the concentrations of chloride, potassium,and magnesium ions. In conclusion, dietary energy and protein contents did notaffect the pH of jenunal fl uid, which indicated a constant jejunal pH was presentin Pekin ducks. However, a few electrolyte ions were affected by dietary theME and CP content.

【题目】Effects of Dietary Energy on Growth Performance and Carcass Quality of White Growing Pekin Ducks from Two to Six Weeks of Age
【中文关键词】无
【英文关键词】duck, energy, requirement
【中文摘要】无
【英文摘要】Adose-response experiment with 6 dietary energy levels (2,600, 2,700, 2,800, 2,900, 3,000, 3,100 kcalofAME/kg) was conducted to study the effects of dietary energy on growth performance and carcass quality of White Pekin ducks from 2 to 6 wk of age. Six hundred 14-d-old White Pekin ducks were randomly divided to 6 dietary treatments, each containing 5 replicate pens with 10 males and 10 females per pen, and these birds were raised until 6 wk of age. At 42 d of age, weight gain, feed intake, and feed:gain of ducks from each pen were measured, and 2 ducks (1 male and 1 female) selected randomly from each pen were slaughtered to evaluate the yields of abdominal fat, breast meat (including pectoralis major and pectoralis minor), and leg meat (including thigh and drumstick). As dietary energy increased from 2,600 to 3,100 kcal of AME/kg, the weight gain of ducks increased significantly, and the feed intake and feed:gain decreased significantly. According to the broken-line regression analysis, the AME requirements of White Pekin ducks from 2 to 6 wk of age for optimal weight gain and feed:gain were 3,008 and 3,030 kcal/kg, respectively, when dietary protein was 18%. On the other hand, high dietary energy did not affect breast and leg meat (P 0.05), but abdominal fat increased (P 0.05) when dietary AME was above 2,700 kcal/kg.

【题目】胶体金免疫层析检测犬、猫抗狂犬病病毒IgG抗体的研究
【中文关键词】狂犬病;N 蛋白;胶体金免疫层析; IgG抗体;SPA
【英文关键词】rabies ; nucleoprotein ; gold immunochromatographic assay ; IgG antibodies ; staphylococcal protein A
【中文摘要】目的 建立检测犬、猫抗狂犬病病毒(RV) IgG抗体的胶体金免疫层析方法。方法 采用柠檬酸三钠还原法制备胶体金用以标记SPA ,同时将重组RV N 蛋白、抗SPA 抗体分别包被至硝酸纤维素膜的检测线与质控线上,制备一种检测犬、猫抗RV IgG抗体的胶体金检测卡,进行了特异性和灵敏度试验,并与EL ISA 同时检测临床样品、统计结果。结果 GICA 试纸条检测灵敏度为0. 5 IU/ mL ,与犬瘟热病毒、犬细小病毒等阳性血清无交叉反应,并与EL ISA 相比,两者的符合率为94. 6 %。结论 成功建立了检测犬、猫抗RV IgG抗体的通用型胶体金免疫层析方法,该方法灵敏度高,特异性强,检测速度快,操作简便,可广泛应用于基层。
【英文摘要】To develop a gold immunochromatographic assay (GICA) for detection of rabies virus (RV) IgG antibodies ,SPA was conjugated with colloidal gold particles prepared by t ri2sodium cit rate reduction method. Meanwhile the recombinant RV nucleoprotein and anti2SPA antibodies were st riped in the test line position and the cont rol line position respectively. The assay could detect RV antibody in dogs and cat s with a sensitivity of 0. 5 IU/ mL. There was no cross reaction to canine distem-per or canine parvovirus positive serum. Compared with EL ISA ,the coincidence rate of these two methods was 94. 6 %. Fur-thermore ,GICA was rapid (15min) and easy to perform without requirement s of professional skills ,reagent s and equipment s. Itsuggest s that GICA is an acceptable alternative for clinical laboratories lacking specialized equipment .

【题目】Suppression of porcine reproductive and respiratory syndrome virus replication in Marc-145 cells by shRNA targeting to ORF1 region
【中文关键词】无
【英文关键词】PRRSV;RNA interference (RNAi);Short hairpin RNA (shRNA); ORF1b
【中文摘要】无
【英文摘要】Porcine reproductive and respiratory syndrome(PRRS) is an economically important disease in swine producing area. The current vaccine strategies cannot provide complete protection against PRRSV. The objective of this study was to determine if specific short-hairpin RNA (shRNA) directed against different genomic regions of ORF1b of PRRSV could be utilized to inhibit virus replication in MARC-145 cells. Two shRNA expression vectors targeting ORF1b gene of PRRSV were constructed and delivered into MARC-145 cells, and then infected withPRRSV. The results showed that PRRSV-specific cytopathic effect (CPE) could be inhibited in the cells transfected with pSUPER-P2 and pSUPER-P3, and the virus titers in the cells transfected with pSUPER-P2 and pSUPER-P3 were lower than those control cells by approximately100 fold. Moreover, the expression of ORF1 of PRRSV in the cells was reduced both at RNA and protein levels comparing to the controls. It indicated that vectorbased shRNA targeting ORF1 region could effectively inhibit PRRSV replication in MARC-145 cells.

【题目】Inhibition of porcine reproductive and respiratory syndrome virus replication by adenovirus-mediated RNA interference both in porcine alveolar macrophages and swine
【中文关键词】无
【英文关键词】PRRSV
Adenovirus vector
RNAi
shRNA
【中文摘要】无
【英文摘要】Porcine reproductive and respiratory syndrome virus (PRRSV) has been mainly responsible for the heavy economic losses in many swine-producing regions. Current vaccination strategies and antiviral drugs provide only limited protection. Consequently, there is a need to develop a new antiviral strategy. In this study, two recombinant adenoviruses expressing short-hairpin RNAs (shRNAs) directed against ORF1b of PRRSV S1 strain were constructed and the inhibition of PRRSV replication was determined. The results showed that pretreatment with these shRNAs delivered by recombinant adenovirus could induce a significant inhibition of viral RNA and protein level in Marc-145 cells infected with PRRSV S1 strains. One recombinant adenovirus (rAd-P2) was found to be also effective in inhibiting the replication of highly virulent PRRSV SY0608 strain in Marc-145 cells and porcine alveolar macrophages at both the proteinand ORF1b mRNA level. The antiviral effect was dose-dependent and sustained for at least 96 h. Twenty 6-week old piglets were assigned to four groups each with five piglets. Groups 1 and 2 were inoculated intramuscularly with rAd-P2 and mock construct rAd-mP2 individually. After 24 h, groups 1, 2 and 3were challenged intramuscularly with the SY0608 strain. Group 4 remained unchallenged but with PBS as mock. The results showed that the viral load of PRRSV in serum and lung tissue of swine was suppressed effectively by rAd-P2. The clinical signs and pathological lesions in the pigs inoculated with rAd-P2 were milder than those in rAd-mP2 negative and PRRSV control. These results indicated that shRNAs mediated by the adenovirus could inhibit PRRSV infection sufficiently in vitro as well as in vivo. RNAi mediated byrecombinant adenovirus might be a potential new tool for controlling PRRSV infection. Of course, the protective efficiency of rAd-P2 should be made by using a large number of pigs in future.

【题目】Effective suppression of porcine reproductive and respiratory syndrome virus replication by adenovirus-mediated small interfering RNAs targeting ORF1b, 5 and 7 genes
【中文关键词】无
【英文关键词】PRRSV
Adenovirus
RNAi
shRNA
【中文摘要】无
【英文摘要】Porcine reproductive and respiratory syndrome virus has caused hundreds of thousands of deaths in pig farms in many swine-producing areas in the world in recent years. However, at present there is no effective method to prevent and control the disease, and there is a need to develop new antiviral strategies. In this study, four recombinant adenoviruses expressing shRNAs targeting ORF1b, ORF5 and ORF7were constructed,and it was found that they could down-regulate effectively specific gene expression and inhibit viral replication in MARC-145 cells when compared to the controls. They could also inhibit effectively PRRSV replication in porcine alveolar macrophages. The inhibition effect was dose-dependent and could be sustained for at least 96 h in macrophages. In addition, PRRSV replication could be suppressed significantly by shRNA in cells infected previously or simultaneously with PRRSV. The results indicated that the shRNA-expressing rAd5 targeting to various gene regions of PRRSV might be a potential anti-PRRSV

strategy

【题目】Construction and Function Test of Chicken MHC I (BF2*15)/peptide Tetramer
【中文关键词】无
【英文关键词】Chicken MHC class I; BF2*15-BSP and b2 microglobulin genes; BF2*15/peptide tetramer
【中文摘要】无
【英文摘要】The major histocompatibility complex class I (MHC class I) peptide tetramer is a sensitive and valuable tool to evaluate antigenspecific cytotoxic T lymphocytes (CTLs) of many animal species. To date, no chicken MHC class I peptide tetramer has been reported. In this report, we describe construction and functional evaluation of a chicken MHC-I (BF2*15)/peptide tetramer. To construct the chicken MHC class I peptide tetramer, genes of the chicken MHC-I a chain (BF2*15) and b2 microglobulin (Chb2m)were synthesized by RT-PCR from the total RNA of PBMCs and the signal sequences were deleted. The BF2*15 was then fused with the BirA substrate peptide (BSP) sequence at the C terminus. Next, the synthesized PCR products of BF2*15 and Chb2m were cloned into the expression vector pET-28a (+) and expressed in Escherichia coli strain BL21 (DE3). Highly purified BF2*15-BSP heavy chain and Chb2m were obtained by a Ni2+ NTA column affinity purification, yielding approximately 1.6 mg of BF2*15-BSP and 2.4 mg of Chb2m per 1 g of the pelleted bacteria. The purified BF2*15-BSP heavy chain and Chb2m were refolded with synthetic peptide originated from infectious bronchitis virus nucleoprotein (IBV N71 – 78) in refolding buffer to generate the monomer of BF2*15/peptide complex. The monomer was then biotinylated and tetramerized using PE-labeled streptavidin. Upon functional evaluation of the construct by using flowcytometry, we observed that 3.65% of CTLs were specific to IBV nucleoprotein.This demonstrates that the CTL response of IBV-infected chicks could effectively be evaluated using the prepared MHC-I BF2*15/peptide tetramer.

【题目】异养型亚硝酸细菌固定化颗粒质量评价的研究
【中文关键词】亚硝酸细菌固定化颗粒, 包埋法, 含氮污水, 物理性状, 化学性能
【英文关键词】AOB immobilized beads ; embedding method ; ammonia2nit rogen containing sewage ; physical character ; chemical character
【中文摘要】采用聚乙烯醇和海藻酸钠凝胶共包埋异养型亚硝酸细菌制备固定化颗粒,从物理性状和化学性能2 个方面综合评价异养型亚硝酸细菌固定化颗粒的质量。物理性状主要指颗粒是否成球、胶体粘连状况、颗粒弹性、稳定性和传质性能等;化学性能指异养型亚硝酸细菌固定化颗粒对氨氮的去除能力。试验结果表明,通过优化制备颗粒的配方可改善固定化颗粒的物理性状;污水中添加碳源有利于提高固定化颗粒的除氮能力;在稳定处理期包埋2 种活菌量的固定化颗粒去除氨氮效果差异不显著。此外,也发现固定化颗粒去除人工污水中氨氮的过程较为复杂,物理吸附、分子扩散和微生物硝化作用同时存在,其中微生物起主要作用。
【英文摘要】Series of immobilized microbial beads was prepared with polythene alcohol (PVA) and Na-alginate as gel mat rix and content rapping heterot rophic ammonium oxidizing bacteria (AOB) . The impact of sodium alginate concent ration ,activated carbon concent ration ,polyvinyl alcohol concent ration and crosslinking time on immobilized beadsquality was investigated by analyzing their

physical and chemical characteristics such as conglutination ,forming ,flexibility ,stability ,mass t ransfer efficiency and ammonia nit rogen removal capacity. The result s showed that the optimum proportion could improve physical characteristics of immobilized beads ,and more carbon source was beneficial to theammonia nit rogen removal capacity. The AOB immobilized beads presented perfect performance for ammonia nit rogenremoval ,and the influence of AOB concent ration on ammonia nit rogen removal rate was negligible. The t reatment of nit rogen containing sewage by AOB immobilized beads was a complicated process including physical adsorption ,molecule diffuse and nit rification ,among which ,microbe played an important role.

【题目】Expression of biologically active recombinant equine interferon- γ in Escherichia col

【中文关键词】无

【英文关键词】Interferon- γ ; Expression; Biological activity

【中文摘要】无

【英文摘要】Interferon gamma (IFN- γ) is a pleiotropic cytokine that is recognized as an important modulator of the immune response. To date, there is no report that prokaryocyte-derived recombinant equine IFN- γ has antiviral activity. In this report, the gene coding equine IFN- γ (EIFN- γ) mature protein was cloned into pET-28a (+) and the recombinant EIFN-g was expressed in Escherichia coli (E. coli). The antiviral activity of expressed recombinant EIFN- γ was evaluated by using a recombinant Vesicular Stomatits Virus expressing green fluorescence protein (rVSV-GFP) system in the equine fetal kidney-78 cell line (EFK-78). The GFP expression in the EFK-78 cells dramatically decreased in the cells treated with EIFN-g in a dose-dependent manner, comparing with the mock-treated cells. The titer of antiviral activity was 1 103 AU/ml. These results demonstrated that the EIFN-g expressed in this study had good biological activity. Pure forms and sufficient quantities of biologically active IFN- γ could facilitate the study of its activities in modulating immune responses both in vivoand in vitro.

【题目】Expression, purification and monoclonal antibodies preparation ofrecombinant equine mature interleukin-18

【中文关键词】无

【英文关键词】Interleukin-18 (IL-18)
Expression
Bioactivity
mAb
Equine

【中文摘要】无

【英文摘要】IL-18 is a cytokine originally discovered as an important modulator of immune responsesand subsequently shown to be pleiotropic. In this report, we expressed the recombinantequine mature interleukin-18 (rEMIL-18) in E. coli and purified it by nickel affinity gelcolumn chromatography. Purified rEMIL-18 had biological activity commensurate withrecombinant human IL-18, as determined by its synergistic effect with recombinant humanIL-12 (rhIL-12) on the induction of IFN- gene expression in equine peripheral bloodmononuclear cells (PBMC). Following intraperitoneal (i.p.) immunization of BALB/c mice with rEMIL-18, nine

monoclonal antibodies (mAbs) against equine interleukin-18 (EIL-18) were obtained and characterized. These mAbs recognized different epitopes on equine mature interleukin-18 (EMIL-18) protein based on their reactivity with two peptides containingdifferent amino acid sequences and one of these mAbs has neutralization activity against EIL-18 in an IFN- γ -induction assay.

【题目】不同措施对北方地区冬季户用沼气池料液温度及产气量的影响
【中文关键词】北方; 冬季; 户用沼气池; 温度; 产气量
【英文关键词】northern; winter; household biogas digesters; temperature; gas production
【中文摘要】提高农村户用沼气池冬季产气量, 是当前循环农业领域面临的主要问题。通过实验室筛选、培养并制取了低温沼气微生物菌剂, 在山东省德州市选取农村户用沼气池进行冬季产气试验, 研究采取不同措施对户用沼气池池内料液温度及沼气产量的影响。结果表明, 对于池容为10 m3 的猪粪原料沼气池, 三种保温措施都能使沼气池内料液温度达到10e以上, 各种措施效果依次为: 暖棚> 简易塑料薄膜> 深埋; 在提高产气量方面, 暖棚加菌剂>简易塑料薄膜加菌剂> 深埋加菌剂> 暖棚> 简易塑料薄膜> 深埋。
【英文摘要】Increasing gas production of rural household biogas digesters in winter is the major problems of current recycling agriculture. Through laboratory screening, cultivation, preparation of the low-temperature microbial agent, the gas production tests were carried out with household biogas digesters in winter in Dezhou city of Shandong Province. The effect of different heat preservation measures on digester temperature and gas production were studied. The results showed that, for the biogas digesters of 10 m3, the methods of greenhouses, plastic film covering, and deep buried digester, could make digester temperature above 10°C in northern winter. And the order of gas production improving was greenhouses plus microbial agent,plastic film covering plus microbial agent, deep buried digester plus microbial agents.

【题目】DNA-chitosan nanoparticles improves DNA vaccine-elicited immunity against Newcastle disease virus through shuttling chicken interleukin-2 gene
【中文关键词】无
【英文关键词】chicken interleukin-2 gene; DNA – chitosan nanoparticles; immunity; Newcastle disease virus
【中文摘要】无
【英文摘要】In this study, pCAGG-ChIL2 plasmid DNA containing the chicken interleukin-2 (ChIL-2) gene was used to prepare DNA – chitosan nanoparticles (CNPs). The CNPs prepared were spherical, with mean diameters between 100 and 200 nm, have a positive surface charge, and could protect DNA against DNase I degradation.The CNPs prepared were successfully used to transfect the Df-1 cell line with almost no cytotoxicity.CNPs prepared at an amino group to phosphate group ratio (N/P ratio) of 16 provided the highest 15 transfection efficiency (1.1%) in medium with a pH of 6.5. When pCAGG-ChIL2 CNPs were administered to chickens simultaneously with a DNA vaccine against Newcastle disease virus (NDV), haemagglutination inhibition antibody titers and serum interferon-γ (IFN-γ) levels were significantly higher than in chickens immunised with the NDV DNA vaccine alone (p50.05). The results demonstrate that pCAGG-ChIL2 CNPsimprove DNA vaccine-elicited immunity against NDV challenge.

【题目】对《城镇污水处理厂污泥处置农用泥质》的思考
【中文关键词】污泥; 处置; 农用泥质; 标准
【英文关键词】sewage sludge; disposal; sludge for agricultural use; standard
【中文摘要】2008年制订了《城镇污水处理厂污泥处置农用泥质》标准,对污泥农用时重金属浓度指标实行分级控制。根据作物试验结果,并结合我国农田土壤的实际情况,对毒性强、危害大的重金属元素从严控制,对毒性和污染风险小的锌和铜,则适当放宽限制;对种植非食用农作物的农田,也适当放宽重金属浓度的限制。另外,增加了污泥中有机污染物、病原菌、腐熟度和污泥施用时间、施用量、禁用区域等方面的具体规定。
【英文摘要】D isposal of S ludge from M unicipal W astewater Treatm en t Plant: the Quality of S ludgeUsed in Agriculturewas set up in 2008, which establishes the requirements for the heavymetals in sewage sludge when app lied to the land. The requirements of the heavy metals concentrations are divided into ClassA and Class B, which depend on the types of crop s p lanted in agricultural land. Based on the experiments and the element background of farmland in China, some heavy metals whose toxicity is more harmful to the crop and human body should be strictly controlled. However, some heavy metals such as Zn, Cu are regulated with a reasonable concentration for the weak toxicity and low risk. The requirements for heavymetals in sewage sludge app lied to the crop swhich do not enter the food chain directly are reasonably relaxed. Also added in this standard are organic pollutants, pathogenic bacteria, maturity, app lication quantity and time limit, the p rohibited app lied areas and so on for sewage sludge app lied to the agricultural land.

【题目】SPME法分析玉米芯物理吸附恶臭气体特征研究
【中文关键词】玉米芯;恶臭气体;固相微萃取;吸附
【英文关键词】Corn-Cob; Odors; SPME; Absorption
【中文摘要】本研究考察以农副产品玉米芯为填料净化恶臭气体的效果,并以SPME-GC(固相微萃取-气相)联用作为监测方法。实验对固相微萃取的萃取头类型、萃取时间及条件进行了优化,对气相色谱的色谱条件进行了筛选,针对填料玉米芯的含水率、进气流量、填料高度等因素对净化效果的影响进行了重点探索,最后考察了最优条件下玉米芯对恶臭气体的物理净化效果。结果表明:采用75 μm CAR/PDMS萃取头吸附恶臭气体5 min,可以实现恶臭气体的有效检测;气相色谱的升温程序能够有效分离三种硫醇物质,FPD检测器能够实现有效检测;玉米芯吸附恶臭气体的最优条件为含水率70%、自然堆积密度0.12 g·cm－3、填料高度65 cm、进气流速0.1 m3·h－1;最优条件下,吸附塔动态吸附恶臭气体47 h,对恶臭气体净化率维持在85%~95%,效果良好。
【英文摘要】This study explored the decontamination effect of corn-cob on odors by using SPME-GC (solid phase mi-cro-extraction, gas chromatography). The type of extraction fiber, the time and condition of the extraction on SPME were optimized, and the chromatographic condition on GC was screened. The study focused on investigating the opti-mum condition of the decontamination effect of corn-cob including the moisture content, the inlet air flow rate and the filling height. Results: The study indicated that using 75 μm CAR/PDMS extraction fiber to absorb odors for 5 minutes could effectively test the odors; three mercaptan could be separated by temperature-programming and effectively de-termine by FPD; the optimum condition of absorption was moisture content 70%, natural packing density 0.12 g·cm－3, filling height 65 cm and inlet air flow rate 0.1 m3·h－1. Under the optimum condition, the decontaminating efficiency of corn-cob on odors maintained at 85%~95% in 47 h.

【中文摘要】以农村生活垃圾中的可堆肥腐熟成分和蘑菇渣为堆肥原料,通过添加微生物菌剂进行堆肥试验,研究其在农业废弃物堆肥腐熟过程中的作用,并通过田间试验研究堆肥腐熟后肥料样品对黄瓜和青椒的增产效果,以验证其肥效。结果表明添加微生物菌剂有助于堆肥腐熟后样品的氮、磷、钾的保全和有机质的增加,促进养分均衡。添加微生物菌剂的堆肥腐熟肥料样品在田间试验中对黄瓜和青椒的增产效果最为显著,分别为22.21%和19.87%。

【英文摘要】The compost decomposition experiment was carried out using decomposable component of living garbage in the countryside and mushroom residue as compost raw material to study the compost composition process using agricultural junks by adding microbial agent,and carried out field experiment to study their effect on production increment of cucumber and green pepper of the fertilizer samples after compost composition in order to verify the fertilizer effect.The result showed that adding microbial agent was conducive to preserve nitrogen,phosphorus,potassium,and increasing organic matter,and promoting nutrient balance after the compost composition process. The output of the cucumber and green pepper increased by 22.21% and 19.87% respectively with significant production increment in the field experiment of the samples of compost composition manure adding microbial agent.

【题目】Simultaneous Heterotrophic Nitrification and Aerobic Denitrification by Bacterium Rhodococcus sp. CPZ24
【中文关键词】无
【英文关键词】Heterotrophic nitrification;Aerobic denitrification;Rhodococuus sp.
【中文摘要】无
【英文摘要】Rhodococcus sp. CPZ24 was isolated from swine wastewater and identified. Batch (0.25 L flask) experiments of nitrogen removal under aerobic growth conditions showed complete removal of 50 mg/L ammonium nitrogen within 20 h, while nitrate nitrogen removal reached 67%. A bioreactor (50 L) was used to further assess the heterotrophic nitrification and aerobic denitrification abilities of Rhodococcus sp. CPZ24. The results showed that 85% of the ammonium nitrogen (100 mg L 1) was transformed to nitrification products (NO-3 -N and NO-2 -N) (13%), intracellular nitrogen (24%), and gaseous denitrification products (48%) within 25 h. The ammonium nitrogen removal rate was 3.4 mg L 1 h 1. The results indicate that the strain CPZ24 carries out simultaneous nitrification and denitrification, demonstrating a potential use of the strain for wastewater treatment.

【题目】通过分层堆肥提高城市污泥堆肥处理效果的研究
【中文关键词】城市污泥; 分层堆肥; 调理剂
【英文关键词】municipal sludge; layered composting; bulking agent
【中文摘要】在不改变整个堆体中污泥和调理剂配比的情况下,研究了改变强制通风静态垛堆体的上、下层物料配比对城市污泥堆肥处理效果的影响。结果表明,在不改变整个堆体中污泥和调理剂配比的情况下,适当减少堆体下层的污泥比例并同时增加堆体上层的污泥比例,可明显改善堆肥的通风效果、促进堆体内部氧气的扩散、增加堆体的最低氧气浓度、加快堆体下层升温并带动堆体上层升温。当堆体上层的污泥和调理剂比例为1∶0.5(体积比)、下层的为0.5∶1(体积比)时,堆体的升温效果最为理想。在不改变整个堆体中污泥和调理剂配比的情况下,采用分层堆肥可明显提高堆肥的处理效果和处理速度。
【英文摘要】The influence of changing the ratio of municipal sludge to bulking agent in the upper and lower layer of the p ile on the treatment effect of municipal sludge composting was studied when the ratio ofmunicipal sludge to bulking agent in the whole p ile was not changed. The results show that under the above condition, reducing the lower layer sludge ratio and increasing the upper layer sludge ratio can improve the ventilation effect obviously, p romote the diffusion of internal oxygen, increase the minimum oxygen concentration, speed up the lower layer temperature rise and drive the upper layer temperature rise. When the ratio ofmunicipal sludge to bulking agent of upper layer is 1 ∶ 0.5, and that of lower layer is 0.5 ∶ 1, the temperature rise effect is desirable. The layered composting can significantly imp rove the treatment efficiency and speed when the ratio ofmunicipal sludge to bulking agent of the whole p ile is not changed.

【题目】造纸污泥工厂化堆肥过程中理化性质的动态变化
【中文关键词】造纸污泥;堆肥;温度;好氧速率
【英文关键词】compost; oxygen consumption; pulp mill sludge; temperature
【中文摘要】工厂化强制通风静态垛好氧堆肥试验结果表明,造纸污泥与木屑按10∶1比例混合后,2~3 d即可达到60 ℃,高温期维持时间超过10 d,完全符合我国标准CJJ/T52-93规定,达到无害化要求;堆肥过程中堆体上层温度大于下层;高温堆肥后物料含水率降低20.2%,脱水效果明显;造纸污泥堆肥过程中物料的挥发性固体持续降低;堆体耗氧速率在升温阶段后期上升到最大值,此后持续降低,到堆肥后期趋于稳定。
【英文摘要】The technology of aerobic composting of pulp and paper sludge was studied on a large scale. Composting of paper mill sludge and wood shaves was made in forced-aeration static pile system, and the changes of temperature, oxygen, moisture and content of volatile substance during the composting were monitored and analyzed. The duration of the hermophilic phase was found to be long enough to meet the sanitary standard of the non-hazardous treatment of paper sludge when the sludge and wood shaves were mixed at rate of 10∶1 (V/V) on a large scale (300 t/d). The consumption rate of oxygen was the highest at the end of temperature incremental stage, and then decreased until the hermophilic phase. The moisture and content of volatile substance decreased during whole process of composting, and gradually tended to be stable eventually. Compared with the results in the initial stage, the moisture and content of volatile substance in the pile decreased 20.2% and 5.9%, respectively, at the end of composting process.

【题目】造纸污泥土地利用的资源价值与潜在风险
【中文关键词】造纸污泥; 堆肥; 资源化; 土地利用;风险评估

【英文关键词】paper sludge; composting; resource; land app lication; risk assessment
【中文摘要】随着造纸工业的发展,造纸污泥产生的环境问题日益显露出来。造纸污泥含水量高达75% ~80% ,有机物含量高,易腐烂、有恶臭、不便于运输和施用,必须对污泥进行稳定化、无害化处理。造纸污泥经过堆肥无害化处理后可以作为一种价廉优质的有机肥料,造纸污泥不仅含有丰富的有机质,且含有N、P、K等其他营养元素,土地利用不会导致重金属、有机污染物、硝酸盐淋失等污染风险。大量的研究表明,施用造纸污泥及其堆肥,可以增加土壤的有机质含量,降低土壤容重,促进团粒结构形成,改善土壤结构,提高土壤孔隙度和保水、保肥能力,增强土壤酶活性。施用造纸污泥还可改善土壤的养分状况,且具有一定的增产效果和后效。造纸污泥经过堆肥后制成有机肥或有机复混肥是解决造纸污泥出路的主要途径。
【英文摘要】The pulp and paper industry generates a considerable amount of sludges from the papermaking p rocesses. With the development of papermaking industry, the environment concerns about paper sludge have increased. Paper sludge has high water content from 75% to 80% and high organic matter. It is easily to be rotten and has odor, and also isn ' t inconvenient to transport and land app lication. Therefore, paper sludge should be stabilized and used non2hazardoustreatment. Composting can be an effective strategy to stabilize the sludge and reduce its environmental risk p rior to land app lication. The composting p rocess biologically stabilizes heterogeneous raw paper sldge and reduces mass and volume and thus hauling costs. Paper sludge is rich in organic matter and other nutrients and its land app lication don ' t lead to the heavy metal contamination, the organic chemicals and nitrate leaching risk.Many studies involving paper sludge and compost land app lication highlight the effects on soil chemical and physical properties. Application of paper sludge can increase soil C, water holding p roperties and aggregation, also can imp rove soil structure, decrease soil bulk density, and p romote the soil enzyme activity. Paper sludge and compost can also imp rove soil nutrients status, and increase crop p roduction and has residual effect. It is a main avenue to dispose paper sludge that paper sludge after composting p rocess mixes with chemical fertilizer as compound organic fertilizer.

【题目】Accumulations of Cadmium,Zinc, and Copper by Rice Plants Grown on Soils Amended with Composted Pig Manure
【中文关键词】积累,浓度,猪粪,重金属,水稻
【英文关键词】Accumulation, concentration, heavy metal, pig manure, rice
【中文摘要】通过盆栽试验从土壤与肥料角度进行评估水稻(水稻)金属积累,其中猪粪堆肥应用土壤率为0%,0.5%,1.5%,3%,和5%(W/W),在土壤中模拟添加不同数量的镉(Cd),铜(Cu),锌(Zn),结果表明,水稻籽粒中镉浓度超过极限0.2mg/kg,当浓度0.14 mg/kg或超过这个值在含铝的粪便中应用,但它不超过石灰性始成土的极限。精米中锌含量不超过允许的限值为土壤中含量为50 mg/kg。铜浓度在水稻籽粒略超过10 mg/kg在铁铝土而不是在石灰性始成土。结果表明重金属污染的肥料对水稻的铁铝土比石灰性始成土风险更大。
【英文摘要】A pot experiment, in which composted pig manure was applied to soils at rates of 0%, 0.5%, 1.5%, 3.0%, and 5.0% (W/W) to simulate additions of different amounts of cadmium (Cd), copper (Cu), and zinc (Zn) to soil, was conducted to assess accumulation of metals by rice (Oryza sativa L.) plants from soils treated with manure. Results indicated that Cd concentrations inrice grains were more than the limit of 0.2mg kg21 when 0.14 mg kg21 or more Cd was loaded to Ferralsols by manure application, but it was not more than the limit in Calcaric Cambisols. Zinc contents in polished rice grains did not exceed the permissible limit of 50 mg kg21 in two soils. Copper concentrations in rice grain were slightly more than the limit of 10 mg kg21 in Ferralsols but not in Calcaric Cambisols. Results suggested greater risk of heavy-metal contamination from manure to paddy rice in Ferralsols than in Calcaric Cambisols.

【题目】中国城市污泥的重金属含量及其变化趋势
【中文关键词】城市污泥; 重金属; 含量变化
【英文关键词】municipal sludge; heavy metal; variation of concentration
【中文摘要】于2006年从全国范围内选取107个城市污泥样品,测定了其重金属含量。结果表明,污泥中As、Cd、Cr、Cu、Hg、Ni、Pb和Zn的平均含量分别为20.2、2.01、93.1、219、2.13、48.7、72.3和1 058 mg/kg。与2001年以前的调查结果

相比,污泥中的重金属含量总体呈下降趋势,其中Cd、Cr、Cu、Hg、Ni、Pb和Zn的含量分别降低了32. 3%、49. 7%、54. 9%、25%、37. 2%、44. 8%和27%。与《城镇污水处理厂污染物排放标准》(GB 18918—2002)相比,城市污泥中Cd、Cu、Ni和Zn含量的超标率相对较高,其超标率分别为6. 5%、6. 5%、6. 5%和11. 2%。

【英文摘要】To identify the concentrations of heavymetals in municipal sludge of China, samp les ofmunicipal sludge were collected from 107 sewage treatment p lants in China in 2006. The results indicate that the average concentrations of As, Cd, Cr, Cu, Hg, Ni, Pb and Zn in the sludge are 20. 2 mg/kg,2. 01 mg/kg, 93. 1 mg/kg, 219 mg/kg, 2. 13 mg/kg, 48. 7 mg/kg, 72. 3 mg/kg and 1 058 mg/kg respectively. Compared with the results of heavy metals in municipal sludge taken before 2001, there is a significant decrease in heavymetals in the sludge, and the average concentrations of Cd, Cr, Cu, Hg,Ni, Pb and Zn are decreased by 32. 3%, 49. 7% , 54. 9% , 25% , 37. 2% , 44. 8% and 27% respectively. However, the concentrations of Cd, Cu, Ni and Zn in the samp les exceed the heavymetal limits of D ischarge S tandard of Pollutants forM unicipalW astewater Treatm ent Plant (GB 18918 - 2002) , being 6. 5% , 6. 5% , 6. 5% and 11. 2% respectively.

【题目】低温对弱光影响甜椒光和作用的胁迫效应
【中文关键词】甜椒;弱光;低温;光合特性;叶绿素荧光;吸收光能分配
【英文关键词】sweet pepper; low light; lower temperature; photosynthetic characters; chlorophyll fluorescence; absobrbed light allocation
【中文摘要】以弱光耐受性不同的甜椒(Capsicum annuum L.) 幼苗为材料,研究弱光低温逆境下及其恢复过程中叶片光合特性、PS Ⅱ光化学活性和吸收光能分配的变化。结果表明,弱光低温及弱光适温处理均导致甜椒净光合速率(Pn) 、PS Ⅱ光化学效率(ΦPS Ⅱ) 和光化学猝灭系数(qP) 明显下降,PS Ⅱ光化学反应中心能量(P) 显著减少,天线耗散(D) ,尤其是反应中心能量耗散(Ex) 显著增加。弱光低温或弱光适温处理下Pn 的下降是非气孔限制的结果,低温降低了植株的弱光耐受性。光温逆境解除后,甜椒光合碳同化的恢复滞后于PS Ⅱ光化学效率的恢复,并且弱光下不同试材对低温的耐受性有所不同。

【题目】覆膜集雨与限量补灌对土壤水分及冬小麦产量的影响
【中文关键词】覆膜集雨;冬小麦;限量补灌;土壤含水率;耗水量;产量
【英文关键词】field rainwater harvesting; winter wheat; complementary irrigation; soil water; water consumption; yield
【中文摘要】依据北京昌平2005年~2006年冬小麦田间试验,探讨覆膜集雨和限量补灌措施对土壤水分及产量影响,结果表明:限量补灌明显的增加了田间土壤水分和耗水量,1.6m土层耗水量比对照增加45.8%,比覆膜增加29%~39%,产量是对照的1.63~1.95倍,比单纯覆膜增产32%~58%,结合覆膜比单纯补灌略增加上层土壤水分,但产量效应不明显;在覆膜面积占种植面积40%,降雨是常年水平一半的条件下,覆膜集雨提升上层土壤水分,降低深层水分,1.6m土层耗水量较对照增加3.68%~12.23%,且对深层水的利用是对照的1.55~1.69倍,小麦抗旱能力增强,增产63%~95%,1m土层水分生产效率提高55.8~73.8%(与上年结论一致);在都有覆膜的前提下,追肥比早秋施肥和一次基肥更好地保持了苗期土层水分。总体来看,覆膜结合补灌追肥和限量补灌措施抗旱增产效果显著,值得在华北地区旱地农田推广应用。
【英文摘要】Based on the field experiment conducted in year 2005~2006 in Changping, Beijing, the effects of field rainwater harvesting of plastic mulch and the complementary irrigation on the soil moisture and yield of winter wheat were studied. Results showed that under the complementary irrigation treatment, soil moisture was improved significantly and water consumption increased by 45.8% in contrast to the control, while by 29%~39% increasing with the rainwater harvesting of plastic mulch came from depth of 1.6 m. At the same time, the yield is 1.63~1.95 times to the control, by 32%~58% increasing than the field rainwater harvesting of plastic mulch. In addition, for the combination with plastic mulch and irrigation treatment, the corresponding yield almost changed nothing. Under the condition of the rainfall closes to normal half level and plastic mulch area reaches 40% of the total planting area, soil moisture within 1.6m depth was improved and water consumption increased by 3.68%-12.23%, while, the deep soil water utilization is 1.55~1.69 times than the control, and the yield of winter wheat increase by 63%~95%. The water production efficiency in the depth of 1m increased by 55.8%~73.8%, as the same as one of last year. For the same consideration of plastic mulch, Spring top-dressing had the best effect for keeping the soil water at seeding stage than fall fertilizer and basal fertilizer. In conclusion, both of Spring top-dressing when in irrigation with plastic mulch and complementary irrigation can greatly increased yield while improved capacity of drought resistance, it is worth expanding in drought area of North China.

【题目】小麦籽粒氨基酸碳氮稳定同位素的测定与分析
【中文关键词】GC-C-IRMS;NPP 氨基酸酯; δ 13C; δ 15N

【英文关键词】GC-C-IRMS; NPP amino acid esters; δ13C; δ15N
【中文摘要】目的是利用气相色谱-燃烧-同位素比值质谱仪(gas chromatography-combustion-isotope ratio massspectrometry,GC-C-IRMS)测定小麦籽粒氨基酸碳氮稳定同位素组成。【方法】以小麦临汾50744 为材料,水解得到其籽粒蛋白质氨基酸,将氨基酸标准样品以及小麦籽粒氨基酸衍生化为N-新戊酰基,O- 异丙醇(N-pivaloyl-isopropyl,NPP)氨基酸酯,利用GC-C-IRMS 测定其碳氮稳定同位素组成。【结果】氨基酸标准样品的碳氮同位素组成分析表明,NPP 氨基酸酯的平均重现性δ13C 为0.47‰,δ15N 为0.28‰,并没有产生大的同位素分馏,因此δ13C 和δ15N 都能得到满意的测定结果。运用GC-C-IRMS 测定了小麦临汾50744 籽粒蛋白质氨基酸的稳定碳氮同位素的自然丰度,其中δ13C 的变化范围在-28.7‰到-34.7‰,δ15N 的变化范围为-6.2‰到9.5‰。采用系统聚类分析进行分类,根据δ13C 可以将氨基酸分为两类;根据δ15N 可以将氨基酸分为三类。【结论】运用GC-C-IRMS 结合NPP 氨基酸酯衍生物可以测定小麦籽粒氨基酸的稳定碳氮同位素,这对于揭示氨基酸代谢途径的差异以及逆境胁迫下氨基酸的合成差异具有重要的意义。
【英文摘要】To measure the stable carbon and nitrogen isotope composition of amino acids in wheat grain by gaschromatography-combustion-isotope ratio mass spectrometry (GC-C-IRMS). 【Method 】 The N-pivaloyl-isopropyl (NPP)derivatives of the protein amino acids, which hydrolyzed with 6M HCl in wheat grain Linfen 50744, and standard amino acids weremeasured by GC-C-IRMS.【Result】 Analysis of stable carbon and nitrogen isotope composition of N-pivaloyl-isopropyl (NPP)amino acid standard esters shows the mean reproducibility of δ13C is 0.47‰ and δ15N is 0.28‰. Good results can be got as lessisotope fractionation is observed in this study. The δ13C values of NPP derivatives were from -28.7‰ to -34.7‰, and the δ15N valuesof NPP derivatives were -6.2‰ to 9.5‰. Amino acids can be divided into two categories according to δ13C, and three categoriesaccording to δ15N by hierarchical cluster analysis. 【Conclusion】 It is feasible to determine the composition of stable carbon andnitrogen isotope of amino acids in wheat with NPP amino acid esters by GC-C-IRMS, which will make great significance to revealthe difference of metabolism and synthesis of amino acids under adverse environment.

【题目】GC- C- IRMS 分析氨基酸碳氮同位素的衍生化方法及其展望
【中文关键词】碳氮稳定同位素; 氨基酸; GC-C-IRMS; 衍生化
【英文关键词】stable carbon nitrogen isotope; amino acids, GC- C- IRMS, derivatization
【中文摘要】碳氮稳定同位素在地球科学、生命科学、环境科学、农业科学等各个领域有着广泛的应用。由于同时含有碳氮原子的氨基酸是蛋白质的构成单位, 参与机体的代谢, 具有重要的生物功能, 因此在利用同位素示踪中, 氨基酸有其重要的研究价值。本文仅就利用气相色谱- 燃烧- 同位素比值质谱仪(gas chromatography-combustion-isotope ratio mass spectrometry, GC-C-IRMS) 分析氨基酸的碳氮同位素比值的衍生化方法进行总结, 比较各种方法的优缺点, 以期对于分析氨基酸的碳氮同位素比值的研究工作提供有益的帮助。
【英文摘要】Stable carbon and nitrogen isotopes have been extensive application in the area of geosciences,biosciences, environmental sciences, agricultural sciences et al. Amino acids include carbon and nitrogen element simultaneously, in the other hand, amino acids take on important biological funtion as the basic unit of proteins to participate in the metabolism of body. Therefore, amino acids play a great role during the research of isotope trace. In this paper, the derivatizative methods of amino acids will be given, whose stable carbon or nitrogen are analyzed by GC- C- IRMS. The advantages and disadvantages of every methods arecompared , which will be expected to provide some beneficial instruction for the research of stable carbonand nitrogen of amino acids.

【题目】N-新戊酰,O-异丙醇酯衍生法分析小麦氨基酸含量与碳氮稳定同位素
【中文关键词】N-新戊酰,O-异丙醇酯(NPP);小麦;氨基酸;气相色谱-质谱仪;气相色谱-燃烧-同位素比值质谱仪
【英文关键词】N-pivaloyl-isopropyl ester (NPP); wheat; amino acids; gas chromatography-mass spectrograph; gas chromatography-combustion-isotope ratio mass spectrograph
【中文摘要】以2-氨基己二酸为内标,采用异丙醇和新戊酰氯将氨基酸衍生化成N-新戊酰基,O-异丙醇酯(NPP),利用气相色谱-质谱仪分析了小麦籽粒蛋白质氨基酸含量,同时利用气相色谱-燃烧-同位素比值质谱仪分析了氨基酸的碳氮稳定同位素组成。结果表明,N-新戊酰基,O-异丙醇酯(NPP)衍生化法可以得到丙氨酸、甘氨酸、缬氨酸、亮氨酸、异亮氨酸、脯氨酸、苯丙氨酸、赖氨酸和酪氨酸的较高的回收率(83.3%~104.9%)和较好的线性关系(相关系数为0.994~1.000);此方法还可以得到丙氨酸、甘氨酸、缬氨酸、亮氨酸、异亮氨酸、脯氨酸、天冬氨酸/天冬酰胺、苏氨酸、丝氨酸、蛋氨酸、谷氨酸/谷氨酰胺、苯丙氨酸、赖氨酸和酪氨酸的可靠的碳氮同位素比值。此方法可以为今后作物品质、营养和氨基酸代谢的深入研究提供更加有利的手段。
【英文摘要】The content and stable carbon and nitrogen isotope composition of amino acids can be analyzed by gas chromatography-mass spectrograph and gas chromatography-combustion- isotope ratio mass spectrograph with 2-aminoadipic acid as internal standard based on N-pivaloyl-isopropyl (NPP) derivatives in wheat grain. Higher recoveries of amino acids were in the range of 83.3%-104.9% and good linear correlation coefficients were in the range of 0.994-1.000, including alanine, glycine, valine, leucine, isoleucine, proline,phenylalanine, lysine and tyrosine by this method. On the other hand, reliable stable carbon and nitrogen isotope composition of amino acids were obtained by this method, including alanine, glycine, valine, leucine, isoleucine, proline, aspartate/asparagine, threoine, serine, methionine, glutamic acid/glutamine, phenylalanine, lysine and tyrosine. The method provides a new way for developing the study of crop quality, nutrition, and amino acids metabolism.

【题目】不同水肥组合对冬小麦产量的影响
【中文关键词】氮磷钾;灌水量;有机肥;小麦产量
【英文关键词】Combined app lication of nitrogen, phosphorus and potassium fertilizers; Irrigation; Organic fertilizer; Winter wheat yield
【中文摘要】试验于2007 /2008年度在北京市昌平区进行,采用5因子4水平的田间试验方案研究不同氮磷钾、有机肥和灌水量的组合对小麦产量的影响。方差分析表明,各因素对产量的影响顺序为氮肥>灌水>钾肥>有机肥>磷肥,同时存在交互作用;水分和产量成较好的正相关,有机肥对产量的提高虽然不如氮肥、钾肥和灌水,但是对产量的影响也达到了极显著水平;在各种组合中,以施氮量为75kg · hm- 2配合12000kg · hm- 2的有机肥、75kg · hm- 2的磷肥、150kg · hm- 2的钾肥以及3000kg · hm- 2灌水量处理的产量较高,为本年度最佳水肥组合。
【英文摘要】To study the effects of different combinations of nitrogen, phosphorus, potash, organic fertilizers and irrigation on winter wheat yields, the field experiments were conducted in Changp ing, Beijing from 2007 to 2008. The results showed that the effects of each factor was nitrogen > irrigation > potassium > organic fertilizer > phosphorus, and interaction was still existed. There was positive correlation between irrigation and yields. Organic fertilizer had a significant relationship with yields, though its effect was less than nitrogen fertilizer, potash fertilizer and irrigation. The most op timum treatment was 75kg/ha nitrogen, 12000kg/ha organic fertilizer, 75kg/ha phosphorus, 150kg/ha potasssium and 3000kg/ha irrigation.

【题目】氮、氧同位素与地下水中硝酸盐溯源研究进展
【中文关键词】地下水;硝酸盐;氮同位素;氧同位素
【英文关键词】groundwater, nitrate, nitrogen isotope, oxygen isotope
【中文摘要】地下水的硝酸盐氮污染已经成为人们普遍关注的问题。最根本的解决办法就是找到硝酸盐的来源,切断污染源。不同N来源的硝酸盐具有不同的N、O同位素组成,利用NO3-中δ15N和δ18O对硝酸盐污染进行示踪研究是当前地下水污染研究的一个重要方向。介绍了水样NO3-氮、氧同位素分析的多种预处理方法、N、O同位素的测定技术以及存在的问题,并对未来发展的方向做了阐述。
【英文摘要】Nitrate pollution of groundwater has become a widespread concern. The most fundamental solution is to find the source of nitrate and cut it off. Different sources of nitrate have different N, O isotopic composition. The use of δ15N and δ18O on a tracer study in nitrate pollution of groundwater is currently an important direction. This paper describes many pretreatment methods、analysis technologies of N, O isotope、existing problems and future development directions.

【题目】HarpinXooc蛋白在毕赤酵母中的分泌表达及其生物活性检测
【中文关键词】毕赤酵母 HarpinXooc蛋白 生物活性检测
【英文关键词】Pichia pastoris harpinXooc bioactivity detection
【中文摘要】采用PCR方法从水稻细菌性条斑病菌RS105菌株中扩增harpinXooc编码基因hrf2,将其克隆到酵母表达载体pPICZαA的分泌信号肽基因下游,获得重组表达质粒pPICZαA-hrf2。重组表达质粒线性化后电击转化至毕赤酵母宿主菌X-33,经抗生素Zeocin筛选和PCR鉴定后,得到重组酵母菌X-33/pPICZαA-hrf2。用甲醇诱导重组酵母菌表达目标蛋白,发酵上清液经浓缩后进行SDS-PAGE电泳分析,在约18kD处有特异目标条带出现。Western blot检测表明表达产物具有良好的抗原性。生物活性检测表明酵母重组表达蛋白harpinXooc能够诱导烟草产生过敏反应和促进烟草生长,活性高于在大肠杆菌中表达的harpinXooc
【英文摘要】The hrf2 gene was amplified from genome of Xanthomonas oryzae pv. oryzicola RS105 by PCR and inserted into the downstream of the α-factor signal sequence of the Pichia pastoris expression vector pPICZαA. The linearized recombinant plasmid was transformed into P. pastoris strain X-33 by electroporation. The recombinant strains were chosen by YPDS plates containing Zeocin and identified by PCR. SDS-PAGE analysis proved a special band about 18 kD and Western blot demonstrated good antigenicity of the expressed protein. The results of bioactivity detection showed that the recombinant harpinxooc had higher activity to induce hypersensitive response and promote tobacco growth than harpinXooc expressed in Escherichia coli.

【题目】Distribution of organic matter in aggregates of eroded Ultisols, Central China
【中文关键词】无
【英文关键词】Distribution; Erosion; Organicmatter; Soil aggregates; Ultisol
【中文摘要】无
【英文摘要】The relationship between organic matter contents and soil aggregates of particle size ranging from >4,2 – 4, 1 – 2, 0.5 – 1 to 0.25 – 0.5 mm in three eroded (slightly, moderately and severely) Ultisols in central China was investigated using dry-sieving and wet-sieving methods, as well as chemical analyses. In different eroded Ultisols, the size distribution percentages of >4 and 2 – 4 mm macroaggregates obtained by dry-sieving method were all higher than that by wet-sieving method by separately between 12.3 and 45.7%, 3.0 and 24.7%, but the percentages of 0.25 – 0.5, 0.5 – 1 and 1 – 2 mm macroaggregates showed opposite trend. Microaggregates (<0.25 mm) averagely constituted the 30.1, 39.7 and 58.2% of aggregates after wet sieving in slightly,moderately and severely eroded soils, respectively. As the degree of erosion increased, the average content of >0.25 mm water-stable aggregates (WSA) and average of mean weight diameter (MWD) decreased from slightly eroded soil to severely eroded soil by 28.0% and 0.14 mm, respectively. The organic matter (OM) content of macroaggregate fractions from slightly and moderately eroded Ultisols rose with increasing in particle size fractions from 0.25 – 0.5 to >4 mm, but that of macroaggregates fractions from severely eroded Ultisols decreased with increasing in particle sizes. The percentages of >0.25 mm WSA correlated well with the OM contents of eroded Ultisols (r2 = 0.6573, n = 19). The OM contents of macroaggregates in eroded soils showed high correlation with that of the bulk soil, and the correlation coefficients decreased in the order of slightly > moderately > severely eroded Ultisols.

【题目】Distribution and accumulation of copper and cadmium in soil-rice system as affected by soil amendments.
【中文关键词】Heavy metals; Amendment; Distribution; Accumulation; Rice; Soil solution
【英文关键词】Heavy metals; Amendment; Distribution; Accumulation; Rice; Soil solution
【中文摘要】The effects of seven amendments on the distribution and accumulation of copper and cadmium in a soil – rice system were investigated using a pot experiment. Results showed that application of limestone, calcium magnesium phosphate (Ca – Mg – P fertilizer), calcium silicate (silicon fertilizer), Chinese milk vetch, pig manure, and peat significantly decreased the concentrations of Cu and Cd in rice roots by 24.8 – 75.3% and 9.7 – 49.9%, respectively. However, no significant difference was observed between zinc sulfate (zinc fertilizer) and the control treatment. The concentrations of Cu and Cd in different parts of rice followed the order: root > straw > grain, and all amendments restrained the transfer of Cu and Cd from rice root to stem. Copper and Cd concentrations in rice stems at the tillering stage were the highest, and then decreased from the tillering stage to the heading stage. However, they increased again at the ripening stage. The results also showed that application of amendments changed Cu and Cd solubility in soil and decreased their bioavailability, which resulted in the reduction of Cu and Cd uptake by rice. Significant correlations between the concentrations of Cu and Cd in soil solutions and in rice stems were found. The result demonstrated that limestone has the best efficiency among all the amendments used in reducing Cu and Cd contamination to rice production.

【题目】Effects of several amendments on rice growth and uptake of copper and cadmium from a contaminated soil.
【中文关键词】heavy metals; amendment; bioavailability; uptake; rice
【英文关键词】heavy metals; amendment; bioavailability; uptake; rice
【中文摘要】Heavy metals in variable charge soil are highly bioavailable and easy to transfer into plants. Since it is impossible to completely eliminate rice planting on contaminated soils, some remediation and mitigation techniques are necessary to reduce metal bioavailability and uptake by rice. This pot experiment investigated the effects of seven amendments on the growth of rice and uptake of heavy metals from apaddy soil that was contaminated by copper and cadmium. The best results were from the application of limestone that increased grain yield by 12.5 – 16.5 fold, and decreased Cu and Cd concentrations in grain by 23.0% – 50.4%. Application of calcium magnesium phosphate, calcium silicate, pig manure, and peat also increased the grain yield by 0.3 – 15.3 fold, and effectively decreased the Cu and Cd concentrations in grain. Cd concentration in grain was slightly reduced in the treatments of Chinese milk vetch and zinc sulfate. Concentrations of Cu and Cd in grain and straw were dependent on the available Cu and Cd in the soils, andsoil available Cu and Cd were significantly affected by the soil pH.

【题目】长期施肥对红壤有机碳矿化及微生物活性的影响

【中文关键词】红壤; 长期施肥; 有机碳矿化; 微生物群落结构

【英文关键词】Red soil; long-term fertilization; mineralization of organic carbon; microbial community structure

【中文摘要】为评价不同施肥条件下红壤有机碳矿化和微生物活性及两者之间的关系, 对长期定位试验施有机肥(M) , 施用氮、磷、钾化肥(NPK) , 有机肥配合化肥(NPKM) , 秸秆配合化肥(NPKS) 和不施肥(CK) 共5个处理的红壤进行室内培养, 分析不同施肥处理下红壤有机碳矿化的CO2 释放量、微生物数量及微生物碳源代谢特征。结果表明, 不同施肥处理的土壤有机碳矿化释放CO2 量差异显著, 由一级反应动力学方程拟合计算出土壤潜在有机碳矿化释放CO2-C 量的大小顺序: M> NPKM> NPK >NPKS> CK, 其值分别为180.3、88.5、47.6、43.4 和34.5mg/kg。培养初期微生物活性较弱时CO2 的释放速率最高, 微生物数量的增长落后于有机碳矿化速率变化, 但培养14、35 和69 d 时3 种微生物数量大小顺序为M> NPKM> NPK >NPKS > CK, 各处理间差异显著且与CO2 释放量显著相关。不同施肥处理间微生物群落结构差异显著, 其趋势与有机碳矿化相符合。说明长期施肥特别是长期施用有机肥能影响微生物的群落结构,提高红壤微生物活性, 进而促进微生物对有机碳的矿化。

【英文摘要】To investigate mineralization of organic carbon, microbial activity and their relationship under different fertilization inred soil, five kinds of samples from long-term fertilized soil (manure, M; nitrogen plus phosphorus plus Potassium, NPK;manure plus NPK, NPKM; NPK plus straw, NPKS; without any fertilization, CK) were incubated, and the CO2 productionrate, the number of and metabolic diversity of microbes of samples were evaluated. The result shows that : soil CO2 productionamoung samples is significantly different, the order of potential CO2-C production of the five kinds of samples, which derivedfrom the f irst-order kinetic model, is as follows: M(180.3 mg/kg) > NPKM(88.5 mg/kg) > NPK(47.6 mg/kg) > NPKS(43.4 mg.kg) > CK (34.5 mg/kg) . The number of increasing bacteria, fungi and Act inomycete which is later than theirmineralization rate of organic carbon, however, is significantly different between the samples under different fertilization at the14th , 35th , 69th day of incubation. The order pattern: M> NPKM> NPK >NPKS > CK, is significantly correlatived with those of CO2 production. The microbial communities of the samples under different fertilizations are obviously different, which issimilar to their mineralization of organic carbon. The result shows that long-term fertilization, especially the use of manure,has significant effect on microbial communities, enhances activity of microbe, and then increases the microbial mineralizat ionof organic carbon.

【题目】湘南丘陵区红壤旱地红薯钾肥最佳用量与产量关系.
【中文关键词】红壤丘陵;红薯;钾最佳用量;红薯产量
【英文关键词】red soil hilly regions; sweet potato; the best application of potassium fertilizer; sweet potato yield
【中文摘要】为了寻求红薯的最佳钾肥施用量,提高钾肥利用率,笔者在湘南红壤丘陵区,设置钾肥5 水平肥料效应田间试验,并采用田间试验和室内分析相结合的研究方法,分别测产,测定红薯养分含量以及土壤速效养分。试验结果表明:在钾肥施用量为225 kg/hm2时,红薯的经济效益最高,每公顷的纯收入为9624.5 元,增收率为47.7%,红薯的经济产量也较高,为19501.5 kg/hm2,每公顷增产52.9%。同时,在该施肥水平下,整株红薯的氮、磷、钾养分吸收总量和钾肥利用率均最高,钾肥利用率达到15.6%。相反,在钾肥施用量为225 kg/hm2时,0~20 cm耕层土壤的速效养分含量和其他钾肥用量的处理相比较,均降低。综合考虑,在五个施钾水平中,笔者得出湘南丘陵区红薯钾肥的最佳施用量为225 kg/hm2。
【英文摘要】In order to find the best application of potassium fertilizer on sweet potato, and improve potassiumfertilizer use efficiency, the article set up the field experiment on red soil hilly region of southern Hunan,applying potassium fertilizer for five levels. And they measured yield, nutrient content of sweet potato, and soilavailable nutrient, by combining field experiment with laboratory analysis. The results indicated that, when thepotassium application on sweet potato was 225 kg/hm2, the economic benefits of sweet potato was highest, andthe net income per hectare was 9624.5 Yuan, with increased 47.7 percent compared to control. The economicyield of sweet potato was also higher on this potassium application, which was 19501.5 kg/hm2, with increased52.9 percent compared to control. At the same time, the total nitrogen phosphorus and potassium nutrientabsorption of whole sweet potato and potassium fertilizer use efficiency was highest than other treatments onthis potassium application. The potassium fertilizer use efficiency reached to 15.6%. Oppositely, the 0-20 cmsurface soil available nutrient content was decreased when the potassium application on sweet potato was225 kg/hm2, which compared to other treatments of potassium application. By comprehensive consideration, inthe five applications of potassium fertilizer, the article concluded that the best application on sweet potato was225 kg/hm.

【题目】长期施肥对红壤旱地剖面硝态氮累积的影响
【中文关键词】红壤旱地;长期施肥;硝态氮
【英文关键词】red soil dry land; long-term fertilization; NO3--N
【中文摘要】研究了长达18 a 长期不同施肥处理下红壤旱地剖面中NO3--N 分布和累积的特征。结果表明:施用化肥的处理中,磷肥和有机肥料的施用能显著降低NO3--N 在0~100 cm 土体中的积累(P<0.05);不同施肥处理(除氮钾处理),均在40~60 cm 之间形成NO3--N 累积层,氮钾配施的旱地土壤20~40cm 层中NO3--N 峰值最高达70.72 mg/kg;各施肥处理NO3--N 残留率在0.69%~8.31%之间,有机肥的施用能显著降低NO3--N 在0~100 cm 土体中的残留(P<0.05)。
【英文摘要】Effects of Long-term (18 years) different fertilization on distribution and accumulation of NO3--N in profile of red soil dry land were studied. The results showed that the applications of organic fertilizer and phosphate fertilizer couldreduce the accumulation of NO3--N in the 0 to 100 cm soil layers significantly (P<0.05); the NO3--N, which under different fertilizer treatments (except the treatments of nitrogen and kalium), could be accumulated in 40 to 60 cm soil layers, and the highest peak value of NO3--N reached 70.72 mg/kg in 20 to 40 cm soil layers of dry land with combined application of nitrogen fertilizer and kalium fertilizer; the residual ratio of NO3 --N in soil under different fertilization treatments was from 0.69% to 8.31%; the application of organic manure could reduce the residue of NO3--N in the 0 to100 cm soil significantly (P <0.05).

【题目】红壤长期不同施肥对玉米氮肥回收率的影响
【中文关键词】长期施肥; 红壤; 酸化; 玉米; 氮肥回收率
【英文关键词】long-term fertilization; red soil; acidification; maize; nitrogen recovery efficiency
【中文摘要】为阐明长期不同施肥下玉米氮肥回收率的变化特征,揭示影响红壤玉米氮肥回收率的关键土壤因素,为红壤氮肥合理施用和提高氮肥回收率提供科学依据,在湖南红壤上连续观测了18年不施肥,施氮、磷、钾化肥,化肥配施有机肥和单施有机肥条件下玉米氮肥回收率的变化特征及其原因。结果表明,与施用化肥相比,玉米的子粒产量和植株氮素积累量在化肥配施有机肥下分别增加了61.5%和63.1%。氮、磷、钾化肥施用8年后,玉米氮肥回收率呈显著下降趋势,年平均下降速率达3.34个百分点; 而化肥配施有机肥下氮肥回收率以每年1.24个百分点的速率显著增加; 单施有机肥下氮肥回收率保持持平并略有上升。土壤pH、全氮和有机质含量均与氮肥回收率呈显著线性正相关,其中土壤pH对氮肥回收率的影响最明显。在土壤pH 4.5~6.3范围内,红壤pH每降低1个单位,玉米氮肥回收率下降10.9%。长期施用化肥的土壤pH以每年0.06的速率下降; 单施有机肥尽管可缓解土壤酸化,但玉米产量较低,而化肥配施有机肥能同时抑制土壤酸化和提高玉米产量及氮肥回收率。因此,化肥配施有机肥具有明显的增产和保肥效果,是红壤上农业生产可持续性的施肥模式。
【英文摘要】The effects of an 18-year different fertilization on nitrogen recovery efficiency(NRE) ofmaize, yield, Naccumulation and NRE were studied in up land red soil. There were four treatments: unfertilized control (CK) , in-organic fertilization (NPK) , combined inorganic withmanure fertilization (NPKM) andmanure (M). Soil pH and itsrelationship with NRE were also studied. The results indicate that compared with the NPK app lication, the grainyield and N accumulation in plants ofmaize are increased by 6115% and 6311% under the NPKM fertilization, re-spectively. The yield and NRE of maize show a constant trend in the M fertilization, which are higher than those ofthe CK, and lower than those in NPKM. The nitrogen recovery efficiency keep s constant in the beginning of 8 yearsafter the NPK is app lied, while it significantly decreased with a rate of 3134% per year at 8 - 18 years, and itsNRE is 24.7% on average of the 18 years. The NRE in the NPKM is increased with a rate of 1124% per year, andits NRE reaches to 42.6% on average of the 18 years. There is positive linear relationship between NRE and soilpH (r = 0.542) in the NPK and NPKM, which suggests that every decrease of 1 pH would result in the decrease of1019% NRE when soil pH is in the range of 4.5 - 6.3. Soil pH shows a decrease trend in the NPK, and keep sconstant in the CK, NPKM andM, which indicates that the inorganic fertilization would reduce soil pH and leads toa low NRE, while manure app lication could remit the acidification, further imp rove the NRE and grain p roduction.Chemical fertilizer in combination with manure is a more effective fertilization to imp rove grain yield and maintain soil fertility, and it is strongly recommended for sustainable agriculture.

【题目】长期施肥对中国3种典型农田土壤活性有机碳库变化的影响
【中文关键词】长期施肥;有机碳;活性有机碳;黑土;灰漠土;红壤
【英文关键词】long-term fertilization; organic carbon; labile organic carbon; black soil; grey-desert soil; red soil
【中文摘要】【目的】观测分析了中国3 种典型农田土壤——黑土、灰漠土和红壤有机碳在时间与空间上对长期不同施肥措施的响应特征,为农田土壤培肥提供理论依据。【方法】通过有机碳分组对比分析了长期施肥后土壤总有机碳与活性有机碳的含量与比例变化。【结果】16 年后,不施肥(CK)灰漠土总有机碳、活性有机碳含量均呈显著下降趋势,下降幅度分别为11.7%和34.9%,且活性有机碳占总有机碳的比例也显著下降了5.4 个百分点;长期施用氮肥(N)3 种土壤总有机碳含量基本保持不变,但活性有机碳所占比例显著下降,其中黑土下降幅度高达9.5个百分点;化肥配施(NP,NPK)后,黑土和灰漠土活性有机碳占总有机碳的比例仍显著下降,红壤则略呈上升趋势;有机无机配施(NPKM、1.5NPKM),3 种土壤的总有机碳、活性有机碳及活性有机碳占总有机碳的比例均显著提高,其中红壤上升幅度最大,NPKM 处理提高幅度分别为80.6%、

146.2%和7.5 个百分点,其次是灰漠土,分别提高了64.4%、138.0%和5.0 个百分点;实施秸秆还田(NPKS)后,红壤的总有机碳、活性有机碳及活性有机碳占总有机碳的比例分别增加了21.6%、59.0%和7.5 个百分点,黑土和灰漠土则相对较稳定。【结论】活性有机碳占总有机碳比例对施肥措施反应敏感,长期不施肥或只施氮肥多数导致土壤总有机碳含量和活性有机碳所占比例下降,有机无机配施能维持和提高土壤有机碳含量和活性有机碳所占比例,且效果优于秸秆还田,优于化肥(NPK)配施。

【英文摘要】【Objective】 Based on 3 long-term experiments, temporal and spatial responses of total soil organic carbon (TOC)and labile organic carbon (LOC) in red soil, black soil and grey-desert soil to various long-term fertilizations were discussed.【Method】 Fractionation method of soil organic carbon was applied to determine the contents of LOC and the percentage of LOC toTOC in black soil, grey-desert soil and red soil. 【Result】 Results showed that the content of TOC and LOC and the percentage ofLOC to TOC under 16 years of non-fertilization (CK) in grey-desert soil decreased significantly by 11.7%, 34.9% and 5.4 percentagepoints, respectively. After long-term application of chemical nitrogen fertilizer (N), the content of TOC of the 3 soils kept nosignificant change throughout the studied period. However, the percentage of LOC to TOC for the 3 soils all decreased significantly.It decreased by 9.5 percentage points in black soil, which was the most of the 3 studied soils. After 16 years application of NP andNPK, the percentage of LOC to TOC in black soil and grey-desert soil decreased significantly. While there was increasing trend forred soil. There was significant increase in the contents of TOC and LOC and the percentage of LOC to TOC under long-termapplication of chemical fertilizers combinated with manure (NPKM、1.5 NPKM). After long-term application of NPKM, the contentsof TOC, LOC and the percentage of LOC to TOC in red soil increased by 80.6%, 146.2% and 7.5 percentage points, respectively,which was the most. For grey-desert soil it was 64.4%, 138.0% and 5.0 percentage points, respectively. For long-term applicationof NPK with straw return (NPKS), the contents of TOC, LOC and the percentage of LOC to TOC in red soil increased by 21.6%,59.0% and 7.5 percentage points. However, it was stable in black soil and grey-desert soil. 【Conclusion】 The percentage of LOC toTOC response sensitively to long-term fertilization and could be one of the indicators for the quality of soil organic carbon.Long-term non-fertilization and only chemical nitrogen fertilizers lead to decrease in the contents of total soil organic carbon and thepercentage of LOC to TOC in most cases. Long-term application of NPKM could maintain and improve quality and quantity of soilorganic carbon. The effect of long-term application of NPKM was better than that of NPKS, and they were both better than that oflong-term application of NPK.

【题目】中国典型农田土壤磷素演化对长期单施氮肥的响应
【中文关键词】长期定位试验;单施氮肥;土壤全磷;Olsen-P
【英文关键词】long-term fertilization; single N fertilization; soil total phosphorus; Olsen-P

【中文摘要】【目的】探讨中国典型土壤长期单施氮肥对土壤全磷和Olsen-P 磷的影响。【方法】以土壤肥力与肥料长期定位试验为基础,应用常规化学分析法和数学统计方法,分析不同气候、不同耕作制度下15 年单施氮肥(每季作物的施氮量为150 kg · hm-2)处理对6 种典型土壤全磷和Olsen-P 含量变化的影响。【结果】在长期单施氮肥条件下,耕作土壤全磷含量和土壤Olsen-P 均呈下降趋势,全磷含量下降幅度为2.7%~25.0%。单施氮肥全磷含量下降幅度大于不施肥。Olsen-P 含量下降有一定阈值,阈值大约为4 mg · kg-1。土壤Olsen-P 含量下降率比全磷高几倍。耕层Olsen-P 含量(y)与土壤磷素表观平衡(x)相关方程为y=0.0005x+3.9986,相关方程斜率很小,表明Olsen-P 含量基本不受磷素表观平衡影响。【结论】长期单施氮肥加速了土壤全磷和Olsen-P 的减少速度,其中全磷含量较低的土壤其下降幅度更大。

【英文摘要】【Objective】 The influence of long term single nitrogen fertilization on the total P and Olsen-P of several typicalsoils in China was studied. 【Method】 The phosphorus changes of 6 typical soils under different cropping systems and climates werestudied based on a 15-year long-term fertilization experiment in China. 【Result】 Results showed that total P and Olsen-P of alltested soils decreased, and the range of total P decrease was from 2.7% to 25.0%. The content of the total P with single nitrogenfertilization decreased more than that of non-fertilizer. The Olsen-P decreased to a value of about 4 mg · kg-1, and its decreased ratiowas a few times higher than that of the total P. 【Conclusion】 Therefore, single nitrogen fertilization accelerated the decrease of thetotal P and Olsen-P, and the soils with low total P decreased much more.

【题目】化肥有机肥配合施用下双季稻田氮素形态变化
【中文关键词】稻田; 氮素动态; 有机无机肥配合
【英文关键词】paddy field ; nitrogen dynamic ; chemical fertilizer combining with organic manure
【中文摘要】为揭示有机无机肥配合施用下稻田氮素的动态及迁移特征,在湘南双季水稻农作区第四纪红土发育的红黄泥稻田上进行了连续6 年田间试验。通过比较不施氮肥(PK) 、施用有机肥猪粪(M) 、化肥(NPK) 及有机肥化肥配合(NPKM) ,研究稻田表层全氮、无机氮动态变化,不同层次(25 —30、55 —60、85 —90 cm) 土壤溶液无机氮动态,耕层土壤无机氮动态等。结果表明,NH+4-N 是红壤双季稻田无机氮素存在的主要形态,施用化学肥料处理(NPK) 施肥后1~3 d 表面水NH+4-N 浓度占全氮比例可达0.5~0.9 ,有机肥处理(M) 为0.3 左右。不同层次土壤溶液及其土壤氮素浓度呈现一致的特征,即施肥后短期内出现浓度峰值随后迅速下降,且随着往下推移,氮素峰值出现时间延长,表层水全氮及无机氮在施肥后1~2 d 出现浓度高峰,耕层土壤及25 —30 cm土壤溶液无机氮浓度高峰约在施肥后3~5 d。化肥有机肥配施有利于水稻稳产高产,年产量达12.2 t/ hm2 ,比不施氮肥的对照产量(7.3 t/ hm2) 增加68 %; 土壤有机质6 年提升18.5 % ,显著高于化肥。施用有机肥(M) 及有机无机肥配合(NPKM) 显著降低了稻田表层水全氮及不同层次土壤溶液和耕层土壤NH+4-N 峰值浓度,提高水稻产量和培肥土壤,有利于减少当前氮肥过量施用带来的环境负荷。
【英文摘要】A six year field experiment was conducted in Quaternary Period red clay soil in double rice region of south Hu-nan province. Its purpose was to disclose dynamics and transferred characteristics of nitrogen under the application ofchemical fertilizer combined with manure. Four treatments , namely , no nitrogen (PK) , swine manure (M) , chemicalfertilizer (NPK) and swine manure applied combined with chemical fertilizer (NPKM) were selected to study the dynam-ics of total nitrogen and inorganic nitrogen in surface water , and as well as the dynamics of inorganic nitrogen in soil solu-tion in different layers (25 - 30 ,55 - 60 and 85 - 90cm) and tillage soil . The results show that NH+4-N is the predominantinorganic nitrogen in red double rice paddy soil , and the ratio of NH+4-N/ total N reaches to 0.5 - 0.9 in surface waterwithin 1 - 3 days after chemical fertilizer (NPKtreatment) applied , while that of organic manure treatment is about 0.31The peak values of nitrogen concentration are detected within 1 - 2 days in surface water and 3 - 5 days in soil solution indifferent layers after fertilizer application. The peak values of nitrogen concentration in surface water , in soil solution andin tillage soil are lower in organic manure (M) , and chemical fertilizer applied combined with organic manure (NPKM)treatments than those of the other two treatments. The NPKM treatment achieves a 12.2 t/ ha mean annual yield (68 %higher than that of PK) . The soil organic matter in tillage soil is increased by 18.5 % during the six-year plantation at the NPKM which is significantly higher than that of the NPKtreatment . Application of chemical fertilizer combined withorganic manure is propitious to reduce environment load due to excessive chemical nitrogen applied

【题目】不同钾肥对赤红壤和水稻土中铅有效性的影响
【中文关键词】钾肥;铅;植物有效性;赤红壤;水稻土
【英文关键词】potassiumfertilizer;Pb:phytoavailability;redlatersol;paddy soil
【中文摘要】采用盆栽试验,研究了赤红壤和水稻土上,施用4种钾肥(KH_2PO_4、K_2SO_4、KNO_3、KCl),在各为5种用量(K 0、60、140、240、360 mg/kg)条件下,小油菜对铅的吸收量及土壤溶液铅和植株吸收铅之间的关系。结果表明,赤红

壤上KCl、KNO_3、K_2SO_4各处理土壤溶液铅的浓度均随钾肥施入量的增加而显著增加。其中KCl最高用量(360 mg/kg)下土壤溶液铅增加最高,达106.9%,K_2SO_4(K)240 mg/kg水平下增加97.8%;水稻土上3种钾肥的情况与之类似,只是增加幅度略低,这可能与赤红壤具有较多的可变电荷和因其CEC较小而缓冲性也小有关。两种土壤施用KH_2PO_4下,随施入量的增加,土壤溶液的铅均显著减少;KH_2PO_4最高用量下,赤红壤和水稻土水溶性铅分别比对照减少45.0%和63.8%。另外,种植第2季作物后,施用KH_2PO_4,两种土壤溶液铅含量与植株茎叶和根系吸收铅浓度之间均表现为良好的正相关。

【英文摘要】Effects of four kinds of potassium fertilizer(KH2PO4,K2SO4,KNO3, and KCl) at five levels (K0,60,140,240,360mg/kg) on the Pb concentration of rape and relationship between Pb content of paddy soil and red latersol solution significantly incteased with application of KNO3, KCl, and K2SO4. The application of KCl (360mg/kg) and K2SO4(240mg/kg) can increase Pb content of soil solution up to 106.9% and 97.8%, respectively. There were similar effects of three kinds of potassium on paddy soil and increased rate was lower than that of laersol soil. The main reason was that latersol soil had more inconstant charges CEC than paddy soil. However, Pb contect of soil solution was significantly decreased with application rate of KH2PO4, moreover Pb content of rape shootalso decreased in both paddy soil and latersol, and under its hightest application rate the decreased rates of Pb concentration in latersol and paddy soil were 45.0% and 63.8%, respectively, compared with the control treatment. In the second season in KH2PO4 treatment, there were positive correlations between Pb absorbed by shoots and roots of rape and Pb content of soil solution.

【题目】长期不同施肥模式对潮土有机碳组分的影响

【中文关键词】长期施肥; 潮土; 有机碳组分; 分布
【英文关键词】long-term fertilization; fluvo-aquic soil; organic carbon fractions; distribut ion

【中文摘要】采用物理分组方法分析了长期不同施肥模式条件下潮土有机碳组分变化及其分布规律。结果表明, 与不施肥(CK) 比较, 长期氮、磷、钾平衡施用(NPK) 、秸秆还田(NPKS) 和有机无机肥配施(NPKM 和1 5NPKM) 均显著提高了潮土粗自由颗粒有机碳(cfPOC) 、微团聚体内物理保护颗粒有机碳(iPOC) 及矿物结合有机碳(mSOC) 的含量, 其中以粗自由颗粒有机碳增幅最高, 达114 5%~ 278 9%, 对施肥最敏感, 能较好地反映长期施肥下土壤有机碳库的变化。矿物结合有机碳是潮土固存有机碳的主要形式, 它占总有机碳的67 0%~ 80 4%。除偏施化肥(N 和NP) 外,其他施肥模式增加的总有机碳的49 1%~ 58 1%进入矿物结合有机碳组分; 26 2%~ 31 7%进入粗、细自由颗粒有机碳组分; 15 7%~ 20 9%进入物理保护有机碳组分。偏施化肥(N 和NP) 有利于自由颗粒有机碳的增加。综上分析, 长期有机无机肥配施或秸秆还田是提升潮土不同组分有机碳库较好的施肥模式。

【英文摘要】The density fractionation scheme was used to study the changes of organic carbon fract ions and their distribu tion in fluvo aquic soil under different long term fert ilizations. The results showed that compared to no fert ilization (CK) ,contents of coarse free particulate organic carbon (cfPOC) , physical protected intra microaggregate particulate organiccarbon (iPOC) and mineral associated soil organic carbon(mSOC) were all increased significant ly under the balancedchemical fertilizat ion(NPK) , straws plus with chemical fertilization (NPKS) , and manure added with chemical fertiliza tion (NPKM and 1 5NPKM) . The cfPOC fract ion with the highest magnitude of increased by 114 5% - 278 9% indi cates it was more sensitive to the fertilizations than other organic carbon fractions. The mSOC, accounting for 67 0% to80 4% of total organic carbon (TOC) , was main form for organic carbon sequestration in fluvo aquic soil. Application ofunbalanced chemical fertilization (N and NP) was apt to increase free POC content, and for other fertilizat ions, about49 1%- 58 1% of TOC was transferred to mSOC, 26 2% - 31 7% to free POC and 15 7%- 20 9% to iPOC. Itcould be concluded that long term manure applicat ion with chemical fertilizers or straw incorporation to soil was more ben efit to organic carbon pools upgrade in fluvo aquic soil.

【题目】控释氮肥对双季水稻生长及氮肥利用率的影响
【中文关键词】控释肥;早稻;晚稻;生长;氮肥利用率
【英文关键词】controlled-release nitrogen fertilizer; early rice;late rice;growth;nitrogen use effciency
【中文摘要】为阐明控释氮肥的产量和生态效应,选用N75和150kg/hm2两种不通用量的控释氮肥和尿素对比,在南方典型双季稻区第四纪红壤发育的水稻土上进行早稻和晚稻田间试验,观测控释肥氮素田间释放规律和水稻的生长、产量和氮肥利用率。
【英文摘要】Controlled-release nitrogen fertilizer ("Meister" made by Japan) were chosen with two application rates,N75 and 150kg/ha, to investigate the nitrogen ralease dynamics of controlled-release fertlilzer and its effect on growth, yield, and nitrogen use efficiency of early rice and late rice in red soil paddy field of Qiyang, Hunan province of Southern China. The results showed that the nitrogen relesae dynamics of S9 and LP70(40%) +LPS100(60%) met with uptake by early rice, and late rice satisfactorily. Furthermore,a significant positive positive correlation was observed between the accumulate N uptake by early rice and N release from S9(R2=0.9764),and the accumulate N uptake by late rice and N release from LP70(40%)+LPS100(60%)(R2=0.9968).Compare to the same application rate of urea, applying controlled-release N fertilizer N75kg/ha increased the grain yield by 3.6%and 9.3%,and nitrogen use efficiency by 29.9 percent point and 10.4 percent for early rice and late rice, respectively. Controlled-release nitrogen fertilizer N 75kg/ha of controlled-release nitrogen fertilizer. Thus, application controlled release nitrogen fertilizer N 75kg/ha was recommended as best ferrtilization approach with comprehensive consideration on high yield and high efficiency

【题目】共存阳离子(Ca、Zn、K)对土壤镉有效性的影响
【中文关键词】镉;共存离子;小油菜;赤红壤;有效性
【英文关键词】Cd; coexistence cations; rape; lateritic red soil; bioavailability
【中文摘要】采用盆栽与吸附试验,研究了镉污染赤红壤上,施用相同摩尔浓度的钙、钾与锌对小油菜生物量、镉吸收量及土壤镉吸附的影响。结果表明,低和高镉污染赤红壤上,施用锌明显增加小油菜地上部生物量,较对照分别增产21.1%和7.82%。不同阳离子(钠、钙、钾和锌离子)共存改变土壤吸附镉能力的程度不同,与钠体系相比,钙、钾和锌体系中土壤镉吸附量分别降低65.6%、72.0%和96.9%,共存离子降低土壤镉吸附量的次序为锌离子>钾离子和钙离子,锌离子的影响最为明显。高镉污染赤红壤上,钙和钾使小油菜吸镉量分别增加5.5%和14.4%,低于低镉污染赤红壤上钙和钾使小油菜吸镉的增加量(分别为16.6%和19.6%);锌明显降低小油菜吸镉量,高和低镉污染赤红壤上,较对照分别减少45.8%和35.0%。3 种阳离子与镉共存时,对土壤镉生物有效性的影响差异取决于竞争吸附与竞争吸收的大小,其机制有待进一步探讨。
【英文摘要】Abstract:Existence of different cations in soils may change phytoavailability of cadmium. The objective of this study was to investigate how and to what extent coexistence cations(Ca, Zn, K)affected the bioavailability of Cd. Pot and sorption experiments were carried out to investigate effects of different cations(Ca, Zn, K)applied to lateritic red soil together with cadmium on rape biomass and related Cd uptake by rape, and as well as sorption of cadmium. The results showed that there was significant influence on rape growth under applied Zn. Rape biomass increased by 21.1% and 7.82%, compared to the controls under low and high contamination of lateritic red soil respectively. Effect of cations(Ca, Zn, K)on capability of adsorption of Cd was significant. The sorption amount of Cd decreased by 65.6%,96.9%, and 72.0% compared to single Na system, respectively. The capacity for releasing Cd from soil particles decreased in the following order:Zn>K>Ca. Zinc could reduce the most of Cd adsorption among three cations. In the lateritic red soils containing high concentration of cadmium, The Ca and K co-existence system, addition of Ca and K enhanced Cd uptake by 5.50% and 14.4%, respectively. As for the lateritic red soil with low concentration of cadmium, the Ca and K co-existence, addition of Ca and

K enhanced Cd uptake by 16.6% and 19.6%, respectively. Zn could decrease significantly Cd content in rape. In the lateritic red soil with higher and lower concentration of cadmium, addition of Zn decreased Cd uptake by rape by 45.8% and 35.0% compared to control treatment, respectively. It was concluded that co-existence of Cadmium with the Ca, K and Zn could influence Cd bioavailability depending on competition absorption and its extent. The mechanism need to be further investigated.

【题目】不同磷酸盐下红壤对镉离子的吸附-解吸特征
【中文关键词】磷酸盐;镉;红壤;吸附;解吸
【英文关键词】phosphate; cadmium; red soil; adsorption; desorption
【中文摘要】采用等温吸附法研究了红壤对镉离子的吸附特性,分析加入不同形态的磷酸二氢盐(磷酸二氢铵、磷酸二氢钾和磷酸二氢钙)对镉离子吸附-解吸特征的影响。结果表明,在加入镉浓度0~20 mg · L-1 范围内,红壤对镉离子的吸附量随平衡液中镉离子浓度的升高而增加,吸附等温线符合Freundlich 方程。土壤吸附镉离子后,在磷添加浓度为0~160 mg · L-1 下,土壤对镉离子的等温吸附仍然符合Freundlich 方程(R2>0.94),但磷酸盐对镉离子吸附具有明显影响;磷酸二氢钙使镉离子的最大吸附量降低了2.5%~7.9%,使镉离子的吸附率降低10%~20%,而磷酸二氢铵和磷酸二氢钾对镉离子的吸附特征无明显影响。随加入磷量的增加,3 种磷酸盐下镉离子解吸量和解吸率均显著降低,解吸量降幅为15.8%~27.8%,解吸率降低了3.7%~9.5%;但在低镉时磷酸二氢钙对红壤镉离子的解吸率显著高于磷酸二氢铵和磷酸二氢钾。由于Ca2+与Cd2+之间存在较强的竞争吸附,使得磷酸二氢钙对红壤镉离子吸附-解吸的影响大于磷酸二氢铵和磷酸二氢钾。
【英文摘要】Abstract:The characteristics of cadmium adsorption and the effects of different kinds of phosphate(NH4H2PO4, KH2PO4, Ca(H2PO4)2)on the adsorption-desorption of cadmium in red soil were investigated by a batch experiment. The results showed that the adsorption amount of cadmium increased with the concentration of cadmium in the equilibrium solution under the range of initial concentration of cadmium from 0 to 20 mg · L-l. The relationship between the adsorption amount of cadmium and the concentration of cadmium in the equilibrium solution couldbe described by the Freundlich equation. After the red soil adsorbed cadmium, the adsorption isotherms of cadmium in red soil could also be described by the Freundlich equation (R2>0.94)in the presence of phosphate from 0 to 160 mg · L-1. But the added phosphate markedly affectedon the adsorption of cadmium. The maximum amount of adsorbed cadmium by the red soil decreased by 2.5%~7.9% after adding Ca(H2PO4)2. The adsorption ercentage of cadmium substantially declined by 10%~20% with the increasing concentration of Ca(H2PO4)2.Whereas, NH4H2PO4 and KH2PO4 didn ' t influence on the adsorption amount of cadmium in red soil. The desorption amount and desorption rate of cadmium from the red soil significantly decreased by 15.8%~27.8% and 3.7%~9.5% with the increasing concentration of phosphates.The desorption rate of cadmium by Ca(H2PO4)2 was higher than H4H2PO4 and KH2PO4 when the cadmium adsorption was lower. Ca(H2PO4)2 had more significant effect on adsorption-desorption of cadmium in red soil than NH4H2PO4 and KH2PO4 because of competitive adsorptionbetween Ca2+ and Cd2+.

【题目】长期不同施肥下我国旱地红壤N2O释放特征及其对土壤性质的响应
【中文关键词】N2O 释放;红壤;长期施肥;土壤性质

【英文关键词】N2O emission; red soil; long-term fertilization; soil property.
【中文摘要】为评价长期不同施肥下红壤N2O 释放特征及其与土壤性质的关系,以湖南祁阳摞荒地(CKo)、不施肥对照(CK)、单施氮磷钾化肥(NPK)、施有机肥(M)、有机肥配施化肥(NPKM)和秸秆配施化肥(NPKS)6 个处理的红壤为研究对象,进行为期30 d 的培养,测定其N2O 释放量、有机质、全氮、碱解氮、速效磷、速效钾、NH+4-N、NO-3-N 含量及其pH 值。结果表明:6 个处理的N2O 释放量差异显著(P<0.05),大小排序为NPK>NPKS>M≈NPKM>CK>CKo。施用有机态氮与等量无机态氮相比,前者N2O 释放量较低。N2O释放量与土壤性质的关系较为复杂,其与铵态氮、硝态氮和碱解氮呈极显著正相关(P<0.01),而与C/N、pH 值呈极显著负相关(P<0.01)。多元回归和通径分析进一步显示,全氮、C/N、碱解氮、硝态氮和pH 值与N2O 的释放量直接相关。本研究表明长期施肥及其土壤性质显著影响红壤N2O 释放量。
【英文摘要】To investigate N2O emission under different fertilization and its relationship with soil properties,measurement of N2O emission was conducted in red soil at a long-term experiment station in Qiyang county of Hunan Province, Southern China. Soil samples were collected from fallow land(CKo), control(no fertilization, CK), inorganic nitrogen-phosphorus-potassium fertilization(NPK), manure application(M), NPK plus manure application(NPKM), NPK plus straw return(NPKS). Subsamples were incubated for 30 days to determine N2O emission.Soil organic matter, total nitrogen, available nitrogen, available phosphorus, available potassium, NH+4 -N, NO-3 -N and pH were measured. This study shows that the amount of N2O emission is significantly different(P<0.05)among six treatments with the following order as NPK>NPKS>M≈NPKM>CK>CKo. The amount of N2O emission is much smaller under the organic nitrogen fertilization than that the same amount of inorganic nitrogen fertilization. The relationship between soil properties and the amount of N2O emission is complex. The amount of N2O emission has significant positive correlations(P<0.01)with the available nitrogen, NH+4-N and NO-3-N. However, the amount of N2O emission has a significantly negative correlation with C/N ratio and pH value(P<0.01). A further analysis of regression and pathway show that total nitrogen,C/N ratio, available nitrogen, NO-3 -N and pH value is significantly correlated with the amount of N2O emission. This study indicates that fertilization management and soil properties have significant influences on N2O emission in red soil.

【题目】长期施肥红壤矿物颗粒结合有机碳储量及其固定速率
【中文关键词】长期施肥;有机碳;储量;土壤颗粒;红壤
【英文关键词】long-term fertilization; organic carbon; reserves; particle-size fractions; red soil
【中文摘要】采用物理分组方法分析了长期不同施肥模式下红壤耕层(0~20 cm)不同大小矿物颗粒结合态有机碳储量差异及其固定速率。结果表明,与不施肥相比,长期施肥均显著增加了耕层土壤砂粒、粗粉粒、细粉粒及粗黏粒结合有机碳的储量,且以配施有机肥(M、NPKM 和1.5NPKM)效果最显著,固碳速率分别达到0.13~0.24、0.19~0.23、0.05~0.16 及0.12~0.36 Mg · hm-2 · a-1;施化肥(NPK、NP、N)和秸秆还田(NPKS)有利于增加细黏粒有机碳储量,且固碳速率高于配施有机肥,分别达到0.08~0.13 和0.11 Mg · hm-2 · a-1。17 a 有机肥配施有利于增加固存于粗粉粒(30.5%)和粗黏粒(30.7%)中的有机碳;而秸秆还田(NPKS)和化肥施用下,有利于增加固存于粗粉粒(32.9%)和细黏粒(42.9%)中的有机碳,说明无论化肥配施还是有机无机配施,红壤粗粉粒是固定新增有机碳的主要组分,而长期配施有机肥是提升红壤各级颗粒有机碳库的较好施肥模式。
【英文摘要】Abstract:The density fractionation scheme was used to study change characteristics of organic carbon stocks and sequestration rate of particle-size fractions in red soil under long-term fertilization. Our results showed that compared to non-fertilization(CK), long-term fertilization significantly increased the organic carbon stock that combined with sand(S), coarse silt(CS), fine silt(FS), and coarse clay(CC). Especially, applications with manure(M, NPKM, 1.5NPKM)showed highest carbon sequestration rate in S-OC(0.13~0.24 Mg · hm-2 · a-1), CS(0.19~0.23Mg · hm-2 · a-1), FS(0.05~0.16 Mg · hm-2 · a-1), and CC(0.12~0.36 Mg · hm-2 · a-1), respectively. Applications of chemical fertilizers(NPK、NP、N)and straw incorporation were more effective to increase organic carbon in FC and the carbon sequestration rate were 0.08~0.13 and 0.11Mg · hm-2 · a-1 respectively, which were higher than the rates of applications with manure. Applications with manure were apt to sequester more organic carbon in the CS(30.5%)and CC(30.7%)particles. However, application of straw incorporation(NPKS)and chemical fertilizerssequenstered more organic carbon in CS(32.9%)and FC(42.9%)particles. Therefore, CS was the main carbon pool that sequestrated organic carbon in red soil under long-term fertilization. Moreover, long-term application with manure was helpful fertilization practices to increase organic

carbon in all particle-size fractions of red soil.

【题目】钙对土壤镉有效性的影响及其机理
【中文关键词】镉;钙;小油菜;赤红壤;有效性
【英文关键词】Cd; Ca; rape; lateritic red soil bioavailability

【中文摘要】采用盆栽试验,研究了赤红壤上两种镉污染水平下,施用4种钙量(0、40、100、200mg/kg-1)对小油菜生物量、镉吸收量及土壤溶液中钙、镉浓度的影响.结果表明:在低镉或者高镉污染水平下,与对照相比,小油菜干质量均以高钙用量处理的增幅最大,两季平均增加了5.5%(低镉)和17.3%(高镉);增加钙的施用量,使土壤溶液中钙浓度明显增加,小油菜体内钙浓度也明显增加;当钙施用量为100 mg/kg-1时,土壤溶液中镉浓度较对照分别增加74.5%(低镉)和31.0%(高镉),而小油菜体内镉浓度较对照分别降低4.5%(低镉)和13.1%(高镉).两种镉污染水平下,土壤溶液中钙/镉(质量比)值与小油菜体内镉浓度均呈显著正相关.土壤溶液中钙/镉比值影响土壤镉的有效性,进而影响小油菜对镉的吸收.

【英文摘要】A pot experimentw ith Cd po lluted lateritic red so ilsw as conducted to study the effects o fapply ing different concentration (0, 40, 100, and 200mg/kg-1) Ca on the rape b iomass, its Cduptake, and the Ca and Cd concentrations in so il so lution. Comparing w ith no Ca application, ap ply ing Ca increased the rape drymass, w hether under h igh or low leve lCd pollu tion. The incremento f the dry mass in tw o cropping seasons w as average ly 5 5% (low level Cd pollution) and 17 3%(h igh leve lCd po llu tion). The Ca concentration both in so il solution and in rape plan t increasedmarked ly w ith increasing Ca applicat ion rate. A t the Ca app lication rate 100 mg/kg-1, the Cdconcen trat ion in soil solution increased by 74.5% (low Cd pollution) and 31.0% (high level Cdpollution), while that in rape plant decreased by 4.5% (low Cd po llution) and 13.1% (h igh level Cd pollution). There was a positive relationsh ip betw een the Ca /Cd (mass ratio) in so il solutionand the Cd concentration in rape p lant under bo th low and h igh levels Cd po llut ion. The Ca /Cd(mass ratio) in so il so lut ion a ffected the b ioava ilability o f soil Cd, and further, affected the Cd up take by rape.

【题目】湘南三种典型红壤生土长期施肥对十字花科作物产量影响

【中文关键词】长期施肥;典型红壤生土;十字花科作物;产量

【英文关键词】long term fertilization, typical material red soil, cruciferae crops, crops production

【中文摘要】为了全面系统地研究土壤熟化这一相当复杂的过程,寻求适宜的熟化方式,为开发利用红壤丘陵区的各种荒地资源、为生产示范、领导决策提供科学依据,以长期定位试验为基本材料,研究了湘南3种典型红壤生土27年长期施肥对十字花科作物(油菜)产量的影响。结果表明:⑴3种母质以紫色土油菜产量(地上部干物重)为最高(紫色土以NPK处理为最高),四纪红土次之,花岗岩油菜产量为最低(2种母质油菜生长均不好,产量差不多)。⑵3种母质种植油菜(生物产量)均以NPK处理为最高。其次是有机物—稻草处理,CK(不施肥)最低。⑶3种母质种植油菜均表现为:归还处理好于带走处理;⑷据试验收产时(2009年3月25日)发现,四纪红土和花岗岩二种母质的NPK处理(尤其是NPK-T处理)的油菜除靠近水泥梗边行长有部分油菜外(占小区面积20%),小区中间(占小区面积80%)的油菜生长不正常或死亡,产量极低;3种母质共18个小区,只有花岗岩母质的NPK处理长有禾本科植物马唐草,其余16个小区很少或没有;四纪红土NPK处理油菜病害(尤其是小区的中间部分)严重。主要症状:叶片有褐色斑点,尤其以基部老叶严重。

【英文摘要】influence of 27 years fertilization into soil on crops outputs of Cruciferae (cole) were studied in threetypical parent material soils in south Hunan under long-team location test. The results showed that: (1) Amongthe three types of parent material, the yield of rape (above-ground dry weight) planted in purple soil was thebest (NPK treatment was the best in purple soil), quaternary red soil and granitization red soil were followed re spectively (both of the two types of parent material appeared poorly growth vigor and had a consistent yield). (2)With planting rape in the three types of parent material, NPK treatment could get more harves (biologicalyield), organic matter-straw treatmemt and CK (no fertilization) were followed restectively. (3) The result alsoshowed that the effect of planting rape with returned treatment was better than taken treatment. (4) Accordingto the experiment when the rape was harvested (In March 25th, 2009), it was found that the rape with NPK treat ment, especially with NPK-T treatment in quaternary red soil and in granitization red soil, grew abnormality ordead in the centre of district (80%), which yield was extremely low, but grew better to the remaining(20%) closeto the cement ridge. Among the three types of parent material, eighteen districts,Dischaemum Schreb of gramine ae plants could only grow in granitization red soil with NPK treatment, and the other sixteen districts were littleor even no. The rape planted in Quaternary red soil with NPK treatment got disease especially in the centre ofthe district. The main symptoms: there are some chocolate spot on leaf ,particularly severe on old basal leaves.

【题目】锌对土壤镉有效性的影响及其机制
【中文关键词】镉; 锌; 小油菜; 赤红壤; 有效性
【英文关键词】Cd; Zn; rape; lateritic red soil; availability
【中文摘要】采用盆栽试验, 研究了赤红壤上两种镉污染水平下, 施用不同用量锌对小油菜生物量、镉吸收量及土壤溶液中锌、镉浓度等的影响。结果表明, 低镉污染水平时, 增加锌的施用量, 可明显促进小油菜的生长; 高镉污染水平时, 不同用量的锌间, 第一季时小油菜的生长有明显不同。两种镉污染水平下, 增加锌的施用量, 土壤溶液中锌浓度明显增加, 镉浓度变化不大; 小油菜体内镉含量明显降低。低、高镉污染水平下, 锌用量为64 mg · kg- 1 土时, 小油菜体内镉含量较不施锌肥分别降低31.8%、28.4%(两季平均值) 。在两种镉污染水平的赤红壤上, 锌/镉比(质量比) 与小油菜体内镉含量呈显著负相关。在同一镉污染水平下, 增加锌的用量后, 土壤溶液中锌/镉(质量比) 的大小可以反映镉有效性的高低。
【英文摘要】Effects of zinc with various application rates on dry weight and Cd content in rape plant, Zn and Cd concentration in lateritic red soil solution were determined by pot trial. The results indicated that dry weight of rape was significantly improved with the increasing additionof zinc fertilizer in lowCd- polluted soil, especially in high Cd- polluted soils with first harvest season. Zn concentration in soil solution wassignificantly improved and Cd content in rape was decreased significantly, but Cd concentration in soil solution did not significantly changewith application of zinc fertilizer in two levels of Cd polluted lateritic red soil. Cd content in rape decreased by 31.8% and 28.4% (averaged in two harvest seasons) at highest rate of Zn (64 mg · kg- 1soil) than that without application of Zn in both lowand high Cd- polluted soils, respectively. Ratio of Zn/Cd in soil solution had significantly negative correlation with Cd content of rape in the contaminated lateritic red soil withhigh or lowcontent of Cd. Thus, ratio of Zn/Cd in soil

solution could reflect the availability of cadmium with the increasing addition of zincfertilizer in the same level of Cd polluted soil.

【题目】长期施肥对红壤和潮土颗粒有机碳含量与分布的影响
【中文关键词】长期施肥;有机碳;含量;土壤颗粒;红壤;潮土
【英文关键词】Long-term fertilization; Organic carbon; Content; Particle-size fractions; Red soil; Fluvo-aquic soil
【中文摘要】【目的】为阐明长期施肥对红壤和潮土不同大小颗粒有机碳含量和分布的影响,探讨土壤持续利用培肥模式。【方法】采集17 年长期施用不同肥料后的红壤和潮土,通过物理分组方法得到砂粒、粗粉粒、细粉粒、粗黏粒及细黏粒,观测了不同颗粒有机碳含量和分布的状况。【结果】与不施肥(CK)相比,施用有机肥(M、NPKM)和秸秆还田(NPKS)均可显著增加红壤和潮土总有机碳及不同颗粒有机碳组分的含量,其中以配施有机肥效果最为明显。施化肥有利于增加细黏粒的有机碳含量。各级颗粒中以砂粒的有机碳(POC)含量增幅最高,在红壤和潮土中分别增加1.7~3.8 倍和1.9~2.8 倍,对施肥最敏感。施肥使红壤和潮土有机碳在砂粒中的分布比例分别提高了37.7%~91.5%和63.6%;黏粉粒中有机碳的分布比例因颗粒大小不同而有差异,但总体上施肥降低了黏粉粒中矿物结合态有机碳(MOC)的分布比例,相应地施肥提高了POC 与MOC 的比率(WPOC/WMOC),改良了土壤有机碳性质。【结论】长期施肥下壤质红壤比轻质潮土固存了更多的有机碳。配施有机肥和秸秆还田是提高两种土壤不同颗粒有机碳含量的有效措施。
【英文摘要】【Objective】 The objective of this study was to clarify the effect of long-term fertilization on content and distribution of organic carbon in particle-size fractions in red soil and fluvo-aquic soil, and discuss fertility maintaining model forsustainable land use. 【Method】 The red soil and fluvo-aquic soil with different long-term fertilizations, collected from the seventeen years filed experiments, were separated into sand, coarse silt, fine silt, coarse clay and fine clay by physical way, and the content and distribution of organic carbon in these particle-size fractions were analyzed. 【Result】 Compared with treatment of CK, the treatment of M, NPKM and NPKS significantly increased the content of total organic carbon (TOC) and organic carbon in particle-size fractions in the two soils, however, application of chemical fertilizer was more favorable for increasing organic carbon in fine clay. Application of manure was the most effective practice for increase soil organic carbon. The POC in sand was the most sensitive fraction to the fertilization among the particle-size organic carbon fractions, as its increase extent of the content was the highest after fertilization and reached 1.7-3.8 times and 1.9-2.8 times in the red soil and fluvo-aquic soil, respectively. Thedistribution percentage of organic carbon in sand was significantly increased after fertilization by 37.7%-91.5% and 63.6% in the red soil and fluvo-aquic soil, respectively. However, the percentage in different-sized clay and silt was significantly different, but it was decreased as a whole, followed by corresponding increase the ratio of POC to MOC (WPOC/WMOC), which aroused improvement of soil organic carbon. 【Conclusion】 Loam red soil could retain more organic carbon than light fluvo-aquic soil and the application of organic manure or straw is a better way to increase organic carbon in particle-size fractions of the two soils.

【题目】化肥有机肥配施对水稻养分吸收和产量的影响
【中文关键词】水稻;化肥;有机肥;养分吸收;产量
【英文关键词】Rice yield; Chemical fertilizer; Organic manure; Nutrient absorption

【中文摘要】【目的】综合评价中国南方双季稻地区化肥有机肥配合施用下水稻产量及土壤肥力效应。【方法】在湖南双季稻区第四纪红土发育的稻田上进行连续6 年的田间定位试验,比较不施氮肥(PK)、施用等量氮磷钾养分的有机肥(猪粪,M)、化肥(NPK,氮肥为尿素)及化肥有机肥配合施用(NPKM,化肥有机肥氮各占一半)水稻地上部养分吸收量、水稻产量、氮肥利用率及土壤有机质含量变化。【结果】化肥有机肥配施有利于水稻稳产高产,产量(12.2 t · ha-1 · a-1)最高,比不施氮肥对照的产量(7.3 t · ha-1 · a-1)增加68%;有机无机肥配施有利于水稻中后期干物质累积和养分吸收,提高单位面积总穗数和穗粒数。化肥有机肥配施的氮肥利用率平均为36.3%,土壤有机质含量5 年提高了18.5%,均显著高于化肥处理。【结论】化肥有机肥配合施用能提高水稻产量和肥料利用率、减少环境污染、培肥土壤,是南方水稻田简单易行的环境保护性施肥技术。

【英文摘要】【Objective】To evaluate the effect of organic manure application on rice yield and soil fertility synthetically indouble-rice cropping region in south China. 【Method】 Successive 6-year field experiments were conducted under quaternary redclay conditions in south Hunan of China. Four different treatments with mixed chemical and organic fertilizers, no nitrogen with chemical P and K (PK), swine manure only (M), N, P and K chemical fertilizers only (NPK; urea as N), and half chemical fertilizers, half swine manure (NPKM) with four replications were examined. Each N, P and K application rate was the same at all the treatments (except the N application rate at PK). All fertilizers applied to soil with once application as base fertilizers. The nutrients uptake rate, grain yield, nitrogen use efficiency and soil organic matter content at each treatment were measured/calculated for comparison. 【Result】 During the six years plantation, the NPKM treatment achieved a 12.2 t · ha-1 mean annual yield, (68% higheryield than that of PK). Higher dry matter accumulation and nutrients absorption were observed during the middle-later growth period in the NPKM treatment, with higher panicle number per unit and filled-grain number per panicle. Its average nitrogen use efficiency was 36.3% and soil organic matter increased by 18.5% during the five-year plantation in the NPKM, which were significantly higher than those in the NPK. 【Conclusion】 Organic manure application with chemical fertilizers increased the yield and nitrogen use efficiency of rice, reduced the risk of environmental pollution and improved soil fertility significantly. It could be said that this is a good practical technique that protects the environment of south China with keeping or raising the rice yield in this region.

【题目】红壤双季稻田不同施肥下的氨挥发损失及其影响因素.

【中文关键词】氨挥发;化肥;有机肥;双季稻田

【英文关键词】Ammonia volatilization; Fertilizer; Organic fertilizer; ShuangJiDao field

【中文摘要】在红壤双季稻田上采用密闭气室法测定了施用等氮量化肥(尿素)、有机肥(猪粪)及化肥有机肥(有机氮无机氮各占一半)配施下氨挥发及其田间表面水NH4+-N 含量、温度和pH 动态变化,研究氨挥发损失及影响因素。结果表明,与施用尿素相比,单施有机肥及化肥有机肥配施显著降低了稻田氨挥发,施用尿素的早稻和晚稻氨挥发损失率分别达41.4%和39.9%,单施有机肥的分别为0.3%和0.9%,化肥有机肥配施的分别为19.6%和8.9%。施肥后, 短期内田面水NH4+-N 含量和pH 均显著上升,其与氨挥发速率均呈显著正相关。

【英文摘要】Ammonia volatilization using a closed chamber method from paddy field soil and the dynamic of NH4+-N concentration, temperature, and pH in surface water were conducted in double rice cropping system. The effects of different types of nitrogen fertilizers applied as urea, swine manure and half of urea with swine manure in the basis of equal nitrogen on ammonia volatilization were studied. The results showed that applied swine manure and urea combing with swine manure reduced ammonia volatilization from paddy field soil significant comparing with applied chemical fertilizer urea. The N losses via ammonia volatilization account for 41.4% of total N input during early rice growth period and for 39.9% during late rice growth period by urea applied only, while the N losses via ammonia volatilization account for 0.3% during early rice growth period and 0.9% during late rice growth period for the treatment of swine manure. For the treatment of urea with swine manure, it was found that the N losses via ammonia volatilization were 19.6% during early rice growth period and 8.9% during late rice growth period, respectively. The concentration of NH4+-N and pH in surface water increased shortly after fertilization. Also, the positive correlation between ammonia volatilization rate with NH4+-N concentration and pH in surface water were obtained.

【题目】A SCAR marker linked to the N gene for resistance to root knot nematodes (Meloidogyne spp.) in pepper (Capsicum annuum L.)
【中文关键词】辣椒,抗病,根结线虫,SCAR,N基因,分子标记辅助选择
【英文关键词】Pepper,Capsicum annuum L., Disease resistance, Root-knot nematode, Meloidogyne spp., SCAR, N gene, Marker assisted selection
【中文摘要】根结线虫(Meloidogyne spp.)是一种重要的线虫,在世界范围内对辣椒有严重危害。至今仍没有关于与根结线虫抗性基因N-基因连锁的分子标记的报道。本文以携带抗根结线虫的N-基因的甜椒自交系“ Carolina Wonder ”和园艺性状优良的自交系“ 20080-5-29 ”的F2代320株单株为试验群体,对亲本、F1、F2的抗性进行根结线虫接种鉴定。利用分离群体法筛选了512对AFLP引物。根据F2的抗性鉴定和AFLP的多态性鉴定结果,计算了AFLP标记与N-基因的遗传距离。获得一个AFLP标记E39/M41-339,并将其转化为一个SCAR标记,抗性等位基因扩增片段为315bp,感性等位基因扩增片段为331bp,分子标记和线虫抗性N-基因的遗传距离为6.3cM。本研究为辣椒抗线虫分子标记辅助选择提供了有效工具。
【英文摘要】The root-knot nematodes (Meloidogyne spp.) are important nematode pests and cause serious diseases in pepper in the world. No molecular markers linked to the nematodes resistance N gene have been reported. In this paper, ‘ Carolina Wonder ’ (Capsicum annuum L.), a sweet pepper line resistant to root-knot nematode with N gene, ‘ 20080-5-29 ’ (C. annuum L.), an inbred line susceptible to root-knot nematode with good horticultural characteristics, and their F2 progeny with 320 individuals were used as materials. Evaluation of resistance and susceptibility of parental lines, F1 and F2 progeny inoculated with root-knot nematodes(Meloidogyne incognita) were carried out. ‘ Bulked segregant analysis ’ method was used to search for polymorphic markers from 512 pairs of AFLP primers. Based on the assessment of resistance and susceptibility and polymorphism of the AFLP marker in F2 population, the genetic linkage distance between the AFLP marker and the N gene was estimated. One AFLP marker E39/M41-339 was obtained and transferred to a SCAR marker amplifying a 315 bp DNA fragment linked to the N resistant allele and a 331 bp fragment linked to the N+ susceptible allele. The distance between the molecular marker and the nematodes resistance N gene is 6.3 cM. This research delivered a valuable tool for the marker assisted selection of nematodes resistance in pepper.

【题目】宁夏地下水中硝态氮含量状况及其影响因素
【中文关键词】地下水;硝态氮;作物类型;埋深;水质;宁夏
【英文关键词】groundwater, nitrate, crop types, burying depth, water quality, Ningxia
【中文摘要】研究了宁夏地区不同作物种植体系下地下水中的硝态氮含量状况及其影响因素,同时对宁夏地区的地下水水质进行评价。结果表明,不同作物种植体系下地下水中硝态氮含量具有明显差异,其中果园>温室菜>葡萄地>林地>小麦玉米>水稻>盐碱地,地下水中硝态氮的总体平均含量都低于20 mg/L,均达到Ⅲ类水质标准。果园所对应地下水的硝态氮含量最大,平均为7.94 mg/L,盐碱地所对应地下水的硝态氮含量最小,平均为0.74 mg/L。综上,宁夏地区地下水情况比较乐观,但个别地区已接近污染警戒,如果不采取合理的预防措施,情形将趋向恶化。地下水中硝态氮含量随埋深的变化,有可能受土壤地质层或地下水补给途径的影响,没有呈现明显的规律性,这也可能与样点的选取和样点多少有关。

【英文摘要】The nitrate concentrations of groundwater as well as their influence factors under different croppingsystems were studied in this paper. At the same time, the quality of groundwater in Ningxia was evaluated. Theresult indicated that there were obvious differences among different cropping systems in the content of nitrate inthe groundwater. Among them, Orchard>Greenhouse Vegetable>Grape>Forest land>Wheat-corn>Paddy rice>Saline and alkali land. The average content of nitrate in the groundwater was all lower than 20 mg/L, which allmet the groundwater quality standard III. The content of nitrate corresponding orchard in the groundwater wasthe highest, whose average was 7.94 mg/L, the lowest of the content of nitrate in the groundwater correspondedsaline and alkali land, its average was 0.74 mg/L. In sum, the quality situation of groundwater in Ningxia wasoptimistic, but individual areas have approached to pollution level. If not take the measures to prevent andcontrol, the situation would deteriorate. The nitrate contents of the groundwater had no obvious regularity alongwith the burying depth, which might be affected by textures of local soil or recharge ways of groundwater. It alsomight be associated with places and numbers of sampling points.Key words: groundwater, nitrate, crop types, burying depth, water

【题目】土壤脲酶抑制剂和硝化抑制剂的研究进展
【中文关键词】土壤;硝态氮;脲酶抑制剂;硝化抑制剂
【英文关键词】soil, nitrate, urease inhibitor, nitrification inhibitor
【中文摘要】氮素是农作物生长必不可少的元素,在促进农作物生长,提高产量方面起到了不可忽视的作用。所以,土壤中氮肥的施用成为控制高产的主要因素。但是随着氮肥施用量的增加,土壤过多累积的硝态氮又导致了环境污染方面的问题。为了解决这种污染问题,许多学者在对脲酶抑制剂和硝化抑制剂的研究上取得了很好的进展,利用脲酶抑制剂和硝化抑制剂可以很好的抑制土壤中铵态氮的硝化作用,控制硝态氮的大量积累所导致的环境污染。
【英文摘要】Nitrogen is essential to the plant. It makes important effects which promote the growth of the plant,increase the yield. So the nitrogen fertilizer became one of the limiting factors which control the yield.However, if too much nitrogen fertilizer is applied into the soil, it will result some problems. Nitrate residue inthe soil produces many problems to the environment. So many scientists made some good processes on theurease inhibitor and nitrification inhibitor. They used the inhibitors to reduce the pollution which the nitrateresidue existed in the soil.

【题目】高效固氮芽孢杆菌筛选及其生物学特性研究
【中文关键词】生物固氮;芽孢杆菌;菌种筛选;微生物肥料
【英文关键词】biological nitrogen fixation; bacillus; strain selection; microbial fertilizer
【中文摘要】【目的】筛选高效固氮芽孢杆菌,研究固氮微生物固氮酶活性、竞争适应能力与接种固氮效能的关系,探讨接种固氮芽孢杆菌对根际细菌多样性的影响。【方法】采用无氮培养基富集、加热筛选固氮芽孢杆菌。乙炔还原法测定固氮酶活性,采用盆栽小白菜选育高效固氮芽孢杆菌、研究菌种竞争适应能力与接种固氮效能。通过形态、生理生化特征和 16S rDNA 序列分析鉴定菌种。【结果】筛选到了3 株固氮酶活性相对较高、固氮能力较强的菌株GD062、GD082 和GD282,初步鉴定为芽孢杆菌Bacillus spp.和类芽孢杆菌Paenibacillus sp.。进一步的研究结果表明菌株GD082竞争适应能力较强,在盆栽试验自然土壤条件下接种固氮效能与施用化肥试验处理效果相当,可望进一步研发用于生产固氮微生物肥料。

试验结果同时显示,供试菌株的固氮酶活性与其接种固氮效能并不直接相关,菌株的竞争适应能力对接种固氮效能影响很大,接种固氮芽孢杆菌使小白菜根际土壤细菌多样性显著增加。【结论】接种固氮微生物为农作物提供氮素养分具有生产实践意义。高效固氮菌种的筛选是一个复杂的过程,菌株的固氮酶活性与其接种固氮效能并不直接相关,竞争适应能力对接种固氮效能影响很大。筛选到的芽孢杆菌GD082固氮酶活性较高、固氮能力较强、竞争适应能力很强,可望进一步研发成为优良的固氮微生物肥料生产用菌种。

【英文摘要】【Objective】Efficient nitrogen-fixing bacilli were isolated, and the relationships between microbial nitrogenase activity, competition ability and inoculation effect were investigated. The influence of inoculating nitrogen-fixing bacillus on the bacterial community in crop rhizosphere was explored. 【Method】Nitrogen-free medium was used to isolate nitrogen-fixers and heat treatment was used for the nitrogen-fixing bacilli. Nitrogenase activity was determined with acetylene reduction assay. Microbial competition ability and inoculation effect were tested with pot culture in greenhouse. Strain identification was carried out based on the morphology, physiology, biochemical test and 16S rDNA sequences analysis. 【Result】 Three strains termed as GD062, GD082 and GD282 with relative high nitrogenase activity and strong nitrogen-fixing ability were isolated, which were identified as Bacillus spp. and Paenibacillus sp. respectively. Further result showed that strain GD082 have strong competition ability, produced an inoculation effect as well as the chemical fertilizer treatment did in the natural soil. Result also indicated that no correspondence between nitrogenase activity and inoculation effect was found. Strain competition ability influences the inoculation effect. Rhizosphere bacterial community increased significantly with the inoculation of nitrogen-fixing bacilli.【Conclusion】It is meaningful in agricultural practice to offer crop nitrogen nutrient through inoculation of nitrogen-fixers. Selection of efficient nitrogen fixer is a complexed process. There is no correspondence between nitrogenase activity and inoculation effect. Strain competition ability influences the inoculation effect even stronger. A nitrogen-fixing bacillus GD082 with high nitrogenase activity, strong nitrogen-fixing ability and competition ability was obtained, which is possible to be further developed as an excellent strain used in the microbial fertilizer production.

【题目】中国十三省市土壤中非共生固氮微生物菌种资源研究

【中文关键词】非共生;生物固氮;微生物资源;系统发育

【英文关键词】Asymbiotic; biological nitrogen fixation; microbial resources; phylogeny

【中文摘要】从全国13个省市自治区的70份土样中分离、采集到了非共生固氮微生物资源181份。从形态特征、生理生化特征和16S rDNA序列分析表明,采集到的菌种资源在科学分类上属于24属66种,大约占到已报道非共生固氮微生物属的一半,具备一定的多样性和代表性。资源在分类学上的特点是分类地位相对集中,有65株菌属于类芽孢杆菌属,占总量的36%;52株菌属于芽孢杆菌属,占总量的29%;19株菌属于节杆菌属,占总量的11%;这3个属菌株合计占采集资源总量的76%。随地域和作物种类分布的特点是芽孢杆菌和类芽孢杆菌两个属的菌种资源具有很强的地域广泛性和作物广泛性,即从采自全国各地、各种作物的土壤样品几乎都可以分离到这两类菌种。这个研究结果对微生物肥料菌种选育和生产应用具有指导意义。

【英文摘要】One hundred and eighty one asymbiotic nitrogen-fixing bacterial strains were isolated from 70 soil samples collected from 13 provinces over China. Results based on the determination of morphology and chemical properties, together with 16S rDNA sequencing, indicated that these strains belong to 66 species of 24 genera, which account for about a half of currently reported genera of asymbiotic nitrogen-fixing bacteria. Taxonomic distribution of these strains was relative converging, 65 strains belongs to Paenibacillus, 52 strains belongs to Bacillus and 19 strains belongs to Arthrobacter, which accounts for 36%, 29% and 11% of gross resource, respectively. Strains of these 3 groups make up 76% of gross resource. Strains of Paenibacillus and Bacillus showed significant diversity on the distribution regarding to geography and crops. Namely strains of these 2 groups could be isolated from almost every sample collected from root area of crops all over China.

【题目】固氮芽孢杆菌GD272的筛选鉴定及其固氮性能研究
【中文关键词】生物固氮;芽孢杆菌;菌种选育;微生物肥料
【英文关键词】Biological nitrogen fixation; bacillus; strain breeding; microbial fertilizer
【中文摘要】对所选育出的一株固氮芽孢杆菌(编号为 GD272)进行了形态、生理生化测定和接种效果研究。通过 16S rDNA基因比对以及生理生化鉴定表明,该菌株属于芽孢杆菌Bacillus sp.。乙炔还原法测定显示该菌株具有较高的固氮酶活性;小白菜盆栽试验看出, 接种GD272菌达到了施用化学氮肥的同等效果。菌株GD272在固氮微生物肥料生产中具有较好的开发应用前景。
【英文摘要】Global energy shortage and the high cost of chemical fertilizer make the research of biological nitrogen fixation become necessary and urgent. Research on the breeding and biology of nitrogen-fixing bacteria is the base for nitrogen-fixing microbial fertilizer industry. A nitrogen-fixing bacillus strain GD272 was isolated and its morphology, physiology and chemical properties were studied. Identification with 16S rDNA sequencing, morphology, physiology and chemical properties showed that strain GD272 is Bacillus sp. Relative high nitrogenase activity of GD272 was determined with acetylene reduction assay. Green house test indicated that pakchoi inoculated with GD272 grew as well as those supplied with chemical nitrogen fertilizer. Strain GD272 shows a good prospect in nitrogen fixing microbial fertilizer production.

【题目】长期不同施肥对水稻产量及土壤肥力的影响
【中文关键词】长期定位试验;施肥;水稻产量;土壤有机质;土壤养分
【英文关键词】long-term experiment; fertilizer application; rice yield; soil organic matter; soil nutrients
【中文摘要】【目的】研究化肥、有机肥对水稻产量、土壤有机质的影响,以及化肥氮磷钾、有机肥氮磷钾提高土壤养分的异同。【方法】依托祁阳站有机无机、肥水稻长期定位试验,分析历史样品及数据。【结果】有机肥与化肥氮磷钾配合施用对水稻高产稳定有显著作用;长期施用化肥和有机肥对提高土壤有机质都有显著作用,但施用化肥只能提高土壤有机质含量至28.1 g·kg-1,与试验开始时相比只提高了42%。凡施用牛粪能使土壤有机质平均最高增加到41.6 g·kg-1,比试验开始时提高了 91%;有机肥氮提高土壤全氮、碱解氮含量的效果优于化肥氮,土壤全氮、碱解氮含量比化肥处理提高了30%和16%。而施入的有机肥磷在土壤中累积较少,土壤全磷、速效磷提高较少, 施入的化肥磷在土壤中累积较多, 土壤全磷、速效磷含量提高幅度较大。与有机肥相比,化肥提高土壤全磷30%,提高速效磷115%。【结论】有机肥与化肥氮磷钾配合施用对水稻高产稳产和提升土壤肥力有重要的作用。
【英文摘要】【Objective】 The objective of this study was to probe the effects of chemical and organic fertilizers on rice yield, soil organic matter and soil nutrients.【Method】Field investigation and soil sample analysis methods were adopted on a long-term experiment in Qiyang, Station, Hunan province, China.【Result】The combined use of chemical and organic fertilizers was an optimum way for high yield and improvement of soil fertility. Application of both chemical and organic fertilizers significantly increased soil organic matter, and application of organic fertilizers increased soil organic matter by 48% compared with the chemical fertilizer. Organic fertilizers made a great contribution to improvement of soil total nitrogen and hydrolysable nitrogen than chemical fertilizer N, but less contribution to soil total P and available P than that of chemical fertilizer phosphorus. The organic fertilizer increased soil total N by 30% and hydrolysable N by 16% while the chemical P fertilizer increased 30% more total P and 115% more available P than did the organic fertilizer. 【Conclusion】Combined use of chemical fertilizer and manure is important for high yield of rice and improvement of soil fertility.

【题目】载Harpin_(Xooc)蛋白纳米粒的制备及生物学效应测定
【中文关键词】HarpinXooc蛋白 纳米粒 理化性质 生物学效应
【英文关键词】HarpinXooc nanoparticles physicochemical properties bioactivities
【中文摘要】为了评价载HarpinXooc蛋白纳米粒的性状及其在农业领域的应用效果,利用静电聚合原理,以壳聚糖为载体,多聚磷酸钠为交联剂制备载HarpinXooc蛋白纳米粒,测定其粒径、zeta电位、包封率、载药量和释放情况,考察振荡时间对纳米粒的影响。结果显示:载HarpinXooc蛋白纳米粒形态均一,粒径、zeta电位、包封率和载药量分别为(270.0±3.0)nm、(16.5±0.9)mV、62.7%±1.8%和12.6%±2.4%,具有缓释效应,可以诱导烟草产生过敏性反应和更好地促进植物生长。表明:此方法制备条件缓和,工艺简单,包封率较高,制得的载HarpinXooc蛋白纳米粒生物学效应好。
【英文摘要】The HarpinXooc loaded nanoparticles were prepared for assaying their bioactivities in agriculture.In this study,the HarpinXooc loaded nanoparticles were prepared by ionic gelation of chitosan with tripolyphosphate,and the effect of shaking time on nanoparticles ′ physicochemical properties was studied.The size and zeta potential of the HarpinXooc nanoparticles were(270.0±3.0)nm and(16.5±0.9)mV.The encapsulation efficiency and loading capacity of nanoparticles were 62.7%±1.8% and 12.6%±2.4%.Moreover,the nanoparticles induced hypersensitive response and promoted the growth of tobacco roots.In general,the HarpinXooc loaded nanoparticles exhibited some attractive features which included subsequent release,mild preparing conditions,simple method,high encapsulation efficiency and promoting bioactivities.

【题目】利用高代回交群体定位野生醋栗番茄发芽期耐盐QTL
【中文关键词】番茄; 耐盐; 种子萌发; AB-QTL
【英文关键词】tomato; salt tolerance; seed germination; AB-QTL
【中文摘要】以野生醋栗番茄(Solanum pim pinellifolium) LA722和栽培番茄(Solanum lycopersicum) 9706为材料, 结合发芽期大规模盐胁迫筛选方法和AB2QTL 技术进行耐盐QTL 定位和转育研究, 建立了包括280个BC3S1单株的高代回交群体, 利用26个CAPS、66个SSR和39个SRAP多态性标记构建了分子遗传图谱并进行了耐盐性QTL定位。利用发芽20、24、28 d的发芽指数分别检测耐盐相关的QTL, 确定发芽24 d时的指数为检测QTL的最优指标,共检测出11个与耐盐相关的QTL, 8个来自于野生醋栗番茄LA722。研究获得了58个极耐盐株系, 对部分耐盐株系进行QTL qST2821 和qST2922 的基因型分析, 其中23021和23023株系含QTL qST2821, 22824株系含主效QTL qST2922, 23126, 21027, 22621, 22626, 22627和20427株系同时含有2个主效QTL, 这些株系的农艺性状接近栽培番茄9706, 可作为耐盐育种种质。

【题目】宁夏灌区不同氮磷组合对水稻产量及氮肥利用率的影响
【中文关键词】水稻;产量构成;氮磷组合;总氮吸收;氮肥利用率
【英文关键词】Rice; Yield components; N and P coup ling; Total N up take; N use efficiency
【中文摘要】依据2008年5 - 10月在宁夏灵武灌区的田间试验资料,探讨最优氮磷组合对水稻产量及氮肥利用率的影响。结果表明: 12个氮磷组合处理的产量为7361~10680kg/hm2 ,比对照增产28% ~85%,差异极显著(F =281013, P = 010001) 。氮磷交互作用显示,低氮水平适量增施磷肥增产,低磷水平适量增施氮肥增产,即处理6(N15 P6) 、4 (N15 P9) 、5 (N15 P3) 、3 (N10 P9)增产明显,其中处理6 (N15 P6)投入氮肥225kg/hm2、磷肥90kg/hm2 ,产量构成因子为524穗/m2 , 93粒/穗,结实率93%,千粒重2315g,各因子增长较均衡,产量最高,为10680kg/hm2 ,氮肥利用率4515% ,比当地常规施肥(氮肥300kg/hm2、磷肥45kg/hm2)增产1714% ,节约氮肥25% ,增施磷肥50% ,氮肥利用率提升2017%,可消减和降低氮素对土壤和水体的污染,该组合值得在当地推广应用。
【英文摘要】Based on field experimental data for irrigation rice in L ingwu, the effects of differentN /P fertilizer app lication on rice yield and N use efficiency were studied. The results showed that the yields of 12 N /P treatments were 71361 t/ha~101680 t/ha, 28%~85% higher than CK. The yield increased if adding app rop riate fertilizerN based on low level of P, as same as adding app rop riate fertilizer P based on low level ofN. So treatments 6 (N15 P6) , 4 (N15 P9) , 5 (N15 P3) , 3 (N10 P9) got the best yield2composition, ofwhich treatment 6 got best yield as 101679 t/ha. The treatment saved N by 25% , increased yield by 1714% and efficiency of N by 2017%. In conclusion, coup ling of N15 P6 was a best solution to app ly and extend in irrigation area of Ningxia.

【题目】Absence of nerve growth factor and comparison of tyrosine kinase receptor A levels in mature spermatozoa from oligoasthenozoospermic, asthenozoospermic and fertile men
【中文关键词】无
【英文关键词】Human spermatozoa; Nerve growth factor; Tyrosine kinase receptor; Expression; Infertility
【中文摘要】无
【英文摘要】Background: Nerve growth factor (NGF) and the Tyrosine kinase receptor (TrkA) are expressed in mammalian ovaries and testes, where they are involved in oocyte maturation and spermatogenesis. We assessed the possibility that NGF and TrkA gene products are present in human spermatozoa, and explored differences in levels of NGF and TrkA in spermatozoa from oligoasthenozoospermic, asthenozoospermic and fertile men.

【题目】两个不同来源的番茄GGPS基因克隆和序列分析
【中文关键词】番茄;GGPS;上游侧翼序列;基因克隆;序列分析
【英文关键词】Tomato;GGPS;5'-flanking regions;Gene cloning;Sequence analysis
【中文摘要】据本实验室得到的GGPS基因片段与NCBI公布的GGPS基因cDNA(DQ267903)序列设计引物,以两份番茄红素含量差异显著的番茄材料:普通番茄(编号E6203)和源于多毛番茄的渐渗系(编号TA517)为试材,分别克隆其DNA和eDNA序列。序列分析显示:GGPS基因不含有内含子。所推导氨基酸序列比对表明:2个不同来源的GGPS基因存在13个差异位点,其中9个位点的氨基酸性质发生了变化。氨基酸变异导致了2个GGPS基因的二级结构与磷酸化位点的不同,初步推测番茄红素含量的差异可能与氨基酸变异有关;采用双链接头介导的染色体步移技术,克隆了GGPS基因5 侧翼序列,进一步分析结果显示:两份材料GGPS上游区序列差异明显,但所包含的顺式元件的分布相对保守,且存在明显的转录调控序列;利用RT-PCR方法对不同器官的GGPS基因表达进行初步研究,结果表明:GGPS基因主要在果实和花器官中表达。

【题目】抗旱种衣剂对大豆抗旱性及产量性状的影响
【中文关键词】抗旱种衣剂; 大豆; 抗旱性; 增产
【英文关键词】Drought resistant seed coating, Soybean, Drought resistance, Increasing yield
【中文摘要】为评价两种抗旱种衣剂在大豆上的抗旱与增产作用, 开展田间试验, 对两种制剂处理下大豆的种子萌发、生长、产量以及与抗旱性相关的指标进行观测。结果表明, 两种抗旱种衣剂均有抗旱增产的功能。抗旱种衣剂1 号处理下, 与对照相比, 大豆的种子出苗率提高4.8%, 平均株高增加4cm, 单株根瘤数量增加13 个, 产量增加7.3%, 净光合速率增加1.4 μmolCO2/(m2·s)。种衣剂2 号处理下, 大豆的种子出苗率提高5.2%, 平均株高增加5.6cm, 单株根瘤数量增加65 个, 产量增加6.3%, 蒸腾速率、叶片失水速率下降,根体积、根冠比增加。表明种衣剂2 号的抗旱效果更强, 种衣剂1 号的增产效果更明显。

【英文摘要】Field experiments were carried out to evaluate the effects of 2 kinds of drought resistant seed coatings (DRSC) on enhancing drought resistance and yield. Seed germination, growth, yield formation and some parameters relative to drought resistance were investigated and measured in soybean plants treated with and without DRSC. The results showed that both the 2 kinds of DRSC effectively promoted drought resistance and yield in soybean. For soybean plants treated with DRSC 1, seed germination increased by 4.8% , plant height, 4cm, root nodule numbers, 13, yield, 7.3% , and net photosynthetic rate was significantly higher than cK. While for those treated with DRSC 2, seed germination increased by 5.2%, plant height, 5.6cm, root nodule numbers, 65, yield, 6.3%, transpiration rate and water loss rate of leavesdecreased, root volume and root/shoot ratio all increased. The study demonstrated that DRSC 2 is more effective in improving drought resistance, while DRSC 1, in promoting photosynthesis and increasing yield.

【题目】Expression of HpaGXooc protein in Bacillus subtilis and its biological functions
【中文关键词】无
【英文关键词】HpaGXooc, Bacillus subtilis, biological function
【中文摘要】无
【英文摘要】HpaGXooc, from rice pathogenic bacterium Xanthomonas oryzae pv. oryzicola, is a member of the harpin group of proteins, eliciting hypersensitive cell death in non-host plants, inducing disease and insect resistance in plants, and enhancing plant growth. To express and secret the HpaGXooc protein in Bacillus subtilis, we constructed a recombinant expression vector pM43HF with stronger promoter P43 and signal peptide element nprB. The SDS-PAGE and Western blot analysis demonstrated the expression of the protein HpaGXooc in B. subtilis. The ELISA analysis determined the optimum condition for HpaGXooc expression in B. subtilis WBHF. The biological function analysis indicated that the protein HpaGXooc from B. subtilis WBHF elicits hypersensitive response (HR) and enhances the growth of tobacco. The results of RT-PCR analysis revealed that HpaGXooc induces expression of the pathogenesis-related genes PR-1a and PR-1b in plant defense response.

【题目】干旱状况小区域灌溉冬小麦农田生态系统水热传输
【中文关键词】该文采用涡度相关技术测定小区域灌溉冬小麦农田实际蒸散量和农田能量平衡各分量,分析表征农田地表获取能量再分配经典参数Priestly-Taylor 系数(α=LE/LEeq)的变化特征。结果表明,在华北地区冬小麦返青至成熟期内,日变化过程中白天时间段内, Priestley-Taylor 系数呈“U”型变化趋势,7∶00~18∶00 时刻内,α平均值为(1.324±0.334),正午前后保持在1.05~1.17 之间。在冬小麦生育期季节变化过程中,Priestley-Taylor 系数(α)平均值为(1.473±0.454),远高于在湿润下垫面时(α=1.26)的数值,在抽穗开花期内土壤水分充足时α最大值为2.317,拔节时期土壤水分胁迫时α值为0.410。干旱少雨状况下,进行小面积充分灌溉时,由于存在农田热平流现象将导致过多的蒸发蒸腾水分耗散,降低农田灌溉水的利用效率。
【英文关键词】crops, small area irrigation, ecological system, winter wheat field, eddy correlation method, Priestley-Taylor parameter, water and heat transport
【中文摘要】该文采用涡度相关技术测定小区域灌溉冬小麦农田实际蒸散量和农田能量平衡各分量,分析表征农田地表获取能量再分配经典参数Priestly-Taylor 系数(α=LE/LEeq)的变化特征。结果表明,在华北地区冬小麦返青至成熟期内,日变化过程中白天时间段内, Priestley-Taylor 系数呈“U”型变化趋势,7∶00~18∶00 时刻内,α平均值为(1.324±0.334),正午前后保持在1.05~1.17 之间。在冬小麦生育期季节变化过程中,Priestley-Taylor 系数(α)平均值为(1.473±0.454),远高于在湿润下垫面时(α=1.26)的数值,在抽穗开花期内土壤水分充足时α最大值为2.317,拔节时期土壤水分胁迫时α值为0.410。干旱少雨状况下,进行小面积充分灌溉时,由于存在农田热平流现象将导致过多的蒸发蒸腾水分耗散,降低农田灌溉水的利用效率。
【英文摘要】Actual evapotranspiration and components of field energy balance were measured by eddy correlation system, and the variations of Priestley-Taylor parameter (α), characterizing the energy partition over winter wheat field surface were analyzed. At the diurnal course, daily average of parameter α was 1.324±0.334, at noon, the value was 1.05-1.17. And the graph of parameter α with time had a concave-up shape from 7∶00 to 18∶00 after regreening stage in winter wheat field in the North China Plain. The seasonal average of parameter α was 1.473±0.454, above the value of 1.26 under wetness surface. The maximum of parameter α was 2.317 under the condition of enough soil water content during winter wheat tassel and anthesis stage, and the minimum of parameter α was 0.410 with soil water stress during stemelongation in winter wheat field. Water use efficiency of small area irrigation in wheat winter field is decreased because of heat advection under drought condition.

【题目】番茄CONSTANS类似基因的克隆与表达分析
【中文关键词】番茄; 开花时间; CONSTANS 类似基因
【英文关键词】tomato; Solanum lycopersicum; flowering time; CONSTANS-like gene
【中文摘要】以一个受生物钟调节的番茄转录衍生片段(transcrip tion2drived fragment, TDF) 为信息探针,通过在NCB I EST数据库中进行电子延伸和RT2PCR验证, 获得了番茄CO类似基因的cDNA全长序列, 命名为SlCO1 (GenBank登录号, EU636698) 。SlCO1蛋白含有386个氨基酸, 氨基端存在两个B2box型锌指结构, 羧基端含有一个TTC结构域。SlCO1蛋白与CO类蛋白的氨基酸一致性为34%-46% , 但在B2box锌指和CCT结构域处高度保守。基因组序列包含1个535 bp的内含子, 位

于B2box锌指和CCT结构域之间。表达谱分析表明,SlCO1在叶片中优势表达, 在根和茎中表达较弱。SlCO1的克隆为了解CO类似基因在番茄开花中的作用奠定了基础。

【题目】我国部分番茄主栽品种抗疮痂病评价和标记辅助选择
【中文关键词】番茄;疮痂病;抗性鉴定;分子标记辅助选择
【英文关键词】Solanum lycopersicum ;Bacterial spot;Resistance evaluation;Marker-assisted selection
【中文摘要】为了明确我国主栽品种对番茄疮痂病抗性状况,本研究以我国番茄疮痂病主要小种T1和T3的菌株接种我国目前种植的39个番茄品种,并通过分子标记进行分析和辅助育种。结果表明,虽然有些品种具有了抗性材料的特征条带,但所有材料对T1和T3小种都不能产生过敏反应。采用与T1小种抗性位点Rx3紧密连锁的分子标记,成功地将抗病品种OH9834的抗性位点Rx3转移到9个不同的感病品种中,获得了抗病植株。从本研究可以看出,我国番茄品种缺乏对番茄疮痂病的抗性,同时也表明分子标记辅助选择可以用于番茄疮痂病的抗性育种中。

【题目】Nitrous oxide emissions from irrigated and fertilized spring maize in semi-arid northern China

【中文关键词】Automated measurement; Nitrous oxide emissions; Nitrous oxide uptake; Emission factor; Fertilizer rate
【英文关键词】Automated measurement; Nitrous oxide emissions; Nitrous oxide uptake; Emission factor; Fertilizer rate
【中文摘要】As maize requires a high input of fertilizer nitrogen, it is likely to be an important source of nitrous oxide (N2O). Detailed information on N2O emissions over long time periods, and management practices that aim to reduce N2O emissions from spring maize fields in China is lacking. Consequently we measured the emissions of N2O from a spring maize field continuously from 2007 to 2009 at Yuci, Shanxi Province, China using newly developed automated chambers and explored strategies to reduce N2O emissions. The results showed that the Optimal fertilizer treatment (120 kg N ha − 1 y − 1) produced the same yield of grain as the Traditional fertilizer treatment (330 kg N ha − 1 y − 1), and significantly reduced N2O emissions by 48%. Topdressing with urea was the main source of N2O, which on average accounted for 58% of thetotal N2O emissions each year. Uptake of N2O occurred during the late stage of maize growth when soil mineral N content was less than 46.4 mg N kg − 1 soil. The N2O emission factors were lower than the IPCC default value. Nitrous oxide emissions could also be reduced if farmers did not apply fertilizer N during periods of heavy rainfall and did not irrigate immediately after fertilization.

【题目】How water saving irrigation contributes to climate change resilience—a case study of practices in China
【中文关键词】Water saving irrigation; Climate change; Mitigation and adaptation; Greenhouse gases
【英文关键词】Water saving irrigation; Climate change; Mitigation and adaptation; Greenhouse gases
【中文摘要】A warming climate system is now an indisputable fact. An effective response to climate change should include both mitigation and adaptation. Water is essential to human survival and social development. But the shortage of water resources is a worldwide problem, which in China has been exacerbated by climate change. In order to find out how to cope with climate change successfully, this study, on the basis of China statistical data 2007 – 2009, quantitatively analyzes the role of water saving irrigation (WSI) in addressing climate change. The study shows that water saving irrigation (WSI) can serve as a useful enabler in dealing with climate change. From the perspective of mitigation, the 3-year total CO2 emission reduction stands at 34.67 (21.83~47.48) Mt, about per year 11.56(7.28~ 15.83)Mt. From the perspective of adaptation, the total water saved from 2007 to 2009 stands at 96.85 (61.81~129.66) Gm3. If per unit farmland irrigation takes a 3-year average of agricultural water consumption, the water saved in 2009 is enough to irrigate additional 5.70 (3.80~7.80)Mhm2, or to increase the grain yield by 22.04 (14.68~30.15) Gt. In addition, WSI can reduce soil salinization and conserve soil to sustain land productivity and environmental benefits. So WSI can be a positive measure in coping with climate change when it is rightly deployed. However, the costs and local context of such practices call for further studies.

【题目】辣椒遗传多样性的SSR分析
【中文关键词】辣椒;遗传多样性;SSR
【英文关键词】Capsicum;Genetic diversity;SSR markers
【中文摘要】采用109对SSR特异引物对89份辣椒材料进行分析,其中87对引物扩增出条带,52对引物具有多样性,扩增带分子量在150 2 000 bp之间,231条谱带中175条谱带具有多态性,多态率占75.760/0,平均每个引物可扩增出2.66条带,说明辣椒材料的遗传多样性相对较小。89份材料经过NTSYS2.1.0软件分析后,计算出材料间遗传距离,并做出SSR分子标记聚类图。结果显示,89份材料在遗传相似系数0.60处分为两类,可以将栽培种和野生种区分开来,在遗传相似系数0.80处可以分为四类,总体上看,将果实类型相似的种质基本都聚在一起,说明用SSR标记进行辣椒遗传多样性的分析是可行的。

【题目】Effects of irrigation, fertilization and crop straw management on nitrous oxide and nitric oxide emissions from a wheat-maize rotation field in northern China
【中文关键词】Emission factor; Grain yield; Wet deposition;Dissolved organic carbon;Inorganic N
【英文关键词】Emission factor; Grain yield; Wet deposition;Dissolved organic carbon;Inorganic N
【中文摘要】One-year winter wheat – summer maize rotation is the most popular double cropping system in northcentral China, and this highly productive system is an important source of nitrous oxide (N2O) and nitric oxide (NO) emissions due to the high fertilizer N and irrigation water inputs. To sustain the high crop production and mitigate the detrimental impacts ofN2O andNOemissions, improved management practices are extensively applied. The aim of this study is therefore to evaluate the effects of an improved management practice of irrigation, fertilization and crop straw on grain yield and N2O and NO emissions for a wheat – maize rotation field in northern China. Using automated and manual chamber measuring systems,we monitored N2O and NO fluxes for the conventional (CT, 2007 – 2008), improved (IT, 2007 – 2008),straw-amended (WS, 2008 – 2009), straw-not-amended (NS, 2008 – 2009), and no N-fertilizer treatments (WS – NN, 2008 – 2009), respectively, for one rotation-year. The grain yields were determined for CT and IT for three rotation-years (2005 – 2008) and for WS, NS and WS – NN for one rotation-year (2008 – 2009). The improved management of irrigation and fertilization reduced the annualNfertilization rate and irrigation amount by 17% and 30%, respectively; increased the maize yield by 7 – 14%; and significantly decreased the N2O and NO emissions by 7% ($p < 0.05$) and 29% ($p < 0.01$), respectively. The incorporation of wheat straw increased the cumulative N2O and NO emissions in the following maize season by 58% ($p < 0.01$) and 13%, respectively, whereas the effects of maize straw application were not remarkable. The N2O andNO emission factors of applied N were 2.32±2.32% and 0.42±1.69% for wheat straw and 0.67±0.23% and 0.54±0.15% for chemical N-fertilizers, respectively. Compared to conventional management practices using high application rates of irrigation water and chemical N-fertilizer as well as the field burning of crop straw, the improved management strategy presented here has obvious environmentally positive effects on grain yield and mitigation of N2O and NO emissions.

【题目】Nitrous oxide and nitric oxide emissions from an irrigated cotton field in Northern China
【中文关键词】Emission factor; Soil nitrogen;Fertilization;Irrigation; Cotton; Sampling frequency
【英文关键词】Emission factor; Soil nitrogen;Fertilization;Irrigation; Cotton; Sampling frequency
【中文摘要】Cotton is one of the major crops worldwide and delivers fibers to textile industries across the globe. Its cultivation requires high nitrogen (N) input and additionally irrigation, and the combination of both has the potential to trigger high emissions of nitrous oxide (N2O) and nitric oxide (NO), thereby contributing to rising levels of greenhouse gases in the atmosphere. Using an automated static chamber measuring system, we monitored in high temporal resolution N2O and NO fluxes in an irrigated cotton field in Northern China, between January 1st and December 31st 2008. Mean daily fluxes varied between 5.8 to 373.0 μg N2O-N $m^{-2}h^{-1}$ and −3.7 to 135.7 μg NO-N $m^{-2}h^{-1}$, corresponding to an annual emission of 2.6 and 0.8 kg N $ha^{-1}yr^{-1}$ for N2O and NO, respectively. The highest emissions of both gases were observed directly after the N fertilization and lasted approximately 1 month. During this time period, the emission was 0.85 and 0.22 kg N ha^{-1} for N2O and NO, respectively, and was responsible for 32.3% and 29.0% of the annual total N2O and NO loss. Soil temperature, moisture and mineral N content significantly affected the emissions of both gases ($p<0.01$). Direct emission factors were estimated to be 0.95% (N2O) and 0.24% (NO). We also analyzed the effects of sampling time and frequency on the estimations of annual cumulative N2O and NO emissions and found that low frequency measurements produced annual estimates which differed widely from those that were based on continuous measurements.

【题目】Responses of N2O and CH4 fluxes to fertilizer nitrogen addition rates in an irrigated wheat-maize cropping system in northern China
【中文关键词】N2O and CH4 fluxes;irrigated wheat-maize cropping system
【英文关键词】N2O and CH4 fluxes;irrigated wheat-maize cropping system
【中文摘要】Model and field studies generally posit that when the application rates of nitrogen fertilizer exceed crop needs, nitrous oxide (N2O) emissions will increase nonlinearly, though linear responses are also extensively reported by field studies. We conducted year-round measurements of crop yield, N2O and methane (CH4) fluxes for treatments of six fertilizer nitrogen levels (0, 135, 270, 430, 650 and 850 kgNha − 1 yr − 1 in the form of urea) in a typical irrigated wheat-maize rotation field in northern China. Linear models characterized the responses of cumulative N2O emissions to fertilizer rates well; therefore, the calculated N2O emission factors of 0.17±0.02 %, 0.73±0.05% and 0.49±0.02% for the wheat season, maize season and annual scale, respectively, were appropriate for the different fertilizer rates. The cumulative CH4 uptake by the soil tended to be enhanced at higher fertilizer rates (_350 kgNha − 1) in the maize season whereas no effect was observed for the wheat season. When the annual fertilizer rates increased from 270 to 430, from 270 to 650, and from 270 to 850 kgNha − 1 yr − 1, the crop yields increased only 3_15% (0.5_2.1 t ha − 1 yr − 1), but cumulative N2O emissions increased 35_115% (0.9_3.0 kgNha − 1 yr − 1). We recommend 270 kgNha − 1 yr − 1as the locally optimum fertilizer rate. Considering the nitrogen inputs by fertilization (270 kgNha − 1 yr − 1), irrigation (4.3±0.2 kgNha − 1 yr − 1) and deposition (wet deposition: 30.5±1.5 kgNha − 1 yr − 1), the slightly positive soil nitrogen balance could maintain the current crop yield (_13.8 t ha − 1 yr − 1) and reduce the present high N2O emissions (>3.51 kgNha − 1 yr − 1) of the local farmers ’ practice (fertilizer rate>430 kgNha − 1 yr − 1).

【题目】Effect of biochar amendment on maize yield and greenhouse gas emissions from a soil organic carbon poor calcareous loamy soil from Central China Plain
【中文关键词】Biochar; CO2 emission ; CH4 emission;N2O emission ;Maize productivity
【英文关键词】Biochar; CO2 emission ; CH4 emission;N2O emission ;Maize productivity
【中文摘要】Aims A field experiment was conducted to investigate the effect of biochar on maize yield and greenhouse gases (GHGs) in a calcareous loamy soil poor in organic carbon from Henan, central great plain, China. Methods Biochar was applied at rates of 0, 20 and 40 tha − 1 with or without N fertilization. With N fertilization, urea was applied at 300 kg N ha − 1, of which 60% was applied as basal fertilizer and 40% as supplementary fertilizer during crop growth. Soil emissions of CO2, CH4 and N2O were monitored using closed chambers at 7 days intervals throughout the whole maize growing season (WMGS). Results Biochar amendments significantly increased maize production but decreased GHGs. Maize yield was increased by 15.8% and 7.3% without N fertilization, and by 8.8% and 12.1% with N fertilization under biochar amendment at 20 tha − 1 and 40 tha − 1, respectively. Total N2O emission was decreased by 10.7% and by 41.8% under biochar amendment at 20 tha − 1 and 40 tha − 1 compared to no biochar amendment with N fertilization. The high rate of biochar (40 tha − 1) increased the total CO2 emission by 12% without N fertilization. Overall, biochar amendments of 20 tha − 1 and 40 tha − 1 decreased the total global warming potential (GWP) of CH4 and N2O by 9.8% and by 41.5% without N fertilization, and by 23.8% and 47.6% with N fertilization, respectively. Biochar amendments also decreased soil bulk density and increased soil total N contents but had no effect on soil mineral N. Conclusions These results suggest that application of biochar to calcareous and infertile dry croplands poor in soil organic carbon will enhance crop productivity and reduce GHGs emissions.

【题目】Effects of biochar amendment on soil quality, crop yield and greenhouse gas emission in a Chinese rice paddy: a field study of 2 consecutive rice growing cycles

【中文关键词】Biochar; Soilamendment; Global warming potential; C intensity; Rice production; Biochar effect intensity
【英文关键词】Biochar; Soilamendment; Global warming potential; C intensity; Rice production; Biochar effect intensity

【中文摘要】Biochar production and application from crop straw had been proposed as one effective countermeasure to mitigate climate change. We conducted a2-year consecutivefield experiment in 2009 and 2010 in rice paddy to gain insight into the consistency over years of biochar effects on rice production and greenhousegasesemissions. Biochar was amended in 2009 before rice transplanting at rates of 0, 10, 20 and 40 t ha − 1, soilemissions of carbon dioxide (CO2), methane (CH4) and nitrous oxide (N2O) were monitored with closed chamber method at 7 days interval throughout the whole ricegrowing season (WRGS) both in 2009 and 2010. The results showed that biocharamendment increased rice productivity, soil pH, soil organic carbon, total nitrogen but decreased soil bulk density in both cycles of rice growth. Soil respiration observed no significant difference between biocharamendment and the corresponding control both in the first and second cycle, respectively. However, biocharamendment decreased nitrous oxide emission but increased methane emission in both cycles. No significant difference in carbon intensity of rice production (GHGI) and global warming potential (GWP) were observed between the biocharamendment at the rate of 10 t ha − 1 and 40 t ha − 1 and control though the GWP and GHGI was increased by 39% and 26% at the rate of 20 t ha − 1 respectively, in the first cycle. However, in the second cycle, both of overall GWP and GHGI were observed significantly decreased under biocharamendment as compared to control, ranging from 7.1% to 18.7% and from 12.4% to 34.8%, respectively. The biochar effect intensity on global warming potential were observed from − 2.5% to 39.2% in the first cycle, and from − 18.7% to − 7.1% in the second cycle. However, the biochar effect intensity on C intensity of rice production was observed from − 10.2% to 25.8% in the first cycle, and from − 36.9% to − 18.6% in the second cycle. Therefore, biochar effect on reducing the overall C intensity of rice production could become stronger in the subsequent cycles than that in the first cycle though a consistently strong effect on reducing N2O emission in a single cropcycle after biocharamendment. Nevertheless, these effects were not found in proportional to biocharamendment rates and a high riceyield but lowest C intensity was achieved under biocharamendment at 10 t ha − 1 in both cycles of the rice paddy in the present study.

We conducted a2-year consecutivefield experiment in 2009 and 2010 in rice paddy to gain insight into the consistency over years of biochar effects on rice production and greenhousegasesemissions. Biochar was amended in 2009 before rice transplanting at rates of 0, 10, 20 and 40 t ha − 1, soilemissions of carbon dioxide (CO2), methane (CH4) and nitrous oxide (N2O) were monitored with closed chamber method at 7 days interval throughout the whole ricegrowing season (WRGS) both in 2009 and 2010. The results showed that biocharamendment increased rice productivity, soil pH, soil organic carbon, total nitrogen but decreased soil bulk density in both cycles of rice growth. Soil respiration observed no significant difference between biocharamendment and the corresponding control both in the first and second cycle, respectively. However, biocharamendment decreased nitrous oxide emission but increased methane emission in both cycles. No significant difference in carbon intensity of rice production (GHGI) and global warming potential (GWP) were observed between the biocharamendment at the rate of 10 t ha − 1 and 40 t ha − 1 and control though the GWP and GHGI was increased by 39% and 26% at the rate of 20 t ha − 1 respectively, in the first cycle. However, in the second cycle, both of overall GWP and GHGI were observed significantly decreased under biocharamendment as compared to control, ranging from 7.1% to 18.7% and from 12.4% to 34.8%, respectively. The biochar effect intensity on global warming potential were observed from − 2.5% to 39.2% in the first cycle, and from − 18.7% to − 7.1% in the second cycle. However, the biochar effect intensity on C intensity of rice production was observed from − 10.2% to 25.8% in the first cycle, and from − 36.9% to − 18.6% in the second cycle. Therefore, biochar effect on reducing the overall C intensity of rice production could become stronger in the subsequent cycles than that in the first cycle though a consistently strong effect on reducing N2O emission in a single cropcycle after biocharamendment. Nevertheless, these effects were not found in proportional to biocharamendment rates and a high riceyield but lowest C intensity was achieved under biocharamendment at 10 t ha − 1 in both cycles of the rice paddy in the present study.

【题目】Grain yield and water use efficiency of two types of winter wheat cultivars under different water regimes
【中文关键词】Harvest index; Aboveground biomass; Grain yield; Water-use efficiency; Winter wheat; Water regimes
【英文关键词】Harvest index; Aboveground biomass; Grain yield; Water-use efficiency; Winter wheat; Water regimes
【中文摘要】there were no significant differences in the TWUs of the two cultivars. The water-use efficiency at grainyield level (WUEy) of Shijiazhuang 8 increased significantly upon irrigation in the dry year, did not change in the normal year, and showed a clear decline in the humid year, while the WUEy of Xifeng 20 was reduced by irrigation in each of the three growing seasons. The harvest index (HI) was not altered by irrigation but it did vary by growing season. The HI of Shijiazhuang 8 was always higher than that of Xifeng 20. A positive correlation was found between both the WUEy and the water-use efficiency at the aboveground-biomass level (WUEbm) and the HI. This suggests that the changes in WUEy as a result of irrigation are mainly due to changes in the WUEbm and that the differences in WUEy between the two cultivars were due to differences in WUEbm and HI. These results suggest the following. (1) The TWUs in the two cultivars were roughly equal, although their levels of drought tolerance differed. (2) A wheat cultivar with moderate drought tolerance is expected to be more suitable for the semi-arid region of the NCP. The variety with strongly drought tolerance was able to keep its biomass high and to maintain grain yield under serious drought stress. (3) In order to both increase grain yield and WUEy, two irrigations in a dry year, one irrigation in a normal year, and no irrigation in a humid year will give optimal results in the studied region.

【题目】不同氮、磷肥用量下双季稻田的 CH4 和 N2O 排放
【中文关键词】稻田;CH4;N2O; 氮肥;磷肥
【英文关键词】rice field; CH4; N2O; nitrogen fertilizer; phosphate fertilizer
【中文摘要】以红壤双季稻田为研究对象,采用静态暗箱-气相色谱法对2009 年水稻生长期内不施肥(CK) ,平衡施肥(BF)、减氮磷一(DNP1)、减氮磷二(DNP2) 和增氮磷(INP) 等5 个处理的CH4和N2O排放通量以及环境因素进行观测. 结果表明,早稻生长期间BF、DNP1、DNP2 和INP 的CH4平均排放通量为4. 57、5. 42、4. 70 和4. 65 mg · (m2 · h) - 1 ,较CK 分别增加39% 、49% 、41% 和40% ;晚稻生长期间CH4排放量普遍高于早稻排放,BF、DNP1、DNP2 和INP 较CK 增加11% 、1% 、26% 和- 4% . 与CK 相比,施氮磷肥均提高早、晚稻返青期的CH4排放. 早、晚稻生长期内所有施肥处理间CH4平均排放通量差异均不显著(p> 0. 05) . 双季稻田晒田期无N2O排放峰值,而晒田后的干湿交替阶段出现较高排放.早、晚稻生长期内N2O排放量占氮肥投入量的0. 18% . 环境因素分析表明,气温、土壤Eh 和土壤湿度决定了稻田CH4排放的季节变化,而N2O排放与水、热等相关环境因子无相关性. CH4是早、晚稻田主要的温室气体,对二者整体温室效应的贡献约占90% ,减排措施应针对CH4排放为主. 综合考虑温室效应和水稻产量,当地早稻施肥量以BF 为宜(N-P2O5 -K2O 用量150-90-90 kg · hm - 2) ,而晚稻施肥量可以在BF(N-P2O5 -K2O用量180-90-135 kg · hm - 2) 基础上少量增加氮磷用量.
【英文摘要】Two non-CO2 greenhouse gas emissions (methane and nitrous oxide) and related environmental factors were measured within rice growing season under five treatments including non-fertilization (CK) , balanced fertilization (BF) , decreased nitrogen and phosphate 1 (DNP1) ,decreased nitrogen and phosphate 2 (DNP2) and increased nitrogen and phosphate 1 (INP) in double rice fields of red clay soil in 2009,using the method of static chamber-gas chromatograph techniques. The results showed that the average CH4 emission fluxes for treatments of BF,DNP1,DNP2 and INP were 4. 57,5. 42,4. 70 and 4. 65 mg • (m2 • h) - 1 during early rice growing period,which increased by 39% ,49% ,41% and 40% compared with non-fertilizer treatment,respectively. The average CH4 emission fluxes in late rice growing season was higher than preseason's. Compared to CK,CH4 emission increased by 11% ,1% , 26% and - 4% in treatments of BF,DNP1,DNP2 and INP within late rice growing season. Applying nitrogen and phosphate enhanced CH4 emission in turning green period for early and late rice. No significant difference was observed between the CH4 emissions of five treatments during early and late rice growing season (p > 0. 05) . N2O emission was very little during mid-seasonal drainage period. In contrast,N2O emission peaks were observed in period of alternation of wetting and drying after mid-seasonal drainage in this experiment. N2O emission was,on average,equivalent to 0. 18% of the nitrogen applied in double rice growing season. Statistically,air temperature,soil Eh and soil moisture(water-filled pore space,WFPS) at 0-10cm depth significantly affected the fluctuations of the seasonal CH4 flux,but no significant correlationship has been found between N2O flux and related environmentalfactors. CH4 was the dominated greenhouse gas in double rice fields which contributed approximately 90% for the integrated global warming potential of CH4 and N2O released during the rice growing season. Therefore,the mitigation options should focus on how to reduce CH4 emission in local area. The result indicates that BF is a recommended fertilization method for early rice production,and a optimum fertilization for late season can increase rates of nitrogen and phosphate fertilizers on the basis of BF treatment slightly by considering total global warming potential and grain yield. The rates of BF treatment were 150-90-90 kg • hm - 2 N-P2O5 -K2O for early rice,and 180-90-135 kg • hm - 2 N-P2O5 -K2O for late rice,respectively.

【题目】不同氮磷肥施用对春玉米农田N2O排放的影响
【中文关键词】春玉米; 氮磷肥; N2O排放
【英文关键词】spring maize; nitrogen and phosphorus fertilizer; N2O emission

【中文摘要】农田过量施肥会增加N2O排放,使农田土壤成为重要的温室气体排放源。为减少农田N2O排放,利用自动观测系统研究了春玉米农田中不同肥料对N2O排放的影响,并结合作物产量及N2O的排放量探索减少温室气体排放的施肥措施。采用田间试验方法设定了不施肥(CK)、尿素(U)、尿素加磷肥(NP)和硝酸磷肥(NOP)4个处理进行研究。结果表明,各处理下N2O排放总量分别为:CK0.21kgN·hm-2、U1.19kgN·hm-2、NP0.93kgN·hm-2、NOP0.69kgN·hm-2;N2O排放主要受施肥、灌溉,降雨和土壤温度的影响;在作物生长后期土壤含氮量小于7mgN·kg-1的情况下,观测到土壤吸收N2O的情况;各处理下排放因子均小于政府间气候变化委员会(IPCC)的缺省值1%,表明IPCC推荐的排放因子不适用于估算中国北方的春玉米农田N2O排放。施加磷肥有助于减少农田N2O排放并提高产量,硝态磷肥较尿素可以显著减少N2O排放。综合考虑产量和N2O排放,相对于施用尿素和尿素加磷肥处理,硝酸磷肥处理不仅可节约15%和30%的肥料投入,而且分别减少42%和26%的N2O排放,具有减排不减产的良好效果。

【英文摘要】Excessive fertilizer application to cropland results in high N2O emissions, cropland becomes an important source of greenhouse gas(GHG) emission. In order to reduce N2O emissions, this study investigated the effects of fertilizer types on N2O emissions in spring maize field in northern China, which was monitored continuously by automatic measurement system. The responses of grain yield, in addition to N2O emissions, were examined to explore feasible strategies to reduce N2O emission. Four fertilization management practices were selected, viz.(1)zero fertilizer as control treatment(CK),(2)urea treatment(U),(3)urea and phosphorus treatment(NP)and(4)nitric phosphate treatment(NOP). The results indicated that the total N2O fluxes under each treatment were CK:0.21 kg N·hm-2,U:1.19 kg N·hm-2,NP:0.93 kg N·hm-2,NOP:0.69 kg N·hm-2 respectively. The N2O emissions were mainly influenced by fertilization, irrigation, precipitation and soil temperature. Soil N2O uptake was observed during the later growth stage of spring maize when the soil mineral N was lower than 7 mg N·kg-1. The N2O emission factor(EF) of every fertilizer treatment was lower than 1% which was suggested by the Intergovernmental Panel on Climate Change(IPCC). This meaned the default EF of IPCC should not be used for estimation of the regional N2O fluxes in spring maize field in northern China. Phosphorus fertilizer not only could reduce the N2O emissions but also increase maize grain yield, whereas nitric phosphate was significantly more effective than urea in reducing the N2O emissions. Evaluation based on crop yield and N2O emissions showed that NOP treatment was a better management practice in the sense that, when compared to U and NP treatments, it reduced not only N2O emission by 42% and 26% separately, but also farmers′ expenditure on fertilizers by 15% and 30%, while maintaining crop yield.

【题目】Identification and mapping of quantitative resistance to late blight (Phytophthora infestans) in Solanum habrochaites LA1777

【中文关键词】番茄;晚疫病;数量抗性;多毛番茄;渐渗系

【英文关键词】Tomato; Late blight; Phytophthora infestans; Quantitative resistance; Solanum habrochaites; Introgression lines

【中文摘要】晚疫病是一种世界性的病害,会对番茄生产造成毁灭性的灾害。大多数番茄商用品种对晚疫病是敏感的。质量和数量性状抗性已经在番茄野生种中阐述。一般来说,质量性状抗性很容易由于新的进化小种的侵染而丧失。对3种多毛番茄进行了整株抗病测验,结果表明,LA1777对几种晚疫菌小种有较高的抗性。为挖掘此野生种的抗晚疫病位点,试验以LA1777渐渗系群体为材料,通过离体叶接种测验,对抗性基因所在染色体进行了筛选。采用2个主要的小种T1,2和T1,2,4进行接种,以叶片病斑面积和叶片发病率2个参数进行评估,不同的渐渗系之间的抗性有很大差异。本试验鉴定的QTLs可以减少叶片病斑面积,但是不能降低叶片发病率。得到的5个QTL(Rlbq4a、Rlbq4b、Rlbq7、Rlbq8、Rlbq12)有明显的抗性,其中,Rlbq4b为新发现的QTL,另外4个QTL与先前报道的来自LA2099的QTL同位。

【英文摘要】Late blight (Phytophthora infestans) can have devastating effects on tomato production over the whole world. Most of the commercial cultivars of tomato, Solanum lycopersicum, are susceptible. Qualitative and quantitative resistance has been described in wild relatives of tomato. In general qualitative resistance can more easily be overcome by newly evolved isolates. Screening of three S. habrochaites accessions (LA1033, LA2099 and LA1777) through a whole plant assay showed that accession LA1777 had a good level of resistance to several isolates of P. infestans. To explore the potential in this wild species, an introgression line (IL) population of S. habrochaites LA1777 was used to screen individual chromosome regions of the wild species by a detached leaf assay. Two major isolates (T1,2 and T1,2,4) were used and two parameters were measured: lesion size (LS), and disease incidence (DI). Substantial variation was observed between the individual lines. QTLs were identified for LS but not for DI. The presence of five QTLs derived from LA1777

(Rlbq4a, Rlbq4b, Rlbq7, Rlbq8 and Rlbq12) results in unambiguous higher levels of resistance. All QTLs co-localized with previously described QTLs from S. habrochaites LA2099 except QTL Rlbq4b, which is therefore a novel QTL.

【题目】Genetics of flesh color and nucleotide sequence analysis of phytoene synthase gene1 in a yellow-fruited tomato accession PI114490
【中文关键词】遗传;基因组DNA序列;番茄红素;Psy1;黄色果肉
【英文关键词】Genetics; Genomic DNA sequence;Lycopene; Psy1; Yellow flesh
【中文摘要】番茄黄色果肉是由于茄红素合成酶基因1非正常的转录而造成。然而,本研究的初始探索过程中,一个黄果肉的品系PI114490具有Psy1基因全长的基因组DNA序列。为探究PI14490中果肉颜色的遗传,以红色果肉品系(OH9242、LA3189)与此黄色果肉品系杂交,得到了F1代和F2代。对来自PI114490和OH9242的Psy1u基因进行了测序。F1均为红果,F2红果和黄果的分离比例为3:1,表明在PI114490黄色果肉性状由隐性单基因控制,通过对4个r基因突变体(LA2056,LA3003,LA0353和LA3532)和PI114490的测验,发现控制黄色果肉的隐性单基因与r基因为等位基因。测序分析发现,PI114490具有完整的Psy1基因的基因组DNA序列,只是在第4个内含子中有1个核苷酸的差异:在PI114490中为G,而在OH9242中为A。此核苷酸的替代造成了F2群体中黄色果肉的出现。在PI114490和黄色果肉的F2中没有或只有极少的番茄红素。番茄红素在F1中的含量为9.77mg/100g,高于两亲本的平均值6.52mg/100g,在F2的红果当中番茄红素的含量介于0到11.69mg/100g之间,表明番茄红素含量为数量遗传。
【英文摘要】Yellow flesh color in tomato is believed to be caused by abnormal transcript of phytoene synthase gene 1 (Psy1). However, our initial work indicated that a yellow-fruited line PI114490 might have full length of genomic DNA sequence for Psy1. To understand the genetics of flesh color in PI114490, we crossed this line to red-fruited lines, OH9242 and LA3189, to develop F1 and F2 progenies, and sequenced the genomic DNA fragment of Psy1 from PI114490 and OH9242. All F1 plants had red fruits, and F2 populations segregated as 3:1 for red and yellow, indicating that one single recessive gene controlled the yellow flesh color in PI114490. This gene was allelic to the known r gene based on tests between PI114490 and four rmutants LA2056, LA3003, LA0353, and LA3532. Sequence analysis indicated that PI114490 had a complete genomic DNA sequence for Psy1 gene with only one nucleotide difference in

the fourth intron: G in PI114490 and A in OH9242. This substitution was associated with yellow flesh in the F2 population. There was no detectable or very low lycopene in PI114490 and all yellow-fruited F2 individuals. Lycopene in the F1 (9.77 mg/100 g) was higher than the mean (6.52 mg/100 g) of two parents, and ranged from 0 to 11.69 mg/100 g in all red-fruited F2 individuals. These results suggested that lycopene content was quantitatively inherited.

【题目】不同施肥结构和调理剂对侵蚀红壤的修复效应
【中文关键词】侵蚀红壤;施肥技术;修复效应
【英文关键词】eroded red soil;fertilization; restoration effect
【中文摘要】利用盆栽试验方法,研究了几种肥料配比和调理剂施用对侵蚀红壤的培肥效应。结果表明:土壤调理剂2号的施用与施用NPK化肥相比可以提高旱地红壤的有效磷含量,减轻因施用化肥带来的土壤酸化,提高大豆和油菜对肥料磷、钾的利用率,增加作物生物量,且对土壤好气性细菌、真菌和硝化细菌数量具有明显的促进作用。施用有机肥可以较快地提高土壤速效钾和有机质含量,与施用化肥相比显著提高了大豆和油菜对肥料氮、磷、钾的利用率,施用有机肥或土壤调理剂2号的施肥措施是提高红壤旱地肥力的较好的施肥方法。因豆科植物具有根瘤菌共生固氮作用,大豆种植生物量大,肥料利用率高,选取大豆作为先锋物种,可较好地提高侵蚀红壤的修复效应。
【英文摘要】Effect of 6 fertilization systems in restoring the eroded red soil caused by soil erosion, which is severely eroded red soil derived from Quaternary Red Clay, were studied with a pot experiment. The result showed that applying soil ameliorant II could increase content of available P compared with appling chemica fertilizer, and also it could alleviate soil acidification and promote the use efficiency of soybean and rape for fertilizer P and K. Applying organic fertilizer can increase the content of available K and organic material while it also promote the use efficiency of soybean and rape for fertilizer N, P and K, and increase the biomass compared with applying chemical fertilizer. Because of the symbiotic nitrogen fixation function of rhizobium on leguminous, the biomass and nutrient use efficiencies of soybean is larger, it also could enhance the restoring effect of eroded red soil by selecting the soybean as the pioneer crop.Key words:eroded red soil;fertilization; restoration effect

【题目】A naturally occurring splicing site mutation in the Brassica rap FLC1 gene is associated with variation in flowering time
【中文关键词】无
【英文关键词】BrFLC1, fl owering time, splicing pattern, splicing site mutation.
【中文摘要】无
【英文摘要】FLOWERING LOCUS C (FLC), encoding a MADS-domain transcription factor in Arabidopsis, is a repressor of fl owering involved in the vernalization pathway. This provides a good reference for Brassica species. Genomes ofBrassica species contain several FLC homologues and several of these colocalize with fl owering-time QTL. Here theanalysis of sequence variation of BrFLC1 in Brassica rapa and its association with the fl owering-time phenotype isreported. The analysis revealed that a G/A polymorphism at the 5 ’ splice site in intron 6 of BrFLC1 is associatedwith fl owering phenotype. Three BrFLC1 alleles with alternative splicing patterns, including two with different partsof intron 6 retained and one with the entire exon 6 excluded from the transcript, were identi fi ed in addition to alleleswith normal splicing. It was inferred that aberrant splicing of the pre-mRNA leads to loss-of-function of BrFLC1.ACAPS marker was developed for this locus to distinguish Pi6+1(G) and Pi6+1(A). The polymorphism detected withthis marker was signi fi cantly associated with fl owering time in a collection of 121 B. rapa accessions and ina segregating Chinese cabbage doubled-haploid population. These fi ndings suggest that a naturally occurringsplicing mutation in the BrFLC1 gene contributes greatly to fl owering-time variation in B. rapa.

【题目】Sources for Heat-Stable Resistance to Southern Root-Knot Nematode in Solanum lycopersicum
【中文关键词】非温敏抗性,南方根结线虫,番茄
【英文关键词】heat-stable resistance, Meloidogyne incognita, tomato
【中文摘要】伴随塑料拱棚和日光温室的发展,南方根结线虫逐渐成为中国蔬菜生产中的一大问题,采用抗性品种是控制此种病害的有效途径。目前已经报道了从Mi-1至Mi-9的9个抗性基因,在番茄抗性育种中只成功使用了Mi-1基因。然而,当温度高于28 ° C时,Mi-1基因处于失活状态。为了挖掘对南方根结线虫热稳定性的抗性材料,试验采用了53个不同基因型的番茄材料,接种1种南方根结线虫小种,在28 ° C或32 ° C的生长箱中培养,进行初步筛选。其中28个基因型的根瘤数少于25个,作为抗性候选材料。对此25个基因型材料中抗性较高的16个基因型材料,在32 ° C下接种相同的小种,进行进一步筛选,其中ZN17、ZN48和LA03853个基因型材料,每株的根瘤数不超过10个,表现出热稳定性抗性。LA0385是一个野生种,ZN17、ZN48是优良的育种材料。将3个材料在温室中种植两季,平均每株根瘤数均少于10个,表现出高抗性,因此,可将其作为番茄抗南方根结线虫育种中的优良材料。
【英文摘要】Southern root-knot nematode (Meloidogyne incognita) is a major problem in vegetable production in China due to the expansion of plastic tunnel and solar greenhouse. Using resistant cultivars is an effective approach to control the disease. Nine genes, Mi-1 to Mi-9, have been reported and only Mi-1 has been successfully used in tomato breeding. However, Mi-1 is inactive at a temperature above 28 ° C. In order to identify sources for heat-stable resistance to southern root-knot nematode, 53 genotypes of tomato (Solanum spp.) were inoculated with an isolate of M. incognita in the growth chamber at 28 or 32 ° C for initial screening. 28 lines had less than 25 galls and were considered as resistant candidates. Thetop 60% (16 in total) of resistant candidates obtained from each temperature were subject to re-evaluation at 32 ° C using the same nematode isolate. Three lines ZN17, ZN 48, and LA0385 showed heat-stable resistance with an average of 10 galls or less per plant. LA0385 is a wild species, while ZN17 and ZN48 are elite breeding lines. These lines were grown in a greenhouse for two seasons, and also showed high resistance with less than 10 galls per plant. Thus they were considered as good sources for breeding resistance to southern root-knot nematode in tomato.

【题目】大白菜细胞核隐性雄性不育系恢复基因 BrMf2 的标记及定位
【中文关键词】大白菜;细胞核隐性雄性不育;基因定位;分子标记;SRAP
【英文关键词】Brasscia rapa L. ssp. pekinesis; recessive genic male sterile (RGMS); gene mapping; molecular marker; SRAP
【中文摘要】摘要:【目的】筛选大白菜细胞核隐性雄性不育(RGMS)育性基因(Mf)的连锁标记,通过定位该基因,为克隆雄性不育基因打下基础。【方法】939A 不育系与 YQD56A 杂交 F1S4 后代为试材,利用混合分组分析法(BSA) ,应用 SRAP 和 SRAP-AFLP 标记技术筛选引物 1 256 对。【结果】获得与大白菜细胞核隐性雄性不育恢复基因连锁的标记2个,PM8K4和Me2M49,与恢复基因的遗传距离分别为2.98 cM和10.92 cM。通过调查PM8K4标记在大白菜DH作图群体中的多态性,将该基因定位在A8连锁群,即大白菜第9染色体。【结论】标记PM8K4可以在苗期对大白菜细胞核雄性不育性状进行标记辅助选择。
【英文摘要】Abstract: 【Objective】 Recessive genic male sterility (RGMS) is one of the important methods for F1 seeds production in hinese cabbage (Brassica rapa L. ssp. pekinensis). Identification of molecular markers linked to RGMS restoring gene not only can ccelerate breeding programs, but also can provide information for cloning of RGMS gene by mapping this gene on the orresponding chromosome. 【Methods】 A segregating population was developed from a cross between a male sterile line 939A and fertile line YQD56A. SRAP and SRAP-AFLP techniques and bulked segregant analysis (BSA) were used to screen markers linked o the RGMS restoring gene. 【Result】 Among the 1 256 primer combinations, only PM8/K4 and Me2/M49 showed polymorphism etween bulks of male sterile and fertile. The polymorphic bands were named as PM8K4 and Me2M49. The distance of PM8K4 and Me2M49 was 2.98 cM and 10.92 cM, respectively. PM8K4 was subsequently mapped on linkage group A8 (Chr9) using a oubled-haploid mapping population. 【Conclusion】 The SRAP and SRAP-AFLP markers developed here can be used in breeding rograms for Chinese cabbage.

【题目】Geographical and climatic differences in long-term effect of organic and inorganic amendments on soil enzymatic activities and respiration in field experimental stations of China
【中文关键词】呼吸 化肥 酶活性 有机肥 土壤肥力
【英文关键词】Basal respiration, Chemical fertilizers, Enzyme activity, Organic manure, Soil quality, Zonality
【中文摘要】本研究表明,在评价不同地区长期施肥对土壤生物活性和土壤肥力的影响时,应该充分环境因子(主要为土壤温度、土壤质地和pH)。
【英文摘要】Soil enzymatic activities and basal respiration are two important bio-indicators of soil quality and are closely related to soil fertility and sustainable crop growth. We collected soil samples from four long-termexperimentalstations of China differing both geographically and climatically – Shenyang Agro-Ecological ExperimentalStation (brown soil), Fengqiu State Key Agro-Ecological ExperimentalStation (fluvo-aquic soil), Taoyuan Agro-Ecological ExperimentalStation (paddy soil) and Qiyang Red SoilExperimentalStation (red soil) – to investigate the effect of long-term application of chemical fertilizer and/or organic manure on soilenzymaticactivities and basal respiration. In general, soilenzymaticactivities and basal respiration increased in soils with long-term application of chemical fertilizers and manures, especially organic manure. Among stations, soilenzymaticactivities were not consistently increased with organic manure alone (e.g. the sucrase and phosphatase activities in the paddy soil from Taoyuan and red soil from Qiyang). As well, soilenzymaticactivities were characterized by distinct zonality. Soil cellulase and urease activity were the two main indicators of soil fertility as evaluated by principal component analysis. Regression analysis of the major abiotic factor(s) influencing enzyme activity revealed a dependence on the specific enzyme tested and the activity of specific soil enzymes depended on the location of the experimentalstation. Environmental factors, mainly soil temperature, moisture and pH, as well as soil texture, should be taken into account in evaluating the effects of long-term fertilization on soil biological activity and soil fertility in fieldexperimentalstations differing geographically and climatically.

【题目】Impacts of soil organic matter, pH and exogenous copper on sorption behavior of norfloxacin in three soils.
【中文关键词】铜 pH 有机质 吸附
【英文关键词】copper, norfloxacin, pH, soilorganicmatter, sorption
【中文摘要】本文研究了黑土、潮土和红壤对诺氟沙星的吸附以及土壤有机质、pH和铜含量的影响。结果表明三种原状土壤及有机质去除土壤中的诺氟沙星吸附均符合Freundlich和Langmuir模型。当缓冲溶液pH为6时,诺氟沙星的吸附常数KD和KOC。土壤吸附诺氟沙星也受土壤铜含量的影响,但与土壤类型和铜浓度有关。
【英文摘要】Norfloxacin sorption and the factors (soilorganicmatter (SOM), pH, and exogenouscopper (Cu) influencing the sorption were investigated in a black soil (soil B), a fluvo-aquic soil (soil F), and a red soil (soil R). With increasing norfloxacin concentrations, sorption amount of norfloxacin increased in both the bulk soils and their SOM-removed soils, but the sorption capacity of SOM-removed soils was higher than that of their corresponding bulk soils, indicating that the process of norfloxacinsorption in soil was influenced by the soil properties including SOM. The sorption data in all bulk soils and SOM-removed soils were fitted to Freundlich and Langmuir models. The correlation coefficients suggested that the experimental data fitted better to Freundlich equation than to Langmuir equation. Furthermore, the data from soil F and SOM-removed F could not be described by Langmuir equation. The norfloxacinsorption amount decreased in soil B and soil F, whereas it increased in soil R as solution pH increased. The maximum KD and KOC were achieved in soil R when the equilibrium solution pH was 6. The norfloxacinsorption was also influenced by the exogenous Cu2+, which depended on the soil types and Cu2+ concentrations. With increasing Cu2+ concentrations in solution, generally, sorption amount, KD and KOC for norfloxacin in soils increased and were up to a peak at 100 mg/L Cu2+, and then the sorption amount decreased regardless of norfloxacin levels

【中文关键词】酶活性 微生物生物量 有机质 土壤质量 呼吸
【英文关键词】Enzymatic activity, Microbial biomass, Organic C, Soil fertility, Soil respiration
【中文摘要】本文研究了长期不同施肥对微生物量、土壤生物活性的季节性变化,及其与土壤肥力的关系。 结果表明,施用有机肥显著提高土壤C和N含量、土壤呼吸、微生物生物量和多种酶活性,而无机肥则显著减低这些指标。因此本研究表明,应该提倡有机和无机肥混施,以提高土壤微生物量、土壤生物活性和土壤肥力。
【英文摘要】The objectives of this study were to explore the effects of long-term and continued application of fertilizers and manures on microbial biomass, soil biological activity and their seasonal variations in surface and subsurface soils in relation to soil fertility. For this, soils were sampled in spring, summer and autumn from Shenyang Long-term Experimental Station, northeastern China. The results showed that soil total nitrogen (N), organic carbon (C), basal respiration, microbial biomass and enzymatic activity increased in manure-amended surface soils, but decreased with soil depth. Long-term application of inorganic fertilizers significantly decreased soil pH value, sucrase activity and microbial biomass C, but increased soil metabolic quotient (qCO2). However, no significant effect of inorganic fertilizers on soil total N, urease activity and microbial biomass N was observed in comparison with CK0 (neither tillage nor fertilization) and CK (no fertilizers). There was no significant difference between CK0 and CK in soil total N, organic C and microbial activity in surface soil layer (0 – 20 cm), but these parameters in subsurface soil layer (20 – 40 cm) were higher in CK than in CK0. Moreover, seasonal changes were observed in terms of soil nutrient contents, enzymatic activity, microbial biomass and soil respiration. There were significant correlations between soil microbial biomass C and N, between organic C and sucrase activity and between total N and urease activity, respectively. It is recommended that combined use of organic manure with inorganic fertilizers should be considered to maintain higher microbial biomass, soil biological activity and soil fertility. Considering considerably high nutrients reserve and microbial activity in subsurface layers of soil and wind-erosion-caused nutrient loss in spring in north China, we also propose that low tillage should be considered to make use of nutrients in soils.

【题目】Effects of nutrient cycling on grain yields and potassium balance
【中文关键词】长期施肥 产量 钾平衡
【英文关键词】Different treatments, Grain yields, Potassium balance
【中文摘要】本文表明光施化肥存在明显不足,而当化肥配合循环有机肥配施时,能持续维持产量和土地生产力。
【英文摘要】Soybean-maize rotation is a profitable cropping system and is used under rain fed conditions in north China. Since crop yields have been reported to decrease when K fertilizers are not used, we analyzed the productivity trends, soil-exchangeable and non-exchangeable K contents, and K balance in a continuous cropping experiment conducted in an area with an alfisol soil in the Liaohe River plain, China. The trial, established in early 1990 and continued till 2007, included 8 combinations of recycled manure and N, P, and K fertilizers. In the unfertilized plot, the yields of soybean and maize were 1,486 and 4,124 kg ha?1 respectively (mean yield over 18 years). The yields of both soybean and maize increased to 2,195 and 7,476 kg ha?1, respectively, in response to the application of

inorganic N, P, and K fertilizers. The maximum yields of soybean (2,424 kg ha?1) and maize (7,790 kg ha?1) were obtained in the plots under treatment with N, P, and K fertilizers and recycled manure. K was one of the yield-limiting macronutrients: regular K application was required to make investments in the application of other mineral nutrients profitable. The decrease in the yields of soybean and maize owing to the absence of K application averaged 400 and 780 kg ha?1, respectively. Soybean seed and maize grain yields significantly increased with the application of recycled manure. For both these crops, the variation coefficients of grain were lower with treatments that included recycled manure than without treatment. After 18 years, the soil-exchangeable and non-exchangeable K concentrations decreased; the concentrations in the case of treatments that did not include K fertilizers were not significantly different. Treatment with N, P, and K fertilizers appreciably improved the fertility level of the soil, increased the concentration of soil-exchangeable K, and decreased the non-exchangeable K concentration. In soils under treatment with N, P, and K fertilizers and recycled manure, the soil-exchangeable and non-exchangeable K levels in the 0 – 20 cm-deep soil layer increased by 34% and 2%, respectively, over the initial levels. Both soil-exchangeable and non-exchangeable K concentrations were the highest with on treatment with N, P, and K fertilizers and recycled manure, followed by treatment with N, P, and K fertilizers. These concentrations were lowest in unfertilized soils; the other treatments yielded intermediate results. The results showed a total removal of K by the crops, and the amount removed exceeded the amount of K added to the soil; in treatments that did not include K fertilizers, a net negative K balance was observed, from 184 to 575 kg ha?2. The combined use of N, P, and K fertilizers and recycled manure increased the K content of the 0 – 20 cm-deep soil layer by 125% compared to the increase obtained with the application of N, P, and K fertilizers alone. The results clearly reveal that current mineral fertilizer applications are inadequate; instead, the annual application of recycled manure along with N, P, and K fertilizers could sustain future yields and soil productivity.

【题目】Long-term fertilization impacts on corn yields and soil organic matteron a clay-loam soil in Northeast China
【中文关键词】玉米产量 长期施肥 有机肥 化肥 单作
【英文关键词】corn yield,farmyard manure,long-term experiment,mineral fertilizer,monoculture,soil organic matter
【中文摘要】本文研究了创立于1980年的吉林省公主岭长期施肥试验玉米单作的产量变化规律。结果表明该地区长期施用化肥能够维持玉米高产,而化肥配施有机肥能提高土壤有机质含量。
【英文摘要】A long-term fertilization experiment with monoculture corn (Zea mays L.) was established in 1980 on a clay-loam soil (Black Soil in Chinese Soil Classification and Typic Halpudoll in USDA Soil Taxonomy) at Gongzhuling, Jilin Province, China. The experiment aimed to study the sustainability of grain-corn production on this soil type with eight different nitrogen (N)-, phosphorus (P)-, and potassium (K) – mineral fertilizer combinations and three levels (0, 30, and 60 Mg ha – 1 y – 1) of farmyard manure (FYM). On average, FYM additions produced higher grain yields (7.78 and 8.03 Mg ha – 1) compared to the FYM0 (no farmyard application) treatments (5.67 Mg ha – 1). The application of N fertilizer (solely or in various combinations with P and K) in the FYM0 treatment resulted in substantial grain-yield increases compared to the FYM0 control treatment (3.56 Mg ha – 1). However, the use of NP or NK did not yield in any significant additional effect on the corn yield compared to the use of N alone. The treatments involving P, K, and PK fertilizers resulted in an average 24% increase in yield over the FYM0 control. Over all FYM treatments, the effect of fertilization on corn yield was NPK > NP = NK = N > PK = P > K = control. Farmyard-manure additions for 25 y increased soil organic-matter (SOM) content by 3.8 g?kg – 1 (13.6%) in the FYM1 treatments and by 7.8 g?kg – 1 (27.8%) in the FYM2 treatments, compared to a 3.2 g?kg – 1 decrease (11.4%) in the FYM0 treatments. Overall, the results suggest that?mineral fertilizers can maintain high yields, but a combination of?mineral fertilizers plus farmyard manure are needed to enhance soil organic-matter levels in this soil type.

【题目】下辽河平原玉米水肥交互作用及对产量的影响
【中文关键词】地统计 遥感 土壤有机碳 黑土 海伦市
【英文关键词】lower reach of Liaohe River Plain, long—term fertilization trial, maize yield, water—nutrient interaction
【中文摘要】以沈阳生态试验站一组持续16年的长期定位试验为平台,研究了不同降水年景作物对施肥的增产反应及水分对肥料增产的促进作用,估算了下辽河平原地区水肥交互作用对作物增产的贡献。结果表明,该地区玉米蒸散耗水与其生育期内降水之间关系密切,且不同的施肥处理对玉米消耗水分量影响不大。过少或过多的降水均会降低玉米产量。在高肥力水平下平水年(降水400-550 mm)玉米产量最高,水肥交互作用对作物增产的贡献亦达最大,可占总增产量的44.9%。
【英文摘要】Based on a long-term located experiment with 16 years, the authors investigated the response of increasing crop yields to fertilization. The effects of water-nutrient interaction on maize yields in lower reach of Liaohe River plain were estimated in different precipitation years. It was shown that the evapotranspiration was significantly correlated with the precipitation in the growth stage of maize. Under different conditions of fertilization, the water consumption of maize was similar. At the same time, the crop growth was directly influenced by the water supply, and the yield decreased markedly in waterlogging or drought years. Under high level fertilization treatments and fitting water supply (normal rainfall), the increase of crop yields was the highest, the effect of water-nutrient interaction on maize yields was the most significant, and it accounted for 44.9% of the total increased crop yields.

【题目】遥感与地统计方法在表层土壤有机碳空间格局研究中的应用比较
【中文关键词】地统计学 遥感 有机质 海伦
【英文关键词】geostatistics, remote sensing, soil organic carbon, phaeozem, Hailun
【中文摘要】土壤有机碳为土壤肥力的核心指标之一,精确、及时、低耗的土壤有机碳空间格局估测对促进精准农业的发展和科学施肥具有重要意义,分别利用地统计方法和遥感技术测定法分析了海伦市表层土壤有机碳的空间分布格局,发现:1)表层土壤有机碳与遥感影像的TM1波段之间存在着极显著的相关性($p<0.01$),而与TM2、TM3和NDSVI显著相关($p<0.05$); 2)通过对两种方法所得结果比较得出在精度基本一致的前提下,遥感技术测定法所需样本量低于地统计法所需样本量,且前者所得结果与当地实际情况更为相符,是一种潜在、高效的表层土壤有机碳空间格局研究方法.
【英文摘要】Soil organic carbon is a core index of soil fertility. It was important for precision agriculture and rational fertilization to understand soil organic carbon (SOC) concentration and its spatial distribution pattern. In this study, geostatistics and remote sensing methods were used to analyze the surface soil organic carbon (SSOC) of Hailun City of Heilongjiang Province respectively. The results show that SSOC is very significantly correlated with TM1($r=0.32$, $p<0.01$) and significantly correlated with TM2, TM3 and NDSVI ($p<0.05$). At the same time, remote sensing method has significant advantages in sample numbers and conformed with reality compared with geostatistics, under the same accuracy. Therefore, remote sensing method was a potential and high performance way to study SSOC spatial distribution pattern.

【题目】不同施肥模式对下辽河平原水稻生态系统生产力及养分收支的影响
【中文关键词】施肥模式 生产力 养分收支
【英文关键词】fertilization pattern, productivity, nutrient budget.
【中文摘要】采用田间肥料试验,研究了不同施肥模式对稻田生态系统的生产力和养分收支的影响。结果表明:随养分配施均衡程度的增加,系统的生产力逐渐提高,其中氮磷钾处理的生产力最高;氮肥对水稻生产力的贡献最大(对生物量的贡献约20% ,对籽实产量的贡献约34%) ,磷肥和钾肥的贡献相当;在水稻各部位对氮、磷、钾养分的吸收中,氮的吸收主要集中在籽实和秸秆中,磷的吸收则主要集中在籽实中,钾的吸收主要集中在秸秆中;在各施肥处理中,土壤全量养分和有机质的变化不大,而速效养分的变化较大,特别是速效磷库和速效氮库;单施化肥处理的土壤,其速效养分含量不高,而施有机肥处理土壤的速效养分含量较高,表明有机肥较有利于土壤养分的积累。
【英文摘要】To study the effects of different fertilization patterns on the rice ecosystem's productivity and nutrient budget in the lower reaches ofL iaohe River p lain, a field experimentwas conducted at the Shenyang Ecological Experimental Station of Chinese Academy of Sciences The results showed thatwith the increasing degree of balanced fertilization, rice ecosystem ’ s p roductivity in creased gradually, being the highest in treatmentNPK. Among the chemical fertilizers, N fertilizer contributed most to the rice p roductivity (20% to biomass and 34% to grain yield) , while P and K fertilizers had the similar contribution rates. As for the allocation of the absorbed nutrients in rice p lant, N wasmainly in grain and stalk, while P and K were more concentrated in grain and in stalk, respectively. Under fertilization, less fluctuation was observed on the contents of soil organic matter and totalN, P and K, but the amounts of soil available nutrients varied greatly, especially for available P and available N. Fertilization with organic manure induced a higher content of soil available nutrients, compared with app lying chemical fertilizers alone.

【题目】不同有机物料及其配施对潮棕壤轻组有机碳的动态影响
【中文关键词】轻组有机碳 有机物料 潮棕壤
【英文关键词】Light fraction organic carbon, Organic material, Aquic brown earth
【中文摘要】用埋袋法研究了潮棕壤中加入单一物料(玉米秸秆,稻草秸秆,苜蓿,鸡粪,猪粪)和混合物料(玉米秸秆- 鸡粪- 猪粪和苜蓿- 鸡粪- 猪粪)后土壤中轻组有机碳的一年内动态变化。结果表明:施不同有机物料后,土壤中轻组有机碳与对照相比都有较大幅度提高。随着培养时间的推移,不同处理的土壤中轻组有机碳碳含量都逐渐下降,且其下降趋势与添加物料的C/N 比值呈显著的正相关。相关分析表明,施用混合物料处理中轻组有机碳的含量与单一物料处理都呈显著的正相关。
【英文摘要】A nylon mesh bag method was conducted to study the dynamic changes of light fraction organic carbon(LF-OC) in aquic brown earth in seven organic matter treatments, including maize stalk (y), rice straw (d), alfalfa(m), pig manure(z), chook excrement(j), y-j-z mixed (h1), m-j-z mixed(h2). The results showed that the content of LF-OC reached maximum immediately after the addition of organic materials, and then decreased gradually. There was a significant correlation between the decrease tendency and the C/N ratio of each material. Correlation analysis also showed that the content of LF-OC in mixed matter in soil was significant correlated with that of each component.

【题目】不同时期土壤有机碳(SOC)空间格局研究的主要方法
【中文关键词】土壤有机碳 传统统计学 地统计学 Kriging 插值 遥感

【英文关键词】SOC, Conventional Statistics, Geostatistics, Kriging, Remote Sensing
【中文摘要】土壤有机碳作为陆地生态系统中的一个区域化随机变量,在系统内部垂直和水平发生变化的同时与大气圈和生物圈这两个碳库之间产生循环作用。为了揭示土壤有机碳的空间分布特性,传统统计学、地统计学、遥感与地理信息系统等方法被相继引入且逐渐走向成熟,其中利用遥感与地理信息系统相结合的方法来反演土壤有机碳库储量及其空间分布格局受到了越来越多的专家学者所推崇。本文在对不同方法基本理论进行简单阐述的基础上,介绍了它们在土壤有机碳的空间分布格局的研究中所取得的一些成果,并就遥感技术在反演表层土壤有机碳的空间分布格局中的应用前景进行了展望。
【英文摘要】Soil organic carbon (SOC) as one regionalized variable of terrestrial ecosystem, cycled between atmosphere and biosphere, while it changed in horizontal and vertical direction inside the system. In order to reveal the spatial distribution characters of SOC, conventional statistics, geostatistics, remote sensing and geographic information system (GIS) etc were used and becoming perfect gradually. Among these methods, the combination of remote sensing and GIS is canonizing by more and more professors and researchers to inverse SOC storage and its spatial distribute pattern. In this paper, the basic theories and some applied products of them in SOC spatial distribute pattern were troduced and it also discussed the perspective of remote sensing in SOC spatial distribute pattern research.

【题目】下辽河平原不同磷肥用量对作物产量及潜在养分的影响
【中文关键词】磷肥利用率 养分收支 磷肥效应 玉米 大豆
【英文关键词】fertilizer phosphorous use efficiency, nutrient budget, phosphorous fertilization effect, Zea mays, Glycine max.
【中文摘要】通过6年的定位试验,对下辽河平原不同磷肥用量条件下,土壤养分库的建立及磷肥的肥料效应、土壤磷的自然释放速率等进行了研究。结果表明:磷肥可以提高作物的产量,且对大豆的增产幅度大于玉米,但磷肥年用量超过25 kg · hm- 2时,增产效果不明显;磷肥也可以提高作物的养分移出量,但养分移出量增加的比例大于作物产量增加的比例;磷肥利用率随着磷肥用量的增加而减小,当磷肥年用量为25 kg · hm- 2时,磷肥利用率约为30% ,但残留磷肥转化为有效磷的比例

随着磷肥用量的增加而增大;磷肥施入土壤后,残留磷肥转化为迟效磷的比例高达80% ,且残留磷肥转化为迟效磷的量随着磷肥用量的增加而增加,这对于构建土壤磷库有重要意义。

【英文摘要】A six years field experimentwas conducted at the lower reaches of L iaohe River Plain to study the effects of different app lication rate of phosphorous (P) fertilizer on the use efficiency of app lied fertilizer P, establishment of soil P pool, and the release rate of soil P. The resultsshowed that P fertilization increased crop yield, and the yield increment of soybean was greaterthan that of maize. However, when the P app lication rate exceeded 25 kg · hm- 2 per year, theyield increasing effect was not significant. Phosphorous fertilization also increased the P up takeby crop s, and the increment was higher than yield increment. When the P app lication rate was25 kg · hm- 2 per year, the fertilizer P use efficiencywas about 30%. With the increase of P app lication rate, the use efficiency of fertilizer P decreased, but the p roportion of soil available P transformed from residual fertilizer P increased. After the P fertilization, the transformation rate of residual fertilizer P into soil less available P reached as high as 80% , and the p roportion of the transformed soil less2available P increased with increasing P app lication rate, which was of significance in the establishment of soil P pool.

【题目】几种酸性土壤供氮力测定方法的综合评价

【中文关键词】棕壤 黑麦草 供氮力 指标

【英文关键词】brown soil, ryegrass, nitrogen supp lying capacity, index

【中文摘要】模拟旱地条件进行黑麦草盆栽试验, 对不同供氮力指标与黑麦草吸氮量相关性进行研究, 结果表明, 短期好气培养法测定的可矿化氮与吸氮量相关系数为01820; 氯化钾与氯化钙浸提的硝态氮与黑麦草吸氮量的相关系数分别为01892和01916, 表明硝态氮含量作为土壤供氮能力指标具有一定的稳定性; 微生物量氮的测定结果不够稳定且与黑麦草吸氮量相关性不高(r = 01751) 。分析表明, 氯仿熏蒸- 浸提全氮与吸氮量的相关性最好,相关系数可达01941, 是一个较好的供氮力指标。

【英文摘要】A pot culture experiment simulated dryland soilwas conducted to study the relationship between different indexes of nitrogen supp lying capacity and up take nitogen by ryegrass. The results showed that the correlation coefficient ofmineralizable nitrogen from short aerobic incubation and up take nitrogen by ryegrass was 01820. And a good correlation between nitrate nitrogen extracted by KCl and up take N by ryegrass was found, so was CaCl2. The correlation coefficient were 01892 and 01916, respectively. It indicated that nitrate nitrogen extracted by KCl and CaCl2 was a good index to evaluate nitrogen supp lying capacity. Lower correlation (r = 01751) between soil microbial biomass nitrogen and up take nitrogen by ryegrass imp lied that the content of soilmicrobial biomass nitrogen was less suitable for reflecting nitrogen supp lying capacity. The fumigation extraction nitrogen was significantly correlated with up take nitrogen by ryegrass (r = 01941). Among the indexes, the fumigation extraction nitrogen was the bestway to evaluate nitrogen supp lying capacity.

【题目】不同磷肥用量对下辽河平原作物体内养分分配的影响

【中文关键词】磷 作物 养分分配

【英文关键词】phosphorus, crop, nutrients alloction

【中文摘要】磷是植物生长所必需的元素之一。作物体内磷素分配一直是相关学科研究的热点,而对于不同磷肥水平下作物体内养分含量变化的研究却不多见。本文以中长期田间试验为平台,就不同磷肥用量下作物体内养分含量、分配及单位经济产量养分收获量的变化进行了分析,以期为合理利用磷肥提供理论依据。1材料与方法田间试验在中国科学院沈阳生态实验站进行,该站处于下辽河平原中部偏东。年均≥10℃活动积温为3300~3400℃。年降雨量平均600~700 mm。年蒸发量1480~1756 mm。试验地土壤为草甸棕壤,2002年试验开始时,主要理化性质为:全氮(N)1·04 g/kg,全磷(P)0·47 g/kg,全钾(K)17·4 更多还原。
【英文摘要】Phosphorus is one of the ensential elemental nutrients of plant.

【题目】有机肥用量对玉米体内养分浓度和养分分配的影响
【中文关键词】有机肥 施肥量 养分浓度 养分分配 玉米 养分奢侈吸收
【英文关键词】Organic fertilizer, Manure application rate, Nutrient content, Nutrient distribution, Maize, Lavish nutrient absorption
【中文摘要】通过5 年(2002~2006 年)的田间定位试验, 研究了不同施肥量处理对玉米体内养分浓度、养分分配及每形成单位籽实产量收获养分量的影响。结果表明:施有机肥具有稳产高产作用, 随着有机肥施用量的增加,玉米的稳产作用更为明显;玉米籽实的氮素和磷素浓度均随有机肥用量的增加而增加, 钾素浓度与有机肥用量未呈现出明显相关性, 玉米秸秆中的养分浓度大体上随有机肥用量的增加而增加;玉米收获产品中氮、磷含量在籽实和秸秆中的分配比与产量均呈现较好的相关性, 钾表现不明显;玉米生长愈好(施肥愈多), 每形成单位经济产量消耗的氮、磷、钾就愈多, 说明玉米对氮、磷、钾的利用都存在一定程度奢侈吸收。
【英文摘要】A consecutive 5-year (2002~2006) field trial in the lower reaches of Liaohe River was conducted. The study investigated the effect of manure application rates on nutrient content, distribution in plant and amount in each harvested unit grain of maize. The results show that manure is an important factor in stable and high maize yield. The content of N and P in grain and stalk increases with increasing rate of manure application. K content in stalk shows the same tendency, but in grain is unrelated to the amount of applied manure. The results also indicate that maize yield is directly correlated with the ratios of N and P content in grain to stalk, and not K. Increasing nutrient consumption to produce unit grains with increased manure application implies that N, P and K are lavishly absorbed by maize crops.

【题目】不同施肥模式下潮棕壤微量元素含量及其变化状况
【中文关键词】微量元素 施肥 养分循环 潮棕壤 茬口
【英文关键词】Trace elements ,Fertilization ,Nutrients cycling ,Aquic brown soil ,Stubble
【中文摘要】了解下辽河平原地区不同施肥模式对于土壤微量元素含量及其变化的影响。利用下辽河平原18 年的定位试验,对不同施肥处理下土壤中Fe、Mn、Zn、Cu、Pb 的含量及其变化进行研究。下辽河地区所测微量元素含量均略低于全国平均水平,长期采用常规施肥方式不会对土壤造成污染;除了Fe 以外,试验前后所测元素的变化量在施肥处理与CK间均有显著差异,而各元素的变化量在养分循环处理与化肥处理间无显著差异;长期试验过程中,对照处理除了Zn 以外均表现出下降的趋势,施肥处理除Cu 以外均表现为增加的趋势;重茬玉米地中Cu 含量比豆茬玉米地高。下辽河平原地区不同施肥模

式下微量元素含量均低于国家限定标准,不会对土壤造成污染;不同施肥模式下微量元素变化不同,但养分循环再利用能够增加农田中微量元素的输入,对于维持农田生态系统的可持续发展有重要意义。

【英文摘要】Objectives of this paper are to elucidate the effect of different fertilization treatments on the contents and changes of trace elements in acquic brown soil . The effect was studied by a consecutive 18 years field trial on aquic brown soil in Shenyang suburb of Northeast China. The contents of trace elements in this area were lower than that of the national average ,and there is no risk of pollution on soil under those fertilizations. Changes of contents of measured elements except Fe in soil between fertilization treatments and the control were significant ,and there were no significant difference between the fertilizer treatment and the nutrient cycling treatment in those changes.All the measured elements except Zn declined during the trial under the control treatment ,while all the measured elements except Cu increased under fertilization treatments. The content of Cu in the soil with continuous maize stubble was higher than that in the soil with soybean stubble. The contents of trace elements under different fertilization treatments in the lower reach of Liaohe Plain were lowerthan the environment quantity standard for soils ,so those fertilization treatments can not make damage to the soil for a long time ;And there are some differences in the changes of trace elements among treatments ,while nutrients cycling can improve the inputs of trace elements in agroecosystem and has an important effect on the sustainable of agriculture.

【题目】施用有机肥对土壤肥力的影响

【中文关键词】有机肥 潮棕壤 土壤肥力 作物产量

【英文关键词】manure,aquic brown soil,soil fertility,crop yield

【中文摘要】在潮棕壤上进行了 5 年的定位试验,研究不同有机肥用量对作物产量和土壤肥力的影响。结果表明,施用有机肥处理与对照处理相比,施用有机肥有明显的增产和稳产作用。不施肥处理,除土壤全钾以外,土壤其他各项养分指标(C、N、P)均有所下降;施用有机肥能显著提高速效 P、K 养分含量和有机碳及全磷含量。5 年时间,低量有机肥处理土壤碱解氮含量下降了 9.19 mgG kg,说明低量有机肥并不能保证土壤氮的供给;中量有机肥处理土壤碱解氮含量略有上升,土壤全氮收支基本平衡;高量有机肥处理土壤碱解氮含量有明显增加,土壤全氮也有较大程度的盈余。

【英文摘要】Effects of manure application rates on crop yield and soil fertility were studied on a five5year field experimentin an aquic brown soil. The results indicate that the manure application plays an essential role in increasing and stabiliz5ing yield. Contents of total C,total N and total P are decreased in the control treatment while total K is not inceased.Contents of available P,available K,organic carbon and total phosphorus are increased significantly with the manure ap5plication. Soil alkali5hydrolyzed nitrogen content is decreased by 9.19 mgGkg in five years under the low manure ratewhich shows that the demand of nitrogen uptake could not be met,while that under the moderate manure rate is slightlyincreased. Content of alkali5hydrolyzed nitrogen is significantly increased and a positive total N balance is observed at thehigh manure rate

【题目】施肥和土壤管理对土壤微生物生物量碳、氮和群落结构的影响

【中文关键词】施肥 土壤管理 微生物多样性 变性梯度凝胶电泳 微生物生物量 氨氧化细菌

【英文关键词】long-term fertilization, soil management, genetic diversity, DGGE, microbial biomass, ammonia-oxidizing bacteria

【中文摘要】以中国科学院沈阳生态试验站的长期定位试验为平台,研究了不同施肥和土壤管理对潮棕壤微生物生物量碳、氮和群落结构的影响。结果表明,裸地和农田处理的微生物生物量碳、氮较低,但是农田处理下施肥增加了微生物生物量,其中NPK +M效果最明显。DGGE图谱显示,处理间细菌条带分布较相似,其中裸地的细菌多样性最高;长期施肥和土壤管理改变了土壤真菌群落结构,施肥增加了真菌多样性,且有机肥的影响大于化肥;不同处理间氨氧化细菌群落结构差异显著,NPK +M显著增加了氨氧化细菌多样性,且无机肥和有机肥对氨氧化细菌群落影响不同。施肥和土壤管理对细菌影响较小,但显著改变了真菌和氨氧化细菌的群落结构。聚类分析结果显示,土壤管理措施较施肥对细菌、真菌和氨氧化细菌群落的影响更为显著。

【英文摘要】Based on a field study of the aquic brown soil in the suburbs of Shenyang City in Northeast China over a consecutive 19 years, the effects of fertilization and soilmanagement on the microbial biomass (C and N) and communities were investigated. The results showed thatmicrobial biomass of the bare land and farmland was low. Fertilization increased the microbial biomass, especially when mineral fertilizers and p ig manure (NPK +M) were app lied. DGGE fingerp rinting indicated a high similarity in the distribution ofmost bacterial bands among all treatments, and the bacterial diversity of thebare land was the highest. There were significant variations of fungal community structure among different treatments. Long-term fertilization increased fungal diversity and manure wasmore effective than mineral fertilizer to increase fungal diversity. Long term fertilization and soilmanagement had a large effect on the ammonia2oxidizing bacteria structure in soil. Moreover, manure and mineral fertilizer influenced the ammonia2oxidizing bacterial communities in different ways. When app liedtogether NPK +M increased the diversity most significantly. On the contrary, fertilization and soil management had less effect on the bacterial communities. Cluster analysis suggested that soil management p ractice had a larger effect on the community structures of bacteria, fungi and ammonia2oxidizing bacteria than fertilization

【题目】氮肥施用对作物吸收土壤氮的影响——兼论作物氮肥利用率

【中文关键词】15N标记肥料试验 加入氮交互作用(ANI) 氮肥利用率 比值法

【英文关键词】15N 1abelled fertilizer experiment:Added nitrogen interaction(ANI),Fertilizer N recovery,proportion method

【中文摘要】在15N标记肥料微区试验巾采取了抑制土壤中氮生物同持作用的措施——用长期不施肥试验地、小麦拔节前施＂N标记KNO,,成功显示了影响施氮作物吸收土壤氮的另一个过程:肥料氮对土壤氮库的稀释作用(或作物吸收养分过程中肥料氮和土壤氮的库替换作用)的存在;试验中施氮作物较不施氮作物少吸收土壤氮,呈现负的ANI(加入氮交互作用)。生物固持作用和肥料氮对土壤氮库的稀释作用是两个作用相反且交织在一起的过程,其相互抵消、平衡后的最终结果可以是正ANI,也可以是负ANI,决定于两者影响力的强弱。由于受上述过程的影响,用田间试验估测作物氮肥利用率,无论＂N标记法或传统的差值法,均不可能获得可信的结果。作为替代方法,比值法可避免上述过程的影响,经本试验检验,结果良好。

【英文摘要】In a microplot 15N 1abelied fertilizer N experiment。where measures were taken to inhibit bio-immobiliza—tion of nitrogen,application of ＂N—labelled KN03 to wheat prior to its shooting stage,and the microplot experiment being carried out in Treatment CK(a treatment of another field experiment that has never been fertilized)successfully exposed another process that affected uptake of soil N by crops.i.e.dilution of soil N pool or substitution of N in the pool by fertilizer N.The crops applied with N fertilizer absorbed less soil N than those applied with nothing,showing negative ANI.Biological N immobilization and dilution of(fertilizer N on)soil N pool are two opposite and intermingled actions.Coun—teraction and balance of the two actions might lead to positive ANI or negative ANI depending on which one is stronger.As is affected bv the abore-discussed proce8s,it is almost impossible to assess N fertilizer recovery rate with reliable result by means of field experiment using either ＂N—labelling method or traditional difference method. As an alternative,the proportion method could help skid over the obstacle and has been verified in this experiment with better results.

【题目】长期施肥和气候因素对东北黑土区玉米产量的影响
【中文关键词】玉米　施肥　产量　气候
【英文关键词】corn, soil, yield, climate
【中文摘要】本试验以公主岭国家黑土监测基地为平台,研究玉米连作条件下施肥及气候因素对产量的可持续性影响。试验共设有机肥和化肥N、P、K的不同组合共24个试验处理。结果表明,与不施有机肥相比,施用常量有机肥和高量有机肥(FYM1、FYM2)均可以显著提高玉米产量,产量分别达到7668kg/hm2和7925kg/hm2,FYM(无有机肥)处理为5718kg/hm2。有机肥配施化肥比单施化肥也有明显的增产作用,施用N肥165kg/hm2可以显著增加玉米产量,单施磷素、钾素及磷钾配施增产作用不明显,表明土壤中的磷钾营养水平没有限制作物产量。降雨量与产量的相关分析结果表明,磷、钾处理的产量与8月份的降雨量显著相关。
【英文摘要】A long-term monoculture corn experiment was established at Gongzhuling, China, to study the sustainability of corn grain yield under the conventional management. Twenty-four treatments consisting of different compositions of chemical N, P, K, and farmyard manure (FYM) were included. Farmyard manure treatments produced more corn grain yields(7 668 kg/ha and 7 925 kg/ha in FYM1 and FYM2) compared to that of non-FYM treatment (5 718 kg/ha). The application of 165 kg N/ha increased grain yield significantly, but the addition of P, K or PK gave no significant response, suggesting that the soil supply of these nutrients did not limit corn yield. Corn grain yields increased and remained relatively constant with time in fertilized and FYM addition treatments and decreased in no-fertilizer addition treatment. Precipitation in August was proportional to corn grain yields only to P and K treatments. Adequate application of fertilizer and FYM can sustain monoculture corn production.

【题目】东北黑土有机硫矿化动力学特征及其影响因素》
【中文关键词】黑土 有机硫 矿化动力学 影响因素
【英文关键词】Black soil, Organic sulfur, Mineralization dynamics, Affecting factor,
【中文摘要】利用开放培养系统分别在20℃和30℃条件下,研究了不同地区(北安、海伦、公主岭)黑土和黑土在不同施肥条件下有机硫的矿化特征。结果表明:在好气培养条件下,黑土有机硫累积矿化量随培养时间的增加不断增加,两者之间的数量关系遵从一级动力学模式,前4周的矿化量占14周矿化总量的50%~62%。公主岭黑土有机硫的供硫潜力最大,且矿化速率快,供硫强度较北安、海伦高。温度越高土壤有机硫矿化势值越大,矿化化学反应速率常数也越大,半衰期越短。长期肥料定位试验地土壤有机硫的矿化势依次为施用有机肥(M)>有机肥+NPK(MNPK)>NPK(NPK)>未施肥(CK),表明施用有机肥可提高土壤供硫潜力。可见,施用有机肥对维持黑土有机硫肥力具有重要作用。 更多还原
【英文摘要】An open incubation method was used.Samples of black soils,collected from different areas(Beian,Hailun,and Gongzhuling)and plots of a long-term fertilization experiment,were incubated aerobically at 20°C or 30°C,respecfively to study characteristics of organic S mineralization in the soils.Results show that in aerobic incubation,cumulative organic S mineralization increased with the time going on,followed the first-order kinetic model.The cumulative organic S mineralization in the first 4 weeks accounted for 50%-62% of the total mineralization in 14 weeks.The black soil in Gongzhuling was the highest in S supply capacity,and stronger in S supply intensity and quicker in organic S mineralization rate than in Hailun and Beian.The higher the temperature,the higher the mineralization potentiality of organic S,the higher the velocity constant of mineralization reaction,and the shorter the half-life period.In terms mineralization potential of organic S in the long term fertilization experiment,the treatments were in the order of M>MNPK>NPK>CK,showing that organic fertilizer was the major source of soil organic S,and improved soil S supply capacity

【中文摘要】利用地统计学和GIS相结合的方法分析了哈尔滨市方正县德善村土壤养分空间异质性。采集土壤表层0~20cm土样51个,面积约50hm2。经常规化验分析和空间分析结果表明有机质变异系数<0.1为弱变异,全氮、速效氮、速效磷、速效钾在0.1~0.9之间为中等变异;土壤有机质、全氮、速效氮的理论模型均为球状模型;速效磷和速效钾理论模型为指数模型;有机质和全氮的C0/(C0+C)分别为8.3%、8.9%,说明这两种养分具有较强的空间相关性;速效氮、速效磷、速效钾的C0/(C0+C)分别为25%、49%、50%,具有中等空间相关性,其中速效磷和速效钾受随机性因子影响较大。本研究旨在为哈尔滨市土壤养分管理和平衡施肥提供科学依据。 更多还原
【英文摘要】Geostatistics method and geographic information systems were introduced to study soil nutrient spatial heterogeneity in Deshan village, Fangzheng county, Harbin. 51 soil samples at the depth 0-20 cm were collected from a 50 hm2 field and measured with routine chemical methods and space analysis. The results were as follows. Soil organic matter (OM) showed weak variation, and the coefficient of variation (CV) was less than 0.1. Total N, available N, available P and available K showed medium variation with CV between 0.1 and 0.9. The theoretic model of OM, total N and available N were spheroid. Models of available P and available K are exponent. The ratios between C0 and C0+C of OM and total N were 8.3% and 8.9%, respectively which indicates the strong spatial correlation of these two nutrients. The ratios of available N, available P and available K were 25%, 49% and 50%, respectively. They showed medium spatial correlation, and available K and available P were strongly affected by random factors. This study aimed at providing scientific gist for soil nutrient management and balanced fertilization in Harbin.

【题目】不同条件下有机物料在黑土中分解规律的研究
【中文关键词】有机物料 黑土 分解规律
【英文关键词】organic materials, black soil, decomposed regularity
【中文摘要】通过在土壤中埋置砂滤管的方法明确不同积温、水分、pH以及有机物料与黑土不同配比条件下有机物料的分解情况。结果表明:小麦和草木樨秸秆分解不受温度高低的影响,低温条件下分解较快,分解速率为草木樨>小麦秸秆;在浇水条件下小麦和草木樨秸秆易于分解,表现为第一年分解速率较高,比正常条件下分解率高出20%左右,第二年分解缓慢平均分解率只有10%左右;玉米秸秆加入量最少分解最快。当加入量为1%时,第一年就分解了75.6%,第二年达88.8%;小麦秸秆在pH7时分解率为63.1%,在pH8.7时的分解率为75.6%,其余也都相差10%左右。埋管第二年,各种物料分解速率趋于平稳。因此,土壤有机物质的分解不仅因有机物料的种类而有差异,而且也受土壤的某些性质(如水分,pH)和气候(如温度)以及还田数量等因素影响。 更多还原
【英文摘要】The method of sand strainer tube was used in this trial for studying the decomposing regularity of organic materials on the condition of different accumulated temperature, moisture, pH, materials and soil proportion. The result shows that: wheat and sweet clover straw were prone to decompose at low temperature, decomposition rate was sweet clover higher than wheat straw. In water condition, sweet clover and wheat straw were prone to decompose in the first year were 20% higher than normal, average decomposition rate was only 10% in the second year. The fastest decomposition, the least addition. When adding amount of 1% straw, the decomposition rate is 75.6% in first year, and the second year up to 88.8%. Wheat straw decomposition rate is 63.1% at pH 7 and 75.6% in pH 8.7, the remaining also have a difference of about 10%. Pipes next year, decomposition rate of various materials were stabilized. Therefore, soil organic matter decomposition not only because of the type of organic materials there are differences, but also by some properties of the soil (such as moisture, pH) and climate (such as temperature) as well as to field the quantity of factors

【题目】三江平原地区不同有机物料腐解规律的研究
【中文关键词】玉米 大豆 秸秆还田 腐解规律 养分释放率 组织结构
【英文关键词】Maize, Soybean, Stalk returning into soil, Decomposition regularity, Nutrition release rate, Tissue structure
【中文摘要】利用网袋法模拟田间还田方式,研究不同还田方式下玉米、大豆秸秆的腐解特征。结果表明:经过150d的分解,玉米和大豆秸秆残留率在33.7%~61.1%之间,秸秆还田分解趋势为:土埋处理>露天处理,土埋玉米秸秆>土埋大豆秸秆,露天条件下大豆和玉米秸秆分解速率一致。从细胞结构上看,玉米秸秆随着还田时间的延长,基本组织和维管束遭到破坏,细胞壁变薄,细胞内物质消失,细胞排列疏松;大豆秸秆组织结构变化不明显。露天和土埋处理各有机物料有机碳分解率分别为39.9%~48.9%、49.6%~65.8%,土埋玉米和大豆秸秆腐解速度明显高于露天处理。两个处理氮、钾分解率无太大差异,分别为51.1%~67.7%、74.6%~91.7%,而磷素变化比较明显,露天和土埋处理玉米秸秆的磷释放率平均比大豆秸秆高49.4%、56.7%。作为还田物料玉米秸秆要好于大豆秸秆。 更多还原

【英文摘要】Net bag method was used to determine the decomposition characteristics of soybean and maize stalks under two approaches of returning crop residues into soils. The results show that after 150 days of composting, residual rates of maize and soybean stalks are between 33.7%~61.1% under the two treatments. The order of decomposition rate of the stalks is: soil-covered treat-ment > open-air treatment, soil-covered maize stalk > soil-covered soybean stalk. Decomposition regularities of soybean and maize stalks in open-air are almost the same. As for the cell structure, with the time of treatments, tissues become blurred and loose, parenchyma and vascular bundles break-down, and intracellular matters disappear in maize stalk. However, there is no significant change in tissue structures of soybean stalk. Organic carbon decomposition rates of different organic materials are respectively 39.9%~48.9% and 49.6%~65.8% under open-air and soil-covered treatments. Stalk decomposition rates under soil-covered treatments are higher than open-air treatments. Decomposition rates of total N and K are respectively 51.1%~67.7% and 74.6%~91.7%. For maize, the decomposition rates of total P are respectively 49.4% and 56.7% higher than soybean under open-air and soil-covered treatments. With regard to material returned to the soil, maize stalk is superior to soybean stalk

【题目】土地利用变化与长期施肥对黑土有机碳密度的影响
【中文关键词】土地利用 长期施肥 有机碳密度 黑土
【英文关键词】SOC density, land use change, long-term fertilization, black soil
【中文摘要】土壤管理方式影响土壤碳库储量,进而影响土壤的源汇功能。该研究通过测定草地(GL)、裸地(BL)、农田无肥(NF)、化肥(NP)和化肥配施有机肥(NPM)处理的有机碳含量和土壤容重,估算了不同土地利用和施肥管理方式下的土壤有机碳密度的变化及农田的固碳潜力。结果表明,土壤有机碳含量表层最高而且变化较大,向下逐渐降低且变化较小。对于不同植被覆盖的3个处理,草地0-20cm土层土壤有机碳含量比裸地和无肥分别高出20.6%和16.4%。对于不同施肥管理方式,化肥有机肥配施土壤有机碳含量比无肥和化肥分别高出25.4%和15.5%,所有处理有机碳含量在160-200cm土层没有显著差异。0-40cm土层及0-100cm土体有机碳密度的变化趋势是NPM>GL>NP>NF>BL;40cm以下有机碳储量无规律性变化,表现出较大的变异性,这可能与土壤本身的空间异质性有关。草地100cm土体有机碳储量比裸地和无肥分别增加6.8%和5.7%,裸地和无肥无显著差异;化肥加有机肥100cm土体有机碳储量比化肥和无肥分别增加10.4%和5.9%。经估算,松嫩平原黑土区0-100cm土体有机碳库储量约为1.35Pg,农田有机培肥后碳库储量可达到0.96Pg,其固碳潜力约为0.05Pg。0-100cm土体有机碳密度与0-20cm土层有机碳含量及有机碳密度呈极显著正相关(r=0.99;r=0.97,P<0.01),表明土壤表层有机碳含量及密度对0-100cm土壤有机碳库具有决定作用
【英文摘要】Soil management practices have impacts on soil organic carbon (SOC) pools and the function of source-sink of soil.SOC content at 0-40 cm layer varied much more drastically than layers below.SOC density and C sequestration capacity were estimated by determining the SOC contents in grassland (GL),bareland (BL),and no fertilizer application (NF) plot,nitrogen and phosphorus chemical fertilizer application alone (NP) plot,and NP amended with organic manure (NPM) plot in arable lands.SOC content in grassland increased by 20.6% and 16.4% respectively,as compared with bareland and NF plot attributing to the difference of vegetation cover.For the cropland of different fertilizer treatments,SOC content of NPM plot increased by 25.4% and 15.5% compared with NF and NP plots.No significant difference of SOC content occurred at 160-200 cm soil layer for all plots.SOC density gradually decreased with the soil profile,decreasing in an order of NPM > GL > NP > NF > BL at both 0-40 cm and 0-100 cm soil horizon.SOC density in grassland at 0-100 cm layer increased by 6.8 and 5.7% compared to BL and NF plot,while no difference was observed between

BL and NF plot.In addition,SOC density in NPM plot increased by 10.4% and 5.9% compared to NF and NP plot.The C pool storage at 0-100 cm soil horizon in Songnen Plain of northeast China was roughly estimated as 1.35 Pg,and 0.91 Pg in croplands within the Plain.Long-term organic amendment can contribute 0.96 Pg carbon to the carbon pool of arable land in this region,thus 0.05 Pg can be available for the carbon sequestration capacity.A significant correlation was found between SOC density at 0-100 cm layer and either SOC content or SOC density at 0-20 cm layer,indicating that SOC stocks at surface layer play a key role in the stability of C pool of 0-100 cm bulk matrix.In sum,SOC contents and density were significantly influenced by land use change and long-term fertilization.

【题目】缺磷胁迫下的大豆根系形态特征研究
【中文关键词】低磷胁迫 根系形态 总氮量 磷积累 磷效率 大豆
【英文关键词】Phosphorus deficiency, Root morphology, Total nitrogen content, Phosphorus accumulation, Phosphorus efficiency, Soybean,
【中文摘要】采用砂培培养方法研究了缺磷胁迫对大豆根系形态和氮磷吸收积累的影响,结果表明:缺磷胁迫促进了大豆根系的生长,根长、根表面积、根体积等均比正常供磷条件下增加,从而增大了大豆根系对磷的吸收利用。大豆植株体内

总氮含量随着营养液中磷水平的增加而增加,缺磷抑制了大豆对氮磷的吸收利用,不同器官中的氮磷含量,籽粒中最高,根瘤中的氮含量显著高于地上部和根,表明根瘤是氮素贮存的一个主要场所;不同磷处理间,无磷与高磷以及低磷与高磷处理间均达到了5%的显著差异。缺磷胁迫增加了大豆的磷素吸收效率,而降低了大豆的磷素利用效率,这是大豆对缺磷胁迫的一种适应机制。

【英文摘要】A sand experiment was conducted to study the effects of phosphorus deficiency stress on root morphology, total nitrogen concentration and phosphorus accumulation in soybean (Glycine max L.) at glassroom condition. The results showed that phosphorus deficiency stress improved root growth which embody in root length, root surfacearea and root volume all increased compared with normal phosphorus supplying so that the uptake of soybean roots for phosphorus was increased. The total nitrogen concentration in soybean plant increased with the concentration of P in supplying nutrient solution. While phosphorus deficiency restrained the absorption of soybean for N and P, N and P content in grain was the highest than that in other organs of soybean, and N concentration in nodule was higher than that in shoot and root, suggested that nodule was a main site for nitrogen reserving. There was significant difference between no P and high P treatment, and low P and high P treatment (P<5%). Phosphorus deficiency enhanced the efficiency of P absorption while made the efficiency of P utilization dropped compared with normal P supplying, this is an adaptation mechanism of soybean to phosphorus deficiency.

【中文关键词】黑土 有机肥 土壤肥力 作物产量

【英文关键词】black soil, organic manure, soil fertility, crop yield

【中文摘要】在东北黑土区中部进行长期定位试验,研究了长期施用有机肥对黑土肥力以及作物产量的影响。结果表明:施用有机肥能够提高土壤肥力,与供试前土壤相比,施用有机肥处理的土壤有机质、全氮、全磷、碱解氮、速效磷和速效钾含量都表现为增加,长期施用氮磷钾化肥处理的有机质、全氮、碱解氮、全磷和速效磷表现为增加,而全钾、速效钾则减少,长期无肥处理的土壤除全氮和全磷表现为增加以外,均呈减小的趋势;各处理土壤C/N均表现为减小,在11.32~12.01之间波动;长期施用有机肥能使土壤的pH稳定在一个适合作物生长的范围内;施用有机肥可以增加土壤>0.25 mm水稳性团聚体的数量,不同处理>0.25 mm水稳性团聚体的含量表现为:化肥+高量有机肥(NPKM2)>化肥+低量有机肥(NPKM1)>化肥(NPK)>无肥(CK);不同处理玉米和大豆产量由高到低的顺序均为:NPKM2>NPKM1>NPK>CK,各处理的玉米产量年际间均表现出增加的趋势,而大豆产量年际间变化不显著。生物耗竭试验表明,长期施用有机肥可提高黑土的生产能力。 更多还原

【英文摘要】Based on long-term experiment located in central section of the northeast black soil,the effect of organic manure application on black soil fertility and crop yield was studied.The results show that long-term organic manure application could enhance black soil fertility,compared to pre-test,organic matter content,total nitrogen,total phosphorus,available nitrogen,available phosphorus and available potassium under organic manure application treatment demonstrated increase trend,organic matter content,total nitrogen,available nitrogen,total phosphorus,available phosphorus of fertilizer treatment showed increase trend, however,total potassium and available potassium showed opposite trend;under no fertilizer treatment,all indicators except total phosphorus and total potassium showed increase trend;C/N under different treatments demonstrated decrease,the range of values from 11.32 to 12.01;pH was suitable range for crop grow attributed to organic manure application.>0.25 mm water stability aggregate under different treatments was in the order of fertilizer plus high organic manure(NPKM2) > fertilizer plus low organic manure(NPKM1) > fertilizer(NPK) > no fertilizer(CK);the yield of maize and soybean indicated increase with fertilizer and organic manure application,and,annual yield of maize under different treatments showed increase trend,but,the same trend was not found in yield of soybean.The bio-exhausting experiment proved that organic manure application could increased black soil productivity.

【题目】大豆共生固氮能力对土壤无机氮浓度的响应与调控
【中文关键词】大豆 共生固氮 土壤环境氮浓度 无机态氮
【英文关键词】Soybean, Symbiotic nitrogen fixation, Soil nitrogen concentration, Inorganic nitrogen
【中文摘要】通过对国内外大豆共生固氮总量及占大豆一生需氮量的比例,以及大豆共生固氮能力对土壤无机氮浓度的响应的综述,提出了如何提高大豆共生固氮能力的途径。明确了协调土壤环境氮浓度和大豆根瘤固氮之间的关系,是充分发挥大豆共生固氮潜力和提高产量的关键所在。 更多还原
【英文摘要】The paper analyzed the ratio of soybean symbiotic nitrogen fixation in the total lifetime need proportion of soybean nitrogen at home and abroad,and reveiwed the response of soybean symbiotic nitrogen-fixing ability on soil inorganic nitrogen concentration,and suggested the effective ways to improve the symbiotic nitrogen-fixing ability of soybean. Meanwhile,it clearly coordinated the relationship between nitrogen concentration in soil environment and nitrogen-fixing nodules of soybean. Therefore,it is the key to fully exploit the potentiality of symbiotic nitrogen fixation and increase the production.

【题目】黑土区长期施肥后土壤供氮能力与氮肥利用特征的研究
【中文关键词】供氮能力 氮肥利用率 长期施肥 黑土
【英文关键词】nitrogen supplying, nitrogen use efficiency, long-term fertilization, black soil
【中文摘要】利用采自中国科学院海伦农业生态实验站长期定位试验地土样,进行框栽试验,种植玉米,比较了长期不同施肥后黑土供氮能力的变化特征和长期不同施肥对氮肥利用率的影响。结果表明:与长期不施肥处理相比,施肥能显著增加土壤铵态氮、硝态氮、可矿化氮含量和土壤生产力、植株吸氮量;与长期单施化肥相比,化肥配施有机肥能够提高土壤铵态氮、硝态氮、可矿化氮含量和土壤生产力、植株吸氮量。长期不施肥处理土壤的氮肥利用率最高,其次为长期单施化肥处理,氮肥利用率最低为化肥配施有机肥处理,这进一步说明长期施肥能够提高土壤氮素肥力。
【英文摘要】The experiment was carried out to study the characteristics of nitrogen use efficiency and soil nitrogen supplying of lack soil in Hailun Agricultural Ecology Station,Chinese Academy of Sciences after long-term fertilization. The results showed that compared with control (no fertilizer application),applying fertilizer could increase the content of soil ammonia,soil nitrate,mineralizable N,plant N and soil productivity obviously; compared with single application of nitrogen fertilizer,chemical fertilizer amended with manure could increase the content of soil ammonia,soil nitrate,mineralizable N,plant N and soil productivity significantly. Moreover,with applying nitrogen fertilizer into the sample soils which were collected from long-term fertilization plot,we found that the highest efficiency of N was in no fertilizer soil,however,the lowest efficiency of nitrogen appeared in nitrogen fertilizer together with manure soil.

【题目】长期不同施肥条件下黑土水稳性团聚体中磷的分布及其有效性
【中文关键词】长期施肥 磷 磷的有效性 黑土 水稳性团聚体
【英文关键词】Long-term fertilization, Phosphorus, Phosphorus availability, Black soil, Soil water-stable aggregate
【中文摘要】利用中国科学院海伦农业生态实验站的长期定位试验,研究了长期不同施肥条件下[对照(CK)、施用化学氮磷肥(NP)、化学氮磷肥配施有机肥(NP+OM)]农田黑土不同粒径水稳性团聚体中磷的分布及其有效性。结果表明,施肥增加了黑土各粒级水稳性团聚体中全磷含量,其中,NP处理比对照(CK)全磷含量增加28.9%~37.8%,NP+OM处理比NP处理增加44.0%~63.9%。施肥增加了黑土各粒级水稳性团聚体中有效磷含量,NP处理比CK处理有效磷含量增加146%~183%,NP+OM处理有效磷含量是NP处理的3.4~5.3倍。各处理水稳性团聚体全磷和有效磷均表现为较均匀地分布在>0.053mm的各粒级水稳性团聚体中,而<0.053mm粒级水稳性团聚体内全磷和有效磷均显著降低。施磷可显著增加土壤磷的有效率,且以化肥配施有机肥处理表现更为明显。NP处理不同粒径水稳性团聚体中磷的有效率是CK处理的1.94~2.32倍,NP+OM处理是NP处理的2.13~2.83倍。
【英文摘要】The distribution and availability of P in black soil water-stable aggregates were studied in a long-term fertilization field experiment. The field is located at Hailun Station of Agro-ecology Research, Chinese Academy of Sciences. The experiment included a control with no fertilization (CK), treatments with only chemical (N and P) fertilization (NP) and with chemical and pig manure (NP+OM) fertilization. The results show that fertilization increases total P content in the soil water-stable aggregates. Total P in the soil water-stable aggregates under NP treatment increases by 28.9%~37.8% compared with CK, whereas that under NP+OM treatment increases by 44.0%~63.9% over NP treatment. Available P content is significantly different for different treatments. Available P in the soil water-stable aggregates under NP treatment increases by 146%~183% compared with CK, whereas that under NP+OM treatment is 3.4~5.3 times as much as treatment NP. Though total P and available P for all the treatments are evenly distributed in the >0.053 mm soil water-stable aggregate, a significantly drop is noted in the soil water-stable aggregates which are smaller than 0.053 mm. Calculated

percent values of available P in total P indicate that fertilization favors P availability in soils. This is especially the case under NP+OM treatment. Percent values of available P in total P in the soil water-stable aggregates under treatment NP are 1.94~2.32 times as much as treatment CK, while those of treatment NP+OM are 2.13~2.83 times as much as treatment NP.

【题目】不同形态氮素对种植大豆土壤中微生物数量及酶活性的影响
【中文关键词】土壤微生物 脲酶 蔗糖酶 氮形态 大豆
【英文关键词】soil microbes, urease, invertase, nitrogen form, soybean
【中文摘要】采用框栽试验方法,研究6种不同形态氮素[生物固氮(N0)、硝态氮(N1)、铵态氮(N2)、氨基酸态氮(N3)、蛋白态氮(N4)和酰胺态氮(N5)]对种植大豆土壤中微生物数量及土壤酶活性动态变化的影响。结果表明:各大豆生育期内真菌、细菌、放线菌数量和土壤脲酶、蔗糖酶活性对不同形态氮素的反应不同;三大菌群在组成上以细菌数量占绝对优势,数量上均在花期时达到峰值,即均随着大豆生育期的推进呈单峰曲线变化;花期不同形态氮处理下的土壤微生物总数量有差异,具体表现为N5>N3>N2>N1>N4>N0。土壤多样性指数的变化趋势随着生育期的推进呈缓慢下降趋势,与土壤微生物数量的变化趋势不一致,因此,评价土壤生物多样性指数应将两者结合起来。土壤脲酶和蔗糖酶活性随着生育期的推进亦为单峰曲线变化趋势,但脲酶与蔗糖酶活性的变化趋势不同,其高峰期出现在鼓粒期。 更多还原
【英文摘要】In this paper,pot experiments were conducted to study the effects of different N forms,including biological nitrogen fixation(N0),NO-3-N(N1),NH+4-N(N2),amino acid-N(N3),protein-N(N4) and amide-N(N5) on microbial quantity and enzyme activities in soil at the growth stages of soybean.All N fertilizers were applied as base fertilizers with the same amount.The results show that bacteria are the predominant ones among microorganisms.The maximum population of bacteria,actinomyces and fungi are observed at the flowering stage,and the change of microorganism is a single-peaked curve at the whole growth stages.As the growing phases of soybean,the total amounts of microorganisms and biodiversity indices were different among treatments supplied with different forms of nitrogen. Moreover,the amounts of the microorganisms change with different forms of nitrogen treatments at the flowering stage with an order: N5>N3>N2>N1>N4>N0.In addition,the change of the biodiversity indices shows a slowly decreased trend.Therefore,the two important factors should be combined to evaluate quality of the soil.The activities of urease and invertase were single-peaked curves with the growing phases as well,however,the maximum urease activity appears at the podding stage while that of the invertase activity at the flowering stage.

【题目】不同施氮量及供氮方式对大豆根瘤生长及固氮的影响
【中文关键词】根瘤 固氮 供氮方式 大豆
【英文关键词】nodule, nitrogen fixation, nitrogen supply method, soybean
【中文摘要】采用框栽试验方法,研究一次供氮(指在总氮量一定的情况下以基肥的形式一次性施入,设3种总供氮量处理:75 kg/hm2、150 kg/hm2、225 kg/hm2)和分次供氮(指在总氮量一定的情况下,分别于播种前、苗期、花期和鼓粒期分4次平均施入,与一次供氮处理相同,设3种总供氮量处理)对大豆根瘤干重和数量、氮积累量、固氮酶活性及豆血红蛋白含量的影响。结果表明:一次性施氮方式下,各处理地上氮积累量随着施氮量的增加而增加,根系氮积累量则随着施氮量的增加呈先增加后下降的趋势。分次施氮方式下,花期和鼓粒期根瘤干重和数量的变化趋势一致;苗期,各组织氮积累均以一次性施

氮方式高于分次施氮和对照,且随着施氮量的增加而增加(地上);随着生育时期的推进,分次施氮对大豆植株氮积累促进作用增大,各组织氮积累表现为分次施氮>一次性施氮>对照。施氮量对固氮酶和豆血红蛋白含量的影响与一次性施氮方式下相似,但整体上较之抑制作用更强。

【英文摘要】A pot culture experiment was carried out to study the effects of one-off nitrogen supply(ONS,i.e.the fertilizer was applied once as base fertilizer at three levels of 75 kg/hm2,150 kg/hm2,225 kg/hm2)and discrete nitrogen supply(DNS,i.e.all the fertilizer was divided into four equal parts,one of which was then applied at the stages of before sowing,seedling,flowering and podding,respectively,at the same rates as those of ONS) on the variation of nodule dry weight(DW),nodule number,N accumulation,nitrogenase activity and leghemoglobin(Lb) concentration in the nodule of soybean(Glycine max L.).Under ONS,the shoot N accumulation increased with the increment of N application rate,however,the root N accumulation showed another trend of increasing before decreasing.Under the DNS,the nodule DW and number at flowering and podding stages showed the same trend.The N accumulation of ONS was higher than that of DNS and CK,and increased with the N application rate of shoot.Besides,the DNS accelerated the N accumulation of soybean.ONS and DNS had the same effects on nitrogenase activity and Lb concentration,but the ONS exhibited stronger inhibition.

【题目】土地利用方式对黑土酶活性的影响

【中文关键词】土壤酶 自然恢复 土地利用 休闲裸地 种植作物 黑土

【英文关键词】Soil enzyme, Natural restoration, Land-use, Bare-land, Corpping system, Black soil

【中文摘要】基于中国科学院海伦农业生态实验站长期定位试验,研究不同土地利用方式下4月份和7月份黑土脲酶、转化酶、磷酸酶活性的变化。结果表明:土地利用方式不同,黑土酶活性有较大差异。草地与裸地相比,4月份脲酶、转化酶、磷酸酶活性分别增加24.66%、29.56%、34.67%,7月份分别增加56.12%、128.40%和30.42%,表明经过自然植被恢复,土壤生物活性增强,土壤肥力提高;农田3种施肥方式相比,脲酶、转化酶、磷酸酶活性大小均为化肥+有机肥处理>化肥处理>无肥处理。3种不同生态系统相比,转化酶、磷酸酶活性大小依次为草地生态系统>农田生态系统>裸地生态系统,脲酶活性大小依次为农田化肥+有机肥处理>草地生态系统>农田化肥处理>农田无肥处理>裸地生态系统。表明采取一定的施肥措施和草地自然植被恢复可增加黑土酶活性,提高土壤肥力。土壤脲酶、磷酸酶和转化酶活性与土壤有机质含量和全氮含量均有显著相关关系,能较好地反映土壤肥力水平。

【英文摘要】Based on long-term experiment at Hailun Agricultural Ecology Station of Chinese Academy of Sciences, the characteris- tics of soil enzyme activity in black soil under different land-use types were investigated. The results show significant differences among the soil enzyme activity under different land-use types. In comparison with bare-land (BL), urease, invertase and phosphatase activity in grassland (GL) respectively increases by 24.66%, 29.56% and 34.67% in April, and 56.12%, 128.40% and 30.42% in July. This suggests that after natural restoration, soil bioactivity increases and soil fertility improves significantly. Compared, however, with the control (i.e. zero-fertilizer; ZF), soil enzyme activity in the cropping treatments follow the same order: nitrogen and phosphorus fertilizers plus organic manure (NPM) > nitrogen and phosphorus fertilizers (NP) > zero-fertilizer (ZF) application. Invertase and phosphatase activity in the ecosystems have the following order: GL > cropping system > BL, and urease activity is the order of: NPM treatment in cropping system > GL > NP treatment in cropping system > ZF treatment in cropping system > BL. This indicates that some fertilization patterns and natural restoration increase soil enzyme activity thereby improving soil fertility. Urease, invertase and phosphatase activity is significantly positively correlated with soil organic matter and total N content, largely reflecting soil property

【题目】干旱条件下黑土农田水分特征研究
【中文关键词】干旱年 黑土 作物耗水 土壤供水 施肥
【英文关键词】Dry year, Black soil, Water consumption of crop, Soil water supply, Fertilization
【中文摘要】在中国科学院海伦农田生态系统国家野外科学观测研究站,应用长期定位试验研究了干旱年份不同施肥处理下的黑土农田水分状况。结果表明:在干旱年份,大气降水不能满足玉米对水分的需求,土壤利用"土壤水库"中的水分进行补给,在玉米全生育期土壤供水量占玉米耗水量的比例为22.23%~25.99%;肥料的施用能够调节土壤的供水能力,表现为化肥+有机肥处理>化肥处理>无肥处理;玉米的耗水量和耗水强度也表现出相同趋势;肥料的施用,特别是化肥和有机肥配合施用能够提高玉米的水分利用效率。 更多还原
【英文摘要】An experiment was carried out to study the effect of different fertilization treatments on soil moisture in black soils during relatively dry years. The study was based on long-term field experiment in Hailun Experimental Station of Agricultural Ecology, Chinese Academy of Sciences. The results show that precipitation is below corn water requirement in dry years. The water deficit is met by soil moisture reserve. The ratio of soil water supply to maize water consumption is 22.23% ~ 25.99% for the entire maize growth season. The capacity of soil water supply is regulated by fertilization. The order of effect of treatments on soil moisture is chemical fertilizer plus organic manure (F3)> chemical fertilizer (F2)>no fertilizer (F1). A similar trend is observed for the amount and rate of maize water consumption. Fertilization enhances water use efficiency of corn, especially chemical fertilizer plus organic manure treatment.

【英文关键词】Soil evaporation, Water use efficiency, Fertilization, Soybean land, Black soil
【中文摘要】以中国科学院海伦农业生态实验站长期定位试验为研究平台,利用Micro-lysimeter法,研究了东北黑土区不同施肥管理对大豆地土壤蒸发和水分利用效率的影响。结果表明:长期施肥通过改变土壤的水分物理性质和作物叶面积指数,进而调控土壤蒸发,不同处理间土壤蒸发表现如下:无肥(F1)>单施化肥(F2)>化肥+有机肥(F3);大豆不同生育时期土壤蒸发强度表现为:开花期-结荚期>子叶期-开花期>出苗期-子叶期>鼓粒期-成熟期>结荚期-鼓粒期,同时土壤蒸发强度与土壤表层含水量间呈显著正相关;在不同施肥管理中化肥+有机肥处理的水分利用效率最高,其次为单施化肥和无肥。因此,在东北黑土区可以通过施肥的方式调控土壤蒸发,提高大气降水的利用效率。 更多还原
【英文摘要】Based on the long-term position experiments at Hailun Agricultural Ecology Station of Chinese Academy of Sciences,the experiment was carried out to investigate the impact of long-term different fertilizations on soil evaporation and water use efficiency in soybean land of northeast black soil using Micro-lysimeter method.The results showed that chemical fertilizers and organic manure application could regulate soil evaporation through changing soil hydro-physical properties and crop leaf area index.Soil evaporation decreased in the order of no fertilizer(F1)>chemical fertilizer(F2)>chemical fertilizer plus organic matter(F3).Soil evaporation rate at different growing stages of soybean decreased in the order of flowering-podding stage>cotyledon-flowering>emergence-cotyledon>pod filling-maturing>podding-pod filling,a significant positive correlation was found between soil evaporation rate and soil moisture,simultaneously.Water use efficiency showed an order as follows:chemical fertilizer amended with organic manure>chemical fertilizer>no fertilizer.Therefore,soil evaporation could be regulated by fertilization in order to enhance water use efficiency in black soil.

【题目】北部黑土区旱年大豆适宜施肥量的研究
【中文关键词】黑土 旱年 大豆 适宜施肥量
【英文关键词】black soil, drought year, soybean, optimum fertilize rate
【中文摘要】试验采用氮磷钾的不同组合,对氮磷钾施用量的配比与北部黑土区旱年大豆产量间的关系及对肥料利用率和经济效益的影响进行了研究。施肥与产量的分析结果表明,当满足磷钾肥施用量时,以氮肥施用纯量为75 kg/hm2的处理产量最高;当满足氮钾肥施用量时,以磷肥施用纯量为90 kg/hm2的处理产量最高;当满足氮磷肥施用量时,以钾肥施用纯量48 kg/hm2的处理产量最高。对施肥量与产量的关系进行回归分析,得出最高大豆产量所需的施肥量为:N 78.3 kg/hm2、P2O583.3 kg/hm2。通过肥料利用率和经济效益的计算,得出经济效益最高的处理对应的施肥量为:N 75 kg/hm2、P2O590 kg/hm2、K2O 48 kg/hm2,相对最佳经济施肥量为:N 45 kg/hm2、P2O560 kg/hm2、K2O 48 kg/hm2。最终根据当地的气候因素,将北部黑土区大豆最佳施肥量定为:N 60 kg/hm2、P2O575 kg/hm2、K2O 48 kg/hm2,最佳施肥配比为N∶P2O5∶K2O=1.25∶1.56∶1。
【英文摘要】The experiment adopts different ratios of N,P and K fertilizer,and the relationships among the ratio of fertilizer,soybean yield,use ratio of fertilizer and economic benefit are studied in north black soil district of China in drought year.The testing results show:when P and K fertilizer is sufficient,soybean yield is the highest under the N fertilizer application at N 75 kg/hm2,;when N and K fertilizer is sufficient,soybean yield is the highest under the P fertilizer application at P2O5 90 kg/hm2,when N and P fertilizer is sufficient,soybean yield is the highest under K fertilizer application at K2O 48 kg/hm2.The results of regression analysis show that the optimum applied amount of fertilizer is N 78.3 kg/hm2 and P2O5 83.3 kg/hm2 in order to gain the highest yield.By calculating the use ratio of fertilizer and economic benefit,the best applied amount of fertilizer is N 75 kg/hm2,P2O5 90 kg/hm2,K2O 48 kg/hm2 in order to obtaining the highest economic benefit.And the optimum relatively economic ratio of fertilizer is N 45 kg/hm2,P2O5 60 kg/hm2,K2O 48 kg/hm2.Finally,according to the climate factors,the optimum applied amount of fertilizer is N 60 kg/hm2,P2O5 75 kg/hm2,K2O 48 kg/hm2 and the optimum ratio of N∶P2O5∶K2O is 1.25∶1.56:1.

【题目】不同形态氮对大豆根瘤生长及固氮的影响
【中文关键词】根瘤 固氮酶活性 不同形态氮 大豆
【英文关键词】Nodule, Nitrogenase activity, Different forms nitrogen, Soybean
【中文摘要】采用框栽的培养方法,通过施用不同形态氮肥,探讨不同形态氮对大豆根瘤生长、含氮量、氮积累量以及固氮酶活性的影响。结果表明:不同形态的氮源,对根瘤干重、数量有促进作用,同时增加了根瘤中的含氮量和氮积累量。根瘤干重及数量的变化均为铵态氮(N2)>蛋白氮(N4)>硝态氮(N1)>氨基酸态氮(N3)>酰胺态氮(N5)>生物固氮(N0),其中N0处理的根瘤干重、数量最少,而N2处理的根瘤干重和数量最多。根瘤含氮量的变化为N1>N4>N5>N2>N3>N0,其中N1处理下的根瘤中的根瘤含氮量最高,N1、N4和N5各处理与N0处理间差异显著(P<5%)。而氮积累的变化为N2>N4>N1>N5>N3>N0,各处理与N0处理相比,差异极显著(P<1%),与含氮量的变化趋势略有不同。添加不同形态的氮源对根瘤固氮酶活性有抑制作用,其变化趋势为N0>N5>N3>N2>N4>N1,N0处理的固氮酶活性最高。
【英文摘要】Nitrogen plays an important role in nitrogen fixation of soybean.In this paper,a pot culture experiment was carried out to study the effects of different forms nitrogen on the variation of dry weight(DW),number,nitrogen content,nitrogen accumulation and nitrogenase activity in nodule of soybean(Glycine max L.) at flowering stage.The results showed that different forms nitrogen promoted nodule formation and growth,which embodied in dry weight and number significantly increased compared with biological

nitrogen fixation.The order of the nodule DW and nodule number were NO+4-N(N2)>Protein-N(N4)>NO-3-N(N1)>Amino Acid-N(N3)>Amide-N(N5)>Biological Nitrogen Fixation(N0),the least nodule DW and number appeared in N0 treatment,while the most occurred in N2 treatment.Meanwhile different forms nitrogen increased N content and N accumulation in nodule.The trend of the nitrogen content in nodule was as follows:N1>N4>N5>N2>N3>N0,and nitrogen content was the highest in the N1 treatment,moreover,the difference among N0,N1,N4,N5 was significan at 5% level.However,the order of the N accumulation was N2>N4>N1>N5>N3>N0.The different forms nitrogen remarkably affected nitrogenase activity,the trend was N0>N5>N3>N2>N4>N1,and the nitrogenase activity was the highest in N0 treatment.Therefore,different forms nitrogen had different effects on nitrogen fixation of soybean

【题目】水钾耦合对大豆产量及品质的影响

【中文关键词】水钾耦合 生育时期 大豆 产量 品质

【英文关键词】Water-potassium coupling, Growth stages, Soybean, Yield, Quality

【中文摘要】采用盆栽试验,研究了不同供钾水平下不同生育时期水分状况对大豆产量及品质的影响。结果表明:除营养生长期涝害能一定程度上增加蛋白质含量外,开花期和结荚期土壤干旱或涝害胁迫均降低了蛋白质及脂肪的含量;钾肥有提高大豆脂肪、降低蛋白质含量的趋势,但只有在水分供应适宜时,钾肥效果才显著。各生育时期土壤干旱或涝害胁迫均影响大豆产量的形成,但干旱引起的减产程度要大于涝害。干旱胁迫对各生育时期引起的减产程度表现为:结荚期>开花期>营养生长期;而涝害胁迫对各生育时期所引起的减产程度则是相近的。无论何生育时期控水,本试验中产量最优的处理是W 2K3(适宜水分+0.136 gK2O/kg土),而经济系数最优的处理是CK(适宜水分+0.068 g K2O/kg土)。钾肥能促进大豆子粒产量的形成,但只有在营养生长期控水条件下,钾肥才显著地影响大豆产量的形成,而开花期、结荚期控水,钾肥的产量效应并不显著;开花期、结荚期控水条件下,水钾互作都显著地影响大豆子粒产量的形成,但营养生长期控水条件下水钾互作对大豆产量的影响未达到显著差异。

【英文摘要】Soybean yield and quality are sensitive to soil moisture.Potassium fertilizer application may enhance the effect of soil moisture on the quality and biomass/seed yield of soybean at different growth stages,but few reports have focused on it.In this study,pot-experiments were carried out to investigate the effect of water-potassium coupling on quality and biomass/seed yield of soybean.Three water supply levels and three potassium fertilizer application levels were applied at vegetative stage(V2-R1),flowering stage(R1-R3) and podding stage(R3-R5),respectively.The results showed that soil waterlogging at vegetative stage increased soybean protein content to a certain extent,however,both soil drought and waterlogging stress reduced the percentage of soybean protein/oil on other growth stages.Potassium fertilizer was beneficial to protein accumulation but not to oil accumulation,indicating that potassium fertilizer played an important role only when soil water content was suitably supplied.For all the stages,both drought and waterlogging conditions were found to decrease the yield of soybean,in which drought condition reduced the yield more significantly.The negative effect of soil drought condition at different stages on soybean yield showed in the order: podding stage> flowering stage>vegetative stage,and soil waterlogging had the similar negative effect on soybean yield.W2K3 was the treament with the highest biomass accumulation,and CK was the one with the optimal economic coefficient at all time for all the stages.In general,the soybean seed yield increased with increasing application of potassium fertilizer,and potassium fertilizer have the positive effect on soybean seed yield when the soil water content was controlled at vegetative stage,however,no effect was observed when the soil water content was controlled at flowering stage and podding stage.The interactive effect of water×potassium fertilizer on soybean seed yield was not found when water was controlled at vegetative stage,whereas the effect was significant as water was controlled at flowering stage and podding stage

【题目】长期施肥对不同热量带土壤供氮能力的影响
【中文关键词】长期施肥 不同热量带 氮素 作物生物量
【英文关键词】Nitrogen, Long-term fertilization, Different thermal zones, Crop biomass
【中文摘要】研究利用中国科学院海伦、栾城、鹰潭农业生态试验站长期定位试验,结合温室盆栽,研究了长期施肥对不同热量带土壤供氮能力的影响。为我国不同热量带下农田土壤的生产潜力,平衡施肥等提供理论依据。结果表明:长期不同施肥土壤全氮、碱解氮和矿质态氮含量的高低顺序均表现为:化肥+有机肥>化肥>无肥。长期施肥对红壤供氮能力的增加幅度最高,其次为潮褐土,最低为黑土,且长期施肥对土壤供氮能力的增加幅度与土壤所处热量带的有效积温呈显著正相关(P<0.05)。在长期不同施肥的土壤上种植小麦后,施肥土壤的作物生物量显著高于不施肥土壤(P<0.05),且作物生物量的变化规律与土壤氮素含量的变化规律大体一致,说明通过生物试验所得的生物量可作为评价土壤氮素肥力的生物学指标。

【题目】降水年型对黑土区土壤水分动态变化的影响
【中文关键词】降水年型 黑土区 土壤水分 植被类型 变异系数
【英文关键词】yearly rainfall pattern, black soil region, soil moisture, land-cover type, variance coefficient
【中文摘要】利用长期定位试验,研究了黑土区不同降水年型下荒地、裸地和农田土壤水分的变化特征。结果表明,降水年型能够影响不同植被类型下土壤水分的季节性动态变化和垂直变化。丰水年不同植被类型土壤含水量均呈"V"型曲线变化,最低值出现在7月份,观测期内裸地较高;平水年呈"W"型曲线变化,分别在6月份和8月份出现两个低值,不同植被类型表现为裸地>荒地>农田;枯水年除裸地在观测后期土壤含水量略有增加外,荒地和农田均持续下降。降水年型对土壤水分变异系数的影响表现为枯水年>平水年>丰水年,其中荒地土壤水分变化最为剧烈,表现在枯水年出现了速变层,而在丰水分内次活跃层也较农田向土壤深层延伸,其次为农田和裸地。
【英文摘要】Based on long-term experiment,the dynamic change of soil moisture in grassland,bare land and farmland in black soil region under effects of different yearly rainfall patterns was analyzed.The result showed that dynamic and vertical changes of soil moisture under different land-covers were effected by different yearly rainfall patterns.In rainy year,change of soil moisture under different land-covers presented "V" type,the lowest value was found in July,bare land was higher than grassland and farmland in observed period;soil moisture in normal year varied in "W" type,two low value were found in June and August,respectively,different land-covers decreased in the order of bare land > grassland > farmland;in dry year,grassland and farmland decreased continually in observed period,while bare land had a little of increase in late period.The effect of different yearly rainfall patterns on variance coefficient of soil moisture decreased in the order of dry year > normal year > rainy year.Because fast-changing layer of soil moisture was found in grassland and its second active layer were deeper than farmland in rainy year,so,change of soil moisture of grassland was the best

active,followed by farmland and bare land.In observed period,soil presented status of supplying water,amount of supplying water of dry year,normal year and rainy year were 103.2 mm,38.8 mm和23.3 mm,respectively

【中文关键词】黑土 肥沃耕层 构建效应
【英文关键词】black soil, fertile cultivated layer, construction effect
【中文摘要】东北黑土区粘重的耕地土壤,经多年不合理耕作后产生了较厚的"犁底层",成为该地区农业生产的主要限制因子.本研究利用田间试验,分析了构建肥沃耕层对作物产量、土壤物理性质、土壤含水量和微生物数量的影响.结果表明:肥沃耕层构建后,土壤形成了一个深厚的耕层,作物产量增加.与常规耕作法相比,向20~35cm土层施用秸秆和有机肥使土壤容重分别降低了9.88%和6.20%,总孔隙度分别增加了9.58%和6.02%,饱和导水率分别增加了167.99%和73.78%,表明肥沃耕层的构建能够有效地改善土壤的通气透水性,提高大气降水的入渗能力;向"犁底层"施用秸秆和有机肥处理0~100cm土层土壤含水量和水分利用效率均显著高于常规耕作法,该处理玉米出苗率与0~35cm土层土壤含水量之间呈显著正相关关系.肥沃耕层的构建由于增加了土壤中的有机碳源和透气性,从而增加了土壤中的微生物数量. 更多还原
【英文摘要】The clayey farmland soil in black soil region of Northeast China,due to the existence of thicker plough pan created by unreasonable tillage,is a main limiting factor for local agricultural production. In this paper,a field experiment was conducted to study

the construction effect of fertile cultivated layer on crop yield,soil physical properties,soil moisture content,and soil microbial number. After the construction of fertile cultivated layer,the soil had a thicker cultivated layer,and the crop yield was increased. Comparing with traditional tillage,applying straw and organic manure into 20-35 cm soil layer decreased soil bulk density by 9.88% and 6.20%,increased soil porosity by 9.58% and 6.02%,and enhanced soil saturated hydraulic conductivity by 167.99 and 73.78%,respectively,indicating that the construction of fertile cultivated layer could improve soil aeration and water permeability,and enhance the infiltration of rainfall. The soil moisture content and water use efficiency under the application of straw and organic manure into plough pan were higher than those under traditional tillage,and a positive correlation was observed between the moisture content in 0-35 cm soil layer and the emergence of maize seedlings. Due to the increased organic carbon source and aeration in the constructed fertile cultivated layer,soil microbial number was also increased.

【题目】不同土地利用下黑土密度分组中碳、氮的分配变化
【中文关键词】土地利用 土壤有机碳 密度组分 结合态腐殖质 黑土
【英文关键词】Land use, Soil organic carbon, Density fractions, Combined humus, Black soil
【中文摘要】陆地生态系统植被覆盖会影响有机质在土壤及其各组分中的分布,是控制土壤有机质储量的重要因子。通过对黑土有机碳、氮含量的估算,阐明土地利用变化对土壤有机碳库及轻组、重组有机碳、氮含量和结合态腐殖质有机碳含

量的影响以及有机碳、氮的消长变化。结果表明:(1)不同土地利用方式下土壤0~20cm土层总有机碳(TOC)、全氮(TN)含量存在显著差异(p<0.05),自然土壤被破坏或转为农田,土壤总有机碳和全氮含量会持续下降,但农田化肥和有机肥配施后,土壤总有机碳和全氮含量显著增加;草地经过20年的植被恢复,土壤总有机碳含量显著高于农田化肥和无肥处理,有机碳库储量显著提高;(2)游离态轻组(Free-LF)和重组(HF)有机碳和氮含量与土壤总有机碳和全氮呈显著或极显著正相关,闭蓄态轻组(Occluded-LF)有机碳和氮在土壤中呈随机分布;(3)游离态轻组的C/N比高于全土和其他组分,易受微生物作用而降解,是土壤不稳定碳库的主要成分;(4)松结态胡敏酸碳含量与土壤总有机碳显著相关(p<0.05),土壤肥力随着胡敏酸的增加而提高。农田有机培肥不但能够提高有机质含量和土壤质量,也能显著提高农田生态系统抵押大气CO2的能力。

【英文摘要】Vegetation coverage in terrestrial ecosystem affects distribution of organic matter in soils and soil density fractions,thus is an important factor controlling storage of soil organic matter.An experiment was conducted to determine soil organic carbon and nitrogen concentration,by using density fractionation,of soil samples collected from the fields of three long-term experiments and evaluate the impact of land use on soil and density fractions.Results show that(i)soils different in land use differed significantly(p<0.05)in total organic carbon(TOC)or total nitrogen(TN),and TOC had a significant positive correlation with TN(p<0.01).Natural ecosystems,subjected to human disturbance or transferred into cropland,suffered chrono TOC and TN losses,however,application of chemical fertilizer plus organic manure increased significantly TOC and TN contents in cropland.Organic carbon storage of black soil under grassland has been increasing in the past 20 years of vegetation rehabilitation;(ii)OC or N contents in free-LF(free light fraction)and HF(heavy fraction)were significantly related to TOC or TN in the whole soil at p<0.05 or p<0.01,respectively,indicating that accumulation of free-LF and HF is very important to net increase in TOC or TN.Occluded-LF,randomly distributed in soils,was less important to accumulation of TOC or TN;(iii)C/N ratio of free-LF was higher than that of the whole soil and other fractions,which suggested that free-LF is a major part of the labile carbon pool on account of its susceptibility to microbial decomposition;(iv)OC contents of humic acid of loosely combined humus significantly correlated with TOC,indicating that increase in humic acid leads to improvement of soil fertility.Application of organic manure to cropland not only led to accumulation of organic matter and improved soil quality,but also increased the capacity of agro-ecosystem to sequester atmospheric CO2.

【中文关键词】大豆 钾 干物质积累 根冠比 蛋白质 脂肪 产量
【英文关键词】Soybean, Potassium, Dry matter accumulation, Root to shoot, Protein, Fat, Yields
【中文摘要】盆栽条件下,通过设置不同的钾素水平,研究钾肥对大豆干物质积累及其产量和品质的影响。结果表明,钾增加了R1期根及地上部的干物质积累,但处理间差异不显著;R3、R5时期取样,随着钾肥用量的增加,根及地上部干物重表现为先增加后降低的趋势,K3(0.068g K2O kg-1土)处理干物质积累量最多,但R3时期取样处理间差异不显著,R5时期取样处理间差异显著。随着大豆的生长发育,根冠比逐渐减小,R5时期根冠比值最小。R1、R3时期随着钾肥用量的增加根冠比表现为先增加后逐渐降低的趋势,K2(0.034g K2O kg-1土)处理根冠比值最大;R5时期以K3处理根冠比值最大。钾有提高大豆脂肪降低蛋白质含量的趋势。钾能促进大豆产量的形成,以K5(0.136g K2O kg-1土)处理产量最高,并且显著高于不施钾肥的处理。

【英文摘要】Spring soybean is one of main crops cultivated in Heilongjiang province in China.The annual planted area is 2-2.3 million hectares.Thus,it is urgent to enhance the yield and its quality.Potassium fertilizer plays a vital role in the period of crop growth and development as well as its quality improving.The objective of current research was to provide technical support for high yield and quality of soybean production with high efficiency fertilization in Heilongjiang province.Pot-experiments were carried out to study the effect of potassium fertilizer on dry matter accumulation,yield and quality of soybean.Five potassium fertilizer supply levels 0,0.034,0.068,0.102,0.136 g K2O kg-1 soil denoted as K1,K2,K3,K4,K5,were used in this experiment.The results showed that potassium enhanced the dry matter accumulation at flowering (R1),however,no significant difference was observed for the five K treatments.The dry matter accumulation showed increased and then decreased trend with the increment of potassium amount at podding(R3) and pod filling(R5),and significant difference among different treatments were observed at pod filling (R5) but not at podding(R3).The

optimum application rate of potassium was K3 (0.068 g K2O kg-1 soil) for dry matter accumulation at podding(R3) and pod filling (R5).The ratio of root to shoot decreased with the growing of soybean,which was lowest at pod filling (R5).The root to shoot ratio declined sharply after the peak in K2 with potassium fertilizer application at flowering (R1) and podding(R3).K3 was the maximum value for the root to shoot ratio at pod filling stage (R5).The application of potassium fertilizer was beneficial to oil accumulation but not to protein accumulation.The more the application of potassium fertilizer,the more yield soybean would reach.The optimum rate of potassium fertilizer for yield was K5 (0.136 g K2O kg-1soil),which was significantly superior to no-potassium (K1) treatment.
