【中文摘要】试验设在海伦农田生态系统国家野外科学观测研究站示范区内,采用N、P、K三因素多水平的不完全设计,旨在从16个不同氮、磷、钾水平的组合中筛选出适合当地的最适宜施肥量。不同氮、磷、钾肥用量玉米两年均获得较高产量的为处理4(N2P2K2),氮磷钾最佳施用量为N 150 kg hm-2,P2O5 90 kg hm-2,K2O 40 kg hm-2。不同氮、磷、钾肥用量大豆两年均获得高产的为处理4(N2P2K2),氮磷钾最佳施用量为N 60 kg hm-2,P2O5 60 kg hm-2,K2O 40 kg hm-2。通过对不同氮、磷、钾肥施用量和大豆与玉米产量进行一元二次方程拟合,建议黑土区玉米最适宜的施肥量为N 150~200 kg hm-2,P2O5 70~90 kg hm-2,K2O 30~40 kg hm-2;大豆为N 50~80 kg hm-2,P2O5 60~90 kg hm-2,K2O 30~40 kg hm-2。肥料利用率随施肥量的增加而降低,玉米与大豆的经济效益和其产量达到最高时的处理相同。 更多还原
【英文摘要】The experiments,located in Hailun national field research station,adopted incomplete design with different rates of nitrogen,phosphorous and potassium fertilizers to find out the optimum fertilization rate for local crops out of sixteen combinations of nitrogen,phosphorous,potassium fertilizers.The highest yields of maize and soybean were obtained in treatment 4(N2P2K2) in two years,and the amounts of the applied fertilizers were as follows: N 150 kg hm-2,P2O5 90 k g hm-2,and K2O 40 kg hm-2 for maize;N 60 kg hm-2,P2O5 60 kg hm-2,K2O 40 kg hm-2 for soybean.By using quadratishe gleichung to simulate the amounts of nitrogen,phosphorous,potassium fertilizers and the yields of maize and soybean,the study suggested that the best suitable amounts of fertilizer were: N 150-200 kg hm-2,P2O5 70-90 kg hm-2,and K2O 30-40 kg hm-2 for maize;N 50-80 kg hm-2,P2O5 60-90 kg hm-2,and K2O 30-40 kg hm-2 for soybean.Fertilizer use efficiency showed decreasing trend as the increase of fertilizing amount,and the highest yield and the most economic benefit of maize and soybean were found in the same treatment

【题目】温度和水分对不同肥料条件下黑土磷形态转化的影响及机制
【中文关键词】温度 水分 黑土 磷形态转化 土壤酶活性
【英文关键词】temperature, moisture, black soil, phosphorus transformation, soil enzyme activity
【中文摘要】采用室内微宇宙试验法,研究了温度(25℃和10℃)、土壤湿度(湿度分别为最大持水量的50%和25%,即50%WHC和25%WHC)对不同肥料条件下黑土磷素形态转化及土壤磷酸酶活性的影响。结果表明,土壤温度和水分及其交互作用对不同肥料条件下土壤磷形态转化以及土壤酶活性有显著影响。土壤温度(25℃)和土壤湿度(50%WHC)显著增加了土壤有效磷、Ca2-P、Ca8-P的含量,而土壤有机磷含量显著降低;在土壤中添加氮、磷、钾肥料后,这种作用变得尤为明

显。高的土壤温度(25°C)和合适的土壤湿度(25%WHC)能够显著提高土壤磷酸酶的活性,土壤磷酸酶活性与土壤有效磷含量呈显著正相关,表明可以通过提高土壤温度和保持土壤合适的湿度来提高土壤磷酸酶,活化和提高土壤磷的有效性,进而促进土壤磷释放。

【英文摘要】Microcosm experiments were conducted to study the effects of temperature such as 25°C & 10°C and soil moisture such as 50%,and 25% of the largest water holding capacity of soil(WHC) on transformation of phosphorus,and the activities of acid phosphatase in the black soil receiving nitrogen & potassium fertilizers(NK),and nitrogen,phosphate,and potassium fertilizers(NPK).The statistic significant effects of temperature and moisture on phosphate transformation,and acid phosphatase activities were found in the present paper.High temperature such as 25°C and moisture such as(50%WHC) can significantly increase contents of available phosphorus,Ca2-P,and Ca8-P,however,significantly decrease the content of organic phosphorus in soils especially in the soils manured with NPK.High temperature such as 25°C and appropriate moisture such as 25%WHC can enhance acid phosphatase activities.The significantly positive correlation between the activity of acid phosphatase and the content of available phosphorus was also found in the present paper.It indicates that we can increase acid phosphatase activity to activate and enhance the availability of phosphorus in soil and to promote phosphorus to be released from black soil through adjusting soil temperature and moisture

【题目】覆膜对不同施肥条件下玉米苗期生长和光合及生理参数的影响

【中文关键词】覆膜 施肥 玉米 生长 光合及生理参数

【英文关键词】plastic film mulching, fertilization, corn, growth, photosynthesis physiological parameters

【中文摘要】在田间试验条件下,研究了东北早春低温条件下,覆膜对不同施肥处理下玉米苗期生长、光合及生理参数的影响。结果表明:(1)覆膜对玉米苗期生长的影响与施肥条件有关。不覆膜情况下,除NPK处理能够显著增加玉米地上部干重外,其余施肥处理对苗期玉米地上部干重影响不显著。覆膜处理能够显著增加玉米地上部的干重,增幅为27.8%~126.3%。其中以单施磷肥的处理,覆膜处理对玉米地上部干重的影响较大,增幅为126.3%,施用氮磷钾肥料处理的影响最小,增幅仅为27.8%。(2)覆膜对玉米叶片光合及生理参数的影响同样也受施肥条件的影响。覆膜处理能够明显增加各施肥处理玉米叶片的蒸腾速率,而对气孔限制值没有显著影响;能明显增加CK、N、P处理玉米叶片光合速率、气孔导度,显著提高N、P处理的水分利用率,而对其他施肥处理影响不显著。上述结果表明,在东北地区玉米生产过程中,覆膜栽培应该根据土壤养分情况综合考虑玉米的施肥。 更多还原

【英文摘要】In order to investigate the effects of plastic film mulching(PFM) on corn,the effects of PFM were studied in the present paper on the growth and photosynthetic parameters of corn receiving different fertilizers at seedling stage in the field condition.The results were presented as follows:(1) The effects of PFM on corn growth depended on the fertilization.Without the presence of PFM,the dry weight of corn plant was significantly increased by the NPK treatment,however,no effect of other fertilizer treatments was observed on dry weight of corn plant.PFM could significantly increase the dry weight by 27.85 ~ 126.3% .The strongest effect of PFM was observed on the growth of corn,which receives the phosphorus fertilizer along,with the increase of dry weight by 126.3% .The weakest effect of PFM was observed on the growth of corn,which receives the nitrogen,phosphorus,and potassium fertilizers together,with the increase of dry weight of corn plant only by 27.8% .(2) Effects of PFM on photosynthetic and physiological parameters also atributed to fertilization.PFM treatments could obviously inprove transpiration rate(Tr),and had no significant effects on stomatal limitation value(Ls) of leaves of corn receiving different fertilizers.PFM could significantly enhance photosynthetic rate(Pn),stomatal conductance(Gs) of leaves of corn in the treatments of CK,N,and P,could also significantly increase the water use efficiency(WUE) of leaves of corn in the treatments of N,and P,with no significant effects on these parameters of leaves of corn in other treatments.For example,PFM increased the photosynthetic rates of leaves of corn by 89.2% 、 49.2% and 28.1% ,respectively,in the treatments of CK,N,and P,compared to the corresponding treatments without PFM.All these results indicated that the conditions of nutrients in soils and fertilization should be considered when PFM were used in corn production in Northeastern China.

【题目】长期不同施肥对暗棕壤甲烷氧化菌群落特征与功能的影响
【中文关键词】暗棕壤 甲烷氧化菌 pmoA基因 实时定量PCR 甲烷氧化速率 冗余分析 Monte Carlo检验 PCR-DGGE
【英文关键词】dark brown soil, methanotrophs, pmoA gene, real time PCR, methane oxidation rate, redundancy analysis, Monte Carlo test, PCR-DGGE
【中文摘要】不同施肥方式对我国旱地农田土壤甲烷氧化影响的微生物机制尚不明确.本研究利用PCR-DGGE和实时荧光定量PCR技术,结合甲烷氧化速率和土壤性质测定,探索了长期不同施肥条件下暗棕壤的"土壤性质-甲烷氧化菌群落特征-土壤甲烷氧化速率"关系.结果表明,有机肥和无机肥配施处理显著降低了土壤甲烷氧化速率,降幅为61.2%,而单独施用有机肥或无机肥对暗棕壤甲烷氧化速率的影响不显著;与对照相比,有机肥处理土壤甲烷氧化菌多样性指数增加91.9%,有机肥和无机肥配施处理增加102.5%,而单施无机肥后土壤甲烷氧化菌多样性指数变化不明显;有机肥处理土壤的pmoA基因丰度显著增加,平均pmoA基因丰度为不施用有机肥的12.7倍;土壤甲烷氧化速率与甲烷氧化菌的群落结构和比活性呈显著正相关,相关系数分别为0.363和0.684,但与甲烷氧化菌群落丰度和多样性不相关;甲烷氧化菌的群落结构和比活性与土壤pH值、全氮和有机质含量呈显著正相关.上述结果说明,长期不同施肥可以通过改变暗棕壤的pH值、全氮和有机质含量等土壤性质,改变甲烷氧化菌群落结构和比活性,进而影响土壤甲烷氧化速率;有机肥和无机肥配施土壤甲烷氧化菌多样性和丰度大幅度增加,而甲烷氧化速率却显著降低,说明有机肥和无机肥配施土壤中只有部分微生物发挥了甲烷氧化活性,但有待进一步研究.
【英文摘要】The microbial mechanisms of how different long-term fertilizations change methane oxidation of Chinese upland arable soil is unclear so far.In the present study,we attempted to investigate the "soil properties-community properties of methanotrophs-methane oxidation"relation of dark brown soil in Northeastern China under different long-term fertilization regimes.Community structure and abundance were monitored with PCR-DGGE and real time PCR,respectively.Methane oxidizing rate and soil properties were measured as well.The results show that combined use of mineral fertilizer and compost(MNP) reduce soil methane oxidation by 61.2%,whereas either mineral fertilizer(NP) or compost(M) shows no effect.Comparing with no fertilizer(CK),M and MNP increase the Shannon index of methanotrophs by 91.9% and 102.5%,respectively,whereas NP has no effect.Similarly,M(M or MNP) significantly increases pmoA gene abundance by up to 12.7 folds compared with no M addition(CK or NP).Methane oxidizing rates are significantly correlated with community structure and specific activity of methanotrophs,with correlation coefficients of 0.363 and 0.684,respectively.However,methane oxidizing rates do not correlate with abundance and diversity of methanotrophs.In addition,community structures and specific activity of methanotrophs are significantly correlated with soil pH and content of total nitrogen and organic matter.Our results suggest that long-term different fertilizations may change soil properties(such as pH and content of total nitrogen and organic matter) and thereafter the community structure and specific activity of soil methanotrophs,by which long-term different fertilizations influence soil methane oxidizing rate.The opposite change of methane oxidation to methanotrophs diversity and abundance in MNP suggests that only parts of the methanotrophs are active,which needs further research.

【题目】稻草易地还土对丘陵红壤有机质和主要物理性质的影响
【中文关键词】稻草;土壤有机质;水稳定性团聚体;容重;田间持水量;孔隙度
【英文关键词】rice straw; soil organic matter; water2stable aggregates; bulk density; field water2holding capacity; porosity
【中文摘要】选取新垦坡地和熟化旱地2种典型土地利用类型,研究了稻草易地还土对丘陵红壤有机质含量和主要物理性质的影响,并探讨了土壤有机质、田间持水量、容重、孔隙度间的相关性。结果表明:稻草易地还土可提高丘陵红壤有机质含量,改良土壤物理性质,增强土壤蓄水性能。与不施肥或化肥处理相比,稻草易地还土提高了耕层(0~20 cm)土壤有机质含量5.8% ~28.9%和 > 0.25 mm水稳性大团聚体含量;降低了亚表层(10~15 cm)土壤容重,降低幅度为4.5%~7.5%,提高了亚表层土壤的田间持水量和孔隙度,提高幅度分别为6.8%~16.2%和4.8%~7.7% (P <0.05)。相关分析表明,土壤有机质含量(0~20 cm)与亚表层土壤容重(r = - 0.799)、孔隙度(r = 0.803)、田间持水量(r = 01844)呈极显著相关(P <0101);表层、亚表层土壤田间持水量与土壤容重(r = - 01638) 、孔隙度(r = 0.664)呈显著相关(P <0.05)。
【英文摘要】Two typical land-use types, newly cultivated slope land and mellow upland, were selected to investigate the effects of ex-situ rice straw incorporation on the organic matter content, field water-holding capacity, bulk density, and porosity of hilly red soil, and to app roach the correlations between these parameters. The results showed that ex-situ incorporation of rice straw increased soil organic matter content, ameliorated soil physical properties, and improved soil water storage. Comparing with non-fertilization and applying chemical fertilizers, ex-situ incorporation of rice straw increased the contents of organic matter (5.8%- 28.9%) and > 0.25 mm water-stable aggregates in 0- 20 cm soil layer, and increased the field water2holding capacity (6.8%- 16.2%) and porosity (4.8%- 7.7%) significantly (P < 0.05) while decreased the bulk density (4.5%-7.5%) in 10-15 cm soil layer. The organic matter content in 0-20 cm soil layer was significantly correlated to the bulk density, porosity, and field water-holding capacity in 10- 15 cm soil layer (P< 0.01) , and the field water-holding capacity in 0-20 cm and 10-15 cm soil layers was significantly correlated to the bulk density and porosity in these two layers (P < 0.05).

【题目】不同土地利用方式对农田土壤养分含量的影响
【中文关键词】有机质;土壤养分;土地利用方式;时空变化
【英文关键词】organic matter; soil nutrients; land use patterns; temporal-spatial variability
【中文摘要】本研究以湖南省祁阳县为例,探讨了南方丘陵区不同土地利用方式下农田土壤养分含量的时空变化及剖面含量分布,并与第二次土壤普查时(1980 年)的土壤养分状况相比较。结果表明,水稻土有机质、全氮、碱解氮及速效磷平均含量高于旱地,而速效钾含量低于旱地土壤。与第二次土壤普查时相比,水稻土和旱地的全氮、碱解氮和速效磷含量都明显增加,水稻土的增加幅度要高于旱地土壤;而速效钾含量有不同程度的下降,水稻土下降程度小于旱地。水稻土各剖面层土壤有机质和全氮含量均远高于旱地土层,各土层全磷含量略高于旱地,而全钾含量则略低于旱地土壤。不同土地利用方式下施肥水平与施肥结构、耕作制度、田间管理等可能是造成研究区域农田土壤养分含量变化的主要原因。
【英文摘要】The study investigated the effect of land use on farmland soil organic matter and nutrients and their temporal-spatial variability in Qiyang County, Hunan Province. The results showed that, the paddy soil organic matter, total nitrogen, alkali-hydrolysable nitrogen and available phosphorus contents were higher than upland field, while available potassium contents were lower than it. Compared with the results of the Second Soil Census, total nitrogen, available nitrogen and available phosphorus contents both in paddy field and in upland field were significantly increased, with higher increased rates in paddy field, while available K content declined at different degrees in paddy field and upland field. Soil organic matter, total nitrogen and total phosphorus contents in paddy soil profile were higher than upland soil profile, and the total potassium content were slightly lower than upland field. Fertilizer levels, fertilizer structure, farming system and field management in different land use patterns may be the main factors to the change of soil nutrients.

【题目】HPLC法测定微乳中伊维菌素的含量
【中文关键词】伊维菌素 伊维菌素微乳 高效液相色谱法
【英文关键词】ivermectin ivermectin mieroemulsion HPLC
【中文摘要】建立了HPLC测定伊维菌素微乳中伊维菌素含量的方法。色谱柱为ZirchromC18(4.6mm×250 mm,5μm),流动相为甲醇：水(85：15),测定波长为245 nm,流速为1.0 mL/min,柱温为40°C。伊维菌素与辅料及溶剂峰分离良好,在2.22~111.0μg/mL时线性关系良好(R^2=0.999 9)。HPLC测定伊维菌素方法便捷、准确、重复性好,可用于伊维菌素微乳含量的测定
【英文摘要】An HPLC method for determining the content of ivermectin in ivermectin microemulsion was established. Zirchrom C18(4.6 mm × 250 mm, 5 μm)was employed, and the mobile phase consisted of methanol: water (85: 15). The detective wavelength was set at 245 nm. The flow rate was 1.0 mL/min, and the column temperature was at 40 °C. There was good resolution between ivermectin and the excipients under this chromatographic condition. The calibration curve was linear in the range of 2.22 - 111.0 μg/mL(R^2 =0.999 9). The method is simple and accurate in determining the content of ivermeetin in ivermectin mieroemulsion.

【题目】水样硝酸盐离子交换色层法氮、氧同位素分析预处理条件试验

【中文关键词】硝酸盐;同位素分析;离子交换色层法;吸附率;洗脱率

【英文关键词】nitrate; isotope analysis; ion exchange chromatography; sorption efficiency; elution recovery

【中文摘要】在地下水硝酸盐溯源的研究过程中,预处理方法是关键,直接关系到N、O同位素测定的准确与否。为提高地下水硝酸盐溯源工作的准确性,对水样硝酸盐氮、氧同位素分析的预处理方法做进一步研究和探讨,对前人的方法做出改进。实验中所采用的方法为离子交换色层法,预处理后转化成的AgNO3直接经TC-EA在线转化为N2和CO引进IRMS进行δ15N和δ18O的测定,省去了以往繁锁的转化步骤。结果表明,Bio-rad3公司生产的AG1-X8 型阴离子交换树脂对NO3-具有较好的吸附性,吸附率能达到98%以上,采用体积为15 mL,浓度为6 mol/L 的HCl 溶液进行洗脱,洗脱率能达到94%以上。此外,δ15N和δ18O测定结果重现性较好,测试精度分别达到0.22‰和0.4‰。此方法已达到国外同类研究水平,能满足水体中硝酸盐溯源和水文地质研究的要求,适用于NO3--N浓度属于中高水平水样的预处理。

【英文摘要】During the process of identifying the sources of nitrate in groundwater, the preprocessing method which could influence the accuracy of δ15N and δ18O values was essential. The preprocessing method for δ15N and δ 18O analysis was further studied and improved in this paper in order to increase the accuracy of identifying sources. The method of Ion exchange chromatography was used in this paper. AgNO3 converted by this method was transformed into N2 and CO directly by TC-EA avoiding the complicated conversion steps in the past. The results indicated that the AG1-X8(Cl-, 200-400mesh) anion resin produced by Bio-rad Corporation had a relatively high affinity for nitrate which made the sorption efficiency achieve more than 98percent. The elution recovery achieved more than 94 percent by using 15 mL of 6 M HCl. Moreover, the reproducibility of δ15N and δ18O values was good. The testing accuracy was 0.22‰ for δ15N and 0.4‰ for δ18O. This method had reached the level of similar studies abroad and met the requirements of the hydrogeological applications and it was suited for waters with moderate nitrate concentrations.

【中文关键词】植物营养;叶面营养;叶面肥;叶面施肥
【英文关键词】plant nutrition; foliar nutrition; foliar fertilizer; foliar application
【中文摘要】综合评述了植物叶面营养机理以及叶面肥应用的研究进展。植物叶片与根一样可以吸收利用养分,叶片对养分的吸收主要是通过叶面气孔和表皮亲水小孔进行的,还可以通过胞间连丝进行主动吸收。植物种类及其生长状况、叶面喷施液的组成与养分元素的性质以及温度、光照等环境条件都影响叶面养分的吸收与利用。叶片类型及叶表蜡质层结构与组成的不同造成双子叶植物叶面施肥效果好于单子叶植物,甚至同种类不同品种的植物叶面养分吸收也不同;植物生长时期不同叶面肥施用效果也不同;表面活性剂等助剂因可以提高叶面喷施效果而成为叶面肥中不可缺少的成分,但通常沿用农药中常用的活性剂种类,由于成分间相溶性差而影响叶面喷施效果。叶面营养机理的研究推动了叶面肥的发展与应用,叶面施肥逐渐成为现代农业中一项重要的施肥措施,但因其施肥量有限只能作为土壤施肥的一种有效辅助措施而不能代替土壤施肥。近年来,中国叶面肥产品数量和种类增长迅速,但产品质量较差,使用技术也有待提高。在今后的发展中,应加强叶面营养机理以及助剂等物质的研究与应用,提高产品质量和施用效果,强化专用叶面肥研究,优化和推广叶面肥施用技术。
【英文摘要】Advances in study of mechanisms of foliar nutrition and foliar fertilizer application were reviewed. Plant leaves canabsorb nutrients as roots do. There are two basic pathways for nutrients entering into the plant tissue: one is through the stomata andthe other is via cuticle hydrophilic pores. Some plant leaves also can absorb nutrients actively through plasmodesmata. So the foliaruptake of nutrients depends upon plant types and the state of plants growth, composition of foliar fertilizer, characters of nutrientsand environmental factors such as temperature, illumination and so on. Foliar application to dicotyledon is better than tomonocotyledon because of different leaf types and structures of surface wax, and of different varietals plants of homogeneity. It isnecessary to spray right fertilizers at right stage of plant growth. Some assistants, such as surfactants are required to enhance nutrientsabsorption in foliar fertilizers, however, most of the surfactants have a poor solubility among compositions of foliar fertilizers as theyare pesticides surfactants. The development of foliar application was promoted by the research on mechanism of foliar nutrition, andnow foliar application is becoming an important fertilization method. But soil application can not be replaced by foliar application offertilizers. Foliar spray can be only as an efficiency assistant method to soil application because the quantity of nutrients supplied is limited. In recent years, foliar fertilizers developed promptly both in quantity and variety, but the quality is poor in China. So the techniques of foliar application need to be improved. Scientists should intensify their research on the mechanism of foliar nutritionand the utilization of assistants in foliar fertilizers. In future, it is necessary to enhance the quality of foliar fertilizers and foliar fertilization, study on optimization of specialized foliar fertilizers and the techniques of foliar application.

【题目】中观尺度果园蒸散研究进展
【中文关键词】果园蒸散; 中观尺度; 测定方法; 估算方法
【英文关键词】Orchard epotranspiration; Mesoscale; Measurement methods; Estimation methods
【中文摘要】提高水资源利用效率是农业可持续发展的关键。中观尺度的果园水分耗散及其规律研究对于指导果园科学灌溉管理、提高水资源利用效率更具有实践生产意义。着重概述中观尺度植被蒸散的测算方法, 及其在果园生态系统蒸散研究的应用。目前, 应用于中观尺度果园蒸散测定技术主要有涡度相关技术、波文比- 能量平衡技术和闪烁通量仪; 广泛应用于果园蒸散估算模型主要有Penman-Monteith 模式和Priestley- Taylor 模式和作物系数法。最后, 展望中观尺度果园蒸散研究的热点问题。
【英文摘要】Increasing water use efficiency is important for developing sustainable agriculture. Study on orchard water depletion and its disciplinarian at mesocale has practical significance for water resource management. In this paper, we initially present the well known evapotranspiration (ET) measurement methods at field scale, such as eddy correlation method,Bowen Ratio- Energy Balance method, and Scintillometer used measuring regional average ET. In the following, we describe the methods to estimate orchard ET, such as Penman-Monteith and Priestley- Taylor models. In conclusion, we focus attention on the most interesting newguidelines for research on the measurement and estimation of actual orchard ET.

【题目】双季稻田改制对土壤剖面构型及性质的影响
【中文关键词】种植制度;土壤剖面构型;土壤团粒;土壤养分;腐殖质
【英文关键词】cropping system; soil profile form; soil aggregates; soil nutrients; humus
【中文摘要】利用田间试验方法,研究了红壤区双季稻田改为稻-稻-紫云英、牧草、水旱轮作和旱作4种种植模式对土壤剖面构型及耕层土壤性质的影响.结果表明:与试验前相比,旱作种植模式下,耕作层厚度增加了4 cm、犁底层厚度减少了2 cm、湿筛>2 mm粒级团粒含量提高了6.94%、湿筛法平均质量粒径增加了0.37mm、水稳性结构商是试验前的1.78倍,腐殖酸碳和富里酸碳含量分别提高了0.15和0.49 g.kg-1;水旱轮作种植模式下,土壤水稳性结构商较高(95.86)、养分含量变幅小;稻-稻-紫云英种植模式下,除有机质含量(增加1.3 g.kg-1)和土壤水稳性结构商(降低8.82)变化较大外,其余指标变化不大;牧草种植模式下,耕作层厚度增加2 cm、过渡层厚度增加9 cm、土壤水稳性结构商增加1.39,而土壤有机质和全钾含量分别下降5.6和2.8 g.kg-1,在所有处理中变化幅度最大。表明在当前红壤地区对灌溉条件较差的双季稻田进行改制是可行的,建议优先考虑改成旱作或水旱轮作,但无论在何种耕作方式下,均应注意土壤钾素的亏损问题。
【英文摘要】Field experimentswere conducted on the double rice cropping paddy field in red soil area to evaluate the influence ofcropping system innovation on soilprofile form and related soil characteristics. Four cropping systems of rice-rice-Chinese Milkvetch (Astragalus sinicus Linn.), forage, paddy-upland rotation, and uplandwere substituted for the double rice cropping system. The results indicated that compared with those under double rice cropping system, the thickness of cultivated horizon underupland cropping system increased by 4 cm, thatofplow pan declined by 2 cm, >2mm aggregates inwet-sieved particle-size fractions increased by 6 • 94%, wet-sieved mean-mass diameter increased by 0.37 mm, contents of humic acid carbon and fulvic acid carbon increased by 0.15 and 0.49 g • kg-1, respectively, and quotient of aggregates water stability was 0.78 times higher. Under paddy-upland rotation, the quotient of aggregates water stability was higher(95.86), while soilnutrient contents changed a little. Under rice-rice-Chinese Milkvetch system, soil organicmattercontent increased by 1.3 g • kg-1, quotient of aggregates water stability declined by 8.82, but other parameters had less changes. Under forage system, the thickness of cultivated and transitional horizons increased by 2 cm and 9 cm, respectively, quotient of aggregates water stability increased by 1.39, while the contents of soil organic matter and total potassium decreased by 5.6 and 2.8 g • kg-1, respectively. Among all test cropping systems, forage system had the greatest changes in soil characteristics. It was completely feasible to substitute the local double rice.

【题目】纳米乳在药剂学中的研究进展及其应用
【中文关键词】纳米乳 表面活性剂 给药系统 生物利用度
【英文关键词】nanoemulsion surfactant delivery system bioavailability
【中文摘要】综述纳米乳作为新型药物载体的优势,形成纳米乳的各组分发挥的作用以及不同给药途径在药剂学方面的应用状况。查阅大量近年来国内外的相关文献并进行归纳、总结。结果表明,纳米乳在透皮给药、口服给药、黏膜给药、注射给药等多个给药途径中较之普通乳剂有明显的优势。纳米乳作为一种新型药物载体系统具有对难溶性药物强大的增溶作用.还具有明显的缓释作用、靶向性及较高的生物利用度等优点,在药剂学领域有广阔的应用前景。

【英文摘要】The advantages of nanoemulsion as a novel vehicle of the drug delivery system, the roles of the ingredients and the application of various methods of administration in pharmaceutics were systematically reviewed. The application of nanoemulsions in drug delivery systems including transdermal, mueosal, oral and injection delivery systems was better than ordinary emulsions. Nanoemulsions, with a very good prospect in pharmaceutics in the future, had many good characters such as good solubilization to indissolvable drugs, delayed release, targets and high bioavailability.

【题目】基于MODIS 数据的草地植被光合过程参数估算
【中文关键词】光合有效辐射; 光合有效辐射吸收系数;吸收性光合有效辐射; 时空变化
【英文关键词】Photosynt hetic active radiation (PAR) ; Fraction of p hotosynthetic active radiation (FPAR) ; Absorbed p hotosynt hetic active radiation (APAR) ; Spatiotemporal variations
【中文摘要】以内蒙古自治区为例,利用MODIS 遥感影像和TOMS 紫外波段反射率数据,在GIS 和RS 软件支持下,计算分析了内蒙古草地生长季的光合有效辐射(PAR) 、光合有效辐射吸收系数(FPAR) 、吸收性光合有效辐射(APAR) 及其时空变化,并分析了气候因子对FPAR、PAR 的影响。结果表明:内蒙古草地生长季的PAR、FPAR、APAR 的估算值与其他研究者基本一致,方法可行,可为草地NPP 估算及建模提供参考。内蒙古草地生长季平均PAR 为197318 MJ / m2 , FPAR 为01275 ,APAR 为516164 MJ / m2 。内蒙古草地生长季的PAR、FPAR、APAR 时空变化明显: FPAR 及APAR 空间上呈东北向西南地区递减的趋势,PAR 与之相反。4 月份(生长季初期) 以后,随着时间的推移PAR、FPAR、APAR 都开始增加,但出现峰值的时间不同。内蒙古草地生长季,不同草地类型的FPAR及APAR 差异明显,在草地NPP 估算及建模时应引起重视。
【英文摘要】Wit h t he aid of geograp hic information system (GIS) sof tware ArcGIS and remote sensing imageprocessing sof tware ERDAS IMA GE , using MODIS data and TOMSps reflectivity of UV band , p hotosyn2t hetic active radiation (PAR) , f raction of p hotosynthetic active radiation (FPAR) and absorbed p hotosyn2t hetic active radiation (APAR) of grassland in growing season in Inner Mongolia were estimated , and t heirspatiotemporal variations , and t he climate factors impacting FPAR , PAR were analyzed. The result sshowed that t he calculated PAR , FPAR and APAR values were identical wit h ot her researchers ’ result s.The met hods is available to model and estimate grassland ’ s NPP. The average PAR , FPAR and APARwere about 1973. 8 MJ / m2 , 0. 275 and 516. 64 MJ / m2 respectively in growing season in Inner Mongolia.Their spatiotemporal variations in growing season in Inner Mongolia were obvious : The spatial dist ributionof PAR and FPAR was gradually descending f rom t he nort heast to sout hwest , while PAR was on t he con2t rary. From beginning of the growing season , t he PAR , FPAR and APAR was gradually increasing , butt he peak value presented at different month. The variation of FPAR and APAR of different grassland typewas very obvious , which should be paid more at tention to when grassland ’ s NPP was modeled and esti2mated.

【题目】3种土壤对水溶性有机物的吸附和解吸研究
【中文关键词】土壤;水溶性有机物;吸附;解吸
【英文关键词】Soil;Dissolved organic matter(DOM);Adsorption;Desorption
【中文摘要】了解不同类型土壤对水溶性有机物的吸附和解吸差异,为有机肥的合理施用以及进一步研究其化学行为提供参考。【方法】选择普通肥熟旱耕人为土(黑土母质发育)、石灰肥熟旱耕人为土(褐土母质发育)和酸性肥熟旱耕人为土(第四纪红壤母质发育)3种理化性质差异较大的土壤,开展添加水溶性有机物(DOM)后不同吸附时间下土壤对DOM的吸附和解吸试验,并利用相关模型计算了土壤对DOM吸附和解吸的参数。【结果】外源DOM进入土壤后,能很快被土壤胶体吸附,并在1 h内达到平衡;3种土壤对DOM的吸附差异明显,其达到平衡时的吸附量分别为10 236、8 372和10 088 mg.kg-1,即以有机质含量高的普通肥熟旱耕人为土和pH低的酸性肥熟旱耕人为土对DOM的吸附量大;3种土壤对所吸附DOM的解吸量比较,在吸附量达到最大时,解吸量占吸附量的比例分别为63.2%、42.1%和93.3%;3种土壤对所吸附DOM的解吸能力比较,亦为酸性肥熟旱耕人为土>普通肥熟旱耕人为土>石灰肥熟旱耕人为土。【结论】土壤性质与其对DOM的吸附和解吸密切相关,因此,不同类型土壤在有机肥施用量和施用方法上也需要相应进行改变。
【英文摘要】The objective of this investigation was to compare the difference of adsorption/desorption of dissolved organic matter (DOM) in different types of soils,and to give guidance of correct application of organic fertilizer and further research on corresponding chemical behavior of DOM.【Method】Three kinds of soils including Typic Fimi-Orthic Anthrosols(black soils-parent material), Calcaric Fimi-Orthic Anthrosols (cinnamon soils-parent material) and Dystric Fimi-Orthic Anthrosols (quaternary red clay-parent material) with great difference each other were selected for studying the adsorption,desorption and fixation of DOM. Some parameters on adsorption/desorption of DOM in soils were calculated using corresponding model through the adsorption/desorption experiment under the condition of different amounts of DOM added into soils at various times.【Result】The study indicated that DOM from external source could be adsorbed by soil colloid,and adsorption and desorption of DOM would reach the balance within one hour.There was a great difference in the adsorption of DOM among the three kinds of soils,and the greatest adsorped amount of DOM in Typic Fimi-Orthic Anthrosols,Calcaric Fimi-orthic Anthrosols and Dystric Fimi-orthic Anthrosols was 10 236, 8 372 and 10 088 mg • kg-1, respectively, when the balance between adsorption and desorption appeared, suggesting the relatively higher amount by adsorption occurred in Typic Fimi-Orthic Anthrosols with relatively higher organic matter content and in Dystric Fimi-Orthic Anthrosols and relatively lower pH value.In comparison with the desorption ability of three kinds of soils,the decreasing order rank was Dystric Fimi-Orthic Anthrosols>Typic Fimi-Orthic Anthrosols>Calcaric Fimi-Orthic Anthrosols【.Conclusion】There is a close relationship between the soil quality and DOM amount in soils through desorption/sorption process.Therefore,some changes in the application amount and methods of organic fertilizer are needed for different types of soils.

【题目】羊草草甸草原FPAR时间变化规律分析
【中文关键词】羊草草甸草原;时间变化规律;FPAR ; PAR ;呼伦贝尔
【英文关键词】leymus chinensis meadow2steppe ; temple variation law ; FPAR ; PAR ; Hulunbeier
【中文摘要】:FPAR 是植被叶子在光合有效辐射(400~700nm) 波段有多少太阳光能被吸收的一个度量,表示了植被冠层能量的吸收能力,是描述植被结构以及与之相关的物质与能量交换过程的基本生理变量。FPAR 模型是否能真实反映植被冠层吸收光合有效辐射状况,将直接影响遥感估算草地NPP 的不确定性程度。本文通过对长生季羊草草甸草原冠层PAR 各分量的观测,研究了入射PAR、冠层反射PAR 及透过冠层到达地面的PAR 的时间变化规律,并以观测的PAR 为基础计算分析了羊草草甸草原FPAR 的时间变化规律。结果表明,羊草草甸草原入射PAR 及透射PAR 日变化规律明显,呈较标准的正弦曲线变化;晴天FPAR 的日变化呈较标准的余弦曲线变化,FPAR 在早晚值较高,最高值约0181 ,日平均FPAR 值可以用9 :30/ 太阳天顶角为48 ° 时瞬时的FPAR 值或14 :30/ 太阳天顶角为30 ° 时瞬时的FPAR 值表示。
【英文摘要】FPAR is a measure of how large a f raction of the sunlight leaves absorb in the 400~700nm spect rum and FPAR thusexpresses a canopyps energy absorption capacity. FPAR is one of the key biophysical variables which describe canopy st ructureand are related to functional process rates of energy and mass exchange. While FPAR model can represent the vegetation ab2sorbed photosynthetically active radiation on vegetation canopies , it will influence directly the uncertainty of NPP estimation u2sing remote sensing data. On the basis of an observation to Leymus chinensis meadow2steppes canopy PAR during the growingseason of 2007 in Hulunbeier , the incident PAR , the reflective PAR of the canopy , the t ransmittance of PAR through the cano2py , the reflectance of land surface were studied respectively in this paper. The FPAR at an interval of one hour and the averageof a day were calculated and analyzed according to each PAR component s in canopy. The result showed that the incident PARand the t ransmittance PAR diurnal variation was a standard curve of sine ; the diurnal FPAR variation was a curve of cosine inclear day , FPAR was found to be highest in the morning and late af ternoon due to large solar zenith angles and lowest aroundnoon where the solar zenith angle is low , the highest value of a day is 0. 81. The daily average of FPAR may be approximatedthe incident FPAR values when the solar zenith angle was 48 ° at 9 :30 am or when the solar zenith angle was 30 ° at 14 :30 pm.

【题目】锡林浩特市草地载畜量及草畜平衡分析
【中文关键词】载畜量;草畜平衡; GRAZFEED 模型
【英文关键词】carrying capacity ;livestock2feeds balance ; GRAZFEED
【中文摘要】以北方典型代表区域———锡林浩特市为例,利用GRAZFEED 模型,模拟了不同月乌珠穆沁羊在没有补饲的情况下的体质量的变化以及气候因子对其体质量的影响;同时结合统计资料对锡林浩特市各苏木的草地载畜量及草畜平衡状况进行了分析。结果表明, 7 - 9 月乌珠穆沁羊体质量日均增质量约8. 7 g ,其他月体质量及膘情具有不同程度的下降,若要维持体质量或增质量,需额外补充饲料。气候因子也是影响乌珠穆沁羊产出的一个重要因子,4 、10 月气温较低,乌珠穆沁羊需付出额外的能量才能维持正常的生理活动。在没有补饲的情况下,锡林浩特市除了达布希勒图苏木5 - 9 月的载畜量可做进一步调整外,其他苏木均已超过其能承受的最大载畜量,或者说草畜已经严重失衡。锡林浩特市各苏木畜牧业要得到健康持续的发展,还需进一步的进行调控和管理。草地和牲畜要得到双赢的发展,需出栏一部分牲畜,或加大对牲畜的补饲量。
【英文摘要】Xilinhot City , t he typical nort h part of China , was selected as the research area to simulatet he body weight variation of Ujimqin sheep under zero supplementation and impact of climate factor onbody weight with GRAZFEED model , meanwhile , t he grassland carrying capacity and livestock2feedsbalance were analyzed. The result s showed t hat t he daily body weight gain was around 8. 7 g f rom J u2ly to September ; t he body condition was poor in ot her mont hs and t he supplementation was necessary.Climate was al so an important factor affecting production of Ujimqin sheep . In April and October , t hetemperat ure is low and the additional energy is needed to maintain normal p hysiological activities. Un2der zero supplementation condition , overgrazing was common in t he most areas. So , t he animal pop u2lation should be reduced to maintain the balance between livestock and feeds.

【题目】施肥措施对不同母质发育的稻田生态系统土壤微生物量碳、氮的影响
【中文关键词】稻田生态系统; 施肥措施; 微生物量碳; 微生物量氮; 土壤肥力
【英文关键词】paddy soil; fertilization system; microbialbiomass C and N; soil fertility.
【中文摘要】以湖南省稻田土壤肥力监测点为基础,研究了稻田生态系统土壤微生物量碳、氮的特性。结果表明,不同施肥措施对不同地域和母质发育的稻田生态系统土壤微生物量碳、氮的影响程度不同。经过18年的不同施肥处理,不同母质发育的稻田生态系统土壤微生物量碳、氮的变化趋势基本一致,变化顺序为湖积物发育的水稻土>河流冲积物和第四纪红土发育的水稻土>石灰岩发育的水稻土>板页岩发育的水稻土。土壤微生物量碳为259.5~864.4 mg.kg-1,土壤微生物量氮为8.7~70.7 mg.kg-1。施肥可以明显提高稻田生态系统土壤微生物量碳、氮含量;有机肥是改善土壤微生物量碳、氮的主要基础物质,但以有机无机配合施用效果最好。与对照相比,施化肥和有机无机配施处理土壤微生物量碳、氮最大增量分别为407.6和59.2 mg.kg-1,最大增长率分别为102.8%和514.8%。
【英文摘要】Based on the monitoring of soil fertility, this paper studied the characteristics of microbialbiomass C (MBC) and N (MBN) in paddy soils derived from different parent materials in Hunan Province. The results showed different fertilization systems had different effects on soil MBC and MBN. After18 years fertilization, the MBC and MBN in different paddy soils had similar variation trend, with the sequence of paddy soil derived from lake sediment>from river alluvium and quaternary red earth>from limestone>from shale. Soil MBC content ranged from 259.5 to 864.4 mg.kg-1, while MBN ranged from 8.7 to 70.7 mg • kg-1. Fertilization could

increase soil MBC and MBN markedly. Organic fertilizer was the main element for the promotion of soil MBC and MBN, and combined application of organic and inorganic fertilizers could obtain the greatest effect .The increment of soil MBC and MBN after applying inorganic fertilizer and its combination with organic fertilizer was 407.6 and 59.2 mg • kg-1, in maximum, and the maximum increasing rate was 102.8% and 514.8%, respectively, compared with no fertilization.

【题目】Detection of nerve growth factor (NGF) and its specific receptor (TrkA) in ejaculated bovine sperm, and the effects of NGF on sperm function
【中文关键词】无
【英文关键词】Bovine sperm; Nerve growth factor; Tyrosine kinase receptor; Expression
【中文摘要】无
【英文摘要】The objective was to confirm the presence of nerve growth factor (NGF) and its specific receptor TrkA, in ejaculated bovine sperm, and to investigate the effects of NGF on specific aspects of bovine sperm function Both TrkA transcripts and immunoreactivity typical of the translated protein were detected by RT-PCR and western blotting However only the NGF protein was detected in bovine sperm using western blotting and there was no RT PCR evidence for NGF transcripts in sperm Using an immunofluorescent technique NGF immunoreactivity was localized to the sperm head and tail whereas that of TrkA was detected in the acrosomal cap nucleus, and tail regions When sperm were treated with exogenous NGF both leptin secretion and sperm viability were increased (P < 0 05) moreover the percentages of late apoptotic and dead sperm were increased (P < 0 05) However NGF had no effects on insulin secretion mitochondrial activity, intracellular calcium levels, or the acrosome reaction of sperm (P > 0 05) In conclusion the presence of TrkA transcript as well as NGF and TrkA immunoreactivity were confirmed in bovine sperm Furthermore exogenous NGF had significant effects on the secretion of leptin, cell viability and sperm apoptosis This study provided strong evidence that NGF/TrkA may have roles in regulation of sperm physiology and perhaps male fertility and infertility (C) 2010 Elsevier Inc All rights reserved

【中文关键词】呼伦贝尔草原、modis、 时空特征
【英文关键词】Hulunber grassland, MODIS, character of spatial-temporal
【中文摘要】本文基于2000-2008年的MODIS NDVI数据,针对呼伦贝尔草原中低地草甸、温性草原、温性草甸草原、山地草甸主要的四类草地类型,分析研究了其9年来的年季NDVImax空间变化趋势、波动程度、出现时间等植被指数时空特征。结果显示:9年间呼伦贝尔草原植被趋于恶化的形势严峻。四类草原年季NDVImax平均值波动明显,特别是温性草原年季NDVImax平均值最大波动幅度接近50%。在各等级草原面积变化上,尽管NDVImax介于(0.4,1]之间的草原平均面积约占总面积的91%,表明呼伦贝尔草原植被状况总体较好,但NDVImax值介于(0.2,0.4]、(0.8,1]之间的草地面积趋于减少,NDVImax在(0.4,0.8]之间的中高盖度草地面积趋于增加,总体形势不容乐观。在空间上,66.25%的草原面积植被状况趋于恶化,33.75%的草原面积植被状况趋于好转。此外,有62.85%的区域NDVImax出现在每年第193天至225天期间(即7月中旬到8月初),因此该时期是呼伦贝尔草原植被最重要的生长季节。

【英文摘要】This paper based on the 2000-2008 MODIS NDVI datam, research on spatial-temporal character of annual NDVImax slope, annual NDVImax standard deviation, annual NDVImax coefficient of variation, The time of annual NDVImax in, low-land meadow, temperate steppe , temperate meadow steppe, up-land meadow, in 2000-2008 years. The results indicated that degeneration trend of hulunber grassland is seriously in the recent years. The annual NDVImax mean of four kinds of grassland types are all instability, especially to temperate steppe, the change range of annual NDVImax mean close to 50%. In the area change of different rank grassland. The grassland area of NDVImax value in (0.2,0.4]、(0.8,1] are inclined to decrease, and the grassland area of NDVImax value in (0.4,0.8] are inclined to increase, the general trends is not optimistic. In spaces, 33.75 percent of the Hulunber grassland is in restored tendency, 66.25 percent of the Hulunber grassland is in degenerate tendency. Furthermore, annual NDVImax spring up form 193rd to 225th day in 62.85 percent of the Hulunber grassland, so this period is important growing season of hulunber grassland.

【题目】不同施肥对退化稻田土壤肥力恢复的影响
【中文关键词】退化;施肥措施;土壤肥力
【英文关键词】degradation; fertilizationmeasure; soil fertility.
【中文摘要】为了探明不同施肥修复措施对退化水稻土壤肥力的修复作用,自2005年起采用盆栽试验连续3年对长期缺肥退化水稻土进行了土壤肥力培肥试验研究。结果表明:6种施肥修复措施均可以显著地改善退化水稻土的肥力特征,土壤有机质含量最多提高了14.0%,土壤有效磷显著增加,最高增加量达到39.0 mg.kg-1,土壤速效钾均恢复到中等水平(80mg.kg-1)以上,但土壤碱解氮除水稻专用复合肥(ZY)处理基本维持试验前水平外,其他施肥措施均有所下降;不同施肥修复措施均可明显地提高土壤微生物数量、微生物活性以及微生物生物量C、N、P含量,但以有机无机肥配合效果最佳;有机无机肥配合还可以促进稻谷产量和显著提高肥料农学效率;对于长期不施肥导致的退化稻田土壤肥力的修复以在施用水稻专用复合肥的基础上配施有机肥的效果最佳。
【英文摘要】A 3-year pot experimentwas conducted at the experimental base of College of Resources and Environmen,t Hunan AgriculturalUniversity to study the improvement effect of different fertilization on degraded paddy soil fertility in red earth region Since 2005. All the test six fertilizationmeasures improved the soil fertility significantly. The soil organic matter content increased up to 14.0%, soil available P increased up to 39.0 mg • kg-1, soil available K recovered tomedium level (80mg • kg-1), but soil available N decreased except that it was maintained at the level before experiment in rice-specific fertilizer treatmen.t All fertilization treatments increased the soil microbes ’amoun, soil microbial activity, and soil microbial biomass C, N and P, with the best effect in treatment inorganic fertilizers incorporating with organic manure. The combined application of chemical fertilizers and organicmanure also increased the rice grain yield and fertilizer agriculturaluse efficiency. Itwas suggested thatapplying rice-specific fertilizer in combining with organic manure could have the best improvement effect for the degraded paddy soil fertility resulted by long term non-fertilization.

【题目】A General agriculture mobile service platform

【中文关键词】无

【英文关键词】Mobile service – Mobile platform – SMS protocol – MMS protocol – Mobile protocol

【中文摘要】无

【英文摘要】Most of today ’s information services on the web are designed for PC users. There are few services fit to be accessed by mobile devices. In the countryside of China, most of the mobile phone users can not access the Internet. For this reason, We developed General Agriculture Mobile Service Platform. The Platform is designed to make these information services fit to be accessed by mobile users, and to make those mobile phone users can use these services without Internet connection. To achieve that, a descriptive language is designed to describe the services ’ inputs and outputs, used to passing requests and responses between the platform and the mobile client software. With those descriptions, client software can generate user interface on the client mobile device. Using that interface, user can manipulate service. The communication between client side and the platform can be carried by SMS, MMS as well as TCP, so that the devices which don ’t have Internet connection can access those services.

【题目】长期定位施肥对湖南水稻土有效态微量养分的影响

【中文关键词】长期定位施肥;有效态微量养分;水稻土;湖南

【英文关键词】long-term fertilization;available trace elements nutrition;paddy soils;Hunan

【中文摘要】为探明合理施肥和土壤培肥的理论依据,研究了长期定位施肥(长期不施肥、单施化肥、施30%有机肥、施60%有机肥共4个处理) 对湖南主要水稻土微量养分(有效硼、有效铁、有效锰、有效铜、有效锌)含量的影响。结果表明,长期定位施肥处理影响不同水稻土的微量养分含量,其含量变动趋势及机理因不同土壤而异。相对于长期不施肥处理,各施肥处理土壤有效硼、有效铜、有效锌含量的增加是因施肥增加的土壤有机物料使土壤固定态硼、铜、锌活化所致,也因为施肥将硼、铜、锌带入了土壤;有效硼、有效铜、有效锌含量的减少是因在单施化肥处理下作物生物量的增加加强了对它们的吸收。有效铁、有效锰含量的增加主要是因施用有机肥降低了土壤Eh,也因施用有机肥将铁、锰带入了土壤;有效

铁、有效锰含量的减少主要是因土壤pH上升及有机质固定所致。
【英文摘要】The variation of trace elements caused by different fertilization in paddy soils in Hunan province were studied for the first time.Trace elements were measured based on long-term sited fertilization experiments with four treatments including CK, NPK, OM30, and OM60, which have been conducted for twenty years on purple tidal clayey earth, reddish yellow clayey earth,blue gray clayey earth,alluvial sandy earth,yellow clayey earth,and whitish clayey earth. The result shows:long-term sited fertilization altered the contents of trace elements nutrition in different paddy soils; the change trends and mechanisms for trace elements differ from various paddy soils and fertilizations.Compared with CK, the contents of available B,available Cu, and available Zn in the paddy soils under fertilization treatments are either increased either through freeing the trace elements fixed in soil by increasing organic matter or inputting B, Cu, and Zn with long term fertilization,or decreased because of the plants with larger biomass taking in more available B, Cu, and Zn under NPK treatment for long term;the contents of available Fe and Mn went up due to the declining of Eh and pH in paddy soils and the inputting of Fe and Mn from organic manure fertilization,while it declined due to the rising of pH and the intensifying of organic matter ’ s adsorption.

【题目】Variation in reference crop evapotranspirationcaused by the A ° ngstro ¨ m – Prescottcoefficient: Locally calibrated versus the FAO recommended
【中文关键词】无
【英文关键词】Reference crop evapotranspiration
A °
ngstro ¨ m – Prescott coefficients
Penman-Monteith
【中文摘要】无
【英文摘要】Accurate estimation of the reference crop evapotranspiration (ET0) is investigated due to its critical role in affecting calculation of crop water use and efficiency in agricultural ecosystems. The main emphasis in this paper is to clarify the possible uncertainty in the estimation of ET0 associated with using uncalibrated A ° ngstro ¨ m – Prescott (A – P) coefficients. We first calibrated the coefficients using long-term data records from 34 sites in the Yellow River basin in China, and then applied these coefficients to estimate short wave irradiance (Rs) and ET0 at 16 sites to evaluate the difference in ET0 between the FAOrecommended and the locally calibrated. We found that the direct use of the FAO recommendedcoefficients significantly affected the estimation of ET0 at most sites, which differed from 3% to 15% at daily scale and from 4% to 16% at monthly scale from the locally calibrated ones. These differences are comparable with or larger than those caused by some alternatives of the FAO recommended algorithms for net irradiance or vapor pressure, which further highlights the importance of using the locally calibrated coefficients. The degree of difference in ET0 showed a significant threshold relation with altitude and longitude in such a way that relatively small impact lies around 2233 mand 988E, and away from these, the effect begins to increase. Given the large overestimation in water use as a consequence ofthe significant overestimation in ET0 associated with the direct use of the FAO coefficients, especially in those high yield production areas with altitude <1200 m, we developed several relationships between the A – P coefficient a, b, (a + b) and other easily obtainable factors (altitude, longitude and air temperature). A three-step procedure was recommended in applying these relations, which was (1) determine if calibration is needed or not for a given location; (2) estimate one of the A – P coefficients, either a or b if calibration is needed; (3) estimate the remaining coefficient using relations of (a + b) due to its higher coefficient of determination. In summary, we have revealed the errors and areas that aremost affected when using the un-calibrated coefficients, and discussed the consequence of such error on agricultural production, and proposed practical solutions to avoid large errors. These results are intended to make the research community aware of such errors so that more appropriate choice of these coefficients is made. We hope that similar assessment will be done in other climates, contributing to managing water resources efficiently in water basins.

【题目】The Study and Implementation of Text-to-Speech System for Agricultural Information
【中文关键词】无
【英文关键词】text-to-speech - software - hardware device - microelectronics
【中文摘要】无
【英文摘要】The Broadcast and Television coverage has increased to more than 98% in china. Information services by radio have wide coverage, low cost, easy-to-grass-roots farmers to accept etc. characteristics. In order to play the better role of broadcast information service, as well as aim at the problem of lack of information resource in rural, we R & D the text-to-speech system. The system includes two parts, software and hardware device, both of them can translate text into audio file. The software subsystem was implemented basic on third-part middleware, and the hardware subsystem was realized with microelectronics technology. Results indicate that the hardware is better than software. The system has been applied in huailai city hebei province, which has conversed more than 8000 audio files as programming materials for the local radio station.

【题目】Evaluation of temperature-based global solar radiation models China
【中文关键词】无
【英文关键词】Global solar radiation
Temperature-based model
Bristow and campbell
Hargreaves
【中文摘要】无
【英文摘要】Estimation of global solar radiation (Rs) from the daily range of air temperature (DT) offers an important alternative in the absence of measured Rs or sunshine duration because of the wide availability of air temperature data. In this paper, we assessed 16 Rsmodels including modified versions of the Bristow and Campbell (B – C) and the Hargreaves (Harg) models across a wide range of agro-ecological conditions in China. Using long-term data from 15 sites in Northeast, North China Plain and Northwest China, we explored the main factors affecting model parameters and the predictive accuracy and proposed empirical equations to estimate these parameters. Two schemes in calculating DT were employed: DT1 (based on single day Tmin) used in the Harg and DT2 (based on 2-day average of Tmin) used in the B – C model. Results showed that the original B – C model performed similarly to the best performing modifiedHarg model, but significantly outperformed the original Harg model with a 4 – 7% higher accuracy. The common practice of fixing some parameters in the B – C model caused the most significant effect and resulted in a 3 – 9% lower accuracy than that of the original model. In contrast, modifications had the smallest effect and yielded little improvement and are thus unnecessary. The DT scheme had a moderate effect, with DT1 generally resulting in a higher accuracy especially in high altitude areas. This indicates that the effect of cold or warm air advection is negligible in the B – C model even in a temperate climate. The accuracy of the temperature-based models was affectedmainly by the magnitude of DT, with largerDT resulting in higher accuracy. Parameters of the B – C model correlated significantly with many commonly used geographical and meteorological factors, meaning that they are more easily obtainable without the need for calibration and consequently Rs measurement. The parameter of the original Harg model correlated insignificantly with all the examined factors,meaning that it has to be calibrated. Main findings in this study are valuable in clarifying the relative impact of different approaches in applications on model accuracy, in demonstrating the advection effect, in identifying the dominant factors of model parameters and thus in increasing their availability.

【题目】2000-2008年内蒙古草原MODIS NDVI时空特征变化
【中文关键词】MODIS,植被指数,时空特征,温带草原
【英文关键词】MODIS, vegetation index, characteristics of spatial-temporal, steppe
【中文摘要】该文选用2000-2008年的MODIS NDVI数据,采用统计学的分析方法,研究了内蒙古草原中温性草原、温性荒漠、低地草甸、温性荒漠草原、温性草甸草原、温性草原化荒漠、山地草甸七类主要植被类型,9年来年度NDVImax空间变化趋势、波动程度、出现时间等植被指数时空特征。结果显示,2000-2008年间,内蒙古草原植被总体趋于恢复。各类型草原年度NDVImax平均值趋于增加,NDVImax介于(0,0.4]之间的低盖度草原植被面积趋于减少,NDVImax介于(0.4,1]之间的高盖度草原植被面积趋于增加。在空间上, 67.15%的草原面积植被状况趋于好转,32.85%的草原面积植被状况趋于恶化,2008年植被状况是9年来最好的一年。除温性荒漠外,内蒙古草原各植被类型NDVImax从6六月底开始集中出现,至9月底结束,其中8月是草甸草原和典型草原NDVImax集中出现的重要时期。

【英文摘要】Time-series MODIS NDVI datasets for 2000-2008 were used in this study to investigate the characteristics of spatial-temporal changes in annual NDVImax for seven typical grassland types, i.e., temperate steppe, desert grassland, low-land meadow, desert steppe, temperate meadow steppe, steppe desert, up-land meadow in Inner Mongolia grassland. The analysis focused on the spatial change trends, the standard deviations and the occurrence time point of annual NDVImax for the period of 2000-2008. The results indicated that Inner Mongolian grassland vegetation was inclined to recovery from 2000 to 2008. The mean of annual NDVImax in seven grassland types were inclined to increase. The areas with NDVImax values in (0, 0.4] are decreased largely, and the areas with NDVImax values in (0.4, 1] show a increasing trend for the study period. Overall, the restoring grassland takes up about 66.25% of the total area; the deteriorating grassland takes the rest. The vegetation of Inner Mongolian grassland in 2008 is the best in the past nine years. The study also showed that there is all of grassland except desert grassland where the NDVImax occurs from June to September in each year. Especially August is the most important growing season for temperate steppe and meadow steppe in Inner Mongolia grassland.

【题目】Calibration of the A ° ngstrom-Prescott conefficients (a,b) under different time scales and their impacts in estimating globalsolar radiation in the Yellow River basin

【中文关键词】无

【英文关键词】A °
ngstro ¨ m – Prescott coefficients
Time scale
Calibration
Global solar radiation estimation

【中文摘要】无

【英文摘要】The A ° ngstro ¨ m – Prescott (A – P) equation relating in its current form the incident top-ofatmospheresolar radiation to the solar radiation received at the surface, is one of the mostaccurate and widely used sunshine-based methods estimating global solar radiation (Rs).The key in its application is the calibration of the locally specific coefficients. Although thecoefficients have been extensively studied and calibrated in many places over the world,their relations with time scale are much less investigated. This paper addressed thevariation in these coefficients caused by time scale and how this variation results on theaccuracy of Rs predictions. This was done using long-term data at 31 sites from the YellowRiver basin in China by parallel calibration at three time scales: daily, monthly mean dailyand yearly mean daily. We found that the A – P coefficients obtained using monthly datagenerally had higher a and lower b and larger variations over those using daily data. Atyearly time scale, the sunshine – radiation relationship can no longer be described by thelinear A – P formula. The difference in coefficients between daily and monthly calibrationwas rather large accounting for 71% of the differences in a and 61% in b that in turn weregreater than 0.03, corresponding to 81% for a and 49% for b being greater than 10%. Timescale had a larger effect on a than on b, and it caused a maximum variation of 82% in a and43% in b in the basin, equaling half of the variation caused by geographical location.However, the large effect of time scales on a and b produced no significant impact onthe estimation accuracy of Rs because of the conservative response of the sum a + b to timescale. In this sense, the coefficients calibrated at daily scale are interchangeable with thosecalibrated at monthly scale, indicating the high flexibility of the A – P formula. Nevertheless,calibration made at daily scale has two important advantages over monthly scale in that itrequires fewer years ’ data to obtain stabilized coefficients, and that it is easily predictedmore accurately with common site information. Our findings have two implications. Firstly,they provide an additional guidance on the explanation of the large variability of thecoefficients found in the literature for the same geographical location. Secondly, theyfacilitate the choice of the coefficients in practical applications by proving their interchangeabilityin the estimation of Rs.

【题目】高效液相色谱法测定土壤中有机酸
【中文关键词】有机酸; 测定
【英文关键词】无
【中文摘要】通过对10种有机酸的色谱条件试验、样品处理试验(以4 和- 20 作为样品运输和储存条件)以及加标回收率试验, 建立并优化了土壤中10种有机酸的测定方法。方法添加回收率在74% - 92%, 变异系数CV 4. 1% , 方法的最低检测限为0. 2~ 50 g kg- 1, 应用该方法测定了土壤及根际区域土壤样品中的有机酸, 结果表明该方法能够满足测量田间环境条件下土壤和根际区域土壤样品中mg kg- 1痕量级有机酸含量要求。

【题目】基于ASI方法的推荐施肥在东北玉米上的应用
【中文关键词】ASI方法;推荐施肥;玉米
【英文关键词】ASI method;fertilizer recommendation;maize
【中文摘要】为了进一步完善基于ASI方法的施肥指标体系建设,本文以东北地区16个玉米试验为研究对象,对基于ASI方法推荐施肥和农民常规施肥进行了对比。结果表明:相对于农民习惯施肥,基于ASI方法的推荐施肥平均提高玉米产量

8.9%,氮、磷、钾肥表观回收率分别平均提高7.2、6.7、5.7个百分点,平均增加农民收入630 yuan/hm2。
【英文摘要】In order to improve fertilizer recommendation indices, 16 experiments were conducted to compare fertilizer recommendation based on ASI systematic approach with the farmer practice in maize in the Northeast of China. Three treatments were included: check without fertilizer application (CK), farmer practice (FP), and fertilizer recommendation (OPT) based on ASI method. Results showed that the OPT produced the yields of maize in an average of 8.9% more than the farmer practice. the apparent nutrient recovery of N,P,K increased,on average, by 7.2, 6.7 and 5.7 percentage point, respectively, and farmers ’ net income increased by 630 Yuan RMB/hm2

【题目】张家口市塞北管理区种草养畜的成本收益分析
【中文关键词】农牧交错带 种草养畜 奶牛 成本收益分析
【英文关键词】Farming-pastoral zone; Livestock raising based on forage cultivation; Dairy cattle; Cost and benefit analysis
【中文摘要】为给华北农牧交错带典型区域张家口市塞北管理区的农、牧业结构调整提供决策支持,在实地调研基础上,对当地种草养畜进行成本收益分析。结果表明:饲草、饲料作物的成本纯收益率为45.2%-125.1%,依次是青贮玉米〉青稞〉禾本科牧草≥豆科牧草;青贮玉米和多年生牧草的生产成本分别为其购入价格的44.4%-59.1%和48.6%-68.9%;投入不足是限制青贮玉米生产效益提高的主要因子;“ 全年舍饲 ”模式下,产奶量4550-6300 kg/头的中、高产奶牛的养殖纯收益为-86.5-1544.2元/头,成本纯收益率为-1.1%-15.5%,盈亏临界产奶量为4588.1-4789.8 kg/头;“ 舍饲+暖季放牧 ”模式下,种草养畜(中、高产奶牛)的纯收益为1453.6-3435.2元/头,51.0%以上的纯收益来源于饲草种植,成本纯收益率为22.7%-42.5%,盈亏临界产奶量为2850.0-3182.8 kg/头。
【英文摘要】In order to provide the basis for the configuration adjustment of agriculture and animal husbandry by local farmer and government,the costs and benefits of cultivating forage to raise livestock were evaluated based on the survey and data collection on the spot in Saibei precinct of Zhangjiakou city,a typical region of the farming-pastoral zone.The results show: 1.Net benefit-cost ratio of the main forage grasses and feed crops varied from 45.2% to 125.1% with the priority of silage corn>highland barley>gramineous grass≥leguminous grass;2.The production costs of silage corn were 44.4% to 59.1% of their purchased price,and those of the perennial forage grass were 48.6% to 68.9%;3.The mostly limiting factor was lack of funds and raw materials for benefit amplification of silage corn production;4.In the mode of ’ all-time pen feeding ’,the net benefit of dairy cattle raising with annual milk production from 4550 to 6300 kg/cow were-86.5 to 1544.2 RMB/cow,the net benefit-cost ratios were-1.1% to 15.5%,and the profit and loss critical milk production were 4588.1 to 4789.8 kg/cow;5.In the mode of ’ pen feeding+warm-season grazing ’,the net benefits from cultivating forage to raise dairy cattle with annual milk production of 4550 to 6300 kg/cow were 1453.6 to 3435.2 RMB/cow,above 51.0% of whose net benefits derived from forage cultivation,the net benefit-cost ratios were 22.7 to 42.5%,and the profit and loss critical milk production were 2850.0 to 3182.8 kg/cow

【题目】长期不同施肥对水稻土交换性钙、镁和有效硫、硅含量的影响
【中文关键词】长期定位施肥;水稻土;交换性钙;交换性镁;有效态硫;有效硅;湖南

【英文关键词】long-term fertilization;paddy soils;exchangeable Ca;exchangeable Mg;a vailable S;available Si;Hunan
【中文摘要】为探明合理施肥和土壤培肥的理论依据,研究了4种长期定位施肥(CK、NPK、OM30、OM60)对湖南主要水稻土交换性钙、交换性镁、有效硫、有效硅含量的影响。结果表明,长期不同施肥改变了供试水稻土中上述养分的含量。在含钙较低的黄泥田、河沙泥、红黄泥中,施肥使土壤交换性钙含量显著升高,在相同土壤中其含量高低依序为OM30,OM60,NPK;在含钙较多的青灰泥、白鳝泥、紫潮泥中,施肥使土壤交换性钙含量降低,降低幅度与施入的有机肥量呈负相关。在黄泥田、河沙泥、青灰泥、白鳝泥、紫潮泥中,施肥使交换性镁含量降低,而在红黄泥中施肥则使交换性镁含量升高。NPK处理使含硫较高的黄泥田、青灰泥、白鳝泥、紫潮泥有效硫含量升高,使含硫较低的红黄泥有效硫含量降低;有机、无机肥配施处理(OM30、OM60)使所有试验水稻土有效硫含量升高。施用钙镁磷肥和有机肥能够提高土壤有效硅含量。
【英文摘要】The regularities of secondary elements ’change caused by different fertilization in paddy soils in Hunan province were studied.The levels of exchangeable Ca and Mg,available S and Si in paddy soils were measured based on experiments for twenty years with 4 treatments including CK, NPK, OM30, and OM60. The results showed that long-term fertilization altered the contents of those elements nutrition in different paddy soils surely. The contents of exchangeable calcium were increased significantly under fertilization treatments,in which the order for increasing exchangeable Ca value in the same soil was: OM30>OM60>NPK>CK, in Yellow clayey earth,Alluvial sandy earth,and Reddish yellow clayey earth,in which content of calcium was less;contrarily, the contents under CK in Blue gray clayey earth, whitish clayey earth,and Purple tidal clayey earth,in which contents of calcium was more, were much higher than that under NPK, OM30, and OM60, in which the exchangeable Ca value negatively correlated to the amount of organic manure applied.The contents of exchangeable magnesium under fertilization treatments decreased in Purple tidal clayey earth,Blue gray clayey earth,Alluvial sandy earth,Yellow clayey earth,and Whitish clayey earth,but increased significantly in Reddish yellow clayey earth.The contents of available sulfur under NPK treatment were more than that under CK in Purple tidal clayey earth, Blue gray clayey earth, Yellow clayey earth, and Whitish clayey earth, which have a high sulfur concentration, and less in Alluvial sandy earth and Reddish yellow clayey earth which have a low sulfur concentration; however,the contents of available sulfur under OM30 and OM60 were increased in all the experimental soils.The contents of available silicon also rose under fertilization treatments in all experimental soils.

【题目】不同配方施肥对长期缺施钾肥的红壤性水稻土微生物特性的影响
【中文关键词】缺钾水稻土;施肥;土壤微生物区系;土壤微生物活度;土壤微生物生物量
【英文关键词】paddy soil with K-defieieney;fertilizations;microbial flora;microbial activities; soil microbial biomass
【中文摘要】为了验证平衡施肥对长期缺施钾肥的南方红壤性水稻上的修复效果,通过2年盆栽试验,以五种不同施肥处理(NPK、NPKSi、NPKOM、NPhK、NPhKOM),研究了长期缺施钾肥的水稻土的微生物特性,结果发现,在对照(NPK)基础上增施硅肥(NPKSi)、钾肥(NPhK)能促进细菌和放线菌数量的增长,提高微生物活度,加速微生物量N、P的转化,同时也能提高微生物量C相反,在淹水条件下配施有机肥(NPKOM),由于降低了水稻根际环境的氧化还原电位,使根际微生物生长萎缩,微生物活度、微生物量C无显著提高;虽然土壤微生物量N、P随之增加,但有机N的矿化减弱,植株可吸收的有效态养分减少增施钾肥的同时配施有机肥(NPhKOM)具有增施钾肥的优点,即可提高微生物活度提高微生物量C,加速有机N、P的矿化,但同时也会减少微生物数量。因此在缺钾水稻土的修复实践中,常规施肥的基础上对水稻增施硅肥、钾肥应是有效举措。而配施有机肥则须谨慎,有机肥或需适量酌施,或需结合增施钾(硅)肥。
【英文摘要】To test remediation effects of balanced fertilization on a paddy soil with long-term K-deficiency, a pot experiment has been being carried out since April,2005 with five fertilization treatments(NPK、NPKSi、NPKOM、NPhK、NPhKOM) .The resultsshowed that the amount of bacterium actinomyces,microbial biomass C and the microbial activities increased, and the rate of mineralization of organic nitrogen and phosphorus promoted with the increasing application rate of silicon fertilizer(NPKSi) or potassium fertilizer (NPhK), While the above mentioned parameter appeared an apposite trend with the addition of organic manure (NPKOM) because it resulted in a worse anaerobic condition though the microbial biomass N and P inceased. Increasing patassium application companied with organic manure (NPhKOM) inceased microbial biomass C and microbial activity, but decreased the amounts of mirobe. Consequently, applying silicon or potassium fertilizer may remediate the paddy soil with long-term K-deficiency

more effciently. Excessive application of organic manure application should be avoided. Combine application of silicon fertilizer of potassium fertilizer was recommended suppose large amount of organic manure was addressed under our study condition.

【题目】外源水溶性有机物对红壤中铜形态的影响
【中文关键词】水溶性有机物;红壤;铜形态
【英文关键词】Dissolved organic matter (DOM); Red soil; Copper from
【中文摘要】利用模拟培养试验研究了外源水溶性有机物(DOM)添加量和培养温度对红壤中 Cu形态的影响。结果表明:与不添加 DOM 比较,添加不同量的DOM 均可提高土壤中交换态Cu的含量、降低铁锰结合态 Cu 含量;随着培养时间的延长,不同DOM 添加量下土壤交换态Cu含量呈逐渐下降趋势;至试验结束时,DOM 添加量为 250 mg.L-1时土壤交换态和碳酸盐结合态 Cu 含量最高, 添加量为 500 mg.L-1时铁锰结合态 Cu 含量最高;不同 DOM 添加量下,土壤中有机结合态 Cu 含量较 CK 增加 10.67% ~23.66%。在 25℃和 45℃温度条件下,添加 DOM 后土壤交换态和铁锰结合态 Cu 含量均随培养时间的延长呈下降趋势,但在 5℃下变化趋势相反;3 种温度下添加 DOM 后土壤碳酸盐结合态 Cu 含量有随培养时间延长而增加的趋势。随着培养温度的升高,土壤有机结合态 Cu 含量增加,但在温度较低(5℃)时土壤残渣态 Cu 含量下降。
【英文摘要】A simulating incubation experiment was conducted to evaluate the influence of added Dissolved Organic Matter (DOM) content and temperature on the copper forms in the red soil. Comparing with the control, adding different amount of DOM increased thr content of soil exchangeable Cu ,but decreased the content of Fe-Mn bound Cu. With increasing time of incubation, the content of soil exchangeable Cu in all DOM-added treatments had a decreasing trend. By the end of the incubation, treatment 250 mg DOM • L-1 had the highest amount of exchangeable Cu and carbonate bound Cu, while treatment 500 mg DOM • L-1 had the highest content of Fe-Mn bound Cu. In the treatments with DOM addition, the content of soil organic bound Cu increased by 10.67%-23.66%, compared with the control. At incubation temperature 25°C and 45°C, the contents of exchangeable Cu and Fe-Mn bound Cu decreased with increasing time of incubation; while at 5°C, an opposite trends was observed. At these three temperatures, the content of soil carbonate bound Cu in treatments with DOM addition increased with incubation time. The content of soil organic bound Cu increased with increasing temperature, but that of soil residual Cu decreased at lower temperature (5°C).

【题目】Study on Development Rule of Muscle Fiber in Different Duck Breeds.
【中文关键词】无
【英文关键词】animal anatomy; breeds; morphology; muscles; poultry
【中文摘要】无
【英文摘要】Objective: The aim of this study was to investigate the development rule of muscle fiber in different duck breeds during various developmental stages. Method: Cherry valley duck, Jinding duck, White muscory duck and Suma duck (Cherry valley duck [female] * Jinding duck [male]) were fed for 10 weeks to observe the ultrastructure of muscle fiber by electron microscope, and the myofibril diameter and sarcomere length were also determined. Result: The myofibril diameter increased with ages. Sarcomere length and myofibril diameter did not change significantly with the increasing ages (P>0.05). The myofibril diameter of White muscory duck and Jinding duck were thicker, while that of Cherry valley duck and Suma duck were thinner. Moreover, the sarcomere length of Suma

duck and White muscory duck were longer, while that of Cherry valley duck and Jinding duck were shorter. Thus, the basic characteristics of ultrastructure of muscle fiber were consistent in these duck breeds. Conclusion: The results have an important meaning for duck breeding.

【题目】Polymorphism in Intron-1 of ApoVLDL-II Gene and its Association with Meat Quality and Fatness Traits in Duck
【中文关键词】无
【英文关键词】Duck; apoVLDL-II gene; polymorphism; meat quality; fatness traits; association analysis
【中文摘要】无
【英文摘要】Very Low Density apolipoprotein-II (apoVLDL-II) is a major constituent of Very Low Density Lipoprotein (VLDL) and is involved in lipid transportation in bird species. The current study was designed to investigate the associations of an apoVLDL-II gene intron-1 polymorphism on duck meat quality and fatness traits. The results showed that there were two alleles (A and B) and three genotypes (AA, AB and BB) in the experimental populations. AA genotype and A allele frequency were highest. Eight SNPs (T667C, C669G, T673C, G674A, G683A, G688A, C708G and T715G) and inserted/deleted GT after position 764 bp were found by sequencing. The apoVLDL-II gene intron-1 polymorphism was associated with multiple traits of meat quality and fatness in the 170 individuals, including pH-value, tenderness, water holding capacity, IMF, serum total cholesterol, serum triglyceride and abdominal fat. This research suggests that apoVLDL-II intron-1 has broad effects on meat quality and fatness traits in duck.

【题目】Δ6-脂肪酸脱氢酶研究进展
【中文关键词】脂肪酸脱氢酶; 多不饱和脂肪酸; 脱氢酶基因; 结构域; 形成过程; 哺乳动物; 亚麻酸; 细胞色素; 中国烟草; 组氨酸
【英文关键词】无
【中文摘要】长链多不饱和脂肪酸(LC-PUFA)是机体组织生物膜的组成成分,具有维持细胞正常功能和增加机体抗逆性的作用,在大脑发育、胎儿视觉发育、炎症反应和止血等方面具有重要的生理功能。动物自身只能初步合成饱和、单不饱和脂肪酸,但动物可以通过体内的脂肪酸脱氢酶催化与载体结合的脂肪酸在脂酰链上脱氢形成双键,将外源性的亚油酸、α-亚麻酸、花生四烯酸等转化为一系列的多不饱和脂肪酸,从而满足自身的需要。根据脂肪酸脱氢酶的定位和对辅因子需求的不同,脂肪酸脱氢酶可以分为两类:可溶性的脂肪酸脱氢酶和膜整合的脂肪酸脱氢酶。Δ6-脂肪酸脱氢酶属于膜整合的脂肪酸脱氢酶,能催化已有的双键和羧基之间形成另一个双键,是多不饱和脂肪

【题目】固始鸡免疫器官内细胞调亡相关蛋白Bax和Bcl-2的动态表达
【中文关键词】细胞凋亡; Bax; Bcl-2; 凋亡相关蛋白; 免疫组织化学; 免疫器官; 固始鸡
【英文关键词】apoptosis; Bax; Bcl-2; apoptosis related protein; immunohistochemistry; immunity organ; Gushi chicken
【中文摘要】应用免疫组织化学技术和Leica显微图像处理系统,对细胞凋亡相关蛋白Bax和Bcl-2在固始鸡免疫器官内的动态表达进行了研究。结果:Bax蛋白在不同发育阶段固始鸡免疫器官内均有表达,但表达量不同;Bax蛋白表达于固始鸡免疫器官内淋巴细胞细胞膜、细胞质和细胞核;Bax蛋白表达阳性细胞在固始鸡不同免疫器官内分布位置不同,呈散在或簇团状分布:脾脏内不同部位均有分布,主要在动脉周围淋巴鞘、红髓、淋巴小结边缘、边缘区,很少出现在淋巴小结内;胸腺内主要分布于胸腺小叶的皮质与髓质交界处,其次是胸腺小叶髓质,极少出现于皮质;法氏囊内阳性细胞主要分布于黏膜靠近上皮细胞的固有膜层内、淋巴滤泡间的区域,在淋巴滤泡边缘的少量淋巴细胞也有Bax蛋白表达,淋巴滤泡内极少有阳性细胞。Bcl-2蛋白在固始鸡免疫器官内的表达与Bax相似,但表达量与Bax相比较少。以上结果表明,细胞凋亡相关蛋白Bax和Bcl-2参与了固始鸡免疫器官内淋巴细胞发育分化过程中的凋亡调控,对免疫器官的稳定发挥重要作用。
【英文摘要】Study on dynamic expression of the apoptosis related protein Bax and Bcl-2 in immunity organs of Gushi chickens was performed and analyzed by using immunohistochemistry technology and Leica Microsystems.The results showed that the expressions of Bax protein in different immunity organs were observed,however,numbers of the positive cells of Bax protein were different on different developmental stages.The positive Bax-protein was found in cell membrane,cytoplasm and nucleus of lymphocytes.The

positive cells were dispersedly(or in clusters) distributed in different places for different immunity organs.Most of the positive cells,in spleen,were found in periarterial lymphatic sheath,red pulp,edge of splenic nodules and marginal zone,few of them in inner of splenic nodules.The positive cells,in thymus,were localized mainly in the connective zone of thymic cortex and thymic medulla,secondly in thymic medulla,and a few in thymic cortex.In Bursa,the majority of positive cells were observed in lamina propria of mucous membrane and areas between lymphoid follicles,a few in edge of lymphoid follicles,and few in inner of lymphoid follicles.The expression of Bcl-2 in the immunity organs of Gushi chickens was similar to that of Bax,but the expression level of Bcl-2 was less than that of Bax.All results mentioned above indicated that the apoptosis related protein Bax and Bcl-2 participated in the regulation of apoptosis of thymocytes and lymphocytes,and played the important roles in keeping the immunity organs stable.

【中文关键词】细胞凋亡; Fas; FasL; 凋亡基因表达; 免疫组织化学; 免疫器官; 固始鸡

【英文关键词】Apoptosis; Fas; FasL; Expression of apoptosis gene; Immunohistochemistry; Immunity organ; Gushi chicken

【中文摘要】【目的】探讨固始鸡免疫器官内细胞凋亡基因Fas和FasL的动态表达。【方法】应用免疫组织化学技术和Leica显微图像处理系统,对细胞凋亡基因Fas和FasL在固始鸡免疫器官内的动态表达进行研究。【结果】Fas在不同发育阶段固始鸡免疫器官内均有表达,但表达量均不相同,呈波浪样动态变化;Fas表达于固始鸡免疫器官内淋巴细胞细胞膜和细胞质,不表达于细胞核;Fas表达阳性细胞在固始鸡不同免疫器官内分布位置不同,呈散在或簇团状分布:法氏囊内阳性细胞主要分布于黏膜靠近上皮细胞的固有膜层内、淋巴小结与淋巴小结之间区域、淋巴小结边缘,淋巴小结内少量淋巴细胞也有Fas表达;胸腺内主要分布于胸腺小叶髓质,极少出现在皮质内;脾脏内主要分布于红髓和边缘区、淋巴小结周围和动脉周围淋巴鞘周围的区域,动脉周围淋巴鞘极少有Fas表达,淋巴小结无Fas表达。FasL在固始鸡免疫器官内的表达与Fas相似,但表达量与Fas相比较少。【结论】细胞凋亡基因Fas和FasL参与了固始鸡免疫器官内淋巴细胞发育分化过程中的凋亡调控,并对免疫器官的稳定发挥重要作用。 更多还原

【英文摘要】【Objective】 Dynamic expression of apoptosis gene Fas and FasL in immunity organs of Gushi chickens was studied. 【Method】 By using the immunohistochemical techniques and Leica image-processing system. 【Result】 The results showed that Fas gene expressed in immunity organs at different developmental stages, but the expression products varied and the dynamic changes were different. Fas expressed in the cell membrane and the cytoplasm in the immunity organs, while negatively in the nucleus of lymphocytes. Fas gene positively expressed cells distributed in various locations in different immunity organs, scatteredly or in clusters. The positively expressed cells in bursa were mainly found in the lamina propria of mucous membrane, among the lymphoid nodules and at the edges of lymphoid nodules. Fas also expressed in a few lymphocytes inside the lymphoid nodules. The positive cells in the thymus localized mainly in the thymic medulla, and a few in the thymic cortex. Fas predominantly expressed in the red pulp, the marginal zones, and the zones around the splenic nodules and the periarterial lymphatic sheath in the spleen. The expression of Fas gene was faintly positive in the periarterial lymphatic sheath and negative in the splenic nodules. The expression of FasL in the immunity organs of Gushi chickens was similar to that of Fas, but the expression product of FasL was less than that of Fas. 【Conclution】 All results mentioned above indicated that Fas and FasL genes participated in regulation of the lymphocytes apoptosis in the immunity organs of Gushi chickens, and played important roles in keeping the immunity organs stable

【题目】家禽免疫器官内细胞凋亡及其凋亡相关基因调控研究进展
【中文关键词】细胞凋亡; 凋亡相关基因; 免疫器官; 家禽
【英文关键词】apoptosis; apoptosis-related genes; immune organs; poultry
【中文摘要】细胞凋亡是生物界广泛存在的一种重要的生命过程,是多细胞动物为调节机体发育、维护内环境稳定、有基因调控的细胞主动性死亡过程。在细胞凋亡的分子生物学研究过程中,发现已有多种基因参与细胞凋亡的调控,其中包括Bcl-2家族和Bax、p53、Fas和FasL等。家禽免疫器官胸腺、脾脏和法氏囊内存在着自然凋亡现象,许多学者用物理性、化学性和生物性因素诱导了家禽免疫器官细胞凋亡,证实了细胞凋亡相关基因参与了家禽免疫器官内细胞凋亡的调控。
【英文摘要】Apoptosis is a basic process of lives in the multi-cellular creatures. It is a programmed cell death controlled with many genes including Bcl-2 family members, p53, Fas and FasL, etc., which regulates development of cells and homeostasis in organisms. Apoptosis not only exists in immune organs of poultry naturally, but would also be induced by many physiological factors, chemical factors and biological factors. All results indicated that apoptosis in immune organs of poultry is controlled by many apoptosis-related genes.

【题目】多重PCR法在微卫星标记中的效果观察
【中文关键词】微卫星; 多重PCR; 标记;
【英文关键词】Microsatellite; Multiplex PCR; Marker
【中文摘要】通过建立一种同时检测3个位点(MCW0083、MCW0037、LEI0166)的多重PCR方法,在同一样品中同时扩增这3个微卫星位点。混合扩增产物与各位点单引物PCR法扩增产物进行聚丙烯酰胺凝胶电泳检测,用BandScan软件分析各微卫星位点的等位基因大小。多重PCR方法扩增出的DNA片段与单PCR扩增的结果表明,每个个体标记等位基因的片段大小差异不大,初步认为该方法是可行的。 更多还原
【英文摘要】Through building a kind of multiplex PCR method that can test 3 sites(MCW0083,MCW0037,LEI0166) at the same time,3 microsatellite sites are amplified in the same sample at the same time.Muli-amplified products and single primer products are tested by polyacrylamide gel electrophoresis,and allele size was analyzed with BandScan software.The results of DNA fragments amplified by multiplex PCR show that the difference of allele size of each marker is not significant,this method is primarily feasible.

【题目】固始鸡与安卡鸡资源群体屠体性状的遗传分离特性
【中文关键词】鸡; 资源家系; 屠体性状; 遗传分离;
【英文关键词】Chicken; Resource population; Carcass traits; Genetic segregation;
【中文摘要】以固始鸡和安卡鸡杂交建立的F2代资源群为研究材料,探讨屠体重、屠体重率、全净膛率、半全净膛率、胸肌重率和腿肌重率的遗传分离规律。结果表明:6个屠体性状在不同性别、批次和家系中均呈极显著差异,母鸡的胸肌率极显著高于公鸡,而其他屠体性状却低于公鸡;第三家系的全净堂率极显著高于其他家系,并且该家系6个屠体性状的最小二乘均值均大于其他家系,正交系各屠体性状值高于反交系。结果显示:该资源群体可有效地用于屠体性状位点定位和相关功能基因的克隆。

【英文摘要】The genetic segregation rules of six carcass traits,including carcass weight,carcass rate,breast muscle rate,leg muscle rate,eviscerated yield with giblet rate and eviscerated yield rate in the F2 resource population established by Gushi chicken crossing with Anka chicken,were conducted in this experiment.The results showed that six carcass traits were extremely in the sex,batch effect and family;Breast muscle rate in male were extremely higher than that in female group but extremely lower in other carcass traits.Third family was more extremely than other family in the eviscerated yield rate.Comparsion of least square mean of third family was more than other family in the six carcass traits.Six carcass traits in direct cross was higher than that in reciprocal cross.This indicates that the resource population can be efficiently used for the mapping of QTL and functional gene cloning of these carcass traits.

【题目】固始鸡免疫器官内T淋巴细胞亚群动态变化
【中文关键词】T淋巴细胞亚群; 流式细胞术; 免疫器官; 固始鸡
【英文关键词】T cell subsets; flow cytometry; immunity organ; Gushi chicken;
【中文摘要】应用流式细胞仪结合免疫荧光抗体技术对固始鸡和固始鸡胚胎免疫器官内T淋巴细胞亚群的动态变化和发育分化规律进行了研究。结果发现,(1)胚胎时期,胸腺内T淋巴细胞发育分化低,表现为成熟的T淋巴细胞(CD3+)和不成熟的胸腺细胞均较少;出壳后,固始鸡胸腺内成熟T淋巴细胞增多,占胸腺细胞的30%左右,但大部分仍是未成熟的胸腺细胞。(2)脾脏内T淋巴细胞为成熟的T淋巴细胞(CD3+),占淋巴细胞的60%左右。胚胎时期脾脏内CD3+水平低,出壳后2周已达脾脏内正常水平(60%左右)。(3)法氏囊内有少量的成熟T淋巴细胞(10%左右)。结果表明,T淋巴细胞在固始鸡胸腺内增殖分化和成熟,脾脏和法氏囊内的成熟T淋巴细胞均来源于胸腺。
【英文摘要】Dynamic changes,development and differentiation of T cell subsets in immunity organs of Gushi chickens and their embryo were carried out by applying flow cytometry.The mature T cells(CD3+) and young T cells in thymus of the embryo were less than those of Gushi chickens.The majority of thymocytes in thymus of Gushi chickens was young,and only about 30% was mature.All of T cells in spleen were mature,and originated from thymus,accounting for about 60% of lymphocytes.The mature T cells(CD3+) in embryo spleen,however,were less than those of Gushi chickens.Its percentage became normal level at 2 weeks after birth.A few mature T cells(about 10%) in Bursa originated from thymus.Results that thymus is only one original place of proliferation and differentiation and maturation of T lymphocytes.

【题目】固始鸡免疫器官指数的发育规律
【中文关键词】生长发育; 免疫器官; 器官指数; 固始鸡
【英文关键词】growth and development; immune organ; organ index; Gushi chicken;
【中文摘要】为研究固始鸡免疫器官指数的发育规律,应用大体解剖学方法,经过SAS(6.12)软件对数据分析处理,结果表明,雄性和雌性固始鸡活体重、免疫器官重量和指数之间存在差异(P<0.01),但免疫器官生长发育规律相似;1周龄~20周龄内,前期固始鸡活体重和免疫器官重量均呈上升趋势,后期活体重仍增加,而免疫器官重量维持较平稳水平。随着固始鸡的生长发育,不同免疫器官指数总体而言均呈下降趋势,免疫器官生长速度小于增重速度。
【英文摘要】The developmental regularity of immunity organ indexes in Gushi chickens were measured and analyzed by using the anatomy technology and SAS(6.12) software.The results indicated that it was different significantly between male and female for body

weight,immune organ weight and immune organ indexes(P<0.01),however,male was similar to female for its regularity of growth and development of immune organs.On the early developmental stages,in 1-20 weeks,both body weight and immune organ weight increased,but,body weight increased,while immune organ weight was stable on the last developmental stages.The immune organ indexes decreased generally as growing of Gushi chickens,which indicated that the growing speed of immune organs was smaller than that of chicken weight

【题目】安卡鸡Mx基因A2032G变异位点对经济性状的效应分析
【中文关键词】鸡; Mx基因; 经济性状; 遗传效应;
【英文关键词】chicken; Mx gene; commercial trait; genetic effect;
【中文摘要】采用错配PCR-RFLP对安卡鸡Mx基因2032位点多态性进行检测,结果表明,安卡鸡Mx基因2032位点经Rsa Ⅰ酶切后,检测到AA、AG和GG 3种基因型,基因型频率分别为0.232、0.681和0.087,抗性等位基因A的频率为0.572。χ2适合性检验结果表明,安卡鸡Mx基因在Rsa Ⅰ酶切位点上等位基因的分布显著偏离Hardy-Weinberg平衡状态。分析这3种基因型与安卡鸡一些经济性状间的关联性,结果表明,抗性纯合子AA基因型的个体各阶段体重、体尺、主要屠宰性状及常规肉质与AG和GG基因型的个体差异不显著,安卡鸡Mx基因2032位点对重要经济性状没有显著的负效应。

【英文摘要】The Mx gene in Anka chicken was analyzed with mismatch PCR-RFLP method,the results showed that M2032 locus of Mx gene digested by restriction endonuclease Rsa Ⅰ could be divided into three kinds of genotypes,AA,GG and AG.The frequencies of these genotypes were 0.232,0.681 and 0.087,respectively.The frequency of resistance allele A was 0.572.The result of Chi Square test indicated that the frequencies of Mx gene digested by Rsa Ⅰ were significantly deviated from Hardy-Weinberg equilibrium in this study.The correlation between the three genotypes with some commercial traits was analyzed,the results showed that the body weight of different developmental stage,body size mainly slaughter traits and meat quality of the individuals were with resistant genotype AA were not significant different with those individuals with AG and GG genotypes in Anka chicken,which indicated that M2032 locus of Mx gene had no significantly negative genetic effects on commercial traits in Anka chicken

【题目】鸡白细胞介素-1β基因内含子1、2多态与部分免疫性状的相关性分析.
【中文关键词】白细胞介素-1β基因; 单核苷酸多态性; 免疫性状; 鸡;
【英文关键词】IL-1β gene; SNP; immune traits; chicken;
【中文摘要】【目的】以白细胞介素-1β(Interleukin-1β,IL-1β)基因为候选基因,研究其单核苷酸多态性(single nucleotide polymorphism,SNP),及其与部分免疫性状的关系。【方法】根据红色原鸡IL-1β基因序列设计引物一对,利用PCR-SSCP方法检测了如皋鸡、文昌鸡以及安卡鸡IL-1β基因内含子1、2的SNP,同时检测了56日龄的血清IL-1浓度、异嗜性粒细胞/淋巴细胞(heterophil/lymphocyte,H/L)值、绵羊红细胞(sheep red blood cell,SRBC)抗体滴度、新城疫(newcastle disease,ND)抗体滴度、禽流感(avian influenza,AI)抗体滴度5个免疫性状,并进一步分析了SNP位点与免疫性状的关系。【结果】共检测出6个SNP位点,分别为T107G突变、T130A突变、C143T突变、A208C突变、T241G突变及T274C突变。经关联分析,发现107、208、241及274位点存在显著的基因型效应(P<0.05或P<0.01),基因型组合对H/L值及ND抗体滴度两个性状上存在显著效应(P<0.05)。【结论】241位点突变型个体3个免疫性状均优于野生型,有望在鸡的抗病育种中筛选为新的标记位点。利用基因型组合选择效果优于对单个位点的选择。
【英文摘要】【Objective】 The SNPs of IL-1β gene and their correlations with some immune traits were tested. 【Method】 A pair of primers were designed as the sequence of IL-1β of red jungle fowls,and the SNPs of intron 1 and 2 of IL-1β gene in Rugao Chicken(RG),Wenchang Chicken(WC),and Anka Chicken(AK) were detected using PCR-SSCP. Meanwhile,concentration of IL-1,H/L value,SRBC antibody titer,ND antibody titer and AI antibody titer were detected at 56 days of age. Then,the correlation between SNP sites and immune traits were analyzed. 【Results】 Totally 6 SNP sites were detected at T107G,T130A,C143T,A208C,T241G and T274C. Furthermore,the mutation at 107,208,241 and 274 sites were found association with immune traits (P <0.05 or P<0.01),and some genotype combinations significantly affected H/L value and ND antibody titer (P<0.05). 【Conclusion】 The mutation at 241 site may be selected as a new candidate mark in disease resistance breeding because of its better performance in three immune traits than that of wild type chickens. Selecting breeder chickens by genotype combinations had more effect than by single genotype of SNPs.

【题目】利用实时荧光定量RT-PCR检测鸡A-FABP和H-FABP基因的差异表达
【中文关键词】荧光定量逆转录PCR; A-FABP基因; H-FABP基因; 相对定量; 鸡;
【英文关键词】FQ-RT-PCR; A-FABP gene; H-FABP gene; relative quantification; chicken;
【中文摘要】依据鸡A-FABP和H-FABP基因及参照基因GAPDH序列设计引物,以鸡心肌、胸肌和腿肌、肝脏和腹脂总RNA逆转录合成的cDNA为模板,GAPDH基因为参照基因,应用SYBRGreenI实时荧光定量PCR检测如皋黄鸡和安卡红鸡A-FABP和H-FABP基因的差异表达。结果表明:A-FABP、H-FABP基因和参照基因GAPDH基因融解曲线为单峰,无杂峰及二聚体,其扩增效率分别为99.7%、99.8%和100.0%。如皋黄鸡H-FABP基因在心肌、胸肌和腿肌的差异表达量分别是安卡红鸡的0.0860、0.0680倍和0.0580倍(P<0.05)。H-FABP基因mRNA表达量与肌内脂肪含量呈显著负相关。如皋黄鸡A-FABP基因在腹脂和肝脏的表达量分别是安卡红鸡的15.9640倍和10.9640倍(P<0.05),而在心肌、胸肌和腿肌的表达量差异不显著。

【英文摘要】The relative expression in heart and adipocyte fatty acid-binding protein(H-FABP and A-FABP) genes was detected using real time quantitative RT-PCR in Rugao and Anka chicken.The primers were designed according to the sequences of H-FABP,A-FABP and GAPDH gene.GAPDH gene was the internal reference gene.The cDNA fragment was amplified from leg muscle,breast muscle,cardiac muscle,liver and abdominal fat mRNA;H-FABP,A-FABP and GAPDH gene expression was detected using SYBR Green I real-time fluorescent quantity PCR.Melting curve analysis showed a single peak of H-FABP,A-FABP gene and GAPDH gene.PCR efficiency of H-FABP,A-FABP and GAPDH was 99.7%,99.8% and 100.0% respectively.The relative H-FABP mRNA level(ratio of Anka to Rugao) in cardiac muscle was 0.0860,0.0680 and 0.0580,significantly higher than that of the other tissues(P < 0.01).H-FABP mRNA expression level was significantly negative correlation with IMF contents.The relative A-FABP mRNA level(ratio of Anka toRugao) in abdomen fat and liver was 15.9640 and 10.9640,significantly higher than that of the other tissues(P < 0.01).The relative A-FABP mRNA level in abdomen fat was higher than that of Liver.There were no significant differences between leg muscle,breast muscle and cardiac muscle of relative A-FABP mRNA levels.

【题目】鸭A-FABP基因内含子1多态性与肌内脂肪和血清甘油三酯含量相关研究
【中文关键词】鸭; A-FABP基因; 克隆; SSCP; 肌内脂肪; 血清甘油三酯;
【英文关键词】duck; A-FABP gene; clone; SSCP; intramuscular fat; serum Triglyceride;
【中文摘要】本研究旨在探讨鸭脂肪型脂肪酸结合蛋白(Adipocyte Fatty Acid-Binding Protein,A-FABP)基因部分序列多态与鸭肌内脂肪和血清甘油三酯含量关系。根据鸭A-FABPmRNA序列和鸡A-FABP基因组序列设计1对引物扩增鸭A-FABP基因内含子1序列。同时根据扩增产物设计4对引物,利用PCR-SSCP对鸭A-FABP基因部分序列进行多态性研究并探究序列多态性与鸭肌内脂肪和血清甘油三酯含量的关系。结果表明:克隆序列包含鸭A-FABP基因外显子1、2部分序列和完整的内含子1序列,与鸡A-FABP基因内含子1同源性为75.1%;经SS-CP检测,发现引物P1扩增片段有3处碱基突变,引物P3有6处碱基突变,这些突变分别产生了3种和8种基因型。在P1位点樱桃谷鸭和苏牧麻鸭偏离了Hardy-Weinberg平衡(P<0.01),金定鸭基因型分布符合Hardy-Weinberg平衡(P>0.05),在P3位点3个群体均符合Hardy-Weinberg平衡(P>0.05)。同时,这些基因型在不同群体中分布存在显著或极显著差异(P<0.05或P<0.01)。最小二乘分析显示,肌内脂肪和血清甘油三酯含量在各群体中有显著差异(P<0.05),P1和P3位点各基因型对肌内脂肪含量无显著影响(P>0.05),仅在P3位点CD基因型个体血清甘油三酯含量显著高于其他基因型个体(P<0.05)。结果提示,鸭A-FABP基因内含子1多态对血清甘油三酯含量有一定影响,但是否影响鸭肌内脂肪沉积,还需进一步研究。
【英文摘要】This experiment was conducted to study the association of the polymorphism of partial Adipocyte Fatty Acid-Binding Protein(A-FABP) gene with the content of intramuscular fat and serum Triglyceride in ducks.A pair of primers P-in1 was designed according to the sequences of A-FABP gene mRNA in duck and A-FABP gene in chicken to amplify duck intron-1 of A-FABP gene,then 4 pairs of primers were designed according to the cloned gene.The SNPs were detected by PCR-SSCP,confirmed by sequencing,then the association of polymorphism of A-FABP gene with the content of intramuscular fat and serum Triglyceride was studied.The results indicated that the product by P-in1 included partial exon-1,exon-2 and complete intron-1 of A-FABP gene after clone and sequence,and homologous comparison was done between duck and chicken A-FABP gene,which showed the homology was 75.1%.Three and six nucleotide mutations were found in the products by primer P1 and P3,respectively,which resulted in three and eight genotypes,respectively.The results of Chi-Square test showed that Cherry Valley duck and Sumu duck deviated from the Hardy-Weinberg equilibrium(P<0.01) except Jingding duck in P1 locus,and all of the three groups fit with it in P3 locus(P>0.05),while the distribution of them was different in various groups(P<0.05 or P<0.01) at the same time.The least square analysis showed that the content of IMF and TG were significant difference in different groups(P<0.05),but the content of IMF had no significant difference between genotypes in P1 and P3(P>0.05),only content of TG had significant difference in various genotypes in P3 and the ducks with CD genotype had higher content of TG than those with other genotypes(P<0.05).These results suggested that polymorphism in intron-1 of A-FABP gene have certain effect on TG content,also indicated that it needs further study to get a conclusion if these SNPs can influence the intramuscular fat trait in duck.

【题目】鸭生长激素(GH)基因编码区及调控区多态性分析
【中文关键词】鸭; 生长激素基因; 单核苷酸多态性
【英文关键词】duck; growth hormone gene; single nucleotide polymorphism
【中文摘要】根据鸭生长激素基因编码区及调控区的序列设计8对引物,利用PCR-SSCP方法对北京鸭、西湖野鸭、樱桃谷鸭、金定鸭、山麻鸭、荆江鸭、绍兴鸭、缙云麻鸭等8个鸭种进行单核苷酸多态性分析。结果共发现3个突变位点,分别为230处(C→G)、244处(C→A)和3 701处(C→T)。前两处突变位于5′调控区,3 701处突变位于编码区第4外显子,但该编码区的突变是沉默突变,3′调控区表现了高度的保守性。统计结果发现:⑴在5′调控区基因座上,金定鸭的等位基因B频率显著高于其他品种;⑵在外显子4基因座上,基因型频率的分布与品种有关,且肉用型鸭的CC基因型频率显著高于蛋用型。可以推测,本研究所检测到的基因座可能与生产性能相关。
【英文摘要】The single nucleotide polymorphism(SNP) of growth hormone gene was investigated in various breeds of duck,including Beijing ducks,Xihu mallards,Cherry Valley Meat ducks,Jinding ducks,Shan Partridge ducks,Jingjiang ducks,Shaoxing ducks and Jinyun Partridge ducks.Eight pairs of primers for coding and regulation regions of GH gene were designed based on the database of duck genomic sequence and the SNPs were detected by PCR-SSCP method.Three SNPs were found among individuals,which were 230(C→G),244(C→A) in 5′-UTR and 3 701(C→T) in exon 4,respectively.However,the mutation at 3 701 was a silence mutation.And the 3′-UTR represented its own high conservativeness.The analysis results showed that: ⑴At locus of 5′-UTR,the frequency of B allele in Jinding ducks was significantly higher than that in other breeds.⑵At locus of exon 4,the frequencies of genotypes in different breeds were significantly different,and the frequency of CC genotype in meat-type ducks were significantly higher than that in laying-type ducks.According to the results above,we can conclude that these SNPs may have relationship with some productive traits of ducks.

【题目】鸭生长激素基因内含子2、3多态性分析
【中文关键词】鸭; 生长激素基因; 单核苷酸多态性
【英文关键词】duck; growth hormone gene; single nucleotide polymorphism
【中文摘要】根据鸭生长激素基因内含子2、3的序列设计5对引物,利用PCR-SSCP方法对北京鸭、西湖野鸭、金定鸭、山麻鸭、荆江鸭、绍兴鸭等6个鸭品种进行了单核苷酸多态性分析,并检测其多态性。结果共发现8个突变位点,其中内含子2有7个:2593处C-T,2770处G-A,2813处T-A,2829处C-A,2894处C-T,2896处T-C,3100处C-G;内含子3有1个:3270处A-G。统计结果显示,这8个变异位点的基因型频率分布与品种有关,在这些基因座的变异水平上,北京鸭和绍兴鸭表现出了相当的品种保守性,本研究所检测到的这些基因座可能与鸭的生产性能有关。
【英文摘要】The single nucleotide polymorphism (SNP) of growth hormone gene was investigated in various breeds of duck, including Beijing ducks, Xihu mallards, Jinding ducks, Shan Partridge ducks, Jingjiang ducks and Shaoxing ducks. The primers for intron 2 and 3 in GH gene were designed based on the database of duck genomic sequence and the SNPs were detected by PCR-SSCP method. Eight SNPs were found among individuals within a breed, which were 2593(C-T), 2770(G-A), 2813(T-A), 2829(C-A), 2894(C-T), 2896(T-C), and 3100(C-G) in intron 2 and 3270(A-G) in intron 3. The analytic results showed that the frequencies of

genotypes in different breeds were significantly different. Based on these SNPs, Beijing ducks and Shaoxing ducks represented their own unique conservativeness, indicating that these SNPs may have relationship with some productive traits of duck.

【题目】The Ecological Compensation of Land Consolidation and Its Evaluation in Hilly Area of Southwest China
【中文关键词】
【英文关键词】land consolidation; ecological compensation; hilly area; ecological environment
【中文摘要】
【英文摘要】Land consolidation is an important action to realize the reasonable disposition of land resource and enhance the land utilization efficiency in China. But as a regional reconstructive activity, there are inevitably directly or indirectly, positive or negative impacts on its regional ecological environment in land consolidation process. To minimize the negative impact of land consolidation, positive practices for ecological compensation was necessary. Taken a land consolidation project in Yujia and Qiaoting village in Wanzhou District of Chongqing as case, the ecological compensation measures and ecological effect was studied in this paper. The result show that compensation practices such as protecting the arable layer, building slope-terrace, taking stone as the raw material for channels, irrigation channel and drainage channel separately in channel design, adopting the mud-gravel road, and building culvert in the intersections of roads and channels can significantly reduce the negative ecological effect in the processes of land consolidation. So, the eco-design in land consolidation project can realize ecological compensation and also achieve the coordinated development of economy, ecology, and society.

【题目】繁殖群体量及隔离对蚕豆种质遗传完整性的影响
【中文关键词】蚕豆;繁殖更新; AFLP;遗传完整性;种质保存
【英文关键词】Vicia faba L. ; Regeneration; AFLP; Genetic integrity; Germplasm conservation
【中文摘要】为研究繁殖群体量和隔离方式对常异花授粉作物蚕豆种质繁殖更新的影响, 以9 份蚕豆地方种质为对象, 以国家库保存的原种为对照群体, 采用 AFLP 分子标记方法, 对比了50 株和20 株群体量及开放无隔离群体和网棚隔离群体更新后代的遗传完整性差异 结果表明:与对照群体相比, 50 株和20 株群体的多态性位点数 多态位点百分率每位点有效等位基因数 香农指数 遗传多样性指数均出现不同程度下降, 但下降幅度 20 株大于 50 株群体; 遗传相似性和 UPGMA 聚类分析表明50 株群体与对照群体的遗传相似性高于20 株群体;网棚隔离可降低群体间串粉与花粉污染, 但其遗传完整性却较开放无隔离群体低
【英文摘要】The genetic integrity of nine faba bean landraces and their regeneration groups were studied to investigate the effects of sample sizes and isolation methods on the regeneration of faba bean (Vicia faba L.) using AFLP markers.Seeds stored in the national genebank were used as control. The results showed that: compared with those of the control group,the number of polymorphic loci,rcentage of polymorphic loci, effective number of alleles per locus,Shannon index,and genetic diversity index decreased in 50 and 20 plants groups, but the decline was greater in 20 plants group.Genetic similarity analysis and UPGMA cluster results showed that the genetic similarity between control and 50 plants group was higher than that between control and 20 plants group. Cages isolation can reduce pollen contamination, but their genetic integrity was lower than that of the open pollination groups.

【中文摘要】种子的衰老是一个复杂的从量变到质变的生物学过程 种子衰老与线粒体功能异常密切相关, 衰老的线粒体学说认为, 线粒体中活性氧的过量产生是种子衰老的主要原因 深入了解种子衰老过程中线粒体的变化对于揭示种子衰老机理和种子安全保存具有重要意义 本文主要介绍了当前有关种子衰老过程中线粒体结构 呼吸作用和抗氧化系统的研究现状,并对种子衰老与线粒体关系研究中存在的问题进行了讨论
【英文摘要】Seed aging is a complex biological progress from quantitative change to qualitative change. Seed aging is closely related to the dysfunction of mitochondria. In the view of the “ mitochondria aging theory ” ,the excessive accumulation of ROS in mitochondria is the main reason of seed aging. Understanding the changes takes place in mitochondria during seed aging is important to reveal the mechanism of seed aging and ensure safe conservation of seeds.In this paper,the current process of mitochondrial structure,respiration and antioxidant systems during seed aging were reviewed. Moreover,problems in the study of seed aging and mitochondria were discussed.

【题目】Cryopreservation of in vitro-grown apical meristems of Liliumby droplet-vitrification

【中文关键词】百合;离体茎尖;正交设计;小滴玻璃化法;超低温保存
【英文关键词】Apical meristem; Cryopreservation; Droplet-vitrification method; Lily (Lilium L); Orthogonal experimental design
【中文摘要】以西伯利亚百合试管苗离体茎尖为试材,通过正交设计试验和单因素试验对预培养基中蔗糖浓度、预培养时间、装载时间和PVS2处理时间等影响超低温保存存活率的主要因素进行了研究,并对小滴玻璃化法和玻璃化法保存效果的差异进行了分析。结果表明,百合离体茎尖在蔗糖浓度为0.3M的预培养基上预培养2天,装载20~40min,PVS2处理90~120min,获得的存活率和再生率最高,小滴玻璃化法优于玻璃化法。三个百合品种,西伯利亚、卷丹、雪皇后的存活率分别为65.0%,83.8%和43.3%;再生率分别为 62.0%,67.6% 和35.0%。
【英文摘要】In this study, apical meristems from adventitious buds of three lily (Lilium L.) cultivars were successfully cryopreserved by droplet-vitrification. The most effective techniques were as follows. Excised meristems from in vitro plantlets which had been subcultured for about 2 months were cold-hardened at 4 ° C for 1 week, precultured on MS medium supplemented with 0.3 mol L − 1 sucrose for 2 days, osmoprotected in loading solution for 20 – 40 min at room temperature and then soaked in PVS2 solution for 90 – 120 min at 0 ° C, frozen in microdroplets of vitrification solution placed on aluminium foils, which were immersed rapidly in liquid nitrogen. The meristems were then rapidly rewarmed by dilution solution, transferred to regeneration medium and stored in the dark for two weeks at 20 ° C, and then cultured under white fluorescent light at an intensity of 2000 lux, with a 16 h photoperiod at 20 ° C. The highest post-thaw survival percentages of three cultivars ‘ Siberia ’ (Lilium ×siberia), Lilium lancifolium Thunb. and ‘ Snow Queen ’ Lilium×longiflorum were 65.0%, 83.8% and 43.3%, and regenerationpercentages were 62.0%, 67.6% and 35.0%, respectively. The study demonstrated that cryopreservation by droplet-vitrification increased survival and regeneration percentages of certain lily cultivars compared with vitrification. Thus to cryopreserve lily meristems, droplet-vitrification method is preferable to the vitrification method.

【题目】Effects of different conservation methods on the genetic stability of potato germplasm
【中文关键词】马铃薯;基因库保存;农艺性状;同工酶;SSR标记;遗传稳定性
【英文关键词】Solanum tuberosum, germplasm conservation, agronomic character, isoenzyme, SSR marker, genetic stability
【中文摘要】本文从农艺性状调查、同工酶生化标记和SSR分子标记3个水平对在国家种质克山马铃薯试管苗库和种质圃均保存15年的50份马铃薯种质资源进行了遗传稳定性检测。结果显示,每一份田间种质圃和试管保存材料的农艺性状与原始记录相比都有较大的差异。试管苗在田间种植两年后,其农艺性状与原始记录的相似程度比种植一年有所增加;有10个品种的种质圃和试管苗保存材料之间存在同工酶酶带的差异。SSR分析结果显示50份资源的种质圃和试管苗保存材料之间都存在着遗传差异,遗传相似系数在0.735~0.993之间;有3份资源的田间种质圃和试管保存材料两者没能够首先聚类到一起。试管保存和大田种质圃保存材料在长期保存过程中都有可能使马铃薯资源产生遗传变异。利用试管苗保存种质资源比较方便,而且劳动强度低,有利于快速繁殖和资源交流;利用田间种质圃保存种质资源则费时费力。因此,马铃薯资源保存时,可以以试管苗保存为主,辅助以田间种质圃种植相结合,并在保存过程中定期进行遗传稳定性检测,以最大限度地保持种质资源的遗传完整性。
【英文摘要】A total of 50 potato (Solanum tuberosum L.) varieties were maintained in vitro or under field conditions at Keshan National Genebank (KNG) for 15 years. At the end of the conservation period, a two year field trial was conducted to evaluate the effect of conservation methods on the genetic stability of accessions,using agronomic characters, isoenzyme markers, and DNA molecular markers. None of the 50 varieties maintained under field conditions had completely preserved agronomic characters. Plants kept in vitro dem onstrated still lower level of stability than those conserved under field conditions. Differences in the isoenzyme electrophoresis patterns were found in ten of the varieties tested. The SSR (simple sequence repeat)analysis indicated genetic variation between each variety maintained in vitro and under field conditions and showed the genetic similarity coefficient ranged from 0.735 to 0.993. Three of the accessions maintained in vitro and under field conditions did not cluster together. The results suggest that the genetic stability of varieties maintained under field conditions was higher than those maintained in vitro. Therefore, in order to maintain the genetic integrity of potato germplasm resources, field conservation should be used for long term conservation of potato germplasm

collections, and the genetic stability should be checked regularly.

【题目】论植物营养智能化递释系统与精准施肥
【中文关键词】智能化递释系统; 缓/控释肥料; 纳米材料; 精准施肥
【英文关键词】smart delivery system; slow / controlled release fertilizers; nano2materials; p recision fertilization
【中文摘要】化学肥料的增产效应受报酬递减率的制约,随着单位面积施肥量的增加,其投入产出效率和有效利用率将会持续降低,养分流失所引发的水体与面源污染也将愈发突出。因此智能化控释肥料的开发与应用是促进环境友好型、可持续农业发展的重要途径。应用纳米技术,特别是以纳米材料为肥料载体或控释介质构建“植物营养智能化递释系统”,有利于突破智能化肥料发展的关键技术瓶颈。本文基于纳米材料学与纳米药物学的观点,针对植物营养智能化递释系统的构建、养分释放与靶向传输的智能化调控机理、智能化肥料设计与精确施肥等理论问题进行了综合评述与讨论。
【英文摘要】The yield2increasing effect of chemical fertilizers is subjected to the law of diminishingmarginal returns.With increasing amount of fertilization per unit area, its input2output efficiency and nutrients absorbing rate will reduce continually; consequently, cause water body and point source pollution. Thus, the development of chemical ertilizerswith intelligently controlled release function has become one of important app roaches for promoting the development of environment-friendly and sustainable agriculture. The application of nanotechnology has been approved to be promising for developing smart fertilizer by using nano-structured materials as fertilizer carriers or a controlled-releasing media for construction of so2called“ plant nutrients delivery system ”. Based on the point of view of nano-pharmacology, this paper reviewed and discussed the underlying theory of smart fertilizer and precise fertilization based on nanotechnologies, such as the interp retation and construction of plant nutrients delivery system, rhizosphere-targeted delivery of soil nutrients, intelligently controlled release patterns and regulatingmechanism of fertilizer nutrients, parameter design of“ smart ”fertilizers and precision fertilization, etc

【题目】猪MyD88基因的原核表达
【中文关键词】猪MyD88分子;原核表达;大肠埃希菌
【英文关键词】porcine mydoid differentiation factor 88(pM yD88);prokaryotic expression;Escherichia coli
【中文摘要】:采用PCR方法从pGEM—pMyD88重组质粒中克隆了猪MyD88分子全长基因,构建了无信号肽序列的原核表达载体pET一30a—pMyD88一ED,在不同IPTG浓度和时间下进行诱导表达,利用切胶洗脱法纯化表达的融合蛋白。结果表明,在IPTG诱导浓度为0.05 mmol/L,诱导时间为6 h时表达量达到最大,SDS—PAGE分析表明表达出约35 ku的融合蛋白,主要以包涵体的形式存在;通过切胶纯化后,融合蛋白的纯度可达90%;Western blot分析显示,表达的融合蛋白能被抗His标签的单克隆抗体识别,说明目的蛋白在大肠埃希菌中得到了成功表达。
【英文摘要】Porcine MyD88 molecule fragment(pM yD88一ED)was amplied by PCR method from the pGEM—T—pM yD88 recom binant plasmid,the pM yD88一ED was cloned into pET~30a vector and expressed inEscherichia coli.The recombinant strain was induced in different IPTG concentrations and different time.The results showed that the optimum concentrations of IPTG is 0.05 mmol/L,‘ the optimum time is 6 h.SDS—PAGE analysis showed that the recombinant protein was expressed with a molecular weight of 35 ku and existed mainly in the form of inclusion bodies.The protein was purified by elution methods and the purity reached 90 . The

Western—blot analysis indicated that the hybridization bands is appeared around 35 ku · and it showed that the fusion protein was identified by the monoclonal antibody of HIS label protein,so the target protein was expressed successfully in the Escherich ia coli.

【题目】茄子甲硫氨酸亚砜还原酶(SmMsrA)基因cDNA 全长的克隆和分析
【中文关键词】茄子;单性结实;甲硫氨酸亚砜还原酶;表达分析
【英文关键词】eggplant;Solanum melongena;parthenocarpy;methionine sulfoxide reductase;
expression analysis
【中文摘要】以茄子单性结实品系D-10 花后7 d 的单性结实果实为试材,并以在茄子单性结实抑制差减文库中差异表达的EST 片段Z569 为基础,利用RACE 技术,获得一个934 bp 的cDNA 全长序列,为甲硫氨酸亚砜还原酶A 基因,命名为SmMsrA。基因编码区共600 bp,编码199 个氨基酸。氨基酸序列分析显示该基因编码的蛋白具有甲硫氨酸亚砜还原酶基因家族结构域和保守基本序列GCFWG,与杨树甲硫氨酸亚砜还原酶A(MsrA)蛋白三级结构相似性较高,为67%。蛋白多序列比对和进化树分析表明,SmMsrA与番茄MsrA 蛋白的同源性最高(92%),进化距离最近。采用荧光定量PCR 对单性结实品系D-10 和非单性结实品系03-2 中不同结实性果实发育过程中SmMsrA 的表达量进行测定,结果表明:在不同结实性的子房和果实发育过程中SmMsrA 基因都有表达,单性结实品系在低温条件下开花当天子房中的SmMsrA的表达量最高。
【英文摘要】Abstract:Using parthenocarpic fruit of eggplant(Solanum melongena)harvested seven days afteranthesis from line D-10 as material,based on the EST Z569 from eggplant parthenocarpic suppressionsubtractive hybridization library,a full cDNA(934 bp)was cloned by rapid amplification of cDNA ends(RACE). The cloned gene was Methionine sulfoxide reductase A(MsrA)gene(SmMsrA),containingan open reading frame(600 bp)and encoding a protein of 199 amino acids. The predicted protein was amember of the peptide methionine sulfoxide reductase(PMSR)superfamily,and contained a conservedsequence GCFWG. The tertiary structure of SmMsrA was similar to the poplar MsrA model(2j89)with asimilarity of 67%. Multiple sequence alignments and phylogenetic tree analyses showed that SmMsrA hadthe highest similarity(92%)with the tomato MsrA(accession number P54153). The expression of SmMsrAwas determined by real-time quantitative RT-PCR during the fruit development of line D-10(parthenocarpic fruits and seeded fruits)and line 03-2(unparthenocarpic fruits and seeded fruits). Theresult showed that the SmMsrA gene was expressed throughout eggplant fruit development in differentcultivars,and in parthenocarpic ovaries the highest expression was at anthesis day and under suboptimaltemperatures.

【题目】Toll 样受体2、4 对病毒囊膜蛋白的识别
【中文关键词】Toll 样受体;先天性免疫;囊膜蛋白;抗病毒免疫
【英文关键词】TLRs; Innate immunity; Envelope protein; Antiviral immunity
【中文摘要】TLR2、4 是TLRs 家族中重要的成员,通过识别囊膜病毒的PAMPs/DAMPs,活化依赖和非依赖于MyD88 的信号通路,诱导促炎性细胞因子和趋化因子等的释放,介导先天性抗病毒免疫反应。本文就TLR2、4 的基本概况、结构特征、抗病毒信号通路以及对不同囊膜病毒的天然免疫反应等相关研究进展进行简要综述。
【英文摘要】TLR 2 and 4 are impor tant members of the TLRs family, which are utilized by the innateimmune system to recognize viral PAMPs/DAMPs. TLR 2 and 4 play critical roles in initiating innate antiviral immune responses by activating the MyD88 dependent and independent signaling pathway, and leading to induction of proinflammatory cytokines and chemokines. In this review, we focus on the current knowledge of TLR 2 and 4 mediated antiviral innate immune responses to viral infections, including molecular features, antiviral signaling pathway, and antiviral immune responses.

【题目】猪IFN-γ和CpG基序双因子重组质粒增强亚洲Ⅰ型口蹄疫灭活病毒抗原免疫水平的研究
【中文关键词】γ干扰素;CpG基序;口蹄疫病毒灭活抗原;免疫佐剂
【英文关键词】Interferon-gamma(IFN-γ);CpG ODN;killed FMDV;adjuvant
【中文摘要】分析CpG基序与猪IFN-γ基因组合的重组表达质粒对口蹄疫灭活抗原的免疫佐剂效应。以亚洲Ⅰ型口蹄疫灭活病毒为抗原,与含有猪IFN-γ基因和CpG基序的重组质粒配伍,采用肌肉注射法免疫小鼠,加强免疫后检测口蹄疫特异性抗体和中和性抗体水平、T淋巴细胞增殖反应、体内细胞毒性T细胞杀伤反应以及细胞因子IL-4、IL-6和IFN-γ的分泌水平。发现猪IFN-γ和CpG基序双因子重组质粒相对单一的因子能诱导更强的体液免疫和细胞免疫反应水平,尤其在中和性抗体和抗原特异性CTL反应方面更为明显。猪IFN-γ和CpG基序在诱导小鼠抵抗亚洲Ⅰ型口蹄疫灭活病毒免疫方面具有良好的佐剂效应,其重组质粒可望成为一种有前途的新型免疫佐剂。
【英文摘要】Abstract:The present experiment was performed to determine whether a recombinant expressionplasmid of IFN-γ and CpG ODN co-administrated with FMD antigen can enhance the immunological response.The mice were vaccinated intramuscularly with the conventional FMD antigen alongwith a recombinant plasmid inserted porcine IFN-γ gene and CpG ODN sequence.Specific antibody and neutralizing antibody of FMDV,lymphocyte proliferation,specific cytotoxic T lymphocyte(CTL)reaction and the

secretory cytokines were detected.Adjuvant effect of the combination compared with CpG ODN alone on the antigen was able to elicit much stronger humoral immunity and cellular immunity in mice vaccinated,especially increase the neutralizing antibody leveland CTL roles.Porcine IFN-γ and CpG ODN can enhance the immunological response against theFDMV antigen in mice,the recombinant plasmid of porcine IFN-γ and CpG ODN is potential to bean alternative adjuvant for the future FMD vaccine.

【题目】猪IL-2基因在毕赤酵母中的高效表达及生物活性分析
【中文关键词】猪IL-2基因;毕赤酵母;活性分析
【英文关键词】porcine interleukine 2gene;Pichia pastoris;bioactivity analysis
【中文摘要】本研究根据密码子偏爱原则设计猪IL-2引物,克隆其基因后构建pPIC9k-IL-2重组表达载体,线性化后电转化毕赤酵母GS115,获得优化密码子的重组酵母转化子;再用G418抗性梯度法筛选得到多拷贝重组菌株,不同条件下进行甲醇诱导表达。结果表明:经PCR鉴定IL-2基因已整合到酵母基因组中。表达产物经SDS-PAGE电泳分析发现相对分子质量为16、20ku两条目的蛋白表达带,脱糖基化分析表明目的蛋白得到了适度的糖基化修饰,Western blotting分析显示表达的蛋白具有良好的免疫反应性,分子筛纯化可以获得纯度为95%的蛋白质,淋巴细胞增殖活性分析表明所得的蛋白质具有促淋巴细胞增殖的活性。毕赤酵母表达系统可以高效地表达具有生物活性的重组猪IL-2蛋白分子。
【英文摘要】A pair of primers was designed to clone IL-2gene according to the codon bias principle and the recombinant expressed vector pPIC9k-IL-2was constructed.The recombinant plasmid was transformed into P.pastoris GS115by electroporation,the positive recombinant strains was screened with different G418concentration and induced with methanol.The result showed that IL-2gene was integrated with chromosome of P.pastoris by PCR identification.The expressed product had a molecular weight of 16and 20kD bands by SDS-PAGE analysis.The result of deglycosylation analysis indicated that the protein was glycosylated moderately.The protein was purified with sephadex column and had a bioactivity of lymphocyte proliferation.The Western blotting analysis showed that target protein had immunological activity.P.pastoris expressed system is an efficient way of production of pIL-2,the expressed product had a good bioactivity

【题目】Adsorption of avermectins on activated carbon: equilibrium, kinetics, and UV-shielding
【中文关键词】无
【英文关键词】activated carbon; avermectins; adsorption; UV-shielding
【中文摘要】无
【英文摘要】The adsorption of biopesticide avermectins onto activated carbon from ethanol solution with different initial concentrations at 303.15 K was performed. The obtained equilibrium and kinetic data of the adsorption process were assayed to evaluate the adsorption potential of activated carbon for avermectins. The results show that the activated carbon is effective for the adsorption of avermectins. Moreover, the adsorption of avermectins onto activated carbon agrees with Langmuir isotherm model,while pseudo-second-order kinetics model is better fitable for such adsorption process. In addition, activated carbon can efficiently protect adsorbed avermectins from photodegradation.

【题目】Transient Expression of Exogenous Gene into Plant Cell Mediated by PEI Nanovector
【中文关键词】无
【英文关键词】polyethylenimine, gene nanovector, plant cell, transient expression, Arabidopsis thaliana protoplast
【中文摘要】无
【英文摘要】This study was carried out to investigate the transfection effect of exogenous gene into plant protoplast cell mediated by polyethylenimine (PEI) nanovector, based on PEI gene delivery system in the field of medical science. PEI/DNA complexes were prepared by using PEI polymer to bind the plant expression plasmid, pCMl205-GFPn. The ability of PEI combiningand protecting DNA was investigated by agarose gel electrophoresis retardation assay. The surface characteristics of PEI/DNA complexes were observed with transmission electron microscope. The transfection efficiency of Arabidopsis thaliana protoplasts mediated by PEI/DNA complexes at different N/P ratios was analyzed based on observation of transient expression of green fluorescent protein with confocal laser scanning microscope. PEI could bind and condense DNA, and form stable 100-200 nm PEI/DNA complexes when the proportion of PEl and DNA is in the range of 5:1-1:4.Transfection efficiency of PEI/DNA complexes increased with N/P ratios in range of N/P<5 and reached the highest at N/P=5, and began to decrease beyond N/P>5 as higher toxicity to cells. The transfection efficiency of PEI/DNA complexesat N/P=5 was higher than PEG. This study confirmed that PEI nanovector could effectively mediate foreign gene entering into A. thaliana protoplast cell to obtain transient expression, which may be developed as a hopeful and novel transgenic method combined with plant protoplast regeneration.

【题目】纳米Cu2+/TiO2抗菌膜对禽流感病毒(H9N2)的灭活效应
【中文关键词】Cu2 + / TiO2 ; 禽流感病毒(H9N2) ; 光催化;灭活效应
【英文关键词】Cu2 + / TiO2 ; avian influenza (H9 N2) ; photocatalysis ; inactivation eff iciency
【中文摘要】利用病毒滴度测定和MDCK细胞电镜观察法,初步探讨了在365nm 的黑光灯(UV) 照射下,纳米Cu2 + / TiO2 抗菌膜对禽流感病毒(H9N2) 的光催化灭活效应,并分别考察了UV 强度、UV 照射时间以及H9N2 病毒量对H9N2 病毒光催化灭活效应的影响。实验结果表明, 在365nm 黑光灯的照射下, 纳米Cu2 + / TiO2 抗菌膜对H9N2 病毒具有显著的灭活效应,在UV 强度为0. 5mW/ cm2 、UV 照射时间为2. 5h 、病毒量为0. 1ml 时, H9N2 病毒的灭活率达到了100 %。研究结果表明,纳米Cu2 + / TiO2 抗菌膜在抑制禽流感(H9N2) 病毒在环境媒介中的扩散与传播方面有潜在的应用价值。
【英文摘要】Nano2Cu2 + / TiO2 was synthesized through a sol2gel met hod , and it s p hotocatalysis of inactivation efficiency on avian influenza (H9N2) were evaluated under 365nm UV black light . Hemagglutination test s were used to determine t he change of the titer of H9N2 . Microscope was used to observe t he deformation of MDCK cell s. The inactivation efficiencies of nano2Cu2 + / TiO2 sol on H9N2 virus were st udied by adjusting t he UV intensity , t he UV illumination time , and the quantity of H9N2 . The result s show that nano2Cu2 + / TiO2 has a remarkable inactivation on H9N2 virus under 365nm UV irradiation. It s inactivating rate on H9N2 viruses can be reached up to 100 %, when t he UV intensity is 0. 5mW/ cm2 , the quantity of H9N2 is 0. 1ml , and the UV illumi2 nation time is 2. 5h. This suggested t hat t he nano2Cu2 + / TiO2 sol has great potential as a kind of anti2virus agent for preventing Avian Influenza.

【题目】纳米TiO2半导体溶胶的光生物学效应
【中文关键词】纳米材料;TiO2;植物病害;防治;光合色素
【英文关键词】nanomaterial;TiO2:Plant disease:Prevention:Photosynthetic Pigments
【中文摘要】通过溶胶一凝胶法制备了纳米TIO:半导体溶胶材料(nan,Tio:semiconductor501,NTSS),并测定了抗菌性能;以黄瓜为研究对象,初步探讨了NTSS在防治植物细菌性/真菌性病害及增加叶片光合色素含量方面的光生物学效应.试验结果表明,溶胶材料中TIO:颗粒的结晶型为锐钦矿型,平均粒径为30.6nm;TIO:溶胶材料可在叶片等固体表面形成连续、稳定的抗菌薄膜,具有很强的光氧化活性,抗菌率达到99.9%;通过人工接种病原菌试验及田间病害调查试验发现,黄瓜喷施一定浓度的NTSS后,可显著降低叶片病斑面积、发病率及病情指数,对黄瓜细菌性角斑病/霜霉病的发生具有抑制效果;测定叶片光合色素含量发现,NTSS对叶绿素(Chi)及类胡萝卜素(Car)的生成具有促进作用.
【英文摘要】Nano-TiO2 semiconductors sol (NTSS)was synthesized through a sol-gel method,and its antibacterial abilities were identified by using bacterial Pathogens of P seudomonos syringae Pv. Lachrymans and Xanthomonasvesicatoria. Taking cucumber plants as experimental objects,the Photobiologieal effeets of NTSS on preventing fromplant bacterial/fungal diseases and promoting eontents of photosynthetic pigments were primarily studied. Results show that crystal species of TiO2 particles synthesized in experiments are inanatase Phase with average size of about30.6nm. NTSS Possesses strong oxidizing power with over 99.9% antibacterial rate by forming eontinuous and stable antibacterial films on surfaces of substance. Lesion areas, disease incidences and disease indexes of leaves can be significantly reduced by spraying NTSS on cucumber leaves: however,content of chlorophyll and carotenoid in leaves can be significantly promoted. It is proved that NTSS can significantly Prevent and control the development and pervasion of bacterial angular leaf spot of cucumber. The experimental results lay an important theoretieal foundation and technical approach for developing and applying of biofuntional nanomaterials in agricultural areas.

【题目】不同施肥处理下双季稻田CH4和N2O排放的全年观测研究
【中文关键词】稻田;CH4; N2O;施肥
【英文关键词】rice field,CH4,N2O,fertilization
【中文摘要】南典型红壤双季稻田为研究对象, 采用静态箱— 气相色谱法对不施肥对照(CK)、常规施化肥(NPK)、新鲜稻草与化肥配施(RS+ NPK1)、菌渣与化肥配施(MR+ NPK1)、新鲜牛粪与化肥配施(CD+NPK2)和沼渣与化肥配施(BD+NPK2)等6个处理的CH4和N2O排放通量进行为期一年的观测(早稻、晚稻和休闲期),研究排放特征与驱动因素。结果表明,不同处理的CH4排放均表现出“ 早稻生长期少,晚稻生长期多,休闲期弱 ”的特点,而N2O排放主要发生在水稻生长期内(78%以上),休闲期内排放较少。NPK的CH4排放比CK增加了35% ,差异不显著(P>0. 05,P是拒绝原假设的犯错概率)。有机无机配施处理中,RS+ NPK1和CD+ NPK2的CH4全年累计排放量分别是MR+ NPK1和BD+NPK2的2.44和2.45倍(P<0.05), 但后者的N2O全年累计排放量分别比前者提高了59%和102%(P>0. 05)。与单施化肥相比,有机无机配施使稻田氮肥N2O—N直接排放系数降低45%~80%。相关环境因素分析表明,水、热变化是驱动稻田CH4排放季节变化的主要因素。本研究未发现水分变化与N2O排放通量之间存在直接联系,而且CH4和N2O在排放时间上不存在消长关系。CH4和N2O的整体温室效应表明,CH4是当地双季稻田的主要温室气体。采用腐熟后的菌渣和沼渣代替新鲜的稻草和牛粪还田可以使稻田CH4排放量降低约60%,CH4和N2O的整体温室效应降低约50%,而稻谷产量保持不变。
【英文摘要】Annual CH4 and N2O emission fluxes were measured from double rice cropping systems under six fertilization treatments by using the method of static chamber-gas chromatograph techniques.The different treatments including non-fertilizer(CK),conventional chemical fertilizers(NPK),fresh rice straw with chemical fertilizers(RS+NPK1),mushroom residue with chemical fertilizers(MR+NPK1),fresh cow dung with chemical fertilizers(CD+NPK2),and biogas digestion with chemical fertilizers(BD+NPK2) were dedicated to this experiment in order to study the characteristics of CH4and N2O emissions and the relationship between gas emission fluxes and related environmental factors.The results showed that,seasonal variation of CH4emission fluxes under different treatments displayed the same trend,which can be described as “ lower in early rice growing period,higher in late rice growing stage,and negligible in the fallow season ”.The majority of N2O emissions(more than 78%)occurred in rice growing periods,and small amounts of N2O emission occurred in the fallow season.Although the annual accumulated CH4emission amount for NPK was increased by 35%compared with CK,the difference between them was not significant at 0.05level.Among different treatments of organic and mineral fertilizers,the annual accumulated CH4emission amount for RS+NPK1was 2.44times more than that for MR+NPK1(P<0.05,Pis the significance level),while the annual N2O emission amount for the latter was 59%higher than that for the former(P>0.05).The annual accumulated CH4emission amount for CD+NPK2was 2.45times more than that for BD+NPK2(P<0.05),but the annual N2O emission amount for the latter increased by 102%compared with CD+NPK2(P>0.05).The fertilizer-induced direct N2O emission factor(E)was reduced by 45%-80%under the treatments of combined application of chemical and organic fertilizers in paddy fields compared to NPK.In this analysis, water status and temperature were main driving factors which affected the seasonal variation of CH4emission fluxes. However,N2O emission fluxes did not have direct relation with water status in double rice paddies and a temporal trade-off relationship between the two gas emission fluxes was not observed in this study.CH4was the dominant greenhouse gas which contributed more than 75%to the integrated global warming potential of CH4and N2O emissions in local double rice fields.By using composted mushroom residue and biogas digestion to substitute for fresh rice straw and cow dung for returning fields,CH4emission and integrated global warming potential of CH4and N2O emissions reduced by approximately 60%and 50%,respectively,and the grain yield will not be affected.

【题目】中国农业领域温室气体主要减排措施研究分析
【中文关键词】农业活动;农村生活;增加碳汇;生物质能源;温室气体减排
【英文关键词】emission reduction; agricultural activity; rural life; increased carbon sinks; biomass energy
【中文摘要】气候变暖已成不争事实, 主要是由于人为温室气体(GHG)排放增加所致,为减缓气候变暖趋势, 各领域迫切需要采取减排措施; 农业是一个重要的GHG排放源,农业领域采取减排措施对于减少我国GHG排放、保护农村生态环境有重要意义。文章在大量阅读前人研究结果的基础上,总结我国农业领域主要的减排管理措施,主要从农业活动、农村生活和生物质能源利用三方面进行阐述,并简要分析各措施的减排效果和存在问题。分析发现,农业活动的水肥管理是农田温室气体减排的研究热点, 但由于地域和管理流程上的差异,对措施的减排效果尚存在争议;农村生活中存在巨大的减排潜力,采取恰当的减排措施不但可以减少GHG排放,还可以改善农村生态状况和环境卫生条件;农村生物质能源有很大发展潜力,合理开发利用,可以有效替代化石能源消耗,缓解能源危机,减少GHG排放,保护生态环境。总之,在农业领域采取积极的减排措施,有助于国家效应对气候变化,降低农业源污染和GHG排放,减轻环境压力, 转换农业发展模式,加速农业现代化,促进农业生产的可持续发展和社会主义新农村建设。
【英文摘要】Climate change, an indisputable fact, is mostly caused by the increased anthropogenic greenhouse gas emissions. In order to slow down the resultant warming, it is urgently necessary to take emission reduction measures in various fields. Agriculture is a major source of GHG emissions. Reduction measures taken in this field are of great importance to the reduced GHG emissions and conserved rural ecology in China. On the basis of a large number of previous studies, this paper reviews selected reduction management measures taken in agricultural China, which are elaborated on from three perspectives: agricultural activities, rural life, and biomass energy use. A brief analysis is made respectively of their strengths and weaknesses. The study finds that water and fertilizer management in agricultural activities is a focus in the research into agricultural GHG reduction. However, due to differences in geography and

management processes, there still exist controversies on the role of such a measure in mitigation. Since rural life promises a huge potential for reduction, a balanced exploitation can contribute to reduced GHG emissions as well as an improved ecological and sanitary conditions. Biomass energies in rural areas suggest a great potential for development. If rightly exploited, they can be used as a very alternative to fossil energy to reduce GHG emissions and protect environment. In summary, smart measures andactions taken in agricultural sector in this regard do help with the national climate change resilience campaign and contribute to the reduced agricultural pollution, mitigated environmental pressure, shifted agricultural development model, accelerated agriculturalmodernization, more sustainable agricultural production and emerging rural lifestyle as envisaged in the so-called new socialist countryside program.

【题目】秸秆热裂解木醋液成分及其对辣椒生长及品质的影响
【中文关键词】木醋液; 有机成分; 辣椒; 作物生长; 维生素C
【英文关键词】pyroligneous solution; organic components; pepper spice; crop growth; vitamin C
【中文摘要】采用气相色谱- 质谱联用仪分析了木醋液的主要化学成分,并将不同稀释倍数(100、300 和500 倍) 的木醋液对辣椒进行叶面喷施温室试验,以清水为对照,考察木醋液对辣椒生长及品质的影响。结果表明: 木醋液是一种成分复杂的液态混合物,主要含有酚类和烯- 酮类等物质。叶面喷施木醋液能提高辣椒的株高、产量以及果实中维生素C 含量。其中稀释300 倍的木醋液叶面喷施对增加辣椒株高及维生素C 含量效果最好,而喷施稀释500 倍的木醋液对辣椒增产效果最好,表明木醋液含有植物生长促进物质,具有开发为农用叶面喷施制剂的应用潜力。
【英文摘要】Organic components of pyroligneous solution(PLS) from straw pyrolysis was analyzed using GC-MS. A greenhouse experiment was conducted on the effect on yield and vitamin C content of pepper spice. The results showed that PLS solution was a mixture containing mainly ethylene,phenolic and ketones groups. Spraying of diluted solution of PLS increased height,yield and vitamin C content of pepper compared to those of water. Dilution at 300 times seemed to have greatest effect on enhancing plant height and the vitamin C content,but biggest increase in yield of pepper was observed at dilution of 500 times. This study showed that the pyroligneous solution from straw pyrolysis contains components beneficial to plant growth and has the potential to be used as foliar sprayer for crops in agriculture.

【题目】Development and validation of a HPLC method for determination of levonorgestrel and quinestrol in rat plasma.
【中文关键词】无
【英文关键词】HPLC method ,levonorgestrel ,quinestrol , rat plasma
【中文摘要】无
【英文摘要】Levonorgestrel and quinestrol, commonly known as EP-1, has long been used in the control of wild rodents. Up to the present time, however, no method for simultaneous quantification of levonorgestrel and quinestrol in rat plasma has been reported. In the present study, a sensitive reverse-phase high-performance liquid chromatography with ultraviolet detection (RP-HPLC-UV) method for quantification of levonorgestrel and quinestrol in rat plasma has been developed. It uses a Kromasil ODS C(18) column and acetonitrile-0.1% formic acid (85 : 15, v/v) mobile phase at ambient temperature. The plasma sample was prepared by hexane-isoamyl alcohol extraction (90 : 10, v/v). The flow rate and detection wavelength were 1.0 mL/min and 230 nm. The correlation coefficients

were greater than 0.9995 within 0.08-50 microg/mL for levonorgestrel and 0.12-50 microg/mL for quinestrol, and the limits of detection were 0.02 and 0.05 microg/mL for levonorgestrel and quinestrol, respectively. Average recovery ranged from 92.5 to 96.3% and inter-day RSDs were less than 7.56%. This method can be applied to the further pharmacokinetic study of levonorgestrel and quinestrol in rat plasma.

【题目】Biodegradation and chiral stability of fipronil in aerobic and flooded paddy soils
【中文关键词】无
【英文关键词】Biodegradation; Chiral; HPLC; Fipronil; Soil
【中文摘要】无
【英文摘要】Microbiological degradation of the racemic mixture, the enantiopure R- and S-fipronil was examined under both aerobic and flooded conditions in three Chinese paddysoils. The degradation kinectics and enantiomer fraction (EF) were determined by means of high-performance liquid chromatography (HPLC) with chiral Chiralcel OD-H column, while desulfinyl, sulfone and sulfide derivatives were monitored by reversed phase HPLC with diode array detection (DAD). The degradation/transformation of enantiomers of fipronil in the three live soils under aerobic and flooded conditions generally complied with the first-order kinetics ($R2 \geq 0.94$). The calculated t1/2 values of the enantiomers of fipronil ranged between 21 and 34 days for aerobic incubation experiments and between 8 and 19 days under flooded conditions incubation, respectively. The calculated EF values of fipronil during the incubation time were all close to 0.5, indicating that the degradation/transformation of fipronil was almost nonenantioselective. The main metabolites of fipronil formed in the incubation experiments were sulfone and sulfide derivatives by oxidative and reductive processes, respectively. The oxidative pathway seemed more active. Under flooded conditions, S-fipronil was preferentially degraded in the three soil samples used. The main metabolite was determined as fipronil sulfide. In control experiments, almost no removal of enantiomers of fipronil was observed indicating that the degradation of fipronil in the paddysoil used was attributed to microbial mediated processes under both aerobic and flooded conditions. In addition, no enantiomerization of fipronil was observed in the soil samples examined under both aerobic and flooded conditions. These results for major differences in the degradation of the enantiomers as well as the formation of toxic metabolites may have some implications for better environmental and ecological risks assessment for chiral pesticides.

【题目】Antimicrobial Activity Investigation on Wuyiencin Fractions of Different Polarity
【中文关键词】无
【英文关键词】Wuyiencin; antimicrobial activity; Rhodotorula rubra; Bacillus subtilis; Bacillus megaterium; Escherichia coli; Cladosporium fulvum; Staphylococcus aureus
【中文摘要】无
【英文摘要】The aim of this study was to evaluate the antimicrobial activity of Wuyiencin fractions with different polarities against six indicator microorganisms: Rhodotorula rubra, Bacillus subtilis, Bacillus megaterium, Escherichia coli, Cladosporium fulvum and Staphylococcus aureus. The fermentation broth of Wuyiencin was submitted to AB-8 macroporous adsorptive resin and fractionated

with solvents of different polarity. The fraction eluted with water had remarkably antimicrobial activity against all the microorganisms investigated except for C. fulvum and S. aureus (MIC ≤ 0.0625 mg/mL), probably due to the presence of active components. The fraction eluted with methanol showed potential antimicrobial activity against all the test microorganisms except for R.rubra, with MIC values of0.5 and 2 mg/mL. In conclusion, fractions eluted with water and methanol, respectively, represent the main active-part of Wuyiencin, and could be emphasized for agricultural applications in the future.

【题目】咪唑啉酮类簇合物的合成及其除草活性
【中文关键词】多位点结合 簇合效应 合成 双甲基咪草烟
【英文关键词】multivalent interactions cluster effect synthesis bis-imazapic
【中文摘要】在生物体系中,二效价配体比单效价配体对受体有更强的亲和力。根据乙酰乳酸合成酶与咪唑啉酮类复合物的3D结构信息特点,设计并合成了8个对称的双甲基咪草烟类化合物,其结构经红外、核磁及元素分析等确证。初步生物活性测定结果表明:咪唑啉酮二效价簇合物对乙酰乳酸合成酶的亲和力没有增加,在100 μg/mL浓度下,对油菜B rassica campestrisL.根长抑制率与单效价化合物相当。

【英文摘要】In biological system, bivalent ligands often possess increased functional affinity for their receptors compared with monovalent ligands. Based on the information of 3D structure of AHAS- imazaquin (IQ) complex, 8 symmetrical bivalent molecules of imazapic were designed and synthesized. Their structures were confirmed by IR, 1H NMR and elementary analysis. The preliminary bioassay results showed that the inhibition rate to the acetohydroxyacid synthase from dimeric compounds were less potent than that of imazapic. And the inhibition rate to the growth of rape (Brassica campestris L.) root from bivalent compounds were very close to that of imazapic at concentration of 100 μg/mL.

【题目】Molecular Mechanism of Plant Growth Promotion and Induced Systemic Resistance to Tobacco Mosaic Virus by Bacillus spp.
【中文关键词】无
【英文关键词】Bacillus spp.;PGPR; Tobacco Mosaic Virus;growth promotion
【中文摘要】无

【英文摘要】Bacillus spp., as a type of plant growth-promoting rhizobacteria (PGPR), were studied with regards promoting plant growth and inducing plant systemic resistance. The results of greenhouse experiments with tobacco plants demonstrated that treatment with the Bacillus spp. significantly enhanced the plant height and fresh weight, while clearly lowering the disease severity rating of the tobacco mosaic virus (TMV) at 28 days post-inoculation (dpi). The TMV accumulation in the young non-inoculated leaves was remarkably lower for all the plants treated with the Bacillus spp. An RT— PCR analysis of the signaling regulatory genes Coil and NPR1, and defense genes PR-1a and PR-1b, in the tobacco treated with the Bacillus spp. revealed an association with enhancing the systemic resistance of tobacco to TMV. A further analysis of two expansin genes that regulate plant cell growth, NtEXP2 and NtEXP6, also verified a concomitant growth promotion in the roots and leaves of the tobacco responding to the Bacillus spp.

【题目】农业废弃物生物黑炭转化还田作为低碳农业途径的探讨
【中文关键词】生物黑炭; 农业废弃物; 气候变化; 固碳减排
【英文关键词】biochar; agricultural waste; climate change; sequestration /release of carbon
【中文摘要】生物黑炭是有机废弃物转化的稳定性碳物质。国际农业废弃物生物黑炭转化技术研究日益活跃,并正在进行农田增汇减排的试验示范。文章介绍了生物黑炭技术发展的背景,以及生物黑炭技术转化和应用研究的国际动态,讨论了生物黑炭技术在应对气候变化中对农业生产和固碳减排的潜在作用,并分析将其纳入国际碳贸易市场和国内自主减排碳交易市场的可能性。最后,提出我国开展农作物废弃物生物黑炭转化与农业应用研究的建议。
【英文摘要】Biochar is a relatively stable carboncious material converted from organic waste. Currently more and more attention and efforts are being given worldwide to development of technologies of converting agricultural waste into biochar and field experiments are being carried out on effect of its use on expansion of carbon pool in and mitigation of carbon emission from farm fields. A brief introduction is presented to the background of the development of biochar technologies as well as the progresses worldwide in the study on production and application of biochar. Meanwhile discussions are carried out on potential effects of the application of biochar on crop productivity and sequestration /release of carbon in agriculture and hence on climate change,and analyses are done on the possibility of including the use of biochar into the world C trade and the country's independent C emissions trading market. Eventually suggestions are brought forth for research on production and application of biochar in agriculture of the country.

【题目】南京地区大棚蔬菜生产的碳足迹调查分析
【中文关键词】设施蔬菜;碳足迹;温室气体减排
【英文关键词】greenhouse vegetables; carbon footprint; carbon sequestration and mitigation
【中文摘要】通过对南京郊区5 种夏季大棚设施蔬菜生态系统的物质和管理投入进行现场问卷调查,分析估算了不同设施蔬菜各个生产环节投入的碳成本以及碳排放强度等。结果表明,不同设施蔬菜单季单位面积碳成本介于(867.1±240.6)~(2 039.4±1 163.3)kgCE · hm-2,物质投入碳成本在整个生产投入中占极其重要的份额,其中肥料投入的碳排放最大,占总碳成本的57.96%~82.37%,而农膜投入占11.97%~29.25%;不同设施蔬菜单位面积碳排放、单位产量碳排放及单位产值碳排放存在差异显著。综上,减少生产过程碳排放尤其是物质投入碳排放、提高施肥效益增加蔬菜产量、因地制宜选择蔬菜种植品种是促进蔬菜生产温室气体减排的重要途径。
【英文摘要】A questionnaire survey of material and management inputs in production of five typical kinds of greenhouse vegetables from Nanjing was conducted. Carbon cost and C emission intensity involved in these vegetable production were evaluated using life cycle analysis methodology. Results showed that the total C inputs in a single growing season of the studied 5 types of greenhouse vegetables ranged from (867.1±240.6)kgCE · hm-2 to(2 039.4±1 163.3)kgCE · hm-2. While the material input possessed a poredominant proportion in the total C cost,fertilizers and agricultural films were found in a proportion of 58%~82% and of 12%~29%, respectively. Furthermore, there were significant differences in the C intensity either per hectare or per ton of production between the vegetable types. Above all, reducing C input in the growing of vegetables and better application techniques to improve

nutrient uptake and choosing suitable greenhouse vegetable varieties would be an effective measure to increasing carbon sequestration and mitigation in soil.

【题目】秸秆生物黑炭农业应用的固碳减排计量方法学探讨
【中文关键词】生物黑炭;固碳减排;计量方法学
【英文关键词】biochar; carbon sequestration and mitigation; approach for measurement
【中文摘要】秸秆或生活垃圾热裂解转化生物黑炭的产业化技术已经成熟,生物黑炭固碳减排方法学是进行自主碳交易的必备技术依据。基于河南三利新能源有限公司生物黑炭的生产工艺,对秸秆燃烧(基线)和转化生物黑炭以及农业应用(项目)整个系统全生命周期的温室气体的排放量和碳汇清除量进行了评价。采用该方法学,对已经进行的秸秆生物质黑炭的生产和稻田施用的总效应初步估计为秸秆产生净碳汇249~398 kg CO2-e·t-1。可以看出秸秆生物黑炭具有显著的固碳减排效果。
【英文摘要】The industrial technology of straw or domestic waste conversion into biochar by pyrolysis has been mature. The approach of straw biochar amendment for measurement of the carbon sequestration and mitigation provides a theoretical basis for carbon trading. The comparativeeffect of straw burned(basis)and biochar amendment(program)on greenhouse gas emission and carbon sink in relation to agricultural application was evaluated on the basis of the manufacturing process of Sanli New Energy Company, Henan Province, China. Using this method, the overall carbon sink was from 249 kg CO2-e to 398 kg CO2-e per ton of straw, indicating that straw biochar has a substantial effect on carbon sequestration and mitigation.

【题目】水稻白叶枯病菌hrpF启动子序列调控的绿色荧光蛋白基因表达体系的构建
【中文关键词】水稻白叶枯病菌,hrpF基因,启动子序列,绿色荧光蛋白,表达体系
【英文关键词】Xanthomonas oryzae pv. oryzae,hrpF gene,GFP,expression system
【中文摘要】为了阐明启动子序列对水稻白叶枯病菌效应子基因表达的调控作用及特征,本研究通过融合PCR将报告基因GFP基因置于水稻白叶枯病菌hrpF基因启动子序列的下游,经酶切、PCR鉴定及序列测定,成功构建了受hrpF启动子序列调控的GFP基因转录单元pMF-GFP, 并转入JXO I 菌株中。结果发现构建的hrpF::GFP转录单元,在hrp诱导培养基XOM2上可有效诱导表达,而在NA培养基上不能诱导表达。结果还显示,在大肠杆菌中,中间表达载体phrpF::GFP具有GFP表达活性。
【英文摘要】In order to elucidation the expression characters for effector genes of Xanthomonas oryzae pv. oryzae (Xoo) regulated by the promoter sequence. In this study, the GFP gene was put under the control of the promoter sequence of the Xoo hrpF gene by fusion PCR. A transcription unit pMF-GFP was constructed and confirmed through restriction enzyme digestion, PCR and sequencing, in which the reporter gene of GFP was regulated by promoter sequence of Xoo hrpF gene. Then, the transcription unit hrpF::GFP was transformed to the JXO I strain. The results showed that the transcription unit could efficiently expression in hrp-induced culture medium XOM2, but un-expression in the NA medium. The results also showed that the GFP protein of intermediate vector phrpF::GFP was obviously expressed in Escherichia coli.

【题目】RNAi分析水稻细胞中抗病信号中一氧化氮的合成途径
【中文关键词】水稻,一氧化氮,合成途径,硝酸还原酶
【英文关键词】Rice,nitric oxide, synthase,nitriate reductase
【中文摘要】信号分子一氧化氮(Nitric Oxide; 简称NO)可参与调节植物多种生理代谢过程,尤其是在植物抗病反应中具有重要作用。然而,植物中NO的合成途径一直不清楚。为了明确水稻中抗病信号NO的合成途径,本研究用PCR扩增水稻硝酸还原酶(Nitrate reductase; 简称NR)基因Osnr,将该片段正反向连接到载体pTCK303中,构建了nr基因的RNA干扰载体pTCK303-Osnr,经农杆菌转化水稻细胞。结果发现编码硝酸还原酶基因的沉默,导致水稻细胞诱导产生的NO量显著降低,表明NR是水稻诱导性NO合成的关键酶。而nr基因沉默的水稻细胞经非寄主菌诱导处理,PAL活性显著升高,HR反应也显著增强,表明抗病信号NO不是诱导水稻抗性反应产生的唯一途径,可能还存在其它信号通路(如:H2O2等)诱导水稻抗性反应的产生。

【题目】纳米TiO2光半导体溶胶对植物病原微生物的抗菌性能
【中文关键词】纳米;二氧化钛;植物病原菌;溶胶材料;抗菌性能;抗菌剂
【英文关键词】Nanometer; TiO2; plant bacterial disease; semiconductor sol; antibacterial activity
【中文摘要】鉴于纳米二氧化钛半导体材料在医学、环保领域对细菌、病毒等微生物长效、安全、无残留的成功抑制,本试验探讨纳米二氧化钛半导体材料在植物领域对植物病原微生物的杀灭与抑制作用。通过溶胶凝胶法合成纳米TiO2 半导体溶胶材料,无菌瓷板涂布成膜,黑光照射,统计病原菌存活数、相对抗菌率,鉴定TiO2溶胶的抗菌效果。结果表明,该溶胶的平均粒径为30.6 nm,为锐钛矿型,分散度、稳定度良好,成膜与附着力良好。抗菌鉴定表明,3 次均匀涂布成膜的抗菌瓷板效

果最好,涂布高于3 次,膜易脱落;对在3 次成膜瓷板的相对菌落存活数统计表明,与对照相比,TiO2 溶胶对植物细菌性病原菌具有显著的抗灭与抑制效果,延长照射时间,抗菌能力增强;相对抗菌率表明,延长光照为24 h,相对抗菌率为100%,对各菌种的抗菌率无差异。因此,TiO2 半导体溶胶材料是一种强效的、广谱的新型绿色环保抗菌剂。

【英文摘要】Nanometer TiO2 photosemiconductor, as a safe antibacterial chemical with a long-effect, has been widely applied to medicine and environmental protection. The authors studied the effects of TiO2 sol on plant pathogens.Nano-TiO2 semiconductor sol was prepared referring to the method developed by Itinose, by which a successive and transparent antibacterial membrane was formed on aseptic tiles, Wood's lamp radiation, statistics antibacterial ratios, to detect antibacterial effectiveness. The results show that the nano-TiO2 was anatase, and mean diameter was 30.6 nm, dispersity, stability and adhesive power were good. The antibacterial experiments show that the effect of the three antibacterial membranes is the best; when the antibacterial membrane is above three, it is easy exfoliated; compared with the blank, nano-TiO2 semiconductor sol has excellent antibacterial effect on plant pathogens, and as the time lasts, the antibacterial rate increases. The results of relative antibacterial rate show that when the illumination lasts for 24 h, the relative antibacterial rate reaches 100%, and there is no discrepancy for different strains. So nano-TiO2 semiconductors sol is a potent and broad spectrum antibacterial.

【题目】量子点荧光标记物在生物学中的应用研究进展

【中文关键词】量子点; 荧光光谱; 组织成像; 分子标记

【英文关键词】quantum dots; fluorescence spectrum; tissue imaging; biomolecular

【中文摘要】量子点作为一种新型的荧光标记物近年来已在生物学中获得广泛应用。概述了量子点的主要光学特性及作为荧光材料的优点, 详细介绍了量子点在分子生物学、活体细胞标记、组织成像和环境分析检测等几方面的应用及其最新研究进展, 同时指出了量子点在应用中存在的一些问题及应用前景展望。

【英文摘要】As a streamlined fluorescence material, quantum dots are currently being investigated for use in biology. This paper summarizes the major optical characteristic and the advantage as a fluorescence material of quantum dots, and introduces the application and latest research development of quantum dots in biomolecular, in vivo marker, tissue imaging and environmental monitoring. At the same time, the paper points out some problems and prospect for the application of quantum dots.

【题目】Chitosan Coated Silica Nanoparticles as a Potential Protein Carrier

【中文关键词】壳聚糖;二氧化硅纳米粒;BSA;载体

【英文关键词】chitosan;silica nanoparticles;BSA;carrier

【中文摘要】通过壳聚糖在二氧化硅纳米粒表面的沉积制备了壳聚糖包覆的二氧化硅(CS@SiO2)。采用BSA 作为模型蛋白,研究了CS@SiO2 作为蛋白载体的可能性。结果表明,CS@SiO2 可有效吸附BSA 且可控释放被吸附的BSA。

【英文摘要】Chitosan(CS)coated silica nanoparticles(CS@SiO2)were prepared by deposition of CS ontosurface of SiO2. Using bovine serum albumin(BSA)as a model protein molecule, the potential of CS@SiO2 as a protein carrier was investigated. It was found that the adsorbed BSA on CS@SiO2 carrier exhibited a controlled release profil.

【题目】Over-expression of Sly-miR156a in tomato results in multiple vegetative and reproductive trait alterations and partial phenocopy of the sft mutant
【中文关键词】no
【英文关键词】Tomato; miR156 ; Plant architecture; Inflorescence structure; Fruit development
【中文摘要】no
【英文摘要】Plant microRNAs (miRNAs) are vital components of the translation control system that regulates plant development and reproduction. The biological function of sly-miR156 was investigated by over-expression in tomato plants. Transgenic tomato plants exhibited a drastically altered phenotype, with reduced height, smaller but more numerous leaves, and smaller fruit. The inflorescences structure of sly-miR156 over-expressing plants phenocopied the sft mutant. The putative targets of sly-miR156 were identified by data base search and included six SQUAMOSA PROMOTER BINDING PROTEIN (SBP)-box transcription factor genes. Their expression patterns were then determined in 35S-miR156a and wild type tomato plants. These target genes, as well as the tomato FLOWERING LOCUS T (FT) ortholog SFT, were significantly down-regulated in sly-miR156 over-expressing plants. These studies reveal novel phenotypes regulated by miR156.

【题目】A regulatory gene induces trichome formation and embryo lethality in tomato
【中文关键词】no
【英文关键词】cell cycle; multicellular trichome
【中文摘要】no
【英文摘要】Trichomes are universal biological structures originating from the aerial epidermis, which serve as an excellent model to study plant differentiation at the cell level. Although the pathway regulating trichome formation in the Rosids has been well characterized, only very recently a few genes were identified for trichome initiation in the Asterids. In this study, we cloned Woolly (Wo), essential for trichome formation in tomato. Transgenic experiments revealed that the woolly phenotype is caused by the mutation in Wo which encodes a homeodomain protein containing a bZIP motif and a START domain. We identified three alleles of Wo and found that each allele contains a missense mutation, which respectively results in an amino acid substitution at the C terminus. Microarray and expression analysis showed that the expression of a B-type cyclin gene, SlCycB2, is possibly regulated by Wo, which also participates in trichome formation. Suppression of Wo or SlCycB2 expression by RNAi decreased the number of type I trichomes, and direct protein-protein interaction was detected between them, implying that both proteins may work together in the regulation of this type of trichome formation. Cytological observation and Wo transcript analysis in the developing seeds showed that embryo development was also correlated with Wo.

【题目】Fine-mapping of the woolly gene controlling multicellular trichome formation and embryonic development in tomato
【中文关键词】no
【英文关键词】TRANSCRIPTION FACTOR; CELL-FATE; LYCOPERSICON-ESCULENTUM; ARABIDOPSIS-THALIANA; GLANDULAR TRICHOMES; MYB GENE; DIFFERENTIATION; RESISTANCE; GL1; DENSITY
【中文摘要】no
【英文摘要】Trichomes are small hairs that originate fromthe epidermal cells of nearly all land plants, and they existin unicellular and multicellular forms. The regulatory pathwayof unicellular trichomes in Arabidopsis is well characterized.However, little is known about the multicellulartrichome formation in tomato (Solanum lycopersicum). Thewoolly (Wo) gene controls multicellular trichome initiationand leads to embryonic lethality when homozygous intomato. To clone and characterize Wo, the gene wasWne-mapped to a DNA fragment of » 200 kb using themap-based cloning strategy. A series of sequence-basedmolecular markers, including simple sequence repeat,sequence characterized ampliWed region, and cleaved ampli-Wed polymorphic sequence were utilized in this study.Analysis of the sequence indicated that this region carries19 putative open reading frames. These results will providenot only the important information for the isolation andcharacterization of Wo but also the starting point for studyingthe regulatory pathway responsible for trichome formationand embryonic lethality in tomato.

【题目】Overexpression of SlGMEs leads to ascorbate accumulation with enhanced oxidative stress, cold, and salt tolerance in tomato
【中文关键词】no
【英文关键词】Ascorbic acid; GDP-Mannose; 3 ',5 '-epimerase; Abiotic stress; Solanum lycopersicum
【中文摘要】no
【英文摘要】GDP-Mannose 3',5'-epimerase (GME; EC 5.1.3.18) catalyses the conversion of GDP-d-mannose to GDP-l-galactose, an important step in the ascorbic acid (AsA) biosynthesis pathway in higher plants. In this study, two members of the GME gene family were isolated from tomato (Solanum lycopersicum). Both SlGME genes encode 376 amino acids and share a 92% similarity with each other. Semi-quantitative RT-PCR indicated that SlGME1 was constantly expressed in various tissues, whereas SlGME2 was differentially expressed in different tissues. Transient expression of fused SlGME1-GFP (green fluorescent protein) and SlGME2-GFP in onion cells revealed the cytoplasmic localisation of the two proteins. Transgenic plants over-expressing SlGME1 and SlGME2 exhibited a significant increase in total ascorbic acid in leaves and red fruits compared with wild-type plants. They also showed enhanced stress tolerance based on less chlorophyll content loss and membrane-lipid peroxidation under methyl viologen (paraquat) stress, higher survival rate under cold stress, and significantly higher seed germination rate, fresh weight, and root length under salt stress. The present study demonstrates that the overexpression of two members of the GME gene family resulted in increased ascorbate accumulation in tomato and improved tolerance to abiotic stresses.

【题目】Expression of artificial microRNAs in tomato confers efficient and stable virus resistance in a cell-autonomous manner
【中文关键词】no

【英文关键词】Artificial miRNA; Anti-virus; Cucumber mosaic virus; Tomato; Cell-autonomous; Mixed infection
【中文摘要】no
【英文摘要】Expression of artificial microRNAs (amiRNAs) in plants can target and degrade the invading viral RNA, consequently conferring virus resistance. Two amiRNAs, targeting the coding sequence shared by the 2a and 2b genes and the highly conserved 3' untranslated region (UTR) of Cucumber mosaic virus (CMV), respectively, were generated and introduced into the susceptible tomato. The transgenic tomato plants expressing amiRNAs displayed effective resistance to CMV infection and CMV mixed with non-targeted viruses, including tobacco mosaic virus and tomato yellow leaf curl virus. A series of grafting assays indicate scions originated from the transgenic tomato plant maintain stable resistance to CMV infection after grafted onto a CMV-infected rootstock. However, the grafting assay also suggests that the amiRNA-mediated resistance acts in a cell-autonomous manner and the amiRNA signal cannot be transmitted over long distances through the vascular system. Moreover, transgenic plants expressing amiRNA targeting the 2a and 2b viral genes displayed slightly more effective to repress CMV RNA accumulation than transgenic plants expressing amiRNA targeting the 3' UTR of viral genome did. Our work provides new evidence of the use of amiRNAs as an effective approach to engineer viral resistance in the tomato and possibly in other crops.

【题目】Identification and expression pattern of one stress-responsive NAC gene from Solanum lycopersicum
【中文关键词】no
【英文关键词】Expression profile; SlNAC3; Stress; Tomato; Transcriptional activity
【中文摘要】no
【英文摘要】NAC (for NAM, ATAF1, 2, and CUC2) family genes have been found to play an important role in diversified developmental processes and environmental responses. A new NAC-type transcription factor SlNAC3 was primarily identified and isolated from the cDNA libraries of tomato cultivar Ailsa Craig. It contains three exons and two introns within genomic DNA sequence and encodes a polypeptide of 329 amino acids. A plant-specific and conserved NAC domain is located in the N-terminus of SlNAC3. The protein SlNAC3 is subcellularly localized in the nucleus of onion epidemical cells and it has a transcriptional activation domain in the C-terminal region which shows extremely divergent among NACs. Phylogenetic analysis showed that SlNAC3 belonged to the OsNAC3 subgroup of the NAC protein family. Tissue expression profile analysis revealed that SlNAC3 was expressed mainly in flower, fruit and root. The transcription expression of SlNAC3 was inhibited by salt, drought stress and ABA treatment. These data

demonstrate that SlNAC3 might interact with environmental and endogenous stimuli and probably function when plants response to salt and drought stresses through ABA signaling pathways as a transcriptional activator.

【题目】利用热稳定蛋白特异条带鉴别籼粳稻的方法研究
【中文关键词】籼稻;粳稻; 热稳定蛋白; SDS 聚丙烯酰胺凝胶电泳; 蛋白免疫印迹
【英文关键词】Indica rice ; Japonica rice ; heat-stable protein ; SDS-PAGE; Western blotting
【中文摘要】以85份栽培稻为材料, 利用SDS聚丙烯酰胺凝胶电泳和蛋白免疫印迹技术分析籼稻和粳稻热稳定蛋白的表达差异, 探讨利用特异蛋白来建立籼粳稻的鉴别方法。结果表明, 在籼粳稻品种之间存在热稳定蛋白的差异表达,尤其在分子量约 42~ 47kD范围。其中 45.2kD条带 (Band I)和 46.5 kD(Band II)条带为典型粳稻特异蛋白(Os03g0168100)的标志带42.0 kD条带 (Band III)为典型籼稻特异蛋白 (OsI_10172)的标志带。以这 3条带作为鉴别方法, 并与程氏指数法进行比较典型籼稻和粳稻的一致度分别为 80.0 %和 86.4%, 表明热稳定蛋白标志带法在一定程度上可用于鉴别典型的籼稻和粳稻。
【英文摘要】Differential expression of heat-stable proteins in eighty-five cultivated rice(Oryza sativa L .) was an-alyzed by using SDS-PAGE and western blotting , to explore the feasibility of using specific proteins to identify Indi-ca-Japonica rice . The results showed that t- he heat-stable proteins expressed differentially between Indica and Japonica rice , especially in the molecular weight of about 42- 47kD range . Among them, 45.2kD band(Band I) and 46.5kD band(Band II) were marker bands for typical Japonica rice . Both bands matched to Os03g0168100 in NCB I protein databank , 42.0kD band(Band III, matched to OsI_10172) was marker band for typical Indica rice . Eighty-five Indica and Japonica rice varieties were identified based on the expression pattern of these three bands , andthen compared the results with Cheng ’ s index . The concordances were 80.0 % and 86.4 % in typical Indica riceand Japonica rice , respectively . Therefore , the method o f hest-stable protein marker bands can be used foridentifying typical Indica rice and Japonica rice .

【题目】干种子高质量总RNA的快速提取方法
【中文关键词】种子;总RNA提取; S DS;异硫氰酸胍; RNA反转录; RT2PCR
【英文关键词】Seed; Total RNA isolati on; SDS; Guanidinium thiocyanate; RNA reverse transcription; RT2PCR
【中文摘要】高效快速提取高质量的种子 RNA是种子分子生物学研究的基础。现有的提取方法难以高效快速地从种子中得到高质量的总 RNA。本试验有机地将改进 SDS法和异硫氰酸胍法相结合 ,采用改进的酸性 S DS提取液、不溶性 PVPP(聚乙烯聚吡咯烷酮)阻止酚类氧化、KAc去除多糖、异丙醇沉淀 RNA,可以高效地从 0101~011g水稻、大豆、蚕豆、芸豆、花生等干种子中提取到高质量总 RNA。此法提取的总RNA,能够满足分子生物学研究的要求可以进行反转录和 RT2PCR反应,用于基因表达研究,并为从具相似成分的其他物种干种子提取总 RNA提供参考方法。
【英文摘要】Extraction of high-quality RNA is the base for seeds molecular biology research. Rapid isolation of high-quality total RNA from dry seeds is difficult by the extraction methods reported previously . In this new protocol, SDS and guanidinium thiocyanate methods were combined for RNA extraction and high-quality of total RNA was obtained in about 3.5h . Extraction at low pH, precipitation of polysaccharides with potassium acetate, usage of phenol blocker polyvinyl polypyrrolidone (PVPP) yielded high-quality RNA from rice, soybean, broad bean, kidney bean and peanut with a small number of samples of 01012011g. The extracted

RNA was suitable for RNA reverse transcription and RT2PCR. This method can provide some references for isolating total RNA from dry seeds of others pecies with similar chemical composition.

【题目】AFLP标记分析生活力影响大豆中黄18种质遗传完整性
【中文关键词】大豆; 生活力; 繁殖世代; AFLP; 遗传完整性; 种质保存
【英文关键词】Soybean; Viability; Regeneration; AFLP; Genetic integrity; Germplasm conservation
【中文摘要】以中黄18种子为试验材料,采用不同时间(0、112、154 和196d)老化处理, 获得4个群体G0-1、G0-2、G0-3和G0-4, 其发芽率分别为 98.0%、95.0%、81.0%和 79.0%。将这4个群体进行 2 次田间繁殖,得到4个繁殖一代群体G1-1、G1-2、G1-3 和 G1-4及4个繁殖二代群体 G2-1、G2-2、G2-3 和 G2-4。以群体 G0-1 为对照 选用12对AFLP引物组合分析12 个群体的遗传完整性。结果显示, 所有处理群体与对照群体 G0-1 的等位基因频率t检验概率值均为1.00, 即无显著差异。群体 G2-4 与对照群体 G0-1 的遗传相似系数仍高达 0.9333,表明发芽率为 79.0%群体的繁殖二代群体与对照群体的遗传相似性仍然较高。显著性t检验结果显示,与对照群体 G0-1相比,群体 G1-1、G2-1、G1-2和 G2-2 的每位点有效等位基因数(Ae)、遗

传多样性指数(H)和香农指数(I)差异不显著; 群体 G0-3、G0-4、G1-3、G1-4、G2-3 和 G2-4 的上述遗传多样性参数则显著降低。与对照群体 G0-1 相比,群体 G1-1、G2-1、G1-2 和 G2-2 的稀有等位基因数无显著变化;而群体 G0-3、G0-4、G1-3、G1-4、G2-3 和 G2-4 的稀有等位基因数则大幅下降。以上结果表明,与对照群体相比,由发芽率分别为98.0%和 95.0%的群体更新的子代群体,其群体遗传多样性和稀有等位基因数无显著变化,而由发芽率分别为 81.0%和 79.0%的群体更新的子代群体,则显著下降。因此, 生活力下降比繁殖世代对大豆种质群体的遗传结构影响更大, 建议初始发芽率为 98.0%的大豆种质更新发芽率标准不应低于 81.0%。

【英文摘要】Using low temperature genebank is a main way for conserving crop germplasm resources. However, with the extension of storage time, the viability of seeds stored in the genebank will inevitably decline. Therefore, preserved seeds need to be regenerated periodically. In this study, soybean cultivar Zhonghuang 18 was used as a material and aged for different days (0, 112, 154, and 196 d) to obtain four populations G0-1, G0-2, G0-3, and G0-4. The germination percentages of the four populations were 98.0%, 95.0%, 81.0%, and 79.0%, respectively. These populations were regenerated twice in the field. The first descendant populations were marked as G1-1, G1-2, G1-3, and G1-4, and the second were marked as G2-1, G2-2, G2-3, and G2-4, respectively. Population G0-1 was taken as the control. The genetic variation between the control and treated populations was detected using AFLP marker. Sixty individual seedlings derived from each population were detected by 12 AFLP primer combinations. The result showed that t-test probability values for allele frequencies were 1.00 between the control and treated populations, which indicated that there was no significant difference in the allele frequencies of the treated population compared with the control. The genetic similarity coefficient between population G2-4 and G0-1 was 0.9333, which manifested high genetic similarity between these two populations. The results of t-test showed that there was no significant difference in effective number of alleles per loci (Ae), index of genetic diversity (H), Shannon ’s information index (I) between the control G0-1 and G1-1, G2-1, G1-2, and G2-2. The index values of Ae, H, and I for the populations of G0-3, G0-4, G1-3, G1-4, G2-3, and G2-4 declined significantly compared with those of the control G0-1. The number of rare alleles for the populations G1-1, G2-1, G1-2, and G2-2 did not change significantly compared with that for the control G0-1 while that for populations of G0-3, G0-4, G1-3, G1-4, G2-3, and G2-4 declined greatly. Above resultsshowed that the genetic diversity and the number of rare alleles for the descendant population of the populations with 98.0% and 95.0% germination percentages did not change significantly compared with those for the control G0-1, but declined significantly for the populations with 81.0% and 79.0% germination percentages. Therefore, the viability decline had a greater impact on the genetic composition of soybean population than the regeneration times. It was recommended that soybean seeds with initial germination percentage of 98.0% should be regenerated before its germination percentage declined to 81.0%.

【中文关键词】马铃薯;离体茎尖;小滴玻璃化法;超低温保存;遗传稳定性

【英文关键词】potato;In vitro shoot tips;droplet vitrification method;cryopreservation;genetic stability

【中文摘要】以马铃薯试管苗为试材,对其茎尖小滴玻璃化法超低温保存的影响因素进行了研究,并对再生植株进行了遗传稳定性检测。结果表明,马铃薯茎尖依次在含有 0.3mol.L-1和 0.5 mol.L-1蔗糖的液体 MS 培养基中预培养各1d 后,在 0°C下 PVS2 处理 30 min,转到铝箔条上 PVS2 小滴上(约 15 μL),将粘有茎尖的铝箔条在液氮里蘸一下,然后直接装入盛满液氮的冷冻管中,投入液氮至少保持1h。室温下用含有 1.2mol.L-1蔗糖的 MS 液体培养基解冻并洗涤30min 后,接种到 MS + 0.5 mg.L-1 Zeatin + 0.1 mg.L-1 NAA+1.0 mg.L-1 GA3 恢复培养基上,存活率和再生率最高达 79.91%和 62.52%。通过 SSR 分子标记检测,再生植株的遗传稳定性没有发生改变。

【英文摘要】Shoot tips from axillary buds of in vitro potato(Solanum tuberosum L.)were successfully cryopreserved by droplet vitrification. The optimum cryopreservation procedures were as follows. Shoot tips excised from 2 – 3 month old plantlets were precultured on liquid MS medium supplemented with 0.3 mol.L-1 and 0.5 mol.L-1 sucrose for 1 day each and then dehydrated with PVS2 for 30 min at 0 °C. Five shoot tips were transferred to approximately 15 μL droplets of PVS2 solution on thin strips of sterile aluminum foil. The aluminum foil strips were folded to enclose the shoot tips. The foil envelope was then carefully immersed into liquid nitrogen(LN)using fine forceps. After immersion the strips were quickly transferred to 2 mL cryotubes and immediately plunged into

LN and maintained for 1 h at least. The shoot tips in the foil strips were then rapidly heated by immersion twice at 15 min intervals into 10 mL 1.2 mol.L-1 sucrose MS medium at room temperature. The shoot tips were then unloaded from the foil,rinsing the PVS2 from the shoot tips. The shoot tips were transferred to solid culture medium(MS + 0.5 mg.L-1 Zeatin + 0.1 mg.L-1 NAA + 1.0 mg.L-1 GA3)for recovery and regeneration. The average survival rate and regeneration rate were 79.91% and 62.52%,respectively. There was no genetic variation in the regenerated plants based on assessment of SSR markers.

【题目】超低温保存法去除马铃薯X病毒和马铃薯纺锤块茎类病毒
【中文关键词】马铃薯,PSTVd ,PVX,超低温保存法,茎尖分生组织培养
【英文关键词】Potato Solanum tuberosum L .) , PSTVd ,PVX,Cryopreservation ,Tip meristem culture
【中文摘要】病毒病严重危害马铃薯生产,是造成马铃薯减产和品质下降的主要因素。PVX和 PSTVd属于危 害马铃薯最主要的病毒。本文尝试用超低温保存法和常规方法(茎尖分生组织培养、温热疗法以及温热疗法结合茎尖分生组织培养)来去除马铃薯试管苗中的P STVd和PVX。结果显示马铃薯茎尖经过超低温保存后, 存活率和成苗率分别为 83.64%和 72.04%, 高于茎尖分生组织培养(46.67%和31.49%)、温热疗法(72.22%和 44.44%) 以及温热疗法结合茎尖分生组织培养(50.54%和30.38%) 。4种方法都可以去除 PV X,其中超低温保存法的脱毒率最高, 为59.13%, 温热疗法结合茎尖分生组织培养为 56.02%, 温热疗法和茎尖分生组织培养较低,为 42.61%和 35.83%。但是 4种方法都未能有效地去除 PSTVd类病毒, 只能通过严格检疫来控制。
【英文摘要】Virus disease severely impair for potato production ,are the major factor of poato yield decrease and the quality decline . Pota- to virus X (ievx) and potato spindle tuber viroid(PSTVd)are the main viruses damaging potato.In this study,we tried eliminating PVX and PSTVd from test tube plant let of potato by using cryopreservation and conventional method ,such as tip meristem culture,thermotherapy。 and thermotherapy followed by tip meristem culture.The results showed that the surviva1 rate and regeneration rate of potato shoot tips were 83.64% and 72.04 %,respectively by cryopreservation,all higher than tip meristem culture(46.67% and 31.4 9 %),thermotherapy(72.22 % and 44.44%) and thermotherapy followed by meristem culture(50.54 and 30.38 %) .PVX could be removed by four methods .The highest elimination rate of 59.13 % by cryopreservation method .The elimination rates of thermotherapy followed by tip meristem culture was 56.02%,and that of thermotherapy and tip meristem culture were lower ,42.61% and 35.83% respectively.But PSTVd couldn't be effectively eliminated by four methods and could be controlled by strict quarantine .

【题目】库存和圃存对雀麦属种质遗传完整性的影响
【中文关键词】雀麦属种质;遗传完整性;保存
【英文关键词】Bromus ; Genetic integrity ; Conservation
【中文摘要】利用20条ISSR引物, 对7份雀麦属种质进行遗传完整性检测,每一份种质包括库存和圃存两个供试亚群体。提取方法为混合取样。本试验 7份种质的供试亚群体之间遗传相似性系数除无芒雀麦 3为 0.78之外, 其余均大于 0.80。采用聚类分析除无芒雀麦 3和杂色雀麦出现分支外, 其余种质亚群体分支都按照同一种质群分别聚类。本试验表明雀麦属种质资源在圃存条件下, 经多年保存易发生遗传分化, 从而影响其遗传完整性。
【英文摘要】The genetic integrity of 7 accessions of Bromus stored in genebank of Inner Mongolia investigated by 20 ISSR primers.Each accession was represented by two subpopulations regenerated indifferent conservation.The genetic similarity between the two subpopulations of the same accession was above 0.80, except for 0.78 in Wu mangquemai 3 Cluster analysis based on the similarity coefficient showed that Wumangquemai 3 and Zasequema diverged from each other, falling into two branches, and each one clusterw as created by two subpopulations of the same accessions.The results showed that the Bromus stored outside had much more genetic divergence.

【题目】水稻种子在不同气候区室温贮藏的适宜含水量及存活特性
【中文关键词】水稻; 种子; 室温贮藏; 适宜含水量; 种子生活力; 发芽特性
【英文关键词】rice ; seed ; storage under room temperature ; optimal moisture content ; seed viability ; germination character
【中文摘要】将不同含水量水平的两个水稻品种幸实(粳稻)和桂朝2 号(籼稻)分别贮藏在三亚、 南昌、北京、西宁、乌鲁木齐 和哈尔滨等6 个不同气候类型地区。通过11年的逐年生活力测定,研究了水稻种子室温贮藏的适宜含水量及其存活特性。结果表明,水稻种子经适当干燥后其生活力和活力没有显著下降。但当种子含水量在310 %以下时种子的生活力和活力受到影响。获得了水稻种子在三亚、南昌室温贮藏时(贮藏温度不是恒定的)的适宜含水量,且适宜含水量510 %~615 %具有地域的广适性。相对于其他含水量,适宜含水量种子在贮藏过程中,其生活力快速下降阶段推迟,且适宜含水量上限和极差与贮藏地点年均温和≥ 0 ℃积温呈显著或极显著负相关,且适宜含水量下限与之呈显著或极显著正相关。种子在年均温度相同的西宁和乌鲁木齐的贮藏效果不同,≥0 ℃积温和气候温差波动的差值可能是其主要影响因素。

【英文摘要】Rice seeds of two varieties, Guichao 2 (indica) and Sachiminori (japonica) wit h different levels of moisture content were stored under room temperature at six sites with different types of climatic zones including Sanya, Nanchang,Beijing, Xining, Urumchi and Harbin , respectively. The optimal moisture contents and the survival characteristics were studied through a successive 11year monitoring on viability and vigor of rice seeds. The viability and vigor of dried rice seeds with optimal moisture content were not significantly declined. However, it proved ot herwise when the seed moisture content declined to below 310 %. The optimal moisture content of seeds stored in Sanya and Nanchang at room temperature was obtained. The optimal moisture content of 615 % to 510 % was widely adaptable to the six climatic zones. The phase of rapid decline in viability of seeds with optimal moisture content was delayed compared with other moisture content s. The upper limit and the range of optimal moisture content were negatively correlated with mean annual temperature and accumulated temperature (≥0 ℃) at significant or highly significant levels , and the lower limit was positively correlated with them at significant or highly significant levels. Although with the same mean annual temperature in Xining and Urumchi ,the seed storage results were different . This implied that the accumulated temperature (≥0 ℃) and fluctuation in temperature were probably the major reasons for the difference.

【题目】切花百合离体茎尖玻璃化法超低温保存研究
【中文关键词】切花百合;离体茎尖;正交设计;玻璃化法;超低温保存
【英文关键词】Cut flower of lily; Shoot tips ; Orthogonal test ; Vitrificati on method; Cryop reservation
【中文摘要】以切花百合西伯利亚试管苗离体茎尖为试材,通过正交设计试验对预培养培养基中蔗糖浓度、预培养时间和PVS2处理时间等影响超低温保存存活率的主要因素进行了分析,初步建立了切花百合种质玻璃化法超低温保存的技术方案。通过形态观察、可溶性蛋白和同工酶检测,冻存前后材料的遗传稳定性没有发生改变,表明该方法对切花百合的种质保存具有较强的实用意义。

【英文摘要】Shoot tips from in vitro plants of cut flower of lily (Lilium L.) , Lilium ×siberia cultivar, were successfully cryop reserved by vitrificati on method. Orthogonal design was used to analyze effects of dominant parameters on survival rates of shoot tips, including sucrose concentration of p reculture medium, duration of preculture an duration of exposure to PVS2. There were no variations in the regenerated plant on the level of morphology, protein and isoenzymic zymogram after cryop reservation. This vitrificati on method appears p romising for cryop reservation of cut flower of lily germplasm.

【题目】基于醇溶蛋白的20份大麦种质资源遗传完整性分析
【中文关键词】大麦 ; 醇溶蛋 白 ; 遗传 完整性 ; 繁殖更新
【英文关键词】Barley;Hordein;Genetic ntegrity;Propagation
【中文摘要】为了给大麦种质的保存和更新提供依据,采用醇溶蛋白电泳技术对2O份大麦种质(每一份 种质各有两个繁殖年份不同的供试材料) 进行了遗传完整性分析。结果表明,有5份种质是具有一种醇溶蛋白谱带带型的同质性种质,15份是具有2~6种醇溶蛋白谱带带型的异质性种质;同质性品种不同繁殖年份之间的谱带带型没有变化,而在15份异质性种质中有4份的带型数量及频率则发生了变化。说明某些大麦异性种质在繁殖更新过程中发生了遗传完整性变化。进一步分析表明,更新发芽率水平不是影响带型频率发生显著变化的主要因素,其遗传完整性变化可能是更新发芽率水、繁殖群体、授粉和收获方式等综合因素的影响结果 。
【英文摘要】The genetic integrity of 2O barley ccessions from different propagation years was studied by acid—polyacrylamide gel electrophoresis .The results revealed that there were 5 genetically homogeneOUS accessions having only one hordein spectrum biotype and 15 genetica- lly heterogeneous accessions having 2~6 hordeins spectrum biotypes.There was no difference of hordeins spectrum

biotype between genetically homogeneous accessions propagated in different years.But for the genetically heterogeneous accessions,the number and frequency of hordein spectrum biotypes changed.It showed the germination rate is not the main factor.The reasons of the change is a composite factor .

【题目】Restoring pollen fertility in transgenic male-sterile eggplant by Cre/loxp-mediated site-specific recombination system
【中文关键词】no
【英文关键词】eggplant, male sterility, Barnase gene, Cre gene, Cre/loxP system
【中文摘要】no
【英文摘要】his study was designed to control plant fertility by cell lethal gene Barnase expressing at specific developmentalstage and in specific tissue of male organ under the control of Cre/loxP system, for heterosis breeding, producing hybridseed of eggplant. The Barnase-coding region was flanked by loxP recognition sites for Cre-recombinase. Theeggplant inbred/pure line (‘ E-38 ’) was transformed with Cre gene and the inbred/pure line (‘ E-8 ’) was transformedwith the Barnase gene situated between loxp. The experiments were done separately, by means of Agrobacteriumco-culture. Four T0-plants with the Barnase gene were obtained, all proved to be male-sterile and incapable of producingviable pollen. Flowers stamens were shorter, but the vegetative phenotype was similar to wild-type. FiveT0-plants with the Cre gene developed well, blossomed out and set fruit normally. The crossing of male-sterileBarnase-plants with Cre expression transgenic eggplants resulted in site-specific excision with the male-sterileplants producing normal fruits. With the Barnase was excised, pollen fertility was fully restored in the hybrids. Thephenotype of these restored plants was the same as that of the wild-type. Thus, the Barnase and Cre genes were capableof stable inheritance and expression in progenies of transgenic plants.

【题目】CaMF2, an anther-specific lipid transfer protein (LTP) gene, affects pollen development in Capsicum annuum L.
【中文关键词】no
【英文关键词】Anther-specific,CaMF2,Capsicum annuum L., Lipid transfer protein,
VIGS,Pollen development
【中文摘要】no
【英文摘要】Based on the gene differential expression analysis performed by cDNA-amplified fragment length polymorphism(cDNA-AFLP) in the genic male sterile – fertile line 114AB of Capsicum annuum L., a variety ofdifferentially expressed cDNA fragments were detected in fertile or sterile lines. A transcript-derived fragment (TDF) specifically accumulated in the flower buds of fertile line was isolated, and the corresponding full-length cDNA and DNA were subsequently amplified. Bioinformatical analyses of this genenamed CaMF2 showed that it encodes a lipid transfer protein with 94 amino acids. Spatial and temporal expression patterns analysis indicated that CaMF2 was an anther-specific gene and the expression of CaMF2 was detected only in flower buds at stage 3 – 7 of male fertile line with a peak expression at stage4, but not detected in the roots, tender stems, fresh leaves, flower buds, open flowers, sepals, petals, anthers or pistils of male sterile line. Further, inhibition of the CaMF2 by virus-induced gene silencing (VIGS) method resulted in the low pollen germination ability and shriveled pollen grains. All these evidence showed that CaMF2 had a vital role in pollen development of C. annuumL.

【题目】Characterization of a new male sterility-related gene Camf1 in Capsicum annuum L.
【中文关键词】no
【英文关键词】Anther-specific, Camf1,Capsicum annum L, Male sterility, Glyoxal oxidase
【中文摘要】no
【英文摘要】For the sake of screening novel genes related to the male sterility in chili pepper for studying the molecular mechanism of plant male sterility, the gene differential expression analysis was performed by cDNA-amplified fragment length polymorphism (cDNA-AFLP) in the genic male sterile – fertile line 114AB of Capsicum annum L., and a variety of differentially expressed cDNA

fragments were detected in fertile or sterility material. Camf1, a transcriptderived fragment (TDF) accumulated in fertile line flower buds was further investigated. The Camf1 has 1,854 bp in length with no introns containing a 1,707-bp open reading frame (ORF). The deduced amino acid sequence of Camf1 shares higher similarity to some members from a glyoxaloxidase-related protein family, and has a glyoxal oxidase conserved domain at the N-terminus and a domain of unknown function (DUF1929) at C-terminal end. Expression analysis showed that Camf1 expressed only in stage 3 – 7 flower buds of male fertile of C. annum L. 114AB, and no detection in all organs of male sterility. The peak of expression level of Camf1 appeared at stage 4 flower buds of fertile line. Furthermore, expression analysis of different organs revealed that Camf1 expressed only in anthers of male fertile material and there were no expression in sepals, petals, pistils, roots, stems, leaves and open flowers. These results suggested that Camf1 was an anther-specific gene and might be essential for the fertility of C. annum L.

【题目】水稻与白叶枯病菌互作的基因表达谱分析与差异性表达基因的识别
【中文关键词】水稻,白叶枯病菌,cDNA-AFLP,表达谱,差异性表达基因
【英文关键词】Rice,Xanthomonas oryzae pv. oryzae,cDNA-AFLP,Gene expression profiling,Differentially expressed genes
【中文摘要】【目的】从基因组水平上阐明水稻在与白叶枯病菌(Xanthomonas oryzae pv. oryzae,Xoo)感病互作条件下基因表达反应的特征。【方法】用cDNA-AFLP 方法对Xoo 接种处理不同时间的水稻细胞进行基因表达谱分析。【结果】在测定的大约4 000 个水稻cDNA 片段中,363 个(9.1%)是差异性表达的,其中295 个受Xoo 诱导上调表达,68 个被抑制下调表达。根据在不同互作时间点的表达特征,它们可分为7 种表达类型。对31 个差异片段的序列同源性进行分析,发现它们在已公布的水稻全基因组中完全相同的序列,但只有10 个基因具有已知或推断的生物学功能,其余21 个基因功能未知。用荧光实时定量PCR 分析法证实了cDNA-AFLP 基因表达结果。【结论】构建了水稻-Xoo 感病组合在细胞水平上互作的基因表达谱,从基因组水平上识别了一批受Xoo 诱导或抑制表达、与水稻感病反应相关的基因,这些新基因的发现为开展水稻感病功能基因组学的研究提供了材料。
【英文摘要】【Objective】The study was conducted to elucidate the gene expression response of rice to bacterial inoculation withXanthomonas oryzae pv. oryzae (Xoo) at the genomic levels. 【Method】cDNA-amplified fragment length polymorphism(cDNA-AFLP) was employed to analyze the gene expression patterns of mock- and Xoo-inoculated rice suspension cultured cells.【Result】Three hundred and sixty-three (9.1%) from approximately 4 000 cDNA fragments analyzed were differentially regulated (295 up-regulated and 68 down-regulated) 0.5, 3, 24 h after co-cultivation with Xoo. Seven gene expression patterns of the differential fragments were identified. Ten of 31 sequenced fragments showed homology to genes with known or putative functions involved in metabolism, pathogen response and signaling. 21 others did not show any homology to sequences with known functions. cDNA-AFLP differential patterns for 5 selected genes were confirmed via real-time reverse transcription PCR analysis.【Conclusion】Gene expression profiling in response to Xoo and differentially expressed genes of rice were revealed and identified via cDNA-AFLP analysis. This work begins to reveal potential disease susceptibility-related genes of this staple crop with global importance.

【题目】Characterization of a Pectin Methylesterase Gene Homolog,CaPME1, Expressed in Anther Tissues of Capsicum annuum L.

【中文关键词】no
【英文关键词】Capsicum annuum L. . CaPME1 . Pectin, methylesterase . Anther-specific
【中文摘要】no
【英文摘要】A pectin methylesterase gene homolog, designated CaPME1, was identified by RNA-sequencing in the genic male sterile – fertile line 114AB of Capsicum annuum L. The full-length transcript of CaPME1 was 1,747 bp, including acomplete coding sequence of 1,662 bp (GenBank accession number: JN246474). The derived protein CaPME1 shares high similarity to members of pectin methylesterase protein family, containing a conserved domain of PMEI at the N terminus and a domain of PME at C-terminal end. The expression of CaPME1 was detected only in flower buds at stage 8 and open flowers of male fertile line, with no detection in any examined organ of male sterility line. Thefine expression analysis revealed that CaPME1 expressed specifically in anthers of male fertile line, and there was no expression detected in any other examined organ such as sepals, petals, pistils, roots, stems, or leaves. The putative function of CaPME1 involved in pollen development was also discussed in the present paper. These results suggested that CaPME1 was an anther-specific gene and might be essential for pollen maturation and germination in C. annuum.

【题目】Non-uniform distribution pattern for differentially expressed genes of transgenic rice Huahui 1 at different developmental stages and environments
【中文关键词】水稻,转基因,基因表达,非均匀分布
【英文关键词】genetically modified rice, differentially expressed genes, non-uniform distribution, different developmental stages, different environments
【中文摘要】利用基因芯片,研究证实了转基因水稻在不同生长期,不同环境条件下,差异基因表达符合非均匀分布模式。
【英文摘要】DNA microarray analysis is an effective method to detect unintended effects by detecting differentially expressed genes (DEG) in safety assessment of genetically modified (GM) crops. With the aim to reveal the distribution of DEG of GM crops under different conditions, we performed DNA microarray analysis using transgenic rice Huahui 1 (HH1) and its non-transgenic parent Minghui 63 (MH63) at different developmental stages and environmental conditions. Considerable DEG were selected in each group of HH1 under different conditions. For each group of HH1, the number of DEG was different; however, considerable common DEG were shared between different groups of HH1. These findings suggested that both DEG and common DEG were adequate for investigation of unintended effects. Furthermore, a number of significantly changed pathways were found in all groups of HH1, indicating genetic modification caused everlasting changes to plants. To our knowledge, our study for the first time provided the non-uniformly distributed pattern for DEG of GM crops at different developmental stages and environments. Our result also suggested that DEG selected in GM plants at specific developmental stage and environment could act as useful clues for further evaluation of unintended effects of GM plants.

【题目】茄子高效遗传转化体系的研究
【中文关键词】茄子;遗传转化;GUS 染色

【英文关键词】no
【中文摘要】茄子木质化程度比较高,组织培养较为困难。本试验中主要通过调节不同激素及其不同浓度配比来寻找茄子的高效遗传转化体系,用以上方法,茄子子叶外植体在MS + Zt 0.2mg • L-1 的培养基中的再生频率达到80%以上,显著高于采用6-BA 和IAA 的培养基。卡那霉素(Kan)及头孢霉素(Cef)浓度的筛选实验表明,浓度为300 mg • L-1 的Cef 为可有效地抑制农杆菌的生长,而浓度为150 mg • L-1 的Kan 卡那霉素具有很好的筛选效果。由此,确定茄子的筛选培养基为MS + Zt2 mg • L-1 + Kan 150 mg • L-1 + Cef 300 mg • L-1。在生根的过程中,通过对IAA 浓度的调节确定生根培养基为MS + IAA 0.2 mg • L-1 + Kan 150 mg • L-1 + Cef 300 mg • L-1。通过农杆菌介导的方法得到30 株PCR 阳性转基因茄子植株,GUS 染色结果显示DR5 启动子能在转基因茄子植株的幼嫩叶片中表达,表明转入基因已经整合到植物基因组中,并能稳定表达。

【题目】Testing of disease-resistance of pokeweed antiviral protein gene (PacPAP) in transgenic cucumber (Cucumis sativus)
【中文关键词】no
【英文关键词】Pokeweed antiviral protein gene; genetic transformation; Cucumis sativus
【中文摘要】no
【英文摘要】Transformation of pokeweed antiviral protein gene (PAP) into plants was shown to improve plant resistance to several viruses or fungi pathogens with no much negative effect on plant growth. The non-virulent defective PAP inhibits only the virus but does not interfere with the host. A non-virulent defective PAP gene (PacPAP) from Phytolacca acinosa was introduced into cucumber successfully by agrobacterium mediated method. Southern blotting and northern blotting analyses indicated that, 5 stable transgenic cucumber lines with PacPAP were obtained and PacPAP showed different expression levels in transgenic plants. The identification of resistances to disease was performed by artificial inoculation of cucumber mosaic virus (CMV) and Fusarium oxysporum fsp. cucumerinum on T-0 and T-1 transgenic plants. Compared with the non-transgenic susceptible plants, all transgenic plants with PacPAP showed resistance in different degree to CMV and the CMV-resistance of progeny (T-1) from transgenic lines could inherit stably, but the transgenic plants did not resist to Fusarium wilt of cucumber, the PacPAP was not resistant to Fusarium oxysporum fsp. cucumerinum. This work provides a new virus resistant cucumber breeding resource.

【题目】Analysis of combining ability and heredity parameters of glucosinolates in Chinese kale
【中文关键词】no
【英文关键词】Chinese kale; glucosinolate; combining ability; heritability; heterosis
【中文摘要】no
【英文摘要】The study was carried out with six Chinese kale lines as materials. Complete diallel crossing was designed with 6 x 6 to calculate the combining ability and the main genetic parameters. The results are as follows: The GCA effect of P(1), P(2) and P(5) was excellent. They were used as parants to get hybrids, the heterosis of anti-cancer glucosinolates of their hybrid was very high. By analyzing the SCA effects, 1 x 2 was an outstanding hybrid. The broad sense heritability of the main GSs were relatively higher, and the narrow sense heritability were lower, so the potential of heterosis was bigger.

【题目】抗病转录因子基因Pti4转化花椰菜的初步研究
【中文关键词】花椰菜;抗病转录因子;基因;Pti4;转化
【英文关键词】cauliflower;disease resistance-related transcription factor;gene;Pti4;transformation
【中文摘要】抗病转录因子Pti4是从番茄中分离的一种能够调控番茄抗病基因Pto转录的蛋白质。通过根癌农杆菌介导法将抗病转录因子基因Pti4导入花椰菜无菌苗下胚轴,同时对转基因植株进行了PCR、PCR-Southern和Southern blot分子检测以及细菌性黑腐病和软腐病病菌接种试验。结果表明,在建立再生系统过程中外植体的最佳苗龄为5～7 d,培养基中激素组合为NAA 0.2 mg · L-1、6-BA 2.0 mg · L-1时不定芽的诱导和分化效果最好。获得的35株阳性植株经分子检测证明抗病转录因子基因Pti4已被整合到花椰菜的基因组中。对其中26株接种病菌发现Pti4转化植株对细菌病害具有一定的抗性。
【英文摘要】The disease resistance-related transcription factor Pti4 is a kind of protein isolated fromtomato which can regulate the transcription of disease-resistance gene Pto. In this paper,Pti4 wastransferred into the hypocotyls of cauliflower (Brassica oleracea var. botrytis L.)mediated byAgrobacterium tumefaciens,and the transgenic plants were detected by PCR,PCR-Southern blot,Southernblot and the inoculation assay of bacterial soft rot and black rot. The results indicated that the optimalconditions for induction and differentiation of adventitious buds were 5 – 7 day-old seedling,coupled withMS medium supplemented with 0.2 mg · L-1 NAA and 2.0 mg · L-1 6-BA. Furthermore,35 positivetransgenic plants were obtained and confirmed by molecular detection,which approved that the diseaseresistance-related transcription factor gene Pti4 was integrated into cauliflower genome. Among them,26transgenic plants were more resistant than non-transgenic ones in disease-resistance assay.

【题目】不同灌溉条件下不同类型冬小麦产量水分利用效率差异原因分析
【中文关键词】小麦品种;抗旱类型;产量水分利用效率;群体水分利用效率;收获指数
【英文关键词】Wheat cultivar,Drought tolerant type,Yield water USe efficiency,Biomass water USe efficiency,Harvest index
【中文摘要】以旱地品种"西峰20"和"晋麦47"、水旱兼用型品种"石家庄8号"、高水肥地品种"石4185"和"科农9204"5个冬小麦品种为材料,通过田间不同灌溉处理试验研究了不同抗旱类型冬小麦品种收获指数和群体水分利用效率对产量水分利用效率的影响差异。结果表明:不同抗旱类型的小麦在不同灌溉处理下,产量水分利用效率(WUEy)以及变化趋势存在显著差异。旱地冬小麦品种WUEy和收获指数(HI)显著低于水地品种和水旱兼用型品种。不同品种间WUEy最大相差42.01%,HI相差25.91%。HI和群体水分利用效率(WUEbm)与WUEy呈显著正相关关系。株高与HI呈显著负相关关系(R2=0.574)。在不灌溉条件下,品种间WUEy差异源自HI的差异;而在补充灌溉条件下,品种间WUEy的差异源自WUEbm和HI的共同作用。说明不同抗旱类型的小麦对不同灌溉处理的响应方式和适应策略不同。旱地品种在干旱胁迫条件下,主要靠增加WUEbm来提高WUEy;而水地品种和水旱兼用型品种在补充灌溉中凭借较高的WUEbm和HI共同作用提高WUEy。
【英文摘要】Five drought tolerant winter wheat cultivars were used to evaluate the differences in the effects of harvest index (HI) and biomags water USe efficiency (WUEbm) on grain yield water use efficiency (WUEy) under different irrigation schemes.Tne wheat cultivars included dryland cultivars of ‘ 'Xifeng 20 ’ ’ and ‘ 'Jinmai 47 ” ,dry/wetland cultivar of ‘ ‘ Shijiazhuang 8 ” ,and wetland cultivars of “ Shi 41 85"and “ Kenong 9204".The results showed significant differences in WUEy and its changing trends among different drought tolerant wheat cultivars.Dryland cultivars had significantly lower WUEr than wetland and wet/dryland cultivars,with the higllest WUEr difference of 42.0 1%.Average water consumption of the drought tolerant wheat cultivars was 343~350 toni.No significant difference was noted in the amount of water consumption among different cultivars.This suggested that although dryland cultivars were drought tolerant.it did not limit the rate of water consumption.It also suggested that the main factor of WUEy wag WUEbm and HI.Dryland cultivars had significantly lower HI than wetland and wet/dryland cultivars.with the highest HI difference of 25.91%.Significant positive correlations were noted between HI and WUEy.and between WUEbm and WUEy.The correlation between plant height and HI was negative(R2=O.574).Under no irrigation, no obvious difference was noted in WUEbm among different cultivars.Dryland cultivars had lower HI than the other culfivars.The differcnce in WUEy among different cultivars was driven by the differences in HI.Under supplemental irrigation conditions,however,wetland and wet/dryland cultivars had higher WUEbm and HI

than dryland cultivars.The differences in WUEy came mainly from interactive effects ofHI and WUEt..The results suggested that different drought-mlerant wheat cultivars had responded differently to the same condition and therefore had different adaptation strategies to environmental conditions.Dryland cuitivars enhanced WUEbm which in turn led to higher WUEy in extreme drought conditions.Wetland and wet/dryland cultivars,on the other bane enhanced HI and WUEbmto yield higher WUEy under supplemental irrigation conditions.

【题目】Functional characterization of the translationally controlled tumor protein (TCTP) gene associated with growth and defense response in cabbage
【中文关键词】no
【英文关键词】BoTCTP; Cabbage; Functional characterization; Stress response
【中文摘要】no
【英文摘要】The translationally controlled tumor protein (TCTP) is an important component of the target of rapamycin (TOR) signaling pathway, the major regulator of cell growth in animals and fungi. Despite its relevance, knowledge on plant TCTP homologs is still limited. In the present study, the full-length BoTCTP cDNA was isolated from a cabbage (Brassica oleracea L.) cDNA library. The BoTCTP cDNA encodes a polypeptide of 168 amino acids and shared the highly conserved GTPase binding surface in all of the species analyzed. Northern blotting analysis showed that BoTCTP was specifically expressed in the root and stem. Furthermore, the expression of BoTCTP could be obviously enhanced by stress stimuli, including high temperature and salt stresses, while no significant changes in the BoTCTP expression were observed under ABA stress. Functional analysis of BoTCTP was performed by the silencing of BoTCTP using RNA interference (RNAi) and the BoTCTP RNAi plants exhibited reduced vegetative growth rate and decreased tolerance of the cold, high temperature, and salt stresses. The reported results clearly suggest that the BoTCTP gene is involved in the regulation of both growth and stress response in cabbage.

【题目】咸水灌溉下土壤水盐动态和作物生长研究进展
【中文关键词】咸水灌溉;灌溉方式;土壤水盐运移;作物生长和生理机理
【英文关键词】Saline water irrigation, Irrigation method, Soil water/salt movement, Crop growth and physiological metabolism
【中文摘要】我国淡水资源短缺且分布不均, 供求矛盾突出, 合理开发利用咸水资源、增辟灌溉水源将成为解决水资源危机的重要途径之一。本文从以下几个方面对国内外咸水资源灌溉利用的研究进展进行了综述, 以期为咸水安全灌溉提供指导。(1)咸水灌溉对土壤水盐运移的影响, 主要包括咸水灌溉后不同土层土壤水盐分布规律、不同灌溉水矿化度对土壤水盐运移的影响、灌溉方式对土壤盐分积累的作用; (2)咸水灌溉对作物生长的影响, 主要包括咸水灌溉与作物产量、品质的关系; (3)咸水灌溉对作物生理变化的影响及其作用机理, 主要包括咸水灌溉对植株脯氨酸含量、抗氧化酶活性、丙二醛含量、叶绿素含量及光合作用的影响。
【英文摘要】Fresh water resource is scarce and unevenly distributed in China. The use of saline water is therefore an effective way of solving the fresh water shortage. This article summarized the impacts of saline water irrigation on water/salt movement in soil, and on crop growth and changes in crop physiological metabolism. It discussed water/salt distribution in the soil profile, the effect of different

degrees of saline water on water/salt movement, and the role of irrigation methods on salt distribution in soil. The paper also epitomized the effects of saline water irrigation on the growth, yield and quality of crops. It further noted effects of saline water irrigation on physiological metabolism; including the changes in praline content, antioxidant enzyme activities, malondialdehyde content, chlorophyll content and photosynthesis.

【题目】喷施抗蒸腾剂对冬小麦旗叶蒸腾效率的影响
【中文关键词】冬小麦;成膜型植物抗蒸腾剂;旗叶水势;蒸腾效率;光合速率;丙二醛;抗氧化酶
【英文关键词】Winter wheat, Plant film-forming anti-transpirant, Flag-leaf water potential, Transpiration efficiency, Photosynthetic rate, Malonyldiadehyde, Antioxidase
【中文摘要】成膜型植物抗蒸腾剂(PFA)可以有效地减少植物的水分耗散, 提高水分利用效率。本试验以冬小麦(Triticum aestivum L.) 品种“ 科农9204 ”为试验材料, 在灌溉0 水、1 水、2 水和3 水条件下叶面喷施PFA, 测定灌浆期小麦旗叶水分生理和胁迫程度在处理间的差异以及衰老进程变化, 探讨了PFA 在冬小麦抵御干热风、提高水分利用效率方面的作用。结果表明: 喷施PFA 可以显著降低旗叶的蒸腾速率, 而对光合速率无显著影响,使叶片蒸腾效率显著提高; 喷施PFA 处理旗叶的保水力提高, 离体失水速率降低, 叶片的相对含水量和水势提高; 灌1 水、2 水和3 水条件下, 喷施PFA 处理旗叶的超氧化物歧化酶(SOD)活性、过氧化氢酶(CAT)活性及丙二醛含量均低于不喷施的对照, 而旱作(全生育期不浇水)喷施处理的旗叶SOD 和CAT 活性则高于对照。喷施PFA 可以有效地维持旗叶的水分生理环境, 抑制活性氧的产生, 保证氧自由基清除系统的正常运行, 维持细胞膜的完整性, 从而维持较高光合速率, 同时有效降低蒸腾速率, 这构成叶片蒸腾效率提高的生理基础。
【英文摘要】Restraining crop transpiration is critical for improving water use efficiency under scarce water resource conditions. Plant film-forming anti-transpirant (PFA) significantly limits plant water consumption, which in turn increases water use efficiency. However, PFA is rarely applied in winter wheat cultivation. We studied the effects of PFA on water stress physiology and senescence of flag leaf of winter wheat “ Kn 9204 ” under different irrigations. The wheat was irrigated 0, 1, 2 or 3 times (respectively denoted as I0, I1, I2 and I3) during the entire period of growth. The results suggested that transpiration rates decreased, photosynthetic rates remained unaffected and transpiration efficiency increased under spray PFA treatment. Flag-leaf water retention under spray treatment was higher than that of CK. Excised-leaf water loss rate under spray treatment was lower by 10.3%, 10.3%, 12.8% and 16.9% under I0, I1, I2 and I3 irrigation treatments, respectively, than that of CK with increasing flag-leaf relative water content and water potential. Under 1, 2 or 3 times of irrigation, wheat superoxide dismutaseon (SOD) and catalase (CAT) activities dropped. Under zero irrigation, however, SOD and CAT activities exceeded that of CK. The rate of change (rate of curve) in malonyldiadehyde content under different treatments ranked as follows: I1+CK (10.59) > I1+PFA (6.99) > I2+CK (5.05) > I2+PFA (3.66) > I3+CK (2.36) > I3+PFA (1.56).This suggested that spray PFA slowed down flag-leaf senescence as it maintained a water condition that restrained active oxygen (AO) production, ensured AO normal scavenging and sustained integrated cell membrane. Hence the high photosynthetic rate coupled with low transpiration rate induced high water use efficiency. Physiologically, this increased water use efficiency under spay PFA treatment. On the basis the results, it was concluded that PFA reduced flag-leaf transpiration and eased dry/hot-wind stress in winter wheat. Despite these findings, it was recommended to continue active research into the effects of spay PFA treatment on winter wheat production.

【题目】不同水分条件下作物蒸腾效率的比较研究
【中文关键词】小麦; 玉米; 谷子; 高粱; 耗水量; 蒸腾效率; 收获指数
【英文关键词】wheat ; corn; sorghum; millet; transpiration efficiency; water consumption; harvest index
【中文摘要】通过盆栽试验, 研究了三种土壤水分下(高水、中水、低水, 分别占田间持水量的80%~ 85%、7 0%~75%、60%~ 65%) 小麦、高粱、玉米、谷子的生物量、耗水量、蒸腾效率(TE) 及干物质分配的特点。结果表明, 随土壤含水量的降低, 作物的生物量、耗水量降低, 单株蒸腾效率(TE单株) 升高, 其中高粱的TE单株升高幅度最大为53. 6%。随土壤水分的降低, 作物的净光合速率、蒸腾速率降低, 作物通过大幅度降低蒸腾速率来维持较高的叶片蒸腾效率(TE叶片) 。作物全生育期的TE叶片呈单峰趋势, 小麦、玉米的TE叶片在开花期均达到最大值, 谷子和高粱的分别在灌浆期和抽穗期达到最大值。相关分析表明, 作物的TE产量与收获指数显著正相关(小麦: R2= 0. 632, 玉米: R2=0. 994, 高粱: R2= 0. 920, 谷子: R2= 0. 949) 。谷子在低水环境中具有更合理的干物质分配机制, 小麦在中、低水环境中能够保持较高的收获指数和TE产量, 它对水分的变动不敏感, 适宜生长的水分条件较广泛。
【英文摘要】Pot experiment was conducted to study the characteristics of biomass, water consumpt ion, transpiration efficiency(TE) and dry matter distribution of wheat, sorghum, corn, millet under 3 soil moisture condit ions (L: 60% ~65% of f ield capacity; M: 70%~ 75% of f ield capacity; H: 80% ~ 85% of field capacity) . The results showed that: With the decreasing of soil moisture, the crop biomass and water consumption reduced, plant TE increased. The TE in creasing range of sorghum was 53. 6%, which was the largest among 4 crops. With the reduct ion of soil moisture, net photosynthetic rate and transpiration rate (Tr) became lower. Cropmaintained a high leaveTE(TEl) by a signif icant reduction of Tr . TEl of crop showed a single peak trend changewithin growth stages, wheat and corn reached the maximum at the flowering stage, while the TEl peak of millet and sorghum appeared in grain filling stage and heading stage, respectively. Correlation analysis showed that TEy and harvest index (HI) was significantly positively related (wheat: R2= 0.632, corn: R2= 0.994, sorghum: R2= 0.920, millet: R2= 0.949) . There was a more reasonable dry matter distribution mechanism for millet in low soil moisture environment, while wheat could maintain higher HI and TEy in medium and low water environments, and it was not sensitive to soil moisture change and could grow in broader soil moisture conditions.

【题目】高温高湿对不同品种(系) 现蕾期辣椒(Capsicum annuum L.) 抗氧化性的影响
【中文关键词】高温高湿;辣椒;现蕾期;抗氧化性
【英文关键词】high temperature / air humidity; hot pepper; buding stage; antioxidant activity
【中文摘要】选用10 个具有代表性辣椒品种(系) ,于人工气候室内分别在正常和高温高湿条件下,研究了现蕾期辣椒抗氧化系统生理生化性状的变化以及不同品种(系) 的抗氧化性差异。结果表明:10 个辣椒品种(系) 抗坏血酸(AsA)、花青素含量下降,而谷胱甘肽(GSH)、花色苷含量增加; 超氧化物歧化酶(SOD)、过氧化物酶(POD)、过氧化氢酶(CAT)、苯丙氨酸解氨酶(PAL) 4 个酶活性一致增强。根据8个生理生化指标的相对值,通过坐标综合评定法对活性氧的抑制和清除进行分析,抗氧化剂类的贡献大于抗氧化酶类;系统聚类法将10 个辣椒品种(系) 的抗氧化性强弱分为3 类:06591、115-5-5-12-9-1-2、B04-99-5-1-1-2、06597、06590 为强抗氧化性品种(系) ;B04-51-4-2-1-2-1 和43-5-1-1-1 为中等抗氧化性品种(系)

;06592、B04-114-1-1-1-1-1、B04-512-4-1(系)为弱抗氧化性品种。

【英文摘要】The experiment was carried out in climate chambers to investigate the effects of high temperature and airhumidity on reduced glutathione content, ascorbic acid content, anthocyanidin content, anthocyanin content andantioxidative enzyme activities in ten hot pepper varieties leaves under both normal and high temperature / air humidityconditions during budding stage. The results indicated that contents of ascorbic acid and anthocyanidin decreased,contents of glutathione and anthocyanin increased, activities of superoxide dismutase, peroxidase, phenylalanineammonia-lyase and catalase increased under high temperature / air humidity stress among the tested 10 varieties.According to the relative value of 8 indexes,the result of the coordinate synthetic assessment method showed that theantioxidant ’s contribution to the inhibition and scavenging of active oxygen was greater than the antioxidant enzymes. Atthe same time,the method of cluster was used to evaluate antioxidant activity differences of hot pepper varieties,and 10tested varieties could be into three classes of the antioxidant activity. The strongest antioxidant activity varieties were06591,115-5-5-12-9-1-2,B04-99-5-1-1-2,06597,06590,followed by B04-51-4-2-1-2-1 and 43-5-1-1-1,and the lowestwere activity varieties 06592,B-04-114-1-1-1-1-1 and B04-512-4-1.

【题目】中国稻田CH4和N2O排放及减排整合分析

【中文关键词】稻田;CH4;N2O;减排措施

【英文关键词】rice field; CH4; N2O; mitigation measurements

【中文摘要】【目的】对中国有关稻田CH4和N2O 排放试验结果进行整合分析,估算不同管理措施的减排潜力,为稻田CH4 和N2O 减排提供参考依据。【方法】通过建立中国稻田CH4 和N2O 排放的数据库,研究稻田CH4 和N2O 的排放特征,分析作用显著的影响因素,比较不同措施的减排效果。【结果】中国稻田CH4 排放存在明显的地域性分布规律,主要表现为西南地区稻田CH4 排放远高于其它地区。水稻生长季节水分管理方式、非水稻生长季水分状态、化肥氮投入量和有机物料对稻田CH4排放具有重要影响(P<0.05)。与淹水灌溉(CF)相比,前期淹水-中期晒田-淹水(F-D-F)、前期淹水-中期晒田-淹水-湿润灌溉(F-D-F-M)和间歇灌溉或完全湿润(M)降低稻田CH4 排放的幅度分别为45%、59%和83%。与休闲期淹水(F)相比,采取冬闲期排干(SD)、稻旱轮作(LD)或旱-旱-稻轮作模式(TD),能降低稻田CH4排放 42%—56%。不同有机添加物产生CH4的能力的顺序为:作物秸秆+厩肥(S+FM)>绿肥(GM)>厩肥(FM)>作物秸秆(S)>堆肥或沼渣(CM)。化学氮肥的种类对CH4排放有一定的影响,但特征不明显,而随着氮肥用量(N)的增加,CH4排放逐渐降低。当0<N≤150 kg N · hm-2,150<N<250 kg N · hm-2和≥250 kg N · hm-2时,CH4排放较不施任何肥料降低12%、29%和65%。中国稻田N2O 排放的地域性分布特征不明显。水稻生长季节水分管理方式、非水稻生长季水分状态和总氮投入量是影响N2O 排放的最重要的因素(P<0.05)。与CF 相比,F-D-F、F-D-F-M和M 能够提高稻田N2O 排放12%、140%和478%,而且在F-D-F、F-D-F-M 模式下的氮肥N2O 排放因子分别为0.43%和0.68%。不同非水稻生长季水分状态模式下N2O 排放平均值表明,SD、LD 和TD 比F 增加40%—110%的排放。【结论】稻田CH4和N2O 排放的消长关系表现在水分管理、非水稻生长季节的水分状态和氮素的投入量等方面。合理的减排措施应基于二者的综合考虑。通过优化稻田水肥管理措施可降低稻田CH4和N2O 排放的温室效应。

【英文摘要】【Objective】 By integrated analyzing field experimental results about CH4 and N2O emissions from rice field in China, the authors estimated the mitigation potential of various factors controlling CH4 and N2O emissions in order to provide some suggestions for reducing them in paddy field. 【Method】 A database of CH4 and N2O emissions from rice field in China wasconstructed in order to study the characteristics of two greenhouse gas emissions and analyze the factors which have a significant effect on them. 【Result】 There clearly existed a zonal distribution law of CH4 emission in China, which showed that the CH4 emissions from Southwest of China were far more than other rice planting areas. It was considered that the factors controlling CH4 emission were water management regimes in rice growing period, water status of non-rice growing season, types of organic or synthetic nitrogen fertilizer and levels of chemical nitrogen fertilizer input (P<0.05). Compared to continuously flooded (F), flooding-midseason drainage-reflooding (F-D-F), flooding-midseason drainage-reflooding-moist intermittent irrigation, but without water logging(F-D-F-M)and alternative flooding and drainage after transplanting, or moister irrigation but without water logging(M)reduced CH4 emission by 45%, 59% and 83%, respectively. Water status of non-rice growing season determined by croppingsystem also has a significant effect

on CH4 emission. The mode of short drainage (SD), long drainage (LD), and two drainage (TD)could reduce CH4 emission by 42%-56% compared to flooded (F). Simulated effect of organic amendments on CH4 emission fromrice field was decreased in the order of crop straw + farm manure (S+FM)>green manure (GM)>farm manure (FM)>crop straw (S)>composted farm manure and biogas digestion (CM). The effect of different types of chemical nitrogen fertilizer on CH4 emissionwas unclear. The CH4 emission decreased gradually with increasing chemical nitrogen fertilizer rate (N). When N was 0<N≤150 kgN · hm-2,150<N<250 kg N · hm-2 and N≥250 kg N · hm-2,CH4 emission was reduced by 12%, 29% and 65% compared withtreatment of non-fertilizer. There did not exist a zonal distribution law for N2O emission. The factors including water management regimes in rice growing period, the non-rice season water status, and total nitrogen fertilizer input were important for N2O emission (P<0.05). Compared to CF, the N2O emission was increased by 12%, 140% and 478% under F-D-F, F-D-F-M and M. The nitrogen fertilizer-induced N2O emission factors were 0.43% and 0.68% in F-D-F and F-D-F-M, respectively. By analyzing the water status of non-rice growing season, the average N2O emission increased by 40%-110% under SD, LD and TD, compared to F. 【Conclusion】There was a trade-off relationship between emission of CH4 and N2O from rice field, appeared water management regimes in rice growing period, water status of non-rice growing season, and the amount of synthetic nitrogen fertilizer. Mitigation measurements in rice fields should be taken consideration comprehensively both of CH4 and N2O emissions. Global worming potential of CH4 and N2O emission from rice field could be reduced by optimizing water regime and fertilizer management.

【题目】Development of adjustable male sterile plant in broccoli by antisense DAD1 fragment transformation
【中文关键词】no
【英文关键词】Brassica oleracea L. var. italica; DAD1; adjustable male sterility; jasmonic acid and antisense RNA
【中文摘要】no
【英文摘要】Male sterile line is very important in hybrid seed production in broccoli (Brassica oleracea L. var. italica). A fragment of BoiDAD1F was amplified from this specie using primers designed against the conserved DAD1F fragment of DAD1 genes in Arabidopsis thaliana and Brassica rapa. The BoiDAD1F sequence was 88 and 99% similar to the homologous genes in Arabidopsis and B. rapa, respectively. The antisense BoiDAD1F was then cloned onto pBI 121 vector to make the transformation construct, pBI-antiBoiDAD1F. Cotyledons with petiole were inoculated with Agrobacterium tumefaciens harboring the pBI-antiBoiDAD1F plasmid. Positive transformation was confirmed using polymerase chain reaction (PCR) and Southern blots. Twenty individual transformants were obtained, of which 15 showed suppressed DAD1 mRNA level. Pollens produced by the male sterile transgenic plants germinated poorly (<= 10%). No seeds were produced on the flowering transgenic plants, and the siliquae were empty, or the few shrinked seeds, which failed to germinate. When pollinated with wild type plant pollen, the siliquas of the transgenic plants enlarged to produce normal seeds. No morphological differences were observed between the transgenic and wild type plants, except a few abnormal flowers on transgenic ones. To restore the fertility, exogenous JA were applied by dipping the floral buds into an aqueous solution containing 500 mu M MeJA and 0.05% Tween 20 after removal of the opened flowers on the inflorescence. The treated flower produced normal pollens which germinated on the medium, and were fertile. T1 population consisted of fertile and sterile plants in the ratio of 3:1. The T2 population comprised of both complete fertile and sterile lines. These results confirmed the Mendel model of separation of the antisense RNA insert in the transgenic plants.

【题目】菜心BrcuFCA 基因的克隆与表达分析
【中文关键词】菜心, 总RNA 提取, FCA 基因, 时空表达
【英文关键词】Flowering Chinese cabbage (Brassica campestris L. ssp. Chinensis (L.) Makino var. utilis), Total RNA extraction, FCA gene, Spatial and temporal expression
【中文摘要】本文以菜心(Brassica campestris L. ssp. chinensis (L.) Makino var. utilis)为实验材料,比较了Trizol法、改进Trizol法及改良SDS 法提取菜心总RNA 的效果。结果表明改进Trizol 法集中了操作简单、耗时短、所需试剂种类少,且完整性好,产量和纯度均高等多重优点,成为提取菜心总RNA 首选方案。同时文章以甘蓝型油菜及其它物种的FCA 保守区设计引物,将质量高的菜心总RNA 反转录合成cDNA,通过RT-PCR 从菜心的早、晚熟品种中均克隆得到与开花有关的基因片段,将之命名为BrcuFCA,片段长1 001 bp,GenBank 登录号为EU700363,与甘蓝型油菜及拟南芥FCA 氨基酸同源性分别达到了98%和82%。另一方面,本研究还利用半定量RT-PCR 研究了BrcuFCA 不同时空表达特性,并结合已发表的开花调控遗传途径中两个关键基因BrcuFLC 和BrcuFRI 时空表达特性研究结果,推测菜心主要的抽薹开花途径不是春化和FRI- 依赖途径,而很可能是自主开花途径。本研究为菜心抽薹开花分子机理的研究提供理论依据。
【英文摘要】In this paper, we used the flowering Chinese cabbage (Brassica campestris L. ssp. chinensis (L.) Makinovar. utilis) as the experimental material and compared the total RNA effect which was extracted by Trizol method,modified Trizol method and modified SDS method respectively. the results showed that modified Trizol method hadseveral advantages, such as simply manipulate, consume time shortly, the little types of needed reagents, the RNAintact well, high yield and purity, and so on, which was most fit for extraction total RNA of flowering Chinese cabbage.Meanwhile, we desinged the primers based on the conserved sequence of FCA gene of Brassica napus and otherspecies, and then the high quality total RNA was synthesed into the cDNA by reverse transcriptase. We cloned a1 001 bp fragment from the early varity and the late varity flowering Chinese cabbage respectively, which was relevantto flowering, named

BrcuFCA and its GenBank accession number was EU700363, further comparison to thegene of Brassica napus FCA and Arabidopsis thaliana FCA, the result showed that the homology of amino acid sequencewas 98% and 82% respectively. On the other hand, we still utilized semi-quantitative RT-PCR to investigatethe different spatial and temporal expression of BrcuFCA, according to BrcuFLC and BrcuFRI, two key genes offlowering-related genetic pathway, we presumed that the main pathway of bolting-flowering regulation of floweringChinese cabbage didn't go back to the vernalization pathway and FRI-dependent pathway, but might be the auto-flowering pathway. The results of this research would provide theoretical basis for investigation the molecular mechanismof flowering Chinese cabbage bolting and flowering

【题目】利用Cre/lox 重组系统获得烟草TA29-Barnase 基因工程雄性不育恢复系
【中文关键词】TA29-Barnase 雄性不育基因, Cre/lox 重组系统, 雄性不育, 育性恢复, 烟草
【英文关键词】TA29-Barnasemale sterile gene, Cre/lox site-specific recombination system, Male sterility, Fertility restoring, Nicotiana tabacum
【中文摘要】结合F1杂种的生产原理,利用Cre/lox 重组系统,建立了一种完全有别于Barnase/Barstar 恢复途径的基因工程雄性不育恢复系。将TA29-Barnase 雄性不育基因表达盒置于两个同向lox 位点之间并与Bar 基因融合后获得植物表达载体pBinBarloxTABn,通过农杆菌介导的叶盘转化法将其转入Wisconsin 38 烟草获得了雄性不育转基因烟草植株。雄性不育转基因植株表现花药瘦小,不饱满,花粉量明显偏少,花粉畸形、皱缩、塌陷、极少萌发,自交无法正常座果结子。TA29-Barnase 雄性不育转基因植株用来自pBinCre 转基因植株的花粉授粉后则能正常结果结子。分别从pBinCre 转基因植株C1 与转基因雄性不育植株BN1、BN6 杂交后代中筛选到23 株、22 株Kan 和PPT 双抗性植株,分子检测结果显示两个杂交组合后代中凡同时含Cre基因和Bar 基因的F1植株,其TA29-Barnase 雄性不育基因均被删除,删除效率达到100%。F1植株中的TA29-Barnase 基因被删除后,育性被恢复,能正常开花结果。
【英文摘要】According to the principle of F1 hybrid production, a new approach to restore the fertility of engineeredmale sterility induced by Barnase gene was constructed using the Cre/lox site-specific recombination system, whichwas distinct from the Barnase/Barstar restoring approach. In this study, the TA29-Barnase male sterile gene expressioncassette that flanked by two directly oriented lox sites and the Bar gene expression cassette were assembledinto pBinBarloxTABn plant expression vector. The vector was transformed into Wisconsin 38 tobaccogenome to produce male sterile plants by Agrobacterium tumefaciens-mediated leave disc transformation method.The male sterile plants appeared anther thinness, unfull and poor pollen produced. The pollen of male sterile plantswas unnormal, crimpy, and lost the germination ability, and no normally expanded fruits and seeds formation wereobserved after self-pollinated. However, there were the normally fruits and seeds appeared on the TA29-Barnasemalesterile plants after pollinated using pollens from pBinCre transgenic plant. Total 23 F1 progenies from thecross combination between pBinCre transgenic plant C1 and male sterile transgenic plant BN1, 22 F1 progeniesfrom cross combination C1 and BN6 with resistance to kanamycin and PPT were screened out respectively, thePCR analysis results indicated the TA29-Barnase gene expression cassette in the genome of those progenies contained both Cre and Bar genes had been excised efficiently, the deletion rate reached 100% for both the BN1×C1and BN6×C1 cross combinations. Those progenies that TA29-Barnase gene deleted could flower and fruit normally,indicated the male sterility had been restored.

【题目】基于AlcR/alcA 和Cre/loxP 系统的标记基因诱导删除体系
【中文关键词】Cre/loxP 重组系统;AlcR/alcA 诱导系统;删除;选择标记基因
【英文关键词】Cre/loxP recombination system; AlcR/alcA induce system; excision; selectable markers
【中文摘要】【目的】通过构建能够在植物生长发育阶段经乙醇诱导将选择标记基因删除的载体,消除选择标记基因带来的潜在安全隐患。【方法】利用AlcR/alcA 诱导系统和Cre/loxP 位点特异性重组系统删除选择标记基因。当外源诱导物乙醇存在时,激活下游Cre 的表达。Cre 重组酶识别2 个同向loxP 位点,剔除位点之间的DNA 片段,包括选择标记基因、AlcR/alcA 系统和Cre/loxP 系统,而目的基因gus 在诱导前后均为组成型表达。【结果】拟南芥转基因植株受乙醇诱导严格控制Cre 表达的“开”和“关”。经诱导的转基因植株不能在选择培养基上继续生长。分子生物学检测显示,2 个同向loxP 位点间序列均已删除,表明标记基因删除效果明显。【结论】基于AlcR/alcA 和Cre/loxP 系统的标记基因诱导删除体系切实可行,有广泛的应用前景。
【英文摘要】【Objective】To eliminate the potential risk in safety raised by selectable markers, an ethanol inducible excisionsystem of selectable markers was constructed, which can be used during plant growth and development. 【Method】 The selectablemarkers can be removed based on AlcR/alcA inducible system and Cre/loxP site-specific recombination system. In the presence ofthe exogenous inducer, the activation of the downstream Cre gene was enabled. Cre recombinase identified and catalyzed excision ofthe intervening sequence between two directly oriented loxP sites, including selectable marker gene, AlcR/alcA and Cre/loxP system.The gene of interest, gus, was constitutively expressed before and after induction. 【Result】 The Arabidopsis thaliana transgenicplants were induced by ethanol. The results revealed that ethanol tightly control the“on”and“off”of the expression of Cre gene.After induction, the transgenic plants could not continuously grow on selective medium, which indicate the selectable marker wasremoved efficiently. The molecule analysis revealed the DNA fragment between two directly oriented loxP sites has been excised.【Conclusion】 The results demonstrate that the excision of selectable markers based on inducible AlcR/alcA and Cre/loxP systemsis reliable, and has a bright future.

【题目】大豆黄酮和染料木素对奶牛瘤胃夜内主要养分相关酶活性的影响
【中文关键词】大豆黄酮;染料木素;瘤胃酶活;奶牛
【英文关键词】Soybean flavonoids; Genistein; Rumen enzyme live; cows
【中文摘要】采用3×3 拉丁方试验设计,每组奶牛分别饲喂不同日粮,(基础日粮)为Ⅰ组、(基础日粮+ 200 mg 大豆黄酮/(d·头- 1))为Ⅱ组、(基础日粮+ 200 mg 染料木素/(d·头- 1))为Ⅲ组,测定大豆黄酮和染料木素对奶牛采食后2 h 瘤胃内与粗纤维、淀粉及蛋白质降解相关酶活性的影响。结果表明:二者在一定程度上均显著提高了瘤胃内微晶纤维素酶、羧甲基纤维素酶、水杨苷酶、木聚糖酶的活性(P < 0.05);淀粉酶和蛋白水解酶活性方面,大豆黄酮和染料木素均没有对各组活性产生显著影响(P > 0.05)。

【题目】Toll 样受体在牛体内抗原呈递细胞中的研究进展
【中文关键词】toll样受体,牛,抗原递呈,细胞
【英文关键词】Toll sample receptor, cattle, antigen is deferred, cells
【中文摘要】免疫系统起着发现和消除入侵病原的作用,在哺乳动物体内它可以分为天然性免疫和获得性免疫两部分。获得性免疫可以通过B细胞和T细胞表面受体识别自身抗体和病原抗体。另一方面,天然性免疫中Toll样受体是近年来备受关注的一种病原体识别受体,它在固有免疫中通过对病原体相关的分子模式(PAMP)的识别发挥作用,通过刺激信号的级联反应导致细胞因子的产生和协同刺激凶子的表达。

【题目】Development of Molecular Markers Linked to Cladosporiumfulvum Resistant Gene Cf-6 in Tomato by RAPD and SSR Methods
【中文关键词】Cladosporium fulvum,Cf-6
【英文关键词】Cladosporium fulvum,Cf-6
【中文摘要】Leaf mold, caused by the fungus Cladosporium fulvum, is a serious disease of tomato. In the current study, the main physiological races of C. fulvum collected from three northeastern provinces of China were identified using a set of identification hosts. The results showed that the prevalent pathogenic physiological races were 1.2.3, 1.3, 3, 1.2.3.4, and 1.2.4. F1, F2, and BC1 tomato plants were obtained by crossing C. fulvum-resistant cultivar 03748 carrying the Cf-6 gene and susceptible cultivar 03036. Three 10-mer oligonucleotide random amplified polymorphic DNA (RAPD) primers and two simple sequence repeat (SSR) primers were selected for the further molecular marking analysis after 210 RAPD primers and 50 SSR primers were screened using the bulked segregate analysis method. The polymorphic DNA bands were amplified among parents, 10 F1 plants, 184 F2 plants including 145 resistant plants and 39 sensitive plants using three RAPD primers and two SSR primers so that three RAPD molecular markers and two SSR molecular markers linked to the Cf-6 loci were identified. Three RAPD markers were linked to the Cf-6 resistant locus separated with 8.7 cM, 20.3 cM, and 33.4 cM. Also, one RAPD codominant marker S374619/559 was found. The locations of the two SSR markers were 12.6 cM and 9.7 cM away from the Cf-6 locus. After cloning and sequencing two specific DNA fragments closely connected to the Cf-6 resistant and susceptible alleles respectively, in the RAPD codominant marker S374619/559 and one codominant sequence characterized amplified region marker S674619/559 was converted from RAPD marker S374619/559. In the RAPD marker S374619/559, the length difference of two specific fragments, 619-bp fragment and 559-bp fragment, is the result of one insertion (60 bp) in the 619-bp fragment. These markers will facilitate the selection of resistant tomato germplasm containing the Cf-6 gene and cloning of Cf-6 to breed new C. fulvum resistant tomato cultivars.

【题目】胁迫下番茄叶片差异表达基因的cDNA-AFLP分析
【中文关键词】番茄;高温胁迫;cDNA-AFLP;差异表达基因
【英文关键词】tomato;Solanum lycopersicum;heat stress;cDNA-AFLP;differentially expressed genes
【中文摘要】为鉴定番茄高温胁迫响应基因,应用cDNA—AFLP技术,以番茄耐热品系Saladette幼苗为研究 对象,对高温胁迫早期叶片基因表达进行了mRNA指纹分析。通过768对引物组合的筛选,共分离得到 187个差异表达的转录衍生片段(TDF),其中增强表达或高温胁迫下特异性表达TDF153条,抑制表达34 条。对其中47个TDF进行了克隆、测序和序列分析。结果表明:34个TDF与NCBI或TIGR已有序列同源 (E-Value<10。),功能涉及信号传导、转录调控以及逆境诱导蛋白等,另有l3个TDF无同源序列或同源 性低,预测是一些未知功能基因。
【英文摘要】In order to identify genes involved in heat shock responses in tomato.cDNA-AFLP approach was employed to identify genes differentially expressed in tomato leaves at high temperature。 Seven hundred and sixty-eight primer combinations were used for selective amplification.One hundred and eighty-seven TDFs were selected for their difierential expression under heat stress.Among the 1 87 TDFs,153 TDFs were up-regulated and 34 TDFs were suppressed.Forty-seven TDFs were cloned and sequenced.Compared with the pub- licly available databases,34 TDFs presented some significant similarity with known plant sequences,whose functions are involved in gene regulation,transcription factor,signal transduction,stress defense,etc.Thir- teen TDFs with low identity and no match to known genes may represent novel tomato genes

【题目】番茄抗叶霉病基因Cf6的RAPD及SCAR标记
【中文关键词】番茄叶霉病;Cf 6 基因;RAPD;SCAR
【英文关键词】Fulvia fulva; Cf6 ; RAPD; SCAR
【中文摘要】【目的】寻找与番茄抗叶霉病基因Cf6连锁的分子标记。【方法】以番茄抗叶霉病和感叶霉病亲本组合(03036×03748)的 F 2 分离群体为研究材料,采用 BSA 法和 RAPD 技术筛选与抗病基因连锁的分子标记。【结果】经 F 2 单株分析,在后代群体中扩增出了两条长约 500 bp 的特异片段,该特异标记与叶霉病抗性基因Cf6紧密连锁,遗传距离为 8.7 cm。测序结果显示,目标片段的大小分别为 619 bp 和 559 bp,并将该标记转换为 SCAR 标记。【结论】SCAR 标记,可用于番茄叶霉病抗性分子标记辅助育种。
【英文摘要】【Objective】The study identified the molecular marker linked to Fulvia fulva resistant gene Cf6 n tomato. 【Method】 With a F 2 population between a resistant and a susceptible parent (03036×03748), the linked marker was screened by BSA method and RAPD technology. 【Result】Two specific bands were found at the 500 bp region using F 2 -based bulked segregant analysis plants. An RAPD marker was tightly linked to Fulvia fulva resistant gene Cf6 in tomato, with a genetic distance of 8.7 cm, The RAPD marker was converted into SCAR marker. Sequencing of the fragment indicated that the length was 619 bp and 559 bp, respectively.【Conclusion】SCAR markers could be applied to identify the resistance to Fulvia fulva, and can be used in molecular marker-assisted breeding practice.

【题目】Molecular identification and the complete nucleotide sequence of TYLCV isolate from Shanghai of China
【中文关键词】Molecular identification - Complete nucleotide sequence - TYLCV - Isolate - Shanghai - DNA-A
【英文关键词】Molecular identification - Complete nucleotide sequence - TYLCV - Isolate - Shanghai - DNA-A
【中文摘要】Tomato yellow leaf curl virus (TYLCV) belongs to the genus Begomovirus, family Geminiviridae. It is transmitted by the whitefly Bemisia tabaci. A pair of primers was designed according to the specific sequence of the TYLCV gene and used in the PCR detection of the virus in the infected tissues of tomato grown in the Shanghai area of China. DNA was extracted from leaves, fruits, seeds, and roots of infected tomato plants separately. The results showed that the target fragment of about 570 bp could be isolated from the leaves, fruits, roots of infected tomato plants, but not from the seeds. Thus, the PCR-based detection technology for the Shanghai TYLCV (TYLCV-Sh10) has been established. Primers were then designed based on the sequence of the 570 bp fragment to obtain the complete DNA-A sequence of TYLCV-Sh10 by genome walking. Sequencing results indicated that the DNA-A sequence of TYLCV-Sh10 contained 2781 nt that included six ORFs. BLAST results showed that DNA-A of TYLCV-Sh10 had low homology with the characterized TYLCV in China (TYLCCNV) except TYLCV-ZJ8 (TYLCV isolated from Zhejiang China). But it was most closely related to TYLCV-USA (99.28% sequence identity). TYLCV-Sh10, TYLCV-ZJ8, TYLCV-USA, TYLCV-Mex, and TYLCV-Eg formed an independent branch by pairwise comparison and phylogenetic analysis. All these results strongly suggested that Sh10 was an isolate of America or Africa TYLCV.

【题目】茄子SSR标记在番茄上的通用性分析.
【中文关键词】茄子,番茄,微卫星标记,通用性
【英文关键词】茄子,番茄,微卫星标记,通用性
【中文摘要】微卫星标记(SSR)是分子育种中常用的遗传标记之一,但目前报道的番茄SSR标记并不能满足番茄分子育种的需要,有必要发展出更多的SSR标记,近缘物种转移法是一种发展SSR标记简便快速的方法。本研究分析了茄子SSR标记在番茄上的通用性情况,结果表明:300对茄子SSR引物中有111对能在番茄基因组DNA上扩增出产物,97对引物扩增出的带型在茄子、番茄问相似程度高,标记通用率为32.3%;EST—SSR比基因组SSR的通用性更好,前者通用率为36.6%,后者为30.O%。将这些标记转移到番茄上,能节省开发番茄S

【题目】牛乳汁中葡萄糖转运基因的表达
【中文关键词】葡萄糖转运基因;乳汁体细胞;初乳;末乳
【英文关键词】glucose transporter genes; milk somatic cell; cow colostrums; the ending cow milk
【中文摘要】以牛初乳和末乳为研究对象, 利用乳汁体细胞的分子生物学技术平台, 对牛乳汁中葡萄糖转运基因的表达进行研究。结果表明, 初乳和末乳中均G A T 一(1 ,4);t % S G L T 一1 表达, 且初乳中的表达高于末乳;G L U T 一1 只在末乳中有表达, 初乳中不表达。提示乳腺细胞葡萄糖的摄取方式与泌乳阶段相关, 初乳期乳腺合成乳糖的作用高于末乳期乳腺。
【英文摘要】Using molecular biology platform of the milk somatic cells to study the expression of the glucose transporter genes in colostrum milk and ending cowmilk. The results showed that the GAT-(1,4) and SGLT-1 gene were expressed in colostrum and ending cowmilk, however the degree in the colostrums was more than that in the ending cowmilk, and the GLUT-1 gene was only expressed in the ending cowmilk. The results suggested that the uptaking mode of glucose in mammary gland cell was related to the lactation period. The lactase synthesis of mammary gland during the period of colostrums was higher than that during the period of ending milk.

【题目】日粮物理有效中性纤维对奶牛营养调控的研究
【中文关键词】日粮;物理有效中性纤维;营养调控;奶牛
【英文关键词】Diet,; Physical effective neutral fiber; Nutrition regulation; cows
【中文摘要】纤维的物理性状影响奶牛的咀嚼、唾液分泌、瘤胃pH 值和乳脂率。物理有效中性洗涤纤维(PeNDF)能有效保持乳脂率和动物健康。奶牛日粮中纤维的化学与物理特性对于刺激其咀嚼活动和维持稳定的乳脂率十分重要。奶牛对日粮中有效中性洗涤纤维(eNDF) 水平的反应是乳脂率变化,而PeNDF 的反应是其咀嚼活动。PeNDF 与纤维的物理性质(主要是指碎片大小、多指长度)有关,有刺激动物咀嚼活动和建立瘤胃内容物两相分层的能力。综述了日粮PeNDF 对奶牛营养调控的研究。

【题目】奶牛专用霉菌毒素吸附剂对泌乳奶牛生产性能的影响
【中文关键词】霉菌毒素吸附剂;奶牛;生产性能
【英文关键词】mycotoxin binder; dairy cattle; production and performance
【中文摘要】奶牛饲料原料中霉菌毒素广泛存在,并严重威胁着奶牛健康,影响奶牛生产性能的发挥。选择年龄、胎次、产奶量、泌乳天数接近的荷斯坦奶牛90 头,随机分成两组,考察奶牛专用霉菌毒素吸附剂对乳牛生产性能的影响。在饲喂等量的基础日粮上,对照组额外添加20 g/d·头精料补充料,试验组添加霉菌毒素吸附剂———普乐菲特20 g/d·头,其他饲养管理方式不变。该试验预饲期7 d,试验期77 d。结果表明,霉菌毒素吸附剂的添加不影响乳脂、乳蛋白,但对提高产奶量及降低原料奶中体细胞数(P<0.05)有明显效果。研究表明,日粮添加霉菌毒素吸附剂可有效提高原料奶质量,提高牧场整体经济效益。
【英文摘要】Mycotoxin in feed can bring negative effect on dairy health and decrease production of lactating dairy cows. The study objective was to evaluate milk production and milk composition when dietary mycotoxin binder was supplemented,and determine change of SCC in milk. Ninety dairy cows were randomly assigned to control group with 20 g concentration for a cow per day and experimental group with 20 g mycotoxin binder for a cow per day. The experimental period keep 97 days. The first 7 d of 97 d for adaptation period, cows were gradually introduced to their assigned diet. It was shown that dietary mycotoxin binder adding had not affect on milk composition,but milk yield increased tendency and SCC markedly decreased (P<0.05). Therefore, the experiment indicated that mycotoxin binder may improve raw milk quality and enhance economic profit for dairy cattle farm.

【题目】中草药添加剂对奶牛干物质采食量及瘤胃内环境的影响
【中文关键词】中草药,干物质采食量,pH,NH3-N,MCP
【英文关键词】Chinese herbal medicine, dry matter intake, pH, NH3-N, MCP
【中文摘要】试验选择4头体重相近,体况良好,安装永久性瘤胃瘘管的荷斯坦牛.采用4*4 拉丁方设计,在保持正常饲养管理的情况下,对照组饲喂基础日粮,试验组在基础日粮的基础上添加中草药添加剂1,中草药添加剂2,中草药添加剂3,试验共分为四期,每期试验共21d,其中预试期7d,正试期14d,结果表明院中草药添加剂能改变奶牛干物质的采食量,改善瘤胃内环境,提高瘤胃液pH,降低瘤胃液NH3-N浓度,提高瘤胃液MCP浓度.
【英文摘要】Four Holstein dairy cows with permanent rumen fistulas were selected in the experiment. The four dairy cows are all under good condition and with similar body weight and healthy condition. The experiment was designed by 4*4 Latin square, the control group was treated with the basic ration, and the tested groups were added with Herb Additives, 1, 2and 3. This experiment include four periods, each period has 21 days, which include pretesting days of 7 and testing days of 14. The results show that the Herb Feed Additives can change dry matter intake, improve rumen internal environment, including increasing the pH of rumen liquid, decreasing the density of NH3 -N and improve the density of MCP.

【题目】Nitrous oxide emissions from an intensively managed greenhouse vegetable cropping system in Northern China
【中文关键词】Nitrous oxide; Greenhouse tomato; Nitrogen fertilization management; Emission factor
【英文关键词】Nitrous oxide; Greenhouse tomato; Nitrogen fertilization management; Emission factor
【中文摘要】Nitrousoxide (N2O) emissions from a typical greenhouse vegetable system in Northern China were measured from February 2004 to January 2006 using a close chamber method. Four nitrogen management levels (NN, MN, CN, and SN) were used. N2O emissions occurred intermittently in the growing season, strongly correlating with N fertilization and irrigation. No peak emissions were observed after fertilization in the late Autumn season due to low soil temperature. 57 – 94% of the seasonal N2O emissions came from the initial growth stage, corresponding to the rewetting process in the soil. The annual N2O emissions ranged from 2.6 to 8.8 kg N ha − 1 yr − 1, accounting for 0.27 – 0.30% of the annual nitrogen input. Compared with conventional N management, site-specific N management reduced N fertilization rate by 69% in 2004 and by 76% in 2005, and consequently reduced N2O emissions by 51% in 2004 and 27% in 2005, respectively.
【英文摘要】Nitrousoxide (N2O) emissions from a typical greenhouse vegetable system in Northern China were measured from February 2004 to January 2006 using a close chamber method. Four nitrogen management levels (NN, MN, CN, and SN) were used. N2O emissions occurred intermittently in the growing season, strongly correlating with N fertilization and irrigation. No peak emissions were observed after fertilization in the late Autumn season due to low soil temperature. 57 – 94% of the seasonal N2O emissions came from the initial growth stage, corresponding to the rewetting process in the soil. The annual N2O emissions ranged from 2.6 to 8.8 kg N ha − 1 yr − 1, accounting for 0.27 – 0.30% of the annual nitrogen input. Compared with conventional N management, site-specific N management reduced N fertilization rate by 69% in 2004 and by 76% in 2005, and consequently reduced N2O emissions by 51% in 2004 and 27% in 2005, respectively.

【题目】分子标记辅助聚合番茄抗病基因育种
【中文关键词】番茄;分子标记;抗病性;聚合育种
【英文关键词】tomato;marker-assisted selection;disease resistance;pyramiding breeding
【中文摘要】利用番茄抗病基因Tm-2 a、I-2、Mi-1、Cf-9 的分子标记辅助选择,聚合抗烟草花叶病、抗枯萎病、抗根结线虫和抗叶霉病 4 个基因于番茄育种材料中。室内苗期接种鉴定和田间观察,获得的含4个抗性基因的株系L11、L19、L46和L51 对4 种病害都达到了抗级(R)水平,且具有较好的农艺性状,可作为抗病育种亲本。
【英文摘要】The elite lines of L11,L19,L46 and L51 containing Tm-2a,I-2,Mi-1 and Cf-9 resistant genes were obtained in tomato with the aid of the molecular marker assisted selection. Seedling inoculation of these inbred lines confirmed higher disease resistant levels. The results of field trials also showed that the four selected disease resistance lines have better agricultural characteristics and may be used for tomato disease resistance breeding program in the future.

【题目】晚稻期间秸秆还田对早稻田CH4和N2O排放以及产量的影响
【中文关键词】早稻田; 秸秆还田; CH4; N2O; 产量;
【英文关键词】Early rice field; Rice straw incorporation; CH4; N2O; Yield;
【中文摘要】选取湖南双季稻田为研究对象,采用静态箱-气相色谱法对晚稻期间秸秆还田配施减量化肥(DNPK+RS)和施化肥(NPK)处理下后季早稻田(2009年)的CH4和N2O排放通量进行观测。结果表明,在早稻田等量化肥条件下,DNPK+RS比NPK增加早稻田CH4排放的81%,减少N2O排放的53%。早稻产量表明,DNPK+RS显著低于NPK(P<0.05)。晚稻期间以秸秆还田来代替部分化肥,会降低次年早稻的有效穗数和肥料增产效应。DNPK+RS处理的单位产量的全球增温潜势为NPK的2倍。秸秆还田应该重视与化肥的搭配比例,否则会降低水稻产量,同时增加下季早稻的温室效应。
【英文摘要】By using the method of static chamber- gas chromatograph techniques, CH4 and N2O emission fluxes from early rice fields in 2009 were studied under decreasing chemical fertilizer + straw incorporation(DNPK+RS)and chemical fertilizer (NPK). The results showed that , with the same amount of applied fertilizer in early rice paddies in 2009,the emission of CH4 in DNPK+RS was increased by 81% , in early rice paddies in 2009,meanwhile, N2O emission was decreased by 53% compared with NPK. The grain yield of the DNPK+RS was far less than that of NPK. Substitution of rice straw incorporation for partial chemical fertilizer in later rice season

decreaseds effective panicles and effect of fertilizer on increasing yield in following early rice season. The global warming potential per unit rice grain of DNPK+RS was twice than that of NPK. Therefore, a great attention we should be paidy attention to the mix ratio of chemical fertilizer and straw returning, otherwise, the grain yield couldwill be decreased and the global warming potential of following season couldwill be increased.

【题目】氮肥管理对夏玉米土壤CH4和N2O排放的影响
【中文关键词】CH4;N2O;尿素;缓释肥;玉米
【英文关键词】CH4, N2O,urea, slow release urea, summer maize
【中文摘要】通过设置四个不同的氮肥管理措施, 即氮肥施用量 300 kg N/ha (N300)和 250 kg N/ha(N250)、改进的施肥模式(Optimized)以及施用缓释肥(SRU), 研究华北平原夏玉米生长季土壤与大气之间CH4和N2O的交换通量及相应措施的减排潜力. 结果表明, 在2008年整个夏玉米生长季,土壤都是大气CH4的净吸收库和N2O的排放源. 夏玉米生长季土壤氧化吸收的CH4总量从大到小依次为 Optimized > N250 > SRU > N300, 对应的吸收总量依次为 624.16、590.07、487.89 以及 316.02g CH4-C/ha, 各处理间氧化吸收的CH4总量无显著差异. 与 N300 和 N250 这两个处理相比, 依据夏玉米对氮肥的需肥规律以及玉米根层土壤速效氮的供给能力而确定氮肥施用量, 同时再平衡施用磷肥和钾肥的改进施肥模式能够显著降低夏玉米生长季N2O的排放. 施用聚乙烯包膜的尿素也能够显著降低夏玉米季N2O 的排放. 夏玉米生长季土壤排放的N2O 总量从大到小依次为 N300 > N250> Optimized > SRU, 对应的排放总量依次为 3462.18、2340.07、1680.00 以及 911.91 g N2O-N/ha, 相应的N2O 排放系数分别为 1.15%、0.94%、0.91%以及 0.30%.
【英文摘要】CH4and N2O fluxes from summer maize soil in North China Plain were measured in 2008 using a close chamber method. Four different nitrogen management levels were used: nitrogen application at the rate of 300 kg N/ha (N300), nitrogen application at the rate of 250 kg N/ha (N250), improved nitrogen management methods (Optimized), and the application of slow-release urea (SRU). The summer maize soil was a net sink of CH4 and an emission source of N2O during the whole growing season. The accumulative CH4 oxidation rate of Optimized, N250, SRU, and N300 was 624.16, 590.07, 487.89, and 316.02 g CH4-C/ha,

respectively. The difference of accumulative CH4 oxidation rate between four treatments was not significant (t-test, P<0.05). The Optimized treatment, which applied nitrogen according to maize demand and mineral nitrogen (N min) content in the soil of maize root layer, and balance phosphorus and potassium fertilizer application rate, could reduce N2O emission obviously compared toN300 and N250. The application of SRU could also reduce N2O emission significantly. The accumulative N2O emissions of N300, N250, Optimized and SRU were 3462.18, 2340.07, 1680.00, and 911.91 g N2O-N/ha,respectively, and the fertilizer-induced N2O emission factors were 1.15, 0.94, 0.91, and 0.30%, respectively.

【题目】鸡粪施入农田土壤的氨挥发研究
【中文关键词】氨挥发;鸡粪;施肥方式;施肥量;添加剂
【英文关键词】ammonia volatilization; chicken manure; application method; application rate; additive
【中文摘要】在北京海淀区东北旺乡利用风洞法氨挥发测定系统,研究了不同施肥方式、施肥量和添加剂对鸡粪在农田施用过程中氨挥发的影响。结果表明,施肥方式显著影响鸡粪氨挥发,试验期间在田间裸地24000kg · hm-2施肥量下,表施的累积氨挥发氮损失为19.8%,而表施后立即深翻5~9cm,氨挥发损失为3.3%;不同施肥量下,24000kg · hm-2比12000kg · hm-2和8000kg · hm-2的氨挥发损失分别减少2.1%和4.9%,但统计差异不显著;锯末对鸡粪氨挥发没有起到抑制作用,未添加锯末处理的氨挥发损失为19.5%,而添加锯末处理的氨挥发损失为21.1%;过磷酸钙对鸡粪氨挥发抑制效果显著,未添加过磷酸钙处理的氨挥发损失为31.8%,而添加过磷酸钙处理的氨挥发损失为21.9%,比未添加降低了31.1%。
【英文摘要】Ammonia volatilization was measured using a wind tunnel system after applying chicken manure to land soil in the suburb of Beijing. Continuous sampling for ammonia volatilizations was done over 16 days after chicken manure application. The influences of application methods, application rates, and additives were evaluated based on N loss through ammonia volatilization over measurement period. It was found that application methods remarkably affected ammonia volatilization. With an application rate of 24 000 kg · hm-2,N loss rate of top application was 19.8%, while it reduced to 3.3% if chicken manure was buried 5~9 cm below the surface. The N loss rate through ammonia volatilization did not change much with different application rates. Compared to the application levels at 12 000 kg · hm-2 and 8000 kg · hm-2, ammonia N loss rate in chicken manure treatment of 24 000 kg · hm-2 was slightly reduced by 2.1% and 4.9%, respectively. Addition of saw-dust had no restrain effect on ammonia volatilization:the N loss rate was 19.5% with sawdust (3% additive rate)and 21.1% without sawdust.Calcium superphosphate can significantly reduce ammonia volatilization. When chicken manure was top-dressed with an application rate of 24 000 kg · hm-2 and calcium superphosphate was added at 3%, N loss rate was 21.9%, which is significantly lower than that without calciumsuperphosphate(N loss rate 31.8%).

【题目】膜生物反应器用于猪场污水深度处理试验
【中文关键词】膜生物反应器; 中空纤维膜; 猪场污水; 水处理
【英文关键词】membrane bioreactor; hollowfiber membrane; swine wastewater; water treatment
【中文摘要】为满足今后越来越严格的畜禽污水排放标准,提高水处理效果,达到污染物排放的减量化,减轻环境污染负荷,采用中空纤维膜生物反应器作为猪场污水厌氧后的好氧工艺进行深度处理,对该工艺的处理效果、负荷特性及膜过滤性能变化等作了试验研究.结果表明,在低溶解氧(多在1 mg · L-1以下)、MLSS(污泥浓度)维持在8.48~13.1 g · L-1的条件下

,COD和NH+4-N负荷分别平均为1.32和0.6 kg · m-3 · d-1,均远高于普通活性污泥法,且随着负荷的增加仍能保持稳定的去除率.负荷的降低主要是由膜出水量的降低造成的,保证膜通量、降低膜污染是获得高效、高质处理效果的关键所在.在运行近两个月时,由于未排泥发生污泥膨胀现象,SRT过长,池内混合液沉降性能变得很差,探索合适的SRT(污泥停留时间)也是一个实际运行的关键所在.

【英文摘要】Stricter discharge standard of pollutants for livestock and poultry breeding will be put forward in the future. To meet the discharge standard, improve effluent quality, reduce pollutant discharge and relieve environment load, a 10 m3 · d-1 hollowfiber membrane bioreactor for swine wastewater treatment was set up as advanced treatment after anaerobic digestion. The effluent quality, loading rate and the membrane permeability were studied. About 4 months operation of the MBR, the COD loading rate was 0.41~2.74 kgCOD · m-3 · d-1, averaged 1.32 kg-COD · m-3 · d-1 and NH4+- N loading rate was 0.1~1.1 kgNH4+- N · m-3 · d-1, averaged 0.6 kgNH4+- N · m-3 · d-1 when DO was low (under 1 mg · L-1) and MLSS maintained 8.48~13.1 g · L-1. The results were better than those of the conventional activated sludge process and biofilm reactor.The removal of COD and NH4+- Nkept stable when the loadingrate was increased. The reduction ofthe throughputs was the main reason of the reduction of the loading rate. Therefore, keeping high permeate flux or reducing membrane fouling was very important to obtain effective and good qualityresults ofwastewater treatment. Sludge bulking happened when MBR ran two months without discharge of sludge, and the set-tlingcharacter ofmixed liquid in MBR turned verybad, soan appropriate SRTwas important in MBR application.

【题目】畜禽粪便的热解特性和动力学研究

【中文关键词】畜禽粪便; 生物质; 热解; 热重分析; 反应动力学

【英文关键词】animal manure; biomass; pyrolysis; thermogravimetric analysis; reaction kinetics

【中文摘要】利用热重- 微商热重的分析方法对猪、牛、鸡和羊 4 种畜禽粪便的热解行为进行了研究。热重试验样品粒径为 0.2 mm, 高纯氮气为热解环境, 加热起始温度为 20 ℃, 终止温度为 900 ℃。通过对热重(TG) 曲线和微商热重(DTG) 曲线的分析, 得出畜禽粪便热解过程的脱水、过渡、主要失重和炭化 4 个阶段以及主要热解阶段的几个特征值参数; 考察了加热速率对样品热解过程的影响, 发现加热速率对样品热失重速率影响比较明显; 利用试验所得数据, 通过建立反应动力学方程, 采用一级单组分和一级双组分分阶段反应模型, 求出不同畜禽粪便在相应热解条件下的反应动力学参数, 结果显示, 几种样品的表观活化能值都在100 kJ · mol-1以下, 说明几种热解对象都很容易受热分解。

【英文摘要】Under high pure N2 and heating rates of 10, 30, and 50 ℃ · min-1 respectively, the pyrolytic experiments for swine, cattle, chicken and goat manure were carried out with the aid of thermogravimetric analyzer (TGA) to investigate their pyrolytic characteristics and kinetics.The sample size is 0.2 mm and the temperature is from 20 ℃to 900 ℃. The TG and DTG figure indicates four pyrolytic stages, including water- losing stage(20~127 ℃), transition stage(127~207 ℃), main weight losing stage(207~427 ℃) and carbonization stage(427~800 ℃). TheDTG curve of swine manure has one peak but the others have two peaks. These samples have high weight losing rates and the highest is 41.91% · s-1 for swine manure at the heating rates of 50 ℃ · min-1. The heating rates only affect the weight losing rates and have no significanteffect on other pyrolytic characteristics. On the basis of experiment data, the kinetics parameters were obtained by establishing first- order dynamic reaction model and by integral computation method. All the apparent activation energy are below100 kJ · mol-1, indicating that all the samples are prone tothermal degradation.

【题目】Detection of the SRY Transcript and Protein in Bovine Ejaculated Spermatozoa
【中文关键词】无
【英文关键词】SRY Gene; Bovine Spermatozoa; In situ Hybridization; Bovine
【中文摘要】无
【英文摘要】The sex-determining region on the Y (SRY) gene is important in mammalian sex determination and differentiation. We report a study of the abundance of SRY gene products in bovine ejaculated. RT-PCR experiments using RNA extracted from bovine spermatozoa with SRY-specific primers yielded a 456 bp product, but the amount of SRY mRNA in sperm was lower than that in the testes ($p<0.01$). A protein of approximately 27 KDa was detected by western blotting. The SRY transcript was detected in the midpiece of approximately half the spermatozoa by in situ hybridization, and the SRY protein was detected in the heads of half the spermatozoa by immunofluorescence, indicating that SRY mRNA and protein may only be present in Y-bearing spermatozoa. These results suggest that the SRY transcript and protein are present in bovine ejaculated Y-sperm. The roles of the SRY gene in spermatogenesis, sperm motility, and the sperm-oocyte interaction merit further investigation.

【题目】不同农业措施下冬小麦田N2O排放通量的特征
【中文关键词】静态自动箱;连续观测;冬小麦田;N2O通量
【英文关键词】Static automated chamber; Continuous measurement; Winterwheat field; N2O flux
【中文摘要】利用静态自动箱连续观测系统对冬小麦农田翻耕(对照)、秸秆覆盖、免耕、秸秆深施和有机肥5种农业措施条件下N2O排放通量进行了监测。结果表明,各处理中N2O高排放通量均在12: 00-17: 00,低排放通量在0: 00-3: 00;冬小麦孕穗期N2O排放通量与气温和土壤5cm处温度显著相关;拔节期的水肥同期会导致15~20d的N2O排放高峰。不同农业措施N2O排放量大小顺序是有机肥>免耕>秸秆覆盖、秸秆深施和对照,差异极显著,而秸秆覆盖、秸秆深施和对照三种措施之间N2O排放量差异不明显。研究结果对估算不同农业措施下冬小麦田N2O的排放量有一定的参考价值。
【英文摘要】The characteristics of the nitrous oxide flux in thewinterwheat field under different fieldmanagements, such as tillage (CK), straw cover, non-tillage, straw deep fertilization and organic manure application wasmonitored by the static automated chamber and field continuous measurement system. The results showed that the highN2O flux occurred from 12: 00 to 17: 00, while the lowN2O fluxwas from 0: 00 to 3: 00.N2O flux during spike formation stage ofwinterwheatwas significantly correlatedwith the air temperature and

the soil temperature at5 cm depth.The synchronous irrigation and fertilization during jointing stage ofwinterwheatwould lead to a 15-20 daysN2O flux peak. The amountof N2O emission under different fieldmanagements during growing period ofwinterwheat from high to low was arranged in turn organicmanure application, non-tillage, straw cover, straw deep fertilization and tillage, and theirdifferenceswere extremely significant. However, the differences ofN2O emission amount among the treatments of straw cover, straw deep application and tillagewere not significant.

【题目】不同施肥量对设施菜地N2O排放通量的影响
【中文关键词】肥料,排放控制,温室气体,设施菜地,排放系数
【英文关键词】fertilizer, emission control, greenhouse gases, protected vegetable land, emission factor
【中文摘要】为明确北京地区设施菜地的N2O排放特征,寻求既能减少N2O排放又使蔬菜增产或保持原有产量的切实有效措施,该研究采用静态箱/气相色谱法对北京地区设施菜地的黄瓜进行了全生长季N2O排放通量的观测,并分析了不同施肥量对N2O排放量、蔬菜产量和经济效益的影响。结果如下:土壤N2O排放通量的季节变化有明显的时间变异性,试验初期受基肥的影响,N2O排放量较大,随着时间的推移,土壤 N2O排放量有所减少并保持稳定;试验后期由于追肥,出现一次排放高峰,且持续时间较长。各处理土壤N2O排放总量的次序是:T4(常规施肥量+鸡粪)>T3(3/4 常规施肥量+鸡粪)>T1(1/4 常规施肥量+鸡粪)>T2(1/2 常规施肥量+鸡粪)>Tn(鸡粪)>T0(无肥处理),各处理之间N2O 排放量差异达到极显著水平。综合考虑施肥量、N2O排放量和黄瓜产量,研究认为 T3(3/4 常规施肥量+鸡粪)的施肥量比较合理,可以为合理施肥、降低农民生产成本以及估算中国农田温室气体排放量和编制温室气体排放清单提供依据。
【英文摘要】To identify the characteristics of N2O emission from protected vegetable land in Beijing, and to seek a way that decreases N2O emission and increase or keep cucumber yield, with the method of static chamber-gas chromatograph technique, N2O emission was monitored in cucumber field from protected vegetable land in Beijing. The effects of different amounts of fertilization on N2O emission, vegetable yields and economic benefit were analyzed. The results showed that significant temporal variability of N2O flux from all treatments was observed in different growing stages of cucumber. Larger emission happened at the initial stage of the experiment. N2O emission decreased and remained stable with time. At the late stage, a peak emission happened and continued for a

long time because of larger amount of topdressing. The order of total N2O emission was: T4 (conventional fertilization + chicken dug,in short “ CF+CD ”) >T3 (3/4CF+CD) > T1 (1/4CF+CD) > T2 (1/2CF+CD) > Tn (CD) > T0 (Control treatment), and there existed significant difference between treatments. By considering fertilizer rates, N2O emission and cucumber yield, it was concluded that the fertilization rate of T3 (3/4CF+CD) was very reasonable, which could provide basis for applying fertilizer rationally, reducing farm production costs, estimating greenhouse gas emissions from cropland and compiling national greenhouse gases emission inventory.

【题目】常温纤维素降解菌群的筛选及其特性初探
【中文关键词】纤维素分解;菌群;常温;筛选
【英文关键词】cellulose degradation; microbial flora; constant temperature; screening
【中文摘要】在改良PCS培养基的基础上,通过定期改变传代方法,从污泥、森林土、发酵腐熟牛粪、堆肥处理麦秆中筛选出1组纤维素分解能力强而稳定的纤维素混合菌群(代号为Xc), 100 mL培养物在37℃静置培养5 d,对滤纸纤维素、脱脂棉、麦秆(片)、牛粪纤维降解率分别达到81%、41%、25%、40%。Xc在37、28℃分解滤纸时,分别在第5天、第7天时CMC酶活性最高,分别达到104. 5、95. 3 U · mL-1。在初始pH 5~9的培养基上接种均能表现出较强分解能力。采用变性梯度胶电泳(DGGE)法比较来源于不同时期菌群16S rDNA条带表明,菌群结构稳定。
【英文摘要】A group of cellulose degrading microbial flora (Xc) was screened from sullage, forest soi,l cow manure and composted wheat strawswith the technology of regularly altering the regenerationmethod during incubation on themodified PCS culturemedium. The flora showed astable and strong capability of degrading cellulose.About81%, 41%, 25% and 40% of the cellulose in filterpaper, absorbentcotton,wheatstraw and cowmanure, respectively,was degradedwith 100 mL of Xc at37°Cin 120 hours under static culture. In decomposing filterpaper, itsCMC enzyme activity peaked up to 104.5 and 95.3U · mL-1, onD5 andD7, at37 and 28°C, respectively.Xc could be inoculated into culturemedia ranging in pH from 5 to 9, however, in the en of incubation the finalpH of themedium tended to be neutra.l TheXc cellulose2decompo2 sing activitymay lastmore than 22 days as long as supply of substrates continues.Xc is very stable in structure. Its main DNA bands remained unchanged as is demonstrated by comparison of16S rDNA with theDGGEmethod ofXc from different time periods of the culture.

【题目】锡林郭勒市草地载畜量及草畜平衡分析
【中文关键词】载畜量; 草畜平衡; GRAZFEED模型;
【英文关键词】carrying capacity; livestock-feeds balance; GRAZFEED;
【中文摘要】以北方典型代表区域 锡林浩特市为例, 利用 GRAZFEED 模型, 模拟了不同月乌珠穆沁羊在没有补饲的情况下的体质量的变化以及气候因子对其体质量的影响; 同时结合统计资料对锡林浩特市各苏木的草地载畜量及草畜平衡状况进行了分析。结果表明, 7- 9 月乌珠穆沁羊体质量日均增质量约 8. 7 g, 其他月体质量及膘情具有不同程度的下降, 若要维持体质量或增质量, 需额外补充饲料。气候因子也是影响乌珠穆沁羊产出的一个重要因子, 4、10 月气温较低, 乌珠穆沁羊需付出额外的能量才能维持正常的生理活动。在没有补饲的情况下, 锡林浩特市除了达布希勒图苏木 5- 9 月的载畜量可做进一步调整外, 其他苏木均已超过其能承受的最大载畜量, 或者说草畜已经严重失衡。锡林浩特市各苏木畜牧业要得到

健康持续的发展,还需进一步的进行调控和管理。草地和牲畜要得到双赢的发展,需出栏一部分牲畜,或加大对牲畜的补饲量。

【题目】稻秸蚯蚓堆制后的物理、化学及微生物特性变化
【中文关键词】水稻秸秆;蚯蚓堆制;物理化学特性;微生物
【英文关键词】rice straw; vermicomposting; physical-chemical property; microbe
【中文摘要】利用水稻秸秆与畜禽粪便(牛粪、猪粪和鸡粪)等干重混合物(RCD、RPM、RCE)接种蚯蚓(Eisenia foetida)进行堆制,研究堆肥产物的物理、化学及微生物特性变化。结果表明,蚯蚓堆制30 d后,稻秸牛粪、稻秸猪粪堆肥产物MBC含量显著下降; 3种稻秸粪便混合物经蚯蚓堆制后,堆肥产物微生物代谢熵、脱氢酶和碱性磷酸酶活性增加,尤以RCD的变化明显。稻秸牛粪、稻秸猪粪及稻秸鸡粪混合物经蚯蚓堆制后,总固形物平均重量损失分别增加6·45%、4·22%和3·82%; pH值均降低,其中RCD显著降低。蚯蚓堆制有助于提高堆肥产物全氮、全磷和全钾含量,同时使碳氮比降低。水稻秸秆混入部分畜禽粪便经蚯蚓堆制可减少堆肥时间并提高堆肥质量,混入的粪便以牛粪最好,猪粪次之,鸡粪最差。
【英文摘要】Vermicomposting is a popular technique used forwaste treatment (e. g. cow dung, pig manure andchicken excrement). In order to evaluate the feasibility of vermicomposting used for rice straw treatmen,t three kinds of rice straw and dung mixture (straw：dung=1：1, dry weight) were set up: rice straw plus cattle dung (RCD), rice straw plus pigmanure(RPM) and rice straw plus chicken excrement(RCE). The physical-chemical andmicrobial properties of end products obtained through composting and vermicompostingwere analyzed respectively. The results indicated thatvermicomposting decreased themicrobialbiomass carbon (MBC) in the end prod-ucts ofRCD and RPM significantly after thirty days, while increased the microbial respiration quotient (qCO2), dehydrogenase and alkaline phosphatase activities in the end products of RCD, RPM and RCE, especially for RCD. The total solid loss (TS loss) in the RCD, RPM and RCE were increased through vermicomposting by 6·45%, 4·22% and 3·82%, respectively. Vermicomposting decreased the pH in the end products of three straw and dungmixture. The vermicompostobtained from RCD, RPM and RCE increased the contents of total nitrogen (TN), total phosphorus (TP) and total potassium (TK), while reduced C：N ratio compared with compost. The vermicomposting effects used for rice strawwas followed with the order: RCD>RPM>RCE. The best dung suitable for vermicompostingwas cattle dung followed by pigmanure and chicken excrement.

【题目】羊草草甸草原FPAR时间变化规律 分析
【中文关键词】羊草草甸草原; 时间变化规律; FPAR; PAR; 呼伦贝尔;
【英文关键词】leymus chinensis meadow-steppe; temple variation law; FPAR; PAR; Hulunbeier;
【中文摘要】FPAR 是植被叶子在光合有效辐射(400~ 700nm) 波段有多少太阳光能被吸收的一个度量, 表示了植被冠层能量的吸收能力,是描述植被结构以及与之相关的物质与能量交换过程的基本生理变量。FPAR 模型是否能真实反映植被冠层吸收光合有效辐射状况, 将直接影响遥感估算草地 NPP 的不确定性程度。本文通过对长生季羊草草甸草原冠层 PAR 各分量的观测, 研究了入射 PAR、冠层反射 PAR 及透过冠层到达地面的 PAR 的时间变化规律, 并以观测的 PAR 为基础计算分析了羊草草甸草原 FPAR 的时间变化规律。结果表明, 羊草草甸草原入射 PAR 及透射 PAR 日变化规律明显, 呈较标准的

正弦曲线变化; 晴天 FPAR 的日变化呈较标准的余弦曲线变化, FPAR 在早晚值较高, 最高值约 0 81, 日平均 FPAR 值可以用 9: 30/ 太阳天顶角为 48 时瞬时的 FPAR 值或14: 30/ 太阳天顶角为 30 时瞬时的 FPA R 值表示。

【题目】粪肥施用方式对设施栽培蔬菜生长和土壤肥力的影响
【中文关键词】蔬菜;鸡粪;产量;品质;维生素C;亚硝酸盐;设施栽培;粪肥
【英文关键词】蔬菜;鸡粪;产量;品质;维生素C;亚硝酸盐;设施栽培;粪肥
【中文摘要】在设施栽培条件下,进行了腐熟鸡粪不同施用方式对青菜生长和土壤肥力的影响试验。结果表明:施用鸡粪6t/hm2、18t/hm2、36t/hm2后,土壤总氮、速效养分和有机质含量增加,且施入量愈多增加量也愈大。总氮、有效磷和有机质的增加尤为显著;当施用18t/hm2腐熟鸡粪时,总氮、有效磷已超过常规化肥处理。与不施肥相比,施用鸡粪6~36t/hm2有机质增加7.8%~50%;株高和产量分别增加31.2% ~85.4%和127.0% ~427. 0%。对青菜维生素C含量的影响总体上看有减少趋势,但不显著;在中低量机械深施时,施用鸡粪可以减少青菜中亚硝酸盐的含量。两种施用方法相比,当季人工撒播比机械深施养分供应充足,蔬菜产量有所增加。建议在设施蔬菜栽培上粪肥年施用量以15 t/hm2为宜。

【题目】秸秆腐熟剂对土壤微生物及养分的影响
【中文关键词】秸秆;腐熟剂;微生物;土壤养分
【英文关键词】straw; inoculants; microbe; soil nutrient
【中文摘要】为了解本研究室于常温下筛选研制的秸秆腐熟剂在土壤中的施用效果,通过盆钵模拟培养试验,设置腐熟剂的不同施用方式(单独施用腐熟剂、配施葡萄糖、配施尿素、配施尿素与葡萄糖),研究小麦秸秆还田施用秸秆腐熟剂后土壤微生物群落特征及养分含量变化,为该秸秆腐熟剂的产品化及合理施用提供理论依据。结果表明,秸秆腐熟剂以不同施用方式进入土壤后,土壤的微生物群落组成与活性相应发生显著变化,AWCD、Shannon 多样性指数(H)、物种丰富度(S)均增大,早期土壤中细菌和真菌数量增加,腐熟剂与尿素的配合施用使土壤的基础呼吸和微生物代谢熵显著下降(P<0.05);腐熟剂施用加快了小麦秸秆的腐解速度,腐熟剂施用 90 d后,土壤中全磷、速效磷及速效钾的含量均有不同程度的增加,腐熟剂与尿素的配合施用增幅显著(P<0.05)。在秸秆还田时,施用腐熟剂有助于土壤微生物群落活性与多样性的提高,同时也有利于改善土壤养分状况,腐熟剂与尿素配合施用的效果最佳。
【英文摘要】Crop straw returning to field is an important way in the maintenance of agro-ecosystem since it could enhance soil fertility and improve soil structure. In wheat-rice rotation region, microbial inoculants for straw decomposing, which could accelerate straw decompositionand mitigate short-term disadvantage, usually is adopted as an important agricultural measure after crop harvest. We obtained a microbial agent from natural condition and got the inoculants culture. A pot experiment was conducted with different utilization methods of the inoculants for the purpose of assessing its effects on straw decomposition, microbial community and nutrient in wheat straw-incorporation soils. Four application methods of inoculants were established as follows:inoculants(I), inoculants plus glucose(IC), inoculants plus urine(IN), inoculants plus urine and glucose(INC). In this research, average well color developmen(tAWCD)and soil microbial diversity were determined byBiolog Eco micro -plate technique, microbial populations of soil were estimated by plate count method, and soil basal respiration(BR)by titration. Metabolize quotien(tqCO2), was calculated consequently. Soil chemical and physical properties were determined by conventionalmethods. The results indicated that the soil microbial community structure and activities were obviously influenced by microbial inoculants with all application methods. The values of AWCD, Shannon-Wiener diversity index(H), and species richness(S)increased. Meanwhile, anearly-stage increase of the soil bacterial and fungal populations was observed in soils treated with inoculants. In the co-application of microbial inoculants and urea, soil BR and qCO2 were significantly decreased(P<0.05), and the decomposition rates of wheat straw in soils were increased in the microbial inoculants application. The contents of soil total phosphorous, available phosphorous and available potassium were increased separately with different application methods of microbial inoculants after ninety days, and the increment were significant(P<0.05) under the co-application of microbial inoculants and urea. The inoculants were helpful to increase soil microbial activity and diversity and to amend soil nutrient property in straw-incorporated soils.

【题目】秸秆还田对土壤脱氢酶和多酚氧化酶活性动态变化的影响
【中文关键词】秸秆还田;脱氢酶;多酚氧化酶;动态变化
【英文关键词】straws; dehydrogenase; polyphenoloxidase; dynamic change
【中文摘要】通过旱田试验研究了冬小麦生长期内,秸秆还田与肥料配施对土壤脱氢酶活性和多酚氧化酶活性动态变化的影响。结果表明,土壤脱氢酶活性在冬小麦生长期内波动较大,出现多个峰值;秸秆还田和厩肥的施入均能显著提高土壤脱氢酶活性。在冬小麦生长后期,尿素能显著提高土壤脱氢酶活性,而过磷酸钙的施入一定程度上降低了土壤脱氢酶活性。土壤多酚氧化酶活性表现为在冬小麦生长前期和中期活性较低,4、5月份活性迅速升高,出现高峰值,随后在收获期迅速降低;秸秆还田和过磷酸钙对土壤多酚氧化酶活性的影响不显著。在冬小麦生长中期,厩肥和尿素对土壤多酚氧化酶活性有

一定的抑制作用,在冬小麦生长旺盛期,厩肥和尿素对多酚氧化酶活性的抑制作用不明显。

【英文摘要】Soil enzyme activities play an important role in the material cycle and energy flow of ecosystem. The objective of this field experimentwas to determine the effect of the use of organic and chemical fertilizers on the dynamic changes of soil dehydrogenase and polyphenol oxidase activities in growth stages ofwinterwheat. The experiment included five fertilizer treatments: control (no fertilizer); returning corn strawto field; returning corn strawto field combining application of manure; returning corn strawto field combining application of nitrogen fertilizer (pure N 210 kg/hm2); and returning corn strawto field combining application of nitrogen (pure N 210 kg/hm2) and phosphate fertilizers (P2O5150 kg/hm2). Each treatment was replicated four times. The results showed that the fluctuation of the trend of dynamic changes of soil dehydrogenase activitywasmuch strongerthan thatof polyphenoloxidase activity. Manure application and returning corn straw to field could increase significantly the dehydrogenase activity. In the late growth stage of winter wheat, nitrogen fertilizer application could increase significantlythe dehydrogenase activity, butthe increasing action was weakened by the input of phosphate fertilizer. The effect of phosphate fertilizer application and returning corn straw to field on the soil polyphenoloxidase activity did not reach the significant level. In the middle growth stage ofwinterwheat,manure and nitrogen fertilizer application could restrain the polyphenoloxidase activity in this experiment. But in late stages, especially in April and May, the restraining action became weaker.

【题目】秸秆留茬翻埋快速腐熟技术及配套机具研究

【中文关键词】秸秆还田;留茬翻埋;快速腐熟;联合作业机

【英文关键词】straw returning; stubble burying; fast decomposition; combined machine

【中文摘要】针对我国北方作物机械化收获模式下,机收后滞留在田间大量秸秆留茬处理问题,结合秸秆整株翻埋技术与秸秆快速腐熟还田技术,设计了秸秆留茬翻埋快速腐熟联合作业机。该机由腐熟剂喷施系统及秸秆留茬翻埋系统两部分组成。通过田间试验表明,秸秆留茬翻埋快速腐熟技术可使翻埋的秸秆留茬快速腐解,7个月后秸秆留茬腐熟率为79.8%,较单一秸秆留茬翻埋作业方式腐熟率提高了18.5%;增加了田间土壤微生物数量,提高了土壤有机质含量;相应配套机具在田间作业时,速度应大于1.46 m/s,悬挂深耕犁耕深应控制在22~29 cm之间。

【英文摘要】Under the mechanization mode of crop harvest in northern China, a combined machine is designed combining straw stubble burying and the straw returning with fast decomposition technology to handle the problem of large amount of straw stubble remaining in field after the machine harvest. The machine consists of degradation agent spraying system and straw stubble burying system. Field experiments showthat the technique can make strawstubble fast decomposing in short time, and the straw stubble decomposition rate of farmland using this machine reached 79.8% after 7 months, whichwas 18.5% higher than a single mechanical burying treatment. This technique also increases the soil microorganismquantity and organic matter in soil. When the corresponding ancillary equipment works in the field, the speed should be controlled as more than 1.46 m/s, and the mounted deep plough ’s tilling depth should be limited between 22~29 cm.

【题目】农艺措施对麦秸腐解初期生化特征的影响
【中文关键词】麦秸;破碎;腐熟剂;尿素
【英文关键词】wheat straw; fragmentation; microbial inoculant; urea
【中文摘要】通过模拟麦秸还田初期的田间状况,设计15 d的3因素麦秸浸泡试验,评估农艺措施(破碎、接种腐熟剂和施用尿素)对稻麦轮作田麦秸腐解初期生化特征的影响,进而为合理采用农艺措施,减轻秸秆还田负面效应提供理论依据。结果表明:增大秸秆破碎程度有利于15 d浸泡麦秸残留率的下降;增大秸秆破碎程度、接种腐熟剂和施用尿素均可显著提高浸提液pH值;施用尿素可显著增强浸提液纤维素酶活性;增大秸秆破碎程度和施用尿素能极显著提高浸提液总酚酸含量,极显著降低水稻发芽指数,浸提液总酚酸含量和水稻发芽指数间呈显著负相关(r=-0 · 766,P<0 · 01);增大秸秆破碎程度、接种腐熟剂和施用尿素均有助于提高浸提液铵态氮与总磷含量,而浸提液硝态氮含量主要受施用尿素的影响。因此,在麦秸淹水还田时,需要对通常采用的麦秸破碎并在早期多施用氮肥的传统农艺措施加以重新评估。
【英文摘要】In order to evaluate the effects of farming pratices (wheatstraw fragmentation, microbial inoculants, and urea) on physica,l chemical and microbial properties ofwheat straw and its extract through short-term decomposition, a 15-d experimentwith three factorswas carried out to simulate the practical field condition afterwheat straw returning. The results indicated that increasing the fragmentation degreewas helpful for the decrease of wheatstraw residual rate. All of the farming practices employed in the experiment

raised the pH value ofwheat straw extracts, the contents of NH4+and total phosphorus significantly. The cellulase activity in wheat straw extracts treated with urea was enhanced significantly. The practices of increasing fragmentation degree and urea application increased the totalphenolic acids content inwheat straw extracts significantly, butdecreased the germination index of rice significantly (P<0.01). The contentof NO3-in wheat straw extract was affected by urea application. The total phenolic acids content and the germination index of rice correlated negatively (r=-0.766,P<0.01). In conclusion, the practice of fragmentation and urea application in the early growth stage of rice afterwheat straw returning to field should be reevaluated.

【题目】施肥与灌溉对春玉米土壤N2O排放通量的影响
【中文关键词】春玉米土壤; 施肥; 灌溉; N2O; 日变化; 通量; 连续观测; 静态自动箱
【英文关键词】springmaize soil; fertilization; irrigation; N2O; diurnal variation; flux; continuous measurement; automatic static chamber system
【中文摘要】2007年在山西省榆次县利用静态箱自动监测系统对传统和优化两种施肥方式下春玉米土壤追肥和灌溉前后N2O排放通量进行了连续测定, 该地区土壤质地为壤土, 气候为温带大陆性半干旱气候。结果表明, 灌溉和施肥对N2O的排放影响较大, 当土壤含水量较低时, 施肥并不会导致N2O通量迅速升高。在不灌溉的条件下施肥前后 N2O 的日排放通量特征为单峰型, 凌晨4: 00左右为最低值, 下午 16: 00 左右达到最高值, 与空气和 5 cm 土壤温度相关性均达到了极显著水平。施肥并灌溉后 N2O排放通量迅速升高, 一天之内能够迅速升高约 50 倍。灌溉后 N2O 日排放通量呈“ N ”字型走势, 在达到最大值后变为单峰型, 一周后日排放出现了直线下降和水平波动两种不同的走势。经检验施肥并灌溉后一周内优化施肥方式下N2O排放通量极显著低于传统施肥方式(P<0.01),优化施肥可以作为减排农田 N2O 排放的措施之一。
【英文摘要】N2O flux variations from spring maize soil under traditional and optimized fertilization were monitored continuously using automatic static chamber system in Yuci County, Shanxi Province in 2007. The results showed that: Nitrous oxide flux was mainly affected by irrigation and fertilization. However, fertilization wouldn ’ t result in high N2O flux immediately if the soil water content is lower. Before and after fertilization without irrigation, the pattern of diurnal N2O flux was in a single peak type. Lowest N2O flux appeared at about 4 amand highest N2O flux occurred at about 4pm. N2O flux had a very significant relative with air temperature and soil temperature at 5 cm. After fertilization and irrigation the N2O flux increased 50 times in one day. Diurnal N2O flux dynamic showed an “ N ” shape, then the diurnal N2O flux dynamic was in a single peak shape after the N2O flux reached the maximumvalue. Diurnal N2O flux dynamic shown two different types one week later: sharply linear fall and horizontal fluctuation. N2O flux with optimized fertilization was very significant lower than that with traditional fertilization (P<0.01). Therefore, the optimized fertilization can be an option for reducing N2O emission from cropland.

【题目】稻田水面漂浮的杂草种子种类及动态
【中文关键词】杂草种子,传播扩散,漂浮动态,稻田
【英文关键词】无
【中文摘要】为了揭示杂草种子的漂浮动态,并为探寻生态控草方法提供理论依据,我们于2005年曲11月,在南京沧波门稻作区调查了水稻种植前及生长后期田间杂草群落以及稻田灌水期间水面漂浮的杂草种子的种类及漂浮时间。结果表明,在水稻种植前及生长后期田间出现有15科24种杂草;可漂浮于水面的杂草种子有17科26种,与田间发生的杂草种类相同的共有18种,占所有32种杂草的56.25%。这些杂草主要隶属于禾本科、蓼科、毛茛科、报春花科、莎草科、菊科和雨久花科。田埂附近漂浮的杂草种类及种子数量均高于田中间;各类杂草种子的漂浮能力不一。其中茼草(Beckmannia syzigachne)、泽珍珠菜(Lysimachia candida)、茴茴蒜(Ranunculus chinensis)、齿果酸模(Rumex dentatus)、蛇床(Cnidium monnierO、鳢肠(Eclipta prostrata)和看麦娘口lopecurusaequal&)等在田间水面漂浮能力较强。漂浮期间杂草种子除多集中于田埂附近,也附着于稻稞周围,并有互相结联的趋势。从整体上看,杂草种子漂浮2天后骤降,8天后基本全部沉降。显然,稻田生境的杂草种子大多可以漂浮于水面传播扩散。因此在灌水早期采取过滤或清除水上漂浮杂草种子可以减少杂草种子的输入和加速杂草种子从田间输出,减少杂草发生基数。

【题目】太湖地区长期施肥条件下水稻-油菜轮作生态系统净碳汇效应及收益评估
【中文关键词】水稻-油菜轮作;农田生态系统;长期试验;肥料处理;碳汇;碳平衡;经济收益
【英文关键词】rice-rape rotation; cropland ecosystem; long-term trial; fertilization treatment; carbon sink; carbon balance; economic benefit
【中文摘要】以太湖地区水稻-油菜轮作系统长期施肥处理试验田为研究对象,利用历年作物产量、凋落物固碳和农田CO2排放等实测资料,以及生态系统的物质投入和管理投入等调查资料,估算了该系统的年碳平衡和经济收益.结果表明:不同施肥处理的年碳汇量在0·9~7·5 tC·hm-2·a-1,有机无机肥配施的净碳汇量是单施化肥的3倍.系统物质投入的碳成本在0·37~1·13 tC·hm-2·a-1,人工管理的碳成本在1·69~1·83 tC·hm-2·a-1,年度经济收益在5·8×103~16·5×103CNY·hm-2·a-1,有机无机肥配施下的经济效益是单施化肥下的1·1倍.与单施化肥相比,有机无机肥配施单位碳汇的边际成本为217·1 CNY·t-1C,与欧盟碳交易市场的碳价格每吨20欧元相近.与单施化肥相比,有机无机肥配施下生态系统不仅生产力较高,而且表现出更高的碳汇效应和经济收益.
【英文摘要】Taking a long-term fertilized rice-rape rotation system inTaihuLake as testobjective, itsannualC balance and economic benefitwere estimated, based on the measurement of past yearsgrain yield, litter C conten,t and field CO2emission as well as the investigation ofmaterial and management inputs. The calculated annual C sink under different fertilizations ranged from0·9 tC·hm-2·a-1to 7·5 tC·hm-2·a-1, and the netC sink effectunder combined inorganic/organic fertilizationwas three folds as thatunder chemical fertilization. The C cost of material input ranged from 0·37 tC·hm-2·a-1to 1·13 tC·hm-2·a-1, and that ofmanagement input ranged from 1·69 tC·hm-2·a-1to 1·83 tC·hm-2·a-1. The annual economic benefit ranged from 5·8×103CNY·hm-2·a-1to 16·5×103CNY·hm-2·a-1, andwas2·1 times higher under combined fertilization than underchemical fertilization. Comparing with that under chemical fertilization, themarginalcost forper tonC sink under combined inorganic/organic fertilization was estimated as 217·1 CNY·t-1C, very close to the C price of20 Euro·t-1C in the EU. In sum,under combined inorganic/organic fertilization, this rice paddy ecosystem could notonly have higher productivity, but also present greater net C sink effect and higher economic benefi,t compared with under chemical fertilizer fertilization.

【题目】Evaluation of connectedness between herds for three pig breeds in China.
【中文关键词】无
【英文关键词】connectedness, cross-herd genetic evaluation, joint breeding system
【中文摘要】无
【英文摘要】Using data on age at 100 kg of three pig breeds (Large White, Landrace and Duroc) the connectedness between herds inChina was evaluated by the connectedness rating (CR) method. The results show that most herds in China have low average CR(0 – 3.59%) with other herds. In Large White, of the 36 herds analyzed there are 20 herds, which are connected with at least oneother herd. In Landrace and Duroc, of the 27 and 18 herds analyzed, only four and fi ve herds, respectively, were found havingconnectedness with other herds. Generally, the connectedness exists only among two or few herds in the same region. A certaindegree of connectedness between herds is a precondition for cross-herd genetic evaluation. A national or regional cross-herdgenetic evaluation is not practicable at the present time in China. More intense efforts are needed to establish and enhance theconnectedness between herds by means of extensively using arti fi cial insemination (AI) in the swine industry in China

【题目】Characterization of porcine MMP-2 and its association with immune traits.
【中文关键词】无
【英文关键词】Pig; MMP-2; Genomic structure; Promotor; Mapping; Association analysis; Immune traits
【中文摘要】无
【英文摘要】Matrix metalloproteinase-2 (MMP-2) plays important roles in inflammation and immunity besides its basic role in degrading and remodelling extracellular matrix (ECM). The expression of MMP-2 is up-regulated in many human as well as animal models of inflammatory and immune diseases. In this study, we cloned the 5'-upstream sequence, 3'-downstream sequence as well as other missed genomic sequences of porcine MMP-2, the genomic Structure and the promotor sequence were analyzed and found to share high similarity with those of human MMP-2. Porcine MMP-2 was assigned to SSC6p14-p15, and closely linked to microsatellite SW1108 (53cR, LOD score 7.59) by IMpRH panel. Real-time PCR analysis revealed that the expression of porcine MMP-2 was remarkably different in diverse tissues, a high level expression was observed in the testis and uterus, relatively low expression in other tissues. Allele frequencies determination in different pig breeds and association study were performed on the selected SNP and indel. The results showed that the SNP Acyl in exon 12 was significantly associated with white blood cell count (WBC) of neonate piglets at 0 day (P=0.0079), and classical swine fever virus antibody level (CSFV-AB) of pigs at 17 days (P=0.0461), the indel MspI in intron 4 had remarkable correlation with mean corpuscular hemoglobin (MCH) of pigs at 17 days (P<0.0001). 【题目】猪HB-EGF 基因多态性与产仔数的关联性分析
【中文关键词】猪;肝素结合性表皮生长因子;多态性;产仔数
【英文关键词】pig; heparin-binding EGF-like growth factor (HB-EGF); polymorphism; litter size
【中文摘要】研究猪 HB-EGF 基因的多态性及其与产仔数的关系,寻找与猪产仔数相关的分子遗传标记,以加快猪育种进程。【方法】利用 PCR-SSCP 技术研究 HB-EGF 基因外显子多态性,利用最小二乘均数法对其与产仔数的关系进行分析,同时对两个多态位点的方差组分进行了分析。【结果】在两对引物(E5 和 E7)中各检测到一个多态位点,均出现 3 种基因型(AA、BB、AB)。E5 位点:对于大白猪,在 3~8 胎中,BB 型个体的 TNB 和 NBA 均显著高于 AA 型个体(P<0.05),在所有胎次中,BB 型个体的 TNB 显著高于 AA 型个体(P<0.05),NBA 极显著高于 AA 型个体(P<0.01),TNB 和 NBA 的遗传主要受基因加性效应的影响;对于长白猪,在 4 个阶段中 3 种基因型个体的 TNB 和 NBA 之间差异不显著(P>0.05)。E7 位点:对于大白猪,在 3~8 胎和所有胎次中,AA 型个体的 TNB均显著高于 BB 型个体(P<0.05),TNB 的遗传主要受基因加性效应的影响;对于长白猪,在 3~8 胎和所有胎次中,AB 型个体的 NBA 均显著高于 BB 型个体。【结论】对于大白猪,E5 位点 BB 基因型可作为在 TNB 和 NBA 性状上的标记基因型,E7 位点 BB 基因型可以作为 TNB 性状的标记基因型
【英文摘要】【Objective】 The pig HB-EGF gene was used to study the polymorphism, and the association between the polymorphism and litter size was analyzed in order to find the molecular marker being used in marker-assisted selection(MAS) toaccelerate the swine breeding progress. 【Method】 The polymorphism of HB-EGF gene was studied by PCR-SSCP, which the association between and litter size was studied by the least square mean, and the variance components at the two polymorphisms were also analyzed. 【Result】 There were two polymorphisms occurring in exon5 (primer E5) and exon6 (primer E7) respectively, each one with three genotypes (AA, BB and AB). At E5, in Large White, BB genotype had significantly higher (P<0.05) TNB and NBA than AA genotype in third to eighth parity, and in all parities, BB genotype had significantly higher (P<0.05) NBA than AA genotype, while had greatly significantly higher TNB than AA (P<0.01), the heredity of TNB and NBA was mostly influenced by the genetic additive effect; In Landrace, there was no significant difference on TNB and NBA in the four phases. At E7, in Large White, AA genotype had significantly higher (P<0.05) TNB than BB genotype in third to eighth parity and all parities, the heredity of TNB was mostly influenced by the genetic additive effect; in Landrace, AB genotype had significantly higher (P<0.05) NBA than BB genotype in third to eighth parity and all parities. 【Conclusion】 In Large White, the BB genotype at E5 was favorable marker genotype for TNB and NBA, and the BB genotype at E7 was favorable marker genotype for TNB.

【题目】MYPN基因多态性研究及其对猪肉品质性状的影响
【中文关键词】猪　肉质性状　MYPN　SNP
【英文关键词】无
【中文摘要】近年来,肉质性状愈发受到重视。本研究即参照已有的相关生理学研究结果,对编码肌钯蛋白的MYPN基因的多态性进行了检测,结果发现在试验群体中存在3个SNP,分别位于MYPN基因3'非编码区一段序列(AJ560657)的第231、298、318碱基处。同时,对3个SNP与试验群体的肉质性状进行了关联分析,结果表明,除嫩度外其它性状两两之间均存在显著相关,其中一些相关程度更达到极显著水平(P0.001);肉品质性状在不同品种中存在显著差异;3个SNP位点与肉色和嫩度均存在显著相关(P=0.0037,0.0248,0.008;P=0.0150,0.0196,0.0009),SNP318与pH及肌内脂肪含量存在显著相关(P0.05),在SNP231位点具有不同基因型的猪的pH值存在显著差异(P0.01),SNP298对肌内脂肪含量影响差异显著(P0.01)。本研究结果为相关肉质性状改良工作提供了重要研究基础。

【题目】猪EPOR和MYPN基因SNPs检测及其与肉质、胴体性状关联分析
【中文关键词】:EPOR;MYPN;肉质;胴体性状
【英文关键词】:EPOR;MYPN;meat quality trait;carcass trait
【中文摘要】:对EPOR、MYPN 2个候选基因进行SNPs检测,并与肉质性状的关联分析,以期为分子育种提供依据。采用PCRSSCP及PCR.-RFI。P方法对目的基因片段进行SNPs检测,结果显示,在研究群体内,EPOR基因不存在SNP,而MYPN基因存在2个SNP。用SAS软件对MYPN基因的2个SNP位点与部分肉质、胴体性状进行关联分析,结果表明,在本试验群体中,SNPl对背膘厚、导电性、眼肌面积和肌内脂肪的影响都达到了显著水平(P<0.05);SNP2对其中的背膘厚和肌内脂肪含量影响达到了显著水平(P<0.05);另外性别、品种对部分性状也有较大影响(P<o.05)。结合本研究结果和其它相关研究结果,可以推断MYPN基因可能是影响肉质、胴体性状的主效基因或与控制这些性状的主效基因连锁,可以作为肉质、胴体性状的候选基因。
【英文摘要】The two genes EPOR and MYPN were analyzed by SNPgenotypingand associated with meat quality traits tOfind the candidate genes for meat quality traits.The methods for SNPsgenotypingare PCR-SSCP and PCR—RFLP.No SNPwere found for EPOR genes.Two SNPs were found in MYPN genes and the tWO genes were associated with meat quality traitsby SAS.The results showed that SNPl had significant effects on back fatthickness,conductivity,eyemuscle area,intramus—cular fat(P<0.05)#SNP2 had significanteffects on back fat thickness and intramuscular fat(P<0.05);sex and breed hadsignificant effects on some traits(P<0.05).Combined results of this study and other related research findings,it may be inferred that the MYPN gene may affect the meatquality traits and carcass traits,or the major gene and control of these traits inthe main chain genecan be used as meat quality carcass traits of the candidate genes.

【题目】不同品种组合肉猪肥育性能观测
【中文关键词】肉猪 日增重 耗料指数 胴体瘦肉率
【英文关键词】Finishing pig Average day gain Feed consumption ratio Lean meat percentage
【中文摘要】在项目实施前、后对肉猪适度规模标准化养殖场(户)进行了肉猪肥育性能观察试验,结果表明:外种猪(配套系)的杂种肉猪、内三杂肉猪、内二杂肉猪在项目实施前的平均日增重分别为730.67g、631.60g、566.40g,项目实施后分别为792.42g、697.30g、611.80g;项目实施前的平均耗料指数分别为3.04、3.31、3.49,项目实施后分别为2.91、3.20、3.40;项目实施前的胴体瘦肉率分别为63.18%、56.86%、49.18%,项目实施后分别为64.02%,58.02%、50.73%.对其结果进行分析比较,表明我省肉猪生产的品种组合外种猪(套系)的杂种肉猪肥育性能明显优于内三杂肉猪、内二杂肉猪,且项目实施后各品种肉猪肥育性能均比项目实施前有较大提高。为此,在全省生猪生产中,应进一步加快母猪良繁体系建设和提高育肥猪养殖技术,大力推广以外种猪(配套系)的杂种肉猪为主的肉猪生产品种组合,提高肉猪生产性能和质量。
【英文摘要】Observations were conducted on finishing-pig fattening performance of moderate scale standardize farm before and after the project, results indicated that: before and after the project carried out, the average of day gain for hybrid finishing pig of west breed pig (multiplication strains).three- native line-hybrid finishing pig and two-native line-hybrid finishing pig were: 730.67 g.631.60 g. 566.40g and 792.42g.697.30g.611.80g respectively. Average feed consumption ratio were: 3.04.3.31. 3.49rand 2.91.3.20.3.40 respectively. Lean meat percentage were:63.18% .56.86% .49.18% and 64.02% ,58.02%.50.73% respectively. Compare of the results shown that the fatting performance of hybrid finishing pig of west breed pig [multiplication strains) was obviously better then the three-native line-hybrid finishing pig and the two-native line-hybrid finishing pig in Sichuan province. The fattening performance of finishing pig were highly improved by the project, so we should quicken up to build the system of improved variety propagate, improve the technique of finishing pig and generalize the hybrid finishing pig of west breed pig(multiplication strains).

【中文关键词】母猪 情期受胎率 窝平产仔数 仔猪70日龄平均个体重 母猪年提供商品仔猪头数
【英文关键词】Sow NR rate Average litter number Average body weight per piglet Number of commercial piglets per sow annually
【中文摘要】本项目实施前、后对母猪适度规模标准化养殖场(户)进行了母猪混合胎次繁殖性能观察试验,结果表明:外二杂(配套系)母猪、内二杂母猪、本地母猪在项目实施前的情期受胎率分别为89.57%、90.13%、89.93%,项目实施后分别为92.78%、92.67%、91.77%;项目实施前窝平产仔数分别为10.57、10.28、10.23头,项目实施后分别为11.35、10.87、10.53头;项目实施前仔猪70日龄平均个体重分别为24.22、22.99、19.76 kg,项目实施后分别为25.97、24.24、20.87 kg;项目实施前母猪年提供商品仔猪数分别为19.40、19.88、17.74头,项目实施后分别为20.75、20.16、18.48头。对其结果进行分析比较,发现外二杂(配套系)母猪的繁殖性能明显优于内二杂母猪、本地母猪,各品种母猪繁殖性能在项目实施后均比项目实施前有明显提高。因此应大力推广外二杂(配套系)母猪,选留和制种二杂母猪或配套系的父母代母猪,全面迅速提高良种母猪的覆盖面,进一步完善母猪良繁体系建设。
【英文摘要】The trials were conducted on sow reproduction performance of moderate scale standardize farm before and after the project, the results indicated that: before and after the project, the NR rate of two west strain hybrid sow,two native strain hybrid sow and pure native sow were 89.57 % ,90.13 % ,89.93 % , 2.78 % ,92.67 % and 91.77 % ,respectively;average litter number were 10.57,10.28,10.23 , 11.35,10.87 and 10.53 , respectively; average body weight per piglet of 70 days were 24.22,22.99,19.76, 25.97,24.24 and 20.87 kg, respectively; the number of commercial piglets per sow annually were 19.40,19.88,17.74 ,20.75,20.16 and 18.48, respectively. Comparison of the results showed that the reproduction performance of two west strain hybrid sow was better than that of two native strain hybrid sow. The sow reproduction performance were highly improved by the project, so we should generalize two west strain hybrid sow, select and breed the parental sow of the two west strain hybrid to rapidly increase the coverage of improved variety and perfect the system of improved variety propagate.

【题目】四川规模猪场产排污系数测定
【中文关键词】规模猪场 产污系数 排污系数
【英文关键词】large scale pig farm pollutants producing coefficient pollutants discharge Coefficient
【中文摘要】为探讨四川规模猪场主要污染物排放量、排放规律,本文选择成都附近的一家典型规模养殖场,按照春夏秋冬四个季节,对保育仔猪、育肥猪和繁殖母猪不同饲养阶段生猪的粪、尿量及其COD/TN/TP/铜/锌等污染物进行了周年监测。结果表明,规模猪场不同饲养阶段猪只的粪、尿产生量差异较大,保育仔猪、育肥猪和繁殖母猪每天每头的粪产生量分别为0.45、0.79和1.01 kg,尿产生量分别为1.65、3.47和5.60 kg,不同饲养阶段猪只的固体粪便含水率基本相同,变化范围在62.13%~68.16%,平均含水率65.27%;全氮、全磷、有机质含量基本一致,分别平均为2.68%,2.38%,55.91%;不同饲养阶段猪只的尿液pH值在6.88~7.41之间,偏碱性。育成猪尿液COD值、氨氮、凯氏氮较低,其次为繁殖母猪和保育猪。在此基础上,研究提出规模猪场主要污染物产污系数24个,排污系数18个,为构建四川生猪产排污系数测算方法、摸清全省乃至全国生猪粪污产生量、为国家制定节能减排相关指标等提供科学依据。
【英文摘要】A typical large scale pig farm located near Chengdu was chosen to explore the amounts of pollutant emissions and discharge regularity of the main pollutants on large scale pig farms in Sichuan province.Monitorings were made in different pig stages,namely nursling piglets,fattening pigs and breeding sows.The monitoring items included the amount of feces,urine and the contents of COD,TN,TP,copper,zinc and other pollutants.The results showed that the pig dung output for piglets,fattening pig and sows per head per day were 0.45,0.79 and 1.01 kg respectively,and urine output were 1.65,3.47 and 5.60 kg respectively.The water content of solid dung was basically the same for different pig stages,varying from 62.13% ~ 68.16% with an average water content of 65.27%.The content of total nitrogen,total phosphorus,organic matter for pig dung were consistent with average value of 2.68%,2.38%,55.91% respectively.The pH value of urine for different stage pigs were between 6.88~7.41.The urine COD,ammonia nitrogen,Kjeldahl nitrogen for fattening pigs was relatively lower,followed by sows and piglets.Based on these data,24 producing coefficients and 18 discharging coefficients for main pollutants were proposed,which will help to build the pollutants calculation for pig industry,providing scientific index for energy saving and pollutant reduction.

【题目】Temporal and Spatial Expression of Muc1 During Implantation in Sows
【中文关键词】无
【英文关键词】endometrium, expression, implantation, muc1, sows
【中文摘要】无
【英文摘要】Recent evidence points to an important role for Muc1 in embryo implantation. In this study, Real-time PCR and immunohistochemistry were used to study mRNA and protein levels at, and between, the attachment sites of the endometrium of Day 13, 18 and 24 pregnant sows. The results indicate that Muc1 mRNA expression was higher between attachment sites than at attachment sites during implantation and this effect was significant on Day 13 ($P < 0.01$) and 24 ($P < 0.01$). Intense Muc1 immunostaining was observed in luminal epithelium and stroma and the staining between attachment sites was stronger than at attachment sites on Days 13 and 18. Collectively, these results suggest the crucial role of Muc1 in successful implantation and embryo survival.

【题目】Composition of floating weed seeds in lowland rice flelds in China and the effects of irrigation frequency and previous crops
【中文关键词】无
【英文关键词】water, weed spread, floating weed seed,diversity, hydrochory, dispersal.
【中文摘要】无
【英文摘要】The diversity and composition of floating weed seed communities were surveyed in 27 sites across the main rice-growing regions in China with the aim of better understanding weed seed dispersal via irrigation water.Seed of 74 species, belonging to 20 families, were identified from floating matter on the water surface in lowland rice fields. Thirty-five species from three families: Poaceae (15), Asteraceae (11), and Polygonaceae (9), accounted for 47% of all species identified. Species with seed maturing in the summer accounted for 64% ofthe weed seed and their mean relative abundance was 0.74. Species richness, Shannon – Wiener index and Pielou evenness index were significantly different among the floating weed seed communities. The diversity of weed seed communities in the Yangtze river valley was higher than that in other sites, and some sites were dominated by only a few weed species, such asBeckmannia syzigachne, Alopecurus aequalis, A. japonicusand Polypogon fugax. At all sites, the dominant weed seeds reflected the dominant weed species in the previous crop. The 27 sample sites of weed seed communities can be clustered into two groups on thebasis of previous crop, either lowland rice or sites with previous crops of winter fallow, winter wheat or oilseed rape. Canonical correspondence analysis (CCA) revealed that irrigation frequency, previous crop, and latitude, but not soil type or longitude, significantly affected species composition. The numbers of floating weed seed species were high in lowland rice fields; composition was affected by previous crops and irrigationfrequency. Filtering irrigation water and collecting and removing floating weed seeds from the water surfacecould be integrated into weed management practices tocontrol weeds in lowland rice fields.

【题目】田间管理对华北平原冬小麦产量土壤碳及温室气体排放的影响
【中文关键词】冬小麦;田间管理;土壤有机碳;温室气体排放
【英文关键词】winter wheat; field managements; SOC; greenhouse gases
【中文摘要】选取华北平原冬小麦为研究对象,针对(1)秸秆移除;(2)秸秆表覆;(3)免耕;(4)秸秆深施;(5)施农家肥这 5 种典型的田间管理,使用农田自动温室气体测定系统对冬小麦农田全生育期进行了原位长期观测,并采用13C 自然丰度法对土壤碳的转化进行了监测,同时对冬小麦产量及生物量、土壤有机碳的变化进行了监测。结果表明,冬小麦产量及生物量高低顺序为施农家肥、秸秆深施、秸秆表覆、秸秆移除和免耕,而且土壤有机碳的更新也有同样的趋势;施农家肥能显著增加土壤有机碳而秸秆移除和免耕则会导致土壤有机碳的轻微下降;冬小麦甲烷的排放或吸收只占总增温潜势的不到 1%,在进行统计总排放当量时基本可以忽略,N2O在总排放当量中的比例在 2.55%~11.62%范围内;N2O 的大量排放主要来自于拔节期及开花期,秸秆移除、施农家肥和秸秆深施会导致 N2O 排放在总当量中的份额增加至 10%左右,而秸秆覆盖和免耕 N2O 排放在总排放当量中的份额只有 3 %左右,冬小麦农田总的温室气体排放88%以上来自于 CO2的排放,特别是秸秆表覆和免耕 95%以上来自土壤碳的损失而释放的 CO2。总体来看,秸秆深施能保证较高的产量,减少碳的损失,增加土壤碳并产生相对较少的总温室气体排放量,是较好的固碳减排方式。
【英文摘要】Five dominant field managements in winter wheat field in North China Plain(NCP)are chosen as treatments. That is(1)residue remova(lTRR),(2)residue mulch(TRM),(3)No Tillage(TNT),(4)residue incorporation(TRI)and(5)manure(TM). Using automatic chamber and GC measurement system in the field to monitor the greenhouse gases emitted from the field during whole season, by 13 C nature abundant method to monitor carbon turnover, winter wheat yield and soil organic carbon is also been monitored. The results showed that:The treatment yield in descending order is TM, TRI, TRM, TNT and TRR respectively, same tendency with the soil organic carbon(SOC)renewing percentage. TM can more significantly increase yield and SOC, while TRR and TNT can slightly drop the yield and SOC. The methane from winter wheat field is less than 1% to total GHG emission and maybe neglectable, and N2O account for 2.55%~11.62% to total GHG emission in winter wheat field. The major N2O emission start from jointing stage and TNT, TM, TRI has higher N2O emission around 10% of total GHG emission, while TRR, TRR has lower N2O emission around 3% of total GHG emission. CO2 account for over 88% total GHG emission in winter wheat field and for TRM and TNT the portion is over 95%. In general comparison, TRI has relatively higher grain yield, SOC renewed and SOC increasing, and relatively lower GHG emission. It is a good method for carbon sequestration and GHG abatement.

【题目】不同水稻品种抑制杂草的差异性研究
【中文关键词】水稻品种;抑制作用;化感作用;杂草
【英文关键词】rice variety;inhibitory effect;allelopathy;weed
【中文摘要】选择江苏宅栽水稻品种5个,以及具有化感特性的P1312777和华抗草78为试验材料。通过田间小区试验对比各水稻品种与稗草、莎草科杂草和阔叶杂草的生态竞争关系。结果表明,扬稻6号和P1312777对杂草发生株数的抑制率达70%~80%,扬稻6号、徐稻4号和P1312777对杂草干质量抑制率超过80%,具有良好的抑制杂草萌发、生长和干物质积累的作用。同时。供试水稻品种对稗草地下部的抑制效果显著优于对稗草地上部的抑制效果,对稗草整株干质量的抑制率与对稗草地上部干质萤抑制率旱相同趋势。
【英文摘要】Field experiments were conducted tO study the competition between rice and weed.and the differences in inhibitory effects Of rice on barnyardgrass[Echinochloacrusgalli(L.)Beauv.],sedge weeds and broadleaf weeds by using 7 rice varieties.The inhibitory effects of Yangdao 6 and P1312777 were 79.74%and 70.26 0A on weed germination,and 91.84%and 82.94%on weed dry weight,respectively.Xudao 4 could also significantly inhibit weed germination and growth.which 1ed tO reduced biomass accumulation of weeds.At the same time。 the results showed that the inhibitory effects of the tested rice varieties on the barnyardgrass roots were significantly higher than that on the shoots.The same tendency was found in the inhibitory effect on both total dry weight and shoot dry weight of barnyardgrass.

【题目】土壤水解类酶活性在玉米秸秆与肥料配合施用下的变化
【中文关键词】玉米秸秆;有机肥;化肥;水解类酶活性
【英文关键词】corn straws; manure fertilizer; chemical fertilizer; hydrolase activities
【中文摘要】通过田间试验,进行了玉米秸秆与厩肥、N肥和P肥配合施入农田后土壤中水解类酶活性变化的研究。结果表明:在小麦生长期内,秸秆配合氮磷肥处理的蔗糖酶活性最高60.09±2.74 mg GLU/(g · 24 h),比对照处理高出28.09±1.79%,脲酶也以秸秆配合氮磷肥处理最高2.86±0.10 mg NH3-N/(g · 24 h),是对照处理的1.04±0.03倍,秸秆配合氮肥处理的碱性磷酸酶活性最高4.01±0.05 mg酚/(g · 24 h),比对照高出0.28±0.05 mg酚/(g · 24 h),秸秆还田处理的3种酶活性都高于对照,配合施用的有机肥和氮磷肥则在小麦的不同生长期、不同酶活性间表现出不同的作用。脲酶活性与蔗糖酶活性、土壤温度都呈极显著相关,蔗糖酶活性、碱性磷酸酶和土壤温度之间相关性不显著。
【英文摘要】To investigate the changes of soil hydrolase activities under application of corn straws with manure,N and P fertilizer,a field experiment was conducted.The results showed that in corn growing stage,invertase activity in the SNP treatment was 60.09±2.74 mg GLU/(g · 24 h),which was 28.09±1.79% higher than the control treatment,urease activity in the SNP treatment was 2.86±0.10 mg NH3-N/(g · 24 h),which was 1.04±0.03 times higher compared to the control treatment,alkaline phosphatase activity in the SN treatment was 4.01±0.05 mg phenol /(g · 24 h),which was higher than the control treatment by 0.28±0.05 mg phenol /(g · 24 h),there kinds of soil hydrolase activities in the straws returning treatments were higher than the control treatment,the manure fertilizer and N,P fertilizer combined application play different roles in different growing stages and different soil hydrolases.Significant correlation was found between the uraese activity and the invertase activity,soil temperature,but not among the invertase activity,alkaline phosphatase activity and soil temperature.

【题目】外来杂草刺萼龙葵及其风险评估
【中文关键词】刺萼龙葵; 外来杂草; 生物生态学特性; 风险分析
【英文关键词】Solanum rostratum, Exotic weed, Bioecological characteristics, Risk assessment
【中文摘要】外来入侵生物已对世界各国的自然生态系统、 农业生产及公众健康造成了严重危害。刺萼龙葵(Solanum rostratum)起源于北美洲, 其繁殖和适应能力很强, 是具有潜在危险的外来有害杂草。对刺萼龙葵的分布、 生物生态学特性、 经济和生态影响及其控制和管理措施等进行了系统综述。根据生物生态学特性、 潜在危险及管理控制的难度等特点, 对刺萼龙葵进行了风险评估, 得出其风险值为 86,属高度危险的检疫性有害生物。应当高度重视刺萼龙葵的入侵, 积极采取措施控制其危害蔓延。
【英文摘要】Invasive alien species caused significant damage to natural ecosystem, agricultural productionand human health throughout the world. Buffalobur (Solanum rostratum Dun.) was a noxious exotic weed with potential harm. It originated from North America and had the strong capability of propagation and adaptation. The distribution, bioecological characteristics, economic and ecological impacts and relevant management strategies of buffalobur were reviewed. Based on the bioecological characteristics, potential harm, difficulties to control and other factors, the risk value for buffalobur was 86 and considered as a quarantine pest with high risks. We should pay more attention to the invasion of buffalobur and took ef-fective measures to control its infestation and overspread.

【题目】外来恶性杂草假高粱种子萌发特性研究
【中文关键词】假高粱;外来杂草;种子;休眠;萌发
【英文关键词】Sorghum halepense;Exotic weeds;Seed;Dormancy;Germination
【中文摘要】【目的】明确外来恶性杂草假高粱(Sorghum halepens口)种子的萌发特性。【方法】研究颖片、温度、光照、G九及土层深度对其种子萌发的影响。【结果】颖片对假高粱种子的萌发具有物理阻碍和化学抑制作用,是导致其种子休眠的主要原因.假高粱种子萌发的最适温度为30'C,在25.12/35°C、12 h/12 h的变温方式下也能较好地萌发.假高粱种子的萌发需要一定的光照条件,在连续光照或12 h光照条件下,其种子萌发率较高.GA,能显著促进假高粱种子的萌发,其最适浓度为1.16 mm01.L-1.0~4 cnl的土层适宜假高粱种子的萌发,随着土层深度的增加其萌发率显著降低。【结论】假高粱种子的萌发受环境条件影响较大,通过采取有针对性的管理措施调控假高粱的萌发生长,可以有效遏制其危害蔓延.
【英文摘要】[Objective]To determine the germination characteristics ofJohnsongrass(Sorghum halepense),a worst exotic weed species.[Method]The effects ofglume,temperature,light,GA3 and soil depth on seed germination Wfl"e studied.[Result]The results showed that the glume of Johnsongrass had physical obsO'ucting and chemical inhibiting effects Oil seed germination,and itwas the major cause of seed dormancy.Germination of Johnsongrass$PAxIs was the best at 30"C,and also better under daily temperature changes of 25"C/35"C for 12 h/12 h.Light was preferred for seed germination,the rate Was relatively higher under 12 h light or continuous light condition.GA3 could significantly stimulate the germination of Johasongrass seeds and the optimum concentration Was 1.16 mmol · L-1.Seeds placed in 0-4锄soil layer Was ideal for germination of Johnsongrass。but the germinationrate decreased markedly with the increase of soil depth.[Conclusion]Environmental conditions have significant influence on seed germination of Johnsongrass,and its spreading and infestation could be well controlled by implementation of correspondingmanagement strategies to regulate and prevent the seed germination.

【题目】温度对粪便与玉米秸秆混合厌氧消化产生特性的影响
【中文关键词】玉米秸秆;厌氧发酵;数学模型;粪便
【英文关键词】corn straw;anaerobic digestion;mathematical model;manure
【中文摘要】【目的】探索牲畜粪便和玉米秸秆混合发酵的产气量与发酵时间和发酵温度之间的关系,确定农村户用沼气原料和最佳发酵温度,为提高农作物秸秆资源化利用效率提供科学依据。【方法】采用自行研究设计的可控性恒温发酵装置,以猪粪、牛粪和玉米秸秆作为发酵原料,以常温厌氧发酵池的底物为接种物,在总固体TS质量分数为8%条件下进行批量试验,在25~40°C,每5°C设一个温度梯度,研究不同发酵温度对猪粪、牛粪与玉米秸秆按不同比例(质量比为1∶1,2∶1,3∶1)配比混合发酵的产气速率、产气量及发酵时间的影响,并用SAS软件对各因素进行多元回归分析,建立回归方程,得出各影响因子的最优值。【结果】在一定温度范围内(25~40°C),厌氧发酵产气速率峰值出现的时间和发酵周期均基本随着温度的升高而缩短,峰值和产气量均基本随着温度的升高而增加。从总累积产气量来看,猪粪与玉米秸秆配比发酵优于牛粪与玉米秸秆配比,猪粪、牛粪与玉米秸秆混合厌氧发酵的最佳温度是34°C左右,发酵时间为58 d左右。【结论】确定了沼气的最佳原料、发酵温度和时间,为农作物秸秆的资源化利用提供了参考。
【英文摘要】To approach the relationships between the biogas yield of mixed anaerobic fermentation of livestock dung and corn straw and fermentation duration and temperature is the key of selecting fermentation materials for rural household biogas,determining optimal fermentation temperature,and improving the reuse efficiency of agricultural residues.【Method】A batch of experiments under the condition of 8% mass fraction of total solid were conducted in a selfmanufactured anaerobic fermentation reactor, with pig dung,cattle manure,and corn straw as fermentation materials,and the substrate of constant temperature fermentation pool as inoculation substance.The biogas production rate,biogas yield,and fermentation duration were determined with temperature increasing in increments of 5°Cfrom 25-40°C.Multiple regression analysis of the data was conducted and regression equations were established using SASsoftware. Based on these results,optimal values for temperature and digestion time were determined to maximize biogas yield per unit dry matter.【Result】The time to maximum biogas production rate and the overall length of the fermentation duration were shortened as temperature increased from 25°Cto 40°C for all the three types of straws.In addition,maximum biogas production rate and biogas yield increased as temperature rose.The cumulative biogas yield of mixed anaerobic fermentation of pig dung and corn straw was higher than that of the fermentation of cattle manure and corn straw.the optimum fermentation temperature and digestion duration from mixture of manure and corn straw respectively were 34°Cand 58d.【Conclusion】Thestudy determined optimal fermentation material,fermentation duration and temperature, and provide a reference for improving the reuse efficiency of agricultural residues.

【题目】温度对奶牛粪便温室气体排放的影响
【中文关键词】奶牛粪便;温度;温室气体;排放速率
【英文关键词】cowmanure; temperature; greenhouse gas; emission rate
【中文摘要】采用封闭罐-气相色谱法对4种不同温度处理下奶牛粪便温室气体排放速率进行测定。结果表明,温度是影响奶牛粪便温室气体排放的主要因子,温度较低时奶牛粪便温室气体排放速率低,而且随着奶牛粪便处理温度升高而增大。在5、15、25和35°C4个处理中,奶牛粪便CO2排放速率两两之间差异显著;CH4排放速率除了5和15°C处理差异不显著之外,其他两两处理之间差异显著; 35°C处理时N2O排放速率与其他温度的排放速率差异均显著,其他两两处理之间差异不显著。
【英文摘要】Fluxes of greenhouse gases emitted from cowmanure in four different temperature treatments (5, 15, 25 and 35°C) weremeasured using closed-air-chamber-gas-chromatography to determine effect of temperature on the emission.Resutls show temperature is themain factor influencing the greenhouse gases emission from themanure. When themanure was low in temperature, greenhouse gases emission was less. The emission increased with the temperature. CO2 emission varied sharplywith the temperature, and so did CH4emission except forTreatments 5 and 15°C. In Treatment 35°C,N2O emission was significantly higher than the others, while itdid not varymuch between the others.

【题目】小麦秸秆静态高温堆腐过程中的理化特征
【中文关键词】小麦秸秆;高温堆腐;E4/E6值;pH值;EC值
【英文关键词】straw; high-temperature composting; temperature; E4/E6; pH; EC
【中文摘要】为了解小麦秸秆堆肥过程中的生物化学特征,进行了高温好氧堆肥试验。结果表明,添加复合微生物腐解菌剂处理较不添加复合微生物腐解菌剂(CK)升温快,温度高,高温持续时间长;堆腐第2d添加菌剂处理堆体温度上升到50°C以上,第3 d达到最高温度67.1°C,50°C以上持续6 d;CK堆腐第3 d达到50°C,第4 d达最高温度59.5°C,50°C以上持续5 d。堆腐第9 d添加菌剂处理E4/E6值达高峰值3.419,CK的达高峰值4.085,堆腐第23 d后添加菌剂处理的胡敏酸E4/E6值为1.512~1.709,而CK处理的E4/E6值为1.649~2.060,堆腐过程添加菌剂处理的E4/E6值一直低于CK,表明添加菌剂能促进腐殖质的缩合和芳构化。堆肥腐熟后pH值较堆制前有所提高,添加菌剂处理的pH值相对较低,变化幅度较小。加入微生物菌剂处理的电导率

(EC)值较高,且在持续高温阶段高于后熟阶段。
【英文摘要】An experimentwas conducted to study the biochemical characteristics ofwheat strawduring its composting at high-temperature and static state. There were two treatments in this experiment, one was with adding microorganism agent, and the other was without adding microorganism agent (CK). The results indicated that the treatment of adding microorganism agent had faster temperature rising, higher temperature and longer high temperature duration than CK; The E4/E6values increased in the initial stage but decreased thereafter, the E4/E6values ofmaterials of addingmicroorganism fungus were 1.512~1.709, and the E4/E6 values ofmaterials of CKwere 1.649~2.060 after 23 d, which indicated thatmicroorganismfungus could promote processing humus; It has been discovered that pHvalues increased after composting while the rate of conductance decreased.

【题目】微贮技术在日喀则地区的应用
【中文关键词】微贮; 紫花苜蓿; 燕麦; 秸秆;
【英文关键词】microbial silage; alfalfa; oat; straw;
【中文摘要】在日喀则试验站, 利用秸秆发酵活干菌对燕麦(A venasativa)、青稞(H ordeumvulgare var. nudum) 秸秆和燕麦+紫花苜蓿(Medicago sativa)混合材料分别进行微贮试验, 测定 3 个原料微贮前后主要营养物质的变化。结果表明: 3 个材料均可制作优质微贮料, 但燕麦+ 紫花苜蓿混贮优于燕麦单贮, 青稞秸秆微贮后粗蛋白含量提高了 41. 74% , 达到 5. 12% ; 燕麦+ 紫花苜蓿混合微贮后粗蛋白含量提高了 39. 73% , 达到10. 68% 。微贮后 3 个材料的饲料总能(G E) 和无氮浸出物 (N F E) 均有不同程度的下降, 其中青稞秸秆的下降幅度最大, 分别为 2. 46% 和 15. 76% 。微贮技术作为提高该地区草地畜牧业的科技含量和生产水平的措施之一, 并可以解决冬春饲草缺乏问题, 所以微贮在该地区推广应用具有广泛的必要性和适用性。

【题目】外来入侵植物小飞蓬化感物质的释放途径
【中文关键词】小飞蓬;化感效应;释放途径;根系分泌物
【英文关键词】Conyza canadesis L. ; allelopathic effects; release mode; root exudates
【中文摘要】在室内以滤纸为载体用离体生测方法测定了小飞蓬(Conyza canadesi L.)全株水浸提物 茎叶淋溶物 根系分泌物及残体土壤分解物对萝卜(Raphanus sativus L.) 黄瓜(Cucumis sativus L.) 马唐(Digitaria sanguinalis (L.) Scop.) 油菜(Brassicacampestris L.)和小麦(Triticum aestivum L.)的化感效应, 同时在温室内以土壤为载体通过盆栽植物浇灌的方法测定了小飞蓬茎叶淋溶物和根系分泌物对盆栽植物生长的影响 室内生测实验结果表明, 小飞蓬全株水浸提物对 5 种受体种子的萌发和幼苗生长均有较强的抑制作用;根系分泌物 茎叶淋溶物和残体土壤分解物对受体种子的生长抑制作用不同, 根系分泌物的活性高于茎叶淋溶物和残体土壤分解物 温室盆栽实验结果也表明, 小飞蓬根系分泌物对受体生长的影响高于茎叶淋溶物 这些结果说明根系分泌是小飞蓬化感物质释放的主要途径之一。
【英文摘要】The allelopathic effects of aqueous extract,root exudates,shoot leachates and decomposition from C. canadesis on radish (Raphanus sativus L.),cucumber (Cucumis sativus L.),crabgrass (Digitaria sanguinalis (L.) Scop.),rape (Brassica campestris L.) and wheat (Triticum aestivum L.), were tested in petri dishes in laboratory. and the shoot leachates and root exudates were also tested in pot in greenhouse. The aqueous extract strongly inhibited the seedling growth of the tested plants. The root exudates,shoot leachates and decomposition inhibited the seedling growth of the tested plants differently,and the inhibitory effect of the root exudates was highest,The similar results were gotten from the greenhouse test. C. canadesis released the allelochemicals mainly through root exudates.

【题目】Determination of the Volatile Composition in Essential Oil of Descurainia sophia (L.) Webb ex Prantl (Flixweed) by Gas Chromatography/Mass Spectrometry (GC/MS)
【中文关键词】无

【英文关键词】Descurainia sophia (L.) Webb ex Prantl; essential oil; GC/MS; cis- β -ocimene; menthol
【中文摘要】无
【英文摘要】Exhaustive hydro-distillation of Descurainia sophia (L.) Webb ex Prantl(flixweed) collected from two different locations (Cangzhou city-Sample 1 and Beijingcity-Sample 2) gave in both cases yellowish colored oils in 0.31 and 0.26% yield,respectively. Detailed chemical composition of the essential oils was analyzed by GC andGC/MS, and forty and thirty-eight compounds were identified. The results indicated that themost abundant component of Sample 1 were cis- β -ocimene (20.1%), menthol (11.27%),neoisomenthyl acetate (3.5%), alloaromadendrene (2.28%) and longicyclene (2.25%).Compared with the constituents of Sample 1, several chemical compounds such as1,8-cineole, α -eudesmol, cis, trans-farnesol and β -pinene were not detected in Sample 2although it was similarly dominated by cis- β -ocimene (17.12%), menthol (10.7%) andneoisomenthyl acetate (2.96%). Final analysis of the chemical constituents in the essentialoils of the two samples showed similarity in their chemical composition, but the relativecontent of all shared chemical constituents in Sample 2 was lower than that in Sample 1.

【题目】应用预抽真空采样提高田间自动采气精度
【中文关键词】自动连续测定,温室气体,预抽真空采样,直接采样,精度
【英文关键词】automated continuous measurements, greenhouse gases, pre-vacuum sampling, direct sampling, precision
【中文摘要】为了提高农田温室气体自动采样精度,该文比较了田间自动连续测定系统观测温室气体通量过程中实际管道直接采样与预抽真空采样的差异,结果表明:管道预抽真空采样能显著减少分析时的样品量,缩短采样时间和减小采集气样与源气样的差异,提高了采样的精度。因此,预抽真空采样能显著提高农田温室气体自动观测的精度。
【英文摘要】In order to improve precision of automated greenhouse gas sampling in the field, the differences between direct tube gas sampling and pre-vacuum gas sampling in the field automated continuous greenhouse gases measurement system were compared. The results show that, in comparison with direct sampling, the pre-vacuum sampling can dramatically decrease gas sampling volume, shorten sampling time, and minish the difference of gas sample and the source, and thus improve sampling precision. So the pre-vacuum sampling is much better than direct sampling in field automated greenhouse gases measurement system.

【题目】山梨酸对多花黑麦草青贮发酵品质变化的影响(简报)
【中文关键词】多花黑麦草; 山梨酸; 发酵品质;
【英文关键词】Italian ryegrass; Sorbic acid; Fermentation quality;
【中文摘要】新鲜青贮原料在青贮容器中压实密封后,由好氧性微生物作用,使乳酸发酵时期发酵底物水溶性碳水化合物(WSC)不足,无法产生足够乳酸,pH值降到4.2以下,引起丁酸发酵[1,2]。因此,早期发酵是青贮成功的关键。山梨酸具有较强的抑制好氧性微生物活性的作用[3,4],据报道0.1%山梨酸能够最有效地抑制青贮饲料中酵母菌和霉菌的活性,提高有氧稳定性,但对牧草青贮发酵品质,尤其是WSC动态变化的影响研究相对较少[5,6]。本试验目的是添加0.1%山梨酸于多花黑麦草(Lolium multiflorumLam)中,分析青贮过程中发酵品质和WSC含量的变化,探讨山梨酸对多花黑麦草青贮发酵品质的影响。

【题目】土壤质地空间预测方法的比较研究
【中文关键词】土壤,质地,空间变异测量,对数比转换,成分数据,成分克里格
【英文关键词】soil texture, logratio transformation, compositional data, compositional Krigin
【中文摘要】土壤质地作为成分数据(compositional data)的一种,其空间插值需满足非负、定和、误差最小和无偏估计4 个条件。采用成分克里格法(compositional Kriging)和基于对数比转换的普通克里格法对土壤质地各颗粒组成进行空间预测,均方根误差(root mean squared errors,RMSE)和标准化克里格方差(mean squared deviation ratio,MSDR)分别被用来衡量不同方法的预测精度及模型拟合效果。研究结果表明:对数比转换的普通克里格法和成分克里格法能够保证插值结果满足成分数据插值的4 个条件;成分克里格法预测的各土壤颗粒组成的RMSE 最小,预测精度最高,其黏粒RMSE值相对于非对称对数比转换的普通克里格法提高将近17%;成分克里格法的变异函数拟合效果总体上好于其他两种预测方法,预测结果极差更宽,更能反映土壤质地各颗粒组成与高程、母质和水域分布的关系。
【英文摘要】Soil texture is one of compositional data in the geosciences. Spatial interpolation for soil texture must meetfour conditions,which including positive definiteness, a constant sum of interpolated values at a given position, errorminimization and unbiased estimation. The study adopted compositional Kriging and ordinary Kriging based on datatransformed by asymmetry logratio transformation (ALR) and symmetry logratio transformation (SLR) to predict spatialdistribution of each soil particle composition. The precision and fitting effect were assessed by utilizing the root meansquared errors (RMSE) and mean squared deviation ratio (MSDR). The results showed that the interpolation results bycompositional Kriging and ordinary Kriging based on data transformed by ALR and SLR could meet the four conditionsin spatial interpolation. Values of RMSE for different soil particle composition by compositional Kriging were the leastand the precision was the highest. For clay, the relative improvement of accuracy to the reference method ordinaryKriging based on ALR was close to 17%. On the whole, fitting effect by compositional Kriging was better than that byother methods. The ranges were wider for compositional Kriging, and its prediction results could better reflect therelations of different soil articlecomposition with elevation,soil parent material and water area distribution.

【题目】丙酸对多花黑麦草青贮发酵动态变化的影响
【中文关键词】多花黑麦草; 丙酸; 发酵品质;
【英文关键词】Lolium multiflorum; propionic acid; fermentation quality;
【中文摘要】在实验室条件下制备多花黑麦草青贮饲料, 评定不同浓度丙酸(0, 0. 20% , 0. 25% , 0. 30%) 对其青贮发酵动态变化的影响。结果表明, 添加丙酸对多花黑麦草青贮过程中 VFAs 含量无明显的影响, 增加了发酵后期乳酸及WSC 的含量及乳酸/ 乙酸值, 在发酵初期降低了乳酸的含量和青贮初期 pH 值; 降低 A N/ T N 值、乙酸含量及生成速度; 丙酸在整个发酵过程中呈现很高的趋势。综合考虑, 0. 25% 添加水平, 多花黑麦草青贮发酵品质最好。

【题目】Tribenuron-Methyl Resistant Flixweed (Descurainia sophia)
【中文关键词】无
【英文关键词】ALS inhibitor, tribenuron-methyl, resistance
【中文摘要】无
【英文摘要】Flixweed seeds were collected from suspected winter wheat fields and remote hillside in Shaanxi Province, China, their sensitivities to tribenuron-methyl were evaluated in the greenhouse. Results revealed that biotype S was susceptible to tribenuron, and its GR50 was 0.23 g a.i. ha-1, whereas biotypes R1, R2, R3, and R4 were resistant to the tribenuron, andtheir GR50 were 161.99, 79.70, 439.80, and 312.30, respectively. Biotypes R1 and R2 showed moderate resistance with resistant indices (RI) of 615.23 and 302.7, respectively. Whereas biotypes R3 and R4 showed high resistance to the herbicide with RI values as high as 1 670.34 and 1 186.10, respectively.

【题目】瘤胃微生物对结构性碳水化合物的降解机制研究进展
【中文关键词】瘤胃微生物; 结构性碳水化合物; 降解; 影响因素;
【英文关键词】rumen microbe; structural carbohydrate; degradation; factor;
【中文摘要】反刍动物瘤胃内含有庞大的微生物种群, 与瘤胃内结构性碳水化合物的降解有密切关系。参与结构性碳水化合物降解的瘤胃微生物主要包括细菌、真菌和原虫, 尤以细菌和真菌的降解作用最大。瘤胃细菌和真菌通过与结构性碳水化合物的附着、粘连或穿透等一系列作用, 使这些紧密连接的结构物质变得松散,再由它们分泌的各种酶类将这些松散的结构性碳水化合物逐步分解, 转化成可以被反刍动物及其寄居的瘤胃微生物吸收利用的单糖。瘤胃微生物对结构性

碳水化合物的降解也受到诸多因素的影响, 主要包括植物的表皮、细胞壁的物理和化学结构特性、细胞壁的组成成分, 以及瘤胃内环境和其他营养素等。

【题目】植被覆盖度对冬小麦冠层光谱的影响及定量化估产研究
【中文关键词】冬小麦; 植被覆盖度; 高光谱; 估产
【英文关键词】Wheat; Vegetation coverage; Hyperspectral; Yield estimation
【中文摘要】为避免土壤背景对冠层光谱的干扰, 提高冬小麦定量化估产精度, 以河北廊坊中低产田条件下的冬小麦为研究对象, 利用ASD Field Spec 高光谱仪定点获取冬小麦冠层光谱信息, 分析了田间植被覆盖度和冠层NDVI在生育期内的变化, 并利用植被覆盖度对冠层NDVI 进行了校正。结果表明, 通过三基色即RGB、色度和亮度可将数字图像中冬小麦和土壤背景进行分割, 从而获得单位面积上冬小麦的覆盖百分比。而通过覆盖度校正后的植被指数即C-NDVI 能够更具针对性地反映植株冠层氮素信息。在本试验条件下利用灌浆中期的C-NDVI 与产量进行一元回归或利用全生育期的C-NDVI 与产量进行多元回归均取得了较好的效果, 决定系数分别为0. 849 和0. 853。由于多元回归模型考虑了不同时期的C-NDVI 的变化, 因此模型具有更强的可靠性和稳定性, 较适合于冬小麦定量化估产。
【英文摘要】To avoid inter ference of soil on canopy spectrum and improve thest imation accuracy of wheatyield, in this experiment , based on w inter w heat varieties (Triticumaestivum L.) under the condition of middle-low yield fields, canopy reflectance w ere monito red using ASD FieldSpec Prospect rometer (Spect ral range from 350 nm to 2500 nm) and the monitoring was conducted in the fix ed site in the w hole growing stages. The chang e t rend o f vegetation co ver w as analyzed, NDVI and C-NDVI w er e calculated from NDVI and vegetat ion cover w ithin growing stages. The results showed that wheat can be separated from the soil based on their differ ences in RGB, H, and L values, so the percentage of wheat in unit area can beobtained. C-NDVI is the NDVI modif ied by vegetation coverage, w hich increased pertinence to spect ral information of wheat canopy. In this paper, good prediction result s were obtained from single reg ression of yield and C-NDV I in grain-filling stage or multiple reg ressio n of yield and C-NDVI in differ ent stages, and the decision coeff icients were 0.849 and 0. 853, respectively. Comparatively, the multiple r eg ression model is more reliable and stable because the changes of C-NDVI in differentstages w ere considered in the model.This method greatly improv es the w heat yield est imat io n accuracy using ground spectral data.

【题目】长期不同施肥方式对稻油轮作田土壤杂草种子库多样性的影响
【中文关键词】土壤杂草种子库, 农业生态系统, 生物多样性, 施肥方式
【英文关键词】soil weed seed bank, agricultural ecosystem, biodiversity, fertilizer management
【中文摘要】施肥等人为管理下农田生态系统生物多样性的变化规律及其保护是生态系统研究的重要内容之一 我们通过镜检法对太湖地区一个长期肥料定点试验稻油轮作田表层(0 – 15 cm)土壤中杂草种子的种类进行了鉴定, 分析了长期不同施肥方式对稻油轮作田土壤杂草种子库群落结构及多样性的影响, 讨论了杂草种子库多样性与农田生态系统生产力和稳定性的关系 4种施肥方式分别为不施肥(NF) 单施化肥(CF) 化肥配施猪粪(CMF)以及化肥配施秸秆(CSF) 结果表明: 无论水稻种植季还是油菜种植季, 与长期不施肥 单施化肥及化肥配施猪粪相比, 化肥配施秸秆条件下的田间土壤杂草种子库密

度均最低, 但其总物种数和多样性较高; 同时, 这种施肥方式下水稻与油菜的年平均产量也较高, 而且年际波动小 可见, 施肥方式的不同会影响杂草种子库的多样性, 而多样性的高低与农作物产量高低及稳定性有着一定的相关关系: 即均衡的施肥方式有利于维持土壤杂草种子库多样性, 提高农作物产量, 并降低产量年际间的波动性 在本文研究的4种施肥方式中, 化肥配施秸秆可以作为提高农田生态系统生产力和稳定性并保持生物多样性的农田施肥管理方式。

【英文摘要】To study the dynamics in crop-field soil biodiversity under long-term fertilization is important for agricultural ecosystem protection. We selected a long-term fertilized paddy field under rice/rape rotation from the Taihu Lake region as a study site, and identified weed seeds in the topsoil (0 – 15 cm) by microscopic examination. Weed seed number and crop yields were recorded. We analyzed the effect of long-term fertilization on soil weed seed bank diversity andthe relationship between weed seed diversity and crop yields. The fertilizer treatments were as follows: non-fertilizer (NF), chemical fertilizer only (CF), chemical fertilizer and pig manure combined (CMF), and chemical fertilizer plus crop stalk (CSF). The results indicated that in the cultivating seasons of both rice and rape, under the treatment of chemical fertilizer plus rice crop stalk, the density of soil weed seed bank was the lowest, whereas the total species number and diversity was the highest. Furthermore, the crop yields were maximal and the steadiest under this treatment. There was definite correlation among fertilizer treatments, soil weed seed bank diversity and crop yields. It was concluded that balanced fertilizer management helps to maintain soil weed seed bank diversity, increase crop yields, and prevent crop yields from fluctuating. Therefore, among the four fertilizer treatments, chemical fertilizer plus rice crop stalk was the best one to increase the productivity of agricultural ecosystems and simultaneously protect biodiversity.

【题目】微生物复合添加剂对苜蓿青贮效果的影响

【中文关键词】微生物复合添加剂; 苜蓿; 青贮; 发酵品质;

【英文关键词】Microbe compound additives; Alfalfa; Silage; Quality;

【中文摘要】为探讨微生物添加剂对苜蓿青贮效果的影响,以发酵活干菌和乳酸菌两种微生物复合添加剂为材料,分别设置三种不同添加浓度和对照,添加到袋装苜蓿青贮中,分别在青贮第 4,8,16,30,60天后取样分析。结果表明:两种微生物复合添加剂均可以改善苜蓿青贮的发酵品质,青贮 pH显著下降,抑制氨态氮含量的增加,但对干物质含量和可溶性碳水化合物含量的变化影响不显著。通过综合分析,本试验认为在苜蓿青贮中添加发酵活干菌复合添加剂 2g/t或乳酸菌复合添加剂 1g/t效果较好。

【题目】油菜田日本看麦娘对高效氟吡甲禾灵抗药性的研究

【中文关键词】高效氟吡甲禾灵;日本看麦娘;抗药性

【英文关键词】Haloxyfop—R—methyl;Alopecurusjaponicus Steud.;Resistance

【中文摘要】【目的]明确油菜田日本看麦娘(Alopecurus japonicus Steud.)对高效氟吡甲禾灵(haloxyfop—R—methyl)的抗药性及对其它药剂的交互抗性水平。【方法】利用种子生物测定法和整株测定法测定了江苏、安徽11个点油菜田日本看麦娘对高效氟吡甲禾灵的抗药性,并用同样方法进行了相关药剂的交互抗性测定。【结果]两种方法测定结果基本相符。种子生物测定结果显示,江苏句容点日本看麦娘对此药剂的相对抗性倍数达61.1 3,整株测定结果为1 331.68,说明句容点的日本

看麦娘对此药剂已产生明显抗性。交互抗性测定结果显示,日本看麦娘对芳氧基苯氧基丙酸酯类(aryloxyphenoxypropionates,简称AOPP)其它药剂已产生了不同程度的抗性,抗性水平依次为精吡氟禾草灵>精喹禾灵>精噁唑禾草灵;对具相同作用靶标的环已烯酮类(cyclohexanediones,简称CHD)除草剂烯禾啶的抗性水平相对较低。室内测定结果与田间实际反映情况相吻合。【结论】种子生物测定法可作为杂草抗性水平测定的方法之一。油菜田日本看麦娘对AOPP类高效氟吡甲禾灵已产生不同程度的抗药性,其中句容点抗性最高,对同类产品精吡氟禾草灵的交互抗性水平也最高;对与AOPP类除草剂具有不同结构、相同作用机制的CHD类烯禾啶交互抗性水平较低。

【英文摘要】[Objective]The objective of this study was to investigate the resistance level of Alopecurus japonicus Steud.tohaloxyfop · R—methyl and its cross—resistance level to other herbicides with the same mode of action.Eleven Alopecurus japonicuspopulations were collected from different oilseed rape fields in Jiangsu and Anhui provinces where haloxyfop · -R · · methyl had beencontinuously applied for years.【Method】The resistance level of Alopecurus japonicus to haloxyfop—R—methyl and thecross—resistance level of the most resistant and susceptible populations to other related herbicides were assessed by two methods:seedbioassay and whole plant assay.[Result]Results confirmed a good correlation between the two different bioassays.Therelative resistance factors ofAlopecurusjaponicus population to haloxyfop—R-methyl from Jurong in Jiangsu province were 61.13 byseed bioassay and 1 33 1.68 by whole plant assay.This result demonstrated Jurong population has apparently evolved resistance tohaloxyfop—R-methyl in fields.The CROSS.resistance tests revealed that this resistant population Was also resistant to other AOPPs.inwhich the resistance was in order of:fluazifop—P—butyl>quizalofop—P—ethyl>fenoxaprop-P—ethyl.However,a relative low resistancelevel was observed for sethoxydim,which was a cyclohexanedione(CHD)herbicide sharing the same target as AOPPs.And theresults obtained in laboratory were agreed with that in fields.[Conclusion】Seed bioassay could be used to determine the resistancelevel of weeds.Resistance of Alopecurus japonicus in oilseed rape fields has occurred to haloxyfop—R-methyl。which belongs toAOPPs.TheJurong population was most resistant to haloxyfop—R—methyl,which also had the highest cross—resistance level withfiuazifop—P-butyl,while lowest with sethoxydim,a CHDs herbicide sharing the same mode of action with AOPPs.

【题目】杂草抗药性研究进展
【中文关键词】杂草;抗药性;抗药性机制;研究技术
【英文关键词】weeds; herbicide resistance; mechanisms; methodology
【中文摘要】目前全球已有188种杂草(112种双子叶,76种单子叶)的324个生物型对19类化学除草剂产生了抗药性,几乎涵盖各类重要的除草剂。抗药性杂草已成为杂草治理和农业生产的严重威胁,由其引发的严重经济和安全问题倍受全球关注。研究证实,杂草体内除草剂作用位点发生改变、杂草代谢解毒能力增强、杂草的屏蔽作用或与作用位点的隔离作用是杂草对除草剂产生抗性的三大主要机制。杂草的抗药性机制相当复杂,同种杂草不仅对不同除草剂的抗药性机制不同,而

且能以完全不同的抗药性机制对多种作用机制不同的除草剂产生抗药性,即交互抗性和多抗性。本文重点描述杂草对 8 大类重要除草剂的抗药性机制,杂草抗药性研究方法,以期为中国抗药性杂草研究和农田杂草科学治理提供参考和借鉴,并提出在杂草治理中必须汲取他人的经验教训,阐明了中国杂草抗药性研究应关注问题。

【英文摘要】With repeated and wide use of herbicides in agricultural systems, 324 herbicide resistant biotypes of 188 species (112 dicots and 76 monocots) have evolved worldwide. The development of herbicide resistance in weeds, rapid increase and widespread of herbicide resistant weeds have become an increasing threat to weed management and crop production in the world, the consequences leading to economic loss and food safety have become a global concern. In the last decades, a significant progress has been made in the areas of herbicide resistance, many of the findings have proven that at least three very different mechanisms endowed herbicide resistance, an altered target site, enhanced detoxification and sequestration in weeds,weeds can also evolve cross resistance and multiple resistance to herbicides with different modes of action. This review described the currant status of world wide herbicide resistant weeds, resistance mechanisms in 8 major herbicide classes, research methodologies to provide useful information and references for researches in herbicide resistance, and posed the lessons learnt from other countries, clarified and stated the future directions we should forward to.

【题目】几种除草剂防除猪殃殃效果评价
【中文关键词】除草剂;猪殃殃;防效
【英文关键词】herbicides;Galium aparina L.contro effect
【中文摘要】在冬季和春季分别施药,对比分析了6种药剂防除小麦田猪殃殃的效果。结果表明,不同药剂对猪殃殃防效差异较大。其中,不同温度下施药,苄嘧磺隆和麦草畏对猪殃殃均表现出很好的防除效果;灭草松和2甲4氯钠受温度影响也较小,但二者对猪殃殃的控制作用稍差;氯氟吡氧乙酸和苯磺隆,尤其是氯氟吡氧乙酸,对猪殃殃的防效明显受环境温度及猪殃殃生长期的影响,冬季低温、猪殃殃处于休眠状态时施药,除草效果较差,而春季气温回升、猪殃殃开始生长时施药,对猪殃殃的防除效果显著提高。

【题目】空心莲子草对大蒜生长的影响及其经济阈值
【中文关键词】空心莲子草; 大蒜; 经济危害允许水平; 经济阈值
【英文关键词】无
【中文摘要】为明确空心莲子草对大蒜生长的影响及其经济危害允许水平, 采用添加系列试验和模型拟合的方法观察了不同空心莲子草密度下大蒜各生长性状的变化规律。结果表明, 大蒜在空心莲子草的竞争干扰下, 株高、鳞茎数、 根数、田间透光率、 蒜薹及蒜瓣产量均随空心莲子草密度的增加而逐渐降低。对数函数模型可以较好地拟合空心莲子草与大蒜产量损失间的关系(y= 6. 039lnx+ 0. 977, P< 0. 001) 。大蒜田采用人工拔除方法对空心莲子草进行防除时,空心莲子草的经济危害允许水平为 5. 21%,经济阈值为 4. 02 株/ m2。

【题目】水稻化感品种结合使用除草剂及深水层管理对稻田杂草的抑制作用
【中文关键词】水稻;化感;水层;除草剂;杂草防治
【英文关键词】rice(Oryza sativ L.);allelopathy;herbicide;water depth;weed control
【中文摘要】摘要:选用具有化感特性的水稻品系华抗草78和长江流域地区主栽的扬稻6号,通过田间试验研究水稻化感作用结合苄嘧磺隆使用及水层管理对水稻田杂草的抑制作用。旨在降低水稻田化学除草剂使用量,探索水稻生产中杂草治理的新途径。结果表明,水稻化感作用结合深水层可有效抑制稗草的萌发和生长,同时水稻移栽后6 d 使用苄嘧磺隆(30 g/hm2)单剂处理。明显地抑制了异型莎草和陌上菜的萌发数量和生物量积累;水稻移栽后50 d,华抗草78和扬稻6号对稗草的干重防效分别为89.16%和81.86%,对异型莎草的干重防效分别为83.56%和84.93%,对陌上菜十重防效分别为95.22%和

88.04%,对这3种杂草的总干重防效分别为87.68%和82.69%;10cm深水层及施用苄嘧磺隆单剂条件下2个水稻品种(系)的产量比5 cm水层、不施化学除草剂的处理分别增产40.33%和21.36%。水稻化感品种对稗草等的抑制作用、水稻自身的竞争作用、10 cm深水层及苄嘧磺隆单剂这4种因素的综合效应不仅具有良好的控草效果,增产显著,而且明显降低r除草帮l的使用量。

【题目】嘧草硫醚对棉花的安全性及除草生物活性测定

【中文关键词】嘧草硫醚; 棉花; 安全性; 杂草; 生物活性

【英文关键词】pyrithiobac-sodium; cotton; safety; weeds; activity

【中文摘要】摘要: 采用温室盆栽生物测定法, 对比测定了10%嘧草硫醚水剂和50%乙草胺乳油、 25%氟磺胺草醚乳油对棉花的安全性及除草活性差异。 试验结果表明10%嘧草硫醚水剂土壤处理对棉花安全, 茎叶处理高浓度对棉花有轻微药害, ED10值为322.69 g a.i./hm2。 10%嘧草硫醚水剂土壤处理对单、 双子叶杂草均有较好的防效,对反枝苋、 马唐、 稗草、 苘麻的ED90值分别为39.85、 272.05、 309.87、 459.01 g a.i./hm2; 与乙草胺相比, 嘧草硫醚的活性略高于乙草胺, 尤其对苘麻的防效明显高于乙草胺。 10%嘧草硫醚水剂茎叶处理对反枝苋防效最好,ED90值小于15 g a.i./hm2; 其次为稗草、 苘麻, ED90值分别为125.27、 486.10 g a.i./hm2; 该药对马唐仅有抑制作用, 防除作用较差, ED90值为2 771.57 g a.i./hm2。 与25%氟磺胺草醚乳油相比, 二者杀草谱相近, 嘧草硫醚作用速度较慢, 氟磺胺草醚作用速度较快, 但氟磺胺草醚不可用于棉田。

【题目】硝磺草酮对玉米药害的早期诊断和缓解方法
【中文关键词】玉米;硝磺草酮;安全性
【英文关键词】无
【中文摘要】2006~2007年于北京市海淀区试验地开展了硝磺草酮对玉米不同品种的安全性及植物生长调节剂一碧护对药害的缓解作用方面的研究。以华北地区主栽的4个玉米品种为试材,按常规栽培习惯进行种植,小区面积60 m2。玉米4—5叶期,以0、105 g a.i./hm2、210 g a.i./hm2、420 g a.i./hm2、840 g a.i./hm2的剂量喷施硝磺草酮,施药7 d后再按0和30 g/hm2的制剂用量喷施碧护。硝磺草酮的喷液量为600 L/hm2,碧护的喷液量为300 L/hm2。施药后2 d,玉米叶片的PPM值迅速降低,而随着时间的延长而逐步恢复,但不同玉米品种表现出较明显的差异。以白糯6号对药剂最敏感,需要10 d才能恢复到正常水平;甜单8号次之,需要8 d才能恢复;滑丰986和郑单2l相对不是很敏感,需要6 d恢复。处理后3—4 d,玉米在硝磺草酮作用下,叶片白化,随用药量的增加而药害程度加重。硝磺草酮对玉米生长有较明显的抑制作用。随着施药剂量的增加,4个玉米品种的株高和鲜重均明显降低,且显著低于不用药的对照。喷施了碧护之后,玉米恢复程度有所加强,玉米株高明显增高。

【题目】四川首次发现三裂叶豚草大面积发生危害
【中文关键词】三裂叶豚草; 恶性杂草; 危害
【英文关键词】无
【中文摘要】三裂叶豚草是一种外来入侵恶性杂草,具有极强的生命力、竞争力和生态适应性,严重影响人类健康、农业生产和生态安全。在我国主要分布于东北、华北地区,2007年9月4日确认四川有分布,近年在四川1自贡、宜宾、内江3市10个县区已有发现,发生面积共约2 666 hmz,已引起农业厅相关部门的重视并进行了有效铲除。但由于地下积存种子以及贸易、旅游、交通和四川气候、地理条件等的影响,仍有蔓延的危险,本文据此提出了相应的防控对策建议。

【题目】黑土全氮含量的高光谱预测分析
【中文关键词】土壤,氮,光谱分析,模型
【英文关键词】soil testing, nitrogen, spectrum analysis, models
【中文摘要】为实现快速、准确估测土壤氮素含量水平,推动土壤信息化管理进程,该研究利用ASD2500 高光谱仪在室内条件下测定了风干土壤样品的可见—近红外光谱。结果表明,通过不同的变换,光谱反射率对数的一阶导数与土壤全氮含量相关性得到增强,以400~600 nm 波段范围内相关性最好。该文确定了以反射率对数的一阶导数光谱预测黑土全氮(TN)含量的最佳回归模型,模型所用的波段为可见光波段的556 nm、近红外的1 642 和2 491 nm。同时,也确定了利用由可见光波段550 和450 nm 组成的归一化光谱指数预测黑土TN 含量的最佳预测模型。模型通过验证达到较好的效果:利用反射率对数的一阶导数、归一化光谱指数对土壤TN 的预测R2 分别为0.863、0.829,均方根误差RMSE 分别为0.122、0.152。
【英文摘要】It provides important information for soil digital management if soil total nitrogen can be rapidly and accurately estimated. In this research, NIR-Visible spectral reflectance of soil samples was measured using ASD2500 hyperspectral meter. The results indicated that Total Nitrogen (TN) content of black soil had better relationship with the first deviation of reflectance logarithm (LOGR-FD) than the original spectrum in 400-600 nm especially. The optimum model predicting TN of black soil using derivative spectra (LOGR-FD) was established by the method of stepwise regression. The selected bands in the model are 556, 1 642 and 2 491 nm respectively. Normal Difference Index (NDI[550, 450]) was constructed by spectral reflectance in the bands of 450 and 550 nm, and the model was also established for TN predicting using the NDI[550, 450]. By validity, the above two models produced better effects: the coefficients of determination (R2) are 0.863 and 0.829 and the Root Mean Square Errors (RMSE) are 0.122 and 0.152 respectively.

【题目】野燕麦对不同小麦品种产量性状的影响及其经济阈值
【中文关键词】野燕麦 ; 小麦 ; 产量性状 ; 竞争 ; 经济 阈值
【英文关键词】Wheat ;Aena fatua;Yield characters;Competition;Economic threshold
【中文摘要】为给防除小麦田间恶性杂草野燕麦提供依据,采用添加系列试验和模型拟合的方法研究了野燕麦与小麦的竞争。结果表明,随着田间野燕麦密度的增加,小麦有效穗数、穗粒数和产量逐渐降低,而小麦千粒重的变化趋势不明显。模型拟合结果显示,野燕麦密度与小麦有效穗数和产量间的关系以指数模型(y=beax)较好,与穗粒数间的关系以直线模型(y=ax+b)较好,而与小麦产量损失间的关系以对数模型(y=alnx+b)最佳。野燕麦对矮秆小麦品种郑麦9023产量性状的影响

大于对高秆品种鄂麦35057的影响。根据小麦的经济危害允许水平,通过拟合的野燕麦密度与小麦产量损失的对数模型估算,当小麦品种为鄂麦35057时,野燕麦人工防除的经济阈值为9.04株.m-2,使用6.9%精噁唑禾草灵水乳剂化学防除的经济阈值为3.77株.m-2;而当小麦品种为郑麦9023时,相应的经济阈值分别为5.85株.m-2和3.32株.m-2。不同小麦品种的生长竞争能力存在较大差异,这可能是导致野燕麦与小麦间的竞争发生变化的原因。

【英文摘要】To provide guidance for control of Avena fatua(Wild oat),a noxious weed in wheat fields,additive series experiment and model fit were adopted to study the competition between A.fatua and two different wheat cultivars.The results showed that the spike number,spike grains number and yield of wheat decreased gradually as A.fatua density increased,but the 1000-grain weight of wheat showed no significant change.The exponential regression model(y=beax) was better for fitting the relationship between A.fatua densi...

【题目】集约化蔬菜地土壤磷素累积特征及流失风险

【中文关键词】集约化蔬菜地; 磷吸附饱和度; 最大缓冲容量; 流失风险

【英文关键词】vegetable soil phosphorus adsorption; degree of phosphorus saturation; maximum buffering capacity;leaching risk

【中文摘要】以南京市郊集约化蔬菜长期种植基地为对象, 采集蔬菜种植年限分别为3~ 5、15~ 20、25~ 30 a的土壤, 测定土壤全磷(TP)、速效磷(Olsen-P)、水溶性磷(CaCl2-P)、生物有效磷(NaOH-P) 的含量, 并对0) 20 cm 土层磷素吸附特性进行分析, 通过研究土壤磷吸附饱和度(DPS) 、最大缓冲容量(MBC) 来对土壤磷素流失风险进行评估。结果表明, 在0) 20 cm 土层, 除NaOH-P外, 其余各形态磷(TP、Olsen-P、CaCl2-P)都随种植年限延长呈增加趋势。不同种植年限土壤TP、Olsen-P、CaCl2-P、NaOH-P主要积累在0) 20 cm 土层, 且随着土层深度的增加土壤磷的累积量逐渐降低。DPS随种植年限延长而升高, 种植年限25~ 30 a的菜地0) 5 cm 土层DPS 超过土壤磷素流失环境敏感指标临界值(25%), 其MBC 也最低, 表明随着蔬菜种植年限的延长土壤磷素流失风险加剧, 且流失风险主要体现在0) 5 cm 土层。

【英文摘要】In order to study accumulation and leaching risk of soil phosphorus, soil samples were collected from vegetable fields, different in intensive vegetable cultivation history (3- 5, 15- 20 and 25- 30 years) in the suburbs of Nanjing forassay o f concentrations of total phosphorus (TP), available phosphorus (Olsen-P) , dissolved reactive phosphorus (CaCl2-P) and bio- available phosphorus (NaOH-P), and P adsorption in 0 - 20 cm soil layer, and for assessment of soil phosphate leaching risk through determination o f degree o f phosphorus saturation (DPS) and maximum buffer capacity (M BC) of the soils. Results show that the longer the history o f intensive vegetable cultivation, the higher the accumulation o f phosphorusfor all P fractions, except for NaOH-P, which w as higher in soils o f 3- 5 a than in the other two groups. TP, Olsen-P, CaCl2-P and NaOH-P accumulated mainly in the 0- 20 cm soil layer, and decreased in concentration with the depth in profile. DPS increased with the history. In the 0- 5 cm soil layers of soils o f 25- 30 a, the concentration o f DPS was even higher than 25%, the environmental sensitive index for soil P loss, while MBC was the lowest, suggesting that the leaching risk o f soil phosphorus rises with the cultivation history, particularly in 0- 5 cm soil layer

【题目】稻油轮作田杂草种子库组成及其垂直分布特征

【中文关键词】杂草种子库;稻油轮作f物种多样性f垂直分布l优势度

【英文关键词】无

【中文摘要】摘要:杂草种子库是潜在的杂草群落.对杂草可持续治理具有重要意义。在稻油轮作田杂草种子库中共检测到28种杂草,主要隶属于禾本科,玄参科和菊科.种子库密度达224 550 seed/m2,其中约64%为冬季油菜田杂草种子。从杂草种子库中种子的垂直分布来看,土壤表层的种子密度较高.占整个种子库数量的63.88%,而中层和下层的种子密度较小.其垂直分布主要有3种类型。种子库中优势恶性杂草有蔺草Beckmannia syzigachne、异型莎草Cyperus difformis、看麦娘Alopecurus aequalis、稻槎菜Lapsana apogonoldes和日本看麦娘Alopecurus japonicus等,随着土层深度的增加,各土层的优势种组成也有差异。通过采取措施调控杂草种子库的规模,有望实现稻油轮作田杂草的可持续治理。

【英文关键词】Avenafatua;Oilseedrape;Lightpenetrationrate;Economicthreshold
【中文摘要】摘要: 采用添加系列试验和模型拟合的方法研究了不同野燕麦密度下油菜各生长性状的变化规律。结果表明, 油菜在野燕麦的竞争干扰下, 植株高度、 分枝数、 角果数及千粒重均随其密度的增加而显著降低, 而第一分枝高度则不断增加。野燕麦能显著降低油菜植株间的透光率, 其对田间25cm高处的透光率影响较大, 对75cm和50cm高处的透光率影响相对较小。野燕麦密度为5株·m-2时油菜产量显著降低, 当其密度达到160株·m-2以上时,可使油菜减产达90%以上。对数模型y=15.436lnx+8.475可以较好地拟合野燕麦与油菜产量损失间的关系(P<0.0001)。油菜田野燕麦人工防除的经济阈值为1.15株·m-2, 使用精 唑禾草灵化学防除的经济阈值为0.70株·m-2。

【题目】醚苯磺隆在小麦田的除草效果及其残留对后茬作物的安全性
【中文关键词】醚苯磺隆;除草效果;残留;后茬作物;安全性
【英文关键词】TriasuIfuron; Weed controI efficacy;Residue effect;Affer_reap crops
【中文摘要】小麦返青期,在河北省小麦 -夏播作物一年两熟地区冬小麦田施用醚苯磺隆,对其除草效果及其在土壤中的残留在不同耕作方式下对后茬作物生长和产量的影响进行了研究。结果表明: 10%醚苯磺隆可湿性粉剂对小麦田主要阔叶杂草有较好的防除效果,对小麦产量无影响。10%醚苯磺隆在小麦田的施药剂量为 60 g / hm2,对下茬作物玉米、谷子幼苗的生长及产量无影响,对大豆、花生、油菜的药害轻;随用药剂量增加药害加重, 480 g / hm2处理对下茬参试作物均有较重的药害,不同作物对醚苯磺隆在土壤中残留量的敏感性有差异,其顺序为:油菜 >大豆 >花生 >谷子 >玉米。播种前进行旋耕比免耕对后茬参试作物幼苗生长及大豆和油菜产量影响要轻。
【英文摘要】FieId experiment was conducted to study weeds controI efficacy of triasuIfuron spraying in regreeningstage of winter wheat and its residue effect on the growth and yieId of after_reap crops(corn, soybean, peanut, miIIet and rape)under different mouIds of tiIIage in wheat summer seeding crop two_crop per annuaI region of Hebei. The resuIts showed that 10% triasuIfuron WP had better controI efficacy on broad_Ieaves weeds of wheat fieId and no in-fIuence on wheat yieId. The appIication rate of 60 g / ha in wheat fieId had no infIuence on the growth of seed Iing andyieId of corn and miIIet, and had Iight harm on soybean, peanut and rape. The hazard became heavier aIong with theincrease of appIication rate, 480 g / ha treatment heavier harm on aII testing after_reap crops. Different crops had dif-ferent sensibiIity to triasuIfuron residue in the soiI, the sensitivity order was rape > soybean > peanut > miIIet > corn.Comparing with zero_tiIIage rotary tiIIage before sowing had Iess infIuence on seedIing growth of aII testing affer_reap crops and yieId of soybean and rape.

【题目】湖北省油菜田杂草种类组成及群落特征
【中文关键词】油菜;杂草群落;物种组成;优势度;相似性
【英文关键词】Oilseed rape;Weed community;Species composition;Relative abundance;Similarity
【中文摘要】采用倒置“W”取样法对湖北省油菜田的杂草组成及群落结构进行了调查。结果表明,湖北省油菜田杂草有135种(含变种),隶属于26科、74属,其中优势杂草有看麦娘、波斯婆婆纳、棒头草、牛繁缕、蔚草、猪殃殃、早熟禾、日本看麦娘等8种,区域性优势杂草有13种,常见杂草有26种,一般杂草有88种。发生优势度较大的杂草为波斯婆婆纳、看麦娘、棒头草、牛繁缕、茼草、猪殃殃和野燕麦等,是构成各地区田间杂草群落的优势种。水旱轮作油菜田主要形成看麦娘+蔄草+棒头草+牛繁缕为主的杂草群落,旱旱连作田形成波斯婆婆纳+野燕麦+猪殃殃+通泉草为主的杂草群落。江汉平原地区油菜田杂草群落的物种丰富度、多样性较其它地区高,而优势度及均匀度指数较低。从群落相似性来看,武鄂黄地区与水旱轮作田杂草群落结构最为相似。作物种类、耕作制度及土壤环境条件的不同,可能是导致油菜田杂草发生及群落组成产生差异的原因。
【英文摘要】Weed survey was conducted by sampling methods of inverted W——pattern to determine the speciescomposition and structure of weed communities in oilseed rape fields in Hubei Province.135 weed species(inclu—ding varieties)were found and they belong to 26 families and 74 genera.Among them,8 species were consideredas dominant weeds,including Alopecurus aequalis,Veronica persica,Polypogon fugax,Malachium aquaticum,Beckmannia syzigachne,Galium aparine Var.tenerum,,Poa annua,Alopecuras japonicas;13 species were regionaldominant weeds;26 common weed species and 88 normal weed species.The overaH abundance of Veronica persica,Alopecuras aequalis,Polypogonfugax,Malachium aquaticum,Beckmannia syzigachne,Galium aparine Var.tenc—rum,and Avena知fzm were relatively higher.They were the major weeds in all oilseed rape regions in Hubei prov—ince.The most common weeds were Alopecurus aequalis+Beckmannia syzigachne+Polypogon/近g麟+Malachiumaquaticum in rice—wheat rotation fields.and Veronica pe您ica+Avenafatua+Galium aparine Var.tenerum+Mazusjaponicus in continuous dryerop fields.The variety and diversity of weeds in oilseed rape fields in Jianghan Plain re—glon were greater than other regions。but the Simpson’8 index and evenness index were relatively lower.Based onthe Sorensen’S similarity index,the weed variety in Wuehuang region was similar to that of rice—wheat rotationfields.The difference of weed occuiTence and their combination might be resulted from the crop type,adopted cul—fivafion system and original soil condition.

【题目】20%烟嘧磺隆-氰草津油悬浮剂的生物活性评价
【中文关键词】除草剂;烟嘧磺隆;氰草津;生物活性
【英文关键词】Herbicide; Nicosulfuron; Cyanazine; Bioactivity
【中文摘要】在温室盆栽条件下,以马唐、反枝苋为试材,采用Gowing法测定了烟嘧磺隆与氰草津复配的联合作用,并对实验室制得的20%烟嘧磺隆.氰草津油悬浮剂进行了大田生物活性评价试验。结果表明,烟嘧磺隆与氰草津复配后对马唐有增效作用,对反枝苋属于相加作用,两者适宜复配,配比为1~4:12.5。于玉米3~5叶期、杂草2~5叶期喷施20%烟嘧磺隆.氰草津油悬浮剂180~300g/hm2,药后30d的杂草总株防效及鲜重防效分别为83.6%~94.3%、92.7%~99.2%,对玉米安全性较好,玉米株高、产量均大于人工除草处理;在玉米7叶期及杂草5叶期以后施用该药剂,玉米的安全性及杂草株防效均出现下降。
【英文摘要】Greenhouse and field experiments were conducted to evaluate the joint effect and bioactivity of nico-sulfuron plus cyanazine mixtures. The results showed that nicosulfuron plus cyanazine was additive and synergistic in Amaranthus retroflexus L. and Digitaria sanguinalis (L.) Scop. controlled respectively, and it was compatible to mix nicosulfuron and cyanazine together in the ratio of 1 - 4 12.5. Preparation of the mixtures was nicosulfuron plus cyanazine 20% OF (oil miscible flowable concentrate). The mixtures should be applied at 3 - 5 leaf stage of maize and2- 5 leaf stage of weeds, and the reduction rates of amount and fresh weight of weeds were up to 83.6% - 94.3% and 92.7% - 99.2% at 180- 300 g/ha after 30 days treatment. Within the recommended period and dosages, application of the mixtures was safe for maize and could result in yield increasing by 0.6% - 6.4%, on the other side, the maize safe-ty

and weeds control would decrease when the mixtures applied over 7 leaf stage ofmaize and 5 leaf stage of weeds.

【题目】牛筋草种子休眠解除方法研究
【中文关键词】牛筋草;果皮;种子;萌发
【英文关键词】无
【中文摘要】研究了光照(12h光周期)和黑暗两种条件下摩擦脱果皮处理及不同药剂(NaOH、HCl、KNO,及GA,)浸泡处理对脱果皮和未脱果皮牛筋草种子萌发的影响。结果表明,牛筋草种子休眠主要是其果皮对种子的束缚引起的机械休眠,种子一经脱果皮,休眠基本解除,萌发率达61%以上。若用蒸馏水浸泡24 h,萌发率显著升高,达80%。种子的萌发不受光照条件的影响。NaOH、HCl、KNO,及GA,浸泡对未脱果皮的牛筋草种子萌发无任何促进作用。与对照相比,脱果皮的牛筋草种子经NaOH、HCl浸泡后萌发率急剧下降,而经KNO,和GA,浸泡24h后,在一定浓度范围内萌发率均有所提高。

【中文摘要】水稻播种面积,上海10.87万hm2、安徽253。33万hm2、浙江95.43万hm2、江苏220万hm2。稻谷单产,上海7 890 kg/hmz,安徽6 150 ke/hm2、浙江6 675 kg/hm2、江苏7 905 kg/hm2。水稻栽培方式主要为直播(手工撒播和机械直播)、移栽(手工插秧和机械插秧)和抛秧,其中直播稻占水稻播种面积的比例,上海84%、安徽13%、浙江37%、江苏33%。稻田主要杂草种群,上海有千金子、稗草、双穗雀稗、假稻、水莧菜等;安徽有千金子、稗草、鸭舌草、雨久花、异型莎草、扁秆藤草、节节菜,少量双穗雀稗、零星发生的有水竹叶、空心莲子草等;浙江海盐有稗草、千金子、水莎草、矮慈姑、节节菜、水蓼、假稻、双穗雀稗、水竹叶等,浙江温州有稗草、鸭舌草、空心莲子草、双穗雀稗和李氏禾等;江苏有稗草、稻稗、千金子、杂草稻、鸭舌草、陌上菜、水莎草、扁秆藤草等。杂草防控技术,秧田主要使用丙草胺(含安全剂)、优克稗·苄嘧磺隆、二氯喹啉酸、禾大壮等防除以稗草为主的一年生杂草。直播稻田采用“一封、二杀、三补”的防除策略,主要使用除草剂复配剂或现混现用。使用千金(氰氟草酯)防除千金子。使用稻杰(五氟磺草胺)防除对二氯喹啉酸已经产生抗性的稗草生物型。目前,存在和必须重视的问题是局部地区杂草稻严重发生、出现除草剂残留对作物的药害、杂草对除草剂的抗药性生物型明显增加。

【题目】野燕麦防除对冬小麦田间光照、养分和水分的影响
【中文关键词】尖;野燕麦;冬小麦;透光率;养分;水分
【英文关键词】无
【中文摘要】摘要选用15%顶尖可湿性粉剂(wettable powder,WP)对冬小麦田间的杂草野燕麦进行防除,测定田间离地不同高度层的透光率和野燕麦对养分、水分的消耗,观察野燕麦防除后对冬小麦田间光照、养分和产量的影响。结果表明:15%顶尖WP能有效控制冬小麦田间野燕麦的发生,对野燕麦的密度防效和鲜重防效分别为97.27%~100.00%和98.86%~100.00%;野燕麦防除后能显著提高冬小麦田间的透光率,改善小麦顶层的光照,同时降低杂草对田间养分和水分的吸收,促进光合作用的进行,从而显著提高冬小麦的产量。

【题目】外源酚酸类物质对一个长雄蕊野生稻材料S37化感效应的调控作用
【中文关键词】黑龙江;吉林;辽宁;水稻;杂草;防除
【英文关键词】无
【中文摘要】黑龙江省、吉林省和辽宁省2007年水稻播种面积分别为225.32万hm2、67万hm2和66.06万hm2,稻谷产量分别为6 300 kg/hm2、7 470 ke/hm2和7 650 kg/hm2。水稻主要栽培方式为旱育秧机械插秧和手工插秧。黑龙江、吉林和辽宁省2008年机械插秧面积分别为30.7万hm2、6万hm2和6.67万hm2。黑龙江省稻田主要杂草有稻稗、稗草、千金子、李氏禾、水莎草、扁秆蔗草、雨久花、泽泻、野慈姑、葡茎剪股颖、疣草、狼巴草、杂草稻等;吉林省稻田主要杂草有稗草、鸭舌草、眼子菜、雨久花、牛毛毡、野慈姑、扁秆蔗草、萤蔺、异型莎草、狼巴草、泽泻、李氏禾、千金子等;辽宁省稻田主要杂草有稗草、藤草、萤蔺、雨久花、扁秆蔗草、鸭舌草、野慈姑、牛毛毡、匐茎剪股颖、眼子菜、陌上菜、疣草、荇菜、苦草、水绵等。杂草防控技术主要是在旱育秧田使用丁草胺·扑草净、丁草胺·嗯草灵或杀草丹等;移栽田使用杀稗剂[如禾大壮、丁草胺、丙草胺(含安全剂)、苯噻酰草胺、二氯喹啉酸、稻思达、嗯草灵、莎稗灵]与磺酰脲类除草剂或苯达松和2甲4氯等的复配剂,也有现混现用防除一年生和部分多年生杂草,用千金(氰氟草酯)防除千金子,用稻杰(五氟磺草胺)防除抗药性稗草。存在的主要问题是气象灾害如干旱、全球气候变暖等逐年加重、杂草对杀稗剂和磺酰脲类除草剂的抗药性生物型增加、杂草稻在黑龙江和辽宁省的局部地区严重发生。

【题目】外来入侵杂草假高粱的化感潜力
【中文关键词】假高粱;化感作用;外来入侵种
【英文关键词】Sorghum halepense (L.) Pers;Allelopathic
【中文摘要】利用种子萌发和幼苗生长的生测方法研究了假高粱(Sorghum halepense (L.) Pers.)对3种农作物小麦、玉米和棉花的化感潜力,并进行化感作用的评价。结果表明:假高粱能够抑制作物种子萌发和幼苗生长,其化感作用强度随浓度升高而增强,随时间而降低;其中对小麦种子萌发率在第3天时0.1 g·ml-1浓度下抑制强度达40.4%,第20天时相同浓度下已经丧失化感活性;第3天和第10天时对作物幼苗生长有抑制作用,第20天时对3种作物幼苗生长均无影响;假高粱的化感潜力可能是其成功入侵的原因之一。
【英文摘要】The allelopathic potential of invasive alien weed Sorghum halepense(L.) Pers. (Johnsongrass) to wheat, maize and cotton was investigated by the laboratory tests of seed germination and seedling growth. The results demonstrated that S. halepense could inhibit the seed germination and seedling growth of the three crops. The allelopathic potential of S. halepense increased with its concentration, but decreased with time. At 0.1 g·ml-1 of S. halepense, the seed germination rate of wheat was decreased from 40 4% on the 3rd day to zero on the 20th day, and the seedling growth of the three crops was inhibited on the 3rd or 10th day but not affected on the 20th day. The allelopathic potential of S. halepense could be one of the reasons of its successful invasion.

【题目】南京地区稻田土壤杂草种子库的数量特征及演替规律
【中文关键词】稻田;杂草;种了库;数量特征;演替规律
【英文关键词】paddy field;weed;seedhank;quantitative characteristic;succession regularity
【中文摘要】通过对南京地区稻田土壤杂草种于库4年的调查,试图探明该地区稻田土壤杂草种子库中杂草种子的种类、数量、垂直分布情况及这些数量特征逐年演替的动态规律。研究表明:在一个内外环境相对稳定的开放稻田系统中,土壤杂草种子库的种子种类约为10种左右,并有逐年减少的趋势;种子库数量1 m2耕层(20 cln)约为(104~105)粒,并有逐年增加的趋势;杂草种子的分布主要以0~10 ca的浅土层为主,并有逐年向浅土层集中的趋势。着重讨论了稻田5种优势杂草种了数量及比例变化的原因,提出了相应的控草策略和措施。

【题目】莲子草假隔链格孢菌粗毒素生物活性研究
【中文关键词】莲子草假隔链格孢菌; 粗毒素; 生物活性
【英文关键词】无
【中文摘要】利用种子生测法, 研究了莲子草假隔链格菌 (N im bya alter m antherae)粗毒素对农田 12种杂草的生物活性及6种作物的安全性。结果表明,该粗毒素对 12种田间常见杂草种子萌发及根长、 芽长均有抑制作用,且随粗毒素溶液浓度的提高抑制作用相应增强。在浓度为 50 g /m l时,粗毒素对光头稗 (Echinochloa colonum)、 荠菜(Ca p sella bursa- pastoris)、升马唐 (D i g itar ia cili aris)的萌发表现出一定的抑制作用, 在粗毒素浓度为 400 g /m l时,对荠菜, 千金子 (Lep tochloa c h i nensis)的萌发具有强烈的抑制作用, 萌发率为 0 。在粗毒素浓度为 50 g /m l时,对鳢肠 (Ecliptaprostrata)、 光头稗 Echinochloa colonum)、 升马唐 (Digitaria ciliaris)、 菵草(Beckmannia syzigachne)、看麦娘 (Alopecurus aequalis)等杂草的根长、 芽长也表现出一定的抑制作用。粗毒素对不同作物萌发的影响也有差异,对花生 (Arach is hyp ogaea)、 大豆 (G lycine max)的萌发及根长的生长无抑制作用, 其中对花生的根长还有一定的促进作用。粗毒素浓度小于或等于 400 g /m l时,对油菜 (Brassia campestris)的萌发及根长、 芽长的生长无抑制作用。粗毒素对小麦 (Triticum aesti vum)不安全。

【题目】PPM法确定异丙隆对几种冬小麦田主要杂草的最低致死剂量
【中文关键词】最低致死剂量;植物光合作用测定仪;异丙隆;杂草防治;小麦安全性
【英文关键词】MLHD;Plant photosythesis meter;Isoproturon;Weed control;Wheat safety
【中文摘要】于2005—2006年,在河北省农林科学院粮油作物研究所温室内,用植物光合作用测定法研究了光合作用抑制型除草剂异丙隆防除冬小麦田5种主要杂草的最低致死剂量。试验结果表明,在用药6 d后杂草才表现出明显的药害症状,新叶黄化,生长受抑制;而杂草的光合作用在施药后2 d就明显地受到抑制,药剂处理的杂草叶片的PPM值显著下降,随着用药剂量的增加,杂草的PPM值显著下降。通过测定和统计杂草的鲜质量防效,可以发现,供试的5种杂草对异丙隆的敏感性存在显著差异,播娘蒿(Descuraiaia sophia)、藜(Chenopodiam album)对药剂最敏感,ED90值分别为301.51,286.02 ga.i./hm2;看麦娘较敏感,ED90值为654.83 ga.i./h1112;而荠菜、雀麦不敏感。经回归分析发现,施药后2,4 d杂草的PPM值与用药后14 d的杂草鲜质量防效密切相关,其R2分别为0.968 8,0.942 5。这表明用药后早期的PPM值可以较好地预测除草剂对杂草防效和对冬小麦的安全性。当杂草的PPM值低于20时,异丙隆对杂草的鲜质量防效高于90%;而当PPM值高于40时,药剂对杂草的鲜质量防效低于50%;当小麦的PPM值高于60时,异丙隆对小麦的株高、地上部鲜质量基本无影响。当杂草的PPM值低于20,而冬小麦的PPM值高于60时,异丙隆的剂量即为最低致死剂量。

【中文摘要】农田草害一直是影响江苏省小麦产量的重要因素,虽然杂草综合治理已经取得了长足进步,但近年来麦田杂草发生数量及草相都发生了一定变化。此外,杂草抗药性、除草剂药害等问题较为严重。本文对此进行了概述,并提出应进一步加强杂草生物学生态学应用基础、杂草抗药性监测、分子生物学应用等方面的研究,实施以化学防除为主,结合农业、生态防除等措施的综合治理策略。

【题目】新型植物生长调节剂全抗1号对部分除草剂药害的恢复作用研究
【中文关键词】全抗l号;生长;恢复;除草剂;药害
【英文关键词】除草剂
【中文摘要】全抗1号是一种新型植物生长调节荆。它能通过诱导植物体内一氧化氮释放以提高作物抵抗不良环境侵扰的能力,并可有效预防多种病害的发生。当植物遭受到药害时,其外部形态特征将由于体内代谢活动发生而在外观上显著异于正常状态。本文以一定时期对作物生长状况的观察和表观数据的测定为依据,判断施用全抗l号后受除草荆药害(包括当茬与后茬药害)作物的恢复情况,并以此探究金抗l号的部分生物活性。

【题目】抗苄嘧磺隆雨久花的田间鉴定与替代药剂的筛选
【中文关键词】抗性;雨久花;苄嘧磺隆
【英文关键词】无
【中文摘要】对稻田雨久花进行高剂量苄嘧磺隆茎叶喷雾,以甄别其是否已对该药剂产生抗性,同时用五氟磺草胺、苯达松、2甲4氯钠对雨久花进行防除。结果表明,雨久花喷施苄嘧磺隆后生长良好,与未施药区无差异,说明雨久花对苄嘧磺隆已产生明显抗性。五氟磺草胺、苯达松、2甲4氯钠对抗性雨久花均有较好的防除效果。由于五氟磺草胺的靶标酶与苄嘧磺隆相同,都是乙酰乳酸合成酶,说明雨久花对五氟磺草胺未产生交互抗性。

【题目】黄顶菊水提取液对植物种子发芽及胚根伸长的化感作用研究
【中文关键词】黄顶菊;化感作用;种子;发芽;胚根
【英文关键词】无
【中文摘要】采用培养皿滤纸法研究黄顶菊水提取液对30种受体植物种子发芽及胚根伸长的化感作用。结果表明,浓度为0.1 g(干重)/ml的成熟黄顶菊植株水提取液对供试的29种植物种子发芽和28种植物胚根伸长有不同程度抑制作用,对2种植物胚根伸长有促进作用。该浓度下,有24种植物的发芽率或胚根长降低50%以上,占供试植物种数的80%。提取液浓度越高对受体植物发芽和胚根伸长的抑制作用越强。黄顶菊不同生育时期和不同器官提取液对受体植物种子发芽及胚根伸长的抑制程度有差异,表现为成熟期植株>营养生长期植株;叶片>花(果实)>茎>根。揭示黄顶菊可能通过产生化感物质抑制周围生境中植物的萌发和早期生长,从而降低这些植物在群落中的多度。一旦黄顶菊大面积、高密度发生,就有可能导致入侵地植物多样性的降低。

【题目】不同环境因子对江苏省杂草稻与常规栽培稻发芽势影响的比较
【中文关键词】杂草稻;发芽势;温度;pH值;水势;盐胁迫
【英文关键词】无
【中文摘要】为了搞清楚杂草稻与常规栽培稻萌发特性的差异,采用培养皿水培法,进行了温度、pH值、水势及NaCl胁迫对杂草稻与常规栽培稻发芽势影响的比较研究。结果为:15 qC和20 cc条件下,杂草稻均具有强于常规栽培稻的发芽势。在pH值为6和8条件下,杂草稻的发芽势也强于常规栽培稻。同样在水势为一0.3 MPa和180 mmol/L NaCl浓度条件下,杂草稻的发芽势也强于常规栽培稻。说明杂草稻萌发过程的抗逆性强于常规栽培稻,具有较强的环境适应能力,能更有效地竞争环境资源。

【题目】江苏中部轻型栽培稻田杂草群落特征及草害综合评价
【中文关键词】杂草群落;稻田;轻型栽培;主成分分析
【英文关键词】无
【中文摘要】利用七级目测法结合定量分析和综合评价对江苏中部的扬州、泰州和南通3个地区6种不同栽培模式稻田的杂草群落进行了调查研究.以期揭示经多年轻型栽培的稻田杂草群落结构及杂草危害特点。在轻犁栽培稻田中共发现杂草36种。隶属于18个科33个属。其中.杂草种类较多的科依次为禾本科、莎草科、菊科、玄参科、泽泻科、千屈菜科等。在

3个地区皆表现出较高的优势度和发乍频率的杂草有4种:稗、水苋菜、鳢肠和下金子,其发生频率都达到或接近100%。然而地区间草害水平存在差异,扬州地区的杂草危害最重.泰州地区次之,南通地区相对最轻。不同的稻作模式皆对应着不同的优势杂草。机插秧模式中优势度值与发生频率皆较高的杂草为鸭舌草、水苋菜;麦套稻模式中。主要的优势杂草包括水苋菜、马唐、鸭舌草,半边莲等;抛秧稻田中为稗、鸭舌草、水苋菜等;水直播稻作模式下是稗、水苋菜、鸭舌草等;旱直播模式中为稗、水苋菜、干金子等。与传统的手工插秧相比.轻型栽培稻作模式下的杂草群落中.不仅物种丰富度高,而且优势度也高。6种稻作模式杂草危害程度由低到商的顺序为:传统手工插秧<机插秧<抛秧<水直播<旱直播<麦套稻。

【题目】长期不同施肥方式对稻油轮作制水稻田杂草群落的影响
【中文关键词】长期施肥;杂草物种多样性;杂草群落; 水稻-油菜轮作制
【英文关键词】long - term fertilization ; weed species diversity ; weed community ; rice -oilseed rape croppi ng syste m
【中文摘要】为揭示长期不同施肥方式下农田生态系统中杂草群落的变化规律, 于 2006年 10月在太湖地区一个长期肥料试验定位监测田, 运用群落生态学方法研究了 7种长期不同施肥处理持续 20a后对水稻-油菜轮作制水稻田杂草群落的影响。试验区共记录到杂草 11种,隶属于 6个科。其中,节节菜 (Ro t ala indica)、 陌上菜 (L i ndernia p roc umbens)、 鸭舌草 (Monochoria vaginalis)、 异型莎草 (Cyperus d i ffor m is)等 4种杂草在所有施肥处理区发生密度较大。莎草科杂草牛毛毡 (E leochar is y oko s censis)只在不施肥区和纯氮肥区出现, 而球穗扁莎 (Pycreus globosus)和萤蔺 (Scirp us juncoi d es)仅在不施肥区出现。长期不同施肥措施下, 田间杂草群落的物种多样性有明显差异:全年秸秆区的物种丰富度 (7 . 3种)最小,不施肥区 (10 . 7种)最大; 不施肥区、 常规区、 秋季秸秆区 Shannon -W iener指数显著大于其他处理区; 不施肥区和常规区 S i mpson指数显著小于其他处理区; 不施肥区和纯氮肥区Pielou均匀度指数显著小于其他处理区。田间杂草群落的优势种组成也发生了一定变化, W hittaker指数表明, 与不施肥处理相比, 单施化肥、 化肥配施猪粪对杂草群落结构及物种组成的影响最显著,化肥配施油菜秸秆和化肥配施油菜水稻秸秆次之, 而纯施氮肥和化肥配施水稻秸秆的影响较小。S rensen群落相似性指数及聚类分析结果也得到相似的结论。结果表明, 单施化肥 (平衡施用 N、 P、 K肥)、 化肥配施猪粪、 化肥配

施夏季、 秋季和全年秸秆处理均能显著改变田间杂草群落的组成,改变某些杂草在群落中的优势地位,从而抑制其发生危害程度。

【题目】杂草种子传播研究进展
【中文关键词】种子传播循环 杂草种子传播 传播因子 传播机制 研究方法
【英文关键词】seed dispersal cycle weed seed dispersal disperser dispersal mechanism technique
【中文摘要】种子传播将母株生殖周期的末端与它们后代种群的建立连结了起来,广泛认为,其对植被结构具有深刻的影响。种子传播的整个过程称为种子传播循环。研究表明,杂草种子传播的因子多种多样,包括仅依赖自身来完成的主动传播,以及依赖风、水、动物、人类等外界媒介的被动传播。其中,人类传播杂草种子是影响最广泛的一种,对现代植物的分布格局产生了深刻的影响。杂草种子的传播,对杂草种子库的数量和空间动态影响很大。研究种子传播的主要方法有荧光染料标记法、放射性同位素标记法、稳定同位素分析、分子遗传标记等。结合近几年国内外的研究进展,作者就杂草种子传播对种子库数量和空间动态影响的精确直接研究、杂草种子传播的过程及传播后的命运、杂草种子适应传播的机理、生态控草措施研究、外来杂草入侵蔓延与其种子传播的关系等方面提出了展望。

【题目】利用有效积温建立夏玉米追肥时期决策模型
【中文关键词】有效积温 夏玉米 追肥时期 模型
【英文关键词】Effective accumulated temperature, Summer maize, Dressing time, Model
【中文摘要】精准决策作物追肥时期是提高肥料利用效率、增加作物产量的重要技术措施。通过田间连续观测作物的发育进程预判追肥时期不仅费时费力,并且确定的追肥时期是否合理与经验存在较大关系。夏玉米生长发育及养分累积进程与积温、光照、降雨等气象因子存在密切的关系,本文以有效积温因子为例,建立区域内基于有效积温的夏玉米养分累积Logistic模型,根据模型特点确立夏玉米养分累积的始盛期、高峰期和盛末期,从而确定最佳追肥时期决策点,旨在为追肥时期的精准确定提供新思路、新方法。根据田间试验及养分测试结果对模型进行检验,显示出利用有效积温的养分累积模型效果优于传统的基于生长天数养分累积模型效果,进一步验证了该模型的创新性及实用性。由于不同区域、不同作物品种差异,试验区域模型并不具有广泛的适应性。为此,对养分累积Logistic模型参数赋予现实意义,结合田间耕作实际,建立追肥时期决策的普适模型,对模型检验表明,普适模型能够较好的预判最佳施肥时期,具有较强的应用价值。
【英文摘要】The sound judgment of dressing time on crops is an important technical measure which can improve utilization rate of fertilizers and increase crop yield. The traditional method of estimating dressing time was continuous taking stock of the crop growth process. But the traditional method was inaccurate and it was bind by the experience of observer. Due to the growth and nutrient accumulated process of summer maize have a close relationship with accumulated temperature, light intensity, rainfall and other meteorological factors, so building a meteorological model could be an effective method to precisely define dressing time of different crop. To study the response of crop growth and development process to temperature, light and others meteorological factors, the monitoring of temperature, light and other meteorological factors and field trials are disposed. In this paper, effective accumulated

temperature affecting crop growth and development process is as an entry point, a meteorological model based on effective accumulated temperature is set up and the model described the relation between the nutrient accumulated of summer maize and effective accumulated temperature. The model is a logistic model. By analyzing the characteristic of the logistic model, three key points of dressing time on summer maize are defined.According to field experiments and determination analysis, the law of nutrient accumulation of summer maize was imitated. By comparing the different models, the model based on effective accumulated temperature is better than the model based on growth days. By further validation of the model, the model is innovative and practical. Because different regions, different crop varieties differ, the model which established by actual test date does not have a wide range of adaptability. Therefore, the model which can fit universal regions and crop varieties was tried to establish and through the testing on the model, the model which can fit universal regions and crop varieties was better able to predict the best dressing time. The study result can provide scientific basis for rational fertilizer application and has the far-reaching significance to improve the utilization rate of fertilizer.

【题目】ISSR 标记对34 份樱桃种质资源的遗传分析
【中文关键词】樱桃; ISSR; 遗传多样性; 聚类分析
【英文关键词】cherry, ISSR, genetic diversity, cluster analysis
【中文摘要】利用ISSR 标记对34 份樱桃种质资源进行遗传多样性检测。结果发现, ISSR 标记能够揭示材料间较高的遗传多样性。每个引物可获得6 ~12 条DNA 片段, 平均为8.76 条; 17 个ISSR 引物共扩增出149 条DNA 片段, 其中143 条具有多态性, 多态性比率(PPB) 为95.97% ; 平均多态信息量(PIC) 为0.90 ;每个位点有效等位基因数(Ne) 为1.914 ; 材料间遗传相似系数GS 变幅为0.44 ~0.91 , 平均达0.73 。通过聚类, 从分子水平对樱桃种质资源的遗传关系进行分析, 并对34 份资源进行分类, ISSR 标记能将34 份樱桃种质完全区分开, 为樱桃种质资源的研究利用提供参考。
【英文摘要】The genetic diversity and genetic relationships among 34 cherry accessions, including 3 interspecificprogenies, 1 Prunus pseudocerasus, and 30 Prunus avium, were evaluated by ISSR markers. In ISSRanalysis, a total of 149 bands were detected, among which 143 bands were polymorphic. The number ofbands from each ISSR marker ranged from 6 to 12, with an average of 8.76. The PPB, PIC and Ne were95.97%, 0.90 and 1.914, respectively. The ISSR- derived genetic similarity (ISSR- GS) ranged from 0.44 to0.91, with a mean of 0.73. The cluster analysis indicated that all the 34 sweet cherry germplasm could bedistinguished by ISSR markers. The genetic relationship cherry accessions were analyzed and 34 germplasmwere classified on molecular level by clustered analysis, which provided reference for research in cherrygermplasm.

【中文关键词】沙质潮土;夏玉米;“ 3414 ”肥效试验;
【英文关键词】sandy Fluvo-aquic soils, summer maize, 3414 experiment design
【中文摘要】在沙质潮土条件下,采用“ 3414 ”肥效试验设计,通过不同方法对玉米产量结果与肥料的施用量回归拟合,建立不同施肥因子组合的施肥效应模型。单因子效应分析表明,氮、磷、钾肥料增产效果表现为氮>磷>钾,夏玉米对钾肥的忍耐度低于磷和氮,表现为过高施用会引起产量的快速降低。三种肥料因子间都存在正向的交互作用,交互作用的大小、程度在不同的模型上有着不同的特点。通过对模型的寻优分析,确定沙质潮土夏玉米N、P2O5、K2O最高产量施用量分别为164kg/hm2、93kg/hm2、57kg/hm2,投入比例为1:0.6:0.4。N、P2O5、K2O最佳经济施用量分别为96kg/hm2、78kg/hm2、38kg/hm2,投入比例为1:0.8:0.4。

【英文摘要】It was studied the response on yield of summer maize on fertilizers by “ 3414 ” experiment design in sandy Fluvo-aquic.The fertilizer response models were set up on different nutrient factors. Monofactorial variance analysis indicated that the nutrient response of summer maize was N>P>K.The tolerance of summer maize to high K application was lower than those of high N and P application, which showed the yield decreased dramatically with high K application. The three nutrient factors had positive interactions which had different characteristic on different fertilization models. The fertilizer recommendation for the maize was N 164, P2O5 93 and K2O 57 kg/km2 on MY and N 96, P2O5 78 and K2O 38 kg/km2 on MEY.

【题目】华北北部沙质潮土区冬小麦需肥特征及施肥技术
【中文关键词】华北北部;沙质潮土;冬小麦;需肥特征;施肥技术
【英文关键词】The north of north China; Sandy Fluvo-aquic Soils; Winter wheat; Fertilizer requirement Character; Fertilization technology
【中文摘要】华北北部沙质潮土区冬小麦产量较低,为摸清区域内冬小麦养分吸收规律,提高施肥效率,通过田间试验研究了区域内冬小麦养分吸收动态及不同肥料因子对产量的影响,结果表明:该区域冬小麦养分吸收速率最快时期出现在拔节期至抽穗期,生育后期的养分吸收比例相对较低;氮磷钾配合施用不仅可以提高冬小麦的养分吸收量,还可以促进养分向籽粒中运转;增加冬小麦有效穗数及调节产量构成因素间的平衡关系,是提高产量的有效田间管理措施;控制养分投入数量,调整养分投入比例,保持养分持续供应强度,增强土壤对养分投入的缓冲能力是提高产量的有效施肥技术。
【英文摘要】he yield of winter wheat was lower on sandy Fluvo-aquic in the north of north China. An experiment was set up to study the fertilizer requirement character and fertilization technology of winter wheat in this area. The results indicated the peak of nutrient absorption velocity was showed between jointing stage with heading stage. The nutrient absorption proportion in later development period was lower than others reports. Balanced fertilization was the key factor which influenced the amount of nutrient absorption. Increased effective panicles and regulated mutual relation of yield component factors were effective measures to increase yield. The main fertilization measures in this area included which controlled the amount of nutrient input, which adjusted the proportion among N,P with K, which ensured the standing supply of nutrient, and which improved the capacity of buffering in soil to nutrient input.

【题目】华北小麦-玉米轮作区缓控释肥应用效果分析
【中文关键词】中低产田;小麦玉米轮作;缓控释肥;硝态氮;产量
【英文关键词】medium-low yield field; wheat-maize rotation; slow/controlled release fertilizer; nitrate nitrogen; yield
【中文摘要】田间试验以常规施肥为对照,分析了华北平原北部小麦-玉米轮作区缓控释肥不同配比和用量土壤硝态氮含量和产量性状的变化。结果表明,常规用量分次施肥(100%UD)处理,土壤中NO-3-N含量在小麦生育后期仍然维持较高的水平,并且穗数、千粒重以及产量相对较高;缓控释肥处理土壤中硝态氮(NO-3-N)含量与100%UD相比处于较低的水平,但产量无显著差异。玉米生长季缓控释肥表现出了明显优势,肥料利用率提高,玉米穗秃尖长度减小;其中减少20%用量的缓控释肥处理(80% SCR)产量显著高于常规施肥处理,增产达到18・3%。缓控释肥缓慢释放的特性有利于被作物及时充分吸收,减少了在土壤中因淋失而造成浪费的机会,从而使得肥料利用率提高。从小麦、玉米两季的变化情况来看,还需要进一步优化肥料在不同生长季之间的配置,使缓控释肥料发挥其最大潜力,实现小麦玉米产量双高产和经济效益、环境效益同

步提高。
【英文摘要】In contrast to traditional fertilizing, nitrate nitrogen content in soil and yield factors ofwheat-maize applied slow/controlled release fertilizerwith differentamounts and rates inNorthChinawas analyzed. The results indicated thatnitrate nitrogen contentstillmaintain high levelduring late growing period, and the yield traits such as panicle number, 1000 grainweightaswell as actualyield keep high level if fertilized according to recommendationat the ratio of6∶4∶2 atpre-sowing, reviving and jointing respectively (the treatmentnamed as100%UD). The for mulated slow/controlled release fertilizer(CSR) showed lowernitrate nitrogen content in soi,l buthad no influence on yields comparedwith 100%UD. CSR showed a positive impact on maize production, e. g. increased fertilizer use efficiency, decreased bare top length. The yield of 80% SCR is 18 · 3% higher than that of 100%UD. Crop could absorb nutrient timely and fullywith the application ofSCR because the nutrient is released slowly and avoided of the loss risk by leaching. On thewhole, furtherstudy on how to optimize SCR fertilization distribution during thewheat andmaize growing seasonwas needed for the purpose of increasing economic and environmentalbenefits simultaneously.

【题目】东北平原不同类型土壤有机质含量高光谱反演模型同质性研究
【中文关键词】光谱,土壤类型,有机质,模型
【英文关键词】Spectrum, soil type, organic matter, the model
【中文摘要】土壤有机质含量是反映土壤肥力的重要特征, 利用高光谱技术对耕层有机质含量进行定量化反演为土壤信息化管理和精准施肥提供了重要的依据。本文利用口高光谱仪在室内条件下测定了风干土壤样品的可见一近红外光谱, 分析了东北平原不同土壤类型土壤光谱反射率曲线形状变化及土壤有机质含量的光谱反演模型。结果表明, 根据土壤光谱反射率曲线变化特点可以将东北平原的几种土壤类型划分为三类, 其主要区别在于一波段反射率上升快慢即该波段范围曲线斜率的差异根据土壤有机质敏感波段建立了不同土壤类型的有机质含量回归预测模型, 并且对不同模型的回归系数和截距进行了方差同质性检验。结果表明黑土和黑钙土、黑土和暗棕壤的模型没有显著差异, 即可以分别构建同质性模型来简化有机质的预测, 但是预测精度略有降低。
【英文摘要】Soil organic matter content is an important feature to reflect soil fertility, topsoil organic matter content using hyperspectral technology quantitative inversion provides an important basis for soil management and precision fertilizer. In this paper, the port high spectrometer seen a near-infrared spectrum of air-dried soil samples measured under laboratory conditions, spectral inversion model of the northeast plains of different soil types, soil spectral reflectance curve shape change and soil organic matter content. The results show that the northeast plains of several soil types according to the characteristics of soil spectral reflectance curve can be divided into three categories, the main difference is that a band reflectivity increased speed differences in the band range the slope of the curve established according to the sensitive band of soil organic matter different types of soil organic matter content of regression prediction model, and different models of regression coefficients and intercept variance homogeneity test. The results show that the black soil and chernozem Black and dark brown soil model does not have significant ifferences, that can build the homogeneous model to simplify the prediction of organic matter, but the prediction accuracy is slightly lower.

【题目】养分平衡法在冬小麦测土推荐施肥中的应用研究
【中文关键词】养分平衡,目标产量,土壤有效养分校正系数,肥料利用率,推荐施肥
【英文关键词】Nutrient balance, the target yield, soil available nutrients correction factor, fertilizer utilization, recommended fertilization
【中文摘要】针对我国冬小麦主产区的主要土壤类型之一潮土,通过对大量小麦肥效试验结果的分析,分别计算出小麦单位产量养分吸收量、土壤有效养分校正系数、肥料当季利用率等施肥参数。并基于养分平衡法的优点,主要研究了土壤环境凶素和产量水平因素等对土壤有效养分校正系数和肥料利用率的影响及变化规律。结果表明,土壤有效养分含量与土壤有效养分校上E系数及肥料当季利用率呈极显著曲线负相关关系。在此基础I二,建它了以养分平衡原理为依据、土壤有效养分的测定为基础的我国潮土冬小麦测土推荐施肥指标体系,以简捷、快速、科学合理地指导我国小麦的施肥与生产。
【英文摘要】The influx of soil for one of the main soil types of the main winter wheat producing areas in China, through the analysis of the efficiency test results in a lot of wheat, respectively, to calculate the output of wheat per unit nutrient uptake, soil available nutrients correction factor, utilization of fertilizer season fertilization parameters. And based on the nutrient balance method has the advantage, the soil environment fierce elements and output level factors, such as the impact of the correction factor on soil available nutrients and fertilizer utilization and changes in the law. The results show that the E coefficient of utilization of fertilizer season was very significant curve a negative correlation between soil available nutrients and soil available nutrient school. On this basis, two to build it based on the principle of nutrient balance, determination of soil available nutrients for the basis of tide soil of winter wheat soil testing and fertilizer recommendation system is simple, fast, scientific and rational way to guide fertilization and production of wheat in China .

【题目】Factors Affecting Buffalobur (Solanum rostratum) Seed Germination and
【中文关键词】无
【英文关键词】Temperature, light, pH, osmotic potential, salt stress, burial depth.
【中文摘要】无
【英文摘要】Buffalobur is a noxious and invasive weed species native to North America. The influence of environmental factors on seed germination and seedling emergence of buffalobur were evaluated in laboratory and greenhouse experiments. The germination of buffalobur seeds occurred at temperatures ranging from 12.5 to 45 C, with optimum germination attained between 25 and 35 C. Buffalobur seeds germinated equally well under both a 14-h photoperiod and continuous darkness; however, prolonged light exposure ($ 16 h) significantly inhibited the seed germination. Buffalobur seed is rather tolerant to low water potential and high salt stress, as germination was 28 and 52% at osmotic potentials of 21.1 MPa and salinity level of 160 mM, respectively. Medium pH has no significant effect on seed germination; germination was greater than 95% over a broad pH range from 3 to 10. Seedling emergence was higher (85%) for seeds buried at a soil depth of 2 cm than for those placed on the soil surface (32%), but no seedlings emerged when burial depth reached 8 cm. Knowledge of germination biology of buffalobur obtained in this study will be useful in predicting the potential distribution area and developing effective management strategies for this species.

【题目】Confirmation of Flixweed (Descurainia sophia) Resistance to Tribenuron
【中文关键词】无
【英文关键词】ALS inhibitor, ALS gene, tribenuron resistance, herbicide resistance, weed resistance.
【中文摘要】无
【英文摘要】Reports arose from major Chinese wheat production regions that flixweed was not controlled by tribenuron after the herbicide was continuously used for several years. Flixweed seeds were collected from wheat fields that had been treated with tribenuron repeatedly over 3 to 15 yr or from road sides and remote hills that had never received tribenuron in Jiangsu, Hebei, Shanxi, Sichuan, Shandong, Shaanxi, and Henan provinces, and Tianjin and Beijing metropolises in China. The response of various biotypes to tribenuron was determined by whole plant experiments in the greenhouse. The experiments demonstrated that 11 of 32 flixweed biotypes were susceptible to tribenuron. The remaining 21 biotypes expressed moderate to high levels of tribenuron resistance with resistance indices ranging from 4 to . 1,500. DNA sequence analysis of acetolactate synthase (ALS) genes of selected biotypes 6, 7, 27, and 29 revealed a point mutation at position 197 of the ALS gene, as numbered relative to the protein sequence of Arabidopsis, where proline was substituted by leucine in biotype 7 and by threonine in biotype 29. These mutations are known to confer resistance to ALS-inhibitingherbicides and are responsible for the high resistance of these biotypes to tribenuron. The results also indicate that tribenuron resistance in flixweed is widespread in China and management programs to control these resistant populations are warranted.

【题目】Isolation and Purification of Psoralen and Bergapten from Ficus carica L.Leaves by High-Speed Countercurrent Chromatography
【中文关键词】Bergapten, Ficus carica L leaves, High-speed countercurrent chromatography, Psoralen
【英文关键词】Bergapten, Ficus carica L leaves, High-speed countercurrent chromatography, Psoralen
【中文摘要】High-speed countercurrent chromatography (HSCCC) was successfully applied for the first time for the isolation and purification of psoralen and bergapten from the plant Ficus carica L leaves. The crude extract was obtained by extraction with light petroleum (b.p.: 60 ° C – 90 ° C) from the dried leaves of Ficus carica L. n-Hexane-ethyl cetate-methanol-water (1:1:1:1, v/v) was used as the two-phase solvent system. Each peak fraction was analyzed by high performance liquid chromatography (HPLC). The method yielded 4.4 mg of psoralen at 99.1% purity and 2.1 mg of bergapten at 98.2% purity from 400 mg of the crude extract in a single run. The structures of the two compounds were identified by 1H-NMR, 13C-NMR, and MS.

【题目】A xylanase with broad pH and temperature adaptability from Streptomyces megasporus DSM 41476, and its potential application in brewing industry
【中文关键词】Xylanase, Streptomyces megasporus, Yeast expression, Mashing
【英文关键词】Xylanase, Streptomyces megasporus, Yeast expression, Mashing
【中文摘要】A xylanase gene, xynAM6, was isolated from the genomic DNA library of Streptomyces megasporus DSM 41476 using colony PCR screening method. The 1440-bp full-length gene encodes a 479-amino acid peptide consisting of a putative signal peptide of 36 residues, a family 10 glycoside hydrolase domain and a family 2 carbohydrate-binding module. The mature peptide of xynAM6 was successfully expressed in Pichia pastoris GS115. The optimal pH and temperature were pH 5.5 and 70 ◦ C, respectively. The enzyme showed broad temperature adaptability (>60% of the maximum activity at 50 – 80 ◦ C), had good thermostability at 60 ◦ C and 70 ◦ C, remained stable at pH 4.0 – 11.0, and was resistant to most proteases. The Km and Vmax values for oat spelt xylan were 1.68mgml − 1 and 436.76 μ mol min − 1 mg − 1, respectively, and 2.33mgml − 1 and 406.93 μ mol min − 1 mg − 1 for birchwood xylan, respectively. The hydrolysis products of XYNAM6 were mainly xylose and xylobiose. Addition of XYNAM6 (80 U) to the brewery mash significantly reduced the filtration rate and viscosity by 36.33% and 35.51%, respectively. These favorable 2.33mgml − 1 and 406.93 μ mol min − 1 mg − 1 for birchwood xylan, respectively. The hydrolysis products of XYNAM6 were mainly xylose and xylobiose. Addition of XYNAM6 (80 U) to the brewery mash significantly reduced the filtration rate and viscosity by 36.33% and 35.51%, respectively. These favorable properties probably make XYNAM6 a good candidate for application in brewing industry.

【题目】A new xylanase from thermoacidophilic Alicyclobacillus sp. A4 with broad-range pH activity and pH stability
【中文关键词】Alicyclobacillus sp., pH adaptability, pH stability, Thermoacidophilic strain,Xylanase
【英文关键词】Alicyclobacillus sp., pH adaptability, pH stability, Thermoacidophilic strain,Xylanase
【中文摘要】We have identified a highly pH-adaptable and stable xylanase (XynA4) from the thermoacidophilic Alicyclobacillus sp. A4, a strain that was isolated from a hot spring in Yunnan Province, China. The gene (xynA4) that encodes this xylanase was cloned,

sequenced, and expressed in Escherichia coli. It encodes a 338-residue polypeptide with a calculated molecular mass of 42.5 kDa. The deduced amino acid sequence is most similar to (53% identity) an endo-1,4- β -xylanase from Geobacillus stearothermophilus that belongs to family 10 of the glycoside hydrolases. Purified recombinant XynA4 exhibited maximum activity at 55 ° C and pH 7.0, had broad pH adaptability (>40% activity at pH 3.8 – 9.4) and stability (retaining>80% activity after incubation at pH 2.6 – 12.0 for 1 h at 37 ° C), and was highly thermostable (retaining >90% activity after incubation at 60 ° C for 1 h at pH 7.0). These properties make XynA4 promising for application in the paper industry. This is the first report that describes cloning and expression of a xylanase gene from the genus Alicyclobacillus.

【题目】A new aminopeptidase from the keratin-degrading strain Streptomyces fradiae var. k11

【中文关键词】Aminopeptidase, Streptomyces fradiae var. k11, C-terminal propeptide

【英文关键词】Aminopeptidase, Streptomyces fradiae var. k11, C-terminal propeptide

【中文摘要】An aminopeptidase gene fragment was isolated from a keratin-degrading strain, Streptomyces fradiae var. k11, by PCR amplification using a degenerate primer set designed based on the partial amino acid sequence of the native enzyme. The gene, designated sfap, encoded a polypeptide of 461 amino acids comprised of three domains: a signal peptide, a mature region, and a C-terminal propeptide. The aminopeptidase, SFAP, had highest amino acid sequence identity (79%) with a putative aminopeptidase from Streptomyces griseus subsp. griseus NBRC 13350. The gene with and without C-terminal propeptide was successfully overexpressed in Escherichia coli BL21 (DE3), and the gene without C-terminal propeptide encoded a functional enzyme. Purified recombinant SFAP exhibited optimal activity at pH 8.0 and 60 ° C, and retained >60% peak activity over a broad range of temperature. The enzyme was thermal and pH stable, and showed metalloprotease characteristics, which was inhibited by EDTA but activated by Ca2+ and Co2+. This is the first study to report the gene cloning and expression of a leucine aminopeptidase from S. fradiae.

【英文摘要】An aminopeptidase gene fragment was isolated from a keratin-degrading strain, Streptomyces fradiae var. k11, by PCR amplification using a degenerate primer set designed based on the partial amino acid sequence of the native enzyme. The gene, designated sfap, encoded a polypeptide of 461 amino acids comprised of three domains: a signal peptide, a mature region, and a C-terminal propeptide. The aminopeptidase, SFAP, had highest amino acid sequence identity (79%) with a putative aminopeptidase from Streptomyces griseus subsp. griseus NBRC 13350. The gene with and without C-terminal propeptide was successfully overexpressed in Escherichia coli BL21 (DE3), and the gene without C-terminal propeptide encoded a functional enzyme. Purified recombinant SFAP exhibited optimal activity at pH 8.0 and 60 ° C, and retained >60% peak activity over a broad range of temperature. The enzyme was thermal and pH stable, and showed metalloprotease characteristics, which was inhibited by EDTA but activated by Ca2+ and Co2+. This is the first study to report the gene cloning and expression of a leucine aminopeptidase from S. fradiae.

【题目】Cloning of a new xylanase gene from Streptomyces sp. TN119 using a modified thermal asymmetric interlaced-PCR specific for GC-rich genes and biochemical characterization
【中文关键词】Xylanase, Batocera horsfieldi, Gut, Streptomyces sp., TN119, Thermal asymmetric interlaced (TAIL)-PCR, High-GC genes
【英文关键词】Xylanase, Batocera horsfieldi, Gut, Streptomyces sp., TN119, Thermal asymmetric interlaced (TAIL)-PCR, High-GC genes
【中文摘要】A bacterial strain, Streptomyces sp. TN119, was isolated from the gut of Batocera horsfieldi larvae and showed xylanolytic activity. A degenerate primer set was designed based on the base usage of G and C in Actinobacteria xylanase-coding sequences belonging to the glycosyl hydrolases family 10 (GH 10), and used to clone the partial xylanase gene from Streptomyces sp. TN119. A modified thermal asymmetric interlaced (TAIL)-PCR specific for high-GC genes, named GC TAIL-PCR, was developed to obtain the full-length xylanase gene (xynA119; 1089 bp). Rich in GC content (67.8%), xynA119 encodes a new GH 10 xylanase (XynA119), which shares highest identity (48.8%) with an endo-1,4- β -xylanase from Cellulosimicrobium sp. HY-12. Recombinant XynA119 was expressed in Escherichia coli BL21 (DE3) and purified to electrophoretic homogeneity. The enzyme showed maximal activity at pH 6.5 and 60 ° C, was stable at pH 4.0 to 10.0 and 50 ° C, was resistant to most chemicals (except for Cu2+, Mn2+, Ag+, Hg2+ and SDS) and trypsin, and produced simple products. The specific activity, Km, Vmax, and kcat using oat-spelt xylan as substrate were 57.9 U mg − 1, 1.0 mg ml − 1, 74.8 μ mol min − 1 mg − 1, and 49.2 s − 1, respectively

【题目】Characterization of a chromosomal segment showing xylanolytic activity from the symbiotic Sphingobacterium sp. TN19
【中文关键词】Batocera horsfieldi, Sphingobacterium sp. , TN19, Gut, Xylan and xylose metabolism
【英文关键词】Batocera horsfieldi, Sphingobacterium sp. , TN19, Gut, Xylan and xylose metabolism
【中文摘要】A 37.5-kb chromosomal segment with 41.5% G+C contentwas cloned using genome walking method from Sphingobacterium sp. TN19, a symbiotic strain isolated from the gut of Batocera horsfieldi (Coleoptera, Cerambycidae) larvae. Twenty-three complete and two partial open reading frames (ORFs) were found in this region, and shared highest identities of 31.6-80.0% (11 of them <60%) to known sequences from the sources shared the common feature-fluid with low dissolved oxygen levels. These ORFs were organized uniquely in chromosome compared to that from other bacteria, and putatively involved in xylan and xylose metabolism. To confirm their putative functions, one xylanase gene (xynB19) and one arabinosidase gene (gh43A19),were heteroexpressed in Escherichia coli BL21 (DE3), respectively, and both the recombinant enzymes showed significant enzymatic

activities. This result indicates that xylan degradation is a complex process involving various enzymes, and genome walking is an efficient method to obtain multiple genes.

【题目】A new xylanase from thermoalkaline Anoxybacillus sp. E2 with high activity and stability over a broad pH range

【中文关键词】Anoxybacillus sp. E2, Xylanase, pH stability , Thermostability

【英文关键词】Anoxybacillus sp. E2, Xylanase, pH stability , Thermostability

【中文摘要】A xylanase gene, xynE2, was cloned from thermoalkaline Anoxybacillus sp. E2 and was expressed in Escherichia coli BL21 (DE3). The gene consisted of 987 bp and encoded a 328-residue xylanase with a calculated molecular weight of 38.8 kDa. On the basis of amino acid sequence similarities, this enzyme was assigned as a member of glycoside hydrolase family 10. Purified recombinant XynE2 showed maximal activity at pH 7.8 and 65 ° C, and was thermostable at 60 ° C. The enzyme was highly active and stable over a broad pH range, showing more than 90% of maximal activity at pH 6.6 – pH 8.6 and retaining more than 80% of activity at pH 4.6 – pH 12.0, 37 ° C for 1 h, respectively. These favorable properties make XynE2 a good candidate in the pulp and paper industries. This is the first report on gene cloning, expression and characterization of a xylanase from the genus Anoxybacillus.

【题目】A xylanase with high pH stability from Streptomyces sp. S27 and its carbohydrate-binding module with/without linker region truncated versions

【中文关键词】Streptomyces sp. S27,Xylanase,Carbohydrate-binding module,Linker,Stability

【英文关键词】Streptomyces sp. S27,Xylanase,Carbohydrate-binding module,Linker,Stability
【中文摘要】A xylanase gene, xynAS27, was isolated from a genomic library of Streptomyces sp. S27. The full-length gene consists of 1,434 bp and encodes 477 amino acids, including a putative signal peptide of 41 residues at its N-terminus. The mature xylanase comprises two functional domains, a family 10 glycoside hydrolase, and a family 13 carbohydrate-binding module (CBM), which were joined by a short Gly/Pro-rich linker region. The intact, the CBM-truncated and the CBM-linker-truncated versions of the mature proteins were expressed in Escherichia coli BL21 (DE3), purified to electrophoretic homogeneity and subsequently characterized. XynAS27 showed high pH stability over the pH range 2.2 – 12.0. XynAS27 may be a compelling tool for the food industry because it generates xylobiose (85% w/w) as the main product of xylan hydrolysis. The truncated versions showed less pH and thermal stability, and less affinity and hydrolytic activity to insoluble substrate than the intact one. These results indicate that the CBM of XynAS27 plays a key role in the hydrolysis of insoluble substrate, and the CBM and linker region are also important for the enzyme stability, and the linker region contributes more.

【题目】Molecular and biochemical characterization of a novel xylanase from the symbiotic Sphingobacterium sp. TN19
【中文关键词】Batocera horsfieldi, Sphingobacterium sp.TN19, Xylanase, Gut
【英文关键词】Batocera horsfieldi, Sphingobacterium sp.TN19, Xylanase, Gut
【中文摘要】A xylanase-encoding gene, designated xynA19, was cloned from Sphingobacterium sp. TN19-a symbiotic bacterium isolated from the gut of Batocera horsfieldi larvae-and expressed in Escherichia coli BL21 (DE3). The full-length xynA19 (1,155 bp in length) encodes a 384-residue polypeptide (XynA19) containing a predicted signal peptide of 24 residues and a catalytic domain belonging to glycosyl hydrolase family 10 (GH 10). The deduced amino acid sequence of XynA19 is most similar (53.1% identity) to an endo-1,4- β -xylanase from Prevotella bryantii B14. Phylogenetic analysis of GH 10 Bacteroidia xylanases indicated that GH 10 xylanases from Sphingobacteria were separated into two clusters, and XynA19 is more closely related to the xylanases of Bacteroidia from gut or rumen than to those of Flavobacteria and Sphingobacteria from other sources. Recombinant XynA19 (r-XynA19) showed apparent optimal activity at pH 6.5 and 45 ° C. Compared with thermophilic and mesophilic counterparts, r-XynA19 was more active at low temperatures, retaining >65% of its maximum activity at 20 – 28 ° C and ~40% even at 10 ° C, and modeling indicated that XynA19 has fewer hydrogen bonds and salt bridges. These properties suggest that XynA19 has various potential applications, especially in aquaculture and the food industry.

【题目】Cloning, expression, and characterization of a new Streptomyces sp. S27 xylanase for which xylobiose is the main hydrolysis product

【中文关键词】Streptomyces sp. S27,Xylanase,Overexpression,Pichia pastoris,Xylobiose

【英文关键词】Streptomyces sp. S27,Xylanase,Overexpression,Pichia pastoris,Xylobiose

【中文摘要】A xylanase gene, xynBS27, was cloned from Streptomyces sp. S27 and consisted of 693 bp encoding a 230-residue protein, including a putative 41-residue signal peptide. Belonging to the glycoside hydrolase family 11, XynBS27 exhibits the maximum identity (75.9%) to the xylanase from Streptomyces sp. zxy19. Recombinant XynBS27 was overexpressed in Pichia pastoris, and the xylanase activity was 7624.0 U/ml after high-celldensity fermentation in 3.7-L fermenter. The purified recombinant XynBS27 had a high specific activity of 3272.0 U/mg. The optimum temperature and pH for XynBS27 activity was 65 ° C and pH 6.5, respectively. XynBS27 showed good pH stability and retained more than 80% of the maximum activity after incubation in buffers with pH ranging between 4.0 and 12.0 at 37 ° C for 1 h. The main hydrolysis product of xylan by XynBS27 was xylobiose (>75%), which was good for human health derived from its ability to modulate the intestinal function. The attractive biochemical characteristics of XynBS27 suggest that it may be a good candidate in a variety of industrial applications.

【题目】Cloning, expression and characterization of a new xylanase with broad temperature adaptability from Streptomyces sp. S9

【中文关键词】Streptomyces sp. S9,Turpan Basin,Xylanase,Xylose

【英文关键词】Streptomyces sp. S9,Turpan Basin,Xylanase,Xylose

【中文摘要】A new xylanase gene, xynAS9, was cloned from Streptomyces sp. S9, which was isolated from Turpan Basin, China. The full-length gene consists of 1,395 bp and encodes 465 amino acids including 38 residues of a putative signal peptide. The overall amino acid sequence shares the highest identity (50.8%) with a putative endo-1, 4- β -xylanase from Streptomyces avermitilis of the glycoside

hydrolase family 10. The gene fragment encoding the mature xylanase was expressed in Escherichia coli BL21 (DE3). The recombinant protein was purified to electrophoretic homogeneity and subsequently characterized. The optimal pH and temperature for the recombinant enzyme were 6.5 and 60 ° C, respectively. The enzyme showed broad temperature adaptability, retaining more than 65% of the maximum activity when assayed at 50 – 80 ° C. The enzyme also had good thermal and pH stability. The Km values for oat spelt xylan and birchwood xylan substrates were 2.85 and 2.43 mg ml − 1, with the Vmax values of 772.20 and 490.87 μ mol min − 1 mg − 1, respectively. The hydrolysis products of xylan were mainly xylose and xylobiose. These favorable properties should make XynAS9 a good candidate in various industrial applications.

【题目】Optimized microwave-assisted extraction of phenolic acids from citrus mandarin peels and evaluation of antioxidant activity in vitro

【中文关键词】Microwave-assisted extraction,Response surface,methodology,Phenolic acid content,Kinnow,Antioxidant activity

【英文关键词】Microwave-assisted extraction,Response surface,methodology,Phenolic acid content,Kinnow,Antioxidant activity

【中文摘要】An efficient microwave-assisted extraction (MAE) technique was developed to extract phenolic acids from citrus mandarin peels. The operating parameters were optimized using central composite design combined with response surface methodology. The optimum extraction conditions were as follows: microwave power, 152W; extraction time, 49 s; liquid to solid ratio, 16; and methanol concentration, 66%. After method development, the extraction yield of phenolic acids (divided into four fractions: free, ester-bound, glycoside-bound and insoluble-bound) and the antioxidant activity of the extract were compared with those of the extracts obtained from the conventional methods including ultrasonic extraction (USE) and rotary extraction (RE). MAE showed obvious advantages in terms of high extraction efficiency and antioxidant activity of extract within shortest extraction time. The results demonstrated that MAE could be a fast and reliable method for quantitative analysis of phenolic compounds in citrus mandarin peels.

【题目】Purification of flavonoid from Gingko biloba extract by zinc complexation method and its effect on antioxidant activity
【中文关键词】Gingko extract,Flavonoid,Purification,Zinc complexation
【英文关键词】Gingko extract,Flavonoid,Purification,Zinc complexation
【中文摘要】The present study was focused on investigating the method for purification of the flavonoid from the Gingko biloba extract (EGb). The flavonoid content was increased from 24% to 55% by the method of the flavonoid – zinc complexes, which was based on the chelating activity of the flavonoids. The purification process parameters optimized were 9.50, 0.20 and 1.0% (w/v, of the methanol) for solution pH value, zinc sulfate EGb ratio (w/w), and the EGb concentration, espectively. The flavonoid ingredients changes after the purification were determined by high performance liquid chromatography (HPLC) and the results revealed that this purification method exhibited high selectivity of flavonoids which had the aglycone of quercetin and kaempferol. The antioxidant activity of the extract before and after purification was compared by the 2,2-diphenyl-1-picryl-hydrazyl (DPPH) radical-scavenging activity method. The results showed that the antioxidant activity of the extract was almost not affected through the purification by complexation method.

【题目】Liberation and separation of phenolic compounds from citrus mandarin peels by microwave heating and its effect on antioxidant activity
【中文关键词】Microwave treatment,Citrus mandarin peels,Phenolic acids,Antioxidant activity,Kinnow
【英文关键词】Microwave treatment,Citrus mandarin peels,Phenolic acids,Antioxidant activity,Kinnow
【中文摘要】The effect of microwave treatment on the phenolic compounds and antioxidant capacity of citrus mandarin peels was evaluated. After microwave treatment, methanol extracts of citrus peels were prepared and the contents of phenolic acids (free and bound) and flavanol, flavanone and flavonol compounds (FCs) were determined by HPLC. Antioxidant capacity of peel extracts was measured using DPPH radical scavenging assay, hydroxyl radical scavenging assay and reducing power. After microwave treatment, the free fraction of phenolic acids increased, whereas the bound fractions decreased and antioxidant activity was increased. The content of total FCs increased with power but at longer irradiation time it was declined which meant that some FCs might be degraded. The results indicated that appropriate microwave treatment could be an efficient process to liberate and activate the bound phenolic compounds and to increase the antioxidant capacity of citrus mandarin peels.

After microwave treatment, methanol extracts of citrus peels were prepared and the contents of phenolic acids (free and bound) and flavanol, flavanone and flavonol compounds (FCs) were determined by HPLC. Antioxidant capacity of peel extracts was

measured using DPPH radical scavenging assay, hydroxyl radical scavenging assay and reducing power. After microwave treatment, the free fraction of phenolic acids increased, whereas the bound fractions decreased and antioxidant activity was increased. The content of total FCs increased with power but at longer irradiation time it was declined which meant that some FCs might be degraded. The results indicated that appropriate microwave treatment could be an efficient process to liberate and activate the bound phenolic compounds and to increase the antioxidant capacity of citrus mandarin peels.

【题目】Protective effects of Forsythia suspensa extract against oxidative stress induced by diquat in rats

【中文关键词】Forsythia suspensa extract,Oxidative stress,Rat

【英文关键词】Forsythia suspensa extract,Oxidative stress,Rat

【中文摘要】Forsythia suspensa extract has been proved as a potential antioxidant in the recent years. The present study was undertaken to obtain the optimal antioxidant fraction in vitro and examine its antioxidative potential against diquat-induced oxidative stress in male Sprague Dawley rats in vivo. In vitro, 1, 1-diphenyl-2-picrylhydrazyl (DPPH) free radical scavenging experiment indicated that the CH2Cl2 fraction of F.suspensa (FSC) exerted the strongest scavenging activities; forsythoside A, forythialan A and phillygenin from it might be the major antioxidant constituents. In vivo, pretreatment of rats with different doses of FSC (25, 50 and 100

mg/kg bw) and vitamin C (100 mg/kg bw, positive control) for 15 days significantly lowered the tumor necrosis factor-α (TNF-α), interleukin-1β (IL-1β), and interleukin-6 (IL-6) in plasma compared to the negative control group. Also, FSC significantly increased the activities of superoxide dismutase (SOD), glutathione peroxidase (GSH-Px), and the levels of glutathione (GSH) in plasma, liver and kidney whereas it decreased the levels of malondialdehyde (MDA) in plasma and kidney. Moreover, the protective effect of FSC (100 mg/kg bw) was better than vitamin C. These results revealed that FSC exerted a protective effect against diquat-induced oxidative stress and is worthy of becoming a potential dietary antioxidant.

【题目】Forsythia suspensa extract alleviates hypersensitivity induced by soybean β-conglycinin in weaned piglets

【中文关键词】Forsythia suspensa,Soybean allergy,Mast cells,Histamine,Cytokines,Swine
【英文关键词】Forsythia suspensa,Soybean allergy,Mast cells,Histamine,Cytokines,Swine

【中文摘要】Aim of the study: Soybeans are known to stimulate food allergies; however, current therapies are lacking in alleviating hypersensitivity. The present study investigated whether Forsythia suspensa extract could attenuate purified soybean β-conglycinin-induced anaphylactic reactions in weaned piglets. Materials and methods: Eighteen 14-day-old piglets were sensitized and boosted by oral administration of purified β-conglycinin. Forsythia suspensa extract was supplemented in the diet after the initial sensitization and continued for the remainder of the experiment. Piglets were challenged on day 28, and anaphylactic symptoms, passive cutaneous anaphylaxis, plasma histamine and intestinal microbial flora were analyzed. T-cell proliferative responses and cytokine production were also determined. Results: Forsythia suspensa extract alleviated β-conglycinin-induced anaphylactic symptoms by markedly reducing anaphylactic antibodies, mast cell degranulation, and histamine release while improving intestinal microbial flora. Furthermore, Forsythia suspensa extract significantly suppressed β-conglycininduced T lymphocyte proliferation and IL-4 synthesis. Conclusion: Forsythia suspensa extract protected β-conglycinin-sensitized piglets from anaphylactic reactions. Forsythia suspensa extract may provide a novel effective therapy for soybean allergy.

【题目】Rapid Identification and Characterization of Antioxidants from Ligularia fischeri
【中文关键词】Ligularia fischeri,Antioxidative activity,Bioassay-linked HPLC,Hyperoside,2''-acetylhyperoside
【英文关键词】Ligularia fischeri,Antioxidative activity,Bioassay-linked HPLC,Hyperoside,2''-acetylhyperoside
【中文摘要】The objectives of this study were to investigate the radical-scavenging activity of Ligularia fischeri on oxidative damage by the radical 1,1-diphenyl-2-picrylhydrazyl (DPPH) and to rapidly identify the active components using the bioassay-linked fractionation method. The MeOH extract and fractions of CH2Cl2, BuOH, and H2O from L. fischeri showed DPPH radical-scavenging effects in a dose-dependent manner ($p < 0.01$). In particular, the BuOH fraction had the most effective ($p < 0.05$) antioxidative capacity. The active constituents from the BuOH fraction of L. fischeri were rapidly isolated by bioassay-linked HPLC method and identified as hyperoside and 2''-acetylhyperoside with potent antioxidant effects against the DPPH radical, with IC50 values of 1.31 and 7.09 μg/mL, respectively. They have not been reported from L. fischeri yet.

【题目】Dietary Arginine Supplementation Affects Microvascular Development in the Small Intestine of Early-Weaned Pigs
【中文关键词】Arginine, Microvascular Development,Small Intestine,Early-Weaned Pigs
【英文关键词】Arginine, Microvascular Development,Small Intestine,Early-Weaned Pigs
【中文摘要】This study was conducted to evaluate the effects of dietary arginine levels on microvascular development of the small intestine in early-weaned pigs. Twenty-four crossbred pigs (5.0 ± 0.3 kg body weight) were individually housed and randomly allotted to 1 of 3 diets supplemented with 0, 0.7, and 1.2% L-arginine (8 pigs per group). Pigs consumed the diets ad libitum for 10 d. We collected blood samples on d 3, 6, and 10. On d 10, 6 pigs from each group were randomly selected and killed for tissue sample collection. Compared with control pigs, dietary supplementation with 0.7% L-arginine increased($P < 0.05$) jejunal concentrations of nitrite and nitrate (stable oxidation products of nitric oxide), intestinal villus height, as well as plasma proline and arginine concentrations on d 6 and 10. Dietary supplementation with 0.7% L-arginine also increased ($P < 0.05$) immunoreactive expression of CD34 in duodenal submucosa, ileal mucosa and submucosa, and expression of vascular endothelial growth factor (VEGF) in duodenal submucosa, jejunal mucosa and submucosa, and ileal mucosa compared with the control and 1.2% L-arginine supplementation. Dietary supplementation with 1.2% L-arginine increased ($P<0.05$) the concentration of jejunal endothelin-1 compared with the control pigs. Immunoexpression of VEGF in duodenal mucosa and plasma lysine concentrations on d 6 and 10 were lower ($P<0.05$) in pigs supplemented with 1.2% L-arginine than in unsupplemented pigs. Collectively, these findings indicate that the effects of L-arginine on

microvascular development are beneficial at lower levels but have adverse effects at higher intakes. Dietary supplementation with 0.7% L-arginine may be a useful method to improve microvascular development in the small intestine of early-weaned pigs.

【题目】Effects of Forsythia Suspensa Extract on the Growth Perforance, Nutrient Digestibility, and Antioxidant Activities in Broiler Chickens under High Ambient Temperature

【中文关键词】Forsythia suspense,Performance,nutrient digestibility,antioxidant,broiler

【英文关键词】Forsythia suspense,Performance,nutrient digestibility,antioxidant,broiler

【中文摘要】A 42-d trial was conducted with 252 broiler chickens (d 1 of age, 38.8 ± 1.3 g of BW) to determine the effects of Forsythia suspensa extract on growth performance, nutrient digestibility, and antioxidant activities under high ambient temperature (32± 1 ° C). The feeding program consisted of a starter diet from d 1 to 21 of age and a finisher diet from d 22 to 42 of age. Dietary treatments included a negative control group (NC) fed a cornsoybean meal based diet without vitamin C or Forsythia suspensa extract, a positive control group fed a diet with 200 mg of vitamin C/kg, and a test group (FS) fed with 100 mg of Forsythia suspensa extract/kg. There were 14 cages per treatment and 6 birds per cage during the study. Birds had free access to diets and water during the entire period. Body weight and feed intake were measured at d 21 and 42. Blood and tissue samples were collected at d 21 and 42 for assay of antioxidant indices. Growth performance did not differ among treatment groups during the starter period. In the finisher phase, birds in FS had greater (P <0.05) average daily gain, feed conversion, and apparent digestibility of energy, CP, calcium, and phosphorus than birds in NC. Furthermore, birds in FS had greater (P < 0.05) total antioxidant capacity and superoxide dismutase activity and lower (P< 0.05) malondialdehyde activity in the serum than birds in NC. The FS birds had greater (P <0.05) muscle superoxide dismutase activity and lower (P < 0.05) malondialdehyde than NC birds. During the entire period, hepatic superoxide dismutase activity of FS birds was greater (P < 0.05) than that of NC birds. Dietary supplementation with Forsythia suspensa extract can enhance nutrient digestibility and growth performance possibly by reducing oxidative stress of broiler chickens under high ambient temperatures.

【题目】Purification, characterization, and cloning of a phytase with low pH optimum and strong proteolysis resistance from Aspergillus ficuum NTG-23
【中文关键词】Phytase,Aspergillus ficuum,Purification,Cloning
【英文关键词】Phytase,Aspergillus ficuum,Purification,Cloning
【中文摘要】A novel phytase was isolated from Aspergillus ficuum NTG-23 with a procedure involving ion-exchange chromatography on DEAE-cellulose, CM-cellulose and FPLC-gel filtration on Superdex 75. The protein exhibited a molecular mass of 65.5 kDa in gel filtration and SDS – PAGE. It possessed an optimal pH of 1.3 and an optimal temperature of 67 ° C, and manifested a Km of 0.295 mM and a Vmax of 55.9 nmol (phosphate)/min. Phytase activity was not significantly affected by metal ions such as Ca2+, Mg2+, Mn2+, Zn2+, but was slightly stimulated in the presence of EDTA. The phytase was stable at 60 ° C with no obvious loss of activity upon its incubation at 70 ° C for 20 min. The enzyme exhibited a broad substrate selectivity and showed strong resistance toward pepsin and trypsin. The unique properties suggest that the phytase has the potential to be useful as an animal feed supplement.

【题目】Vinegar production residue as substrates for phytase production by Aspergillus ficuum
【中文关键词】Vinegar production residue,Vinegar processing,Solid-state fermentation,Aspergillus ficuum,Phytase
【英文关键词】Vinegar production residue,Vinegar processing,Solid-state fermentation,Aspergillus ficuum,Phytase
【中文摘要】Two kinds of vinegar production residues, sorghum vinegar residue (SVR) and corn vinegar residue (CVR), were used as a substrate for phytase production in solid-state fermentation (SSF) by Aspergillus ficuum. Various process parameters influencing phytase production were evaluated by single factor design experiments; further study involved VCR and its goodness-of-fit levels. An incubation time of 48 hours, initial moisture of 55% and an inoculum of 1.2×107 spores per millilitre were the optimum cultural conditions for the production of phytase in waste corn vinegar residue, without adding in vitro nutrient elements by orthogonal design

experiment. Results showed that vinegar production residue as substrates for phytase production by Aspergillus ficuum through microbiology fermentation could be applied to treatment of an integrated system for waste from vinegar processing.

【题目】Alfalfa polysaccharides improve the growth performance and antioxidant status of heat-stressed rabbits

【中文关键词】Alfalfa polysaccharides,Performance,Antioxidant status,Heat-stressed,Rabbit
【英文关键词】Alfalfa polysaccharides,Performance,Antioxidant status,Heat-stressed,Rabbit

【中文摘要】The study was conducted to evaluate the antioxidant properties of alfalfa polysaccharides (APS) extracted from alfalfa (Medicago sativa L.) through 1,1-Diphenyl-2-picryl-hydrazyl (DPPH) radical-scavenging assay and the effects of the inclusion (0%, 0.1%, and 0.5%) of APS in the diet on the growth performance and antioxidant status in heat-stressed rabbits. 120 New Zealand male rabbits (average body weight 1123 g, 40 d old) were divided into three groups (40 rabbits per group) and were fed with a basal diet or the basal diet with 1 g or 5 g of APS/kg of diet. Rabbits had free access to diets and water in an environmentally controlled room at 30±1 ° C and 55% relative humidity during the entire period (21 d). On days 7, 14 and 21 of the trial, body weight and feed intake were measured and blood samples were collected for assay of antioxidant induces. Liver tissue samples were collected on day 21 for assay of antioxidant induces. Results in vitro showed the scavenging effect of APS on DPPH radicals increased (P<0.05) in a dose-dependent manner. The APS exerted an inhibitory effect on DPPH radical generation, with 66.3% inhibition at 100 μg/mL and 74.5% inhibition at 250 μg/mL. Results in vivo showed that APS 0.1% supplementation increased (P<0.05) average daily gain (ADG) and reduced (P<0.05) feed conversion rate (FCR) in the first week of trial. Compared with the control group, average daily feed intake (ADFI) was significantly (P<0.01) reduced by APS treatment. From days 8 to 14 of the trial, ADG of the APS 0.5% group was greater (P<0.05) than that of the control group. Compared with the control group, FCR was significantly (P<0.05) reduced by APS treatment. From days 15 to 21 of the trial, ADFI of the APS 0.1% group was greater (P<0.05) than that of the control group. For the overall period, APS 0.5% supplementation had a significantly (P<0.05) positive effect on ADG. ADFI and FCR were lower (P<0.05) with APS than without APS. Furthermore, on day 7, the inclusion of APS reduced significantly MDA (P<0.01). The rabbits fed with APS 0.1% had significantly (P<0.01) lower cortisol and greater (P<0.05) T-AOC, SOD, and GSH-Px than the control group. On day 14, addition of APS increased T-AOC (P<0.01) and reduced MDA (P<0.05). The APS 0.5% group showed lower (P<0.05) cortisol and greater (P<0.05) GSH-Px than the control group. On day 21, the rabbits fed with the APS 0.5% diet had greater (Pb0.05) GSH-Px and T-AOC compared with the control rabbits. In contrast, the opposite was true for cortisol (P<0.05) and MDA (P<0.05). On day 21, MDA was lower (P<0.01) with APS than without APS in the liver tissue. Hepatic GSH-Px activity of rabbits fed with the APS 0.5% diet was greater (P<0.05) than those of other groups. APS supplementation seemed to have a positive influence on the growth performance and antioxidant status of heat-stressed rabbits.

【英文摘要】The study was conducted to evaluate the antioxidant properties of alfalfa polysaccharides (APS) extracted from alfalfa (Medicago sativa L.) through 1,1-Diphenyl-2-picryl-hydrazyl (DPPH) radical-scavenging assay and the effects of the inclusion (0%, 0.1%, and 0.5%) of APS in the diet on the growth performance and antioxidant status in heat-stressed rabbits. 120 New Zealand male rabbits (average body weight 1123 g, 40 d old) were divided into three groups (40 rabbits per group) and were fed with a basal diet or the basal diet with 1 g or 5 g of APS/kg of diet. From days 8 to 14 of the trial, ADG of the APS 0.5% group was greater (P<0.05) than that of the control group. Compared with the control group, FCR was significantly (P<0.05) reduced by APS treatment. From days 15 to 21 of the trial, ADFI of the APS 0.1% group was greater (P<0.05) than that of the control group. For the overall period, APS 0.5% supplementation had a significantly (P<0.05) positive effect on ADG. ADFI and FCR were lower (P<0.05) with APS than without APS. Furthermore, on day 7, the inclusion of APS reduced significantly MDA (P<0.01). The rabbits fed with APS 0.1% had significantly (P<0.01) lower cortisol and greater (P<0.05) T-AOC, SOD, and GSH-Px than the control group. On day 14, addition of APS increased T-AOC (P<0.01) and reduced MDA (P<0.05). The APS 0.5% group showed lower (P<0.05) cortisol and greater (P<0.05) GSH-Px than the control group. On day 21, the rabbits fed with the APS 0.5% diet had greater (Pb0.05) GSH-Px and T-AOC compared with the control rabbits. In contrast, the opposite was true for cortisol (P<0.05) and MDA (P<0.05). On day 21, MDA was lower (P<0.01) with APS than without APS in the liver tissue. Hepatic GSH-Px activity of rabbits fed with the APS 0.5% diet was greater (P<0.05) than those of other groups. APS supplementation seemed to have a positive influence on the growth performance and antioxidant status of heat-stressed rabbits.

【题目】Effects of dietary taurine supplementation on growth performance and immune status in growing Japanese quail

【中文关键词】Taurine,quail,performance,immune

【英文关键词】Taurine,quail,performance,immune

【中文摘要】The effect of dietary taurine was investigated on performance and immune responses in growing (1 to 42 d) Japanese quail. One-day-old quails of both sexes (300) were randomly allotted to 12 groups with 25 quails in each group (3 dietary treatments, 4 replicates). They were fed with maize-soybean meal-based diets containing 0, 0.01, or 0.05% taurine for 42 d. Dietary 0.01% taurine decreased food intake (P <0.05) in the starter phase but did not affect BW gain and feed efficiency from d 1 to 42 of age. In the starter phase, dietary 0.05% taurine did not affect food intake but increased weight gain and improved feed efficiency (P < 0.05). In the grower phase, dietary 0.05% taurine did not affect weight gain but improved feed efficiency and decreased food intake (P < 0.05). In the overall period, dietary 0.05% taurine improved feed efficiency and decreased food intake (P < 0.05). The relative weights of thymus were greater in the quails given 0.01% taurine in diet (P < 0.05). The relative weights of the bursa of Fabricius and thymus were greater in dietary 0.05% taurine compared with the control (P< 0.05).The quail serum anti-Newcastle disease virus hemagglutination antibody titer in the taurine-supplemented diet had no significant effects compared with the control (P > 0.05). The response to phytohemagglutinin measured as the foot web index was significantly increased by 0.05% taurine supplementation (P< 0.05). It is concluded that the taurine-supplemented diet has a beneficial effect on immune responses and performance in growing Japanese quail.

【题目】喷雾干燥法制备黄酮苷元微胶囊的研究(Microencapsulation of flavone aaglycone by spray drying)
【中文关键词】黄酮苷元; 微胶囊; 喷雾干燥
【英文关键词】Flavone aglycone; Microencapsulation; Spray drying
【中文摘要】以乳清蛋白和麦芽糊精构成复合型壁材,采用喷雾干燥方法制备黄酮苷元微胶囊。壁材组成为乳清蛋白∶麦芽糊精为2 ∶ 7(W ∶ W),单甘酯浓度0. 3%,海藻酸钠浓度0. 3%。芯材黄酮苷元首先溶解于无水乙醇,最适宜的芯材添加量为芯壁比1 ∶ 9(W ∶ W)。微胶囊化工艺参数为乳化均质压力40 MPa,时间20 min,喷雾干燥进风温度200 ℃,出风温度90℃。在最优条件下,微胶囊包埋率为91%。黄酮苷元微胶囊的扫描电镜结果显示,该微胶囊化产品具有较好的包埋效果。
【英文摘要】The microencapsulation of flavone aglycone was prepared by spray drying,with the mixture of whey protein,maltodextrin,glyceryl monostearate and sodium alginate as wall material. The ratio of whey protein to maltodextrin (W ∶ W),the concentration of glyceryl monostearate and sodium alginate were 2 ∶ 7(W ∶ W),0. 3% and 0. 3%,respectively. Flavone aglycone as core material was dissolved with anhydrous ethanol and the amount of core material was the core /wall ratio 1 ∶ 9(W∶ W). The optimal techniques parameter of microencapsulation was as follows: homogenizing at 40 MPa for 20 minutes and tuice,the temperature for inlet and outlet wind being 200 ℃ and 90 ℃,respectively. The microencapsulation rate of flavone aglycone was 91% at optimal conditions. The SEM picture of microencapsulation of flavone aglycone showed that the microencapsulation quality was desirable.

【题目】连翘提取物对肉仔鸡热应激下生长性能和抗氧化活性的影响(Effects of For sythia suspensa Extract on Antioxidant Activities and Growth Performance in Broiler Chickens under Heat Stress)
【中文关键词】连翘提取物; 生长性能; 抗氧化; 肉仔鸡
【英文关键词】forsythia suspensa; performance; antioxidant; broilers
【中文摘要】选用1日龄健康的爱拔益加肉公雏196 只, 平均体重为(38.8±1.3) g, 研究连翘提取物(FSE) 对热应激(32 ± 1) °C环境下肉鸡生长性能和抗氧化能力的影响。将肉仔鸡随机分为3个处理, 每个处理14 个重复, 每个重复6 只鸡。日粮处理组, 分别为空白对照组(NC) , 维生素C 组(PC) : 基础日粮+ 维生素C 200 mg/ kg; 连翘提取物组(FSE) : 基础日粮+FSE 100 mg/ kg。结果表明: 试验前期各处理间生长性能没有显著性差异。试验后期FSE 组与NC 组相比日增重显著提高(P < 0.05) , 并且饲料转化率提高。FSE 组比NC 组血液总抗氧化能力(TAOC) 、超氧化物歧化酶(SOD) 含量显著提高(P < 0.05) , 而丙二醛(MDA) 水平下降。从试验全期看FSE组比NC 组肝脏SOD 含量显著提高(P < 0.05) 。说明FSE 通过清除自由基途径, 缓解活性氧对肠黏膜的损伤,改善营养物质消化率和生长性能, FSE 有望成为高效天然抗氧化剂。
【英文摘要】A 42- d trial was conducted with 196 broiler chickens (d 1 of age, 38.8±1.3 g BW) to determine the effects of Forsythia suspensa extract (FSE) on growth performance, and antioxidant activities under heat stress (32 ±1) °C. Dietary treatments included were NC: a negative the control group fed a corn- soybean meal based diet without vitamin C and FSE; PC: a positive control group fed a diet with 200 mg vitamin C/kg; and FSE: a test group fed with 100 mg FSE /kg. There were 14 cages per treatment and 6 birds per cage during the study. Growth performance did not differ among treatment groups during the starter period. In the finisher phase, FSE had greater (P < 0.05) ADG, FCR than NC. Further more, FSE had greater TAOC, SOD (P < 0.05) and lower MDA in the serum than NC. During the entire period, hepatic SOD of FSE was greater (P < 0.05) than NC. Correctively dietary supplementation of FSE can enhance growth performance possibly by reducing oxidative stress of broiler chickens under heat stress.

【题目】连翘提取物对肉仔鸡肌肉抗氧化活性的影响
【中文关键词】连翘提取物; 抗氧化; 肌肉; 肉仔鸡
【英文关键词】Forsythia suspensa; antioxidant; muscle; broiler
【中文摘要】本研究旨在探讨连翘提取物对肉仔鸡胸肌抗氧化和脂质过氧化指标的影响, 为连翘提取物在养鸡生产中的应用提供试验依据。试验选用1 日龄健康的爱拔益加肉公雏252 只, 平均体重为(38.8±1.3) g, 研究连翘提取物(FSE) 对热应激(32±1) ℃肉鸡肌肉抗氧化能力的影响。试验期为42 d。将肉仔鸡随机分为3 个处理, 每个处理14 个重复, 每个重复6 只鸡。日粮处理组分别为: (1) 空白对照组(NC) : 基础日粮; (2) 维生素C 组(PC) : 基础日粮+200mg/ kg 维生素C; (3) 连翘提取物组(FSE) : 基础日粮+100 mg/ kg FSE。试验第21 天和第42 天屠宰取胸肌样品, 检测抗氧化指标。结果表明, 在试验后期, 与NC空白组和维生素C 组相比, FSE 组肉仔鸡的超氧化物歧化酶(SOD) (P< 0.05) 、谷胱甘肽过氧化物酶(GSH- Px) 和总抗氧化能力(T- AOC) 含量增加, 其抗氧化活性好于维生素C 组, 而丙二醛(MDA) 含量显著降低(P < 0.05)。FSE 通过清除自由基途径, 缓解热应激诱导的活性氧对机体细胞膜的损伤, 进而改善肌肉抗氧化活性及提高肉品质。
【英文摘要】Forsythia suspensa extract (FSE) on antioxidant activities of breast muscle were evaluated in broilers chickens. A 42- d trial was conducted with 252 one day age broiler chickens of (38.8±1.3) g body weight to determine the effects of Forsythia suspensa extract (FSE) on growth performance, and antioxidant activities under heat stress (32±1) ℃. Dietary treatments included NC: a negative the control group fed a corn- soybean meal based diet without vitamin C and FSE; PC: a positive control group fed a diet with 200 mg/kg vitamin C; and FSE: a test group fed with 100 mg /kg FSE. There were 14 cages per treatment and 6 birds per cage during the study. Muscle samples were collected at the 21st and 42nd day for assay day of antioxidant indexes. During the finisher period, FSE had greater SOD (P < 0.05) , GSH- Px, TAOC and lower MDA in the muscle than NC and PC. Correctively dietary supplementation of FSE can reduce oxidative stress of broiler chickens under heat stress.

【题目】高速逆流色谱法分离制备无花果叶中的补骨脂素及佛手内酯(Separation and purification of psoralen and bergapten from Ficuscarical leaves by preparative high- speed counter-current chromatography)
【中文关键词】高速逆流色谱,无花果叶,补骨脂素,佛手内酯,分离
【英文关键词】preparative high-speed counter-current chromatography (HSCCC) ; Ficuscarical leaves; psoralen; bergapten; separation
【中文摘要】利用高速逆流色谱分离制备无花果叶中的补骨脂素和佛手内酯,经过高效液相色谱、质谱、核磁共振检测,确定其纯度及结构。新鲜的无花果叶经干燥、破碎后用石油醚(60-90°C)室温浸提48h,浸提液经浓缩后得到浸膏。采用正己烷:乙酸乙酯:甲醇:水(1:1:1:1)的两相体系将所得的浸膏进行高速逆流色谱的分离纯化,得到样品A和样品B。利用高效液相色谱检测样品A和B的纯度分别为99.1%和98.2%。将得到的样品A和B进行MS, 1 H- NMR, 13 CNMR检测确定其化学结构,并最终确认A为补骨脂素,B为佛手内酯。制备型高速逆流色谱可以成功的将无花果叶中的补骨脂素和佛手内酯进行分离制备。
【英文摘要】The preparative high- speed counter- currentchromatography (HSCCC) was applied to separating and purifying the psoralen and bergapten from the Ficuscarical leaves. At first, the crude extract was obtained by extracting with light petroleum from the dried leave s of Ficuscarical. Then, n- Hexane - ethylacetate – methanol-water (1:1:1:1, v / v) was used as the HSCCC two – phase solvent system for the separation and purification. The components purified and collected were analyzed by high - performance liquid chromatography (HPLC). The structures of psoralen and bergapten were identified by NMR and MS. This method yielded 414m g of psoralen at 99.1% pu rity and 211mg of bergapten at 98.2% purity from 200mg of the crude extract in a single run. Preparative high- speed counter- current chromatography could separate and purify these two components successfully from

Ficuscarical leaves.

【题目】制备型高速逆流色谱分离纯化长松萝中的松萝酸(Isolation and Purification of Usnic Acid from Usnea longissima by Preparative High-speed Counter-current Chromatography)
【中文关键词】制备型高速逆流色谱;长松萝;松萝酸;分离;纯化
【英文关键词】high-speed counter-current chromatography;Usnea longissima;usnic acid;isolation;purification
【中文摘要】利用制备型高速逆流色谱分离纯化长松萝中的松萝酸,经过高效液相色谱、核磁共振检测,确定其纯度及结构。将长松萝破碎后用石油醚(60~90℃)回流浸提4h,浸提液经过滤浓缩后得到松萝酸粗提物。采用正己烷:乙腈:乙酸乙酯:水(8:7:5:0.8,V/V)的两相体系将所得的粗提物进行制备型高速逆流色谱的分离纯化,一次进样25mg,可得到11.2mg 样品。利用高效液相色谱检测该样品纯度达到99%。将得到的样品进行1H-NMR、13C-NMR检测确定其化学结构,并确定该样品为松萝酸。实验证明制备型高速逆流色谱可以成功地将长松萝中的松萝酸进行分离纯化。
【英文摘要】Preparative high-speed counter-current chromatography (HSCCC) was used for the isolation and purification of usnic acid from Usnea longissima. Crude extract was firstly obtained by reflux extraction with petroleum ether at 60 to 90 ℃ for 4 h from dried Usnea longissima. Then hexane-acetonitrile-ethyl acetate-water (8:7:5:0.8, V/V) was used as the two-phase solvent system for purification. Finally the collected components were analyzed using high-performance liquid chromatography (HPLC) and the structure of main component was identified using 1H-NMR and 13C-NMR. By this way, the 11.2 mg of usnic acid is obtained from 25 mg of the crude extract of dried Usnea longissima with the purity of 99%.

【题目】叶黄素对鹌鹑繁殖性能及母源IgG向后代转移的影响(Effects of Lutein on Reproductive Performance and Maternal IgG Transferring to Offspring of Quails)
【中文关键词】叶黄素;鹌鹑;繁殖性能;母源IgG;转移
【英文关键词】lutein;quail;reproductive performance;maternal IgG;transition
【中文摘要】本试验旨在研究叶黄素对鹌鹑繁殖性能及母源IgG向后代转移的影响。试验选取1日龄朝鲜龙城父母代鹌鹑144羽,按体质量随机分为4个处理组,每组设3个重复,每个重复12羽。采用小麦-豆粕型基础日粮,分别添加0、50、100、150 mg·kg-1 叶黄素。10周龄时,每个重复取2羽,ELISA法检测血清IgG含量。收集种蛋并孵化,计算孵化率、受精率、死胚率。子代鹌鹑在相同条件下饲养,日粮中不添加叶黄素,分别在1、3、7、14、21日龄时,每重复取2羽心脏采血,检测血清中IgG含量。结果表明:叶黄素可以显著提高种蛋的受精率和孵化率(P<0.05),降低死胚率(P<0.05);对雌鹌鹑血清中IgG的含量没有显著影响(P>0.05),但可以显著提高卵黄IgG水平(P<0.05);子代鹌鹑血清IgG的含量与叶黄素的添加量成正比,高剂量叶黄素可显著提高1日龄血清IgG水平(P<0.05)。结论:叶黄素可以显著改善鹌鹑的繁殖性能,并通过促进母源IgG在卵黄内的沉积从而提高后代血清中IgG水平。
【英文摘要】This experiment was conducted to study the effects of lutein on reproductive performance and maternal IgG transferring to offspring of quails. 144 1-d-old parental generation North Korea Longcheng quails were randomly divided into four treatments groups with 3 replicates of 12 quails each. W heat-soybean basal diet was used,and the treatment groups were supplied with 0,50,100 and 150 mg · kg-1 lutein. At 10 weeks old age,2 quails each replicates were randomly selected and serum IgG levels were tested

by ELISA. Then fertilized eggs were collected and hatched.Hatching rate,fertilization rate and death rate were calculated. Newly hatched birds were reared under the same condition,but without lutein in basa1 diet. On d 1,3,7,14 and 21,2 birds per replicate were selected and serum IgG levels were tested. The results showed that lutein could significantly improve fertilization rate and hatching rate of quails(P< 0.05), significantly reduce death rate of embryos(P< 0.05). Lutein had no significant impact on female quails serum IgG contents (P> 0.05), but could significantly increase IgG deposition in egg yolk (P<0.05). Serum IgG levels of new hatched quails were correlated with lutein contents in the diet, and 150 mg · kg-1 lutein could significantly increase serum IgG levels of 1-d-old quails (P<0.05). Conclusion:Lutein could significantly improve reproductive performance of quails, and raise serum IgG level of offspring by promoting maternal IgG deposition in egg yolk.

【中文关键词】防御素;苜草素;多糖;黄酮;皂苷
【英文关键词】Beta-defensin;Polysavone;polysaccharide;flavonoids;saponins

【中文摘要】本研究旨在观察苜草素活性成分多糖、黄酮、皂苷对小鼠β-防御素表达的影响。分别采用含有30、60、90、150μg·mL-1苜草素多糖、含有10、20、30、50μg·mL-1苜草素黄酮、含有30、60、90、150 μg·mL-1苜草素皂苷的细胞培养液处理RAW264.7细胞,观察其对小鼠RAW 264.7细胞β防御素(mouse beta-defensin,mBD)mRNA表达水平的影响。结果发现,苜草素多糖对mBD1的表达水平没有影响,对mBD2、mBD3的表达有促进作用,30μg·mL-1效果最明显;苜草素黄酮促进mBD1的表达,10μg·mL-1效果最明显,对mBD2、mBD3的表达有抑制作用;苜草素皂苷对mBD1的表达有促进作用,对mBD2的表达水平没有影响,对mBD3表达有抑制作用。苜草素中的多糖、黄酮、皂苷对RAW264.7细胞mBDs表达的作用效果不同,苜草素多糖可能主要促进动物的特异性免疫功能,苜草素黄酮、皂苷可能促进动物的先天性免疫功能。

【英文摘要】To investigate the effect of polysaccharide,flavonoids and saponins of Polysavone on the expression of mouse beta-defensins in RAW 264.7 cells,RAW 264.7 cells were cultured with Polysavone polysaccharide at 30,60,90,150 μg · m L-1,Polysavone flavonoids at 10,20,30,50 μg · m L-1,Polysavone saponins at 10,20,30,50 μg · m L-1 ,respectively. The mRNA expression of mouse beta-defensin (mBD1-3) was detected. The results showed that the mBD2 and mBD 3 mRNA expression could be improved by Polysavone polysaccharide,especially the treatment with 30 μg · m L-1 ,but there was no effect on the mRNA expression of BD1. The BD1 mRNA expression could be improved by Polysavone flavonoids,especially the treatment with 10 μg · m L-1,the mBD2 and mBD3 mRNA expression could be inhibited. The mBD1 mRNA expression could be improved by Polysavone saponins, the mBD3 mRNA expression could be inhibited, but Polysavone saponins had no effects on the mRNA expression of mBD2. The results showed the different effects of polysaccharide, flavonoids and saponins of Polysavone on the m RNA expression of mBD1,mBD2 and mBD3. The Polysavone polysaccharide may enhance the function of adaptive immunity.The flavonoids and saponins of Polysavone may enhance the func tion of innate imm unity.

【题目】小麦日粮添加木聚糖酶对鹌鹑生长性能及免疫性能的影响(Effect of Wheat Adding add Xylanase on Quail Growth Performance and Immune Properties)

【中文关键词】小麦日粮;木聚糖酶;生长性能;免疫性能;鹌鹑
【英文关键词】wheat-basal diet; xylanase; growth performance; immunity; quails
【中文摘要】试验选取1 日龄朝鲜龙城鹌鹑108 只,研究小麦- 豆粕型基础日粮添加木聚糖酶对鹌鹑生长性能及免疫性能的影响。试验鹌鹑按体重随机分为3 个处理组,每个处理设3 个重复,每重复12 只。第1 组设为对照,饲喂玉米- 豆粕型基础日粮;第2 组饲喂小麦- 豆粕型基础日粮;第3 组在小麦- 豆粕型日粮中添加2 000 U/ kg 的木聚糖酶,试验期42 d。结果表明:小麦日粮对育雏期(0~21 日龄)鹌鹑生长性能无显著影响(P > 0.05),但是显著降低育成期(22~42 日龄)鹌鹑的体重和日增重(P < 0.05)。小麦日粮中添加木聚糖酶2 000 U/ kg,对鹌鹑的生长性能无显著影响(P > 0.05)。小麦日粮组的新城疫抗体效价显著低于玉米对照组(P < 0.05),但是小麦日粮可以显著提高细胞免疫水平(P < 0.05)。添加木聚糖酶对鹌鹑的免疫性能无显著影响(P > 0.05)
【英文摘要】This experiment was conducted to study the effects of xylanase added in wheat -basal diet on growth performance and immune properties of quails. A total of 1081-day-old quails were randomly assigned to three groups with 3 replicates of 12 quails each. Birds in the control group were supplied with corn-basal diet, the second group was supplied with wheat-basal diet and the third group was supplied with the same diet added xylanase. The experiment last for 42 days. The result showed that①Wheat -basal diet had no significant effect during 0 ~21 d, but could obviously decrease body weight and average daily intake of quails (P < 0.05); ②Wheat diet added 2000 U/kg xylanase had no significant effect on growth performance of quails (P > 0.05); ③in the NDV HI antibody titers in the were significantly lower than those of control group (P < 0.05), but cell-mediated immunity of quails was increased (P < 0.05); ④Wheatbasal diet added xylanase had no significant effect on immunity of quails(P > 0.05).

【题目】八种食用菌菌渣中三种饲用酶活性的测定(Three Kinds of Feed Enzymes Activity of Eight Mushroom Residue)
【中文关键词】食用菌菌渣;木聚糖酶;β- 葡聚糖酶;植酸酶;活性
【英文关键词】Mushroom residue; Xylanse; β-glucanase; Phytase; Activity
【中文摘要】对可商业化人工栽培的8 种常见食用菌菌渣中的木聚糖酶、β-葡聚糖酶和植酸酶生物活性进行了测定。结果表明,被测的8 个样品均不同程度具有木聚糖酶和β-葡聚糖酶活性。其中,双孢蘑菇和毛木耳菌渣木聚糖酶活性最高,分别为2.856 U·g-1 和1.109 U·g-1;杏鲍菇和毛木耳菌渣β-葡聚糖酶活性最高,分别为0.389 U·g-1 和0.351 U·g-1;毛木耳在pH 2.5 和pH 5.2 下均具有植酸酶活性,分别为0.139 U·g-1 和0.222 U·g-1;杏鲍菇和糙皮侧耳在pH 5.2 下,植酸酶活性分别为0.126 U·g-1 和0.122 U·g-1;其它菌渣均不具有明显的植酸酶活性。本研究表明,食用菌菌渣中具有一定的饲用酶活性,利用食用菌菌渣作为畜禽饲料,可在一定程度上减少饲用酶的添加,从而降低生产成本。
【英文摘要】The biological activity of xylanse, β-glucanase and phytase in mushroom residue of 8 commercial edible fungi were detected. All of the tested samples had xylanse activity and β-glucanase activity of different degree. The xylanse activity of Agaricus bisporus and Auricularia polytricha were 2.856 U·g-1 and 1.109 U·g-1, respectively. While the β-glucanase activity of Pleurotus eryngii and Auricularia polytricha were 0.389 U·g-1 and 0.351 U·g-1, respectively. Auricularia polytricha showed phytase activity at pH 2.5 and pH 5.2 with the activity of 0.139 U·g-1 and 0.222 U·g-1, respectively. The phytase activity of Pleurotus eryngii and Pleurotus ostreatus at pH 5.2 were 0.126 U·g-1 and 0.122 U·g-1. Other samples had no phytase activity. According to this research, mushroom residue can be used as animal feed and partially replace the feed enzymes added.

【题目】海带岩藻聚糖及其级分对体外培养肉鸡巨噬细胞免疫功能的影响(Efects of Fucoidan and Its Fraction Isolated from Laminaria japonica on Immunity of Broiler Macrophagesin vitro)
【中文关键词】海带岩藻聚糖:级分; 免疫功能; 巨噬细胞; 肉鸡
【英文关键词】Fucoidan; Fraction; Immunity; Macrophage; Broiler
【中文摘要】【目的】通过研究海带岩藻聚糖及其级分对肉鸡巨噬细胞免疫功能的影响,寻找海带提取物调节肉鸡免疫功能的有效级分,为饲料工业科学使用海带资源提供理论依据。【方法】采用水提醇沉的方法,从海带中提取岩藻聚糖,通过纤维柱和凝胶柱层析,对岩藻聚糖进行分级纯化。体外培养肉鸡腹腔巨噬细胞,在培养液中分别加入岩藻聚糖(200 μg · ml-1)和岩藻聚糖5种级分(100 μg · ml-1),采用MTT方法检测细胞存活率,采用ELISA检测细胞因子IL-1和TNF-α,同时测定巨噬细胞的吞噬活性等其它免疫指标。【结果】海带岩藻聚糖及其级分显著提高肉鸡腹腔巨噬细胞的吞噬活性,促进巨噬细胞呼吸爆发、NO的产生量和iNOS活性,促进巨噬细胞分泌IL-1(P<0.05);海带岩藻聚糖不同级分对肉鸡巨噬细胞免疫功能的调控作用不同,其中级分III和级分IV的促进作用较强,与对照组相比,可显著提高巨噬细胞的吞噬活性、呼吸爆发、NO产生量和iNOS活性。对其它指标无显著影响(P>0.05)。【结论】海带岩藻聚糖及其级分可提高体外培养肉鸡腹腔巨噬细胞的免疫功能,不同级分对肉鸡巨噬细胞免疫功能的调控作用不同,其中级分III和级分IV促进巨噬细胞免疫功能的作用最强,是海带岩藻聚糖中的有效级分。
【英文摘要】[Objective] The immunomodulatory activities of a Fucoidan and its fraction,purified from the Laminaria japonica (Fucoidan from Laminaria japonica,FLJ),were investigated in vitro in relation to broiler peritoneal macrophages. [Method] Fucoidan was extracted from Laminaria japonica and used ion exchange and size exclusion chromatography to separate them into five fractions. Analysis of the efects of Fucoidan and five fractions on broilers peritoneal macrophages immunity function was conducted. The broiler macrophages were cultured with fucoidan (200 μg · ml-1)and fraction from I to V (100 μg · ml-1)for 24 h,the cell vialibility was detected by using the method of MTT and the phagocytic activity was detected.The induced nitric oxide synthase (iNOS),NO,IL-1 and TNF-α in culture supernatants was measured. The respiratory burst capacity in macrophages was measured by luminal dependent chemiluminescence. [Result]Cell vialibility results showed that the proliferation of macrophages was not influenced by FLJ and its fractions.The treatment of FLJ and its fraction increased the phagocytic activity, enhanced the production of IL-1,NO,iNOS and the respiratory burst capacity (P<0.05). The fucoidan and its fraction had no significant efect on TNF-α (P>0.05). The different fractions had different efects on broiler macrophage immunity function.Fraction III and fraction IV had the most effective promoting action. Their promotion effect was higher than fraction V. The fraction V had no effect on broilers macrophages immunity function. [Conclusion] The fucoidan isolated from Laminaria japonica had promoting effect on broiler macrophage immunity at 200 μg · ml-1. The fraction III and fractionIV purified from fucoidan were the effective ftaction among the five fractions.

【题目】海带岩藻聚糖及其级分在氧化应激条件下对肉鸡巨噬细胞免疫功能的影响(Effect of Fucoidan and Fraction Isolated from Laminaria Japonica on Immunity of Broiler Macrophages Under Oxidation Stress Condition)
【中文关键词】海带岩藻聚糖;级分;氧化应激;巨噬细胞;免疫;肉仔鸡
【英文关键词】Fucoidan; Fraction; Macrophages; Oxidation stress; Immunity; Broiler
【中文摘要】【目的】在氧化应激条件下,研究海带岩藻聚糖及其级分对肉鸡巨噬细胞免疫功能的影响,初步探讨海带岩藻聚糖及其级分的免疫调节功能与抗氧化作用的关系。【方法】以叔丁基过氧化氢(tBOOH)为活性氧诱导剂,加入肉鸡腹腔巨噬细胞培养液中,测定细胞培养液中抗氧化酶的变化,巨噬细胞分泌一氧化氮(NO)、诱导型一氧化氮合成酶(iNOS)、以及细胞因子IL-1 和TFN-α等免疫指标的变化。【结果】用tBOOH 处理后的巨噬细胞,细胞存活率显著下降(P<0.05),乳酸脱氢酶(LDH)和丙二醛(MDA)显著升高(P<0.05),SOD 和GSH-Px 酶活性显著降低(P<0.05)。巨噬细胞的吞噬活性显著降低(P<0.05),NO、iNOS 和呼吸爆发显著降低(P<0.05),细胞因子IL-1 分泌量显著下降(P<0.05),表明细胞出现明显的氧化损伤。在培养液中加入海带岩藻聚糖及其级分,能够缓解细胞的氧化应激,使得细胞存活率上升,LDH 和MDA 降低,SOD 和GSH-Px 升高,免疫指标均有不同程度的恢复。【结论】海带岩藻聚糖及其级分具有抗氧化活性,不同级分的抗氧化活性存在差

异,其中级分III、级分IV的作用较强。海带岩藻聚糖对巨噬细胞的免疫促进作用与其抗氧化活性有关。
【英文摘要】[Objective] The immunomodulatory activities of a fucoidan (FLJ) and its fraction, purified from the Laminaria japonica, were investigated in vitro under oxidation stress in broiler macrophages.[Method] After the broiler macrophages were cultured with FLJ and its fraction for 24 h, the tBOOH was added to the culture as oxygen reagent. The activities of superoxide dismutase (SOD), glutathione peroxidase (GSH-Px) and induced nitric oxide synthase (iNOS) were detected. The content of lactate dehydrogenase (LDH), malonic dialdehyde (MDA), NO, IL-1 and TNF-α were measured. Production of reactive oxygen species (ROS) in macrophages was measured by luminal dependent chemiluminescence. [Result] The elevated MDA and LDH, decreased cell vialibility, increased SOD and GSH-Px levels indicated that adding tBOOH in culture caused the oxidation stress in broiler macrophages. The decrease of phagocytic activity, NO, iNOS, IL-1and respiratory burst capacity indicated that the immune function of broiler macrophages were influenced by tBOOH. When the FLJ and its fraction were present in culture, the oxidation stress were eliminated. The cell vialibility, SOD and GSH-Px were significantly increased (P<0.05), LDH and MDA were significantly decreased (P<0.05). The immune function of macrophages was enhanced. [Conclusion] The different fractions of FLJ have different antioxidant activities. Fraction III and fraction IV have the most effective antioxidant activities. These data suggest that the FLJ and its fractions have antioxidant activities, and the antioxidant activities of FLJ and its fractions are related to their immunomodulatory activities.

【题目】四株耐制粒益生菌对0-3周龄肉仔鸡死亡率、腹泻率及盲肠菌群的影响(Effects of four strains of probiotics on diarrhea rate,mortality rate and cecum flora during 0-3 weeks broilers)
【中文关键词】地衣芽孢杆菌;枯草芽孢杆菌;乳链球菌;啤酒酵母;肉仔鸡;死亡率;腹泻率;盲肠菌群
【英文关键词】Bacterillus licheniformis; Bacillus subtilis; Streptococcus lactis; Saccharomyces cerevvisiae; diarrhea rate; cecum florabroilers; mortality;
【中文摘要】为了评价4株耐制粒益生菌(地衣芽孢杆菌、枯草芽孢杆菌、乳链球菌及啤酒酵母制剂)经0.1 MPa,65 ° C 制粒后对0-3周龄肉仔鸡死亡率、腹泻率及盲肠菌群的影响,将自制益生菌粉剂按0.3%添加量与1-21日龄肉仔鸡无抗生素日粮混合,制成试验颗粒料(0.1 MPa,65 ° C)。选用1日龄健康的AA肉仔鸡混雏240只。随机分为5组。分别为对照组、地衣芽孢杆菌组、枯草芽孢杆菌组、乳链球菌组和啤酒酵母组,每组4个重复,每重复12只鸡.试验期为3周。研究表明:地衣芽孢杆菌、枯草芽孢杆菌、乳链球菌和啤酒酵母对改善0-3周龄肉仔鸡的腹泻率和死亡率有一定作用,地衣芽孢杆菌、枯草芽孢杆菌、乳链球菌可以优化0-3周龄肉仔鸡盲肠菌群结构。
【英文摘要】An experiment was conducted using a total of 96 one-day-old Arbor Acres broilers to investigate the effects of 4 strains of probiotics (Bacillus licheniformis, Bacillus subtilis, Streptococcus lactis and Saccharomyces cerevisiae) on diarrhea rate,mortality rate and cecum flora during 0-3 weeks of age. Chicks were randomly allotted to 5 treatments by body weight, and each group was 4 repeats with 12 in each repeat. Probiotics were mixed in l-21 days feed at supplement amount 0.3%,and were pelleted under the condition of 0.1 MPa, 65 ° C. The result showed that: 4 strain of probiotics could improve the diarrhea rate and mortality rate, optimize cecum flora.

【题目】黄芪多糖对肉仔鸡生产性能和部分免疫指标的影响(Effects of Astragalus polysacchrides on growth performance and partial immune parameters in broilers)

【中文关键词】黄芪多糖;肉仔鸡;生长性能;免疫功能
【英文关键词】Astragalus polysacchrides;broilers;growth performance;immune function
【中文摘要】本文研究了黄芪多糖对不同性别肉仔鸡不同阶段生产性能及部分免疫指标的影响。试验选用1200只1日龄AA肉仔鸡。随机分为5个处理组。每个处理设12个重复,每个重复20只鸡,公母各半,分笼饲养。对照组饲喂基础日粮,其他各处理组分别在对照组日粮的基础上添加黄芪多糖500、1000、2000、3000 mg/kg。试验期为7周,分为试验前期(0-21日龄)和试验后期(22-49日龄)。结果表明:(1)试验前期,各添加黄芪多糖处理组公鸡饲料转化率无显著变化。但平均日增重降低,其中2000 mg/kg 组变化显著(P<0.05);各处理组试验前期母鸡的饲料利用率显著提高(P<0.05),平均日增重提高,其中1000 mg/kg和2000 mg/kg 组变化显著(P<0.05)。试验后期,除母鸡3000 mg/kg组平均日增重较对照组显著降低外(P<0.05),其他各处理组公母鸡平均日增重争饲料转化率均无显著变化。(2)试验前期,各处理组公母鸡胸腺指数均无显著差异,1000mg/kg 组显著提高公母鸡新城疫抗体效价(P<0.05);试验后期,公鸡1000mg/kg组胸腺指数、2000mg/kg 组法氏囊指数和脾脏指数均较对照组显著增加(P<0.05)。而母鸡各处理组免疫器官指数、公母鸡新城疫抗体效价与对照组相比均无显著差异(P>0.05)。
【英文摘要】The experiment was conducted to study the effects of Astragalus polysacchrides (APS) on the growth performance and partial immune parameters in broilers of different gender and different feeding stages. One thousand and two hundred one-day-old Arbor Acres broilers were randomly divided into five treatments, each including twelve replicates of twenty birds, male and female equally divided,sub-cage reared. Control group was fed basal diet, treatment groups were fed basal diet supplemented with 500,1000,2000,3000 mg/kg APS for 7 weeks. The early stage was 0-2l d,the late stage was 22-42d. The results showed that: (1) Dietary APS supplementation reduced the average daily gain (ADG)of the male broilers in the early stage,only 2000 mg/kg group changed significantly (P<0.05). Feed utilization efficiency of APS groups was increased significantly in the male broilers, the ADG in female birds of 1000 mg/kg and 2000 mg/kg group increased significantly (P<0.05). In the late stage, ADG and feed convension ratio (FCR) in all the APS groups had no significant difference except for 3000 mg/kg female group, which was significantly lower than control group (P<0.05). (2)In the early stage, the thymus index in all APS groups had no significant difference,the new castle disease antibody titer of 1000 mg/kg group was significantly increased in male and female broilers(P<0.05). In the late stage, the thymus index of 1000 mg/kg group,the bursa of Fabricius and spleen index of 2000 mg/kg group were significantly increased in male broilers. The immune organs in female broilers and the new castle disease antibody titer in the male and female broilers all had no significant difference compared with the control group(P<0.05).

【题目】圈卷链霉菌7100分化相关基因-sawE的结构与功能
【中文关键词】圈卷产色链霉菌7100 分化相关基因 sawE 结构 功能 形态分化
【英文关键词】无
【中文摘要】以天蓝色链霉菌的whiB基因为探针,从圈卷产色链霉菌7100的总DNA部分文库中克隆了含有whiB同源序列的2.8kbDNA片段,并对其中的1.4kb片段进行了序列测定。序列分析表明,该片段含有一个完整的开放阅读框--sawE。预测的蛋白质结构及同源性分析显示,sawE与天蓝色链霉菌孢子形成早期的关键基因whiB高度同源,编码产物为一个调控蛋白。SawE的破坏使圈产色链霉菌7100的分化终止在气生菌丝阶段,在延长培养时间的情况下仍保持白色的表型,菌丝不能分隔,不能形成成熟的灰色孢子,结果表明sawE基因是一个与圈卷产色链霉菌分化有关的重要基因。

【题目】Disruption of sabR affects nikkomycin biosynthesis and morphogenesis in Streptomyces ansochromogenes
【中文关键词】无
【英文关键词】nikkomycin, regulatory gene, sporulation, Streptomyces ansochromogenes
【中文摘要】无
【英文摘要】The gene, sabR, encoding a receptor for gamma-butyrolactone, was cloned from the genomic DNA of Streptomyces ansochromogenes 7100. Its deduced protein shows strong homology to several gamma-butyrolactone-binding proteins in Streptomyces. Disruption of sabR retarded nikkomycin production in liquid media containing glucose or glycerol as carbon source. Sporulation of sabR disruption mutants was earlier than the parent strain on solid media with glucose or glycerol as carbon source. However, disruption of sabR had no effect on either nikkomycin production or sporulation on media containing mannitol as carbon source, suggesting that sabR is a pleiotropic regulatory gene that controls the onset of nikkomycin production and sporulation in S.

ansochromogenes and is related to the utilization of carbon source.

【题目】Structure and Function of sanV: A Gene Involved in Nikkomycin Biosynthesis of Streptomyces ansochromogenes
【中文关键词】无
【英文关键词】nikkomycin biosynthesis,sanV, Streptomyces ansochromogenes
【中文摘要】无
【英文摘要】A 6.3-kb BamHI- BglII DNA fragment was cloned from cos20 by using chromosome walking strategy. It was partially sequenced with the result that there is a possible ORF of 1272 nucleotides. The ORF designated sanV was deposited in GenBank under accession no. AF469955. Database search indicated that the deduced protein of sanV shows 28% identity and 44% similarity over 405 amino acid residues to the large component (E) of glutamate mutases from Clostridium cochlearium. Gene disruption was performed to study the function of sanV. It was found that sanV disruptants exhibited much poorer inhibition to the test strain than the wild-type S. ansochromogenes 7100. Furthermore, HPLC analysis indicated that the sanV disruptants almost did not produce nikkomycins X and Z, whereas they accumulated new nikkomycins O(x) and O(z), which revealed that sanV is an important gene involved in the biosynthesis of the peptidyl moiety of nikkomycins.

【题目】Cloning and characterization of sanO, a gene involved in nikkomycin biosynthesis in Streptomyces ansochromogenes
【中文关键词】无
【英文关键词】DNA sequence, gene expression, nikkomycin, sanO, Streptomyces ansochromogenes.
【中文摘要】无
【英文摘要】AIMS: To clone and characterize sanO, a gene involved in the biosynthesis of nikkomycins in Streptomyces ansochromogenes. METHODS AND RESULTS: A 4.5-kb BamHI-KpnI fragment was cloned and sequenced. Sequence analysis revealed that this fragment contains three complete open reading frames. The largest one with 2034 bp was designated sanO, which encodes a protein consisting of 667 amino acids with high similarity to module of peptide synthetase. sanO disruption mutants produced no nikkomycin X, but formed nikkomycin Z at almost the same level of the wild-type strain. The production of nikkomycin X can be recovered by genetic complementation of sanO disruption mutants. Primer extension also revealed that transcription start point(tsp) of sanO was localized 87 bp upstream of the potential start codon (GTG). CONCLUSIONS: sanO was essential for the biosynthesis of nikkomycin X. SIGNIFICANCE AND IMPACT OF THE STUDY: Nikkomycins have received increased interest of study because of their prospective application in agriculture and medicine. Cloning and characterization of genes involved in the nikkomycin biosynthesis will help to elucidate the whole biosynthetic pathway of nikkomycins.

【题目】Cloning, Function and Expression of sanS:A gene essential for nikkomycin biosynthesis of Streptomyces ansochromogenes
【中文关键词】无
【英文关键词】nikkomycin biosynthesis,sanS, Streptomyces ansochromogenes
【中文摘要】无
【英文摘要】A 2-kb SmaI DNA fragment was cloned from the cosmid library of Streptomyces ansochromogenes. This DNA fragment contains a complete open reading frame which is 1275 bp in length, designated sanS (GenBank accession no. AF322179). The deduced SanS protein consists of 424 amino acids and belongs to a superfamily of enzymes with an unusual ATP-grasp fold. The disruption and complementation of sanS indicated that sanS is essential for nikkomycin biosynthesis in Streptomyces ansochromogenes. The sanS gene was subcloned into expression vector pET23b and overexpressed in E. coli BL21 (DE3). The protein was then purified and showed ATPase activity.

【题目】Enhanced production of nikkomycin X by over-expression of SanO, a non-ribosomal peptide synthetase in S. ansochromogenes
【中文关键词】无
【英文关键词】gene expression, nikkomycin, non-ribosomal peptide synthetase, sanO, Streptomyces ansochromogenes
【中文摘要】无
【英文摘要】A recombinant strain was constructed by introducing pWO6 which contains the sanO gene encoding a non-ribosomal peptide synthetase (NRPS) into Streptomyces ansochromogenes 7100 (wild-type strain). The bioassay of nikkomycin indicated that the

anti-fungal activity was enhanced in the recombinant strain in comparison with the wild-type strain. HPLC analysis revealed that 1200 mg nikkomycin X l(-1) was produced in the recombinant strain after growth for 6 d, which was about twice that of the wild-type strain. RT-PCR also indicated that higher transcription of the sanO gene was observed in the recombinant strain in contrast with wild-type strain.

【题目】Improvement of nikkomycin production by enhanced copy of sanU and sanV in Streptomyces ansochromogenes and characterization of a novel glutamate mutase encoded by sanU ans sanV
【中文关键词】无
【英文关键词】nikkomycin, regulatory gene, sporulation, Streptomyces ansochromogenes
【中文摘要】无
【英文摘要】Previous studies revealed that two genes-sanU and sanV were associated with nikkomycin biosynthesis in Streptomyces ansochromogenes. A plasmid used to increase an extra copy of sanU and sanV was constructed and introduced into wild-type strain. HPLC results showed that nikkomycin production of recombinant strain was about 1.8 fold than that of wild-type strain. RT-PCR analysis indicated that the transcriptional level of sanU and sanV in this recombinant strain was about two folds than that of wild-type strain. The sanU and sanV were expressed in E. coli BL21 (DE3). SanU and SanV were purified individually. SanU and SanV assembled with coenzyme B12 to form a complete enzyme in vitro, which showed glutamate mutase activity. The glutamate mutase converted L-glutamate toL-threo-beta-Methylaspartic acid, and then l-threo-beta-Methylaspartic acid was probably deaminated to form 2-oxo-3-methylsuccinic acid to join biosynthetic pathway of the peptidyl moiety HPHT in S. ansochromogenes. SanU is the coenzyme B12-binding component and more than two folds of SanU are required for maximal enzyme activity. The optimal pH and temperature for the formed enzyme are 7.5-8.5 and 35-42 degrees C, respectively. Sulfhydryl compounds are important for activity of the reassembled enzyme.

【题目】A pathway-specific transcriptional regulatory gene for nikkomycin biosynthesis in Streptomyces ansochromogenes that also influnces colony development
【中文关键词】无
【英文关键词】nikkomycin biosynthesis,sanV, Streptomyces ansochromogenes
【中文摘要】无
【英文摘要】DNA sequence analysis of a 7.5 kb XhoI DNA fragment from the region flanking the nikkomycin biosynthesis gene cluster in Streptomyces ansochromogenes revealed one 3.3 kb open reading frame (ORF), designated sanG. The deduced product of sanG (1061 amino acids), which is similar to PimR of Streptomyces natalensis, contains an OmpR-like DNA binding domain in its N-terminal portion and A- and B-type nucleotide binding motifs in the middle of the protein. Disruption of sanG abolished nikkomycin biosynthesis, reduced sporulation and led to brown pigment accumulation. All aspects of this complex phenotype were complemented by a single copy sanG which was integrated into the chromosome. The introduction of multiple copies of sanG resulted in increased nikkomycin production. S1 mapping results indicated that sanG is transcribed from at least three promoters (P1, P2 and P3), P1 being strongly upregulated when production of nikkomycins starts. Two putative transcription units for nikkomycin biosynthesis, starting from sanN and sanO, are dependent on the expression of sanG, whereas a putative transcription unit starting from sanF was not regulated by sanG. These results suggested that sanG encodes a transcriptional activator important for nikkomycin biosynthesis that, unusually, also has pleiotropic effects on secondary metabolism and development.

【题目】SanJ, an ATP-dependent picolinate-CoA ligase, catalyzes the conversion of picolinate to picolinate-CoA during nikkomycin biosynthesis in Streptomyces ansochromogenes
【中文关键词】无
【英文关键词】DNA sequence, gene expression, nikkomycin, sanO, Streptomyces ansochromogenes.
【中文摘要】无
【英文摘要】Nikkomycins, a group of peptidyl nucleoside antibiotics, are competitive inhibitors of chitin synthase. The nikkomycin biosynthetic gene cluster has been cloned previously from Streptomyces ansochromogenes. The cluster contains 25 complete ORFs including sanJ. The sanJ gene was inactivated by the insertion of a kanamycin resistance gene and the resulting disruption mutants failed to produce nikkomycins. Moreover, the nikkomycin production was restored by complementation with a single copy of sanJ. The deduced product of sanJ bears striking sequence similarity with enzymes belonging to the adenylate-forming superfamily. sanJ was overexpressed as a His6-tagged fusion protein in Escherichia coli and purified to apparent homogeneity by affinity chromatography. The purified SanJ demonstrated adenylate ligase activity in the presence of picolinate or its analogs (benzoate, nicotinate, 4-methoxybenzoate, 4-hydroxybenzoate), ATP and Mg2+. SanJ was also found to catalyze the conversion of picolinate, benzoate, nicotinate to their corresponding CoA esters and 4-methoxybenzoate, 4-hydroxybenzoate to their respective AMP derivatives in vitro. This was unambiguously shown by using HPLC and electrospray ionization mass spectrometry (ESI-MS) or by comparing the reaction product with an authentic standard of benzoyl-CoA. These results indicated that sanJ encodes an ATP-dependent picolinate-CoA ligase which is essential for nikkomycin biosynthesis.

【题目】SanT, a bidomain protein, is essential for nikkomycin biosynthesis of Streptomyces ansochromogenes
【中文关键词】无
【英文关键词】sanC, Streptomyces ansochromogenes, nikkomycin, secondary metabolism.
【中文摘要】无
【英文摘要】Nikkomycins act as a competitive inhibitor of chitin synthetase and display potent activities against phytopathogenic and human pathogenic fungi. sanT is located in the gene cluster of nikkomycin biosynthesis in Streptomyces ansochromogenes. Sequence analysis revealed that the deduced product of sanT has an unusual domain structure, which consists of an N-terminal acyl carrier protein (ACP) domain and a C-terminal aminotransferase (AMT) domain. Gene disruption and complementation indicated that sanT is essential for nikkomycin biosynthesis. Each domain of SanT was overexpressed in Escherichia coli and then purified. ACP domain is posttranslationally modified with phosphopantetheine (Ppant) prosthetic group at Ser-33. AMT domain catalyzes the transamination of 4-pyridyl-2-oxo-4-hydroxyisovalerate (POHIV), a precursor of peptidyl moiety of nikkomycins, to pyridylhomothreonine (PHT) in vitro. The two domains function independently but both are essential for nikkomycin biosynthesis. The biochemical and genetic evidences suggested that SanT is possibly a bifunctional protein, participating in the biosynthesis of peptidyl moiety and the assembly of nikkomycins.

【题目】SanM catalyzes the formation of 4-pyridyl-2-oxo-4-hydroxyisovalerate in nikkomycin biosynthesis by interacting with SanN
【中文关键词】无
【英文关键词】nikkomycin biosynthesis,sanS, Streptomyces ansochromogenes
【中文摘要】无
【英文摘要】Nikkomycins are peptidyl nucleoside antibiotics with potent activities against phytopathogenic and human pathogenic fungi. The sanM and sanN genes are required for the nikkomycin biosynthesis of Streptomyces ansochromogenes. In the present study, interaction between SanM and SanN was identified by yeast two-hybrid and co-immunoprecipitation assays. Moreover, SanM and SanN were heterologously expressed and purified. Further biochemical assay demonstrated that the SanM-SanN interaction is essential for SanM aldolase activity but not for SanN dehydrogenase activity. SanM converts piconaldehyde and 2-oxobutyrate to 4-pyridyl-2-oxo-4-hydroxyisovalerate in nikkomycin biosynthesis by interacting with SanN. Steady state kinetics analysis revealed that K(m) and k(cat)/K(m) of SanM are 123.2 microM and 11.4 mM(-1)s(-1) for picolinaldehyde, while 335.6 microM and 4.0 mM(-1)s(-1) for 2-oxobutyrate, respectively. However, SanN as a dehydrogenase is independent of SanM.

【题目】Identification and characterization of sawC, a whiA-like gene, essential for sporulation in Streptomyces ansochromogenes
【中文关键词】无
【英文关键词】gene expression, nikkomycin, non-ribosomal peptide synthetase, sanO, Streptomyces ansochromogenes
【中文摘要】无
【英文摘要】sawC, encoding a protein homologous to the WhiA sporulation regulator of Streptomyces coelicolor, was cloned from a fairly distantly related species, Streptomyces ansochromogenes. Disruption of sawC led to formation of aerial mycelium much longer than normal spore chains and with somewhat increased coiling, indicating that sawC plays an important role in the cessation of aerial hyphal growth similar to that of whiA, and that it has an effect on cell wall structure. However, complementation of sawC and whiA mutants with the same DNA fragment gave different results, which suggested that there may be some difference in regulation or function of WhiA/SawC between the two strains. S1 nuclease mapping identified one transcription start point of sawC. Using EGFP as a reporter, the spatial expression of sawC was shown to be confined to aerial hyphae. Computer-aided structural prediction analysis of SawC/WhiA proteins revealed the presence of a fold very similar to the endonuclease domain of PI-PfuI, raising the possibility that these proteins may interact with an intermediate in DNA repair or replication.

【题目】Identification and characterization of sanH and sanI involved in the hydroxylation of pyridyl residue during nikkomycin biosynthesis in Streptomyces ansochromogenes
【中文关键词】无
【英文关键词】nikkomycin, regulatory gene, sporulation, Streptomyces ansochromogenes
【中文摘要】无
【英文摘要】Nikkomycins are highly potent inhibitors of chitin synthase. The nikkomycin biosynthetic gene cluster has been cloned from Streptomyces asochromogenes. Two cytochrome P450 monooxygenase genes (sanQ, sanH) and one ferredoxin gene (sanI) were found in the cluster. It was reported that SanQ is involved in the hydroxylation of L: -His, a key step in 4-formyl-4-imidazolin-2-one base biosynthesis. Here, we have studied the function of sanH and sanI. Disruption of sanH abolished the production of nikkomycin X and Z, but it accumulated one dominant component nikkomycin Lx, which is the nikkomycin X analog lacking the hydroxy group at the pyridyl residue. The sanI disruption mutant accumulated predominantly nikkomycin Lx in addition to nikkomycin X and Z. The nikkomycin production profile of the sanH and sanI double disruption mutant was the same as that of the sanH disruption mutant. These results confirmed that SanH is essential for the hydroxylation of pyridyl residue in nikkomycin biosynthesis of S. ansochromogenes and first demonstrated that SanI is an effective electron donor for SanH, but not for SanQ in vivo.

【题目】The tyrosine degradation gene hppD is transcriptionally activated by HpdA and repressed by HpdR in Streptomyces coelicolor, while hpdA is negatively autoregulated and repressed by HpdR

【中文关键词】无
【英文关键词】nikkomycin biosynthesis,sanV, Streptomyces ansochromogenes
【中文摘要】无
【英文摘要】Streptomyces coelicolor produces a brown pigment on nutrient-limited agar medium (Tyr-PM) using l-tyrosine as the sole nitrogen and carbon source. The pigment production is associated with the second step of l-tyrosine catabolism catalysed by 4-hydroxyphenylpyruvate dioxygenase (HppD), which converts 4-hydroxyphenylpyruvate (4HPP) to 2, 5-dihydroxyphenylacetate (homogentisate) to provide the carbon and energy substrates for the growth of S. coelicolor on Tyr-PM. An hppD mutant did not produce brown pigment, and its normal growth was impaired on Tyr-PM. hpdA and hpdR, located close to hppD, were identified as activator and repressor genes for hppD transcription in the presence of tyrosine. hpdA, divergently transcribed from hppD, is negatively autoregulated in the absence of tyrosine, whereas it is repressed by both its own protein and HpdR in the presence of tyrosine. Electrophoretic mobility shift assays and footprinting experiments showed that HpdA and HpdR each bind to an overlapping region spanning the promoters of both hppD and hpdA, and that 4HPP, instead of tyrosine, is the specific ligand modulating the binding patterns and footprints of HpdA and HpdR on the hppD-hpdA promoter region. These results suggested that the transcription of hppD is subject to coarse and fine control by a complex regulatory system.

【题目】Identification of a Nitroalkane Oxidase Gene: naoA Related to the Growth of Streptomyces ansochromogenes
【中文关键词】无
【英文关键词】DNA sequence, gene expression, nikkomycin, sanO, Streptomyces ansochromogenes.
【中文摘要】无
【英文摘要】naoA, encoding a nitroalkane oxidase that can catalyze toxic nitroalkanes to their corresponding aldehydes or ketones and hydrogen peroxide, was cloned from Streptomyces ansochromogenes, but its function related to the growth of Streptomyces is unknown. naoA was disrupted by the insertion of a kanamycin-resistance gene; the resulting strain can grow earlier than a wild-type strain under the same conditions. It was shown that naoA disruption accelerated growth of the naoA-disruption mutant, which could restore its phenotype and morphology as a wild-type strain by complementation of a single copy number of naoA inserted into the chromosome. The introduction of an extra copy of naoA into the wild-type strain resulted in delayed growth. The result suggested that

naoA is an important gene related to the growth of S. ansochromogenes.

【题目】sanN encoding a dehydrogenase is essential for Nikkomycin biosynthesis in Streptomyces ansochromogenes
【中文关键词】无
【英文关键词】sanC, Streptomyces ansochromogenes, nikkomycin, secondary metabolism.
【中文摘要】无
【英文摘要】Nikkomycins are a group of peptidyl nucleoside antibiotics with potent fungicidal, insecticidal, and acaricidal activities. sanN was cloned from the partial genomic library of Streptomyces ansochromogenes 7100. Gene disruption and complementation analysis demonstrated that sanN is essential for nikkomycin biosynthesis in S. ansochromogenes. Primer extension assay indicated that sanN is transcribed from two promoters (sanN-P1 and sanN-P2), and sanN-P2 plays a more important role in nikkomycin biosynthesis. Purified recombinant SanN acts as a dehydrogenase to convert benzoate-CoA to benzaldehyde in a random-order mechanism in vitro, with respective Kcat/Km values of 3.8 mM-1s-1 and 12.0 mM-1s-1 toward benzoate-CoA and NADH, suggesting that SanN catalyzes the formation of picolinaldehyde during biosynthesis of nikkomycin X and Z components in the wild-type stain. These data would facilitate us to understand the biosynthetic pathway of nikkomycins and to consider the combinatorial synthesis of novel antibiotic derivatives.

【题目】Genetically engineered production of 1,1'-bis-valienamine and validienamycin in Streptomyces hygroscopicus and their conversion to valienamine
【中文关键词】无
【英文关键词】Aminocyclitol Antifungal Biosynthesis Validamycin Valienamine
【中文摘要】无
【英文摘要】The antifungal agent validamycin A is an important crop protectant and the source of valienamine, the precursor of the antidiabetic drug voglibose. Inactivation of the valN gene in the validamycin A producer, Streptomyces hygroscopicus subsp. jinggangensis 5008, resulted in a mutant strain that produces new secondary metabolites 1,1′-bis-valienamine and validienamycin. The chemical structures of 1,1′-bis-valienamine and validienamycin were elucidated by 1D and 2D nuclear magnetic resonance (NMR) spectroscopy in conjunction with mass spectrometry and bioconversion employing a glycosyltransferase enzyme, ValG. 1,1′-Bis-valienamine and validienamycin exhibit a moderate antifungal activity against Pellicularia sasakii. Chemical degradation of 1,1′-bis-valienamine using N-bromosuccinimide followed by purification of the products with ion-exchange column chromatography only resulted in valienamine, whereas parallel treatments of validoxylamine A, the aglycon of validamycin A, resulted in an approximately 1:1 mixture of valienamine and validamine, underscoring the advantage of 1,1′-bis-valienamine over validoxylamine A as a commercial source of valienamine.

【题目】hmgA, transcriptionally activated by HpdA, influences the biosynthesis of actinorhodin in Streptomyces coelicolor
【中文关键词】无
【英文关键词】nikkomycin biosynthesis,sanS, Streptomyces ansochromogenes
【中文摘要】无
【英文摘要】Homogentisate 1,2-dioxygenase (HmgA) converts homogentisate to maleylacetoacetate in the pathway of tyrosine catabolism in living organisms. Studies published to date have not elucidated the transcriptional regulation of hmgA and its biological function in Streptomyces spp. Here it is shown that the transcription of hmgA in Streptomyces coelicolor was activated by HpdA, an AsnC-type activator, in the presence of tyrosine. Disruption of hmgA led to enhanced production of diffusible brown pigment, suggesting that hmgA is required for tyrosine catabolism in Streptomyces coelicolor. The production of actinorhodin in the hmgA disruption mutant was several fold higher than that in the wild-type strain (M145), indicating that hmgA of tyrosine catabolism correlates with actinorhodin biosynthesis. Furthermore, S1 mapping showed that the transcription of actII-ORF4, a pathway-specific activator gene of actinorhodin biosynthesis, was increased in the hmgA disruption mutant. These results reveal the transcriptional regulation of hmgA and the positive contribution of hmgA disruption to the actinorhodin biosynthesis in Streptomyces coelicolor.

【题目】An unusual response regulator influences sporulation at early and late stages in Streptomyces coelicolor
【中文关键词】无
【英文关键词】gene expression, nikkomycin, non-ribosomal peptide synthetase, sanO, Streptomyces ansochromogenes
【中文摘要】无
【英文摘要】WhiI, a regulator required for efficient sporulation septation in the aerial mycelium of Streptomyces coelicolor, resembles response regulators of bacterial two-component systems, but lacks some conserved features of typical phosphorylation pockets. Four amino acids of the abnormal "phosphorylation pocket" were changed by site-directed mutagenesis. Unlike whiI null mutations, these point mutations did not interfere with sporulation septation, but had varying effects on spore maturation. Transcriptome analysis was used to compare gene expression in the wild-type strain, a D27A mutant (pale grey spores), a D69E mutant (wild-type spores), and a null mutant (white aerial mycelium, no spores) (a new variant of PCR targeting was used to introduce the point mutations into the chromosomal copy of whiI). The results revealed 45 genes that were affected by the deletion of whiI. Many of these showed increased expression in the wild-type at the time when aerial growth and development were taking place. About half of them showed reduced expression in the null mutant, and about half showed increased expression. Some, but not all, of these 45 genes were also affected by the D27A mutation, and a few by the D69E mutation. The results were consistent with a model in which WhiI acts differently at sequential stages of development. Consideration of the functions of whiI-influenced genes provides some insights into the physiology of aerial hyphae. Mutation of seven whiI-influenced genes revealed that three of them play roles in spore maturation.

【题目】Rapid and effective methods for breaking seed dormancy in buffalobur (Solanum rostratum)
【中文关键词】无
【英文关键词】Scarification, endosperm cap, gibberellic acid, potassium nitrate, sulfuric acid.
【中文摘要】无
【英文摘要】The spread of buffalobur in China poses a serious threat to existing ecosystems, and control and eradication of this specieshave become increasingly important. Studies were carried out to ascertain the seed production, morphologicalcharacterization, dormancy behavior, and methods for breaking dormancy of buffalobur. The results showed that a singlebuffalobur plant could produce 1,600 to 43,800 seeds with an average weight of 3.0 mg. Average seed length, width, andthickness were 2.5, 2.0, and 1.0 mm, respectively. Newly ripened buffalobur seeds were innately dormant and exhibitedcombinational dormancy, which involves a hard seed coat (physical dormancy, PY), a partial dormant embryo(physiological dormancy, PD), and a dark requirement to germinate. PY of buffalobur seeds could be broken by dehuskingor acid scarification by 14 M H2SO4 for 15 min, with germination rates of 55 or 50%, respectively. PD was effectivelybroken by KNO3 or gibberellic acid (GA3). The optimum concentration for KNO3 was between 20 and 40 mM, whichresulted in over 70% seed germination. When presoaked with GA3 at 30 C in dark for 24 h, maximum germination(. 98%) was obtained at 2.4 mM, the corresponding germination speed (85%) and germination index (16) were alsohighest at this concentration. Synergistic effects were observed in seed germination when H2SO4 and GA3 were combined.The most rapid and effective combination in breaking dormancy was when the seeds were immersed in H2SO4 (14 M) for20 min and presoaked with 2.4 mM GA3 for 24 h. Germination index for this combination was over 35, and 95% of theseeds germinated within 7 d. Knowledge gained in this study will be useful in increasing germination of buffalobur andfacilitating further laboratory studies.

【题目】沙棘果渣提取物对小麦型日粮鸡蛋品质调控的研究
【中文关键词】畜牧学;小麦日粮;鸡蛋品质;沙棘果渣提取物;蛋鸡
【英文关键词】animal science; wheat-based diet; egg quality; hippophae rhomnoides fruit resides extraction; layer
【中文摘要】选用365 日龄的健康罗曼商品蛋鸡480 只,随机分为5 个组,每组3 个重复,每个重复32 只。5 组蛋鸡饲喂5 种日粮,分别为小麦基础日粮及在此基础上分别添加0.5% 、1% 、2% 和4% 的沙棘果渣提取物形成的试验日粮,研究从沙棘果渣中提取的黄色素对鸡蛋蛋黄的着色效果、营养价值的影响。结果表明:在产蛋鸡日粮中添加沙棘果渣提取物能够极显著(P < 0.01)提高蛋黄罗氏比色扇(R C F)值、蛋黄颜色的红值a* 和黄值b*,并显著(P < 0.05)降低蛋黄亮值L;能显著(P < 0.05)降低蛋黄胆固醇含量,但各添加水平之间无明显差异;能显著(P < 0.05)提高蛋黄中类胡萝卜素含量,且随着添加水平的提高,蛋黄中类胡萝卜素总量上升。沙棘果渣提取物有提高蛋鸡生产性能的趋势,对蛋重、蛋形指数、鸡蛋比重和哈夫单位无显著(P > 0.05)影响。
【英文摘要】This experiment was conducted to test the effect of hippophae rhomnoides fruit resides extraction (HRE) on egg yolk color of layer fed wheat-based diet. 480 Lohman layers at 53 weeks were allotted to five dietary treatment randomly (three replicates of 32 layers per replicate). The dietary treatments were: wheat diet (C),C+0.1%,0.2%,0.4% and 0.8% HRE, respectively. The results showed that: (1) the RCF of yolk in the trial groups increased significantly (P < 0.05), but the values were no more than 6. (2) with the increas of HRE from 0 to 4%, a* increased (P < 0.05) and Ldecreased significantly (P < 0.05), b* increased extremely (P < 0.01). (3) Yolks from the higher levels of HRE showed aproportionally higher content of total carotenoids deposition (P < 0.01), and the content of cholesterin decreased significantly(P < 0.05)

【题目】热应激对快速生长型肉仔鸡脂肪沉积规律的影响
【中文关键词】热应激; 脂肪沉积; 肉仔鸡
【英文关键词】heat stress; body fat deposition; broilers
【中文摘要】将126 只35 日龄AA 商品肉用仔公鸡随机分成高温自由采食组、适温自由采食组及适温配对试验组3组, 每组6 个重复, 每个重复7 只鸡, 饲养在人工环境控制舱内的层叠式育雏笼中, 研究热应激对肉仔鸡脂肪沉积的影响。56 日龄时,

停食12 h, 从每个重复中随机抽取3 只鸡进行屠宰测定。研究结果表明, 在自由采食条件下, 35 ℃高温热应激显著降低AA 肉仔鸡腹脂重、右腿皮脂重、右腿肌间脂肪重、腹脂率、右腿皮脂率、右腿肌间脂肪率(P <0.05) 。但是与适温配对组相比, 热应激显著升高AA 肉仔鸡腹脂重、右腿肌间脂肪重、腹脂率、右腿肌间脂肪率(P <0.05) , 而对右腿皮脂重、右腿皮脂率两组间差异不显著(P > 0.05)

【英文摘要】One hundred and twenty six 35- day- old male broilers were divided into 3 groups with 6 replicates to study the effects of heat stress on body fat deposition of broilers.One group broilers fed ad libitum in neutral thermal environment (AT 22 ℃ and RH 55 %) .Another group broilers raised in high temperature by ad libitum feeding (AT 35 ℃ and RH 55 %) , and the third group broilers raised in neutral thermal but given feed consumed by heat- stress chickens just before one day.It was found heat stress(AT 35 ℃ and RH 55 % significantly decreased the content of abdominal fat, skin and subcutaneous fat and intermuscular fat under ad libitum feeding conditions.Compared to pair- feeding, heat stress significantly enhanced the lipid contents of abdominal, intermuscular, but lipid contents of skin and subcutaneous had no significant difference.

【题目】应激模式对不同品种肉鸡肉色的影响

【中文关键词】应激模式; 肉鸡; 品种; 肉色

【英文关键词】Stress model; Broiler; Breed;Meat color

【中文摘要】采用2×3 二因素随机区组试验设计, 探讨了在相同日龄屠宰及相同生长周期屠宰条件下适温自由采食、适温限饲和高温自由采食3 种应激模式对AA 肉鸡和北京油鸡肉色造成的差异。结果表明: 按相同日龄屠宰时, 2 个品种肉鸡之间胸肌亮度、红度、黄度均差异极显著; 3种应激模式之间的亮度、红度、黄度差异均不显著。按相同生长周期屠宰时, 2 个品种肉鸡之间的亮度、红度差异极显著, 黄度差异不显著; 3 种应激模式下的亮度差异显著, 红度、黄度差异不显著。

【英文摘要】To study the effects of stress models on broilers. meat colors, the differences of meat colors between AA broiler and Beijing You broiler were discussed among three stress models on the condition that slaughtered at the same age and slaughtered during the same growing period separately. The three stress models were fitting temperature and ad libitum, fitting temperature and restriction, high temperature and ad libitum. The experiment involved 6 reatments with 6 repeats, 2×3 factorial arrangement, consisting of 2 levels of broiler breeds and 3 levels of stress models. Results show that, when slaughtered at the same age, the differences of the lighteness、redness、yellowness of musculus pectoralis were all very significant between the two broiler breeds andwere not significant among the three stress models. When slaughtered during the same period, the differences of the lightenless and the redness were very significant and the differences of the yellowness was not significant between the two broiler breeds, the differences of the lightenless was signif-icant among the three stress models, and the differences of the redness and the yellowness were not significant.

【中文关键词】北京鸭;空肠液;消化酶
【英文关键词】Peking duck ; jejunal fluid ; digestive enzyme
【中文摘要】本试验旨在通过研究鸭空肠套管中食糜流量及空肠液中消化酶活性的变异,探讨获取相对可比的空肠液样品的适宜采样方案,为鸭小肠中消化酶酶谱的研究提供依据。采用3 ×6 (日期×时间) 完全随机设计,每4 h 采集1 次空肠食糜,每采集1 h 后间隔3 h ,隔日重复采样过程,共采集3 d。试验1 ,随机选择15 只荷术鸭,分成5 个重复,每个重复3 只鸭,测定空肠套管中食糜的流量。试验2 ,从鸭群中随机选择24只荷术鸭,分成6 个重复,每个重复4只鸭,测定空肠液中淀粉酶、胰蛋白酶、糜蛋白酶的活性。结果表明:空肠套管内的食糜流量呈现出日间及日内变异,日内食糜流量呈现出先升后降的总体规律。日内采样时间对空肠液中淀粉酶、胰蛋白酶、糜蛋白酶活性有极显著的影响(P < 0101) 。不同日间,淀粉酶、糜蛋白酶的日平均活性有显著差异(P < 0105) ,而胰蛋白酶日间平均活性没有显著差异(P = 0128) 。3 种消化酶活性均呈现出同一日内随采样时间而逐渐降低的总体现象。鉴于上述现象,通过套管获取反映鸭空肠中消化酶活性生理水平的采样方案为:白天采集3 次样品,每次采集1 h 间隔3h ,隔日重复采样,共采集3 d。
【英文摘要】The variation of jejunal digesta flux in cannula and digestive enzymes activities in jejuna fluid of Peking duck were investigated to st udy t he scheme of representive jejunal fluid sample. The 3 6 factorial t reatment was performed in two experiment s and jejunal digesta samples were collected for 1 h out of every 4 h on d 16 , 18 and 20 of the experiment . In experiment 1 , fif teen male Peking ducks of 18 wk of age fit ted a T type jejunal cannula were randomly allotted into 5 replication with 3 birds per replication. The volume per h of jejunal digesta in cannula was deter2 mined. In experiment 2 , twenty2four cannulated ducks were randomly selected and divided into 6 replication with 4 birds per replication. The amylase , t ryp sin and chymot ryp sin activities in jeju2 nal fluid were determined. The result s showed that t here was obvious variation of digesta flux in cannula wit h collection time and collection day. Collection time significantly affected the average activities of amylase , t ryp sin and chymot ryp sin in 24 h cycle (P < 0101) . Significant differences were al so found in the average activities of amylase and chymot ryp sin among days (P < 0. 05) . Three digestive enzymes activities were declining wit h collection time in a 24 h cycle. According to the result s , it is possible to develop a representative sampling scheme t hat sampling for 1 h out of every 4 h in t he daylight at 1 day interval for 5 days for st udying in endogenous digestive en2 zymes.

【题目】国外种质对中国大豆育成品种遗传贡献的分子证据
【中文关键词】大豆;育成品种;引进种质;遗传贡献
【英文关键词】Soybean; Cultivars; Soybean germplasm introduction; Genetic contribution
【中文摘要】用SSR标记对32份中国大豆品种与40份国外引进大豆育成品种祖先亲本的遗传多样性进行分析,以明确引进国外大豆种质对中国大豆育种的遗传贡献。结果表明,在22个SSR位点共检测到170个等位变异,中国大豆和引进国外大豆平均等位变异数分别为6.0和6.9个,遗传多样性指数都为0.71,国外品种中检测到48个特有等位变异,而中国大豆中仅检测到22个,且共有等位变异在中外大豆中的分布频率差异较大。聚类分析也发现中国育成品种与国外引进大豆存在较大差异。遗传组成分析发现,Amsoy和十胜长叶2个国外种质的引入使5个中国大豆育成品种增加了23个国外种质特有等位变异;其在育成品种中的保留比例为29.13%,但不同遗传背景中保留的等位变异不同,说明国外种质在中国大豆育种中起着重要作用,而且仍有很多特有等位变异没有被利用,可以继续作为亲本在中国大豆改良中发挥作用。
【英文摘要】Molecular marker analysis can be used to quantify diversity of Chinese and introduced soybean germplasm and can provide useful information for the relationship of these materials1 The genetic diversity of 32 Chinese varieties and 40 foreign ancestral cultivars were investigated by 22 SSR markers1 One hundred and seventy alleles were detected , with an average of 610 and 619 in Chinese and foreign materials , respectively1 The polymorphism information content (PIC) was 0171 in both populations , which indicated a relatively high genetic diversity1 There were 48 specific alleles in foreign materials and only 22 in Chinese varieties1 The frequency of the alleles in common was very different in the two populations1 Great differentiation was also observed between the two

populations when UPGMA cluster analysis was used1 We analyzed the pedigree of five Chinese cultivars derived from two introduced soybean cultivars , Amsoy and Tokachi nagaha , and found 23 specific alleles from foreign materials1 The reserved specific alleles were different in each genetic background , and 29113 % specific alleles were reserved in total1 This indicated that the introduction of foreign materials in Chinese soybean breeding increased the soybean genetic diversity1 For foreign materials , more pecific alleles have not been used yet , and should be used as parental materials in elite lines breeding in the future to enlarge the genetic bases of Chinese soybean1

【题目】大豆粗蛋白、粗脂肪含量近红外检测模型建立及可靠性分析
【中文关键词】大豆;近红外;蛋白质;脂肪
【英文关键词】Soybean; N IS; Protein; Oil
【中文摘要】大豆是重要的植物蛋白和食用油来源,目前常用的蛋白质和脂肪化学分析方法不仅操作步骤繁琐,而且籽粒粉碎而不能延续后代,在大豆品质改良的后代选育过程中的应用受到限制。为明确快速、简便、非破坏籽粒的近红外检测方法利用的可行性。利用4个建模样品集,采用偏最小二乘法建立了3个近红外大豆粗蛋白、粗脂肪籽粒检测模型和1个粉末检测模型。通过重新采集8个不同蛋白质和油份含量的大豆样品检测分析,并送检权威检测部门进行化学分析比较,分析近红外检测的可靠性。通过稳定性、一致性等分析表明,合适的建模样品集是正确建模的前提,在所建3个籽粒模型中,以含415个大豆材料的样品集所建模型(M6)可靠性最好;分析结果还表明,近红外检测结果与化学分析结果一致,在需要保存籽粒完好的大豆杂交分离世代或大量样品检测时,用近红外检测代替化学分析是可行的。
【英文摘要】Soybean p rovides a major source of p rotein and oil. The p resent analysismethod of p rotein and oil is time2consu2 ming and destructive, and its app lication in high oil and high p rotein breeding is restricted, hence, rap id and nondestructive analysismethod is required for quality imp rovement. This research was done in order to validate the reliability of the near in2 frared spectroscopy(N IS) models which was rap id, simp le and nondestructive. Near infrared spectroscopy of 4 samp le pools were emp loyed to develop regression models depending on least squares. They were 3 seed model and 1 powdermodel. De2 pending on re2samp ling, comparison was done among 7 results including 3 chemistry results from different elite testing2cen2 ter and 4 N ISmodels ’ results. The result showed that the suitable samp le poolwas necessary for excellentmodels. M6 which depended on a samp le including 415 samp les was the best one among 3 N IS seed model. Correlation among differentmeth2 ods were obviously consistent. Hence, usingN ISmodels to substitute chemistrymethod was reliable especially for large scale nondestructive testing.

【题目】排空-强饲法测定鸭饲料氨基酸真消化率的研究1
【中文关键词】北京鸭;氨基酸真消化率;排空-强饲法
【英文关键词】Beijing duck ; True digestibility of amino acids ; Emp tying2f orce2f eeding met hod
【中文摘要】本试验旨在通过研究“ 排空2强饲 ”条件下,鸭饲料氨基酸的排泄规律是否满足Sibbald “ 排空-强饲 ”法的基本条件,为Sibbald 法是否适合于鸭饲料氨基酸真消化率的测定提供参考。试验采用单因素完全随机设计,将84只成年公鸭随机分配到7个处理中,即饥饿组和6 种试验日粮组(豆粕在试验日粮中的比例分别为0 、10 %、20 %、30 %、40 %、50 %) ,每个处理4 个重复,每个重复3 只鸭,以“ 排空-强饲 ”法测定日粮的氨基酸排泄量。结果表明,在以豆粕为唯一氨基酸来源

【中文摘要】的日粮中,成年公鸭17 种氨基酸的排泄量与摄入量间呈极显著的线性关系(P < 0101) 。无氮日粮条件下内源性组氨基酸的排泄量显著地高于饥饿条件下所测值(P < 0105) ,而其他内源性氨基酸的排泄量在饲喂无氮日粮与饥饿条件下无显著差异。鸭氨基酸排泄量与摄入量间回归直线截距中仅精氨酸、组氨酸及甘氨酸的回归截距显著地高于饥饿法所测相应的内源性氨基酸值(P < 0. 05) ,而其他14 种氨基酸的回归截距与饥饿法所测相应的内源性氨基酸无显著差异。因此,Sibbald “ 排空-强饲 ” 法可以用于鸭饲料氨基酸真消化率的测定。然而,客观、准确地估测内源性氨基酸的量对 “ 排空-强饲 ” 法氨基酸真消化率的测定值至关重要。

【英文摘要】The relationship between outp ut and intake of amino acids in ducks was investigated t o study t he f easibility of Sib2 bald ’ s emp tying2f orce2f eeding met hod f or t rue digestibility of amino acids dete rmination. Eighty f our male adult ducks we re randomly divided int o 7 t reatments wit h 4 replicates pe r t reatment and 12 ducks p er replicate . One t reatment was f asted t reatment and ot her 6 t reatments we re f ed wit h soybean meal wit h 6 levels in diets (0 % , 10 % , 20 %, 30 %, 40 % , and 50 % respectively) . Sibbald ’ s emp tying2f orce2f eeding met hod was used t o dete rmine t he volume of amino acid outp ut . The results showed t hat t he signif icant linea r relationship between amino acids outp ut and intake was app ea red in t hese 6 diets using soy2 bean meal as t he only p rotein source (P < 0. 01) . The endogenous losses of 17 amino acids excep t His we re not signif icantly dif f erent between t he ducks f ed wit h nit rogen2f ree diet and t he f asted t reatment (P < 0. 05) . In t he regression inte rcep ts of outp ut and intake of amino acids in ducks , only t he regression inte rcep ts of Arg , His and Gly were signif icantly highe r t han t he cor resp onding endogenous amino acids value of f asting ducks (P < 0. 05) . In conclusion , Sibbald ’ s emp t ying2f orce2f eed2 ing met hod can be used f or measuring t he t rue digestibility of amino acids of duck f eedstuf f , but t he accuracy of t he dete rmi2 nation of endogenous amino acids losses is imp ortant t o t he t rue digestibility of amino acids in ducks . 【题目】用SSR标记鉴定大豆杂交组合F1 的方法研究

【中文关键词】SSR; 大豆; F1; 分子标记辅助鉴定

【英文关键词】SSR; Soybean; Hybrid; Marker assisted identification

【中文摘要】为建立鉴定大豆杂种的方法,采用亲本间有多态性的3对SSR引物,对148个耐盐与盐敏感大豆品种正反交F1 植株进行分子鉴定,结果表明,有81. 8%的F1 为真杂种,且3对多态性SSR引物检测结果一致;在亲本基因型纯合的情况下,采用1对在亲本间有多态性的SSR引物即可对F1 真伪进行准确判断;亲本间分子量差异大的SSR位点可用高浓度琼脂糖电泳进行快速鉴定。利用该方法对2007年参加国家大豆区试的大豆杂交种品系H022286的50粒种子进行纯度鉴定,进一步验证了SSR标记检测杂种真伪的可行性。

【英文摘要】In order to test the verity of hybrids derived from the cross of salt tolerant and salt sensitive cultivars, three polymorphic SSR markers between soybean parentswere selected to evaluate 148 hybrids. The purity ratio of soybean hybrids is 81. 8% , and the results identified by different SSR markerswere identical. This study indicated, if the parents were pure lines, that a single app rop riate SSR marker can be used to test seed purity of the hybrids. The SSR lociwith great fragment length different between the parents should be selected in order to identify the genotypes by agarose gel. In order to estimate the effectiveness of thismethod, fifty seeds of a hybrid line named H022286 were used as materials for further research, and the result showed the feasibility of this method.

【题目】直接法与差量法测定豆粕鸭代谢能值的比较研究1
【中文关键词】北京鸭;代谢能;直接法;差量法
【英文关键词】Beijing duck ; Metabolizable energy ; Di rect met hod ; Dif f e rence met hod
【中文摘要】本试验旨在通过比较研究直接法与差量法测定豆粕鸭代谢能值的差异,为豆粕鸭代谢能值的客观评定提供参考。试验采用单因素完全随机设计,将84 只成年公鸭随机分配到7 个处理中(豆粕在试验日粮中的比例分别为0 %、10 %、20 %、30 %、40 %、50 %、100 %) ,每个处理4个重复,每个重复3只鸭,以排空强饲法测定日粮的代谢能值。结果表明,日粮中豆粕的含量从10 %升高到50 %时,日粮的AME 和TME 的实测值均显著高于其计算值(P < 0. 05) 。然而,在试验日粮中豆粕含量为40 %时, 试验日粮的AMEn 和TMEn 实测值与计算值无显著差异(P > 0. 05) 。在试验日粮中豆粕含量分别为10 %、20 %、30 %时, 由差量法测得的豆粕鸭代谢能值(AME、TME、AMEn 和TMEn) 显著高于直接法测值(P < 0. 05) 。在试验日粮中豆粕含量分别为40 %、50 %时,差量法测得的豆粕AME、TME 值显著高于直接法测值,但在AMEn 、TMEn 上与直接法无显著差异。因此,在鸭的代谢能值测定中,差量法应要求日粮的豆粕含量达到40 %~50 %。豆粕的AMEn 和TMEn 值既可选用直接法,也可选用差量法测定,但在AME、TME 的测值上建议使用差量法。
【英文摘要】This study was conducted t o establish a reasonable met hod f or determining t he metabolizable ene rgy (ME) of soy2 bean meal in ducks by comp aring direct met hod wit h dif f erence met hod in ME determination. Eighty2f our adult ducks we re randomly divided int o seven t reatments wit h f our replicates each and 12 ducks in each replicates . Seven t reatments were f ed wit h 7 diets containing 7 levels of soybean meal (0 %, 10 % , 20 % , 30 %, 40 %, 50 %, and 100 %, respectively) . Sibbald ’ smet hod was used t o dete rmine ME. The results showed t hat t he dete rmined AME and TME values of 5 diets (soybean meal content of 10 %, 20 %, 30 % , 40 %, 50 %) were signif icantly highe r t han t hei r calculated values (P < 0. 05) . Howeve r , t he re was no signif icant dif f e rence between determined value and calculated value of AMEn and TMEn in t he diet wit h 40 % soy2 bean meal . When dieta ry soybean meal contents were 10 %, 20 %, and 30 % , t he ME values (AME , TME , AMEn , TMEn) of soybean meal dete rmined wit h dif f erence met hod we re signif icantly highe r t han t hose dete rmined wit h direct met hod (P < 0. 05) . When dieta ry soybean meal contents we r 40 % and 50 %, t he AME and TME values of soybean meal dete rmined wit h dif f e rence met hod we re highe r t han t hose dete rmined wit h direct met hod (P < 0. 05) , but t he re was no signif icant dif f erence in t he AMEn and TMEn values dete rmined wit h t hese two methods (P > 0. 05) . In conclusion , to determine the ME values of soybean meal with difference method , the optimal dietary soybean meal content should be 40 %~50 %. The AMEn and TMEn value of soybean meal can be determined with both direct method and difference method , but when determining AME and TME determined values ,it was suggested to use difference method. 【题目】不同油脂日粮中添加RRR- α-生育酚琥珀酸酯对肉鸡生产性能、抗氧化和免疫功能的影响
【中文关键词】RRR- α - 生育酚琥珀酸酯; 肉鸡; 生产性能; 抗氧化; 免疫
【英文关键词】RRR2A2t oco phe ro l succinate; Br o ilers; Per f ormance; Anto x idation; Immunity
【中文摘要】本试验旨在研究不同油脂日粮中添加RRR - α生育酚琥珀酸酯(α - TOS) 对肉鸡生产性能、抗氧化和免疫功能的影响。选用600 只1 日龄AA 肉鸡, 随机分为10 个处理, 每个处理6 个重复, 每个重复10 只鸡。试验采用2× 5因子设计, 即2 种油脂(新鲜油脂和氧化油脂) 和5 种 α - 生育酚类型, 分别为30 mg / kg all – rac - α - 生育酚,醋酸酯(TOA1) 、3 0 mg/ kg RRR - α - 生育酚醋酸酯(TOA2) 及15、3 0、6 0 mg/ kg α -TOS(TOS1 、TOS2 和TOS3) 。试验期为42 d。结果表明: 1) α - TOS 和氧化油脂显著影响1~ 21 日龄肉鸡的料重比, 对其他生产性能无显著影响(P > 0. 05) ; 2) 随着 α - TOS 添加量的增加, 不同油脂日粮肉鸡血清中三碘甲状腺原氨酸(T3) 和促甲状腺激素(TSH) 水平均升高, 皮质醇显著降低, 血清的抗氧化能力不同程度提高(P < 0. 05 或P < 0. 01) , 丙二醛(MDA) 含量显著降低和新城疫抗体效价升高(P < 0. 05) ; 3) 氧化油脂日粮使肉鸡血清激素水平、抗氧化酶活性和新城疫抗体效价均下降, 低于同水平添加 α - TOS 新鲜油脂组(P> 0. 05) 。结果提示, 氧化油脂日粮能诱导肉鸡产生免疫应激, 并导致生产性能和抗氧化功能下降; 日粮中添加 α - TOS 能一定程度上提高肉鸡生产性能、血清抗氧化功能及机体免疫功能, 且在不同油脂日粮中均以60 mg/ kg α - TOS 添加组的作用效果最佳。

【题目】低磷日粮中添加植酸酶对蛋鸡产蛋性能、内源消化酶及养分消化率的影响
【中文关键词】植酸酶; 蛋鸡; 产蛋性能; 消化酶; 养分消化率
【英文关键词】phytase; laying hen; laying performance; digestive enzyme; nutrient utilization

【中文摘要】为探明在低磷的玉米-豆粕型日粮中添加植酸酶对蛋鸡产蛋性能、内源消化酶及养分消化率的影响,该研究选用18周龄体重、产蛋周龄相近的伊莎褐蛋鸡840 羽, 随机分成7组: 对照1(Ⅰ 组, 基础日粮, 未添加植酸酶) 、对照2(Ⅱ组, 有效磷水平降低0. 12 个百分点)及在对照2 基础上分别添加300 U /kg、1 000 U /kg 和10 000U / kg 的包衣状植酸酶、300 U /kg的粉状植酸酶及300 U /kg 的微丸状植酸酶(试验Ⅲ、Ⅳ、 Ⅴ、Ⅵ和Ⅶ组)。结果表明: 与对照2相比, 除Ⅴ组外, 各试验组的产蛋量和产蛋率显著提高(P < 0.05), 平均蛋重和破蛋率则差异不显著(P > 0. 05); 蛋品质的各项指标无显著差异(P > 0.05); 各试验组的淀粉酶、二糖酶活性无显著差异(P > 0.05) , 组的胰蛋白酶活性得到了显著提高(P < 0.05); 各试验组的干物质、灰分、能量及氨基酸的表观消化率无显著差异,Ⅳ组的钙、磷及蛋白质的利用率得到了显著提高(P < 0.05)。由此可见, 在低磷日粮中添加适量的植酸酶可改善蛋鸡的产蛋性能, 增强蛋鸡肠道消化酶活性并能提高饲料的养分消化率。

【英文摘要】To evaluate the effects of low available phosphorus (AP) diet supplemented with phytase on the laying performance, the activity of digestive enzyme and nutrient utilization in laying hens, 18week old laying hens (n = 840) were randomly allocated into 7 groups. Group Ⅰ, as the positive control, w as fed with the basal diet. Group Ⅱ, as the negative control was fed with low-AP diet groups Ⅲ,Ⅳand Ⅴ were fed with low AP diet adding coaed dosage-form phytase at three levels (300 U /kg, 1 000 U /kg and 10 000 U /kg, respectively). Groups Ⅵ and Ⅶ were supplemented with 300 U / kg phytase of powdery dosage form and granular dosage form, respectively. The results indicated that com pared with the negative control, the addition of phytase to the low AP diet did not significantly affect egg weight, broken eggshell rate, the indexes o f egg quality, the activity o f amylase, the activity of disaccharidase and the apparent digestibility of dry matter, ash and energy (P > 0. 05), but significantly enhanced the egg production, laying rate, the activity of trypsin in group Ⅳ and the apparent digestibility of Ca, P and protein (P < 0. 05). It was concluded that low AP diet supp lemented with phytase could increase laying performance, the activity of digestive enzyme and nutrient utilization in laying hens. The 300 U /kg coated phytase was enough to meet the nutrient requirement o f laying hens for growth and production.

【英文关键词】lead;feed regulation;animal product;contamination;decrease lead

【中文摘要】环境中的铅可通过生物链污染饲料和动物性产品,带来食品安全风险。本文总结了铅的污染来源、铅在动物中的代谢及其影响因素,归纳了饲料及动物食品中铅的污染现状,重点叙述近年来铅的减量控制技术研究进展,并分析展望了今后的研究重点,以期为保障动物食品的质量安全提供参考。

【英文摘要】Lead is one of the most toxic substances to animals and human. Lead in environment could be accumulated in animal food through food chains such as feed or water, and result in problems of food safety. The sources of lead pollution, lead metabolism and factors in animals, and lead contamination in feed and animal products were reviewed in this paper. In addition, methods of feed control technologies to decrease lead content in animal products were also discussed. Moreover, future research directions were proposed.

【题目】复合酶对蛋鸡生产性能鸡蛋品质血液生化指标的影响

【中文关键词】复合酶; 蛋鸡; 生产性能; 鸡蛋品质; 血液生化指标
【英文关键词】complex enzyme; egg-layer; production performance; egg quality; blood biochemical indexes
【中文摘要】研究复合酶制剂对蛋鸡产蛋后期生产性能、鸡蛋品质及血液生化指标的影响。结果表明: 添加复合酶制剂对产蛋率和料蛋比有一定的改善作用, 但对蛋重和鸡蛋品质无显著影响; 复合酶制剂3 组总蛋白、球蛋白、血磷含量均显著增加(P< 0. 05) , 各试验组白蛋白和甘油三酯含量均有不同程度的提高, 而尿素含量均有不同程度的降低。
【英文摘要】The effect of complex enzyme preparations on production performance, egg quality and blood biochemical indexes of egg- layers in later laying stage was studied. The results showed that adding complex enzyme preparations improved the egg laying rate and feed- egg ratio in a certain extent, but influenced the egg weight and quality not significantly. The content s of total protein, globulin and blood phosphor in three groups of complex enzyme preparations were all increased significantly (P< 0. 05) , the contents of albumen and triglyceride in each test group were all increased in different degrees, while the content s of urea were all decreased in different degrees.

【题目】酵母蛋白粉替代肉鸡日粮中鱼粉的效果研究1
【中文关键词】酵母蛋白; 肉鸡; 生产性能; 营养物质; 利用率
【英文关键词】yeast prote in mea ;l bro iler; production perfo rmance; nutritive; utiliza tion
【中文摘要】选用1日龄AA肉鸡600羽随机分成5组, 每组设6 个重复, 每个重复20 羽, 分别饲喂鱼粉对照日粮和用酵母蛋白粉等能等蛋白替代对照日粮中25%、50%、75%和100%鱼粉的试验日粮, 研究用活性酵母蛋白粉替代鱼粉作为蛋白源对肉鸡生长性能以及养分利用率的影响。结果表明: 100%替代组的后期增重较对照组提高0.84% (P > 0.05) , 100%替代组的后期及全期料重比较对照组降2.20%和1.56%, 但差异均不显著(P > 0.05)。各组之间营养物质的利用率差异不显著(P > 0.05)。100%替代组可以降低饲料成本和增重成本。酵母蛋白粉替代肉鸡日粮中的鱼粉是可行的。
【英文摘要】In order to study the effects of replacement of dietary fish meal with yeast protein meal as the protein source on performance and the nutritive utilization of broilers, 600 AA commercial broilers of 1 day old were randomly assigned into 5 groups with 6 replicates for each. Five dietary treatments we re fish meal basal diet, replacement of the fish meal with yeast protein meals at the level of 25%, 50%, 75% and 100%, respectively. The results showed that fish meal replacement of 100% by yeast protein meal improved the daily weight gain 0.84% from 1 to 21 day slightly compare with fish mea l group, and the feed /gain was lower than the control group 2.20% from 22 to 41 day and 1.56% from 1 to 41day, but not significantly (P > 0.05). The utilization of nutrients w as no improved (P > 0.05). Replacement of 100% could reduce the cost of feed and the cost of increasing unit weight. It suggests that replacement of fish meals with yeast protein the in the diet of broilers is practicable.

【题目】植酸酶对樱桃谷肉鸭能量、蛋白质和氨基酸利用率及消化酶活性的影响
【中文关键词】植酸酶; 樱桃谷肉鸭; 营养素利用率; 消化酶活性
【英文关键词】Phytase; Cherry Valley Meat Ducks; Nutrient availability; Digestive enzyme activities
【中文摘要】本试验研究了颗粒饲料中添加植酸酶对樱桃谷肉鸭能量、养分利用率和消化酶活性的影响。试验随机选取600只樱桃谷肉鸭,随机分为5个处理,每个处理6个重复,每个重复20只肉鸭。分为Ⅰ组(正对照组,饲喂基础日粮),Ⅱ组(负对照组,有效磷水平降低,未添加植酸酶),Ⅲ、Ⅳ、Ⅴ组(分别在负对照的基础上添加500、1 000及10 000 U/kg植酸酶)。结果表明:(1)与Ⅱ组相比,Ⅳ组21日龄肉鸭能量表观利用率、脂肪真利用率分别提高了3.18%和13.27%(P<0.05);Ⅳ组42日龄干物质、粗蛋白质、粗脂肪表观利用率及粗脂肪真利用率显著提高(P<0.05),分别提高了10.07%、9.45%、17.49%和16.56%;(2)Ⅳ组21日龄肉鸭丝氨酸、甘氨酸、半胱氨酸和苯丙氨酸,42日龄甘氨酸、丙氨酸、蛋氨酸、异亮氨酸和酪氨酸的表观消化率比Ⅱ组均有显著提高(P<0.05);(3)Ⅳ组21日龄空肠蛋白酶和二糖酶活性分别比Ⅱ组高14.29%和17.87%,差异显著(P<0.05);42日龄Ⅳ组胰蛋白酶活性和Ⅲ、Ⅳ组脂肪酶活性较Ⅱ组显著提高(P<0.05)。试验结果表明,日粮颗粒饲料中添加不同水平的植酸酶可不同程度地提高樱桃谷肉鸭消化酶活性和养分利用率,其中以1 000 U/kg添加水平效果最佳.
【英文摘要】The trial was conducted to study the effect of phytase on energy, nutrient availability and digestive enzyme activities of cherry valley meat ducks. Six hundred one-day-old healthy ducks were randomly divided into 5 groups with 6 replicates and 20 ducks in each replicate. The dietary treatments were as follows: group Ⅰ was basic diet without phytase as the positive control group; group Ⅱ was basic diet with reduced AP as the negative control group; group Ⅲ was diet Ⅱ with plused 500 U/kg phytase; group Ⅳ was diet Ⅱ with plused 1 000 U/kg phytase; group Ⅴ was diet Ⅱ with plused 10 000 U/kg phytase. The results showed that: 1)compared with group Ⅱ, energy apparent utilization and crue lipid true utilization of 21-day-old meat-strain ducks were increased significantly by 3.18% and 13.27% in group Ⅵ(p<0.05). respectively; apparent utilization of dry matter and crude protein, apparent and true utilization

of crude lipid of 42-day-old meat-strain ducks were increased significantly by 10.07%, 9.45% and 17.49% in groupⅣ($p<0.05$), respectively; 2) compared with group Ⅱ, apparent availabilities of Ser, Gly, Cys and Phe were increased significantly at the age of 21 days($p<0.05$),as were as that of Gly, Ala, Met, Ile and Tyr at the age of 42 days($p<0.05$); 3) at the age of 21 days, protease and disaccharidase activities in jejunum in group Ⅳ were increased significantly by 14.29% and 17.87 than that in group Ⅱ ($p<0.05$); at the age of 42 days, trypsin activity in group Ⅳ and lipase activity in group Ⅲ and Ⅳ in jejunum were significantly improved compared with that in group Ⅱ ($p<0.05$). Results indicated that phytase supplementation in the pellet diets of ducks could improve nutrient availability and digestive enzyme activities, and the optimal supplemental level of phytase was 1 000 U/kg.

【题目】用分离群体中的残余杂合系定位大豆 C1 连锁群的分枝数qBN-c1-1 位点
【中文关键词】大豆;分枝数;残余杂合系;QTL
【英文关键词】soybean; branch number; residual heterozygous line; quantitative trait locus (QTL)
【中文摘要】:【目的】大豆分枝数与大豆株型及产量关系密切,检测世代间可稳定遗传的大豆分枝数QTL,为大豆株型和产量育种的分子标记辅助选择奠定基础。【方法】根据科新3 号×中黄20 杂交组合F2群体构建的分子遗传图谱,对F2:4 群体进行QTL 定位,并利用定位QTL 两侧的标记选择残余杂合个体,构建残余杂合系,对分枝数相关的QTL 进行验证。【结果】在F2:4群体将分枝数QTL(qBN-c1-1)定位在C1 连锁群区间satt294-Satt399,贡献率为12.01%,来自于科新3 号亲本的加性效应为-0.51;用F2:5 选出残余杂合系,将控制大豆分枝数QTL 定位在C1 连锁群Satt399-Satt361 区间,贡献率为11.16%,来自于科新3 号的加性效应为-1.74,研究结果与F2:4 群体一致。【结论】位于C1 连锁群的与分枝数相关的QTL 在该遗传背景下可稳定遗传。
【英文摘要】【Objective】 Branch number is one of the major factors related to both plant type and yield in soybean. The objective of this study was to map the branch number related QTL, and analyze the inheritance stability over generations for the improvement of yield in marker assistant selection (MAS) in soybean. 【Method】 A molecular genetic map was constructed by using the F2 population derived from KeXin3×ZhongHuang20, which was used to map the branch number related QTL with F2:4 population. Residual heterozygous lines were selected from F2:5 population by two markers flanking the QTL, to construct secondary separated population. 【Result】 The QTL related to branch number was located at the interval of Satt294 and Satt399 on linkage group C1, explained 12.01% of the variance and the additive effect is -0.51, and the effect originated from KeXin3. QTL analysis by the residual heterozygous line mapped the QTL of soybean branch number between Satt399 and Satt361, with R2 of 11.16% and additive effect of -1.74, and the inhibited effect also originated from Kexin3, which was the same with result of F2:4 population.【Conclusion】 The branch number related QTL was mapped on soybean linkage group C1 and could be stably inherited in different generations from the same cross.

【题目】优良大豆品种合丰25 的遗传组成
【中文关键词】大豆; 合丰25; 系谱; SSR; 遗传组成
【英文关键词】Soybean (Glycine max); Hefeng 25; Pedigree; SSR; Genetic composition

【中文摘要】合丰25 由合丰23 和克4430-20 杂交选育而成, 是我国大豆生产上累计种植面积最大的品种。本研究利用463 个SSR 标记对合丰25 及亲本进行检测, 并分析其遗传组成及其与亲本的遗传关系。463 个SSR 位点中有177 个位点在合丰25 的两个亲本间无多态性, 合丰23 和克4430-20 对合丰25 的遗传贡献率分别为39.4%和48.3%。在G和E 两个连锁群发现克4430-20 有大片段传递给合丰25, 特别是G 连锁群没有发现来自合丰23 的片段, 而合丰23在L 连锁群传递给合丰25 的位点是克4430-20 的2.3 倍。不同连锁群亲本染色体片段的组成不同, 可能与产量、抗病性等重要性状相关QTL 的分布有关, 从而使合丰25 通过重组集合了两个亲本的优点。合丰25 在57 个位点出现新等位变异。为分析位点突变对合丰25 纯度的影响, 用包括57 个位点在内的207 个SSR 标记对12 个不同销售点的合丰25 种进行检测, 207 对SSR 引物中有13 对在4 个大豆样本中检测到杂合条带, 而8 个样本的纯度均为100%。说明大部分突变位点已在品种利用过程中纯合, 合丰25 的优异基因型及其在推广20 多年后仍保持的高纯度, 是其在生产上利用经久不衰的主要原因之一。

【英文摘要】Elite soybean cultivar Hefeng 25, derived from a cross of Hefeng 23×Ke 4430-20, has an accumulated planting area of 13 million hectares and the longest planting history of soybean cultivars. The objective of this study is to evaluate the genetic composition of Hefeng 25 and the relationship of Hefeng 25 with the parents. Four hundred and sixty-three SSR markers wereused to screen Hefeng 25 and its parents Hefeng 23 and Ke 4430-20. Of the 463 SSR markers 177 were monomorphic between Hefeng 23 and Ke 4430-20 and 57 loci were detected in Hefeng 25 with new alleles mutated not from the parents. The genetic contribution of Hefeng 23 and Ke 4430-20 to Hefeng 25 was 39.4% and 48.3%, respectively based on molecular information. Analysis of each linkage group revealed that large portions of loci on linkage groups G, E, and L were inherited entirely from one parent. Especially on linkage group G, all loci were inherited from Ke4430-20. The loci on linkage group L inherited from Hefeng 23 were 2.3 fold of that from Ke4430-20. Detailed analysis showed that QTLs for yield and disease resistance may relate to these loci. These analyses suggested that breeders may select recombination events with agronomic favorable alleles of two parents. In order to evaluate the effect of SSR mutation on soybean seed purity, we screened Hefeng 25 seed samples from 12 different seed companies at 207 SSR loci including 57 mutated loci. Hybrid alleles were observed only in 4 seed samples at 13 SSR loci. The result indicated that most of the mutated loci were purified during the breeding process. The elite genotype and high seed purity of Hefeng 25 may be the most important factors for its long-term utilization in soybean production.

【题目】Genetic diversity comparison between Chinese and Japanese soybeans (Glycine max (L.) Merr.) revealed by nuclear SSRs

【中文关键词】无

【英文关键词】Genetic diversity; Germplasm pools; Glycine max,Soybean; SSR

【中文摘要】无

【英文摘要】Soybean (Glycine max (L.) Merr.) has a long planting history in both China and Japan. In order to investigate the genetic relationship between Chinese and Japanese soybeans, 205 Chinese soybean accessions, that represent the seven different soybean ecotypes, and 39 Japanese soybean accessions from various regions were analyzed by using 46 SSR loci. In total 745 alleles were detected with an average allele number of 16.2 per locus. The allelic frequencies varied from 0.002 to 0.554 with an average of 0.06. Cluster analysis with UPGMA separated the Chinese accessions from Japanese accessions, suggesting that soybean in these two countries form different gene pools. When comparing the Japanese soybean with that from seven different Chinese soybean ecotypes, 164 – 200 alleles were specific to the Chinese accessions and 64 – 112 specific to the Japanese accessions. The comparison of SSRs diversity revealed that accessions from China exhibited more genetic diversity than those from Japan. Thedata were analyzed to resolve the genetic structure and to interpret the evolutionary relationships between groups. Three distinct groups were identified, corresponding to Japanese soybean, Northern China soybean, Southern China soybean and a mixed group in which most accessions were from central China. The results indicate that accessions from Japan are distinct from Chinese ones, and Japanese accessions had more close relationship with Chinese northeast spring and southern spring ecotypes. We further analyzed five agronomic trait-related SSR loci and found that the preponderant alleles are different in Chinese and Japanese soybean. Our study provides important insights into further utilization of Japanese soybean in Chinese soybean breeding.

【题目】中品95-5117 抗大豆花叶病毒基因源分析
【中文关键词】大豆; 中品95-5117; 系谱; SMV
【英文关键词】Soybean; ICGR95-5117; Pedigree; SMV
【中文摘要】中品95-5117 和中品95-5383 是以中品661 为亲本选育的抗东北花叶病毒病3 号株系(SMV3)的大豆新品系。中品95-5383 抗病基因的SCAR 标记已被定位于大豆F 连锁群(Chr.13), 与抗病基因Rsv1 紧密连锁。利用大豆F 连锁群的34 个对SSR 标记引物及与抗病基因紧密连锁的SCAR 标记SCN11 及Rsv1 候选基因标记Rsv1-f/r, 对中品95-5117 系谱亲本进行检测, 结合对SMV3 的抗性鉴定结果进行分析, 旨在明确抗SMV3 基因在系谱中的传递规律,为利用分子标记辅助选择培育抗SMV3 新品种提供依据。通过SSR 标记分析发现, 中品95-5117 和中品95-5383 与亲本中品661 的相似性最高, 而与另外一个亲本鲁豆4 号关系较远。SCAR 标记SCN11 检测表明, 只有1 份材料Mangnolid(F-53)B 为感病基因型。系谱的Rsv1-f/r 标记分析表明, Williams 82 是中品95-5117 中Rsv1 基因的供体亲本。抗病性鉴定发现鲁豆4 号高抗SMV3, 但它并不携带Rsv1 基因。据上述结果推测中品95-5117 中不仅含有Rsv1,还具有来自鲁豆4 号的抗病基因, 证明该品系比其亲本中品661 具有对SMV3 更强的抗性。
【英文摘要】Soybean mosaic virus (SMV) is a prevalent viral pathogen of soybean. The soybean mosaic virus N3 (SMV3) is the most toxic strain in northeast China. Soybean lines ICGR95-5117 and ICGR95-5383 with high resistance to SMV3, which were all derived from ICGR661, are recently released from Chinese Academy of Agricultural Sciences. Several genes resistant to soybean mosaic virus have been identified and mapped on different soybean linkage groups by molecular markers. The resistance gene in ICGR95-5383 has been mapped on soybean linkage group F near Rsv1 gene. A dominant marker developed from the candidate gene of Rsv1 has been reported recently. The purpose of this research was to find the origin of the SMV3 resistance gene in ICGR95-5117 and the relationship of this resistance gene with Rsv1 by analyzing the pedigree. Thirty four SSR markers selected from linkage group F and two markers, SCAR marker (SCN11) tightly linked with resistance gene in ICGR95-5383 and Rsv1-f/r makers co-segregated with resistance gene Rsv1, were used to detect the materials in pedigree of ICGR95-5117. The similarity coefficient of the two lines between ICGR95-5117, ICGR95-5383 and ICGR661 was the highest. All the material except for Mangnolid(F-53)B had SMV3 resistance allele at locus SCN11. Williams 82 and ICGR661 had the same allelic variation at Rsv1-f/r locus with ICGR95-5117, revealing that the Rsv1 gene in ICGR95-5117 was inherited from Williams 82 via ICGR661. But ICGR95-5117 had higher resistance than ICGR661, indicating it might inherit different genes from SMV3 resistance parent Ludou4

【题目】持续高温对大豆品种萌发及幼苗生长的影响

【中文关键词】大豆; 萌发期; 幼苗期; 耐热性
【英文关键词】Soybean; Germination; Seedling; High temperature tolerance
【中文摘要】通过人工控温, 在大豆萌发期和幼苗生长期, 对10个栽培大豆品种和2个野生大豆材料实施38 °C持续高温处理, 研究了持续高温对大豆品种萌发及幼苗生长的影响。结果表明: 持续高温对大豆种子萌发没有显著影响, 但对幼苗生长的影响达到了显著水平, 且不同品种间存在差异。大豆品种的抗高温特性与籽粒大小、蛋白质含量和脂肪含量显著相关。野生大豆的抗高温能力远远高于栽培大豆。
【英文摘要】10 soybean cultivars and 2 wild soybean were treated under 38 °C during germination and seedling, and the effects of continuous high temperature on germination and seedling growth of soybean were studied1The results showed that continuous high temperature had no significant effects on germination rate, while had a significant influence on the seedling growth, and there were differences among different varieties1The high temperature tolerance had significant correlation with seed size and the contents of p rotein and fat1The high temperature tolerance of wild soybean was higher than that of cultivated soybean1

【题目】DNA导入和系选大豆品种及其亲本遗传关系的 SSR标记分析
【中文关键词】遗传分析, 系选品种, 大豆
【英文关键词】genetic analysis, intra-cultivar selected cultivars, soybean
【中文摘要】利用现有品种的变异进行系选并培育新品种是一种重要的育种方法。利用SSR标记, 对系选大豆(Glycine max)新品种和其亲本的遗传组成进行分析, 明确二者的遗传关系, 为大豆系选育种提供依据。使用48对SSR引物对22个大豆品种及其亲本进行分析, 结果表明, 由外源DNA导入育成的3个品种与其亲本的一致性为35.42% – 95.83%, 虽然供体相同, 但由于导入的外源DNA不同, 故育成的品种间差异很大。另外19个系选品种与其亲本的一致性为27.08% – 89.58%, 其中有6个品种与亲本间的差异小于30%。聚类分析发现, 所有参试品种分为东北春大豆及黄淮和南方大豆2类, 其中有8个品种不能与其亲本聚在一起, 说明系选品种并不完全是由于亲本通过突变获得。此外, 农艺性状与分子标记分析结果差异较大, 说明利用有限的农艺性状评价品种间的遗传关系存在一定的局限性。通过比较系选品种和亲本之间的保守位点发现, 特定等位变异出现次数≥7的位点有14个, 分布在11个连锁群, 其中有7个位点与产量和抗病性等重要农艺性状有关, 说明DNA导入和系选品种在选择变异性状的同时, 使一些与重要农艺性状有关的等位变异得到了保留。
【英文摘要】Intra-cultivar selection, reselection from existing cultivars by using intra-cultivar variation, is an important method in plant breeding. The main objective of this study is to evaluate the relationship of 22 soybean cultivars and 21 parents by use of 48 simple sequence repeat (SSR) loci. The genetic identity of 3 cultivars, developed by introducing foreign genome DNA through the pollen tube, and their parents was 35.42% – 95.83%. Cultivars derived from the same parent showed differences in identity because of the difference in exogenous DNA. The identity of 19 soybean cultivars breeded by intra-cultivar selection and their parents was 27.08% – 89.58%. Six cultivars showed < 30% identity with their parents. The 43 cultivars were clustered into Northeast spring, Huanghuai and South groups; 8 cultivars could not be grouped with their corresponding parents. The variation was from natural mutation but may also come from natural outcrossing. Agronomic and molecular data revealed great differences, which shows that use of only agronomic data is limited in evaluating relationship of cultivars. The preserved loci between parents and selected cultivars showed 14 SSR loci distributed in 11 linkage groups, specific allele was observed more than 7 times at each loci, and 7 alleles preserved in different materials were related to yield and disease-resistance quantitative trait loci. The result suggested that selecting for improved agronomic traits of soybean from elite cultivars preserved some alleles related to important characters such as yield.

【题目】Allelopathic effects of Conyza canadesis the germination and growth of wheat, sorghum, cucumber, rape and radish
【中文关键词】no
【英文关键词】Allelopathic effects, aqueous extracts, Conyza canadesis L., cucumber,
radish, rape, root exudates, seed germination, seedling growth , shoot
leachates, sorghum, wheat
【中文摘要】no
【英文摘要】The allelopathic effects of aqueous extract from Conyza canadesis weretested in Petri dishes in Laboratory and Greenhouse assays. The aqueous extractstrongly inhibited the germination, germination speed and seedling growth of sorghum(Sorghum vulgare Pers.), cucumber (Cucumis sativus L.), wheat (Triticum aestivumL.), rape (Brassica campestris L.) and radish (Raphanus sativus L.). Rape and radishwere more sensitive than other spp. C. canadesis released the allelochemicals mainlyas root exudates. The extract inhibited the hypocotyl and root growth ofendosperm-removed wheat and sorghum cultivated in darkness, but the inhibitoryeffect was drastic in sorghum than in endosperm-removed wheat. The aqueous extractdecreased the photosynthesis activity but increased the MDA contents of cucumberand radish. Thus allelopathic effects of C. canadesis affects non-photosynthesisactivity and MDA, but may also affect the photosynthesis activity.

【题目】Over-expression of an AT-hook gene, AHL22, delays flowering and inhibits the elongation of the hypocotyl in Arabidopsis thaliana.
【中文关键词】无
【英文关键词】Arabidopsis thaliana　AT-hook
Flowering time　Hypocotyl　Photomorphogenesis
【中文摘要】无
【英文摘要】The Arabidopsis genome encodes 29 AHL(AT-hook motif nuclear localized) proteins, but the functionfor most of them remains unknown. We report here astudy of the AHL22 gene, which was originally identifiedas a gain-of-function allele that enhanced the phenotype ofthe cry1 cry2 mutant. AHL22 is a nuclear protein with thebinding activity for an AT-rich DNA sequence. AHL22overexpression delayed flowering and caused a constitutivephotomorphogenic phenotype. The loss-of-function AHL22mutant showed no clear phenotype on flowering, butslightly longer hypocotyls. However, silencing four AHLgenes (AHL22, AHL18, AHL27, and AHL29) resulted inearly flowering and enhanced ahl22-1 mutant phenotype onthe growth of hypocotyls, suggesting genetic redundancyof AHL22 with other AHL genes on these plant developmentalevents. Further analysis showed that AHL22 controlledflowering and hypocotyl elongation might resultfrom primarily the regulation of FT and PIF4 expression,respectively.

【题目】Evaluation of putative reference genes for gene expression normalization in soybean by quantitative real-time RT-PCR.
【中文关键词】无
【英文关键词】reference genes;quantitative real-time RT-PCR
【中文摘要】无
【英文摘要】Background: Real-time quantitative reverse transcription PCR (RT-qPCR) data needs to benormalized for its proper interpretation. Housekeeping genes are routinely employed for thispurpose, but their expression level cannot be assumed to remain constant under all possibleexperimental conditions. Thus, a systematic validation of reference genes is required to ensureproper normalization. For soybean, only a small number of validated reference genes are availableto date.Results: A systematic comparison of 14 potential reference genes for soybean is presented. Theseincluded seven commonly used (ACT2, ACT11, TUB4, TUA5, CYP, UBQ10, EF1b) and seven newcandidates (SKIP16, MTP, PEPKR1, HDC, TIP41, UKN1, UKN2). Expression stability was examined byRT-qPCR across 116 biological samples, representing tissues at various developmental stages,varied photoperiodic treatments, and a range of soybean cultivars. Expression of all 14 genes wasvariable to some extent, but that of SKIP16, UKN1 and UKN2 was overall the most stable. Acombination of ACT11, UKN1 and UKN2 would be appropriate as a reference panel for normalizinggene expression data among different tissues, whereas the combination SKIP16, UKN1 and MTPwas most suitable for developmental stages. ACT11, TUA5 and TIP41 were the most stablyexpressed when the photoperiod was altered, and TIP41, UKN1 and UKN2 when the light qualitywas changed. For six different cultivars in long day (LD) and short day (SD), their expressionstability did not vary significantly with ACT11, UKN2 and TUB4 being the most stable genes. Therelative gene expression level of GmFTL3, an ortholog of Arabidopsis FT (FLOWERING LOCUS T)was detected to validate the reference genes selected in this study.Conclusion: None of the candidate

reference genes was uniformly expressed across allexperimental conditions, and the most suitable reference genes are conditional-, tissue-specific-,developmental-, and cultivar-dependent. Most of the new reference genes performed better thanthe conventional housekeeping genes. These results should guide the selection of reference genesfor gene expression studies in soybean.

【题目】大豆GmCOL8 基因的克隆及表达分析
【中文关键词】大豆; CONSTANS-like; 生物钟节律; 生物信息学
【英文关键词】Glycine max; CONSTANS-like; circadian clock; bioinformatics
【中文摘要】从大豆品种‘ 垦农18 ’中克隆了一个CONSTANS-like 基因, 命名为GmCOL8。进化树分析表明它属于CONSTANS-like亚家族1 的成员。mRNA 表达分析显示, GmCOL8 在短日下具有明显的生物钟节律性表达特性, 其表达高峰出现在凌晨。GmCOL8 主要在复叶中表达, 表达高峰出现在开花时期。
【英文摘要】A CONSTANS-like gene, named GmCOL8, was cloned from soybean (Glycine max) cultivar ‘ Kennong 18 ’ in the study. The analysis of phylogenetic tree showed that GmCOL8 was a member of soybeanCONSTANS-like subfamily group 1. The mRNA expression pattern revealed that GmCOL8 had rhythmicity ofcircadian clock under the condition of short day, and reached a peak at dawn. It expressed mainly in trifoliolates,and the maximum level appeared at the stage of flowering.

【题目】大豆GmCOL4 基因的克隆与分析
【中文关键词】CONSTANS; 生物信息学; 生物节律钟; 光周期; 大豆
【英文关键词】CONSTANS; Bioinformatics; Circadian clock; Photoperiod; Glycine max L.
【中文摘要】CONSTANS (CO)是植物光周期开花途径中的关键基因之一。通过RT-PCR 和生物信息学的方法, 克隆了大豆GmCOL4 基因并分析其结构特征, 用实时荧光定量PCR (quantitative real-time RT-PCR, qRT-PCR)研究了其转录特点。结果表明, GmCOL4 的4 个外显子编码一个具有B-box 和CCT 保守结构域的CO-like 蛋白, 在序列上与拟南芥(Arabidopsis thaliana) COL9 相似性最高, 为64.3%。分析其转录特征发现, GmCOL4 表达主要受生物节律的影响, 受光的调节作用较弱。器官特异性表达分析发现, GmCOL4 主要在大豆叶片中表达, 表达模式与COL9 相似。这为大豆中CO 基因家族的功能研究提供了重要的依据。
【英文摘要】The model plant Arabidopsis thaliana has been identified to have four major flowering pathways. Among them, thephotoperiod pathway integrates the light signal including light/dark cycle, light spectrum, light intensity, and light duration, tomediate flower initiation. CONSTANS (CO) is a key gene in photoperiodic flowering pathway and acts between genes of the circadianclock and meristem identity. CO encodes a protein containing two zinc finger regions (B-box I and II) near the amino terminusand a CCT (CO, CO-like, TOC1) domain near the carboxy terminus. The CO from Arabidopsis thaliana is one member ofthe family comprised of 17 members, which can be classed into three subgroups based on their characters of functional domains.To elucidate the function of CO in flowering in soybean, cloned one of CO-like gene, named as GmCOL4, from Glycine max L.Kennong 18. Bioinformatics analysis revealed that GmCOL4 encoded a protein embedded two conserved domains, B-box andCCT, and belonged to subgroup III. Phylogenetic analysis based on the critical amino acid sequences indicated that GmCOL4 wasmuch close to COL9 with similarity of 64.3%. The expression profiles of GmCOL4 by quantitative real-time RT-PCR (qRT-PCR)showed a similar

pattern to that of COL9. GmCOL4 was largely regulated by biological circadian, while the light appeared weakeffect on it. And GmCOL4 expressed mainly in leaves and had its highest amount in anthesis. The results suggested that GmCOL4is one of the important genes in the regulation of flowering and photoperiodic in soybean. It paves a way to study the function ofCO family in soybean and its application in soybean molecular breeding.

【题目】Chlorothalonil degradation by Ochrobactrum lupini strain TP-D1 and identification of its metabolites
【中文关键词】百菌清(TPN) 代谢途径 Ochrobactrum lupini
【英文关键词】Chlorothalonil (TPN) • Metabolic pathway • Ochrobactrum lupini
【中文摘要】作为中国和其他国家常用的广谱杀真菌剂,百菌清(TPN)成为水和土壤的重要污染物。本研究从河南省重污染土壤中分离到一株新的百菌清降解菌TP-D1,根据其16S rDNA序列分析结果和其形态及生理生化特征将其鉴定为Ochrobactrum lupini。在添加50 μg/ml.g百菌清的无机盐培养液或灭菌土中,接种TP-D1,4天和7天后,该菌株对百菌清的降解率分别为90.4% 和99.7%。其降解产物除文献报道的TPN-OH (代谢物A)以外,还检测到二种新的代谢物,分别是methyl 2, 5, 6-trichloro-3-cyano-4-methoxy-benzoate (代谢物 C) 和methyl 3-cyano-2, 4, 5, 6-tetrachlorobenzoate(代谢物 D),表明TP-D1可将TPN的-CN基团转化为酰胺,该结果为采用其他途径进行TPN污染土壤的生物修复提供了可能。
【英文摘要】Chlorothalonil (2,4,5,6-tetrachloroisophthalonitrile, TPN) has been widely used as a wide-spectrum fungicide in China and other countries, and is considered to be an important soil and water contaminant. Here we reported the isolation and characterization of a novel TPN-degrading bacterial strain TP-D1 from a heavily TPN-polluted soil in Henan Province, China. Cells of strain TP-D1 are gram-negative, rod-shaped and motile with one or two polar flagellum. Full-length 16S rRNA gene sequence analysis and biochemical and physiological characterization confined this strain into Ochrobactrum lupini. When TPN was supplemented in mineral salt medium and autoclaved soil at 50 μg ml (g) − 1, strain TP-D1 can degrade 90.4% and 99.7% of TPN after incubation for 4 and 7 days, respectively. Two new metabolites were determined to be methyl 2,5,6-trichloro-3-cyano-4-methoxy-benzoate (metabolite C), and methyl 3-cyano-2,4,5,6-tetrachlorobenzoate(metabolite D) except previously reported metabolite 4-hydroxy-2,5,6-trichloroisophthalonitrile (TPN-OH, metabolite A). However, TPN-OH is still the major metabolite, it could persist in the phosphate buffer in the sample of day 6, while other metabolites only could be detected in the sample of day 2. Based on the determination of the metabolites, four metabolic pathways involved in the TPN degradation by TP-D1 were proposed. The detection of metabolite C and D indicated that the cyano-group in TPN could be converted into amides by pure culture of TP-D1, and suggested the possibility of the engineering of the bacterium for the bio-remediation of TPN-polluted soil in an alternative pathway.

【题目】中间偃麦草RAR1基因的分离及其在小麦背景中的功能分析

【中文关键词】RAR1;分离;小麦;转基因;PCR 检测;抗病性

【英文关键词】RAR1; Isolate; Wheat; Transgene; PCR assay; Disease resistance

【中文摘要】【目的】RAR1 是大麦抗白粉病基因和多种植物抗病(resistance, R)基因介导的抗病信号途径中的重要信号元件。为明确 RAR1 在小麦抗白粉病反应中的作用,为小麦广谱抗病分子育种提供基因资源,开展了本研究。【方法】采用生物信息学技术、RT-PCR 和 RACE 方法分离克隆中间偃麦草 RAR1 基因,通过酶切和连接构建该基因的单子叶高效表达载体,采用基因枪法转化小麦,对转基因小麦植株进行分子检测、表达分析和抗病鉴定。【结果】分离克隆出中间偃麦草 RAR1 基因,其编码蛋白具有典型的 RAR1 功能结构域;构建了中间偃麦草 RAR1 基因的单子叶高效表达载体 pUBI∷RAR1;用基因枪法轰击小麦推广品种扬麦 12 幼胚愈伤组织 1545 个,获得 152 株再生植株,通过 PCR 检测出阳性植株 18 株,转化率为 1.17%;对 T1、T2代转基因材料进行 PCR 检测、RT-PCR 分析和白粉病抗病鉴定,结果表明转入的 RAR1 基因能够在小麦背景中遗传,RAR1 基因的超量表达可提高小麦对白粉病菌的抗性、拓宽小麦的抗病谱。【结论】分离出中间偃麦草 RAR1 基因,RAR1 基因在小麦中超量表达可提高小麦对白粉病菌的抗性、拓宽其抗病谱,可以作为小麦白粉病广谱抗性分子育种的潜在的重要基因资源。

【英文摘要】【Objective】The study established the foundation to understand the role of RAR1 gene in wheat resistance to diseases,especially powdery mildew, as RAR1 is a required component in some signaling pathways mediated by disease resistance (R) genes in many plant species. 【Method】 RT-PCR and RACE methods were used to isolate the full-length cDNA sequence of the RAR1 gene from Thinopyrum intermedium,a wheat wild-relative with multi-resistance to various pathogens. The gene expression vector pUBI∷RAR1 was constructed and then transformed into a wheat variety ‘ Yangmai 12 ’ by the biolistic particle method. The regenerated transgenic plants were detected through PCR, RT-PCR and test of the resistance to powdery mildew.【Result】The full-length cDNA of the RAR1 gene was isolated from Thinopyrum intermedium, named TiRAR1, which encodes the RAR1 protein possessing 2 CHORD domains and 1 CCCH domain. The sequence of the TiRAR1 protein shows high homology with the sequences of RAR1 proteins in barley and rice. The expression vector of TiRAR1 gene, pUBI::RAR1, was correctly constructed, and transformed into the wheat variety ‘ Yangmai 12 ’. 1545 immature embryos of ‘ Yangmai 12 ’ were bombarded by the particle containing pUBI∷RAR1. From the regenerated 154 plants, 18 positive transgenic individuals were identified by PCR assay in the T0generation with a transformation frequency of 1.17%. The results of PCR and RT-PCR assay showed that the RAR1 gene could beinheritable from T0 generation to T1 one, then from T1 generation to T2 one, and could be transcribed and expressed. The resistance test showed that the RAR1 transgenic individuals in T1 and T2 generations showed high resistance to powdery mildew in their alllifecycle, suggesting that the overexpression of RAR1 enhanced the resistance to powdery mildew. 【Conclusion】The full-length cDNA of the RAR1 gene in Thinopyrum intermedium was isolated and transformed into a wheat variety ‘ Yangmai 12 ’. The RAR1 gene could confer high resistance to powdery mildew when overexpressed, and could be used as a potential gene in wheat breeding with broad spectrum resistance to powdery mildew.

【题目】南方草食动物生产预测模型—以湖南道县为例
【中文关键词】中国南方;饲草资源;草食动物;动态平衡;预测模型
【英文关键词】South China; Forage resources; Herbivores; Dynamic equilibrium; Forecast model
【中文摘要】为促使中国南方拥有合理的载畜量和保证其生态系统的良性循环,以湖南道县为南方养殖典型区示例,系统分析南方饲草资源的种类,及其总量计算的方法,探讨南方草食动物发展的潜力,并在此基础上建立草畜平衡的预测模型,并以道县为例对模型进行了验证,同时介绍了该模型的组成和使用情况及其不足。养殖户只需输入一些基本信息,该模型就会以图示方式直观地指导用户进行畜牧生产活动。同时,通过该模型的预测,可以了解南方畜牧业的发展潜力,使畜牧区拥有合理的载畜量,从而使草畜之间达到相对动态平衡。该预测模型的建立对南方畜牧业的发展有着重要的指导意义。

【题目】磷肥和石灰对红壤墨西哥玉米生长的影响
【中文关键词】墨西哥玉米;磷肥;石灰;交互作用
【英文关键词】Zea mexicana; P fertilizer; Lime; Interaction

【中文摘要】为推广墨西哥玉米(Zea mexicana)栽培,于2009年采用盆栽试验,研究了南方丘陵区酸性红壤上石灰和磷肥配合施用对墨西哥玉米生长发育的影响。结果表明:施磷(25~200 mg·kg-1)能显著提高墨西哥玉米的株高、分蘖数和生物产量(P<0.05)。且其效应基本是随磷肥用量增加而增加;低量石灰下(0.7~1.4 g·kg-1),石灰能提高墨西哥玉米的株高和分蘖数,石灰与磷肥有显著的正交互作用(P<0.05);高量石灰下(2.1~2.8 g·kg-1),墨西哥玉米的株高和分蘖数有所降低;墨西哥玉米的经济产量对低量石灰(0.7~1.4 g·kg-1)呈现为正效应,对高量石灰(2.1~2.8 g·kg-1)呈现为负效应,以1.4 g·kg-1的石灰和高量磷为最高产组合。因此,施用1.4 g·kg-1石灰和高量磷有利于红壤环境中墨西哥玉米生产。

【题目】Plastidial glutathione reductase from Haynaldia villosa is an enhancer of powdery mildew resistance in wheat (Triticum aestivum)

【中文关键词】无
【英文关键词】Chloroplastic glutathione reductase — Diseaseresistance — Haynaldia villosa — Powdery mildew —Triticum aestivum.
【中文摘要】无
【英文摘要】A full-length cDNA (Hv-GR) whose transcript accumulation increased in response to infection by Blumeria graminis DC.f.sp. tritici (Bgt) was isolated from Haynaldia villosa. Southern analysis revealed a single copy of Hv-GR present in H. villosa. This gene encodes a glutathione reductase (GR) with high similarity to chloroplastic GRs from other plantspecies. Chloroplastic localization of Hv-GR was confirmed by targeting of the green fluorescent protein (GFP) – Hv-GR fusion protein to chloroplasts of epidermal guard cells. Following inoculation with Bgt, transcript accumulation of Hv-GR increased in a resistant line of wheat, but no significant change was observed in a susceptible line. In vivo function of Hv-GR in converting oxidized glutathione (GSSG) to the reduced form (GSH) was verified through heterologous expression of Hv-GR in a yeast GR-deficient mutant. As expected, overexpression of this gene resulted in increased resistance of the mutant to H2O2, indicating a critical role for Hv-GR in protecting cells against oxidative stress. Moreover, overexpression of Hv-GR in a susceptible wheat variety, Triticum aestivum cv.Yangmai 158, enhanced resistance to powdery mildew and induced transcript accumulation of other pathogenesis-related genes, PR-1a and PR-5, through increasing the foliar GSH/GSSG ratio. Therefore, we concluded that a high ratio of GSH to GSSG is required for wheat defense against Bgt, and that chloroplastic GR enzymes might serve as a redox mediator for NPR1 activation.

【题目】从小麦-簇毛麦易位系TAC文库中筛选Hv-S/TPK基因
【中文关键词】小麦-簇毛麦易位系, 可转化人工染色体文库, Hv-S/TPK 基因, 荧光原位杂交
【英文关键词】Triticum aestivum-Haynaldia villosa translocation line, transformation-competent artificial chromosome (TAC),Hv-serine/threonine protein kinases (Hv-S/TPK) gene, fluorescence in situ hybridization (FISH)
【中文摘要】本实验室已经通过基因芯片技术筛选到一个白粉菌诱导后上调表达的抗病相关基因 Hv-S/TPK, 并获得了它的全长 cDNA 序列。利用 Hv-S/TPK 的特异引物筛选小麦-簇毛麦 6VS/6AL 易位系基因组可转化人工染色体(Transformation-competent artificial chromsome, TAC)文库, 获得了阳性 TAC 单克隆, 并进一步获得了含有 Hv-S/TPK cDNA 序列的 5160 bp(GenBank Accession No. EU153366)的亚克隆。对亚克隆的序列分析结果表明, Hv-S/TPK 基因在起始密码子和终止密码子之间有 3 个内含子和 4 个外显子, 4 个外显子序列与簇毛麦上已得到的 Hv-S/TPK 的 cDNA 序列100%同源。对起始密码子上游序列分析结果表明, 该基因的调控序列中, 含有 W-Box、OCS-element 等与抗病相关的元件。以 TAC 克隆为探针与小麦-簇毛麦 6VS/6AL 易位系有丝分裂中期染色体进行荧光原位杂交(Fluorescence in situ hybridization, FISH), 结果表明含有 Hv-S/TPK 基因的 TAC 克隆来自于簇毛麦。
【英文摘要】Hv-S/TPK gene, a resistance related gene to powdery mildew, was cloned by using genechip, and its expression was upregulated after the inoculation of Blumeria graminis to Haynaldia villosa. Using the specific primers of Hv-S/TPK to screen a genomic TAC (Transformation-competent artificial chromosome) library of translocation line 6VS/6AL, a positive TAC wasscreened. A 5-kb fragment containing Hv-S/TPK was subcloned and identified. This 5160-bp fragment (GenBank Accession No.EU153366) was determined by specific primer walking. The analysis of Hv-S/TPK genomic sequence showed three introns and four extrons between start code and stop code. In the promoter region of Hv-S/TPK, there were W-box and OCS-like elements which were the elements related to disease resistance. In this study, the positive TAC clone was used to as probe in situ hybridized to mitotic metaphase chromosomes of translocation line. The result of fluorescence in situ hybridization (FISH) indicated that the TAC clone containing Hv-S/TPK was from Haynaldia villosa chromosome.

【题目】小麦类甜蛋白基因的转化及转基因植株的抗病性分析

【中文关键词】小麦类甜蛋白基因; 基因枪; 遗传转化; 白粉病; 抗性鉴定

【英文关键词】Wheat thaumatin-like protein gene (Ta-Tlp); Particle bombardment; Genetic transformation; Powdery mildew;Resistance identification

【中文摘要】目前已克隆出许多类甜蛋白基因并成功转化马铃薯、水稻和小麦等植物, 均可引起植株抗病性的提高。在以往的研究中我们从小麦中克隆了一个类甜蛋白基因(Ta-Tlp), 该基因在高抗白粉病的小麦 6VS/6AL 易位系中能够高水平表达, 推测它与白粉病抗性密切相关。为进一步研究该基因的功能, 本研究构建了包含在 ubi 强启动子控制下的 Ta-Tlp 基

因的表达载体 pAHC-TlP, 用基因枪将其导入小麦品种扬麦 158 的幼胚愈伤组织, 在含除草剂的选择培养基上经两轮筛选和分化, 获得再生抗性植株。对 T0、T1和 T2代植株进行 PCR、Southern 杂交与 RT-PCR 分析, 结果表明 Ta-Tlp 基因已整合进受体基因组并且能够表达。对 T0代及其衍生的 T1代(来自 6 个 T0代阳性株系的 183 个单株)和 T2代(来自 6 个 T0代阳性株系的 241 个单株)转化植株进行白粉病抗性鉴定, Ta-Tlp 基因超量表达的转基因植株, 能延缓白粉病发病进程, 其白粉病抗性有一定提高。对 T2代阳性转化植株进行赤霉病抗性鉴定表明, 其抗性与受体对照相比无显著差异。

【英文摘要】The thaumatin-like protein in plants, an important member of pathogenesis-related proteins (PRs), involves in plant resistant reaction to many fungi. A series of thaumatin-like protein genes have been isolated and transformed to potato (Solanum tuberosum L.), rice (Oryza sativa L.), and wheat (Triticum aestivum L.) resulting in resistance improvement to plant diseases. We have cloned a thaumantin-like protein gene, Ta-Tlp, from wheat in our earlier studies. The Ta-Tlp gene expresses in high level in wheat 6VS/6AL translocation line with high resistance to powdery mildew (Erysiphe graminis f. sp. tritici Em. Marchal.),implying its close relation to the resistance of the disease. To further understand the gene ’s function, we constructed Ta-Tlp into a expression vector driven by the strong ubi promoter in the present study. The constructed vector pAHC-TlP was transformed into immature embryo-derived calli of a common wheat cultivar Yangmai 158 through particlebombardment. After two rounds of herbicide bialaphos selection and regeneration, herbicide-resistance plants were obtained. The Ta-Tlp was confirmed having been integrated into the wheat genome and expressed in T1 and T2 generations by PCR, Southern blot, and RT-PCR. The transgenic plants of T0, T1, and T2 generations were inoculated by E. graminis f. sp. tritici and F. graminearum for resistance identification.All plants of T0, T1, (183 individuals derived from 6 positive T0 lines), and T2 (241 individuals derived from 6 positive T0 lines) generations appeared some resistance to wheat powdery mildew by delaying disease development, but no distinct resistance toscab (F. graminearum).

【题目】A novel activator-type ERF of Thinopyrum intermedium, TiERF1, regulates positively defense responses
【中文关键词】无
【英文关键词】Ethylene response factor, phenotypic change,resistance, Thinopyrum intermedium, transcription activator,transgenic
【中文摘要】无
【英文摘要】Thinopyrum intermedium is resistant to many different pathogens. To understand the roles of ethylene response factors (ERFs) in defence responses, the first member of the ERF family in T. intermedium, TiERF1, was characterized and functionally analysed in this study. The TiERF1 gene encodes a putative protein of 292 amino acids, belonging to the B3 subgroup of the ERF transcription factor family. Biochemical assays demonstrated that the TiERF1 protein is capable of binding to the GCC box, a cis-element present in the promoters of pathogenesis-related (PR) genes, and possessing transactivation activity, as well as localizing to the nucleus. The transcript of TiERF1 in T. intermedium is rapidly induced by infection withRhizoctonia cerealis, Fusarium graminearum, or Blumeria graminis, and ethylene, jasmonic acid, and salicylic acid treatments. More importantly, the ectopic expression of TiERF1 in tobacco activated the transcript of the PR genes of tobacco with a GCC box ciselement, and ACO and ACS genes key to ethylene synthesis, and in turn improved the resistance level to Alternaria alternata and tobacco mosaic virus, as well as causing some phenotypic changes associated with ethylene response in the transgenic tobacco plants. Taken together, TiERF1 protein as an ERF transcription activator positively regulates defence responses via the activation of some defence-related genes.

【题目】Overexpression of TiERF1 confers resistance to Overexpression of TiERF1 confers resistance to sharp eyespot by activating defense-related genes in transgenic wheat
【中文关键词】无
【英文关键词】Defence-related gene, ethylene response factor (ERF), Rhizoctonia cerealis, sharp eyespot, Thinopyrum intermedium, transgenic wheat plants.
【中文摘要】无
【英文摘要】Wheat sharp eyespot, primarily caused by a soil-borne fungus Rhizoctonia cerealis, has become one of the most serious diseases of wheat in China. In this study, an ethylene response factor (ERF) gene from a wheat relative Thinopyrum intermedium, TiERF1, was characterized further, transgenic wheat lines expressing TiERF1 were developed, and the resistance of the transgenic wheat lines against R. cerealis was investigated. Southern blotting analysis indicated that at least two copies of the TiERF1 gene exist in the T. intermedium genome. Yeast one-hybrid assay indicated that the activation domain of TiERF1 is essential for activating the transcript of the reporter gene with the GCC-box cis-element. The TiERF1 gene was introduced into a Chinese wheat cultivar, Yangmai12, by biolistic bombardment. Results of PCR and Southern blotting analyses indicated that TiERF1 was successfully integrated into the genome of the transgenic wheat, where it can be passed down from the T0 to T4 generations. Quantitative reverse transcription-PCR analysis demonstrated that TiERF1 could be overexpressed in the stable transgenic plants, in which the expression levels of wheat pathogenesis-related (PR) genes primarily in the ethylene-dependent signal pathway, such as a chitinase gene and a b-1,3-glucanase gene, were increased dramatically. Disease tests indicated that the overexpression of TiERF1 conferred enhanced resistance to sharp eyespot in the transgenic wheat lines compared with the wild-type and silenced TiERF1 plants. These results suggested that the overexpression of TiERF1 enhances resistance to sharp eyespot in transgenic wheat lines by activating PR genes primarily in the ethylene-dependent pathway.

【题目】苏云金芽孢杆菌营养期杀虫蛋白基因vip3A的研究
【中文关键词】甜菜夜蛾 苏云金芽孢杆菌 杀虫活性 营养期杀虫蛋白 Bt菌株 棉铃虫 小菜蛾
【英文关键词】无
【中文摘要】根据已知vip3A基因序列设计一对特异性引物VIP3/VIP5,对218株Bt菌株进行PCR鉴定,有51株含有vip3A类基因,其中12株为不同亚种的标准菌株,有4株标准菌株不含有该基因。从Bt C9菌株中分离克隆了vip—C9基因,并插入表达载体pET—21b,转化大肠杆菌BL21,诱导表达出分子量88.6kDa的可溶性蛋白,表达产物对甜菜夜蛾和棉铃虫具有较高的杀虫活性,LC50分别为0.42ng/mg和25.95ng/mg,对小菜蛾活性较低。构建了缺失蛋白Vip—C9—N(N端去除39个氨基酸组成的信号肽序列),杀虫活性测定结果表明其对甜菜夜蛾的活性显著降低,说明N端39个氨基酸对甜菜夜蛾的活性是必需的。

【题目】苏云金芽孢杆菌杀虫晶体蛋白Cry1Ba3 活性区的研究

【中文关键词】苏云金芽孢杆菌 Cry1Ba3 蛋白 活性区 小菜蛾

【英文关键词】Bacillus thuringiensis Cry1Ba3 protein Active fragment Plutella xylotella

【中文摘要】通过对Cry1Ba3 蛋白序列的分析,以及与已知Cry 蛋白比较,设计了6 对特异性引物,通过PCR 扩增获得6 种不同长度的cry1Ba3 基因片段。将这些基因片段克隆到pET-21b 载体上,导入大肠杆菌BL21 中进行诱导表达,最终得到6 种不同长度的Cry1Ba3 蛋白片段。采用浸叶法检测这些蛋白片段对小菜蛾的杀虫活性,研究结果表明含有第1~685 位和含有第22~655 位氨基酸的蛋白片段对小菜蛾的毒性,与全长Cry1Ba3 蛋白相比,没有改变;含有第54~655 位氨基酸的蛋白片段对小菜蛾的毒力明显降低;而含有第22~627 位和含有第85~655 位氨基酸的蛋白片段完全丧失了对小菜蛾的活性。上述结果表明Cry1Ba3 蛋白对小菜蛾的活性区在第22~655 位氨基酸之间。

【英文摘要】To determine the minimal active fragment of Cry1Ba3 protein, six fragments of cry1Ba3 gene with different lengths were amplified using PCR with different specific primers. These fragments were cloned into pET-21b vector at BamH I and Sal I restriction enzyme sites, and then introduced into E. coli BL21 strain. After induced with IPTG, the proteins expressed by different fragments were analyzed by SDS-PAGE, and the results showed that all these truncated proteins could be expressed in E. coli BL21. Bioassay result against Plutella xylotella showed that the active fragment of Cry1Ba3 protein was located between amino acid No. 22 and No. 655. As the insecticidal activity of the truncated protein containing amino acid No. 54-655 was declined significantly, and No. 22-627 and No. 85-655 were lost completely, so the toxicity of fragment including amino acid No. 22-655 was not changed with original Cry1Ba3.

【题目】transfer and expression of the mosquitocidal plasmid pBtoxis in bacillus cereus group strains

【中文关键词】无

【英文关键词】Conjugation pBtoxis Israelensis Lepidopteran Dipteran Mosquitocidal Transconjugant

【中文摘要】无

【英文摘要】The toxicity of Bacillus thuringiensis subsp. israelensis to dipteran larvae (mosquitoes and black flies) depends on the presence of the pBtoxis plasmid. In this paper, two antibiotic resistance tagged pBtoxis were transferred by conjugation to other Bacillus

cereus group strains. Among 15 potential recipients, only a lepidopteran active B. thuringiensis subspecies kurstaki and a B. cereus strain received the plasmid pBtoxis with a low transfer rate of about 10(-8) transconjugants/recipient. The resulting B. thuringiensis subspecies kurstaki transconjugant was active to both lepidopteran and dipteran targets and the B. cereus transconjugant was active against dipteran insects. Phase contrast microscopy showed that the B. cereus transconjugants could produce only round crystalline inclusion bodies while B. thuringiensis subspecies kurstaki transconjugant could produce both round and bipyramidal crystals during sporulation. SDS-PAGE revealed that all the major mosquitocidal proteins from pBtoxis could express in the two transconjugants, including Cry4Aa, Cry4Ba, Cry10Aa, Cry11Aa and Cyt1Aa. However, none of the experiment showed any indications of mobilising abilities of pBtoxis. The limited number of strains, which could receive and maintain pBtoxis using a conjugational helper plasmid, indicates a very narrow host range of the B. thuringiensis subsp. israelensis pBtoxis plasmid.

【题目】Preliminary characterization of a thermostable DNA polymerase I from mesophilic Bacillus sphaericus strain C3-41,

【中文关键词】无

【英文关键词】Thermostable DNA polymerase I Bacillus sphaericus Æ Mesophile Mosquitocidal activity

【中文摘要】无

【英文摘要】A thermostable DNA polymerase I from a mesophilic Bacillus sphaericus strain C3-41 was characterized in this study. The polI was cloned, sequenced and over-expressed in Escherichia coli. The expressed 110 kDa fusion protein of PolI was stable at 70 degrees C for 1 h. Compared with DNA polymerase I of E. coli (TaKaRa), the relative polymerase activity of this PolI was 3.33 +/- 0.1 RFU microl(-1) at 37 degrees C using fluorescent quantitative analysis. It showed higher polymerase activity than E. coli PolI at higher temperature, with a relative activity of 3.75 +/- 0.1 RFU microl(-1) at 70 degrees C. The polI sequence analysis and the protein structure prediction indicated that this protein had a high similarly to other PolI from thermophilic micro-organisms. This information is of importance for future study for evolution of the house-keeping gene polI in entomopathogenic bacterium B. sphaericus.

【题目】Detection and phylogenic analysis of one anthrax virulence plasmid pXO1 conservative open reading frame ubiquitous presented within Bacillus cereus group strains
【中文关键词】pXO1 ORF101 Bacillus cereus, Bacillus thuringiensis SNP
【英文关键词】pXO1 ORF101 Bacillus cereus, Bacillus thuringiensis SNP
【中文摘要】The presence of one of the anthrax virulence plasmid pXO1 conserved fragments was analyzed in 24 Bacillus cereus and B. thuringiensis strains, including 6 B. thuringiensis subspecies, by polymerase chain reactions. Twelve out of 24 strains showed PCR-positive for an ORF101 homologous sequence. Two pXO1-ORF101-like fragments from a B. cereus B-4ac and a commercial B. thuringiensis kurstaki HD1 were cloned, sequenced and expressed in Escherichia coli. Toxicity assays revealed that the product encoded by the pXO1-ORF101-like fragment had no impact on either Vero cells or Chinese Hamster Ovary cells, suggesting that this fragment probably not contribute to enterotoxic activity. Sequence alignment of the pXO1-ORF101 from three Bacillus anthracis and ORF101-like fragments from other12 B. cereus group isolates indicated high identity (more than 90%) and the presence of subgroup- and strain-specific SNPs among these fragments.

【题目】苏云金芽胞杆菌cry1Ia基因的克隆、表达与活性研究
【中文关键词】苏云金芽胞杆菌 cry1Ia基因 克隆 表达 杀虫活性测定
【英文关键词】无
【中文摘要】根据cry1Ia类基因的全长序列设计引物,以苏云金芽胞杆菌(Bacillus thuringiensis)菌株Btc008的总DNA为模板扩增出片段长为2.1kb的cry1Ia的全长基因,插入大肠杆菌(Escherichia coli)表达载体pET-21b,转化大肠杆菌BL21(DE3)菌株,诱导表达出81kD的蛋白。该蛋白由719个氨基酸组成,推导的分子量为81.2kD。该蛋白的氨基酸序列不同于已知的12种Cry1Ia蛋白,是一种新的Cry1Ia蛋白,该基因已被国际基因命名委员会正式命名为cry1Ia8。杀虫活性测定结果表明:Cry1Ia8对亚洲玉米螟(Ostrinia furnacalis)和小菜蛾(Plutella xylostella)有很强的杀虫活性,LC50分别为0.268 μg/g和2.227 μg/mL,其杀虫效果与Cry1Ab和Cry1Ac相当。对大豆食心虫(Leguminivora glycinivorella)也有较好的活性,但对鞘翅目叶甲科害虫榆兰叶甲(Pyrrhalta aenescens)没有活性。该基因的获得将为我国抗虫转基因作物和工程菌的研制提供新的基因来源,为筛选延缓昆虫抗性产生的基因组合提供了重要依据。

【题目】ARDRA方法在荧光假单胞菌分离鉴定中的应用
【中文关键词】荧光假单胞菌 分离鉴定 ARDRA 分析 拮抗作用
【英文关键词】Pseudomonas fluorescens Isolation and identification ARDRA analysis Antagonism
【中文摘要】利用紫外下产生荧光的特性,采用梯度稀释及鞭毛染色的方法,对采自云南、海南、山东和新疆的488 份植物根际土壤进行分离筛选,分离菌株进行ARDRA 分析,采用室内平板对峙法筛选对植物病原真菌具有较强拮抗作用的菌株,并对其进行生理生化分析和分子鉴定。【结果】分离筛选到102 株紫外下产生荧光的杆状单极生鞭毛菌株。ARDRA 分析产生荧光假单胞菌类型、恶臭假单胞菌类型以及一个未知的谱带类型。以油菜立枯病菌作为靶标菌,筛选到25 株具有拮抗作用的菌株,其中TC222 产生的抑菌圈最大,进一步的生测结果表明该菌株对9 种重要的植物病原真菌如番茄灰霉病菌等具有很强的拮抗活性。TC222 的 16S rDNA 核苷酸序列与荧光假单胞菌PfO-1 同源性达到99%,其最终鉴定为荧光假单胞菌。【结论】ARDRA 方法在分子水平上为荧光假单胞菌的分离鉴定探索了一条新途径;TC222菌株具有拮抗多种植物病原真菌的能力,显示了良好的应用前景。
【英文摘要】Fluorescence under UV and flagella staining were used to isolate fluorescent pseudomonas from 488 soil samples collected from Shandong, Hainan, Yunnan and Xinjiang Provinces. About 1.5 kb 16S rDNA fragments of these strains were amplified with 16S rDNA primer pairs of eubacterium.Amplified ribosomal DNA restriction analysis (ARDRA) was performed. Antagonistic activities to plant pathogens were tested on PDA plates. Nucleic acid BLAST searches were performed using the website http://www.ncbi.nlm.nih.gov/blast. TC222 identification was performed according to 16S rDNA sequenced together with physiological and biochemical analysis.【Result】A total of 163 fluorescent bacterial strains were isolated, of which 102 were rod shaped and had monotrichous or lophotrichous flagella. All strains produced three digestion patterns according to ARDRA analysis.These were similar to the digestion patterns of P. fluorescens, P. putida. The data suggested that all isolated strains belonged to at least three species. 25 strains showed inhibitory to Rhizoctonia solani in dual-culture test on PDA plates, one of which showed the highest antagonistic activity was named TC222. Moreover, TC222 displayed inhibitory to other plant pathogens, e.g. Gaeumannomyces graminis, Magnaporthe grisea, Drechslera sorakiniana, Alternaria brassicae, Botrytis cinerea, Phomopsis asparagi, Fulvia fulva, Colletotrichum lindemuthianum Sacc. et Magn and Phytophthora parasitica var nicotianae. 16S rDNA sequence analysis of TC222 showed 99% homology to P. fluorescens PfO-1. TC222 was further confirmed to belong to P. fluorescens according to physiological and biochemical characteristics. 【Conclusion】ARDRA analysis provides a new way for P. fluorescens isolation and identification. TC222 showed a potential prospect in biocontrol for plant diseases.

【题目】苏云金芽孢杆菌HD-73菌株芽孢萌发条件的优化及质粒pHT73对芽孢萌发的影响
【中文关键词】苏云金芽孢杆菌 质粒pHT73 芽孢萌发 萌发条件 HD-73菌株
【英文关键词】Bacillus thuringiensis plasmid pHT73 germination HD-73
【中文摘要】芽孢的萌发是芽孢杆菌从芽孢成长为营养体的第一步。在芽孢菌属中,有些菌株对人畜具有致病性。研究芽孢萌发过程对解析其致病性和生理功能至关重要。本文优化了苏云金芽孢杆菌(Bacillus thuringiensis, Bt)芽孢的萌发条件,确定芽孢萌发的适宜条件为:缓冲液为NaH2PO4(10 mmol · L-1)与NaCl(100 mmol · L-1)的混合物、pH值为7.2、萌发温度为37°C,萌发剂为肌苷或L-丙氨酸(1 mmol · L-1)与其它单一氨基酸(100 mmol · L-1,除酪氨酸和色氨酸为1 mmol · L-1)组成的混合物;利用该萌发条件,检测了苏云金芽孢杆菌菌株HD-73及其无晶体突变株HD-73-在利用不同氨基酸途径中的芽孢萌发率差异,发现缺失质粒pHT73的无晶体突变株HD-73-在肌苷与天冬氨酸和肌苷与谷氨酸为营养萌发剂的条件下,萌发率明显高于菌株HD-73,说明在质粒pHT73上可能存在对这两种途径起负调控作用的相关基因。
【英文摘要】The germination of dormant spores of Bacillus species is the first crucial step in the return of spores to vegetative growth. Some members of Bacillus species cause serious diseases in livestock and humans. Elucidation of the germination process is essential to understand their pathogenesis and life cycle. To determine the role of plasmid pHT73 in nutrient-induced germination, the conditions for germination of Bacillus thuringiensis HD-73 was optimized. The optimum germination buffer was NaH2PO4 (10 mmol · L-1) and NaCl (100 mmol · L-1) and pH 7.2. The optimum temperature was 37°C. Comparing the germination rate between HD-73 strain and HD-73- mutant spores, which was based on the optimum germination conditions, germination rate of HD-73- spores was twice of that of HD-73 in the pathways of inosine (1 mmol · L-1) / Asp (100 mmol · L-1) and inosine (1 mmol · L-1) / Glu (100 mmol · L-1). This result supported that the plasmid pHT73 contained the germination genes which partly blocked those two pathways, because HD-73- was cured of plasmid pHT73 which contained cry1AC gene

【题目】球形芽孢杆菌Mtx1蛋白和苏云金杆菌杆菌Cyt1A晶体蛋白的协同作用
【中文关键词】球形芽孢杆菌 苏云金芽孢杆菌 杀蚊毒素 协同作用 致倦库蚊 Mtxl CytlA
【英文关键词】Bacillus sphaeKcus Bacillus thuringiensis Mosquitocidal toxin synergism Culex quinquefasciatus Mtxl CytlAa
【中文摘要】采用常规的生物测定方法确定了纯化的球形芽孢杆菌(Bacillus sphaericus)的缺失信号肽的97kDa营养期杀蚊毒素(Mosquitocidal toxin l,Mtx1)蛋白和苏云金芽孢杆菌(Bacillus thuringiensis)27.3kDa的CytlAa晶体蛋白对致倦库蚊(Culex g“ i钾 c t)幼虫的杀虫活性。结果表明Mtxl和CytlAa不同比例的混合物对致倦库蚊的毒力比单独毒素蛋白高,经统计分析表明两毒素蛋白对目标蚊幼虫具有明显的协同作用。在L(1删处理浓度下,Mtxl和CytlAa按3:l混合的混合物I 值比单独Mtxl的提前了6.36h。表明C~IAa和Mtxl对致倦库蚊具有协同毒杀作用,提高对目标蚊虫的毒力、缩短半致死时间。该结果为深入研究Mtxl和C~IAa的杀蚊作用方式奠定了基础,同时为其在蚊虫防治中的应用提供了新的思路和方法。
【英文摘要】Mosquitocidal toxin 1(Mtx1)was synthesized during vegetative phase of Bacillus sphaericus and it had been proved to have hi曲er activity to Aedes spp.1arvae and Binary toxin(Bin)resistance Culex larvae.The truncated 97kDa Mtxl with a deletion of the signal peptide an d the Cyt1 Aa crystal protein, a 27.3kDa 6一endotoxin from Bac illus thuringiensis subsp.israelensis(Bti),were purified from Escherichia coli and B.thuringiensis recombinant strains respectively.Both purified toxins had high toxicity against Cu quinquefasciatus larvae.Bioassay result revealed the purified Mtxl toxin had high toxicity against the target mosquito larvae,with LC50 of 45.2ng/mL.However,the mixture of Mtxl and Cyt1Aa exhibited higher toxicity against the mosquito larvae,with a lowest LC50 value of 2O.19ng/mL at theratio of 1:3.(Mtxl:Cyt1Aa).The calculated synergistic factor of diferent mixtures suggested a strong synergistic effect between Cyt1Aa toxin and Mtx1.Furthermore ,the presence of CytlAa in the mixture could induce early larval mortality.enhan cing the

activity of Mtxl to the target mosquito larvae.Th e synergistic efect of Cyt1 Aa on mortality of Mtxl tomosquito larvae might be caused by the damage of the larval midgut—hemocoel barrier induced by the activated Cyt1 Aa toxin,which enhanced the specific pathogenesis of Mtxl on mosquito larvae.It is sug ested that the co—application of Mtxl and Cyt1 Aa in future will be integrated for mosquito man agement

【题目】苏云金杆菌以色列亚种杀蚊蛋白Cyt1Aa在离中不粘柄菌中的表达
【中文关键词】离中不粘柄菌 苏云金杆菌以色列亚种 CytlAa Cryl1Aa 多外源基因表达 总RNA
【英文关键词】Asticcacaulis excentricus Bacillus thuringieusis subsp. israelensis, Cyt1Aa Cry1Aa expression of multiple foreign genes total RNA
【中文摘要】在蚊幼虫生活水域里的离中不粘柄菌(Asticcacaulis excentricus,Ae)中已成功表达苏云金芽孢杆菌以色列亚种(Bacillus thuringiensis subsp./srac/ens/s,Bti)杀蚊蛋白基因cryllAa的基础上,将另一成 杀蚊蛋白基因cytlAa转化入 e中表达。构建并转化了分别单独含有cytlAa基因、及同时含有cryllAa基因的表达质粒pSODCy~0和pSODCryCyt20,蛋白免疫杂交检测相应的Ae重组子分别表达产生了CytlAa和Cryl1Aa蛋白。为了探究Ae(pSODCryCyt20)重组子不能表达cytlAa的原因,提取了重组子总RNA、并与同是革兰氏染色阴性的大肠杆菌的总RNA比较,结果显示两者RNA系统显著不同,推测Ae中多个外源基因的表达,可能要求每个基因必需一个启动子。
【英文摘要】Asticcacaulis excentricus,who lives in upper—layer waters providing food resource to the mosquito larvae and has been proven to be a successful host to produce the mosquitocidal binary toxins or Cry Il Aa toxin from Bacilli(Liu et a1..1996,Nat Biotech 14:343;Armengol,et aZ.,2005,Curr Microbiol 51:430),was developed to express cytlAa gene from Bacillus thuringieusis subsp.israeleusis(Bt).Two A.excentricus transformants were constructed with the attempt of producing Cyt1 Aa alone and alongside with Cryl 1 Aa. repectively. Detection of expressed Cryl 1 Aa and Cytl Aa proteins by immunoblot in the recombinant A .excentricus clones showed that either cryl 1Aa or cytlAa was expressed well solely but not simultaneously although both restriction analyses of plasmid DNA and DNA sequencing showed that thetransformed plasmid was identical to scheme.To investigate the reason why the recombinant A.excentricus harboring both genes and their ribosome binding site(RBS)sequences expressed only Cryl 1 Aa,the total RNA of A.excentricus cclB wa6 cxtract,d and r~vcakd three—band pattvrn iii which iIll RNA molecule weights are not~reater than 16S RNA of e ia coli by formamide agarose gel electrophoresis。indicating that different RNA systems within these two Gram—negative strains required distinguishingly organised constructs to express multiple foreign genes.It is hypothesized that an extra promoter upstream of RBS sequence is required to express cytlAa in the cryl1Aa—cytlAa tandom plasmid.

【题目】苏云金芽孢杆菌γ-氨基丁酸代谢旁路中相关的两个功能基因的克隆、表达及同源性分析
【中文关键词】γ-氨基丁酸代谢旁路 苏云金芽胞杆菌 γ-氨基丁酸转氨酶 琥珀酸半醛脱氢酶 蜡样芽胞杆菌
【英文关键词】无
【中文摘要】γ-氨基丁酸代谢旁路作为三羧酸循环的一个分支,在真核、原核生物中广泛存在。在这条代谢途径中,涉及γ-氨基丁酸分解代谢的主要有两种酶:一种是γ-氨基丁酸转氨酶,能将γ-氨基丁酸转变成琥珀酸半醛;另一种是琥珀酸半醛脱氢酶,该酶能将琥珀酸半醛氧化形成琥珀酸,后者进入三羧酸循环。从国内分离得到的苏云金芽胞杆菌G03菌株中克隆

了gabT和gabD基因。其中gabT基因含有1440bp,编码一个大小为52.6kD的蛋白质,而gabD基因大小为1449bp,编码一个52.2kD的蛋白质。这两个基因都分别在大肠杆菌中进行了表达和纯化。通过酶活测定结果表明,GabT和GabD蛋白分别呈现出γ-氨基丁酸转氨酶和琥珀酸半醛脱氢酶的活性。氨基酸序列同源性比对分析发现,这两个蛋白质在蜡样芽胞杆菌群(B.cereus group)中具有较高的相似性,而与枯草芽胞杆菌的相似性较低则分别为58%、51%。为进一步深入研究γ-氨基丁酸代谢旁路在苏云金芽胞杆菌中的生物学功能及其转录调控机制奠定了基础。

【题目】Characterization of a Cryptic Plasmid from Bacillus sphaericus Strain LP1-G
【中文关键词】无
【英文关键词】Bacillus sphaericus Cryptic plasmid Rolling-circle replication Replication initiator protein ssDNA
【中文摘要】无
【英文摘要】A cryptic plasmid from Bacillus sphaericus strain LP1-G, designated as pLG, was sequenced and characterized. It was an 11,066 bp circular molecule, with G + C content of 37%. The plasmid pLG was predicted to encode 23 putative ORFs,and ORF 21 shared the highest identity with Rep of pGI1 and pBMB9741, members of rolling-circle replication (RCR) pC194-family. Sequence analysis revealed a pC194-type double strand origin (dso) and a single strand origin (sso) like sequence located upstream and downstream of ORF 21, respectively. Moreover, Mung bean nuclease analysis and South-ern hybridization con fi rmed the existence of single stranded DNA (ssDNA) intermediates, indicating that pLG belongs to the RCR pC194-family. Accumulation of multiple ssDNA intermediates in native strain LP1-G and decline of ssDNA and supercoiled DNA in rifampicin-treated strain implied that a special mechanism might be employed by pLG. Furthermore,the copy number of pLG in its original host was determined and about 58 copies of the plasmid exist in each cell. Sub-cloning and transformation experiments proved that the minimal replicon of pLG was within a 1.6-kb fragment, which was composed of rep gene and dso. These data are a good basis for the understanding of replication mechanisms and genetics of this B. sphaericus plasmid.

【题目】Microbial Control and Biotechnology Research on Bacillus thuringiensis (Bt) in China
【中文关键词】无
【英文关键词】Microbial control Biopesticide Bacillus thuringiensis Biotechnology Bt crops
【中文摘要】无
【英文摘要】The current status of production and application of biopesticides for pest control in China is briefly reviewed, with a focus on research advances in microbial control with Bacillus thuringiensis (Bt). These have led to improvements in Bt production, exploitation of Bt gene resources, and development of engineered Bt insecticides and transgenic Bt crops that have expanded host ranges and increased efficacy against target pests. Both conventional and biotechnology approaches need to be employed to achieve further progress in discovery, production technology, formulation processing, development of quality standards and recommended use patterns.

【题目】Isolation of transposon mutants and characterization of genes involved in bioWlm formation by Pseudomonas Xuorescens TC222
【中文关键词】无
【英文关键词】BioWlm formation Complementation
【中文摘要】无
【英文摘要】BioWlm formation mutants are often found to have defective or altered motility. The motility phenotype was exploited to identify Pseudomonas Xuorescens bioWlm formation mutants. Fourteen motility mutants were obtained from P. Xuorescens isolate TC222 and eight stable mutants were studied further. The eight transposon insertion mutants showed altered ability to form bioWlm compared with the parent. Five Tn5-inserted genes from these mutants were cloned and sequenced. Genetic analysis showed that two insertions were located in genes aVecting multiple cell surface characteristics, including lipopolysaccharide (rfbD) and polar Xagella (XiR). Three genes encoding for a putative Mig-14 family protein (epsB), a probable bacteriophage signal peptide protein (bspA) and a soluble pyridine nucleotide transhydrogenase (pyrA) were reported for the Wrst time to be involved in bioWlm formation. Complementation experiments of rfbD and epsB genes proved that bioWlm formation of the corresponding mutants could be restored. Further semi-quantitative reverse transcription-PCR analysis showed that both rfbD and epsB can express their transcripts much higher in the complemented strains than that in wild-type strains. The transcripts of both genes in their mutants could not be detected.

【题目】Detection of chromosomally located and plasmid-borne genes on 20-kb DNA fragments in parasporal crystals from Bacillus thuringiensis
【中文关键词】无
【英文关键词】Bacillus thuringiensis 20 kb DNAs Crystal Chromosome and plasmid Insecticidal activity
【中文摘要】无
【英文摘要】The association of 20 kb heterologous DNA fragments with the parasporal crystals from native and recombinant Bacillus thuringiensis strains was analyzed, respectively. The cry2Aa10 gene cloned in plasmid pHC39 was transformed into B. thuringiensis subsp. kurstaki strains Cry B and HD73, producing recombinant strains Cry B(pHC39) and HD73(pHC39). SDS-PAGE and scanning electron microscopy analyses demonstrated that the recombinant Cry B(pHC39) produced cuboidal crystals of Cry2Aa10 protoxin, while recombinant HD73(pHC39) produced both bipyramidal crystals of Cry1Ac1 protoxin and cuboidal crystals of Cry2Aa10 protoxin. Bioassay results proved that recombinant HD73(pHC39) showed higher insecticidal activity to Helicoverpa armigera than Cry B(pHC39). It was found that 20 kb DNA fragments were present in bipyramidal and cuboidal crystals from both native and recombinant strains, and the 20 kb heterologous DNAs contained chromosome-specific and resident large plasmid-borne DNA fragments, suggesting the 20 kb heterologous DNA fragment embodied in crystals came randomly from the bacterial chromosomal and plasmid genome. This was the first investigation devoted exclusively on the origin of 20 kb DNA fragments in the parasporal crystals of B. thuringiensis. The data provides a basis for further investigation of the origin of 20 kb DNAs in the crystals and

the interaction of DNA and protoxins.

【题目】Insecticidal action of Quinomycin A from Streptomyces sp. KN-0647, isolated from a forest soil.
【中文关键词】无
【英文关键词】Insecticidal activity Quinomycin A 16S rRNA gene Streptomyces sp.
【中文摘要】无
【英文摘要】An actinomycete strain KN-0647 was isolated from a forest soil sample collected from Dali Cangshan mountain, Yunnan Province, China. The strain was identified as Streptomyces sp. according to the morphological, physiological characteristics and whole nucleotide sequence analysis of 16S rRNA gene, and could not be identified up to species level, just suggesting a potential new taxon. The ethyl acetate extract from this strain displayed growth inhibition on the test pathogenetic insects, such as Spodoptera exigua, Dendrolimus punctatus, Plutella xylostella, Aphis glycines and Culex pipiens. The active compound was isolated and identified through a combination of spectral and chemical methods (UR, MS, and 1HNMR) as quinomycin A. This is the first report on the insecticidal activity of antibiotic quinomycin A.

【题目】Phylogenetic analysis and heterologous expression of surface layer protein SlpC of Bacillus sphaericus C3-41.
【中文关键词】surface layer Bacillus sphaericus pathogenic crystal lattice toxicity
【英文关键词】surface layer Bacillus sphaericus pathogenic crystal lattice toxicity
【中文摘要】The surface layer protein encoding genes from five mosquito-pathogenic Bacillus sphaericus isolates were amplified and sequenced. Negative staining of the S-layer protein extracted from the cell wall of wild-type B. sphaericus C3-41 was prepared. It showed a flat-sheet crystal lattice structure. Two genes encoding the entire and N-terminally truncated S-layer protein (slpC and DeltaslpC respectively), were ligated into plasmid pET28a and expressed in Escherichia coli. SDS-PAGE revealed that about 130 KD and 110 KD proteins could be expressed in the cytoplasm of recombinant E. coli BL21(pET28a/slpC) and E. coli BL21(pET28a/DeltaslpC) respectively. Furthermore, an intracellular sheet-like or fingerprint-shape structure was investigated in two recombinant strains, which expressed SlpC and DeltaSlpC protein respectively, by ultrathin microscopy study, but bioassay results suggested that the S-layer protein of wild B. sphaericus C3-41 and recombinant E. coli BL21 (pET28a/slpC) have no direct toxicity against mosquito larvae. These results should provide information for further understanding of the function of S-layer protein of pathogenic B. sphaericus.

【题目】A Nonribosomal Peptide Synthetase Gene tzw1 Is Involved in Zwittermicin A Biosynthesis in Bacillus thuringiensis G03.
【中文关键词】无
【英文关键词】无
【中文摘要】无
【英文摘要】A 4.20-kb SspI fragment from Bacillus thuringiensis G03 was cloned and sequenced. Sequencing analysis revealed two complete open reading frames (ORF; tzw1 and tzw2), and one incomplete ORF (tzw3) (GenBank accession no. EU293887). Tzw1 encodes a putative nonribosomal peptide synthetase with thiolation and condensation domains localized at the C-termini, whereas tzw2 and tzw3 encode acyl carrier protein and Acyl-CoA dehydrogenase, respectively. To investigate the function of tzw1 in zwittermicin A (ZA) biosynthesis, an in-frame deletion of 1,461 bp within tzw1 was constructed. The mutant abolished ZA production. Complementation of the mutant with cloned tzw1 restored ZA productivity. These results revealed that tzw1 is required for ZA

biosynthesis in B. thuringiensis G03.

【题目】Recombinant Bacillus thuringiensis strain shows high insecticidal activity against Plutella xylostella and Leptinotarsa decemlineata without affecting nontarget species in the field.
【中文关键词】无
【英文关键词】Bacillus thuringiensis, bioassay, microbialpopulation variation, nontarget organisms,recombinant strain
【中文摘要】无
【英文摘要】The cry-type gene of wild Bt strain UV17 was identified and a novel cry1Ba gene was cloned. The cry3Aa7 gene, which was highly toxic to coleopteran pests, was introduced into UV17, and a recombinant strain designated as UV173A was obtained. Bioassay results showed that UV173A was not only highly toxic against Plutella xylostella (50% lethal concentration [LC50] = 18?03 lg ml-1), but also against coleopteran Leptinotarsa decernlineata (LC50 = 0?19 mg ml-1). The recombinant strain was then tested in field trials to monitor its spatial variation of population and to investigate the impact on nontarget invertebrates. A recombinant Bt stain UV173A with broad insecticidal spectrum was obtained, and it did not cause adverse effects on the population of nontarget organisms.

【题目】Ubi1 intron-mediated enhancement of the expression of Bt cry1Ah gene in transgenic maize (Zea mays L.).
【中文关键词】无
【英文关键词】Bacillus thuringiensis - cry1Ah gene - ubi1 intron - intron-mediated enhancement - insect-resistant transgenic maize
【中文摘要】无
【英文摘要】The cry1Ah gene was one of novel insecticidal genes cloned from Bacillus thuringiensis isolate BT8. Two plant expression vectors containing cry1Ah gene were constructed. The first intron of maize ubiqutin1 gene was inserted between the maize Ubiquitin promoter and cry1Ah gene in one of the plant expressing vectors (pUUOAH). The two vectors were introduced into maize immature embryonic calli by microprojectile bombardment, and the reproductively plants were acquired. PCR and Southern blot analysis showed that foreign genes had been integrated into maize genome and inherited to the next generation stably. The ELISA assay to T1 and T2 generation plants showed that the expression of Cry1Ah protein in the construct containing the ubi1 intron (pUUOAH) was 20% higher than that of the intronless construct (pUOAH). Bioassay results showed that the transgenic maize harboring cry1Ah gene had high resistance to the Asian corn borers and the insecticidal activity of the transgenic maize containing the ubi1 intron was higher than that of the intronless construct. These results indicated that the maize ubi1 intron can enhance the expression of the Bt cry1Ah gene in transgenic maize efficiently.

【题目】Cloning and characterization of a novel Cry1A toxin from Bacillus thuringiensis with high toxicity to the Asian corn borer and other lepidopteran insects.
【中文关键词】无
【英文关键词】Bacillus thuringiensis　novel cry1Ah gene
【中文摘要】无
【英文摘要】A novel cry1A was cloned from Bacillus thuringiensis strain BT8 and expressed in the B. thuringiensis acrystalliferous mutant HD73 . The gene, designated cry1Ah1, encoded a protein with a molecular weight of 134 kDa. Reverse transcriptase-PCR and Western blotting showed that Cry1Ah was expressed in the host strain BT8. The toxin expressed in HD73 exhibited high toxicity against lepidopteran larvae of Ostrinia furnacalis, Helicoverpa armigera, Chilo suppressalis, and Plutella xylostella. The 50% lethal concentrations (LC50s) were 0.05, 1.48, 0.98 mg g 1 and 1.52 mgmL 1, respectively. The LC50s of Cry1Ah were significantly lower than that of Cry1Ac for H. armigera, C. suppressalis, and O. furnacalis, and lower than that of Cry1Ab and Cry1Ie for Ostrinia furnacalis. The high toxicity against a range of pest species makes this novel toxin a potential candidate for insect biocontrol.

【题目】The occurrence of Bacillus cereus, B. thuringiensis and B. mycoides in Chinese pasteurized full fat milk.
【中文关键词】Bacillus cereus　B. thuringiensis　B. mycoides　Occurrence　Pasteurized full fat milk
【英文关键词】Bacillus cereus　B. thuringiensis　B. mycoides　Occurrence　Pasteurized full fat milk
【中文摘要】In 2006, a total of 54 samples of pasteurized full fat milk packaged in cartons were collected in spring and in autumn from chain supermarkets in Wuhan, China. The samples were examined and enumerated by MPN methods strictly according to guidelines laid out in US FDA/CFSAN BAM Chapter 14. Among 102 isolated B. cereus-like bacteria, 92 isolates were identified to be B. cereus, 9 B. thuringiensis and 1 B. mycoides. It was found that the occurrences of B. cereus were 71.4% and 33.3% in spring and in autumn samples respectively and the average count among the positive samples was 11.7 MPN/ml. The PCR detection results revealed that the enterotoxin genes hblA, hblC, hblD, nheA, nheB and nheC occurred in B. cereus isolates with frequencies of 37.0%, 66.3%, 71.7%, 71.7%, 62.0% and 71.7% respectively. Nine B. thuringiensis isolates were also identified from six pasteurized milk samples, and most of them harbored six enterotoxic genes and the insecticidal toxin cry1A gene. The single B. mycoides isolate harbored nheA and nheC genes. The data provides information for further evaluating the effect of B. cereus-like bacteria on food safety of Chinese milk products.

【题目】连作花生土壤中酚酸类物质的检测及其对花生的化感作用
【中文关键词】酚酸;花生;连作;化感作用
【英文关键词】Phenolic acids; peanuts; continuous cropping; allelopathy
【中文摘要】研究了南方红壤区不同连作年限花生土壤中酚酸物质的种类、含量,及其对花生生长的影响。结果表明:连作花生土壤中对羟基苯甲酸香草酸和香豆酸随着连作年限的增加而增加,连作10a后3种酚酸总量达11.09mg·kg-1干土,显著高于连作3a和6a的土壤;而土壤中香豆素和苯甲酸含量比较低,且变化没有规律。所有酚酸处理组对花生幼苗的株高和根长表现出抑制作用,对花生幼苗地下部的干鲜重均表现出“低促高抑”的特点。香草酸和香豆酸处理组对花生幼苗地上部的干鲜重表现出低促高抑的特点,其他处理组均表现出抑制作用 花生幼苗根系活力随着酚酸处理浓度的增加而降低,花生幼苗的超氧化物歧化酶活力(SOD)、过氧化物酶活力(POD)、丙二醛含量(MDA)则随着酚酸浓度的增加而增加。与只用茄腐镰刀菌孢子悬液浸泡花生种子的对照相比,加入酚酸后,花生种子的病原菌的感染率随着酚酸浓度的增加而增加,发芽率则随着酚酸浓度的增加而下降。以上结果说明,酚酸物质可以抑制花生幼苗的生长和提高花生的发病率,可能是因为酚酸物质破坏花生细胞膜的完整性而使病原菌入侵,影响花生生长,产生连作障碍。

【题目】白粉菌(Erysiphe graminis)侵染诱导表达的小麦糖苷水解酶基因TaGlc2 的克隆与鉴定
【中文关键词】1,3- β -葡聚糖酶; 白粉菌; 真菌侵染; 基因表达; 小麦
【英文关键词】1,3- β -glucanase; Powdery mildew; Fungal inoculation; Gene expression; Wheat
【中文摘要】真菌病害是世界小麦生产中的最重要的病害之一。目前, 在小麦中已经鉴定出一批小麦病菌侵染诱导基因,包括病程相关基因和抗真菌水解酶基因(葡聚糖酶基因和几丁质酶基因)。最近的研究表明, 植物 1,3- β -葡聚糖酶参与对真菌侵染的防卫。本研究从小麦 cDNA 文库中克隆出一个编码小麦 1,3- β -葡聚糖酶的新基因, 命名为 TaGlc2。该基因编码的氨基酸序列与糖苷水解酶基因家族 17 高度同源。采用实时定量 PCR 分析方法对 TaGlc2 基因在白粉菌侵染(Erysiphe graminis)后小麦叶片中的表达模式进行研究, 发现 TaGlc2 基因在白粉菌侵染 6 h 后表达明显增强, 至 24h 达到峰值, 说明该基因受白粉菌侵染诱导表达。获得了 TaGlc2 基因 5'上游调控区序列, 发现存在与病菌侵染响应有关的顺式元件。小麦 TaGlc2 基因在小麦白粉病抗性上可能具有重要作用。
【英文摘要】Fungal diseases cause serious yield losses of wheat worldwide. Up to date, numerous genes involved in the wheat-pathogen response have been identified. These include pathogenesis related (PR) genes and antifungal hydrolases such as glucanase and chitinase genes. Recently, there has been increasing number of studies providing evidence of the potential involvement of 1,3- β -glucanase in defense against fungal infection. In this study we identified a cDNA encoding a 1,3- β -glucanase,designated TaGlc2, from wheat cDNA library. The deduced peptide sequence of TaGlc2 is similar to a glycoside hydrolase family 17. Using real time PCR, the expression pattern of TaGlc2 in wheat seedlings inoculated with powdery mildew pathogen (Erysiphe graminis) was determined. The results showed that TaGlc2 is inducible in response to fungal infection. The 5' genomic region of TaGlc2 was isolated and it contains some cis-elements which are reported to be involved in pathogenesis response.

【题目】Genotypic Differences in Photosynthesis and Dynamic Characteristics of NPQ in Maize
【中文关键词】无
【英文关键词】maize(Zea mays),genotypes,photosynthesis,non-photochemical quenching of chlorophyll fluorescence
【中文摘要】无
【英文摘要】In order to identify the genotypic differences in photosynthesis and energy balance in internal energy balance in internal photosystem in maize (Zea mays L.), the photosynthetic rate (Pn) and some main parameters of chlorophyll fluorescence (Fo/Fv, qP, NPQ and Øp) were measured and the dynamic characteristics of Non-Photochemical Quenching (NPQ) were observed and analyzed

during photosynthetic induction. The results showed that there was marked difference in Pn, but no difference existed between different genotypes in maize in some parameters such as Fv/Fm, qP and Øp, while apparent difference existed in the NPQ and its change characteristics, such as TNPQ, TNPQmax, RNPQ and RNPQmax, the maximum value among all tested genotypes was about 2 times the minimum one. Above all TNPQ and NPQmax were found to be significantly correlated to Pn, which meant that not only NPQ but also its dynamic characteristics such as TNPQ and NPQmax, especially TNPQ might be good index for selecting the high photosynthesis genotype in maize.

【题目】利用高通量测序技术发现植物小分子RNA研究进展
【中文关键词】高通量测序技术;454-FLX;Solexa;小分子 RNA;微 RNA;小干扰 RNA
【英文关键词】high-throughput sequencing; 454-FLX; Solexa; small RNA; microRNA; siRNA
【中文摘要】小分子 RNA 是一类长约 20~30 个核苷酸的非编码 RNA 分子,其介导的转录后基因调控是植物中的一种新型基因调控机制。它在植物的生长发育和适应外界各种环境胁迫的过程中起着非常重要的作用。植物中小分子 RNA 数量巨大、种类繁多,而高通量测序技术的出现大大加快了它们的发现过程。本文在简要介绍目前已知植物小分子 RNA 的类型及特点的基础上,综合阐述近年来利用高通量测序技术克隆和分析植物小分子 RNA 的研究成果,以期反映当前植物小分子 RNA 的基因组分布规律、功能和进化等方面的最新研究进展。
【英文摘要】Small RNAs are 20-30 nucleotides long non-coding RNAs. Small RNA-mediated post-transcriptional regulation represents a new mechanism of gene regulation and plays important roles in plant growth and development as well as responses to different environmental stresses. In plants, there are tremendous amount of small RNAs of various types. The advance of highthroughput sequencing technology has significantly facilitated their discoveries. In this review, in addition to a brief introduction of small RNA features, the authors attempted to summarize recent progresses in small RNA research using next generation sequencingtechnology and aim to highlight the new insights in their genome organization, function and evolution in plants.

【题目】桃品种资源结果习性遗传多样性与评价指标探讨
【中文关键词】桃、结果习性、遗传多样性、评价
【英文关键词】Peach、Fruit setting habits、Genetic diversity、Description
【中文摘要】通过对桃品种资源数据库进行统计分析,展示桃种质资源结果习性性状的遗传多样性,并提出其数值分类指标和参照品种,为桃种质资源描述的规范化、标准化提供依据。以386~411份品种资源为试材,研究了与结果习性有关的4个指标的遗传多样性,结果表明单花芽复花芽比率具有最大的遗传多样性,遗传变异系数达到101%,其次变异系数依次为花叶芽比率37.50%、花芽起始节位32.49%、节间长度12.61%;根据遗传多样性分布状况,提出5级数值分级指标和参照品种,其中3级作为中间级;每个性状的每个等级均有2个参照品种,分别为亚洲品种和欧美品种,且尽量选择育种者公知或广泛栽培的品种。
【英文摘要】There are two description models for peach genetic resources.One was made by IPRGI in 1980,the other made in China in 1990.But the first one is only suitable for cultivars without quantity grades;the latter one has some lists about char-acteristics.Neither is easy to be used for breeders to share genetic resource information.In order to describe the main quanti-tative characteristics,a new system is created in this article.4 kinds of characteristics of 386 to 411 peach cultivars were ob-served and studied from 1986 to 2002 in the National Peach Genetic Collection in Zhengzhou, Henan province. The results showed that the ratio between single and double flower buds had the great genetic diversity, the genetic variant coefficient reached 101%, then flower buds/leaf buds, 37.5%;first flower bud node, 32.49%; node length, 12.61%. Based on the frequency distribution of diversity, grade index and reference cultivars were given by statistical data for peach description. These grade indexes were recorded on 1 to 5 scales. In general, two reference cultivars for each grade were given, one is Oriental cultivar, the other is Euramerican cultivar. The authors try to use these as the reference cultivars, which are grown or used by breeders widely in China.

【题目】基于SSR标记和生物学性状进行桃遗传多样性的比较分析
【中文关键词】桃、花粉形态、变异、演化、扫描电镜
【英文关键词】Peach、Biological traits、Simple sequence repeats(SSR)、Genetic diversity
【中文摘要】利用生物学性状和SSR分子标记对50个桃品种进行遗传多样性研究,并将两种标记所得结果进行比较。14个生物学性状揭示出品种间的遗传相似系数范围为0~0.9,均值为0.4;而13对SSR引物揭示出遗传相似系数范围为0.52~0.97,均值为0.75。对两种标记进行共表型相关系数检测,结果显示两种结果无明显差异。经Mental检测,两种标记之间相关性较差,这可能与形成机理差异大有关。进行聚类和主成分分析,生物学性状方面品种主要分为3个组且与果肉性状相关,而分子方面品种主要分为2组,与地域相关。
【英文摘要】The genetic diversity of 50 peach varieties was studied using 14 biological traits and 13 molecular markers. The mean similarity coefficient of the biological traits was 0-0.9 with the average of 0.4,and the coefficient detected by SSR was 0.52-0.97 with the average of 0.75. There is no evident difference between the cophenetic correlation coefficients of biological and SSR data. Cluster and principal component analysis showed that the tested varieties were divided into 3 groups by phenotypic data related with the origin of the varieties.

【题目】利用SSR 研究不同国家桃育成品种的遗传多样性
【中文关键词】桃、简单重复序列(SSR)、遗传多样性
【英文关键词】Peach (Prunus persica L.)、Simple sequence repeats (SSR)、 Genetic diversity
【中文摘要】利用34对SSR分子标记对来自不同国家的56份桃育成品种进行遗传多样性分析。筛选的13对SSR引物共检测出226个等位基因,其中多态性等位基因为222个。桃群体的平均Nei’s基因多样度为0.224,Shannon遗传多样性表型指数为0.367,说明桃总群体遗传变异较低;基因分化系数为0.081,与AMOVA分析结果8.13%相近,说明2者遗传变异以群体内遗传变异为主;基因流值为5.657,则说明不同国家间桃育成品种交流比较频繁。根据Nei’s基因多样度和Shannon遗传多样性表型指数2指标所得,欧美品种群遗传变异最高,其次为中国,最后为日本。UP-GMA聚类分析结果表明,品种间的遗传距离与系谱关系基本吻合。
【英文摘要】A collection of 56 peach cultivars, originated from different countries, have been screened with 34 SSR primer pairs in order to analyze their genetic diversity. 226 bands were amplified by 13 informative and reliable primers, of which 222 were polymorphic loci. A relatively low level of genetic diversity (Nei s gene diversity 0.224 and Shannon index 0.367) was revealed at population level. A lower level of genetic differentiation was detected among populations with GST (0.081) analysis and analysis of mole

【题目】桃不同果实类型的品质和产量性状的差异研究
【中文关键词】桃、果实类型、品质、产量
【英文关键词】peach、fruit type、quality、yield
【中文摘要】通过对普通桃、蟠桃、油桃、油蟠桃4种果实类型496份品种资源(Prunus persica L.)的主要品质、产量性状的比较分析,目的在于揭示不同果实类型群体的农艺性状特性。结果表明:不同果实类型桃的生育期不存在显著差异。②普通桃与蟠桃、油桃与油蟠桃的比较,果形扁平果实的可溶性固形物、可溶性糖、糖酸比增加;可滴定酸、带皮硬度、去皮硬度、平均单果质量、平均果核质量、核质量/单果质量、产量指数减小。③普通桃与油桃、蟠桃与油蟠桃的比较,果皮无毛果实的可溶性固形物含量、可滴定酸、着色面积、去皮硬度增加;可溶性糖、果皮韧性、平均单果质量、产量指数减小。④油桃与蟠桃比较,油桃的可滴定酸含量、着色面积、平均单果质量和产量指数高于蟠桃。⑤普通桃与油蟠桃比较,油蟠桃可溶性固形物、可溶性糖含量均有显著增加,平均单果质量显著减少
【英文摘要】A comparison of the quality and yield between 496 varieties of plants which produce four different types of peach—normal peach,flat peach,nectarine and flat-nectarine peach,was performed to evaluate the differences in the agricultural characteristics between each type of peach.The results were as follows:(1)No significant difference in growth period was found among these 4 peach types.(2)By comparison,the flat fruit types had higher soluble solids content(SSC)and soluble sugar content in fruits,but lower titratable acid content, firmness with skin, firmness without skin, average fruit weight, pitweight, pitweight/fruitweight and yield (3) Higher content of SSC, titratable acid, red flush degree, firmness without skin and pitweight/fruitweight in glabrous fruit types, but lower soluble sugar content, skin firm, fruit average weight and yield index (4) Nectarine peach had higher titratable acid content, fruit pigmentation, average fruit weight, and yield compared with the flat peach (5) Flat-nectarine peach had significantly higher SSC, soluble sugar content, but significantly lower average fruit weight compared with normal peach.

【题目】油桃、蟠桃的遗传多效性及育种利用价值探讨
【中文关键词】油桃、蟠桃、遗传多效性、育种价值
【英文关键词】Nectarine、Flat peach、Heritable pleiotropy、Breeding value
【中文摘要】油桃、蟠桃是世界桃育种的重要方向。综述了油桃和蟠桃基因对生长发育的影响。桃果实无毛(油桃)和扁平(蟠桃)基因起源于我国的西北,是质量性状,有毛/无毛、扁平/圆为显性。油桃、蟠桃基因具有广泛的遗传多效性,油桃具有使果实的可溶性固形物、可滴定酸、着色面积、去皮硬度和亚表皮细胞的淀粉粒增加的作用;使可溶性糖、果皮韧性、平均单果质量减少趋势;桃杂合体基因型Gg比纯合体基因型gg的茸毛短。蟠桃具有使果实的可溶性固形物、可溶性糖、糖酸比和亚表皮细胞的淀粉粒增加;使带皮硬度、去皮硬度、平均单果质量、平均果核质量、核质量/单果质量、产量指数减少趋势;油桃和蟠桃基因的这种多效性在油蟠桃中有累加作用。探讨了油桃和蟠桃遗传多效性对生态和对育种的利用价值,提出利用油桃和蟠桃改善果实品质,利用隐性无毛基因(g)增加有毛桃的着色程度、降低茸毛长度,培育短毛品种,培育小果形油蟠桃品种,适当提高我国鲜食品种可滴定酸。
【英文摘要】Diversification of fruit types is one of the peach breeding trends.Heritable pleiotropy of glabrous and saucer shape gene loci from peach were summarized in this article.Glabrous and saucer shape of peach cultivars originated in Northwest China and are qualitative characters.Pubescent to glabrous and saucer to non-saucer shape are dominant characters.Glabrous gene makes higher SSC,higher titratable acidity,higher red flush degree,higher firmness and more starch granule at sub-epidermis cell, but lower soluble sugar contents, lower fruit average mass. Gg(heterozygous gene type) makes fuzz short. Saucer shape makes higher SSC, higher soluble sugar content and more starch granule at sub-epidermis cell but lower titratable acidity, lower flesh firmness, lower average fruit mass and lower yield index. Heritable pleiotropy of glabrous and saucer shape gene have additional effects in flat-nectarine, their breeding value is discussed.

【题目】利用AFLP和RAPD标记构建桃的遗传连锁图谱
【中文关键词】桃、RAPD标记、AFLP标记、遗传连锁图
【英文关键词】Peach、RAPD、AFLP、Genetic linkage map
【中文摘要】为了给进一步研究桃的遗传标记的定位打下基础,以毛桃北京2—7[Prunus persica(L.)Batsch.Beijing2-7]、山桃白花山碧桃[Prunus davidiana(Carr.)Franch.Baihuashanbitao]以及2者的F1代为试材,用RAPD、AFLP标记构建了北京2—7和白花山碧桃的遗传连锁图,分别覆盖221.7 cM(7个连锁群)、1238.8 cM(12个连锁群)。其中北京2—7的连锁图包含19个标记,标记间平均距离为11.7 cM;白花山碧桃的连锁图包含103个标记,标记间平均距离为12.0 cM。
【英文摘要】The biological characteristics of 38 F1 seedlings, which were derived from a cross between Primus persica (L.) Batsch. Beijing 2-7 and P. davidiana (Carr.) Franch. Baihuashanbitao, were studied. The aim was to construct a genetic linkage map of peach nuclear genome. The genetic linkage map of 2-7 was elaborated with a total of 19 loci by using Map-maker. Seven linkage groups covering 221.7 cM of the peach genome were found. The genetic linkage map of Baishanbitao was elaborated with a total of 103 loci by using Mapmaker. 12 linkage groups covering 1238.8 cM of the peach genome were found.

【题目】‘岩溪晚芦’椪柑果皮与果肉差减cDNA文库的构建及初步分析
【中文关键词】柑橘、抑制性差减杂交(SSH)、cDNA文库、表达序列标签、克隆、差异表达基因
【英文关键词】citrus、suppression subtractive hybridization(SSH)、cDNA library、expressed sequence tag、clone、differentially expressed genes
【中文摘要】以‘岩溪晚芦’椪柑(Citrus reticulata Blanco)成熟果实果皮和果肉为材料,采用抑制性差减杂交技术成功构建了果皮(tester)与果肉(driver)的差减cDNA文库。结果显示:cDNA克隆外源插入片段大小介于100~500bp之间。成功对411个克隆进行了测序,测序结果经与NCBI基因库中序列进行比较,377个EST找到了同源序列,它们分属于126个基因,涉及到色素合成、能量代谢、初级代谢、次生代谢、抗逆防御、蛋白代谢、信号转导、香味形成、果皮软化(衰老)、精油合成、抗氧化等代谢途径和生理生化过程。还有一些基因涉及到三价铁螯合物、反转录转座子gag蛋白、查尔酮合成、硼离子转运、儿茶酚氧位甲基转移酶等功能。功能已知且没有重复的EST共有63个,占总数的49.2%。有5个基因共62个克隆虽在Blast搜索时找到了较高的同源性序列,但功能目前尚未明确。另有34个基因未搜索到同源序列,可能为新发现的基因。
【英文摘要】A cDNA library was successfully constructed via suppression subtractive hybridization between fruit epicarp(experimental group,tester)and pulp(control group,the driver)of Ponkan(Citrus reticulata Blanco).Results showed that most of the clones had inserting fragments which length ranged from 100 bp to 500 bp.Four hundred and eleven ESTs were successfully sequenced and searched against NCBI GenBank,the results indicated that 377 ESTs had significant similarities with known genes.All the ESTs were divided into 126 genes according to the gene annotation. These ESTs were mainly involved in pigment synthesis, energy metabolism, primary metabolism, secondary metabolism, defense against stresses, signal transduction, trascription, flavor formation, oil synthesis, peel softening, antioxidant metabolism etc. There were 63 uni-ESTs which accounted for 49.2% of the total ESTs and another 34 ESTs had no matching homologous sequences found.

【题目】枳属种质遗传多样性及其与近缘属植物亲缘关系的SSR和cpSSR分析
【中文关键词】枳、SSR、cpSSR、遗传多样性、亲缘关系
【英文关键词】Poncirus trifoliata、SSR、cpSSR、genetic diversity、phylogenetic relationship
【中文摘要】应用核基因组SSR和叶绿体基因组SSR,分析了枳属28份枳及枳杂种种质的遗传多样性及其与近缘属植物的亲缘关系。核基因组SSR分析表明普通枳的遗传差异明显,22个SSR位点的平均多态性信息含量(PIC)为0.51,平均期望杂合度为0.52,表明中国枳种质资源具有较丰富的遗传多样性。在遗传距离约0.16时,22份普通枳可以分成4个类型。叶绿体基因组SSR分析则发现普通枳间基本无差异,表明以母系遗传为特征的枳叶绿体基因组相对保守。富民枳与普通枳无论是在核基因组还是在叶绿体基因组上均存在较大差异,支持富民枳种的地位。SSR和cpSSR结合使用可比较准确地鉴定枳杂种。
【英文摘要】Twenty-eight accessions of trifoliate orange(Poncirus trifoliata Raf.),hybrids and seven accessions of its relatives,were analyzed for genetic diversity and phylogenetic relationship using nuclear and chloroplast SSR markers.Average PIC(polymorphism information content)value of 0.51 and average expected heterozygosity of 0.52 were given according to nuclear SSR results.Twenty-two common trifoliate orange accessions could be divided into four groups with a genetic distance of 0.16.It indicates a rich genetic diversity of China trifoliate orange germplasm cpSSR revealed no difference among common trifoliate orange accessions which indicates a relatively conservative chloroplast genome. Four cpSSR loci were found different between Fumin (P. polyandra S Q. Ding et al) and common trifoliate orange Fum in trifoliate orange is genetically distant from common trifoliate orange, from its hybrids as well as relatives. Therefore it could be regarded as a true species. The combined application of nuclear and chloroplast SSR could serve a more accurate way to identify trifoliate orange hybrids.

【题目】利用SSR标记鉴定柚和杂柑品种
【中文关键词】柚、 杂柑、SSR、品种鉴定、指纹图谱
【英文关键词】Pummelo (Citrus grandis (L.) Osbeck)、Hybrid citrus、SSR、Cultivar identification、 Fingerprinting
【中文摘要】采用SSR技术,从105对柑桔SSR引物中,筛选出10对在柑桔大类品种间多态性位点丰富、带型清晰、重复性好的SSR引物。利用其中5对SSR引物对5个柚和7个杂柑品种DNA进行PCR分析,共扩增出35条谱带,其中27条谱带呈现多态性,引物多态性带纹比例均在60%以上。扩增片断的大小集中在100bp~500bp之间。分别针对柚和杂柑品种筛选出两个高效的引物组合(SSR17、SSR15、SSR16、SSR12与SSR17、SSR18、SSR16),利用这两组引物成功构建出了我国主推的5个柚和7个杂柑品种的特征指纹图谱。并应用指纹图谱自动识别软件Gel2.0对各品种指纹图谱进行识别,建立了相应品种的指纹模式图谱库。
【英文摘要】Simple sequence repeat(SSR)was used to construct the fingerprinting of mainly cultivars of pummelo(Citrus grandis(L.)Osbeck)and hybrid citrus in China.A total of ten primer pairs with stable and repeatable polymorphism that can identify closely related citrus cultivars were screened out from 105 SSR primer pairs.In this paper,five pummelo and seven hybrid citrus cultivars were analyzed by using five of these SSR markers.As a result,a total of 35 bands were detected,27 of which were polymorphic.The polymorphic rate of each primer pair was beyond 60%. The bands range in size was from 100bp to 500bp. The fingerprinting of five pummelo and seven hybrid citrus cultivars was constructed by using two particularly high efficiency primer groups (SSR17、SSR15、SSR16、SSR12 and SSR17、SSR18、SSR16) respectively. Furthermore, the mode fingerprinting datebase of citrus cultivars was

established by fingerprint analysis system-Gel 2.0.

【题目】日光温室内凯特和9803杏光合特性及去果对源叶光合作用影响

【中文关键词】日光温室;　杏;　光合特性;　源库关系;
【英文关键词】greenhouse;　apricot;　photosynthetic characteristics;　sink-source relationship;
【中文摘要】以辽宁省主栽的凯特杏和9803杏为试材,利用LI-6400光合测定仪,对其光合特性和去果对源叶光合作用的影响进行比较研究。结果表明:温室内凯特杏叶片的净光合速率(Pn)日变化呈单峰曲线,9803杏叶片的净光合速率日变化呈双峰曲线,气孔限制是9803杏光合"午休"的主要调节因素;2个杏品种光合作用对光照强度和CO2浓度等单一生态水平变化的响应均可以用二次方程来描述;9803杏的光补偿点和光饱和点均比凯特杏低,且光量子效率比凯特杏高,而凯特杏的CO2补偿点和CO2饱和点均比9803杏低,且羧化效率和CO2饱和时光合能力比9803杏高,由此可见,凯特杏和9803杏在温室中栽培各有优势;去果处理对上位新梢源叶的影响比下位新梢大,对上位新梢第7、8位源叶影响最大。
【英文摘要】Photosynthetic characteristics of two apricot cultivars katy and 9803 were studied comparatively with the LI-6400 photosynthetic instrument in greenhouse.The results were as follows: In greenhouse,the curve of diurnal change of net photosynthetic rate in leaves of katy showed single peak.The diurnal change of net photosynthetic rate in leaves of 9803 was a bimodal curve regulated by stomatal conductance.The responsive curve of photosynthesis in two apricot cultivars leaves to the change of photosynthetic active radiation, concentration of CO2 could be described with quadratic equation. The light compensation point and light saturation point of 9803 were lower than those of katy, and its apparent quantum yield was higher. The CO2 compensation point and CO2 saturation point of katy were lower than those of 9803, and its carboxylation efficiency and maximal net photosynthetic rate were higher.This showed that there was diffent predominance in two apricot cultivars in greenhouse. The effect of defruiting on net photosynthetic rate of source leaf at upper new shoot was greater than that of source leaf at lower new shoot. The effect of defruiting on net photosynthetic rate of source leaf at seventh and eighth node of upper new shoot was greatest.

【题目】植物关联分析的研究进展及其在茶树分子标记辅助育种上的应用前景
【中文关键词】茶树、数量性状、连锁不平衡、关联分析
【英文关键词】tea plant(Camellia sinensis)、quantitative traits、linkage disequilibrium(LD)、association analysis
【中文摘要】茶树是中国重要的经济和饮料作物,由于自交不亲和和长期的异花授粉使其高度异质杂合,选育一个良种耗时长,提高早期选育效率和准确鉴定目标性状成为茶树育种家关心的重大问题之一。关联分析是研究分子标记或候选基因与目标性状关系的一种新方法,现已广泛应用于植物等位基因发掘、功能基因验证以及功能性标记的开发和应用等各方面的研究中,为茶树遗传育种研究提供了新思路。此文主要介绍了关联分析的基本原理、策略和及其在植物中的应用现状,并且探讨了其在茶树分子标记辅助育种研究上的应用前景。
【英文摘要】Tea is an important economic and beverage crop in China.The tea plant(Camellia sinensis(L.)O. Kuntze)is self-incompatible,long-term allogamy contributes to high heterogeneity.It takes a long time for the successful breeding of a new tea cultivar.It is very important to improve the efficiency of early appraisal of individual selection and the evaluation accuracy of target traits in the breeding procedure.Association analysis was a new approach of studying the relationship of molecular markers and/or candidate genes with target phenotypic traits. It was widely used to in allelic gene mining, functional gene appraisal, generation and application of functional markers in plant breeding, which also might be a new promising approach for the breeding of tea plant. In this paper, the basic statistic principles, strategies, characteristics and current successful applications of association analysis in plants were reviewed. Finally, we also discussed the potential application of association analysis in the marker assisted selection of tea breeding.

【题目】茶树简化EcoTILLING技术的建立
【中文关键词】茶树、CEL Ⅰ、 EcoTILLING、SNP
【英文关键词】tea plant、CEL Ⅰ、EcoTILLING、SNP
【中文摘要】EcoTILLING(Ecotype Targeting Induced Local Lesions IN Genomes)可快速检测自然群体中的SNP(Single Nucleotide Polymorphism)等DNA变异。第一次建立了简化的茶树EcoTILLING技术体系:首先筛选扩增目的基因的特异PCR引物;然后通过CEL Ⅰ酶切PCR产物优化实验,确定酶切时间20 min、10×buffer组成为250 mmol/L Tris-HCl(pH7.4)、150 mmol/L KCl、15 mmol/L MgSO4、4 μg/mL BSA和0.04%Triton x-100,反应温度为47.5℃,酶量为1.8 μL CJE(Celery Juice Extract)/10 μL反应体系时,酶切的谱带信号较强、特异性高;初步确定合适的非变性聚丙烯酰胺凝胶电泳检测条件为凝胶浓度5%、上样量4~5 μL、有效分离长度要达到15 cm。利用上述简化的EcoTILLING对6份茶树种质870 bp的PPO基因片段实现了分型,经测序验证酶切产生的谱带与6份种质内部或不同种质间的SNP位置吻合。
【英文摘要】EcoTILLING(Ecotype Targeting Induced Local Lesions In Genomes) had been used as a SNP(Single Nucleotide Polymorphism) discovery tool to examine DNA variation in natural populations.A simple EcoTILLING technique for tea plant was established.Firstly,specific PCR primers for the amplification of the target gene were screened out.Then through comparison,a fine CEL Ⅰ enzyme digestion could be resulted using 20 min with 10× buffer containing 250 mmol/L Tris-HCl(pH7.4),150 mmol/L KCl,15 mmol/L MgSO4,4 μg/mL BSA and 0.04%Triton x-100, and 1.8 μL CJE(Celery Juice Extract)/10 μL reacting solution at 47.5℃. Moreover, a good picture could be obtained when using 5% polyacrylamide gels(PAGE), adding 4-5 μL digesting products in PAGE electrophoresis. The 870bp fragment within the PPO (Polyphenol Oxidase) gene of 6 tea germplasms was distinguished from each other using the simplified EcoTILLING. The CEL Ⅰ digested bands were ascertained that according to the position of SNP in or between the 6 accessions through sequencing verification.

【中文关键词】茶树、品种、ISSR、遗传多样性、亲缘关系
【英文关键词】Tea、Cultivar、ISSR、Genetic diversity、Genetic relationship
【中文摘要】利用ISSR分子标记分析了我国36个主要茶树无性系品种的遗传多样性和亲缘关系。结果表明20个ISSR引物在供试品种中共扩增出368条谱带,其中多态性条带占总条带的99.7%,引物的多态性信息指数(PIC)平均达0.90。供试品种的基因多样性(H)和Shannon信息指数(I)分别为0.23和0.38。茶区内茶树品种的遗传多样性低于总体水平,江南和华南茶区主栽无性系品种的多样性高于西南茶区。AMOVA分析表明区域因素引起的变异(占5.6%)远小于品种因素(占94.4%)。供试品种间的相似系数介于0.58~0.84,平均为0.69,显示出我国茶树主栽品种的遗传基础已相对比较狭窄。ISSR聚类分析表明,中国台湾品种金萱与大陆品种的遗传距离较远,形成单独的个类。35个大陆品种聚成一个大类群,其中除宜红早形成独立的个类外,其他品种又聚为3个亚类群。亲缘关系树状图在分子水平上显示了我国主要茶树无性系品种间的亲缘关系,为今后茶树育种亲本的选配提供了理论依据。
【英文摘要】Tea is an important beverage crop in China.In recent years many clonal tea cultivars have been developed and widely replaced the diverse traditional tea population.Our knowledge on genetic diversity and relationship of these clonal tea cultivars is critical to guide tea breeding,but still limited.In this study,the genetic diversity and relationship of 36 clonal tea cultivars which mainly cultivated in China were analyzed with ISSR markers.Total 368 bands were generated with 20 ISSR primers,of which 367(99.7%)were polymorphic. The average polymorphism information content(PIC) was 0.90, Nei's gene diversity(H) and Shannon's information index(I) were 0.23 and 0.38, respectively. Diversity of clonal cultivars within tea area was lower than that of in whole nation. The levels of diversity in Tea Area of Jiangnan and South China were higher than those of Southwest China. Analysis of molecular variance(AMOVA) showed that variance component among cultivars(94.4%)was far higher than that among regions(5.6%). The genetic similarity among all the tested clonal cultivars ranged from 0.58 to 0.84, averaging 0.69, which indicated that the genetic basis

was relatively narrow. The cluster analysis based on ISSR markers revealed that cultivar “ Jinxuan ” from Chinese Taiwan was of the farthest distance with others from Chinese mainland in the dendrogram. Thirty-five clonal cultivars from Chinese mainland were clustered into a major group, and they could be further classified into three sub-groups except cultivar “ Yihongzao ” .The genetic relationship of all 36 tea cultivars revealed by the ISSR dendrogram would be of great help to accurately select the parents in tea breeding programs.

【题目】基于EST-SSR 的西南茶区茶树资源遗传多样性和亲缘关系分析
【中文关键词】茶树、EST-SSR、遗传多样性、亲缘关系
【英文关键词】Tea、EST-SSR、Genetic polymorphism、Genetic relationship
【中文摘要】利用本实验室cDNA文库测序所获得的茶树EST序列为主自行开发的24对和他人7对共31对EST-SSR引物,对60份西南茶区茶树资源进行了遗传多样性和亲缘关系分析。结果表明,西南茶区茶树资源的遗传多样性非常丰富。31对引物共检测到等位位点137个,每个引物为2　8个之间,平均4.42个。遗传多态性信息含量(PIC)在0.09　0.85之间,平均达0.63。观测杂合度(Ho)在0.07　0.94之间,平均值为0.53。UPGMA聚类表明,按相似系数为0.39可将参试的60份种质资源分为五大类。聚类结果在分子水平上显示了我国西南茶区种质资源间的亲缘关系,为以后种质资源保存和新品种选育提供一定的启示。
【英文摘要】In total, 31 pairs of EST-SSR primers, among them 24 were newly developed from the ESTs of tea plant and 7 were designed from references, were used to analyze the genetic polymorphism and genetic relationship of 60 tea germplasms from Tea Area in Southwest China. The results showed that the genetic polymorphism of tea germplasms in the Tea Area in Southwest China were very abundant. Totally 137 alleles were amplified using 31 EST-SSR primers, the number of alleles per primer ranged from 2 to 8, on average of 4.42. The polymorphism information content(PIC) varied from 0.09 to 0.85 and the observed heterozygosity(Ho) ranged from 0.07 to 0.94, on average of 0.63 and 0.53, respectively. The 60 accessions were classfied into 5 groups based on the UPGMA method with the coefficient at 0.39. The genetic relationship of all 60 accessions revealed by the EST-SSR analysis would not only be of great help to conserve the tea germplasms but also give some useful implications for tea breeding.

【题目】普通杏(Prunus aemeniaca L.)初级核心种质资源的构建及评价
【中文关键词】普通杏(Prunus; armeniaca; L.)、初级核心种质、聚类、遗传多样性
【英文关键词】Apricot(Armeniaca vulgaris L.)、Primary core collection、Clustering、Genetic diversity
【中文摘要】核心种质的构建不仅能够提高种质圃资源的保存效率、方便资源的管理,而且有利于种质资源的深入研究和种质创新。以国家果树种质熊岳李杏圃中保存的447份普通杏为材料,利用40个农艺性状的鉴定数据,对核心种质构建的几种聚类取样方案进行比较,明确了杏初级核心种质构建的最佳取样方案。在按品种类群分组的基础上,采用S策略经过多次聚类抽样,获得由111份种质材料组成的初级核心样本集,占总体样本比例25%。对该初级核心种质遗传多样性进行检测和评价,结果表明本研究所构建的初级核心种质能够很好地保留普通杏种质资源的遗传多样性。
【英文摘要】The core collection has been well accepted as a useful way to improve the efficiency of crop germplasm evaluation,conservation and utilization.In order to characterize and utilize the germplasm more efficiently for further apricot improvement,the available morphological and agronomic data of apricot were analyzed for developing a core collection.Total of 447 accessions of apricot(Armeniaca vulgaris L.) germplasm collected by the Xiongyue National Germplasm Repository for Plums and Apricots and 40 agronomic traits of them were used for studying the optimal clustering method for primary core collection of apricot. The whole collection was grouped by origin locations, then based on the data of the agronomic traits, the accessions in each origin location were clustered by SPSS program. The primary core collection consisting of 111 accessions, which was 25% of the whole collection, were randomly selected by Improved Least Distance Stepwise Sampling strategy (ILDSS) from this group whole collection accessions. The genetic diversity of primary core collection were compared with the whole collection, which showed that the genetic variation in the primary core collection was well presented in the whole collection based on comparison of diversity index of the involved traits.

【题目】李、杏优良新品种的落花落果规律及保花保果措施研究
【中文关键词】李; 杏; 落花落果; 保花保果;
【英文关键词】Plum;Apricot;Flower and fruits dropping;Flowers and fruits protecting
【中文摘要】研究李、杏优良新品种的落花落果规律和保花保果措施。[方法]大蕾期调查花朵数,每隔4~5d观测1次花果数量的变化情况,直到果实采收期。于盛花期喷施营养元素、激素。[结果]李树在盛花后第5天开始落花,第8天达落花高峰;杏树在盛花后第4天开始落花,第8天达落花高峰,不同品种存在差异,极早熟品种骆驼黄杏盛花后第4天即达落花高峰,并持续5d。李树在盛花后第24天达落果高峰;杏树晚熟品种在盛花后第24~25天达落果高峰,早熟品种在盛花后第22天达落果高峰。大石早生李以花期喷硼砂或赤霉素骆驼黄杏以花期喷赤霉素或1200倍稀土串枝红杏以花期喷赤霉素或1200倍稀土、磷酸二氢钾、硼砂,丰仁杏、国仁杏均以花期喷磷酸二氢钾或硼砂提高坐果率效果显著。[结论]李、杏树在果实采收前均会出现2次落花落果高峰,为花后4~8d和花后22~25d。于盛花期喷施营养元素或激素可显著提高坐果率。

【英文摘要】The objective of this study were to observe the regularity of flower and fruit drop in plums and apricots and to protect flower and fruit setting. [Methods] Flower and fruit drop of plums and apricots were investigated from large flower bud stage to fruit harvest period,in every 4-5 d,and flowers of plums and apricots were sprayed with nutrients and hormones. [Results] Flower of plums started to drop after full flowering 5d and reached the peak after full flowering 8d; flower of apricots started

【题目】抗病无籽西瓜新品种郑抗5503 的选育
【中文关键词】无籽西瓜;抗病;新品种;郑抗5503
【英文关键词】Seedless watermelon;Resistant ; New variety;ZhengKang 5503
【中文摘要】郑抗5503是一个抗病的无籽西瓜新品种,母本是新诱变的抗病四倍体自选单系2002S1和2002S2的杂交种,父本是自选单系2002S58。 2004~2006年参加了河南省西瓜区域和生产试验, 2007年4月通过河南省农作物品种审定委员会审定。全生育期105 d,果实发育期32 d,单瓜质量5~6kg,最大可达8 kg。果实圆形,底色浅绿上覆墨绿齿条,果肉红色,中心可溶性固形物含量为11.0%左右。果皮较硬,较耐贮运,高抗枯萎病。
【英文摘要】ZhengKang 5503 is a new resistant seedless watermelon variety, The female parent is a F1 hybrid cross between new resistant tetraploid inbred line 2002S1 and 2002S2 , the male parent is a inbred line 2002S58 . the check in Henan seedless watermelon variety regional and production test during the period of 2004-2006, and approved by Henan Crop Variety Approval Committee in April 2007. The plant growth period is about 105 days, the fruit growth period is about 32 days. The mass per fruit is 5-6 kg and 8 kg to the max.. The fruit is spherical, the ground colour is light green , and the over colour is dark green narrow stripes, red flesh with about 11.0% central soluble solids content. It's high resist to fusarium wilt, and the fruit can be stored a longer time because of its slightly tough rind.

【题目】利用分子标记筛选源于野生多毛番茄的高可溶性固形物的基因
【中文关键词】番茄;可溶性固形物; CAPS; 分子标记辅助选择
【英文关键词】tomato; soluble solid content; CAPS marker; marker-assisted selection(MAS)
【中文摘要】TA1218是野生多毛番茄(Lycopersicoum hirsutum) LA1777 的一个近等基因系,带有 LA1777 第1染色体的含高可溶性固形物基因(QTL)的长 1.2cM 的染色体片段。研究以 TA1218 与栽培番茄(L.esculentum)骨干系 9706、F1代及回交一代(BC1)为材料,对该染色体片段进行了 AFLP 分析,并对 QTL 附近的 4 个 RFLP 标记进行了 CAPS 标记的转化研究,共获得了 2 个CAPS 标记 TG161 和 TG237。对 BC1群体进行遗传鉴定、可溶性固形物含量和其它农艺性状的综合分析,获得了8个比TA1218 中的外源染色体片段更短的番茄材料,其中 3 个含 TG161 的阳性标记的单株和1 个含 TG237 阳性标记的单株的可溶性固形物含量高,而且综合农艺性状优良,可作为新的高可溶性固形物种质用于番茄遗传育种。
【英文摘要】TA1218 is a near isogenic line in the Lycopersicon esculentum cv. E6203 background and carries a 1.2 cM introgression at the bottom of chromosome 1 from L. hirsutum LA1777. It has been demonstrated that this segment contains QTL increasing soluble

solid content (SSC). Molecular markers were developed spanning the 1.2 cM introgression by AFLP and CAPS. Two RFLP markers, TG161 and TG237, were converted to CAPS. A total of 80 BC1 plants were derived from a backcross between TA1218F1×9706 and screened with the markers TG161 and TG237. Eight independent recombinant plants, which contained a segment shorter than 1.2 cM respectively, were identified. Four recombinant plants showed a significant increase in soluble solids and also had good agronomic characters, indicating that these materials can be used for improving tomato qualities.

【题目】西双版纳黄瓜群体遗传多样性的SSR分析
【中文关键词】黄瓜;西双版纳黄瓜; SSR;遗传多样性;群体
【英文关键词】cucumber; Cucum is sa tivus L.var.xishuangbannanesis; genetic diversity; SSR; population
【中文摘要】西双版纳黄瓜 (Cucum is sa tivus L.var.x ishuangbannanesis Q i et Yuan)是我国特有的黄瓜变
【英文摘要】Xishuangbanna cucumber (Cucum is sativus L.var.x ishuangbannanesis Q i et Yuan) is a special variation in our country. Simp le sequence repeat (SSR) analyses were conducted to assess the genetic,diversity of 30 germplasm resources collected in Xishuangbanna prefecture in 1979 and 1980, which showed that relatively abundant genetic diversity existed in Xishuangbanna cucum ber polymorphic loci, Nei ,s gene diversity (H) and Shannon inform ation index (I) of 273 samp les were 92.86% , 0.1818 and 0.2972, respectively. The indexes of genetic diversity of 30 germplasm showed that the genetic variation among germplasm was 54.06% and that within germplasm was 45.94%. The genetic diversity of No.17 germplasm was the highest among 30 germplasm (H = 0.1376, I = 0.2032, percentage of polymorphic loci = 37.21%). C luster analysis showed that the result of classification of most germp lasm was consistent w ith fruit skin color and flesh color. Among 5 populations according to accession source, the genetic diversity of J inghong population was the highest, who se polymorphic loci, H value and I value were 76.19% ,0.1562 and 0.2516 respectively. Genetic identity of 5 populations was between 0.9071 and 0.9889. C luster analyses suggest that the difference of genetic background existed in 5 populations with different collecting source. The coefficient of genetic differentiation (Gst) and gene flow (Nm) were 0.2201 and 1.7718, which indicated that the genetic differentiation was relatively low, with relatively larger gene flow in C1 sativus L.var.x ishuangbannanesis.

【中文摘要】通过对30份西双版纳黄瓜种质资源5个质量性状和13个数量性状的形态鉴定。结果显示通过对30份西双版纳黄瓜种质资源5个质量性状和13个数量性状的形态鉴定。结果显示: 30份西双版纳黄瓜种质在形态水平上具有一定的遗传多样性。与性型分化和侧枝发生相关的5个数量性状的差异较大,变异系数较高。子叶长等8个性状差异不明显。基于形态性状的聚类分析结果, 29份种质可分为5组,分组结果与其重要农艺性状基本吻合.
【英文摘要】Morphological characterization and evaluation were conducted to assess the genetic diversityin 30 Cucum is sativus L.var.x ishuangbannanesis germplasm. Identification of 5 qualitative and 13 quantitative characters suggest that there was relatively abundant genetic diversity in X ishuangbanna cucumber at morphological level. 5 quantitative characters related w ith sex differentiation and lateral branch development showed great difference. Based on above data, the result of cluster analysis expressed that 29 germplasm could be divided into 5 group s, which as basically consistent with important morphological characters.

【题目】葫芦科蔬菜种质资源对南方根结线虫的抗性评价
【中文关键词】葫芦科;种质资源;南方根结线虫;抗性;评价
【英文关键词】Cucurbitaceae; Germplasm resources; Meloidogyne incognita; Resistance; Identification
【中文摘要】根据不同种质的来源地、农艺性状等背景信息,从国家蔬菜种质资源中期库中选取具代表性的444份主要瓜类作物地方品种,分属葫芦科7个属的13个种或变种,采用病土接种法进行苗期根结线虫抗性鉴定,得出了不同葫芦科作物对南方根结线虫的抗性分布范围。忽略基因型差异,不同作物的平均病级指数从小到大的顺序为:冬瓜、西瓜、丝瓜、节瓜、苦瓜、越瓜、甜瓜、菜瓜、瓠瓜、黄瓜、中国南瓜、印度南瓜、美洲南瓜。通过抗性鉴定,共获得27份抗根结线虫种质(病级指数1~2) 包括12份冬瓜、3份苦瓜、7份丝瓜和5份西瓜。
【英文摘要】According to the basic information such as origin, agricultural characters of different germplasm ,444 representative domestic cultivars, belonging to 13 species o r varieties, 7 genus of cucurbitaceae respectively, were selected as experimental materials to identify their resistance to knot nematode using the inoculation method of infected soil. Results showed the resistance distribution of different cucurbit crop s. Omitting the discrepancy of different genotype, the average disease indexes in the same crop were in turn of wax gourd, watermelon, towel gourd, chiehqua, balsam pear, oriental pickling melon, melon, bottle gourd, cucumber, pumpkin, w intersquash, summ er squash. Through identification, 27 accessions of germplasm with resistance to root knot nematode were obtained, including 12 accessions of wax gourd, 3 accessions of balsam pear, 7 accessions of towel gourd and 5 accessions of watermelon.

【题目】黄瓜核心样本构建方法初探

【中文关键词】黄瓜;种质;取样比例;取样策略;核心样本; RAPD
【英文关键词】Cucumber; Germp lasm; Samp ling rate; Samp ling strategy; Core collection; RAPD marker
【中文摘要】对来自不同国家或地区的90份代表性黄瓜种质进行了RAPD分析,并利用其数据对构建黄瓜核心样本的方法进行了探讨。在聚类分析的基础上,分别按初选核心样本的10%、15%、20%、25%、35%和45%抽取核心样本,通过对它们的多态位点数、丢失位点数和遗传多样性指数的比较,认为25%左右是构建黄瓜种质核心样本较为理想的比例;另外经过对组内随机取样法、最大离差度法和最大遗传距离法3种不同抽样方法的比较,认为最大遗传距离法较为适合用RAPD数据构建黄瓜核心样本。进一步的验证表明,按上述方法构建的核心样本能比较好地代表初选核心样本,同时也不能忽视保留样本的作用.
【英文摘要】The genetic diversity of 90 cucumber (Cucum is sativus L.) accessions from different countriesor regions was detected by RAPD analysis. The methods of establishing the cucumber core collection based on RAPD data were studied. Firstly, six co re collections were individually established at different sampling rate of 10% , 15% , 20% , 25% , 35% and 45% from the original collection. The various core collections were compared w ith the original collection in the number of polymorphic loci, number of lost loci and genetic diversity index. The results showed that 25% was more ideal for developing cucumber core collection in this study. Secondly, three sampling strategies (random sampling method, maxim al deviation method, and maximal genetic distance method) were compared. The result demonstrated that the strategy of maximal genetic distancewas better than others in establishing cucumber core collection with RAPD data. Further, it was verified that the core collection developed according to the sampling rate and strategy determined above could well re resent the original collection, but at the same time, the reserve collection could not be neglected in germplasm conservation and utilization

【题目】黄瓜及其近缘种对南方根结线虫的抗性及酶响应变化的研究
【中文关键词】黄瓜; 甜瓜属; 近缘种; 南方根结线虫; 抗性; 酶
【英文关键词】cucumbe;r Cucum is; related species; M eloidogyne incognita; resistance; enzyme
【中文摘要】选取 6份黄瓜品种和 2份近缘种 (非洲角和酸黄瓜) 进行了南方根结线虫病抗性鉴定, 2份近缘野生种高抗南方根结线虫病, 6份黄瓜品种为感病类型。接种前后根系酶活性与病情指数相关性分析表明, 超氧化物歧化酶 (SOD)、过氧化物酶 (POD)、苯丙氨酸解氨酶 (PAL) 活性变化与其病情指数分别呈显著正相关 (r= 0 8278*)、极显著负相关 (r = - 0 9679* *) 和显著负相关 (r = - 0 8499*) 。 POD同工酶电泳分析表明, 抗病材料酸黄瓜较未接种对照增加了 3条酶带 (相对迁

移率 R f= 0 126, 0 188,0 944), 而感病材料北京截头只增加了 1条弱带 (R f= 0 396)。 SOD、 POD 及 PAL 活性水平可作为甜瓜属作物抗根结线虫病鉴定的生化指标及常规抗性鉴定方法的补充。

【英文摘要】The eight Cucum is germplasm s w ere selected for evaluation of their resistance to the root knotnematodesM eloidogyne incognita. T he results show ed that the wt o Cucum is wild relatives were highly resistant to M eloidogyne incognita, and the six varieties of cucumber w ere all susceptib le. T he correlation analysis between the rates of changes o f superoxide dismutase (SOD), peroxidase (POD) , phenylalan ineamm onialyase (PAL) in roots before and after inoculation and disease index for Cucum is species tested was perfored.The results show ed that there w as a sign if icant positive correlation of SOD (r = 0 8278*) , highly significant negative correlation o f POD (r = - 0 9679* *) and significant negative correlation of PAL (r = - 0 8499*)associated with the disease index, respectively. POD isoenzym e electrophoresis analysis showed that there were three m ore enzyme bands (R f= 0 126, 0 188, 0 944) in the resistant genotype C. hystrix , but only one weak band (R f= 0 396) in the susceptible genotype Beijing Jietou when compared to noninoculated control. The level of SOD, POD and PAL activities can be used as the biochemical markers and the supplement for the conventional method of evaluation for resistance to the root knot nematodes in Cucum is species.

【题目】黄瓜游离小孢子培养诱导成胚和植株再生

【中文关键词】黄瓜;小孢子培养;胚状体;植株再生

【英文关键词】cucumber; microspore culture; embryoid; plant regeneration

【中文摘要】以10个不同基因型黄瓜为试材进行游离小孢子培养,通过对成胚条件的系统研究,从‘ 7447 ’和‘ Poinsett97 ’中获得了子叶形胚和再生植株。研究结果表明:基因型和小孢子发育时期是限制黄瓜游离小孢子成胚的关键因子。不同品种间胚状体产量差异显著,每皿产胚1.5~33.4个。单核靠边期是进行黄瓜游离小孢子培养的最佳时期。低温预处理有利于胚状体的诱导, 4°C预处理2~4 d为宜,以处理2 d的胚状体产量最高。外源激素在诱导胚状体时并非必需,但低浓度外源激素 (0.5 mg • L- 1 2, 4-D、 0.2 mg • L- 1 6-BA)能促进小孢子成胚。NLN和B5两种基础培养基在诱导胚状体上无显著差异。子叶形胚易分化成苗,而其它类型的胚状体未能获得再生植株.

【英文摘要】Isolated microspore culture in cucumber was studied by using 10 different varieties of cucumber. Cotyledonary embryoids and plantlets were obtained from ‘ 7447 ’ and ‘ Poinsett97 ’ genotypes for the first time. The results showed that genotype and the developmental stage of m icro spore were the key factors in embryo id induction. The embryoid yield was different significantly among different genotypes. Embryo id yield per culture dish varied from 1.5 – 33.4. The late uninucleate stage of micro spore was found optimum for isolated microspore culture in cucumber. Cold pretreatment (4°C)for 2 - 4 days also promoted embryoid induction, while the highest embryoid yield was obtained form micro sporepretreated at 4°Cfor 2 days. The results also indicated that low concentration of exogenous hormones (0.5 mg • L- 1 2, 4-D and 0.2 mg • L- 1 6-BA) were conductive to embryogenesis, whereas NLN and B5 medium had no significant difference on embryoid induction. The regenerated plantlets were obtained only from cotyledonary embryoids and no plantlet was produced from the embryoids at other developmental stages.

【题目】黄瓜种质资源单性结实性评价

【中文关键词】黄瓜;种质资源;单性结实;评价
【英文关键词】cucumber; germplasm; parthenocarpy; evaluation
【中文摘要】在春季日光温室条件下,对75份黄瓜种质资源的单性结实性进行了评价。结果表明: 75份材料的单性结实率在0~100%呈连续分布,其中强单性结实材料40份,占53.3% ,中等单性结实材料24份,占32% ,弱单性结实材料11份,占14.7%。其中的24份品种资源中,强单性结实品种20个,占83.3% ,其余为中等单性结实。单性结实性强弱表现为坐果率的差异,不同种质资源无籽果实与有籽果实的单瓜质量和瓜形指数基本相似。单性结实性一般随着节位升高而增强,其评价工作可侧重于20节内的低节位。
【英文摘要】Parthenocarpy of 75 cucumber germplasm and cultivars was evaluated under greenhouse condition in sp ring season. The results showed that the parthenocarpy percentage of 75 accessions was continuously distributed from 0 to 100%. W hile 40 accessions were found strongly parthenocarpy (53.3%) , 24 were medium (32%) and 11 were weakly parthenocarp ic (14.7%). Twenty out of the 24 cultivars were found as strong parthenocarpy (83.3%) , and the rest was midparthenocarpy. The degree of parthenocarpy was expressed by the fruit set capability, and the fruit weight and fruit shape index of the seedless fruit p resent a good similarity w ith that of the seeded. The cucumber plants get stronger parthenocarpic with the nodes increase and the best evaluation should be done under 20 th nodes.

【题目】雄性不育系配制的甘蓝新品种及其繁育技术
【中文关键词】雄性不育系 繁育技术 新品种 中国农业科学院蔬菜花卉研究所 甘蓝 配制 自交不亲和系 胞质不育系
【英文关键词】无
【中文摘要】直到20世纪90年代,世界各国育成的甘蓝一代杂种,几乎都是采用自交不亲和系途径育成的。21世纪初,一些国家利用雄性不育系配制的甘蓝新品种开始面市。我国于20世纪70年代开始进行甘蓝雄性不育系的研究,90年代末至今,已分别采用显性核基因雄性不育系和胞质不育系途径配制出一批甘蓝新品种,并通过国家或省(区、市)级审定,在各地区推广,这些新品种的特点是杂交率达100%,整齐度好,深受生产者和市场的欢迎。本文主要介绍中国农业科学院蔬菜花卉研究所近年用雄性不育系配制出的7个已通过审定的新品种的主要特征特性及其繁育技术要点

【题目】结球甘蓝耐裂球性状的配合力及遗传力研究

【中文关键词】结球甘蓝;耐裂球性状;配合力;遗传力

【英文关键词】Cabbage; Splitting resistance characteristic; Com bining ability; Heritability

【中文摘要】按照Griffing双列杂交方法Ⅳ,选用6个结球甘蓝骨干自交系配制15个杂交组合,进行耐裂球性状的配合力及其遗传力分析。结果表明:基因加性效应和非加性效应对耐裂球性状均起重要作用,且以加性效应为主,随着田间持续生长时间的延长其加性效应所占比例增加, GCA方差在总遗传方差中所占比例大,GCA / SCA值大于1,且差异达显著水平。选择耐裂球材料时,应着重一般配合力的选择,且应重视在早期世代进行选择。

【英文摘要】According to Griffing Ⅳ method, 15 cross combinations involving 6 backbone parents were made to analyze the combining ability and heritability of splitting resistance characteristic in cabbage (Brassica oleracea var.capitataL.) . The results showed splitting resistance characteristic was controlled by additive effect and non additive effect, but mainly by additive effect. The percentage of additive effect increased with the prolongation of field duration. GCA (general combining ability) variance accounted for a large proportion in the total genetic variance, and the mean square ratio of GCA and SCA was greater than 1 , which also had significant difference. For splitting resistant breeding, the GCA should be focused on, and early generation selection also should be emphasized.

【题目】甘蓝类蔬菜小孢子再生植株染色体倍性与气孔保卫细胞叶绿体数相关性研究

【中文关键词】甘蓝;青花菜;芥蓝;气孔保卫细胞;叶绿体数;倍性鉴定

【英文关键词】Brassica oleracea var. capitata; Brassica oleracea var. italica; Brassica alboglabra Bailey; stomatal guard cells;chloroplast number; identification of ploidy

【中文摘要】【目的】研究甘蓝类蔬菜游离小孢子再生植株的染色体倍性与气孔保卫细胞叶绿体数的相关性,为甘蓝类蔬菜提供一种快速、简易、经济、实用而又可靠的倍性鉴定方法。【方法】采用分布型分析和 t 测验,对结球甘蓝、青花菜和芥蓝不同倍性的小孢子再生植株的气孔保卫细胞叶绿体数进行统计分析。以根尖染色体计数法和田间形态学观察法的倍性鉴定结果,对叶绿体数分界法的可靠性进行验证。【结果】同一倍性植株上的不同叶片间及同一叶片的不同部位间

,气孔保卫细胞叶绿体数平均值及变异幅度非常接近。同一小孢子再生植株群体内的不同倍性植株的叶绿体数平均值差异极显著。不同倍性植株间的气孔保卫细胞叶绿体数均呈正态分布。本研究提出了一种根据甘蓝类蔬菜气孔保卫细胞叶绿体数进行染色体倍性鉴定的方法,即气孔保卫细胞叶绿体数≤10 的为单倍体,10<叶绿体数≤15 的为二倍体,>15 的为多倍体。该方法经花期形态学观察和根尖染色体计数法验证,其吻合率达 93.93%,且此倍性鉴定方法稳定,不受植株生长环境等外界因素影响。【结论】甘蓝类蔬菜游离小孢子再生植株的染色体倍性,可于幼苗期根据气孔叶绿体数目的多少进行鉴定,而且此倍性鉴定方法简单、快捷、经济而又可靠。

【英文摘要】【Objective】 The relationship between the ploidy level of microspore-derived plants and chloroplast number in stomatal guard cells was studied in cabbage, broccoli and Chinese kale.【Method】 Distribution statistics analysis and t-test were used to perform statistical analysis on chloroplast number of different ploidy levels in those stomatal guard cells mentioned above, and morphology identifying and chromosome counting were used to test accuracy of counting chloroplast number in stomatal guard cells. 【Result】 The chloroplast average number in stomatal guard cells was very similar among the different leaf positions on the same plant and among the different locations in the same leaf, while the chloroplast number varied significantly among the different ploidy stoma in the same variety. All the distributions of the chloroplast number in different ploidy stoma were normal distribution fitted. A correlation has been established between ploidy and chloroplast number in the stomatal guard cells. In every single stoma of microspore-derived plants, the chloroplast number for a haploid should not be more than 10, that for diploids should be 11 to 15, and polyploids should be more than 15. The accuracy of this method for identification of different ploidy plants was 93.93%. Further more, the accuracy of this method was reliable and did not vary with the plants growth conditions. 【Conclusion】 Therefore, the chromosome ploidy of plants derived from microspore culture in cabbage, broccoli and Chinese kale can be identified by simply counting the chloroplast number in stomatal guard cells.

【题目】甘蓝耐裂球性与叶表面微形态及细胞组织结构的关系研究

【中文关键词】结球甘蓝;裂球;叶表面微形态;细胞组织结构;扫描电镜

【英文关键词】Cabbage; Head splitting; Leaf epiderm is; Cell structure; Scanning electron microscopy

【中文摘要】从细胞学水平上探讨影响甘蓝裂球的原因,为甘蓝耐裂性材料的选育和新品种的育成提供理论依据,并为甘蓝耐裂性鉴定指标的制定提供依据。运用扫描电子显微镜对4份耐裂性不同的甘蓝叶表面微形态及细胞组织结构进行比较观察。结果表明:甘蓝球叶表皮细胞为无规则型,气孔为卵圆形或长椭圆形。材料间下表皮微形态存在较显著的差别:耐裂材料的垂周壁上有明显的波状嵴,平周壁上有加厚的条纹状角质层纹饰,保卫细胞四周角质层褶皱较多、起伏较大,表皮细胞上覆盖有大量的粉状或颗粒状蜡质。易裂材料的垂周壁呈沟槽状下陷,平周壁上角质层光滑,保卫细胞四周角质层较平坦。耐裂材料的叶肉细胞层数多,排列紧密,间隙小。易裂材料叶肉细胞层数少,排列松散,间隙大。耐裂材料与易裂材料在球叶表面微形态及细胞组织结构上表现显著差异。

【英文摘要】The research explored the reason for cabbage head splitting based on cytology to provide the theoretic basis for selection of splitting tolerant materials and development of new varieties, and also laid the foundation for splitting assessment index. The electron microscope scanning was used to observe leaf epidermal structures and tissue characters of 4 cabbage cultivars which differ in splitting resistance. The epidermal cells were anomo shaped,the stomata were mostly focused in the low epiderm is and stomatal apparatus were ovate or elliptical. The significant differences existed in lower epiderm is among materials: in 2 splitting resistant cultivars, their anticlinal walls had clearly sinuous ridges and the periclinal walls had equal thick ornamentations of cuticles; the defensive cells were rounded cuticles of projected ridges, and epidermal cells were covered w ith dense powder. In splitting susceptibility cultivars, the anticlinal walls sink in and form groove, and the cuticles in periclinal walls were more smooth; the stoma were rounded smooth cuticle. In splitting tolerant cultivars, mesophyll cells arranged tightly and small gap between cell, and mesophyll cells had loose structure and big space between cell in splitting susceptible ones. All thedata indicated that there were distinctive differences in surface micro configuration and tissue characters of leaf between splitting resistant varieties and splitting susceptible varieties.

【题目】萝卜SRAP-PCR反应体系的建立与优化.
【中文关键词】萝卜;SRAP-PcR;反应体系
【英文关键词】Radish(Raphanus sativus L.);SRAP · PCR;Reaction system
【中文摘要】以萝卜基因组DNA为模板,对其SRAP-PCR反应体系的各个主要影响因子进行了系统的优化,建立了重复性好、多态性丰富的萝卜SRAP-PCR反应体系:20 ul反应体系中,DNA 50 ng、Mg+2 2.25 mmol/L、dNTP 0.2mmol/L、Taq l U、Primer 0.7umol/L。扩增程序为:94°C预变性5min;94°C变性1 min、35°C复性1 min、72°C延伸lmin,5个循环;94°C变性l min、50°C复性l min、72°C延伸1 min,35个循环,72°C延伸10 min,4°C保温。该反应体系在不同萝卜种质资源遗传多样性分析、遗传图谱构建、分子标记辅助选择育种等方面都有重要作用。
【英文摘要】In this study,radish genomic DNA Was used for the PCR template to optimize radish SRAP-PCR reaction system.ASRAP—PCR system with good stability was stablished.In tlle 20 uL reaction system,DNA 50 ng,Mg+2.25mmoL/L,dNTP 0.2mmol/L,Taq1U,Primer 0.7 umoL/L.PCR procedure:initially denaturing at 94°C for 5 main;then 94°C,1 min,35°C,1 min and 72°C 1 min for the first five cycles,then the annealing temperature was raised to 50°C for another 35cycles;At last,72°C 10 min and 4°C for ever.The optimum SRAP—PCR reaction system isadaptive to different radish variety.It laid a good foundation for genetic diversity analysis genetics map construction and molecular marker assisted breeding in radish.

【题目】萝卜自交不亲和基因SLG6的CAPS标记的开发
【中文关键词】萝卜;自交不亲和性;SLG。基因;CAPS标记
【英文关键词】Radish(Raphanus sativus);Self_incompatibility;SLG6 gene;CAPS marker
【中文摘要】萝卜是我国的主要蔬菜之一。其杂种优势十分明显,培育自交不亲和系是萝卜杂种优势育种的主要途径之一。本研究根据萝卜自交不亲和基因SLG。序列设计特异引物,以8个自交系为材料,其中自交不亲和系和自交亲和系各4个,扩增SLG。基因第232—7llbp之间的单拷贝片段,8个材料均获得了一条480bp的特异片段。用限制性内切酶Taq I对该片段进行酶切,自交不亲和系均产生约125bp和244bp的片段,其中,244bp的片段为自交不亲和系所特有,可作为SLG。基因的CAPS标记用于萝卜自交不亲和基因SLG。的检测;而自交亲和系则具有与自交不亲和系相同的125bp的片段和不同的多态性片段。
【英文摘要】Radish,which has obvious heterosis,is one of the main vegetables in China.Developing serf-in • Compatible lines is one of the major approaches of radish heterosis breeding.In this study,the specific primers were designed based on the sequence of serf-incompatible gene SLG6.A single copy and specific 480bp fragment from 232 bp to 71 bp of SLG6 gene was amplified by using designed specific primers in all 8 serf-crossing lines,of which there were 4 serf-incompatible lines and 4 serf-compatible lines respectively.The fragments of 480bp from different line samplified was cleaved by the restriction endonucleage Taq I.Consequently a 125bp and a 244bp fragmentswere produced in all the self-incompatible lines,while there were a 125bp and other diverse fragments in serf-compatible lines and the 244bp fragment was absent,which indicated that the 244bp fragment was specific or serf-in-compatible.Accordingly,the result suggested the possible application of the CAPS markers of SLG6 genein molecular marker-assisted breeding of SLG genes in radish.

【题目】基于形态数据的大白菜核心种质构建方法的研究
【中文关键词】大白菜;形态数据;核心种质;取样规模;取样方法
【英文关键词】Chinese cabbage; morphological data; core germplasm; sampling scale; sampling method
【中文摘要】以国家蔬菜种质资源中期库收集保存的1 651份大白菜种质为试材,按照大白菜分类系统生态型,采用分层分组法,将所有种质分为6组。基于43个形态性状的数据,比较了4种组内取样比例法、6种总体取样规模和2种取样方法在构建大白菜核心种质中的作用和效果。结果表明:组内以多样性比例法更能使各组的取样份数或比例趋于平衡,并较好地保持原始收集品的变异度。当总体取样规模为15%时,多样性比例法所构建的核心种质的遗传多样性指数达到最大,表型保留比例亦能达到98%左右;而当总体取样规模增加到20%以上时,虽然表型保留比例接近100% ,但核心种质遗传多样性指数迅速降低。因此,认为15%总体取样规模较为合适。在一定的组内取样比例法和总体取样规模下,聚类取样构建的核心种质的遗传多样性指数 (I)、表型保留比例 (R PR)和变异系数 (CV)均比随机取样的高。根据获得的优化方案最终在表型水平建立了包含248份种质的中国大白菜核心种质。
【英文摘要】The method to construct Chinese cabbage core germplasm based on four types of samp ling proportion methods in group , six overall sampling scales and two sampling methods were studied in light of 1 651 accessions of Chinese cabbage germplasm and their data of 43 morphological characters in the National Medium-term Genebank of Vegetable Germplasm Resources. The main results were as follow s: The best proper sampling proportion within group was based on index of genetic diversity which enabled the

sampled number or proportion from different groups tend to balance, and better maintained the variability of original collection. The index of genetic diversity of the core germplasm established according to the method of genetic diversity index proportion reached maxim um and the ratio of phenotypic retained reached 98% when the overall sampling scale increased to 15%. Although the proportion of phenotypes retained nearly 100% and phenotypic variability changed little, the genetic diversity index of the core germplasm decreased accordingly when the overall sampling scale increased to over 20%. So 15% of the overall sampling sizes were more appropriate. In certain sampling proportion method and sampling scale, index of genetic diversity, ratio of phenotype retained and coefficient of variation of the co re germplasm constructed by cluster sampling was much higher than that by random sampling. Based on the optimized sampling scheme, the Chinese cabbage core germplasmof 248 accessions of Chinese cabbage germplasm were established.

【题目】萝卜小孢子不同发育时期的细胞学和花器官形态特征观察
【中文关键词】萝卜 小孢子发育时期 细胞学观察 形态特征
【英文关键词】Radish; Development stage of microspore; Cytological observation; Morphological characteristics
【中文摘要】通过醋酸洋红染色和 DAPI荧光染色对萝卜小孢子的发育过程进行了细胞学观察, 两种染色方法中, 后者较前者能更清楚和全面地显示细胞的结构。通过对 4份萝卜材料不同发育时期花蕾的细胞学和形态学的观察发现, 小孢子的发育时期与花器官形态特征之间存在密切的关系。各材料小孢子不同发育时期的花蕾纵径、花蕾横径、花蕾纵横比、花药长、花药宽、花瓣长和瓣药比均存在明显差异。不同萝卜材料处于单核靠边期的花器官各形态指标也存在明显差异, 其中花蕾纵径、花蕾纵横比、花瓣长和瓣药比适合于作为不同材料花蕾取样适期的鉴定指标, 各指标的适宜尺度: 花蕾纵径在 2. 991~ 3. 510mm之间, 花蕾纵横比在 1. 412~ 1. 480之间, 花瓣长在 1. 889~ 2. 561mm之间, 瓣药比在 0. 923~ 1. 057之间。此外, 适合小孢子培养的花蕾的外观特征为花药被萼片包裹紧密, 花瓣和花药等长或接近等长, 花蕾饱满, 花药浅黄色至黄色。
【英文摘要】The developmental stage of microspores was observed by two different methods:acetic magenta staining and DAPI staining.It was found that the nucleolus in microspore display more clearly by DAPI staining than acetic magenta staining.The relationship between microspore developmental stage and morphological characteristics of flower buds and anthers was studied by both of cytological and morphological methods on four different radish genotypes.There were significant differences in longitudinal diameter

and tra...

【题目】萝卜优异种质对芜菁花叶病毒抗性的遗传分析
【中文关键词】萝卜 TuMV 抗病性 遗传分析
【英文关键词】Radish TuMV Resistance Genetic analysis
【中文摘要】为了深入认识萝卜优异种质对芜菁花叶病毒(TuMV)的抗性遗传机制,本研究以高抗TuMV的自交系Q07-12(P_1)和高感自交系KB07-10(P_2)为亲本,构建了包括P_1、P_2、F_1、B_1、B_2及F_2的6个群体,采用数量性状主基因+多基因混合遗传的六世代联合分析法,对其抗性遗传规律进行研究。结果表明,萝卜对TuMV的抗性受两对基因控制,并符合“加性-显性-上位性多基因”模型,其中主基因遗传率在B1、B2及F2群体中分别为89%、55%和95%,多基因遗传率分别为0、40.9%和0.环境因素对抗性强弱的影响较小。因此结果表明了该优异种质在萝卜抗病毒遗传改良种的利用价值,在萝卜抗病育种与抗病基因挖掘提供了理论依据。
【英文摘要】In order to further understand the genetic mechanism on the resistance to turnip virus (TuMV) in elite radish germplasm ,the inheritance was analyzed by applying the jiont segeration analysis of a mixed genetic model major gene plus polygene in six generations (P1、P2、F1、F2、B1and B2) from cross between highly resistant inbred line QO7-12(P1) and highly susceptible line KB07-10(P2). The inheritance of resistance to TuMV was fitted by the two major genes plus polygene mixed model(E model). In B1、B2、and F2 populations ,the estimated inheribility of major genes wwere 89%、55% and 95%,respectively.The inheribility of polygenes were 0、40.9% and 0 respectively.The enviromental factors had small effect on the resistance to TuMV in radish .The result indicate that the elite resistant radish germplasm is of value in radish genetic improvement ,and provide the genetic basis for improving the efficiency of breeding for TuMV-resistance.

【题目】钼锰对不结球白菜硝酸还原酶活性及营养品质的影响
【中文关键词】不结球白菜; 钼; 锰; 硝酸还原酶; 营养品质
【英文关键词】Brassica campestris ssp chinensis; Mo; Mn; Nitrate reductase activity; Nutrient quality
【中文摘要】采用叶面喷施、根部施用、叶面喷施与根部施用相结合的3种处理方式, 研究了钼、锰对不结球白菜硝酸还原酶活性、硝酸盐含量及营养品质的影响。结果表明, 钼能够显著提高不结球白菜的硝酸还原酶活性, 使其硝酸盐含量显著降低; 锰对不结球白菜硝酸还原酶活性的影响不明显, 但可以显著降低其硝酸盐含量。钼和锰均可提高不结球白菜可溶性糖和VC含量。与单施钼、锰相比, 钼锰配施对降低不结球白菜硝酸盐含量、提高其可溶性糖和VC 含量效果更明显。
【英文摘要】Effect of molybdenum and manganese on nitrate reductase activity, nitrate content and nutrient quality in Brassica campestris ssp.chinensis were studied using so lu tion culture by spraying Mo and Mn elem ents on leaf, root and leaf combined with root treatment. The results indicated that nitrate reductaseactivity was significantly improved by Mo treatment, which caused significant reduction of nitrate content. Although, no remarkable effect on improving nitrate reductase activity was found by Mn treatment nitrate content was also reduced. Both Mo and Mn could improve the contents of soluble sugar and VC. Compared with single treatment of Mo or Mn, the reduction of nitrate content, improvement of soluble sugar and VC contents were more distinct by treatment with Mo plus Mn.

【题目】小白菜光合性能与硝酸还原酶活性关系的研究
【中文关键词】小白菜; 光合特性; 硝酸还原酶活性
【英文关键词】pakchoi; photosynthetic; NRA
【中文摘要】对营养液培养条件下的6 个不同基因型小白菜幼苗在不同光照度和硝酸还原酶抑制剂Na2WO4 处理下的光合参数、硝酸盐含量和硝酸还原酶活性(NRA) 进行分析, 以明确小白菜光合性能与NRA 的关系。结果发现: 随着光照强度的增强, 小白菜NRA 极显著增强, 其硝酸盐含量则显著降低, 并且基因型间有显著差异; Na2WO4 处理能使小白菜的NRA

和净光合速率显著降低,而对其叶绿素含量、气孔导度、胞间CO2 浓度和蒸腾速率无显著影响。研究表明,光照度是制约小白菜幼苗硝酸还原酶活性和硝酸盐含量的重要因素之一,小白菜幼苗的硝酸还原酶活性与其净光合速率有密切关系,但对其他光合参数无直接影响。

【英文摘要】The relationships between nitrate reductase activity(NRA) and photosynthetic characters of six different genotypes of pakchoi were studied by using solution culture. The studies included the effect of different light intensity on the contents of nitrate and NRA, and the effect of NRA on photosynthetic characters. The results indicated that the NRA improved and the nitrate content reduced following strengthen of light intensity, especially on NRA, suggesting that the main factor af fecting the NRA and nitrate contentwas light intensity. By using the treatment of Na2WO4, it was found that the photosynthetic decreased with the reduction of NRA, indicating that NRA could feed back the photosy nthetic. In addition, the chlorophyll content , Gs and Ci did not change obviously after NRA reduced, suggesting that these indexes were not affected directly by NRA.

【题目】光照度、施肥量及品种互作对不结球白菜硝酸盐含量和产量的影响

【中文关键词】不结球白菜; 光照度; 施肥量; 品种; 硝酸盐含量; 产量

【英文关键词】non-heading Chinese cabbage; light intensity; fertilization amount; variety; nitrate content; yield

【中文摘要】采用方差分析和多元相关分析法,选用3个不结球白菜品种研究了光照度、施肥量和品种3因素互作对叶片和叶柄硝酸盐含量和产量的影响。结果表明: 光照度、施肥量及品种对不结球白菜硝酸盐含量和产量都存在显著影响。随着光照度的增加,叶片和叶柄的硝酸盐含量显著下降,而产量明显增加,相关系数分别达-0.574、-0.314和0.508; 同时,还发现若适当增加施肥量,能明显提高产量,但叶片和叶柄中硝酸盐积累也增多。施肥量与产量的相关系数达0.433。硝酸盐积累和产量增加的多少因品种不同而异。

【英文摘要】Three non-heading Chinese cabbage varieties were selected to study the effect of light intensity, fertilization amount and variety on the nitrate content and yield bymultip le analys is of variance and correlation analysis. The results showed that all of the light intensity, fertilization amount and variety had significant impact on nitrate content and production of non-heading Chinese cabbage. The leaf and petiole nitrate content of non-heading Chinese cabbage decreased with the enhancement of lightintensity, and the yield improved with increase of light intensity, the correlation coefficient being -0.574, -0.314, 0.508, respectively. Moreover, the proper increase of fertilization amount could significantly improve the yield (r=0.433), but lead to a lot of nitrate accumulation. Meanwhile, the variety also had effect on nitrate content and production of non-heading Chinese cabbage.

【题目】低温胁迫对三个小白菜OguraCMS与保持系生化指标的影响

【中文关键词】小白菜; OguCM S; 低温胁迫; 生化指标

【英文关键词】Non-heading Chinese cabbage; OguCMS; Cold stress; Biochemical index

【中文摘要】以3个小白菜OguCM S与保持系为试材,苗期进行低温处理,对其叶绿素、可溶性糖、可溶性蛋白质和脯氨酸含量及超氧化物歧化酶(SOD)、过氧化物酶(POD) 和过氧化氢酶(CAT) 活性的变化进行研究。结果表明: 不育系的叶绿素、可溶性糖、可溶性蛋白质和脯氨酸含量在处理的各阶段均低于其保持系,SOD、POD 和CAT活性则是不育系高于其保持系。随着低温处理时间的延长,不育系和保持系叶绿素和可溶性蛋白质含量一直下降,可溶性糖和脯氨酸含量呈现

先上升后下降的趋势; SOD、POD和CAT活性呈现先上升后下降的趋势。不育系和保持系在处理的各个阶段变化的一致性和处理后各生化指标数值差异缩小, 表明小白菜OguCMS在苗期遇低温的抗逆能力与保持系很接近。
【英文摘要】Three cytoplasmic malesterile lines (CMS) and their maintainer lines of the non-heading Chinese cabbage (Brassica campestris L. ssp. chinensis(L.) Makino var. communis Tsen et Lee.) were taken as experimental materials, and the contents of chlorophyII, soluble sugar, soluble protein, proline and changes of the activities of SOD, POD, CAT in leaf were tested during seedling. The results show ed that the contents of chlorophyII, soluble sugar, soluble protein, proline in CMS were sign ificant lower than the irmaintainer, while the activities of three protective enzymes (SOD, POD and CAT) were higher in CMS with the treatment of low temperature stress. The contents of chlorophyII and soluble protein decreased continuously in both CMS and their maintainer; while the contents of soluble sugar, praline and the activities of three protective enzymes (SOD, POD and CAT) at first increased, then decreased under co ldstress. There was consistency in all stages of change between CMS and its maintainerline. And after processing, the differences in physiological and biochemical characteristics reduced. All these facts suggested the resistance of cold stress of non-heading Chinese cabbage OguCMS was greatly improved.

【题目】野生马铃薯材料耐霜冻性评价
【中文关键词】马铃薯、霜冻害、耐霜冻性
【英文关键词】wild potato、frost injury、frost tolerance
【中文摘要】在自然霜冻条件下,对4个种 (Solanum acaule, S. demissum, S. infundibuliforme, S. tuberosum) 的25份马铃薯材料进行耐霜冻性评价。应用系统聚类分析的方法对这些材料进行分级聚类,使其归属于3 个等级,分别是:强耐、中耐霜冻和霜冻敏感。其中强耐霜冻的材料有4份,中耐霜冻的有16份,霜冻敏感的有5份。筛选出的强耐霜冻材料有利于对马铃薯栽培种的耐冻性改良。
【英文摘要】Frost tolerance of 25 accessions of four species, including 3 wild species,Solanum acaule,S. demissum,and S.infundibuliforme,was assessed under natural conditions. By cluster - analysis system, these potato materials were classified into 3 groups based on different levels of frost tolerance: strong frost tolerance, medium frost tolerance, and frost sensitivity. There were 4 accessions with strong frost tolerance, 16 with medium frost tolerance and 5 with frost sensitivity. The accessions with strong frost tolerance may be helpful in improvement for frost tolerance in potato breeding.

【题目】COr辐照对莱芜姜当代生长的影响
【中文关键词】姜、根茎、辐照效应、RAPD、同工酶
【英文关键词】Ginger、rhizome、irradiation effect、RAPD、isozyme
【中文摘要】本试验以莱芜姜根茎为材料,用60C o γ射线进行了0、 20、 40和60G y 4个不同剂量的辐照处理,研究结果表明:辐照使莱芜姜当代(VM1)成苗率降低,出苗、 展叶时间延迟,生长受到明显抑制,且随剂量的增加,其抑制作用增强;对辐照当代植株进行POD、 EST同工酶和RAPD检测分析,均得到了与对照不同的差异性谱带,说明辐照生姜根状茎可以使植株在分子水平上发生变异;莱芜姜根茎使用LD30~40的中等剂量比较合适,适宜辐照剂量为20~30 G y。
【英文摘要】Rhizome of Laiwu ginger were treated with γ 2irradiation at the doses of 0 , 20 , 40 and 60 G y. The results showed that 60 Co γ 2irradiation inhibited the rhizome burgeoning , and decreased the survival rate of the seedlings , rate of leaf2 expansion and the growth of plants (VM1) . The inhibition effects became stronger with the increase of the irradiation dose.Different bands were found through the analysis of POD、 EST is ozymes and RAPD of VM1 plants ,which showed that variation on molecular level occurred in VM1 plants. LD30~40 was appropriate for the irradiation of rhizomes of Laiwu ginger and the optimal irradiation dose was about 20~30 Gy.

【题目】蔗糖浓度和光强对姜试管苗生长和光合的影响
【中文关键词】姜试管苗、蔗糖浓度、光强、生长、光合作用
【英文关键词】ginger plantlet in vitro、sucrose concentration、light intensity、growth、photosynthesis
【中文摘要】研究了0%、1%、3%三个蔗糖浓度和60、120、180μmolm-2s-1三个光强梯度对河南张良姜和四川竹根姜试管苗生长和光合作用的影响.结果表明,随着蔗糖浓度的降低,两个品种试管苗的生长受到明显抑制,叶绿素和类胡萝卜素含量也随之下降,但总光合速率(Pg)、净光合速率(Pn)和暗呼吸速率(Rd)却随之升高,Fv/Fm均以3%蔗糖处理最低.将光强从60μmolm-2s-1提高到120μmolm-2s-1,对试管苗生长有一定促进作用,但180μmolm-2s-1光强下其生长受到抑制.两个品种的叶绿素含量随光强增加均呈下降趋势.张良姜Pn以120μmolm-2s-1光强处理最高,竹根姜Pn随培养光强升高而升高,180μmolm-2s-1光强下达到最大值,为0.88μmolm-2s-1.180μmolm-2s-1光强下培养的张良姜试管苗Fv/Fm明显降低,发生了光抑制.竹根姜各光强处理间Fv/Fm无显著差异.张良姜试管苗的Rd随培养光强升高而增大,而竹根姜各光强处理间R差异不显著.表6参22
【英文摘要】The growth and photosynthesis of ginger plantlets in vitro in response to the three different sucrose concentrations (0%, 1%, 3%) and three different photosynthetic photon fluxes (60, 120, 180 μmol m-2 s-1) were investigated. The results showed that as the sucrose concentration decreased, the growth of the plantlets of two cultivars (Henan Zhangliang and Sichuan Zhugen) was restrained, the chlorophyll and carotenoid content reduced, and the gross photosynthesis (Pg), net photosynthesis (Pn) and dark respiration rate(Rd) increased. FV/Fm was the lowest at 3% sucrose concentration. When the light intensity was elevated from 60 umol-2s-1to 120 umol-2s-1,the growth of the plantlets of the two cultivares was promoted. However,the growth was restained when the light reached 180 umol-2s-1.The chlorophyll content decreased as the light intensity increased. The Pn of Zhangliang ginger was greatest when cultured under the light intensity of 120 umol-2s-1. The Pn of Zhangliang ginger increased as the culture light intensity increased and reached 0.88 umol-2s-1,the hightest value when measured under 180 umol-2s-1 light intensity.The Zhangliang ginger

cultured under 180 umol-2s-1 and a significantly lower FV/Fm,showing that it had suffered photoinhibition. However,no differences were observed in the three treatments of Zhugen ginger.As the light intensity increased,the Rd increased in Zhangliang ginger,but no differences was found in Zhangliang ginger.Tab6,Ref22.

【题目】Apricot germplasm resources and their utilization in China
【中文关键词】无
【英文关键词】apricot、resources、species、variety、cultivar
【中文摘要】无
【英文摘要】There are about ten species of apricot (Armeniaca Mill.) worldwide among which nine species are native to China. Above 2000 local apricot cultivars or types are investigated and recorded in the Chinese literature. Six hundred and forty-three accessions of apricot have been collected, conserved, identified, evaluated and documented up to now in the National Germplasm Repository for Plums and Apricots located in Xiongyue Town, Yingkou City, Liaoning Province of Northeastern China. In this paper, the history, distribution and production of apricot are reviewed; the botanical features and biological characteristics of ten species, as well as the important economic traits of the main local cultivars are briefly described. The research area and utilization of apricot germplasm resources in China are suggested.

【题目】Resources and breeding of ornamental apricot in China
【中文关键词】无
【英文关键词】ornamental、apricot、resources、breeding、Prunus mume、Prunus armeniaca、Prunus sibirica
【中文摘要】无
【英文摘要】‘Mei Flower’(Prunus mume Sieb. et Zucc.), which is also known as‘Mei Hua’,‘Plum blossom’or ‘Japanese apricot’, has played an important role in Chinese culture for many centuries and bestowed both aesthetics value and spiritual sustenance on the Chinese. It is not cold hardy and cannot be grown in northern China. Found when exploring the national apricot germplasm resources during 1979-1986, wild Liaomeixing [P. sibirica (L.) Lam. var. pleniflora J.Y. Zhang et al.] and Shaanmeixing (P. armeniaca L. var. meixinesis J.Y. Zhang et al.) not only can favourably compare with‘Mei Flower’in ornamental value but also are much hardier than it, therefore they may be cultivated in North China as an analogous‘Mei Flower’. In this paper, we introduced the botanical features, biological characteristics, ornamental value, culti ¬ vated technology of two new botanical varieties of apricot species, and the breeding of diverse ornamental apricot cultivars in China.

【题目】Genetic diversity and relationship among tea cultivars (Camellia sinensis) from China, Japan and Kenya revealed by ISSR markers and its implication for parental selection in tea breeding programs
【中文关键词】无
【英文关键词】Camellia sinensis、 genetic diversity、 genetic Relationship、inter-simple sequence repeat
【中文摘要】无
【英文摘要】Tea plant [Camellia sinensis (L.) O. Kuntze] is an important beverage crop in the world. In recent years many clonal tea cultivars have been released, and they play major roles in improving the production and quality of tea. It is important to understand the genetic diversity and relatedness of these cultivars to avoid inbreeding and narrow genetic basis in future tea breeding. In the present study, genetic diversity and relationship of 48 tea cultivars from China, Japan and Kenya were evaluated by inter-simple sequence repeat (ISSR) markers. A total of 382 ISSR bands were scored, of which 381 (99.7%) were polymorphic. The ISSR primers showed high ability to distinguish between tea cultivars according to their high Resolving Power (RP) with an average of 7.4. The mean of Nei ’s gene diversity (H) and Shannon ’s information index (I) were 0.22 and 0.35, respectively. More abundant diversity was revealed among cultivars in China than those in Japan and Kenya. Within Chinese populations, the level of diversity in east China was higher than that in other regions. The coefficient of genetic differentiation (GST) was 0.202, which indicates a high degree of genetic variation within populations. This result was further confirmed by analysis of molecular variance, which revealed the variance component within the populations (92.07%) was obviously larger than that among populations (7.93%). The level of gene flow (Nm) was estimated to be 2.0. This could be explained by frequent natural cross-pollination and seed dispersal among tea populations. The pairwise similarity coefficient between the cultivars varied from 0.162 to 0.538. A dendrogram of 48 tea cultivars was constructed where all the tested cultivars were divided into two groups. Our data show that the genetic relationship among tea cultivars can be determined by the ISSR markers. This will provide valuable information to assist parental selection in current and future tea breeding programmes.

【题目】Generation and characterization of 24 novel EST derived microsatellites from tea plant (Camellia sinensis) and cross-species amplification in its closely related species and varieties
【中文关键词】无
【英文关键词】Expressed sequence tag、Germplasm 、Microsatellite、 SSRs、Tea plant
【中文摘要】无
【英文摘要】A total of 31 expressed sequence tag (EST)-derived polymorphic microsatellites from tea plant, Camellia sinensis (L.) O. Kuntze, were generated and characterized using the ESTs of the author ’s EST sequencing project and other sources. A set of 40 accessions tea germplasms had been used to examine the diversity. Among the 31 microsatellite loci, 24 had two to eight polymorphic alleles. Observed heterozygosity (H o) were relatively higher (on an average of 0.533), varying from 0.175 (primer 21) to 0.950 (primer 228). Cross-species polymorphic amplification in other four species and two varieties of section Thea (L.) Dyer genus Camellia L. was successful for the 24 loci. Contribution of the 24 novel EST-SSR primers presented here will provide necessary and powerful molecular tools for management and conservation studies on the tea germplasms in the future.

【题目】结球甘蓝自交系遗传差异的AFLP分析
【中文关键词】结球甘蓝、AFLP分析、亲缘关系、遗传差异
【英文关键词】Brassiea oleraeea L.、genetie diversity、relationship、AFLP
【中文摘要】应用AFLP技术对52个结球甘蓝自交系的亲缘关系进行了研究。9对AFLP选择性扩增引物组合共产生689条带,并对其进行聚类分析。结果表明:AFLP技术清楚地将所研究的结球甘蓝自交系分为四个类群,春甘蓝自交系、紫甘蓝自交系、秋甘蓝自交系和来自我国台湾的自交系。其中春甘蓝自交系与紫甘蓝自交系之间的亲缘关系最近,紫甘蓝自交系与春、秋甘蓝自交系在亲缘关系的远近上几乎相同,而与来自我国台湾的自交系的亲缘关系最远。研究并明确了类群内自交系之间的亲缘关系。
【英文摘要】The Brassica genus comprises a large and diverse group of Plant species and Brassiea oleracea L.is one of the most important crops in China . AmPlified fragment length Polymorphism(AFLP) analysis was used to evaluate the genetic diversity in 52 inbred lines of Brassica oleracea L in this study. Using 9 primer pairs,689 informative AFLP markers were generated and scored as binary data. The finger printing data were further analyzed using Hierarchieal Cluste methods in the sofiware Paekage SPSS, Four subgroups Presenting spring eabbage, red eabbage, autumn cabbage and the eabbage comefrom Taiwan can be obviously distinguished by AFLP teehnique. Spring cabbage and red cabbage have the most closely relationship in our study. Red cabbage has almost the same genetic distance to spring cabbage and autumn cabbage, but far from the cabbage come from Taiwan Provinee.

【题目】Efficient Agrobacterium-mediated transformation of rice by Phosphomannose Isomerase/Mannose selection

【中文关键词】无
【英文关键词】Agrobacterium-mediated transformation, Mannose selection, Transgenic rice
【中文摘要】无
【英文摘要】A positive selection system was developed for Agrobacterium-mediated trans-formation of rice that does not use toxic compounds such as antibiotics or herbicides. The selection system is based on the Escherichia coli phosphomannose isomerase (pmi) gene as selectable marker and mannose as selective agent. Only transgenic plants were able to metabolize mannose into a usable source of carbon, fructose. Selection was achieved using a combination of mannose and sucrose at 10 g/l and 5 g/l, respectively. Transgenic rice plants were produced efficiently in japanica rice variety Zhonghua 8, with transformation frequency of 16.5%, which was a slightly lower than that achieved by hygromycin selection.

【题目】Greenhouse gas emissions from swine barns of various production stages in suburban Beijing, China
【中文关键词】Methane; Nitrous oxide; Carbon dioxide; CO2 balance; Natural ventilation
【英文关键词】Methane; Nitrous oxide; Carbon dioxide; CO2 balance; Natural ventilation
【中文摘要】Gaseous emissions from animal feeding operations may be influenced by production stage, genetics, dietary type and nutritional plan, housing type, manure handling schemes, and climatic conditions. This study was conducted to quantify annual emission rates (ERs) of greenhouse gases (GHGs)—methane (CH4), carbon dioxide (CO2) and nitrous oxide (N2O) from naturally ventilated swine gestation (GE), farrowing (FA), nursery (NU) and growing-finishing (GF) barns under typical operational conditions in suburban Beijing, China. Variables relative to the GHG ERs were measured every two months for a one-year period, with each measurement episode lasting 72 h. Air exchange rate of the naturally ventilated barns was estimated using CO2 balance method. The annual mean daily GHG ERs (mean ±SD), expressed in g/d/AU(AU= animal unit=500 live body weight), for the GE, FA, NU, and GF barns were, respectively, 5920 ±440; 7490±110; 29 670±1090 and 16 730 ±1060 for CO2; 9.6 ±1.9; 9.6±3.6; 58.4 ±21.8 and 32.1 ±11.7 for CH4; and 0.75±0.56; 0.54±0.15; 1.29±0.37 and 0.86± 0.75 for N2O. The GHG ER values from the current study

paralleled those reported in the literature in some cases but differed considerably in other cases. This outcome of similarity and disparity confirms the need to exercise caution when applying literature data to estimation of GHG emissions under various production systems. Results of this study are expected to contribute to the global GHG inventory.

【题目】Emissions of greenhouse gases from a typical Chinese swine farrowing barn

【中文关键词】Carbon dioxide, CO2 balance, Methane, Natural ventilation, Nitrous oxide
【英文关键词】Carbon dioxide, CO2 balance, Methane, Natural ventilation, Nitrous oxide

【中文摘要】Emissions of greenhouse gases (GHGs) from animal feeding operations to the atmosphere are of environmental importance and concerns because of their impact on global warming. Gaseous concentrations and emission rates (ERs) of animal facilities can be affected by the animal production stages, animal species, dietary nutrition, housing types, manure handling schemes, and environmental conditions. This article reports ERs of methane (CH4), nitrous oxide (N2O), and carbon dioxide (CO2) for a typical, naturally ventilated 24-crate swine farrowing barn located in suburban Beijing, China, that was monitored over one-year period. The measurements were made at bi-monthly intervals (i.e., six measurement episodes total), with each measurement episode covering three consecutive days. Gaseous concentrations were monitored at bi-hourly intervals throughout each 3-day measurement episode. The ventilation rate of the barn was estimated using the CO2 mass balance method. The GHG concentrations and ERs of the farrowing barn showed diurnal and seasonal variations. Specifically, the concentrations (monthly mean ±SD, mg/m3) ranged from 2.3 (±0.3) to 9.3 (±2) for CH4, from 0.6 (±0.02) to 1.2 (±0.16) for N2O, and from 1,370 (±163) to 11,100 (±950) for CO2, with the higher levels occurring in January and the lower levels in July. The specific ER ranged from 95.2 to 261.8 mg h?1 pig?1 for CH4, from 6.4 to 12.9 mg/h/head for N2O, and from 122.9 to 127.3 g/h/head for CO2. On the basis of per animal unit (1 AU = 500 kg live body mass), the average daily ERs of the farrowing barn were 9.6 ±3.6 g/AU/d for CH4, 0.54 ±0.15 g/AU/d for N2O, and 7.5±0.1 kg/AU/d for CO2. Results of the GHG ERs from this study differ markedly from the limited literature data collected primarily under European production systems and conditions. Results of the current study provide some baseline data on GHG ERs for swine farrowing operations, thus contributing to development or improvement of GHG emission inventory under the Chinese livestock production conditions.

【英文摘要】Emissions of greenhouse gases (GHGs) from animal feeding operations to the atmosphere are of environmental importance and concerns because of their impact on global warming. Gaseous concentrations and emission rates (ERs) of animal facilities can be affected by the animal production stages, animal species, dietary nutrition, housing types, manure handling schemes, and environmental conditions. This article reports ERs of methane (CH4), nitrous oxide (N2O), and carbon dioxide (CO2) for a typical, naturally ventilated 24-crate swine farrowing barn located in suburban Beijing, China, that was monitored over one-year period. The measurements were made at bi-monthly intervals (i.e., six measurement episodes total), with each measurement episode covering three consecutive days. Gaseous concentrations were monitored at bi-hourly intervals throughout each 3-day measurement episode.

The ventilation rate of the barn was estimated using the CO2 mass balance method. The GHG concentrations and ERs of the farrowing barn showed diurnal and seasonal variations. Specifically, the concentrations (monthly mean ±SD, mg/m3) ranged from 2.3 (±0.3) to 9.3 (±2) for CH4, from 0.6 (±0.02) to 1.2 (±0.16) for N2O, and from 1,370 (±163) to 11,100 (±950) for CO2, with the higher levels occurring in January and the lower levels in July. The specific ER ranged from 95.2 to 261.8 mg h?1 pig?1 for CH4, from 6.4 to 12.9 mg/h/head for N2O, and from 122.9 to 127.3 g/h/head for CO2. On the basis of per animal unit (1 AU = 500 kg live body mass), the average daily ERs of the farrowing barn were 9.6 ±3.6 g/AU/d for CH4, 0.54 ±0.15 g/AU/d for N2O, and 7.5±0.1 kg/AU/d for CO2. Results of the GHG ERs from this study differ markedly from the limited literature data collected primarily under European production systems and conditions. Results of the current study provide some baseline data on GHG ERs for swine farrowing operations, thus contributing to development or improvement of GHG emission inventory under the Chinese livestock production conditions.

【题目】Assessment of in-line dust filter type and Condition on Ammonia adsorption
【中文关键词】Air emissions, Air quality, Air sampling integrity, Ammonia adsorption, Dust filter
【英文关键词】Air emissions, Air quality, Air sampling integrity, Ammonia adsorption, Dust filter
【中文摘要】Gas analyzers are commonly protected from impurities in air sampling via use of in‐line dust filters to ensure operational performance and longevity of the instruments. This is especially true with extended periods of air quality monitoring in dusty environments. Prices for commercially available filters and monitoring needs vary considerably. A question that has often come up but has not received much investigation is how the filter media types (e.g., paper vs. Teflon) and operational conditions (clean vs. dirty) impact the integrity of gaseous concentration measurement. The study reported here was conducted toward addressing this issue. Specifically, the study assessed the magnitude of ammonia (NH3) adsorption for several types of in-line filters and conditions often used or encountered in animal feeding operation air emission studies, namely, Teflon (most expensive), paper (least expensive), and stand‐alone automobile fuel filters, being either clean (new) or dust‐laden. Three nominal NH3 levels (20, 45, or 90 ppm, generated with poultry manure) coupled with two nominal airflow rates (4 vs. 8 L/min or 8 vs. 16 L/min) through the filters were used in the evaluation. The types of dust used in the study included corn starch and broiler-house dust. Simultaneous measurements of NH3 concentrations before and after the tested filter were made with two photoacoustic gas spectrometers. The results revealed that NH3 adsorption was highest for the fuel filter initially but negligible for the Teflon filters. However, after 30 min exposure, relative NH3 adsorption by the filters mostly fell below 1%. The higher flow rate led to significantly lower relative NH3 adsorption for both the fuel and paper filters ($P < 0.001$) but made no difference for the Teflon filters ($P = 0.31$ to 0.49). During fresh‐air purging of the fuel filters laden with broiler-house dust, NH3 was initially released but diminished after 15 min. The results suggest that when used properly (e.g., proper flow rate), the in-line dust filters tested in this study (fuel, paper, and Teflon) offer viable, performance‐based options for air emissions (especially NH3) measurement applications.
【英文摘要】Gas analyzers are commonly protected from impurities in air sampling via use of in‐line dust filters to ensure operational performance and longevity of the instruments. This is especially true with extended periods of air quality monitoring in dusty environments. Prices for commercially available filters and monitoring needs vary considerably. 【题目】育肥猪舍氨气浓度测定与排放通量的估算
【中文关键词】氨气; 猪舍; 浓度; 排放通量
【英文关键词】ammonia; pig house; concentration; emission flux
【中文摘要】在北京选择典型猪场, 对不同季节育肥舍的氨气浓度进行了为期1年的试验测定, 2004—2005年试验期间每2个月测定1次, 每次测定3-4d, 每2h采样一次, 并根据二氧化碳平衡原理, 对猪场不同生长阶段的育肥猪氨气排放通量进行了估算。结果表明, 2005年1月舍内氨气的平均浓度为(10.09±4.60)mg/m3。2004年7月舍内氨气平均浓度为(3.44±2.34)mg/m3, 5月舍内氨气浓度为(6.29±4.07)mg/m3, 11月舍内氨气浓度为(6.98±2.63)mg/m3, 夏季舍内氨气浓度日夜变化不显著, 冬季每日最低氨气浓度出现在9:00-17:00 时段; 育肥猪饲养期间的氨气排放通量为每头107.18-424.42mg/h。
【英文摘要】Ammonia concentration in animal housing facilities has been one of the high concerns because of its significant effects on human health, animal behavior and the environment. To investigate NH3 emissions flux from finishing pigs, ammonia concentration measurements were taken from pig farmhouses for one year. Every two months, each collection data of 72-80 h were scheduled in 2004-2005. The results indicated that NH3 emission was strongly related to temperature and seasonal variation. The NH3 emission flux per pig was estimated based on ventilation rates calculated by application of carbon dioxide mass balance method. The NH3 concentration and emission flux varied diurnally and seasonally. The concentrations of NH3 averaged (10.09±4.60)mg/m3 in January, (3.44±2.34)mg/m3 in July, (6.29±4.07)mg/m3 in May and (6.98±2.63)mg/m3 in November, respectively. The concentrations of NH3 were lower between 9:00 am-17:00 pm during winter season, which greatly related to temperature and ventilation rate. NH3 emission flux from pig house varied between 107.18-424.42 mg/h per pig.

【题目】猪舍氨气排放预测模型的研究现状
【中文关键词】猪舍;氨气;排放;模型
【英文关键词】Swine houses; ammonia emission; Prediction models
【中文摘要】该文就氨气对环境的影响和猪舍氨气排放机制进行了简要的叙述,详细综述了氨气排放的机理模型和基于不同因素建立的经验模型。从中可以看出,国外对氨气排放的模型做了大量的研究,也取得了一定的研究成果,但是不同的研究结果有一定的差异。最后针对中国的实际情况,对中国氨气排放需进一步研究的问题进行了探讨。
【英文摘要】The effects on environment of ammonia are getting more and more serious. According to the information of literature,the authors summarized the studies on the mechanism and predietable models for ammonia emissions. From the literature,it is obvious that there are a lot of predicting models for ammonia emission developed abroad. And the model predicting results have some differences. Finally,based on the condition in China,some issues for further study on ammonia emission were discussed.

【题目】猪场厌氧出水后续处理效果的测定
【中文关键词】石灰; 沉淀; 氧化塘; 猪场污水; 后续处理
【英文关键词】lime; precipitation; anaerobic lagoon; swine waste water; post treatment
【中文摘要】针对猪场污水厌氧处理出水的有机物浓度高,后续处理困难的问题,该试验对石灰混凝法处理猪场高浓度厌氧出水的效果进行了测试,并与氧化塘的处理效果进行比较分析。试验中选择了1g/L和5g/L两种石灰投加剂量,对沉淀1、2、3、4、5和6h的净化效果进行取样分析;并对氧化塘猪场污水处理工艺连续取样三天,分析处理效果。结果表明:石灰混凝法投加剂量为5g/L、沉淀时间为5h时,对COD的去除率高达57.8%,明显好于氧化塘的去除效果;但对氨氮的去除率低于氧化塘。石灰混凝法沉淀时间短,基建投资小,可作为猪场污水进入二级处理或深度处理工艺前的可选择性过渡工艺。
【英文摘要】here are some difficulties to treat high concentration anaerobic digestion effluent from swine waste water treatment plant. In this study,the treatment efficiencies of lime coagulation and anaerobic lagoon were measured. In lime treatment experiment,two dosages of lime coagulation were 1 and 5g/L respectively,the sedimentation time was l,2,3,4,5 and 6h. In the same term,the measurements of removal efficiency of anaerobic lagoon were made at twice per day and (i.e.,six measurement episodes) 72h measurement episode,The result showed that average COD removal of lime coagulation treatment was 57.8% when the dosage of lime was 5g/L with 5h sedimentation time. The removal efficiency was better than 1g/L dosage and anaerobic lagoon. The NH3 removal of lime coagulation treatment was lower than the removal efficiency of anaerobic lagoon. The capital construction investment of the lime coagulation may be low because of short retention time and required volume,so it is possible process for high concentration anaerobic digestion effluent before second grade or advanced treatment.

【中文摘要】粪便贮存是废弃物农田利用和无害化处理的关键环节之一,该文对畜禽养殖粪便污水贮存设施设计过程中的选址、基本参数确定、如何防渗等进行了论述,提出优化设计方法,为资源化处理粪便的肥料利用成为可能,该设计运行费用低,使用方便,且能取得良好的经济效益,环境效益。设计可供畜牧环境工程设计和管理人员参考。
【英文摘要】Manure storages play an important role in the manure treatment and land application. This paper summarizes the general principles in manure storages design and management, including site selection, volume determination and leakage prevention measures of manure storages. An optimum design idea is proposed. The design can wake the manure as fertilizer resources. The design of the storage facility for animal manure runs economically, is easy to operate and has great benefits of both economy and environment. It can provide a reference of design for livestock environment facilities design and management.

【题目】畜禽粪便热解特性和动力学研究
【中文关键词】畜禽粪便; 生物质; 热解; 热重分析; 反应动力学
【英文关键词】animal manure; biomass; pyrolysis; thermogravimetric analysis; reaction kinetics
【中文摘要】利用热重- 微商热重的分析方法对猪、牛、鸡和羊4种畜禽粪便的热解行为进行了研究。热重试验样品粒径为0.2mm, 高纯氮气为热解环境, 加热起始温度为20℃, 终止温度为 900℃。通过对热重(TG) 曲线和微商热重(DTG) 曲线的分析, 得出畜禽粪便热解过程的脱水、过渡、主要失重和炭化 4 个阶段以及主要热解阶段的几个特征值参数; 考察了加热速率对样品热解过程的影响, 发现加热速率对样品热失重速率影响比较明显; 利用试验所得数据, 通过建立反应动力学方程, 采用一级单组分和一级双组分分阶段反应模型, 求出不同畜禽粪便在相应热解条件下的反应动力学参数, 结果显示, 几种样品的表观活化能值都在100 Kj/mol以下, 说明几种热解对象都很容易受热分解。
【英文摘要】Under high pure N2 and heating rates of 10, 30, and 50°C/min respectively, the pyrolytic experiments for swine, cattle, chicken and goat manure were carried out with the aid of thermogravimetric analyzer (TGA) to investigate their pyrolytic characteristics and kinetics. The sample size is 0.2mm and the temperature is from 20°Cto 900°C. The TG and DTG figure indicates four pyrolytic stages, including water- losing stage(20~127°C), transition stage(127~207°C), main weight losing stage(207~427 °C) and carbonization stage(427~800°C). The DTG curve of swine manure has one peak but the others have two peaks. These samples have high weight losing rates and the highest is 41.91%/s for swine manure at the heating rates of 50°C/min. The heating rates only affect the weight losing rates and have no significant effect on other pyrolytic characteristics. On the basis ofexperiment data, the kinetics parameters were obtained by establishing first- order dynamic reaction model and by integral computation method. All the apparent activation energy are below100 kJ?mol-1, indicating that all the samples are prone tothermal degradation.

【题目】施用沼液对杂交狼尾草产量和土壤养分含量的影响
【中文关键词】沼液; 杂交狼尾草; 生物量; 土壤养分
【英文关键词】slurry; crossbred pennisetum; biomass; soil nutrient
【中文摘要】探讨了"猪- 沼液- 牧草"模式中兼顾生物量生产与防止土壤和地下水污染的沼液适用量。田间试验在15个、面积分别为9m2的小区上进行, 试验设1个对照, 1个无机肥处理和3个沼液处理; 每个季节杂交狼尾草施肥生长28d后收获测定生物量与土壤养分变化。结果表明, 在厦门除冬季不适合种植杂交狼尾草外, 春、夏、秋季节施用沼液种植杂交狼尾草均能获得较好生长; 在沼液施用量0~400L/9m2/2周范围内, 杂交狼尾草生物量随沼液施用量增加呈上升趋势, 最大沼液施用量组(400L/9m2/2周)杂交狼尾草生物量春夏秋冬依次为26.03、19.97、11.70、3.41 kg/区; 至全年试验结束, 在上述沼液施用强度内(最大400L/9m2/2周) , 土壤 TN、TP、NH+4- N 呈略有下降的趋势, 土壤硝态氮略有上升, 一年之内未见对土壤养分含量构成显著影响。与使用化肥比较, 使用沼液因N引起的环境和地下水硝酸盐污染风险小。针对单施沼液出现土壤养分含量下降问题, 建议加大沼液施用量或者配施一定的无机肥。
【英文摘要】A feasible slurry application was determined for both the maximum harvested biomass and friendly environment in ' swine- biogas-grass' system. 15 plots, 9m2 for each, were randomly arranged for field test, five treatments including one group of inorganic fertilizer, 3 levels of slurry and 1 ck were designed. The grass biomass and soil nutrients were determined after planting 28 d within each season. The results showed that the grass could grow well with application of pig slurry except in winter. Crossbred pennisetum growth was enhanced with increasing of slurry application within 0-400L/9m2/2周. Under the maximum application of slurry (400L/9m2/2周), harvested biomass of crossbred pennisetumin spring, summer, autumn and winter was 26.03, 19.97, 11.70 and 3.41 kg?9 m-2 respectively. In the end of the experiment, no significant difference of soil nutrients was found even in the treatment of400 Lslurry?9 m-?22weeks-1, although soil TN, TP and NH4+-N decreased and the nitrate increased slightly. Compared with inorganic fertilizer, application of pig slurry resulted in less environmental risk, indicated by lower nitrate residue in soil. Increasing slurry application or applying mixed fertilizer was suggested to meet the loss of soil nutrient.

【题目】Development of SNP markers and haplotype analysis of the candidate gene for rhg1, which confers resistance to soybean cyst nematode in soybean.
【中文关键词】单倍型,SCN,SNP标记,大豆
【英文关键词】Haplotype, SCN, SNP marker, Soybean
【中文摘要】Soybean cyst nematode (SCN; Heterodera glycines Ichinohe) is one of the most destructive pests in the cultivation of soybean (Glycine max (L.) Merr.) worldwide. Markers based on the SCN resistance gene will enable efficient marker-assisted selection (MAS). We sequenced the candidate gene rhg1 in six resistant and two susceptible soybean genotypes and identified 37 SNPs (single nucleotide polymorphisms) among the sequences, of which 11 were in the coding region. Seven of these 11 SNPs led to changes in the amino acid sequence of the gene. The amino acid sequence we obtained differs from the previously published one by a stretch of 26 – 27 amino acids. Six codominant allele-specific SNP markers based on agarose gel detection were developed and tested in 70 genotypes, among which occurred only nine different haplotypes. Two neutrality tests (Tajima ’ s D and Fu and Li ’ s F) were significant for the six SNP loci in the 70 genotypes, which is consistent with intensive directional selection. A strong LD pattern was detected among five SNPs except 2868T>C. Two SNPs (689C>A and 757C>T) formed one haplotype (689C-757C) that was perfectly associated with SCN resistance. The new allele-specific PCR markers located in the alleged sequence of the rhg1 candidate gene, combined with the microsatellite marker BACR-Satt309, will significantly improve the efficiency of MAS during the development of SCN-resistant cultivars.

【题目】Cloning and sequence diversity analysis of GmHs1pro-1 in Chinese domesticated and wild soybeans.
【中文关键词】Glycine max, Glycine soja, DNA, 序列多样性, GmHs1pro-1, 大豆胞囊线虫, 抗性, 选择, 瓶颈
【英文关键词】Glycine max, Glycine soja, DNA, sequence diversity, GmHs1pro-1, Soybean cyst nematode, Resistance, Selection, Bottleneck
【中文摘要】Soybean cyst nematode (SCN) (Heterodera glycines Ichinohe) is the most important pathogen in soybean production worldwide and causes substantial yield losses. An apparent narrow genetic base of SCN resistance was observed in current elite soybean cultivars, and searching for novel SCN resistance genes as well as novel resistance sources rather than focusing on the two important genes rhg1 and Rhg4 has become another major objective in soybean research. In the present paper we report a 1,477 bp Hs1pro-1 homolog, named GmHs1pro-1. This gene was cloned from soybean variety Wenfeng 7 based on information for Hs1pro-1, a beet cyst nematode resistance gene in sugar beet. It has two domains, Hs1pro-1_N and Hs1pro-1_C, both of which are believed to confer resistance to nematodes. Of the 1,477 bp sequence in GmHs1pro-1, anopen readingframe of 1,314 bp, encoding a protein with 437 amino acids, was flankedby a 50-untranslated region of 27 bp and a 30- untranslated region of 135 bp. Fourteen single-nucleotide polymorphisms (SNPs) were observed in 44 soybean accessions including 23 wild soybeans, 8 landraces, and 13 soybean varieties (or lines), among which 5 in wild soybeans and 3 in landrace accessions were unique. Sequence diversity analysis on the 44 soybean accessions showed p = 0.00168 and h = 0.00218 for GmHs1pro-1; landraces had the highest diversity, followed by wild soybeans, with varieties (or lines) having the lowest. Although we did not detect a significant effect of selection on GmHs1pro-1 in the three populations, sequence diversity, unique SNPs, and phylogenetic analysis indicated a slight domestication bottleneck and an intensive selection bottleneck. High sequence diversity, more unique SNPs, and broader representation across the phylogenetic tree in wild soybeans and landraces indicated that wild collections and landrace accessions are invaluable germplasm for broadening the genetic base of elite soybean varieties resistant to SCN.

【题目】Novel microRNAs uncovered by deep sequencing of small RNA transcriptomes in bread wheat (Triticum aestivum L.) and Brachypodium distachyon (L.) Beauv.
【中文关键词】无
【英文关键词】Brachypodium.
Wheat.
Small RNA.
MicroRNA.
SiRNA
【中文摘要】无
【英文摘要】The small RNA transcriptomes of bread wheat and its emerging model Brachypodium distachyon were obtained by using deep sequencing technology. Small RNA compositions were analyzed in these two species. In addition to 70 conserved microRNAs (miRNAs) from 25 families, 23 novel wheat miRNAs were identified. For Brachypodium, 12 putative miRNAs were predicted from a limited number of expressed sequence tags, of which one was a potential novel miRNA. Also, 94 conserved miRNAs from 28 families were identified in this species. Expression validation was performed for several novel wheat miRNAs. RNA ligase-mediated 5 ′ rapid amplification of complementary DNA ends experiments demonstrated their capability to cleave predicted target genes including three diseaseresistant gene analogs. Differential expression of miRNAs was observed between Brachypodium vegetative and reproductive tissues, suggesting their different roles at the two growth stages. Our work significantly increases the novel miRNA numbers in wheat and provides the first set of small RNAs in B. distachyon.

【题目】MOS1 osmosensor of Metarhizium anisopliae is required for adaptation to insect host hemolymph
【中文关键词】无

【英文关键词】Metarhizium anisopliae
【中文摘要】无
【英文摘要】Entomopathogenic fungi such as Metarhizium anisopliae infect insects by direct penetration of the cuticle, after which the fungus adapts to the high osmotic pressure of the hemolymph and multiplies. Here we characterize the M. anisopliae Mos1 gene and demonstrate that it encodes the osmosensor required for this process. MOS1 contains transmembrane regions and a C-terminal Src homology 3 domain similar to those of yeast osmotic adaptor proteins, and homologs of MOS1 are widely distributed in the fungal kingdom. Reverse transcription-PCR demonstrated that Mos1 is up-regulated in insect hemolymph as well as artificial media with high osmotic pressure. Transformants containing an antisense vector directed to the Mos1 mRNA depleted transcript levels by 80%. This produced selective alterations in regulation of genes involved in hyphal body formation, cell membrane stiffness, and generation of intracellular turgor pressure, suggesting that these processes are mediated by MOS1. Consistent with a role in stress responses, transcript depletion of Mos1 increased sensitivity to osmotic and oxidative stresses and to compounds that interfere with cell wall biosynthesis. It also disrupted developmental processes, including formation of appressoria and hyphal bodies. Insect bioassays confirmed that Mos1 knockdown significantly reduces virulence. Overall, our data show that M. anisopliae MOS1 mediates cellular responses to high osmotic pressure and subsequent adaptations to colonize host hemolymph

【题目】Genetic diversity in domesticated soybean (Glycine max) and its wild progenitor (Glycine soja) for simple sequence repeat and single‐nucleotide polymorphism loci

【中文关键词】多样性格局特征,驯化,地理变异,基因渗入,群体结构。

【英文关键词】diversity pattern, domestication,geographic variation, introgression,population structure.

【中文摘要】The study of genetic diversity between a crop and its wild relatives may yield fundamental insights into evolutionary history and the process of domestication. • In this study, we genotyped a sample of 303 accessions of domesticated soybean (Glycine max) and its wild progenitor Glycine soja with 99 microsatellite markers and 554 single-nucleotide polymorphism (SNP) markers. • The simple sequence repeat (SSR) loci averaged 21.5 alleles per locus and overall Nei ’ s gene diversity of 0.77. The SNPs had substantially lower genetic diversity (0.35) than SSRs. A SSR analyses indicated that G. soja exhibited higher diversity than G. max, but SNPs provided a slightly different snapshot of diversity between the two taxa. For both marker types, the primary division of genetic diversity was between the wild and domesticated accessions. Within taxa, G. max consisted of four geographic regions in China. G. soja formed six subgroups. Genealogical analyses indicated that cultivated soybean tended to form a monophyletic clade with respect to G. soja. • G. soja and G. max represent distinct germplasm pools. Limited evidence of admixture was discovered between these two species. Overall, our analyses are consistent with the origin of G. max from regions along the Yellow River of China.

【题目】基于大豆胞囊线虫病抗性候选基因rhg1的InDel 标记开发与鉴定
【中文关键词】大豆; 胞囊线虫病; InDel 标记
【英文关键词】Soybean; SCN; InDel marker
【中文摘要】大豆胞囊线虫病是严重危害大豆生产的重要病害之一, 根据抗病候选基因开发标记可为分子标记辅助选择抗病材料提供标记资源。本研究通过对大豆胞囊线虫抗性候选基因rhg1 的序列比对分析, 发现4 个插入/删除位点, 针对其中3 个多碱基插入/缺失位点开发了InDel 标记。应用开发的3 个InDel 标记对33 份栽培大豆进行基因型鉴定, 共检测到等位变异11 个, 平均每个位点3.67 个。其中rhg1-I1 位点有等位变异5 个, rhg1-I2 位点有等位变异2 个; rhg1-I4 位点有等位变异4 个。各等位变异发生频率范围为0.8%~77.3%。InDel 标记与大豆胞囊线虫抗性间的关联分 析表明, rhg1-I4 为抗性相关标记, 对抗病资源的检出效率为88.2%, 对感病资源的检出效率为100%。该标记的288 bp 等位变异和294 bp 等位变异为抗病相关等位变异, 269 bp 等位变异和272 bp 等位变异为感病相关等位变异。此标记 与常用于标记辅助选择的Satt309 配合鉴定可以提高SCN 抗病资源的检测效率。
【英文摘要】Soybean cyst nematode (Heterodera glycaines, SCN) is one of the most important pests of soybean in the world. New molecular markers developed from resistance genes can provide marker resources for marker-assisted selection (MAS) breeding. Among four InDel loci detected by comparing the sequences of candidate rhg1 conferring SCN resistance, three multiple-bases InDel loci were used to develop markers. A total of 11 alleles were detected in 33 cultivated soybean genotypes using the three InDel markers with 5, 2, and 4 alleles at rhg1-I1, rhg1-I2, and rhg1-I4 locus, respectively. In combination with phenotypic identification in earlier investigations, rhg1-I4 was highly associated with SCN resistance, and screened out 88.2% of the resistant genotypes and 100% of the susceptible genotypes. Alleles of 288 and 294 bp presented in the SCN-resistant germplasm, and alleles of 269 and 272 bp presented in the SCN-susceptible germplasm. In addition, rhg1-I4 is also effective to distinguish the susceptible cultivar Lee and the resistant line PI88788 that have same amplification pattern with the SSR marker Satt309. It is suggested to use the both markers (rhg1-I4 and Satt309) for SCN-resistance selection in MAS breeding program in soybean.

【题目】基于大豆胞囊线虫病抗性候选基因的SNP位点遗传变异分析
【中文关键词】栽培大豆; 野生大豆; SNP标记; 遗传变异
【英文关键词】Glycine max; Glycine soja; SNP marker; genetic variation
【中文摘要】以我国363份栽培和野生大豆资源为材料, 对大豆胞囊线虫抗性候选基因(rhg1和Rhg4)的SNP位点(8个)进行遗传变异分析, 以期阐明野生和栽培大豆间遗传多样性及连锁不平衡水平差异。结果表明, 与野生大豆相比, 代表我国栽培大豆总体资源多样性的微核心种质及其补充材料的连锁不平衡水平较高(R2值为0.216)。在栽培大豆群体内, 基因内和基因间分别有100%和16.6%的SNP位点对连锁不平衡显著, 形成两个基因特异的连锁不平衡区间(Block)。在所有供试材料中共检测到单倍型46个, 野生大豆的单倍型数目(27)少于栽培大豆(31), 但单倍型多样性(0.916)稍高于栽培大豆(0.816)。单倍型大多数(67.4%)为群体所特有(31个), 其中15个为野生大豆特有单倍型。野生大豆的两个主要优势单倍型(Hap_10和Hap_11)在栽培大豆中的发生频率也明显下降, 推测野生大豆向栽培大豆进化过程中, 一方面形成了新的单倍型, 另一方面因为瓶颈效应部分单倍型的频率降低甚至消失。
【英文摘要】For clarifying the difference of genetic diversity and linkage disequilibrium (LD) level between cultivated (Glycine max (L.) Merr.) and annual wild soybean (Glycine soja Sieb. & Zucc.), genetic variation pattern of 8 SNP loci developed from soybean cyst nematode resistance candidate genes rhg1 and Rhg4 in soybean germplasm were analyzed. The results indicated that G. max population, consisted of cultivated soybean mini-core collection and modern cultivars, had a higher LD levels (R2 value is 0.216) than G. soja population. Since 100% of pairwise loci within a gene and 16.6% of pairwise loci between genes were significant in G. max population, two specific LD regions were formed for each gene. A total of 46 haplotypes were detected in 363 soybean germplasm. The population of G. soja had less number of haplotypes and higher haplotype diversity than the population of G. max. Among the 31 population-specific haplotypes, 15 haplotypes were specific for G. soja population. In addition, the frequency of two major predominant haplotypes (Hap_10 and Hap_11) in G. soja population was obviously decreased in G. max population, which might indicate that some new haplotypes were formed and some old haplotypes were lost during the G. max domesticated from G. soja.

【题目】Photosynthetic rate and yield formation in different maize hybrids
【中文关键词】无
【英文关键词】chlorophyll content, dry mass, photosynthetic rate, Zea mays L.
【中文摘要】无
【英文摘要】The relationship between photosynthetic rate and yield formation processes of the newer and older maize hybrids were investigated. Leaf area at flowering (source) and kernel number (sink) of the newer hybrids were greater than the older ones although their light-saturated photosynthetic rate (Psat) were not greater than the older ones before flowering. After flowering, Psat and chlorophyll content of the newer hybrids declined more slowly than the older ones. They not only distributed almost all photosynthates produced after flowering to grain but also reallocated some reserved photosynthates produced before flowering to grain. The newer hybrids exhibited greater grain mass than the older ones mostly because they could optimally regulate the photosynthetic rate and yield formation processes to maximize grain mass.

【题目】一种大豆 SNP 分型新方法.
【中文关键词】大豆;SNP ;分型;片段长度差异等位基因特异性PCR
【英文关键词】Soybean ;SNP ; Genotyping ; Fragment Lengt h Discrepant Allele Specific PCR
【中文摘要】单核苷酸多态性(SNP) 在大豆基因组中分布广泛,SNP 分型是大豆SNP 遗传作图,关联分 析、分子标记辅助选择等研究的重要技术。本文以Rh g4 基因开发的5 个SNP 为例,介绍了一种 大豆SNP 分型的新方法- 片段长度差异等位基因特异性PCR (FLDAS - PCR) 。采用AS - PCR 原理,针对某个SNP 位点设计2 条相差4 - 5bp 的特异引物和1 个公用引物 ,PCR 产物约100bp 或 150bp ,2 种等位基因型PCR 产物相差4 - 5bp ,在2 个特异引物3 ′ 端第3 和4 碱基位置分别人为引 入错配碱基来提高PCR 特异性,通过6 %变性聚丙烯酰胺凝胶电泳可将纯合和杂合基因型检测出 来。探讨了特异引物浓度和退火温度对Rhg4 - 1592 扩增效果的影响,研究表明,可通过调整特异 引物浓度和退火温度优化扩增效果。FLDAS - PCR 对18 份种质分型结果与PCR 产物克隆测序 法一致,表明本研究建立的FLDAS - PCR 法是一种简便、快捷、新型的大豆SNP 分型方法。
【英文摘要】Single nucleotide polymorphism (SNP) is a genome wide mutation type for organisms-SNP genotyping is an important technique for SNP genetic mapping ,association analysis , and molecular assistant selection and so on-We introduced a fragment length discrepant allele specific PCR (FLDAS - PCR) method for SNP genotyping in soybean ,using 5 SNPs in Rhg4 as examples- For a SNP loci ,we designed 2 allele specific primers which had 4 - 5bp length difference and 3 ’ - end complementary to each of bi - allelic SNPs ,and common primer ,as a result PCR product s of different alleles had 4 - 5bp difference in length ,which could be separated by 6 % denature polyacrylamide gel. In order to improve PCR specificity and data accuracy , an additional base mismatch was introduced at t he 3rd or 4th nucleotide closest to the 3 ’ - end of each of t he specific primer s-We al so investigated t he influence of annealing temperature and primer concentration on PCR amplification ,Rhg4 - -592 as an example ,and found t hat lower concentration of t he specific primer would reduce it s annealing competition in PCR reaction ,and behaved more sensitive to annealing temperature ,so we could optimize PCR by increasing or reducing specific primer concentration. The genotypes of SNPs by the FLDAS - PCR agreed with the results by PCR cloning and sequencing for -8 soybean genotypes ,which approved that the method was effective in SNP genotyping in soybean

【题目】Development of soybean EST-SSR markers and their use to assess genetic diversity in the subgenus Soja.
【中文关键词】EST-SSR, 多样性, Soja亚属
【英文关键词】EST-SSR, diversity, Soja subgenus
【中文摘要】Developing expressed sequence tag-derived SSR (EST-SSR) markers is imperative in genetic research. In this paper, we reported 37 EST-SSR markers which were developed from 286 unigenes obtained from soybean cDNA library. Among the 286 markers designed for the 4 accessions of Glycine max and 6 of its wild progenitor (G. soja) within the subgenus Soja, 209 markers amplified DNA fragments, taking 73.1% and 37 markers appeared to be polymorphic, which was 12.9% of the total. The 37 loci detected a total of 142 alleles, while the PIC values varied from 0.194 to 0.794. Both the number of alleles per locus and PIC value were significantly related to the SSR motif. Six EST-SSR loci may be fixed for different alleles between G. max and G. soja since they were particularly polymorphic among the 6 G. soja accessions. A neighbor-joining tree placed the G. max accessions together as a group within the G. soja, though the average genetic distance among G. soja accessions was much higher. These new EST-SSRs markers will be useful for genetic diversity analysis, genetic mapping construction and gene discovery in Soja subgenus.
【英文摘要】Developing expressed sequence tag-derived SSR (EST-SSR) markers is imperative in genetic research. In this paper, we reported 37 EST-SSR markers which were developed from 286 unigenes obtained from soybean cDNA library. Among the 286 markers designed for the 4 accessions of Glycine max and 6 of its wild progenitor (G. soja) within the subgenus Soja, 209 markers amplified DNA fragments, taking 73.1% and 37 markers appeared to be polymorphic, which was 12.9% of the total. The 37 loci detected a total of 142 alleles, while the PIC values varied from 0.194 to 0.794. Both the number of alleles per locus and PIC value were significantly related to the SSR motif. Six EST-SSR loci may be fixed for different alleles between G. max and G. soja since they were particularly polymorphic among the 6 G. soja accessions. A neighbor-joining tree placed the G. max accessions together as a group within the G. soja, though the average genetic distance among G. soja accessions was much higher. These new EST-SSRs markers will be useful for genetic diversity analysis, genetic mapping construction and gene discovery in Soja subgenus.

【题目】小麦白粉病菌诱导的TaWRKY34 基因的鉴定与分析
【中文关键词】小麦; 白粉病菌; WRKY 转录因子; 染色体定位; 表达模式
【英文关键词】Wheat; Blumeria graminis f. sp. tritici; WRKY transcription factor; Chromosome location; Expression pattern
【中文摘要】WRKY 转录因子在植物抗病防卫反应中发挥重要作用。利用 cDNA 宏阵列(macroarray)和 RT-PCR 相结合的方法, 从小麦全长 cDNA 文库的 WRKY 转录因子中筛选出一个应答小麦白粉病菌胁迫的 TaWRKY34 转录因子, 该基因编码 464 个氨基酸。染色体定位分析表明, 该转录因子位于小麦第一同源群染色体的短臂上, 并且只在细胞核中表达。其蛋白序列与拟南芥、大麦和葡萄抗病相关 WRKY 转录因子的亲缘关系较近, 与其中的 3 个 WRKY 基因具有相似的表达模式。TaWRKY34 在 Pm16/北京 8377抗白粉病近等基因系中, 对小麦白粉病菌、水杨酸和茉莉酸诱导的表达模式存在差异。TaWRKY34 可能与小麦对白粉菌的抗性有关。
【英文摘要】WRKY transcription factors play important roles in plant defense signaling network. However, little is known about the biological roles of WRKY proteins in wheat (Triticum aestivum L.). The objectives of this study were to screen WRKY transcription factor genes conferring resistance to powdery mildew (Blumeria graminis f. sp. tritici, Bgt) and disclose their function in wheat defense reaction. A WRKY transcription factor gene, TaWRKY34, was identified in response to Bgt by cDNA macroarray and semiquantitative RT-PCR from the wheat full-length cDNA libraries that were constructed in the authors ’ earlier studies. This gene encodes 464 amino

acid residues. TaWRKY34 was mapped onto short arms of chromosome 1B and 1D through blast search GrainGenes database and homemade full length cDNA library database of Aegilops tauschii. A further experiment indicated that TaWRKY34 also exists on chromosome 1AS through amplifying in Langdon D-genome disomic substitution lines and Chinese Spring nulli-tetrasomic lines with gene specific primers. Examining the subcellular localization of TaWARKY34, its coding region was fused to the 3′ end of green fluorescent protein (GFP). The GFP signal was detected only in the nucleus of onion epidermal cells to transiently express TaWRKY34-GFP, and the control-GFP protein distributed ubiquitously in both nuclei and cytoplasm. This suggests that TaWRKY34 is a nucleus-localized protein. Multiple sequence alignments of 57 WRKY domains from various species indicated that TaWRKY34 is closely related to WRKY transcription factors in response to pathogens in Arabidopsis thaliana (AtWRKY3, AtWRKY4, and AtWRKY33), Hordeum vulgare (HvWRKY42 and HvWRKY46), and Vitis vinifera (VvWRKY2) with identities ranging from 81.8% to 94.5%. Furthermore, TaWRKY34 has similar expression pattern with three sequences from A. thaliana, which was up-regulated at first and then down-regulated when inoculated with pathogens. The expression profiles of TaWRKY34 induced by powdery mildew fungus, salicylic acid, and jasmonic acid were different between Pm16/Beijing 8377 near-isogenic lines (resistant to Bgt) and Beijing 837 (susceptible to Bgt). The results imply that TaWRKY34 is probably related to the resistance to powdery mildew in wheat.

【题目】The size and ratio of homologous sequence to non-homologous sequence in gene disruption cassette influences the gene targeting efficiency in Beauveria bassiana
【中文关键词】无
【英文关键词】Beauveria bassiana
【中文摘要】无
【英文摘要】Targeted gene replacement via homologous recombination (HR) is a conventional approach for the analysis of gene function. However, this event is rare in Beauveria bassiana, which hampers efficient functional analysis in this widely used entomopathogenic fungus. To improve homologous recombination frequency in B. bassiana, we investigated the effect of the ratio of homologous sequence to non-homologous sequence (HS/NHS) in gene disruption cassette upon the HR frequency by two gene loci BbNtl and BbThi, using the herpes simplex virus thymidine kinase as a negative selectable marker against ectopic transformants. Our data revealed that an increase of the ratio of HS/NHS achieved by either extending homologous sequence or decreasing non-homologous sequence could improve HR frequency in B. bassiana. We determined empirically that (1) at least 700 bp of homology to both sides of a target gene was needed to get a reasonable number of disruptants, e.g., 6.7 per thousand to 13.3 per thousand in B. bassiana. (2) When the ratio of HS/NHS was above 0.8, an acceptable HR frequency could be achieved for gene replacement in B. bassiana, while when the ratio was below 0.3, few gene disrupted mutants were obtained

【题目】Bt 杀虫晶体蛋白—肠溶性微囊制备

【中文关键词】关键词:苏云金芽孢杆菌(Bacillus thuringensis);肠溶性微胶囊;Bt 伴孢晶体蛋白

【英文关键词】Key words: Bacillus thuringensis, enteric microcapsule, Bt crystal proteins

【中文摘要】摘 要:【目的】研究 Bt(Bacillus thuringensis)晶体蛋白肠溶性微囊的制备方法,为进一步研究它对防止紫外线损伤晶体蛋白及促进晶体蛋白在害虫中肠快速释放等方面的作用奠定基础;【方法】 用复相乳液法制备肠溶性微囊,并应用 L16(45)正交试验设计研究相关因子对微胶囊包封率的影响;【结论】采用复相乳液法可以制备 Bt 晶体蛋白的肠溶性微囊。 5 个因子对包封率有显著影响, 影响大小依次为乳化转速 >HPMCP 浓度(壁材)>Bt 晶体蛋白含量(芯材)> 蓖麻油含量(助剂)> 甲基纤维素浓度(亲水胶体)。 以 500ml分散系为条件, 筛选出的肠溶性微胶囊较佳工艺为:8.6mg/mL Bt 晶体蛋白溶液 1ml,20mg/mL HPMCP溶液 50ml 及蓖麻油 2ml,三者混合并在匀化器转速 6000r/min 下乳化,而后分散于 2.1%或 3.3%甲基纤维素钠溶液中成囊。

【英文摘要】Abstract:【 OBJECTIVE】 The paper aimed to research the preparation technology of enteric microcapsules of insecticidal crystal proteins (ICP) of Bacillus thuringensis (Bt)【.Method】 Double emulsion method was used for the effort to prepare enteric microcapsules with ICP as core material and hydroxypropyl methylcellulose phthalate (HPMCP) as shell material.Experiment in orthogonal matrix design [L1645)] was used to value theinfluence of the relevant elements【. Results】 Enteric microcapsules wrapping ICP could be prepared by double emulsion method. The encapsulation of ICP was influenced by factors such as emulsification rotation speed, concentration of shell and core materials, emulsification agent and hydrocolloids, which were listed in a pattern of decreasing importance. In 500 ml aqueous medium for formation of the microcapsules, the optimal technology was to emulsify 1 ml 8.6mg/mL IPC, 50ml 20mg/mL HPMCP and 2 ml castor oil at emulsification rotation speed of 6000 r/min, then disperse the emulsion in 2.1% or 3.3% carboxymethyl cellulose(CMC-Na).

【题目】蛋氨酸羟基类似物(HMTBA)和酸化剂、抗生素对肠道病原菌的体外抑制对比试验

【中文关键词】蛋氨酸羟基类似物; 酸化剂; 抗生素

【英文关键词】HMTBA; organic acid; antibiotics

【中文摘要】该研究采用平板法和试管法测定蛋氨酸羟基类似物(HMTBA) 体外抑菌效果, 并与常见有机酸, 如乳酸(LA) 、甲酸(FA) 、柠檬酸(CA) , 以及二甲酸钾(KDF) , 广谱抗生素氯霉素(Chl) 、诺氟沙星(Nor) 进行比较。结果表明, HMTBA 对6 株供试菌的最低抑菌浓度(MIC) 为0.1 % ~0.2 %, 与LA、CA、C.KDF、B.KDF 相当, 高于FA 的0.05 %~0.1 %;

Chl 对6 株供试菌的最低抑菌浓度(MIC) 为1.95 ~7.81 mg/ kg, Nor 对5 株供试菌的最低抑菌浓度在0.391~0.781 mg/ kg, 而对鸡源沙门氏菌S1 的MIC 却是12.5 mg/ kg, 说明该菌已对Nor 产生了耐药性。

【英文摘要】In this research, inhibition efficacy of 2- hydroxy- 4- (methythio) butanoic acid (HMTBA) against majorenteric pathogens was studied comparing with other antibacterial substances, such as lactic acid, formic acid, potassium diformate,norfloxacin and chloromycetin in vitro.The result showed that the MIC of HMTBA to the six tested strains was0.1 % ~0.2 %.The antibacterial activity of HMTBA was almost the same as lactic acid, citric acid, formic acid and potassiumdiformate, but no better than formic acid and the two antibiotics.The MIC of chloromycetin to six tested strains was 1.95 ~7.81 mg/kg, and the MIC of norfloxacin to five of the six tested strains was 0.391 ~0.781 mg/kg, but it was 12.5 mg/kg to the chicken- source salmonella S1, which showed that this strain acquired resistance to norfloxacin.

【题目】Perennial O.Sativa ryza sativax O.Rufipogon interspecific hybrids:I.Photosynthetic charaoteristics and their inheritance

【中文关键词】无

【英文关键词】Rice; Photosynthesis; Oryza; O. sativa; O. rufipogon

【中文摘要】无

【英文摘要】A survey of 24 wild Oryza accessions identified Oryza australiensis and Oryza rufipogon as potential sources of enhanced photosynthetic ratefor introgression into cultivated rice. Photosynthetic capacity per unit leaf area (CER) was associated with leaf N content but not with leafchlorophyll concentration, flag leaf area, or specific leaf area. Eight fertile, perennial F1 hybrids between O. sativa and O. rufipogon were grown innon-flooded soil, and CER was measured at flowering under saturating light. Two F1 hybrids had greater CER than the average of26.1 mmol m2 s 1. The F2 progeny from these hybrids were screened for CER in the field, and segregants with even greater rates of photosynthesiswere selected. The basis of high photosynthetic rate in the F2 populations was not leaf thickness or leaf chlorophyll content. One F2 line hadexceptionally high CER and stomatal conductance. Broad-sense heritability on an individual plant basis for CER in two F2 populations was 0.44and 0.37. A highly significant offspring-parent regression of 0.89 for CER was observed in a replicated field evaluation (four blocks, five plants perplot) of 20 vegetatively propagated F2 selections and their F3 seedling progeny. Broad-sense heritability for CER on a plot-mean basis wasestimated as 0.74 for both selected F2:3 families and for the selected F2 clones. Genetic resources in the genus Oryza may represent a source ofalleles to increase leaf photosynthetic rate in the cultivated species, which we have demonstrated to be a heritable, though environmentally variable,trait in an O. sativa/O. rufipogon population.

【题目】Characterization of a wheat HSP70 gene and its expression in response to stripe rust infection and abiotic stresses

【中文关键词】无

【英文关键词】Wheat, HSP70, Stripe rust,
Expression profile, Abiotic stress

【中文摘要】无

【英文摘要】Members of the family of 70-kD heat shock proteins (HSP70 s) play various stress-protective roles in plants. In this study, a wheat HSP70 gene was isolated from a suppression subtractive hybridization (SSH) Cdna library of wheat leaves infected by Puccinia striiformis f. sp. tritici. The gene, that was designated as TaHSC70, was predicted to encode a protein of 690 amino acids, with a molecular mass of 73.54 KDa and a pI of 5.01. Further analysis revealed the presence of a conserved signature that is characteristic for HSP70s and phylogenetic analysis demonstrated that TaHSC70 is a homolog of chloroplast HSP70s. TaHSC70 mRNA was present in leaves of both green and etiolated wheat seedlings and in stems and roots. The transcript level in roots was approximately threefold less than in leaves but light – dark treatment did not charge TaHSC70 expression. Following heat shock of wheat seedlings at 40 ° C, TaHSC70 expression increased in leaves of etiolated seedlings but remained stable at the same level in green seedlings. In addition, TaHSC70 was differentially expressed during an incompatible and compatible interaction with wheat-stripe rust, and there was a transient increase in expression upon treatment with methyl jasmonate (MeJA) treatment. Salicylic acid (SA), ethylene (ET) and abscisic acid (ABA) treatments had no influence on TaHSC70 expression. These results suggest that TaHSC70 plays a role in stress-related responses, and in defense responses elicited by infection with stripe rust fungus and does so via a JA-dependent signal transduction pathway.

【题目】全收粪法与Cr2O3指示剂法测定家禽表观代谢能方法比较
【中文关键词】表观代谢能;全收粪法;指示剂法;肉鸡
【英文关键词】apparent metabolizable energy(AME);total collection method;indicator method;broiler chicken
【中文摘要】通过全收粪法和Cr2O3指示剂法,对20种不同来源玉米-豆粕型日粮的肉鸡的表观代谢能(AME)进行测定。结果表明:全收粪法测定玉米AME在绝干基础上是14.92~16.10MJ/kg,平均15.60MJ/kg,RSD为2.15%;指示剂法所测玉米AME在绝干基础上是15.05~16.16MJ/kg,平均15.65MJ/kg,RSD为2.11%;两种方法所测代谢能值相关分析,相关方程式AME(全)=1.00142×AME(指)-0.06918(R2=0.9708),二者高度相关;配对T检验,指示剂法比全收粪法值高,但差异不显著(P>0.05)。可见,Cr2O3指示剂法与全收粪法在测定肉禽AME时具有高度相关性,指示剂法可作为一种快速准确的评定家禽表观代谢能的方法在试验研究和生产实践中推广。
【英文摘要】This study was conducted to compare the methodologies of total collection method and the Cr2O3 indicator method on determining the AME content of 20 kinds of corn used in corn- soybean meal diets.The results indicated that,the determined AME values for corns ranged from 14.92 MJ/kg to 16.10 MJ/kg by using total collection method,with average of 15.60 MJ/kg,RSD=2.15%; indicator method determined AME values for corns varied from 15.05 MJ/kg to 16.16MJ/kg,with average of 15.65 MJ/kg,RSD=2.11 %;correlate equation between two methods was: AME(total)= 1.00142×AME(indicator)- 0.06918 (R2=0.9708).There were no significant difference between the total collection method and Cr2O3indicator method in the determined AME values for corns (P > 0.05)by using paired T test,although the values from indicator method were higher than those from total collection method.Therefore,indicator method can be used to replace the total collection method to determine AME content in metabolism research.

【题目】Recovery of Residual Fertilizer-Nitrogen by Wheat in a Winter Wheat – Summer Maize Rotation in the North China Plain: A Soil Column Study
【中文关键词】无
【英文关键词】Soil,nitrogen use efficiency
【中文摘要】无
【英文摘要】Cropping systems is potentially useful practice for mitigating nitrate leaching and increasing nitrogen use efficiency (NUE) because deeper rooted crops could capture the leached N from previous shallower rooted crops. The recovery of fertilizer nitrogen (FN) applied to maize (Zea mays L.) by the succeeding wheat (Triticum aestivum L.) in a winter wheat – summer maize rotation in North China Plain (NCP) was studied in 2003 – 2004 and 2005 – 2006 by creating 15N-labeled soil columns. We found that the in-season maize plant use efficiency of FN was about 46 to 48% and the total residual fertilizer nitrogen (RFN) in a 2-m soil profile at maize harvest was 34% in 2003 – 2004 and 41% in 2005 – 2006, the ratios of FN unaccounted for were about 19 and 12%, respectively. The RFN declined significantly down the soil profile. About 13 and 10% of total RFN, or 4.4 and 4.0% of total applied FN were observed below the 1.2 m soil depth. Wheat was able to recover the RFN up to the 2.0-m soil depth, the recovery ratio from upper soil layers was higher than that from lower layers and ranged from 4.4 to 23% in 2003 – 2004 and 4.6 to 34% in 2005 – 2006. Corresponding total recovery ratios were 13.7 and 21.4% of total RFN, or 4.9 and 8.7% of total applied FN, respectively. The annual recovery ratios were 51.6% in 2003 – 2004 and 56.2% in 2005 – 2006. The deep-rooting characteristics of winter wheat for deep N uptake should be taken as an important index in N fertilizer management in the rotation system.

【题目】日粮三聚氰胺对产蛋鸭组织氧化损伤的影响
【中文关键词】三聚氰胺,组织,氧化损伤,产蛋鸭
【英文关键词】melamine, tissue, oxidative damage, laying duck
【中文摘要】采用单因子试验设计,研究了日粮三聚氰胺(MEL)对产蛋鸭组织氧化损伤的影响。选用体重和产蛋率相近的19周龄金定鸭648只,随机分成6个处理,每个处理6个重复,每重复18只。6种日粮的MEL添加水平分别为0、1、5、25、50 mg/kg和100 mg/kg。试验期21 d。结果表明:与对照组相比,100 mg/kg处理组血清中谷胱甘肽过氧化物酶(GSH-Px)活性显著降低(P < 0.05),丙二醛(MDA)含量显著升高(P < 0.05);50 mg/kg和100 mg/kg处理组肾脏中GSH-Px活性显著降低(P < 0.05);100 mg/kg处理组肝脏中过氧化氢酶(CAT)和超氧化物歧化酶(SOD)活性显著降低(P < 0.05),MDA含量显著升高(P < 0.05);50 mg/kg处理组肝脏中SOD活性显著降低(P < 0.05);胸肌中各抗氧化指标均未见显著差异(P > 0.05),表明MEL可引起产蛋鸭血清、肾脏和肝脏组织的氧化损伤。
【英文摘要】Effect of dietary supplemental melamine on the oxidative damage of laying duck tissues were studied by toxic experimental methods. Six hundred and fourty-eight 19 weeks old Jinding laying ducks were randomly divided into 6 groups with 6 replications, 18 ducks per replication. The melamine levels added to the dietary were 0, 1, 5, 25, 50, 100 mg/kg in each group respectively. The trial lasted for 7 days for adaptation, and 21 days for sampling. The results showed that compared with control group, in 100 mg/kg group, the activities of glutathione peroxidase (GSH-Px) in serum was significantly decreased (P < 0.05), the content of malonaldehyde (MDA) was significantly increased; In 50 and 100 mg/kg group, the activities of GSH-Px in kidney was significantly decreased (P < 0.05), the content of MDA was increased with 11.08%, 15.57% (P > 0.05), respectively; In 100 mg/kg group, the activities of catalase(CAT) and superoxide dismutase (SOD) in liver was significantly decreased (P < 0.05), the content of MDA was significantly increased, and the CAT activities in liver was increased also; However, the parameters had no notable differences in the breast. Dietary supplementation high level of melamine can resulted in oxidative damage in serum, liver and kidney of laying ducks, but it didn't cause oxidative damage in the breast.

【题目】Construction of an Escherichia coli to Bacillus thuringiensis shuttle vector for large DNA fragments.
【中文关键词】无
【英文关键词】Bacillus thuringiensis
【中文摘要】无
【英文摘要】Shuttle vectors for Bacillus thuringiensis or Bacillus cereus usually cannot hold fragments larger than 20 kb. With the development of genome research, shuttle vectors with higher loading capacity are necessary. We constructed an Escherichia coli to B. thuringiensis shuttle vector, pEMB0557, with a large loading capacity. This vector incorporated the ori60 replicon from B. thuringiensis subsp. kurstaki YBT-1520, erythromycin resistance (B. thuringiensis), and chloromycetin resistance (E. coli) genes. A bacterial artificial chromosome library of B. thuringiensis strain CT-43 was constructed and pEMB0557 was able to accommodate at least a 70-kb DNA fragment. Simultaneously, the cry1B gene on a 40-kb fragment could express a 140-kDa protein in plasmid-cured B. thuringiensis BMB171. Due to its high capacity and utility in expressing exogenous genes, pEMB0557 will be useful in cloning (especially silencing genes) and expressing large DNA fragments (e.g., gene clusters) in B. thuringiensis. Plasmid pEMB0557 provides a new tool for B. thuringiensis genome or B. cereus group research.

【题目】Cloning and characterization of a wheat β-1,3-glucanase gene induced by the stripe rust pathogen Puccinia striiformis f. sp. tritici.

【中文关键词】无
【英文关键词】β-1,3-Glucanase, Wheat, Stripe rust fungus, Immunocytochemistry, Expression profiles
【中文摘要】无
【英文摘要】β-1,3-Glucanases are a group of pathogenesisrelated proteins that have been reported to be involved in plant defense against pathogens in many other plantpathogen systems. However, it was not clear if these genes play similar role in wheat (Triticum aestivum L.) against Puccinia striiformis f. sp. tritici (Pst), the stripe rust pathogen. To investigate the role of β-1,3-glucanase (EC 3.2.1.39) in the resistance response of wheat (cv. Suwon 11) to stripe rust, a wheat β-1,3-glucanase gene induced by Pst, designated as TaGlu, was cloned and characterized. TaGlu was predicted to encode a basic protein of 334 amino acids. Quantitative real-time PCR analyses revealed that the transcription of TaGlu was induced during both compatible and incompatible interactions with Pst, but the transcription level was much higher in the incompatible interaction than that in the compatible interaction. TaGlu also showed noticeable induction of gene expression in young green leaf tissues treated with salicylic acid, methyl jasmonate or ethylene. Immunogold labeling assays showed that the enzyme were localized mainly in the host cell wall and over the extrahaustorial matrix, and the labeling densities were found significantly higher in the incompatible interaction than those in the compatible interaction.

【题目】A novel negative regulatory factor for nematicidal Cry protein gene expression in Bacillus thuringiensis
【中文关键词】无
【英文关键词】Nematicidal Cry Protein Gene Expression;Bacillus thuringiensis
【中文摘要】无
【英文摘要】A 3-kb HindIII fragment bearing the cry6Aa2 gene and the adjacent and intergenic regions was cloned from Bacillus thuringiensis strain YBT-1518. Two open reading frames (ORFs), namely, orf1 (termed cry6Aa2) and orf2 that were separated by an inverted-repeat sequence were identified. orf1 encoded a 54-kDa protein that exhibited high toxicity to the plant-parasitic nematode Meloidogyne hapla. The orf2 expression product was not detected by SDS-PAGE, but its mRNA was detected by RT-PCR. The orf2 coexpressed with orf1 at a high level in the absence of the inverted-repeat sequence, whereas, the expression level of otfl was decreased. When orf2 was mutated, the level of orf1 expression was enhanced obviously. In conclusion, the inverted-repeat sequence disturbs orf2 expression, and the orf2 downregulates orf1 expression. This is an example of novel negative regulation in B. thuringiensis and a potential method for enhancing the expression level of cry genes.

【题目】套算法测定玉米代谢能适宜的玉米替代比例研究
【中文关键词】表观代谢能;玉米;套算法;替代比例;肉仔鸡
【英文关键词】Apparent metabolizable energy (AME) ; Corn; Substitution; Ratio; Broiler
【中文摘要】本试验应用插值法探讨了套算法测定单个饲料(玉米) 代谢能值中被测饲料的适宜替代比例问题。选用396只28日龄AA 肉仔鸡, 按体重相近、公母各占1/ 2 的原则分配到9 个处理组中, 每处理11 个重复, 饲喂以被测玉米按不同比例(0、20%、3 0%、40%、5 0%、60%、70%、8 0% 和100%) 替代基础日粮组成的试验日粮, 进行代谢试验, 同时测定各处

理的生产性能(平均日增重、采食量、饲料/ 增重) 。数据显示玉米替代基础日粮测定肉仔鸡代谢能时, 随玉米替代基础日粮的比例增加, 试验日粮的AME 值除60%和80%两个处理组外呈明显的上升趋势(P <0.01),但是被测玉米的AME值除80%处理组外无显著差异(P> 0.05)用插值法计算出被测玉米AME “ 真值 ”,代入其与替代比例建立的回归公式中, 计算得到套算法中玉米替代基础日粮适宜比例为63.45%。生产性能数据显示, 低于70%的处理组试鸡的采食量大, 日增重高, 饲料/ 增重处于正常水平且无显著差异(P > 0.05),高于40%的处理组测得的玉米AME 值组内数据变异小(低于3%),可认为该比例是试鸡处于正常生产状态下测得的稳定数值, 具有实际意义。

【英文摘要】The study was conducted to determine the exact substitution ratio of tested feedstuff by using the method of extrapolation to evaluate feedstuff AME in chicken. A total of 396 28-day AA broiler chickens were raised and randomly allotted into 9 different treatments consisted of 11 replicates with 2 male and 2 female each. Broiler chickens in different treatment were fed tested feedstuff substituted by different ratio of tested corn (0, 20%, 30%, 40%, 50%, 60%, 70%, 80% and 100%) in metabolizable experiment with performance testing . The results showed that the AME of tested feedstuff raised significantly except for the groups which the corn ratio was 60% and 80%, while no significant difference was observed on the AME of tested corn except for group with 80% corn ratio (P > 0.05). Substituting the ME value of tested corn calculated by the methods of extrapolation into the regression models established with the AME value of tested corn (Y) and its substitution ratio in basal diets (X), the corr esponding X was 63.45%. It was concluded that performance in the treatments which tested corn ratio less than 70% showed high FI and ADG, but the FCR in different treatments showed no significantdifference (P>0.05). There was little variation (lower than 3%) of tested corn AME value in treatments with corn ratio higher than 40%. All showed that 63.45% was practical while it was tested stably during the natural states of the broiler chickens.

【题目】基于PDA的无公害农产品产地土壤质量现场评价系统的研究
【中文关键词】土壤质量 描述性指标 无公害农产品 信息采集 PDA
【英文关键词】无

【中文摘要】农产品是人类赖以生存的物质基础和保障。国内外此起彼伏的农产品污染和农产品污染引起的中毒事件,使消费者更加关注农产品的安全问题。无公害农产品是为从根本上解决农产品质量安全和餐桌污染问题提出的概念。在影响农产品安全的诸多因素中,产地是农产品质量安全的源头,产地的安全管理显得尤为重要。然而,随着我国农业生产的迅速发展,化肥、农药大量使用,农业土壤环境污染日益明显,而土壤污染具有隐蔽性、潜伏性和长期性,最易被人们忽略,因此,获取足够的产地信息、尤其是产地土壤信息保障产地安全具有重要意义。本文从保障农产品安全的角度出发,提出了无公害农产品产地土壤质量评价描述性指标体系,并提出了标准化、数值化的方法,在此基础上,建立了以土壤质量现场评价信息为主体的无公害农产品产地信息采集与产地现场评价系统,旨在将先进的农业数字化技术引入无公害农产品认证中来,为保障产地安全提供一种高效的技术手段。该系统在重庆市、云南通海县进行了试用,主要研究结果如下: (1)从土壤耕性、土壤肥力、作物健康状况、土壤生物、污染源等六个方面筛选出土壤结构、土壤质地、耕层厚度、田间持水量、土壤水分入渗能力、有机质、盐碱化程度、土壤pH值、农田排水状况、地下水埋深、作物长势、作物颜色及缺素现象、根系形态、土壤动物、作物残茬、坡度、地形部位、植被覆盖度、土壤侵蚀、排水沟水颜色、土壤气味、土壤颜色、土壤触觉、土壤侵入体、产地与潜在污染源相对风向、受控污染源与产地间距离等27个便于进行土壤质量评价的描述性指标。 (2)为了提高描述性指标数据的相对可比性,细化不同土壤质量间的差异,对描述性指标进行了标准化与数值化:根据对评价指标的不同描述,将其分为“好”、“中”、“差”三等,将三个等级设为满分10分,10~8分为“好”,7~4分为“中”,3~1分为“差”。现场评价时,先判断土壤各指标的等级,再根据等级内的差异判断指标得分。 (3)根据无公害农产品产地现场检查的内容与重点,对产地信息的特征进行了分析,共建立字段469个,表28个;以特征分析为基础,采用实体关系(E-R)模型构建了无公害农产品产地信息数据模型,构建了无公害农产品产地信息数据库,目前库中共收录产地信息869条;以PDA为移动终端,建立无公害农产品产地土壤质量评价信息采集系统,系统功能包括GPS定位、数据操作、数据处理、查询、多用户登陆、数据传输,实现了数据的本地与远程查询、检查结果自动判定、产地信息实时传输等。 (4)通过对通海县农户调查数据与PDA现场采集数据的对比分析,发现大部分描述性指标得分随着土壤肥力和土壤质量等级的升高而增大,其变化趋势与肥力高低变化、土壤质量等级高低变化基本一致,即本文所选取的土壤质量评价描述性指标具有较强的代表性,现场评价得分能够比较灵敏地、相对量化地反映土壤质量的状况。 (5)云南通海县无公害农产品产地土壤质量现场评价的指标体系可以优化为:土壤结构、土壤质地、耕层厚度、田间持水量、土壤水分入渗能力、有机质、盐碱化程度、土壤pH值、农田排水状况、地下水埋深、作物长势、作物颜色及缺素现象、根系形态、土壤动物、作物残茬、坡度、地形部位、植被覆盖度、土壤气味、土壤触觉、土壤颜色、土壤侵入体、产地与潜在污染源相对风向、受控污染源与产地间距,共24个指标。

【题目】复合酸化剂对断奶仔猪生长性能、胃肠道酸度及消化酶活性的影响
【中文关键词】酸化剂;断奶仔猪;生长性能;pH;消化酶活性
【英文关键词】English keywords are not available.
【中文摘要】选择28日龄断奶、体重(6±1.04)kg的杜长大杂种健康仔猪200头,按遗传和体重相近的原则随机分为5个处理组,每组4 个重复,每个重复10头猪。对照组在每千克基础饲粮中添加15mg黄霉素(1组)不添加酸剂;4个试验组分别在基础饲粮中添加0.1%磷酸型酸化剂(2组)、0.3%磷酸型酸化剂(3组)、0.1%乳酸型酸化剂(4组)和0.3%乳酸型酸化剂(5组)代替等量玉米,均不添加抗生素。研究并比较了两种酸化剂以不同水平添加时对断奶仔猪生长性能、胃肠道酸度及消化酶活性的影响。结果表明,添加磷酸型酸化剂和乳酸型酸化剂均可显著增加仔猪日采食量、提高日增重、改善饲料转化率、降低腹泻率,其中以添加0.3%乳酸型酸化剂效果最佳;添加磷酸型酸化剂和乳酸型酸化剂都可显著降低仔猪胃和十二指肠食糜pH,显著提高仔猪胃蛋白酶和胰蛋白酶活性。

【题目】基于资源丰度指数模型的石家庄市农业资源研究
【中文关键词】资源丰度指数 农业资源 石家庄 AreGIS
【英文关键词】resources enrichment index; agricultural resources; Shijiazhuang; Arc GIS;
【中文摘要】选用资源丰度指数模型对石家庄市19个县市区农业资源进行横向比较,综合自然-生态-社会-经济等各方面因素选用10项代表性指标,分析研究各地农业资源的相对数量、匹配程度及高效利用状况。结果表明:石家庄市68.4%的县市水资源量低于平均水平;73.68%的县市我均耕地面积不足,低于全国平均水平;人均GPD和人均纯收指数,市区远高于西部山区,地区之间贫富差距明显。利用AreGIS做出各地资源空间分布图,直观的看出农业资源配制最优的是石家庄市区和平山县,靠近市区周围的县市农业资源处于中等水平。说明社会经济因素对农业生产的影响较大,交通便利地理位置优越的大都市高于其他县市区,为农业可持续发展提供一定的信息基础。
【英文摘要】The paper analysis and study agriculture resources of nineteen town and country in Shijiazhuang through the model of resource enrichment index,selected ten representative items from nature,ecology,society and economy resources.Furthermore, it analysis the number,matching level and the availability of utilizes of regional agriculture resources.The result shows water resources is very low level of 68.4% county,the area of farm land in 73.7% county is lower than the average of china.The gross domestic product .

【题目】Application of oligonucleotide microarray for the detection and genotyping of cry genes in Bacillus thuringiensis
【中文关键词】无
【英文关键词】oligonucleotide microarray, cry genes, genotyping, random primer labeling, bioinformatics.
【中文摘要】无
【英文摘要】We have developed a parallel, rapid, high-throughput oligonucleotide microarray-based assay for the reliable detection and genotyping of three cry genes (cry1, cry2 and cry9) in Bacillus thuringiensis (Bt). After the nonpolymerase chain reaction (PCR), amplified Bt genomic DNA were fluorescent-labeled using a random primer. The corresponding oligonucleotide probes were designed for the different cry genes that can hybridize Bt genomic DNA after cluster analysis and were printed on glass slides. This microarray has unambiguously detected and identified the cry genes in 10 isolates and reference Bt. Our data demonstrates that the microarray assay is simple and rapid for the detection and genotyping of genes. This type of assay is also a potentially valuable tool for identification and characterization of bacterial functional genes in general.

【题目】Effects of Yeast Culture in Broiler Diets on Performance and Immunomodulatory Functions
【中文关键词】酵母培养物,肉仔鸡,免疫功能,黏膜形态,消化率
【英文关键词】yeast culture, broiler, immune function, mucosal morphology, digestibility
【中文摘要】本论文旨在研究日粮中不同剂量酵母培养物对肉仔鸡生长性能和免疫机能的影响。
【英文摘要】A study was conducted to evaluate the effect of supplemental yeast culture (Diamond V XP YeastCulture; YC) in broiler diets on performance, digestibility,mucosal development, and immunomodulatory functions.One-day-old Arbor Acres chicks (n = 960) were randomly assigned to 1 of 4 dietary treatments based on corn and soybean meal and containing 0, 2.5, 5.0, and 7.5 g/kg of YC in the diet for 42 d. Each treatment consisted of 12 replicates of 20 broilers each. Nutrient digestibility was determined on d 15 and 35 by total fecal collection.On d 21 and 42, 12 birds per treatment were sacrificed to evaluate gut morphology and secretory IgA. Broilers were

vaccinated with Newcastle disease vaccine by eye drop on d 7 and 28 and antibody titer was determined on d 14, 21, 35, and 42. Dietary supplemental YC at 2.5 g/kg improved average daily gain and feed conversion during grower and overall periods ($P \leq 0.05$). Yeast culture supplementation increased digestibility of Ca (linear and quadratic, P = 0.01) and P (linear, P = 0.01) on d 35,but did not affect ($P > 0.05$) protein retention and energy digestibility. Villus height to crypt depth ratios in the duodenum and jejunum (d 42) and ileum (d 21) were increased ($P \leq 0.05$) in broilers fed 2.5 g/kg of YC. Yeast culture increased antibody titers to Newcastle disease virus (linear, $P \leq 0.05$), serum lysozyme activity (linear and cubic, $P \leq 0.05$), and IgM (linear, $P \leq 0.05$) and secretaryIgA concentrations in the duodenum (linear, P = 0.01). Results of this study indicate that dietary supplemental YC at 2.5 g/kg improved growth performance. Dietary YC affected immune functions, digestibility of Ca and P, and intestinal mucosal morphology of broilers. Growth performance was optimized at 2.5 g/kg of YC in the present study. Immune function could be modified with dietary YC supplementation.

【题目】Effect of Saccharomyces cerevisiae fermentation product on immune functions of broilers challenged with Eimeria tenella
【中文关键词】酵母培养物,肉鸡,免疫机能,球虫感染
【英文关键词】yeast culture , broiler , immune function , coccidian infection
【中文摘要】中文摘要无。
【英文摘要】Three hundred sixty 1-d-old male ArborAcres broilers were randomly allotted to 6 groups witha 2 × 3 factorial arrangement of treatments. Threesupplemental levels (0, 0.25, and 0.50%) of Saccharomycescerevisiae fermentation product (XP) were fedto control and Eimeria tenella-infected broilers. Growthperformance and immune response criteria were measuredafter coccidian

infection. Broiler ADG was lowered(P < 0.01) by coccidian infection and improved byXP supplementation (P = 0.04). Supplementation oXP increased CD3+, CD4+, and CD8+ T-lymphocytecounts (P < 0.05) and the ratio CD4+:CD8+ in blood(P = 0.06) and spleen (P = 0.04) as well as ileum intraepitheliallymphocyte count, cecal tonsil secretoryIgA counts, serum lysozyme content (P < 0.01), andalbumin:globulin ratio (P = 0.02). These results suggestthat dietary XP supplementation could improveimmune function and growth performance in coccidiainfectedbroilers.

【题目】肉仔鸡胸肌卫星细胞氧化应激模型的优化

【中文关键词】塞米松;肉仔鸡;胸肌卫星细胞;氧化应激模型

【英文关键词】dexamethasone phosphate solution;boiler;breast satellite cell;oxidative stress model

【中文摘要】将体外培养的肉仔鸡胸肌卫星细胞(SC)按地塞米松(DEX)处理浓度(0、0.03、0.06、0.12、0.24、0.48和0.96 mg/mL)分为7组,分别测定SC的存活率(MTT法)、丙二醛(MDA)、氧自由基(ROS)、超氧化物歧化酶(SOD)和谷胱甘肽硫转酶(GST)含量或活性。筛选DEX处理的最佳时间和浓度以便优化肉仔鸡胸肌SC的氧化应激模型。结果表明,随DEX浓度升高,MDA和ROS产生量升高(P<0.01),SOD与GST活性显著降低(P<0.01)。随着DEX处理时间的延长,SC的存活率及GST和SOD活性均有所下降,MDA和ROS产生量上升。使用0.12 mg/mL的DEX处理SC 24 h后,SC存活率显著降低(P<0.01)。说明DEX浓度为12 mg/mL处理24 h能使肉仔鸡骨骼肌SC产生适度的氧化应激,可以作为肉仔鸡胸肌卫星细胞的氧化应激模型。

【英文摘要】Abstract:Time and concentration of dexamethasone phosphate solution (DEX) were optimized to establish oxidative stress model of boiler breast muscle satellite cells(SC).Seven concentrations of DEX(0, 0.03,0.06,0.12,0.24,0.48 and 0.96 mg/mL)were used to treat boiler breast muscle SC,Methyl thiazolyl tetrazolium (MTT) assay was used to assess cell livability.The relative production of malonaldehyde (MDA),reactive oxidative species (ROS),the activities of superoxide dismutase(SOD)and glutathione S-transferase(GST)were measured respectively.The results show with the increasing of DEX level, the concentrations of MDA and ROS increased (P<0.01),while activities of SOD and GST decreased (P<0.01).Celllivability and the activities of SOD and GST decreased with the prolonging of treat time,while the production of MDA and ROS increased.Treatment of boiler breast muscle SC with DEX at 12 mg/mL for 24 h, the cell livability was significantly lower than that of the control group(P<0.01).In conclusion, treatment of boiler breast muscle SC with DEX at 1 2 mg/mL for 24 h could be used to set up the oxidative stress model of boiler breast muscle satellite cells (SC).

【题目】Identification of genes that are preferentially expressed in conidiogenous cell development of Metarhizium anisopliae by suppression subtractive hybridization
【中文关键词】无
【英文关键词】Metarhizium anisopliae
【中文摘要】无
【英文摘要】The insect pathogenic fungus Metarhizium anisopliae is widely used as an insect biocontrol agent. The M. anisopliae conidium plays an important role in pathogenesis and disease transmission. The aim of this study was to identify genes whose expression is up-regulated during conidiogenous cell development. This is a powerful strategy for obtaining insight into the molecular events that regulate conidiation. We isolated genes that are preferentially expressed in the developing conidiophores of the common fungal locust pathogen M. anisopliae CQMa102 using suppression subtractive hybridization. Based on the results of cDNA array dot blotting, we identified 109 unique expressed sequence tags (ESTs) that were up-regulated more than fivefold during conidiophore formation. Among these 109 ESTs were 45 (41.3%) with significant similarity to NCBI annotated hypothetical proteins, 35 (32.1%) with low similarity to known or predicted genes that might represent novel genes, and 29 (26.6%) with significant similarity to known proteins involved in various cell and molecular processes, such as ell structure and function, cell metabolism, protein metabolism, stress response, nucleic acid metabolism, and cell cycle and growth. We confirmed the up-regulation of 11 randomly selected genes with real-time reverse transcriptase-PCR analysis. The results of this study provide a preliminary description of genes that may be involved in the molecular regulation of fungal conidiogenesis

【题目】功能型禽肉及禽肉来源活性肽研究概况
【中文关键词】功能禽肉;活性肽
【英文关键词】Functional poultry meat; Bioactive peptides
【中文摘要】肉类在居民膳食蛋白质摄入量中占有重要比例。在我国肉类总产量中,禽肉占20%,且因其高蛋白、低脂肪和低胆固醇的特性逐渐受到消费者的喜爱。近年来,随着人们营养保健意识的增强,食物的功能特性不断得到重视。通过对产品营养和功能性成分进行改善与调控,生产功能型禽肉是肉禽业的新出路之一。禽肉中也含有较多的生物活性肽类,开发生产禽肉相关功能性肽类,作为活性成分应用于食品和医药行业,是禽肉加工的发展方向之一。本文对功能禽肉的概念、设计思路、目前功能禽肉的生产以及禽肉水解物中功能性肽的提取及生理作用进行综述,并讨论了功能禽肉的研究方向和发展前景。
【英文摘要】Meat and meat product play an important role in the protein intake of consumers. Poultry meat, accounting for twenty percent of the overall meat product in China, gains its popularity in consumers due to characteristics of high protein, low fat and low cholesterol content. With the increasing consciousness of nutrition and health, the functional properties of food are paid much attention. Introduction of additional physiologically functional properties into meat is the leading tread in meat-type poultry industry. There are several attractive chicken meat-based bioactive substances. Development of bioactive peptides derived from chicken meat is the promising direction of poultry meat processing. This paper includes a brief introduction of functional meat definition and designing strategies, and a review of the current functional poultry meat production and the potential benefits of chicken meat protein-derived peptides. The future research direction and perspective of functional chicken meat are also discussed in the paper.

【题目】Identification of genes preferentially expressed during microcycle conidiation of Metarhizium anisopliae using suppression
【中文关键词】无
【英文关键词】Metarhizium anisopliae
【中文摘要】无
【英文摘要】Microcycle conidiation has been defined as the production of conidia directly by a spore without the intervention of hyphal growth. The molecular mechanisms underlying this process are still poorly understood. Suppression subtractive hybridization was used here to isolate the genes preferentially expressed during microcycle conidiation vs. in normal conidiation hypha of Metarhizium anisopliae CQMa102, a common fungal pathogen of locusts. A total of 1600 clones from the subtracted cDNA library were screened by cDNA array dot blotting and 221 unique expressed sequence tags were identified as being differentially expressed. These genes were found to be homologous genes involved in various cellular processes, including general metabolism, protein synthesis, energy, cell-cycle and DNA processing, cellular transport, transcription, signal transduction and stress response. Real-time reverse transcriptase PCR assay of six randomly selected genes revealed that they are all highly expressed during microcycle conidiation.

【题目】不同强度的运输应激对肉仔鸡血液应激指标和肌肉品质的影响
【中文关键词】运输应激;肉仔鸡;应激强度;肌肉品质
【英文关键词】Transport stress; Broiler; Stress intensities; Meat quality
【中文摘要】本试验研究了不同强度的运输应激对肉仔鸡血液应激敏感指标和肌肉品质的影响。360只1日龄健康AA肉仔鸡公雏随机分配到5个处理中,分别为不运输且无休息的对照组,另4个处理采用2×2因子设计,处理因素分别为运输时间(45和180 min)、运输结束至屠宰的间隔时间(45和180 min)。每个处理6个重复,每个重复12只鸡。46日龄时对肉仔鸡进行运输处理并采集样品。结果表明,与对照组相比,肉仔鸡血浆皮质酮水平在45 min/45 min显著升高(P<0.05),但随运输时间和休息时间的增加又降至运输前水平;180 min/45 min组胸肌率后24 h黄度(b*)值显著升高(P<0.05),45 min/45 min组胸肌率后24 h亮度(L*)值较高(P>0.05),红度(a*)值下降幅度较大(P>0.05)。因子分析结果表明,运输时间对所测指标均无显著影响(P>0.05)。休息时间在一定程度上影响血浆皮质酮水平,运输后45 min休息组皮质酮高于180 min休息组(P=0.05)。休息时间对胸肌率后24 h的L*值(P=0.07)和a*值(P=0.02)有一定影响,180 min休息组L*值较低、a*值较高(P>0.05)。运输时间与休息时间的互作效应对所测指标的影响均不显著(P>0.05)。试验表明,运输应激会引起肉仔鸡血浆皮质酮升高,使机体处于较强的应激状态,但运输后较长时间的休息则有助于降低肉仔鸡的应激水平,缓解肌肉品质的下降。
【英文摘要】This study was to investigate the effect of different intensities of transport on blood stress parameters and meat quality in broiler chicks. Three hundreds and sixty 1-day-old Arbor Acres broiler chicks (males) were randomly allotted into five treatments with one unstressed control group and four stressed groups using a 2×2 factorial arrangement with transport time (45 and 180 min) and rest time (45 and 180 min) as main effects. There were six replicates in each treatment and twelve birds in each replicate. At 46 days of age, all birds (except those in unstressed group) were transported according to a designed protocol. One bird of each replicate was selected for blood and skeletal muscle samplings after electrically stunned. Compared with unstressed group, plasma corticosterone (CORT) concentration significantly increased in 45 min/45 min group (P<0.05), and then decreased to the level in unstressed group with

transport time and rest time prolonged. For breast muscles at 24 h postmortem, the b* value was significantly increased in 180 min/45 min (P<0.05), and both a higher L* value (P>0.05) and a lower a* value (P>0.05) were found in 45 min/45 min group. Factor analysis results showed that transport time did not affect all parameters in the present study (P>0.05). Rest time affected plasma CORT concentration (P=0.05), L* value (P=0.07) and a* value (P=0.02) in breast muscle at 24 h postmortem to some extent. Plasma CORT concentration in 45 min rest groups was higher than that in 180 min rest groups. In 180 min rest groups, lower L* value and higher a* value were observed in breast muscle 24 h postmortem. No interaction between transport time and rest time was found in the present study. This study indicated that transport stress induced the release of plasma CORT in broilers, but a long-term rest after transport was beneficial to decrease plasma CORT, which may help maintain meat quality.

【题目】Effects of transport stress on blood metabolism, glycolytic potential, and meat quality in meat-type yellow-feathered chickens
【中文关键词】无中文关键词。
【英文关键词】transport stress, chicken, glycolytic potential, muscle type, meat quality
【中文摘要】无中文摘要。
【英文摘要】To investigate the effects of transport stress on blood metabolism, glycolytic potential, and meat quality in male Chinese Lingnan meat-type yellow-feathered chickens, three hundred sixty 72-d-old birds were randomly assigned to 1 of 5 treatments: unstressed control, 45-min (short-term) transport with 45-min (short-term) recovery, 45-min transport with 3-h (long-term) recovery, 3-h (long-term) transport with 45-min recovery, and 3-h transport with 3-h recovery. Each treatment consisted of 6 replicates with 12 birds each. All birds (except control group) were transported according to a designed protocol. Long-term transport decreased the plasma glucose level (P < 0.001), glycogen concentration in both breast (P = 0.023) and thigh (P = 0.012) muscles, and affected the size of IIb fibers in the tibialis anterior by decreasing the area (P = 0.031) and increasing the density (P = 0.046), drip loss (P = 0.045), and the a* (redness; P = 0.040) valuein breast muscle. Long-term recovery after transport also decreased the plasma glucose level (P = 0.018) and showed a trend toward decreased breast glycogen concentration (P = 0.064). These results suggested that transport did not cause any noticeable changes in overall meat quality characteristics, although breast meat drip loss and meat color were affected. A long-term recovery from a period of feed and water deprivation also caused hypoglycemia and did not improve meat quality in Lingnan meat-type yellow-feathered chickens.

【题目】利用均匀设计方法研制复合酸化剂的配方
【中文关键词】均匀设计;酸化剂;pH;系酸力;抑菌能力
【英文关键词】Uniform design:Acidifiers;pH;Acid一binding capacity;Bacteriostatic ability
【中文摘要】本研究旨在探讨复合酸化剂配方的研制方法。试验采用均匀设计方法, 设计了2 个类型的酸化剂: 磷酸型(酸化剂A) 和乳酸型(酸化剂B), 每种酸化剂设置6 种不同的配方, 通过研究不同配方的2 种酸化剂的饲料p H、系酸力以及抑菌能力, 建立回归方程, 并用逐步回归分析法确定2 种酸化剂的最佳配方。结果表明, 当酸化剂A 中磷酸占30 %、柠檬酸占20 %、延胡索酸占20 %、甲酸钙占5 % 时, 酸化剂A 对饲料p H、饲料系酸力以及有关细菌的抑制作用方面效果最佳; 当酸化剂B 中乳酸占4 0 %、柠檬酸占20 %、延胡索酸占20 % 时, 综合效果最佳。结果提示,用均匀设计方法研制复合酸化剂的

配方完全可行, 而且可减少试验次数, 提高试验效率。

【英文摘要】The uniform design method was used to study the formula of compound acidifiers. Two types of acidifiers, i.e. phosphoric acid type (acidifier A) and lactic acid type (acidifier B), with 6 different formulas for each type were selected. Based on the pH of feed, acid-binding capacity and the bacteriostatic ability of the two types of acidifiers with different for- mulas, a regression equation was set and the optimum formula was determined with stepwise regression analysis method. Results The result indicated it had optimum effects when phosphoric acid, citric acid, fumaric acid, and calcium formiate accounted respectively for 30%, 20%, 20%, and 5% in acidifier A. However, it had best effects when lactic acid, citric acid, and fumaric acid accounted respectively for 40%, 20% and 20% in acidifier B.It was concluded that the study of acidifier formulation with uniform design was feasible and the efficiency of formulat of acidifier study was improved with the uniform design method.

【题目】Association of the circadian rhythmic expression of GmCRY1a with a latitudinal cline in photoperiodic flowering of soybean.

【中文关键词】无

【英文关键词】blue light cryptochrome photoperiodism photoreceptor

【中文摘要】无

【英文摘要】Photoperiodic control of flowering time is believed to affect latitudinaldistribution of plants. The blue light receptor CRY2 regulatesphotoperiodic flowering in the experimental model plant Arabidopsisthaliana. However, it is unclear whether genetic variations affectingcryptochrome activity or expression is broadly associated with latitudinaldistribution of plants. We report here an investigation of thefunction and expression of two cryptochromes in soybean, GmCRY1aand GmCRY2a. Soybean is a short-day (SD) crop commonly cultivatedaccording to the photoperiodic sensitivity of cultivars. Both cultivatedsoybean (Glycine max) and its wild relative (G. soja) exhibit a stronglatitudinal cline in photoperiodic flowering. Similar to their Arabidopsiscounterparts, both GmCRY1a and GmCRY2a affected bluelight inhibition of cell elongation, but only GmCRY2a underwentblue light- and 26S proteasome-dependent degradation. However,in contrast to Arabidopsis cryptochromes, soybean GmCRY1a, butnot GmCRY2a, exhibited a strong activity promoting floral initiation,and the level of protein expression of GmCRY1a, but notGmCRY2a, oscillated with a circadian rhythm that has differentphase characteristics in different photoperiods. Consistent withthe hypothesis that GmCRY1a is a major regulator of photoperiodicflowering in soybean, the photoperiod-dependent circadian rhythmicexpression of the GmCRY1a protein correlates with photoperiodicflowering and latitudinal distribution of soybean cultivars.We propose that genes affecting protein expression of theGmCRY1a protein play an important role in determining latitudinaldistribution of soybeans.

【题目】The isolation and analysis of a soybean CO homologue GmCOL10.

【中文关键词】无

【英文关键词】Glycine max, CONSTANS, GmCOL10, flowering, zinc finger protein

【中文摘要】无

【英文摘要】The CONSTANS (CO) gene is a key regulator of the response to photoperiod in the model plantArabidopsis thaliana, and its homologues are present in many plant species. We describe here the isolation ofthe CO homologue for zinc finger protein gene

GmCOL10 (Glycine max CONSTANS Like 10) from the soy bean cultivar Kennong18. Sequence comparisons showed that the closest A. thaliana gene to GmCOL10 isCOL5. The expression of GmCOL10 was regulated in a circadian manner, especially under short day condi tions. The expression of GmCOL10 was concentrated in vegetative organs, and in particular in the unifoli olates and cotyledons. An analysis of subcellular localization found GmCOL10 in the nucleus. Our data sug gested that GmCOL10 was not related to the photoperiodic pathway of floral transition as Arabidopsis CO does.

【题目】Cloning and expression analysis of the soybean CO-like gene GmCOL9.
【中文关键词】无
【英文关键词】CONSTANS-Like . Soybean . Gene expression
【中文摘要】无
【英文摘要】Photoperiod is one of the important environmentaltriggers of flowering, and the CONSTANS (CO) gene is akey regulator of this pathway in the model plant Arabidopsisthaliana. CO-like genes are present in many plant species.We describe here the isolation of the CO homolog Glycinemax CONSTANS-like 9 (GmCOL9) from the soybeancultivar Kennong18. Sequence comparisons showed thatthe closest A. thaliana gene to GmCOL9 is COL13. Theexpression of GmCOL9 was investigated using quantitativereal-time reverse transcriptase polymerase chainreaction, which showed that GmCOL9 was not regulatedby a circadian mechanism, since its expression oscillatedat a cycle of 12 h instead of 24 h. GmCOL9 expressionwas influenced by the developmental stage of the plantand varied between tissue/organs. The expression ofGmCOL9 was concentrated in the unifoliolate leavesduring the vegetative phase of growth and in the stemduring the reproductive phase. However, traces of expressionwere also present throughout the plant, indicating that GmCOL9 may be a multifunctional gene in the context ofthe development of the soybean plant.

【题目】Expression profiles of a CONSTANS homologue GmCOL11 in Glycine max.
【中文关键词】无
【英文关键词】Glycine max GmCOL11 CO flowering zinc finger protein
【中文摘要】无
【英文摘要】Soybean (Glycine max L.) is a typical short day crop, and its flowering is strictly restricted by specific photo period conditions. CONSTANS (CO) plays a pivotal role in the photoperiod pathway of flowering regulation.CO like genes are present in many plant species. Here we describe the isolation of the CO homologueGmCOL11 (Glycine max CO like 11) from the soybean cv. Kennong 18. Sequence comparisons show thatGmCOL11 is a group II CO like gene with some similarity to AtCOL6 and AtCOL16. Its sequence includes aconserved B box and a CCT domain. The study of GmCOL11 expression using quantitative real time RT PCRdemonstrated that this gene was regulated in a diurnal rather than in a circadian manner. The gene was ex pressed throughout the plant, but mainly in adult leaves and maturing seeds; its expression was enhanced fol lowing flowering. Apparently GmCOL11 is involved in several aspects of soybean development.

【题目】Cloning of an acetylcholinesterase gene in Locusta migratoria manilensis related to organophosphate insecticide resistance
【中文关键词】无
【英文关键词】Locusta migratoria
【中文摘要】无
【英文摘要】An acetylcholinesterase (AChE, EC 3.1.1.7) cDNA was cloned and characterized from oriental migratory locust (Locusta migratoria manilensis). The complete cDNA contains a 1638-bp GC-rich (GC% = 66%) open reading frame encoding 546 amino acid residues. The key amino acid residues, including the three residues Ser151 (200 in Torpedo), Glu277 (327) and His391 (440) forming a catalytic triad, five out of six cysteines putatively forming intra-chain disulfide bonds, and 10 out of the 14 aromatic residues lining the active site of the Torpedo AChE, are conserved. Bioinformatics analysis shows that the cloned gene belongs to a member of ace 1. RNA interfering (RNAi) with a specific double strand RNA (dsRNA) led to a significant decrease in AChE1 mRNA, enzyme synthesis and activity. Bioassay showed that the RNA interfered locust was more susceptible to malathion than the control. The results are discussed in the light of the hypothesis that the cloned AChE1 gene is related to the organophosphate insecticide resistance of L. migratoria manilensis

【题目】Cloning and Analysis of GmCOL4 Gene in Glycine max.
【中文关键词】无
【英文关键词】CONSTANS; bioinformatics; circadian clock; photoperiod; Glycine max
【中文摘要】无
【英文摘要】CONSTANS (CO) is a key gene in photoperiodic flowering pathway and locates between the circadian clock gene and themeristem identity gene. For elucidating the function of CO in flowering behavior of soybean, a CO-like gene, designated GmCOL4, wascloned from Glycine max cv. Kennong 18 using reverse transcription-polymerase chain reaction (RT-PCR) and bioinformatics methods.This gene encodes a protein embedded 2 conserved domains, B-box and CCT, which belong to subgroup III. Phylogenetic analysis basedon critical amino acid sequences indicated that GmCOL4 is close to COL9 with similarity of 64.3%. The expression profiles of GmCOL4revealed by quantitative real-time RT-PCR (qRT-PCR) showed a similar pattern to that of COL9. GmCOL4 was largely regulated bybiological circadian, while light had weak effect on it. GmCOL4 expressed mainly in leaves with the highest expression at anthesis stage.Therefore, GmCOL4 is one of the important genes for regulation of flowering in soybean.

【题目】Inactivation kinetics of polyphenol oxidase from pupae of blowfly (Sarcophaga bullata) in the dimethyl sulfoxide solution
【中文关键词】无
【英文关键词】Polyphenol oxidase - Blowfly pupae - Inactivation - Kinetics - Dimethyl sulfoxide
【中文摘要】无
【英文摘要】The effects of dimethyl sulfoxide (DMSO) on the activity of polyphenol oxidase (PPO, EC 1.14.18.1) from blowfly pupae for the oxidation of L-3,4-dihydroxyphenylalanine were studied. The results showed that low concentrations of DMSO could lead to reversible inactivation to the enzyme. The IC(50) value, the inactivator concentration leading to 50% activity lost, was estimated to be 2.35 M. Inactivation of the enzyme by DMSO was classified as mixed type. The kinetics of inactivation of PPO from blowfly pupae in the low concentrations of DMSO solution was studied using the kinetic method of the substrate reaction. The rate constants of inactivation were determined. The results show that k(+0) was much larger than k'(+0), indicating that the free enzyme molecule was more fragile than the enzyme-substrate complex in the DMSO solution. It was suggested that the presence of the substrate offers marked protection of this enzyme against inactivation by DMSO.

【题目】Expression and characterization of aiiA gene from Bacillus subtilis BS-1
【中文关键词】无
【英文关键词】Bacillus subtilis
【中文摘要】无
【英文摘要】AHL-lactonase (AiiA), a metallo-beta-lactamase produced by Bacillus thuringiensis, Bacillus cereus and Bacillus anthracis, specifically hydrolyzes N-acyl-homoserine lactones (AHLs) secreted by Gram-negative bacteria and thereby attenuates the symptoms caused by plant pathogens. In this study, an aiiA gene was cloned from Bacillus subtilis BS-1 by PCR with a pair of degenerate primers. The deduced 250 amino acid sequence contained two small conserved regions, 103SHLHFDH109 and 166TPGHTPGH173, which are characteristic of the metallo-beta-lactamase family. Homology comparison revealed that the deduced amino acid sequence had a high degree of similarity with those of the known AiiA proteins in the B. cereus group. Additionally, the aiiA gene was expressed in Escherichia coli BL21 (DE3) pLysS and the expressed AiiA protein could attenuate the soft rot symptoms caused by Erwinia carotovora var. carotovora.

【题目】In vitro and in vivo responses of fungal biocontrol agents to gradient doses of UV-B and UV A irradiation
【中文关键词】无
【英文关键词】Beauveria bassiana
【中文摘要】无
【英文摘要】Conidia of Beauveria bassiana and Metarhizium spp. smeared on glass slides were assayed for their responses to irradiation with weighted 312-nm UV-B and 365-nm UV-A at gradient doses of 0.005 – 1.1 and 1.0 – 18.0 J cm − 2, respectively. All inverted, sigmoid dose – survival trends showed good fit to a survival model (r2 ≥ 0.97), yielding respective UV-B LD50s of 0.23 – 0.59 and 0.05 – 0.65 J cm − 2 for 24 B. bassiana and 36 Metarhizium isolates, and UV-A LD50s of 2.78 – 10.46 J cm − 2 for 24

Metarhizium isolates. Myzus persicae apterae on detached leaves were sprayed with a concentrated spore suspension of B. bassiana or M. anisopliae, followed by exposure to the UV-B doses to cause 10 – 90% viability losses. These doses caused aphid mortality reductions as expected but affected neither spray-to-death period nor fungal growth on cadavers. The results highlight the merits of using UV-tolerant candidates and photoprotection measures in fungal formulations for pest control.

【题目】Characterization of a highly active promoter,PBbgpd , in Beauveria bassiana.

【中文关键词】无

【英文关键词】PBbgpd;Beauveria bassiana

【中文摘要】无

【英文摘要】The promoter of glyceraldehyde-3-phosphate dehydrogenase (gpd) gene from Aspergillus nidulans (PgpdA) is widely used to direct expression of target genes constitutively in fungi. However, in some species, a heterogeneous promoter is found to be of low efficiency. To obtain a high-efficiency promoter for transformation of Beauveria bassiana, an entomopathogenic fungus widely used as an mycoinsecticide, a glyceraldehyde-3-phosphate dehydrogenase gene (Bbgpd) promoter, was cloned and characterized. Four deletion constructs (-2118, -1153, -726, and -354) of the 5'-upstream sequence of Bbgpd linked to a bar::gus fusion gene (phosphinothricin-resistance::beta-glucuronidase fused gene), which were used as selected marker gene and report gene, respectively, were generated. GUS activities of transgenic strains harboring -726, -1153, and -2118 deletion constructs were much stronger than that of the promoter of Aspergillus nidulans gpdA (PgpdA), with a twofold to threefold increase over that in the PgpdA construct. The -726 fragment was necessary to direct GUS expression in B. bassiana. No -354 transgenic progenies were obtained, possibly because it failed to initiate the transcription of bar::gus fusion gene. A remarkable increase of GUS activity was found between the -1153 and -726 constructs, indicating that some active transcriptional elements were located in this region. With a high expression level and relatively short sequence, PBbgpd can be used to drive target genes in B. bassiana transgenic research.

【题目】滇池流域蔬菜地NO与NO2排放的研究
【中文关键词】滇池流域; 集约化菜田; NO 与NO2 排放速率; NOx-N 损失率
【英文关键词】Dianchi watershed ; intensive vegetable field ; NO and NO2 flux ; NOx-N loss rate
【中文摘要】采用密闭通气气室法,在滇池流域旱季和雨季开展了2 个生长周期内集约化西芹地NO/ NO2 排放研究。结果表明, NO/ NO2 排放速率的日变化规律受温度的影响较为明显,中午时段最高,凌晨时段最低。西芹生育期间,CK处理(裸地) 的NO/ NO2 排放速率维持在一定水平,中后期NF 处理(不施氮) NO/ NO2 排放速率有所升高; LF(N450 kg/ hm2) 和HF(N 1200 kg/ hm2) 处理受西芹的生长和频繁氮肥追施的影响,生育期NO/ NO2 排放速率逐渐升高。旱季与雨季CK处理NO/ NO2 排放量分别为1130 和NOx2N 1151 kg/ hm2 ,NF 处理分别较CK高出NOx2N 110 和1144kg/ hm2 。LF 处理旱季与雨季NO/ NO2 排放量分别为NOx2N 4188 和5167 kg/ hm2 ,其损失率分别为0179 %和0192 %;HF 处理旱季和雨季NO/ NO2 排放量分别为NOx2N 7158 和10119 kg/ hm2 ,其损失率分别为0163 %和0185 % ,说明氮肥用量较高时,土壤- 作物系统的NOx2N 损失量也较高,但其损失率并不随施氮量的升高而升高。
【英文摘要】Enclosure growth chamber method , which removes the air inlet NO/ NO2 first and then monitors NO/ NO2 flux of enclosed growth chamber , was used to collect and determine in situ NO/ NO2 emission from intensive vegetable field in Dianchi watershed in both dry and rainy seasons. The following results were obtained : 1) The NO/ NO2 flux varied diur2 nally along with the soil temperature , its maximum appeared at noon , and its minimum appeared before dawn ; 2) In the celery growth stage , the NO/ NO2 flux of CKtreatment (bare land) maintained at a certain level ; the NO/ NO2 flux of NF treatment (N 0 kg/ ha) was higher than CKtreatment in the mid and late period of celery growth ; the NO/ NO2 fluxes of LF (N 450 kg/ ha) and HF (N 1200 kg/ ha) treatments increased gradually because of the celery ’s growth and frequent N fertilizer application ; 3) In dry and rainy seasons , the NO/ NO2 emission of CKtreatment in the growth stage was NOx2 N 1130 and 1151 kg/ ha , respectively , and the NO/ NO2 emission of NF treatment in the growth stage was NOx2N 1107 and 1144 kg/ ha higher than that of CK, respectively ; 4) In dry and rainy seasons , the NO/ NO2 emission of LF treatment in the growth stage were NOx2N 4188 and 5167 kg/ ha , which accounted for about 0179 % and 0192 %of applied fertiliz2 er N , respectively ; the NO/ NO2 emission of HF treatment in the growth stage was NOx2N 7158 and 10119 kg/ ha , which accounted for about 0163 % and 0185 % of applied fertilizer N , respectively. The NO/ NO2 2N emission in the growth stage increased with nitrogen fertilizer application rate , but its loss rate does not increase accordingly.

【题目】滇池流域集约化西芹地的N2O排放
【中文关键词】滇池流域; 集约化菜田; N2O 排放速率; N2O- N 损失率
【英文关键词】Dianchi watershed; intensive vegetable field; N2O flux; N2O- N loss rate
【中文摘要】集约化菜田的土壤养分和水热条件适合土壤的硝化反硝化作用, 而我国集约化菜田N2O排放的研究少见报道。本文采用密闭式箱法, 在滇池流域旱季(95 d) 和雨季(99 d) 开展了2 个生长周期内西芹地N2O 排放的监测研究, 结果表明, 在集约化菜田土壤氮素养分含量较高的情况下,(1) N2O 排放的日变化规律受温度的影响较为明显, 中午时段N2O 排放速率最高, 凌晨时段最低;(2) N2O 排放的季节性变化规律是在种植后不久, 出现1 个小的N2O 排放高峰外, 随后CK 处理(

裸地) 的N2O 排放速率维持在一定的水平, 而种植作物的不施肥(NF) 、推荐施肥(LF) 和习惯施肥(HF) 处理受西芹的生长及频繁氮肥追施的影响, 中后期N2O排放速率有所升高;(3) 在中后期, 不施用氮肥的NF 处理较CK 的N2O 排放速率高; 旱季与雨季, CK 处理N2O 排放量分别为2.79 和2.66kg N2O - N · hm- 2; NF 处理分别为3.07 和3.67 kg N2O - N · hm- 2, 远高于粮田1.0 kgN2O- N · hm- 2 · a- 1 的N2O背景排放量;(4) LF 处理旱季与雨季为5.25 和6.66 kg N2O - N · hm- 2, 其损失率分别为1.17%和1.48%; HF 处理旱季和雨季N2O 排放量分别为9.35 和12.12 kg N2O -N,其损失率分别为0.78%和1.01%, 说明氮肥施用量较高时, 土壤- 作物系统的N2O - N 损失量也较高, 但是N2O - N 损失率并不随施氮量的升高而升高。

【英文摘要】Soil nitrification and de- nitrification easily occur under the soil conditions of intensive vegetable field. However, the research of soil N2O emissions from intensive vegetable field in China was rare reported. Using an enclosed chamber method, the N2O flux from celery field was in situ measured in Dianchi watershed during a dry season(95 days) and a rainy season(99 days) . The result indicated:(1) The maximum N2O flux appeared at noon and the minimum appeared before dawn, suggesting that the diurnal variation of N2O flux might be related to soil temperature.(2) In the celery growth stage, there was a small N2O flux peak just after celery planting. Afterwards, N2O flux of CK treatment(bare land) maintained a certain level, but the N2O fluxes of NF(0 kgN · hm- 2) , LF(450 kgN · hm- 2) and HF(1 200 kgN · hm- 2) treatments planted celery increased gradually with the growth of celery or with the frequent N fertilizer application.(3) The N2O flux of NF treatment was higher than CK treatment in the mid and late period of celery growth stage. In dry and rainy seasons, the N2O emission of NF treatment was up to 3.07 and 3.67 kgN2O- N · hm- 2, respectively, which were greatly higher than 1.0 kg N2O - N · hm- 2 · a- 1 of N2O - N background emission level of grain field. (4) In the dry and rainy seasons, the N2Oemission of LF treatment were 5.25 and 6.66 kg N2O - N · hm- 2, which accounted for about 1.17% and 1.48% of applied fertilizer- N, respectively. The N2O emission of HF treatment were 9.35 and 12.12 kg N2O - N · hm- 2, which was about 0.78% and 1.01% of applied fertilizer- N, respectively. The N2O - N emission in the celery growth stage increased with the increasing N fertilizer application rate, but the loss rate of N2O - N emission in the total N fertilizer rate did not increase.

【题目】红壤双季稻田不同施肥下的氨挥发损失及其影响因素

【中文关键词】氨挥发;化肥;有机肥;双季稻田

【英文关键词】ammonia volatilization; chemical fertilizer; organic manure; double rice paddy field

【中文摘要】在红壤双季稻田上采用密闭气室法测定了施用等氮量化肥(尿素)、有机肥(猪粪)及化肥有机肥(有机氮无机氮各占一半)配施下氨挥发及其田间表面水NH4+-N 含量、温度和pH 动态变化,研究氨挥发损失及影响因素。结果表明,与施用尿素相比,单施有机肥及化肥有机肥配施显著降低了稻田氨挥发,施用尿素的早稻和晚稻氨挥发损失率分别达41.4%和39.9%,单施有机肥的分别为0.3%和0.9%,化肥有机肥配施的分别为19.6%和8.9%。施肥后, 短期内田面水NH4+-N 含量和pH 均显著上升,其与氨挥发速率均呈显著正相关。

【英文摘要】Ammonia volatilization using a closed chamber method from paddy field soil and the dynamic of NH4+-N concentration, temperature, and pH in surface water were conducted in double rice cropping system. The effects of different types of nitrogen fertilizers applied as urea, swine manure and half of urea with swine manure in the basis of equal nitrogen on ammonia volatilization were studied. The results showed that applied swine manure and urea combing with swine manure reduced ammonia volatilization from paddy field soil significant comparing with applied chemical fertilizer urea. The N losses via ammonia volatilization account for 41.4% of total N input during early rice growth period and for 39.9% during late rice growth period by urea applied only, while the N losses via ammonia volatilization account for 0.3% during early rice growth period and 0.9% during late rice growth period for the treatment of swine manure. For the treatment of urea with swine manure, it was found that the N losses via ammonia volatilization were 19.6% during early rice growth period and 8.9% during late rice growth period, respectively. The concentration of NH4+-N and pH in surface water increased shortly after fertilization. Also, the positive correlation between ammonia volatilization rate with NH4+-N concentration and pH in surface water were obtained.

【题目】多功能固沙保水剂性能及其效果的研究
【中文关键词】风化煤;非均相混聚;固沙保水;抗风蚀
【英文关键词】Air-slake coal;mixing in non-hom0geneous solution;sand-fixing and water-preserving;Anti-wind erosion
【中文摘要】采用液相化学方法,微乳化、高剪切和非均相混聚技术,以风化煤和废弃塑料为主要原料,研制了集提供养分、固沙保水、改良土壤、修复荒漠化土壤作用于一体的3种多功能固沙保水剂,通过试验研究,优化出一组固沙保水剂。结果表明,该固沙保水剂的胶团粒径为20-60 nm,固结层抗压强度为5.30-16.0 MPa,抗冻融性能和耐老化性能良好,在风速15 m·min-1和25 m·min-1连续吹30 min、在风速30 m·min-1吹5 min均未见起尘及风蚀现象,抗风蚀性能显著。
【英文摘要】Desertification of lands is one of the most serious ecological problems in China.Three mature methods,namely engineering sand-fixing, biological sand-fixing and chemical sand-fixing,can be applied to control and recover the desert.Former two not only take time and effort but also capital intensive.Therefore,chemical approaches aim at sand-fixing,water maintaining and nutriments-offering have been an alternate option.In this paper,three types of multifunctional sand-fixing and water maintaining polymer(humus-plastic polymer,plastic starch polymer and air-slake coal polymer),which could provide nutriments,fix sand,preserve water,remediate soil and recover desert,were made from the air-slake coal and the abandoned plastics by liquid chemical method,emulsification,high velocity cutting method and mixing in no homogeneous solution.The characteristics of the polymers such as particle size distribution,viscosity,ant press intension,freeze thaw capacity,aging capacity and anti-windy capacity was analyzed to select one polymer with excellent sand-fixing and water maintaining characters.The results indicated that all three types of polymer not only decreased water evaporation under no vegetation,for example,in 15 days the control evaporated 99.8% ,while three types polymer evaporated 98.2% ,98.1% and 97.4% in 50 days respectively,but also increased moisture content with vegetation,for example,after 60 days of seeding,water content in soil was 8.33% ,14.33% ,15.45% and 16.35% respectively.And air-slake coal polymer was the best one with integrated analysis as follow:the diameter of the particles was in the scope of 20 nm to 60 nm.the anti-press intension of concretion was 5.30 MPa to 1 6.1 0 MPa.and the effect of anti-gelation and anti-weathering were significant.Additionally,the function of anti—wind erosion was strong,for that no dust and erosion occurred when the wind blown continuously at 25 m · min or 30 rain and 30 m · min-1for 5 min,respectively.Therefore,air-slake coal polymer was the optimum one to provide nutriments,fix sand,preserve water.

【题目】Effect of Organic Manure Application With Chemical Fertilizers on Nutrient Absorption and Yield of Rice in Hunan of Southern China
【中文关键词】土壤中有机质;水稻,磷肥,钾肥
【英文关键词】organic matter in soil; paddy; phosphate fertilizers; potash fertilizers
【中文摘要】化肥施用有机肥提高水稻产量和氮肥利用效率,减少对环境的污染和提高土壤肥力大大的风险。这可能是一个很好的实用技术,保护环境,并提出了在这一地区的水稻产量。
【英文摘要】To evaluate the effect of organic manure application with chemical fertilizers on rice yield and soil fertility under long-term double-rice cropping system, a six year field experiment was conducted continually in the paddy soil derived from Quaternary red clay in Hunan Province, southern China. Four different treatments, i.e., no nitrogen with chemical P and K (PK), swine manure only (M), N, P and K chemical fertilizers only (NPK), and half chemical fertilizers combined with half swine manure (NPKM) were

included. Each N, P and K application rate was the same at all the treatments (except the N application rate at PK) and N application rate was 150 kg N ha -1. All fertilizers were applied to soil tillage layer with once application as basal fertilizers. The nutrients uptake rate, grain yield, nitrogen use efficiency, and soil organic matter content at each treatment were investigated. The NPKM treatment achieved the highest mean annual yield of 12.2 t ha -1 (68% higher than that of PK). Higher dry matter accumulation and nutrients absorption were observed during the middle-late growth period in the NPKM treatment, with higher panicle number per unit and filled-grain number per panicle. Its average nitrogen use efficiency was 36.3% and soil organic matter increased by 18.5% during the experimental period in the NPKM treatment, which were significantly higher than those in the NPK treatment. Organic manure application with chemical fertilizers increased the yield and nitrogen use efficiency of rice, reduced the risk of environmental pollution and improved soil fertility greatly. It could be a good practical technique that protects the environment and raises the rice yield in this region.

【题目】施氮模式对番茄氮素吸收利用及土壤硝态氮累积的影响

【中文关键词】施氮模式;滴灌;土壤硝态氮累积

【英文关键词】models of applying N fertilizer; drip irrigation; accumulation of NO3--N in the soil

【中文摘要】采用田间小区试验,以番茄为指示植物,研究不同施氮模式:农民习惯施肥(N-farmer)、减施化肥氮26%(74%N-farmer)、减施化肥氮26%结合调节土壤 C/N(74%N-farmer+S)、减施化肥氮 26%结合调节土壤 C/N 和采用滴灌(74%N-farmer+S+D)、减施化肥氮45%结合调节土壤 C/N 和采用滴灌(55%N-farmer+S+D)的集成模式对设施番茄氮素吸收利用及土壤硝态氮累积的影响。结果表明,55%N-farmer+S+D 模式下番茄产量最高为 108 349 kg · hm-2,产投比最高为 26.1;与 N-farmer 模式相比,74%N-farmer、74%N-farmer+S、74%N-farmer+S+D 和 55%N-farmer+S+D 模式的氮素利用率和氮素农学利用效率均有增加,其中 55%N-farmer+S+D 模式的氮素当季利用率为9.56%,氮素农学效率为 43.67 kg · kg-1,均显著高于N-farmer 模式(P<0.05);氮肥生理利用效率在各施氮模式间没有显著差异,55%N-farmer+S+D 模式的效率最高为 598.06 kg · kg-1;55%N-farmer+S+D 模式的氮素果实生产效率和收获指数分别为 493.81 kg · kg-1和 53.84%,均高于 N-farmer 模式。氮平衡结果表明,N-farmer 模式的表观损失最高,55%N-farmer+S+D 模式显著低于N-farmer 模式;相同土壤剖面中不同模式硝态氮含量随番茄生育进程均呈先增高后降低的趋势;番茄盛果期和拉秧期,74%N-farmer+S、74% N-farmer+S+D 和 55%N-farmer+S+D 模式在 0~100 cm 剖面累积的硝态氮含量均低于 N-farmer 模式,拉秧期 N-farmer 模式累积的硝态氮含量最高达 705.24 kg · hm-2,74%N-farmer+S+D 模式累积的硝态氮含量最低为 453.75 kg · hm-2;番茄在 3个不同生育期,土壤硝态氮多累积在 0~40 cm 土层,硝态氮的相对累积量约为 50%。综合以上分析结果,集成模式 55% N-farmer+S+D具有明显优势,能够提高氮肥的吸收和利用效率,减少土壤硝态氮的残留。

【英文摘要】Continuously excessive nitrogen(N)input in vegetable-greenhouse is one of the major problems in China, especially in Shouguang , Shandong Province, the famous vegetable production base, which has cause the imbalance of C/N, the decrease of utilization rate of N and fall of fruit quality. Besides, over accumulation of soil nitrate-nitrogen(NO3--N)in protected vegetable fields will give a serious menace to the quality of groundwater. Aiming at these problems, a field experiment was conducted to study the effects of different N levels(1 000, 740, 550kg · hm-2)and models of applying N fertilize(reducing chemical N fertilizer, reducing chemical N fertilizer combined to adjust soil C/N ratio, reducing chemical N fertilizer combined to adjust soil C/N ratio and adopting drip irrigation)on tomato N uptake, N utilization and NO3--N residual in soil. The main results were as follows:Tomato yield were increased after applying N fertilizer and yield growth rate reached over20%. The maximum production(108 349 kg · hm-2)and value cost ratio(26.1)appeared in the model of 55%N-farmer+S+D. Compared with the local farmer ' s conventional model of applying N fertilize(N-farmer), N use efficiency and N agronomic efficiency of reducing chemical N fertilizer combined to adjust soil C/N ratio and adopting drip irrigation measure(74% N-farmer、74%N-farmer+S、74 %N-farmer+S+D and55%N-farmer+S+D)were all increased, N use efficiency of 55%N-farmer+S+D was 9.56% and N agronomic efficiency was 43.67 kg · kg-1,respectively, which were both significantly higher than N-farmer (P<0.05). There was no significant difference of N physiologic efficiency among the models, the maximum value was 598.06 kg · kg-1in the model of 55%N-farmer+S+D. N fruit production efficiency and N harvest index of 55%N-farmer+S+D was 493.81 kg · kg-1and 53.84%, respectively, higher than N-farmer. The research on N balance indicated that N surplus(apparent N losses)was more higher in N-farmer than others models, the apparent N of 55%N-farmer+S+D was 186.24

kg · hm-2which was significantly lower than N-farmer(P<0.05). In the same soil depth, the amount of NO3--N of different models of applying N fertilizer increased from the flowering stage to the full fruit stage, but decreased from the full fruit stage to last harvest. The NO3--N accumulation in the soil layer of 0~100 cm of the models of 74 %N-farmers, 74%N-farmer+S+D and 55%N-farmer+S+D was lower than that of N-farmer. The NO3--N accumulation of the model of N-farmer model was 705.24 kg · hm-2, which was higher than others models at last harvest. 74%N-farmer+S+D model accumulated less NO3--N in the soil, which was 453.75 kg · hm-2 . Nitrate accumulates mostly in the soil layer of 0~40 cm and less in deep soil layers, relative nitrate-N accumulation account for more than 50%. The results of all the above-mentioned indicated that the model of 55%N-farmer+S+D is the feasible N management practice.

【题目】秸秆和猪粪的施用对土壤镉有效性的影响和机理研究
【中文关键词】秸秆;猪粪;镉;有效性;富里酸;胡敏酸
【英文关键词】straw; pig manure ; cadmium; availability ; humic acid ; fulvic acid
【中文摘要】用盆栽试验研究作物秸秆和腐熟猪粪对土壤镉(Cd) 有效性的影响及机理。结果表明,施用秸秆促进油麦菜对Cd 的吸收,而施用猪粪降低油麦菜对Cd 的吸收,这主要是由于秸秆显著地增加了交换态Cd 含量,而猪粪则显著降低交换态Cd 含量。秸秆或猪粪对交换态Cd 含量的影响则主要与土壤胡敏酸(HA) 和富里酸(FA) 的变化有关。施用秸秆对土壤中FA 增加幅度大于对HA 的增加幅度,即HA/FA 比值降低。而施用猪粪则增加了HA/FA 比值。相关分析表明,施用秸秆和猪粪情况下土壤HA/FA 与交换态Cd 含量之间呈显著负相关关系(P < 0.05) 。结果还表明,秸秆和猪粪对土壤交换态Cd 含量的影响还与其对腐殖酸芳构化程度的影响有关,添加猪粪比添加秸秆的土壤腐殖酸芳构化程度大。因此,有机物质对土壤Cd 有效性的影响与土壤有机质组成的变化密切相关。
【英文摘要】A pot experiment was conducted to study the effects of straw or composted pig manure application on availability of cadmium (Cd) in soil and the related mechanisms. Results showed that application of straw increased Cd uptake and pig manure decreased Cd uptake of leafused lettuce. It was mainly because that straw increased exchangeable Cd and pig manure decreased exchangeable Cd. The effect of straw or pig manure on exchangeable Cd was related to the changes of humic acid (HA) and fulvic acid (FA) . When straw was applied the increase of FA in the soil was more than HA and HA/FA ratio decreased, while application of pig manure increased HA/FA. Statistical analysis showed that soil HA/FA ratio was negatively correlated with soil exchangeable Cd (P < 0.05) . Results also showed that the aromatization of humic substance was higher in soil applied with pig manure than the soil amended with straw. It was concluded that the availability of Cd in soil could be influenced by the changes of organic fractions after application of organic materials.

【题目】微生物对几种水溶性聚合物的降解作用
【中文关键词】水溶性聚合物;微生物;生物降解
【英文关键词】water-soluble polymer; microorganisms; biodegradation
【中文摘要】针对缓/控释肥料包裹材料的广泛应用,通过实验室微生物培养,对几种水溶性聚合材料生物降解作用进行了测定。结果表明,纳米-亚微米级聚乙醇混聚物、甲基丙烯酸羟乙酯混聚物在第4 周最先开始降解,废弃聚苯乙烯泡沫塑料

混聚物第8 周才开始降解;聚乙烯醇混聚物、聚苯乙烯泡沫塑料混聚物、丙烯酸酯类混聚物在11~20 周完全降解,苯乙烯-丙烯酸酯混聚物第20 周后降解达98%,试验所用纳米-亚微米级聚乙醇混聚物等7 种水溶性聚合物均可作为环境友好型缓释肥料包裹材料。

【英文摘要】Slow release fertilisers (SRFs) could improve fertilizer use efficiency and simultaneously reduce environmental pollution and coated fertilizer accounted for 85% of SRFs. Here seven coating materials of water soluble polymer were examined to investigate their biodegradation in soil. Results showed nano-subnano sized polyethylene alcohol mixture (CF2) and 2-Hydroxyethyl methacrylate mixture (JBQ) commenced the degradation from the 4th week, while polystyrene foam mixture(N-PS) from the 8th week. CF2, N-PS and acrylic ester mixture(N-BX)were degraded completely within 11~20 weeks. Polystyrene-Acryl ate mixture (Sty-MM) needed 20 weeks to be degraded about 98% of it.

【题目】Accumulations of Cadmium, Zinc, and Copper by Rice Plants Grown on Soils Amended with Composted Pig Manure

【中文关键词】积累,浓度,重金属,猪粪,大米

【英文关键词】Accumulation, concentration, heavy metal, pig manure, rice

【中文摘要】无

【英文摘要】A pot experiment, in which composted pig manure was applied to soils at rates of 0%, 0.5%, 1.5%, 3.0%, and 5.0% (W/W) to simulate additions of different amounts of cadmium (Cd), copper (Cu), and zinc (Zn) to soil, was conducted to assess accumulation of metals by rice (Oryza sativa L.) plants from soils treated with manure. Results indicated that Cd concentrations in rice grains were more than the limit of 0.2mg kg-1 when 0.14 mg kg-1 or more Cd was loaded to Ferralsols by manure application, but it was not more than the limit in Calcaric Cambisols. Zinc contents in polished rice grains did not exceed the permissible limit of 50 mg kg-1 in two soils. Copper concentrations in rice grain were slightly more than the limit of 10 mg kg-1 in Ferralsols but not in Calcaric Cambisols. Results suggested greater risk of heavy-metal contamination from manure to paddy rice in Ferralsols than in Calcaric Cambisols.

【题目】不同施氮模式对日光温室番茄产量、品质及土壤肥力的影响
【中文关键词】番茄; 日光温室; 施氮模式; 土壤肥力
【英文关键词】tomato ; greenhouse ; models of applying nitrogen fertilizer ; soil fertility
【中文摘要】在日光温室栽培条件下,研究了不同施氮模式对番茄产量、品质及土壤肥力的影响。结果表明,与当地习惯施肥模式(N1) 相比,分别减施化肥氮26 %(N2) 、减施化肥氮26 % 结合调节土壤C/N(N3) 、减施化肥氮26 % 结合调节土壤C/N 和采用滴灌(N4) 、减施化肥氮45 % 结合调节土壤C/N 和采用滴灌(N5) 的集成模式对产量和品质无显著影响; 减氮模式下植物吸收的总氮量、氮素利用率和氮肥农学效率均高于习惯施肥模式,其中N5 模式的氮素利用率和氮肥农学效率显著高于N1 模式(P < 0.05) ,说明减少化肥氮的施用量结合调节土壤C/N 和/ 或滴灌措施能够保证番茄的产量和品质,达到减肥增效的目的。结果还看出,番茄拉秧后0-100 cm土层累积的硝态氮含量低于习惯施肥模式,对0-20 cm表层土壤碱解氮、速效磷、速效钾含量和土壤脲酶和蔗糖酶活性的影响不显著; 减氮条件下,N3 和N5 模式土壤细菌/ 真菌比值高于N1 模式。综上研究结果表明,N3 和N5 两个集成模式具有明显优势。
【英文摘要】Continuously excessive nitrogen (N) input in greenhouse is one of the major problems in China, especially in Shouguang , Shandong province ,a famous vegetable production base , and this led to deteriorate fertilization profit , product quality and soil quality , etc. Aiming at those problems, a field experiment was conducted to study the effects of different models of applying N fertilizer on yield and quality of tomato and soil fertility in greenhouse in Shouguang to provide better approaches and models to develop the sustainable utilization of soil. Compared with the local farmer ’s conventional model of applying N fertilizer (N1) , the treatments of reducing 26 % chemical N fertilizer (N2) , reducing 26 % chemical N fertilizer combined to adjust soil C/ N ratio (N3) , reducing 26 % chemical N fertilizer combined to adjust soil C/ N ratio and adopting drip irrigation measure (N4) and reducing 45 % chemical N fertilizer combined to adjust soil C/ N ratio and adopting drip irrigation measure (N5) respectively , could ensure the yield and quality of tomato. Total N uptake by plant , N use efficiency and N agronomic efficiency of the models to reduce N fertilizer application were higher than those of local farmer ’s , N5 treatment was significant higher in N use efficiency and N agronomic efficiency than N1 (P < 0.05) . The results showed that reducing N fertilizer combined with soil C/ N ratio adjustment and/ or drip irrigation can reduce chemical N application, increase the yield and quality of tomato. The nitrate accumulation of the treatment of N3 , N4 and N5 were lower than that of N1. During winter spring season , there were no significant difference in the contents of soil alkali hydrolysable N , available phosphorus (P) and available potassium (K) and in soil crease activity and invertase activity , however , soil bacterium/ fungi (B/ F) ratio was higher under the integration models of N3 and N5.The results of all the above mentioned indicated that reducing N fertilizer combined with agronomic measures can reduce the waste of fertilizer resource and remit degeneration of the soil quality , without loss of yield and quality compared to farmer ’s conventional fertilization approach. Above all the results showed that the integration models of N3 and N5 have a promising future and can provide the basis of the theory for studying the reduction of N fertilizer application, ensuring high grade and yield of the vegetable and soil sustainable utilization.

【题目】不同氮肥用量对设施番茄产量、品质和土壤硝态氮累积的影响
【中文关键词】设施蔬菜;减施氮肥;硝态氮累积
【英文关键词】vegetable greenhouse; reducing N fertilizer rate; NO3--N accumulation
【中文摘要】在设施栽培条件下,采用田间小区试验,以番茄为指示植物,研究了不同氮肥用量:农民习惯施氮量(N1,尿素,纯氮1 000kg · hm-2)、70%农民习惯施氮量(N2,尿素,纯氮 700 kg · hm-2)、70%农民习惯施氮量结合调节土壤 C/N(N3,尿素,纯氮 700 kg · hm-2)、50%农民习惯施氮量结合调节土壤 C/N 和采用滴灌(N4,尿素,纯氮 500 kg · hm-2)对设施番茄产量、品质和土壤硝态氮累积的影响。结果表明,与农民习惯施用氮肥相比,减施氮肥处理(N2、N3 和 N4)的番茄产量没有降低,N4 处理产量最高,比 N1 增产 9.7%。N2和N4 处理氮肥的农学效率和肥料的产投比均显著高于 N1 处理(P<0.05),其中 N4 处理最高,为 28.9 kg · kg-1和12.6,施肥效益最高。不同施氮肥处理间果实 Vc 含量虽没有显著差异,但 N4 处理是 N1 处理的 1.2 倍。番茄果实的硝酸盐含量随氮施用量的增加而增加,两者呈显著的正相关关系(R2=0.8307,P<0.05),N3 和 N4 处理果实硝酸盐含量均显著低于 N1 处理(P<0.05)。0~100 cm 土层累积的硝态氮随氮肥施用量的增加而增加,N1 处理土层累积的硝态氮含量最高,减施氮肥处理均降低了土壤对硝态氮的累积。土壤硝态氮多累积在 0~40 cm 土层,硝态氮的相对累积量约为 50 %,这部分残留的氮素可被下季作物吸收利用。果实硝酸盐含量与土壤累积的硝态氮存在显著的相关关系(R2=0.800 3,P<0.05),说明土壤硝态氮含量过高能够增加果实对氮素的吸收和积累。在寿光设施蔬菜生产条件下,在农民习惯施氮量基础上减氮 30% ~ 50%既可以保证较高产量和较好的果实品质,同时降低土壤中硝态氮累积,从产量、肥料效益和土壤可持续利用角度来看,N4 处理更具优势,具有较好应用价值。
【英文摘要】Field experiment was carried out to study the effects of different treatments of nitrogen(N)fertilizer on the yield, quality of tomato and soil NO3--N accumulation in vegetable-greenhouse in Shouguang, Shandong Province, an important greenhouse vegetable production area in North China. There were five treatments: a control receiving no chemical N fertilizer(N0), habitual N management of the local farmers(100% chemical N, named as N1, 1 000 kg N · hm-2), 70% chemical N fertilizer of N1(named as N2, 700 kg N · hm-2), 70% chemical N fertilizer of N1 combined with maize straw (named as N3, 700 kg N · hm-2), and 50% chemical N fertilizer of N1 combined with maize straw and drip irrigation(named as N4, 500 kg N · hm-2). Results showed that under current cultivation conditions, tomato yields could still be ensured even at 30%~50% deduction in N fertilizer input comparing with the local farmer habitual usage. Maximum yield was found in N4 treatment, 9.7% higher against the N1 treatment. N2 and N4 treatments were significant higher in N agronomic efficiency and the value of cost ratio than N1 treatment(P<0.05). The maximum N agronomic efficiency(28.9 kg · kg-1)and the value of cost ratio(12.6)appeared in the treatment of N4. There was no significant difference in Vitamin C(Vc)content of tomato among different N fertilizer treatments and N4 treatment got higher Vc content. A close relationship was found between fruit nitrate content and N application(R2=0.830 7,P<0.05). Tomato nitrate content of N3 and N4 treatment were significantly lower than the habitual N usage(P<0.05). High application of N fertilizer(N1)caused high accumulation of NO3--N within the 0~100 cm soil profile. Deduction of 30%~50% in N input decreased the soil NO3--N accumulation. Nitrate accumulates mostly in the soil profile of 0~40 cm, relative NO3--N accumulation account for more than 50%, and which could be utilized in next season. Correlation analysis showed that there were positive relationships between tomato nitrate content and soil NO3--N accumulation (R2=0.800 3,P<0.05). In conclusion, under current cultivation conditions in Shouguang, high tomato yields, quality and less NO3--N accumulation could be obtained at 30%~50% reduction in habitual N input, which presents a possible scale to a safety and efficient N fertilizer utilization in greenhouse farming system. N4 treatment is the feasible N management practice.

【题目】RothC模型模拟华北潮土区的土壤有机碳动态
【中文关键词】RothC模型; 潮土; 土壤有机碳; 模型模拟
【英文关键词】RothC model; fluvo-aquic soil; soil organic carbon; model simulation
【中文摘要】运用RothC (Version 26.3) 模型, 模拟研究华北地区典型潮土长期定位施肥试验小麦- 玉米轮作下土壤有机碳(SOC) 含量的变化。本研究选取潮土区较为常见的6个典型施肥处理: 不施肥(CK) 、单施氮肥(N) 、氮磷配施(NP) 、氮磷

钾配施(NPK) 、氮磷钾配施有机肥(NPKM) 和氮磷钾配施秸秆(NPKS) , 对耕层土壤SOC的模拟值与实际测定值进行了比较。除NPKS处理外, 其余各处理模型模拟值与实测值之间吻合较好。将NPKS处理植物碳DPM /RPM由1.44调至3.35后, 模拟效果明显改善。RothC模型可用来模拟和预测不同施肥措施下潮土SOC变化趋势, 但在大量秸秆还田时需调整部分模型参数。

【英文摘要】The RothC model (Version 26.3) was used to simulate the dynamics of soil organic carbon (SOC) under the wheat maize cropping system in a long term fertilization experiment in the Northern China Plain. Six typical fertilizer treatments (CK、N、NP、NPK、NPKM - NPK + manure、NPKS - NPK + maize straw) were chosen to simulate the SOC dynamics of the top soil (0~20 cm). Model simulation agreed well with the measurements except t the NPKS treatment. The simulation efficiency of the NPKS treatment imp roved when we modified the DPM /RPM ratio of plant carbon from 1.44 to3.35. So we concluded that the RothC model was feasible to predict the SOC dynamics of fluvo-aquic soil under different fertilizer management practices in the Northern China Plain, but some model parameters should be modified when a great amount of straw carbon input into the soil.

【题目】潮土区农田土壤肥力的变化趋势

【中文关键词】潮土; 耕地地力; 国家土壤肥力监测点

【英文关键词】fuvo-aquic soil; farmland soil fertility; national soil fertility long term monitoring sites

【中文摘要】自1986年起, 农业部全国农业技术推广服务中心在全国典型潮土区开展了耕地土壤的肥力动态监测, 以了解潮土区耕地地力的动态变化趋势。1987~2006年的土壤肥力动态监测结果表明, 潮土区土壤有机质和全氮含量均有所增加, 1987~1997年全国潮土区土壤有机质和全氮含量年均分别增加2.04%和2.59%; 1998~2006年全国潮土区土壤有机质含量年均分别增加0.62% , 全氮含量年均降低0.39%; 土壤有效磷和速效钾含量年均增加0.77%~1.47%和1.61%~2.73%; 土壤pH值降低0128个单位, 有酸化的趋势。随着潮土区土壤有效磷和速效钾含量的快速上升, 说明可以适当降低磷、钾肥的施用量。

【英文摘要】Since 1986, National Agro Tech Extension and Service Center of China, Ministry of Agriculture has carried out a dynamic monitoring on the farmland soil fertility in fluvo-aquic soil district. The soil fertility survey indicated from 1987 to 2006: The soil organic matter and total nitrogen content increased on the whole. The soil organic matter increased 2.04% and 0.62% annually from 1987 to 1997 and from 1998 to 2006, respectively; Total nitrogen content increased 2.59% and decreased 0.39% annually from 1987 to 1997 and from 1998 to 2006, respectively; Soil Olsen P and available K content increased by 0.77% ~1.47% and 1.61%~2.73% annually; Soil pH value decreased 0.28 indicating the tread of soil acidification. With the rap idly increasing rate of soil Olsen P and available K content in the past 20 years, the phosphorus and potassium fertilizers could be reduced properly.

【题目】The Effects of slow-release nitrogen fertilization models on soil biological properties in rice-wheat cropping system

【中文关键词】稻麦轮作,缓释肥料,酶,土壤中的微生物

【英文关键词】Rice-wheat rotation, slow-release fertilizers, enzyme, soil microbes.

【中文摘要】无

【英文摘要】Slow-release fertilizers (SRFs) are of great significance in enhancing fertilizer efficiency and improving soil fertility. The effects of different SRF application models on soil enzyme (sucrase, protease and urease) activity and soil microbes (actinomycetes,

bacteria, fungi) as well as the microbial diversity were investigated in rice-wheat cropping system. The results showed that, in comparison with no N control group, four N fertilizer application models (Urea, Slow-release-Urea (SR-Urea), SR-Urea/Urea, SR-Urea/Urea/Org.N) increased the soil enzyme activity and the number of soil microbes significantly in both wheat and rice soils. Compared to pure Urea application model, the soil enzyme activity was higher and the number of soil microbes was greater in other three SRF models (SR-Urea, SR-Urea/Urea, SR-Urea/Urea/Org.N); particularly in SR-Urea/Urea/Org.N model, the activity of sucrase, protease, and urease were increased by 5%-38%, 4%-15%, and 2%-5% respectively, and the number of soil bacteria, actinomycetes, fungi were increased by 9%-27%, 3%-14%, 13%-28% respectively. In addition, microbial diversity index (Shannon ' s diversity index) of SR-Urea/Urea/Org. N model was increased by 15%-103% compared to other fertilization models. The results indicated that combined application of SRF and organic manures was a good precaution to improve the soil biological properties and soil fertility in rice-wheat cropping system.

【题目】不同氮肥管理对吉林春玉米生长发育和养分吸收的影响
【中文关键词】春玉米 氮肥管理 产量 氮肥利用效率
【英文关键词】Spring corn; nitrogen management; production; nitrogen use efficiency
【中文摘要】针对吉林春玉米氮肥施用中存在氮肥用量偏大,且具盲目性的现状,采用田间试验研究农民习惯施氮量和推荐施氮量下氮肥不同施用方式对春玉米干物质积累、子粒产量、氮素吸收和利用效率的影响。结果表明,推荐施氮量下,苗期和灌浆期春玉米干物质积累量显著高于习惯施肥,有机无机配合提高了春玉米干物质积累速率。施氮处理与不施氮相比均显著增加玉米子粒产量,增产11.2%~16.8%;推荐施氮量下玉米子粒产量与习惯施氮量相当,但显著提高氮素的偏因子生产力和农学效率。在氮磷钾用量一致的基础上,用30%有机肥氮替代化肥氮与100%化肥氮处理的产量相当,对氮素利用效率也没有影响,并降低收获期土壤无机氮含量。说明合理施用氮肥不但能够维持玉米产量,还可减少氮肥投入,提高氮肥利用效率;有机肥部分替代化肥氮是吉林春玉米氮素管理的有效途径之一。
【英文摘要】For Jilin Chun corn nitrogen fertilizer, nitrogen fertilizer is too large, the possessed blindness of the status quo, a field trial study farmers used nitrogen application rate and the recommended nitrogen rate, nitrogen application method on spring maize dry matter accumulation, grain yield, nitrogenUptake and utilization efficiency. The results show that the recommended nitrogen application, the seedling stage and grain filling of spring maize dry matter accumulation was significantly higher than the conventional fertilization, organic and inorganic with spring corn dry matter accumulation rate. Nitrogen fertilization than without N application significantly increased grain yield, yield 11.2% to 16.8%; recommended nitrogen rate of corn grain yield and habits nitrogen application fairly, but significantly enhance nitrogen partial factor productivity and agronomic efficiency . NPK dosage on the basis of 30% of organic fertilizer nitrogen substitution of fertilizer nitrogen and 100% fertilizer nitrogen processing yield quite no effect on the nitrogen use efficiency, and reduce the harvest soil inorganic nitrogen. Description of the reasonable application of nitrogen fertilizer to corn production can not only maintain, but also to reduce nitrogen inputs, nitrogen use efficiency; organic fertilizer a partial substitute for nitrogen fertilizer is one of effective ways of of Jilin Chun corn nitrogen management

【题目】有机肥磷替代化肥磷对春玉米干物质积累和磷素吸收的影响
【中文关键词】春玉米;磷肥;有机肥;磷素吸收
【英文关键词】Spring maize; Phosphate fertilizer; Organic manure; Phosphorus uptake
【中文摘要】2008~2009年在吉林省公主岭黑土上研究有机肥磷部分替代化肥磷对春玉米干物质积累、产量、养分吸收和利用的影响。结果表明,有机肥磷替代化肥磷增加苗期或拔节期土壤速效磷含量;与100%化肥磷处理相比,用30%有机肥磷替代化肥磷对玉米干物质积累、子粒产量和磷素吸收没有显著影响,但显著增加营养体磷素的再分配率和对子粒的贡献率,提高了磷素的农学效率。
【英文摘要】In 2008 and 2009, field trials were conducted in spring maize in black soil of Jinlin to evaluate the effects of phosphorus (P) substitution by manure P on biomass, grain yield and P use efficiency. The results indicated that soil Olsen- P increased in seedling or jointing stage by manure substitutions. Compared with full chemical P, manure substitutions for P did not significant influence on biomass accumulation, grain yield and P uptake. Manure substitutions for P significantly increased P redistribution and contribution efficiency from vegetative parts to grain. Agronomic efficiency was also increased by manure substitution.

【题目】A Field Study on Effects of Nitrogen Fertilization Modes on Nutrient Uptake, Crop Yield and Soil Biological Properties in Rice-Wheat Rotation System
【中文关键词】稻麦轮作,氮施肥模式,更换有机肥,土壤酶活性,微生物多样性
【英文关键词】rice-wheat rotation, N fertilization mode, organic manure replacement, soil enzyme activity, microbial diversity
【中文摘要】无
【英文摘要】Rational application of nitrogen (N) fertilizers is an important measure to raise N fertilizer recovery rate and reduce N loss. A two-year field experiment of rice-wheat rotation was employed to study the effects of N fertilization modes including a N fertilizer reduction and an organic manure replacement on crop yield, nutrient uptake, soil enzyme activity, and number of microbes as well as diversity of microbes. The result showed that 20% reduction of traditional N fertilizer dose of local farmers did not significantly change crop yield, N uptake, soil enzyme activity, and the number of microbes (bacteria, actinomycetes, and fungi). On the basis of 20% reduction of N fertilizer, 50% replacement of N fertilizer by organic manure increased the activity of sucrose, protease, urease, and phosphatase by 46-62, 27-89, 33-46, and 35-74%, respectively, and the number of microbes, i.e., bacteria, actinomycetes, and fungi by 36-150, 11-153, and 43-56%, respectively. Further, organic fertilizer replacement had a Shannon ’ s diversity index (H) of 2.18, which was higher than that of other modes of single N fertilizer application. The results suggested that reducing N fertilizer by 20% and applying organic manure in the experimental areas could effectively lower the production costs and significantly improve soil fertility and biological properties.

【题目】Role of Added Carbon in the Transformation of Surplus Soil Nitrate to Organic Forms of Nitrogen in an Calcareous Soil
【中文关键词】养分管理和农业的可持续发展,在发展中世界; C的利用率;温室气体;土壤有机氮土壤盈余硝酸盐
【英文关键词】Nutrient Management and the Sustainability of Agriculture in the Developing World; C source availability; greenhouse gases; soil organic N; soil surplus nitrate

【中文摘要】无
【英文摘要】Excessive amounts of nitrate have accumulated in many soils on the North China Plain due to the large amounts of chemical N fertilizer used combined with low carbon inputs. The present study investigated the promotion of soil nitrate transformation to soil organic N by different carbon amendments. A laboratory incubation experiment using 15N tracer (K15NO3) was employed to elucidate the proportion of soil organic N derived from accumulated soil nitrate following amendment with glucose (G) or maize straw (S) at controlled soil temperature and moisture content. During the 56-d incubation period we determined the dynamics and isotopic abundance of mineral N (NO3- and NH4+) and soil organic N and greenhouse gas (N2O and CO2) emissions.Carbon amendment markedly stimulated transformation of nitrate to soil organic N. Mineralization of native soil organic N was also enhanced because soil organic N at the end of the incubation period was not significantly different from that in the control without added C. Glucose had a greater effect on nitrate-N immobilization (25.0 mg kg-1) than maize straw (9.4 mg kg-1) and glucose addition also led to highest greenhouse gas emissions. With glucose and straw amendment total N2O-N emissions were 1.01 and 0.03 mg kg-1, respectively. Similarly, glucose amendment lowered the concentration and abundance of NO3--N and increased that of NH4+-N more than maize straw. In agricultural practice straw amendment may be an effective strategy to deplete the excess NO3--N pool and restrict leaching, to promote nitrate-N immobilization and to decrease greenhouse gas emissions.

【题目】Synergistic interactions between Glomus mosseae and Bradyrhizobium japonicum in enhancing proton release from nodules and hyphae. Mycorrhiza.
【中文关键词】Bradyrhizobium japonicum . Glomus mosseae .Soybean . Proton release . Nodulesphere . Hyphosphere
【英文关键词】Bradyrhizobium japonicum . Glomus mosseae .Soybean . Proton release . Nodulesphere . Hyphosphere
【中文摘要】无
【英文摘要】Soybean (Glycine max L. Merr.) seedlings were inoculated with Glomus mosseae (GM) and Bradyrhizobium japonicum (BJ) together or separately to study the effect of interactions on net H+ effluxes of nodules or extraradical hyphae by in vivo vibrating electrode techniques. GM promoted three-fold the H+ effluxes of nodules on mycorrhizal lateral roots and BJ increased eight-fold the net H+ effluxes of hyphae developing in the vicinity of nodules on lateral roots. Increments in plant P content were positively and linearly correlated with the net H+ efflux of nodules and hyphae. It is concluded that increased H+ effluxes of nodules resulted from enhanced nitrogenase activities induced by the presence of the AM fungus in lateral roots. The results point to additive effects of interactions between mycorrhizal fungi and rhizobia in increasing the extent of acidification of the “ nodulesphere ” and the hyposphere.

【题目】Long-Term Evaluation of Manure Application on Maize Yield and Nitrogen Use Efficiency in China.
【中文关键词】CK,控制; NPKS,无机氮,磷,钾肥与秸秆返回;,无机氮,磷,钾复合肥加肥NPKM氮肥利用率,氮肥利用效率。
【英文关键词】CK, control; NPKM, inorganic nitrogen, phosphorus, and potassium fertilizer plus manure; NPKS, inorganic nitrogen, phosphorus, and potassium fertilizer with Stover returned; NUE, nitrogen use efficiency.

【中文摘要】无
【英文摘要】Improving N use efficiency (NUE) and reducing the negative impact of N fertilization on the environment are essential for sustaining agricultural production in many intensive farming regions around the world. The objective of this research was to investigate the effect of various fertilization regimes on yield, N uptake, and NUE by maize (Zea mays L.) in long-term (15-yr) experiments performed at four sites (Changping, Zhengzhou, Yangling, and Qiyang) in China. Eight treatments were examined: unfertilized control (CK); inorganic fertilizer (manufactured source) N, N and P, N and K, and N, P, and K; inorganic N, P, and K with manure (NPKM); 1.5 ′ the rate of NPKM (1.5NPKM); and N, P, and K with maize Stover returned (NPKS). Compared with inorganic fertilization, mixed inorganic and manure fertilization (NPKM and 1.5NPKM) resulted in more stable and significantly higher yield and NUE as well as increases in soil nutrient storage at all sites, with the most significant improvement in the acid soil (pH = 5.7) at Qiyang. Phosphorous was identified as one of the most important limiting factors in maize NUE because the NUE at all four sites increased from about 20 to 45% by increasing the available P in the soil. Higher NUEs (up to 70%) were observed mostly from the continuous manure applications. We conclude that manure and P applications are the most important and effective

【题目】Effect of Long-Term Potassium Fertilization on Crop Yield and Potassium Efficiency and Balance Under Wheat-Maize Rotation in China
【中文关键词】交换性钾,内部钾利用效率,钾收获指数,钾的吸收,非交换性钾
【英文关键词】exchangeable K, internal K use efficiency, K harvest index, K uptake, non-exchangeable K
【中文摘要】无
【英文摘要】Sustainable potassium (K) management at different soil sites requires understanding the relationships between crop productivity and long-term K fertilizations on a regional or national scale. We analyzed responses of grain yield of wheat (Triticum aestivum L.) and maize (Zea mays L.), K efficiency, and partial balance (difference between K input through fertilizer and K output in the aboveground biomass) during 15- (1990 – 2005) or 18-year (1990 – 2008) K fertilizations at five distinctive agro ecological zones across China. Compared to the inorganic nitrogen (N) and phosphorus (P) fertilization, the inorganic NPK fertilization significantly increased grain yields of wheat (21%) and maize (16% – 72%) at Qiyang and Changping, where soils have low exchangeable and non-exchangeable K contents, but not at ¨ Ur ¨ umqi, Yangling and Zhengzhou, where soils have a high exchangeable and non-exchangeable K and/or low N/K ratio in crop plants. Compared to the inorganic NPK fertilization, the inorganic NPK (30% N) and organic manure (70% N) fertilization (NPKM) increased grain yields of wheat (14% – 40%) and maize (9% – 61%) at four sites, but not at Zhengzhou. For a productivity of wheat at 2 – 5 t ha − 1 or maize at 3 – 6 t ha − 1, 13 – 26 or 9 – 17 kg K ha − 1 were required to produce 1.0 t wheat or maize. The NP fertilization resulted in the lowest negative partial K balance and accumulated 52 kg K ha − 1 year − 1 less than the NPK fertilization, which accumulated 28 kg ha − 1 year − 1 less K than the NPKM fertilization. A re-evaluation of the site-specific fertilization effects on N/K ratio in crop plants and soil K accumulation under current NPK and NPKM fertilization is urgently needed to increase both crop yield and K use efficiency at different agro ecological zones across China.

【题目】家畜肠道和粪便甲烷排放研究进展
【中文关键词】动物;肠道;粪便;甲烷;测定方法
【英文关键词】animal; enteric; manure; methane; measurement methods
【中文摘要】家畜采食饲料在胃肠道发酵及其排泄粪便在处理贮存过程中会产生甲烷,目前每年的排放量超过全球甲烷排放总量的1/4。甲烷是主要的温室气体,会破坏大气臭氧层。减少家畜肠道和粪便的甲烷产量对提高饲料能量利用率和改善环境具有重要意义。该文在对目前反当动物甲烷排放影响因素、肠道甲烷排放量和粪便甲烷排放量测定方法等方面的研究现状进行分析的基础上,就如何减少家畜肠道和粪便的甲烷产量提出了自己的看法。
【英文摘要】Enteric and manure derived methane emissions from domestic animals around the world per year now are above one-fourth of the total methane emissions. Methane, a principal greenhouse gas, can damage the ozonosphere. Methane emissions mitigation can not only improve utilization of feed energy, but also meliorate environment. This article reviews the influencing factors of methane emissions, methods used to measure enteric and manure-derived methane emissions from domestic animals. On the basis of these advices on how to reduce the methane emission from enteric and manure are given.

【题目】不同pH值淋溶液对猪粪中不同指标溶出的影响
【中文关键词】猪粪;淋溶;释放;pH值
【英文关键词】Swine manure; leaching; release; PH value
【中文摘要】本文研究猪粪在酸雨条件下释放污染物的规律,分析释放物的环境危害性。试验配置pH值为3.60、4.80和5.60的淋溶液,模拟广东省内的酸雨降水环境,对新鲜猪粪进行24d的淋浴,然后对各组淋出液和猪粪残留化学成分进行分析,得出不同pH值淋溶下污染物重金属铜、锌、砷和氨氮、总磷、CODcr等时间一浓度曲线。结果表明,新鲜猪粪在酸性淋溶下,其渗滤液的pH值有所降低,在24d淋溶过程中渗滤液重金属(Zn、Cu、As)的浓度总体上呈下降趋势,以pH4.8时滤出重金属的速度较pH3.6、5.6快;COD、氨氮早期溶出较快,以后逐步减缓。新鲜猪粪经酸性淋溶后,渗滤液中铜、砷以及COD、总磷、氨氮含量均显著增加。因此对即使临时堆放亦需采取措施,以防止因雨水等导致的渗滤液污染。
【英文摘要】This paper studied the pollutants released from swine manure on open ground under leaching of acid rain,analysed environmental harm of the release. Simulation tests were carried out under Guangdong acid rain condition,using PH3.60,4.80 and 5.60 of the leaching solution,showering for 24 days for fresh pig manure. Experiment results showed that heavy metal of Cu,Zn,As,ammonia,total Phosphorus,and COD were formed in pollutants,and their time concentration curves were plotted. The results show that after acid rain leaching the pH value of swine feces lower than that of fresh swine manure,and during the 24days the concentration of Cu,Zn and As in leached swine feces showed decline trend,the leaching rate of heavy metal in the treatment of pH4.8 was faster than that in treatment of pH3.6 and 5.6; COD and ammonia leaching rates were fast at start,then its lowed down. After acid rain leaching all concentrations of copper,arsenic,COD,total phosphorus,and ammonia in swine feces were over the relevant environmental standards. So it is necessary to take measures to prevent fresh swine manure from leaching.

【题目】Adsorption and release of phosphorus in the surface sediment of wastewater stabilization pond
【中文关键词】Wastewater stabilization pond Sedimentary phosphorus Adsorption and release Redox potential pH
【英文关键词】Wastewater stabilization pond Sedimentary phosphorus Adsorption and release Redox potential pH

【中文摘要】In wastewater stabilization ponds, sedimentary phosphorus usually presents significant release and adsorption differences from that in lakes. However, their mobile potentials in stabilization pond have seldom been studied. In this study, the transformation characteristics of sedimentary phosphate in a wastewater stabilization pond are studied. The adsorption and release potential under different pH and Eh conditions is investigated and possible mechanisms involved are also proposed. Additionally, the forming process of ironbound-phosphorus with Eh steadily increasing is also discussed. Results of this study show that the binding capability of each phosphorus fraction differed greatly under different pH conditions as follows: iron – phosphorus (Fe – P) and aluminum – phosphorus (Al – P) possessed the greatest binding capability at pH 7 – 8; and organic phosphorus extracted at alkaline conditions (OPalk) and calcium – phosphorus (Ca – P) showed the greatest binding capability at pH 5 and pH 9, respectively. Mainly through changing the proportion of Fe(III) in Total-Fe and the subsequent binding of its possible forms with phosphate, Eh can effectively affect the adsorptive and releasing behaviors of sedimentary phosphorus. With Eh increasing from − 650mVto − 50mV, Fe(II)was gradually oxidized to Fe(III), and Fe(III) – P significantly formed at the same time. Furthermore, the results show that there was no Eh threshold for phosphorus adsorption with increasing Eh.

【题目】Research on nutrient removal and recovery from swine wastewater in China
【中文关键词】Nutrient removal; recovery; swine; wastewater
【英文关键词】Nutrient removal; recovery; swine; wastewater
【中文摘要】Heavy pollution of livestock and poultry wastewater has been a problem in China. It is already noticed that nutrient removal is necessary for water environment protection, but nutrient recovery is still a rather fresh topic. In the present study, research on nutrient removal and recovery by magnesium ammonium phosphate (MAP) from swine wastewater was carried out at bench and pilot scale. It showed that for MAP crystallization the optimum pH value was at 9.0 – 10.0, the coexistence of Ca in solution would increase the P removal efficiency, but would affect the morphology of MAP; the coexistence of carbonate would slightly decrease the crystallization efficiency of MAP. The pilot scale experiments of 10 m3/d in the piggery showed that both discontinuous and continuous flow MAP crystallization reactors were efficient for phosphorus (P) removal and recovery from anaerobically treated swine wastewater, while the discontinuous reactor was more efficient; the reactors were resistant to temperature variation in the range of 12 to 30 °C, and to influent phosphorus concentration variation in the range of 30 to 80 mg/L; the effluent P concentration could meet the national discharge standard of livestock and poultry wastewater. Ammonia could be also removed with MAP crystallization, but more ammonia was removed by carbonate stripping for pH increase purpose instead of the MAP crystallization reaction.

【题目】Nutrients removal and recovery by crystallization of magnesium ammonium phosphate from synthetic swine wastewater

【中文关键词】Magnesium ammonium phosphate; Crystallization; Phosphorus recovery; Effect of calcium; Effect of carbonate; Crystal morphology

【英文关键词】Magnesium ammonium phosphate; Crystallization; Phosphorus recovery; Effect of calcium; Effect of carbonate; Crystal morphology

【中文摘要】With synthetic swine wastewater, lab-scale batch experiments were carried out to investigate the effects of pH value, magnesium dosage, calcium and carbonate concentrations on magnesium ammonium phosphate (MAP) crystallization. The morphology of the precipitates obtained was observed by using scanning electron microscopy with energy dispersive X-ray analysis, and the composition of the precipitates was analyzed with X-ray diffraction. The results show that the optimum pH value for MAP crystallization is in the range of 9.5-10.5; the phosphorus removal efficiency increases with the increase of Mg/P molar ratio; the optimum Mg/P molar ratio is 1.4, and excessive Mg dosage does not show significant effect on the efficiency improvement of MAP crystallization; the co-existing of Ca in solution disturbs the morphology and purity of the MAP product, and amorphous calcium phosphate will form when Ca increases to a certain concentration; CO32- can affect the P removal efficiency, but does not obviously affect the morphology and purity of MAP.

【题目】SPRR工艺回收养猪废水营养元素研究
【中文关键词】序批式磷回收反应器;养猪废水厌氧消化液;磷酸铵镁;营养元素
【英文关键词】sequencing-batch phosphorus recovery reactor;,piggery wastewater anaerobic digestion effluent;MAP;nutrient
【中文摘要】采用磷酸铵镁(MAP)结晶法,研究序批式磷回收反应器(SPRR)从养猪废水厌氧消化液中回收营养元素的能力,初步确定了SPRR反应器的运行参数,考察了废水组成对反应器运行效果的影响。结果表明,在废水pH=8.5时,SPRR工艺能够有效富集MAP晶体,单个运行周期仅3.6h;养猪废水中适量投加Mg盐能使MAP产量提高约10.5%~11.6%;考虑经济成本,当养猪废水仅用于营养元素回收时,可不投加Mg盐。SPRR工艺可直接从养猪废水厌氧消化液中高效回收营养元素。具有广阔的应用前景。
【英文摘要】When adopting the crystallization technology of magnesium ammonium phosphate(MAP)for P recovery from high strength wastewater, fluid bed reactor is usually viewed 88 the most common choice.However, due to its poor hydrodynamics conditions,masses of MAP particles cannot remain in the reactor but flow out the system with the effluent.which result in lower recovery efficiencies of phosphorus.For improving these recovery efficiencies,a new kind of sequencing batch phosphorus recovery reactor(SPRR),which can accelerate the separation efficiencies of MAP particles from water, Was designed. The nutrients recovery potential of SPRR from anaerobic digestion effluent of piggery wastewater Was studied.Primary operational parameters of the SPRR were determined,and the influences of pollution components on the MAP crystallization were investigated.The results show that only through 3.0 h aeration stage,the anaerobic digestion wastewater Can offer appropriate conditions for MAP crystallization.A running cycle of this SPRR including five stages,namely influent stage,pH increase stage,MAP crystal stage,MAP precipitation stage,effluent stage,it can be finished only in 3.6 h.The addition of M could improve MAP production by 10.5%~l1.6%;however, considering the cost of nutrients recovery,it is not necessary to add Mg salt.Except some ions,such as NH4+,PO43- and Mg2+,the rest pollution components in anaerobic digestion effluent of piggery wastewater did not significantly restrain MAP formation.In conclusion,this kind of SPRR has a broad application future as a high-efficiency installation for direct nutrients recovery from anaerobic digestion effluent of the piggery wastewater.

【题目】特定有益菌对奶牛粪便中温厌氧消化体系稳定性和指示菌存活的影响
【中文关键词】牛粪;中温厌氧消化:有益微生物:指示菌
【英文关键词】mesophilic anaerobic digestion;effective microorganism;indicator bacterium
【中文摘要】本文研究了添加假单胞菌、芽孢杆菌、乳酸菌、酵母菌和放线菌对奶牛粪便中温(35°C)厌氧消化过程中消化体系稳定性和指示菌(粪大肠菌群、产气荚膜梭菌、厌氧菌和需氧菌)存活情况的影响。通过采用1 L抽滤瓶作为消化罐,置于恒温箱内35°C模拟中温厌氧消化。检测厌氧消化过程中粪大肠菌群、产气荚膜梭菌、厌氧菌和需氧菌数量的变化,同时对挥发性脂肪酸(VFA)含量、NH4+-N含量和pH值等指标进行测定。结果发现,在厌氧消化体系中添加假单胞菌、芽孢杆菌、乳酸菌、酵母菌和放线菌对整个消化过程中VFA含量、NH4+-N含量和pH值没有显著影响(P>0.05),但可提高酸化阶段丁酸和乙酸的产量,降低丙酸的产量,有利于形成一个良好、稳定的厌氧消化体系。添加的微生物可以显著促进粪大肠菌群数量的减少(P<0.05),但对产气荚膜梭菌、厌氧菌和需氧菌的数量并没有显著的影响(p>0.05)。试验结果表明,假单胞菌、芽孢杆菌、乳酸菌、酵母菌和放线菌在厌氧消化处理畜禽排泄物过程中的应用有一定的理论推广价值,其实际应用的研究有待进一步开展。
【英文摘要】The study was to evaluate inactivation of indicative bacteria or bacterial flora:fecal Coliform,C.perfringens (Clostridium perfringens), the total number of anaerobic and aerobic bacteria,by bioaugmenting anaerobic digestion of cow dung slurry with a commercial product containing selected strains of bacteria from genera Lactobacillus, Pseudomonas, Microzymes and Actinomycetes, along with ancillary organic compounds containing various micronutrients. Specifically, the effects of the bioaugment on the concentration of volatile fatty acids, NH4+-N, the value of pH. The number of Coliform and C. perfringens during anaerobic digestion of dairy cattle dung slurry were studied. The results indicated that the bioaugmenting anaerobic digestion could reduce the number of Fecal Coliform significantly (P<0.05), as well as could be of advantage to form a better and more stable digestive system, however, no obvious effect on reduction of the number of C. Perfringens, the total number of anaerobic and aerobic bacteria were observed.The

bioaugmenting anaerobic digestion could not significantly affect the output of volatile fatty acids(VFA),NH4+-N and the value of pH (P>0.05).In brief, the bioaugmenting anaerobic digestion could improve anaerobic digestive microecology and could be used for treatment of dairy cattle dung slurry before their land application.

【题目】不同通风量对猪粪好氧堆肥的影响
【中文关键词】堆肥; 通风; 调理剂; 猪粪;
【英文关键词】composting; ventilation; bulking agents; swine feces;
【中文摘要】该文以玉米秸和稻壳混合作为调理剂进行猪粪好氧堆肥,研究不同通风量对堆肥效果的影响。试验设3个处理,通风量分别为0.5、0.3和0m3/min,通风时间根据堆体温度调整,测定了堆体温度和堆料水分、pH值、有机质含量、总氮含量和C/N。结果表明,通风能有效保证堆料升温和高温期的维持,而且能够抑制堆肥过程中堆料pH值的上升,有利于有机质的降解和C/N的降低,通风量为0.3m3/min时,综合效果较理想。结果提示,以玉米秸和稻壳混合作为调理剂,初始C/N为30∶1,含水率为62%左右时,适当通风能够满足猪粪腐熟的需要。
【英文摘要】With the use of corn straw and rice hull as bulking agents,an experiment was conducted to investigate the effects of ventilation on the aerobic composting of swine feces.Three kinds of ventilation(0.5,0.3 and 0 m3/min)were designed for three treatments,and the time for aeration and alternation was regulated by different temperatures in central piles.The changes of temperature in piles,pH value,water content,content of organic substance,content of total nitrogen and ratio of carbon to nitrogen in composting

【题目】钙型天然斜发沸石同步脱氮除磷特性
【中文关键词】钙型天然斜发沸石; 氨氮; 磷; 吸附; 沉淀; 特性;
【英文关键词】Ca-type clinoptilolite; ammonium nitrogen; phosphorus; adsorption; precipitation; characteristics;
【中文摘要】以钙型天然斜发沸石为试验材料进行废水同步脱氮除磷特性研究,考察反应时间,沸石投加量,pH,温度及废水中的有机物含量对斜发沸石同步去除氨氮和磷的影响.结果表明:在沸石投加量为250 g/L,pH为7.0~9.0,温度为25°C,吸附时间为24 h的条件下,钙型天然斜发沸石对氨氮的去除率达到96%,对磷的去除率接近100%.pH对钙型天然斜发沸石除磷效果影响显著,但对氨氮去除效果影响不大.当pH由3.0升至5.0时,磷的去除率由54%降低至43%,吸附作用是磷的主导去除机制;当pH由5.0升至8.0时,磷的去除率迅速升高,化学沉淀逐渐成为磷的主导去除机制;pH为8.0以上时,磷的去除率接近100%.废水有机物对钙型天然斜发沸石去除磷的效果存在差异,其中柠檬酸的加入使磷的去除率降低16%,显著抑制了磷的去除;腐殖酸的加入仅使磷的去除率降低3%,影响甚小.柠檬酸和腐殖酸的加入对氨氮的去除效果影响均较小(低于3%).
【英文摘要】Taking Ca-type clinoptilolite as the experimental material,batch experiments were carried out to investigate the influence of reaction time,dosage of Ca-type clinoptilolite,pH,temperature and organic compounds on simultaneous removal of nitrogen and phosphorus from wastewater.The experiments showed that under the conditions of clinoptilolite dosage 250(mg/L),pH 7.0-9.0,temperature(25 °C) and adsorption duration 24 h, the removal efficiency of high-concentration ammonium nitrogen by clinoptilolite could reach..

【题目】不同沼液灌溉强度对土壤和渗滤液的影响
【中文关键词】沼液; 灌溉强度; 土壤; 渗滤液;
【英文关键词】fermented slurry; irrigation intensity; soil; leaching liquid;
【中文摘要】采用盆栽试验研究不同强度施用沼液种植杂交狼尾草对环境的影响。试验按所施用沼液比例不同设7个处理,每个处理5个重复。盆栽试验采用20 L的塑料桶,桶底钻孔以收集渗滤液;灌溉间隔5 d,每次灌溉后3 h收集渗滤液。盆栽采用水稻土和株高、根系相近的杂交狼尾草苗。结果表明:随着沼液灌溉强度的提高,渗滤液和盆栽土中三氮(总氮、氨氮、硝氮)含量升高,但再高灌溉强度可导致硝氮下降;按本试验条件,合适的沼液灌溉强度是控制沼液不超过50%,渗滤液总氮、氨氮、硝氮分别稳定在52.99~57.87 mg/L、52.66~52.78 mg/L和3.33 mg/L以内。以上说明,沼液灌溉杂交狼尾草存在一个合适灌溉强度,这与一定时间内的沼液灌溉量及其养分含量有关,并受施用气候、土壤条件、植被发展影响。
【英文摘要】The effects of fermented slurry applied in planting crossbred pennisetum on environment were investigated by pot incubation test.7 treatments,5 replications for each,were employed varied by volume of applied liquid.Plastic bucket,volume 20 L with holes at bottom,was used for pot incubation.Another plastic basin was located under the pot for collecting leaching liquid.Plants were sprayed with slurry each five days and leaching liquid was collected after spraying 3 hours.Rice soil was applied for pot incubati...

【题目】铝盐对鸡粪中氨气释放的影响及其机理研究
【中文关键词】铝盐; 鸡粪; 氨;
【英文关键词】aluminum salt; poultry litter; ammonia;
【中文摘要】通过在鸡粪中添加明矾研究铝盐对鸡粪中氨气产生和释放的影响。试验设0、2%和4%3个铝盐添加水平,测定了不同时间鸡粪中氨气释放量及pH、脲酶活性、氨氮和氮含量。结果:(1)鸡粪中氨的释放随时间的延长逐渐减少(P<0.000 1),添加铝盐处理能降低其氨气的释放(P<0.000 1),尤其是4%铝盐处理组在试验的前5 d显著低于对照组(P<0.05);(2)铝盐处理极显著降低鸡粪的pH值(P<0.000 1),而且时间效应对其的影响也极显著(P<0.000 1),4%铝盐处理组pH在3、7 d时显著低于对照组(P<0.05);(3)铝盐处理显著抑制鸡粪的脲酶活性(P=0.023 1),时间效应对其有极显著的影响(P<0.000 1);(4)铝盐处理对于鸡粪中的总氮含量有极显著的影响(P<0.01),但对于氨氮的影响不显著(P>0.05),而时间效应对二者的影响均极显著(P<0.01)。研究表明,铝盐引起鸡粪中pH的下降和脲酶活性、氮损失的改变,从而控制鸡粪中氨的释放,一定程度上减轻氨对养殖生产及环境的影响。
【英文摘要】To investigate the effect of aluminum salt on ammonia production from poultry litter in commercial broiler houses,aluminum was added into hen dung at three different levels: 0,2% and 4%(aluminum(g)/dung(g)).After aluminum salt treatment,the pH value,ammonia production,urease activity of treated dung and the content of ammonia nitrogen or total nitrogen in treated dung were measured respectively at indicated days.We found that ammonia released from dung and the pH value of dung decreased significantly after ...

【题目】猪粪对淡水养殖水质及罗非鱼安全的影响
【中文关键词】粪便; 水环境; 罗非鱼; 安全;
【英文关键词】manure; aquatic environment; Tilapia; safety;
【中文摘要】探讨施用畜粪对淡水养殖水体及水产品安全的影响。试验设不施用猪粪、施用新鲜猪粪、施用发酵猪粪共3组,分别养殖罗非鱼,定期测定水质及鱼体病原体指标。结果表明:投放发酵猪粪与新鲜猪粪均引起水体氨氮、COD升高,以及水体溶解氧、透明度下降,上述水质指标在新鲜猪粪组和发酵猪粪组之间没有显著差异。此外,施用发酵猪粪导致水体pH值下降。向水体施用发酵或新鲜猪粪,均可显著增加水体沙门氏菌数、大肠菌群数、罗非鱼肠道沙门氏菌数,并引起鱼SOD活力升高,施用新鲜猪粪对上述指标影响比发酵猪粪大。研究指出,向养殖水体投放新鲜或发酵猪粪对水体产生的不同效应主要体现在病原体指标变化(生物学效应),而水质理化效应差异不明显。
【英文摘要】The experiments were conducted to investigate the effects of livestock manure on the safeties of aquatic environment and products.Tilapias were fed in the aquatic systems added with fresh or fermented pig manure.The water and fish sample were collected for measurement.The results showed that applications of fermented and fresh pig manure resulted in significant increases of ammonia nitrogen and COD content,while decreases of DO and transparency of water.No significant differences of the above items were fou

【题目】猪粪和土壤样品中微生物DNA提取方法的比较
【中文关键词】猪粪; 土壤; DNA提取; 微生物多样性;
【英文关键词】swine feces; soil; DNA extraction; microbial diversity;
【中文摘要】猪粪施于土壤可能会对土壤微生物多样性造成影响,为选用同一种DNA提取方法用于土壤和猪粪微生物DNA的提取,该文采用了化学裂解法和试剂盒法同时从土壤和猪粪样品中提取微生物DNA,并对这两种方法的提取DNA的效果进行了比较。结果表明,试剂盒法不能用于提取土壤中的微生物DNA;可以从猪粪中提取到DNA,PCR扩增能得到目的产物,但重复性不高。化学裂解法提取的土壤微生物DNA浓度高但纯度低,纯化后纯度增加,但DNA有所损失,用于PCR扩增时结果不理想;处理猪粪样品,提取的DNA浓度较低但纯度较高,PCR扩增结果比较理想。由此可见,化学裂解法用来提取猪粪样品中的微生物DNA是可行的,但需寻求更好的土壤样品微生物DNA的提取方法。
【英文摘要】The growth of the livestock industry resulted in the increase of feces and sullage,which caused consider- able environment pollution.Swine feces would affect the soil microorganism when it entered the soil.To study the influence of swine feces on soil microorganisms,the same method for microbial DNA extraction from soil and swine feces was the basis.The efficiency of two methods as chemical lysis method and DNA Isolation Kit method for microbial DNA extraction was compared in this experiment.The results sho

【题目】厌氧技术在生活垃圾处理中应用现状及发展趋势
【中文关键词】农村能源; 沼气; 厌氧消化; 原料;
【英文关键词】rural energy; biogas; anaerobic treatment; raw material;
【中文摘要】针对目前我国能源短缺的现状,通过厌氧消化技术制取沼气补充化石能源是解决农村用能紧缺的重要措施。本文概述了使用生活垃圾制取沼气的意义,分析了厌氧生物处理技术在生活垃圾资源化利用中的进展,并对发酵原料进行了系统分析,提出了厌氧消化技术在生活垃圾领域应用中存在的问题。
【英文摘要】As improvement of people ’s standard of living, per capita energy consumption and garbage let is growing. At the same time, due to the price of the energy in international market is sharply running up, energy costs is increasing in residents ’ living. In light of China ’s energy shortage, in rural areas the use of biogas makeup fossil energy is the important measure to solve current energy shortage. This paper outlines the significance of biogas brought by domestic waste and analyses the evolve of the anaerobi.

【题目】肉牛甲烷排放影响因素的试验研究
【中文关键词】肉牛; 甲烷排放; SF6示踪法; 粗饲料; 日粮能量摄入水平;
【英文关键词】beef cattle; methane emission; SF_6 tracer methods; roughage; energy intake level;
【中文摘要】为考察不同粗饲料类型、日粮精粗饲料比、能量摄入水平等因素对肉牛甲烷排放量的影响,从而为控制甲烷排放提供理论依据,本研究选用4头18月龄的健康肉用公牛(鲁西黄牛),针对不同粗饲料类型、饲料精粗比和日粮能量摄入水平进行了试验,采用SF6示踪法对甲烷排放量进行了测定。试验结果表明:SF6示踪法可用来快速测定反刍动物的甲烷排放量;影响肉牛甲烷排放量因素的主次顺序依次为:饲料粗料类型>饲料精粗比>能量摄入水平;对肉牛饲喂紫花苜蓿和青贮玉米秸比饲喂稻草和干玉米秸时甲烷排放量要小;日粮中粗饲料越多,则肉牛的甲烷排放量越大;随着能量摄入水平的加大

,肉牛的甲烷排放量也呈增加的趋势。
【英文摘要】To investigate the effects of roughage type,the ratio of concentrate to roughage and energy intake level on amount of methane emission,four beef cattle were subjected to different roughages,ratios of concentrate to roughage in diet and energy intake level,SF_6 tracer method was used to determine methane emission from cattle.Research results show that methane emission from beef cattle could be determined quickly by SF_6 tracer method,methane emission effect factors were as follows: roughage type>ratio of ...

【题目】育肥猪舍甲烷排放浓度和排放通量的测试与分析
【中文关键词】甲烷; 猪舍; 温室气体; 排放;
【英文关键词】methane; pig house; greenhouse gas; emission;
【中文摘要】畜禽养殖是重要的温室气体排放源,畜禽养殖的甲烷排放量受动物生长特性、粪便收集方式和气候条件的影响。为了探讨中国特有的饲养管理方式下育肥猪舍温室气体排放规律,为减少甲烷排放提供依据,该研究在北京选择一典型猪场,对不同季节育肥舍的甲烷排放浓度进行了试验测定,从2004年5月至2005年3月,每2个月一次连续采集72~80 h甲烷浓度和相关数据,并根据二氧化碳平衡原理,对猪场的甲烷排放量进行了估算。结果表明:育肥猪舍内甲烷浓度有明显的季节性和日变化特性,2005年1月舍内甲烷的平均浓度为(22.98±10.52)m g/m3,7月舍内甲烷浓度为(2.68±0.68)m g/m3;每日最低甲烷浓度出现在9:00 am~17:00 pm时段;冬季舍内二氧化碳浓度明显偏高,夜间比允许浓度高1倍;每头育肥猪饲养期间的甲烷排放量为68.10~207.01 m g/h,折合每标准动物单位排放量:436~1185 m g/h.(500 kg),在IPCC推荐的发展中国家猪呼吸代谢甲烷排放1.0 kg/(a.头)范围内。
【英文摘要】Methane(CH_4) emissions from animal breeding has become a concern.The concentration and emissions per animal species are affected by animal characteristics,housing type and manure collection management as well as the climate.To investigate CH_4 emissions from finishing pigs appropriate for China management method and climate situation,the CH_4 concentration and related information were measured in Beijing during 2004~2005,six data collection periods,72~80 hours each were scheduled through one year and four

【题目】Genetic Improvement in Yield and Its Associated Traits of Winter Wheat in South China from 1949 to 2000
【中文关键词】无
【英文关键词】Bread wheat,Genetic improvement,Yield potential,Yield components,Dwarfing gene
【中文摘要】无
【英文摘要】To understand the genetic gains of grain yield in the Southern China Winter Wheat Region (SCWWR), two yield potential trials, i.e., YPT 1 including 11 leading cultivars from the Middle and Low Yangtze Valley (Zone III) and YPT 2 including 15 leading cultivars from theSouthwestern China Region (Zone IV) from 1949 to 2000, were conduced during the 2001 – 2003 cropping seasons. A completely randomized block design of three replicates was employed with controlled field environments. Molecular markers were used to detect the presence ofdwarfing genes and the 1B/1R translocation. Results showed that average annual genetic gain was 0.31% ($P < 0.05$) or 13.96 kg/ha/year and 0.74% ($P < 0.01$) or 40.80 kg/ha/year in Zones III and IV, respectively. In YPT 1, changes of all other traits were not significant, but plant height was significantly reduced. In YPT 2, the genetic improvement of grain yield was primarily attributed to the increased thousand kernel weight (TKW) (0.65%, $P < 0.01$) and kernel weight/ spike (0.87%, $P < 0.01$), reduced plant height and increased harvest index (HI). The dwarfing gene Rht 8 was most frequently present (46.1%), Rht-B1b was observed in three genotypes in Zone III, and Rht-D1b was present in only one genotype in Zone IV. The 1B/1R translocation was present in four genotypes. Utilization of Italian germplasm and development of landmark cultivar Fan 7 were the key factors for grain yield improvement in SCWWR. The future challenge of wheat breeding in this region is to continue improving grain yield and disease resistance, and to develop cultivars suitable for the reduced tillage of wheat/rice double cropping. Utilization of Mexican germplasm could provide opportunities for future yield improvement.

【题目】Genetic Improvement of Grain Yield and Associated Traits in the Northern China Winter Wheat Region from 1960 to 2000
【中文关键词】无
【英文关键词】Genetic improvement,Yield potential,Yield components,Dwarfing gene
【中文摘要】无
【英文摘要】Knowledge of changes of grain yield and associated traits of historical cultivars is essential for understanding yield limiting factors and developing strategies for future cultivar improvement. Four trials, including 47 leading common wheat (Triticum aestivum L.) cultivars from the Northern China Winter Wheat Region (NCWWR) from 1960 to 2000, were conducted during 2001-2003 using a completely randomised block design of three replicates under controlled field environments. Molecular markers were used to detect the presence of dwarfing genes and 1B/1R translocation. Results showed that average annual genetic gain in grain yield ranged from 32.07 kg ha-1year-1 to 72.11 kg ha-1year-1 or from 0.48% to 1.23% annually in different Provinces. The most significant increase in grain yield occurred in the early 1980s, largely due to the successful utilization of dwarfing genes and 1B/1R translocation. There was no common trend across trials in terms of changes in spikes m-2, kernels per spike, thousand kernel weight (TKW), or biomass. The genetic improvement of grain yield was primarily attributed to increased kernel weight per spike, reduced plant height, and increased harvest index (HI). The dwarfing allele Rht-D1b was the most frequent (68.0%), followed by Rht 8 (42.0%) and Rht -B1b (16.0%). The frequency of 1B/1R translocation cultivars was 42.6%. The future challenge of wheat breeding in this region is to maintain the genetic gain in grain yield and to improve grain quality, without increasing inputs for the wheat-maize double cropping system

【题目】Chromosome sorting and its applications in common wheat (Triticum aestivum) genome sequencing
【中文关键词】无
【英文关键词】Triticum aestivum, flow cytogenetics, chromosome sorting, physical map, wheat genome sequencing
【中文摘要】无
【英文摘要】The large genome size (~17000 Mb) and complicated DNA structures of common wheat (Triticum aestivum) hamper its genome sequencing. By means of flow cytometry, systematic investigations on individual chromosome sorting have been carried out to construct chromosome-specific bacterial artificial chromosome (BAC) libraries since the 1980s. Several wheat chromosome-specific BAC libraries, such as chromosome 3B, three D genome chromosomes (1D, 4D and 6D), and the short arm of chromosome 1B, have been developed, and the physical map of chromosome 3B was established in 2008. The same chromosome-based strategy is being employed by the International Wheat Genome Sequencing Consortium (IWGSC) to establish the physical maps of the other 20 common wheat chromosomes (cv. Chinese Spring). Several projects on wheat genome sequencing are currently underway. The availability of new sequencing technologies provides new choices for sequencing of gene space of the wheat genome. The applications of flow-sorted chromosomes in wheat genome studies present some examples to analyze the complex genomes of cereals.

【题目】矮败小麦与矮败小麦育种技术
【中文关键词】矮杆;雄性不育;矮败小麦;育种技术
【英文关键词】Dwarf; Male-Sterile; Dwarf Male-Sterile Wheat; Breeding Technolongy
【中文摘要】矮败小麦是具有矮杆基因的太谷核不育小麦。在矮败小麦中,太谷核不育基因MS2与显性矮杆基因Rht10在4D染色体短壁上连锁十分紧密,交换率仅有0.18%。矮败小麦后代群体中有一半是靠异交结实的矮杆不育株,一半是靠自交结实的非矮杆可育株,是理想的遗传改良工具。经过多年的研究实践,笔者建立了简单有效的矮败小麦育种技术体系,包括基础群体的组建,花粉源的选择与控制,矮杆不育株分期多次选择和互交重组等技术环节。利用该技术使矮败小麦轮选群体得到显著改良,从中选育出轮选987、轮选518等国审小麦新品种。
【英文摘要】Dwarf Male-Sterile Wheat (DS wheat) is a genetic material called AiBai which linked Ms2, the Taigu genic male-sterile gene, with Rht10 dwarfing gene tightly on the same chromosome 4DS with 0.18 crossing-over unit. This provides a genetic marker for male sterility. The progeny of DS wheat alwalys segregates into 1:1 for male-sterile plants with dwarfing gene Rht10 and male-fertile plants without dwarfing gene Rht10. So the male-sterile plants are shorter than the male-fertile plants, it is easy to identify male sterilety plants based on the plants height. Dwarf male-sterile wheat is a favorable tool for wheat breeding in recurrent seletion. Using dwarf male-sterile wheat, we hace created a simple, effective and practical merhod and technology in recurrent seletion called DS wheat breeding system. The new DS technical system construction of basic population,choice of male parent, selection of male-sterile plant and intercrossing. For more than a decade, now the characteristics of improved population, such as yield, quality, resistance and plant-type have been increased more rapidly. New cultivar RS987 and a series of new lines have been released in recent year. Dwarf male-sterile wheat and its breeding technical system is an effective technology platform for wheat breeding in different ecology areas.

【题目】30 余年来北部冬麦区小麦品种产量改良遗传进展
【中文关键词】普通小麦; 产量潜力; 农艺性状; 矮秆基因; 1BP1R 易位系
【英文关键词】Bread wheat; Yield potent ial; Agronomic trait; Dwarfing gene; 1BP1R translocation
【中文摘要】采用1965 年以来北部冬麦区育成的10 个主栽品种, 在水、肥供应充足、病、虫、倒伏得到有效控制条件下, 连续两年共进行4 个点次试验; 同时对1BP1R 易位系和矮秆基因进行分子鉴定。结果表明, 品种产量年遗传进展为64163 kghm- 2 或1120%, 其较大幅度的提高出现在1980 年丰抗号品种育成时期。丰抗2 号和丰抗8 号是该地区最早育成的含有1BP1R 染色体和Rht-D1b 矮秆基因的品种。主要农艺性状演变的总趋势是抽穗期提前、株高显著降低、生物学产量基本保持稳定、单位面积穗数减少、每穗粒数有所增加、千粒重和收获指数大幅度提高, 其年遗传进展分别为- 0110%、- 0170%、0135%、- 01 50%、0163%、1112%和0179%。通过减少不孕小穗和小花数来增加每穗粒数, 通过提高灌浆速率来提高千粒重, 再把高穗粒重与较多的单位面积穗数结合在一起, 是北部冬麦区进一步提高产量的重要途径。
【英文摘要】Knowledge on genetic gain of yield potent ial and its associated traits is essent ial for understanding yield-limiting factors and developing strategies for future variety improvement1 Yield potential trials, comprised of 10 landmark and newly released wheat cultivars (Triticum aestivum L1) from Beijing, were conducted, using a complete randomised block designwith three replicates, under controlled environment during 2001- 2002 and 2002- 2003 seasons1 Molecular markers were used to detect the presence of dwarfing genes and the 1BP1R translocation1 The result showed that genetic gain in yield was 64163 kg ha- 1 year- 1 or 1120% per year1 The breakthrough on yield plateau occurred at the period of release of Fengkang cultivars in 19801 Fengkang 2 and Fengkang 8 were the first cultivars carrying 1BP1R and Rht-D1b released in Beijing1 Yield genetic gain was slowed down after 19801 Newly released cultivars were characterized by early heading, reduced plantheight, decrease of spikes per square meter, slight increase of kernels per spike, remarkable increase of thousand kernel weight and harvest index, with annual genetic gains of - 0110%, - 0170%, 0135%, - 0150%, 0163%, 1112%, and 0179%, respectively1 Increasing the number of kernels per spike by reducing the number of sterile spikelets per spike and reducing the number of sterile florets per spikelet, increasing thousand kernel weight by increasing the rate of grain filling, then combining greater weight of grains per spike with higher number of spikes per squire meter, is one of the best approaches in breeding for further yield increase1.

【题目】黄淮冬麦区小麦冬、春性改良及分子标记辅助选择技术初探
【中文关键词】小麦育种; 春化基因; 分子标记
【英文关键词】Wheat breeding; Vernalization gene; Molecular marker
【中文摘要】通过对小麦品种石麦12 春化特性的遗传和分子标记研究, 探索黄淮冬麦区小麦冬、春性改良途径和分子标记辅助选择技术。石麦12 与冬性品种石家庄8 号杂交后代F2:3 株系中的春性株系、冬春性分离株系、冬性株系的分离比例符合1∶2∶1, 表明石麦12 具有一个显性春化基因, 经已知春化基因的基因特异性标记鉴定为Vrn-D1。利用Vrn-D1 的基因特异性标记对上述F2:3 株系进行冬、春性鉴定的结果与表型鉴定结果一致, 说明该分子标记可用于小麦冬、春性改良中对Vrn-D1 的辅助选择。在高海拔、长日照地区夏播是小麦冬、春性表型鉴定的一个快速、简便途径。

【英文摘要】The vernalizatioin gene in wheat cultivar Shimai 12 (Triticum aestivum L.) was investigated to find a more efficient way for the improvement of growth habit of wheat cultivars grown in Yellow and Huai River Reaches. In the F2:3 lines derived from the cross between Shimai 12 and Shijiazhuang 8 (a winter wheat cultivar), the ratio of the spring, segregating, and winter lines was in accordance to 1:2:1 based on chi-square test, showing that the spring growth habit of Shimai 12 was determined by single dominant gene, which was identified as Vrn-D1 by gene-specific markers. The Vrn-D1 gene-specific marker was further used to genotype the F2:3 lines, and the results were consistent with phenotyping, verifying the available utilization of the marker assisted selection for Vrn-D1 in breeding programs. Besides, summer sowing in high altitude and cool area proved to be a cost-saving and efficient method for wheat growth habit identification.

【题目】中国88个马铃薯审定品种SSR 指纹图谱构建与遗传多样性分析.
【中文关键词】马铃薯; 审定品种; SSR 标记; DNA 指纹图谱; 遗传多样性
【英文关键词】Potato; Approved cultivars; SSR markers; DNA fingerprinting; Genetic diversity
【中文摘要】为对马铃薯品种鉴别、优良杂交组合选配提供分子水平上的依据, 利用SSR 标记构建了中国2000—2007 年审定的88 个马铃薯品种的指纹图谱并进行了遗传多样性分析。以138 对SSR 引物对16 份遗传差异较大的马铃薯材料的基因组DNA 进行了扩增, 筛选出10 对多态性高、谱带清晰的引物。利用10 对SSR 引物对全部供试材料进行扩增及电泳检测, 共检测到135 个等位位点, 其中133 个为多态性位点, 多态性比率达98.52%。每对SSR 引物扩增出的等位位点数7~22 个, 平均13.5 个, 多态性信息量变化范围为0.7604~0.9375, 平均0.8501。通过对电泳检测结果的统计分析, 利用S180、S25、S7、S151、S184 及S192 共6 对引物构建了88 份供试材料的SSR 指纹图谱。聚类分析表明, 在相似系数0.620 处, 所有供试材料被被聚为一类, 在相似系数0.652 处, 81.8%的材料仍然聚在一起, 从分子水平上表明供试材料遗传基础非常狭窄。聚类分析结果与供试材料系谱来源有较好一致性, 同一栽培区域育成的品种在不同程度上聚在一类。
【英文摘要】Potato (Solanum tuberosum L.) is one of the most important food crops in the world. Approved potato cultivars have contributed a lot not only to potato production but also to varietal improvement as germplasm resource, and about 110 potato cultivars were approved during 2000 – 2007 in China. It is necessary to make potato cultivar identification and genetic relationship analysis for seed production, germplasm management, plant variety protection, and breeding practice. Currently, the simple sequence repeats (SSRs) are preferred as molecular markers due to their highly desirable properties. In this study, for the purpose of cultivar identification and parents combination at the molecular level, SSR markers were employed to analysis on fingerprinting and genetic diversity of 88 potato cultivars approved in China during 2000 – 2007. Ten of 138 pairs of SSR primers were screened out based on 16 accessions distinct in genetics. The 10 primer pairs amplified a total of 135 alleles (including 133 polymorphic alleles) among the 88 cultivars, and the ratio of polymorphism was as high as 98.52%. Alleles amplified by each pair of primers ranged from 7 (primer S7) to 22 (primer S189), with a mean of 13.5. The polymorphic information content values (PIC) ranged from 0.7604 (primer S192) to 0.9375 (primer S189), with a mean of 0.8501. The fragment size varied from 80 to 380 bp. The fingerprinting of 88 cultivars was constructed by 6 pairs of primers of S180, S25, S7, S151, S184, and S192. Eighty-seven out of 88 cultivars were univocally identified using only five SSR primers (S180, S25, S7, S151, and S184). UPGMA cluster analysis of genetic similarity showed that all the materials were clustered in to one group at the genetic similarity of 0.620, and 81.8% of the cultivars were still clustered together at the genetic similarity of 0.652. The

genetic relationships of cultivars were identical to the family tree basically. It is indicated that the genetic basis of potato cultivars in China is narrow, and the genetic relationship of the potato cultivars derived from the same district is similar. The fingerprinting and analysis of genetic diversity in this study give a basis for exploration and utilization of approved potato cultivars as germplasm resources.

【题目】一个结球甘蓝D H群体主要农艺性状的遗传效应分析
【中文关键词】结球甘蓝;DH群体;农艺性状;主基因+多基因;遗传分析
【英文关键词】Brassica oleracea var. capitata; DH population; agronomy trait; mixed major gene and polygene genetic model; inheritance analysis
【中文摘要】摘 要:采用游离小饱子培养方法,构建了一个甘蓝F1(624×24-5) 的DH群体,利用该D H群体重复试验数据建立了结球甘蓝主要农艺性状的数量性状主基因+多基因混合遗传模型,分析了结球甘蓝8个主要农艺性状的遗传效应。结果表明,除开展度没有主基因只有多基因存在外,其余7个性状均符合2对主基因+多基因遗传模型。其中,数量性状主基因的遗传率中最 高的是最大外叶柄长,为90.4%,最大外叶宽次之,为67.2%;外短缩茎长和中心柱长的主基因遗传率较高,分别为58.62 % 和56.0 0 %;叶球高主基因遗传率最 低,为20.30%,其次为最大外叶长和株高,分别为23.犯%和31.74%;多基因遗传率中最高的是叶球高度,为49.80%;开展度环境效应方差 占总表现型方差的81.35 %,受环境影响最大,而外叶柄长的环境效应方差只占总表现型方差的9.56%,受环境影响最小。
【英文摘要】Abstract: The segregation analysis method of identifying mixed major genes and polygenes by using a doubled haploid (DH) population derived from F1 microspore culture of a cross between 624 and 24-5 was conducted to study the inheritances of the 8 agronomic traits in cabbage. Except the plant spreading showed a modle of polygenes, the other inheritances of the 7 traits showed the models of two major genes plus polygenes. The largest petiole length had the highest heritability of major genes of 90.44%, the heritability of the largest leaves width was 67.22%, basic stem length and core length had a lower heritability of major genes of 58.62% and 56.00%, head height had the lowest heritability of major gene of 20.30%, the next are the largest leave length and plant height of 23.32% and 31.74%, respectively. Head height had the highest heritability of polygenes of 49.80%. The influence of environment on trait of the plant spreading was the best, the environmental variance was 81.35% of phenotype variance. The influence of environment on trait of the petiole length was the least, the environmental variance was 9.56% of phenotypic variance.

【题目】甘蓝 EST-SSR 标记的开发与应用
【中文关键词】甘蓝;EST-SSR;标记开发;指纹图谱
【英文关键词】cabbage;EST-SSR;marker development;fingerprinting
【中文摘要】摘 要:从 NCBI 数据库下载 62 567 条甘蓝相关 EST,处理后得到19 611 条无冗余的EST,对其进行SSR搜索,共得到 1 219 条 SSR,分布在 1 176 条 EST 上,分布密度为 1/11.48 kb,包括 273 种重复基元。在甘蓝EST-SSR中,二核苷酸(353个SSR)和三核苷酸(423个SSR)占主导地位,所占比例分别为28.96%和34.70%;出现最多的重复基元是 AG/CT,占总数的25.59%,其次为 AAG/CTT(94 个,占 7.71%)。针对 1176 条含有 SSR 的 EST 设计合成了 978 对引物。用两份甘蓝自交系对 978 对引物进行初筛,897 对引物有扩增产物,共扩增出 1 026 条扩增带;128 对引物表现出多态性,共有 258 条多态性带(占总带数的 25.15%)。利用 4对多态性引物,初步构建了中甘 11、8398、中甘 15、中甘 21 杂交新品种及其亲本的指纹图谱。以上结

果说明从甘蓝相关 EST 数据库中开发的 SSR 引物有较好的可用性。
【英文摘要】Abstract:A total of 62567 ESTs in Brassica oleracea were downloaded from NCBI for the identification and development of SSR marker. In total, 1219 SSRs distributed in 1 176 ESTs were identified from 19611 non-redundant ESTs, with an average of one SSR per 11.48 kb, and included 273 SSR motifs.Analysis of SSR motifs revealed that the dinucleotides (353 SSR) and tricleotides (423 SSR) were major motifs, accounted for 28.96% and 34.70% respectively. The AG/CT was the most frequent motifs and accounted for 25.59%,followed by AAG/CTT (94 SSR,7.71%). Based on the 1176 SSR-containing ESTs, a total of 978 primer pairs were successfully designed and assessed validation of the amplification using two cabbage inbreed lines (397 and 20-2-5). The results showed that 897 primer pairs yielded 1026 amplification bands, of which 128 primer pairs exhibited polymorphism with 258 polymorphic bands accounted for 25.15%. SSR fingerprint was obtained for 4 cabbage F1, Zhonggan 11, 8398, Zhonggan 15 and Zhonggan 21, and their parents,and all the above materials could be discriminated by four specific EST-SSR primer pairs. The results indicated that the developed SSRs from ESTs of Brassica oleracea were validate and practicable.

【题目】结球甘蓝自交系抽薹与开花性状配合力及遗传力分析
【中文关键词】结球甘蓝; 抽薹期; 开花期; 配合力; 遗传力
【英文关键词】Cabbage; Bolting;Flowering; Combining ability;Heritability
【中文摘要】摘 要: 对 6 个甘蓝自交系的抽薹期与开花期性状配合力进行分析, 并估算其遗传参数, 为筛选时耐期抽薹品种提供理论依据。采用 Griffing 完全双列杂交方法四对 6 个结球甘蓝优良自交系的抽薹期和开花期性状进行配合力和遗传力分析。结果表明: 自交系 05521-2 和 04M9-2的一般配合力均较好, 具有作为耐抽薹亲本材料的潜力; 抽薹期性状的广义遗传力和狭义遗传力分别为 92.6% 和 50.04%; 开花期性状的广义遗传力和狭义遗传力分别为 92.09%和67.28%, 抽薹期和开花期性状主要受加性效应基因控制, 在早世代着手对结球甘蓝的抽薹期和开花期性状的选择是有效的。
【英文摘要】Abstract: Combining ability and heritability of bolting and flowering characters of six fine cabbage inbred lines were analyzed using Griffing diallel cross.The results showed that: the general combining ability of inbred lines 05521-2 and 04M9-2 were better,with as bolting?resistant potential parental materials; the broad sense heritability and narrow sense heritability of bolting and flowering characters were 92.6%, 50.04% and 92.09%, 67.28% respectively, and mainly affected by additive genes. So,the selection of bolting and flowering characters in cabbage were effective in early generations.

【题目】结球甘蓝和青花菜小孢子胚植株再生
【中文关键词】结球甘蓝, 青花菜, 子叶胚, 游离小孢子培养, 植株再生
【英文关键词】Brassica oleracea var. capitata, Brassica oleracea var. italica, cotyledonary embryos, isolated-microspore culture, plant regeneration
【中文摘要】摘 要: 结球甘蓝(Brassica oleracea var. capitata)和青花菜(Brassica oleracea var. italica)小孢子胚再生植株频率低是目前影响游离小孢子培养技术有效应用的关键问题之一, 研究其小孢子胚植株再生频率的影响因素, 提高胚再生植株频率, 对促进游离小孢子培养技术在甘蓝类蔬菜育种中更好地应用具有重要意义。该文以结球甘蓝中甘11和青花菜TI-111等基因型为试材, 对影响游离小孢子胚再生成植株的固体培养基类型、琼脂浓度、胚的类型及胚在液体培养基中的滞留时间

等因素进行了研究。结果表明: 游离小孢子培养25天的子叶胚在琼脂浓度为1% – 1.25%的B5培养基上植株再生频率最高。进一步通过8个不同基因型对上述实验结果进行了验证, 结果显示, 游离小孢子培养25天的子叶胚在1%琼脂浓度的B5培养基上植株再生频率达77.8% – 97.2%。

【英文摘要】Abstract : The application of microspore culture still produces low frequency of plant regeneration from microspore-derived embryos in many cabbage and broccoli genotypes. To improve the frequency of plant regeneration, we studied the effect of medium, agar concentration, embryoid type and days of culture of microspores on plant regeneration in hybrid F1 generations of a cabbage, ‘ Zhonggan 11 ’, and a broccoli, ‘ TI-111 ’. B5 medium with 1% – 1.25% agar was optimal for germination and regeneration of embryos, and the frequency of plant regeneration from cotyledonary embryos was significantly higher than that from other embryos, especially cotyledonary embryos from the 25-day-cultured microspores. The frequency of plant regeneration for cotyledonary embryos from 25-day-cultured microspores in 8 cultivars of cabbage and broccoli transferred to B5 medium with 1% agar ranged from 77.8% to 97.2%.

【题目】甘蓝显性雄性不育材料 DGMS79-399-3不育性的遗传效应分析

【中文关键词】甘蓝; 显性雄性不育性; 遗传效应

【英文关键词】Cabbage; The dom inant geneticmale sterility; Genetic effect

【中文摘要】摘 要: 采用两种不同的遗传分析模型, 研究了甘蓝显性雄性不育材料 DGM S79-399-3不育性的遗传效应。结果表明, 运用 Griffing II的方法进行遗传效应的分析, 就不育度而言, 加性作用的方差占总的遗传方差为21.89%, 而显性作用的方差为 78.11%; 广义遗传力为 97.22%, 狭义遗传力为 21.23%。配合力的比较结果表明,5个不育亲本中,523-16的一般配合力最高, 达 3.17; 特殊配合力最高的组合是606-7×102, 达 10.42。用 6个世代联合分析的方法进行遗传规律的研究, 结果表明, 影响甘蓝显性雄性不育材料育性的最适遗传模型为一对加性 - 显性主基因 + 加性 - 显性 - 上位性多基因模型 (D 模型),主基因的遗传率为 82.03% ~ 94.12%, 微效基因的遗传率为 0.14% ~ 10.94%, 两种遗传分析模型研究结果均表明: 主基因的显性作用在不育性表达中占主导地位, 但主基因的加性作用以及微效基因的影响也不可忽视。

【英文摘要】Abstract: Genetic effect of the dom inant genicmale sterilematerialDGMS79-399-3 in cabbage (Brassica oleracea var. capitata L.) was studiedw ith two different genetic analysismodels. The principle of genetics was studiedw ith themethod of Griffing II, and the result showed that the variance of additive effect in the total genetic variance was only 21.89% , but the dom inant variance was 78.11%. The value of the broad heritability was 97.22% , but the value of narrow heritability was only 21.23%. The result of comparison of combining ability, in the fivemale sterile parents, the highest general combining ability of P1 from 523-16 was 3.17, but the highest special combining ability from the combination of 606-7×102was10.42. The principle of geneticswas studiedw ith joint analysis of six generations and the result indicated that the best fitted genetic model affecting fertile characteristics of the dom inant geneticm ale sterility in cabbage was one major additive-dominant gene plus additive-dom inan-t epistatic polygenes (D model), the heritability of major gene was 80.03% - 94.12%, and the heritability of polygeneswas 0.14% - 10.94% . Them ajor dom inant gene had an important effec,t however, the additive effect ofmajor gene and the polygenes effect should be also valued.

【题目】甘蓝类蔬菜小孢子再生植株染色体倍性与气孔保卫细胞叶绿体数的相关性
【中文关键词】甘蓝;青花菜;芥蓝;气孔保卫细胞;叶绿体数;倍性鉴定
【英文关键词】Brassica oleracea var. capitata; Brassica oleracea var. italica; Brassica alboglabra Bailey; stomatal guard cells; chloroplast number; identification of ploidy
【中文摘要】摘 要:【目的】研究甘蓝类蔬菜游离小孢子再生植株的染色体倍性与气孔保卫细胞叶绿体数的相关性,为甘蓝类蔬菜提供一种快速、简易、经济、实用而又可靠的倍性鉴定方法。【方法】采用分布型分析和 t测验,对结球甘蓝、青花菜和芥蓝不同倍性的小孢子再生植株的气孔保卫细胞叶绿体数进行统计分析。以根尖染色体计数法和田间形态学观察法的倍性鉴定结果,对叶绿体数分界法的可靠性进行验证。【结果】同一倍性植株上的不同叶片间及同一叶片的不同部位间,气孔保卫细胞叶绿体数平均值及变异幅度非常接近。同一小孢子再生植株群体内的不同倍性植株的叶绿体数平均值差异极显著。不同倍性植株间的气孔保卫细胞叶绿体数均呈正态分布。本研究提出了一种根据甘蓝类蔬菜气孔保卫细胞叶绿体数进行染色体倍性鉴定的方法,即气孔保卫细胞叶绿体数≤10 的为单倍体,10<叶绿体数≤15 的为二倍体,>15 的为多倍体。该方法经花期形态学观察和根尖染色体计数法验证,其吻合率达93.93%,且此倍性鉴定方法稳定,不受植株生长环境等外界因素影响。【结论】甘蓝类蔬菜游离小孢子再生植株的染色体倍性,可于幼苗期根据气孔叶绿体数目的多少进行鉴定,而且此倍性鉴定方法简单、快捷、经济而又可靠。
【英文摘要】Abstract: 【Objective】 The relationship between the ploidy level of microspore-derived plants and chloroplast number in stomatal guard cells was studied in cabbage, broccoli and Chinese kale. 【Method】 Distribution statistics analysis and t-test were used to perform statistical analysis on chloroplast number of different ploidy levels in those stomatal guard cells mentioned above, and morphology identifying and chromosome counting were used to test accuracy of counting chloroplast number in stomatal guard cells. 【Result】 The chloroplast average number in stomatal guard cells was very similar among the different leaf positions on the same plant and among the different locations in the same leaf, while the chloroplast number varied significantly among the different ploidy stoma in the same variety. All the distributions of the chloroplast number in different ploidy stoma were normal distribution fitted. A correlation has been established between ploidy and chloroplast number in the stomatal guard cells. In every single stoma of microspore-derived plants, the chloroplast number for a haploid should not be more than 10, that for diploids should be 11 to 15, and polyploids should be more than 15. The accuracy of this method for identification of different ploidy plants was 93.93%. Further more, the accuracy of this method was reliable and did not vary with the plants growth conditions. 【Conclusion】 Therefore, the chromosome ploidy of plants derived from microspore culture in cabbage, broccoli and Chinese kale can be identified by simply counting the chloroplast number in stomatal guard cells.

【题目】甘蓝结球过程中内源激素含量与裂球性的关系
【中文关键词】结球甘蓝 ; 裂球性 ; 内源激素
【英文关键词】B rassica oleraca L. var. capitata L.; Head-splitting character; Endogenous hormone
【中文摘要】摘 要: 以 4份耐裂球性不同的甘蓝高代自交系为试验材料 , 采用间接酶联免疫(EL ISA) 检测技术,对甘蓝结球过程中球叶中的生长素(IAA)、赤霉素(GA3) 、玉米素核苷(ZR) 和脱落酸(ABA) 4大类内源激素的含量和比值变化进行了分析 , 以探讨甘蓝裂球性与内源激素含量的关系。结果表明 : 在整个结球期 , 耐裂球材料各个时期的 IAA、GA3含量均高于易裂球材料。ZR含量对甘蓝的裂球性影响不大。ABA含量在 4种内源激素中含量值最大 , 而且耐裂球材料与易裂球材料间的动态差异较大。叶球生长后期(IAA + GA3+ ZR)/ABA比值高可使叶球保持较高的生长势头 , 从而承受内部生长应力的能力较大 , 减少叶球开裂。

【英文摘要】Abstract: This study was designed to elucidate the relationship between endogenous hormone contents and head-splitting character of Brassica oleraca L var. capitata L. Enzyme-linked immunosorbent assays (ELISA) was used to determine the contents of indoleacetic acid (IAA) , gibberellin (GA3) , cytokinin (ZR) and abscisic acid (ABA) and to analyze their ratio changes, so as to probe into the relation between head-splitting and endogenous hormone. These endogenous hormones were taken from head leaves of 4 Brassica oleraca L. var. capitata L. Cultivarswhich differ in splitting susceptibility during vegetative period. The results showed that during the whole vegetative period, the contents of IAA and GA3 in splitting-resistant cultivars were higher than those of splitting-susceptible cultivars. ZR content had less effect on head-splitting of Brassica oleraca L. var. capitata L. ABA contentwas the highest among the 4 endogenous hormones, and there were great dynam ic differences between splitting-resistant and splitting-susceptible cultivars. The high ratio of (IAA + GA3 + ZR) to ABA at the late stage could keep the B rassica oleraca L. var. capitata L. Head in a strong growing vigor, thus reduce the head-splitting probability.

【题目】Identification of specific molecular markers linked to the rustresistance gene M4 in flax
【中文关键词】亚麻; M4;标记
【英文关键词】Flax, M4 gene, marker
【中文摘要】摘 要:为了确定与亚麻锈病抗性基因M4紧密连锁的标记,本研究采用540对对NM4的近等基因系和Bison的回交亲本进行RAPD扩增。结果表明,引物OPA18在NM4近等基因系中扩增出特异条带(OPA18432),通过来源于Bison×NM4双亲获得的F2分离群体进行验证,发现标记OPA18432和M4基因紧密连锁,遗传连锁距离为2.1cM。对OPA18432进行测序设计了特异引物和M4的SCAR标记。不同的抗性材料扩增结果显示该标记与M4紧密连锁,该标记已经成功的应用于亚麻分子辅助选择育种。
【英文摘要】Abstract. To identify molecular markers linked to the flax rust-resistance gene M4, RAPD analysis of NM4 (a near-isogenic line containing the M4 gene) and the recurrent parent Bison was performed using 540 decamer primers. The primer OPA18 amplified a specific fragment, OPA18432, in the NM4 line. The OPA18432 marker was found to be closely linked to the M4 gene, with

a genetic distance of 2.1cM, through the analysis of the F2 segregating population derived from a cross of Bison×NM4. Based on the sequence of OPA18432, the specific PCR primers were designed and a SCAR marker for the M4 gene was developed.The amplification of different resistant germplasm proved that the marker is specific for the M4 gene.This marker has been used successfully in marker ssisted selection in the flax breeding program.

【题目】甘蓝细胞质雄性不育类型的分子鉴定
【中文关键词】甘蓝;细胞质雄性不育; orf 138 ; orf 224
【英文关键词】Cabbage (Brassica oleracea var. capitata L.) ; Cytoplasmic male sterility (CMS) ; orf 138 ; orf 224
【中文摘要】摘 要:为鉴定几种来源不同的甘蓝细胞质雄性不育材料的类型,获得与其不育性状相关的特异序列,基于同源序列的候选基因法,通过检索NCBI 核苷酸及蛋白质数据库获得orf138 和orf 224 开放阅读框序列,依据其保守序列设计2 对引物,对甘蓝的5 个不育系及其保持系进行PCR 扩增。orf138 引物在5 个甘蓝雄性不育系中均扩增出749 bp 的片段,同源性比对发现这5 个不育材料的特异片段与萝卜Ogu CMS 所具有的Oguorf 138 基因同源度达100% ,表明这几个来源不同的甘蓝细胞质不育材料同属萝卜细胞质不育类型。
【英文摘要】Abstract: In order to identify the cytoplasmic male sterile (CMS) types in cabbage and gain the sterility-related specific sequence ,the homology-based candidate gene method was used and the sequences of orf 138 and orf 224 genes were got by searching the nucleotide and protein databases of NCBI. Based on their conserved sequences ,two pair of primers were designed and the DNA amplification of 5 CMS lines of cabbage and their maintainer lines were carried out by PCR. The result indicated that a 749 bp specific fragment was produced in all the 5 CMS lines by amplification with the orf 138 primer . The sequencing and comparison showed that the specific fragment from the 5 CMS lines and the Ogu orf 138 of Ogu CMS in radish reached 100% in homology ,meaning the 5 cabbage CMS lines belong to CMS type of radish.

【中文关键词】甘蓝, SRAP, 遗传多样性, 聚类分析
【英文关键词】Cabbage (Brassica oleracea var. capitata L.), SRAP, Genetic diversity, Cluster analysis
【中文摘要】摘 要:本研究利用26 对SRAP 引物组合对46 份甘蓝材料的遗传多样性和亲缘关系进行了分析,以期为甘蓝亲本选配提供参考。结果表明这26 对引物共扩增出稳定清晰的条带439 条,其中多态性条带为227 条,多态性位点比率为51.7%。根据SRAP 扩增结果,应用NTSYSpc2.1 数据分析软件计算各品种间的遗传相似系数,结果表明这些材料间的遗传相似系数的变化范围是0.41~0.99。在相似性系数为0.568 的水平上,可将46 份甘蓝品种分为4 大类,除第4 类是形态特征明显有别于其它材料的抱子甘蓝外,其余3 类结球甘蓝的主要聚类依据是其开花时间依次间隔一个星期左右。
【英文摘要】Abstract: In this paper, we analyzed the genetic diversity and relationship among 46 cabbage germplasms by employing 26 SRAP primer combinations in order to provide reference for choice of parents for crossing in cabbage. The results showed that 439 amplified bands were obtained, among which 227 were polymorphic bands accounted for 51.7% polymorphism. The genetic similarity coefficients among these germplasm ranged from 0.41 to 0.99 by software NTSYSpc2.1 based on SRAP results. The 46 cabbage germplasm were divided into four groups on coefficient threshold of 0.568, among which three groups were clustered mainly according to flowering interval of about one week, while the fourth group consisted of brussel sprout and showed obvious differences from other germplasm in morphological characters.

【题目】甘蓝杂种优势育种技术及中甘系列新品种选育回顾与展望
【中文关键词】甘蓝;杂种优势;育种技术;品种选育
【英文关键词】Cabbage; Heterosis; Breeding technology; New variety development
【中文摘要】摘 要:回顾课题组成立近40年来,先后突破甘蓝自交不亲和系和雄性不育系两项共性关键技术,育成甘蓝新品种21个,累计推广约1亿亩。研究工作分为4个阶段:1970年至80年代初,以突破甘蓝杂种优势利用和自交不亲和系选育技术,培育丰产型甘蓝杂交种为主要目标;1983年至90年代初,以抗病抗逆育种为主要目标;90年代初至90年代末,以培育优质品种、突破雄性不育系选育技术为主要目标;90年代后期以来,以生物技术与常规技术相结合,实现甘蓝雄性不育系规模化制种,培育商品性好、品质优、耐裂球、耐贮运的品种为主要目标。总结了课题组的成功经验与存在的主要问题,提出课题组近期的主要方向任务。
【英文摘要】Abstract: Since the set up of cabbage research group nearly 40 years ago, two key technology breakthroughs of self-incompatible lines and male sterile line have been achieved, and 21 new cabbage varieties have been developed, which have been popularized in an area of about 6.7 million hectares totally. Research work was divided into four stages: from 1970 to the early 1980s, the breakthrough of Cabbage heterosis utilization and self-incompatible lines breeding technology, and the development of high-yield cabbage varieties were major objectives; from 1983 to the early 1990s, breeding varieties with disease resistance and stress resistance ware major objectives; from early 1990s to the late 1990s, the breeding of high-quality varieties, and the breakthrough of male sterile line breeding technology were major objectives; since the late 1990s, the combination of biotechnology and conventional technology, the accomplishment of large-scale seed production with cabbage male sterile lines, the development of varieties with good market

characters and quality, resistance to head splitting and storage & transportation were major objectives. The success experience and the main existing problems for the group were summarized. The major direction and task for the group recently also were discussed.

【题目】Molecular variation among Chinese and global germplasm in spring faba bean areas
【中文关键词】春蚕豆,遗传资源,AFLP技术,多样性,种群结构
【英文关键词】spring faba bean, genetic resources, AFLP, diversity, population structure
【中文摘要】A sample of 39 spring type faba bean landraces from four provinces in China, were compared in diversity with 136 spring accessions from the rest of the world, including Africa, Canada, Asia, Europe, and 41 breeding lines from ICARDA. These germplasm were characterized with 12 amplified fragment length polymorphism (AFLP) primer pairs. 244 unambiguous bands were detected, of which 236 were polymorphic, and four gene pool populations were identified. The spring faba bean accessions were broadly geographically associated in their genetic diversity, and ICARDA breeding lines were relatively narrow in genetic diversity. Chinese spring faba bean landraces differed to some extent from the rest of the world, with distribution in three of the four gene pool populations. The diversity levels of accession gene pool populations were measured and compared for relationship to geographic origin.

【题目】Molecular characterization of GmNHX2, a Na+/H+ antiporter gene homolog from soybean, and its heterologous expression to improve salt tolerance in Arabidopsis
【中文关键词】GmNHX2,Na+ / H +逆向转运蛋白,耐盐,大豆,离子平衡。
【英文关键词】GmNHX2, Na+/H+ antiporter, salt tolerance, soybean, ion homeostasis.
【中文摘要】Na+/H+ antiporters have been well documented to enhance plant salt tolerance by regulating cellular ion homeostasis. Here, a putative Na+/H+ antiporter gene homolog GmNHX2 from soybean was cloned and predicted to encode a protein of 534 amino acids with 10 putative transmembrane domains. GmNHX2 was expressed in all soybean plant tissues but enriched in roots and its expression was induced by NaCl and polyethylene glycol (PEG) treatments. GmNHX2 exhibits greater sequence similarity with LeNHX2 and AtNHX6 than that of AtNHX1 and AtSOS1. Although phylogenetic analysis clustered GmNHX2 with organellar (tonoplast and vesicles) antiporters, the GmNHX2-EGFP (enhanced green fluorescent protein) fusion protein was possibly localized in the plasma membrane or organelle membrane of transgenic plant cells. Furthermore, transgenic Arabidopsis plants expressing

GmNHX2 were more tolerant to high NaCl concentrations during germination and seedling stages when compared with wild-type plants. These results suggest that GmNHX2 is a membrane Na+/H+ antiporter and may function to regulate ion homeostasis under salt stress.

【题目】Overexpression of soybean Ubiquitin -conjugating enzyme gene GmUBC2 confers enhanced drought and salt tolerance through Modulating abiotic stress-responsive gene expression in Arabidopsis

【中文关键词】GmUBC2,泛素化,泛素化酶,耐盐及耐旱,大豆,胁迫应答基因
【英文关键词】GmUBC2, Ubiquitination, Ubiquitincongugating enzyme, Salt and drought tolerance, Soybean, Stress-responsive genes

【中文摘要】Previous studies have shown that ubiquitination plays important roles in plant abiotic stress responses. In the present study, the ubiquitin-conjugating enzyme gene GmUBC2, a homologue of yeast RAD6, was cloned from soybean and functionally characterized. GmUBC2 was expressed in all tissues in soybean and was up-regulated by drought and salt stress. Arabidopsis plants overexpressing GmUBC2 were more tolerant to salinity and drought stresses compared with the control plants. Through expression analyses of putative downstream genes in the transgenic plants, we found that the expression levels of two ion antiporter genes AtNHX1 and AtCLCa, a key gene involved in the biosynthesis of proline, AtP5CS, and the copper chaperone for superoxide dismutase gene AtCCS, were all increased significantly in the transgenic plants. These results suggest that GmUBC2 is involved in the regulation of ion homeostasis, osmolyte synthesis, and oxidative stress responses. Our results also suggest that modulation of the ubiquitination pathway could be an effective means of improving salt and drought tolerance in plants through genetic engineering.

【题目】Cloning and sequence diversity analysis of GmHs1Pro-1 in Chinese
【中文关键词】大豆,野生大豆,DNA序列多样性,GmHs1pro-1,大豆胞囊线虫病抗性,选择,瓶颈
【英文关键词】Glycine max, Glycine soja, DNA sequence diversity, GmHs1pro-1, Soybean cyst nematode, Resistance, Selection, Bottleneck
【中文摘要】Soybean cyst nematode (SCN) (Heterodera glycines Ichinohe) is the most important pathogen in soybean production worldwide and causes substantial yield losses. An apparent narrow genetic base of SCN resistance was observed in current elite soybean cultivars, and searching for novel SCN resistance genes as well as novel resistance sources rather than focusing on the two important genes rhg1 and Rhg4 has become another major objective in soybean research. In the present paper we report a 1,477 bp Hs1pro-1 homolog, named GmHs1pro-1. This gene was cloned from soybean variety Wenfeng 7 based on information for Hs1pro-1, a beet cyst nematode resistance gene in sugar beet. It has two domains, Hs1pro-1_N and Hs1pro-1_C, both of which are believed to confer resistance to nematodes. Of the 1,477 bp sequence in GmHs1pro-1, anopen readingframe of 1,314 bp, encoding a protein with 437 amino acids, was flankedby a 50-untranslated region of 27 bp and a 30- untranslated region of 135 bp. Fourteen single-nucleotide polymorphisms (SNPs) were observed in 44 soybean accessions including 23 wild soybeans, 8 landraces, and 13 soybean varieties (or lines), among which 5 in wild soybeans and 3 in landrace accessions were unique. Sequence diversity analysis on the 44 soybean accessions showed p = 0.00168 and h = 0.00218 for GmHs1pro-1; landraces had the highest diversity, followed by wild soybeans, with varieties (or lines) having the lowest. Although we did not detect a significant effect of selection on GmHs1pro-1 in the three populations, sequence diversity, unique SNPs, and phylogenetic analysis indicated a slight domestication bottleneck and an intensive selection bottleneck. High sequence diversity, more unique SNPs, and broader representation across the phylogenetic tree in wild soybeans and landraces indicated that wild collections and landrace accessions are invaluable germplasm for broadening the genetic base of elite soybean varieties resistant to SCN.

【题目】十五”大豆创新种质和1963-1995年间育成品种的SSR遗传结构及遗传多样性分析
【中文关键词】创新种质;育成品种;SSR标记;遗传结构;遗传多样性
【英文关键词】New enhanced germplasms;Released cultivar;SSR marker;Genetic structure;Genetic diversity
【中文摘要】对22份“十五”攻关培育的创新种质和22份大豆育成品种进行了24个SSR标记的分析比较,目的是在分子水平上阐明创新种质的遗传结构特点,为拓宽我国大豆育成品种遗传基础及亲本选择提供理论依据。本研究在24个SSR位点共检测出231个等位变异,其中15.8%(36个等位变异)为创新种质所特有,特别是在与大豆胞囊线虫紧密连锁的Satt309位点上验证了一个我国独有的等位变异。结合UPGMA和Model-based聚类结果,将创新种质和育成品种分为4组,第1组由13份来自东北和山西的创新种质组成;第Ⅱ组由8份来自东北的育成品种组成;第Ⅲ组由8份来自黄淮海 和南方的大豆种质组成,其中创新种质和育成品种各为4份;第Ⅳ组由4份育成品种组成,分别来自吉林、黑龙江、河南和山西。遗传多样性分析结果表明,利用国外种质和野生大豆创造的创新种质丰富了东北地区育成品种的遗传多样性。因此,应加强利用国外种质、我国栽培大豆地方品种和野生大豆等优异资源,在创造优异大豆新种质的同时,拓宽我国大豆的遗传基础。
【英文摘要】To clarify the patterns of genetic structure,22 relased modern cultivars and 22 new enhanced germplasms were analyzed with 24 SSR markers.Among the total of 23 1 alleles,36 unique alleles were found only in new enhanced germplasms.At Satt309 locus,which closely linked with soybean cyst nematode resistance,an allele,which only was found in Chinese soybean landrace was confirmed.Combining the results obtained by using UPGMA method and model— based method.four distinct clusters were discovered.Cluster 1 was comprised of 13 new enhanced germplasms from Northeast region and Shanxi province.Cluster Ⅱ included 8 released cultivars from Northern east region.ClusterⅢ consisted of 4 neW enhanced germplasms and 4 released cultivars from Huanghuaihai and Southern region.Cluster IV contained 4 relased cultivars from Jilin,Heilongjiang,Shanxi and Henan provinces.The results of genetic diversity analysis showed that the new enhanced germplasms,which utilized foreign germplasms and wild species as parent,broadened the genetic base of released cultivars in northeast region.

【题目】基于大豆胞囊线虫抗病性候选基因的SNP位点遗传变异分析
【中文关键词】栽培大豆; 野生大豆; SNP 标记; 遗传变异
【英文关键词】Glycine max; Glycine soja; SNP marker; genetic variation
【中文摘要】以我国363 份栽培和野生大豆资源为材料, 对大豆胞囊线虫抗性候选基因(rhg1 和Rhg4)的SNP 位点(8个)进行遗传变异分析, 以期阐明野生和栽培大豆间遗传多样性及连锁不平衡水平差异。结果表明, 与野生大豆相比, 代表我国栽培大豆总体资源多样性的微核心种质及其补充材料的连锁不平衡水平较高(R2 值为0.216)。在栽培大豆群体内, 基因内和基因间分别有100%和16.6%的SNP 位点对连锁不平衡显著, 形成两个基因特异的连锁不平衡区间(Block)。在所有供试材料中共检测到单倍型46 个, 野生大豆的单倍型数目(27)少于栽培大豆(31), 但单倍型多样性(0.916)稍高于栽培大豆(0.816)。单倍型大多数(67.4%)为群体所特有(31 个), 其中15 个为野生大豆特有单倍型。野生大豆的两个主要优势单倍型(Hap_10 和Hap_11)在栽培大豆中的发生频率也明显下降, 推测野生大豆向栽培大豆进化过程中, 一方面形成了新的单倍型, 另一方面因为瓶颈效应部分单倍型的频率降低甚至消失。
【英文摘要】For clarifying the difference of genetic diversity and linkage disequilibrium (LD) level between cultivated (Glycine max (L.) Merr.) and annual wild soybean (Glycine soja Sieb. & Zucc.), genetic variation pattern of 8 SNP loci developed from soybean cyst nematode resistance candidate genes rhg1 and Rhg4 in soybean germplasm were analyzed. The results indicated that G. max population, consisted of cultivated soybean mini-core collection and modern cultivars, had a higher LD levels (R2 value is 0.216) than G. soja population. Since 100% of pairwise loci within a gene and 16.6% of pairwise loci between genes were significant in G. max population, two specific LD regions were formed for each gene. A total of 46 haplotypes were detected in 363 soybean germplasm. The population of G. soja had less number of haplotypes and higher haplotype diversity than the population of G. max. Among the 31 population-specific haplotypes, 15 haplotypes were specific for G. soja population. In addition, the frequency of two major predominant haplotypes (Hap_10 and Hap_11) in G. soja population was obviously decreased in G. max population, which might indicate that some new haplotypes were formed and some old haplotypes were lost during the G. max domesticated from G. soja.

【题目】中品95-5117抗大豆花叶病毒基因源分析
【中文关键词】大豆; 中品95-5117; 系谱; SMV
【英文关键词】Soybean; ICGR95-5117; Pedigree; SMV
【中文摘要】中品95-5117 和中品95-5383 是以中品661 为亲本选育的抗东北花叶病毒病3 号株系(SMV3)的大豆新品系。中品95-5383 抗病基因的SCAR 标记已被定位于大豆F 连锁群(Chr.13), 与抗病基因Rsv1 紧密连锁。利用大豆F 连锁群的34 个对SSR 标记引物及与抗病基因紧密连锁的SCAR 标记SCN11 及Rsv1 候选基因标记Rsv1-f/r, 对中品95-5117 系谱亲本进行检测, 结合对SMV3 的抗性鉴定结果进行分析, 旨在明确抗SMV3 基因在系谱中的传递规律,为利用分子标记辅助选择培育抗SMV3 新品种提供依据。通过SSR 标记分析发现, 中品95-5117 和中品95-5383 与亲本中品661 的相似性最高, 而与另外一个亲本鲁豆4 号关系较远。SCAR 标记SCN11 检测表明, 只有1 份材料Mangnolid(F-53)B 为感病基因型。系谱的Rsv1-f/r 标记分析表明, Williams 82 是中品95-5117 中Rsv1 基因的供体亲本。抗病性鉴定发现鲁豆4 号高抗SMV3, 但它并不携带Rsv1 基因。据上述结果推测中品95-5117 中不仅含有Rsv1,还具有来自鲁豆4 号的抗病基因, 证明该品系比其亲本中品661 具有对SMV3 更强的抗性。
【英文摘要】Soybean mosaic virus (SMV) is a prevalent viral pathogen of soybean. The soybean mosaic virus N3 (SMV3) is the most toxic strain in northeast China. Soybean lines ICGR95-5117 and ICGR95-5383 with high resistance to SMV3, which were all derived from ICGR661, are recently released from Chinese Academy of Agricultural Sciences. Several genes resistant to soybean mosaic virus have been identified and mapped on different soybean linkage groups by molecular markers. The resistance gene in ICGR95-5383 has been mapped on soybean linkage group F near Rsv1 gene. A dominant marker developed from the candidate gene of Rsv1 has been reported recently. The purpose of this research was to find the origin of the SMV3 resistance gene in ICGR95-5117 and the relationship of this resistance gene with Rsv1 by analyzing the pedigree. Thirty four SSR markers selected from linkage group F and two markers, SCAR marker (SCN11) tightly linked with resistance gene in ICGR95-5383 and Rsv1-f/r makers co-segregated with resistance gene Rsv1, were used to detect the materials in pedigree of ICGR95-5117. The similarity coefficient of the two lines between ICGR95-5117, ICGR95-5383 and ICGR661 was the highest. All the material except for Mangnolid(F-53)B had SMV3 resistance allele at locus SCN11. Williams 82 and ICGR661 had the same allelic variation at Rsv1-f/r locus with ICGR95-5117, revealing that the Rsv1 gene in ICGR95-5117 was inherited from Williams 82 via ICGR661. But ICGR95-5117 had higher resistance than ICGR661, indicating it might inherit different genes from SMV3 resistance parent Ludou4.

【题目】Reduction of Bacillus thuringiensis Cry1Ac toxicity against Helicoverpa armigera by a soluble toxin-binding cadherin fragment
【中文关键词】Bacillus thuringiensis; Cadherin; Cry0Ac toxin, Toxicity; Reduction
【英文关键词】Bacillus thuringiensis; Cadherin; Cry1Ac toxin, Toxicity; Reduction
【中文摘要】A cadherin-like protein has been identified as a putative receptor for Bacillus thuringiensis (Bt) Cry1Ac toxin in Helicoverpa armigera and plays a key role in Bt insecticidal action. In this study, we produced a fragment from this H. armigera Cry1Ac toxin-binding cadherin that included the predicted toxin-binding region. Binding of Cry1Ac toxin to this cadherin fragment facilitated

the formation of a 250-kDa toxin oligomer. The cadherin fragment was evaluated for its effect on Cry1Ac toxin-binding and toxicity by ligand blotting, binding assays, and bioassays. The results of ligand blotting and binding assays revealed that the binding of Cry1Ac to H. armigera midgut epithelial cells was reduced under denaturing or native conditions in vitro. Bioassay results indicated that toxicities from Cry1Ac protoxin or activated toxin were reduced in vivo by the H. armigera cadherin fragment. The addition of the cadherin fragment had no effect on Cry2Ab toxicity.

【题目】Regulation of the seasonal population patterns of Helicoverpa armigera moths by Bt cotton planting

【中文关键词】Helicoverpa armigera - Population dynamics - Light trapping - Bt cotton
【英文关键词】Helicoverpa armigera - Population dynamics - Light trapping - Bt cotton

【中文摘要】Transgenic cotton expressing the Bacillus thuringiensis (Bt) Cry1Ac toxin has been commercially cultivated in China since 1997, and by 2000 Bt cotton had almost completely replaced non-transgenic cotton cultivars. To evaluate the impact of Bt cotton planting on the seasonal population patterns of cotton bollworm, Helicoverpa armigera, the dynamics of H. armigera moths were monitored with light traps from four locations (Xiajin, Linqing and Dingtao of Shandong Province; Guantao of Hebei Province) in high Bt density region and five locations (Anci and Xinji of Hebei Province; Dancheng and Fengqiu of Henan Province; Gaomi of Shandong Province) in low Bt density region from 1996 to 2008. A negative correlation was found between moth densities of H. armigera and the planting years of Bt cotton in both high and low Bt density areas. These data indicate that the moth population density of H. armigera was reduced with the introduction of Bt cotton in northern China. Three generations of moths occurred between early June and late September in the cotton regions. Interestingly, second-generation moths decreased and seemed to vanish in recent years in high Bt density region, but this tendency was not found in low Bt density region. The data suggest that the planting of Bt cotton in high Bt density region was effective in controlling the population density of second-generation moths. Furthermore, the seasonal change of moth patterns associated with Bt cotton planting may regulate the regional occurrence and population development of this migratory insect.

【英文摘要】Transgenic cotton expressing the Bacillus thuringiensis (Bt) Cry1Ac toxin has been commercially cultivated in China since 1997, and by 2000 Bt cotton had almost completely replaced non-transgenic cotton cultivars. To evaluate the impact of Bt cotton planting on the seasonal population patterns of cotton bollworm, Helicoverpa armigera, the dynamics of H. armigera moths were monitored with light traps from four locations (Xiajin, Linqing and Dingtao of Shandong Province; Guantao of Hebei Province) in high Bt density region and five locations (Anci and Xinji of Hebei Province; Dancheng and Fengqiu of Henan Province; Gaomi of Shandong Province) in low Bt density region from 1996 to 2008. A negative correlation was found between moth densities of H. armigera and the planting years of Bt cotton in both high and low Bt density areas. These data indicate that the moth population density of H. armigera was reduced with the introduction of Bt cotton in northern China. Three generations of moths occurred between early June and late September in the cotton regions. Interestingly, second-generation moths decreased and seemed to vanish in recent years in high Bt density region, but this tendency was not found in low Bt density region. The data suggest that the planting of Bt cotton in high Bt density region was effective in controlling the population density of second-generation moths. Furthermore, the seasonal change of moth patterns associated with Bt cotton planting may regulate the regional occurrence and population development of this migratory insect.

【题目】Oil-soluble dyes in larval diet used for marking Helicoverpa armigera
【中文关键词】cotton bollworm, marking dye, release-recapture, insect dispersal, Lepidoptera, Noctuidae
【英文关键词】cotton bollworm, marking dye, release-recapture, insect dispersal, Lepidoptera, Noctuidae
【中文摘要】The cotton bollworm,Helicoverpa armigera(H ü bner)(Lepidoptera: Noctuidae), is an important pest with a worldwide distribution (Fitt, 1989). Its dispersal ability and long-distance migratory flights play important roles in its widespread occurrence. In China, transgenic cotton producing an insecticidal protein of Bacillus thuringiensis(Bt) is a key means for control of this pest (Wu & Guo, 2005). Concern has arisen for the capability of H. armigera to develop resistance against transgenic cotton (Wu & Guo, 2005). To counter such resistance, a refuge strategy has been proposed and widely adopted (Bates et al., 2005). The dispersal and random mating of insects play a key role in the success of this strategy (Bates et al., 2005).Marking techniques are very helpful in studying insect dispersal and mating competition (Wu et al., 1995; Hagler & Jackson, 2001; Qureshi et al., 2004). Dye is an ideal marking material, because it is inexpensive, non-toxic,easily applied (Hagler & Jackson, 2001; Qureshi et al., 2004),and identifiable (Qureshi et al., 2004). Dyes dissolved in a vegetable oil, such as cottonseed or corn oil, and incorporated into the larval diet have been used to mark insects,especially Lepidoptera and Diptera, in sterile insect release programs, area-wide pest-management programs, and resistance-management programs (Steiner, 1965; Qureshi et al., 2004; Vilarinho et al., 2006). However, different dyes in different amounts show varying marking efficiencies and effects on the development of the same insect species,and the same dye can exhibit varying marking efficiencies and effects on the development of different insect species(Hendricks, 1971; Qureshi et al., 2004; Vilarinho et al.,2006). Therefore, to mark H. armigera using dye, the marking efficiency of dyes and their effects on this species should be investigated. The goals of this research were to investigate whether an internal marking technique could be used for H. armigera, by using two oil-soluble dyes,Sudan Red 7B (C.I. 26050) and Solvent Blue 35 (C.I. 61554),incorporated into its artificial diet.

【题目】Activities of digestive and detoxification enzymes in multiple generations of beet armyworm, Spodoptera exigua (H ü bner), in response to transgenic Bt cotton
【中文关键词】Spodoptera exigua - Transgenic Bt cotton - Ecological risk assessment - Multi-generation - Detoxification enzyme - Digestive enzyme
【英文关键词】Spodoptera exigua - Transgenic Bt cotton - Ecological risk assessment - Multi-generation - Detoxification enzyme - Digestive enzyme
【中文摘要】To reveal the multi-generation effects of transgenic Bt cotton on the metabolism of secondary target herbivores, the activities of digestive and detoxification enzymes in beet armyworm, Spodoptera exigua (H ü bner), fed with transgenic Bt (cv. GK-12) vs. non-Bt cotton (cv. Simian-3) for three successive generations were examined. Significantly lower activities of lipase, carboxylesterase (CarE) and acetylcholinesterase (AChE), and higher activities of trypsin and total superoxide dismutase (T-SOD) were observed in Bt-fed S. exigua than in non-Bt fed individuals during the three generations. But the activity of amylase did not differ between the Bt-fed and non-Bt fed S. exigua. Among the three generations of Bt-fed S. exigua, the activities of lipase and trypsin decreased significantly in the second or third generation than in the first generation. But those of CarE and AChE were increased significantly. Among the three generations of non-Bt fed S. exigua, the activity of lipase was significantly higher in the second and third generations than in the first generation. The increasing adaptation and fitness of S. exigua after continuous exposure to Bt cotton was supposed to be associated with the enhanced activities of detoxification enzymes. Measuring multi-generational enzymes activities of S. exigua in response to Bt cotton can provide proofs of its adaptation development, which is suggested to be a mandatory part of risk assessment of transgenic Bt plants on secondary target herbivores.

【题目】Altered mating behaviour in a Cry1Ac-resistant strain of Helicoverpa armigera (Lepidoptera: Noctuidae)
【中文关键词】Bacillus thuringiensis;Helicoverpa armigera;fitness cost;random mating;resistant
【英文关键词】Bacillus thuringiensis;Helicoverpa armigera;fitness cost;random mating;resistant
【中文摘要】Randomness of mating between susceptible and resistant individuals is a major factor that closely relates to the refuge strategy of resistance management for Helicoverpa armigera (H ü bner) to Bacillus thuringiensis cotton. The mating behaviour of Cry1Ac-susceptible and Cry1Ac-resistant strains of H. armigera was compared to investigate the randomness of their mating. The percentage of mating was lower for Cry1Ac-resistant H. armigera compared with that of the susceptible strain under both no-choice and multiple-choice conditions. The low percentage of mating in the resistant strain indicates a reduced incidence of successful mating.

The percentage of spermatophore-containing mated female H. armigera in the crossing of susceptible females × resistant males was significantly lower than in the crossing of resistant females × susceptible males, but the observed mating frequencies of these two types of cross were similar to each other. This indicates that resistant males reduce the incidence of mating paternity more than they do their mating frequency. The percentages of heterogametic matings (susceptible females × resistant males, resistant females × susceptible males) in the multiple-choice experiment were lower than those of homogametic matings (susceptible × susceptible, resistant × resistant) on peak mating nights. However, the difference between heterogametic and homogametic mating was not significant, indicating that there was a random mating between susceptible and resistant strains. The results presented here do not reflect reality in mating associated with Cry1Ac resistance but can provide insight into variable expression.

【题目】Biochemical and molecular characterizations of Sitobion avenae-induced wheat defense responses

【中文关键词】Sitobionavenae; Real-time quantitative PCR; Volatiles; Induceddefense pathway in wheat plant; Jasmonic acid; Salicylic acid

---

【英文关键词】Sitobionavenae; Real-time quantitative PCR; Volatiles; Induceddefense pathway in wheat plant; Jasmonic acid; Salicylic acid

---

【中文摘要】In this experiment, the aphid – wheat interaction system was chosen to study the changes in activity levels of key enzymes [lipoxygenase (LOX), polyphenoloxidase (PPO), phenylalanine ammonialyse (PAL) and β-1,3-glucanase] and in transcript level of key defense genes [encoding farnesyl pyrophosphate synthetase (fps), encoding allene oxide synthase (aos), and encoding phenylalanine ammonialyse (pal)] under pressure of aphid-feeding, aphid-induced volatiles, as well as specific volatiles using enzymes assay, RT-PCR and real-time quantitative PCR techniques. At the same time, the induction of enzymatic and transcript levels of defense genes with artificial wounding, wounding-induced volatiles and inductive chemical agents (jasmonic acid and methyl salicylate) were also studied. Our results showed that the activities of key enzymes which belong to both jasmonic acid (JA) and salicylic acid (SA)-signaling pathways increased significantly with aphid-feeding. The relative transcript levels of key defense genes in the signaling pathways were also enhanced. So we propose that aphid-feeding could activate both jasmonic acid (JA) and salicylic acid (SA)-signaling transduction pathways. Mechanical wounding and aphid-feeding are not equivalent. Sitobionavenae-induced volatiles elicit the transcript of all three defense genes in neighboring plants, suggesting that the volatiles emitted from aphid-infested plants might induce the activity of LOX followed by activating the JA-signaling pathway and the transcript level of multiple defense genes that JA

mediates. 6-Methyl-5-hepten-2-one, 2-tridecanone and (E)-2-hexen-1-ol in S. avenae-induced volatiles not only activated the transcript level of defense genes, but also inhibited aphid-feeding behavior and population growth.

【题目】Changes of inheritance mode and fitness in Helicoverpa armigera (Hubner) (Lepidoptera: Noctuidae) along with its resistance evolution to Cry1Ac toxin

【中文关键词】Helicoverpaarmigera; Bt resistance; Inheritance; Fitness

---

【英文关键词】Helicoverpaarmigera; Bt resistance; Inheritance; Fitness

---

【中文摘要】The changes of inheritancemode and fitness of resistance in Helicoverpaarmigera (Hübner) along with its resistance evolution to Cry1Ac toxin were evaluated in the laboratory. The resistance levels reached 170.0-, 209.6- and 2893.3-fold, on selection of the field population in the 16th (BtR-F16), 34th (BtR-F34) and 87th (BtR-F87) generation with artificial diet containing Cry1Ac toxin, respectively. As the resistance levels increased, more larvae feeding on the Bt cotton expressing Cry1Ac toxin survived. Most larvae of BtR-F87 could develop to the 5th instar and about 3% individuals reached the adult stage. The inheritance of Cry1Ac resistance trait at three resistant levels was autosomal and incompletely recessive, but the degree of dominance decreased as the resistance increased. The resistance was primarily monogenic in BtR-F16 strain, but polygenic as resistance increased. The relative fitness of H. armigera, measured as a ratio of R0 (the net replacement rate) of resistant strain divided by R0 of the susceptible strain, decreased with an increase of the resistance levels, with ratios of 0.79, 0.64 and 0.59 in their respective BtR-F16, BtR-F34 and BtR-F87 strains.

【题目】Comparative study of temperature-dependent life histories of three economically important Adelphocoris spp.
【中文关键词】Adelphocoris fasciaticollis;Adelphocoris lineolatus;Adelphocoris suturalis;development;fecundity;longevity;life history;temperature
【英文关键词】Adelphocoris fasciaticollis;Adelphocoris lineolatus;Adelphocoris suturalis;development;fecundity;longevity;life history;temperature
【中文摘要】Subsequent to the widespread adoption of Bt transgenic cotton in China and an associated reduction in pesticide use, Adelphocoris spp. (Hemiptera: Miridae) are the key pests of this crop. Three species (Adelphocoris suturalis, Adelphocoris fasciaticollis and Adelphocoris lineolatus) are found in Chinese Bt cotton fields, each with a distinct geographic distribution and phenology. In the present study, the development and fecundity of the three species are compared in the laboratory at various temperatures in the range 10 – 35 ° C. Although nymphal development and adult moulting occurs under all temperature regimes, egg eclosion is not observed at 10 ° C. In general, egg and nymphal development periods decrease with increasing temperature up to 30 ° C. The lower and upper development thresholds are, respectively, 5.6 and 40.1 ° C for A. suturalis eggs; 5.0 and 38.4 ° C for nymphs; 6.3 and 39.0 ° C for A. fasciaticollis eggs, 3.0 and 41.9 ° C for nymphs; 5.6 and 41.3 ° C for A. lineolatus eggs; and 6.2 and 38.8 ° C for nymphs. Thermal constants are 189.9 degree days (DD) (egg) and 308.8 DD (nymph) for A. suturalis, 188.8 DD (egg) and 366.7 DD (nymph) for A. fasciaticollis, and 231.7 DD (egg) and 291.6 DD (nymph) for A. lineolatus. Temperatures above 30 ° C affect egg development of A. fasciaticollis and A. lineolatus adversely, but not that of A. suturalis. At the same time, nymphal survival of A. suturalis is reduced at 10 ° C. Longevity of all species declines with increasing temperature, whereas extremes of temperature (i.e. 10 and 35 ° C) interfere with oviposition. The estimated optimum range for oviposition is 23 – 25 ° C, irrespective of species. In general, development and fecundity of the three Adelphocoris spp. is consistent with their respective distribution and seasonal dynamics. The present study provides insight into the distribution and phenology of Adelphocoris spp., and contributes to the modelling of their population dynamics.

【题目】Frequency of Bt Resistance alleles in H. armigera during 2006 – 2008 in northern China
【中文关键词】Cry0Ac, Helicoverpa armigera, Bt cotton, resistance frequency
【英文关键词】Cry1Ac, Helicoverpa armigera, Bt cotton, resistance frequency
【中文摘要】Helicoverpa armigera is an important lepidopteran pest of cotton in China. From 2002, the frequency of Bt resistance alleles and quantitative shifts in larval Cry1Ac tolerance of field H. armigera population were monitored using bioassays of F1 and F2 offspring of isofemale lines from Xiajin County of Shandong Province (an intensive Bt cotton planting area) and Anci County of Hebei Province (a multiple-crop system including corn, soybean, peanut, and Btcotton) in northern China. During 2006 – 2008, a total of 2,306 isofemale lines from the Xiajin population and a total of 1,270 isofemale lines from the Anci population were successfully screened on Cry1Ac diets. For each year, it was estimated that the major resistance gene frequency in Xiajin population in 2006, 2007, and 2008 was 0, 0.00022, and 0.00033, respectively. No major alleles conferring resistance to Cry1Ac were found in the Anci population; the frequency of resistance alleles for Cry1Ac was 0. Based on the relative average development rates (RADRs) of H. armigera larvae in F1 tests, no substantial increase in Cry1Ac tolerance was found in either location over the 3-yr period. There were also significantly positive correlations between RADR of lines in the F1 generation and the RADR of their F2 offspring, indicating genetic variation in response to toxin. The low frequency of resistance alleles found in this study and in our previous results from 2002 to 2005 suggest the frequency of resistance alleles has remained low and that natural refugia resistance management strategy maybe effective for delaying resistance evolution in H. armigera to Bt cotton in northern China.

【题目】Cross-Resistance Studies of Cry1Ac-Resistant Strains of Helicoverpa armigera (Lepidoptera: Noctuidae) to Cry2Ab
【中文关键词】 Helicoverpa armigera, Cry1Ac, Cry1Ab, cross-resistance, binding
【英文关键词】 Helicoverpa armigera, Cry1Ac, Cry2Ab, cross-resistance, binding
【中文摘要】Bioassays and binding tests between Cry toxins (Cry1Aa, Cry1Ab, Cry1Ac, and Cry2Ab) and brush-border membrane vesicles (BBMVs) from larvae of aBacillus thurningiensis(Bt)-susceptible (96S) and two Cry1Ac-resistant strains (BtR and LFR10) were conducted for investigating cross-resistance of Cry1Ac-resistant strains to Cry2Ab inHelicoverpa armigera (H ü bner) (Lepidoptera: Noctuidae). The resistance ratio (RR) values of the BtR and LFR10 strains to Cry1Ac and Cry2Ab were 2,971- and 1.1-fold and 253-

and 1.0-fold, respectively, indicating that there was no cross-resistance to Cry2Ab. The binding experiments between Cry toxins and BBMVs from BtR, LFR10, and 96S larvae showed that all of the toxins could bind with these BBMVs, but the Cry2Ab could not displace125I labeled Cry1Ac and Cry1Ab. The same results were observed in reciprocal binding tests, demonstrating that Cry1A and Cry2Ab had different binding sites inH.armigera and providing a potential mechanism for the lack of cross-resistance between Cry1A and Cry2Ab toxins. These results suggest that the transgenic cotton,Gossypium hirsutum L., expressingCry1AcandCry2Ab genes may be deployed for management of Cry1Ac resistantH.armigera.

【英文摘要】Bioassays and binding tests between Cry toxins (Cry1Aa, Cry1Ab, Cry1Ac, and Cry2Ab) and brush-border membrane vesicles (BBMVs) from larvae of aBacillus thurningiensis(Bt)-susceptible (96S) and two Cry1Ac-resistant strains (BtR and LFR10) were conducted for investigating cross-resistance of Cry1Ac-resistant strains to Cry2Ab inHelicoverpa armigera (H ü bner) (Lepidoptera: Noctuidae). The resistance ratio (RR) values of the BtR and LFR10 strains to Cry1Ac and Cry2Ab were 2,971- and 1.1-fold and 253- and 1.0-fold, respectively, indicating that there was no cross-resistance to Cry2Ab. The binding experiments between Cry toxins and BBMVs from BtR, LFR10, and 96S larvae showed that all of the toxins could bind with these BBMVs, but the Cry2Ab could not displace125I labeled Cry1Ac and Cry1Ab. The same results were observed in reciprocal binding tests, demonstrating that Cry1A and Cry2Ab had different binding sites inH.armigera and providing a potential mechanism for the lack of cross-resistance between Cry1A and Cry2Ab toxins. These results suggest that the transgenic cotton,Gossypium hirsutum L., expressingCry1AcandCry2Ab genes may be deployed for management of Cry1Ac resistantH.armigera.

【题目】Cry2Ab Tolerance Response of Helicoverpa armigera (Lepidoptera: Noctuidae) Populations From Cry1Ac Cotton Planting Region

【中文关键词】Cry1Ac, Cry1Ab, Helicoverpa armigera, cross-tolerance
【英文关键词】Cry1Ac, Cry2Ab, Helicoverpa armigera, cross-tolerance

【中文摘要】Helicoverpa armigera (H ü bner) (Lepidoptera: Noctuidae) is an important lepidopteran pest of cotton, Gossypium hirsutum L., in Asia. Transgenic cotton expressing the cry1Ac gene from Bacillus thuringiensis (Bt) has been widely planted for control of this pest. For managing the potential risk from resistance evolution in this pest, a new transgenic Bt cotton containing cry1Ac and cry2Ab genes (gene pyramided strategy) was designed as a successor of cry1Ac cotton. This article reports on levels of Cry2Ab tolerance in H. armigerapopulations from Cry1Ac cotton planting region in China based on bioassays of F1 and F2offspring of isofemale lines. In total, 572 isofemale families of H. armigera from Xiajin County of Shandong Province (an intensive Bt cotton-planting area) and 124 families from Anci County of Hebei Province [a multiple-crop system, including corn (Zea mays L.), soybean (Gycine max (L.) Merr., peanut (Arachis spp.), and Bt cotton] were screened with both Cry1Ac- and Cry2Ab-containing diets in 2008. The bioassays results indicated that relative average development rates (RADR) of F1 full-sib families from field-collected female moths on Cry1Ac- and Cry2Ab-containing diet were positively correlated. The same correlation was found in the F2 generation, indicating cross-tolerance between Cry1Ac and Cry2Ab in field populations of H. armigera in Yellow River cotton-farming region of China. This cross-tolerance must be considered in evaluating the utility of pyramiding Bt genes in cotton for delaying evolution of resistance.

【题目】Degradation of Cry1Ac protein within transgenic Bacillus thuringiensis rice tissues under field and laboratory conditions

【中文关键词】Bacillus thuringiensis, rice plant, Cry0Ac protein, soil, degradation

【英文关键词】Bacillus thuringiensis, rice plant, Cry1Ac protein, soil, degradation

【中文摘要】To clarify the environmental fate of the Cry1Ac protein from Bacillus thuringiensis subsp.kurstaki (Bt) contained in transgenic rice plant stubble after harvest, degradation was monitored under field conditions using an enzyme-linked immunosorbent assay. In stalks, Cry1Ac protein concentration decreased rapidly to 50% of the initial amount during the first month after harvest; subsequently, the degradation decreased gradually reaching 21.3% when the experiment was terminated after 7 mo. A similar degradation pattern of the Cry1Ac protein was observed in rice roots. However, when the temperature increased in April of the following spring, protein degradation resumed, and no protein could be detected by the end of the experiment. In addition, a laboratory experiment was conducted to study the persistence of Cry1Ac protein released from rice tissue in water and paddy soil. The protein released from leaves degraded rapidly in paddy soil under flooded conditions during the first 20 d and plateaued until the termination of this trial at 135 d, when 15.3% of the initial amount was still detectable. In water, the Cry1Ac protein degraded more slowly than in soil but never entered a relatively stable phase as in soil. The degradation rate of Cry1Ac protein was significantly faster in nonsterile water than in sterile water. These results indicate that the soil environment can increase the degradation of Bt protein contained in plant residues. Therefore, plowing a field immediately after harvest could be an effective method for decreasing the persistence ofBt protein in transgenic rice fields.

【题目】Diapause, cold hardiness and flight ability of Cry1Ac-resistant and susceptible strains of Helicoverpa armigera (Lepidoptera: Noctuidae)
【中文关键词】Noctuidae, Helicoverpa armigera, Bt resistance, resistance management, fitness costs, transgenic crops
【英文关键词】Noctuidae, Helicoverpa armigera, Bt resistance, resistance management, fitness costs, transgenic crops
【中文摘要】The diapause inducement condition, cold hardiness, and flight ability in Cry1Ac-resistant (BtR) and Cry1Ac-susceptible(96S) strains of Helicoverpa armigera (H ü bner) were compared in the laboratory. The BtR strain was derived from the 96S strainand shows 1375-fold resistance to the Cry1Ac toxin after having been selected for 52 generations. Compared with the 96S strain, theBt-resistant strain was more likely to go into diapause under a short-photoperiod environment. At 11L : 13D, 12L : 12D and 13L :11D photoperiods, the percentages of BtR insects entering diapause were 72.7%, 82.9% and 68.7%, respectively, which were significantly higher than those in the 96S strain (58.6%, 67.4% and 46.3%, respectively) under the same conditions. The supercoolingpoints (SCP) and freezing points (FP) were not significantly different between the BtR and 96S strains. The LT50 (50% lethal time)and LT90 (90% lethal time) of BtR pupae were also not significantly different from those of the 96S strain at – 15 ° C. The moths fromboth strains had similar flight ability when their larvae were fed with nontoxic control diet. However, the total flight distance ofthese BtR moths was 56.2 km whose larvae fed on normal diet, which was more than twice as much as for those feeding on Bt diet(26.2 km). Flight duration for these BtR moths was longer after feeding on normal diet (11.6 h) than after feeding on Bt diet (7 .3 h).

【题目】Efficacy of transgenic rice expressing Cry1Ac and CpTI against the rice leaffolder, Cnaphalocrocis medinalis (Guenee)
【中文关键词】Transgenicrice; Cnaphalocrocismedinalis; Population dynamics; Control efficacy
【英文关键词】Transgenicrice; Cnaphalocrocismedinalis; Population dynamics; Control efficacy
【中文摘要】Detached leaf bioassays, open field tests and cage tests were conducted to evaluate the control efficacy of two transgenicrice lines, expressingCry1Ac and CpTI, againstCnaphalocrocismedinalis (Guen é e) during 2005 – 2006 in Fuzhou, China. Bioassay results showed that cumulative feeding areas of C. medinalison transgenic lines were significantly lower than that on control rice lines at different developmental stages. The corrected mortalities at 96 h after infestation on transgenic lines during six rice growth stages were >90% and 100% during experiments conducted in 2005 and 2006, respectively. In the open field test, there was no significant difference in egg density between transgenic and control lines during early days of infestation, but significant differences were detected in late season, due to serious damage on control lines. Larval densities on control lines were significantly higher than the low larval populations observed ontransgenic lines during both seasons. The percentages of plants with folded leaves and percentages of folded leaves on transgenic lines were significantly lower than that on control lines with and without insecticide applications, during the entire season. In cage tests the cumulative numbers of C. medinalis adults derived from transgenic lines were significantly lower than that from control lines with and without

insecticide treatments. The high level of efficacy of the two transgenicrice lines againstC. medinalis may provide an important basis for reduced insecticide applications, an expansion of alternative pest-control strategies and insect resistance management of Btrice in the future.

【题目】Increasing tolerance to Cry1Ac cotton from cotton bollworm, Helicoverpa armigera, was confirmed in Bt cotton farming area of China

【中文关键词】Cry0Ac;Helicoverpa armigera;Bt cotton;resistance frequency

【英文关键词】Cry1Ac;Helicoverpa armigera;Bt cotton;resistance frequency

【中文摘要】Changes in the frequency of Cry1Ac resistance genes and shifts in tolerance of cotton bollworm, 1. Helicoverpa armigera, to the Cry1Ac toxin were assessed using bioassays of F1 and F2 offspring of isofemale lines from Anci County of Hebei Province (a multiple-crop system including corn, soybean, peanut, and Bt cotton) and Xiajin County of Shandong Province (an intensive Bt cotton planting area) in Northern China during 2002 – 2005.A conservative analysis of the overall results indicated that there was a small increase in the frequency of major, non-recessive resistance genes over time. 2.The relative average development ratings [RADR – growth rate of a line on a Bt diet in proportion to the growth rate on a non-Bt (NBT) diet] of the bollworm larvae in F 3.1 tests increased significantly from year to year, indicating a gradual trend towards higher tolerance to Cry1Ac in the field populations.There were also significant positive correlations between RADR of the lines in the F 4.1 generation and the RADR of their F2 offspring, indicating that the tolerance was genetically based.

【题目】Influence of soil moisture on supercooling capacity and associated physiological parameters of overwintering larvae of the rice stem borer
【中文关键词】body water content;Chilo suppressalis;glycerol;substrate moisture;supercooling point
【英文关键词】body water content;Chilo suppressalis;glycerol;substrate moisture;supercooling point
【中文摘要】Influence of soil moisture on the supercooling capacity and associated physiological parameters of overwintering larvae of the rice stem borer Chilo suppressalis was examined by exposing larvae to soil moistures of 25, 50, 75 and 100% of saturated soil water content (SSWC) at ambient temperature for 30 d from December 2007 to January 2008 in Beijing, China. At the end of the exposure, supercooling points (SCPs) varied significantly among the treatments, the lowest being in the larvae exposed to soil moisture of 25% SSWC. Fresh weight was significantly higher in the larvae exposed to soil moisture of 100% SSWC than in those kept at 25 and 50% SSWC. Dry weight and body water content (% fresh weight) were not different among the treatments. Glucose and trehalose contents were markedly lower, and glycerol content was significantly higher in the larvae confined to soil moisture of 25% SSWC than in those exposed to the other soil moisture treatments. It is suggested that variation in body water content (% fresh weight) contributes to the differences in SCPs of the overwintering C. suppressalis larvae in all treatments, but the influence of soil moisture treatments on supercooling capacity are caused through changes in glycerol content.

【题目】Monitoring and management strategy for Helicoverpa armigera resistance to Bt cotton in China
【中文关键词】Btcotton; Helicoverpaarmigera; Resistancemanagement; Natural refugia
【英文关键词】Btcotton; Helicoverpaarmigera; Resistancemanagement; Natural refugia
【中文摘要】The cotton bollworm, Helicoverpaarmigera, is one of the most important insect pests in cotton growing regions of China. Transgenic cotton that expresses a gene derived from the bacterium Bacillus thuringiensis(Bt) has been deployed for combating cotton bollworm since 1997. Natural refuges derived from the mixed planting system consisting of cotton, corn, soybean, vegetables, peanut and others on single-family farms of a small scale were used for delaying the evolution of resistance to Btcotton. Susceptibility of H. armigerafield populations to the Bt insecticidal protein Cry1Ac was monitored from 1997 to 2006. The results indicate that the field populations are still susceptible to Cry1Ac, and monitoring indication no apparent shifts in susceptibility in field populations of this important pest.

【题目】Potential of mungbean, Vigna radiatus as a trap crop for managing Apolygus lucorum (Hemiptera: Miridae) on Bt cotton
【中文关键词】Mungbean; Apolyguslucorum; Cotton; Host preference; Trapcrop
【英文关键词】Mungbean; Apolyguslucorum; Cotton; Host preference; Trapcrop
【中文摘要】In recent years, the mirid Apolyguslucorum has become the key insect pest of Btcotton in China. Currently, insecticide use is the sole pest management option available for most Chinese cotton farmers. As irrational pesticide use may have several undesirable effects, environmentally sound and sustainable management alternatives are urgently needed. In this paper, we evaluate the potential of mungbean,Vignaradiatus as atrapcrop for A. lucorum in Btcotton. Plant suitability trials showed that A. lucorumpopulation densities on mungbean were significantly higher than those on cotton. Large-scale field experiments were conducted during 2006 and 2007 to determine the effectiveness of mungbean strips formanagingA. lucorum in Btcotton fields. In this experiment, 0.1 ha Btcotton fields were established, andmungbean strips covered approximately 10% of the total area. With periodical insecticide applications inmungbean strips, average mirid population densities in cotton fields were 18.1 ± 2.1 individuals per 100 plants, versus 36.0 ± 3.4 in the fields without mungbean strips in 2006. However, A. lucorum population still surpassed economic threshold (i.e., 5, 10, and 20 individuals per 100 cotton plants at the seeding stage, the squaring and flowering stages, and the belling stage, respectively). In 2007, aside from the insecticide sprays within the mungbean strips, 2 – 3 insecticide applications were done in the cotton field. As a result, A.lucorum populations were kept below economic threshold, and the total amount of insecticides reduced about 70% of those used in the common chemical-controlled fields. Our work shows that mungbean has considerable potential as atrapcrop in Btcotton fields, and its adoption by Chinese farmers very likely will reduce current levels of pesticide use in this crop.

【题目】Response of multiple generations of beet armyworm, Spodoptera exigua (H ü bner), feeding on transgenic Bt cotton
【中文关键词】Spodoptera exigua;development;food utilization;resistance management;successive generations;transgenic Bt cotton
【英文关键词】Spodoptera exigua;development;food utilization;resistance management;successive generations;transgenic Bt cotton
【中文摘要】Development, reproduction and food utilization of three successive generations of beet armyworm, Spodoptera exigua (H ü bner), fed on transgenic and non-transgenic Bt cotton were examined. Significantly longer larval life-span and lower pupal weight were observed in three successive generations of S. exigua fed on transgenic Bt cotton compared with non-transgenic Bt cotton. Significantly higher survival rate and adult fecundity of S. exigua were found in three successive generations of S. exigua fed on transgenic Bt cotton compared with non-transgenic Bt cotton. The survival rate and adult fecundity of S. exigua were occurred significant increase in the third generation compared with the first generation after feeding on transgenic Bt cotton. Significantly lower consumption, frass and relative growth rate (RGR) were observed in three successive generations of S. exigua fed on transgenic Bt cotton compared with non-transgenic Bt cotton. Cotton variety significantly affected all indices of larval consumption and utilization in three successive generations of S. exigua, except for efficiency of conversion of ingested food. However, beet armyworm generation only significantly affected RGR of S. exigua. The results of this study indicated food quality on the diet-utilization efficiency of S. exigua was different along with beet armyworm generation. Measuring multigenerational development and food utilization of S. exigua at individual and population level in response to Bacillus thuringiensis (Bt) can provide a more meaningful evaluation of long-term population dynamics than experiments on a single generation. It is imperative to develop an appropriate multigenerational pest management tactic to monitor the field population dynamics of non-target pests (e.g., beet armyworm) in agricultural Bt cotton ecosystem.

The results of this study indicated food quality on the diet-utilization efficiency of S. exigua was different along with beet armyworm generation. Measuring multigenerational development and food utilization of S. exigua at individual and population level in response to Bacillus thuringiensis (Bt) can provide a more meaningful evaluation of long-term population dynamics than experiments on a single generation. It is imperative to develop an appropriate multigenerational pest management tactic to monitor the field population dynamics of non-target pests (e.g., beet armyworm) in agricultural Bt cotton ecosystem.

【题目】Species composition and seasonal abundance of pestiferous plant bugs (Hemiptera: Miridae) on Bt Cotton in China
【中文关键词】转基因棉,盲蝽,种类组成,季节消长动态,中国
【英文关键词】Transgenic Btcotton; Mirid; Speciescomposition; Seasonalabundance; China
【中文摘要】无
【英文摘要】Only recently, due to a major reduction of broad-spectrum insecticide use in transgenic (Bt) cotton inChina, plantbugs (Heteroptera: Miridae) have emerged as key pests of this crop. To determine theirspeciescomposition and seasonal activity at various locations nationwide, field surveys were carried out between 2002 and 2006, using sweep-net samples and visual observation. Surveys were conducted in three major cotton-growing regions: Changjiang River, Yellow River, and Northwestern Region. The mirid complex on Btcotton basically consisted of five different species, with Lygus lucorum, Lygus pratensis, andAdelphocoris suturalis most commonly encountered. L. lucorum and A. suturalis were the dominant speciesin the Changjiang River and Yellow River Region, while L. pratensis was the most common species in the Northwestern Region. The various mirid species were found in cotton fields throughout the cotton-growing season, usually with great population densities during the squaring and flowering stages. Peak miridabundance ranged from 50 to 200 per hundred plants. Given the comparatively low economic thresholds for mirids (approx. 10 individuals/100 plants), these insects constitute serious pests in all cotton-growing regions of China. This paper suggests that L. lucorum, L. pratensis, and A. suturalis should be treated as the main targets for developing pestiferous mirid forecasting and management strategies, which would be defined at or prior to the flowering and squaring stages of cotton in China

【题目】Silicon-mediated rice plant resistance to the Asiatic rice borer: effects of silicon amendment and rice varietal resistance
【中文关键词】silicon, Chilo suppressalis, rice, plant resistance, boring behavior
【英文关键词】silicon, Chilo suppressalis, rice, plant resistance, boring behavior
【中文摘要】The Asiatic rice borer, Chilo suppressalis (Walker) (Lepidoptera: Crambidae), is one of the most destructive pests in rice, Oryza sativa L., throughout Asian countries. The aim of this study was to investigate the potential of applied silicon in mediating rice plant resistance to C. suppressalis in a susceptible (Shanyou63) and a moderately resistant (Yanfeng47) rice cultivar. Silicon-treated plants showed significant increases in silicon content compared with the control. Silicon addition significantly decreased borer penetration, weight gain, and stem damage, and it prolonged penetration duration and larval development; some of the effects were manifested more strongly in the susceptible rice cultivar compared with the moderately resistant cultivar. Therefore, silicon amendment may contribute to the suppression of C. suppressalis directly through reduced feeding damage and performance and indirectly through increased exposure time of young larvae to natural enemies and control measures.

【题目】Seasonal changes in supercooling points and glycerol content in overwintering larvae of the Asiatic rice borer from rice and water-oat plants
【中文关键词】supercooling capacity, overwintering, Chilo suppressalis, paddy rice, water-oat
【英文关键词】supercooling capacity, overwintering, Chilo suppressalis, paddy rice, water-oat
【中文摘要】The Asiatic rice borer Chilo suppressalis (Walker) occurs mainly on rice Oryza sativa L. and water-oat Zizania latifolia (Turcz). Certain ecological and physiological differentiations between rice and water-oat populations have been shown. To determine whether there is host-associated differentiation in supercooling capacity, seasonal changes in supercooling points, glycerol content, and other physiological parameters of naturally occurring C. suppressalis larvae overwintering in rice and water-oat plants were compared over the winter. Supercooling points were low in the winter (November and December), significantly higher in March, and significantly lower in the water-oat population than in the rice population in the winter. Larvae from the water-oat population experienced a significant weight loss from December to March and were heavier than those from the rice population in the winter. Body water content (percentage of fresh weight) was low in the winter and increased significantly in March; no population differences were detected. Hemolymph glycerol content was high in the winter and dropped significantly in March; interpopulation differences were significant in December. Hemolymph trehalose content increased in the winter, and no population differences were detected. Whole body glucose and lipid content varied differently between the rice and the water-oat populations over the winter. It was found that variations in hemolymph glycerol content were responsible for the host-associated seasonal changes in supercooling capacity of overwintering larvae of the Asiatic rice borer.

【题目】Temporal allocation of metabolic tolerance in the body of beet armyworm in response to three cotton cultivars
【中文关键词】Spodoptera exigua - gossypol - free fatty acid - detoxification enzyme - acetylcholinesterase - total superoxide dismutase

【英文关键词】Spodoptera exigua - gossypol - free fatty acid - detoxification enzyme - acetylcholinesterase - total superoxide dismutase

【中文摘要】The nutrient composition and enzyme activities in larvae of the beet armyworm, Spodoptera exigua(Hübner), fed on high, medium or low gossypol cotton cultivars were examined at different time intervals. Significantly lower free fatty acid was observed in larvae fed for 6 h on high gossypol ‘M9101’ compared to larvae fed on the low (ZMS13) and intermediate (HZ401) gossypol cultivars. Significantly higher trypsin activity was observed in larvae fed on high gossypol ‘M9101’ for 24 h compared to those fed for 1, 4 and 6 h. Significantly higher catalase and total superoxide dismutase enzyme activities were observed in larvae of S. exigua fed on high gossypol ‘M9101’ compared with low gossypol cultivars ‘ZMS13’ and ‘HZ401’ for 1, 4, 6 and 24 h. However, significantly lower carboxylesterase and acetylcholinesterase enzyme activities were found in larvae fed on high gossypol ‘M9101’ compared with the other cultivars for 1, 4, 6 and 24 h. The interaction between cotton variety and beet armyworm infestation time significantly affected the carboxylesterase enzyme activity in S. exigua. The characterization of the effects of plant allelochemicals on herbivorous larvae is important for aiding understanding of plant-insect interaction as well as in devising solutions to pest problems by breeding plant resistance, identifying metabolic targets for insecticide development, etc.

【题目】Tri-trophic interactions between Bt-cotton, the herbivore Aphis gossypii Glover (Homoptera: Aphididae) and the predator Chrysopa pallens (Rambur) (Neuroptera: Chrysopidae)

【中文关键词】transgenic Bt cotton, Aphis gossypii, Chrysopa pallens, tri-tropic interaction

【英文关键词】transgenic Bt cotton, Aphis gossypii, Chrysopa pallens, tri-tropic interaction

【中文摘要】Tri-trophic impacts of transgenic Bacillus thuringiensis (Bt) cotton GK12 and NuCOTN 99B were studied using a predator, the great lacewing Chrysopa pallens (Rambur), and its prey, the cotton aphid Aphis gossypii Glover, in laboratory feeding experiments. The parental nontransgenic cotton cultivar of GK12 was used as control. The predator was fed with uniform (aphids from a single cultivar) or mixed prey (aphids from the three cotton cultivars provided on alternate days). Mortality and development of the immature stages, pupal body mass, adult sex ratio, fecundity, and egg viability of C. pallens were measured. When fed GK12-originated aphid prey, pupal body mass of C. pallens was significantly higher than that of the control, more females emerged, and these females laid significantly more eggs. Other parameters were not impacted. Females emerging from larvae maintained on NuCOTN 99B-originated prey laid fewer eggs than those maintained on GK12. Other measurements did not differ significantly between the two Bt cotton cultivars. Compared with the control, mixed feeding significantly prolonged pupal development time and increased pupal body mass and percentage of females but did not affect other parameters. These results indicate that C. pallens is sensitive to aphid prey from different cotton cultivars. Transgenic Bt cotton GK12-originated aphid prey has no adverse impact on survival, development, and fecundity of C. pallens. Between the two Bt cotton cultivars, NuCOTN 99B-originated aphid prey provided to C. pallens in the larval stage may lower female fecundity. Mixed feeding of C. pallenswith the two Bt cotton – originated prey and non-Bt prey may have some adverse impacts on pupal development.

【题目】Twelve nuclear microsatellite loci for the rice stem borer Chilo suppressalis (Walker) (Lepidoptera; Pyralididae)
【中文关键词】Chilo suppressalis (Walker);Lepidoptera;microsatellite;PCR primers;Pyralididae;the rice stem borer
【英文关键词】Chilo suppressalis (Walker);Lepidoptera;microsatellite;PCR primers;Pyralididae;the rice stem borer
【中文摘要】We developed 12 polymorphic microsatellite markers for the rice stem borer Chilo suppressalis (Walker). These loci were screened for 96 individuals from eight populations across China. The total number of alleles ranged from 3 to 33 and the expected heterozygosity at these loci ranged from 0.131 to 0.671. These molecular markers will be useful for fully investigating the population structure and host preference of C. suppressalis at fine spatial scales.

【题目】Impact of intercropping aphid-resistant wheat cultivars with oilseed rape on wheat aphid (Sitobion avenae) and its natural enemies.
【中文关键词】Agrobiodiversity; Intercropping; Naturalenemies; Oilseedrape; Sitobionavenae; Wheat resistance
【英文关键词】Agrobiodiversity; Intercropping; Naturalenemies; Oilseedrape; Sitobionavenae; Wheat resistance
【中文摘要】The effects of intercropping of wheatcultivars and oilseedrape on the densities of wheataphid,Sitobionavenae, and their arthropod naturalenemies were evaluated. Three winter wheatcultivars with different resistant levels to S. avenae were used: ‘ KOK ’ (high resistance), ‘ Xiaobaidongmai ’ (low resistance) and

‘Hongmanghong’(susceptible). The results showed that the densities of S. avenae were significantly higher on the monoculture pattern than on either the 8-2 intercropping pattern (eight rows of wheat with two rows of oilseedrape) or the 8-4 intercropping pattern (eight rows of wheat with four rows of oilseedrape). The mean number of predators and the mummy rates of S. avenae were significantly higher in twointercropping patterns than those in the monoculture pattern. The densities of S. avenae, ladybeetles, and mummy rate of S. avenae were significantly different among different wheatcultivars. The highest densities of S. avenae and ladybeetles were found on wheatcultivar Hongmanghong. The lowest densities of S.avenae associated with high mummy rate of S. avenae were found on wheatcultivar Xiaobaidongmai. The results showed that wheat-oilseedrapeintercropping conserved more predators and parasitoids than inwheat monoculture fields, and partial resistance of wheatcultivar Xiaobaidongmai had complementary or even synergistic effects on parasitoid of S. avenae.

【题目】Cloning and eucaryotic expression of olfaction related Gq-protein gene in England grain aphid

【中文关键词】无
【英文关键词】grain aphid,protein related with olfactory, Gqα protein, Gqα gene cloning, Baculovirus expression vactor system(BEVS)

【中文摘要】无

【英文摘要】Based on conserved homologous amino acid sequences of Gq protein α subunit in arthropods, a pair of degenerate primers were designed to amplify the gene from the England grain aphid(Sitobion avenae) by RT-PCR and (3′/5′)-RACE techiques. A Gqα was obtained from the alate adult aphids. The open reading-frame was 1 062 bp, encoding 352 amino acid residues with calculated molecular weight of 40.8 kD. The cDNA sequence was deposited in GenBank with the accession number EF638906. The deduced amino acid sequence of Gqα shared high identity (≥82.17%) with reported Gqα from other insects and even vertebrates, and with the typical characteristics of Gqα protein. In order to explore the function of Gqα gene, a eukaryotic expressional system(Baculovirus expression vector system, BEVS) was constructed by TOPO and Gateway technique. After the recombinant reaction between pUC-Gqα and Gateway-adapted Baculovirus DNA from Autographa californica nuclear polyhedrosis virus (AcMNPV), the constructed recombinant viruses containing V5-His6Gqα were transfected singly into an insect (Trichoplusia ni) cell line of Tn-5B1-4. After collecting the infected cell, an expected protein (about 42 kD) was detected by SDS-PAGE and Western blot. The results showed that the system of recombinant Baculovirus and Tn could express Gqα protein successfully.

【题目】北方稻田和茭白田二化螟越冬幼虫生物学特性的比较
【中文关键词】水稻田 茭白田 二化螟 越冬 生物学特性
【英文关键词】Paddy-rice filed, Water-oat field, Rice-stem borer, Overwintering, Bionomics
【中文摘要】在冬初(11月中旬)和冬后(3月上旬)调查了北方稻田和茭白田二化螟越冬幼虫的生物学特性。二化螟越冬幼虫龄期均在4龄以上, 茭白田冬初6龄幼虫的比例比稻田高17.5%;冬后稻田和茭白田高龄幼虫比例均高于冬初。冬初和冬后稻田二化螟雌雄比分别为1∶ 2.0 和1∶ 1.7, 茭白田分别为1∶ 1.4 和1∶ 1.2。冬初幼虫历期高于冬后, 同一时期不同寄主田之间无显著差异, 但冬初茭白田幼虫历期比稻田长14.0%;稻田幼虫体重和蛹重均显著低于茭白田。冬初采集越冬幼虫的死亡率在65%以上, 茭白田幼虫的主要致死因子为真菌, 其致死率在90%以上;稻田幼虫的主要致死因子是寄生蜂和细菌, 其致死率分别在50%和25%以上, 其中二化螟绒茧蜂和中华钝唇姬蜂是优势寄生蜂。
【英文摘要】Bionomics of Chilo suppressalis larvae overwintering in paddy-rice and water-oat fields were investigated in Beijing inearly-winter (middle November) and after-winter (early March). The results show that overwintering larvae are 4th instar or older, andthe 6th instar ratio in water-oat fields is 17.5% higher than that in paddy-rice fields in early-winter. Old larvae account for a

higherpercent in after-winter period than in early-winter. Female to male larvae ratios are respectively 1∶2.0 and 1∶1.7 in early-winterand after-winter periods in paddy-rice fields, and 1∶1.4 and 1∶1.2 in water-oat fields. Larvae duration is longer in early-winter thanafter-winter, and not significantly different between in paddy-rice and water-oat fields in one period. However, larvae from water-oatfields take 14.0% more time before pupation than that from paddy-rice fields in early-winter, while larvae and pupa from water-oatfields are significantly heavier than those from paddy-rice fields. Mortality rate of larvae collected in early-winter is greater than 65%.Fungi infection is the primary mortality factor in water-oat fields (i.e. over 90% total mortality), while parasitic wasp and bacteriainfection constitute the primary mortality factors in paddy-rice fields (i.e. respectively over 50% and 25% total mortality). Apanteleschilonis and Eriborus terebrans are the two dominant parasitic wasps.

【题目】不同棉花品种及种植区域对土壤无脊椎动物群落结构的影响

【中文关键词】转Btt基因棉;土壤无脊椎动物;群落结构;多样性

【英文关键词】transgenic Bt cotton; soil invertebrate; community structure; diversity

【中文摘要】采用干、湿漏斗分离法,在山东省陵县采集了试验田的Btt棉(新棉33B)和常规棉(中棉12)及大田条件下Btt棉的0~15 cmcm土层中的土壤无脊椎动物,并对其群落结构进行了分析. 结果表明,线虫和螨类是3种类型棉田的优势土壤动物类群,其频度分别为60%~85%和9%~27%. 试验田的常规棉和Btt棉相比,33B棉田土壤动物的类群较多,线虫、鞘翅目、双翅目数量和土壤动物总数均较高,但各土层土壤动物的多样性指数H ’和均匀度指数J值均较低. 试验田和大田的33B相比,其土壤动物的类群数相近,但大田33B的轮虫和线蚓数量较高,线虫、蠋、鞘翅目数量和土壤动物总数均较低,各土层土壤动物的多样性和均匀度均较高. R nyiR é nyi多样性指数曲线也表明,试验田33B棉田的土壤动物多样性高于中棉12,大田33B的土壤动物多样性高于33B试验田. 6~11月期间,各土层土壤动物的数量动态在不同类型棉田趋势基本相同. 7月是中棉12棉田土壤动物数量的高峰期,9月是试验田和大田33B的高峰期. 试验田的中棉12和33B棉田,6~8月土壤动物的多样性指数和均匀度指数变化趋势较为一致;9~10月,33B棉田土壤动物的多样性和均匀度较高. 6~11月,大田33B土壤动物的多样性和均匀度均显著高于试验田33B. 可见,棉花品种和实验地点等因素均可显著影响土壤动物的群落结构. Btt棉33B棉田的土壤动物多样性高于常规棉中棉12;大田33B的土壤动物多样性高于33B试验田. 图2 表4 参29

【英文摘要】Soil invertebrates were collected by Tullgren an Baermann funnels from soil at 0~15 cm depth grown with Bt cotton (cv. NuCOTN 33B) an non-Bt (ZM12) in Lingxian, Shandong, China, an their community structures analyzed. The structures in the experimental plots and fields planted with 33B were also compared. Nematodes and acarids dominant groups and frequencies 60%~85% an 9%~27% in all treatments under survey. Soil invertebrate groups and individuals, as well as nematodes, Coleoptera and Diptera were founs more in the plots with 33B than those non-Bt cv. ZM12. But the Shannon ’s diversity and Pielou ’s evenness values were significantly lower in the plots with 33B. The numbers of soil invertebrate groups in 33B fields were similar to those in the plots with 33B. There were more Rotatoria and Enchytraelidae, but fewer nematodes, Pauropoda, Coleoptera, and also total invertebrate individuals in 33B fields. The Shannon ’s diversity and Pielou ’s evenness were significantly higher in 33B fields. From the scalable one-parametric Renyi- R é diversity profiles, it also showed higher diversity in the plots with 33B than in those with ZM12,and higher diversity in the 33B than in those with ZM12, and higher diversity in the fields than in the plots both with 33B. From June to November, the abundance of soil invertebrates fluctuated in similar trends in all the treatments. It peaked in July in the plots with ZM12, and in September in the experimental plots and fields with 33B. The diversity and evenness of invertebrates exhibited a similar trend from June to August in 33B and ZM12 plots, but they were higher in September and October in 33B than in ZM12 plots. The diversity and evenness in 33B fields were higher than in 33B ots in the perio June November. These results indicated that cotton varieties and danting areas coudl change the soil invertebrate structures significantly.Thesoilinvertebratediversitywashigherin33BthaninZM12plots,andhigher The soil invertebrate diversity was higher in 33B than in ZM12 plots,and higher soil invertebrate higher iversity was higher in 33B thigher 33B than in ZM12 pots, and higher in 33B fields than in 33B plots. 【题目】不同作物布局对转基因抗虫棉田节肢动物群落结构的影响
【中文关键词】转基因抗虫棉　作物布局　节肢动物　群落结构　多样性
【英文关键词】transgenic bollworm-resistant cotton　crop arrangement　arthropod　community structure　diversity
【中文摘要】比较了不同作物布局下转基因抗虫棉田节肢动物的群落结构.结果表明,与单作棉田相比,蔬菜-棉花、果树-棉花及花生-棉花布局的棉田节肢动物群落、植食性害虫亚群落和天敌亚群落的物种数均增加,中性节肢动物的数量均有增加;蔬菜-棉花和花生-棉花布局的棉田植食性害虫个体数量增加;蔬菜-棉花和果树-棉花布局的棉田天敌个体数量增加.花生-棉花和果树-棉花布局棉田的节肢动物群落相似性最大;而单作棉田与蔬菜-棉花布局棉田的节肢动物群落相似性最小.R晴nyi多样性指数表明,与单作棉田相比,蔬菜-棉花布局棉田节肢动物群落多样性较低,害虫亚群落多样性较低;果树-棉花布局棉田节肢动物群落多样性较高,天敌亚群落多样性较高;花生-棉花布局棉田节肢动物群落多样性较高,害虫亚群落多样性较高.果树-棉花布局是值得推广的转基因抗虫棉田布局方式.
【英文摘要】The study on the arthropod community structures in transgenic bollworm-resistant cotton (cv. Lumianyan 15) fields with different crop arrangement patterns showed that compared with those in mono-cultured cotton plot, there were more species of arthropod community and of phytophagous pest and natural enemy sub-communities as well as more individuals of neutral arthropods in vegetable-, fruit tree-, and peanut-cotton plots. More individuals of phytophagous pests in vegetable- and peanut-cotton plots, and natural enemies in vegetable- and fruit tree-cotton plots were observed. The arthropod community in peanut- and fruit tree-cotton plots had the highest similarity, while that in mono-cultured cotton and vegetable-cotton plots had the lowest one. The Renyi diversity index indicated that compared with mono-cultured cotton plot, vegetable-cotton plot had lower diversities of arthropod community and pest sub-community, while fruit tree- and peanut-cotton plots had higher diversities of arthropod community and natural enemy sub-community, and of arthropod community and pest sub-community diversity, respectively. It was concluded that fruit tree-cotton was a recommendable crop arrangement pattern for transgenic bollworm-resistant cotton.

【题目】二化螟与寄主作物之间的相互关系
【中文关键词】化螟　寄主植物　互作关系
【英文关键词】Chilo suppressalis　host plant　interaction
【中文摘要】二化螟Chilo suppressalis(Walker)是水稻等多种作物的主要害虫,深入了解二化螟与寄主植物之间的相互关系及其作用机制是防治二化螟的重要前提。综述报道了二化螟与不同寄主植物、水稻品种、栽培制度和其它因素之间的关系,着重从二化螟的行为、发育、存活和种群增殖等方面论述二化螟与寄主植物及相关因素间的关系。
【英文摘要】
Understanding the interactions between the rice stem borer,Chilo suppressalis (Walker) , one of the most destructive rice insect pests, and its host plants is an important step to develop effective and sustainable control strategy. Interactions between the rice stem borer and different host plant species, rice varieties, rice planting patterns, and other factors were reviewed, with focus on behavior, development, survival and population increase of the rice stem borer.

【题目】硅介导的水稻对二化螟幼虫钻蛀行为的影响
【中文关键词】二化螟　水稻　硅　钻蛀行为　抗虫性
【英文关键词】Chilo suppressalis　rice　silicon　boring behavior　plant resistance
【中文摘要】　采用对二化螟敏感(汕优63)和中抗(盐丰47)的水稻品种,设置硅酸钙处理,观察二化螟蚁螟和三龄幼虫在不同处理稻茎上的钻蛀率、蛀入率和蛀入耗时,同时测定不同处理植株的硅细胞数量及植株与土壤的二氧化硅含量,旨在明确水稻施用硅肥对二化螟幼虫钻蛀行为的影响以及这种影响在不同龄期幼虫和不同抗虫性水稻品种间是否存在差异。蚁螟和三龄幼虫钻蛀率随硅肥施用量增加而降低(幅度为5%—28%)。蚁螟蛀入率在硅肥处理之间和水稻品种之间均没有差异;三龄幼虫蛀入率随硅肥施用量增加而显著下降10%—40%,盐丰47上的蛀入率显著低于汕优63(差异10%—30%)。蚁螟蛀入耗时随硅肥施用量增加而显著延长,三龄幼虫蛀入耗时与品种抗性有显著关系。稻茎硅含量随硅肥施用量增加而增大,并且与三龄幼虫蛀入率呈负相关、与三龄幼虫蛀入耗时呈正相关关系。因此,施用硅肥可直接抑制二化螟幼虫钻蛀,蛀入耗时的延长可间接地延长幼虫暴力于其它防治措施的时间;施用硅肥对三龄幼虫成功蛀入的影响大于对蚁螟的影响;相对于抗虫品种,施用硅肥能在更大程度上增强感虫品种对二化螟幼虫钻蛀行为的抑制作用。
【英文摘要】　Boring behavior of first and third instar larvae of the rice stem borer (RSB), Chilo suppressalis, on calcium silicate (Si)-treated susceptible (Shanyou63) and moderately resistant (Yanfeng47) rice cultivars was compared in terms of percentage of larvae bored (PLB), percentage of larvae penetrated (PLP) and penetration duration (PD), and number of silica cells in leaf sheaths and SiO2 content in soil and rice culms were determined, with the aims to clarify the influence of Si amendment on RSB boring behavior and whether there are differences in the Si-mediated influence regarding larval instars and rice cultivars. PLB decreased 5%-28% with increase in Si addition. PLP did not differ among Si treatments or between rice cultivars for the first instars; for the third instars, PLP significantly decreased 10%-40% with increase in Si supply and was 10% to 30% lower on Yanfeng47 than on Shanyou63. Si addition significantly prolonged PD in the first instars and, Yanfeng47 compared to Shanyou63 extended PD in the third instars. Increased SiO2 content in rice culms due to Si addition contributed to the reduction in PLP and prolong in PD of the third instar larvae. The current results indicate that Si amendment may contribute to the suppression of C. suppressalis directly through impeding larval penetration, and indirectly by delaying penetration, resulting in prolonged exposure of larvae to other control measures; Si supply impairs penetration more strongly in the third instars than in the first instars; and, susceptible rice cultivar benefits more from Si addition than resistant one in deterring boring by RSB larvae.

【题目】寄主植物对甜菜夜蛾生长发育和消化酶活性的影响
【中文关键词】甜菜夜蛾　寄主植物　营养物质　生长发育　消化酶活力
【英文关键词】Spodoptera exigua　host plant　nutrition substances　larval development　digestive enzyme activity
【中文摘要】通过室内饲养和生化测定,研究了甜菜、玉米和黄瓜3种寄主植物的营养物质及其对甜菜夜蛾幼虫发育、成虫产卵及5龄幼虫体内蛋白质和总氨基酸含量、淀粉酶和脂肪酶活力的影响。结果表明:与取食玉米和黄瓜的个体相比,取食甜菜的甜菜夜蛾,其幼虫期和蛹期较短,分别为11.4天和5.6天;蛹期存活率最高,达100%;成虫寿命较长,为26.3天;单雌产卵量最高,为301.8粒。取食3种寄主植物,甜菜夜蛾5龄幼虫体内的蛋白质含量无差异,但总氨基酸含量差异显著,此外,幼虫体内淀

粉酶和脂肪酶活力也存在显著差异,取食甜菜的个体〉取食玉米的个体〉取食黄瓜的个体。取食不同寄主植物,甜菜夜蛾幼虫的消化酶和脂肪酶活力与其发育适合度呈正相关

【英文摘要】

By laboratory stances of three kinds of feeding experiments and biochemistry detection methods, the nutrition subhost plant (sugar beet, maize and cucumber) were detected, and the effects of these host plants on development and oviposition of beet armyworm Spodoptera exigua (Hiibner), total amino acid contents and the digestive enzyme activities in the 5th instar larvae were compared. It showed that comparing with those fed on maize and cucumber, S. exigua individuals fed on sugar beet had shorter larval and pupal periods, higher pupal survival rate, longer adult lifespan and laid significantly more eggs per female, which was 11.4d, 5.6d, 100%, 26.3d, 301.8 eggs respectively. Among the three feeding treatments, the protein contents in the 5th instar S. exigua larvae showed no significant difference, whereas total amino acid contents, amylase and lipase activities differed significantly. According to the host plants, the amylase and lipase activities in S. exigua ranked as maize 〉 sugar beet 〉 cucumber. It also showed positive correlation between larval development and amylase and lipase activities in S. exigua feeding on different host plants.

【题目】棉铃虫中肠Cry1A 受体蛋白氨肽酶N1 在Tn 细胞系的表达

【中文关键词】APN;杆状病毒表达载体;Tn;表达

【英文关键词】APN; Baculovirus expression vector; Tn; Expression

【中文摘要】【目的】将棉铃虫中肠Bt 受体蛋白在真核表达系统中成功表达。【方法】用PCR 方法分别扩增出对Cry1Ac毒素敏感和抗性棉铃虫的中肠氨肽酶N1(APN1)基因的去信号肽片段,将其克隆至pUC 19 载体,测定核酸序列后,克隆入Bac-to-Bac 表达系统中杆状病毒转移载体pFastBacHTB 中多角体基因启动子的下游,筛选出重组质粒pFastBacHTB/APN1 并转化大肠杆菌DH10Bac,在体内进行重组,经抗性和蓝白斑筛选,获得杆状病毒重组载体Bacmid/APN1。转染粉纹夜蛾(Trichoplusia ni)细胞(Tn-5B1-4),获得含APN1 基因的重组杆状病毒,重组病毒感染Tn 细胞后,得到表达的蛋白。【结果】SDS-PAGE 分析和点杂交显示,目的基因得到了成功表达。【结论】APN1 基因在Tn 细胞中成功表达,为今后继续研究其功能和与抗性的关系奠定了基础。

【英文摘要】Abstract: 【Objective】 The present study was conducted to successfully express the Bt (Bacillus thuringiensis) toxin receptorprotein located on internal membrane of larval midgut of cotton bollworm (Helicoverpa armigera H ü bner), within eukaryoticexpression system. 【Method】 PCR method was used to separately amplify the fragments without signal peptide of AminopeptidaseN1 gene from midguts of susceptible and resistant H. armigera, and separately cloned into pUC 19 vector. After sequencing the gene,the fragments encoding for APN1 without signal peptide were cloned into the Bac-to-Bac baculovirus expression system transfervector pFastBacHTB under the polyhedron gene promoter. The recombinant transposing plasmid pFastBacHTB/APN1 was screenedand then transformed into E scherichia coli DH10Bac. It was cultured in LB plate which contained Te, Kan, Ge, X-gal and IPTG. Theresulting recombinant bacmid was transfected into cells of the insect Trichoplusia ni (Tn) and recombinant baculovirus was obtained.The lysate of cells infected with recombinant baculovirus was analyzed by SDS-PAGE and blot analysis. 【Result】 The resultsshowed that the recombinant baculovirus was fully capable of expressing APN1. 【Conclusion】 The APN1 gene was successfullyexpressed in Tn cell has established a foundation for its function research and its relationship of resistance to Bt.

【题目】辽河流域栽培稻对二化螟的抗性及机制
【中文关键词】 水稻品种 二化螟 抗虫性 形态特性 生化特性 组织特性
【英文关键词】Resistance of japonica rice varieties in Liaohe Valley to Chilo suppressalis and its underlying mechnisms
【中文摘要】采用活体成株鉴定法测定了辽河流域主栽水稻品种对二化螟发育和为害的影响,同时测定了不同品种的主要形态特性、硅细胞数量和主要生化特性,评价这些品种对二化螟的抗性、分析其发生的可能机制。盐丰47对二化螟幼虫表现出较好的抗性,在沈农265上二化螟幼虫体重最小。在所测定的特性中,螟害株率与不同品种倒二叶叶角的自然对数之间具有显著的正相关关系,与稻茎Si含量之间具有显著的负线性相关关系;二化螟幼虫体重只与不同品种稻茎直径之间具有显著的正线性相关关系。研究结果对水稻品种抗性利用和未来水稻抗性育种的意义。
【英文摘要】 To screen resistant rice varieties in Liaohe Valley to the rice stem borer Chilo suppressalis Walker, development of and damage by the borer larvae on the varieties were examined using intact-plant resistance evaluation method, and morphological and biochemical characteristics and number of silica cells of the rice varieties were determined to explore the potential resistance mechanisms. Percent of damaged plant was the smallest on the variety Yanfeng 47, and larval weight on Shennong 265 was the lowest. Percent of damaged plant was found to be strongly correlated with angle of the reciprocal 2nd leaf and Si content in stem, where the former is a positive logarithmic correlation and the latter is a negative linear one. And, a strong positive linear correlation was revealed between larval weight and stem diameter. Implications of the current results were discussed in the context of utilization of and future rice breeding for insect resistance.

【题目】绿盲蝽触角感器的扫描电镜观察
【中文关键词】绿盲蝽　触角　感器　超微结构
【英文关键词】Lygus lucorum　antenna　sensilla　ultrastructure
【中文摘要】利用扫描电镜对绿盲蝽雌雄成虫的触角形态和感器进行了观察。结果表明: 绿盲蝽触角为线形, 共4节, 即柄节、梗节和2个鞭节。触角感器共有4种, 分别为毛形感器、刺形感器、锥形感器、Böhm氏鬃毛。其中, 毛形、刺形、锥形感器各有两种类型。雌雄个体之间触角感器的类型、分布均没有明显差异。不同感器在触角各节上的数量与分布各不同。
【英文摘要】Antennal morphology and sensilla of the green plant bug, Lygus lucorum Meyer Dür (Heteroptera: Miridae), were studied using scanning electron microscopy. The results showed that the linear antenna consists of the scape, pedicel and two flagellomeres. Two types of sensilla trichodea, two types of sensilla chaetica, two types of sensilla basiconic and one type of Böhm bristles were distinguished with the shapes and distribution of sensilla. No difference was found in the type and distribution of the sensilla between the male and female adults. The quantity and distribution of each sensillum, however, were different in different segment of antenna.

【题目】麦长管蚜嗅觉相关蛋白Gqα基因的克隆及真核表达
【中文关键词】麦长管蚜,嗅觉,G蛋白α亚基q类蛋白(Gqα),克隆,昆虫杆状病毒表达系统
【英文关键词】England grain aphid, olfaction, Gqα protein, gene clone, baculovirus expression vector system (BEVS)
【中文摘要】蚜虫通过直接取食及传播病毒病造成危害,是温带农作物的主要害虫,是农业重大害虫之一。研究表明,昆虫的嗅觉在处理来自环境的化学信号过程中起着非常重要的作用,从而使昆虫能够成功地进行寄主定位,寻找配偶、产卵场所等。深入了解蚜虫嗅觉行为,可为研制高效的引诱剂或杀虫剂提供理论依据,具有重要的理论和实际意义。本研究结合RT-PCR及RACE技术扩增编码麦长管蚜嗅觉相关Gqα蛋白的cDNA序列,分析该基因的结构特征;并通过构建昆虫杆状病毒表达载体对该基因进行真核表达。取得如下研究结果:首次克隆麦长管蚜Gqα全长cDNA序列。根据已报道的动物嗅觉相关蛋白Gqα的氨基酸序列保守区设计简并引物,以麦长管蚜(Sitobion avenae)有翅成蚜cDNA为模板,结合RT-PCR及RACE技术扩增编码麦长管蚜Gqα蛋白的cDNA序列,其cDNA序列开放阅读框长为1062bp,编码352个氨基酸,预测蛋白分子量为40.8kDa,与GenBank多个物种Gqα的cDNA序列及氨基酸序列均有很高相似性(≥82.17%),并具有Gα亚基q类蛋白的典型特征(GenBank核酸序列登录号:EF638906,氨基酸序列登陆号:ABR37295)。利用TOPO及Gateway技术,通过重组反应,构建苜蓿丫纹夜蛾核型多角体杆状病毒(Autographa californica nuclear polyhedrosis virus, AcMNPV)重组病毒。将N端插入了V5-His6标记的V5-His6Gqα序列整合到AcMNPV病毒基因组DNA中,得到具有独立转染活性的重组杆状病毒。转染粉纹夜蛾离体细胞系Tn(Trichoplusia ni)进行Gqα蛋白的真核表达。SDS-PAGE检测到预期分子量约42kDa的蛋白带,Western-blotting检测到表达产物。表明含有6个组氨酸标签及V5抗原位点的Gqα融合蛋白V5-His6Gqα在昆虫离体细胞系中成功表达。本研究为进一步研究蚜虫G蛋白的功能及其信号传导途径奠定了基础,对今后深入开展昆虫与寄主植物互作机理及植物抗虫机制的研究,开辟防治新途径具有重要的理论和实践意义。
【英文摘要】The aphid is not only the primary pest of crops in variable zone but one of the most important pest to global agriculture also. For insects, olfaction plays an essential role in processing chemical signals from the environment, leading to the detection of food, reproductive partners, oviposition sites, host, prey or predators. Elucidation of the olfaction signalling will provide the theoretical foundation for the development of the effective attractant and deterrent, and the fresh ideas and approaches for potent control of Aphid.In this paper, a Gqα gene was cloned by RACE techniques and PCR from the England grain aphid, Sitobion avenae. further, the recombinant protein V5-His6Gqα were obtained by eukaryotic expression after an exhaustive analysis on both the cDNA sequence and amino sequence. The main results are as follows:Gqα was cloned for the first time from the England grain aphid(Sitobion avenae). Based on conserved homologous amino acid sequences of Gq protein α subunit in several animals, a pair of degenerate primers were designed to amplify the gene from the England grain aphid, Sitobion avenae. by RT-PCR and (3′/5′)-RACE techniques, A Gqα was obtained from the alate adult aphids. The open reading-frame is 1062bp, encoding 352 amino acid residues with calculated molecular weight of 40.8kDa. Both the nucleic acidsequence and amino acid sequence were deposited in GenBank with the accession

number, EF638906 and ABR37295. The deduced amino acid sequence of Gq α shared high identity (≥82.17%) with reported Gq α from other insects and even vertebrates, and with the typical characteristics of Gq α protein.In order to explore the function of Gq α gene, a eukaryotic expressional system (Baculovirus Expression Vector System, BEVS) had been constructed by TOPO and Gateway techniques. After the Recombinant reaction between the entry clone vector and Gateway-adapted Baculovirus DNA from AcMNPV, the construct recombinant viruses containing V5-His6Gq α were transfected into the insect cell line of Tn. After collecting the infected cell , the recombinent expression products were detected by SDS-PAGE and confirmed by Western blotting analysis, which showed that the molecule weight of V5-His6Gq α protein was about 42 kDa. The result showed that the system of recombinant baculovirus and Tn could expressed Gq α protein successfully.These achievements provide substaintial foundation for further research of G proteins and G-protein signaling pathways in England grain aphid (Sitobion avenae). It also has important theoretic and practical significance on going deep into interaction between insect and host plant, into pest-resistant mechanism of plant and exploring new control method.

【中文关键词】棉铃虫齿唇姬蜂; 寄主识别; 寄生偏好; 经历
【英文关键词】Campoletis chlorideae Uchida ; host discrimination ; host preference ; experience
【中文摘要】棉铃虫齿唇姬蜂室内寄生行为观察发现,无选择条件下,处女蜂对棉铃虫和斜纹夜蛾幼虫的寄生偏爱强于甜菜夜蛾,第 3 次遭遇,雌蜂对棉铃虫、斜纹夜蛾和甜菜夜蛾幼虫的累计产卵刺探率分别为 7313 %、70 %和 30 %; 产卵经历能显著增强雌蜂对最优寄主和次优寄主的寄生能力; 雌蜂不具同种识别过寄生能力,具一定自身识别过寄生能力,但时效期短于 8h。雌蜂对混合种群的寄生选择研究发现,寄生蜂对斜纹夜蛾幼虫的寄生率显著高于甜菜夜蛾幼虫,分别为 9110 %和 7613 %; 雌蜂对 3 日龄、4 日龄和 5 日龄斜纹夜蛾幼虫的寄生率分别为 7117 %、6718 %和 6314 %,三者之间差异不显著,均显著高于对 6 日龄幼虫的寄生率(3014 %) 。
【英文摘要】Observations indicated that naive female Campoletis chlorideae preferred larvae of Helicoverpaarmigera and Spodoptera litura to S . exigua under no2choice condition in a petri dish arena in the labo2ratory. The wasps parasitized 73. 3 % , 70 % and 30 % of larvae of H. armigera , S . litura and S . ex2igua , respectively , after encountering with host larvae for three times. Previous oviposition experiencesignificantly increased parasitism against both the most suitable and the hypo2suitable host larvae. Fe2males can not discriminate hosts parasitized by other conspecific females , and can only discriminatedhosts self2parasitized within 8 h. Under choice condition , female wasps parasitized more of larvae of S .litura (9110 % ±818 %) than S . exigua (7613 % ±1610 %) . Compared with 62d2old host larvae ,higher parasitism rates were found in 32d2old , 42d2old and 52d2old larvae ; while parasitism rates of thelatter three were not different.

【题目】棉铃虫齿唇姬蜂室内交配行为及影响因素的研究
【中文关键词】棉铃虫齿唇姬蜂　交配行为　影响因子
【英文关键词】Campoletis chlorideae　mating behavior　affecting factors
【中文摘要】对棉铃虫齿唇姬蜂室内交配行为研究表明,雄蜂是交配主导因素,一生中有多次交配表现,而雌蜂一般仅交配一次;雌雄个体交配持续时间为162.45±9.40s。24~36h蜂龄的雌蜂和36h蜂龄的雄蜂交配成功率最高;温度26℃和光照1500lx是雌雄个体成功交配的最佳条件。讨论认为,室内环境条件也可能是导致寄生蜂室内饲养性比失调的重要原因。
【英文摘要】
Mating behaviors of Campoletis chlorideae and affecting factors were investigated in laboratory. Results indic

ated that male adults played dominant role in mating. Male adult copulated more than one time while female usually copulated just one time in their lifetime. Successful copulation was the highest in 24 h and 36 h old female and, 36 h old male among all the adults tested, and suitable temperature and light intensity for successful copulation were 25-

35°C and 1500 lx, respectively. It was suggested that indoor environmental condition were important factors responsible for offspring male bias.

【题目】甜菜夜蛾对不同寄主植物的产卵和取食选择
【中文关键词】甜菜夜蛾 寄主植物 产卵选择 取食选择 植物挥发物抽提物 行为反应
【英文关键词】Spodoptera exigua host plant oviposition preference feeding preference plant volatile extract behavioural response
【中文摘要】为了探讨甜菜夜蛾Spodoptera exigua对不同寄主植物的产卵选择及成虫产卵选择与幼虫取食选择间的关联度,本研究选取玉米、豇豆、甘蓝、黄瓜、棉花、辣椒和番茄7种植物进行了选择性和非选择性实验研究,并采用Y型嗅觉仪测定了成虫对其中3种寄主植物及其挥发物抽提物的趋性。结果表明:在田间非选择性实验中,甜菜夜蛾在不同寄主植物上的落卵量依次为:玉米>辣椒>棉花>黄瓜、豇豆、番茄>甘蓝。Y型嗅觉仪的行为测定表明,雌成虫对玉米及其挥发物抽提物的趋性最强,黄瓜次之,对甘蓝的趋性最弱,这与雌虫的产卵选择性一致。不同龄期甜菜夜蛾幼虫对寄主植物的取食选择性有所不同,且随观测时间的延长有所改变;低龄幼虫对豇豆、玉米和黄瓜的选择性较强,对甘蓝、番茄、辣椒和棉花的取食选择性则较弱,高龄幼虫对辣椒也具有较强的选择性;5龄幼虫对寄主植物的选择性不如低龄幼虫明显。结果显示,甜菜夜蛾对不同寄主植物的产卵选择性显著不同,植物抽提物在雌成虫的产卵选择中具有重要作用,甜菜夜蛾对寄主植物的产卵选择性和幼虫取食选择性并不一致。
【英文摘要】 To explore the adult oviposition and larval feeding preferences of Spodoptera exigua (H ü bner) to different host plants and their relationship, adult oviposition and larval feeding preferences of the moth on seven host plants, i.e., maize Zea mays L., cowpea Vigna unguiculata (L.) Walp., cabbage Brassica oleracea L. var.capitata L., cucumber Cucumis sativus L., cotton Gossypium hirsutum L., pepper Capsicum frutescens L. and tomato Lycopersicon esculentum Miller, were assessed by selection and non-selection tests. Behavior response of S. exigua females to three plants (maize, cabbage and cucumber) and their volatile extracts were also tested by Y-type olfactometer. The results of the field non-selection oviposition preference test indicated that the amount of S. exigua eggs on different plants ranked as maize > pepper > cotton > cucumber, cowpea, and tomato > cabbage. In the Y-type olfactometer tests, females showed the strongest behavioural response to maize and its volatile extract, less response to cucumber, and the weakest response to cabbage. The results of behavioural response tests were in accordance with the results of the oviposition preference tests. Host plant feeding preference of S. exigua larvae at different instars differed to some extent with the prolonged observation period. Young larvae of the 1st and 2nd instars preferred to feed on cowpea, maize and cucumber, but not on cabbage, tomato, pepper and cotton. Larvae of the 4th and 5th instars also showed feeding preference to pepper. Feeding preference of the 5th instar larvae was not as obvious as the earlier larvae. These results suggest that the oviposition preference of S. exigua to different host plants differs significantly, the plant volatiles play important roles in its oviposition host selection, and adult oviposition and larval feeding preferences of S. exigua are not consistent.

【题目】甜菜夜蛾体内代谢耐受性对转Bt基因棉响应的时间动态
【中文关键词】　苏云金杆菌　甜菜夜蛾幼虫　解毒酶　羧酸酯酶活力　乙酰胆碱酯酶　超氧化物歧化酶　棉花品种　保护酶　常规棉　时间动态
【英文关键词】无
【中文摘要】在室内用转Bt基因棉和亲本常规棉饲养甜菜夜蛾(Spodoptera exigua Hübner)幼虫,测定了不同取食时间后甜菜夜蛾4龄幼虫体内营养物质含量和消化酶、保护酶、解毒酶活力的变化.结果表明,分别取食Bt棉和常规棉,甜菜夜蛾幼虫体内的营养物质含量和消化酶、保护酶、解毒酶活力差异显著.与取食常规棉相应时间的个体相比,取食Bt棉1,6,24h后,幼虫体内的游离脂肪酸和葡萄糖含量显著提高;取食Bt棉1,4,6,24h后,幼虫体内胰蛋白酶和总超氧化物歧化酶的活力显著增高,脂肪酶、羧酸酯酶和乙酰胆碱酯酶活力则显著降低.取食相同品种棉花,幼虫体内营养物质含量和消化酶、保护酶、解毒酶活力受甜菜夜蛾危害时间的显著影响.取食Bt棉24h的幼虫,其体内游离脂肪酸和总氨基酸含量显著低于取食1h的个体;脂肪酶和胰蛋白酶活力显著低于取食1和4h的个体,但羧酸酯酶和乙酰胆碱酯酶酶活力显著高于取食1,4,6h的个体.棉花品种和甜菜夜蛾为害时间的交互作用可显著影响甜菜夜蛾体内脂肪酶、胰蛋白酶、乙酰胆碱酯酶和总超氧化物歧化酶的活力.通过测定甜菜夜蛾体内保护酶和解毒酶活力对Bt棉响应的时间动态,对于评价植食性昆虫在毒素蛋白持续选择压力下的生理反应和抗性变化具有重要参考意义.

【题目】甜菜夜蛾体内酶活性对三种棉酚含量棉花的响应
【中文关键词】　甜菜夜蛾幼虫　棉酚含量　游离脂肪酸　解毒酶　乙酰胆碱酯酶　总过氧化物歧化酶　超氧化物歧化酶　棉花品种　过氧化氢酶活性　羧酸酯酶
【英文关键词】无
【中文摘要】在室内用3种不同棉酚含量的棉花饲养甜菜夜蛾幼虫,并在不同取食时间测定了甜菜夜蛾幼虫的营养物质、消化酶、保护酶和解毒酶活性的变化.实验结果表明,甜菜夜蛾幼虫取食高棉酚含量的棉花M9101品种6h后,体内的游离脂肪酸较取食其他两种低酚含量棉花出现了显著性的降低.甜菜夜蛾幼虫取食高棉酚含量的棉花M9101品种24h后,体内的胰蛋白酶较取食1,4,6h后出现了显著性的增加.甜菜夜蛾幼虫取食高棉酚含量的棉花M9101品种1,4,6,24h后,体内的过氧化氢酶和总超氧化物歧化酶显著高于取食低酚棉花品种ZMS13和HZ401,但体内显著较低的羧酸酯酶和乙酰胆碱酯酶酶活性显著低于取食低酚棉花品种ZMS13和HZ401.多因素方差分析表明,不同棉酚含量棉花品种除对甜菜夜蛾幼虫体内淀粉酶活性无影响外,对其他消化酶、保护酶和解毒酶活性均有显著性的影响.棉花品种和甜菜夜蛾不同为害时间的交互作用可显著影响甜菜夜蛾幼虫体内的羧酸酯酶和过氧化氢酶活性.测定对甜菜夜蛾不同为害时间体内酶活性对不同棉酚含量的棉花的响应,可有效评估植食性昆虫在植物次生代谢物质压力下的生理反应和抗性变化.

【题目】小麦叶片表面蜡质及其与品种抗蚜性关系
【中文关键词】小麦　叶表蜡质　麦蚜　抗虫性　BSTFA　气相色谱-质谱联用仪
【英文关键词】wheat;epicuticular wax on leaves;wheat aphid;resistance to pest insect;BATFA;GC-MS
【中文摘要】建立了一套适宜小麦表面蜡质的提取和气相色谱-质谱联用(GC—MS)分离和鉴定的方法,测定了16种不同小麦品种的叶表蜡质成分,初步分析了不同抗虫品种及不同生育期各组分的变化动态与趋势.从小麦表面蜡质的提取物中分离和鉴定出30余种化合物,为9种烷烃、7种脂肪醇、10种脂肪酸、2种醛和2种酮;并以GC—MS进行组分鉴定,以峰面积值为指标,定量计算和比较表面蜡质各组分的含量,其中主要成分是脂肪醇,占68.1%,仅C28醇就占分离物质总量的50.14%,其次为烷烃,再次为脂肪酸和醛,酮含量最低.抗蚜与感蚜小麦品种表面蜡质的组成变化不大,但大多数组分的含量差异明显,其中醇、酸和醛的含量均有随小麦品种抗蚜性增强而升高的趋势;不同生育期,小麦表面蜡质各组分的含量也存在明显差异,在小麦孕穗-抽穗期,抗蚜小麦品种中C28醇、C30醇及总醇的含量高于感蚜小麦品种.室内、田间小麦苗期及孕穗-抽穗期表面蜡质中的C28醇,C28酸、C18酸、C18烯酸,C26醛、C28醛的含量则随抗性增加而升高.研究结果可为进一步开展小麦表面蜡质单一组分对麦蚜寄主选择和抗蚜作用影响研究奠定基础.
【英文摘要】Based Oll GC.MS.a method for extraction.isolation and identification of epicuticular wax on wheat leaves was es—tablished.The epicuticular wax components from 16 varieties at different resistant levels to aphids were measured.thus the dy—namic changes and trends among the different cuhivars and at different growth stages were preliminarily analyzed.The major re—suits were obtained as:30 compounds of epicuticular wax were isolated and identified from wheat leaf extraction,including 9alkanes.7 fatty alcohols,10 fatty acids.2 aldehydes and 2 diketones. By using the value of peak area,the contents of thecomponents were ca]lculated and analyzed.The result showed that the cascade ranks of the contents were fatty alcohol > al—kanes>fatty acids and aldehyde> diketone.The fatty alcohol was the major component of the epicuticular wax.and it ae—counted for 68.1% and octacosanol accounted for 50.14% of the fatty alcoho1.W ith analysis and comparison of the compo—nents of epicuticular wax in the aphid—resistant and aphid—susceptible wheat varieties.it was found there were no obvious differ—ences among wheat varieties,but there were significant differences in the contents of epicuticular wax components among wheatvarieties.There was a trend that the content of fatty alcohols.fatty acids and aldehydes increased with the rising of wheat a—Dhids-resistanee leve1.In the meantime.the contents of some components of the epicuticular wax on wheat leaves varied signifi—cantly at different growth stages.At ear sprouting stage there was a trend that the contents of octacosanol,triacontanol and totalalcohol were higher in resistant wheat varieties than those in susceptible ones.At seedling and ear sprouting stages,no matterwhat samples from wheat grew indoors or in field,the contents of octacosanol,octacosanoic acid,octadecanoic acid,oleicacid.hexaeosanal and octacosanal increased with the rising of aphid—resistant level of the wheat cuhivars.The results lay afoundation for funher research of the function of single component of wheat expicuticular wax on aphid host plant selection andresistance to aphid.Fig 4.Tab 1.Ref 33

【题目】植食性昆虫的寄主选择机理及行为调控策略
【中文关键词】 植食性昆虫 寄主选择 行为 机理 害虫行为调控
【英文关键词】phytophagous insects host-plant selection mechanism pest behavioural manipulation
【中文摘要】害虫是影响农作物生产的重要因素,过度使用化学农药已带来严重的“3R”问题。为了长期有效地控制害虫的危害,基于植食性昆虫寄主选择机制的行为调控策略已成为害虫治理研究的重要方向。天然植物资源(如驱避植物、诱集植物与诱集枝把)、物理模拟材料(如诱集色、驱避色与诱集模型)和人工合成物质(如引诱剂、驱避剂、刺激剂与抑制剂)等研发工作皆取得了突破性的进展。除单一措施的使用外,多种诱集措施协同利用的“诱集+诱集”策略、诱集措施与趋避措施结合使用的“排斥-诱集”策略也已被广泛应用。
【英文摘要】Insect pest is one of the most important factors adversely affecting the development of crop production,and the control method intensively depending on insecticide application has brought serious 3R (residue, resistance and resurgence) problems. The novel control strategy based on the behavioral manipulation of phytophagous insects has become a main research field in recent decades for sustainable management of crop pests. Many trap and repellent techniques derived from the natural plant resources (e.g. trap crop, repellent crop and trap twig bundle), physical stimulant materials (e.g. trap color, repellent color and trap model) and synthetic compositions (e.g. attractant, repellent, stimulant, deterrent) have been developed successfully. Beside the single trap strategy, the pull-pull strategy combining different trap measures and the push-pull strategy integrating the utilization of trap and repellent measures, have been widely exploited for pest management in agricultural production.

【题目】植物表面蜡质对植食性昆虫的影响研究进展
【中文关键词】表面蜡质;植食性昆虫;植物保护
【英文关键词】无
【中文摘要】植物表面蜡质的最初角色是防止植株体内水分的散失和外界水分的进入,其分布的部位、化学成分和结构的复杂性与复杂的生态角色相对应。植物表面蜡质的物理化学特性能够抵抗各种各样生物与非生物侵害,这些侵害包括真菌病害、植食性昆虫、太阳射线、冻结温度等。植物表面蜡质还是植物、植食性昆虫及其捕食者和寄生者相互作用的竞技场,其特有的化学成分和形态学特征赋予它特有的生态机能,这些机能之一便是植物与植食性昆虫之间相互作用的媒介。植物表面蜡质的物理结构和数量能够影响植食性昆虫的附着和移动。表面蜡质可通过影响天敌对植食性害虫的捕食,从而间接影响植食性害虫的行为。表面蜡质提取物和单一的蜡质成分能够刺激或者抑制植食性昆虫产卵、活动和取食。烷烃、蜡酯、游离脂肪醇和酸等脂肪族化合物是表面蜡质的主要成分,在植食性昆虫选择寄主植物中,长链脂肪族化合物起着尤为重要的作用;芳香族化合物也影响昆虫对寄主植物的选择。植食性昆虫较少在光滑蜡质少表现型的作物上取食,在光滑蜡质少表现型的作物上,表面蜡质的数量少,化学组分和形态学特征也不同。研究光滑蜡质少作物抗虫的分子生物学机制,有助于阐明植物表面蜡质在植物与昆虫之间所起的作用。表面蜡质的理化特性能够改变害虫与寄主植物间的相互作用,具有重要的农业影响,已成为一个活跃的研究领域。

【题目】中黑盲蝽在几种寄主植物上取食行为的比较研究
【中文关键词】中黑盲蝽;取食行为;刺探电位参数;寄主;组织
【英文关键词】Adelphocoris suturalis; Probing behavior; EPG; Host crop; Structures
【中文摘要】【目的】明确中黑盲蝽在主要寄主植物上的取食刺探行为,为评价寄主抗虫性和寄主选择习性提供方法和依据。【方法】通过EPG技术研究中黑盲蝽在菜豆、苜蓿、甘蓝和小麦以及棉花的生长点、子叶、真叶等器官上的取食特征。【结果】中黑盲蝽在各寄主上的刺探电位波形由Ⅰ波、Ⅱ波、Ⅲ波和Ⅳ波4部分组成。Ⅰ波表示口针的刺入;Ⅱ波表示口针在撕裂植物组织和细胞,并向外分泌唾液;Ⅲ波表示取食;Ⅳ波表示口针的拔出。中黑盲蝽取食苜蓿和棉花生长点的每次刺探时间、每次刺探中的Ⅲ波时间均显著长于其它测试植物或器官。【结论】发现并定义了中黑盲蝽的四类刺探波(Ⅰ波、Ⅱ波、Ⅲ波、Ⅳ波)。通过比较EPG参数,发现在几种测试植物中,中黑盲蝽喜欢取食苜蓿,而在棉花植株上喜欢取食生长点。
【英文摘要】【Objective】 The feeding behavior of Adelphocoris suturalis was investigated in the laboratory in order to provide basis for evaluation of host plant resistance and host choice of this insect. 【Method】 The probing waveforms of A. suturalis on green bean, alfalfa, cauliflower, wheat and cotton were recorded and analyzed with direct current electrical penetration graph (DC-EPG) technique. 【Result】 Observations on five host plants revealed that four waveforms correlated with feeding behavior: Ⅰ represents stylet thrusting into plant tissue, Ⅱ represents multiple-cell laceration and salivation, Ⅲ represents ingestion, and Ⅳ represents withdrawal of the stylet from the plant tissue. The probe duration and the duration of Ⅲ per probe by A. suturalis on alfalfa were significantly longer than on other hosts, while the insect much preferred the growing point of cotton to other structures (cotyledon and leaf). 【Conclusion】 The probing waveforms of A. suturalis were defined in this experiment. The results by comparing the EPG parameters in the test showed that alfalfa and growing point of cotton in this test were the best feeding plant or structure for the insect.

【题目】转Bt基因抗虫棉对棉蚜消化酶的风险评价
【中文关键词】转Bt 基因抗虫棉; 棉蚜; 消化酶
【英文关键词】Transgenic Bt insect resistant cotton; Cotton aphid; Digestive enzyme
【中文摘要】棉蚜是转Bt 基因抗虫棉(简称Bt 棉) 上的非目标害虫, 也是Bt 棉上危害较严重的害虫之一。用酶标仪在室内测定了取食Bt 棉GK12 不同世代棉蚜中肠消化酶系的活力和比活力, 包括蛋白酶、蔗糖酶、海藻糖酶和淀粉酶,并与取食亲本常规棉泗棉3 号的棉蚜比较, 以研究Bt 棉对棉蚜中肠消化酶的短期影响和长期效应。结果发现, 取食Bt 棉1 代、2 代、3 代和60 代以上的棉蚜, 与取食常规棉棉蚜的这4 种消化酶的活力和比活力之间均无显著差异, 在Bt 棉上取食不同世代棉蚜的消化酶活力也无显著差异。表明无论从短期影响还是长期效应来看, Bt 棉对棉蚜的中肠消化酶系均无显著影响。
【英文摘要】Cotton aphid Aphis gossypii (Homoptera: Aphidae) is one of the seriously occurred non target pests intransgenic Bt cotton fields. The activit ies and specific activit ies of midgut digestive enzymes, including proteinase, amy lase, trehalase and sucrase, of cotton aphids fed on Bt cotton cv. GK12 for different generat ions were detected with mi crotiter plate reader, and were compared with those of cotton aphids fed on the non Bt parental cotton cv. simian 3.Thus the short term and long term effects of Bt cotton on the digest ive enzymes of cotton aphids were determined. The re sults showed that there were no significant differences in the activities and specific activities of the four digest ive enzymesbetween the cotton aphids fed on Bt cotton and non Bt parental cotton, no matter for one to three generations, or for oversixty generations. And there were no significant difference among the cotton aphids fed on Bt cotton for different genera tions. It indicated that Bt cotton had no significant impacts on the activities of cotton aphid s midgut digestive enzymesboth in the short run and long term.

【题目】转Bt基因棉对土壤无脊椎动物群落结构的影响
【中文关键词】转Bt基因棉 土壤无脊椎动物 群落结构 多样性
【英文关键词】Transgenic Bt cotton Soil invertebrate Community structure Diversity
【中文摘要】采用干、湿漏斗分离法, 运用群落生态学方法, 研究了转Bt基因棉“ GK12 ”和“ 新棉33B ”对棉田0~15 cm土层土壤无脊椎动物群落结构的影响。结果表明, 线虫和螨类为棉田土壤无脊椎动物优势类群, 其频度分别为54%以上和18%以上。与亲本常规棉“ 泗棉3号 ”相比,“ GK12 ”提高了土壤线蚓数量, 但降低了某些土壤无脊椎动物类群(如同翅目、虫齿目和双翅目)的数量; 两种Bt棉田中,“ 新棉33B ”棉田的同翅目昆虫数量显著高于“ GK12 ”, 蜘蛛目数量显著低于“ GK12 ”棉田, 其他土壤无脊椎动物类群的数量则基本上无显著差异。“ GK12 ”显著降低了土壤无脊椎动物类群的丰富度、多样性和均匀度; 两种Bt棉中,“ 新棉33B ”棉田土壤无脊椎动物类群的丰富度、多样性和均匀度较高。R é nyi多样性指数曲线也表明,“ GK12 ”棉田各土层土壤无脊椎动物群落的多样性均显著低于“ 泗棉3号 ”棉田;“ 新棉33B ”棉田各土层土壤无脊椎动物群落的多样性高于“ GK12 ”, 但10~15 cm土层常见类群和优势类群的多样性较低。在各土层中, 土壤无脊椎动物数量、多样性指数和均匀度指数动态在不同类型棉田趋势基本相同。7~11月期间, 10月是土壤无脊椎动物数量的高峰期, 此时在“ 泗棉3号 ”棉田土壤无脊椎动物在0~5 cm的表层和10~15 cm的深层土壤均较多, 在“ GK12 ”和“ 新棉33B ”棉田则集中于10~15 cm的深层土壤。11月,“ 泗棉3号 ”土壤无脊椎动物类群的多样性和均匀度呈下降趋势,“ GK12 ”则呈上升趋势。可见, 种植Bt棉“ GK12 ”可改变某些土壤无脊椎动物类群的数量, 降低类群的丰富度、多样性和均匀度; 两种Bt棉田的土壤无脊椎动物群落结构也有一定的差异,“ 新棉33B ”棉田土壤无脊椎动物群落的多样性高于“ GK12 ”。
【英文摘要】Soil invertebrates were collected by Tullgren and Baermann funnels and analyzed using community ecology method. Then soil invertebrate community structures in the 0~15 cm soil layer in transgenic Bt cotton (cvs.“ GK12 ” and “ NuCOTN 33B ”) fields were compared with those in non-Bt cotton (cv.“ SM3 ”) fields. Nematodes and acarids are dominant soil invertebrate groups with frequencies above 54% and over 18% respectively in each cotton cultivar field. Compared with parental non-Bt cv.

“ SM3 ” field, “ GK12 ” field has more enchytraelidae and less homopetera, psocoptera and diptera. Cumulative numbers of most soil invertebrate groups do not significantly differ in “ GK12 ” and “ NuCOTN33B ” fields, except that there are less homoptera and more araneae in “ GK12 ” field. Soil invertebrate group richness, Shannon diversity and Pielou evenness are significantly lower in “ GK12 ” field than in “ SM3 ” field. Those in “ NuCOTN 33B ” field are also higher than in “ GK12 ” field. Scalable one-parametric R é nyi-diversity profiles also indicate significantly lower diversity in “ GK12 ” than in “ SM3 ” field, and generally lower diversity in “ GK12 ” than in “ NuCOTN 33B ” field, except for dominant and common invertebrate groups in the 10~15 cm soil layer. The dynamics of soil invertebrate abundance, diversity and evenness have a similar fluctuation trend for the three cotton cultivar fields. Abundance of soil invertebrate reaches its peak in October during the period from July to November. At the peak, soil invertebrates are concentrated in the 0~5 cm and 10~15 cm soil layers in “ SM3 ” field, but in the 10~15 cm soil layer in “ GK12 ” and “ NuCOTN 33B ” fields. While invertebrate diversity and evenness decrease in November in “ SM3 ” field, they increase in “ GK12 ” field. The above findings imply that planting “ GK12 ” changes the abundance, and decreases the richness, diversity and evenness of soil invertebrate groups. Soil invertebrate community structures also differ between the two Bt cotton cultivars, with higher diversity in “ NuCOTN 33B ” than in “ GK12 ” field.

【题目】转基因抗虫棉对棉蚜生长发育和繁殖的影响
【中文关键词】转基因抗虫棉　非目标害虫　棉蚜　生长发育　繁殖
【英文关键词】Transgenic insect-resistant cotton　Non-target pests　Cotton aphid Aphids gossypii Glover　Development　Reproduction

【中文摘要】以常规棉泗棉3号上饲养10代的棉蚜作为虫源,以其亲本为对照,在室内分别研究了转单、双价基因抗虫棉对棉蚜的短期影响,及单价抗虫棉对棉蚜的长期效应。结果发现,单价抗虫棉GK12和双价抗虫棉SGK321在短期内对棉蚜生长发育、繁殖和生命表参数无显著影响。在抗虫棉上取食1代的棉蚜,各龄发育历期、成虫寿命、产仔数和产仔历期、内禀增长率、净增长率、平均发育历期等和取食亲本的棉蚜之间均无显著差异。在GK12上取食37代的棉蚜与取食亲本常规棉泗棉3号和在GK12上取食1代的棉蚜之间以上各指标也无显著差异。可见,单价抗虫棉GK12和双价抗虫棉SGK321在短期内对棉蚜的生长发育和繁殖均无显著影响,GK12在长期内对棉蚜也未产生显著影响。

【英文摘要】The short-run impacts of transgenic insect-resistant cotton cvs. GK12 and SGK321 and long-term impacts of GK12 on cotton aphids Aphis gossypii Glover were evaluated by laboratory experiments. Laboratory cotton aphid population kept on non-transgenic cotton cv. Simian 3 for ten generations was used for the experiments, and the isogenic nontransformed varieties of GK12 and SGK321 were used as their relative controls. The results indicated that GK12 and SGK321 had no impacts on the development, reproduction and parameters of life tables of cotton aphids in the short run. When fed on transgenic cotton cv GK12 or SGK321 for one generation, the development period of each instars larvae, adult longevity, number of offsprings, reproduction period, intrinsic rate of increase, net reproductive rate, average development period of cotton aphids did not differ significantly to those of cotton aphids fed on their relative isogenic cotton. GK12 showed no impacts on the development and fecundity of cotton aphids, even the cotton aphids were fed with GK12 for 37 generations. So it was concluded that there were no impacts of transgenic insect-resistant cotton GK12 and SGK321 on the development and reproduction of cotton aphid both in the short run, and GK12 had no impacts on cotton aphid in the long term.

【题目】转基因抗虫棉田二代棉铃虫的不完全生命表
【中文关键词】转基因抗虫棉　　棉铃虫　　生命表
【英文关键词】transgenic insect-resistant cotton　　Helicoverpa armigera　　life table
【中文摘要】通过罩网和开放式观测相结合的方法,组建了单、双价抗虫棉田二代棉铃虫自然种群的不完全生命表,分析了消长的关键因素。与亲本常规棉相比,单、双价抗虫棉对棉铃虫一龄幼虫均有较好控制作用,Bt蛋白致死效应是抗虫棉田棉铃虫种群消长的关键因素。天敌捕食也是棉铃虫卵和一龄幼虫消亡的重要因素,捕食作用在抗虫棉及其亲本棉田相近。
【英文摘要】　By cage experiments, partial life tables of the second generation of　Helicoverpa armigera　(CBW) in transgenic cotton fields (cvs. SGK 321 and GK 12) were established to evaluate key factors affecting their populations. It showed Bt protein expression in cotton plant was the key factor affecting population dynamics of CBW in GK 12 and SGK 321. Predation ranked the second, and predation efficacy in both transgenic cotton fields had no significant difference to that in their correspongding parental cotton fields.

【题目】转基因抗虫棉田棉蚜种群消长关键因素分析
【中文关键词】　转CryAc+CpTI基因棉　转Bt基因棉　棉蚜种群　生命表　控害作用　转基因抗虫棉　双价抗虫棉　自然死亡显著差异　常规棉
【英文关键词】TransgenicCrylAc+CpⅢ cotton;transgenicBtcotton;Aphisgossypii;lifetables;controleicacy
【中文摘要】为研究转基因抗虫棉田棉蚜种群动态的主要影响因素,在河北省南皮县采用罩网和开放式观测相结合的方法,以亲本常规棉为对照,对转Bt基因棉田和转Bt+CpTI双价基因棉田棉蚜自然种群消长的关键因素进行了分析。与常规棉相比,单、双价抗虫棉对天敌捕食和寄生、病原物、风雨等生物和非生物因素对棉蚜种群的自然控制作用均未产生显著影响;各因素中,除自然死亡及未知因素死亡外,天敌捕食对棉蚜自然种群的控制作用最强,风雨的作用次之,天敌寄生和病原物的作用则较弱。单价抗虫棉田棉蚜的发育历期和产仔量均与亲本常规棉田无显著差异,但双价抗虫棉田棉蚜的发育历期较对照显著延长,产仔量则无显著差异。由此表明,捕食性天敌对单、双价抗虫棉田非靶标害虫棉蚜具有较好的自然控制作用,是影响棉蚜自然种群数量动态的关键因素;单、双价抗虫棉的抗蚜性存在一定差异。
【英文摘要】Bycageexperiments,lifetablesofcottonaphid,Aphisgossypii,intransgeniccottonifelds(CVS.GK12andSGK321)wereestablishedtoevaluatekeyfactorsaffectingaphidpopulations.Thesestudieswerecarriedoutin NanpiCounty,HebeiProvinceinJuly,20o4withthenon—transgenicparentlacottonvarieties(CVS.Simian3andShiyuan321)ascontro1.ItshowedthatbothGK12andSGK321hadno signiifcantimpactson naturalcontroleicacyofthebiologicaland non・-biologicaldeath factorsofcot・-ton aphids.Exceptforthefactorofnaturaldeathand others,predationwasthekeyfactorfafecting popu—lation dynamicsofcotton aphid.Rain ranked the second,praasitism by insectsand pathogenshadweakcontrolefficacy.Exceptthatcotton aphidhadlongerdevelopmentalpeirod in SGK321ifeld,transgeniccotton GK12 andSGK321had noadvesreimpactson developmentandfecundityofcottonaphids.Itindi—cated thatpredation was the key factor fafecting population dynamics ofcotton aphids in GK12 andSGK321 and theirrespectiveparentalcotton ifelds. And impactsofGK12 and SGK321 on developmentandfecundityofcotton aphidswerediffernt.

【题目】转基因棉田释放赤眼蜂增强生物控害功能的研究
【中文关键词】转基因抗虫棉; 棉铃虫; 螟黄赤眼蜂; 控害作用
【英文关键词】Transgenic insect-resistant cotton; Helicoverpa armigera; Trichogramma chilonis; Pest control efficary
【中文摘要】为了增强转基因抗虫棉与自然天敌的联合控害功能,为转基因棉田害虫控制策略的调整和制定提供依据,于2002年在山东省惠民县转基因抗虫棉田设置化防田和以释放赤眼蜂为主的综防田,研究了棉铃虫卵的分布格局、释放赤眼蜂对棉铃虫的控制效果及生态效应。结果发现:棉铃虫卵在棉株不同部位的分布差异较大,2代棉铃虫卵主要分布在叶正面、叶背面和茎尖,3代棉铃虫卵主要分布于蕾铃;在放蜂田,赤眼蜂对棉株不同部位棉铃虫卵的寄生率差异较大,2,3代棉铃虫时期对叶正面、叶背面、茎尖、蕾铃的棉铃虫卵寄生率均较高,对叶柄和茎杆处卵的寄生率较低;并以3代棉铃虫时期的寄

生率较高;在2,3代棉铃虫时期分别连续释放3次赤眼蜂,对棉铃虫具有很强控制作用,2,3代棉铃虫卵的被寄生率分别为66.0% ~70.7%和76.0% ~81.2% ,均显著高于化防田的自然寄生率(2代:7.0%~ 12.3% ,3代:5.2% ~7.4%);蕾铃被害率分别为2.2% 和3.1% ,均显著低于化防田(2代:8.5% ,3代:20.9%);2代棉铃虫时期,放蜂田和化防田的棉铃虫卵量和幼虫数量差异均不显著,但3代棉铃虫以后,放蜂田棉铃虫卵量和幼虫数量均显著低于化防田,且放蜂田的捕食性天敌数量显著高于化防田。可见,转基因抗虫棉田棉花生长中后期通过释放赤眼蜂可有效防治棉铃虫,降低其为害,并有利于棉田捕食性天敌的保护。

【英文摘要】Abstract:To improve the integrated pest control efi cacy of transgenic insect—resistant cotton an d natural enemies,biological control eficacy and ecological effects of mass-releasing Trichogramma chilonis in transgenic insect—resistant cotton(CV.Lumianyanl5)field were surveyed in Huimin county,Shandong province in 2002,with the chemically con—trolled cotton field as contro1.Trichogramma showed high control eficacy on cotton bollworm eggs after three times of re—lease both in the second and in the third generation bollworm periods.The parasitism on the second and third generationbollworm eggs were 66.0% 一70.7% and 76.0% 一81.2% ,respectively,which were significantly higher than that in thecontrol(second generation:7.0% 一12.3% ,third generation:5.2% 一7.4%).And the injury rate of cotton buds andbolls in the second and third generation bollworm were 2.2% and 3.1% ,respectively,which were sign ificantly lower thanthat in the control(second generation:8.5% ,third generation:20.9%).In the second generation bollworm period,nunberof bollworm eggs or larvae in the Tnchogramma released cotton field did not difer to that in the chemi cally controlledfield.But in the third generation,there were sign ificantly less bollworm eggs an d larvae in the Trichogramma released cottonfield.Th ere were more predators in the Trichogramma released cotton field.Th ese results indicated that cotton bollworm in the transgenic insect—resistant cotton field can be effectively controlled by mass—releasing of T.chilonis.And thebiocontrol method is also beneficial to predator protection in the cotton fields.

【题目】转基因植物的生态安全性风险

【中文关键词】转基因植物, 生态风险, 害虫抗性, 非目标生物, 基因漂移

【英文关键词】Genetically modified plant, Ecological risk, Insect resistance, Non—target organism, Gene flow

【中文摘要】转基因植物的应用在对农业生产带来重大变革的同时,其安全性风险备受关注。本文重点论述了转基因植物的生态安全性风险,即转基因植物的使用带来的直接或间接的生态影响,包括:目标害虫对转基因植物的抗性,转基因植物对非目标害虫的毒性及其对寄主嗜好性、有益生物及天敌的安全性、生物多样性及生态系统结构的影响;基因漂移及杂草化问题及应用转基因作物后植保费用的变更等。针对这些关键问题,定量风险评估和制定风险预防与治理策略具有重要意义

【英文摘要】Application of genetically modified plants(GMP)results in great agricultural renovation,though their potential environmental impacts also cause world—wide concern. The ecological risks of GMP,including resistance development among target pests;non-target pest toxicity and host preference shifts of pests;impact on beneficial insects,biodiversity and ecosystem structure;transgene dissemination and development of fitter or more competitive hybrids;changes in plant protection costs;etc require special emphasis in GMP application.For these key aspects,quantitative risk assessment and establishment of risk prevention andmanagement strategy are of great importance

【题目】Lethal effect of imidacloprid on the coccinellid predator Serangium japonicum and sublethal effects on predator voracity and on functional response to the whitefly Bemisia tabaci
【中文关键词】Toxicity, Hazard quotient, Neonicotinoid, Risk assessment, Integrated pest management
【英文关键词】Toxicity, Hazard quotient, Neonicotinoid, Risk assessment, Integrated pest management
【中文摘要】Neonicotinoid insecticides are widely used for controlling sucking pests, and sublethal effects can be expected in beneficial arthropods like natural enemies. Serangium japonicum is an important predator in many agricultural systems in China, and a potential biological control agent against Bemisia tabaci. We evaluated the toxicity of imidacloprid to S. japonicum and its impact on the functional response to B. tabaci eggs. S. japonicum adults exposed through contact to dried residues of imidacloprid at the recommended field rate on cotton against B. tabaci (4 g active ingredient per 100 l, i.e. 40 ppm [part per million]), and reduced rates (25, 20, 15 and 10 ppm) for 24 h showed high mortality rates. The mortality induced by a lowest rate, 5 ppm, was not significantly different than the control group and thus it was considered as a sublethal rate. The lethal rate 50 and hazard quotient (HQ) were estimated to be 11.54 ppm and 3.47 respectively, indicating a risk for S. japonicum in treated fields (HQ[2). When exposed to dried residues of imidacloprid at the sublethal rate (5 ppm) on cotton leaves, functional response of S. japonicum to B. tabaci eggs was affected with an increase in handling time and a reduction in peak consumption of eggs. Imidacloprid residues also disturbed predator voracity, the number of B. tabaci eggs consumed on treated leaves being significantly lower than on untreated leaves. All effects disappeared within a few hours after transfer to untreated cotton leaves. Imidacloprid systemically applied at the recommended field rate (for cotton) showed no toxicity to S. japonicum, nor affected the functional response of the predator. Sublethal effects of imidacloprid on S. japonicum observed in our study likely negatively affect S. japonicum development and reproductive capacity and may ultimately reduce predator population growth. These results hint at the importance of assessing potential effects of imidacloprid on S. japonicum for developing effective integrated pest management programs of B. tabaci in China.

【题目】Genetic Variation Among the Geographic Population of the Grain Aphid, Sitobion avenae (Hemiptera: Aphididae) in China Inferred from Mitochondrial COI Gene Sequence
【中文关键词】Sitobion avenae, insect pest, mitochondrial DNA, mtDNA-COI gene, geographic variation
【英文关键词】Sitobion avenae, insect pest, mitochondrial DNA, mtDNA-COI gene, geographic variation
【中文摘要】In order to characterize the genetic relationship of the geographic populations of Sitobion avenae (Hemiptera: Aphididae) in China, a 588 bp region of the mitochondrial cytochrome oxidase subunit I (mtDNA-COI) gene was sequenced and

analyzed among the different geographic populations. 269 individuals were collected from 17 localities in different wheatgrowing areas in China that covered most of the range reported for this species. Within the sequence among these geographic populations, 15 polymorphic sites defined 16 distinct haplotypes, ranging in sequence divergence from 0.2% (one nucleotide) to 1.7% (10 nucleotides). Of the 15 variable sites, 12 were transitional substitutions, 2 were transversional substitutions and 1 was transitional and transversional substitution. Phylogenetic analysis showed that all haplotypes were highly interconnected with each other, in absence of phylogeographic structing. Each of 8 haplotypes was found only at one locality, and the other haplotypes were the widespread distributed in the different localities. The higher genetic diversity was found in the northern China populations than that in the southern China populations. The low genetic differentiation (FST=-0.06945-0.69857) and high migration rate (Nm=0.21575-infinite) of Chinese populations suggest that dispersal over long distance is a major factor in the demography of S. avenae.

【题目】Temporal allocation of metabolic tolerance to transgenic Bt cotton in beet armyworm, Spodoptera exigua (H ü bner)

【中文关键词】Bacillus thuringiensis, Spodoptera exigua, detoxification enzyme, carboxylesterase, acetylcholinesterase

【英文关键词】Bacillus thuringiensis, Spodoptera exigua, detoxification enzyme, carboxylesterase, acetylcholinesterase

【中文摘要】Digestive and detoxification enzyme activity and nutrient composition were examined in the body of fourth instar beet armyworms, Spodoptera exigua (H ü bner), fed on transgenic Bacillus thuringiensis (Bt) and non-Bt cotton for different time periods.Nutrient composition and specific enzyme activities differed significantly between the S. exigua fed Bt vs. non-Bt cotton. At 1,6 and 24 h, free fatty acid and glucose levels were significantly lower in S. exigua fed on Bt cotton than those fed on non-Btcotton. S. exigua fed on Bt cotton had significantly higher trypsin and total superoxide dismutase (T-SOD) activities and significantlylower lipase, carboxylesterase and acetylcholinesterase activities than non-Bt fed worms for all feeding time periods.Differences were also observed among feeding times within each cotton variety group. Significantly lower free fatty acid andtotal amino acid were observed in S. exigua fed on Bt cotton for 24 h than in those fed for 1 h. Significantly lower activities of lipaseand trypsin were detected in S. exigua fed on Bt cotton for 24 h than those for 1 and 4 h. However, carboxylesterase andacetylcholinesterase activities in S. exigua fed on Bt cotton for 24 h were significantly higher than those for 1, 4 and 6 h. Theinteraction between cotton variety and feeding time significantly affected the activities of lipase, trypsin, acetylcholinesteraseand T-SOD enzymes in S. exigua. Measuring the temporal allocation of protection and detoxification enzyme activities in thebody of S. exigua in response to B. thuringiensis can provide a meaningful evaluation on the metabolic tolerance of herbivorousinsects under the continuous selection pressure of a toxic protein.

【题目】Sublethal Effects of Imidacloprid on Bemisia tabaci (Hemiptera: Aleyrodidae) Under Laboratory Conditions

【中文关键词】Bemisia tabaci, imidacloprid, toxicity, sublethal effect

【英文关键词】Bemisia tabaci, imidacloprid, toxicity, sublethal effect

【中文摘要】The sweetpotato white, Bemisia tabaci (Gennadius) (Hemiptera: Aleyrodidae), isone of the most important pests in tropical and subtropical agriculture and is a key pest in greenhouseproduction worldwide. Current management of B. tabaci relies upon frequent applications of insecticides.Insecticide use not only directly affects pest populations through acute toxicity but also hasindirect (sublethal) effects on pest physiology or behavior. In this study,wedescribed sublethal effectsof imidacloprid on adult feeding, immature development, adult fecundity, and F1 development of B.tabaci. Honeydew excretion of adults feeding on leaves treated with LC20 and LC40 concentration wassigniTcantly lower than that on untreated leaf discs. Egg production of B. tabaci adults subject to LC20and LC40 concentrations also was less than untreated individuals. Upon transfer to untreated leaves,honeydew excretion and egg production recovered well within 24 and 48 h, respectively. Exposureto LC20 and LC40 concentrations signiTcantly affected developmental time of B. tabaci eggs andnymphs, whereas it did not affect adult molting rate. We did not Tnd sublethal effects on longevityand fecundity of B. tabaci adults when exposed to LC20 and LC40 concentrations for 24 h, and on egghatching rate, nymphal mortality, and molting rate of the subsequent F1 generation. Exposure toimidacloprid atLC40 concentration signiTcantly decreased the number of females in theF1 generation.Imidacloprid negatively affects development and reproduction of exposed individuals, and sex ratioof subsequent (F1) generation of B. tabaci, which probably disrupts B. tabaci population dynamics,slows population increase, and reduces infestation levels. Therefore, it is necessary to considerpotential impact from imidacloprid for integrated management of the pest.

【题目】Long-term effects of transgenic Bacillus thuringiensis cotton on the non-target Aphis gossypii (Homoptera: Aphididae) maintained for multiple generations
【中文关键词】Transgenic Bacillus thuringiensis cotton, Aphis gossypii, Bacillus thuringiensis detection, life-table parameters, multiple-generation, non-target effects.
【英文关键词】Transgenic Bacillus thuringiensis cotton, Aphis gossypii, Bacillus thuringiensis detection, life-table parameters, multiple-generation, non-target effects.
【中文摘要】The effects of transgenic Bacillus thuringiensis (Bt) cotton on non-target Aphis gossypii were assessed by comparing the life-table parameters of aphids that fed on Bt vs. non-Bt cotton cultivars for the first and 37th generations. The enzyme-linked immunosorbent assay (ELISA) method was used to detect the transmission of the Bt protein from Bt cotton to A. gossypii and their honeydew. We found that the life-table parameters of A. gossypii that fed on Bt cotton for the first and 37th generations did not differ significantly from those of the non-Bt-fed individuals. However, the Bt protein was detected by ELISA in the Bt cotton leaves, and the content varied significantly at different growth stages. Furthermore, trace amounts of the Bt protein were detected in some of the Bt-fed aphids, and the honeydew of the Bt-fed aphids contained over 10 ng/g Bt protein. These results indicate that although trace amounts of the Bt protein were ingested, the Bt cotton had no significant negative impacts on A. gossypii in either the short or long term.

【题目】硅对植物抗虫性的影响及其机制
【中文关键词】硅; 植食性昆虫; 抗虫性; 组成性防御; 诱导性防御
【英文关键词】silicon; herbivorous insect; insect resistance; constitutive defense; induced defense
【中文摘要】硅对植物抗虫性的影响及其机制
【英文摘要】Although silicon (Si) is not an essential element for the majority of plant species,it plays an important role inplant resistance to a range of abiotic and biotic stresses. In this paper,we review the role of Si in regulating host plantresistance to herbivorous insects. Si can enhance resistance to insect herbivores in the majority of plant species,whichdepends on the sources and the application modes of Si fertilizer. Si can enhance constitutive resistance of plants toherbivorous insects by increasing hardness and abrasiveness of plant tissues and /or reducing digestibility. This leads to areduction in insect growth and reproduction with a concomitant reduction in crop damage. Si content,sediment position andalignment in plants affects the subsequent strength of constitutive resistance. In addition,Si can regulate nduced directplant defenses as well as indirect defenses. Induced direct defense comprises producing toxic

substances,producinglocalized hypersensitive response and systemic acquired resistance,and releasing toxic compounds and defensive proteins,which slow herbivore growth and development. Induced indirect defense is realized through the emission of volatilecompounds that attract parasitic and /or predatory natural enemies of the herbivorous insects.

【题目】Development and evaluation of a storage root-bearing sweetpotato somatic hybrid between Ipomoea batatas (L.) Lam. and I. triloba L.
【中文关键词】甘薯,I.triloba, 体细胞杂种
【英文关键词】Sweetpotato, I. triloba, Somatic hybrid
【中文摘要】本文首次报道了由甘薯品种及其近缘野生种I.triloba的具有膨大块根的种间体细胞杂种的获得,并表明其抗旱性显著提高.
【英文摘要】A storage root-bearing somatic hybrid was produced for the first time by protoplast fusion between sweetpotato (Ipomoea batatas (L.) Lam.) cv. Kokei No. 14 and its wild relative I. triloba L. Protoplasts isolated from embryogenic suspension cultures of Kokei No. 14 were fused with petiole protoplasts of I. triloba L. using polyethylene glycol-mediated protocol. Fusion products were cultured in a modified Murashige and Skoog medium containing0.05 mg l-1 2,4-dichlorophenoxyacetic acid (2,4-D) and 0.5 mg l-1 kinetin. A total of 176 plants were obtained from 42 out of 134 calluses derived from fused protoplasts, and 91 of these plants were confirmed to be somatic hybrids through peroxidase isozyme, random amplified polymorphic DNA, amplified fragment length polymorphism, and cytological analyses. Upon transfer into soil and grown in the greenhouse and then to the field, 100% survival wasobserved. A single plant, designated KT1, was found to produce storage roots. Genomic in situ hybridization analysis confirmed presence of chromosomes from both parents and recombinant chromosomes in KT1. Drought tolerance, dry matter content, soluble sugar content, and fertility of this somatic hybrid were evaluated for potential use in sweetpotato breeding.

【题目】甘蔗新品种闽糖92-505的选育研究
【中文关键词】甘蔗; 品种; 选育; 特性

【英文关键词】Sug arcane; v ariety ; breeding; char acteristics;
【中文摘要】闽糖92—505是福建省农科院甘蔗研究所以选15为母本、CP73-1547为父本的杂交组合中选育出的一个优良甘蔗新品种,该品种具有高产高糖、早熟、宿根性强、抗逆性好、适应性广的优良特性。在福建多年多点试验结果表明,闽糖92—505每公顷蔗茎产量118.424 t,11月至翌年2月份平均蔗糖分(绝对值)15.06% ,每公顷含糖量17.887 t,比福建目前主栽品种闽糖70—611增产24.3O%、蔗糖分提高0.87个百分点、增糖32.20%。
【英文摘要】Mintang92-505 selected from the cross combination of Xuan 15 and CP73-1547,was a new sugarcanecultivar with early mature,high yield and sucrose content,stronger ratooning ability,high adverse resistance andwide adaptability.The results from different si

【题目】根癌农杆菌介导的抗除草剂转基因甘薯植株的获得
【中文关键词】甘薯, 除草剂抗性,转基因植株
【英文关键词】Sweetpotato, herbicide resistance, transgenic plant
【中文摘要】用农杆菌介导法将bar基因导入甘薯品种栗子香的胚性悬浮细胞中,获得了抗除草剂的转基因植株。除草剂喷洒试验结果表明,转基因植株具有高度除草剂抗性。
【英文摘要】Generation of transgenic sweetpotato plants expressing bar gene for herbicide resistance was achieved using Agrobacterium tumefaciens-mediated transformation and sweetpotato (Ipomoea batatas (L.) Lam.) cv. Lizixiang embryogenic suspension cultures. Total 450 embryogenic cell aggregates were cocultivated with A. tumefaciens strain LBA4404 harboring a binary vector pCAMBIA3300 with the bar gene. Eight weeks after selection on MS medium supplemented with 2.0 mg/L 2,4-D, 100 mg/L Carb and 0.5 mg/L PPT (phosphinothricin), 19 PPT-resistant embryogenic calluses were produced. After transferred to MS medium supplemented with 1.0 mg/L ABA, 100 mg/L Carb and 0.5 mg/L PPT, 10 of them formed 103 putative transgenic plants. PCR analysis indicated that 69 plants were transgenic. Stable integration of the bar gene into the genome of transgenic plants was confirmed by Southern blot analysis. Experiment result showed that transgenic plants exhibited functional expression of the bar gene by in vivo assay for herbicide resistance.

【题目】广西自育甘蔗品种主要性状的遗传改进
【中文关键词】广西;甘蔗;主要性状;遗传改进
【英文关键词】sugarcane;main traits ;genetic improvement; Guangxi
【中文摘要】以台糖134为对照,以广西1957-2006年期间杂交选育并通过国家审定(鉴定)或广西审定的22个桂糖甘蔗品种为材料,对不同品种主要农艺性状的遗传改进进行分析。结果表明,近50年来甘蔗的株高、节数、节间长度变化不大;丛有效茎数、茎径、单茎重明显增加;产量大幅度提高,产量性状遗传改进明显;甘蔗早期(11月)锤度、成熟期(12月一3月)平均锤度前30年平稳上升,后20年上升幅度变小。株高、丛有效茎数、茎径对提高产量贡献最大,是广西甘蔗品种性状选择的主要内容;蔗糖分含量和早熟性取得明显改进,但要选育更早熟、更高
【英文摘要】Sugarcane variety F134 was used as the control,the genetic improvement for main agronomic traits of 22Guitang sugarcane varieties which were bred in Guangxi and passed the registration by National or Guangxi Committer forCrop Variety

【题目】粤糖00-236和ROC10适宜植期、下种量与施肥量研究
【中文关键词】甘蔗;品种;植期;下种量;施肥量
【英文关键词】Sugarcane; Variety; Planting time; Planting density; Rate of fertilization
【中文摘要】在湛江蔗区,对甘蔗新品种粤糖00-236 和当地主栽培品种ROC10 进行不同植期、不同下种量及不同施肥水平的试验。结果表明,提早植期和增施磷肥有显著的增产增糖效果。粤糖00-236 的平均蔗茎产量与ROC10 相近,但其公顷含糖量极显著高于后者。粤糖00-236 特早熟高糖,适合糖厂早期开榨。在本试验条件下,公顷下种量45000 段与37500 段双芽苗之间、公顷尿素施用量1050 kg 与750 kg 之间,以及公顷氯化钾施用量600 kg 与450 kg,蔗茎产量和含糖量均无显著差异。

【题目】Differential responses of two types of winter wheat (Triticum aestivum L.) to autumn and spring applied mesosulfuron-methyl
【中文关键词】无
【英文关键词】Application timing; Hard winterwheat; Mesosulfuron-methyl; NDVI; Soft winterwheat; Visible injury
【中文摘要】Field experiments were conducted in the 2005/2006 and 2006/2007 crop seasons to evaluate the tolerance of hard winterwheat (HWW) and soft winterwheat (SWW) varieties to post-emergence mesosulfuron-methyl treatment. The application of mesosulfuron-methyl at 11.25 g a.i. ha − 1 plus a noninonic surfactant at 252 g a.i. ha − 1 to three HWW and three SWW varieties in either autumn (Zadoks stage 14 – 15) or spring (Zadoks stage 24 – 25) resulted in visible injury, including chlorisis, stunting and leaf deformities. The greatest injury occurred at fourteen days after treatment (DAT) for all wheat varieties. All varieties showed the same initial sensitivity to herbicide treatment, but differed significantly in their recovery from plant damages. The HWW varieties recovered more successfully from spring-applied herbicide than the SWW varieties; conversely, the SWW varieties recovered more rapidly from damage caused by autumn-applied herbicide than the HWW varieties. Normalized Difference Vegetative Index (NDVI) values were severely affected by autumn herbicide application for HWW varieties and spring application for SWW varieties. Autumn herbicide application for SWW varieties and spring herbicide application for HWW varieties produced higher grain yields. Based on these data, we conclude that applying mesosulfuron-methyl plus a noninonic surfactant in autumn for SWW varieties and in spring for HWW varieties is optimal, and that application timing has profound implications for herbicide tolerance and production of wheat.

【题目】Wheatcroppingsystems and technologies in China
【中文关键词】无
【英文关键词】Conservation agriculture; Croppingsystems and technology; Raised bed-planting; Wheat
【中文摘要】无
【英文摘要】Chinese wheat (Triticum aestivum) production has developed rapidly during the last 57 years, largely due to improved crop management technologies and new varieties. The history of wheat planting technologies in China was reviewed, and the

physiological mechanisms that allow wheat to attain high yield under these planting systems were analyzed. The use of leaf number and stage of development to indicate the optimum timing for applications of fertilizers and irrigation water, and uniform seeding at reduced seeding rates to control lodging contributed significantly to the substantial progress in wheat productivity. However, flood irrigation and tillage-based practices also resulted in serious problems, including a decline in soil fertility and quality, environmental pollution, and inefficient use of water resources. The major future challenges facing wheat production are to improve water and nutrient use efficiency. Conservation agriculture-based resource conservation technologies such as zero or reduced tillage, flat or raised bed-planting systems, and rational management of crop residues to eliminate burning in the field are among the strategies we strongly recommend for improving agricultural environments and stabilizing/increasing wheat production in China.

【题目】comparison of yield components and plant type characteristics of high-yield rice between Taoyuan, a ‘special eco-site’ and Nanjing, China.

【中文关键词】无

【英文关键词】Grain yield; Hybrid rice; Yieldcomponents; LAI; Planttype

【中文摘要】无

【英文摘要】A number of field studies have reported very highriceyields in Taoyuan, Yunnan province, China, and the physiological and ecological factors associated with highyield have been explored. However, little attention has been paid to differences in planttype. The main objective of this study was to reveal the planttypecharacteristics associated with the highriceyield through the comparison of two sites: Taoyuan, Yunnan province and Nanjing, Jiangsu province, China. The physiological and environmental factors were also discussed. Field experiments were conducted at two sites in 2006 and 2007. Three Indica F1 hybrid varieties, Eryou 107, Xieyou 107 and Eryouhang 1 in 2006, Eryou 107 and Xieyou 107 in 2007 were grown at two sites under optimum crop management to achieve maximum attainable yields. Leaf area, leaf length, leaf width, leaf angles, specific leaf weight (SLW) and specific leaf nitrogen (SLN) at heading, yield and yieldcomponents at maturity were determined. Daily radiation, air temperature and relative humidity (RH) were monitored. The highestyield of 18.5 t ha − 1 was achieved by Eryou 107 at Taoyuan in 2006, and average yield of all varieties at Taoyuan was 96% and 85% higher than Nanjing in 2006 and 2007, respectively. The higheryield at Taoyuan was attributed primarily to the larger sink size, which was mainly caused by the greater number of panicles per m2. Biomass production was greater at Taoyuan than at Nanjing in 2006 and 2007, while differences in harvest index were very small. Compared with Nanjing, the rice planted in Taoyuan has greater leaf area index about 10 with smaller area per stem, shorter, wider and thicker leaves and smaller leaf angles. These results indicate that in addition to the higher biomass accumulation (main physiological factor) and the intense solar radiation with the large diurnal temperature range (main environmental factor), the greater leaf area index (LAI) with smaller area per stem, may be an important morphological factor contributing to the highyield in Taoyuan.

【题目】Genetic Diversity of Chinese Summer Soybean Germplasm Revealed by SSR Markers

【中文关键词】Chinese summer soybean (Glycine max (L.) Merr), SSR markers, Genetic diversity

【英文关键词】Chinese summer soybean (Glycine max (L.) Merr), SSR markers, Genetic diversity

【中文摘要】There are abundant soybean germplasm in China. In order to assess genetic diversity of Chinese summer soybean germplasm, 158 Chinese summer soybean accessions from the primary core collection ofG. max were used to analyze genetic variation at 67 SSR loci. A total of 460 alleles were detected, in which 414 and 419 alleles occurred in the 80 Huanghuai and the 78 Southern summer accessions, respectively. The average number of alleles per locus was 6.9 for all the summer accessions, and 6.2 for both Huanghuai and Southern summer accessions. Marker diversity (D) per locus ranged from 0.414 to 0.905 with an average of 0.735 for all the summer accessions, from 0.387 to 0.886 with an average of 0.708 for the Huanghuai summer accessions, and from 0.189 to 0.884 with an average of 0.687 for the Southern summer accessions. The Huanghuai and Southern summer germplasm were different in the specific alleles, allelic-frequencies and pairwise genetic similarities. UPGMA cluster analysis based on the similarity data clearly separated the Huanghuai from Southern summer soybean accessions, suggesting that they were different gene pools. The results indicate that Chinese Huanghuai and Southern summer soybean germplasm can be used to enlarge genetic basis for developing elite summer soybean cultivars by exchanging their germplasm.

【题目】Characteristics of genetic diversity and establishment of applied core collection for Chinese cyst nematode resistant soybean

【中文关键词】applied core collection;resistance;simple sequence repeat marker;soybean;soybean cyst nematode

【英文关键词】applied core collection;resistance;simple sequence repeat marker;soybean;soybean cyst nematode

【中文摘要】Soybean cyst nematode (SCN; Heterodera glycines) is one of the most important pests affecting soybean production. The best method of control of SCN is through the development of resistant cultivars. However, limited progress has been made in soybean breeding in China because most modern cultivars have no resistance to SCN. The distribution and phenotype of 432 immune or highly resistant Chinese accessions were surveyed and a primary core collection was selected as a representative sample for further analyses. Using evenly distributed simple sequence repeat markers, five selection methods were applied to the primary core collection and the optimal method was chosen to establish a core collection, which consisted of 28 accessions. These encompassed 70.8% of the allelic variation present in the overall resistant collection. The 28 accessions differed from the reference resistant accessions at the genomic level, indicating that Chinese resistant accessions are distinct from known resistant accessions. This applied core collection provides a rational framework for undertaking diversity surveys, using genetic variation for the investigation of complex traits and for the discovery of novel traits.

【题目】Establishment of Chinese soybean (Glycine max) core
【中文关键词】Glycine max, Germplasm, Breeding, Landrace
【英文关键词】Glycine max, Germplasm, Breeding, Landrace
【中文摘要】It is very important to efficiently study and use genetic diversity resources in crop breeding and sustainable agriculture. In this study, different sampling methods and sample sizes were compared in order to optimize the strategies for building a rationally sized core collection of Chinese soybean (Glycine max). The diversity in the core collection captured more than 70% of that in the pre-core collection, no matter what sampling methods were used, at a sampling proportion of 1%. Core collections established with both simple sequence repeat (SSR) marker data and agronomic traits were more representative than those chosen on an independent basis. An optimal sampling method for a soybean core collection was determined, in which strategy 'S' (allocating accessions to clusters according to the proportion of square root of the original sample size within each ecotype) was used based on SSR and agronomic data. Curve estimation was used to estimate the allelic richness of the entire Chinese soybean germplasm and a minimum sample size for a core collection, on which a sampling proportion of about 2% was determined to be optimal for a core collection. Further analysis on the core collection with fourteen agronomic traits and allelic constitution at 60 SSR loci suggested that it highly represented the entire collections both on genetic structure and diversity distribution. This core collection would provide an effective platform in proper exploitation of soybean germplasm resources for the study of complex traits and discovering important novel traits for crop genetic development.

【题目】Genetic contribution of foreign germplasm to elite Chinese soybean (Glycine max) cultivars revealed by SSR markers
【中文关键词】soybean, pedigree analysis, simple sequence repeats (SSR), genetic relationship
【英文关键词】soybean, pedigree analysis, simple sequence repeats (SSR), genetic relationship
【中文摘要】Simple sequence repeats (SSR) marker analysis, combined with pedigree analysis, was carried out to trace the genetic constitutes of Suinong 14 and Hefeng 25 in assessing the contribution of foreign germplasm to those elite cultivars. The overall goal is to accumulate information for further effective utilization of foreign germplasm in Chinese soybean breeding programs. SSR clustering results indicated that the genetic base of elite Chinese soybean cultivars, including Suinong 14 and Hefeng 25, were broadened and enhanced via introduction of Amsoy from the U.S. and Shishengchangye from Japan. The pedigree analysis showed a very high coefficient of parentage between Shishengchangye and Hefeng 25, between Shishengchangye and Suinong 14, and between Amsoy and Suinong 14. The genetic similarity between Suinong 14 and Hefeng 25 was 60.58%. Among 20 linkage groups, more genomic regions were transferred from Hefeng 25 to Suinong 14 in linkage group (LG) I, L and C2 than other LGs. Among the unique alleles of foreign parents, five specific loci in Amsoy were transferred to Suinong 14, and three loci from Shishengchangye to Suinong 14. Some SSR loci were proved to be correlated with phenotypes: two loci for seed size introgressed from Shishengchangye to Suinong 14, and one locus for protein content from Amsoy to Suinong 14. These results indicate that the two foreign parents might have important contributions in the development of Suinong 14 and Hefeng 25.

Some SSR loci were proved to be correlated with phenotypes: two loci for seed size introgressed from Shishengchangye to Suinong 14, and one locus for protein content from Amsoy to Suinong 14. These results indicate that the two foreign parents might have important contributions in the development of Suinong 14 and Hefeng 25.

【题目】Cloning and sequence diversity analysis of GmHs1 pro-1 in Chinese domesticated and wild soybeans
【中文关键词】Glycine max, Glycine soja, DNA sequence diversity, GmHs1 pro-1, Soybean cyst nematode, Resistance, Selection, Bottleneck
【英文关键词】Glycine max, Glycine soja, DNA sequence diversity, GmHs1 pro-2, Soybean cyst nematode, Resistance, Selection, Bottleneck
【中文摘要】Soybean cyst nematode (SCN) (Heterodera glycines Ichinohe) is the most important pathogen in soybean production worldwide and causes substantial yield losses. An apparent narrow genetic base of SCN resistance was observed in current elite soybean cultivars, and searching for novel SCN resistance genes as well as novel resistance sources rather than focusing on the two important genes rhg1 and Rhg4 has become another major objective in soybean research. In the present paper we report a 1,477 bp Hs1pro-1 homolog, named GmHs1pro-1. This gene was cloned from soybean variety Wenfeng 7 based on information for Hs1pro-1, a beet cyst nematode resistance gene in sugar beet. It has two domains, Hs1pro-1_N and Hs1pro-1_C, both of which are believed to confer resistance to nematodes. Of the 1,477 bp sequence in GmHs1pro-1, an open reading frame of 1,314 bp, encoding a protein with 437 amino acids, was flanked by a 5′-untranslated region of 27 bp and a 3′-untranslated region of 135 bp. Fourteen single-nucleotide

polymorphisms (SNPs) were observed in 44 soybean accessions including 23 wild soybeans, 8 landraces, and 13 soybean varieties (or lines), among which 5 in wild soybeans and 3 in landrace accessions were unique. Sequence diversity analysis on the 44 soybean accessions showed $\pi = 0.00168$ and $\theta = 0.00218$ for GmHs1pro-1; landraces had the highest diversity, followed by wild soybeans, with varieties (or lines) having the lowest. Although we did not detect a significant effect of selection on GmHs1pro-1 in the three populations, sequence diversity, unique SNPs, and phylogenetic analysis indicated a slight domestication bottleneck and an intensive selection bottleneck. High sequence diversity, more unique SNPs, and broader representation across the phylogenetic tree in wild soybeans and landraces indicated that wild collections and landrace accessions are invaluable germplasm for broadening the genetic base of elite soybean varieties resistant to SCN.

【题目】Genetic diversity of Chinese Spring Soybean Germplasm Revealed by SSR Markers

【中文关键词】Glycine max;genetic distances;microsatellites
【英文关键词】Glycine max;genetic distances;microsatellites

【中文摘要】To use, maintain and increase crop germplasm collections efficiently, it is important to assess the diversity of these collections. In this study, 1383 accessions of Chinese spring sowing soybean (Glycine max) were used for SSR analysis. In total, 1111 alleles were detected among these collections with an average number of alleles (NA) of 18.52 per locus. The genetic diversity index (PIC value) varied from 0.456 to 0.928 with an average of 0.815. Intensive breeding of cultivars have led to a decrease of genetic diversity. Random-repeated sampling within landraces of different geographical regions suggested that the ranking of both average NA and PIC values among different geographical regions were North spring soybean (Nsp) > South spring soybean (Ssp) > Northeast spring soybean (NEsp), but because of the uneven distribution of SSR variation patterns, the differences between them did not reach a significant level. There was a relationship between genetic distances and geographical distances among soybean populations from different regions, indicating a certain degree of geographical differentiation among Chinese soybean germplasm collections.

【题目】Discovery and transmission of functional QTL in the pedigree of an elite soybean cultivar Suinong14
【中文关键词】in silico mapping;soybean cultivar;ancestral line;QTL;transmission
【英文关键词】in silico mapping;soybean cultivar;ancestral line;QTL;transmission
【中文摘要】In this study, we extended in silico mapping for single trait to analyse data from multiple environments by calculating intraclass correlations and to mapping pleiotropic QTL for multiple traits by defining new statistic to measure the correlation between multiple traits and the marker. Data sets include phenotypes of eight agronomic traits obtained from six different ecologic environments and years, and genotypic information from 477 polymorphic markers on 14 ancestral lines in the pedigree of ‘ Suinong14 ’. With in silico mapping, a total of 39 markers distributed on 14 linkage groups are detected as QTL responsible for eight agronomic traits and 10 QTL are identified as having pleiotropic effects. Tracing transmission of functional QTL in the pedigree indicated that certain QTL, such as Sat_036 on linkage group D1a, Satt182 on linkage group L, and Satt726 on linkage group B2 may be responsible for the contribution of exotic germplasm to the improved cultivars.

【题目】Development of SNP markers and haplotype analysis of the candidate gene for rhg1, which confers resistance to soybean cyst nematode in soybean
【中文关键词】Haplotype, SCN, SNP marker, Soybean
【英文关键词】Haplotype, SCN, SNP marker, Soybean
【中文摘要】Soybean cyst nematode (SCN; Heterodera glycines Ichinohe) is one of the most destructive pests in the cultivation of soybean (Glycine max (L.) Merr.) worldwide. Markers based on the SCN resistance gene will enable efficient marker-assisted selection (MAS). We sequenced the candidate gene rhg1 in six resistant and two susceptible soybean genotypes and identified 37 SNPs (single nucleotide polymorphisms) among the sequences, of which 11 were in the coding region. Seven of these 11 SNPs led to changes in the amino acid sequence of the gene. The amino acid sequence we obtained differs from the previously published one by a stretch of 26 – 27 amino acids. Six codominant allele-specific SNP markers based on agarose gel detection were developed and tested in 70

genotypes, among which occurred only nine different haplotypes. Two neutrality tests (Tajima ' s D and Fu and Li ' s F) were significant for the six SNP loci in the 70 genotypes, which is consistent with intensive directional selection. A strong LD pattern was detected among five SNPs except 2868T > C. Two SNPs (689C > A and 757C > T) formed one haplotype (689C-757C) that was perfectly associated with SCN resistance. The new allele-specific PCR markers located in the alleged sequence of the rhg1 candidate gene, combined with the microsatellite marker BACR-Satt309, will significantly improve the efficiency of MAS during the development of SCN-resistant cultivars.

【题目】Genetic diversity comparison between Chinese and Japanese soybean (Glycine max (L.) Merr.) revealed by nuclear SSRs

【中文关键词】Genetic diversity, Germplasm pools, Glycine max, Soybean, SSR
【英文关键词】Genetic diversity, Germplasm pools, Glycine max, Soybean, SSR

【中文摘要】Soybean (Glycine max (L.) Merr.) has a long planting history in both China and Japan. In order to investigate the genetic relationship between Chinese and Japanese soybeans, 205 Chinese soybean accessions, that represent the seven different soybean ecotypes, and 39 Japanese soybean accessions from various regions were analyzed by using 46 SSR loci. In total 745 alleles were detected with an average allele number of 16.2 per locus. The allelic frequencies varied from 0.002 to 0.554 with an average of 0.06. Cluster analysis with UPGMA separated the Chinese accessions from Japanese accessions, suggesting that soybean in these two countries form different gene pools. When comparing the Japanese soybean with that from seven different Chinese soybean ecotypes, 164 – 200 alleles were specific to the Chinese accessions and 64 – 112 specific to the Japanese accessions. The comparison of SSRs diversity revealed that accessions from China exhibited more genetic diversity than those from Japan. The data were analyzed to resolve the genetic structure and to interpret the evolutionary relationships between groups. Three distinct groups were identified, corresponding to Japanese soybean, Northern China soybean, Southern China soybean and a mixed group in which most accessions were from central China. The results indicate that accessions from Japan are distinct from Chinese ones, and Japanese accessions had more close relationship with Chinese northeast spring and southern spring ecotypes. We further analyzed five agronomic trait-related SSR loci and found that the preponderant alleles are different in Chinese and Japanese soybean. Our study provides important insights into further utilization of Japanese soybean in Chinese soybean breeding.

【题目】长江春大豆核心种质构建及分析
【中文关键词】SSR分子标记; 农艺性状; 聚类分析; 等位变异保留比例; 取样策略
【英文关键词】SSR markers; agronomic traits; cluster analysis; reserving ratio of SSR alleles; sampling strategy;
【中文摘要】利用长江春大豆初选核心种质SSR(simplesequencerepeat)标记和农艺性状表型等基础数据,对用不同个体取样方法以及不同数据类型建立的核心种质进行评价,目的是为确定中国大豆(Glycinemax)核心种质的最佳取样策略提供依据。结果表明,根据SSR分子数据聚类,采用类内随机取样、类内以遗传相似性系数取样以及仅依据遗传相似性系数取样都可用于大豆核心种质构建。但是综合不同评价参数发现,以类内随机取样最佳,类内按遗传相似性系数取样次之,单独以遗传相似性系数取样较差。分析不同SSR等位变异保留比例的遗传多样性指数发现,当保留90%和80%的SSR等位变异时,核心种质具有更高的遗传多样性。由于与SSR分子数据对种质遗传关系评价的不一致性,农艺性状等基础数据虽然可用来构建核心种质,但其SSR分子水平代表性相对较低。本研究结果还表明,用不同方法或同一方法不同重复次数取样建立的核心种质具有异质性,且这种异质性随核心种质取样比例的降低而增大。因此,虽然可依据不同数据类型确定相应的方法建立核心种质,但综合表型和分子数据建立的核心种质更具有代表性。
【英文摘要】Sampling strategy is very important for core collection establishment. In this study, different methods to construct a core collection of Changjiang spring sowing soybean were performed based on data of SSR(simple sequence repeat) markers and agronomic traits in order to optimize the sampling strategy for core collection. The results showed that, based on cluster analysis of SSR data, each of the three methods, i.e., random sampling within each group, sampling by genetic similarity coefficient within each group and sampling by genetic similarity coefficient, could be used to construct a soybean core collection. When SSR allelic reserving ratios were maintained at 90% and 80%, the core collections had higher genetic diversity indices of SSR alleles than if maintained at 70%. Core collections could also be constructed by agronomic and other basic data if there was no molecular data; however, SSR allelic reserving ratio might be decreased, which suggested that assessment of genetic diversity by SSR data was not always consistent with assessment by agronomic data. We found that core collections were heterogeneous, either when created with different sampling methods or with the same sampling method in different repeats, because randomicity always existed in selecting individuals. This indicated that the germplasm to form a core collection was variable, so optimal sampling strategies should be chosen to establish core collections based on different data according to practical or scientific objectives. Integrating phenotypic and genotypic data together would be better for improving the representativeness of core collections. 更多

【题目】黄淮夏大豆(G. max) 初选核心种质代表性检测
【中文关键词】初选核心种质; 黄淮夏大豆; 遗传多样性;
【英文关键词】Primary core collection; Huanghuai summer sowing soybean; Genetic diversity;
【中文摘要】代表性是衡量核心种质的主要指标。本研究用 4 92 3份黄淮夏大豆种质以及从中选出的 4 2 8份黄淮夏大豆初选核心种质为实验材料 ,比较两者的农艺性状差异 ,目的是检测黄淮夏大豆初选核心种质对其总体的代表性 ,为大豆核心种质构建提供依据。结果表明 ,初选核心种质的种皮色、花色、茸毛色等 9个质量性状的不同表现型频率和 5个数量性状的平均数、标准差、方差、变异系数等参数 ,与黄淮夏大豆总体资源基本一致。 14个农艺性状Shannon weaver遗传多样性指数和Simpson遗传多样性指数的t测验 ,结果表明初选核心种质与总体差异不显著 ;对 9个质量性状频率分布进行 χ2 测验 ,二者差异不显著 ,初步表明初选核心种质能够代表全部资源的遗传多样性。
【英文摘要】The representative of core collection is an important criteria for establishment of core collection. In this study, the entire collection and primary core collection of summer sowing soybeans in Huanghuai region of China were used as the materials, and 14 agronomic traits were compared. The aim was to test the representative of primary core collection to the entire collection. In quantitative distribution and frequency of the trait variation, the primary core collection and the entire collection were similar. The $\chi 2$ test for 9 discontinuous characters and the t test of both indexes for 14 morphological cha- racters did not reach significant level between the primary core collection and the entire collection, indicating the primary core collection may represent the entire collection.

【题目】黄淮夏大豆遗传多样性分析
【中文关键词】黄淮夏大豆; 遗传多样性; SSR;
【英文关键词】Huanghuai summer sowing soybean; Genetic diversity; SSR;
【中文摘要】利用49对SSR引物和14个农艺性状对96份黄淮夏大豆进行遗传多样性分析 ,以了解黄淮夏大豆产区的资源多样性状况 ,为种质资源的利用和开发提供帮助。结果表明 ,SSR的遗传多样性指数的分布范围为 1.0 70 0~2 .7310 ,Simpson指数分布范围为 0 .5 313~ 0 .92 0 3;14个农艺性状的遗传多样性指数平均值为 1.1912 ,Simpson指数的平均值为 0 .6 0 79,可见黄淮夏大豆具有丰富的遗传变异。 96份材料的农艺性状和分子数据聚类结果均呈现一定的地理分布规律。根据农艺性状聚类时 ,可根据种皮色将材料划分为 2大类群。种皮色、生育期、粒大小相同的材料聚在一起 ,说明在对不同生态类型的大豆进行分类时 ,将种皮色、生育期、粒大小等作为进一步分组的依据是有效的 ,能够反映大豆的遗传特点以及区域特性
【英文摘要】This study evaluated genetic diversity of Huanghuai summer sowing soybean by means of 49 SSR loci and 14 traits. The aim of the study is to reveal genetic diversity of Huanghuai summer sowing soybean. 49 pairs SSR loci of the distribution of Shannon-weaver index is 1.0700-2.7310 and the distribution of Simpson index is 0.5313-0.9203.14 traits of mean of Shannon-weaver index is 1.1912 and mean Simpson index is 0.6079. This indicated that the Huanghuai summer sowing soybean has abundant genetic diversity. The results of clustering showed some rules in the geographical distribution by means of morphological traits and molecular data. The seed coat color plays an important role in morphological traits clustering. The materials has divided into two sections by means of the seed coat color in the clustering which make use of the 14 traits. The result indicated that the sampling method of soybean core collection in China based on geography and taxonomic system and grouped by seed coat color, growth period, 100-seed-weight is rational and effective.

【题目】利用SSR指纹图谱分析大豆花叶病毒(SMV)病抗源的遗传多样性
【中文关键词】大豆(G.max); 大豆花叶病毒(SMV); SSR; 遗传多样性;
【英文关键词】soybean (G. max); Soybean mosaic virus; SSR; genetic diversity
【中文摘要】利用61个SSR(simple sequence repeats)引物对筛选出的113份高抗大豆花叶病毒(SMV)病抗源进行了遗传多样性分析。113个抗源产生了387个等位变异,平均每个引物可以扩增6.34个等位变异。采用Nei-Li公式计算相似系数,使用NTSYS-pc2.10t数据分析软件,非加权组平均法进行聚类。分析结果表明抗源间平均相似系数为0.295,说明鉴定的这些抗源遗传差异较大。113个抗源被明显地聚为7类,地理来源相同和亲缘关系较近的品种大多聚在一起。相似系数较小、聚在不同类群中的抗源可能携带不同的抗病基因。
【英文摘要】The genetic diversity of 113 soybean varieties with high resistance to SMV was evaluated using 61 SSR primers. A total of 387 allelic variants were obtained in the varieties with average 6.34 alleles per SSR locus. Nei-Li genetic similarity coefficients were calculated using the software of NTSYS-pc2.10t and a dendrogram was constructed by the unweighted pair group method of arithmetic average (UPGMA). Mean similarity coefficient among the varieties was up to 0.295, which indicated that genetic difference among them was significant. Based on the genetic similarity coefficient matrix, the varieties were divided into seven groups. The varieties with the same geographical origin and the approximate pedigree were clustered together. The varieties whose genetic similarity coefficients were small and that were clustered in the different group probably carried the different resistant genes.

【题目】东北春大豆样本的代表性及其SSR位点的遗传多样性分析
【中文关键词】东北春大豆; SSR标记; 遗传多样性; 等位变异; 核心种质;
【英文关键词】Northeast China spring soybean; SSR marks; Genetic diversity; Core collection;
【中文摘要】从3226份东北春大豆总体中选择283份春大豆种质,用质量性状和数量性状进行检测,对总体的代表性为80%.利用筛选出61对SSR核心引物对具代表性的东北春大豆样本进行分析,共检测到534个等位变异,平均每个位点的等位变异为8.75个,变幅为2~16个;遗传多样性指数变化范围在0.406~0.886,平均为0.704;东北春大豆样本在大多数位点上有优势等位变异,从而降低了其遗传多样性.其中35份种质具有特异等位变异,分布在29个位点上;各个位点上分化系数均较小,遗传多样性分化程度较低.东北春大豆中3个省种质的共有等位变异较多,以吉林省和辽宁省种质的遗传多样性表现较为一致,均高于黑龙江省种质的遗传多样性.地方品种的遗传多样性高于育成品种.东北春大豆种质资源的遗传多样性分布特点为有目的选择杂交亲本拓宽遗传基础以培育新品种提供了理论依据.
【英文摘要】A total of 283 accessions were selected from the total 3 226 Northeast China spring soybeans,which represented >80% of the whole based on their qualitative and quantitative traits.The representative samples were analyzed by 61 SSR loci,and a total of 534 alleles were detected,ranging 216 alleles per locus,with an average of 8.75 alleles per locus.Among the accessions,the Simpson diversity index (SDI) for each locus ranged from 0.406 to 0.886,with a mean of 0.704,which was relatively lower since there were dominant alleles at most of loci in the representative samples.35 accessions had specific alleles,which distributed among 29 loci.The differentiation coefficient was lower than 9.27% in 61 loci among the three provinces of Northeast China,which might be caused by lots of common alleles shared among these provinces.The genetic diversity in Jilin and Liaoning provinces was nearly equal,but was higher than that in Heilongjiang Province.The landraces of the representative samples at 61 loci had a higher genetic diversity than that of the released cultivars.The genetic diversity appeared within and between the provinces could be used to broaden the genetic base of modern cultivars,and also,the landraces were the major source for soybean breeding because of their high genetic diversity.

【中文关键词】南方夏大豆; SSR; 遗传多样性;
【英文关键词】southern summer soybean; SSR; genetic diversity;
【中文摘要】利用60个SSR位点对来自华南地区9个省份的191份南方夏大豆(Glycinemax)进行分析,结果显示:在191份材料中共检测到663个等位变异,平均每个位点的等位变异数为11.05个;Shannon-Weaver指数平均值为1.67,材料的成对相似系数范围为0.19　0.95,平均相似系数为0.29,说明华南地区南方夏大豆材料间的相似程度高,与表型性状表现相一致;在聚类分析中,以相似系数0.26为划分标准,可将夏大豆分为4个类别,但9个省(市)之间并没有明显的界限,相近纬度和同一流域夏大豆趋向于聚在一起;通过等位变异数及遗传多样性指数分析发现,华南地区南方夏大豆分子遗传多样性中心可分成2个:一个以安徽省为中心的长江流域,另一个以广西壮族自治区为中心的珠江流域。由于多数相同来源的夏大豆分别聚在不同的类别中,为充分利用本地资源拓宽育种遗传基础提供了理论依据。
【英文摘要】A total of 191 southern summer soybeans(Glycine max) in 9 provinces from Huanan region of south China were analyzed by 60 SSR loci. The results indicated that 663 alleles were detected with averaged 11.05 alleles per locus. The mean Shannon-Weaver index was 1.664 per locus . The range of Nei-Li similarity coefficient was from 0.19 to 0.95 with averaged 0.29. It indicated that there were relatively high similarity between southern summer soybeans, which showed the same trends as agronomic traits. Based on Nei-Li similarity coefficient matrix, the southern summer soybeans were clustered into four groups by setting similarity coefficients at 0.26. No borderline was defined among 9 provinces, but some soybeans from the same valley or adjourn latitude were clustered together. Based on genetic diversities of SSR markers, there were two genetic diversity centers around the regions, which one was located at the Anhui Province in Changjiang river and the other was located at Guanxi in Zhujiang river. Since some soybeans originated in same place were clustered into different groups, it provides evidence to broaden genetic base of modern cultivars by using local germplasms.

【题目】中国黄淮和南方夏大豆(Glycine max L.)SSR标记的遗传多样性及分化研究
【中文关键词】夏大豆; 遗传多样性; 分化; SSR标记;
【英文关键词】Summer sowing soybean; Genetic diversity; Differentiation; SSR marker;
【中文摘要】以黄淮和南方两种类型共288份夏大豆为实验材料,用60个SSR位点进行多个遗传多样性指标的分析,旨在明确黄淮夏大豆(HHS)和南方夏大豆(SS)品种资源的遗传分化,为夏大豆品种资源的利用提供依据。结果表明,在夏大豆中共检测到808个等位变异,每个SSR位点等位变异范围为2~38个,平均13.47个,其中HHS的等位变异数(725个)和特异等位变异数(141个)低于SS(729个和145个),且特异等位变异的位点不同,但差异不显著;HHS的平均数遗传多样性指数显著高于SS,而相似系数显著低于SS,但两种夏大豆之间的相似系数(0.103~0.209)显著低于类型内的相似系数(0.161~0.307)。两种夏大豆类型之间的分化系数为8.72%,相比之下,各夏大豆类型内的分化更明显。这些结果表明,HHS和SS内部的遗传变异丰富,但两者之间存在明显差异,这为大豆的育种亲本选配及起源研究提供了依据。
【英文摘要】China owns the most soybean germplasm resources in the world, and is the origin of the soybean too. There are 11 207 accessions of summer sowing soybean, accounting for 49% in Chinese soybean germplasm resources. Chinese Summer sowing soybean is divided into 2 different ecotypes: Huanghuai summer sowing soybean (HHS) and Southern summer sowing soybean (SS). It will provide valuable information for broadening genetic base of modern cultivars and deducing the evolution of cultivated soybean by

using the genetic diversity existed in it.In this experiment, 142 HHS and 146 SS accessions sampled from the primary core collection, which was established by Qiu et al. (2003)[1] based on the total of HHS (4711) and SS (6496) (Table 1), were analyzed at 60 SSR loci for their genetic diversities. The aim was to illustrate the genetic similarities and diversities in order to provide the evidence for study and utilization of summer sowing soybean germplasm resources. The results indicated that there were total of 808 alleles at 60 loci with average 13.47 alleles per locus.The HHS had 725 alleles and 141 unique alleles, which were lower than those of SS (729 and 145), and the loci for unique alleles were different between two types of summer sowing soybeans, though there was no significant difference.(Com-)(paring) genetic diversities being represented Simpson index (SI), the HHS was higher than SS, and SI (0.76) of HHS was significantly different from that of SS (0.73). Though there was obvious differentiation (8.72%) between the two type of summer sowing soybean, the differentiation within each of them was even higher (Table 3). By comparison of pairwise (simi-)(larities) between or within each type of summer sowing soybeans, similarity coefficients within HHS ranged 0.161-0.285, which was lower than that within SS (0.191-0.307),but they were relatively higher than those(0.103-0.209)between the two types of summer sowing soybeans (Fig.3, Table 6). These parameters indicated that both HHS and SS had abundant genetic diversities and differentiation as compared with those between them. It provides molecular evidence for origins of soybean and parents selection in soybean improvement. 更多

【题目】利用大豆核心种质部分样本鉴定28K和30K过敏蛋白缺失材料

【中文关键词】核心种质; 栽培大豆; 野生大豆; 28K过敏蛋白; 30K过敏蛋白;

【英文关键词】Core collection; Cultivar; Wild Soybean; Gly m Bd 28K; Gly m Bd 30K;

【中文摘要】以栽培大豆(G.max)核心种质经聚类随机选择样本为主,以栽培大豆保留种质和野生大豆(G.soja)为对照,利用小鼠单克隆抗体Gly m Bd 30K(F5)和Gly m Bd 28K(C5)分别检测大豆的30K和28K过敏蛋白抗原,目的是发掘过敏蛋白缺失的品种资源,明确其分布规律和特点,检测大豆核心种质的代表性,为资源和育种研究提供参考。鉴定结果表明,在参试的60份野生大豆和421份栽培大豆中没有发现30K过敏蛋白缺失的种质,但28K过敏蛋白缺失率分别为13.3%和37.8%。栽培大豆核心种质28K过敏蛋白缺失比率的变化趋势与栽培大豆保留种质总体规律基本相同,在3个生态区的缺失比率差异均不显著,说明核心种质在28K过敏蛋白缺失这个性状上具有代表性。SSR标记分析发现,在缺失过敏蛋白的种质中,80%相似系数在0.44以下,表明这些种质遗传基础较为广泛,可充分利用类群内或类群间差异较大的材料作为亲本配制杂交组合,培育缺失28K过敏蛋白优质品种。

【英文摘要】Soybean core collection is very important foundation for novel gene mining.Part of soybean(G.max) core collection was used to compare with reserved germplasm and wild soybean by using immunoblotting,in order to select Gly m Bd 30K and Gly m Bd 28K allergen-null germplasm,and evaluate the representation of core collection.The result showed that all the materials,including 60 wild soybean and 421 cultivars,contained Gly m Bd 30K,and the absence ratio of Gly m Bd 28K in cultivars(37.8%)was higher than that in wild soybean(13.3%).The distribution tends of Gly m Bd 28K null materials in core collection was similar to that in reserved collection.The absence ratios of Gly m Bd 28K were not significantly different in three ecotype regions of both core collection and reserved collection,which indicated that the core collection has perfect representative.SSR marker analysis showed that similarity index among 80% cultivars lacking Gly m Bd 28K was less than 0.44,which indicated these germplasms had abundant genetic diversity and could be used in the breeding of Gly m Bd 28K lacking cultivars.

【题目】拟南芥γ-生育酚甲基转移酶(γ-TMT)启动子的分离及表达特性分析
【中文关键词】拟南芥, 维生素E, 生育酚, -生育酚甲基转移酶(-TMT) , 启动子
【英文关键词】Arabidopsis thaliana, Vitamin E, tocopherols, gamma-tocopherol methyltransferase (-TMT) , promoter
【中文摘要】维生素E是一类人体所必需的脂溶性的维生素, 具有重要的生理功能。 -生育酚甲基转移酶(-TMT)是维生素E生物合成途径中的关键酶之一, 催化 、 -生育酚甲基化, 生成 、 -生育酚。从拟南芥中分离了 -生育酚甲基转移酶基因1552bp的启动子序列, 构建了含有该启动子和GUS报告基因的植物表达载体, 通过农杆菌介导转化拟南芥, 获得了转基因植株。GUS组织化学染色结果表明, 在 -TMT启动子的驱动下, 报告基因GUS在拟南芥的叶、茎以及花均有表达, 且在茎尖、雄蕊和幼叶中表达最强, 而在根、种子和种荚中则没有检测到GUS基因的表达, 表明 -TMT基因可能仅在拟南芥某些组织中特异性高表达。
【英文摘要】Vitamin E (Tocopherols) is lipid-soluble ant ioxidants and essent ial for human health. Gamma-tocopherolmethyltransferase(-TMT) , one of the key enzymes in tocopherol biosynthetic pathway in plants, converts 、 -tocopherols into 、 -tocopherols. In this study, we isolated the 1552 bp promoter of Arabidopsis TMT gene. The promoter was fused with GUSreporter gene and this expression cassette was introduced into wild Arabidopsis thaliana by Agrobacterium-mediatedtransformation. GUS staining shows that GUS gene is expressed in leaves, stems and flowers, with the highest expression inyoung leaves, stamens and stem apices, while not observable in roots、seeds and siliques. The data indicate that -TMT genepromoter is likely to be expressed preferentially in some of the tissues of Arabidopsis.

【题目】拟南芥γ-生育酚甲基转移酶启动子在转基因烟草中的表达特性分析
【中文关键词】烟草;维生素E; .生育酚甲基转移酶;启动子;GUS染色
【英文关键词】Tobacco Vitamin E Gamma-Tocopherol methyltransferase Promoter GUS-staining
【中文摘要】γ-生育酚甲基转移酶(γ-TMT)是维生素E生物合成途径中的关键酶之一,催化γ、δ-生育酚甲基化,生成活性较高的α、β-生育酚.研究构建了含有γ-TMT启动子和GUS报告基因的植物表达载体,通过农杆菌介导转化烟草,筛选出PCR阳性植株,进行GUS组织化学染色,结果表明,在γ-TMT启动子的驱动下,报告基因GUS在烟草的根、茎、叶中均有表达.
【英文摘要】Gamma-tocopherol methyltransferase(γ-TMT) played a significant role in vitamin E pathway, which catalyze γ、δ-tocopherol into α、β-tocopherol. To analyze the function of γ-TMT promoter, it was inserted into a plant expression vector containing GUS report genes. The expression vector was transferred to wild Tobacoo by Agrobacterium-mediated transformation. GUS histochemical assay showed that transgenic tobacco expressed GUS in root, stem and leaf under γ-TMT promoter.

【题目】以湖南和湖北大豆[Glycine max(L.)Merr.]为例分析影响遗传多样性评价的因素
【中文关键词】大豆; 遗传多样性; SSR标记; Shannon指数; 期望杂合度; 等位变异数; 取样量;
【英文关键词】Soybean; Genetic diversity; SSR Markers; Shannon index; He; Number of alleles; Sample size;

【中文摘要】以不同来源大豆种质为材料进行基因组SSR分析,探讨大豆遗传多样性研究方法,旨在为科学评价大豆种质资源提供参考。当取样比例相同时,湖北大豆的遗传丰富度显著高于湖南大豆,但两省大豆遗传多样性指数之间没有显著差异。当取样量相同时,利用随机取样法比较,湖南大豆的遗传多样性显著高于湖北,而利用聚类取样比较,两省大豆的遗传多样性没有显著差异。在遗传多样性指数相同情况下,湖北大豆的遗传丰富度显著高于湖南大豆。取样数与三个遗传多样性评价参数(等位变异数、Shannon指数、He)之间均达到显著和极显著相关。以湖南大豆为例,估算出在大豆SSR遗传多样性分析中,至少需要50-60个样本,即占总体9.0%-10.8%的取样比例,才能代表总体的遗传变异。提出在评价大豆遗传多样性时,应用大豆样本数对其遗传多样性指数计算公式进行修正,建议将Shannon指数计算公式改为H=-lnN∑PilnPi(N为样本数)。根据修正公式分析,结果表明,湖北大豆的遗传多样性高于湖南大豆。

【英文摘要】Accessions from Hunan and Hubei provinces in the Chinese soybean pre-core collection were analyzed with SSR markers to determine an optimal strategy in genetic diversity evaluation.The results showed that when analyzed with the same sampling ratio,the number of alleles in accessions from Hubei province was higher than those from Hunan province,however the difference did not reach the significant level in genetic diversity index.When analyzed with same sample size by random sampling,accessions from Hunan province were higher both in number of alleles and diversity index than those from Hubei,while there was no significant difference between them as sampled based on cluster.Accessions from Hubei were larger in number of alleles than those from Hunan when sampled by the same genetic diversity index.Genetic diversity index was influenced by sample size as we concluded,and we deduced that in genetic diversity analysis,a minimum of 5060 accessions(9.0%10.8% percent of total accessions) was required to represent most of genetic variation,so that it could explain the total genetic variation.An adjustment of the formula for Shannon index was also proposed after a set of analyses based on accessions from Hunan and Hubei.And with it,accessions from Hubei showed higher genetic diversity than those from Hunan province.

【题目】“十五”大豆创新种质和1963-1995年间育成品种的SSR遗传结构及遗传多样性分析

【中文关键词】创新种质; 育成品种; SSR标记; 遗传结构; 遗传多样性;

【英文关键词】New enhanced germplasms; Released cultivar; SSR marker; Genetic structure; Genetic diversity;

【中文摘要】对22份"十五"攻关培育的创新种质和22份大豆育成品种进行了24个SSR标记的分析比较,目的是在分子水平上阐明创新种质的遗传结构特点,为拓宽我国大豆育成品种遗传基础及亲本选择提供理论依据。本研究在24个SSR位点共检测出231个等位变异,其中15.8%(36个等位变异)为创新种质所特有,特别是在与大豆胞囊线虫紧密连锁的Satt309位点上验证了一个我国独有的等位变异。结合UPGMA和Model-based聚类结果,将创新种质和育成品种分为4组,第Ⅰ组由13份来自东北和山西的创新种质组成;第Ⅱ组由8份来自东北的育成品种组成;第Ⅲ组由8份来自黄淮海和南方的大豆种质组成,其中创新种质和育成品种各为4份;第Ⅳ组由4份育成品种组成,分别来自吉林、黑龙江、河南和山西。遗传多样性分析结果表明,利用国外种质和野生大豆创造的创新种质丰富了东北地区育成品种的遗传多样性。因此,应加强利用国外种质、我国栽培大豆地方品种和野生大豆等优异资源,在创造优异大豆新种质的同时,拓宽我国大豆的遗传基础。

【英文摘要】To clarify the patterns of genetic structure,22 relased modern cultivars and 22 new enhanced germplasms were analyzed with 24 SSR markers.Among the total of 231 alleles,36 unique alleles were found only in new enhanced germplasms.At Satt309 locus,which closely linked with soybean cyst nematode resistance,an allele,which only was found in Chinese soybean landrace,was confirmed.Combining the results obtained by using UPGMA method and model-based method,four distinct clusters were discovered.Cluster Ⅰ was comprised of 13 new enhanced germplasms from Northeast region and Shanxi province.Cluster Ⅱ included 8 released cultivars from Northerneast region.Cluster Ⅲ consisted of 4 new enhanced germplasms and 4 released cultivars from Huanghuaihai and Southern region.Cluster Ⅳ contained 4 relased cultivars from Jilin,Heilongjiang,Shanxi and Henan provinces.The results of genetic diversity analysis showed that the new enhanced germplasms,which utilized foreign germplasms and wild species as parent,broadened the genetic base of released cultivars in northeast region.

【题目】拟南芥2-甲基-6-叶绿基-1,4-苯醌甲基转移酶启动子在转基因烟草中的表达特性分析
【中文关键词】烟草; 维生素E; 2- 甲基-6- 叶绿基-1,4- 苯醌甲基转移酶(MPBQ MT) ; 启动子; GUS 组织化学染色
【英文关键词】Tobacco, Vitamin E, 2 - methyl - 6 - phytyl - 1,4 - benzoquinol methyltransferase (MPBQ MT), Promoter, GUS- staining
【中文摘要】通过对报告基因GUS 产物的分析进行了拟南芥2- 甲基-6- 叶绿基-1,4- 苯醌甲基转移酶(MPBQMT) 启动子在转基因烟草中的表达特性的初步研究。构建含该启动子和GUS 报告基因的植物表达载体, 通过农杆菌介导转化烟草, 对转基因烟草进行GUS 组织化学染色和GUS 荧光定量分析该启动子表达特性。GUS 在转基因烟草的根和种子中基本不表达, 茎上有一定表达, 叶上表达量最高, 约是茎的4.7~10.9 倍。结果表明MPBQ MT 基因启动子主要在烟草绿色组织中特异性高表达。
【英文摘要】The expression pattern of the promoter of Arabidopsis gene 2- methyl- 6- phytyl- 1,4- benzoquinolmethyltransferase (MPBQ MT) in transgenic tobacco was studied according to the analysis of GUS reportergene. The promoter was fused with GUS reporter gene and this expression cassette was introduced into wildtobacco by Agrobacterium- mediated transformation. The expression pattern of the promoter was analyzed byGUS staining and quantitative fluorometric GUS assay. The GUS staining wasn' t observed in roots andseeds of transgenic tobacco, which was visualized in stems and leaves. The GUS expression was the highestin leaves, which was about 4.7~10.9 times of stems. MPBQ MT promoter was expressed preferentially inthe green tissues of tobacco.

【题目】大豆核心种质和微核心种质的构建、验证与研究进展
【中文关键词】大豆; 核心种质; 检验; 遗传多样性; SSR; 等位变异; 利用;
【英文关键词】Soybean; Core collection; Test; Genetic diversity; SSR; Allele variation; Utilization;
【中文摘要】我国作物种质资源长期库中保存大豆资源2.3万余份,数量居世界之首。然而,大豆资源在新品种培育中的利用率仅为1%左右,导致大豆育成品种的遗传基础趋于狭窄。主要原因是缺少对其重要经济性状的鉴定,尤其是缺少多年多点的评价,难以定向选择有重要价值的育种亲本。为了加速大豆资源的评价并促进其利用,在国家基础研究项目(973)的连续资助下,开展了"大豆核心种质构建(1998—2003)"和"大豆微核心种质基因多样性(2004—2009)"研究,目的是浓缩大豆资源的遗传多样性,强化其表型和基因型鉴定,为发掘和利用大豆资源中的优异基因提供指导。本文在研究构建不同比例(占总体2%~5%)大豆核心种质和大豆微核心种质(占总体1%)的同时,介绍了核心种质补充和完善的研究进展。为了验证核心种质的代表性,从SSR位点、样本组成、取样比例、低频率等位变异4个方面对代表性进行了分析,并用随机抽样方法对核心种质代表性进行了检测和验证。文中还介绍了利用核心种质和微核心种质在新基因发掘、种质创新和育种利用方面的研究进展,尤其介绍了与育种单位密切合作,建立基于核心种质的种质创新与利用体系的研究成效。围绕遗传多样性、核心种质利用方式进行了讨论,指出大豆核心种质为性状鉴定、新基因发掘、新种质创造和新品种培育等理论研究和实际应用提供材料基础,具有潜在的应用前景。实践证明,大豆种质资源的系统研究与利用,将促进我国大豆种质资源由数量保存型向研究应用型转变。

【英文摘要】China has the most soybean germplasm in the world, but only about 1% of them have been used in soybean breeding program, which results in narrow genetic base for developing varieties. This exiguous use of germplasm is due to lack of reliable information on traits with economic importance, which requires replicated multilocational evaluations to identify useful parents. In order to accelerate evaluation and utilization of germplasm, the projects of "Establishment of soybean core collection" (1998 – 2003) and "Gene diversity of mini core collection in soybean" (2004 – 2008) were carried out by the continuous supporting from National Basic Research Program (973 project) so that large germplasm collections has been evaluated properly on the basis of the guideline from core collections. In this paper, the development of core (2 – 5% of entire collection) and mini-core (10% of core or 1% of entire collection) is introduced. Meanwhile, the complement of the core or mini-core collections is carried out in order to broaden their representative from national wide into international soybean accessions. For testing the representatives of the core collection, four parameters including SSR loci, sample components, sampling ratio and low frequency allele are analyzed, and then confirmed by the random sampling test. The core and mini-core collections have been used in identifying elite traits and developing new lines, in which the approaches have been introduced that based on core and mini-core collections. The further utilization of core and mini-core collections related to genetic diversity and utilization method of collections is discussed, it is pointed that core collections are basic materials for new trait identification, novel gene mining, germplasm enhancement and new variety development. It has been proved that systematic study and use of soybean germplasm will improve the research of thesoybean germplam from conservation into wider use.

【中文关键词】绵羊;繁殖力;FecB 基因;OarJL36;连锁不平衡
【英文关键词】sheep; prolificacy; FecB gene; OarJL36; linkage disequilibrium
【中文摘要】:【目的】阐明微卫星座位OarJL36 与小尾寒羊高繁殖力主效基因FecB 之间的连锁关系,为绵羊高繁殖力的标记辅助选择提供依据。【方法】分析与FecB 基因最紧密连锁的微卫星座位OarJL36 在高繁殖力绵羊品种(小尾寒羊和湖羊)与低繁殖力绵羊品种(特克塞尔和多赛特)中的遗传多态性,探讨该微卫星与小尾寒羊FecB 基因的连锁不平衡关系。【结果】高繁殖力小尾寒羊和湖羊在骨形态发生蛋白受体IB(bone morphogenetic proteinreceptor IB,BMPR-IB)基因编码序列第746 位碱基处发生了与Booroola Merino 绵羊相同的FecB 突变(A746G),低繁殖力特克塞尔和多赛特绵羊则未发生这种突变;小尾寒羊BB、B+、++型频率分别为0.500、0.386 和0.114,湖羊BB、B+、++型频率分别为0.800、0.200 和0.000;微卫星座位OarJL36 在4 个绵羊品种463 个个体中共检测到10 个等位基因和31 种基因型,最小等位基因为160 bp,最大等位基因为200 bp;182 bp 等位基因在小尾寒羊(n = 308)和湖羊(n = 60)中处于优势等位基因,频率分别为0.696 和0.925,在特克塞尔(n = 47)和多赛特绵羊(n = 48)中的频率分别为0.085 和0.125,在BB 型小尾寒羊(n = 154)和BB 型湖羊(n = 48)中该等位基因频率更高,分别为0.916 和0.938,而在++型小尾寒羊(n = 35)中的频率为0.129;OarJL36 在小尾寒羊、湖羊、特克塞尔、多赛特以及BB、B+、++型小尾寒羊和BB、B+型湖羊中的多态信息含量分别为0.475、0.139、0.661、0.768、0.152、0.588、0.843、0.115 和0.212;连锁不平衡分析显示小尾寒羊FecB 基因B 等位基因与OarJL36 微卫星座位182 bp 等位基因之间存在较强的连锁关系,但仍有一定的重组(D′=0.614),而+等位基因与OarJL36 微卫星座位上的160、192、196、200 bp 等位基因完全连锁(D′=1.000)。【结论】OarJL36 微卫星座位182bp 等位基因与小尾寒羊FecB 基因B 等位基因之间存在较强的连锁关系,是与小尾寒羊多羔主效基因紧密连锁的一个遗传标记。

【英文摘要】【Objective】 The objectives of the present study were to elucidate the linkage relationship between microsatellitelocus OarJL36 and FecB gene of Small Tail Han sheep and to provide a scientific basis for marker-assisted selection for highprolificacy in sheep. 【Method】 Genetic polymorphisms of microsatellite locus OarJL36 which was the closest linked marker to theovine prolificacy major gene FecB were detected in high fecundity sheep breeds (Small Tail Han and Hu sheep) and low fecunditysheep breeds (Texel and Dorset). The linkage disequilibrium between microsatellite locus OarJL36 and FecB gene of Small Tail Hansheep was also analyzed. 【Result】 There was a same FecB mutation (A746G) of BMPR-IB gene in both Small Tail Han and Husheep as that in Booroola Merino ewes. The same mutation did not exist in both Texel and Dorset sheep. The frequency of BB, B+and ++ genotype was 0.500, 0.386 and 0.114 in Small Tail Han sheep, and was 0.800, 0.200 and 0.000 in Hu sheep, respectively. Tenalleles and 31 genotypes

were detected at OarJL36 in 463 individuals from four sheep breeds, in which 160 bp was the shortest alleleand 200 bp was the longest allele. The 182 bp was the predominant allele in Small Tail Han (n=308) and Hu sheep (n=60), of whichfrequency was 0.696 and 0.925, but 0.085 and 0.125 in Texel (n=47) and Dorset (n=48). Especially, the 182 bp allele frequency was0.915 and 0.938 in BB genotype group from Small Tail Han and Hu sheep, but 0.129 in ++ genotype group from Small Tail Hansheep. The polymorphism information content (PIC) was 0.475, 0.139, 0.661, 0.768, 0.153, 0.588, 0.843, 0.116 and 0.212 in SmallTail Han, Hu, Texel, Dorset, BB group from Small Tail Han, B+ group from Small Tail Han, ++ group from Small Tail Han, BBgroup from Hu sheep, B+ group from Hu sheep, respectively. In Small Tail Han sheep, linkage analysis indicated that there werefervent linkage disequilibrium as well as certain recombination between 182 bp allele of microsatellite locus OarJL36 and B allele ofFecB gene (D′=0.614) , and complete linkage between 160 bp,192 bp, 196 bp, 200 bp alleles of microsatellite OarJL36 and + alleleof FecB gene (D′=1.000). 【Conclusion】 These results preliminarily showed that 182 bp allele of microsatellite locus OarJL36 is agenetic marker closely linked to B allele of the prolificacy major gene FecB in Small Tail Han sheep.

【题目】绵羊微卫星300U和FecB基因的多态及连锁分析

【中文关键词】绵羊;多羔性;犊豺友犅基因;300犦;连锁不平衡

【英文关键词】she ep; prolificac y; FecB g ene ; 300 U; linkag e disequilibr ium

【中文摘要】旨在阐明微卫星座位300犦与小尾寒羊高繁殖力主效基因犊豺友犅之间的连锁关系,为绵羊高繁殖力的标记辅助选择提供科学依据。分析与绵羊高繁殖力主效基因犊豺友犅紧密连锁的微卫星座位300犦在高繁殖力绵羊品种(小尾寒羊和湖羊)和低繁殖力绵羊品种(特克塞尔和多赛特)中的遗传多态性,同时探讨该微卫星座位与小尾寒羊犊豺友犅基因的连锁不平衡关系。微卫星座位300犦在4个绵羊品种的472个个体中共检测到14个等位基因和52种基因型,最小等位基因为124bp,最大等位基因为162bp;小尾寒羊(狀=316)、湖羊(狀=60)、特克塞尔(狀=48)、多赛特(狀=48)和小尾寒羊的犅犅型(狀=156)、犅+ 型(狀=124)、++ 型(狀=36)以及湖羊的犅犅型(狀=48)、犅+ 型(狀=12)群体中优势等位基因分别是160、148、160 、150、160、160、138以及148和148bp,其频率分别为0.294、0.958、0.750、0.271、0.327、0.282、0.236以及0.959和0.958。连锁不平衡分析显示小尾寒羊犊豺友犅基因犅等位基因与300犦座位160bp等位基因之间存在一定的连锁不平衡(犱′=0.341),而+ 等位基因与300犦座位138bp等位基因之间存在一定的连锁不平衡(犱′=0.275)。本研究结果表明微卫星座位300犦只能在一定程度上反映犊豺友犅座位信息。

【题目】神经肽Y基因多态性及其与小尾寒羊产羔数的关系
【中文关键词】:绵羊;多羔性;神经肽Y基因;PCR—SSCP
【英文关键词】sheep;prolificacy;neuropeptide Y gene;PCR—SSCp
【中文摘要】:本研究旨在阐明神经肽Y(neuropeptide Y,NPY)基因的多态性及其与小尾寒羊产羔数的关系,为绵羊多羔性的标记辅助选择提供科学依据。采用PCR-SSCP技术检测NPY基因全部3个外显子在小尾寒羊、湖羊、特克塞尔和多赛特羊中的单核苷酸多态性,分析该基因对小尾寒羊多羔性的影响。仅引物P1扩增片段存在多态性,在小尾寒羊中检测到5种基因型,在湖羊和多赛特羊中检测到3种基因型,而在特克塞尔羊中仅检测到1种基因型;测序分析显示,在小尾寒羊中存在CR、TR和Tw 3种等位基因,在湖羊和多赛特羊中存在CR和TR 2种等位基因,而在特克塞尔中仅存在CR 1种等位基因。TR与CR相比在绵羊NPY基因编码区第93 bp处发生了1个c—T的单碱基突变;Tw 与CR相比除发生C93T的单碱基突变外,还在130和131 bp发生了GA—AT的双碱基突变,该突变引起绵羊NPY成熟肽第16位氨基酸由天冬氨酸变为异亮氨酸。对于多态位点C/T,小尾寒羊3种基因型之间产羔数差异均不显著(P>O.05) 对于多态位点GA/AT,RW 型小尾寒羊产羔数平均比RR型的多0.56只(P<O.05)。在小尾寒羊5种复合基因型中,TTRw 和CTRW 型小尾寒羊产羔数差异不显著(P>0.05);TTRR、CTRR和CCRR型小尾寒羊产羔数差异也不显著(P>O.05);TTRw 和CTRW 型小尾寒羊产羔数均显著高于其余3种基因型(P<o.05)。本研究结果初步表明NPY基因GA/AT突变位点的w 等位基因是提高绵羊产羔数的1个潜在有效的DNA标记。
【英文摘要】Abstract:The objectives of the present study were to elucidate the polymorphism of ovine neu—ropeptide Y (NPY)gene and its relationship with litter size of Small Tail Han sheep,and to pro—vide a scientific basis for marker—assisted selection for prolificacy in sheep.The N PY gene wasstudied as a candidate gene for prolificacy in some sheep breeds.Single nucleotide polymorphisms(SNPs)of all three exons(exon 1,2 and 3)of NPy gene were detected in Small Tail Han,Hu,Texel and Dorset sheep by polymerase chain reaction—single strand conformation polymorphism.Only the product amplified by primer P1 displayed polymorphism. Five genotypes were detectedin Small Tail Han sheep,three genotypes in H u and Dorset sheep,but only one genotype in Texel sheep.Sequencing results revealed that there were three alleles(CR,TR and TW)in SmallTail Han sheep,two alleles(CR and TR)in Hu and Dorset sheep,only one alle1e(CR)in Texelsheep. Compared with CR allele,there was one single nucleotide mutation (C— ’ T)at 93 bp posi—tion of coding region of NPy gene in the TR allele.Compared with CR allele,besides C93T mu—tation,there was one double nucleotide mutation (GA÷ AT)at 130 and 131 bp position of codingregion of NPY gene in the TW allele.This mutation caused an Asp Ile replacement at position1 6 of amino acid sequence of sheep NPY mature peptide.For C/T polymorphic

site,the differ—ences of the litter size between three genotypes were non—significant in Small Tail H an sheep(P>0.05).For GA/AT polymorphic site,the ewes with genotype RW had 0.56(P< 0.05)lambs more than those with genotype RR in Small Tail H an sheep.In the five combined geno—types of Small Tail H an sheep,the difference of the litter size between TTRW and CTRW geno—types was non—significant(P> 0.05),the differences of the litter size between TTRR。CTRR andCCRR genotypes were non—significant(P> 0.05),least squares means of 1itter size for TTRWand CTRW genotypes were significantly higher than those for the other genotypes(P< 0.05).These results preliminarily indicated that allele W of GA/AT polymorphic site of N PY gene is apotential DNA marker for improving litter size in sheep.

【题目】ADLS和GARS-AIRS-GART基因多态位点和聚合基因型对白耳鸡胸肌肌苷酸含量的效应分析
【中文关键词】:腺 苷琥珀酸裂解酶( )基 因;甘 氨酰胺核苷酸合成酶 5氨基咪唑核苷酸合成酶 甘氨酰胺核苷酸转甲基酶( )基 因;白 耳鸡;基 因聚合;肌 苷酸
【英文关键词】gene ； glycinamide ribonucleotide synthetaseaminoimidazole ribonucleotide synthetaseglycinamide ribonucleotide transformylase ( ) gene ； Baier chicken ； gene pyramiding ； inosine monophosphate acid (IMP)
【中文摘要】:采 用 PCRSSCP方法检测白耳鸡( )腺 苷琥珀酸裂解酶( )基 因外显子 2 和甘氨酰胺核苷酸合成酶 5氨基咪唑核苷酸合成酶 甘氨酰胺核苷酸转甲基酶( )基 因5' 侧翼区多态性,分 析多态位点不同基因型及聚合基因型与 90 日龄胸肌肌苷酸(IMP)含 量的关联,并 比较分析了不同聚合基因型个体的生产性能。结果表明, 基因外显2和 基因 5' 侧翼区的多态位点 C3484T、C 179T与 IMP 含量显著相关(< 0.05),T T 为两种有利单基因型,其对 IMP 含量的加性效应分别为 0.1710 和 0.128 mg/g,显性效应分别为-0.025 和 0.031 mg/g 。两种有利单基因型聚合个体TTTT 的IMP 含量显著高于其它基因型聚合个体(除 TTCC 型),且 在聚合基因型中两种有利单基因型 TT 对 IMP 含量的影响均达到显著水平(< 0.05),但 两者间的互作效应并不显著(> 0.05)。T TTT 聚合基因型个体的 90 日龄平均体重、7 2 周龄产蛋性能仍保持相对稳定。
【英文摘要】The polymorphism sites in exon 2 domain of adenylosuccinatelyase ( ) and 5'flankingdomain of( )genes on Baier chicken ( ) were identified by PCRSSCP.Association between the founded polymorphism sites as well as pyramidinggenotyp es and inosine monophosphate acid (IMP) contents in muscles were tested by least square analysis. The reproductionperformance of individuals with different pyramiding genotypes were also analyzed. The results showed the founded polymorphismsites C3484T and C179Thad significant correlation with IMP contents in muscles. The TTs were two advantageous genotypes. Theiradditive effects for and genes were 0.1710 and 0.128 mg/g, and the dominant effects were -0.0250 and0.031 mg/g respectively. The pyramiding genotype TTTT had higher IMP contents than that of other pyramiding genotypes. The effectsof two advantageous TTs in pyramiding genotype TTTT were still significant on IMP contents, however,their interaction effectwas not significant (>0.05). The average weights of 90 days and egg reproduction in pyramiding TTTT populations had no variation.

【英文关键词】Tibetan pigs; traits; quality character
【中文摘要】为探明藏猪内脏器官和消化系统生长发育规律,选择日龄、体重相近的藏猪在1~6月龄时屠宰,分析内脏器官和消化系统的生长发育规律。结果表明,藏猪的心脏在1~6月龄生长迅速,各月龄间差异极显著;肝脏的重量在1、2月龄与3、4月龄,3、4月龄与5、6月龄差异极显著;脾脏的生长速度较快,但在1、2月龄和5、6月龄时差异不显著;肺和肾脏在1、2、3月龄时差异均不显著;胃从3月龄开始快速生长,3、4、5、6月龄时差异极显著,而其它消化器官的发育相对较晚。通过相对生长系数分析,5个内脏器官中,心脏、肝脏、肺的相对生长系数在2月龄时最大,分别为93.08%、95.29%和113.17%;在8个消化器官指数中,舌头和胃的相对生长系数在2月龄最大,分别为53.59%和123.96%,藏猪的胃、心、肝、肺属相对早熟器

官。

【题目】基于cytb 基因探讨家绵羊和多角绵羊的系统发育
【中文关键词】绵羊;细胞色素b;起源
【英文关键词】sheep; cytochrome b; origin
【中文摘要】【目的】研究中国家绵羊起源进化以及多角绵羊和普通家绵羊的亲缘关系。【方法】测定8 个省区42个绵羊个体的细胞色素b 基因全序列。【结果】本试验的绵羊个体可定义为40 个单倍型,单倍型多样度为0.997±0.006,核苷酸多样度为0.793%。中国绵羊群体可分为4 个支系(A、B、C 和D),其中支系D 首次在中国绵羊群体中被检测到;支系B 与支系C 的差异最大,分化时间大约为595±150 万年。多角绵羊与家绵羊聚在一起,而与野绵羊亲缘关系较远,分属于支系A、B 和D。【结论】系统发育分析表明,中国绵羊有多个母系起源或经过多次驯化,未发现盘羊、东方盘羊和亚洲摩佛伦羊与绵羊母系祖先形成相关的分子证据。
【英文摘要】【objective】 The aim of the study is to investigate the origin and evolution of Chinese domestic sheep (ovis aries)and the relationship between domestic sheep and multi-horned sheep, 【Method】 The complete cytb sequences of 42 individualsfrom 8 provinces were sequenced. 【Result】 The result showed that totally 40 haplotypes were detected, and Haplotype diversity(Hd) and nucleotide diversity (π) were 0.997±0.006 and 0.793%, respectively. The neighbour-joining tree indicated that there are fourdistinct lineages (A, B, C and D) in Chinese domestic sheep. It is firstly reported that lineage D were detected in Chinese sheep. Andlineages B and C had the highest variance value, which diverged from each other about 595±150 million years. The multi-hornedsheep belonged to lineages A, B and D, which had closer relationship with domestic sheep than wild sheep. 【Conclusion】 Analysisof phylogenesis shows that Chinese sheep have multiple maternal origins or ever experienced several times domestication possibly.There is no evidence that urial, argali and asian mouflon had molecular contribution to the maternal ancestor of Chinese sheep.

【题目】藏猪IGF I基因外显子4和IGF I I基因内含子7 PCR2RFLP分析
【中文关键词】藏猪; IGFs基因; PCR2RFLP;多态性
【英文关键词】Tibet p ig; IGFs gene; PCR2RFLP; Polymorphism
【中文摘要】藏猪为我国高原特色的原始小型猪种,其生长发育速度缓慢。本研究采用PCR2RFLP技术检测藏猪IGF I基因外显子4和IGF II基因内含子7酶切多态性。结果发现藏猪IGF I基因exon42PCR2Hha I2RFLP出现AA、AB和BB 3种基因型,AA基因型频率较高,为66. 07%;等位基因A和B频率分别为80. 36%和19. 34%。藏猪IGF II基因intron72G162C位点全部为GG基因型,intron72C179G位点全部为CC基因型。藏猪这2个基因的基因型分布与国内外其他猪种表现差异,这可能与其生长速度慢有关。
【英文摘要】Tibet Pig was a special Chinese indigenous p ig breed native to high2altitude areas of Tibet. In the p resent study, the polymor2phisms of exon4 of insulin2like growth factor2I (IGF I) and intron7 of insulin2like growth factor2II (IGF II) were measured with the methodof PCR2RFLP in Tibet p ig. The results showed that there were three genotypes, AA, AB and BB, for IGF I2exon42PCR2Hha I2RFLP in Ti2bet p ig population, and the p redominant genotypeswasAA (60. 07%) . The frequencies of allele A and allele B were 80. 36% and 19.34%, respectively. The genotype of IGF II2intron72G162C was GG and the genotype of IGF II2intron72C179Gwas CC in all Tibet p ig indi2vidual. The distribution of genotype of the two genes in Tibet p ig population was differentwith other p ig breeds, and might be relative to thelow growth rate of the Tibet p ig.

【题目】鸡Lmbrl基因一种异常可变剪接的克隆和表达分析
【中文关键词】鸡;Lmbrl;异常可变剪接;克隆;表达
【英文关键词】chicken;Lmbrl;abnormal alternative splicing;cloning;expression
【中文摘要】根据人Lmbrl/C70rf2基因的一种缺失外显子4的可变剪接与Acheiropodia(ACHP)疾病的关联,本研究拟根据可变剪接在物种间的保守性,进行鸡Lmbrl这种相似可变剪接的鉴定和表达分析。设计跨越Lmbrl外显子4的引物可同时检测这2种转录产物的表达,本研究成功地从鸡的心脏组织获得了缺失外显子4的Lmbrl异常剪接(Lmbrl一8)。在自来航初生雏鸡及5~6胚龄胚的组织表达分析显示,2种转录产物均可在所检测的组织中表达,与包含外显子4的转录产物(Lmbrl—a)相比,可变剪接Lmbrl—B为一种次要表达产物,表达量较弱。对多趾的丝羽乌骨鸡和四趾的自来航鸡胚组织间2种转录产物表达进行进一步分析,在2个品种3~11胚龄(E3~E11)的胚胎发育期间均可同时检测到Lmbrl-a和Lmbrl—B的表达,Lmbrl-a为主要表达产物,Lmbrl-f]为次要表达产物,Lmbrl—B表达量微弱。在2个品种的胚胎发育期间未见2种转录产物明显的表达差异。结果显示,包含外显子4的Lmbrl—a为鸡Lmbrl基因的主要转录产物,广泛而稳定地在锥鸡和发育鸡胚各组织中表达,丝羽乌骨鸡多趾表型的发育与常见转录产物Lmbrl-a和异常可变剪接Lmbrl—B的表达无直接的相关。
【英文摘要】Abstract:Based on the report that the abnormal splice form deleted exon 4 of Lmbrl/C70rf2 asso—pression difference was identified between the two breeds.It showed that Lmbrl—a containing ex—on 4 was the main transcript of Lmbrl,which expressed in all detected tissues of the chicken anddeveloping embryos,the development of polydaetyly in Silky was not related with the expressionof chicken Lmbrl—a and Lmbrl—B.ciated with human Acheiropodia and the conservation of the alternative splices among species tosome degree,the identification and expression analysis of chicken Lmbrl similar transcript variantwere conducted.Primers spanning chicken Lmbrl exon 4 were designed to clone the alternativesplice deleted exon 4(Lmbrl—p)of chicken Lmbrl—m The primers spanning exon 4 could detect theexpression of two different transcripts of chicken Lmbrl at the same time.The tissue expressionanalysis in one day-old chicks and 5-6 day-old embryos of White Leghorn showed that two tran—scripts could be detected in all tissues,and comparing with chicken Lmbrl—a,Lmbrl—p was a mi—nor transcript and its expression level was weak.Comparison between the Lmbrl expression ofE3・_El l in polydactyly Silkies and four tetradactyly White Leghorn showed that both Lmbrl。’a andLmbrl一8 expressed in all detected chicken embryo tissues,Lmbrl—a was the main transcript prod—uct and Lmbrl—B was a minor transcript product in very weak expression.No significant tissue ex-

【题目】限饲对肉仔鸡生产性能及部分血清生化指标的影响
【中文关键词】肉鸡;能量限制;生产性能;生化指标
【英文关键词】broilers;energy restriction;performance;serum biochemical parameter
【中文摘要】随机选取4~8周龄期间经30%能量限制的健康哈博德父母代母雏,研究能量限制对其生产性能及血清生化指标的影响。结果表明:30%能量限制后,肉鸡的体重、平均日增重和腹脂率显著降低I血清超氧化物歧化酶活性显著升高,丙二醛含量极显著降低,尿酸水平极显著升高;血清甘油三酯和总胆固醇水平极显著降低,较对照分别下降32.2%和13.7%;血清尿素氮水平显著升高;血清碱性磷酸酶水平极显著降低。可见30%能量限制可提高肉鸡的抗氧化水平和降低血脂。
【英文摘要】The effect of feed restriction on performance and serum biochemistry,anti—oxidant levels(superoxide dis—mutase,SOD;malondialdehyde,MDA;uric acid,UA),lipometabolism levels(triglyeride,TG;cholesterol,CHO),blood urea nitrogen(BUN),and alkaline phosphatase(AKP)were studied in meat type female chickens(Habord).Adlibitum fed birds were compared with those subjected to 30 percent energy feed restriction from 22 to 58 days of age.Feedrestriction decreased body weight,average daily weight gain and abdomen fat ratio;Feed restriction elevated serum SOD(P<O.05)and UA(P<0.01)1evels,but not for MDA.A feed restriction-induced decrease was observed for triglyeride(32.21%)and cholesterol(13.69%).Alkaline phosphatase was lower for the feed restricted chickens,but BUN wassignificantly increased.Significant changes Of serum biochemical parameters induced by 30 percent energy feed restrictionillustrated that limiting feed intake had an intensive stress on meat type chickens during the rapid growth period.Thiscontrast between feed restriction and ad libitum feed indicated that 30 percent feed restriction could elevate

anti—oxidantlevels and reduce lipometabolism levels in growing broilers chickens.

【题目】LPIN1基因的研究进展
【中文关键词】LP IN1基因,关键基因
【英文关键词】LP IN1　gene; L ip in1
【中文摘要】LP IN1基因是LP IN家族的一员,是调控脂肪细胞分化与脂类代谢的关键基因。该基因突变将改变血浆中胰岛素抵抗性及葡萄糖含量,导致体内脂肪组织功能性紊乱,造成多种代谢疾病。随着对LP IN1基因的研究不断深入,将该基因多态与相关疾病或药物反应进行关联分析,可以揭示复杂性疾病的致病机制与疾病的不同临床表型,也可作为实行个体化治疗的依据。本文就LP IN1基因的研究现状、生物学功能、突变和表达差异对脂肪的影响及其多态性与2型糖尿病的相关研究进展作一综述。

【中文关键词】野家杂交猪;繁殖性状;候选基因;PCR-RFLP

【英文关键词】wild boar and domestic hybrid pig, reproduction trait, candidate gene, PCR-RFLP

【中文摘要】测定和分析了野猪与大白猪杂交后F1代群体内8 个与繁殖性状相关基因的群体遗传情况,以期为猪的杂交育种以及标记辅助选择提供一定的理论依据。采用PCR-RFLP法对248 头杂交猪(大白♀×野猪♂)的ESR、FSH β、GPX5、FUT1、PRLR、NCOA1、OPN和RBP4基因的多态位点进行了检测,并计算了每个位点的基因型频率和基因频率。大白猪群体内引入野猪血统后,F1代的ESR、FSH β 和PRLR的优势等位基因频率都有不同程度的下降,FUT1 和GPX5 的优势等位基因频率与现有研究结果基本一致,而NCOA1 和OPN 的优势基因频率都高于已检测的杂交品种,只有RBP4 基因处于哈代-温伯格平衡状态。野猪与家猪杂交育种工作中,要选择ESR、FSH β 和PRLR的优势等位基因频率较高的母本群体。

【英文摘要】To detect and analyze the group heredity of eight reproduction genes in F1 generation of wild boarand Large White pig, hope the result could be useful for crossbreed and marker assisted selection (MAS). Thegenotypic frequencies and allele frequencies of eight genes related to reproduction, i.e. ESR, FSH β , GPX5,FUT1, PRLR, NCOA1, OPN and RBP4 were tested in the 248 F1 generation hybrid pig (Large White ♀×wildboar♂) by PCR-RFLP. In F1 crossbred, ESR, FSH β and PRLR predominance allele frequency had decreasetrend, except FUT1 and GPX5, but NCOA1 and OPN ’s were all higher than had been detected in crossbreds,only RBP4 was existed in Hardy-Weinberg equilibrium state. In breeding work of wild boar and domestic pig,it should select female parent group which contained highly predominance allele frequency of ESR、FSH β andPRLR genes.

【题目】猪LPL基因部分序列的克隆及多态性分析
【中文关键词】猪;LPL基因;脂肪;PCR.SSCP
【英文关键词】LPL,fat,PCR—SSCP
【中文摘要】脂蛋白脂酶是一种多功能蛋白,其主要作用是催化乳糜微粒和极低密度脂肪酸的甘油三酯水解,是影响脂肪沉积的关键酶之一。对猪LPL基因部分序列进行克隆测序,并利用PCR.SSCP方法对其进行分子扫描,寻找多态位点,分析不同基因型在不同猪种间的分布规律。Z独立性检验表明,野猪、民猪、大白猪、长白猪、杜洛克之间不同基因型的分布差异极其显著(P<0.01)。
【英文摘要】Lipoprotein lipase(LPL)gene is a muhifunctional protein,which catalyses the hydrolysis of thetriglycerides component of Chylomicrons and very low density lipoproteins(VLDL).It is one of the keyenzymes for implicating the control of fat storage and fat mobilization.This study was designed to clone thepart of the swine LPL gene and detected the polymorphisms by PCR-SSCP.疋2 analysis showed that in thepolymorphic locus,there were extremely significant difference in the distribution of genotypes among Wildboar,Min pig,Yorkshire,Duroc and Landrace(P<0.01).

【题目】猪MEF2a基因的克隆与表达
【中文关键词】猪;MEF2a;克隆;Real—time PCR
【英文关键词】porcine;M EF2a;clone;Real—tim e PCR
【中文摘要】为了进一步了解猪MEF2a基因的结构与功能,本研究采用生物信息学结合RT—PCR的方法,克隆了猪的MEF2a基因,获得了它的2个变异体序列。结果表明,猪MEF2a variant 1基因cDNA长1 524 bp(EF576923),编码508个氨基酸,分子量为54.481 ku;variant 2基因cDNA长1 416 bp(EF576922),编码471个氨基酸,分子量为50.846 ku。MEF2a两个变异体的氨基酸序列同源性为86.79 ,第laa~77aa和第132aa~470aa完全一致,第78aa~131aa是高变区,variant2与variantl相比,在第224aa~258aa处存在34个氨基酸(102 bp)的缺失。利用Real-time PCR方法检测了MEF2a的表达。结果表明,MEF2a mRNA是一个广谱表达基因,在心、肝、胃、脾、肾、肺、大肠、小肠、背肌和腿肌中都能检测到,在腿肌中优势表达。MEF2a variantl与马和家鼠构成一个小类群,而variant 2与牛和人构成了另外一个小类群,推测MEF2a基因在进化过程中发生了较为明显的变异。
【英文摘要】Abstract:In order to understand the structure and function of porcine M EF2 a gene,porcineM EF2a gene was cloned by bioinformatics and RT—PCR,and two variant sequences were ob—tained.Variant 1(1 524 bp,EF576923)encodes 505 amino acids which iS 54.481 ku.Variant 2(1 416 bp,EF576922)encodes 471 amino acids which iS 50.846 ku.Amino acid sequence homologybetween MEF2a variants is 86.79 .It is completely identical in 1st 一77th and 132th 一470th amino acids。 and is hypervariable in 78th一131th region.Variant 2 has 34 amino acids(102bp)deletion in 224th一258th compared with variant 1.M EF2a mRNA iS a broad—spectrum expressiongene.It was detected in heart,liver,stomach,spleen,kidney,lung,large intestine,small intestine,dorsal muscle and leg muscle,especially superior expression in leg muscle by Re—al—time PCR.It was showed that in phylogentic tree,for variant 1,horse and house mouse wasclustered one group and for variant 2,cattle and human was clustered another group. So it waspresumed that M EF2a gene undergoes apparent variation during evolutionary process.

【题目】野猪CAPN7 基因的克隆、表达和变异分析
【中文关键词】野猪;CAPN7;克隆;序列分析;组织表达;钙蛋白酶
【英文关键词】Wild boar; CAPN7; Cloning; Sequence analysis; Tissue expression; Calpains
【中文摘要】钙蛋白酶是细胞质中主要的蛋白水解酶,在肌肉生长、蛋白转化及嫩化过程中发挥复杂的作用。该研究利用RT-PCR、生物信息学方法克隆野猪(Sus scrofa ussuricus)CAPN7 cDNA 并进行序列分析,利用相对定量RT-PCR 方法研究其组织表达情况和利用PCR-SSCP 方法对其进行变异分析。结果表明,野猪CAPN7 基因编码区全长2 442 bp,预期编码813 个氨基酸残基,多肽链中存在着calpain 家族的催化结构域和催化活性中心;野猪CAPN7不同程度地表达于所检测的12 种组织中,在6、9 月龄野家杂交猪肌肉组织中的相对表达量高于同一时期的大白猪肌肉组织;所检测到的3 种基因型在野猪、民猪和杜洛克中的分布存在着极显著差异。该研究为进一步揭示calpain7 的功能提供了分子生物学基础。
【英文摘要】Calpains are the key proteases involved in muscle growth, protein transformation and meat tenderization.In this study, CAPN7 cDNA of Wild boar was cloned by RT-PCR, its sequence analysis, expression characterization andpolymorphism analysis were performed. The results showed that the full-length coding sequence of Wild boar CAPN7 is2442 bp long, and encodes a protein of 813 amino acids with the catalytic site of calpain family, whose catalytic triadresidues is located at amino acids 290, 458 and 478, respectively. RT-PCR expression analysis indicated that CAPN7mRNA was ubiquitously expressed in the 12 tissues examined, but the relative abundance was unevenly distributed intissues. The CAPN7 mRNA levels in muscle of 6 and 9-month-old crossbred pigs were higher than those of Yorkshirepigs at the same ages. In addition, a missense mutation was identified by PCR-SSCP and its distribution

in wild boar, Minpig and Duroc was significantly different. The results lay the foundation for further studying the function of CAPN7 gene.

【题目】A-FABP 基因多态性与肉鸡生长和体组成性状的关联研究
【中文关键词】A-FABP 基因;鸡;单倍型;生长;体组成性状
【英文关键词】A-FABP gene; chicken; haplotype; growth; body composition traits
【中文摘要】为探讨A-FABP基因多态性对肉鸡生长和体组成性状的影响,文章选用肉鸡高、低脂双向选择品系第十世代肉仔鸡为实验材料,采用测序、PCR-RFLP、PCR-LP、DHPLC的方法进行基因多态性检测和个体基因型分析,通过对8个SNPs进行连锁不平衡分析并选择5个标签SNPs构建单倍型,进而利用单位点和单倍型分别与鸡生长和体组成性状进行关联分析。结果表明,7个SNPs(除SNP 5以外)及单倍型同时对鸡肌胃重、肌胃率有显著影响(P<0.05),而对生长和其他体组成性状无显著影响(P>0.05)。鉴于不同物种A-FABP基因现有的功能研究均没有发现其对消化系统有重要作用,因此该基因是否为影响肉鸡肌胃重和肌胃率的主效基因还有待于进一步研究。
【英文摘要】This experiment was designed to study the effects of polymorphisms of A-FABP gene on growthand body composition traits in chickens. The 10th generation broiler population, derived from the NortheastAgricultural University broiler lines divergently selected for abdominal fat content (NEAUHLF) was used.Polymorphisms among individuals were detected by DNA sequencing, PCR-RFLP, PCR-LP and DHPLC.Linkage disequilibrium analysis for eight SNPs was performed, and five htSNPs were selected to constructhaplotypes. The association analyses between the individual SNPs and haplotypes and growth and bodycomposition traits were investigated, respectively. The results showed that there were consistently significanteffects on muscle stomach weight (MSW) and percentage of muscle stomach (MSW/BW) (P<0.05) in theseven SNPs (except SNP 5) and haplotypes, and no significant effect on any other trait (P>0.05). Due to noevidence on effects of A-FABP for digestion system in other species, future experiments need to be developedto confirm whether A-FABP could be a major gene of MSW and MSW/BW traits in broiler chicken.

【题目】Crop discrimination in North China with double cropping systems using Fourier analysis of time-series MODIS data
【中文关键词】english
【英文关键词】MODIS; NDVI; Crop discrimination; Fourier transform
【中文摘要】english
【英文摘要】Crop identification is the basis of crop monitoring using remote sensing. Remote sensing the extent and distribution of individual crop types has proven useful to a wide range of users, including policy-makers, farmers, and scientists. Northern China is not merely the political, economic, and cultural centre of China, but also an important base for grain production. Its main grains are wheat, maize, and cotton. By employing the Fourier analysis method, we studied crop planting patterns in the Northern China plain. Then, using time-series EOS-MODIS NDVI data, we extracted the key parameters to discriminate crop types. The results showed that theestimated area and the statistics were correlated well at the county-level. Furthermore, there was little difference between the crop area estimated by the MODIS data and the statistics at province-level. Our study shows that the method we designed is promising for use in regional spatial scale crop mapping in Northern China using the MODIS NDVI time-series.

【题目】Cold-induced modulation and functional analyses of the DRE-binding transcription factor gene, GmDREB3, in soybean (Glycine max L.)

【中文关键词】无

【英文关键词】Abiotic stress, DREB transcription factor, drought tolerance, gene function, soybean

【中文摘要】无

【英文摘要】DREB (dehydration-responsive element-binding protein) transcription factors have important roles in the stress-related regulation network in plants. A DREB orthologue, GmDREB3, belonging to the A-5 subgroup of the DREB subfamily, was isolated from soybean using the RACE (rapid amplification of cDNA ends) method. Northern blot analysis showed that expression of GmDREB3 in soybean seedlings was induced following cold stress treatment for 0.5 h and was not detected after 3 h. However, it was not induced by drought and high salt stresses or by abscisic acid (ABA) treatment. This response was similar to those of members in the A-1 subgroup and different from those of other members in the A-5 subgroup, suggesting that the GmDREB3 gene was involved in an ABA-independent cold stress-responsive signal pathway. Furthermore, analysis of the GmDREB3 promoter elucidated its cold-induced modulation. A promoter fragment containing bases −1058 to −664 was involved in response to cold stress, and its effect was detected for 1 h after treatment, but a transcriptional repressor appeared to impair this response by binding to a cis-element in the region −1403 to −1058 at 24 h after the beginning of cold stress. Moreover, the GmDREB3 protein could specifically bind to the DRE element in vitro, and activated expression of downstream reporter genes in yeast cells. In addition, overexpression of GmDREB3 enhanced tolerance to cold, drought, and high salt stresses in transgenic Arabidopsis. Physiological analyses indicated that the fresh weight and osmolality of GmDREB3 transgenic Arabidopsis under cold stress were higher than those of wild-type controls. GmDREB3 transgenic tobacco accumulated higher levels of free proline under drought stress and retained higher leaf chlorophyll levels under high salt stress than wild-type tobacco. In addition, constitutive expression of GmDREB3 in transgenic Arabidopsis caused growth retardation, whereas its expression under control of the stress-inducible Rd29A promoter minimized negative effects on plant growth under normal growth conditions, indicating that a combination of the Rd29A promoter and GmDREB3 might be useful for improving tolerance to environmental stresses in crop plants.

【题目】A cotton (Gossypium hirsutum) DRE-binding transcription factor gene, GhDREB, confers enhanced tolerance to drought, high salt, and freezing stresses in transgenic wheat
【中文关键词】无
【英文关键词】Wheat DREB gene Abiotic stress tolerance
【中文摘要】无
【英文摘要】"A cotton (G. hirsutum L.) dehydration responsive element binding protein gene, GhDREB, which encodes a 153 amino acid protein containing a conserved AP2/EREBP domain, was isolated from the cDNA library of cotton cv. Simian 3 by a yeast one-hybrid system. RNA blot analysis showed that the GhDREB gene was induced in cotton seedlings by drought, high salt and cold stresses. An electrophoretic mobility shift assay (EMSA) indicated that the GhDREB protein bound specifically to the DRE core element (A/GCCGAC) in vitro. Two expression vectors containing the GhDREB gene with either of the Ubiqutin or rd29A promoters were constructed and transferred into wheat (Triticum aestivum L.) by bombardment. Fifty-eight Ubi::GhDREB and 17 rd29A::GhDREB T(0) plants of Yangmai (36 plants) and Lumai (39 plants) were identified by PCR analysis, respectively. Southern blot and RT-PCR analyses showed that two or three copies of the GhDREB were integrated into the Yangmai 10 genome and were expressed at the transcriptional level, and three or four copies were integrated into the Lumai 23 genome. Functional analysis indicated that the transgenic plants had improved tolerance to drought, high salt, and freezing stresses through accumulating higher levels of soluble sugar and chlorophyll in leaves after stress treatments. No phenotype differences were observed between transgenic plants and their non-transgenic controls. These results indicated that GhDREB might be useful in improving wheat stress tolerance through genetic engineering.

【题目】Overexpression of the soybean GmERF3 gene, an AP2/ERF type transcription factor for increased tolerances to salt, drought, and diseases in transgenic tobacco
【中文关键词】无
【英文关键词】Abiotic stress, biotic stress, ethylene response factor, pathogen
【中文摘要】无
【英文摘要】"A new member of the AP2/ERF transcription factor family, GmERF3, was isolated from soybean. Sequence analysisshowed that GmERF3 contained an AP2/ERF domain of 58 amino acids and two putative nuclear localization signal(NLS) domains. It belonged to a group IV protein in the ERF (ethylene response factor) subfamily as typified bya conserved N-terminal motif [MCGGAI(I/L)]. Expression of GmERF3 was induced by treatments with high salinity,drought, abscisic acid (ABA), salicylic acid (SA), jasmonic acid (JA), ethylene (ET), and soybean mosaic virus (SMV),whereas there was no significant GmERF3 mRNA accumulation under cold stress treatment. GmERF3 could bind tothe GCC box and DRE/CRT element, and was targeted to the nucleus when transiently expressed in onion epidermalcells. The GmERF3 protein fused to the GAL4 DNA-binding domain to activate transcription of reporter genes inyeast. Ectopic expression of the GmERF3 gene in transgenic tobacco plants induced the expression of some PRgenes and enhanced resistance against infection by Ralstonia solanacearum, Alternaria alternata, and tobaccomosaic virus (TMV), and gave tolerance to high salinity and dehydration stresses. Furthermore, overexpression ofGmERF3 in transgenic tobacco led to higher levels of free proline and soluble carbohydrates compared to wild-typeplants under drought conditions. The overall results suggested that GmERF3 as an AP2/ERF transcription factor mayplay dual roles in response to biotic and abiotic stresses in plants.

【题目】大豆抗逆基因GmDREB3启动子的克隆及调控区段分析
【中文关键词】干旱应答元件结合蛋白质;启动子;顺式作用元件;瞬时表达
【英文关键词】Dehydration responsive element binding protein;Promoter;Cis—element;Transient expression
【中文摘要】"GmDREB3基因能提高转基因烟草和拟南芥的抗逆性。利用SiteFinding—PCR技术,从大豆品种铁丰8号基因组中分离到大豆抗逆基因GmDREB3启动子片段,长度1 648 bp。该片段富含A/T碱基,还含有TATA—box、低温响应元件MYC及其他顺式元件MYB、CAAT-box等。将该启动子分区段与GUS报告基因连接构建表达载体,利用基因枪法转化小麦愈伤组织,并进行干旱、高盐、低温等处理,通过组织化学染色和GUS荧光定量测定分析各区段调控元件的活性。结果表明,在干旱和低温的诱导下,该启动子能激活下游GUS基因的表达,在一285—一1 117区域存在与低温和干旱应答有关的重要调控元件,在一1 464—~1 648区域内存在抑制启动子活性的调控元件。由此推断,在逆境条件下通过启动子区域正、负调控元件的共同作用,使GmDREB3基因的表达维持在一个恰当的水平。
【英文摘要】"In order to analyze transcriptional regulative mechanism of G zDREB3 gene.the GmdREB3 promoter f1 648 bp)wasisolated from soybean genome using SiteFinding—PCR m ethod.The sequences is abundan t in A/T base an d predicted to contain alot of putative cis—element,such as low—temperature responsive element(MYC),dehydration responsive element(MYB),ABAresponsive element(ABRE),and so on,as well as TATA—box in biological database.To identify the key promoter regulative re—glen controlling gene expression,GmDREB3 promoter was truncated according to the prediction of putative cis—element an d in—serted into the site upstream of GUS reporter gene.Then.vectors containing different 1ength GmDREB3 promoters were trails—ferred into wheat callus by particle bombardm ent,an d after different stress treatments,function of these putative cis—elem ents wasanalyzed by identifying activation of GUS using histochemistry staining and GUS fluorescence intensity an alysis.The resultsindicated that the promoters between-285 and-1 648 bp frelative to the translational start site)activated expression of GUS re—port gene under drought an d low temperature stresses.But only the promoter region between一285 and一1 117 bp could activateexpression of maximal GUS gene in wheat callus.Another promoter region between一1 117 and-1 464 bp weakened the abilityfor activating expression of G gene under drought and low—temperature stress conditions. Thus.it was suggested that there aresome positive regulating motif between一285 an d-1 117 bp and negative regulating motif between一1 117 and一1 464 bp 0fGmDREB3 promoter.As a result.the expression of GmDREB3 gene can be kept in an appropriate level response to variousstresses through the regulation of beth positive an d negative regulating motifs.

【题目】化肥和有机肥配合施用下双季稻田氮素形态变化
【中文关键词】稻田; 氮素动态; 有机无机肥配合
【英文关键词】paddy field ; nitrogen dynamic ; chemical fertilizer combining with organic manure
【中文摘要】为揭示有机无机肥配合施用下稻田氮素的动态及迁移特征,在湘南双季水稻农作区第四纪红土发育的红黄泥稻田上进行了连续6 年田间试验。通过比较不施氮肥(PK) 、施用有机肥猪粪(M) 、化肥(NPK) 及有机肥化肥配合(NPKM) ,研究稻田表层全氮、无机氮动态变化,不同层次(25 —30、55 —60、85 —90 cm) 土壤溶液无机氮动态,耕层土壤无机氮动态等。结果表明,NH+4-N 是红壤双季稻田无机氮素存在的主要形态,施用化学肥料处理(NPK) 施肥后1~3 d 表面水NH+4-N 浓度占全氮比例可达0.5~0.9 ,有机肥处理(M) 为0.3 左右。不同层次土壤溶液及其土壤氮素浓度呈现一致的特征,即施肥后短期内出现浓度峰值随后迅速下降,且随着往下推移,氮素峰值出现时间延长,表层水全氮及无机氮在施肥后1~2 d 出现浓度高峰,耕层土壤及25 —30 cm土壤溶液无机氮浓度高峰约在施肥后3~5 d。化肥有机肥配施有利于水稻稳产高产,年产量达12.2 t/ hm2 ,比不施氮肥的对照产量(7.3 t/ hm2) 增加68 %; 土壤有机质6 年提升18.5 % ,显著高于化肥。施用有机肥(M) 及有

机无机肥配合(NPKM) 显著降低了稻田表层水全氮及不同层次土壤溶液和耕层土壤NH+4-N 峰值浓度,提高水稻产量和培肥土壤,有利于减少当前氮肥过量施用带来的环境负荷。

【英文摘要】A six year field experiment was conducted in Quaternary Period red clay soil in double rice region of south Hunan province. Its purpose was to disclose dynamics and transferred characteristics of nitrogen under the application of chemical fertilizer combined with manure. Four treatments , namely , no nitrogen (PK) , swine manure (M) , chemical fertilizer (NPK) and swine manure applied combined with chemical fertilizer (NPKM) were selected to study the dynamics of total nitrogen and inorganic nitrogen in surface water , and as well as the dynamics of inorganic nitrogen in soil solution in different layers (25 - 30 ,55 - 60 and 85 - 90cm) and tillage soil . The results show that NH+4-N is the predominant inorganic nitrogen in red double rice paddy soil , and the ratio of NH+ 4 -N/ total N reaches to 0.5 – 0.9 in surface water within 1 - 3 days after chemical fertilizer (NPK treatment) applied , while that of organic manure treatment is about 0.3. The peak values of nitrogen concentration are detected within 1 - 2 days in surface water and 3 - 5 days in soil solution in different layers after fertilizer application. The peak values of nitrogen concentration in surface water , in soil solution and in tillage soil are lower in organic manure (M) , and chemical fertilizer applied combined with organic manure (NPKM) treatments than those of the other two treatments. The NPKM treatment achieves a 12.2 t/ ha mean annual yield (68 % higher than that of PK) . The soil organic matter in tillage soil is increased by 1815 % during the six-year plantation at the NPKM which is significantly higher than that of the NPK treatment . Application of chemical fertilizer combined with organic manure is propitious to reduce environment load due to excessive chemical nitrogen applied.

【题目】Isolation and molecular characterization of the Triticum aestivum L. ethylene-responsive factor 1 (TaERF1) that increases multiple stress tolerance.

【中文关键词】无

【英文关键词】chromosomal localization ERF multiple stress tolerance NLS protein interaction Triticum aestivum

【中文摘要】无

【英文摘要】ERF transcription factions play important roles in regulating gene expression under abotic stresses.The first member of the ERFgene family in wheat (Triticum aestivum L)was isolated by screening as T.aestivum ethylene-responsive factor

1(TaERF1),which encoded a putative protein of 355 amino acids with a conserved DNA-binding domain and a conserved N-terminal motif(MCGGAIL).The TaERF1gene was located on chromosome 7A.Protein interaction assays indicated that TaERF1,with a putative phtative phosphorylation site(TPDTTS)in the C-terminal motif enhanced the interaction of TaERF1with TaMAPK1.The predicated TaERF1protein contained three putative nuclear localization signals(NLSs),and three NLSs modulated synergistically the activity od subcellular localization.As a trans-acting factor,TaERF1 was capable of bingding to the GCC-box and CRT/DRE elements in vitro,and trans-activating reporter gene expression in tobacco leave. Transcription of the TaERF1 gene was induced not by drought,salinity and low-temperature stresses and exogenous ABA,ethylene and salicy acid,but also by infection with Blumeria graminisf.sp.tritici. Furthermore,overexpression of TaERF1 activated stress-related genes,including PR and COR/RD genes,under nomal growth conditions,and improved pathogen and abiotic stress tolance in transgenic plants.These results suggested that the TaERF1gene encodes a GCC-box and CRT/DRE element bingding factor that might be involved in multiple stress signal transduction pathways

【题目】Establishment and characterization of a Chinese Game chicken embryo fi broblast bank.

【中文关键词】no

【英文关键词】Chinese Game chicken fi broblasts ; biological characteristics ; genetic conservation

【中文摘要】no

【英文摘要】For preserving the genetic resources of the Chinese Game chicken and exploring a new method to preserveendangered animals, a Chinese Game chicken embryo fi broblast cell bank was established by the attachmentculture method and the cryopreservation biotechniques. Th is bank includes 43 embryo samples andhas stocks of 178 cryovials, with each containing 4.0×10 6 cells respectively. Quality assays and biologicalcharacteristics of the bank established showed that the cells cultured in vitro were all typical fi broblast andthe cell population doubling time (PDT) was about 2 days. Th e cell viability before freezing was 97.37% ±2.25% and 91.43% ± 3.22% after thawing. Tests for microbial contamination by bacteria, fungus, virusesand mycoplasmas were all negative. Th e frequency of cells having the diploid number of chromosomes(78) was 94.65% ± 3.29%. Isoenzyme analysis confi rmed that there was no cross-contamitation in theculture. Th e fl uorescence could be observed well-distributed in cytoplasm and nucleus except for somecryptomere vesicles at 24 h after transfection, and the expression effi ciency of pEGFP-C1, pEGFP-N3,pEYFP-N1, pECFP-N1, pECFP-mito and pDsRed1-N1 were all between 9.5%~34.6% at 24 h, 48 h and72 h after transfection. Th is research provided both technical and theoretical support for preserving thegenetic resources of other animals and poultry at the cell level.

【题目】Establishment and Characterization of the Fibroblast Line from Silkie Bantam.

【中文关键词】no

【英文关键词】Silkie Bantam,Embryo Fibroblast Line,Establishiment,Identification

【中文摘要】no

【英文摘要】A silkie Bantam embryo fibroblast line(named SBF59 line)was successfully established by using direct explant culture and cryopreservation techniques.Cell morphology, viability ,dynamic growth and contamination were tested and the karyotype and levels of isoenzymes of lactic dehydrogenase and malic dehydrogenase were analyzed.Fore kinds of fourescent protein extrogenes,

including pEGFP-N3,pECFP-N1,pEYFP-N1 and pDSRED1-N1 were transfected into the cells. The results showed that the cells were healthy and possessed a fibrous structure without a change in morphology. the average viability of the cells was 96% before freezing and 90.5% after thawing. th growth curve appeared as typical "s" shape and the cell growth passed through a detention phase,a logarithmic phase and a platfoum phase; the estimated populaiton doubling time(PDT) was 38.5h; assays for the presence of bacteria,fungi, viruse and mycoplasmas were negative; the cell line showed no cross contamination when assessed by isoenzyme analysis;the chromosome number was2n=78 on more than 88% of occasions;four kinds of fluorescent protein extro-genes appeared to be expressed effectively with a high transfection efficiency between 18.3% and 42.3%.The line met the required quality control standard.It not onyl preserves the genetic resources of the important Silkie Bantam at the cellular level but also provides valuable materials four genomic, post-genomic, somatic cell cloning research and other applications.

【题目】Differentiation potential of bone marrow mesenchymal stem cells in duck.

【中文关键词】no

【英文关键词】duck; mesenchymal stem cells; induction; differentiation

【中文摘要】no

【英文摘要】The bone marrow mesenchymal stem cells (MSCs) are multipotent stem cells which can differentiate into mesenchymal cells in vitro.In this study, MSCs in duck were isolated from bone marrow by density gradient centrifuge separation, purified and expanded in the medium.The primary MSCs were expanded for 11 passages. The different-passage MSCs were induced to differentiate into osteoblasts andneuron-like cells. Karyotype analysis indicated that MSCs kept diploid condition and the hereditary feature was stable. The differentpassageMSCs expressed CD44, ICAM-1 and SSEA-4, but not CD34, CD45 and SSEA-1 when detected by immunofluorescence staining.There was no significant difference among the positive rates of passages 2, 6 and 8 ($P > 0.05$), but a significant difference existed amongthose of passages 2, 6, 8 and 11 ($P < 0.05$). After the osteogenic inducement was added, the induced different-passage MSCs expressedhigh-level alkaline phosphatase (ALP), and are positive for tetracycline staining, Alizarin Red staining and Von Kossa staining. After theneural inducement was added, about 70% cells exhibited typical neuron-like phenotype, the induced different-passage MSCs expressedNestin, neuron-specific enolase (NSE) and glial fibrillary acidic protein (GFAP) when detected by immunofluorescence staining. Therewas no significant difference among the positive rates of passages 3, 4 and 6 ($P>0.05$), but a significant difference existed among those ofpassages 3, 4, 6 and 8 ($P<0.05$). These results suggest that MSCs in duck were capable of differentiating into osteoblasts and neuron-likecells in vitro.

【题目】Establishment and Characterization of a Fibroblast Line from Landrace.

【中文关键词】no

【英文关键词】Landrace, fi broblast, cell bank, biological characteristics

【中文摘要】no

【英文摘要】Up to 32 Landrace ear marginal tissue samples were used for establishing a fi broblast cell bank by the means of primaryexplantation and cryopreservation. Biological analysis suggested that the Population Doubling Time (PDT) of the cell line

wasapproximately 24h. The diploid accounted for 97.2% of the whole population; isozyme analysis of Lactic Dehydrogenase (LDH)and Malic Dehydrogenase(MDH) disproved cross-contamination from other cell lines. The results of bacterium, fungus, virus andmycoplasma tests were all negative. The transfection rates of three fl uorescent proteins were high, indicating that the exogenous genescould be effectively expressed in the cells. It had not only preserved the precious germplasm resource of the Landrace on the cell levelbut also provided valuable material for the researches of genomics, postgenomics, somatic cloning and so on.

【题目】Isolation and functional characterization of HvDREB1 that encodes a dehydration- responsive element binding protein in Hordeum vulgare
【中文关键词】无
【英文关键词】Abiotic stress Barley DREB
Induction kinetics Salt tolerance Transgenic plants
【中文摘要】无
【英文摘要】A gene encoding Hordeum vulgare dehydration-responsive element binding protein 1 (HvDREB1), a member of the A-2 subgroup of the DREB subfamily, was isolated from barley seedlings. A subcellular localization assay revealed accumulation of HvDREB1 protein in the nucleus. As a trans-acting factor, HvDREB1 was able to bind to RE/CRT elements and transactivate reporter gene expression in yeast cells. A study of various deletion mutants of HvDREB1 proteins indicated that the transactivation activity was localized to the N-terminal region. Expression of the HvDREB1 gene in barley leaves was significantly induced by salt, drought, and low-temperature. In contrast to most A-2 subgroup members in Arabidopsis thaliana, HvDREB1 also responded to exogenous ABA. Overexpression of HvDREB1 activated a downstream gene, RD29A, under normal growth conditions and led to increased tolerance to salt stress in Arabidopsis plants. These results suggest that HvDREB1 produces a DRE-/CRT-binding transcription factor that may have an important role in improving salt tolerance in plants.

【题目】Analysis of Specific Binding and Subcellular Localization of Wheat ERF Transcription Factor W17.
【中文关键词】无
【英文关键词】ERF/AP2 domain, ERF, DRE element, GCC-box, subcellular localization
【中文摘要】无
【英文摘要】The study aims to detect the subcellular localization of ERF (ethylene-responsive element binding factor) transcriptionfactor W17 protein, the interaction between W17 and cis-acting regulatory elements GCC-box and DRE in vitro, thebinding and transactivating ability in vivo, and the role of W17 in higher plant stress-signal pathway. Recombinantplasmid W17/163hGFP was introduced into onion epidermal cells by the particle bombardment method with a PDS1000/He.Transformed cells were incubated for 24 h at 22 ° C in the dark and green fluorescence was monitored under a confocalmicroscope. The gene W17 was fused N-terminus of GST (glutathione-S-transferase) in prokaryotic expression vectorpGEX-4T-1 and then transformed into E. coli strain BL21 (DE3). IPTG (0.5 mmol L-1) was added to induce the expressionof recombinant GST/W17 for 3 h. The fused proteins were purified by GST purification columns, and then subjected to gelretardation assay with a 32P-labeled GCC or DRE sequence. The

different reporter and effector plasmids were introducedinto tobacco leaves through agroinfiltration, then transformed leaves stained by X-Gluc, faded with 75% alcohol andmonitored under a Stereozooming microscope. The GFP fused with W17 protein was localized in the nuclei; SDS-PAGEassay demonstrated that the fused protein GST/W17 could be induced and purified with molecular weight at around 42.2kD under the induction of IPTG. Purified fused protein was able to specifically bind to both the wild-type GCC-box andDRE element, but had no interaction with either the mutant DRE or GCC-box; W17 protein can bind to GCC-box andtransactive downstream GUS gene in vivo. W17 can localize into the nuclei, and it may be involved not only in bioticstresses controlled by GCC-box, but also in abiotic stresses (e.g., salt-) induced signaling pathway.

【题目】Isolation and Identification of two genes encoding leucine-rich repeat (LRR) proteins differentially responsive to pathogen attack and salt stress in tobacco.

【中文关键词】无

【英文关键词】Promoter · Osmotic stress tolerance · Wheat

【中文摘要】无

【英文摘要】Leucine-rich repeat proteins (LRRs) play important roles in signal perception and activation of defense responses. We isolated two new LRR genes, NtLRR1 and NtLRR2, in tobacco (Nicotiana tabacum). NtLRR1 and NtLRR2 are characterized by 9 and 3 LRR domains, respectively. The phylogenetic relationships show that NtLRR1 and NtLRR2 belong to different subfamilies of the polygalacturonase inhibitor proteins (PGIPs) and LRP-related proteins (LRPs), respectively. NtLRR1 and NtLRR2 are responsive to pathogen attack and salt stress, but display differential expression patterns in tobacco. NtLRR1 is activated rapidly by infection with the tobacco wildfire pathogen (Pseudomonas syringae pv. tabaci), but slowly by tobacco mosaic virus (TMV). In contrast, NtLRR2 transcripts rapidly accumulate after infection with TMV, and only sluggishly with infection by the wildfire pathogen. In addition, NtLRR1 transcripts abundantly accumulate in stems, whereas NtLRR2 appears mainly in the roots. Isolation of the NtLRR2 promoter revealed some cis-acting elements responding to stresses and defense signal molecules. Subcellular localization indicated that NtLRR1 and NtLRR2 proteins localize in the cell walls and plasma membranes, respectively. It was concluded that NtLRR1 and NtLRR2 are important proteins having different functions in response to different stresses and mediating in binding interactions in a wide variety of biological processes.

【题目】Characterization of the TaAIDFa gene encoding a CRT/DRE -binding factor responsive to drought, high-salt, and cold stress in wheat.

【中文关键词】无

【英文关键词】Abiotic stress , DBF ,Gene expression Promoter ,Osmotic stress tolerance ,Wheat

【中文摘要】无

【英文摘要】"Dehydration responsive element-binding factors(DBFs) belong to the AP2/ERF superfamily and play vital regulatory roles in abiotic stress responses in plants. Inthis study, we isolated three novel homologs of the DBFgene family in wheat (Triticum aestivum L.) by screening a drought-induced cDNA library and designated them asTaAIDFs (T. aestivum abiotic stress-induced

DBFs). Compared to TaAIDFb and TaAIDFc, TaAIDFa lacks a short Ser/Thr-rich region, a putative phosphorylation site, following the AP2/ERF domain. The TaAIDFa gene, located on chromosome 3BS, is interrupted by a single intron at the 17th Arg (R) in the N-terminal domain. The N-terminalregion of the TaAIDFa protein modulates nuclear localization.The TaAIDFa protein is capable of binding to CRT/DRE elements in vitro and in vivo, and of trans-activating reporter gene expression in yeast cells. The TaAIDFa promoter,with various stress-related cis-acting elements,drives expression of the GUS reporter gene in wheat calliunder stress conditions. This was further conWrmed by responses of TaAIDFa transcripts to drought, salinity, lowtemperature,and exogenous ABA. Furthermore, overexpressionof TaAIDFa activated CRT/DRE-containing genes under normal growth conditions, and improved drought and osmotic stress tolerances in transgenic Arabidopsis plants.These results suggested that TaAIDFa encodes a CRT/DREelement-binding factor that might be involved in multiple abiotic stress signal transduction pathways."

【题目】Overwintering and population dynamics of Bemisia tabaci biotype B in greenhouse during the spring in northern China

【中文关键词】烟粉虱 种群动态 越冬寄主 抗寒

【英文关键词】Bemisia tabaci Population dynamics Overwintering hosts Cold hardiness

【中文摘要】自20世纪90年代中期B型烟粉虱入侵中国南部,它已经蔓延到其他地区和国家,并成为农业和园艺生产中的重要害虫。越冬调查B型烟粉虱,可能有助于了解其在中国北方的春天繁殖的主要因素,这为更好的分析虫害控制策略的害虫种群动态提供依据。

【英文摘要】Since the sweetpotato whitefly, Bemisia tabaci (Gennadius) biotype B invaded southern China in the mid-1990s, it had spread to mostother regions of the country, and become an important pest in agricultural and horticultural production. Investigations on overwinteringof B. tabaci biotype B and its spring reproduction in northern China were conducted to determine the main factors that might contributeto an understanding of the population dynamics of this pest for developing improved pest control strategies. A cold hardiness testshowed that when exposed for 10 h at 10 1C, mortalities of eggs, nymphs, and adults reached to 86.6%, 88.4%, and 100%, respectively,suggesting that it is probably impossible for feral populations of B. tabaci to survive in the winter under natural environmentalconditions in northern China. A survey on vegetables, ornamental plants and weeds in greenhouses at Hebei Province and Beijing innorthern China revealed at least 14 species of plants on which B. tabaci fed during the winter and spring. Lycopersicon

esculentum Mill,Brassica alboglabra Bailey, Ficus carica L., Euphorbia pulcerrima Wild, and Hemelia patens Haence were the main host plants. Furtherresearch on the population dynamics of B. tabaci on three major greenhouse hosts; tomato, cucumber, and melon, indicated thatdensities remained at a low level during the winter, but increased steadily from February to March until migration into field crops inApril. It is concluded that the control of the insect in greenhouse in winter and spring can play an important role for seasonalmanagement of this pest in northern China.

【中文关键词】“ 棉蚜 生物防治 草蛉 生态效益
【英文关键词】Aphis gossypii biological control Chrysopa sinica ecological efficiency
energy budget predation
【中文摘要】中国草蛉的幼虫阶段的能量代谢,一定实验条件下,在14:10光照期间:27±1 ° C和75%±2%RH。取食,消化,呼吸,生产力和粪便用于监测能量代谢。此外,这些实验条件下,作为生物控制剂对中华草蛉的潜力进行了评估根据摄食这种捕食和棉蚜。本研究结果表明,中华草蛉是一个重要的棉蚜的天敌,此方法是非常有用的量化天敌生物防治途径。
【英文摘要】Energy budgets of larval stages of the Chinese green lacewing, Chrysopa sinica(Tjeder) (Neuroptera: Chrysopidae) were determined under laboratory conditions at photoperiodof 14:10 L:D, 27 ± 1oC and 75% ± 2% RH. The energy used as ingestion,assimilation, respiration, productivity and feces was constructed for each developmentalstage. In addition, under these experimental conditions, the potential of C. sinica as abiological control agent was evaluated according to the ingestion by this predator and theenergy content of cotton aphid, Aphis gossypii (Glover) (Homoptera: Aphididae). The larvalstage of C. sinica was able to consume 1281.4 1-day-old aphids, 1018.7 2-day-old aphids,626.9 3-day-old aphids, 393.5 4-day-old aphids, 312.1 5-day-old aphids or 203.5 9-day-oldaphids, respectively. No significant difference was detected between the estimated numberof aphids consumed by the lacewings using energetic methods and the actual number ofaphids consumed by the lacewings in this experiment. Our results showed that C. sinica isan important natural enemy of the cotton aphid, and energetic methods are very useful toquantify biological control efficacy of natural enemies.

【题目】Impact of insecticides on the structure and productivity of insect pest and natural enemycommunities associated with intercropping in cotton agroecosystems
【中文关键词】棉田 杀虫剂 群落
【英文关键词】community structure productivity cotton agroecosystem insecticides insect communities
【中文摘要】应用杀虫剂的化学防治对害虫种群动态和天敌种群动态具有一定的影响。
【英文摘要】Effects of insecticides on the structure and productivity of insect pest and natural enemy communities wereanalyzed in the four types of cotton agroecosystem associated with intercropping in Raoyang County, HeBeiProvince, China. The interaction of chemical control 6 intercropping had a significant effect on the mostcommunity structure parameters of insect pest and natural enemy communities, except for the diversity index ofthe predator community. The damage index for the insect pest community and control

index of the natural enemycommunity were also affected significantly by the chemical control 6 intercropping interaction. Pearsoncorrelation analyzes showed that community structure and productivity of insect pest and predator communitieshad a complex relationship with lower trophic productivity in these cotton agroecosystems. Few effects ofchemical control on these correlations were found. Chemical methods influenced the correlations between insectpest community productivity and parasitoid community structure in most cotton agroecosystems. Our resultssuggest that the interaction of chemical control 6 intercropping significantly influenced the damage index, thecontrol index, and the correlation between community structure and productivity of insect pest and naturalenemy communities in cotton agroecosystems.

【题目】Population Dynamics of Spodoptera litura (Lepidoptera: Noctuidae) on Bt Cotton in the Yangtze River Valley of China
【中文关键词】Bt棉花 小地老虎
【英文关键词】Bt cotton common cutworm survival population dynamics
【中文摘要】Bt是苏云金芽孢杆菌产生的一种晶体蛋白,已被广泛应用到防治鳞翅目害虫。然而,不同昆虫对Bt蛋白的敏感性不同,需要建立一个有效防治害虫的战略体系。
【英文摘要】Genetically modified cotton that produces a crystalline protein from Bacillus thuringiensis subsp. kurstaki (Berliner) (Bt) has been widely deployed to manage lepidopteran insect pests in cotton growing areas worldwide. However, susceptibility of different insect species to Bt protein varies, which may affect lepidopteran pest populations in the field. Studies on effects of two transgenic cotton lines (BG1560 and GK19) carrying a Cry1A gene on common cutworm Spodoptera litura F. (Lepidoptera: Noctuidae), were conducted during 2002 – 2005 in the cotton planting region of the Yangtze River valley of China. Results showed that common cutworm larvae had low susceptibility to Bt cotton. There was no significant difference in larval population densities in conventional and Bt cotton fields. However, the larval populations of the insect on conventional plants treated with chemical insecticides for control of target pest of Bt cotton were significantly lower than that in Bt cotton fields. These results indicated that the common cutworm was the potential to become a major and alarming pest in Bt cotton fields, and therefore efforts to develop an effective alternative management strategy are needed.

【题目】Interactive effect of elevated CO2 and cotton cultivar on tri-trophic interaction of Gossypium hirsutum, Aphis gossypii, and Propylaea japonica.
【中文关键词】棉蚜 棉花品种 CO2浓度 龟纹瓢虫 三级营养关系
【英文关键词】Aphis gossypii cotton cultivar elevated CO2 Propylaea japonica tri-trophic interaction
【中文摘要】CO2浓度升高对植物的化学成分和植食性动物具有一定的影响,其捕食这种变化的影响信息是一个重要的植物和昆虫的反应,是了解全球环境变化的第一步。通过研究CO2对三个营养水平的影响推测,CO2浓度升高可能影响着害虫种群的暴发。
【英文摘要】Information on the effects of enriched CO2 on both the chemical composition of plants and the consequences of such changes for performance of a herbivore and its predator is an important first step in understanding the responses of plants and insects to global environmental change. We examined interactions across three trophic levels, cotton, Gossypium hirsutum, an aphid herbivore,

Aphis gossypii Glover, and a coccinellid predator, Propylaea japonica (Thunberg), as affected by elevated CO2 concentrations and crop cultivars. Plant carbon:nitrogen (C:N) ratios, condensed tannin, and gossypol content were significantly higher, and nitrogen content was significantly lower in plants exposed to elevated CO2 levels compared with that in plants exposed to ambient CO2. Cotton aphid survivorship significantly increased and free fatty acid content decreased with increased CO2 concentrations. No significant differences in survival and lifetime fecundity of P. japonica were observed between cultivars and CO2 concentration treatments. However, stage-specific larval durations of the lady beetle were significantly longer when fed aphids from elevated CO2 concentrations. Our results indicate that high gossypol in the cotton host plant had an antibiotic effect on A. gossypii and produced a positive effect on growth and development of P. japonica at the third trophic level. However, elevated CO2 concentrations showed a negative effect on P. japonica. We speculate that A. gossypii may become a more serious pest under an environment with elevated CO2 concentrations because of increased survivorship of aphid and longer development time of lady beetle.

【中文摘要】通过研究棉田亚致死剂量下盲蝽的种群动态,对棉田合理用药,有效防治害虫的危害提供依据。

【英文摘要】Various pesticides directly impact insect pest populations through acute toxicity (lethal)effects, but they also cause a range of indirect (sublethal) effects on pest physiology or behavior.In this study, we describe both lethal and sublethal effects of endosulfan on the survival, development,and fecundity of Apolygus lucorum Meyer-Du ¨ r (Hemiptera: Miridae), an important pest of Bacillusthuringiensis (Bt) cotton, Gossypium hirsutum L., in China. We quantify pesticide effects on adultmirids as well as on subsequent (F1, F2) generations. Toxicity bioassays determined the median lethalconcentration (LC50) for adult A. lucorum as 0.58 ppm. To evaluate the sublethal effect of endosulfan,we used LC20 and LC40 concentrations at 0.30 ppm and 0.48 ppm, respectively. Sublethal concentrationsof endosulfan signi Þ cantly reduced longevity and fecundity of female adults, but slightlyaffected male longevity. We also found sublethal effects on the F1 generation, through a reductionof egg hatching rate, nymphal mortality, adult molting rate, and adult fecundity, and on the F2generation, through a decrease of egg hatching rate. These results show that endosulfan has far greatereffects onA. lucorum than estimated by acute toxicity tests, and the effects of this pesticide on survivingmirids can be comparatively long-lived. This pesticide likely causes severe disruptions of A. lucorumpopulation dynamics, with single endosulfan application, invoking a great reduction of populationgrowth of resident mirid populations. We discuss implications of this work for control programs forA. lucorum on Bt cotton.

【中文摘要】Cry1Ac与昆虫体内内共生菌的增效研究

【英文摘要】In this study, interactions on the mortality and debilitating effects between Cry1Ac, a toxic protein produced by Bacillusthuringiensis (Berliner) and HaCPV (Chinese strain) on first and third instars larvae of Helicoverpaarmigera were evaluated in laboratory. When first instar was exposed to combination of Bt cotton leaf discs containing HaCPV (6 × 106, 1 × 107, and 3 × 107 PIB ml − 1) the effect on mortality was additive, when such instar larvae exposed to combination of Cry1Ac (0.9, 2.7, or 8.1 μg g − 1) and the same concentrations of HaCPV the effect on mortality was additive except for the combination of Cry1Ac (0.3 μg g − 1) and HaCPV concentrations that showed synergism. When third instars of H. armigera were infected using a suspension containing both HaCPV and Cry1Ac, most combinations of them showed additive effect except for the combination of Cry1Ac (0.3 μg g − 1) and HaCPV (3 × 107 PIB ml − 1) that showed synergism. However, when they exposed to Bt cotton leaf discs and HaCPV the effect on mortality was synergism except combination of Bt cotton leaf discs and HaCPV (6 × 106 PIB ml − 1) that showed additive. Most of the combinations are showed additive effect in the toxicity and in combinations of Cry1Ac at lowest and HaCPV at highest concentrations synergism is observed. Not only were larval growth and development delayed, but pupation and pupal weight also decreased when larvae were fed on artificial diet containing Cry1Ac and HaCPV or transgenic Bt cotton leaf discs specially in first instar.

【题目】Influence of tannic acid and Cry1Ac toxin of Bacillus thuringiensis, on larval survival, growth and development of Helicoverpa armigera.

【中文关键词】Bt毒蛋白 鞣质 相互作用 鳞翅目 夜蛾科

【英文关键词】Bt toxin, tannins interaction additive effect Lepidoptera Noctuidae cotton

【中文摘要】在苏云金芽孢杆菌与增效剂的应用可以降低杀虫剂的使用,从而延迟杀虫剂抗性的发展。

【英文摘要】Helicoverpa armigera (Hu ¨ bner) (Lepidoptera: Noctuidae) causes huge economic losses in cotton productionaround the world. Tannin, one of the important secondary substances in cotton plants, canincrease the d-endotoxin activity of Bacillus thuringiensis ssp. kurstaki. The mechanism of interactionbetween tannin and Bt toxin on H. armigera is unclear.We investigated the interaction between tannicacid and Cry1Ac toxin in H. armigera, and monitored survival, growth, and development duringthe larval period after treating the larvae with four concentrations of Cry1Ac toxin (0, 2, 8, and14 lg)1) alone or in combination with four concentrations of tannic acid (0, 0.5, 1, and 2 mg g)1).Mortality of larvae treated with both tannic acid and Cry1Ac was higher than the mortality of larvaetreated with tannic acid or Cry1Ac alone. Mortality was 47.5 and 51.5% in larvae treated with14 lg g)1 Cry1Ac alone or 2 mg g)1 tannic acid alone, respectively. In contrast, larval mortality was75% when treated with the mixture of 14 lg g)1 Cry1Ac and 2 mg g)1 tannic acid, suggesting that amixture of the two enhanced the effectiveness of each one alone. The developmental time of larvaetreated with the combination of tannic acid and Cry1Ac was significantly longer than when they weretreated with Cry1Ac or tannic acid alone. Larval weight, pupal weight, and pupation rate were alsosignificantly reduced in larvae treated with both toxins, compared with the larvae treated with eithertoxin alone. These results showed that the interactive effect of tannic acid and Cry1Ac on larvalgrowth inhibition is additive, and that tannic acid improves Cry1Ac toxicity to insects. Tannicacid used in combination with B. thuringiensis might potentially reduce overall insecticide use, thusdelaying development of insecticide resistance.

【题目】Laboratory evaluation of flight activity of the common cutworm, Spodoptera litura (Lepidoptera: Noctuidae)
【中文关键词】斜纹夜蛾 飞行活动
【英文关键词】Spodoptera litura flight activity tethered-flight
【中文摘要】对斜纹夜蛾的飞行活动进行评估在实验室中使用计算机介导的飞行磨。 3-4日龄蛾再飞远高于其他年龄段的。男性和女性的飞蛾表现出类似的飞行活动。交配状态不会影响飞行时间和距离为2天岁的女性。然而,这两个6日龄的雌性交配飞行参数显著降低比未交配的。飞行的最佳温度为16-24。,而最佳的相对湿度介于60%-100%。在72小时内,总飞行天1岁的男性和女性飞蛾的时间和距离分别为19.6小时(±5.8)和83.3公里(±28.4),以及24.0小时(±7.0)和105.4公里(±37.4),分别。这些结果表明:斜纹夜蛾具有很大的潜力,进行长途迁徙飞行。
【英文摘要】The flight activity of Spodoptera litura in tethered conditions is evaluatedusing a computer-mediated flight-mill in the laboratory. The 3 – 4-day-old moths fly longerand farther than those of other ages. Male and female moths exhibit similar flight activity.Mating status does not influence the flight duration and distance of 2-day-old females.However, these two flight parameters with a 6-day-old mated female is significantly lowerthan that of unmated ones. The optimum temperature for flight ranged from 16 – 24 ◦ C,whereas the optimum RH ranged from 60% – 100%. During 72-h period, the total flightduration and distance of 1-day-old male and female moths were 19.6 h (± 5.8) and 83.3 km(± 28.4), and 24.0 h (± 7.0) and 105.4 km (± 37.4), respectively. These results indicatethat S. litura has a great potential to undertake long-distance migratory flights.

【题目】Response of amino acid changes in Aphis gossypii (Glover) to elevated CO2 levels.
【中文关键词】CO2 浓度升高 氨基酸 棉蚜
【英文关键词】amino acids cotton aphid elevated CO2 honeydew phloem sap
【中文摘要】对棉蚜营养物质的研究,更多的韧皮部汁液的摄入,寻找满足其营养要求和平衡盈亏平衡点。
【英文摘要】Effects of elevated CO2 levels on the amino acid constituents of cottonaphid, Aphis gossypii (Glover), fed on transgenic Bacillus thuringiensis(Berliner) (Bt) cotton [Cryl A(c)], grown in ambient and double-ambientCO2 levels in closed-dynamics CO2 chambers, were investigated. Loweramounts of amino acids were found in cotton phloem under elevatedCO2 than under ambient CO2 levels. However, higher amounts of freeamino acids were found in A. gossypii fed on elevated CO2-grown cottonthan those fed ambient CO2-grown cotton, and the contents of aminoacids in honeydew were not significantly affected by elevated CO2levels. A larger amount of honeydew was produced by cotton aphidsfeeding on leaves under elevated CO2 treatment than those feeding onleaves under ambient CO2 treatment, which indicates that A. gossypiiingests more cotton phloem because of the higher C:N ratio of cottonphloem under elevated CO2 levels. Moreover, the amino acid compositionwas similar in bodies of aphids ingesting leaves under both CO2treatments, except for two alkaline amino acids, lysine and arginine.This suggests that the nutritional constitution of the phloem sap wasimportant for A. gossypii. Our data suggest that more phloem sap will beingested by A. gossypii to satisfy its nutritional requirement and balancethe break-even point of amino acid in elevated CO2. Larger amounts ofhoneydew produced by A. gossypii under elevated CO2 will reduce thephotosynthesis and result in the occurrence of some Entomophthora spp.

【题目】Flight potential of Microplitis mediator, a parasitoid of various lepidopteran pests
【中文关键词】侧沟茧蜂 飞行能力 飞行磨 扩散
【英文关键词】Microplitis mediator Flight ability Flight mill Dispersal
【中文摘要】天敌定位害虫,有效的防控昆虫种群的发生。
【英文摘要】The efficacy of using natural enemies tocontrol pests under field conditions largely depends ontheirmobility and,more specifically, on their capacity toquickly locate pest infestation. For many naturalenemies, for example parasitoids, mobility is directlyrelated to flight aptitude, which is determined by thecapacity and inclination of a species to engage in flight.In this study, we determined the various factors thataffected flight performance of Microplitis mediator(Haliday) (Hymenoptera: Braconidae), using a computer-monitored flight mill. No differences were foundin flight performance (i.e., flight distance, duration,speed) between both sexes of M. mediator, and flightcapacity increased up to an age of 5 – 7 days followed bya gradual decline afterwards. For one-day-old female parasitoids, mean (±SE) flight distance and durationwere 6.23 ± 0.88 km and 85.15 ± 14.44 min, respectively,with a maximum flight distance of 18.0 km. Formale parasitoids, mean flight distance and duration were5.27 ± 0.51 km and 85.74 ± 7.63 min, respectively.Mating status did not affect flight performance of males,while flight distance of four-day-old ovipositingM. mediator females was much lower than that ofun-mated females of the sameage.Un-mated adultsflewmost actively at 22 – 24 Cand inclination to fly graduallydeclined with decreasing temperature. Temperaturesabove 26 C considerably reduced flight activity ofM. mediator. Wasps engaged in normal flight under abroad range of relative humidity (RH) conditions, withan optimum RH range identified as 75 – 90%. Ourresearch shows that M. mediator is a highly activeparasitoid, because both sexes show great inclination tofly under a range of environmental conditions and flightcapacity at different ages. Our results can help explainparasitoid performance in the field and provide baselineinformation to help guide augmentative releases.

【题目】Effects of elevated CO2 and plant genotype on interactions among cotton, aphids and parasitoids
【中文关键词】棉蚜 基因型 二氧化碳 棉酚 营养关系
【英文关键词】Aphis gossypii cotton genotype elevated CO2 gossypol Lysiphlebia japonica tritrophic interaction
【中文摘要】二氧化碳水平影响棉(陆地棉)基因型和棉蚜虫(棉蚜)的相互作用,其膜翅目寄生(Lysiphlebia的粳稻Ashrnead)进行量化。据推测作物systemsmay蚜虫寄生相互作用,改变CO2浓度升高,植物基因型的变化程度的影响。棉花品种有高(M9101),中期(HZ401)和低(ZMS13)棉酚含量,升高的响应二氧化碳是基因型特异性。 CO2浓度升高的比例增加了总的非结构性在高棉酚的基因型和mediumgossypol:碳水化合物氮(列印跨国公司)基因型。对于所有三种基因型,CO2浓度升高有没有浓度的影响棉酚和缩合单宁。棉蚜健身下降,饲养蚜虫时上与下CO2浓度升高的低棉酚基因型的高棉酚的基因型。此外,CO2浓度升高降低了金银花相关的发育时间高棉酚基因型和低棉酚的基因型,但不影响寄生或出现率。我们的研究表明,棉蚜对棉花的丰不能直接影响大气中二氧化碳的增加。我们推测,棉蚜在CO2浓度升高和高棉酚基因型环境可能会减少有害生物状况由于减少了健身高棉酚基因型和发育时间短,金银花。
【英文摘要】Effects of CO2 level (ambient vs. elevated) on the interactions among threecotton (Gossypium hirsutum) genotypes, the cotton aphid (Aphis gossypii Glover), and itshymenoptera parasitoid (Lysiphlebia japonica Ashrnead) were quantified. It was hypothesizedthat aphid-parasitoid interactions in crop systemsmay be altered by elevated CO2, andthat the degree of change is influenced by plant genotype. The cotton genotypes had high(M9101), medium (HZ401) and low (ZMS13) gossypol contents, and the response to elevatedCO2 was genotype-specific. Elevated CO2 increased the ratio of total non-structuralcarbohydrates to nitrogen (TNC : N) in the high-gossypol genotype and the mediumgossypolgenotype. For all three genotypes, elevated CO2 had no effect on concentrationsof gossypol and condensed tannins. A. gossypii fitness declined when aphids were rearedon the high-gossypol genotype versus the low-gossypol genotype under elevated CO2. Furthermore,elevated CO2 decreased the developmental time of L. japonica associated withthe high-gossypol genotype and the low-gossypol genotype, but did not affect parasitismor emergence rates. Our study suggests that the abundance of A. gossypii on cotton willnot be directly affected by increases in atmospheric CO2. We speculate that A. gossypiimay diminish in pest status in elevated CO2 and high-gossypol genotype environmentsbecause of reduced fitness to the high-gossypol genotype and shorter developmental timeof L. japonica.

【题目】Elevated CO2 lessens predation of Chrysopa sinica on Aphis gossypii
【中文关键词】棉蚜 成活率 半翅目 蚜虫
【英文关键词】cotton aphid development, survival rate predatory ability successive generation Neuroptera Chrysopidae Hemiptera Aphididae
【中文摘要】大气二氧化碳浓度升高对生物体的影响,大部分研究都集中在性能植物或食草动物。一些报告审查敌害的能力的影响营养级。在这个实验中,我们利用开顶式气室,以量化的影响CO2浓度升高的增长,发展和捕食能力两个中国历代草蛉,中华草蛉(Tjeder)(Neuroptera:Chrysopidae)的棉蚜,棉蚜虫为食,棉蚜(哥拉巴)的(半翅目:蚜),其中,陆地棉棉花饲养(锦葵科),生长在CO2浓度升高(双环境与环境)。高等大气中的二氧化碳浓度降低了持续发展幼虫和蛹的成活率,造成中华草蛉雌成虫体重下降,但对每个幼虫的存活率没有显着影响阶段,雌成虫生殖力,卵孵化率,成虫寿命。在幼虫捕食能力第三龄和中华草蛉幼虫期的总对棉蚜美联储均显着升高二氧化碳环境。
【英文摘要】Most studies on the effects of elevated atmospheric CO2 on organisms have focused on the performanceof plants or herbivores. Few reports have examined the impact on the ability of predators atthe third trophic level. In this experiment, we made use of open-top chambers to quantify the effectsof elevated CO2 on growth, development, and predatory ability of two successive generations of Chineselacewing, Chrysopa sinica (Tjeder) (Neuroptera: Chrysopidae), feeding on cotton aphids, Aphisgossypii

(Glover) (Hemiptera: Aphididae), which were reared on cotton, Gossypium hirsutum L.(Malvaceae), grown under elevated CO2 (double ambient vs. ambient). Higher atmospheric CO2concentrations reduced the duration of larval development and the survival rate of pupae, and causeddecreased weight in adult female C. sinica, but had no significant effects on survival rate of each larvalstage, female adult fecundity, egg hatch rate, or adult life span. The predatory ability of larvae in thethird instar and the total larval stage of C. sinica that fed on A. gossypii were significantly lower in elevatedCO2 environments. The number of aphids consumed by first-generation lacewing populationdid not change significantly with different CO2 treatments; however, significantly fewer aphids wereconsumed by the second generation of the lacewing population with elevated CO2.We speculate thatA. gossypii may become a more serious pest under an environment with elevated CO2 concentrationsbecause of the reduced predatory ability of C. sinica on A. gossypii.

【题目】B型烟粉虱触角感受器的超微结构及对寄主植物气味的嗅觉行为反应
【中文关键词】B型烟粉虱 触角
【英文关键词】B biotype of Bemisia tabaci antennal sensillum ultrastmctures host plant odor
【中文摘要】利用扫描电镜和透射电镜分别观测了烟粉虱触角感受器的分布、形态和结构。扫描电镜观察结果表明,烟粉虱触角由柄节、梗节和1—5节鞭节组成,绝大部分触角感受器分布在触角的背面、腹面和外侧面。雌、雄蛾触角上均存在5种感器,即微毛感器、锥形感器、刚毛感器、钟形感器和腔锥感器,各种感器在雌、雄蛾触角上的分布和数量没有明显的区别。除了微毛感器和刚毛感器的数量较多外,腔锥感器、锥形感器和钟形感器的数量均较少,分别为6、4和1个。透射电镜观察结果表明,烟粉虱触角上起嗅觉作用的锥形感器和腔锥感器均由表皮壁、鞘细胞和感觉神经元等结构组成。利用“Y型”嗅觉仪测定了烟粉虱雌虫对苘麻、棉花、烟草、黄瓜和甘蓝5种寄主植物气味的行为反应,结果显示,约30%的烟粉虱个体对气味源无反应,50%以上的个体对寄主植物具有显著的行为反应,对寄主植物的选择率差异显著,从大到小顺序为:黄瓜>苘麻>棉花>烟草>甘蓝。
【英文摘要】The morphology,especially the ultrastmctures of antennal sensilla of B.tabaci was observedunder scanning and transmission electron microscope.Antennae of B.tabaci are made up of scapus,pedicleand flagella that the latter consist of l一5 segments and most of the antennal sensilla lie on its outer,upper and lower surfaces.Both the antennae of male and female contain five kinds of antennal sensilla,namely,microtrichia,chaetae sensilla,coeloconic sensilla,campaniform sensilla,basieonic sensilla,and the kinds,number and distribution of antennal sensilla of both sexes are similar.There have a largenumber of microtrichia and chaetae sensilla on the antenna of B.tabaci,and the number significantlyhigher than that of coeloconic,basiconic and campaniform sensilla,which was just 6,4 and 1,respec—tively.Coeloconic sensilla and basiconic sensilla,the main chemical odor receptors on antennae of B.tabaci,consist of cuticular wall,sheath cells,sensillum lymph and dendrites.The role of olfactory func—tion in the host-selection behavior of B.tabaci was investigated by Y—tube olfactometer.The result indicated30%of B.tabaci adults have no response to the odor of host plants,but more than 50%of adults show the strongest host preference to piemarker,cotton,tobacco,cucumber and cabbage.There wassignificant difference on the orientation rate among the five host plants,followed by the order:cucumber>piemarker>cotton>tobacco>cabbage.

【题目】用四季豆饲养盲蝽螨的方法
【中文关键词】盲蝽 饲养技术

【英文关键词】Miridae feeding techniques
【中文摘要】四季豆是多种盲蝽的寄主植物,该研究旨在发展一个利用四季豆豆荚规模化饲养多种盲蝽的技术。研究结果表明:绿盲蝽与中黑盲蝽的若虫最佳饲养密度约为100头/盒(2L),成虫为60~80头/盒。绿盲蝽成虫喜好在切头豆荚的两端伤口处产卵,而中黑盲蝽喜欢在完整豆荚的两端产卵。养虫盒内添加一些弯曲的纸条有助于提高若虫存活率和成虫产卵量。产卵后的豆荚需晾干后放置在25~28℃、相对湿度60%~70%、光照16∶8(L∶D)的环境下,以减少豆荚腐烂和提高卵的孵化率。利用这一方法饲养盲蝽的若虫存活率、成虫产卵量和卵孵化率分别达60%、40粒和80%。
【英文摘要】The green bean, Phaseolus vulgaris is a main host plant of several important mirids, and astudy was conducted for developing a rearing method to culture of mirids with fresh beanpods in the labo- ratory. The optional rearing density for Apolygus lucorum and Adelphocoris suturalis was approximately 100nymphs or 60- 80adults pe 2L box A. lucorum prefers to oviposit in the wound of end-cutting bean-pods, and A. suturalis likes to lay eggs in the ends of intact beanpods. Adding some curving scrips in theculture boxes can greatly benefit the nymphal survival and adult oviposition. After adult oviposition,beans with eggs need to decrease water content firstly, then place under the environment of 25- 28°Cand16∶8(L∶D)with60%- 70% RH for avoiding the rot of beansand increasing egg hatching rate. Usingthis method, four species of mirids were successfully reared with a nymphal survival rate of 60%, egg in-cubation rate 80% and fecundity of 40 eggs per female.

【题目】转基因棉花品种对棉大卷叶螟抗性水平的鉴定评估
【中文关键词】转基因棉花 棉大卷叶螟
【英文关键词】transgenic cotton Cotton leaf roller
【中文摘要】在棉大卷叶螟主害代危害高峰期,采用不同抗性指标调查统计法,综合量化鉴定不同转基因棉花品种对棉大卷叶螟的抗性水平。结果表明:以活虫减退率、株害减少率、卷叶减少率作为品种抗性检测指标,可很好区分不同转基因棉品种对棉大卷叶螟的综合抗性水平。在供试的30个品种中,达到高抗的有24个,中抗的有3个。不抗的有3个,可将高抗品种充实到棉大卷叶螟综合防控的技术体系中。
【英文摘要】The main victims on behalf of endangering the peak of the cotton leaf roller, the survey method with different resistance index, the comprehensive quantitative identification of genetically modified cotton varietiesLevel of resistance to cotton leaf roller. The results showed that: the decline rate of live insects, plants and harm reduction rate, the leafroll reduce the rate as the varieties of resistance detection indicators can be a very good areaPoints the resistance level of transgenic cotton varieties of cotton leaf roller. In the 30 varieties tested, to achieve high anti-24, there are three anti-A. 3 resistance, high resistance varieties to enrich the integrated prevention and control of cotton leaf roller system.

【题目】江苏省棉花区试品种抗黄萎病性鉴定
【中文关键词】棉花 黄矮病
【英文关键词】Cotton yellow dwarf disease
【中文摘要】2003~2005年对来自江苏省棉花区域试验品种(系)174份次材料在江苏省农业科学院植物保护研究所人工黄萎病圃进行抗黄萎病性鉴定,病情考查分花铃期发病高峰时和拔棉秆时两次进行。花铃期病叶发病程度轻于拔秆时的剖秆

调查结果。3年来共鉴定出高抗品种(系) 8份次,占4. 60%;抗病48份次,占27. 59%;耐病57份次,占32.76%;感病61份次,占35.06%。鉴定结果表明,棉花区域试验品种(系)抗黄萎病性有逐年提高的趋势。

【英文摘要】The artificial Verticillium wilt nursery for resistance to Verticillium wilt identification, disease examine the sub-peak of incidence during the blooming period twice and pull the cotton stalk. The process of flower and boll stage diseased leaves incidenceThe degree of light in the sectional pull stalk stalk findings. High resistance varieties (lines) were identified three years out of eight times, accounting for 4.60%; disease resistance of 48, accounting for 27.59%; disease-resistant57, accounting for 32.76%; susceptible to 61, accounting for 35.06%. The identification results show that cotton regional test varieties (lines) resistant to Verticillium wilt resistance have increased every year Trend.

【题目】间接ELISA法检测棉子携带黄萎病菌新方法

【中文关键词】ELISA 棉子 黄矮病

【英文关键词】ELISA cotton seed yellow dwarf virus

【中文摘要】以棉花黄萎病菌Bp2 培养液中毒素蛋白免疫BALB/C小白鼠制备抗血清,建立了可特 异性检测棉花黄萎病菌的间接ELISA方法。所制备的毒蛋白抗血清效价为1:204800,对毒 蛋白的最低检测量达7.81 μg · L-1。可以与江苏省各地采集到的棉花黄萎病菌的培养液发生 特异性反应,而与其它致病菌培养液反应呈阴性。用该方法对81份江苏省抽样的棉子进行检 测,12份呈阳性反应。取检测为阳性反应的这些棉子培养液针刺接种棉苗也全都发病。这些 结果表明所建立的间接ELISA方法可用于棉子携带黄萎病菌的快速检测。

【英文摘要】Verticillium wilt of cotton is a widespread and destructive disease that is caused by the fun— gus pathogen Verticillium dahliae.Except condign climate and lack of resistant varieties,one of the important reasons made the disease more and more serious is seed—borne pathogen.To establish an ef— fective method to detect Verticillium dahliae in cottonseed,an indirect ELISA method was devel— oped.The toxin of Verticillium dahliae strain Bp2 was used asantigen to prepare polyclonal antlse— rum.An indirect ELISA method was developed using alkaline phosphatase—conjugated goat anti—mouse antibody as secondary antibody according to standard ELISA procedures.If the value of P/N≥2,the sample was positive.P/N means the rate of OD405 of sample and OD405 of negative contro1.The titre of the antiserum was 1:204800 and the toxin could be detected as 1ow as 7.81 ng · mL-1.A11 of Vertici— lillium dahliae strains collected from different cities in Jiangsu Province performed positive reaction, and no cross—reactivity was observed among the isolates representing other species of fungi such as Rhizoctonia solani,Fusarium moniliforme,Fusarium graminearum,Sclerotinia sclerotiorum, Magnaporthe grisea.The Verticilillium dahliae strain Bp2 or T9 was cultured after 1 day,the toxin conld be detected in the culture solution.Any of these two strains was cultured after 3 days,the value of P/N was 9.05,8.82,respectively,and this high value could remain 1 1 days.So Verticilillium dnhline in cottonseed could be deduced by detecting the toxin with this developed indirect ELISA. 81 cottonseed samples were randomly chosen from different seed companies and were detected if there was Verticillium dahliae in them.100 g cottonseeds from each sample were washed by glide.Coated cotton— seeds were washed till the coating chemical was moved clearly.Then the cottonseeds were dried in room tem— derature and separated by five shares each. Each share was put in 150 mL Czapek medium and then cultured for three days.The culture medium was centrifuged for 30 min at 5000 r · min-1 .and the supernatant was tested using indirect ELISA.1 2 out of 8 1 cottonseed samples performed positive reaction.Cotton seedlings were infected Verticillium wilt by inoculated with the culture solution of the cottonseed samples that per— formed positive reaction.These results demonstrated that method of indirect ELISA could be used for quickly detection of Verticillium dahliae in cottonseeds.

【题目】不同温度下绿盲蝽实验种群生命表研究
【中文关键词】绿盲蝽 温度 生命表 有效积温 种群动态
【英文关键词】Lygus lucorum temperature life table effective accumulated temperature population trend index
【中文摘要】组建了5个不同温度(17,20.23,26和29℃)下绿盲蝽Lygus lucorum实验种群的生命表。结果表明:在17—29℃温度范围内,随温度升高绿盲蝽的发育速率加快,并符合Logistic模型; 在实验温度范围内,若虫期、产卵前期、卵期和世代历期分别为10.04~27.63,8.33~19.33,6.74~15.00,25.11~61.96 d。绿盲蝽的若虫、产卵前期和卵的发育起点温度分别为9.45,7.28和6.28℃,有效积温分别为210.25、191.83和160.12日度,完成整个世代需要的有效积温为555.04日度。在实验温度范围内,23℃时绿盲蝽的世代存活率最高(82.3%),雌成虫的产卵历期最长(41.67 d),单雌繁殖若虫数最多(35.42头/雌),种群趋势指数也最高(14.58) 在较低的温度(17℃)和较高的温度(29℃)下,绿盲蝽的的种群趋势指数分别仅为8.44和9.06,均不利于其种群数量增加。
【英文摘要】Life tables of the laboratory population of Lygus lucorum Meyer-D ü r at five different temperatures(17,20,23,26 and 29°C)were constructed.The results showed that the developmental rate of L.1ucorumincreased with the increment of temperature at 17—32°C.and the relationship between them could besimulated by the Logistic model.The developmental durations of nymph,preoviposition,egg and generationwere 10.04—27.63,8.33—19.33,6.74—15.00 and 25.11—61.96 days at the experimental temperatures,respectively.The threshold temperatures of nymph,preoviposition and egg were 9.45,7.28 and 6.28°C witheffective accumulated temperatures of 210.25,191.83 and 160.12 day-degree,respectively.The effectiveaccumulated temperature of the whole generation Was 555.04 day—degree.The generation survival rate,preoviposition time,number of nymph produced by one female and population trend index all reached thehighest at 23°C,being 82.30%,41.67 days,35.42 and 14.58,respectively.Population trend index at17°Cand 29°C were 8.44 and 9.06 respectively,which were not suitable for the increment of L.lucorumpopulation.

【题目】植物内生细菌及其生物防治植物病害的研究进展
【中文关键词】植物内生菌 生物防治
【英文关键词】plant endophytic bacteria plantdisease biological control
【中文摘要】综述了植物内生细菌及其生物防治植物病害的研究进展。植物内生细菌分布广,种类多,存在于大多数高等植物中,已在生物防治细菌性病害、真菌性病害和线虫病害方面发挥了巨大的作用。植物内生细菌的防病机理主要通过与病原菌竞争生态位和营养物质、产生抗菌活性物质以及诱导植物产生系统抗性等多种作用方式。同时,对植物内生细菌防治植物病害存在的问题及未来发展前景进行了讨论。
【英文摘要】Recent advances in the study of endophytic bacteria in plants and their effects on biological control ofplant diseases were reviewed. Endophytic bacteria including awide variety of species and genera are widely distributed andexist in most higher plants. Plant endophytic bacteria have played tremendous roles on biological control of bacterial disea-ses, fungal diseases and nematode diseases in plants. Themechanism of biological control is by many effect manners such ascompeting with pathogen for ecological niche and nutrition, producing antibiotic active substances and inducing systemic re-sistance and so on. In addition, the problems and prospects about endophytic bacteria on biological control of plant diseases were discussed.

【题目】去早蕾对转基因抗虫棉黄萎病发生及早衰的影响
【中文关键词】早衰
【英文关键词】removal early squares Verticilliumwilt early senescence
【中文摘要】以我国黄河流域和长江流域种植面积较大的8个品种为试验材料,研究了去早蕾对棉花黄萎病、生理性早衰及产量的影响。结果表明,去早蕾可显著减轻棉花黄萎病和早衰危害。2005年7月18日、8月19日和2006年8月22日,去早蕾处理黄萎病病情指数显著低于对照; 除欣抗4号外,其它7个品种病情指数降低1.6%~15.0%,99B、冀668、豫杂35、中棉所41与对照之间差异达显著水平。2005年8月19、8月24日和2006年8月27日,去早蕾处理早衰指数显著低于对照; 除邯109外,其它7个品种早衰指数降低1.3%~19.0%,99B、冀668、豫杂35、中棉所29之间差异达显著水平。去早蕾能显著提高棉花产量,但在不同品种之间存在差异,其中杂交棉品种表现较为明显。
【英文摘要】Eight cotton varieties with larger planting area in Huanghe River valley and Changjiang Riv-er valley are tested to research that the effect of removal of early squares on cotton Verticillium wilt ,early senescence of cotton plant and yield. The result showed that the disease indexes and the early se-nescence indexes of removal of early squares treat ments are evidently lower than the comparison, Dis-ease index of removal of early squares is evidently lower than the comparison in 18 July, 19 August in2005 and 22 August in 2006.Except Xinkang 4, disease indexes of the other 7 varieties is lower 1.6%~15.0% than the comparison. Early senescence ID of removal of early squares is also evidently lowerthan the comparison in 19 August, 24 August in 2005 and 27 August in 2006.Except Han 109, diseaseindex of the other 7 varieties is 1.3%~19.0% lower than those of the comparison. The yield of re-moval of early squares is evidently higher than the comparison. But different varieties show differenteffect, the hybridizing varieties are more evident.

【题目】我国农业害虫综合防治研究现状与展望
【中文关键词】农业害虫 病虫害综合防治 研究进展;
【英文关键词】agricultural insect pests, IPM, research progress
【中文摘要】害虫综合防治作为农业生产的一项重要策略,在农业可持续发展中具有举足轻重的作用。近年来,针对我国害虫防治所存在的技术需求,科技部等部门先后通过973计划、863计划、科技支撑计划和农业行业专项等对重要害虫防治研究立项支持。通过这些项目的实施,我国建成了一支由国家和省级科研单位和大学组成的专业科研队伍和研究平台,对害虫监测预警技术、基于生物多样性保护利用的生态调控技术、害虫生物防治技术、化学防治技术、抗虫转基因作物利用技术等方面的研究取得了一系列的重要进展,研究建立了棉花、水稻、玉米、小麦和蔬菜等作物重要害虫的综合防治技术体系,并在农业生产中发挥了重要作用。以基因工程和信息技术为代表的第二次农业技术革命的到来,推动了害虫综合防治的理论发展,为害虫综合防治技术的广泛应用提供了新的机遇。地理信息系统、全球定位系统等信息技术和计算机网络技术的应用,提高了对害虫种群监测和预警的能力和水平,转基因抗虫作物的商业化种植等技术的应用显著增强了对害虫种群的区域性调控效率。针对产业结构调整和全球气候变化所带来的害虫新问题,进一步发展IPM新理论与新技术将成为我国农业昆虫学研究的重要方向之一。
【英文摘要】Integrated pestmanagement (IPM) in crops is an important strategy for insect pest control, which plays animportant role for sustainable agriculture. In order to meet the demand of crop production in China, Chinesegovernment launches a series of scientific programs for insect pest researches during 2006-2010, including 973Project, 863 Project, the State Key Project and others. Based on these projects, China has established a national andprovince network which consists of scientist teams and special facilities for insect pest researches in universities andinstitutes. And many achievements on pest control such as methods and technologies on monitoring and forecasting foroutbreaks of major pest insects, ecological management for insect population, biological control, chemical control,and the commercial use of transgenic insect-resistant crops, as well as IPM systems in cotton, rice, corn, wheat,vegetables and other crops, have been established in recent years.The current progress in modern sciences such as biological engineering and information technology is bring a newrevolution for agriculture science, which is pushing IPM theory forward and giving a new opportunity for IPM applicationworldwide. Deployment of GPS, GIS and computer science in pest management is taking

pest forecasting work to a highlevel. Commercialization of insect-resistant genetically modified crops is presenting a great potential for regional controlof insect pests. The studies on newtheory and technology of crop IPMfor resolving the pest problems derived from thechanges of crop planting structures and globe climate will become an important area in the coming years.

【题目】荒漠过渡带与相邻棉田寄生性天敌的昆虫群落特征研究初报
【中文关键词】荒漠 种群动态
【英文关键词】Desert population dynamics
【中文摘要】对新疆南部喀什地区莎车县恰热克镇棉田及相邻荒漠过渡带寄生性天敌昆虫群落结构及动态进行了初步的研究和分析,寄生性天敌在棉田中共有14科,荒漠过渡带共有21科。在棉田中蚜茧蜂数量最多,占总数的19.86%;荒漠过渡带中无后缘姬小蜂数量最多,占总数的34.93%。荒漠过渡带的寄生性天敌群落的丰富度、多样性指数均比棉田高,均匀性指数总体来说比棉田低。棉田中寄生性天敌昆虫和相邻荒漠过渡带中寄生性天敌昆虫关系密切。荒漠过渡带为棉田提供了丰富的寄生性天敌资源。
【英文摘要】This article carries out a preliminary research and analysis on community character of the parasite natural enemy insects in desert transition zone and its adjoining cotton field in the south of Xinjiang,14 families of parasite natural enemy were collected and indentified in the cotton field, and 21 families in the desert transition zone.Aphidiidae is maximum species in the cotton field, 19.86% of the total species number of parasite natural enemy insects in the cotton field,and Tetrastichidae is maximum in the deserts transition zone. Aphidiidae is maximum species in the cotton field, 19.86% of the total species number of parasite natural enemy insects in the cotton field, and Tetrastichidae is maximum in the deserts transition zone,34.93% of the total species number of parasite natural enemy insect in the deserts transition zone. The results showed that the numerical values of richness and diversity of the parasite nature enemies in the desert transition zone were higher than those in the cotton field,and the value of E was lower than that in the desert transition zone.There is a close relationships between the parasity natural enemy insects in desert transition zone. There is a close relationships between the parasity natural enemy insects in desert transiction zone and its adjoining cotton field. This clearly indicated that the desert transition zone provided resource of the parasite natural enemy insect for the cotton field.

【中文关键词】烟粉虱 棉田 种群动态
【英文关键词】Tabaci population dynamics of Cotton Field
【中文摘要】在长江下游的江苏沿江棉区,采用5点随机取样法对鲁棉研15号(Bt棉)、中棉所29号(Bt棉)和苏棉9号(常规棉)棉田烟粉虱成虫种群动态与在棉株上的垂直分布动态进行了系统调查。结果表明,Bt棉田烟粉虱成虫种群数量显著高于常规棉田,鲁棉研15号最高(58.4头/百叶),中棉所29号次之(39.3头/百叶),苏棉9号最低(29.4头/百叶); 3种棉花植株上烟粉虱成虫种群消长的时序动态一致, 7月中旬始见成虫, 8月中下旬出现全年最高峰, 10月下旬逐渐消失;烟粉虱成虫数量在3个品种棉花不同叶层均表现为上部叶>中部叶>下部叶。据此,提出了棉田烟粉虱施药防治技术。
【英文摘要】英语中文(简体)日语AlphaRandom sampling method Lumianyan 15 (Bt cotton), cotton (Bt cotton) on the 29th and Su cotton 9 in the lower reaches of the Yangtze River in Jiangsu along the Yangtze River cotton-growing areas,(Conventional cotton),

cotton fields of B. tabaci adult population dynamics on cotton on the vertical distribution of dynamic system investigation. The results show that the Bt cotton fields of B. tabaci adults kindsGroup number was significantly higher than conventional cotton, the 15th highest (58.4 Lumianyan / louvers), CCRI on the 29th, followed by (39.3 / louvers), Sumian on the 9th lowest (29.4Head / louvers); three cotton plants tabaci adult population on the rise and fall of the temporal dynamics consistent, visible until mid-July, adult, mid-August to late full-year peak of 10Gradually disappeared in late May; B. tabaci adults the number of three varieties of cotton leaf layer performance of the upper leaves> middle leaves> lower leaves. Accordingly, the cotton fields smokeWhitefly pesticide control techniques.

【题目】棉田烟粉虱成虫空间分布型与序贯抽样技术
【中文关键词】烟粉虱 空间分布型
【英文关键词】B. tabaci Spatial distribution pattern
【中文摘要】为探讨烟粉虱成虫在长江下游的江苏沿江棉区不同棉田(Bt棉和常规棉)的种群空间分布型,指导田间取样,本研究应用5种空间分布型聚集度指标和2种回归方法(lwao回归法及Taylor幂法则),于2008年测定和分析了烟粉虱成虫的空间分布格局。结果表明:烟粉虱成虫种群不论在Bt棉田还是在常规棉田,种群空间分布格局均一致,8月1日之前和10月3日以后,烟粉虱成虫在3个不同品种棉田中都呈均匀分布;8月1日至10月3日期间,符合聚集分布的检验标准。本文还探讨了影响其聚集的原因,并利用分布型参数确定了棉田烟粉虱成虫的理论序贯抽样数。
【英文摘要】In order to investigate the spatial distribution patterns of Bemisia tabaci(Gennadius) adult,its population aggregation indexes in two types of cotton fields(Bt cotton and non-Bt cotton)were calculated based on the five different kinds of related index formulae and two regression methods(Taylor's and lwao's regression formulations).The results indicated that the spatial distribution before August 1 and after October3. The spatial distribution of adult exhibited aggregated from August 1 and October 3.In addition,the theoretical sequence sampling mumber was obtained from the parameters of the distributioon pattern.

【题目】2008年河南安阳转Bt基因棉叶抗棉铃虫性时空动态
【中文关键词】安阳 棉铃虫 时空
【英文关键词】bollworm time and space
【中文摘要】近几年来,国内外学者对转Bt 基因棉花的抗虫性进行了一系列的室内和田间鉴定,并研究了转Bt 基因棉对目标害虫取食、生长发育、行为变化及对非目标害虫种群动态的影响。但外源基因的表达受多种因素的影响,如降雨、光强、温度等,因此,不同年份转基因抗虫棉对棉铃虫的抗性有所不同。本文初步分析了转Bt 基因棉花对棉铃虫的抗性时空动态,为转基因棉花的正确安全评价提供了一定的依据。
【英文摘要】In recent years, scholars turn of Bt cotton resistance toThe insects were a series of laboratory and field identification, and to study the transferBt cotton on the target pests, feeding, growth and development, behavioral changes andThe impact on non-target pest population dynamics. But the table of the exogenous geneReached by many factors such as rainfall, light intensity, temperature, etc. Therefore,Different years of transgenic Bt cotton on bollworm resistance to different.A preliminary analysis of transgenic Bt cotton to bollworm resistance toTemporal and spatial dynamics, provide a proper safety assessment of genetically modified cottonA certain basis.

【题目】绿盲蝽对13种不同寄主植物适合度的初步研究
【中文关键词】绿盲蝽 适合度
【英文关键词】miridae
【中文摘要】室内条件下研究了绿盲蝽在13 种寄主植物上不同龄期若虫的发育历期和成虫的寿命。结果表明,绿盲蝽在不同寄主植物上不同龄期若虫的发育历期及若虫期均有显著差异, 其中四季豆上若虫的发育历期明显缩短, 其它寄主植物之间无明显差异;在常规棉花上若虫的发育历期延长, 但和豆类及转基因抗虫棉相比无明显差异。在两种抗虫棉上成虫的寿命明显缩短, 其它寄主植物之间无明显差异。说明转基因抗虫棉和豆类植物更适合绿盲蝽的生长发育。
【英文摘要】Under laboratory conditions, the of lucorum instar nymphs in 13 kinds of host plants, the developmental duration and adult life. The results show thatThe lucorum instar nymphs of the developmental duration of nymphs of different host plants have significant differences, including the development of nymphs on the green beans calendarWas shortened, no significant difference between the other host plants; duration of extended development of nymphs on the conventional cotton, and beans and transgenic insectCotton was no significant difference. In both cotton on the adult life was shortened, no significant difference between the other host plants. Description of transferred genesCotton and legumes are more suitable for the growth and development of the lucorum.

【题目】棉花生长后期剖杆调查棉花黄萎病方法商榷
【中文关键词】棉花 黄萎
【英文关键词】Cotton yellow dwarf
【中文摘要】黄萎病菌侵染棉花后会造成植株维管束颜色加深、变黑。因此,除在棉花黄萎病发生期,通过对罹病棉株叶部出现的病害症状进行调查外,剖杆调查维管束是否变黑以及变黑的程度,也是鉴别棉花黄萎病及病害调查的一种有效手段,这种调查方法在以往的抗病鉴定、抗病育种、病害综合防治等研究中被广泛应用。我们在工作中发现,后期剖杆调查结果与黄萎病发生期外部症状调查的结果有很大差异,本研究通过对两种调查结果的比较及棉株的室内分离鉴定,以期找到其差异的原因,为相关研究工作提供依据。
【英文摘要】Verticillium dahliae infection of cotton will cause plant vascular colorDeepened, black. Therefore, in addition to Verticillium dahliae and the occurrence of, throughDiseased cotton plant leaf disease symptoms to investigate, profile rod tuneInvestigation of vascular black and black level, but also the identification of cottonAn effective means of Verticillium wilt disease survey, this survey methodologyIn the past, identification of disease resistance, breeding for disease resistance, comprehensive disease prevention and control researchThe study has been widely used. We found in the work, the late profile stalk tuneFindings and verticillium wilt of external symptoms of the survey resultsBig difference, the two findings, and the cotton plantIndoor isolation, identification, in order to find the reasons for the difference, for the relevantStudy to provide evidence.

【题目】转CpTI基因对棉花主要病害及早衰的影响
【中文关键词】棉花病害 风险评估
【英文关键词】CpT I cot ton co tton disease r isk assessment
【中文摘要】2006- 2007 年, 采用4 个转CpTI 基因棉花材料及其受体研究了转CpTI基因对棉花苗病、黄萎病、后期叶斑病及早衰的影响。结果表明: 3 个转CpT I 基因材料苗病死苗率均低于其对应的受体材料。在6 月底和7 月初黄萎病的发生初期, 转基因材料黄萎病发生较受体材料轻, 7 月中旬到8 月底9 月初, 不同品种以及同一品种的不同生育期之间差异较大, 转基因材料C 连续两年病指极显著低于对照受体材料。与非转基因材料相比, 转CpT I 基因材料叶斑病的发生显著加重, 早衰发生也加重。
【英文摘要】The cow pea trypsin inhibito r gene(CpTI) has been widely used in genetic engineering formore than ten years and has been successfully transferred into cotton (Gossypium hirsutum L.) .Widely growing of transgenic plant may be accompanied by ecological effects including changes in dis eases those coursed by fungus, bacterial or virus. People have paid more attention on environment riskassessment of transgenic plant recently. Most research on Bt cotton has focused on invasiveness, geneflow to indigenous organisms, development of resistant in target pests, and direct or indirect effectson non-target organisms and ecosystem. But a few studies have been published to evaluate the effectsof CpTI on cotton diseases. Four CpTI cotton lines and their contrasts(non-CpTI cotton) were moni tored for changes in diseases including seedling disease, Verticillium wilt, latter leaf spot and earlysenescence in 2006 and 2007. The results showed that the percentage of died seedling coursed by seed ling disease of three CpTI cotton lines were lower than that of their contrasts (non Cp-TI cotton) .Verticillium wilt disease index (ID) of four CpTI cotton lines were lower than that of non-CpTI cot ton lines in the end of June and the beginning of July (the beginning stage of Verticillium wilt) , afterthat changes of Verticillium wilt ID were different among lines and stages. Verticillium wilt ID ofCpTI A was remarkably higher than that of its contrast . ID of latter leaf spot and early senescence offour CpTI cotton lines were distinctly higher than that of four non-CpTI cotton lines.

【题目】转CpTI基因对棉花根际土壤中微生物的影响
【中文关键词】风险评估
【英文关键词】CpT I cot ton rhizo sphere microbes risk assessment
【中文摘要】2006- 2007 年, 采用4 个转Cp TI 基因棉花材料及其受体, 于棉花不同生育期取根际土壤, 研究了转CpT I 基因对棉花根际细菌、放线菌及真菌数量的影响。结果表明: 转Cp TI 基因及其受体材料根际土壤中细菌、放线菌和真菌的数量均随着棉花的生长发育变化, 细菌在棉花的花铃期达到高峰, 放线菌和真菌在蕾期至花铃期达到高峰, 之后随着棉花的衰老均减少。转CpTI 基因对棉花根际土壤中细菌、放线菌和真菌的数量有显著影响, 细菌和放线菌的数量均比对应受体材料显著增加, 而真菌的数量显著减少;从棉花的不同生育时期看, 细菌的数量在苗期和花铃期显著高于受体材料, 放线菌在不同时期均显著高于受体材料, 尤以苗期和花铃期更明显, 而真菌的数量在吐絮期显著低于受体材料。
【英文摘要】Widely growing of transgenic plant may be accompanied by ecological effects including chan ges in plant-associated with micro-flora. People pay more attention to environment risk assessment oftransgenic plant . Most researches on Bt cotton have focused on invasiveness, gene flow to indigenousorganisms, development of resistance in target pests, and direct or indirect effects on non-target or ganisms and ecosystem. Some research have focused on the evaluation of ecological effects of Bt cottonon microbial flora. But a few studies have been published to evaluate the ecological effects of CpTIcotton on microbial flora. Four CpTI cotton lines and their contrasts(non-CpTI cotton) were moni tored for changes in total bacterial, actinomycetic and fungal population in 2006 and 2007. The resultsshowed that the total bacterial, actinomycetic and fungal population of CpTI cotton and non-CpTIcotton changed in different growing period. The total bacterial population reached the maximum inflowering-bolling stage. So did the total actinomycetic and fungal population between budding stageand flowering-bolling stage. After that they declined gradually

along with the decrepitude of cotton.The total bacterial population of CpTI cotton was significantly higher than that of non-CpTI cotton,especially in seedling stage and flowering-bolling stage. So did the total actinomycetic population ofCpTI cotton from seedling stage to boll-opening stage. But the total fungal population was remarkablylower than that of non-CpTI cotton, especially in boll-opening stage.

【题目】几种因素对斜纹夜蛾性信息素诱捕效果的影响
【中文关键词】斜纹夜蛾 性信息素
【英文关键词】Sp odop tera litura sex pheromone he igh t trap w ith sex pheromone storage t ime
【中文摘要】采用田间诱集效果测定,就不同来源诱芯、诱捕器不同置放高度、不同类型诱捕器、诱芯不同储藏期等因素对信息素诱集斜纹夜蛾数量以及时序动态的影响进行了研究,以探讨蔬菜害虫斜纹夜蛾性信息素应用的关键技术。结果表明:3种不同来源的斜纹夜蛾性诱剂诱捕效果无显著差异;斜纹夜蛾性信息素置放高度依据不同寄主田间生长高度,以1~1.5m效果较好 3种诱捕器诱集效果相当,诱集代次清晰、峰谷明显,均可作为斜纹夜蛾性信息素配套的诱捕器 斜纹夜蛾橡皮塞诱芯置放冰箱贮藏1年或2年,诱蛾活性显著下降,诱蛾量下降60%以上。
【英文摘要】For understanding of the key application technology of sex pheromone trap for Spodoptera litura(Fabricius) , the effects of different factors, such as different sources induced core, different types oftraps, attract wick AW different storage periods, traps in different places and so on were studied in thefields. The results showed that the quantitative dynamics of the males trapped by different sources of sexpheromone was similar. The optimum height of the trap from the ground was 1- 1.5m. The differencesof the quantity of the males by three types of trap were not significant. The sex pheromone stored in 1-2 years significantly reduced the quantity of trappedmales, the number of males trapped by the sex pher omone was reduced by more than 60%.

【题目】马铃薯SoFtsH 基因全长cDNA克隆与在干旱条件下表达研究
【中文关键词】马铃薯(Solanum tuberosum) ; 抗旱性; 全长cDNA; FtsH
【英文关键词】Potato; Solanum tuberosum L ; Drought tolerance; Ful-l length cDNA; FtsH
【中文摘要】FtsH (Filamentation Temperature- Sensitive H) 是一种ATP 和Zn2+ 依赖型金属蛋白酶, 广泛存在于原核生物和真核生物中, 在真核生物中是多基因家族。FtsH 具有ATP 酶活性、蛋白水解活性和分子伴侣活性, 参与多种胁迫反应。从抗旱马铃薯(Solanum tuberosum) 二倍体品系H145 中分离得到cDNA-AFLP 差异片段, 利用RACE 技术克隆了SoFtsH cDNA 全长序列, 并对其进行分析。结果表明, 该序列包含完整的开放阅读框, 长为723 bp, 编码129 个氨基酸。SoFtsH 具有2 个铁氧化还原蛋白结合位点, 并存在信号肽序列、跨膜区域和Zn2+ 结合域。FtsH 基因序列与GenBank 数据库中的其他FtsH 基因进行同源序列比对, 并构建系统进化树, 发现该基因与番茄、烟草、拟南芥等高等植物FtsH 基因同源性达90%以上。半定量RT-PCR 和Northern Blot 杂交结果表明SoFtsH 基因在干旱胁迫下叶片和根系里的表达量明显增加, 且在抗旱品系H145 与干旱敏感品系H214 中表达模式不同。说明SoFtsH 基因在马铃薯抗旱中起作用。
【英文摘要】Filamentation temperature- sensitive H (FtsH) is an ATP dependent metalloprotease and chaperone ident ified inmany prokaryotes and eukaryotes; its homologs have been identified in many plants FtsH belongs to a larger family ofproteins collectively known as theAAA proteins (ATPases associated with diverse cellular activities) Function studies haverevealed an important role for FtsH in stress responses On the basis of one cDNA-AFLP differential fragment isolated frominduced mRNA under drought in the potato (Solanum tuberosum L) genotypeH145 that is diploid with drought tolerance,the full length cDNA of a putative FtsH gene, SoFtsH gene was cloned by rapid amplificat ion of cDNA ends (RACE) Thegene consists of 723 bp encoding a predicted protein of 129 amino acids Sequence analysis revealed that it has two 2Fe- 2Sferredoxins , iron-sulfur binding regions The putative signa-l peptide, transmembane regions and the Zn2+ binding domain,characteristic of FtsH metalloproteases family, were found in the SoFtsH protein Alignment and phylogenetic analysis ofthe amino acid sequence deduced from the fragment and the FtsH sequences of other plants retrieved from GenBank wereperformed with ClustalX program, which showed that SoFtsH shares high identity (> 90%) with FtsH reported in tomato,tobacco and Arabidopsis etc Transcription level of of SoFtsH was investigated by sem-i quantitat ive RT- PCR and Northernblot, using actin gene as a control The result showed that the transcript of SoFtsH was significantly enhanced underdrought The different profiles of transcript of SoFtsH gene were detected under continuous drought between drought tolerantH145 and drought sensitiveH214 that is susceptive to drought The results suggest that SoFtsH gene is closely related withthe drought tolerance in potato

【中文关键词】铃薯薯肉;类胡萝卜素;高效液相色谱法
【英文关键词】Key words:potato tuber flesh;carotenoids;high performance liquid chromatography
【中文摘要】本实验研究了用高效液相色谱法测定马铃薯薯肉中叶黄素和玉米黄素。采用丙酮:石油醚(1:1,含0.1%BHT)混合液直接提取,用ZOBAX C18(4.6 × 250mm,5μm)色谱柱,乙腈:甲醇:二氯甲烷(75:20:5,含0.1% BHT)为流动相,进样量为5μl, 流速为1ml/min ,柱温为25℃,在450nm 下检测类胡萝卜素。研究结果表明,该法可以快速、准确地分离测定马铃薯薯肉中叶黄素和玉米黄素的含量,具有良好的线性(相关系数分别为0.9997 和0.9987)和重复性,叶黄素和玉米黄素回收率分别达到92.87% 和95.68%。而且本方法可有效防止类胡萝卜素氧化,因而非常适用于大批量样品的分析检测。
【英文摘要】:A high performance liquid chromatographic method was used to determine carotenoids in potato tuber flesh.Carotenoids were extracted from tuber flesh with acetone and petroleum ether(1:1, contain 0.1 % BHT). Using ZOBAX C18column (4.6×250 mm, 5 μm), ile:methanol:methylene chloride (75:20:5, contain 0.1 % BHT) as mobile phase,carotenoids were eluted and monitored at 450 nm.The method showed good linearity (the correlation coefficient were 0.9997 and0.9987) and repeatability.The recoveries of lutein and zeaxanthin were 92.87 % and 95.68 %, and oxidation of carotenoids waseffectively

prevented.It proved to be a very useful method for testing large quantities of samples.

【题目】硫代硫酸银对二倍体马铃薯试管苗生长和生理特性的影响
【中文关键词】马铃薯; 硫代硫酸银; 试管苗生长; 生理特性
【英文关键词】Potato; Silver thiosulfate (STS); Plantlet growth; Physiological characteristics
【中文摘要】植物组织培养中由于气体交换的限制, 培养器皿中常伴有乙烯积累, 影响植株形态建成和器官生长发育。以马铃薯二倍体品系HS66、ED13 和DH401 为试材, 研究不同浓度(0、1、2、4、8 mg L－1)硫代硫酸银(STS)对试管苗生长和相关生理指标的影响。结果发现, 与培养基中不加STS 相比, 附加1 mg L－1 STS 可增加试管苗叶面积和叶绿素含量, 抑制气生根的产生; 附加4 mg L－1 以上STS 试管苗出现紫色色素沉积、叶片背面生成愈伤组织等畸形现象。试管苗可溶性蛋白、脯氨酸和丙二醛含量随STS 浓度的增加呈先降后升的趋势, 在培养基中附加1 mg L－1 STS 时, 3个品系试管苗的可溶性蛋白、脯氨酸和丙二醛含量均下降; 附加2 mg L－1 STS 时, DH401 可溶性蛋白和脯氨酸含量及HS66 丙二醛含量反弹升高; 附加4 mg L－1 以上STS 时, 3 个品系试管苗的可溶性蛋白、脯氨酸和丙二醛含量均随STS浓度的增加而增加。上述结果说明, 低浓度STS 可以缓解乙烯胁迫, 促进试管苗正常生长, 高浓度STS 则造成试管苗生理及形态上的明显毒害。
【英文摘要】potato (Solanum tuberosum L.) genotypes (HS66, ED13, and DH401) with different concentrations (0, 1, 2, 4, and 8 mg L－1) ofSTS in culture medium. The results showed that the leaf areas and total chlorophyll contents in three genotypes increased andaerial root could be eliminated by addition of 1 mg L－1 STS into ulture medium as compared with control (0 mg L－1). Toxicsymptoms like black purple pigment accumulation and callus occurring on leaf abaxial urface were observed on plantlets whenthe STS concentration was over 4 mg L－1. The soluble protein, proline, and malondialdehyde (MDA) contents in three genotypesdecreased first and increased then with the STS concentration increase. They declined in the medium containing 1 mg L－1 STScompared with control. Addition of 2 mg L－1 STS resulted in the ascending of soluble protein and proline contents in DH401 andMDA content in HS66. The soluble protein, proline, and MDA contents of three genotypes increased with STS concentration increasingin the medium containing 4－8 mg L－1 STS. These results indicated that supplement of 1 mg L－1 STS in medium couldalleviate ethylene stress and improve plantlet growth. No morphological abnormality was observed in plantlets, but some physiologicalparameters showed STS toxicity to plantlets of HS66 and DH401 in the medium containing 2 mg L－1 STS. Both morphologicaland physiological parameters indicated that higher concentration (4－8 mg L－1) of STS in the medium was toxic to threegenotypes in vitro.

【题目】干旱胁迫对马铃薯类黄酮和类胡萝卜素合成关键酶基因表达的影响
【中文关键词】马铃薯; 干旱胁迫; 类黄酮; 类胡萝卜素; 酶; 基因表达
【英文关键词】potato; Solanum tuberosum L. ; drought stress; flavono id; caroteno id; enzyme; gene expression
【中文摘要】利用马铃薯抗旱二倍体材料H 145和对干旱敏感二倍体材料H 214, 通过半定量RT-PCR方法研究了干旱胁迫0、7、10、12、14 d 时叶片和根系中3 - 二氢黄酮羟化酶(F3H) 基因、黄酮合成酶(FLS) 基因和 - 胡萝卜素羟化酶1 (HYD-1) 基因的表达状况。结果表明: 干旱胁迫过程中马铃薯品系H145和H 214叶片和根系中F3H 基因、FLS 基因、H YD-1基因的表达量在轻度或中度干旱胁迫下有不同程度的增加, 但品系H 145在干旱的早期叶片中F 3H 基因表达量比根系

中增加快, 并且叶片中FLS 基因和HYD-1基因受干旱诱导的表达持续时间比根系中长; 品系H 214叶片中F 3H 基因受干旱诱导表达持续的时间比根系中长, 在干旱的早期叶片里FLS 基因和HYD-1基因表达量没有根系中增加快。说明F 3H、FLS 和HYD-1基因参与了马铃薯抗旱反应, 但不同的品系这些基因起作用的方式可能不同。

【英文摘要】The -carotene hydroxy lase-1 (HYD-1), flavonone-3-hydroxy lase (F3H) and flavono l synthase (FLS) are key enzym es in b iosyn thesis o f flavonoid and caro tenoid. The transcr ipt levels o f genes o f these three key enzymes w ere investiga ted by sem -i quant itat ive RT-PCR under drough t (w ithho lding w atering for 0, 7, 10, 12, 14 days respect ively) in drought tolerance geno type o f d iplo idH145 and drought susceptive genotype o f diplo id H 214. The resu lts show ed tha t the gene transcript of these three key enzymes w as increasedin leaves and roots o f two genotypes underm ild andmoderate drough.t In the geno type ofH145, the transcript leve l ofF 3H gene in leaves increased faster than that in roots, and the duration of transcript ofFLS & H YD-1 gene in leaves w as longer than that in roots under drought stress. In genotype ofH214, the durationof transcript o fF 3H gene in leaves w as longer than that in the roots, the transcript level o fFLS andH YD-1gene in leaves increased slow er than that in roots under drought stress. The resu lts suggested that the genes o f -caro tene hydroxy lase-1, flavonone-3-hydroxylase and flavono l synthase w ere concerned w ith the drought to-lerance in potato, and there m ight be d ifferent acting models o f these genes under drought in different genotypes.

【题目】马铃薯块茎性状对块茎损伤的影响

【中文关键词】马铃薯; 块茎; 损伤; 偏最小二乘回归;

【英文关键词】potato; tuber; bruises; partial least-squares regression;

【中文摘要】研究分析了马铃薯块茎本身对块茎损伤影响显著的关键因素,从而为通过改善栽培条件、品种选育和种质创新等减轻马铃薯块茎损伤提供依据。选用损伤性状差异显著的5个品种(系):Desiree、Russet Burbank、春薯4号、9637-83和TD38-2为试验材料,测定其表皮擦伤(SK)、内部损伤(IB)和损伤变色(BR)性状,同时测定块茎硬度等17个块茎指标,并对数据进行偏最小二乘回归分析并建立模型。分析可知:不同块茎指标对表皮擦伤和内部损伤的影响作用相似,与对损伤变色的影响作用差别较大。Ca2+、酪氨酸和绿原酸共同对3种损伤起着较大的正向或负向作用。偏最小二乘回归模型对本研究中多重相关数据的分析结果整体性较强,结论客观合理,回归系数易于解释,从而可为生产和科研提供可靠的理论依据。

【英文摘要】The potato tuber bruises can be alleviated by breeding new cultivar, imp roved agronomy andenhanced germp lasm based on understanding the key factors affecting bruises. In this research, the cultivars(clones) with p rominent difference in bruises, Desiree, Russet Burbank, Chunshu 4, 9637283 and TD3822were chosen as experimental materials. Data were taken for skinning (SK) , internal bruise (IB) , andbrowning (BR) , as well as for 17 tuber indexes. Correlation analysis was made, and then partial least2squares regression (PLSR) model was established after PLSR analysis. Based on the model, tuber indexesmeasured had similar impact on both skin bruise and internal damage, but not for discoloration. However,Ca2 + , tyrosine and chloregenic acid had remarkable effects on all bruises variables, positively or negatively. Itwas shown that thismodel in the research had more advantages, such as stronger integrity, reasonable conclu2sion, easily exp lainable regressive parameter, thus it can p rovide theoretical basis for scientific research andp roduction

【题目】RRR-α-生育酚琥珀酸酯对肉鸡生产性能和营养物质代谢的影响
【中文关键词】RRR-α-生育酚琥珀酸酯;肉鸡;生产性能;代谢率;消化酶
【英文关键词】α-TOS, broiler, performance, metabolism; digestive enzyme

【中文摘要】试验旨在研究日粮中添加RRR-α-生育酚琥珀酸酯(α-TOS)对肉鸡生产性能和营养物质代谢的影响。选用600只1日龄肉鸡,随机分为10个处理,每处理6个重复。试验采用2×5因子设计,即两种油脂类型(新鲜油脂和氧化酸败油脂),以及5种α-生育酚的不同处理,分别为30 mg/kg allrac-α-生育酚醋酸酯(TOA1)、30 mg/kg RRR-α-生育酚醋酸酯(TOA2)及15、30、60 mg/kg RRR-α-生育酚琥珀酸酯(TOS1、TOS2和TOS3)。试验期为21 d。结果表明,氧化酸败油脂造成肉鸡料重比显著升高(P<0.05);日粮中添加α-TOS可降低新鲜油脂组肉鸡的料重比,提高营养物质的代谢利用率(P>0.05),也可以改善因日粮中油脂氧化酸败造成的肠道食糜消化酶活性下降,导致营养物质代谢率下降,引起肉鸡生产性能降低的趋势。

【英文摘要】The effects of α-TOS on the performance and metabolism in broilers were studied. 600 1-day chickens were delivered into 10 treatments, 6 replicates per treatments. The experiment was conducted as the design of 2×5 factors, two lipid (one was fresh and another was spoiled), and different α-TOS: TOA1 and TOA2 with supplement of 30 mg/kg, α-TOS at the dose of 15, 30 and 60 mg/kg. The experiment lasted 21 days. The results showed that, the spoiled lipid could increas the feed weight ratio obviously, while α-TOS could decrease the value in broils fed fresh lipid. At the same time, α-TOS could also relieve the damage induced by the spoiled lipid on the activity of digestive enzymes, the nutritive metabolism (P>0.05), and the performance in broilers.

【题目】不同剂型植酸酶对育肥猪饲料养分利用率的影响

【中文关键词】植酸酶 生长育肥猪 生产性能 养分利用率 氨基酸消化率

【英文关键词】phytase enzyme, growing pig, growth performance, nutrient availability

【中文摘要】研究日粮中添加不同剂型植酸酶对生长育肥猪生产性能和饲料养分利用率的影响,选用240头健康的三元杂交(杜×长×大)断奶仔猪,随机分为5组,即正对照组PC(基础日粮,未添加植酸酶)、负对照组NC(降低有效磷水平,未添加植酸酶)及在负对照组日粮中分别添加500 U/kg的包衣、粉状和微丸植酸酶(试验T1、T2和T3组),试验期为100 d。结果表明:(1)日粮中添加不同剂型植酸酶均可提高猪的平均日增质量和饲料利用率,包衣植酸酶添加效果最好。(2)添加包衣植酸酶能显著提高干物质、能量、粗灰分和磷的消化率,而粗蛋白和钙的利用率差异不显著。(3)添加植酸酶的各处理组中,包衣植酸酶有提高赖氨酸、蛋氨酸和异亮氨酸消化率的趋势,但效果不显著,而其他氨基酸的消化率也无显著变化。结果表明:包衣植酸酶对猪生产性能及饲料养分利用率的效果最好,其次是微丸植酸酶,粉状植酸酶的效果最差

【英文摘要】The effect of different type of phytase enzyme on growth performance and feed conversion ratio in growing pigs was studied. 240 weaned piglets were divided randomly into 5 groups, base diet without adding phytase enzyme (PC), low available phosphor diet without adding phytase enzyme (NC), and adding covered, powdered and pellet enzyme in NC with the dose at 500 U/kg. The experimental period was 100 days. The results showed that: all the adding enzymes could improve the daily weight gain and feed conversion ratio, and the impacts of coverd enzyme were the best. Otherwise, the covered enzyme could also improve the digestibilities of DM, energy, CF and phosphor. The conclusion was, the effect of covered phytase enzyme on growth performance and feed conversion ratio were better than the other two kind of enzymes.

【题目】中国玉米生产技术的演变与发展
【中文关键词】玉米; 产量; 增产因素; 发展趋势;
【英文关键词】maize; yield; yield increase factor; development trend;
【中文摘要】为探索今后玉米增产的途径,本文从单产提高的主要措施、技术特征和增产机理角度,分析了50多年来中国玉米生产技术的演变与发展。从1949至2007年中国玉米单产每公顷提高了4205.1kg,增幅为437.3%,年均增加85.84kg·hm-2;总产由1241.8万吨提高到15230.0万吨,增加了12.3倍,其中单产增加的贡献占68.4%、种植面积扩大的贡献为31.6%,总产量的提高主要依赖于单产的增加。玉米生产技术的发展经历了如下阶段:(1)玉米品种选育由筛选推广优良农家品种——品种间杂交种——双交种、三交种——单交种4个阶段,在杂种优势得到广泛利用后,抗病基因选择、株型改良、保绿与晚熟成为玉米品种产量潜力提高的主要育种技术方向,今后将向着耐密、抗逆、广适、高产和适应机械化作业的新品种选育方向发展;(2)栽培技术表现出由单项适用技术推广、农田条件改善到技术集成与模式化栽培,今后将向以耐密、抗逆、高产品种与机械化为载体的简化高产优质高效栽培方向发展;3)随着种植密度的不断提高,玉米增产的生理机制由提高单株生产力,到改善株型增大群体和保绿、晚熟延长光合与灌浆时间来增大群体生产量,向提高群体整齐度、花后物质高效生产与...
【英文摘要】To study the approaches for maize yield increase, this paper has analyzed the change and development of maize production techniques in the past 5 decades and more in China from the perspectives of main measures, technical characteristics and mechanisms for per unit area yield increase. The results showed that maize yield per unit area in China increased by 4 205.1 kg or 437.3% from 1949 to 2007, with annual growth rate of 85.84 kg·hm-2, and the total yield increased from 12.418 million tons to 152.30 millio...

【题目】保护性耕作方式下华北平原夏玉米产量效应的研究
【中文关键词】夏玉米; 保护性耕作; 产量;
【英文关键词】Summer maize; Conservation tillage; Yield;
【中文摘要】在长期定位条件下,研究不同耕作方式下夏玉米产量性状的变化。经过连续5年的定位试验后,小麦、玉米秸秆全量还田双季免耕的处理(DNT)较玉米秸秆不还田、翻耕种植冬小麦、小麦全量还田免耕种植夏玉米的处理(PNT)以及玉米秸秆粉碎还田旋耕种植冬小麦、小麦全量还田免耕种植夏玉米的处理(RNT)连续两年平均增产19.43%和7.35%。DNT处理增加了穗长、穗行数、行粒数和百粒重,减小了秃尖度;DNT方式种植的玉米吐丝前、吐丝后干物质生产均高于其他两种耕作;DNT种植的玉米群体叶面积指数大喇叭口期开始明显优于PNT和RNT处理,且没有出现下部叶片早衰现象,吐丝后光合势、净同化率值均高于其他两种耕作。
【英文摘要】To research yield characteristics of summer maize which planted in long-term site-specific experiment field under different tillage patterns. There were three tillage patterns which were whole wheat-maize straw mulch with double-no-tillage(DNT), planting wheat under plough tillage without maize-straw return and planting maize under no tillage with wheat-straw mulch(PNT), and planting wheat under revolve tillage with maize-straw return and planting maize under no tillage with wheat-straw mulch(RNT). Average ...

【题目】保护性耕作农户认知情况调查分析
【中文关键词】保护性耕作; 农户调查; 产量效应;
【英文关键词】Conservation tillage; Household Survey; yield effect;
【中文摘要】通过面对面的访谈,对我国东北平原、华北平原、成都平原和西北绿洲区4个典型生态类型区的666户农户进行了保护性耕作技术认知情况调查。表明我国保护性耕作模式比较多,产量效应及推广应用情况存在明显区域差异。其中,华北平原农户保护性耕作技术采用率较高,而西北绿洲区相对较低,与之相对应,各区域农户对保护性耕作技术的认识程度也存在明显差别。
【英文摘要】Four typical ecological zones of the Northeast China Plain, the North China Plain, Chengdu Plain and the northwest oasis region 666 farmers, conducted a survey of conservation tillage technology awareness. Conservation tillage model for our country that the yield effect and promote the application of significant regional differences. Among them, the higher the rate of adoption of conservation tillage farmers of the North China Plain, Northwest oasis region is relatively low, corresponding to regional farmers there are also significant differences in the level of awareness of conservation tillage technology.

【题目】不同耕作方式对成都平原麦稻轮作模式下小麦生长及产量的影响
【中文关键词】不同耕作方式; 成都平原; 小麦; 产量;
【英文关键词】Different Cultivation way; West Sichuan Plain; Wheat; Quality;
【中文摘要】了明确不同耕作方式对成都平原小麦生长及产量的影响,进行了麦—稻轮作、麦免稻旋、麦免+稻旋+秋作、麦稻双免、麦稻垄作5种耕作方式定位试验,研究不同处理下小麦生长发育和产量的变化。结果表明:不同耕作方式对小麦生长及产量的影响达到显著差异,其中麦免稻旋模式产量最高。免耕不仅对小麦苗期生长、成穗、干物质积累均影响较大,而且可显著提高小麦产量,并且省工、培肥、效益好,可作为成都平原的主要耕作模式。
【英文摘要】Experiments were conducted to investigate differences of wheat quality under different conservation tillage ways with the wheat and rice rotation mode in West Sichuan Plain.Five cultivation ways were designed,including wheat-rice rotation,wheat free-rice rotation,wheatfree-rice rotation-autumn planting,double-free of wheat and rice,and wheat ridge-rice free.The results showed that wheat free-rice rotation had the maximum actual output,leaf area index and biological yield.

【题目】挡板导流式喷雾机的防飘性能试验
【中文关键词】防飘; 仿真试验; 田间试验;
【英文关键词】anti-drift; simulation experiment; field experiment;

【中文摘要】为了测试新研制的挡板导流式喷雾机的防飘性能,本文对其与常规喷雾进行了仿真模拟试验与田间试验的对比研究。结果表明挡板导流式喷雾机改变了喷头周围的流场,使气流的水平速度减小,并产生了垂直向下的气流,减少了雾滴飘失的潜能并胁迫雾滴向靶标沉积。药液在小麦中、下冠层的沉积量分别增加了119.2%和112.3%,在冠层上总的沉积量增加了20.3%。上、中、下冠层叶面药液沉积量的变异系数分别为7.85%、6.37%和8.71%,都小于常规喷雾。
【英文摘要】In order to test the anti-drift performance of the guided baffle plate type sprayer,the simulation experiment and field experiment were done to compare the anti-drift performance of new sprayer and conventional sprayer.The results showed that the guided baffle plate type sprayer changed the flow field around the nozzle,which could reduce the horizontal velocity and product the down vertical airflow.So the drift potential of droplets was reduced and the droplets were intimidated to deposit on target.The depo..

【题目】稻麦轮作区麦秸还田对水稻产量及主要品质性状的影响
【中文关键词】稻麦轮作区; 麦秸还田; 水稻; 产量; 品质性状;
【英文关键词】Rice-wheat cropping system; Wheat residue retention; Rice; Grain yield; Quality characters
【中文摘要】2005~2007年,研究了稻麦轮作区麦秸还田方式、还田量及免耕麦秸覆盖还田条件下移栽方式对水稻产量和主要品质性状的影响。结果表明:①与传统栽培方式(翻耕、无麦秸还田)相比,免耕麦秸覆盖还田对水稻产量没有影响,但对出糙率、整精米率等品质性状不利;翻埋还田有一定增产效果(增产5.5%),对主要品质性状影响不明显;免耕垄作麦秸沟填处理则显著减产。②免耕条件下,适当增加麦秸还田量,能减少无效分蘖,提高个体和群体质量,增产效果明显。以9.0×103kg·hm-2麦秸还田量的水稻产量最高,与对照差异显著。③免耕麦秸覆盖条件下,撬窝移栽水稻根系分布层次较深

,抗倒力强,产量高于其他处理;不同移栽方式对稻米外观品质无显著影响,但撬窝移栽的整精米率显著高于抛秧和摆栽处理。试验结果说明,以适当方式实施麦秸还田,对水稻生长发育及产量和品质的提高具有良好的促进作用。

【英文摘要】In rice-wheat cropping system,with wheat residue retention the effect of returned methods,quantities and transplanting patterns on grain yield and main quality characters of rice were studied.The results showed that,compared with tradition cultivation,residue mulching had no obvious effect on rice yield,but reduced its milling grain quality.Residue incorporation could increase rice yield by 5.5 % and had no obvious effect on quality.Residue filled ditch in zero-tillage and ridge culture reduced the yield by..

【题目】稻田冬季保护性耕作条件下的土壤酶活性与水稻成熟期叶片衰老和籽粒产量之间的关系

【中文关键词】水稻; 保护性耕作; 土壤酶活性; 叶片衰老; 相关性;

【英文关键词】rice; conservation tillage; soil enzyme activity; leaf senescence; relationship;

【中文摘要】为研究稻田冬季保护性耕作不同种植模式对土壤酶活性以及水稻成熟期叶片衰老的影响,设计了5种种植模式:免耕直播稻草全程覆盖马铃薯(T1)、免耕直播黑麦草(T2)、免耕直播油菜(T3)、免耕直播燕麦草(T4)和空闲(CK),供试品种为杂交组合国稻6号。与对照(CK)相比,T1、T2和T3处理均可显著提高土壤蛋白酶、中性磷酸酶、过氧化氢酶以及转化酶活性,尤其是T1处理,其土壤酶活性明显高于其他处理,而T4处理与对照相比,差异不明显。T1、T2和T3处理均可有效延缓水稻成熟期剑叶的衰老,主要表现为成熟期剑叶中的超氧化物歧化酶、过氧化物酶活性、可溶性蛋白质和叶绿素含量下降缓慢,丙二醛含量上升的幅度较小,相对于对照(CK),差异均达显著水平。在本试验条件下,土壤酶对水稻叶片衰老的影响程度依次为蛋白酶>过氧化氢酶>中性磷酸酶>转化酶。叶片衰老对水稻产量的影响主要表现在灌浆中后期。

【英文摘要】Five planting modes of winter conservation tillage in paddy field,including potato with straw mulching under zero-tillage(T1),ryegrass direct seeding under zero-tillage(T2),rape direct seeding under zero-tillage(T3),oat grass direct seeding under zero-tillage(T4) and the control(CK),were designed to study the changes in the soil enzyme activities and their effects on leaf senescence of hybrid rice Guodao 6 during grain filling.Compared to the control(CK),T1,T2 and T3 treatments could significantly increase ...

【题目】典型生态区保护性耕作主体模式及影响农户采用的因子分析

【中文关键词】保护性耕作; 农户调查; 技术扩散; 影响因子;

【英文关键词】conservation tillage; farmer survey; techno-diffuse; influential factors;

【中文摘要】明确中国典型生态区保护性耕作主体模式及农户采用情况,并揭示影响农户采用的因子。【方法】在典型生态类型区-东北平原、华北平原、成都平原、西北绿洲区的保护性耕作技术示范区,通过农户一对一的问卷调查,获取原始数据,统计分析影响农户采用保护性耕作技术的因子。【结果】研究发现,华北平原和成都平原农户保护性耕作采用率较高,东北平原和西北绿洲区相对较低;不同区域均有适应当地生态条件的保护性耕作模式,其中东北平原宽窄行留高茬交替休闲种植及破茬合垄耕作模式、华北平原玉米秸秆还田旋耕播种小麦和小麦秸秆还田免耕直播玉米、成都平原稻草覆盖地免耕种植小麦或油菜或马铃薯等作物的保护性耕作模式具有明显的增产效果。数据分析表明,作物产量增加、政府示范与宣传引导、邻里效应等是吸引农户采用保护性耕作技术的主要原因,而机具不配套则在一定程度上阻碍了保护性耕作技术的应用。【结论】由于不同区域的生态因子和生产条件的差异,保护性耕作技术的推广应用要因地制宜,针对主要限制

因子,选择合适的技术模式,采用有效的宣传推广手段,促进保护性耕作技术的发展。
【英文摘要】he objective of this study is to understand the conservation tillage modes and farmers ’ adoption, and to reveal the factors influencing farmer adoption. 【Method】 A face-to-face investigations on peasant household were carried out in main demonstration area of conservation tillage of typical ecological region: the Northeast China plain, the North China plain, the Chengdu plain, and the Northwest China oasis. 【题目】基于种植制度利用MODIS数据提取冬小麦种植面积
【中文关键词】遥感; 农作物; 分类; 山东省; 冬小麦; 稻茬麦; 面积;
【英文关键词】remote sensing; crops; classification; Shandong Province; winter wheat; rice wheat; area;
【中文摘要】为了及早获取冬小麦种植面积,为国家制定相关政策提供科学依据,该文基于山东省种植制度,将山东省冬小麦划分为"机播冬小麦—玉米"和"人工撒播冬小麦—水稻"两种类型,利用MODIS影像数据,分析冬小麦播种后、越冬期前冬小麦、大蒜、温室蔬菜的归一化差值植被指数(NDVI)值特征,结合9月中旬前茬作物NDVI特征建立当年机播冬小麦提取条件;鉴于稻茬麦播种后、越冬前的光谱特征与温室蔬菜光谱特征极为相似,则在水稻种植区利用拔节期冬小麦生物量迅速增长的特点提取上一年稻茬麦种植面积,由于"人工撒播冬小麦—水稻"这种耕作模式在山东特定地区较为固定,因此将上一年稻茬麦面积作为当年稻茬麦种植面积;合并两种类型冬小麦面积,用284组定位点数据对提取结果进行检验,精度达到了94.01%,结果表明:于越冬期前提取冬小麦种植面积是可行的,提取时间较利用拔节期NDVI值方法提前4个月。
【英文摘要】Winter wheat is one kind of important crop in China. Its planting area is one key element to explain yield change. To obtain winter wheat planting area as soon as possible can provide scientific reference for our country to make related policy. Based on the cropping system in Shandong Province, winter wheat is divided into two kinds "winter wheat sowed by machine-maize" and "labour broadcast winter wheat-rice". Using MODIS data, NDVI characters of winter wheat, garlic, greenhouse vegetable, from sowing till...

【题目】The Inhibiting Effect of 1・4 Recombinant P Chromosome of Wheat- Agropyron cristatum Addition Line on the Ph Gene

【中文关键词】小麦-冰草附加系 P染色体 Ph基因 部分同源染色体联会

【英文关键词】wheat-Agropyron cristatum addition line, P chromosome, Ph gene, homoeologous chromosome synapsis

【中文摘要】冰草属(Agropyron Gaertn)的P组染色体被推测可能携带有抑制小麦Ph基因的遗传系统, 但是相关的研究很少. 本文研究发现在小麦-冰草附加系Ⅱ-21-2(附加1・4重组P染色体)的减数分裂中存在染色体联会异常的现象. 对该附加系进行细胞遗传学和Ph1基因扩增等分析与检测, 结果表明附加系Ⅱ-21-2的Ph1基因扩增正常, 未见缺失;小麦-冰草附加系Ⅱ-21-2减数分裂中期每个花粉母细胞出现六价体或四价体的数目分别为0.41和0.13,而附加系受体小麦Fukuho减数分裂无染色体异常联会. 双色GISH/FISH检测表明, 附加系Ⅱ-21-2的P染色体不直接参与多价体的组成, 多价体为小麦自身染色体构成. 附加系Ⅱ-21-2的1・4重组P染色体能够抑制小麦Ph基因的作用, 从而引起小麦部分同源染色体之间的联会, 并造成包括小麦3B-3D等部分同源染色体之间的易位. 小麦-冰草附加系的P染色体促进小麦部分同源染色体联会的作用或特性在未来小麦的遗传改良中具有潜在应用价值.

【英文摘要】P chromosomes may carry a genetic system that inhibits the Ph gene in wheat. Abnormal chromosome synapsis in wheat-Agro-pyron cristatum addition line II-21-2 (additional 1・4 recombinant P chromosome) was observed in this study. The results of cyto-genetics and Ph1 gene amplification showed that the Ph1 gene was normal and the average number ofquadrivalents or hexava-lents was determined to be 0.41 and 0.13, respectively, in pollen-mother cells of wheat-Agropyron cristatum addition line II-21-2. The analysis of dual-color GISH/FISH showed that the P chromosomes were not directly involved in the composition of multiva-lents but could inhibit the effect of the Ph gene, leading to synapsis of wheat homoeologouschromosomes and translocation be-tween wheat homoeologous chromosomes such as 3B-3D chromosomes. The characteristic of P chromosomes ’ promoting synap-sis of wheat homoeologous chromosomes may have potential application in the genetic improvement of wheat.

【题目】小麦-冰草多粒新种质及其多粒性遗传分析

【中文关键词】小麦-冰草多粒新种质3228;穗粒数;遗传分析;有效利用

【英文关键词】common wheat-Agropyron germplasm 3228; kernels per spike; inheritance analysis; effective utility

【中文摘要】【目的】探讨小麦-冰草多粒新种质 3228 多粒特性(>90 粒/穗)的遗传及其利用价值。【方法】将该材料在5个不同小麦种植区进行种植,以评价该材料多粒特性的稳定性;采用主基因+多基因混合遗传模型分析方法对小麦-冰草多粒新种质3228(♀)×京4839(♂)的F2单株表型进行遗传分析。【结果】小麦-冰草多粒新种质3228多粒特性在不同环境下

表现稳定,其穗粒数均大于90;小麦-冰草异源新种质3228与京4839(41粒左右/穗)F2 群体遗传分析表明,多粒特性主要受1对主效基因控制,主基因的遗传率为27.81%,其加性效应是9.33;此外,在F2 群体中,78.11%的单株穗粒数都高于京4839,表明3228中的多粒基因具有一定的显性效应。【结论】小麦-冰草多粒新种质 3228 多粒特性具有较好的环境稳定性,其在遗传上主要受 1 对主基因控制,有望利用该多粒基因通过提高穗粒数实现小麦高产育种。

【英文摘要】【Objective】 This research was conducted to study the utility value and the inheritance of the kernels per spike in the novel wheat-Agropyron germplasm 3228. 【Method】 A field experiment in five wheat regions was designed to explore the stability of kernels per spike of wheat-Agropyron germplasm 3228. Inheritance analysis of the F2 population derived from the cross between 3228 and Jing4839 was carried out using mixed major gene plus polygenes inheritance model of quantitative traits. 【Result】 Results of field experiment showed that the kernels per spike of 3228 were more 90 and has the desirable stability in different planting regions. The analysis result of the F2 population in which the 78.11% individual plants have more kernels per spike than Jing4839 indicated that the kernels per spike of the 3228 was mainly controlled by one major gene, the heritability value and the additive effect of the major gene were estimated as 27.81% and 9.33, respectively【Conclusion】 The large kernels number per spike of 3228, which mainly controlled by one major gene, has the better environmental stability, which suggested that the kernel gene would play an important role in improving wheat yield through increasing the kernels per spike.

【题目】小麦-冰草衍生系3228主要产量性状的遗传分析

【中文关键词】小麦-冰草衍生系3228,多粒,产量性状,遗传分析,可利用性

【英文关键词】Wheat- Agropyon cristatum derivative 3228,Much grains,Yield traits,Inheritance,Utility value

【中文摘要】为了探讨小麦-冰草(Agropyron cristatum)衍生系3228的多粒(66~82粒/穗)特性在育种中的可利用性,本研究以3228与黄淮冬麦区5个主栽品种进行杂交,并将其杂种F1分别种植于北京、陕西和四川,采用MINQUE(1)统计方法及AD模型对主要产量性状进行了遗传分析。在研究的6个产量性状中,均存在极显著的加性方差比率,普通广义遗传率在产量性状的遗传中所占比例较大,所有性状的遗传均存在加性和环境的互作。特别值得指出的是,3228在穗粒数方面具有极显著的加性和显性效应,在穗长、小穗数方面也具有极显著的加性效应,说明利用该种质对于提高小麦的穗粒数具有重要作用。

【英文摘要】In order to explore the utility value of the much grain per spike of the wheat-Agropyon cristatum derivatives 3228 in wheat breeding,3228 and its hybrids F1 derived from the crossing between 3228 and one of the five main cultivars from Huanghuai winter wheat area were planted in Beijing Shaanxi and Sichuan, respectively.The main yield traits of the parents and their F1 were analyzed for ther dominant and additive effects by MINQUE(1) approaches and AD models.The results indicated that the main yield traits had high significance in the additive variance ratio,and ordinary broad sense heritability accounted for the large proportion of the yield traits inheritance.Meanwhile,the effects of all the yield traits were interacted by environment.On the emphasis,Grains per spike length and spikelets number in additive effect,which suggested 3228 would play an important role in increasing grains number per spike in the wheat yield traits improvement.

【题目】Cloning and characterization of repetitive sequences and development of SCAR markers specific for the P genome of Agropyron cristatum

【中文关键词】重复序列,RAPD,SCAR,冰草属,小麦
【英文关键词】Repetitive sequences , RAPD , SCAR ,Agropyron Gaertn , Wheat
【中文摘要】在之前的研究中,我们利用远缘杂交的方法将冰草P基因组成功转移到小麦中。在本研究中,我们克隆了重复序列并用来开发冰草P基因组特异的分子标记。利用随机扩增多态性鉴定并获得了3个P基因组特异标记,分别命名为OPX07-1036, OPX11-817和OPC05-1539。这三个标记能够在所有含有冰草染色质的测试材料中成功扩增,例如冰草和小麦-冰草附加系。这些RAPD标记被转换成SCAR标记,用来检测小麦背景中的冰草染色质。用标记DNA做探针进行原位杂交结果发现他们分布在冰草染色体的所有臂上,因此它们可用于小麦背景中P基因组渗入的研究中。
【英文摘要】In previous studies, we successfully transferred the P genome of Agropyron cristatum intowheat using wide hybridization methods. In the current investigation, repetitive sequences were clonedand DNA markers speciWc for the P genome of A.cristatum were developed. Three P genome-speciWc markers, designated OPX07-1036, OPX11-817 and OPC05-1539, were identiWed and isolated using ran- dom ampliWed polymorphic DNAs. The three markers were successfully ampliWed in all tested materials that contained Agropyron chromatin, such as Agropyron itself and wheat-Agropyron addition lines. These RAPD markers were converted into SCAR markers tobe used in detection of P genome chromatin in wheat.In situ probing with Xuorescent-labeled marker DNA has shown that they are distributed in all arms of Agropyron hence they will be useful in a variety of studies on introgressions of the P-genome chromatin into wheat.

【题目】植物诱发突变技术育种研究现状与展望
【中文关键词】作物改良;诱变技术;突变品种;突变基因资源;DNA 技术;粮食安全
【英文关键词】crop improvement ;induced mutation ;mutant variety ;mutant gremplasm;DNA technology ; food security
【中文摘要】自1928 年以来,诱发突变技术应用于农作物新材料创制和优良新品种培育,在解决世界粮食安全与营养供给中发挥了显著作用。据不完全统计,截至2009 年9 月,世界上60 多个国家在170 多种植物上利用诱发突变技术育成和推广了3088 个突变品种,其中中国在45 种植物上育成了802 个突变品种,超过目前国际诱变育成品种数据库中总数的四分之一而位居世界第一。中国育成的突变品种年最大种植面积900 万hm2 ,每年为国家增产粮、棉、油10~15 亿kg ,社会经济效益超过20 亿元。近年来,加速器离子束辐照、空间环境诱变等新型诱变手段,以及传统核辐射诱变技术的有效利用,在我国农作物诱变改良与新基因挖掘中的应用日趋活跃。植物基因组学和高通量DNA 技术(如TILLING等) 的发展将把传统诱变育种推向分子突变育种新时代,并将在支撑我国及世界粮食安全领域发挥更大作用。
【英文摘要】Since 1928 , induced mutations have played a significant role in solving world food and nutritional security problems through mutant germplasm enhancement and new mutant variety development . According to incomplete statistics , up to September 2009 , induced mutations have officially released 3088 mutant cultivars in more than 170 crop species by more than60 countries in the world. China tanks the first in the world , which has have released 802 mutant cultivars in 45 crop species ,and takes more than a quarter of the total number of mutant varieties in the FAOPIAEA database. The maximum annually accumulated planting area of the mutant varieties was 9 million hectares , with an additional increase of 115 billion kilograms to national output of grain , cotton , oil , being converted to social and economic benefits of more than 2 billion RMB. The recent development and application of accelerator ion beam irradiation , the spaceflight environment and the other new mutation means , as well as the effective use of traditional radiation mutagenesis are becoming more active in crop improvement and new gene discovery. The adven of plant genomics and high throughput DNA techniques , such as TILLING, have opened a new era of molecular mutation breeding , which will overcome the limitations of conventional mutation breeding and play a significantrole in solving China and world food security.

【题目】陕农138小孢子不同发育时期蛋白质差异的比较分析
【中文关键词】小麦;蛋白质;小孢子发育时期;SDS-PAGE电泳;代谢机理
【英文关键词】Wheat; Protein; Microspore development; SDS-PAGE electrophoresis; Metabolic pathway
【中文摘要】为了探索小麦花药发育过程中的蛋白质代谢机理,利用SDS-PAGE电泳对陕农138花药单核早期、单核中晚期和双核期小孢子的全蛋白电泳谱带进行了分析。结果表明,双核期同时出现2条明显的条带或表达丰度大的条带,其分子量分别为50.7、48.2 kD,而这两个条带分别在单核早期和单核中晚期单独出现,认为通过电泳所获得的这些差异蛋白很可能直接或间接参与小孢子发育过程中某些关键的代谢途径;单核中晚期是小麦花药培养中出愈率最高的时期,这些差异蛋白又很可能与小麦花药培养力的表达调控和代谢机理有关。
【英文摘要】Most research demonstrated that the mid and late uninucleate pollen period was the best time to conduct wheat anther culture. To explore the cause of high induced rate and the mechanism of protein metabolism during anther development, this study analyzed the total protein bands at the early uninucleate pollen period, mid and late unimucleate pollen period and binucleate pollen period of microspore development by SDS-PAGE electrophoresis with Shannong 138 as the material. The result indicated that two protein bands appeared at the binucleate pollen period of the microspore development, with molecular weight of 50.7 kD, 48.2 kD, but these two bands appeared alone at the early and mid-late uninucleate pollen period, respectively. The specific composition of protein bands could be used as biochemical marker not only to identify the different stages of microspore development, but also to select the attribute of high induced rate of anther culture. The discriminative proteins obtained through one-dimensional electrophoresis were likely to involve in some key metabolic pathway in the process of microspore development directly or indirectly. Furthermore, given that the mid and late uninucleate pollen period was the best stage to study anther culture in wheat, these distinct protein may relate to regulate the expression and metabolism of anther culture.

【题目】小麦高分子量麦谷蛋白亚基突变体的筛选与鉴定
【中文关键词】小麦; 航天诱变; 谷蛋白; 突变体
【英文关键词】wheat; space mutation; glutenin; mutant

【中文摘要】本研究对小麦品种白硬冬2 号航天搭载SP2 代单株籽粒的高分子量麦谷蛋白亚基(HMW GS) 组成进行了SDS PAGE 电泳分析, 在92 株材料中发现了2 个突变体mut1 和mut2, 突变频率为2. 17%, 并利用醇溶蛋白电泳验证了航天诱变引发HMW GS 变异的真实性。在突变体mut1 中发现了4 种HMW GS组成突变类型, 突变发生在Glu 1B 和Glu 1D 位点。突变亚基是由航天诱变引发相关编码基因突变形成的, 它们的电泳迁移率发生了明显变化, 为新的亚基类型。本研究表明, 航天诱变能够诱导产生新的HMW GS, 是丰富HMW GS 基因资源的有效途径。

【英文摘要】The variation and compositions of high molecular weight glutenin subunits (HMW GS) in the SP2 of space loaded Baiyingdong 2 were analyzed by SDS PAGE techniques. 2 mutants (mut1 and mut2) of HMW GS were screened out, the variation frequency was 2 17% . Using gliadin protein electrophoresis proved the HMW GS mutants were induced by space flight mutation. 4 kinds of HMW GS compositions were found in mut1 seeds, and the mutations occurred in Glu 1B and Glu 1D sites. The mutated subunits resulted from the coding genes mutations which were induced by space flight , their electrophoret ic mobility changed significantly, these mutated subunits were new glutenin subunits. The results of this study showed that space flight mutation could create new HMW GS, and space flight mutation was an effective method for enriching the HMW GS gene resource.

【题目】不同节水施肥处理对国审富麦2008产量及品质的影响

【中文关键词】富麦2008;灌水;施肥; 产量;品质

【英文关键词】Fumai 2008; Irrigation; Fertilization; Yield; Quality

【中文摘要】以国审富麦2008为试材,研究了不同灌水和施肥处理对该小麦品种产量和主要品质性状的影响。结果表明,灌水5次的产量显著高于灌水2次,但与灌水3次差异不显著,湿面筋、沉降值含量以灌水2次最高,比较灌水5次(CK) ,灌水2次增收681. 45元/hm2 ;底施和追施比例3∶7为宜,全生育期施氮量300和225 kg/hm2 的籽粒产量显著高于150 kg/hm2 处理;全生育期施磷量135、160 kg/hm2 的籽粒产量差异不显著,显著高于100 kg/hm2 处理;随钾肥用量增加,该品种产量呈先上升后下降趋势;增施磷、钾肥有改良品质性状趋势,但效果不显著。在该试验条件下,综合考虑产量、品质和经济效益,以灌水2次,施氮量225 kg/hm2 ,底施和追施比例为3∶7,磷肥135kg/hm2 ,钾肥75 kg/hm2 的处理为宜。

【英文摘要】With Fumai 2008 as testmaterials, the effects of different treatments ofwater2saving and fertilizer on yield and main quality characters of Fumai 2008 were studied. The results showed that the yield of the treatment of irrigation 5 timeswas significantly higher than that of irrigation 2 times, and had no obvious difference with treatment of irrigation 3 times, there had the highest contents ofWet gluten and Sedimentation value with irrigation 2 times, the purely income of treatment of irrigation 2 times increased 681. 45 yuan /hm2 than that of CK; the grain yield was the highest in the treatment of p roportion of base fertilizer to top dressing was 7∶3, the yield of treatments of app lied Nitrogen 300,225 kg/hm2 was significantly higher than that of 150 kg/hm2 ; there had no obvious difference of yield in the treatments of 135, 160 kg/hm2 ,but significantly higher than that of 100 kg/hm2 ; the yield showed increasing trend by increased use of Potassium app lication; It can imp roved the quality characters of Fumai 2008 by increasing Phosphorus and Potassium, but had no obvious effect. In the test condition, irrigation 2 times, Nitrogen app lication 3∶7, 225 kg/hm2 Nitrogen, 135 kg/hm2 Phosphorus and 75 kg/hm2 Potassium app lication was the best for grain yield.

【题目】春小麦空间诱变SP2代SSR标记变异分析
【中文关键词】空间诱变;春小麦;SSR 分子标记
【英文关键词】rice ;new mat rix disk seedling ;yield ;quality
【中文摘要】为了考察空间搭载对小麦的诱变效果,以实践八号育种卫星搭载的小麦品系为试材,对SP2 的DNA 分子标记突变频率进行分析。结果表明:12 对SSR 引物共扩增出3 种突变类型:扩增片段增多、扩增片段减少和扩增片段长度有差异。出现的单一突变类型居多,在同一品系的个体上同时出现多类型突变的情况很少。突变频率在供试的品系之间以及SSR 染色体位点都存在差异。该研究又以7 个EST2SSR 标记对上述SP2个体的扩增结果显示,与一般的SSR 位点相比,EST2SSR 标记检测到的突变类型单一,仅有“扩增片段增多”一种类型,且突变频率普遍较低,大部分基因位点无突变发生。表明空间搭载对小麦基因组产生的诱变主要发生在重复序列区,基因表达区相对较少。
【英文摘要】Comparison of new mat rix (rice husk) disk seedling (NMDS) and conventional soil seedling (cont rol)was investigated by using of Longjing 18 in Xinhe village in Qiqihar city. The result s showed that the seedlingquality was better in NMDS than that of the cont rol ,especially rooting capacity ,which could promote seedlinggrowth af ter t ransplanting1Otherwise ,yield in NMDS was slightly higher than that of the cont rol ;quality t rait sin NMDS were slightly bet ter than that of the cont rol1 Therefore ,NMDS was better than soil seedling , andcould replace soil seedling for rice cultivation as a new seedling technology1

【题目】小麦空间环境与60Co-γ辐射诱变效应的比较研究
【中文关键词】小麦;诱变育种;空间环境诱变; 60Co2γ辐射诱变;诱变效应
【英文关键词】Wheat;Mutation breeding; Space environment; 60Co2γ irradiation;Mutagenic effects
【中文摘要】以12份小麦品种(系)为材料,分别经“实践八号”返回式卫星空间环境诱变和200 Gy 60Co2γ辐射诱变处理,以未经任何处理的相同材料为对照,研究了以上两种诱变方式对小麦的诱变效应。结果表明: ①空间环境诱变对所有参试材料在诱变方向和突变体类型上表现出多样性; 60Co2γ辐射诱变则对某些基因型的小麦材料表现出诱变方向上的倾斜。

②空间环境诱变对诱变当代植株的生理抑制小于常规剂量的60Co2γ辐射诱变,获得稳定株系所需的世代数低于60Co2γ辐射诱变;就小麦而言,空间环境诱变获得的诱变率低于60Co2γ辐射诱变,但有益突变所占比例相对较高,有利于小麦突变体材料及品种的选育。③能够通过不同材料对60Co2γ辐射诱变的相对敏感性和突变频率来预测空间环境诱变的相对敏感性和突变频率,可选择地面上表现为高敏感的材料做空间环境诱变之用,可能获得较好的诱变效果。本研究结果对于开展小麦航天育种实践工作具有一定的指导意义。

【英文摘要】In order to compare the mutagenic difference between space environment and 60Co-γ irradiation, 12 accessions of wheat varieties (lines) were treated with space environment by space flight ‘ ShiJ ian No. 8 ’ and 60Co-γ ray irradiation. Then the first and second genera-tions of treatmentswere p lanted and observed on agronomic characters. The results showed: (i)Mutational direction and types in all ofmate- rials in space environment treatment were diversified; 60Co-γ irradiation could induce a partial mutational direction in some special genotypes. (ii) The physiological damage of space environmentwas less than that of 60Co-γ irradiation, so itwould take less generations to make the p rogenies stable. Although the mutational frequency of space environmentwas lower than that of 60Co-γ irradiation, the usefulmutation obtained from space environmentwas relativelymore than that from 60Co-γ irradiation, making it easier to obtain idealwheatmutants or cultivars. (iii) Some materials sensitive to 60Co-γ irradiation could be selected and used for space breeding. The results in the p resent study could p rovide useful information forwheat space breeding in the future.

【题目】实践八号卫星飞行环境中不同因素对小麦的诱变效应
【中文关键词】小麦; 空间飞行; 宇宙射线; 微重力; 生物损伤; 诱变效应
【英文关键词】Wheat; Spaceflight; Cosmic rays; Microgravity; Biological damage; Mutagenic effect
【中文摘要】以实践八号育种卫星1×g 离心机、铅屏蔽室和卫星舱内同时搭载处理的3个小麦品种为材料, 分别分析同一飞行环境下空间辐射、空间微重力和空间综合环境作用对小麦的损伤特点, 比较研究其对小麦品种的诱变效应。结果表明, 空间综合因素处理抑制了小麦轮选987 和新麦18 当代(SP1 代)的苗期生长, 而对周麦18 没有显著影响, 空间辐射单因素处理只对轮选987 有显著的抑制作用, 而空间微重力对3 个品种的抑制作用都不显著; 成熟后3 种处理对各农艺性状的影响都不存在显著差异。3个小麦品种SP2 代均出现株高、穗长、千粒重等多种表型性状突变; 轮选987 和新麦18 都表现空间综合环境因素诱发的突变频率高于其他2 个单一因素, 而空间微重力的突变效应最小。在新麦18 空间综合因素处理的群体中, 还发现了叶片条纹状白化突变体(0.48%)并可以遗传到后代。上述结果证实, 在空间条件下宇宙射线和微重力的共同作用具有累加的效应, 宇宙射线是产生变异的主要因素, 空间微重力的单独作用也可以导致变异的产生。

【英文摘要】Space environment mainly consisted of cosmic rays and microgravity is a kind of complicated mutagen, and has been used for plant mutation induction and breeding. In the recoverable satellite Shijian-8 that was launched for breeding purpose on September 9, 2006, seeds of three wheat (Triticum aestivum L.) cultivars, Lunxuan 987, Xinmai 18, and Zhoumai 18, were loaded.In the 1×g centrifuge, 300 seeds of each variety were treated with space cosmic rays (CR-E), and in the lead screen container and the satellite capsule, 500 seeds of each cultivar were treated with microgravity (Mg-E) and comprehensive factors of space environment(SPc-E), respectively. The treated seeds were germinated at room temperature and transplanted in the field after vernalization,the inhibition effects of the three treatments were evaluated and the mutagenic effects on wheat were compared. In the SPc-E treatment, growth of seedlings was significantly inhabited in the first generation (SP1) of Lunxuan 987 and Xinmai 18,whereas no significant effect was observed in the seedling growth of Zhoumai 18. In the CR-E treatment, only the growth of Lunxuan 987 seedlings was significantly inhibited. The Mg-E treatment had no significant effect on seedling growth in all the three cultivars. No significant variations were detected in main agronomic traits in the SP1 generation. In the SP2 generation, there were obvious mutations in phenotypes of the three cultivars, such as plant height, spike length, and thousand-grain weight. In Lunxuan 987 and Xinmai 18, the highest mutation frequency was observed in the SPc-E treatment, followed by the CR-E reatment,and the lowest mutation frequency in the Mg-E treatment. A novel inheritable mutant of striated-albino leaf, with the frequency of 0.48%, appeared in the SP2 population of Xinmai 18 under the SPc-E condition. Among the three treatments, comprehensive factors of space environment induced the most frequent mutations of wheat, indicating the synergistic effect between cosmic rays and microgravity, while the single effect of microgravity was much lower

than that of cosmic rays.

【题目】高能混合粒子场诱发的小麦矮杆突变体的SSR分析
【中文关键词】小麦;混合粒子场;7射线辐照;矮杆突变体;SSR
【英文关键词】wheat;mixed particle field(CR);7一rays iradiation;dwarf mutant;SSR
【中文摘要】为了研究高能混合粒子场(cR)和7射线两种不同处理方法诱变小麦产生的具有相同表型的突变体之间的分子差异,选用随机分布于小麦21对染色体上的114对微卫星(SSR)引物,对CR和7射线处理冬小麦品种ZY9和ZH7获得的矮杆突变体M 代进行SSR分析。结果表明,CR处理产生的蟹杆突变体的多态性位点主要分布在染色体2A、2B、2D、3D和5A上,而7射线处理产生的矮杆突变体的多态性位点主要分布在染色体2A、2B、2D、4A和5A上;与7射线处理相比,CR处理较容易

产生扩增条带的增加和扩增条带长度的差异,不易产生扩增条带的缺失。序列分析表明,CR处理产生的变异主要是碱基的置换和插入,其中碱基T为易发生突变的碱基。CR诱变能够在DNA水平上导致小麦遗传物质变异,其诱变机制不同于7射线,是一种有效的诱发突变新途径。

【英文摘要】M3 dwarf mutants derived from both mixed particle field(CR)and 7一rays irradiation in winter wheat varieties ZY9 and ZH7 were used to compare the DNA molecular diferences of two induced mutagenesis by SSR polymorphism analysis.1 14 sets of SSR markers randomly distributed over the 21 chromosomes of wheat were included.The results showed that the SSR polymorphic loci mostly distributed in chromosomes 2A,2B,2D,3D and 5A of the M3 dwarf mutants induced by CR;but in chromosomes 2A ,2B,2D,4A and 5A by 7一rays in wheat varieties ZY9 and ZH7.Compared to the 7一rays iradiation,more DNA fragments and change of molecular weight could be induced in the mutants derived from CR iradiation in ZY9 and ZH7,but less band lack was found in M3 dwarf mutants derived from CR iradiation.Sequence analysis showed that base substitution and insertion were the main mutation types induced by CR iradiation,and base T might be the hotspot base to mutation.It was concluded that CR iradiation could result in DNA variation of wheat and could be a new efective approach for crop mutatiOn breeding.

【题目】实践八号育种卫星搭载植物种子的空间辐射剂量分析

【中文关键词】实践八号卫星;空间辐射;植物种子;CR239 ;核径迹;LiF 热释光片

【英文关键词】Shijian28 satellite ; space radiation ; plant seed ; CR39 ; nuclear track ; thermoluminescence dosemeter (TLD)

【中文摘要】为了探明植物种子在空间搭载后发生一系列改变的原因,尤其是探寻空间辐射与突变发生的内在关联,设计了“ 照相定位 ”实验法,采用CR239 固体核径迹探测器来探测空间重离子,并利用空间重离子径迹与植物种子的相对位置,来确定被重离子击中的种子及其击中部位;同时用LiF 热释光片测量种子所受的较低LET 空间辐射的剂量。结果表明“ ,照相定位 ”法简便易行,经济实用,并极大地缩短镜下分析时间;最终测得空间重离子注量率为4144 个Pcm2 · d ,种子所受较低LET 空间辐射的平均剂量为4179mGy。

【英文摘要】In order to identify cause of mutagenesis of plant seeds induced by space flight , especially to ascertain the interrelation between space radiation and mutagenesis , a “ photograph location ” experimental setup was designed in this study.CR239 solid2state nuclear track detectors were used to detect space heavy particles. The plant seeds and their position hit byspace heavy ions were checked based on relative position between track and seeds in the setup. The low LET part of the spectrum was also measured by thermoluminescence dosemeter (TLD ,LiF) . The results showed that the “ photograph location ” experimental method was convenient , practicable and economical . This new method also greatly saved time for microscopical analysis. On Shijian28 satellite , the average ion flux of space heavy ions was 4144 ionsPcm2 · d and the average dosage of low LET space radiation to the plant seeds was 4. 79 mGy.

【题目】我国作物航天育种2O年的基本成就与展望

【中文关键词】作物;航天育种;新品种;突变种质;发展战略

【英文关键词】crop;space breeding;new variety;mutan t germplan sm;development strategy

【中文摘要】航天育种是我国科学工作者开创的农作物诱变遗传改良的一种有效新途径。经过20年的探索发展,已建立了全国航天育种研究协作网,航天育种研究工作取得了可喜的成果:在水稻、小麦、棉花、青椒、番茄、芝麻、牧草等作物上育成和审定了40多个高产、优质、多抗的农作物新品种,并开始在农业生产中发挥作用;获得了一批有可能对产量和品质等重要经济性状有突破性影响的罕见突变;航天诱变与地面模拟诱变育种技术创新取得显著进展;航天育种技术及其产品的知识产权保护与产业化、航天诱变机理探索等方面研究得到稳步推进。本文系统评述了我国航天育种20年来的基本成就,并根据当前研究和应用形势提出了发展战略。

【英文摘要】Space breeding is a novel efective approach to crop mutational improvement, which was firstly founded by the chinese scientists in 1987.A national collaborative research network has been estab lished and significant achievements have been made during the past twenty years.More than forty new mutant varieties derived from space mutagenesis in rice,wheat,cotton,sweet pepper,tomato,sesame an d alfalfa have been developed,officially released and put into production.A series of useful rare mutan t germplasms which might make a great breakthrough in crop grain yield an d/or quality improvement have been obtained.Technique innovations in space breeding and ground simulation of space environmental factors have been made good progresses.Intelleetive property right protection and industrialization of space mutation techniques an d mutan t varieties,exploration of the mechan ism of space mutation induction have also been stably advan ced. In this paper, the main achievements of crop space breeding in the past twenty years had been reviewed.The perspective development strategies of space breeding were also discussed.

【题目】航天诱变新品种龙辐麦18 的选育

【中文关键词】航天诱变;小麦;蛋白组分;品质特性

【英文关键词】space mutation ;wheat ; protein fraction ; quality property

【中文摘要】比较了航天诱变选育的高产优质抗病新品种龙辐麦18 与亲本龙9424083 在植物学特征和主要农艺性状上的差异。结果表明,龙辐麦18 生育期较其亲本长2d ,株高高511~514cm ,产量构成因子也有不同程度的改善,较亲本增产513 %~614 % ,且差异达到显著水平。龙辐麦18 不仅保留了亲本龙9424083 的主要优良品质,而且增大了抗延阻力和面团面积。在龙辐麦18 DNA 的RAPD 分子标记检测中,60 个引物的多态率为617 % ,与其亲本在OPAQ26、OPP24、OPP22 和OPK215 4 对引物扩增产物上存在多个位点的变异;在低分子量麦谷蛋白亚基基因标记中,发现龙辐麦18 具有1 条1151bp 的特异谱带,该谱带对应的低分子量麦谷蛋白亚基为GluA3e ,这可能是龙辐麦18 较其亲本具有更大抗延阻力和面团面积的原因之一。龙辐麦18 与亲本主要特征特性的对比研究充分证明了航天诱变育种的有效性和可靠性。

【英文摘要】High yield and high quality wheat variety , Longfumai 18 was developed from wheat line Long9424083 by space mutation. There are some differences of morphological and agronomic traits between Longfumai 18 and its parent line2Long 942 4083. Longfumai 18 is two days later in maturity and 511~516cm higher in plant height , the yield of Longfumai 18 is ignificantly increased by 513 %~614 % compared with Long 9424083. On the basis of high quality level of Long 9424083 ,Longfumai 18 is much improved in the maximum resistance and area of extensogram of its dough. To study the DNA polymorphism , 60 pairs of RAPD primers were used to amplify the DNA of Longfumai 18 and Long 9424083 , 617 %of primers showed polymorphism and Longfumai 18 is different fromLong 9424083 in primer OPAQ26 ,OPP24 ,OPP22 and OPK2151 In the detection of a DNA marker for LMW2GS , Longfumai 18 has a specific band of 1151bp while Long 9424083 doesn ’ t have , the band is correspond to GluA3e ,which may be one of the reason why ongfumai 18 has higher maximum resistance and area in extensogram than Long 9424083. Comparative study of Longfumai 18 and Long 9424083 certified that space mutation breeding is effective and relable.

【题目】Biological effects of high energy 7li ion beams implantation on wheat
【中文关键词】无
【英文关键词】7Li ion beam,wheat,biological,mutation
【中文摘要】无
【英文摘要】Dry seeds of four wheat cvs.LX987,XM18,ZH7 and ZY9 were implanted with 7Li ion beam at the doses of 0,10,30,50,100 and 150 Gy with an initial energy level of 43MeV.The effects of damage in M1 generation indicated that 7Li ion beam irradiation could inhibit wheat seedling growth effectively.The inhibition effects exhibited dose dependent tendency with a peak of 50Gy,and then decreased with further dose increase.Phenotypic variations such as chlorophyII deficiency of midrib,split leaf,curly leaf and tufted seedling etc.were observed in M1 generation.In the M2,mutation frequencies observed in two cvs.ZH7 and ZY9 ranged from 0.49% to 2.23%.Mutants with altered plant height,spike type etc. were selected in M2 generation.The relationship between mutation frequency and dose in the M2 was identical with that of inhibition and dose in M1 generation.The optimum dose of wheat irradiation by 7Li ion beams appears to be about 50Gy,which is obviously lower than that of gamma ray irradiation.

【题目】春小麦航天诱变入选后代的变异研究
【中文关键词】航天诱变;小麦;性状变异;高分子量麦谷蛋白亚基;醇溶蛋白电泳图谱
【英文关键词】space mutation ; wheat ; character variance ; HMW2GS; gliadin profiles
【中文摘要】本文介绍了小麦纯系克498 和龙0657 航天诱变第2 代(SP2) 和第3 代(SP3) 的入选与决选情况,SP2 和SP3 代主要农艺性状的变异,SP3 代决选株籽粒高分子量麦谷蛋白亚基(HM2GS) 和醇溶蛋白电泳谱带的变异。研究表明: (1) 克498 SP2 和SP3 代的有益变异入选株率和决选株率分别为1102 %、0181 %和2147 %、1139 %; 龙0657 SP2 和SP3 代的有益变异入选株率和决选株率分别为0197 %、0150 %和3177 %、1168 %。(2) 克498 SP2 和SP3 代的入选株主要农艺性状的变异幅度、极值和变异系数与其亲本相比都有很大差异;SP2 代的差异大于SP3 代;克498 SP2 和SP3 代的差异大于龙0657 SP2 和SP3 代的差异。(3) 克498 和龙0657 SP3 代决选株间主要品质性状存在较大差异;0657 SP3 决选株间主要品质性状的差异大于克498 SP3 代决选株。(4) 克498 和龙0657 SP3 代HMW2GS 组成的变异频率分别为813 %和2811 %。(5) 克498 和龙0657 SP3 代醇溶蛋白电泳谱带变异频率分别为4518 %和5010 %。
【英文摘要】This paper described selection and main agronomic traits variation of space induced mutants of wheat lines Ke 498 and Long 0657 in SP2 and SP3 , as well as variation of HMW2GS and gliadin profiles of selected lines in SP3 . Results showed :(1) percentage of field selected plants and final selected plants on Ke 498 in SP2 and SP3 generation are 1102 % , 0181 % and2147 % , 1139 % ,respectively , while that on Long 0657 are 0197 % , 0150 % and 3177 % , 1168 % ,respectively. (2) There are great differences between SP3 selection lines and its induced donor Ke 498 on variance range , extremum and CV %of main agronomic traits , the traits diversity in SP2 is bigger than that in SP3 . The trait differences between SP2 and SP3 for Ke 498 are larger than that for Long 0657. (3) There are bigger diversity of main quality characters in final selected plant for Ke 498 and Long 0657. The quality diversity among final selected lines in SP3 for Long 0657 is greater than that for Ke 498. (4) Variancefrequency of HMW2GS on Ke 498 and Long 0657 in SP3 are 813 % and 2811 % , respectively. (5) Variance frequency of gliadin bands on Ke 498 and Long 0657 in SP3 are 45. 8 %and 50. 0 % , respectively.

【题目】7Li离子束注入小麦干种子诱发M1代变异的SSR分析
【中文关键词】小麦; 7Li 离子束; 变异; SSR 分析
【英文关键词】Wheat ; 7Li ion beam ; Variation ; SSR analysis
【中文摘要】为了探讨7Li 离子束处理对植物种子的诱变效应,以冬小麦品种新麦18 和轮选987 的干种子为试验材料,研究了7Li 离子束处理对小麦幼苗生长和M1 代基因组DNA 变异的影响。结果表明,7Li 离子束处理虽然对小麦干种子的发芽率和幼苗根的生长无显著影响,但对幼苗高度影响极显著,而且20 Gy 剂量的7Li 离子束就可使幼苗高降低到对照的一半左右。SSR 分析表明,7Li 离子束可明显诱发小麦M1 代基因组DNA SSR 带型的变化。两个品种各处理间的平均多态性频率都达到了13.1%,且多态性片断的类型以扩增片断的增加和缺失为主。以上结果表明,7Li 离子束处理小麦种子具有较高的生物损伤效应,可以造成DNA的变异,从而有可能产生可遗传的变异。
【英文摘要】Dry seeds of two wheat cultivar s Xinmai18 and Lunxuan987 were implanted by different doses of 7Li ion beam to st udy t he effect s on seedling growt h and DNA variation in M1 neration. The result s showed t hat 7Li ion beam implantation into wheat seeds can significantly affect seedling height , while no significant effect on germination rate and root growt h. The 20 Gy dose of 7Li ion beam implantation could make the seedling height about 50 % shorter t han t he cont rol . The bands of SSR were greatly changed and t he average polymorp hic f requency was bot h 13. 1 % in two wheat cultivars implanted by different doses of 7Li ion beam. The polymorp hic pat terns were mainly t he increase or deletion of amplified f ragment s. It was concluded t hat high biological damage effect s and DNA variations could be induced by 7Li ion beam implantation , which could result in the hereditable variation in t he later eration.

【题目】Analysis of classification margin for classification accuracy with applications
【中文关键词】分类器集成
【英文关键词】Classi fi er ensemble
Classi fi cation margin
Bagging
Optimal bound
【中文摘要】分类器集成分析及应用
【英文摘要】Classi fi cation margin is commonly used for describing the classi fi cation capability of a committee of classi fi ers. In this paper, we study the relation between classi fi cation margin and misclassi fi cation error, focusing on exploring useful information about misclassi fi cation error from the known classi fi cation margin. We propose a max – min type bound concerning the minimal misclassi fi cation rate, and presentsome useful properties. Finally, we seek the way to improve classi fi cation performance by incorporating the classi fi cation margins, and devise an algorithm for improving average classi fi cation accuracy based on the proposed bound. Experimental results show the effectiveness of the proposed algorithm and also validate our analytic results.

【题目】A weighted subspace approach for improving bagging performance
【中文关键词】分类器整体;概率方法;分类;优化
【英文关键词】bagging; classifier ensemble; probabilistic methods; classification; optimization
【中文摘要】加权空间方法提高分类性能
【英文摘要】Baggingis an ensemble method that uses random resampling of a dataset to construct models. In classification scenarios, the random resampling procedure in bagging induces some classification margin over the dataset. In addition, when perform bagging in different feature subspaces, the resulting classification margins are likely to be diverse. We take into account the diversity of classification margins in feature subspaces for improving the performance of bagging. We first study the average error rate of bagging, convert our task into an optimization problem for determining some weights for feature subspaces, and then assign the weights to the subspaces via a randomized technique in classifier construction. Experimental results demonstrate that our method is able to further improve the classification accuracy of bagging, and also outperforms several other ensemble methods including AdaBoost, random forests and random subspace method.

【题目】Augmented tree partitioning for interactive image segmentation
【中文关键词】图像分割、扩充树、动态规划
【英文关键词】Image segmentation; augmented tree; dynamic programming
【中文摘要】扩充树分区实现交互式图像分割
【英文摘要】In this paper, we propose a new fast semi-supervised image segmentation method based on augmented tree partitioning. Unlike many existing methods that use a graph structure to model the image, we use a tree-based structure called the augmented tree, which is built up by augmenting several abstract label nodes to the minimum spanning tree of the original graph. We then model image segmentation as the partitioning problem on the augmented tree. Dynamic programming is used to efficiently solve the optimization problem. Experimental results show that our method gives competitive segmentation results, and the speed is much faster than graph-based methods.

【英文摘要】In this paper we propose a new distributed learning method called distributed network boosting (DNB) algorithm for distributed applications. The learned hypotheses are exchanged between neighboring sites during learning process. Theoretical analysis shows that the DNB algorithm minimizes the cost function through the collaborative Junctional gradient descent in hypotheses space. Comparison results of the DNB algorithm with other distributed learning methods on real data sets with different sizes show its effectiveness.

【题目】Common hyperspectral image database design
【中文关键词】高光谱数据库 需求导向 平行处理
【英文关键词】Hyperspectral database, Demand-oriented, MVC, Open Source, Parallel processing
【中文摘要】高光谱图像数据库的建立
【英文摘要】This paper is to introduce Common hyperspectral image database with a demand-oriented Database design method (CHIDB), which comprehensively set ground-based spectra, standardized hyperspectral cube, spectral analysis together to meet some applications. The paper presents an integrated approach to retrieving spectral and spatial patterns from remotely sensed imagery using state-of-the-art data mining and advanced database technologies, some data mining ideas and functions were associated into CHIDB to make it more suitable to serve in agriculture, geological and environmental areas. A broad range of data from multiple regions of the electromagnetic spectrum is supported, including ultraviolet, visible, near-infrared, thermal infrared, and fluorescence. CHIDB is based on dotnet framework and designed by MVC architecture including five main functional modules: Data importer/exporter, Image/spectrum Viewer, Data Processor, Parameter Extractor, and On-line Analyzer. The original data were all stored in SQL server2008 for efficient search, query and update, and some advance Spectral image data Processing technology are used such as Parallel processing in C# ; Finally an application case is presented in agricultural disease detecting area.

【题目】Cost-sensitive boosting algorithms as gradient descent
【中文关键词】boosting; cost-sensitive classification; gradient descent; optimization
【英文关键词】boosting; cost-sensitive classification; gradient descent; optimization
【中文摘要】A daBoost is a well known boosting method for generating strong ensemble of weak base learners. The procedure of AdaBoost can be fitted in a gradient descent optimization framework, which is important for analyzing and devising its procedure. Cost sensitive boosting (CSB) is an emerging subject extending the boosting methods for cost sensitive classification applications. Most CSB methods are performed by directly modifying the original AdaBoost procedure. Unfortunately, the effectiveness of most cost sensitive boosting methods are checked only by experiments. It remains unclear whether these methods can be viewed as gradient descent procedures like AdaBoost. In this paper, we show that several typical CSB methods can also be view as gradient descent for minimizing a unified objective function. We then deduce a general greedy boosting procedure. Experimental results also validate the effectiveness of the proposed procedure

【题目】Learning distance metric for semi-supervised image segmentation

【中文关键词】Semi-supervised; image segmentation; distance metric learning

【英文关键词】Semi-supervised; image segmentation; distance metric learning

【中文摘要】Semi-supervised image segmentation is an important issue in many image processing applications, and has been a popular research area recently, the most popular are graph-based methods. However, parameter selection in these methods is still largely heuristic. In this paper, we introduce distance metric learning into graph-based semi-supervised segmentation to automatically obtain good results for images with different appearances. We first derive the optimization problem with respect to the distance metric as well as the segmentation labels, and use gradient descent method to find a local optimum solution. Experiments on general images and the fungal disease analysis application have shown that our method provides a steady performance under casual user annotations and different image appearances.

【题目】Localized content-based image retrieval using multiple instance active learning

【中文关键词】无

【英文关键词】Image processing

【中文摘要】无

【英文摘要】In this paper, we propose two general multiple instance active learning (MIAL) algorithms, multiple-instance active learning with a simple margin strategy (S-MIAL) and multiple- instance active learning with fisher information (F-MIAL), and apply them to the relevance feedback in localized content based image retrieval (LCBIR). S-MIAL considers the most ambiguwww.lw20.comous picture as the most valuable one, while F-MIAL can utilize the fisher information and analyze the value of

the unlabeled pictures by assigning different labels to them. We show that F-MIAL can be integrated more naturally into the multiple instance learning scenario. In experiments, we will show their superior performances on some real-world image datasets.

【题目】Natural Colour Reproduction in the Diagnosis of Plant Diseases and Insect Pests
【中文关键词】无
【英文关键词】COLOUR REPRODUCTION DIAGNOSIS PLANT DISEASES
【中文摘要】无
【英文摘要】For a reliable diagnosis of plant diseases and insect pests,it is very important to reproduce the original colour of the object.But it is not certain by conventional colour imaging systems.Natural colour system is capable of reproducing the original colour of objects using multispectral images. In this paper a natural colour reproduction system for the diagnosis is presented.The images of the cucumbers' leaves are captured under the illumination of incandescent lamp by the narrow- band multispectral system and reproduction on a display device.For accurate colour reproduction the spectral reflectance of plant diseases and insect pests is calculated using Spline Interpolation in the process.In the experiment,it is confirmed that the system realizes good accuracy in the colour reproduction of plant diseases and insect pests from 14 narrow bands multispectral image.

【题目】基于高光谱成像和判别分析的黄瓜病害识别
【中文关键词】高光谱成像技术 黄瓜病害 逐步判别 典型判别
【英文关键词】Hyperspectral imaging technique; Cucumber diseases; Stepwise discriminate; Canonical discriminate
【中文摘要】利用光谱成像技术(400~720 nm)识别黄瓜白粉病、 角斑病、 霜霉病、 褐斑病和无病区域。 构建高光谱图像采集系统进行样本图像的采集, 预处理和光谱信息的提取。 由于获得的原始光谱数据量很大, 为了减少后续运算量, 提高准确率, 采用逐步判别分析和典型判别分析两种方法进行降维。 逐步判别从55个波段中选择12个波段, 典型判别从55个波段中提取2个典型变量。 利用选择的光谱特征参数建立病害识别模型。 逐步判别构建的模型对训练样本和测试样本的判别准确率分别为100%和94%, 典型判别构建的模型对训练样本和测试样本的判别准确率均为100%。 说明利用高光谱成像技术可以进行黄瓜病害的快速、 准确识别, 并为实现可见光谱范围内黄瓜病害的田间实时在线检测提供了可能。
【英文摘要】Hyperspectral imaging(400-720 am) and discriminate analysis were investigated for the detection of normal and dis eased cucumber leaf samples with powdery mildew (Sphaerotheca fuliginea). angular leaf spot (Pseudomopnas syringae). downy mildew(Pseudoperonospora cubensis), and brown spot(Corynespora cassiicola). A hyperspectral imaging system was established to acquire and pre-process leaf images. as well as to extract leaf spectral properties. Owing to the complexity of the original spectral data. stepwise discriminate and canonical discriminate were executed to reduce the numerous spectral information. in order to decrease the amount of calculation and improve the accuracy. By the stepwise discriminate we selected 12 optimal wavelengths from the original 55 wavelengths. and after the canonical discriminate. the 55 wavelengths were reduced to 2 canonical variables. Then the discriminate models were developed to classify the leaf samples. The result shows that the stepwise discriminate model achieved classification accuracies of 100% and 94% for the training and testing sets. respectively. For the canonical model, the classification accuracies for the training and testing sets were both 100%. These results indicated that it is feasible to identify and classify cucumber diseases using

hyperspectral imaging technology and discriminate analysis. The preliminary study, which was clone in a closed room with restrictions to avoid interference of the field environment. showed that there is a potential to establish an online field application in cucumber disease detection based on visible spectroscopy.

【题目】基于彩色数字相机的光谱反射率重建方法研究
【中文关键词】光谱反射率重建 神经网络 基向量 非线性
【英文关键词】Spectral reflectance reconstruction; Neural network; Basis vectors; Nonlinearity
【中文摘要】如何在给定照明条件和观测条件的情况下,由彩色数字相机的响应值重建物体表面光谱反射率,仍是颜色科学与工程领域一个尚待解决的重要课题。文章使用奇异值分解的方法将光谱反射率近似为若干基向量的线性组合,求得组合系数,然后使用相机输出数据与组合系数训练人工神经网络,使之能够准确的模拟相机输出与组合系数之间的非线性关系,最后采用经训练的神经网络,与基向量结合,由相机输出准确的重建物体表面的光谱反射率。实验结果显示,与线性近似的方法相比,使用该方法对标准Munsell色块进行反射率重建,重建误差减小了约67%,具有高精度、易实现、易操作的特点,可用于对重建精度要求较高的诸多领域。
【英文摘要】It is still challenging to reconstruct the spectral reflectance of a surface using digital cameras under given luminance and observation conditions. A new approach to solving the problem which is based on neural network and basis vectors is proposed. At first, the spectral reflectance of the sample surface is measured by spectrometer and the response of an digital camera is recorded. Then the reflectance is represented as a linear combination of several basis vectors by singular value decomposition (SVD). After that, a neural network is trained so that it is able to approximate the relationship between the camera responses and the coefficients of basis vectors accurately. In the end, the spectral reflectance can be reconstructed based on the neural network and basis vectors. In the present paper, the authors reconstructed the spectrum reflectance based on neural network and basis vectors. Compared with other traditional methods, neural network expands the space of unknown function F(S) from linear functions to more general nonlinear functions, which gives more accurate estimation of the coefficients a(k) and better reflectance reconstruction. Results show that the reflectance of standard Munsell color patch (Matte)can be reconstructed successfully with mean of RMS which is 0.023 4. Compared with linear approximation method, reconstruction of standard Munsell color patch (Matte)using this approach reduces the reconstruction error by 67%. Since the neural network can be implemented by Matlab neural network toolbox, this method can be easily adopted in many other cases. Therefore we conclude that this approach has advantages of higher accuracy, easy implementation and adaptation, thus can be used in many applications.

【题目】常见黄瓜病害的多光谱诊断
【中文关键词】多光谱成像技术 光谱分析技术 黄瓜病害
【英文关键词】Multispectral imaging technique; Spectroscopy analysis technique; Cucumber diseases
【中文摘要】为了实现可靠的植物病虫害诊断,文章提出把光谱分析技术和多光谱成像技术相结合的方法用于常见的红粉、黑星、白粉、褐斑和霜霉五种黄瓜病害的识别研究。实验采用窄带多光谱成像技术在标准观测环境下获取患病黄瓜叶面的14个可见光通道和近红外通道、全色通道的多光谱图像。利用距离法、光谱角度匹配法和相关系数法对病斑样本的

光谱信息进行学习分类。对于实验提出的七种分类情况,通过距离法和相关系数法组合筛选,对红粉、白粉、黑星和白板的分类正确率达100%,对霜霉及无病的分类正确率达80.00%和93.33%,平均分类正确率为81.90%。实验结果表明,光谱分析方法和多光谱成像技术结合能全面、快速、精确提取植物病害的信息,实现分类,为对植物病害进行快速、准确和非破坏性诊断提供技术支持。

【英文摘要】For a reliable diagnosis of plant diseases and insect pests, spectroscopy analysis technique and mutispectral imaging technique are proposed to diagnose five cucumber diseases, namely Trichothecium roseum, Sphaerotheca fuliginea, Cladosporium cucumerinum, Corynespora cassiicola and Pseudoperonospora cubensis. In the experiment, the cucumbers' multispectral images of 14 visible lights channels, near infrared channel and panchromatic channel were captured using narrow-band multispectral imaging system under standard observation environment. And the 5 cucumber diseases, healthy leaves and reference white were classified using their multispectral information, the distance, angle and relativity. The discrimination of Trichothecium roseum, Sphaerotheca fuliginea, Cladosporium cucumerinum, and reference white was 100%, and that of Pseudoperonospora cubensis and healthy leaves was 80% and 93. 33% respectively. The mean correct discrimination of diseases was 81. 90% when the distance and relativity were used together. The result shows that the method realized good accuracy in the cucumber diseases diagnosis.

【题目】一种离散点插值算法用于重建光谱反射率

【中文关键词】光谱学; 光谱反射率重建; 查找表; Delaunay剖分

【英文关键词】spectroscopy; spectral reflectance reconstruction; LUT; Delaunay tessellation

【中文摘要】提出了一种用离散点插值算法来重建光谱反射率的方法。首先建立数字相机响应值与典型反射样品表面光谱反射率之间的查找表,然后进行Delaunay分区、提取和插值,最后通过数字相机的输出数据来准确地重建物体表面的光谱反射率。实验结果表明,该方法能够重建典型反射样品的光谱反射率,能够实时获取被摄场景的多光谱图像,易于硬件的实现。

【英文摘要】A new technique for spectral reflectance reconstruction based on LUT (look-up-table) interpolation method is proposed. The spectral reflectance of the sample surface is measured by spectrometer, and the response of an RGBY digital camera is recorded. Then a LUT is created connecting the camera responses and spectral reflectance of each color chip. After that, the source space is tessellated by Delaunay method, and the neighboring points are extracted so as to calculate the spectral reflectance of the targeted point. In the end, the spectral reflectance can be reconstructed based on the interpolation method. Experimental results show that this approach can obtain the multi-spectral images in real-time so that it can be used in many applications.

【题目】用于植物病虫害诊断的多光谱成像系统

【中文关键词】多光谱成像 光谱反射率 颜色重建 植物病虫害

【英文关键词】Multispectral imaging; Spectral reflectance; Color reproduction; Plant diseases and insect pests

【中文摘要】准确重建被测目标的颜色信息对实现可靠的植物病虫害诊断具有十分重要的意义。文章提出把多光谱成像技术应用于植物病虫害诊断,所采集的多光谱图像可以从光谱维和图像维反映被测目标的特征信息。在此基础上,实验采用16个窄带滤色片、单色面阵CCD、积分球混合光源照明和标准观测环境建立了能进行适时、无损检测的多光谱成像系

统。并利用该设备对Macbeth色卡中8个色卡进行光谱和颜色重建,重建的结果与光谱辐射度计的测量结果进行了比较。通过对光谱匹配角度和CIE标准色差分析,证明这种多光谱成像系统能够准确、稳定地重建出目标的光谱信息和颜色信息。
【英文摘要】For a reliable diagnosis of plant diseases and insect pests, it is very important to reproduce the original color of the object. But it is not certain by conventional color imaging systems. Multispectral imaging techniques are capable of providing additional useful spectral information of common pathological samples using image acquisition. The authors present a multispectral imaging system for the diagnosis. This system uses 16 narrow-band filters, a monochrome CCD camera, and standard illumination environment. Spectral match angle and color difference can be obtained through measurements and analysis of 8 Macbeth color patch using PR-715 spectraScan and multispectral imaging system. In addition, the color image and spectral reflectance of cucumber diseased leaves were reproduced using the multispectral imaging system. In the experiment, it was confirmed that the system realized good accuracy in the color reproduction and spectral reflectance reproduction from a limited number of color bands.

【题目】基于彩色图像颜色统计特征的黄瓜炭疽病和褐斑病的识别研究
【中文关键词】黄瓜 植物病害 彩色图像 颜色 统计特征 定量识别
【英文关键词】Cucumber; Plant disease ; Color image ; Color; Statistical characteristics ; Quantitative discrimination
【中文摘要】为了进行数字化、标准化、无损伤定量识别植物病害,运用数字图像分析技术,对生产中两种常见的黄瓜病害(黄瓜炭疽病和黄瓜褐斑病)进行研究。利用图像的颜色统计特征对来自不同时期的病害样本图像进行分类和识别。采用逐步判别分析,选取显著性较大的特征参量,建立起黄瓜炭疽病、黄瓜褐斑病和无病区域的分类器模型。结果表明,对黄瓜炭疽病、黄瓜褐斑病和无病区域的正确回判率分别达到96.67%,93.33%和100%。测试集中,黄瓜炭疽病、黄瓜褐斑病和无病区域的正确识别率分别达到83.33%,80.00%和100%,说明利用彩色图像颜色统计特征对植物病害进行识别有可行性。[
【英文摘要】Colour image statistical analysis was used to distinguish between cucumber anthracnose (caused by Colletotrichum orbiculare) and cucumber brown speck (Corynespora cassiicola). Colour characteristic parameters obtained for different stages of disease development were used for disease classification and identification. Stepwise discriminant analysis was used to select significant parameters, and the Bayesian classifier method was used to classify regions infected by cucumber anthracnose, regions infected by cucumber brown spot, and healthy regions. The results showed that the accuracy of discrimination of regions infected by cucumber anthracnose, regions infected by cucumber brown spot, and healthy region reached 96. 67, 93.33 and 100.%, respectively. For the test set, the accuracy of discrimination of areas infected by cucumber anthracnose, areas infected by cucumber brown spot, and healthy region reached 83. 33, 80.00 and 100%, respectively. The results showed that it is feasible to identify and classify plant diseases using colour image statistical characteristics.

【题目】基于计算机视觉技术的番茄叶片叶绿素含量的检测
【中文关键词】番茄; 计算机视觉; 叶绿素含量; 颜色特征
【英文关键词】tomato; machine vision; chlorophyll content; color characteristic
【中文摘要】利用计算机视觉技术快速测定叶绿素含量的方法,建立了根据番茄叶片颜色特征确定其叶绿素含量的一元二次拟合模型。在计算机视觉图像采集系统中采集番茄叶片图像,利用MATLAB图像处理工具提取图像的颜色特征参数,对颜色特征参数和番茄功能叶叶绿素含量做相关分析,建立回归模型。结果表明:RGB颜色系统的R/G、(G-R)/(G+R)、G-R、色度坐标r、r-g及HIS颜色系统的H值均与叶绿素含量呈极显著非线性相关,可用于测定番茄叶片叶绿素含量。从建立的6组模型中筛选出拟合度较高的3组模型进行检验,预测误差在0~22.22%之间。用预测精度最高的G-R颜色特征预测叶绿素含量的模型为Chl.a=0.0926+0.1208(G-R)-0.0009(G-R)2,Chl.b=-0.0252+0.0397(G-R)-0.0003(G-R)2和Chl.(a+b)=0.1271+0.1600(G-R)-0.0011(G-R)2。
【英文摘要】The rapid methods detecting chlorophyll concentration by the computer vision technology, and a unary quadratic model to predict chlorophyll content based on color parameters of tomato leaf images have been established in this study. The images

of tomato leaves were taken in the image acquisition system, then the color characteristics were extracted with the MATLAB image processing software. The correlation between color parameters of tomato digital image and chlorophyll content of tomato functional leaf were analyzed by nonlinear regress models. The results showed that the color characteristics such as R/G, (G- R)/(G+ R), G- R, r, r- g in the RGB color system, and H-value in the HIS color system were significantly correlation with chlorophyll content of tomato leaf at P<0.01. Six sets of prediction model were established and among them 3 models with high fitting degree were selected to use. The prediction accuracy of the selected model were tested, and error ranged 0 to 22.22%. According to the determination coefficients and RMSE (root mean square error), G- Rwas the best color characteristic to predict chlorophyll content of tomato leaf. The corresponding models are Chl. a=0.0926+0.1208 (G-A)-0.0009 (G- R) 2, Chl. b=-0.0252+0.0397 (G- R)-0.0003 (G- R) 2 and Chl. (a+b)=0.1271+0.1600 (G- R)-0.0011 (G- R) 2.

【题目】如何利用显微镜简易诊断蔬菜细菌病害
【中文关键词】细菌病害 简易诊断 显微镜 彩色图 蔬菜 致病菌 显微观察 植物病害 田间识别 生产实践
【英文关键词】无
【中文摘要】在生产实践中,基层农民和相关从业人员,对蔬菜细菌病害的田间识别主要是通过发病症状进行诊断,但植物病害的发生是致病菌、寄主和环境的共同作用产物,土壤、温湿度、轮作物等环境条件的差别可能导致病原物积累,发病症状甚至致病菌自身发生变化,这样,一种病害表现的症状就不一而足。单是凭借症状识别细菌病害不准确,容易误诊。在很多时候,人们的传统认识还拘泥在病斑水浸状,流脓,腐烂等就是细菌病害的固定模式中,实际上,这种认识是不科学的。在我们广泛采集标本镜检、鉴定的基础上,我们发现,很多生理性病害也会有细菌病害的常见症状,所以仅仅依靠经验和肉眼观察是不够的,比较可靠的方法是利用显微镜对病部进行显微诊断,根据有无病原细菌菌体溢出(简称“菌溢”,切开感病组织后,组织液中大量繁殖的细菌吸水溢出)来判别细菌病害,这是比较科学的方法,也很简单易行。

【题目】Local Regularized Least-Square Dimensionality Reduction
【中文关键词】EIGENMAPS; MANIFOLDS
【英文关键词】EIGENMAPS; MANIFOLDS
【中文摘要】In this paper, we propose a new nonlinear dimensionality reduction algorithm by adopting regularized least-square criterion on local areas of the data distribution. We first propose a local linear model to describe the characteristic of the low-dimensional coordinates of the neighborhood centered in each data point, and use regularized least-square criterion to evaluate the fitness of the low-dimensional embedding. Next, we form an optimization task similar to the graph Laplacian and efficiently retrieve the solution via eigenvalue decomposition. The relationship between our method and the Laplacian Eigenmaps are discussed, and experimental results are presented.

【题目】原料乳热处理条件对Mozzarella干酪品质的影响
【中文关键词】乳源阿片肽 理化特性 制备和检测 生理功能
【英文关键词】Opioid peptide derived from milk;physical and chemical characters;preparation and determination methods;biological functions
【中文摘要】采用3×3拉丁方试验设计,3个奶酪槽中原料乳热处理条件分别设为未杀菌,63℃(30 min)杀菌,72℃(15 s)杀菌.研究干酪加工中原料乳热处理条件对Mozzarella干酪的品质的影响.结果表明,未杀菌乳制干酪的蛋白水解、硬度及弹性与杀菌乳制干酪的蛋白水解、硬度及弹性值具显著差异(p<0.05),未杀菌乳制干酪的蛋白水解显著增加,弹性及硬度显著降低;63℃(30 min)及72℃(15 s)不同杀菌温度处理的乳制得的干酪之间蛋白水解、硬度及弹性无显著差异;不同热处理乳制干酪之间的融化性和油脂析出性在统计学上无显著差异.
【英文摘要】This study compared the efect of heat treated of row milk on quality of M ozzarela cheese.The cheese making was replicated on 3 diferent d using a 3~3 Latin square design.The condition ofheat treated was set without sterilization,63~(2 30min,72~(2 15s in three vat,The result is the flee oil formation and meltability of the cheese was not afected by heat treated.hardness and springiness of M ozzarela cheese made by milk that without sterilization,significandy decreased.,Proteolysis significandy increased.

【题目】Production of conjugated linoleic acid by propionibacterium freudenreichii
【中文关键词】共轭亚油酸

【英文关键词】"Conjugatedlinoleicacid;
P. freudenreichii;
SLM;
MRS;
Skim-milk
"
【中文摘要】共轭亚油酸
【英文摘要】Two strains each of Propionibacteriumfreudenreichii ssp. shermanii and P. freudenreichii ssp. freudenreichii were tested for their ability to produce conjugatedlinoleicacid (CLA) in sodium lactate medium (SLM), De Man-Rogosa-Sharpe (MRS) medium and skim-milk. Data showed that both strains were able to produce CLA in three media supplemented with different concentrations of sunflower oil. Maximum production of CLA (78.8 μg/ml) was observed after 36 h of incubation in MRS containing 12 mg/ml of sunflower oil by P. freudenreichii ssp. shermanii. Moreover, the growths of both strains were inhibited by sunflower oil and a positive relationship between CLA production and ability to tolerate sunflower oil was observed. At the same time, it was also observed that the inhibitory effects on P. freudenreichii ssp. shermanii and P. freudenreichii ssp. freudenreichii in three media follow the order SLM > skim-milk > MRS and SLM > MRS > skim-milk, respectively. Micro aerobic conditions were in favour of increasing the amounts of CLA. The amounts of CLA increased from 0 to 36 h under micro aerobic conditions and no significant ($p > 0.05$) increases in total CLA levels were observed after 80 h of incubation. Results showed that P. freudenreichii may have potential for producing CLA

【题目】自然酸度下乳蛋白酶解动态分析及其物化特性研究
【中文关键词】" 水解度 三氯乙酸可溶性氮含量 乳蛋白肽 pH值 理化特性
"
【英文关键词】degree of hydrolysis trichloroacetic acid-soluble nitrogen milk-protein peptide pH physico-chemical
【中文摘要】"通过在自然变化pH值和人工调控恒定pH值两种酸度下,四种蛋白酶水解乳蛋白的动态分析及测定前种方法的酶解产物的主要理化特性,特别是苦味特性,以期筛选出低苦味水解酶及水解工艺。以蛋白水解度(DH)和10%三氯乙酸可溶性氮含量(TCA-SN)为指标,比较四种蛋白酶在两种工艺下水解的情况。以溶解度、黏度、苦味和蛋白水解电泳图谱指标研究了自然pH值条件下四种酶解物的理化特性。结果表明:四种蛋白酶分别在两种处理条件下的水解度和可溶性氮含量差异不大;pH未恒定条件下得到的酶解物与乳蛋白相比,在酸性范围内有较大的溶解度;蛋白浓度升高时,黏度变化不大;四种酶解物中Neutrase和木瓜蛋白酶的苦味最强,Protamex的苦味最小;SDS-PAGE电泳表明,两种中性蛋白酶主要水解乳中的酪蛋白。因此可用本研究选用的四种蛋白酶在pH值自然变化条件下酶解乳蛋白,从而简化酶解工艺,并且该酶解物都有较好的理化特性。"
【英文摘要】The dynamic analysis of protease hydrolysis of milk protein in pH naturally changed and controlled conditions was studied and the physico-chemical properties, especially the bitter taste, of hydrolysates with the former method was further investigated to select the right protease for less bitter hydrolysates and the proper hydrolysis technique. The two indexes, degree of hydrolysis and 10% trichloroacetic acid-soluble nitrogen(TCA-SN) content, were used to compare the four kinds of proteolysis in naturally changed pH and controlled conditions. The solubility, viscosity, bitter taste and protein hydrolyzed conditions of the four hydrolysates produced by the pH naturally changed technique were further studied to find their physicochemical properties. The results showed: There is little difference on hydrolysis degree and TCA-SN content between the two techniques; Compared with the milk protein, the hydrolysates show good solubility in acidic condition. Viscosity does not change much with the improvement of concentration. Hydrolysates produced by Novo Neutrase and Papain are the most bitter while by Novo Protamex less bitter. SDS-PAGE showed that the two neutrases mainly hydrolyze milk protein casein. In a word, these four enzymes can be used to hydrolyze milk protein in the naturally changed pH conditions in order to simplify the hydrolyzed process, to give the hydrolysates good properties.

【题目】不同体细胞数牛乳中纤溶酶热变性动力学研究
【中文关键词】HSCC牛乳 LSCC牛乳 纤溶酶 热变性 动力学 表观活化能
【英文关键词】HSCC milk LSCC milk plasmin thermo-inactivation kinetic apparent activation energy
【中文摘要】通过对高体细胞数(HSCC,100万个/ml)和低体细胞数(LSCC,30万个/ml)原料乳中纤溶酶进行65-130℃范围内热处理,探究牛乳体系中纤溶酶热变性动力学规律。结果表明:纤溶酶在热变性过程中显示了典型的一级动力学方程(n=1);经不同热处理后,牛乳中纤溶酶活性均下降;65-85℃范围的巴氏杀菌对纤溶酶活性影响不显著(P〉0.05),超高温灭菌处理对纤溶酶活性影响显著(P〈0.05);HSCC样品在≤110℃范围内的D值都大于LSCC样品,在T=130℃时,HSCC样品的D值为53.76s,LSCC样品D值为58.94s;HSCC和LSCC乳中纤溶酶热失活表观活化能Ea在65-95℃范围内分别为65.76kJ/mol和57.26kJ/mol,在95~130℃范围内分别为22.12kJ/mol和21.48kJ/mol。结论:巴氏杀菌范围内,热处理对牛乳中纤溶酶活性影响不显著,HSCC乳中纤溶酶活性比LSCC乳中的更稳定些;超高温灭菌处理后,两样品中纤溶酶活性明显下降,稳定性无差异。
【英文摘要】The thermo-inactivation kinetic law of plasmin in milk was studied by heating high somatic cell count (HSCC) and low somatic cell count (LSCC) milk at 65 130 , respectively. Results revealed that plasmin inactivation kinetics in milk was in agreement with classic first-order equation. Plasmin activity decreased through heating at different temperatures. No significant difference of plasmin activity was observed after pasteurization at 65 85 (P 0.05), but plasmin activity of either HSCC or LSCC milk exhibited a significant difference through thermal treatments at ultra-high temperatures (P 0.05). The D value (the time for 90% plasmin inactivation) of HSCC milk was larger than that of LSCC milk below 110 ; however, the D-value was determined to be 53.75 s for HSCC milk and 58.94 s for LSCC milk at 130 , respectively. The apparent activation energy (Ea) for HSCC and LSCC milk was 65.76 and 57.26 kJ/mol at 65

95 , 22.12 and 21.48 kJ/mol at 95 130 , respectively. Therefore, no significant difference for plasmin activity is observed in high and low SCC milk with low temperature treatments (65 85) through pasteurization. Moreover, HSCC milk shows a higher stability than LSCC milk. In contrast, both HSCC and LSCC milk exhibit an obvious decrease in plasmin activity and no difference in thermostability through ultra-high temperature treatments.

【题目】离心条件对冻干菌株存活率影响的研究
【中文关键词】嗜酸乳杆菌 离心 冻干 存活率
【英文关键词】Lactobacillus acidophilus centrifugation freez drying survival rate
【中文摘要】选择酶解乳清培养基为离心基质,研究了不同的离心条件对于冻干后活菌存活率的影响,确定了冻干后活菌存活率最高的适宜离心条件。结果表明:在8000r/min、10min条件下离心的活菌存活率最高;在4000r/min,10min条件下离心的活菌冻干存活率最高,贮藏期内的损失最小,益生菌冻干制剂的活菌数高;离心温度对于活菌离心存活率的影响不显著。
【英文摘要】The effect of centrifugation conditions (speed, duration, temperature) on the survival rates of Lactobacillus acidophilus was studied. Whey hydrolysate was chosen to be the centrifugation medium. Results indicated that Lactobacillus acidophilus concentrated at 8000r/min for 10min displayed the best survival rate in the period of centrifugation but a better survival rate at 4000r/min for 10min in both freezing and frozen storage.The freeze-dried powder of Lactobacillus acidophilus showed the highest cell viability when concentrated at 4000r/min for 10min.Temperature didn't significantly influence the survival rate in the period of centrifugation.

【题目】再制干酪物化特性及加工工艺的研究
【中文关键词】"再制干酪,物化特性,加工工艺,正交实验
"
【英文关键词】"processed cheese;physicochemical properties;processing technology;orthogonal experiment
"
【中文摘要】经过L16(45)正交实验设计,对制作出的再制干酪进行水分、pH、熔化性、油脂分离度的测定,并且对其进行感官评价。利用流变仪,测定再制干酪在降温过程中黏度值变化,初步确定了再制干酪适宜的灌装温度。结果表明,加水量对再制干酪水分和油脂分离度的影响极显著(P<0.01),乳化盐添加量对产品最终pH的影响极显著(P<0.01),乳化温度对熔化性的影响极显著(P<0.01)。对黏度的影响大小顺序为乳化盐>原料>乳化速度>乳化温度>加水量。再制干酪适宜的灌装温度为45℃左右。
【英文摘要】According to orthogonal experimental design L16(45),the moisture,pH,meltability and oil separation index of processed cheese were tested,also including sensory evaluation. Canning temperature of processed cheese when mensurating viscosity changes with the cooling of cheese were confirmed preliminarily using a rheometer. The results indicated:Adding water significantly affected the moisture and oil separation index(P<0.01) Emulsify salts affected the pH of final products significantly(P<0.01). Cooking temperature significantly affected meltability(P<0.01). As for the influence on viscosity,emulsify salts>raw material>auger speed>cook temperature>adding water. 45℃ was the most suitable canning temperature for processed cheese

【题目】酪蛋白肽及其水相肽、醇相肽功能特性的研究
【中文关键词】酪蛋白肽 苦味肽 理化特性 生理活性
【英文关键词】"casein peptide bitter peptide physicochemical property biological activity
"
【中文摘要】用Alcalase碱性蛋白酶水解酪朊酸钠制备酪蛋白肽,并用异丁醇萃取获得有强烈苦味的醇相肽和无苦味的水相肽。分别对酪蛋白肽及其水相肽、醇相肽进行了功能特性的研究。结果表明:在2。11的广泛pH值范围内,三样品的溶解性都较好。乳化性、乳化稳定性及起泡性、泡沫稳定性都极显著低于酪朊酸钠(p〈0.01)。水相肽与醇相肽相比:前者对超氧阴离子自由基和羟自由基的清除率较高,对假单胞菌、金黄色葡萄球菌、大肠杆菌、藤黄微球菌的抑制作用较强;而后者对DPPH自由基的清除和在亚油酸体系中抗氧化能力较大,对枯草芽孢杆菌的抑制作用较强。酪蛋白肽及其水相肽、醇相肽都能抑制血管紧张转换素酶(ACE)活性,其中水相肽的抑制率最高。由于具有阿片活性的酪啡肽β-Casomorphin-5、β—Casomorphin-7均为平均疏水度较高的小肽,因此两种肽大部分存在于醇相萃取的肽组分中,而水相中含量较少。
【英文摘要】Lactobacillus casei Zhang is a novel strain that was screened out of koumiss collected in Inner Mongolia, and our previous research showed that L. casei Zhang has health benefits such as cholesterol-reducing and immunomodulating effects. The fermentation characteristics of L. casei Zhang in soymilk and bovine milk and the transit tolerance of L. casei Zhang in fermented milk products during refrigerated storage for 28 d were assessed. A faster decrease in pH and faster growth of L. casei Zhang during fermentation were observed in soymilk compared with bovine milk at various inoculation rates, probably because of the low pH buffering capacity of soymilk. The fermented bovine milk samples had much higher final titratable acidity (TA) values (between 0.80 and 0.93%) than the soymilk samples (between 0.40 and 0.46%). Dramatic increases in TA values in the fermented soymilk samples during storage were observed, and the TA values of the fermented soymilk samples changed from <0.56% to values between 0.86 and 0.98%. On the other hand, only slight increases in TA were observed in the bovine milk samples during the 28 d of storage. The survival rates of freshly prepared cultures of L. casei Zhang in simulated gastric juice at pH 2.0 and 2.5 were 31 and 69%, respectively, and the delivery of L. casei Zhang through fermented soymilk and bovine milk significantly improved the viability of L. casei Zhang in simulated gastric transit. Lactobacillus casei Zhang showed good tolerance to simulated gastric juice and intestinal juice in the fermented soymilk and bovine milk samples, and maintained high viability (>10(8) cfu/g) during storage at 4 degrees C for 28 d. Our results indicated that both soymilk and bovine milk could serve as vehicles for delivery of probiotic L. casei Zhang, and further research is needed to elucidate the mechanism of the change in pH and TA of L. casei Zhang in fermented milk samples during fermentation and storage and to understand the difference between soy- and milk-based systems.

【题目】植物果聚糖合成酶基因克隆及功能分析
【中文关键词】果聚糖;非生物胁迫;基因工程
【英文关键词】Fructan ; Abiotic stress; Gene cloning
【中文摘要】果聚糖是蔗糖来源的果糖多聚体,其类型常因聚合度的多寡、分支结构有无、相邻果糖基成键差异及葡萄糖位置不同而多种多样。果聚糖不仅是植物储存非结构性碳水化合物的形式之一,而且在干旱、低温等非生物胁迫中具有保护植物细胞免受伤害的作用。果聚糖作为一种益生素,对人体健康具有保健作用,有效减少或避免结肠癌、心血管疾病及骨质疏松等发病机率。就果聚糖的存在形式、生物合成代谢途径、果聚糖合成酶基因克隆和转化等研究做一介绍,并对植物中FBEs结构特点进行了讨论,同时对小麦中FBEs基因的拷贝数、染色体定位及亚细胞定位等研究进行了讨论,为从更多植物中分离FBEs基因,研究FBEs基因的作用方式和表达特性,以及利用转基因技术提高重要作物抗逆性奠定基础。
【英文摘要】Fructans play important roles not only as a carbon source but also as agents protecting high plants against abiotic stresses such as water deficit and low temperature. Moreover, they are also utilized as a probiotics in human diets, as low-calory sweeteners and are digested in the lower gut. Some related studies on fructan including its presence, biosynthesis or degradation pathway, encoding genes cloning and transformation were reviewed in this article, and the sequence features of fructan biosynthesis enzyme genes (FBEs) are also analyzed to clone the genes from more plants, study their function and expression one by one, and improve fructan accumulation in some important crops by gene engineering.

【题目】空间搭载高产葡萄糖耐量因子(GTF)酵母的选育
【中文关键词】空间搭载 葡萄糖耐量因子 GTF 有机铬
【英文关键词】Space piggyback experiment Glucose tolerance factor GTF Organic chromium
【中文摘要】"葡萄糖耐量因子(GTF)是一种小分子的铬结合蛋白(肽),三价有机铬是其重要活性成分,含有半胱氨酸、天门冬氨酸、甘氨酸和谷氨酸。本项研究从本试验室收藏的7株啤酒酵母入手,探索一条通过航天诱变、高产菌株的选育、GTF的分离纯化以及功能特性研究为主要线索的微生物发酵高产GTF的途径。本论文的主要试验结果如下: 利用GTF可溶于氨水的性质,完善其提取参数,优化消解工艺,确定GTF有效提取方法和测定方法。结果表明:0.1g的菌体悬浮于10mL的0.1moL/L氨水溶液于37°C、200r/min提取3h,5000r/min离心10min,收集上清液,上火焰原子吸收光谱法测定其铬含量。验证试验结果显示该方法可有效的测定和评价菌体中GTF的含量。该方法可靠,处理时间短、耗酸量少,其回收率在95%~102.5%之间,相对偏差小于4%。 利用航天诱变技术对本实验是收藏的7株啤酒酵母进行诱变处理。通过梯度含铬平板、液体培养和筛选得到一株遗传性能稳定、GTF高产菌株YS-3。其有机铬产量为1258μg/g.dcw,总铬含量为1926μg/g.dcw,有机铬率达65.31%,生物量40 g/L。相比于出发菌株Y-3,YS-3有机铬产量提高了53%。 铬离子为800μg/mL时,严重抑制菌体的生长;400μg/mL时,对菌体有刺激生长作用。与无铬离子培养相比,400μg/mL的铬离子延长了菌体延迟期,发酵6 h后进入对数生长期,生物量增长超过无铬离子培养。有机铬富集主要发生在对数生长期(6 h~44 h);菌体最快的有机铬富集速度主要出现在延迟期(0 h~6 h),此时单位菌体的富铬量最大。通过二次加铬培养,摇瓶培养YS-3富集有机铬量可提高一倍,有机铬为2644μg/g.dcw左右,菌体生物量无显著性降低。发酵罐扩大规模培养,有机铬量为1930μg/g.dcw,生物量为33 g/L。 采用中红外分析了其蛋白结合铬前后的二级结构的变化。大分子蛋白结合铬后,部分α-螺旋结构和无规则卷曲向β-转角结构转变,β-折叠结构几乎无变化;小分子蛋白结合铬后,部分β-折叠结构转向无规则卷曲和α-螺旋,β-转角结构几乎无变化。 通过HPLC-ICP-MS/AES对Sephadex G-75凝胶层析Peak1、Peak2中金属铬和蛋白的分布进行微量分析和评估,对大、小含铬蛋白组分采用不同的分离纯化路线:小分子含铬蛋白:采用三次超滤(100kD、50kD、10KD)、Sephadex G25、Sephadex G15凝胶过滤层析脱盐处理获得峰形对称的含铬峰PP1。大分子含铬蛋白采用Sephadex G75、高效液相层析处理。 对峰PP1的结构分析表明其为一个含铬的小肽类物质,由天门冬氨酸、谷氨酸、甘氨酸、半胱氨酸组成;其中的氨基酸有可能并非以肽键相连,或以配位键与金属结合。峰PP1中含有两个m/z比值为712.2535、769.2747离子峰,并根据其一、二级质谱图推测其氨基酸组成比例。通过LC-ESI-MS对peak1中第8管进行测定,分析该含铬大分子蛋白有可能为HBT1蛋白或3-

磷酸甘油醛脱氢酶或核蛋白体蛋白。 糖尿病动物试验结果显示富铬酵母菌体对糖尿病有一定的改善作用,具有一定的降脂、降糖作用(糖基化血红蛋白),对胰腺组织和β细胞具有一定的保护和恢复作用。 从本文结果可以看出,通过航天诱变、筛选得到的YS-3,在优化其发酵条件基础上,通过二次补铬工艺,有机铬产量达至1930μg/g.dcw,生物量为33 g/L。发酵所产的GTF的氨基酸组成与文献报道一致,通过动物饲喂试验证明其对糖尿病有一定改善作用,具有降脂、降血糖、保护胰腺组织的功能。因此通过微生物高产GTF、使生物铬补充剂工业化具有广阔的研究价值和发展前景。"

【英文摘要】A strain of high-biomass, producing glucose tolerance factor yeast strain was screened from seven yeast strains and seven strains mutated by spaceflight-induced mutagenesis through gradient concentration of chromium plates cultivation and liquid fermentation cultivation. The biomass of it was 40 g/L. Extracting GTF with ammonia and determining the content of Cr with flame atomic absorption spectrometry, the content of organic Cr was 1287 mg/g and that of total Cr was 1917 mg/g. At the same time, dynamic relationship between other parameters and the amount of organic chromium was analyzed during fermentation.

【题目】酵母源性葡萄糖耐量因子(GTF)含量测定方法的研究

【中文关键词】"葡萄糖耐量因子(GTF) 有机铬 提取 火焰原子吸收光谱法
"

【英文关键词】glucose tolerance factor(GTF),organic chromium, extraction,flame atomic absorption spectrometry

【中文摘要】"酵母源性葡萄糖耐量因子为铬和小分子蛋白的复合物。测定其含量应包括2个步骤:第一有效地从菌体中提取出GTF;第二检测GTF中有机铬的含量。文中以葡萄糖耐量因子(GTF)高产酵母菌株为研究对象,研究不同提取方法提取GTF的条件及效果,比较了2种消化方法对测定结果的影响,对GTF提取液的消化方式进行了改良,确定了GTF测定的最佳方法和参数。试验结果表明:0.1g左右的菌体悬浮于10mL0.1mol/L的氨水,在37℃、200r/min振荡提取3h,离心收集上清液进行微波消解。用火焰原子吸收光谱法分别测定上清液中铬的含量、提取后菌体中残余铬的含量以及菌体中总铬含量。测定结果显示残余铬的理论数据与测定实际结果比较吻合,表明该测定方法可有效的测定和评价酵母中GTF含量。""

【英文摘要】Glucose tolerance factor is a complex of chromium and protein. Determining Glucose Tolerance Factor of yeast strains should include two steps: one is extracting GTF from yeast efficiently; the other is determining the organic chromium of GTF. This paper studied different extraction methods and digestion methods on the influence of determination of GTF,modified the digestion method of GTF extraction. The optimum method and parameters were confirmed as follows: 0.1g yeast suspended in 10mL 0.1mol/L NH_4OH, shook with 200r/min for 3h at 37°C, collected the supernatant with centrifugation, microwave digested and oxidized the supernatant. Determining the organic chromium of GTF, residual chromium in the yeast after extraction and the total chromium in the yeast with flame atomic absorption spectrometry. The experiment result showed that the theoretical residual chromium content meet with determination result closely. This method is suitable for determining GTF in the yeast.

【题目】小麦果聚糖合成酶基因6-SFT结构分析及功能验证

【中文关键词】小麦;6-SFT基因; 亚细胞定位;转基因烟草

【英文关键词】Wheat (Triticum aestivum L.); 6-SFT; Subcellular localization; Transgenic tobacco

【中文摘要】果聚糖广泛存在于温带、亚温带草本及禾本科植物中,能提高植物对干旱、盐碱和低温等非生物胁迫的抗性,蔗糖：果聚糖-6-果糖基转移酶(6-SFT)在果聚糖合成途径中起重要作用。研究小麦中6-SFT基因的结构特性、遗传特性、表达特性,并在模式植物中鉴定小麦6-SFT基因的功能,对于利用基因工程技术改良植物抗逆性具有重要意义。本文利用同源序列克隆方法从抗旱性较强的普通小麦品种扬麦6号中扩增到6-SFT基因,基因组DNA和cDNA长度分别为3134 bp和1851 bp,序列结构分析表明该基因含有4个外显子、3个内含子;将小麦6-SFT基因与绿色荧光蛋白GFP基因构建融合表达载体,利用基因枪轰击洋葱表皮细胞进行亚细胞定位,结果显示该基因表达酶蛋白位于质膜上;利用6-SFT基因片段做探针对小麦基因组DNA进行Southern blot杂交分析,表明该基因在二倍体小麦中至少含有2-3个拷贝,在四倍体小麦中含有4-6个拷贝,在普通小麦中至少含有7-8个拷贝;利用农杆菌介导法将小麦6-SFT基因转入烟草,转基因烟草植株表现抗旱、抗盐和抗低温能力。本研究结果为后续通过转基因途径提高小麦抗逆性提供了理论依据。

【英文摘要】Fructans have been found to accumulate mainly in temperate and cool zone grasses plants. In addition to be a carbohydrate reserve, fructans are thought to play roles in protection of plants against environmental stresses such as low temperature, salinity and drought. Sucrose: fructan 6-fructosyltransferase (6-SFT) is a key enzyme for fructan biosynthesis. It is necessary to study the structure features, existing copies, expression location and function level of the gene in Triticeae family. In our previous results, commercial wheat line Yangmai 6 was proved to accumulate higher content of fructans and represent superior tolerance to drought stress. In this paper, we isolated 6-SFT gene by PCR approach from Yangmai 6. Structural analysis showed gDNA and cDNA length of 6-SFT were 3134 bp and 1851 bp, respectively, which is interrupted by three introns. Subcellular localization of 16318-hGFP::6-SFT transient expression in onion epidermal cells using particle bombardment indicated 6-SFT is mainly localized in cytoplasm membrane. Southern blot analysis employing a partial fragment of 6-SFT sequence as probe revealed that 6-SFT gene presents multiple copies in wheat genome, 2 to 3 copies, 4 to 6 copies and 7 to 8 copies in diploid, tetraploid and hexaploid wheat,respectively. By constructing recombination plasmid with the 6-SFT gene and using Agrobacterium-mediated method, the gene of interest was transferred into tobacco, which was confirmed through traditional PCR detection and ELISA assay for positive transgenic tobacco lines. Identified under stress conditions, transgenic tobacco plants showed some tolerance to drought, salinity and low temperature. The study presents a theoretical platform for the improvement of tolerance to adverse environmental stresses through subsequent transgenic pathway in wheat

【中文关键词】果聚糖;果聚糖合成酶基因;基因结构;小麦进化
【英文关键词】fructans, fructan biosynthesis enzymes, gene structure, wheat evolution
【中文摘要】小麦族植物中1-SST基因序列比较保守。gDNA长度为3326 bp,cDNA大小为1989 bp,由4个外显子和3个内含子构成,4个外显子大小依次为406 bp、9 bp、872 bp、702 bp,3个内含子大小分别为161 bp、146 bp、1030 bp。小麦族植物中的1-SST基因都含有一个只有9个核酸序列(ATCCCAACG)组成的小外显子,是目前植物中发现的最小的外显子。在氨基酸水平上,AABB同AA和SS的序列相似性分别为95.62%和96.83%。AABBDD同AA、SS和DD的相似性分别为97.89%、99.09%和99.24%;小麦族植物中的1-FFT基因大小在AA、SS、AABB、AABBDD基因组上都为2652 bp, cDNA大小均为1947 bp,由4个外显子和3个内含子构成,4个外显子大小分别为367 bp、9 bp、869 bp和702 bp,3个内含子大小分别为156 bp、377 bp和172 bp。在DD基因组上gDNA序列长度是2603 bp,cDNA大小为1935 bp,4个外显子大小分别为355 bp、9 bp、869 bp和699 bp,3个内含子大小分别为160 bp、393 bp和118 bp。1-FFT基因也有一个只含有9个碱基(ATCCCAACG)的外显子序列。在氨基酸水平上,AABB同AA和SS的序列相似性分别为97.84%和99.38%。AABBDD同AA、SS和DD的相似性分别为99.07%、99.07%和88.63%。小麦族植物6-SFT基因在进化上比较活跃。其gDNA在AA、SS、DD、AABB和AABBDD基因组中分别为3122 bp、3302 bp、3100 bp、3138 bp和3146 bp,cDNA大小同为1851 bp。与1-SST和1-FFT基因相同,6-SFT也含有4个外显子和3个内含子。在第一个外显子上出现了插入/缺失突变,它们的gDNA长度主要差异在第三个内含子上。在氨基酸水平上,AABB同AA和SS的序列相似性分别为97.08%和98.54%。AABBDD同AA、SS和DD在DNA序列上的相似性分别为97.24%、98.70%和96.92%。
【英文摘要】Fructan is not only a carbon source for storage but also plays an important role as anti-stress agents in many plant species. Complex fructans having both β-(2,1)- and β-(2,6)-linked fructosyl units accumulate in Triticeae plants commonly. Three enzymes (sucrose: sucrose 1-fructosyltransferase, 1-SST, EC: 2.4.1.99; sucrose: fructan 6-fructosyltransferase, 6-SFT, EC: 2.4.1.10; and fructan: fructan 1-fructosyltransferase, 1-FFT, EC: 2.4.1.100) were involved in fructan biosynthesis in Triticeae plant species. We successfully isolated these genes from tetraploid wheat (Triticum turgidum, genotype: AABB), common wheat (Triticum aestivum L., genotype: AABBDD) and three wild relatives of common wheat, Triticumurartu Thum. (the origin of the AA genome), Aegilops speltoides (Tausch) Gren. (the putative source of the SS genome) and Aegilops tauschii Coss. (the source of the DD genome). Sequence analysis revealed that all the FBEs (fructan biosynthetic enzymes) had three highly conserved functional motifs except 1-SST (EU981912) from tetraploid wheat species only with conserved DPNG. Low pI (isoelectric point) and potential N-glycosylation sites were predicted, whichwere crucial for protein compartmentation and post-translational process. Analysis on subcelluar localization signals showed that only 6-SFT had vacuolar-directed signal. Sequences alignment result showed that 1-SST and 1-FFT were more conservative and had closer relationship each other, while 6-SFT was more active during the evolution processing.According to the syntenic relationship between wheat and rice genome, FBEs were predicated to be located on the homeologous group 6 and group 2

chromosomes. Expression profile confirmed that expression of all the three FBEs were drought-stress induced. This study can assist to establish a useful theoretical platform for cold- or drought-tolerant improvement of wheat by modulating FBEs expression.

【题目】费氏丙酸杆菌谢氏亚种和植物乳杆菌亚油酸异构酶结构及酶学性质研究
【中文关键词】共轭亚油酸(CLA) 植物乳杆菌(L.plantarum) 费氏丙酸杆菌谢氏亚种(P.freudenreichii ssp.shermanii) 亚油酸异构酶
【英文关键词】conjugated linoleic acid (CLA) L. plantarum P. freudenreichii ssp. shermanii linoleate isomerase
【中文摘要】"【目的】对来源于植物乳杆菌(Lactobacillu plantarum)和费氏丙酸杆菌谢氏亚种(Propionibacteriu freudenreichii ssp.shermanii)亚油酸异构酶酶学特性开展研究,探讨不同来源的亚油酸异构酶酶学性质存在的差异。【方法】通过酶反应动力学方法及电泳技术测定了酶的最适反应条件、米氏常数、酶的分子量,并在此基础上,采用高效液相色谱(HPLC)与电喷雾离子化/质谱(ESI-MS)相结合的方法测定了L.plantarum和P.freudenreichii ssp.shermanii亚油酸异构酶的氨基酸序列。【结果】P.freudenreichii ssp.shermanii亚油酸异构酶的最适pH为8.0,最适反应温度是30°C,Km=20.53 μ mol · L^-1,Vmax=0.44 μ g · mL^-1 · min^-1;L.plantarum亚油酸异构酶的最适pH为7.5,最适反应温度是为50°C,Km=17.85 μ mol · L^-1,Vmax=0.73 μ g.mL^-1 · min^-1。【结论】来源于L.plantarum和P.freudenreichii ssp.shermanii亚油酸异构酶的全氨基酸序列不同,但两者具有一定的同源性,且两者酶学特性也有差异。"
【英文摘要】【Objective】 The attributes of linoleate isomerases from both Propionibacteriu freudenreichii ssp. shermanii and Lactobacillu plantarum were studied to understand the different characters of linoleate isomerase originated from different strains. 【Method】 Dynamic and characteristic parameter such as Michaelis constant, molecular weight of linoleate isomerase with different origins were determined using the method of enzyme activity analysis and electrophoresis. The peptide mass fingerprints produced by P. freudenreichii ssp. shermanii and L. plantarum linoleate isomerase were studied by HPLC – ESI – MS system. 【Result】 The optimum pH for P. freudenreichii ssp. shermanii linoleate isomerase was 8.0 and the optimum temperature was about 30°C. The Km and Vmax of linoleic acid was 20.53 μ mol•L-1 and 0.44 μ g•ml-1•min-1. The optimum pH for L. plantarum linoleate isomerase was 7.5 and the optimum temperature was about 50°C. The Km and Vmax of linoleic acid was 17.85 μ mol•L-1 and 0.73 μ •ml-1•min-1, respectively. Molecular structure of linoleate isomerase produced by P. freudenreichii ssp. shermanii and L. plantarum showed some extent homogeny on sequences. 【Conclusion】 The linoleate isomerase originated from the two strains has different attributes. The sequences of both linoleate isomerases have some extent homogeny and the characteristic parameters of experimental linoleate isomerase are different from those of reported

【题目】农产品加工装备的竞争力结构与发展策略
【中文关键词】农产品加工 加工装备 竞争结构 国家宏观调控 销售收入 装备制造业 加工工业 同比增长 市场竞争 竞争优势
【英文关键词】农产品加工 加工装备 竞争结构
【中文摘要】近年来,在国家宏观调控和大力发展农产品加工工业的环境下,我国农产品加工装备制造业保持了良好的发展态势。2004年,产品销售收入同比增长21%左右,是近10年来增长最快的一年,产品销售收入利润率为6.5%,同比降低1%。

目前,我国农产品加工装备的市场竞争十分激烈,需要创造条件以获取竞争优势。
【英文摘要】"Through gradient concentration of chromium plates cultivation and liquid fermentation cultivation,a high-biarkass,producing glucose tolerance factor yeast strain v/as screened from seven yeast St~dJI'lS which were mutated by spaceflight-inducedmutagenesis.Extracting GTF with ammonia and determining the content of Cr with flame atomic absorption spectrometry,thecontent of organic Cr WaS 1287 g/g and that of total Cr WaS 1917 g/g.At the same time,dynamic relationship between otherparam eters and the amount of organic chaxanium WBS investigated during fermentation."

【题目】新模式植物短柄草模式特性研究进展
【中文关键词】短柄草; 模式植物; 基因组; 分子标记; 组织培养; 遗传转化
【英文关键词】Brachypodium distachyon; Model plant; Genomics; Molecular markers; Tissue culture; Transformation
【中文摘要】短柄草(Brachypodium distachyon)是一种广泛分布于温带地区的禾本科植物, 基因组小、染色体少、DNA 重复序列少、植株较矮、生育期短、种子数量多, 与小麦族植物一样具有二倍体、四倍体和六倍体, 且不需要严格的生长条件和栽培措施, 是小麦等早熟禾谷类理想的模式植物。近几年来, 国际上对短柄草开展了较多研究, 而国内对短柄草的研究尚属空白。本文综述了短柄草细胞遗传学、分子生物学、基因组学、组织培养和遗传转化等方面的研究进展, 对今后的研究和应用趋势进行了简要展望, 以促进国内对短柄草模式特性, 以及小麦等植物结构基因组学和功能基因组学的研究。
【英文摘要】Brachypodium distachyon, a monocot grass plant and widely distributed in temperate areas, has been regarded as an new potential model plant species and studied extensively in recent years because of its smaller genome, less chromosomes, shorter plant height, rapid life cycle, higher seed yield, undemanding growth requirements, and different ploidies similar to Triticumincluding diploid, tetraploid, and hexaploid. But, related research on this plant in domestic is just in initial stage. Cytogenetics,molecular genetics, genomics, mapping, tissue culture, and transformation of Brachypodium distachyon were reviewed in this paper, and its further investigation and application were briefly prospected at the same time in order to promote its study on the characteristics as model plant and benefit the structural and functional genomics research of some Pooideae species such as wheat and barley.

【题目】不同利用状况下草原遥感估产模型
【中文关键词】草原估产; 利用状况; 植被指数; MODIS; 虚拟变量
【英文关键词】grassland yield estimation; utilization status; vegetation index; MODIS; dummy variables.
【中文摘要】在内蒙古自治区的温性草甸草原、温性草原、温性荒漠草原、温性草原化荒漠和温性荒漠5种具有代表性的草地类型区地面观测数据的基础上,考虑草地的利用状况信息,分类建立了产草量与4种植被指数(由MOD IS数据计算得到)的回归估产模型,将利用状况这一定性变量作为虚拟变量与遥感估算模型相结合,找出了3种利用状况下的鲜草产量最优混合估算模型和估算指数。结果表明: (1) EV I是反映产草量变化的最好指标,分类构建的模型平均测产精度达到了80%; (2)将利用状况作为虚拟变量考虑之后建立的混合测算模型精度达到了79% ,明显高于利用状况未知时构建的混合模型的精度,比分类建模应用更简洁方便。

【英文摘要】Based on the observation data obtained from five rep resentative steppes, i. e. , temper2ate meadow steppe, temperate steppe, temperate desert steppe, temperate steppe2desert and tem2perate desert in InnerMongolia, regression models were established to exp ress the relations be2tween each grassland biomass and four vegetation indices, with the information about grassland u2tilization status considered. The qualitative variable utilization status was introduced into remotesensing estimation models as a dummy variable, and the op timal mixed estimation models andvegetation indices for three types of utilization statuswere selected. The results showed that EV Iwas the best index reflecting grassland yield variation, and the average estimation p recision of themodels was 80%. The p recision of the mixed models introduced with utilization status (mixedmodel Ⅱ) arrived to 79% , being higher than that of the modelswithout the information of utili2zation status. Comparing with the models established for different utilization status, mixed model Ⅱ had the advantages of concision and convenience.

【题目】白菜类作物ITS序列分析
【中文关键词】芸薹属; nrDNA; 内转录间隔区; 遗传距离;
【英文关键词】Brassica; nrDNA; Internal transcribed spacer (ITS); Genetic distance;
【中文摘要】以不同地理来源的18份不同类型的白菜类作物(Brassica campestris L.)为试材,对其ITS区进行扩增、测序和序列比对,构建NJ系统树,研究白菜类作物ITS序列的变异情况。结果表明:白菜类作物中不同类型材料的ITS序列没有明显变异,序列非常保守;白菜类作物与芸薹属其他种间存在明显变异。芸薹属中的基本种内的变种间没有明显变异;复合种内的变种间有明显变异,分别倾向于禹氏三角(U-triangle)假说推测的父母本。
【英文摘要】The ITS sequences of 18 different types of Brassica rapa were amplified by PCR and sequenced,and then the NJ tree was constructed by ITS sequences to analyze the variations of ITS sequence. The results show that the sequences of the ITS of Brassica rapa are very conservative,and no variations exist between different types. Brassica rapa has variations with other species of Brassica respectively.The ITS sequences have variations among the species of Brassica,and the different type materials of the basic species of Brassica have no variations. However,those of the complicate species have variations and the ITS sequences tend to the putative parents of the U-triangle respectively.

【题目】提取液中的蔗糖和甘露醇对大白菜小孢子胚胎发生的影响
【中文关键词】大白菜; 小孢子培养; 胚胎发生; 预处理; 蔗糖; 甘露醇; 培养基
【英文关键词】Ch inese cabbage; microspore culture; embryogenesis; pretreamen;tsucrose; mannito;lmedium
【中文摘要】研究了大白菜游离小孢子提取过程中, 培养基中的蔗糖和甘露醇对后期小孢子胚胎发生的影响。结果表明, 在小孢子短期的提取过程中提高B5提取培养基的蔗糖浓度或添加甘露醇对小孢子的活力无影响, 但会大幅度提高小孢子的胚胎诱导效果, 其中17%蔗糖处理和8%甘露醇处理效果最佳, 与对照相比平均出胚量都达到极显著水平, 同时也促进了难诱导材料的胚胎发生。
【英文摘要】The effects of short-term pretreament were studied on embryogenesis of isolated microspores in Chinese cabbage.The results showed that mannitol and sucrose with higher concentration of sucrose in B5 washing medium addition during isolation of microspores had no influence on microspores viability but can increase the frequency of embryogenesis significantly.In our experiments,all nine cultivars responded to the treatment.B5 washing medium with 17% sucrose treatment and B5-13 washing medium with 8% mannitol mannito ltreatm entwere optimal treatments of two group tests.

【题目】大白菜游离小孢子培养胚胎发生中的加倍机制
【中文关键词】大白菜; 小孢子培养; DAPI荧光染色; 胚胎发生; 染色体自然加倍;
【英文关键词】Chinese cabbage; Microspore culture; DAPI fluorescence stain; Embryogenesis; Spontaneously doubled haploid;
【中文摘要】利用Leica体视显微镜,DAPI荧光染色观察比较大白菜小孢子正常发育为成熟花粉粒与游离小孢子培养胚胎发生细胞核的分裂方式,探讨大白菜游离小孢子培养胚胎发生及其自然加倍的机理。观察结果显示以B途径为主要发育途径的大白菜小孢子,胚胎发生的启动机制是热激诱导下单倍体小孢子体积膨大,染色体发生自然加倍,从而激发小孢子进入孢子体发育途径;大白菜小孢子胚再生植株具有较高的自然加倍率,这与小孢子培养热激诱导激发小孢子单核自然加倍为二倍体密切相关。
【英文摘要】The pathway of nuclear divisions of isolated microspore at different development stages and their embryogenesis process in Chinese cabbage were investigated under a fluorescence microscopy by using DAPI staining to understand embryogenesis and doubling mechanism of isolated microspore culture in Chinese cabbage. The results showed that after heat shock pretreatment the isolated microspores expanded. Most of microspores exhibited B pathway, and nuclear chromosomes doubled at very early stage,then doubled haploid embryoids formed.That is why isolated microspore culture of Chinese cabbage usually produce high frequency of spontaneously doubled haploid plants.

【题目】与大白菜细胞质不育相关RAPD特征片段的克隆和序列分析
【中文关键词】大白菜; 细胞质不育; 线粒体DNA; RAPD; 克隆; 测序;
【英文关键词】Chinese cabbage; Cytoplasmic male-sterility; mtDNA; RAPD; Clone; Sequence;
【中文摘要】为了研究和获得大白菜细胞质不育系和保持系线粒体DNA的多态性,选用153个RAPD随机引物,对3套材料,每套中包含不同来源、同核异质的大白菜细胞质不育系(Pol-CMS、Ogu-CMS和CMS96)和保持系线粒体DNA进行RAPD分析。结果表明,有4个RAPD随机引物可以在全部Ogu-CMS和CMS96不育系中扩增出特异带,有1个随机引物仅在所有Ogu-CMS不育系中扩增出特异带;同时将OPAH16随机引物扩增的与不育相关的特异带进行了克隆和测序。结果表明,所获得的特异片段均与拟南芥和甘蓝型油菜的线粒体基因组序列部分同源,但与已发表的不育基因序列没有同源性。由这5个序列推导出的蛋白质与拟南芥中的一种未知功能蛋白AtMg00760(ORF109b)具有部分同源性。这5个序列的可能功能正在验证中。
【英文摘要】To abtain the differences between maintainer and cytoplasmic male sterile line in Chinese cabbage(Brassica campestris L.ssp. pekinensis), 153 random primers were used for RAPD analysis in maintainer and cytoplasmic male sterile mtDNA which had the same nucleus and different cytoplasm. Specific fragments could be amplified by 4 RAPD primers in all Ogu-CMS and CMS96. And specific fragments related to all Ogu-CMS could be amplified by one RAPD primer. 5 specific fragments amplified by OPAH16 primers in all Ogu-CMS and CMS96 were cloned.Then sequences were compared by Blastn method.Results show that these sequences are homological to Brassica napus and A rabidopsis mtDNA genome partially.But they ale not homological to CMS gene reported before.The 5 sequences can be induced a protein that is homological to ORF109b in A rabidopsis mtDNA genome.The functions of the 5 sequences are testing

【题目】大白菜CMS96细胞质雄性不育分子特性研究.
【中文关键词】大白菜; 细胞质不育; CMS96; 线粒体DNA; orf138; orf224; RT-PCR; 同源性比较;
【英文关键词】Chinese cabbage (Brassica campestris L. ssp. pekinensis); Cytoplasmic male sterility; CMS96; mtDNA; orf138; orf224; RT-PCR; Alignment;
【中文摘要】大白菜CMS96细胞质不育系是由大白菜株系与甘蓝型油菜细胞质不育源杂交、多代回交后获得的。该不育系生长势旺、不育性稳定,不育度和不育株率均为100%,蜜腺正常,在大白菜杂种一代生产中具有广阔的应用前景。为了定位大白菜CMS96细胞质不育所属的类型和获得其不育有关的特异序列,依据atp9、coxI、orf138和orf224保守序列设计4对引物,对3组11份大白菜材料线粒体DNA进行PCR扩增,每组材料内包含同核异质PolCMS、OguCMS、CMS96三种大白菜不育系和一种共用保持系。结果表明,atp9和coxI引物在所有材料中均有扩增产物,供试材料间没有差异;而orf138和orf224引物扩增产物存在差异。orf138引物仅在全部OguCMS和CMS96不育系中扩增出309bp特异带,而保持系和PolCMS不育系没有扩增产物;orf224引物仅在所有PolCMS中扩增出689bp特异带,而保持系、OguCMS和CMS96不育系没有扩增产物。同时,对保持系和不育系花组织mRNA进行RT-PCR分析,进一步验证了orf138和orf224引物扩增产物的特异性和一致性。同源性分析结果表明,,利用orf138引物所获得的309bp大白菜mtDNA特异片段均与萝卜Ogu CMS、甘蓝型油菜Ogu CMS萝卜体细胞杂种所具有的Ogu orf138高度同源,二者有172个核苷酸完全相同,有58个氨基酸完全相同;orf224引物所获得的689bp大白菜mtDNA特异片段与甘蓝型油菜的Pol 00'224高度同源,二者有677个核苷酸完全相同,有225个氨基酸完全相同,同源性均达到100%。初步认为大白菜Ogu CMS和CMS96不育系具有相似性,Ogu CMS萝卜所具有的orf138是导致二者不育的原因;Pol甘蓝型油菜所具有的Pol 00'224是导致大白菜Pol CMS不育的原因。
【英文摘要】The cytoplasmic male sterile line CMS96 was transferred into Chinese cabbage by hybridization and subsequent backcrosses using CMS donor of B.napus. CMS96 are strong in vigor, stable in sterility and normal in nectar. The degree and percentage of male sterility are 100 percent. It showed significant value in Chinese cabbage hybrids production. To identify the male sterile type and study specific fragments related to CMS96, 4 primers according to atp9?coxI?orf138 and orf224 were designed for PCR analysis in three sets ofeleven Chinese cabbage materials(including maintainer、 Pol CMS、 Ogn CMS and CMS96),which had same nucleus and diferent cytoplasm in each set.Results showed fi'agments could be amplified by atp9 an d coxl primers in all materials,and there were no diferences between them.While specific fragm ents could be amplified by o0C138 and orf224 primers.309bp fragm ents could only be am plified in all Ogu CM S an d CM S96,an d there were no products in maintainer and Pol CMS by orf138 primers.689bp fragm ents could only be amplified in all Pol CMS,and there were no products in maintainer、 Ogu CMS and CMS96 by orf224 primers.RT · PCR analysis showed 309bp flag mems were expressed in flowers of Ogu CMS and CMS96,and 689bp fagments were expressed in flowers of Pol CMS.Sequences were aligned by BLAST method.Result showed that 309bp fragments shared high similarity with orf138 in Ogu CMS radish and Brassica cybrids of Ogu CMS radish,wllich 172 nucleotide sequences and 58 amino acids were same among them.And 689bp fragments shared high similarity(100%)with Pol orf224 in B.napus,which 677 nucleofide sequences and 225 amino acids were same among them.Therefore the initial male stefility transferred to Ogu CMS and CMS96 in Chinese cabbage came from Ogu CMS in radish.The possine reason related to them was similar to Ogu orf(138 in radish.and for Pol Chinese cabbage it was similar toPol orf224 in B.napus .

【题目】大白菜细胞质雄性不育的分子鉴定及序列分析
【中文关键词】大白菜; 细胞质雄性不育; CMS96; atp6; orf222; 多重PCR;
【英文关键词】Chinese cabbage; Cytoplasmic male sterile; CMS96; atp6; orf222; Multi-PCR;

【中文摘要】为了获得3种大白菜细胞质雄性不育系Ogu CMS,Pol CMS,CMS96和保持系间的多态性以及定位大白菜CMS96不育系所属的不育类型,利用设计的atp6,orf222单一和混合引物PCR扩增3组11份同核异质大白菜细胞质雄性不育系和保持系mtDNA。结果表明,atp6引物在大白菜Ogu CMS不育系扩增的200 bp片段为其特异带;orf222引物仅在大白菜Pol CMS和CMS96不育系有扩增产物,但二者有3点完全不同:大白菜Pol CMS不育系扩增产物为675bp,CMS96不育系扩增产物为669 bp,二者相差6个核苷酸,后者定名为大白菜CMS96-orf222。大白菜CMS96-orf222与甘蓝型油菜Nap CMS的nad5c基因和Nap-orf222基因同源性均为99%,E值为0.0;大白菜Pol CMS的675 bp序列具有ORF224开放阅读框,没有保守结构域,而大白菜CMS96的669 bp序列具有ORF222开放阅读框和保守结构域YMF19。另外,atp6和orf222混合引物多重PCR扩增产物存在明显多态性:800 bp为大白菜保持系的差异带型;2 300 bp和1 500 bp为大白菜P0l CMS不育系特异带型;200 bp为大白菜Ogu CMS不育系特异带型;690 bp为大白菜CMS96不育系特异带型。该方法仅用一次PCR反应快速地将3种大白菜细胞质雄性不育系和保持系一次性全部区分开,为大白菜分子育种和常规育种更好地相结合提供了简单、快速、准确和重复性好的方法和手段。

【英文摘要】To study specific fragments linked to Pol CMS,Ogu CMS,CMS96 and to identify sterile system of CMS96 in Chinese cabbage (Brassica campestris L.ssp.pekinensis),primers ofatp6,orf222 and their primer combinations were designed for PCR analysis in 11 Chinese cabbage mtDNAs.Results showed 200 bp fragments could only be amplified in all Ogu CMS by atp6 primer;Fragments of 669 bp in CMS96 and 675 bp in Pol CMS could only be amplified by orf222 primer.Further study showed that ORF(open reading frame)in Pol CMS 675 bp fragments was 0RF224,while it was ORF222 in CMS96 669 bp fragments.669 bp fragment in CMS96 was named CMS96-o~222.Alignment with nucleotide acids showed CMS96-orJ'222 in Chinese cab bage was 99% homological to nad6c and 00'222 of Nap CMS in Brassica napus.The E-value was 0.0.CMS96-ORF222 owned a putative conserved domain YMF19 which was similar to the mitochondrial membrane protein YMF19,while 675 bp fragments in Pol CMS did not.Meanwhile,by multi-PCR technique with atp6 and orf222 primer comb inations,polymorphic results were obtained:200 bp fragments were specific for Ogu CMS;800 bp fragments were different bands for maintainer;1 500 and 2300 bp fragments were specific for Pol CMS;690 bp fragments were specific for CMS96.A rapid molecular technique for distinguishing 3 CMS types in Chinese cabbage were founded.Therefore,3 CMS systems in Chinese cab bage were different in the rearrangement of mtDNAs.Now the chimeric rearrangement of mtDNA in CMS96 is obtained and studied.

【题目】大力发展大白菜生产和消费新模式
【中文关键词】大白菜;生产;消费;新模式
【英文关键词】无
【中文摘要】大白菜是我国栽培面积最大的蔬菜作物之一,2006年全国播种面积262.37万hm2,占蔬菜总播种面积的14.5%(1),居各种蔬菜作物之首。近年来,随着人民生活水平的日益提高,蔬菜种类日趋丰富,与过去相比,不但传统秋冬季大白菜消费量逐年减少,而且大白菜的栽培季节、栽培区域、生产和消费模式都发生了重大改变,出现了一些新的生产和消费模式———苗用大白菜、娃娃菜和小型大白菜。

【中文关键词】大白菜黑腐病; 苗期; 成株期; 相对湿度; 抗病性;
【英文关键词】Black rot of Chinese cabbage; Seedling stage; Adult-plant stage; Relative humidity; Disease resistance;
【中文摘要】对北京新4号、北京新1号、北京大牛心、京翠70号、京翠60号、京秋65号6个大白菜品种进行苗期黑腐病鉴定的湿度试验及其苗期和成株期抗病性的相关性分析。结果表明:试验材料之间对黑腐病的抗性存在显著差异,其中北京新1号抗性最强。比较不同保湿处理下的病情指数,表明湿度是影响黑腐病发病的关键因素。用DPS软件对6个大白菜品种的苗期和成株期抗性的相关性进行回归分析,表明苗期人工接种(接种前不保湿,接种后保湿24h)和成株期的病情指数存在显著线性相关,说明用苗期人工接种鉴定大白菜黑腐病抗性的方法是可靠的。
【英文摘要】Taking Chinese cabbage〔Brassica campestris L.ssp.pekinensis(Lour)olsson〕‘Beijingxin No.4’,‘Beijingxin No.1’,‘Beijingdaniuxin’,‘Jingcui No.60’,‘Jingcui No.70’,‘Jingqiu No.65’as tested materials,humidity test and correlation analysis of Chinese cabbage seedling and adult-plant resistance to black rot were studied.The result indicated that there existed significant differences among different Chinese cabbages for black rot resistance and‘Beijingxin No.1’had the strongest resistance to black rot.Comparing disease indexes under different wet conditions, we found moisture was the key factor affecting black rot occurances. Using DPS software to conduct regression analysis and analyzing the correlation between artificial inoculation disease index of black rot in seedling stage and in adult plant stage, we found the results were that there existed notable linear correlation between artificial inoculation in seedling stage(before inoculation no moisture and after inoculation moisture for 24 h)and the disease index in adult-plant stage, and the method of artificial inoculation in seedling stage to identify resistance to black rot is reliable.

【题目】甘蓝链格孢菌侵染对白菜保护酶活性和H2O2含量的影响
【中文关键词】白菜;甘蓝链格孢菌;保护酶;H202
【英文关键词】non-heading Chinese cabbage;Alternaria brassicicola;protective enzymes;H2 02
【中文摘要】以抗黑斑病白菜'苏州青'自交系和感黑斑病白菜'短白梗'自交系为材料,研究其接种甘蓝链格孢菌后保护酶活性及H2O2含量的变化.结果显示,抗病和感病材料的多酚氧化酶(PPO)、超氧化物歧化酶(SOD)和过氧化氢酶(CAT)活性与接种前相比均升高,且抗病材料的PPO、SOD活性始终高于感病材料,而CAT活性低于感病材料;接种后抗病材料苯丙氨酸

解氨酶(PAL)活性升高,而感病材料的PAL活性降低;抗病和感病材料接种后过氧化物酶(POD)活性、H2O2含量均呈上升趋势,且抗病材料的H2O2含量能很快降至较低水平.由此表明:甘蓝链格孢菌侵染白菜后,抗病材料与感病材料相比,能生成较多的PAL和PPO抵抗病原菌的侵染,并能短时迸发H2O2刺激抗氧化酶活性升高,使植物体内H2O2含量处于相对较低的水平,降低活性氧伤害.

【英文摘要】Changes of protective enzymes activities and the content of H202 were studied after Alternaria brassicicola infection on two no · heading Chinese cabbage materials(Suzhouqing and Duanbaigeng).Results showed that PPO activity.SOD activity and CAT activity were increased in both disease · resistant material and disease-susceptible material,and PPO activity,SOD activity in Suzhouqing were higher than that in Duanbaigeng after infection,while CAT activity was lower than that in Duanbaigeng.As to PAL activity,it Was increased in Suzhouqing but decreased in Duanbaigeng.POD activity and H202 content were increased in both Suzhouqing and Duanbaigeng after inoculation,and the content of H202 could be lowered quickly in disease—resistant line.Thus it could be considered that compared with disease—susceptible material,disease—resistant material Was able to produce more PPO and PAL that may resist the infection of Alternaria brassicicola,and Was able to produce more H202 in a short time to promote antioxidant enzymes activities,which could maintain low H20 level and reduce the damage of reactive oxygen species after innoculation.

【题目】水杨酸诱导不结球白菜抗黑斑病机制的探讨
【中文关键词】不结球白菜; 黑斑病; 水杨酸; 抗病相关物质;
【英文关键词】non-heading Chinese cabbage; black spot disease; SA; resistant-related materials;
【中文摘要】以不结球白菜感黑斑病品种短白梗为材料,于两叶一心期用0.5 mmol.L-1水杨酸(SA)进行叶面喷雾处理,用半定量RT-PCR技术检测叶片中Bcchi、BcPR4、BcAF基因的表达变化,并在SA处理后24 h接种甘蓝链格孢菌(Alterna-ria brassicicola),研究抗病相关物质的变化,以探讨SA诱导的抗病机制。结果表明,SA喷雾处理后显著诱导了BcAF、BcPR4、Bcchi在短白梗中的表达;接种后,经SA处理的短白梗中,48 h前SOD活性、12 h后POD活性、48 h前PPO活性和0~12 h与84 h后H2O2含量均高于未经处理的,而CAT活性在处理36 h后低于未经处理的。用SA对短白梗进行喷雾处理可明显降低其病情指数,表明SA诱导系统获得性抗性在提高黑斑病抗性方面起到重要作用。

【英文摘要】0.5 mmol · L-1 SA was used to spray leaves of Duanbaigeng which is susceptible to black spot disease at two-leaves and one heart stage,and semi-quantitative RT-PCR was done to detect the expression of Bcchi,BcPR4,BcAF in leaves.Alternaria brassicicola was inoculated 24 h after SA treatment in order to study the changes of resistance-related materials to know better of the resistant mechanism of SA induction.The results showed the expression of Bcchi,BcAF and BcPR4 was significantly induced and enhanced by Duanbaigeng. After inoculation, the activities of SOD (0-48) , POD (12h later) , PPO (0-48 h) and the content of H2O2 (0-12h and 84h later) were all higher than those unp rocessed by SA in Duanbaigeng. However, CAT active was lower than that unp rocessed after 36 h2treatment. SA can reduce the disease index which indicates that systematically acquired resistance induced by SA plays an important role in the resistance to A lternaria brassicicola in non-heading Chinese cabbage.

【题目】热激诱导不结球白菜热激蛋白合成与耐冷性分析

【中文关键词】不结球白菜; 热激蛋白; 耐冷性; 实时定量; 抗氧化酶;
【英文关键词】Brassica campestris ssp.chinensis; heat shock protein(HSP); chilling tolerance; real-time quantitative PCR; antioxidase;
【中文摘要】以不结球白菜暑绿为试材,研究了热激处理(42℃)诱导不结球白菜热激蛋白(BcHSP)合成与耐冷的相关性。结果表明:热激处理明显增强了不结球白菜幼苗的耐冷性,降低了膜伤害程度。超氧化物歧化酶(SOD)、过氧化氢酶(CAT)、过氧化物酶(POD)活性含量增加,而丙二醛(MDA)含量下降。已从热激诱导的不结球白菜中克隆了小分子量BcHSP基因(日本DNA数据库DDBJ登录号:AB367955)。荧光实时定量PCR分析表明BcHSP的表达量与耐冷性相一致。低温(4℃)胁迫下,在大肠杆菌中异源表达BcHSP可维持大肠杆菌较高的细胞活力,这些结果表明BcHSP合成与不结球白菜耐冷性的提高有关。
【英文摘要】The relationship between heat shock protein expression and plant chilling tolerance was studied in Brassica campestris ssp.chinensis Shul ü .Heat shock(42 ℃)applied to Brassica campestris ssp.chinensis seedling increased the chilling tolerance of seedling and decreased the permeability of cellular membranes.The activities of superoxide dismutase,catalase and peroxidase increased,and in contrast,the malondialdehyde content depressed.A full length cDNA of small heat shock protein(sHSP) was isolated from Brassica campestris ssp. chinensiswith 42 ℃ heat shock. The gene was designated as B cHSP (DDBJ accession number AB367955). Realtime quantitative PCR analysis revealed that the BcHSP gene exp ression was coincided with chilling tolerance of seedling. The heterologous expression of BcHSP could maintain higher cell viability of Escherichia coliunder low temperature stress (4 ℃). These results indicated that the BcHSP synthesis was correlated with the increased chilling tolerance of B rassica campestris ssp1chinensis seedling.

【题目】秋早熟大白菜无公害栽培技术规程
【中文关键词】秋早熟大白菜;无公害栽培;技术规程
【英文关键词】无
【中文摘要】大白菜是北方冬春淡季的主食菜,大白菜生产的丰欠直接关系到市场供应的稳定,也关系到农民的经济收入问题。栽培早熟大白菜,对提早秋菜上市、增加花色品种和解决秋淡有重要作用,特别是增加了农户种大白菜的收入,具有较高的经济效益。近年来,河南省早熟大白菜栽培面积迅速增加,但由于缺乏科学系统的早熟、高产、无公害栽培技术,延用传统的种植方法,致使产量产值较低。针对生产上存在的问题,我们组织协作,开展了早熟大白菜秋无公害栽培技术研究,在前几年研究工作的基础上,总结出大白菜秋早熟无公害栽培技术规程。

【题目】小白菜硝酸盐累积的基因型差异
【中文关键词】小白菜; 基因型; 硝酸盐; 硝酸还原酶; 采收时期
【英文关键词】B rassica chinensis; genotype; nitrate; nitrate reductase; harvest time
【中文摘要】比较分析了32种基因型小白菜材料及同一基因型小白菜不同部位硝酸盐含量的差异及其原因。结果显示:不同基因型小白菜间和同一基因型小白菜的不同部位间硝酸盐含量均有显著差异;不同基因型小白菜的不同部位硝酸盐含量与该部位硝酸还原酶活性呈显著负相关;随着收获期的延长,不同基因型小白菜各部位的硝酸盐含量均显著下降,且叶片中硝酸盐累积量的降低幅度比叶柄中大。
【英文摘要】An experimentwas carried out to investigate the differences in nitrate accumulation in 32 genotyp ic materials aswell as in different parts of same genotyp ic material of B rassica chinensis. And the cause of the difference was analyzed. Significant differences in nitrate contentswere observed between parts of the same genotyp icmaterial and between different genotyp ic materials of B rassica chinensis. For different genotyp ic materials of B rassica chinensis, nitrate content accumulated in one organ exhibited a negative correlation with nitrate reductase activity in the organ.Asmaterials ripened, the nitrate contents in different parts declined significantly,with more decrease in leaves than in petioles.

【题目】橙色大白菜球叶总黄酮的提取与测定方法的研究
【中文关键词】大白菜; 黄酮; 超声波; 分光光度法; RP-HPLC
【英文关键词】Chinese cabbage; Flavonoid; Ultrasonic; UV spectrophotometry; RP-HPLC
【中文摘要】以橙色叶球大白菜为试材对总黄酮提取及含量测定方法进行了研究。通过单因素试验和L12 (43)正交试验筛选出最佳提取方法是超声波法, 其提取工艺是以80%乙醇为溶剂, 在料液比(g/mL)为1∶20, 温度60℃条件下, 用频率为60 Hz的超声波连续提取2次, 每次提取1 h。以芦丁为标样, 利用分光光度法和RP-HPLC法进行黄酮测定, 比较表明, 分光光度法和RP2HPLC法测定的结果趋势一致, RP-HPLC法优于分光光度法。建立了大白菜黄酮的RP-HPLC测定法, 流动相为甲醇∶水∶乙酸= 6∶9314∶016,流速015 mL /min, 柱温25℃, 检测波长280 nm。
【英文摘要】The methods of extraction and determination of the total flavonoids in the leaf2head of heading Chinese cabbages [B rassica cam pestris ssp. pek inensis (Lour.) O lsson] were studied. The op timal conditions for the ultrasonic extracting p rocess were screened by single factor analysis and orthogonal analysis, which using 80% ethanol as imp regnant, at the ratio 1∶20 of solid to liquid (g/mL) , the total flavonoids were extracted by 60 Hz ultrasonic at temperature 60℃ for 1 h, 2 times. U sing rutin as standard compound, the total flavonoids of orange colour Chinese cabbages were determined byUV spectrophotometry and RP2HPLC, respectively. The result shows that RP2HPLC is better than spectrophotometry with the same trend. The condition of RP2HPLC is that a ODS column was used with methanol-water-acetic acid (6∶931.4∶0.6) as the mobile phase, at a flow rate of 015 mL /min, 25℃ of the column temperature and 280 nm of the UV detectection wavelength.

【题目】彩色大白菜新品种“ 金冠2号 ”的选育
【中文关键词】彩色大白菜 ; 金冠2号 ; 一代杂种 ; 类胡萝卜素 ; 抗病
【英文关键词】Color Chinese cabbage;Jinguan No.2;F1 hybrid;Carotenoid;Disease resistance
【中文摘要】在1996年育成彩色大白菜材料的基础上,应用优良自交系92S24等采用杂交、自交,育成了系列彩色大白菜自交系,2002年从20多个杂交组合中筛选“ 金冠2号 ”新品种(01S1024×01S915)。该品种叶球叠抱,高头球形,株高41cm,株幅65cm;球形指数1.4;外叶绿色,球叶外层2~3片叶为绿色,内层叶色为橙色,在阳光下叶色稍变红;单球净重2.5~3.0kg,净菜率为75%以上,结球紧实,营养丰富,商品性好;球叶类胡萝h素含量为优质普通大白菜秦白二号的3.47倍,vC、可溶性糖、粗蛋白分别提高44%、36%和18%,干物质提高11.73%,粗纤维减少26.0%。一般净菜产量为90.0t/hm~2左右,高抗病毒病、霜霉病、干烧心、软腐病和黑斑病,生育期75~80d。2004年通过陕西省新品种鉴定。
【英文摘要】Jinguan No. 2 is a new F1 hybrid of orange heading Chinese cabbage suitable for autumn, combined by self-incompatible lines 01S1024 and 01S915, with green leaf, low of leaf margin undulation, mid-maturity,vigorous plant. Its leaf head is obovate, orange color. The average net weight per leafhead is 2.5~3.0 kg, with hard head, high nutrient, and attractive appearance. The content of carotenoid in head is 3.47 times as Qinbai No. 2, a normal Chinese cabbage, and vC, soluble sugar, crude protein, dry

material is 44%, 36%, 18% and 11.73% higher than it respectively, and cellulose is 26. 0% lower than it. The ratio of net vegetable is over 75%. It is resistance to virus, downy mildew, tipburn and soft-rot. It can be harvested in 75~80 days after sowing and yielded net vegetable 90.0 t · hm~(-2). It has been approved by Shaanxi Province Crop Approving Committee in 2004.

【中文关键词】大白菜; 黑斑病; 甘蓝链格孢; 抗性鉴定
【英文关键词】Chinese cabbage; black leaf spot; A lternaria brassicicola; resistance identification
【中文摘要】为大白菜抗黑斑病新品种选育和种质创新,对陕西省春夏大白菜黑斑病进行调查、病样采集、病菌分离及形态和分子鉴定。结果表明,甘蓝链格孢A lternaria brassicicola是唯一病原。利用3个不同抗性的白菜品种研究了孢子浓度、苗龄和温度对大白菜黑斑病发病的影响,建立了大白菜抗甘蓝链格孢黑斑病的人工接种鉴定方法,即采用二叶期幼苗,以1×104 pfu /mL孢子浓度喷雾接种,随后置25 ℃条件下,先黑暗下保湿24 h , 接着正常管理3天, 从第4天开始夜间保湿, 白天揭开,第8天保湿24 h后调查发病情况,其结果客观反映大白菜品种的抗病性能。
【英文摘要】In order to p rovide technical support for breeding new varieties and germp lasm innovation of Chinese cabbage resistance to black spot, the black spot leaves samp les of Chinese cabbage were collected in Shaanxi Province. The pathogen was isolated and purified by single spore and identified by special molecule marker. It was determined that Alternaria brassicicola was the only pathogen causing black spot in spring-summer Chinese cabbage. By studying the influence of inoculation spore concentrations, seedling stage and growing temperature on black spot occurrence with three different resistance varieties, an artificial inoculation method for black spot identification was optimized and set up, which key procedure is praying 1 ×104 pfu /mL spores on seedling with two true leaves, and placing at 25 ℃ condition, then keeping moisture and dark for 24 h, keep ingmoisture at night from 4th - 7th day, keep ingmoisture 24 h in 8th day, then investigated. The result from the method was exact in accordance with the true resistance type of Chinese cabbage.

【题目】陕西省大白菜黑腐病苗期人工接种抗性鉴定方法研究
【中文关键词】大白菜;黑腐病;抗性鉴定
【英文关键词】Brassica campestris L . ssp penki nsis ;Black rot ; Identification
【中文摘要】为给大白菜抗黑腐病的新品种选育和种质创新提供技术保障,以陕西省大白菜主产区致病力强的黑腐病病菌株YL217 做菌源,以4 个不同抗病性的大白菜品种为试材,研究了苗龄、接种浓度和发病温度对抗病性鉴定的影响,建立了优化的大白菜黑腐病苗期人工接种鉴定方法,即接种方法采用喷雾法,接种菌量为1. 0 ×108 pfu/ mL ,接种时期为4~5 叶期,发病温度控制26 ℃。该方法鉴定结果准确可靠,能客观反映不同大白菜品种的抗病性能。
【英文摘要】In order to provide a technical support for breeding new varieties and germplasm innovation of Chinese cabbage (B rassica cam pestris L .ssp penki nsis) with resistance to black rot , the representative Chinese cabbage leaves of black rot were collected in cent ral Chinese cabbage fields of Shaanxi province , then the pathogen bacterium (Xanthomonas campestris pv. campestris (Pam.) Dowson ,)was separated , purified and classified according to its morphologic characteristics and Koch ’ postulates ,the bacterium strian YL217 ,which has strongest infection capacity in 35 representative bacterium strains , was selected and used in resistance inoculation , by comparing the effects of seedling stage ,temperature and concent ration of bacterium on the disease identification. The optimizing artificial inoculation method for black rot identification were set up , which key procedure is praying bacterium liquor of 1 ×108 pf u/ mL on seedling with 425 true leaves stage , and keeping at 26 ℃. it's results was effective and exact and was in accordance with the resistance type of different Chinese cabbage.

【题目】大白菜温敏雄性不育TsCMS7311育性恢复的细胞学观察
【中文关键词】大白菜温敏雄性不育系;育性恢复; 细胞形态学
【英文关键词】Thermo-sensitive male sterile Chinese cabbage ; Fertility restoration ; Cytomorp hology
【中文摘要】以大白菜温敏雄性不育系TsCMS7311 为试材,对发生育性恢复和未发生育性恢复的花药进行细胞学观察。结果表明,在孢原细胞期之前,二者没有明显差异。常温下,未发生育性恢复的花药在孢原细胞期就停止发育;少数花药1~2 个角隅处可分化形成孢原细胞,造孢细胞,花粉母细胞,但花粉母细胞在减数分裂的第一次分裂时解体。在低温处理条件下,育性恢复,花药发育正常,经过孢原细胞期、造孢细胞期、花粉母细胞期后,可以顺利形成四分体,可育花药的四分体可以释放出小孢子并发育为成熟的花粉粒,同时绒毡层细胞开始解体,最后消失。
【英文摘要】Thermo2sensitive male sterile Chinese cabbage TsCMS7311 was used as test material s , and the cytomorp hology was carried out in ant hers of t he fertility restoration and not . It was found that there was no significant difference between two group s before t he stage of archesporical cell . Under normal temperature , anthers of not fertility restoration stopped developing in the stage of archespori-cal cell ;122 comers of a few anther could differentiate and form archesporical cell , sporogenous cells and microspore mot her cell , but microspore mother cell disintegrated on the first meiotic division.Under low temperat ure condition , fertility restoring , anther developing normally , the tetrads formed after archesporical cell , sporogenous cells and microspore mother cell . Subsequently , micro spores were free from the tetrad of fertile anther and formed mature pollen grains , tapetumof the fertile anthers began to disintegrate and disappear at last .

【题目】大白菜抽薹性状的主基因+多基因遗传分析
【中文关键词】大白菜;抽薹;主基因+多基因;遗传
【英文关键词】Chinese cabbage;bolting;major gene plus polygene;inheritance
【中文摘要】以大白菜易抽薹自交系06S1703和耐抽薹自交系06J32形成的P,、Pz、F-、Fz、Bl和岛等6个世代为材料,应用主基因+多基因多世代联合分析方法,对大白菜抽薹性状进行了研究。结果表明,大白菜的抽簟性受2对加性一显性一上位性主基因+加性一显性一上位性多基因控制,其中2对主基因的加性效应值分别为一3.575 8和一13.619,显性效应值分别为一3.755 2和一2.257 7。b、岛和F2世代的主基因遗传率分别为87.95%、95.13%和96.25%。只在B1群体中检测到多基因效应,遗传率仅为1.39%,说明大白菜的抽薹性是以主基因遗传为主,可以进行早期选择。
【英文摘要】The mixed major-gene plus polygene inheritance model was used to analyze the inheritance of bolting in the heading Chinese cabbage(Brassica campestris L.ssp.pekinensis)with six generations of early bolting variety 06S1 703(P1)and bolting variety 06J32(P2)and their,F1,B1,B2 and F2.The results showed that the bolting trait was controlled by two major genes with additive-dominance-epistatic effects plus poly-genes with additive-dominance-epistatic effects(E-0 model)in hybrid (06S1703X06J32).the additive effects of the tWO major genes were-3.575 8 and-13.619 respectively,and the dominance effects of the two major genes were-3.755 2 and-2.257 7 respectively;The heritability of the major genes in B1,B2 and F2 were 87.95%,95.13%and 96.25%respectively,but the polygene heritability only be checked in B1,which is 1.39%.It indicated that the bolting trait in Chinese cabbage was dominated by major genes.It is fit for early selection.

【题目】大白菜感染甘蓝链格孢后三种抗氧化酶活性的变化
【中文关键词】大白菜; 黑斑病; 甘蓝链格孢; 酶活性; 抗病性
【英文关键词】Chinese cabbage; black leaf spot;A. brassici cola; enzymes activit ies; disease resistance
【中文摘要】以2个抗病和2个感病的大白菜品种为材料,研究人工接种甘蓝链格孢后叶片过氧化物酶(POD)、过氧化氢酶(CAT)和苯丙氨酸解氨酶(PAL)活性的动态变化及其与抗病性的关系。结果表明:抗病品种在受到甘蓝链格孢侵染时,叶片内POD活性反应较感病品种快,但POD活性值上升比感病品种小;抗病品种在受到病原菌侵染时,叶片内CAT活性反应快,且一直维持在一个较高的水平,而感病品种在受病菌侵染后叶片内的CAT活性变化缓慢,变化程度低;另外无论是抗病品种还是感病品种的PAL酶活性在接种后的动态变化有相似规律,接种后所有品种的PAL酶活性均比未接种前增加。
【英文摘要】The relationship between the activity of CAT,POD,PAL and the resistances to Alternaria brassicicola were studied.The results showed that POD activity in the resistant cultivars raised earlier than in the susceptible ones after inoculation with A.brassicicala,but the highest point of POD activity in the resistant cultivars was lower than in the susceptible cultivars;The activities of CAT in the resistant cultivars raised earlier and kept a high level after inoculation with A.brassicicola,but slow and small change in the susceptible cultivars; The dynamic change of PAL activity were similar in susceptible and resistant varieties af ter inoculation with A. brassicicola, which was that the act ivities of PAL were increased after inoculation with A. brassicicola.

【题目】早熟大白菜新品种东农906的选育
【中文关键词】大白菜 东农906 一代杂种 早熟
【英文关键词】Chinese cabbage,Dongnong 906, F1 hybrid, Earlymaturity
【中文摘要】东农906是由自交不亲和系47-5-2和88-4-1配制而成的秋大白菜一代杂种。矮桩合抱类型,株高31.5cm,株幅58.0cm,球形指数1.5,顶部小尖开。叶浅绿色,帮白色,球叶40片左右。早熟,播种后63d(天)可以收获,可持续采收到85d(天),不长侧芽、不裂球。65d(天)收获时平均单株质量1.8kg,每667m2净菜产量4000kg左右;80d(天)收获时平均单株质量2.5kg,每667m2净菜产量5000kg左右;净菜率77.4%。品质优良,口感好,VC含量246.50mg·kg-1,纤维素0.22%,可溶性固形物5.65%,干物质4.54%。抗TuMV、软腐病、霜霉病,已在黑龙江、吉林、内蒙古等地推广种植。
【英文摘要】Dongnong 906 is a new Chinese cabbage F_1 hybrid developed by crossing two self-incompatible lines 47-5-2 and 88-4-1.Its head shape index is 1.5.It takes only 63 days from sowing to harvest and can be harvested up to 85 days after sowing.The average head weight is about 1.8 kg in 65 days after sowing and 2.5 kg in 80 days after sowing.The yield in open field is about 60-75 t · hm -2 .It is resistant to TuMV,downy mildew and soft rot.It is suitable for cultivation in Heilongjiang,Jilin and InnerMongolia in autumn.

【题目】大白菜抗感品种间作提高感病品种抗病毒病能力研究
【中文关键词】大白菜; 间作; 病毒病; 病情指数

【英文关键词】Chinese cabbage ; intercropping ; incidence index ; virus disease
【中文摘要】为了探讨通过抗感品种间作栽培方式来提高大白菜品种抗病毒病的能力,采用小区试验和对黑龙江大白菜区试与生试结果分析。结果表明,抗感品种间作可提高感病大白菜品种抗病毒病能力;抗性不同的品种间作使同一品种在区试、生试中表现出不同的抗性,与对照相比表现出不同增产幅度。
【英文摘要】The resistance of the susceptible variety of Chinese cabbage to viruses was studied by plot tests,regional tests and productive tests in Heilongjiang. The results showed that the resistance of the susceptible variety to viruses could be enhanced through intercropping of resistant varieties and susceptible varieties.Intercropping made cultivars exhibit different resistance to viruses in regional tests and productive tests,leading to increase of yields to different degrees compared with the control.

【题目】芸薹种作物抽薹相关基因BrFLC1的CAPS标记.
【中文关键词】芸薹种作物; 抽薹; B rFLC1基因; CAPS标记
【英文关键词】Brassicarapa L. syn. campestris L. ; bolting; BrFLC1 gene; CAPS marker
【中文摘要】以16份芸薹种作物DH系为试材,通过人工春化处理对其抽薹性状进行了鉴定,明确了材料间抽薹早晚存在显著差异;根据BrFLC1基因序列设计引物进行PCR扩增发现,所有16份材料均获得980bp的片段。多序列比对与抽薹性的关联分析发现,材料的抽薹早晚与扩增片段的碱基变异相关联,并发现关联位点的碱基变异为限制性内切酶Mva Ⅰ的识别位点;利用该酶对PCR产物酶切可以将材料明显区分开来,从而建立了BrFLC1基因的CAPS标记(命名为G-Mva Ⅰ)。利用此标记对96份芸薹种作物DH材料的验证表明,该基因的分子标记结果与抽薹时间表型显著相关,用该标记可以进行分子标记辅助选择。
【英文摘要】Bolting time of 16 Brassica rapa accessions was investigated under artificial vernalization treatment.The results showed that there was a wide range variation of bolting time among these accessions.Polymerase chain reaction(PCR)with a primer pair based on the BrFLC1 gene sequence generated a 980 bp fragment from all accessions.A base variation located at P3 was significantly associated with bolting time,and the base variation at this position is the recognition site of restriction enzyme Mva Ⅰ.Therefore,a cleaved amplified polymorphic sequences (CAPS) marker designated as G2M va Ⅰ was developed for this locus by digesting the amp lified fragmentwithM va Ⅰ. The markerwas verified in 96 B. rapa DH lines, disp laying a significant association between the bolting phenotypes and the genotypes of G2M va Ⅰ. These results indicated that G2M va Ⅰ can be easily used formarker2assisted selection (MAS) in late bolting or bolting2resistance breeding.

【题目】大白菜DH群体TuMV抗性的QTL定位与分析.
【中文关键词】大白菜 ; TuMV ; QTL定位 ; DH群体
【英文关键词】Chinese cabbage; Turnip mosaic virus (TuMV) ; QTL mapping; DH population
【中文摘要】利用已构建的包含287个标记位点的遗传图谱的大白菜DH群体,采用多模型QTL作图的方法,通过苗期人工接种TuMV-C_4株系对来自抗病亲本Y195-93和感病亲本Y177-12的DH群体的TuMV抗性进行QTL分析.共检测到3个QTLs,分别位于R03、R04和R06连锁群上,解释的表型变异在10.5%~21.9%之间,3个QTLs可解释40.0%的表型总变异.其中位于R04上命名为Tu-2的QTL解释的表型变异最高,为21.9%,其余两个位于R03和R06上的QTLs,分别解释10.5%和14.5%的表型变异.
【英文摘要】One hundred and eighty-three doubled haploid (DH) lines derived from the cross of two Chinese cabbage [Brassica campestris L. ssp. pekinensis (Lour.) Olssom] DH lines, Y177-12 (TuMV-susceptible) and Y195-93 (TuMV-resistant) , were used to map quantitative trait loci (QTL) related to TuMV resistance. TuMV resistance was evaluated for young seedlings by inoculating true leaves with TuMV-C_4 strain. Based on the reported genetic map with 287 loci, 3 QTLs were detected for TuMV resistance, localizing on linkage groups R03, R04 and R06, respectively. The most significant of the identified QTL locates on R04, named Tu-2, explaining 21. 9% of the phenotypic variance. The other two QTLs mapped on R03 and R06, explaining 10. 5% and 14. 5% of the phenotypic variance, respectively. The three QTLs together explained 40. 0% of the TuMV resistance variance.

【题目】影响白菜游离小孢子培养关键因素分析
【中文关键词】白菜; 小孢子培养
【英文关键词】Brassica campestris ssp. chinensis; Microspore culture
【中文摘要】对影响白菜游离小孢子培养的关键因素进行分析研究。单因素研究结果表明:54个基因型之间的小孢子胚诱导率差异显著;对供体材料低温处理,在0~5d范围内小孢子胚诱导率差异不大,超过5d则明显降低;高温诱导在12~60h范围内差异不大,超过此范围则小孢子胚诱导率明显降低;NLN培养基中添加生长素(NAA)和细胞分裂素(6-BA)对小孢子胚诱导率影响不大,添加的浓度过大时小孢子胚诱导率反而降低;活性炭的有无和浓度大小对小孢子胚诱导率影响极大。通过基因型、生长素、细胞分裂素、活性炭4因素分析表明:基因型之间差异显著,活性炭不同浓度之间差异显著;基因型与活性炭不同浓度之间的互作差异显著;其它的5个一级互作、4个二级互作和1个三级互作差异均不显著。
【英文摘要】Several factors affecting isolated microspore culture of non-heading Chinese cabbage(Brassica campestris ssp.chinensis)were studied in experiments.The results from mono-factor experiments showed that there were significant differences in the frequency of microspore-induced embryos among different genotypes.In the low temperature treatment,no significant differences were found during 0-5 days,while the frequencies were obviously lower when the period was longer than five days.There were no significant differences in high temperature when the incubation time was within 12-60 h, but the frequencies of microspore-induced embryos were much lower over this duration. The addition of auxins (NAA) and the cytokinins (62BA) in NLN medium showed no significant effect on the frequencies of microspore-induced embryos, but when the concentration was excessive, the frequencies decreased. The p resence and concentration of activated charcoal had a great influence on the frequency of microsporeinduced embryos. Moreover, fourfactor analysis of genotype, auxin, cytokinins and activated charcoal concentrations indicated that there were significant differences among different genotypes and activated charcoal concentrations,respectively, and also significant differences among these two interactions, while other interactions remained nonsignificant.

【中文关键词】小白菜; 花药培养; 诱导率; 植株再生
【英文关键词】Pak- choi; Anther culture; Efficiency of induction; Plant regeneration
【中文摘要】对13个小白菜品种进行花药培养,结果表明:在B5+谷氨酰胺0.8g/L+蔗糖10%固体培养基上有11个诱导出小孢子胚。各品种间小孢子胚产量差别较大,每100枚花药产胚数(诱导率)在0.11%-17.62%之间。比较B5培养基中蔗糖、有机物浓度和谷氨酰胺配比结果表明,B5+2倍B5有机物+谷氨酰胺0.4g/L+蔗糖10%+琼脂0.8%效果较好,小孢子胚最高诱导率达103.91%。
【英文摘要】Anthers from 13 varieties of pak-choi were cultured in B5 medium with 10% sucrose and 0.8 g/L L-glutamine, microspore-derived embryoids and regenerants were obtained from 11 varieties. The yield of microspore-derived embryoids (No. of embryoids per 100 anthers)varied from 0.11% to 17.62% among varieties. The effect of sucrose concentrations and additive organic matters in B5 medium on embryogenesis was investigated. The results showed that B5 medium with 10% sucrose and 0.4 g/L L-glutamine was optimal,with the highest efficiency of induction of 103.91%.

【题目】活性炭对小白菜游离小孢子培养的影响
【中文关键词】小白菜;游离小孢子培养;小孢子胚;诱导率;活性炭
【英文关键词】Chinese cabbage ; Isolated microspore culture ;Microspore-derived embryos ;Frequency ;Activated charcoal
【中文摘要】以24个小白菜品种为材料,通过在NLN培养基中添加不同浓度活性炭,研究其对游离小孢子培养的影响。结果表明:在NLN-13培养基中添加活性炭(0.5 g/L),有利于小孢子胚的诱导和形成,供试材料(N4,N8)添加活性炭处理胚诱导率较未添加活性炭的处理分别提高19,66.5倍。采用添加活性炭(0.5 g/L)的NLN培养基对24份小白菜品种进行游离小孢子培养,有20份材料诱导出胚,培养成功率为83.3%。表明添加活性炭的培养基对小白菜游离小孢子培养有较好的效果。不同基因型间胚诱导率差别较大,每花蕾诱导胚数为0.4~86.7个。依据胚诱导率的高低可将其分为极易诱导、易诱导、难诱导和不能诱导出胚4类。B5+6-BA 0.2 mg/L+NAA 0.02 mg/L+活性炭0.5 g/L+3%蔗糖+1%琼脂培养基有利于幼胚长成植株。
【英文摘要】Fluency of activated charcoal on isolated microspore culture in Chinese cabbage was studied.The results showed that NLN-13 liquid medium with activated charcoal(0.5 g/L)was obviously better in frequency of microspore-derived embryos and frequency of regenerated plants.Frequency of microspore-derived embryos in N4 and N8 was increased 19 and 66.5 times.Isolated microspores from 24 varieties of Chinese cabbage were cultured in NLN-13 liquid medium with activated charcoal(0.5 g/L),20 varieties were produced microspore-derived embryos. Embryo yield per bud (frequency microspore-derived embryos) was from 0.4 to 86.71.Microspore-derived embryos on B5 medium with 62BA 0.2mg/ L and NAA 0.02 mg/ L and activated charcoal 0.5 g/ L and 3% sucrose and 1% agar is good to regenerated plants.

【题目】四种甘蓝雄性不育类型差异基因表达分析
【中文关键词】甘蓝; 雄性不育; cDNA-AFLP; 基因表达

【英文关键词】cabbage; male sterility; cDNA-AFLP, gene expression
【中文摘要】通过cDNA-AFLP分析了4种甘蓝(Brassicaoleracea)雄性不育类型的花粉败育特异中断基因表达特点,并对不同特异表达类型分别选取代表性TDFs克隆测序。结果表明,表达差异在转录片段多态性上能反应出不同雄性不育类型在细胞学水平上的败育时期和特征差异,4种不育类型中萝卜胞质不育(OguCMS)与可育类型遗传距离最近。实验未检出萝卜胞质不育特异中断的TDFs,说明其特异中断基因数目较少,因此检测到这一类基因较为困难。三种代表黑芥胞质不育(NiCMS),隐性核不育(Ms-cr1)和显性核不育(Ms-cd1)特异中断表达的TDFs共计46条。序列分析结果表明,黑芥胞质不育,隐性核不育和显性核不育类型分别与烟酰胺腺嘌呤二核苷酸(NADH)脱氢酶,具RNA识别结构域(RRM)的蛋白,质膜类钙转运ATP酶基因表达受阻有关。
【英文摘要】There are four most important types of cabbage (Brassica oleracea) male sterilities (Nigra crtoplasmic male sterility, NiCMS; Ogura cytoplasmic male sterility, OguCMS; recessive genic male sterility, Ms-cr1 and dominant genic male sterility, Ms-cd1)in China. These male sterile lines and their corresponding fertile lines were analyzed for their gene expression specificity by cDNA-AFLP. The transcript diversity reflected the different characteristics among the four types of male sterility. OguCMS had the nearest genetic distance to fertile types. The OguCMS specifically interrupted TDFs was not detected. The results suggested that there were fewer OguCMS specifically interrupted genes as they were more difficult to be detected when comparing with others. Forty six NiCMS totally, Ms-cr1 and Ms-cd1 specific TDFs were detected. Sequence analysis of representative TDFs from each group showed that NiCMS, Ms-cr1 and Ms-cd1 were related to nad4 NADH dehydrogenase, RNA recognition motif (RRM)- containing protein and calcium-transporting ATPase expression interruption respectively.

【题目】芜菁花叶病毒外壳蛋白基因的克隆与序列分析
【中文关键词】芜菁花叶病毒 外壳蛋白基因 序列分析
【英文关键词】TuMV, Coat p rotein gene, Sequence analysis

【中文摘要】将来自北京地区甘蓝和芥菜上的TuMV外壳蛋白基因片段分别克隆到pMD18-T载体中,测序并进行序列分析。结果表明:两者CP基因序列长度均为867个核苷酸,编码288个氨基酸,它们的核苷酸同源性为97·2%,氨基酸同源性为97.6%;两者与GenBank中的部分CP基因序列的核苷酸同源性在87.8%~97.8%之间,氨基酸同源性在91.7%~99.0%之间;分子进化树分析两者可归属World-B组。

【英文摘要】Two samples of turnip mosaic virus,which infected cabbage and turnip in Beijing,were named TuMV-BJ1 and TuMV-BJ2,respectively. The CP genes of TuMV-BJ1 and TuMV-BJ2 were sequenced after being cloned into pMD18-T Vector,and were compared with the CP gene sequences of TuMV reported in GenBank. The results showed that the CP genes of TuMV-BJ1 and TuMV-BJ2 were all 867 nucleotides and coded 288 amino acids in length,and nucleotids homology was 97.2 % and amino acids homology was 97.6 %. They all shared,with the CP gene sequences of TuMV reported in GenBank, nucleotid homologies of 87. 8 % - 97. 8 % and amino acid homologies of 91. 7 % - 99. 0 %. Based on the phylogenetic analysis of the CP gene sequences, TuMV - BJ1 and TuMV - BJ2 belonged to world - B group of TuMV.

【题目】一个结球甘蓝群体主要农艺性状的遗传效应分析
【中文关键词】结球甘蓝; DH群体; 农艺性状; 主基因+多基因; 遗传分析;
【英文关键词】Brassica oleracea var.capitata; DH population; agronomy trait; mixed major gene and polygene genetic model; inheritance analysis;
【中文摘要】采用游离小孢子培养方法,构建了一个甘蓝F_1(624×24-5)的DH群体,利用该DH群体重复试验数据建立了结球甘蓝主要农艺性状的数量性状主基因+多基因混合遗传模型,分析了结球甘蓝8个主要农艺性状的遗传效应。结果表明,除开展度没有主基因只有多基因存在外,其余7个性状均符合2对主基因+多基因遗传模型。其中,数量性状主基因的遗传率中最高的是最大外叶柄长,为90.44%,最大外叶宽次之,为67.22%;外短缩茎长和中心柱长的主基因遗传率较高,分别为58.62%和56.00%;叶球高主基因遗传率最低,为20.30%,其次为最大外叶长和株高,分别为23.32%和31.74%;多基因遗传率中最高的是叶球高度,为49.80%;开展度环境效应方差占总表现型方差的81.35%,受环境影响最大,而外叶柄长的环境效应方差只占总表现型方差的9.56%,受环境影响最小。
【英文摘要】The segregation analysis method of identifying mixed major genes and polygenes by using a doubled haploid(DH) population derived from F_1 microspore culture of a cross between 624 and 24-5 was conducted to study the inheritance of 8 agronomic traits in cabbage.Except the plant spreading showed a model of polygenes,the other inheritances of the 7 traits showed the models of two major genes plus polygenes. The largest petiole length had the highest heritability of major genes of 90.44%,the heritability of the largest variance leave width was 67.22%, basic stem length and core length had a lower hefitability of major genes of 58.62% and 56.00%, head height had the lowest heritability of major genes of 20.30%, the next are the largest leave length and plant height of 23.32% and 3l.74%, respectively. Head height had the highest heft-tabitity of polygenes of 49.80%.The influence of environment on trait of the plant spreading was the best,the environmental variance was 81.35% of phenotypic variance. The influence of environment on trait of the petiole length was the least,the environmental variance was 9.56% of phenotypic variance.

【题目】甘蓝自交不亲和信号传导中THL1和SRK相互作用的体外检测
【中文关键词】S-位点受体激酶; 类硫氧还蛋白; 毕赤酵母;
【英文关键词】S-locus receptor kinase; Thioredoxin-like protein; Pichia pastoris;
【中文摘要】在甘蓝自交不亲和信号传导中SRK和THL1之间可能存在相互作用。为进一步证实该相互作用,以甘蓝E1为材料,采用RT-PCR技术扩增了THL1和SRK激酶结构域(记为SRKE1)编码序列,构建了THL1原核表达质粒pET43.1-THL1,SRKE1原核表达质粒pET431-SRKE1和真核表达质粒pPIC9K-SRKE1,分别在宿主菌大肠杆菌BL21和毕赤酵母GS115中进行表达。THL1融合蛋白经胰岛素检测,表明表达的THL1有氧化还原活性。建立了体外检测蛋白质相互作用的新方法,并用该方法对THL1与SRKE1的相互作用进行了检测,结果表明THL1可与SRKE1相互作用并形成稳定的复合体,这为深入分析THL1与SRK相互作用机理提供了理论和技术基础。
【英文摘要】The SRK and THL1 from Brassica oleracea L. act probably with each other in self-incompatibility signal process. In present study, with an aim to testify the interaction, the coding sequences of THL1 and SRK kinase domain(named as SRKE1) were amplified from stigma mRNA of Brassica oleracea L., and inserted into the expression vector pET43.1 and yeast expression vec- tor pPIC9K to construct the recombinant plasma pET43.1-THL1, pET43.1-SRKE1, and pPIC9K-SRKE1. The recombinant protein were expressed in E. coli(BL21) and Pichia pastoris (GS115), respectively. Thioredoxin activity was tested by the ability of THL1 reducing insulin, showing that THL1 had oxidation/reduction activity. A new method was put forward for testing the interaction between proteins, through the method the interaction between SRKE1 and THL1 was analyzed, showing that SRKE1 and THL1 could act with each other to combine and form a stable complex. This research provides a theoretical and technical bases for further analysis of the interaction mechanism between SRK and THL1.

【英文关键词】无
【中文摘要】以两个耐抽薹能力不同的春甘蓝品种“春丰”和“2006042”为材料,研究了抽薹过程中不同发育阶段叶片中碳水化合物和POD、SOD的变化。结果表明,两品种的可溶性糖和蔗糖伴随着花芽分化的进行而升高,花芽分化结束时逐步降低.蔗糖在抽薹时降低至最低水平。POD活性在花原基分化期和抽薹期出现两次峰值,有可能参与了植物的花芽分化及抽薹过程。SOD活性呈现“之”字形升高的趋势,到抽薹时达到最高值。

【题目】甘蓝叶片组织结构与裂球关系探讨
【中文关键词】甘蓝;叶片组织结构;裂球
【英文关键词】无
【中文摘要】本试验以“争春甘蓝”(易裂球)、紫甘蓝“宝石马特2号”(极耐裂球)和“荷兰捷甘65”(较耐裂)为材料,采用石蜡切片法对叶片解剖特征进行了研究。结果表明:甘蓝叶片组织结构与抗裂程度有关。抗裂球品种“宝石马特2号”(紫甘蓝)的叶表皮细胞壁较厚,薄壁组织细胞较小,呈椭圆形,排列紧密且整齐,细胞间隙小,角质层较厚,维管束发达,次生木质部导管多;易裂球品种表皮细胞薄,薄壁组织细胞较长、较大,排列疏松且不整齐,细胞间隙大,角质层薄,维管束不发达且次生木质部导管少。

【题目】甘蓝自交不亲和决定因子的体外表达和相互作用的检测
【中文关键词】结球甘蓝 ; 自交不亲和 ; S位点受体激酶(SRK) ; S位点富含半胱氨酸蛋白(SCR) ; 原核表达
【英文关键词】Brassica oleracea L. var. capita ta L. ; self-incompatibility; S-locus receptor kinase(SRK) ; S-locus cysteine-rich protein (SCR) ; prokaryotic expression
【中文摘要】S位点受体激酶(SRK)和s位点富含半胱氨酸蛋白/S位点蛋白11(SCR/SP11)分别为甘蓝自交不亲和(self-incompatibility,S1)信号传导的雌雄决定因子.为了深入研究两者的作用机理和进行人工调控,本研究以结球甘蓝ZQ为材料,利用pET · NusA融合蛋白表达系统,将包含SRK胞外域和跨膜域的mSRK蛋白和SCR蛋白在大肠杆菌B121中融合表达,经SDS-PAGE电泳检测表达出融合蛋白大小分别约为116 kD和74 kD.进一步将两融合蛋白进行体外相互作用的检测,结果表明mSRK与SCR蛋白能够相互结合形成稳定的复合体,这为下一步实现SRK-SCR复合体聚合与解离的人为调控提供了技术平台.
【英文摘要】Self-incompatibility of Brassica okracea L. var. cczpitata L. is determined by the female de- terminant S-locus receptor kinase (SRK) and the male determinant S-locus cysteine rich proteinls-locus pro- tein 11 (SCR/SPl1). For further study on mechanism and reagent control of the interaction between the de- terminant factors, extracellular and transmember domains of SRK (named as mSRK) and open reading frame of SCR were amplified from Brassica oleracea L. ' ZQ' . Then fusion protein of mSRK about 116 kD and SCR- orf about 74 kD were expressed in E. coli BL21 by the PET NusA fusion expression system and separated by SDS-PAGE electrophoresis. After SCR-orf was incubated with mSRK for 2 hours, the interaction between the two proteins was analyzed; The result shows that mSRK and SCR could combine with each other and form a stable complex.

【题目】甘蓝SSR-PCR技术体系的优化
【中文关键词】甘蓝 ; SSR ; 技术体系 ; 影响因子
【英文关键词】cabbage;SSR;system;influencing factor
【中文摘要】以甘蓝自交系15R(南宝)和14S(北黑大平头)为材料,对SSR-PCR扩增程序进行了优化,分别利用不同浓度的聚丙烯酰胺凝胶电泳和琼脂糖凝胶电泳对SSR-PCR扩增产物进行了检测.结果表明:适宜的扩增程序为94℃变性45 sec,60℃退火,72℃延伸1 min,每个循环较低0.5℃,进行20个循环,94℃变性45 sec,55℃退火45sec,72℃延伸1 min,进行15个循环,72℃延伸10 min,16℃保存,10%的聚丙烯酰胺凝胶电泳比琼脂糖凝胶电泳更适合对甘蓝SSR-PCR扩增产物的检测.
【英文摘要】In this study, we optimized SSR-PCR amplification procedure and detected SSR-PCR amplifica-tion of the cabbage varieties 15R(NANBAO)and 14S (BEIHEIDAPINGTOU), using polyacrylamide gel electrophoresis and agarose gel electrophoresis. The following procedure consisting of two steps was shown to be appropriate for amplification, i. e. the first step: 20 cycles of denaturation at 94 ℃ for 45 s, annealing at 60 ℃ and extension at 72 ℃ for 1 min; the second step: 15 cycles of denaturation at 94℃ for 45 c, annealing at 55 ℃ for 45 s and extension at 72 ℃ for 1 min. After that, amplification was ended with extension at 72 ℃ for 10 min. 10% polyacrylamide gel electrophoresis appeared to be more suitable for SSR-PCR amplification of cabbage than agarose gel electrophoresis.

【题目】甘蓝花药培养胚状体诱导形成影响因子研究
【中文关键词】甘蓝; 花药; 组织培养; 诱导; 胚状体;
【英文关键词】cabbage; anther; tissue culture; induction; embryoid;
【中文摘要】用甘蓝F1、F2和自交系S33个世代6种基因型材料进行甘蓝花药培养诱导胚状体形成影响因子研究。结果显示:(1)高浓度蔗糖对甘蓝胚状体形成具有显著的诱导作用,6%蔗糖浓度是甘蓝花药培养的最适浓度,其胚状体的诱导率最高达12.2%;(2)材料基因型是影响花药培养的主要因素,F2和F1代材料胚状体诱导效果好,且胚状体诱导率F2代(F2P192和F2P194)18.9%比F1代(F1S17和F1S13)17.1%较高,但差异不显著,自交系S3代材料很难诱导出胚状体;(3)B5培养基比MS培养基更适合甘蓝花药胚状体的诱导培养。结果表明,甘蓝F2代是其花药诱导培养胚状体的最佳基因型材料,B5+2.0 mg/L 2,4-D+2.0 mg/L KT+6%Suc是甘蓝花药诱导培养胚状体的最适培养基。
【英文摘要】Six genotypes in three generations,cabbage F_1 and F_2 and inbred S_3 were used in anther culture to study the factors affecting embryoid induction and formation of cabbage anthers in culture.It was shown that(1) high sucrose concentration exerted significant inductive effect on embryoid formation and the optimum sucrose concentration of cabbage anther culture was 6% and the embryoid induction rate reached as high as 12.2% at this sucrose concentration;(2) The genotypes of the materials were the major factor affecting cabbage anther culture and the materials in cabbage F1 and F2 performed better in embryoid induction and the embryoid induction rate in F2 (F2 P192 and F2P194) was 18. 9% , higher but not significantly than the embryoid induction rate of 17.1% in F1 (F1 S17 and F1 S13) and the inbred materials in S3 were difficult to be induced to produce embryoids; (3) B5 medium was more suitable to induce cabbage anthers to produce embryoids in culture than MS medium. These indicated that cabbage materials in F2 were the best materials for embryoid induction of cabbage anthers in culture and the optimal medium for embryoid induction of cabbage anthers was B5+ 2.0 mg/ L2, 4-D+ 2.0 mg/ L KT+ 6% sucrose.

【题目】不同因素对甘蓝花药愈伤组织诱导的影响
【中文关键词】甘蓝; 花药培养; 愈伤组织; 诱导率;
【英文关键词】cabbage; anther culture; callus; induction rate;
【中文摘要】以F2代甘蓝品种P 192和P 194为材料,研究了激素、温度、光照、活性炭及取材部位对甘蓝花药愈伤组织诱导培养的影响。结果表明,2,4-D在甘蓝花药诱导培养中具有重要作用,各激素组合中以2.0 m g/L 2,4-D+2.0 m g/L KT处理的诱导率最高,达到41.67%;在甘蓝花药培养前对花蕾同时进行低温预处理3 d、高温预培养3 d和初期暗培养处理3 d的效果较任何一种单独处理效果好,其诱导率为25.00%;添加活性炭的诱导率较不添加活性炭略低;同一生长时期同一植株的不同部位的材料对甘蓝花药诱导培养无显著影响。
【英文摘要】Using hybrids of F_2 P192 and P194 as the materials,effects of factors,such as hormone,temperature and light,active carbon and material positions on induction culture of cabbage anther were studied.The results showed that:2,4-D had important effect on anther induction culture.Hormone composition of 2,4-D 2.0 mg/L and KT 2.0 mg/L was best to promote induction culture among all hormone compositions,and its induction rate was 41.67%.The composition treatment with low temperature pretreatment,pre-culture at high temperature and darkness culture at initial stage was better than any kind alone to process before anther culture of cabbage, its induction rate was 25.00%. Induction rate of active carbon treatment was lower than that of contrast treatment slightly . Materials gotten from different positions of the same plant at the same growth period had no significant influence on induction culture.

【题目】甘蓝胞质雄性不育系及其保持系花药和叶片生化特性分析
【中文关键词】甘蓝; 胞质雄性不育系; 激素; 游离氨基酸; 叶绿素;
【英文关键词】cabbage; cytoplasmic male sterility line; hormone; free amino acid; chlorophyll;
【中文摘要】对甘蓝胞质雄性不育系CMS158及其保持系花药激素、游离氨基酸和叶片叶绿素含量进行了比较研究。结果表明,不育系花药KT和IAA含量极显著低于保持系,GA含量不育系和保持系没有显著差异。游离氨基酸总量不育系花药极显著高于保持系,脯氨酸和胱氨酸含量不育系花药极显著低于保持系,赖氨酸含量两系无明显差异,苏氨酸在两系中均未检出,其余氨基酸含量均是不育系花药高于保持系;不育系花药中丝氨酸含量最高,保持系花药中脯氨酸含量最高,两系中天冬氨酸和脯氨酸含量的差异最大。叶片叶绿素含量不育系和保持系无显著差异。
【英文摘要】The contents of anther hormones,free amino acids and chlorophyll in CMS158,a cytoplasmic male sterility line,and its maintainer,were comparatively examined.It was shown that the KT and IAA content in the anthers of the male sterility line were significantly lower than those in the anthers of the maintainer and there existed no obvious difference between the GA contents in the anthers of the male sterility line and its maintainer.The content of free amino acids in the anthers of the male sterility line was extremely higher than that in the anther of the maintainer, the contents of proline and cystine contents in the anthers of the male sterility line were extremely lower than those in the anthers of the maintainer, there was no significant differences between the lysine contents of the male sterility line and its maintainer; threonine were not detected in the male sterility line and its maintainer and the contents of the other amino acids were higher in the male sterility line than in the maintainer; the highest serine content appeared in the anthers of the male sterility line and the highest proline appeared in the anthers of the maintainer and the aspartic acid and proline contents in the anthers of the male sterility line and its maintainer. The anthers of the male sterility line did not significantly differed from those of the maintainer in chlorophy ll content.

【题目】甘蓝一代杂种秦甘60及其双亲的同工酶电泳分析
【中文关键词】甘蓝; 一代杂种; 秦甘60; 同工酶;
【英文关键词】Cabbage; F1 hybrid; Qingan60; Isozyme;
【中文摘要】应用同工酶电泳技术,分析了甘蓝一代杂种秦甘60及其亲本叶片中的过氧化物酶(POD)和酯酶同工酶(EST)图谱。结果表明,甘蓝秦甘60(F1)及其亲本在苗期的POD酶谱和EST酶谱表现相一致,都表现为单一亲本型,具有母本的完整酶带。对秦甘60(F1)杂交率的鉴定在其反交种中是可以利用POD酶Rf0.227、0.273酶带或EST酶Rf0.778酶带将其与父本自交种区分开,但在正交种中与母本自交种不易区别。
【英文摘要】Applying to isozymes electrophoresis technique,this article analysised the hybrids of cabbage Qingan60 and its parents in seedling stage.The result showed that the hybrids and its parents POD isoenzyme patterns in leaves were similar to EST isoenzyme patterns.They all have the whole isoenzyme of female plant,all showing the single parent shape.According to the identification of

crossing rate of Qingan60(F1),it can be separated the reciprocal crosses hybrids from self-pollinated seeds by using the bands of EST Rf 0.778. Otherwise orthogonal hybrids are difficult to separate from self-pollinated seeds.

【题目】菜粮间套高效栽培模式
【中文关键词】菜粮间套;高效;栽培模式
【英文关键词】无
【中文摘要】陕西省三原县位于关中盆地中部, 地势北高南低, 南部为平原区, 夏季多雷阵雨, 秋季多连阴雨,6~ 8月常有干旱发生, 但灌溉条件好, 为三原县主要农作区, 一般早霜始于10月下旬, 晚霜终于3月下旬, 无霜期204 d(天)。为使本地种植业朝着菜粮兼顾、节本增效的方向发展, 笔者根据当地气候条件和市场需求进行了一年多茬栽培试验, 总结出3种覆盖与露地相结合、菜粮间套高效栽培模式, 每667m2年收入1. 0万元左右。目前这3种模式主要应用于三原县鲁桥镇, 种植面积达1 000 hm2。

【题目】春甘蓝耐裂球性鉴定方法及标准研究初报
【中文关键词】春甘蓝;裂球;鉴定方法
【英文关键词】无
【中文摘要】通过对春甘蓝几个不同耐裂球性品种的叶球成熟后,延迟不同天数的田间裂球指数研究分析,结果表明,随着时间延长甘蓝叶球裂球指数逐步增加,扁圆型叶球比圆球型叶球的耐裂球性较强,并初步提出了甘蓝叶球成熟后晚收10天作为耐裂球性鉴定时期,根据叶球的裂球指数对甘蓝叶球耐裂球性划分成高耐裂球、耐裂球、中耐裂球和易裂球4个不同的等级标准。

【题目】甘蓝小孢子诱导胚状体选用花蕾与细胞发育关系研究
【中文关键词】甘蓝;小孢子;胚状体;花蕾;发育
【英文关键词】无

【中文摘要】甘蓝在春季自然条件下生长抽薹植株花蕾的小孢子发育时期,以现蕾5天时,花粉细胞随着内容物的增多和液泡的形成变大,细胞核被挤到细胞边缘,靠近细胞壁,处于单核靠边期。以花蕾大小判断,在4.5~5.49mm区段范围内甘蓝小孢子所处的单核靠边期平均所占比例为76%.花蕾小孢子多数处在单核靠边期,容易诱导出胚状体。

【题目】春甘蓝腋芽叶片离体培养及植株再生技术研究
【中文关键词】春甘蓝 ; 腋芽 ; 叶片 ; 组织培养 ; 植株再生
【英文关键词】spring cabbages;axillary bud;leaf;tissue culture;plant regeneration
【中文摘要】[目的]探索一种能保留春季栽培春甘蓝亲本春性的育种方法.[方法]以春季田间栽培的春甘蓝MP01-11152、GB9266-18136、DT409-05121 3个亲本自交系为试材,选用其成熟叶球腋芽叶片为外植体,首先以MS为基础培养基,添加0,2,3,4,5 mg/L 6-苄基腺嘌呤(6-BA)、0,0.05,0.1,0.2,0.3,0.4,0.5 mg/L α-萘乙酸(NAA)对MP01-11152亲本自交系进行筛选,筛选出6-BA和NAA的最佳质量浓度;然后利用已选出的6-BA和NAA最佳质量浓度,分别对供试3个品种进行腋芽叶片离体培养及植株再生研究.[结果]以MP01-11152为材料进行离体培养,筛选出6-BA和NAA的最佳质量浓度分别为2和0.4 mg/L.3个亲本自交系中,GB9266-18136在MS+2 mg/L 6-BA+0.4 mg/L NAA中诱导的不定芽分化率最高,为211%;MP01-11152次之,为122%;DT409-05121最低,为82%.将诱导出的不定芽在 MS+0.3 mg/L NAA生根培养基中诱导生根,不定根的诱导频率可达98%,并锻炼生长成苗.[结论]在MS培养基中添加适宜质量浓度的6-BA或NAA 2种激素,能够有效地提高春甘蓝腋芽叶片不定芽的诱导分化率,基因型对不定芽诱导的分化率有一定影响.
【英文摘要】[Objective] This passage discusses the method for keeping the springness from the leaf of the axillary buds on spring, to develop and enhance the breeding of spring cabbages. [Method] Three parental inbred lines MP01-11152, GB9266-18136, DT409-05121 were cultured in axillary bud's leaves. A study on maximum plants regeneration was done in MS medium complementing to the material of MPOl-11152,with MS as media by adding 6-BA with the concetration of 0,2,3,4,5 mg/L,then adding NAA with the concetration of 0,0. 05,0. 1,0. 2,0. 3,0. 4,0. 5 mg/L to screen the optimal concentration on this basis, Finally,the obtained optimal concentration of 2 mg/L 6-BA + 0. 4 mg/L NAA was used to research the plant regeneration on the material of MP01-11152,GB9266-18136,DT409-05121. IResultl The differentiation of shoot regeneration of MP01-11152 was 92% with 6-BA 2 mg/L and 122% with 2 mg/L 6-BA+0. 4 mg/L NAA. GB9266-18136, one of the three parental inbred lines, obtained a high differentiation rate of 211%,MP01-11152's differentiation 122%. DT409-05121's differentiation 82%. Medium for root was MS containing 0. 3 mg/L NAA and could be cultured and developed into plantlets, the rooting rate as high as 98%. [Conclusion] For the leaf in growth period of the axillary buds on spring cabbages,it could improve the differentiation of shoot in MS medium complemented with 6-BA or NAA. The genotypes have certain effects on shoot differentiation rate.

【题目】结球越冬甘蓝无公害栽培技术
【中文关键词】结球甘蓝;越冬;无公害栽培技术
【英文关键词】无

【中文摘要】结球越冬甘蓝在长江流域栽培面积比较大,在湖北、湖南、河南、上海等地形成相当生产规模,是当地冬季种植的主要蔬菜品种之一。结球越冬甘蓝无公害栽培667m2产量可达到3500~4500kg,由于采用无公害栽培技术生产,销售价格基本上能够稳定在0.7 元/kg 左右,除去农资成本500 元/667 m2,667 m2 经济效益达3 000 元左右, 经济效益可观,市场前景十分广阔。

【题目】SRAP、ISSR技术的优化及在甘蓝类植物种子鉴别中的应用
【中文关键词】甘蓝类植物; SRAP; ISSR; 反应体系; 鉴别;
【英文关键词】Brassica oleracea L.; SRAP; ISS; reaction system; identify;
【中文摘要】将SRAP与ISSR2种分子标记技术应用于8种甘蓝类植物(BrassicaoleraceaL.)的种子鉴别中。先以甘蓝(Brassicaoleraceavar.capitata)基因组DNA为模板,通过对SRAP、ISSR反应体系中各影响因素的逐一筛选,优化了甘蓝类植物SRAP、ISSR反应体系。进而采用30个SRAP引物组合和15个ISSR引物对白甘蓝、皱叶甘蓝、红甘蓝、羽衣甘蓝、花椰菜、青花菜、抱子甘蓝、球茎甘蓝的基因组DNA进行了PCR扩增,结果表明M3-E5与M4-E5两个SRAP引物组合可以在8种甘蓝类植物之间显示较高的多态性;844和888两个ISSR引物也可在8种甘蓝类植物之间产生很好的多态,特别是844引物单独应用即可区分所有材料。
【英文摘要】In this study, the molecular marker technology of SRAP and ISSR were applied in rapid identification of seeds from eight species of Brassica oleracea L. Firstly, using the genomic DNA of cabbage as template, SRAP and ISSR reaction systems were optimized through testing every factor, respectively, that affects PCR amplification. Then, using the optimized reaction systems, 30 SRAP primer pairs and 15 ISSR primers were applied to amplify genomic DNA of cabbage, savoy, purple cabbage, borecole, cauliflower,broccoli, Brussels sprouts, and kohlrabi The results showed that high polymorphisms were exhibited among the eight species of Brassica oleracea L. by SRAP primer pairs of M3-E5 and M4-E5, as well as ISSR primers of 844 and 888, especially primer 844 which can identify all eight materials efficiently.

【题目】6个甘蓝自交系的3个主要营养品质性状配合力分析
【中文关键词】甘蓝; 营养品质性状; 一般配合力; 特殊配合力;
【英文关键词】Cabbage; Nutritional quality character; General combining ability; Specific combining ability;
【中文摘要】采用P(P+1)/2完全双列杂交设计对6个甘蓝自交系的3个主要营养品质性状进行一般配合力(GCA)和特殊配合力(SCA)分析,结果表明:3个性状同时受加性和非加性效应控制。同一品质性状不同亲本的GCA差异很大,同一自交系不同品质性状的GCA也有差异,在6个自交系中Vc的一般配合力效应值最高的是P6亲本;还原糖的一般配合力效应值最高为是P1;P6粗纤维的一般配合力效应值最低。同一性状不同组合和同一组合各性状的SCA效应值均有较大差异。试验中Vc含量的特殊配合力较好的有P1×P2、P3×P4、P4×P5;还原糖含量特殊配合力较好的有P1×P6、P3×P5;而对于要求降低粗纤维含量的育种要求,选择P1×P4较为适合。
【英文摘要】The general combining ability(GCA) and specific combining ability(SCA) of 3 major nutritional quality characters in 6 inbred lines of cabbage were analysed through P(P+1)/2 complete diallel cross.The results showed that the three characters were controlled simultaneously by both additive gene actions and non-additive gene actions.The difference of GCAs for each character was great between different parents,and for one inbred line also there was difference between the GCAs of different characters. Among 6 inbred lines, P6 had the highest GCA of vitamin C and the low est GCA of crude fiber, and P1 had the highest GCA of reducing sugar. The SCAs of a character between different combinations were quite different and so were the SCAs of different characters for one combination. P1×P2, P3×P4 and P4×P5 had a better SCA of vitamin C, and P1×P6 and P3×P5 had a better SCA of reducing sugar character. P1×P4 combination was appropriate for the breeding purpose of low crude fiber.

【题目】“ 夏光 ”、“ 早夏16 ”甘蓝杂交种DNA指纹图谱的构建
【中文关键词】甘蓝 ; 杂交种 ; SSR ; RAPD ; DNA指纹图谱
【英文关键词】Cabbage;Hybrid;SSR;RAPD;DNA Fingerprint
【中文摘要】用SDS法提取甘蓝(Brassica oleracea vat.capigata)杂交种“ 夏光 ”、“ 早夏16 ”及其各自亲本的基因组DNA,通过SSR、RAPD两种分子标记方法构建其DNA指纹图谱用于纯度鉴定。利用30对甘蓝SSR引物和50个适用于甘蓝的RAPD引物,以各杂交种及其亲本的基因组DNA为模板组合进行筛选,结果显示:多数SSR引物对两组合扩增带型一致,未能建立SSR指纹图谱;通过RAPD标记方法筛选出能鉴定两杂交种纯度的引物分别为S15、S42、S147和S42、S78、S88,其中引物S42对两组合均能扩增出特异的RAPD指纹图谱,并将RAPD指纹图谱转蛮为相府的数字指纹。
【英文摘要】The genomic DNAs were extracted by the method of SDS from two cabbage (Brassica oleracea vat, capitata) hybrids ("Xiaguang", "Zaoxia 16") and their parents in order to establish their DNA fingerprints by RAPD and SSR methods for identification of seed purity, The genomic DNAs of each hybrid and its parents were used as one group of template DNA to screen 30 pairs of SSR primers and 50 RAPD primers. The results indicated that the types of DNA bands amplified by most SSR primers in the two groups was similar, so the establishment of SSR fingerprints failed, But 3 efficacious RAPD primers were gained in each group, which were S15, S42, S147 and S42, S78, S88 respectively. The specific RAPD fingerprints in the two groups could be established with S42 primer and then transformed into digital fingerprints.

【题目】番茄抗病基因的Codominant-SCAR体系建立与优化
【中文关键词】番茄 ; 抗病基因 ; Codominant-SCAR ; MAS
【英文关键词】Tomato,Resistant gene,Codominant-SCAR, MAS
【中文摘要】在本研究中,利用近等基因系建立了番茄抗病基因的Codominant—SCAR体系。利用已知序列设计的5对引物SCAR1、SCAR2、SCAR3、SCAR4和SCAR5,分别可以用于标记识别抗根结线虫基因胁,抗番茄斑点萎凋病毒病基因Sw-5,抗烟草花叶病毒基因Tin2~2、Tm-1、Tm-2;其中SCAR1、SCAR3和SCAR5为共显性,能有效地区分纯合抗病基因型、杂合抗病基因型与感病基因型。结果表明该方法具有重复性好、迅速、简便、成本低的特点,可用于番茄和其它作物的分子育种。
【英文摘要】A standard Co-dominant-SCAR system fitting for tomato was established to identify seven tomato NILs. 5 PCR primers were designed based on the published sequence, SCAR1 marker tightly linked with Mi gene, SCAR2 marker tightly linked with Sw-5 gene, SCAR3 marker tightly linked with Tin2~2 gene, SCAR4 marker tightly linked with Tin-1 gene, SCAR5 marker tightly linked with Tin-2 gene. Among them, SCAR1, SCAR3, SCAR5 were co-dominant marker, homozygous genotypes, heterozygous genotypes and

susceptible genotypes were distinguishable after cleavage with the restriction enzyme. The results indicated that the co-dominant-SCAR is characterized by good reproducibility, low cost and time consuming. It is useful for the MAS application in tomato and other crops breeding.

【题目】番茄苗龄对晚疫病生理小种T1的抗性表现差异研究

【中文关键词】番茄 ; 晚疫病 ; 苗龄抗性
【英文关键词】Tomato;Late blight; Age-related resistance
【中文摘要】对感病和抗病品系3、6、9叶苗龄番茄幼苗人工接种晚疫病菌T1小种,结果表明,感病品系随着苗龄的增加,对晚疫病的感病程度有所减轻,其中6叶期较3叶期、9叶期较6叶期幼苗的病级指数分别降低了28.8%和3.9%,但差异不显著;9叶期较3叶期降低了31.0%,差异达显著水平.抗病品系的6叶期和9叶期较3叶期幼苗病级指数均降低了50%左右,差异达极显著水平;6叶期和9叶期幼苗抗性基本相同.
【英文摘要】Susceptible and resistant tomato lines were artificially inoculated with Phytophthora infestans strain T, during different seedling ages of 3, 6, 9 leaves. Results indicated that with the seedling aging the susceptible lines presented lower susceptible level. The disease index decreased 28. 8% and 3. 9% respectively for 6 leaves stage compared to 3 leaves stage and 9 leaves stage compared to 6 leaves stage, while the difference between them was not significant. The disease index of 9 leaves seedlings decreased 31. 0% than 3 leaves ones and the difference was significant at 5 % level. Regarding to the resistant lines, the disease index of 6 and 9 leaves reduced also about 50% when compared to 3 leaves seedling. The difference was significant at 1% level. The resistance of 6 and 9 leaves age seedling was almost the same.

【题目】番茄遗传转化体系的建立及LC和GFP标记基因的表达
【中文关键词】Le gene:绿色荧光蛋白;番茄:遗传转化
【英文关键词】Lc gene,GFP gene,Tomato,Genetic transformation
【中文摘要】本研究以小型番茄(miniature Lycopersicon esculentum Mill.)Micro-Tom为试材,建立其以子叶、下胚轴为外植体的高效、稳定再生体系及遗传转化体系.结果表明,以子叶、下胚轴为外植体时,诱导愈伤组织和芽分化的适宜培养基均为MS+6-BA 2.0mg/L+IAA 0.2mg/L,芽分化率均可高达92%.两种外植体适宜的生根培养基均为MS+NAA 0.1mg/L.同时,通过根癌农杆菌介导法,建立了Micro-Tom的遗传转化体系.而乙酰丁香酮能大大提高根癌农杆菌转化番茄的效率,当AS=180 μm/L时,芽分化率为52.8%;OD600=0.14是转化的最佳菌液浓度;子叶外植体与农杆菌共培养后,经过诱导,根的再生,获得了抗性苗,利用绿色荧光蛋白(GFP)检测和整株表型为紫色(Lc)基因的表达,初步证明外源基因已经整合到Micro-Tom中,为番茄激活标签体系的建立奠定了基础.
【英文摘要】Micro-Tom(miniature Lycopersicon esculentum Mill.)was used as the material,to establish the high efficient and stable plant regeneration by cotyledon and hypocotyl.111e results showed that with cotyledon and hypocotyl as explants,the best callus initiation and shooting medium was MS+6-BA 2.0ms/L+IAA 0.2mg/L.The best rooting medium for both the explants was MS+NAA 0.1 mg/L.Meanwhile established genetic transformation system of Micro-Tom though Agrobacterium tumefaciens,and gained purple mutant.The results showed that AS could improve the transformation rate.when AS is 1 801xm/L,the differentiation rate was 52.8%,OD啪20.14 Was the best infect concentration;Kan resistant plant obtained from the infection of explants with Agrobacterium.Detection of green fluorescent protein under microscope and the express of Lc gene firstly confirmed that transgene was integrated into Micro—Tom.

【题目】江苏省番茄晚疫病菌小种鉴定及品种抗性筛选
【中文关键词】番茄;晚疫病;生理小种;抗性资源;
【英文关键词】tomato; late blight; physiological race; resistance resource;
【中文摘要】分离纯化72份采自江苏省的番茄晚疫病标样,获得番茄晚疫病菌菌株35株。采用亚洲蔬菜研究与发展中心提供的5个鉴别寄主进行生理小种鉴定,鉴定结果表明:江苏省番茄晚疫病菌的小种类型有T0、T1、T1.2、T1.2.3、T1.3.4,其中T1.2地理分布最广,出现频率最高,占鉴定总数的37.2%;其次为T1,占总数的34.3%;T1.2.3、T1.3.4和T0分别占鉴定总数的17.1%、5.7%和5.7%。采用优势小种T1.2对54份番茄品种或育成品系进行苗期喷雾接种,结果表明:高抗、中抗、高感品种分别占鉴定总数的14.8%、7.4%和77.8%,其中高抗材料均来自野生材料和野生材料杂交转育的后代,而江苏省生产上大部分主栽品种对晚疫病菌均表现为感病。因此,江苏省番茄生产应该高度重视抗病品种的引进和培育。
【英文摘要】Thirty-five isolates were obtained from 72 tomato late blight specimens collected in Jiangsu province and part of neighbor zone.Physiological races of the isolates were identified with five differential tomato cultivars from the World Vegetable Center.T0,T1,T1.2,T1.2.3 and T1.3.4 were identified,with race T1.2 the most widely distributed and predominant one with a frequency of 37.2%.Following T1.2,T1 occurred with frequency of 34.3%.The races T1.2.3,T1.3.4 and T0 were narrowly distributed with frequencies of 17.1%, 5.7% and 5.7%, respectively. Artificial spraying inoculation was carried out with predominant raceT1. 2 on the seedlings of 54 tomato varieties or lines. Highly resistant and moderately resistant cultivars which were derived from wild resources accounted for only 14.8% and 7.4% of the total identified cultivars, while highly susceptible cultivars which were also predom inantely planted in Jiangsu province amounted to 77.8%. It is important to introduce resistant resources and breed resistant cultivars for tomato production in Jiangsu province.

【题目】耐贮藏番茄新品种‘浙杂205’
【中文关键词】番茄; 一代杂种; 耐贮藏

【英文关键词】Tom ato; Hybrid; Long-storage
【中文摘要】‘浙杂205’.是中早熟番茄一代杂种,耐低温、弱光,高抗枯萎病,抗ToMV,中抗叶霉病;中大果型,大红色,鲜艳,果面光滑;丰产性好,产量可达150~ 200 t/hm2,耐贮藏,室温下(25℃) 货架期长达25 d;适合保护地栽培。
【英文摘要】A new mid-early maturing tomato hybrid ‘Zheza 205’ has been released. It can be grown normally in low temperature and weak light. It is highly resistant to ToMV, fusarium w ilt ,verticillium wilt and moderately resistant to leafmold. Medium to large in fruit size, bright red in color, regular in shape and good commodity with high yield. The yield is 150- 200 t /hm2. Fru it is storable. Its shelflife lasts 25 days in room temperature (25℃). The cultivar is suitable for protected cultivation.

【题目】苗期亚低温对番茄生殖生长的影响
【中文关键词】番茄; 亚低温; 苗龄; 生殖生长; 畸形果率
【英文关键词】Tomato; Low temperature; Seedling age; Reproductive growth; Malformed fruit rate
【中文摘要】对10个不同基因型番茄(Lycopersicon esculentum Mill)品种(系)的苗期3个不同阶段进行10/5℃ 亚低温处理。结果表明,苗期10/5℃ 处理使番茄开花期推迟,对第一花序坐果率有较大影响,并以7~ 8片真叶期低温处理影响最大;苗期10/5℃ 处理均会引起畸形果率的提高,以2~ 3、7~ 8 片真叶期处理影响大。不同的基因型,其生殖生长对低温的反应也是不同的。
【英文摘要】Ten different genotypes of tomato lines were used as test materials. The 10/5℃ low temperature treatment for them was carried out at their three different leaf ages, and then the seedlings were planted in a plastic tunnel. The results showed that the low temperature treatment made the flowering time of tomato postpone and in jured the first in florescence fruit setting. The effect of the treatment at 7-8 leaves stage was the greatest. The low temperature treatment also made them alformed fruit rate in crease and the effect of the treatment at 2-3 and 7-8 leaves stages were greater. Different geno types of tomato lines had different responses of reproductive growth to the low temperature treatment.

【题目】番茄抗黄化曲叶病育种研究进展
【中文关键词】番茄黄化曲叶病;抗性基因;分子标记;育种
【英文关键词】tomato yellow leaf curl disease (TYLCD); resistance gene; molecular marker; breeding
【中文摘要】番茄黄化曲叶病是一种毁灭性病害,该病是世界许多地区番茄生产的重要限制因素。该病害在田间由烟粉虱传播,由于不同地区的番茄黄化曲叶病毒变异较大,这使番茄抗番茄黄化曲叶病育种进展很慢。本文从番茄黄化曲叶病毒的检测与防治、番茄抗源材料的筛选与抗性鉴定、抗番茄黄化曲叶病基因及其分子标记等几个方面论述了目前国内外的研究现状,并就存在的问题及未来研究方向进行了讨论。
【英文摘要】Tomato yellow leaf curl disease (TYLCD) is the most destructive disease of tomato. It can cause serious loss, and is the main limiting factor in tomato production in many parts of the world. It is spread by silverleaf whiteflies, also known as Bemisia tabaci. The high variability among tomato yellow leaf curl virus isolates from different geographical areas makes progress in breeding for resistance to TYLCD slowly. This paper reviews detection and control of TYLCV, current advance of study on the screening of TYLCD-resistance, methods of resistance identification, genes with resistance/tolerance to TYLCD and molecular marker. The

problems to be solved and prospects of TYLCD-resistant breeding were discussed.

【题目】利用PCR技术同时检测番茄抗根结线虫基因(Mi-1)和抗叶霉病基因(Cf-9)
【中文关键词】番茄 ; Mi-1 ; Cf-9 ; 分子标记
【英文关键词】tomato;Mi-1;Cf-9;molecular marker
【中文摘要】利用同一PCR反应体系,对分别与番茄抗根结线虫的Mi-1基因和抗番茄叶霉病的Cf-9基因紧密连锁的CAPS(cleaved amplified polymorphic sequences)标记进行同时扩增筛选,扩增的特异性片段与单引物扩增片段吻合.与Cf-9基因紧密连锁的CAPS1标记在抗病试材中可扩增出2775bp的特异片段,且存在TaqⅠ酶切位点,酶切后产生1177bp、446bp、370bp和160bp的不同特异片段;与Mi-1基因紧密连锁的CAPS2为共显性标记,抗性材料中产生915bp的特异片段,TaqⅠ酶切后产生719bp和196bp的特异片段.该体系可用于在同一PCR反应体系中对Mi-1和Cf-9 2个抗病基因进行同时筛选鉴定.该体系的建立不仅省时、省工,节省费用,而且可用于苗期早期辅助选育,加快番茄育种进程.
【英文摘要】Mi-1 and C f-9 genes in tomato tightly linked with two CAPS (cleaved amplified polymorphic sequence) markers and respectively resistant to root-knot nematode and leaf mold were amplified and screened by using a single PCR reaction. The PCR products were correspond to the amplified bands produced by single CAPS primer. Among them, 2775 bp fragment linked with C f-9 gene was amplified in the resistant tomato lines. The amplified bands were distinguishable after cleavage with the restriction enzyme TaqⅠ. Genotype with C f-9 gene could produce 1177 bp, 446 bp, 370 bp and 160 bp bands, respectively. The co dominant CAPS2 marker tightly linked with Mi-1 gene produced 915 bp fragment in the resistant tomato lines. Genotype with Mi-1 gene could produce 719 bp and 196 bp bands, respectively. The replicated stable results proved that two resistant genes could be identified simultaneously by using corresponding CAPS primer under adaptable condition. Compared with single primer PCR, this system is time-saving, labor saving and low cost. It could be very useful for markerassisted selection during early stage in tomato and efficiently speed up breeding procedure.

【题目】上海地区番茄黄化曲叶病毒病的鉴定及嫁接接种法研究
【中文关键词】番茄黄化曲叶病毒, 鉴定, 嫁接
【英文关键词】Tomato Yellow leaf curl virus (TYLCV), Identification, Graft
【中文摘要】番茄黄化曲叶病毒(tomato yellow leaf curl virus, TYLCV)是一种由烟粉虱(Bemisia tabaci)和嫁接传播的双生病毒,在热带、亚热带地区给番茄生产造成严重威胁。根据番茄黄化曲叶病毒的保守序列设计一对引物,运用PCR 技术从上海地区的感病番茄中扩增出一条575 bp 的特异带,而健康植株无此带。测序表明该序列与番茄黄化曲叶病毒具有极高的同源性(97%~99%)。将健康接穗嫁接到感染番茄黄化曲叶病毒的番茄砧木上,间隔15 d 和30 d,分别提取接穗的DNA,并用PCR 法检测病毒,发现嫁接15 d 后在部分接穗中检测到TYLCV 病毒,嫁接30 d 后在所有的接穗中均检测到病毒,因此,嫁接法可以作为番茄黄化曲叶病毒病的接种鉴定方法。
【英文摘要】Tomato yellow leaf curl virus (TYLCV), transmitted by the whitefly Bemisia tubuci (Gennadius) and grafting is one of the most devastating diseases of cultivated tomato (Lycopersicon esculenrum Mill.). TYLCV causes economic losses in tomato crop in many tropical and subtropical regions. A pair of primers was designed according to the specific sequence of the TYLCV gene and used in the PCR detection of the virus in the infected tissues of tomato grown in the Shanghai areas. The results showed that the target fragment of about 575 bp could be detected in infected sample, but not from health sample. Sequencing results indicated that the DNA, a sequence was most closely related to TYLCV (97%~99% sequence identity). In graft inoculation, health tomato as cions were side graft-inoculated with stems from TYLCV-infected source plants of tomato. Total DNA were extracted from cions after 15 days and 30 days for PCR detection. The results showed that some of cions infected TYLCV after 15 days,and all of them infection after 30 days. Thereby, graft-inoculation can be used in TYLCV resistance breeding.Thereby, graft-inoculation can be used in TYLCV.

【题目】TYLCV侵染对番茄叶绿素荧光猝灭和吸收光能分配的影响
【中文关键词】番茄 ; TYLCV ; 叶绿素荧光猝灭 ; 吸收光能分配
【英文关键词】Tomato;TYLCV;Chlorophyll fluorescence quenching;Absorbed light energy allocation
【中文摘要】研究了上海地区番茄黄化曲叶病毒侵染番茄后在不同时期对叶绿素荧光猝灭和吸收光能分配的影响.结果表明:病毒侵染后,叶绿素含量逐渐下降,后期虽有所提高,但一直低于健康对照;叶绿素荧光参数Fv/Fm、Fv'/Fm'、ETR、ΦPSⅡ、qP均低于对照,只有qN大于对照.与健康对照比,病毒侵染后导致了光化学反应速率的降低以及天线热耗散和反应中心过剩能量的增加.
【英文摘要】The chlorophyll fluorescence quenching and absorbed light energy allocation changes of TYLCV-infected tomato plants at different stages were studied in Shanghai area. The results showed that after infected,the plants' chlorophyll content started decreasing and somewhat increased at later stage,but was lower than that of control plants all the time.Compared with control plants,the infected plants were lower in such fluorescence parameters as Fv/Fm,Fv'/Fm',ETR,ΦPS Ⅱ and qP,and higher only in qN.TYLCV infection resulted in a decrease in photochemical reaction rate and an increase in antenna heat dissipation and excessive energy of reaction center.

【中文摘要】‘ 莎龙 ’是青岛农业科学院新育成的适合保护地、露地栽培的中熟番茄一代杂种, 抗ToMV、枯萎病、南方根结线虫害, 中果型大红果, 丰产性好, 产量达150 000 kg /hm2 以上, 耐贮藏, 室温下(25℃) 货架期在18 d以上。
【英文摘要】Shalong is a new mid-ripening tomato hybrid. It is resistant toMV, fusarium wilt and southern root-knot nematode disease, mid-type fruit,regular shape, good commodity and high yield. The yield is more than 150 000 kg /hm2. It has good storage to lerance and its shelf life is 18 days at room temperature (25℃).The variety is suitable for protected field and open field production.

【题目】番茄抗晚疫病基因Ph-3的RAPD标记
【中文关键词】番茄 ; 晚疫病 ; RAPD标记 ; Ph-3基因
【英文关键词】late blight; RAPD marker; gene Ph-3
【中文摘要】以番茄抗晚疫病材料CLN2037和感病材料T2-03杂交的F_2分离群体的147个单株为试材,通过抗病性鉴定,选择高抗单株和高感单株分别建抗、感病池.采用BSA法筛选了230条RAPD引物,其中引物CCPB272-03(序列为GGTCGATCTG)在抗、感病池扩增出多态性片段CCPB272-03_(740),通过F_2单株验证后证明CCPB272-03_(740)与抗晚疫病基因Ph-3紧密连锁,遗传距离为5.8 cM.

【英文摘要】The objective of this study was to identify RAPD marker for resistance to late blight in tomato.BSA (Bulked Segregant Analysis) was used to search for RAPD markers linked to late blight resistant gene Ph-3,using F_2 segregating population(147 individuals)derived from a cross of CLN2037(resistant) and T2-03(susceptible).Two hundred and thirty decamer primers with arbitrary sequences are chosen for polymerase chain reaction amplication.One RAPD marker CCPB272-03_(740)(the sequence of the primer is GGTCGATCTG) was tightly linked to the resistant gene Ph-3 and it was 5.8 cM from the resistant gene.

【题目】辽宁部分地区番茄晚疫病菌生理小种及抗病性鉴定.
【中文关键词】番茄晚疫病 生理小种 鉴别寄主 抗病性鉴定
【英文关键词】Tomato late blight, Physiological race, Differential host, Resistance identification
【中文摘要】将番茄材料Ts19、Ts33、W. Va700、L3708和LA1033作为鉴别寄主, 对辽宁省沈阳、新民、岫岩的番茄晚疫病菌的6个菌株进行了生理小种鉴定, 结果共鉴定出3个生理小种, 即生理小种T0、T1和T1, 2。引进的抗病材料CLN2037G、CLN2037H 对辽宁地区番茄晚疫病菌生理小种T1, 2表现为抗病, 抗性明显优于当地材料。辽宁当地主栽品种对晚疫病没有抗性, 全部枯死。
【英文摘要】Five tomato lines, TS19(ph+) , TS33 (ph-1) , W. Va 700(ph-1,2), L3708(ph-3,4) and LA1033(ph-5), were used as differential hosts to identify the physiological races of six Phytophtora infestans strains collected from Shenyang, Xinmin and Xiuyan of Liaoning province. Three races of T0, T1 and T1, 2 were found out. Two breeding lines of CLN2037G and CLN2037H were resistant to race T1, 2. Eight breeding lines and five varieties planted in Liaoning province were all susceptible to physiologica l race T1, 2.

【题目】番茄晚疫病人工接种技术研究及抗病种质资源筛选
【中文关键词】番茄; 晚疫病; 人工接种; 抗病性鉴定
【英文关键词】tomato; late blight; artificial inoculation; resistance identification
【中文摘要】为探索适宜番茄晚疫病人工接种的技术体系, 对番茄晚疫病人工接种技术进行了系统的研究, 结果表明: 适宜番茄晚疫病苗期人工接种的方法是孢子囊悬浮液喷雾法和涂抹法, 6~8 叶期是植株适宜的接种时期, 适宜接种的保湿时间和孢子囊浓度分别为24h和5×104 孢子囊・mL-1。采用孢子囊悬浮液喷雾法和离体叶片涂抹法对20 份番茄材料进行了抗病性鉴定, 筛选出6 份抗病试材, 以CLN2037G、CLN2307H 和CLN2037I 抗性最好, 表现为高抗; 喷雾法和离体叶片涂抹法两种方法的鉴定结果基本一致。
【英文摘要】The artificial inoculation of tomato late blight was studied. The results indicated that spraying method and painting method with sporangial suspension were the proper inoculation methods. Seedling ages of 6 to 8 leaves were suitable for the artificial inoculation. The best moisture preserving time and inoculation concentration were 24h and 5×104sporangia・mL-1respectively.The resistance identification of 20 tomato resources with spraying method on the seedlings and painting method on the detached leaves showed 6 resistant tomato resources, with CLN2037G, CLN2037H and CLN2307I as the examples.The results of spraying method and painting method of detached leaves were idemfified.

【题目】番茄晚疫病菌生物学特性研究
【中文关键词】番茄; 晚疫病菌; 生物学特性
【英文关键词】Tomato;Phytophthora infestans;Biological characteristics
【中文摘要】对番茄晚疫病菌的生物学特性进行了初步研究, 试验结果表明: 病菌菌丝在大多数培养基上均能良好生长, 其中RSA 培养基最适宜菌丝生长及产孢; 光照条件不利于菌丝生长及产孢, 而黑暗条件起到促进作用; 菌丝对碳源的利用, 以蔗糖最好, 甘露糖最差; 在氮源利用方面, 大多数氮源均促进菌丝生长, 产孢量以氨基丙酸最多, 胱氨酸最少; 菌丝生长和产孢的温度范围为10~ 30℃ , 最适温度20℃ , 适宜pH 为5~ 9。孢子囊萌发的最适温度为15℃ , 高于35℃不能萌发; 光照抑制孢子囊的萌发, pH 为7 时孢子囊萌发率最高; 孢子囊在各种营养物质中均能萌发; 孢子囊的致死温度为57℃ , 10min。
【英文摘要】The study of biological characteristics of Phytophthora inf estans showed that the mycelium could grow better on the most of culture media, but RSA was the best one. The light held up the growth of mycelium and sporangium, and the dark generated the promoting effect. The pathogen could make full use many kinds of carbohydrates. The sucrose was the best C source and mannose was the worst C source. Alanine was the best N source while cystine was the worst one. The temperature for mycelial growth and sporulation was from 10℃ to 30℃ , and the optimum temperature was 20℃ . The proper pH values ranged from 5 to 9. For sporangium germination of the pathogen, the optimum temperature was 15℃ . The sporangium failed to germinate at temperature higher than 35℃ . The light had no effect on the sporangium germination, and the proper pH value was 7. All kinds of nutrients were suitable for sporangium germination. The sporangia lethal temperature was 57℃, 10min.

【题目】番茄灰霉病抗病资源的初步筛选

【中文关键词】番茄; 灰霉病; 抗源筛选; 离体茎接种
【英文关键词】Tomato; Gray mold; Resistance screening; Vitro stem inoculation
【中文摘要】通过离体茎接种法, 对26份番茄材料进行灰霉病抗病资源筛选, 结果表明: 多毛番茄T2-07-316高抗灰霉病, 接种6 d后相对茎侵染率及相对茎腐扩展速率均为0; 另有7份转基因普通番茄对灰霉病也表现出较好的抗性, 相对茎侵染率在151 00 % ~ 381 33% 之间, 相对茎腐扩展速率在101 22 % ~ 23157% 之间, 其中以T2-07-337抗性最好。
【英文摘要】Through vitro stem inoculation method, resistances of 26 tomato germplasms to gray mold(Botrytis cinerea) were identified. The results showed that Solanum. habrochaites T2-07-316 was highly resistant to graym old with zero of relative stem infection frequency (RSIF) and relative stem rot expansion rate (RSRER) after inoculated 6 days. That other 7ma terials showed resistant to the disease with RSIF of 15100% - 38133% and RSRER of 10122 % - 23157 %, and T2-07-337 showed stronger disease resistance.

【题目】番茄花药培养愈伤组织诱导及植株再生的研究
【中文关键词】番茄; 花药培养; 愈伤组织; 植株再生
【英文关键词】tomato; anther culture; callus; plant regeneration
【中文摘要】以5 个番茄F1 杂交种为试材, 研究了基因型、植物生长调节剂、变温处理和椰乳对愈伤组织发生及植株再生的影响, 旨在优化番茄花药培养的技术方法。结果表明: 不同基因型愈伤组织发生率不同; 培养基中添加0.5mg · L- 1 的2,4- D 较NAA, 5 个材料的愈伤组织平均诱导率提高了10.04%; 4℃48h+33℃72h 的处理对愈伤组织的诱导有明显的促进作用; 培养基中加入50mg · L- 1 的椰乳可提高愈伤组织诱导率。植株再生的较优培养基为MS+0.2mg · L- 1 IAA+2.0mg · L- 16- BA +0.5mg · L- 1ZT。基因型和培养基是愈伤组织的发生和植株再生的主要影响因素; 适当的低温处理配合高温热激, 及在培养基中添加椰乳有利于愈伤组织的发生。
【英文摘要】The effects of genotypes, plant growth regulators, variable temperature pretreatment, coconut milk on callus inducement frequency and plant regeneration were studied in five F1 hybrids of tomato by anther culture method in order to optimize the technology and method. It was found that the rate of callus was related to the genotypes; the callus inducement frequency with addition of 0.5mg · L- 1 2,4- D increased 12.91% than that with addition of NAA; 4℃ 48h+33℃ 72h pretreatments enhanced remarkably the frequency of the callus inducement frequency; 50mg · L- 1 coconut milk could enhance the callus inducement frequency; the medium of MS+0.2mg · L- 1IAA+ 2.0mg · L- 16- BA +0.5mg · L- 1ZT induced plant regeneration. So genotypes and culture medium are the major factors which effect the callus inducement frequency and plant regeneration; suitable low and high temperature pretreatment and coconut milk can enhance the callus inducement frequency.

【题目】番茄抗根结线虫病基因(Mi)分子标记的评估

【中文关键词】番茄; 根结线虫病; 分子标记; 人工接种; 分子标记辅助选择
【英文关键词】Tomato; Root-knot nematode; Molecule markers; Artificial inoculation; Molecular marker assisted selection
【中文摘要】利用前人研究获得的2 对与番茄根结线虫病基因(M i) 连锁的分子标记, 对15份番茄材料进行苗期抗根结线虫病鉴定, 以检测其在育种实践中的有效性。结合室内分子标记鉴定和苗期人工接种鉴定, 筛选出对番茄根结线虫病免疫的材料1 份, 高抗根结线虫病的材料3份, 感根结线虫病的材料11份。结果表明,引物SCAR1和SCAR2均能检测出抗根结线虫病的特异条带, 但SCAR1标记与苗期人工接种的病情指数表现出更大的相关性。说明SCAR1标记更适合应用于番茄抗根结线虫病的辅助选择中。
【英文摘要】Two molecule markers linked to root-knot nematode resistance gene (Mi) were used to identify the root-knot nem atode resistance in 15 tomato materia ls during the seedling stage, and 1 immune material, 3 high resistant materials, and 11 susceptivem aterials were selected by molecular markers assisted by selection and artificial inoculation. The results showed that both SCAR1 and SCAR2 can amplify the specific band which may linked to root-knot nem atode resistance gene. Themarker SCAR1, which showed closer relation with disease index of artificial inoculation during seedling stage, was more suitable to be selected to identify root-knot nematode resistance in tomato.

【中文关键词】番茄;新品种;抗根结线虫;引种;注意事项
【英文关键词】无
【中文摘要】近年来,根结线虫的为害已成为农业、特别是设施蔬菜生产中的一个严重问题。以北京为例,全市十几个郊区县均有根结线虫发生,感病蔬菜一般减产20 %~30 %,严重的减产50 %,甚至绝收。番茄是受根结线虫为害严重的主要蔬菜作物之一。早在20 世纪40 年代,科学家就已把野生番茄对根结线虫的抗性成功地转入到栽培番茄。20 世纪60、70 年代抗线虫番茄品种就已在发达国家应用。实践证明,在根结线虫为害严重的地区,选用抗线虫番茄品种是最为经济、有效、安全的防控途径。北京市农林科学院蔬菜研究中心从1997 年就开始了番茄抗根结线虫育种研究,经过多年的遗传改良、资源与技术储备,成功地把抗线虫基因转入到优良骨干自交系中。2005 年培育出粉果、硬肉型抗线虫番茄品种仙客1号,相继又培育出仙客5 号、仙客6 号等系列粉果抗线虫番茄品种。

【题目】番茄苗期抗旱性鉴定及其评价方法的研究
【中文关键词】抗旱,番茄,苗期,极度干旱,聚类分析
【英文关键词】Drought resistance, Tomato, Seedling, Extreme drought, Clustering analysis
【中文摘要】以不同番茄品种(系) 为材料, 采用极度干旱过程中遮阳和不遮阳的处理方法对其进行抗旱性筛选, 以确定有效、易行的番茄苗期抗旱性鉴定评价方法。经过比较分析, 发现苗期以营养钵栽植, 施以极度干旱处理并在强光照天气采取遮阳措施是番茄抗旱性鉴定较为有效的方法, 通过此方法从139 份番茄材料中筛选出24 份抗旱性强的材料, 59份耐旱材料。
【英文摘要】In order to establish an effective evaluation method for testing tomato drought resistance, different tomato varieties(lines) were tested under extreme dry conditions with sun covered and uncovered treatments to screen their drought resistance. Through comparative analysis, an effective method was found for drought resistance identification. In this method, seedlings were planted in earthen bowl filled with nutrients, treated with extreme dry soil under in tensified sun light but with coverage. 24 highly drought resistance and 59 drought tolerance materials were screened from 139 tomato materials by this method.

【题目】番茄新品种阿克斯1号的选育
【中文关键词】番茄; 阿克斯1号; 一代杂种; 抗病
【英文关键词】Tomato; ‘ AkesiNo.1 ’ ; F1 hybrid; Resistant to disease

【中文摘要】阿克斯1号是以优质、高抗青枯病、抗病毒病的X20 株系为母本, 以1801株系为父本配制而成的番茄一代杂种。无限生长类型, 中晚熟, 春季栽培从播种至初收约108 d (天) , 秋季栽培约99 d (天) 。果实近圆形, 果形指数01 96, 外形美观, 青果无绿色果肩, 成熟果鲜红色、有光泽。平均单果质量125 g, 果肉厚01 75 cm, 肉质硬实, 耐贮运。中抗青枯病和病毒病, 在高温条件下能正常结果, 抗逆性强, 品质优, 适合出口、市销和北运。每667 m 2 产量3 000 kg左右, 适宜华南及类似气候地区露地栽培。

【英文摘要】‘ AkesiNo.1 ’is a tomato F1 hybridbred by crossing lineX20 which is good quality, high resistant to bacterialwilt and virus disease as female parent and 1801 as male parent. It grows vigorously.It is of middle and late maturity. It takes about 108 days from seedling to harvest in spring cultivation and about 99 days in autumn cultivation. Its fruit is of round shape with 0.96 fruit shape index. Its young fruit shoulder is not green. The matured fruit is red in color with better firmness. Its average single fruit weight is 125g and the fruit thickness is 0.75 cm. It is good for storage and transportation. It is middle resistant to bacterialwilt and virus disease. It can bear fruit under high temperature with good stress resistance and superior quality. It is suitable for exporting, city marketing and transporting to Northern areas. Its yield is about 45 t/ hm 2. It is suitable to be cultivated in open field in Southern or similar climate region.

【题目】SCAR标记转化失败的原因和对策

【中文关键词】SCAR标记; SCAR转化失败; 原因和对策;

【英文关键词】SCAR marker; SCAR conversion failure; Reasons and remedies;

【中文摘要】SCAR标记作为一种快速、简便可以直接应用的分子标记,在标记辅助选择育种中发挥着重要的作用。但是目前SCAR标记的转化效率不是很高。本文从引物设计、序列相似或多拷贝及DNA甲基化等方面分析SCAR标记转化失败的可能原因;同时从引物设计技巧、PCR反应条件、借助CAPS和SSCP技术以及借助原始标记邻近序列等方面综述了SCAR标记转化失败的情况下获得序列特异性标记的几种有效补救手段。

【英文摘要】SCAR marker,as a fast,simple and direct useable molecular marker,played an important role in marker-assisted selection breeding. However,the conversion rate of SCAR markers is not very high at present. In this summary,we analysed the possible causes of SCAR conversion failure from the aspects,such as primer design,multi-copy or similarity of sequence,and DNA methylation,etc. At the same time,when the conventional SCAR marker conversion was failed,several effective remedy approaches for obtaining sequence-specific markers were overviewed from the aspects of primer design, PCR reaction condition, by CAPS and SSCP technology and with the aid of the flanking sequences of the origin markers.

【题目】利用高光谱数据和叶面积指数对加工番茄产量估算的研究
【中文关键词】冠层高光谱; 光谱变量; 叶面积指数; 估算模型;
【英文关键词】canop hyperspectral; hyperspectral parameters; estimation mode;
【中文摘要】以ASD FieldSpec光谱仪实测了大田中不同生育期加工番茄的冠层高光谱、叶面积指数及作物的产量,采用单时相线性逐步回归和复合回归,建立了加工番茄光谱变量-叶面积指数与产量的复合光谱估产模型,并对模型的估算结果进行了初步分析。分析结果表明,在青熟期光谱参数与叶面积指数相关性最大,而其他时期的光谱变量与产量相关性均达到了显著水平;复合回归模型以4个生育期与产量的复合回归最为理想。
【英文摘要】Canopy reflectance of processing tomato was measured with ASD FieldSpec at different growth stages; leaf area index (LAI) and processing tomato yields were collected. The relationship between canopy reflectance LAI and processing tomato yield was analyzed with single phase Linear Stepwise Regression and multivariate regression. The results revealed that there was a good relativity

between hyperspectral data and leaf area index at green maturing period, and was not significant correlation in other period.The ideal compound regression model of compound regression between production and 4 growth periods of tomato was obtained.

【题目】加工番茄光响应特征及其与产量的相关性研究
【中文关键词】加工番茄; 产量; 光响应特征参数; 相关性;
【英文关键词】Processing tomato; Yield; Photoresponse characteristic parameters; Relationship;
【中文摘要】[目的]研究加工番茄光响应特性及其与产量的相关性。[方法]用Li-6400在设定的光强梯度下对不同品种加工番茄进行光响应测定,对光响应曲线加以研究分析。根据光响应曲线的拟合方程计算最大光合速率,光饱和点,光补偿点,暗呼吸和表观量子效率等相关参数,把产量与这些参数进行相关性分析。[结果]结果表明,产量与最大光合速率、光饱和点、光补偿点、暗呼吸和表观量子效率等相关参数之间存在显著相关关系。[结论]可为加工番茄的田间栽培和高光效育种提供理论依据。
【英文摘要】[Objective] The research aimed to study the photoresponse characteristics of processing tomato and the relationship between its and yield.[Method] The response of photosynthesis rate to light intensity of different varieties were measured with Li-6400 under the different gradients,and the light response curves were researched and analyzed.The characteristic parameters including maximum photosynthetic ratio(Pnmax),light saturation point(LPS),light compensation point(LCP),dark respiration(Rd),apparent quantum efficiency (AQY) were calculated from those simulated equations. The relationship between yield and these characteristic parameters was analyzed. [Result] The results showed that there were significant relationship between yield and those characteristic parameters. [Conclusion] The study can provide theoretical basis for the cultivation and high light efficiency breeding of processing tomato.

【题目】叶面喷施NaCl对加工番茄果实耐挤压性和品质的影响
【中文关键词】加工番茄; NaCl处理; 果实品质; 果实硬度; 果实耐压力;
【英文关键词】processing tomato; sodium chloride treatment; fruit quality; fruit firmness; fruit compression tolerance;
【中文摘要】以加工番茄品种里格尔87-5和石红12为试材,研究了在果实发育期叶面喷施不同质量浓度NaCl对果实耐挤压性和品质的影响。结果表明,在适宜质量浓度范围内,叶面喷施NaCl可以提高加工番茄果实硬度、耐压力和产量,改善果实品质,但两个品种对NaCl质量浓度的反应有一定差异。对品种里格尔87-5,3.0 g/L NaCl处理使产量和果实硬度极显著提高,果实耐压力、可溶性总糖、还原糖和Vc含量增加;6.0 g/L NaCl处理可显著增加还原糖和可溶性总糖含量,对果实硬度、耐压力、Vc含量和产量的影响不大;9.0 g/L NaCl处理使果实硬度极显著降低,并对果实耐压力和产量有一定的不利影响。对品种石红12,3.0 g/L NaCl处理能显著提高产量,并有增加可溶性总糖、还原糖、Vc含量、果实硬度和耐压力的趋势;6.0 g/L NaCl处理能极显著提高产量,显著增加果实耐压力和Vc含量,但还原糖含量显著降低;9.0 g/L NaCl处理则显著降低果实耐压力和还原糖含量,对其他指标的影响不大。综合各指标分析认为,NaCl处理加工番茄的适宜质量浓度为3.0-6.0 g/L。
【英文摘要】The effects of foliage spraying of sodium chloride at different qualities and concentrations during fruit development on fruit firmness,compression tolerance and quality etc were studied with two processing tomato varieties Ligeer 87-5 and Shihong 12 as the experiment materials.The results showed that foliage spraying of sodium chloride could increase the firmness,compression tolerance,quality and yield of fruit,but the same concentration of sodium chloride might result differently on different cultivars.For cv. Ligeer 8725, 3.0 g/L sodium chloride treatment most significantly increased the f ru it yield and compression tolerance, and increased total sugar content, fruit firmness and contents of reducing sugar and vitam in C. 6.0 g/L sodium chloride treatment significantly raised the contents of reducing sugar and vitam in C, but had no significant influence on fruit firmness, compression tolerance, yield and the content of total soluble sugar. 9.0 g/L sodium chloride treatment most significantly decreased fruit firmness, and had bad effects on fruit compression tolerance and yield. For cv. Shihong 12, 3.0 g/L sodium chloride treatment significantly increased the yield, and had the trend to increase the contents of total soluble sugar, reducing sugar, vitamin C and fruit firmness and compression tolerance. 6.0 g/L

sodium chloride treatment most significantly increased the yield, significantly increased fruit compression tolerance and vitamin C content,but greatly decreased reducing sugar content. 9.0 g/L sodium chloride treatment significantly decreased fruit compression tolerance and reducing sugar content, but had no obvious influence on the other index. In comprehensive consideration, the suitable concent ration of sodium chloride treatment on processing tomato variety falls in the range of 3.0- 6.0 g/L .

【中文关键词】番茄; 可溶性固形物含量; 果实指标; 相关性;
【英文关键词】tomatoes; soluble solids content; fruit indication; relations];
【中文摘要】为探究影响可溶性固形物含量(SSC)的密切关系因子,及为高固形物品种的选育和番茄采后加工出高质量的番茄酱产品提供依据,对6个番茄品种果实发育、成熟后贮藏过程中SSC的动态变化及其与其果实指标的相关性进行了分析。结果表明:在影响番茄SSC的各种指标中,品种间差异较大,品种TD41×TD13(X2)SSC最低,品种HT16-①-①-①(X6)SSC最高;在番茄的不同成熟期,SSC先是增加,增加到一定含量时就略有下降,但品种HT16-①-①-①(X6)却是先下降后直线上升,这可能与品种的早熟有关,与田间观察一致。TD13(X3)和HT16-①-①-①(X6)两个番茄品种,在采摘后放置过程中,SSC先降后升,第4d时达到了最高,后基本保持不变,到第9d时SSC又开始下降。番茄SSC与可溶性糖含量呈显著相关,相关系数为0.840;与有机酸含量呈极显著相关,相关系数为0.946;与Vc含量呈极显著相关,相关系数为0.952;与番茄红素含量呈中度正相关,相关系数为0.545;与单果重呈轻度负线性相关,相关性系数为-0.140;与果型指数也呈轻度负线性相关,相关性系数仅为-0.077。
【英文摘要】In order to find the tight related factors that contribute to the SSC,to provide proof for the choosing and cultivating of tomatoes and the producing high-quality tomato jam products,our experiment chooses six types of tomatoes to seek the relations between tomatoes,ssc and other fruit indication,through two processes of fruit developing periods and fruit storage time.The outcome shows that varieties is the most important.In all the effects that influence soluble solids content(SSC),TD 41 ×TD 13(X 2)contains the least SSC while HT16 2 ①2 ①2 ①(X6) contains t he most . In t he different growing periods of t he f ruit s , SSC increased at first ,when it comes to a point ,it will decrease ,while HT16 2 ①2 ①2 ①(X6) decreases at the early stage ,then increase to the top ,which may be explained by its later maturiaty. In the process of the tomatoes storage ,SSC decreases at first t hen increases slowly. On t he fourth day ,it reaches the top and keep s steady in the following days ,when the ninth day comes ,ssc decreases again. Ssc has a significant positive relation with the suluble sugar ,Pearson Correlation is 0. 840 ;a greatly significant positive relation with content of the organic arid ,Pearson Correlation is 0. 946 and a greatly significant positive relation with Vc , Pear son Correlation is 0. 952 ,a positive relation with ycopene when the γ value equals 0. 545. But ssc has negative relation with the weight of the every fruit when the γ is - 0. 140 ,also a negative relation with the types of the fruit ,the γ equals - 0. 077 ,the two relations are too light .

【题目】田间管理对加工番茄品种特性的影响
【中文关键词】加工番茄;田间管理;品种特性;影响
【英文关键词】无
【中文摘要】加工番茄在我国大面积栽培已有十余年时间。随着加工番茄杂交种的研发推广, 品种越来越多,但是生产中产量提高幅度并不大,主要原因是种植户对加工番茄的品种特性和生长习性等并未完全了解,甚至在某些认识上存在误区。一般来说,基因是决定一个品种特性表现的内在因素,而栽培环境对品种特性的影响也相当大。一个优良品种的优良特性要得以表现,必须要创造与其相适应的栽培环境。如果在田间管理中采取措施不当,往往使该品种的田间表现与品种自身具有的熟性、产量、品质、抗病性等特性大不相同。

【题目】hp-1和hp-2 基因对番茄营养生长及色素积累的影响
【中文关键词】hp-1 ; hp-2 ; 番茄 ; 营养生长 ; 色素

【英文关键词】hp-J;hp-2;Tomato;Nutritional growth;Pigment
【中文摘要】以9套含有纯合hp-1和hp-2基因的番茄自交系为材料,通过对苗期营养生长和果实色素积累有关特征比较发现:在光周期生长条件下,所有含有hp-1和hp-2基因的番茄自交系均表现出相似的特征。即与不含hp基因对照相比:幼苗下胚轴和植株节间显著受到抑制,花期延迟(p<0.01);子叶、胚轴、花萼以及果实中叶绿素、花青素和番茄红素显著提高;hp-1和hp-2基因在不同遗传背景下表现度不同。
【英文摘要】In order to compare the characteristics of nutritional growth and pigment accumulation in different genetic background,nine tomato inbred lines containing pure hp-1 and hp-2 gene were used as experimental materials.The results suggested that NIL(Liger nearly isogenic lines)contained consistent characteristics with hp mutant in photoperiod growth condtion;such as,they had shorter hypocotyls,elevated levels of anthocyanin in cotyledons,hypocotyls and calyces compared with control.Furthermore,all inbred lines containing hp gene had later flowering time(days)and shorter internode;further research on fruit pigment showed that chlorophyll and locopene content were significantly enhanced.But hp-1 and hp-2 gene had inconsistent expressivity in different genetic background.

【题目】利用等位基因特异性PCR技术检测番茄高色素基因hp1和hp2的单核苷酸多态性
【中文关键词】高色素基因; 单核苷酸多态性(SNP); 等位基因特异性PCR; 番茄;
【英文关键词】high pigment genes; single nucleotide polymorphism(SNP); allele-specific PCR; tomato;
【中文摘要】番茄(Lycopersicon esculentem)高色素基因hp1和hp2突变体与野生型基因相比均发生了单碱基的点突变,用常规PCR技术很难区分。实验对碱基错配类型和位置与特异性PCR的关系进行了研究。结果表明,引入TA-TG双碱基错配的引物,退火温度在49.3±0.1℃时能把hp1基因的突变位点和野生型的对应位点区分开来。引入T-C碱基错配的引物,退火温度在53.5±0.1℃时能把hp2基因的突变位点和野生型的对应位点区分开来。错配碱基在引物3 端的位置对PCR的特异性影响不大。
【英文摘要】Comparing with their corresponding wild allele genes, a single nucleotide mutation was taken place in high pigment genes hp1 and hp2 of tomato(Lycpersicon esculentum), respectively, which was very difficult to be discriminated by normal PCR technique.In this experiment, the relationship between specific PCR and mismatched bases as well as their positions were studied.Results showed that the primer with double-base mismatch TA-TG could distinguish mutation location of hp1 from its wild allele location at annealing temperature 53.5+0.1 ℃. The position of mismatched bases at 3' end of primers had little effect on specificity of PCR.

【题目】辣椒苗期耐热耐湿鉴定方法的研究
【中文关键词】辣椒; 苗期; 耐热耐湿; 鉴定;
【英文关键词】hot pepper (Capsicum annuum L.); seedling stage; high temperature and air humidity resistance; identification;
【中文摘要】以辣椒各生理指标的耐逆系数为衡量辣椒单项耐逆能力大小的指标,用聚类分析法、主成分分析法、隶属函数法对辣椒不同品种(系)耐热耐湿性予以综合评价。综合评价的结果,将10个供试品种(系)按耐热耐湿由强到弱划分为4级:高度耐热耐湿(I)、中度耐热耐湿(G、J、W、H)、不耐热耐湿(C、E、F、K)和极不耐热耐湿(D)。几种关于辣椒品种(系)耐热耐湿综合评价的方法具有较好的一致性,同时利用耐热耐湿性的综合评价值与单项指标间建立的最优回归方程可以预测其他辣椒品种(系)耐热耐湿性大小。
【英文摘要】The high temperature and air humidity resistance coefficient of single character were used to value the single capability of high temperature and air humidity resistance of hot peper(Capsicum annuum L.), and the methods of cluster analysis, principal component analysis and subordinate function were used in comprehensive evaluation for high temperature and air humidity resistance of hot pepper varieties at the seedling stage. On the basis of correlation analysis between the high temperature and air humidity humidity resistance obtained from the above components in varieties , the 10 tested varieties could be divided into four classes of tolerance:most tolerant variety was I, followed by G, J, W, H. Less tolerant were C , E , F , K.The rest variety was not tolerant at all . The results showed that the above comprehensive evaluation methods for high temperature and air humidity resistance of hot pepper varieties at the seedling stage were well coincident . At the same time ,the evaluation of high temperature and air humidity resistance could be forecasted by using the best regressive function that was founded by the comprehensive value of high temperature and air humidity resistance and the value of single index.

【题目】辣椒耐高温高湿生理生化性状灰色关联度分析
【中文关键词】辣椒; 耐高温高湿性; 生理生化性状; 灰色关联度分析;
【英文关键词】Hot pepper; High temperature and air humidity resistance; Physic-biochemical traits; Gray correlation analysis;
【中文摘要】采用灰色关联分析(Gray correlation analysis),探讨辣椒生理生化性状与耐高温高湿的关系。对分别处于高温高湿和正常条件下的10个辣椒品种(系)21个生理生化性状耐高温高湿系数进行了分析和评价。依据各品种(系)的加权关联度对参试品种(系)进行了聚类分析,参试品种(系)中极耐高温高湿的品种(系)有I、G二个品种(系)。与耐高温高湿关联度最大的是花青素含量、过氧化氢含量、超氧化物歧化酶活性和脱氢抗坏血酸还原酶活性4个生理生化性状,它们在高温高湿双重逆境胁迫下所受的影响最大,与辣椒耐高温高湿性关系最密切。因而可以选用花青素含量、过氧化氢含量、超氧化物歧化酶活性、脱氢抗坏血酸还原酶活性等生理生化性状进行辣椒耐高温高湿的以性状为基础的选择,以提高选择效率。
【英文摘要】This paper aims at probing the relationship between physic-biochemical traits and the high temperature and air humidity resistance of hot pepper varieties.A total 21 physic-biochemical traits that measured in 10 hot pepper varieties at high temperature and air humidity and control conditions,were analyzed using gray relational grade analysis method.Gray correlation degrees facilitated in identifying the high temperature and air humidity resistance of hot pepper.And the cluster based on the relation

degree of 10 hot pepper varieties. Varieties that had the strongest high temperature and air humidity resistance among the 10 hot pepper varieties were I and G. It was concluded that the physicbiochemical traits had the closest relationship with the high temperature and air humidity resistance of hot pepper , and these traits were significantly influenced by high temperature and air humidity stress ,thus had the greatest relation degree with the high temperature and air humidity index. So the physicbiochemical traits including leaf flower pigment content , H2O2 content , SOD , DHAR could be used.

【题目】Study on Agrobacterium-mediated transformation of pepper with Barnase and Cre Gene.
【中文关键词】无
【英文关键词】pepper (Capsicum annuum L.); genetic transformation; male sterile; TA29-Barnase; Crellox system
【中文摘要】无
【英文摘要】This study was designed to control plant fertility by cell lethal gene Barnase expressing at specific developmental stage and in specific tissue of male organ under the control of Crellox system, for heterosis breeding of chili pepper (Capsicum annuum L.). Chili pepper inbred lines (A, D, E, and I) were transformed with Cre gene and Barnase gene situated between loxp, separately, by means of Agrobacterium co-culture. In this study, we had established a high transformation system by extensive study of affecting factors including genotype, selection of marker, and lethal dose. Cotyledon with petiole from 9-11-day-old seeding was pre-cultured on media MR [MB (MS mineral + vitamine B5)+BA (6-Benzyladenine) 5.0 mg L(-1)+IAA (indoleacetic acid) 1.0 mg L(-1)+GA(3) (gibberellic acid) 1.0 mg L(-1)+sucrose 3%+agar 6.5 g L(-1)] for 2 d. The explants were infected by Agrobacterium tumefaciens when their OD(600) (optical density at 600 nm) reached 0.6-0.9. After co-cultured for 4-5 d on media MC [MB + BA 5.0 mg L(-1)+IAA 1.0 mg L(-1)+GA(3) 1.0 mg L(-1)+sucrose 3%+agar 6.5 g L(-1)+AS (acetosyringone) 200 mu mol L(-1)], these cotyledons with petiole were cultured on selective differentiation medium in the media MT [MB medium supplemented with BA [5.0 mg L(-1)+IAA 1.0 mg L(-1)+GA(3) 1.0 mg L(-1)+AgNO(3) 5.0 mg L(-1)+CW (coconut water) 5% + Km (kanamycin) 65 mg L(-1)+Cb (carbenicillin) 500 mg L(-1)+3% sucrose + agar 6.5 g L(-1)]. The Kmr (kanamycin resistant) bud rosettes were elongated on selective elongation medium and rooted on rooting medium. PCR and Southern blotting analysis of Kmr plantlet indicated that the foreign genes had been integrated into the genome of pepper. The transgenic plants with Cre gene developed well, blossomed out, and set fruit normally. The transgenic plants with Barnase gene grew well with normal appearance of flower, but they showed different fertility from complete sterility, partial sterility to complete fertility, and similar results were obtained from in vitro pollen germination experiments.

【题目】高温高湿对不同品种(系)现蕾期辣椒(Capsicum annuum L.)抗氧化性的影响
【中文关键词】高温高湿 ; 辣椒 ; 现蕾期 ; 抗氧化性
【英文关键词】high temperature/air humidity;hot pepper ; buding stage;antioxidant activity
【中文摘要】选用10个具有代表性辣椒品种(系),于人工气候室内分别在正常和高温高湿条件下,研究了现蕾期辣椒抗氧化系统生理生化性状的变化以及不同品种(系)的抗氧化性差异.结果表明:10个辣椒品种(系)抗坏血酸(AsA)、花青素含量下降,而谷胱甘肽(GSH)、花色苷含量增加;超氧化物歧化酶 (SOD)、过氧化物酶(POD)、过氧化氢酶(CAT)、苯丙氨酸解氨酶(PAL)4个酶活性一致增强.根据8个生理生化指标的相对值,通过坐标综合评定法对活性氧的抑制和清除进行分析,抗氧化

剂类的贡献大于抗氧化酶类;系统聚类法将10个辣椒品种(系)的抗氧化性强弱分为3类:06591、115-5-5-12-9-1-2. B04-99-5-1-1-2、06597、06590为强抗氧化性品种(系);B04-51-4-2-1-2-1和43-5-1-1-1为中等抗氧化性品种(系);06592、B04-114-1-I-1-1-1、B04-5124-1(系)为弱抗氧化性品种

【英文摘要】The experiment was carried out in climate chambers to investigate the effects of high temperature and air humidity on reduced glutathione content, ascorbic acid content, anthocyanidin content, anthocyanin content and antioxidative enzyme activities in ten hot pepper varieties leaves under both normal and high temperature/air humidity conditions during budding stage. The results indicated that contents of ascorbic acid and anthocyanidin decreased, contents of glutathione and anthocyanin increased, activities of superoxide dismutase, peroxidase, phenylalanine ammonia-lyase and catalase increased under high temperature/air humidity stress among the tested 10 varieties. According to the relative value of 8 indexes, the result of the coordinate synthetic assessment method showed that the antioxidant's contribution to the inhibition and scavenging of active oxygen was greater than the antioxidant enzymes. At the same time, the method of cluster was used to evaluate antioxidant activity differences of hot pepper varieties, and 10 tested varieties could be into three classes of the antioxidant activity. The strongest antioxidant activity varieties were 06591,115-5-5-12-9-1-2, B04-99-5-1-1-2, 06597,06590, followed by B04-51-4-2-1-2-1 and 43-5-1-1-1, and the lowest were activity varieties 06592,B-04-114-1-1-1-1-1 and B04-512-4-1

【题目】辣椒雄性不育材料H9A小孢子败育机理

【中文关键词】生化特性; 细胞形态学; 雄性不育; 小孢子; 辣椒;

【英文关键词】biochemical characteristics; cytomorphology; male sterile; microspore; pepper;

【中文摘要】运用光学、电子显微技术及生化指标测定法,对辣椒(Capsicum annuum)雄性不育材料H9A及其保持系H9B小孢子不同发育时期进行细胞形态学观察及生化特性分析。结果表明,雄性不育材料H9A的小孢子败育发生在单核前期,由于绒毡层细胞极度膨胀,四分体受挤压后破裂并降解,无法形成正常的单核花粉粒,属于孢子体败育。不育材料花蕾中的过氧化物酶活性从四分体时期开始明显高于保持系,保持系游离脯氨酸含量从单核小孢子期开始明显高于不育材料;不育材料小孢子发育各时期的可溶性蛋白含量都明显低于保持系,但丙二醛含量均高于保持系。

【英文摘要】The study involved cell morphological observation and comparison of biochemical characteristics of the new male sterile materials H9A and its maintainer H9B by means of optical and electron microscopy and measurement of biochemical indexes.Microspore abortion of H9A occurred in the early uninucleate stage.The tapetum cells were in extreme hypertrophy so that tetrads were extruded to crack and break down and could not form normal uninucleate pollen grains;the abortion type was sporophyte.During this period,the buds were 0.526 – 0.572 cm long and 0.318 – 0.372 cm in diameter; the corolla was about one quarter the length of the calyx. The peroxidase activities in the flower buds of H9A were significantly greater than that in the maintainer line beginning at the tetrad stage, and the content of free proline in the flower bud of the maintainer line H9B was significantly higher than that of H9A in the mononuclear microspore stage.The soluble protein content during the stages of microspore development in H9A was significantly lower than that in H9B,but malonaldehyde (MDA) content was higher than that in the maintainer line.

【题目】辣椒新型质核互作雄性不育材料H9A不育机理研究
【中文关键词】辣椒; 小孢子; 雄性不育; DDRT-PCR;
【英文关键词】pepper; microspore; male sterility; DDRT-PCR;
【中文摘要】为研究辣椒雄性不育的机理,在花期,采用常规的石蜡切片法,对新型辣椒雄性不育材料H9A及其保持系H9B小孢子不同发育时期进行细胞形态学观察;采用DDRT-PCR技术对H9A与H9B小孢子发育过程进行mRNA差异显示,筛选差异表达的基因。切片观察发现:供试雄性不育材料的小孢子败育发生在单核前期,此时花蕾纵径0.526~0.572 cm,横径0.318~0.372 cm,花冠和花萼之比约为1∶4;通过DDRT-PCR,共获得27条差异表达的cDNA片段,其中在H9A中获得12条,在H9B中获得15条。结果说明新型辣椒雄性不育材料H9A的小孢子败育发生在单核前期,败育原因可能是绒毡层细胞程序性死亡异常并极度液泡化膨胀,四分体受挤压后破裂降解,不能形成正常的单核花粉粒。败育时期与花蕾外部形态相关。在败育期表达的27条差异cDNA片段为研究辣椒雄性不育机理的候选基因奠定了基础。
【英文摘要】To observe the abortion process during the development of microspore and to isolate the genes related to male sterility in the new cytoplasmic-nuclear male sterile material H9A,to further reveal the male sterile mechanism in pepper.The cell morphological observation between the new male sterile material H9A and its maintainer H9B was conducted by means of normal paraffin section method.The DDRT-PCR was used to isolate the differentially expressed genes during the development of microspore between H9A and H9B.The results showed that the microspore abortion of H9A occurred in the early uninucleate stage , during this period , the buds were 0. 526 - 0. 572 cm in height and 0. 318 -0. 372 cm in diameter , the length was approximately in the ratio of 1 ∶ 4 between corolla and calyx ; Twenty seven differentially expressed cDNA fragments were is olated by DDRT2PCR, including 12 cDNA fragments in H9A and 15 in H9B. The reas on for the abortion was possibly that the tapetum cells were subjected to hypertrophy via vacuolation so that the tetrads were extruded and broken into pieces , so the normal uninucle ate pollen grains could not form. The microsp ore abortion stage was related to the external shape of the flower bud. The 27 cDNA fragments acquired in this study could be candidate genes related to male sterility and their function needs further study.

【题目】冷诱导基因C-重复基序结合因子4(CBF4)在辣椒中的遗传转化及抗寒性分析
【中文关键词】辣椒 ; 遗传转化 ; 农杆菌介导 ; CBF4基因
【英文关键词】pepper;genetic transformation;Agribacterium mediated;CBF4 gene
【中文摘要】利用根癌农杆菌(Agribacterium tumefaciens)介导的带柄子叶转化法将拟南芥(Ambidopsis thaliana)C-重复基序结合因子4(CBF4)转入辣椒(Capsicum annuum L.),优化并完善了甜椒品种B12的遗传转化体系.结果表明,外植体经过2 d预培养,在OD600约为0.8的工程菌液中侵染5~6 min后,再经共培养2 d,延迟筛选10 d能获得较高的转化率.获得60株卡那霉素抗性再生植株,经PCR和RT-PCR检测.46株为阳性转基因植株,转化率高达76.67%.经过15°C低温处理后,对阳性植株的抗寒性生化指标、形态指标分析发现,转基因植株的SOD和POD活性都明显高于未转基因植株,转基因植株比未转基因植株的株型紧凑,叶片肥厚、平直,叶色浓绿,叶面积大.
【英文摘要】The cultivar B12 of pepper(Capsicum almUllll L.)was successfully transformed with the C-repeat binding factor 4 (CBF4)gene of Arabidopsis thaliana by Agrobacterium-mediated transformation.The regeneration system of peppers was optimized and promoted.The results showed that the highest transformation frequency was obtained when the leaves were precultivated for 2 days,the OD600 of Agrobacterium was about 0.8,the Agrobacterium was infected for 5~6 min,and cocultured for 2 days,and selected at 10 days later.Results showed that 60 km-resistant regenerated plants were obtained.and 46 of which were positive by the analysis of PCR and RT-PCR.The rate of transgene was 76.67%.The biochemical indexes indicated that the activities of SOD and POD in transgenetic plants were higher than that of the non-transgenic plant after the cold(15°C)resistant treatment.The morphological indexes of transgenic plants showed that it was compact plant type with thicker,darker green and larger leave areas compared with the non-transgenic plants.

【题目】辣椒花药培养胚状体发生的组织学和细胞学研究
【中文关键词】辣椒 ; 花药培养 ; 胚状体 ; 组织学 ; 细胞学
【英文关键词】Pepper.Anger culture.Embryoid.Histology.Cytology
【中文摘要】采用荧光显微镜、扫描电镜和透射电镜技术,系统研究了辣椒花药培养胚状体发生的组织学和细胞学变化特征.辣椒单个花药中花粉发育具有强烈的不同步性.随着培养时期的变化,不同时期花粉的百分率也发生变化.处于单核靠边期的小孢子培养以后按两种发育途径之一进行发育.在多数情况下,孢子体不对称分裂,产生典型双核花粉.胚性花粉粒是由营养核的重复分裂形成的.当小孢子从四分体中释放出来,特殊类型的外壁已经形成.在随后的花粉发育过程中,小孢子体积增大,外壁继续加厚.培养24h后,小孢子体积增大.胚性发生的小孢子表现出两种不同的形态变化,当胚状体发育到心形胚时,胚状体的表皮细胞排列规则.用光学和电子显微镜分析了小孢子胚状体形态形成过程,及胚状体诱导后细胞组织发生的一系列结构变化的时序性特征,这些变化主要影响质体、液泡室、细胞壁和细胞核,进一步分化的程序模拟合子胚的发育.
【英文摘要】The characteristics of histology and cytology of embryogenesis in pepper anther culture were examined with fluorescence microscopy, scanning microscopy, and electron microscopy. Pepper was characterized by a strong asynchrony of pollen development within a single anther. With the change of culture period, the proportion of dead pollen increased drastically from 2 day after culture. Microspores that were cultured at the late-uninucleate stage followed one of two developmental pathways. In the more common route, the first sporophytic division was asymmetric and produced what appeared to be typical bicellular pollen. Embryogenic pollen was formed by repeated divisions of the vegetative nuclei. An exine with its specific pattern had already been formed, when microspores were released from tetrads. During subsequent pollen development, microspores increased in size and continued to strengthen the exine. After 24h in culture, the microspores had increased in size. Thereafter, embryogenesis was indicated in some microspores by two different morphological changes. One featured an expansion in volume of the cell cluster around the germination aperture, the other showed cell cluster volume expansion over the entire microspore surface. Morphogenesis of microspore-derived embryos has been analyzed, at both light and electron microscopical levels. The changes in cell organization after embryogenesis induction, and the characterization of the time sequence of a set of structural events, had been also explained. These changes mainly affected the plastids, the vacuolar compartment, the cell wall and the nucleus. Further differentiation processes mimicked that of the zygotic development.

【题目】利用mRNA差异显示技术克隆辣椒抗疫病相关基因片断
【中文关键词】辣椒疫病; 抗病基因; mRNA差异显示;
【英文关键词】Phytophthora blight; Resistant gene; mRNA differential display;
【中文摘要】利用差异显示技术,以感病对照品种B27、中抗疫病品种A3、高抗疫病品种A11为试材,用辣椒疫霉菌诱导处理6叶期幼苗,进行接种前后基因差异表达分析。采用3条锚定引物5′dT12A/G/C 3′和20条随机引物(B0301-B0320)组合,进行反转录差异显示PCR,克隆并分析辣椒疫病抗性相关基因。共获得差异表达片段7条,经BLAST检索,发现T12C/B0312-251(Gen-Bank登录号EU280142)与粉蓝烟草的推测编码ml基因的部分mRNA有90%的同源性;T12C/B0312-248(GenBank登录号EU280143)与辣椒编码区序列ERD15 mRNA有99%的同源性;T12G/B0312-339(GenBank登录号EU280144)与番茄mRNA序列113946R克隆有92%的同源性,片段T12C/B0307-170,T12G/B0317-374,T12A/B0320-235,T12A/B0320-195未发现其与已报导的序列有同源性。该试验所得的差异片段推测为与辣椒疫病抗性相关的基因。

【英文摘要】We extracted total RNA from the leaves of cv.B27(susceptible variety),cv.A3(medium-resis-tant variety) and cv.A11(high-resistant variety) in pepper after inoculated with Phytophthora capsici at six-leaf stage,and analyzed the different genes expression after inoculation by DDRT-PCR.Using 3 anchor primers(5 dT12A/G/C 3) and 20 arbitrary primers(B0301-B0320)at DDRT-PCR,Cloning of the Genes Resistant to Phytophthora capsici in Pepper.Finally we gained seven different expression gene fragments.The BLAST results showed that T12C/ B0312O251(GenBank accession No. EU280142) was homologous to Nicotiana glauca partial mRNA for putative ML domain protein (ml gene) at 90 %. T12C/ B0312O248(GenBank accession No. EU280143) was homologous to Capsicum annuum ERD15 mRNA ,complete cds at 99%. T12 G/ B0312O339(GenBank accession No. EU280144) was homologous to L ycopersicon esculentum clone 113946R mRNA sequence at 92%. T12 C/ B0307O170 , T12 G/ B0317O374 ,T12 A/ B0320O235 ,T12 A/ B0320O195 was lowly homologous to known genes. These fragments we gained from the experiment are proposed to be diseaseO resistant genes.

【题目】辣椒小孢子发育时期与花器形态的相关性
【中文关键词】辣椒; 小孢子; 发育时期; 花器形态;
【英文关键词】Capsium annuam L.; microspore; development stage; shape of flower organs;
【中文摘要】为了直接从花蕾大小或花药的形态特征来判断小孢子的发育时期,对辣椒小孢子发育时期的细胞学,以及小孢子不同发育时期与花萼特征、花蕾大小和花药颜色的关系进行了研究。结果表明,辣椒小孢子发育经四分体时期、单核期和双核期,各时期特征明显。辣椒小孢子发育时期与花蕾的外部形态特征、花药颜色密切相关。供试辣椒品种的小孢子处于单核靠边期时花蕾纵径在4.253-5.074 mm,花蕾横径在4.191-5.367 mm,花瓣与花萼等长或稍长,花药长度在2.020-2.565 mm,花药宽度在0.982-1.417 mm。辣椒同一花蕾小孢子发育存在一定程度的渐续性即不同步。依据花器官形态特征可判断小孢子的发育时期,从而确定花药培养最佳时期所对应的选蕾标准。
【英文摘要】The bud size and morphological characteristics of the buds and anthers were defined and the paper focused on the relation between the microspore development and the calyx characteristics,the size of bud and the color of anthers.The results showed that pepper s microspore develped at three stages:tetrad,uninucleate,and binucleate,and each stage demonstrated distinctive characteristics.Microspore development also has correlativity with the morphological characteristics of buds and the color of anthers.The buds 4. 253- 5. 074mm in height and 4. 191- 5. 367mm in diameter, and the anthers 2. 020- 2. 565mm in length and 0. 982- 1. 417 mm in width were discovered to contain microspores at the late2un inucleate. Microspore development of the same bud in pepper showed graduality to some extent. We can judge the development stage of pepperps micro spore by morphological characterist ics of flower organs so as to define the standard of bud selection in correspondence with the optimal stage of anthers culture.

【题目】辣椒产量和品质性状Hayman遗传分析
【中文关键词】辣椒; 双列杂交; 产量性状; 品质性状; 遗传参数估算;
【英文关键词】Pepper; Capsicum annuum L.; Diallel crosses; Yield characters; Quality characters; Genetic parameter estimation;
【中文摘要】将辣椒(Capsicam annuumL.)6个亲本,按(1/2)n(n-1)双列杂交法配制15个杂交组合,用Hayman双列杂交分析法估算5个关于产量、品质性状的遗传参数。Wr对Vr的回归分析结果表明,单株产量、小区产量、辣椒素和干物质含量的遗

传符合“加性—显性”模型;早期产量的遗传不符合“加性—显性”模型。Wr+Vr与Yr间相关分析表明,单株产量、小区产量、早期产量和干物质含量呈负相关,说明含有更多显性基因的亲本具有较小的Wr+Vr值;辣椒素含量呈正相关,说明含有较多辣椒素显性基因的亲本具有较大的Wr+Vr值。遗传参数估算表明,辣椒素和干物质含量的遗传是加性效应方差明显大于显性效应方差;单株产量和小区产量的遗传加性效应方差明显小于显性效应方差;早期产量的遗传是显性效应方差显著大于加性效应方差,同时还存在显著的、复杂的上位性效应。

【英文摘要】Six pepper(Capsicam annuum L.) parents were used to produce 15 combinations by diallel crosses excluding reciprocals.Genetic parameters for five yield or quality characters were estimated according to Hayman s method.Analysis of regression Wr against Vr indicated that inheritance of yield per plant,yield per plot,capsaicin or dry matter content conformed to the “ additive-dominant ” model while that of early yield per plot did not.Correlation analysis showed that there was a negative correlation between Wr+Vr and Yr in the characters of yield per plant, yield per p lot, early yield per plot and drymatter content, implying that the parents possessing more dominant genes have lower W r +V r values. However, there was a positive correlation betweenW r +V r and Yr in capsaicin content at 1% significant level, which means that the parents possessing more dominant genes for high cap saicin content have relatively highW r +V r values. Estimation of the genetic parameters showed that the additive variance was greater than the dominant variance for cap saicin and drymatter contentswhile the opposite situationswere true for yield per plant, yield per plot. For early yield per plot,the dominant variance was significantly higher than the additive variance, and there were significant complex epistatic effects.

【题目】辣椒离体植株再生及其变异的SSR检测

【中文关键词】辣椒; 离体植株再生; 变异; SSR;
【英文关键词】Pepper(C.annuum L.); In vitro plant regeneration; Variation; SSR;
【中文摘要】采用6个不同基因型辣椒(Capsicum annuum L.)的子叶、下胚轴、去除生长点并带下胚轴和各切去一半的两片子叶、去除生长点并带下胚轴和半片子叶为外植体,分别培养在附加不同激素和AgNO3的MB5和MS培养基上,研究不同基因型、外植体、激素配比和AgNO3等对外植体不定芽诱导和芽伸长的影响。结果表明,不定芽诱导以MB5+2.0mg・L-1TDZ+1.0mg・L-1IAA+4mg・L-1AgNO3培养基最佳,诱导率最高可达100%。而芽伸长的最佳培养基为MB5+3.0mg・L-16-BA+0.5mg・L-1IAA+5.0mg・L-1AgNO3+2.0mg・L-1GA3,最高伸长率可达87.5%。生根培养基为MS+0.2mg・L-1IAA+0.1mg・L-1NAA,生根率均达100%。不同的外植体类型具有不同的不定芽诱导和芽伸长的能力,以去除生长点并带下胚轴和各切除一半的两片子叶作外植体时的诱导效果最好。用50对SSR引物检测再生植株,其中86株伏地尖的再生植株和对照植株间均没有扩增出差异条带,而茄门再生植株的SSR检测结果有12对引物表现多样性。
【英文摘要】In vitro plant regeneration was achieved from 6 pepper lines(C.annuum L.).The effects of different types of explants including cotyledon(C),hypocotyls(H),two half cotyledons with hypocotyl(CS)and half of one cotyledon with hypocotyl(CH),medium,genotype,hormones and SSR detecting of regenerated plants were evaluated.The best medium for bud induction was MB5 with addition of 2.0 mg・L-1 TDZ,1.0 mg・L-1 IAA,and 4 mg・L-1 AgNO3.The induction rate was as high as 100 %.The best medium for bud elongation was MB5 with 310 mg・L - 1 6 - BA, 015 mg・L - 1 IAA, 510 mg・L - 1 AgNO3 and 210 mg・L - 1 GA3. The highest rate of bud elongation was 8715 %. Medium for rooting was MS with 012 mg・L - 1 IAA and 011 mg・L - 1 NAA. The rate for rooting was 100 %. Different types of explants had different abilities to bud induction and elongation. The CS was the best for induction. A total of 50 pairs of SSR primers were used to analyze generation variation in regenerated-plants and original plants. Twelve pairs of primers showed polymorphisms in plants regenerated from line ‘ Q iemen ’, while no genetic variance was detected in 86 regenerated p lants of line ‘ Fudijian ’

【题目】Changes in Biochemical Characteristics Related to Firmness during Fruit Development of Pepper (Capsicum annuum L)
【中文关键词】无
【英文关键词】cellulose; cell wall hydrolases; flesh firmness; pepper lines; insoluble pectin; soluble pectin
【中文摘要】无
【英文摘要】Five pepper (Capsicum annuum L.) lines with varying degrees in flesh firmness were used to identify biochemical characteristics related to fruit softening. Firmness of fruit flesh (with epidermis attached) and flesh (without epidermis) was measured at different developmental stages: premature [15-20 days post-anthesis (DPA), stage 1], green mature (commercially ripe, 30-35 DPA, stage 2), colour turning (fruit becoming 30-40% red, 40-50 DPA, stage 3), and red ripe (fruit totally red, 60-70 DPA, stage 4). Since firmness with and without the epidermis attached changed similarly in all pepper lines during development, flesh firmness (without the epidermis) was used to represent pepper fruit firmness. Biochemical characteristics measured included insoluble pectin, soluble pectin, and cellulose contents, and the activities of pectin methyl-esterase (PME), polygalacturonase (PG), beta-galactosidase, and cellulase. in all lines, flesh firmness was highest at stage 3, and then decreased during development. Soluble pectin content also increased in all lines. Cellulose content normally decreased after stage 3, but these changes varied among lines. With ripening PG and PME decreased in the most firm lines, and cellulase and beta-galactosidase were the key enzymes involved in the less firm lines. These biochemical characters related to fruit firmness and firmness type should provide for breeding for improvements in storage and transportation.

【中文关键词】辣椒; 硬度; 组织结构; 果胶; 纤维素;
【英文关键词】Pepper(Capsicum Annuum L.); Firmness; Tissue structure; Pectin; Cellulose;
【中文摘要】选用5个不同硬度的辣椒品系,分别在果实发育不同时期,进行果实硬度和细胞壁物质原果胶、可溶性果胶以及纤维素等含量的测定,同时采用石蜡切片法对不同时期果实的组织结构进行了观察。结果表明,不同硬度品系果实带皮硬度与果肉硬度之间没有显著差异;在硬度下降过程中,果实组织结构变化很大,硬度越小的果实,组织结构变化越剧烈;原果胶与可溶性果胶含量变化对405和409等灯笼椒类型品系的果实硬度可能有较大影响,而纤维素含量变化对529等尖椒类型品系可能有较大影响。
【英文摘要】Five pepper(Capsicum Annuum L.) lines with different fruit firmness were selected to detect the fruit firmness and investigate the cell wall substrates such as primary pectin,soluble pectin,and cellulose content,the fruit tissue structure at different developmental stages of fruit was observed by means of paraffin section.The results showed that there was no significant difference between fruit firmness and flesh firmness;the fruit tissue structure changed drastically along with the fruit firmness decreasing , the smaller the fruit firmness , the greater the fruit tissue structure changing , the primary pectin and soluble pectin content may have greater influence to the 405 , and 409 lines , which were lantern type pepper , however , the cellulose content may have more influence to the 529 , 585 , and 607 lines , which were hot chilli type pepper .

【题目】A SCAR marker linked to the N gene for resistance to root knot nematodes (Meloidogyne spp.) in pepper (Capsicum annuum L.),
【中文关键词】无
【英文关键词】Pepper; Capsicum annuum L.; Disease resistance; Root-knot nematode; Meloidogyne spp.; SCAR; N gene; Marker assisted selection
【中文摘要】无
【英文摘要】The root-knot nematodes (Meloidogyne spp.) are important nematode pests and cause serious diseases in pepper in the world. No molecular markers linked to the nematodes resistance N gene have been reported. In this paper, 'Carolina Wonder' (Capsicum annuum L.), a sweet pepper line resistant to root-knot nematode with N gene, '20080-5-29' (C. annuum L), an inbred line susceptible to root-knot nematode with good horticultural characteristics, and their F(2) progeny with 320 individuals were used as materials. Evaluation of resistance and susceptibility of parental lines, F(1) and F(2) progeny inoculated with root-knot nematodes (Meloidogyne incognita) were carried out. 'Bulked segregant analysis' method was used to search for polymorphic markers from 512 pairs of AFLP primers. Based on the assessment of resistance and susceptibility and polymorphism of the AFLP marker in F(2) population, the genetic linkage distance between the AFLP marker and the N gene was estimated. One AFLP marker E39/M41-339 was obtained and transferred to a SCAR marker amplifying a 315 bp DNA fragment linked to the N resistant allele and a 331 bp fragment linked to the N(+) susceptible allele. The distance between the molecular marker and the nematodes resistance N gene is 6.3 cM. This research delivered a valuable tool for the marker assisted selection of nematodes resistance in pepper. 【题目】辣椒幼苗叶片解剖特征及光合特性对弱光的响应
【中文关键词】辣椒; 弱光; 显微结构; 叶绿体超微结构; 气孔; 光合特性;
【英文关键词】capsicum; low light; anatomical structure; ultrastructure of chloroplast; stomata; photosynthetic characteristics;
【中文摘要】以4个弱光适应性不同的辣椒(Capsicum annuum L.)基因型(甜味型和辣味型)为试材,在人工气候室内研究了弱光(75~100μmol.m-2.s-1)条件下幼苗叶片显微结构、叶绿体超微结构、气孔特征,以及光合特性的适应性变化。结果表明,弱光下辣椒幼苗叶片变薄,栅栏组织/海绵组织比值增加,‘伏地尖’(辣味型)和‘上海圆椒’(甜味型)具有较高的栅栏组织/海绵组织比值;叶绿体数减少,但叶绿体变大,基粒数、基粒厚度和基粒片层增加,淀粉粒增大、增多,2个辣味型材料比2个甜味型材料具有较高的叶绿体数和基粒数。辣椒(甜味型)展叶过程中下表皮气孔密度下降,而展叶14d以后的气孔指数和单片叶气孔数变化不大。弱光下叶片气孔密度、气孔指数和单片叶气孔数减小,但气孔变大,其中‘上海圆椒’气孔纵轴、横轴较正常光照下增加,‘20078’则横轴显著增加;弱光环境中叶片表皮细胞变大并发生扭曲皱褶,气孔与表皮平齐或略显外突,保卫细胞角质层上可观察到明显的环状褶皱。弱光下辣椒幼苗的光饱和CO2同化速率(Asat)、暗呼吸速率(Rd)、夜间呼吸速率(Rn)、光呼吸速率(Rp)、光补偿点(LCP)、光饱和点(LSP)、CO2补偿点(Γ)、CO2饱和点(CSP)、羧化效率(CE)以及RuBP最大再生速率下降,表观量子效率(Φi)上升;辣味型较甜味型材料Asat下降幅度较小,并且具有较低的LCP、LSP及其Rd、Rn和Rp。弱光下各基因型辣椒的光合启动时间均有所延长,弱光敏感性材料表现更为明显。
【英文摘要】Four genotypes of capsicum(Capsicum annuum L.) with distinct low light tolerance were used to study the response of anatomical structure,ultrastructure of chloroplast,stomatal characteristics and photosynthetic characteristics of leaves to low light(75-100 μmol · m-2 · s-1) in a phytotron.The results revealed that leaves treated with low-light became thinner with an increase of palisade/spongy tissue ratio,and two genotypes including hot pepper Fudijian and sweet pepper Shanghai Yuanjiao had higher ratio than the other two. Under low light, the number of chlorop last decreased, but the size of chlorop lasts and starch grains, the number of grana, grana lamella, starch grain and grana thickness of chlorop last increased. Comparing with sweet pepper, hot pepper had more chlorop lasts and granas. In sweet pepper, the stomatal density in lower epidermal descended during leaf unfolding, but no more changes of stomatal index and number of stomata per leaf occurred after 14 days of leaf unfolding. Low light treatment resulted in decreases of stomatal density, stomatal index and number of stomata per leaf, and increases of the stomatal size, the vertical and horizontal axes of stomata in ‘Shanghai Yuanjiao’. Simultaneously, the longer horizontal axes of stomata were also observed in another genotype ‘20078’. The epidermal cells of sweet pepper grown under low lightwere large and distorted. Meanwhile the stomata and lower epidermal cellwere equal height or the stomata slightly protruded out of the epidermalwall. The cycle wrinkle could be obviously observed on cuticle of guard cell in lower epidermis of leaves under low light. Photosynthetic parameters including light saturated rate of the CO2 assimilation (Asat) , dark resp iration rate (Rd) , night resp iration rate (Rn) , light resp iration rate (Rp) , light compensation point (LCP) , light saturation point (LSP) , CO2 compensation point (Γ) , CO2 saturation point(CSP) , carboxylation efficiency (CE) and maximum RuBP regeneration rate decreased, while apparent quantum yield (Φi) increased under low light. The Asat decreasing, LCP, LSP, Rd , Rn and Rp were lower in hot pepper than those in sweet pepper. The start time of photosynthesis (namely, the net photosynthetic rate i.e. Pn from zero to maximum) in low2light leaveswas relatively p rolonged, especially in low light-sensitive than in low light-tolerant genotypes. Hence, some adap tive response of photosynthetic characteristic to low light have happened in capsicum leaves.

【题目】甜(辣)椒花药培养胚状体诱导与植株再生

【中文关键词】甜(辣)椒; 花药培养; 胚状体; 植株再生;
【英文关键词】pepper(Capsicum annuum L.); anther culture; embryoid; plant regeneration;
【中文摘要】以10份不同基因型甜(辣)椒为试材进行花药培养,通过对基因型、取蕾时期、低温预处理、热激处理、碳源及外源激素浓度配比等因素的研究,建立有效的甜(辣)椒花药培养胚状体发生体系。结果表明:基因型是限制甜(辣)椒花药培养胚状体诱导的关键因素,不同品种间出胚率差异显著,其中品种003出胚率最高,为10.8%;处于盛花期的花蕾最适于甜(辣)椒花药培养;4℃低温预处理1~3 d有利于胚状体的诱导,以处理2 d的胚状体产率最高;以2%的麦芽糖代替3%的蔗糖能显著提高出胚率和子叶形胚的比率,筛选出适于甜(辣)椒花药培养胚状体诱导的最佳培养基为MS+0.5 mg/L NAA+1.0 mg/L KT+2%麦芽糖,能有效地提高出胚率并促进植株再生;获得了6个基因型的子叶形胚和再生植株。
【英文摘要】Ten varieties of pepper were used to study the effects of genotype,flower buds harvest time,cold-pretreatment, hot-shock treatment,carbon source and combination of hormones on the anther culture in Capsicum annuum L. Through these tests,an effective system of embryoid production was established.Cotyledonary embryoids and plantlets were obtained from six genotypes.The results showed that genotype was the key factor in embryoid induction.The embryoid formation frequency was different significantly among different genotypes.The variety 003 had the highest embryoid formation frequently which was 10.8%.The flower buds at full-bloom stage were found to optimum for anther culture in pepper.Coldpretreatment(4°C)for 1-3d also promoted embryoid induction,while the highest embryoid for frequently was obtained from anther pretreated at 4°C for 2d.Embryoid and cotyledonary embryoid formation frequently could be more remarkably improved by 2% maltose than 3% sucrose.The optimal culture medium which could effectively improve embryoid and regenerated plantlets formation was MS +0.5mg/L,NAA+1.0mg/L KT +2% maltose.

【题目】辣椒抗黄瓜花叶病毒同源序列的克隆与分析
【中文关键词】辣椒; 黄瓜花叶病毒; 抗病基因同源序列; 核苷酸结合位点-富含亮氨酸重复;
【英文关键词】pepper(Capsicum annuum L.); cucumber mosaic virus; resistance gene analog; NBS-LRR;
【中文摘要】根据已知抗病基因的核苷酸结合位点(NBS)保守结构域设计简并引物,以高抗黄瓜花叶病毒的辣椒Yv2007001为试材,获得10条抗病基因同源序列(RGA)。经序列分析,这些RGAs皆具有开放阅读框和NBS保守结构域(P-loop、Kinase-2、Kinase-3a、RNBS-C和GLPL),属于nonTIR-NBS-LRR类抗病基因同源序列。其中RGA46与番茄花叶病毒抗性基因Tm-22的氨基酸同源性为78%,可能与辣椒抗黄瓜花叶病毒(CMV)相关。其它序列与已知抗病基因Prf、RPP13、I2C-1、Mi-1.2、L6、M氨基酸相似性为21%~70%。所得RGA序列的Ka/Ks值为0.0110~0.3051,均显著小于1,表明"纯化选择"在辣椒NBS区域进化中起主要作用。
【英文摘要】Ten resistance gene analogs(RGAs) were cloned from a pepper variety(Yv2007001)with high resistance to cucumber mosaic virus(CMV),using a PCR approach with degenerate primers designed from conserved motifs found in a number of plant resistance genes.Sequence analysis showed that all RGAs belong to nonTIR-NBS-LRR subgroup,containing ORF and five conserved motifs including P-loop,kinase-2a,kinase-3a,RNBS-C and GLPL.RGA46 showed 78% homology at the deduced amino acid with Tm-22(ToMV),suggesting that RGA46 has correlation with resistance to CMV. The highest and the lowest homology, between the RGAs and known resistance genes (Prf, RPP13, I2C21,M i2112, L6 and M)were found 70% and 21% respectively. The ratios of non2synonymous (Ka) to synonymous nucleotide substitution (Ks) of the NBS domains of RGAswere 01011 0 - 01305 1, less than which showed that purifying selection plays an important role in evolutionary process of resistance genesNBS region of pepper.

【题目】辣椒细胞质雄性不育基因的AFLP分析
【中文关键词】辣椒; 细胞质雄性不育(CMS); 扩增片段长度多态性(AFLP); 序列分析;
【英文关键词】Hot pepper(Capsicum annuum L.); Cytoplasmic male sterility(CMS); Amplified fragment length polymorphism(AFLP); Sequence analysis;
【中文摘要】本文采用AFLP(amplified fragment length polymorphism)技术对辣椒(Capsicum annuum L.)细胞质雄性不育系21A及其相应的保持系21B基因组DNA进行多态性比较,筛选了64对AFLP选择性引物Pst Ⅰ-NNN+Mse Ⅰ-NNN组合,有60对引物组合均在两系间扩增出5447条带,多态性位点为4个,其中在不育系材料中仅有2个多态性片段AGC/CGC378和ATC/GAG446,对特异片段进行克隆、测序,其序列全长分别为340bp和408bp,它们编码的氨基酸序列与烟草基因组线粒体DNA序列同源性达94%和96%。
【英文摘要】AFLP technique with 64 pairs of primer combinations Pst Ⅰ-NNN+Mse Ⅰ-NNN were employed to find the polymorphisms between the genomic DNAs of cytoplasm male sterile line 21A and its maintainer line 21B in hot pepper. It was shown that 5 447 bands were amplified in two lines with 60 pairs of primer combinations. There were 4 polymorphic loci in two lines and only 2 polymorphic fragments AGC/CGC378 and ATC/GAG446 were found in cytoplasm male sterile line. These specific AFLP fragments were cloned and sequenced.Sequencing analysis indicated that the length of the sequence were 340 bp and 408 bp, with 94% and 96% identities of its amino acid sequence with a part of the Nicotiana tabacum mitochondrial DNA genome.

【题目】雌雄同株黄瓜单性结实性遗传分析
【中文关键词】黄瓜; 雌雄同株; 单性结实; 主基因+多基因; 遗传;
【英文关键词】cucumber; monoecious; parthenocarpy; major gene plus polygene; inheritance;
【中文摘要】【目的】分析雌雄同株黄瓜单性结实性的主基因+多基因混合遗传特点,为选育强单性结实雌雄同株黄瓜品种提供理论依据。【方法】通过强单性结实雌雄同株黄瓜自交系‘6457’与非单性结实自交系‘6429’和‘6426’构建的6个世代群体,应用植物数量性状主基因+多基因联合分离分析方法,分析不同遗传背景和季节雌雄同株黄瓜单性结实性遗传表现。【结果】雌雄同株黄瓜单性结实性遗传受2对主基因+多基因控制(E-1-0,E-1-2)。两主基因的加性效应值均较大,B1、B2、F2主基因遗传率分别为72.2%—88.8%、52.5%—93.1%、88.6%—95.4%,相应的多基因遗传率分别为0—11.2%、0—43.1%、0—1.5%。【结论】强单性结实性雌雄同株黄瓜品种选育以双亲均为强单性结实为宜,常规杂交育种早期世代选择有效。
【英文摘要】【Objective】 The mixed major gene plus polygenes inheritance of parthenocarpy in monoecious cucumber were studied to provide a theoretical basis for breeding monoecious cucumber varieties of strong parthenocarpy. 【Method】 Using the model of the major gene plus polygene of quantitative traits,a joint analysis of six-generations from crossing a highly parthenocarpic monoecious lines 6457 with two non-parthenocarpic inbred lines 6429 and 6426 was carried out to investigate the inheritance of the parthenocarpy in cucumber in different backgrounds and seasons. 【Result】 The results showed that inheritance of parthenocarpy was controlled by two major genes and polygenes. The additive effects of the two major genes were great. The major gene heritabilities of B1, B2, and F2 were 72.2%-88.8%, 52.5%-93.1%, and 88.6%-95.4%, respectively. While the corresponding polygene heritabilities were 0-11.2%, 0-43.1%, and 0-1.5%, respectively. 【Conclusion】 The breeding of monoecious cucumber with highly parthenocarpy should choose parents that both are highly parthenocarpy. Selection of parthenocarpy can be carried out in the earlier generations of conventional crossing breeding.

【题目】黄瓜同源三倍体创制及减数分裂行为观察
【中文关键词】黄瓜; 同源三倍体; 减数分裂;
【英文关键词】cucumber(Cucumis sativus L.); autotriploid; meiotic;
【中文摘要】采用常规杂交法研究黄瓜二、四倍体杂交过程中亲本育性、授粉组合及亲本基因型对杂交结实率的影响,并利用减数分裂制片法对获得的黄瓜同源三倍体进行了花粉母细胞减数分裂行为的观察。结果显示:(1)同源四倍体自交结实率比较低(13.0%~14.5%),可能与其花药内所包含的正常花粉粒比例小及花粉管萌发长度较短有关。(2)二、四倍体杂交组合的结实率很低(0.26%~1.02%),但在两种配组方式之间存在着明显差异,即以同源四倍体黄瓜为父本和二倍体黄瓜为母本的杂交结实率比较高,反之则杂交结实率比较低。(3)在二、四倍体杂交过程中,二、四倍体的基因型对杂交结实率的影响较大,以杂交双亲同属一个基因型的杂交效果较好。(4)同源三倍体花粉母细胞减数分裂过程与二倍体基本相同,但存在较高频率的染色体异常行为:中期Ⅰ染色体构型复杂,在大多数花粉母细胞中可观察到单价体、二价体、三价体的存在;中期Ⅰ和Ⅱ有少数染色体游离于赤道板外;后期Ⅰ和后期Ⅱ常出现落后染色体、染色体桥及细胞分裂不同步现象,其最终结果导致了不正常四分体和不可育配子的形成。(5)同源三倍体花粉粒的平均可染率和萌发率分别为18.8%和11.3%。研究结果表明,黄瓜二、四倍体正反交能直接获得同源三倍体材料;同源三倍体花粉母细胞减数分裂异常导致不育配子的形成是引起其育性低的细胞学原因;同源三倍体的部分育性为通过同源三倍体的回交来选育初级三体系奠定了基础。
【英文摘要】The effects of fertility of parents,pollination combination and genotype of parents on seed-setting in hybridization between autotetraploid and diploid were analyzed with conventional cross method,and the meiosis of pollen mother cells(PMCs) in autotriploid cucumber was also studied using meiotic analysis.The results showed:(1)The low seed-sets(13.0%~14.5%) of the autotetraploidy combinations may be attributed to the presence of more abnormal pollen in the anthers or length of pollen tube.(2)The seed-sets of cross combinations between autotet raploid and diploid were very low (0. 26 %~1. 02 %) ,but t here were obvious different seed2settings between t he two mating met hods. If the autotet raploid cucumber was used as the male parents and the diploid as the female parents , higher seed-sets were found in the hybridized combination. However ,the seed-sets in the combinations were lower if the diploid cucumber was used as male parents. (3)Besides ,the effect of genotype of parents on production of autot riploid was biggish ; the average percentage of autot riploid production was higher when autotet raploid and diploid were belonging to same genotype. (4) The PMCs meio is of the autot riploid was similar to the diploid. However , the higher frequency of abnormality was observed in autot riploid. Variable chromosome configurations ,e. g. univalent and trivalent were observed in most PMCs of the autot riploid at metap hase Ⅰ. In additional , some of the chromo somes were found not to rank at metap hase plate in metap hase Ⅰ and metap hase Ⅱ cell s. At anaphase Ⅰ and anap hase Ⅱ ,chromosome lagging ,bridges and asynchronization were f requently observed as well ,which led to formation of abnormality tet rad and inviable gametes. (5) The average percentages of pollen dryration and pollen germination were 18. 8 % and 11. 3 % ,respectively. These findings indicate t hat autot riploid could obtain directly f rom autotet raploid by diploid crosses. The decrease in fertility is due to irregularities of chromosome behavior during meiosis with the formation of imbalanced and non-viable gametes in autot riploid cucumber . Meanwhile ,autot riploid was partially fertile which established groundwork for the selection of the primary trisomic cucumber by autot riploid backcross method.

【题目】全雌黄瓜单性结实性的遗传分析
【中文关键词】黄瓜; 全雌; 单性结实性; 遗传;

【英文关键词】cucumber; gynoecious; parthenocarpy; inheritance;
【中文摘要】采用植物数量性状主基因+多基因混合遗传模型对黄瓜强单性结实雌性系‘6401’与非单性结实自交系‘6429’、‘6426’杂交组合多世代群体的单性结实性进行联合分析,结果表明:全雌黄瓜单性结实性在不同遗传背景下遗传表现基本一致,单性结实性遗传均表现为不完全隐性基因遗传,符合E-1-1模型,受两对加性—显性—上位性主基因+加性—显性多基因控制。两组合第1主基因显性效应、主基因显性×显性互作效应以及多基因效应较大。‘6401×6429’组合的B1、B2、F2群体(主基因+多基因)遗传率分别为51.36%、72.31%和76.78%;‘6401×6426’组合的B1、B2、F2群体(主基因+多基因)遗传率分别为20.50%、75.39%和74.58%。强单性结实全雌黄瓜品种选育以双亲均为强单性结实为宜。
【英文摘要】Using the model of the major gene plus polygene of quantitative traits, a joint analysis of multi-generations from crossing a highly parthenocarpic gynoecious lines‘6401’with two non-parthenocarpic inbred lines‘6429’and‘6426’was carried out to investigate the inheritance of the parthenocarpy in cucumber. Results showed that the inheritance of parthenocarpy in gynoecious cucumbers with different genetic backgrounds was fitted into the same genetic model. Inheritance of parthenocarpy is expressed as incompletely recessive, fit the E-1-1 model, and controlled by two additive-dominant-ep istatic major genes and additive-dominant polygenes. Dominant effect of the firstmajor gene and dominant ×dominant interaction between the two major genes as well as polygene effects were higher in those two cross combinations. The heritabilities of B1 , B2 , F2 from cross‘6401 ×6429’were 51136% , 72131% and 76178% , respectively, while the heritabilities of B1 , B2 , F2 from‘6401 ×6426’were 20150% , 75139% and 74158% respectively. These results indicated that breeding of gynoecious cucumber with highly parthenocarpy should choose parents that both are highly parthenocarpy.

【题目】黄瓜品种RAPD指纹图谱的构建及遗传相似性分析
【中文关键词】黄瓜; RAPD标记; 遗传相似性分析; 指纹图谱;
【英文关键词】cucumber(Cucumis sativus L.); RAPD; fingerprinting; genetic similarity analysis;
【中文摘要】利用RAPD技术对22个具有广泛遗传基础的黄瓜品种进行了指纹图谱构建及遗传相似性分析,从240条RAPD随机引物中筛选出27条具有稳定多态性的引物。27条引物共扩增出163条带谱,其中多态性带70条,平均多态性比例为43.10%。9条RAPD引物产生的12个特异性标记可以单一地鉴别9个品种,利用不同引物的组合可将其他品种鉴别出来。通过UPGMA法进行聚类分析,当GSC=0.6888时,可将22个黄瓜品种分为4个群。22个品种间的平均遗传相似系数为0.8004,说明黄瓜的遗传变异较低,遗传基础狭窄。
【英文摘要】Twenty-seven RAPD primers that could amplify stable polymorphic products were selected from 240 random primers for the fingerprinting construction of cucumber varieties and genetic similarity analysis.Totally 163 bands were amplified,among which 70 bands were polymorphic,the average percentage of polymorphic bands being 43.10%.Nine varieties could be identified independently with 12 specific markers generated by 9 primers.All the 22 varieties could be identified by the combination of several primers.The clustering analysis showed that 22 cucumber varieties could be divided into four group swhen the GSC value was 0.688 8. The average genetic similarity coefficence was 0.800 4, which indicated low genetic diversity and narrow genetic base of cucumber.

【题目】黄瓜耐热材料筛选
【中文关键词】黄瓜; 耐热性; 种质资源;
【英文关键词】Cucumber; Heat tolerance; Germplasm resource;
【中文摘要】为了获得黄瓜耐热性材料,以所收集的生态型不同的黄瓜品种为试材,经田间自然高温幼苗期与成株期耐热性筛选,结合人工高温幼苗耐热性筛选,结果获得耐热黄瓜材料6个,热敏黄瓜材料2个,丰富了黄瓜耐热性与热害研究的材料,有助于解决黄瓜生产中的热害问题。
【英文摘要】In order to select heat tolerant cucumber,we had compared heat tolerance of different ecotype cucumbers in the field and at seedling stage under 42 °C for 24 h. The results showed that six cultivars were heat tolerant and two cultivars were heat sensitive. The tests found materials for study heat tolerance and heat injury in cucumber. This discovery will play a role in finding a genetic solution for heat injury problem in cucumber production.

【题目】热胁迫对耐热性不同黄瓜品种及其F1代叶片膜透性和保护酶活性的影响
【中文关键词】黄瓜;热胁迫;保护酶;膜透性;杂种优势
【英文关键词】Cucumber;Heat stress;Protective enzyme;Membrane permeability;Hetemsis
【中文摘要】为了选育耐热黄瓜品种,以黄瓜(Cucumis sativus L.)耐热品种Poinsett 97、热敏品种Boothbyls Blonde和它们的F1代为试验材料,研究黄瓜幼苗在28、38°C条件下,叶片中保护性酶类活性和膜透性的变化.结果表明:在38°C热胁迫下.耐热品种的相对电导率、MDA含量提高量明显低于热敏品种,而其保护酶SOD、POD活性和PRO含量的提高量明显高于热敏

品种,CAT活性的降低量明显低于热敏品种.在F1代中,POD活性表现正向杂种优势外,其余均为负向优势.
【英文摘要】Cucumber varieties Poinsett 97,a heat tolerance variety,Boothbyls Blonde,a heat susceptive variety,and their FI Poinsett 97xBoothbyls Blonde were used to research the dynamic changes of the activities of membrane protective enzymes(superoxide dismutase—SOD.pemxidase—POD,catalase—CAT),the content of malondialdehyde(MDA),the content of PRO and relative conductance(RC) of the leaves under 28°Cand 38°C.The results showed that under heat stress the increase of RC,MDA content was evidently lower;the increase of the SOD,POD activity and the content of PRO was evidently higher.The decrease of CAT activity was evidently lower in the heat tolerance variety than the heat susceptive variety.The positive heterosis of POD was observed,negative heterosis of the others index were found in the FI.

【题目】与黄瓜抗黑星病相关基因紧密连锁的SSR标记
【中文关键词】黄瓜 ; 黑星病 ; 抗性相关基因 ; SSR
【英文关键词】Cucumber,Scab,Resistance-related gene,SSR
【中文摘要】本研究以黄瓜抗黑星病母本Q6和感黑星病父本F51及其F2代分离群体为试材,采用BSA法和SSR技术建立了对黑星病的抗病组和感病组,SSR引物CSWCTT02D在抗感组间表现多态性,且呈共显性.经162个F2单株验证,在高抗单株和高感单株中分别仅扩增出246 bp和256 bp的特异片段,而在中间类型个体中同时扩增出了两个特异片段.连锁分析结果表明,该标记与黄瓜黑星病抗病相关基因紧密连锁,距离为3.1 cM.测序结果显示,两个片段的差异在于10个碱基的插入或缺失.
【英文摘要】With a F_2 population derived from (Q6×F51) as materials,polymorphism between resistant and susceptible bulk of cucumber scab were studied using BSA method and SSR technology.A co-dominant SSR marker,CSWCTT02D-246 bp/256 bp,was screened.The resistant and susceptible F_2 plants possessed the 246 bp and the 256 bp fragments,respectively,and the mid-plants owned the two fragments.The SSR marker was closely linked to the cucumber scab resistance-related gene,and the genetic distance between the marker and gene was 3.1 cM.Fragements sequencing of the co-dominant SSR marker indicated that their length were 246 bp and 256 bp respectively.The difference of the two fragments lied in the insert-deletion of 10 bp.

【题目】黄瓜新品种粤秀3号的选育
【中文关键词】黄瓜;新品种;粤秀3号;选育
【英文关键词】无
【中文摘要】粤秀3 号是以A- 2 为母本、C- 8 为父本配制的一代杂种。A- 2 是在100 多份资源材料鉴定的基础上, 从中选出从亚洲蔬菜中心引进的材料, 用单株选育法经7 代自交纯化的优异材料。主要特点是早熟, 植株长势较强, 分枝强,主侧蔓结果, 瓜长棒形、瓜条顺直、瓜长40cm、瓜把3.8cm, 品质中等。父本C- 8 是从长春密刺系统变异植株中选出单株, 其表现植株生长势强, 叶色深绿、叶片较小, 抗病性强, 商品瓜多、瓜条顺直, 皮色深绿有光泽, 黄色条纹不明显, 经6 代单株选育, 表现稳定。2001 年试配组合, F1 表现综合性状好,尤其在生长势及产量性状表现优异。2002- 2003 年进行品种比较试验, 2004- 2005 年参加全省区试, 同时在广东的番禺、茂名、湛江及广西、四川等地进行不同区域生产试种, 表现早熟, 果实商品性强, 产量高, 抗病抗逆性较强, 适合华南地区及全国各地种植。该品种于2006 年12 月通过广东省品种委员会审定。

【题目】不同材质果袋春夏季节套袋对黄瓜果实发育和品质的影响
【中文关键词】黄瓜; 果实套袋; 连续套袋; 果实发育; 微环境; 品质; 农药残留;
【英文关键词】cucumber; fruit bagging; successive-fruit-bagging; fruit growth; micro-environment; quality; residual pesticide;
【中文摘要】以“冬冠3号”黄瓜品种为试材,于春夏生长季节(4~7月份)在日光温室中研究了白膜袋、鲜膜袋、白纸袋和黄纸袋4种套袋处理对黄瓜果实微环境、果实生长发育和营养品质及农药残留的影响。结果表明:不论晴天还是阴天,所有套袋处理的袋内光照强度降低,相对湿度增大,温度提高;白纸袋增温效果最好,鲜膜袋内相对湿度最高,黄纸袋内光照最弱。单株单瓜套袋和单株果实连续套袋试验均表明,套袋后果实鲜重增长加快,瓜长度增加,瓜皮色显著变浅。连续套袋后,单瓜重普遍提高,大头瓜率降低,但化瓜率、弯瓜率和尖头瓜率增加;游离氨基酸含量提高;维生素C含量无显著变化;叶绿素和类胡萝卜素的含量普遍降低;可溶性蛋白质含量白纸袋和鲜膜袋的提高,黄纸袋和白膜袋的降低,但与CK间的差异均未达到5%显著水平。套袋可有效降低果实中氧化乐果的残留量,其中黄纸袋效果最好,其次为鲜膜袋、白膜袋和白纸袋。综合考虑各指标,认为春夏季节黄瓜果实套袋栽培应优先选用白纸袋,鲜膜袋和白膜袋不适宜在该季节使用。
【英文摘要】The research of fruit bagging was conducted in a farmer s solar greenhouse in Yangling,Shaanxi Province from April to July 2005 with four different types of bags: the white plastic film bag(WFB),the freshness-keeping plastic film bag(FFB),the white paper bag(WPB) and the yellow paper bag(YPB),in which cucumber fruit of cv.Dongguan No.3 was bagged.The objectives are first to rate the effectiveness of fruit bagging with different types of bags in controlling the residual chemical pesticides which are now commonly used to control pests in cucumber production, and second to investigate the bio-effects of fruit bagging on fruit growth and quality to evaluate the feasibility of fruit bagging technique in cucumber production. The no-bagging of fruit was taken as the control (CK) . Two experiments were carried out in this research, one was to bag only one fruit on a plant (one-fruit-bagging) and the second was to bag all the fruits on a plant(successive-fruit-bagging) . The experiments were rep licated three times and randomly arranged in the greenhouse. The treatment was conducted by choosing the newly opening female flower, measuring the length of the ovary, artificially pollinating the flower, and then bagging the female flower (young fruit) with a bag. The samp le p lants were sp rayed with the testing pesticide oxidized dimethoate twice. The micro-environment wasmeasured, which include the temperature, the relative humidity (RH) and the light intensity both outside and inside the bag during the period of fruit growing. The sample fruits were harvested to examine fruit morphology, yield, nutritive quality and the residual of the testing pesticide.The results show that on both sunny and cloudy days, light intensity inside all the bags is weakened, while RH and temperature increased. The highest temperature increase is inWPB and the highest RH increase is in FFB. The lowest level of light intensity record is in YPB. Both one-fruit-bagging and the successive-fruit-bagging on a plant show that the fresh weight (FW) growth rate and fruit length are increased by different levels according to different bagging treatments. Thecolor of fruit skin is lightened markedly in all four treatments of both experiments. With the successive-fruit-bagging, the single fruit weight is generally increased, the rate of big-head fruit is decreased, but the rate of aborted fruit, the rate of crooked fruit and the rate of pointed-head fruit are increased. Compared with the control, the content of free amino acids is increased, the amount of vitamin C is not changed markedly, but the content of chlorophyll and carotenoid are decreased.The content of soluble protein in fruit inWPB and FFB are increased, but reduced in YPB andWFB. There is no marked difference in soluble protein between

those treatments and the control. The residual of testing pesticide in the harvested fruit is effectively reduced by all the treatment of fruit bagging. YPB appears to be the best, which reduces the residual by 76.6%. FFB, WFB and WPB decrease the residual by 71. 6% , 69. 8% and 68. 9% respectively. In comprehensiveconsideration, WPB is recommended first. FFB and WFB are thought not suitable to use in the spring-summer growth season.

【题目】黄瓜耐热性芽苗期鉴定指标筛选及预测方程的建立
【中文关键词】黄瓜; 耐热性; 芽苗期鉴定; 形态指标; 预测方程;
【英文关键词】cucumber; hot tolerance; identification at germination stage; morphological index; forecast equation;
【中文摘要】【目的】研究高温胁迫下黄瓜芽苗期的主要生物学性状,筛选芽苗期黄瓜耐热鉴定的形态指标。【方法】以25℃为对照(CK)温度,以4个已知耐热性的黄瓜品系种子为试材,在不同高温(35,38,42℃)下发芽6d后,测定芽苗形态指标,并进行主成分分析和回归分析。【结果】38℃高温发芽条件下,黄瓜幼苗的全鲜质量(X1)、去子叶鲜质量(X2)、根鲜质量(X3)、下胚轴长(X4)、活力指数(X5)与黄瓜品系耐热性的相关性比35和42℃下更密切,可作为耐热种质筛选的指标;主成分分析表明,第一、二主成分对耐热性评价的贡献率分别为89.03%和9.86%;通过回归分析建立了黄瓜耐热性预测方程。【结论】在38℃高温条件下发芽后6d测定的X2和X5,可作为黄瓜耐热性芽苗期鉴定的简易指标,利用回归方程Y=-0.347 3+0.245 0 X2+0.073 5 X5,可以预测黄瓜品种资源的耐热性。
【英文摘要】【Objective】 The biological characteristics at germination and sprouting stage were studied to screen hot tolerance identification morphologic indexes for cucumber.【Method】 Taking the 4 hot-tolerance known straits of cucumber as the test material and 25 ℃ as the temperature control,the main morphological indexes of cucumber were investigated under different high temperature(35 ℃,38 ℃,42 ℃) conditions 6 days after germination.The principal component analysis and regression analysis were made according to these indexes.【Result】 The whole-plant fresh weight(X1),fresh weight of plant without cotyledon(X2),root fresh weight(X3),hypocotyl length (X4) and vigor index(X5)showed significant correlations with hot-tolerance,which were suggested to be the reliablescreening indexes to identify hot tolerance variety .The first and second principal component contributed 89.03% and 9.86% to the hot tolerance of cucumber,respectively.A regressive equitation was established to access cucumber hot tolerance.【Conclusion】 The indexs X2 and X5 of cucumber germinated at 38℃ for 6 days are thought to be the simple indexs and the regressive equitation Y=-0.3473+0.2450×2+0.0735×5 is selected to forecast the hot tolerance of cucumber germplasm at germination and sprouting stage.

【题目】黄瓜自交系低温弱光耐受性快速筛选平台的建立
【中文关键词】黄瓜; 低温弱光耐受性; 快速筛选平台;
【英文关键词】Cucumber; Tolerance to low temperature and poor light; Rapid screening system;
【中文摘要】黄瓜对低温和弱光的耐受性是两个相对独立的性状,需要单独进行评价。设计了以叶面积增长量为主要性状指标的弱光(或弱光+偏低温)耐受性的评价指标体系和以冷害指数作为临界低温耐受性评价指标的快速筛选体系,两者可复合实施。
【英文摘要】The tolerance to low temperature and the tolerance to poor light are two independent characters of cucumber. So they need to be evaluated separately. A multiple evaluating system is designed. First step, using the increase of leaf area to evaluate the tolerance ability under poor light or the combination of poor light and sub-optimal temperature. Second step, using the same seedlings, critical low temperature tolerance ability can be evaluated by investigating the cold injury index. Ideal results have been gained by using the evaluating system on the selection of cucumber inbred lines .

【题目】龙园“绿春”旱黄瓜栽培关键技术
【中文关键词】旱黄瓜;龙园“绿春”;栽培关键技术
【英文关键词】无
【中文摘要】龙园“绿春”旱黄瓜是黑龙江省农业科学院园艺分院黄瓜研究室培育的适合春大棚及露地栽培的旱黄瓜杂优一代新品种,是哈尔滨市近郊早春主栽品种,也是黑龙江省主栽品种,并在吉林、辽宁有较大面积栽培,内蒙、广东、山东等省栽培效果反映良好。“绿春”为鲜食品种,也可以作加工用,商品瓜淡绿色,有光泽,刺瘤稀少,果肉脆嫩,清香味浓,深受北方人喜爱。因其产量高,品质佳,销路旺,效益好,深受生产者、消费者欢迎,栽培面积也迅速扩大,经济效益及社会效益日益显著。

【题目】保存方法和年限对黄瓜枯萎病病菌致病力的影响
【中文关键词】黄瓜; 枯萎病菌株; 保存方法;
【英文关键词】Cucumber; Bacterial strain of fusarium wilt of cucumber; Preservation method;
【中文摘要】对已经在冰箱里用不同方法保存了11~22a的黄瓜枯萎病病菌进行了致病力的测定研究。研究结果表明,黄瓜枯萎病菌在试管PDA固体斜面培养基中保存22a,经过培养纯化后仍有很强的致病力,同一方法保存不同年限的菌株其成活率与致病力差异不显著,而相同保存年限不同保存方法保存的菌株成活率差异显著,其中试管PDA固体斜面培养基和大三角瓶麦粒培养基保存方法较好。
【英文摘要】Pathogenicity determination of fusarium wilt pathogens in cucumber preservation in icebox for 11-22 years since 1984 was studied. The results showed that pathogens preservation for 22 years in PDA solid slant medium in test tube were still high pathogenicity. Preserved by the same method and different period,difference between survival rate of bacterial strain and pathogenicity was not significant. Preserved by the same period and different method,difference was significant. The method of PDA solid slant medium and wheat grain in trigonal tank were better.

【题目】黄瓜耐热性遗传分析
【中文关键词】黄瓜; 耐热性; 细胞质膜热稳定性; 遗传分析;
【英文关键词】cucumber; heat tolerance; cytoplasm membrane heat stability; genetic analysis;
【中文摘要】以两个耐热和两个热敏的黄瓜亲本进行完全双列杂交,连同亲本、F1代自交和回交世代(P1,P2,F1,F2,B1,B2)作为试验材料,对高温处理的叶片进行细胞质膜热稳定性测定。运用MINQUE(1)的统计方法,以Cockerham提出的遗传模型建模原理,用加性-显性遗传模型对结果进行遗传分析。结果表明,黄瓜耐热性属于多基因控制的数量遗传,由主效基因控制;加性效应为59.052,显性效应为18.509;广义遗传率为42.109%,狭义遗传率为55.308%。
【英文摘要】Using the two cucumber parents of complete diallel cross between heat tolerance and heat sensitive,the generation F1 of the two parents and backcross generation(P1,P2,F1,F2,B1,B2) were as the experiment materials to determine heat stability of cytoplasm membrane of cucumber leaves treated by high temperature.By using MINQUE(1) statistical method and the genetic model modeling theory brought by Cockerham,the research analyzed the genetic result by AD genetic model.The result showed the heat tolerance of cucumber belonged to quantity heredity controlled by multi- genes and was also controlled by main gene. The adding effect was 59.052, dominance effect was 18.509, broad heritability ratio was 42.109% and the narrow heritability ratio was 55.308%.

【题目】黄瓜霜霉病抗病基因的RAPD及SCAR标记
【中文关键词】黄瓜; 霜霉病抗病基因; RAPD标记; SCAR标记;
【英文关键词】cucumber(Cucumis sativus L.); downy mildew resistance gene(dm); RAPD markers; SCAR markers;
【中文摘要】以感霜霉病黄瓜L18-10-2和抗霜霉病黄瓜129为亲本构建F2代分离群体,以F3代植株霜霉病抗性鉴定表示F2代各单株抗病性并得以区分各单株杂合或纯合感病性,采用RAPD技术和转SCAR的方法筛选黄瓜抗霜霉病基因分子标记.结果显示,在318条RAPD引物中有18条引物表现出两亲本间多态性,其中引物P18的SB-SP18561扩增片段与霜霉病抗病基因之间紧密连锁,根据交换率和Kosambi函数公式计算其遗传距离为7.85 cM.回收SBSP18561片段并克隆和测序,其准确长度为561 bp.将该RAPD标记转换为SCAR标记,长度为494 bp,命名为SSBSP18494.
【英文摘要】The mapping population was constructed with the susceptible cucumber L18-10-2 and the resistant cucumber 129 as parents.The identification of resistance for downy mildew of F2 progeny was carried out using that of F3 progeny,which could distinguish the heterozygous and homozygous susceptibility of every individual.The markers of resistance to downy mildew were screened with the RAPD technique.The results showed that 18 primers of 318 RAPD primers could detect the polymorphism between the two parents. The polymorphic fragment SBSP18561 amplified by the primer P18 showed linkage relation with the dm gene. The linkage distance was calculated as 7. 85 cM according t he crossover value and the formula of the Kosambi function. The segment SBSP18561 was recovered ,cloned and sequenced. Its length truly was 561 bp . The RAPD marker was t riump hantly converted into a SCAR marker . The marker was named SSBSP18494 for the length of 494 bp .

【题目】黄瓜瓜把长度QTL定位的研究
【中文关键词】黄瓜; 瓜把长度; SSR; QTL;
【英文关键词】Cucumis sativus; carpopodium length; SSR; QTL;
【中文摘要】利用长瓜把的黄瓜自交系129与短瓜把的Z3杂交衍生的F2株系,检测与瓜把长度相关的QTL。DNA从F2株系提取,并且利用SSR引物对其进行扩增。总共有5个呈现清晰、可重复的多态性分子标记用于QTL检测。结合瓜把数据,利用Mapmaker3.0b构建基因连锁图谱,运用Windows QTL Cartographer V2.0检测QTL。LOD大于2作为QTL存在的阈值。4个来自于同一个连锁群的分子标记CSWGATT01B、CSWGATT01C、CSCT335和CSWGATT01A与瓜把长度显著相关。Qchl1与分子标记CSWGATT01B、CSWGATT01C紧密连锁,与二者分别相距3.4cM和18.0cM,且变异贡献率为18.49%。
【英文摘要】A F2 population derived from 129, a cucumber inbred line with long carpopodium, and Z3, a cultivar with short carpopodium, was used to identify quantitative trait loci (QTL) associated with cucumber carpopodium length. DNA was extracted from F2 plants and amplified using simple sequence repeat (SSR) marker. Five polymorphic SSR markers were used for QTL detection and construct the genetic linkage map using Mapmaker 3.0b. QTLs were detected with Windows QTL Cartographer V2.0. Four markers CSWGATT01B, CSWGATT01C, CSCT335 and CSWGATT01A that came from one linkage group significantly associated with carpopodium length. Qchl1 was linked with SSR markers CSWGATT01B and CSWGATT01C by 314 cM and 1810 cM, respectively. It explained 18149% of phenotypic variation.

【题目】水果型黄瓜新品种东农804选育
【中文关键词】水果型黄瓜; 东农804; 一代杂种;
【英文关键词】Mini-cucumber; ‘ Dongnong 804 ’; F1 hybrid;
【中文摘要】东农804是利用优势育种法选育的水果型黄瓜一代杂种。母本D0420是强雌性自交系,父本D0202是高代稳定自交系。植株长势强,叶片深绿色,茎秆粗壮,分枝少、主蔓结瓜,节成性好,第7~8节以上每节有瓜,高抗细菌性角斑病和枯萎病,抗霜霉病、白粉病。瓜长22~24cm,瓜粗3cm左右,单瓜质量150~180g,标准瓜率大于85%。果实深绿色,有光泽,瓜腔小于瓜横径1/2,每667m2产量3800~4300kg。适宜在华北、东北地区春秋保护地栽培。
【英文摘要】‘ Dongnong 804 ’ is a new mini-cucumber F1 hybrid bred by using heterosis breeding.The female D0420 is strong female inbred line,and the male D0202 is inbred line.It grows vigorously.Its leaf is dark green and the vine is thick and strong.It bears fruits mainly in its main stem with high rate of fruit-setting and low rate of branching.It is highly resistant to bacterial augular leaf spot and Fusarium wilt,resistant to downy mildew and powdery mildew.Its fruit is dark green,lustrous,22-24 cm in length,about 3 cm in diameter, and 150 - 180 g in weight. The standard fruit rate is above 85 %. The length of fruit cavity is below 1 /2. It yields 5710 - 6415 t · hm- 2.

【题目】常规灌溉条件下嫁接和增施氮肥对温室黄瓜耗水量及水分利用效率的影响
【中文关键词】嫁接; 施氮水平; 黄瓜; 耗水量; 水分利用效率;
【英文关键词】graft; nitrogen supplying level; cucumber; water consumption; water use efficiency;
【中文摘要】在日光温室内研究了常规灌溉条件下,嫁接和3种施氮水平(0、110和331kg.hm-2)对日光温室黄瓜耗水量和水分利用效率的影响.结果表明:在嫁接和追施氮肥331kg.hm-2时,黄瓜耗水量最高,冬春茬和秋冬茬分别为3350和2181m3.hm-2,水分利用效率也最高,两茬口分别为27.2和36.9kg.m-3.在施氮量相同的情况下,嫁接黄瓜的耗水量比自根黄瓜提高3~6,经济产量和水分利用效率则分别提高28和20.9;随着施氮量的增加,嫁接黄瓜耗水量和水分利用效率均显著增加,自根黄瓜耗水量也随施氮量的增加而增加,但水分利用效率却在施氮110kg.hm-2时最高.因此,嫁接栽培可显著提高黄瓜耗水量及水分利用效率,且随着施氮量的增加而显著增加;增施氮肥也可显著提高自根黄瓜的耗水量,但氮肥增施过多则将降低自根黄瓜的水分利用效率。
【英文摘要】An experiment was conducted in solar greenhouse to study the effects of graft and different nitrogen(N) supply levels(0,110,and 331 kg · hm-2) on the water consumption and water use efficiency(WUE) of cucumber(Cucumis sativus L.) under traditional irrigation.The results showed that when topdressing 331 kg N · hm-2,the water consumption of grafted cucumber was the

highest,being 3 350 m3 · hm-2 and 2 181 m3 · hm-2 in winter-spring and autumn-winter cropping,so did the WUE,being 27.2 kg · m-3 and 36.9 kg · m-3,respectively. Comparing with those of self-rooted cucumber, the water consump tion, economic yield, andWUE of grafted cucumber under the same N topdressing levels were increased by 3%- 6% , 28% , and 2019% , respectively, and the water consump tion andWUE of grafted cucumber were increased with increasing N supply level. The water consump tion of self-rooted cucumber also increased with increasing N supply level, but itsWUE was the highestwhen the N supply was 110 kg · hm- 2. It was indicated that graft could markedly promote the water consumption andWUE of cucumber, and the effectwasmore markedly with increasingN supply level. To increase N supp ly could also markedly promote the water consumption of self-rooted cucumber, but the WUE would be lower when excessive N was supplied.

【题目】中国刺瘤型黄瓜种质遗传多样性和亲缘关系的AFLP分析
【中文关键词】黄瓜; AFLP; 遗传多样性; 亲缘关系;
【英文关键词】Cucumber; AFLP; Genetic diversity; Relationship;
【中文摘要】利用AFLP(Amplified fragment length polymorphisms)分子标记技术对99份来源不同的中国刺瘤型黄瓜(Cucumis sativusL.)种质的遗传多样性和亲缘关系进行了分析,以确定中国黄瓜的遗传基础,指导育种实践。从77对引物组合中选出7对多态性较高的组合进行扩增,共扩增出382条条带,多态性带179条,多态性带比率为46%,总体平均期望杂合度为0.314。聚类分析显示,可将99份黄瓜种质资源划分为短瓜类群和长瓜类群,长瓜类群又可以分为3个亚群,3个亚群的黄瓜具有各自类群的表型特点。中国刺瘤型黄瓜种质资源表现出丰富的遗传多样性,是黄瓜育种优良的基因源。

【英文摘要】In this study,Genetic diversity and relationship of 99 cucumber germplasms were assessed by molecular marker technology AFLPs,to make sure the genetic basement of the Chinese warty cucumber and direct breeding.7 selective primer pairs were screened from total 77 primer pairs and 179 polymorphic bands were observed from total 382 bands.The percentage of polymorphic bands was 46.86%.The average expected heterozygosity of AFLP loci among all accessions was 0.314.Based on AFLPs results,99 materials were clustered into two groups , namely short fruit cucumber group and long fruit cucumber group , and the long fruit cucumber group was further classified into there sub-groups. This results were consistent with the morphological character. Chinese cucumber germplasm had a high degree in genetic diversity and were an excellent gene source for cucumber breeding.

【题目】优质日光温室黄瓜新品种“中农26号”的选育
【中文关键词】黄瓜; 中农26号; 一代杂种; 优质; 抗病;
【英文关键词】Cucumber; ‘Zhongnong No.26’; F1 hybrid; Superior quality; Resistance to disease;
【中文摘要】中农26号是以01316为母本和04348为父本配制而成的黄瓜一代杂种。瓜色深绿,腰瓜长约30cm,瓜把短,心腔小,果肉绿色,商品瓜率高;综合抗病性强,抗霜霉病、白粉病、病毒病,中杭枯萎病;耐低温弱光;持续结瓜及丰产优势明显。早春日光温室栽培产量高达8900kg·(667m2)-1。适宜北方日光温室各茬口栽培。
【英文摘要】‘Zhongnong No.26’is a newly bred cucumber F1 hybrid using inbred line 01316 as maternal parent and 04348 as paternal parent. Its fruit is about 30 cm in length with short neck and dark green skin. It has resistance to downy mildew, powdery mildew, ZYMV, WMV, mid-resistance to Fusarium wilt. It is tolerate to low temperature and weak light. It can bear fruit sustainably and has remarkable high yielding potential. It can yield 133.5 t·hm-2 in early spring in solar-greenhouse. It is suitable for protected cultivation, especially for solar-greenhouse.

【题目】Vegetable Production in Solar Plastic Greenhouses: Past, Present and Future in Shandong Province
【中文关键词】无
【英文关键词】Yang Qi; protected culture; winter vegetable production; SPG; cucumber
【中文摘要】无
【英文摘要】The primitive form of solar plastic greenhouse (SPG) was plastic covered "Yang Qi", which was normally used for culture of vegetable transplants but with glass windows. Since its appearance in Shandong Province (China) around 1989, SPG has gone

through major modifications on both structure and cover materials. Most of current SPGs have three solid brick/soil walls (the east, west and north side) and polyethylene plastic covers (the south side and top). Relying exclusively on solar energy, SPG is capable of producing over 30 different vegetable species, including temperate vegetable crops in winter, at regions with the minimal temperature above 15 degrees C. The acreage of SPG in Shandong Province has exceeded 140 kha, producing 20-25% of the vegetables in China. The total output and value of vegetables produced was 18.5% and 20.4% of the nation, respectively. The export of Shandong vegetables was about a million t/year, valued over $400 million. In addition to the improvement in SPG structure, progress in the cultivation techniques through the years had made the rapid growth in SPG acreage possible. These techniques, which had aided in boosting farmer's profits from $15k/ha to $50k/ha, included the use of SPG specific cultivars, grafted transplants, adequate fertilizer, CO2 implementation, and scientific temperature controls. The major challenges to vegetable production in SPGs are soil deterioration and severe plant disease and pest problems. Future study should address the integrated pest control, diversification of vegetable species and cultivars, and improvement of qualities in vegetable produces.

【题目】弱光下黄瓜苗期几个生理指标的遗传分析

【中文关键词】黄瓜幼苗; 双列杂交; 弱光; 配合力; 遗传力; 遗传分析; POD; PPO; MDA; Chla/Chlb;

【英文关键词】Cucumber seedling; Diallel crossing; Low light; Combining ability; Heritability; Genetic analysis; POD; PPO; MDA; Chl a/Chl b;

【中文摘要】以6份黄瓜自交系为试材,采用完全双列杂交设计GriffingⅡ配制了21个组合。对正常温度(25℃/15℃)弱光条件下黄瓜苗期几个生理指标作了配合力、遗传力和遗传分析的研究,其中包括过氧化物酶(POD)、多酚氧化酶(PPO)两种酶的活性,丙二醛(MDA)含量,叶绿素a与b的比值(Chl a/Chl b)4个指标,得到表现较好的3个亲本和5个组合。结果表明,在正常温度弱光条件下这4个指标的狭义遗传力均很低。PPO活性、MDA含量和Chl a/Chl b值的遗传均不符合加性-显性模型。

【英文摘要】Six cucumber inbred lines were used as test materials and 21 combinations were made through complete diallel cross GriffingⅡ.The combining ability,heritability and genetic analyses of several physiological indexes at the seedling stage,including activities of peroxidase(POD)and polyphenol oxidase(PPO),content of MDA and ratio of chlorophyll a to chlorophyll b,were conducted.The results showed that the narrow heritabilities of all the four indexes were very low under normal temperature(25℃/15℃) and low light.The activity of polyphenol oxidase (PPO) , content of MDA and ratio of chlorophyll a to chlorophyll b were not in line with additive2dominant model . In the experiment 3 inbred lines and 5 combinations had a rather good performance.

【题目】不同砧木对嫁接黄瓜细胞保护酶活性和丙二醛含量的影响
【中文关键词】黄瓜; 嫁接; 细胞保护酶; 丙二醛;
【英文关键词】cucumber; graft; protective enzyme; MDA;
【中文摘要】将欧洲型黄瓜品种春秋王和华南型黄瓜品种沪杂6号分别嫁接到4种不同的砧木上,对嫁接黄瓜和自根黄瓜叶片2种细胞保护酶(SOD和POD)活性的变化及丙二醛(MDA)含量进行分析。结果表明,不同砧木嫁接处理后SOD和POD的活性都呈先升高后下降的趋势,第3周时达到最大,且春秋王和沪杂6号嫁接苗叶片中2种酶的活性水平都高于自根苗,而自根苗中MDA含量高于所有嫁接苗;不同砧木之间保护酶活性和MDA差异不显著。
【英文摘要】Europe type "Chunqiuwang" and South China type "Huza No.6" were grafted on 4 different rootstocks. Activities of protective enzyme and contents of MDA of grafted and self-root cucumber seedlings were studied. The results showed that activities of superoxide dismutase(SOD) and peroxidase(POD) in leaves of grafted seedlings were higher than those of self-root seedlings, and the current went firstly up and then went down. But the contents of MDA of self-root seedlings were higher than those of grafted seedling.It also showed that there was no significant difference between grafted seedlings in cucumber grafting.

【题目】黄瓜早期耐冷性鉴定指标的筛选
【中文关键词】黄瓜; 耐冷性; 鉴定指标; 筛选; 相关分析;
【英文关键词】Cucumber; Cold tolerance; Determining indicator; Screening; Correlation analysis;
【中文摘要】以津春5号黄瓜品种和上海市农业科学院园艺研究所黄瓜课题组选育的3个材料07-QP-17(华南型)、07-QP-22(欧洲型)、07-QP-48(欧洲型)为试材,比较研究了黄瓜在目前设施栽培中经常出现的临界低温(15℃/7~8℃)下形态指标、叶绿素荧光参数和几种生理生化指标的变化。结果表明:低温胁迫下,黄瓜叶片表现出明显的冷害症状,叶长和叶宽增长缓慢;叶绿素、脯氨酸和丙二醛(MDA)含量呈下降趋势;叶绿素荧光参数Fo、Yield、ETR、qN比处理前有所下降,Fv/Fm先上升后下降,各品种间叶绿素荧光参数的变化差异不大。相关性分析表明:叶绿素含量和叶绿素荧光参数与黄瓜的冷害指数显著相关。
【英文摘要】The cucumber cultivar Jinchun 5 and three different-type lines(07-QP-17,07-QP-22 and 07-QP-48)bred by the Horticultural Research Institute were used as test materials,and the comparative study was made on the morphological indexes,chlorophyll fluorescence parameters and physiological and biochemical changes of cucumber seedings under the critical low temperature(15℃at day and 7~8℃at night which often occurred in protected culture in winter and spring) in order to screen determining indicators of early cold tolerance of cucumber. The results showed that under the low temperature,cucumber grew slowly

in leaf length and width and decreased in chorophyll, proline and MDA contents, and the chlorophyll fluorescence parameters Fo, yield, ETR and qN were slightly less than those before low temperature treatment,but Fv/Fm increased first and then decreased. The differences in changes of chlorophyll fluorescence parameters were not great among different cultivars(lines).The correlation analysis indicated that the chorophyll content and the chlorophyll fluorescence parameters were significantly correlated with the index of chilling injury of cucumber seedlings.

【题目】不同南瓜砧木对嫁接黄瓜生长和果实品质的影响
【中文关键词】黄瓜; 砧木; 嫁接; 生长; 品质
【英文关键词】Cucumber; rootstock; graft; growth; quality
【中文摘要】用4种不同的南瓜(cucurbita moschata)砧木中原共生Z101、圣砧三号、西光和K2 - 902对欧洲型黄瓜(Cucumis sativus L.)品种春秋王和华南型黄瓜品种沪杂6号进行嫁接,试验结果表明: 2个黄瓜品种与4种砧木的嫁接亲和性都较好;嫁接苗的茎粗大于自根苗,生长势强;嫁接果实中Vc含量下降,而可溶性糖含量增加,可溶性蛋白含量除了春王/K2902低于对照外,其它组合都高于对照。春秋王嫁接苗果实的风味只有春秋王/K2902比自根苗差,而沪杂6号嫁接苗的果实风味普遍都比自根苗淡。综合分析,中原共生Z101和圣砧三号比较适合做春秋王和沪杂6号的嫁接砧木。
【英文摘要】The Europe type cucumber variety “ Chunqiuwang ” and South China type “ Huza No. 6 ” were grafted on the 4 different pumpkin rootstocks of Zhongyuangongsheng Z101, Shengzhen No. 3, Xiguang and K2 - 902. The survival rate, growth and fruit quality after graftingwere studied. The results showed that, Chunqiuwang and Huza No. 6 have good graft compatibilitywith 4 rootstocks; Stem diameter of grafting cucumber is bigger than that of self - rooted cucumber, the growth potential is better; In the grafting cucumber fruit, the Vc content is decreased and the soluble sugar content is increased, the soluble p rotein contents in grafting combinations excep t Chunqiuwang/K2 - 902 are higher than that in self - rooted cucumber. In the grafting combinations of Chunqiuwang, the fruit flavor of Chunqiuwang/K2 - 902 isworse than that of self - rooted cucumber, which is the same as the grafting combinations of Huza No.6. Generally analyzed, Zhongyuangongsheng Z101 and Shengzhen No. 3 are the suitable rootstocks for Chunqiuwang and Huza No. 6.

【题目】黄瓜果实性状的Hayman遗传分析
【中文关键词】黄瓜; 果实性状; 遗传参数估计;
【英文关键词】Cucumber; Fruit characters; Genetic parameter estimation;
【中文摘要】将黄瓜6个亲本,按照完全双列杂交配制30个杂交组合,用Hayman分析方法估计果长、把长、横径、单果重、单株结果数等果实性状的遗传参数。Wr对Vr的回归分析表明,果长、把长、横径、单果重、单株结果数的遗传符合"加性-显性"模型。Wr+Vr与Yr的相关性分析表明,单株结果数呈负相关,说明含有更多显性基因的亲本具有较小的Wr+Vr值;果长、把长、横径、单果重呈正相关,说明含有更多显性基因的亲本具有较大的Wr+Vr值。遗传参数估算表明,把长、单株结果数、单果重的遗传加性效应方差小于显性效应方差;果长、横径的遗传是加性效应方差大于显性效应方差。
【英文摘要】Six cucumber parents were used to produce 30 combinations by crosses.Genetic parameters for five fruit characters were estimated according to Hayman s method.Analysis of regression Wr against Vr indicated that inheritance of fruit length,fruit stalk length,fruit width,weight of per fruit and the fruit number of per plant conformed to the additive-dominant model.Correlation analysis showed that there was a negative correlation between Wr+Vr and Yr in the fruit number of per plant,It implied that the parents possessingmore dominant genes had lowerW r +V r values . However, there was a positive correlation between W r + V r and Yr in fruit length, fruit stalk length, fruit width and weight of per fruit ,which meaned that the parents possessingmore dominant genes had higherW r +V r values. Estimation of the genetic parameters showed that the dominant variance was greater than the additive variance for fruit stalk length,weight of per fruit and the fruit number of per plant. while the additive variance was greater than the dominant variance for fruit length and fruit width.

【题目】甜瓜基因组学研究进展
【中文关键词】甜瓜(Cucumismelo; L.); 国际葫芦科基因组计划; 遗传图谱; 分子标记; QTL定位; 基因克隆;
【英文关键词】Melon; ICuGI; Genetic mapping; Molecular marker; QTL mapping; Gene cloning;
【中文摘要】甜瓜是一种世界性的园艺作物。随着现代生物技术的迅速发展,甜瓜基因组学研究越来越深入,国际葫芦科基因组计划也已经筹备完成即将启动。目前已构建有14张甜瓜遗传图谱,多个重要性状的分子标记及数量性状位点已找到并定位在图中,并开始在葫芦科作物之间进行比较基因组图谱方面的研究。已克隆出枯萎病抗性基因Fom-2,其它农艺性状基因的克隆工作也在陆续开展。本文在甜瓜遗传连锁图谱的构建、重要性状分子标记及QTL定位、比较基因组学及基因克隆等方面分别对其研究进展进行了探讨,以期为我国的甜瓜基因组学研究提供有益的参考。
【英文摘要】Melon (Cucumis melo L.) is one of a worldwide horticultural crop. Along with the development of modern biotechnology, much more progresses in the study of the genomics of melon have been made. International Cucurbit Genomics Initiative (ICuGI) has been ready run soon. At present, fourteen melon genetic maps have been constructed, many molecular markers linked to important traits and quantitative trait locis are found and some has been located on the maps. The research of compatative genomic maps on cucurbitaceous crops has begun. The cloning of resistance gene to Fom- 2 has been cloned and the cloning of other economical genes is also listed in this article. The study of melon genetic map construction, molecular marker linked to the important traits and QTL mapping, comparative genomics,gene cloning are discussed, which may be implicative for accelerating melon genomics studies in China.

【中文关键词】葫芦科; 分子标记; 遗传图谱; 基因定位; 标记辅助选择;
【英文关键词】Cucurbitaceae Molecular marker Genetic map Location of gene MAS;
【中文摘要】综述了几种常用分子标记在葫芦科瓜类作物遗传图谱构建、重要性状基因定位、遗传多样性及亲缘关系分析、分子标记辅助选择及在葫芦科遗传育种中的应用,对目前葫芦科遗传育种中应用分子标记技术存在的问题和解决方案进行了探讨,并对葫芦科分子标记辅助育种的前景做了展望。
【英文摘要】The paper summarizes the applications of molecular markers in the construction of genetic linkage maps,genetic mapping of the important traits,analysis of germplasm diversities and genetic relations,molecular marker-assisted selection,the applications of the genetics and breeding in Cucurbitaceae. The problems and solutions of molecular markers in genetics and breeding of Cucurbitaceae are discussed. The prospect of molecular marker-assisted breeding of Cucurbitaceae is viewed in order to improve the research in this field in China.

【题目】甜瓜白粉病抗性基因Pm_2F的遗传特性及与其紧密连锁的特异片段
【中文关键词】甜瓜; Cucumis; melo; L.; 白粉病; 抗性基因; 特异片段;
【英文关键词】melon; Cucumis melo L.; powdery mildew; resistant gene; specific fragment;
【中文摘要】在明确瓜类白粉病生理小种的基础上,以感白粉病新疆哈密瓜[Cucumis melo L.ssp.melo convar.ameri(Pang.)Greb.]来源的自交系K7-2和抗白粉病日本网纹甜瓜[Cucumismelo L.ssp.melo convar.cantalupa(Pang.)Greb.]来源的自交系K7-1为亲本及其F2S6群体为试材,对甜瓜白粉病抗性遗传机制和紧密连锁标记进行深入研究。群体遗传分析表明,K7-1对白粉病Podosphaera xanthii(DC.)VPGelyuta生理小种2F的抗性受一对显性基因Pm-2F控制。同时采用SSR分析技术发现,抗病特异片段CM-BR120-172、CMBR8-98与Pm-2F紧密连锁,连锁距离分别为1cM和3cM。抗病特异片段CMBR120-172在120份甜瓜种质资源材料验证中符合率达87.5%。
【英文摘要】Podosphaera xanthii(DC.)VP Gelyuta race 2F caused melon(Cucumis melo L.)powdery mildew was the prevailing race in Beijing.The segregation of resistance had been evaluated in F2S6 population of the cross between the resistant Japanese cantaloupe[Cucumis melo L.ssp.melo convar.cantalupa(Pang.)Greb.]line K7-1 and the susceptible Xinjiang Hami melon[Cucumis melo L.ssp.melo convar.ameri(Pang.)Greb.]line K7-2.The resistance to P.xanthii race 2F in K7-1 was controlled by one single dominant Pm-2F gene.SSR technique had been used for the identification of markers linked to powdery mildew resistance. Two specific fragments CMBR120- 172 and CMBR8- 98 were closely linked to Pm 22F gene at a distance of 1 cM and 3 cM, respectively. The efficiency of CMBR120- 172 was about 87.5% in 120 melon germplasms. The markers identified in this experminentwere closest to Pm 22F gene to date, and the research,therefore, can be used in melon molecular breeding.

【题目】西瓜抗病毒基因zym-CH的比较图谱定位
【中文关键词】西瓜 ; zym-CH ; BSA法 ; 共线性 ; 比较定位
【英文关键词】watermelon; the resistant gene for Zucchini yellow mosaic virus; bulked segregant analysis; collinearity relationship; comparative mapping
【中文摘要】以西瓜抗ZYMV-CH(小西葫芦黄花叶病毒中国株系,Zucchini yellow mosaic virus-CHINA)野生种质P. I.595203和感病自交系98R为试材构建F_2群体和F_(2:30群体,采用BSA法筛选与抗病基因zym-CH连锁的分子标记,并利用以F_2S_8群体(P.I.296341-FR×97103)构建的西瓜参考遗传图谱进行zym-CH的比较定位.试验结果表明:在参考遗传图谱已经定位的RAPD和SSR标记中,RAPD标记b13_(-1400)与zym-CH的遗传距离为25.6 cm;SSR标记MCPI_(-14)和MCPI_(-26)与zym-CH的遗传距离分别为57 cM和87 cM,比较分析发现这些标记在两个图谱上的分布呈共线性关系.根据zym-CH与标记b13(-14000、MCPI(-14)和MCPI(-26)之间的遗传关系,将西瓜抗病毒病基因zym-CH初步定位在西瓜参考遗传图谱3号连锁群105 cM处.
【英文摘要】The watermelon germplasm P. I. 595203 resistant to ZYMV-CH (Zucchini yellow mosaic virus-CHINA) and 98R susceptible to ZYMV-CH were used as the parents to construct F_2 population and F_(2:3) population. The markers linked to the resistant gene zym-CH were filtered by BSA strategy. The reference genetic map constructed basing on the F_2S_8 population (P. I. 296341-FR 97103) was used for comparative mapping of zym-CH gene. The results showed that bl3_(1400), MCPI_(-14) and MCPI_(26) were linked to zym-CH gene with the genetic distance of 25. 6 cM, 57 cM and 87 cM respectively. The resistant gene zym-CH was located on 105 cM of the linkage group 3 by the collinearity relationship of zym-CH, b13_(-1400), MCPI_(-14) and MCPI_(-26)in the two linkage maps.

【题目】早熟优质耐裂西瓜新品种京欣四号的选育
【中文关键词】京欣四号; 优质; 耐裂; 品种选育;
【英文关键词】Jingxin No.4; Good quality; Anti-cracking; Cultivar breeding;
【中文摘要】西瓜新品种京欣四号早熟,果实发育期28 d,全生育期90d左右。植株生长势强,抗病,坐瓜性好。果实圆形,绿底覆盖墨绿窄条纹,外形美观。单瓜质量7~8 kg,剖面均匀,红瓤,中心可溶性固形物含量11.5%。皮薄,耐裂,耐储运,肉质脆嫩,口感佳。与京欣一号相比,耐裂性有较大提高,中心糖度高,瓤色更红。适于早春小拱棚、露地和秋大棚栽培及远距离运输。
【英文摘要】Jingxin No.4 is a new early-maturing and good quality anti-cracking watermelon F_1 hybrid with high yield.It takes about 90 days from sowing to harvest and 28 days from flowering to fruiting.It s vigorous with good disease resistance and fruit setting ability.Its fruit shape is round with bright-green rind and dark-green narrow stripes.The average fruit weight is 7-8 kg.Its flesh color is red and the taste is crisp with excellent flavor.Its soluble solid content is above 11%.It has thin and tough rind,and the fruit is suitable for storage and transportation. It's more anti-crack and sweeter than Jingxin No.l. It's well adapted to early spring and autumn plastic house culture and open field culture.

【题目】西瓜抗枯萎病基因同源序列的克隆与分析
【中文关键词】西瓜; 枯萎病; 抗病基因同源序列; 核苷酸结合位点;
【英文关键词】Watermelon; Fusarium wilt; Resistance gene analogs; Nucleotide binding site;
【中文摘要】本研究根据已克隆的抗枯萎病基因的NBS保守结构域设计了22条上游简并引物和17条下游简并引物,以西瓜抗枯萎病种质PI296341-FR和感枯萎病品种97103为材料,获得了7条来自基因组DNA的RGA序列(GenBank登录号:DQ156558-DQ156564),均含有NBS保守区的P-环、kinase-2或kinase-3等抗病基因的特征序列结构,所编码的氨基酸序列与已知抗枯萎病基因Fom-2、I2C-1、I2C-2和I2等编码的氨基酸序列表现出11% 72%的同源性,其中来自PI296341-FR的RGA序列175R1与甜瓜抗枯萎病基因Fom-2的同源性最高,为72%。来自PI296341-FR与97103的RGA序列之间同源性较高(73% 97%),证明了抗病基因在进化上的保守性。
【英文摘要】22 upper degenerate primers and 17 lower degenerate primers were designed basing on the NBS conserved domains of the cloned wilt resistance genes. 7 RGA sequences (GenBank Accession number: DQ156558-DQ156564) were harvested from the genomics DNA of wilt resistance germ plasm PI296341-FR and the susceptible variety 97103. All the RGAs contain NBS conserved domains such as P-loop、kinase-2 and kinase-3. The amino acids deduced from the RGAs shared homology (11%~72%) with those deduced from the known wilt resistance gene such as Fom- 2, I2C- 1, I2C- 2 and I2. The RGA 175R1 from PI296341-FR shared high homology (72%) with the melon wilt resistance gene Fom- 2. The RGAs from PI296341-FR were homologous (73%~97%) with the RGAs from 97103. This result proves the conservation of disease resistance gene evolution.

【题目】西瓜抗枯萎病相关EST-SSR的信息分析
【中文关键词】西瓜 ; 枯萎病 ; EST ; SSR
【英文关键词】Watermelon;Fusarium wilt;EST;SSR
【中文摘要】对西瓜枯萎病菌生理小种1诱导的抑制差减杂交cDNA文库测序获得的4000条EST进行分析,经过前处理后拼接得到1487条unigene序列,全长为759 kb.在其中978条unisene序列中共检索出2136个EST-SSR,出现频率为53.4%.EST-SSR的平均分布距离和平均长度分别是1/0.36 kb、19.59 bp.EST-SSRs中的重复单元以二核苷酸和三核苷酸重复为主,二者在总EST-SSRs中的出现频率为98.08%.GA/TC和GAA/TTC是二、三核苷酸中的优势重复类型,分别占二、三核苷酸重复的25.78%和12.97%.西瓜抗枯萎病相关EST资源的SSR信息分析为进一步建立西瓜EST-SSR标记和探索其在西瓜基因组学研究中的应用奠定了基础.
【英文摘要】Simple sequence repeats (SSRs) were investigated in the unigene sequences from suppression subtractive hybridization (SSH) cDNA library which constructed with watermelon root induced by Fusarium oxysporum f. sp. niveum race 1 .A total of 1487 unigene sequences corresponding to 795 kb were searched,resulting in the identification of 2 136 SSRs.The estimated frequency of SSRs was approximtely 53.4% ,and the overall average length of SSRs was 19.59 bp, the average distance of distribution were 1/0.36 kb.The di- and tri-nucleotide repeats appeared to be the most abundant SSRs,accounting for 98.08% in all the EST-SSRs.The adentine rich repeats such as GA/TC and GAA/TTC were predominant in each type of SSRs (di-,tri-),accounting for 25.78% and 12.97% in di- and tri-nucleotide repeats respectively . These EST-SSRs information could be efficiently exploited for the development of gene-derived SSR markers.

【题目】新疆哈密瓜永久遗传图谱构建及比较分析
【中文关键词】甜瓜; SSR; 遗传图谱; 比较作图;
【英文关键词】melon; Cucumis melo L.; SSR marker; genetic map; comparative mapping;
【中文摘要】新疆哈密瓜〔Cucumismelo L.ssp.melo convar.ameri(Pang.)Greb.〕是我国特有的栽培甜瓜种质资源,具有不同于网纹甜瓜〔Cucumismelo L.ssp.melo convar.cantalupa(Pang.)Greb.〕的独立遗传背景。以新疆哈密瓜和网纹甜瓜为亲本构建F2S6作图群体,采用SSR标记技术获得同时具有哈密瓜和网纹甜瓜遗传背景的永久遗传图谱。图谱由22个连锁群组成,包括201个SSR标记,1个白粉病抗性基因标记,覆盖基因组长度977.153cM,标记间的平均距离4.837cM。本图谱中的17个连锁群与Fernandez-Silva等构建的网纹甜瓜遗传背景图谱具有线性关系,两张图谱共有46个相同SSR标记。
【英文摘要】Xinjiang Hami melon,with independent and different genetic background of cantaloupe,is a unique cultivar in China.A set of populations were developed from a cross between the cantaloupe[Cucumis melo L.ssp. melo convar. cantalupa(Pang.) Greb.]and the Xinjiang Hami melon[Cucumis melo L. ssp. melo convar. ameri(Pang.) Greb.].Simple sequence repeat(SSR) markers were used to construct permanent genetic map with the F2S6 populations. The map consisted of 22 linkage groups,contained 201 SSR markers and 1 morphological trait, it spanned a total genetic distance of 9771153 cM with an average map interval of 41837 cM between two markers. Seventeen linkage groups in the map were collinearwith cantaloupe genetic map, 46 SSR markers were common in two maps. The construction of Xinjiang Hamimelon SSR map laid foundation for the continuation of the international integration of melon common genetic map and comparative study.

【题目】西瓜和黄瓜乙烯受体ETR1基因片段的克隆与序列比较分析
【中文关键词】ETR1; 基因克隆; 西瓜; 黄瓜;
【英文关键词】ETR1; Gene cloning; Citrullus lanatus(Thunb.) Matsum & Nadai var.lanatus; Cucumis sativus L.;
【中文摘要】乙烯受体基因ETR1是乙烯信号转导过程中的关键调控基因。研究根据ETR1基因的保守序列设计引物,以西瓜(Citrullus lanatus(Thunb.)Matsum&Nadai var.lanatus)和黄瓜(Cucumis sativus L.)的基因组DNA为模板进行PCR扩增,获得序列长度分别为1 633 bp和1 491 bp的基因片段CLETR1和CSETR1。序列分析表明,CLETR1和CSETR1与Genebank中收录的多条ETR1基因的核苷酸序列同源性在80%~98%,氨基酸序列同源性在75%~98%。西瓜和黄瓜ETR1基因片段的编码序列存在明显的单核苷酸变异,共23个核苷酸位点存在SNPs(Single nucleotide polymor-phisms),其中5个SNPs导致4个编码氨基酸的改变。
